SUBJECT: Operational Report - Lessons Learned, Headquarters, 9th
Infantry Division Artillery, Period Ending 31 July 1968 (U)

SEE DISTRIBUTION

1. Subject report is forwarded for review and evaluation in accordance with paragraph 5b, AR 525-15. Evaluations and corrective actions should be reported to ACSFOR OT RD, Operational Reports Branch, within 90 days of receipt of covering letter.
2. Information contained in this report is provided to insure that the Army realizes current benefits from lessons learned during recent operations.
3. To insure that the information provided through the Lessons Learned Program is readily available on a continuous basis, a cumulative Lessons Learned Index containing alphabetical listings of items appearing in the reports is compiled and distributed periodically. Recipients of the attached report are encouraged to recommend items from it for inclusion in the Index by completing and returning the self-addressed form provided at the end of this report.

Section 1: Operations: Significant Activities

1. (C) Introduction:

a. During this reporting period, 1 May - 31 July 1968, the 9th Infantry Division Artillery has been engaged in the defense of Saigon and in stability operations in the Mekong Delta region. Assigned, attached and OPCON artillery units have supported four major operations from fire support bases and mobile riverine firing positions in GIA DINH, LONG AN, GO CONG, DINH TUONG, KIEN HOA, VINH BINH, VINH LONG, PHUOC DINH, BIEN HOA, SA DEC, KIEN PHUONG and LONG KANH Provinces. Major operations have included operation KUDZU, which replaced Operation HOPTAC on 1 May and continues, Operation TOAN THANG, Operation TRUONG CONG DINH, and Operation DUONG CUA DAN (Peoples' Road). In support of each of these operations, the artillery has continued to furnish close and continuous fire support from bases located from the outskirts of Saigon to the inundated rice paddies of the lower Mekong Delta. Frequent displacements of all classes of artillery have required road march, airlift, and riverine movement. Fires have been delivered from roadways, barges, landing craft, airmobile artillery platforms and semi-permanent fire support/patrol bases (FSPB). The remarkable flexibility made possible by the organization and equipment of the 9th Infantry Division Artillery has permitted immediate reaction to any extreme of employment.

SUBJECT: Operational Report of 9th Infantry Division Artillery for Period
Ending 31 July 1968 (RCS CSFOR-65) (R-1) (U)

b. The task organization of the 9th Infantry Division underwent a major change on 25 June when the 1st Brigade and the 3d Brigade exchanged missions and areas of responsibility. Because of the familiarity of the observers and liaison personnel of the direct support battalions with their respective areas of operations, it was decided that the two artillery battalions affected would remain in place and assist the infantry battalions in the transition period. Therefore, the close of the reporting period finds the 2d Battalion, 4th Artillery, in direct support of the 1st "Recondo" Brigade in Long An Province, while the 1st Battalion, 11th Artillery, is in direct support of the 3d Brigade, scheduled to become part of the second Mobile Riverine Force of the 9th Infantry Division. The 1st Brigade is organized with three infantry battalions and two mechanized infantry battalions, making the attachment of additional fire units to the 2d Battalion, 4th Artillery, necessary in order to provide immediately responsive fire support to the maneuver units.

c. The start of the reporting period found the batteries of the artillery disposed in their post-TET positions, with the 1st Battalion, 11th Artillery in fire support/patrol bases along highway QL-4 and in Dong Tam Base, from where they supported activities of the 1st Brigade in Operation TRUONG CONG DINH and Operation DUONG CUA DAN. The 3d Battalion, 34th Artillery remained with the 2d Brigade, furnishing two barge mounted batteries to the Mobile Riverine Force and one land based battery in Operation TRUONG CONG DINH and Operation KUDZU. The 2d Battalion, 4th Artillery continued to operate from semi-permanent fire support bases in Long An Province in direct support of the 3d Brigade in Operation TOAN THANG. As aggressive action by the Viet Cong/North Vietnamese Army decreased, a corresponding increase in activity by the brigades developed in order to make and maintain contact. This activity resulted in intermingling and cross-attachment of division elements, with the Mobile Riverine Force operating with the 1st Brigade in Operation TRUONG CONG DINH and with the 3d Brigade in Operation TOAN THANG. Additional infantry battalions and companies attached to the brigade in the Saigon defense role also caused the attachment of non-divisional artillery batteries and displacement of organic artillery to become commonplace. The Division Artillery displaced a forward element and the AN/TPS-25 radar to the South Saigon area in order to coordinate and control the activities of these artillery units. Because most of the attempts to infiltrate were made at night, the radar became the source of information on which much of the division's operations were based. Sightings made during the night were evaluated and became planning guidance for the next day's operations. These ground operations, based on radar sightings, met with varying degrees of success, due largely to the ability of the VC to disperse before daylight and to reassemble after darkness. Where clearances to fire could be rapidly obtained, many of these sightings were taken under fire by the artillery. Again, significant evaluation of the effectiveness of this action is difficult to obtain because casualties are removed before first light, when a visual recon can be made. However, questioning of prisoners of war has revealed that the effect is devastating and morale shattering when fires are timely. It is clearly indicated that employment of artillery in this fashion, rather than in the

