FOREWORD

This report was prepared by the Douglas Aircraft Company, Inc., Aircraft Division, Long Beach, California, under USAF Contract Nr. AF 33(616)-7647, Project Nr. 1447, "High Level Turbulence." This Project is a part of the Air Force Systems Command's Applied Research Program 750A, "Mechanics of Flight." The work was administered under the Flight Dynamics Laboratory, Aeronautical Systems Division with Mr. Denver W. Mullins and Mr. Lawrence R. Phillips acting as Project Engineers.

The data gathering was a combined effort of the Aeronautical Systems Division's Directorate of Flight Test and the Douglas Aircraft Company, Inc. The operation and maintenance of the test aircraft was the responsibility of the Directorate of Flight Test under Capt. C. D. Smith, Jr., the Project Pilot. The aircraft instrumentation, data recording and data reduction was the responsibility of Douglas Aircraft Company, Inc., Flight Test Division under Mr. J. C. Londelius. Douglas Project Engineers were Mr. T. C. Naughton and Mr. J. A. Strom.

Data defining gust intensities and frequencies from 109 high altitude storm penetrations flown during the Rough Rider II and III phases of the 1961 National Severe Storms Project are included in this report.

This is the final report under Contract AF 33(616)-7647. The Contractor's report number is LB-31236.

ABSTRACT

Volume II contains the power spectra plots for vertical, lateral and forward gust velocities corrected for airplane motion, followed by the power spectra plots of uncorrected vertical and uncorrected lateral gust velocities. The data presented were obtained from 109 high altitude storm penetrations in which the length of runs varied up to 240 seconds. The data were sampled 25 times per second and the autocorrelation function was computed for 125 phase shifts.

PUBLICATION REVIEW

This report has been reviewed and approved.

LIST OF SYMBOLS

ΔT	Time difference between each point in the time series, sec.
M	Number of phase shifts for which the autocorrelation function was computed.
N	Number of data samples in the time series from which the spectra was computed.

LIST OF VOLUMES

VOLUME I

General discussion of the high altitude survey.

Section:

1. Summary of parameters for each penetration.
2. One-dimensional frequency distribution of the peaks for vertical, lateral and forward gust velocities.
3. Composite power spectra plots of vertical, lateral and forward gust velocities.
4. Power spectra comparison plots of vertical, lateral and forward gust velocities.
5. Pilots' flight reports.
6. Cross-spectra plots, autocorrelations, time series plots and two-dimensional frequency distribution of the peaks from four severe penetrations.

Appendix:

