FOREWORD

The Air Force Scientific Research Bibliography is part of our way of doing business. The Air Force Office of Scientific Research has the job of supporting fundamental research relevant to the Air Force operating mission. AFOSR regards this as a responsibility to document and make accessible the written results of the research it supports.

Volume V covers the year 1961, the beginning of the second decade of research results to be surveyed in this series. Volume I abstracted those publications produced from 1950 to 1956. That task was undertaken barely in time to produce reasonable completeness in view of the tendency of files to be retired, records to be stored, and items to simply disappear from shelves.

These compound bibliographic and abstracting challenges are no doubt the reason why, in publishing a work of this kind, AFOSR stands alone among Federal agencies supporting basic research. That AFOSR began in time to begin at the beginning is only because of the initiative and foresight of Harold A. Wooster, Director of Information Sciences, who set up this project and continues to guide it.

With this volume, perhaps more than 25,000 separate research publications have been catalogued and abstracted. Volumes for subsequent years are in preparation, and with each the difference becomes less between survey year and appearance of a volume.

With a printing of 3,000 copies, this edition will be distributed, as were earlier volumes, to libraries, universities and research centers the world over. There researchers and research managers may have direct access to a large body of scientific investigation directed along highly specific lines of relevance and potential application. This demand for the series is further evidenced by additional distribution by the Defense Documentation Center and sales by the Superintendent of Documents, U. S. Government Printing Office.

Aside from the very real contribution of augmenting scientific information centers, The Air Force Scientific Research Bibliography packages in final form, thus far, 11 years of research support and accounts for the use of about $160 million of public funds.

Ivan C. Atkinson, Col., USAF
Executive Director, Acting
Air Force Office of Scientific Research

PREFACE

Prolegomenon

Ten years ago, when work on this series of bibliographies started, basic research was in a parlous state. Concern for the national debt ceiling had prompted reduction of research expenditures; research contracts were cancelled to maintain this ceiling. Despite this austere regime, this Directorate devoted a substantial portion of its resources to starting work on these bibliographies, on the grounds that library research cost less than laboratory research, and that the collecting into a series of easily accessible volumes of the results of research already supported by the Air Force Office of Scientific Research was a necessary (if not sufficient) first step towards ensuring efficient use of scant research resources.

Shortly after this work was started Sputnik flew; basic research became a summum bonum, and entered into a period of unprecedented prosperity. But now, ten years later, the cycle seems to have come full swing. The talk these days is of coupling, and of technology transfer, and of hindsight, and of applying what we already know, but the results seem to be the same as in the black August of 1957. And the arguments for continuing this slow, patient, complete and accurate compilation of the results of all research supported by the Air Force Office of Scientific Research seem as valid today as they did ten years ago when this work was started.

Scope

This is the fifth volume of a continuing bibliographic series, and includes within the limitations of the law of diminishing returns, abstracts of all technical reports, journal articles, books, symposium proceedings, and monographs produced and published by scientists supported in whole or in part by the Air Force Office of Scientific Research during the calendar year 1961. Previous publications in this series have been:

Vol. I (1950-1956), issued in 1961
Vol. II (1957-1958), issued in 1964
Vol. III (1959), issued in 1965
Vol. IV (1960), issued in 1966

The Air Force Office of Scientific Research supports fundamental research in the five major scientific disciplines: physics, chemistry, engineering sciences (subsuming mechanics and propulsion), life sciences (both biological and behavioral, but not medical), and mathematics (including during the period of this bibliography, the information sciences). Thus the publications abstracted herein are multi-disciplinary, their common link being task support by AFOSR.

Sources Searched

References, reports, and clues to the existence of reports were found by searching the indexes and report collection of the Air Force Office of Scientific Research Technical Library, and the collection of the Defense Documentation Center. Detailed searches were made of each contract file in the several AFOSR Directorates. In addition, cover-to-cover searches were made of over 300 scientific journals issued mostly in the time period 1961-1964.

Form of Entry and Arrangement

Inherent in the organization of this book is the concept of the reports within a contract as an unanalyzed monographic series. Reports are posted chronologically and/or alphabetically under contracts, these in turn under departments or laboratories, and these under contractors. This does, in fact, provide a rough subject grouping, with the detailed subject index leading into clusters of like reports.

The abstracts are identified by item numbers and are listed under the numbers in the indexes. The form of entry is, in general, that being used for DDC catalog cards i. e., source of the document; title; personal author, if any; date; pagination; report number; contract number; and accession number. The chief exception to DDC form of entry is that the primary entry is by the parent organization followed by the name of the specific laboratory or important subdivision.

Availability of Reports

The principal accession or control numbers, which indicate the locations of reports in collections are:

AD — ASTIA Document or Accessioned Document: (available at DDC Defense Documentation Center), Cameron Station, Alexandria, Virginia 22314

PB — Publication Board: for sale by the Clearinghouse for Federal Scientific and Technical Information (CFSTI), Sills Building, 5285 Port Royal Road, Springfield, Virginia 22151

The fact that a report is abstracted in this book means that a copy of this report existed at the time the abstract was written; it should not be construed to imply that either AFOSR or the Library of Congress necessarily has a copy available for distribution. Those seeking reports should do so from the cited agencies, not from AFOSR.

Indices

A detailed subject index, arranged alphabetically, and a special subject classification for mathematics, have been provided. In addition, there are a contract index, an AFOSR control number index, and a personal author index for this volume. Finally a cumulative personal author index for the first five volumes has been added.

Acknowledgments

Many people have shared in the production of this volume. The work has been fostered and nurtured by the previous Commanders and Executive Director of Air Force Office of Scientific Research: Brigadier Generals H. F. Gregory and B. G. Holzman; Colonels A. P. Gagge and Jack L. Deets; Dr. Knox Millsaps and the present Executive Director, Dr. William Price. During the period of compilation of this volume (not the period of the literature covered) much of the responsibility for documentation within AFOSR was transferred to the Office of the Assistant Executive Director for Research Operations, Lt. Col. Carl S. Jennings, Jr. He, his administrative assistant for documentation, Miss Arlene Blose, and their intermittently faithful computer have been in large part responsible for providing the AFOSR input to this volume. Alex Nagy, chief designer, and staff artist Pat Shealy, of the Office of Aerospace Research, drew the chapter end plates (with the usual disclaimer about resemblances to persons living or dead being purely coincidental).

The bibliographic team has worked under the guidance and leadership of Dr. Clement R. Brown, Head of the Special Bibliographies Section, Science and Technology Division, Library of Congress. The chief bibliographers have been G. Vernon Hooker, Doris C. Yates, Harvey D. Brookins, Joan E. Halpin, Parthenia A. Patrick, Carl Kirksey, and Jeanne D. Weber. Recognition is also due for the invaluable work in preparation of this manuscript, searching, and preliminary cataloging done by Mrs. Marion S. Carr and Mrs. Phyllis M. Martin.

DETERMINANTS OF A CERTAIN CLASS OF NON-HERMITIAN TOEPLITZ MATRICES, by G. Baxter and P. Schmidt. [1960] [7]p. (AFOSR-232) (AF 61-(052)42 and AF AFOSR-61-4) AD 611295 Unclassified

Also published in Math. Scand., v. 9: 121-128, 1961.

An elementary identity is established between 2 determinants and its use is illustrated as a tool for investigating a certain class of Toeplitz determinants. The feature of the identity which makes it useful in such investigations is that it equates a determinant of large order n to one fixed small order k. Thus, using only elementary techniques, precise information can be obtained on the asymptotic behavior of certain n x n Toeplitz determinants as n becomes infinite. Consider the function $f(z) = z^{-k}\Sigma_0^{\infty} a_m z^m$, where $k \geq 0$, $\Sigma_0^{\infty}|a_m| < \infty$, and $\log f(e^{i\theta}) = \Sigma_{-\infty}^{\infty} h_m e^{im\theta}$, with $\Sigma_{-\infty}^{\infty}|h_m| < \infty$. The corresponding Toeplitz matrix is non-Hermitian, but the authors derive the following analogue of classical theory. If $D_n(f)$ is the determinant of the n^{th} section of the Toeplitz matrix, then $\lim D_n(f)/\exp nh_0 = \exp(\sum_0^{\infty} mh_m h_{-m})$.

Aarhus U. [Mathematical Inst.] (Denmark).

ON THE RATE OF GROWTH OF THE PARTIAL MAXIMA OF A SEQUENCE OF INDEPENDENT IDENTICALLY DISTRIBUTED RANDOM VARIABLES, by O. Barndorff-Nielsen. [1961] [12]p. (Technical scientific note no. 5) (AFOSR-1339) [AF 61(052)42] AD 264846 Unclassified

Also published in Math. Scand., v. 9: 383-394, 1961.

Let $X_1, X_2, \cdots, X_n$ be a sequence of independent, identically distributed random variables defined on a probability field (Ω, A, P) and let F denote their (common) distribution function so that $F(x) = P(\{X_n \leq x\})$ for all $x \in (-\infty, \infty)$ and $n = 1,2,\cdots$. The main result is the following: Let $\{\lambda_n\}$ be a non-decreasing sequence of real numbers, such that the sequence $\{(F(\lambda_n))^n\}$ is non-increasing. Then $P\left(\left\{\max_{1\leq k\leq n} X_k \leq \lambda_n \text{ for infinitely many } n\right\}\right) = \begin{cases} 0 \\ 1 \end{cases}$ if $\sum_{n=3}^{\infty} (F(\lambda_n))^n \frac{\log\log n}{n} \begin{cases} < \infty \\ = \infty \end{cases}$. The result is established by means of a generalization of the convergence part of the Borel-Cantelli lemmas.

3

Aarhus U. [Mathematical Inst.] (Denmark).

ON A GENERALIZATION OF THE FINITE ARCSINE LAW, by G. Baxter. [1961] [12]p. (AFOSR-2877) (In cooperation with Minnesota U., Minneapolis) [AF 61-(052)42] AD 428404 Unclassified

Also published in Ann. Math. Stat., v. 33: 909-915, Sept. 1962.

A generalization of the arcsine law for infinitely divisible stochastic processes is found. The generalization method consists of finding a pair of differential equations for the generating functions of quantities like those in the distribution of N which is the number of positive partial sums considered. These equations are solved and the generating functions inverted. The sequence X consists of independent, identically distributed random variables with continuous and symmetric distributions; the probability that 2 of the partial sums are equal is zero.

Aberdeen U. Dept. of Chemistry (Scotland).

THE SYSTEM CaO-Ga_2O_3, by J. Jeevaratnam and F. P. Glasser. [1961] [4]p. incl. diagr. tables. (AFOSR-2374) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)276] and United Kingdom Government) AD 611454 Unclassified

Also published in J. Amer. Ceram. Soc., v. 44: 563-566, Nov. 1, 1961.

CaO and Ga_2O_3 form 3 compounds: $3CaO{\cdot}Ga_2O_3$, $CaO.Ga_2O_3$, and $CaO.2Ga_2O_3$. $3CaO.Ga_2O_3$ melts incongruently to CaO plus liquid at 1263°C; $CaO.Ga_2O_3$ and $CaO.2Ga_2O_3$ melt congruently at 1369° and 1504°C respectively. Eutectics are located at the following temperatures and composition (in mol % Ga_2O_3): between $3CaO.Ga_2O_3$ and $CaO.Ga_2O_3$, 1245°C and 37.5%; between $CaO.Ga_2O_3$ and $CaO.2Ga_2O_3$, 1323°C and 57%; and between $CaO.2Ga_2O_3$ and β-Ga_2O_3, 1457°C and 68%. There is a peritectic at 1263°C and 36%. Three polymorphs of $CaO.Ga_2O_3$ are described. Compositions from approximately 35 to 70 mol % Ga_2O_3 can be quenched to yield homogeneous glasses. (Contractor's abstract)

5

Aberdeen U. Dept. of Chemistry (Scotland).

CRYSTALLOGRAPHIC STUDY OF $Ca_2BaSi_3O_9$, by F. P. Glasser and L. S. D. Glasser. [1961] [3]p. incl. tables. (AFOSR-2716) [AF 61(052)276] Unclassified

Also published in Zeitschr. Krist., v. 116: 263-265, 1961.

$Ca_2BaSi_3O_9$ was prepared by heating weighed quantities of reagent grade $CaCO_3$, $BaCO_3$, and SiO_2. Large (0.2 - 1.0 mm) single crystals of $Ca_2BaSi_3O_9$ were readily prepared by heating the composition just at or below the temperature of incongruent melting (1320°C). The unit-cell parameters were refined by using the indexed powder pattern. The powder pattern was indexed down to about d = 1.6A by direct comparison of the powder photograph with single crystal rotation photographs. Results show that $Ca_2BaSi_3O_9$ is triclinic, a = 6.72A, b = 6.73A, c = 9.62A, α = 88°22', β = 111°03', γ = 102°20', space group $P\bar{1}$, Z = 2.

Aberdeen U. Dept. of Chemistry (Scotland).

HEXAGONAL HIGH TEMPERATURE POLYMORPH OF CALCIUM CHROMITE, by F. P. Glasser and L. S. D. Glasser. [1961] [2]p. incl. table. (AFOSR-2848) [AF 61(052)276] Unclassified

Also published in Inorg. Chem., v. 1: 428-429, May 1962.

Calcium chromite exists in 2 polymorphic forms. The low temperature modification, β-$CaCr_2O_4$, is isostructural with $CaFe_2O_4$ and CaV_2O_4. The high temperature form, stable above 1570°, was designated α-$CaCr_2O_4$ by Ford et al, (Trans. Brit. Ceram. Soc., v. 48: 291, 1949). A powder pattern was reported and a tetragonal unit cell with a = 5.53A, c = 19.16A deduced from it. A single crystal study indicates that the unit cell is hexagonal. (Contractor's abstract)

SILICATE TRANSFORMATIONS: RHODONITE-WOLLASTONITE, by L. S. D. Glasser and F. P. Glasser. [1960] [5]p. incl. diagrs. refs. (AFOSR-4067) (AF 61(052)276) Unclassified

Also published in Acta Cryst., v. 14: 818-822, Aug. 1961.

Details of the oriented transformation rhodonite - wollastonite have been studied. The results show conclusively that the cation-oxygen skeleton is preserved during the change, at the expense of silicon-oxygen bonds. This provides direct evidence of the migration of silicon during thermal transformations of silicates. (Contractor's abstract)

LOW TEMPERATURE PLASMA JET (Abstract), by H. F. Calcote. [1960] [1]p. (AF 49(638)300) Unclassified

Presented at Third AFOSR Contractors' meeting on Ion and Plasma Propulsion, Republic Aviation Corp., Farmingdale, N. Y., Mar. 22-24, 1960. (AFOSR-TN-60-405; AD 235949)

The low temperature plasma jet is a device for producing a non-equilibrium supersonic stream of partially dissociated and partially ionized gas. The vacuum system utilized by this research has been increased from 400 cfm (1 to 10 mm Hg) to 3,000 cfm (1μ to - 10 mm Hg) and the capacity of the power supply has been increased so the range over which measurements can be made is greater. Further evaluation of the differential catalytic probe for measuring atom concentrations shows that it can be brought into agreement with the chemical titration. This requires assuming a surface activity of 0.07 to 0.08 for platinum at 1100°K. The effect of secondary air and argon shows that the catalytic probe and chemical titration are both measuring the same thing, assumed to be nitrogen atoms. Experiments with greater power density indicate the increasing power requirements necessary to increase the atom concentration, i.e., with present geometries and discharge characteristics, the point of diminishing returns is being approached. Discharge characteristics have been obtained for air, nitrogen, argon and helium over a range of pressures. There are marked differences in behavior between the diatomic and monatomic gases. STEADY STATE SURFACE TEMPERATURES OF RADIATION COOLED BODIES IN DISSOCIATING ATMOSPHERES, by D. E. Rosner. Feb. 1961 [15]p. incl. diagrs. (Rept. no. TP-26) (AFOSR-697) (AF 49(638)300) AD 257862 Unclassified

The conditions under which the skin temperature of a radiation cooled vehicle in a dissociating atmosphere can exceed that in an inert atmosphere at the same vehicle velocity are investigated. If the Lewis-Semenov

number for atom diffusion is greater than unity, this is found to be possible for both radiation-cooled active catalytic surfaces in the chemically frozen regime and solids of arbitrary catalytic activity in the chemical equilibrium region. (Contractor's abstract)

DIFFUSION AND CHEMICAL SURFACE CATALYSIS IN A LOW-TEMPERATURE PLASMAJET. THE DETERMINATION OF ATOM CONCENTRATIONS IN NONEQUILIBRIUM SUPERSONIC STREAMS OF ACTIVATED NITROGEN, by D. E. Rosner. [1961] [9]p. incl. diagrs. tables, refs. (AFOSR-913) [AF 49-(638)300] Unclassified

Presented at Winter annual meeting of the Amer. Soc. Mech. Eng., New York, Nov. 26-Dec. 1, 1961.

Also published in Jour. Heat Transfer, v. 84: 386-394, Nov. 1962.

Chemical and thermal methods have been used to estimate the free atom concentration in a nonequilibrium supersonic jet of activated nitrogen emerging from a direct-current, high pressure, glow discharge. Emphasis is given to differential catalytic probe techniques, several variations of which are discussed. For nonequilibrium dissociated streams of low stagnation enthalpy, a differential catalytic thermometer is described which, in principle, offers the advantages of: (a) Linearity of probe response; (b) sensitivity independent of catalyst activity, details of gas dynamic environment, and catalyst geometry. A simple thermometric probe has been constructed and its output has been studied over a small range of electrical power dissipation. Evidence is given in support of the view that the probe responds principally to the same component of activated nitrogen that is depleted by chemical reaction with ethylene and propylene. Both catalytic probe measurements and the limiting amount of hydrogen cyanide production yielded about the same atom concentration (mol fractions of about 2%). For electrical discharges operating at higher power densities, radiation losses from the catalytic thermometer surfaces necessitate design compromises which reduce the potential accuracy of the thermometric technique applied herein. This difficulty can be circumvented by using cooled catalytic probes (calorimeters), 1 type of which is currently under investigation. In general, it appears that the aerodynamic uncertainties involved in the catalytic probe theories presented are minor compared to the physicochemical questions raised by the use of such probes in nonequilibrium environments. Particular attention must be devoted to the role of excited species (other than ground state atoms) on the accuracy of both differential thermal detectors and chemical reactivity methods of analysis. GENERATION OF SUPERSONIC DISSOCIATED AND IONIZED NONEQUILIBRIUM STREAMS. ENERGY UTILIZATION AND THE DETERMINATION OF ATOM CONCENTRATIONS, by D. E. Rosner. July 1961 [64]p. incl. illus. diagrs. tables, refs. (Rept. no. TP-31) (AFOSR-1360) (AF 49(638)300) AD 264973 Unclassified

Three distinct methods to determine atom concentrations in the nonequilibrium supersonic jet of activated N emerging from an unconventional direct current glow discharge are evaluated. The accuracy of each method is discussed and compared, both as to the ability to predict trends as well as absolute values. The first is based on over-all power and pressure measurements alone and is capable only of setting an upper limit to the actual atom concentration. The second is classified as differential catalytic thermometry, and relies on the use of differential thermochemical effects for atom recombination reactions on surfaces as a basis of inferring local atom concentrations in the gas phase. The results of a series of upstream mixing experiments support the view that the catalytic probes respond to the same component of active N that is depleted by chemical reaction with unsaturated hydrocarbon gases (ethylene, propylene), the most likely of these species being ground state N atoms. Finally, measurements of the limiting amounts of HCN produced by the reaction of active N with propylene have been used to estimate the dissociation level in the discharge products. Each of the methods leads to dissociation levels of the order of 1% (by mass) in N. (Contractor's abstract)

SURFACE TEMPERATURES OF HIGH SPEED, RADIATION COOLED BODIES IN DISSOCIATING ATMOSPHERE, by D. E. Rosner. [1961] [3]p. incl. diagrs. refs. (AFOSR-1661) (AF 49(638)300) Unclassified

Also published in ARS Jour., v. 31: 1013-1015, July 1961.

On the basis of this brief examination of radiation cooled surface temperature, it is concluded that operating surface temperatures in an initially undissociated environment can exceed those encountered in an inert environment at the same stagnation enthalpy but only if the average Lewis-Semenov number Le_f exceeds unity.

This condition is, however, not sufficient. A temperature overshoot is found to be possible both for catalytically active radiation cooled solids in the chemically frozen (nonequilibrium) boundary layer regime, and radiation cooled solids of arbitrary activity in the local thermochemical equilibrium boundary layer regime only if, in addition, the nondimensional convection-radiation parameter $\Re$ is sufficiently large to cause the equilibrium

atom concentration corresponding to the interface temperature to be negligible compared to the atom concentration at the outer edge of the boundary layer. Thus the temperature overshoot phenomenon should be considered the exception rather than the rule. If non-catalytic, high temperature coatings are available, and the boundary layers are in practice chemically frozen, then operating surface temperatures of radiation cooled vehicles can be considerably lower than would be encountered in an inert atmosphere for all values of the convection-radiation parameter.

PRELIMINARY OBSERVATIONS ON THE EFFUSION COOLING OF CATALYTIC SOLIDS EXPOSED TO PARTIALLY DISSOCIATED NONEQUILIBRIUM GAS STREAMS, by D. E. Rosner. Oct. 1961, 22p. incl. diagrs. tables, refs. (Rept. no. TN-37) (AFOSR-1841) (AF 49(638)300) AD 269000 Unclassified

The consequences of gas phase chemical reaction between an effusion coolant and chemically reactive species present in the free stream are discussed with regard to convective energy transfer to catalytically active solids. A porous Cu surface was exposed to a supersonic stream of activated N. The relative effectiveness of ethylene, NH_3, N, and NO_2 as coolants was markedly altered by the effects of specificity in their gas phase chemical behavior. This suggested that differences in gas phase chemical reactivity could be used in selecting effusion coolants for catalytically active solids exposed to high temperature partially dissociated streams. THE APPARENT CHEMICAL KINETICS OF SURFACE REACTIONS IN EXTERNAL FLOW SYSTEMS - DIFFUSIONAL FALSIFICATION OF ACTIVATION ENERGY AND REACTION ORDER, by D. E. Rosner. Aug. 1, 1961 [51]p. incl. diagrs. tables, refs. (Rept. no. TP-35) (AFOSR-1994) (AF 49(638)300) Unclassified

Presented at Amer. Inst. of Chem. Engineers Symposium on Transport and Kinetic Factors in Heterogeneous Catalysis, New York, Dec. 7, 1961.

If the temperature level of free stream reactant concentration is deliberately changed, the resulting change in the observed global reaction rate on a catalytic surface in a flow system will not necessarily reflect the true chemical kinetics at the fluid/solid interface. General expressions, reminiscent of those applicable to a static system, are derived for the relation between the falsification of the activation energy and reaction order in terms of a logarithmic derivative of the isothermal diffusion correction (effectiveness factor). Approximate solutions are given for the case of the thin, non-turbulent diffusion layer which develops along a non-porous, catalytic flat plate, for arbitrary values of the true reaction order and Prandtl number for diffusion (Schmidt number). Comparisons with exact solutions to the boundary layer equations and alternate approximate methods are given for the special case of first order surface reactions. Of the various quantities of interest in the diffusional theory of heterogeneous reactions in flow systems, it is shown that the accuracy of the Prandtl-Kamenetzkiĭ quasi-stationary method can become unacceptably poor for the calculation of these falsification parameters. The physico-chemical conditions under which these errors are likely to be largest are discussed. Applications are given to the study of the chemical kinetics of fast surface reactions. (Contractor's abstract)

CATALYTIC PROBES FOR THE DETERMINATION OF ATOM CONCENTRATIONS IN HIGH SPEED GAS STREAMS, by D. E. Rosner. [1961] [9]p. incl. diagr. refs. (AFOSR-3209) (AF 49(638)300) Unclassified

Also published in ARS Jour., v. 32: 1065-1073, July 1962.

Whereas spectroscopic and chemical methods of determining free atom concentrations in the gas phase tend to average over comparatively large stream tube areas, catalytic probe measurements can be made locally and with good sensitivity. For low stagnation enthalpy supersonic streams of nonequilibrium dissociated gases, continuum differential catalytic thermometers (uncooled) can be designed which, in principle, offer the advantages of an output that is (1) linearly proportional to free-stream atom concentration regardless of the true kinetic order of the interfacial reaction; (2) insensitive to small changes in the catalytic activities of the probe surfaces; and (3) insensitive to the details of the gasdynamic environment (Mach number, Reynolds number) and catalyst shape. However, for high stagnation enthalpy applications, the last of these features is forfeited by having to go to internally cooled catalytic probes, since it is shown that, even in the absence of a materials problem, the required thermometer diameters become prohibitively large and, hence, the radiation errors excessive. Rational formulas are derived for each basic probe type, and some physicochemical questions raised in using catalytic probes in nonequilibrium environments are discussed.

ATOM CONCENTRATIONS IN SUPERSONIC STREAMS (Abstract), by D. E. Rosner and A. Fontijn. [1961] 2p. [AF 49(638)300] Unclassified

Presented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech., Armour Research Foundation, Chicago, Sept. 11-12, 1961. (AFOSR-1417; AD 265513)

Experimental studies of some chemical and thermochemical properties of high-speed, non-equilibrium streams of activated nitrogen are described, with emphasis on the determination of: (1) steady state nitrogen atom concentrations, and (2) effects of excited species other than ground state atoms on energy transfer rates to catalytic solids from the products of a dc glow discharge. Gases with different chemical reactivity were passed through a porous catalyst exposed to the supersonic stream of active nitrogen. For making detailed comparisons with the results of a new transient thermal detector, a quartz chemical sampling probe was developed. This probe samples a small central portion of the supersonic stream. From the measurements made, the atom concentration in the supersonic flow at the point of sampling is determined. Finally the results of recent theoretical studies of the apparent kinetics of heterogeneous reactions in flow systems are described, with emphasis on the diffusional falsification of activation energy and reaction order.

LOW-TEMPERATURE KINETIC BEHAVIOR OF HYDROGEN ATOMS IN GAMMA-IRRADIATED ICE, by J. M. Flournoy, L. H. Baum, and S. Siegel. Nov. 1961 [21]p. incl. diagrs. refs. (Rept. no. TN-42) (AFOSR-1541) (AF 18(603)110) AD 266438 Unclassified

The rate of disappearance of trapped hydrogen atoms in gamma-irradiated ice has been studied at temperatures up to 60°K. H atoms produced by gamma-irradiation of ice at 4.2°K appear to be trapped in a variety of different sites, with activation energies for de-trapping ranging from less than 1.0 to more than 2.0 kcal/mol. The results are discussed in terms of various models; the preferred model involves an initially non-isotropic spatial distribution. (Contractor's abstract)

KINETICS OF ENERGETIC SPECIES AT LOW TEMPERATURES, by H. S. Judeikis, M. K. Barsh and others. Final rept. Nov. 1961 [44]p. incl. diagrs. tables, refs. (Rept. no. 2121) (AFOSR-1758) (AF 18(603)110) AD 268034 Unclassified

Research on the stabilization and chemical reactions of energetic free radicals is summarized. Studies were made on the irradiation of ice, solid N_2F_4, solid NH_3, EtBr, MeI, MeOH, and tetramethyltetrazene. H atoms, OH radicals, and other normally unstable chemical species produced by ionizing radiation and by electric charges were stabilized at low temperature and investigated. The disappearance of OH in irradiated ice at 100°K followed a 3/2-order reaction rate law; the activation energy is 6 kcal/mol. H atoms produced by irradiation of wet pyrex recombined rapidly at 100°K and followed a second-order reaction rate law with an activation energy of 4 kcal/mol. Tests designed to trap NH_2 radicals at 77°K yielded inconclusive results.

Stabilization of H atoms was observed on the surfaces of quartz vessels used for UV studies of MeI, MeOH and tetramethyltetrazine. The rates of formation and disappearance of some of these radicals were measured by electron paramagnetic-resonance techniques.

KINETICS OF ENERGETIC SPECIES AT LOW TEMPERATURES (Abstract), by M. K. Barsh. [1961] [1]p. [AF 18(603)110] Unclassified

Presented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech., Armour Research Foundation, Chicago, Sept. 11-12, 1961. (AFOSR-1417; AD 265513)

The kinetic behavior of free radicals formed by ionizing irradiation at temperatures between 4 and 110°K has been the subject of investigation on this program. The kinetics of the disappearance of the OH radicals was found to follow a 3/2 order rate law in OH radical concentration between 92 and 110°K. This rate law was obeyed regardless of the nature or duration of the irradiation or of the manner of preparation of the sample. The rate constant can be represented by the expression $k = 3 \times 10^{11} \exp(-6000/RT)(m/l)^{-\frac{1}{2}} sec^{-1}$. A mechanism was proposed for the disappearance of the OH radical assuming that the fractional-order behavior of the radical was attributable to a sequence of chemical reactions involving the equilibrium dissociation of the OH radical as an acid followed by the rate determining, irreversible reaction of the anion O^- with a second OH radical to give HO_2^-. The mechanism is subject to question as a result of attempts to confirm the kinetics by measuring the disappearance rates of the OH radical in the presence of acidic and basic additives in the irradiated ice.

THERMAL DECOMPOSITION OF GASEOUS DIMETHYLNITRAMINE, by J. M. Flournoy. [1961] [2]p. incl. diagr. [AF 18(603)110] Unclassified

Published in Jour. Chem. Phys., v. 36: 1106-1107, Feb. 15, 1962.

The pyrolysis of gaseous dimethylnitramine was investigated at temperatures from 165° to 200°C and at initial pressures from 200 to 750 mm Hg. Mass spectrometric analysis showed that the principal product of the reaction was dimethylnitrosamine, in 80% yield, plus smaller amounts of low-molecular-weight oxidation products. $(CH_3)_2HNO_2 \rightarrow (CH_3)_2HNO$ + secondary products. The reaction was found to be homogeneous, kinetically first order with respect to the concentration of dimethylnitramine, and unaffected by addition of nitric oxide. The proposed mechanism was: $(CH_3)_2NNO_2 \rightarrow (CH_3)_2N. + NO_2$ (the rate determining reaction), $NO_2 + (CH_3)_2NNO_2 \rightarrow NO$ + oxidation products, and $(CH_3)_2N. + NO \rightarrow (CH_3)_2NNO$.

THERMAL DECOMPOSITION OF GASEOUS 2,2-DINITROPROPANE, by J. M. Flournoy. [1961] [2]p. incl. diagr. [AF 18(603)110] Unclassified

Published in Jour. Chem. Phys., v. 36: 1107-1108, Feb. 15, 1962.

The pyrolysis of gaseous 2,2-dinitropropane (DNP) was investigated in 10 experiments at temperatures from 175° to 210°C. Preliminary results offer evidence for a chain mechanism involving the 2-nitropropyl radical and an intermediate nitro-nitrite. The results of five mass-spectrometric analyses of the products of the first 2-7% of the reaction indicated that the initial products are acetone, NO, and NO_2, in equimolar amounts. As acetone and NO_2 accumulate, the NO_2 is rapidly reduced to NO by reaction with acetone to yield H_2O, CO, CO_2, etc. It is suggested that the C-O bond may be formed through an intermediate nitro-nitrite, $(CH_3)_2C(ONO)(NO_2)$, which decomposes by loss of NO and NO_2 to form acetone. The mechanism was explained as $(CH_3)_2C(NO_2)_2 \rightarrow (CH_3)_2C(NO_2) + NO_2$, $(CH_3)_2C(NO_2) + ONO \rightarrow (CH_3)_2C(ONO)(NO_2)$ or $(CH_3)_2C\,NO_2 + (O_2N)_2C(CH_3)_2 \rightarrow (CH_3)_2C(ONO)NO_2 + (O_2N)C(CH_3)_2$, and the final step being $(CH_3)_2C(ONO)(NO_2) \rightarrow (CH_3)_2CO + NO + NO_2$.

DISAPPEARANCE OF TRAPPED HYDROGEN ATOMS IN GAMMA-IRRADIATED ICE, by J. M. Flournoy, L. H. Baum, and S. Siegel. [1961] [2]p. incl. diagr. [AF 18-(603)110] Unclassified

Published in Jour. Chem. Phys., v. 36: 2229-2230, Apr. 1962.

When ice is subjected to gamma-irradiation at 4.2°K, H and OH radicals are formed and are stabilized in approximately equivalent amounts, with an initial yield of about 0.8 radical pairs/100 ev. When the system is warmed to 77°K, all of the H and a portion of the OH disappear. This paper describes the results of kinetic observations of the disappearance of H in irradiated ice at temperatures between 4.2° and 77° using ESR techniques. In an effort to determine independently the order of reaction and the activation energy, a number of rate measurements were made under isothermal conditions at several temperatures. The dependence of the isothermal rate upon the total H-atom concentration, is much too great to correspond with a normal rate law form. Instead, at each temperature, the initial rapid rate of disappearance seems to approach a very slow, asymptotic value long before all the atoms have disappeared. Comparisons of the rate toward the end of a run at one temperature with the rate at the beginning of the run at the next higher temperature yield apparent activation energies ranging from somewhat less than 1 kcal/mol near 30°K to nearly 2.5 kcal/mol near 50°K. The temperature dependence of the apparent activation energy suggests that the H atoms may be stabilized in a

variety of different trapping sites, with a spectrum of energies for de-trapping and reaction. An alternative explanation for the kinetic behavior is that the reactions occurring in irradiated ice between 4.2° and 77°K may be primarily intra-spur reactions rather than isotropic processes.

HIGH-FREQUENCY COMBUSTION INSTABILITY, by R. G. Peoples, P. D. Baker, and L. S. Knowles. Rept. for Mar. 15, 1957-Aug. 18, 1961. Nov. 1961 [39]p. incl. diagrs. refs. (Rept. no. 2126) (AFOSR-1802) (AF 49(638)178) AD 269500 Unclassified

Analytical and experimental studies of stable and unstable combustion phenomena were conducted to determine the parameters affecting inherent stability. It was demonstrated that inherent stability is determined by the amount of pressure-sensitive energy available to a given pressure perturbation, and by the relationship between replenishment of this energy and the time period of the perturbation. Analytical concepts describing the support mechanism and experimental data indicating the complexity of a nonlinear perturbation were established. (Contractor's abstract)

TANGENTIAL MODE OF COMBUSTION INSTABILITY, by H. C. Krieg, Jr. [1961] [28]p. incl. illus. diagrs. refs. (AFOSR-J912) (AF 49(638)178) Unclassified

Presented at ARS Propellants, Combustion and Liquid Rockets Conf., Palm Beach, Fla., Apr. 26-28, 1961.

Also published in Prog. in Astronaut. and Rocketry, v. 6: 339-366, 1962.

The results of pulse motor investigations into the tangential mode of combustion instability are discussed. Particular emphasis is placed on: The axial and radial distribution of the instability front within the experimental chamber; correlation of luminosity, instantaneous pressure with the front motion; and estimation of the chamber-gas movement during unstable combustion. A combustion model for tangential instability is presented, and its application to combustion systems is discussed. The inherent stability of combustion processes is shown to be dependent on the relationship between cyclic pressure modes and the mechanism for replenishment of pressure sensitive energy. It is shown that the pressure modes are controlled by chamber geometry, whereas the replenishment of energy is a function of the chemical and physical processes. (Contractor's abstract)

ION ENGINE DEVELOPMENT. I. DIFFUSION TYPE ION SOURCES, by R. J. Sunderland, J. R. Padbill, and R. D. Gilpin. [1960] [32]p. incl. illus. diagrs. table, refs. (AFOSR-TN-60-820) (AF 49(638)214) Unclassified

Also published in Advances in the Astronautical Sciences; Proc. of Third Annual West Coast meeting of the Amer. Astronaut. Soc., Seattle, Wash. (Aug. 4-5, 1960), New York, Plenum Press, v. 7: 148-172, 1961.

The experimental results of investigations in the areas of ionization of gases and vapors upon diffusion through heated metal foils, the ionization of alkali metals upon electrolysis through platinum coated glass membranes, and the ionization of alkali metal vapors upon diffusion through porous tungsten maintained at elevated temperatures are presented. An outline is also given for future work in these areas at the Aerojet Astronautics Lab. The problem evolves around the fact that the nuclear powered rocket will be capable of specific impulses of the order of 1000 sec, but for economical voyages within the solar system and beyond, much higher effective exhaust velocities will be required. Electrical methods of propulsion offer a means of achieving these high velocities, but unfortunately at extremely low thrust levels. Ion propulsion methods depend critically upon the development of suitable ion sources. Results are presented that indicate that a diffusion type ion source may provide the high exhaust velocities and high thrust levels provided problems on interactions between individual beams do not prove too troublesome.

ION-ELECTRON RECOMBINATION KINETICS (Abstract), by C. B. Kretschmer. [1961] [1]p. [AF 49-(638)540] Unclassified

Presented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech., Armour Research Foundation, Chicago, Sept. 11-12, 1961. (AFOSR-1417; AD 265513)

The rate of disappearance of ionization in gas-discharge plasmas has been studied using Langmuir probes to measure ion concentrations. The following values of the recombination coefficient are obtained from the observed decay probe current: argon 7 x 10^{-7} cm^3/sec; nitrogen 7 x 10^{-7} cm^3/sec; oxygen 2 x 10^{-6} cm^3/sec. These are in good agreement with recent microwave measurements of dissociative recombination coefficients. In other experiments, the following values were obtained for the rate coefficient for formation of molecular ions from atomic ions in 3-body collisions: helium 5.7 x 10^{-32} cm^6/sec; argon 2.4 x 10^{-31} cm^6/sec.

CHARGED COLLOID PROPULSION (Abstract), by R. D. Schultz, L. B. Becker and others. [1960] [1]p. (AF 49(638)656) Unclassified

Presented at Third AFOSR Contractors' meeting on Ion and Plasma Propulsion, Republic Aviation Corp., Farmingdale, N. Y., Mar. 22-24, 1960. (AFOSR-TN-60-405; AD 235949)

Preliminary results are presented of an attempt to produce electrically charged colloidal-size droplets of oil in high vacuum by means of an electrostatic spray technique such that the resultant beam of particles has an average positive charge to mass ratio over 200 coulombs/kg. It had been possible to electrically atomize unpurified di-octyl phthalate oil from sharp needle tips in vacuum of about +30 kv. It was suspected, however, that some corona discharge was occurring which would produce undesirable light weight extraneous ions in the charged colloid beam. It has now been found possible to electrically atomize purified di-octyl phthalate in high vacuum in the absence of appreciable corona by placing a suitable biased hot-filament in the vicinity of the needle tips. The electrons emitted from the filament and accelerated toward the needle tips provide a substitute for the $(e^-)^*$ (energetic electron) of the corona charging process. The extent of extraneous ion formation in the resultant colloid beam and the average charge to mass ratio of the colloidal oil droplets remain to be determined.

CHARGED-COLLOID PROPULSION SYSTEM, by R. B. Edmonson and W. C. Miles. Quarterly summary rept. Apr. 1961 [7]p. incl. illus. diagrs. (Rept. no. 0290-01-3) (AFOSR-945) (AF 49(638)656) AD 257723 Unclassified

Activity was limited primarily to the design, construction, and evaluation of various feed systems for electrostatic spraying in vacuum. The feed system, utilizing a non-conductive, porous fiber as a spray source was found to have limiting voltage operating conditions. A feed system was constructed where instead of a spray wedge, a convex porous exit surface is provided with a fine-micron porous-metallic element from which an oil-spray tip is pulled upon application of the electric field.

SECOND-ORDER THEORY FOR A THIN WING IN SUPERSONIC FLOW WITH A WEAK SPANWISE ENTROPY GRADIENT, by P. G. Wilby. June 1961, 20p. incl. diagrs. (Rept. no. 88; technical note no. 5) (AF-OSR-1845) (AF 61(052)75) AD 267914 Unclassified

The 3-dimensional perturbation velocities over an infinite thin wing with a sharp leading edge in non-uniform supersonic flow are derived and used to investigate the second-order contribution to the pressure coefficient on a wing surface, due to a spanwise entropy gradient. Pressure distributions are calculated for a wedge section wing at various Mach numbers for probable values of entropy gradient. Results show that entropy gradient effects can be important. Procedure for an application of the theory is given for the case of a wing situated behind the curved shock generated by a blunt nosed body. (Contractor's abstract)

THE INFLUENCE OF PERIODIC PRESSURE VARIATIONS ON CHAIN REACTIONS, by H. M. Wight. [1959] [5]p. incl. diagr. refs. (AFOSR-613) (AF 49(638)311) Unclassified

Also published in Proc. Conf. on Phys. Chem. in Aerodynam. and Space Flight, Pennsylvania U., Philadelphia (Sept. 1-3, 1959), New York, Pergamon Press, 1961, p. 94-98. (AFOSR-TR-60-106)

Also published in Planetary and Space Sci., v. 3: 94-98, Feb. 1961.

A theoretical study is made of the effect of simultaneous periodic variations in temperature and volume for chain reactions, with particular emphasis on the frequency dependence of the perturbation. If a kinetic mechanism is postulated for any given gas-phase chain reaction, a system of first order differential equations describing the time rate of change of the various species can be obtained by applying the Mass Action Law. Such a system is generally nonlinear and can be integrated usually only by successive approximation techniques. Specific calculations are made for the law and high frequency cases for the HBr chain reaction. Numerical evaluation of the rate enhancement for the formation of HBr at intermediate frequencies is performed. A slow fall-off in the rate is predicted with increasing frequency. However, the high frequency rate is still greater than the unperturbed rate. (Contractor's abstract)

MEASUREMENTS ON MAGNETICALLY DRIVEN SHOCK WAVES (Abstract), by T. A. Bergstralh and J. Worcester. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)670) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

An experimental arrangement is described in which magnetically driven shock waves can be generated and observed under varying conditions of gas type, pressure and transverse magnetic fields. Shock velocities have been measured on intense shocks generated by 50 kv discharges in helium and nitrogen at pressures from 5 to 50 μ of mercury. The maximum velocities observed were 3.4 cm per μsec in helium and 2.5 cm per μsec in nitrogen. The shock front velocity is observed to decay with time as t^{-n} where n is of the order of 0.5. When an 800 gauss transverse field is established across a 2 ft section of the shock tube, the velocity attenuation of the helium shocks is observed to be greater than in the absence of the field. The additional attenuation by the magnetic field has not been observed for shock waves in nitrogen in this same pressure range.

IMPLICATIONS OF BASIC RESEARCH IN INFORMATION SCIENCES TO MACHINE DOCUMENTATION, by H. [A.] Wooster [Jr.] [1961] [14]p. (AFOSR-492) Unclassified

Also published in Machine Indexing; Progress and Problems; Proc of Third Institute on Information Storage and Retrieval, American U., Washington, D. C. (Feb. 13-17, 1961), [Washington] American U. School of Government and Public Administration, p. 331-344.

The role of the machine and its effect on documentation is discussed. It is known that the speed of the computer is an attractive brute force method for literature searching, but the question that must be faced is will the effects of the machine be qualitative or quantitative. Will it make an impact on the theoretical studies in the information sciences or on the handling practices of good documentation procedures? The answer of course lies in the future. Machines today are used as tools. They can do very fast arithmetic, but need to be told in excruciating detail what to do. One of the implications of the Information Science research program is the possibility that some day computers can be used as mental machines, capable of relieving man of the burdens of routine decision-making. The question then becomes whether the world will recognize this for the value that it obviously is, or whether it will be rejected out of ignorance.

THE INFLUENCE OF AIR DENSITY ON THE CHARACTERISTIC PARAMETERS OF THE OSCULATING ELLIPSE OF A SATELLITE ORBIT, by R. H. Anderson. Feb. 1961, 15p. incl. illus. (AFOSR-103) AD 251310 Unclassified

The general equations describing the perturbations of an orbit due to air drag were derived. The methods used in their derivation differ from those usually applied to orbit perturbation problems, and it is evident that these methods are applicable to a wide range of trajectory problems. For many practical problems it is necessary to have an estimate of the decrease in the altitude of a satellite whose orbit is nearly circular. For this purpose a very simple equation was developed which quickly gives a good estimate of the variation of the altitude of a satellite after one rotation. (Contractor's abstract)

ACCURACY LIMITS DUE TO REFRACTION ON ELECTRONIC TRACKING OF SPACE VEHICLES, by F. W. Hoehndorf. Apr. 1961, 27p. incl. diagrs. tables. (AFOSR-107) AD 256327 Unclassified

The investigation was concerned with the refractive index of electromagnetic microwaves coming from a space vehicle in an environment where this index equals unity. Originally, this effort was planned to be a continuation of an earlier effort to merely give the results of the computations for higher altitudes of the observation sites. However, the results obtained with the primary accepted assumptions for the approximation of the refractive index versus altitude showed them to be physically unrealistic, and therefore some modifications had to be made. These modifications, which do not invalidate the conclusions drawn in the earlier effort, are discussed in some detail. The results of the new computations are given and are compared with a long series of astronomical measurements. (Contractor's abstract)

COLORIMETRIC PROPERTIES OF SOME TRANSITION-METAL GALLATES, by E. L. Grove, L. Maddox, and W. S. Jeffery. [1961] [5]p. incl. diagrs. table. (AFOSR-3805) (AF 18(600)1567) Unclassified

Also published in Jour. Alabama Acad. Sci., v. 32: 25-29, Jan. 1961.

The use of gallic acid in a spectrometric procedure for both tantalum and niobium is investigated. Since it contains 3 phenolic groups, extraction techniques can be avoided. The effect of pH on the absorbance of niobium, tantalum, and vanadium-gallate chelates is presented. Tantalum developed a yellow color at a lower pH than the niobium gallate. At pH 4 and wavelength 390 mu, and at pH 5, wavelength 350 mu, the tantalum gallate showed a definite color while the niobium gallate solutions at the same pH and wavelengths showed no absorbance. The elements that were studied developed no color when the solutions were strongly acidic, except rhenium, which was a pale yellow. Color developed as the solutions were made less acid and became more intense and darker as the pH approached neutral to slightly alkaline. Solutions with pH values from 4 to 8 were studied. At values slightly more acidic a white granular precipitate formed and a gas evolved that appeared to be sulfur dioxide. The optimum pH, maximum, relative absorbance, and molar extinction coefficient for each metal gallate are presented. Most are neutral or slightly acidic. Tantalum chelates with gallic acid to produce a reasonably good color in acid solution, pH 4 and 5, with the maximum at 390 mu and 350 mu. Since the other elements studied are colorless at this pH, except titanium and rhenium, it should be possible to develop a colorimetric procedure without prior separation of these elements. Titanium would have to be separated, but rhenium would be found rarely and only in special alloys.

DIELECTRIC LOSS AND INTERNAL FRICTION IN IONIC SOLIDS, by D. P. Detwiler. Final rept. Aug. 28, 1961, 3p. (AF 49(638)87) Unclassified

This report summarizes briefly the work performed under this contract. The work involved primarily 2 aspects of the properties on ionic solids, viz. dielectric loss and internal friction. A small amount of corroborative data were obtained on electrical conductivity of Al_2O_3. The results on internal friction are incomplete. Dielectric loss in Al_2O_3 was studied from 80°K to 700°K. Two points of interest arise in this region. At around 600°K a small loss peak is observed, and from about this temperature upwards, the loss rises approximately exponentially to the highest temperature measured. It was observed that at this temperature the peak could be induced or removed at will by controlling the atmosphere to which the sample was exposed and treatment of heat to which it was subsequently subjected. It is believed that the loss arises from the presence of hydrogen on or near the dislocations in the Al_2O_3, and that these experiments demonstrate the mobility of hydrogen on the dislocations.

THE ADJOINT HEAT CONDUCTION PROBLEM FOR SOLIDS, by T. R. Goodman. Apr. 1961, 23p. (AFOSR-520) (AF 49(638)839) AD 254769 Unclassified

A new mathematical method is presented for solving the linear transient heat conduction equation for solids. Its primary advantage lies in the fact that having solved an appropriate adjoint heat conduction problem, the solution to a large class of physical heat conduction problems can immediately be expressed in terms of a

quadrature. A number of results are presented by way of example for 1-dimensional problems. In particular a 3-temperature equation is derived which relates the temperature-time history at 3 successive boundaries of a composite slab. A numerical example using the 3-temperature equation is worked out for the steady case. (Contractor's abstract)

EFFECT OF ARBITRARY NONSTEADY WALL TEMPERATURE ON INCOMPRESSIBLE HEAT TRANSFER, by T. R. Goodman. [1961] [6]p. incl. diagrs. (AFOSR-3691) (AF 49(638)839) Unclassified

Presented at Winter annual meeting of the Amer. Soc. Mech. Eng., New York, Nov. 26-Dec. 1, 1961.

Also published in Jour. Heat Transfer, v. 84: 347-352, Nov. 1962.

The title problem is solved using an integral method and ignoring viscous dissipation. A partial differential equation is derived which yields as special cases Lighthill's non-uniform heat-transfer formula and the nonsteady heat conduction in a slab. The differential equation is then specialized to the unsteady but uniform heat transfer on a flat plate. Comparisons with other solutions are made when available, and it is shown that the integral method produces accuracy of a few % in these limited cases. (Contractor's abstract)

SOME EFFECTS OF GRADUATED PARTIAL CUEING ON THE LEARNING OF PAIRED ASSOCIATES, by P. M. Guthrie and A. A. Lumsdaine. Sept. 1961, 34p. incl. diagrs. tables, refs. (Research rept. no. AIR-C14-9/61-SR3) (AFOSR-1341) (AF 49(638)681) AD 275851 Unclassified

The effects of several cueing methods on paired-associates learning were investigated. A total of 48 subjects learned the items in lists of city-names paired with corresponding airport-city codes, using special cueing procedures or standard anticipation procedures. Response terms, presented under lowered conditions of visibility, were the cues. Visibility, and hence cue strength, was varied tachistoscopically or gradually by adjusting illumination of the cue. Under conditions in which subjects had increasing amounts of time to anticipate the response terms, tachistoscopic cueing produced better learning than a comparable anticipation condition. However, the positive effects produced were small. Furthermore, this form of partial prompting was not superior to an immediate full prompt. These results are discussed in relation to needs for further study of graduated cueing techniques in the learning of paired-associate and continuous-discourse materials. (Contractor's abstract)

American Inst. for Research, San Mateo, Calif.

A STUDY OF SUBJECT-CONTROLLED PARTIAL CUEING IN PAIRED-ASSOCIATE LEARNING, by D. Angell and A. A. Lumsdaine. Sept. 1961, 13p. incl. tables. (Research rept. no. AIR-C14-9/61-SR4) (AFOSR-1342) (AF 49(638)681) AD 265070 Unclassified

A study was performed to determine what effect, if any, a training procedure which utilized partial cueing at the option of the learner would have upon the learning of paired-associate materials. The technique was a simple one which provided partial cueing by successive revelation, upon student demand, of the letters of the 3-letter response term in an S-R pair. No instrumentation was employed; E served as the device by which response components were revealed (aurally) to the student. The data showed little difference in over-all effectiveness between the partial-cueing technique and a standard anticipation procedure for learning paired associates. When the effectiveness of the 2 training procedures was examined with respect to "task difficulty" —items having been dichotomized into difficult and easy, and S_s having been dichotomized into slow learners and fast learners—the partial-cueing procedure was found to be somewhat more effective for slow learners with hard items, and slightly less effective for fast learners with easy items. This interaction was marginally significant ($P < .10$). The findings are discussed in relation to other studies of partial cueing in paired-associate learning.

52

American Inst. for Research, San Mateo, Calif.

THE EFFECTS OF PROMPTING TRIALS AND PARTIAL-CORRECTION PROCEDURES ON LEARNING BY ANTICIPATION, by D. Angell and A. A. Lumsdaine. Sept. 1961, 47p. incl. diagrs. tables, refs. (Research rept. no. AIR-C14-9/61-SR5) (AFOSR-1343) (AF 49(638)681) AD 264969 Unclassified

Two experiments are reported which were designed to provide data on several issues relevant to [illegible]-instructional techniques. The first of these issues is the question of the relative effectiveness of prompting trials and anticipation (confirmation) trials. The second issue is the question of the effectiveness of partial-cueing techniques. The 2 experiments used different paired-associate materials and somewhat different experimental procedures and designs. Results of Experiment I showed a highly significant effect due to prompting trials, a significant effect due to correction treatment in the case where no prompting trials had been given, and a

significant interaction which reflects 2 clear experimental facts: (1) a prompting trial was more effective than an anticipation trial when partial correction was employed but not when full correction was used, and (2) full correction is superior to partial correction when there had been no initial prompting trials but not when there had been 2 or more prompting trials. In Experiment II, the advantage of prompting trials over anticipation trials (found in Experiment I) did not materialize, and there was in fact some indication of a trend in the opposite direction. The differing results of the 2 experiments is interpreted as being dependent on the nature of the correction treatment: in Experiment I, subjects did not respond overtly following partial correction; in Experiment II, they continued to choose from among the partial correction alternatives until they made a correct response.

CONVEXITY; PROCEEDINGS OF SYMPOSIA IN PURE MATHEMATICS, VOLUME VII, Washington U., Seattle, June 13-15, 1961, ed. by V. L. Klee. Providence, Amer. Math. Soc., 1963, 516p. incl. diagrs. tables, refs. (AF 49(638)964) Unclassified

Thirty-two papers of which seventeen were presented at the Symposium on Convexity make up this volume. The symposium was intended to emphasize the more qualitative aspects of the theory. Particularly the following 5 aspects are represented in this volume: the combinatorial geometry associated with intersection and covering properties, the refinement and application (especially in functional analysis and game theory) of such notions as extremal structure and separation properties, the study of convexity in infinite-dimensional spaces, increasing use of convexity as a descriptive tool, and the evolution of various analogues and generalizations of convexity. In addition to the wide range of topics treated, there is much variety of approach. Some of the shorter papers treat a single problem in full detail, while at the other extreme are several long papers which include very few proofs but survey broad areas in the field of convexity.

EFFECT OF HYDROSTATIC PRESSURE UP TO 8000 ATM ON THE SELF-DIFFUSION RATE IN SILVER

SINGLE CRYSTALS, by C. T. Tomizuka. [1960] [5]p. incl. diagr. (AFOSR-262) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)-790 and Office of Naval Research under N6ori-02020) Unclassified

Also published in Progress in Very High Pressure Research: Proc. Internat'l. Conf., Bolton Landing, Lake George, N. Y. (June 13-14, 1960), New York, Wiley and Sons, 1961, p. 266-270.

Investigations on the pressure effect on the self-diffusion rate in noble metals are presented. It is generally accepted that the activation volume for self-diffusion is closely related to the actual volume of a mole of moving vacancies. The experimentally determined activated volume ΔV is considered to be a measure of the volume relaxation around a vacancy. Experiments of this type on lead, sodium, and white phosphor indicate that there is approximately 50% volume relaxation around a moving vacancy. A similar amount of relaxation is not, however, expected in the close packed structure of noble metals. It is shown that the atomic relaxation around the vacancy is 10% in volume.

DIFFUSION IN Ag-Zn SYSTEM, by C. T. Tomizuka and R. A. Roberts. [1961] [6]p. incl. diagr. table. (AFOSR-2808) (AF 49(638)790) AD 281233 Unclassified

The present work is an attempt to enhance the current understanding of measuring diffusion by radioactive tracer methods and anelastic techniques. There is 1 school of thought that says the 2 methods are the same. If that be the case, then the activation energies found by the 2 methods should be identical. The activation energy obtained by Zn tracer diffusion in Ag-Zn at 15% Zn is practically identical to that of anelastic relaxation in the same alloy. Three possible explanations are offered: (1) It could be that the discrepancy between the 2 activation energies is approximately proportional to the Zn concentration and the expected 2 kcal/mol difference is difficult to establish by the present experimental techniques. (2) It could be that an appreciable amount of zinc was lost from the surface of those specimens with a high Zn concentration (30%) and the observed discrepancies at 30% Zn were brought about by not comparing the activation energies at the same Zn concentration. (3) It is probable that the anelastic relaxation is controlled by the faster moving component of an alloy, even though the actual model by which such a relaxation takes place is difficult to conceive.

SOME ISOTOPE SHIFTS IN THE SPARK SPECTRUM OF Te, by R. H. Hughes, W. A. Hilton, and F. A. Sharpton. [1961] [1]p. incl. table. (AFOSR-3551) [AF 49(638)547] Unclassified

Also published in Jour. Opt. Soc. Amer., v. 51: 696, June 1961.

The 2 previous investigations of the isotope shifts in tellurium have produced widely differing results (Bull. Amer. Phys. Soc., v. 3: 414, 1958 and Phys. Rev., v. 85: 559, 1952). It therefore seemed reasonable to check the isotope shifts in the region of the largest discrepancy to ascertain the nature of the discrepancy. The hollow-cathode spectra from enriched samples of Te-124, Te-126, and Te-128 were studied. The discharge tubes were liquid-air cooled. The isotopic abundance of the principal isotope in the 124, 126, and 128 samples was 83.9%, 95.4%, and 96.5%, respectively. The 126-124 shift was corrected for the presence of 4.5% of Te-126 in the 124 sample. The present measurements correspond closely with those of Kuhn and Turner.

STUDIES OF OPTICAL POLARIZATION BY ELECTRON IMPACT, by R. H. Hughes and O. H. Zinke. Final rept. Dec. 1961 [54]p. incl. diagrs. refs. (AFOSR-2259) (AF 49(638)559) AD 273339 Unclassified

An investigation of the polarization of the atomic line radiation induced by electron impact on helium has been undertaken. Experimental data have been obtained on the polarization of several lines as a function of both electron energy and pressure. Secondary excitation processes, such as collision of the second kind and radiative transfer (cascade), are found to play an important role in the polarization. An expression is derived which enables the measurement of gas-kinetic collision cross sections involving atoms in excited states by observing the depolarization as the gas pressure increases. The feasibility of the detection of the Lyman alpha radiation from positronium formed through the charge-changing collisions between positrons and gas atoms, was investigated. Excitation of nitrogen and rare-gas atoms by beta emission from W^{185} has been observed.

POLARIZATION OF SPECTRAL EMISSION INDUCED BY ELECTRON IMPACT ON HELIUM (Abstract), by R. H. Hughes, R. B. Kay, and L. D. Weaver. [1961] [1]p. [AF 49(638)559] Unclassified

Presented at meeting of the Amer. Phys. Soc., Schenectady, N. Y., Oct. 11-13, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 130, Feb. 23, 1962.

The polarization of several lines induced by electron impact on helium is being studied as a function of electron energy and pressure. Data have been obtained on the lines λ 3889A ($3^3P - 2^3S$), λ 4922A ($4^1D - 2^1P$), and λ 4471A ($4^3D - 2^3P$). The λ 3889 polarization data at low energy confirm the minimum in the polarization found by Lamb and Maiman. A minimum polarization at ≈ 25.5 v with rising polarization of about 24 v, the lowest energy used, was obtained. λ 4922 shows a peak polarization of slightly over 50% (at ≈ 31 v and < 1 μ pressure). Both λ 4922 and λ 4471 exhibit a monotonic decrease in polarization with decreasing energy past the peak. In the "high"-energy region, the point at which the polarization changes sign is pressure dependent for all 3 lines. This "crossover" point occurs at higher energies as the pressure is decreased. The polarization is sensitive to secondary excitation processes, such as cascade and collisions of the second kind.

A POSSIBLE METHOD FOR THE STUDY OF GAS-KINETIC COLLISIONS INVOLVING ATOMS IN EXCITED STATES, by R. H. Hughes. [1961] 6p. (AF 49(638)559) Unclassified

It appears possible to study gas-kinetic collisions between ground state atoms and excited atoms by observing the pressure dependence of the polarization of optical radiation induced by the passage of an electron beam through a gas or by the absorption of polarized resonance radiation. It is well known that a well-collimated mono-energetic beam of electrons, particularly low energy electrons somewhat near excitation threshold, can simultaneously excite and orient the atom with respect to beam direction, thus producing polarization of the optical radiation emitted when the atom de-excites. As the gas pressure increases, the probability of disorienting collisions before de-excitation is also increased and subsequently should produce depolarization of the emitted radiation. This depolarization depends on the following parameters: the lifetime of the excited state, the gas density, the thermal velocity, and the collision cross section. An expression involving the depolarization and these parameters is derived.

INVESTIGATION OF HEAT VIBRATIONS IN SOLIDS BY USING X-RAYS, by J. Boscovits, M. Rollos and others. Aug. 1961 [18]p. incl. diagrs. tables, refs. (AFOSR-2090) (AF 61(514)1248) AD 272414 Unclassified

Measurements were reported of x-ray integrated intensities at low and high temperature, carried out on several diffraction lines of Ag, Au, Pt and Pb powders in vacuum, to determine the temperature dependence of characteristic temperature. For Au and Pt a decrease of characteristic temperature with temperature, resulting from volume expansion, was found. In the case of Ag, the decrease of characteristic temperature with temperature exceeds that due to volume expansion. For Pb, the disagreement in characteristic temperature values obtained from the various diffraction lines did not allow any conclusion. (Contractor's abstract)

A STUDY OF THE TRAPPING OF FREE ALKYL RADICALS, by J. B. Levy. Final rept. Sept. 1958-Dec. 1961. Dec. 22, 1961, 13p. (AFOSR-2037) (AF 49-(638)483) AD 601705 Unclassified

The kinetics of the decomposition of 2,2'-azoisobutane, the compound chosen as the source of the free radicals, were studied. In the next phase of the work studies of the pyrolysis of 2,2'-azoisobutane in a fast flow system were performed. The suitability of this compound as a source of t-butyl radicals was demonstrated by mirror removal studies and many experiments performed under a variety of conditions in which it was attempted to demonstrate the presence of trapped t-butyl radicals. The last portion of this program was devoted to a study of the colored deposits obtained in the pyrolysis of dibenzyl ketone. (Contractor's abstract)

CESIUM SOLID PROPELLANT AS PLASMA SOURCE (Abstract), by R. Friedman and L. [W.] Fagg. [1960] [1]p. incl. table. (AF 49(638)651) Unclassified

Presented at Third AFOSR Contractors' meeting on Ion and Plasma Propulsion, Republic Aviation Corp., Farmingdale, N. Y., Mar. 22-24, 1960. (AFOSR-TN-60-405; AD 235949; PB 146900)

Experimental and theoretical studies have been made of the combustion characteristics and the ion density produced in the burning of compressed strands of $CsClO_4$:Al and $CsNO_3$:Al. The purpose of this research has been to develop and characterize a convenient technique for producing a concentrated plasma. Computer calculations have been made which predict the adiabatic flame temperature and equilibrium percentages of the various expected atomic, molecular and ionic species. Small particle size (< 37 microns), lower ambient pressure, and lower compressing pressure generally favor slower, more uniform burning. It has been found that $CsClO_4$:Al inhibited strands compressed at from 3000 to 20,000 psi will burn at atmospheric pressure with an average rate of about 0.15 in/sec. At these compressing pressures, the strand is at 75% of theoretical density. This porosity made it necessary to use only nonpenetrating surface-inhibiting materials. Measurements have been made of ion densities by means of spectroscopic methods. Other measuring methods are also being attempted.

HIGH PRESSURE PLASMA PRODUCTION TECHNIQUES (Abstract), by L. W. Fagg and R. Friedman. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)651) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

Mixtures of $CsClO_4$:Al and $CsNO_3$:Al are being investigated in terms of a study of their burning characteristics and measurements of the electron density produced. It has been found that more complete, but considerably faster, burning takes place when fine grain sizes are used in both mixtures and when percentages of aluminum somewhat higher than stoichiometric are used. These techniques have made it possible to burn the $CsNO_3$:Al mixture in strand form at atmospheric pressure. Work has also been done on both mixtures with various percentages of polyvinyl chloride added. Although the burning temperature and consequently the ion density are lower, the addition of this material has served to make the burning of both mixtures slower and more uniform, and also makes strand burning possible without inhibition. Tentative measurements of the electron densities of the plasmas created in the burning of both the $CsNO_3$:Al and $CsClO_4$:Al mixtures were made by a method due to Petschek et al involving the measurement of the line shift occurring as a result of the second-order Stark effect. In the light of more recent theoretical work, the theory upon which the method is based is now no longer considered adequate, and in its present form is only reliable to within perhaps a factor of five. Nevertheless, the method was used to give tentative results averaging to 1.3×10^{16} electrons/cc for $CsClO_4$:Al and 4.8×10^{16} for $CsNO_3$:Al at one atmosphere. These values agree fairly well with thermodynamic equilibrium computations of electron density. Infrared absorption studies are now in progress at both atmospheric and high pressure, which may yield an additional value of the electron density for each of the mixtures.

THE THERMAL DECOMPOSITION OF PERCHLORIC ACID VAPOR, by J. B. Levy. Oct. 4, 1961 [32]p. incl. diagrs. tables, refs. (AFOSR-1555) (AF 49(638)813) AD 265051 Unclassified

Presented in part at 140th Nat'l. meeting of the Amer. Chem. Soc., Chicago, Ill.

Also published in Jour. Phys. Chem., v. 66: 1092-1097, June 1962.

The thermal decomposition of perchloric acid vapor has been studied from 200° to 439°C. The reaction products over this temperature range have been found to be chlorine, water and oxygen. From 200° to 350°C the kinetics of the decomposition reaction have been studied by determining the rate of chlorine formation colorimetrically; from 350° to 439°C the kinetics were determined by a flow system technique. The results of the kinetic measurements are interpreted in terms of a heterogeneous reaction at the lower temperatures and a homogeneous 1 at the higher temperatures. A mechanism for the homogeneous reaction is proposed. (Contractor's abstract)

RESEARCH ON SOLID-PROPELLANT COMBUSTION. Final technical rept. Dec. 31, 1961 [35]p. incl. diagrs. tables, refs. (AFOSR-2005) (AF 49(638)813) AD 270929 Unclassified

The experimental work already carried out and reported in this program includes measurements of burning rate and lower pressure limit of flammability of dead-pressed ammonium perchlorate as a function of ambient pressure, initial temperature, incident radiant flux, and catalyst content. Temperature measurements have been made with fine thermocouples and by photopyrometry. Detailed chemical analysis of combustion products has been carried out for a variety of combustion conditions. Kinetics of the gaseous decomposition of perchloric acid vapor has been studied. In very recent and incomplete work, experiments dealing with kinetics of the perchloric acid vapor-ammonia reaction are presented. A variety of experiments dealing with pure ammonium perchlorate

deflagration and interactions of deflagrating ammonium perchlorate with gaseous and solid fuels in controlled geometrices are described. In addition to this body of experimental work, much thought has been given to the coupling of the various rate processes and to possible kinetic schemes relevant to the governing chemical reactions. Simplified mathematical models have been developed, and the more accurate model developed by Nachbar, which however, requires extensive computation to obtain numerical solutions, has been carefully considered. Attention has been given to experimental results arising out of other programs. A review is presented of the current understanding of the combustion mechanism of ammonium perchlorate-based solid propellants as viewed by the Atlantic Research Corp.

SHOCK WAVES IN COLLISION-FREE PLASMAS, by M. Camac, A. R. Kantrowitz and others. Aug. 1961, 67p. incl. diagrs. refs. (Research rept. no. 107) (AFOSR-1173) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)61 and Office of Naval Research under Nonr-252400) AD 265454 Unclassified

Presented at Internat'l. Atomic Energy meeting, Salzburg (Austria), Sept. 4-8, 1961.

Investigation of the structure of a shock wave provides an excellent opportunity for studying the dissipation processes in collision-free plasmas. The thickness of collision-free shock waves was previously obtained from measurements of the light emitted by the plasma in a magnetic annular shock tube. The magnitude of the shock thickness, and its Mach number and density dependence were in agreement with a theoretical estimate based on the concept that the required dissipation in the shock is produced by non-linear interactions between magnetohydrodynamic waves. Further confirmation of these results has been obtained. Measurements of the magnetic field have shown that the magnitude of the field change across the shock agrees with that expected from the conservation equations. Also the distance over which the field changes agrees with the previous shock thickness measurements. The electron temperature was estimated to be above 10 ev based on the ultraviolet radiation intensity and the ratio of bound-bound and free-free radiation. Measurements of the heat transfer from the plasma to the shock tube wall indicates that less than 1/10 of the gas energy is dissipated to the walls, thus, there is good containment of the shock heated plasma for a time large (50 times) compared to the shock rise transit time. The theory of the wave dissipation mechanism has been reformulated so that the distribution of wave action in wave-vector space is described by a Boltzmann equation similar to that for the distribution of phonons in solids. Estimates of relaxation times for the non-linear wave interactions agree with previous predictions. Preliminary results for the shock structure suggest that in the shock front the wave distribution is somewhat concentrated in regions of wave-vector space away from the origin. There are indications that the wave frequency band should be narrow at the shock front and increase going towards the back of the shock. Waves of about ion cyclotron frequency may persist behind the shock while other waves spread to high frequencies by wave-wave collisions and are damped. (Contractor's abstract)

BASIC STUDIES IN MAGNETOHYDRODYNAMICS, by R. M. Patrick. Final rept. May 1, 1957-Oct. 31, 1961, 28p. incl. illus. diagrs. refs. (AFOSR-1782) (AF 49(638)61) AD 269797 Unclassified

Research was directed toward obtaining a basic understanding of magnetohydrodynamics. The initial studies led to 3 possible applications for magnetohydrodynamics which in turn led to 3 categories of research. The first application appeared in connection with the problem of high-altitude, very high velocity flight which we call flight magnetohydrodynamics. The second application was plasma propulsion. The third category was the production of a very high temperature collision-free plasma. (Contractor's abstract)

EXPERIMENTAL INVESTIGATION OF COLLISION-FREE SHOCKS AND PLASMAS, by R. M. Patrick and M. Camac. Sept. 1961, 38p. incl. illus. diagrs. refs. (Research rept. no. 122) (AFOSR-2266) (AF 49(638)61) AD 274218 Unclassified

Investigation of the structure of a shock wave provides an excellent opportunity for studying the dissipation processes in collision-free plasmas. Measurements of the magnetic field have shown that the magnitude of the field change across the shock agrees with that expected from the conservation equations. The electron temperature was estimated to be above 10 ev based on the ultraviolet radiation intensity and the ratio of bound-bound and free-free radiation. Measurements of the heat transfer from the plasma to the shock tube wall indicates that less than 1/10 of the gas energy is dissipated to the walls; thus, there is good containment of the shock heated plasma for a time large (50 times) compared to the shock rise transit time. The results of these experiments show that the collision-free thickness is inversely proportional to the Alfvén Mach number of the shock. The radiation emitted by the shock heated plasma has been measured over a large range in plasma density; these results, together with those for the magnetic field jump across the shock, show that the performance of the MAST can be predicted by a theory which assumes infinite plasma conductivity.

BASIC STUDIES IN MAGNETOHYDRODYNAMICS (Abstract), by R. M. Patrick. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)61) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

An experimental investigation of the structure of shock waves produced in a magnetic annular shock tube (MAST) has been reported. Recently, the change in the magnetic field across these shock waves has been measured. These measurements give a collision-free shock thickness which agrees with previous results. The change in the field agrees with the value predicted using the Rankine-Hugoniot equations in conjunction with the measured shock speeds and plasma density behind the shock. Additional measurements of the dependence of the collision free shock thickness on the Alfvén Mach number have been obtained. The range of plasma densities has been extended to 10^{17} part/cm^3. The overall shock thickness (the order of 1 mm) obtained at high densities by monitoring the radiation across the annulus indicates that the angle between the plane of the shock and the normal to the wall is equal to or less than 2°. Experimental measurements of the heat transfer rates on the side wall of the magnetic annular shock tube have been initiated with the use of a new type of heat-transfer gage that works in the presence of strong electric and magnetic fields. A portion of the stainless steel shock tube wall is replaced with a thin sapphire window coated with a 1000 A carbon layer. The shock heated plasma comes in contact with the carbon. Infrared radiation from the back surface of the carbon is sensed with a fast 0.1 μsec rise time IR detector.

REALIZATION OF MAGNETOHYDRODYNAMIC PROPULSION (Abstract), by G. S. Janes. [1960] [1]p. (AF 49(638)659) Unclassified

Presented at Third AFOSR Contractors' meeting on Ion and Plasma Propulsion, Republic Aviation Corp., Farmingdale, N. Y., Mar. 22-24, 1960. (AFOSR-TN-60-405; AD 235949; PB 146900)

An analysis has been made of a low temperature magnetic plasma accelerator which consists of a rectangular duct in which the magnetic field and the electric current are perpendicular to each other and to the direction of the flow. An analysis has been made of the eddy current losses associated with removal of the conducting plasma from the magnetic field. These losses take the form of joule heating of the plasma (rather than push) and will be excessive unless the plasma is removed from the magnetic field slowly over a long distance. A precise evaluation of the effects of this requirement which appears to be in conflict with the requirements for minimum wall losses will require a more detailed understanding of the boundary layer wall losses, although it is now apparent that this device is closer to an arc jet with some magnetic push rather than to a magnetic accelerator with some incidental joule heating. The use of a magnetic annular shock tube as a pulsed plasma propulsion engine is being investigated. The ultimate objective is to develop an efficient propulsion device which will operate at specific impulses of up to 5000 sec at an average power level of 50 kw. The aim of this program is to measure and to minimize the various losses in the device as well as to establish design criteria for such a propulsion system. In order to establish these design criteria, various features of the magnetic annular shock (such as magnetohydrodynamic containment, electrode arc voltage drops, etc.) are being investigated. Despite conceptual simplicity, plasma accelerators employing electrodes have limitations which are associated with the necessity for contact between the electrode materials and the hot plasma. In accelerators employing electrodes, a limitation is imposed by the requirements for minimizing energy losses which occur in the arc voltage drop. In order to avoid this power limitation and permit steady state operation, an electrodeless traveling wave machine is being built in which the acceleration is accomplished by a multiple moving mirror magnetic field configuration. The initial plans call for operation with sodium vapor at a specific impulse of 3000 sec.

A MAGNETIC ANGULAR ARC, by W. E. Powers and R. M. Patrick. Mar. 1961, 15p. incl. illus. diagrs. (AFOSR-300) (AF 49(638)659) AD 275739 Unclassified

Presented at Second Symposium on Engineering Aspects of Magnetohydrodynamics, Pennsylvania U., Philadelphia, Mar. 9-10, 1961, p. 5-18.

Experiments have been carried out in a geometry where an arc was formed by a radial current in the annulus between 2 coaxial electrodes. The arc was used to heat a cold gas which was flowing in the axial direction in the annulus. There was an axial magnetic field throughout the flow region. The operation characteristics of this annular arc have been calculated. The variation of the electrical impedance of the arc with power level, particle density and magnetic field strength has been measured and compared to the calculated values and indicate that the arc impedance is linearly dependent upon $\omega_e \tau_e$ where ω_e is the gyro frequency and τ_e is the average time between collisions. The heat flux to the walls of the arc chamber has been measured and compared to the theoretical value. The static and total pressure of the arc heated plasma have been measured and the results have been used to establish the plasma conditions, which are necessary to obtain a preliminary comparison of the experimental results with theoretical predictions. PLASMA BOUNDARY LAYERS, by J. A. Fay. Dec. 1961, 29p. incl. refs. (Rept. no. AMP-83; rept. no. NP-12150) (AFOSR-3902) (AF 49(638)659) AD 294152 Unclassified

A review is given of recent work on boundary layers in electrically-conducting fluids. This includes a discussion of the differences between ordinary boundary layers and plasma boundary layers with special reference to the new dimensionless parameters for the magnetic case, including those which arise from the microscopic structure of the fluid. The convection of current and vorticity along magnetic field lines by the Alfvén wave mechanism is shown to be the principal new propagation mechanism in magneto-hydrodynamic boundary layers. Recent work in inertial boundary layers, channel flows, wakes, and electrode boundary layers is summarized. (Contractor's abstract)

RESEARCH ON PLASMA PROPULSION (Abstract), by G. S. Janes. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)659) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

Low Temperature Accelerator Experiments: A plasma acceleration device consisting of an annular dc arc configuration with an axial magnetic field has been under study. Experiments have shown that the arc impedance can be increased and the energy transfer thereby improved through the application of a magnetic field. This result is an agreement with a 1-dimensional theory relating arc impedance to $\omega_e \tau_e$. Pulsed Accelerator Experiments: The flow field in a magnetic annular shock tube of radius 3:1 is being studied using optical, electrostatic, and magnetic probes. It has been found that when the center electrode is positive the current interface is not plane but assumes the shape of a blunt body for which Newtonian pressure distributions match the magnetic pressure. It has been further determined that the gas does not accumulate ahead of the current interface but flows around the "body" to the outside wall where it "leaks by" the current interface and accumulates in a bubble behind it. Electrodeless Traveling Wave Accelerator Experiments: Steady-state electrodeless plasma acceleration experiments have been performed utilizing the moving magnetic cusp configuration. In initial experiments, the mean final plasma velocity (2500 sec) corresponds to about 2/3 of the final phase velocity. The experimental evidence includes thrust, heat transfer, and Langmuir probe measurements, as well as mass flow rate and energy balance considerations.

GALVANOMAGNETIC EFFECTS IN III-V COMPOUND SEMICONDUCTORS, by A. C. Beer. [1961] [6]p. incl. diagrs. refs. (AFOSR-955) [AF 49(638)959]
AD 451556 Unclassified

Also published in Jour. Appl. Phys. Suppl., v. 32: 2107-2112, Oct. 1961.

Also published in Semiconducting Compounds; Proc. of the Conf., Schenectady, N. Y. (June 14-16, 1961), New York, W. A. Benjamin, Inc., 1961, p. 2107-2112. (AFOSR-2010)

The influence of various structural characteristics in the III-IV compounds on galvanomagnetic properties is discussed. Evidence for the scattering of charge carriers by polar optical modes is reviewed, and the behavior of Hall and magnetoresistance coefficients is examined in regard to the conduction band structure. Unique characteristics, imparted by light masses in certain bands, include high mobilities and large magneto-effects associated either with transport in the band or with ionization energies of the impurity centers. The importance of avoiding inhomogeneities, either in specimen or in magnetic field, when measuring Hall coefficient or magnetoresistance in high-mobility materials is emphasized. Illustrations are given of the effects of nonuniformities in carrier concentration or in applied magnetic field on various galvanomagnetic phenomena. (Contractor's abstract)

EVIDENCE FOR A SELENIUM DONOR LEVEL ABOVE THE PRINCIPAL CONDUCTION BAND EDGE IN GaSb, by R. T. Bate. [1961] [3]p. incl. diagrs. refs. (AFOSR-956) (AF 49(638)959) Unclassified

Also published in Jour. Appl. Phys., v. 33: 26-28, Jan. 1962.

Low-temperature Hall coefficient and resistivity data on selenium-doped GaSb are interpreted under the assumption that selenium introduces a donor level above the principal [000] conduction band minimum. The postulated level is associated with electrons in [111] valleys localized in hydrogen-like orbits around selenium atoms. The results at 77°K are consistent with the assumption that impurity scattering is dominant and that a selenium donor level is located about 0.07 ev above the principal conduction band edge at 77°K. The low-temperature data on tellurium-doped samples are also discussed. (Contractor's abstract)

INTERSENSORY COMPARISONS OF TEMPORAL JUDGMENTS, by S. Goldstone, W. K. Boardman, and W. T. Lhamon. [1958] [6]p. incl. diagr. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 18(603)79 and Public Health Service) Unclassified

Published in Jour. Exper. Psychol., v. 57: 243-248, Apr. 1959.

Audio-visual comparisons were made of absolute judgements of a standard unit of time, 1 sec. The Ss judged the duration of sounds and lights as more or less than their concept of 1 clock sec. Four hundred and three Ss were divided into 12 groups. The following results are discussed: (1) The visual "second" was consistently longer than the auditory "second". (2) Long and short anchor stimuli pulled the transition zone of the Ss' subjective "second" in the direction of the anchor magnitude for both modes. Visual judgments were more affected by the anchors. (3) Past experience with long and short anchors influence contemporary temporal judgments, with the residual effect of a past anchor being more potent for the visual mode. (4) Stimulus effectiveness and sensory dominance appeared to be a function of stimulus intensity. Under conditions of simultaneous audio-visual stimulation, the judgments approximated auditory alone when auditory was more intense; when visual was more intense the judgments approximated visual alone. (5) Stimulus intensity was the differentiating factor even when attention was varied through instructions to focus on either the light or the sound.

HEAD-BODY DIFFERENTIATIONS IN BODY IMAGE AND SKIN RESISTANCE LEVEL, by S. Fisher. [1958] [3]p. (Sponsored jointly by [Air Force Office of Scientific Research under AF 18(603)79] and Public Health Service) Unclassified

Published in Jour. Abnorm. and Social Psychol., v. 60: 283-285, Mar. 1960.

The data support the hypothesis that different levels of reactivity in given body sectors are linked with corresponding differences in body image attitudes toward such sectors. Thus, when the head area was perceived as having large magnitude with reference to the body, it was characterized by relatively lower skin resistance (indicating greater reactivity) than that of the non-head area. These findings are congruent with previously reported correlations between body image boundary definiteness and body interior vs body exterior reactivity... body image attitudes towards a given body sector may play a causative role in the level of reactivity of that sector.

THE EFFECTS OF ANCHORS ON APPARENT LENGTH, by W. K. Boardman, R. C. Aldrich and others. [1958] [5]p. incl. tables. (Sponsored jointly by Air Force Office of Scientific Research under AF 18-(603)79 and National Institute of Mental Health) Unclassified

Published in Jour. Gen. Psychol., v. 61: 45-49, July 1959.

Anchor effects on judgments of a standard physical unit, 1 in., were studied in 61 normal Ss, divided into 3 groups: neutral anchor (1.0 in.), long anchor (2.0 in.), and short anchor (0.1 in.). Anchor refers here to the initial stimulus of a series. S's estimate of an in. and his variability of judgment were derived and these measures compared for the 3 groups. Judgments showed no significant anchor effect and approximated the 1.0 in. objective standard. An anchor-reversed condition produced a significant change in judgments of the 0.1 in. initial anchor group but not in those of the 2.0 in. initial anchor group. The findings are discussed in comparison to analogous temporal judgments. (Contractor's abstract)

A RAPIDLY CONVERGENT ORTHOGONAL REPRESENTATION FOR EEG TIME SERIES AND RELATED METHODS OF AUTOMATIC ANALYSIS, by B. Saltzberg and N. R. Burch. [1959] [9]p. incl. diagrs. [AF 18-(603)79] Unclassified

Presented at Western Electronic Show and Convention, San Francisco, Calif., Aug. 18-21, 1959.

Published in I.R.E. Wescon Convention Record, Pt. 8: 35-43, 1959.

A mathematical model for characterizing electroencephalograph waveforms and a simple method of data analysis based on this model are described. A Gram-Charlier series representation arises as a consequence of the model used and the parameters which characterize this series are evaluated by measuring and processing zero crossing of the waveform and its derivatives. The model considers each time interval bounded by a pair of zeros of the EEG record as representing a probability distribution over this interval. The EEG is then characterized by parameters which relate to the shape of the distribution and which can be derived from derivative zero crossings within the interval. This technique has been applied with encouraging results to EEG studies of hypoxia and the effects of drugs administered to simulate human stress and fatigue. (Contractor's abstract)

A FURTHER NOTE ON INTERSENSORY DIFFERENCES IN TEMPORAL JUDGMENT, by S. Goldstone, C. Jernigan and others. [1959] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 18(603)79 and Public Health Service) Unclassified

Published in Perceptual and Motor Skills, v. 9: 252, Sept. 1959.

A previous study (see item no. 82, Vol. V) showed that a longer visual than auditory duration is likely to be judged by Ss' as 1 clock sec and compared binaural judgments of a pure tone with binocular judgments of a 1° circular target. This study was to determine whether this intersensory difference was a function of the dissimilar pattern of stimulation directed to the 2 modes since only part of the visual field was stimulated and greater visual attention presumably was required. Test results verify the previously reported intersensory difference in temporal judgment.

A BIOPHYSICAL BASIS FOR EXPRESSING THE GSR AS A CHANGE IN CONDUCTANCE: PRELIMINARY NOTE, by R. Edelberg. [1959] [5]p. incl. diagr. [AF 18(603)79] Unclassified

Published in Psychophysiol. Newsltrs., v. 6: 9-13, Aug. 1960.

The following expression, which has the advantage of a theoretical basis and experimental validation as well as pointing the way toward the recording circuit most logically used in measuring the exosomatic GSR, is given: $E = I.t/F^2(u_o r_o c_o + \frac{v_i c_i}{r_i})$, where E is the voltage across membrane; t the membrane thickness; F the Faraday constant; u_o the mobility of the external cation; c_o the concentration of the external cation; r_o the Donnan ratio for the external boundary (actually a function of fixed charge concentration on the membrane); v_i the mobility of the internal anion; c_i the concentration of the internal anion; and r_i the Donnan ratio for the internal boundary. The equation is further discussed with respect to the resting voltage (dE) in case of a small change in ionic mobility. It is concluded that a system is developed which will give a writeout in which changes in skin resistance are automatically converted to conductance units and most important, in which changes in basal resistance are automatically taken into account.

THE INTERRELATIONSHIP BETWEEN THE GALVANIC SKIN RESPONSE, BASAL, RESISTANCE, AND TEMPERATURE, by R. L. Maulsby and R. Edelberg. [1959] [5]p. incl. diagrs. refs. (Sponsored jointly by [Air Force Office of Scientific Research under AF 18-(603)79], National Institute of Mental Health, and Wright Air Development Center) Unclassified

Published in Jour. Compar. and Physiol. Psychol., v. 53: 475-479, Oct. 1960.

A comparison of 2 simultaneously recorded skin sites shows that basal resistance varies inversely with skin surface temperature by 3%/°C. Cooling of the site initially increases the GSR by about 5%/°C, and warming similarly reduces the GSR; but after 2-8 min there is a reversal of the effect. These changes are interpreted in terms of the membrane concept of the GSR effector. A peripheral interrelationship between GSR and basal resistance is indicated. (Contractor's abstract)

FRONT-BACK DIFFERENTIATIONS IN BODY IMAGE AND BODY REACTIVITY, by S. Fisher. [1959] [7]p. incl. table. (Sponsored jointly by [Air Force Office of Scientific Research under AF 18(603)79] and Public Health Service) Unclassified

Published in Jour. Gen. Psychol., v. 64: 373-379, Apr. 1961.

Ss' estimates of the relative sizes of front vs back areas of their bodies were obtained. Measures of front vs back reactivity were secured by means of skin resistance recordings. As hypothesized, it was found that the ratio of front skin resistance to back skin resistance was significantly related to the body image valuations applied to these areas. It was predicted that the greater the body image prominence and also physiological reactivity of the back vs the front, the greater the imaginative spontaneity in interpreting stimuli. Data from the Rorschach and Thurstone Interest Schedule were partially supportive of this view.

THE RELATIONSHIP BETWEEN THE GALVANIC SKIN RESPONSE, VASOCONSTRICTION, AND TACTILE SENSITIVITY, by R. Edelberg. [1960] [9]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 18(603)79 and National Institute of Mental Health) Unclassified

Published in Jour. Exper. Psychol., v. 62: 187-195, Aug. 1961.

The relationship over short periods of time between cutaneous tactile threshold and autonomic activity, as reflected in galvanic skin response (GSR) or in degree of vasoconstriction, was determined by a method allowing continuous monitoring of S's threshold to 250 cps vibration. Increased autonomic activity occurring either spontaneously or as a result of external stimulation is generally accompanied by a fall in tactile threshold, the highest correlation occurring when finger pulse volume is used as the autonomic measure. Experiments to determine whether the correlation with vascular activity is due to the mechanical effect of the stretching or relaxing of the skin on tactile threshold showed that this is a possible explanation but cannot account for all of the results. A survey of the palmar surface of the hand showed a relationship between the relative magnitude of the GSR from a given site and its tactile sensitivity, and further, that the sites comprise separate populations, each associated with a different cutaneous nerve. It is postulated that the GSR may in part be a by-product of the arrival of sympathetic impulses whose function is to sensitize tactile receptors. The influence of general arousal and of focus of attention on the tactile-autonomic relationship has tentatively been assigned a dominant position. (Contractor's abstract)

MICROELECTRODE STUDY OF THE GALVANIC SKIN RESPONSE (Abstract), by R. Edelberg. [1961] [1]p. (Sponsored jointly by [Air Force Office of Scientific Research under AF 18(603)79] and Public Health Service) Unclassified

Presented at Forty-fifth annual meeting of the Fed. Amer. Soc. for Exper. Biol., Atlantic City, N. J., Apr. 14, 1961.

Published in Fed. Proc., v. 20 (Pt. 1): 326, Mar. 1961.

Several lines of indirect evidence have indicated that epidermal cells as well as sweat glands may participate in the electrical resistance changes occurring during the GSR. This hypothesis has been tested directly on 30 humans by exploration of the palmar skin surface with reversible microelectrodes. Because shunting of current by the corneum renders interpretation uncertain, a micro-surgical technique has been utilized to isolate physically and electrically a slab of epidermis from the surrounding sweat ducts. Even with this precaution, local humidity changes incidental to sweating have been shown to alter epidermal hydration and thereby introduce an uncertainty in determining the origin of the large resistance changes observed on these slabs. Demonstration of selective inactivation of these epidermal slabs and observation of the phase and amplitude relations of the resistance changes with those of nearby sweat glands and gross sites under various degrees of local humidity lead to the conclusion that the living layer of the epidermis contributes significantly to the resistance changes of the GSR.

NEW MICROWAVE STRUCTURAL MEASUREMENTS OF LINEAR MOLECULES (Abstract), by J. K. Tyler and J. Sheridan. Feb. 1961 [1]p. (Technical note no. 1) (AFOSR-802) (AF 61(052)241) Unclassified

Structures have been determined for fluorine cyanide, FCN (3 isotopic forms), and fluoroacetylene, FCCH (6 isotopic forms). Spectra have also been measured for the following molecules for use with earlier data in computing structures: $Cl^{35}CN^{15}$, $Cl^{37}CN^{15}$, ICN^{15}, $Cl^{35}C^{13}CH$, and $Cl^{35}CC^{13}H$. Dipole moments have been determined from stark effects for FCN and FCCH, and l-type doublet spectra have been measured for excited states of both these molecules and for cyanoacetylene, HCCCN. The CN substitution distances are 1.159A in all the halogen cyanides. The quadrupole coupling constant for N^{14} in these falls along the series to a value of -2.67 mc/sec in FCN, and bears no simple relation to the CN length. The CF distances in FCN and FCCH are the shortest ever found for this linkage. The CC distance in FCCH is probably slightly shorter than the 1.204A found in ClCCH and acetylene itself. Iodoacetylene, ICCH and ICCD, have been prepared and characterized for the first time by means of mass- and infrared-spectra. Failure to date to detect a microwave spectrum of this substance indicates that it has a very small dipole moment.

THE EFFECTS OF CHLORPROMAZINE, THIOPENTONE AMPHETAMINE AND D-LYSERGIC ACID DIETHYLAMIDE ON CONDUCTION WITHIN AN EXTRALEMNISCAL SYSTEM IN THE BRAIN STEM OF THE CAT, by A. J. Hance. [1958] [2]p. [AF 61(514)1184] Unclassified

Presented at meeting of the Physiol. Soc., London (Gt. Brit.), Dec. 5-6, 1958.

Published in Jour. Physiol. (London), v. 145. 41P-42P, Mar. 1959.

The experiments were carried out on cat preparations of the encéphale isolé type in which the spinal cord was transected at the C 1 level while the animal was under ether anesthesia. Single 1 msec rectangular pulses, 4-10 v in amplitude, were applied once/2 sec to the region of the nucleus recticularis slightly lateral and dorsal to the inferior olive by means of a concentric bipolar electrode. Potentials were recorded from the nucleous commissurae posterioris or occasionally from the central grey matter at the level of the superior colliculus and displayed on a cathode-ray oscilloscope. Measurements were made of the initial latency, peak latency and amplitude of the evoked response during 1 or more control periods and again after the administration of drugs. Latency measurements show that the fastest components of the recorded wave had a conduction velocity of 1.0-3.0 m/sec while the peak of the wave was propagated at 0.5-0.95 m/sec. Both thiopentone sodium and r-amphetamine sulphate caused reduction in amplitude of the evoked potential. The results support earlier findings that there is a difference in the sites of action of amphetamine and LSD-25.

A COMPARATIVE STUDY OF THE EFFECTS OF DRUGS ON THE AROUSAL SYSTEM OF THE BRAIN, by P. B. Bradley and B. J. Key. [1959] [10]p. (AF 61-(514)1184) Unclassified

Published in Brit. Jour. Pharmacol. and Chemotherapy, v. 14: 340-349, 1959.

A concentric bipolar stimulating electrode was oriented in the brain stem reticular formation in the encéphale isolé of the cat; the electrocorticogram was recorded from 12-16 cortical electrodes and the behavioral arousal response (opening of the eyes and contraction of the nictitating membrane) to electrical stimulation was observed. The response to auditory stimulation was also examined. Thresholds for arousal response

were determined and the effects of the following drugs were examined: chlorpromazine, promazine, acepromazine, hydroxyzine, benactyzine, imipramine, hyoscine, reserpine, rescinnamine, deserpidine, meprobamate, and azacyclonal. The drugs could be classified into 4 groups: (1) drugs producing slight depression of the direct and afferent nerve stimulation, arousal with similar effects on the electrocorticogram and arousal (chlorpromazine, promazine, acepromazine and hydroxyzine), (2) drugs increasing arousal thresholds but dissociating behavior and electrical activity (benactyzine and imipramine), (3) drugs having no effect on arousal but in high doses producing changes in the electrocorticogram towards activation pattern (reserpine add related compounds, and (4) with no detectable effects (meprobamate and azacyclonal).

ELECTROPHYSIOLOGICAL INVESTIGATION INTO THE ACTION OF CENTRAL STIMULANT AND TRANQUILLISING DRUGS, by P. B. Bradley. Final technical rept. May 31, 1961, 49p. incl. diagrs. table, refs. (AFOSR-1034) (AF 61(514)1184) AD 262162
Unclassified

Three main types of investigation have been carried out: (1) Studies of the effects of drugs on conduction within the brain stem. Of the drugs studied, only 2, thiopentone sodium and amphetamine had any significant effects. (2) Studies of the effects of central stimulant and tranquilizing drugs on arousal responses. Three central excitant drugs, Preludin, Ritalin and Meratran were found to have similar effects to those of amphetamine and it is suggested that they have the same site of action. Of the tranquilizers studied, promazine, acepromazine and hydroxyzine were found to have similar effects on arousal thresholds to those of chlorpromazine and probably act in the same way. (3) Studies of the effects of drugs on conditioning and habituation to arousal stimuli in animals. In this investigation chlorpromazine was found to elevate thresholds for both unconditioned and conditioned afferent stimuli in producing arousal and eventually blocked these responses. Reserpine caused only a slight rise in threshold for the conditioned response but blocked the unconditioned response although this latter effect may have been partly due to habituation. REACTIONS OF ACTIVE NITROGEN WITH ORGANIC SUBSTRATES. I. THE MONOMERIC PRODUCTS OF THE REACTION WITH 1,3-BUTADIENE, by A. Tsukamoto and N. N. Lichtin. [1961] [5]p. incl. diagrs. tables, refs. (AFOSR-3752) (AF 49(638)2)
Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 1601-1605, May 5, 1962.

The reaction of active nitrogen with 1,3-butadiene yields important amounts of pyrrole and cis- and trans-crotononitriles which can be rationalized as resulting from addition of a nitrogen atom and loss of a hydrogen atom. Other products arise from degradative processes and include cis- and trans-1-cyano-1,3-butadiene, 3-cyano-1-butene, 2 nitriles tentatively identified as cis- and trans-1-cyanopentene-3, ethylene, acetylene, propylene and hydrogen cyanide, the most abundant product. A substantial quantity of polymeric material of composition approximating $(C_4H_6N)_x$ is also formed. The small dependence of the relative yields of monomeric (i.e., C_4N, C_5N and C_6N) products on partial pressures of reactants suggests that they are all formed via the same nitrogenous intermediate. Mechanistic speculations consistent with the data are offered. (Contractor's abstract)

STRUCTURE OF A QUANTIZED VORTEX IN BOSON SYSTEM, by E. P. Gross. [1961] [23]p. incl. refs. (AFOSR-J520) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)27] and National Science Foundation) AD 414439 Unclassified

Also published in Nuovo Cimento, Series X, v. 20: 454-477, May 1, 1961.

For a system of weakly repelling bosons, a theory of the elementary line vortex excitations is developed. The vortex state is characterized by the presence of a finite fraction of the particles in a single particle state of integer angular momentum. The radial dependence of the highly occupied state follows from a self-consistent field equation. The radial function and the associated particle density are essentially constant everywhere except inside a core, where they drop to zero. The core size is the de Broglie wavelength associated with the mean interaction energy/particle. The expectation value of the velocity has the radial dependence of a classical vortex. In this Hartree approximation the vorticity is zero everywhere except on the vortex line. When the description of the state is refined to include the zero point oscillations of the phonon field, the vorticity is spread out over the core. These results confirm in all essentials the intuitive arguments of ONSAGER and FEYNMAN. The phonons moving perpendicular to the vortex line are coherent excitations of equal and opposite angular momentum relative to the subetratum of moving particles that constitute the vortex. The vortex motion resolves the degeneracy of the Bogolyubov phonons with respect to the azimuthal quantum number. (Contractor's abstract)

DYNAMICAL STRUCTURE AND DEFINITION ON ENERGY IN GENERAL RELATIVITY, by S. Deser. [1959] [13]p. incl. refs. (AFOSR-3960) (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)636] and National Science Foundation) Unclassified

Also published in Les Théories Relativistes de la Gravitation; Colloq. Internationaux du Centre Nat'l. de la Recherche Scientifique, Royaumont (France). (June 21-26, 1959), Paris, Centre Nat'l. de la Scientifique, 1962, p. 395-407.

Also published in Phys. Rev., v. 116: 1322-1330, Dec. 1, 1959.

The dynamical structure and definition of energy for the classical general theory of relativity is considered on a formal level. The Schwinger action principle is used. Starting with the full Einstein Lagrangian in 1st order Palatini form, an action integral is derived in which the algebraic constraint variables have been eliminated. This action possesses a "Hamiltonian" density which vanishes due to the differential constraints. An analysis of the equations of motion and the constraint equations shows that the 2 pairs of dynamical variables representing the 2 independent degree of freedom of the gravitational field are explicitly exhibited. It is suggested that the theory is to be restated in terms of variables that possess the geometrical properties of decomposing the 4 dimensional characterizations of the space into 3 + 1 dimensional aspects.

CANONICAL VARIABLES, EXPRESSION FOR ENERGY, AND THE CRITERIA FOR RADIATION IN GENERAL RELATIVITY, by R. Arnowitt, S. Deser, and C. W. Misner. [1959] [9]p. (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)636] and National Science Foundation) Unclassified

Published in Nuovo Cimento, Series X, v. 15: 487-491, Feb. 1, 1960.

A canonical form for general relativity involving only 2 pairs of unconstrained conjugate variables is obtained by an orthogonal decomposition of the space part of the metric and the conjugate momentum variables, of the form $f_{ij} = f_{ij}^{TT} + \frac{1}{2}[f^{T}\delta_{ij} - (1/\Delta^2)f^{T}{}_{,ij}] + f_{i,j} + f_{j,i}$, ($1/\Delta^2$ the inverse of the flat space Laplacian operator with appropriate boundary conditions). The coordinate conditions (without which the decomposition is

meaningless) are $g_{ij,j} = 0$, $\pi^{ii}{}_{,jj} - \pi^{ij}{}_{,ij} = 0$. The criterion for the existence of radiation at a point is then a non zero TT part of the metric (of conjugate variable).

CANONICAL VARIABLES FOR GENERAL RELATIVITY, by R. Arnowitt, S. Deser, and C. W. Misner. [1959] [8]p. (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)636] and National Science Foundation) Unclassified

Published in Phys. Rev., v. 117: 1595-1602, Mar. 15, 1960.

The general theory of relativity is cast into normal Hamiltonian form in terms of 2 pairs of independent conjugate field variables. These variables are explicitly exhibited and obey ordinary Poisson bracket relations. This form is reached by imposing a simple set of coordinate conditions. It is shown that these functionals of the metric used as invariant coordinates do not appear explicitly in the Hamiltonian and momentum densities, so that the standard differential conservations laws hold. The bearing of these results on the quantization problem is discussed. (Contractor's abstract)

Brandeis U. Dept. of Physics, Waltham, Mass.

ENERGY AND THE CRITERIA FOR RADIATION IN GENERAL RELATIVITY, by R. Arnowitt, S. Deser, and C. W. Misner. [1959] [4]p. incl. refs. (Sponsored jointly by Aeronautical Research Lab., [Air Force Office of Scientific Research under AF 49(638)636], and National Science Foundation) Unclassified

Published in Phys. Rev., v. 118: 1100-1104, May 15, 1960.

The Hamiltonian for general relativity obtained in a previous paper (Phys. Rev., v. 113: 745-750, Jan. 15, 1959) furnishes a definition of energy whose physical interpretation is direct, and which fulfills the conditions required of the energy in other physical systems. The energy can be expressed as a surface integral at spacial infinity in terms of the spacial components of the covariant metric tensor at any given time. Thus, the energy depends only on the minimal initial Cauchy data and may be evaluated in any coordinate system, provided this system can be made asymptotically rectangular. These statements remain valid when particles are coupled to the gravitational field. The criteria for existence of gravitational radiation are formulated in terms of the canonical variables and the stress-tensor. These criteria are identical to those used in electromagnetic theory. Some applications are discussed. (Contractor's abstract)

HEISENBERG REPRESENTATION IN CLASSICAL GENERAL RELATIVITY, by A. Arnowitt, S. Deser, and C. W. Misner. [1960] [14]p. incl. refs. (AFOSR-J1433) (Sponsored jointly by Aeronautical Research Laboratory, Air Force Office of Scientific Research under AF 49-(638)636, and National Science Foundation) AD 427646 Unclassified

Also published in Nuovo Cimento, Series X, v. 19: 668-681, Feb. 16, 1961.

The energy of the gravitational field (as of any other system) is not always the numerical value of the Hamiltonian (for example, not in a Hamilton-Jacobi formulation). A classical "Heisenberg representation" is here defined that excludes Hamilton-Jacobi-like canonical transformations. Ordinarily, within the Heisenberg representation, there remains only the possibility of time-independent canonical transformation among the dynamical variables. However, the freedom of co-ordinate transformations in general relativity allows many extra "canonical" transformations not found in conventional Lorentz covariant theory. This wider class of canonical formalisms possess all the properties usually associated with the Heisenberg picture in that in each formalism the measurable quantities, $g_{\mu\nu}(t)$, are obtained from knowledge of the canonical variables at the same time without any explicit co-ordinate dependence. Further, the Hamiltonian is a constant of motion. Only in Heisenberg frames is the Hamiltonian to be associated with the energy of the system. In spite of the additional freedom of canonical transformations (due to the freedom of co-ordinate change mentioned above), it is shown that the Hamiltonian is numerically the same for a fixed state of the gravitational field in any Heisenberg representation. The energy is then a uniquely definable quantity in the theory. In the process, it is established that 2 Heisenberg frames can differ by coordinates. These transformations must also preserve the property that depend only on the canonical variables and not explicitly on the coordinates. These transformations must also preserve the property that at spatial infinity the metric become Lorentz so that the physical boundary conditions are unaltered. (Contractor's abstract)

Brandeis U. [Dept. of Physics] Waltham, Mass.

WAVE ZONE IN GENERAL RELATIVITY, by R. Arnowitt, S. Deser, and C. W. Misner. [1960] [11]p. incl. refs. (AFOSR-J1452) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)-636], National Science Foundation, and Wright Air Development Division) AD 427582 Unclassified

Also published in Phys. Rev., v. 121: 1556-1566, Mar. 1, 1961.

In general relativity a "wave zone" may be defined for systems which are asymptotically flat. In this region, gravitational radiation propagates freely, independent of its interior sources, and obeys the superposition principle. The independent dynamical variables of the full theory which describe the radiation are shown to be coordinate invariant in the wave zone and to satisfy the linearized theory's equations there. Thus, the basic properties of free waves in linear field theories (e.g., electrodynamics) are reproduced for the gravitational case. True waves are also clearly distinguished from so-called "coordinate waves". Reduction to asymptotic form (taking leading powers of 1/r), is not identical to linearization, since, for example, the Newtonian-like 1/r part of the metric begins quadratically in the linear theory's variables. The Poynting vector of the full theory, which measures energy flux in the wave zone, is correspondingly shown to be given by the linearized theory's formula. (Contractor's abstract)

SPIN-STATISTICS THEOREM (Abstract), by R. Arnowitt and S. Deser. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)636] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 305-306, Apr. 24, 1961.

A derivation of the connection between spin and statistics is obtained on the basis of the specific set of postulates of the Schwinger action principle. These included that (1) the Hilbert space metric is positive-definite, (2) local commutativity, (3) proper Lorentz invariance hold, (4) the fields have local interactions, and (5) variations of field amplitudes either commute or anticommute with the fields themselves. Neither positive-definiteness of the Hamiltonian nor TCP invariance need then be involved to obtain the connection for charged and neutral spin 0 to 1 and for neutral spin 1/2. Either of the last named assumptions may be used to guarantee the proper connection for the charged spin 1/2 field, where the purely algebraic consistency proof used in the other cases is not sufficient.