CONFIDENTIAL

Ending 31 July 1968 (RCS CSFOR-65)(R1) (U)

sometimes haphazard "harassing and interdiction" fires, has been instrumental in denying hostile forces the freedom of mass and movement during the hours of darkness that they had been accustomed to. Because of the relatively certain success of this method of employment, an AN/TPS-33 replaced the AN/TPS-25 south of Saigon city limits and the AN/TPS-25 moved to Can Ciuoc, then to Rach Kien further south in the infiltration lanes to Saigon. In one night's operation, over 1,290 personnel sightings were obtained, showing the extensive pattern of movement in this area. The value of the personnel detection radars is unquestioned; all that remains is further refinement of procedures and methods of attack.

d. A recent refinement of this denial of the protection of darkness has been developed by the 2d Battalion of the 4th Artillery. Discussed in greater detail in Section II, Lessons Learned, this method is called the "Cobra Flash" and involves the use of gunships of the Air Cavalry and illumination provided by the Artillery. When combined with "hard" intelligence of enemy locations, it provides a positive method of identification coupled with an immediate and destructive attack of the target. It is particularly effective against clandestine sampan traffic, which is a principle method of transportation of supplies for hostile forces. Further tests of this procedure will be made during the coming quarter, and may develop a new basic technique for employment of fire support units in a primary combat role.

e. With the decrease in hostile ground action has come a wave of low-level "hit and run" attacks on civilian settlements and lightly protected RF/PF towns. To counteract this and to assist in development of an effective and responsive countermortar program, the artillery has expanded its target acquisition plan in this area also. In the DINH TUONG sector, the AN/MPQ-4A countermortar radars have been practicing for rapid reaction. A counterfire net has been established and all ARVN, RF and PF locations have been furnished a simplified procedure for requesting countermortar radar support. The radar sites monitor this net continuously and will respond rapidly to a call for support. This system is exercised by frequent test messages originating at Division Artillery FDC or in the various district headquarters. As a further aid, observation towers at My Tho, Dong Tam and Vinh Kim have been erected and are manned by US artillery personnel. These observation towers serve as flash bases, with the capability of furnishing an immediate azimuth to a suspect position. The countermortar radar lays on this position and fire is also brought on it as soon as required clearances are obtained. An added benefit of the tower is the increased field of observation as a deterrent to ground attack. By such means, the frequency and effectiveness of hostile mortar attacks against US/GVN locations has been substantially reduced.

f. The employment of the self-propelled twin 40-mm automatic weapons and of the truck-mounted quad .50 cal machine guns has also been the subject of considerable study. Battery C, 5th Battalion (AW)(SP), 2d Artillery has been attached to the 9th Division Artillery since mid-year 1967. For-

Ending 31 July 1968 (RCS CSFOR-65)(R1) (U)

merly restricted to convoy escort and security of fire support bases, these versatile weapons are proving their capability in the indirect fire role. On 28 May 1968, tests were conducted of the feasibility of joining the twin 40mm "Dusters" with the Mobile Riverine Force. One M-42 gun carriage was loaded aboard an LCM-8 boat and deployed along the My Tho River south of Dong Tam. Tests were made by firing from the stationary (anchored or beached) position and while on the move. No loss of accuracy was noted from the stationary position. Some initial loss of accuracy was evident while moving, but this could be compensated for by the observer. In June the tests were extended to include several "Artillery raids" by the "Dusters," firing from LCM boats at suspect locations along the My Tho River. Following the successful completion of these tests, the weapons were displaced with 8-inch and 155mm howitzers to Can Tho where they provided security for Mobile Riverine fire support bases deep in the Mekong Delta. By removing these gun carriages from the restrictions forced on them by the mud and inundated terrain of the monsoon season, their awesome fire power is more fully utilized. Using long range ammunition, an artillery plotting board for fire direction, and an aiming circle for direction of lay, the Dusters have been successfully employed in indirect fire at ranges up to seven kilometers. The principal difficulty in this type of mission is the adjustment of fire since, without the self-destruction feature of conventional ammunition, it is difficult to see the small burst of the 40mm round in wet vegetation or in mud. Prior planning, aerial reconnaissance and aerial observation are essential for best results. Employment in this manner in the vicinity of the Ben Luc bridge resulted in the destruction of 100 B-40 rounds, 4 VC KIA (BC) and the surrender of 3 VC who were frightened into submission by the volume and accuracy of the 40mm fire.

