FINAL REPORT

PROJECT 85017

DATE 17 SEPTEMBER 1953

PREPARED BY:

Keith C. Giles
Keith C. Giles

REPORT NO.: 1228

APPROVED BY:

J. R. Smith
J. R. Smith
Balloon and Meteorological
Systems Group

I. INTRODUCTION

On 1 October 1952, Contract Hour-875(00) between General Mills, Inc. and the Office of Naval Research was amended to provide for the execution of an experiment designed to carry scientific payloads to high altitudes. Payloads were supplied by the Armour Research Foundation, Chicago, Illinois. General Mills, Inc. supplied "Skyhook" balloons to carry aloft the payload instruments, balloon controls, recording and safety equipment. The flights were launched by General Mills technical personnel.

II. PROJECT PROGRAM

A traditional "Skyhook" balloon flight program was outlined for this project. One flight, #915, was flown from the University of Minnesota Airport, New Brighton, Minnesota. This flight was tracked and recovered by General Mills, Inc. technical personnel in a Stinson aircraft.

The remaining flights were launched from the Naval Air Station at Waldron, Texas.

Except as noted below, the equipment included in each flight consisted of the following:

1. A polyethylene balloon 85 feet in diameter and one mil thick.
2. A 28 foot parachute on which the scientific payload and balloon instruments descended to earth after being released from the balloon.
3. A timer set to release the load from the balloon at a predetermined time when the scientific experiment was concluded.
4. A safety device required by the C.A.A., consisting of a pressure switch set to prevent the balloon from floating below 30,000 ft.

5. Scientific payload provided by Armour Research Foundation, Chicago, Illinois.

6. A radio transmitter whose frequency is modulated by a pressure sensor.

7. A barograph to record the altitude reached.

8. Two 5-gallon tins to act as floats for a water impact.

Helium for inflation was provided by the Navy. Inflation was carried out with the use of a platform to keep the "bubble" taut in the early stages.

The exceptions to the above equipment list is as follows:

1. The flight from New Brighton, Minnesota, used a 24 foot parachute, carried no float tins and used a radio-controlled release. Two control stations were activated, one transmitter, 100 watts, was located at the General Mills Laboratory at Minneapolis; the other transmitter, 40 watts, was carried in the General Mills tracking aircraft. The release was accomplished from the aircraft.

2. The first two flights from Texas, flights 941 and 942, and the last two flights from Texas, flights 949 and 950, carried no float tins. In addition, flight 950 used a 24 foot parachute.

A total of 11 flights were made under this project. The flight performance data are presented in the next section of this report.

One flight, 941, gave inaccurate pressure-height data, as checked with a theodolite, and another, 943, was torn in launching and lost equipment. The remaining 9 flights were all successful in balloon operation, the accessory balloon equipment showing excellent results and providing the

desired services. It is hoped that the scientific payload performed satisfactorily and that the entire operation met with success. General Mills, Inc. is happy to have had the opportunity of working with the Office of Naval Research and the Armour Research Foundation in carrying out these experiments.

FLIGHT SUMMARY

Flight No.: 915

Balloon Serial No.: 504

Date: 16 October 1952 Launching Time: 0810 Type: 851A Weight: 148#

Who: 8-5017 Armour Research Foundation

What: Armour Gondola

Duration: 3 3/4 hrs. to release by
radio control.

Load on Balloon: 122#

Gross Load: 270#

Free Lift: 35# 13.3%

Maximum Altitude: 98,900 ft.

Rate of Rise: 611 ft/min to 70,000 ft.

Theoretical Altitude: 101,800

Altitude Maintenance: Excellent

Recovery: where? 10 Mi. SE Republic, Michigan when? Immediate

Balloon Success: Good

Critique: Air picked up by cell due to too slow a rate of rise and levelled
off below theoretical ceiling. Load released by Church's radio re-
lease at Lake Superior's shore.

Flight Check of Telemetered Scintillation Counter Data

Scientific Purpose:

Scientific Success as known: Good

FLIGHT SUMMARY

Flight No.: 941

Balloon Serial No.: 417

Date: 2 November 1952 Launching Time: 0846C Type: 851A Weight: 163#

Who: 8-5017 -- Armour Research Foundation

What: Armour Gondola

Load on Balloon: 113.

Duration: Scheduled - 4.5 hrs. from 0820; Actual - 3.9 hrs.

Gross Load: 276#

Free Lift: 48 17%

Maximum Altitude: 95,000 estimated

Rate of Rise: 1068 ft/min to 68,350 ft.

Theoretical Altitude: 101,600 ft.

Altitude Maintenance: Good

Recovery: where? none. Impact at sea

Salloon success: Good

Critique: High rate of rise, did not reach theoretical ceiling by telemetering though double theodolite readings indicate it.

Scientific Purpose: Flight Check of Malacostoma Sublimation Counter Into

Scientific Success as known: Incorrect Altitude information made calibration impossible.

FLIGHT SUMMARY

Flight No.: 942

Balloon Serial No.: 401

Date: 3 November 1952 Launching Time: 0630C Type: 851A * Weight: 1267

Who: 8-5017 Armour Research Foundation

What: Armour Gondola

Duration: Sched. 8 hrs. from 0630
Actual Unknown

Load on Balloon: 1137

Gross Load: 2397

Free Lift: 377 157

Maximum Altitude: 95,100

Rate of Rise: 1012 ft/min to 94,100 ft.

Theoretical Altitude: 104,600

Altitude Maintenance: Good

Recovery: where? None

Balloon Success: Excellent

Critique: High initial rate of rise and flight did not reach theoretical ceiling.
Maximum timer setting did not produce recovery as anticipated. Scintillation telemetering (6425KC) faded before altitude telemetering (1746KC) faded indicating flight proceeded beyond skip distance.

*.0005 wall balloon.

Scientific Purpose:

Flight Check of Telemetered Scintillation Counter Data.

Scientific Success as known: Good