FURTHER CONSIDERATIONS ON ELECTROMAGNETIC POTENTIALS IN THE QUANTUM THEORY, by Y. Aharonov and D. Bohm. [1961] [14]p. incl. refs. [AF 49-(638)636] Unclassified

Published in Phys. Rev., v. 123: 1511-1524, Aug. 15, 1961.

The significance of potentials in the quantum theory is discussed in order to answer a number of arguments that were raised against the conclusions of a previous paper (Phys. Rev., v. 115: 485, 1959) on the same subject. It is then proceeded to extend the treatment to include the sources of potentials quantum-mechanically, and it is shown that when this is done, the same results are obtained as those of the previous paper, in which the potential was taken to be a specified function of space and time. In this way it not only answers certain additional criticisms that have been made of the original treatment, but also brings out more clearly the importance of the potential in the expression of the local character of the interaction of charged particles and the electromagnetic field. THE SPIN-STATISTICS THEOREM, by R. Arnowitt and S. Deser. [1961] 38p. incl. refs. (AFOSR-J1449) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-22 and National Science Foundation) AD 427648 Unclassified

Also published in Jour. Math. Phys., v. 3: 637-649, July-Aug. 1962.

A derivation of the connection between spin and statistics is obtained for spin 0, 1/2 and 1 fields with arbitrary local interactions. The basis used is the Schwinger action principle, whose assumptions are specified; they include neither positive energy spectrum nor TCP invariance. The connection can be obtained without either of these 2 extra requirements in most cases. The remaining cases are characterized by non-TCP invariant free Lagrangians and non-positive definite free-particle

energies. Commutation relations among different fields are also briefly discussed by means of the action principle. (Contractor's abstract)

INTERFERENCE EFFECTS IN THE DECAY OF NEUTRAL K MESONS: $K^0 \to \pi + \pi + \gamma$, by S. Barshay and C. Iso. [1961] [4]p. incl. diagr. refs. (AFOSR-64-0876) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-61-22] and National Science Foundation) AD 438669 Unclassified

Also published in Phys. Rev., v. 125: 2168-2171, Mar. 15, 1962.

An analysis is made of interference effects between the K_1^0 and K_2^0 components of a neutral K beam undergoing the $\pi^+ + \pi^- + \gamma$ decay mode. It is shown that a time dependence of the angle between the photon polarization and the normal to the decay plane in the rest system of the K particle results from the interference between the K_1^0 and K_2^0 channels. If we can assume that for π-π scattering at the energies relevant here only I = 0, D wave and I = 1, P-wave elastic phase shifts may be large, then these interference terms can be uniquely written in terms of the π-π phase shifts and Δm, the $K_1^0 - K_2^0$ mass difference. This effect may serve as a good method to determine the sign, as well as the magnitude, of the $K_1^0 - K_2^0$ mass difference. It may also be useful to determine the π-π scattering phase shifts. SYMMETRIC MEANS AND MATRIX INEQUALITIES, by P. Bullen and M. Marcus. [1960] [8]p. (AF 49-(638)776) Unclassified

Published in Proc. Amer. Math. Soc., v. 12: 285-290, Apr. 1961.

Several inequalities for elementary symmetric functions are studied. Let (a) denote the n-type of positive numbers $(a_1, \ldots, a_n)$, $(\bar{a})$ the $(n+1)$-tuple of positive numbers $(a_1, \ldots, a_n, a_{n+1})$, $E_r(a)$ the rth elementary symmetric function of the (a), $p_r(a) = \binom{n}{r}^{-1} E_r(a)$, $F_{r,p} = (E_r/E_{r-p})^{1/p}$; (a) is proportional to (b) if there exists λ such that $a_i = \lambda b_i$, i = 1, 2, ..., n. The following are proved: (1) If $1 \le r \le k \le n$, then $p_r^k(a)/p k^r(a) = p_r^{k+1}(\bar{a})/p_{k+1}^r(\bar{a})$, with equality only if $a_1 = \ldots = a_{n+1}$. (2) If $\mu_1 \ge \ldots \ge \mu_{n+1} > 0$ are eigenvalues of a positive definite Hermitian matrix H and $\lambda_1 = \ldots = \lambda_n > 0$ the eigenvalues of a principal submatrix of H, then $p_1^k(\lambda)/p_k(\lambda) \ge p_1^{k+1}(\bar{\mu})/p_{k+1}(\bar{\mu})$. (3) If $1 \le p \le r \le n$, the $F_{r,p}(a+b) \ge F_{r,p}(a) + F_{r,p}(b)$, with equality only if r = 1, p = 1 or (a) is proportional to (b). (4) If A and B are positive definite Hermitian matrices with eigenvalues $0 < \alpha_1 \le \ldots \le \alpha_n$, $0 < \beta_1 \le \ldots \le \beta_n$, respectively, and C = A + B has eigenvalues $0 < \delta_1 \le \ldots \le \delta_n$, then $1 \le p \le r \le k \le n$ $F_{r,p}(\delta_1, \ldots, \delta_k) \ge F_{r,p}(\alpha_1, \ldots, \alpha_k) + F_{r,p}(\beta_1, \ldots, \beta_k)$.

SOME RESULTS ON NON-NEGATIVE MATRICES, by M. Marcus, H. Minc, and B. N. Moyls. Apr. 1961, 16p. (AFOSR-599) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)776 and Office of Naval Research) AD 258985 Unclassified

Also published in Jour. Research Nat'l. Bur. Stand., v. 65B: 205-209, Sept. 1961.

In 1946 Birkhoff proved that any doubly stochastic (d.s.) matrix with non-negative entries is a convex combination of permutation matrices and that a matrix is d.s. if every row and column sum is 1. Let Ω_n denote the polyhedron of non-negative d.s. matrices. As noted in a previous paper (see item no. BCU.03:002, Vol. II) that dim $\Omega_n = (n-1)^2$, and hence any $A \in \Omega_n$ can be written as a convex combination of at most $(n-1)^2 + 1$ permutation matrices. Mirsky and Farahat have suggested (Proc. Camb. Phil. Soc., v. 56: 322-328, 1960) that an investigation of the minimum no $\beta(A)$ of permutation matrices is necessary to represent $A \in \Omega_n$ as a convex combination. The study is carried out as follows: (1) An inequality relating $\beta(A)$ to h(A) is obtained, the no of characteristic roots of A of absolute value 1. A problem of the similarity of 2 matrices in Ω_n is studied. (2) Conditions on $A \ge 0$ that are implied by the equality $\det(I-A) = \prod_{i=1}^{n} (1 - a_{ii})$ are studied. (3) An inequality is obtained for the difference between the max characteristic roots of 2 matrices A and B satisfying $B \ge A \ge 0$, where $B \ge A$ means $b_{ij} = a_{ij}$ for all i, j. (4) The question is discussed of transitivity of sets of functions on the set of integers $(1, \ldots, n)$ into itself by matrix methods.

ASYMPTOTIC ESTIMATES FOR LIMIT POINT PROBLEMS, by C. A. Swanson. [1961] [12]p. (AFOSR-J1019) (AF AFOSR-61-89) AD 418299 Unclassified

Also published in Pacific Jour. Math., v. 13: 305-316, Spring 1963.

The variation of characteristic values and functions of the differential operator L defined by $Lx = \frac{1}{k(s)}\left\{-\frac{d}{ds}\left[p(s)\frac{dx}{ds}\right] + q(s)x\right\}$ is studied when the domain of L varies because of a change of boundary conditions. The basic interval is an open interval $\omega_- < s < \omega_+$ on which k is positive and piecewise continuous, p is positive and differentiable, and q is real-valued and piecewise continuous. For a closed subinterval [a,b] of the basic interval the main purpose is to obtain estimates for the characteristic values μ_{ab} and characteristic functions y_{ab} of regular Sturm-Liouville problems on [a,b] when a,b are near ω_-, ω_+. Such results have been obtained previously (Pacific Jour. Math., v. 11: 1549-1559, 1961) in the case that both ω_- and ω_+ are limit circle singularities in H. Weyl's classification. Here the analogous results are derived in the limit point case and the mixed case (one singularity of each type).

SOME TOPICS IN THE FLUCTUATIONS OF PHOTOPROCESS IN SOLIDS, by R. E. Burgess. [1961] [7]p. [AF AFOSR-61-91] Unclassified

Presented at the 1961 Internat'l. Conf. on Photoconductivity, Cornell U., Ithaca, N. Y., Aug. 21-24.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 484, Nov. 24, 1961.

Published in Jour. Phys. and Chem. Solids, v. 22: 371-377, Dec. 1961.

Photons and electrons in solids can undergo the stochastic processes of generation, absorption and multiplication. A general analysis of the steady-state mean value and variance due to these processes is applied to consideration of imperfect photon absorbers, and of photon and electron multipliers. The fluctuations of photon flux interacting with perturbed populations in a pair of electron levels are shown to be consistent with boson statistics at an effective temperature determined by the temperature of the input photons and the temperature of the level populations; the results are valid even if the latter temperature is negative and thus apply to amplifying as well as to attenuating systems. Fluctuations of carrier numbers in a nonstationary system are considered and the difficulties of formulating their spectral distribution are indicated. Carriers in a photoconductor produced by energetic photons have excess energy which is rapidly lost by photon scattering or by further ionization and these hot carriers therefore introduce additional noise components. FURTHER STUDIES OF THE INFLUENCE OF ACOUSTIC MICROSTREAMING ON THE PHOTOGRAPHIC DEVELOPMENT PROCESS, by F. J. Jackson. [1961] [2]p. incl. illus. diagrs. (AFOSR-2124) (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(603)54], National Institutes of Health, and Office of Naval Research) Unclassified

Presented at Fifty-ninth meeting of the Acoust. Soc. Amer., Brown U., Providence, R. I., June 9-11, 1960.

Also published in Jour. Acoustic Soc. Amer., v. 33: 1144-1145, Aug. 1961.

A major obstacle in attempting quantitative investigations of the influence of microstreaming on solid-liquid interface reactions has been the inability to prevent gaseous cavitation (which destroys the orderly streaming action) from occurring in the liquid medium when the latter is subjected to a high-amplitude sound field. A description

is given of a modification of an earlier experimental arrangement, used to study microstreaming effects on a specific interphase chemical reaction (i.e., development of a photographic emulsion), which incorporates a means for suppressing undesired cavitation. Preliminary results obtained using this apparatus are presented. These results permit a more precise correlation between observed effects and properties of the streaming field than has hitherto been possible. Preliminary data indicating the extent to which microstreaming affects the local development rate are also presented. (Contractor's abstract)

ULTRASONIC ATTENUATION IN SUPERCONDUCTORS, by R. W. Morse. [1961] [5]p. incl. diagrs. [AF 49(638)-6] Unclassified

Presented at IBM Conf. on Fundamental Research in Superconductivity, Yorktown Heights, N. Y., June 1961.

Published in IBM Jour. Research and Develop., v. 6: 58-62, Jan. 1962.

A brief review is given of the ultrasonic attenuation in metals arising from direct interaction of the elastic waves and conduction electrons, and the physical variables on which it depends. The drop in attenuation of longitudinal waves on entering the superconducting state is in good agreement with BCS theory, the various factors combining to make the relative attenuation, α_s/α_n, depend only on the energy gap; the measurements give evidence, however, for gap anisotropy or the presence of more than 1 gap. Recent measurements at Brown by Claiborne of shear wave attenuation in single-crystal Al, are in good agreement with a theory based on the Boltzmann and London equations. The steep drop at T_c is produced by shorting out of electromagnetic waves by supercurrents; the residual attenuation results from the effects of collision drag. (Contractor's abstract)

THE VISCOSITY OF STEAM AND WATER AT MODERATE PRESSURES AND TEMPERATURES, by J. R. Moszynski. [1961] [14]p. incl. diagrs. tables, refs. (In cooperation with Case Inst. of Tech., Cleveland, Ohio) (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)891 and Steam Research Committee of American Society of Mechanical Engineers) Unclassified

Presented at ASME-AIChE Heat Transfer Conf., Buffalo, N. Y., Aug. 15-17, 1960.

Published in Jour. Heat Transfer, v. 83: 111-124, May 1961.

The paper reports the results of an investigation of the viscosity of steam and compressed water. The measurements were carried out by means of an oscillating-body-type viscometer in order to develop an alternative method of measurement to the usually employed capillary viscometer, and also to provide an independent check on published data. The results for compressed water, obtained with the aid of an oscillating sphere, represent absolute measurements, and cover a range from 3 to 340 atm and from 20° to 186°C. The viscosity of water is shown to have a negative pressure coefficient below 35°C and a positive coefficient above that temperature. The maximum change in viscosity at any given temperature over the pressure range covered is 5%. The results show good agreement with previously published data and the deviations of experimental points from smoothed curves do not exceed 0.05%. Although the present instrument is severely limited in range, the feasibility of measurements at elevated temperatures and pressures by means of the oscillation-type viscometer is clearly demonstrated. Particularly striking is the reproducibility and self-consistency of the results obtained. (Contractor's abstract)

THERMALLY DRIVEN NONLINEAR OSCILLATION IN A PIPE WITH TRAVELLING SHOCK WAVES, by B.-T. Chu and S. J. Ying. Apr. 1961, 32p. incl. diagrs. (Rept. no. AF 646/1) (AFOSR-686) (AF 49(638)646) AD 267069 Unclassified

Also published in Phys. Fluids, v. 6: 1625-1637, Nov. 1963.

Lin's method of characteristics perturbation was successfully applied to the calculation of a case of periodic nonlinear vibration of a column of gas in a pipe. The system consists of a heater located at the mid-section of a pipe closed at both ends. When the frequency of change in the heat-release rate is nearly equal to the natural frequency of the column of gas to 1 side of the heater, the fluctuation in pressure at the heater becomes almost in phase with the fluctuating change in heat-release rate. As a result, the amplitude of fluctuation in the pipe increases linearly with time until shock waves are formed in the system. Ultimately the level of fluctuation in the pipe attains a limiting value and the changes in the pipe become periodic. The results of this calculation of periodic nonlinear vibration agree with those of Betchov (Phys. Fluids, v. 1: 205-212, 1958). The method used here opens the way toward solving many similar problems of nonlinear vibration by a straight-forward and systematic procedure. (Contractor's abstract)

ON THE STABILITY OF LAMINAR FLAME, by B.-T. Chu and J. Y. Parlange. Sept. 1961, 30p. incl. diagrs. (Rept. no. AF 646/2) (AFOSR-1593) (AF 49(638)646) AD 267070 Unclassified

The stability of a laminar flame subjected to a small perturbation is examined. A practical case is considered in which the amplitude of the disturbance, as measured by the flame displacement, is small in comparison with the wave length of the disturbance, but not necessarily small in comparison with the flame thickness. From the basic equations governing a reactive mixture and making use of an expansion procedure in the parameter 1, defined as the ratio of the wave length to the flame thickness, the following results are obtained (1) For $1 \gg 1$, the phenomenological theory of Landau is justified. Accordingly, Landau's conclusion that a flame is unstable to small disturbances is strictly valid for disturbances of sufficiently long wave length. (2) The second term in the expansion in $1/1$ yields a correction to Landau's theory. Both the coefficient of thermal conduction and viscosity enter into the correction. The stabilizing influence of these additional terms is indicated. (Contractor's abstract)

EFFECTS OF CONDUCTION AND VISCOSITY ON THE STABILITY OF LAMINAR FLAME, by J. Y. Parlange and B.-T. Chu. Sept. 1961, 19p. incl. diagr. (Rept. no. 646/3) (AFOSR-1594) (AF 49(638)646) AD 269350 Unclassified

The effects of conduction and viscosity on the stability of laminar flame are examined. If 1 denotes the ratio of the wave length of a disturbance to the flame width and α is the ratio of the ultimate temperature of the burned gas to the initial temperature of the fresh mixture, the flame is found to be stable if $1 < \left(\frac{2\alpha}{\alpha-1}\right)\left(\frac{1}{RePr}\right)$, where Re is the Reynolds number of

the flame based on the flame width and Pr denotes the Prandtl number of the mixture. It is further shown that the stabilization is achieved primarily through the effect of heat conduction on the flame speed rather than the influence of viscosity. (Contractor's abstract)

ANALYSIS OF A SELF-SUSTAINED NONLINEAR VIBRATION IN A PIPE CONTAINING A HEATER, by B.-T. Chu. Sept. 1961, 18p. incl. diagrs. (Rept. no. AF 646/4) (AFOSR-1755) (AF 49(638)646)
AD 269351 Unclassified

Also published in Phys. Fluids, v. 6: 1638-1644, Nov. 1963. (Title varies)

A pipe of length 2L closed at both ends contains a pressure-sensitive plane heater at its midsection. The rate of heat release per unit area of the heater is assumed to vary with the pressure fluctuation. Such a system is unstable to small disturbances and a self-excited oscillation grows exponentially in time until nonlinear effects set in and shock waves are formed in the system. Ultimately a self-sustained nonlinear periodic vibration takes place in the pipe. When the feedback coefficient is small in comparison with unity, the nonlinear vibration can be calculated by a perturbation technique. (Contractor's abstract)

EFFECTS OF A MAGNETIC FIELD ON THE STABILITY OF A LAMINAR FLAME, by J. Y. Parlange and B.-T. Chu. Sept. 1961, 33p. incl. diagrs. (Rept. no. 646/5) (AFOSR-1756) (AF 49(638)646)
AD 269352 Unclassified

The stability of a laminar flame in the presence of a magnetic field is examined. Two important cases are considered: In the first case, the imposed magnetic field is assumed to be parallel to the flame; in the second, it is assumed to be normal to the flame. It is shown that a flame cannot be stabilized by the imposition of such magnetic fields and that the parallel magnetic field of sufficient strength can have a stabilizing effect on some harmonic components only.

Published in Studies in Statistical Mech., v. 1: 217-298, 1962.

A discussion is given of the foundations of quantum statistical mechanics. The tools used for this discussion are the density matrix and the phase-space distribution function due to Wigner. The general properties of these 2 concepts are reviewed in detail in Chapter 1. Chapter 2 is devoted to a discussion of equilibrium systems: subjects such as time average, phase averages and ergodic theory are reviewed; but the main part of the paper deals with non-equilibrium theory. The problems are stated and discussed qualitatively in Chapter 4. In a general system one is faced with the study of 2 types of evolution: a relatively rapid relaxation in momentum space and a much slower hydrodynamical evolution, the 2 processes being intimately coupled. The 2 following chapters illustrate the 2 existing approaches towards the solution of these problems; one based on the direct study of reduced distribution functions and kinetic equation (Boltzmann-like theories) and the 2nd based on the direct study of the time evolution of the macroscopic quantities, expressed in terms of certain correlation functions(Kubo-like theories). In both cases the authors present their own formulation of the theory. In the 1st case it is based on an extension of Kirkwood's original theory, employing time-smoother distribution functions. In the 2nd approach the authors start from the local equilibrium distribution and express the flows in terms of the derivation of the real distribution and express the flows in terms of deviation of the real distribution from the local equilibrium.

SUBMICROSCOPIC CHANGES IN VISUAL CELLS OF THE RABBIT INDUCED BY IODOACETATE, by A. Lasansky and E. DeRobertis. [1958] [5]p. incl. refs. (Sponsored jointly by [Air Force Office of Scientific Research under AF AFOSR-60-5] and National Institutes of Health) Unclassified

Presented at Seventy-first annual meeting of the Amer. Assoc. of Anatomists, Buffalo U., Buffalo, N. Y., Apr. 2-4, 1958.

Abstract published in Anat. Rec., v. 130: 423-424, Feb. 1958. (Title varies)

Also published in Jour. Biophys. and Biochem. Cytol., v. 5: 245-249, Mar. 25, 1959.

Alterations produced by iodoacetate in visual cells were studied under the electron microscope. Lesions of the outer segments of the rods are visible as early as 3 hr after a single injection of 20 mg iodoacetate/kg body-wt. After 6 hr the changes are more marked and consist then of disorganization, vesiculation, and lysis of the rod sacs. The inner segments of most rod cells show swelling and vacuolization of the matrix, the endoplasmic reticulum, and the Golgi complex. The mitochondria of the ellipsoid show a tendency to disintegrate. In some inner segments the changes consist primarily in an increase in density of the matrix and deposition of a granular material. The rod synapses are also affected, showing lysis of the synaptic vesicles and alterations of the synaptic membrane. All these changes become more marked and lead to complete destruction of the rod cells when a 2nd injection of 20 mg iodoacetate/kg body-wt was given. The cones seem more resistant than the rods. A single injection produces no visible changes in the outer or inner segments of the cones. These observations are discussed in relation to various hypotheses put forward to explain the mode of action of iodoacetate on visual cells. The pronounced alterations of submicroscopic intracellular membranes suggest that the locus of action of iodoacetate may be a component widely dispersed throughout the visual cells and related somewhat to the maintenance of these lipo-protein structures. THE ACTION OF GLUTAMATE AND THE PROBLEM OF THE "EXTRACELLULAR SPACE" IN THE RETINA. AN ELECTRON MICROSCOPE STUDY, by F. Wald and E. De Robertis. [1961] [13]p. incl. illus. diagr. refs. (AFOSR-2421) (AF AFOSR-60-5) Unclassified

Also published in Zeitschr. Zellforsch. und Mikroskop. Anat., v. 55: 649-661, 1961.

Turtle's retinae were incubated in isotonic Ringer and then studied. Like the normal ones, no extracellular space was observed. However, no increase of intracellular volume was observed. The addition of glutamate to the incubation medium caused cellular swelling localized in the inner synaptic layer and gangiion cells. This selective action is discussed with relation to the biochemistry and physiology of synapses in these 2 strata.

A NEW AVERAGING TECHNIQUE FOR IMPROVING THE SIGNAL-TO-NOISE RATIO OF EVOKED POTENTIALS, by A. J. Buller and P. R. Styles. [1959] [1]p. [AF 61(514)1178] Unclassified

Presented at meeting of the Physiol. Soc., Mill Hill [London] (Gt. Brit.), Nov. 6-7, 1959.

Published in Jour. Physiol. (London), v. 149: 65P, Dec. 1959.

The use of the E.M.I. Barrier grid storage tube in a purely electronic system functioning on similar principles to those suggested by Dawson (Jour. Physiol., v. 115: 2, 1951) increases the flexibility of the method. The scanning beam passes through the barrier grid and deposits charge on the storage surface of the dielectric sheet. The charge deposited at any point depends on the time integral of the scanning beam current, up to an equilibrium charge determined by the potential difference between the barrier grid and the backing plate. The signal is read off by scanning the storage surface with a high beam current, and measuring the current flowing into the backing plate; this operation also erases the store. The resolution of the tube is approx 150 elements and the max storage time approx 60 min. Deflection and focus of the scanning beam are electrostatic. This device improves the time discrimination greatly.

THE RELATION BETWEEN NEUROPHYSIOLOGICAL AND PSYCHOSOCIAL ASPECTS OF HUMAN MENTALITY AND BEHAVIOR, by W. G. Walter. Final technical rept. [Jan. 1957-Oct. 1960] Mar. 1, 1961, 1v. incl. illus. diagrs. tables, refs. (AFOSR-716) (AF 61(514)1178) AD 262029 Unclassified

A total of 326 experiments have been performed on 200 human subjects, including 71 complete Defensive-avoidance conditioning procedures with 58 subjects. During conditioning records were obtained of: temperamental disposition, operant performance, EEG activity analyzed in 22 channels, somatic and autonomic responses indicated by EMG, EKG, BP, GSR and Respiration, together with introspective reports. The results

show wide variations in all factors, and in their interrelations, between individuals. The most significant variations are in the time-relations of intrinsic brain rhythms and in the latencies of both cerebral and autonomic responses. Individual patterns of intrinsic rhythms and responses are significantly related to characters of conditional adaptation to the experimental situation. Acute or chronic perturbations of the response time-relations are associated with irregular or totally incompetent conditional adaptation. Against the theoretical background of this research these results suggest that (a) the intrinsic adaptive capacity of a human brain depends on its accurate computation of contingent association; (b) the manner in which the cerebral computation is performed varies considerably in different brains, particularly in the extent to which information from different external and internal sources is combined and correlated; (c) the interaction between neo-cortical and paleo-cortical systems (including autonomic functions) is essential for the initiation of the computation but may impede its completion; and (d) the distribution of the variables determining the above may be such as to justify a pragmatic operational typology of human behavior patterns. SOCIAL-PSYCHOLOGICAL NEEDS AND "INVOLUNTARY" BEHAVIOR AS ILLUSTRATED BY COMPLIANCE IN INTERROGATION, by A. D. Biderman. [1958] [28]p. incl. refs. [AF 49(638)727] Unclassified

Published in Sociometry, v. 23: 120-147, Mar. 1960.

Some social-psychological aspects of the situation of a prisoner confronting enemy interrogration are interpreted as accounting in part for the observation in recent wars that almost all prisoners converse with interrogators, despite rigid orders to the contrary. The interpretations are based primarily on an analysis of the interrogation experience of 235 Air Force personnel returned from captivity in China and North Korea, with special reliance on a content analysis of 203 interviews with cases repatriated at the close of the Korean War. The discussed aspects of interrogation are not distinctive to experiences of the Korean War prisoners. The study confirmed the conclusion that a prisoner is unable to maintain silence in the face of intensive interrogation.

INTRODUCTION—MANIPULATIONS OF HUMAN BEHAVIOR, by A. D. Biderman and H. Zimmer. [1960] [18]p. incl. refs. [AF 49(638)727] Unclassified

Published in The Manipulation of Human Behavior, ed. by A. D. Biderman and H. Zimmer, New York, John Wiley and Sons, Inc., 1961, p. 1-18.

Both scholarly and popular literature have written about the dangers of scientific developments that could be used to control and manipulate human behavior. The aim of this book is to give a critical examination of some of the conjectures about the application of scientific knowledge to manipulate human behavior with particular reference to the interrogation of an unwilling subject. Specific references are given with regard to the background, origin of nonrational concern, myth and reality, focus on objective behavior, scientific purpose, sources, and scope.

CULTURAL MODELS OF CAPTIVITY RELATIONSHIPS, by A. D. Biderman. Feb. 1961 [56]p. incl. refs. (BSSR Research rept. no. 339-4) (AFOSR-452) (AF 49(638)-727) AD 257325 Unclassified

The behavior of captives is in large measure dependent upon their conceptions of what social roles are appropriate to the unfamiliar situations they encounter. These situations are also shaped in important ways by cultural conceptions of the captor regarding the status of his captives. The present report reviews some of the historical and traditional elements of the cultures of captor and captives that have important direct effects on these role conceptions. Some possible implications of the discussion for the training of armed forces personnel for the event of capture are indicated. The report was prepared as part of a critical review of studies of prisoners of war, concentration camp prisoners, and political prisoners. The study examined the relevance of this literature for the social sciences. The emphasis in the present report, as in the larger study, was on works dealing with the Korean war. DEATH AS A CRITERION IN THE STUDY OF EXTREME CAPTIVITY SITUATIONS, by A. D. Biderman. Feb. 1961 [55]p. (BSSR Research rept. no. 339-3) (AFOSR-453) (AF 49(638)727) AD 254487
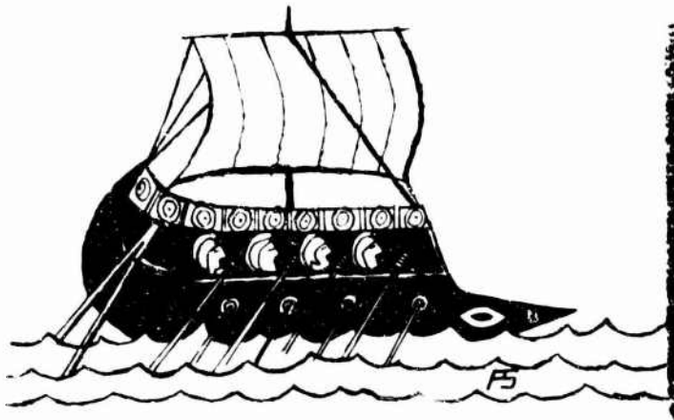
Unclassified



Some questions raised in previous evaluations and interpretations of fatalities among American prisoners of war in Korea are examined by reference to studies of other historical cases of stressful captivity and by some reanalysis of Korean War data. The paper considers effects on survival of the following: individual and cultural concepts of survival requirements, modes of adaptation to privation, social background characteristics, and forms of prisoner organization. The adequacy of data and frequently employed theoretical formulations in which death is the criterion are also considered in relation to generalizations regarding these relationships. The paper is a preliminary effort in a larger study considering the relevance for the social sciences of knowledge developed by studies of extreme captivity situations. (Contractor's abstract)

THE RELEVANCE FOR THE SOCIAL SCIENCES OF KNOWLEDGE DERIVED FROM STUDIES OF STRESSFUL CAPTIVITY, by A. D. Biderman and E. H. Schein. Mar. 1961 [26]p. (BSSR Research rept. no. 339-2) (AFOSR-454) (AF 49(638)727) AD 253365; PB 155460
Unclassified

An outline is given of major topics treated in accounts and studies of conditions of stressful captivity that are relevant to the social sciences. It is focused on studies of Americans who were prisoners during the Korean War, however, it also considered in the context of the broad literature that exists on prisoners of war, concentration camp prisoners, and political prisoners. The topics are: (1) Cultural models of captivity relationships; (2) physical privation in captivity; (3) captivity as an incomplete social situation; (4) captor-captive relationships; (5) prisoner societies; (6) psychological self-maintenance and change; and (7) post-captivity problems. Numerous references (see item no 143, Vol. V) are given under each discussion. The present study will be employed in a larger work which attempts to analyze and integrate the present and potential contributions of studies of stressful captivity situations to social science knowledge.

BERYLLIUM SAMPLE CELL FOR X-RAY DIFFRACTION STUDY OF LIQUIDS, by H. H. Paalman and C. J. Pings. [1961] 4p. (Bound with its AFOSR-2428, as Appendix A) (AFOSR-J5) (In cooperation with Stanford U., Calif.) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)800], National Science Foundation, Office of Naval Research, and Research Corporation) AD 400075 Unclassified

Also published in Rev. Scient. Instr., v. 33: 496-497, Apr. 1962.

A description is presented of a cylindrical beryllium sample cell which has been used successfully for an extensive set of x-ray diffraction measurements on a sample of liquid nitrogen confined at 100 psi and -193°. The central portion of the cell is the active sample area which is irradiated during the experiments. To the right and left are somewhat larger cylindrical sections which fit snugly into a cell holder. These latter areas affect thermal communication between the sample and a liquid nitrogen heat sink. The left section serves as a thermocouple well which permits positioning a thermocouple within 0.04 in. of the sample cavity. At the extreme right end of the assembly is a collar which is required for a pressure seal. An estimate of the x-ray absorption within the cell is obtained by considering a beam scattered from the axis of the cylindrical sample. For this case the x-ray attenuation was calculated to be 20%, using a mass absorption coefficient of 1.35.

MEASUREMENTS ON THE ASYMMETRICALLY-EXCITED PROLATE SPHEROIDAL ANTENNA, by H. H. Kuehl. [1960] [3]p. incl. illus. diagrs. (AF 18-(600)1113) Unclassified

Published in I.R.E. Trans. on Antennas and Propagation, v. AP-9: 105-107, Jan. 1961.

An experimental study is reported on the asymmetrically-fed prolate spheroidal antenna. The measurements presented were made on a spheroidal antenna operated in the receiving state and the detecting equipment was contained within the antenna so that the usual rf transmission line was not necessary to carry the signal from the antenna. The "gap" is a polystyrene ring through which the impinging radiation travels. Two circular metal plates on either side of the "gap" form a radial transmission line which guides the received energy to the detector within the antenna. Experimental and theoretical patterns of the far zone electric field are shown for the 3 positions of the gap. It is estimated that the experimental error in the measurements is less than 2%.

COMPARATIVE EXPERIMENTAL AND THEORETICAL STUDIES OF THE FLUTTER OF FLAT PANELS IN A LOW SUPERSONIC FLOW, by M. H. Lock and Y. C. Fung. Final rept. [May 1961] 80p. incl. illus. diagrs. tables, refs. (AFOSR-670) (AF 49(638)220) Unclassified

A series of panel flutter experiments were performed in the GALCIT transonic wind tunnel. The preflutter panel motion and the motion during flutter were studied in detail. Flutter boundaries were obtained between Mach numbers 1.15 and 1.5. Three analytical studies of the flutter phenomenon, based upon conventional assumptions, are presented which facilitate comparison between theory and experiment. A detailed comparison between the theoretical and experimental results reveals considerable disagreement in the flutter boundaries at supersonic Mach numbers less than 1.4. The agreement between theory and experiment improves at the higher Mach numbers. The theory appears inadequate for the prediction of flutter boundaries at the lower supersonic Mach numbers. A possible cause of this inadequacy of the theory is discussed. (Contractor's abstract)

SUPERSONIC FLUTTER OF A CYLINDRICAL SHELL OF FINITE LENGTH IN AN AXISYMMETRICAL MODE, by H. Krumhaar. Oct. 1961, 78p. incl diagrs. refs. (GALCIT rept. no. 95) (AFOSR-1574) (AF 49(638)220) AD 268497 Unclassified

Also published in Internat'l. Jour. Solids and Structures, v. 1: 23-57, 1965.

The flutter in an axisymmetrical mode of a simply supported cylindrical shell is studied. The linearized Timoshenko shell equations and linear piston theory lead to a non-self-adjoint eigenvalue problem, which has been solved without further approximations. Using these exact solutions two checks can be made. A comparison of the exact result with those obtained by Galerkin's method proves whether or not this method is reliable if applied to the present eigenvalue problem. On the other hand, a comparison of the exact results with experimental data will prove whether or not the basic physical assumptions are satisfactory. (Contractor's abstract)

BLUNT BODY THEORY FOR HYPERSONIC FLOW, by K. Hida. Jan. 1961 [27]p. incl. diagrs. table. (AFOSR-204) (AF 49(638)476) AD 262022 Unclassified

A systematic analysis of Newtonian flow past an axisymmetrical blunt body is developed by expanding various physical quantities in power series of $\lambda = (\gamma-1)/(\gamma+1)$, where γ stands for the ratio of specific heats of a gas. Some general results such as stand-off distance, pressure distribution along the axis of symmetry are given, provided that the shock is detached and has finite curvature at its nose. More extensive calculations are made for the flow past a flat-faced disc and power-law bodies. (Contractor's abstract)

STOKES FLOW PAST AN AXIALLY SYMMETRIC BODY IN A CYLINDRICAL TUBE IN THE PRESENCE OF A MAGNETIC FIELD, by I.-D. Chang. [1961] [15]p. incl. diagr. table. (Publ. no. 512) (AFOSR-4215) (AF 49(638)521) Unclassified

Also published in Jour. Math. and Phys., v. 40: 205-219, Oct. 1961.

Consideration is given the motion within a fluid-filled tube of an axially symmetric body. The fluid is incompressible, viscous and electrically conducting; the magnetic field is along the axis of the tube and both the Reynolds number and magnetic Reynolds number are assumed to be small. The author's purpose is to derive a drag formula which accounts for the effect of the wall. The resultant formula is $D = D_0(1 + \frac{D_0 M}{16\pi\rho\nu a U} + \frac{\varkappa D_0}{2\pi\rho\nu UR} + \cdots$, where M is the Hartman number, R is the tube radius and $\varkappa$ is a known function of MR. UNIFORMLY VALID ASYMPTOTIC APPROXIMATIONS FOR CERTAIN NON-LINEAR DIFFERENTIAL EQUATIONS, by J. D. Cole and J. Kevorkian. [1961] [8]p. (AF 49(638)521) Unclassified

Published in Proc. Internat'l. Symposium on Nonlinear Differential Equations and Nonlinear Mechanics, Air Force Academy, Colorado Springs, Colo. (July 31-Aug. 4, 1961), New York, Academic Press, 1963, p. 113-120.

Various physical problems lead to differential equations characterized by the presence of a small force active for a long time. It is often useful to be able to construct an approximation which is a good representation of the solution for the complete time interval $0 < t < \infty$. In this note a new method is presented which utilizes an expansion in terms of 2 or more time scales. This method is applicable when the overall behavior of the solution is sufficiently well known. The various time scales have significance also for nonlinear systems since they are formed of combinations of the physical constants (with dimensions) which enter the description of the phenomena. The small parameter, ϵ, of the problem can be expressed as a ratio of 2 significant time scales. The explicit introduction of several time scales changes the original ordinary differential equation into what is formally a partial differential equation, which can be exploited in several ways. The solution to this equation is expanded in a suitable series, each term of which satisfies an ordinary differential equation. In this note the method is applied to several simple examples. The advantage of the present method is its simplicity especially for computing higher approximations and its applicability to a large class of problems for which the motion is bounded for large times.

SOME REMARKS ON INTEGRAL MOMENT METHODS FOR LAMINAR BOUNDARY LAYERS WITH APPLICATION TO SEPARATION AND REATTACHMENT, by L. Lees and B. L. Reeves. Dec. 31, 1961, 10p. incl. diagrs. table. (AFOSR-1920) (AF 49(638)916) AD 275557 Unclassified

It is pointed out that the Kármán-Pohlhausen integral method may be completely inadequate for the analysis of laminar boundary layers in regions of adverse pressure gradient, particularly downstream of separation, between the separation and reattachment points. It is suggested that an integral method is needed which exhibits velocity profiles containing reverse-flow for vanishingly small adverse pressure gradients analogous to the "lower branch" solutions of the Falkner-Skan equation, which were found by Stewartson. The present report demonstrates that the method first proposed by Walz and modified by Tani produces velocity profiles with reverse flow, even in the limit of constant pressure, and appears to be a promising method for predicting the behavior of separated flows.

EXPERIMENTS ON CARBON FORMATION FROM HYDROCARBONS BEHIND INCIDENT AND REFLECTED SHOCK FRONTS, by S. S. Penner, E. N. Bennett and others. [1961] [38]p. incl. illus. diagrs. refs. (AF 18(603)2) Unclassified

Published in Fundamental Data Obtained from Shock-Tube Experiments, ed. by A. Ferri. London, Pergamon Press, 1961, p. 183-220. (NATO AGARDograph no. 41)

One of the theories of carbon formation from hydrocarbons involves the assumption that carbon formation is preceded by the production of acetylene as an intermediate step. Slow pyrolysis (i. e. heating of acetylene with maintenance of chemical equilibrium to decomposition temperatures) often involves heterogeneous processes and usually leads to a variety of polymerization reactions. The shock tube provides a unique tool for preparing hydrocarbons, under uniform conditions, at elevated temperatures where the decompositions and/or polymerization rates may be studied conveniently. The following experimental studies on carbon formation are reported: (1) thermodynamic calculations on carbon formation from acetylene; (2) estimates for the temperature rise associated with the decomposition of acetylene; (3) thermodynamic calculations on carbon formation from methane, n-heptane, and benzene using equilibrium values of γ; (4) calculation of the minimum time at temperature T_5 behind a reflected shock wave; (5) description of apparatus and procedure for the study of acetylene decomposition; and (6) experimental results of the studies.

CONSTANT-TEMPERATURE MAGNETO-GASDYNAMIC CHANNEL FLOW, by J. L. Kerrebrock and F. E. Marble. [1959] [1]p. [AF 49(638)758] Unclassified

Published in Jour. Aero Space Sci., v. 27: 78, Jan. 1960.

Some simple algebraic solutions of magneto-gasdynamic channel flow are developed for the case of a constant temperature plasma. The solutions serve as free stream boundary conditions for investigations of the boundary layer in a plasma accelerator.

SIMILAR SOLUTIONS FOR BOUNDARY LAYERS IN CONSTANT-TEMPERATURE MAGNETO-GASDYNAMIC CHANNEL FLOW, by J. L. Kerrebrock. [1959] [2]p. [AF 49(638)758] Unclassified

Published in Jour. Aero/Space Sci., v. 27: 156-157, Feb. 1960.

The boundary layer equations are considered for a viscous, compressible heat conducting, electrically conducting gas moving near a wall in the presence of a magnetic field whose direction is perpendicular to that of the stream. Among others it is assumed that the magnetic Reynolds number is low enough for the induction to be prescribed, that the wall temperature is constant, and that the Mach number is small. It is shown that similar solutions exist for both the thermal and velocity boundary layers. A brief discussion on the relevance of this work to boundary layer growth on the walls of plasma accelerators is given. (Math. Rev. abstract)

CONDUCTION IN GASES WITH ELEVATED ELECTRON TEMPERATURE, by J. L. Kerrebrock. [1961] [20]p. incl. illus. diagrs. tables. (AF 49-(638)758) Unclassified

Published in Engineering Aspects of Magnetohydrodynamics; Proc. Second Symposium, Philadelphia, Pa. (Mar. 9-10, 1961) New York, Columbia U. Press, 1962, p. 327-346.

A simple theory of nonequilibrium conduction in ionized gases has been developed which accounts for the elevation of the electron temperature by energy gain in the electric field. It is assumed that the ionization is in equilibrium at the electron temperature. The theory yields a modified Ohm's law such that the current density varies as a power of the electric field. The power is unity for gases at high temperatures, but can be very large at low gas temperatures. Measurements carried out with hot tantalum electrodes in an argon-potassium plasma at temperatures between 1500° and 2500°K, at atmospheric pressure, agree with the predicted variations of the

conductivity with both current density and gas temperature. This is regarded as a verification of the assumption of ionization equilibrium at the electron temperature. (Contractor's abstract)

IONIZATION RATES IN SHOCK HEATED ARGON—EFFECT OF IMPURITIES (Abstract), by R. G. Jahn. [1961] [1]p. (Bound with its AFOSR-582; AD 257892) (AF 49(638)758) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

Argon initially at room temperatures and 5mm pressure is heated suddenly to atomic temperatures between 5500 and 9000°K by the passage of shock waves of Mach number 7.5 to 9.2. The subsequent relaxation to ionization equilibrium is observed by a transverse probing 24.0 kmc microwave beam which interacts with the free electron components in the ionized gas. The reflection and transmission amplitude of the beam as a function of time after passage of the shock are recorded on a dual-beam oscilloscope. From this data the electron density and collision frequency and the rate of ionization can be evaluated. Small amounts of air from a few parts per million to 3/10 of 1% have been added as a controlled impurity and are found to increase the ionization rate substantially.

FURTHER SHOCK-TUBE STUDIES OF THE HOMOGENEOUS DECOMPOSITION OF NH_3, by T. A. Jacobs. Oct. 1961 [13]p. incl. diagrs. (Technical rept. no. 3) (AFOSR-1471) (AF 49(638)984) AD 266412 Unclassified

The rate of decomposition of NH_3 in Ar was measured between 2000 to 3000°K by following the rate of decrease of NH_3 emission intensity in the 2.7 to 3.2 micron wavelength region. Data indicated that the thermal decomposition of NH_3 follows a kinetic law given by $d(NH_3)/dt = k\,(NH_3)^{3/2}\,(Ar)^{1/2}$ where $k = (2.5 \times 10^{13})\, e^{-77,700/RT}$ liters/mole-sec.

APPROXIMATE SPECTRAL ABSORPTION COEFFICIENT CALCULATIONS FOR ELECTRONIC BAND SYSTEMS BELONGING TO DIATOMIC MOLECULES, by R. Patch, W. [L.] Shackleford, and S. S. Penner. Nov. 1961, 17p. incl. diagrs. (Technical rept. no. 4) (AFOSR-1624) (AF 49(638)984) AD 266740 Unclassified

Also published in Jour. Quant. Spectros. and Radiative Transfer, v. 2: 263-271, July/Sept. 1962.

The spectral absorption coefficients in electronic band systems of diatomic emitters were computed in the past by models that may be described as the just overlapping line model and a model utilizing a smeared out rotational structure. Although basic relations are obtained by utilizing somewhat different physical arguments, the resulting equations are, in fact, identical. Spectral absorption coefficients were calculated for the NO γ-bands at 2000°K by using the approximate theoretical relations. The calculated results are in good agreement with estimates derived by numerical calculations in which, however, the absorption coefficient data were averaged over intervals of 1/2000 cm. PRELIMINARY STUDIES ON THE SPECTRUM OF Ti I EMITTED BEHIND REFLECTED SHOCK WAVES IN $TiCl_4$-Ar MIXTURES, PART A. APPROXIMATE CONTINUOUS OPACITY CALCULATIONS FOR IONIZED TITANIUM AND CHROMIUM, PART B, by W. L. Shackleford. Dec. 1961, 1v. incl. illus. tables, refs. (Technical rept. no. 5) (AFOSR-1738) (AF 49(638)984) AD 269010 Unclassified

Part B also published in Jour. Quant. Spectros. and Radiative Transfer, v. 2: 93-98, Jan./Mar. 1962.

Part A: Time integrated emission spectra from a shock tube containing $TiCl_4$-Ar mixtures were photographed and several Ti I lines were identified. Self absorption could not be sufficiently reduced to permit temperature measurements from relative line intensities. Investigations of shock-heated $Cr(CO)_6$-Ar mixtures are in progress. PART B: The technique of Raizer, as modified by Pappert and Penner, was applied to the approximate calculation of the Rosseland and Planck mean free paths for titanium and chromium continuum radiation. The method involves use of unscreened hydrogenic transition probabilities and replacement of the summation over discrete levels by an integration. (Contractor's abstract)

A PRELIMINARY STUDY OF NEUTRAL TITANIUM EMISSION BEHIND REFLECTED SHOCK WAVES IN $TiCl_4$-Ar MIXTURES, by W. L. Shackleford. [1961] [2]p. (AFOSR-J98) (AF 49(638)984) AD 400062 Unclassified

Also published in Jour. Quant. Spectros. and Radiative Transfer, v. 2: 245-246, Apr./June 1962.

Mixtures of $TiCl_4$ and argon were subjected to incident and reflected shock waves and the time integrated spectra of the visible radiation emitted axially through the end of the tube were photographed. The more dilute mixtures yielded spectra showing several multiplets of neutral titanium at the highest Mach numbers used. Under these conditions, the gas behind the reflected shock was completely dissociated and partially ionized at a temperature of about 8000°K. Weaker shocks and shocks in mixtures containing higher $TiCl_4$ concentrations produced only background and impurity radiation (because of the lower shock temperatures). Relative line intensity measurements showed that the observed spectral lines were heavily self-absorbed, and therefore, were not suitable for color temperature of f-number measurements.

THE ORIGIN OF THE SOLAR SYSTEM, by A. G. W. Cameron. [1960] 6p. (In cooperation with Mount Wilson Observatory, Pasadena, Calif.) (AF 49(638)-21) Unclassified

Published in Problems Related to Interplanetary Matter; Proc. Informal Conf., Highland Park, Ill. (June 20-22, 1960), Washington, National Academy of Sciences—National Research Council, 1961, p. 1-6. (AFOSR-721)

The solar system could have been formed from neutron sources of moderate power in a variety of ways. It is suggested that the N^{22} (α, n) Mg^{25} reaction is the principal source of neutrons for the building of heavy elements. With this assumption, together with others regarding a time scale such as the age of the galaxy, a process by which the sun and planets could have been formed is outlined.

THE ATMOSPHERES OF TWO B-TYPE STARS IN THE GALACTIC HALO, by G. Traving. [1961] [20]p. incl. diagrs. tables, refs. (AFOSR-50) (In cooperation with Mount Wilson Observatory, Pasadena, Calif.) (AF 49(638)21) AD 612344 Unclassified

Also published in Astrophys. Jour., v. 135: 439-458, 1962.

Spectra of 2 B-type stars (+33°2642, which is at a galactic latitude of 49°, and Barnard 29, a member of the globular cluster M13) have been analyzed by using the method of coarse analysis. In +33°2642 the relative abundance of He is approximately the same as in the main-sequence star τ Sco, whereas the heavier elements C, N, O, Mg, and Si are less abundant by a factor of 5-10. In Barnard 29, for which only lower-dispersion spectra were available, only the He/H ratio could be determined. Compared with τ Sco, it is smaller by a factor of 2. The colors of both stars are the same and correspond to spectral type B2. The procedure followed in this rough analysis is based on a generalization of the methods of Unsöld. In addition, the theory of line broadening is discussed, for H and He I. The ionization temperature, derived from the measured strength of the Si III lines combined with the absence of the strongest lines of Si II and Si IV, was found to be $0.265 < \theta_i < 0.295$. The electron densities from the broadening of H and He I lines, are log N = 13.32 (BD + 33°2642) and log N = 13.60 (Barnard 29). The surface gravities are smaller than for main-sequence B stars, log g = 2.34 and log g = 2.66. Using the known distance modulus of Barnard 29, we obtain its mass, $0.2\ \mu\odot \leq \mu B_{29} \leq \mu\odot$, which is extremely low. The uncertainty arises mainly from insufficient knowledge of turbulent velocities in the atmosphere. (Contractor's abstract)

THE CIRCUMSTELLAR ENVELOPE OF RHO CASSIOPEIAE. by W. L. W. Sargent. July 1961 [20]p. incl. diagrs. tables, refs. (AFOSR-126) (In cooperation with Mount Wilson Observatory, Pasadena, Calif.) (AF 49(638)21) AD 261992 Unclassified

Also published in Astrophys. Jour., v. 134: 142-160, July 1961.

It has been found that ρ Cas is surrounded by a shell which is expanding at ~40 km/sec relative to the photosphere. Absorption lines of Fe I, Ni I, and Ca I are formed in the shell. Variations in the strengths of these lines are attributed to variations in the mass of the shell. From galactic rotation, we find $M_{bol} = -5.5$. The radius is about 700 $R_\odot$ and the mass about 25 $M_\odot$. The emission and absorption lines of Ca I indicate a small geometrical dilution (0.1 - 0.01) in the shell. A curve-of-growth analysis shows it to be composed of neutral hydrogen having a density of $\sim 10^{10}$ H atoms/cm^3. The excitation temperature in the shell is ~3500°; the ionization temperature is ~4000°. The turbulent velocities in the shell and in the photosphere are estimated both from the curves of growth and from the line profiles. In the shell both methods lead to a microturbulent velocity of 7 km/sec. In the reversing layer the macroturbulent velocity is 20 km/sec for ionized and 14 km/sec for neutral atoms. The microturbulent velocity is 10 km/sec for zero volt neutral lines and decreases to 6 km/sec with increasing excitation. A pronounced weakness in the Balmer absorption lines is attributed to their being filled in by emission arising in a chromosphere which lies between the reversing layer and the cool shell. There is insufficient Lyman continuum radiation from ρ Cas to heat the chromosphere, which must therefore be heated by the dissipation of mechanical energy. The flux of turbulent energy is probably sufficient. It is found that ρ Cas is losing mass at a rate of 10^{-6} stellar masses per year. The ejection is sporadic, although the rate quoted may be comparable with the mean rate.

THE EXISTENCE OF He^3 IN 3 CENTAURI A, by W. L. W. Sargent and J. Jugaku. [1961] [6]p. incl. diagr. tables, refs. (AFOSR-502) (In cooperation with Mount Wilson Observatory, Pasadena) (AF 49-(638)21) AD 612333 Unclassified

Also published in Astrophys. Jour., v. 134: 777-782, Nov. 1961.

The positions of 10 He I lines have been measured on 5 high-dispersion plates of 3 Centauri A (B4p) Some of the lines are displaced longward of their normal wavelengths by up to 0.39 A. There is a good correlation between the observed shifts and the isotope shifts for He^3. On comparing the displacements in 3 Centauri with those measured in other B stars, it is concluded that the Stark effect cannot produce shifts of the magnitude observed in 3 Centauri. Using the simple approximation that the observed displacements are proportional to the ratio $He^3/He^3 + He^4$, it is found that this ratio in 3 Centauri is 0.84 ± 0.10. From a study of the profile of $H\gamma$ measured on 3 plates, it is found that the ratio deuterium: hydrogen is less than about 0.01. Some possible ways in which He^3 could be produced in large quantities in the atmosphere of 3 Centauri are considered. (Contractor's abstract)

THE SPECTRUM OF α SCULPTORIS, by J. Jugaku and W. L. W. Sargent. [1961] [7]p. incl. tables, refs. (AFOSR-586) (In cooperation with Mount Wilson Observatory, Pasadena, Calif.) (AF 49(638)21) AD 612334 Unclassified

Also published in Publ. Astronom. Soc. Pacific, v. 73: 249-255, Aug. 1961.

Studies of the spectrum of α Sculptoris resulted in the following conclusions: (1) α Sculptoris is a star of spectral type about B4 V; (2) it may be a spectrum variable; (3) oxygen and helium are underabundant by a factor of about five; and (4) chromium, titanium, and strontium are overabundant by an undetermined factor. The stars α Sculptoris and 3 Centauri appear to be the hottest objects whose spectra contain anomalous line intensities similar to those in the peculiar A stars. However, the peculiarities in the two stars are remarkably different. Thus, 3 Centauri has strong N II lines and normal C II lines, whereas the reverse is the case in α Sculptoris. In 3 Centauri phosphorus is overabundant by a factor of about 100 whereas in α Sculptoris phosphorus lines are not observed at all. In α Sculptoris some of the iron peak elements are enhanced; in 3 Centauri lines of Ti II and Cr II are not observed. Weak lines of S II are observed in α Sculptoris but not in 3 Centauri. The two stars resemble each other in two respects—they both have He I and O I lines that are far too weak.

THE FORMATION OF THE SUN AND PLANETS, by A. G. W. Cameron. Feb. 1961, 106p. incl. tables, refs. (AFOSR-726) (In cooperation with Mount Wilson Observatory, Pasadena, Calif.) (AF 49(638)21) AD 289469 Unclassified

Also published in Icarus, v. 1: 13-69, 1962.

The evidence concerning the presence of the products of extinct radioactivities in meteorites and in the atmosphere is reviewed and analyzed. The radioactive

content of the interstellar medium depends on the history of galactic nucleosynthesis. Some mechanisms of nucleosynthesis are reviewed, and it is shown that the elements can be divided into products of primary and secondary processes. A model of the stellar activity throughout galactic history is devised, and its parameters are determined by the abundances of the uranium and thorium isotopes. In this model stellar activity decreases exponentially with time, but there is a localized increase immediately prior to formation of the solar system. A chronology is then deduced for events associated with the early history of the solar system, based on the assumption that Al^{26} may have been required to melt iron in the meteorite parent bodies. Some physical processes probably associated with the formation of the solar system are discussed. It appears that an interstellar cloud must be fairly dense and massive before it can undergo gravitational collapse. It also appears likely that it will attain instability through the action of an unusually large external pressure. The collapse and fragmentation of the cloud requires of the order of 10^6 yr, after which the subsequent evolution of the protostars becomes very rapid.

AN ABUNDANCE ANALYSIS OF 3 CENTAURI, by J. Jugaku, W. L. W. Sargent, and J. L. Greenstein. [1961] [14]p. incl. diagrs. tables, refs. (AFOSR-871) (In cooperation with Mount Wilson Observatory, Pasadena, Calif.) (AF 49(638)21) AD 611515 Unclassified

Also published in Astrophys. Jour., v. 134: 783-796, Nov. 1961.

Abundances in 3 Centauri A (B4 IV or Vp) are derived, using γ Pegasi (B2 IV) as a standard comparison star and the approximation of a single-layer atmosphere. The abundances of certain elements (P, Ca, Ga, and Kr) not observed or observed only weakly in γ Pegasi are derived relative to Si in 3 Centauri A. It is found that C, Ne, Si, A, and Ca have normal abundances. He and O are underabundant by a factor of 6 in 3 Centauri A; N is overabundant by a factor of 5; P by a factor of 100; Fe by a factor of 4; and Kr by a factor of about 1300. An identification of Ga II which is not yet certain leads to an overabundance of about 8000 for Ga. Upper limits are derived for the abundances of Al, S, Cl, Zn, Ge, As, Se, Br, Rb, and Sr. Of these, S is deficient by a factor of more than about 10. It is likely that Ga and Kr are local abundance peaks but that other elements in the same region of the periodic table could be almost as overabundant without being detected spectroscopically. It is conjectured that these abundance anomalies, together with the large concentration of He^3 reported previously, have been produced by the acceleration of particles on the surface of 3 Cen A. H. W. Babcock has not detected a regular magnetic field in the star, although it is probably related to the "manganese" stars which have magnetic fields. (Contractor's abstract)

NUCLEOSYNTHESIS DURING THE EARLY HISTORY OF THE SOLAR SYSTEM, by W. A. Fowler, J. L. Greenstein and F. Hoyle. [1961] [73]p. incl. tables, refs. (AFOSR-988) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)21], Atomic Energy Commission, and Office of Naval Research) AD 613242 Unclassified

Also published in Geophys. Jour., v. 6: 148-220, 1962.

Abundances in terrestrial and meteoritic matter indicate that the synthesis of D^2, Li^6, Li^7, Be^9, B^{10} B^{11} and possibly C^{13} and N^{15} occurred during an intermediate stage in the early history of the solar system. In this intermediate stage, the planetary material had become largely separated, but not completely, from the hydrogen which was the main constituent of primitive solar material. Appropriate physical conditions were satisfied by solid planetesimals of dimensions from 1 to 50 m consisting of silicates and oxides of the metals embedded in an icy matrix. The synthesis occurred through spallation and neutron reactions simultaneously induced in the outer layers of the planetesimals by the bombardment of high energy charged particles, mostly protons accelerated in magnetic flares at the surface of the condensing sun. The total particle energy was approximately 10^{45} ergs while the average energy was close to 500 mev per nucleon. Recent studies of the abundance of lithium in young T Tauri stars serve as the primary astronomical evidence for this point of view. The observed abundances of lithium and beryilium in the surface of the sun are discussed in terms of the astronomical and nuclear considerations brought forward.

DEUTERONOMY. SYNTHESIS OF DEUTERONS AND THE LIGHT NUCLEI DURING THE EARLY HISTORY OF THE SOLAR SYSTEM, by W. A. Fowler, J. L. Greenstein, and F. Hoyle. [1961] [11p. incl. table, refs. (AFOSR-1351) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)21], Atomic Energy Commission, and Office of Naval Research) Unclassified

Presented at joint ceremonial session of the Amer. Assoc. Phys. Teachers and Amer. Phys. Soc., New York, Feb. 2, 1961.

Presented at meeting of the Astronom. Soc. Pacific, Los Angeles, Calif., June 12-14, 1961.

Also published in Amer. Jour. Phys., v. 29: 393-403, July 1961.

Abstract published in Publ. Astronom. Soc. Pacific, v. 73: 326-327, Oct. 1961. (Title varies)

Abundances in terrestrial and meteoritic matter indicate that the synthesis of deuterons and of the isotopes of lithium, beryllium, and boron occurred during an intermediate stage in the early history of the solar system. In this intermediate stage, the planetary material had become largely separated, but not completely, from the hydrogen which was the main constituent of primitive solar material. Appropriate physical conditions were satisfied by solid planetesimals with dimensions of the order of 10 m and consisting of silicates and oxides of the metals embedded in an icy matrix. The synthesis occurred through spallation and neutron reactions induced in the outer layers of the planetesimals by the bombardment of high-energy charged particles accelerated in magnetic flares at the surface of the condensing sun. The importance of the (n, α) reactions on Li^6 and B^{10} is indicated by the relatively low abundances of these two nuclei. Anomalous abundances of Xe^{129} and Ag^{107} observed in meteorites can be attributed to the decay of radioactive I^{129} and Pd^{107} produced in the planetesimals. The interval between the irradiation of the small planetesimals and the formation of large bodies in the solar system could not have exceeded 10^7 to 10^8 yr.

EFFECTIVE TEMPERATURES OF F-TYPE STARS USING Hγ LINE PROFILES, by L. Searle and J. B. Oke. [1961] [12]p. incl. diagrs. tables, refs. (AFOSR-1740) (In cooperation with Mount Wilson Observatory, Pasadena, Calif.) (AF 49(638)21) AD 611516 Unclassified

Also published in Astrophys. Jour., v. 135: 790-801, May 1962.

Line profiles for the hydrogen line Hγ have been computed for a range of effective temperatures and gravities corresponding to those of F-type stars of different luminosity classes. These have been compared with observed profiles for (a) the cluster-type variables RR Lyrae and SU Draconis, (b) 2 F-type subdwarfs, and (c) the F-type stars with metal lines of normal strength-ν Herculis, η-Aquilae, and δ-Cephei. For the first 2 groups of stars, the metal lines are weak, and the continuum can be drawn unambiguously. The observed and computed profiles are in excellent agreement, and the line profiles can be used as reddening-independent temperature indicators. A comparison of these Hγ temperatures with those determined by fitting observed absolute energy distributions to fluxes computed from model atmospheres shows satisfactory agreement, provided that 1 allows for interstellar reddening. For the third group of stars, which have strong metallic lines, the evidence is strong that no true continuum is observed. The depression of the continuum is small enough in ν-Herculis (F2 II) that an estimate of the effective temperature can still be made by fitting the observed Hγ profile to those computed. At spectral types F5 or later, the continuum is depressed to such an extent that a temperature determination by Hγ fitting is not possible. (Contractor's abstract)

HEATING OF STELLAR CHROMOSPHERES BY SHOCK WAVES, by R. Weymann. [1960] [9]p. incl. diagr. (AFOSR-J139) (AF 49(638)21) AD 400450 Unclassified

Also published in Astrophys. Jour., v. 132: 452-460, Sept. 1960.

On the basis of a very simple model for the dissipation of energy by shock waves, the structure of the chromospheres of stars with very different values of the surface gravity is discussed. Sharp jumps in the temperature at certain critical points would be expected. Reasonable chromospheric structures follow from this model for dwarfs, but not for stars of very low surface gravity unless very long-period shock waves are considered. The question of the thermal stability of the solutions is discussed. (Contractor's abstract)

ANOMALOUS ABUNDANCES OF ATMOSPHERIC

XENON RELATIVE TO METEORITIC XENON ISOTOPES (Abstract), by A. G. W. Cameron. [1961] [1]p. [AF 49(638)21] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 51, Feb. 1, 1961.

It has been found that the isotopic composition of cosmogenic xenon extracted from stone meteorites is the same except for variations in Xe^{129} (attributed to the decay of I^{129}). However, the relative isotopic composition of atmospheric xenon differs from that of meteoritic xenon in all isotopes. The largest difference is the excess of unshielded xenon isotopes in the atmosphere, attributed by Kuroda to spontaneous fission of Pu^{244} in the primitive earth. The differences in abundances of the shielded isotopes appear to require the subjection of part of the atmospheric xenon to a large moderated neutron flux. The order of magnitude of the anomalies can be accounted for if it is assumed that about 10% of atmospheric xenon has come from the sun where it has been subjected to the neutron flux associated with deuterium thermonuclear reactions. The ordinary constituents of the solar wind should be deflected away by the earth's magnetic field, but the large mass-to-charge ratio of the xenon ions may allow them to be captured into the atmosphere.

AN ANALYSIS OF THE ABSOLUTE ENERGY DISTRIBUTION IN THE SPECTRUM OF δ CEPHEI, by J. B. Oke. [1961] [8]p. incl. diagrs. tables, refs. (In cooperation with Mount Wilson Observatory, Pasadena, Calif. and Toronto U. (Canada)) [AF 49(638)21] Unclassified

Published in Astrophys. Jour., v. 134: 214-221, July 1961.

Photoelectric spectrum scans and high-dispersion spectra have been analyzed to obtain the absolute energy distributions in the spectrum of δ Cephei at various phases. Assuming an interstellar reddening of 0.11 in B - V, comparisons of these energy distributions with model atmospheres yield effective temperatures. Using fluxes from the model atmospheres, the observed absolute energy distributions, and the radial-velocity data, a mean radius of $40.3 \pm 0.8\ R_\odot$ is obtained. The radius and temperature give a mean absolute visual magnitude of -3.3. A comparison of these data with those obtained previously for η Aquilae indicates that the temperature-color relations agree if the reddening of η Aquilae is increased from 0.14 to 0.20. This increases the mean absolute visual magnitude found previously from -4.05 to -4.25. Consideration of some recently computed model atmospheres suggests the possibility that the temperatures obtained are a little too high; if this is the case, the absolute magnitudes of δ Cephei and η Aquilae should be changed to -3.2 and -4.1, respectively. A suggested relation between intrinsic color, $(B - V)_0$, and θ_e is given by equation (3); a slight modification of this equation is suggested. (Contractor's abstract)

RADIATION OF SEISMIC SURFACE-WAVES FROM FINITE MOVING SOURCES, by A. Ben-Menahem. [1960] [35]p. incl. diagrs. refs. (AF 49(638)910) Unclassified

Published in Bull. Seismol. Soc. Amer., v. 51: 401-435, July 1961.

A theory is proposed for the propagation of seismic surface-waves from finite moving sources. The method consists of obtaining, in the first place, basic solutions for surface displacements from directional sources. These solutions are integrated to obtain the effect of a moving fault with arbitrary dip angle. Displacements are evaluated for Rayleigh and Love waves at long ranges. It is shown that the dimensions of the source and the speed of rupture play an important role in the wave-pattern and cannot be ignored whenever the dimensions of the source are of the order of the radiation's dominant wavelength. It is demonstrated how this theory may lead to a derivation of the velocity of rupture and the length of faulting from seismic records of a single station. (Contractor's abstract)

A FAST, CONVENIENT PROGRAM FOR COMPUTATION OF SURFACE-WAVE DISPERSION CURVES IN MULTILAYERED MEDIA, by F. Press, D. G. Harkrider, and C. A. Seafeldt. [1961] [8]p. incl. diagr. tables. (AFOSR-576) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)910 and National Aeronautics and Space Administration under NAS w-6 and NAS w-81) Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 51: 495-502, Oct. 1961.

Surface wave analysis has become an important tool for exploration of crustal and mantle structure. The need exists for fast, convenient digital computer programs for computing theoretical dispersion curves and displacements for Rayleigh waves and Love waves. One such program for an IBM 7090 computer is described and made available to the scientific community. Among the conveniences are mail-order service, high speed, and choice of many options. ELASTIC WAVE PROPAGATION IN LAYERED

ANISOTROPIC MEDIA, by D. L. Anderson. [Aug. 17, 1961] 36p. incl. diagrs. table, refs. (AFOSR-1116) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)910 and Army Research Office under DA-04-495-ORD-1808) AD 454671 Unclassified

Also published in Jour. Geophys Research, v. 66: 2953-2963, Sept. 1961.

This is an analysis of the dispersive properties of transversely isotropic media. Such anisotropy is exhibited by hexagonal crystals, sediments, planar igneous bodies, ice sheets and rolled metal sheets where the unique axis is perpendicular to the direction of surface wave propagation and the other axes are distributed randomly in the plane of the layers. Period equations are derived for Rayleigh, Stoneley and Love type waves and comparisons are made, in certain cases, with ray theoretical and plane stress solutions. Anisotropy can have quite a pronounced effect on both the range of existence and the shape of the dispersion curves and can lead to an apparent discrepancy between Love and Rayleigh wave data. Attention is focused in this initial paper on a single solid layer in vacuo (i. e., a free plate) and a solid layer in contact with a fluid halfspace. The single layer solutions can be generalized to n-layer media by the use of Haskell matrices. (Contractor's abstract)

EXPERIMENTAL DETERMINATION OF EARTHQUAKE FAULT LENGTH AND RUPTURE VELOCITY, by F. Press, A. Ben-Menahem, and M. N. Toksöz. [Aug. 17, 1961] 1v. incl. diagrs. refs. (AFOSR-1117) (AF 49(638)910) AD 454672 Unclassified

Also published in Jour. Geophys. Research, v. 66: 3471-3485, Oct. 1961.

Three methods for determining the fault parameters of length and rupture velocity are examined with ultrasonic models. The theory behind the methods is shown to have a valid though approximate basis. Oversimplified assumptions and imperfect experimental data restrict initial results to only rough indications of fault parameters. When applied to the great Chilean earthquake of May 1960, a fault length of the order of 1000 km and a rupture velocity near the speed of shear waves in crustal is found. (Contractor's abstract)

RADIATION OF SEISMIC BODY WAVES FROM A FINITE MOVING SOURCE IN THE EARTH, by A. Ben-Menahem. [1961] [6]p. incl. diagrs. refs. (AFOSR-1527) (AF 49(638)910) Unclassified

Also published in Jour. Geophys. Research, v. 67: 345-350, Jan. 1962.

Body waves from a finite moving source are investigated. Ray theory is used to obtain a long-range approximation for the surface displacements from a buried horizontal force. A weak velocity gradient in the medium is assumed, and the curvature of the earth is replaced by an equivalent additional velocity gradient. The displacements are then integrated over a finite line to simulate a disturbance moving with constant speed. Results indicate that the finiteness of the source is manifested in a factor of the form $e^{-iX}\sin X/X$ and that the derivation of the fault length and the velocity of rupture of earthquakes from the spectra of body waves is possible. The results are similar to those obtained earlier for seismic surface waves, except that for body waves X depends on both polar coordinates of the station with respect to the source. The method can be extended to other types of common faulting. (Contractor's abstract)

RELEASE OF TECTONIC STRAIN BY UNDERGROUND NUCLEAR EXPLOSIONS, by F. Press and C. Archambeau. [1961] [23]p. incl. diagrs. table, refs. (AFOSR-1538) (AF 49(638)910) Unclassified

Also published in Jour. Geophys. Research, v. 67: 337-343, Jan. 1962.

The strong excitation of horizontally polarized shear (SH) waves and other phenomena associated with underground nuclear explosions suggest the hypothesis that pre-existing tectonic strain was released by the explosion. The pertinent evidence from the Rainier explosion is reviewed. A calculation of tectonic energy release is made for a simple model in which a spherical cavity is inserted in a prestrained medium. It is tentatively concluded that, although tectonic release does occur, its magnitude is probably too small to affect the character of seismograms. Experiments are suggested which could provide the basis for a better evaluation of the hypothesis. (Contractor's abstract)

COMPUTATION OF SURFACE WAVE DISPERSION FOR MULTILAYERED ANISOTROPIC MEDIA, by D. G. Harkrider and D. L. Anderson. [1961] [12]p. incl. diagr. tables. (AFOSR-1597) (AF 49(638)910) Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 52: 321-332, Apr. 1962.

A program is described which now makes it possible to compute surface wave dispersion in a solid heterogeneous halfspace containing up to 200 anisotropic layers. Certain discrepancies in surface wave observations, such as disagreement between Love and Rayleigh wave data and other independent evidence,

suggest that anisotropy may be important in some seismological problems. In order to study the effect of anisotropy on surface wave dispersion a program was written for an IBM 7090 computer which will compute dispersion curves and displacements for Rayleigh waves in a layered halfspace in which each layer is transversely isotropic. A simple redefinition of parameters makes it possible to use existing programs to compute Love wave dispersion.

A SPECIAL PURPOSE PROGRAM FOR EARTHQUAKE LOCATION WITH AN ELECTRONIC COMPUTER, by J. M. Nordquist. [1961] [7]p. incl. tables. (AFOSR-1598) (AF 49(638)910) Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 52: 431-437, Apr. 1962.

An electronic digital computer program has been developed for determining the source and origin time of a local earthquake by the method of least squares using the times of arrival of direct and refracted P waves at stations in the Pasadena network. Output includes the geographic coordinates and depth of the source, the origin time, direct distances from the source to each station, and the difference between observed and computed arrival time of P at each station. Limitations to the applicability of the program are discussed. (Contractor's abstract)

SOURCE-MECHANISM FROM SPECTRA OF LONG-PERIOD SEISMIC SURFACE WAVES. I. THE MONGOLIAN EARTHQUAKE OF DECEMBER 4, 1957, by A. Ben-Menahem and M. N. Toksöz. [1961] 41p. incl. diagrs. tables, refs. (AFOSR-1931) (AF 49-(638)910) AD 454673 Unclassified

Also published in Jour. Geophys. Research, v. 67: 1943-1955, May 1962.

The Pasadena seismograms of the Mongolian earthquake of Dec. 4, 1957 were studied: Mantle Rayleigh waves R_3, R_4, R_5, and R_6 were separated, digitized, filtered and Fourier-analyzed. After the evaluation of the phase-velocities and the absorption coefficients from R_3/R_5 and R_4/R_6 the directivity was computed from the amplitude ratio of R_3/R_4. A fault of 560 km, striking S 80° E, and a rupture velocity of 3.5 km/sec gave the best fit to the observed directivity. Auxiliary data from aftershock distribution, initial motions, air-waves from the main shock and geological surveys of the fault-area seems to support these findings. The phase-spectra of R_3 and R_4 were corrected for the propagation-phase and the instrumental phase-shift to obtain the initial phases at the source. The results for R_3 and R_4 are close. A rough estimate of the depth of faulting is obtained on the basis of the calculated strain-release and observed displacements at the fault. (Contractor's abstract)

CRUSTAL STRUCTURE OF THE ANDES FROM RAYLEIGH WAVE DISPERSION, by A. Cisternas. [1961] [8]p. incl. diagrs. tables, refs. (AFOSR-2965) (AF 49(638)910) Unclassified

Published in Bull. Seismol. Soc. Amer., v. 51: 381-388, July 1961.

Records from a Benioff short-period seismograph located at Huancayo, Peru, are digitalized and then passed through a low-pass filter to get the long-period waves. In this way the dispersion curves of Rayleigh waves for paths along the Andes can be computed from seismograms which otherwise would be unusable. The comparison with the empirical curve for a "normal" continental crust and with specially computed theoretical models indicates a crustal thickness of the order of 50 km. For periods between 20 and 25 sec, the observed group velocity shows abnormally low values. (Contractor's abstract)

LEAKING MODES IN THE CRUSTAL WAVEGUIDE. PART I. THE OCEANIC PL WAVE, by R. A. Phinney. [1961] [25]p. incl. diagrs. table. (AFOSR-2966) (AF 49(638)910) Unclassified

Also published in Jour. Geophys. Research, v. 66: 1445-1469, May 1961.

The problem of the seismic signal associated with the earliest P wave is treated by application of normal mode theory, in which the signal is regarded as a quasi-surface wave, coupled both to the motion of the earth's layered surface and to body waves propagating in the underlying media. Predictions made for the particular model assumed are relevant to explosion and earthquake sources. The oscillations following the initial P motion are explained. The transient solution obtained by Rosenbaum for leaking mode propagation in an acoustic waveguide has been generalized to describe propagation in an elastic halfspace overlain by a liquid layer. The early-arriving PL modes known from earthquake studies have been computed for several theoretical models to test the effect of the elastic constants on their dispersion and attenuation. Physical reasoning, based on harmonic plane wave models, appears inadequate for predicting many features of the exact dispersion and attenuation. The analogy between PL waves and normal modes in the case treated by Pekeris is exploited, and it is also believed that PL waves are related to an attenuated pseudo-surface wave of a free solid halfspace.

Late-arriving quasi-standing waves are treated briefly and their relevance to certain seismic phenomena is mentioned. (Contractor's abstract)

UPPER MANTLE STRUCTURE UNDER OCEANS AND CONTINENTS FROM RAYLEIGH WAVES, by K. Aki and F. Press. [1961] [14]p. incl. diagrs. tables, refs. (AFOSR-2967) (AF 49(638)910) AD 613745 Unclassified

Also published in Geophys. Jour., v. 5: 292-305, Oct. 1961.

Theoretical seismograms of Rayleigh waves based on several models of mantle structure are compared with actual records for various paths. It is found that the model 8099 of Dorman, Ewing and Oliver explains seismograms for Pacific paths but does not agree with records from Indian-Atlantic ocean paths in the period range shorter than about 100 s. The velocity of the Airy phase corresponding to the group velocity maximum is about 0.10 km/s lower for the Indian-Atlantic path than for the Pacific. This difference can be accounted for by reducing the shear velocity at the top of the mantle under the Indian and Atlantic oceans by about 0.1-0.2 km/s. The difference between the Pacific mantle and the Continental mantle can be explained either by a reduction in shear velocity of the low-velocity layer under the Pacific ocean or by making the low-velocity zone shallower. RAREFIED GAS DYNAMICS; PROCEEDINGS OF THE SECOND INTERNATIONAL SYMPOSIUM, California U., Berkeley, Aug. 3-6, 1960, ed. by L. Talbot. New York, Academic Press, 1961, 748p. incl. illus. diagrs. tables, refs. (Advances in Appl. Mech. Suppl. no. 1) (AFOSR-1728) (Sponsored jointly by Air Force Office of Scientific Research, International Union of Theoretical and Applied Mechanics, National Aeronautics and Space Administration, National Science Foundation, and Office of Naval Research) AD 268413 Unclassified

This symposium was comprised of 6 sessions. In all, 41 of the papers presented in these sessions are contained in the proceedings. Sections I and II of the symposium dealt with subject matter which falls mainly in the category of boundary problems. In Section I studies are made of 3 different types of surface interactions: energy exchange, chemical reactions, and sputtering. Recent developments in the area of molecular beam methods for studying surface interactions are reported. Free-molecule flow is discussed in Section II and several new methods for computing free-molecule flows are presented. The Maxwell-Boltzmann equation is generally accepted as the fundamental equation of rarefied gas dynamics for the entire range of conditions from continuum to free-mole flow. In recent years there has been increasing emphasis on the study of the linearized equation and on the use of simpler kinetic models and approximation methods which retain many of the features of the Maxwell-Boltzmann theory. Sections III, IV, and V contain a number of examples of such approaches. Investigations of shock wave structure are exemplified by several papers in Sections IV and V. The final Section deals with the topic of ionized gases at low density.

THE INFRARED SPECTRUM OF SOLID CARBON MONOXIDE, by G. E. Ewing and G. C. Pimentel. Feb. 1, 1961, 19p. incl. tables, refs. (AFOSR-242) (AF 49(638)1) AD 254304 Unclassified

Also published in Jour. Chem. Phys., v. 35: 925-930, Sept. 1961.

The infrared spectrum of solid CO at 20°K was examined in the fundamental and overtone region. Sharp features (band widths about 1 cm^{-1} are assigned to vibrational modes of the various isotopic species: $C^{12}O^{16}$, 2138.1 cm^{-1}; $C^{12}O^{17}$, 2112.3 cm^{-1}; $C^{13}O^{16}$, 2092.2 cm^{-1}; and $C^{12}O^{18}$, 2088.4 cm^{-1}. These frequencies are examined with the aid of existing theories of frequency shifts in condensed phases. A broad absorption (band width about 40 cm^{-1}) centered at 2208 cm^{-1} is assigned to combinations of the fundamental mode with lattice modes. Calculations suggest that that the lattice modes involved probably include translations as well as librations. (Contractor's abstract)

HYDROGEN ABSTRACTION FROM HYDROCARBONS BY METHYL RADICALS FROM THE PHOTOLYSIS OF METHYL IODIDE IN SOLID NITROGEN, by C. D. Bass and G. C. Pimentel. Mar. 31, 1961, 21p. incl. tables, refs. (AFOSR-1067) (AF 49(638)1) AD 274797 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 3754-3758, Sept. 20, 1961.

Methyl iodide was photolyzed at 20°K in solid matrix materials, N_2, Kr, and Xe, containing hydrocarbons [C_2H_6 or $(CH_3)_3CH$] or deuterated hydrocarbons [CD_4, CH_3CD_3, or $(CH_3)_3CD$]. Hydrogen abstraction was studied by infrared detection of CH_4 and CH_3D. In the solid the abstraction products can be attributed to methyl radicals with an "effective temperature" in the range 1000-3000°K. Furthermore, the products obtained from photolysis of methyl iodide with ethane present as well as those from photolysis of ethyl

iodide in nitrogen, indicate that about 85% of the reactions probably occur within the cage at the site of photon absorption. These studies provide information concerning the dissipation of the energy of a 'hot" radical constrained within a reactive cage. (Contractor's abstract)

INFRARED STUDIES OF FREE RADICALS AND UNSTABLE REACTION INTERMEDIATES, by G. C. Pimentel. Final rept. July 1, 1956-Feb. 28, 1961. Aug. 15, 1961, 11p. (AFOSR-1302) (AF 49(638)1) AD 435297 Unclassified

The specific novel applications of the matrix isolation method are listed as follows: (1) First infrared detection of reactive species: the detection of HCO. (2) Chemistry of reactive species: Free radical reactions can be studied under conditions where secondary reactions are interrupted. (3) Primary act of photolysis: Due to inert environment, the primary act of photolysis can be learned in the condensed phases. (4) Hydrogen bonding: Narrowing of bands of hydrogen bonded polymers gives this method power to segregate the infrared spectra of polymers of different size. The above are published in 19 reports.

MOLECULAR ORBITAL CORRELATIONS IN ORGANIC CHEMISTRY, by A. Streitwieser, Jr. Final rept. Mar. 7, 1961 [43]p. incl. diagrs. tables, refs. (AFOSR-547) (AF 49(638)105) AD 255313 Unclassified

Experimental work and calculations were conducted to establish the validity of molecular orbital (MO) correlations in the following areas: (1) ionization potentials of organic compounds; (2) acidity of hydrocarbons; (3) acetolysis rates of arylmethyl tosylates; and (4) rates of base-catalyzed hydrogen-deuterium exchange of hydrocarbons. Acetolysis rate studies of compounds of the type, $ArCH_2OSO_2\ C_6H_4CH_3$ indicated that only fair correlations are obtained between MO predictions and experiment. The products of reduction of aromatic hydrocarbons with alkali metals and liquid ammonia are accounted for with the HMO theory. The deficiencies of the HMO theory arise mainly from its specific neglect of electron-repulsion terms which show up particularly in the treatment of charged species.

AN HMO TREATMENT OF THE REDUCTION OF AROMATIC HYDROCARBONS WITH ALKALI METALS; REDUCTION OF FLUORANTHENE, by A. Streitwieser, Jr. and S. Suzuki. [1961] [35]p. incl. diagrs. tables, refs. (AFOSR-65-0214) (AF 49-(638)105) AD 611289 Unclassified

Also published in Tetrahedron, v. 16: 153-168, Dec. 1961.

Simple molecular orbital theory is applied to the metal-ammonia reduction of aromatic hydrocarbons. The theory is based on protonation at sites of highest electron density in the corresponding anions. Good agreement is observed between predicted and observed reduction products. The reduction of the non-alternant hydrocarbon fluoranthene takes an anomalous course that is not inconsistent with the theory. Evidence is presented to show that an initial dihydro-reduction product, 2,3-dihydrofluoranthene, undergoes a Michael addition by its conjugate anion to yield 1,2,2',3,3',10b-hexahydro-1,2'-bifluoranthyl. ACIDITY OF HYDROCARBONS. III. PRIMARY ISOTOPE EFFECTS IN THE PROTON EXCHANGE OF TOLUENE AND ETHYLBENZENE WITH LITHIUM CYCLOHEXYLAMIDE, by A. Streitwieser, Jr., W. C. Langworthy, and D. E. Van Sickle. [1959] [4]p. incl. tables, refs. (AFOSR-65-0218) (AF 49-(638)105) AD 611351 Unclassified

Presented in part at Sixteenth Nat'l. Org. Symposium of the Amer. Chem. Soc., Seattle, Wash., June 1959.

Also published in Jour. Amer. Chem. Soc., v. 84: 251-254, Jan. 20, 1962.

Primary isotope effects were determined for the proton exchange reactions of toluene-α-d and -α-t and of ethylbenzene-α-d and -α-t with lithium cyclohexylamine. The k_D/k_T values average 3.0 ± 0.2, a rather high value that corresponds to $k_H/k_D = 12$. This high isotope effect is shown to rule out a one-step mechanism for the exchange and to implicate relatively stable intermediates of the carbanion type. (Contractor's abstract)

THERMOLUMINESCENCE OF SOLID NITROGEN AFTER ELECTRON BOMBARDMENT AT 4.2°K, by B. Brocklehurst and G. C. Pimentel. Aug. 31, 1961, 18p. incl. table, refs. (AFOSR-1375) (AF 49(638)-944) AD 274798 Unclassified

Also published in Jour. Chem. Phys., v. 36: 2040-2046, Apr. 15, 1962.

Solid N annealed at 20°K and then bombarded with electrons at 4°K gives 3 glow peaks on warming, at 10°, 14.5°, and 19°K. Unannealed N gave broader peaks. A feeble, long-lived glow followed the normal afterglow after bombardment at 4°K. Thermal effects during warming were observed in 1 apparatus with radiation shielding at 77°K but they were not observed in a much more sensitive apparatus with radiation shielding at 4°K. The thermal effects were probably caused by an anomalous vapor pressure and loss of Dewar vacuum. The data are discussed with reference to 2 interpretations, the storage of ^2D excited N atoms and the recombination of ^4S atoms through diffusion. The latter explanation is preferred and a simple model is offered to account for the 3 diffusion activation enthalpies implied by the 3 thermoluminescence peaks. (Contractor's abstract)

INFRARED SPECTRA OF AMMONIA SUSPENDED IN SOLID NITROGEN, by G. C. Pimentel, M. O. Bulanin, and M. Van Thiel. [1961] [7]p. incl. diagrs. tables, refs. (AFOSR-J683) (AF 49(638)944) AD 413627 Unclassified

Also published in Jour. Chem. Phys., v. 36: 500-506, Jan. 15, 1962.

Matrix isolation studies of the infrared spectra of ammonia suspended in solid nitrogen at 20°K are presented. Variation of the mol ratio of nitrogen to ammonia shows that monomeric NH_3 in solid nitrogen absorbs at 3440, 3332, 1620-1632, 1143, and 970 cm^{-1}. A large enhancement of ν_3 3440 cm^{-1}, occurs relative to ν_1, 3332 cm^{-1}, just as observed for the pure solid. The totally symmetric vibrations ν_1 and ν_2 are relatively sharp (half-widths are 1 and 1.5 cm^{-1}, respectively). The umbrella mode ν_2 shows no evidence of inversion nor of free rotation. The band at 1143 cm^{-1} is ascribed to ν_2 in combination with librational movement about the B axes. The constraints to movement within the nitrogen matrix cage seem to be larger than those reported for inert-gas matrices. Some results on the hydrogen bonding in dimeric and polymeric ammonia are reported. The dimer absorbs at 3404, 1004.5, 987 cm^{-1} and possibly as well at 3313, 3246 and 3237 cm^{-1}. DIFFERENTIAL FORMS AND LIE ALGEBRA COHOMOLOGY FOR ALGEBRAIC LINEAR GROUPS, by G. Hochschild and B. Kostant. [June 1961] 34p. (Technical rept. no. 19) (AFOSR-681) (AF 49(638)-79) AD 259905 Unclassified

Also published in Illinois Jour. Math., v. 6: 264-281, June 1962.

G is an irreducible linear algebra group over a field F of characteristic zero, K a fully reducible algebraic subgroup over F, V a rational G-module (i.e., a module which is sum of finite-dimensional rational representation spaces of G), $\mathfrak{G}$ [respectively, $\mathfrak{k}$], the Lie algebra of G[K]. This paper relates the K-fixed part $H(\mathfrak{G}, \mathfrak{k}, V)^K$ of the relative Lie algebra cohospace $H(\mathfrak{G}, \mathfrak{k}, V)$, the rational cohomology group H (G, V) of G in the sense of G. Hochschild (Illinois Jour. Math., v. 5: 492-519, 1961) and a further cohomology space of which two equivalent definitions are given, one being the cohomology space $H(DCR^K)$ of the algebra of universal differential forms on the ring R^K of regular functions on G, defined over F which are invariant under left translations by elements of K. The results of this paper extend those of Hochschild above. It is also shown that G/K admits a structure of affine algebraic variety for which R^K is the coordinate ring over F. (Math. Rev. abstract, in part)

DIFFERENTIAL FORMS ON REGULAR AFFINE ALGEBRA, by G. Hochschild, B. Kostant, and A. Rosenberg. Aug. 1961, 46p. incl. refs. (Technical rept. no. 21) (AFOSR-833) (AF 49(638)79) AD 263322 Unclassified

Also published in Trans. Amer. Math. Soc., v. 102: 383-408, Mar. 1962.

A mathematical discussion of the algebras of differential forms is treated as a special combination of linear algebra and homological algebra. There is specific identification of this particular exterior algebra as applied to canonical graded algebra based on the Tor functor and obtained by the cohomology of differential forms from the ext functor to a universal algebra i.e., Lie algebra. Attention is directed chiefly to a regular affine algebra, K-algebra, which is Noetherian with a finite Krull dimension, i.e., the largest non-negative integer.

ON THE TRANSITIVITY OF HOLONOMY SYSTEMS, by J. Simons. [July 1961] 42p. (Technical rept. no. 22) (AFOSR-1000) (AF 49(638)79) AD 261659 Unclassified

Also published in Ann. Math., v. 76: 213-234, Sept. 1962.

A classification of possible candidates for the holonomy groups of manifolds having affine connections with zero torsion discloses only groups transitive on the unit sphere in the tangent space of the manifold, except in the case where the manifold is a symmetric space of rank greater than or equal to 2. An intrinsic proof of this rather startling fact, and an algebraic generalization of the notion of a holonomy group are given with a short, intrinsic proof of the result on transitivity. Although only that portion of the problem which has to do with Riemannian manifolds is treated, it is possible that the devices employed could be altered to pertain to other situations. HOMOTOPY-COMMUTATIVITY IN ROTATION GROUPS, by I. James and E. Thomas. [1961] [4]p. (AFOSR-3349) [AF 49(638)79] Unclassified

Also published in Topology, v. 1: 121-124, Apr.-June, 1962.

In this paper, the authors show the rotation group R_m does not homotopy commute with R_n in R_{m+n-2} if $m + n > 4$ and may possibly homotopy commute in R_{m+n-1} only if $m + n = 4$ or 8 or $m-1$ and $n-1$ are divisible by different powers of 2. It is still unknown for example, if R_3 homotopy commutes with R_9 in R_{11}. This information follows from computation of the Steenrod squares in $X = S(RP^{m-1} * RP^{n-1})$ which show that over any bundle over X, the Stiefel-Whitney class $W_{m+n} = 0$ except for the possible values of m and n indicated, while if R_m and R_n did homotopy commute in R_{m+n-1}, there would be a bundle over $S(RP^{m-1} * RP^{n-1})$ with $W_{n+n} \neq 0$. SCHEMATA OVER LOCAL RINGS, by M. J. Greenberg. [1960] [24]p. incl. refs. [AF 49(638)-603] Unclassified

Published in Ann. Math., v. 73: 624-648, May 1961.

The notion of algebraic ring is introduced. It happens that every Artin local ring has a natural structure of algebraic ring, so that the theory over a discrete valuation ring mod p^n, which is presented, can be developed equally equally well over any Artin local ring. It is within this general context that the work is presented. The construction of new varieties in the affine case proceeds as follows: in each polynomial equation with coefficients in the Artin local ring, coordinates can be substituted for the coefficients and the variables, obtaining an equivalent system of many polynomial equations in more variables, but now over the residue field. The construction is equivalent to the solution of a certain universal problem and from this all the functorial properties can be deduced.

ON QUOTIENT VARIETIES AND THE AFFINE EMBEDDING OF CERTAIN HOMOGENEOUS SPACES, by M. Rosenlicht. [1961] [13]p. (Technical rept. no. 8) (AFOSR-27) (AF 49(638)603) AD 254675; PB 155607 Unclassified

Also published in Trans. Amer. Math. Soc., v. 101: 211-223, Nov. 1961.

Let G be an algebraic group operating regularly on an algebraic variety V. A quotient variety exists if the set V/G of orbits admits a structure of algebraic variety such that the natural projection of V onto V/G is a regular map having some natural properties, which in particular insure uniqueness. For this it is necessary that all orbits be closed and of the same dimension. This condition is sufficient when V is an affine variety and G is an algebraic torus. Remarks are made concerning quotient varieties, and a case of non-existence, where G is a torus, and V is quasi-affine. It is also shown that if G is unipotent, and V quasi-affine, then all orbits of G are closed.

DERIVATIONS OF COMMUTATIVE BANACH ALGEBRAS, by P. C. Curtis, Jr. Feb. 1961, 6p. (Technical rept. no. 1) (AFOSR-131) (AF 49(638)85) AD 254228 Unclassified

Also published in Bull. Amer. Math. Soc., v. 67: 271-273, May 1961.

Let A be a commutative semi-simple Banach algebra with a unit. Let D be a derivation of A into itself. It is an open question whether D must be 0. I. M. Singer and J. Wermer showed that if D is bounded as an operator, then D is 0. (Math. Ann., v. 129: 260-264, 1955). It is shown here that if A is assumed to be regular than every derivation is bounded and hence 0. It is proven more generally: Denote by Φ_A the maximal ideal space of A. If D is a derivation of A into $C(\Phi_A)$, then D is a bounded operator from A to $C(\Phi_A)$.

EQUILIBRIUM PROPERTIES OF HYDROGEN GAS FROM 5000° TO 20,000°K, by O. Sinanoglu, M. S. Vardya and others. [1961] [7]p. incl. diagr. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)299 and National Science Foundation) Unclassified

Published in Phys. Fluids, v. 5: 665-671, June 1962.

Equilibrium properties of hydrogen gas are calculated from 5000° to 20,000°K by considering it as a monatomic gas with imperfections. The usual "H_2 and H equilibrium" method is not suitable at high temperatures, even with anharmonicity corrections. Properties are obtained from the second virial coefficient B(T) of the monatomic gas and its derivatives. The Rydberg potential is used for the $^1\Sigma$ state and the best numerical potential for the $^3\Sigma$ state. Ionization, higher excited states, and quantum effects are examined. The third virial coefficient for H_3 is estimated and it is shown that properties from B(T) part alone are sufficient up to pressures of 1000 atm at 10,000°K and 13,000 atm at 20,000°K. Results are compared with those of the "equilibrium constant" approach. (Contractor's abstract)

CONVERSION OF MUONIUM INTO ANTIMUONIUM, by G. Feinberg and S. Weinberg. [1961] [22]p. (AFOSR-782) (In cooperation with Columbia U.,

New York) (Sponsored jointly by Air Force Office of Scientific Research and Atomic Energy Commission under AF 49(638)327 and Office of Naval Research under Nonr-22260) AD 259003 Unclassified

Also published in Phys. Rev., v. 123: 1439-1443, Aug. 15, 1961.

A detailed analysis is made of the possible conversion of muonium into antimuonium in various environments. Assuming a typical $\bar{\mu}e\bar{\mu}e$ weak interaction gives a probability of 2.6×10^{-5} in vacuum, even in the presence of reasonable external electric fields. In a solid the probability is less by at least 10, and probably 20, orders of magnitude. In an inert gas the probability is roughly to be divided by the numbers of collisions during a muon lifetime, and hence is quite small unless the pressure at room temperature is less than about 10^{-4} atmospheres. Lowering the temperature does not help. A possible experiment is suggested. (Contractor's abstract)

CROSS SECTIONS AT HIGH ENERGIES, by S. Weinberg. 1961 [9]p. (AFOSR-1075) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)327 and Office of Naval Research under Nonr-22260) AD 260959 Unclassified

Also published in Phys. Rev., v. 124: 2049-2050 Dec. 15, 1961.

If the difference $\sigma_+(E) - \sigma_-(E)$ of particle and antiparticle total cross sections changes sign at a finite number of energies, then the odd part $f_+(E) - f_-(E)$ of the forward scattering amplitude has a very useful representation, as a rational times a "Herglotz" function. The representation implies a correlation between the high-energy asymptotic behavior of $\sigma_+(E) - \sigma_-(E)$ and $f_+(E) - f_-(E)$. For example, if $[f_+(E) - f_-(E)]/E\ln^m E$ is bounded, and $m \leq \frac{1}{2}$ then we have the Pomeranchuk result that $\sigma_+(E) - \sigma_-(E) \to 0$. Even if $m > \frac{1}{2}$ it seems likely that although the difference of $\sigma_+(E)$ and $\sigma_-(E)$ may not tend to zero, their ratio does tend to one. (Contractor's abstract)

THE NEUTRINO PROBLEM IN COSMOLOGY, by S. Weinberg. Sept. 1961, 18p. (Rept. no. UCRL-9855) (AFOSR-1461) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)327 and Office of Naval Research under Nonr-22260) AD 267942 Unclassified

Also published in Nuovo Cimento, Series X, v. 25: 15-27, July 1, 1962.

The absence of an Olbers paradox for neutrinos shows that the average neutrino luminosity must fall off as we observe older and more distant parts of the universe. Unlike the situation for light, the paradox could not be avoided by any kind of red shift, and hence puts a strong constraint on cosmological speculation. The ambient neutrino flux turns out to be finite in the modern steady state or evolutionary cosmologies, and is estimated at about 10^4 neutrinos/sq cm-sec, a density less than that allowed by the Pauli principle by a factor of about 10^{-33}. Taking absorption of neutrinos into account does not affect these remarks, except that in the oscillating cosmologies there must recur periods when neutrino absorption is faster than neutrino emission. It is estimated that the onset of neutrino absorption for an oscillating universe comes when it has contracted by a (linear) factor of about 10^5, and absorption might not lower the neutrino population very much until the contraction reaches about 10^{14}. Even then there is no neutrino degeneracy. (Contractor's abstract)

THE EIKONAL METHOD IN MAGNETOHYDRODYNAMICS, by S. Weinberg. Sept. 1961, 59p. (AFOSR-1546) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)327 and Office of Naval Research under Nonr-22260) AD 266038
Unclassified

Also published in Phys. Rev., v. 126: 1899-1909, June 15, 1962.

The eikonal method is extended to waves with several components propagating in inhomogeneous anisotropic media. Formulas are derived for the motion of wave packets, the change in amplitude along a ray path, and the corrections due to diffraction. The method is applied to pure magnetohydrodynamic disturbances, and the problem of computing ray paths in the ionosphere is discussed. One result is that the fraction of the energy of an isotropic disturbance that eventually gets as low as 200 km drops from .99 at 200 km to .2 at 450 km, rises again to .99 at 700 km, drops to .5 at 3000 km and continues dropping at greater altitudes. Energy trapped between 200 km and 700 km oscillates around 450 km with period 8.5 sec (at the geomagnetic equator). The eikonal method is also applied to a very general problem involving coupled magnetohydrodynamic, electrodynamic, and acoustic modes. (Contractor's abstract)

QUASI-ELASTIC NUCLEON-NUCLEUS SCATTERING AT HIGH ENERGY, by R. Karplus and Y. Yamaguchi. Aug. 1961 [25]p. incl. diagrs. tables, refs. (AFOSR-1614) (AF 49(638)327) AD 265982
Unclassified

Also published in Nuovo Cimento, Series X, v. 22: 589-603, Nov. 1, 1961.

The angular distribution for elastic nucleon-nucleon scattering at high energy is sharply peaked in the forward direction. As a consequence, there is an angular interval in nucleon-nucleus-scattering to which successive small-angle elastic nucleon-bound nucleon scatterings are more likely to contribute than a single nucleon-bound nucleon scattering through the angle of observation. Such plural collisions result in outgoing nucleons which have suffered a smaller energy loss than nucleons that are scattered from hydrogen at the same angle. The Fermi motion of the bound-nucleons produces a broadening in the energy distribution of the scattered nucleons, but displaces the center of the distribution only negligibly. The results of calculations with a simple model are in satisfactory agreement with the observations on proton-carbon scattering. (Contractor's abstract)

MODIFIED LEE MODELS AND THE FIELD THEORETICAL DEFINITION OF ELEMENTARY PARTICLE, by F. Calogero. Oct. 1961 [107]p. incl. diagrs. (AFOSR-1890) (AF 49(638)327) AD 272206
Unclassified

Also published in Nuovo Cimento, Series X, v. 24: 614-656, May 16, 1962.

Exactly solvable models of field theories are introduced and discussed. In some of these models the physical states involve an infinite number of bare particles. Some solutions are also found, which depend in a nonanalytic way on the coupling constant: these solutions may appear as new elementary particles. The field theoretical definition of elementary particle is then discussed. The renormalized coupling constants are always assumed to be smaller than some critical values (depending on the form factors of the models), thereby excluding any pathological feature (such as ghost states, etc.). LAW OF CONSERVATION OF MUONS, by G. Feinberg and S. Weinberg. Feb. 1961, 10p. incl. refs. (AFOSR-1948) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)327, Atomic Energy Commission; and Office of Naval Research under Nonr-22260) AD 272207
Unclassified

Also published in Phys. Rev. Lirs., v. 6: 381-383, Apr. 1, 1961.

The apparent absence of muon-electron transitions without neutrinos leads one to suspect that there is a new conservation law forbidding them. Calculations of the rate of such processes, assuming no such law exists, indicate that it is hard to understand their absence in an intermediate boson theory of weak interactions. Even if there is no intermediate boson, the decay would lead to these processes in some order of perturbation theory, and arguments are given which indicate that any field theory of weak interactions may predict unacceptably large rates for these processes in the absence of a selection rule.

DISPERSION-THEORETICAL FITTING OF NUCLEON-NUCLEON SCATTERING, by L. A. P. Balázs. [1961] [6]p. incl. diagrs. table. (Sponsored jointly by Air Force [Office of Scientific Research under AF 49-(638)327] and Atomic Energy Commission) Unclassified

Published in Phys. Rev., v. 125: 2179-2184, Mar. 15, 1962.

A general approach based on partial-wave dispersion relations is presented for obtaining a formula for phase shifts which depends on only a small number of parameters. This approach does not make any specific assumptions on, or approximations of, the unphysical discontinuity, and involves only approximations of functions that are already known from the general framework of the theory. The method approximately reproduces the $^1S_0$ state in the 0-100 mev range, with 2 parameters determined from the low energy data and a third from a phase shift at a higher energy. NUCLEAR SPIN, HYPERFINE STRUCTURE, AND NUCLEAR MOMENTS OF 6.8-DAY LUTETIUM-177, by F. R. Petersen and H. A. Shugart. [1961] [6]p. incl. diagrs. tables, refs. (AFOSR-3523) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)339] and Atomic Energy Commission) Unclassified

Also published in Phys. Rev., v. 126: 252-257, Apr. 1, 1962.

The atomic-beam magnetic-resonance method has been used to measure the nuclear spin and hyperfine structure of 6.8-day Lu^{177} in the ground $^2D_{3/2}$ state and in the $^2D_{5/2}$ electronic state. The results are: I = 7/2; $^2D_{3/2}$: a = 194.84(2) mc/sec, b = 1466.71(12) mc/sec; $^2D_{5/2}$: a = 147.17(1) mc/sec, b = 1805.93(14) mc/sec. The uncorrected nuclear moments for Lu^{177} calculated from these measurements and from known constants of Lu^{175} are: μ_I = +2.217(10) nm, Q = +5.51(6) b. (Contractor's abstract)

MAGNETIC DIPOLE AND ELECTRIC QUADRUPOLE INTERACTION CONSTANTS OF Bi^{210} (Abstract), by S. S Alpert, E. Lipworth and others. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)339] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 74-75, Feb. 1, 1961.

The magnetic dipole interaction constant a and the electric quadrupole interaction constant b were measured for Bi^{210} (I = 1, $T_{1/2}$ = 5.0 days) using the method of atomic beams. These results were a = 21.78 ± 0.03 mc/sec and b = 112.38 ± 0.03 mc/sec. Sixteen "flop-in" resonances were observed including the 3 direct transitions (F = 5/2, m = 1/2 ⟷ F = 3/2, m = 1/2), (F = 3/2, m = 1/2 ⟷ F = 1/2, m = 1/2), and (F = 3/2, m = 1/2 ⟷ F = 1/2, m = 1/2). The radioactive isotope was produced from the stable metal by the reaction $Bi^{209}(n, \gamma)Bi^{210}$ in the Livermore Pool Type Reactor. Detection was accomplished by collection on sulfur-coated "buttons" which were counted in continuous flow beta counters.

HYPERFINE STRUCTURE AND NUCLEAR MOMENTS OF LUTETIUM-177 (Abstract), by F. R. Petersen and H. A. Shugart. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)339] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 224, Apr. 24, 1961.

The hyperfine structure separations for radioactive lutetium-177 (I = 7/2) have been measured in both the $^2D_{3/2}$ and $^2D_{5/2}$ electronic states by the atomic beam magnetic resonance method. Seven "flop-in" transitions in the $^2D_{3/2}$ state and 10 in the $^2D_{5/2}$ state corresponding to the high field transition M_J = ±1/2 ⟷ ∓1/2 have been observed. The interaction constants a and b fitted to these observations are $a(^2D_{3/2})$ = 194.84(2) mc/sec, $b(^2D_{3/2})$ = 1466.71(12) mc/sec, $a(^2D_{5/2})$ = 147.17(1) mc/sec, $b(^2D_{5/2})$ = 1805.93(14) mc/sec. The uncorrected nuclear magnetic moment calculated from the interaction constant a is μ_I = +2.0(2) nm. The sign of the moment was determined from the g_I-dependent $\Delta F = \pm 1$ transitions for which the magnetic field dependence of the frequency was zero at high fields. The uncorrected nuclear electric quadrupole moment calculated from the interaction constant b is Q = +5.0(6) barns. Uncertainties in both moments will be considerably reduced when more precise measurements of the hyperfine structure and moments of stable Lu^{175}, currently in progress by G. J. Ritter and H. Lew, are published.

NUCLEAR SPIN OF SCANDIUM-46 (Abstract), by F. R. Petersen and H. A. Shugart. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)339] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Mexico City (Mexico), June 22-24, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 363, June 22, 1961.