g. Significant changes in enemy tactics noted during the period included the increased use of 120mm mortars, 107 and 122mm rockets and B-40 rockets. The enemy also has become more proficient in the use of booby-traps, emplacing them in military vehicles as well as his customary use of them to deny the terrain. In one case, he was successful in concealing an explosive device in an artillery ammunition truck. Although it cannot positively be determined from the evidence remaining, it appears likely that the device was placed in an ammunition box or fuze box where it would not arouse suspicion. Detonation of the device resulted in one US KIA and two US WIA. No secondary explosion of the ammunition resulted; some 155mm rounds simply fell through the hole blasted in the bed of the truck. In another case, a grenade was placed in a trash truck returning from the sanitary fill. The grenade was wedged between the trash drums and the pin removed. The drums did not shift enough to release the arming spoon on the return trip and the grenade was not discovered until the drums were being removed in the battery area when it rolled free into the bed of the truck. Due to the quick reactions of a member of the trash detail, who seized the grenade and threw it toward a vacant area where it exploded in mid-air, no casualties resulted. Some evidence of another new technique was discovered in fire support/patrol base (FSPB) Moore when a crater analysis team investigating a crater three

CONFIDENTIAL

SUBJECT: Operational Report of 9th Infantry Division Artillery for Period Ending 31 July 1968 (RCS CSFOR-65) (R-1) (U)

feet in diameter by two feet deep caused by an "incoming round," were unable to find shell fragments, fuze or tail fins. A search of the entire FSPB after daylight revealed three unexploded satchel type charges. Approximately one cubic foot in volume, wrapped in burlap, each had two time fuzes attached which had failed to function. The charges were secured with nylon cord and wire and had not broken up on impact. The infantry made a sweep of the area outside FSPB Moore and discovered two burned areas, four meters in diameter, ten meters apart. No evidence of the device used to propel the charges has been found and the system utilized is a matter of speculation.

h. Unit activities:

(1) In providing combat support for the division and RVN forces, assigned and attached units of the division artillery fired 19,168 missions and expended 290,139 rounds, further broken down as follows:

DIVISION ARTILLERY

<u>CALIBER</u>	<u>MISSIONS</u>	<u>ROUNDS</u>
105mm	6,919	191,426
155mm	4,018	46,691
8-inch	1,459	7,779

NON-DIVISIONAL ARTILLERY

105mm	6,383	37,020
155mm	389	7,223

SUPPORT OF ARVN TROOPS

105mm	608	18,345
155mm	270	2,341

(2) 2d Battalion, 4th Artillery (105mm towed):

(a) During the reporting period the battalion provided direct support to the 3d Brigade (1 May - 22 June) and the 1st Brigade (23 June to date) in Operation TOAN TRUNG. In the role of the primary supporting artillery unit in the defense of South Saigon, the battalion has made many displacements to include displacement of a forward FDC, received the support of several additional firing batteries in the reinforcing role and has acted as the principal fire control agency for sightings of the personnel radar. The opening of the reporting period found all organic batteries in their semi-permanent fire support bases at Rach Kien, Binh Phuoc and Tan Tru. Heavy mortar attacks at Binh Phuoc, Rach Kien, Ben Luc, FSPB Smoke and Tan An Airstrip signalled the presence of numerous hostile forces in the vicinity. On 7 May Battery A (-) displaced to FSPB Smoke to support brigade operations,

SUBJECT: Operational Report of 9th Infantry Division Artillery for Period Ending 31 July 1968 (RCS CSFOR-65) (R-1) (U)

remaining overnight and returning to Rach Kien on 8 May. On that date Battery B displaced three tubes to Ben Luc. On 9 May the developing situation caused an additional tube of Battery B to link up with those three and the four tubes, together with Battery C from Tan Tru, displaced to Saigon to support a heavy contact south of that city. On 13 May Battery B displaced to BINH CHANH while Battery C occupied FSPB Smoke. On 21 May Battery B again displaced to Saigon at the "Y" bridge where it remained until 7 June. On 25 July Battery C was airmobiled into position near LUONG HOA in the Plain of Reeds. During the report period the AN/TPS-25 radar occupied positions at Tan An, Thu Thua, Ben Luc, FSPB Smoke, Can Giuoc, Saigon and Rach Kien, with elements of the battalion supporting the attack of targets detected.

