INTRODUCTION

Both the present report and the one which will follow it shortly (NSF-9) are devoted entirely to describing the results of work on the syntax of English initiated almost two years ago and now proceeding in parallel with the work on Russian, with which most of the earlier reports of this series have been concerned. There have been earlier studies of English, as described in Reports NSF-4 and NSF-6, but the present approach is a marked departure from earlier efforts both at Harvard and elsewhere in that it leads to all syntactic structures of a sentence that are compatible with the grammar describing the language, not merely to one.

The general strategy of multiple-path syntactic analysis has already been described in a paper presented at the International Federation of Information Processing Congress held in Munich in August 1962. For the sake of completeness that paper is presented again in updated form as Section I of this report. The remainder of the material is entirely new.

The complete grammar table currently used with the multiple-path English analyzer forms the bulk of this report. A synoptic description of this grammar is given in Section II. A more detailed analytical description of the grammar, more extensive examples of analyzed sentences and an evaluation of the products of analysis are forthcoming in Report NSF-9.

Programming details and operating instructions are not described in either report, but all the material necessary for operating the multiple-path English analyzer on an IBM 7090 system can be made available to responsible research workers.

I. MULTIPLE-PATH SYNTACTIC ANALYZER*

Susumu Kuno and Anthony G. Oettinger

Abstract

Multiple analyses of syntactically ambiguous sentences have been effectively and economically realized ~~(for the first time)~~ by a new extension of the method of predictive syntactic analysis. Branchings caused by homography (membership of a given word form in more than one syntactic word class) and by multiple functions of a given word class are followed in a systematic loop-free sequence in which each partial path is traversed only once. Different paths that reach the last word in a sentence correspond to different acceptable syntactic structures of the sentence. _____

The prediction pool for this method is a pushdown store in the strict sense; the topmost prediction in the pool is matched against the class of the next word form of the sentence by look-up in an internally stored table of grammar rules, whose content may be varied at will without affecting the program for the analysis algorithm.

*This section is an updated version of "Multiple-Path Syntactic Analyzer" by the same authors presented at the International Federation of Information Processing Congress - 62, Munich, Germany, August 29 to September 1, 1962. The abstract for the original version was submitted on August 29, 1961 and the paper itself on January 9, 1962. New developments since that date are included in this section. The Proceedings of the Congress have not yet appeared.

Satisfactory results have been obtained with programs for the analysis of English. The basic principles of the new method offer a convenient framework for the development of powerful techniques for the syntactic analysis not only of English, but also of Russian. The availability of alternative acceptable syntactic structures clarifies some of the issues lumped under the heading of "semantic ambiguity".

1. Introduction

The method of predictive syntactic analysis^{1,2,3,4} aims at obtaining a single most probable description of the structure of an input sentence in a single left-to-right scan through the sentence. The computer program uses a storage area called the prediction pool. At any intermediate point in the analysis of a sentence, the prediction pool contains a single set of predictions, generated by the processing of the preceding words, that may be fulfilled by the remaining words. The prediction pool is similar to a pushdown store, in that the prediction fulfilled and discarded is usually among the topmost ones in the pool and in that the newly generated predictions are placed above the remaining predictions.

Experiments on Russian and English texts have demonstrated the capability of predictive analysis for handling complex sentence structures including many levels of subordination or coordination, but the results have been disappointing for the following reasons:

(1) There are many syntactically ambiguous sentences in natural texts. Provisions for determining all legitimate alternative syntactic

structures are therefore essential from both the theoretical and the practical points of view. Neither estimates of the reliability of syntactic analysis nor significant attacks on the problems of choosing the semantically correct structures are possible without such provisions. A storage area termed hindsight has been provided in predictive analysis programs in the hope of enabling at least local alternative parsings, but practical use of this facility now appears inordinately difficult.

(2) When a single-path analysis comes to a dead end, determining which of the previous branching points was the cause of the failure poses serious problems.

(3) Owing to the lack of an effective method for distinguishing paths which have already been followed from those which have not, it has not been possible to try different paths in a systematic loop-free sequence.

A new method has been developed for extending the predictive approach by including effective and economical provisions for multiple analyses of syntactically ambiguous sentences. The prediction pool for this method is of variable size, consisting of one or more subpools, each of which contains a set of predictions corresponding to a path that may lead to an acceptable structure for the complete sentence. Each subpool is a pushdown store in the strict sense; that is, only the topmost prediction in each subpool is tested against the next word of the sentence.

After the $(k-1)$ st word in a sentence has been processed, the prediction pool contains a subpool for each sentence structure compatible with the first $(k-1)$ words. The topmost prediction of each subpool is then tested against all the homographs of the k th word. By a simple

process of grammar table look-up, each allowable combination of a prediction and a homograph is associated with new predictions which replace the topmost prediction of the appropriate subpool. Subpools for which no allowable combination exists are discarded. The subpools resulting from this process are used in turn for the processing of the $(k+1)$ st word. After the processing of the last word of a sentence, only those subpools which have no predictions remaining are retained in the prediction pool. By tracing back the paths that have yielded those subpools, the alternative acceptable syntactic structures of the sentence are obtained.

2. Dictionary and Syntactic Word Classes

Each word of an input sentence is looked up in a dictionary and is coded for membership in all the syntactic word classes to which it belongs. For example, the input English sentence "THEY ARE FLYING PLANES." will be coded as shown in Table 1. The first three characters in the column for "CLASS CODE" are for syntactic word classes, the fourth character for the grammatical number representation (S for singular, P for plural, and C for singular-plural). Punctuation marks are treated like words in the ordinary sense.

3. Grammar Table

A grammar table is a rectangular array defining the grammatical matching function G of a language whose syntax is described in terms of a set of predictions P , a set of syntactic word classes S , and a set of

ENGLISH WORD	CLASS CODE	COMMENTS (NOT STORED IN MACHINE)
THEY	PRNP	plural personal pronoun in the nominative case
ARE	BE1P	plural finite complete intransitive verb, as in "They <u>are</u> in the sky." (A prepositional phrase, according to the present grammar, is considered to be adverbial, and cannot fulfill the role of a complement or object of a verb.)
	BE2P	plural finite copula, as in "They <u>are</u> students." and "They <u>are</u> good."
	BE3P	plural finite auxiliary verb for the progressive form, passive voice, and be-to form, as in "They <u>are</u> coming.", "They <u>are</u> seen.", and "They <u>are</u> to come here."
FLYING	RI1	present participle of complete intransitive verb, as in "They are <u>flying</u> to Boston.", "It is a <u>flying</u> plane."
	RT1	present participle of single-object transitive verb, as in "He is <u>flying</u> a plane."
	GI1S	singular gerund of complete intransitive verb, as in " <u>Flying</u> is pleasant."
	GT1S	singular gerund of single-object transitive verb, as in " <u>Flying</u> a plane is pleasant."
PLANES	NOUP	plural noun, as in "They are <u>planes</u> ."
	VI1S	singular finite complete intransitive verb, as in "The glider <u>planes</u> ."
	VT1S	singular finite single-object transitive verb, as in "He <u>planes</u> the surface of the board."
.	PRD	period as end of sentence punctuation

Sample From an English Dictionary

TABLE 1

syntactic role indicators R . Each prediction stands for a certain syntactic structure recognized in the language. To each ordered argument pair (P_i, S_j) , G assigns a set, possibly empty, of ordered pairs

$$G(P_i, S_j) = \left\{ \left[(p_1^1, p_1^2, \dots, p_1^{m_1}), (r_1) \right], \left[(p_2^1, p_2^2, \dots, p_2^{m_2}), (r_2) \right], \dots, \right. \\ \left. \left[(p_q^1, p_q^2, \dots, p_q^{m_q}), (r_q) \right] \right\},$$

where $p_k^l \in P$ and $r_k \in R$ ($k = 1, 2, \dots, q$; $l = 1, 2, \dots, m$). Each element of $G(P_i, S_j)$ corresponds to a set of structures that may follow when the syntactic structure represented by the given prediction P_i is initiated by a word belonging to class S_j . Whenever P_i and S_j are grammatically incompatible, $G(P_i, S_j) = \emptyset$, the empty set. Each couple $[P_i, S_j], G(P_i, S_j]$ in G is a rule of the grammar. A rule subsumes as many subrules as there are members of $G(P_i, S_j)$, each subrule being defined as a couple $[P_i, S_j], g_k(P_i, S_j]$, where $g_k(P_i, S_j) \in G(P_i, S_j)$.*

In the present English grammar, the rule for $(P_1, S_j) = (\text{SENTENCE}, \text{PRN})$ (PRN = personal pronoun in the nominative case) consists of the subrules shown in Table 2. The ordered set of predictions in $g_k(P_1, S_j)$ is a pushdown store in the exact sense; the prediction which is topmost in the pool is the first to be tested, and no inner prediction will ever be satisfied unless it becomes the topmost

*This characterization of the grammatical matching function is due to Warren Plath.

prediction. The column for "ENGLISH EXAMPLES" corresponds to the structures which refer to the predictions in the same line.

In practice, rules are stored sequentially in machine memory in the alphabetic order of their argument pairs, those pairs for which $G(P_i, S_j) = \Phi$ being omitted. The present experimental English grammar has approximately 2,100 subrules. It is so written that most of the English structures which appear or may appear in scientific papers can be recognized, from declarative sentences to interrogative and imperative ones, each with various kinds of nested structures.

4. Analysis of a Sentence

The procedure for analyzing a sentence will be explained using "THEY ARE FLYING PLANES." as an example. At the beginning of the analysis of the sentence, the prediction of "SENTENCE" is stored in the prediction pool. The reason for making simply the prediction of "SENTENCE" instead of making the detailed predictions of "SUBJECT - PREDICATE HEAD - OBJECT", etc. as Sherry did,⁵ or of NV^+ as Sager suggests doing⁶ is to keep the predictions as general as possible until it becomes compulsory to make them specific, and thus to postpone the branching in syntactic analysis as far as possible.

Next, the prediction of "SENTENCE" is paired with the syntactic word class (PRN) of the first word ("THEY") to form an argument pair which, when looked up in the grammar table, yields the nine sets of predictions shown in Table 2. Due to "Number Agreement Information" in subrules 1, 2 and 5, the prediction of "PREDICATE" in these subrules is

(P_i, S_j) ARGUMENT PAIR	(r_k) SYNTACTIC ROLE INDICATOR	$g_k(P_i, S_j)$ NEW PREDICTIONS	ENGLISH EXAMPLES (NOT STORED IN MACHINE)	NUMBER AGREEMENT INFORMATION
(SENTENCE, PRN)-1	SUBJECT OF PREDICATE VERB	PREDICATE PERIOD	THEY GO .	NUMBER AGR BETWEEN PRN AND PREDICATE
(SENTENCE, PRN)-2	SUBJECT OF PREDICATE VERB	ADJECTIVE CLAUSE PREDICATE PERIOD	WE WHO ARE READY TO DIE SALUTE YOU .	NUMBER AGR BETWEEN PRN AND PREDICATE
(SENTENCE, PRN)-3	SUBJECT OF PREDICATE VERB	(A) AND (B) NOUN SUBJECT PREDICATE PERIOD	THEY AND JOHN CAME .	
(SENTENCE, PRN)-4	SUBJECT OF PREDICATE VERB	COMMA NOUN SUBJECT (A, B,) AND (C) NOUN SUBJECT PREDICATE PERIOD	THEY , JOHN AND MARY CAME .

(SENTENCE, PRN)-9	SUBJECT OF PARTI- CIPIAL PHRASE	COMMA SUBJECT COMMA PARTICIPLE COMMA SENTENCE	THEY , THE RUSSIANS , HAVING SAID NO , WE TOOK A DECISIVE STEP.	

The Subrules of $G(\text{SENTENCE}, \text{PRN})$

TABLE 2

suffixed so that it can only accept a finite verb of the same number as the word class in the argument pair: the fourth character of the word class code for "THEY" denotes that it is to be followed by a plural verb.

The nine sets of new predictions given by the grammar table then replace the initial prediction of "SENTENCE". The prediction pool now contains nine subpools each of which corresponds to a different way, recognised by the present grammar, of terminating the sentence initiated by PRN.

The analysis proceeds to the second word, and the three syntactic word classes assigned to "ARE" are coupled with the topmost prediction of each of these nine subpools in the prediction pool. The resulting argument pairs are all the possible combinations of the word classes BE1, BE2 and BE3 with the predictions PREDICATE, ADJECTIVE CLAUSE, (A) AND (B), COMMA, COMMA, PARTICIPLE, (A) AND (B), COMMA and COMMA.

Each of these 27 argument pairs is looked up in the grammar table, but only (PREDICATE, BE1), (PREDICATE, BE2) and (PREDICATE, BE3) yield nonempty $G(P_i, S_j)$. All the subpools stored in the prediction pool - except that with "PREDICATE" as the topmost prediction - are discarded, since the predictions in them cannot be fulfilled by the sentence in question.

The subrules for (PREDICATE, BE1), (PREDICATE, BE2) and (PREDICATE, BE3) are shown in Table 3. Now, the new predictions given by these grammar subrules replace the topmost prediction (PREDICATE)

(P, S) ARGUMENT PAIR	(r) SYNTACTIC ROLE INDICATOR	$G(P, S)$ NEW PREDICTIONS	ENGLISH EXAMPLES (NOT STORED IN MACHINE)	NUMBER AGREEMENT INFORMATION
(PREDICATE, BE1)-1	PREDICATE	ADVERB AFTER BE1	• THE MAN IS AT HOME	NUMBER AGR TO BE TESTED

The Subrules of $G(\text{PREDICATE}, \text{BE1})$

TABLE 3

of the subpool which originally contained PERIOD | PREDICATE.^{*} Twelve new subpools, all of which have the prediction of "PERIOD" as the bottom prediction, are generated and stored in the prediction pool. These subpools in turn are used for the processing of the next word, "FLYING", and so on.