The nuclear spin I = 4 for radioactive scandium-46 ($T_{1/2}$ = 84 days) has been measured by the atomic-beam magnetic-resonance method. Three "flop-in" transitions in the $^2D_{5/2}$ electronic state and 2 in the $^2D_{3/2}$ electronic state have been observed at various fields from 5 to 75 gauss. These resonances provide unambiguous evidence for the assigned spin value and furnish preliminary values for the hyperfine-structure separations and nuclear moments of the isotope. The radiosotope was produced from stable metal by the reaction $Sc^{45}(n, \gamma)Sc^{46}$ in the Livermore pool-type reactor. Purity and identification of the isotope were established by pulse height analysis of the gamma ray spectrum. Resonance detection was accomplished by collecting the beam on sulfur-coated "buttons" which were subsequently counted in continuous-flow beta counters.

NUCLEAR SPIN OF YTTRIUM-91 (Abstract), by F. R. Petersen and H. A. Shugart. [19( ] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)339] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Los Angeles, Calif., Dec. 27-29, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 514, Dec. 27, 1961.

The nuclear spin I = 1/2 for 58-day yttrium-91 has been measured by the atomic-beam magnetic-resonance method. Five resonances in the $^2D_{3/2}$ electronic ground state corresponding to the transition (2, 1 $\longleftrightarrow$ 2, 0) have been observed up to a field of 200 gauss. These resonances establish the spin of this isotope and provide preliminary information concerning its hyperfine structure and magnetic moment. The isotope was obtained from Oak Ridge National Laboratories as an aqueous solution of YCl_3. Anhydrous YCl_3 was reduced to yttrium metal with calcium filings prior to forming the yttrium beam. Identification and purity of the sample were checked by decay analysis. Resonance detection was accomplished by collecting the radioactive atoms on sulfur-coated "buttons" which were later counted in continuous-flow beta-counters. The observed spin is the same as for stable Y^{89}.

THERMODYNAMIC BEHAVIOR OF LIQUID HELIUM THREE IN ITS POSSIBLE SUPERFLUID PHASE. 1, by T. Soda and R. Vasudevan. [1961] [45]p. incl. diagrs. (AFOSR-631) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AF 49(638)508) AD 259867 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 288, Apr. 24, 1961.

Also published in Phys. Rev., v. 125: 1484-1493, Mar. 1, 1962.

The thermodynamic behavior of liquid He^3 in its possible superfluid phase is investigated by extending the methods of Brueckner et al. They suggest that such a correlated phase can exist at very low temperatures due to the fact that there exist attractive D-state interactions near the Fermi surface. The free energy and the energy gap of the system for D-state interactions corresponding to different pure azimuthal modes are calculated at different temperatures. It is found that l = 2, m = 2 and l = 2, m = 1 modes correspond to the lowest free energy of the system near the critical temperature. In the intermediate range of temperatures the free-energy curves for the 2 modes, when the computations are made numerically, come out to be very nearly the same. But actually it can be shown by an analytical method that they are identical. The l = 2, m = 0 mode yields a higher free energy for all temperatures less than the critical temperature. The mixing of modes is investigated near the critical temperature. Any linear combination of all the modes l = 2, m = 0, 1, -1, 2, and -2 does not seem to lead to a lower free energy than that of the l = 2, m = ±2, and m = ±1 modes. The correlation lengths at different temperatures are also analyzed. The specific heat and entropy curves for the l = 2, m = 2 mode are given. (Contractor's abstract)

THE SECOND-ORDER OPTICAL POTENTIAL FOR PION-NUCLEAR SCATTERING, by R. R. Johnston and K. M. Watson. [1961] 31p. incl. tables, refs. (AFOSR-632) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AF 49(638)508) Unclassified

Also published in Nuclear Phys., v. 28: 583-597, Dec. 1961.

The optical model for high energy elastic scattering of pions by nuclei may be explicityl evaluated in terms of 2-nucleon correlations in nuclei

(neglecting tertiary and higher order correlations), using dispersion relations to give the relevant scattering amplitudes. Previous treatments of the effects of pair correlations have assumed specific nuclear models. In the present discussion it is shown how this may be done avoiding model-dependent assumptions. EXTENDED SHELL MODEL CALCULATIONS AND EFFECTS OF NONLINEARITY OF DENSITY MATRIX EQUATIONS (Abstract), by J. Sawicki and T. Soda. [1961] [1]p. [AF 49(638)508] Unclassified

Presented at meeting of the Amer. Phys. Soc., Mexico City, June 22-24, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 377-378, June 22, 1961.

Equations for the off-diagonal components of the single particle density matrix of a finite system of fermions are linearized with the inclusion of exchange terms taking into account part of the nonlinearity effect due to the exclusion principle. The leftover terms bilinear in the density operator are then "minimized" by a method somewhat similar to that discussed by Sawada and Sawada and Soda. The effect of the resulting correction terms is estimated on the example of the giant dipole state in O^{16} and is found small giving support to the random-phase approximation. A successive approximation perturbation procedure based on this method can be useful in applications to finite nuclei.

CYCLOTRON RESONANCE IN COPPER, by A. F. Kip, D. N. Langenberg, and T. W. Moore. [1961] [14]p. incl. diagrs. refs. (AFOSR-963) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)600 and Office of Naval Research) AD 451639 Unclassified

Also published in Phys. Rev., v. 124: 359-372, Oct. 15, 1961.

Extensive cyclotron resonance experiments in copper at 24 kmc/sec are described. The results are consistent with the Azbel-Kaner theory of cyclotron resonance in metals and with the known Fermi surface geometry. Stationary orbits (orbits having extremal effective mass and vanishing average velocity in the magnetic field direction) are found to dominate the cyclotron resonance signals in copper. The effective mass anisotropy of various classes of stationary orbits is reported. The effects of tipping the magnetic field slightly out of the plane of the sample surface and of the direction of the rf currents with respect to the magnetic field are described. CYCLOTRON RESONANCE IN ALUMINUM, by T. W. Moore and F. W. Spong. [1961] [1]p. incl. diagrs. tables, refs. (AFOSR-1486) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)600 and Office of Naval Research) AD 454657 Unclassified

Also published in Phys. Rev., v. 125: 845-847, Feb. 1, 1962.

Preliminary results of cyclotron resonance experiments at 35 kmc/sec in aluminum having a relatively long relaxation time at 4.2°K are presented. Discrepancies and errors in earlier cyclotron resonance experiments are resolved. A tentative orbit identification scheme is proposed which indicates (a) that the second-zone Fermi surface is consistent with the single orthogonalized plane wave (OPW) model, and (b) that the third-zone Fermi surface is connected and that the connecting region is thicker than in the single OPW model. The effective masses obtained are compared with the values predicted by the single OPW model and with other experimental values, where pertinent. Departures of the effective mass value of orbits in the second zone from values given by the single OPW model are noted and may be attributable to electron-electron or electron-phonon effects. BALLOON OBSERVATIONS OF AURORAL-ZONE X-RAYS, by R. R. Brown. [1961] [10]p. incl. diagrs. tables. (AFOSR-414) (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)-873], Atomic Energy Commission, and Office of Naval Research) Unclassified

Also published in Jour. Geophys. Research, v. 66: 1379-1388, May 1961.

A series of balloon flights launched from the vicinity of College, Alaska, during June and July 1960 showed that auroral-zone x-rays are detectable with Geiger counters approximately 10% of the time at pressure altitudes in the range 10-15 mb. The results of these flights indicate that the daily flux of electrons with energies greater than 50 kev over the auroral zone is 6×10^{10} particles/cm^2. Late in a magnetic storm that started with a sudden commencement at 1701 UT on July 14, 1960, the average electron influx exceeded the daily rate by more than a factor of 25. (Contractor's abstract)

THEORY OF COLLECTIVE EXCITATIONS OF SPHERICAL NUCLEI WITH PARTICULAR APPLICATION TO THE GIANT DIPOLE STATE, by J. Sawicki and T. Soda. [1961] [23]p. incl. tables, refs. (AFOSR-J20) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-121] and Office of Naval Research) AD 400451 Unclassified

Also published in Nuclear Phys., v. 28: 270-292, Dec. 1961.

The system of equations of motion for the components of the one-particle density matrix is linearized for a finite system of fermions interacting through a two-body "residual" force. Exchange terms are included. Equations corresponding to those of the "extended shell model" method are obtained for calculating collective states of spherical nuclei of definite angular momentum, parity, spin and isobaric spin, both in the j-j and L-S coupling scheme. Particular application and solution of such equations is obtained for the case of the giant dipole state of O^{16} by the use of finite range potentials with two different mixtures of exchange forces and radial shapes. The matrix elements are antisymmetrized and the "backward-going graphs" are included. Satisfactory agreement with experiment is obtained. The left-over terms bilinear in the density operator are then "minimized" by extracting their lowest order linear contribution. The resulting correction terms are estimated for the giant dipole state in O^{16} and found small, giving support to the random phase approximation. (Contractor's abstract)

ELECTRON SCATTERING FROM HYDROGEN, by C. Schwartz. [1961] [4]p. incl. diagrs. table. (AFOSR-J25) (Sponsored jointly by [Air Force Office of Scientific Research under AF AFOSR-62-121] and Office of Naval Research) AD 297115 Unclassified

Also published in Phys. Rev., v. 124: 1468-1471, Dec. 1, 1961.

Kohn's variational principle has been used to calculate s-wave elastic scattering of electrons from atomic hydrogen, using up to 50 trial functions of the type introduced by Hylleraas to describe the bound states of two-electron atoms. The phase shifts calculated at several energies up to 10 ev appear to have converged well, leaving residual uncertainties mostly less than one thousandth of a radian. Taking extra pains to include the effect of the long-range force at zero energy, we have also determined very accurate values for the scattering lengths.

STATISTICAL THEORY OF THE DIELECTRIC CONSTANT OF AN IMPERFECT GAS, by A. N.

Kaufman and K. M. Watson. [1961] [13]p. incl. diagrs. refs. (AFOSR-J26) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-121] and Atomic Energy Commission) AD 297116 Unclassified

Also published in Phys. Fluids, v. 4: 931-943, Aug. 1961.

By means of the linked-diagram expansion of the grand partition function of a molecular gas in an electrostatic field, an expression for the polarization P(R) of the gas is obtained. Spatial variation of the external electric field $E_0(R)$ requires an explicit treatment of long-range cooperative interactions between "clusters" of molecules. For fields that vary appreciably over microscopic dimensions, an integral relation is found relating the polarization P(R) to the electric field E(R). For fields varying negligibly over microscopic regions, an expression for the dielectric constant K of the gas is obtained, which is a generalization of the Clausius-Mossotti formula involving the density n and the temperature-dependent polarizabilities of m-molecule linked clusters. VARIATIONAL CALCULATIONS OF SCATTERING, by C. Schwartz. [1961] [15]p. incl. diagrs. (AFOSR-J136) (Sponsored jointly by [Air Force Office of Scientific Research under AF AFOSR-62-121] and Office of Naval Research) AD 400187 Unclassified

Also published in Ann. Phys., v. 16: 36-50, Oct. 1961.

It was found that the behavior of calculated results using variational principles for scattering problems is rather different from that previously known for bound-state problems. As more and more adjustable terms are added to the trial function, the "stationary" value for the phase shift does not converge smoothly but may on occasion turn out to be grossly inaccurate. The phenomenon is displayed and partially analyzed, but not completely understood. The conclusion is that for a given amount of computational labor, a scattering phase shift may be determined only to an accuracy an order of magnitude worse than that of the analogous eigenvalue problem. SAMPLED-DATA CONTROL SYSTEMS, by E. I. Jury. New York, Wiley and Sons, 1958, 453p. incl. diagrs. tables, refs. [AF 18(600)1521] Unclassified

The bulk of the material of this book was taught as a two-semester graduate course at Berkeley in the field of control systems. The book is considered a basic text in this field and includes substantial coverage of nonlinear systems. The first four chapters and chapter 8 are oriented toward the analysis problem. Chapters 5, 6, and 7 are directed toward synthesis. Chapter 9 presents an exact analysis and stability study of sampled-data systems with finite pulse width and the limitations of the z-transform.

CONVOLUTION Z-TRANSFORM METHOD APPLIED TO CERTAIN NONLINEAR DISCRETE SYSTEMS, by E. I. Jury and M. A. Pai. Jan. 18, 1961, 28p. incl. diagrs. table, refs. (Series no. 60 ; issue no. 341) (AFOSR-200) (AF 18(600)1521) AD 252737; PB 155452 Unclassified

Also published in I. R. E. Trans. on Automatic Control, v. AC-7: 57-64, Jan. 1962.

The convolution z-transform method is applied to obtain an explicit solution of certain nonlinear difference equations. The explicit solution is often desired for system design as well as for obtaining the response for large intervals of time. In these difference equations which describe the physical discrete systems, it is assumed that the nonlinearities are small. This is necessitated by the form of solution applicable to the use of the convolution method. The advantage of the method is to systematize the procedure for the solution as well as to obtain results in a closed form. The convergence of the solution is discussed as well as applications to certain examples. The examples chosen are feedback sampled-data systems with nonlinearities in the forward and feedback paths, respectively. Explicit solution

in a closed form is obtained for the error as well as the output response. These results compare favorably with the numerical solution of the nonlinear difference as a recurrence relationship. (Contractor's abstract)

TWO THEOREMS CONCERNING REGULAR MARKOV CHAINS, by G. G. Lendaris. Feb. 27, 1961, 19p. (Series no. 60; issue no. 347) (AFOSR-480) (AF 18-(600)1521) AD 255355 Unclassified

A (weighted, directed) graph is associated to the transition matrix P and its graph theoretic properties are used to establish the proofs of the following two theorems: (1) If for an r x r non-negative matrix P = (p_{ij}) there exists an n > 0 such that $p_{ij}^{(n)} > 0$ for all i, j, then there is an $n' \leq N = r^2 - 2r + 2 = (r-1)^2 + 1$ such that $p_{ij}^{(n')} > 0$ for all i, j. (2) A Markov chain is regular if and only if the (directed) graph corresponding to its transition matrix has the following 2 properties: (a) there exists at least one (directed) closed path containing all nodes, and (b) the set of numbers $\{a_i\}$, representing the lengths of all the simple loops in the graph, be relatively prime.

ON THE IDENTIFICATION AND ADAPTIVE CONTROL OF SAMPLED-DATA SYSTEMS, by G. G. Lendaris. Mar. 21, 1961 [79]p. incl. diagrs. table, refs. (Series no. 60; issue no. 351) (AFOSR-720) (AF 18-(600)1521) AD 259906 Unclassified

A procedure is presented for identifying a linear, lumped-parameter, time-invariant (at least during the measurement period), single-input system from its response to a step excitation. Then, an adaptive sampled-data control system is designed using a digital computer to perform this identification procedure and to act as the controller for the system. The system was actually built, and some experimental results are cited. This identification technique requires 2n + 1 measurements of the magnitude of the output, where n is the order of the system and the measurements are taken at equally spaced intervals of time. These measurements are used as the coefficients in n scalar equations whose n unknowns are the coefficients of the z-transformed characteristic equation of the system. This set of n scalar equations is solved for these coefficients (on a digital computer). For some applications, this characterization of the system is sufficient; when it is not, then this equation is factored to yield the system's z-plane poles, and from this, the corresponding s-plane poles are found. This procedure is independent of initial conditions and will work for any such system (even for the multiple eigenvalue case) the only restriction being that all the poles of the system be excited when the measurements are made. (Contractor's abstract)

A DISCRETE COMPENSATOR FOR SAMPLED-DATA SYSTEMS USING MAGNETIC CORES AS STORAGE ELEMENTS, by G. G. Lendaris. May 11, 1961, 39p. incl. illus. diagrs. (Series no. 60; issue no. 356) (AFOSR-1141) (AF 18(600)1521) AD 264355 Unclassified

The construction of a discrete compensator to be used in a sampled-data control system is described. The compensator employs a discrete delay line utilizing magnetic cores to store, in pulse-width-modulated form, the sampled values of the signal. This system requires no relays or stepping switches; everything is solid state except for the amplifiers used in the sample and hold circuits, demodulation integrators, and coefficient multiplication. This tapped delay line operates like a shift register. A group of toroidal cores with coils wound on them are connected in series. Each core is set to negative saturation; then a signal is impressed onto the first core in the chain for a certain period of time. Next, a reset signal is impressed onto this first core, and simultaneously a set signal of the same amplitude is impressed onto the second core. Thus the first step of the shifting is accomplished. This can be repeated as often as desired, depending only on how many cores are in the chain. (Contractor's abstract)

A SIMPLIFIED STABILITY CRITERION FOR LINEAR DISCRETE SYSTEMS, by E. I. Jury. June 14, 1961, 36p. incl. diagrs. tables, refs. (Series no. 60; issue no. 373) (AFOSR-1170) (AF 18(600)1521) AD 264678 Unclassified

Also published in Proc. Inst. Radio Engineers, v. 50: 1493-1500, June 1962.

A simplified analytic test of stability of linear discrete systems is obtained. This test also yields the necessary and sufficient conditions for a real polynomial in the variable z to have all its roots inside the unit circle in the z-plane. It is shown that for the test of a fourth-order system only a third-order determinant is required and for the fifth-order only two determinants are required. The test is applied directly in the z-plane and yields the minimum number of constraint terms. Stability constraints up to the fifth-order case are obtained and for the nth-order case are formulated. (Contractor's abstract)

[SAMPLED DATA CONTROL SYSTEMS], by E. I. Jury. Final technical rept. July 15, 1955-Sept. 30, 1961, 18p. incl. illus. diagr. refs. (Series no. 60; issue no. 401) (AFOSR-1171) (AF 18(600)1521) AD 264630 Unclassified

The material of this report is divided into 2 parts: (1) theoretical investigations and (2) experimental investigations. In the first part discussions are made of (a) linear theory, (b) statistical theory, (c) time-varying theory, (d) nonlinear theory (e) optimal control, (f) identification and adaptive control, (g) applications to other fields, and (h) other pertinent topics. In the section on experimental investigations, problems associated with simulation, programming and physical implementation of components and systems are discussed. Pictures illustrating the physical set-up of equipment and its purpose are presented, as well as references to published reports and papers.

STATISTICAL STUDY OF PULSE WIDTH MODULATED CONTROL SYSTEMS (I), by S. C. Gupta and E. I. Jury. Sept. 12, 1961, 55p. incl. diagrs. tables, refs. (Series no. 60; issue no. 403) (AFOSR-1628) (AF 18(600)1521) AD 267895 Unclassified

Also published in Jour. Franklin Inst., v. 273: 292-321, Apr. 1962.

Efforts concern a statistical study of pulse width modulated control systems. The pulse width modulator (PWM) was first considered for positive signals only. The output of this was then compared with the output of the approximate model where the PWM was replaced with a sampler, saturating nonlinear element and a hold circuit based on equal area approximation. An example was worked to show that there is little error involved in the use of this approximation. Using this as the basis, the open loop case was worked out for Gaussian inputs. The results were tabulated and graphed. In the solution of the closed-loop system the difficulty of the calculation of the cross-correlation function was overcome by making another approximation based on the separability property of the Gaussian process. This facilitates the whole problem and the relationship of output mean square value to input is graphed for a simple example. (Contractor's abstract)

THE ANALYSIS OF NONLINEAR FEEDBACK SAMPLED-DATA SYSTEMS, by M. A. Pai. June 20, 1961 [71]p. incl. diagrs. table, refs. (Series no. 60; issue no. 384) (AFOSR-1791) (AF 18(600)1521) AD 271763 Unclassified

Various techniques are available for the analysis of nonlinear sampled-data systems. Most of these methods use either the phase plane approach or the describing function technique. Since the performance of such a system is described, at sampling instants, by means of a difference equation, an approach based on the difference equation would seem to be both natural and direct. The principle of complex convolution for a transform is explained and its geometrical interpretation is given. It is shown how the application of the convolution transform is both direct and simple with respect to solving nonlinear difference equations when the equation is given in scalar form. Dependence of the convergence of the solution on the initial value and the degree of nonlinearity is pointed out. It is concluded that for difference equations of second order and higher, this method involves too much laborious computation to justify its use. A simple method is presented for examining free oscillations in a sampled-data system containing either relay or a saturating amplifier. In addition, a certain analytical technique, analogous to that for differential equations, is developed to investigate the stability of forced oscillations for certain types of nonlinear difference equations.

STABILITY STUDY OF PULSE-WIDTH MODULATED AND NONLINEAR SAMPLED-DATA SYSTEMS, by T. Nishimura. Apr. 4, 1961, 68p. incl. diagrs. refs. (Series no. 60; issue no. 353) (AFOSR-2268) (AF 18-(600)1521) AD 273858 Unclassified

The fundamental equation that describes limit cycles in nonlinear sampled-data systems was derived.

The equivalence of limit cycles with finite pulsed systems having a periodically varying sampling-rate was observed, and the methods of analysis applied to the latter were extended to obtain these limit cycles with the aid of final value theorem. This fundamental equation is modified and simplified under certain assumptions as it can be applied to systems both with and without integrators. The limitation on the longest period of saturated and unsaturated oscillation is investigated and the critical gain for their existence is derived, starting from the modified fundamental equation. Also, the stability of limit cycles and the equilibrium point is considered, based on Neace's method. Various kinds of non-linearities, namely, pulse-width modulation, relay saturating amplifier with linear zone, and quantized level amplifier are discussed. Self-excited oscillations are mainly examined, as well as the possible existence and stability of limit cycles, however, the method can be extended to forced oscillations. (Contractor's abstract)

ADDITIONS TO STABILITY CRITERION FOR LINEAR DISCRETE SYSTEMS, by E. I. Jury. [1961] 7p. (AFOSR-3920) (AF 18(600)1521) Unclassified

Also published in I. R. E. Trans. on Automatic Control, v. AC-5: 342-343, Sept. 1961. (Title varies)

In a preceding note, the author discussed a simplified form of the Schür-Cohn criterion that can be readily applied to the stability test of linear discrete systems. A further identification is described in which one of the constraints (depending on the evaluation of an n-th order determinant) is replaced by two auxiliary constraints of a simple nature.

NOTES ON THE STABILITY CRITERION FOR LINEAR DISCRETE SYSTEMS, by E. I. Jury and B. H. Bharucha. [1961] [3]p. [AF 18(600)1521] Unclassified

Published in I. R. E. Trans. on Automatic Control, v. AC-6: 88-90, Feb. 1961.

It is shown that the evaluation of the Schür-Cohn determinants can be simplified considerably, so that the manipulations involved in testing for the zeros of a polynomial are comparable to those using the "transformed" Routh-Hurwitz criterion, thus avoiding the bilinear transformation. For an n-order polynomial in z, the test for stability involves evaluating determinants up to order n.

OPTIMIZATION PROCEDURES FOR SAMPLED-DATA AND DIGITAL CONTROL SYSTEMS, by E. I. Jury. [1959] [11]p. incl. diagrs. refs. [AF 18(600)-1521] Unclassified

Presented at Fifth meeting of the Swiss Federation of Automatic Control, Lausanne (Switzerland), May 20, 1959.

Published in Sci. Elec., v. 7: 16-26, Mar. 1961.

This paper discusses the main features of optimization procedures for control systems. The optimization procedure is based on minimizing the mean squared error (difference between actual and desired output). Physical realizability and stability conditions are included in the procedure for obtaining the digital transfer function $D^*(z)$. The method of approach is based on the modified z transform and certain features of this method are briefly indicated. The extension of this method to the use of digital computers as means of compensation and filtering in a feedback path and to systems with pure delays and of finite pulse width are indicated. (Contractor's abstract, in part)

ON THE EVALUATION OF THE STABILITY DETERMINANTS IN LINEAR DISCRETE SYSTEMS, by E. I. Jury. [1961] [5]p. incl. diagrs. [AF 18(600)1521] Unclassified

Published in I. R. E Trans. on Automatic Control, v. AC-7: 51-55, July 1962.

In this note it is shown that for obtaining the stability condition of an n-order polynomial in the z plane, only one (n-1) order determinant need be evaluated. This major simplication is of importance to obtain the stability constraints when the coefficients of the polynomial are given other than numbers.

HIGH-FREQUENCY EFFECTS OF THE POTENTIAL MINIMUM ON NOISE, by J. R. Whinnery. [1959] [13]p. incl. diagrs. refs. [AF 49(638)102] Unclassified

Published in I.R. E. Trans. on Electron Devices, v. ED-7: 218-230, Oct. 1960.

A physical model of the compensation phenomenon in space-charge reduced shot noise is discussed and first applied to a planar diode of infinite spacing short-circuited to ac effects. Analysis of both the time response and frequency response shows that

parameters of the potential minimum are very important to the degree of noise compensation or over-compensation, and for certain parameters the internal feedback mechanism of returning charges may cause a self oscillation without external stimuli, or in other words a building-up to saturation levels of noise phenomena in these frequency ranges. The short-circuited diode of finite spacing is analyzed in both the frequency domain and time domain, and an approximate correction to the results found as a function of total transit angle across the diode. In particular, the factor produces appreciable decreases in the reduction factor in the vicinity of certain transit angles across the diode, and as the Tien dips occur in these general ranges, the finite diode spacing is believed to be a strong candidate for explanation of these dips. SPACE-CHARGE INSTABILITIES IN ELECTRON DIODES AND PLASMA CONVERTERS, by C. K. Birdsall and W. B. Bridges. Jan. 26, 1961, 29p. incl. diagrs. table, refs. (Series no. 60; issue no. 343) (AFOSR-387) (AF 49(638)102) AD 258890 Unclassified

Also published in Jour. Appl. Phys., v. 32: 2611-2618, Dec. 1961.

Space-charge instabilities in diodes were found to produce variations in potential and current that are larger than predicted from classical static analyses and, moreover, which produce sustained electrokinetic oscillations. The classical static solution is reviewed and the new transient solution is presented briefly. As applications, tentative explanations are offered for recent observations of extra shot-noise smoothing and of oscillations in thermionic converters. (Contractor's abstract)

GENERAL ANALYSIS OF OPTICAL, INFRARED, AND MICROWAVE MASER OSCILLATOR EMISSION, by J. R. Singer and S. Wang. Mar. 21, 1961, 8p. incl. diagrs. refs. (Series no. 60; issue no. 352) (AFOSR-388) (AF 49(638)102) AD 256632 Unclassified

Also published in Phys. Rev. Ltrs., v. 6: 351-354, Apr. 1, 1961.

The equations governing coherent emission from quantum mechanical amplifiers (microwave, infrared, and optical masers) are generalized, using either electric or magnetic dipole transitions. It is found that an amplitude modulation of the output is to be expected from all maser oscillators except those in which excited atoms are supplied at a notably greater rate than the depopulation rate due to coherent induced emission. The analysis also suggests that energy population inversions of electric dipole moments can be performed using coherent light sources in the same manner as with magnetic dipole moments. It appears, therefore, that modulation of an optical or infrared maser may be easily accomplished by varying the population of excited states through control of the pumping energy. This modulation may be both by absorption and by amplification.

COHERENT OPTICAL EMISSION FROM MOLECULAR BEAMS, by I. Gorog. Nov. 20, 1961, 29p. incl. diagr refs. (Series no. 60; issue no. 418) (AFOSR-1978) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)102 and Army Research Office under DA-ARC(D)-31-124-G151) AD 275428 Unclassified

The feasibility of constructing an optical maser in which the excited atoms are obtained as products of photodissociation of alkali-halides is considered. It is shown that by confining the active particles to a molecular beam an excess reduction in the output linewidth can be obtained. The case of a rubidium-iodide system is treated in detail. Photodissociation is achieved by pumping at 2537A and induced emission occurs at 7800A corresponding to the $Rb^{I}(5p \rightarrow 5s)$ transition. The calculations show that maser oscillation in such a system is possible. (Contractor's abstract, in part)

A SPIN-ECHO MEMORY FOR A CARRIER TYPE

DIGITAL COMPUTER, by L. K. Wanlass. Aug. 28, 1961, 149p. incl. illus. tables, refs. (Series no. 60; issue no. 399) (AFOSR-2767) (AF 49(638)102)
AD 284290 Unclassified

Electron spin-echo was studied as a possible carrier digital computer memory element at microwave frequencies. A general study is made of solid state paramagnetic crystals as possible storage materials. Spin-spin and spin-lattice relaxation times are considered in general, and were measured for calcite, silicon, and other crystals. A study was made of cross-relaxation in calcite using a stimulated spin-echo technique. A decrease in the potential storage time of this crystal by a factor of 8000 is reported due to this relaxation mechanism. Detailed measurements were made on the spin-echo signals obtainable at microwave frequencies, and usable amplitude echoes are reported for many crystals and impurity concentrations. A study of noise sources and signal to noise ratios was made. An original system for storing the phase of phase script information pulses was investigated. A complete carrier computer regenerative memory system using two spin-echo devices and a single connecting channel was considered. The storage capacity of the memory device was theoretically determined. (Contractor's abstract)

THE EMISSION, PULSE-LEVEL INVERSION, AND MODULATION OF OPTICAL MASERS, by J. R. Singer and S. Wang. [1961] [9]p. incl. diagr. refs. (AFOSR-JC2) (AF 49(638)102) Unclassified

Presented at Second Internat'l. Conf. on Quantum Electronics, Berkeley, Calif., Mar. 23-25, 1961.

Also published in Advances in Quantum Electronics, New York, Columbia U. Press, 1961, p. 299-307.

It is shown that for any two-level optical or microwave maser system, the interaction between the radiation field and the radiating molecules results in an amplitude modulation of the radiation output. When the rate of excitation of active molecules is sufficiently large, the output may be essentially smooth at equilibrium, but rather unusual conditions are required to observe a constant amplitude output. A combined amplitude and pulse position modulation method is discussed which is suitable for information transmission with an optical maser. Pulse inversion can be accomplished using partially coherent light. Pulse inversion optical masers can be efficiently modulated by use of a pulse position code.

PHASE STABILITY IN FREQUENCY MULTIPLIERS, by R. R. Dimmick. June 2, 1961, 43p. incl. illus. diagrs. tables, refs. (Series no. 60; issue no. 366) (AFOSR-1014) (Sponsored jointly by Air Force Office of Scientific Research, Department of the Army, and Office of Naval Research under AF 49(638)1043)
AD 265755 Unclassified

Work is described pertaining to phase stability of frequency multipliers with particular emphasis on class C vacuum-tube frequency multiplier chains. Various sources of phase perturbations were considered and experimental work performed to establish the magnitude of their effects on a practical device. Temperature variation was found to be the most serious source of phase instability. A general discussion of frequency standards is included and the need for frequency multipliers in the translation of a

standard frequency is pointed out. Frequency multiplier chains are discussed and the class C multiplier selected for the major portion of the work because of the simplicity of its design and its general use. Sources of phase perturbation considered include tube noise, temperature variation, and supply-voltage variation. The effects of such sources were determined on an experimental multiplier chain and recommendations were made regarding multiplier chain design. Indications were that frequency errors due to phase perturbations could be held to less than $1:10^{11}$ with suitable precautions. It is suggested that a similar program on semiconductor multiplier chains would be of interest. (Contractor's abstract)

CORRELATION PROCESSES IN ANTENNA ARRAYS, PART II, by I. W. Linder. June 13, 1961, 28p. incl. diagrs. table. (Series no. 60; issue no. 371) (AFOSR-1348) (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under AF 49(638)1043) AD 267894 Unclassified

Investigations concern the use of statistical correlation techniques in combining the voltages induced on the elements of a receiving antenna array. Analysis was made of the nonlinear processes in these arrays when both signal and distributed noise sources are present. The effect of distributed noise was analyzed, resulting in an expression for element spacing which will minimize the undesired noise voltage induced on the array. Channel capacities of linear and of nonlinear arrays were then compared. These results are employed to construct nonlinear arrays which will optimize the S/N or will provide a minimum beamwidth in the antenna directional pattern. (Contractor's abstract)

A VARIATIONAL SOLUTION FOR THE SCATTERING OF ELECTROMAGNETIC PULSES FROM A CYLINDER OF FINITE LENGTH, by W. J. Welch. Aug. 11, 1961, 27p. incl. diagrs. (Series no. 60; issue no. 392) (AFOSR-1534) (Sponsored jointly by Air Force Office of Scientific Research, Department of the Army, and Office of Naval Research under AF 49(638)1043) AD 265853 Unclassified

The problem of the scattering of an essentially plane electromagnetic pulse by a thin metallic cylinder of finite length is treated by means of a variational formula derived in an earlier paper (I. R. E. Trans. on Antennas and Propagation, v. AP-8: 68, Jan. 1960). The pulse is a delta function, and it is assumed that the current induced on the scatterer is a damped sinusoid with the frequency of oscillation such that the cylinder is one half wavelength long and the damping is calculated by a related variational technique. The time dependence of the echo at a large distance from the cylinder is plotted for two different thicknesses of the cylinder. (Contractor's abstract)

A study is presented on the behavior of the mesa transistor as the active component in a video amplifier. The drift potential across the base was found, and the internal parameters of the transistor based on the one dimensional analysis were obtained by solving the continuity equation. Simple calculations of the parameters were made and used, together with the knowledge of the physical dimensions, to develop the equivalent circuit. The method of measurements of the parameters is discussed, then follow the actual measurements which are compared, wherever possible, with the calculated values. The equivalent circuit and the measured parameters were finally used in a simple video amplifier circuit. From the calculated and measured response of the amplifier, the equivalent circuit of the mesa transistor was simplified and found to be similar to that of a normal transistor. NEURO MUSCULAR CONTROL: POSSIBLE SUBJECT FOR BIONIC STUDY, by G. G. Furman. Aug. 11, 1961, 32p. incl. diagrs. refs. (Series no. 60; issue no. 393) (Sponsored jointly by Air Force Office of Scientific Research, Department of the Army, and Office of Naval Research under AF 49(638)1043) AD 270452 Unclassified

Although the neuromuscular systems responsible for the activation of skeletal muscles in mammals are known to contain feedback, only an incomplete picture of their function can be pieced together from present information. The dynamic role of the minute muscle-length transducers (muscle spindles) that are scattered among the main motor fibers is discussed in some detail and the important papers are summarized. Some physiologists have exhibited great ingenuity in their investigations of neuromuscular control, but these workers have often been reluctant to apply the powerful and highly germane analytical techniques of control system theory and the statistical theory of communication. As a result it appears that they have approached the limits of their methods. The present report proposes that the extensive preparatory surgery frequently performed on laboratory animals to minimize random activity often produces unphysiological preparations. Ordinary statistical methods should make it possible to deal with the noise

introduced by working with intact, chronic animals. The important benefits to both physiology and engineering that a control engineer's approach to neuromuscular systems can be expected to produce are discussed and various experiments are suggested. (Contractor's abstract)

DETERMINATION OF PHYSICAL PARAMETERS OF DRIFT TRANSISTORS HAVING A DIFFUSED COLLECTOR JUNCTION, by A. R. Boothroyd. Aug. 11, 1961, 31p. incl. diagrs. (Series no. 60; issue no. 391) (AFOSR-2118) (Sponsored jointly by Air Force Office of Scientific Research, Department of the Army, and Office of Naval Research under AF 49-(638)1043) AD 274237 Unclassified

A procedure for the determination of physical parameters of drift transistors with a diffused collector junction was developed on the assumption of a device model with exponential base grading. Only relatively low-frequency measurements are involved. Studies were made of a double-diffused silicon mesa unit and the results obtained suggest that the theory used may be adequate for practical application, despite discrepancies between the assumed model and the actual device. Good correlation between certain known design values of physical parameters of the device, and the values deduced from measurements, was obtained. More investigation is necessary, however, to establish the conditions of validity, accuracy and possible need for further elaboration of the approach presented. (Contractor's abstract)

NOTES ON SYSTEM THEORY, VOL. I. Oct. 1, 1961, 71p. incl. diagrs. tables, refs. (Series no. 60; issue no. 408) (AFOSR-2234) (Sponsored jointly by Air Force under AF 19(604)5466, Air Force Office of Scientific Research under AF 18(600)1521 and AF 49-(638)1043, National Science Foundation under G-9106 and G-15965, and Office of Naval Research under Nonr-22253) AD 270449 Unclassified

This is a first issue of what is hoped to be a sequence of notes on system theory. The purpose of these notes is (1) to provide an auxiliary publication medium for short contributions by the students and faculty who are engaged in research in systems and related areas; and (2) to contribute to the development of system theory as a basic scientific discipline. The following 14 papers are presented: (1) A note on Tsypkin's locus, by A. R. Bergen; (2) Simple oscillations in continuous relay control systems with linear plant, by A. Chang; (3) Complete controllability and a basic fact about linear mappings, by C. A. Desoer; (4) A theorem concerning compact and cyclic sequences, by A. Gill; (5) Simulation of probabilistic finite-state systems, by A. Gill; (6) A summary of a simplified stability for linear discrete systems, by E. I. Jury; (7) A summary of a stability criterion for linear discrete systems in a table form, by E. I. Jury and J. Blanchard; (8) A note on the inverse z-transformation, by E. I. Jury and C. A. Galtieri; (9) Reachability of states of a linear, time-invariant system, by H. Kwakernaak; (10) Construction of a probabilistic finite state machine, by G. Machol; (11) A note on complete controllability, by B. Whalen; (12) The necessi- for nonlinear decoding for the binary symmetric channel, by T. J. Wagner; (13) A simplifying notation for n-variable calculus, by B. Whalen; and (14) On the notion of inverse in continuous-state systems, by L. A Zadeh.

THE EQUIANGULAR PLANE SPIRAL ANTENNA, by R. Sussman. Sept. 15, 1961, 57p. incl. diagrs. (Series no. 60; issue no. 406) (AFOSR-2265) (Sponsored jointly by Air Force Office of Scientific Research, Department of the Army, and Office of Naval Research under AF 49(638)1043) AD 274238 Unclassified

The equiangular plane spiral antenna belongs to the class of frequency independent antennas. The electromagnetic field of the equiangular plane spiral antenna with a finite number of arms is investigated. The pattern, the phase variation and the polarization of the field of spiral antennas with a small number of arms, as generated by various methods of excitation, are examined. A method of decomposing any complicated feeding arrangement into a set of basic feedings was developed. This method can be applied to any equally spaced plane antenna with any number of arms. Measurements on 2-, 4-, and 6-arm spiral antennas were performed. Results show that the solution recently found for the limiting case of a spiral antenna which has an infinite number of arms, can serve as a good approximation to antennas with a small number of arms. Some correction terms, which depend on the number of arms, are introduced into the solution of the infinite arm antenna, so as to get a still better approximation. (Contractor's abstract, modified)

THE MINIMUM PERIOD OF OSCILLATION OF SIMPLE TUNNEL DIODE OSCILLATORS, by D. K. Lynn, R. S. Pepper, and D. O. Pederson. Aug. 2, 1961, 37p. incl. diagrs. (Series no. 60; issue no. 388) (AFOSR-2275) (Sponsored jointly by Air Force Office of Scientific Research, Department of the Army, and Office of Naval Research under AF 49(638)1043) AD 274236 Unclassified

A study was made of th minimum period of oscillation, regardless of waveshape, for a class of electronic oscillators, one member of which is a tunnel-diode oscillator having a resistive-inductive load. Analysis shows that the minimum period of oscillation is never obtained for a harmonic mode of oscillation. The results are confirmed by experiment.

Two methods of solution of the tunnel-diode oscillator equation are used. Computer solutions are used for cases of highly nonsinusoidal oscillations. If a cubic polynomial approximation to the tunnel-diode negative resistance characteristic is used, analytic solutions are found by means of a perturbation technique (Lindstedt method). From the piecewise linear solutions it is seen that there are many factors that influence the shape of the curve of period oscillation with the load parameter. The tunnel diode oscillator may operate as a soft oscillator, hard oscillator, or be truly bistable. The conditions for determining the type of operation are given. (Contractor's abstract)

TRANSISTOR BANDPASS AMPLIFIERS OF WELL-DEFINED PERFORMANCE, by A. R. Boothroyd. Dec. 1961, 26p. incl. illus. (Series no. 60; issue no. 424) (AFOSR-2448) (Sponsored jointly by Air Force Office of Scientific Research, Department of the Army, and Office of Naval Research under AF 49-(638)1043) AD 277370 Unclassified

A discussion of basic stability and gain considerations in active two-port networks is followed by an analysis of the conditions under which the transducer gain may be well-defined, in the sense of being affected little by changes in active device parameters. Two methods of achieving well-defined performance, involving mismatching or loading with loss elements respectively at the ports, are treated, and shown to lead to simple design procedures for both single and transformer-coupled cascaded stages. It is also shown that by suitably loading the ports with dominant imaginary terminations the gain characteristic may be made well-defined and analytic in form over wide frequency range. Practical examples of transistor bandpass amplifiers illustrate the theory and show that common-base stages are particularly appropriate for amplifiers of the type considered. In the examples quoted the bandwidth is of the same order as the bandcenter frequency. (Contractor's abstract)

A SOLUTION TO THE FREQUENCY-INDEPENDENT ANTENNA PROBLEM, by B. R. Cheo, V. H. Rumsey, and W. J. Welch. [1961] [8]p. incl. diagrs. (Series no. 60; issue no. 428) (AFOSR-3496) ([Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1043] and Signal Corps under DA 36-039-sc-349) AD 427641 Unclassified

Also published in I. R. E. Trans. on Antennas and Propagation, v. AP-9: 527-534, Nov. 1961.

A solution of Maxwell's equations is obtained for an antenna consisting of an infinite number of equally spaced wires in the form of coplanar equiangular spirals. Radiation amplitude patterns obtained from this solution agree closely with measurements on two-element spiral antennas. The phase pattern shows the approximate validity of a phase center at a distance behind the antenna which decreases with the tightness of the spiral. The current distribution shows increased attenuation with increase in the tightness of the spiral, thus showing how the frequency-independent mode depends on the curvature. A remarkable feature of the solution is that the current consists of an inward traveling wave at infinity when the antenna is excited in that sense which produces an outward wave at the center. (Contractor's abstract)

STATISTICAL STUDY OF PULSE WIDTH MODULATED CONTROL SYSTEMS (II), by S. C. Gupta. Nov. 13, 1961, 55p. incl. illus. tables, refs. (Series no. 60; issue no. 414) (AFOSR-2442) [AF AFOSR-62-70] AD 276999 Unclassified

Computer solutions using IBM 704 Fortran monitor coding of closed loop pulse width modulator (PWM) systems are considered. Examples with simple linear plants with two types of input correlation functions are considered. The case of the pure integrator is also discussed. Modifications for delay element are given. Signal plus noise was considered for the open loop case and a simple example is given. Optimization using a first order discrete compensation is achieved both for open loop case and the closed loop case. (Contractor's abstract)

ON THE ROOTS OF A REAL POLYNOMIAL INSIDE THE UNIT CIRCLE AND A STABILITY CRITERION FOR LINEAR DISCRETE SYSTEMS, by E. I. Jury and J. Blanchard. Dec. 26, 1961, 28p. incl. illus. tables, refs. (Series no. 60; issue no. 425) (AFOSR-2443) [AF AFOSR-62-70] AD 277000 Unclassified

Necessary and sufficient algebraic conditions for the roots of a real polynomial to lie inside the unit circle, in a table form, are given. In this form, the constraints are obtained only by evaluation of second order determinants. The connection and identity between the stability criterion established and a previously obtained criterion are compared. The table is valuable if the coefficients of the real polynomial are given in numbers. Conditions on the numbers of the roots inside, outside, or on the unit circle are also discussed under the cases when the determinants are zero or non-zero. Necessary and sufficient conditions are formulated for all the roots to be inside a circle of radius sigma or less than unity, and also the conditions when the roots are to lie between plus and minus unity in the z-plane. Various examples from discrete systems are presented which illustrate the applications of the new stability criterion and the

other conditions formulated in this report. In the conclusion, the various analytical stability criteria applied to linear discrete systems are compared, with emphasis on the advantageous applications of each of the criteria.

PROOF OF A GENERAL RELATIONSHIP USED IN THE STABILITY TEST OF LINEAR DISCRETE SYSTEMS. AN ADDENDUM TO A SIMPLIFIED STABILITY CRITERION FOR LINEAR DISCRETE SYSTEMS AND ON THE ROOTS OF A REAL POLYNOMIAL INSIDE THE UNIT CIRCLE AND A STABILITY CRITERION FOR LINEAR DISCRETE SYSTEMS, by E. I. Jury. [1961] 8p. (Series no. 60; issue nos. 373 and 425) (AF AFOSR-62-70) AD 285176 Unclassified

In the stability criterion developed for the linear discrete systems, the following general relationship is used to reduce the stability constraints. $\Delta_k = A_k^2 - B_k^2 = 1/2[(A_{k+1} + B_{k+1})(A_{k-1} - B_{k-1}) + (A_{k+1} - B_{k+1})(A_{k-1} + B_{k-1})]$, $k = 2, 3, \ldots, n-1 = A_{k-1}A_{k+1} - B_{k-1}B_{k+1}$ where $A_k \pm B_k$ are given in the Appendix. The proof is based on the combined use of 3 propositions. The reader should be familiar with item nos. 265 and 300, Vol. V, in order to follow the details of the proofs.

THE EFFECT OF PLASTIC DEFORMATION ON SELF-DIFFUSION IN NICKEL, by A. R. Wazzan, J. Mote, and J. E. Dorn. Apr. 18, 1961, 30p. incl. diagrs. tables, refs. (Technical rept. no. 3; series no. 14; issue no. 3) (AFOSR-961) (AF 49(638)58) AD 257188 Unclassified

The coefficient of self-diffusion of nickel single crystals undergoing plastic deformation was measured for strain rates ranging from 0.0085 to 0.055 hr^{-1} at temperatures of 948 ± 1.5°K and 1021 ± 1.5°K. It was found that the coefficient of self-diffusion increased with an increase in strain rate at a constant temperature and decreased with an increase in temperature at constant strain rate. These results are discussed in terms of a model which assumes that vacancies are produced by the motion of jogged screw dislocations and the thermally activated climb of edge dislocations, and that vacancies anneal by migrating to fixed sinks, namely dislocation lines. The analysis indicates that the motion of jogged screws may be an unimportant source for vacancies at these temperatures and strain rates. (Contractor's abstract, modified)

INFLUENCE OF WAVE REFLECTIONS ON THE DEVELOPMENT OF DETONATION, by A. J. Laderman and A. K. Oppenheim. [1961] [5]p. incl. illus. diagrs. table, refs. (AFOSR-1680) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)166] and National Aeronautics and Space Administration) Unclassified

Also published in Phys. Fluids, v. 4: 778-782, June 1961.

One of the most significant features of the transition from deflagration to detonation is the dynamics of wave interactions occurring in the course of the process. Of particular interest is the effect of waves reflected from the closed end. The present study was based on a streak self-light photograph of a stoichiometric hydrogen-oxygen flame accelerating to detonation, and a simultaneous pressure transducer record taken at the closed end of the tube in the vicinity of the source of ignition. The photograph revealed considerable information on the flow field behind the flame, so that with the additional pressure measurement it was possible to deduce specific data on the changes of state in the gas, and the dynamic effects of wave reflections on the initiation of the process. The results were rationalized by means of a gas wave dynamic analysis yielding sufficiently complete wave diagrams of the phenomena to assess their importance with respect to the transition from deflagration to detonation. INITIAL FLAME ACCELERATION IN AN EXPLOSIVE GAS, by A. J. Laderman and A. K. Oppenheim. [1961] [32]p. incl. illus. diagrs. refs. (AFOSR-3524) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)166 and National Aeronautics and Space Administration) AD 420681

Also published in Proc. Royal Soc. (London), v. 268A: 153-180, July 10, 1962.

Pressure waves generated by a flame during the initial phase of its acceleration in a detonation tube filled with a stoichiometric hydrogen + oxygen mixture are studied. The process was observed by

means of streak schlieren photography with simultaneous pressure measurements at several stations in the tube. Experimental records revealed in considerable detail the characteristics of pressure waves and yielded information on the structure of the reaction zone with a noticeable effect of the transition from a wrinkled laminar to a turbulent flame. Marked influence of the mode of ignition (electrical obtained by spark discharge, chemical by pilot flame, and thermal by glow coil) on the process of flame acceleration was demonstrated. It is shown that the generation of pressure waves by the flame can be accounted for by the change in the rate of heat release brought about by the increase in the surface area of the combustion front. The computed acceleration of the flame and the structure of the pressure wave ahead of it were in a satisfactory agreement with experimental observation. (Contractor's abstract)

A COMPARISON BETWEEN LANGMUIR PROBE AND MICROWAVE ELECTRON DENSITY MEASUREMENTS IN AN ARC HEATED LOW DENSITY SUPERSONIC WIND TUNNEL, by L. Talbot, J. E. Katz, and C. L. Brundin. Jan. 27, 1961, 19p. incl. illus. (Rept. no. HE-150-185; series no. 132; issue no. 3) (AFOSR-336) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)502] and Atomic Energy Commission) AD 251634 Unclassified

Abstract presented at meeting of the Amer. Phys. Soc., Mexico City, June 22124, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 369, June 22, 1961.

Also published in Phys. Fluids, v. 6: 559-565, Apr. 1963.

Measurements were made of the electron density in low-density supersonic plasma jet flow by the stagnation point Langmuir probe method and by a microwave interferometric technique. The two methods yielded results in reasonably good agreement. It was also possible to obtain some information on the radial distribution of ionization in the jet from the microwave measurements. An attempt to determine the electron temperature by measurement of the microwave power radiated from the jet was not successful. (Contractor's abstract)

California U. Inst. of Engineering Research, Berkeley.

A NOTE ON THE STAGNATION-POINT LANGMUIR PROBE, by L. Talbot. Dec. 15, 1961, 6p. incl. illus. (Rept. no. HE-150-195; series no. 132; issue no. 4) (AFOSR-1065) (AF 49(638)502) AD 271646 Unclassified

The stagnation-point Langmuir probe theory is presented, valid for supersonic flow with completely frozen but low degree of ionization. It is shown that under certain cold-wall conditions, diffusion and compression within a region of the stagnation point of the boundary layer act to exactly balance one another, with the result that the ion density remains constant throughout this region, and thus the probe characteristic curve exhibits a nearly constant ion saturation limit. (Contractor's abstract)

DIAGNOSTIC STUDIES OF A LOW DENSITY ARC HEATED WIND TUNNEL STREAM, by F. S. Sherman and L. Talbot. [1961] [18]p. incl. diagrs. refs. (AFOSR-1450) (AF 49(638)502) Unclassified

Presented at ARS Internat'l. Hypersonics Conf., Cambridge, Mass., Aug. 16-18, 1961.

Also published in Prog. in Astronaut. and Rocketry, v. 7: 581-598, 1962.

Investigations were made of the local flow properties of an arc heated low density hypersonic argon jet by means of several different probe techniques. These included impact and static pressure probes, free molecular flow and stagnation point heat transfer probes, and a stagnation point Langmuir double probe. Results presented include axial and radial surveys of impact pressure and computed stagnation temperature, and radial surveys of ion density and electron temperature, and electrical conductivity computed from these latter quantities. It is pointed out that interpretation is difficult of measurements with continuum flow probes, such as the stagnation point heat transfer and static pressure probes, because the probes are subject to important viscous effects, and that some of these effects are associated with the relatively unexplored transition flow regime of rarefied gas dynamics. Further development of high temperature free molecular flow probes and of nonaerodynamic methods for flow measurements is desirable. (Contractor's abstract)

309

FUNDAMENTAL ANALYSIS OF VARIOUS DYNAMIC STABILITY PROBLEMS FOR MISSILES, by T. J. Coakley, E. V. Laitone, and W. L. Maas. June 1961, 96p. incl. diagrs. refs. (Series no. 175; issue no. 1) (AFOSR-1019) (AF 49(638)818) AD 259127 Unclassified

A theoretical analysis is made for special cases of the short period and the phugoid or long period oscillations of a non-rolling high speed missile that has a longitudinal plane of symmetry. The linearized equations of

motion with time dependant coefficients are derived for short period oscillations of a hypersonic ballistic missile during rapid acceleration or deceleration. It is also shown that the effect of accelerated motion is strikingly different on either the w, q or α oscillations. An explicit relation is derived that shows that the atmospheric density gradient will produce a large decrease in the period of the phugoid oscillation, and that this effect increases with the velocity until near orbital speeds are approached. A new parameter is found which predicts the altitude at which the aerodynamic oscillations of a re-entry missile will effec- -ly begin. This new parameter allows the development t uni-versal curve which can be used for predicting th. gh altitude oscillations of hypersonic re-entry ballist missiles for the linear pitching moment case. California U. Inst. of Engineering Research, Berkeley.

THE ANGULAR DISTRIBUTION OF SPUTTERED POTASSIUM ATOMS, by R. P. Stein and F. C. Hurlbut. Jan. 15, 1961, 1v. incl. illus. table. (Rept. no. HE-150-170; series no. 20; issue no. 129) (AFOSR-540) (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245) AD 253764 Unclassified

The angular distributions of potassium particles issuing from a potassium surface under bombardment by noble gas ions were observed under moderately good vacuum conditions. Sputtered potassium atoms were detected for incident ion energies above approx 15 ev and useful observations of angular distributions were obtained for incident ion energies in the range 50 to 450 ev for all available values of the incident angle. A means was discovered for the discrimination between the total sputtered flux and that fraction of it possessing particle energies above a certain threshold. The apparatus and experimental procedures are described and the observed distribution patterns and the 2-collision sputtering mechanism is discussed, along with related observations. (Contractor's abstract)

California U. Inst. of Engineering Research, Berkeley.

EXPERIMENTAL DETERMINATION OF PITCHING MOMENT AND DAMPING COEFFICIENTS OF A CONE IN LOW DENSITY, HYPERSONIC FLOW, by W. L. Maas. Oct. 9, 1961 [32]p. incl. illus. diagrs. table. (Rept. no. HE-150-190; series no. 20; issue no. 135) (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245) AD 266787 Unclassified

Values of stability derivatives were determined experimentally for cones with semi-vertex angles of 45° and 9°. The results were compared with theoretical estimates and with other experimental data. The function of angle of attack was found to be positive, indicating negative damping. The influence of viscous effects upon these results is discussed. The experiment was conducted with freely oscillating models in hypersonic, low density flow, and was one of the first dynamic stability tests performed under these flow conditions. The instability is a marked deviation from the ordinary assumption of positive stability and certainly warrants further study and investigation. The cause of the instability remains undetermined; the effects of viscous flow and shedding of vortices is discussed in this connection.

TENSILE BEHAVIOR OF LITHIUM FLUORIDE, by D. B. Hoover and J. Washburn. [1961] [11]p. incl. illus. diagrs. (Technical rept. no. 4; series no. 150; issue no. 4) (AFOSR-436) (AF 49(638)601) AD 254821 Unclassified

Also published in Jour. Appl. Phys., v. 33: 11-14, Jan. 1962.

Two large crystals of LiF were grown by the Czochralski technique. The crystals were annealed for 1 wk at 490°C and cooled at 45°C/hr. Rectangular specimen bars, approximately 1.25-x 0.10 x 0.04-in. were cleaved from these crystals and heated again for 24 hr at 490°C. Further heat treatment tended to remove surface dislocation loops introduced by cleavage and handling of specimens. After polishing, specimens were mounted and tested in tension at about 0.006 in./in./min. Fifteen specimens that were prepared according to the above procedure were compared with 16 into which mobile surface half loops had been introduced. The following conclusions were made: (1) When the number of slip band sources is small, the yield stress is a function of the number of slip bands that are nucleated. (2) When large numbers of sources are present the yield stress is probably close to the min required to move dislocations in the crystal. (3) A slip band on a given [110] $(1\bar{1}0)$ system is a more effective barrier to subsequent growth of intersecting bands on the 4 systems that cut through it at 60° than it is to slip on the 1 other system that cuts through it at 90°. THE THERMODYNAMICS OF SOLID IRON AT ELEVATED TEMPERATURES, by P. D. Anderson and R. Hultgren. [1961] [4]p. incl. tables, refs. (Technical note no. 6; series no. 137; issue no. 6) (AFOSR-4009) (AF 49(638)83) AD 409487 Unclassified

Also published in Trans. Metall. Soc. AIME, v. 224: 842-845, Aug. 1962.

Heat contents of extremely pure iron were measured over the range 300° to 1433°K, using a diphenyl ether calorimeter. Results from 3 samples containing widely differing impurities agreed with one another and with previously reported results at higher temperatures (1184° to 1809°K) by Olette and Ferrier. From these data a table of heat contents of iron has been prepared which is believed to be more accurate than those previously available. Cp values have been derived which are consistent with these heat contents, with the best experimental Cp data, and with the thermodynamic conditions of equilibrium between bcc and fcc iron. The opinion is expressed that low-temperature extrapolations of presently known Cp values for γ-Fe are not reliable. (Contractor's abstract)

A DIGITAL SEISMOGRAPH SYSTEM FOR MEASURING EARTH NOISE, by F. A. Haubrich and H. M. Iyer. [1961] [15]p. incl. diagrs. (AFOSR-1208) (AF 49(638)905) Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 52: 87-94, Jan. 1962.

A digitally recording seismograph station has been installed at La Jolla to record and study earth noise in the frequency range 0.1 to 1 cps. The system is capable of recording 4 channels of information plus time on paper tape at sample rates of up to 3 times/sec with a dynamic range of 90 db. Preliminary analyses of the digital records show that the spectral peak between 0.1 and 0.2 cps exhibits properties consistent with Rayleigh waves arriving from the southwest mixed with isotropic noise. RENORMALIZATION OF MANY-FERMION MOMENTUM-SPACE DISTRIBUTIONS IN HIGHER RANDOM PHASE APPROXIMATIONS, by N. R. Werthamer and H. Suhl. [1961] [5]p. (AFOSR-1696) [AF 49(638)-1038] Unclassified

Presented at meeting of the Amer. Phys. Soc., Los Angeles, Calif., Dec. 27-28, 1961.

Abstract also published in Bull. Amer. Phys. Soc., Series II, v. 6: 520, Dec. 27, 1961.

Also published in Phys. Rev., v. 125: 1402-1406, Feb. 15, 1962.

The approach to the many-fermion problem known as the method of higher random phase approximations (RPA) is given a more rigorous formulation. It is shown that the previous heuristic procedures for evaluation of the second RPA are justified, in that expectation values of plane wave operators with respect to the true ground state may validly be replaced by their values in the unperturbed Fermi state. This property of momentum-space occupation renormalization is conjectured to hold also to higher orders of RPA than the second. (Contractor's abstract)

THEORY OF MAGNETIC RESONANCE IN THE HEAVY RARE EARTH METALS, by B. R. Cooper, R. J. Elliott and others. [1961] 47p. incl. refs. (AFOSR-2103) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1038 and National Science Foundation) AD 284478 Unclassified

Also published in Phys. Rev., v. 127: 57-68, July 1, 1962.

The spin wave spectrum was calculated from a Hamiltonian including anisotropic exchange, axial and hexagonal anisotropy and magnetic fields for the various types of magnetic order which are known to occur in the heavy rare earth metals Tb-Tm. Particular attention is paid to those spin waves which can be excited by radiation. Because of the high anisotropy most resonances will occur in the infrared where they will be difficult to observe. However, those phases which show either ferromagnetic ordering with moments in the hexagonal planes, or spiral configurations of the moments in those planes, should display a microwave resonance when a suitably chosen magnetic field is applied in that plane. In the spiral phases an additional resonance may also be observed. (Contractor's abstract)

DECOUPLING OF BLOCH BANDS IN THE PRESENCE OF HOMOGENEOUS FIELDS, by G. H. Wannier and D. R. Fredkin. [1961] [6]p. (AFOSR-3664) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)1038] and Office of Naval Research) Unclassified

Also published in Phys. Rev., v. 125: 1910-1915, Mar. 15, 1962.

Following up an earlier communication (Phys. Rev., v. 117: 432, 1960), wave functions are then constructed which are valid if a charge moves in a superposition of a periodic electric potential and a uniform magnetic field. The wave functions are not themselves solutions of the Schroedinger equation, but yield the traditional effective Hamiltonian for this problem. Contrary to the electric field case the manifold of states linked by the "band index" does not form a Bloch band; the reason is that the cellular transforms of the Bloch-like functions are modified by the Peierls phase. At present, the derivation of these results is in closed form, but justifiable only "to all powers of the magnetic field." This was also the case for the previous electric derivation. The limitation may not be genuine. It is proved directly that the existence of closed Bloch bands in the presence of a homogeneous electric field; the case of free electrons is given as an example. One expects from this that the new results for the magnetic field are at least in part also independent of the power series method used for their justification. The procedure is then extended to crossed electric and magnetic fields. (Contractor's abstract)

IMPEDANCE MEASUREMENTS IN BRAIN TISSUE OF ANIMALS USING MICROVOLT SIGNALS, by W. R. Adey, R. T. Kado, and J. Didio. [1961] [20]p. incl.

diagrs. refs. (AFOSR-2286) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)686 and Public Health Service under M-3708, B-1883, and M-5763) AD 611482 Unclassified

Also published in Exper. Neurol., v. 5: 47-66, Jan. 1962.

A technique is described for measurement of cerebral impedance with signals in the tissues of 1 to 20 μv amplitude, and having a current density of the order of 10^{-13} amp/μ^2 of electrode surface at 1000 c/sec. The system will resolve a 1%-shift in resistive impedance, and is limited in sensitivity only by the input noise of the differential amplifier. Using chronically implanted coaxial electrodes in the cat for both EEG and impedance measurements, certain clear and consistent changes in impedance were observed, particularly in the dendritic layer of hippocampal pyramidal cells and in the septum, in response to somatic, olfactory, visual, and auditory stimuli, and to changing physiological states of consciousness, as well as drug-induced changes during barbiturate anesthesia and the effects of hallucinogenic agents. Certain repeatable changes were also observed during hippocampal seizures. Physiological peripheral stimuli all produced a transient decrease in impedance in the hippocampal dendritic layer. Arousal from normal sleep was also followed by a baseline shift towards a lower impedance. Waning of consciousness was accompanied by a return to a higher level. Normal sleep was accompanied by trains of very regular sinusoidal waves in the septum at about 3 c/min. During Nembutal anesthesia, there was a marked increase in impedance in hippocampal dendritic layers, and a return to pre-drug levels with recovery of consciousness. A psychotomimetic cyclohexamine drug produced a converse series of changes. Seizures induced in the hippocampus by septal stimulation were accompanied by small rapid perturbations in impedance, and followed by rhythmic impedance changes at about 1 c/sec, occurring on a rising impedance baseline. Differences were noted between impedance changes in the initial seizure episodes and those occurring from identical stimulation 10 days later. The possible relationship of these impedance changes to ionic shifts and volume changes between neuronal elements (or both) and glial tissue, and the extracellular space is discussed, with reference to a possible modulating influence by glial tissue on electronic phenomena in dendrites. EEG RECORDS FROM CORTICAL AND DEEP BRAIN STRUCTURES DURING CENTRIFUGAL AND VIBRATIONAL ACCELERATIONS IN CATS AND MONKEYS, by W. R. Adey, J. D. French and others. [1960] [7]p. incl. illus. diagrs. refs. (AFOSR-2287) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)686 and Public Health Service under B-1883, B-485, and B-611) Unclassified

Presented at Thirteenth annual conf. on Electrical Techniques in Med. and Biol., Washington, D. C., Oct. 31-Nov. 2, 1960.

Also published in I. R. E. Trans. on Bio-Med. Electronics, v. BME-8: 182-188, July 1961.

Electroencephalographic records have been taken from deep regions of the brains of cats and monkeys with chronically implanted electrodes during centrifugal and shaking accelerations comparable to booster forces. Histological and x-ray controls have indicated that displacement of the electrodes does not occur, and that damage to brain tissue is comparable with nonaccelerated animals. A transistorized EEG amplifier suitable for recording in satellite biopack environments has been developed. In centrifuge tests, transverse accelerations up to 8 g were associated with rhythmic "arousal" patterns of slow waves in hippocampal regions of the temporal lobe during increasing or decreasing acceleration. Longitudinal accelerations between 5 and 6 g produced blackouts after 30 to 40 sec, with flattening of EEG records, and frequently with induction of epileptic seizure activity in temporal-lobe leads. Shaking tests suggested that vibrational acceleration may be associated with the intermittent "driving" of the cerebral rhythms, in a fashion resembling photic driving, at shaking rates from 11 to 15 cps, and from 22 to 30 cps. COMPUTER TECHNIQUES IN CORRELATION AND SPECTRAL ANALYSES OF CEREBRAL SLOW WAVES DURING DISCRIMINATIVE BEHAVIOR, by W. R. Adey, D. O. Walter, and C. E. Hendrix. [1961] [24]p. incl. diagrs. refs. (AFOSR-2289) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)686 and Public Health Service under B-1883, B-610, and B-811) Unclassified

Also published in Exper. Neurol., v. 3: 501-524, June 1961.

Data reducing and computing techniques have been applied to EEG records taken during training from 5 cats with implanted electrodes and having records typical of 75 other implanted animals. Implanted electrodes were placed in dorsal and ventral parts of the hippocampal arch, the adjacent entorhinal cortex, and in subcortical areas, including subthalamus, and mesencephalic reticular formation, and in visual and sensorimotor cortex. Animals were trained in T-maze approach and in delayed response tests, both to food rewards. EEG records were manually digitized for presentation to a digital computer (IBM 709) Inherent rhythmicity of hippocampal records was examined in auto-correlations in "waiting" records prior to approach performance, and during approach. Pre-approach records showed a wide spectrum, with a 3 or 4 c/sec dominant frequency. Approach records showed a dominant frequency in a narrow range at 6 c/sec. Cross-correlations of approach records from different parts of the hippocampal arch in the

fully trained animal showed a highly consistent phase pattern in different correct trials on the same day, and on different days. By contrast, incorrect responses were characterized by a markedly different pattern, which was consistent for the incorrect responses on different days. Lability of frequencies in extrahippocampal slow-wave bursts during approach minimized the value of simple cross-correlation analysis. More comprehensive cross-spectral analysis has been initiated and represents an innovation in EEG data analysis. It has confirmed phase pattern shifts between records of correct and incorrect responses. The possible role of wave processes in cerebral systems in integration and transfer of information is discussed. (Contractor's abstract)

Also published in Amer. Jour. Surgery, v. 100: 354-357, Aug. 1960.

Experiments were performed on 19 cats and 5 monkeys anesthetized with either sodium pentothal or ether. It was demonstrated clearly that cardiac arrest was the result of a striking increase in the excitability of the cardiac reflex which occurred at a specific depth of anesthesia. This reflex hyperexcitability in turn correlated precisely with a change in reactivity of the reticular formation, signaled by the appearance within it of a long latency evoked response. It may be presumed, therefore, that the reflex hyperexcitability leading to cardiac arrest was central in origin and indicated a drug-induced distortion of visceral reflex control normally mediated by the reticular formation.

Also published in Jour. Compar. and Physiol. Psychol., v. 55: 633-640, 1962.

Two macaque monkeys, 1 rhesus and 1 cynomolgus, were raised, from 3 wk of age for 1 yr, in an environment isolated from patterned auditory stimulation by white noise and deprived of light except for 1 hr of unpatterned light stimulation each day. The activity of the 2 monkeys was continuously monitored by a stabilimeter system. Analysis of the records revealed intrinsic diurnal activity cycles which were anchored to the period of light stimulation and shifted position on an absolute time scale when the light-stimulation period was shifted. Dropping of feeding periods or shifting the feeding schedule had no such effect on the activity cycle. With each shift in the light schedule a transition period of 3 to 5 wk was required before the activity cycle stabilized in a new location relative to the light. (Contractor's abstract)

AD 420288 Unclassified

Also published in A.M.A. Arch. Neurol., v. 6: 194-207, Mar. 1962.

Trains of slow waves appearing in discriminative motor activity in T-maze training and in a delayed-response situation were examined in cats with chronically implanted electrodes. Regular 6 c/sec activity appeared in hippocampal structures during the approach performance and was accompanied by similar bursts of slow waves in diencephalic areas, including subthalamus and midbrain reticular substance, and in the sensorimotor area of the cerebral cortex. Successive electrocoagulation of the subthalamic zones produced temporary alterations in discriminative performance. During the period of impaired performance, there was a loss of normal slow-wave patterns, which returned with recovery of behavioral discriminative capacity. These subthalamic lesions produced a loss of awareness of the opposite half of the environment resembling in many ways the defects recently described following midbrain lesions. The study suggests that such defects may arise from lesions over a considerable rostrocaudal extent of midbrain and diencephalon, and relate particularly to interference with normal interrelationships between rhinencephalic structures and subcortical regions.

EEG STUDIES OF HIPPOCAMPAL SYSTEM IN THE LEARNING PROCESS, by W. R. Adey. [1961] [22]p. incl. illus. diagrs. refs. (AFOSR-J1063) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)686 and Public Health Service under B-1883) Unclassified

Also published in Physiologie de L'Hippocampe: Colloques Internationaux du Centre National de la Recherche Scientifique, Montpellier (France)(Aug. 24-26, 1961), Paris, Centre National de la Recherche Scientifique, No. 7: 203-224, 1962.

Patterns of slow wave activity in the hippocampal system of cats and monkeys in the course of learning certain discriminative motor performances were studied. Certain very regular trains of waves at approximately 6 c/sec appeared in dorsal hippocampal areas and in entorhinal cortex during the approach to the food reward. Extinction of the response led to disappearance of this regular wave train. Its appearance in these structures was singularly unadapting throughout the training period, and it occurred equally in correct and incorrect performances. Administration of psychotomimetic and hallucinogenic cyclohexamine drugs abolished all regular slow wave activity in hippocampal structures and loss of learned behavioral performance coincided with disruption of hippocampal and entorhinal 6 c/sec bursts of slow waves during the approach. Rhythmic slow wave discharges were noted in extra-hippocampal structures, including subthalamus, rostral midbrain reticular formation and primary visual and somatic cortical areas. They were most clearly phase-locked to the hippocampal discharges only at onset. Small subthalamic lesions produced major changes in EEG records during the learned discrimination. There was a temporary loss of awareness of the opposite half of the environment. EEG records showed a virtual disappearance of rhythmic hippocampal discharges, and concurrent slow wave train in midbrain reticular formation and visual cortex were much reduced. Computer studies indicated high consistency in phase patterns within the hippocampal system and the occurrence of shifts in these patterns from untrained to trained states in the same animal. In the fully trained animal, there were consistent differences in phase patterns between correct and incorrect responses. (Contractor's abstract)

USE OF CORRELATION ANALYSIS IN EEG STUDIES OF CONDITIONING, by W. R. Adey. [1960] [5]p. incl. diagrs. (AFOSR-J1064) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)686 and Public Health Service under B-1883 and B-611) AD 420296 Unclassified

Presented at Conf. on Computer Techniques in EEG Analysis, California U., Los Angeles, Oct. 29-30, 1960.

Also published in Electroencephalog. and Clin Neurophysiol., Suppl. 20: 41-45, 1961.

An IBM 709 computer has been used to study auto- and crosscorrelation functions in EEG records in cats during training. The studies have been directed at the patterns of slow wave activity in both cortical and subcortical structures during acquisition of conditioned reflexes. They have been conducted exclusively in animals in training in a series of discriminative performances for food rewards. Autocorrelations of hippocampal and entorhinal records during the intertrial periods in T-maze testing, and in the delay period of delayed response testing, have indicated a strong periodicity at 3-4 c/sec. By contrast, autocorrelations during the approach period were almost sinusoidal, with a dominant frequency at 5.5-6.5 c/sec. The studies have indicated that the frequency of the "approach burst" remains unchanged from early to late training, over a period of many weeks. Crosscorrelations of records from different parts of the hippocampal arch and from the adjacent entorhinal area showed a high consistency of phase patterns in early training. In the same animal, crosscorrelations in late training showed an entirely converse phase pattern. Cross-spectra analyses revealed a striking difference between correct and incorrect responses in a fully trained animal. Correct responses consistently showed a hippocampal-entorhinal phase difference of 20-30° over a spectrum from 2-20 c/sec, whereas in incorrect responses a sharp reversal of phase pattern occurred at 5 c/sec.

NEUROPHYSIOLOGICAL ASPECTS OF SPACE FLIGHT, by W. D. Winters, R. T. Kado, and W. R. Adey. [1961] [30]p. incl. illus. diagrs. refs. (AFOSR-J1066) (AF 49(638)686) AD 420298 Unclassified

Presented at Symposium on Manned Lunar Flight, Denver, Colo., Dec. 29, 1961.

Also published in Advances in Astronaut. Sci., v. 10: 181-209, Dec. 1961.

The results of studies simulating a 14-day lunar flight indicate that a fully restrained monkey can survive and perform adequately during this period. The EEG patterns during simulated launch and reentry centrifuge profiles as well as during the period of restraint were not altered. LSD-25 studies reveal that drug-induced seizures occur at lower doses when administered to animals in a relatively sensory-deprived environment. Furthermore, the appearance of this seizure activity may alter the animal's performance. It is apparent from these studies that EEG evidence of seizure activity is seen during periods of high acceleration associated with cerebral anoxia. During this time the animals are incapable of performing learned discriminative tasks. During the periods of frequency locking noted in the vibration studies, the same type of behavior disorganization would be expected.

A TRANSISTORIZED PREAMPLIFIER FOR FIELD

STUDY OF EEG, by R. T. Kado and W. R. Adey. [1961] [1]p. (AFOSR-J1067) (AF 49(638)686)
AD 419571 Unclassified

Also published in Digest Fourth Internat'l. Conf. on Medical Electronics, New York (July 1961), Conf. Committee for Publication, 1961, p. 172.

A differential input preamplifier is described which has been designed and constructed to operate under severe physical stresses. The major design considerations were the need for a mechanically sound structure, low noise characteristics, high input impedance, and a high voltage gain. Structural rigidity, compactness, and some temperature stability were obtained by assembling the amplifier in and around a magnesium core suitably drilled for the various component parts. The transistors and coupling capacitors were mounted in the core. After assembly and testing, the amplifier was encapsulated in a high impact epoxy resin using vacuum techniques to form a solid unit which is shock resistant. Physically the complete amplifier is 6" long by 1-3/4" deep by 7/8" wide and weighs 8 oz. The amplifier has successfully withstood vibration testing from 5-2000 c/sec over 30 min periods in all 3 planes and 25 g peak accelerations at resonance.

BRAIN FUNCTION. [VOL. I.] CORTICAL EXCITABILITY AND STEADY POTENTIALS; RELATIONS OF BASIC RESEARCH TO SPACE BIOLOGY; PROCEEDINGS OF THE FIRST CONFERENCE, Los Angeles, Calif., 1961, ed. by M. A. B. Brazier. Berkeley and Los Angeles, California U. Press, 1963, 394p. incl. illus. diagrs. tables, refs. (UCLA Forum in Medical Sciences no. 1) (AFOSR-65-1496) (AF 49-(638)948) Unclassified

The UCLA Forum in Medical Sciences was created to review, synthesize, and analyze topics,from various areas of biology, chemistry, and physics, to applied medical arts. The present volume deals with the factors and mechanisms maintaining and controlling the excitability of the brain, with particular reference to the physiological role of steady potentials. The topics discussed include: synaptic organization, metabolic changes in the cortex during excitation and depression, changes in cortical potentials in learning, in wakefulness and sleep, and in seizures, and finally, the relation of basic neurological research to space science.

ANALYSIS AND STANDARDIZATION OF ASTRODYNAMIC CONSTANTS, by M. W. Makemson, R. M. L. Baker, Jr., and G. B. Westrom. [1960] [20]p. incl. tables, refs. (Astrodynamical rept. no. 12) (AFOSR-128) (AF 49(638)498) AD 263782 Unclassified

Presented at Seventh annual meeting of the Amer. Astronaut. Soc., Dallas, Tex., Jan. 16-18, 1961.

Also published in Jour. Astronaut. Sci., v. 8: 1-13, 1961.

Also published in Advances in Astronaut. Sci., v. 8: 274-293, 1961.

Physical astronomical constants are among the most precisely known constants in nature. With the advent of astronautics, however, an even higher degree of precision is required and additional constants, not normally associated with astronomy, must be included. In this paper, the constants associated with astronautics are called "astrodynamic constants." These constants are analyzed and an effort is made to standardize them. The astrodynamic constants are classified into heliocentric, geocentric, selenocentric, planetocentric, and atmospheric constants. (Contractor's abstract)

The review surveys eight subdivisions within astrodynamics: geometry, coordinate systems and ephemerides; astrodynamic constants (including heliocentric, genocentric, lunar and planetary, and atmospheric constants); orbit determination; orbit perturbations (gravitational and non-gravitational); orbit prediction (using both special and general perturbation techniques); applications (orbit selection and optimization, low thrust orbits, geocentric orbits, lunar, planetary and interplanetary orbits); observation theory; and attitude dynamics. Each subdivision is introduced and a number of the outstanding research papers in each area are mentioned. Specifically, an effort is made to delineate voids in our knowledge and to point up areas of profitable future research in astrodynamics.

THE CRYSTAL AND MOLECULAR STRUCTURES OF [3, 3]PARACYCLOPHANE AND RELATED SUBSTANCES (Abstract), by P. K. Gantzel, C. L. Coulter, and K. N. Trueblood. [1960] [2]p. incl. diagr. (AFOSR-TN-60-605) (AF 49(638)719) Unclassified

Presented at Fifth Internat'l. Cong. of Crystallography, Cambridge (Gt. Brit.), Aug. 15-24, 1960.

Also published in Acta Cryst., v. 13: 1042-1043, Dec. 10, 1960.

The structure of [3, 3]paracyclophane has been determined. This compound forms crystals of space group $P2_1/n$, with a = 9.715 ± 0.01, b = 8.138 ± 0.01, c = 8.524 ± 0.01A, β = 90.69 ± 0.03°, z = 2. Since the molecules are centrosymmetric and are of approximately known shape, only 2 vectors are needed to locate either of the 9 carbon atoms in the asymmetric unit. An observed Fourier map revealed the position of the ninth carbon atom. After least-squares refinement, a difference synthesis indicated reasonable positions for all hydrogens. If the 15 intensities are omitted, R is 8.2%. The intramolecular non-bonded distances between the rings are (a) 3.29 and (b) 3.13A. The benzene rings are displaced parallel to one another, are folded slightly about an axis parallel to the long direction of the molecule, and are bowed 6.4° at each end. The average values of the angles within the aromatic rings are 116.8 ± 0.4° at the atoms to which the methylene bridges are joined and 121.3 ± 0.4 at the other 4 atoms. Before corrections for thermal vibration, the average aromatic C-C bond angle distance is 1.386 ± 0.004 A, the average single bond distances are 1.506 and 1.530 ± 0.005 A. The bond angles in the bridges are α, 113.5; β, 117.2; and γ, 115.8. The corresponding dihedral angles are 65° and 70°. A detailed comparison is made of the geometries of these different molecules, and in particular of the distortions in both the aromatic rings and the aliphatic bridges.

DISSOCIATION OF HALOGENS IN SHOCK WAVES, by H. Hiraoka and R. Hardwick. [1961] [6]p. incl. diagrs. tables. (AFOSR-1790) [AF 49(638)733] Unclassified

Presented at Second AFOSR Contractor's meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech. Armour Research Foundation, Sept. 11-12, 1961. (AFOSR-1417; AD 265513)

Also published in Jour. Chem. Phys., v. 36: 1715-1720, Apr. 1962.

The rate of dissociation of Cl_2 has been measured at high temperatures in a shock tube. The temperature dependence curves, regardless of Cl_2 concentration, are fitted by invoking 4° of freedom of internal motion and an activation energy of 48 kcal. From the temperature T_H at which the decrease of Cl_2 optical density through dissociation matches the increase due to the cooling, by reaction enthalpy, the dissociation energy of Cl_2 has been calculated. The agreement with the well-known spectroscopic value gives a confirmation of the shock-tube temperature measurements and of many assumptions made in the other calculations. (Contractor's abstract)

The thermal decomposition of NO_2Cl in Ar and in O_2 as well as that of pure NO_2Cl was studied from 600° to 1000°K at concentrations of 0.001 to 0.01 mol/l using a shock wave technique. In general, the

results are compatible with earlier, low temperature measurements. The activation energy for pure NO_2Cl decomposition is about 2.5 kcals/mol less than that for $NO_2Cl + Ar$ or $NO_2Cl + O_2$. This is compared to the drop in activation energy calculated from the differences in energy transfer efficiency assuming deactivation on every collision. (Contractor's abstract)

ISOTOPE SIZE EFFECT IN VAN DER WAALS RADII AND THE BARRIER TO ROTATION AROUND THE CARBON-CARBON SINGLE BOND, by W. F. Libby. [1961] [1]p. (AFOSR-562) (AF 49(638)901) Unclassified

Also published in Jour. Chem. Phys., v. 35: 1527, Oct. 1961.

The isotope size effect is used to investigate the 2.85 kcal/mol barrier to internal rotation in ethane, and to check the possibility of using isotopic substitution to prove whether the extra stability of the staggered form is due to repulsive interference of the hydrogen atoms in the eclipsed state. It is concluded that the lack of sensitivity of the barrier height to isotopic substitution is a strong argument that steric repulsion between hydrogens is not the principal cause of the barrier to hindered rotation.

TRITIUM GEOPHYSICS, by W. F. Libby. [1961] [16]p. incl. diagrs. tables, refs. (AFOSR-2162) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)901, California U. Research Committee, and California U. Water Resources Center) Unclassified

Also published in Jour. Geophys. Research, v. 66: 3767-3782, Nov. 1961.

Rainfall from the northern and southern hemispheres has been analyzed for tritium. During the spring, summer, and early fall of 1959, in the northern hemisphere there was a peak in tritium fallout which was proportional to the peak in Sr^{90} fallout, whereas in the southern hemisphere there was no appreciable increase in either the tritium or the Sr^{90} fallout. It seems clear, therefore, that the peak in the northern hemisphere was due to the Russian nuclear bomb tests of October 1958, which injected large amounts of tritium and Sr^{90} into the stratosphere. The proportionality of the two fallout curves suggests that single molecules of water and fine particulate matter have the same residence time in the stratosphere and that the mixing of the stratospheric air with tropospheric air followed by rainfall scavenging must be the mechanism for removal of both from the atmosphere. The general rise in the tritium level due to hydrogen-bomb explosions was found to be proportional to the total energy release, even though the bombs were fired under a variety of conditions. Therefore, rain and ground-water data can be interpolated and extrapolated so as to supply values for the tritium levels where samples were not collected and measured.

INDUSTRIAL USES OF ISOTOPES, by W. F. Libby. [1961] [23]p. incl. tables, refs. (AFOSR-3288) (AF 49(638)901) Unclassified

Also published in Ann. Rev. Nuclear Sci., v. 11: 461-483, 1961.

In the first section of this paper, the uses in industry which exist because isotopes are chemically identical, or nearly identical, with the ordinary nuclides constituting the main part of the element, are discussed. These include their applications to the study of nutrition of farm animals, milk producing in grazing animals, and estimating lean meat content in live animals. Uses of radioactive isotopes that do not take advantage of the fact that the isotopes have the same chemical characteristics as the nonradioactive partner nuclides in the element include their use as radioactive nonisotopic tracers; i.e., in attrition studies, and as radiation sources for gauging. Probably the most important is the beta thickness gauge. The principal present industrial uses of isotopic radiation are plant mutations for production of superior crop plants, pest control, and power sources. Potential new applications to food preservation are also discussed, as well as limitations on isotope uses which public health requires.

STRESS FIELD IN POLYCRYSTALLINE METALS AT INITIAL STAGE OF PLASTIC DEFORMATION, by T. H. Lin, S. Uchiyama and others. Jan. 1961, 68p. incl. diagrs. refs. (Rept. no. 61-6) (AFOSR-530) (AF 49(638)20) AD 259282 Unclassified

The stress fields caused by the following cases are analytically computed: (1) uniform slip in a cubical crystal at the interior of the aggregate; (2) non-uniform slip in a cubical crystal in the interior; (3) non-uniform slip in 2 closeby crystals in the interior, and (4) uniform slip in a crystal at the surface of the aggregate. In cases (1) and (4), the critical shear stress in the sliding crystal is uniform but the resolved shear stress is not. These 2 cases computed give stress fields caused by inclusions uniformly transformed in shape and give approximate stress fields for sliding work-hardening crystals in an aggregate. In cases (2) and (3), the resolved shear stresses in the slipped region equal to its critical shear stresses and these 2 cases give the stress fields caused by sliding work-hardening crystals in the aggregate.

ROTATION OF CRYSTALS UNDER AXIAL STRAIN, by T. H. Lin and B. Lieb. [1961] [15]p. incl. diagrs. (AFOSR-3593) (AF 49(638)20) Unclassified

Also published in Jour. Mech. and Phys. Solids, v. 10: 65-72, Jan. 1962.

Deformation texture of a polycrystalline aluminum under compression is calculated with the assumption that individual crystals suffer the same strain as the aggregate. The sequence of active slip systems is calculated with the consideration of elastic strain. The most slipped system is taken to be least hardened. Latent systems on active planes are assumed to be less hardened than those on latent planes. The active slip systems, the rotation vector, and the orientation of a crystal at any stage of loading are calculated at 1% successive incremental strains. The distribution of preferred orientations at 30% compression is shown. It has been found that crystals of a range of orientations slide and rotate toward a common end orientation ($\theta = 84.9°$, $\Phi = 28.0°$). (Contractor's abstract)

STRESS FIELD IN METALS AT INITIAL STAGE OF PLASTIC DEFORMATION, by T. H. Lin, S. Uchiyama, and D. Martin. [1961] [10]p. incl. diagrs. refs. (AFOSR-3629) (AF 49(638)20) Unclassified

Also published in Jour. Mech. and Phys. Solids, v. 9: 200-209, July 1961.

The initial stage of plastic deformation of a fine grained aggregate with slip occurring only in the most favorably oriented crystals is studied. The elastic modulus of the individual crystals is taken to be isotropic. The sliding crystals are assumed to be cubical in shape and located at the interior of the aggregate. Work-hardening in the sliding crystal is considered. The analogy of plastic strain gradient and body force in producing stress field in an elastic medium is developed. This analogy is applied to calculate the slip and stress fields caused by (1) one sliding crystal and (2) two sliding crystals spaced at a clear distance of half the crystal width. This shows the interaction effect of slips in two nearby crystals. From these stress fields, the residual stress may be easily obtained and the Bauschinger effect is clearly shown.

OPTIMUM NONLINEAR BANG-BANG CONTROL SYSTEMS WITH COMPLEX ROOTS. I. SYSTEM SYNTHESIS, by P. Chandaket and C. T. Leondes. [1960] [12]p. incl. diagrs. (AF 49(638)438) Unclassified

Published in Trans. Amer. Inst. Elec. Engineers, v. 80 (Pt. II): 82-95, May 1961.

The optimum switching criterion for second-order predictor control systems with complex characteristic roots are derived. Though the derivation is rather lengthy, the final result of the optimum switching boundary is reduced to a pattern where it can be determined easily by using an electronic analog computer. Due to the practical difficulty of mechanizing the nonlinear controller which is required in this off-on type servosystem, a compromise switching boundary which was examined in an analog computer study is suggested. The compromise switching boundary is composed of only the zero-loop boundary (Γ_p and Γ_n) of the optimum system and the rest of this boundary extends along the error axis. The analog study of a second-order system of this type is presented wherein the approximate switching boundary is used in a system with the damping ratio 0.2. The system time response to step, ramp, and sinusoidal input are recorded. The results obtained are satisfactory.

OPTIMUM NONLINEAR BANG-BANG CONTROL SYSTEMS WITH COMPLEX ROOTS. II. ANALYTICAL STUDIES, by P. Chandaket, C. T. Leondes, and E. C. Deland. [1960] [7]p. incl. diagrs. (AF 49-(638)438) Unclassified

Published in Trans. Amer. Inst. Elec. Engineers, v. 80 (Pt. II): 95-101, May 1961.

The scope and utility of the synthesis described in part I of this paper are verified by analytical studies of the dynamic response capabilities of the systems. The results of the analog studies indicate that the error response of a system using the compromise switching boundary is slightly slower than that of the optimum system. The compromise optimum system is nevertheless nearly as fast as the optimum system, which results in the conclusion that the compromise optimum nonlinear control system can be used effectively, particularly since in many cases system error may be expected to be maintained at a small value.

SYNTHESIS OF QUASI-STATIONARY OPTIMUM NONLINEAR CONTROL SYSTEMS. PART I. SYNTHESIS CONSIDERATIONS, by P. Chandaket and C. T. Leondes. [1960] [7]p. incl. diagrs. (AF 49(638)438) Unclassified

Published in Trans. Amer. Inst. Elec. Engineers, v. 80 (Pt. II): 313-319, Jan. 1962.

Synthesis techniques are developed for optimum nonlinear control systems of the quasi-stationary class wherein the controller configuration depends on a knowledge of certain information about the input to the system. In this manner the range of inputs for which the system is optimum has been significantly extended. The synthesis techniques have been developed in detail for second- and third-order systems, but the techniques are directly extendable to higher-order systems.

SYNTHESIS OF QUASI-STATIONARY OPTIMUM NONLINEAR CONTROL SYSTEMS. PART II. EXTENSIONS IN MECHANIZATION CONCEPTS, by P. Chandaket and C. T. Leondes. [1960] [6]p. incl. diagrs. (AF 49(638)438) Unclassified

Published in Trans. Amer. Inst. Elec. Engineers, v. 80 (Pt. II): 319-325, Jan. 1962.

Optimum "bang-bang" or relay-type control systems for which the plant or controlled system is described by a linear differential equation of higher order than the second, present a practical mechanization problem in that function generators of high order are required in realizing the system. Such function generators are fairly complicated and expensive. This paper presents techniques which permit realization of the optimum system but which require only single-variable function generators.

ON THE APPLICATION OF LYAPUNOV'S SECOND METHOD TO THE SYNTHESIS OF NONLINEAR CONTROL SYSTEMS, by A. Stubberud, C. T. Leondes, and M. Margolis. Jan. 1961, 11p. incl. illus. (Rept. no. 61-3) (AFOSR-218) (AF 49(638)438) AD 252814; PB 155308 Unclassified

Presented at Western Electronic Show and Convention, San Francisco, Calif., Aug. 1961.

An approach to the design of nonlinear compensation networks is presented. The design procedure is based on Lyapunov's second method, a method of examining the stability of a set of differential equations. A Lyapunov function is formed for the control system under question, and this function is then manipulated to minimize the system settling time. A method for generating Lyapunov functions for a particular class of feedback control systems is discussed. Some examples of the design procedure are presented. The chief merits of the design procedure are: (1) the nonlinear system which is determined will not introduce instability into the system; and (2) the nonlinear differential equations of the system need not be solved; thus eliminating many of the computational difficulties associated with nonlinear design. ON THE OPTIMUM SYNTHESIS OF RANDOM SAMPLING MULTIPOLE FILTERS WITH STATIONARY INPUTS, by H. C. Hsieh. Feb. 1961, 39p. incl. diagrs. (Rept. no. 61-8) (AFOSR-569) (AF 49(638)-438) AD 257318 Unclassified

Also published in Trans. Amer. Inst. Elec. Engineers, v. 80 (Pt. II): 239-247, Nov. 1961.

The synthesis of multipole filter whose inputs are stationary stochastic processes and are randomly sampled is considered. Each input will consist of signal and noise. The sampling process of each input is described by probability density functions of various orders and is assumed to be statistically independent from those of the others and also from the input processes. The system under investigation is linear and time invariant. The power spectral densities of inputs before sampling are assumed to be rational functions in s. In case the spectral densities after sampling are not rational functions in s, they have to be approximated by this type of function. Since the signals usually have power concentrated in low frequencies, appropriate approximants for these non-rational functions will introduce negligible error in designing.

SYNTHESIS OF SHAPING FILTERS FOR NONSTATIONARY STOCHASTIC PROCESSES AND THEIR USES, by E. [B.] Stear. Aug. 1961 [67]p. incl. diagrs. refs. (Rept. no. 61-50) (AFOSR-2036) (AF 49(638)-438) AD 274207 Unclassified

This study considers the problem (usually called the shaping filter problem) of synthesizing linear systems whose responses to white noise input processes and appropriate sets of random initial conditions will be stochastic processes whose covariance functions are prescribed functions of 2 variables. Exact solutions to the shaping filter problem are presented for certain special cases and some discussion of predictability of the processes is presented. Attention is then focused on the general problem and by means of the Schauder fixed point theorem and by Picard's method of successive approximations the existence of physically realizable shaping filter is established for a large class of separable covariance functions. The question of the uniqueness of the shaping filter and its relationship to the covariance matrix of the set of random initial conditions is investigated. It is shown that if an appropriate set of random initial conditions is specified, then the weighting function of the shaping filter is unique up to a multiplicative factor of ± 1. The further requirements on the covariance function in order to guarantee that the shaping filter can be characterized by a finite-order, linear differential equation with continuous coefficients are given, as well as certain lesser requirements which permit easy analog simulation. A STATISTICAL MEASURE OF THE EFFECTIVENESS OF ADAPTATION IN CONTROL SYSTEMS, by R. A. Nesbit. [1961] [7]p. incl. diagrs. refs. (AFOSR-4222) (AF 49(638)438) Unclassified

Presented at I. R. E. Internat'l. Convention, New York, Mar. 20-23, 1961.

Also published in I. R. E. Internat'l. Convention Record, Pt. 4: 18-24, 1961.

A statistical measure of the effectiveness of adaptive variation of one or more control parameters is developed in terms of the environmental parameter's distribution. This measure allows the evaluation and comparison of different types of control systems and is applicable to linear and nonlinear systems with one or many control variables. The concept of ideal adaptive control with respect to a particular control parameter is defined, and the definition used to compare a given control system with the ideal adaptive system. The comparison shows where adaptive control is not needed as well as where it is desirable. System reliability is easily incorporated in the comparison. The technique is applied to a simple control system to demonstrate the different types of parameter variations and their effect on the value of an adaptive controller. (Contractor's abstract)

SOME PROPERTIES OF OPTIMAL SPACING IN POLYNOMIAL ESTIMATION, by P. G. Hoel. [1961] [8]p. (AFOSR-3037)[AF AFOSR-60-24] Unclassified

Also published in Ann. Inst. Stat. Math. (Tokyo), v. 13: 1-8, 1961.

In the usual model of linear regression with uncorrelated random variables of equal variance and with regression function $\theta' f(x) = \Sigma_1^k \theta_i f_i(x)$, $x \in X$, suppose, as is the case for univariate polynomial regression, that a design D* which (approx, neglecting concern about fractional observations) minimizes the generalized variance can be obtained using only k values of the independent variable x. (It follows that D* takes equal numbers of observations at these values). Under this assumption the author proves that, for $1 \leq L \leq k$, this same D* minimizes the max over $x_1, \cdots x_L \in X$ of the generalized variance of the estimates of $\theta' f(x_i)$, $i = 1, \cdots, L$ (using also, the reviewer believes, the assumption that k points suffice for the latter problem, which they do in the polynomial case). In the polynomial ca.., D* is also optimum for estimating $d\,\theta' f(x)/dx$ at any number of points. (Math. Rev. abstract, in part)

SIMPLE REALISTIC TREATMENT OF NUCLEAR DIRECT-INTERACTION PROCESSES, by I. E. McCarthy and D. L. Pursey. [1960] [13]p. incl. diagrs. refs. (Sponsored jointly by Air Force [Office of Scientific Research under AF 49(638)717] and National Science Foundation) Unclassified

Published in Phys. Rev., v. 122: 578-590, Apr. 15, 1961.

Physical arguments are used to predict qualitatively the effect on direct-interaction differential cross sections of the distortion of the wave functions of the scattered particle. These qualitative predictions are confirmed by calculations using a simple but fairly realistic model for the wave function distortion in (α, α') scattering. The model used is based on examination of the properties of optical model wave functions. Good fits to experimental data are found using the model for (α, α') scattering in the energy range 20-40 mev for scattering angles less than 90°. Features of direct-interaction processes involving nucleons are interpreted in terms of a focus in the optical model wave functions for these particles, but detailed calculations are not presented. OPTICAL-MODEL ANALYSIS OF ELASTIC SCATTERING OF PROTONS ON CARBON AT INTERMEDIATE ENERGIES, by J. S. Nodvik, C. B. Duke, and M. A. Melkanoff. [1961] [13]p. incl. diagrs. tables, refs. (AFOSR-1344) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)717], Atomic Energy Commission, and National Science Foundation) Unclassified

Also published in Phys. Rev., v. 125: 975-987, Feb. 1, 1962.

Differential cross sections and polarizations for the elastic scattering of protons by carbon at energies between 7 and 20 mev have been analyzed according to the diffuse-surface optical model of the nucleus. The model parameters were varied systematically, the best fits to the experimental data being determined by a method of least squares. Various forms of the absorptive part of the potential were investigated, although the main part of the analysis was carried out with a surface-plus-volume absorption potential. It was found that the model could not account satisfactorily for the data below about 12 mev, and the presentation of results is limited to the region $11.85 \text{ mev} \leq E_{lab} \geq 19.4 \text{ mev}$. Excellent fits can be obtained over the latter region with generally reasonable values of the model parameters, although some features of their behavior as a function of energy remain to be explained. The most striking feature of the results is the thin absorptive shell and small volume absorption which characterizes the potential. Although the predicted reaction cross sections appear generally too low, the experimental data are not sufficiently precise to warrant drawing a definite conclusion. (Contractor's abstract)

THE STRONG COUPLING IN A SPACE WITH TORSION, by R. Finkelstein and W. Ramsay. [1961] [25]p. (AFOSR-1552) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)717] and National Science Foundation) Unclassified

Also published in Ann. Phys., v. 17: 379-403, Mar. 1962.

A generally covariant field theory, characterized by an asymmetric metric, an asymmetric connection, and an arbitrary gauge group is investigated as a possible formal basis for the experimentally observed strong couplings. Transposition invariance is put

into correspondence with TCP invariance. The parts of the connection irreducible under both coordinate and gauge groups are identified with the independent boson fields. Representations of the strong and electromagnetic couplings of the baryon-meson system are found, subject to the same dynamical uncertainties as global and unitary symmetry. In the simplest version the pion and kaon fields correspond to the Hermitian torsion, while the vector bosons, including the photon, correspond to the anti-Hermitian torsion. (Contractor's abstract)

K* AND K MESON POLE CONTRIBUTIONS TO LEPTONIC Λ DECAY, by R. E. Norton. [1961] [4]p. incl. refs. (AFOSR-2002) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)717] and National Science Foundation) Unclassified

Also published in Phys. Rev., v. 126: 1216-1219, May 1, 1962.

An attempt is made to calculate the leptonic Λ decay rate on the known K_{3}^{e} and K_{2}^{μ} decay rates. Unsubtracted dispersion relations are written for the relevant matrix elements of the strangeness-changing vector weak current and the absorptive parts are approximated by retaining only the contribution from the K*. In this way the vector current contribution to the Λ decay is related to the known K_{3}^{e} rate, the known effective π-K-K* coupling constant, and the as yet unknown Λ-p-K* coupling constant. The latter coupling constant will hopefully be determined soon from extrapolation of the associated production data. The axial vector contribution to Λ decay is related to the K_{2}^{μ} decay rate by writing unsubtracted dispersion relations for the divergence of this current and approximating the absorptive parts by keeping only the contribution of the K meson. The numerical consequences of this calculation can only be evaluated once the Λ-p-K* is determined, but a crude estimate suggested by "unitary symmetry" yields a leptonic Λ decay rate a few times smaller than is now suggested experimentally. RUNAWAY MODES IN MODEL FIELD THEORIES, by S. Coleman and R. E. Norton. [1961] [7]p. incl. refs. (AFOSR-2003) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)717] and National Science Foundation) AD 611492 Unclassified

Also published in Phys. Rev., v. 125: 1422-1428, Feb. 15, 1962.

Within the framework of linear quantum field theories, a general study is presented of the existence and removal of runaway modes-solutions of the equations of motion which exhibit a real exponental time dependence. It is hoped that this work will yield insight into the corresponding problem in physically realistic theories. It is shown that runaway modes occur only when the Hamiltonian is not positive definite, and that they occur in linear quantum theories whenever they appear in the corresponding classical theories. Three methods are proposed for eliminating these unphysical modes. One is analog of the method used by Dirac in classical electron theory; the other 2 are believed to be new.

SPINOR FIELDS IN SPACES WITH TORSION, by R. Finkelstein. [1960] [22]p. (AFOSR-J333) [AF 49-(638)717] AD 408010 Unclassified

Also published in Ann. Phys., v. 12: 200-221, Feb. 1961.

It is suggested that the short-range interactions lead to a torsion of physical space, as gravitational interactions lead to its curvature. The existence of torsion implies 2 kinds of parallelism, (+) and (-), which in turn imply 2 types of spinor field, ψ (+) and ψ (-). If the geometry is symmetric with respect to (+) and (-) parallelisms, then ψ (+) and ψ (-) have no vector or electromagnetic coupling, and the geometry may be called neutral. The simplest neutral geometry with variable torsion is derivable from a Lagrangian in which a pseudoscalar Yukawa field (the torsion potential) is coupled by pseudovector coupling to ψ (+) and and ψ (-). If the geometry does not have neutral symmetry, then ψ (+) and ψ (-) behave like a charge doublet. The hypercharge and the parity of this charge doublet are determined by the weight of the spinor under general coordinate transformations. It follows from the model that leptonic (m = 0) particles are not coupled to the torsion. (Contractor's abstract)

ELEMENTARY INTERACTIONS IN SPACES WITH TORSION, by R. Finkelstein. [1961] [27]p. (AFOSR-J334) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)717] and National Science Foundation) AD 408055 Unclassified

Also published in Ann. Phys., v. 15: 223-249, Aug. 1961.

Parallel transfer is generalized to allow for the existence of a local gauge group. In spaces with torsion such a group may be introduced in a natural way and physically interpreted as a generalization of the electromagnetic gauge group. It is possible to construct simple theories of this type, which correctly represent the isospin symmetries of the known fields. According to the program here proposed the local connection of microspace is restricted by the symmetries of the observed fields; the dynamics is then determined by the curvature of space, just as in the known macroscopic limit. In the models here considered the discrete groups are not discussed and all conservation laws are exact. (Contractor's abstract)

THE PARAMETERS OF THE OPTICAL MODEL POTENTIAL AND THEIR PHYSICAL INTERPRETATION, by D. S. Saxon. [1960] [15]p. incl. table, refs. (AFOSR-J336) [AF 49(638)717] AD 408057 Unclassified

Also published in Proc. Internat'l. Conf. on Nuclear Structure, Kingston, Ont. (Canada) (Aug. 29-Sept. 3, 1960), Toronto U. Press, 1960, p. 197-211.

The optical model parameters, determined phenomenologically from the analysis of experimental data, are summarized. The possible physical significance of these parameters are discussed. The uniform volume absorption potential contains 6 parameters and the surface absorption potential, 7. Proton reaction cross sections were measured for Al, Ar, Ni, Cu, and Zn. They were also calculated using the volume absorption potential. The scattering of deuterons, He^3, α particles, and mesons (K) was also studied by this method. With one exception, very little progress was made in connecting the effective potential and the optical-model potential. This exception, high energy scattering at small angles, is discussed.

NUCLEAR MATTER CALCULATIONS USING THE SEPARATION METHOD, by B. L. Scott and S. A. Moszkowski. [1961] [7]p. incl. diagrs. tables. (AFOSR-J337) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)717], Army Research Office, Atomic Energy Commission, and National Science Foundation) AD 408063 Unclassified

Also published in Nuclear Phys., v. 29: 665-671, Feb. 1962.

The convergence of the separation method for calculating the 2-body reaction matrix is established for central interactions by comparing the separation method results to those obtained by solving the integral equation numerically. A spin-dependent central well which approximately satisfies 2-body data as well as giving reasonable nuclear saturation properties is presented. (Contractor's abstract)

OPTICAL-MODEL ANALYSIS OF ELASTIC SCATTERING OF PROTONS BY CARBON AT 11 TO 20 MEV (Abstract), by J. S. Nodvik, C. B. Duke, and M. A. Melkanoff. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)717], Atomic Energy Commission, and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Mexico City, Mex., June 22-24, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 367, June 22, 1961.

An extensive analysis of the elastic scattering of protons by carbon over the energy range 11-20 mev has been carried out with an optical-model potential which includes a Gaussian surface absorption and a spin-orbit coupling. Experimental data at small energy intervals from several laboratories was fitted by means of an automatic search program utilizing UCLA's IBM 709 and 7090 computers. This analysis has yielded remarkably good fits to the differential cross sections and qualitative fits for the polarizations and reaction cross sections. The values of the model parameters and their behavior as a function of energy is generally reasonable except that the surface thickness associated with the real part of the potential shows some systematic increase with energy, and the surface absorption is generally limited to a thin shell. Anomalous behavior of the parameters in the 17-18 mev region are discussed.

ON THE SHAPE OF THE IMAGINARY PART OF THE OPTICAL MODEL POTENTIAL, by M. A. Melkanoff, D. S. Saxon, and J. S. Nodvik. [1961] [2]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)717], Atomic Energy Commission, and National Science Foundation) Unclassified

Published in Proc. Rutherford Jubilee Internat'l. Conf., Manchester (Gt. Brit.) (Sept. 4-8, 1961), New York, Academic Press, 1961, p. 411-412.

