ABSTRACT

A modification of the wagon wheel grain design is considered in which short spears or spokes of propellant alternate with longer ones, and in which three different webs give rise to a three-level surface-time history.

There are six possible combinations of these webs under the limitation that the outer web must always be equal to or greater than either of the other two. This report discusses the analysis for the case where $w_1 > w_2 > w_3$, and presents tabulated data resulting from the solution for a wide range of parameters of the equations which characterize the design.

THE MODIFIED WAGON WHEEL DESIGN

$w_1 > w_2 > w_3$

INTRODUCTION

The equations which characterize the modified wagon wheel grain design were reported[1] a few years ago. They were programmed for an IBM 704 computer and a series of calculations was made; however, a rather small number of valid answers was received for a wide range of input values. It was felt that there was an error in the computer program, but because of the low priority assigned to the project it was put aside. Much later it was determined that the trouble really was in the interpretation of the results, in that the equations are very sensitive to small changes in the parameters that were being varied and the increments chosen were large enough to obscure most of the valid solutions. This was discovered when part of the problem was re-programmed for a small computer, the LGP-30. At the same time it became apparent that there was not a suitable way to present all the necessary data about each configuration in graphical form, as had been done with the star and wagonwheel[2,3], and more recently with the slotted-tube design.[4] This report, and similar ones to follow, result from the decision to use the LGP-30 to calculate a complete set of configurations, print the answers, and photographically reproduce the sheets of printed data. Although lacking the continuity and some of the convenience of graphical presentation, it is more accurate and much more complete in its present form.

NOMENCLATURE

The terms that are used in the discussion and in the equations are defined below, and most are represented on the drawings which follow the text of the report.

N = number of long spokes, or spears of propellant, or the number of short spokes, but not the sum of both.

D = outside diameter of the grain; also the inside diameter of the motor for case-bond grain.

w_1 = major web, or shortest burning distance to the outside.

[4] M. W. Stone, "The Slotted Tube Grain Design," Rohm & Haas Company Rept. No. S-27, December 23, 1960.

w_2 = one-half the thickness of the short spoke.

w_3 = one-half the thickness of the long spoke.

r = radius of stress relief fillets.

β = π/N

PR_i = progressivity ratio
= propellant surface area at end of interval / propellant surface area at beginning of interval

ϵ = loading fraction = cross-sectional area of propellant / cross-sectional area of motor

SF = sliver fraction
= cross-sectional area of unburned propellant at major web burnout / cross-sectional area of motor

DISCUSSION

The configuration described in this report is a modification of the wagonwheel design in which two major changes are considered. One is the use of alternately long and short spokes, or spears of propellant; and the other is the designation of three different webs, resulting in three levels of thrust via three different levels of surface area during the course of burning. This report is confined to the case where $w_1 > w_2 > w_3$; subsequent reports will consider the other combinations of webs, e.g., $w_1 > w_2 = w_3$.

The equations by which the data in this report were obtained derive directly from the geometrical relationships evident in Fig. 3 and from the ballistic definitions found in the section titled "Nomenclature." Proceeding in a logical order, the equations may be written as follows for the angles.

$$\alpha = \beta - \arcsin \frac{r+w_3}{\frac{D}{2} - r - w_1} \tag{1}$$

$$\gamma = \arcsin \frac{r+w_2}{\frac{D}{2} - r - w_1} \tag{2}$$

$$\theta = 90^\circ + \beta - \alpha \tag{3}$$

$$\phi = 90^\circ + \gamma \tag{4}$$

The length of K, the side of the short spear, can be represented by Eq. 5.

$$K = L - m + \frac{r+w_2}{\tan \gamma} - \frac{w_2 - w_3}{\tan \beta} - \frac{r+w_3}{\tan (\beta - \alpha)} \tag{5}$$

The length of L, the side of the long spear, can be found from the progressivity ratio equation because it is more practical to specify PR than L. However, such a course may give rise to impossible values of L, i.e., negative values or values so large that the long spear would pass through the center of the motor and "overlap" other spears. It is necessary to define maximum and minimum values for L in terms of the problem parameters. The maximum value occurs when z (see Fig. 3) is zero, the minimum value when K is zero. These criteria may be translated into the following equations:

$$L_{max} = \frac{r+w_3}{\tan(\beta - \alpha)} - \frac{w_3}{\tan\beta} \tag{6}$$

$$L_{min} = m + \frac{w_2 - w_3}{\tan\beta} + \frac{r+w_3}{\tan(\beta - \alpha)} - \frac{r+w_2}{\tan\gamma} \tag{7}$$