(b) During the three month period the battalion fired 106,645 rounds in support of US and Allied operations.

(3) 1st Battalion, 11th Artillery (105mm towed):

(a) During the reporting period the battalion provided direct support to the 1st Brigade (1 May - 22 July) and the 3d Brigade (23 July to date) in Operation DUONG CUA DAN (People's Road) and in Operation TRUONG COG DINH. In addition batteries of the battalion fired in support of Operation KUDZU, Special Forces and CIDG operations and conducted several artillery raids. These raids were conducted for the purpose of supporting operations outside the normal range of semi-permanent FSPB Moore and FSPB Lambert and employed not only the organic batteries of the battalion but also the 155mm and 8-inch elements of the general support battalion in the reinforcing role. In support of Operation DUONG CUA DAN, which was designed to open and secure highway QL-4 from My Tho to the junction of highway QL-4 and LTL 6a west of Cai Lay, the battalion tested the concept of using the 105mm towed howitzer with bee-hive ammunition to prevent interdiction of the highway by sapper squads in the area. In one such test starlight scopes and searchlights in the infra-red mode were used for target detection. An FO party was placed in a PF outpost for coordination and a command and control party was sent to the district CP to insure that no friendly elements were in the kill zone. The howitzer was emplaced in an indirect fire position at the outpost for deception, moving out after dark to a direct fire position on the highway. Difficulty was experienced with visibility due to reflection from the road surface which limited visual surveillance to 300 to 400 meters. Two rounds were fired on a possible sighting with the fuze setting on muzzle action. Flechettes were found as far away as 800 meters, indicating a far greater range than the 300 meters indicated in the firing tables. This technique is discussed in greater detail in Section II, Lessons Learned. Operation TRUONG COG DINH taxed the ability of the battalion and its reinforcing units to the utmost during the first nine days of June. On 1 June the 1st Brigade established contact with the 261A and 261B VC Battalions and pursued them to the Iron Triangle area (vicinity XS 250575) where the 514B Main Force Battalion was waiting to

CONFIDENTIAL

Ending 31 July 1968 (RCS CSFOR-65) (R-1) (U)

rendezvous. Encirclement was completed about midnight on the 3rd of June, after heavy artillery support and many air strikes. Once the cordon was closed massive artillery and air strikes were placed on the target. A body count of 233 was officially reported, with a Chieu Hoi, a Regimental S-1 Captain, taken on 8 June, reporting in excess of 475 casualties in the three battalions. On 8 June contact was regained and rapid insertions by infantry units again began the pattern of encirclement. Before the encirclement could be completed the 261A and 261B Battalions slipped through the cordon, leaving the 267B Battalion to bear the brunt of twelve hours of artillery pounding and 14 air strikes. On 9 June a sweep of the battlefield revealed a 67 VC body count.

(b) In support of operations of the maneuver units, the battalions fired 2,124 missions and expended 53,057 rounds.

(4) 3d Battalion, 24th Artillery (105mm towed. One land based battery equipped with airmobile firing platforms, two riverine batteries barge mounted):

(a) During the reporting period the battalion remained in support of the 2d Brigade, the Army element of the Mobile Riverine Force. In this role, the battalion participated in Operations TROUNG CONG DINH and TOAN THANG, ranging from the South China Sea to near the Gulf of Siam. Operations were conducted in KIEN HOA, LONG AN, DIEM TUONG, VINH LONG, SA DEC, GO CONG, VINH BINH, PHUOC DIEM and KIEN PHUONG Provinces, employing riverine, road marches and airlifts to occupy 30 different firing positions. In the flooded rice paddy areas of Long An Province the airmobile artillery platforms again demonstrated their versatility. Battery A was emplaced on the platforms in the vicinity of Can Giuoc on the night of 20 July when the battery position received approximately ten 82mm rounds. Although one platform received moderate damage, its usefulness was not impaired and no personnel were injured. Changes in riverine technique became necessary as the enemy developed his pattern of canal interdiction. Reconnaissance by fire of suspected enemy positions or known ambush sites, where such fires are permitted, the installation of the Tactical CS Dispenser (E8) on river assault craft and the installation of M132 flame turrets on the Armored Troop Carrier (Zippo) form an effective counter-ambush combination. However, the enemy has increased the use of stand-off attacks of the fire support bases, using B-40 rockets and mortars to harass and destroy the vulnerable landing craft and barges. One such attack occurred in the vicinity of WS 787038 on 20 June 1968 when the barge carrying two tubes of Battery B was struck by a B-40 rocket. The round impacted near the breech and started ammo burning. The barge was beached and personnel evacuated until the fire was brought under control. No personnel were injured, one howitzer was heavily damaged, one was unharmed and the barge was severely damaged.