An indication of the shape of the imaginary part of the optical model potential has been obtained from analyses of p-C and p-Cu scattering at intermediate energies. Absolute minima are found in the X^2 deviation between calculated and experimental angular distributions. The shape of the X^2 surface near the minimum provides information on the acceptable range of parameters. For carbon, the volume absorption is generally less than 2 mev and the surface absorption is confined to a shell less than 1 fermi thick. For copper, the volume absorption at 17 mev appears to be rather less than 5 mev. (Contractor's abstract)

THE MANY BODY PROBLEM OF O^{16}, by H. S. Köhler. [1961] [2]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)717] and National Science Foundation) Unclassified

Published in Proc. Rutherford Jubilee Internat'l. Conf., Manchester (Gt. Brit.) (Sept. 4-8, 1961), New York, Academic Press, 1961, p. 415-416.

The nuclear many body problem of O^{16} was investigated by the reaction matrix theory. The single particle wavefunctions were taken to be those of a harmonic oscillator. The reaction matrix was calculated by the separation method. The 2-nucleon interaction was represented by a spin-independent potential of exponential shape and with a hard core. Only the first order term and the dispersion correction were calculated. A minimum in total energy was obtained of -2 mev/A (exp)-8 mev/A) at a root mean square radius of 2.74 fermis (exp 2.57 fermis). (Contractor's abstract)

ON THE SEPARATION METHOD FOR CALCULATING THE NUCLEAR REACTION MATRIX, by H. S. Köhler. [1961] [12]p. incl. diagr. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)717] and National Science Foundation) Unclassified

Published in Ann. Phys., v. 16: 375-386, Dec. 1961.

The separation method for calculating the nuclear reaction matrix that was presented by Moszkowski and Scott has been investigated. Estimates are made which suggest that their dispersion, interference, and Pauli corrections are underestimated. A modification in the treatment of these terms is presented that gives considerable improvement. The treatment also permits good insight into the nature of the approximation. The errors in the new method are discussed. An alternative approximation that involves an iteration of the dispersion correction is also suggested. (Contractor's abstract)

EXPERIMENTAL RESEARCH WORK ON INFORMATION STRUCTURES, by E. W. Bastin. Annual rept. no. 1, Jan. 1-Dec. 31, 1960. Mar. 6, 1961 [19]p. incl. diagrs. (AFOSR-855) (AF 61(052)331) AD 257974 Unclassified

The PACE (Brussels, Belgium) analog computer equipment is being used to investigate a physical interpretation of a calculus, (namely the calculus defined by the program of instructions for the computer). In the case under review the calculus is the set of instructions for the PACE equipment set up according to certain rules together with everything the machine turns out, and the interpretative freedom of the model is being used to attack problems that arise at both large and small ends of our measurement scale, and especially in the fundamental questions underlying the physics of elementary particles, where it is acknowledged that classical concepts of space and time break down. The experiments show the correct form for the representation of mass in an information structure.

SELF ORGANIZING MECHANISMS AS MODELS FOR SCIENTIFIC THEORIES, by E. W. Bastin and K. S. Jones. July 20, 1961 [15]p. incl. diagrs. (AFOSR-1442) (AF 61(052)331) AD 264866 Unclassified

The current state of theoretical physics makes it urgently desirable to develop a theory which is initially non-metrical for the discussion of problems that arise on the very large and on the very small scale, and from which metrical physics can be deduced as a special case. It is shown that the idea of control is inherently capable of providing a calculus into which basic physical concepts can be incorporated which has the required initially non-metrical properties. The physical ideas that replace the cartesian assumption are derived from the properties of a self-organizing mechanism, and this application of the principles of self-organizing mechanisms suggests others in more general fields. HIERARCHIES OF DESCRIPTIVE LEVELS IN PHYSICAL THEORY, by A. F. Parker-Rhodes. 1961, 28p. (AFOSR-5051) (AF 61(052)331) AD 416504 Unclassified

It is shown that if we attempt to build up a mathematical system for the description of physical phenomena, on the assumption that the essential observations are two-valued, so that the appropriate algebra is the field of characteristic two, we are led to formulate a hierarchical system. The principal entities in this system are matrices over the field J2 whose orders increase in successive levels. A rule for constructing the various levels of the hierarchy is given, and it is shown that in non-trivial cases the number of levels is always finite. (Contractor's abstract)

A NEW MODEL OF SYNTACTIC DESCRIPTION, by A. F. Parker-Rhodes. [1961] [37]p. incl. diagrs. tables, refs. (Paper no. 34) (AFOSR-J573) [AF 61-(052)331] AD 414779 Unclassified

Also published in Proc. Internat'l. Conf. on Machine Translation of Languages and Applied Language Analysis, Teddington (Gt. Brit.) (Sept. 5-8, 1961), London, Her Majesty's Stationery Office, v. 1: 25-62, 1962.

This paper is intended to contain a fully mathematical model of syntactic structure. The use of lattice theory, which is the mathematical basis of the paper, is not merely formal, but is employed to find algorithms. The algorithms are used to predict what will be the syntactic function of a compound substituent when given those of its components. A strong point in favor of the theory is that it makes use of the possibility of forming direct products of lattices. The theory also has a certain predictive value.

THE IDEA OF SIZE IN LARGE-SCALE PHYSICS, by E. W. Bastin. [1961] [3]p. (AFOSR-J712) [AF 61-(052)331] AD 415445 Unclassified

Also published in Proc. Cambridge Philos. Soc., v. 57: 848-850, Oct. 1961.

Modern cosmology depends upon the assumption of the exact constancy of the velocity of light irrespective of the ways photons may be in interaction with atoms and on the interpretation of the red shift as indicating a galactic recession over great distances.

Independent evidence to support this assumption becomes progressively more slender as the distances we say we observe become greater.

Also published in Proc. Internat'l. Conf. on Machine Translation of Languages and Applied Language Analysis, Teddington (Gt. Brit.) (Sept. 5-8, 1961), London, Her Majesty's Stationery Office, v. 2: 437-475, 1962.

Also published in part in Semantic Problems in Language; Colloquium rept., Cambridge (Gt. Brit.) (Sept. 9-10, 1961), 1962, p. 6-14. (AFOSR-4501)

The purpose of this paper is to draw attention to a semantic feature of language which must be well understood before it is possible that machines should be programmed to do genuine machine translation, that is, the argument, or message of any piece of discourse. Failure to detect the message can prove misleading, even when the machine though it does not detect the message is programmed to detect many features of the input language's grammar and syntax, and when it is provided with a considerable bilingual dictionary. The trouble with present systems is that even when they are successful, they will retrieve subject matter but not detect message, and for purposes of machine translation this is not enough. A model of the system T' is described in this paper, of which the major constituent is the Thesaurus T.

STRUCTURAL INVESTIGATIONS, BY X-RAY DIFFRACTION METHODS, OF TRANSITION METAL ALLOYS, by W. H. Taylor. Final technical rept. Aug. 21, 1961, 40p. incl. tables, refs. (AFOSR-1849) (AF 61(052)50) AD 272205 Unclassified

Procedures for the determination of electron distributions in transition metal alloys were studied. The intensities of x-ray diffraction were measured on an absolute scale. If the unit cell of the structure was small and of high symmetry the powder-pattern could be used; measurements on CoAl, NiAl and Cr were continued. For more complex structures single-crystal methods were necessary. Methods of placing the intensities on an absolute scale and of testing for freedom from the effects of extinction were devised. Equipment for x-ray fluorescence analysis of minute single crystals used to obtain the x-ray data was designed and built. The importance of the crystal symmetry both in influencing the selection of suitable alloy structures for detailed examination, and in its bearing on the interpretation of the experimental measurements, was studied. The AlMn, AlFe and AlMo systems, and a group of sigma-phases and related structures were studied.

THE STRAIN-RATE DEPENDENCE OF THE FLOW STRESS OF COPPER SINGLE CRYSTALS, by P. R. Thornton, T. E. Mitchell, and P. B. Hirsch. [1961] [22]p. incl. diagrs. tables, refs. (AFOSR-3421) (AF 61(052)98) AD 613741 Unclassified

Also published in Philos. Mag., v. 7: 337-358, Feb. 1962.

An experimental study is described of the strain-rate sensitivity of the flow stress of Cu single crystals in all stages of deformation and over a wide temperature range. The curves relating the increase $\Delta\tau$ in flow stress on increasing the strain-rate by a fixed amount to the flow stress τ are generally divisible into 3 regions a, b and c. Region a is linear and characteristic of easy glide. At the end of this region the rate of increase of $\Delta\tau$ with strain increases, and a transition region, b, occurs in which $\Delta\tau$ varies with τ much more slowly than in easy glide. Another linear region, c, of $\Delta\tau$ versus τ, of intermediate slope, begins during stage II and is characteristic of the latter part of stage II and of stage III of the work-hardening curves. The lower the test temperature, the greater is the range in stage II in which the linear region c applies. No change occurs in the curves of $\Delta\tau$ versus τ at the onset of stage III. The slope of region c is similar for crystals deforming by single or double slip, and is of the same order of magnitude as that for polycrystals. The results agree with those of previous workers in that the temperature dependence of the flow stress is greater during easy glide than in stages II and III. The 2 linear regions, a and c, are thought to correspond to 2 different arrangements of dislocations, the transition from one type of arrangement to the other taking place in region b. The occurrence of linear regions can be explained on the long range stress, forest, or jog theories of work-hardening. However, while the similarity in the slopes of the curves of $\Delta\tau$ versus τ for single crystals deforming in single or double slip, and for

polycrystals, follows naturally from the forest and jog theories, it does not seem to be so easily explicable in terms of the current long-range stress theory. (Contractor's abstract)

SELECTION OF NEST MATERIAL BY FEMALE CANARIES, by R. A. Hinde and E. A. Steel. [1961] [9]p. incl. diagrs. tables, refs. (AFOSR-4200) (AF EOAR-62-44) Unclassified

Also published in Animal Behavior, v. 10: 67-75, Jan.-Apr. 1962.

Domesticated canaries, provided with grass and feathers for nest material, use primarily grass for the outer structure and feathers for lining the cup. The selection of material is governed at least in part by stimuli from the nest cup. Females treated with estrogen, building in large pans and provided with nest material only during occasional watches select mostly grass. The preference for grass is correlated with active building under circumstances in which stimulation of the ventral surfaces is infrequent and/or of low intensity. In normal building the female brings a higher proportion of feathers to the nest as the date of egg laying approaches. This is partly due to the decreasing size of the nest cup, for females bring a higher proportion of feathers when building in a small nest cup than when building in a large one. However, females provided with a small nest but not allowed to build a nest in it show an increasing preference for feathers as egg laying approaches even though the size of the nest cup remains constant. The data indicate that the selection of feathers in normal building is related to (a) the development of the brood patch, and (b) adequate external stimulation from the nest pan.

THE EFFECT OF TWO "TRANQUILLIZERS" ON AUDITORY DISCRIMINATION AND DELAYED RESPONSE PERFORMANCE OF MONKEYS, by C. G. Gross and L. Weiskrantz. [1961] [6]p. incl. tables, refs. (AFOSR-1724) (AF 61(052)185) AD 611505 Unclassified

Also published in Quart. Jour. Exper. Psychol., v. 13: 34-39, Feb. 1961.

Five rhesus monkeys were tested on performance of an auditory discrimination and a delayed response test with a sliding scale of increasing difficulty after treatment with (a) 0.2 to 0.5 mg/kg reserpine, (b) 150 mg/kg meprobamate, (c) an equivalent saline injection, and (d) no treatment. Both drug treatments resulted in a severe deficit on the auditory discrimination and no change or improvement in delayed response performance. The auditory deficit was not due simply to an increased latency of response. It is suggested that these results support the hypothesis that reserpine and meprobamate reduce the utilization of sensory information. (Contractor's abstract)

ROLE OF EXPERIENCE IN MISREACHING PRODUCED BY VISUAL CORTEX LESIONS, by A. Cowey and L. Weiskrantz. [1961] [1]p. (AFOSR-3521) (AF 61(052)185) Unclassified

Also published in Nature, v. 192: 1319, Dec. 30, 1961.

When the macular projection area — that part of the visual striate cortex to which the macular region of the retina projects — is removed in monkeys, the animal frequently misreaches for small pieces of food when they are presented to him on a flat surface. The symptom declines after the first few days of operation, and almost invariably disappears within 10 days, after which the animals are as adept as normal ones at reaching for food. Experiments conducted on monkeys to determine whether practice is necessary for this recovery to occur or whether the recovery process is spontaneous, demonstrated that, although the cause of misreaching is still not clear, recovery depends on experience in the light. Further work is necessary in order to determine whether mere exposure to the light is sufficient, or whether specific practice in reaching for objects is necessary. The latter appears more likely.

THE LOGIC OF THE LOCALIZATION OF FUNCTION IN THE CENTRAL NERVOUS SYSTEM, by R. L. Gregory. [1961] [3]p. (AFOSR-J58) [AF EOAR-61-13] AD 400094 Unclassified

Also published in Biological Prototypes and Synthetic Systems; Proc. Second Annual Bionics Sympostum, Cornell U., Ithaca, N. Y. (Aug. 30-Sept. 1, 1961), New York, Plenum Press, v. 1: 51-53, 1962.

The use of the technique of ablation by neurologists who hope to discover the function of parts of the nervous system is discussed and compared with the experience of the engineer working with an electronic system. It is suggested that for the neurologist, results from ablation studies should be described with great caution and not interpreted as indicating function except in terms of some explicitly described model. If a component of an electronic system is removed from a circuit, the other components will, in general, function differently. If the bias is changed on a valve this stage may no longer amplify, but may oscillate or produce high-energy harmonics. This, then will become a different circuit with new properties which can be explained only by knowing the parameters and sufficient general principles. If part of the brain is removed and the patient loses his anxieties, or his speech, or the ability to make sensible decisions, what can be inferred as to the function of the part lost. The point is not that ablation is of no theoretical interest, but rather that the results should be interpreted according to what should happen when recognized parts of a similar system are removed.

REGULATION OF OXYGEN TENSION IN THE BRAIN, MAMMARY GLAND AND TESTIS, by B. A. Cross and I. A. Silver. Annual summary rept. no. 1, Oct. 1, 1960-Sept. 30, 1961, 6p. (AFOSR-2508) (AF 61(052)301) AD 288491 Unclassified

The primary aim of this research was to investigate whether changes in the oxygen or carbon dioxide tension of the blood reaching the hypothalamus influences the cerebral circulation through activation of descending sympathetic outflows from the hypothalamus. To this end, study has been made of the resting levels of oxygen tension in various parts of the forebrain and the changes produced by a variety of experimental procedures. Similar phenomena in the mammary gland and testis have also been investigated. Observations confirmed that a major determinant of oxygen tension in these organs is capillary blood flow. This factor made it possible to use mammary and testicular oxygen tension readings as indicators of peripheral vasoconstrictor activity, to obtain evidence that hypoxia and hypercapnia produce a central sympathetico-adrenal discharge.

MAMMARY OXYGEN TENSION AND THE

MILK-EJECTION MECHANISM, by B. A. Cross and I. A. Silver. [1961] [6]p. (AFOSR-2509) (AF 61-(052)301) Unclassified

Presented at Eighty-third general meeting of the Soc. for Endocrinol., London (Gt. Brit.), May 5, 1961.

Abstract published in Jour. Endocrinol., v. 22: XXXIII, July 1961.

Also published in Jour. Endocrinol., v. 23: 375-384, 1962.

Mammary oxygen tension was monitored polarographically with gold-plated needle electrodes using the method of Cater, Silver & Wilson (1959) in 20 lactating rabbits under light urethane anaesthesia. The contractile activity of mammary myoepithelium in response to i.v. injection of standard doses of oxytocin (10-100 mu 'Pitocin', Parke Davis and Co.) was recorded kymographically from cannulated teats by the method of Cross & Harris (1952). Resting pO_2 levels of 15-30 mm Hg were found in the lactating glands. Evacuation of milk from distended glands raised their resting pO_2. Conversely, a rise of intramammary pressure elicited by injection of oxytocin caused a fall in mammary pO_2, the extent and duration of which depended upon the magnitude of the milk-ejection response. Evacuated glands showed a negligible fall of pO_2 following injection of oxytocin. Wide variations in mammary pO_2 (± 80% of the resting level) brought about by inhalation of oxygen or air diluted with nitrogen had no effect on the contractile response of the myoepithelium to i.v. injection of oxytocin. On the other hand, equivalent depressions of mammary pO_2 produced by vascular changes, viz. by i.v. injection of 5-10 µg adrenaline or electrical stimulation of the sympathetic centres of the hypothalamus (Cross, 1955), or by thoracolumbar spinal anaesthesia, were associated with drastically reduced milk-ejection responses. No improvement of the responses followed oxygen breathing, even when the initial pO_2 values were restored thereby. These findings, together with the effects of intramammary pressure reported above, indicate that under normal conditions of respiration the mammary pO_2 serves as an index of capillary blood flow in mammary tissue, and moreover that this capillary flow rather than the absolute oxygen tension determines the response of mammary myoepithelium to circulating oxytocin.

CENTRAL ACTIVATION OF THE SYMPATHETICO-ADRENAL SYSTEM BY HYPOXIA AND HYPERCAPNIA, by B. A. Cross and I. A. Silver. [1961] [13]p. incl. diagrs. tables, refs. (AFOSR-3460) (AF 61(052)301) Unclassified

Also published in Jour. Endocrinol., v. 24: 91-103, Mar. 1962.

In rabbits under urethane anesthesia sympathetico-adrenal vasoconstrictor activity was monitored by the reduction of oxygen tension (measured polarographically with needle electrodes) in the testis and lactating mammary gland, and by the inhibitory effect on milk ejection. Electrical stimulation of the dorsal, lateral and posterior hypothalamus evoked a sympathetic response in these organs, characterized by a rapid nervous effect and secondary humoral effect which outlasted the stimulus, resembled the response to intravenous adrenaline, and was abolished by removal of both adrenal glands. Hypoxia produced by making the animals inhale nitrous oxide or nitrogen for 15-30 sec and hypercapnia induced by inhalation of a mixture of 80% CO_2 and 20% O_2 for 5-15 sec both induced a sympathetic discharge similar to that resulting from hypothalamic stimulation. Hypercapnia was a notably more potent stimulus than hypoxia. The effects were reversibly blocked by thoraco-lumbar spinal anesthesia. Placement of discrete bilateral lesions in the septum, hippocampus and medial thalamus did not impair the sympathetic activation elicited by hypercapnia. Hypothalamic lesions, on the other hand, often reduced and occasionally prevented the central sympathetic discharge. The possible role of the hypothalamus in cardiovascular regulation is discussed in the light of these findings. (Contractor's abstract)

Cambridge U. Sub-Dept. of Veterinary Anatomy (Gt. Brit.).

NEUROVASCULAR CONTROL OF OXYGEN TENSION IN THE TESTIS AND EPIDIDYMIS, by B. A. Cross and I. A. Silver. [1961] [21]p. incl. illus. diagrs. refs. (AFOSR-4203) (AF 61(052)301) AD 407595 Unclassified

Also published in Jour. Reprod. Fertil., v. 3: 377-395, June 1962.

Interstitial oxygen tension was recorded polarographically with gold-plated needle electrodes in the testis and cauda epididymidis of the rabbit, sheep and dog. The mean epididymal resting oxygen tension was about twice that of the testis in the rabbit and sheep, and nearly three times testis oxygen tension in the dog. A short period of oxygen breathing doubled testicular oxygen tension while nitrous oxide breathing more than halved it. The latency of the testis response was always much longer than that of the epididymal response in the rabbit and sheep, but only slightly longer in the dog. The discrepancy was accounted for by the arterial arrangement in the 3 species. Occlusion of the internal spermatic artery produced a drastic fall in testis oxygen tension in the rabbit, sheep and dog, and had little effect on epididymal oxygen tension. Vasal artery occlusion reduced oxygen tension in the cauda epididymidis but not the testis, and a large fall occurred only if collateral vessels from the internal spermatic or cremasteric arteries were also clamped. Circulatory hypotension produced by amyl nitrite inhalation reduced oxygen tension in the testis and epididymis of all 3 species. Local cooling of the rabbit, sheep and dog. Conversely, local

warming of the scrotum produced a rise of oxygen tension in the ipsilateral testis. Thoraco-lumbar spinal anesthesia did not block these effects. Electrical stimulation of the sympathetic areas of the hypothalamus in the rabbit elicited a profound depression of testicular oxygen tension characterized by an initial rapid phase, which was abolished by posterior mesenteric ganglionectomy and hypogastric nerve section, and a secondary slower phase, which was abolished by adrenalectomy. The 2 phases could be mimicked by stimulation of the posterior mesenteric ganglion or hypogastric nerves, and by intravenous injection of adrenaline respectively. (Contractor's abstract)

SOME FACTORS AFFECTING OXYGEN TENSION IN THE BRAIN AND OTHER ORGANS, by B. A. Cross and I. A. Silver. [1961] [17]p. incl. diagrs. tables, refs. (AFOSR-4277) (AF 61(052)301) Unclassified

Also published in Proc. Royal Soc. (London), v. 156B: 483-499, Nov. 20, 1962.

Polarographic recording of cerebral oxygen tension was performed by means of gold-plated needle electrodes oriented stereotaxically in the forebrain of rabbits under light urethane anesthesia. The indicated mean resting level of oxygen tension in grey matter was 13 mm Hg. Higher levels were recorded in cerebral ventricles and lower levels in white matter. O_2 breathing doubled the forebrain oxygen tension and N_2 or N_2O reduced it nearly to zero. Inhalation of 80% CO_2 and 20% O_2 produced a threefold increase in oxygen tension. Forebrain oxygen tension was drastically reduced by inhalation of amyl nitrite and by carotid artery occlusion. The oxygen tension recorded in a small coagulated lesion or in dead forebrain was low, and no change resulted when the animal inhaled O_2, N_2 or CO_2. Intravenous injection of 1 to 10 μg adrenaline elicited a rise of up to 20% in forebrain oxygen tension and at the same time a fall in the oxygen tension recorded in the testis, lactating mammary gland or skin. Electrical stimulation (15 s) of the lateral or posterior hypothalamus produced an elevation of forebrain oxygen tension persisting for a minute or more after the stimulus, suggesting a release of adrenomedullary adrenaline. Opposite effects were seen in the oxygen tension measured in testis, mammary gland or skin. Electrical stimulation of the cervical sympathetic nerve evoked an ipsilateral depression of forebrain oxygen tension amounting to nearly 50% in some instances. Cervical sympathetic section did not influence resting forebrain oxygen tension. (Contractor's abstract)

THE HALL EFFECT IN FERROMAGNETICS, by E. M. Pugh. Final rept. June 30, 1961 [41]p. incl. diagrs. tables, refs. (AFOSR-1175) (AF 49(638)257) AD 267112 Unclassified

Results of Hall effect and resistivity measurements on a number of ferromagnetic metals and alloys are presented. These measurements verify some earlier ideas regarding the electronic structure in the region of Ni and its alloys and give new information about this structure in the region of Fe. It is shown that the 4 band model of the ordinary Hall effect in ferromagnetics correctly predicts the results and yields new information regarding the band structure. The measurements of the extraordinary Hall effect are compared with predictions of recent theories. It is found that in their present form none of these theories adequately describe the data. Data are also given for alpha phase Ag-Zn alloys. (Contractor's abstract)

CONDUCTION ELECTRONS IN PSEUDONICKEL ALLOYS FROM HALL DATA, by E. R. Sanford, A. C. Ehrlich, and E. M. Pugh. [1961] [5]p. incl. diagrs. table, refs. [AF 49(638)257] Unclassified

Published in Phys. Rev., v. 123: 1947-1951, Sept. 15, 1961.

The 2 Hall coefficients and resistivity of 4 Ni-Cu-Fe alloys having 28 electrons/atom, with Ni content from 97-70 atomic-%, were measured at 20°K, 77°K, and room temperature using fields up to 3.1 webers/m^2. R_0 was found to increase with decreasing temperature for all compositions, and also to increase with decreasing Ni content for each of the 3 temperatures measured. The effective number of conduction electrons calculated from the R_0's measured at low temperatures was found to fall smoothly from the anomalous peak at pure Ni to about 0.3 at 70% Ni, in agreement with the predictions of the 4-band model. A short summary of the considerable evidence supporting this model is given. The extraordinary Hall coefficient, R_e, is negative at all temperatures for the 3 samples richest in Ni, being increasingly negative as the Ni content is lowered. On the other hand, the 70% Ni-20% Cu-10% of Fe alloy has positive extraordinary Hall coefficients at all temperatures. The behavior of R_e obeys none of the variously proposed theoretical relations. EFFECT OF ORDER ON THE HALL CONSTANTS OF Ni_3Mn, by J. A. Dreesen. [1961] [3]p. incl. diagrs. tables, refs. [AF 49(638)257] Unclassified

Published in Phys. Rev., v. 125: 1215-1217, Feb. 15, 1962.

Hall effect measurements as a function of temperature are reported for ordered and disordered Ni_3Mn. At low temperatures the ordinary Hall coefficient is found to be negative for both the ordered and disordered alloy. It is shown that the apparent positive value of the ordinary Hall coefficient in the disordered alloy at room temperature is due to the near coincidence of the Curie temperature of this alloy with room temperature. This results in a positive contribution to the measured value of the ordinary Hall coefficient from the extraordinary effect, a smaller contribution being present at low temperatures. An approximate correction is made for this contribution, with the result that the true ordinary coefficient in disordered Ni_3Mn is found to be nearly equal to that in the ordered alloy. Furthermore, its absolute magnitude and temperature dependence are much like that of Cu-Ni and pseudo-nickel alloys. Thus, it is concluded that ordering has much less effect on the band structure of this alloy than was previously assumed. (Contractor's abstract)

FUNCTION THEORETIC SOLUTIONS OF CERTAIN BOUNDARY-VALUE PROBLEMS, by V. P. Sreedharan. July 1961, 39p. (Technical rept. no. 34) (AFOSR-1083) (AF 49(638)227) AD 261985 Unclassified

Also published in Jour. Math. and Mech., v. 14: 211-230, 1965.

The domains of analyticity of solutions of the equation $\Delta u \pm k^2 u = 0$ in 2 independent variables are studied with a view to solving boundary-value problems in the large. The boundary value problems are transformed into function theoretic problems. Specifically the Sommerfeld half-plane problem for $\Delta u + k^2 u = 0$ is solved. A related result on integral equations is obtained. Green's functions for a wedge with various boundary conditions are constructed in the case of the equation $\Delta u - k^2 u = 0$. An attempt was made to determine the conditions

which gave rise to differing frequencies of the 2 types of error, reporting a dot as present when it was not (errors of commission) and failure to identify a dot which was present (errors of omission). The proportion of occurrence of dots was .5, and the size of the circular area in which the dot appeared, brightness of the dot, and duration of presentation were varied. The results indicated that at conditions of poor visibility, errors of omission predominated. As conditions improved, the proportions of each type of error became more alike. At some conditions of good, but not perfect visibility, errors of commission were more frequent than errors of omission. Possible determinants of response tendencies in experiments of this sort were discussed. (Contractor's abstract)

THE EFFECTS OF INSTRUCTIONAL SETS ON THE PERCEPTION OF PERIPHERAL VISUAL STIMULI, by H. W. Karn and L. W. Gregg. [1961] [17]p. incl. diagrs. tables. (AFOSR-1919) (AF 49(638)770) AD 271754 Unclassified

The effects of different instructions on a task requiring the detection of a learnable cue under conditions which precluded the possibility of complete observation of three targets in a peripheral visual field were studied. The failure to obtain anticipated insightful shifts in performance does not support the supposition that cognitive sets are critical determinants of the behavior generated by the multiple stimulus task. The experimental conditions apparently lead Ss to acquire information about the stimulus complex but do not enable them to draw inferences that maximize performance. Unspecified nonverbalized perceptual and response sets, biases, and purely peripheral components are suggested as possible explanatory factors governing the observed behavior.

A SORTING PROBLEM, by R. C. Bose and R. J. Nelson. Apr. 1961, 22p. incl. tables. (Computing Center publ. no. 1043) (AFOSR-636) (In cooperation with North Carolina U. Inst. of Statistics, Chapel Hill) (AF 49(638)213 and AF 49(638)971) AD 256333 Unclassified

Also published in Jour. Assoc. Comput. Mach., v. 9: 282-296, Apr. 1962.

An important problem in digital computer applications is the problem of sorting a collection of records, documents, numbers or other data into some predesigned arrangement according to a key or field which is associated to each record. Given a set of n real numbers, the problem is to find the least number of comparisons f(n) for arranging the set in ascending order with the condition that the number of permutations (transpositions) be no larger than the number of comparisons, and to provide an algorithm for obtaining this arrangement. The problem as stated is not relevant to radix or merging algorithms since both are fixed schemes in which speed in making comparisons and not in minimizing their number, is the criterion of efficiency. However the new upper bound f(n) is found to be so much better than $\binom{n}{2}$ for large n that it suggests the desirability of a different hardware approach to the problem. An apparent shortcoming of this method is that every n requires a different algorithm; however, a simple meta-algorithm is available for calculating an algorithm for any n.

A PHTHALOCYANINOSILOXANE, by R. D. Joyner and M. E. Kenney. [1961] [2]p. incl. diagr. table. (AFOSR-4354) [AF 49(638)773] Unclassified

Presented at 139th Nat'l. meeting of the Amer. Chem. Soc., St. Louis, Mo., Mar. 1961.

Also published in Inorg. Chem., v. 1: 717-718, Aug. 1962.

Recently it has been reported that oxy-linked polymers are formed by both phthalocyaninogermanium and phthalocyaninomanganese (IV) systems. Work now has been carried out which shows that a related siloxane, $HO(PcSiO)_xH$, is formed by the dehydration of $PcSi(OH)_2$. The reaction by which it is formed, $xPcSi(OH)_2 \rightarrow HO(PcSiO)_xH + (x - 1)H_2O$, entails the cleavage of Si-O bonds in the presence of Si-N bonds. No observable amounts of gas were evolved below 400° but at 400° water was evolved rapidly for less than 15 min and then the reaction ceased. The amounts of water evolved during the formation of $HO(PcSiO)_xH$ indicate that the minimum value of x is greater than 10, perhaps near 10^2. The polymer withstood 520° in vacuo for 2.5 hr with no detectable gas evolution and no discoloration of itself or the apparatus. At 550° for 1 hr it did produce 3.3 mm of pressure and gave evidence of a more rapid decomposition at 625°.

THE LOW FIELD DE HAAS-VAN ALPHEN EFFECT IN ZINC, by A. S. Joseph. Nov. 1961 [60]p. incl. diagrs. refs. (Technical rept. no. 3) (AFOSR-1757) (AF 49(638)621) AD 273017 Unclassified

Also published in Phys. Rev., v. 126: 489-497, Apr. 15, 1962.

A study of the low field de Haas-van Alphen effect in Zn employing automatic recording of the variation of the torque as a function of the reciprocal of the applied magnetic field revealed 6 sets of periods. These periods are assigned in a consistent manner to portions of the free-electron model of the Fermi surface (single OPW). Cyclotron masses associated with the 3 larger sets of the observed periods agreed well with the theoretical estimates. Evidence is obtained for the presence of a spin-orbit energy gap across the hexagonal face of the first Brillouin zone near the corners. Thus, the validity of the single Brillouin zone construction is demonstrated for Zn. (Contractor's abstract)

THE MEASUREMENT OF THE RESISTIVITIES OF METALS USING AN EDDY CURRENT METHOD, by L. D. Bogan. 1961, 34p. incl. diagrs. (AF 49(638)-621) Unclassified

A method is described which measures the electrical resistivity of metals in cylindrical form by placing the bar in a uniform magnetic field and then rapidly reducing the field to zero. The resistivity of the metal may be calculated from the observed rate of decay of the eddy current induced in the metal bar. No electrical contact to the metal is necessary. Measurements of residual resistivity ratios, P273/P4.2, were made on a sample of triply sublimed magnesium and 2 samples of zone refined beryllium. The ratio found for the magnesium sample was 374 ± 11. The beryllium sample which was 1 pass zone refined had a ratio of only 8.2 ± 0.3 while the 8 pass zone refined sample had a resistivity ratio of 18.1 ± 0.6. (Contractor's abstract)

THE FOLDED NORMAL DISTRIBUTION, by F. C. Leone, L. S. Nelson, and R. B. Nottingham. Jan. 1961, 22p. incl. illus. tables. (Case Statistical Lab. publ. no. 1041) (AFOSR-180) (AF 49(638)361) AD 251168; PB 154731 Unclassified

Also published in Technometrics, v. 3: 543-550, Nov. 1961.

The folded normal probability density function is considered, as it relates to the original normal population from which it came. Some maximum likelihood estimates are presented, followed by other estimating procedures which are simpler to handle. A table is given for the estimation of μ and σ (the mean and standard deviation of the original normal) given an estimate of the ratio of μ_f and σ_f (of the folded normal). A second table gives the areas of the folded normal for the values of T_f from 0.0 to 7.0 for 18 different ratios of μ_f to σ_f. An example of real camber data is presented with the appropriate estimation of the theoretical distributions. (Contractor's abstract)

FOLDED NORMAL II: COMPARISON OF TWO METHODS OF ESTIMATING PARAMETERS FROM MOMENTS, by R. C. Elandt. Feb. 1961, 20p. incl. diagrs. tables. (Case Statistical Lab. publ. no. 1042) (AFOSR-393) (AF 49(638)361) AD 253245 Unclassified

Also published in Technometrics, v. 3: 551-562, Nov. 1961. (Title varies)

The general formula for the r^{th} to the n^{th} power moment of the folded normal distribution is obtained, and formulae for the first four non-central and central moments are calculated explicitly. To illustrate the mode of convergence of the folded normal to the normal distribution, as $\mu/\sigma = \theta$ increases, the shape factors β_{11} and β_{12} were calculated and the relationship between them represented graphically. Two methods, one using first and second moments and the other using second and fourth moments of estimating the parameters μ and σ of the parent normal distribution are presented and their standard errors calculated. The accuracy of both methods, for various methods of θ are discussed. (Contractor's abstract)

Abstract published in Ann. Math. Stat., v. 32: 623, June 1961.

Also published in Ann. Math. Stat., v. 33: 1375-1383, Dec. 1962.

The asymptotic relative efficiency of Mood's test against the likelihood ratio test for the change in location of exponential distribution, is derived. Further, this is carried out for all 3 alternatives for Massey's test. The asymptotic powers are compared with the exact powers to find out how large a sample size is needed before one could use the expressions for the asymptot'c power. (Contractor's abstract)

EXACT POWER OF SOME TESTS BASED ON MOOD'S AND MASSEY'S STATISTICS, by I. M. Chakravarti, F. C. Leone, and J. D. Alanen. Apr. 1961, 59p. incl. tables. (AFOSR-1049) (AF 49(638)361) AD 260730 Unclassified

Presented at Eastern Regional meeting of the Inst. Math. Stat., Ithaca, N. Y., Apr. 20-22, 1961.

Abstract published in Ann. Math. Stat., v. 32: 629, June 1961.

When sample observations are originally recorded in order of their magnitude, Mood's test, based on the median of the combined samples, and Massey's extension of Mood's test based on fractiles, have much to commend themselves as quick tests. In Mood's test one need record observations only up to the median of the combined samples, and in Massey's test, up to the highest fractile included in the test. It is known (Mood, (1954) and Andrews, (1954)) that the asymptotic relative efficiency of Mood's test against normal and rectangular alternatives is low. However, it was felt that there was enough gain in Massey's extension to justify this investigation. The objects of the present investigation are: (1) to derive the exact power functions of Mood's and Massey's tests for two samples against parametric alternatives of exponential and rectangular populations; (2) to tabulate them for comparable sample sizes in order to get an idea about their respective performances and also to evaluate if there is any resultant gain in the use of Massey's test (which uses more than one fractile and hence is more elaborate) over Mood's tests.

EXACT POWER OF SOME QUICK TESTS BASED ON MOOD'S AND MASSEY'S STATISTICS, by F. C. Leone, I. M. Chakravarti, and J. D. Alanen. [1961] [11]p. incl. tables. (AFOSR-65-2602) (AF 49(638)-361) Unclassified

Also published in Bull. Inst. Internat'l. Stat. (Paris), [v. 38: 1-11, 1961].

The objects of the present investigation were (1) to derive the exact power functions of Mood's and Massey's tests for 2 samples against parametric alternatives of exponential and rectangular populations, and (2) to tabulate them for comparable sample sizes in order to get an idea about their respective performances as well as to evaluate the possibility of any resultant gain in the use of Massey's test (which uses more than 1 fractile and hence is more elaborate) over Mood's test. It was found that Massey's test for comparable size does not show sufficient gain over Mood's test when the selected value a is small. But as a increases, the power function of Massey's test increases at a much faster rate than Mood's test.

TABLES OF MINIMUM FUNCTIONS FOR GENERATING GALOIS FIELDS GF (p^n) (Abstract), by J. D. Alanen. [1961] [1]p. [AF 49(638)361]
Unclassified

Presented at Eastern Regional meeting of the Inst. Math. Stat., Ithaca, N. Y., Apr. 20-22, 1961.

Published in Ann. Math. Stat., v. 32: 621, June 1961.

A polynomial f(x) of degree n irreducible in the field GF(p) where p is a prime number, is called a minimum function, if a root ω of the equation f(x) = 0, serves as a primitive element of GF (p^n), that is, $\omega^0 = 1$, ω, ω^2, ···, ω^{p^n-2} are the p^n - 1 non-zero elements of GF(p^n). It is known that for the GF(p^n), there are $\varphi(p^n - 1/n$ minimum functions, where φ is the Euler function, p a prime, and n an integer. Minimum functions were very successfully used in the past in constructing sets of mutually orthogonal Latin squares, balanced incomplete block designs, confounded and fractorial designs. Recently these have found a new application in the construction of error-correcting codes. While searching for a minimum function of GF (13^3), a lack of comprehensive tables of minimum functions in the published literature was noticed. A program has been written and all minimum functions generated for a fairly comprehensive set of values of p and n.

EXCITED ELECTRONIC STATES OF LINEAR SYMMETRIC H_3 (Abstract), by H. L. Morrison and V. Griffing. [1960] [1]p. [AF 18(600)1537]
Unclassified

Presented at meeting of the Amer. Phys. Soc., Montreal (Canada), June 15-17, 1960.

Published in Bull. Amer. Phys. Soc., Series II, v. 5: 339, June 15, 1960.

The Roothaan self-consistent field procedure has been applied to the problem of calculating the excited states of H_3 in the linear symmetric configuration. The excited states considered have an electron pair in a nodeless molecular orbital that consists of a linear combination of 1s wave functions from the respective centers. The first excited wave function—containing 1 electron and having 1 central node-is constructed from 2s atomic functions; a second excited orbital contains 2p functions instead. A third molecular orbital is a linear combination of all three 2s functions. The molecular orbitals of the singly occupied states are orthogonal to the doubly occupied state by virtue of symmetry. One then obtains separate Hartree-Fock equations for the open and closed shell orbitals. This type of calculation was performed for the ungerade orbitals of the 2s and 2p functions at seven values of the internuclear distance ranging from 1.4 a.u. to 2.6 a.u. Curves for both state functions exhibit minima at 1.8 a.u., when one plots total energy versus internuclear distance. The third excited state was calculated only approximately.

INTERACTION OF TWO Be ATOMS (Abstract), by R. Hampson and J. S. Dooling. [1960] [1]p. [AF 18(600)-1537]
Unclassified

Presented at meeting of the Amer. Phys. Soc., Montreal (Canada), June 15-17, 1960.

Published in Bull. Amer. Phys. Soc., Series II, v. 5: 339, June 15, 1960.

Calculations of the interaction of 2 Be atoms have been carried out using the LCAO MO SCF approximation for 6 distances ranging from 3.58A to infinity. Two ground-state calculations were performed: one using as the basis set 1s, and 2s Slater orbitals for each atom; the other using 1s, 2s, and 2pσ orbitals. A single determinant SCF calculation for the excited state, $(\sigma_g 1s)^2(\sigma_u 1s)^2(\sigma_g 2s)^2\, X(\sigma_g 2p\sigma)^2$, approx, also was made. Curves for these states, and one including configuration interaction are presented. An excited state, $^3\Sigma_u$, represented by $(\sigma_g 1s)^2\, X(\sigma_u 1s)^2 (\sigma_g 2s)^2 (\sigma_u 2s\alpha) (\sigma_g 2p\sigma\alpha)$ has been calculated and is is discussed.

INTERACTION OF TWO HELIUM ATOMS (Abstract), by J. S. Dooling and P. Piper. [1960] [1]p. [AF 18-(600)1537]
Unclassified

Presented at meeting of the Amer. Phys. Soc., Montreal (Canada), June 15-17, 1960.

Published in Bull. Amer. Phys. Soc., Series II, v. 5: 339, June 15, 1960.

Calculations using the LCAO MO SCF approximation were carried out for the ground state of 2 He atoms for distances ranging from 2.51 to 3.76A. The atomic functions used as the basis set were Slater orbitals with ζ = 1.6875 on all atomic orbitals. In the first calculation the MO's were constructed from 1s and 2pσ on each atom; the second calculation used as the basis set, 1s, 2s, and 2pσ atomic orbitals. Curves for the interaction potential for each of these calculations show a minimum in the van der Waal's region. The inclusion of the 2s atomic functions in the basis set lowers the minimum and shifts it

toward smaller internuclear distances. The degree to which the wave functions lead to the fulfillment of the virial theorem was tested, and the results are shown.

ON TUBE STATISTICS AND CHARACTERIZATION PROBLEMS, by E. Lukacs. [1961] [10]p. (AFOSR-4389) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-32 and National Science Foundation under G-9968) Unclassified

Also published in Zeitschr. Wahrscheinlichkeitstheorie und Verwandte Gebiete, v. 1: 116-125, 1962.

Let $X_1, X_2, \ldots, X_n$ be a sample from a population with distribution function $F(x)$. A single-valued and measurable function $S = S(X_1, X_2 \ldots, X_n)$ of the observations is usually called a statistic. It is customary to represent the observations $(X_1, X_2, \ldots, X_n)$ as a point in an n-dimensional Euclidean space E_n, the sample space. The equation $S(X_1, X_2, \ldots, X_n) = c$ (c a real parameter) determines then a family of hypersurfaces in E_n which partitions the sample space. A statistic S can therefore also be defined as a family of hypersurfaces (or as a partition) in the sample space. In this paper these surfaces are referred to as the level surfaces of the statistic. In section 2 certain notations are introduced and tube statistics, defined. In section 3 it is assumed that a tube statistic is independent of the sample mean. Section 4 discusses characterizations of the normal and of the gamma distribution.

COMPLEX CLUSTER INTEGRALS FOR AN AUGMENTED GAUSSIAN GAS, by T. Tanaka, P. H. E. Meijer, and J. N. Fox. [1961] [6]p. incl. diagrs. table, refs. (AFOSR-2636) [AF 49(638)452] AD 612338 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 245, Apr. 24, 1961.

Also published in Jour. Chem. Phys., v. 36: 731-736, Feb. 1, 1962.

It has been shown by Montroll, Berlin, and Hart that complex cluster integrals can be evaluated very easily if the actual Ursell-Mayer f function is replaced by a Gaussian. The possibility of using a more realistic function was suggested by the same authors. We have carried out the actual calculation of the cluster integrals for 4 particles and determined the dependence of the parameters on the temperature. It is shown that the integration problem is reduced to the evaluation of higher derivatives of the so called graph determinant. The method can also be used to calculate the effective interaction between 2 articulation points of a complicated cluster. The importance of the nonring diagrams is stressed by some numerical estimates of discrepancy between actual condensation and the divergence of the ring series.

RELAXATION PHENOMENA IN AN ISING SPIN SYSTEM, by T. Tanaka and P. H. E. Meijer. [1961] [3]p. (AFOSR-J91) (Sponsored jointly by Air Force [Office of Scientific Research under AF 49(638)452] and Office of Naval Research) AD 400133 Unclassified

Presented at Internat'l. Conf. on Magnetism and Crystallography, Kyoto (Japan), Sept. 25-30, 1961.

Also published in Jour. Phys. Soc. Japan, v. 17: Suppl. B-I: 78-80, Mar. 1962.

The kinetics of an Ising model is formulated by the method of thermodynamics of irreversible processes. From the expression for the entropy production, generalized forces and fluxes are determined. By introducing kinetic coefficients which satisfy the Onsager relation, the kinetic equations are obtained. By solving these equations a set of relaxation times is obtained. In terms of these relaxation times 2 initial value problems are solved. A set of N identical Ising spins of magnitude 1/2 is considered. In thermodynamic equilibrium these spins behave similarly, and one can dismiss the long range or the short range

order. In a time dependent phenomenon, this is not the case and all spins behave differently at a given instant of time. There is a certain phase relation between motions of neighboring spins. The following form is assumed for the total distribution function: $f_N = \prod f_n(\sigma_n)$, $\sigma_n = \pm 1$, and $\sum_{\sigma_n} f_n(\sigma_n) = 1$. The fluctuations in the neighborhood of the equilibrium conditions are discussed.

DYNAMIC BEHAVIOR OF A SET OF WEAKLY COUPLED ISING SPINS, by P. H. E. Meijer, T. Tanaka, and J. Barry. [1961] [5]p. (AFOSR-J92) [AF 49(638)452] AD 400099 Unclassified

Also published in Jour. Math. Phys., v. 3: 793-797, July-Aug. 1962.

The master equation of a set of independent spins contains only 1 undetermined constant, the rate constant. If one assumes the local field to be altered by the field produced by the 2 neighboring spins, one can formulate a set of equations for the average of 1, 2, 3, etc., spins. On assuming an Ising interaction between the spins, weak compared to the coupling with the heat bath, we can terminate the hierarchy and solve the problem of a linear chain with periodic boundary conditions by Fourier-transformation. The resulting secular equation determines 2 sets of relaxation times and 2 sets of eigensolutions. An explicit solution for the spin averages is given for the initial condition describing a localized excitation. Similarities with, and differences between, this and the random walk problem is pointed out. (Contractor's abstract)

THEORY OF RELAXATION PHENOMENA NEAR THE SECOND-ORDER PHASE-TRANSITION POINT, by T. Tanaka, P. H. E. Meijer, and J. G. Barry. [1961] [6]p. (AFOSR-J93) (AF 49(638)452) AD 400097 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 55, Feb. 1, 1961.

Also published in Jour. Chem. Phys., v. 37: 1397-1402, Oct. 1962.

It is expected that the observables connected with nonequilibrium processes will show abrupt changes if a substance undergoes a second-order phase-transition, since the equilibrium thermodynamic quantities appear to do so. In order to study these phenomena in a connected way the assumption is made that the long-range order parameter and the short-range order parameter can be treated as fluxes and forces in the sense of Onsager's theory of irreversible thermodynamics. Actual calculations are performed for two cases: an order-disorder system with short- and long-range and a system with 2 modes of long-range order (antiferromagnet). The absorption of sound is calculated and its behavior near the critical temperature is analyzed. The function is continuous with a discontinuity in the slope provided the phenomenological constants are smooth functions of the temperature. (Contractor's abstract)

MASTER EQUATION OF A SET OF WEAKLY COUPLED ISING SPINS (Abstract), by P. H. E. Meijer, T. Tanaka, and J. H. Barry. [1961] [1]p. [AF 49-(638)452] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 55, Feb. 1, 1961.

The master equation of a set of independent equivalent Ising spins contains only 1 undetermined constant, the rate constant. Assuming the local field to be altered by the field produced by the 2 neighboring spins, one can formulate a hierarchy of equations for the time dependence of the average spin $\langle \sigma_k \rangle$, the average of 2 neighboring spins $\langle \sigma_k \sigma_{k\pm1} \rangle$, the average of 3 neighboring spins, etc. This set of simultaneous linear first-order differential equations can be solved if 1 makes a cutoff by assuming that the local field is smaller than the external field. The 2 sets of equations are solved by a Fourier transform. The resulting secular equation determined 2 sets of relaxation times. The initial conditions are taken in the form of a delta function in order to obtain the Green's function of the problem. The initial conditions have to be replaced by 2 proper linear combinations of initial conditions in order to determine the time-dependent solution. The solution has the general characteristic of a Gaussian with a variance that increases in time, but the area under the curve diminishes approximately exponentially.

QUANTUM MECHANICAL STUDY OF THE HYDROGEN BIMOLECULAR EXCHANGE REACTION, by A. R. Ruffa and V. Griffing. [1961] [6]p. incl. diagrs. tables, refs. (AFOSR-4227) [AF 49(638)906] Unclassified

Also published in Jour. Chem. Phys., v. 36: 1389-1394, Mar. 1, 1962.

A theoretical calculation of the potential-energy curves of several linear 4-atom hydrogen complexes has been made in order to study the interaction governing the kinetics of the bimolecular exchange reaction. In particular, an attempt was made to determine for what distance of approach the 2 diatomic molecules make a transition into the 4-atom complex. Hence, the linear H_4 complex H—r—H—R—H—r—H was chosen for study as function of r and R. The partial potential energy surface constructed in this manner indicates that 2 hydrogen molecules approaching on a line experience an increase in interatomic separation with the inner 2 atoms forming a hydrogen molecule at small separations while the outer 2 atoms are repelled outward from the center of the system. The minimum occurs for r = R = 1.8 and gives an activation energy of 65 kcal for the bimolecular exchange reaction, if one assumes a linear transition state. An additional calculation was performed on a linear chain of 6 hydrogen atoms with interatomic separation of 2 atomic units in order to get additional information regarding the relative stability of the linear hydrogen chain in comparison with other possible configurations. Computation of the total energies in the LCAO MO SCF approximation with 1s functions indicates that the energies of the chains of 4 or 6 hydrogen atoms generally lie between the energies of the separated hydrogen molecules and the separated hydrogen atoms. EFFECT OF OXYTOCIN STRUCTURAL CHANGES ON RAT RENAL EXCRETION OF Na, K, AND WATER, by R. Rosas, L. Barnafi, and others. [1961] [4]p. incl. diagrs. refs. (AFOSR-843) (AF 49-(638)584) Unclassified

Also published in Amer. Jour. Physiol., v. 202: 901-904, May 1962.

The common action of oxytocin on the smooth musculature of the uterus and on the renal excretion of sodium, potassium, and water suggests a relationship between the 2 effects. In order to investigate this possibility, the action of oxytocin treated with chymotrypsin and with sodium thioglycollate on sodium, potassium, and water excretion was studied. These agents greatly reduce the uterotonic activity of the hormone as well as its effect on electrolyte and water excretion in rats. Equivalent uterotonic doses of oxytocin, Val_3-oxytocin, and Phe2-Tyr_3-oxytocin were assayed on the excretion of electrolytes and water. Excretion of sodium and potassium produced by Val_3-oxytocin was less than that produced by oxytocin. Phe2-Tyr_3-oxytocin was approximately one-ninth as active as oxytocin in this respect. In studies with low doses of oxytocin it was established that 0.25 mu (0.005 μg) was necessary to increase sodium excretion while 0.5 mu had to be administered in order to increase potassium as well.

EFFECT OF VASOPRESSIN STRUCTURAL MODIFICATIONS ON RAT RENAL EXCRETION OF Na, K, AND WATER, by L. Barnafi, R. Rosas and others. [1961] [4]p. incl. diagr. table, refs. (AFOSR-3183) (AF 49(638)584) AD 612339 Unclassified

Also published in Amer. Jour. Physiol., v. 202: 593-596, Mar. 1962.

Lys8-vasopressin was incubated with trypsin, chymotrypsin, and sodium thioglycollate, and the resultant modification of the effect of the hormone on sodium, potassium, and water excretion was studied. These agents, which destroy the antidiuretic-pressor activity of the hormone, also bring about a loss of its natriuretic and kaliuretic effects. The action of Arg8-vasopressin, Phe2-Lys8-vasopressin, and His2-Lys8-vasopressin on sodium, potassium, and water excretion was studied; comparisons were made with the effects of equivalent pressor doses of Lys8-vasopressin. No significant differences between Arg8- and Lys8-vasopressin were obtained. Phe2-Lys8-vasopressin had nearly 10 times the antidiuretic effect and 4 times the natriuretic and kaliuretic effect. Even though His2-Lys8-vasopressin has an antidiuretic effect, it lacks activity with regard to blood pressure or electrolyte excretion. (Contractor's abstract)

SLOW WAVES AND ASSOCIATED SPIKING IN NERVE CELLS OF APLYSIA, by A. Arvanitaki and N. Chalazonitis. [1961] 15p. incl. illus. refs. (AFOSR-3415) (AF EOAR-61-30) Unclassified

Also published in Bull. Inst. Oceanog. (Monaco), No. 1224: 1-15, Dec. 14, 1961.

The purpose of this work was to investigate patterns of activity of the giant nerve cells of the isolated Aplysia's visceral ganglia (especially Br-type nerve cells). The spontaneous activity of the giant A cell (on the surface of the parieto-branchial ganglion near the origin of the pleuro-branchial connective was characterized by constant low frequency of the order of 1/sec, rapid (8-10 msec duration), full-sized spikes (~ 90 mv) preceded by a prepotential and followed by a hyperpolarizing afterpotential. In contrast the giant ganglion cells visible on the parieto-visceral ganglion at the origin of the genital and the anal nerves were characterized by an arrhythmic type of spontaneous activity. The Br soma repeated spontaneously, at regular intervals, a slow signoidal wave of depolarization. If the maximum rate of rise did not exceed 20 mv/sec and the maximum amplitude remained below 20 mv, no firing of spikes was observed. The slow depolarizing wave was then subliminal. If the depolarization developed with a threshold rate, a train of spikes was elicited and reached a maximum frequency of 3/sec to 20/sec according to the preparation. Any increase in the membrane potential reduced the rate of the depolarizing slow wave, decreased the frequency of the patterns, and later on, the spontaneous activity ceased. Any decrease in the membrane potential increased the frequency patterns by inhibiting the repolarizing wave to the point that emission of spikes became continuous.

SLOW CHANGES DURING AND FOLLOWING REPETITIVE SYNAPTIC ACTIVATION IN GANGLION NERVE CELLS, by N. Chalazonitis and A. Arvanitaki. [1961] 23p. incl. illus. refs. (AF EOAR-61-30) Unclassified

Published in Bull. Inst. Oceanog. (Monaco), No. 1225: 1-23, Dec. 27, 1961.

The visceral branchio-genital ganglion of Aplysia fasciata, depilans, or californica were submitted to excitatory or inhibitory synaptic actions at various frequencies. In certain cells, by repetitive activation at low frequencies it was possible to record the development of the excitatory postsynaptic potential (EPSP) from its classical transient "cuneiform" shape to a "rectangular" shape whose plateau was ~ 15mv amplitude. It was found that the responsiveness (or excitability) of the cells increases to a maximum during the initial of the plateau and declines as the latter subsides. When the level of the subsiding plateau attains a threshold value, a rapid repolarization is initiated. When the nerve cell was subjected to a series of afferent volleys of subliminal synaptic efficiency at frequencies of 10/sec to 20/sec, a cumulative membrane depolarization was built up, soon reaching the threshold membrane potential for spike discharge. Following cessation of the EPSP bombardment 2 main modalities were observed: (1) the membrane remained for many seconds at a depolarized level, to the extent that the cell continued to fire at a high frequency, and (2) a rapid repolarization and a transient rebound, hyperpolarizing the membrane to a level 5 to 10 mv more positive than the peak of the spike positive afterpotential, developed. Successive inhibitory postsynaptic potentials (IPSP's) at high frequency resulted in a cumulative hyperpolarization which increased as a function of the frequency of the IPSP's. After cessation of the IPSP bombardment the membrane was observed to undergo (1) post-inhibitory long-lasting hyperpolarization and inhibition, and (2) post-inhibitory depolarizing rebound and spiking.

STUDY OF A THREE-DIMENSIONAL SEISMIC DETECTION SYSTEM, by J. E. Woodburn. Dec. 20, 1961, 15p. incl. diagrs. (Rept. no. P-5-61-4) (AF 49(638)-1084) AD 290385 Unclassified

A study of a 3-dimensional seismic detection system is described. The study had the following objectives: (1) the acquisition of 5 suitably spaced, deep (3900 ft or more) bore holes to be used in the construction of a 5-spot, 3-level, 3-dimensional seismic array; and (2) by means of quarry blasts or other types of chemical explosions, evaluate the following: (a) the ratio of background noise with depth; (b) signal-to-noise improvement in vertical arrays and the effect of compositing vertical or horizontal arrays as a means of increasing the signal-to-noise ratio; and (c) suitability of 3-dimensional arrays in determining direction and velocity of recorded pulses. A MODEL FOR CONDITIONING AND THE EFFECT OF SPACED TRIALS IN LEARNING, by H. D. Landahl. [1961] [5]p. (AFOSR-154) (AF 49(638)414) AD 260512 Unclassified

Also published in Bull. Math. Biophys., v. 23: 159-163, June 1961.

A mechanism is suggested in which a postulated substance can enter a synaptic region only during the simultaneous action of a conditioned and an unconditioned stimulus. If this substance remains and produces a physico-chemical change, then a consequence is that the degree of learning will depend on the spacing of conditioning trials and the time constant of the process will be related to the rate of diffusion or transport of the substance along the axon. MATHEMATICAL MODELS OF NEURONE INTERACTION, by H. D. Landahl. [1961] [7]p. (AFOSR-1131) (AF 49(638)414) Unclassified

Also published in Proc. Symposium on Switching Circuit Theory and Logical Design, Detroit, Mich., Oct. 17-20, 1961, p. 70-76.

With other than weak conditions of the parameters a neural element may have a behavior very different from its behavior as a logical element when the stimuli are weak. When the stimuli are strong its behavior can be approximated by a continuous model taking into account the average output rate and the author devises a mathematical expression for the average output frequency under such conditions. He then applies his model to a number of psychological properties such as the mechanism in response to curvature in movement, enhancement effects, flicker phenomena, discrimination and detection or real and apparent movement. Insight into certain types of psychological phenomena can be obtained by the study of neural nets made up of both logical and continuous elements.

A CANONICAL FORM FOR NERVE NETS WITHOUT CIRCLES, by J. Towber. [1961] [9]p. (AFOSR-1390) (AF 49(638)414) Unclassified

Also published in Bull. Math. Biophys., v. 24: 335-353, Sept. 1962.

By "neural net" will be meant "neural net without circles." Every neural net effects a transformation from inputs (i.e., firing patterns of the input neurons) to outputs (firing patterns of the output neurons). Two neural nets will be called equivalent if they effect the same transformation from inputs to outputs. A canonical form is found for neural nets with respect to equivalence, i.e., a class of neural nets is defined, no 2 of which are equivalent and which contains a neural net equivalent to any given neural net. AN HYPOTHESIS OF FREESE AND THE DNA-PROTEIN CODING PROBLEM, by R. Rosen. May 15, 1961, 14p. incl. refs. (AFOSR-976) (AF 49(638)917) AD 264447 Unclassified

Also published in Bull. Math. Biophys., v. 23: 305-318, Sept. 1961.

Freese's Hypothesis states that a single specific alteration in the sequence of nucleotides of an information-bearing DNA molecule results in a specific mutational effect. Within the framework of the DNA-protein coding problem developed elsewhere, and assuming the quasi-ergodicity of the general coding process, it is shown that Freese's Hypothesis allows us to derive expressions for the length of the smallest mutable DNA molecule and to obtain a bound for the maximal number of allelic molecules of fixed length. To illustrate these ideas, calculations are carried out on appropriate data from bacteriophage and man, and the results are shown to differ by a factor of 10 (modulo the rather crude approximations used). The implications of this result for the spontaneous aggregation of a sufficient number of information-bearing words to characterize an organism are discussed. (Contractor's abstract)

ON THE ROLE OF CHEMICAL SYSTEMS IN THE MICROPHYSICAL ASPECTS OF PRIMARY GENETIC MECHANISMS, by R. Rosen. [1961] [11]p. (AFOSR-977) (AF 49(638)917) Unclassified

Also published in Bull. Math. Biophys., v. 23: 393-403, Dec. 1961.

It is pointed out that 2 fundamentally different views of primary genetic processes occur in the literature which are frequently confused. The first is a true communication-theoretic view, which regards the genetic apparatus as containing a real information-source and a transducer which converts that information to useful form. The second view is generally expressed as a template scheme based on the Watson-Crick model; it is shown that in this model there is actually no such thing as genetic information in a communication-theoretic sense. Both views are then discussed on the basis of microphysical principles developed in previous work (Bull. Math. Biophys.,

v. 22: 227-255, 1960) in an attempt to find which approach is in closer accord with the biological facts. It is shown that, if the communication-theoretic view is correct, then the information-bearing object must act as a "catalyst," but it is pointed out that the type of catalysis involved must be of a fundamentally different nature than that occurring in familiar enzyme-catalyzed reactions. On the basis of general considerations of irreversible changes in microphysical measuring systems, it is shown that any type of template must suffer a gradual and irreversible denaturation, which seems to make it unlikely that a template could play a primary role in fundamental genetic processes. A NOTE ON ABSTRACT RELATIONAL BIOLOGIES, by R. Rosen. [1961] [8]p. (AFOSR-1943) (AF 49-(638)917) Unclassified

Also published in Bull. Math. Biophys., v. 24: 31-38, Mar. 1962.

It is shown that the class of abstract block diagrams of $(\mathfrak{M},\mathfrak{R})$-systems which can be constructed out of the objects and mappings of a particular subcategory $\mathcal{S}_0$ of the category $\mathcal{S}$ of all sets depends heavily on the structure of $\mathcal{S}_0$, and in particular on the number of sets of mappings H(A, B) which are empty in $\mathcal{S}_0$. In the context of $(\mathfrak{M},\mathfrak{R})$-systems, therefore, each particular category $\mathcal{S}_0$ gives rise to a different "abstract biology" in the sense of Rashevsky. A number of theorems illustrating the relation between the structure of a categroy $\mathcal{S}_0$ and the embeddability of an arbitrary mapping $\alpha \in \mathcal{S}_0$ into an $(\mathfrak{M},\mathfrak{R})$-system are proved, and their biological implication is discussed. THE ALGEBRAIC MECHANISM OF FIBER SPACES, by S. MacLane. Final rept. Oct. 1, 1955-May 31, 1961. June 1961, 12p. (AFOSR-1005) (AF 18(600)-1383) AD 261852 Unclassified

This research has been concerned with a variety of topics in algebra and in topology related to its main objectives. The present summary of the various investigations is classified by subject matter. The achievements of the project have included publications in group theory, algebraic topology, twisted simplicial products, topology, homological algebra, lie groups, categorical theory of algebras, and cohomotopy multiplication in functional spaces. Two outstanding achievements which have had a major influence on the course of mathematical research are J. F. Adams on Hopf Invariant one and John Thompson on the Frobenius problem.

THE HOMOLOGY OF TWISTED CARTESIAN PRODUCTS, by R. H. Szczarba. [1961] [20]p. incl. refs. [AF 18(600)1383] Unclassified

Published in Trans. Amer. Math. Soc., v. 100: 197-216, Aug. 1961.

Let X and F be simplicial sets and let $X \times_\tau F$ be their twisted cartesian product with respect to a simplicial group G acting on F and a twisting function τ: X → G. In Guggenheim's paper (Illinois Jour. Math., v. 4: 292-311, 1960) it is shown by means of acyclic models that there is a twisting cochain φ : C(X) → C(G) (C denotes the associated chain complex) so that $C(X \times_\tau F)$ and the twisted tensor product $(C X)_\varphi \otimes C(F)$ (Ann. Math., v. 69: 223-246, 1959) are chain equivalent. In this paper an explicit construction is given by means of which φ may be obtained from τ. This construction is used to obtain some partial results concerning the ring structure of the cohomology groups of a fibre space over a sphere. (Math. Rev. abstract)

ON TRANSITIVE SIMPLE GROUPS OF DEGREE 2p, IN WHICH THE NORMALIZER OF A SYLOW p-SUBGROUP HAS ORDER 2p, by N. Ito. June 1961, 21p. incl. refs. (AFOSR-911) (AF 49(638)858) AD 261075 Unclassified

Also published in Math. Zeitschr., v. 78: 453-468, Mar. 1962. (Title varies)

Two theorems are proven concerning G, a transitive permutation group, on omega, a set of symbols 1, . . . , 2p, where p is an odd prime number. In G, which is a simple group, the normalizer of a Sylow p-subgroup has order 2p. Theorem I: If G is doubly transitive on omega, then G is isomorphic to the linear fractional group LF(2, q) with q + 1 equal to 2p. Theorem II: If G is not doubly transitive on omega, then p equals 5 and G is isomorphic to the icosahedral group.

ON A CLASS OF DOUBLY TRANSITIVE PERMUTATION GROUPS, by N. Ito. [June 1961] [16]p. (AFOSR-936) [AF 49(638)858] AD 261074 Unclassified

Also published in Illinois Jour. Math., v. 6: 341-352, June 1962.

Let G be a doubly transitive permutation group on m + 1 in which no non-trivial permutation leaves three symbols fixed. Such a group is called a Zassenhaus group. It is known that $m = p^e$ for some prime p, and furthermore, if G is not isomorphic to a known group, then the Sylow p-group of G is non-abelian and satisfies certain conditions. Theorem: If G is a Zassenhaus group, and if $p \neq 2$, then the Sylow p-group of G is abelian. This theorem, together with the above mentioned result and a recent result of Suzaki yields a complete classification of Zassenhaus groups. The proof is very ingenious and uses some detailed information about the character of G. At one point it is necessary to use the fact that a p-block of defect d contains at most p^{2d-2} ordinary irreducible characters. If p^{2d-2} could be replaced by the conjectured bound p^d, then the proof of the above mentioned theorem could be considerably simplified. (Math. Rev. abstract)

ON A FINITE GROUP WITH A PARTITION, by M. Suzuki. [1961] [14]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)858 and National Science Foundation) Unclassified

Published in Arch. Math., v. 12: 241-254, 1961.

A non-trivial partition of a group G is a collection $\{U_i\}$ of proper subgroups U_i of G such that every element ≠ 1 in G is contained in one and only one subgroups U_i. The group U_i are called the components of the partition. A partition is normal if conjugation by any element of G permutes the components. A partition is nilpotent if every component is nilpotent. Theorem: A finite non-solvable group G has a non-trivial partition if and only if G is isomorphic to one of PGL(2, q), PSL(2, q) with q ≥ 4 or G(q). Here G(q) denotes the family of simple groups discovered by the author previously. By using a result of Kegel it is quickly shown that a finite non-solvable group G with a non-trivial partition has a normal nilpotent partition. Let G be a finite non-solvable group with a normal nilpotent partition. The case that G has odd order is eliminated by using a modification of an unpublished argument of the reviewer (W. Feit) and J. G. Thompson in conjunction with the fact that some non-identity element of G has a non-nilpotent centralizer. The case that G has even order is dealt with by appealing to several structure theorems. THE DETERMINATION OF THE ASSIGNMENT OF TRIPLET STATES IN CATACONDENSED AROMATIC HYDROCARBONS, by D. R. Kearns. [1961] [47]p. incl. diagrs. tables, refs. (AFOSR-1233) (AF 49-(638)923) AD 450831 Unclassified

Also published in Jour. Chem. Phys., v. 36: 1608-1621, Mar. 1962.

The assignment of the triplet states in benzene plays a central role in the determination of the assignment of triplet states of all catacondensed aromatic hydrocarbons. In this paper 2 tests of the assignment of triplet states, based on (1) the prediction of triplet state energies in catacondensed aromatic hydrocarbons calculated using a perimeter model developed by Moffitt, and (2) the prediction of the lowest singlet-triplet transitions in substituted benzenes calculated using perturbation theory, are developed and applied to existing data. The above tests are in agreement with the generally accepted assignment in which the lowest triplet state in benzene as well as the linear catacondensed aromatic hydrocarbons is assigned to ^3L_a. The first test virtually rules out all alternative assignments. The second test is consistent with the favored assignment and provides fairly strong evidence against the assignment which, on theoretical grounds, is considered the next most likely assignment (lowest triplet state in benzene assigned ^3L_b). More crucial experiments are proposed which should lead to an even more definitive selection of the correct assignment of the triplet states in the catacondensed aromated hydrocarbons. (Contractor's abstract)

LEARNED RESPONSES ELICITED BY ELECTRICAL STIMULATION OF AUDITORY PATHWAYS (Abstract), by W. D. Neff, P. C. Nieder, and R. E. Oesterreich. [1959] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)99] and Office of Naval Research) Unclassified

Presented at Eighty-second meeting of the Amer. Physiol. Soc., Atlantic City, N. J., Apr. 13-17, 1959.

Published in Fed. Proc., v. 18: 112, Mar. 1959.

Bipolar electrodes have been implanted at medullar, tectal, and cortical levels of the auditory pathways of the cat. In some animals conditioned avoidance responses were established to a series of clicks (100 per sec) presented over a loudspeaker. Test trials were then conducted in which auditory pathways were directly stimulated by short pulses at a similar frequency. In a number of cases the response conditioned to sound was elicited immediately by the direct stimulation of the auditory neural pathways. The converse procedure, conditioning to electrical stimulation of auditory pathways and testing for response to sound stimuli, has also produced positive results.

THE DISTRIBUTION OF TRAPPED PARTICLES IN A CHANGING MAGNETIC FIELD, by E. N. Parker. Feb. 1961 [37]p. incl. diagrs. refs. (Rept. no. EFINS-61-9) (AFOSR-402) (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)-666 and National Aeronautics and Space Administration under NsG-96-60) AD 261088 Unclassified

Also published in Jour. Geophys. Research, v. 66: 2641-2652, Sept. 1961.

The redistribution of charged particles in the mirror field $B(s,t) = B_0 T(t) [1 + [s/a(t)]^{\nu(t)}]$ is worked out for slow changes in T(t), a(t), and $\nu(t)$. It is found that increasing T(t) gives a relatively greater particle density increase in the center of the field than deep in the mirrors $s >> a(t)$. The mirror distance retracts like $1/T^{1/(\nu+2)}$. Decreasing a(t) has the opposite effect. Field variations constrained to preserve $T(t)a^2(t)$ and $\nu(t)$ leave the form of the particle distribution unchanged, increasing the density everywhere by the same factor. Comparing the theoretical results with the analysis by Fan, Meyer, and Simpson (Jour. Geophys. Research, v. 66: 1961) of the large changes in the outer Van Allen radiation zone during the magnetic activity of Aug. 1960 shows that the changes in the particle density can be explained by a small increase of T(t) with a(t) fixed, and later by a decrease of a(t) so that $T(t)a^2(t)$ approximates to its initial value. No irreversible particle injection or acceleration appears necessary to explain the changes in the radiation zone. (Contractor's abstract)

THE STELLAR WIND REGIONS, by E. N. Parker. Nov. 1960 [53]p. incl. diagrs. refs. (AFOSR-403) (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)666 and National Aeronautics and Space Administration under NsG-96-60) AD 261089 Unclassified

Also published in Astrophys. Jour., v. 134: 20-27, July 1961.

From the observations of the solar wind and of the M-giant α-Herculis the gross dynamical features of the stellar wind regions associated with class G main sequence and M-giant stars are given for various interstellar environments. The supersonic wind from a class G star undergoes a shock transition to subsonic flow at a radial distance of 10^2-10^3 a.u. and may extend many times farther as a subsonic flow. This subsonic flow will be subject to turbulence and other instabilities in many cases. The wind from an M-giant may extend many parsecs if the M-giant phase of evolution lasts long enough for its wind to approach equilibrium; the resultant interstellar contamination and heating is important for a distance of many parsecs. A rough calculation of the cavity formed by a stellar wind in a large-scale interstellar field is carried out, and it is found that the cavity shape and dimensions for stationary flow depend upon the back pressure at infinity. As the pressure increases, the cavity changes from a circular cylinder of infinite radius, through an increasingly bulbous shape of finite radius, to a sphere of infinite radius with one finite cylindrical channel from each pole. HYDROSTATIC PROPERTIES OF AN IONIZED ATMOSPHERE, by E. N. Parker. Feb. 1961 [16]p. incl. diagrs. (Rept. no. EFINS-61-14) (AFOSR-404) (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)666 and National Aeronautics and Space Administration under NsG-96-60) AD 261090 Unclassified

It is shown that the electrostatic field in an ionized atmosphere causes ions of different charge and mass to concentrate at different levels. Thus, for instance, if the solar corona is sufficiently quiet as to permit an approach to equilibrium, its composition is stratified and not at all typical of the true solar composition. On the other hand, in the presence of sufficient stirring to maintain chemical homogeneity it is shown that the settling of helium ions through the hydrogen corona toward their lower equilibrium level is a powerful heating mechanism. It is shown that the ionized atmosphere of a hypothetical helium star will eject protons into space with a velocity of the order of the gravitational escape velocity (energies of the order of kv) (Contractor's abstract)

COSMIC-RAY PRODUCTION OF LOW-ENERGY GAMMA RAYS, by F. C. Jones. Jan. 1961 [63]p. incl. diagrs. refs. (Rept. no. EFINS-61-3) (AFOSR-405) (AF 18(600)666) AD 261091 Unclassified

Also published in Jour. Geophys. Research, v. 66: 2029-2042, July 1961.

An attempt was made to detect and measure any vertically incident flux of low-energy (0.25 - 10 mev) γ-rays that might be present at high altitudes. A series of balloon flights were made carrying a phoswitch gamma spectrometer with pulse height recording to altitudes of approx 5.5 g/cm^2 atmosphere depth. Directional sensitivity was obtained by placing a lead collimating shield around the detector and by periodically opening and closing a lead shutter above the opening of the shield. At altitudes between 5.4 and 6.0 g/cm^2 atmospheric depth the experiment yielded a value of 0.000 ± 0.034 photons sec^{-1} cm^{-2} sterad^{-1} for the vertical flux of γ-rays in the vicinity

of 0.5 mev energy. This is a null result; however, it places a new upper limit on the vertical γ-ray flux which is lower than any previously reported for this energy region. At lower altitudes it was observed that γ-rays are generated by cosmic rays in the atmosphere and in the collimating lead shield. At an atmospheric depth of 300 g/cm^2 the flux of γ-rays from the atmosphere was about 0.3 photons sec^{-1} cm^{-2} sterad^{-1}. Convincing evidence was found that the γ-rays of atmospheric origin were generated by the secondary nucleonic component and that they are not genetically related to the electromagnetic or "soft" component of the secondary cosmic rays. THE OBSERVED OUTER BELT ELECTRON DISTRIBUTION AND THE NEUTRON DECAY HYPOTHESIS, by W. N. Hess, J. Killeen and others. May 1961 [7]p. incl. diagr. (Rept. no. EFINS-61-26) (AFOSR-866) (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)366, Atomic Energy Commission, and National Aeronautics and Space Administration) Unclassified

Also published in Jour. Geophys. Research, v. 66: 2313-2314, Aug. 1961.

Measurements of electron flux along a line of force in the outer radiation belt are compared with calculations which assume that all electrons are injected by neutron decay. The comparison shows that the 2 distributions are entirely different at intermediate and low latitudes where corrections are unimportant. It is concluded that other processes in addition to electron injection by neutron decay are necessary to explain the experimentally observed flux distribution along a line of force. Presented at Internat'l. Conf. on Cosmic Rays and the Earth Storm, Kyoto (Japan), Sept. 4-15, 1961.

Also published in Jour. Phys. Soc. Japan, v. 17: Supp. A-II: 154-161, Jan. 1962. (Title varies)

From an analysis of electron measurements in the Explorer VI satellite (Aug. 7-Oct. 6, 1959) four time-dependent parameters have been investigated which characterize the outer electron belt. They are: (1) the equatorial electron intensity I_c, (2) the equatorial range from the earth R_0 of the peak intensity, (3) the electron density distribution along a line of force through the intensity peak, and (4) a measure of the change in electron spectrum with time. These parameters along with measurements of magnetic field intensity make it possible to study the origin of the changes in electron intensity and distribution which are known to occur in the outer belt. Several magnetic storms occurred during the observation on Explorer VI. Within the sequence of changes in the outer belt induced by these geomagnetic storms, there are some changes of the parameters which are accounted for only by invoking an irreversible energy gain or loss within the outer belt. The energy gain process appears to be through irreversible local acceleration of electrons. The energy loss process leads to a stable mirror point distribution characteristic of the periods between geomagnetic storms. The time intervals are identified within which each of these processes is operative. Reversible processes are possibly the cause for other changes. The foregoing analysis rests upon the proof given in this paper that the outer belt peak intensity coincides over a wide range of geomagnetic latitudes with magnetic field lines of force in the centered dipole approximation. Consequently, the measured electron intensity maximum is used as a tracer of the geomagnetic field lines of force for analyzing changes in the outer belt with time. It is shown that even during geomagnetic storms the trace of the electron intensity maximum followed a centered dipole line of force. This indicates that at all times the particle energy density of the radiation belt is much less than the energy density of the magnetic field in the region. The electron fluxes, high energy proton fluxes and possible electron spectra are investigated. Two distinct peaks of electron intensity are identified to persist in the outer belt for about two months, and it is shown that these peak distributions undergo radial motion during geomagnetic disturbances. PRIMARY COSMIC-RAY AND SOLAR PROTONS, by R. Vogt. [1961] [48]p. incl. diagrs. tables, refs. (Rept. no. EFINS-61-43) (AFOSR-1662) (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)666, National Science Foundation under G7629 and G14669, and Office of Naval Research under Nonr-(G)-00010-60) Unclassified

Also published in Phys. Rev., v. 125: 366-377, Jan. 1, 1962.

A study of the low-energy portion of the primary cosmic-ray proton spectrum was made in Aug. and Sept. 1960. A significant flux of primary protons with energies below 500 mev were detected, which previously had been considered absent. This result is of importance to astrophysical considerations as it imposes restraints upon possible modulation mechanisms should these particles be of galactic origin. The alternate possibility, namely of solar origin of

these particles is also discussed. The observations were made in three high altitude balloon flights at geomagnetic latitudes $\lambda \geq 73°$ N. The results show that the low energy proton spectrum observed on quiet days may be represented by $dJ/dE = 2.3 \times 10^4 \times E^{-2}$ protons/m^2 sec-sr mev for $78 \leq E \leq 200$ mev and flattens between 200 and 350 mev. On Sept. 8, 1960, the observed proton flux between 70 and 350 mev was several times larger than on quiet days. These protons are believed to have been produced by a class 3 flare on Sept. 3, 1960. Their energy spectrum has been measured. (Contractor's abstract)

THE PRIMARY COSMIC-RAY ELECTRON FLUX DURING A FORBUSH-TYPE DECREASE, by P. Meyer and R. Vogt. [1961] [9]p. incl. diagrs. (Rept. no. EFINS-61-50) (AFOSR-1663) (Sponsored jointly by Air Force Office of Scientific Research under AF 18-(600)666, National Science Foundation, and Office of Naval Research) Unclassified

Also published in Jour. Geophys. Research, v. 66: 3950-3952, Nov. 1961.

Observations are described which indicate that if, during the Sept. 3, 1960 flare, electrons were produced on the sun, they were not stored in space like protons of similar rigidity. Since this does not appear plausible, the observation indicates that the flare did not lead to the emission of electrons. Also a Forbush decrease, which began about Sept. 4, 1960 and amounted to about 4% at high-latitude neutron monitor stations, and to about 9% for primary protons with energy greater than 350 mev, affected the primary electron component and reduced the electron flux by more than 40% in the rigidity range from 100 to 1000 mev. This suggests that the electrons observed at the earth have a history similar to the galactic protons and, therefore, a galactic origin. The possibility of solar emission with subsequent, temporary storage in space at other times is not excluded by these measurements.

THE EQUATORIAL PITCH ANGLE DISTRIBUTIONS OF ELECTRONS IN THE OUTER RADIATION BELT, by C. Y. Fan, P. Meyer, and J. A. Simpson. [1961] [9]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)666 and National Aeronautics and Space Administration under NASw-24) Unclassified

Published in Space Research II; Proc. Second Internat'l. Space Science Symposium, Florence (Italy) (Apr. 10-14, 1961), Amsterdam, North-Holland Publishing Co., 1961, p. 867-875.

It is shown that the Explorer VI satellite (Aug. 7 - Oct. 6, 1959) passes, for some orbital periods, along sections of a dipole line of force. This makes it possible to determine the electron intensity as a function of geomagnetic latitude along lines of force in the E_3 region of the outer Van Allen radiation belt. The electron pitch angle distributions are derived from these results. The analysis shows that (1) the equatorial pitch angle distribution for electrons moving in a tube of force with velocity v is peaked about an angle of ~35°, (2) a great increase of intensity observed by bremsstrahlung sensitive detectors is accompanied by a change in pitch angle distribution, (3) after the disturbed phase of a geomagnetic storm the pitch angle distribution returns to the prestorm distribution even though the number of electrons of velocity v has changed by a large factor. THE COSMIC RAY INTENSITY GRADIENT IN SPACE DURING SOLAR MODULATION, by J. A. Simpson, C. Y. Fan, and P. Meyer. [1961] [3]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific

Research under AF 18(600)666, Air Force Cambridge Research Center, and National Aeronautics and Space Administration) Unclassified

Presented at Internat'l. Conf. on Cosmic Rays and the Earth Storm, Kyoto (Japan), Sept. 4-15, 1961.

Published in Jour. Phys. Soc. Japan, v. 17: Suppl. A-II: 505-507, Jan. 1962.

Measurements of cosmic radiation intensity have been made to ~0.1 a.u. from the earth in Pioneer V for investigating the heliocentric properties of the 11 year and Forbush decrease modulations of cosmic ray intensity by magnetic fields in interplanetary space. It is shown that during a Forbush decrease at 0.03 a.u. the cosmic ray spectrum undergoes a sudden change wherein approx 10% of the total flux (mostly low energy particles) is removed from the spectrum. A second decrease at 0.1 a.u. (30 days later) shows that this low energy component does not return to the vicinity of Pioneer V. It is shown that this change in spectrum is important for determining the gradient of cosmic ray intensity in space at the time of solar maximum. The gradient for the 11 year intensity variation (0.0 ± 2.0) %/0.1 a.u. This result shows that if the cosmic ray flux at solar minimum approximates the galactic flux of cosmic rays, then the main heliocentric gradient in space lies beyond the orbit of the earth. SOME PROPERTIES OF THE PRIMARY COSMIC RAY ELECTRONS, by P. Meyer and R. Vogt. [1961] [4]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)666, National Science Foundation, and Office of Naval Research) Unclassified

Presented at Internat'l. Conf. on Cosmic Rays and the Earth Storm, Kyoto (Japan), Sept. 4-15, 1961.

Published in Jour. Phys. Soc. Japan, v. 17, Suppl. A-III: 5-8, Jan. 1962.

If, during the Sept. 3, 1960 solar flare, electrons were produced on the sun, they were not stored in interplanetary space like protons of similar rigidity. Since this does not appear plausible, the measurement indicates that the flare did not lead to an emission of electrons. A Forbush decrease which began on Sept. 4, 1960, and amounted to about 9% for primary protons with E > 350 mev, affected the primary electron component and reduced the electron flux by more than 40% in the rigidity range from 100 to 1000 mev. This strongly suggests that the electrons observed at the earth have a history which is similar to the galactic protons. The evidence, therefore, points to a galactic origin of the primary electrons. However, it does not exclude the possibility of solar emission with subsequent, temporary storage in interplanetary space at other times.

IDENTIFICATION OF HYPERNUCLEI $_{\Lambda}^{7}$Li BY K^- ABSORPTION ANALYSIS IN NUCLEAR EMULSION, (Abstract), by P. E. Schlein and W. E. Slater. [1960] [1]p. [AF 49(638)209] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1960.

Published in Bull. Amer. Phys. Soc., Series II, v. 5: 12, Jan. 27, 1960.

Analysis of the production reactions, (K^-,Σ^-) + emulsion nucleus → hypernucleus + residual particles, will often provide additional information for the identification of the heavier hypernuclei. In the work reported here the EFINS events from EFINS-NU collaboration were studied in order to investigate the extent to which production analysis would be generally useful in resolving certain hypernucleus-identification ambiguities. To be reported are (1) 3 examples of mesic $_{\Lambda}C^{12,13}$. One of these is a unique example of $_{\Lambda}C^{13}$ which probably decays into $N^{13} + \pi^-$ with $B_{\Lambda} = 10.8 \pm 0.6$ mev. (2) One new example of mesic $_{\Lambda}B^{12}$ with $B_{\Lambda} = 9.9 \pm 0.6$ mev, production analysis of a $_{\Lambda}B^{11}$ event and an example of nonmesic $_{\Lambda}B^{12}$. (3) One example of $_{\Lambda}Be^{8,9}$ whose Λ^0 is produced in a 2-nucleon primary reaction $K^- + 2H^1 \rightarrow \Lambda^0 + H^1 + 317$ mev. This hypernucleus is most probably produced in C^{12}. (4) Production analyses of other heavy hypernuclei some of which have a bearing on the existence of Be^{10}. All heavy hypernuclei thus far analyzed have been produced in C^{12} or O^{16}.

IDENTIFICATION OF HEAVY HYPERNUCLEI FROM K^- CAPTURE BY PRIMARY STAR ANALYSIS, by P. E. Schlein and W. E. Slater. [1961] [24]p. incl. illus. diagrs. tables, refs. (AFOSR-775) (AF 49-(638)209) Unclassified

Also published in Nuovo Cimento, Series X, v. 21: 213-234, July 16, 1961.

Several hypernuclei of $A \geq 7$ have been unic ely identified from an analysis of the parent K^- capture reactions. This method has proved of great value in the choice of the correct identity when the decay process offered various alternative interpretations. An example of the decay $C^{13}_{\Lambda} \rightarrow \pi^- + N^{13}$, $B_{\Lambda} = (10.8 \pm 0.5)$ mev has been thus identified for the first time. A second example of the decay $B^{12}_{\Lambda} \rightarrow \pi^- + 3\,He^4$, $B_{\Lambda} = (9.9 \pm 0.6)$ mev is reported here, confirming the previous observation of this hypernuclide. Some progress is made in resolving the composition of a group of heavy two-body decays. None of the events studied here is inconsistent with K^- capture on light nuclei (C, N, O); two events require a two-nucleon capture process. (Contractor's abstract)

PRODUCTION OF HYPERFRAGMENTS FROM K^- CAPTURE IN NUCLEAR EMULSION (Abstract), by O. Skjeggestad, R. G. Ammar and others. [1961] [1]p. [AF 49(638)209] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 291, Apr. 24, 1961.

K^- capture stars emitting mesic hyperfragments (HF) were studied in an attempt to understand the mechanism of their production. Out of a total of 436, 390 were found in a stack of standard K5 and L4 emulsion (EFINS-NU collaboration), and 46 were in a stack of K5 2X diluted emulsion. In addition, about 120 K^- stars yielding Li^8 fragments were considered. A separation between captures in light and heavy elements has been achieved making use of the prong-range cutoff arising from the Coulomb barrier of Ag and Br. Lower limits for HF emission from light elements are 50, 70, 80, and 80% for $_{\Lambda}H$, $_{\Lambda}He$, $_{\Lambda}Li$, and Li^8. The range distributions on $\sim 60_{\Lambda}$ Li and ~ 100 Li^8 tracks are indistinguishable. Analogous results are obtained for the range distribution of $\sim 150_{\Lambda}$ He and of ~ 500 stable prongs of range < 150 μ (mostly α particles). The HF momentum was found to point preferentially opposite to that of the associated π or fast proton. Various hypotheses for the HF production mechanism are discussed.

SELF-DIFFUSION OF LEAD, THALLIUM AND BISMUTH IN THE SOLID LEAD-THALLIUM SYSTEM, by H. A. Resing and N. H. Nachtrieb. [1960] [17]p. incl. diagrs. tables, refs. (AFOSR-3425) (AF 18-(600)1489) AD 615193 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 21: 40-56, 1961.

Results are reported for the self-diffusion of both lead and thallium over the whole range of solid solution for these elements (0-87 at-% Tl) for the temperature interval 206-323°C. Data for the trace impurity diffusion of bismuth over the same concentration range are also given for a more limited temperature range. All 3 elements show the same qualitative dependence of their diffusion coefficient upon alloy composition: namely, a slight max at about 35 at-% thallium and a deep min at about 75% at-% thallium at all temperatures. The results are compared with the predictions of the corresponding states principle and with theories based upon the Johnson vacancy-solute complex mechanism. A correction applied to the corresponding states principle, based upon lattice parameter deviations from Vegard's law, leads to agreement with observation. Some evidence for the existence of a superlattice at alloy compositions in the neighborhood of $PbTl_7$ is inferred from trends in the ratios D_{Tl}/D_{Pb} and D_{Bi}/D_{Pb} with thallium concentration. EFFECT OF UNIAXIAL COMPRESSION ON IMPURITY CONDUCTION IN n-TYPE GERMANIUM, by H. Fritzsche. Oct. 17, 1961 [36]p. incl. diagrs. tables, refs. (AFOSR-1621) (AF 49(638)802) Unclassified

Also published in Phys. Rev., v. 125: 1552-1560, Mar. 1, 1962.

Shear strains, which change the donor wave functions, greatly affect impurity conduction, which depends sensitively on the wave function overlap of neighboring impurity states. Using uniaxial compression along [111] investigation was made as a function of stress of the critical impurity separation d_c for the transition from non-metallic to metallic conduction and impurity conduction in the intermediate concentration range $7 \times 10^6 < N < 3 \times 10^7$ cm^{-3}. The largest stress applied was 2×10^9 dyne cm^{-2}. The main effect of stress is a change of the activation energy ε_2 of impurity conduction. In arsenic and phosphorus-doped germanium [111] compression decreases ε_2 and increases d_c. In antimony-doped germanium the opposite is observed. At 1.2°K [111] compression can increase the resistivity of antimony-doped germanium by a factor of 10^7. Using the same orientation and temperature, a decrease of the resistivity of arsenic-doped germanium by a factor of 5×10^{-4} is observed. These results suggest that the activation energy ε_2 depends strongly on the wave function overlap and shear strains change the donor wave functions originating from the individual valleys by an amount which is proportional to the valley-orbit splitting of the donor element. EFFECT OF STRESS ON THE DONOR WAVE FUNCTIONS IN GERMANIUM, by H. Fritzsche. Oct. 17, 1961 [32]p. incl. diagrs. table, refs. (AFOSR-1622) (AF 49(638)802) Unclassified

Also published in Phys. Rev., v. 125: 1560-1567, Mar. 1, 1962.

The effect of the corrections to the effective mass approximations on the stress dependence of the donor wave functions has been reexamined. It is found that not only the relative valley contributions to the ground state wave function are changed by the stress but also the individual envelope functions $F_j(r)$ which originate from the j conduction band valleys. The stress dependence of the $F_j(r)$ depends strongly on the value of the valley-orbit splitting of the donor. This can explain qualitatively the different behavior of the piezo-resistance effect in the impurity conduction range of germanium doped antimony, arsenic, or phosphorus. The stress dependence of the hyperfine splitting of the electron spin resonance is shown to be very insensitive to the stress-induced changes in $F_j(r)$ except in the limit of very large stresses. THE THEORY OF IMPURITY CONDUCTION, by N. F. Mott and W. D. Twose. [1961] [57]p. incl. diagrs. tables, refs. (AFOSR-3359) [AF 49(638)802] AD 613743 Unclassified

Also published in Philos. Mag., Suppl., v. 10: 107-163, Apr. 1961.

Also published in Advances in Phys., v. 10: 107-163, Apr. 1961.

A theoretical study is made of one of the ways in which electricity can flow in a semiconductor containing impurities. The following topics are discussed: the model and a general discussion of impurity conduction, impurity wave functions, observations of impurity conduction, methods of calculating the electrical conductivity at low concentrations, the properties of a 1-dimensional disordered lattice, the interaction of localized carriers with lattice vibrations, calculations of impurity conduction, dependence of the transition concentration on degree of compensation, concentration at which transition occurs, and resistivity in the region of metallic conduction.

IMPURITY CONDUCTION IN STRAINED n-TYPE GERMANIUM (Abstract), by H. Fritzsche. [1961] [1]p. [AF 49(638)802] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 136, Mar. 20, 1961.

Impurity conduction of germanium doped with antimony or with arsenic has been measured as a function of uniaxial compression along [111]. Using Sb as donors the resistivity measured along [111] rises rapidly with increasing compression by more than a factor of 10^7 at low temperatures. Saturation is reached when the strain-induced shift of the conduction band valleys becomes larger than the valley-orbit splitting. The resistivity measured perpendicular to the stress direction remains almost unchanged. The resistivity anisotropies and resistivity changes are several orders of magnitude smaller in arsenic-doped Ge at comparable stresses. This is due to the larger valley-orbit splitting of As donors. These effects can be explained in terms of the strain-induced change of the impurity ground state wave function and of the low-temperature activation energy of impurity conduction.

USE OF GERMANIUM AS A SECOND SOUND RECEIVER, by H. A. Snyder. [1961] [3]p. incl. diagr. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)802 and National Science Foundation under NSFG-15538) Unclassified

Published in Rev. Scient. Instr., v. 33: 467-469, Apr. 1962.

It is shown that doped germanium crystals can be used as second sound receivers. Their frequency response, sensitivity, and noise level have been measured for samples of several thicknesses. By comparing the results with the corresponding values found in other types of second sound receivers, it is concluded that germanium receivers are superior to the other types in common use for applications below 10 kc.

KINETIC THEORY OF IDEAL IONIC MELTS, by S. A. Rice. [1961] [12]p. incl. refs. (AFOSR-1776) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-52 and Petroleum Research Fund) Unclassified

Also published in Trans. Faraday Soc., v. 58: 499-510, Mar. 1962.

The kinetic theory of molten salts is considered from the point of view of the model fluids proposed by Rice and Allnatt, and Rice and Kirkwood. An ideal ionic melt is defined as a useful reference system with the

definition chosen to make the melt equivalent to a one component system. In an ideal ionic melt the interionic pair potential is defined as the sum of 3 terms: a coulomb attraction (repulsion), a Van der Waals interaction, and a rigid core repulsion. All rigid cores are taken to be the same, as are all polarizabilities. The effect of polarization appears in a dielectric constant. It is shown that the coulomb potential causes only slow dissipation of energy and therefore that the transport properties of the melt are largely determined by short-range forces. A comparison is then possible of, say, the properties of liquid argon and molten KCl. The self-diffusion constant, viscosity and thermal conductivity of an ideal ionic melt, approximately representative of KCl, are computed and shown to be in good agreement with experiment. ON THE KINETIC THEORY OF DENSE FLUIDS. IX. THE FLUID OF RIGID SPHERES WITH A SQUARE-WELL ATTRACTION, by H. T. Davis, S. A. Rice, and J. V. Sengers. [1961] [24]p. incl. refs. (AFOSR-1779) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-61-52] and Petroleum Research Fund) Unclassified

Also published in Jour. Chem. Phys., v. 35: 2210-2233, Dec. 1961.

Using methods previously introduced, the statistical theory of a dense fluid of molecules interacting with a square-well potential is discussed. The argument proceeds via the derivation and solution of a modified Boltzmann equation. The theory is used in 2 ways: (a) to provide a test of the theory proposed by Rice and Allnatt; and (b) to estimate the attractive force contribution to the transport of momentum and energy in a real fluid. The approach of Rice and Allnatt is shown to give a friction coefficient in agreement with experiment for liquid argon. The presence of the attraction has a marked effect on the transport of momentum and energy, and the square-well-model fluid gives a surprisingly accurate representation of the properties of liquid argon. The computed thermal conductance and self-diffusion coefficient are in agreement with experiment. (Contractor's abstract, in part)

A CONJECTURE CONCERNING THE ELECTRICAL CONDUCTANCE OF METAL-MOLTEN SALT MIXTURES, by S. A. Rice. [1961] [6]p. incl. refs. (AFOSR-1780) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-52, National Science Foundation, and Petroleum Research Fund) Unclassified

Also published in Faraday Soc. Discussions, No. 32: 181-187, 1961.

It is proposed that the excess electrical conductance in an atomically dispersed solution of metal atoms in a molten parent metal halide arises from a random walk of the electron between atom and metal ions. The resonant charge transfer is considered for the cases when the anion does and does not act as a mediating bridge. The order of magnitude of the computed electron mobility is in accord with experiment, as is the qualitative nature of the concentration dependence of the excess conductance. The computations do not permit a definite decision as to whether or not the anion plays a role in the conductance. (Contractor's abstract)

AN ACOUSTIC CONTINUUM MODEL OF MOLECULAR FRICTION IN SIMPLE DENSE FLUIDS, by S. A. Rice. [1961] [6]p. incl. refs. (AFOSR-1781) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-61-52] and Petroleum Research Fund) Unclassified

Also published in Molec. Phys., v. 4: 305-310, July 1961.

An acoustic model is presented with the aim of calculating an upper bound for the molecular friction constant. Problems arising from the use of macroscopic boundary conditions at molecular surfaces are circumvented by treating the molecule in a continuum as a distributed force center modifying the propagation of acoustic waves. The computed friction constant is a factor of 2 larger than experiment. Physical arguments are given for the validity of the relation, $\zeta_0 < \zeta$ (real system) $< \zeta$ (acoustic). Other acoustic models are briefly discussed. (Contractor's abstract)

KINETIC THEORY OF DENSE FLUIDS. X. MEASUREMENT AND INTERPRETATION OF SELF-DIFFUSION IN LIQUID Ar, Kr, Xe, AND CH_4, by J. Naghizadeh and S. A. Rice. [1961] [11]p. incl. diagrs. tables, refs. (AFOSR-1873) (AF AFOSR-61-52) Unclassified

Also published in Jour. Chem. Phys., v. 36: 2710-2720, May 15, 1962.

The self-diffusion coefficients of Ar, Kr, Xe, and CH_4 have been measured as functions of temperature and pressure and the data used to examine critically the current theories of diffusion. It is found that: (1) The self-diffusion coefficients of Ar, Kr, and Xe fit one corresponding states relationship, and this relationship differs from that needed to fit the observed diffusion coefficients of CH_4. For Ar, Kr, and Xe:

$\log\tilde{D} = 0.05 + 0.07\tilde{p} - (1/\tilde{T})(1.04 + 0.1\tilde{p})$, with $\tilde{D}$, $\tilde{T}$,

$\tilde{p}$ the reduced diffusion coefficient, temperature and pressure. (2) The free volume theory of diffusion is inadequate to describe the observations. (3) The volume of activation for CH_4 is 1/3 of the molar volume, while for Ar, Kr, and Xe it is 1 molar volume or larger. This observation is related to the steepness of the intermolecular repulsion, as is the deviation of CH_4 from the corresponding states curve determined by Ar, Kr, and Xe. (4) The dominant temperature dependence of D arises from the correlation between successive increments in momentum. In describing molecular motion it is necessary to include negative portions of the momentum autocorrelation function. A simple fluid continuum model appears to be accurate in describing momentum correlations. Calculations of D and (d lnD/dT) are in good agreement with experiment. (5) The dense square-well fluid provides a zeroth-order approximation to real fluids. The computed temperature dependence of D is in quantitative agreement with experiment, but the computed values of D are in error by about 30%. (Contractor's abstract)

CONCENTRATION DEPENDENCE OF THE FRICTIONAL COEFFICIENT OF POLYMERS IN SOLUTION, by H. Yamakawa. [1961] [7]p. incl. diagr. tables, refs. (AFOSR-1882) (AF AFOSR-61-52) Unclassified

Also published in Jour. Chem. Phys., v. 2995-3001, June 1, 1962.

The frictional coefficient of chain polymers at finite concentrations is calculated on the basis of the Kirkwood-Riseman approach taking into account the intramolecular and intermolecular hydrodynamic interactions. The intermolecular potential energy of Flory and Krigbaum is employed for the calculation of the perturbation velocity produced in the neighborhood of one molecule by the presence of another. Difficulties arising from an improper integral encountered in the intermolecular treatment of the viscosity to the Stokes approximation do not occur in the present problem. Evaluation is carried out up to the term linear in concentration, and the final expression is rewritten in terms of the molecular parameters familiar in the recent dilute polymer solution theories. The results show that the frictional coefficient is initially independent of concentration at the theta temperature, and that the ratio of the coefficient of the linear term to the intrinsic viscosity takes a value of about 1.7 for good solvent systems. These conclusions are in agreement with the experimental observations. A detailed comparison with experiment is made for several systems. (Contractor's abstract)

STUDIES IN MOLECULAR STRUCTURE. V. COMPUTED SPECTROSCOPIC CONSTANTS FOR SELECTED DIATOMIC MOLECULES OF THE FIRST ROW, by S. Fraga and B. J. Ransil. [1960] [10]p. incl. diagrs. tables. (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)699], National Science Foundation, and Office of Ordnance Research) Unclassified

Published in Jour. Chem. Phys., v. 35: 669-678, Aug. 1961.

Limited LCAO MO functions were computed for several diatomic molecules at 4 different values of the internuclear distance near R_e, and the corresponding total energies fitted to a third degree polynomial in R.

Spectroscopic constants ω_e, $\omega_e x_e$, B_e, α_e, R_e, k_e were derived from the resulting potential curve and compared to observed values. The good agreement obtained in most cases suggests a valuable application of the self consistent field function. In addition, calculations were made for a few more values of the internuclear distance providing a potential curve over a reasonably broad range around R_e. (Contractor's abstract)

CONFIGURATION INTERACTION TREATMENT OF He_2 (Abstract), by P. E. Phillipson. [1961] [1]p. [AF 49(638)699] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 165, Mar. 20, 1961.

The repulsion energy between two normal helium atoms ($^1\Sigma_g$ of He_2) has been investigated by the method of configuration interaction. The wave function is expressed as a linear combination of determinantal configurations of the form $|\varphi_i\alpha(1)\,\varphi_i\beta(2)\,\varphi_j\alpha(3)\,\varphi_k\beta(4)| + |\varphi_i\alpha(1)\,\varphi_i\beta(2)\,\varphi_k\alpha(3)\,\varphi_j\beta(4)|$ where the φ's are symmetry orbitals constructed from Slater-type atomic orbitals (1s, 1s', $2p\sigma$, $2p\pi$). At several internuclear distances R between 0.5 A and ∞, the orbital exponents were independently varied to minimize the energy for a chosen set of configurations. Various types of wave functions were tried varying from one to 64 configurations. It was found that between 0.5 A and ∞ the repulsion energy (the difference between the energy at a given R and the separated atom energy) is quite constant at a given R over a range of optimized wave functions of various degrees of goodness. It appears that any improvement in the energy at a given R is compensated for by a quantitatively similar improvement in the separation energy so that the repulsion energy remains essentially the same. At 0.5 A, a repulsion energy of 27.71 ev was calculated using a 64-configuration wave function, and all wave functions tried gave an energy within 0.9 ev of this figure.

AN LCSTO SCF CALCULATION OF O_2 (Abstract), by S. Huzinaga. [1961] [1]p. [AF 49(638)699] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 165, Mar. 20, 1961.

The energies of the ground state $^3\Sigma_g^-$ of O_2 were computed at several interatomic distances by Roothaan's open-shell SCF method. Computations were made automatically by use of the McLean-Weiss Molecular SCF Program written for the Univac 1103-A computor. The basis functions used were 1s, 2s, $2p\sigma$, $2p\pi$ and $3d\pi$ STO's (Slater-type orbitals). Our main interest was in the polarization effect of $2p\pi$ due to $3d\pi$. The additional flexibility imparted to the π_u and π_g molecular orbitals yielded improvements of about 2 ev in the total energy and in the binding energy over the case of the so-called minimum set: 1s, 2s, $2p\sigma$ and $2p\pi$. Similar calculations were also made for F_2.

REPULSIVE INTERACTION BETWEEN TWO GROUND-STATE HELIUM ATOMS, by P. E. Phillipson. [1961] [12]p. incl. diagrs. tables, refs. (AFOSR-4031) (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)1068], Atomic Energy Commission, and Office of Naval Research) Unclassified

Also published in Phys. Rev., v. 125: 1981-1992, Mar. 15, 1962.

