FOREWORD

These tables were prepared for the use of engineers interested in temperatures in structures under heating conditions which may be represented by the noted mathematical problem.

The work was carried out in 1958 and 1959. It was supported by NOTS Task Assignment 502-726/61010/01060, 520-226/61001/01060, RMMO-53 034/216 1/F009-10-002, and Technical Services, a distributable general overhead expense.

This report was reviewed for adequacy and technical accuracy by Margaret W. Maxfield, Mathematics Division, Research Department, and by W. K. Smith, Aeromechanics Division, Weapons Development Department.

ABSTRACT

Temperature tables are given for the calculation of temperatures in a two-layer slab as a function of distance from one face and time. Heat is transferred at the interface and at the two outside faces. The complete solution is a linear combination, V_1 and V_2, tabulated in Volume 1 and Volume 2, respectively.

INTRODUCTION

The problem considered here is determining the temperature in a two-layer slab with heat transfer at both outside faces and a "contact resistance" at the interface. The initial temperatures of the two layers are constant and the outside stagnation temperatures are constants. These are special cases of the problems of references 1 and 2. Details of the solutions are given there.

THE PROBLEM

The equations to be satisfied are

$$U_{1XX} = k_1 U_{1t} \text{ for } 0 < X < L_1,\ t > 0, \qquad (1)$$

$$U_{2XX} = k_2 U_{2t} \text{ for } L_1 < X < L_2,\ t > 0, \qquad (2)$$

$$U_1 = U_a \text{ for } 0 < X < L_1,\ t = 0, \qquad (3)$$

$$U_2 = U_b \text{ for } L_1 < X < L_2,\ t = 0, \qquad (4)$$

$$K_1 U_{1X} = -h_i (U_i - U_1) \text{ for } X = 0,\ t > 0, \qquad (5)$$

$$K_1 U_{1X} = K_2 U_{2X} = -h_c (U_1 - U_2) \text{ for } X = L_1,\ t > 0, \qquad (6)$$

$$K_2 U_{2X} = -h_o (U_2 - U_o) \text{ for } X = L_2,\ t > 0. \qquad (7)$$

The temperatures in degrees are given by Eq. (17). $V_1(X,t)$ is given in Table 1. $V_2(X,t)$ is given in Table 2. $V_3(X,t)$ is the value of V_2 in Table 2 for the parameter and variable correspondence of Eq. 18.

V_1 is tabulated in this volume, and V_2 is tabulated in Volume 2.

V_1 is directly the temperature for

$$U_i = 1,\ U_a = 0,\ U_b = 0,\ U_o = 0\ .$$

V_2 is directly the temperature for

$$U_i = 0,\ U_a = 1,\ U_b = 0,\ U_o = 0\ .$$

V_3 is directly the temperature for

$$U_i = 0,\ U_a = 0,\ U_b = 1,\ U_o = 0\ .$$

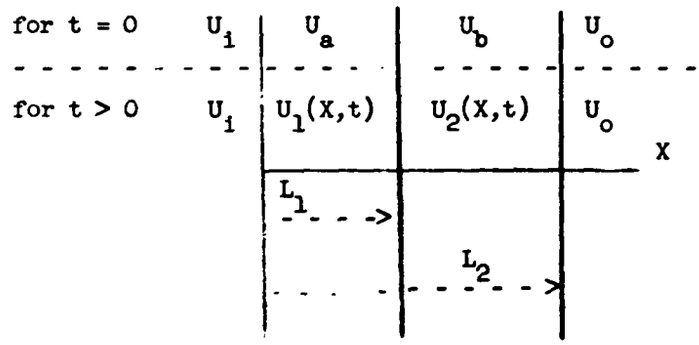

Fig. 1

THE SOLUTION

Changing variables to x, τ Eqs. (1) through (7) can be written

$$U_{1xx} = U_{1\tau} \quad \text{for } 0 < x < \alpha_1,\ \tau > 0, \tag{8}$$

$$U_{2xx} = \alpha_2^2 U_{2\tau} \quad \text{for } \alpha_1 < x < 1, \tau > 0, \tag{9}$$

