RECENT INFORMATION ON LONG-TIME CREEP DATA
FOR COLUMBIUM ALLOYS

DEFENSE METALS INFORMATION CENTER
BATTELLE MEMORIAL INSTITUTE
COLUMBUS, OHIO 43201

The Defense Metals Information Center was established at Battelle Memorial Institute at the request of the Office of the Director of Defense Research and Engineering to provide Government contractors and their suppliers technical assistance and information on titanium, beryllium, magnesium, aluminum, refractory metals, high-strength alloys for high-temperature service, corrosion- and oxidation-resistant coatings, and thermal-protection systems. Its functions, under the direction of the Office of the Director of Defense Research and Engineering, are as follows:

1. To collect, store, and disseminate technical information on the current status of research and development of the above materials.
2. To supplement established Service activities in providing technical advisory services to producers, melters, and fabricators of the above materials, and to designers and fabricators of military equipment containing these materials.
3. To assist the Government agencies and their contractors in developing technical data required for preparation of specifications for the above materials.
4. On assignment, to conduct surveys, or laboratory research investigations, mainly of a short-range nature, as required, to ascertain causes of troubles encountered by fabricators, or to fill minor gaps in established research programs.

Contract No. AF 33(615)-1121
Project No. 8975

Roger J. Runck
Director

Notices

When Government drawings, specifications, or other data are used for any purpose other than in connection with a definitely related Government procurement operation, the United States Government thereby incurs no responsibility nor any obligation whatsoever; and the fact that the Government may have formulated, furnished, or in any way supplied the said drawings, specifications, or other data, is not to be regarded by implication or otherwise as in any manner licensing the holder or any other person or corporation, or conveying any rights or permission to manufacture, use, or sell any patented invention that may in any way be related thereto.

Qualified requesters may obtain copies of this report from the Defense Documentation Center (DDC), Cameron Station, Bldg. 5, 5010 Duke Street, Alexandria, Virginia, 22314. The distribution of this report is limited because the report contains technology identifiable with items on the strategic embargo lists excluded from export or re-export under U. S. Export Control Act of 1949 (63 STAT. 7), as amended (50 U.S.C. App. 2020, 2031), as implemented by AFR 400-10.

Copies of this report should not be returned to the Research and Technology Division, Wright-Patterson Air Force Base, Ohio, unless return is required by security considerations, contractual obligations, or notice on a specific document.

RECENT INFORMATION ON LONG-TIME CREEP DATA FOR COLUMBIUM ALLOYS

J. J. English and E. S. Bartlett*

Introduction

This memorandum summarizes recent information relating to long-time creep parameters for columbium alloys. The available creep data for columbium alloys through mid-1963 were previously reported in DMIC Memorandum 170.

Long-time-creep test programs are being conducted by NASA-Lewis Research Center, Thompson Ramo Wooldridge, and Oak Ridge National Laboratory. Data from these and other selected sources for times greater than 10 hours are compiled in this memorandum.

Comparisons among many of the creep data are obscured by uncertainties relating to material parameters (i.e., was the material stress relieved, recrystallized, or processed according to some "optimized" schedule?). Other uncertainties accrue from methods of testing and reporting. Most frequently, external readout of creep strain (dial gages or differential transformers) is used rather than direct optical measurements of strain gages mounted on reduced sections. The accuracy of compensation for heterogeneous creep throughout the specimen is questionable in some cases, even when such corrections are made. In addition, at least two laboratories, CANEL and Martin-Denver, have reported observation of anisotropic behavior in columbium alloys related to creep straining. Such observations could be most important in compensating for external readout techniques. In most sources, it is not clear whether creep deformation includes elastic as well as plastic deformation.

NASA-Lewis Research Center

Table 1 gives some creep data obtained by NASA.⁽¹⁾ Test apparatus capable of a vacuum about 10^{-9} torr was used in the investigation. Creep strain was measured by direct optical techniques. Although limited, these data do provide some indication of relative long-time creep behavior of most columbium alloys of current interest.

Thompson Ramo Wooldridge

TRW is conducting long-time creep tests in the 10^{-9} to 10^{-10} torr pressure range under NASA sponsorship.⁽²⁾ Direct optical readout of creep strain is being used. Although the only columbium alloys scheduled for creep analysis are the high-strength forging alloys Cb-132M (Cb-20Ta-15W-5Mo-1Zr-0.1C) and AS-30 (Cb-20W-1Zr-0.1C), TRW has conducted a preliminary equipment check using the FS-85 alloy (Cb-28Ta-10W-1Zr). The FS-85 test specimens were annealed at 2600 F for 1 hour before testing. Creep results at 2000 F for a load of 7000 psi are shown in Figure 1. A tabulation of dimensional changes for FS-85 at 2000 F and 4000-psi stress is given in Table 2. The physical properties determined for FS-85 as a result of the strain measurements are footnoted in Table 2. The generally good agreement with previously reported data attests to the accuracy of the strain measurements.