The repulsion energy between two ground-state helium atoms ($^1\Sigma_g^+$ state of He_2) has been investigated in the single-configuration MO (molecular orbital) approximation and then further refined to include the effects of electron correlation by the inclusion of superposition of configurations. In the former case, the wave function is expressed as a single antisymmetrized spin-orbital product (ASOP) of the form $|\sigma_g 1s(1)\alpha(1)\sigma_g 1s(2)\beta(2)\sigma_u 1s'(3)\alpha(3)\sigma_u 1s'(4)\beta(4)|$, where the MO's $\sigma_g 1s$ and $\sigma_u 1s'$ are approximated as the sum and difference of Slater-type orbitals (STO's) 1s and 1s', respectively, and the energy minimized with respect to the orbital exponents. In addition to the repulsion energy at small internuclear distances the slight polarization of the $\sigma_u 1s'$ MO effected by the ζ variation, permitted the single ASOP wave function to give indications of the Van der Waals energy minimum at large distances. The superposition of configurations treatment employed a linear combination of configurations constructed out of a 1s, 1s', $2p\sigma$, $2p\pi$ STO basis set, and at five internuclear distances R between 0.5 and 2.0 A, the STO orbital exponents were varied to minimize the energy. Various wave functions including from 10 to 64 electron configurations were tried, which were so chosen that the wave functions would go properly as $R \to 0$ into the ^1S ground-state function of beryllium and as $R \to \infty$ go into a product of two ^1S helium atom functions. The computed repulsion energies in the region $0.5 A \leq R \leq 1.0 A$ are 2.8 to 1.2 times higher than values deduced from experimental scattering data obtained previously, and since the difference between the lowest computed (64-configuration) energy and the estimated exact energy is much smaller than this, a reinvestigation of the scattering analysis is emphasized. STUDIES IN MOLECULAR STRUCTURE. VIII. He_2^{++} IN THE SINGLE- AND MANY-CONFIGURATION LCAO MO SCF APPROXIMATION, by S. Fraga and B. J. Ransil. [1961] [8]p. incl. diagrs. tables, refs. (AFOSR-4033) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)1068], National Science Foundation, and Office of Ordnance Research) Unclassified

Also published in Jour. Chem. Phys., v. 37: 1112-1119, Sept. 1, 1962.

Single- and many-configuration wave functions and their corresponding molecular energies are reported for the diatomic molecular ion He_2^{++} in the LCAO MO SCF approximation for a wide range of internuclear distances. A potential curve displaying a min at 0.71 A and a max at about 1.11 A is obtained with $\omega_e = 3295\ cm^{-1}$ and $D_e = 1.21$ ev. Comparison with potential curves and correlation energies computed by the more accurate methods of Kolos, Roothaan, Weiss, Yoshimine, and McLean are made. The results are discussed with reference to stability and occurrence of the ion. Correlation energy is computed as a function of internuclear distance and compared with the isoelectronic analog H_2.

SCF-LCAO-MO WAVE FUNCTION FOR THE $^1\Sigma_g^+$ GROUND STATE OF C_3, by E. Clementi and A. D. McLean. [1961] [3]p. incl. tables. (AFOSR-4034) (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)1068] and National Science Foundation) Unclassified

Also published in Jour. Chem. Phys., v. 36: 45-47, Jan. 1, 1962.

The $^1\Sigma_g^+$ grcund state wave function for the C_3 molecule is computed in the SCF-LCAO-MO approximation. Four wave functions derived from different basis sets of Slater type orbitals (STO's) are compared. Subject to the limitations of the available computer program investigation has been made of the effects of expanding a minimal basis set by adding extra functions which should allow for polarization effects, and changes in optimum orbital exponents of atomic orbitals in the molecular environment.

SCF-LCAO-MO WAVE FUNCTIONS FOR THE BIFLUORIDE ION, by E. Clementi and A. D. McLean. [1961] [5]p. incl. tables, refs. (AFOSR-4035) (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)1068], National Science Foundation, and Office of Ordnance Research) Unclassified

Also published in Jour. Chem. Phys., v. 36: 745-749, Feb. 1, 1962.

Several SCF-LCAO-MO wave functions for the ground state of HF_2^- are reported. The best one has a total energy ~4 ev higher than the estimated Hartree-Fock energy for HF_2^-, and it is about 30 ev lower than the energy corresponding to an SCF-LCAO-MO wave function with minimal basis set. These wave functions give indications as to what, in the SCF-LCAO-MO framework, is the smallest basis set which would give a wave function with total energy very near the Hartree-Fock energy. The importance of inclusion of a 2pπ Slater type orbital (STO) on the hydrogen atom is discussed. (Contractor's abstract)

SCF-MO WAVE FUNCTIONS FOR THE HYDROGEN FLUORIDE MOLECULE, by E. Clementi. [1961] [12]p. incl. diagrs. tables, refs. (AFOSR-4038) (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)1068] and National Science Foundation) Unclassified

Also published in Jour. Chem. Phys., v. 36: 33-44, Jan. 1, 1962.

An SCF-LCAO-MO ground-state wave function is reported for the HF molecule at several internuclear distances. The basis set of Slater-type orbitals (STO's) was chosen so as to obey the following 4 criteria: (a) be a balanced basis set, i.e., each atom should have a set of STO's equally extended relative to the number and kinds of occupied AO's in the free atom; (b) include in the set STO's for a balanced polarization; (c) optimize the orbital exponents; (d) avoid redundancy in the set. The computed total energy at the internuclear distances of 1.7328 au is -100.05804 au. This should be about 0.004 au above the Hartree-Fock energy of the HF molecule. The significance of the STO's in the basis set adopted is illustrated by several parallel computations. The computed equilibrium distance is 1.74 au and the experimental is 1.733 au. The dipole moment is computed for several wave functions and the value corresponding to the best wave function is 1.984 D (experimental is 1.74 D), whereas the best computed moment for another wave function is 1.970 D. The significance of this variation is discussed. The $d\mu/dr$ is estimated at 1.7 D/au at the equilibrium distance (experimental is 0.954). The overlap population and gross charge Q are computed for several internuclear distances. The significance of the Q_H is discussed; the best value of Q_H at the internuclear distance is 0.479. The ground-state $^2\pi$ and the excited state $^2\Sigma^+$ for HF are investigated. An SCF computation is made

for the $^2\Pi^+$ excited state at several internuclear distances. Gross charges and overlap populations are given for different internuclear distances for the 2 ionic states. The reorganization effect due to the removal of one electron is discussed in relation to the total energy, population analysis, and gross charge Q_H for the ion. A discussion of the computed ionization potential I(3σ) is given at the end of the paper. (Contractor's abstract)

THE RATE OF REACTION OF HEXYNE-1 WITH SUBSTITUTED PHENYLMAGNESIUM BROMIDES, by R. E. Dessy and R. M. Salinger. [1960] [2]p. incl. table, refs. (AFOSR-1326) [AF 49(638)824] Unclassified

Also published in Jour. Org. Chem., v. 26: 3519-3520, Sept. 1961.

The rates of reaction of a series of substituted phenylmagnesium bromides with hexyne-1 in ether have been determined by following the rate of change of the dielectric constant of the reaction mixture with time. The reactions were run under pseudo-first order conditions in ether with a 20-fold excess of hexyne-1 and obeyed the first order rate law for at least 3 half-lives. A determination of reaction rate of a solution 0.2M in both phenylmagnesium bromide and hexyne-1 obeyed the second order equation past 70% completion, indicating that this reaction is first order in Grignard reagent and in hexyne-1, and is second order overall. The rate constant for the second order reaction was 28% above that for the first order determinations, which is probably due to solvent effects from the excess of hexyne-1 used. The relative reactivities and rate constants of the compounds investigated are given.

SPIKED BLUNT BODIES IN SUPERSONIC FLOW, by H. H. Album. June 1961 [138]p. incl. illus. diagrs. tables, refs. (AFOSR-307) AD 257055 Unclassified

The force and moment characteristics of spiked bodies with hemispherical, hemispherical-flat, and flat noses were determined in a supersonic wind tunnel at angles of attack from zero to 10°. The afterbodies were right circular cylinders. A fineness ratio of 3 was maintained for all of the basic bodies. The

spikes were of 5 different configurations and ranged in length from 0.75 to 2.0 body diam. Free-stream conditions included Mach numbers from 2.0 to 3.0 and Reynolds numbers from 300,000 to 900,000 (based on body diam). It was found that the spikes greatly reduced the zero-angle drag, made the drag extremely sensitive to angle of attack variations, substantially increased the lift, and also increased the normal force. The body nose shape proved to be a critical factor in determining the magnitude of these characteristics and whether or not the spikes would have a stabilizing effect on the body pitching moment characteristics. SECOND INTERNATIONAL CONFERENCE ON THE PHYSICS OF ELECTRONIC AND ATOMIC COLLISIONS; ABSTRACTS OF PAPERS, Colorado U., Boulder, June 12-15, 1961, New York, W. A. Benjamin, 1961, 181p. incl. diagrs. tables, refs. (AFOSR-1327) (MIPR-61-10) Unclassified

Reviewed in Phys. Today, v. 15: 30-34, Feb. 1962.

This conference was the second in a series of conferences organized largely to emphasize (1) the need for experimental work in support of the effort to extract from quantum mechanics useful results for low-energy scattering phenomena, and (2) the shortage of experimental low-energy collision parameters for use in astrophysics, ionospheric physics, and other fields of application of plasma physics. The conference committee was largely successful in limiting experimental papers to those giving results of measurements of collision parameters. The program of contributed papers dealt with collision physics, and not with experimental techniques. The conference attracted well over 300 participants.

BIREFRINGENCE IN A STRAINED VISCOELASTIC FLUID UNDER STEADY STATE ROTARY CONDITIONS, by S. J. Gill and F. R. Dintzis. Feb. 1961 [15]p. incl. diagrs. (AFOSR-399) (Also bound with its AFOSR-2301) (AF 49(638)310) AD 254242 Unclassified

The theory and apparatus involved in a study of the birefringence of a strained viscoelastic fluid are discussed. Consideration was given to a material in a state of continuous rotary strain. Methods of mathematical analyses of the strain within the fluid subjected to a rotated elliptical boundary, and its birefringence were reviewed. The experimental apparatus was composed of a thin walled Teflon tube rotating inside of a stationary brass tube squeezed to form an elliptical cross section. Optical windows and other mechanical devices were at either end. Birefringence and axes orientation measurements may be made with the Soleil-Babinet compensator. Results are presented for carboxymethyl cellulose and polystyrene solutions. Accuracy depended on factors such as solution concentration, temperature, and speed of rotation. Theoretical expectations were realized; steady state retardation increased with rotation speed; and the angular orientation of the principal optic axes was found to depend on rotation speed.

A DETERMINATION OF MOLECULAR ENTANGLEMENTS IN POLYMER SOLUTIONS BY STRAIN BIREFRINGENCE MEASUREMENTS, by S. J. Gill and R. Toggenburger. [1961] [4]p. (AFOSR-1819) (Also bound with its AFOSR-2301) [AF 49(638)310] AD 295865 Unclassified

Also published in Jour. Polymer Sci., v. 60: S69-S70, 1962.

The birefringence Δn for a deformed network is given as $\Delta n = \frac{2N\pi}{45} \frac{(\bar{n}^2 + 2)^2}{\bar{n}} (\alpha_1 - \alpha_2)(\lambda_1^2 - \lambda_2^2)$ where N is the number of junctions (entanglements in solutions) per cc, $\bar{n}$ is the refractive index of the solutions, $\alpha_1 - \alpha_2$ is the difference of the statistical link polarizabilities along and perpendicular to the link direction, and λ_1, λ_2 are the extension ratios of the imposed macroscopic strain. The above equation is used in conjunction with direct experimental measurements of Δn, $\bar{n}$, λ_1, and λ_2, and a value of -184×10^{-25} cc for $\alpha_1 - \alpha_2$, to determine the number of entanglements per cc of several polystyrene solutions in benzene.

ON PERIODIC INFINITE RADICALS, by G. Schuske and W. J. Thron. [1961] 8p. (AFOSR-546) (AF 49-(638)100) AD 256245 Unclassified

Also published in Ann. Acad. Scient. Fennicae, Series A.I., No. 307, 1962, 8p.

In an earlier paper (see item no. 478, Vol. IV) investigation was made of the convergence problem of the infinite radical $\{u_n\}$, $u_n = \sqrt{(a_1 + \sqrt{(a_2 + \ldots + \sqrt{(a_n)})})}$, where the elements a_n's are complex numbers, with the help of some properties of function theory. In this paper the periodic infinite radicals of period one are considered with the complex elements. Following an elementary method, in which no functional theory is needed, it is shown that such an infinite radical is always convergent and converges to $(1 + \sqrt{(1 + 4a)})/2$, where a is the element of the infinite radical and $\sqrt{(1 + 4a)}$ is taken in accordance with the authors' definition. CERTAIN CONTINUED FRACTIONS ASSOCIATED WITH THE PADÉ TABLE, by A. Magnus. [1961] [14]p. (AFOSR-2799) (AF 49(638)100) Unclassified

Also published in Math. Zeitschr., v. 78: 361-374, Mar. 1962.

The author defines a P-fraction to be a continued fraction, terminating or not, of the form $b_0 + K_1^{\infty}(1/b_n)$, where the b_n are polynomials in $1/z$. It is shown that there is a unique, one-to-one correspondence between P-fractions and formal Laurent series, $L_0 = \Sigma_{-N}^{\infty} a_n z^n$. The algorithm for the P-fraction of L_0 is generated by the formal power series identity $(L_n - b_n) L_{n+1} = 1$, where b_n is the principal part plus constant term of L_n, and terminates at the nth stage if $L_n - b_n = 0$. The terminating case arises if and only if L_0 is the Laurent expansion of a rational function. In the computation of the b_n the inversion of power series can be avoided by using a method similar to that of Frank [Amer. Jour. Math., v. 68: 89-108: 1946] for C-fractions. In case L_0 is a power series it is shown that z^{-s} times any approximant of the P-fraction expansion of $z^s L_0$ lies in the diagonal $[n, n-s]$ of the Padé table for L_0 $(s = 0, \pm 1, \pm 2, \cdots)$. THE INTERACTION OF PARAMAGNETIC IONS AND ALUMINUM NUCLEI IN RUBY, by C. M. Verber. July 1961, 69p. incl. diagrs. tables, refs. (AFOSR-1333) (AF 49(638)611) AD 267071 Unclassified

The techniques of continuous and pulsed nuclear magnetic resonance were used to study the aluminum nuclei in ruby crystals. Four commercially prepared samples having nominal chromium ion concentrations of 0.01, 0.1, 1.5, and 4% were investigated at 300, 78, 4, and 1.7°K. The line widths were found to be due to 2 major contributions. The mutual interaction of the aluminum nuclei contributed a constant broadening of about 7 gauss. The paramagnetic ions contributed a broadening which ranged from 0 to 42 gauss as a function of temperature, concentration and static magnetic field. This dependence can be calculated by assuming that the chromium ions have an effective magnetic moment which is determined by the Boltzman average of the 4 spin states of the ion at each temperature considered. This indicates that the chromium ions are in good thermal contact with the lattice down to 1.7°K. The relaxation times were found to be a strong function of the chromium ion concentration. An effort was made to predict these times, using known values of the chromium relaxation times and existing theories in which the nuclear relaxation times are given in terms of the paramagnetic relaxation times. No agreement was found between theoretical and experimental values, and a revision of existing theories is indicated. (Contractor's abstract)

NUCLEAR RESONANCE OF ALUMINUM IN SYNTHETIC RUBY, by C. M. Verber, H. P. Mahon, and W. H. Tanttila. [1961] [9]p. incl. diagrs. tables, refs. (AFOSR-3077) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)611] and National Science Foundation) Unclassified

Also published in Phys. Rev., v. 125: 1149-1157, Feb. 15, 1962.

The linewidth, line shape, and spin-lattice relaxation time T_1 have been measured as a function of temperature in single crystals of $(Al^{27})_2O_3$ having nominal Cr_2O_3 concentrations of 0% and 0.01, 0.1, 1.5, and 4% by weight. Of the two important contributions to the linewidth, the nuclear spin-spin interaction is 7 gauss and temperature-independent. The contribution from the paramagnetic ions increased from zero at 300°K to as much as 42 gauss, depending upon concentration, temperature, and static magnetic field. An anomalous structure in the aluminum resonance was evident in both the steady-state and pulsed nuclear induction data. The $\frac{1}{2}$ to $-\frac{1}{2}$ transition has a splitting of 2.84 gauss with a $3\cos^2\theta - 1$ dependence on the angle between the c axis and H_0. The splitting is

independent of the observation frequency and chromium ion concentration. T_1 was observed to vary from 150 sec to 1.5 msec as a function of ion concentration and temperature, and to vary in a manner not correctly given by existing theory. Many of the samples were observed to have a nonunique T_1. (Contractor's abstract)

COHERENT AMPLIFICATION OF ELECTROMAGNETIC WAVES BY ATOMIC AND MOLECULAR PHENOMENA, by C. H. Townes. [1958] [19]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-73279]) Unclassified

Published in Physikertagung Essen 1958: 110-128, 1959.

Coherent amplification of electromagnet waves by atomic and molecular phenomena is discussed. Amplifiers which work on this basis are called molecular amplifiers, quantum mechanical amplifiers or masers (an abridgement of Microwave Amplification by Stimulated Emission of Radiation). The workings of a NH_3 beam-type maser are discussed. In the case of a maser amplifier the noise temperature (power per unit bandwidth which can also be expressed in terms of black body radiation at a certain temperature) is the ratio of the number of systems in the upper states to those in the lower states or $n_2/n_1 = \exp(-h\nu/kt)$. $n_1 - n_2 \geq Vh\Delta\nu/16\pi^2\mu^2Q$ shows the number of excited atoms and molecules required for oscillation or amplification increases as the line width increases. No present maser delivers much power, but solid state masers using paramagnetic materials have power outputs as high as a few mw, whereas the beam-type systems are limited to about 10^{-8} w. The 2-level solid state maser is based on an isolated electron spin having 2 levels separated by an energy 2 μH. The 3 level system is based on a quanta of energy $h\nu$, producing a non-equilibrium condition so that there is a larger population in level 1 than in level 2, or in level 2 than level 3, allowing amplification at 1 of the 2 lower frequencies. The most popular of which is an amplifier using the paramagnetic centers of ruby. Another type uses the proton resonance in water and oscillates at frequencies in the mc region or lower. The Raman effect can also provide amplification. Schematic illustrations and descriptions are given for some masers and the possibilities offered by them suggested.

HYPERFINE STRUCTURE MEASUREMENTS IN THE METASTABLE 2S STATE OF HYDROGENIC ATOMS, by P. Kusch. [1959] [13]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-73279]) Unclassified

Published in Recent Research in Molecular Beams, New York, Academic Press, 1959, p. 93-105.

Atomic beam spectroscopic experiments on the metastable 2S state of H, D, and He^{3+} yielded the following values for the zero field hfs splittings: $\Delta\nu$ (2S;H) = 177, 556.86 ± 0.05 kc/sec; $\Delta\nu$ (2S;D) = 40,924.439 ± 0.020 kc/sec; and $\Delta\nu$ (2S, He^{3+}) = 1083.35499 ± 0.00020 mc/sec. Comparison of the latter experimental value with the predicted value of $\Delta\nu$(2S, He^{3+}) = 1083.557 ± 0.010 mc/sec shows a discrepancy of 182 ± 22 parts/million. The discrepancy presumably arises from nuclear structure effects such as those that lead to the hyperfine structure anomaly of H and D.

CONCENTRATION-MODULATION ELECTRON-BEAM DEVICES, by H. Lashinsky. [1960] [7]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-73279]) Unclassified

Published in I. R. E. Trans. on Electron Devices, v. ED-8: 185-191, May 1961.

Electron-beam devices are considered in which a form of concentration modulation, as defined by Gabor is utilized. In the devices described a scalloped electron beam is produced by a combination of crossed electric fields and a magnetic field, and strikes a collector after passing through a fixed aperture. The points of minimum width of the scalloped beam are "images" of the cathode which are reproduced along the longitudinal axis of the system by virtue of the

cyclotron motion of the electrons. The application of an additional alternating electric field, parallel to the fixed electric field causes a periodic variation in the longitudinal position of the cathode images, giving rise to an alternating component in the current which reaches the collector. Concentration modulation is compared with other modulation methods. Transit-time limitations are evaluated and possible applications are considered, including frequency multiplication at microwave frequencies. The use of the concentration-modulation technique in modulating a high-density electron beam at audio frequencies in an experimental system is described. (Contractor's abstract)

Published in Rev. Scient. Instr., v. 32: 1083-1089, Oct. 1961.

The construction and operation of a molecular beam maser spectrometer, similar to the ammonia maser, is described. The observed linewidths are of the order of 5 kc at microwave frequencies, thereby allowing high resolution hyperfine spectroscopy on a number of molecules. The major factors affecting the resolution and sensitivity are examined. A brief survey of possible experiments is given. (Contractor's abstract)

Cerenkov radiation is considered as the electromagnetic analog of the acoustic shock wave which is produced when a projectile moves through a medium at a velocity which exceeds the velocity of wave propagation in the medium. The present review summarizes the general theory of the Cerenkov effect and investigates the theoretical considerations and design factors which pertain to the generation of microwaves by Cerenkov radiation.

Radiation at 3 cm wavelength associated with the planets Venus, Mars, and Jupiter has been measured with the use of a maser type radiometer in conjunction with the U. S. Naval Research Lab. 50 ft reflector. The fluxes of radiation correspond to apparent planetary temperatures of 575°K, 211°K, and 177°K, respectively. The apparent temperature is defined as the temperature of a black body subtending the same solid angle as the planetary disk, which produces the observed flux. The measurement of radiation intensities from 5 radio sources observed for the first time at 3 cm wavelength and a search for radiation from planetary nebulae are also reported.

Also published in Jour. Appl. Phys., v. 32: 1177-1178, June 1961.

For this experiment a 0.05% Cr^{3+} ruby rod of dimensions 1/4 x 1/4 x 1 3/4 in. was cut with the optic axis

perpendicular to the length of the rod, and the ends were polished and silvered. The maser output was coupled through the partially transmitting end, and directed into a Jarrell Ash 3.4m grating spectrometer set at high order. The light was found to be essentially 100% plane polarized, with the plane of vibration of the E vector perpendicular to the plane containing the optic axis, and the normal to the end face of the rod. The light was incident on the grating with the plane of vibration parallel to the rulings, and the lines were photographed in the exit plane, where the dispersion in the eighth order, 6940A, is 0.677A/mm. A sample of ruby lines and comparisons spectra show that the intensity of successive lines decreases since the threshold increases with temperature. It was also observed that in a number of cases, the ruby R_1 line consisted of 2 or 3 closely spaced components, with widths about 0.07A; the total width of the group was about 0.2A. The slope is found to be 0.065A/deg and, because the spectral width is of this order, good temperature control is necessary for frequency stability; indeed, some degree of line broadening may occur as a result of temperature variation within a single pulse. A number of runs were made with the ruby cooled in liquid nitrogen and then mounted into the flashlamp. The results show that the variation of oscillation wavelength is due to the shift of the fluorescent R_1 line.

ALKALI-METAL OPTICAL MASERS, by I. D. Abella and H. Z. Cummins. Nov. 1, 1961, 12p. incl. diagrs. (AFOSR-1465) (Rept. no. CU-1-61) (AF 49(638)507) AD 265988 Unclassified

Presented at Western Electronic Show and Convention, San Francisco, Calif., Aug. 1961.

An optical maser device is described by which a pressure broadened mercury lamp provides the outside light source. The mercury line was observed at high resolution and was found to be self-reversed. An adsorption cell containing potassium-absorbed energy was found to be about half as intense as mercury. The apparatus was assembled such that the mercury lamp was focussed by means of an elliptical cylinder onto a closed cell containing vaporized potassium.

ALKALI VAPOR INFRARED MASERS, by H. Z. Cummins, I. [D.] Abella and others. [1961] [6]p. incl. diagrs. (AFOSR-3251) [AF 49(638)507] Unclassified

Presented at Second Internat'l. Conf. on Quantum Electronics, Berkeley, Calif., Mar. 23-25, 1961.

Also published in Advances in Quantum Electronics, New York, Columbia U. Press, 1961, p. 12-17.

Experiments using optically pumped cesium for maser action are reported. Six spectral lines were examined in fluorescence under varying conditions of temperature and gas pressure. These were: the 2 resonance lines at 8943 and 8521A; the 2 transitions $8S_{1/2}$ - $6P_{1/2,3/2}$ at 7609 and 7944A; the $6D_{3/2}$ - $6P_{1/2}$ transition at 8761A; and the unresolved 4F - $5D_{3/2,5/2}$ doublet at 10,100A. The measurements were made in order to study the relative intensities of the lines under different operating conditions and to provide some quantitative estimate of populations as an indication of the feasibility of maser action. It was found that at a cesium vapor pressure of 0.01 mm Hg and a foreign gas pressure less than 2×10^{-5}, the first 5 lines occurred with relative intensities close to predicted calculations. The 10,100A line did not appear under these conditions. As the cesium pressure was increased to 0.1 mm, the apparent intensities of the resonance lines increased by about 30X, the intensities of the 8S-6P and the 6D-6P transitions remained roughly constant, while the 4F-6P line increased from 0 to about the same intensity as the 3 nonresonance lines. Introduction of Xe produced a decrease in line intensity by a factor of 100. It was apparent that Cs-Cs collisons of the second kind cause transitions from the 8S to the 4F state even in the absence of foreign gas. Addition of the foreign gas enhanced this effect while quenching some of the other excited states.

HYPERFINE STRUCTURE OF THE $(5p)^5(6s)\ ^3P_2$ STATE OF $_{54}Xe^{129}$ AND $_{54}Xe^{131}$, by W. L. Faust and M. N. McDermott. [1961] [7]p. incl. diagrs.

tables, refs. (AFOSR-280) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [AF 49(638)557]) Unclassified

Also published in Phys. Rev., v. 123: 198-204, July 1, 1961.

The hyperfine structure of the metastable $(5p)^5(6s)\ ^3P_2$ state of $_{54}Xe^{129}$ and $_{54}Xe^{131}$ has been measured by the atomic beam magnetic resonance method. The zero magnetic field intervals $f(F \leftrightarrow F')$ are: for Xe^{129}, $f(3/2 \leftrightarrow 5/2) = 5961.2577(9)$ mc/sec; and for Xe^{131}, $f(5/2 \leftrightarrow 7/2) = 2693.6234(7)$ mc/sec, $f(3/2 \leftrightarrow 5/2) = 1608.3475(8)$ mc/sec, and $f(\frac{1}{2} \leftrightarrow 3/2) = 838.7636(4)$ mc/sec. The values of the quadrupole and octupole moments of Xe^{131}, without polarization corrections and without corrections for any effects of configuration mixing, are $Q = -0.120(12)$ b and $\Omega = +0.048(12)$ nmb. The hyperfine-structure anomaly for the 2 isotopes due to the $s\frac{1}{2}$ electron alone is $\Delta(s\frac{1}{2}) = +0.0440(44)\%$, in disagreement with the prediction of the single-particle model. PRECISE MEASUREMENT OF LEVEL CROSSING FIELDS FOR $Cd^{111,113}$ (Abstract), by P. Thaddeus and R. Novick. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)936] Office of Naval Research, and Signal Corps) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 74, Feb. 1, 1961.

The crossing point of the (1/2, - 1/2) and (3/2, 3/2) hyperfine levels of the $5s5p\,^3P_1$ state has been determined to lie at 1964.48 ± 0.07 gauss for Cd^{111} and 2054.99 ± 0.07 gauss for Cd^{113}. A linewidth for the crossing of 0.17 gauss, about 3 times that expected from the known lifetime of the $5s5p\,^3P_1$ state, has been obtained by improving the magnetic field homogeneity. Using field modulation and phase sensitive detection of 30 cps, a signal-to-noise ratio of about 50:1 has been attained with a detector time constant of 10 sec.

SPIN AND MOMENT DETERMINATION OF Cd^{109} BY OPTICAL DOUBLE RESONANCE (Abstract), by M. N. McDermott and R. Novick. [1961] [1]p. [AF 49(638)-936] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 142, Mar. 20, 1961.

The spin and nuclear moments of Cd^{109} (475d) have been determined by the optical double resonance technique. An isotopically pure sample was prepared by proton bombardment of silver. Radio frequency resonances in the $^3P_1$ state were detected by a change in the polarization of scattered 3261A cadmium resonance radiation. The spin was determined to be I = 5/2 from a study of the low-field Zeeman resonances. The hyperfine structure has been determined by observing the transitions $\Delta F = 0, \Delta m_F = \pm 1$ at magnetic fields sufficiently large to resolve the individual Zeeman lines. The intervals so obtained are f (7/2 ↔ 5/2) = 4204 ± 20 mc/sec and f (5/2 ↔ 3/2) = 2610 ± 35 mc/sec. The hyperfine interaction constants derived from these intervals are A ($^3P_1$) = -1149 ± 6 mc/sec and B ($^3P_1$) = -174 ± 17 mc/sec. An incomplete analysis gives μ_I = -0.829 ± 0.005 nm and Q = +0.80 ± 0.20 barns. The ordering of the hyperfine levels and thus the sign of μ_I was unambiguously determined by utilizing circularly polarized exciting radiation.

NUCLEAR SPIN OF Cd^{107} (Abstract), by M. [N.] McDermott and R. Novick. [1961] [1]p. [AF 49(638)-936] Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 427, Nov. 24, 1961.

The ground state nuclear spin of Cd^{107} has been determined to be I = 5/2 by an optical double resonance technique. The determination thus far rests on the observation of a single Zeeman resonance in the $5\,^3P_1$ state as well as on the lack of resonances which would be expected for other spins. Difficulties arising from the presence of a large stable cadmium contamination have prevented a second expected resonance from being seen. The identity of the nucleus involved is established by noting the decay of the resonance signal with time. This decay is well fitted by an exponential with a decay constant of 6.7 hr corresponding to the known half-life of Cd^{107}. (Contractor's abstract)

OPTICAL DETECTION OF LEVEL CROSSING IN THE $(5s5p)^3P_1$ STATE OF Cd^{111} AND Cd^{113}, by P. Thaddeus and R. Novick. [1961] [22]p. incl. illus. diagrs. tables, refs. (AFOSR-1695) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)996, Office of Naval Research, and Signal Corps) AD 407808 Unclassified

Also published in Phys. Rev., v. 126: 1774-1780, June 1, 1962.

The magnetic field at which crossing occurs for the $|F, m_F\rangle = |3/2, 3/2\rangle$ and $|\tfrac{1}{2} - \tfrac{1}{2}\rangle$ hyperfine levels of the $(5s5p)\,^3P_1$ state of Cd^{111} and Cd^{113} has been measured to high precision by observing the change in intensity at an angle of 90° of the resonance fluorescence of the 3261 A intercombination line. The measured crossing fields, in units of the nuclear magnetic resonance frequency of protons in mineral oil, are H_c^{111} = 8363.408(30) kc/sec, H_c^{113} = 8748.734(20) kc/sec. Using these results and the known values of the $(5s5p)\,^3P_1$ hyperfine interval for the 2 isotopes, it is found that the Lande g_J factor for this state is $g_J^{111} = 3/2 - 160(9) \times 10^{-6}$, $g_J^{113} = 3/2 - 146(9) \times 10^{-6}$. These results include corrections for second-order interaction with the adjacent fine-structure levels of the 5s5p configuration. (Contractor's abstract)

THEORETICAL INTERPRETATION OF CARBON-13 HYPERFINE INTERACTIONS IN ELECTRON SPIN

RESONANCE SPECTRA, by M. Karplus and G. K. Fraenkel. [1961] [12]p. incl. diagrs. tables, refs. (Technical note no. [9]; rept. no. CU-9-61 AF520-Chem) (AFOSR-398) (AF 49(638)520) AD 255802 Unclassified

Also published in Jour. Chem. Phys., v. 35: 1312-1323, Oct. 1961.

A quantitative theory of the isotropic electron-nuclear spin interactions of C-13 in pi-electron radicals is presented and applied to the hyperfine splittings observed in the electron spin resonance spectra of these substances. The theory predicts both the magnitude and sign of the hyperfine splittings and is readily applied to a variety of compounds. For the methyl radical, the measured C-13 splitting is shown to be consistent with a planar model and limits the deviation from planarity to less than or approximately equal to 5 degrees. The theory provides a useful criterion for the validity of approximate wave functions. The sigma-pi interaction parameters are shown to depend on the bond length, the type of hybridization, and on the nature of the bonding atoms. For pi-electron systems, the results demonstrate that the magnitude of the sigma-pi exchange energy is a small fraction of the total energy.

CARBON-13 HYPERFINE SPLITTING IN THE ELECTRON SPIN RESONANCE SPECTRA OF SEMIQUINONES AND CYCLOOCTATETRAENE, by H. L. Strauss and G. K. Fraenkel. Apr. 15, 1961, 1v. incl. diagrs. tables, refs. (Technical note no. 8; rept. no. CU-8-61AF520-Chem) (AFOSR-559) (AF 49(638)520) AD 255803 Unclassified

Also published in Jour. Chem. Phys., v. 35: 1738-1750, Nov. 1961.

Measurements were performed on the C-13 hyperfine splitting in the electron spin resonance spectra of a series of methyl- and chloro-substituted semiquinones and of the cyclooctatetraene anion radical. The splittings were observed from C-13 nuclei present in natural abundance (about 1%); the C-13 satellites were distinguished from spurious low-intensity lines arising from side-reaction produced radical impurities by means of careful intensity measurements as well as other techniques. The largest observed C-13 splitting had a magnitude of 1.7 gauss. In the p-benzosemiquinone ion, a previously observed line of low intensity was identified as a splitting arising from C-13 nuclei, and was assigned, on the basis of intensity measurements, to the 4 CH carbon atoms. Splitting constants tentatively identified with the methyl C atoms of the methyl-substituted compounds were in the neighborhood of 1.5 gauss. The splitting in the cyclooctatetraene anion indicates that the 3 sigma bonds attached to a C atom lie in a single plane. (Contractor's abstract)

ELECTRON SPIN RESONANCE STUDIES OF THE CYCLOOCTATETRAENYL ANIONS, by H. L. Strauss, T. J. Katz, and G. K. Fraenkel. [1961] [5]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)520] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., California U., Los Angeles, Dec. 27-29, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 513, Dec. 27, 1961.

Also published in Jour. Amer. Chem. Soc., v. 85: 2360-2364, Aug. 20, 1963.

The ESR spectrum of the cyclooctatetraenyl radical has been studied in dimethoxyethane and tetrahydrofuran using Li, Na, and K as reducing agents. The spectra are interpreted by assuming varying concentrations of ion pairs which contribute alkali metal hyperfine structure, and radical species which do not. The parameters which characterize the spectrum of the uncomplexed radical are: hydrogen splitting 3.209 ± 0.007 gauss; carbon-13 splitting 1.28 ± 0.03 gauss; $g = 2.0025 \pm 0.0001$; minimum linewidth 0.17 gauss; $T_1 \approx T_2$. The disproportionation constant of the radical is about 5×10^8. This leads to an estimate of about 56 kcal/mol for the compression energy. The relative rates of electron exchange among the anions were found to depend strongly on the alkali metal and the solvent. The conflicting evidence concerning the planarity of the radical is discussed. (Contractor's abstract)

SPIN RELAXATION IN OPTICAL PUMPING, by R. A. Bernheim. [1931] [6]p. incl. diagrs. tables, refs. (AFOSR-900) [AF 49(638)785] AD 613788 Unclassified

Also published in Jour. Chem. Phys., v. 36: 135-140, Jan. 1962.

The spin relaxation of optically aligned rubidium vapor has been studied as a function of helium buffer gas pressure. Relaxation times as long as 0.68 sec were observed in helium at ½-atm pressure. The diffusion constant D_0 for rubidium in helium at 50°C was evaluated as 0.54 cm^2 sec^{-1}. The disorientation cross section σ for rubidium-helium collisions was found to be 6.2×10^{-25} cm^2. A mechanism for spin relaxation in optically aligned alkali vapors is proposed and discussed. It is found that the relaxation arises from the coupling of the alkali electron spin to orbital and rotational motion accompanying the collision. The variation of σ for rubidium in the presence of other inert gases is also discussed. (Contractor's abstract)

EFFECT OF BUFFER GASES ON ATOMIC HYPERFINE FREQUENCIES (Abstract), by G. A. Clarke. [1961] [1]p. [AF 49(638)785] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 248, Apr. 24, 1961.

Recent experiments on the effect of buffer gases (B) on the atomic hyperfine frequencies of the hydrogen isotopes show a dependence of the fractional frequency shift $\Delta\nu/\nu_0$ on the buffer gas and the hydrogen isotope. In principle, the fractional frequency shift, as a function of the internuclear coordinates R, is obtained from the expectation value of the hyperfine Hamiltonian using, in the two body collision approximation, an appropriately antisymmetrized system wave function $\Psi_{H\text{-}B}(r_e;R)$. The quantity of physical interest, the statistically averaged frequency shift, can be computed classically using the intermolecular energies associated with the system wave function. This procedure has been carried out for the H-He system using an approximation to the system wave function, the antisymmetrized product of 1s state orbitals. The calculation results in a fractional frequency shift which is in good agreement with experiment. Corrections to the classical distribution function for this near-classical system have been made in order to ascertain the nature of the mass dependence. For this most favorable system calculation shows that the quantum statistical correction is small (~2%).

NUCLEAR QUADRUPOLE INTERACTION IN PURE METALS, by T. P. Das and M. Pomerantz. [1961] [7]p. incl. diagr. tables, refs. [AF 49(638)785] Unclassified

Published in Phys. Rev., v. 123: 2070-2076, Sept. 15, 1961.

Calculations of the ionic part of the electric field gradient at the nuclei of certain metals are combined with available experimental data to obtain information about the electronic structures of the metals, or estimates of nuclear quadrupole moments. The metals considered are Be, Sc, Re, La, Mg, Co, An,

and Cd, which have the hexagonal close-packed structure, and indium, which has centered tetragonal structure. Some comparison is made with other information about the shapes of the Fermi surfaces and a pertinent experiment on Zn is suggested. (Contractor's abstract)

EFFECTS OF HELIUM BUFFER GAS ATOMS ON THE ATOMIC HYDROGEN HYPERFINE FREQUENCY, by G. A. Clarke. [1961] [6]p. incl. tables, refs. (AFOSR-J653) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-228] and Atomic Energy Commission) AD 415396
Unclassified

Also published in Jour. Chem. Phys., v. 36: 2211-2216, Apr. 15, 1962.

Calculations are made for the pressure, mass, and temperature dependence of the atomic hydrogen hyperfine frequency shift arising from the perturbing influence of He buffer gas atoms. The calculated fractional pressure shift is found to be $+1.73 \times 10^{-9}$ mm Hg^{-1} compared with the experimental value of $+3.7 \times 10^{-9}$ mm Hg^{-1}. This discrepancy may be related to a failure of the simple wave function employed to adequately characterize the unpaired electron spin density at the hydrogen nucleus. The results of the calculations for the temperature variation and mass dependence indicate that these are very small effects. The form of the mass dependent quantum statistical correction used to elucidate the mass effect, suggests that the relatively large variations experimentally observed with other buffer gases, due to hydrogen isotope variation, are in error. Finally, a calculation is made for the pressure shift from a kinetic theory point of view and the result obtained ($+1.79 \times 10^{-9}$ mm Hg^{-1}) is in fair agreement with the above mentioned quantum statistical calculation. FAMILIES OF PRINCIPAL SOLUTIONS OF ORDINARY DIFFERENTIAL EQUATIONS, by E. W. Chamberlain. [1961] [12]p. (AF 49(638)644)
Unclassified

Published in Trans. Amer. Math. Soc., v. 107: 261-272, May 1962.

In the present paper the author shows that if the factorization sequence $W_1, W_2, \ldots W_l$ satisfies the additional condition that $W_i \sim W_j$ implies $i = j$, then a second factorization sequence $(V_1, V_2, \ldots, V_n)$ with $V_i \sim W_i$ can be found such that the associated approximate factorization is an exact factorization; this exact factorization is used to show that for a broad class of asymptotically (=weakly) quasi-linear equations with linear part Ly, the totality of principal solutions includes a u-parameter family, where u is the number of strictly negative f_i.

ON THE ALGEBRAIC CLOSURE OF CERTAIN PARTIALLY ORDERED FIELDS, by W. Strodt. [1961] [22]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)644 and National Science Foundation under G12984) Unclassified

Presented at meeting of the Amer. Math. Soc., June 3, 1961.

Published in Trans. Amer. Math. Soc., v. 105: 229-250, 1962.

The main theorem states the following: If (a) ζ_0 (a subfield) is algebraically closed, and (b) whenever an asymptotically inscribed polynomial F and a point p of instability of multiplicity 1 is given, then F has a root $y \sim p$; then (c) every asymptotically inscribed polynomial of degree n has n roots in A_0. Further, (c) implies (a) and (b). These ideas and results are applied to meromorphic functions in the finite complex plane. Various explicit choices of U (a divisible totally ordered subgroup of a field K) are given, e.g., U is chosen such that M (where M equals C_0 U) is the set of all logarithmic monomials. Application is made to the theory of algebraic differential equations.

A FIVE-PORT MATCHED PSEUDO-MAGIC TEE, by A. Okaya. [1960] [4]p. incl. illus. diagrs. table. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)631], Office of Naval Research, and Signal Corps) Unclassified

Published in I. R. E. Trans. on Microwave Theory and Tech., v. MTT-9: 216-219, May 1961.

The 5-port matched pseudo-magic tee consists of an input waveguide, 2 load arm waveguides which are coupled into the input waveguide with +90° and -90° phase shifts, respectively, and an output waveguide which is split into 2 load waveguides by a septum. The improvements include a much broader matching and isolation bandwidth, higher isolation between arms, and a variety of modifications for different applications. These characteristics have been obtained by employing frequency-insensitive phase shifters, hence, frequency coverage is mainly limited by mechanical asymmetry and the characteristics of the directional coupler in the magic tee. While this type of hybrid junction is not a true magic tee because

the load arms are not used as the input arm, it does have several applications which an ordinary magic tee does not have. X-, K-, and M-band models were examined experimentally, and highly sensitive and accurate impedance measurements were made. (Contractor's abstract)

OPERATION OF A CW PUSH-PULL SOLID-STATE MASER FROM 48 TO 56 KMC/SEC (Abstract), by D. L. Carter. [1961] [1]p. [AF 49(638)631] Unclassified

Presented at Second Internat'l. Conf. on Quantum Electronics, Berkeley, Calif., Mar. 23-25, 1961.

Published in Advances in Quantum Electronics, New York, Columbia U. Press, 1961, p. 426.

Operation of an Fe^{3+}-doped rutile maser with a pump frequency of 78.2 kmc/sec and signal frequencies ranging from 48 to 56 kmc/sec has been achieved. The push-pull operation utilizes the upper 4 of 6 levels at a magnetic field orientation of 73° from the [110] direction in the [001] plane of the crystal. At this orientation the pump levels maintain equal splittings for a large range of magnetic field strengths. The crystals were doped with 0.18% Fe to TiO_2 by weight. The pumping radiation was supplied by a Raytheon QKK866 reflex klystron and delivered approx 50 mw to the maser crystal. The doped rutile served as its own multimode dielectric resonator. Both oscillation and amplification over the stated

frequency range was achieved by varying the magnetic field strength from 7000 to 5400 gauss without any change in pump frequency or crystal orientation. Preliminary root gain bandwidth measurements yielded typical values of 30 to 40 mc/sec throughout the band. It is believed that further adjustment of pump frequency and crystal orientation will permit a slight extension in the range of signal frequencies.

ANTICIPATED ALIGNMENTS OF NATIONS IN THE COLD WAR, by J. N. Nehnevajsa. Jan. 20, 1961, 45p. incl. tables. (AFOSR-92) (AF 49(638)743) AD 251732 Unclassified

Propensities on the part of nations to shift from one major ideological posture into another are analyzed. Specifically, some nations might become Communistic in the future either by force or voluntarily. Communist nations may accept democratic governmental models; or they may adapt Communism to their nationalistic strivings; or there may be anti-Communist rebellions. Brazilian and Finnish respondents were interviewed about general likelihood of these outcomes; about their desirability; about the likelihood and desirability of such changes in the United States and their own country on one hand, and in the Soviet Union and China on the other hand. The subjects were then provided with alternative lists of nations to state which ones of the countries cited might change in any one of the ways considered. The findings are presented and discussed. SOME POSSIBLE APPLICATIONS OF PROJECT "OUTCOMES" RESEARCH METHODOLOGY, by A. S. Frances. Mar. 31, 1961, 25p. incl. refs. (AFOSR-444) (AF 49(638)743) AD 256332 Unclassified

Section I, refers to the possibility of using the theory and methodology of Project Outcomes to problems of strategic information. It is felt that once the methods of this Project have been satisfactorily developed, they might be standardized and operationalized for the use of the agencies concerned with gathering strategic information. Section II covers possible applications of this Project to problems of intelligence, evaluation and control of specific foreign operations as related to logistic and tactical problems. Section III discusses possible development of our methodology for the purposes of assessing present and future organizational effectiveness. Section IV refers to the applications that the study may have for problems of personnel selection, training and evaluation. Specifically, it is possible that the inclusion of ex-ante data in the standard procedures currently in use for personnel selection, training and evaluation, might lead to substantive improvements in predictive power and reliability. COMPARATIVE STUDY OF PERSONAL AND PERCEIVED NATIONAL IDEOLOGIES, by C. W. Wheatley. May 5, 1961, 32p. incl. diagrs. tables. (AFOSR-575) (AF 49(638)743) AD 259195 Unclassified

This report is concerned with the problem of how citizens of contemporary societies relate to their countrymen, to their nation, and to other nations in ideological terms. The survey was attempted by requesting that each Finnish and Brazilian legislator and student in the sample designate which from a list future outcomes would be most, next most, least, and next least desired by specific referent nations. The respondent was requested to rate these outcomes for their personal desirability. From these data, indices of ideological orientation were obtained for each respondent group with respect to each nation. Such indices might take values between minus and plus twelve. Subjects were then characterized as being either in agreement or disagreement with their national ideology. The resulting empirical distributions were found to correlate with other central variables of this study, as specified in the body of this report. The approach represented is viewed as an initial step in assessing the ideological constitution of particular nations and their citizenry on a replicable basis.

RESEARCH ON SAMPLED DATA FEEDBACK CONTROL SYSTEMS, by G. M. Kranc. Final rept. May 1, 1961 [42]p. (Rept. no. CU-66-61AF677-EE) (AFOSR-666) (AF 18(600)677) AD 257403 Unclassified

Research is presented in the field of control systems; particularly in the field of sampled data systems. Investigations demonstrated the feasibility and

superiority of the Z-transform methods for linear sampled data systems. The Z-transformation was recognized as the effective tool for the analysis and synthesis of the linear sampled systems. A radically new concept in sampled-data compensation techniques was developed. The work on various synthesis problems yielded new analytical techniques utilizing Z-transforms as the main tool of the investigations. A particularly novel approach to the design of sampled systems was also developed. A sampled data processing unit was constructed based on analog multiplication and digital storage. Work was also carried out in the field of continuous systems. (Contractor's abstract)

OPTIMAL CONTROL METHODS FOR ON-OFF SAMPLING SYSTEMS, by W. L. Nelson. [1961] [2]p. incl. refs. (AF 18(600)677) Unclassified

Published in Proc. Joint Automatic Control Conf., Colorado U., Boulder (June 28-30, 1961), New York, Lewis Winner, 1961, p. 41, 53.

This paper considers the problem of achieving optimal or near-optimal on-off control of sampling systems in the sense of minimum time to reach the desired equilibrium state from any initial state. The approach used is to imbed the optimal control problem in the broader problem of determining the inherent capability of a given class of control inputs to drive the plant to the desired state in a given number of steps (sampling periods). The class of systems considered is described by the vector differential equation: $\dot{x} = Ax + b\mu(t)$ where x, the state of the plant, is an n-vector having elements or conditions, x_i in the n-dimensional state space x; A is an nxn matrix with constant elements a_{ij}; b is an n-vector with constant elements, b_i and $\mu(t)$ is the control input to the plant. The optimal control problem is therefore 1 of selecting the control input $\mu(t)$, within the prescribed class of control inputs, which takes the plant from an arbitrary initial state, x (0), into the origin in the minimum possible time.

DEFORMATION AND FRACTURE OF CADMIUM AND CADMIUM-MAGNESIUM ALLOYS, by N. S. Stoloff. Apr. 1961, 123p. incl. illus. diagrs. tables, refs. (AFOSR-593) (AF 49(638)408) AD 257735 Unclassified

An attempt was made to determine the mechanisms of deformation and fracture in polycrystalline Cd, to correlate these mechanisms with pertinent aspects of single crystal behavior, and to determine whether the slip systems and mode of fracture of polycrystalline Cd could be altered by reduction of the axial ratio (1.886) by alloying. Tests on polycrystalline Cd and Cd-Mg alloys indicated that the yield stress, flow stresses for arbitrary small strains, and the average coefficient of work hardening were relatively insensitive to temperature from room temperature to 4.2°K. The tensile strength of Cd was strongly temperature dependent but relatively independent of grain size between room temperature and -175°C; below -175°C it was dependent on grain size, but not on temperature. Cd had a ductile to quasi-brittle transition at about -155°C which did not depend on grain size or purity. The minimum ductility, about 15% reduction in area, was reached near -196° and persisted at -269°C.

VOCAL EXCHANGES BETWEEN DOLPHINS: BOTTLENOSE DOLPHINS "TALK" TO EACH OTHER WITH WHISTLES, CLICKS, AND A VARIETY OF OTHER NOISES, by J. C. Lilly and A. M. Miller. [1961] [4]p. incl. diagrs. table. (AFOSR-2296) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-61-62], Coyle Foundation, Department of Defense, National Institute of Mental Health, National Institute of Neurological Diseases and Blindness, and Office of Naval Research) Unclassified

Also published in Science, v. 134: 1873-1876, Dec. 8, 1961.

Observations of the vocal exchanges of bottlenose dolphins under various conditions are presented. Experimental conditions under which isolated emissions from each animal of a pair are separately recorded and in which the distance between the rostrum and the hydrophone is controlled are described. The exchanges consist of vocal alternations (A, then B, then A, and so on), "duets" (A plus B simultaneously), and long "solos" or "monologs." The emissions exchanged are: (1) whistles alone; (2) slow click trains alone; (3) simultaneous whistles and clicks from either or both animals; and (4) squawks, quacks, blats, and so on, alone or simultaneously with whistles. Any or all of these sounds may occur in a given period. The significant carriers of meaning are to be determined. (Suggestions include various functions of relative amplitudes, absolute and relative frequency, frequency modulations, phase-shift variations, and durations of whistle emissions.) Average and peak amplitudes (at the rostrum) of each class of sound cover at least a 100-decibel range (controlled by the dolphin). (Contractor's abstract)

Communication Research Inst., Miami, Fla.

SOUNDS EMITTED BY THE BOTTLENOSE DOLPHIN, by J. C. Lilly and A. M. Miller. [1961] [5]p. incl. diagrs. (AFOSR-2516) (Sponsored jointly by [Air Force Office of Scientific Research under AF AFOSR-61-62] and Office of Naval Research) Unclassified

Also published in Science, v. 133: 1689-1693, May 26, 1961.

The sonic emissions of the bottlenose dolphin are discussed. Three classes of these sounds are presented: (1) sine-wave type whistles; (2) slow trains of clicks (buzzings); and (3) a class of complex waves emitted in bursts (quacks, squawks, blats). The sine-type wave whistles range in frequency from approx 4000 - 18,000 c/sec. The clicks contain components of this same frequency range plus some components of higher frequencies. Complex waves of high amplitude and of many frequencies are also emitted in water or in air. Situations in which sounds of one or more of these classes can be elicited simultaneously from 1 and from 2 restrained animals are described.

SOME INTEGRAL INEQUALITIES by R. P. Gosselin. [1961] [7]p. (AFOSR-3611) (AF 49(638)608) AD 428413 Unclassified

Also published in Proc. Amer. Math. Soc., v. 13: 378-384, June 1962.

The purpose of this paper is to present a general integral inequality concerning subadditive functions and to make applications of this inequality. The applications pertain to relations among integrals involving first and second differences of L^p functions. The finiteness of some of the integrals is connected with generalized Lipschitz conditions and with the existence of fractional derivatives. These facts are exploited to obtain new and known theorems. Finally it is shown that in some cases the finiteness of the integral is not affected by interchanging the first and second differences of the function.

DYNAMICS OF SEPARATING BODIES. VOLUME II. MEASUREMENTS AT MACH 2, 4, AND [illegible] by H. L. Wackelin and R. O. Fredette. Mar. 1961, 69p. incl. diagrs. tables. (AFOSR-106) (AF 29(600)1711)
AD 257734 Unclassified

Wind tunnel tests were conducted on a data capsule shape in the interference field of a carrier vehicle model at Mach numbers of 4.0 and 5.0 with limited data at Mach 2. The data obtained were analyzed and a preliminary evaluation made as to the agreement with methods of prediction. It is shown that in areas where the flow field is known, estimated values of the derivatives obtained with relatively simple calculation techniques agree reasonably well with the data. A discussion of the direct application of these data to capsule separation analyses is presented.

DYNAMICS OF SEPARATING BODIES. VOLUME I. THEORETICAL ANALYSIS, by A. H. Solarski, R. Turner, and F. Doerr. Mar. 1961, 161p. incl. diagrs. tables, refs. (AFOSR-109) (AF 29(600)1711)
AD 271998 Unclassified

The theoretical foundations of a detailed study of the dynamics of separating bodies at supersonic speeds are established. Carrier vehicle flow field characteristics are investigated to define the environment into which the ejected bodies are projected. The aerodynamic properties of representative capsule configurations in locally varying flows are documented, and the equations of motion pertinent to the several modes and techniques of ejection and separation are stated. Trajectory computations based upon a realistic summary of the problem inputs are discussed, and the relative importance of the operational parameters assessed. Separation system requirements are compared for the several ejection modes and capsule configurations considered. Particular emphasis is given to the section describing the wake structure behind a body representative of a carrier vehicle traveling at supersonic speeds. (Contractor's abstract)

ANALYSIS OF THE MICROWAVE SPECTRUM OF 2-FLUORONAPHTHALENE WITH A DISCUSSION OF STRUCTURE DETERMINATION POSSIBILITIES, by B. Bak, D. Christensen and others. [1961] [10]p. incl. tables. (AFOSR-1244) (AF 61(052)73)
Unclassified

Also published in Spectrochim. Acta, v. 18: 229-233, Feb. 1962.

The microwave spectrum of gaseous 2-fluoronaphthalene has been recorded in the 12,800-20,800 mc/s region and successfully analyzed, the final analysis accounting very precisely for 21 observed lines. The rotational constants are: A = 2864 ± 1; B = 808.18 ± 0.01; C = 629.49 ± 0.01 mc/s. For structure determination purposes in which changes of rotational constants on isotopic substitution are decisive, A, B and C may be fixed more sharply according to procedures indicated. An estimate of the accuracy, with which the position of each of the 7 hydrogen atoms and 10 carbon atoms may be found by means of the method of isotopic substitution, is given.

SYNTHESIS OF ALPHA- AND BETA CARBON ISOTOPICALLY LABELLED FURAN, by B. Bak, J. T. Nielsen, and M. Schottländer. [1961] [4]p. (AFOSR-3809) (AF 61(052)73) Unclassified

Also published in Acta Chem. Scand., v. 16: 123-126, 1962.

The preparation of 200 mg quantities of 22% enriched [α-^{13}C] furan and [β-^{13}C] furan from enriched K^{13}CN is described. The over-all yields are, respectively, 11 and 8% with respect to K^{13}CN. The first synthesis involves 6 steps, the second 17 steps. The purity, as controlled by the infrared gas-spectrum, was highly satisfactory. (Contractor's abstract)

ON THE ARGUMENT OF THE DERIVATIVE OF A UNIVALENT FUNCTION, by P. J. Donohoe and P. B. Kennedy. Mar. 20, 1961, 8p. (Technical scientific note no. 1) (AFOSR-269) (AF 61(052)263) AD 264867 Unclassified

By consideration of an example due to Littlewood (Quart. Jour. Math., v. 9: 14-20, 1938) it is shown that, for functions f(z) regular and univalent in $z < 1$, the known estimate $V(r,f) = \int_0^{2\pi} |d_\theta \arg f'(re^{i\theta})| = 0(1)/(1 - r)$ (as $r \to 1$) is best-possible in the sense that $V(r,f) > A/(1 - r)$ for some function f of the class under consideration, some constant $A > 0$ and all sufficiently small $1 - r > 0$. This is an improvement on a result due to Flett (Quart. Jour. Math., v. 6: 59-72, 1955). (Contractor's abstract)

A SURVEY OF SOME NUMERICAL WEATHER PREDICTION METHODS, by G. V. Kelly. Dec. 1961, 32p. incl. tables. (Technical note no. 13) (AFOSR-2688) (AF EOAR-61-4) AD 289477 Unclassified

A report is made of numerical weather prediction techniques which consist in solving the thermo- and hydro-dynamical equations of motion of the atmosphere. Most of the experimentation has been performed on quasi-geostrophic models. Appropriate expressions for gradient, divergence, and vorticity are obtained for a co-ordinate system in which pressure is used as the vertical co-ordinate. The equation of continuity is developed and the vorticity equation, which is the basis of numerical prediction techniques, is derived from the horizontal equation of motion. The geostrophic wind vector is introduced and the relation between geostrophic vorticity and the change of height of an isobaric surface is demonstrated. Two simultaneous partial differential equations in which the unknowns are the vertical velocity and the local change of height of the surface are derived, and it is shown how these equations may be solved by the relaxation technique to give estimates of the future values of the unknowns. Particular atmospheric models are presented in detail.

KINETIC STUDIES IN A SINGLE-PULSE SHOCK TUBE, by A. Hertzberg and H. S. Glick. [1961] [22]p. incl. illus. diagrs. refs. (AF 18(600)1332) Unclassified

Published in Fundamental Data Obtained from Shock-Tube Experiments, ed. by A. Ferri. London, Pergamon Press, 1961, p. 161-182. (NATO AGARDograph no. 41)

The single-pulse shock tube method is reviewed, using studies that have been performed on nitric oxide formation and aliphatic hydrocarbon decomposition as illustrative examples. The aim of the single-pulse method is to raise the temperature and pressure of a reactant gas sample very quickly to known values, allow the gas to react for a time of the order of msec, and then cool the gas sample rapidly so as to "freeze" the composition of the reactant gas that existed just prior to the initiation of cooling. The kinetic measurements carried out thus far have demonstrated the technique to be flexible and capable of producing reliable data. The density-controlled freezing capability of the method offers the possibility of creating large

concentrations of free radicals by the high temperature and short duration phase of the temperature pulse, and then capturing a large fraction of these reactive species by reducing the density of the reaction mixture rapidly.

THE CAL PRESSURE WAVE CHEMICAL REACTOR, by A. Hertzberg, W. Squire and H. S. Glick. Jan. 1956 [27]p. incl. illus. diagrs. refs. (Rept. no. AD-1052-A-13) (AFOSR-64-2530) (AF 18(603)10)
AD 611139 Unclassified

A novel type of chemical reactor which utilizes strong pressure waves to heat and cool gases rapidly and uniformly is proposed. Its principal advantages over existing devices are claimed to be: (1) extremely rapid rates of heating and cooling reacting gases, (2) very precise control over reaction parameters, (3) effective reaction temperatures far above maximum wall temperatures, (4) a continuous flow system with a rate of chemical production competitive with other units of comparable size, and (5) low energy consumption per unit mass of product as compared with other reactors using similar chemistry. On the basis of a preliminary survey of reactions to which such a reactor might be applied, a detailed analysis was made of its application to the fixation of atmospheric nitrogen. Calculations of the mass handling capacity, net energy requirement, size of auxiliary equipment, etc., for an industrial wave reactor were carried out. The calculated yields and energy requirements compared favorably with other processes.

RADIATION AT HYPERSONIC SPEEDS, by C. E. Treanor. [1961] [26]p. incl. diagrs. table, refs. [AF 18(603)141] Unclassified

Presented at ARS Internat'l. Hypersonic Conf., Cambridge, Mass., Aug. 16-18, 1961.

Also published in Prog. in Astronaut. and Rocketry, v. 7: 255-280, 1962.

The optical radiation from the heated air which enveiopes a high speed vehicle is of interest in many different problems related to re-entry vehicles. In this report, the data available for the radiation from equilibrated high temperature air are reviewed. The results available are presented in graphical form, showing the absorption coefficient for each radiating species as a function of temperature and wavelength. The temperature range considered is from ~3000K to ~8000K, the wavelength range from ~0.2 to 1.5 μ. Seven molecular band systems are considered. For 2 of these ($NO\nu$ and O_2S-R) there is good agreement among the various experimental results. For 4 bands ($N_2(1+)$, $N_2^+(1-)$, NO_β and NO_2 continuum) there is substantial disagreement. For the other molecular band system ($N_2(2+)$, and for the oxygen free-bound and free-free radiation, there is only a single source of data. (Contractor's abstract)

EXACT SOLUTION FOR NONEQUILIBRIUM EXPANSIONS OF AIR COUPLED REACTIONS, by A. Q. Eschenroeder, D. W. Boyer, and J. G. Hall. May 1961, 21p. incl. diagrs. tables, refs. (Rept. no. AF-1413-A-1) (AFOSR-622) (AF 49(638)792)
AD 257396 Unclassified

Results of numerical integrations of the coupled chemical rate equations and gasdynamic equations are presented for nozzle airflows. Composition histories are shown for a kinetic mechanism including 6 species and 14 reactions. The freezing process is complex because the N-O shuffle reactions couple the dissociation-recombination reactions. In many cases where the energy in N dissociation is significant, the fast shuffle reactions prevent N atom freezing which would otherwise occur if 3 body recombination were the only process operating. Nitric oxide concentrations undershoot the equilibrium values in many cases. Oxygen freezing is affected little by the shuffle reactions. Results suggest the applicability of simplified chemical kinetic models based on the shuffle reactions for airflows in various regimes of the initial state. (Contractor's abstract)

DEVELOPMENT OF A SHOCK-TUBE DRIVEN MOLECULAR BEAM, by G. T. Skinner. Oct. 1961 [64]p. incl. diagrs. (Rept. no. RM-1396-A-1) (AFOSR-166) (AF 49(638)793) AD 266365 Unclassified

The preliminary development of a high intensity molecular beam, in which a small tailored-interface hypersonic shock-tunnel is used as the gas source, is reported. The aim is to extend molecular beam techniques into the 1-10 ev per particle range by utilizing the capability of the shock tube to generate high temperatures. A 0.7 ev nitrogen beam was produced in the pilot apparatus. The intensity of 2.5×10^{18} molecules 1/sq cm/sec and the spreading angle of 6° agree with a theoretical analysis which takes into account attenuation caused by scattered molecules which have been thermally accommodated at the walls of the apparatus. A modified Kantrowitz-Grey system is used to obtain the high-energy beam. (Contractor's abstract)

ON THE VISCOSITY OF DISSOCIATED AIR, by F. K. Moore. Sept. 1961 [18]p. incl. diagrs. (Rept. no. RM-1396-A-2) (AFOSR-1554) (AF 49(638)793) AD 265747 Unclassified

Also published in ARS Jour., v. 32: 1415-1416, Sept. 1962. (Title varies)

Using a particular set of interaction parameters, it is shown that the viscosity of dissociated high-temperature air is well represented by a simple formula which is a perturbation from the pure-molecule result. To this order, information about atom-atom interactions is not needed. The perturbation formula is then used to show that there is no point in calculating the effect of composition on viscosity unless the atom-molecule interaction parameters are known within a very few per cent. Finally, it is noted that the composition effect on boundary-layer transport properties stems chiefly from the dilatation factor in the state equation, tending to justify calculation of viscosity on a pure-molecule basis. SHOCK TUBE DRIVEN MOLECULAR BEAM FOR THE 1-10 EV RANGE (Abstract), by G. T. Skinner. [1961] [1]p. [AF 49(638)793] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 41, Feb. 1, 1961.

A small tailored interface hypersonic shock tunnel, consisting of shock tube and two-stage expansion nozzle, is being used as a source for an atomic or molecular beam. Such a source provides a stream of high-velocity particles at low ambient temperature, giving a high degree of energy collimation. Dissociation products in the shock tube can be preserved intact by operating at moderately low density and allowing gas composition to freeze early in the expansion. The beam is defined by a collimating orifice placed in the hypersonic flow at a point where the mean free path is large compared with the orifice diameter. The beam intensity is of the order of 10^{19} molecules cm^{-2} sec^{-1}. In passing such an intense stream of high-energy particles through a cold orifice, certain problems arise from collision processes which can be neglected in conventional molecular beams. These are essentially rarefied gas dynamic phenomena. This apparatus gives a well-defined beam for several diameters downstream of the orifice.

DEVELOPMENT OF THE SHOCK TUNNEL AND ITS APPLICATION TO HYPERSONIC FLIGHT, by A. Hertzberg, C. E. Wittliff, and J. G. Hall. [1961] [57]p. incl. illus. diagrs. tables, refs. (AF 49(638)-952) Unclassified

Presented at ARS Internat'l. Hypersonics Conf., Cambridge, Mass., Aug. 16-18, 1961.

Also published in Prog. in Astronaut. and Rocketry, v. 7: 701-758, 1962.

The development of the shock tunnel, its present capabilities and future prospects are reviewed and discussed. The ability of the shock tunnel to produce air flows at stagnation temperatures and pressures associated with hypersonic flight has been well established. The chief difficulty associated with this type of tunnel has been very short (millisecond) testing time. The "tailored interface" technique has significantly increased the available testing time in a shock tunnel. This testing time extension, plus the development of effective rapid response instrumentation, now permits the accurate measurement of pressures, forces, and heat transfer rates. The hypersonic shock tunnel in its present form is capable of duplicating re-entry flight conditions for various hypersonic vehicles over an important area of the re-entry flight corridor. However, complete duplication over the entire range of interest for re-entry flight cannot be obtained with present shock tunnels. For some regions it is necessary to resort to the techniques of partial simulation. However, the flexibility of the shock tunnel permits a wide range of simulation conditions to be studied. In its present form the shock tunnel has exceeded initial expectations regarding both range of performance and scope of testing. Exploratory experiments have demonstrated the usefulness of the shock tunnel for the investigation of hypervelocity rarefied-gas flows associated with the re-entry of manned vehicles. Anticipated developments in the technique of operation indicate the possibility of extending the range of complete flight duplication so that nearly the entire range of critical flight re-entry can be conveniently studied.

THE INTERSTELLAR ABUNDANCE OF THE HYDROGEN MOLECULE, by R. J. Gould. Aug. 31, 1961, 42p. incl. diagrs. tables, refs. (AFOSR-1401) (AF 49(638)915) AD 264674 Unclassified

Presented at 109th meeting of the Amer. Astronom. Soc., Denver, Colo., Dec. 26-30, 1961.

Abstract published in Astronom. Jour., v. 67: 115A, Mar. 1962.

The various processes which determine the concentration of molecular hydrogen in HI clouds are investigated. It is shown that, contrary to the results of previous investigations, the processes involving a dissociation of the molecule are quite negligible compared to the relatively rapid formation of H_2 on the surfaces of grains. As a result there is a gradual build-up of molecular hydrogen in the clouds until the clouds, thru their random motion, pass near a bright star whereby the H_2 is dissociated again. The percentage of hydrogen which should have associated to molecular form is estimated under various conditions. In particular, calculations are made for the case of a constant ratio of gas to dust density and for the case where the dust density is independent of the gas. The results of the calculations vary considerably, depending on the conditions but the general results point to the likelihood of a molecular hydrogen concentration comparable to that of the observed atomic hydrogen and in some circumstances to a value much greater than that of the atomic concentration. THE HETEROLACTIC FERMENTATION. III. POSITION OF C^{14} IN THE PRODUCTS OF FRUCTOSE DISSIMILATION BY LEUCONOSTOC MESENTEROIDES, by M. Busse, P. K. Kindel, and M. Gibbs. [1961] [4]p. incl. tables, refs. (AFOSR-1072) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and National Science Foundation under AF 49(636)798) Unclassified

Also published in Jour. Biol. Chem., v. 236: 2650-2653, Nov. 1961.

Leuconostoc mesenteroides ferments fructose to carbon dioxide, ethanol, acetic acid, lactic acid, and mannitol. Degradation data for specifically labelled fructoses show that most of the tracer is distributed among the fermentation products in the same way as in the case of glucose fermentation. Some tracer, however, is spread to other positions in the fermentation products. These data indicate that some of the mannitol formed is reoxidized resulting in an exchange of radioactive carbon 14. The pattern of radioactive carbon 14 distribution among the fermentation products also indicates the action of fructose phosphoketolase. In crude extracts of Leuconostoc mesenteroides, a reversible, diphosphopyridine nucleotide-specific mannitol dehydrogenase has been found. The organism cannot be used to determine isotope distribution in fructose.

STUDIES ON PHOTOSYNTHETIC PROCESSES. II. ACTION SPECTRA AND QUANTUM REQUIREMENT FOR TRIPHOSPHOPYRIDINE NUCLEOTIDE REDUCTION AND THE FORMATION OF ADENOSINE TRIPHOSPHATE BY SPINACH CHLOROPLASTS, by C. C. Black, J. F. Turner and others. [1961] [4]p. incl. diagrs. refs. (AFOSR-1182) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)798, National Science Foundation, and Public Health Service) AD 295898 Unclassified

Also published in Jour. Biol. Chem., v. 237: 580-583, Feb. 1962.

Action spectra and quantum requirements were determined with spinach chloroplast fragments for the processes of triphosphopyridine nucleotide reduction, adenosine triphosphate formed during reduction, and adenosine triphosphate formation supported by phenazine methosulfate. The action spectrum for triphosphopyridine nucleotide reduction showed peaks at 450, 500, and 675 mμ; peaks for concomitant phosphorylation were at 430 and 660 mμ, with a shoulder at 500 mμ. Phosphorylation in the presence of phenazine methosulfate exhibited peaks at 430, 500, and 680 mμ. Carotenoid pigments appeared to function in the processes studied. The quantum requirement for triphosphopyrine nucleotide reduction was 9 at 675 mμ, and for the associated phosphorylation, 15, but the phosphorylation supported by phenazine methosulfate had a quantum requirement from 10 - 15 times greater. The molar ratio of adenosine triphosphate to reduced triphosphopyridine nucleotide only approached one at high light intensities. The highest ratios were obtained in the blue absorption bands; in contrast, the highest quantum yields were in the red region for both phosphorylation and reduction. (Contractor's abstract)

STUDIES ON PHOTOSYNTHETIC PROCESSES. I. THE EFFECT OF LIGHT INTENSITY ON TRIPHOSPHOPYRIDINE NUCLEOTIDE REDUCTION, ADENOSINE TRIPHOSPHATE FORMATION, AND CARBON DIOXIDE ASSIMILATION IN SPINACH CHLOROPLASTS, by J. F. Turner, C. C. Black, and M. Gibbs. [1961] [3]p. incl. diagrs. refs. (AFOSR-1183) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)798 and National Science Foundation) AD 296204 Unclassified

Also published in Jour. Biol. Chem., v. 237: 577-579, Feb. 1962.

The effect of light intensity on CO_2 fixation, triphosphopyridine nucleotide reduction and adenosine triphosphate formation by spinach chloroplasts was investigated. Increasing light intensity brought about a higher rate of CO_2 fixation but low light intensities produced a lag in the rate. At low and high chlorophyll concentrations the rate of TPN reduction increased linearly with increasing light intensity. In contrast, ATP formation showed a distinct lag at intensities of 25 foot-candles or less at the low chlorophyll concentration and a more pronounced lag of up to 250 foot-candles at higher chlorophyll concentrations. With low chlorophyll reaction mixtures, the molar ratio of ATP to reduced TPN approached unity at 3000 foot-candles. The ratio reached a maximum of 0.5 at 3000 foot-candles and high chlorophyll concentrations. No exchange reaction between inorganic phosphate and ATP was observed with these preparations.

ROLE OF ALDOLASE IN PHOTOSYNTHESIS. 1. ENZYME STUDIES WITH PHOTOSYNTHETIC ORGANISMS WITH SPECIAL REFERENCE TO BLUE-GREEN ALGAE, by C. A. Fewson, M. Al-Hafidh, and M. Gibbs. [1961] [5]p. incl. tables, refs. (AFOSR-2044) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)798 and National Science Foundation) Unclassified

Also published in Plant Physiol., v. 37: 402-406, May 1962.

Several enzymes involved in carbohydrate metabolism were assayed in extracts of blue-green, green, red, and golden-brown algae, the photosynthetic bacterium Rhodospirillum rubrum (von Esmarch) Molisch, and spinach. Aldolase was absent from the blue-greens but could be detected in all the other organisms. Glucose-6-phosphate and gluconate-6-phosphate dehydrogenases were especially active in the 3 blue-greens examined and it is suggested that the pentose phosphate pathway is the main method of hexose dissimilation in these organisms. These dehydrogenases were low in the red alga Chondrus crispus (L.) Stackhouse, but a non-specific glucose oxidase was very active. It is suggested that the apparent absence of aldolase from some photo-autotrophic organisms makes it likely that the formation of hexoses during photosynthesis does not necessarily proceed by the condensation of 2 molecules of triose phosphate. (Contractor's abstract)

FACTORS AFFECTING CO_2 FIXATION BY CHLOROPLASTS, by M. Gibbs, C. C. Black, and B. Kok. [1961] [4]p. incl. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)798 and National Science Foundation) Unclassified

Published in Biochim. et Biophys. Acta, v. 52: 474-477, Sept. 30, 1961.

The low rate of CO_2 uptake by spinach chloroplasts may be due to the loss of photosynthetic pyridine nucleotide reductase during isolation of the particle. The addition of orthophosphate, adinosine diphosphate (ADP) and Mg^{2+} accelerates triphosphopyridine nucleotide (TPN) reduction, which may account for an earlier observation that small amounts of phosphate stimulate CO_2 reduction by chloroplasts. Aging destroys the ability of chloroplasts to assimilate CO_2 but does not affect TPN reduction. (Contractor's abstract)

CONTRIBUTION TO THE THEORY OF INELASTIC MOLECULAR COLLISIONS, by J. Weinstock. [1959] [47]p. incl. diagr. tables, refs. (AFOSR-338) (AF 18(603)111) AD 282841 Unclassified

The validity of the distorted wave (dw) approximation for the solution of the vibrational energy transfer problem is investigated. The behavior of the transition probability integral is shown to be determined by the behavior of its integral at a single point. This critical point is used to obtain an exact solution of the transition probability with which the dw solution is compared. The dw solution is found to lie within 20% of the exact solution whenever the transition probability is less than roughly 0.6. The existence of the critical point leads to a simple expression for the transition probability in terms of an arbitrary interaction potential. The effects of adiabatic changes due to short range repulsive forces are investigated by means of the method of perturbed stationary states. (Contractor's abstract)

An exponential formula commonly used in the discussion of vibrational transition probabilities in molecular collisions is analyzed with the object of determining the extent to which it is dependent on specific (but questionable) assumptions about the form of the interaction energy. Using a principle of Landau, a very general expression is derived for the exponential appropriate to the 1-dimensional case. It is shown that the leading term is very insensitive to the precise nature of the interaction, so that this term in its commonly used form has a great degree of generality. The correction terms in the exponential, on the other hand, depend sensitively on the assumed form of the interaction in the region of strong repulsion, so the corrections in current use must be considered very uncertain.

ANISOTROPY OF NUCLEAR MAGNETIC RESONANCE IN VANADIUM PENTOXIDE, by J. L. Ragle. [1961] [2]p. incl. diagr. (AFOSR-643) (AF 49(638)191)
Unclassified

Also published in Jour. Chem. Phys., v. 35: 753-754, Aug. 1961.

The NMR spectra of V^{51} in V_2O_5 at high fields show a marked asymmetry of the central component of the 7-line quadrupole pattern. The proportionality of this asymmetry to field strength indicates that its origin lies in an anisotropic magnetic shielding.

STUDIES IN NON-STOICHIOMETRY. ELECTRICAL CONDUCTIVITY AND CARRIER MOBILITY IN LITHIUM TUNGSTEN BRONZES, by M. J. Sienko and T. B. N. Truong. [1961] [5]p. incl. diagr. tables, refs. (AFOSR-644) (AF 49(638)191) Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 3939-3943, Oct. 5, 1961.

Single crystal resistivity measurements, x-ray spacings and densities are reported for 3 lithium tungsten bronzes: $Li._{.394}WO_3$, $Li._{.377}WO_3$, and $Li._{.365}WO_3$. In the range −150 to 90°, conduction is metallic, in contradiction to previous reports. The electron mobility increases with lithium content and decreases with temperature. Arguments are given for believing there should be a transition from localization of electrons to delocalization at approximately $Li._{.25}WO_3$. Reexamination of previously reported magnetic results suggest a maximum in the effective mass of the carriers at $M._{.30}WO_3$. The change in effective mass and mobility is attributed mainly to the effect of cationic point charge defects on the 5d conduction band. (Contractor's abstract)

STUDIES IN NON-STOICHIOMETRY. MAGNETIC SUSCEPTIBILITIES IN THE TUNGSTEN-OXYGEN SYSTEM, by M. J. Sienko and B. Banerjee. [1961] [4]p. incl. diagr. tables, refs. (AFOSR-645) (AF 49(638)-191)
Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 4149-4152, Oct. 20, 1961.

Magnetic susceptibilities have been measured by the Gouy method for several tungsten oxides of the series WO_x. At 297.5°K the susceptibility per unit volume is found to increase monotonically from -0.65×10^{-6} to $+0.46 \times 10^{-6}$ as x in WO_x decreases from 3 to 2. Results are interpretable in terms of a defect structure in which 3 − x oxygen atoms have been removed from a host WO_3 lattice leaving 2(3 − x) electrons in the conduction band of the host. Quantitative agreement with a Pauli-Peierls calculation is surprisingly good. The model may be applicable to other nonstoichiometric oxides for which "mixed-oxidation-state" structures have been postulated. (Contractor's abstract)

CARRIER CHARACTERISTICS IN COPPER-DOPED WO_3 FROM CONDUCTIVITY, HALL VOLTAGE, AND THERMAL E. M. F. STUDIES, by M. J. Sienko and P. F. Weller. [1961] [25]p. incl. diagrs. table, refs. (AFOSR-1705) (AF 49(638)191) AD 269007
Unclassified

Also published in Inorg. Chem., v. 1: 324-331, May 1962.

Single crystals of $Cu_{0.076}WO_3$, $Cu_{0.094}WO_3$, and $Co_{0.95}WO_{3+\delta}$ have been prepared by thermal decomposition of $CuWO_4$ and WO_3. Potential-probe resistivity measurements in the range 120 to 770°K indicate complex semiconducting behavior. $Cu_{0.094}WO_3$, which is orthorhombic, shows 3 linear segments in the log ρ vs 1/T dependence, the apparent activation energies being 0.05 ev below 170°K, 0.4 ev between 170 and 220°K, and 0.45 ev above 500°K. Between 220 and 500 K, behavior is metallic. $Cu_{0.95}WO_{3+\delta}$, which is triclinic, shows no metallic region but has 2 linear segments with activation energy 0.10 ev below 700°K and 0.15 ev above. Measurements of the Hall voltage and of the thermoelectric power indicate that

carriers are electrons. At 300°K, representative carrier densities are 5×10^{18}, 15×10^{18}, and 1×10^{18} electrons/cc with mobilities 6, 10, and 0.4 cm^2/v sec for $Cu_{0.076}WO_3$, $Cu_{0.094}WO_3$, and $Cu_{0.95}WO_{3+\delta}$, respectively. Thermal emf values fall in the range -2[illegible] to -300 μv/deg. Results are interpreted in terms of [illegible]nduction band model with destruction of the b[illegible]low room temperature due to a probable ferr[illegible]ectric transition in the host lattice. Excess oxygen acceptor centers of appreciable ionization energy apparently are present in small concentration in the low-copper materials and in large concentration in the high-copper material. A RAMAN STUDY OF THE BROMIDE SOLUTIONS OF ZINC AND CADMIUM, by W. Yellin and R. A. Plane. [1960] [3]p. incl. diagrs. table, refs. (AFOSR-1024) (AF 49(638)279) AD 454548 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 2448-2452, June 5, 1961.

Raman intensity measurements were made of zinc bromide solutions containing various ratios of total zinc to total bromide. These results led to the following as the most probable assignments for the 3 polarized lines: ν_{172} cm^{-1} ($\rho = 0.06$), $ZnBr_4^=$; ν_{186} cm^{-1} ($\rho = 0.09$), $ZnBr_2$; ν_{205} cm^{-1} ($\rho = 0.13$), $ZnBr^+$. Comparison with $ZnBr_2$ in non-aqueous solvents indicated that the aqueous $ZnBr_2$ molecule is different from that in other solvents and may be tetrahedral $Zn(H_2O)_2Br_2$. Stepwise formation constants for the 3 complexes were found in concentrated solution to be: $(ZnBr^+)/(Zn^{++})(Br^-) = 0.3$, $(ZnBr_2)/(ZnBr^+)(Br^-) = 1$, $(ZnBr_4^=)/(ZnBr_2)(Br^-)^2 = 0.2$. If $ZnBr_3^-$ were present, its principal Raman band was coincident with that of 1 of the other species. In cadmium bromide solution of various ratios of total Br^- to total Cd^{++}, only 1 polarized line was found. Coincident with that line, at 166 cm^{-1} ($\rho = 0.08$) which was due to $CdBr_4^=$, was the principal line of 1 (or more) lower species. The lower species appeared to be of less importance than in the zinc system, while the tetrabromo species was of greater importance: $(CdBr_4^=)/(Cd^{++})(Br^-)^4 > 1$. (Contractor's abstract)

POLYMERIZATION IN COBALTIC PERIODIC SOLUTIONS, by C. J. Nyman and R. A. Plane. [1960] [4]p. incl. diagrs. (AFCSR-1575) (AF 49(638)279) AD 454549 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 2617-2620, June 20, 1961.

Acidified solutions of $Na_5H_2Co(IO_6)_2 \cdot 10H_2O$ show the presence of 2 types of periodate ions as evidenced by the fact that a portion, but not all, of the periodate may be removed by precipitation or reduction without changing the absorption spectra. Polymerization of the cobalt species to form a soluble polynuclear complex having a cobalt (III) to periodate ratio of 4:3 occurs at a measurable rate which increases with increasing hydrogen ion concentration. From a 2 M perchloric acid solution, a dark green crystalline solid is obtained which has 3 strongly ionized hydrogen ions and 3 iodine atoms per 4 cobalts. The crystals are soluble in water and have an elemental analysis and equivalent weight leading to a postulated formula $H_3[Co_4I_3O_{30}H_{24}]$ for their composition. (Contractor's abstract)

NATURE OF THE METAL-LIGAND BOND IN SOME COMPLEX CYANIDES FROM A STUDY OF RAMAN INTENSITIES, by G. W. Chantry and R. A. Plane. [1961] [5]p. incl. tables, refs. (AFOSR-4310) [AF 49(638)279] Unclassified

Also published in Jour. Chem. Phys., v. 35: 1027-1031, Sept. 1961.

A study of the Raman spectra of solutions of $Zn(CN)_4^=$, $Cd(CN)_4^=$, $Hg(CN)_4^=$, $Co(CN)_6^{-3}$, $Cu(CN)_4^{-3}$, $Ag(CN)_4^{-3}$, and $Fe(CN)_6^{-4}$ shows that these complex ions fall into 2 distinct sets. For the first set, consisting of the first 4 species, the A_1 CN frequencies are 2143, 2145, 2148, and 2152 cm^{-1} and the $\bar{\alpha}_{CN'}$ lie intermediate between those determined for free CN^- and CH_3CN. For the latter 3 species, the corresponding frequencies are 2094, 2097, and 2094 cm^{-1}. Furthermore, members of the latter set have abnormally large Raman intensities, i.e., large $\bar{\alpha}_{CN'}$, and an additional ultraviolet absorption band at 2600A. For the first group, the assumption of partial sigma bonding of metal to C, consistent with the principle of essential electroneutrality, explains both the observed force constant and the values of $\bar{\alpha}_{CN'}$. The low intensity found for the ν_2 mode is explained in terms of the effect on this quantity of the large amount of s character in the carbon sigma orbital. The second group cannot be simply treated and appears to present an example of the breakdown of bond localized polarizabilities. (Contractor's abstract)

ENAMINES OF 2-INDANONES, by A. T. Blomquist and E. J. Moriconi. Dec. 15, 1960, 31p. incl. tables, refs. (AFOSR-TR-60-166) (AF 49(638)688) Unclassified

Also published in Jour. Org. Chem., v. 26: 3761-3769, Oct. 1961.

Enamines 2-(N-pyrrolidyl) (IIa), 2-(N-piperidyl) (IIb), 2-(N-hexamethyleneimino) (IIc), and 2-(N-morpholinyl)indene (IId) were prepared from 2-indanone and the appropriate sec-amines; similarly 3-phenyl-2-(N-hexamethyleneimino)indene was obtained from 1-phenyl-2-indanone (VIII). C-Alkylation of IIa-IId with bromomethyl benzyl ether was highest with IIc. 1-Methyl (V), 1-benzyloxymethyl- (VI), and 1-benzyl-2-indanone (VII) were prepared by C-alkylation of IIc with the appropriate alkyl halide. A shift of 100-131 cm^{-1} in the double bond stretching maximum was observed in going from IIa-IId to their respective ternary iminium salts. Selenium dioxide oxidation of VIII and 3-phenyl-1-indanone gave, respectively, 1-hydroxy-1-phenyl-2-indanone and 3-hydroxy-3-phenyl-1,2-indandione, and 3-phenylindone. Nitrosation of V and VI under alkaline conditions gave no o-oximinoindanones but unexpectedly yielded ring expanded products tentatively identified as alkylated 3-hydroxyisoquinoline N-oxides. MASS SPECTROMETRIC STUDIES OF LOW PRESSURE PYROLYSIS REACTIONS OF CHLORINATED AND FLUORINATED C_1 AND C_2 COMPOUNDS ON GRAPHITE, by D. R. Bidinosti and R. F. Porter. [1961] [7]p. incl. diagrs. table, refs. (AFOSR-531) [AF AFOSR-60-25] Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 3737-3742, Sept. 20, 1961.

The pyrolysis behavior of chlorinated derivatives of methane, ethane and ethylene has been investigated in graphite ovens at pressures between 10^{-2} and 1 mm of Hg in the temperature range 450-1300°K. Several C_2 compounds studied transfer chlorine atoms from adjacent carbon atoms to the graphite surface. The pressure dependence of the yield of dechlorinated products indicated a first-order relationship between product and reactant. This is interpreted as evidence for the existence of an equilibrium reaction with graphite. Heats of reaction for the removal of 2 chlorine atoms from adjacent carbon atoms are found to vary between +12 and +25 kcal. The compound sym-tetrachloroethane pyrolyses to both sym-dichloroethylene and trichloroethylene, the latter by the elimination of HCl(g). The HCl elimination reactions are found to follow a more complex pressure dependence than those observed for dechlorination. Several fluoro-chloro C_1 and C_2 compounds also have been dehalogenated over graphite. (Contractor's abstract)

MASS SPECTROMETRIC STUDY OF THE REACTIONS OF $BF_3(g)$ WITH $BCl_3(g)$, $B(OH)_3(g)$, AND $B_2O_3(l)$, by R. F. Porter, D. R. Bidinosti, and K. F. Watterson. [1961] [5]p. incl. diagrs. tables. (AFOSR-1366) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-60-25 and Advanced Research Projects Agency) Unclassified

Also published in Jour. Chem. Phys., v. 36: 2104-2108, Apr. 1962.

Exchange reactions of halogen and hydroxyl with $Bx_3(g)$ have been studied mass spectrometrically. The major product produced by the reaction of $BF_3(g)$ with boric acid at 25°C and pressures of the order of 10^{-6} atm is $B(OH)F_2(g)$. The species $B(OH)_2F(g)$ is also formed at higher temperatures when $B(OH)_3(g)$ is observable. Equilibria involving the reactions $1/3\ BF_3(g) + 2/3\ BCl_3(g) = BFCL_2(g)$, $2/3\ BF_3(g) + 1/3\ BCl_3(g) = BF_2Cl(g)$, $1/3\ BF_3(g) + 2/3\ B(OH)_3(g) = B(OH)_2F(g)$, and $2/3\ BF_3(g) + 1/3\ B(OH)_3(g) = B(OH)F_2(g)$, have been studied as a function of temperature. Heats of formation at 298°K for $BFCl_2(g)$, $BF_2Cl(g)$, $B(OH)_2F(g)$, and $B(OH)F_2(g)$ are found to be -154.1 ± 1.0, -211.9 ± 2.0, -249.8 ± 2.5, and -260.2 ± 2.5 kcal/mol, respectively. Reactions of $BF_3(g)$ with $B_2O_3(l)$ have also been studied at pressures between 10^{-6} and 10^{-3} atm and temperature between 400 and 1000°K. Results are consistent with published data from studies with BF_3 at pressures near 1 atm and show that $(BOF)_3(g)$ is the primary product at both pressure extremities. For the reaction $BF_3(g) + B_2O_3(l) = (BOF)_3(g)$ we obtain $\Delta H_T^o = 3.46 \pm 0.30$ kcal/mol. (Contractor's abstract)

SIMULTANEOUS CHANNELS, by J. Wolfowitz. [1959] [16]p. [AF 18(600)685] Unclassified

Published in Arch. Rational Mech. Anal., v. 4: 371-386, Feb. 18, 1960.

Let $\{w(i|j|s)\}$ $(i = 1, \ldots, a;\ j = 1, \ldots, b;\ a, b \geq 2$ $s \in S$ an arbitrary index set) be a family of a x b

matrices such that $w(i|j|s) \geq 0$ and $\Sigma_{i=1}^{a} w(i|j|s) = 1$ for all j, s. The following results are established. Let u and v stand for n-component vectors whose components range over the integers $1,\ldots,b$ and $1,\ldots,a$, respectively. Define a code of length N, word length n, and error probability $\leq \lambda$, as a set $u_1,\ldots,u_N$ of distinct u's, and disjoint v-sets $A_1,\ldots,A_N$, such that if $P(v|u|s) = w(y_1|x_1|s)\, w(y_2|x_2|s)\cdots w(y_n|x_n|s)$, where $u = (x_1,\ldots,x_n)$ and $v = (y_1,\ldots,y_n)$, then $P(A_k|u_k|s) \geq 1 - \lambda$ $(k = 1,\ldots,N;\ s \in S)$. The coding theorem is as follows: There exists a number $C_0 \geq 0$ with the property that for any $\lambda > 0$ there is a $K \geq 0$ such that for every n there exists a code of length $N \geq 2^{nC_0 - K\sqrt{n}}$, word length n, and error probability $\leq \lambda$. Strong converse: There exists a $K' \geq 0$ such that the length of any code of word length n and error probability $\leq \lambda$ satisfies $N \geq 2^{nC_0 + K'\sqrt{n}}$. These results correspond to the case when the channel is unknown to transmitter or receiver (except that it is a member of S) but remains fixed over a word. If the family $A_1,\ldots,A_N$ is permitted to depend upon s and if $P(A_k(s)|u_k|s) \geq 1 - \lambda$ $(k = 1,\ldots,N;\ s \in S)$, then the above results are unchanged. If the set $u_1,\ldots,u_N$ is permitted to depend upon s, there is a $C_1 \geq C_0$ in terms of which the coding theorem and strong converse are valid. Simple expressions for C_0 and C_1 are given. A NOTE ON THE STRONG CONVERSE OF THE CODING THEOREM FOR THE GENERAL DISCRETE FINITE-MEMORY CHANNEL, by J. Wolfowitz. [1959] [5]p. (AF 18(600)685) Unclassified

Published in Inform. and Control, v. 3: 89-93, Mar. 1960.

The present note is a proof of the strong converse of the coding theorem for the special discrete finite-memory channel. Two theorems are proven. The first states: Let C be the capacity of a general discrete finite-memory channel. Let $\epsilon > 0$ and λ, $0 \leq \lambda < 1$, be arbitrary. For n sufficiently large any code (N, λ) must satisfy $N < 2^{n(C+\epsilon)}$. The second reads: The capacity C of the general discrete finite-memory channel satisfies, for every positive integer l,

$$\frac{C(l+m)}{(l+m)} \leq C \leq \frac{C(l+m)}{l+m) + \frac{m}{l+m}}.$$

MARKOFF CHAINS AND MARTIN BOUNDARIES, by G. A. Hunt. [1959] [28]p. [AF 18(600)685] Unclassified

Published in Illinois Jour. Math., v. 4: 313-340, Sept. 1960.

This paper presents an argument, using only the basic properties of Martingales and Markoff chains, in which the main convergence theorem of Doob (Jour. Math. Mech., v. 8: 433-458, 1959) is proved at the beginning by reversing the sense of time in a Markoff chain. In view of the symmetry of past and future in the notion of Markoff chain, the lack of such symmetry in defining Markoff chains with stationary transitions must puzzle many a probabilist. Now, a slight and momentarily ugly alteration of the latter definition yields the notion of random chain with approximately stationary transitions, a notion symmetric in past and future. This symmetry is used to establish the convergence mentioned above and to reduce problems concerning the entrance boundary to ones concerning the exit boundary. Doob's convergence theorem, established directly, leads to the proofs of the Poisson-Martin representation of excessive functions, the behavior of excessive functions near the Martin boundary, and the resolutivity of the Martin boundary.

THE SEMI-GROUP PROPERTY OF POISSON TRANSFORMATION AND SNOW'S INVERSION FORMULA, by H. Pollard. July 1961, 9p. (AFOSR-1509) [AF 49-(638)226] AD 267686 Unclassified

Also published in Proc. Amer. Math. Soc., v. 14: 285-290, Apr. 1963.

The set F stands for the family of functions f which are integrable on each finite interval of the real axis and for which the integrals $\int^{\infty} \frac{f(x)}{x^2}\,dx$ and $\int_{-\infty} \frac{f(x)}{x^2}\,dx$ converge. For each member f of this set and each positive number a the Poisson transform $P_a f$ is defined by the point function $(P_a f)(x) = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{a f(\xi)}{(x-\xi)^2 + a^2}\,d\xi$, $-\infty < x < \infty$. The main purpose of this paper is to establish the validity of the semi-group property of this transform $P_b P_a f = P_{a+b} f$, $a > 0$, $b > 0$.

CHANNELS WITH ARBITRARILY VARYING CHANNEL PROBABILITY FUNCTIONS, by J. Kiefer and J. Wolfowitz. [1961] [11]p. incl. table. (AFOSR-3324) [AF 49(638)226] Unclassified

Also published in Inform. and Control, v. 5: 44-54, Mar. 1962.

Codes are described which apply to the cases (1) where neither the sender nor the receiver knows the channel sequence which governs the transmission of a word, and (2) where the sender or the receiver, or both, do know the channel sequence which governs the transmission of a word. For these situations, the present paper gives necessary and sufficient conditions for the existence of a positive (possible) rate of transmission. In the case where both sender and receiver know the channel probability function, a determination is made of the capacity. The codes described are all "nonrandomized".

THEORETICAL AND EXPERIMENTAL INVESTIGATIONS OF THE ATOMIC PHENOMENA OCCURRING ON AND NEAR THE SURFACES OF SOLIDS, by B. M. Siegel. Final rept. Mar. 10, 1961, 27p. (AFOSR-383) (AF 18(600)674, Task 1) AD 254688 Unclassified

Efforts were directed towards obtaining an understanding of properties and phenomena such as structure, oxidation, corrosion, and electron emission. The recently developed ultra high vacuum techniques were deemed essential for obtaining controlled surface conditions and efforts were directed to employing these conditions in all phases of the program. The atomic structure and surface morphology of surfaces and evaporated films were investigated by high resolution electron optical devices. A large amount of the work was directed toward the development of the necessary apparatus and conditions for the utilization of ultra high vacuum so necessary for the realization of controlled conditions on surfaces. SCATTERING OF 50-KV ELECTRONS AT VERY SMALL ANGLES (Abstract), by B. M. Siegel and L. Bachmann. [1961] [1]p. (Sponsored jointly by Advanced Research Projects Agency and Air Force Office of Scientific Research under [AF 18(600)674, Task 1]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 109, Mar. 20, 1961.

The differential scattering cross-section of 50-kv electrons from C and Cu was measured in the angular range of $1\text{-}5 \times 10^{-3}$ radians. Using the optics of the electron microscope and monitoring the incident intensity with a Faraday cage, absolute values were obtained and compared with the theoretical curves given by Lenz (see Zeitr. Naturforsch., v. 9a: 185, 1954). Good agreement was obtained for C if the screening radius of the potential field of the nucleus used by Leisegang (Zeitschr. Physik, v. 132: 183, 1952) is chosen. The measured values of the scattering cross section obtained for Cu are larger by a factor of 2 than the calculated values.

MULTIPLE EXCITATION AND IONIZATION OF INNER ATOMIC SHELLS BY X RAYS, by H. W. Schnopper. Dec. 15, 1961 [6]p. incl. diagr. (Research rept. no. 9) (AFOSR-1732) (AF 49(638)402) AD 282339 Unclassified

Also published in Phys. Rev., v. 131: 2558-2560, Sept. 15, 1963.

Re-investigation of the argon K absorption edge region revealed a new resonance absorption structure followed by a new continuum. These new features may be interpreted as arising from double-electron-excitation processes in which an M electron, as well as the K electron, takes part in the transitions. The first new resonance line lies about 23 ev above the first line in the previously observed single-electron-excitation resonance structure. No additional resonance structure was found in the region from zero to about 50 ev. The results of this experiment are particularly interesting since the physical system dealt with is such a simple theoretical case, viz., a monatomic, noninteracting atom. However, no significant theoretical predictions of multiple excitation or ionization of inner shells have yet been made. (Contractor's abstract)

SHOCK PROFILES IN HYPERSONIC FLOW OF A RELAXING GAS ABOUT A WEDGE, by F. R. Dressler. Feb. 1961, 39p. (AFOSR-263) (AF 49(638)544) PB 155550 Unclassified

A small-perturbation technique is used to give the change in the shock inclination on a thin wedge in steady, 2-dimensional, hypersonic flow. This change in shock angle is due to either dissociation or a lagging vibrational heat capacity in the flow behind the bow shock-wave. The problem is solved by transferring the physical domain into a "piston" plane with one less space dimension. The resulting unsteady, 1-dimensional problem is solved here. A general result is obtained giving the shock perturbation as a function of the unperturbed-flow parameters, body shape and equilibrium conditions behind the shock. An expression for the final shock inclination is given in closed form. (Contractor's abstract)

ON SIMILAR SOLUTIONS FOR STRONG BLAST WAVES AND THEIR APPLICATION TO STEADY HYPERSONIC FLOW, by E. F. Brocher. [1961] [8]p. incl. diagrs. refs. (AFOSR-580) (AF 49(638)544) Unclassified

Also published in Jour. Aerospace Sci., v. 29: 694-701, June 1962.

The general solution of the strong blast waves is found in the Newtonian approximation – i. e., neglecting terms of order ϵ (density ratio across the shock) compared with terms of order 1. The expressions obtained for the pressure, temperature, density, and velocity profiles are simple. The results are applied to power-law bodies in hypersonic flow using the equivalence principle. Higher-order approximations for strong blast waves are investigated for the cases in which the shock layer is thin. A simple pressure formula is found, which constitutes an improvement upon the Newton-Busemann formula, and some of its applications are shown. (Contractor's abstract)

A THEORETICAL APPROACH TO A STUDY OF STALL-FLUTTER PROBLEMS, by J. M. Li. June 1961, 64p. incl. refs. (AFOSR-899) (AF 49(638)-544) Unclassified

An analytic method for the study of stall flutter with one degree of freedom in torsion is developed. The aerodynamic moment is determined from quasi-steady theory, 2 essential features being introduced: (1) account is taken of nonlinear behavior by expansion of the static-moment curve in a Taylor series about the mean incidence angle for terms up to the third power in the effective angle of attack; and (2) the influence of the von Kármán vortices shed from the given blade, or from the aerodynamic interference of other blades, is represented by a forcing function of general harmonic form. The response of the system after a quasi-steady state is reached is determined by the method of Kryloff and Bogoliuboff. The stability problem, and distinctive nonlinear characteristics such as the limit cycle and jump phenomena are discussed. An illustrative example is included, and it is shown that the method holds considerable promise.

LINEARIZED OSCILLATIONS IN A PLASMA, by G. Schubert. Sept. 1961 [82]p. incl. diagrs. (AFOSR-1026) (AF 49(638)544) AD 265101 Unclassified

The possible modes of oscillation of a plasma are determined from the linearized equations of the 2-fluid model. The linearization is carried out in the presence of a strong steady magnetic field, and only wave propagation normal to the magnetic field is considered. These equations determine the regimes of applicability for the single-fluid equations and the magnetoionic theory; and both theories are found to be special cases of the general equations. The linearized equations of the single-fluid model are used to investigate the interaction of a low frequency electromagnetic wave with a semi-infinite plasma. The magnetoionic theory is found to be a special case of the linearized 2-fluid equations. (Contractor's abstract)

THEORY OF VISCOUS MAGNETOGASDYNAMIC FLOW IN SLOWLY DIVERGENT TWO-DIMENSIONAL CHANNELS, by B. U. O. Sonnerup. Sept. 1961, 160p. incl. illus. tables. (AFOSR-1332) (AF 49(638)-544) AD 265103 Unclassified

Also published in Plasma Hydromagnetics; Sixth Lockheed Symposium on Magnetohydrodynamics, Palo Alto, Calif. (Dec. 15-16, 1961), Stanford U. Press, 1962, p. 124-136.

A class of viscous magnetogasdynamic flows at moderate Reynolds number in slightly divergent 2-dimensional channels is treated theoretically. The

conducting walls of the channel serve as electrodes and are connected to an external load so that the device operates as a power generator. The main component of the applied magnetic field is perpendicular to the flow direction but parallel to the channel walls. The flowing medium is a slightly ionized gas with variable fluid properties. In particular 2 different mathematical models of the electrical conductivity are used. The theory pertains to low values of the magnetic Reynolds number, based on the channel height, and to moderate values of the Hall parameter. Entrance and exit effects are not considered. Numerical examples pertaining to various types of boundary conditions on temperature, wall heat transfer, or potential difference across the channel are presented showing channel shapes, velocity and temperature profiles and efficiency data. INTERACTION OF LOW-FREQUENCY ELECTROMAGNETIC WAVES WITH A PLASMA, by D. L. Turcotte and G. Schubert. [1961] [6]p. (AFOSR-2396) [AF 49-(638)544] Unclassified

Also published in Phys. Fluids, v. 4: 1156-1161, Sept. 1961.

The interaction of a low-frequency electromagnetic wave with a semi-infinite plasma is considered. The single-fluid equations of magneto-gas dynamics are linearized in the presence of a strong, uniform, steady magnetic field. Solutions are obtained for both normal incidence and parallel propagation of the electromagnetic wave. In both cases the strong, steady magnetic field is parallel to the interface and the magnetic component of the incident wave has the same direction. In the examples considered, the parameter $\mu_0^2 \sigma_0 H_0^2 / \rho_0 \omega$ determines the interaction between electromagnetic and acoustic modes. With normal incidence an acoustic mode is excited if this parameter is of order one. In the case of parallel propagation an appreciable parallel velocity component is excited when the governing parameter is quite small. (Contractor's abstract)

THE EFFECT OF SLIP, PARTICULARLY FOR HIGHLY COOLED WALLS, by N. Rott and M. Lenard. [1961] [5]p. incl. diagr. (AFOSR-2841) (AF 49-(638)544) Unclassified

Also published in Jour. Aerospace Sci., v. 29: 591-595, May 1962.

It is found that for boundary conditions on the velocity slip and on the temperature jump which are not oversimplified in an unrealistic way, the effect of these phenomena on the heat transfer and the shear at a stagnation point is of the order of the ratio of the mean free path outside the boundary layer to the boundary layer thickness, even for highly cooled walls. A simplified theory of this effect is given, which puts the physical reasons for the results in evidence and agrees closely with the more accurate calculations. It is concluded that the effects of slip and jump are not negligible in comparison with other low-Reynolds number corrections, even for very cold walls. (Contractor's abstract)

SOME PARADOXES OF SUB-ALFVENIC FLOW OF A COMPRESSIBLE CONDUCTING FLUID, by W. R. Sears. [1961] [10]p. incl. diagrs. table, refs. (AFOSR-3393) (AF 49(638)544) Unclassified

Also published in Proc. Symposium on Electromagnetics and Fluid Dynamics of Gaseous Plasma, New York (Apr. 4-6, 1961) Brooklyn, Polytechnic Press, 1962, p. 363-372. (AFOSR-3388)

Steady magnetogasdynamic flows in the category called "aligned-fields flows" may be classified as sub-Alfvénic or super-Alfvénic when the flow speed is respectively, less or greater than the Alfvén-wave speed. For plane or axisymmetric sub-Alfvénic flow of a perfectly conducting gas, there are both elliptic and hyperbolic regimes in both the subsonic and supersonic speed ranges. It is shown that these are consequences of the anisotropic propagation properties of magnetosonic waves. One result is a possibility of smooth transition directly from elliptic to hypercritical flow at points in the flow field. Some examples illustrating this phenomenon are shown. An apparent paradox is posed by supersonic-elliptic flow; it is conjectured that this must be resolved by introduction of magnetogasdynamic shock waves, and some possible flow patterns are sketched. THEORY OF UNSTEADY FLOW ABOUT THIN CYLINDERS IN FLUIDS OF HIGH ELECTRICAL CONDUCTIVITY, by L. E. Ring. [1961] [23]p. incl. diagrs. refs. (AF 49(638)544) Unclassified

Published in Jour. Fluid Mech., v. 11: 417-439, Nov. 1961.