$$U_1 = U_a \quad \text{for } 0 < x < \alpha_1,\ \tau = 0, \tag{10}$$

$$U_2 = U_b \quad \text{for } \alpha_1 < x < 1,\ \tau = 0, \tag{11}$$

$$U_{1x} = -\alpha_i(U_i - U_1) \quad \text{for } x = 0,\ \tau > 0, \tag{12}$$

$$U_{1x} = \alpha_3 U_{2x} = -\alpha_c(U_1 - U_2) \text{ for } x = \alpha_1,\ \tau > 0, \tag{13}$$

$$U_{2x} = -\alpha_o(U_2 - U_o) \text{ for } x = 1,\ \tau > 0. \tag{14}$$

It can be seen that Eqs. (8) through (14) will be satisfied by

$$U(x,\tau) = U_i V_1(x,\tau) + U_a V_2(x,\tau) + U_b V_3(x,\tau) + U_o V_4(x,\tau) \tag{15}$$

$$\text{where } U(x,\tau) \equiv \begin{cases} U_1(x,\tau) & 0 < x < \alpha_1 \\ U_2(x,\tau) & \alpha_1 < x < 1 \end{cases} \tag{16}$$

and V_1, V_2, V_3, V_4 are the solutions of Cases I - IV:

Case I $\quad U_i = 1,\ U_a = 0,\ U_b = 0,\ U_o = 0,$

Case II $\quad U_i = 0,\ U_a = 1,\ U_b = 0,\ U_o = 0,$

Case III $\quad U_i = 0,\ U_a = 0,\ U_b = 1,\ U_o = 0,$

Case IV $\quad U_i = 0,\ U_a = 0,\ U_b = 0,\ U_o = 1.$

It can also be seen that

$$U(x,\tau) - U_o = (U_i - U_o)\, V_1(x,\tau) + (U_a - U_o)\, V_2(x,\tau) + (U_b - U_o)\, V_3(x,\tau), \tag{17}$$

and that

$$V_3(x,\tau,\alpha_o,\alpha_i,\alpha_c,\alpha_1,\alpha_2^2,\alpha_3) = V_2\left(1-x,\frac{\tau}{\alpha_2^2},\alpha_i,\alpha_o,\frac{\alpha_c}{\alpha_3},1-\alpha_1,\frac{1}{\alpha_2^2},\frac{1}{\alpha_3}\right). \tag{18}$$

This symmetry is, with a few exceptions, preserved in constructing tables of V_1 and V_2; i.e., for many values of α_o, α_i, α_c, α_1, α_2^2, α_3 found in the tables the "symmetric-image", α_i, α_o, α_c/α_3, ..., may also be found in the tables. Values of V_3 are to be found from corresponding entries in V_2 as given by Eq. (18). In some cases the desired entries are outside the range given but many of them are in regions where they will be closely given by the last table entry.

Taking the Laplace transform of Eqs. (8), (9), (12), (13) and (14), we have

$$(s = -b^2, \quad U_{1L} \equiv \int_0^\infty e^{-s\tau} U_1(x,\tau)d\tau)$$

$$U_{1Lxx} = -b^2 U_{1L} - U_a \text{ for } 0 < x < \alpha_1, \tag{19}$$

$$U_{2Lxx} = -\alpha_2{}^2 b^2 U_{2L} - \alpha_2{}^2 U_b \text{ for } \alpha_1 < x < 1, \tag{20}$$

$$b^2 U_{1Lx} = \alpha_i(U_i + b^2 U_{1L}) \text{ for } x = 0, \tag{21}$$

$$U_{1Lx} = \alpha_3 U_{2Lx} = -\alpha_c(U_{1L} - U_{2L}) \text{ for } x = \alpha_1, \tag{22}$$

$$U_{2Lx} = \alpha_o(U_o - U_{2L}) \text{ for } x = 1. \tag{23}$$

The solution to (19) and (20) is of the form

$$U_{1L} = c_1 \sin bx + c_2 \cos bx + P_1(x,b) \tag{24}$$

and

$$U_{2L} = c_3 \sin \alpha_2 bx + c_4 \cos \alpha_2 bx + P_2(x,b). \tag{25}$$

Substitution in Eqs. (21) through (23) gives

$$c_1 b^3 - \alpha_i b^2 c_2 = \alpha_i U_i + \alpha_i b^2 P_1(0,b) - b^2 P_{1x}(0,b) \equiv A_1(b) \tag{26}$$