(b) During the reporting period the battalion fired 2,395 missions, expending 68,744 rounds.

10

(5) 1st Battalion, 84th Artillery (one battery 155mm SF, two batteries 155mm towed, one battery 8-inch SF):

(a) During the reporting period the battalion remained in general support of the 9th Infantry Division, reinforcing the fires of the direct support battalions throughout the Division TAOI. As of 1 May 1968 Battery A (155mm SF) was located at Camp Martin Cox in a general support role. Battery B (155mm towed) was split between FSPB Moore on Highway QL-4 (4 tubes) and French Fort (2 tubes) on the South China Sea. Battery C (155mm towed) was split with two platoons (4 tubes) at Tan An South and one platoon (2 tubes) at FSPB Smoke. Battery D (8-inch SF) was split with one platoon (2 tubes) at Long Thanh and one platoon (2 tubes) at Dong Tam. On 3 May the scattered elements of the battalion began to reassemble as Battery C closed into Tan An South. The platoon of Battery D displaced from Long Thanh to Dong Tam, closing on 7 May. Battery A rejoined the parent headquarters at Dong Tam on 23 May after firing support missions from Camp Martin Cox to Binh Son to Binh Chanh to FSPB Smoke to Can Giuoc to Ben Luc to Dong Tam. This "move and shoot" employment was typical of the battalion operations throughout the reporting period. The platoon of Battery B from French Fort also closed Dong Tam on 23 May, reuniting their battery for the first time since 10 February 1968. After closing Dong Tam, Battery A began training in the employment of the M109's as a reinforcement medium artillery battery for the Mobile Riverine Force, practicing loading and unloading from the Landing Craft, LCM-8. The battery also practiced delivery of fires while on the move and at anchor. Battery B began the first of nine airlifts that took them to Ben Tre, Keim Hoa Province; Giao Duc, Dinh Tuong Province; My Phuoc Tay, Dinh Tuong Province; and Cong Long, Vinh Binh Province. Battery C also took to the air, making trips to My Phuoc Tay, Dinh Tuong Province and Gieng Trom, Keim Hoa Province. Battery D and Battery A became amphibious as they traveled from Dong Tam to Can Tho by landing craft to reinforce the fires of the 3d Battalion, 34th Artillery. In spite of mud, maintenance problems and persistent mortar attacks in all firing positions, the battalion fulfilled the mission of delivering medium and heavy fires anytime, anyplace for anyone.

(b) During the reporting period the battalion fired 5,444 missions and expended a total of 53,938 rounds; breakdown by caliber is as follows:

<u>CALIBER</u>	<u>MISSIONS</u>	<u>ROUNDS</u>
Organic Batteries		
155mm	4,018	46,691
8"	1426	7,247
Attached (battery E, 1st Bn, 27th Arty, 1-25 May)		
155mm	389	7,223

// SUBJECT: Operational Report of 9th Infantry Division Artillery for Period Ending 31 July 1968 (RCS CSFOR-65) (R-1) (U)

2. (C) Organization:

a. Other than the task reorganization discussed in paragraph 1a (2) which involved the artillery to the extent that two direct support battalions were supporting different brigades after the transfer was completed, no significant changes in organization occurred during the reporting period.

b. Headquarters of the Artillery, as of the close of the reporting period, are as follows:

<u>HEADQUARTERS</u>	<u>LOCATION</u>	<u>MISSION</u>
Division Artillery	XS 4143	
2d Bn, 4th Arty	XS 5564	DS, 1st Bde
1st Bn, 11th Arty	XS 4143	DS, 3d Bde
3d Bn, 34th Arty	XS 4143	DS, 2d Bde
1st Bn, 84th Arty	XS 4143	GS, 9th Div

c. Attached as Inclosure 1 is a roster of Commanders of the Artillery.

3. (U) Personnel and Administration: None.