A theory is developed for the incompressible flow of a fluid with high electrical conductivity about thin cylinders (airfoils) in non-uniform motion. A uniform magnetic field is applied parallel to the free stream and solutions are obtained subject to the restriction of small perturbations. The effects of viscosity are included, for the most part, only through the use of the Kutta condition, where applicable, for lifting airfoils. The validity and range of applicability of the infinite-conductivity assumption are determined on the basis of an order-of-magnitude analysis; the general character of the flow is discussed at length. The flow-field for infinite conductivity is changed from the non-magnetic case only through the new transport speed of vorticity; the forces on the airfoil are changed due to surface currents. For the case of the Alfvén speed less than the free-stream speed, the airfoil lift and pitching moment are given in integral form for general unsteady-airfoil motion and are given in closed form for harmonic oscillations. The forces at moderate frequencies may be larger than in the corresponding nonmagnetic case. The response to a unit-step change in the downwash is studied and the asymptotic form of the lift is obtained for small and large time. For the case of the Alfvén speed greater than the free-stream speed, vorticity and current are shed from both the leading and trailing edges. Therefore the extension of the usual Kutta condition is not obvious. It is shown that if finite viscosity and/or conductivity tend to remove the trailing-edge singularity, the flow is unstable and no steady flow can be obtained. (Contractor's abstract)

SUB- AND SUPER-ALFVÉNIC FLOWS PAST BODIES, by W. R. Sears and E. L. Resler, Jr. [1961] [18]p. incl. diagrs. refs. (AF 49(638)544) Unclassified

Published in Advances in Aeronaut. Sci., v. 3-4: 657-674, 1961.

In steady magnetohydrodynamic flows past obstacles an important parameter is the "Alfvén number" m, defined as the ratio of stream speed to the speed of Alfvén waves. To illustrate the significance of this parameter, the particular category of flow is considered in which the undisturbed velocity and magnetic-field vectors far from the obstacle are parallel or anti-parallel, i.e. "aligned-fields" flow. For such flows the change from $m > 1$ (super-Alfvénic) to $m < 1$ (sub-Alfvénic) is especially profound. Contrasts between super- and sub-Alfvénic flows are described in terms of the following categories of sub-Alfvénic phenomena: (1) upstream wakes, (2) upstream-inclined waves, and (3) elliptic supersonic and hyperbolic subsonic flows; negative lift of airfoils at positive incidence. These phenomena are discussed with a view toward explaining their origins. It is concluded that none violates simple physical principles, but that the lift produced in elliptic sub-Alfvénic regimes cannot be predicted with confidence until the analog of the Kutta-Joukowski condition is understood. Finally, an attempt is made to assess the probability of laboratory observations of these phenomena. It is concluded that values of the magnetic Reynolds number can be realized that will permit these effects to be studied before they are attenuated by diffusion.

DIFFUSION OF A MAGNETIC FIELD INTO A HIGH-DENSITY PLASMA (Abstract), by D. L. Turcotte and T. J. Falk. [1961] [1]p. [AF 49(638)544] Unclassified

Presented at meeting of the Amer. Phys. Soc., Berkeley, Calif., Nov. 20-22, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 371, Apr. 23, 1962.

If a plasma with infinite conductivity is confined by a strong magnetic field, the current sheath at the edge of the plasma has zero thickness. However, if the plasma has finite conductivity, the thickness of the current sheet increases with time. The complete magnetohydrodynamic equations appropriate for the confinement of a high-density plasma are simplified by a boundary-layer type of approximation. The parameter analogous to the viscous Reynolds number is a magnetic Reynolds number based on time and the Alfvén velocity. After this simplification, a similarity solution is used to reduce the equations to 3 total differential equations. Preliminary numerical results have been obtained for a range of thermal conductivity values.

HIGH-FIELD EFFECTS IN MAGNETOHYDRODYNAMICS, by W. R. Sears. [1961] [7]p. incl. diagrs. refs. [AF 49(638)544] Unclassified

Published in Proc. Internat'l. Conf. on High Magnetic Fields, Cambridge, Mass. (Nov. 1-4, 1961), Cambridge, M.I.T. Press and New York, Wiley and Sons, 1962, p. 652-658, 1962.

Flows in which a uniform, steady stream is only slightly perturbed as it flows past a slender obstacle are studied. It is assumed that these bodies are cylinders placed across the stream, so that the flow is two-dimensional. The most interesting phenomena predicted by these studies are "forward-inclined waves and upstream wakes" and "wave free supersonic flow." Both of these topics are discussed after a description of pertinent dimensionless parameters characterizing magnetohydrodynamic flows (Alfvén, Reynolds, Mach and magnetic Prandtl numbers) are given.

SOME STUDIES OF COUETTE-TYPE FLOWS, by J. Kondo. Jan. 1961 [78]p. incl. refs. (AFOSR-70) (AF 49(638)674) PB 155549 Unclassified

Some mathematical models are introduced and the exact treatment of compressible Couette-type flow is shown, although numerical results are not yet obtained. The simple Couette flow is obtained as the first approximation of the exact treatment, and some effects of mathematical models are investigated. Couette flow with air injection is solved and the solution is obtained in a closed form under certain conditions. This is the unique case where a cross flow exists and still the flow is uniform in the direction of the main flow. Numerical results are obtained. Couette flow of equilibrium dissociating air is analyzed and numerical examples assuming the specific heat of the gas at constant pressure, Cp, to be constant are shown. A method of improvement to include cases of variable Cp is suggested. (Contractor's abstract)

ON THE FLOW OF INVISCID CONDUCTING FLUID PAST A CIRCULAR CYLINDER WITH APPLIED MAGNETIC FIELD, by K. Tamada. July 1961 [47]p. incl. diagrs. (AFOSR-1087) (AF 49(638)674) AD 265102 Unclassified

An analysis is made on the steady flow of an incompressible, inviscid, electrically conducting fluid past a circular cylinder, in the presence of an applied magnetic field parallel to the undisturbed stream. The fundamental equations are linearized by making use of the Oseen-type (or small-perturbation) approximation in order to make the problem tractable. This approximation is difficult to justify in the vicinity of the cylinder. Qualitatively correct pictures of the flow and magnetic fields may be obtained, just as in the classical Oseen theory for the ordinary viscous flow. Explicit solutions for the velocity and magnetic fields are obtained in series expansion in R_m, the magnetic Reynolds number, correct to $O \times R_m^4$. More complete solutions are given for the special case in which S (pressure number) is infinite and SR_m is finite, and for the case where S = 1 and $(S-1) R_{m=0}$ or finite.

Some numerical discussions of the results are also made. (Contractor's abstract)

ON THE DISTORTION OF WEAK MAGNETIC FIELD BY THE FLOW OF CONDUCTING FLUID PAST A CYLINDRICAL OBSTACLE, by K. Tamada. Sept. 1961, 26p. incl. diagrs. (AFOSR-1551) (AF 49(638)-674) AD 272081 Unclassified

The distortion of a uniform magnetic field, which is parallel to the flow at infinity, caused by the flow of an incompressible inviscid fluid with large electric conductivity past a cylindrical obstacle is studied. The magnetic field is assumed to be so weak that its influence upon the flow may be neglected. The analysis revealed the following features: The magnetic field outside the cylinder is aligned with the flow owing to high conductivity of the fluid except in a thin layer along the surface of the cylinder and in a wake behind it. The field inside the cylinder (supposed to be non-conducting) is almost zero, except in the vicinity of the rear stagnation point where the lines of force converge and form a singularity (sink inside and source outside the cylinder) for infinite conductivity of the fluid. ON COMBINED FREE AND FORCED CONVECTIVE LAMINAR MAGNETOHYDRODYNAMIC FLOW AND

HEAT TRANSFER IN CHANNELS WITH TRANSVERSE MAGNETIC FIELD, by Y. Mori. [1961] [7]p. incl. diagrs. (AF 49(638)674) Unclassified

Published in Internat'l. Developments in Heat Transfer; Proc. 1961-1962 Heat Transfer Conf., Boulder, Colo. (Aug. 28-Sept. 1, 1961) and London (Gt. Brit.) (Jan. 8-12, 1962), New York, Amer. Soc. Mech. Engineers, 1963, p. 1031-1037.

The problem of fully developed, combined free and forced convective, laminar magnetohydrodynamic flow and heat transfer in vertical channels with transverse magnetic field is studied, and the effects of the magnetic field on the flow and temperature patterns are discussed. When M denotes Hartmann number and Ra Rayleigh number, this problem is found to be divided into 3 cases. The first one is that for $M^4 < 4Ra$, where the magnetic field is shown to flatten the velocity profiles. The second case considers the flow when $M^4 > 4Ra > 0$, which has the Hartmann flow as its limit. It is also shown that between these 2 cases there exists a very narrow region where the ratio of the mean velocity to that without the magnetic field has a weak singularity. The third case is for $Ra < 0$. This includes the problem of dependence of the flow direction on Rayleigh number, and it is shown that the magnetic field resists the reversal of the flow direction and increases the Rayleigh number required for flow reversal. CHEMICAL KINETICS: A GENERAL INTRODUCTION, by S. H. Bauer. [1961] 38p. incl. diagrs. table, refs. (AFOSR-3578) (AF 49(638)716) AD 284537 Unclassified

Presented at ARS Internat'l. Hypersonic Conf., Cambridge, Mass., Aug. 16-18, 1961.

Also published in Prog. in Astronaut. and Rocketry, v. 7: 143-180, 1962.

The relationships between the experimentally determined quantities and molecular parameters are reviewed, and attention is called to the fundamental assumptions. In hypersonic gas dynamics, with the fluid at the high temperatures and low densities, the half times for chemical reactions are comparable to characteristic flow times. The corresponding terms which must be inserted in the flow equations appear as phenomenological rate constants. In the low density regimes, one should describe the system in molecular variables only; the chemical rate constants would then be replaced by averages over differential collision cross sections which are very sensitive to the molecular structures and the details of the collisions. Even for the simplest reactions, such expressions are very complex, and the data are insufficient to permit an adequate formulation. Gas dynamic procedures have permitted the extension of rate measurements to temperatures and densities not ordinarily available to the chemical kineticist. (Contractor's abstract)

IONS SPUTTERED FROM COPPER, by R. C. Bradley and E. Ruedl. [1961] [9]p. incl. diagrs. tables, refs. (AFOSR-1376) (AF 49(638)748) Unclassified

Also published in Jour. Appl. Phys., v. 33: 880-888, Mar. 1962.

Positive ions sputtered from copper under a variety of different bombardment and surface conditions have been mass analyzed and found to include species characteristic of the incident ions ("reflected" ions), of copper and some of its compounds, and of alkali metal impurities. A model is described which accounts for most of the properties of the reflected ions, not in terms of reflection but in terms of the amount of gas trapped and released by the surface. The ionizing agent is unknown but is thought to be the bombarding ions (or their secondary electrons) rather than the surface. The Cu^+ ions, on the other hand, seem to be surface ionized sputtered particles originating from patches of high local work function. Yield data seem to correlate qualitatively with probable changes in work function caused by absorption of impurities, sputtering, or vacuum annealing. The CuO^+ peak is believed to be caused by dissociation and ionization of cuprous oxide molecules under the action of the ion bombardment. The rates of formation and disappearance of this peak were studied under various

circumstances. An unusually high sputtering rate was found to occur at an argon bombarding energy of 75 ev. Na and K impurities sputtered from and ionized by the copper surface showed some interesting transient effects which can be interpreted in terms of a low sputtering probability compared to the base metal. The relevance of these experiments to sputtering theories, ion pumping, oxidation, cleanup, and surface ionization theory is discussed. (Contractor's abstract)

VAPORIZATION OF IMPURITIES IN COPPER, INCLUDING THOSE INTRODUCED BY ION BOMBARDMENT, by E. Ruedl and R. C. Bradley. [1961] [6]p. incl. diagrs. table, refs. (AFOSR-4150) [AF 49-(638)748] Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 23: 885-890, July 1962.

A mass spectrometric analysis has been made of particles sputtered and/or evaporated from the (221) plane of a high-purity single crystal copper surface in high vacuum. The results are relevant to such processes as heterogeneous catalysis and nucleation, as well as to the techniques of cleaning solid surfaces by ion bombardment and annealing. Copper oxide layers may be completely removed from a copper surface (or at least reduced to a very small fraction of a monolayer) by repeated cycles of inert gas ion bombardment and annealing. During ion bombardment, particles of the bombarding beam and the ambient gas are physically trapped by the surface. These may be released from the copper by heating it to 200°C. The activation energy for this release is 0.3 ± 0.1 ev (measured only for argon). Sodium and potassium bulk impurities diffuse readily to the surface at a temperature of 600°C with activation energies of 2.8 ± 0.1 and 2.3 ± 01. ev, respectively. These same impurities also desorb from copper at 600°C with an activation energy (for potassium) of 1.2 ± 0.1 ev. The surface concentration of sodium and potassium, while always less than a monolayer, was never found to be zero; it was less after annealing, however, than after ion bombardment. A SEQUENTIAL MULTIPLE-DECISION PROCEDURE FOR SELECTING THE BEST ONE OF SEVERAL NORMAL POPULATIONS WITH A COMMON UNKNOWN VARIANCE. II. MONTE CARLO SAMPLING RESULTS AND NEW COMPUTING FORMULAE, by R. E. Bechhofer and S. Blumenthal. May 1, 1961, 26p. incl. tables. (Technical rept. no. 16) (AFOSR-671) (AF 49(638)230) AD 257405 Unclassified

Also published in Biometrics, v. 18: 52-67, Mar. 1962.

Reference is made to an earlier paper by R. E. Bechhofer (Biometrics, v. 14: 408-429, 1958) in which the sequential multiple-decision procedure used in the present paper, was described. The purpose of the present work is to present results which are important for the practical application of the procedure. Studies were made using a high-speed electronic computer to simulate the operation of applying the procedure to experimental data. In the course of programming the procedure for the electronic computer it was found that the computing formulas could be considerably simplified. As a result, the computations at each stage of experimentation can be reduced to working with certain sums and sums of square which are quite similar to those used with the associated one-stage analysis of variance. Report is made of the statistical assumptions, a statement of the experimenter's goal, specification, and requirement, and a description of the sequential procedure.

CONTRIBUTIONS TO THE THEORY OF THE TWO-SAMPLE PROBLEM, by S. Blumenthal. Oct. 1, 1961, 71p. incl. refs. (Technical rept. no. 17) (AFOSR-1786) (AF 49(638)230) AD 266267 Unclassified

The problem of determining whether 2 samples came from the same population (2-sample problem) is discussed. Based on m and n independent observation on 2 independent stochastic variables, x and y, the null hypothesis that x and y have identical cumulative distribution functions is tested. A sequential test for the 2-sample problems is described, and its properties studied. When the size of the test is small and the power near unity, the Wald approximations to the average sample size of the Wald sequential probability ratio test applied to the binomial distribution are shown to be valid approximations to the average sample size of the proposed 2-sample test. An estimate of the efficiency of the proposed sequential test is obtained by comparing the approximation of its expected sample size to an approximation of the sample size required by a fixed sample size test when the 2 tests guarantee the same error probabilities.

SELF-DIFFUSION IN DELTA IRON, by L. I. Staffansson and C. E. Birchenall. Apr. 1961 [21]p. incl. diagrs. table, refs. (AFOSR-733) (AF 49(638)-872) AD 259447 Unclassified

Self-diffusion of Fe was measured in delta Fe between 1404 and 1518°C. Although the delta Fe results are adequately described by the equation $D = 0.019 \exp(-2400/RT)$ cm^2/sec, in order to join these coefficients in a reasonable way with the self-diffusion coefficients of α Fe, it is necessary to introduce a curved line in the plot of logarithm of diffusivity versus reciprocal of absolute temperature. Although this curved line diminishes the magnitude of the Curie point anomalies observed for self-diffusion in α Fe and probably for diffusion in Fe-V alloys, it does not appear that the excess vacancy formation energy arising from spin ordering is enough to account for the whole Curie point effect. Possible ways to obtain information about changes in the activation energy for vacancy motion are discussed. (Contractor's abstract)

OXIDATION OF METALS AND ALLOYS, by C. E. Birchenall. Final rept. July 1, 1960-Dec. 31, 1961, 10p. (AFOSR-1965) (AF 49(638)872) AD 270051 Unclassified

Effort was made to study the transport processes that contribute to, or control, the oxidation of metals and alloys at high temperatures. Attention centsred mainly on diffusion of ions in metals, alloys, oxides and sulfides and the dependence of these processes on defect concentrations and other aspects of the structure including electron spin order. Preparations are being made to explore the relation between the diffusive phenomena and oxide plasticity, because these processes affect the adherence of scales. Some preliminary studies were made of methods of preparing large single crystals. (Contractor's abstract)

RELATIONSHIP BETWEEN CERTAIN LATTICE SUMS AND THE MADELUNG CONSTANT, by R. H. Wood. [1961] [2]p. (AFOSR-J57) (AF 49(638)1054) AD 400083 Unclassified

Also published in Jour. Chem. Phys., v. 37: 681-682, Aug. 1962.

It is the purpose of this note to present a simple method of deriving relationships between lattice sums representing the energy of separating 2 hemicrystals and the Madelung constant which is not limited to any type of crystal and which has a simple physical meaning. The basic method is to find a set of forces which will counteract the electrostatic forces and keep the crystal in its position. In order to affect a simplification, the set of forces should be smaller in number than the electrostatic forces. The simplest case is nearest-neighbor forces. Once the forces have been calculated, the lattice energy is simply the work done by the forces in uniformly expanding the crystal to infinite separation.

THEORETICAL STUDY OF INTERACTION OF SINGLE-DOMAIN PARTICLES, by A. W. Jenkins, Jr. Final rept. Sept. 1961 [9]p. incl. diagr. (AFOSR-1374) (AF AFOSR-61-50) Unclassified

Investigation of the magnetic properties of bulk samples of single-domain powder materials is made, taking into account the interaction between particles. A model of 2 spheroidal, single-domain particles is used assuming coherent rotation of magnetization in each domain with a description of the total magnetization vector of the 2 particles as a function of the direction and magnitude of the impressed field. The separation, size, and orientation of the 2 particles are treated as parameters in the calculations and are varied over appropriate ranges and averaged.

EXPERIMENTS WITH THE IBM-9900 AND A DISCUSSION OF AN IMPROVED COMAC AS SUGGESTED BY THESE EXPERIMENTS, by M. Taube. Apr. 1961, 20p. (AFOSR-475) (AF 49(638)91) AD 155555 Unclassified

This paper presents the system and machine considerations which led, in the first instance, to the development of the design of a Continuous Multiple Access Comparator; a description of the IBM 9900, which is IBM's reduction to practice of the COMAC principle; certain improvements in design of the COMAC to make it a more efficient low-priced device for the storage and retrieval of information; and finally, the concept of using a wholly new method of logical comparison in order to achieve maximum efficiency from the use of E. P. P. equipment in the storage and retrieval of information. (Contractor's abstract)

RESEARCH ON THE DEVELOPMENT OF A STORAGE AND SEARCH THEORY. Nov. 1961 [14]p. incl. refs. (AFOSR-1837) (AF 49(638)91) AD 267606
Unclassified

The research on this contract, for the development of a storage and search theory, was begun in December 1956 and concluded in September 1961. The investigations started with identification, descriptions, and definitions of the relationships among basic concepts in storage and retrieval, in order to determine the general characteristics of storage and retrieval systems, and to describe these characteristics in quantitative terms. The development of formal techniques for the logical analysis of storage and search systems was accomplished. A systematic mathematical statement of the storage and search theory, as a special branch of information theory, was worked out. A system was designed, with generalized concepts applicable to any information problem involving the storage and retrieval of changing sets of information. A brief report of the use of this system is given. The frequency of use of the system was considered a significant reflection of the utility value of the Experimental Contract Highlight Operation as an instrument for assisting in the administration of the Air Force research program.

ALGEBRA OF POLYNOMIALS IN SEVERAL VARIABLES FOR A DIGITAL COMPUTER, by L. H. Williams. [1961] [12]p. incl. diagr. refs. (AFOSR-2328) (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)1341 and Office of Ordnance Research under DA 36-034-ORD-1535 and DA 31-124-ORD-10-8) Unclassified

Also published in Jour. Assoc. Comp. Mach., v. 9: 29-40, Jan. 1962.

An interpretive system for automatic formal manipulation of polynomials by a digital computer is presented. Its purpose is to make practical the solution of certain types of problems which require formal manipulation of polynomials. For example, it can be used for the formal solution of systems of polynomial equations. The manipulations of the system are those producing the sum, difference, product, remainder after division, greatest common factor, and eliminant of 2 polynomials in any reasonable number of variables. Euclid's Algorithm is used for the greatest common factor, and the eliminant. Applications are discussed and examples are given. The system has been programmed for an IBM 650. SOME NONLINEAR SYSTEMS OF DIFFERENTIAL EQUATIONS EQUIVALENT TO LINEAR SYSTEMS, by F. G. Dressel and J. J. Gergen. [Oct. 1961] [11]p. (AFOSR-1419) (AF 49(638)892) AD 266468
Unclassified

Also published in Proc. Internat'l. Symposium on Nonlinear Differential Equations and Nonlinear Mechanics, Air Force Academy, Colorado Springs, Colo. (July 31-Aug. 4, 1961), New York, Academic Press, 1963, p. 218-223.

The problem, what equations of order n have general solutions expressible in the form of a variable set of solutions of a fixed linear differential equation, is considered for systems of 2 and 3 equations. Results for the case n = 2 , closely parallel the results for linear homogeneous second order equations. For linear systems in 3 unknowns, information of a negative nature is obtained. That is, results for n = 2 cannot be extended to systems in 3 unknowns within the broad class of solution forms examined.

AN AXISYMMETRIC BOUNDARY VALUE PROBLEM OF MIXED TYPE FOR A HALF-SPACE, by M. Lowengrub and I. N. Sneddon. Oct. 1961 [12]p. (AFOSR-1667) (AF 49(638)892) AD 266471 Unclassified

Also published in Proc. Edinburgh Math. Soc., v. 13: 39-46, 1962.

In problems in the mathematical theory of elasticity related to the symmetric deformation of an infinite elastic solid with an external crack we encounter the problem of determining an axisymmetric function which is harmonic in the half-space and satisfies the mixed boundary conditions. The solution of this mixed boundary value problem is reduced to that of a pair of dual integral equations whose solution is derived by an elementary method. By means of this solution, an integral representation of the axisymmetric function can be constructed; its properties are discussed. The forms of the solution in certain special cases are then derived.

DUAL INTEGRAL EQUATIONS WITH TRIGONOMETRICAL KERNELS, by I. N. Sneddon. Aug. 26, 1961, 6p. (AFOSR-J731) (AF 18(600)1341 and AF 49(638)892) AD 414193 Unclassified

Also published in Proc. Glasgow Math. Assoc., v. 5: 147-152, Jan. 1962.

Given the dual integral equations:

$$(A)\ \int_0^\infty \xi^{-1}\psi(\xi)\cos(x\xi)\,d\xi = f(x),\ 0 \le x \le 1,$$

$$\int_0^\infty \psi(\xi)\cos(x\xi)\,d\xi = 0,\ x > 1.$$

If $f(x)$ can be represented in a series of Jacobi polynomials in the form

$f(x) = \sum_{q=1}^\infty p_q \mathfrak{P}_q(0, \tfrac{1}{2}, x^2)$ $(\mathfrak{P}_q(0, \tfrac{1}{2}, u) = {}_2F_1(-q, q; \tfrac{1}{2}; u))$ and satisfies the condition

$$\int_0^1 \frac{f(x)\,dx}{\sqrt{(1-x^2)}} = 0,$$ then a solution to (A) is

$\psi(\xi) = 2\sum_{q=1}^\infty qp_q J_{2q}(\xi)$, where $J_q(\xi)$ is the Bessel function of order q. If in (A), $\cos x\xi$ is replaced by $\sin x\xi$ and $f(0) = 0$, the solution is analogous to the above. (Math. Rev. abstract)

OSMOTIC TOLERANCE OF THE MUSCLES OF THE CRAB-EATING FROG RANA CANCRIVORA, by S. Thesleff and K. Schmidt-Nielsen. [1961] [4]p. incl. illus. diagr. (AFOSR-1984) (AF AFOSR-61-16) Unclassified

Also published in Jour. Cellular and Comp. Physiol., v. 59: 31-34, Feb. 1962.

Muscles of the crab-eating frog R. cancrivora, which unlike other amphibians lives in water of high salinity, are about twice as resistant to hypertonic solutions as are muscles of fresh water frogs. In R. cancrivora tension failure and a reduced speed of contraction occur when the external medium has a salinity of about 300 mm NaCl and a total osmotic concentration which is 3—4 times higher than that of ordinary frog's plasma. The resting and action potentials of single muscle fibers of R. cancrivora are similar in magnitude and time course to those of ordinary frogs. (Contractor's abstract)

AN ELECTROPHYSIOLOGICAL STUDY OF THE SALT GLAND OF THE HERRING GULL, by S. Thesleff and K. Schmidt-Nielsen. [1961] [4]p. incl. diagrs. (AFOSR-1985) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-16 and National Institutes of Health) Unclassified

Also published in Amer. Jour. Physiol., v. 202: 597-600, 1962.

When the salt gland of the herring gull excretes sodium chloride the duct of the gland becomes positive relative to the blood. Strophanthin, an inhibitor of active sodium transport, prevents the establishment of the positive potential and also blocks gland secretion. The findings suggest that an active transport of sodium from the blood to the gland lumen may be a primary secretory mechanism. (Contractor's abstract)

INFLUENCE OF PSYCHODYNAMIC FACTORS ON CENTRAL NERVOUS SYSTEM FUNCTIONING IN YOUNG AND AGED SUBJECTS, by S. I. Cohen, A. J. Silverman, and B. M. Shmavonian. [1959] [15]p. incl. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)354, Duke U. Regional Center for the Study of Aging, Foundation's Fund for Research in Psychiatry, John and Mary Markle Foundation, and National Institute for Mental Health) Unclassified

Presented at annual meeting of Amer. Psychosom. Soc., Atlantic City, N. J., May 2, 1959.

Published in Psychosom. Med., v. 23: 123-137, 1961.

A matched group of 10 young and 10 old subjects were presented pure tones, neutral phrases, and phrases designed to be charged for the young and for the old subjects while continuous GSR (galvanic skin resistance) recordings were obtained as a measure of CNS (central nervous system) activity. The subjects were then interviewed by a technique structured to evaluate the degree of memory for the preceding experimental period, as well as the meaning of and the affective response to the test situation and stimuli. Arousing expressions appeared to facilitate the older subjects' memories by allowing them to form highly personalized associations. The expressions causing the highest level arousal in the young subjects were associated with a high degree of forgetting which appeared to be analogous to various psychological defenses such as repression and denial, in spite of the fact that the young subjects' over-all recognition was superior to that of the older subjects. The data suggested that the cognitive results were influenced by the old subjects' perception of the experiment as a test of their intellectual capabilities and the young subjects' perception of the experiment as an attempt to uncover information about their feelings, impulses, and values. The results indicated that studies assessing perception and cognitive functions should take into consideration the influence of: (1) reception and conduction of specific sensory inputs; (2) the level of nonspecific CNS activation; and (3) the psychological adaptive mechanisms activated by the psychodynamic implications of the experimental stimul and the emotional arousal produced. (Contractor's abstract)

PSYCHOPHYSIOLOGICAL MECHANISMS OF STRESS RESPONSIVITY, by S. I. Cohen and A. J. Silverman. Annual rept. June 1961 [55]p. incl. diagrs. tables, refs. (AFOSR-1515) (AF 49(638)354) Unclassified

This report briefly summarizes the work in 4 areas which has been investigated by the Dept. of Psychiatry under this contract. The first was on the central nervous system, peripheral, physiological, endocrinological and psychological responses of body and field oriented subjects to experimental situations characterized by uncertainty, social and sensory isolation, and limitation of movement. Studies also include analysis of personality, physiological and central nervous system correlates of body and field perceptual modes, and the exploration of other individual determinants of the response to low sensory input experiments. In addition, a study was made of the influence of

drugs acting on the central nervous system in body and field oriented subjects in low sensory input experiments. Finally, an exploratory study was done on the influence of a psychochemical (LSD) on the response to 2 hr low sensory input experimental conditions.

NEUROPHYSIOLOGICAL HUMORAL AND PERSONALITY IN THE RESPONSE TO EXPERIMENTAL STRESS (Abstract), by S. I. Cohen, A. J. Silverman, and B. M. Shmavonian. [1961] [2]p. (AFOSR-J47) [AF 49(638)354] AD 400093 Unclassified

Also published in Abstracts of Proc. Third World Cong. on Psychiatry, Montreal (Canada) (June 4-10, 1961), p. 788-789.

This investigation was aimed at studying the relationship of environmental conditions and individual psychological characteristics to the response of 35 subjects in an experiment designed to create a state of uncertainty by reducing environmental information input. No uniform or psychological effects could be attributed to the experimental conditions when the total subject population was considered. However, sub-groups of subjects, based on pre-experimental testing of perceptual mode and personality characteristics, did not demonstrate a random distribution of responses in that field oriented subjects with high anxiety test scores showed the highest levels of central nervous system arousal, urinary adrenaline, psychological discomfort and anxiety, and the poorest sensory discrimination. A significant correlation was noted between the level of psychological discomfort and the level of urinary adrenaline and peripheral sympathetic nervous system activity. Anxious-passive responses were associated with higher percentages of urinary adrenaline than angry-aggressive responses. EEG evidence of cortical alerting correlated with skin resistance evidence of increased peripheral sympathetic nervous system activity. It was concluded that an individual's psychophysiological response is a function of (1) the environmental condition to which he is exposed, (2) individual personality and perceptual characteristics, and (3) the influence of psychological and neurophysiological activation of physiological and endocrinological changes.

DEUTERIUM SUBSTITUTION IN AN ESR STUDY OF RADIATION-INDUCED FREE RADICALS, by I. Miyagawa and W. Gordy. [1961] [26]p. incl. diagrs. refs. (AFOSR-1021) (Also bound with its Quarterly progress rept. no. 32, Jan. 1-Mar. 31, 1961) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)-765 and Office of Ordnance Research) AD 259009 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 1036-1040, Mar. 1961.

Effects of deuterium substitution on the electron spin resonance of X-irradiated organic compounds were investigated. The compounds range from carboxylic acids, amino acids, and amides to proteins. Substitution of deuterium for hydrogens of polar groups - hydroxyl, carboxyl, and amino - showed that the hydrogens of these groups generally do not contribute, or give only a slight contribution, to the hyperfine structure of the resonance pattern. Exceptions were found, however, notably formic acid and glycine. Most often the hydrogens bonded to carbon gave the hyperfine structure of the ESR patterns. In some instances the additional information provided by deuterium substitution allowed a fairly definite identification of the free radicals. (Contractor's abstract)

THE MILLIMETER WAVE SPECTRUM OF METHYL CYANIDE AND THE A-TYPE DOUBLING, by P. Venkateswarlu, J. G. Baker, and W. Gordy. [1961] [32]p. incl. diagrs. tables, refs. (AFOSR-1022) (Also bound with its Quarterly progress rept. no. 32, Jan. 1-Mar. 31, 1961) (AF 49(638)765) AD 259009 Unclassified

Also published in Jour. Molec. Spectros., v. 6: 215-228, Feb. 1961.

The millimeter wave spectrum of methyl cyanide corresponding to the transitions J = 4 → 5 to J = 11 → 12 in the region 90 kmc – 225 kmc has been studied. Transitions corresponding to the molecules in the ground vibrational state as well as in the excited states

$\nu_8 = 1$ and $\nu_8 = 2$ are observed. The B_O, D_J and D_{JK} obtained for the ground vibrational state are 9198.899 mc, 3.81 kc, and 176.9 kc, respectively and for the excited state $\nu_8 = 1$, 9226.444 mc, 3.8 kc, and 176.9 kc respectively. The pattern for the excited state $\nu_8 = 1$ is equalitatively as expected according to Nielsen's theory, but it has been found that the theory is inadequate to give a quantitative fit. TEMPERATURE EFFECTS ON THE FORMATION OF FREE RADICALS IN THE AMINO ACIDS, by F. Patten and W. Gordy. [1961] [38]p. incl. diagrs. refs. (AFOSR-1023) (Also bound with its Quarterly progress rept. no. 32, Jan. 1-Mar. 31, 1961) (AF 49(638)765)
AD 259009 Unclassified

Also published in Radiation Research, v. 14: 573-589, May 1961.

The present investigations show that the free radicals at room temperature in the amino acids are generally not the same as those found when the sample is irradiated at the much lower temperature of liquid nitrogen, 77°K. They show, however, that when the sample is irradiated at the lower temperature and is allowed to warm to room temperature, the radical obtained is usually the same as that produced by irradiation at room temperature. It thus appears that the free radicals observed earlier at room temperature are generally not the primary ones produced by the ionizing irradiation, but are secondary free radicals produced by molecular motions after the primary event of ionization. ASYMMETRY OF CYCLOTRON RESONANCE LINES IN THE REACTION ZONES OF LOW-PRESSURE ACETYLENE AND CYANOGEN FLAMES, by E. M. Bulewicz and P. J. Padley. [1961] [17]p. incl. diagrs. tables. (AFOSR-1356) (Also bound with its Quarterly progress rept. no. 33, Apr. 1-June 30, 1961) (AF 49-(638)765) Unclassified

Also published in Jour. Chem. Phys., v. 35: 1590-1593, Nov. 1961.

A marked asymmetry and shift of line maximum (at 17,000 gauss) by more than 100 gauss is reported for cyclotron resonance lines obtained in or very close to the reaction zones of low-pressure flames containing high concentrations of free electrons. The effect is interpreted in terms of the variation of the real part of the refractive index of the flame plasma, at microwave frequencies, in the neighborhood of the absorption line. The electron concentration gradients in the vicinity of the reaction zone then have the effect of refracting the microwaves traversing the finite thickness of the plasma towards or away from the microwave receiver. ESR SPECTRA OF A GAMMA-IRRADIATED SINGLE CRYSTAL OF DL-SERINE, by D. V. G. L. Narasimha Rao and W. Gordy. [1961] [6]p. incl. diagrs. table. (AFOSR-1357) (Also bound with its Quarterly progress rept. no. 33, Apr. 1-June 30, 1961) (AF 49(638)765)
Unclassified

Also published in Jour. Chem. Phys., v. 35: 764-765, Aug. 1961.

Single crystals of DL serine were grown by slow evaporation of aqueous solutions for a few weeks. The crystals have monoclinic symmetry. There are 4 molecules in the unit cell. Selected crystals of the order of 3 x 2 x 1 mm in size were given gamma-ray dosages of the order of 10^7 r at room temperature. The induced ESR was observed at 9 kmc/sec. The patterns were found to be complex for all orientations of the crystal in the magnetic field, even for the field in the [0 1 0] plane. In an effort to obtain a simpler spectrum single crystals were grown from heavy water solutions. In this process the amino and hydroxyl hydrogens are replaced by deuterium, but the CH hydrogens are not. The following free radical is proposed to explain the isotropic doublet, $COODCH(NDD)CH_2ODO$. In the formation of this free radical presumably one of the C=O bonds of the original molecule is broken, and the oxygen gains the deuterium of the hydrogen bridge. The resulting unpaired electron is localized on the C atom and is coupled to the nearest CH proton spin through the mechanism of hyperconjugation.

ELECTRON SPIN RESONANCE OF AN IRRADIATED SINGLE CRYSTAL OF UREA OXALATE, by D. V. G. L. Narasimha Rao and W. Gordy. [1961] [38]p. incl. diagrs. tables, refs. (AFOSR-1358) (Also bound with its Quarterly progress rept. no. 33, Apr. 1-June 30, 1961) (AF 49(638)765) Unclassified

Also published in Jour. Chem. Phys., v. 35: 362-368, July 1961.

The present article describes a study of a single crystal of urea oxalate. Free radicals produced in a single crystal of urea oxalate by gamma-irradiation have been investigated with the method of electron spin resonance.

Only one species of free radical was observed at room temperature. Analysis of the resonance leads to the conclusion that the free radical has the form RĊHOH and has the electron spin density concentrated mostly on the CH carbon. The radical was found to be very stable. While working on some of the substitution products of urea in the powder form, it was found that ureau oxalate when irradiated with gamma-rays gave a spectrum with 4 hyperfine components which are almost symmetric.

ELECTRON SPIN RESONANCE INVESTIGATIONS OF THE PROTEINS, by W. Gordy. [1961] [30]p. incl. diagrs. table, refs. (AFOSR-1359) (Also bound with its Quarterly progress rept. no. 33, Apr. 1-June 30, 1961) (AF 49(638)765) Unclassified

Presented at Colloquium on Applications of Radiofrequency Spectroscopy to Biochemistry and Chemical Structure, Royal Academy of Belgium, Apr. 6-7, 1961.

The progress made to date in electron spin resonance studies is briefly reviewed. Particular attention is given to the doublet resonance of which the free radical giving rise to the resonance is of the form, RHNĊHCOR. The cystine-like resonance is also discussed. It is considerably anisotropic. The cystine-like resonance should be a sensitive device for finding the direction of the C-S bonds in sulfur-containing proteins. Unfortunately, however, in all the species so far investigated only resonances like those in powdered cystine have been observed.

ELECTRON SPIN RESONANCE OF AN IRRADIATED SINGLE CRYSTAL OF DEUTERATED DL-TARTARIC ACID, by D. V. G. L. Narasimha Rao and W. Gordy. [1961] [14]p. incl. diagrs. tables. (AFOSR-1658) (Bound with its rept. no. 34, July 1-Sept. 20, 1961) (AF 49(638)765) AD 262001 Unclassified

Also published in Jour. Chem. Phys., v. 36: 1143-1145, Mar. 1, 1962.

The electron spin resonance spectra of an irradiated single crystal of DL-tartaric acid grown from water was found to be complex, but the spectra of a deuterated single crystal could be analyzed and the nature of the free radical ascertained. Measurements were made at 9 and at 23 kmc/sec. For some orientations of the crystals in the external magnetic field an unresolved doublet was observed with weak satellite lines separated by 5 gauss at 9 kmc/sec and 13 gauss at 23 kmc/sec. These satellite lines evidently arise from second-order transitions. The principal values of g are 2.0025, 2.0026, and 2.0047. The principal elements of the nuclear coupling of the CH protons are ± 0.2, ± 1.1, and ± 6.5 gauss. (Contractor's abstract)

ELECTRON SPIN RESONANCE OF AN IRRADIATED SINGLE CRYSTAL OF TRIFLUORCACETAMIDE (Abstract), by R. Lontz and W. Gordy. [1961] [1]p. (AFOSR-2082) (Bound with its Quarterly progress rept. no. 35, Oct. 1-Dec. 31, 1961) (AF 49(638)765) AD 270043 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 44-45, Jan. 24, 1962.

Also published in Jour. Chem. Phys., v. 37: 1357-1366, Sept. 15, 1962. (Title varies)

Electron spin resonance measurements have been made on gamma irradiated single crystals of CF_3CONH_2. Analysis of the results shows that the irradiation breaks a CF bond, to leave the free radical CF_2CONH_2. The remaining CF bonds become reoriented so that the $\geq C\text{-}CF_2$ group is planar and probably in the plane of the $CONH_2$ group. Although the structure of the crystal is unknown, its form is approximately monoclinic. The present study indicates that there are 2 molecules in the unit cell. The free radicals formed from these have their molecular planes parallel to the 2 crystal faces, ac and bc, which have relative orientations of 68°. Nuclear couplings of the 2 F atoms of the free radical are equivalent and are symmetric about an axis perpendicular to the plane of the free radical with principal elements parallel and perpendicular to the symmetry axis: $A_{\parallel} = 178$ gauss, $A_{\perp} = 24$ gauss. Also the elements of g are axially symmetric and their principal axes have the same direction as those of A, with $g_{\parallel} = 2.0025 \pm 0.0010$ and $g_{\perp} = 2.0045 \pm 0.0010$. It is concluded that the electron spin density is in a π orbital perpendicular to the plane of the free radical with approximately 11% of the density in a p orbital of each of the F atoms.

MILLIMETER WAVE SPECTROSCOPY OF HIGH TEMPERATURE MOLECULAR BEAMS. CESIUM AND RUBIDIUM HALIDES (Abstract), by J. R. Rusk and W.

Gordy. [1961] [1]p. (AFOSR-2083) (Also bound with its Quarterly progress rept. no. 35, Oct. 1-Dec. 31, 1961) (AF 49(638)765) AD 270043 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Also published in Bull. Amer. Phys. Soc., Series II, v. 7: 43, Jan. 24, 1962.

The high temperature molecular beam microwave spectrometer designed by Garrison and Gordy (Phys. Rev., v. 108: 899, 1957) has been improved and used for high precision measurements of millimeter wave rotational spectra of most of the alkali halides. Some of the derived constants are given. Mass ratios obtained for bromine and rubidium isotopes are $\frac{Br^{79}}{Br^{81}}$ = 0.9753102 and $\frac{Rb^{85}}{Rb^{87}}$ = 0.9770177. Similar results have been obtained for the corresponding halides of Li, Na, and K.

ELECTRON SPIN RESONANCE OF FREE RADICALS PRODUCED BY GAMMA IRRADIATION OF VARIOUS SUBSTANCES AT 4.2°K, by H. N. Rexroad and W. Gordy. [1961] [24]p. incl. diagrs. refs. (AFOSR-2084) (Also bound with its Quarterly progress rept. no. 35, Oct. 1-Dec. 31, 1961) (AF 49(638)765) AD 270043 Unclassified

Also published in Phys. Rev., v. 125: 242-247, Jan. 1, 1962.

Hydrogen atoms and other free radicals were produced by gamma-irradiation of a number of substances at 4.2°K. Electron spin resonance was employed for detection and study of the free radicals within the solids at this temperature. Strong electron spin resonance signals of H atoms could then be produced by dosages of one million r or less in H_2O, HF, H_2, and CH_4, but no H atom signals could thus be produced in HCl, H_2S, NH_3, NaH, or LiH. It was concluded that in HF and H_2O the H atoms are formed from electron capture by the essentially ionic hydrogens rather than by removal of an electron from the molecule (ionization). Because this process does not require displacement of the atoms from their original sites in the lattice, it can take place in hard-frozen, rigid solids. In H_2, CH_4, and similar substances the production of H atoms requires the breaking of covalent bonds. This process, although initiated by ionization, appears to require also the displacement of the H from its original site in the lattice. (Contractor's abstract)

SUGGESTED ORIGIN OF THE ANOMALOUS LINE-REVERSAL TEMPERATURES IN THE REACTION ZONE OF HYDROCARBON FLAMES, by E. M. Bulewicz and P. J. Padley. [1961] [10]p. incl. diagrs. tables, refs. (AFOSR-3930) (AF 49(638)765) Unclassified

Also published in Combustion and Flame, v. 5: 331-340, Dec. 1961.

Measurements of electron concentrations by the method of cyclotron resonance, and of non-thermal iron line intensities in emission, as a function of composition and dilution in the reaction zone of low-pressure acetylene-oxygen-argon mixtures, reveal a marked similarity in behavior of these 2 quantities. On this and other circumstantial evidence, the possible causes of the anomalous line-reversals can be narrowed down to 2, neither of which can, however, be considered objection-free until further experimental evidence reveals in even more detail the nature of certain of the reaction steps proposed. One of these schemes involves postulating the bimolecular production of an excited species Y* by the mechanism also responsible for electron production. Species Y* must be sufficiently energetic, and be present in sufficient quantity, to produce excited metal atom M* by energy transfer with M. The other—a more specific scheme—involves reaction between M+ and e^- to produce M*, the emitted radiation being discrete. Although there is experimental evidence for all the important steps involved in this second scheme, this scheme, too, can fail if the cross sections for capture of e^- by M+ prove to be too small. Schemes so far postulated involving termolecular reactions are eliminated as not satisfying the experimental observations presented. (Contractor's abstract)

ELECTRON SPIN RESONANCE OF γ-IRRADIATED SINGLE CRYSTALS OF α-AMINO ISOBUTYRIC ACID, ISOBUTYRAMIDE, AND DL VALINE (Abstract), by H. Shields and W. Gordy. [1961] [1]p. [AF 49(638)765] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 257, Apr. 24, 1961.

The electron spin resonances of γ-irradiated single crystals of α-amino isobutyric acid $(CH_3)_2C(NH_2)COOH$, isobutyramide $(CH_3)_2CHC(NH_2)OH$, and DL valine $(CH_3)_2CHCH(NH_2)COOH$ have been observed at room temperature. The first 2 gave the septet patterns

characteristic of 6 protons with equal and very nearly isotropic couplings of 23 gauss. The g factor observed for both is only slightly anisotropic and is close to that for the free electron spin, 2.0023. It is concluded that the free radical is $(CH_3)_2CCOOH$ for isobutyric acid and $(CH_3)_2CC(NH_2)OH$ for isobutyramide. The pattern for DL valine is incompletely resolved for most orientations, but for H perpendicular to the flat surface of the crystal a septet pattern is observed. The pattern, apparently caused by 6 equivalent protons of 23 gauss coupling, has a triplet substructure which is probably caused by N^{14} coupling of 9 gauss. The free radical is believed to be $(CH_3)_2$ $CCH(NH_2)COOH$.

ELECTRON SPIN RESONANCE OF H ATOMS PRODUCED BY γ-IRRADIATION OF SUBSTANCES AT 4.2°K (Abstract), by H. N. Rexroad and W. Gordy. [1961] [1]p. [AF 49(638)765] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 257, Apr. 24, 1961.

ESR has been observed in several substances γ-irradiated directly in the microwave cavity at 4.2°K. For dosages less than 10^6 r, strong doublets of H atoms were observed from HF and H_2O with spacings of 506 gauss and line widths of less than a gauss. No H atoms were detected for the same dosage in the related substances HCl and H_2S. Although resonance of H atoms in irradiated H_2O has been previously detected, an anomaly not reported has been observed. The lower field component of the H-doublet in γ-irradiated H_2O at 4.2°K was found to be many times stronger than the upper one, an effect thought to arise from an interaction of the H with an unidentified free radical having a broad resonance which overlaps the lower component and enhances its relaxation. No such anomaly was observed for the D component in irradiated D_2O, but surprisingly in this sample (D above 99%) the lower H component was observed to be an order of magnitude stronger than the D components.

ELECTRON SPIN RESONANCE STUDIES ON AN IRRADIATED SINGLE CRYSTAL OF DEUTERATED DL-TARTARIC ACID (Abstract), by D. V. G. L. Narasimha Rao and W. Gordy. [1961] [1]p. [AF 49-(638)765] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 257, Apr. 24, 1961.

The ESR spectra of an irradiated single crystal of DL-tartaric acid grown from water is found to be quite complex, but the spectra of a deuterated single crystal could be analyzed and the nature of the free radical ascertained. Measurements were made at 9 and at 23 kmc/sec. For some orientations of the crystal in the external magnetic field an unresolved doublet with weak satellite lines separated by 5 gauss at 9 kmc/sec and 13 gauss at 23 kmc/sec was observed. These satellite lines evidently arise from second order transitions and are very similar to those already reported for a single crystal of urea oxalate. From the analysis it is suggested that the free radical is probably,

COODCODCODHCOOD with the unpaired spin on a carbon atom.

COMPARISONS OF THE ESR OF γ-IRRADIATED PROTEINS WITH THAT OF PROPORTIONAL MIXTURES OF THEIR AMINO ACID CONSTITUENTS (Abstract), by R. Patten and W. Gordy. [1961] [1]p. [AF 49(638)765] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 258, Apr. 24, 1961.

The electron spin resonance of a number of proteins has been compared with that of proportional mechanical mixtures of their amino acid constituents, both at 77°K and 300°K. The proteins include bovine albumin, ovalbumin, chymotrypsinogen, edistin, gliadin, lysozyme, and zein. Generally, the proteins give broad, unresolved ESR patterns similar to those of their mixed constituents when irradiated and observed at 77°K. When warmed to 300°K the proteins give patterns more noticeably different from those of their constituent amino acid mixtures and more like those found in a number of other proteins irradiated and observed at room temperature. The results support the thesis that at room temperature radiation damage to proteins does not occur proportionally in all the different amino acid residue, but selectively in certain residue. Also, it appears that as the temperature is raised unpaired electrons produced in different parts of the protein at 77°K tend to migrate to the more favored sites.

CORRELATION OF ANOMALOUS LINE-REVERSAL MEASUREMENTS OF TEMPERATURE WITH EXCESS ELECTRON CONCENTRATIONS IN ACETYLENE-OXYGEN FLAMES (Abstract), by E. M. Bulewicz and P. J. Padley. [1961] [1]p. [AF 49(638)765] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 258, Apr. 24, 1961.

Line-reversal measurements, made on the spectral lines of various metal additives, in the reaction zone of premixed hydrocarbon-oxygen-diluent flames often give rise to temperatures considerably above those expected on the basis of full thermodynamic equilibrium of the burnt gases. Line intensities of the Fe 4050A (non-resonance) group (produced by addition of $Fe(CO)_5$) were measured as a function of preburned flame gas composition (λ varying from 0.35 to 2.6) in acetylene-oxygen mixtures burning at 10-30 mm pressure. The technique of cyclotron resonance was used to measure, in these same flames, the anomalously high electron concentrations known to exist in the reaction zone – for these purposes, convenient absorption was found to take place, with 48 kmc/sec radiation, at a magnetic field strength of 17,000 gauss. When quenching is taken into consideration, a good correlation between these 2 effects can be obtained, even when the preburned gases are suitably diluted with argon or hydrogen, or when the pressure is varied from 10 mm Hg to 1 atmosphere. A scheme is proposed to account for these observations.

A CYCLOTRON RESONANCE STUDY OF LOW-PRESSURE ACETYLENE-OXYGEN FLAMES, CONTAINING TRACES OF CHLORINE (Abstract), by P. J. Padley and E. M. Bulewicz. [1961] [1]p. [AF 49(638)-765] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 258, 1961.

The reaction zones of acetylene flames contain anomalously high concentrations of free electrons – up to a factor of 10^5 above equilibrium. At reduced pressure these concentrations can conveniently be measured by the method of cyclotron resonance. When traces of chlorine gas (of the order of 1% of the total gas) are added, a reduction in the electron concentration is observed, which can be attributed to the formation of the Cl^- ion. The flame gases normally contain about 10% of the H_2 and H atoms, and the total chlorine is distributed between HCl and Cl, in accordance with the balanced reaction $Cl + H_2 = HCl + H$. Cl^- can then be formed by 2 distinct mechanisms, (1) $HCl + e \rightarrow H + Cl^-$, or (2) $Cl + e + X \rightarrow Cl^- + X$ where X is a third body. The 2 mechanisms lead to widely different values of $[Cl^-]/[e]$, with different dependence on the flame temperature and composition. It was shown that the experimental results are consistent only with mechanism 1, in agreement with earlier work on the formation of the Cl^- ion in gaseous discharges.

ELECTRON SPIN RESONANCE OF γ-IRRADIATED POLYPEPTIDES (Abstract), by R. Drew and W. Gordy. [1961] [1]p. [AF 49(638)765] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 258, Apr. 24, 1961.

Electron spin resonance has been observed in 19 γ-irradiated synthetic polypeptides, including polyglycine, poly-L-Alanine, poly-L-valine, poly-L-leucine, poly-L-phenylalanine, poly-L-proline, poly-L-glutamic acid, poly-L-aspartic acid, and poly-L-tyrosine. Studies have been made on powdered samples at 77°K and 300°K. The effects of air or oxygen on the resonances have been observed. The various ESR patterns and oxygen effects are compared with those for native proteins. Unlike the proteins, the synthetic polypeptides were found to give characteristically different ESR patterns when irradiated, except that poly-glycine and poly-sarcosine gave similar doublets. Of the polypeptides so far investigated, none of which contained sulfur, the ESR pattern of poly-glycine (or poly-sarcosine) is the only 1 which is strikingly similar to that found in a variety of proteins. More detailed studies are planned on oriented samples of certain of these polypeptides and an attempt is being made to obtain some polypeptides which contain sulfur.

ELECTRON SPIN RESONANCE OF A GAMMA-IRRADIATED SINGLE CRYSTAL OF N-ACETYL METHIONINE (Abstract), by E. Cipollini and W. Gordy. [1961] [1]p. [AF 49(638)765] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 258, Apr. 24, 1961.

The ESR of a γ-irradiated single crystal of N-acetyl methionine has been investigated at 9 kmc/sec. Patterns from 2 chemically different free radicals were observed. The free radical giving the more intense pattern has principal g values 2.008, 2.022, and 2.071 and a nearly isotropic doublet splitting of 9 gauss. This free radical is believed to be · ·$SCH_2CH_2C(COOH)HNHCOCH_3$ which is similar in form to that found for L-cystine dihydrochloride in which the unpaired electron is mainly on the S. The second free radical has principal g values 2.0023, 2.0025, and 2.0045 and a nearly isotropic and equal coupling by two protons of 10.5 gauss. It is believed to have the form $CH_3SCH_2CH_2C(COOH)NHCOCH_3$, in which the spin density is concentrated on a C.

ELECTRON-MOLECULE AND ELECTRON-ATOM COLLISION CROSS-SECTIONS FROM A CYCLOTRON RESONANCE STUDY OF FLAME GASES, by E. M. Bulewicz. [1961] [31]p. incl. diagrs. refs. (Bound with its rept. no. 34, July 1-Sept. 30, 1961) (AF 49(638)765) AD 262001 Unclassified

Also published in Jour. Chem. Phys., v. 36: 385-391, Jan. 15, 1962.

When microwaves are passed through a partially ionized gas in a uniform magnetic field, absorption takes place at the cyclotron resonance frequency, provided the pressure of the gas is sufficiently low. The cyclotron line width is directly proportional to the electron-gas molecule collision frequency, and can thus be used to deduce electron-molecule cross-sections. In this work, acetylene-oxygen flames were used as the source of electrons; hydrocarbon flames with air or oxygen contain large concentrations of free electrons in the reaction zone and in its neighborhood. The flames were diluted with various proportions of nitrogen and the rare gases, and covered a pressure range 6-40 mm Hg and a temperature range of 1600-2400°K. The following results were obtained at 2200°K: undiluted, near stoichiometric C_2H_2-O_2 flame gases, $40A^2$; nitrogen $30A^2$, decreasing with temperature; helium, $27A^2$, decreasing with temperature; argon, $7A^2$; neon, $5A^2$; water, about $80A^2$; carbon dioxide about $37A^2$. The values are up to 3-fold larger than the cross sections for collisions with electrons reported for systems other than flame gases. (Contractor's abstract)

ELECTRON SPIN RESONANCE IN A GAMMA-IRRADIATED SINGLE CRYSTAL OF DIGLYCOLIC ACID MONOHYDRATE, by Y. Kurita. [1961] [8]p. incl. diagrs. (Bound with its rept. no. 34, July 1-Sept. 30, 1961) (AF 49(638)765) AD 262001 Unclassified

Also published in Jour. Chem. Phys., v. 36: 560-561, Jan. 15, 1962.

From single crystal studies on the electron spin resonance, radicals produced in thiodiglycolic acid by γ-irradiation were confirmed to be of the form $HOOC\text{-}CH_2\text{-}S\text{-}CH\text{-}COOH$ (I). In this free radical the electron spin density is in a π-orbital, about 60% of which is the p-orbital of CH carbon, 2% is the 1s-orbitals of CH_2 hydrogen and 22% is the p-orbital of S. It is of interest to compare the ESR of this compound with that of the oxygen analog. Single crystals of diglycolic acid monohydrate, $HOOC\text{-}CH_2\text{-}O\text{-}CH_2\text{-}COOH \cdot H_2O$ were grown from water and irradiated with ^{60}Co γ-rays. The crystal is monoclinic with a : b : c = 1.324 : 1 : 0.463 and $\beta \approx 90°$. The ESR of irradiated single crystals were measured at 9.04 kmc. (Contractor's abstract)

ELECTRON-MOLECULE COLLISION CROSS-SECTIONS IN THE BURNED GASES OF A VARIETY OF FUELS, by E. M. Bulewicz and P. J. Padley. [1961] [4]p. incl. table. (Bound with its rept. no. 34, July 1-Sept. 30, 1961) (AF 49(638)765) AD 262001
Unclassified

Also published in Jour. Chem. Phys., v. 36: 2231-2232, Apr. 15, 1962.

In a previous paper (item no. 711, Vol.V) it was shown how the method of cyclotron resonance could be applied to a study of electron-molecule collision cross-sections in low pressure acetylene-oxygen flames. By suitably diluting such flames with hydrogen, carbon monoxide or the rare gases, cross-sections Q_{H_2O} and Q_{CO_2} were found to be $80 \pm 4A^2$ and $37 \pm 2A^2$, respectively in flames at about 2200°K. The relative Q values obtained were considered reliable. It has proved possible to test this conclusion further by extending the measurements of collision frequency to other fuels, using exactly the same apparatus described previously. REACTIONS OF ALUMINUM BOROHYDRIDE, by P. C. Maybury. Final rept. Apr. 20, 1961, 32p. incl. diagrs. tables, refs. (AFOSR-585) (AF 18(603)119) AD 256887 Unclassified

The objective of this research has been to study the nature of the chemical reactivity of aluminum borohydride by means of several isotopic exchange reactions. The similarity of the chemical and physical properties of aluminum borohydride and diborane suggested that borane should play an important role as an intermediate in these reactions and it was hoped that direct evidence could be obtained in support of the existence and nature of this species. The nuclear magnetic resonance spectrum of aluminum borohydride indicates that all 12 hydrogen atoms in the molecule are equivalent and it was expected that further evidence concerned with bond equivalence could be obtained through these studies. It is hoped that a better understanding of the structures and reactivity of aluminum borohydride will help in future studies and applications of this useful and important compound. The report is divided into three separate sections, the first two authored by P. C. Maybury and J. C. Larrabee and the third by L. Taylor and published in Sb. Nauchn. Tr. Pumsk. Politekhn. Inst., No. 10: 105-110, 1961. KINETICS OF THE EXCHANGE REACTION OF $Al(BH_4)_3$ WITH D_2: Preliminary studies indicated a drift in exchange rates as calculated by the exchange law, especially for those runs where the ratio of D_2 to $Al(BH_4)_3$ pressure was large. The assumption was made that the drift was due to the contribution of 2 different mechanisms proceeding at different rates. DEUTERIUM EXCHANGE BETWEEN B_2D_6 AND $Al(BH_4)_3$: The kinetics of the exchange were studied from -70° to 20°C. The orders of reaction were dependent on the relative proportions of B_2D_6 and $Al(BH_4)_3$. A mechanism was proposed involving the thermal dissociation of both $Al(BH_4)_3$ and B_2D_6 followed by a rate determining collision of B_2D_6 with borane radicals. Evidence was obtained proving that the B atoms undergo exchange in this reaction by the use of B-10 enriched B_2D_6. THE REACTION OF $Al(BH_4)_3$ WITH NH_3: The $Al(BH_4)_3$-NH_3 reaction product was obtained as a uniform white amorphous appearing powder which dissolved in cold water with slow gas evolution. The solid was ignited with a laboratory burner flame and burned smoothly with a green flame. IR spectroscopy indicated that some B-H bonds remain intact in the ammoniated $Al(BH_4)_3$.

ELECTRICAL CONDUCTION IN RAPIDLY EXPLODED WIRES, by P. H. Levine, A. V. Tollestrup and F. H. Webb, Jr. [1961] 28p. incl. illus. diagrs. (AFOSR-1363) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1063 and Army Ordnance Corps under DA 04-495-ORD-1298) Unclassified

A wire exploder capable of vaporizing small wires in times shorter than 10^{-7} sec has been used to study the electrical explosion of wires of various materials and sizes in a variety of environments, with peak specific power levels between 5×10^{12} and 2×10^{14} watts/mol. Simultaneous voltage and current oscillograms with a time resolution of one nanosecond have been obtained, as well as Kerr cell photographs of the wire at different times during the explosion process. From these measurements, the time history of the wire resistance during an explosion is obtained, and its scaling properties are investigated. (Contractor's abstract)

EXPLODING WIRES AND FILMS (Abstract), by F. H. Webb [Jr.]. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)1063) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

Exploding materials show promise for eventual application in pulsed propulsion systems. Preliminary experiments for a single shot will be directed in which relatively large amounts of metallic vapor or plasma were obtained from electrically exploded thin films up to several hundredths of a gram. Specific impulses in the range 1000 sec to 3000 sec may be obtainable from the explosion process along with higher specific impulses anticipated when magnetic plasma acceleration is employed. It is important to understand the nature of the explosion process, the state of the vapor or plasma after the explosion, the effects of different configurations, confinement techniques and means of coupling to magnetic pressure in order to treat problems of energy transfer and to achieve a high degree of directed kinetic energy.

Published in Exploding Wires; Proc. of Second Conf. of the Exploding Wire Phenomenon, Boston, Mass. (Nov. 13-15, 1961), New York, Plenum Press, 1962, p. 37-75.

Results are presented of a series of experiments with wires which are exploded in times less than 10^{-7} sec. The vapor expansion dynamics during the initial conduction phase for exploded silver and copper wires is in agreement with the supersonic model over the range of conditions of this study. The scaled resistivity as a function of energy density for these materials follows a main sequence with a positive energy coefficient of resistivity. The vapor expansion dynamics during the initial conduction phase in molybdenum wires is in agreement with the ablation model until about 2/3 of the latent heat required for vaporization is placed in the material. The scaled resistivity as a function of energy density for molybdenum follows a main sequence with a small positive energy coefficient of scaled resistivity. Above the onset of vaporization the inferred energy coefficient of resistivity decreases with increasing energy input. A classification scheme of exploding wire phenomena is suggested in terms of specific power level for wires thin compared to the initial skin depth.

SELF-ASSOCIATION CONSTANT OF CHLOROFORM FROM NMR CHEMICAL SHIFTS, by C. F. Jumper, M. T. Emerson, and B. B. Howard. [1961] [2]p. incl. diagr. refs. (AFOSR-1214) (AF 49(638)278) Unclassified

Also published in Jour. Chem. Phys., v. 35: 1911-1912, Nov. 1961.

NMR measurements yielded an association constant of 0.16 (mol fraction)$^{-1}$ in cyclohexane and approximately 0.1 (mol fraction)$^{-1}$ in CCl_4. The shift for chloroform in carbon tetrachloride, as illustrated graphically, is linear with concentration and has a total dilution shift of only 0.022 ppm.

A MONTE CARLO METHOD FOR NUCLEAR MANY BODY PROBLEMS, by E. W. Schmid. [1961] [16]p. incl. diagr. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)-278 and Office of Naval Research) Unclassified

Published in Nuclear Phys., v. 32: 82-97, Apr. 1962.

A Monte Carlo method is given to solve nuclear many body problems in the frame of Ritz' variational principle. The antisymmetrization and all integrations are performed by a random process. The method is formulated for a 2 cluster system, using oscillator wave functions and hard core forces, but it can be generalized to rather arbitrary forces and wave functions. The ground state energy and rms-radius of the α-particle has been calculated. For the final parameter values, an accuracy in the energy of 10% (2%) was obtained after a calculation time of 40 sec (16 min) with an IBM 7090 computer. The accuracy in the radius is better by a factor of 8. The minimum energy depends on the form of the trial wave function near the hard core. (Contractor's abstract)

ENERGY TRANSFER IN HYDROGEN-BONDED N-HETEROCYCLIC COMPLEXES AND THEIR POSSIBLE ROLE AS ENERGY SINKS, by M. A. El-Bayoumi and M. Kasha. [1961] [2]p. incl. diagrs. (AFOSR-J360) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)712 and Atomic Energy Commission) AD 411057 Unclassified

Also published in Jour. Chem. Phys., v. 34: 2181-2182, June 1961.

The energy transfer results for the acridine-carbazole H-bonded complex is reported. Hydrogen-glass solution (initial concentration of 1 x 10^{-4} mol/l) favors the formation of acridine-carbazole hydrogen-bonded complexes; in contrast, in hydroxylic glass solution (EPA) hydrogen bonding of each solute molecule with the solvent occurs. Strong quenching of carbazole (1 x 10^{-4} mol/l) emission was observed in hydrocarbon-glass solution at a smaller relative concentration of acridine (1 x 10^{-5} mol/l). The quenching was greater than expected even if it assumed that complete association of carbazole with acridine has occurred. Therefore, the emission of some free carbazole molecules is also quenched, which means that the complex is acting as an energy sink.

EFFECT OF REDUCING THE SYMMETRY ON THE SPECTRA OF BENZENE IN THE 1500-2000A REGION: SPECTRA OF PYRIDINE, PYRIMIDINE, AND PYRAZINE, by M. [F.] A. El-Sayed. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)712 and Harvard U. Chemical Research Fund) Unclassified

Published in Jour. Chem. Phys., v. 36: 552-553, Jan. 15, 1962.

In the 2000A region, the longest wavelength band of the spectrum is found to be at 2009.3, 1913.6, and 1966.3A in pyridine, pyrimidine, and pyrazine, respectively. The corresponding band in benzene is 2042.1A. The pyridine vapor spectrum in the 1600-1800A region shows at least 3 different systems: sharp, diffuse, and continuous. Pyrimidine and pyrazine vapors show very sharp, well-resolved absorption systems in the 1600-1900A region. The diffuse system, in accordance with symmetry expectation and the above assignment could

only be recognized in the pyrimidine spectra (C_{2v} symmetry) but is definitely missing in the pyrazine spectrum (D_{2h} symmetry with center of symmetry). In the latter molecule, the $^1E_{2g}$ level splits into ^1A_g and $^1B_{3g}$, the transition from the ground state to either of which is still symmetry forbidden.

MATRIX SLIDE RULES, by E. P. Miles, Jr. [1960] [4]p. (AFOSR-3154) [AF AFOSR-61-12] Unclassified

Also published in Amer. Math. Monthly, v. 67: 788-791, Oct. 1960.

The author considers a k by ∞ matrix A with columns the vectors C_n, $-\infty < n < +\infty$ whose k elements $C_{1,n}$ ..., $C_{k,n}$ are defined as follows: The k adjacent vectors $C_0, C_1 \ldots, C_{k-1}$ are the successive columns of the identity matrix of order k, and all other $C_{j,n}$ are defined recursively by the relation: $c_{j,n} = \sum_{m=1}^{k} a_m c_{j,n-m}$, $a_k \neq 0$. This means in particular that the vector C_k has elements $c_{j,k} = a_{k-j+1}$, $j = 1, \ldots, k$. Let A_j, $-\infty < j < \infty$, be the k by k submatrix of A consisting of the consecutive column vectors $C_j, C_{j+1}, \ldots, C_{j+k+1}$. Note that $A_0 = I_k$ and A_1 is a nonsingular matrix with characteristic equation: $x^k = \sum_{m=1}^{k} a_m x^{k-m}$. It may be established by induction that $A_j = (A_1)^j$, $-\infty < j < \infty$. It is shown how finite submatrices of A may be used to construct matrix slide rules which are helpful in suggesting numerous problems involving the matrices A_j and providing a quick check for answers to these problems.

QUASI-FREE NUCLEON-NUCLEON SCATTERING, by T. A. J. Maris. [1958] [8]p. incl. diagrs. [AF 49(638)-427] Unclassified

Published in Nuclear Phys., v. 9: 577-584, Jan. 2, 1959.

A simple approximation is described for the calculation of quasi-free proton-proton scattering using distorted incoming and outgoing waves. The method is applied to Li^7. Results show that in this light nucleus the refraction by the collective nuclear potential does not destroy the strong connection between the angular correlation of the emerging protons and the momentum distribution of the knocked-out proton in the nuclear shell concerned. LOW-LYING ENERGY LEVELS IN Sc^{41}, by H. S. Plendl and F. E. Steigert. [1959] [5]p. incl. diagrs. table. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)427] and Office of Naval Research) Unclassified

Published in Phys. Rev., v. 116: 1534-1538, Dec. 15, 1959.

The reaction $Ca^{40}(d,n)Sc^{41}$ was studied at 4.15-mev bombarding energy using nuclear emulsions as detectors. Four groups of neutrons were observed with Q values of -0.57, -2.43, -2.64, and -2.65 mev. The observed angular distributions can be fitted with distribution curves obtained from stripping analysis on the basis of $r_0 = 6.0$ fermi and $l_p = 3,1,1,1$, respectively. Two additional groups of questionable assignment were observed at $Q = -1.13$ and -1.41 mev. Neutron groups from reactions on C^{12} and O^{16} were also observed and served to confirm the beam calibration as well as background and other correction methods. (Contractor's abstract)

THEORY OF THE PHOTODISINTEGRATION OF THE DEUTERON, by L. D. Pearlstein and A. Klein. [1959] [19]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)-427] and Atomic Energy Commission) Unclassified

Published in Phys. Rev., v. 118: 193-211, Apr. 1, 1960.

By means of a covariant field-theoretic technique, a formally exact expression has been derived for the amplitude for photodisintegration of the deuteron. By expanding the result only in the number of mesons exchanged and by making a series of nonrelativistic approximations, the expression is reduced to one in which the corrections to the conventional dipole matrix element depend only on the amplitude for photomeson production, the renormalized meson-nucleon coupling constant, and the appropriate two nucleon wave functions. The virtual meson effects play a minor role at energies below 100 mev. At higher energies good agreement with the total cross section was obtained by the inclusion of both hard core and tensor force effects in the wave functions. In addition the folded angular distribution could be fitted by using a reasonable extrapolation of the phase shifts in the $^1S_0$ and $^1D_2$ states. (Contractor's abstract)

ANGULAR DISTRIBUTION OF γ RADIATION FOLLOWING $C^{12}(p_1,p_2\gamma)C^{12}$, by M. Nomoto. Mar. 10, 1961 [10]p. incl. diagrs. (Technical rept. no. 2) (AFOSR-784) (AF 49(638)427) AD 613314 Unclassified

Also published in Nuclear Phys., v. 30: 513-519, Feb. 1962.

An analysis is made of the angular distributions of the 4.43-mev γ radiation following $C^{12}(p_1,p_2\gamma)C^{12}$ in the vicinity of the 2 resonance peaks at bombarding energies 5.36 mev and 5.69 mev. It is shown that the angular distributions of this γ radiation are strongly dominated not only by the 2 resonance levels (3/2 + and 5/2 +) in N^{13}, with excitation energies 6.91 mev and 7.42 mev (called C and E respectively), but also by another lower level (5/2 +) with 6.38 mev excitation (called A) and their interference. A better fit between the theory and experimental data is obtained for reduced-width amplitude ratios $\gamma'_{s'_1 l'_1} \gamma'_{s'_2 l'_2} / \gamma_{s_1 l_1} \gamma_{s_2 l_2} = -2.3$ and

$$\gamma''_{s''_1 l''_1} \gamma''_{s''_2 l''_2} / \gamma_{s_1 l_1} \gamma_{s_2 l_2} = -0.32,$$

where no prime, 1 prime and 2 primes are used for the levels C, A and E, respectively, and subscripts 1 and 2 for incoming and outgoing channels, respectively. The relationship $N_2 + N_4 = N_0$ is deduced, if the angular distribution is expressed by $W(\theta) \propto N_0 + N_2 \cos^2\theta + N_4 \cos^4\theta$. Finally, the effects of other neighboring levels in N^{13} are considered. (Contractor's abstract)

ONE-MINUTE POSITRON-DECAY ACTIVITY FROM $K^{39}(\alpha,n)Sc^{42}$, by J. W. Nelson, H. S. Plendl, and J. D. Oberholtzer. [1961] [2]p. incl. diagrs. (AFOSR-1057) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)427 and National Science Foundation) Unclassified

Also published in Proc. Rutherford Jubilee, Internat'l. Conf., Manchester (Gt. Brit.) (Sept. 4-8, 1961), London (Gt. Brit.), Heywood and Co., Ltd., p. 819-820.

A 62-sec, 0.51-mev gamma-ray activity observed in the α-particle bombardment of postassium targets is ascribed to the β^+ decay of an isomeric state in Sc^{42} formed by the $K^{39}(\alpha,n)$ reaction. Gamma rays observed in coincidence with the above activity and of the same half-life are interpreted as transitions from the Ca^{42} excited state formed in the β^+ decay to the Ca^{42} ground state. The threshold for this activity occurs at: $E_\alpha = 8.86 \pm 0.04$ mev ($Q = -8.04 \pm 0.04$ mev). (Contractor's abstract)

ANGULAR DISTRIBUTIONS OF 4.43-MEV GAMMA RADIATION FROM $C^{12}(p,p'\gamma)C^{12}$, by H. S. Adams, J. D. Fox and others. [1961] [5]p. incl. diagrs. tables, refs. (AFOSR-1236) (AF 49(638)427) Unclassified

Also published in Phys. Rev., v. 124: 1899-1903, Dec. 15, 1961.

The yield at 90°, and 32 angular distributions of the 4.43-mev γ-ray from the first-excited state of C^{12} were measured for proton bombarding energies between 5 and 12 mev. The excitation curve for inelastic scattering is characterized by a number of strong resonances, some of which were previously known. In addition, underlying the resonances, there is a monotonically rising background. The angular distributions were fitted by least squares to the expression $W(\theta) = A_0 + A_2P_2(\cos\theta) + A_4P_4(\cos\theta)$. Those obtained in the region of the resonances at $E_p = 5.36$ mev and $E_p = 5.89$ mev can be interpreted by taking into account these 2 resonances with respective characters $\frac{3+}{2}$ and $\frac{5+}{2}$ plus 1 additional state at an excitation energy of 6.38 mev ($\frac{5+}{2}$) in the compound nucleus N^{13} which can be seen only in elastic scattering. A simple direct-reaction model using a nucleon-nucleon interaction accounts very well for 4 angular distributions at higher energies in regions showing no resonant structure. (A preliminary account of this report was given as item no. 667, Vol. IV.) (Contractor's abstract)

DETERMINATION OF (p,n) THRESHOLDS FOR Cr^{52} (Abstract), by J. A. Becker and J. D. Fox. [1961] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 47, Feb. 1, 1961.

The thresholds for $Cr^{52}(p,n)Mn^{52}$(5.6-day) and $Cr^{52}(p,n)Mn^{52m}$(21-min) are determined by means of residual activity method. The activity produced in thick Cr_2O_3 targets is detected using a 3-in. x 3-in. NaI(Tl) scintillation spectrometer. The known γ-rays and coincidence sum peaks for the decays were observed. Preliminary data show the 21-min threshold to be at 5.98 ± 0.02 mev, in agreement with radioactivity data, and in disagreement with a previous threshold measurement (see Phys. Rev., v. 58: 929-934, Dec. 1940).

EXCITATION FUNCTIONS OF THE $Li^7(\alpha,n)B^{10}$ AND $Li^6(\alpha,n)B^9$ REACTIONS (Abstract), by M. K. Mehta, W. E. Hunt and others. [1961] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer Phys. Soc., Series II, v. 6: 226, Apr. 24, 1961.

The neutron yield from the $Li^7(\alpha,n)B^{10}$ reaction has been measured as a function of bombarding energy from threshold at 4.37 to 14.5 mev α-particle energy (lab). Neutrons were detected by 3 paraffin embedded BF_3 counters subtending an angle of about -15° to +15° with respect to the beam direction. Prominent peaks in neutron yield were observed at 5.23, 5.6, 7.05, 8.46, 9.22, 10.09, 12.66, and 13.95 mev (lab) α-particle energy. These correspond to levels in the compound nucleus B^{11} at 12.00, 12.24, 13.16, 14.05, 14.53, 15.09, 16.73, and 17.55 mev, respectively, which compare well with those reported in a previous work (Nuclear Phys., v. 11: 1, 1959). The measured ground state and first excited state thresholds of this reaction are 4.37 and 5.50 mev (lab). A general rise in the neutron yield with indications of many contributing resonances has been observed between 14.5 and 18.0 mev bombarding energy. The observed threshold for the reaction $Li^6(\alpha,n)B^9$ is 6.63 mev (lab) which corresponds to a Q value of -3.98 mev in good agreement with previous work. Energy calibrations are based on an Al(p,n) threshold at 5.800 mev and the estimated error in the present determination is ± 0.02 mev. Neutron yield from the reaction $Li^6(\alpha,n)B^9$ increases by a factor of 10 between 7 and 16 mev bombarding energy of the α-particles.

STUDY OF THE GAMMA RAY YIELD FROM THE $C^{12}(\alpha,\alpha'\gamma_{4.43})C^{12}$ REACTION (Abstract), by G. E. Mitchell, E. B. Carter, and R. H. Davis. [1961] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 227, Apr. 24, 1961.

The excitation function for $C^{12}(\alpha,\alpha'\gamma_{4.43})C^{12}$ has been measured from 7.3 to 17.0 mev. Gamma rays produced in thin (< 0.1 mg/cm^2, 99% C^{12}) targets were detected with a 3-in. x 3-in. NaI (Tl) crystal. Resonances were observed at bombarding energies of 7.94 (Γ = 120 kev), 8.14 (Γ = 50 kev), 8.95 (Γ = 90 kev), 10.08 (Γ ~ 400 kev), and 10.19 (Γ = 40 kev) mev, where the widths quoted are observed widths. The corresponding excitation energies in O^{16} are 13.10, 13.25, 13.86, 1471, and 14.79 mev. The first 3 levels have been previously studied via N^{15} + p reactions. Above 11 mev bombarding energy, there appear to be many unresolved levels. Most of the angular distributions throughout the region of well resolved resonances show a max in the vicinity of 30° and a minimum at 90°.

(α,n) THRESHOLDS ON C^{12}, Si^{28}, S^{32}, AND S^{34} (Abstract), by J. W. Nelson, E. B. Carter and others. [1961] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 235, Apr. 24, 1961.

Using α particle beams of 1-6 mu amp from the Florida State U. Tandem Van de Graaff accelerator, the following ground state neutron thresholds have been observed: C^{12} 11.484 ± 0.045, Si^{28} 10.00 ± 0.12, S^{32} 9.98 ± 0.07, S^{34} 5.37 ± 0.15 mev. Energies of α particles were determined by magnetic analysis assuming the Al(p,n) threshold to be 5.800 mev. Thick targets were used for all determinations. Annihilation γ rays from positron decay of the product nuclei were measured in the C^{12}, Si^{28}, and S^{32} experiments while a BF_3 proportional counter was used to detect neutrons from S^{34} targets. Indications for excited state thresholds have been observed in Si^{28}, S^{32}, and S^{34}. Analysis of these data in terms of known residual nucleus states will be presented.

Florida State U. Dept. of Physics, Tallahassee.

EXCITATION FUNCTION OF THE $O^{16}(\alpha,\alpha'\gamma)O^{16}$ REACTION (Abstract), by W. E. Hunt, M. K. Mehta and others. [1961] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 248, Apr. 24, 1961.

Excitation function for the reaction $O^{16}(\alpha,\alpha'\gamma)O^{16}$ has been measured for α-particle bombarding energies (lab) from 10.0 mev to 16.5 mev by observing the yield of the 6.14-mev γ ray and the unresolved 6.92-mev and 7.12-mev γ rays from the 2nd, 3rd, and 4th excited states in O^{16}, respectively, using a 3-in. x 3-in. NaI crystal at 0° with respect to the α beam. Prominent peaks in the yields of 6.14 mev γ ray occur at 11.97, 12.76, 13.27, 14.42, 14.85, 15.73, and 16.07 mev α-particle energy (lab) which correspond to the energy levels in

Ne^{20} at 14.33, 14.96, 15.37, 16.29, 16.63, 17.33, and 17.61 mev, respectively. Peaks in the combined yield of 6.92 and 7.14 γ rays occur at 12.02, 13.51, 12.76, 13.69, 14.53, 14.85, 15.51, add 16.07-mev α-particle energy (lab). These correspond to levels in Ne^{20} at 14.37, 14.76, 14.96, 15.70, 16.37, 17.16, and 17.61 mev. Peaks in the 2 yields do not always occur at the same energy, indicating that the α particles from the same level in compound nucleus Ne^{20} do not always populate all the 3 levels in O^{16}. The levels seen in this work are in good agreement with those seen in yields of α_0, α_*, α_1, α_2, α_3, in the reaction $F^{19}(p,\alpha)O^{16}$ reported earlier.

STUDIES OF (p,α) REACTIONS UP TO 12 MEV (Abstract), by H. S. Adams, J. D. Fox and others. [1961] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 250, Apr. 24, 1961.

The excitation curves and some angular distributions of α-particles from $Al^{27}(p,\alpha)Mg^{24}$ (at least 7 states in Mg^{24}) and $Na^{23}(p,\alpha)Ne^{20}$ (at least 4 groups) are studied. A small Si junction counter was used as a detector. Strong resonances are still observed in the region of 20-mev excitation energy in Si^{28}. This survey is being extended to heavier nuclei.

PRODUCTION OF AN 18- MEV ALPHA PARTICLE BEAM IN A TANDEM VAN DE GRAAFF ACCELERATOR (Abstract), by E. B. Carter and R. H. Davis. [1961] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 253, Apr. 24, 1961.

An analyzed beam of 8 mμa of He^{++} has been identified by γ-rays the $Be^9(\alpha,n\gamma_{4.43})C^{12}$ reaction, by tracks in Ilford K2 plates of particles scattered from Au foils, and by the $C(\alpha,n)O^{15}$ reaction threshold. A mixture of He and H_2 is normally used in the duoplasmatron ion source, but the importance of H_2 is not clear since significant traces have been found after 4 hr of operation of the unmodified ion source with the H_2 inlet valve turned off. The beam from the negative ion source has a momentum consistent with a He^+ assignment for beam from the duoplasmatron ion source and He^- from the charge exchange canal. The terminal voltage is consistent with a He^- beam in the first half of the tandem accelerator. Hydrogen as a charge exchange gas yields a beam 25% larger than air and 5 times larger than He. Modifications of the ion source to study mixtures of gases will be discussed.

CLUSTER MODEL CALCULATION ON THE ENERGY LEVELS OF THE LITHIUM ISOTOPES, by Y. C. Tang. [11]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)427 and Office of Naval Research) Unclassified

Published in Phys. Rev., v. 123: 548-558, July 15, 1961.

A variational procedure is adopted to determine the energies of the levels of the highest space symmetry type in Li^6 and Li^7. The trial wave functions employed take into consideration the existence of cluster structures in those nuclei. With a simple 2-body force, it is shown that the computed energies of the various states are in reasonable agreement with experiment. The $^2F_{5/2}$ level in Li^7, as yet undetermined experimentally, is found to have an excitation energy of about 5.6 mev and a rather large level width. The calculation also indicates that to explain the splitting of levels in those nuclei, a constant 2-body spin-orbit force of the pure neutral form is inadequate. (Contractor's abstract)

CLUSTER MODEL CALCULATIONS IN LIGHT NUCLEI, by K. Wildermuth, Y. C. Tang and others. [1961] [2]p. incl. table. [AF 49(638)427] Unclassified

Published in Proc. Rutherford Jubilee Internat'l. Conf., Manchester (Gt. Brit.) (Sept. 4-8, 1961), London (Gt. Brit.), Heywood and Co., Ltd., p. 259-260.

A variational procedure is used to calculate the energies of the various levels in the light nuclei with A = 5,6,7,8. The trial wave functions are chosen according to the prescription of the cluster model. It is found that to produce satisfactory results, it is, in general, necessary to depart from the usual shell model picture. Also, it is found that the 7.47 mev level in Li^7 is definitely a

member of the ^4P multiplet, with the experimentally undetected $F_{5/2}$ level lying at an excitation of about 6 mev. Furthermore, results indicate that the existence of a broad positive parity level at 6.54 mev in Li^7 as indicated by some experiments is highly questionable. (Contractor's abstract)

$Be^9(p,\alpha)Li^6$ AND $B^{11}(p,\alpha)Be^8$ REACTIONS (Abstract), by H. R. Blieden, G. M. Temmer, and K. L. Warsh. [1961] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 514, Nov. 24, 1961.

The reactions $Be^9(p,\alpha)Li^6$ has been studied for proton energies between 3.5-12 mev with the Tandem accelerator. The charged particles were detected by solid-state counters. The total cross section for α-particle emission is a smooth, monotonically decreasing function of energy. The shape of the angular distribution of α_0, and α_1 obtained between 6 and 11.5 mev changes remarkably little. The α_0 angular distributions show a broad max at θcm ~60°, a min at θcm ~115°, and strong backward peaks in all cases. The α_1 angular distribution has one shallow min at θcm ~65°. At the higher energies, the α_2 angular distribution was also observed. These results will be discussed in terms of the direct and exchange modes of the triton pickup process. The excitation curve for $B^{11}(p,\alpha)Be^8$ shows pronounced structure in contrast to the former reaction. Details of this reaction will also be discussed.

EXCITATION FUNCTION AND ANGULAR DISTRIBUTIONS FOR THE $Li^7(p,\alpha)\alpha$ REACTION (Abstract), by I. G. Han and N. P. Heydenburg. [1961] [1]p. (AF 49-(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 415, Nov. 24, 1961.

The excitation function for the $Li^7(p,\alpha)\alpha$ reaction has been studied for proton bombarding energies from 2.75-12.0 mev. In addition to the 3-mev resonance peak observed in previous work (Phys. Rev., v. 73: 241, 1948), a prominent peak was observed at 5.6 mev with an asymmetry at the higher energy side indicating an unresolved resonance at about 6.5 mev. Twenty angular distributions have been obtained over this energy range. The angular distributions near the 5.6 mev peak show similar patterns to those near the 3-mev resonance having a maximum at 90° (cm). The resonance at 5.6 mev is probably due to a $J = 2^+$ level in Be^8. The angular distributions from 6.5—7.5 mev also indicate a rather broad resonance at about 6.5 mev. The angular distributions from 9.5—12.0 mev are similar and the yield remains almost constant. Similar work on Li^6 is in progress.

$C^{12}(\alpha,\alpha_1)C^{12*}$ REACTION FROM 10 TO 19 MEV (Abstract), by G. E. Mitchell, E. B. Carter, and R. H. Davis. [1961] [2]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 415-416, Nov. 24, 1961.

The excitation curves for the reaction $C^{12}(\alpha,\alpha_1)C^{12*}$ (Q = -4.43 mev) have been measured at 6 fixed laboratory angles for the range of bombarding energy 10-19 mev. Considerable structure is observed on all of these excitation functions. Fifteen detailed angular distributions were taken. These angular distributions show qualitatively the direct inelastic diffraction pattern, especially at the higher energies. At 14 mev and below, there are minima at approximately 60° and 120°; above 14 mev, there are minima at about 60°, 90°, and 120°. The back angle behavior is irregular. A qualitative change observed in the character of the angular distributions near 14 mev was also found in the $C^{12}(\alpha,\alpha_1\gamma_{4.43})C^{12}$ reaction.

EXCITATION CURVES AND ANGULAR DISTRIBUTIONS OF 10- TO 19-Mev ALPHA PARTICLES ELASTICALLY SCATTERED FROM CARBON (Abstract), by E. B. Carter, G. E. Mitchell, and R. H. Davis. [1961] [1]p. (AF 49-(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 416, Nov. 24, 1961.

Excitation curves from 10- to 19-mev bombarding energy have been taken in about 50 kev steps at 13 angles.

These curves are dominated by several broad anomalie with widths up to 1 mev; in addition, there are about 20 narrow anomalies superimposed. The angular distribution at 11 mev is fit fairly well with the Blair model with cutoff angular momentum equal to 5. The minima in the experimental angular distributions are not as deep as the Blair model predicts. The irregular dependence of the angular distributions on energy may be characterized by listing the energies and the observed number of minima: 11 mev-4 or 5; 11.74 mev-4 or 5; 12.1 mev-6; 12.46 mev-4; 13 mev-4; 14 mev-4; 14.42 mev-4; 14.53 mev-4 or 5; 15 mev-5; 16 mev-5; 17 mev-5 or 6; 17.5 mev-6; 18 mev-7; 18.5 mev-5 or 6; and 19 mev-4.

ELASTIC SCATTERING OF ALPHA PARTICLES BY O^{16} FROM 10 TO 19 MEV (Abstract), by M. K. Mehta, W. E. Hunt, and R. H. Davis. [1961] [2]p. (AF 49(638)-427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 439-440, Nov. 24, 1961.

The yield of α particles elastically scattered from O^{16} was measured as a function of α particle bombarding energy in range 10-19 mev. At least 22 resonances are resolved in the excitation curves with observed level widths as large as 0.3 mev. Detailed angular distributions were taken at bombarding energies of 9.92, 11.97, 13.37, 15.20, 17.22, 18.30, and 18.90 mev; the distribution at 18.30 mev is in agreement with that of Correlli, et al (Phys. Rev., v. 116: 1184, 1959). In the vicinity of 18.3 mev, prominent resonance structure was observed and the angular distribution at 17.22 mev is rather different from the distributions at 18.3 mev and 18.9 mev. All of the angular distributions exhibit strong diffraction patterns. The number of maxima and minima increase with increasing energy and all angular distributions exhibit strong backward peaking.

ANGULAR DISTRIBUTIONS OF THE REACTIONS $Al^{27}(p,\alpha_0)Mg^{24}$ AND $Al^{27}(p,\alpha_1)Mg^{24}$ FROM 10 TO 12 MEV (Abstract), by K. L. Warsh, H. R. Blieden, and G. M. Temmer. [1961] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 440, Nov. 24, 1961.

The reactions $Al^{27}(p,\alpha_0)Mg^{24}$ and $Al^{27}(p,\alpha_1)Mg^{24}$ were studied at 10.0, 10.5, 11.0, 11.5, and 12.0 mev. The alphas were detected with junction counters thick enough to stop the alphas but thin enough not to detect the full energy of the protons. The shapes of the angular distributions were observed to change rapidly with beam energy. Some of these show large forward or backward peaking. An excitation curve will be presented; further work is in progress for higher excited states.

EXCITATION FUNCTION OF $O^{16}(p,p'\gamma)$ TO 10.6 MEV (Abstract), by R. F. Sturgeon, Jr., J. A. Becker, and J. D. Fox. [1961] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Los Angeles, Calif., Dec. 27-29, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 506, Dec. 27, 1961.

The excitation functions for production of the 6.12 and 6.92 mev γ rays in O^{16} by protons have been measured from thresholds to 10.6 mev. The γ rays were detected at 90° from the beam axis with a 3-crystal scintillation pair spectrometer. A gas target of CO_2 at 6.7 cm Hg pressure was bombarded with proton beams of 2 μa. The yield of the oxygen gamma rays was determined relative to that of the C 4.43 mev γ ray for each run of 200 μcoul. The excitation functions were obtained by normalization to the data of Adams et al on the $C^{12}(p, p'\gamma_{4.43})$ reaction. Resonances were observed at incident proton energies of 6.88, 7.23, 7.43, 7.88, 8.31, 8.86, 9.19, and 9.98 mev.

EXCHANGE STRIPPING EFFECTS IN THE REACTION $B^{11}(d,n)C^{12}_{4.43}$, by C. A. Bruns, R. A. Zandis and others. [1961] [10]p. incl. diagrs. tables. (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)427 and Atomic Energy Commission) Unclassified

Published in Nuclear Phys., v. 28: 550-559, Dec. 1961.

Angular distributions for the $B^{11}(d,n)C^{12}_{4.43}$, reaction are presented for bombarding energies of 1.1, 2.5, and 2.8 mev (lab). These distributions are fitted with a 2-mode stripping theory. This theory with all parameters fixed

is used to fit n-γ correlations at 1.1 mev and published data at 2.65 mev. It is suggested that the discrepancies which still remain between theory and experiment may be reconciled by using a distorted wave Born approximation to the 2-mode theory. (Contractor's abstract)

EXPERIMENTAL DETERMINATION OF A STATISTICAL REPRESENTATION OF THE NOISE FIELD OF A SUBSONIC AIR JET, by M. R. P. Trubert, H. G. Kizner, and W. A. Nash. Aug. 1961, 15p. incl. illus. diagrs. refs. (Technical note no. 3) (AFOSR-991) (AF 49(638)328) AD 264123 Unclassified

Also published in Developments in Mechanics, Proc. of the Seventh Midwestern Mechanics Conf., Michigan State U. (Sept. 6-8, 1961), New York, Plenum Press, v. 1: 460-483, 1961.

A space-time investigation of the noise field created by a subsonic air jet has been carried out with a model nozzle 1.4 in. in diameter. The random-noise pressure of the jet has been measured at the surface of a rigid plate placed outside the jet boundary. The cross correlation of the random noise has been chosen to represent the statistical properties of the noise field. A set of cross-correlation curves has been obtained experimentally. This investigation presents statistical representations of pressures in an obstructed field, whereas previous studies have pertained only to free fields. (Contractor's abstract)

RESPONSE OF AN ELASTIC PLATE TO A DISTRIBUTED RANDOM PRESSURE CHARACTERIZED BY A SEPARABLE CROSS CORRELATION, by W. A. Nash. Sept. 1961, 25p. incl. refs. (Technical note no. 1) (AFOSR-1215) (AF 49(638)328) AD 265640 Unclassified

The technique of generalized harmonic analysis is employed to predict the mean-square response of a thin elastic plate to a random pressure acting normal to the surface of the plate. Damping of the plate is considered, and it is assumed that the pressure is spatially uniform. A general expression is presented for the power spectrum of the response; and, for the special case of a space-time separable pressure cross correlation, the response is evaluated for 2 cases: (a) white noise, and (b) all noise power concentrated at 1 frequency. DECAY OF Br^{78}, by R. Rikmenspoel and D. M. Van Patter. [1961] [6]p. incl. diagrs. refs. (AFOSR-3012) (AF 49(638)512) Unclassified

Also published in Nuclear Phys., v. 24: 494-499, May 1961.

Br^{78} sources have been produced by proton bombardment of isotopically enriched (97%) thin targets of Se^{78}, in order to investigate the decay scheme of Br^{78}. The $Se^{78}(p,n)Br^{78}$ threshold was measured at 4.40 ± 0.01 mev, using a slow-fast neutron counter arrangement. Annihilation radiation with a half-life of 6.5 ± 0.1 min was observed for bombardments with $E_p \geq 4.40$ mev. Using an anthracene crystal, the end-point of the β^+ spectrum of Br^{78} was measured and was found to be consistent with the value of 2.54 ± 0.01 mev calculated from the $Se^{78}(p,n)$ threshold determination. Measurements of the γ-ray spectrum of Br^{78} indicate a γ-ray of 0.612 ± 0.003 mev, of intensity 0.14 ± 0.015 that of all positons, which is assigned to the known first 2 + state of Se^{78}. Excitation of the known second 2 + state at 1.31 mev is not observed, occurring with $\leq 0.4\%$ of the decays, with log ft ≥ 5.9. The results indicated that the ground state of Br^{78} has spin parity of 1 + . (Contractor's abstract)

NEW LEVELS IN Ge^{70} (Abstract), by P. N. Trehan, R. Rikmenspoel, and D. M. Van Patter. [1961] [1]p. [AF 49(638)512] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 48, Feb. 1, 1961.

Proton bombardment of thin Ge^{70} targets at $E_p < 5.2$ mev showed 0.175-, 0.67-, 1.04-, 1.71-, and 2.15-mev (± 1%) γ rays in singles spectra and 0.18-, 0.50-, 0.67-, and 1.11-mev γ rays in coincidence with 1.04 mev. The 1.04- and 0.175-mev γ rays arise from known levels at 1.04 (2+) and 1.21 (0+) mev. The prominent γ rays of 0.67 and 1.71 mev are assigned to a new level at 1.71 mev, which is considered as the second 2+ level, both on the basis of systematics and prominence of these γ rays, with a branching ratio (crossover/cascade) = 1.7 ± 0.1. The branching of this level to the 1.21-mev

was found to be < 3%. The 1.11-mev γ ray seen in the coincidence spectra indicates a new level at 2.15 mev with a branching of 0.8 ± 0.3. Excitation curves and angular distributions for some of the prominent γ rays have been measured.

755

[Franklin Inst.] Bartol Research Foundation [Swarthmore, Pa.]

(p,p'γ) SPECTRA FOR Ni^{58}, Ni^{60}, AND Ni^{62} (Abstract), by P. N. Trehan and D. M. Van Patter. [1961] [1]p. [AF 49(638)512] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 272, Apr. 24, 1961.

Isotopically enriched targets of Ni^{58} (99.9%), Ni^{60} (99.8%), and Ni^{62} (98.0%) on 8-mil Au backings were bombarded by protons with E_p = 3.4-5.2 mev, and γ-ray spectra with E_γ > 0.6 mev were investigated. In the case of Ni^{58}, only γ rays of 1.01 and 1.45 mev (±1%) were seen. Gamma-rays of 0.83, 0.95, 1.33, 1.79, 2.16, and 2.28 (weak) mev (±1%) were observed from Ni^{60}. The branching ratio of the second 2+ level of Ni^{60} at 2.16 mev has been measured as 0.14 ± 0.02, which differs from earlier radio activity measurements. In the case of Ni^{62}, γ rays of 0.88, 1.17, 1.73, 2.05 (weak) and 2.30 mev (± 1%) were observed. The branching ratio for the 2.05-mev level is estimated as 0.06 ± 0.015. The observation of a prominent 2.30-mev γ ray appears to eliminate the possibility of 0+ for the 2.30-mev level of Ni^{62}. Knowledge of the level schemes of these nickel isotopes indicates that all the γ rays listed should be assigned to the (p, p'γ) reaction. The excitation curves for some prominent γ rays of Ni^{60} and Ni^{62} have been measured.

THE (p,p'γ) REACTION IN EVEN ISOTOPES OF Zn, Ge AND Se, by D. M. Van Patter, R. Rikmenspoel, and P. N. Trehan. [1961] [23]p. incl. diagrs. tables, refs. (AF 49(638)512) Unclassified

Published in Nuclear Phys., v. 27: 467-480, Oct. 1961.

It has been found possible to study the systematic properties of the second 2+ level in medium-weight even nuclei by investigation of γ-radiation from the (p,p'γ) reaction. For the mass region A = 60-80, the present method of observing (p,p'γ) spectra has been successful for nuclei whose (p,n) threshold exceeds about 4 mev. Measurements of the branching ratio of the second 2+ level have been made for Zn^{64}, Zn^{66}, Zn^{68}, Ge^{72}, Se^{76}, and Se^{78}, which are in reasonable agreement with available results from radioactivity. New levels have been found in Ge^{70} at 1.71 ± 0.01 and 2.16 ± 0.01 mev. The 1.71 mev level is considered to be the second 2+ level with a branching (crossover/cascade) of 0.9 ± 0.1. Information concerning the excitation curves for various (p,p'γ) radiation of Zn^{66} and Ge^{70} has been obtained for proton energies in the range of 3.0 to 5.2 mev. (Contractor's abstract)

757

[Franklin Inst.] Bartol Research Foundation [Swarthmore, Pa.]

DECAY OF 18-MIN Br^{80} (Abstract), by P. N. Trehan and D. M. Van Patter. [1961] [1]p. [AF 49(638)512] Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 428, Nov. 24, 1961.

The decay of Br^{80} was investigated by means of scintillation spectrometry. The 18-min Br^{80} was produced by proton bombardment of 99.4% enriched Se^{80} targets with E_p = 4.0 mev. Gamma rays of energy 0.62, 0.67, 1.26, and 1.33 mev (±1%) were observed in singles spectra, and γ rays of energy 0.64 and 0.71 mev appeared in coincidence with the 0.62-mev γ rays. The 0.62-mev γ ray arises from the known level at 0.62 (2+) mev in Kr^{80}. The 0.64- and 1.26-mev γ rays are assigned to a new level at 1.26 mev in Kr^{80}, and 0.71- and 1.33-mev γ rays are assigned to a second new level at 1.33 mev in Kr^{80}. The level at 1.26 mev is considered to be the second 2+ level, both on the basis of systematics and the log ft value of the beta transition to this level. The 0.67-mev γ ray is assigned to the first 2+ level in Se^{80}. The ratio of 0.62 γ/β+ has been measured as 2.6 ± 0.1, which is used for the evaluation of the log ft values for the transitions to various levels in Se^{80} and Kr^{80}

758

Franklin Inst. Bartol Research Foundation, Swarthmore, Pa.

DECAY OF 18-MIN Br^{80}, by P. N. Trehan and D. M. Van Patter. [1961] [6]p. incl. diagrs. table, refs. [AF 49(638)512] Unclassified

Published in Phys. Rev., v. 126: 266-271, Apr. 1, 1962.

Gamma rays with energies of 0. 18 ±0.003, 0.640 ±0.009, 0.67 ± 0.02, 0.710 ± 0.010, 1.258 ± 0.007, and 1.333 ± 0.010 mev have been observed in the decay of 18-min Br^{80}, and their intensities determined. Of these, only the 0.618-mev γ ray has been previously reported. Two new levels are proposed at 1.26 and 1.33 mev in Kr^{80}, and the branching (crossover/cascade) determined for these levels as 0.46 ± 0.08 and 0.14 ± 0.06, respectively. The 0.67-mev γ ray is assigned to the first 2+ state of Se^{80}, whose energy has been determined as 0.667 ± 0.004 mev from (p,p'γ) reaction. Excitation of the second level of Se^{80} at 1.44 mev was not observed. The measured value of 0.62 mev $\gamma/\beta+$ of 2.6 ± 0.1 has been used to evaluate log ft values for the transitions to various levels in Se^{80} and Kr^{80}. The allowed transitions from the 1+ ground state of Br^{80} to the ground state and first 2 levels of both Se^{80} and Kr^{80} are found to be successively hindered, in accord with the empirical rule of Sakai. A NOTE ON THE EFFECTIVE CONSTANTS OF COMPOSITE MATERIALS, by Z. Hashin and S. Shtrikman. [1961] [6]p. incl. refs. (AFOSR-947) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)159 and Office of Naval Research) Unclassified

Also published in Jour. Franklin Inst., v. 271: 423-426, May 1961.

It is the purpose of this work to find the most restrictive upper and lower bounds on the effective constants that can be obtained in terms of phase constants and fractional volumes, assuming isotropy of the composite material. For reasons of mathematical analogy the results obtained also apply to dielectric, electric conduction, heat conduction and diffusion properties of such materials.

MAGNETIC METHOD FOR THE DETERMINATION OF THE ANISOTROPY DISTRIBUTION IN FERROMAGNETIC POWDERS, by P. J. Flanders and S. Shtrikman. Aug. 1961 [16]p. incl. diagrs. refs. (Interim rept. no. 1-A2026-3) (AFOSR-984) (AF 49(638)159) AD 262027 Unclassified

Presented at Internat'l. Conf. on Magnetism and Crystallography, Kyoto (Japan), Sept. 25-30, 1961.

Also published in Jour. Phys. Soc. Japan, v. 17, Suppl. B-I: 673-675, Mar. 1962.

A technique to determine the anisotropy distribution in a ferromagnetic powder consisting of uniaxial particles has been developed which can be used for samples with randomly oriented particles as well as with oriented samples. In principle it eliminates incoherent magnetization reversals. It involves saturating the material in a magnetic field and then making torque measurements at an angle several degrees away from the saturation direction. In these measurements the torque on the specimen as a function of magnetic field is recorded as the field is cycled from zero to a specified field and then reduced to zero. This cycling procedure is continued, gradually increasing the maximum applied field upon subsequent cycles until the magnetic field exceeds the highest anisotropy field of the particles in the distribution. For elongated γ-Fe_2O_3 particles this technique gives length to width distributions which approach those observed by the electron microscope technique. (Contractor's abstract)

MAGNETIC AND STRUCTURAL PROPERTIES OF PRECIPITATING FERROMAGNETIC SYSTEMS, by P. J. Flanders. Final rept. Jan. 1, 1957-Dec. 31, 1961 [8]p. (Rept. no. F-A2026) (AF 49(638)159) Unclassified

Magnetic investigation of the precipitating systems proved to be a sensitive means by which the structural properties of the alloys could be determined. These structural properties could be examined during the earliest stages of anneal with a degree of precision not possible when standard techniques are employed. The experimental torque magnetometer method for the examination of anisotropy and orientation has proved to be a potentially powerful tool and it would be of continued interest and value if applied to other precipitating alloy systems. This technique has applications which extend beyond the study of precipitating alloys into the field of powder ferromagnetism.

EXPERIMENTAL DETERMINATION OF THE ANISOTROPY DISTRIBUTION IN FERROMAGNETIC POWDERS, by P. J. Flanders and S. Shtrikman. [1961] [4]p. incl. diagrs. refs. (AFOSR-4431) (AF 49(638)159) AD 295957 Unclassified

Also published in Jour. Appl. Phys., v. 33: 216-219, Jan. 1962.

A technique to determine the anisotropy distribution in a ferromagnetic powder consisting of uniaxial particles has been developed. This technique can be used for samples with randomly oriented particles as well as with oriented samples. In principle it eliminates incoherent magnetization reversals which led to errors in previous methods. It involves saturating the material in a magnetic field and then making torque measurements at an angle several degrees away from the saturating direction. In these measurements the torque on the specimen as a function of magnetic field is recorded as the field is cycled from zero to a specified field and then reduced to zero. This cycling procedure is continued, gradually increasing the max applied field upon subsequent cycles until the magnetic field exceeds the highest anisotropy field of the particles in the distribution. For elongated γ-Fe_2O_3 particles this technique gives length-to-width distributions which approach those observed by the electron microscope technique. These results are compared to those obtained by remanence measurements which give smaller values of anisotropy constants, indicating the importance of incoherent magnetization reversals, when the remanence is acquired. REMANENT TORQUE STUDIES IN POLYCRYSTALLINE $BaFe_{12}O_{19}$, by P. J. Flanders and S. Shtrikman. [1961] [2]p. incl. diagrs. table, refs. (AFOSR-4434) (AF 49(638)159) AD 295959 Unclassified

Presented at Seventh Conf. on Magnetism and Magnetic Materials, Phoenix, Ariz., Nov. 13-16, 1961.