$$c_1 b \cos \alpha_1 b - c_2 b \sin \alpha_1 b - c_3 \alpha_2 \alpha_3 b \cos \alpha_2 \alpha_1 b + c_4 \alpha_2 \alpha_3 b \sin \alpha_2 \alpha_1 b$$
$$= -P_{1x}(\alpha_1,b) + \alpha_3 P_{2x}(\alpha_1,b) \equiv A_2(b) \tag{27}$$

$$c_1(b \cos \alpha_1 b + \alpha_c \sin \alpha_1 b) + c_2(-b \sin \alpha_c \cos \alpha_1 b) - c_3 \alpha_c \sin \alpha_1 \alpha_2 b$$
$$-c_4 \alpha_c \cos \alpha_1 \alpha_2 b = \alpha_2 P_2(\alpha_1,b) - \alpha_c P_1(\alpha_1,b) - P_{1x}(\alpha_1,b) \equiv A_3(b) \tag{28}$$

$$c_3(\alpha_2 b \cos \alpha_2 b + \alpha_o \sin \alpha_2 b) + c_4(-\alpha_2 b \sin \alpha_2 b + \alpha_o \cos \alpha_2 b) =$$

$$-\alpha_o P_2(1,b) - P_{2x}(1,b) - \frac{\alpha_o U_o}{b^2} \equiv A_4(b). \qquad (29)$$

The solutions to Eq. (26) through (29) will be of the form

$$c_i = \frac{N_i(b)}{D(b)} \text{ for } i = 1, 2, 3, 4.$$

The most convenient form for writing $N_i(b)$ and $D(b)$ is found by using the two-row two-column Laplace minors.

Define

$$A^1_{ij} = \begin{vmatrix} a_{i,j} & a_{i,j+1} \\ a_{i+1,j} & a_{i+1,j+1} \end{vmatrix}, \quad A^2_{ij} = \begin{vmatrix} a_{i,j} & a_{i,j+1} \\ a_{i+2,j} & a_{i+2,j+1} \end{vmatrix}$$

$$D(b) = \begin{vmatrix} a_{11} & a_{12} & 0 & 0 \\ a_{21} & a_{22} & a_{23} & a_{24} \\ a_{31} & a_{32} & a_{33} & a_{34} \\ 0 & 0 & a_{43} & a_{44} \end{vmatrix}$$

Then

$$D(b) = A^1_{11} A^1_{33} - A^2_{11} A^2_{23} \qquad (30)$$

$$\begin{aligned} N_1(b) \sin bx + N_2(b) \cos bx = A^1_{33} \{A_1[a_{22} \sin bx - a_{21} \cos bx] \\ + A_2[a_{11} \cos bx - a_{12} \sin bx]\} + \{A^2_{23} A_1[a_{31} \cos bx - a_{32} \sin bx] \\ + A_3[a_{12} \sin bx - a_{11} \cos bx]\} + \{A^1_{23} A_4[a_{11} \cos bx - a_{12} \sin bx]\} \end{aligned} \qquad (31)$$

$$N_3(b)\sin\alpha_2 bx + N_4(b)\cos\alpha_2 bx = A_{21}^{1}\left\{A_1\left[a_{44}\sin\alpha_2 bx - a_{43}\cos\alpha_2 bx\right]\right\} + A_{11}^{2}\left\{A_2\left[a_{43}\cos\alpha_2 bx - a_{44}\sin\alpha_2 bx\right] + A_4\left[a_{24}\sin\alpha_2 bx - a_{23}\cos\alpha_2 bx\right]\right\} + A_{11}^{1}\left\{A_3\left[a_{44}\sin\alpha_2 bx - a_{43}\cos\alpha_2 bx\right] + A_4\left[a_{33}\cos\alpha_2 bx - a_{34}\sin\alpha_2 bx\right]\right\} \tag{32}$$