4. (U) Intelligence: None.

5. (C) Operations:

a. Because of the frequent displacement of artillery units required to provide fire support to the maneuver elements, artillery coverage of the TROI fluctuates from day to day; at the close of the period it was approximately 35%.

b. For the same reason, coverage available to RF/PF outposts varies depending on the emplacement of the artillery at the moment. When the artillery occupies a fire support base within close support range of an outpost, continuous coverage and support is available, dependent only on the tactical situation. A quick fire channel is established upon occupation of the position, and is used to request fire for outposts under attack. All such requests are immediately honored, provided proper clearances can be obtained.

c. The division artillery has continued to expand its target acquisition program, to include the use of SLAR (Side Looking Airborne Radar), infra-red detection and photography, people sniffer missions and increased use of personnel radars. The AN/TPS-33 of the infantry brigade, the PPS-5 and PPS-4 of the infantry battalion and the AN/TPS-25 of the division artillery are all effectively tied into a surveillance net which can detect and develop a pattern of activity on which the plan of fire and maneuver is based.

CONFIDENTIAL

AVDE-40

31 July 1968

SUBJECT: Operational Report of 9th Infantry Division Artillery for Period Ending 31 July 1968 (RCS CSFOR-65) (R-1) (U) 12

d. A "Big Brother" program to foster mutual respect and camaraderie between ARVN Division Artillery commanders and their advisors and US Artillery battalion commanders has been inaugurated. An Artillery Seminar has been held to acquaint all concerned with the objectives of the program and to introduce the participants to their counterparts. A follow-up program of seminars, exchange programs and implementation of improved training programs is scheduled for the coming quarter and will be reported in detail in the next Operational Report.

6. (C) Training: Artillery training continues to concentrate on the problems of training replacement personnel in the techniques of fire in the Vietnam environment. Emphasis is on training of FADAC operators, computers and chart operators, with safety and use of the double-check system stressed in all phases of training. The current shortage of howitzer section chiefs has forced the employment of junior noncommissioned officers in these positions with a consequent lack of experience and professional expertise. This, in turn, requires a greater degree of supervision on the part of the XO and Chief of Firing Battery, degrading the rapid response capability of the firing battery. No short cut method of achieving experience and reliability is acceptable; only time and training can solve this problem. Frequent practice drills, with all operations closely monitored by available senior personnel, are bringing about a gradual upgrading.

7. (U) Logistics: None.

Section 2: Lessons Learned: Commander's Observations, Evaluations and Recommendations.

a. (U) Personnel: None.

b. (C) Operations:

(1) (C) Coordinated Illumination and Gunship Strikes.

OBSERVATION: Coordinated use of artillery and Army Aviation gunships can interdict enemy movement at night.

EVALUATION: The AN/TPS-25 radar is capable of detecting enemy movement at night, particularly the movement of supply sampan convoys. However, since this is a moving target on which clearance to fire is extremely difficult to obtain, artillery fires are often ineffective. To counter this problem, the 2d Battalion, 4th Artillery, has developed the "Cobra Flash" technique. A howitzer battery fires illumination with special corrections applied to each tube so that rounds burst about 500 meters apart along the canal. Thus, the six-gun battery can provide illumination of approximately three kilometers on the canal where the suspected sampan traffic has been detected. Rounds are timed and fired to burst simultaneously. Cobra gunships orbit near the battery position and follow the direction of fire after all howitzers have fired, timing their flight to arrive after the rounds have burst and thus avoiding any danger from

falling cannisters. By flying under the illumination the aircraft are able to observe and engage any traffic moving on the canal, either destroying it or forcing it to beach where artillery may be called in. As a variant, used either in conjunction with the gunships or as a substitute when they are not available, an aerial observer goes in under the illumination to adjust artillery on a pre-cleared grid. If the initial rounds are close the sampans will usually beach where they can be effectively destroyed by artillery.

RECOMMENDATION: That artillery battalions and air cavalry units work in coordination to execute and perfect this technique.

(2) (U) Short Life of Wooden Sideboards for Ammunition Trucks.

OBSERVATION: Wooden sideboards and end boards as issued with the 2½-ton cargo truck are easily broken when the vehicle is used to load and carry ammunition, particularly in pallet lots or A-22 bags.

EVALUATION: Because of the non-availability of repair items for splintered sideboards, units of the division artillery fabricated sideboards by using steel engineer stakes welded to solid steel planking of the type used for airfield runways. This provides a substantial sideboard which will withstand the shock of ammo loaded by forklift or loaded and unloaded in the A-22 bags by Chinook. As an added benefit, when the vehicle is used to transport troops, the SSP provides protection from Claymore type mines and small arms fire.

