PREFACE

This is XV-5A Report No. 154, published in three volumes, which presents low and high speed wind tunnel test results for a 1/5-scale inlet model of the U.S. Army XV-5A Lift Fan Research Aircraft. The tests were conducted at the David W. Taylor Model Basin (DTMB) subsonic and transonic wind tunnel facilities during the period 4 April to 29 May, 1962. Tabulated data are located in Volume II for the low speed tests (Mach 0 to 0.2), and in Volume III for the high speed tests (Mach 0.4 to 0.85). Summary tables, graphs, model description, instrumentation, conditions tested, validity of data and other information are presented in Volume I. In general, good repeatability of data was obtained, and with the exception of Run 1 data of the high speed tests and a few other isolated test points, the data presented are believed to offer a reliable basis for predicting aircraft performance.

This is Volume II.

1.0 INTRODUCTION

This report published in three volumes presents low and high speed wind tunnel test results for a 1/5-scale inlet model of the U.S. Army XV-5A Lift Fan Flight Research Aircraft.

Tests were conducted at David W. Taylor Model Basin (DTMB) by Ryan Aeronautical Company as a part of the XV-5A wind tunnel test program. Inlet performance data were obtained over the anticipated flight speed range of the XV-5A aircraft for a variety of inlet and model configurations. Low speed tests (M = 0 to .2) were conducted in the DTMB 8 x 10 foot subsonic wind tunnel facility during the period 4 April to 2 May 1962. High speed tests (M = .4 to .85) were conducted in the DTMB 7 x 10 foot transonic wind tunnel facility during the period 24 May to 29 May 1962. Presentations in this report are limited to reduced test data, and information considered necessary for their proper interpretation. Evaluation, analysis and discussions relating to data use for predicting XV-5A aircraft performance characteristics will be presented in subsequent aircraft technical reports. All reduced pressure data obtained from the wind tunnel tests are presented in tabular form. Low speed data are located in Volume II and high speed data are located in Volume III.

The following information is located in Volume I:

The model description is located in Section 3.0; General sketches and photographs are presented in Figures 2-1 to 2-8 of Section 2.0; Detailed model drawings are located in Figures 7-1 through 7-10 of Section 7.2; Photographs of the model installed in the low speed tunnel facility are shown in Figures 2-2 and 2-3; and in the high speed wind tunnel facility Figure 2-8.

2.0 MODEL DESCRIPTION AND TEST PROCEDURES

2.1 MODEL AND INSTALLATION

The Ryan XV-5A 1/5 scale inlet model was designed for testing in both low speed and high speed wind tunnels of the David W. Taylor Model Basin facility. The model was constructed and instrumented by Contour Company, Rosemead, California according to specifications, drawings, and loft boards furnished by Ryan Aeronautical Company. Model configuration flexibility was obtained through a series of interchangeable instrumented components, including two canopy sections, three inlet sections and three inlet splitter sections which were attachable to the basic fuselage. Air flow passages were provided to simulate engine air flow and boundary layer bleed ducts. Compatible and interchangeable sting adaptors attached to the model base permitted model installation on the mounting systems of both low speed and high speed wind tunnel facilities without modification.

The model was constructed mostly of alternately oriented laminates of one-inch mahogany bonded with Penacolite to form a herringbone bond for added strength. The Penacolite bond is suitable for use to 120° F. The basic model component is the fuselage section, which provides space for instrumentation and attachment of model interchangeable components, and which is attached to the sting adaptors for wind tunnel installation. Model fabrication tolerances related to loft boards were: external lines, ± 0.030; inlet lips, ± 0.003; and inlet duct passages, ± 0.005 inches. Inlet lips were fabricated of aluminum. The model was finished with a highly polished paint. Component notation and model configurations tested are summarized in Table 2-1.

Model instrumentation consisted of 153 total and static pressure probes generally located and identified in Table 2-2. Table 2-2 also references model drawings where detailed instrument location and identification may be obtained. A majority of the pressure probes were connected to three Scanivalves of 48 ports each. Simultaneous readings of all Scanivalve data were obtained by storing pressures in the storage manifolds by means of lockout valves. Stored pressures were fed to the Scanivalves, and transmitted to the recording system by two 5 psid and one 1 psid pressure transducers.

Data were recorded sequentially on punched tape, coded for the ALWAC III-E computer, and typed by a Friden Flexowriter. Test condition control information was manually typed into the data recording system. Model engine air flow rates were controlled by remotely positioned conical plugs at the outlet of the model air flow passages. Since the plugs were separately controlled from fully closed to fully open positions, engine out conditions could be simulated. Only the left engine duct was fully instrumented. Thus in applying model data to the full scale aircraft, identical flow in both ducts is expected at all angles of attack for zero sideslip angle, while unequal flow is expected during sideslip angle studies, so that both positive and negative values must be considered to determine inlet performance during sideslip conditions. Flow control instrumentation (see Table 2-2) was provided in the calibrated model venturi section of both engine air ducts and photographically recorded from manometer boards. In the low speed tests engine air flow was obtained by drawing air through two 4.0 inch hoses connected to an external suction system provided by the facility. This system also served to calibrate the venturi section of the model.

2.2 TEST PROCEDURE

Prior to model installation in the low speed wind tunnel, model instrumentation was thoroughly checked for defects resulting from shipping and/or handling. Except for the pressure probes noted in Table 2-3, all instrumentation was considered in workable order. Periodically throughout both low speed and high speed wind tunnel tests, pressure checks were made to determine the validity of the pressure probes. Any discrepancies were noted and indicated on the output data. Transducer calibrations were obtained by applying known pressure differentials and noting the number of counts on the recorder system.