The current grammar yields three analyses for "THEY ARE FLYING PLANES.". The first (Table 4) shows the syntactic structure of the sentence applicable when "THEY" refers to planes. The third shows the syntactic structure of the sentence acceptable when "THEY" refers to people. Analysis No. 02 is semantically absurd, but it reflects the structure of a sentence such as "The facts are smoking kills.", which is not semantically absurd. The same three analyses would be obtained for "The facts are smoking kills.", but only one would be semantically correct for this sentence.

The analyses obtained for "THEY ARE FLYING PLANES." can be limited to the two syntactically and semantically acceptable ones simply by deleting the subrule pertaining to

$$g_4(\text{PREDICATE, BE2}) = \text{DECLARATIVE CLAUSE.}$$

However, the semantically correct analysis of "The facts are smoking kills." would thereby be lost, leaving only two unacceptable analyses. The easy way out of this particular dilemma would be to rule out "The

^{*}This notation will be used to indicate that the left-side prediction is the bottom prediction in a grammar subrule or in a prediction subpool when more than one prediction are involved.

TABLE 1.

facts are smoking kills." as ill-formed and accept only "The facts are: smoking kills.". The problem is, however, a more general one, whose solution must be sought, not within the presently defined precincts of syntax, but on the border line of the grammatical and the nongrammatical as well as beyond, in the shadowy realm of semantics. A set of multiple analyses provides, for the first time, a firm base from which to start such an exploration.

The same grammar produced two analyses for "IT HAS ALREADY BEEN MENTIONED THAT A RESPONSE MAY BE LEARNED BY THE MACHINE IF ENCOURAGED BY THE EXPERIMENTER.". Analysis No. 01 (Table 5) shows the structure of the sentence in which "IT" is a "temporary" subject without normal pronominal reference and in which "THAT" introduces the "real" subject noun clause. This analysis corresponds to the way in which the sentence is generally understood. Analysis No. 02 (Table 6) shows the structure of the sentence in which "THAT" introduces an adverbial clause, with "IT" referring to something mentioned before. The syntactic structure reflected in this analysis corresponds to the structure of such semantically similar but more normal expressions as "It has already been mentioned (so) that a response may be learned by the machine..." or, more precisely, "It has already been mentioned lest a response may inadvertently be learned by the machine...".

The second analysis is due to subrules pertaining to adverbial "that"-clauses as in "We eat that we may live." or "It has been kept polished that it may glitter forever.". One solution is to keep the syntactic classification of words simple and the grammar rules general,

Analysis No. 2 of "IT HAS ALREADY BEEN MENTIONED..."

TABLE 6

and to tolerate getting Analysis No. 02 for "It has already been mentioned that a response may be learned..." and Analysis No. 01 for "It has been kept polished that it may glitter forever.". Another approach is to make the syntactic classification of words more detailed and the grammar rules more complicated so that a "real" subject noun clause introduced by "that" is admitted only when it is preceded by "it" plus special verbs and adjectives ("It is known that the number is greater than zero."; "It is clear that there is no solution to the question ") and so that an adverbial clause introduced by "that" is admitted only in other cases. Further theoretical and empirical studies are necessary to determine which choice to make for any given purpose.

The column headed "PREDICTION" in Tables 4, 5 and 6 shows the history of prediction subpools. Each English word is connected to a pair of prediction subpools which appear above and below the line for the word. The above subpool shows the status before the processing of the word; the below one, the status after the processing. Whenever "PD" (PERIOD prediction) appears alone in that column, the word in the preceding line is the last of a well-formed substring of the sentence. Thus the sentence could have been terminated with a period in any position marked by a slash: "IT HAS ALREADY BEEN MENTIONED / THAT A RESPONSE MAY BE LEARNED / BY THE MACHINE / IF ENCOURAGED / BY THE EXPERIMENTER."

The column headed "SENTENCE STRUCTURE" in Tables 4, 5 and 6 shows the sentence structure diagram automatically given by the diagramming subroutine of the present English analyzer. It consists of a string of characters corresponding to each word of the input sentence. Each character in these strings stands for a syntactic role: "S" is for "subject," "V" is for "verb", etc. The ordering of characters within the string indicates the

dependency of the syntactic roles on one another from right to left. Thus, a structure code of "lCA" for "FLYING" in Analysis No. 1 of Table 4 indicates that "FLYING" is an attributive ("A") which modifies a complement ("C") of a declarative sentence ("1"). In other words, "FLYING" as an attributive, is nested within a complement which is nested within a declarative sentence. The number of characters in the string for a given word corresponds to the depth of nesting of that word. The sentence structure characters are equivalent to but more economical of space than an explicit tree diagram of the sentence structure.

The set of structure codes for a given analysis of a sentence, when looked at vertically, shows basic syntactic patterns at different depths of nesting. All the three analyses for "THEY ARE FLYING PLANES." have a node for a declarative sentence ("1") as the highest order nest of the sentence. Analysis No. 1 has the basic pattern of "S" (subject) - "V" (verb) - "C" (complement) - "." (period) as the second order nests, Analysis No. 3 has "S" (subject) - "V" (verb) - "O" (object) - "." (period), while Analysis No. 2 has "S" (subject) - "V" (verb) - "6" (complement clause) - "." (period). In the second analysis, a gerund ("G") which constitutes a subject ("S") by itself is nested within a complement clause ("6") together with a verb ("V"), forming a basic syntactic pattern of "S" (subject) - "V" (verb) as the third order nests.

The diagramming routine makes some assumptions as to the determination of the dependencies of certain structures upon higher-

level structures. The validity of the assumptions has not yet been examined in detail. In some cases, the diagramming routine gives less detailed information than the prediction pool histories shown in the column "PREDICTION". The concepts of basic syntactic roles and of their dependencies represented in these diagrams are also still experimental, and a different diagram can be obtained for a different concept of how sentence structures should be represented.

5. Program

The analysis program for an IBM 7090 was written to follow only one path at a time so that all data transfers and table references required in the course of analysis might be effected entirely within core memory (32,000 words).

A path is determined in part by the choice of a single homograph S_{β_k} for each word position k , $k = 1, 2, \dots, n$, where n is the number of words in a sentence. If the k th position has a_k homographs

$$S_{\beta_k}, \beta_k = 1, 2, \dots, a_k,$$

then the total number of distinct selections is

$$N = \prod_{k=1}^n a_k.$$

These N selections are effectively enumerated by means of a variable radix representation in which the k th digit β_k is initially set to 1 for all k ; then β_n is incremented by unity until $\beta_n = a_n + 1$, following

which β_n is reset to 1 and β_{n-1} is incremented by a unit carry, and so on in the usual way until

$$\beta_k = \alpha_k \text{ for all } k.$$

Let p_k be a subpool in the prediction pool following the analysis of the k th word, and P_{ik} the topmost prediction in p_k . The number of paths from word k to the homograph $S_{\beta_{k+1}}$ due to p_k is then equal to the number γ_k of subrules

$$[(P_{ik}, S_{\beta_{k+1}}), g_{\ell_k}(P_{ik}, S_{\beta_{k+1}})], \quad \ell_k = 1, \dots, \gamma_k.$$

A single path from k to $k+1$ is thus determined by fixing β_{k+1} and ℓ_k . When

$$g_{\ell_k}(P_{ik}, S_{\beta_{k+1}})$$

replaces P_{ik} at the top of p_k , a new subpool p_{k+1} and a corresponding $P_{i,k+1}$ are obtained, and the single path may, if possible, be extended to $k+2$.

The extension will not be possible if either $k+2 = n+1$ or

$$G(P_{i,k+1}, S_{\beta_{k+2}}) = \overline{\Phi}.$$

In the former case, a path has been found through the sentence which, if p_{k+1} is empty, corresponds to an acceptable analysis. In the latter case, the path has no continuation to and through $S_{\beta_{k+2}}$, hence β_{k+2} is incremented (see Table 7). If

$$\beta_{k+2} + 1 = \alpha_{k+2} + 1,$$

Flowchart of Analysis Program

TABLE 7

extension of the path from k to $k+1$ on to $k+2$ is ruled out completely; hence a new path from k to $k+1$, determined by λ_k+1 , is tried; β_{k+2} is reset to 1. Similarly, if $k+2 = n+1$, the path from k to $k+1$ determined by λ_k+1 is checked. In either case, when $\lambda_k+1 = \gamma_k+1$, the paths from k to $S_{\beta_{k+1}}$ have been exhausted, β_{k+1} is incremented, a new γ_k is provided, and λ_k is reset to 1. If $\beta_{k+1}+1 = \alpha_{k+1}+1$, then β_{k+1} is set to 1 and a new path from $k-1$ to k is tried, providing a new P_{ik} . The process is terminated when $\lambda_k = \gamma_k$, and $\beta_k = \alpha_k$ for all k .

Thus, branchings caused by homography (membership of a given word form in more than one syntactic word class) and by multiple functions of a given word class (more than one subrule in a grammar rule) are followed in a systematic loop-free sequence in which any given partial path is never followed more than once. The amount of core storage required in the course of analyzing a sentence is proportional to n .

6. Minimizing the Number of Paths to be Followed

It was originally feared that the number of different paths to be taken, and hence the processing time, would grow exponentially with n , making the method impractical. The programming technique of Part 5 has, however, proved to be a very effective means of discarding irrelevant paths: if no path is open to S_{β_k} because

$$G(P_{i,k-1}, S_{\beta_k}) = \bar{\Phi},$$

then at least

$$\prod_{k=1}^n a_k$$

path continuations are eliminated at one stroke.

Several other techniques have been developed that eliminate additional irrelevant paths without destroying any paths which may yield acceptable analyses.

(a) Shaper: All the predictions stored in a subpool at any stage of the analysis must be fulfilled eventually if the subpool is to be empty after a homograph of the final word has been processed. Hence, if the sum over all predictions in a subpool of the minimum number of words necessary to fulfill each prediction ever becomes greater than the number of words remaining to be processed, the subpool can never be properly emptied. The corresponding path can therefore be abandoned at once. For example, although PRN at the beginning of a sentence potentially opens the nine paths corresponding to the nine subrules in Table 2, only the four paths generated by g_1 , g_2 , g_3 , and g_6 need be followed for "THEY ARE FLYING PLANES.". This technique, embodied in the present program, is most effective as the analysis approaches the end of a sentence.*

(b) Nesting: The number of predictions in a subpool at any stage of the analysis of a sentence shows the number of nested structures⁵

*The use of a shaper was proposed by William Bossert and David Isenberg.

which are to follow to complete the sentence. It is expected that there will be a finite and small maximum number of nested structures within well-formed sentences found in natural habitats. This maximum number must be derived empirically. At any stage of the analysis, a path with a subpool containing more predictions than the maximum number can be discarded on the assumption that it predicts a depth of nesting rarely if ever reached by well-formed sentences.

(c) Dropping of Predictions: In order to identify the syntactic role played by a connective and to associate properly the second component of a compound structure to the first one, it is necessary to follow two branches in the analysis procedure when a structure which can be compound is opened by a single component. One branch is for the case in which the component entirely satisfies the structure with no other component following. The other branch is for the case in which the second component of the structure is expected. This is why (PREDICATE, BE1), for example, has two subrules in the grammar table (Table 3): g_1 for the simple structure, g_2 for the compound one. For the processing of the homographs for the next word, the same two sets of argument pairs are formed with the prediction of "ADVERB AFTER BE1" of g_1 and with that of g_2 , causing a repetition of the table lookup with the same argument pairs. Usually the two branches thus opened are followed in parallel until one or the other is terminated by the absence or presence of a connective in the sentence. Quite often such parallel paths which are opened near the beginning of a sentence are retained until close to the end of the sentence. The

effect of these parallel paths is quite serious because the number of paths to be followed increases exponentially with the number of branching points for simple and compound structures.

A technique has been devised in order to avoid following parallel paths which differ only in the predictions of a connective and a second member of a compound structure. The rule for (PREDICATE, BEL) now consists of a single subrule which has an ordered set of predictions of

PREDICATE	COMMA,AND,OR (DROP)	ADVERB AFTER BEL.

The prediction of "COMMA,AND,OR (DROP)" is droppable together with the immediately following prediction of "PREDICATE". A single path is followed, as far as possible, for the compound structure. If there is actually a connective in a succeeding word position of the sentence, and if the prediction of "COMMA,AND,OR (DROP)" happens to be the topmost prediction in the prediction pool, the connective can satisfy the prediction as one possibility. On the other hand, when all the homographs for the k th word have been tested and before k_{k-1} is incremented by unity to deal with the next subrule, the test is made as to whether the topmost prediction is a droppable one or not. If it is not droppable, the normal analysis procedure is followed as was explained in Part 5. If it is a droppable one, the pair of predictions is dropped as if a simple structure had been predicted from the beginning, and the third prediction from the top becomes the new topmost prediction. In this way not only the duplicate table lookup can be avoided, but also the number of paths to be followed can be greatly reduced. A pair of droppable predictions in the prediction pool does not enter the tests for the shaper and nesting.

