ABSTRACT

(C) Object.

The object of this phase of the Traversal Program is to estimate the quantity of V-agent that can be picked up on the clothing of troops traversing contaminated areas.

(C) Results.

"Creep and crawl" trials simulating a straight-line traversal of open terrain under fire were conducted at Army Chemical Center, Maryland, on test sites where the moderately dense vegetation (80 to 90% coverage) was maintained at a height of 3 to 6 in. The quantity of simulant picked up on the U.S. Army fatigue uniforms of test subjects crawling across the area within an hour after the dispersion of simulant averaged approximately 1% of the contamination density per unit length of the traversal path (ie, P' = 0.01 CL; where P' is the pick-up of simulant, g; C is the contamination density, g/sq m; and L is the distance traversed, m). This relationship appeared to be independent of the particle size of the dispersed simulant, although evidence exists to show that particle size does have some effect on the transferability of simulant and agent.

A comparison of the transferability of agent to that of simulant indicated that the relative transferability of agent decreased with increasing contamination. This relationship may be expressed as R = exp-(0.06 C), where R is the ratio of agent to simulant picked up on the cloth-covered roller. The constant of this equation is an approximation based on limited data and requires substantiation by further testing.

From the foregoing it was assumed that, if V-agent were used instead of simulant in the "creep and crawl" trials, the average quantity of agent that would have been picked up could be represented by the equation P = 0.01 CL exp -(0.06 C).

The quantity of agent picked up on the cloth-covered roller traversing contaminated areas one day after the dispersion of V-agent averaged approximately 4% of that picked up when the traversal was effected within one hour after the dispersion. This reflects the apparently rapid decline in agent available for pick-up, a fact which was corroborated in CWL Technical Memorandum 33-19, dated 9 February 1959, covering Phase A (Persistence) of the CWL Traversal Program. (Note: The results presented are specific for a particular field activity and for essentially one type of terrain condition. Additional testing is required to provide information relative to other field activities performed on V-ex and other types of terrain.)

INTERIM REPORT
CWL TRAVERSAL PROGRAM
PHASE B - "PICK-UP"

I. (C) OBJECT.

The object of this phase of the Traversal Program is to estimate the quantity of V-agent that can be picked up on the clothing of troops traversing contaminated areas.

II. (U) AUTHORITY.

This study was authorized in the Chemical Warfare Laboratories Traversal Program, dated 25 March 1957.

III. (C) INTRODUCTORY REMARKS.

To study and assess the traversal and occupational hazards of dispersed V-agent, the CWL Traversal Program was implemented by direction of the Deputy Commander for Scientific Activities, U.S. Army Chemical Warfare Laboratories. This program is divided into three related phases: Phase A - Persistence and Decontamination - determining the persistence of V-agent and factors governing this persistence; Phase B - "Pick-Up" - determining the quantity of agent transferred to personnel traversing or occupying contaminated areas; and Phase C - Casualty Production - estimating the effectiveness of "pick-up" in producing casualties. These phases are detailed in a CWL document, subject: The Casualty Producing Capability of V-agent when Dispersed as Terrain Contaminant (C), dated 25 March 1957.

This report is concerned primarily with the results of the areal traversal trials conducted under Phase B of the Traversal Program. These trials were designed to provide information relative to the transferability of V-agent to the uniforms of troops crawling across contaminated terrain (ie, simulating the traversal of open areas under fire at night). No tests employing the direct measurement of V-agent pick-up on the clothing of test subjects were considered because of the hazard to participating personnel. Therefore, the objectives of this phase of the program had to be satisfied by estimating the pick-up of V-agent from the results of Field Test No. 1324 and Test Plan No. 29 which were prepared and executed by Test Division. Field Test No. 1324 provided for the conduct of a series of "creep and crawl" trials to determine the quantity of simulant picked up on the uniforms of test subjects crawling across terrain on which simulant was disseminated in specified ranges of contamination densities and particle sizes. Test Plan No. 29 provided for a series of trials to establish (1) the relative transferability of simulant from the ground to both man and a cloth-covered roller, and (2) the relative transferability of agent and simulant from the ground to the roller. The resulting man-to-roller and agent-to-simulant data provided the basis for estimating the quantities of agent that would have been picked up by test subjects had V-agent instead of simulant been used in the "creep and crawl" trials.

