PRINTED CIRCUIT CONNECTORS

FOR

MICROASSEMBLIES

First Quarter Progress Report

Report No. 1

1 February 1963 to 1 May 1963

The Program covered by this contract entails the development of microassembly connectors, specifically designated for use with hermetic and encapsulated microassemblies developed under Signal Corps Contract No. DA-36-039-SC-89176.

This program is made up of two tasks: Task A is a Development Program, to provide the design and development of a receptacle to mate with established hermetic microassembly pin terminations. Task B is a Feasibility Study of a printed circuit connector for an encapsulated microassembly of special design.

1.0 PURPOSE

The purpose of this contract is the investigation, design and development of printed circuit connectors, to be used as a means for connecting microassemblies into equipment of minimum possible size. The program covered by this contract comprises two parts hereafter referred to as Task A and Task B.

1.1 Objective

Task A Design, fabricate and evaluate a 20 contact receptacle, whose female contacts are capable of mating with 0.016 to 0.020 diameter microassembly pins.

The dimensions of the receptacle shall be such that the contacts can be mounted in an insulator body and onto a printed circuit board on a 0.075 grid. The maximum height of the receptacle shall not exceed 0.100 inches, excluding the contact tabs. The dimensions of the receptacle shall not exceed 0.393 by 0.393 inches.

Task B A Feasibility Study leading to the design of a printed circuit connector for an encapsulated microassembly of special design. Task B is divided into two phases, hereafter referred to as Phase 1 and Phase 2.

Phase 1 is concerned with the integration of a connector with a microassembly stack containing thirty-six (36) .010 X .002 conductor ribbons extending on 0.025 centers from the periphery of its base. The overall dimensions of the connector body are not to exceed 0.350 by 0.350 inches.

Phase 2 is concerned with the integration of a connector with a microassembly stack containing eighty (80) .010 X .002 conductor ribbons extending on 0.025 centers from the periphery of its base. The overall dimensions of the connector body are not to exceed 0.700 by 0.700 inches.

The contact tabs of the receptacle, shall be spaced on 0.050 centers and shall be contained within the area of the base. The maximum height of the mated halves in both Phases shall not exceed 0.100 inches excluding the contact tabs of the receptacle.

1.2 Related Projects

The following program is closely related to this contract:

Carr Fastener Company, Cambridge, Massachusetts a Division of United-Carr Fastener Corporation, is presently engaged in working with Hamilton Standard, Division of United Aircraft Corporation in the design and manufacture of a hermetic header to be attached to a microassembly stack or module. The work being performed by Hamilton Standard relates to the same assembly for which this contract provides the connectors.

2.0 ABSTRACT

2.1 Task A - 20 Contact Microassembly Receptacle

During this period design effort was concentrated on a total of eleven (11) contact approaches to mate with 0.016" to 0.020" diameter microassembly pins. The contact designs were studied analytically and hand-made contacts of the most promising designs were fabricated and tested with regard to their retention characteristics. Six of the eleven contact designs were selected for further analysis.

2.2 Task B - Encapsulated Microassembly Connector

Analytical analyses of three connector design approaches for the 36 and 80 conductor encapsulated microassemblies were made during this period.

3.0 PUBLICATIONS, LECTURES, REPORTS AND CONFERENCES

3.1 Reports

Technical Progress Chart - Technical effort on development program for Printed Circuit Connectors for Microassemblies, Dated, 28 February 1963.

Progress Chart - Monthly expenditures of funds on development program for Printed Circuit Connectors for Microassemblies, Dated 28 February 1963.

3.2 Conferences

The first meeting was held on February 26, 1963 in the offices of the U.S. Signal Corps at Fort Monmouth, New Jersey.

Present

Mr. Roy Witte	- Cinch Manufacturing Company
Mr. John Ralph	- United Carr Fastener Corporation
Mr. Peter Byrne	- Cinch Manufacturing Company
Mr. Sherman Bassler	- U.S. Army Electronic R & D, Laboratory
Mr. Weldon Lane	- U. S. Army Electronic R & D, Laboratory

The purpose of this meeting was to discuss generally provisions and requirements of the development contract covered by this report. The Signal Corps representative stated at this meeting the possibility of changing the number of contacts required in both tasks A and B.

A second meeting was held on April 10, 1963 at Fort Monmouth, New Jersey to discuss progress to date.

