CLASSIFICATION OF SOLAR PROMINENCES FOR SUNSPOT CYCLE 19--1956

by Donald H. Menzel and F. Shirley Jones

ABSTRACT

Behavior classifications and measures of position and size for the solar prominences on the surveys made at the Sacramento Peak Observatory, Sunspot, New Mexico, for the year 1956 are tabulated. An analysis of the distribution of the various classes of prominences with solar latitude is then carried out. A similar study for the year 1955 appeared in Scientific Report No. 13 under contract AF19(604)-4962.

The research reported in this paper has been sponsored by the Geophysics Research Directorate of the Air Force Cambridge Research Laboratories, Office of Aerospace Research, under contract AF19(604)-4962.

INTRODUCTION

The observations we used in this research consisted of the complete set of prominence surveys made at the High Altitude Observatory at Sunspot, New Mexico, during the year 1956, and the motion picture films of prominences made on 58 days during the same year at the same observatory.

In Table I we list the measures of position and area, the intensity estimates, and the classification according to the Menzel and Evans scheme (1953), modified by the addition of classes ASa (rain) and ANe (suspended clouds) of all the prominences in the surveys. We give classifications for the prominences in the motion picture studies in Table II.

Column 1 gives the date of the observations. Column 2 indicates the amount of spread, in terms of the position angles marked by the beginning and end of each prominence. A spread of 1° indicates the position only of each of the narrower prominences, some of which are less than 0.5° in width. Column 3 gives the latitude of the center of intensity.

Column 4 indicates the "importance" of the prominence by an assigned letter giving a rough measure of the total intensity, from D- for the most insignificant through A+ for the most impressive prominences. Column 5 records the area of the prominence, expressed in standard prominence units.

Column 6 contains the class. Doubtful classifications are followed by a question mark. Non-spot prominences so adjacent to spot prominences as to suggest association with the spot are noted by asterisks. Column 7 gives additional comments.

Table II gives the classifications for the prominences in the motion picture studies. The columns show date, position angle of the center of the frame, classification, and additional comments.

COMPARISON OF CLASSES FROM SURVEYS AND FILMS

When we compared the classifications made on the films with those made on the surveys we discovered that on two of the 58 days that motion picture studies were made, no stills were made at a corresponding position angle. In the comparable pictures we classified a total of 219 prominences. Of these, 184 were found on both the films and the surveys.

In Table III we show the classifications given to the prominences in both media. Of the prominences seen in both, 127 or 69 per cent were classified indentically; 43 or 23 per cent were typed as belonging to closely related groups; and 14 or 8 per cent otherwise.

TABLE III
COMPARISON OF CLASSIFICATIONS FROM FILMS AND SURVEYS
PROMINENCE TYPES SEEN IN SACRAMENTO PEAK FILMS, 1956

ANALYSIS

In Table IV we give the average number of prominence units per day for the various prominence classes and for each 10° of solar latitude.

In Table V we list the average number of prominence units at all latitudes for types A and B, S and N, those unclassified, and for all types together, for each third of the year. The total areas increased throughout the year and the total for 1956 is considerably greater than for 1955.

For 1956 we were unable to type 0.3 per cent of the prominences; to 92 per cent we assigned A classifications, denoting that the material was moving downward toward the chromosphere; and to 16 per cent we gave S classifications, indicating their association with sunspots.

In Table I we indicated the N type prominences which were interacting with S types by adding an asterisk to the classification. During 1956, 20 per cent of the treetrunks (ANb), 23 per cent of the tree (ANc), 21 per cent of the hedgerows (ANd), 17 per cent of the suspended clouds (ANe), and 2 per cent of the mounds (ANm), showed this activity.