The pick-up due to other activities in the field is yet to be studied. However, as a result of a series of field trials conducted at Army Chemical Center in March 1954, a considerable quantity of such data is available. This information is reported in CRLR 500, subject: Liquid Agent Picked Up by Troops Traversing Areas Contaminated with CW Agents, dated 7 December 1955. It is planned to study the extent to which this large body of information is applicable to the present problem.

All data relative to "pick-up" accumulated since the inception of this phase of the program in July 1957 are incorporated in this report. These results and the inferences drawn therefrom are regarded as interim in character, and as such are issued for temporary or limited use only. They may be superseded when additional data are received and evaluated.

IV. (C) EXPERIMENTAL.

4. "Crawl and Crawl" Trials.

a. Procedure.

The "crawl and crawl" trials, as prescribed in the test directive for Field Test No. 1324, were conducted on "J" Field, Army Chemical Center, on a site selected for the uniformity of vegetation which covered about 90% of the terrain surface. This area was divided into test strips [illegible] wide by 50 ft long. To insure similar terrain conditions for each trial, the grass on these strips was maintained at 3 to 6 in. In each trial, five of six test strips were contaminated with simulant (dibutyl phthalate dyed with Fisher Red) disseminated uniformly by means of a mechanical device. The spinning-disk aerosolizer (figure 1, appendix C) was employed for the distribution of small particles, whereas the multijet disperser (figure 2, appendix C) was employed for large particles. The uniformity of the contamination and the particle size distribution were determined from sampling cans and 4x6 paper placed strategically along each test strip. As soon as practicable (2½ to 3 min) after the dissemination of simulant, each test strip was traversed by two test subjects*, each crawling as if he were advancing under fire along an assigned path one a side. For this reversal, the dress consisted of U.S. Army fatigue uniforms over cotton drawers and long-sleeved undershirts; the test subjects also wore cotton gloves and helmet liners, and carried simulated (wooden) rifles. As soon as the 50-meter traversal was effected, all clothing was removed, and traces of simulant on the rifles, helmet liners and skin were swabbed with solvent. The skin and all swabs were furnished for analysis at the close of the trial. Items of clothing were photographed and sectioned prior to being analyzed for the quantities of simulant picked up on the various parts of the uniform.

*In the last four trials, a cloth-covered roller (figure 4, appendix C), was substituted for the second test subject traversing 3 of the 5 test strips. (cf, par 3 b 1).

2. Results.

During the period of July 1957 through May 1958, a total of eleven "creep and crawl" trials were conducted. In these trials simulant was disseminated in densities ranging from 0.3 to 13.6 g/sq m with particle size distributions having mass median diameters of about 90 to 3,100 microns. The data derived from these trials, representing a total of 103 individual traversals, are presented in tables 1 through 11, appendix A. Photographs of the representative distributions of simulant on clothing are included as figures 5 through 7, appendix C.

The quantity of simulant picked up on the uniforms of test subjects was found to be directly proportional to the density of the disseminated agent. The average pick-up was equal to 1% of the contamination density per unit length of the traversal path, or as alternately phrased, equal to 0.01 times the contamination density times the distance traversed (viz, for the 50-meter traversal during these "creep and crawl" trials, the average pick-up was numerically equal to one-half the contamination density). This relationship, which appeared to hold equally well over the entire range of densities employed, appeared to be independent of the particle size of the dispersed agent.

In general the simulant on the uniforms was located, in descending order of contamination, on the gloves, lower abdomen, elbows, knees, forearms, upper abdomen, thighs, shins, chest, and upper arms. This distribution of simulant is presented graphically in figures 1 and 2, appendix B, and is summarized in the table below. Variations in pick-up and distribution of the simulant on uniforms were attributed to differences in the manner in which individuals crawled; they could not be ascribed to the physical characteristics (ie, height and weight) of the subjects nor to the traversal time.