The tests for the shaper and nesting are performed before forming a new prediction pool by adding a new set of predictions given by the grammar subrule. If both of the tests are passed, "Form p_k " in Table 7 is the next path to be followed. If either one of the tests fails, " $\beta_k + 1 \rightarrow \beta_k$ " is followed. The test for a pair of droppable predictions against the topmost prediction in the prediction subpool is performed immediately following " $1 \rightarrow \beta_k$ " and preceding " $k-1 \rightarrow k$ " in Table 7. If the topmost prediction is the first of a pair of droppable predictions, the third prediction from the top is used to form the argument pair; the next path to be followed is " $(P_{ik-1}, S_{\beta_k}) = \Phi?$ ". Otherwise, " $k-1 \rightarrow k$ " is followed.

Table 8* illustrates the processing of the sample sentence "THEY ARE FLYING PLANES." by the system. The words of the sentence are shown at the top of the table, numbered in ascending order. Immediately below each word is the set of syntactic word classes assigned by the dictionary.

The analysis process is illustrated below the long horizontal line. Within the vertical boxes below each word, the word's set of syntactic classes are shown, repeated as many times as the number of prediction subpools active at the point of the processing of the word in question. After the k th rectangle, the set of prediction subpools which are to be used for the processing of the $(k+1)$ st word appears. A subpool which is followed by a line leading to a circle is a subpool

*This graphic representation of the analysis procedure is due to Paul Jones.

History of the Analysis of "THEY ARE FLYING PLANES."

TABLE 8

which is discarded due to the shaper test. A subpool which is followed by a line leading to a cross through a word class code is a subpool which is discarded due to the absence of the argument for the topmost prediction and the word class in the grammar table. A pair of predictions bound by a bracket are the droppable predictions. Whenever such droppable predictions appear on top of a prediction subpool, an additional line is initiated from the third prediction from the top leading to a homograph for the next word. The three paths taken for the three legitimate analyses of this sentence are represented by bold lines connecting prediction subpools and word class codes printed also in bold characters.

7. Running Time

The analysis of "THEY ARE FLYING PLANES." on an IBM 7090 took less than one second. The analysis of "IT HAS ALREADY BEEN MENTIONED THAT A RESPONSE MAY BE LEARNED BY THE MACHINE IF ENCOURAGED BY THE EXPERIMENTER." took approximately 0.5 minutes. 1.2 minutes were needed for the analysis of the 23-word sentence: "THE U.S. HAS REACHED A MOMENTOUS POINT OF DECISION IN A PROJECT THAT ONLY A FEW YEARS AGO WOULD HAVE SEEMED IMPROBABLE.", for which four legitimate analyses were obtained by the present system.

The time necessary for the analysis of a sentence is not directly proportional to the length of the sentence, since it strongly depends on the nature of the sequence of homograph sets that are assigned to the words in the sentence.

Various more powerful and efficient programming techniques for the analyser are now being implemented. It is expected that a considerable reduction of the processing time over that required by the present experimental program will be obtained in the near future.

8. Conclusion

A program for multiple-path syntactic analysis of English has been written for both the Univac I and the IBM 7090 and tested on a variety of sentences. Experiments so far have yielded satisfactory results, and have given hints as to what should be done toward improving the definitions of word classes and of grammar rules and toward further reducing running time.

The application of the system to the analysis of Russian is now being tested also on an IBM 7090, and it is expected that the basic principles of the method offer a convenient framework for the development of more powerful syntactic analyzers for both English and Russian. Since arbitrary sets of homographs can be assigned to one or more word positions, the system is also an experimental tool for the study of distributional and generative grammars.

Acknowledgment

The authors are indebted to Rodney Thorpe, David Isenberg, William Bossert, Julia Walkling, Margaret Weiler and Barbara Huberman for their programming of the current multiple-path English syntactic analyzer on the IBM 7090.

II. THE CURRENT GRAMMAR FOR THE MULTIPLE-PATH ENGLISH ANALYZER

Susumu Kuno

1. Introduction

→ The current grammar for the multiple-path syntactic analyzer is described and listed in full. Brief explanations of the format of the grammar and of the various symbols used in conjunction with it are given in the succeeding section, in order to help readers to understand the grammar. The full details of the system which utilizes this grammar and an evaluation of its performance to date are to be given in the forthcoming Mathematical Linguistics and Automatic Translation, Rpt. No. NSF-9.

The English Grammar No. 1, which was compiled for the first experiment on Univac I in the summer of 1961, included some 1,700 subrules, with 56 distinct predictions and 105 distinct word classes. The English Grammar No. 6, which is the current version, consists of approximately 2,100 subrules, with 82 distinct predictions and 133 distinct word classes.

Compilation of the first grammar was begun by devising a set of rules pertaining to the "SENTENCE" prediction and the syntactic word classes provisionally recognized on the basis of parts of speech which are widely accepted in English. All the syntactic word classes that can appear at the beginning of a sentence were studied. Structures which are expected to follow such word classes gave rise to newly recognized predictions. A syntactic word class found to generate a set of predictions, some of which were valid for some members of the set but not for others,

was partitioned into two or more new syntactic word classes. After the "SENTENCE" prediction was exhaustively combined with all the word classes, a list of predictions so far recognized was obtained together with a list of syntactic word classes so far needed. With each such prediction, all the word classes were combined and the sets of expected structures were studied. Some combinations needed predictions which had not been included in the prediction list; some such new predictions needed word classes which had not been included in the word class list. The first grammar was ready when all the allowable combinations of predictions and syntactic word classes were exhaustively formulated.

The grammar was then expanded on the basis of a series of experimental analyses of English test sentences. In the earlier stage of experimentation the expansion was mainly due to a desire to enlarge the scope of the grammatical structures recognizable by the system, or due to attempts to refine the quality of analysis. In the later stage expansion arose mainly from attempts to delete semantically unacceptable analyses out of sets of multiple analyses of test sentences.

At the beginning, the ratio of expansion between successive versions was extremely acute, sometimes almost doubling the size of the grammar. Later, the grammar was greatly condensed through the use of techniques for extracting features common to several similar word classes (see Part 5) and for dropping pairs of predictions which may or may not be fulfilled in the course of analysis (see Part 4).*

* The 2,100 subrules in the current grammar correspond to some 3,400 subrules which would be needed but for these two techniques.

At present, it seems that the size of the grammar has more or less stabilized, at least so far as the demands of syntactic analysis are concerned. The probable effect of future attempts to reduce ambiguity through the introduction of features currently viewed as "semantic" cannot yet be accurately assumed.

2. Scope of the Grammar

The current grammar was written in an attempt to account for all the structures which occur or may occur in scientific papers; no attempt was made to restrict the scope of the grammar to a small number of structures which appear in any particular small-test corpus.

Whether or not a given structure should be regarded as well-formed is sometimes open to discussion. Since the criterion of grammaticalness differs from person to person, from category to category of corpora (e.g., literary, scientific, and colloquial corpora), and since it may also legitimately depend on the application to be made of analyzed texts, no clear-cut line can be drawn between well-formed and ill-formed structures. A given structure was included in the grammar when it was thought that the structure might appear in scientific papers. The grammar is so arranged that addition or deletion of recognizable structures raises no major difficulties.

A list of some of the structures which have been provisionally excluded from the grammar as ill-formed follows. These structures were excluded from the grammar not because it would be difficult to recognize them as well-formed, but rather because their inclusion at this time

would cause an excessive increase in the number of semantically unacceptable analyses for common sentence types which do not have such structures among their normal semantically acceptable analyses. Many of these structures are also on the borderline of grammaticalness.

- (1) Certain type of word order inversions:*

Example: "Where it might stop, nobody knew."

- (2) Compound structures whose members are not of the same nature:

Examples: "The suggestion that words are symbols for actions, qualities, and relationships is naive, a gross simplification."

"In time the satellite's surface begins to wrinkle, making reflected signals fade and harder to hear."

"There was little doubt that A.T.&T., with assets of \$22.6 billion, and able to make yearly capital outlays running around \$2.5 billion, could take on the job."

"A.T.&T.'s proposal drew immediate fire from companies not now in the international-communication swim but engaged in manufacturing space equipment."

- (3) Initial "and":

Examples: "And so, Kennedy called Eleanor Roosevelt and Walter Reuther..."

"And no administration policy had yet been set."

* There are many types of word-order inversions of more normal nature recognizable in the current grammar, such as: "In each chapter is included a bibliography." [(SE, PRE)-3,4,5]; "Crucial is the question..." (SE, ADJ)-1]; "Attached to the text is a bibliography." (SE, PT1)-1]; "There comes a train." (SE, AV4)-0]; "We have available these devices." (VX, VT3)-2].

(4) The use of one or two commas for a two-member compound noun phrase:

Examples: "Diplomatic policies of the nation as determined by the cabinet, and the principles of the UN may not always accord well with each other."

"My father, and my mother also, are against my proposal."

"No such initiative has yet come to light in Russia, which, in fact, has shown little interest so far, and no recorded firsts, in space experiments pointed toward a communication system."

There are also structures which are widely accepted as well-formed but which have not been included in the current grammar. The typical examples of such structures are elliptical ones such as "Mary loves John, and John (*) Mary." and "The transformation of ambiguous (*) to unambiguous English sentences is difficult.". These structures have been excluded from the current grammar because it was feared, again, that the inclusion would cause too many semantically unacceptable analyses for sentences which do not contain such elliptical structures and because we have not yet conceived of a method for automatically identifying elliptical structures with reference to parallel structures which precede or succeed them.

The following is a sample of other miscellaneous structures that the current grammar cannot recognize. The scope of the grammar will be enlarged in the near future so that the structures below can be recognized as well-formed.

- (1) A pair of quotation marks:

Examples: "The third problem, linked to delay, is "echo"."

"Get your teams ready," said Lawson."

- (2) A parenthetical expression which is not parallel with any structure that precedes it, or which cannot be accepted as a floating structure:

Examples: "Technologically speaking, there are three basic contending schemes (see diagrams, pages 158 and 159), with a number of variations, for orbiting a communication satellite system."

"The first big one was Score, an improvised communication package of the delayed-repeater type (it stores voice messages on tape...), put up by a joint military team as part of an Atlas rocket in December, 1958."

- (3) A certain type of word-order inversion:

Examples: "Little did he know about it."

"Not only did he work hard, but also he worked efficiently."

The word-order inversion of this type is caused by a small number of adverbs such as "little", "not only", "hardly", and "no sooner". The recognition of the inversion will require a new word class for such adverbs. Another type of word-order inversion, caused by an adjective, a past participle, or a prepositional phrase at the beginning of a main sentence, can be recognized by the current grammar (see the footnote on p. II-4).

(4) Certain types of discontinuous structures:

Examples: "The word got out that President Kennedy admitted that he had indeed given sanction to the deal."

"He let it be known that he would be ready to answer any question."

"A better man was found than we had expected."

There are many types of discontinuous structures which are recognizable in the current grammar. Typical of these structures are:

"It is true that you have won." [temporary subject "it" and a real subject; see (SE, TIT)]

"Better men were found than we had expected." (an adjective in the comparative degree and "than"-clause when the adjective initiates the subject phrase)

"He is as good a scholar as one would expect to find in this world." [(N3, AV3)]

The complexity of recognizing the discontinuous structures exemplified in the first three examples in (4) above in contrast to those recognizable in the current grammar is due to the necessity of opening the branches for the former at a very early stage of analysis. For example, for the recognition of "Better men were found than we had expected.", the prediction of the discontinuous "than"-clause ("88") is generated when "better" is processed: the subrule (SE, AAB)-1 generates the new predictions

FD	88	VZ	4Z

. For the recognition of "A better man was found than we had expected.", it is too late to make the same prediction

when "better" is processed because at this point the prediction pool contains the predictions

PD	VZ

 and the positioning of the "88" prediction below the topmost prediction would violate the principle of pushdown store and would also involve complicated tests as to where in the prediction pool it should be stored. This requires a new subrule for (SE, ART) which would generate new predictions

PD	88	VZ	4Z	COMPARATIVE ADJ

 . Another solution to this problem would be to allow the acceptance of a "than"-clause by the predicate prediction. This solution would be less profitable than the former one because the test for the well-formedness of input sentences would be greatly weakened and because the dependency of a "than"-clause on the preceding adjective in the comparative degree would not be determined.

(5) Certain types of nominal adverbial phrases or clauses:

Examples: "The problems still to be solved are as complex, one within another, as a set of Chinese boxes."

"At these heights the satellites, randomly following one another, would orbit the earth about once every two to three hours."

"What is better, he is a good scholar."

"What I liked best of all, he remembered my name."

The recognition of the first and second examples involves a new word class for "one". The third and fourth examples can be made recognizable simply by adding rules in the grammar which would cover the use of RL3 and RL4 for introducing an adverbial clause.

(6) Certain types of inserted clauses which are not introduced by any conjunction:

Examples: "The delay adds up to six-tenths-of-a-second lag in each transmission, enough, say some authorities, to be a serious annoyance in two-way telephone conversations."

"This is what I think is important."

The current grammar recognizes an inserted clause when it is introduced by a conjunction. The first example in (6) above would be accepted if "say some authorities" were replaced by "as some authorities say".

The current grammar recognizes an adjective clause with no introducing relative word. Examples: "The man I saw yesterday is Mr. A."; "This is the boy I call stupid."

Recognition of the inserted clauses in (6) can be enabled by setting up a new prediction for reporting verbs (VT6 and VT7) and by providing such subrules as (DA, VT6) = NOUN SUBJECT (for ", say some authorities,") and (NC, IPN) = PREDICATE REPORTING VERB NOUN SUBJECT (for "what I think is important").