I. General description of the A076 statistical analysis program.

II. Explication of the IBM printout format.

VOLUME II

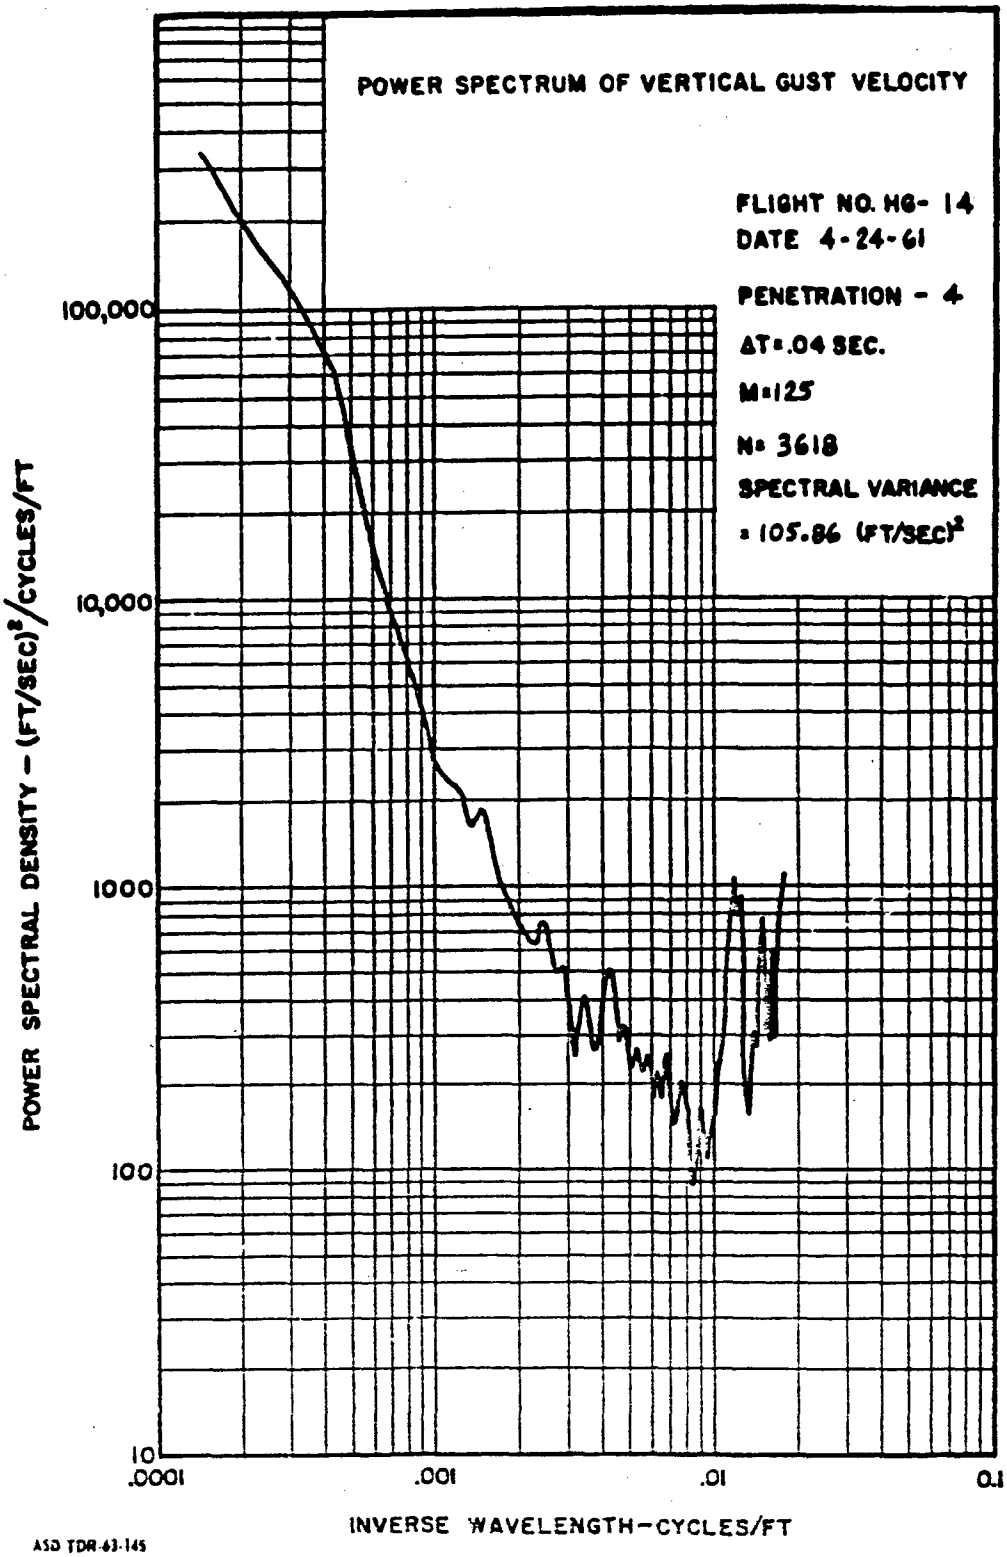

Power spectra -- plots of vertical, lateral, forward, uncorrected vertical and uncorrected lateral gust velocities.