Present

Mr. Roy Witte	- Cinch Manufacturing Company
Mr. Ben Johanson	- Cinch Manufacturing Company
Mr. Peter Byrne	- Cinch Manufacturing Company
Mr. Sherman Bassler	- U.S. Army Electronic R & D, Laboratory
Mr. Weldon Lane	- U.S. Army Electronic R & D, Laboratory

The proposed design approaches for Task A were examined and discussed and the following design decision arrived at:

The center of the module is to coincide with the center of the receptacle.

Every possible effort should be made to have the contact tabs in line with the header pins. Failing this, the contact tabs shall be located on a 25-Mil. grid pattern.

Three of the contact designs considered worthwhile and worthy of further investigation are (a) Approach A-5 (b) Approach A-9 (c) Approach A-2. At the request of Mr. Lane

sketches of these three contacts were sent to him.

The preliminary designs shall be further explored before testing on a full scale.

Suggested changes to Technical Requirement SCL-7673 covering Task A and Task B were advanced by the Army Signal Corps. These changes were discussed and mutually agreed upon. These were:

Task A - The number of contacts to be reduced from forty (40) to twenty (20).

Task B - Phase 1 The number of contacts increased from thirty-two (32) to thirty-six (36).

These changes were accomplished by an amendment to Technical Requirement SCL-7673, dated 8 March 1963, and sent to us.

4.0 FACTUAL DATA

4.1 Introduction

First Quarterly Report, covers the period February 1, 1963 to May 1, 1963. During this quarter, sketches, drawings, calculations and hand made samples were made in an effort to define the technical approaches and designs most applicable to the accomplishment of technical requirements for Tasks A and B.

4.2 Task A - Development and Evaluation of Design Approaches for a Female Contact to Mate with Established Hermetic Microassembly Pin Terminations

4.2.1 Equipment Used

1. Drop Weight - Graduated ounce weights
(Graduated in ounces and gram increments)
2. Hunter Scale
Manufacturer: Hunter Spring Company
Lansdale, Pa.
Model No.: LO-2-M

4.2.2. Results

Contact Approach A-1

Explanation

This particular contact was a redesign of a popular similar contact of Cinch Manufacture, which had been well received by our customers. It was felt that if we could retain the special features of the contact (such as long operating times and therefore greater resiliency) and yet reduce the size to the Task A minimum requirement, it would work. However, upon redesign, it could not meet the minimum space requirement.

Results Discarded. (Ref.: FIG. 1 P.17)

Contact Approach A-2

Explanation

A similar contact had previously been used in an experimental project calling for a micro-miniature connector of comparable size. We felt that minor

changes in its geometry would result in a contact usable in an insulator body of one piece construction, thereby providing a desirable pin lead-in feature. This design was fabricated by three different methods, two of which proved feasible.

Results (Ref. TABLE 1 P.18 - FIG.2 P.19)

Fabricated using phosphor bronze grade A hard temper. Contact failed to hold minimum size pin after tests. The tests further showed satisfactory insertion and retention forces with the minimum and nominal size pin. A permanent set resulted with the insertion of the maximum size pin.

Approach A-2-1 (Modification of A-2)

Results (Ref. TABLE 2 P.20 - FIG.3 P.21)

This approach was fabricated with beryllium copper alloy 25, half-hard temper. The tests resulted in favorable insertion and retention forces as well as an ability to hold the minimum size pin.

Since the temper of the beryllium copper and that of the phosphor bronze material are similar, we cannot overlook the possibility that the hand forming of both contacts could be a resulting factor in the contact being able to hold the minimum size pin.

Approach A-2-2 (Modification of A-2)

Results (Ref: TABLE 3 P.22 - FIG. 4 P.23)

Fabricated using beryllium copper alloy 25 half-hard temper heat-treated to 700F for 30 minutes showed increasing ability thus greater reliability to hold the minimum size pin. Noticeable insertion forces greater than those of A-2-1 were observed.

Contract Approach A-3

Explanation

It is a unique combination of desirable features in a sheet metal contact, such as a restricted opening in the top of the contact prevents over sized probes or pins from entering. Bifurcation of the contact tines permits three point contact on the pin, a non-restrictive arrangement for the pin length.

Results (Ref: TABLE 4 P.24 - FIG. 5 P.25)

Fabricated using phosphor bronze spring temper. Preliminary tests showed failure of contact to hold minimum size pin. Due to the exceptional features, we will fabricate using beryllium copper material

and test the contact before making any decision.-

Contact Approach A-4

Explanation

This contact features long operating tines and therefore greater resiliency, also bifurcation of the tines permitting a four point contact with the pin. As of this writing it has not been fabricated. Due to the small size, the major problem is that of cutting out the tail portion from the contact and forming such tail, without weakening the contact at its base.

