CHOPTANK RIVER-SUMMER CRUISE
28 June - 1 July 1952

This report contains results of work carried out for: the Office of Naval Research of the Navy Department under research project NR 083-016, Contract Nonr 248(20), and research project NR 083-070, Contract Nonr 248(30); the State of Maryland (Department of Research and Education); and the Commonwealth of Virginia (Virginia Fisheries Laboratory).

D. W. Pritchard
Director

The data presented in this report were collected in the Choptank River during the period 28 June to 1 July 1952.

The purpose of this cruise was to study the physical and chemical structure of the area in the summer season.

The presentation of data in this report does not constitute publication and the information may be subject to modification at a later date.

Location of Stations

An arbitrary line designating the mouth of the river was chosen from red nun buoy 16FF off James Island to black spar 3 off Sharps Island (See U. S. Coast and Geodetic Survey Chart 551, November 1951). The stations were chosen upstream from this line in the deepest part of the channel. The Station designators consist of the letters CK followed by the numerals representing the number of nautical miles to the nearest mile upstream from the mouth. Thus CK-30 is the station 30 nautical miles upstream from the line designating the mouth of the river.

Observations

Current speed and direction were measured with the confined submerged drags described in Pritchard, D. W. and W. V. Burt (1951), "An Inexpensive and Rapid Technique for Obtaining Current Profiles in Estuarine Waters." J. Mar. Res. V. 10 No. 2.

Temperature and salinity were determined by means of the Conductivity-Temperature Indicator (CTI). This is an instrument in which a nickel resistance thermometer and a conductivity cell have been combined to provide direct continuous readings of water temperature and conductivity. The sensing elements are located in a single under water unit that can be lowered and raised on a two hundred and fifty foot cable. Two four digit counters in portable units can be conveniently located on deck or in the ship's laboratory. Direct reading of temperature can be obtained in the range - 2.00°C to 32.00°C from one of the counters. Calibration of the thermal unit indicates that readings are within $\pm 0.05^\circ\text{C}$ of the true temperature. Direct conductivity readings in the range 0 to 50.00 millimhos can be obtained from the second counter. Salinity is obtained from the temperature and conductivity data with the aid of curves plotted from accepted functions of the three parameters. Field calibrations have been made by comparing data from the CTI with titrated values of chlorinity and temperatures from mercury thermometers. A calibration tank is being constructed which will allow simultaneous calibration of the thermal and conductivity units.

Oxygen was determined by the modified Winkler titration method.

pH was determined with a Beckman pH meter.

Inorganic phosphate analyses were made by the ceruleomolybdate method using stannous chloride as the reducing agent. All samples were centrifuged with a Foerst Centrifuge prior to analysis. Sample size was 50 ml. Within 10 to 20 minutes after addition of the stannous chloride, the transvission of the sample at a wave length of 700 $\text{m}\mu$ was measured using a Beckman Model DU Spectrophotometer or a Scripps Automatic Servo-Operated Photometer. Measurements were calibrated against standard KH_2PO_4 reference solutions. Analyses for inorganic phosphate were made on shipboard within two hours

after the samples were drawn. No salt correction has been applied. An estimate of the precision of the method from triplicate analyses indicated deviations of $\pm 10\%$ of the reported values.

The turbidity was determined with a Beckman Model DU Spectrophotometer by measuring the transmission through a 10 cm. cell containing the sample at the indicated wave lengths. In order to minimize the interference by settling, samples for these analyses were drawn from the Nansen bottles or pumped samples immediately after they reached the deck laboratory. The results are expressed as extinction for each wave length.

The chlorophyll analyses were made by a method developed at the Chesapeake Bay Institute. This method consists of running a one liter sample through a Foerst Continuous Centrifuge in 15-18 minutes. The collected material is transferred to a 40 ml centrifuge tube with a rubber policeman and the cup rinsed with distilled water several times. The material is centrifuged and the supernatant decanted. Methyl alcohol is added and the sample is placed in the dark at room temperature for four to eight hours. After this time the sample is made up to 40 ml, the solids are centrifuged out, and the percent transmission of the supernatant fluid is determined at 500, 625, 635, 667, and 750 $m\mu$. The results have been corrected for background scattering and absorption by small particles and expressed as mygrams (10^{-6} grams) per liter.

Alkalinity was determined by the method found in Anderson, D. H. and R. J. Robinson, (1946), "Rapid Electrometric Determination of the Alkalinity of Sea Water". Industrial and Engineering Chemistry, Analytical Edition, Volume 18, No 12, 1946.
