TECHNICAL NOTE 1966-11

9 MARCH 1966

ABSTRACT

During the operation of the Haystack Pointing System, variable amounts of system generated data are recorded on magnetic tape for purposes of later reconstruction of the pointing aspect of the experiment. The Print Program, a pseudo-celestial computation program, is the means whereby this system data, recorded during actual system operation or during a system planning run, is reconstituted in the form of print-outs for immediate inspection or as BCD magnetic tape equivalents of the print-outs for remote printing and for input to other programs. The Print Program provides a variety of operation options which can be altered dynamically.

Accepted for the Air Force
Franklin C. Hudson
Chief, Lincoln Laboratory Office

HAYSTACK POINTING SYSTEM: PRINT PROGRAM

INTRODUCTION

The Print Program (PP) is the means whereby system data, recorded on magnetic tape during actual system operation or during a system planning run, is converted to on-line print-outs for visual inspection and to BCD magnetic tape equivalents of the print-outs for remote printing as well as for input to other programs.

PP resides on the master bootstrap tape as a pseudo-celestial computation program as a matter of convenience in calling the program to operate after system operation is completed.

PP uses the Printer Package* subroutine and a right ascension-declination conversion routine adapted from the Right Ascension-Declination Display Program.[†]

INPUT

Primary input to PP is the system produced high density (556 ℓ pi) binary tape written by the system subprogram RECORDING.[‡] PP is concerned with only two types of records on this tape. The first type is the so-called title record which contains the titling information supplied by the experimenter and certain other pertinent data. This record is viewed by PP as a "logical file" separator and is recognized as such by the fact that the first word contains the five Fieldata character representation of TITLE. The second type is the record which contains all of or a selected part of the portions of Common Storage (C/S) necessary to produce the desired output. The first word identifier for this record is MCPGM.

These two classes of records contain all of standard system generated information necessary to reconstruct the pointing aspect of the experiment. Data processing programs are free to avail themselves of the recording facility provided by the system and thereby record information on the system data recording tape. PP, however, was designed to interpret the format unique to the system data and consequently ignores non-system records.

*See Reference 1.

†See Reference 2.

‡See Reference 3.

Input information to PP is also supplied by the user via the keyboard. This will be discussed in the Operation section below.

OUTPUT

The user may elect to get his print-out directly on the high-speed printer or he may choose to produce an IBM-compatible BCD magnetic tape or he may get both of these simultaneously. Various control options which govern the format and amount of output are offered. These are discussed in the Operation section below.

Figure 1 shows a sample output of the program. The labeling and the units used are described in Appendix A.

OPERATION

The Print Program is a non-real-time program which is normally called to operation after the dynamic system has completed a run and has produced a magnetic tape recording which serves as input to PP. The usual manner in which the Master Control Program* (MCP) brings PP into core memory from the master bootstrap tape is via the attention symbol sequence.

Once MCP has read PP into core the role of control program is taken over by PP. This arrangement makes it possible for the user to communicate via the attention symbol with PP as the recorded data is being processed in the very same manner as the experimenter was able to communicate with MCP while the experiment was in progress.

When PP assumes control then, one of the very first things done is the setting up of a new intercom interlace[†] establishing PP as the control program. From this point until a return is made to the system proper, hitting the attention key will cause the following typeout:

```
TO SYSTEM(0) NEXT 'FILE'(1) NEW TIMES(2)
```

If the user elects choice (0) an exit is made to MCP and the system is ready for the next experiment with the recording tape returned to the load point for re-recording.

*See Reference 4.

†See Reference 4 and 5.

Fig. 1. Sample output of Print Program.

A choice of (1) will cause PP to search for the next logical file on the recording tape identified by the code word TITLE as the first word in the record. When the next "file" is located PP will issue a subset of the typeouts and questions that are output when the first logical file is about to be processed. (This set of typeouts is described below.) When "new times", choice (2) is elected PP will initiate another subset of the original line of questioning.

The balance of this memo concerns itself with question-answer sequence one encounters when using PP to process the system data tape. At this point we shall assume that the experiment has been concluded and the user has directed the control program to load PP into memory.

At the outset, PP now established as the control program senses whether or not the recording program has finalized the recording tape and if not will ask:

TAPE IS OK(0) REWIND IT(1) END FILE & REWIND(2)

PP will take whatever action is indicated by the user. Now the question of output media comes up, whether direct high-speed printer or BCD tape or both - hence the question:

ELECT O/P...HSP(0) BCD TAPE(1) BOTH(2)

Here, of course, the user must indicate the type of output(s) he desired.

Next, as a memory jog, the typeout:

SET TOP OF PAGE CLEAR PRINTER CHANNEL

Now PP begins a search of the tape for the first TITLE record. When it is located PP prepares the heading record which appears ahead of each frame. In Fig. 1 this is the line containing LES 2 as the titling information along with Friday May 21, 1964 SATELLITE SYSTM, the other pertinent information in the title record. At this point PP types out:

TITLE FOLLOWS

followed by the actual titling information entered earlier by the experimenter. In the example at hand this would be:

LES II

Now comes the question:

GMT START(HHMMSS)

to which the user may enter a time to start (and PP will skip over previously recorded data) or he may implicitly state "at the beginning" by simply answering with a carriage return. Next comes the companion question:

GMT END(HHMMSS)

and here again the user may elect a specific time to stop or implicitly indicate "to the end" with the carriage return reply. Now the question:

FOR EVERY NTH DATUM ENTER N(0-500)

Here the user must indicate how much (if any) of the interpolated data he wishes to be printed out. For every frame (2 seconds in real time) there are available the directly computed quantities as well as 500 interpolated command azimuth and elevation angles, the corresponding 500 incoming azimuth and elevation angles plus 500 interpolated doppler values. If the user wishes every interpolated point to be printed, he would enter N as 1 and every 1th point is output. On the other hand, if he chose N as 500 he would see only the first interpolated point (as well as the entire array of 2 second computed data whose output is non selectable). By convention N = 0 will eliminate all interpolated data from the output.