DISTRIBUTION OF SIMULANT ON CONTAMINATED UNIFORMS

Right	9.9

In three of the eleven trials, the pick-up deviated significantly from characteristic results. In trials 5 and 7 roughly half the anticipated quantity of simulant was picked up. This reduced pick-up was attributed to the frozen terrain during trial 5, and to the dead and very dry vegetation covering the area during trial 7. In trial 11 the use of a different dye in preparing the simulant was assumed responsible for the pick-up which was apparently twice the anticipated quantity.

B. "Man-Vs-Roller" Trials.

1. Procedure.

In accordance with Test Plan No. 29, as amended, the test site on Graces Quarters was divided into 20 adjacent test strips, 2 meters by 25 meters, which were numbered consecutively. To eliminate grass height as a variable in these trials, the grass was mowed to 3 in. on days of test. On the ten

odd-numbered strips simulant (dibutyl phthalate dyed red) was disseminated uniformly in a specified range of densities in both large and small particle sizes. Large droplet sizes (about 3,000 microns) were generated by the multijet disperser (figure 2, appendix C); small particle sizes (about 500 microns), by the same device equipped with air-operated spray nozzles (figure 3, appendix C). As soon as practicable after the dissemination of simulant (ie, about 15 min, the time to collect the contents of sampling pans used to check the uniformity of dispersion), each test strip was traversed as in the "creep and crawl" trials described in par A, 1, above, however, with the cloth-covered roller substituting for the second test subject. The quantities of simulant picked up on both clothing and cloth of the roller were determined. (Note: One test subject was employed throughout these trials. His selection for these trials was based on a cursory review of "creep and crawl" data which indicated that his manner of crawling resulted in pick-up most representative of the average of all test subjects.)

2. Results.

The results of these ten trials conducted in June 1958 to establish the relative transferability of simulant from terrain to the uniform of a crawling test subject and to the cloth-covered roller are presented in tables 12 and 13, appendix A. These tables also include supplementary data derived from "creep and crawl" trials (see footnote b b).

The average quantity of simulant picked up on the uniform of the test subject was somewhat in excess of 1% of the contamination density per unit length of the traversal path. This pick-up was not significantly different from the results derived from "creep and crawl" trials conducted on "M" Field (cf par A, 2, above).

A good correlation was obtained between the comparative quantities of simulant picked up by man and the cloth-covered roller; ie, ratio of simulant picked up by the roller to that picked up by man appeared to be essentially constant and independent of particle size. The same relationship was found in the supplementary trials conducted in conjunction with "creep and crawl" tests on "M" Field.

Figure 3, appendix B, indicates that smaller particles are somewhat more transferable from the terrain to cloth than are the larger particles. This relationship between particle size and pick-up was not detectable from "creep and crawl" data because of the overshadowing effects of minor differences in crawling techniques of individual test subjects, and differences in terrain characteristics during the 10-mo test period.

C. "Agent-Vs-Simulant" Trials.

1. Procedure.

As prescribed in Test Plan No. 29, the trials described in par B, 1, above, were rerun on the even-numbered test strips with VX substituted for

simulant and with the traversal of the strips by test subjects eliminated. As soon as practicable after the dispersion of toxic agent, the roller, covered with two layers of cotton sateen cloth, was rolled along the left side of the strip. In a like manner, the right side of the strip was traversed by the roller on the following day. In both cases, as soon as the traversal was effected, each layer of cloth was removed from the roller and analyzed for agent picked-up. The procedure of analysis used was the DB3 method.

2. Results.

The results of 10 trials conducted in July and August 1958 to determine the quantity of V-agent picked up from contaminated terrain by the cloth-covered roller are included as table 14, appendix A.