Results Discarded (Ref: FIG. 6 P.26)

Contact Approach A-5

Explanation

This approach is a modification of a popular Cinch Screw-machine contact providing a means where the contact tab lines up with the center line of the contact.

Results (Ref. TABLE 5 P.27 - FIG. 7 P.28)

Fabricated using beryllium copper alloy 25 half-hard temper. The test resulted in the contact taking a set thus preventing it from holding the minimum size pin.

Approach A-5-1 (Modification of A-5)

Results (Ref: TABLE 6 P.29 - FIG. 8 P.30)

Modification to this design was the increased depth of cut on barrel. Results were somewhat better than those of Approach A-5, although it still would not hold the minimum size pin.

Note: (Same material as A-5)

Approach A-5-2 (Modification of A-5)

Results (Ref: TABLE 7 P.31 - FIG. 9 P.32)

Contact was fabricated using beryllium copper alloy 25 half-hard heat-treated material. Two cuts were made in the barrel resulting in four segments. A permanent set resulted in two of the four segments early in the test stage, thus

destroying the effectiveness of the contact.
Probable reason for failure, segments too small
and weak.

Approach A-5-3 (Modification of A-5)

Results (Ref: TABLE 8 P.33 - FIG. 10 P.34)

On this approach the barrel was lengthened and the slot cut deeper. Material used: beryllium copper alloy 25 half-hard heat-treated. Preliminary test results indicate the contact will hold the minimum size pin after sizing.

Preliminary evaluation on contact approach A-5 shows that barrel length and depth of cut, coupled with the heat-treated material provided a workable contact. Additional tests will be conducted to further evaluate the design.

Contact Approach A-6

Explanation

This approach is a modification of a Cinch fork-type contact. Miniaturized in past usage, it has proved reliable in related similar applications. Since approach A-6 and A-7 are very similar, we decided to proceed with Approach A-7.

Results Discarded (Ref: FIG. 11 P.35)

Contact Approach A-7

Explanation

This approach offered a miniaturized sheet metal contact with good contact bearing surface.

Result (Ref.: TABLE 9 P.36 - FIG. 12 P.37)

Fabricated using phosphor bronze grade A hard temper. Preliminary tests indicated inability of contact to hold minimum size pin. This contact is now being fabricated from beryllium copper material.

Contact Approach A-8

Explanation

The ability in drawing and forming from a piece of tubing was the reason for choosing this approach. After preliminary discussion on the design, it was decided that many problems would result from this method due to its miniaturized size.

Results Discarded (Ref.: FIG.13 P.38)

Contact Approach A-9

Explanation

Of all the contact approaches considered this appears thus far to be superior. The action of the contact in maintaining a suitable pressure against a mating pin, is of a cantilever type and controlled by the insulator cavity walls. By design the contact tines can be spread to the wall of the cavity prior to the material reaching its elastic limit. This of course, enhances the reliability of the contact when considering its susceptibility to damage due to mishandling. The contact is inserted into the cavity from the bottom. Two ears which are located on the top of the contact, spread out onto two shoulders of the insulator body, retaining the contact in the cavity. To minimize the effect of capillary action during the soldering process, the contact is indented across the folded tail to keep solder from flowing up into the pin area.

Another desirable feature is the restricted or closed entry arrangement in the top surface of the insulator body. This restriction prevents oversized probes or pins from entering, thereby reducing the potential damage due to mishandling. This restriction will also accurately control the pin alignment for engaging the contact.

Results Ref.: TABLE 10 P.39 - FIG.14 P.40 -
FIG. 15 P.41)

Fabricated from beryllium copper alloy 25 half-hard temper. Has proved itself very reliable in preliminary tests.

Approach A-9-1 (Modification of A-9)

Results Ref: TABLE 11 P.42 -, FIG.16 P.43. - FIG.17 P.44)

Very similar to A-9 with slight modifications as indicated by drawing. Has shown the same desirable qualities as that of A-9. Slight variation in insertion and retention forces.

Contact Approach A-10

Explanation

The desirability of this approach relates to our belief that it will provide a contact with long

operating times and, therefore, the greatest resiliency. We plan to provide pre-tension in the contact utilizing either restrictive times in the cavity opening, or having the times of the contact pre-loaded against each other in such a way as to provide high pressure immediately upon entry of the male pin. It was hoped that we could design this contact for a one piece insulator body. After study and evaluation it appeared as though this could not be done. Since the technical requirement calls for a one piece construction, the approach was discarded.

