BALLOON FLIGHT RECORD STATUS REPORT

as of 31 December 1962

School of Physics, University of Minnesota
Minneapolis 14, Minnesota

↓ This tabulation is a continuation of four previous status reports.*
Balloon flights were launched from Minneapolis, Minnesota, Fort Churchill, Manitoba, Canada, and Kerguelen Island in the South Indian Ocean; the latter being a coordinated experiment with Professor Jacques Blamont of the Meudon Group. The flights used either the standard monitoring apparatus described earlier, or the scintillation counters to obtain more specific data about x-rays resulting from electron precipitation. Besides the launchings made simultaneously at Kerguelen and Minneapolis in September 1962, coordinated launchings were made at Minneapolis and Fort Churchill simultaneously with launchings at Flin Flon, Manitoba, Canada, carried out by Dr. Kinsey Anderson of the University of California, Berkeley. These latter experiments were to measure x-rays resulting from electron precipitation during magnetic storms at high latitudes.

The tabulation gives the flight number, launch time, launch location, duration, and type of instrumentation used on each of the flights. The flight duration is measured from launch time. The floating pressure altitude of the current balloon system is 6 mb. In general, the flights attempt to maintain altitude about two hours after the stated launch time. The balloon system allows flight at a constant altitude, however, so that the balloon can be used for a longer duration and analysis of status report of

to February 1963.
Balloon Flight Record Status Report as of 31 December 1959.
Balloon Flight Record Status Report as of 30 December 1960.
Balloon Flight Record Status Report as of 31 December 1961.

Best Available Copy

detailed time-pressure curve for each flight is necessary for final analysis. An index for the types of instruments used is attached at the end of the tabulation. The original data from flights during 1960, 1961, and 1962 are being plotted in standard form and copied photographically on 5 x 7 inch negatives. We shall endeavor to furnish copies of these original graphs in a convenient size to qualified scientists in other laboratories. Nuclear emulsion packages were carried on most flights. This analysis is carried out by the Nuclear Emulsion Group, School of Physics, University of Minnesota.

Inquiries about this project should be addressed to Professor J. R. Winckler, School of Physics, University of Minnesota, Minneapolis 14, Minnesota.
