Abstract

A seven place table of the Debye integral and the ratio $\frac{C_v}{3R}$ has been calculated. For $Z = \theta/T$ in the range $1.0 < Z < 30.0$ the increment in Z is 0.01 and for the range $30.0 < Z < 100$ the increment in Z is 0.1. The three point Simpson's rule integrations were performed on a CDC 1604 computer.

The values of the internal energy and specific heat of a Debye solid have been well tabulated by Beattie.¹ However in deriving equivalent Debye temperatures from specific heat data and in making computations involving the sum of several Debye spectra, it is convenient to have an extended table not only of the Debye specific heat but also other associated quantities. In addition, although it is true that above $\theta/T = 24$ the T^3 law holds to a high precision, it is more convenient to work with tabulated values rather than an analytic form which must be evaluated for each desired value. For these reasons we have prepared this table for general distribution.

The Debye integral

$$I(Z) = \int_0^Z \frac{x^3 dx}{e^x - 1},$$

where $Z = \theta/T$, with θ the Debye temperature and T the absolute temperature, was evaluated for $1.0 \leq Z < 100.0$ by a 3-point Simpson's Rule with a $\Delta x = 1.0 \times 10^{-4}$. The value at $Z = 1.0$ was taken from Beattie.¹ Because this value was available to only six significant figures, the tabulated values may be uniformly in error by $\pm 0.5 \times 10^{-8}$. The actual calculations were performed to 10 significant figures, and rounded to the values appearing in the table. When this technique is used, the error introduced in any increment to the integration is of the order of $(\Delta x)^5$. The calculation was performed with $\sim 10^6$ increments; so the integration method should be considerably more accurate than the actual calculations which are ultimately limited by the computer word length.

The program was run twice and compared to minimize the possibility of a computer initiated computational error.

¹James A. Beattie, Journ.Math.&Phys., 6, 1 (1926)

The column headings are, respectively:
 THETA/T which is just Z, 1/Z, its reciprocal, 1/Z**3 is Z^{-3} ,
 INTEGRAL is the actual value of I(Z), C/3R is the I(Z) value
 appropriately scaled to become $C_v/3R$, and DEL(C/3R) are first
 differences in the C/3R column.

In the limit of $Z \rightarrow \infty$ the value of the integral is $\frac{4\pi^4}{15}$
 which is closely approached for $Z > 30$.