Results Discarded (Ref.: FIG. 18 P.45)

Contact Approach A-11

Explanation

This approach is identical to Approach A-9 except modified to have contact tab and header pin on the same center line.

Results (Ref: FIG. 19 P.46)

At this writing the contact is being fabricated. The results should prove to be as favorable as those of Approach A-9.

4.3 Task B- A feasibility Study Leading to the Design of a Printed Circuit Connector for an Encapsulated Microassembly

The basic design problem is (1) terminate the 0.002" X 0.010" conductor ribbons extending from the encapsulated microassembly into a male connector, and (2) design a receptacle which mates with the male connector and is compatible with mounting on a printed wiring board. The following design approaches were studied analytically this period.

4.3.1 Design Approaches

Design Approach B-1 (Ref: FIG. 20 P.47)

The attached drawing shows the basic layout of what the overall connector might look like, the cross-sections representing what will be fabricated on an experimental basis toward providing electrical contact. The intent here is to provide from the module, a series of contact ribbons, which, in themselves, would be permanently attached to an insulator base having an adequate lead-in so that entry to the connector receptacle would be easily permitted.

The female contact would be secured to its insulator and formed in such a way as to be required to flex upon engagement with the contact which is part of the male module package. In spite of the fact that this would represent probably the most conventional approach toward the solution of this problem, it is considered that this would be a very desirable starting point.

Design Approach B-2 (Ref: FIG. 21 P.48)

This approach, which is essentially very similar to B-1, has one basic difference in the fact that the receptacle contact is not required in itself to have the strength and accurate positioning required to make contact. To provide this feature, a suitable non-conductive external elastic member will be properly positioned in such a way as to cause the contact per se to be in an interference position with the male contact, so that upon mating the elastic member could be compressed and thereby be the vehicle for providing the pressure for electrical contact between the male and female members.

Design Approach B-3 (Ref: FIG. 22 P.49)

Approach B-3 provides another geometric view of the utilization of an independent external elastic contact pressuring member having the ability for greater flexure and quite possibly less contact insertion force than Approach B-2.

One additional feature of this approach is in the provision for greater engagement depth by the module into the receptacle and with it the inherent advantage of stability.

5.0 CONCLUSIONS

Task A

Tests have indicated that it is possible to provide a contact to accept a microassembly pin within the requirements of SCL-7673. Six of the approaches considered appear to have the capabilities of performing within the requirements and will be explored further. These are: A-2, A-3, A-5, A-7, A-9 and A-11.

Task B

The microassembly connector approaches B-1, B-2 and B-3 appear feasible. However, it is concluded from these studies that an approach wherein the male connector replaces the hermetic header in the microassembly stack is a more practical approach. Modification of the B-1, B-2 and B-3 as well as new design approaches will be pursued based on a header design compatible with electron beam welding in the microassembly stack (Ref. Final Report Contract #DA-36-039-SC-89176).

6.0 PROGRAM FOR NEXT INTERVAL:

Task A

Contact Approaches A-2, A-3, A-5, A-7, A-9 and A-11 will be further tested and evaluated. By the end of June all tested and supporting data will be reviewed and at this time we will finalize on three (3) contact approaches. During the month of July we will fabricate from temporary tooling, the three contact approaches selected. By the end of July all testing shall be completed on three approaches. From these tests one of the three shall be selected as the contact design, to fulfill the requirements covered in this contract, under Task A.

In conjunction with selecting a final contact approach, we will have established the following:

1. Header pin length and end configuration.
2. Plating specification for contacts

By this time samples will be available for visual observation.

Task B

The three approaches defined in section 4.3 as B-1, B-2, B-3 and other approaches will be considered and evaluated. Preliminary fabrication and tests will be performed to evaluate the feasibility of approaches considered.

7.0 IDENTIFICATION OF KEY PERSONNEL.-

During this quarter the following personnel took part in the work covered by this report.

NAME	TITLE	MAN HOURS
R. Witte	Project Director	*
B. Johanson	Technical Administrator	*
A. Van Keulen	Services Coordinator	*
R. Scott Modjeska	Physical Sciences Consultant	*
S. Majewski	Senior Engineer	176
H. Dwan	Mechanical Engineer	160
Model Makers		166
Laboratory Technicians		8

* R. Witte, B. Johanson, A. Van Keulen, R. Scott Modjeska do not charge directly to this project.