(7) A gerund, with its dependent structure, modified by a possessive pronoun:

Example: "I object to your postponing the decision."

(8) Others:

Examples: "Were it not for your help, I should fail."
(conditional clause represented by the word-order inversion)

"How beautiful a flower this is!" (exclamatory sentence involving the word-order inversion)

"He works harder than I am able to." (omission of a basic form of a verb after "to" for infinitive)

"The secret out, he admitted that he had indeed given sanction to the deal." (so-called nominative absolute construction with a participle missing)

"It was the temperature the closest to absolute zero." (post-positional attributive preceded by "the"*)

"The satellites would orbit the earth about once every two to three hours." (attributive prepositional phrase in front of a noun**)

"To begin with, he is dead."; "This is unheard of." (the object of "with" and "of" is missing***)

"The number of telephones had more than tripled." ("more than" as a unit adverbial phrase****)

-
- * The recognition of the structure will require a new word class for adjectives in the superlative degree.
 - ** The recognition of the structure will require a new word class for the preposition "to", which seems to be the only preposition that can be used for introducing an attributive phrase in front of a noun.
 - *** The current grammar expects an object after the processing of "with" and "of" in the two examples. In order to recognize these and other idiomatic expressions, it is necessary to embody, in the current dictionary lookup routine, a mechanism for detecting a series of word forms which are to be regarded as a unit word form in the analysis routine. To avoid excessive ad hoc use of "idioms", the introduction of such a mechanism into the system, although quite simple to achieve, has been deliberately deferred.
 - **** The structure can be made recognizable by adding rules in the grammar pertaining to "more" as AV6 or by regarding "more than" as an "idiom" in the dictionary lookup routine.

3. Format of the Grammar

The current English grammar is written mnemonically so as to make it intelligible to those people who are not familiar with the symbolic expressions used in the system.* For the use of the computer, the mnemonic grammar is compressed into a symbolic grammar whose unit segment (usually corresponding to a single subrule) consists of five IBM 7090 machine words.

Each subrule is initiated in the grammar table by an argument pair and a subrule number in the column headed "ARGUMENT PAIR". Two characters preceding a comma stand for a prediction, three characters succeeding a comma stand for a syntactic word class, and a character following a hyphen stand for a subrule number. The subrule number (0,1,2,...,9,A,B,...,Z) pertains to the order of subrules within a rule.

Each subrule has a pair of characters in the second column headed "SR". The characters represent the syntactic role played by the word class of the argument pair in the particular subrule. These characters, called the syntactic role code, will be explained in Part 7.

Each subrule has a set of five bits in the column headed "AGREE TEST". These bits, called agreement test indicator, are used for the control of agreement tests in the course of analysis. They will be explained in Part 6.

* The author is greatly indebted to Mrs. Julia Walkling for her original design of the format of the mnemonic grammar; to Miss Maxine Nealley and Mrs. Ethel Taylor for their help in converting the original symbolic grammar to the mnemonic one; and to Miss Maxine Nealley and Miss Verna Massell for their help in updating the grammar. The author is also greatly indebted to Miss Barbara Huberman for her programming of the automatic editing routine of the grammar for this progress report, and to Mr. Carleton DeTar and Miss Verna Massell for their programming of the format checking.

The column "NEW PREDS" displays a set of newly generated predictions for each subrule. The format of this column is that of a pushdown store: the prediction which appears on top for each subrule is the first to be tested. Some subrules give no new predictions; hence there are no predictions in the column "NEW PREDS". Each expression in "NEW PREDS" consists of two characters (to the left of the hyphen) which refer to one of the currently recognized eighty-two predictions, and of one character (to the right of the hyphen) which is called a prediction subclassification index. The prediction subclassification index is used for specifying the subclassification of the prediction for each of its occurrences. When the character to the right of a hyphen is a space, it means that the prediction has no subclassification currently recognized. The predictions and their subclassification indices will be discussed in some detail in Part 4.

The column headed "MNEMONIC DESCRIPTIONS OF PREDICTIONS" gives the mnemonic expression for the prediction listed on the same line in column "ARGUMENT PAIR" or "NEW PREDS". For example, the subrule (SE, PRN)-O shows that "SE" is the "SENTENCE" prediction, "VX" the "PREDICATE" prediction, and "PD" the "PERIOD" prediction. The mnemonic description of the word class symbol in the argument pair of a subrule is not given in each subrule, but in the fold-out attached at the end of this report.

The column "STRUCT, SHIFT CD" gives information used in obtaining the sentence structure diagram of a given analysis. The series of symbols (called structure symbols) in this column which appear on the same line

as the argument pair is called a substructure code. The substructure code of a subrule represents the dependency of the structure of the word class of the argument pair upon the higher-level structure of the prediction of the same argument pair. Each newly generated prediction in a subrule has a number called the "shifting code" which is either 0, 1, 2, 3, or Y. Part 8 gives a brief explanation of the information stored in this column.

The column "ENGLISH EXAMPLES" shows one way, one of the simplest ways in most cases, of fulfilling each newly generated prediction. For example, the subrule (SE, PRN)-0 shows that the "SE" prediction has been fulfilled by "THEY" as PRN. The new prediction of "VX" can be fulfilled by "GO" as VII, and that of "PD" by a period ".". The reader may find out what kind of structures, other than "GO" as VII, can fulfill "VX" by referring to the rules in the grammar pertaining to "VX".

Some subrules have an "introductory phrase" and/or "closing phrase". The former is marked by three asterisks on its left. The introductory phrase of a subrule is such that the prediction of the argument pair will become the topmost prediction in the prediction pool after the processing of the word classes for the introductory phrase, and therefore provides an appropriate illustrative context for the example given with the subrule. Paired introductory and closing phrases indicate that after the processing of the word classes for the introductory phrase, the prediction of the argument pair will be the topmost prediction in the pool and the prediction for the structure represented by the closing phrase will be the second one from the top.

Except for subrules for "SE" prediction, the introductory phrase which appears with the first subrule on each page of the grammar should be carried over to the succeeding subrules until a new introductory phrase is again introduced.

Dotted horizontal lines in the grammar table mark the boundaries of grammar rules.

4. Predictions

Eighty-two predictions which appear on the current English grammar are shown in Table 1, together with their corresponding mnemonic expressions. Some predictions are found in the column "NEW PREDs" but are not included explicitly in the list. They are those which carry information as to their grammatical number or conditional mood. Subject predictions (1X, 4X, 7X, MX) and predicate predictions (CX, EX, FX, HX, IX, TX, UX, VX, WX) change their forms due to such information: the second character "X" of these predictions is replaced by "S", "P", "C", "Y", or "Z" as required. "S" stands for the singular number, "P" for plural, "C" for singular-plural, and "Y" for conditional mood. "Z" is the number code assigned to the predictions of a subject and a predicate when the grammatical number of the two predictions is still unknown. As soon as the number is determined for the prediction which is first satisfied, the same number is to be carried over to the other prediction.

The prediction of "ZM", "ZC", or "ZD" and the prediction immediately below it in a grammar subrule form a pair of droppable predictions corresponding to a compound structure which may or may not be fulfilled by the

List of Predictions

TABLE 1

succeeding words in a sentence. When one of "ZM", "ZC", or "ZD" becomes the topmost prediction in the prediction pool, it is changed to "CM", "XC", or "XD", respectively, before an argument pair is formed with the next homograph to be processed.

If the argument pair is found in the grammar, a set of new predictions is added to the old prediction pool, and the prediction which was stored below "ZM", "ZC", or "ZD" behaves as a normal prediction which has to be fulfilled by one or more succeeding words in the sentence.

On the other hand, if the argument pair is not found in the grammar table, and if all the homographs of the next word form have been exhaustively processed, a test is made as to whether the (topmost) prediction used for the current argument pair is a droppable prediction or not. If it is not, the normal process of going back to the previous branching point of the immediately preceding word form is performed. If it is a droppable prediction, that is, one of "ZM", "ZC", or "ZD", it is dropped from the prediction pool together with the prediction immediately below it, because the possibility is now precluded of having the compound structure prediction fulfilled by the succeeding words in the sentence.

The prediction of "DM-Y" in the subrule (XC, CMA)-1 is for the processing of "listing" structures whose members can be endlessly extended to the right of the word position for the prediction of "XC", as in "A, B, C, ..., and Z". When the set of new predictions

XC	DM

 given by the subrule (XC, CMA)-1 is placed on top of the prediction pool, "DM", called a dummy prediction, is replaced by the prediction which is stored immediately below the fulfilled prediction "XC". If the prediction pool

contained

NQ	XC

 before the processing of "XC" against a comma, the "DM" prediction will be replaced by "NQ", so that the prediction pool will now contain

NQ	XC	NQ

 . Assuming the next topmost prediction "NQ" is fulfilled by a noun, the prediction pool will contain the same set of predictions

NQ	XC

 as it did before the processing of the preceding comma. In this way, a "listing" structure with any number of components can be processed.

Table 2 shows the set of subclassification indices currently associated with certain predictions. To determine the subclassification indices associated with a given prediction, look it up in the leftmost column of Table 3; if it is not found in the table, it has no subclassification; if it is found, convert it to the prediction given in the column for "GENERALIZED PREDICTION". The new prediction thus obtained can be used as a key to Table 2.

For example, the grammar subrule (SE, IPO)-0 generates six new predictions:

QU-	BW-A	LZ-A	UZ-B	IO-	ZC-B

 . "IO" and "QU" are not found in Table 3; therefore these two predictions have no subclassification. "UZ" and "LZ" are the predicate and subject predictions with the agreement code of "Z". Therefore, they are first converted to "UX" and "LX", respectively. Then, "ZC", "UX", "LX", and "BW" are converted to "CN", "VX", "LX", and "IF" through Table 3. These four new predictions, together with their original subclassification indices, are used as the keys for Table 2 which gives the mnemonic interpretations for the original predictions as shown in Table 4.

Prediction and Index	Mnemonic Interpretation	Comments
IX-A	SUBJECT OF PREDICATE VERB	subject of participial construction to be changed to A or B in the course of analysis

TABLE 2 (continued)

The index "X" which all predictions in Table 2 can have is an index which is used in the grammar table, but which is never found in the prediction pool at any stage of analysis. Before a prediction with index "X" is transferred to the prediction pool for the analysis of the next word, "X" is changed to whatever index was assigned to the prediction used to form the argument pair for the grammar table lookup. For example, when the prediction "BW" of Table 4 is fulfilled by IT1 through the subrule (BW, IT1)-0, a set of new predictions

BW-X	ZM-I

 is obtained. Before these two predictions are transferred to the prediction pool, the subclassification index "X" of the new "BW" is changed to "A" since this is the index of the prediction "BW" in the argument pair. Thus, the new prediction "BW" has the indication that it is the prediction of a basic form of a verb for a "predicate verb", and not for a "subject infinitive", "adverbial infinitive," and so forth.

A	Z → P
B	Z → Q
C	Z → R
D	Z → S
E	Z → T

Conversion of "Z" Index

TABLE 5

The index "Z" for "IF" and "PA" behaves like "X", but instead of carrying over directly to a new prediction the index of the fulfilled prediction, it performs the conversion described in Table 5. For example, if the index for the fulfilled prediction is "A", then "Z" is converted to "P".

5. Syntactic Word Classes

The list of 133 syntactic word classes currently recognized is given in the fold-out attached at the end of this report.

A manual of syntactic word classes is given in Appendix A.

6. Agreement Test Indicator

Each word form in the dictionary has one or more word class codes assigned to it. Each word class code, which consists of three characters, is followed by a fourth character used for the specification of the grammatical number of the corresponding word form. There are five kinds of number codes presently recognized. "S" stands for singular, "P" for plural, "C" for singular-plural, "Y" for conditional (only for BE1, BE2, and BE3 for "be"), and " " (a space) for a syntactic word class which would never be subjected to the number agreement test.

There are five grammatical number codes presently recognized for subject predictions (1X, 4X, 7X, MX) and predicate predictions (CX, EX, FX, HX, IX, TX, UX, VX, WX): "S" for singular, "P" for plural, "C" for singular-plural, "Y" for conditional mood. "Z" is the number code assigned to a pair of subject and predicate predictions when the grammatical number of the two predictions is still unknown. As soon as the number is known for the prediction which is first satisfied, the same number is to be carried over to the other prediction.

Each subrule in the grammar table has an agreement test indicator in the column "AGREE TEST". The agreement test indicator consists of five bits (a_1, a_2, a_3, a_4, a_5). a_1 is for the agreement test between the number of the prediction and the number of the syntactic word class of the argument pair. a_2 and a_3 are for the number code specifications of the newly generated predictions, while a_4 and a_5 are for the number specification of the prediction with the number code "Z" in the old pool when the fulfilled prediction itself had the number code "Z".

a_1 : The word class in question will be rejected if $a_1 = 1$ and if one of the following conditions is fulfilled:

- (1) "S" is the number code of the prediction, and "P" or "Y" is the number code of the word class;
- (2) "P" is the number code of the prediction, and "S" or "Y" is the number code of the word class;
- (3) "C" is the number code of the prediction, and "Y" is the number code of the word class.

The subrule (BV, III)-0, for example, has $a_1 = 0$ because there is no distinction of number for the prediction of an infinite verb, and there is no number code assigned to an infinite form of a verb. The subrule (VX, VII)-0, on the other hand, has $a_1 = 1$ because "VX" is the prediction of a predicate whose grammatical number has been determined by its preceding subject: the number of VII should match the number of the fulfilled prediction "VX".

a_2 : a_2 indicates whether or not the number code specification of new predictions is to be performed using the number code of the syntactic word class in question.