When the quantity of agent picked up on the roller traversing the test strip within an hour after contamination was compared with the quantity of simulant picked up under similar conditions in trials described in par B, above, it was found that the relative transferability of agent decreased with increasing contamination. This relationship is graphically depicted in figure 4, appendix B, where the ratio of agent to simulant pick-up is plotted against contamination density on semi-logarithmic paper to produce a straight line whose equation is $R = \exp -(0.06\ C)$; where R is the ratio of agent to simulant pick-up; and C, the contamination density in g/sq m. This line was based on limited data, and the equation, therefore, requires substantiation by further testing.

As was the case with simulant, agent disseminated in smaller particles was picked up somewhat more efficiently by the roller on the first traversal than was agent disseminated in the larger droplets. Whereas the pick-up of simulant was found to be directly proportional to the contamination density (within test limits), the pick-up of agent leveled off or became less efficient with increasing ground contamination.

The penetration of agent from the top layer of cloth to the under layer was not significant during the first traversal, amounting to an average of about 2%. However, on the second traversals of trials 6 through 10 performed on wet terrain, the increased percentage of agent on the undercloth indicated the aid to penetration provided by moisture.

The quantity of agent picked up on the roller traversing the contaminated area one day after the dispersion of V-agent was found to average approximately 4% of that picked up on a roller traversing the area within an hour after contamination is effected. This indicates the rapid decline in agent available for transfer to troops traversing the area.

V. (C) DISCUSSION.

The over-all objective of the Traversal Program is the estimation of the casualty producing capabilities of V-agent dispersed as a ground contaminant. The performance of the trials covered in this report provided agent pick-up data which, when coupled with information relative to the percutaneous toxicity of the agent and its penetration through treated and untreated fabrics, permit an estimation of

REMARKS:

*Total quantity of simulant picked up on jacket, trousers, and gloves.
**Pick-up factor equals percent of the ground contamination picked up on the uniform per meter of traversal.

17 Apr 58	R	8.00	2500	3.82	3.36	1.14
15 May 58	H	1.45	3100	1.09	0.85	1.28
15 May 58	G	0.81	3100	0.80	0.57	1.40
15 May 58	E	1.62	3100	1.45	1.01	1.44
28 May 58	G	0.90	600	1.24	0.77	1.61
28 May 58	H	2.53	600	3.08	2.82	1.09
28 May 58	A	0.81	600	1.32	0.63	2.09

Remarks:

1. Trials conducted on 19 Jun 58 were run in accordance with Test Plan No. 29. The other data presented were obtained in conjunction with "creep and crawl" trials.

2. Physical characteristics of test subjects appear in preceding tables.

APPENDIX A

Table 14

Comparative Transferability of Agent and Simulant

Trial no.	Contamination density	Particle size	Roller Pick-Up				
			First Traversal			Second Traversal	
			Top cloth	Under cloth	Ratio agent/sim*	Top cloth	Under cloth
	g/sq m		mg	mg		mg	mg
1	8.5	Small	2,440	23	0.68	27	1
2	13.9	Small	2,390	43	0.41	80	2
3	6.9	Small	2,530	40	0.89	17	2
4	3.6	Small	1,270	52	0.85	16	1
5	2.2	Small	250	25	0.29	10	1
6	10.0	Large	2,000	7	0.53	76	54
7	12.9	Large	1,290	23	0.25	60	59
8	8.2	Large	1,250	2	0.40	47	23
9	3.4	Large	1,100	15	0.85	18	11
10	1.0	Large	520	16	1.34	7	5

Remarks:

*In establishing the ratio of agent to simulant pick-up, corresponding values of simulant pick-up were obtained from curves in figure 3, appendix B, which were fitted to data obtained on 10 June 1953 as presented in table 13, this appendix.

PHOTOGRAPHS

FIGURE 1

SPINNING TIP APPARATUS

View shows sled-mounted spinning tip apparatus employed in dispersing simulant in fine droplets.