Also published in Jour. Appl. Phys., Suppl., v. 33: 1318-1319, Mar. 1962.

Measurements of the anisotropy distribution in $BaFe_{12}O_{19}$ were carried out using the remanent torque technique. Two randomly oriented powder samples with coercive forces of 1500 and 4000 oe were tested. The remanent torque curves for both samples were essentially identical indicating an anisotropy distribution with an average of $2.1 \pm 0.2 \times 10^6$ ergs/cm^3 compared with a value of 3.3×10^6 ergs/cm^3 for single crystal $BaFe_{12}O_{19}$. The origin of this disagreement is unclear but it seems to be associated with splitting into domains. (Contractor's abstract)

COMPARISON OF DISLOCATION PATTERNS IN DEFORMED PURE fcc METALS AND α BRASS (Abstract), by J. T. Fourie, P. R. Strutt, and H. G. F. Wilsdorf. [1961] [1]p. (AF 49(638)162) Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Also published in Bull. Amer. Phys. Soc., Series II, v. 6: 163, Mar. 20, 1961.

Specimens suitable for diffraction electron microscopy have been prepared from deformed single crystals of aluminum and α-brass, the smallest dimension being not less than 10^{-1} cm. In pure fcc metals the majority of dislocations appear as tangles, and many prismatic dislocation loops are found in their vicinity. In contrast, the dislocations in α-brass are straight, and large numbers of them are arranged on single slip planes. The difference in the observed patterns can be construed as evidence that the multiplication mechanism is entirely different for these classes of metals. While the operation of single Frank-Read sources could be invoked for α-brass, the same mechanism could not account for the majority of dislocations produced in pure fcc metals. The underlying cause for the different behavior of dislocations in pure fcc metals and alloys of α-brass type are discussed for the early stages of deformation and specific mechanisms are proposed.

SUPPRESSION OF ACOUSTIC INPUT BY THALAMIC STIMULATION, by J. E. Desmedt and K. Mechelse. [1958] [4]p. incl. illus. (AFOSR-4892) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(514)1112, Lekime Foundation and Rockefeller Foundation) AD 415107 Unclassified

Also published in Proc. Soc. Exper. Biol. and Med., v. 99: 772-775, 1958.

Electrical responses to clicks were recorded from the ventral cochlear nucleus in curarized cats and the effect thereon of brain stem repetitive stimulation was investigated (stereotaxic method). Clearcut inhibition of the cochlear nucleus response to the click was recorded when a critically-localized region of the posterior diencephalon was stimulated. These and previous results provide the first physiological evidence for a specific extra-reticular descending pathway, presumably enabling higher levels of the nervous system to control acoustic input. CORTICOFUGAL PROJECTIONS FROM TEMPORAL LOBE IN CAT AND THEIR POSSIBLE ROLE IN ACOUSTIC DISCRIMINATION, by J. E. Desmedt and K. Mechelse. [1959] [2]p. (AFOSR-J428) (AF 61(514)1112) Unclassified

Presented at meeting of the Physiological Soc., University Coll., London (Gt. Brit.), Mar. 20-21, 1959.

Also published in Jour. Physiol. (London), v. 147: 17P-18P, 1959.

The organization of corticofugal projections from auditory areas and surrounding cortex has been investigated with the Nauta-Gygax method. Special emphasis is placed on the pattern of corticofugal projections terminating in the caudal diencephalon. In view of the evidence that ventral temporal cortex in the cat is at least partially involved in the operation of a specific descending inhibitory pathway controlling cochlear nucleus response to sound, it seems reasonable to suggest that discrimination of acoustic patterns depends on centrifugal modulation of coding processes in auditory afferent relays.

[EVIDENCE SHOWING A FOURTH ACOUSTIC PROJECTION AREA IN THE CEREBRAL CORTEX OF THE CAT] Mise en évidence d'une quatrième aire de projection acoustique dans l'écorce cérébrale du Chat, by J. E. Desmedt and K. Mechelse. [1959] [2]p. (AFOSR-J616) [AF 61(514)1112] AD 416720 Unclassified

Presented at the Twenty-seventh meeting of the Association des Physiologistes de Langue Française, Marseille, June 1-4, 1959.

Also published in Jour. Physiol. (Paris), v. 51: 448-449, 1959.

Evidence is presented for the existence of a fourth projection area in the cerebral cortex of the cat. This area is located between the anterior rhinal fissure and the anterior ectosilvian fissure, in front of the pseudosilvian fissure. It is definitely found outside of the generally accepted boundaries of the first, second and third auditory areas and of the somesthetic areas. The latency of the evoked potential of the fourth acoustic projection area to clicks is from 7 to 12 msec.

EFFERENT OLIVO-COCHLEAR GATING OF ACOUSTIC INPUT AND THE RESULTANT CHANGES IN AUDITORY CORTEX POTENTIALS, by J. E. Desmedt. 1961, 2p. incl. illus. diagr. (AFOSR-J170) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)120 and National Institutes of Health) AD 400432 Unclassified

Presented at meeting of the Physiological Soc., Sept. 28-29, 1962.

Also published in Jour. Physiol. (London), v. 165: 33P-24P, Jan. 1963.

A cat anesthetized with chloralose, immobilized with Flaxedil and with the middle ear muscles cuaterized is studied. Cathode-ray oscillograms of responses to clicks recorded simultaneously at the round window, in the principal division of the superior olive, in the inferior colliculus and in the auditory I area of the cerebral cortex are presented. Forty-two shocks at 400/sec were delivered to the olivo-cochlear bundle through stereotaxic bipolar needles, 20 msec before the testing click. Although OCB activation potentiates the cochlear microphonic potential it effectively suppresses evoked potentials all along the auditory pathway. Pooled data from several cats anesthetized either by pentobarbitone or chloralose are represented graphically. Each point on the graph corresponds to a given parametric set of OCB stimulation and relates equivalent db changes observed in simultaneously recorded auditory nerve and primary cerebral cortex surface-positive potential.

THE PHARMACOLOGY OF A CENTRIFUGAL INHIBITORY PATHWAY IN THE CAT'S ACOUSTIC SYSTEM, by J. E. Desmedt and P. Monaco. [1961] [6]p. incl. illus. diagrs. refs. (AFOSR-J171) (AF 61(052)120) AD 400433 Unclassified

Also published in Proc. of the First Internat'l. Pharmacological meeting, Stockholm (Sweden) (Aug. 22-25, 1961), New York, Pergamon Press, v. 8: 183-188, 1962.

Strychnine and brucine can reduce or suppress the 2 centrifugal effects of stimulation of the Rasmussen bundle on the inner ear, i.e., the inhibition of responses evoked by sound in auditory nerve and cochlear nucleus, and the potentiation of the cochlear microphonic potential. Experiments involving topical application of drugs to the fenestrum rotunda establish this as a genuine effect of the alkaloids. Picrotoxine and metrazol, as well as compound 1757 I.S., do not affect these phenomena. The olivo-cochlear axons presumably liberate the same inhibitory transmitter as the 1 postulated for post-synaptic inhibition in spinal cord. The mechanisms involved are discussed and it is suggested that the preparation used may be useful in further screening and assay of convulsant drugs. (Contractor's abstract)

NEUROPHYSIOLOGICAL MECHANISMS IN CEREBRAL AROUSAL, by F. Bremer. [1960] [27]p. incl. illus. refs. (AFOSR-J402) (AF 61(052)120) Unclassified

Also published in Ciba Foundation Symposium on the Nature of Sleep, London (Gt. Brit.) (June 27-29, 1960), Boston, Little, Brown and Co. [1961] p. 30-56.

Convergence and interaction of sensory and reticular impulses on neurones of the cat's visual area characterized the microphysiological observations of Jung. Potential waves recorded from the brain surface have revealed similar interactions. In the evoked potentials of the brain cortex, the interaction of specific and reticular impulses has been shown to result in conflicting processes, a suppressive one and a facilitatory one. Both have their main seat at the cortical level, in a proportion depending on the experimental conditions. The psychophysiological implications of the experimental data are discussed. It is hypothesized that the reticulo-cortical discharges which arouse the brain exert both an intensifying and a differentiating effect on the thalamocortical processes which result in perceptual integration.

NEUROGENIC FACTORS INFLUENCING THE EVOKED POTENTIALS OF THE CEREBRAL CORTEX, by F. Bremer. [1959] [24]p. incl. illus. diagrs. refs. (AFOSR-J403) (AF 61(052)120) Unclassified

Also published in Sensory Communication: Contributions to the Symposium on Principles of Sensory Communication, Endicott House, Massachusetts Inst. of Tech. (July 19-Aug. 1, 1959) [Cambridge] M.I.T. Press, 1961, p. 675-698 (AFOSR-796).

The aim of this report is to survey some of the neurogenic factors that influence the electrical responses evoked in the neocortical gray matter by a brief volley of afferent impulses. Special emphasis has been given to heterosynaptic convergences of specific sensory and unspecific reticular impulses at the thalamic and cortical levels. Like the mono- and polysynaptic reflex responses of spinal motoneurons to single electrical stimuli, the evoked potentials of the cerebral cortex are obviously the artificial product of experiments devised for analytical purposes. Yet the study of the factors of variation of these integrated cortical responses throws light on the physiological properties of the neuronal networks of the brain. By doing so, it represents an approach to the knowledge of the primary neural events, which, initiating an immensely complicated chain of neurophysiological processes, underlie perceptual integration.

[WEDENSKI INHIBITION IN THE CEREBRAL CORTEX] Inhibition de Wedenski dans l'encore cérébrale, by F. Bremer and N. Stoupel. 1960, 2p. (AFOSR-J404) (AF 61(052)120) AD 416715 Unclassified

Also published in Jour. Physiol. (Paris), v. 52: 34-35, 1960.

Electrical responses of the strychninized primary auditory cortex of cat are studied. Clicks presented at 20-50/sec show a falloff of amplitude after the first responses; when a click of different timbre is interpolated, a high-amplitude response occurs. Similarly a transcallosal volley yields an uninhibited response, indicating that when different synapses are employed the same neuron can be activated unless the heterosynaptic volley arrives within the 200-msec refractory period. This may be interpreted as a cortical analog of Wedenski inhibition.

STEREOTAXIC STIMULATION OF EFFERENT PATHWAYS IN THE AUDITORY NERVOUS SYSTEM OF THE CAT] Stimulation stéréotaxique de voies efférentes dans le systeme nerveux auditif du Chat (Démonstration), by J. E. Desmedt and P. Monaco. [1961] [3]p. (AFOSR-J405) (AF 61(052)120) AD 414149 Unclassified

Presented at meeting of the Soc. Belge de Physiologie et Pharmacodynamie, Brussels (Belgium), Apr. 15, 1961.

Also published in Arch. Internat'l. Pharmacodyn. et Ther., v. 132: 492-494, 1961.

Various parametric properties of the auditive nerve system are demonstrated. One notices, therefore, some quantitative changes in the inhibition of auditative responses to the cortex by the systematic change (1) of the frequency of electric shocks in the series preceding the click, (2) of the number of shocks at a chosen frequency and (3) of the interval between the last shock of a series and the click. Several shocks were applied at frequencies up to 50/sec in order to produce the impressions which are dissipated rather slowly in 0.2 to 3 sec according to a regular curve.

MODE OF ACTION OF THE EFFERENT OLIVO-COCHLEAR BUNDLE ON THE INNER EAR, by J. E. Desmedt and P. Monaco. [1961] [3]p. incl. diagrs. (AFOSR-J406) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)120 and National Institutes of Neurological Disease and Blindness) Unclassified

Also published in Nature, v. 192: 1263-1265, Dec. 1961.

In experiments on cats (pentobarbitone, chloralose or high spinal section; middle ear muscles stapedius and tensor tympani cauterized; "Flaxedil" infusion) the auditory nerve compound action potential (N_1) evoked by clicks and the cochlear microphonic potential (CM) evoked by tone pips have been recorded through an electrode placed on the round window. Trains of electrical pulses were applied to the crossed olive-cochlear bundle through bipolar stereotaxic electrodes at known intervals before delivery of the testing sound (click or tone pip) to the ear. Effective stimulation of the efferent bundle produces two effects, namely inhibition of the N_1 spike and potentiation of CM. The observations herein suggest that both effects are genuine and that they are simultaneously produced by a chemical transmitter released from the olivo-cochlear axon terminals.

[ANALYSIS OF THE CORTICAL PROCESSES IN AROUSAL] Analyse des Processus corticaux de l'éveil, by F. Bremer. [1960] [10]p. incl. illus. (AFOSR-J410) (AF 61(052)120) Unclassified

Presented at the Moscow Colloquium on Electroencephalography of Higher Nervous Activity, Moscow (USSR), 1960.

Also published in Electroencephalog. and Clin. Neurophysiol., Suppl. 13: 125-136, 1960.

Results indicate that the reduction, in arousal, of the cortical evoked potentials, which is a regular feature of the response provoked by stimuli applied on peripheral receptors is replaced by an increase of the evoked potentials of the same receiving and associative areas when the testing stimulus is applied on the adequate thalamic relay nucleus or on the optic nerve. The same diffuse cortical facilitation follows stimulation of the mesencephalic and the thalamic reticular system. A single reticular shock applied as a conditioning stimulus may exert a powerful facilitation of the response to a subsequent testing stimulus. The oscillographic and some pharmacological characteristics of the phenomenon are described. An explanation is proposed for the 2 contrasting effects of reticular arousal on evoked cortical potentials, and their physiological significance is discussed. The general conclusion of this study is that ascending reticular impulses exert on the cortical neurone population both a sensitizing and an activating effect. (Contractor's abstract, modified)

[OSCILLOGRAPHIC ANALYSIS OF EVOKED POTENTIALS OF CORTICAL RECEPTOR AREAS] Analyse oscillographique des potentiels évoqués de réception corticales, by V. Bonnet. [1961] [8]p. incl. illus. (AFOSR-J411) (AF 61(052)120) Unclassified

Also published in Arch. Internat'l. Physiol. Biochim., v. 69: 609-616, Dec. 1961.

In the cat the recording within the sensory areas of the cortex of responses to sensory stimuli or to electrical excitation of the nerve of corresponding thalamic relay indicated the complex nature of reactionary potential thus observed. Starting with a certain stimulation intensity a negative slow wave of long duration is grafted, in effect, on the descending phase of negative potential. The origins of two waves at the level of the same cortical neurons have been determined from the observed modifications during repeated stimulation and under the influence of Nembutal. Results indicate the slow wave may be attributed to the putting into play of the non-specific transmission nerve system by peripheral or thalamic stimulus.

[THE EVOKED POTENTIAL OF THE VISUAL CORTICAL AREA] Le potentiel évoqué de l'aire visuelle corticale, by F. Bremer. [1960] [16]p. incl. illus. refs. (AFOSR-J412) (AF 61(052)120) Unclassified

Also published in Neurophysiologie und Psychophysik des Visuellen Systems, Freiburg (Germany) (Sept. 1960), Berlin (Germany), Springer-Verlag, 1961, p. 335-350.

The response evoked by an electrical stimulus applied on the optic pathway is characterized by a sequence of brief initial transients, preceding the positive negative slow phases, obviously of postsynaptic origin. Spike 1 is the record of the radiation potential. But the nature of spikes 2 and 3 is still a matter of controversy. A significative feature of the spike sequence is the striking dependence of the spacing of its constituting potentials on the temperature of the cortex, a fact which, together with other data, suggests that spikes 2 and 3 contain important intracortical presynaptic components. The complex configuration of the cortical response to a flash of light reflects essentially retinal organization. The various factors that have proved responsible for

correlated changes of retinal, geniculate and cortical reactivity are discussed. Special emphasis is placed on the facilitatory and suppressive processes which are operative during reticular arousal of the brain. (Contractor's abstract)

EFFECTS OF ILLUMINATION OF THE EYE ON THE VESTIBULAR RESPONSES IN THE PIGEON, by M. Van Eyck. [1960] [3]p. incl. illus. (AFOSR-J415) (AF 61(052)120) Unclassified

Also published in Acta Oto-laryngol., v. 51: 420-422, Mar. 1960.

Experiments were made on pigeons completely awake after dissipation of light ether anesthesia employed for the neck-muscle dissections or to prepare the labyrinth. A well-fixed head, a mechanical coupling of the light source with the eye during the rotations and also complete darkness avoid the superimposition of optokinetic nystagmus. First it was checked that sudden illumination had no effect on the neck-muscle electromyograms before any stimulation of the canals by rotation. After this check, the combination of rotatory stimulus and light stimulus show the following: (1) Eye illumination of a normal pigeon during a labyrinth stimulation by rotation provokes an amplification of the initial volleys of both the pre- and post-rotatory head nystagmus, if compared with the responses of the same animal without light stimulus; (2) If the light stimulus is only given during the rotation, the post-rotatory nystagmus is unaffected; (3) If a similar experiment is performed on a pigeon with a chronic unilateral labyrinthectomy and showing clearly the phenomenon of compensatory vestibular nystagmus, the light stimulus has just the same effects on this compensatory nystagmus as on a normal nystagmus; and (4) If a light stimulus is given without rotation to a pigeon with an acute unilateral labyrinthectomy in which a small spontaneous nystagmus is green, it is found to amplify and also to accelerate the nystagmic volleys of muscular potentials, the head being immobile.

NEUROPHYSIOLOGICAL MECHANISMS CONTROLLING ACOUSTIC INPUT, by J. E. Desmedt. [1960] [16]p. incl. illus. diagrs. refs. (AFOSR-J422) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)120, Lekime Foundation, and Rockefeller Foundation) Unclassified

Also published in Neural Mechanisms of the Auditory and Vestibular Systems, ed. by G. L. Rasmussen and W. Windle, Springfield, Charles C. Thomas, 1960, p. 152-164.

Neurophysiological mechanisms controlling acoustic input have been studied. Various aspects of the problem are considered including: (1) control of acoustic input in behaving animals, (2) acoustic centrifugal mechanism, and (3) acoustic evoked potentials in thalamus and cortex. The observations summarized in the present paper, though still far from comprehensive, are in good agreement with the evidence presented by Rasmussen, and they suggest that the central mechanisms responsible for the control of acoustic input have a more elaborate organization than hitherto supposed.

LEADING EDGE EFFECT ON SEPARATED SUPERSONIC FLOWS, by J. J. Ginoux. May 1961 [33]p. incl. illus. diagrs. table. (Technical note no. 1) (AFOSR-1197) (AF 61(052)350) AD 262031 Unclassified

In supersonic tunnel tests with a 2-dimensional backward-facing step model, span-wise perturbations were found in the reattachment region. Studies were made using the same and other similar models. In these later studies, the same 3-dimensional perturbations were detected, into the full thickness of the boundary-layer, after reattachment, both in turbulent and laminar regions of the flow. Their amplitude was a maximum in the transition region. Using a model with a much improved accuracy of manufacture, notably at the leading-edge, it was found that the amplitude of the perturbations was greatly reduced, roughly in proportion to the size of the irregularities of manufacture of the leading-edge itself. It is concluded that the phenomenon is essentially 1 of instability in the 2-dimensional flow, the main triggering action arising from small irregularities in the leading-edge. THEORETICAL INVESTIGATION OF EROSIVE BURNING OF SOLID PROPELLANTS, by J. A. Vandenkerckhove. July 1961, 67p. incl. diagrs. table, refs. (Technical rept. no. 2) (AFOSR-1889) (AF 61(052)354) AD 272008 Unclassified

Presented at Third AFOSR Contractors' meeting on Combustion of Solid Propellants, Utah U., Salt Lake City, Jan. 30-31, 1961. (AFOSR-986)

After a critical survey of existing theories of erosive burning and of published experimental data, the combustion mechanism of NH_4ClO_4 propellants is discussed and a model of erosive burning of these formulations is proposed. Erosion is assumed to smooth the surface whose burning rate is then controlled by oxidizer regression, no energy being supplied by the main diffusion flame. Furthermore the adiabatic decomposition temperature of the perchlorate is assumed to be obtained at the end of the laminar sublayer whose thickness can be related to mean flow velocity through fluid dynamics. Correlation of test data permits the determination of the transition point. Grain design and motor scale are taken into account through local hydraulics radius. Low pressures, large radii and high burning rates are shown to reduce erosive burning. An attempt is made to explain irregular burning by surface nature and roughness through erosivity. STATISTICAL AND THERMODYNAMICAL PLASMA PHYSICS. THE APPROACH TO EQUILIBRIUM OF A PLASMA, by R. Balescu. [1961] [4]p. [AF 61(052)-179] Unclassified

Published in Plasma Physics, Accelerators, Thermonuclear Research, v. 2: 169-172, Jan. 1961.

After a short presentation of the general theory of irreversible processes established by Prigogine and Balescu, its application to the problem of long range forces in a plasma is discussed. The diagram technique permits an unambiguous choice of the main contributions to the distribution function. The result is an equation describing the evolution of the distribution function of momenta, which takes rigorously into account the many-body collisions. The latter results from a summation of an infinite number of diagrams, the structure of which is very simple. The successive diagrams involve more and more particles interacting simultaneously. The equation has a formal similarity with the usual Fokker-Planck equation, but the Coulomb interaction between 2 particles is replaced by an effective interaction, which depends on the distribution of all the other particles of the medium. At very low temperatures this effective interaction reduces to a screened Coulomb-Debye potential. The relation of this approach to the previous theories of plasmas (Fokker-Planck equation, Vlasov equation, random phase approximation) can be discussed very clearly by means of the diagrams. MAGNETO-RESISTANCE IN SUPERFLUID LIQUID HELIUM, by G. Severne. [1961] [14]p. (AF 61(052)179) Unclassified

Published in Physica, v. 27: 465-478, May 1961.

In solids, the magneto-resistance effect appears as an additional effect, a modification of a pre-existent scattering mechanism. Partially ionized liquid helium II bears a strong formal analogy to a single band solid. However, if the superfluid medium is at zero temperature, and for low ion energies, the intrinsic resistance of the system is zero; the ions experience no friction. It is shown that in the presence of a magnetic field the system becomes dissipative. Thus, in contradistinction to the situation in solids, the magneto-resistance effect in helium II corresponds to the actual creation of a scattering mechanism, and appears as a fundamental phenomenon.

ON THE INITIAL CONDITIONS IN THE THEORY OF IRREVERSIBLE PROCESSES, by J. Philippot. [1961] [7]p. [AF 61(052)179] Unclassified

Published in Physica, v. 27: 490-496, May 1961.

It is the purpose of this note to clarify the physical meaning of the various classes of initial states for which irreversilbe equations have been derived. From the point of view of the ergodic theory it is also interesting to distinguish between a distribution representing a single system and a distribution representing an ensemble of systems. First the "random phase condition" and the diagonal singularity condition used by Van Hove is analyzed and then the properties of the initial distributions used by Prigogine.

ON THE APPROACH TO EQUILIBRIUM IN QUANTUM SYSTEMS, by P. Résibois. [1961] [30]p. incl. diagrs. refs. [AF 61(052)179] Unclassified

Published in Physica, v. 27: 541-570, June 1961.

The diagram technique used by Prigogine and others to study the approach to equilibrium of classical systems is extended to quantum systems. The similarity of the equation of Liouville and von Neumann suggest the study of spatial correlations and the use of the density matrix. It is claimed that the diagram technique can be generalized in ways that are intuitively almost obvious, and that the theory can be formally carried through in the usual limit of an assembly of large volume and number of particles. Almost the only initial assumptions required are that the "reduced variables" e.g., volume and energy/particle should all be finite, and that, initially, all corrections should be restricted to finite ranges.

ON THE KINETICS OF THE APPROACH TO EQUILIBRIUM, by I. Prigogine and P. Résibois. [1961] [16]p. incl. diagrs. refs. [AF 61(052)179] Unclassified

Published in Physica, v. 27: 629-646, July 1961.

The diagram technique developed by Prigogine and Balescu for a classical gas is applied to obtain the solution of the system of equations. The equations obtained are valid to all orders in the coupling constant and for all times. They are non-Markovian for short times, but in the limit of long times they approach the Markovian equations obtained earlier by Henin, Résibois and Andrews. It is shown that the non-Markovian character of the equations does not influence the calculation of the transport coefficients which are completely determined by the asymptotic values of the cross-sections.

ON THE APPROACH TO NON-EQUILIBRIUM STATIONARY STATES AND THE THEORY OF TRANSPORT COEFFICIENTS, by R. Balescu. [1961] [14]p. incl. diagr. refs. [AF 61(052)179] Unclassified

Published in Physica, v. 27: 693-706, July 1961.

A general formula for the time dependent electric current arising from a constant electric field is derived along the line of ideas of Kubo's theory. This formula connects the time dependence of the current to the singularities of the resolvent of Liouville's operator of a classical system. It permits a direct contact with the general theory of approach to equilibrium developed by Prigogine and his coworkers. It constitutes a framework for a diagram expansion of transport coefficients. A proof of the existence of a stationary state and of its stability (to first order in the field) are given. It is rigorously shown that, whereas the approach to the stationary state is in general governed by complicated non-Markoffian equations, the stationary state itself (and thus the calculation of transport coefficients) is always determined by an asymptotic cross section. This implies that transport coefficients can always be calculated from a Markoffian Boltzmann-like equation even in situations in which that equation does not describe properly the approach to the stationary state. BINARY COLLISION EXPANSION OF QUANTUM STATISTICAL PAIR PROPAGATOR, by S. Fujita. [1961] [10]p. incl. diagrs. refs. [AF 61(052)179] Unclassified

Published in Physica, v. 27: 930-939, Oct. 1961.

The binary collision expansion of the pair propagator, which is closely related to the grand canonical pair distribution function, is obtained in terms of quantum statistical Feynman-type diagrams. The result may be summarized by stating that the pair propagator can be expanded in a manner in which (1) all interaction lines, representing potentials v of the usual perturbation diagrams, are replaced by sets of ladder diagrams representing binary collision kernels B and (2) whenever a double ladder structure occurs in the diagrams, the statistical factor $(1 \pm f_1)(1 \pm f_2)$ (f being the Bose or the Fermi distribution function) associated with the intermediate lines with momenta P_1 and P_2 should be replaced by $(1 \pm f_1)(1 \pm f_2) - 1$. ON THE GENERALIZED BOLTZMANN EQUATION OF A QUANTUM GAS, by S. Fujita. [1961] [17]p. incl. diagrs. refs. [AF 61(052)179] Unclassified

Published in Physica, v. 27: 940-956, Oct. 1961.

The generalized master equation for a quantum gas due

to Résibois is analyzed with the aid of new diagrams, which are intimately related to operator diagrams invented by Prigogine and Résibois. It is shown that part of the equation, which is important for the derivation of generalized Boltzmann equation, has a form analogous to the Pauli equation with the probability of quantum statistical transition between many-body states, the probability being expressible in terms of a matrix A formally identical to the so-called scattering. By use of the technique devised by the author for developing the binary collision expansion of the quantum statistical pair propagator, many-body elements of A are expanded in terms of 2-body elements of A. The generalized Boltzmann equation or the reduced equation for the average occupation number of a single-particle momentum state is derived in the usual manner from the generalized master equation. It is pointed out that the Uehling-Uhlenbeck equation for a hard-sphere Fermi gas is valid only in the lowest order a^2, a being diameter of a hard sphere, at very low temperatures. The new equation valid up to the order $a^2 (a P_F^{h-1}) P_F$ being the Fermi momentum of an ideal Fermi gas and h Planck's constant, is explicitly given in the text. Any higher order corrections could easily be calculated in the framework of the theory. (Contractor's abstract)

RADIATION DAMPING AND EQUATION OF MOTION IN CLASSICAL ELECTRODYNAMICS, by I. Prigogine and F. Henin. [1961] [3]p. incl. diagrs. refs. [AF 61-(052)179] Unclassified

Published in Physica, v. 27: 982-984, Oct. 1961.

Using the Lorentz equation which corresponds to the change of energy through radiation an equation is developed which for slow processes reduces to the Lorentz equation while for rapid processes it avoids some of the usual difficulties. A Hamiltonian description of the system is given and to this Hamiltonian corresponds the Liouville equation

$$\frac{\partial \rho}{\partial t} + iL\rho = 0$$

After considerable manipulation the following equation is obtained in the form

$$ma(t) = eE + \frac{e}{c} v \times H + m\tau_0 \frac{2}{\pi} \int_0^t d\tau \frac{\sin \tau/\tau_0}{\tau/\tau_0} \dot{a}(t-\tau).$$

THEORY OF TRANSPORT COEFFICIENTS. I. GENERAL THEORY AND ELECTRICAL CONDUCTIVITY OF ELECTRON-PHONON SYSTEM, by S. Fujita and R. Abe. [1961] [9]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 61-(052)179] and Office of Naval Research) Unclassified

Published in Jour. Math. Phys., v. 3: 350-358, Mar.-Apr. 1962.

A general method is presented for the calculation of static transport coefficients based on Kubo's formulas. Techniques of perturbation expansion, diagram representation, and linked-cluster expansion are used. As an example, the electrical conductivity of an electron-phonon system is calculated with the natural introduction of irreversibility, following the ideas of Van Hove, and Prigogine and his collaborators. Under certain conditions the present method is shown to be equivalent to the conventional method by means of the Boltzmann equation. These conditions are examined and the improvement of the approximation is discussed. (Contractor's abstract)

THEORY OF TRANSPORT COEFFICIENTS. II. VISCOSITY COEFFICIENTS OF QUANTUM GASES OBEYING THE BOLTZMANN STATISTICS, by S. Fujita. [1961] [9]p. incl. diagrs. [AF 61(052)179] Unclassified

Published in Jour. Math. Phys., v. 3: 359-367, Mar.-Apr. 1962.

The viscosity coefficients of a weakly coupled and a dilute quantum gas, both obeying the classical statistics, are calculated using the method developed by Abe and the present author. In this method transport coefficients are calculated from exact formulas due to Kubo with the natural introduction of the irreversibility based on the ideas of Van Hove, Prigogine, and their collaborators. It is shown explicitly that the low-density limit as well as the weak-coupling limit of the viscosity are those which are expected from the conventional calculation via the Boltzmann equation. The nature of these limits is closely related to the 2 well separated time scales — average duration of collision and average time between successive collisions. (Contractor's abstract)

Free U. of Brussels. [Dept. of Chemical Physics] (Belgium).

THEORY OF TRANSPORT COEFFICIENTS. III. QUANTUM STATISTICAL SYSTEMS, by S. Fujita. [1961] [5]p. incl. diagrs. refs. [AF 61(052)179] Unclassified

Published in Jour. Math. Phys., v. 3: 1246-1250, Nov.-Dec. 1962.

The electrical conductivity of an electron-phonon system is calculated from Kubo's formula using a perturbation method on the assumptions that the coupling is weak, the system is infinitely large, and that the electrons do not interact between them and obey the Fermi-Dirac statistics and phonons are in thermodynamic equilibrium. The result is identical with that one would obtain from the usually assumed Boltzmann-Bloch equation. The calculation is a logical extension of the previous treatment (item no. 805, Vol. V), where the same problem is treated on the assumption that the electrons obey the Boltzmann statistics. The relation between the present calculation and the derivation of master equation is critically discussed. A brief sketch is given for the calculation of the viscosity coefficient of a dilate quantum statistical gas. (Contractor's abstract)

EQUIVALENCE BETWEEN THE TWO GENERALIZED MASTER EQUATIONS, by S. Fujita. [1961] [43]p. incl. diagrs. refs. (AFOSR-1909) [AF EOAR-62-16] AD 289191 Unclassified

Also published in Physica, v. 28: 281-297, Mar. 1962.

The 2 forms of generalized master equation derived by Van Hove and by Prigogine and Résibois are examined with the aid of diagrams. Given the random-phase initial condition they are shown to describe equivalently the exact asymptotic behavior of a diagonal element of the density matrix. Their interrelation is clarified. Both of the equations exhibit non-Markoffian evolution. The way in which they are derived gives valuable hints to the problem in what conditions and in what manner such non-Markoffian equations will be reduced to the usual Markoffian master equations. A few remarks are given on this point. (Contractor's abstract)

ROLE OF SULFHYDRYL AND DISULFIDE GROUPS, by J. Brachet. Summary rept. no. 1, Feb. 1, 1960-Jan. 31, 1961. Feb. 24, 1961 [1]p. (AFOSR-606) (AF 61(052)356) AD 457255 Unclassified

Experiments on the role of sulfhydryl and disulfide groups in morphogenesis have been performed at both the biological and biochemical levels. The main results obtained can be summarized as follows: β-mercaptoethanol inhibits morphogenesis in all the biological systems. Cysteine and glutathione are less inhibitory then β-mercaptoethanol. β-mercaptoethanol, if used at relatively low concentrations, inhibits pigment formation in amphibian embryos. Lipoic acid exerts the same inhibitory effects as β-mercaptoethanol on early embryonic development and on regeneration in Acetabularia. β-mercaptoethanol has little effect on the oxygen consumption, the ATP content and the catheptic activity of amphibian eggs. It does not modify the ATP, DNA and RNA content of the liver of intraperitoneally injected rats and mice.

[SOME EFFECTS OF BETA MERCAPTOETHANOL AND OF DITHIODIGLYCOL ON REGENERATION] Quelques effets du β-mercaptoéthanol et du dithiodiglycol sur la régénération, by F. Descotils-Heernu, J. Quertier, and J. Brachet. [1961] [20]p. incl. illus. refs. (AFOSR-2174) (AF 61(052)356) AD 611737
Unclassified

Also published in Develop. Biol., v. 3: 277-296, June 1961.

The effects of β-mercaptoethanol and dithiodiglycol (the former containing an -SH group and the latter an -SS- group) on regeneration have been studied in 5 animal species. Mercaptoethanol inhibits regeneration while dithiodiglycol (at those concentrations at which it can be employed) has almost no effect. Mercaptoethylgluconamide, a derivative of mercaptoethanol, cannot penetrate into the cells and it has no noticeable influence on regeneration, except at extremely high concentrations. Mercaptoethanol moderately reduces mitotic activity and basophilia in the blastema. However, it stimulates the synthesis of RNA without acting on DNA synthesis. Dithiodiglycol does not modify mitotic activity, but it increases slightly the basophilia of the regenerating tissue. It also stimulates RNA synthesis. (Contractor's abstract)

[STUDY OF THE BIOCHEMICAL EFFECTS OF BETA MERCAPTOETHANOL ON THE EGGS OF BATRACHIANS] Etude des effets biochimiques du β-mercaptoéthanol sur les oeufs de Batraciens, by J. Brachet, M. Cape and others. [1961] [20]p. incl. tables, refs. (AFOSR-2175) (AF 61(052)356) AD 611736
Unclassified

Also published in Develop. Biol., v. 3: 424-443, Aug. 1961.

The biochemistry of amphibian eggs treated with mercaptoethanol (M/100) under conditions which completely inhibit morphogenesis has been studied. It has been found that: (1) Mercaptoethanol undergoes a fairly rapid oxidation under the experimental conditions; (2) The acid-soluble -SH groups content increases in mercapto-ethanol-treated embryos; (3) Treatment with

mercaptoethanol leads to a moderate decrease in the oxygen consumption and has no marked effect on the ATP content; (4) The block in development induced by mercaptoethanol cannot be explained on the basis of a stimulation of the catheptic activity; (5) Mercaptoethanol does not immediately inhibit incorporation of thymidine into DNA, of uridine into nuclear nucleic acids, and of leucine into the proteins of the treated embryos. Inhibition of nucleic acid and protein synthesis can be observed when the effects of mercaptoethanol on morphogenesis become irreversible.

[STUDY OF THE ROLE OF SULFHYDRIL GROUPS IN THE MORPHOGENESIS OF THE CHICKEN EMBRYO] Etude du role des groupes sulfhydriles dans la morphogénèse de l'embryon de poulet, by V. Pohl and J. Brachet. [1961] [20]p. incl. illus. tables, refs. (AFOSR-4176) (AF 61(052)356) Unclassified

Also published in Develop. Biol., v. 4: 549-568, June 1962.

β-mercaptoethanol (M/100) and dithiodiglycol (M/1000) inhibit the closure of the neural tube in explanted chick embryos. The effect is at first reversible when the embryos are placed back in normal medium. Alternate treatments with mercaptoethanol and dithioglycol (or

vice versa) have only favorable consequences. Lipoic acid (20-30 μg/ml) also inhibits the closure of the neural tube. Oxaloacetate (1 mg/ml) and succinate (10^{-2} M) initially have a favorable effect, but oxaloacetate soon becomes toxic. ATP (0.1 mg/ml) accelerates the closure of the neural tube, where it increases the number of mitoses. Its addition reverses to a large extent the inhibitory effects of mercaptoethanol, dithiodiglycol and lipoic acid.

[AUTORADIOGRAPHICAL STUDY OF METABOLISM OF NUCLEIC ACIDS AND OF PROTEINS OF NEURULAS OF BATRACHIANS TREATED WITH β-MERCAPTOETHANOL] Etude autoradiographique du metabolisme des acides nucléiques et des protéines chez neurulas de batraciens traitées au β-mercaptoéthanol, by J. Quertier. [1961] [14]p. incl. illus. refs. (AFOSR-4177) [AF 61(052)356] Unclassified

Also published in Acta Embryol. Morphol. Exper., v. 5: 57-70, 1962.

The incorporation of precursors of nucleic acids and proteins in the study of isolated medullary plates has been subjected to treatment with β-mercaptoethanol, a substance which inhibits the closing of the neural plate. Different times of treatment with mercaptoethanol have been applied; the brief treatments permitting a reversibly complete or at least a partial restoration of the morphogenetic activity and the prolonged treatment has lead to irreversible morphogenetic blockage.

[THE EFFECTS OF β-MERCAPTOETHANOL ON THE INCORPORATION OF PRECURSORS OF PROTEINS AND OF OPTIMIZATION OF NUCLEIC ACIDS IN THE LIVER AND INTESTINE OF MICE] Les effets du β-mercaptoéthanol sur l'incorporation des précurseurs des protéines et des acides nucléiques dans le foie et l'intestin de souris, by J. Brachet and A. Miraux-Jonckheere. [1961] [9]p. incl. refs. (AFOSR-4240) (AF 61(052)356) Unclassified

Also published in Exper. Cell Research, v. 27: 539-547, Sept. 1962.

The effects are studied by means of an intraperitoneal injection of β-mercaptoethanol (2 mg/20 g body weight) on nucleic acid and protein synthesis in the liver and and intestine of mice. The incorporation of ^{3}H-thymidine, ^{3}H-cytidine and ^{3}H-leucine has been followed by autoradiography. The experiments have shown that β-mercaptoethanol inhibits mitotic activity and incorporation of thymidine into DNA in the intestine. The incorporation of cytidine and that of leucine are also strongly inhibited in the intestine as well as in the liver. The inhibition is of the same order of magnitude for the nucleus and the cytoplasm (except for cytidine, in the case of intestinal nuclei). In the liver, the incorporation of both precursors is higher in the nucleus than in the cytoplasm, while the opposite situation holds for the intestine. The significance of these results is briefly discussed. (Contractor's abstract)

[VOLUME CONDITIONED CHANGES IN THE SODIUM EXCRETION IN THE DOG] Volumenreflektorische Änderung der Natriumausscheidung bein Hund, by K. Pabst and O. H. Gauer. [1959] [3]p. incl. diagrs. (AFOSR-J453) [AF 61(052)31] Unclassified

Also published in Verhandl. Deut. Ges. Kreislaufforsch., v. 25: 263-265, 1959.

Since the magnitude of the blood volume and of the extracellular volume is closely connected with the intake and excretion of sodium chloride, it was postulated that, in addition to the intrathoracic circulatory system, a second system must exist which is responsible for the sodium excretion. To answer this question it is necessary to find a certain form of hydration which causes a tendency to increased sodium excretion. Dogs were first given 400-600 cc of a 0.9% NaCl solution, and then, after anesthetization, were hydrated with a continuous infusion with 3% glucose solution. After diuresis had reached constancy, the animals were forced to breathe thin air so as to reduce pressure in the chest cavity. Under these conditions both water and sodium excretion increased and the Na/K ratio also increased. Consequently the requirements to be satisfied by volume receptors are fulfilled and the assumption of special receptors for the regulation of sodium excretion becomes unnecessary.

[ANTI-DIURESIS AND DIURESIS IN THE RAT AFTER TONEPHIN INJECTION] Antidiurese und Diurese nach kleinen Tonephingaben bei der Ratte, abhängig vom oralen NaCl-Angebot, by E. Witte, H. Reineck, and O. H. Gauer. [1961] [10]p. incl. illus. diagrs. tables, refs. (AFOSR-J454) (AF 61(052)31) Unclassified

Also published in Pflügers Arch. ges. Physiol., v. 274: 262-271, Dec. 1961.

The modified (Vorherr and Friedberg) method of Jeffer's bioassay of ADH was used to measure the influence of 20, 40, and 100μ U highly purified Tonephin, injected intravenously, on the excretion of water, when the rats were hydrated orally with (a) 1% alcohol solution, (b) 0,9% saline and (c) 2,5% saline. Hydration with isotonic saline produced a reduction or even a reversal of the familiar antidiuretic effect of ADH during water hydration. When loading the animals with 2,5% saline a diuretic effect was seen only. These effects cannot be attributed to changes of blood pressure. It seems remarkable that such very minute dosages producing changes of ADH concentration in the blood which are near the normal estimated concentrations of endogenous ADH in human plasma may induce a moderate however regular increase in urine flow, when the animals are hydrated with hypertonic saline. (Contractor's abstract)

[KIDNEY HOMODYNAMICS AND EXCRETORY FUNCTION IN THE KIDNEY DURING DEFINITE CHANGES IN BLOOD VOLUME] Nierenhämodynamik und Ausscheidungsfunktion der Niere unter definierten Änderungen des Blutvolumens, by K. Pabst and O. H. Gauer. [1961] [14]p. incl. diagrs. tables, refs. (AFOSR-J455) (AF 61(052)31) Unclassified

Also published in Pflügers Arch. ges. Physiol., v. 274: 213-226, Dec. 1961.

As a rule oliguria after severe hemorrhage has been attributed to a low filtration rate, due either to a low blood pressure or to a vasoconstriction of the renal vascular flow. However to our knowledge data on the effect of relatively small hemorrhages in unanesthetized animals which are not under stress are not available. Such data alone seem pertinent to the question of normal volume control. Five healthy trained dogs with carotid loops were used in 16 experiments. After due controls approximately 15% of the measured blood volume (Evans Blue) was taken and retransfused 1½ hr later. Urine volume, osmolar concentration, PAH and Inulin clearances, arterial and central venous pressures were recorded. In half the experiments the animals were hydrated with water, in the other half with isotonic saline (20 cc/kg orally followed by continuous infusion). In part of the experiments a correlation of the hemodynamics of the kidney with urine flow could not be excluded. However under saline hydration the oliguria during hemorrhage cannot be attributed to a decrease of filtration rate. Contrary to expectation the U/P ratio increased during hemorrhage 3-4 fold in both series of experiments. These observations can only be due to a reflex effect on the concentrating mechanisms of the kidney (ADH, hemodynamics of the renal medulla). The behavior of central venous pressure suggests that the intrathoracic receptors of the low pressure system may be involved on the afferent side of this reflex. If we interpret the oliguria during hemorrhage and the diuresis with infusion as a volume regulatory measure, we must admit, that volume regulation during moderate deviations from the normal is handled in the first place by the regulation of water excretion, while the behavior of osmotic excretion is non characteristic. [CENTRAL VENOUS PRESSURE IN MAN DURING ACUTE ARTERIAL HYPOXIA] Der zentrale Venedruck des Menschen bei akuter arterieller Hypoxie, by H. L. Thron and A. Hintze. [1961] [10]p. incl. diagr. table, refs. (AFOSR-J456) (AF 61(052)31) Unclassified

Also published in Pflügers Arch. ges. Physiol., v. 274: 252-261, Dec. 1961.

In 6 healthy subjects not acclimatized to high altitudes the behavior of central venous pressure was examined, using the method of Gauer and Sieker, during acute arterial hypoxia of 10-24 min duration induced by respiration of gas mixtures containing 8.3-12.3% O_2 in N_2. In only 1 of a total of 13 experiments was there a consistent increase in central venous pressure. In the great majority of the experiments, a tendency towards a slight fall of central venous pressure was observed. These reactions of the central venous pressure were not related to the degree of oxygen lack within the range of hypoxia used. The results are discussed in relation to the constriction of the hand veins observed under severe acute arterial hypoxia. (Contractor's abstract)

[THE EFFECT OF ACUTE ARTERIAL HYPOXIA ON THE VEIN OF THE HAND IN MAN] Das Verhalten der menschlichen Handvenen bei akuter arterieller Hypoxie, by A. Hintze and H. L. Thron. [1961] [25]p. incl. diagrs. table, refs. (AFOSR-J457) (AF 61(052)31) Unclassified

Also published in Pflügers Arch. ges. Physiol., v. 274: 227-251, Dec. 1961.

The behavior of the tone of the capacitance vessels of the hand under the influence of acute hypoxia (breathing of gas mixtures containing 8,1—12,6% O_2 in N_2; in some experiments with the addition of 4% CO_2) was investigated in 13 healthy subjects aged 21-35 yr. The pressure volume characteristic of the capacitance vessels of 1 hand was determined by means of a fast responding plethysmograph combined with venous pressure recording in the same vascular bed. Repeated engorgement of the hand circulation was obtained by inflation of venous occlusion cuffs. The method also allowed the simultaneous determination of the blood flow through the hand. The

results were as follows: (1) There was a consistent decrease in distensibility of the capacitance vessels at low venous pressures. This reaction which must be attributed to a sustained constriction of the hand veins was demonstrable only when breathing gas mixtures of less than 11% O_2 in N_2. With less severe hypoxia there were no clear cut changes in the distensibility of the hand veins. (2) The tone of the resistance vessels of the hand, as judged by blood flow, also showed an increase, which corresponded approximately with that of the capacitance vessels. In individual cases, however, marked differences between the reactivity of the 2 vascular beds were observed. (3) The heart rate increased when breathing the oxygen poor gas mixtures. In contrast to the changes in tone of the hand vascular bed there was a significant increase also with mixtures of 12% O_2 in N_2 and more. (4) Addition of 4% CO_2 to gas mixtures of less than 9.5% O_2 in N_2 resulted in a less severe increase of both heart rate and vascular tone of hand vessels. (Contractor's abstract)

PROPERTIES OF VEINS IN VIVO: INTEGRATED EFFECTS OF THEIR SMOOTH MUSCLE, by O. H. Gauer and H. L. Thron. [1961] [26]p. incl. diagrs. table, refs. (AFOSR-J459) (AF 61(052)31) Unclassified

Presented at Symposium on Vascular Smooth Muscle, Washington, D. C., Nov. 12-15, 1961.

Also published in Physiol. Rev., v. 42, Pt. 2: 283-308, 1962.

Properties of the total circulatory system and of isolated vascular beds were demonstrated which reflect the basic characteristics of passive distensibility and active contractility of the smooth muscle of the walls of the capacity vessels. Due to the very complicated geometry of an undisturbed vascular system, it appears impossible to obtain results comparable to the translucent biophysical analysis of the properties of isolated smooth muscle. On the other hand, they do appear to be of more immediate value to the circulatory physiologist.

A THEORETICAL ANALYSIS OF THE TURBULENT MIXING OF REACTIVE GASES WITH APPLICATION TO THE SUPERSONIC COMBUSTION OF HYDROGEN, by P. A. Libby. June 1961, 42p. incl. diagrs. refs. (Technical rept. no. 242) (AFOSR-752) (AF 49(638)991) AD 288166 Unclassified

Also published in ARS Jour., v. 32: 388-396, Mar. 1962.

The turbulent mixing of an axisymmetric jet of a reactive gas is considered. By assuming a convenient model for the compressible eddy viscosity the momentum equation is reduced to a form amenable to approximate solution. The resulting velocity distribution in both incompressible and compressible flows is compared with experiment and found to be in reasonable agreement therewith. The usual assumptions with respect to chemical behavior, namely either frozen or equilibrium flow, and to unity Lewis numbers and Prandtl number are employed. The theoretical results for chemical equilibrium are compared to experimental data from low speed hydrogen flames and are shown to agree reasonably well therewith. A numerical example of interest in connection with a hypersonic, air-breathing vehicle is carried out in detail. (Contractor's abstract)

A THEORETICAL INVESTIGATION OF HYDROGEN-AIR REACTIONS. PART I. BEHAVIOR WITH ELABORATE CHEMISTRY, by P. A. Libby, H. S. Pergament,

and M. H. Bloom. Aug. 1961, 52p. incl. diagrs. tables, refs. (Technical rept. no. 250) (AFOSR-1378) (AF 49-(638)991) AD 266515; PB 158977 Unclassified

A study was made of the reaction history of hydrogen-air mixtures under adiabatic, isobaric conditions. An elaborate chemistry was treated with a view toward establishing rather accurate reaction histories. In the future, simplified chemical models will be considered which will permit approximate analyses of the non-equilibrium behavior of hydrogen-air mixtures under flow conditions as, for example, in exhaust nozzles and mixing regions. The results presented for a variety of initial temperatures, pressures and mixture ratios indicate that during the early phases of the reaction the main products achieve close to their equilibrium values with little change in temperature. However, the intermediates, atomic O, atomic H, and the OH radical exceed their equilibrium values. The remaining, major portion of the reaction time involves the decay of these intermediates and the chemical energy release associated therewith. Because of its thermodynamic importance, i.e., its large enthalpy per unit mass, atomic H appears to be the most important intermediate for the reaction considered. (Contractor's abstract)

OBSERVATIONS OF 26.3 MC/S SOLAR RADIO NOISE DURING AUGUST 1959, by W. C. Erickson. [1961] [8]p. incl. diagrs. (AF 49(638)561) Unclassified

Published in Jour. Geophys. Research, v. 66: 1773-1780, June 1961.

Decameter wavelength observations of the solar noise storm during the latter portion of Aug. 1959 are reported. The data displayed several characteristics not apparent in the observations at shorter wavelengths. Decameter wavelength emission was detected before the meter wavelength emission. Intense decameter wave emission ended on Aug. 25, whereas intense meter wavelength emission persisted until Sept. 3. Observations indicated that the emission was quite uniform. The intense angular scintillations reported by other observers was not detected during this period, but observations tend to confirm the identification of this disturbance as a type I noise storm. Even at decameter wavelengths, the emission region appeared to be of small angular diameter, and low in the corona. (Contractor's abstract, modified)

THERMAL STRESSES IN PERFORATED PLATES AND BODIES OF REVOLUTION, by R. D. Sutherland, S. M. Manville and others. June 1961, 100p. incl. diagrs. table, refs. (Rept. no. TM-349-35) (AFOSR-1050) (AF 49(638)592) AD 265537 Unclassified

Methods are derived for the determination of thermal stress in perforated plates and bodies of revolution. The perforated plate problem, being 2-dimensional, is found to be amenable to the complex analysis of Muskhelishvili. The problem of thermal stresses in bodies of revolution is solved in an exact manner by restricting the problem to the aft end of the ogive-shaped body considered. To obtain solutions to the 2-dimensional problems of thermal stresses in perforated plates, the complex analysis of Muskhelishvili is employed with the additional use of conformal mapping. The conformal mapping makes necessary the use of special techniques in order to apply the boundary conditions. Two different examples are presented: (1) thermal stresses in a square plate containing a central circular perforation and (2) thermal stresses in a circular plate containing a central star-shaped perforation. The problem of thermal stresses in ogival bodies of revolution, being a 3-dimensional problem, must be approached in a different manner. To

begin with, a coordinate system is developed based on the classic ogive shape which can approximate a variety of low aerodynamic drag shapes. Thermoelastic and thermoplastic equations are then developed in this coordinate system. The thermoelastic problem is then solved in this system by a combination of stress functions and a numerical technique. Closed form solutions are obtained by considering only the aft end of the ogive. (Contractor's abstract)

TRANSPORT EQUATIONS FOR PLASMAS IN STRONG EXTERNAL FIELDS, by E. Meeron. Mar. 21, 1961, 9p. (AFOSR-635) (AF 49(638)855) Unclassified

Also published in Phys. Rev., v. 124: 308-310, Oct. 15, 1961.

In this note an outline is provided of the derivative of a hierarchy of closed transport equations in which each successive set yields an approximation valid through successively higher powers of a dimensionless parameter which expresses field force, thus providing a description of precisely those situations in which the existing transport equations are inapplicable. It is shown that higher approximations than the resultant nonlinear Vlasov type equation that is expected from very strong external electric fields in which the motion of each charged particle is assumed to be relatively independent of the individual motions of other particles are readily obtained. Consideration is given to a system of N particles of s kinds, N_i particles of kind i, in a volume V, each carrying a charge $z_i e$. A discussion is also presented on the probable range of validity of the approximation.

ATMOSPHERIC BREAKDOWN, by R. Akerib and K. A. Brueckner. June 30, 1961, 22p. incl. diagrs. (Rept. no. ZPh-106, Appendix 1) (AF 49(638)855) AD 261519 Unclassified

The propagation of a microwave beam of high energy through the atmosphere is treated in connection with the problem of the breakdown of the atmosphere. A density of a few electrons is first considered. Under the influence of the field, these electrons are accelerated and, in colliding with the various atoms, pick up sufficient energy to undergo an ionizing collision with an atom. This process continues until the density of electrons is sufficiently high to reflect the microwave beam. Ionization is thus the basic process of the buildup of density of electrons. The story, however, is not so simple. A number of electron loss mechanisms are present; e.g., diffusion, attachment, and recombination processes. These

processes are not all important simultaneously. In Section II, a simple theory of breakdown is described which is applied to attachment-controlled, diffusion-controlled breakdown. Sections III and IV discuss breakdown times and the case of pulsed radiation. In Section V, a short discussion is presented of the theory. (Contractor's abstract)

NON-LINEAR SOLUTIONS OF FOKKER-PLANCK EQUATIONS, by N. Edmonson, Jr. and T. Summers. June 30, 1961, 25p. incl. diagrs. (Rept. no. ZPh-106, Appendix 3) (AF 49(638)855) AD 261521
Unclassified

Mathematical statements of the presumed nature of the interaction between a plasma and electromagnetic waves are re-examined for possible methods of exploiting the effects of nonlinear terms in the heretofore linearized versions of magnetohydrodynamic equations. A procedure is studied for orthogonal polynomial expansion of the velocity dependence of the particle distribution functions. The procedure consists of substituting the expansion into the transport equation whose result yields an infinite set of linked equations for the coefficients of the expansion. The set of equations to be studied consists of a finite number of the linked equations combined with the electromagnetic field equations. The important assumptions made are: (1) the plasma is fully ionized, (2) the ions have a Maxwellian distribution, (3) electron-electron interactions can be ignored, (4) electron-ion interactions may be described by the Fokker-Planck collision terms used by Grad (Comm. on Pure and Applied Math., v. 2: 325, v. 3: 331, 1949). The proposed solution method contains implicitly the assumptions that (5) the electron distribution is in some sense close to a Maxwellian distribution, (6) coefficients of third (products of velocity components taken 3 at a time) and higher order terms can be ignored.

CORRELATION FUNCTIONS IN PLASMA, by I. Oppenheim. June 30, 1961, 9p. (Rept. no. ZPh-106, Appendix 6) (AF 49(638)855) AD 261616
Unclassified

The correlation function between the potential at point a and the potential at point b in a fully ionized plasma is computed. The correlation function is shown to be a long-range function of the distance between points a and b. This result has significance in the treatment of the interaction of radiation with a plasma because of its effect on transport properties in a plasma. (Contractor's abstract)

INDIRECT EXPONENTIAL COUPLING IN THE CLASSICAL MANY-BODY PROBLEMS, by E. Meeron. June 30, 1961 [7]p. incl. refs. (Rept. no. ZPh-106, Appendix 7) (AF 49(638)855) AD 414140 Unclassified

Also published in Phys. Rev., v. 126: 883-886, May 1, 1962.

The usual coupling procedure consists of multiplying the interparticle potential $U_n(r^n)$, by a coupling parameter λ and then expanding thermodynamic functions in powers of λ. The Kirkwood variation of this procedure couples only one particle of the system, resulting in an integro-differential equation for distribution functions, which also can be expanded in powers of the coupling parameter. These expansions converge only for weakly coupled systems. If the Ursell f bonds are coupled instead of the direct interaction potentials, we can expand certain thermodynamic functions in powers of the exponential coupling parameters. Integrodifferential equations for distribution functions are derived, and it is seen that distribution functions are given by ratios of two practically finite polynomials in the exponential coupling parameters. The coefficients in these polynomials are finite even for strongly singular (e.g. hard sphere) potentials. The method provides a well-defined expansion parameter for the Kirkwood-Saltzburg hierarchy and appears related to the f-bond chain summation and nodal expansion methods. Present and possible future applications include: theory of fused salts and electrolytes, theory of ferroelectricity, ion pairing in semiconductors, equation of state of the high-temperature electron gas, and problems of phase transitions. The possibility of applying exponential coupling to quantum-mechanical systems is noted.

COEFFICIENT OF DYNAMIC FRICTION FOR SLOW IONS, by S. Rand. [1961] [8]p. incl. diagrs. refs. [AF 49(638)855] Unclassified

Published in Phys. Fluids, v. 4: 1251-1258, Oct. 1961.

The coefficient of dynamic friction for a subsonic ion is determined, in a phenomenological manner, by requiring that the drag force acting on a test particle in a plasma be identical with the drag force on a field particle. The drag coefficient is determined in both a fully ionized gas and in a specialized partially ionized gas. The effect on collisions between ions and neutral particles on the drag force is considered. It is found that, with some rather special conditions, the stopping power on a charged particle traversing a plasma may be reduced when the density of neutral particles is increased.

CHEMICAL REACTIONS USING FREE RADICAL BEAMS (Abstract), by W. L. Fite, H. Harrison, and R. T. Brackmann. [1961] [1]p. [AF 49(638)301] Unclassified

Presented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech. Armour Research Foundation, Chicago, Ill., Sept. 11-12, 1961. (AFOSR-1417; AD 265513)

In attempting to extend crossed-beam experiments for the measurement of 2-body, gas-phase chemical reaction cross sections from cases involving alkali metals (which may be detected by surface ionization) to the general case where detection is made mass spectrometrically, a number of important successes have been achieved. Foremost has been the systematic increase in signal-to-noise ratio by 5 orders of magnitude since the First AFOSR Contractors' meeting (item no. 707, Vol. IV). Accompanying this improvement, a number of spurious signals have been made evident, but the identification and elimination of unwanted effects has generally proceeded satisfactorily. It is believed that the gas-phase 2-body reaction $H + D_2 \rightarrow HD + D$ has been observed for which tentative values of the cross-section range from 4×10^{-20} cm^2 to 1×10^{-18} cm^2. The prognosis appears good for measurements of the other 2 reactions to which most attention has been directed, $H + O_3 \rightarrow OH + O_2$ and $D + Cl_2 \rightarrow DCl + Cl$, for which some experimental limits have been established.

HIGH TEMPERATURE HEAT TRANSFER TO CYLINDERS, by J. F. Cassidy, M. L. Ghai, and J. W. Reid. Final rept. Mar. 1, 1959-May 29, 1961 [71]p. incl. illus. diagrs. refs. (AFOSR-872) (AF 49(638)243) AD 260372 Unclassified

A combined analytical-experimental program was performed to provide basic knowledge of heat transfer from gases at high temperatures. The principal objective of this program was to obtain information regarding the forced convective heat transfer process associated with the transition flow region in a tubular test section. The experiments were conducted in a test stand which utilized the high temperature nitrogen gas flow discharge from an electrothermal generator. The results, describing the forced convection heat transfer phenomenon in a transition flow, are presented. They quantitatively describe the Nusselt number variation with the Reynold's number and the pipe L/D ratio. The typical transition relation, $\frac{Nu}{Pr^{1/3}_{R.N.}} (\frac{\mu s}{\mu b})^{0.14}$ was plotted vs Reynolds number for various L/D ratios. A theoretical investigation of the laminar boundary layer in an electrical conducting fluid, for an arbitrarily applied magnetic field was performed. New advances in high temperature thermometry have also been made under this program. These resulted from the development and use of a tungsten-tungsten rhenium thermocouple system. Improved probe calibration methods have demonstrated the probe's temperature and pressure measurement capabilities in gaseous temperatures as high as 5600°F. (Contractor's abstract)

VISCOUS MAGNETOHYDRODYNAMIC BOUNDARY LAYER, by A. Sherman. [1960] [6]p. incl. diagrs. (AFOSR-1679) [AF 49(638)243] Unclassified

Published in Phys. Fluids, v. 4: 552-557, May 1961.

The behavior of the Blasius boundary layer, for a fluid of constant electrical conductivity, in the presence of a non-uniform magnetic field is studied. Distortion of the applied field due to currents flowing in the fluid is neglected; that is, the magnetic Reynolds number is assumed to be zero. Since the fluid is of uniform conductivity, the influence of the pressure distribution, caused by the interaction between the magnetic field and the inviscid flow, on the boundary layer is taken into account along with the Lorentz body force within the layer itself. The nonlinear boundary layer equations are solved by the method of power series expansion utilizing the Görtler variables. Particular attention is given to the case in which the

nonuniform field is established in a constant height channel. The boundary layer, then, is assumed to begin at some position along 1 wall, and grow in the downstream direction. For purposes of computation, the problem is further specialized to treat the case in which the nonuniform field is generated by a current-carrying wire imbedded in 1 wall of the channel and aligned normal to the flow. The results of a calculation, for 1 choice of the relevant nondimensional parameters, show that the reduction in skin friction is sufficient to separate the boundary layer. (Contractor's abstract)

OBSERVED EMISSIVITIES OF ROCKET COMBUSTION GASES, by D. E. Robison and S. J. Van Grouw. Final rept. Dec. 1961, 12[illegible]p. incl. illus. diagrs. tables, refs. (AFOSR-1904) (AF 49(638)413) AD 269387 Unclassified

The total and the spectral intensity of the radiation emitted by rocket combustion products at high pressure was studied. Spectral and total radiation data are presented for 3 rocket propellant systems: HNO_3 and HN_3; N_2O_4 and NH_3; and N_2O_4 and N_2H_4. Each of the combinations contained H_2O as the principal radiating gas.

The measurements were made at a nominal combustion pressure of 700 psia. Emissivity correlations and methods of estimating the temperature of the combustion gases are developed. A technique is given for obtaining direct observation of high temperature gases inside the combustion chamber of a small rocket motor.

OBSERVATIONS ON INDIVIDUAL ADSORBED ATOMS (Abstract), by G. Ehrlich and F. G. Hudda. [1961] [1]p. (AF 49(638)791) Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 168, Mar. 20, 1961.

The interactions of nitrogen with a tungsten surface have been studied in Müller's field ion microscope, with a resolution of less than 5A. Adsorption at 300°K results in a nonuniform distribution of adatoms with the highest concentration in the jogged regions between the 100 and 111 zones. During the initial stages the more closely packed planes, such as (110) and (211), remain devoid of gas. This distribution is dictated by the kinetics of the dissociation step and not by variation in the binding energy of adatoms. At 300°K the adatoms appear fixed in place; extensive rearrangement is only observed at T > 400°K. The configuration of surface atoms from which a nitrogen atom has moved on heating is identical with that prior to adsorption, indicating that no permanent perturbation of the lattice occurs. At 300°K adsorption of nitrogen is not observed on pairs of nearest neighbor sites. Instead, adatoms are separated by several lattice spacings. This suggests that in the dissociation of the molecule vibrationally excited adatoms are formed which can migrate before decaying to their groundstate.

ADSORPTION KINETICS ON THE ATOMIC LEVEL (Abstract), by G. Ehrlich and F. G. Hudda. [1961] [1]p. [AF 49(638)791] Unclassified

Published in Abstracts of Scientific Papers presented at Eighteenth Internat'l. Cong. of Pure and Applied Chemistry, Montreal (Canada) (Aug. 1961), Toronto U. Press, 1961, p. 155.

Adsorption processes on a tungsten surface have been examined in the low-temperature field ion microscope with a resolution of less than 5A. Nitrogen interacting at room temperature with a surface formed by field desorption appears in the microscope as brightly emitting spots of somewhat larger diameter than a tungsten atom. The distribution of these over the different crystallographic regions is not uniform: the low index planes, such as (110) and (211), remain unchanged, and the highest concentration appears in the region between the 111 and 100 zone lines, in which lattice steps are heavily kinked. At T = 300°K the adsorbed material proves to be

immobile, and this nonuniformity therefore stems from differences in the kinetics of adsorption on different planes. However, at T > 400°K the emitting spots around (111) move over the surface. Examination of the original adsorption sites reveals no change in the lattice structure and establishes that these emission spots correspond to adatoms. From the spacing of adatoms after adsorption at T = 300°K it can be shown that in the dissociation process vibrationally excited atoms are found.

ADSORPTION AND ELECTRICAL CONDUCTION IN THIN FILMS, by G. Ehrlich. [1961] [3]p. incl. refs. [AF 49(638)791] Unclassified

Published in Jour. Chem. Phys., v. 35: 2165-2167, Dec. 1961.

Changes in the electrical resistance of high-area, evaporated metal films after adsorption of gases have been attributed to a long-range effect of the adsorbed material. It is shown that the experimental findings do not demand this interpretation, and that contributions to the observed resistance increases may arise from any of the following: (1) A localized resistance change at necks in the film, (2) Changes in surface stress on adsorption, (3) A decrease in the rate of electron tunneling across gaps in the film with an increase in the work function. The last mechanism appears most likely, and experiments to establish these effects quantitatively are outlined. (Contractor's abstract)

SEMICONDUCTING COMPOUNDS; PROCEEDINGS OF THE CONFERENCE, Schenectady, N. Y., June 14-16, 1961. New York, W. A. Benjamin, Inc., 1961 [241]p. incl. illus. diagrs. tables, refs. (AFOSR-2010) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)997 and General Electric Research Lab.) Unclassified

Also published in Jour. Appl. Phys. Suppl., v. 32: 2063-2304, Oct. 1961.

The aim of this conference was to summarize both experimental and theoretical results in various classes of compounds and to synthesize physical ideas common to these compounds. Emphasis was placed on 3-5 and 2-6 compounds with some discussion of the lead compounds and oxides. This was thought to be the first conference devoted exclusively to papers and discussion on the physics of semiconducting compounds It was restricted to fundamental physical properties, such as band structure, transport, optical galvanomagnetic, and resonance phenomena. The proceedings seem to constitute a fairly complete and impressive summary of present knowledge and understanding of compound semiconductors.

THE GENERALIZED INVERSE PROBLEM OF ORBIT COMPUTATION, by V. G. Szebehely. [1961] [21]p. incl. diagr. (AFOSR-435) (AF 49(638)814) AD 611517 Unclassified

Also published in Space Research II; Proc. Second Internat'l. Space Science Symposium, Florence (Italy) (Apr. 10-14, 1961), Amsterdam, North-Holland Publishing Co., 1961, p. 318-338.

The basic problem of celestial mechanics—finding the motion for given initial conditions in a given force field—is inverted by asking for force fields which result in either a specific orbit or which allow to obtain a closed form solution of the equations of motion. The first case leads to a generalized concept of guidance and thrust programs, while the second opens the way to finding new closed form solutions for slightly modified n-body (n > 2) gravitational fields. The problem discussed in this paper is a generalization in purpose and in method of the classical problem of orbit determination in celestial mechanics. It allows the determination of classes of functions which either furnish optimization opportunities of the guidance problem (first case) or furnish overall field modifications which allow closed form solutions (second case) applicable to perturbation calculations as reference orbits with predetermined approximations. Establishing new reference orbits for perturbations and formulating a concise and systematic method of guidance analysis are the 2 main results presented in the paper. (Contractor's abstract)

INFLUENCE OF TENSOR CONDUCTIVITY ON CURRENT DISTRIBUTION IN A MHD GENERATOR, by H. Hurwitz, Jr., R. W. Kilb, and G. W. Sutton. [1960] [12]p. incl. diagrs. [AF 49(638)914] Unclassified

Published in Jour. Appl. Phys., v. 32: 205-216, Feb. 1961.

Magnetohydrodynamic generators may operate under conditions such that the product of electron cyclotron frequency and mean collision time is not small compared to unity. Accordingly the electrical conductivity is a tensor rather than a scalar quantity. The influence of tensor conductivity on the electrical current distribution has been investigated in 2 idealized situations, 1 pertaining to the entrance and exit regions of the generator and the other pertaining to the region near segmented electrodes. The calculations predict modifications of the internal impedance of the generator which can be described in terms of increases in the effective duct length and width. (Contractor's abstract)

DETERMINATION OF THE LONGITUDINAL VARIATION OF MHD CHANNEL CROSS-SECTION FOR MAXIMUM POWER, by H. Yeh. June 1961 [18]p. incl. diagrs. (Rept. no. R61SD066) (AFOSR-1030) (AF 49(638)914) AD 438717 Unclassified

This analysis is based on the 1-dimensional inviscid flow equations of an ionized gas (whose electrical conductivity is in general a function of pressure and temperature) flowing through a channel for the purpose of the extraction of electrical power. The problem is: given the inlet conditions and a fixed channel length, what should be the distribution of channel cross-sectional area (and hence of all other gas properties) in order to extract maximum power? This variational problem is solved in the present report by means of a computation procedure based on the method of steepest descent. After the procedure is formulated for the general case, a simplification is obtained if the conductivity is assumed to vary with temperature only according to a power law. In order to test this method, a sample calculation of the first variation is obtained, using the constant-velocity distribution as the zero-th approximation. Further calculations required for the complete solution can likewise be performed in a straightforward manner. (Contractor's abstract)

VELOCITY PROFILES AND EFFICIENCY OF MHD GENERATORS WITH SEGMENTED ELECTRODES, by H. Yeh and G. W. Sutton. Sept. 15, 1961, 30p. incl. diagrs. (Rept. no. R61SD150) (AFOSR-1595) (AF 49-(638)914) AD 266275 Unclassified

The 2-dimensional problem of an infinitely long magnetohydrodynamic generator with segmented electrodes of finite length was solved for constant properties, including the Hall effect. First, it was shown that the non-uniform current distribution does not affect the velocity profile, which is therefore parabolic for laminar flow. Second, the generator efficiency (not including friction) is exactly equal to the generator loading factor even for a non-uniform velocity. In these investigations it was assumed that opposite pairs of electrodes have no mutual influence. This assumption has been verified when the Hall effect is absent even when the electrode pitch is equal to channel width. (Contractor's abstract)

END EFFECTS IN INVISCID FLOW IN A MAGNETO-HYDRODYNAMIC CHANNEL, by G. W. Sutton and A. W. Carlson. [1961] [12]p. incl. diagrs. table. (AFOSR-3402) (AF 49(638)914) Unclassified

Also published in Jour. Fluid Mech., v. 11: 121-132, Aug. 1961.

The flow of an inviscid, incompressible electrical conducting fluid in a channel of constant rectangular cross-section is considered, when the flow enters a region which contains a magnetic field transverse to the flow and electrodes on opposite sides of the channel. This geometry is typical of a dc induction pump or magnetohydrodynamic generator. The conducting fluid external to the magnetic field acts as a shunt and produces a non-uniform electric potential field and hence a non-uniform Lorentz force on the fluid, and causes the fluid velocity profile to be distorted. These effects are calculated theoretically for small magnetic Reynolds number and small magnetic interaction parameter. It is found that the velocity at the centre-line of the channel is retarded and at the walls the velocity is accelerated. The fractional change of velocity at the wall is equal to approximately 0.44 times a modified magnetic interaction parameter. (Contractor's abstract)

MAGNETOHYDRODYNAMIC RESULTS FOR HIGHLY DISSOCIATED AND IONIZED AIR PLASMA PRODUCED BY HYPERSONIC SHOCK WAVES (Abstract), by H. T. Nagamatsu and R. E. Sheer, Jr. [1961] [1]p. [AF 49-(638)914] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 21, Feb. 1, 1961.

An investigation of air plasma moving through a constant (2300 gauss) transverse magnetic field was conducted in a shock tube. As the plasma traveled through the field, an electromotive force was produced in the plasma. Two diametrically opposite, 1/2-in. diam, copper electrodes were used to measure this potential. The shock Mach number varied from 10 to 32 with corresponding equilibrium plasma temperatures from 3600 to 11,000°K. At Mach number 30 the observed potential across the electrodes, with a 1-meg external load, was 236 v, which agreed with the theoretical value, but at lower Mach numbers the observed potentials were much lower than theory. By varying the external load for a shock Mach number of 30, the current from the plasma varied from nearly zero to 115 amp. This high current was extracted from the copper electrodes at nearly room temperature. The observed potential decreased linearly with increasing current indicating a nearly constant plasma resistance. For this resistance the electrical conductivity was calculated and was much less than the theoretical prediction. The maximum power extracted from the plasma was 7.8 kw with an external load of 1.85 ohms.

FUNDAMENTALS OF MHD FLOW (Abstract), by G. W. Sutton. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)914) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

Several important theoretical problems associated with the steady flow of an electrically conducting fluid in a rectangular channel with mutually perpendicular magnetic and electric fields have been investigated. The results are applicable to both MHD electrical power generators and accelerators. The first problem considers the generation of vorticity by the magnetic field at the entrance to the channel. The coupled inviscid linearized momentum and electric field equations were solved by means of an expansion in power of the magnetic interaction parameter. It was found that the fractional change in velocity profile is greatest at the wall, amounting to 44% of the magnetic interaction parameter. Since the Hall effect will not be negligible in an MHD generator or accelerator, complete expressions were derived for the tensor conductivity from the kinetic theory of gases for

an inverse power interaction force. It was found that simpler expressions may be used within an accuracy of 15% (provided the scalar conductivity is calculated correctly) except if electron-ion collisions dominate, in which case the error is much larger. Work has been initiated on the entrance effects into a channel with segmented electrodes and tensor conductivity. It has been found that if the magnetic field extends appreciably downstream of the inlet region, the electrical characteristics of the channel are independent of the Hall effect. The problem of channel flow with both viscosity and tensor conductivity has been solved for segmented electrodes considering the flow to be laminar and fluid properties to be constant. The result is that the electrical characteristics are not effected by either viscosity or the Hall effect; but the friction is increased by both effects, which decreases the efficiency. In addition it has been found that a transverse pressure gradient will develop.

ALPHA AND BETA GRAIN BOUNDARIES IN INDIUM ANTIMONIDE, by R. K. Mueller and R. L. Jacobson. [1961] [5]p. incl. illus. diagrs. table, refs. (AFOSR-1466) (AF 49(638)628) Unclassified

Also published in Jour. Appl. Phys., v. 33: 2341-2345, July 1962.

Grain boundaries in indium antimonide with misfit angles of 6° have been prepared which, according to the dislocation model for grain boundaries, consist of rows of alpha or beta dislocations. Current flow across these boundaries in n- and p-type material has been studied. Alpha boundaries were found to present a barrier to current flow in n- and p-type material, beta boundaries only in p-type material. This indicates for alpha dislocations donor behavior in p-type material, acceptor behavior in n-type material, and for beta-dislocations donor characteristics. A theoretical model for the boundary states is proposed. (Contractor's abstract)

ANALYSIS OF ENERGY EFFICIENCY OF RAIL ACCELERATORS, by G. M. Palmer. July 1961, 24p. incl. diagrs. refs. (Engineering rept. no. 2252) (AFOSR-1631) (AF 49(638)864) AD 267221 Unclassified

Application of possible energy loss mechanisms to the rail accelerator problem has shown how large amounts of energy could be consumed and not become available as axial kinetic energy. Axial kinetic energy vs specific impulse plots indicate that a specific impulse of 10,000 sec would require a kinetic energy of 40 joules. For the conditions considered, radial kinetic energy and the plasma formation and heat energy are negligible by comparison. Thus, an efficiency of 10 to 20% based on absorbed energy is implied depending upon emissivity up to a 50% reduction. The range of efficiency is in good agreement with experimental results. Two of the mechanisms considered, Joullian heating of the rails and radio frequency electromagnetic radiation, were found completely negligible. Although the relative energy contained in radial motion at the velocities considered is small compared to the thermal radiation energy losses, a reduction in radial velocity has a corresponding effect on the radiation by reducing the radiating surface area for a given time interval. A marked improvement in efficiency could be realized by utilizing a cold plasma so that losses based on temperature could be reduced.

STUDY OF RAIL-TYPE ELECTROMAGNETIC ACCELERATOR (Abstract), by T. L. Rosebrock. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)864) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

Theoretical and experimental studies were made of a pulsed rail-type electromagnetic accelerator employing an exploding-wire propellant charge. The dimensionless governing equations of the idealized accelerator circuit with filamentary discharge were derived and solved on the analogue computer. Several studies of the discharge process have been conducted including: (1) a study of the time-variation of plasma conductivity and temperature, (2) calculated mass-velocity distribution of a plasma expanding in a magnetic field, and (3) generalized electromagnetic field equations for the accelerator. An experimental accelerator circuit has been fabricated consisting of a 2000-joule capacitor coaxially coupled through a low inductance vacuum spark gap to the accelerator mounted in a 1 ft diam x 4 ft length plastic vacuum chamber. Principle measurements have included: (1) momentum, obtained with a ballistic pendulum which can completely surround the accelerator; (2) plasma front velocity, obtained with a photomultiplier system; (3) time records of current and voltage; and (4) mass distribution, obtained by spectroscopic analysis of plasma deposits on targets surrounding the discharge. Momentum measurements and plasma deposition patterns validate theoretical predictions of large losses in undirected kinetic energy.

INDUCTION OF SLEEP IN CATS BY ELECTRICAL STIMULATION OF THE BRAIN STEM RETICULAR FORMATION (Abstract), by E. Favale, A. Guissani, and G. F. Rossi. [1961] [1]p. (AFOSR-3449) (AF 61(052)-461) Unclassified

Presented at Second Internat'l. Cong. of Neurological Surgery, Washington, D. C., Oct. 14-20, 1961.

Also published in Excerpta Medica, Internat'l. Cong. Series No. 36, 1961.

The induction of light and deep sleep described is possible only if proper parameters of stimulation are employed and if the stimulation is performed on a proper EEG and behavioral background. Low frequency pulses and a background of relaxed wakefulness are essential for the induction of light sleep; high frequency pulses applied during the intermediate sleep are essential for the precipitation of deep sleep.

BLOOD PRESSURE DURING NATURAL SLEEP IN CATS, by G. F. Rossi, E. Favale and others. [1961] [1]p. (AFOSR-3450) (AF 61(052)461) Unclassified

Presented at Fifth Internat'l. Cong. of Electroencephalography and Clinical Neurophysiology, Rome (Italy), Sept. 7-13, 1961.

Also published in Excerpta Medica, Internat'l. Cong. Series No. 37, 1961.

The behavior of the blood pressure during sleep strongly supports previous findings indicating that it is during the episodes characterized by EEG desynchronization and muscular hypotonia that sleep reaches its maximal depth. In addition, the relation between EEG desynchronization, EMG flattening, blood pressure fall and depth of sleep suggests that all these phenomena are produced by a common neural mechanism.

RESEARCHES ON THE NERVOUS MECHANISMS UNDERLYING DEEP SLEEP IN THE CAT, by G. F. Rossi, E. Favale and others. [1961] [23]p. incl. diagrs. refs. (AF 61(052)461) Unclassified

Published in Arch. Ital. Biol., v. 99: 270-292, July 1961.

The present study is devoted to the neural mechanisms underlying the deep sleep episodes characterized by complete postural relaxation and EEG desynchronization. Unanesthetized, free moving cats carrying chronically implanted electrodes for EEG and EMG recording and for electrical stimulation of peripheral and central nervous structures were used. (1) The EEG, EMG and behavioral criteria followed for the valuation of the depth of sleep are described. (2) Low rate electrical stimulation of the thalamic and reticular EEG synchronizing systems is ineffective during deep sleep. (3) The intravenous injection on thiopental sodium during sensory arousal, leaves the EMG silence unaffected but induces EEG synchronization. Low rate electrical stimulation of the thalamic recruiting system becomes once more effective following the injection of barbiturate. (4) High rate electrical stimulation of the brain stem reticular formation, which is followed by arousal when it is performed during light sleep, may lead to central and peripheral episodes of deep sleep if it is performed during the intermediate stage of sleep. (5) On the basis of these results the hypothesis is made that: (a) the EEG desynchronization that characterizes the deep sleep episodes results from the functional depression of the subcortical systems which are responsible for EEG synchronization-(b) this depression is due to the influence of an inhibitory mechanism which becomes active at the onset of the episodes of deep sleep; (c) this inhibitory mechanism is

probably responsible for the appearance of deep sleep itself. (6) The possible relations of these findings with those obtained by other authors, and the general conclusions drawn from them on the mechanisms underlying sleep are discussed. (Contractor's abstract)

EXPERIMENTS IN INDIA ON "VOLUNTARY" CONTROL OF THE HEART AND PULSE, by M. A. Wenger, B. K. Bagchi, and B. K. Anand. [1961] [7]p. incl. diagrs. table. (Sponsored jointly by Air Force Office of Scientific Research, under AF 18(600)1180, Indian Council of Medical Research, Institute of Mental Health under M-788, Rackham Foundation, and Rockefeller Foundation) Unclassified

Published in Circulation, v. 24: 1319-1325, Dec. 1961.

The authors investigated 4 practitioners of Yoga in respect to control of the heart and pulse. Two claimed to stop the heart. One formerly made this claim but only demonstrated his method. The method for the first 3 was similar, involving retention of breath and considerable muscular tension in the abdomen and thorax, with closed glottis. It was concluded that venous return to the heart was retarded but that the heart was not stopped, although heart and radial pulse sounds weakened or disappeared. The fourth subject, with different intervening mechanisms also presumably under striated muscle control, did markedly slow his heart. The data indicate strong increase in vagal tone of unknown origin.

A TEST OF MILIEU EFFECTS WITH SOME OF PIAGET'S TASKS, by J. J. Goodnow. [1961] [68]p. incl. diagrs. tables, refs. (AFOSR-1801) (AF 49(638)682) AD 611288 Unclassified

Approximately 500 European and Chinese boys between the ages of 10 and 13 were given four Piaget tasks (combinatorial reasoning, conservation of space, weight and volume), and Raven's Progressive Matrices (generally regarded as an intelligence test). Among the Chinese boys education varied from little or none to full schooling. Similarities across milieus were more striking than differences: there was an odd lack of relationship between the combinatorial task (closely tied to Matrices performance) and the conservation tasks (no such tie); replication of Geneva results was fair to good; the differences occurring suggest a need for a closer look at the concept stability of reasoning and at the expected inter-relationships among various tasks.

THEORETICAL VIBRATIONAL ENERGY LEVELS OF H_2 ASSOCIATED WITH VARIOUS LC STO MO CONFIGURATION COMBINATIONS (Abstract), by G. M. Leies. [1961] [1]p. [AF AFOSR-60-1] Unclassified

Published in Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, June 12-16, 1961, p. 28-29.

Also published in Spectrochim. Acta, v. 17: 1103, Oct. 1961.

Vibrational energy levels G_v and first differences ΔG_v have been determined for 11 different theoretical potential curves of the H_2 ground electronic state. These potential curves were previously determined by McLean et al using LC STO MO wave functions with configuration interaction. Values of G_v and ΔG_v have been calculated for each potential curve through the use of the WBK approximation. Since each wave function differs from the preceding one by the addition of one more configuration, a comparison of the ΔG_v curves provides a measure of the influence of each configuration on the shape of the ΔG_v curve. The effects of each configuration on the vibrational levels will be discussed. The ΔG_v curves group into 2 distinct families. All wave functions including the $(\sigma_u 1s\sigma_u 1s')$ configuration have rapidly converging vibrational levels at high quantum number v, characteristic of the experimental levels. Those wave functions which exclude $(\sigma_u 1s\sigma_u 1s')$ show ΔG_v curves which have a positive curvature at all values of v for which calculations have been made.

VIBRATIONAL ENERGY LEVELS OF IONIC MOLECULES BOUND BY CLASSICAL FORCES (Abstract), by E. J. Finn. [1961] [1]p. [AF AFOSR-60-1] Unclassified

Published in Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, June 12-16, 1961, p. 34-35.

Also published in Spectrochim. Acta, v. 17: 1109, Oct. 1961.

Theoretical energy levels of LiI, NaCl, and InF (chosen as representative diatomic ionic molecules) have been calculated up to vibrational quantum number v = 10,000. Two classical vibrational potentials were studied for each molecule. The first potential consisted of the

Coulombic attraction term and a nuclear repulsion term, while the second added a polarizability term to the first. The vibrational energy levels were computed with an IBM 704 program, using a first-order WKB approximation. Analysis of the data shows that at very low v ($v < 30$) a power series adequately represents the energy levels, while at very high values of v ($v \to \infty$) the energy levels approach H atom-like energies corresponding to a 1/r Coulombic potential. Further, the first energy difference curves show positive curvature at all v for all cases. Formulae will be presented that accurately yield the vibrational energies and first differences at all v.

EMPIRICAL FUNCTIONS FOR VIBRATIONAL ENERGY DIFFERENCES OF H_2 (Abstract), by M. Shafi and C. L. Beckel. [1961] [1]p. (AF AFOSR-60-1) Unclassified

Published in Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, June 12-16, 1961, p. 40-41.

Also published in Spectrochim. Acta, v. 17: 1114, Oct. 1961.

A number of analytic functions other than power series have been used to represent the vibrational differences of the ground state of H_2. The best of these functions are presented and the roles that the concepts of covalency and ionicity played in their choice are discussed. Several of the functions give significantly better results than can be obtained with a power series. The best formulae indicate the existence of an unobserved $v = 15$ level.

ROTATION-VIBRATION ENERGY LEVELS OF A DIATOMIC MOLECULE (Abstract), by C. L. Beckel. [1961] [1]p. [AF AFOSR-60-1] Unclassified

Published in Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, June 12-16, 1961, p. 53.

Also published in Spectroschim. Acta, v. 17: 1126, Oct. 1961.

It appears that Dunham's theoretical work on the energy levels of a rotating vibrator is in error in the second order when applied to diatomic molecules. The reason for this is that Dunham treated the one-dimensional problem whereas molecules undergo radial motion. The 2 cases require use of different effective potentials in the WBK integrals. A description will be given of the adjustment of Dunham's work to handle the radial problem. This adjustment alters the spectroscopic coefficients by new terms of the same magnitude as the second-order corrections listed by Dunham. One new result is that a radial harmonic oscillator has vibrational levels which are not quite equidistant and a minimum not exactly at $v = -1/2$. The new terms increase the zero point energy of H_2 by 15 cm^{-1}. The significance of this with regard to recent experimental and theoretical determinations of the H_2 dissociation energy will be discussed. Other numerical examples of the new corrections will be presented.

A FREE RESPONSE APPROACH TO THE STUDY OF PERSON COGNITION, by L. Beach and M. Wertheimer. [1960] [8]p. incl. tables, refs. (In cooperation with Colorado U., Boulder) [AF 49(638)487] Unclassified

Published in Jour. Abnorm. and Social Psychol., v. 62: 367-374, Mar. 1961.

In person perception experiments subjects (Ss) have often been required to make judgments about other people (Os) on dimensions that may not be applicable or relevant from the S's point of view. The results of such studies are, consequently, difficult to interpret. It has been argued that fixed scale research should be preceded by free response—content analysis studies to aid in decisions as to which scales or dimensions are appropriate for the Ss, the Os, and the situation involved. In an attempt to show that dimension use does differ for different Ss and Os, Ss were asked to describe persons they knew who fit the specifications of classes of Os designated by E. These descriptions were then content analyzed.

The findings serve to support the contention that the dimension used in judgments of other peopel are a function of the Ss doing the judging, the Os being judged, the situation, and the interaction among these variables. It was concluded that a prior free response—content analysis approach like the present one might well be considered logically and methodologically prior to the study of how independent variables affect ratings along fixed predetermined scales.

MASS SPECTROGRAPHIC IDENTIFICATION OF THE ION OBSERVED IN HYDROGEN MOBILITY EXPERIMENTS, by W. S. Barnes, D. W. Martin, and E. W. McDaniel. [1961] [2]p. (AFOSR-626) [AF 18(600)1524] AD 255602 Unclassified

Also published in Phys. Rev. Ltrs., v. 6: 110-111, Feb. 1961.

In studies of hydrogen, the 3 known species (H^+, H_2^+, and H_3^+) are all observed at very low drift-tube pressures, p, and for short drift distances, d. The H_3^+ ion is by far the most abundant throughout the range covered. As pd is increased, the abundances of H^+ and H_2^+ relative to that of H_3^+ diminish, the H_2^+ abundance falling off more rapidly than that of H^+. Taking into account the increasing ion losses due to diffusion recombination, etc., it appears that the H_3^+ population increases mainly at the expense of H_2^+.

MOBILITY AND CLUSTERING OF NEGATIVE IONS AND MASS-SPECTROGRAPHIC STUDY OF ION-MOLECULE REACTIONS OCCURRING AT THERMAL ENERGIES UNDER GAS KINETIC CONDITIONS, by E. W. McDaniel and D. W. Martin. Final summary rept. Aug. 1, 1955-Mar. 31, 1961 [11]p. incl. refs. (Technical status rept. no. 23) (AFOSR-826) (AF 18(600)1524) AD 256481 Unclassified

Investigations were made to obtain an identification of the negative ion observed in mobility experiments involving oxygen and oxygen mixtures: SO_2, SF_6 and HCl. The mobilities of the negative ions at room temperature are measured by means of a direct observation of the transit times of the ions over a given distance in a weak electric field. Attempts to observe clusters were made by examining the ions in helium and lithium. With helium it was found that appreciable clustering never occurred because of the high ionization potential which made charge transfer to essentially any collision partner energetically favorable. Preliminary studies of hydrogen mobility revealed that the only ion that will normally be present during experiments in hydrogen-ion mobility is H_3^+.

X-RAY STUDIES OF DAUPHINÉ TWINNING IN QUARTZ (Abstract), by J. H. Koenig and R. A. Young. [1961] [1]p. (Technical rept. no. 8) [AF 49(638)624] Unclassified

Presented at meeting of the Georgia Academy of Sciences, Apr. 28, 1961.

Dauphiné twinning, which amounts to an 180° rotation of the twin about the c-axis, cannot be observed by ordinary polarizing-optics methods. Specular reflection from properly etched surfaces may show up twin boundaries which intersect the surface of the crystal. Certain x-ray reflections are affected, some profoundly, by the presence of these twins whether or not they either intersect the surface or are of macroscopic size. An x-ray method making use of this effect has been employed in a preliminary study of several aspects of the occurrence of Dauphiné twinning. The method will be described. Some of the effects on Dauphiné twinning of thermal cycling will be discussed and evidence for the possible occurrence of microscopic or submicroscopic twinning will be presented. The significance of such twinning behavior to piezoelectric applications and to crystal structure studies will be mentioned.

DRIFT TUBE-MASS SPECTROMETER FOR STUDIES

OF LOW-ENERGY ION-MOLECULE REACTIONS, by E. W. McDaniel, D. W. Martin, and W. S. Barnes. [1960] [6]p. incl. illus. diagrs. refs. (AFOSR-2874) (AF 49(638)1064) Unclassified

Also published in Rev. Scient. Instr., v. 33: 2-7, Jan. 1962.

Apparatus has been developed for the mass spectrographic study of ion-molecule reactions occurring under gas-kinetic conditions. Ions are produced by electron bombardment inside a long drift tube containing gas at a pressure of up to about 0.7 torr. The ions diffuse down the drift tube under the influence of a weak electric field. A sample of the ion population at the end of the drift tube is extracted through a two-stage, field-free differential pumping section and passed into a 60° magnetic deflection mass spectrometer. The number of ion-molecule collisions in the drift tube may be varied over a wide range by changing the source position and/or the gas pressure. Information concerning the nature and probability of the reactions occurring is revealed by the resulting changes in the ionic mass spectrum. (Contractor's abstract)

IONIZATION IN AN ELECTRODELESS DISCHARGE. PART II, by R. P. Treat. Sept. 1961 [35]p. incl. illus. diagrs. (AFOSR-1522) (AF 49(638)1014) AD 271423 Unclassified

The breakdown of a gas in an electrodeless discharge is studied. The configuration consists of a long cylindrical gas column subjected to a strong, fast rising axial magnetic field. The investigation showed that when losses are by free electron diffusion and electric fields due to charge separation are negligible, appreciable multiplication of electrons takes place in an interval of time 2tc (the cut-off time for ionization) when the magnetic field is nearly zero. The voltage around the discharge tube that produces a given multiplication of electrons in the time interval 2tc (the cut-off time for ionization) is determined. This voltage is compared with experimentally observed breakdown voltages in argon and hydrogen. (Contractor's abstract)

IONIZATION EXPERIMENT OF AN ELECTRODELESS DISCHARGE WITH TOROIDAL GEOMETRY, by J. E. Chambers, H. G. Loos and others. Aug. 1961 [42]p. incl. illus. diagrs. (AFOSR-1825) (AF 49(638)1014) AD 269857 Unclassified

Measurements were made concerning the initial breakdown of a gas subjected to an electrodeless discharge in a toroidal geometry with the magnetic field in the longitudinal direction. The current through a ring conductor embracing the toroidal discharge tube established the rotational transform required for plasma equilibrium. Smear photographs of the discharge were made, looking through the discharge tube in a plane which passes through the torus axis. Simultaneous measurements of light intensity and of the magnetic field in the gas show that the initial breakdown occurs at a time when the magnetic field is zero. The data allow an interpretation in which the plasma has the form of a shell. Marginal breakdown conditions have been measured. (Contractor's abstract)

THE BIOCHEMICAL RELATIONSHIP BETWEEN NEURON AND ITS OLIGODENDROGLIA. MOLECULAR CHANGES IN THE RNA OF NERVE AND GLIA CELLS DURING LEARNING AND DURING EXPERIMENTALLY INCREASED RNA AND PROTEIN SYNTHESIS, by H. Hydén. Apr. 30, 1961, 11p. incl. tables, refs. (AFOSR-1104) (AF 61(052)248) AD 262035 Unclassified

Fresh, isolated nerve cells or oligodendroglia have been analyzed with respect to RNA nucleotides, protein, respiratory enzyme activities, anaerobic glycolysis and ATP-ase activity. The amount of RNA nucleotides and protein has been expressed as $\mu\mu$g/cell. Several new methods for the $\mu\mu$g-range are described. The biochemical composition and enzyme activities were found to differ considerably in the nerve cell compared with its glia. Quantitative as well as qualitative differences could be produced by stimulation even down to the molecular level. They were found to be inversely related in the 2 types of cells of the neuron-glia complex. Evidence is presented that the nerve cell and the glia constitute a metabolic symbiosis. From an energetic point of view they form a coupled system. Based on these findings, the results are presented from a study of changes during learning experiments in rats. (Contractor's abstract)

EXPERIMENTALLY INDUCED CHANGES IN THE BASE COMPOSITION OF THE RIBONUCLEIC ACIDS OF ISOLATED NERVE CELLS AND THEIR OLIGODENDROGLIA CELLS, by E. Egyházi and H. Hydén. [1960] [8]p. incl. illus. diagrs. tables, refs. (AFOSR-2119) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)248, National Multiple Sclerosis Society, and Swedish Medical Research Council) AD 612854 Unclassified

Also published in Jour. Biophys. and Biochem. Cytol. v. 10: 403-410, July 1961.

The effect of tricyano-amino-propene, a dimer of malononitrile, on the base composition of the RNA in isolated Deiters' nerve cells and their oligodendroglial cells has been studied using a microelectrophoretic method. Tri-a-p in a dose of 20 mg/kg has the effect of increasing the RNA and protein content per nerve cell by 25% and decreasing the glia RNA by 45%. The RNA base composition of the nerve cells from the control animals differs from that of their glial cells. The guanine of the nerve cell is significantly higher than that of the glia, but the content of cytosine is higher in the glia than in the RNA of nerve cell. The cytosine of nerve cells decreased significantly after tri-a-p administration. In the glial cells the cytosine showed a 20% increase, and the guanine a 25% decrease. Tri-a-p sharpened the difference in RNA composition already existing between the control nerve cells and their glial cells by almost 300% for the guanine and by 400% for the cytosine. The chemical and functional relationship between the nerve cell and its oligodendroglial cells is discussed. (Contractor's abstract)

Also published in Biochim. et Biophys. Acta, v. 60: 271-283, July 1962.

Hydrolysis of radioactive ATP by isolated neurons and equal volumes of glia were studied. Glia without homogenization gave a rate of 1.7 μμ mol per sample/h indicating an "ecto"-ATPase; this value was 50% lower near the capillaries. The intact neuron gave no ATPase activity, however, on homogenization the activity was 1.0 μμ mol of ATP hydrolyzed per h. The pH dependence of the ATP hydrolysis by the neuron was broad with a maximum at pH 7.4, with glia it was sharper with a maximum about pH 8.0. The luciferin-luciferase system was used to measure ATP and the amount of ATP found was 123 μμg for the neuron and 5 μμg for glia. The cell wall of the neuron was isolated. This membrane preparation gave an "endo"-ATPase activity of 0.14 μμ mol of ATP hydrolyzed in either sucrose plus Mg^{2+} or Na^{+} plus Mg^{+2}. The rate was doubled when K^{+} was added to Na^{+} plus Mg^{2+} and completely inhibited by ouabain. These results emphasize the importance of this system in "active transport" and indicate that K^{+} and Na^{+} transport is coupled. (Contractor's abstract)

A METHOD FOR THE DETERMINATION OF NORMETANEPHRINE IN BRAIN, by A. Carlsson and M. Lindqvist. [1961] [4]p. incl. diagr. (AFOSR-4329) (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-61-44] and Swedish Medical Research Council) Unclassified

Also published in Acta Physiol. Scand., v. 54: 83-86, 1962.

Brain tissue is extracted with perchloric acid. The extract is neutralized and passed through a Dowex 50 column. Elution is performed by means of a carbonate-bicarbonate buffer, pH 10. Utilizing the principles of the trihydroxyindole method the normetanephrine of the eluate is converted into a strongly fluorescent compound. Fluorescence is measured in a spectrophotofluorometer. Results are satisfactory with respect to reproducibility, recovery, and specificity. (Contractor's abstract)

A Mg^{++}-ATP DEPENDENT STORAGE MECHANISM IN THE AMINE GRANULES OF THE ADRENAL MEDULLA, by A. Carlsson, N.-A. Hillarp, and B. Waldeck. [1961] [7]p. incl. diagrs. refs. (AFOSR-4330) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-61-44 and Public Health Service) Unclassified

Also published in Med. Exper., v. 6: 47-53, 1962.

The amine granules of the adrenal medulla take up and concentrate adrenalin and dopamine in vitro at low external concentrations of the added amines. The storage mechanism is activated by ATP and Mg^{++} and is blocked by some tranquillizers, especially reserpine, at low concentrations. It is also inhibited by 4 adrenergic blocking agents, dibenamine, phenoxybenzamine, dihydroergotamine and 3,4-dichloroisopropylnoradrenalin. (Contractor's abstract)

When L-DOPA (100 mg/kg body wt) was given intravenously to rabbits large amounts of first 3,4-dihydroxyphenylacetic acid (DOPAC) and then homovanillic acid rapidly accumulated in the brain stem. The data suggest that the dopamine formed in the brain from the administered DOPA first reaches sites of monoamine oxidase. The DOPAC thus formed then reaches sites of catechol-O-methyl transferase. The data also suggest that the accumulated phenolic acids do not easily escape from the brain to the blood. (Contractor's abstract)

HISTOCHEMICAL LOCALIZATION AT THE CELLULAR LEVEL OF HYPOTHALAMIC NORADRENALINE, by A. Carlsson, B. Falck and others. [1961] [2]p. (AFOSR-4332) (AF EOAR-61-44) Unclassified

Also published in Acta Physiol. Scand., v. 54: 385-386, 1962.

There is evidence that NA in the hypothalamus is accumulated in what appears to be synaptic nerve terminals. This amine may consequently serve as a synaptic transmitter in the brain. Another interesting finding is that there seems to be a local accumulation of NA (or possibly DA) in the median eminence where the hypophysial porta system arises.

IN-VIVO DECARBOXYLATION OF α-METHYL DOPA AND α-METHYL METATYROSINE, by A. Carlsson and M. Lindqvist. [1961] [8]p. incl. illus. diagrs. refs. (AFOSR-4333) (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-61-44] and the Swedish Medical Research Council) Unclassified

Also published in Acta Physiol. Scand., v. 54: 87-94, 1962.

α-Methyl DOPA (DOPA = 3, -dihydroxyphenylalanine) and α-methyl metatyrosine were injected to mice (400 mg/kg intraperitoneally). The former amino acid was also injected to rabbits (200 mg/kg intravenously). At varying intervals after the injection the brains were examined for monoamines (5-hydroxytryptamine, noradrenaline, dopamine, and α-methyl analogues). A transient decrease in 5-hydroxytryptamine and dopamine and a prolonged and more marked decrease in noradrenaline were observed. The α-methyl amino acids were found to undergo decarboxylation and subsequent β-hydroxylation in vivo. The drop in noradrenaline and dopamine levels in brain caused by the α-methyl amino acids appears to be largely due to displacement by these decarboxylation products, which may possibly also take over the functions of the physiological amines. FLUORESCENCE OF CATECHOL AMINES AND RELATED COMPOUNDS CONDENSED WITH FORMALDEHYDE, by B. Falck, N.-A. Hillarp and others. [1961] [7]p. incl. diagr. tables, refs. (AFOSR-4335) (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-61-44], National Institutes of Health, and Swedish Medical Research Council) Unclassified

Also published in Jour. Histochem. and Cytochem., v. 10: 348-354, May 1962.

The reaction under mild conditions between formaldehyde and phenylalanine and phenylethylamine derivatives has been studied. When the amines included in a dried protein film were exposed to formaldehyde vapor a very intense green to yellow fluorescence was given only by those that as well as being primary amines also have hydroxyl groups at the 3 and 4 positons (3,4-dihydroxyphenylalanine, dopamine, noradrenaline). The 3-OH group seems to be essential for the reaction. The catechol amines, which are secondary amines (adrenaline, epinine), gave a much weaker fluorescence that developed more slowly. The results obtained on further examination of the reaction favor the view that the amines primarily condense with formaldehyde to 1,2,3, 4-tetrahydroisoquinolines which are involved in a secondary reaction to become highly fluorescent and at the same time insoluble. This secondary reaction may be a binding to protein, an oxidation with the formation of double bonds in the heterocyclic ring, or both. (Contractor's abstract)

[ON A RHYTHMIC BREATHING STIMULATION SUBSTRATE IN THE RHOMBENCEPHALON OF THE CAT] Über ein Substrat atmungsrhytmischer Erregungsbildung im Rautenhirn der Katze, by R. von Baumgarten, K. Balthasar and H. P. Koepchen. [1959] [25]p. incl. illus. diagrs. refs. (AF 61(514)1265) Unclassified

Published in Pflügers Arch. ges. Physiol., v. 270: 504-528, Mar. 1960.

In 38 histologically controlled microrecordings of inspiratory neurons of the cat the previously marked recording point was situated within a group uniquely of large nerve cells in the rhombencephalon, 1-3 mm rostral and 2-3 mm lateral to the obex. These cells form a 2 mm long band-like structure immediately ventrolateral to the tractus solitarius. Because of their well-defined position and specific function it seems to be justified to regard them as an "inspiratory nucleus". Homologous cell-formations are also to be found in dogs, rabbits, monkeys, and in man. It has been shown that afferent vagal fibers run to the inspiratory nerve cells. This was seen in experiments in which the vagus nerve was stimulated with electric shocks and its lung stretch receptors through lung inflation, as well as in investigations of degeneration following the severance of some vagal rootlets. Retrograde degenerations of inspiratory nerve cells following vagotomy could not be found. Therefore there is no evidence that these cells are vagal motoneurones. On the other hand, alterations of the inspiratory nerve cells of both sides were observed in cats and monkeys, following unilateral hemisection of the spinal cord at the level of C2. They seemed to be retrograde degenerations, thus it may be suggested that efferent axons coming from the inspiratory nerve cells descend, partially crossed, partially uncrossed, to spinal levels. Intracellular microrecordings of the inspiratory neurons showed, beside action potentials, also repolarization potentials, pacemaker potentials, miniature potentials and a slow "respiratory potential" lasting throughout the discharging period. The discharging threshold (firing level) rose markedly and continuously reaching a maximum at the end of the discharging period. As a new working hypothesis, it is suggested that the inherent rhythmicity of breathing rests, among other things, on 2 independent mechanisms: The end of each inspiratory period is caused by the excessive height of the discharging threshold, whereas the beginning of the period depends more on the cessation of inhibiting discharges which come from the reciprocally innervated expiratory neurons. (Contractor's abstract)

[CONTRIBUTIONS ON THE TECHNIQUE OF THE EXTRA- AND INTRACELLULAR, AS WELL AS THE STEREOTAXIC MICROELECTRODES IN THE BRAIN] Beitrag zur Technik der extra- und intracellulären, sowie der stereotaktischen Mikroableitung in Gehirn, by R. von Baumgarten, E. Kanzow and others. [1960] [ ] incl. illus. refs. (AF 61(514)1265) Unclassified

Published in Pflügers Arch. ges. Physiol., v. 271: 245-256, May 1960.