If $a_2 = 0$, no specification is performed.

If $a_2 = 1$, "X" of "1X, 4X, 7X, MX, CX, EX, FX, HX, IX, TX, UX, VX, WX" in the set of new predictions is changed to the number code of the syntactic word class.

The grammar subrule (SE, PRN)-0, for example, has $a_2 = 1$ because the grammatical number of the PRN should be carried over to the grammatical number of the new prediction "VX". If the PRN has the number code "S" for singular, "VX" is changed to "VS".

a_3 : a_3 indicates whether or not the number code specification is to be performed utilizing the number code of the fulfilled prediction.

If $a_3 = 0$, no specification is performed.

If $a_3 = 1$, "X" of "1X, 4X, 7X, MX, CX, EX, FX, HX, IX, TX, UX, VX, WX" in the set of new predictions is changed to the number code of the fulfilled prediction.

a_2 and a_3 can never be 1 simultaneously.

The subrule (SE, PRN)-0, for example, has $a_3 = 0$ because the grammatical number of the new prediction "VX" cannot be determined on the basis of the fulfilled prediction "SE" which has no number specification for itself. The

subrule (MX, AAA)-0, on the other hand, has $a_3 = 1$ because the new prediction "4X" should have the same grammatical number as was assigned to the fulfilled prediction "MX". After the processing of "There is" of "There is a man.", the prediction pool may contain the prediction of singular noun subject ("MS") as the topmost prediction; for the processing of the next word form "a", the subrule (MX, AAA)-0 will be used. Because $a_3 = 1$ in this subrule, "X" of the new prediction "4X" is changed to "S" of the fulfilled prediction "MS", so that "4S" is stored on the top of the prediction pool.

a_4 and a_5 : These two bits are referred to only when the fulfilled prediction had the number code "Z". They indicate whether the number specification of a prediction in the prediction pool which has "Z" as the number code should be performed on the basis of the number code of the word class in question or whether "Z" should be changed to "C".

If $a_4 = a_5 = 0$, no specification is made.

If $a_4 = 1$, "Z" of the first "1Z, 4Z, 7Z, 9Z, CZ, EZ, FZ, HZ, IZ, TZ, UZ, VZ, WZ" in the prediction pool is to be changed to the number code of the word class in question.

If $a_5 = 1$, "Z" of the first such prediction is to be changed to "C".

a_4 and a_5 cannot be 1 simultaneously.

For example, after the processing of "the" in "The man came.", the prediction pool may contain the predictions of

PD	VZ	4Z

 due to the grammar subrule (SE, AAA)-0. Next, "4Z" is generalized and forms the argument pair together with MMM for "man". The subrule (4X, MMM)-0 has the agreement test indicator $a_4 = 1$. "VZ" in the old prediction pool is changed to "VS" because of the number code "S" assigned to MMM for "man". After the processing of "a" in "A watch and chain is out of date." the prediction pool may contain the predictions of

PD	VZ	4Z

. The subrule to be used for the processing of the next word form is (4X, MMM)-3 which generates the prediction of the second member of the noun subject. The grammatical number of the word class MMM for "watch" cannot determine the grammatical number of the predicate verb in such a case: the number of the predicate verb may be singular or plural depending on the nature of a compound subject.* This is why the grammatical number of the predicate is determined as being singular-plural ("C"). Due to $a_5 = 1$ of the subrule, "VZ" in the prediction pool is changed to "VC".

* Compare the following examples: "A teacher and a student are here."; "A teacher or a student is here."; "A publisher and an editor are needed."; "A publisher and editor is needed."

7. Syntactic Role Code

Mnemonic interpretations of the two-character syntactic role codes in column "SR" of the grammar are given in Table 6.

The mnemonic interpretation of the syntactic role played by a word class of a subrule which has "YY" or "GY" as the syntactic role code can be obtained with reference to the subclassification index of the fulfilled prediction. The fulfilled prediction is first converted to a general

List of Syntactic Role Codes

TABLE 6

prediction with the aid of Table 3, and the new prediction thus obtained, together with the subclassification index of the original prediction, is looked for in Table 2, which gives the mnemonic interpretation of the syntactic role played by the word class in question. "GY" indicates that the word class is a gerund.

8. Substructure Code and Shifting Code

Each subrule in the grammar has a substructure code and a set of shifting codes which are used in the sentence structure diagramming subroutine to obtain structure diagrams. A sentence structure diagram is assigned to each analysis of an input sentence as an aid to the interpretation of the recognized structures.

There are certain structures whose dependencies upon higher-level structures are not determined by the current analysis program. Prepositional phrases, adverbial phrases, and adverbial clauses belong to such structures which will be referred to as "floating structures". Since we do not have available at the moment any systematic technique for automatically determining whether "in the park" in "I saw a man in the park." modifies "a man" or "saw a man", we leave the prepositional phrase "in the park" floating without determining its dependency on a higher-level structure. In order to obtain a tree structure diagram, some kind of approximation has to be made: a prepositional phrase is now assumed as being dependent upon the nearest preceding higher-level structure which can be modified by it. Thus, the current diagramming routine produces a diagram in which "in the park" is connected to "a man", not to "saw a

man". The validity of such assumptions has not yet been carefully examined. The current diagramming routine also assumes that the basic structures such as "subject" ("S"), "verb" ("V"), "object" ("O"), "complement" ("C"), "period" (".") occur on the same level. This method is in contrast to the common method of placing the verb on topmost level, with other basic structures dependent on it. The concepts of basic syntactic structures and their dependencies on each other represented in our diagrams are still experimental, and a different diagram can be obtained for a different concept of how sentence structures should be represented. More detailed explanations about the principles adopted for dependency representations will be given in "Mathematical Linguistics and Automatic Translation," Rpt. NSF-9, the Computation Laboratory of Harvard University.

The substructure code attached to each subrule in the grammar consists of one or more structure symbols.

Each structure symbol stands for a syntactic structure as shown in Table 7. A substructure code represents the dependency of the structure of the word class in question upon the higher-level structure of the prediction in question. For example, (SE, PRN)-O has the substructure code of "1S" because a PRN in this subrule plays a role of a subject ("S") of a declarative sentence ("1"). (SE, AAA)-O has the substructure code of "1SA" because an adjective in this subrule plays a role of an attributive ("A") of a subject ("S") of a declarative sentence ("1").

A subrule may have the substructure code which is initiated by "\$". This is a sign to call for an examination of the subclassification index

1 declarative	S subject
2 interrogative	V verb
3 imperative	O object
4 subject clause	C complement
5 object clause	D adverb
6 complement clause	P phrase
7 adjective clause	A attributive
8 adverbial clause	M participle
	G gerund
	X auxiliary verb
b copy what follows*	R phrase or clause introducer (preposition or conjunction)
* copy what precedes	E adverbial noun phrase
\$ refer to index	. period
	, comma
	+ and/ or/ but
	= question mark

List of Structure Symbols

TABLE 7

of the fulfilled prediction, just like the syntactic role code "YY" for syntactic role expressions (ref. Part 7). The fulfilled prediction is converted to a general prediction by means of Table 3; the new prediction thus obtained, together with the subclassification index of the original prediction, is looked for in Table 8, the structure symbol conversion table. Thus, "\$" in the subrule (BW, IT1)-0 will be converted to "V" for "BW-A" of Table 4. The same dollar sign will be converted to "DV" if the fulfilled prediction is "BW-M" instead of "BW-A".

* "b" stands for a space.

Substructure Code Conversion Table

TABLE 8

A subrule may have a substructure code which has a space as the first structure symbol. For example, the subrule (SE, R11)-2 has the substructure code " PM" with a space in front of "PM". The reason for having a space is that when this subrule is used for the processing of "arriving" for the participial construction, it is not still known whether the participial phrase ("PM") depends upon "1" (declarative sentence),

"2" (interrogative sentence), or "3" (imperative sentence). After the whole input sentence is processed, and the type of the sentence is known, the space in front of "PM" will be replaced by "1", "2", or "3", as the case may be.

The subrule (PD, PRD)-0 has the substructure code of "**.". The symbol "*" is replaced by "1" or "3" according to whether the preceding sentence is declarative or imperative, respectively.

A subrule may have a substructure code preceded by "-". The sign "-" shows that the word class in question has introduced an adverbial floating structure which should be connected to the nearest higher-level structure of "V, G, M, X, P, A, 1, 2, 3, 4, 5, 6, 7, or 8".

A subrule may have a substructure code preceded by "/". The sign "/" shows that the word class in question has introduced a prepositional phrase which should be connected to the nearest preceding higher-level structure other than "R, X, ,(comma), D".

Each newly generated prediction in a subrule has a number called the "shifting code". A shifting code shows how many structure symbols should be retained from the substructure code (counting from the left) when the prediction to which it is attached is fulfilled and a new substructure code corresponding to this prediction is added on the right side of the retained structure symbols. For example, the prediction of "VX" in the subrule (SE, PRN)-0 has the shifting code of "1". When the prediction is fulfilled by VII (e.g., "go"), the subrule (VX, VII)-0 gives the new substructure code "V", which is to be added to the right of the one retained structure symbol of "1S". Thus, the word form "go"

will be given the structure code of "1V", interpreted as the verb ("V") which is dependent on a declarative sentence ("1"). The shifting code of the "PD" prediction for the subrule (SE, PRN)-0 is "0", because when the prediction is fulfilled by PRD in (PD, PRD)-0, the substructure code "**." is obtained. Thus, the zero symbol is retained from the original substructure code "1S" of (SE, PRN)-0. The asterisk is replaced by "1", so that the period for the end of sentence receives the structure code of "1.", interpreted as the period (".") dependent on a declarative sentence ("1").

In a subrule which accepts a floating structure, the shifting code "Y" is assigned to a new prediction of a structure which is not dependent upon the floating structure, but upon the fulfilled prediction. "Y" indicates that the shifting code for the corresponding prediction should be the same as that of the fulfilled prediction. More details of substructure codes and shifting codes and of the way sentence structure diagrams are obtained will be explained in our forthcoming Rpt. NSF-9.

Each subrule in the grammar has a set of structure codes in the column "STRUCT, SHIFT CD". The set of such structure codes is a local diagram that will be obtained when the English examples given in the column "ENGLISH EXAMPLES" fulfill all the newly generated predictions. For example, the subrule (MX, AV8)-0 shows that "too expensive gifts" will be assigned a local diagram $\begin{bmatrix} \text{SAD} \\ \text{SA} \\ \text{S} \end{bmatrix}$ which will depend on a higher-level clause structure in an over-all sentence structure diagram. These structure codes are the expected output of the sentence structure diagramming routine. What the diagramming routine utilizes out of each

subrule is the substructure code which appears on the same line as the argument pair and a set of shifting codes for the newly generated predictions.

9. Aids for Reference to the Grammar Table

The grammar table is accompanied by two tables: one (Appendix B) is a list of the distinct argument pairs in the grammar table, sorted on the word class codes. By using this table, one can determine what kind of predictions a given word class can initiate in the current English grammar. The second table (Appendix C) gives a list of argument pairs for each prediction in order to show in what subrules a given prediction is generated.

APPENDIX A
MANUAL OF SYNTACTIC WORD CLASSES

SWC Code	Mnemonic Expression	Comments
AAA*		Common features of ADJ, ADK, ADM, ADN, ADO, and ART
AAB*		Common features of ADK and ADN
ADJ	ADJECTIVE 1	(a) ADJ is for usual adjectives which can be modified by "very", are capable of forming the comparative degree with "more" and also can be used both as pre-positional adjectives and as adjective complements. "Many, much, few, little" are excluded from this class. Examples: "This is a very <u>beautiful</u> flower."; "This flower is more <u>beautiful</u> than that one." (b) ADJ also designates adjectives in the superlative degree, excluding "most" and "least".

*In an input text, there will be no word which has the word class code of AAA. AAA is used for the set of those grammar rules which are common to ADJ, ADK, ADN, ADO, and ART. This provision is for grammar table compression. The same applies to AAB, MMM and NNN also. For example, an argument pair with the second member ADJ calls forth not only the sub-rules associated with ADJ, but also those associated with AAA.

SWC Code	Mnemonic Expression	Comments
		Examples: "This is the <u>prettiest</u> flower."; "This is the <u>best</u> thing."; "These are the goods <u>best</u> in quality but <u>worst</u> in quantity."; "<u>Youngest</u> children in a family are always spoiled." Note: "More beautiful" and "most beautiful", for example, correspond to "AV6, ADJ," and "AV1, ADJ" respectively.
ADK	ADJECTIVE 2	ADK is for adjectives in the comparative degree, excluding "more" and "less". Examples: "This is a <u>better</u> toy than that one."; "I am <u>older</u> than you are."
ADL	ADJECTIVE 3	ADL is for adjectives which cannot be used as post-positional adjectives or as adjective complements and also cannot stand at the beginning of a noun phrase. "Very", "only", "same" and possibly several others belong to this class. Examples: "This is the <u>very</u> book that I want."; "This is the <u>only</u> book that I have read." One cannot say "This book is <u>very</u>."; one can say "I like the book <u>very</u> much.", but <u>very</u> in this case modifies not "book" but "much".