The solutions are

$$U_1(x,\tau) = \frac{\alpha_i\left\{\alpha_c\left[1+\alpha_o(1-\alpha_1)\right] + \alpha_o\alpha_3(1+\alpha_1\alpha_c) - \alpha_o\alpha_3\alpha_c x\right\}}{\alpha_i\alpha_c + \alpha_o\left[\alpha_i\alpha_c(1-\alpha_1+\alpha_1\alpha_3) + \alpha_3(\alpha_i+\alpha_c)\right]} - 2\sum_{n=1}^{\infty}\left[N_1(b_n)\sin b_n x + N_2(b_n)\cos b_n x\right]\frac{b_n e^{-b_n^2\tau}}{D'(b_n)} \tag{33}$$

$$U_2(x,\tau) = \frac{\alpha_i\alpha_c\left[1+\alpha_o - \alpha_o x\right]}{\alpha_i\alpha_c + \alpha_o\left[\alpha_i\alpha_c(1-\alpha_1+\alpha_1\alpha_3) + \alpha_3(\alpha_i+\alpha_c)\right]} - 2\sum_{n=1}^{\infty}\left[N_3(b_n)\sin\alpha_2 b_n x + N_4(b_n)\cos\alpha_2 b_n x\right]\frac{b_n e^{-b_n^2\tau}}{D'(b_n)} \tag{34}$$

where the b_n's are the positive ordered zeroes of $D(b)$ and $D'(b_n) = \frac{dD(b)}{db}$ at $b = b_n$. Further details are given in Ref. 1 or Ref. 2. The functions actually tabulated are the V_1 and V_2 of Case I and Case II, respectively. Equation (18) can be used to find V_3 and actual temperatures are found by using Eq. (17). The particu- solutions were:

For V_1, $P_1 = 0$, $P_2 = 0$ and thus

$$A_1 = \alpha_i,\ A_2 = 0,\ A_3 = 0,\ A_4 = 0$$

For V_2, $P_1(x,b) = -\frac{1}{b^2}(1 - \cos bx)$, $P_2 = 0$ and thus

$$A_1 = 0,\ A_2(b) = \frac{\sin b\alpha_1}{b},\ A_3(b) = \frac{\sin b\alpha_1}{b} + \alpha_c \frac{1-\cos bx}{b^2},$$

$$A_4 = 0$$

Characteristic numbers (b_n, n=1,2, ... , the positive zeroes of D(b))

By introducing "variable phase angles" into the function $D_1^*(b) = \frac{D(b)}{b^2}$, these angles being monotone increasing functions of b, we can see that D(b) = 0 if and only if $h_1(m_1(b)) = K[h_2(m_2(b))+b]$, K = pos. const., where the m_i are monotone increasing functions of b and the h_i are--up to constant multipliers--"oppositely directed" tangent functions. This yields two sets of b-values, $(A_i)i=0,1,2,...$ and $(B_j)j=0,1,2,...$, the points where the vertical asymptotes of h_1 and h_2 cut the b-axis, with the property that between two adjacent values there lies one and only one zero of D(b).

The only caution to be observed is to note that, if $A_i = B_j$ (for some i,j) then the zero "between" A_i and B_j is $A_i = B_j$.

The location of the (A_i) and (B_j) reduces to the location of the zeroes of functions of the form $f(b) = c_1 \cos(K'b) - c_2 b \sin(K,b)$, c_1 non-neg. consts., K' a pos. const., and the zeroes of this function occur at precisely those values of b for which

$$\operatorname{ctg}(k'b) = K''b,\ K'' \text{ a non-neg. const.}$$

Again, we have two "oppositely-directed" functions, only one of which is tangent type, so we can find just one set $(C_i)i=0,1,2,...$ of b-values such that "between" two adjacent ones there lies one and only one zero of f(b).

A similar caution must be taken here--for certain values of α, the zero "between" C_i and C_{i+1} can actually be C_i (or C_{i+1}). In working out the explicit details, the cases where this happens are simple to observe.

THE TABLES

The values of the parameters and variables used in the tables.

A. For all parameter-settings, the following values of time, τ, and proportional distance, ρ, are used:

$$\tau = 10^{-3},\ 10^{-2},\ 10^{-1},\ 1,\ 10,\ 10^{2},\ 10^{3},\ 10^{4},$$

occurring across the top of the body of any one column as

$$\rho = \underbrace{0,\ .2,\ .4,\ .6,\ .8,\ 1.0;}_{\text{1st layer}} \quad \underbrace{0,\ .2,\ .4,\ .6,\ .8,\ 1.0.}_{\text{2nd layer}}$$

Distance, x, is connected to ρ by:

$$\begin{aligned} x &= \rho\alpha_1, \text{ in 1st layer,} \\ x &= \alpha_1 + \rho(1-\alpha_1), \text{ in 2nd layer} \end{aligned} \tag{35}$$

We might note, in particular, that $U(\rho^{\beta},\tau) = U(1^{(1)},\tau)$ is the answer at the right edge of layer one ($\rho^{(1)}$ means "a ρ from the first string of ρ's"; $\rho^{(2)}$ means "a ρ from the second string of p's"), whereas $U(\rho^{\beta},\tau) = U(0^{(2)},\tau)$ is the answer at the left edge of layer two; x itself is α_1, in both cases.

