INTRODUCTION

These tables give formulas for various special functions in terms of the Rodrigues operators. These operators are defined by

(1) $A(\alpha)t^{\mu} = \dfrac{\Gamma(\mu+\alpha+1)}{\Gamma(\mu+1)}\, t^{\mu} \qquad \mu+\alpha \neq -1,-2,\ldots$

(2) $\tilde{A}(\alpha)t^{\mu} = \dfrac{\Gamma(\mu+1)}{\Gamma(\mu+\alpha+1)}\, t^{\mu} \qquad \mu \neq -1,-2,\ldots$

(3) $B(\alpha)t^{\mu} = \dfrac{\Gamma(\alpha-\mu)}{\Gamma(-\mu)}\, t^{\mu} \qquad \alpha-\mu \neq 0,-1,-2,\ldots$

(4) $\tilde{B}(\alpha)t^{\mu} = \dfrac{\Gamma(-\mu)}{\Gamma(\alpha-\mu)}\, t^{\mu} \qquad \mu \neq 0,1,2,\ldots$

(5) $Mt^{\mu} = \Gamma(\mu+1)t^{\mu} \qquad \mu \neq -1,-2,\ldots$

(6) $\tilde{M}t^{\mu} = \dfrac{1}{\Gamma(\mu+1)}\, t^{\mu}$

(7) $Nt^{\mu} = \Gamma(-\mu)t^{\mu} \qquad \mu \neq 0,1,2,\ldots$

(8) $\tilde{N}t^{\mu} = \dfrac{1}{\Gamma(-\mu)}\, t^{\mu}.$

The first four are related to the operators of fractional integration and the second four to the Laplace transform and its inversion.

The details of the application of these formulations are given in "The Rodrigues Operator Transform, Preliminary Report," by T. P. Higgins.

These tables can be used to obtain many more relations. If we use

$$Rf(t) = t^{-1}f(\tfrac{1}{t}),$$

then, for example, from the formula

$$f(t) = A(\alpha)\tilde{A}(\beta)MA(\gamma)g(t),$$

it follows that

$$f(\tfrac{1}{t}) = B(\alpha+1)\tilde{B}(\beta+1)A(\gamma+1)Ng(\tfrac{1}{t}).$$

Many, but certainly not all, of the relations which can be obtained in this way have been included in the tables. Using the techniques given in the Preliminary Report, integral transform tables such as the Bateman Manuscript Project can be used to derive additional formulas.

The notation conforms to that of the Bateman series. The symbols are listed at the end of the tables.