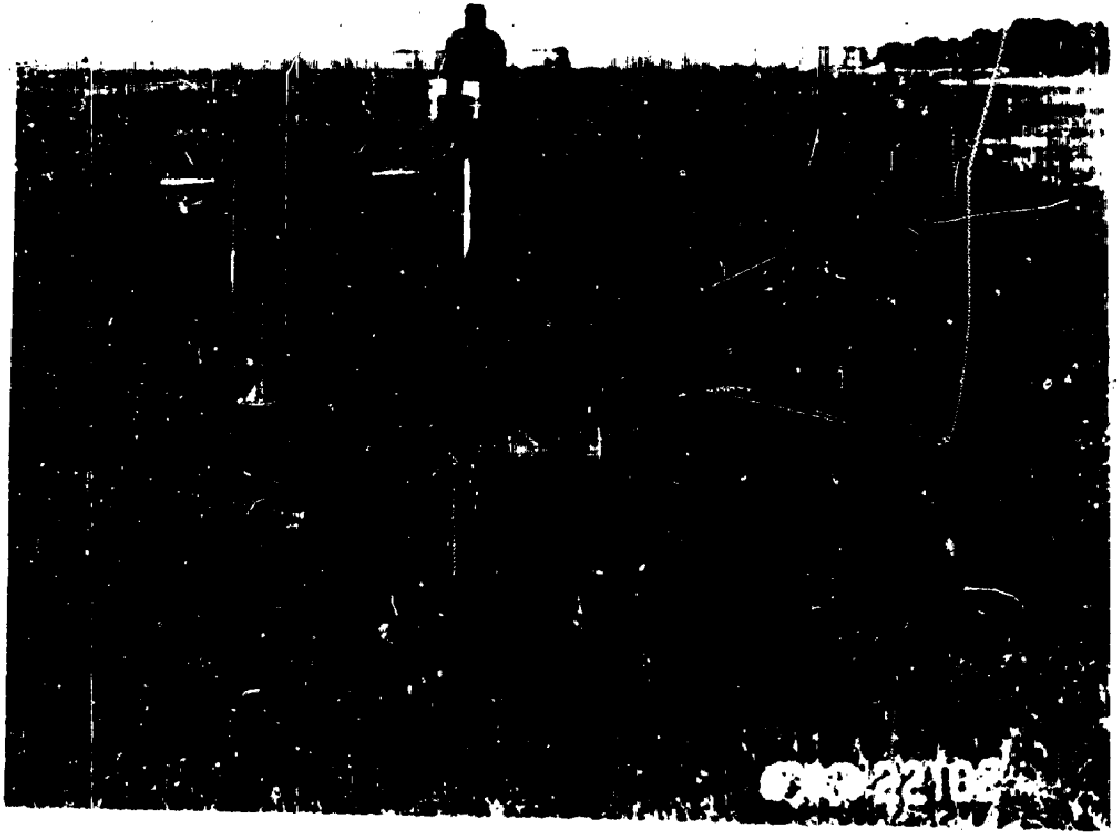

FIGURE 2

MULTIJET DISPERSER

View shows sled-mounted multijet disperser employed in the dissemination of large droplets. The sled for the spinning tip apparatus is seen in the background.

