## FOREWORD

Among the responsibilities assigned to the Office of the Manager, National Communications System, is the management of the Federal Telecommunication Standards Program. Under this program, the NCS, with the assistance of the Federal Telecommunication Standards Committee identifies, develops, and coordinates proposed Federal Standards which either contribute to the interoperability of functionally similar Federal telecommunication systems or to the achievement of a compatible and efficient interface between computer and telecommunication systems. In developing and coordinating these standards, a considerable amount of effort is expended in initiating and pursuing joint standards development efforts with appropriate technical committees of the Electronics Industries Association, the American National Standards Institute, the International Organization for Standardization, and the International Telegraph and Telephone Consultative Committee of the International Telecommunication Union. This Technical Information Bulletin presents an overview of an effort which is contributing to the development of compatible Federal, national, and international standards in the area of facsimile. It has been prepared to inform interested Federal activities of the progress of these efforts. Any comments, inputs or statements of requirements which could assist in the advancement of this work are welcome and should be addressed to:

## Volume II - Radio Facsimile Test Results

This volume contains the raw data obtained from tests of groups-1, -2 and -3 FAX using The Government's HF simulator at Ft. Monmouth, New Jersey. (Volume I is the Final Report based on this data.) Both the premessage exchange and the message portion of a FAX transmission are tested. For a premessage test, five trials are made and the successes and failures are recorded. For the message test, the message is transmitted and the received document taken as the test result.

The tests are identified by a Roman numeral which may be followed by a letter, and a number. The numeral I identifies the base-line test, II indicates a test of a single impairment, and III is a composite test. The capital letter identifies the type of impairment, such as selective fading or noise; and the number identifies the degree of impairment.

It will be noted that variations in bandwidth are not included in the tests. The bandwidth was set (using external filters) to run from 600 to 2800 Hz.

Most tests are run for both the premessage exchange and the message portion of the transmission. In some cases, when the premessage exchange failed, the test of the message portion was still run by forcing the equipment to go to the message phase.

Legible Document per letter

Dist
A-1

Following is a list of those tests performed:

I. Base-line tests, single path, no noise, no impairments. These tests provide a basis for comparison.

II. Primary tests, single impairment. These tests measure the effect of one impairment at a time.

A. Gaussian noise (simulator setting plus 7.5 dB).

1. S/N = 10 dB (normal)
2. S/N = 12 dB
3. S/N = 14 dB
4. S/N = 16 dB
5. S/N = 22 dB

B. Impulse Noise

1. Random, 100/min, 1 m sec, 0 dB peak-to-rms signal
2. Random, 500/min, 1 m sec, 0 dB peak-to-rms signal
3. Random, 500/min, 1 m sec, 6 dB peak-to-rms signal

C. Multipath ( = differential delay)

1. Two paths, equal attenuation, $\tau$ = 1 m sec, 1 Hz off-set.
2. Two paths, 3 dB difference, $\tau$ = 1 m sec, 1 Hz off-set.
3. Two paths, 6 dB difference, $\tau$ = 1 m sec, 1 Hz off-set.
4. Two paths, 9 dB difference, $\tau$ = 1 m sec, 1 Hz off-set.

5. Two paths, 12 dB difference, $\tau$ = 1 m sec, 1 Hz off-set.

6. Two paths, 15 dB difference, $\tau$ = 1 m sec, 1 Hz off-set.

7. Two Paths, 18 dB difference, $\tau$ = 1 m sec, 1 Hz off-set.

8. Three paths, 9 dB difference, $\tau$ = 1 and 0.5 m sec, 1 and 0.5 Hz off-set.

9. Three paths, 12 dB difference, $\tau$ = 1 and 0.5 m sec, 1 and 0.5 Hz off-set.

D. Flat Fading

1. Single path, Doppler spread = 1 Hz.

E. Doppler

1. Single Path, - 75 Hz
2. Single Path, + 75 Hz
3. Single Path, - 32 Hz
4. Single Path, + 16 Hz
5. Single Path, + 7 Hz
6. Single Path, + 10 Hz

III. Secondary tests with multiple impairments

C-1. Multipath, Doppler, and Gaussian Noise;
Two paths, 12 dB difference, 1 m sec delay,
1 Hz off-set, 21.5 dB S/N, 7 Hz Doppler.

C-2. Same as C-1 but with 19.5 dB S/N, and 16 Hz Doppler.

C-3. Same as C-2 but with impulse noise added. (500 ppm, 1 m sec duration 0 dB peak-to-rms)

C-4. Impulse Noise and Gaussian Noise only; single path, 14 dB S/N.

If the date and time are printed above, they are not part of the transmitted text.

This is a document prepared for checking facsimile transmission over radio. Since radio channel parameters may change over the transmission of one document, this page is filled with text in order to observe the effect of any changes.

This text is purposely typed close to the top of the page. Some transmitted documents may be rejected after a few inches of text in order to save testing time where a short text is sufficient.