Progressivity ratio is usually defined as the ratio of final to initial surface. In a multistep trace, such as this grain will produce (see Fig. 2), the foregoing definition is inadequate and meaningless. A separate PR must be computed for each step, as follows (again refer to Fig. 2):

$$PRa = \frac{\text{surface at A}}{\text{initial surface}} \tag{8}$$

$$PRb = \frac{\text{surface at B}}{\text{surface at AB}} \tag{9}$$

$$PRc = \frac{\text{final surface}}{\text{surface at BF}} \tag{10}$$

Equation 8 will be used to define L, with all other parameters set; therefore, the remaining surfaces and thence PRb and PRc can be calculated. A more detailed equation for PRa is

$$PRa = \frac{2N}{S_i}\left[K+L-2m+\frac{w_2-w_3}{\sin\beta} + (r+w_3)(\theta+\phi) + \frac{2w_3}{\tan\beta} + \left(\frac{D}{2} - w_1+w_3\right)(\alpha-\gamma)\right] \tag{11}$$

where

$$S_i = 2N\left[m+n+K+L+r(\theta+\phi) + \left(\frac{D}{2} - w_1\right)(\alpha-\gamma)\right] \tag{12}$$

After Eq. 11 has been solved for L, then surface AB can be found from Eq. 13.

$$\text{Surface AB} = 2N\left[K + \frac{w_2 - w_3}{\sin\beta} - m + \frac{w_3}{\tan\beta} + (r+w_3)(\theta+\phi) + \left(\frac{D}{2} - w_1 + w_3\right)(a-\gamma)\right] \quad (13)$$

And the other surfaces are

$$\text{Surface B} = 2N\left[K - n + \frac{w_2}{\tan\beta} + (r+w_2)(\theta+\phi-\Psi) + \left(\frac{D}{2} - w_1 + w_2\right)(a-\gamma)\right] \quad (14)$$

where
$$\Psi = \arctan \frac{\sqrt{(r+w_2)^2 - (r+w_3)^2}}{r+w_3} \quad (15)$$

$$\text{Surface BF} = 2N\left[(r+w_2)(\theta+\phi-\Psi) + \left(\frac{D}{2} - w_1 + w_2\right)(a-\gamma)\right] \quad (16)$$

and
$$S_f = 2N\left[\frac{D}{2}(a-\gamma) + (r+w_1)(\lambda+\mu)\right] \quad (17)$$

where
$$\lambda = \phi - \arccos \frac{r+w_2}{r+w_1} \quad (18)$$

and
$$\mu = \theta - \arccos \frac{r+w_3}{r+w_1} \quad (19)$$

In looking at Fig. 1 and observing how burning would progress as the surface recedes in parallel layers, one notes that a special situation may arise when the short spear is very short, i.e., K is close to zero. Such a case is shown in Fig. 4, where it is seen that K disappears completely before w_2 burns out (it may even happen before w_3 burns out) and the propellant surface in that region is no longer correctly identified by the equations previously presented. Not only has the straight side of the short spear disappeared, but the angle ϕ has been diminished by the angle ζ.

In computing specific solutions for this design, each must be checked for the above condition, and appropriate changes made if it exists. The checking and correction may be accomplished as follows:

Calculate surface AB, then test if

$$w_3 > K \tan\frac{180^\circ - \beta}{2} \quad (20)$$

If not, no correction is required. If w_3 is larger, however, subtract from surface A the following quantity:

$$2N\left[(r+w)\zeta + K + \frac{w_3}{\tan\beta} - m\right] \tag{21}$$

where ζ is found by iteration from

$$\sin\zeta + (\cos\zeta)\tan(90^\circ - \beta) = \frac{\frac{w_3}{\sin\beta} - K + r\tan(90^\circ - \beta)}{r + w_3} \tag{22}$$

Now PRa must be recalculated from the corrected surface A and the original S_i. (Originally PRa was chosen and L was the dependent variable; now the correction must extend all the way back to PRa.)

When a correction is requried for surfaces A and AB, then one will also be required for surfaces B and BF. If no correction were applied for w_3, however, there is still the possibility that one will be needed when w_2 burns out. The test is, similarly,

$$w_2 > K\tan\frac{180^\circ - \beta}{2} \tag{23}$$

If w_2 is greater, use Eq. 22 to calculate ζ, substituting w_2 for w_3. Now, surfaces B and BF will be equal to each other and may be calculated by Eq. 24.

$$SB = SBF = (r+w_2)(\phi - \theta - \psi - \zeta) + \left(\frac{D}{2} - w_1 + w_2\right)(\alpha - \gamma) \tag{24}$$

Equation 24 is also used when it is unnecessary to test w_2 because w_3 has previously met the test.

This means that there is no step-down in the surface time history when w_2 burns out, resulting in a two-level trace. Such cases are shown on the data sheets by the printing of "Two-Level Thrust" following the case.

Equation 17 is still considered to be valid for final surface.

SUMMARY

The data which follow were computed on the LGP-30 digital computer. Identifying symbols are printed before each number for convenience. An attempt was made to vary the parameters w_1, w_2, w_3, PRa, and N over a sufficiently wide range to cover the cases of practical interest. The increment sizes for the webs and PRa are small to permit adequate coverage. The stress relief radius r was chosen to be 0.03 D in., the same as that used previously in star, wagon wheel and slotted tube work.

ACKNOWLEDGEMENT

Mrs. Mary Lou Cagle programmed the equations and computed the data on the LGP-30 computer.