B. Two sets of α's are used:

1. $\alpha_o = 0$ (1 value)

$\alpha_i = 10^{-3},\ 10^{-2},\ 10^{-1},\ 1,\ 10$ (5 values)

$\alpha_c = 10^{-3},\ 10^{-2},\ 10^{-1},\ 1,\ 10,\ 10^{2},\ 10^{3}$ (7 values)

and

$\alpha_2^2 = 10^{-3},\ 10^{-2},\ 10^{-1},\ 1,\ 10,\ 10^{2},\ 10^{3}$ (7 values)

$\alpha_3 = \frac{1}{10}(\frac{1}{\alpha_2^2}),\ (\frac{1}{\alpha_2^2}),\ 10(\frac{1}{\alpha_2^2})$ (3 values)

$\alpha_1 = .01,\ .05,\ .1,\ .2,\ .5,\ .8,\ .9,\ .95,\ .99$ (9 values)

The α_2^2-, the α_3, and the α_1- set stay the same. One column (for one case) is taken up by a sweep of the nine α_1- values. Thus, the sweep of this set occupies the first 735 columns of each table.

2. $\alpha_o = 10^{-2}, 10^{-1}, 1, 10$ (4 values)

$\alpha_i = 0, 10^{-2}, 10^{-1}, 1, 10$ (5 values)

$\alpha_c = 10^{-2}, 10^{-1}, 1, 10$ (4 values)

The sweep of these (together with the α_2^2-, α_3-, α_1- sets above) takes 1,680 columns or c. 736 through c.2,415 (the last column of a table).

The order of sweep is the inverse of the ordering above; i.e., the α_3- set is swept out, then the α_2^2- set, the α_c-set, etc.

The accuracy--Symbols A, B, C, X, U.

In any one clump of answers (a sweep of $\rho^{(\beta)}$ and τ), order the answers from upper left to lower right, in the natural way, (i.e., sweep the first row from left to right, then the second row, etc.).

The accuracy of the first answer of the clump is denoted by one of the above symbols. This symbol also indicates the accuracy of following answers until the accuracy changes, when a new symbol is met.

The (symbol-accuracy) connection is meant to be:

A - All 4 digits have meaning (4-digit accuracy)
B - Right-most digit is meaningless (3-digit accuracy)
C - The 2 right-most digits are meaningless
X - The 3 right-most digits are meaningless
U - Your guess = If you guess between 0 and 1 - as good as the one printed!

(The right-most meaningful digit may be wrong, but by, at most, 1 unit).

Unfortunately, there is at least one section of the tables in which the above table is not to be trusted. It is c.2140, Case II, with $\alpha_o = 10^{\cdot}$, $\alpha_i = 0.01$, $\alpha_c = 1$, $\alpha_2^2 = 1000.$, $\alpha_3 = .0001$, $\alpha_1 = .99$.

The loss of meaning of the symbol (here, A) or, equivalently, the loss of accuracy of the table-entries, was due to the oversight of an obvious source of round-off error on the part of the programmer and was initially confined to isolated clumps in the tables. However, many--if not all--of the worst clumps were re-done, after the program had been corrected.

These errors, when they are obvious, are made obvious by a certain local monotonicity (in either ρ or τ) being violated (in the case of c. 2140, for fixed and smallest value of τ, in the second layer, the table-entries whould be zero, clearly, for $\rho^{(2)} = .6, .8$, since the entry is zero for $\rho^{(2)} = .4$). In Table 1, the monotonicity in τ for fixed ρ is the easiest to use.

Since τ enters the formula for temperature in a negative exponent (see formulae (33) and (34)), the table entries should improve in accuracy (for fixed ρ) as τ gets larger.

