RESISTANCE AS DISSIPATION INTO MANY REACTIVE CIRCUITS:
LANDAU DAMPING AND NYQUIST'S NOISE THEOREM

by

O. Buneman

Technical Report No. 104-4
November 23, 1960

Electron Devices Laboratory
Stanford Electronics Laboratories
Stanford University
Stanford, California

Reproduction in whole or in part
is permitted for any purpose of
the United States Government.

Prepared under
Air Force Contract AF19(604)-5480
for
Electronics Research Directorate
Air Force Cambridge Research Laboratories
Air Force Research Division (ARDC)
UNITED STATES AIR FORCE
Bedford, Massachusetts

In general, B depends on Ω . The case of constant B leads to divergence of the integral but this simple and interesting case can be approximated arbitrarily closely, without loss of convergence, by taking

$$B = \frac{B_0}{1 + \Omega^2/\Omega_0^2}$$

with sufficiently large Ω_0 . The integration is effected by completing the path around a large semi-circle in the upper half-plane and contracting around the only pole at $\Omega = +j\Omega_0$. The pole at $\Omega = -js$ is in the lower half-plane, by the rules of Laplace transform theory ($\text{Re } s > 0$).

The result,

$$Y = \frac{\pi B_0}{2 \left(1 + \frac{s}{\Omega_0} \right)},$$

shows that the effective impedance of our network consists of a resistance $2/\pi B_0$ and an inductance $2/\pi B_0 \Omega_0$. The latter vanishes in the limit $\Omega_0 \rightarrow \infty$. The simulation of resistance by reactive elements is thus established. The conductance with $\Omega_0 \neq \infty$ is

$$\frac{1}{2} \frac{\pi B_0}{1 + \omega^2/\Omega_0^2} = \frac{1}{2} \pi B(\omega)$$

and this formula for the conductance is obtained also with more general forms of $B(\Omega)$ than that assumed here.

3. Applications of the Resistance Model.

Our picture of dissipation assists the understanding of Landau¹

¹L. Landau, J. Phys. USSR 10, 25(1946).

damping of disturbances with wave number k in a collision-free plasma; the electron streams passing through the plasma with their continuously distributed velocities v provide a continuous range of resonance frequencies $\Omega = kv$.

Moreover, Nyquist's² noise theorem is readily obtained from this resonant-circuit model of resistance. If the network is shorted at the port of measurement after having been in thermal contact with the surroundings, each circuit will be left oscillating with energy

$$\frac{1}{2} L_v |I_v|^2 + \frac{1}{2} C_v |V_v|^2 = L_v |I_v|^2 = C_v |V_v|^2 = KT$$

from which we deduce

$$|I|^2 = \frac{KT}{L_v} = KTB \, d\Omega = \frac{2}{\pi} KTG \, d\Omega$$

where G is the "conductance" identified above. This is Nyquist's formula.

²H. Nyquist, P. R. 32, 110 (1928).