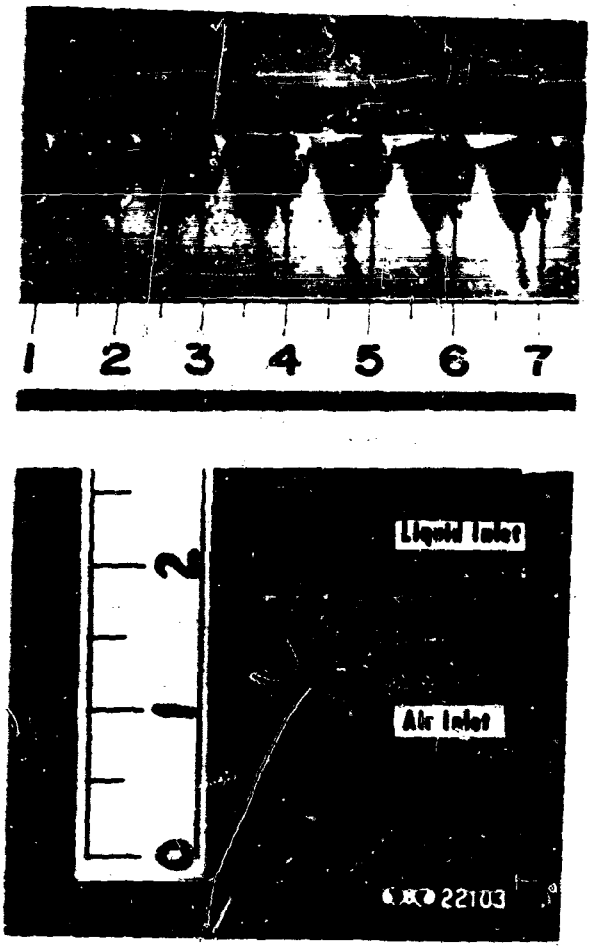

FIGURE 3

NOZZLES FOR MULTIJET DISPERSER

Top view shows a section of the disperser manifold with needles for disseminating 3 mm droplets. Bottom view shows nozzles for disseminating shattered droplets averaging less than 0.5 mm in diameter.