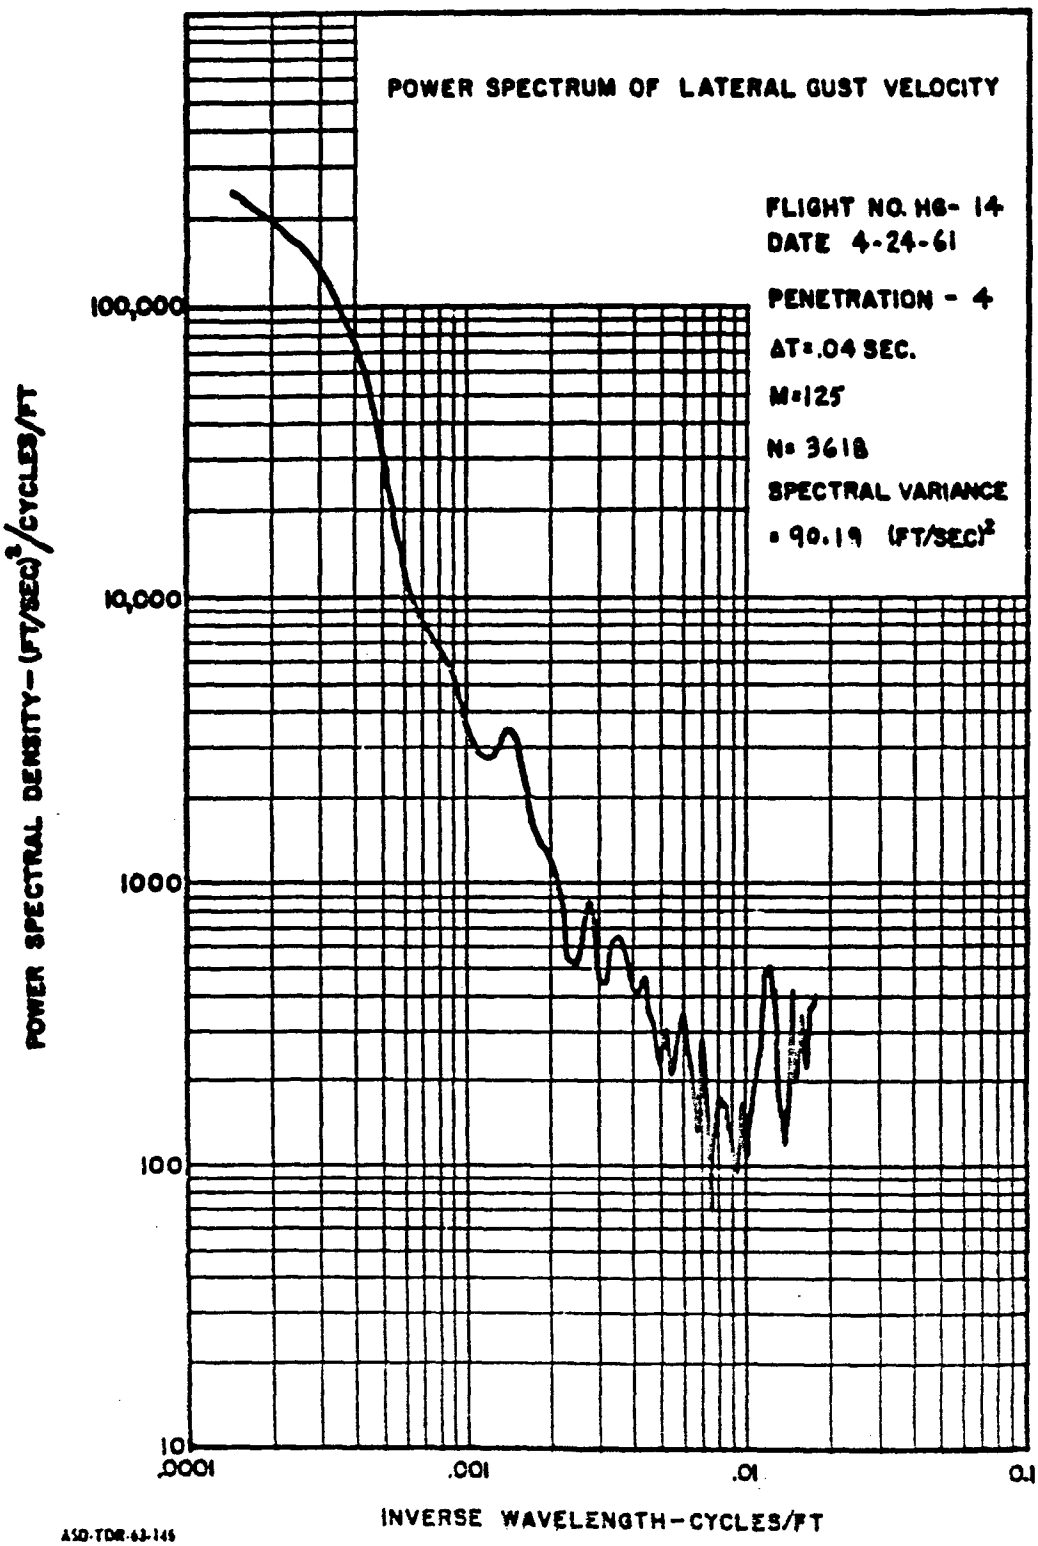

VOLUME III