SWC Code	Mnemonic Expression	Comments
ADM	ADJECTIVE 4	"Most" and "least" are the only members of this class. The characteristics of these two words are that they can be used neither as post-positional adjectives nor as adjective complements. Examples: <u>"Most"</u> people think so."; "I spent the <u>least</u> amount of money possible."; but one cannot say "People <u>most</u>..." with <u>"most"</u> modifying "people" or "This is <u>most</u>." Note: The use of "most" and "least" as nouns, as in "This is the <u>most</u> I can say." or "The <u>least</u> we can say is this.", will be covered by NO4, the syntactic word class to which these two words are assigned as well as to ADM.
ADN	ADJECTIVE 5	"More" and "less" are the only members of this class. They can form structures like "Slightly <u>more</u> (or <u>less</u>) <u>than</u> <u>twenty</u> people came.", in which "more than twenty" is a compound attributive modifying "people". This feature is not shared by members of ADM.

SWC Code	Mnemonic Expression	Comments
ADO	ADJECTIVE 6	"Many, much, few, little" are the only members of this class. They can form structures like " <u>As many as twenty</u> people came." or " <u>As much as two</u> gallons of oil is needed.", in which "as many as twenty" and "as much as two" are compound attributives. This feature is not shared by members of any other adjectival word classes. All of these four words have the coding of NOV, as well as ADO, and "much" and "little" also belong to AVI.
ADP	ADJECTIVE 7	"Such" is the only member of this class. Examples: "He is <u>such</u> a nice man."; " <u>Such</u> a nice man as he cannot be found elsewhere."
ART	PRO-ADJECTIVE	ART is for noun-phrase introducers such as definite and indefinite articles ("the, a"), demonstrative adjectives ("this, that, these, those"), possessive pronouns ("my, your, his, her, its, our, their") and pro-adjectives ("another, any, etc.") and titles ("Mr.", "Dr."). Characteristics of these words are that they cannot be preceded by another adjective, and that they cannot be followed by any one of the words of the same class. Examples: "this book" but not "beautiful <u>this</u> flower" or " <u>this</u> my book"

SWC Code	Mnemonic Expression	Comments
AUX	AUXILIARY VERB	"Will, shall, can, may, do, does, would, should, could, might, did, must, need" are the members of AUX. The features common to these words are that they are followed by a basic form of a verb, and that they cannot be followed by any one of the words of the same class. Examples: "He <u>will</u> come."; but not "He <u>will</u> <u>can</u> come." "Ought" does not belong to this class according to the present system because it cannot be followed by a basic form of a verb, but by a to-infinitive. "Ought" is provisionally coded as VT1.
AV1	ADVERB 1	AV1 is for usual adverbs other than AV2 through AV7. Example: "He sings <u>beautifully</u> ."
AV2	ADVERB 2	AV2 is for adverbs homographic with prepositions. Examples: "He came <u>in</u> ."; "I went <u>out</u> ."; "He is <u>out</u> ."
AV3	ADVERB 3	"As" and "so" are the only members of AV3, the class of adverbs of comparison. They can be used either (1) in structures such as "He is <u>as</u> good a man as can be found." or (2) in structures such as " <u>As</u> many as twenty people came."

SWC Code	Mnemonic Expression	Comments
AV4	ADVERB 4	"There" and "here" are the only members of AV4, which is the class of sentence-introducing adverbs. After "there" and "here", the word order of subject and predicate is reversed. Examples: "<u>There</u> is a book on the table." ("a book" is the subject of the predicate verb "is"); "<u>Here</u> is a book." These two words should also be coded as AV1 (ex. "There is a book <u>there</u>."; "He was <u>here</u>.").
AV5	ADVERB 5	AV5 is for adverbs which require another modifier. "very", "no", "any" and possibly several others belong to this class. Examples: "That is <u>very</u> good."; "It is <u>no</u> longer available."; "It is not available <u>any</u> longer."
AV6	ADVERB 6	Adverbs in the comparative degree belong to this class. "more, less, later, earlier, etc." They can predict the conjunction of comparison "than". "He comes here <u>more</u> often than before."; "He gets up <u>earlier</u> now than he used to do before."

SWC Code	Mnemonic Expression	Comments
AV7	ADVERB 7	AV7 is for adverbs which can stand after a form of BE1, fulfilling the prediction of DB (adverbial phrases which can follow the form of BE1). "Well", "alone" and several other examples belong to this class. Examples: "He is <u>well</u> ."; "I am <u>alone</u> ." Both "well" and "alone" should be coded as AV1 ("He did it <u>well</u> ."; "He <u>alone</u> did it.")
AV8	ADVERB 8	"Too" is the only member of AV8. Examples of the use of "too" are: "This is <u>too</u> difficult a problem for me to answer."; "This is a problem <u>too</u> difficult for me."; etc.
BE1	BE1-COMplete VI	BE1 is for finite forms of "be" as a complete intransitive* verb. "Am, is, are, was, were, be" belong to this class. Example: "They <u>are</u> in the sky." (A prepositional phrase, according to the present grammar, is considered to be

*For "complete" and "intransitive", refer to the footnote of the entry for "VII".

SWC Code	Mnemonic Expression	Comments
		adverbial, and cannot fulfill the roll of a complement or object of a verb.) Note: The word form "be" is included in this class and also in BE2 and BE3 for the analysis of sentences such as "He moved that the problem <u>be</u> up for discussion."; "Even if it <u>be</u> true, no one will believe it."
BE2	BE2-COPULA	BE2 is for finite forms of "be" as a copula which has to be followed by a noun complement or by an adjective complement. "Am, is, are, was, were, be" belong to this class. Examples: "They <u>are</u> students."; "They <u>are</u> good."
BE3	BE3-AUXILIARY	BE3 is for finite forms of "be" as an auxiliary verb for the progressive form, passive voice, or be-to form. Examples: "They <u>are</u> coming."; "They <u>are</u> seen."; "They <u>are</u> to come here."
BG1	GERUND OF BE1	"Being", the gerund form of BE1, is the only member of this class. BG1, followed by an adverbial phrase, can be used as a subject of a verb, or as an object of a verb or preposition. "He got tired of <u>being</u> at home all the time."; "<u>Being</u> in heaven is bliss."

SWC Code	Mnemonic Expression	Comments
BG2	GERUND OF BE2	"Being", the gerund form of BE2, is the only member of this class. BG2, followed by a noun complement or an adjective complement, can be used as a subject of a verb or as an object of a verb or preposition. "He stopped <u>being</u> the trouble maker at school."; "<u>Being</u> honest is pleasant."
BG3	GERUND OF BE3	"Being", the gerund form of BE3, is the only member of this class. BG3 can only be followed by a past participle, not by a present participle or to-infinitive. BG3, followed by a past participle, can be used as a subject of a verb, or as an object of a verb or preposition. Examples: "I am accustomed to <u>being</u> called a fool."; "<u>Being</u> called a fool is embarrassing."; but not "I am accustomed to <u>being</u> calling him a fool."
BI1	INFINITE BE1	BI1 has only the one member "be". This class is for the infinite form of BE1, which can be used as an imperative verb, or after AUX, or after "to" for infinitives. Examples: "<u>Be</u> in a good mood."; "He will <u>be</u> at home."; or "I like to <u>be</u> at home."

SWC Code	Mnemonic Expression	Comments
BI2	INFINITE BE2	BI2 has only the one member "be". This class is for the infinite form of BE2, which can be used as an imperative verb, or after AUX, or after "to" for infinitives. Examples: " <u>Be</u> a good boy."; "They may <u>be</u> students."; "You have to <u>be</u> kind to others."
BI3	INFINITE BE3	BI3 has only the one member "be". This class is for the infinite form of BE3, which can be used after AUX or after "to" for infinitives. Examples: "They will <u>be</u> seen."; "The case has to <u>be</u> investigated."
BF1	PAST P OF BE1	"Been", the past participle form of BE1, is the only member of this class, which is used to form the perfect tense together with a form of "have". Examples: "I have <u>been</u> at home."; "I had <u>been</u> there for three hours when he arrived."; "I will have <u>been</u> here for ten years by next month."
BP2	PAST P OF BE2	"Been", the past participle form of BE2, is the only member of this class, which is used to form the perfect tense together with a form of "have". Example: "He has <u>been</u> a good boy."

SWC Code	Mnemonic Expression	Comments
BP3	PAST P OF BE3	"Been", the past participle form of BE3, is the only member of this class, which is used to form the perfect tense together with a form of "have". Examples: "He has <u>been</u> reading a book for two hours."; "He has very often <u>been</u> punished by his teacher."
BR1	PRESENT P OF BE1	"Being", the present participle form of BE1, is the only member of this class. The form is used (1) in a progressive form together with a form of "be", and (2) in a participial phrase. Examples: "You are <u>being</u> out of your mind."; "God <u>being</u> in heaven, we must be faithful."
BR2	PRESENT P OF BE2	"Being", the present participle form of BE2, is the only member of this class. The form is used (1) in a progressive form together with a form of "be", and (2) in a participle phrase. Examples: "He is <u>being</u> a good boy."; " <u>Being</u> active, he has accomplished the reformation of the whole institute."

SWC Code	Mnemonic Expression	Comments
BR3	PRESENT P OF BE3	"Being", the present participle form of BE3, is the only member of this class. The form is used (1) in a progressive form together with a form of "be", (2) in a participial phrase, and (3) as a post-positional modifier of a noun. Examples: "The program is <u>being</u> developed now."; " <u>Being</u> encouraged by his success, he is full of ambition."; "This is the program currently <u>being</u> developed."
CCO	ADVERB CONJ 2	Non-conditional adverbial clause introducers such as "before, after, because, since, except, lest, once, that, where", etc. These conjunctions cannot introduce elliptical structures in contrast to C02. Examples: "He came <u>before</u> I left."; "It is two years <u>since</u> I came to live here."
CIF	ADVERB CONJ IF	Conditional adverbial clause introducer: "if". Example: " <u>If</u> I were a bird, I would fly to you."
CMA	COMMA	A comma, semicolon, colon, dash, and parenthesis belong to this class according to the current grammar.

SWC Code	Mnemonic Expression	Comments
C01	NOUN CON- JUNCTION	C01 is for noun clause introducing conjunctions. "That", "if" and "whether" are the only members of this class. Examples: "He says <u>that</u> it is true."; "He asked <u>if</u> (or <u>whether</u>) it was true." Note 1: The other word classes for "that" are: ART, CCO, PRZ, RL1, RL2, and RL6. "If" has the homograph of CIF, "whether" that of C02. Note 2: "What, who, whom, which, when, where" and so forth at the beginning of noun clauses are regarded as relative words, not as conjunctions.
C02	ADVERB CONJ 1	C02 is for non-conditional adverb clause introducing conjunctions "as, while, although, when, though, still, whenever, until, whether". Example: "<u>While</u> I was walking along the street, I met an old friend of mine." These conjunctions allow elliptical structures such as "I will help you <u>when</u> necessary."

SWC Code	Mnemonic Expression	Comments
C03	CONJ OF COMPAR 1	C03 has only one member, which is, "as" as the subordinate conjunction of comparison. C03 normally has to be used in correlation with a member of AV3 or ADP. Examples: "I am as old <u>as</u> you are."; "Such a difficult question <u>as</u> this will never be solved in a day." C03 can also introduce an adverbial clause which has no subject: e.g. "<u>As</u> is usual with him, he was late again."; "The answer to this question is <u>as</u> follows.".
C04	-EVER CONJ ADV	"However" is the only member of this class. The peculiarity of this word is that it introduces an adverbial clause but that it should be directly followed by an adverb, by a participle or by an adjective complement, thus causing the inversion of word order. Examples: "<u>However</u> hard you may try, you will not succeed." "<u>However</u> tired you may be, you must do it."; "<u>However</u> diligent you may be, you will fail." Note: "However" should also be coded as AV1 (e.g. "I cannot, <u>however</u>, approve of your design.")

SWC Code	Mnemonic Expression	Comments
C05	-EVER CONJ NOM	"Whatever, whoever, whichever" in the nominative case are the only members of this class. C05 introduces an adverbial clause and at the same time acts as a subject or a complement of a verb within the clause. Examples: "<u>Whatever</u> may be said about him, I have full confidence in him."; "<u>Whoever</u> may come, he will be accepted cordially."; "<u>Whoever</u> you may be, I will speak out my opinion." Note: "Whatever, whoever, whichever" should also be coded as RL3 ("<u>Whoever</u> wants to work here is quite welcome.").
C06	-EVER CONJ ACC	"Whatever, whomever, whichever" in the accusative case are the only members of this class. C06 introduces an adverbial clause and at the same time acts as an object of a verb or a preposition within the clause. Examples: "<u>Whomever</u> you may meet, you have to be polite to him."; "<u>Whichever</u> you may refer to, you have to make sure which you are referring to." Note: "Whatever, whomever, whichever" should also be coded as RL4 (e.g. "You may choose <u>whatever</u> you like.")

SWC Code	Mnemonic Expression	Comments
C07	.-EVER CONJ ADJ	"Whatever, whichever" of the adjectival use are the only members of this class. C07 introduces an adverbial clause and at the same time acts as a pre-positional modifier of a subject, complement or object noun within the clause. Examples: "<u>Whatever</u> book you may read, you have to read it carefully."; "<u>Whichever</u> book you may choose, you will be satisfied."; "<u>Whatever</u> position you may be in, you have to work hard in order to succeed." C07 also introduces a noun clause, as in "You may choose <u>whichever</u> book you like."
C08	CONJ OF COMPAR 2	C08 has only one member, which is "than" as the subordinate conjunction of comparison. C08 has to be used in correlation with ADK or ADN (adjectives in the comparative degree) or with AV6 (adverbs in the comparative degree). Examples: "I am older <u>than</u> you are."; "You look better today <u>than</u> yesterday."
CPR	CONJUNCTIVE ADV	Adverbs which have to be followed by a prepositional phrase: "because, regardless, irrespective, except". Examples: "I was absent from school <u>because</u> of illness."; "I will come <u>regardless</u> of the weather."