Key Personnel - Brief Statement of Technical Background.-

R. Witte - Project Director.-

Mr. Witte joined Cinch Manufacturing as Vice President of Research and Development in 1961. During his career he has held executive engineering positions in several companies since joining Ditto, Inc. in 1940. Among his more recent affiliations have been Link Belt Co., Motorola, Halicrafters and Magnecord. Before joining Cinch he served as Manager of Engineering for the Heydon Division of General Time Corporation. He holds a B.S.M.E. degree from Illinois Institute of Technology and is a member of the Institute of Radio Engineers, American Management Association and the American Society of Military Engineers. He is a registered professional engineer in the state of Illinois.

B. Johanson - Technical Administrator.-

Mr. Johanson joined Cinch Manufacturing Company in 1938. In his 24 years with Cinch he has worked directly as a designer of Electrical Sockets and Connectors and holds basic patents on many innovations on this type product. In the past ten years he has functioned as Chief Design Engineer of the Research and Development Department.

A. Van Keulen - Services Coordinator.-

Mr. Van Keulen received his B.S. degree from American Television Institute of Technology in 1949.

He has had 14 years experience in the Electronics Industry having spent the past 11 years in the R & D Department of Cinch Manufacturing Company. During this time he has served as Laboratory Supervisor and in the early part of 1961 was appointed Engineering Services Manager.

Mr. Van Keulen is active in EIA, having served as Secretary of the O8C Committee for 10 years, and is a member of the P-5.1 and P-5.2 Working Groups on Connectors and Sockets respectively.

He is a member of IRE and a United States Delegate in IEC.

He also presently serves as Chairman of EIA Task Group HR-21097 which is engaged in the formulation of established reliability methods in Military Specifications in accordance with the PSMR-1 recommendations to the Department of Defense. (Darnell Report).

R. Scott Modjeska - Physical Sciences Consultant.-

Prior to joining Cinch, Mr. Modjeska was Technical Director of Scientific Control Laboratories. He is recognized as a pioneer in the field of printed circuits. He consulted for both General Electric Company and Motorola Inc. in the production of printed circuits. His research activities have included vacuum metallurgy, electrodeposition, metalizing non conductors, extractive metallurgy, corrosion, physical metallurgy, studies of physical properties of thin metallic film, semiconductor and rectifier materials.

His educational background is as follows:

Undergraduate: Chemical Engineering, Illinois Institute of Technology.

Graduate: Chemistry, DePaul University; Chemistry, University of Chicago. He has taught applied Electro-Chemistry at Illinois Institute of Technology and various chemistry courses at DePaul University.

S. Majewski - Senior Engineer.-

Mr. Majewski is a graduate of Illinois Institute of Technology.

His previous experience is as follows:

Mechanical Engineer - Belmont Radio Corporation
- 4 years.

Assistant Chief Engineer - Daval Products Corporation
- 5 years.

Plant Superintendent - Candace, Inc.
- 5 years.

Design Engineer - American Phenolic Corporation
- 2 1/2 years.

Mr. Majewski has been with Cinch Manufacturing Company as a Design Engineer for a period of 5 years.

Mr. Majewski's contributions while with Amphenol and Cinch have been entirely in the field of electrical connector design.

H. Dwan - Mechanical Engineer.-

Mr. Dwan is a graduate of the Aeronautical University and holds a degree in Aeronautical Engineering.

Previous to this he attended DePaul University for one year.

His previous experience is as follows:

Andrew Corporation - Junior Design Engineer - 2 years.

While with Andrew Corporation, Mr. Dwan participated in the design of Parabolic Dishes, Cable Connectors and Communications Antennas.

Mr. Dwan has been with Cinch Manufacturing Company 2 1/2 years. His function at Cinch is Design Engineer of Electrical Connectors.

UNCLASSIFIED CENTRAL MANUFACTURING COMPANY DIVISION OF UNITED - CARP PASTER CORPORATION CHICAGO, ILLINOIS PRINTED CIRCUIT CONNECTORS FOR MICROASSEMBLIES HOWARD E. DWAN First quarterly progress report. 1 February 1963 to 1 May 1963. 47 pp - two text - illus. USARLMDL Contract No. DA-36-039-AWC-00122(E) Unclassified Report. TASK A - (20 Contact Microassembly Receptacle) During this period design effort was concentrated on a total of eleven (11) contact approaches to mate with 0.018" to 0.020" diameter microassembly pins. The contact designs were studied analytically and hand-made prototypes of the most promising designs were fabricated and tested with regard to their retention characteristics. Six of the eleven contact designs were selected for further analysis. TASK B - (Encapsulated Microassembly Connector) Analytical analyses of three connector design approaches for the 36 and 60 conductor encapsulated microassemblies were made during this period.