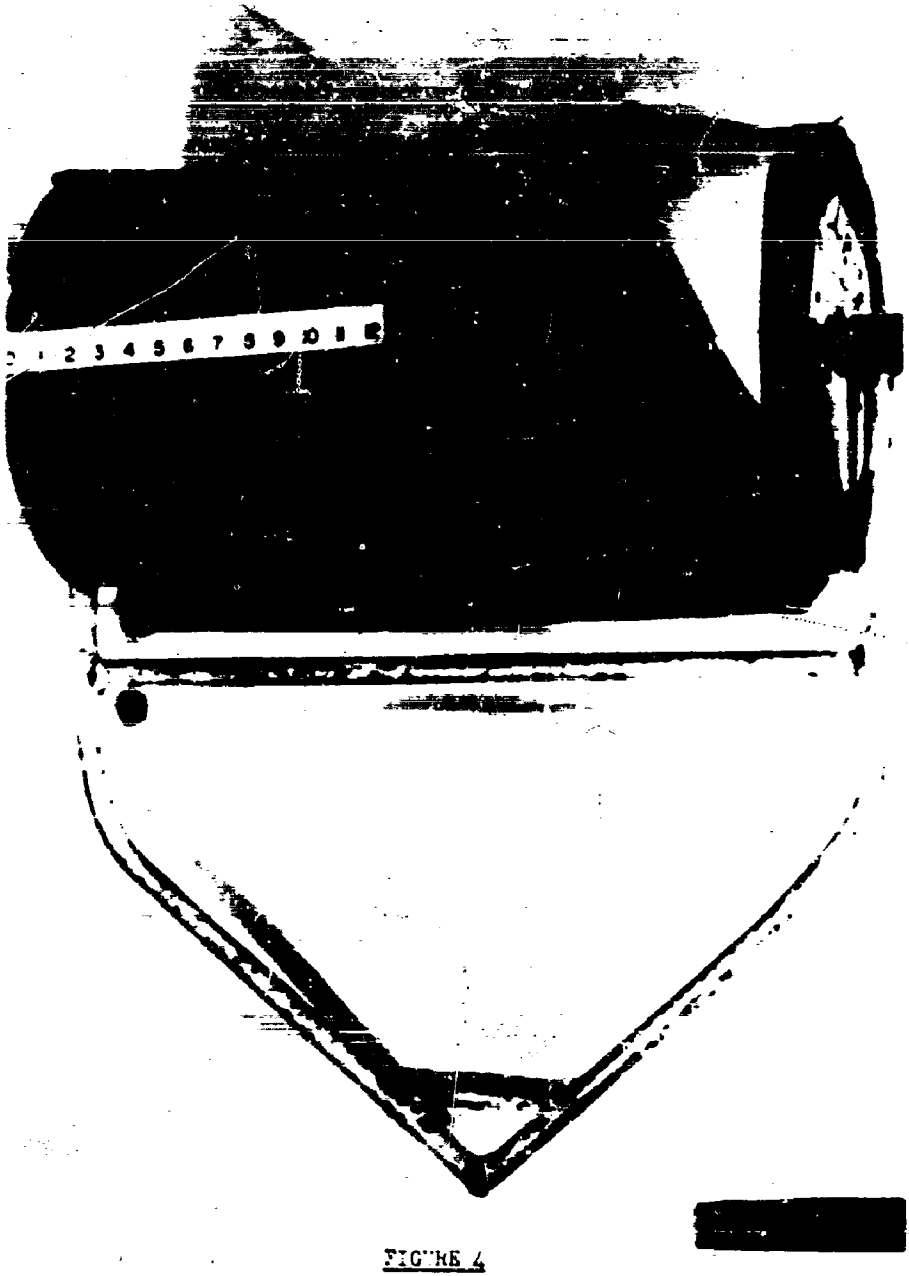

FIGURE 4

CLOTH-COVERED ROLLER

In this view the cotton sateen cover is lifted to show the 1/2-in. thick foam rubber pad covering the steel drum of the roller.

FIGURE 5

CONTAINMENT INTERIOR (LIGHT)

FIGURE 6

CONTAMINATED UNIFORM (MEDIUM)

View shows contaminated clothing mounted on a plane surface after seams were cut.