SWC Code	Mnemonic Expression	Comments
DOI	IMPERATIVE DO	DOI has only three members, which are "do" and "don't" (used as an auxiliary in the emphatic and negative imperative) and "let's", followed by a basic form of a verb. Examples: " <u>Don't</u> go."; " <u>Do</u> perform it in this way."; " <u>Let's</u> go."
GI1	GERUND OF VII	GI1 is for a gerund form of VII which takes neither object nor complement. Gerund forms of verbs (GI1, GI2, GI3, GT1,...,GT7) are used (1) as a subject and (2) as an object of a verb or preposition.* Examples: "He likes <u>skiing</u> ."; " <u>Flying</u> is pleasant."
GI2	GERUND OF VI2	GI2 is for a gerund form of VI2 which must take a noun complement or an adjective complement. Examples: " <u>Becoming</u> sick is unpleasant."; "He has the intention of <u>becoming</u> a teacher."

*According to the present grammar, a gerund cannot be a complement of "be". This provision is for avoiding two-fold analyses for every "be -ing" form. A sentence such as "Seeing is believing", however, cannot therefore be properly analyzed.

SWC Code	Mnemonic Expression	Comments
GI3	GERUND OF VI3	GI3 is for a gerund form of VI3 which takes neither object nor complement, but which has to be followed by a prepositional phrase. Example: "The committee stopped <u>consisting</u> of intelligent people."
GT1	GERUND OF VT1	GT1 is for a gerund form of VT1 which must take a single object. Examples: " <u>Learning</u> German is not so easy."; "He is fond of <u>studying</u> mathematics."
GT2	GERUND OF VT2	GT2 is for a gerund form of VT2 which must take both indirect and direct objects. Examples: " <u>Giving</u> these students lessons in French is very pleasant."; "I am fond of <u>teaching</u> them English."
GT3	GERUND OF VT3	GT3 is for a gerund form of VT3 which must take an object and an objective complement. Examples: "I am fond of <u>making</u> people happy."; " <u>Making</u> him angry gives me pleasure."

SWC Code	Mnemonic Expression	Comments
GT4	GERUND OF VT4	GT4 is for a gerund form of VT4 which has to take an object followed by a basic form of a verb. Example: "I am accustomed to <u>letting</u> these people work."
GT5	GERUND OF VT5	GT5 is for a gerund form of VT5 which has to take an object followed by a present or past participle form of a verb. Examples: "I like <u>hearing</u> the bell ringing."; " <u>Seeing</u> a boy run over by a car gave me a shock."
GT6	GERUND OF VT6	GT6 is for a gerund form of VT6 which has to take a noun clause object. Examples: " <u>Knowing</u> that you are right is different from <u>saying</u> that I agree with you."
GT7	GERUND OF VT7	GT7 is for a gerund form of VT7 which has to take an indirect object followed by a noun clause object. Examples: "I dislike <u>telling</u> you that you are right."; "He stopped <u>asking</u> me whether I agreed with him."

SWC Code	Mnemonic Expression	Comments
HAV	HAVE-TENSE AUX	HAV is for the finite form of "have" as an auxiliary verb of the perfect tense and have-to form. "Have, has, had" are the only members of this class. Examples: "I <u>have</u> finished the work."; "He <u>has</u> to do it."
HP1	HAD AS PT1	HP1 is for "had" as PT1. Example: "He has <u>had</u> his lunch." The aim of having single-member classes (HP1, HP3, HP4, HP5) for "had" is to prohibit the use of the form as a post-positional modifier which an ordinary past participle (PT1, PT3, PT4 or PT5) can serve, as in "The men <u>recommended</u> for promotion got their raises.". Otherwise, most of the sentences with the past perfect predicate verbs, such as "The man <u>had</u> finished his work.", would be subject to the unacceptable analysis in which "had" is regarded as a post-positional modifier of the preceding subject ("man") and the following verbal form ("finished") as the predicate verb.
HP3	HAD AS PT3	HP3 is for "had" as PT3. Example: "I have <u>had</u> it ready."

SWC Code	Mnemonic Expression	Comments
HP4	HAD AS PT4	HP4 is for "had" as PT4. Example: "I have <u>had</u> him apologize."
HP5	HAD AS PT5	HP5 is for "had" as PT5. Example: "I have <u>had</u> my house built by the carpenter."
HPP	PAST P OF HAV	HPP is for the past participle form of "have" as HAV, i.e., as an auxiliary verb of the have-to form. "I have <u>had</u> to work all through the week-end."
HVG	GERUND OF HAV	HVG is for the gerund form of "have" as an auxiliary verb of the perfect tense and have-to form. "Having" is the only member of this class. Examples: "I remember <u>having</u> seen him once."; "I dislike <u>having</u> to do this."
HVI	INFINITE HAV	HVI is for the infinite form of "have" as an auxiliary verb of the perfect tense and have-to form. "Have" is the only member of this class. Examples: "I will <u>have</u> finished it a week ago next Tuesday."; "You will <u>have</u> to do it."

SWC Code	Mnemonic Expression	Comments
HVP	PRESENT P OF HAV	HVP is for the present participle form of "have" as an auxiliary verb of the perfect tense and have-to form. "Having" is the only member of this class. Examples: " <u>Having</u> finished his work, he went home."; " <u>Having</u> to work on week-ends, he is very tired."
IAD	INTERROG ADJ	IAD is for interrogative adjectives. "Which, what, whose, how" are the only members of this class.* Examples: " <u>Which</u> book do you prefer?"; " <u>What</u> color is this?"; " <u>Whose</u> hat is this?"
IAV	INTERROG ADVERB	IAV is for interrogative adverbs. "Where, when, why, how" are the only members of this class. Examples: " <u>Where</u> do you live?"; " <u>When</u> will he come?"; " <u>Why</u> did you go there?"; " <u>How</u> do you like it?"

*"How" is provisionally assigned the word class IAD for structures such as "How many flowers are there in the vase?"

SWC Code	Mnemonic Expression	Comments
III1	INFINITE VII	III1 is for an infinite form of VII which takes neither object nor complement. Infinite forms of verbs (III1, II2, II3, IT1, IT2,..., IT7) are used (1) as imperative verbs, (2) after an auxiliary verb (AUX) and (3) after "to" for infinitives. Examples: " <u>Go</u> ."; "Spring will <u>come</u> and <u>go</u> ."; "I want to <u>go</u> there."
II2	INFINITE VI2	II2 is for an infinite form of VI2 which has to take a noun complement or an adjective complement. Examples: " <u>Grow</u> strong."; "You will <u>become</u> President."
II3	INFINITE VI3	II3 is for an infinite form of VI3 which takes neither object nor complement, but which has to be followed by a prepositional phrase. Example: "The committee will <u>consist</u> of eight people."
IPN	INTERROG PRN NOM	IPN is for interrogative pronouns in the nominative case. "Who, what, which, whose" are the only members of this class. Examples: " <u>Who</u> are you?"; " <u>What</u> happened?"; " <u>Which</u> is better?"

SWC Code	Mnemonic Expression	Comments
IPO	INTERROG PRN ACC	IPO is for interrogative pronouns in the accusative case. " <u>Whom</u> , <u>what</u> , <u>which</u> " are the only members of this class. Examples: " <u>Whom</u> did you see?"; " <u>What</u> are you looking for?"; " <u>Which</u> do you like better?"
IT1	INFINITE VT1	IT1 is for an infinite form of VT1 which has to take a single object. Examples: " <u>Study</u> English."; "He wanted to <u>see</u> the world."
IT2	INFINITE VT2	IT2 is for an infinite form of VT2 which has to take both indirect and direct objects. Examples: " <u>Give</u> me the book."; "I will <u>teach</u> you English."
IT3	INFINITE VT3	IT3 is for an infinite form of VT3 which has to take an object and an objective complement. Examples: " <u>Make</u> me happy."; "You will <u>find</u> the man dead."
IT4	INFINITE VT4	IT4 is for an infinite form of VT4 which has to take an object followed by a basic form of a verb. Examples: " <u>Let</u> me go."; "I will <u>make</u> him go to the hospital."

SWC Code	Mnemonic Expression	Comments
IT5	INFINITE VT5	IT5 is for an infinite form of VT5 which has to take an object followed by a present or past participle form of a verb. Examples: " <u>Hear</u> the bell ringing."; "You will <u>see</u> him punished by his father."
IT6	INFINITE VT6	IT6 is for an infinite form of VT6 which has to take a noun clause object. Example: "I have to <u>say</u> that it is true."
IT7	INFINITE VT7	IT7 is for an infinite form of VT7 which has to take an indirect object followed by a noun clause object. Examples: "I can <u>tell</u> you that you are right."; "He used to <u>ask</u> her if she agreed with him."
MMM		Common features of NOU, NOV and NUM
NAD	NOUN ADVERB	NAD is for nouns which can be used adverbially. All these nouns should be coded also as NOU, NOV, or NUM, as the case may be. Nouns of time, location and measurement usually belong to this class. Examples: "I got up at six this <u>morning</u> ."; "He worked <u>day</u> and <u>night</u> ."

SWC Code	Mnemonic Expression	Comments
NNN		Common features of NOU, NOV, NUM, PRZ
NO ₄	NOUN 4	"More, most, less, least" are the only members of this class. They cannot be modified by a post-positional phrase and cannot form a compound noun phrase together with a noun. Example: "<u>More</u> can be said about it."
NOU	NOUN 1	NOU is for a noun which can be used as a subject, object and complement, which can be modified by a pre-positional adjective of some kind, and which can be used adjectivally immediately followed by another noun. NOU in the adjectival use cannot be modified by any adverb. Examples: "A bear is an <u>animal</u>."; "We love <u>peace</u>."; "There is much to be learned about the <u>surface</u> tension of water." Note: With regard to the last example above, one cannot put an adjective between "surface" and "tension". This is one peculiarity of NOU.

SWC Code	Mnemonic Expression	Comments
NOV	NOUN 3	NOV is for a noun which can be used as a subject and object, but which cannot be used as a complement if not preceded by a noun phrase introducing adjective, and which cannot be used adjectivally. The aim of having NOV as a distinct word class from NOU is to account for word forms which can be used both as nouns and as usual adjectives. "Red", for example, can be used both as a noun (e.g., "<u>Red</u> is the color I like best.") and as an adjective (e.g., "Her cheeks were as <u>red</u> as a rose."; "He turned slightly <u>red</u>"). If the word form were coded as NOU and ADJ, two-fold analyses would be obtained for sentences such as "I like a <u>red</u> flower." and "The flower is <u>red</u>". The coding of "red" as NOV and ADJ deletes the analysis of "red" in the preceding examples as a noun used adjectivally and as a noun used as a complement. A word form which belongs to NOV also belongs to one of the classes for adjectives such as ADJ, ADL, ADM, ADN, and ADO.

SWC Code	Mnemonic Expression	Comments
NUM	NOUN 2	NUM is for a noun which can be used as a subject, object and complement, and which can be modified by a pre-positional adjective of some kind, and which can be used adjectivally. When NUM is used adjectivally, it cannot be modified by an adverb, but it can be followed by one or more adjectives before a noun is reached. Numerals and some other words belong to this class. Examples: "These are the <u>two</u> important things to be remembered."; "<u>One</u> and <u>one</u> makes <u>two</u>."; "It was the <u>first</u> terrible blow to him."
PII	PAST P OF VII	PII is for a past participle form of VII which takes neither object nor complement. Past participle forms of verbs are used (1) in the perfect tense together with a form of "have", (2) in the passive voice together with a form of "be", (3) as a passive post-positional modifier of nouns, and (4) in the passive participial construction. There are some restrictions with the use of past participle forms in the passive sense which appears

SWC Code	Mnemonic Expression	Comments
		in (2), (3) and (4). When PI1 is used in the passive sense, it has to be followed by a preposition without an object. Examples: (1) "Spring has <u>come</u>."; (2) "He was <u>run</u> over by a car."; (3) "The boy <u>run</u> over by a car was the son of my friend."; (4) "<u>Run</u> over by a car, the boy was found dead."
PI2	PAST P OF VI2	PI2 is for a past participle form of VI2 which has to take a noun complement or an adjective complement. PI2 cannot be used in the passive sense. Example: "The leaves have <u>turned</u> red."
PI3	PAST P OF VI3	PI3 is for a past participle form of VI3 which takes neither object nor complement, but which has to be followed by a prepositional phrase. When PI3 is used in the passive sense, it has to be followed by a preposition without an object. Examples: "I have <u>applied</u> for the vacant post."; "The position was <u>applied</u> for by a man."; "This was the position <u>applied</u> for by a large number of people."

SWC Code	Mnemonic Expression	Comments
PRD	PERIOD	PRD is for a period or an exclamation mark which signifies the end of a sentence.
PRE	PREPOSITION	PRE is for prepositions. Examples: "I went <u>to</u> school."; "There is a book <u>on</u> the desk." Note: If the same word form can be used as an adverb by itself, it also belongs to AV2 (e.g. "He called me <u>up</u> .")
PRN	PERSONAL PRN NOM	PRN is for personal pronouns in the nominative case. "I, you, he, she, it, we, they" are the only members of this class. Examples: " <u>I</u> am a student."; "It is <u>you</u> ."
PRO	PERSONAL PRN ACC	PRO is for personal pronouns in the accusative case. "Me, you, him, her, it, us, them" belong to this class. Examples: "He likes <u>me</u> ."; "I like <u>it</u> ." Adverbs such as "here", "now" are provisionally assigned the word class PRO for structures such as "from <u>here</u> ", and "from <u>now</u> ".