At this point, PP is ready to commence processing the data on the recording tape. In a steady state condition PP is time equating data which appeared in three separate input records. For the incoming azimuth and elevation angles, the record just read in is used; for the command azimuth and elevation angles the penultimate record is the source and for the two second directly computed values the data saved from the third record back is used.

In general, the program will continue to cycle and output in this manner until one of four things occur. The first, an end of file mark on the input tape will result in the typeout:

END OF FILE...RETURNING TO SYSTEM

Here control is returned to MCP, the input tape is returned to the load point and the system is ready to recycle.

The second source of interruption occurs when PP has come to a specified time to stop (GMT END(HHMMSS)).

In this case PP types out:

DONE....

followed by the timeout normally occasioned by striking the attention key i.e.

TO SYSTEM(0) NEXT 'FILE'(1) NEW TIMES(2)

Again the user must decide what is to be done.

The next way in which the cycle is disrupted occurs when PP encounters a new "logical file" on the input tape. This causes PP to terminate processing on the current file and proceed with the timeout/question sequence starting with

TITLE FOLLOWS

The remaining way in which processing is interrupted is, of course, by the user himself striking the attention key.

The flow diagram and listing of the Print Program follow Appendix A.

APPENDIX A

The sample print-out in Fig. 1 shows 4 seconds worth of real-time pointing information in two 2 second frames. Each frame begins with a title line which gives the identification information (here the caption LES II) supplied by the user followed by the day of the week, the date and the particular celestial computation program chosen by the user.

The pointing information for each frame is broken down into two categories, the "two second" direct-computation data followed by the interpolated data.

Two Second Data

HHMMSS	...	Greenwich mean time at the start of the frame. (Time in C/S TRUETIME). This is the reference time for this frame.
RA(DEG)		and further to the right of the page on the same line
RA(HMS)	...	Right ascension of the body at reference time in degrees and in hours, minutes, and seconds respectively.
DEC(DEG)		and further to the right of the page on the same line
DEC(DMS)	...	Declination of the body at reference time in degrees and in degrees, minutes and seconds respectively.
DISTANCE	...	The distance from geocenter to center of the body at reference time in earth radii for near-earth satellites and the moon; in astronomical units for the sun and planets. For stars an arbitrary zero is printed.
DISTDOT	...	Numerical derivative of DISTANCE in nautical miles per second.
RADOT	...	Numerical derivative of right ascension in radians per second. N.B. This quantity is taken from C/S register RADOT which contains $\dot{\alpha} \cos \delta$. A planned change to PP will remove the $\cos \delta$ factor.
AZIM	...	Computed azimuth in degrees.
ELEV	...	Computed elevation in degrees.
CAZIM	...	AZIM with corrections in degrees.
TRUERANGE	...	Range of the body from the site with same units conventions described under DISTANCE.
SRA	...	Right ascension in degrees with scan added.

SDEC	...	Declination in degrees with scan added.
CRANGE	...	Corrected range in radar units.
RANGEDOT	...	Time derivative of range in nautical miles per second.
DECDOT	...	Time derivative of declination in radians per second.
SAZIM	...	Azimuth in degrees with scan added.
SELEV	...	Elevation in degrees with scan added.
CELEV	...	Elevation in degrees with corrections added.
SIDERTIME	...	Right ascension of the site in degrees at CONVERTIME.

Interpolated Data

TIME SECS	...	Elapsed time in seconds (for real time) from HH MM SS (TRUETIME given above).
INCOMING AZIMUTH	...	Actual antenna position in degrees at indicated time. An * preceding the value indicates azimuth overlap zone.
INCOMING ELEVATION	...	Analogous to incoming azimuth.
COMMAND AZIMUTH	...	Interpolated azimuth value in degrees sent to the antenna at the indicated time.
COMMAND ELEVATION	...	Analogous to azimuth.
RECVD R/A HH MM SS.SS and RECVD DECLN DDD MM SS.S	...	Actual antenna position in the right ascension-declination coordinate system.
COMND R/A HH MM SS and COMND DECLN DDD MM SS.S	...	The position in celestial coordinates to which the antenna was being directed.

CMND DOPLR
CYCLES/SEC ... Doppler frequency in cycles per second.
MODES
ABCDE ... Mode switches setting. Not currently used.

11. SUPPLEMENTARY NOTES None	12. SPONSORING MILITARY ACTIVITY Air Force Systems Command, USAF	
13. ABSTRACT During the operation of the Haystack Pointing System, variable amounts of system generated data are recorded on magnetic tape for purposes of later reconstruction of the pointing aspect of the experiment. The Print Program, a pseudo-celestial computation program, is the means whereby this system data, recorded during actual system operation or during a system planning run, is reconstituted in the form of print-outs for immediate inspection or as BCD magnetic tape equivalents of the print-outs for remote printing and for input to other programs. The Print Program provides a variety of operation options which can be altered dynamically.