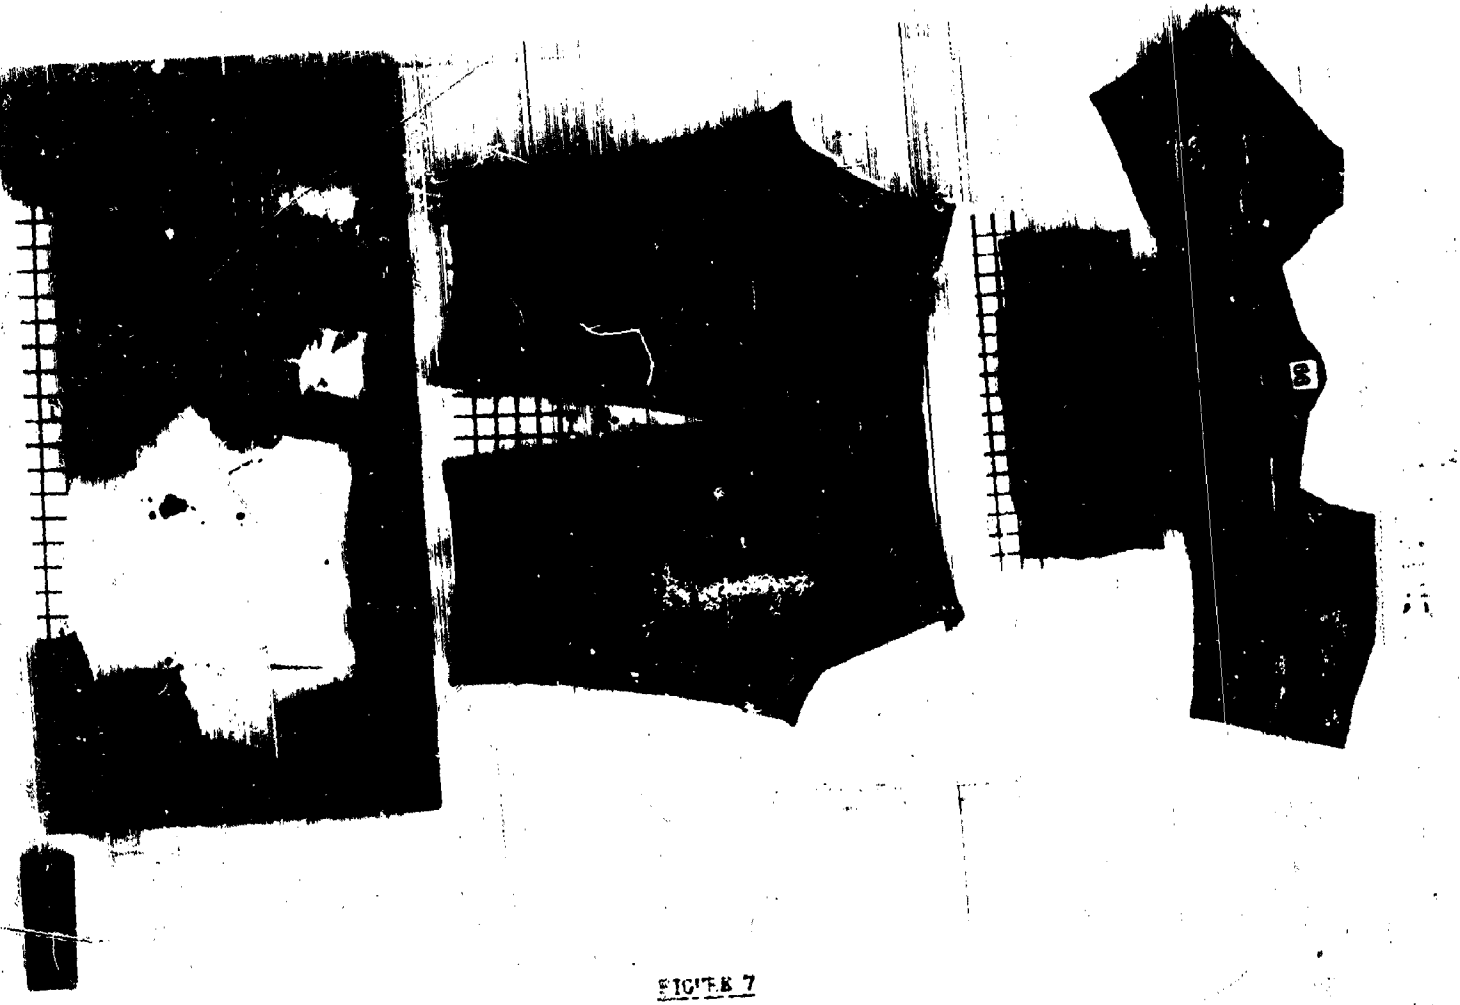

FIGURE 7

CONTAMINATED [illegible] (HEAVY)

View shows contaminate, clothing [illegible] on a clean surface after seams were cut.

DISTRIBUTION LIST

Copies made: 27

1	Technical Library, CW Laboratories, (Record Copy)
2 - 5	Technical Library, CW Laboratories
6	Director of Development, Thru: Technical Library, CW Laboratories
7 - 8	Chief Chemical Officer, Department of the Army, Washington 25, D. C.
9	Commanding General, CmlC Research and Development Command, Department of the Army, Washington 25, D. C.
10 -11	Chief, Technical Operations, Dugway Proving Ground, Dugway, Utah ATTN: Chief, Technical Library
12	Director, CmlC Operations Research Group, Building 400, Army Chemical Center, Maryland
13	President, Chemical Corps Board, Army Chemical Center, Maryland
14	Asst for Caramu, Thru: Technical Library, CW Laboratories
15- 20	Commander, Armed Services Technical Information Agency, Document Services Center, Knott Building, Dayton 2, Ohio, ATTN: TICSCP
21- 22	Canadian Army Technical Representative, Building 330, Army Chemical Center, Maryland
23- 24	British Liaison Officer, Washington 6, D. C.
25- 26	Director of Medical Research, Army Chemical Center, Maryland ATTN: Toxicology Division

MEMORANDUM THRU Director, Edgewood Chemical Biological Center, (RDCB-D/ Dr. Joseph Corriveau), 5183 Blackhawk Road, Aberdeen Proving Ground, Maryland 21010-5424

FOR Defense Technical Information Center, 8725 John J. Kingman Road, Ft Belvoir, VA 22060

SUBJECT: Internal Request for Change in Distribution

1. This action is in response to an Edgewood Chemical Biological Center (ECBC) Internal Request for a Change in Distribution.

2. The attached listed documents have been reviewed by ECBC Subject Matter Experts and deemed suitable for the change in distribution to read "Approved for public release; distribution unlimited."

3. The point of contact is Adana Eilo, ECBC Security Specialist, (410) 436-2063 or adana.l.eilo.civ@mail.mil.