An Example of Table Use

To take advantage of Eq. (18), let us note that to the set $(\rho_i^{(\beta)}, \tau, \alpha_o, \alpha_i, \alpha_c, \alpha_1, \alpha_2^2, \alpha_3)$ corresponds the symmetric set

$$(\rho_{5-i}^{(\beta')}, \frac{\tau}{\alpha_2^2}, \alpha_i, \alpha_o, \frac{\alpha_c}{\alpha_3}, 1 - \alpha_1, \frac{1}{\alpha_2^2}, \frac{1}{\alpha_3})$$

$$= (\rho_i^{(\beta)'}, \tau', \alpha_o', \alpha_i', \alpha_c', \alpha_1', \alpha_2^{2'}, \alpha_3') .$$

Here, the index i runs over 0, 1, 2, 3, 4, 5 and $\beta' = 2$ if $\beta = 1$ and $\beta' = 1$ if $\beta = 2$. The correspondence between $\rho_i^{(\beta)}$ and x-values is the natural one (Eq. (35)).

Suppose, then, we have the initial temperatures $U_i = 1200$, $U_a = 600$, $U_b = 200$, $U_o = 100$. Suppose also that we want the temperature at $\tau = .1$ at the right edge of the first layer and that $\alpha_o = 0$, $\alpha_i = 10$, $\alpha_c = 1$, $\alpha_2^2 = .1$, $\alpha_3 = 1$, $\alpha_1 = .2$.

Here, $\rho_i^{(\beta)} = \rho_5^{(1)} = 1\ 0$ (in first string of entries), so that $\rho_i^{(\beta)'} = \rho_o^{(2)} = 0$ (in second string of entries).

In addition,

$$\tau' = 1,\ \alpha_o' = 10,\ \alpha_i' = 0,\ \alpha_c' = 1,\ \alpha_1' = .8,\ \alpha_2^{2'} = 10,\ \alpha_3' = 1.$$

Equation (17), which, in general, reads

$$U - U_o = (U_i - U_o)V_1 + (U_a - U_o)V_2 + (U_b - U_o)V_3,$$

here, in this example, is

$$(*)\quad U - 100 = (1100)V_1 + (500)V_2 + (100)V_3.$$

There remains only to look up V_1 in Case I tables, V_2 in Case II tables, and V_3 in Case II tables, under the primed values of the variables and parameters. These are substituted in (*), and we obtain the value of U, thus:

In Table 1, c. 658, under $\alpha_1 = .20$, we read:

$$V_1(1^{(1)}, .1) = .8326.$$

In Table 2, same slot, we read:

$$V_2(1^{(1)}, .1) = .0699.$$

In Table 2, c. 2052, under $\alpha_1' = .8$, we read:

$$V_3(0^{(2)}, 1.) = .0974.$$

Substituting in (*), we get the desired temperature

$$U = 1060.55.$$

NOTATION

K_1, K_2 = thermal conductivity of first and second layer materials

c_1, c_2 = specific heats "

ρ_1, ρ_2 = densities "

$L_1, L_1 - L_2$ = thickness "

h_i, h_o, h_c = heat transfer coefficients at inside face, outside face and interface

$k_1 = \frac{c_1 \rho_1}{K_1}$, $k_2 = \frac{c_2 \rho_2}{K_2}$

$\alpha_1 = \frac{L_1}{L_2}$

$\alpha_2^2 = \frac{k_2}{k_1}$

$\alpha_3 = \frac{K_2}{K_1}$

$\alpha_i = \frac{h_i L_2}{K_1}$

$\alpha_o = \frac{h_o L_2}{K_2}$

$\alpha_c = \frac{h_c L_2}{K_1}$, and at times is called also α_4

$k_1 L_2^2 \tau = t$

$x = \frac{X}{L_2}$

$\rho^{(\beta)}$ = "proportional distance" in the βth layer, see page 8

U_a, U_b = initial temperatures of first and second layer materials

U_1, U_2 = temperatures as functions of x and τ, in first and second layers

$U(\rho^{(\beta)}, \tau)$ = temperature (in EITHER layer) as a function of $\rho^{(\beta)}$ and τ

U_i, U_o = stagnation temperatures

V_1 = temperature for Case I (tabulated)

V_2 = temperature for Case II (tabulated)

V_3 = temperature for Case III (can be obtained from V_2 table)

V_4 = temperature for Case IV

σ_t = .000 σ = .001 σ_c = .001

σ_j^2 = .001 σ_3 = 100.0000

σ_1 = .01