RECOMMENDATION: That ammunition trucks be equipped with SSP sideboards and that wooden racks be stored for use if the vehicle is converted to troop use solely.

(3) (U) Selection of Medium and Heavy Artillery Firing Positions.

OBSERVATION: In areas where terrain is largely inundated, firing positions for medium and heavy artillery must be selected with extreme care.

EVALUATION: With the advent of the monsoon season in the Delta Area, suitable firing positions for medium and heavy artillery have become increasingly scarce. On several occasions, positions have been selected by personnel from the reinforced direct support battalion who are not familiar with position area requirements for the heavier weapons. Many of these positions were untenable for the heavier artillery, particularly from a soil flotation standpoint. Attempts to occupy these positions have resulted in unnecessary delays in fire support and mired vehicles. Additionally, the heavy recovery aspects must be considered in the case of self-propelled artillery, since the M88 recovery vehicle is too heavy to cross most bridges in the area.

Ending 31 July 1968 (RCS CSFOR-65)(R1) (U)

RECOMMENDATION: That position areas for medium and heavy artillery be selected only by the general support battalion commander, S3 or battery commander.

(4) (C) Employment of Firing Batteries by Platoon.

OBSERVATION: Employment of artillery firing batteries in platoon elements reduced the overall effectiveness of the artillery because of insufficient personnel and equipment resources.

EVALUATION: When a firing battery is employed in a split configuration for extended periods of time, the overall capability of the battery to deliver accurate and timely fire is degraded. Manning levels do not provide sufficient officer personnel for 24-hour operation of an XO post at two or more locations, nor are sufficient senior enlisted personnel provided to furnish a Chief of Firing Battery at each positions. Further, insufficient radios are authorized to support an efficient operation in the split configuration for extended periods of time. Batteries augmented with one officer and additional radio assets can operate effectively for periods of up to three or four days. After that period, a corresponding loss in efficiency and lowered levels of maintenance, morale and appearance are inevitable.

RECOMMENDATIONS: That plans to employ artillery batteries in a split configuration be carefully evaluated in view of the undesirable effects on efficiency, morale and maintenance.

(5) (C) Use of Towed Artillery to Support Mechanized Infantry Operations.

OBSERVATION: During recent operations in support of a mechanized infantry battalion in and around Saigon, 2½-ton trucks proved ineffective as prime movers and ammunition vehicles.

EVALUATION: In order to provide close and continuous support to the maneuver unit, it is axiomatic that the artillery must be able to accompany the infantry. In the soft and muddy rice paddy terrain surrounding Saigon, it was often necessary to borrow M113 and M548 tracked vehicles in order to emplace the towed M101 105mm howitzers. These tracked vehicles negotiated the marshy terrain with no difficulty. One M548 per howitzer with ammunition and section equipment would serve as the prime mover, one M577 command vehicle would serve as the CP/FDC and would enable the direct support artillery battery to keep up with the infantry scheme of fire and maneuver.

RECOMMENDATION: That the towed artillery battery normally employed to support a mechanized infantry battalion be equipped with six M548 prime movers and one M577 Command Vehicle.

(6) (C) Combining Direct Fire with Beehive Ammunition and the
Infra-red Searchlights.

OBSERVATION: Under suitable conditions of terrain and employment, the 105mm howitzer in the direct fire role, and firing beehive ammunition against targets illuminated by the vehicular mounted searchlight in the infra-red mode, can prevent enemy interdiction or infiltration.

EVALUATION: In support of Operation DUONG CAU DAN (Peoples' Road), the 1st Battalion, 11th Arty experimented with the use of beehive ammunition in the role described. Two howitzers were used in each of the two tests conducted, emplaced to fire in opposite directions along the highway. The howitzers and searchlights were secured by two M42A1 twin 40mm gun carriages (Dusters) and a platoon of RF/PF infantry. The mechanics of occupation are described in paragraph 2(b)(1) of Section 1. Such occupation is not the optimum condition for tests because of the minor damage to the road surface caused by the trail spades, the reflectivity of the road surface which limits the range of the infra-red searchlight and the exposed nature of the position. A better situation might be in guarding a bridge approach or an access road with dirt surface which would not reflect the infra-red rays so severely.

RECOMMENDATIONS: That the concept of employment of beehive with infra-red searchlights be tested by the appropriate development agency and the results published for the use of artillerymen world wide.