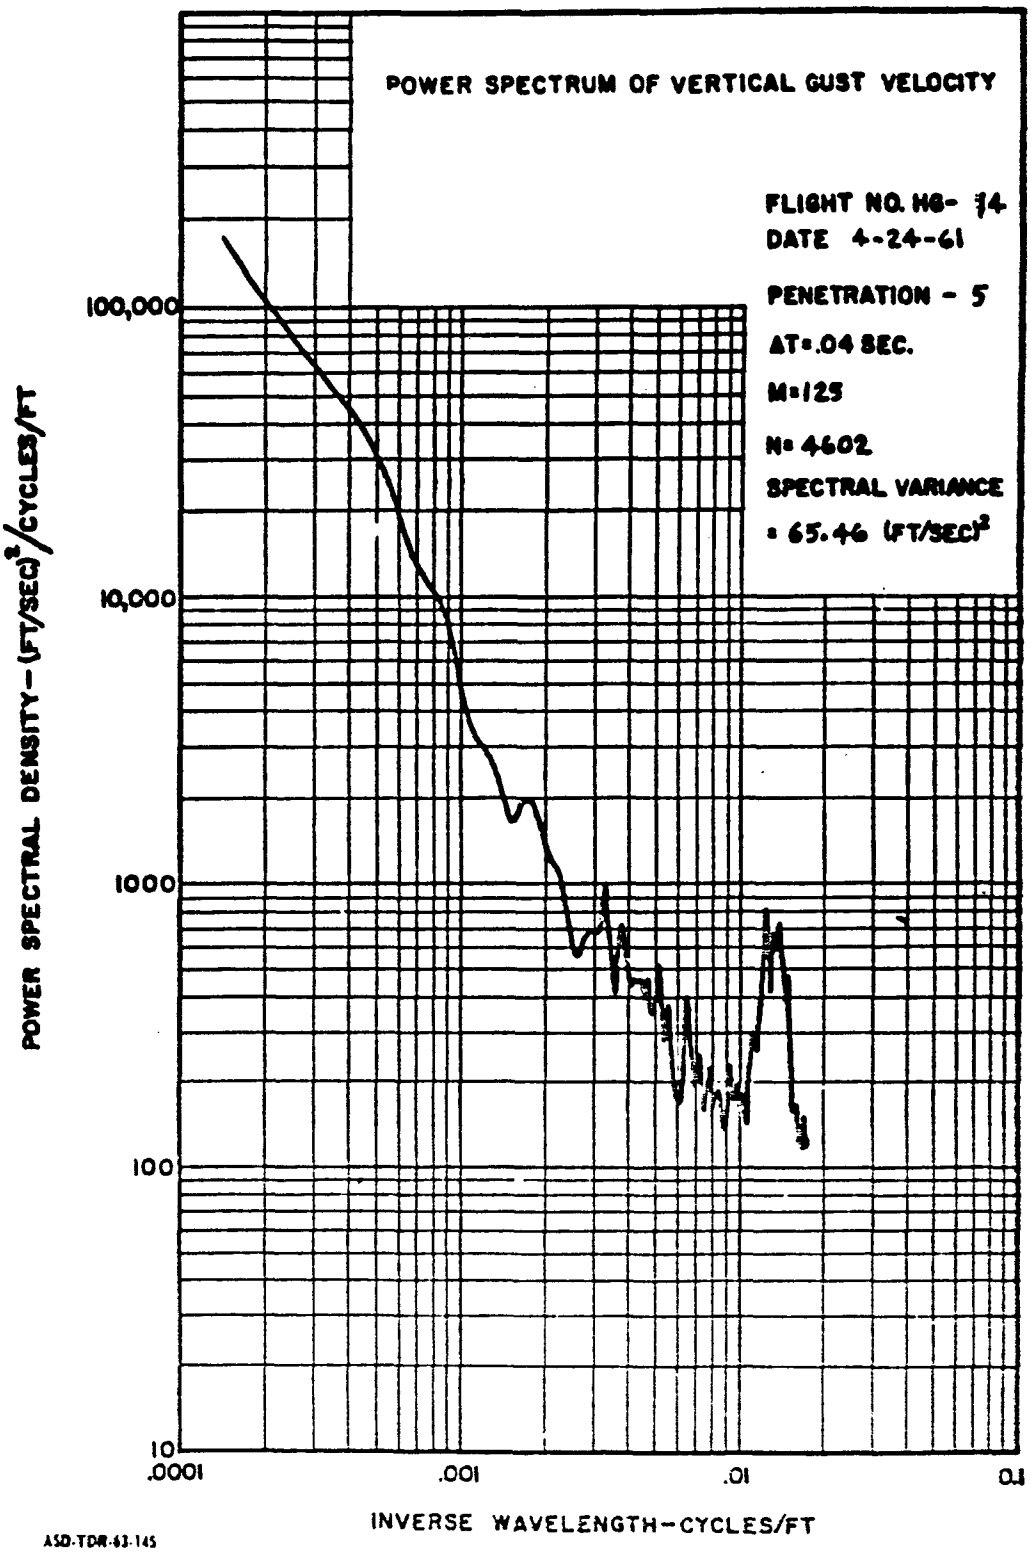

Time series -- plots of gust velocities, airspeed, altitude, temperature and normal acceleration.