In general, the test procedure followed in both low speed and high speed wind tunnels consisted of the following steps:

1. Installation of model configuration in wind tunnel.

2. Establishment of wind tunnel speed.

3. Adjustment of model air flow rate.

4. Setting of model attitude by varying pitch (α) and sideslip (β) angles.

The variables in each step were investigated until the desired matrix of test data for each configuration was obtained. In the low speed facility,

tunnel speed was controlled by dynamic pressure and all pressure data were referenced to barometric data. In the high speed facility, tunnel speed was controlled by Mach number, and all pressure data were referenced to total pressure. Definition of terms are presented in Table 2-4.

DEFINITION OF SYMBOLS AND TERMS

Symbol	Definition	Units
A_c	Area of compressor face	in^2
A_t	Area of inlet throat	in^2
B	Barometric pressure	inches H_g
C_p	Pressure coefficient	None
g	Acceleration of gravity = 32.174	ft/sec^2
K	Compressor face total pressure variation factor	%
L	Compressor face static pressure variation factor	%
m/m*	Mass flow ratio referenced to critical mass flow at inlet throat	None
M_c	Mach number at compressor face	None
M_o	Free stream Mach number	None
P_{cb}	Average static pressure engine bullet, tubes 207-212	lb/in^2
P_{cw}	Average static pressure compressor face wall, tubes 201-206	lb/in^2
P_s	Static pressure	lb/in^2
$P_{s\ max}$	Maximum static pressure, tubes 201-206	lb/in^2
$P_{s\ min}$	Minimum static pressure, tubes 201-206	lb/in^2
P_{sn}	Static pressure tube n	lb/in^2
P_{so}	Free stream static pressure	lb/in^2
P_t	Total pressure	lb/in^2

TABLE 2-4 (Continued)

Symbol	Definition	Units
P_{tc}	Average total pressure at compressor face, tubes 101-130	lb/in^2
$P_{t\ max}$	Maximum total pressure at compressor face, tubes 101-130	lb/in^2
$P_{t\ min}$	Minimum total pressure at compressor face, tubes 101-130	lb/in^2
P_{to}	Free stream total pressure	lb/in^2
P_{tc}/P_{to}	Inlet total pressure recovery factor	None
q	Free stream dynamic pressure	lb/in^2
R	Gas constant for air = 1716.322	$ft^2/sec^2\,°R$
T	Tunnel temperature	°F
T_{tc}	Compressor face total temperature T + 459.69	°R
W_c	Model air flow rate at compressor face	lb/sec
α	Model angle of attack	Degrees
β	Model angle of sideslip	Degrees
γ	Ratio specific heats for air = 1.4	None
C_p	$= (P_{sn} - P_{so})/q$ or	
C_p	$= (P_{sn} - P_{so})/P_{so}$ at $q = 0$	
K	$= (P_{t\,max} - P_{t\,min})/P_{tc}$	
L	$= (P_{s\ max} - P_{s\ min})/P_{tc}$	
m/m^*	$= 1.728\ M_c\ A_c\ P_{tc} / A_t\ P_{to} \left[1 + \frac{\gamma - 1}{2} M_c^2\right]^{\frac{\gamma + 1}{2(\gamma - 1)}}$	

TABLE 2-4 (Continued)

Symbol	Definition	Units

$$M_c = (2/\gamma - 1)^{1/2} \left[(P_{tc}/P_{sc})^{\frac{\gamma - 1}{\gamma}} - 1 \right]^{1/2}$$

$$M_o = (2/\gamma - 1)^{1/2} \left[(P_{to}/P_{so})^{\frac{\gamma - 1}{\gamma}} - 1 \right]^{1/2}$$

$$q_o = \gamma \; M_o^{\,2} \; P_{so}/2$$

$$W_c = \frac{g \, M_c \, Ac \, P_{tc} \, (\gamma/R)^{1/2}}{144 \, (T_{tc})^{1/2} \left[1 + \frac{\gamma - 1}{2} \, M_c^{\,2} \right]^{\frac{\gamma + 1}{2(\gamma - 1)}}}$$

3.0 TEST RESULTS

All reduced data obtained from low speed wind tunnel tests ($0 \leq M_0 \leq 0.2$) for the conditions of Table 3-1 are presented in Tables 3-2 through 3-9 of this volume. When two values of m/m* are given in the tables, the values are for the left and right hand inlet ducts respectively. A single value of m/m* indicates left and right inlet ducts are operating at essentially equal flows (within $\pm$ 0.5% or that only one engine is operative (Eng. 1). In addition to the defective tubes of Table 2-3, certain tubes developed leaks or constrictions during the tests; either in the model or the readout instrumentation. An effort was made to identify the tubes by overlining the questionable data. Also parts of the data for tubes 131 and 134 are overlined, since they were cross-connected for a portion of the tests. When the Scanivalve capacity was exceeded, data was labeled n.g. (this is equivalent to blowing a manometer tube for a specific test point). Tabular headings, identification of instrumentation, symbols, and supporting equations are defined in Tables 2-1 through 2-4.

The reported mass flow ratios (m/m*) for the low speed tests were based on a compressor face to inlet throat area ratio of 1.0177. Review of inlet model loft boards show this ratio should have been 1.0288; therefore, although of small effect, values of m/m* quoted in Tables 3-2 through 3-9 should be increased by a factor of 1.0109.

LOW SPEED TEST DATA

In the following Table, it should be noted that:

- *Tubes 330-334 should read 330A-334A.*
- *Tubes read horizontally and consecutively.*
- *Pressure data struck out by lining indicates dejective reading due to leakage, line plug, etc.*