*Research Metallurgist and Associate Chief, Non-ferrous Metallurgy Division, Battelle Memorial Institute, Columbus, Ohio.

The initial test on a specimen machined from AS-30 plate in the stress-relieved condition was conducted at 2000 F and 12,000 psi. Figure 2 gives the creep results for 800 hours' duration.

Under Navy sponsorship,⁽³⁾ TRW has examined the creep behavior of B-66 (Cb-5Mo-5V-1Zr) and D-43 (Cb-10W-1Zr) when coated with the Pfaudler modified silicide and TRW Cr-Ti-Si coatings. The specimen deformation was not monitored during the tests. Elongation (plastic deformation) was determined by measurement before and after test. The tests were conducted in air; so, the test life of the specimens was dependent on the protectiveness of coatings under stress as well as the creep-rupture characteristics of the two alloys. The cross-sectional area of the uncoated specimens was used to calculate the stresses in these tests. Tables 3 and 4 give the results of these tests. These results demonstrate the importance of considering the behavior of the coated substrate when the columbium alloy is to be used in an oxidizing environment. The TRW data show that both the coating and coating process can affect creep behavior. For example, premature fractures occurred at 1600 F and low stresses for coated D-43 and B-66. These failures at the low temperature were not caused by normal creep rupture but by the inability of the coatings to protect the columbium alloys from oxidation and contamination. In the unstressed condition, the protective lives of these coatings at 1600 F averaged about 100 hours. However, in the stressed condition, coating protection was degraded at 1600 F, presumably by coating crack formation and the absence of a viscous oxide product. At the higher temperatures, better coating performance was obtained in the stressed condition. Also, the TRW data show that the creep behavior of an alloy is dependent on the coating and coating process used to protect the alloy from oxidation.

Union Carbide Corporation

Union Carbide determined the creep properties of heavily worked and stress-relieved 0.065-inch-thick D-43 sheet, and lightly worked and stress-relieved 0.068-inch-thick B-66 sheet.⁽⁴⁾ Test equipment included a vacuum capability of 10^{-7} to 10^{-8} torr. An externally mounted dial indicator was used to measure strain. The creep values reported in Figures 3 through 10 reflect plastic deformation only. These design-type data show a greater (negative) slope for B-66 in the condition tested than for D-43. As a result, B-66 appears the more attractive material for very short-time (<1 hr) strength, and D-43 appears superior at longer times. Despite the more severe cold work, D-43 was much more resistant to recrystallization during testing than B-66, according to this investigation.

13. ABSTRACT This memorandum summarizes recent information relating to long-time creep parameters for columbium alloys. The available creep data for columbium alloys through mid-1963 were previously reported in DMIC Memorandum 170. Long-time-creep test programs are being conducted by NASA-Lewis Research Center, Thompson Ramo Wooldridge, and Oak Ridge National Laboratory. Data from these and other selected sources for times greater than 10 hours are compiled in this memorandum.

INSTRUCTIONS

1. **ORIGINATING ACTIVITY:** Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (*corporate author*) issuing the report.

2a. **REPORT SECURITY CLASSIFICATION:** Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. **GROUP:** Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. **REPORT TITLE:** Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. **DESCRIPTIVE NOTES:** If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. **AUTHOR(S):** Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. **REPORT DATE:** Enter the date of the report as day, month, year; or month, year. If more than one date appears on the report, use date of publication.

7a. **TOTAL NUMBER OF PAGES:** The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. **NUMBER OF REFERENCES:** Enter the total number of references cited in the report.

8a. **CONTRACT OR GRANT NUMBER:** If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, 8c, & 8d. **PROJECT NUMBER:** Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. **ORIGINATOR'S REPORT NUMBER(S):** Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. **OTHER REPORT NUMBER(S):** If the report has been assigned any other report numbers (*either by the originator or by the sponsor*), also enter this number(s).

10. **AVAILABILITY/LIMITATION NOTICES:** Enter any limitations on further dissemination of the report, other than those

imposed by security classification, using standard statements such as:

- (1) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. **SUPPLEMENTARY NOTES:** Use for additional explanatory notes.

12. **SPONSORING MILITARY ACTIVITY:** Enter the name of the departmental project office or laboratory sponsoring (*paying for*) the research and development. Include address.

13. **ABSTRACT:** Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. **KEY WORDS:** Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