(7) (C) Aircraft Warning Procedures in Joint Operations.

OBSERVATION: Although US Artillery has clear-cut procedures for warning aircraft of friendly artillery fires, this warning is not always provided by ARVN arty firing in the vicinity. Further, in many joint operations, arty of both forces is quite often occupied with fires into the same general area in support of maneuver elements of the respective force.

EVALUATION: A mutual exchange of information concerning artillery fires in support of ground operations, location of maneuver units and broadcast of air warning data is essential to safety and an orderly conduct of operations.

RECOMMENDATION: That, whenever possible, a liaison officer be provided to the ARVN artillery in a joint operation to furnish both US and ARVN forces with a knowledge of troop operations and dispositions, air warning and an exchange of information of lucrative targets for possible coordinated attack.

HEADQUARTERS, UNITED STATES ARMY VIETNAM, APO San Francisco 96375 22 SEP 1968

TO: Commander in Chief, United States Army, Pacific, ATTN: CPOP-DT,
APO 96558

1. This headquarters has reviewed the Operational Report-Lessons Learned for the quarterly period ending 31 July 1968 from Headquarters, 9th Infantry Division Artillery.

2. Reference item concerning combining direct fire with beehive ammunition and the infrared searchlight, page 13, paragraph 2b(6): Concur in both observation and evaluation. Certainly the pairing of searchlight and howitzer is an effective defensive expedient. Nonconcur, however, with the recommendation that the employment concept "be tested by the appropriate development agency". Combat is the ultimate test of a weapons combination and it appears that the expedient was successfully utilized by the 1/11 Artillery.

ANNEX C (VC Flying Mines) to 9th Inf Div INTSUM 224-68

(MACV - IVC - 25010 from SA, IV Corps)

1. (C) At 040125H August, an unknown number of VC fired 82mm mortar, 57mm RR, and 75mm RR rounds into Cao Lanh vic WS 7056. Initial analysis of the attack revealed that an unusual type of round landed at the B-43 Special Forces air boat compound located vic WS 695556. It caused extensive damage by tremendous concussion, yet there appeared to be no shrapnel. A crater caused by this round measured six feet across and four feet deep. A package wrapped in burlap and bound by wire and rope was found in the debris, and it appeared to have been catapulted into the area.
2. (C) Subsequent analysis of the attack and a search of the area revealed that the weapon used at Cao Lanh, and probably at My An, was what has been described as a VC "flying mine." Components to this system include a wooden template for aiming, a propelling charge composed of 12 lbs of TNT, ignition wire, ignition box, a 2x4-inch wooden piece, a wood board and the mine composed of 30 lbs of TNT. These components are set as follows. The mine is placed in a hole about one foot deep and with front and rear sides slanting at about 45 degrees to the surface of the ground. The propellant is placed in another hole located to the rear and beneath the mine hole. The 2x4-inch piece is driven through the earth between the propellant charge and the wooden board on which the mine rests. Wires connect the propellant to the ignition box, and when the propellant is detonated, it propels the mine by means of the wood piece and wooden board up and forward at a 45-degree angle toward the target area. Estimated range of this weapon is 200-300 meters, and the expected standoff distance from the target area would be 250 meters. The mine is believed to detonate on impact, but technical details on its detonation are not currently available. (See attached sketch).
3. (C) The use of "flying mines" reportedly dates back 16 years to the French/Viet Minh conflict. However, while it is not a new system, there currently appears to be a re-emphasis of its employment by VC/NVA forces in South Vietnam. A PW captured in Quang Hgai Province on 24 June 1968 stated during interrogation that he and 240 other men were given a 20-day familiarization course on the employment of "flying mines" in early October 1967. Source was told by the instructors that his class was the first to receive this type of training and the course terminated with the actual firing of the mine during a field exercise, (Source: CMIC report US 2107-68). In late 1967, a similar system was used in Tay Ninh Province in III CTZ to fire a CS package into a friendly FSPB.
4. (C) The use of "flying mines" in the Delta represents an increased VC indirect fire capability and is especially effective against fixed installations with no standoff defenses.

9th Inf Div G2 Opns comment:

On 16 July, vic XS 250500, c-3-39 Inf at FSPB Mohawk came under a mortar attack. During the mortaring, 10 satchel charges were catapulted into the FSPB. The satchel charges were 1'x1'x1' square and were covered with burlap with wire mesh wrapped around them. Each satchel charge had two fuses. The firing sites for these "flying mines" were not located.