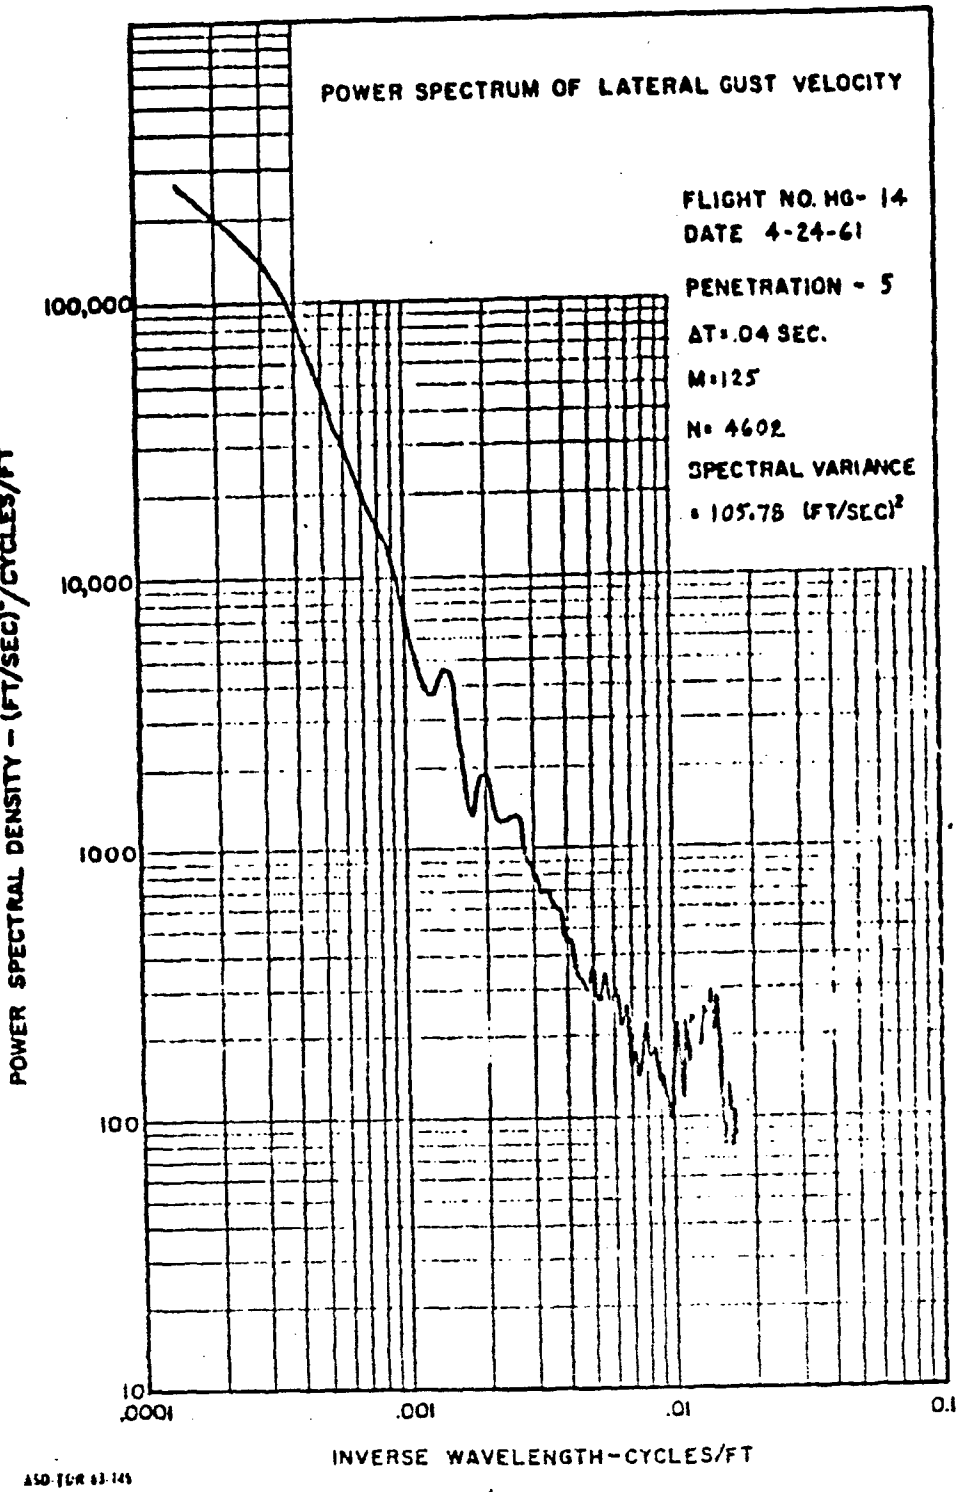

BASIC DATA -- IBM PRINTOUT

INVERSE WAVELENGTH-CYCLES/FT

Aeronautical Systems Division, AF Flight Dynamics Laboratory, Wright-Patterson Air Force Base, Ohio.
Rpt Nr ASD-TDR-63-145, Vol II. NB-66B HIGH ALTITUDE GUST SURVEY; Power Spectra, Final Report, June 63, 443pages.

Unclassified Report

Volume II contains the power spectra plots for vertical, lateral and forward gust velocities corrected for airplane motion, followed by the power spectra plots of uncorrected vertical and uncorrected lateral gust velocities. The data presented were obtained from 109 high altitude storm penetrations in which the length of runs varied up to 240 seconds.

III. Douglas Aircraft Co, Aircraft Division, Long Beach, Calif.
IV. J. A. Strom
T.G. Weathermon
V. Aval fr OTS
VI. In ASTIA collection

UNCLASSIFIED

The data were sampled 25 times per second and the autocorrelation function was computed for 125 phase shifts.