SWC Code	Mnemonic Expression	Comments
PRZ	INDEFINITE PRN	PRZ is for demonstrative pronouns ("this, these, that, those") and indefinite pronouns ("someone, another, everyone," etc.). The characteristics of a member of this class are (1) that it cannot be modified by any pre-positional adjective and (2) that it can be followed by a post-positional adjective or participle without the intervention of a comma. The first feature is shared by PRN and PRO, but not by any of the noun classes. The second feature is shared by noun classes, but not by PRN or by PRO. Examples: <u>"Something strange happened."</u>; not "Strange something happened."
PTI	PAST P OF VTI	PTI is for a past participle form of VTI which must take a single object. In addition to the four uses of past participles listed in the entry for PII, PTI can be used as a pre-positional attributive of nouns. When PTI is used in the passive sense, it cannot be followed by an object.

SWC Code	Mnemonic Expression	Comments
		Examples: "I have <u>read</u> the paper."; "The paper was <u>read</u> before the audience."; "This is the letter <u>written</u> by my wife."; "<u>Wounded</u> in battle, the soldiers were taken prisoners."; "The <u>wounded</u> soldiers were taken prisoners."
PT2	PAST P OF VT2	PT2 is for a past participle form of VT2 which has to take both indirect and direct objects. When PT2 is used in the passive sense, only one of the two objects should remain after it. Examples: "I have <u>taught</u> him English."; "He has been <u>taught</u> English."; "Students, <u>taught</u> mathematics by him, became very interested in the subject."
PT3	PAST P OF VT3	PT3 is for a past participle form of VT3 which has to take an object followed by an objective complement. When PT3 is used in the passive sense, an objective complement remains after it. Examples: "I have <u>made</u> him happy."; "He was <u>found</u> guilty."; "The man, <u>appointed</u> president of the company, took decisive steps to reform the company."

SWC Code	Mnemonic Expression	Comments
PT4	PAST P OF VT4	PT4 is for a past participle form of VT4 which has to take an object followed by a basic form of a verb. When PT4 is used in the passive sense, it is followed by a to-infinitive. Examples: "No one has <u>made</u> us believe in communism."; "They have been <u>made</u> to believe in communism."
PT5	PAST P OF VT5	PT5 is for a past participle form of VT5 which has to take an object followed by a present or past participle form of a verb. When PT5 is used in the passive sense, it is followed by a participle form. Examples: "I have <u>heard</u> the bell ringing."; "He was <u>seen</u> entering the house."
PT6	PAST P OF VT6	PT6 is for a past participle form of VT6 which has to take a noun clause object. Example: "He has <u>said</u> that he believes in democracy." According to our grammar, PT6 is regarded as precluded from use in the passive sense. The reason for this provision is that if all the word forms which belong to PT6 have the homograph PT1, PT1 is enough to explain the passive use of these forms. For example, "said" in "It was <u>said</u> quickly." is regarded only as PT1, not as PT6.

SWC Code	Mnemonic Expression	Comments
PT7	PAST P OF VT7	PT7 is for a past participle form of VT7 which has to take an object followed by a noun clause object. When PT7 is used in the passive sense, it is followed by a noun clause object alone. Examples: "He has <u>told</u> us that he loves peace."; " <u>Asked</u> whether he liked peace, he answered yes."
QUE	QUESTION MARK	QUE is for a question mark.
RI1	PRESENT P OF VII	RI1 is for a present participle form of VII which takes neither object nor complement. Present participle forms of verbs (RI1, RI2, RI3, RT1, RT2, ..., RT7) are used (1) in the progressive form together with a form of "be", (2) in the participial construction, and (3) as a post-positional modifier of nouns. In addition to these three features of present participle forms, (4) RI1 can be used as a pre-positional attributive of nouns. Examples: (1) "He is <u>coming</u> ."; (2) " <u>Walk- ing</u> along the street, I met an old friend of mine."; (3) "Look at a man <u>coming</u> towards us."; (4) "This is a <u>flying</u> plane."

SWC Code	Mnemonic Expression	Comments
RI2	PRESENT P OF VI2	RI2 is for a present participle form of VI2 which has to take a noun complement or an adjective complement. Examples: "It is <u>getting</u> cold."; " <u>Getting</u> angry, he shouted at me."; "I like leaves <u>turning</u> red."
RI3	PRESENT P OF VI3	RI3 is for a present participle form of VI3 which takes neither object nor complement, but which must be followed by a prepositional phrase. Examples: " <u>Consisting</u> of eight members, the committee discusses the problems of juvenile delinquency."; "Several questions <u>corresponding</u> to the first part of his paper have been raised."
RL1	RELATIVE PRN NOM	RL1 is for relative pronouns in the nominative case. "Who, that, which" are the only members of this class. RL1 introduces an adjectival clause in which it plays a role of either subject or complement of a verb. Examples: "This is the man <u>who</u> teaches me French."; "The kind of a boy <u>that</u> he is now tells the kind of a man <u>that</u> he is to become."

SWC Code	Mnemonic Expression	Comments
RL2	RELATIVE PRN ACC	RL2 is for relative pronouns in the accusative case. "Whom, that, which" are the only members of this class. RL2 introduces an adjectival clause in which it plays a role of an object of a verb or preposition. Examples: "This is the man <u>whom</u> I love."; "This is the thing <u>that</u> I have been looking for."
RL3	REL PRN NOM WHAT	RL3 is for relative pronouns in the nominative case which have no antecedents. "What, whatever, whoever, whichever" are the only members of this class. RL3 introduces a noun clause in which it plays a role of either subject or complement of a verb. Examples: "This is <u>what</u> happened."; "You can take <u>whatever</u> suits you."; "This is <u>what</u> I am."
RL4	REL PRN ACC WHAT	RL4 is for relative pronouns in the accusative case which have no antecedents. "What, whatever, whomever, whichever" are the only members of this class. RL4 introduces a noun clause in which it plays a role of object of a verb or preposition. Examples: "He gave me <u>what</u> he had in his hand."; "You may choose <u>whichever</u> you like."

SWC Code	Mnemonic Expression	Comments
RL5	RELATIVE ADJ	RL5 is for the relative adjective "whose", which is the only member of this class. RL5 introduces an adjective clause in which it plays a role of a pre-positional adjective. Example: "A child <u>whose</u> parents are dead is called an orphan."
RL6	RELATIVE ADVERB	RL6 is for relative adverbs. "Where, when, why, that" are the only members of this class. RL6 introduces an adjective clause within which it acts as an adverb. Examples: "This is the town <u>where</u> I was born."; "This is the reason <u>why</u> he failed."; "He was born on the same day <u>that</u> his mother died."; "The fact <u>that</u> he is wrong is obvious."
RT1	PRESENT P OF VT1	RT1 is for a present participle form of VT1 which must take a single object. Examples: "He is <u>studying</u> English."; " <u>Hitting</u> the ball, he dashed to the base."; "The boy <u>reading</u> a book in the room is my brother."

SWC Code	Mnemonic Expression	Comments
RT2	PRESENT P OF VT2	RT2 is for a present participle form of VT2 which must take both indirect and direct objects. Examples: " <u>Giving</u> me the money, he went away."; "I am <u>teaching</u> them English."
RT3	PRESENT P OF VT3	RT3 is for a present participle form of VT3 which must take an object and an objective complement. Examples: " <u>Finding</u> the man dead, he screamed in horror."; "They have been <u>making</u> these people happy."
RT4	PRESENT P OF VT4	RT4 is for a present participle form of VT4 which has to take an object followed by a basic form of a verb. Examples: " <u>Hearing</u> the bell ring, he left home for church."; "I have been <u>letting</u> him work only twice a week."
RT5	PRESENT P OF VT5	RT5 is for a present participle form of VT5 which has to take an object followed by a present or past participle form of a verb. Examples: " <u>Hear- ing</u> the bell ringing, he left home for church."; "I have been <u>watching</u> the boy teased by everyone."

SWC Code	Mnemonic Expression	Comments
RT6	PRESENT P OF VT6	RT6 is for a present participle form of VT6 which has to take a noun clause object. Examples: "He went away, <u>saying</u> that he could not agree with me."; "I have received a latter <u>saying</u> that he will be coming to town."
RT7	PRESENT P OF VT7	RT7 is for a present participle form of VT7 which has to take an indirect object followed by a noun clause object. Examples: "He went away <u>telling</u> me that he could not agree with me."; "The book, <u>teaching</u> us that we should always be honest, is a good guide for life."
TIT	TEMPORARY SUBJECT	TIT is for "it" as the temporary subject of a sentence or of a participial phrase. Examples: " <u>It</u> is true that we love peace."; " <u>It</u> is difficult always to be consistent."; " <u>It</u> being difficult always to be consistent, one can make many mistakes."

SWC Code	Mnemonic Expression	Comments
TOI	TO FOR IN-FINITIVE	TOI is for "to" which introduces to-infinitives. To-infinitives can be used (1) in the have-to form, (2) as objects of verbs. (3) as complement of passive PT₄, (4) as subjects of verbs, (5) as post-positional attributive of nouns and (6) as adverbs. Examples: (1) "I have <u>to</u> go there."; (2) "I want <u>to</u> go there."; (3) "He was made <u>to</u> go."; (4) "<u>To</u> work is my duty."; (5) "Give me something <u>to</u> eat."; (6) "I went there <u>to</u> see a friend of mine." Note: "To" should also be coded as PRE (I went <u>to</u> Washington.).
VII	COMPLETE VI	VII is for a finite form of a complete intransitive* verb which takes neither object nor complement. Finite forms of verbs (VII, VI2, VI3, VT1, VT2, ..., VT7) are used as predicate verbs which have subjects of their own. Examples: "Spring <u>comes</u> and <u>goes</u>."; "He <u>swims</u> in a pool."

*A verb is "complete" if it does not need a complement and is "incomplete" if it needs one. A verb is "intransitive" if it does not require an object, and is "transitive" if it does need an object.

SWC Code	Mnemonic Expression	Comments
VI2	COPULATIVE VI	VI2 is for a finite form of an intransitive verb which has to take a noun complement or an adjective complement. Examples: "He <u>became</u> sick."; "He <u>became</u> a teacher."
VI3	PREPOSITIONAL VI	VI3 is for a finite form of a complete intransitive verb which takes neither object nor complement, but which has to be followed by a prepositional phrase. Examples: "A <u>corresponds</u> to B."; "The committee <u>consists</u> of eight members."
VT1	SINGLE OBJECT VT	VT1 is for a finite form of a complete transitive verb which has to take a single object. Examples: "I <u>like</u> coffee."; "He <u>hit</u> the ball."; "He <u>learned</u> German."
VT2	DOUBLE OBJECT VT	VT2 is for a finite form of a complete transitive verb which has to take both indirect and direct objects. Examples: "He <u>gave</u> me a book."; "He <u>taught</u> the boy English."

SWC Code	Mnemonic Expression	Comments
VT3	OBJECT-COMPL VT	VT3 is for a finite form of an incomplete transitive verb which has to take an object and an objective complement. Examples: "He <u>made</u> me happy"; "They <u>appointed</u> him president of the company."; "I <u>found</u> him dead."; "I <u>found</u> him a reliable person."
VT4	OBJ-INF VERB VT	VT4 is for a finite form of an incomplete transitive verb which has to take an object followed by a basic form of a verb. So-called causative verbs and perceptive verbs, such as "make, let, have; see, find, watch, hear", belong to this class. Examples: "I <u>made</u> him go."; "I <u>had</u> a student do the work."; "I <u>saw</u> them move."; "He <u>hears</u> the bell ring."
VT5	OBJ-PARTICIPLE VT	VT5 is for a finite form of an incomplete transitive verb which has to take an object followed by a present or past participle form of a verb. So-called perceptive verbs belong to this class. Examples: "I <u>saw</u> them killed."; "He <u>hears</u> the bell ringing."; "I <u>felt</u> my fingers trembling."

SWC Code	Mnemonic Expression	Comments
VT6	NOUN CLAUSE VT	VT6 is for a finite form of a complete transitive verb which has to take a noun clause object. So-called reporting and knowing verbs belong to this class. Examples: "He <u>said</u> that it was true."; "He <u>asked</u> if I knew it."; "He <u>taught</u> that life should be enjoyed."
VT7	OBJ-NOUN CL VT	VT7 is for a finite form of a complete transitive verb which has to take an indirect object followed by a noun clause object. Examples: "He <u>told</u> me that it was true."; "He <u>asked</u> me if I knew it."; "He <u>taught</u> us that life can be enjoyable." Note: "Said" for example cannot be used as VT7.
XCO	COORDINATE CONJ1	XCO is for coordinate conjunctions which can connect the same two structures of almost any nature. "And, or, but, nor" are the only members of this class. Examples: "I am old <u>and</u> you are young."; "Either you <u>or</u> I am right."; "He succeeded not only in doing it <u>but</u> also in doing it perfectly."
YCO	COORDINATE CONJ2	YCO is for coordinate conjunctions which can only connect two coordinate clauses. Example: "I will say no more, <u>for</u> I detest explanations."