A method for preparation of glass insulated and sharpened platinum-wire-microelectrodes is outlined. Some experiences of the laboratory in preparing and using capillary microelectrodes are given. A method for avoiding brain pulsation during intracellular recording is reported. A headsupport with a microdrive especially adapted for microrecording and a new apparatus for stereotaxic microrecording are described. A new method for marking the site of recording with capillary or metallic electrodes is suggested. It is based on the photographic reduction of silver at small metallic deposits in the tissue. A critical consideration is given to the interpretation possibilities of microrecording in the brain.

INTRACELLULAR POTENTIALS FROM RESPIRATORY NEURONES IN BRAIN-STEM OF CAT AND MECHANISM OF RHYTHMIC RESPIRATION, by G. C. Salmoiraghi and R. von Baumgarten. [1960] [16]p. incl. illus. diagrs. refs. (AF 61(514)1265) Unclassified

Published in Jour. Neurophysiol., v. 24: 203-218, Mar. 1961.

The potential level at which action potentials were produced by 7 inspiratory and 1 expiratory neurones successfully penetrated was not the same throughout the burst of action potentials but shifted in the direction of depolarization as the burst progressed. Since temporal summation of synaptic potentials was the cause of each spike, the observed shift of the firing level implies that the excitability of respiratory neurones became less as the burst progressed. It is suggested that such a limiting factor plays a major role in periodically bringing the discharge of the neurone to an end. Rhythmicity would appear to result from the interplay of 3 factors: (1) self-reexciting and (2) self-limiting mechanisms within the inspiratory and the expiratory networks of neurones, and (3) reciprocal innervation of the 2 networks.

[ON THE TERMINAL REGION OF THE AFFERENT, CARDIOVASCULAR FIBERS OF THE VAGUS NERVE IN THE RHOMBENCEPHALON OF THE CAT] Über ein Endigungsgebiet afferenter, kardiovasculärer Fasern des Nervus vagus im Rautenhirn der Katze, by K. Hellner and R. von Baumgarten. [1961] [12]p. incl. illus. diagrs. refs. (AF 61(514)1265) Unclassified

Published in Pflügers Arch. ges. Physiol., v. 273: 223-234, June 1961.

A systematic exploration with microelectrodes of the cat rhombencephalon has been made to localize neurons discharging in sunchrony with various phases of the heart beat. One to 3 mm rostral to the obex and 1 mm lateral to the edge of the fourth ventricle a point was found where such action potentials were especially common. The depth and exact position of the microelectrode tip was indicated by making a small electrolytic lesion. The recording points were found to lie within the sensory nucleus of the vagus dorsal or dorsolateral to the tractus solitarius. Three types of burst discharges were noted within the region indicated: shortly after the R wave of the electrocardiogram, during the P wave and during the T wave. This corresponds to the 3 types of activity which have been found in vagal neurons. A variety of reasons have been advanced for believing that the action potentials are recorded postsynaptically. Evoked potentials were recorded selectively in the same region when the vagus was stimulated. These evoked potentials were not able to follow stimuli over 100/sec. Stimulation at the same point with the same microelectrode lowered the blood pressure and slowed the heart. It is concluded that the cardiovascular vagal afferents terminate in this region of the medulla and that neurons there are fired with approximately the same rhythms as the vagal afferent fibers. EFFECT OF AUTONOMIC AFFERENT IMPULSES ON BRAINSTEM NEURONS, by R. von Baumgarten. Final technical rept. Sept. 30, 1961 [49]p. incl. illus. diagrs. table, refs. (AFOSR-2011) (AF 61(052)14) AD 272254 Unclassified

Methods were developed for production of sharpened platinum-wire electrodes with glass isolation; and for recording from moving tissue. A new stereotaxic machine is introduced which allows changing arbitrarily the point of drillhole on the skull and the direction of approach with the electrode for a given target. A technique for the large exposure of the rootlets of the ninth and tenth cranial nerves and a new method for histological

determination of the site of the tip of micropipettes in tissue are presented. The usefulness of different kinds of microelectrodes for different purposes is discussed. Analysis of recordings from single filaments of the vagal rootlets has shown that cardiac and respiratory afferent activity enters the brain at different levels. Chronic degeneration experiments with transsection of caudal (respiratory) rootlets of the vagus nerve showed terminal degeneration in a region rostrolateral to the obex and ventral to the tractus solitarius. Intracellular records of respiratory nerve cells in the medulla oblongata of cats were obtained. The rhombencephalon was explored for impulses correlated with heart beats.

A STUDY OF NATURAL CONVECTION ABOVE A LINE FIRE, by S.-L. Lee and H. W. Emmons. [1961] [16]p. incl. illus. diagrs. table. (AFOSR-1958) (AF 49-(638)29) Unclassified

Also published in Jour. Fluid Mech., v. 11: 353-368, Nov. 1961.

In the theoretical treatment, a turbulent plume above a steady 2-dimensional finite source of heated fluid in a uniform ambient fluid is investigated. By the use of the lateral entrainment assumption, a quadrature solution has been obtained for each of 2 separate ranges of a source Froude number, $F > 1$ or $F < 1$. In neither of these cases can the finite width line source be accurately represented by an equivalent mathematical line source at a lower level. Only the special case, $F = 1$, can be so represented and its solution is discussed. In the experimental treatment, hot gases, resulting from the burning of a liquid fuel in a long channel burner, are driven upwards by buoyancy and gradually cooled down by the entrainment of ambient air. The average temperature along lines parallel to the channel burner was measured by a piece of resistance wire. For the case of a non-luminous diffusion flame, the effective radiation loss to the surroundings was assumed to be negligible, and, by a comparison of the energy flux supplied from the fuel and the energy flux contained in the plume, the characteristic turbulence entrainment coefficient is determined. By the alternate use of either an absorbing or a reflecting surface for the table-top surrounding a luminous flame, a measurement was made of the energy radiated from the flame that was intercepted by the fire surroundings and subsequently returned to the buoyancy plume by heating the ingested air. These measurements agree with available estimates computed from such data. The experimental results relating to the behavior of the convection plume agree closely with the theoretical predictions in all cases.

GEOMETRICAL CONSIDERATIONS IN THE BURNING OF LIQUID DROPS, by D. G. Udelson. [1961] [10]p. incl. illus. diagrs. (AFOSR-2994) (AF 49(638)29) AD 438559 Unclassified

Also published in Combustion and Flame, v. 6: 93-102, June 1962.

Previous experimental work has demonstrated the existence of 2 regimes of burning on liquid fuel spheres placed in a moving air stream: envelope flames and wake flames. In this study, a third regime of burning is distinguished wherein a flame is stabilized in the boundary layer at the side of a liquid sphere. The angular position which the side flame assumes when measured from the forward stagnation point of the sphere is shown to increase with free stream air velocity. It is also demonstrated that the angular position depends on the sphere size as well as on the orientation of the air flow with respect to the gravity force thus proving natural convection to be an important factor. Boundary layer theory is employed and provides a quantitative basis for the above phenomena. (Contractor's abstract)

A STUDY OF THE OPTIMAL CONTROL OF DYNAMIC SYSTEMS, by Y.-C. Ho. Feb. 10, 1961 [103]p. incl. diagrs. refs. (Technical rept. no. 335) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616) AD 261851 Unclassified

The problem of controlling the behavior of a general dynamic system subject to various physical constraints is studied. The class of dynamic systems considered is assumed to obey the linear vector differential equation $\dot{x} = Fx + Du$, $x(0) = c$, where x is an n-vector called the state vector, F is a nxn matrix of constant elements, D is a nxr matrix of constant elements, and u is an r-vector called the control vector. The constraints stipulated are, (1) $u(t) = u(iT)$ for $iT \leq t < (i + 1)T$ and (2) $|u(t)| \leq 1$ for $t \geq 0$, i.e., the control vector is constrained to be piecewise constant and amplitude limited. The determination of u(t) subject to (2) or (3) or both such that the state vector x(t) attains the value zero in minimum time or the integral of some measure of the vector is a minimum over a period of time, is of interest. A well-known example of this class of problems is the so-called bang-bang control problem. (Contractor's abstract)

THE ANALYSIS OF A SECOND-ORDER LINEAR DIFFERENTIAL EQUATION WITH EXPONENTIALLY VARYING GAIN, by T. S. Baker and K. S. Narendra. Mar. 15, 1961 [28]p. incl. diagrs. (Technical rept. no. 334) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616) AD 258891 Unclassified

The behavior of a second-order differential equation with exponentially varying gain is analyzed. When a system has a certain type of time varying gain it may be possible to approximate it by a function of the form $(B^2 e^{-2\alpha t} + 1)$. In other situations it may be practical to introduce just such a variation to obtain desirable transient characteristics. The step response of the equation

$$\frac{d^2\theta(t)}{dt^2} + 2\zeta\frac{d\theta(t)}{dt} + (B^2e^{-2\alpha t} + 1)\theta(t) = (B^2e^{-2\alpha t} + 1)f(t)$$

is obtained analytically by means of an analog computer in terms of the system parameters. Solutions for time varying gain and with constant maximum overshoot are discussed. It is concluded that the major difficulty in discussing this system is that there are too many parameters to keep track of. Hence, for $\zeta = 1$, $\zeta = 2$, the overshoot shall not exceed 50% if the special case of $a = 2$ is considered. For the fastest initial time response, B should be adjusted to give the response with the maximum overshoot, $\theta_m = 1.5$.

FINAL VALUE CONTROL PROBLEMS AND THE METHOD OF CONSTRAINED DESCENT, by Y.-C. Ho. Apr. 10, 1961, 5p. (Technical rept. no. 340) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616) AD 258557 Unclassified

The solution of the vector matrix equation, $Ax = b$ subject to the constraint $L^- \leq x \leq L^+$ where $L^+ \geq 0$, $L^- \leq 0$, and $L^+ - L^- > 0$ is discussed, where A is an r x n matrix, b is an r vector, L^+, L^-, and x are n vectors. Such problems often arise in the consideration of final value control systems. In such case, b is visualized as the vector representing the desired final state of the system: x, the control to be applied at successive control intervals 1, ..., n; A, the matrix of influence coefficients which represent the effect of the components of x on the final state of the system; L^+ and L^-, the limits for the control vector x, reflecting practical constraints for allowable variations of x. Examples as to how such problems arise in detail have been described by others. Solutions to the above mentioned problem may be nonexistent or infinite in number. The purpose here is to illustrate a systematic way of solving such a problem which does not require advanced knowledge concerning the existence of solutions. (Contractor's abstract)

917

Harvard U. Cruft Lab., Cambridge, Mass.

APPLICATION OF MATRIX METHODS TO THE OPTIMUM SYNTHESIS OF MULTIVARIABLE SYSTEMS SUBJECT TO CONSTRAINTS, by K. S. Narendra and R. M. Goldwyn. June 15, 1961 [23]p. incl. diagrs. (Technical rept. no. 342) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616) AD 263428 Unclassified

Matrix methods are used to extend well-known concepts in single variable systems to the case of systems with several inputs and outputs. The analysis of such multivariable systems, when subjected to random inputs, is considered in the time and frequency domains. Constraints are set up in terms of bandwidth and saturation—as logical extensions of the single variable case—for multivariable systems, and the physical significance of such constraints is discussed. Using the matrix relations obtained, a vector integral equation of the Wiener-Hopf type is derived by minimizing a generalized mean square error. The effect of constraints on the minimization procedure is studied using variational methods. (Contractor's abstract)

Harvard U. Cruft Lab., Cambridge, Mass.

ON COMPUTING MINIMA BY THE PENALTY FUNCTION APPROACH, by Y.-C. Ho. Nov. 10, 1961 [21]p. incl. diagrs. (Technical rept. no. 347) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616) AD 269057 Unclassified

There has been considerable interest in the computational solution of problems of optimal control or programming. This problem may be stated as follows: Minimize $x_0(t_1)$ subject to either (1) $x_i(t_1) = c_i$, $i = 1,2,...,n$ or (2) $x_j(\tau_k) \leq 0$, $j = 1,...,n$, $k = 1,2,...,K$ or both equation 1 and equation 2. The effectiveness of the penalty function approach as a computational tool for solving minimization problems is discussed. The effectiveness of this method as compared to that of gradient projection when applied to problems with equality constraints as side conditions, is yet to be determined. The penalty function method is not applicable in practice to problems with inequality side conditions because a systematic procedure to assure its convergence to approximately the true minimum is lacking at present. All proposed solutions to this

problem seem to, of necessity, involve the eventual determination of the vector g which represents the correct multipliers to the problem.

LINEAR EFFECT OF APPLIED ELECTRIC FIELD ON NUCLEAR QUADRUPOLE RESONANCE, by J. Armstrong, N. Bloembergen, and D. Gill. [1961] [4]p. incl. diagr. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-186616]) Unclassified

Published in Phys. Rev. Ltrs., v. 7: 11-14, July 1, 1961.

The second moments of the Cl^{35} resonances in polycrystalline $NaClO_3$ were found to increase linearly with the strength of an applied static electric field, up to the max field used (17 kv/cm). The interpretation is the same as given by T. Kushida and K. Saiki (Phys. Rev. Ltrs., v. 7: 9-10, July 1, 1961) and is based on a linear variation of the electric field gradient at the position of the nuclei with the externally applied electric field, if these positions lack inversion symmetry. Suggestions are made for the related experiments, including the induction of nuclear spin transitions by a radiofrequency electric field.

Published in Phys. Rev., v. 123: 1122-1129, Aug. 15, 1961.

The anisotropy fields, g values, and linewidths of yttrium, erbium, and ytterbium iron garnets (YIG, ErIG, and YbIG); $MgFe_2O_4$ with variable distribution of Mg^{+2} ions; and $Ni_{1-z}Co_zFe_2O_4$ with variable z = 0, 0.05, and 0.10, were measured at X-band and room temperature as functions of hydrostatic pressure to 10^4 kg/cm^2. The pressure dependence of magnetization was measured using magnetostatic mode methods in the narrow linewidth materials, YIG and $MgFe_2O_4$. The complexity of the crystal structure and magnetic interactions makes any quantitative interpretation very difficult. However, the observations can be understood qualitatively in terms of the volume dependence of the crystalline fields and the exchange interactions. In the case ErIG, the volume dependence of the ferric-rare-earth exchange constant is calculated; and, in the case of nickel cobalt ferrite, a simple explanation is given for the observed volume dependence of the Co^{+2} anisotropy. The contribution of thermal lattice vibrations to the linewidth in YIG is discussed, and the possibility of the anisotropic spin-orbit interaction is considered.

LINEAR EFFECT OF ELECTRIC FIELD ON THE Cl^{35} QUADRUPOLE INTERACTION IN PARADICHLOROBENZENE, by J. Armstrong, N. Bloembergen, and D. Gill. [1961] [2]p. incl. diagr. table. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-186616]) Unclassified

Published in Jour. Chem. Phys., v. 35: 1132-1133, Sept. 1961.

Observations of the broadening of the Cl^{35} pure quadrupole resonance in polycrystalline p-dichlorobenzene in fields up to 23.8 kv/cm at 77°K. A linear relation between second moment and field squared is observed corresponding to 500 ± 60 c/sec (see item no. 925, Vol. V). This is 3 times as large as in (ionic) NaCl. This stark effect may give additional information about chemical bonds.

REACTANCES ASSOCIATED WITH A CLASS OF NEGATIVE RESISTANCES, by J. S. T. Huang and A. A. Pandiscio. [1961] [7]p. incl. diagrs. table. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616) Unclassified

Published in Jour. Electronics and Control, v. 12: 265-271, Apr. 1962.

For those classes of negative resistance devices which can be cast into appropriate feedback models, knowledge of the loop gain is sufficient to determine the negative resistance and its associated reactance utilizing Bode's active immittance relations (1945). Even when the external stray elements are taken into account, it is shown that a shunt capacitance is always associated with a voltage controlled and a series inductance with a current controlled negative resistance. THE TRANSIENT RESPONSE OF LINEAR ANTENNAS AND LOOPS, by R. W. P. King and H. J. Schmitt. Mar. 30, 1961 [14]p. incl. diagrs. (Technical rept. no. 338) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632) AD 259650 Unclassified

The transient response of straight wires and circular loops when short pulses are applied is studied experimentally and theoretically. It is shown that the initial response is always that of an infinitely long antenna at a frequency near the upper limit of the frequencies contained in the pulse provided this is sufficiently short so that the first reflection from the end of the wire or loop is not superimposed on it. THE ELECTRICAL PUMPING OF DIELECTRIC LIQUIDS, by W. Pickard. Dec. 1, 1961, 1v. incl. diagrs. refs. (Technical rept. no. 350) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632) AD 274913 Unclassified

The problem of the pumping of dielectric fluids by the action of electric fields is considered both theoretically and experimentally. The existing theory of co-field effects is revised and extended; a qualitative theory is developed for cross-field effects. A number of original experiments are described for both the co- and cross-field cases; for example, the pressures generated in a cross-field pump are studied as a function of fluid temperature and rate of fluid flow. It is concluded that co-field pumping is due to the emission of ions from the electrodes and that cross-field pumping is a result of Sumoto type phenomena at fluid interfaces and of co-field effects in the fringing fields of the pump. THE MOLECULAR AND CRYSTAL STRUCTURE OF HYDROGEN CYANIDE TETRAMER (DIAMINOMALEONITRILE), by B. R. Penfold and W. N. Lipscomb. [1961] [8]p. incl. diagrs. tables, refs. (AFOSR-1125) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)809] and National Institutes of Health) AD 259965 Unclassified

Also published in Acta Cryst., v. 14: 589-597, June 1961.

A 3-dimensional crystal structure analysis of hydrogen cyanide tetramer has led to a location of all atoms with average standard deviations of 0.0025A for C and N atoms and 0.04A for hydrogens. The diaminomaleonitrile structure is proved. In its crystal setting the molecule has no symmetry. The 2 amino groups have different configurations, 1 being planar and 1 tetrahedral with both being involved in intermolecular N-H. . .N hydrogen bonds. An analysis is made of the anisotropic nature of the atomic thermal vibrations. Molecular orbital calculations have been made for this molecule and for tetracyanoethylene leading to π bond orders for all bonds. Order/length relationships for the C-C bonds are discussed. THE CRYSTAL AND MOLECULAR STRUCTURE OF CELLOBIOSE, by R. A. Jacobson, J. A. Wunderlich, and W. N. Lipscomb. [1961] [10]p. incl. diagrs. tables, refs. (AFOSR-1126) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)809] and National Institutes of Health) AD 259966 Unclassified

Also published in Acta Cryst., v. 14: 598-607, June 1961.

The structure of β-cellobiose has been determined by 3-dimensional Patterson superposition techniques, in which an improved sharpening procedure based on the gradient of the electron density function was used to increase resolution. The 1:4 linking of the 2 'chair'

β-glucopyranose residues is confirmed. The molecule has an internal hydrogen bond, O'_3-H:···O_5 of length 2.80A, and C-O-C angles within the rings of 117° and 115°, significantly greater than the tetrahedral angle. It is of interest in connection with the proposed structures of forms of cellulose that the molecule has the bent conformation with the glucose residues somewhat twisted relative to one another, and that the isolated molecule would not have a 2-fold axis. All OH hydrogens seem to be involved in the hydrogen bonding scheme in the crystal. (Contractor's abstract)

RAMIFIED COVERINGS OF RIEMANN SURFACES, by D. H. Husemoller. [1961] [8]p. [AF 18(600)1461] Unclassified

Published in Duke Math. Jour., v. 29: 167-174, Mar. 1962.

A. Hurwitz (Math. Ann., v. 39: 1-61, 1891) introduced the general idea of describing a ramified covering by its associated unramified covering and investigated the case of coverings of simply connected surfaces. This paper develops a precise setting for the general classification of ramified coverings. This is then applied to the determination of all finite coverings of compact surfaces and bordered surfaces of genus strictly greater than zero. The Hurwitz relation for the genera of a covering of a compact surface is generalized to bordered surfaces.

ON BLOCKS OF REPRESENTATIONS OF FINITE GROUPS, by R. Brauer. [1961] [3]p. (AFOSR-64-0071) (AF 49(638)287) AD 431078 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 47: 1888-1890, Dec. 1961.

Further results, needed for the application of the theory to an investigation of the structure of groups of even order, are given. Suppose G is a finite group and p a fixed prime. The irreducible characters of G are distributed into disjoint sets, the p-blocks of G. Let G^0 be the set of p-regular elements of G and χ_μ^0 the restriction of the character χ_μ to G^0. If B is a fixed block, the functions χ_μ^0 with $\chi_\mu \in B$ generate a Z-module, a basis for which is called a basic set for B. It is shown that for a given p-block of defect d, a basic set can be chosen so that the Cartan invariants are bounded above by a number depending only on p^d. Among other results, it is shown that given p^d, there are only a finite number of types of p-blocks of defect d.

ON DIFFERENTIALS IN FUNCTION FIELDS, by O. Zariski and P. Falb. [1961] [15]p. (AFOSR-1788) (AF 49(638)494) AD 428467 Unclassified

Also published in Amer. Jour. Math., v. 83: 542-556, July 1961.

It is concerned mainly with finding a suitable definition of the v-value v(dx) of a differential dx on a curve C, for a valuation v. The difficulty arises when the ground field k is imperfect (although the field K = k(C) is assumed to be separably generated), and is usually overcome by means of the repartitions, and by an artificial definition of the differentials. The definition proposed is as follows: (1) write $k = k_1(u_1, \ldots, u_\rho)$, where $\{u_1, \ldots, u_\rho\}$ is a subset of a p-basis of k over k^p such that the defining ideal of C has a basis consisting of polynomials in $k^p[u, X]$ (the X's are the coordinates of the affine space); k_1 must contain k^p, and the u's must form a p-basis of k over k_1; (2) call "differential" an element of the dual of the K-module of the derivations in K with k_1 as constant field; (3) at a place v of K over k, consider "uniformizing parameters" $\xi_1, \ldots \xi_{\rho+1}$ such that there are derivations D_i with the property $D_i R_v \subseteq R_v$, $D_i \xi_j = \delta_{ij}$; (4) set $v(dx) = v(A)$ if $dx \wedge du_1 \wedge \ldots \wedge du_\rho = A\, d\xi_1 \wedge \ldots d\xi_{\rho+1}$. With this definition, which is independent of k_1 and of the ξ's and u's, it is shown that the

v-value of dx is related in the customary manner to the different; it is therefore a "good" definition for use in the Riemann-Roch theorem.

[THE SOLUTION OF A SINGULARITY OF AN EMBEDDED ALGEBRAIC SET. NOTE II.] La risoluzione delle singolarità delle superficie algebriche immerse. Nota II, by O. Zariski. [1961] [4]p. (AFOSR-3315A) (AF 49(638)494) Unclassified

Also published in Atti Accad. Naz. Lincei, Rend. Classe Sci. Fis. Mat. e Nat., v. 31: 177-180, Nov. 1961.

A simple demonstration is given of the following theorem: If F is an algebraic surface substituted in a nonsingular variable V of dimension 3, F can be transformed into a nonsingular surface which is the average of a set of transformations of an ambient variable. It defines the average of the discriminant, the locus of the critical curve of a singular point P of F, and says that P is "isolable" if it is the singular point of this curve. The singular "isolable" points that do not satisfy any singular curve of F, and certain points (in name only) of singular curves of F, of a point boundary, wherein the critical curve has a double point of distinct tangents, follow at points where this curve has a simple point (i.e., simple points or singular, non-isolable ones). The previous note (see item no. 939, Vol. V) shows how to resolve the singular curves of F.

CURVATURE PROPERTIES OF TEICHMÜLLER'S SPACE, by L. V. Ahlfors. [1961] [16]p. (AFOSR-8) [AF 49(638)574] AD 256013 Unclassified

Also published in Jour. Anal. Math. (Jerusalem), v. 9: 161-176, 1961.

Using integral representations of the Beltrami differentials and quadratic differentials associated with compact surfaces of a given genus $g > 1$, a number of formulae bearing on the structure of the Teichmüller space T_g is obtained. A Riemannian metric on T_g is examined and explicit expressions are obtained for the derivatives of the coefficients g_{ij}. This leads first to a direct proof that the metric is Kahlerian, and then to a demonstration that the Ricci curvatures and the curvatures of holomorphic sections are negative. It follows that the scalar curvature at each point, being the sum of Ricci curvatures, is also negative. (Math. Rev. abstract)

Harvard U. [Dept. of Mathematics, Cambridge, Mass.]

A NEW GENERALIZATION OF JENSEN'S THEOREM ON THE ZEROS OF THE DERIVATIVE OF A POLYNOMIAL, by J. L. Walsh. [1961] [6]p. (AFOSR-62) (AF 49(638)574 and AF 49(638)845) AD 256038 Unclassified

Also published in Amer. Math. Monthly, v. 68: 978-983, Dec. 1961.

Generalizations (A) and (B) are established and discussed for the following theorem, which is itself a generalization of Jensen's theorem: Let p(z) be a real polynomial not identically constant all of whose zeros have real parts in the interval $\alpha \leq x \leq \beta$ of the axis of reals, and let γ be a real point not interior to that interval and not having an abscissa equal to that of a nonreal zero of p(z). Let $\Gamma(z_k)$ denote the circle through the conjugate pair $(z_k, \bar{z}_k)$ of nonreal zeros tangent to the line γz_k at z_k. Then all nonreal zeros of the derivative $p'(z)$ lie in the closed interiors of the circles $\Gamma(z_k)$. Generalizations are: (A) Let r(z) be a real rational function but identically constant all of whose finite zeros lie in the half-plane $x > 0$ and all of whose finite poles lie in the half-plane $x > 0$, except that $z = 0$ may be a zero or a pole. Let a circle $\Gamma(z_k)$ be drawn with center on the axis of reals passing through each conjugate pair $(z_k, \bar{z}_k)$ of zeros and of poles, where $\Gamma(z_k)$ is tangent at z_k to the line $0z_k$. Then all nonreal zeros of $r'(z)$ lie in the closed interiors of the $\Gamma(z_k)$. (B) Let p(z) be a real polynomial all of whose zeros lie in the closed interior of the circle whose diam is the segment $\alpha\beta$ of the axis of reals, and let all the nonreal zeros lie interior to that circle. For each pair $(z_k, \bar{z}_k)$ of conjugate imaginary zeros of p(z) let Γ_k be the circle tangent at z_k and $\bar{z}_k$ to the respective circles $\alpha z_k \beta$ and $\alpha \bar{z}_k \beta$. Then all nonreal zeros of $p'(z)$ lie in the closed interiors of the Γ_k. A nonreal point z_0 on a circumference Γ_k but not a multiple zero of p(z) and not on or within a second circle

Γ_j cannot be a zero of p'(z) unless p(z) has precisely three distinct zeros, one at α or β.

DEGREE OF POLYNOMIAL APPROXIMATION TO AN ANALYTIC FUNCTION AS MEASURED BY A SURFACE INTEGRAL, by J. L. Walsh. [1961] [7]p. (AFOSR-63) (AF 49(638)574 and (AF 49(638)845) AD 256015 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 48: 26-32, Jan. 1962.

Let C be an analytic Jordan curve with interior D. Walsh and Russel (see item no. HAR.05:010, Vol. II or Trans. Amer. Math. Soc., v. 92: 355-370, 1959) have found the connection between the best polynomial approximation on C in the sense of $\int_C |f(z) - p_n(z)|^p dz$, $p > 1$, and integrated Lipschitz conditions satisfied by the derivatives of f on C. The present note is concerned with approximation in the sense of (1) $\iint_D |f(z) - p_n(z)|^p dz$, $p > 1$. By definition, the class $L_p(k, \alpha)$, $p > 1$, $k = 0, 1, 2, \ldots$, $0 < \alpha < 1$, consists of those functions in H^p such that $\int_{-\pi}^{\pi} |f^{(k)}(e^{i\theta}) - f^{(k)}(e^{i(\theta+\delta)})|^p d\theta \leq A|\delta|^{p\alpha}$. This function class can be transplanted to D by conformal transformation. The main result is a constructive characterization of the (transplanted) class $L_p(k, \alpha)$: A function f(z) holomorphic in D belongs to $L_p(k, \alpha)$ if and only if there exist polynomials $p_n(z)$ of degree n such that (1) does not exceed $M/n^{k+\alpha+1/p}$, M being independent on n, z. The proof follows from the corresponding result of Walsh and Russell through the inequality $\iint_{|z|<1} |P(z)|^p d\sigma \leq \frac{1}{np+2} \int_{-\pi}^{\pi} |P(e^{i\theta})|^p d\theta$, valid for polynomials P(z), which connects the norms. There are equally satisfactory results for the case when $\alpha = 1$, as well as when $k = -1$, involving instead of $L_p(k, \alpha)$ a function class defined through an integrated modulus of smoothness. Finally, 2 theorems concerning approximation by bounded analytic functions are stated.

GRUNSKY INEQUALITIES AND COEFFICIENTS OF BOUNDED SCHLICHT FUNCTIONS, by V. Singh. Apr. 1961 [32]p. incl. refs. (AFOSR-550) (AF 49(638)574) AD 256016 Unclassified

Also published in Ann. Acad. Scient. Fennicae, Series A. I., No. 310, 1962, 22p.

Let D be a plane finitely connected domain whose boundaries are closed Jordan curves C_ν and let f(z) be a regular analytic function in D whose coefficients in power series expansion about a point $\zeta \in D$ are b_ν. Grunsky had given a set of necessary and sufficient conditions, depending upon b_ν, so that f(z) may be extended as a schlicht function in D. In the present report, Grunsky's conditions have been extended to the case when f(z) has the additional restriction of being bounded. i.e., $|f(z)| < 1$, $z \in D$. These conditions have then been used to get distortion theorems and coefficient inequalities for bounded schlicht functions in $|z| < 1$ and in $|z| > 1$. (Contractor's abstract)

Harvard U. [Dept. of Mathematics] Cambridge, Mass.

APPROXIMATION BY BOUNDED ANALYTIC FUNCTIONS TO FUNCTIONS REPRESENTED BY DIRICHLET SERIES, by J. P. Evans and J. L. Walsh. [1960] [9]p. (AFOSR-552) (AF 49(638)574 and AF 49(638)845) AD 256017 Unclassified

Also published in Proc. Amer. Math. Soc., v. 12: 875-879, Dec. 1961.

Results on approximation to a function f(z) which is analytic on a closed point set $\bar{R}_0$ by functions analytic and bounded in a region R_1 which contains $\bar{R}_0$ and whose boundary C_1 has points in common with $\bar{R}_0$ have been established by the authors [Walsh and Evans, Arch. Math., v. 5: 191-196, 1954]. Here the study of the problem is continued under the assumption that there be exactly one common point A of the boundaries C_0 and C_1, which are required to be Jordan curves, and that f(z) no longer need be analytic at A. A new method is employed, the use of Dirichlet series. Let $w = \theta(z)$, $z = x(w)$ map conformally R_1 onto Re $w > u_1$ and C_0 onto Re $w = u_0$, $u_1 < 0 > u_0$; f(z) is supposed to belong to the class D, that means $f(x(w)) = g(w)$ is representable by the Dirichlet series $\sum_{\nu=1}^{\infty} a_\nu e^{-\lambda_\nu w}$, $0 \leq \lambda_1 < \lambda_2 < \ldots$, $\lambda_\nu \to \infty$, which converges [converges uniformly] to g(w) throughout every half-plane of analyticity of g [contained in the half-plane of convergence]. If $\varphi(z)$ is harmonic and bounded in $R_1 - \bar{R}_0$, continuous in $\bar{R}_1 - R_0 - A$, $= 0$ on $C_0 - A$, $= 1$ on $C_1 - A$, and if C_σ is the locus $\varphi(z) = \sigma$ $(0 < \sigma < 1)$, R_σ the interior of $C_\sigma + A$, and if f(z) is of D analytic throughout some R_ρ but no $R_{\rho'}$ $(0 < \rho < \rho' < 1)$, then for a function $f_u(z)$ of best approximation to f(z) on $\bar{R}_0 - A$, where fu(z) is analytic and $|fu(z)| \leq M$ in R_1, the

lim sup $(M \to \infty)$ of the $(\log M)^{-1}$ power of sup $|f(z) - fu(z)|$, $z \in R_\sigma - A$, sup $|fu(z)|$, $z \in R_\sigma$, is $\exp((\sigma - \rho)/(1 - \rho))$ for $0 \le \sigma < \rho$ and $\rho \le \sigma \le 1$, respectively. By the above conformal mapping the problem is reduced to another one that concerns Dirichlet series: C_σ is mapped onto the line Re $w = u_\sigma$, C_ρ onto Re $w = u_\rho$ which may be taken to be 0, point A on $w = \infty$.

In this form the problem is solved by the authors with the aid of known properties of Dirichlet series. Analog results can be gained in the discussion of the companion question of approximation to f(z) by functions fm(z) of minimum norm.

CONFORMAL MAPS OF SMALL DISKS, by J. L. Walsh and T. S. Motzkin. [1961] [6]p. (AFOSR-3319) (In cooperation with California U., Berkeley) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)574] and Office of Naval Research) AD 453957 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 47: 1838-1843, Nov. 1961.

Partial answers are given to 3 problems. (A) The simplest case of least max (Tchebycheff) approximation on a point set is that by a constant. For an analytic function, $w(z) = \sum_{j=0}^{\infty} C_j Z^j$ in the prescribed neighborhood $|z| \le \epsilon$ of zero, the value $w(0) = c_0$ is obviously a good approximation. By how much do the above best-constant and this value differ? (B) Where is the above constant attained as a value of the function, and what are the asymptotic properties of such a location when $\epsilon \to 0$? General theorems on problems (A) and (B) are proven and discussed with respect to special situations, e.g., $w(z) = z + z^2$, $\epsilon < \frac{1}{4}$. (C) The above problems are related to that of describing and determining global properties of the conformal transform of small regions, e.g., the location of the circumcenter and of the incenter of the transform $w(\epsilon)$ of $|z| \le \epsilon$ as well as establishing a distortion theorem giving displacement and ellipticity properties of the transform.

REPRODUCING KERNELS AND PRINCIPAL FUNCTIONS, by B. Rodin. [1961] [11]p. (AFOSR-4932) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)574, Army Research Office (Durham) under DA 04-495-ORD-722, and National Science Foundation) AD 414122 Unclassified

Also published in Proc. Amer. Math. Soc., v. 13: 982-992, Dec. 1962.

The Hilbert space of square integrable harmonic differentials on a Riemann surface W is denoted by Γ_h. Let γ be a 1-chain on W and let ψ_γ be the element in Γ_h with the property, $(w, \psi_\gamma) = \int_\gamma w$ for all $w \in \Gamma_h$. A reproducing kernel for periods for Γ_h is referred to as ψ_γ. Let ζ be a point of W and $z = x + iy$ be a local parameter near ζ such that $z(\zeta) = 0$. A Γ_h-kernel for nth derivatives at ζ is a differential $\psi_\zeta \in \Gamma_h$ which satisfies $(w, \psi_\zeta) = (\partial^n/\partial x^n)u(0)$ for all $w \in \Gamma_h$ where $w = du(z)$ near ζ. This kernel is uniquely determined by ζ, the uniformizer z, and the positive integer n. If in the above definitions Γ_h is replaced by one of its subspaces then the corresponding kernels are referred to as reproducing kernels for that subspace. The kernels for the spaces Γ_h, Γ_{hse}, Γ_{he}, Γ_{hm}, Γ_{ho}, $\Gamma_{he} \cap \Gamma^*_{hse}$, $\Gamma_{ho} \cap \Gamma^*_{hse}$, Γ_a, Γ_{ase}, and some spaces associated with a regular partition of the ideal boundary of the surface are found in terms of principal functions. Some applications of these results are given.

A UNIQUENESS THEOREM FOR BELTRAMI EQUATIONS, by L. Ahlfors and G. Weill. [1961] [4]p. (AFOSR-4979) (AF 49(638)574) AD 415443 Unclassified

Also published in Proc. Amer. Math. Soc., v. 13: 975-978, Dec. 1962.

Consider the Beltrami equation $f_{\bar z} = \tilde q(z)(1 - z\bar z)^2 f_z$ denoted as (1), where q is analytic and satisfies $|q(1 - z\bar z)^2| \le k < 1$. If v_1 and v_2 are solutions of $v'' = qv$ normalized by $v_1(0) = 1$, $v_1'(0) = 0$, and $v_2(0) = 0$, $v_2'(0) = 1$, then $f = [z\bar v_2 + (1 - z\bar z)\bar v_2']/[z\bar v_1 + (1 - z\bar z)\bar v_1']$ is a solution of (1) and both f and $\tilde g = \bar v_2/\bar v_1$ are continuous and univalent in $|z| \le 1$. They map the unit disk onto complementary regions of the extended plane whose common boundary is a Jordan curve with zero area. The function q is uniquely determined by the boundary values of f.

ON THE CONVEXITY OF THE OVALS OF LEMNISCATES, by J. L. Walsh. Sept. 1961, 11p. (AFOSR-794) (AF 49(638)845) AD 264702 Unclassified

Also published in Studies in Mathematical Analysis and Related Topics: Essays in Honor of George Pólya, ed. by H. Chernoff, M. M. Shiffer and others, Stanford U. Press, 1962, p. 419-423.

A lemniscate is defined as a locus in the z-plane $|P(z)| = \mu$ (> 0), where P(z) is a polynomial not identically constant and μ is a constant. This locus consists of one or more Jordan curves (branches of the lemniscate), which are mutually exterior except that each one of a finite number of points may belong to several branches. Each branch is sometimes called an oval, and the question arises whether these curves are actually ovals in the sense of being convex, at least when μ is sufficiently small. (Contractor's abstract)

THE LOCATION OF THE ZEROS OF THE DERIVATIVE OF A RATIONAL FUNCTION, REVISITED, by J. L. Walsh. [1960] [33]p. (AFOSR-3076) (AF 49(638)-845) Unclassified

Also published in Jour. Math. Pures et Appl., v. 43: 353-370, 1964.

From the general standpoint of circle geometry and linear transformations of the plane, the following theorem is formulated. Let there be given a (closed) circular region C and 2 fixed points Z and z exterior to C. Let a number of particles have C as their locus with the requirement that their center of gravity with respect to Z shall be the inverse of Z in the boundary of C. Then the locus of the center of gravity of these particles with respect to z is the closed region not containing Z bounded by that circle of the coaxial family determined by the boundary of C and the null-circle Z which passes through the harmonic conjugate of z with respect to the intersections with the boundary of C of the circle through z of the conjugate coaxial family. This theorem is established for the special case Z = infinity. This is the most important special case, for if a set of points (weighted particles) in the plane is given, their center of gravity is easily found, as is a disc with the center of gravity as center containing the given points. Nevertheless some attention is devoted to the special case of this theorem when Z is the center of a disc whose closed exterior is C. Most of the conclusions deal with lemniscates and curves of higher degree. (Contractor's abstract)

A SEQUENCE OF RATIONAL FUNCTIONS WITH APPLICATION TO APPROXIMATION BY BOUNDED ANALYTIC FUNCTIONS, by J. L. Walsh. [1961] [13]p. incl. refs. (AFOSR-64-2487) [AF AFOSR-62-198] AD 453796 Unclassified

Abstract published in Notices, Amer. Math. Soc., v. 9: 209, 1962.

Also published in Duke Math. Jour., v. 30: 177-189, June 1963.

A series of interpolation in the z-plane whose terms are rational functions and which can be used for the expansion of an arbitrary function analytic on a suitable point set, was recently described by the present writer--that series is closely connected with a canonical domain for the mapping of an arbitrary multiply connected region, and the series has applications to approximation by bounded analytic functions. The present paper describes a new series of rational functions that is no longer a series of interpolation but nevertheless shares the more important delicate convergence properties of the previous series. A special case of the new series involves approximation by polynomials on a set of mutually exterior Jordan curves that need not be analytic Points of interpolation are distributed equally on each of the Jordan curves with respect to that parameter.

CONNECTION BETWEEN GAUGE INVARIANCE AND MASS, by D. G. Boulware and W. Gilbert. [1961] [5]p. (AFOSR-1891) (AF 49(638)589) Unclassified

Also published in Phys. Rev., v. 126: 1563-1567, May 15, 1962.

The limit, as the bare mass vanishes, of a theory of a massive neutral vector meson interacting with charged fields is investigated. A redefinition of the charged-field operators is exhibited so that the original theory, involving a positive definite metric, goes over smoothly to a radiation gauge theory. The spectral forms for the boson 2-point function are exhibited to show that the limit to a gauge-invariant theory does not restrict the interacting mass of the vector particle. A soluble example is given

in which these limits can be studied in detail and in which the gauge-invariant limit describes a massive vector particle. (Contractor's abstract)

THEORY OF MANY-PARTICLE SYSTEMS. II. SUPERCONDUCTIVITY, by L. P. Kadanoff and P. C. Martin. [1961] [28]p. incl. diagrs. refs. (AFOSR-2066) (AF 49-(638)589) AD 449992 Unclassified

Also published in Phys. Rev., v. 124: 670-697, Nov. 1, 1961.

A fermion system with a simple attractive interaction is discussed with the aid of time-dependent correlation functions. Although perturbation theory is inapplicable, a sequence of correlation approximations described in Part I (Phys. Rev., v. 115: 1342, 1959) can be used. The lowest approximation in the sequence expresses the 2-particle correlation function in terms of single-particle functions and leads to the Hartree approximation; the second expresses 3-particle correlation function in terms of 1- and 2-particle correlation functions and leads to the time-dependent correlation functions that characterize the super-conductioning model of Bardeen, Cooper, and Schrieffer. Section 2: these correlation functions are determined and the thermodynamic properties of the superconductor are calculated from them. Section 3: the electromagnetic effects of the superconductor predicted by the Bardeen-Cooper-Schrieffer time-dependent correlation functions are considered. Section 4: improved density correlation functions are valid at nonvanishing temperature. Section 5: the properties of a pure superconductor which depend on the lifetimes of the single particle excitations are discussed.

ROTATIONAL INELASTIC SCATTERING AT HIGH ENERGIES (Abstract), by R. J. Glauber. [1961] [1]p. [AF 49(638)589] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 57, Feb. 1, 1961.

Let V(r) be a spherically symmetric complex potential of arbitrary radial dependence. The potentials of spheroidal symmetry, constructed from V(r) by applying an angle-dependent scale transformation to the coordinate r, are considered. The scale factor is assumed to differ from unity by a small term proportional to the second zonal harmonic. The eccentricity β is defined by letting the scale change along the axis of symmetry be the factor $1 + \beta$. The deformed potential is assumed to be free to rotate and that the incident particles satisfy the conditions of the high-energy approximation. Let the amplitude for scattering through angle θ by the spherically symmetric potential $\lambda V(r)$ be $f_\lambda(\theta)$, where λ is an arbitrary parameter. Then the differential cross section for inelastic scattering at small angles may be shown to be equal to $\frac{1}{5}\beta^2\left\{\left|\left(1 - \frac{d}{d\lambda} + \tan\frac{\theta}{2}\frac{d}{d\theta}\right) f_\lambda(\theta)\right|^2 + 3\tan\frac{\theta}{2}\frac{d}{d\theta} f_\lambda(\theta)\right|^2\right\}$, evalued at $\lambda = 1$. This result holds to all orders in the potential strength for $\beta < 1$.

ON A SOLUBLE GENERALIZATION OF THE THIRRING MODEL TO INCLUDE COUPLING WITH A BOSON FIELD (Abstract), by C. M. Sommerfield. [1961] [1]p. [AF 49(638)589] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 59, Feb. 1, 1961.

A generalization of Thirring's field theory in 1 space dimension was investigated. The model used, which is also exactly soluble, consists of a charged, massless fermion field coupled not only to itself but also to a vector boson field with mass. The fermion Green's function is found to possess both ultraviolet and infrared divergences; however, there exists a suitable choice of the coupling constants for which the latter disappears, while the former can be removed by means of wave-function renormalization. Two charges may be defined,

and there is a finite charge renormalization for each. The boson Green's function has a pole corresponding to a physical mass which differs by a finite amount from the bare mass. There is also a pole with zero mass corresponding to the generation of an electromagnetic field which, in 1 dimension, consists solely of gauge parts. The physical significance of these results were discussed.

CRITICAL FLUCTUATIONS IN SUPERCONDUCTORS (Abstract), by K. Gottfried and L. P. Kadanoff. [1961] [1]p. (In cooperation with Copenhagen U. (Denmark)) [AF 49(638)589] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 65, Feb. 1, 1961.

The existence of critical fluctuations follows directly from the Cooper effect. In terms of time-dependent correlation functions, the Cooper pairing manifests itself as an instability of $R(r, t) = \langle \psi^{\uparrow}(rt)\psi^{\downarrow}(rt)\psi^{\downarrow\dagger}(0)\psi^{\uparrow\dagger}(0)\rangle_T$ as $T \to T_c$; in fact the form of $R(r,0)$ is exactly that of the Ornstein-Zernike correlation function. This leads to the question of whether any phenomena analogous to critical opalescence occur in the vicinity of T_c. Since $\psi^{\uparrow}(rt)\psi^{\downarrow}(rt)$ cannot be coupled to an external field, R itself is not measurable. R actually describes the effective interaction between electrons; thus its anomalous behavior at T_c results in a resonant electron-electron scattering amplitude near the Fermi surface. The linear response is described by functions of the type $D(r, t) = \langle \psi_s^{\dagger}(rt)\psi_s(rt)\psi_{s'}^{\dagger}(0)\psi_{s'}(0)\rangle_T$. Therefore the question is reduced to determine the influence of the aforementioned resonance on entities like D. For this purpose, Boltzmann-like integral equations which connect D and R are constructed. The somewhat inconclusive results found here will be discussed.

SINGLE UNIT ACTIVITY IN STRIATE CORTEX OF UNRESTRAINED CATS, by D. H. Hubel. [1958] [13]p. incl. illus. diagrs. refs. [AF 49(638)713] Unclassified

Published in Jour. Physiol. (London), v. 147: 226-238, Sept. 1959.

A method is described for recording from single units in unanesthetized, unrestrained cats. The following observations were made in a survey of a small region of the cat's striate cortex: (1) Most units showed firing in the absence of intentional stimuli, regardless of the waking state, and even with the animal in total darkness. (2) Cortical unit firing was generally very irregular. Grouped patterns were common, and groups often recurred rhythmically. (3) Two main arousal effects were seen: some units showed a smoothing out of grouped activity, with little change in rate of firing, others showed a marked decrease in firing rate. (4) Diffuse retinal illumination produced little or no response in most units. (5) Many units which are unresponsive to changes in background illumination responded briskly to a restricted light source. Both "on"- and "off"-type responses were seen. (6) The receptive field of most units was near the center of gaze. (7) Units which were affected by stationary spots were also affected by a horizontally moving light source. Crossing the sensitive region produced discharges which were sometimes unequal for the 2 directions horizontal movement. Many units responded to movement in 1 direction only. Some of these gave no response to a stationary spot. The region over which responses to movement could be evoked varied greatly from unit to unit, and ranged from a few degrees to about 20. SINGLE UNIT ACTIVITY IN LATERAL GENICULATE BODY AND OPTIC TRACT OF UNRESTRAINED CATS, by D. H. Hubel. [1959] [14]p. incl. illus. diagrs. refs. [AF 49(638)713] Unclassified

Published in Jour. Physiol. (London), v. 150: 91-104, Jan. 1960.

A method is described for stereotaxic recording from single units from subcortical structures in the unanesthetized, freely moving cat. Patterns of firing and responses to diffuse and restricted light stimuli were studied in optic tract, lateral geniculate body and optic radiations; these were compared with previous findings in cells of the striate cortex. Most geniculate cells responded briskly to diffuse light stimuli. In sleep, they tended to fire impulses in brief, high-frequency clusters. Arousal, or activation by light stimulation, abolished these clusters. Similar firing patterns and responses were recorded from fibers in the optic radiation and the striate cortex below layer IV. These fibers were presumed to be geniculate axons. Receptive fields were studied in a small number of geniculate neurones. These had a concentric arrangement of excitatory and inhibitor ("on" and "off") regions, similar to that described from retinal ganglion cells by Kuffler (Jour. Neurophysiol., v. 16: 37-68, 1953). This arrangement was confirmed for units in the optic tract. A spot of light moved across the receptive field of a geniculate or optic tract unit produced responses which were independent of the direction of movement. From a comparison of optic tract and geniculate units with cortical cells, in their responses to diffuse and restricted light stimuli, it is concluded that the cortex is the site of complex integrative processes. INTEGRATIVE ACTION IN THE CAT'S LATERAL GENICULATE BODY, by D. H. Hubel and T. N. Wiesel. [1960] [15]p. incl. illus. diagrs. refs. (AFOSR-1982) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)713 and Public Health Service) AD 621437 Unclassified

Also published in Jour. Physiol. (London), v. 155: 385-398, Feb. 1961.

Cells were recorded with tungsten electrodes in the dorsal lateral geniculate body of the cat. Receptive fields of these units were mapped out, in the light-adapted state, with small spots of light. In their general arrangement geniculate receptive fields resembled those of retinal ganglion cells, having an excitatory ("on") center and inhibitory ("off") periphery, or reverse. The two

portions of a receptive field were mutually antagonistic; the decrease in center responses caused by inclusion of peripheral portions of receptive fields was termed peripheral suppression. Cells recorded in layers A and B of the lateral geniculate body were driven from the contralateral eye; cells in layer A_1 from the ipsilateral eye. In penetrations normal to the layers receptive fields of cells in a single layer were close together or superimposed, and from one layer to the next occupied exactly homologous positions in the two retinas. Binocular interaction was not observed in any of the cells studied. All 3 layers of the lateral geniculate contained both "on"- and "off"-center units. Cells in layers A and A_1 were similar both in their firing patterns and in average receptive field size. Cells in layer B were more sluggish in their responses to light stimuli, and tended to have larger receptive field centers. Cells with receptive fields within or near the area centralis tended to have smaller field centers and stronger suppression by the receptive field periphery than cells with their fields situated in more peripheral regions of the retina.

ELECTROCORTICOGRAMS IN CATS DURING NATURAL SLEEP, by D. H. Hubel. [1960] [11]p. incl. diagrs. refs. [AF 49(638)713] Unclassified

Published in Arch. Ital. Biol., v. 98: 171-181, May 20, 1960.

A study of the electrocorticograms of normal cats confirms the observations of Dement that a sleeping cat shows protracted periods of low voltage high frequency activity with sporadic muscle twitching. On falling asleep a stage of high voltage slow waves and spindles precedes the low voltage twitching stage. In response to natural arousal stimuli an animal in the low voltage stage of sleep may either awaken or revert to the slow wave stage; in the slow wave stage a similar stimulus never brings on the low voltage twitching stage of sleep. It is concluded that in the cat low voltage rapid activity and twitching occur in deep sleep. The significance of this for the interpretation of corticograms in the cat is discussed.

RECEPTIVE FIELDS, BINOCULAR INTERACTION AND FUNCTIONAL ARCHITECTURE IN THE CAT'S VISUAL CORTEX, by D. H. Hubel and T. N. Wiesel. [1961] [49]p. incl. illus. diagrs. tables, refs. [AF 49-(638)713] Unclassified

Published in Jour. Physiol. (London), v. 160: 106-154, Jan. 1962.

The visual cortex was studied in anesthetized cats by recording extracellularly from single cells. The eyes were stimulated with spots of white light of various shapes, stationary and moving. The paper has 3 parts: (1) Organisation of receptive fields in cat's visual cortex; properties of "simple" and "complex" fields; (2) Binocular interaction and ocular dominance; and (3) Functional cytoarchitecture of the cat's visual cortex.

PHARMACOLOGY OF NEUROENDROCRINE BLOCKING AGENTS, by P. L. Munson. [1961] [33]p. incl. diagrs.

refs. (AFOSR-J959) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)740 and National Science Foundation) AD 415919
Unclassified

Also published in Advances in Neuroendocrinology; a Symposium, Miami, Fla. (Dec. 6-8, 1961), Urbana, Illinois U. Press, 1963, p. 427-459.

Essentially all of the drugs and hormones that block the release of pituitary gonadotropin exert at least part of their effects indirectly via the central nervous system. As demonstrated in the rabbit or rat, the blocking agents exert profound influences on a rhinencephalic-hypothalamic system—influences that are registered as altered EEG patterns or marked changes in threshold of a peculiar "EEG after-reaction" response to direct electrical stimulation. Several blocking drugs and the natural sex steroids also alter the threshold of another system, the "EEG arousal" system of the reticular formation, but changes in this threshold appear to be more closely related to sexual behavior than to pituitary function. A differential elevation of the EEG after-reaction threshold characterizes the action of the new progestational antifertility steroids. The critical site of estrogen "feedback" appears to be the basal tuberal-posterior median eminence region, an area with other claims, from stimulation-lesion evidence, to the title, "gonadotropic center." Certain ovulation blocking agents appear to exert their critical blocking action between the basal tuberal region and the median eminence. The gonadotropins themselves appear to exert a direct feedback influence on the nervous system, perhaps to control the release of further gonadotropin. (Contractor's abstract)

OCCUPATION TIMES FOR MARKOV AND SEMI-MARKOV CHAINS, by H. Kesten. Mar. 1961 [45]p. incl. refs. (Technical scientific note no. 16) (AFOSR-980) (AF 61(052)187) AD 262032
Unclassified

Also published in Trans. Amer. Math. Soc., v. 103: 82-112, Apr. 1962.

Let $y_0, y_1 \ldots$ form a recurrent, irreducible Markov chain with integer states. Let $\{y(t)\}$ be the semi-Markov chain obtained from $\{y_n\}$ by making the waiting times between transitions random variables whose distribution depends (only) on the state occupied. This paper studies limiting distributions for functionals $\beta(\lambda) = \int_0^\lambda V(y(t))dt$ as $\lambda \to \infty$, where V is a function on the integers; if V is the characteristic function of a set J, $\beta(\lambda)$ is thus the occupation time of J up to λ. The results are described roughly. Suppose V is the characteristic function of a finite set J. Suppose that the total time spent in J during the first i visits has a limiting distribution as $i \to \infty$, and so does $K(\lambda)$, which denotes the number of visits to J before the total time outside J reaches λ. Then $\beta(\lambda)$ (the time in J before $t = \lambda$) also has a limit law, and it can be expressed in terms of the other two (Theorem 1). In Theorem 2, V can be any function with finite support. The main new hypothesis is that $\lambda^{-1}\beta(\lambda)$ tends in probability to a constant $\lambda \to \infty$; the conclusion gives a limit distribution for $\beta(\lambda) - BM(\lambda)$, where $M(\lambda) + 1$ is the number of visits to J before time λ and B is a certain constant. Theorem 3 specializes the results to Markov chains. The last result is of a different kind; it provides a limit distribution as λ and $A \to \infty$ for $M(A, \lambda)$, defined as the number of k for which $s_k \leq \lambda$ and $s_k - s_{k-1} \geq A$, where s_0, s_1, s_2 are the successive times when $y_n = j_0$ for some fixed j_0. The

hypothesis here is the familiar one that

$\Sigma P_{00}^{(n)} z^n = (1-z)^{\alpha} L(1/1-z)$, where $[P_{ij}]$ is the transition matrix of $\{y_n\}$, $0 \leq \alpha \leq 1$, and L is slowly varying.

The basic idea underlying the proofs of these theorems is that $\beta(\lambda)$ can be written as a sum of a random number of random variables with the number and the summands almost independent. This provides a very natural approach, though the execution is not simple.

EXISTENCE OF INVARIANT MEASURES FOR MARKOV PROCESSES, by S. R. Foguel. Apr. 1961 [9]p. (Technical scientific note no. 18) (AFOSR-1282) [AF 61(052)187] AD 264005 Unclassified

Also published in Proc. Amer. Math. Soc., v. 13: 833-838, Dec. 1962.

Let X be a locally compact Hausdorff space with a countable base. Let P(x,A) be a transition function defined for x in X and A a Borel subset of X such that $x \to P(x, U)$ is continuous for all open sets U and $P(x,X) = 1$. A (finite, positive) measure μ is invariant if $\mu(A) = \int \mu(A) = \int \mu(dx) P(x,A)$. Theorem: If a compact set C a measure ν exists such that $\liminf \int^n \nu(c) > 0$, then there exists an invariant measure. In addition, it is shown that certain sets are null with respect to any invariant measure and obtains a criterion for the uniqueness of an invariant measure.

SOME NEAR-SPHERICITY RESULTS, by A. Dvoretzky. [1961] [8]p. [AF 61(052)187] Unclassified

Published in Convexity; Proc. of Symposia in Pure Mathematics, Washington U., Seattle (June 13-15, 1961), Providence, Amer. Math. Soc., v. 7: 203-210, 1963.

The purpose of this paper is to discuss some results of a former report (item no. 800, Vol. IV). A new result of the projections of a cube, which is a counterpart to a result given in the previous report on the sections of a cube but is more precise and easier to prove, is given. A discussion of some open questions is also included, and a new result on the convergence of series in Fréchet spaces, which is derived from near-orthogonality—a rather poor relation of near-sphericity—is presented. The paper deals almost exclusively with Euclidean spaces.

Hebrew U. Dept. of Physics, Jerusalem (Israel).

PARAMAGNETIC RESONANCE SPECTRA OF f^3 IONS IN A CUBIC SITE, by G. Vincow and W. Low. [1961] [3]p. incl. tables, refs. (AFOSR-3098) [AF 61(052)59] Unclassified

Also published in Phys. Rev., v. 122: 1390-1392, June 1, 1961.

The paramagnetic resonance spectra of Nd^{3+} and U^{3+} in the cubic field of CaF_2 have been investigated at 3 cm at 20°K. In the case of Nd^{3+} transitions within the lowest quartet Γ_8 and possibly in the next higher quartet Γ_8 have been observed. The angular behavior conforms with that predicted by Bleaney's formulism of the spin Hamiltonian of a Γ_8 state. In the case of U^{3+} there are considerable deviations of the experimental g values from the calculated ones. It is suggested that these deviations are caused by the stronger cubic field. The efficiency of the thermal conversion from axial to cubic site is discussed. Additional lines suggest a new axial center along the [111] direction. (Contractor's abstract)

Hebrew U. Dept. of Physics, Jerusalem (Israel).

ANISOTROPIC BROADENING OF LINEWIDTH IN THE PARAMAGNETIC RESONANCE SPECTRA OF MAGNETICALLY DILUTE CRYSTALS, by D. Shaltiel and W. Low. [1961] [6]p. incl. diagrs. tables. (AFOSR-3099) [AF 61(052)59] Unclassified

Also published in Phys. Rev., v. 124: 1062-1067, Nov. 15, 1961.

The effects of mosaic structure on the anisotropic broadening of the linewidth in paramagnetic resonance spectra of dilute crystals is investigated. A general formula for the line shape and the linewidth at half max is derived. The half-width of the spectrum of Gd^{3+} in the single crystal of ThO_2 is measured as a function of the angle of the magnetic field with respect to the cubic axes. Good agreement is found with the above theory. The average deviation of the crystallites from the symmetry axis is found to be about 0.12°. Small deviations from the agreement indicate a compensating defect approximately along the [100] direction which gives rise to a small axial distortion. (Contractor's abstract)

PROPERTIES OF THE SLIDING SPARK AND THE VACUUM SPARK TRIGGERED BY THE SLIDING SPARK, by B. S. Fraenkel, U. Feldman and others. [1961] [3]p. (Bound with its AFOSR-2395; AD 279511) (AF 61(052)-340) Unclassified

The degree of ionization in the sliding spark, as obtained from emission spectra, is shown to be remarkably smaller than the degree of ionization in the triggered spark. A qualitative explanation is proposed. In the 3 electrode spark the auxiliary spark produces electrons and ions. In the vacuum sliding spark, however, the electrons and ions "slide" along the surface of the insulating material. Experiments made, using the sliding spark method in the 2000 to 4000A range show that there is a certain correlation between the strongest spectrum obtained of an element and its valence. Thus the spectra of Cu II, Fe II, Zr IV, and Si IV were the strongest obtained from these elements, under the sliding spark method. This may suggest that when an atom is pulled away instantaneously from the solid state it may leave, in many cases, all its valence electrons there, and the strongest spectrum is the one which is obtained when it captures another electron. In the Bockasten type of spark chamber the first spectrum of Cu was obtained more prominently than in the soft x-ray tube spark chamber. This seems to be caused by the higher vapor density in this, relative to the other, arrangement. (Contractor's abstract)

STUDY OF THE LOW-TEMPERATURE TRANSITION IN MAGNETITE AND THE INTERNAL FIELDS ACTING

ON IRON NUCLEI IN SOME SPINEL FERRITES, USING MOSSBAUER ABSORPTION, by R. Bauminger, S. G. Cohen and others. [1961] [10]p. incl. diagr. table, refs. (Technical note no. 3) (AFOSR-657) (AF 61(052)347) AD 258337 Unclassified

Also published in Phys. Rev., v. 122: 1447-1450, June 1, 1961.

A study has been made of the internal fields acting on Fe^{57} nuclei in some spinel ferrites, with particular reference to the low-temperature order-disorder transition in magnetite, using the techniques of Mössbauer absorption. For the Fe^{3+} ions at both the octahedral and tetrahedral sites in nickel ferrite ($NiFe_2O_4$) at 300°K, γ Fe_2O_3 at 85° and 300°K, and magnetite (Fe_3O_4) at 85°K, the effective magnetic field at the Fe^{57} nuclei is the same and equal to about 5.1×10^5 oe. In magnetite, the value of H_{eff} in the Fe^{2+} ions is about 4.5×10^5 oe at 85°K. Measurements on Fe_3O_4 at room temperatures provide a microscopic confirmation of Verwey's hypothesis that above the transition temperature of magnetite there is a fast exchange between the ferrous and ferric ions in the octahedral sites. HYPERFINE INTERACTIONS IN THE GROUND STATE AND FIRST EXCITED STATE OF D_y^{161} IN DYSPROSIUM IRON GARNET, by R. Bauminger, S. G. Cohen and others. [1961] [16]p. incl. diagrs. tables, refs. (Technical note no. 4) (AFOSR-987) (AF 61(052)347) AD 262033 Unclassified

Also published in Phys. Rev. Ltrs., v. 6: 467-470, May 1, 1961.

The hyperfine Zeeman splittings in the recoil-free absorption spectrum of the 26 kev γ-rays from Dy^{161m} in Dy^{161} situated in dysprosium iron garnet have been observed. At 85°K, the magnetic hyperfine interactions of the ground state and first excited state of Dy^{161} are -400 ± 40 mc and 455 ± 40 mc, respectively. The electric quadrupole interactions (eq Q/4) at this temperature are 120 ± 30 and 90 ± 30 mc, respectively. At 300°K the effective magnetic field, H_{eff} is 4.6 times smaller, and illustrates the proportionality between H_{eff} and spontaneous magnetization of the Dy sub-lattice. Assuming Parks value of -0.37 ± 0.05 nm for the Dy^{161} ground state magnetic moment, H_{eff} (85° K) equals 3.5×10^6 oe, and 0.42 ± 0.08 nm for the magnetic moment of the first excited state were obtained. At 300°K a quadrupole interaction of less than 20 mc was obtained. The strongly temperature dependent quadrupole interaction is interpreted as being largely due to the effective electric field gradient produced at the nucleus by the 4f electrons which should be partially aligned below the Curie temperature. (Contractor's abstract)

NUCLEAR MOMENTS OF STATES OF Dy^{161}, by R. Bauminger, S. G. Cohen and others. [1961] [4]p. incl. table, refs. (AFOSR-3518) (AF 61(052)347) Unclassified

Also published in Proc. Rutherford Jubilee Internat'l. Conf., Manchester (Gt. Brit.) (Sept. 4-8, 1961), New York, Academic Press, 1961, p. 329-332.

Hyperfine Zeeman splittings in the recoil-free absorption spectrum of the 26 kev γ-ray from Dy^{161} situated in dysprosium iron garnet have been observed. At 85°K, the magnetic hyperfine interactions ($g\mu_n H_{eff}$) of the ground state and first excited state of Dy^{161} are (-400 ± 40) mc/s and (+455 ± 40) mc/s respectively. The electric quadrupole interactions (eqQ/4) at this temperature are (120 ± 30) mc/s and (90 ± 30) mc/s respectively. From earlier measurements on the ground state we obtain H_{eff} (85°K) = 3.5×10^6 oe, and (+0.42 ± 0.08) nm for the magnetic moment of the first excited state. A theory of the origin of the large temperature dependent quadrupole interaction is outlined. Preliminary results relating to the second excited state of Dy^{161} are mentioned. STUDIES OF THE INTERNAL FIELDS ACTING ON NUCLEI IN FERRIMAGNETIC AND PARAMAGNETIC SOLIDS, USING RECOIL-FREE RESONANCE ABSORPTION (MÖSSBAUER EFFECT), by R. Bauminger, S. G. Cohen and others. [1961] [2]p. (AFOSR-4046) [AF 61-(052)347] AD 611500 Unclassified

Presented at Internat'l. Conf. on Magnetism and Crystallography, Kyoto (Japan), Sept. 25-30, 1961.

Also published in Jour. Phys. Soc. Japan, v. 17, Suppl. B-I: 123-124, Mar. 1962.

Recoil-free gamma ray absorption spectra have been observed in ferrimagnetic and paramagnetic solids containing nuclei of Fe^{57} and Dy^{161}, using radioactive sources of Co^{57} and Tb^{161}. The hyperfine Zeeman

splittings in ferrimagnetic materials permit a determination of the effective magnetic field (H_{eff}) at the nuclei. H_{eff} at Fe^{57} nuclei in yttrium iron garnet, dysprosium iron garnet and in some spinel ferrites have been measured at 300°K and 85°K. Measurements on Fe_3O_4 confirm Verwey's hypothesis of a fast exchange between ferrous and ferric ions in the octahedral sites above the transition temperature. H_{eff} at Dy^{161} in dysprosium iron garnet has been found to be 3.5×10^6 oe at 85°K and 7.5×10^5 oe at 300°K and is proportional to the Dy sub-lattice spontaneous magnetization. A large temperature dependent quadrupole interaction in dysprosium iron garnet has been observed, which is ascribed to an effective electric field gradient at the Dy nuclei produced by the partially aligned orbitals of the 4f electrons, and thus correlated with the spontaneous magnetization. ELECTRON DENSITY AND IONIZATION RATE IN THERMALLY IONIZED GASES PRODUCED BY MEDIUM STRENGTH SHOCK WAVES, by Y. Manheimer-Timnat and W. Low. [1959] [13]p. incl. illus. diagrs. tables, refs. (AFOSR-3729) [AF 61(052)401] Unclassified

Also published in Jour. Fluid Mech., v. 6: 449-461, Oct. 1959.

A method, based on the measurement of attenuation of microwaves, which allows the electron density and the ionization rate of shock-heated gases to be obtained, is described. Results obtained for air in the shock Mach range 8.2—10.4, and for nitrogen containing 0.25% oxygen in the range 7.4—8.8, show that the electron density is in agreement with theoretical calculations based on thermodynamic equilibrium. Ionization time measurements in air are presented in this range and these results extend the measurements of Niblett and Blackman to a lower Mach range. (Contractor's abstract)

REPORT ON THE ROLE OF THE AGRICULTURAL PRODUCER IN COOPERATIVE SETTLEMENTS (MOSHAVIM) IN ISRAEL, by D. Weintraub, E. Yuchtmann, and H. Weihl. Oct. 1961 [77]p. incl. diagrs. tables. (Technical note no. 2) (AFOSR-2240) (AF 61-(052)480) AD 280494 Unclassified

The main purpose of this study is to define the role of the settler in Smallholders' Cooperative Settlements in Israel and to investigate the cause of the changes under different situations. It is based on a re-analysis of a series of community studies on the structure and the development of the settler-role. The concept of the role is considered as a pattern of actions normatively defined, designed for one actor, and set within a given situation, and which fulfills a specific social function. It is analyzed with respect to the situation (ecological background and time), the resources (material resources and man-power), the know-how, and motivation. The adaptive norm is discussed with regard to the relative danger to person and property, the ecological and climatic conditions. The economic and occupational norms are analyzed with regard to the production directed to the market economy, agricultural work, the family small-holding, the dependence on public and national considerations and planning and the specific significance of different branches of the farm. It is concluded that other studies must be made on the multiple-role in order to correlate the influence of the independent variables on the dependent variables.

REPORT ON THE ROLE OF THE PILOT-CADET IN ISRAEL, by M. Lissak, D. Weintraub and others. Dec. 1961, 31p. (Technical note no. 3) (AFOSR-2241) (AF 61(052)480) AD 280496 Unclassified

The role of the cadet in the military school for fighter pilots is defined as a soldier who must learn to handle different types of planes within a limited period of time and on a certain level of competence. Then the normative pattern of the role is defined and analyzed in detail with respect to the ecological background, time, material complements, man-power, know-how, and motivation.

[CHEMORECEPTOR ORIGIN OF RETICULAR AND CORTICAL ACTIVATION IN HYPOXIA] Activation réticulaine et corticale d'origine chemoceptive au cours de l'hypoxie, by A. Hugelin, M. Bonvallet and P. [C.] Dell. [1959] [16]p. [AF 61(052)45] Unclassified

Published in Electroencephalog. and Clin. Neurophysiol. Jour., v. 11: 325-340, 1959.

Hypoxia, induced by inhalation of low O_2 mixture, induces cortical arousal in unanesthetized cats and dogs immobilized with Flaxedil concurrently with the respiratory stimulation. It depends on the carotid and aortic bodies and is related to mesencephalic reticular activity. This activation, which precedes the classical cortical depression, is dependent on an adequate pCO_2.

EFFECTS OF HYPOXIA ON THE RETICULAR AND CORTICAL DIFFUSE SYSTEMS, by P. [C.] Dell, A. Hugelin, and M. Bonvallet. [1959] [13]p. incl. illus. diagrs. refs. [AF 61(052)229] Unclassified

Published in Cerebral Anoxia and the Electroencephalogram, Internat'l. Colloquium on Anoxia and the EEG, Marseille (France) (Oct. 5-9, 1959), ed. by H. Gastaut and J. S. Meyer, Springfield, Ill., Charles C. Thomas, 1961, p. 46-58.

The purpose of this paper is to use hypoxia as a tool for analyzing the functional interrelations between cortex and brain stem reticular system, rather than to study hypoxia itself. It is now clear that the effects of hypoxia upon non-specific systems of the CNS occur earlier and are far more important than the effects upon specific sensory and motor pathways. During the entire evolution of hypoxia, the essential central mechanism is a reticular activation due to the discharges of the aortic and carotid chemoceptors. The patterns of this activation are, however, modified by the cortical control of the reticular activity. The result of this control is to introduce 2 stages in the evolution of the central effects of hypoxia. The first phase of hypoxia is a state of an enhanced vigilance, represented physiologically by electrical cortical arousal. Although the motor activity for the most part is not facilitated, more integrated functions are intensified. The second phase, introduced by cortical depression and the release of the reticular activity from the cortical inhibitory control shows the pathological motor hyperactivities studied clinically in men.

MECHANISMS OF RETICULAR DEACTIVATION, by P. [C.] Dell, M. Bonvallet, and A. Hugelin. [1960] [17]p. incl. diagrs. refs. (AF 61(052)229) Unclassified

Published in Ciba Foundation Symposium on The Nature of Sleep, London (Gt. Brit.) (June 27-29, 1960), Boston, Little, Brown and Co. [1961], p. 86-102.

Passive reticular deactivation, i.e., a diminution in reticular activity as a result of the absence of the every-day stream of stimuli of humoral, interoceptive, exteroceptive and cortical origin, is briefly discussed. Recent experimental facts concerning the origin and initiation of the tonic and phasic effects produced by the cortex and the medulla which bring out an active reticular deactivation are discussed in detail. Some evidence is presented which suggests that, at least in the animal, sleep may result from the cumulative effects of active as well as passive reticular deactivation. (Contractor's abstract)

BULBAR CONTROL OF CORTICAL AROUSAL, by M. Bonvallet and V. Bloch. [1960] [2]p. incl. diagrs. (AF 61(052)229) Unclassified

Published in Science, v. 133: 1133-1134, Apr. 14, 1961.

In the cat, the cortical arousal induced by reticular or nociceptive stimulation is more intense and more long-lasting after elimination of the caudal and medial part of the medulla than in preparations with intact brain. This difference is explained by the intervention of a phasic-ascending inhibitory bulbar control secondarily triggered by the mesencephalic activating system.

[INFLUENCE OF THE RETICULAR FORMATION AND OF THE CEREBRAL CORTEX ON MOTOR EXCITABILITY DURING HYPOXIA] Influence de la formation reticulaire et du cortex cérébral sur l'excitabilite motrice au cours de l'hypoxie, by M. Bonvallet and A. Hugelin. [1960] [15]p. incl. illus. [AF 61(052)229] Unclassified

Published in Electroencephalog. and Clin. Neurophysiol. Jour., v. 13: 270-284, 1961.

In curarized cats, acute progressive hypoxia (6.5%

O_2 in N_2) induces reticular facilitation of motoneurons excitability. The delay of the onset and manner of development of this phenomenon depend on 3 factors: early chemoreflex reticular excitation, direct excitation of reticular cells, and release of a corticofugal inhibitory influence. In the unanesthetized animal with a functional cortex, the onset and the manner of development of motor facilitation of reticular orgin depend entirely on the last of these factors. In encéphale isolé preparations where telencephalic influence had been eliminated by a diencephalic transection of the brain stem (tronc cérébral isolé preparation), acute progressive hypoxia (APH) produces progressive facilitation of the monosynaptic masseter reflex (cranial homologue of a monosynaptic extension reflex). After elimination of the aortic and carotid chemoreceptors, APH still produces motor facilitation, although it is less intense and more delayed than previously. At relatively high partial pressures of oxygen, the progressive facilitation of the motoneurons therefore arises from the increased discharge of the carotid and aortic chemoreceptors. At very low partial pressures of oxygen, however, the facilitatory reticular formation can be excited by another mechanism. Unit recording in an islet of réticulée isolée shows that this action consists of a direct humoral activation of reticular cells. In ordinary encephalé isolé preparations, the development of motor facilitation due to hypoxia is entirely different owing to the presence of a cortical control system. The results indicate that: (a) in the encephalé isolé preparation with functional cortex, reticular activity is subject to tonic inhibitory control which ceases at the moment when cortical activity stops; (b) reticular excitation provoked by intensification of chemoreceptor discharge is controlled in a phasic manner by the same cortical system; (c) these conclusions are similar to those derived from a series of earlier investigations which demonstrated the existence of a feedback system, comprising the ascending activating system, a diffuse cortical system and a cortico-reticular descending system; the static and dynamic properties of this system can account for both the motor and the cortical manifestations obtained during hypoxia. In the non-curarized encephalé isolé preparation or in a preparation with a transection at the level of D_2, acute progressive hypoxia gives rise to a series of movements beginning at the same time as cortical arousal and ceasing at the same time as the convulsions. Since the descending facilitatory reticular activity is not increased simultaneously, it appears that the latter is not necessary for the development even of intense motor activity. The functional consequences of this fact are considered in relation to homeostatic regulation. (Contractor's abstract)

GROWTH OF TURBULENT FLUCTUATIONS IN FREE SHEAR FLOW, by R. Wille, O. Wehrmann, and A. Michalke. Apr. 30, 1961 [52]p. incl. diagrs. refs. (AFOSR-2142) (AF 61(052)412) AD 272261 Unclassified

The results of experimental investigations on the laminar-turbulent transition in a special flow regime are given. They are part of a research program for determining a critical value of vorticity linked with the onset of turbulence. The flow investigated is called a free shear flow and this term is used for a flow region with a velocity gradient or with an asymmetrical velocity profile in an otherwise infinite fluid. The border range of the free jet is a special case of a free shear flow. (Contractor's abstract)

BASIC RESEARCH RESUMÉS 1960. A SURVEY OF BASIC RESEARCH ACTIVITIES IN THE OFFICE OF AEROSPACE RESEARCH. 1961, 389p. (AFOSR-925) (AF 49(638)903) AD 268200 Unclassified

The purpose here is to promote the broad accessibility of information about fundamental research projects supported by the Air Research and Development Command. The volume is a by-product of a research project whose purpose is the comparative study of indexing systems for scientific information. The subject index used is a working example of one means of organizing highly technical information for search and retrieval. It utilizes a system involving the permutation of key terms in phrases describing the content of documents, or, as in the present case, project outlines. The descriptive phrases, drawn directly from the texts of the project outlines, give as specifically as possible the subject of the work done, and where applicable the method used. Since there are, as a rule, as many descriptive phrases per project outline as there are major subjects discussed, there is an unusual depth and informativeness of index entry. The effectiveness and look-up flexibility of this form of entry are enhanced by the permutation of key terms within descriptive phrases. (Contractor's abstract)

METHODS OF ORGANIZING INFORMATION FOR STORAGE AND SEARCHING, by S. Herner. Nov. 14, 1961 [12]p. incl. refs. (AFOSR-5038) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)903 and Rome Air Development Center) AD 413947 Unclassified

Presented at Eleventh annual convention of the Amer. Doc. Inst., Massachusetts Inst. of Tech., Cambridge, Nov. 7, 1961.

Also published in Amer. Doc., v. 13: 3-14, Jan. 1962.

The act of organizing bodies of information for subsequent search and retrieval of pertinent parts can be broken down into 2 distinct phases. The first of these 2 phases might be termed the analytical and categorization phase: What is a document about and what subject headings, terms, descriptors, or classes best describe the subject contents of the document. The second phase might be called the file or storage phase: the part given to incorporating the index record of the document into the over-all index record for the entire collection, and to arranging the physical document or an image of the document within the collection of documents or images. A definition of the status of these 2 phases of the organization of information is discussed. Trends and developments that have had a far-reaching effect on how information and sources of information are organized for search, retrieval, and subsequent consultation and use are discussed. Specific projects and project descriptions out of the recent past as illustrative guideposts in the description of trends and developments are used. (Contractor's abstract)

THE INHIBITION OF THE HYDROGEN+ OXYGEN REACTION BY FORMALDEHYDE, by R. R. Baldwin and D. W. Cowe. [1961] [14]p. incl. diagrs. table, refs. (AFOSR-J147) [AF 61(052)62] AD 416081
Unclassified

Also published in Trans. Faraday Soc., v. 58: 1768-1761, Sept. 1962.

The inhibiting action of HCHO on the first and second limits of the H_2 + O_2 reaction has been studied in KCl-coated vessels at 540°C. The efficiency of inhibition is almost inversely proportional to the mol fraction of O_2, and is less dependent on the mol fraction of H_2. This indicates that the main primary termination process is the reaction H + HCHO(14) which competes with the reaction H + O_2(2); a smaller contribution results from the reaction of OH + HCHO(15) competing with OH + H_2(1), or from O + HCHO = OH + HCO(13) competing with O + H_2 = OH + H(3). The efficiency of inhibition is independent of diam showing that the HCO radicals are not destroyed at the surface; this is confirmed by the fact that the fraction of HCO radicals undergoing chain-termination reactions is effectively independent of mixture composition and of pressure over the range 4-100 mm Hg. Evidence against the reactions HCO = H + CO and HCO + O_2 = CO_2 + OH is provided, and it is concluded that chain termination ultimately results either from the reaction HCO + O_2 = CO + HO_2, or from the reaction HCO + O_2 = HCO_3, the HCO_3 radicals being destroyed at the surface. The results permit the evaluation of the ratios k_{14}/k_2 and k_{15}/k_1 (or k_{13}/k_3) and from estimates of k_{14}, a value of k_2 can be obtained which agrees with earlier estimates. HOMOGENEOUS GAS-PHASE DECOMPOSITION OF HYDROGEN PEROXIDE, by R. R. Baldwin and D. Brattan. [1960] [10]p. incl. diagrs. table, refs. (Sponsored jointly by [Air Force Office of Scientific Research under AF 61(052)62], Imperial Chemical Industries, Ltd., Royal Soc., and Shell Research Ltd.) Unclassified

Also published in Eighth Symposium (Internat'l.) on Combustion, California Inst. of Tech., Pasadena (Aug. 28-Sept. 3, 1960), Baltimore, Md., Williams and Wilkins Co., 1962, p. 110-119. (AFOSR-TR-60-127)

The kinetics of the homogeneous gas-phase decomposition of H_2O_2 is reviewed. Experimental procedure carried out in this study gives the following results: (1) The decomposition is of first order; and the rate is independent of the total pressure. (2) In the presence of H_2, as the mol fraction of H_2 increases, the decomposition rate increases linearly to a max and then decreases. Mechanisms are proposed for the variation of rate in the presence of H_2.

THERMAL AND ISOTHERMAL EXPLOSIONS IN THE INHIBITION OF THE HYDROGEN + OXYGEN REACTION BY HYDROCARBONS, by R. R. Baldwin, D. Booth, and R. W. Walker. [1961] [6]p. incl. diagrs. (AFOSR-J522) (AF 61(052)62) AD 406786 Unclassified

Also published in Trans. Faraday Soc., v. 58: 60-65, Jan. 1962.

The inhibiting efficiency of ethane at the second limit of hydrogen + oxygen + inert gas mixtures was shown to be independent of the inert gas used, thus confirming the isothermal nature of the inhibited boundary. With methane as inhibitor, the efficiency increases in the order: argon, nitrogen, helium, carbon dioxide. This is the order expected if the boundary is thermal in character. Further support for the thermal character of the methane-inhibited limit is obtained from studies of the diam effect, and the observation of pressure pulses in mixtures that do not explode. KINETICS OF HYDROGEN-OXYGEN AND HYDROCARBON-OXYGEN REACTIONS, by R. R. Baldwin. [1961] [2]p. [AF 61(052)62] Unclassified

Presented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech. Armour Research Foundation, Chicago, Ill., Sept. 11-12, 1961. (AFOSR-1417; AD 265513)

Methane, ethane, propane, butane, ethylene, propylene and formaldehyde were studied to obtain information on the relative rates of reaction of the radicals, H, OH and O, with different hydrocarbons RH, and on the subsequent reactions of the radical R. With all these inhibitors except methane, the inhibited second limit has no isothermal boundary, and the inhibition arises directly from termination reactions of the radical R produced in the primary inhibition process. A detailed study has been made of the slow reaction and second limit of moist carbon monoxide-oxygen mixtures in aged boric-acid-coated vessels. The effects of the concentration of carbon monoxide, oxygen and water vapor, of inert gas addition, of vessel diam and of temperature have been examined. A striking feature of the second limit studies is that the limit rises sharply at low mol fractions of oxygen, recalling the behavior of the hydrogen-oxygen system when quadratic branching is occurring.

THE ROLE OF HYDROGEN PEROXIDE AT THE SECOND LIMIT OF THE HYDROGEN + OXYGEN REACTION, by R. R. Baldwin and P. Doran. [1961] [12]p. incl. diagrs. refs. (AF 61(052)62) Unclassified

Published in Trans. Faraday Soc., v 57: 1578-1589. Sept. 1961.

The effect of experimental procedure on the second limit of hydrogen + oxygen mixtures has been examined in fresh and aged boric-acid-coated vessels over the temperature range 440-500°C. At the lower temperatures, and particularly at low mol fractions of O_2, the limit increases significantly with increase in the manipulation time prior to explosion. This is attributed to the fact that the H_2O_2 requires appreciable time to reach its equilibrium concentration, and the important role of H_2O_2 in the quadratic branching mechanism is thus confirmed. Even with very fast manipulation at 440°C, so that initiation by H_2O_2 seems unlikely, there still appears to be a residual quadratic branching effect which is greater in fresh than in aged vessels. It is suggested that this results from a surface initiation which is greater in fresh vessels than in aged vessels: this suggestion also accounts for the increase in limit with decreasing diam found in fresh vessels at 500°C. It is shown that these views on the role of H_2O_2 are consistent with the inhibiting effect of H_2O_2 found by Forst and Giguère (Contractor's abstract)

THE DECOMPOSITION OF HYDROGEN PEROXIDE IN THE PRESENCE OF HYDROGEN, by R. R. Baldwin, D. Booth, and D. Brattan. [1961] [4]p. incl. diagr. (AF 61(052)62) Unclassified

Published in Canad. Jour. Chem., v. 39: 2130-2133, Oct. 1961.

Studies were carried out by means of a flow system at atmospheric pressure, the partial pressure of H_2O_2 varying from 0.2-1.0 mm Hg, and partial pressure of H_2 varying from 10-760 mm Hg. The following mechanisms are obtained: (1) $H_2O_2 + M' = 2OH + M'$; (2) $OH + H_2 = H_2O + H$; (3) $H + H_2O_2 = H_2O + OH$; (4) $H + H_2O_2 = H_2 + HO_2$; (5) $OH + H_2O_2 = H_2O + HO_2$; (6) $2HO_2 = H_2O_2 + O_2$; and (7) $H + O_2 + M = HO_2 + M$. The above mechanism is consistent with those obtained by Forst (see item no. LAV.01:021, Vol. II). By assuming that the relative coefficients of H_2 and O_2 are the same in reactions (7) and (1), and since the ratio of the rate constants for reaction (7), $k_{N_2}/k_{H_2} = 0.43$ and for reaction (1) $k_P/k_{N_2} = 6\text{-}7$, the calculated value for reaction (1) k_{H_2}/k_P is ~ 0.33-0.38, whose P is H_2O_2. The value obtained by a plot of the experimental data is 0.30, thus further reactions need not be postulated.

THE NATURE OF THE PRIMARY PROCESSES IN ELECTRON AND GAMMA IRRADIATED SYSTEMS, by P. Y. Feng. Feb. 21, 1961 [26]p. incl. diagrs. (AFOSR-241) (AF 18(603)121) AD 251616; PB 154909 Unclassified

A study was conducted on the distribution of the primary events in electron irradiated systems as a function of electron energy. It is shown that, for systems of radiation chemical interest (i. e. with radiation energies in the kev to mev region) approximately one-half of the absorbed energy is dissipated via secondary electrons with average energies less than approximately 60 ev and that variations in the effective spectrum of the electrons occur only in the higher energy region. Since the relative cross sections for the various electronic transitional events are much less sensitively energy dependent with high energy electrons, the results of this model explain satisfactorily the known insensitivity of many primary radiation chemical processes on the initial radiation energy spectrum. STRUCTURE OF DEFECT CLUSTERS IN SOLIDS, by J. W. Buttrey. Terminal rept. Mar. 1, 1960-Mar. 15, 1961. May 12, 1961, 27p. incl. refs. (AFOSR-732) (AF 49(638)829) AD 258384 Unclassified

Preliminary results have been obtained on a small angle scattering study of defect clustering in irradiated single crystals. Silicon single crystals irradiated to a total of 2×10^{19} nvt fast neutron flux fail to show any small angle scattering. Some small angle x-ray scattering was detected from a lightly irradiated sample of LiF, but preliminary results from a lithium-doped silicon single crystal are negative, even though it was thought to contain 100A clusters of pure lithium metal. Such clusters should be detectable using small angle x-ray diffraction; no conclusive reasons are apparent why this sample did not show small angle scattering. Scattering intensity calculations are treated in an appendix. (Contractor's abstract)

SIZE DISTRIBUTIONS FROM SMALL ANGLE SCATTERING (Abstract), by R. H. Bragg. [1961] [1]p. (Bound with its AFOSR-732; AD 258384) [AF 49(638)829] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 158, Mar. 20, 1961.

The main features of the size distribution in a system of particles (inhomogeneous regions) are revealed by analysis of the function $h^3I(h)$, where $h = 4\pi \sin \theta/\lambda$ and I(h) is the scattered intensity. For nearly-spherical particles a maximum is found for each mode of the distribution and the location of these maxima are used to determine characteristic sizes for each mode. These sizes are used as a check on the radius of gyration, R, derived from the slope of curves of log I(h) vs h^2. The function $h^3I(h)$ approaches S, the total surface area, for large h provided the experimental conditions approximate infinite slit height collimation. In systems of nonspherical particles the dominant type, i. e., rods, spheres, or plates, is recognized by visual inspection. Other details, such as axial ratios based on an ellipsoidal model of shape are obtained from a simple analysis based on curve fitting.

PHOTOCHEMICAL DECOMPOSITION OF OZONE, by C. K. Hersh. [1961] [1]p. [AF 49(638)847] Unclassified

Preeented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech. Armour Research Foundation, Chicago, Sept. 11-12, 1961. (AFOSR-1417; AD 265513)

The objective of this program is to compare the thermal and photochemical decomposition rates of gaseous ozone as a method of determining the mechanism of ozone decomposition. Apparatus for the study consists of two one-liter flasks, a fluorocarbon oil manometer, and a reference manometer. The flasks now being used are silvered on the outside to eliminate stray radiation effects. The 2 flasks are separated by the oil manometer and are thermostated. The incident radiation from a sodium light is admitted to one flask at a time. Currently the decomposition is being studied at 61°C and initial ozone pressures of up to 0.25 atm. The experimental procedures are detailed and the thermal data compared with data reported in the literature.

STUDIES ON RADIATION-IMAGE DETECTORS, by L. Reiffel. [1961] [28]p. incl. illus. diagrs. (AFOSR-1185) (AF 49(638)1010) AD 456576 Unclassified

Also published in Nuclear Electronics; Proc. Conf., Belgrade (Yugoslavia) (May 15-20, 1961), Vienna (Austria), International Atomic Energy Agency, v. 1: 269-284, 1962.

Work underway on radiation detectors capable of preserving spatial distribution information is described. Preliminary problems are to determine intensity distributions in a plane or possibly over a cylindrical surface. This class of problems includes neutron diffraction, neutron radiography and x-ray and γ-ray radiography or scattering studies with these radiations. Emphasis is being given to imaging radiation detectors based on spark breakdown and on luminescence or stimulated phosphorescence. Very large spark counters, which weigh over 100 lb and have sensitive areas of about 2000 cm^2 defined by staggered planar arrays of up to 400 anode and cathode wires are developed. Flow-counter operation using an air or argon-methane gas atmosphere provides an α-sensitive system and slow neutron detection is accomplished with enriched B^{10} converter plates. With other fill gases, proton and electron sensitivity has been demonstrated. Read-out of the intensity distribution is by photographic recording of the spark distribution. Neutron Laue patterns have been recorded in 10 min using the Armour Research Reactor at low power; peak core flux was 10^{11} nv and the collimator was a straight 1 x 1 cm tube. Application of these counters to other neutron studies are described with comments on the ultimate resolution to be obtained with smaller electrode spacings, dynamic scanning and possibly space filtering of the optical image. A second general approach to radiation-image detection concerns the use of luminescent or phosphorescent converter screens. Matrices of luminescent fibres are being tested which comprise very thin glass tubes filled with liquid scintillator. These are useful in x-ray and γ-ray detection and either the wall materials or the core liquid may be "loaded" to obtain neutron sensitivity. New methods of fabricating various types of luminescent fiber screens are presented together with optical performance data also germane to scintillation-chamber technology. Possible imaging detectors using thick blocks of material which are capable of significant energy storage and stimulated phosphorescence upon irradiation are discussed briefly along with read-out methods using optical scanning beams to eliminate resolution loss due to finite phosphor thickness. ATTEMPTED PREPARATION OF 2-AZABICYCLO-OCTATRIENE, by S. Kikkawa, R. L. Bartosiewicz, and S. I. Miller. [1961] [2]p. incl. diagrs. (AFOSR-3476) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)39] and National Institutes of Health) Unclassified

Also published in Jour. Org. Chem., v. 27: 320-321, Jan. 1962.

Three approaches to the 2-azabicyclo[2, 2, 2]-octatriene system in order to find analogs of barreiene, bicyclo[2, 2, 2]-octatriene containing nitrogen are described. (1) Experiments carried out to degenerate 1, 4-diazabicyclo[2, 2, 2]octane or Dabco were failures. (2) Electrolysis of 3-styryl-7, 8-dicarboxy-2-azabicyclo[2, 2, 2]-2, 5-octadiene led to undefined products. (3) Treatment of N-benzoyl-3-phenylethynyl-7, 8-dicarboxy-2-azabicyclo[2, 2, 2]-5-octene anhydride with $Pb(OAc)_4$ in decalin yielded some 3-styryl-7, 8-dicarboxy-2-azabicyclo[2, 2, 2]-2, 5-octadiene, benzaldehyde, benzoic acid, stibazole, benzonitrile, and benzylacetophenone. A scheme is proposed to account for 3 plausible intermediates by PbO_2 oxidation. The presence of a fugitive 3-styryl-2-azabicyclooctatriene appeared as a highly plausible precursor of PhCh:CHCOPh and PhCN.

THERMODYNAMIC PROPERTIES IN THE SYSTEM HYDROGEN-HAFNIUM, by R. K. Edwards and E. Veleckis. [1957] [16]p. incl. diagrs. tables.

(AFOSR-1108) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)346] and Office of Naval Research) Unclassified

Presented at meeting of the Phys. and Inorg. Chem. Div. of the Amer. Chem. Soc., Miami, Fla., Apr. 7-12, 1957.

Abstract published in 131st meeting of the Amer. Chem. Soc. Abstracts of Papers, 1957, p. 22R.

Also published in Jour. Phys. Chem., v. 66: 1657-1661, Sept. 1962. (Title varies)

Equilibrium vapor pressure measurements have been carried out as a function of composition for the hydrogen-hafnium system in the temperature range 251-827°C and up to a max pressure of 1 atm. A partial phase diagram is presented. The extrapolated phase boundaries show good correlation with the room-temperature x-ray studies of Sidhu and McGuire. The solubility of hydrogen in the primary solid solution phase, α-Hf, reaches nearly 11 atom-% hydrogen at the highest temperature investigated, but decreases rapidly at lower temperatures. Henry's law is obeyed by monatomic hydrogen in the α-phase. The δ-phase exists from a min composition of 24 atom-% hydrogen at the highest temperature and from 63 atom-% hydrogen at the highest temperature to a max of about 64.3 atom-% hydrogen. The latter composition boundary remains essentially constant with temperature up to 365°, which was as far as observations were made. A very narrow 2-phase region separating the δ-phase field and the ε-phase field is inferred with the latter extending to $HfH_{1.98}$ for the authors' lowest temperature. The relative partial molal and integral thermodynamic quantities in the composition range 0-56 atom-% hydrogen are presented for 779°C. The exothermic nature of the solution reaction was established. The integral enthalpy of solution at 50 atom-% hydrogen (δ-phase) is -32.06 kcal/mol of diatomic hydrogen. The relative partial molal contribution of diatomic at this composition is -40.38 kcal/mol. CHEMICAL THERMODYNAMICS OF MATERIAL AT HIGH TEMPERATURES, by R. K. Edwards and P. G. Wahlbeck. Final rept. June 30, 1961 [14]p. incl. diagr. tables. (AFOSR-1109) (AF 49(638)346) AD 259044 Unclassified

The activities of Ga and In are to be determined as a function of the composition of the 2-component system, Ga-In. An investigation of the Sc-H and Y-H systems is in progress. The present effort is aimed at the establishment of the thermodynamic properties of the systems and construction of the phase diagrams. For this purpose, equilibrium H pressure-temperature-composition data are obtained. The behaviors of the Sc-H and Y-H systems are similar, with the equilibrium pressures in the Sc-H system being higher than those of the Y-H system. Experimental work was completed on the volume of mixing of non-interacting spheres of various radius ratios. Glass beads, 126 to 222 μ in diam were used.

DISSOCIATION ENERGIES OF DIATOMIC MOLECULES BY THE KNUDSEN-TORSION EFFUSION METHOD (DISSOCIATION ENERGY OF GASEOUS S_2), by P. Budininkas. Jan. 1961 [62]p. incl. diagrs. tables, refs. (AFOSR-1110) (AF 49(638)346) AD 282434 Unclassified

A Knudsen-Torsion effusion apparatus was developed which permits the study of a 2-species gaseous equilibrium system at variable pressures and high temperature. In particular, this apparatus is suitable for the determination of the dissociation energies of S_2, Se_2, and Te_2. The dissociation energy of diatomic sulfur, obtained by this method is 76.46 - 1.36 kcal. This value shows that the spectroscopically observed dissociation of diatomic sulfur is into the 1 normal and 1 excited atom.

TRANSIENT AND DESTRUCTIVE INSTABILITY IN TORSION, by N. H. Polakowski and S. Mostovoy. [1961] [13]p. incl. illus. diagrs. table, refs. (AFOSR-592) (AF 49(638)308) Unclassified

Also published in Trans. Amer. Soc. Metals, v. 54: 567-579, Sept. 1961.

Cold stretched or drawn polycrystalline copper, iron and some of their alloys as well as quenched and tempered 4340 steel are shown to deform in torsion by propagation of localized annular shear zones. These zones superficially resemble Luder's bands; the shear strain γ within them increases with the relative initial hardness level, γ reaching 3 to 4.5 after only 50% cold reduction or γ = 1 after quenching and tempering at about 315°C (600°F). The severe local shearing is accompanied by a drooping torque-twist curve which may show several humps, each corresponding to a new band forming and spreading. The phenomenon occurs when the strain-hardening exponent (or Meyer's index) is quite low and is attributed to an easy glide condition progressively developing with increasing prestrain at the planes normal to the specimen axis. While the suggested mechanism is tentative and is less likely to apply to quenched and tempered steel, the effect as such seems to be typical of FCC and BCC metals and alloys of substantially single-phase structure. Moreover, the results presented appear to throw a new light on certain long known but ill-understood aspects of the mechanical behavior of metals. (Contractor's abstract)

DIRECT STUDY OF IMPERFECTIONS IN NEARLY PERFECT CRYSTALS, by R. H. Bragg and L. V. Azároff. Mar. 1, 1961 [26]p. incl. diagrs. refs. (AFOSR-308) (AF 49(638)425) AD 254141
Unclassified

Also published in Direct Observation of Imperfections in Crystals, Proc. Technical Conf., St. Louis, Mo. (Mar. 1-2, 1961) New York, Interscience Publishers, 1962, p. 415-429.

The Laue focusing geometry employed by Guinier and Tennevin (Acta Cryst., v. 2: 133, 1949) to observe imperfections in deformed crystals can be used to study imperfections in nearly perfect crystals as well by interpreting the observed intensity distributions in terms of the dynamical theory of x-ray diffraction. A rather perfect silicon crystal was examined by this method. It was found that neighboring regions of the same crystal slice consist of mosaic blocks approx. 10^{-3} cm thick whose relative tilts range from 8 to 12 sec of arc. As suggested by the more qualitative etch pit densities and diffraction line breadths, the central portions of the crystal contain larger blocks with smaller relative misorientations than those lying near the surfaces of the crystal. It is thus possible to use this method to accurately map the distribution of imperfections throughout as small or as large a region of a single crystal as is desired. (Contractor's abstract)

STRUCTURE STUDIES OF IMPERFECTIONS IN CRYSTALS, by L. V. Azároff. Final rept. Oct. 1, 1961, 7p. (AFOSR-1463) (AF 49(638)425) AD 264936
Unclassified

Two procedures for studying imperfections present in crystals are described. In 1, electron density distributions in pure and doped CdS and ZnO crystals were obtained and their differences used to determine the imperfections present. This method was sufficiently sensitive to clearly establish the presence and amount of interstitial zinc atoms in ZnO. This excess zinc atom concentration led to the development of a diffusion theory for binary compounds. The second method makes use of the dynamical theory of x-ray diffraction to interpret intensity variations from single crystals in terms of imperfections present in such crystals. It has been applied successfully to transistor grade Si crystals. (Contractor's abstract)

DIFFUSION PATHS AND ACTIVATION ENERGIES IN AgI AND ZnO CRYSTALS (Abstract), by L. V. Azároff. [1961] [1]p. [AF 49(638)425]
Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 23, Feb. 1, 1961.

The diffusion paths in hexagonal closest packed structures consist of successive octahedral voids and in cubic closest packed structures of alternating octahedral and tetrahedral voids. The saddle points encountered in both paths are the same since 2 adjacent voids share a triangular face composed for 3 closest packed atoms. The activation energy for diffusion is primarily composed of the saddle-point energies because other terms tend to cancel. The existence of continuous paths in the zinc blende and wurtzite structures eliminates the need for vacancies, and it can be shown that the activation energy in β AgI is twice that in γ AgI because 2 saddle points must be crossed in the wurtzite structure as opposed to one only in zinc blende. Similarly, it can be shown that the different activation energies for diffusion of Zn in ZnO measured by electrical and by tracer methods can be explained when actual diffusion paths are considered.

ON A PHASE METHOD FOR TREATING STURM-LIOUVILLE EQUATIONS AND PROBLEMS, by N. Wax. [1960] [18]p. incl. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-56695; and Rand Corporation) Unclassified

Published in Jour. Soc. Indus. and Appl. Math., v. 9: 215-232, June 1961.

The general linear second-order differential equation $d^2W/ds^2 + \nu^2 f^2(s)W = 0$, in which ν is a constant, is investigated by use of the first-order non-linear equation (1) $\frac{dx}{d\theta} = [2 - \sin\theta \frac{d(\log f)}{dx}]^{-1}$, in which the "phase" θ is defined by $W^{-1}(dW/ds) = -f(s)\tan\frac{1}{2}\theta$, and the variable x by $x = \int_0 sf(\eta)d\eta$. Thus if (1) is integrated numerically, the zeros of W will be related to the values of x at which θ is an odd multiple of π. Here, this method is applied to the evaluation of zeros of Bessel functions and quotes numerical results. The results are compared with those of a similar method by F. J. W. Olver (Proc. Cambridge Philos. Soc., v. 46: 570-580, 1950) based on a different definition of phase. Another application is to the evaluation of eigenvalues in boundary-value problems. A method of successive approximation, again based on the numerical integration of (1), is proposed.

TERMINAL AND BRANCH CAPACITY MATRICES OF A COMMUNICATION NET, by W. Mayeda. [1960] [9]p. incl. diagrs. (Sponsored jointly by [Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122]) Unclassified

Published in I. R. E. Trans. on Circuit Theory, v. CT-7: 261-269, Sept. 1960.

Communication net consists of branches representing communication channels with the weight of each branch being a positive real number which represents the capacity of transferring information through the branch (called a "branch capacity"). The terminal capacity between the vertices i and j of a communication net is the capacity of transferring information between the vertices i and j by considering the net as a whole. To indicate the terminal capacities between all possible pairs of vertices in a net, a terminal capacity matrix is defined. The necessary and sufficient conditions for a terminal capacity matrix are then given. To represent the structure of a communication net, a branch capacity matrix is defined. The synthesis of a communication net from a given terminal capacity matrix can be obtained by using the relationship between a branch capacity matrix and a given terminal capacity matrix.

DETERMINATION OF THE HYPERFINE STRUCTURE OF ATOMIC NITROGEN BY CONTINUOUS OPTICAL ORIENTATION, by W. W. Holloway, Jr. and E. Lüscher. [1960] [2]p. incl. illus. (Sponsored jointly by [Air Force Office of Scientific Research], Office of Naval Research, and [Signal Corps under DA 36-039-sc-85122]; and National Science Foundation) Unclassified

Published in Nuovo Cimento, Series X, v. 19: 1296-1297, Dec. 16, 1960.

The technique of atomic orientation by optical pumping with spin-exchange was used to measure the hyperfine splitting constants of atomic nitrogen. Cesium was used as the optical pumping agent and air-cooled r f electrodeless discharges produced a continuous supply of N_2 atoms. The zero field splitting for N^{14} was measured as $\nu(5/2 - 3/2) = 26\ 127\ 325 \pm 125$ Hz, $\nu(3/2 - 1/2) = 15\ 676\ 380 \pm 75$ Hz; and for N^{15} as $\nu(2 - 1) = 29\ 290\ 950 \pm 100$ Hz. The hyperfine structure constants were measured as: N^{14} magnetic h f s coupling constant $|A(14)| = 10\ 450\ 928 \pm 45$ Hz, N^{14} quadrupole coupling constant $|B(14)| = 14\ 645\ 475 \pm 50$ Hz. The hyperfine structure anomaly, due to effects of finite nuclear volume is $\Delta = (1.000 \pm 0.006) \times 10^{-3}$.

SENSITIVITY CONSIDERATIONS FOR TIME-VARYING SAMPLED-DATA FEEDBACK SYSTEMS, by J. B. Cruz, Jr. [1960] [9]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122) Unclassified

Published in I. R. E. Trans. on Automatic Control, v. AC-6: 228-236, May 1961.

A synthesis procedure for linear time-varying sampled-data feedback systems is described. Just as in the continuous system case, one of the advantages of feedback in a sampled-data system is that it can potentially reduce the effect of plant variations on the system performance. To a certain extent, load disturbance and instrument noise may be simultaneously reduced also. A time-domain sensitivity matrix is defined and used in the design of the digital compensators for prescribed insensitivity of the system to plant variation. In addition, two optimization criteria are presented for the design of these compensators when load disturbance and instrument noise have to be reduced as well. The procedure is also applicable to time-invariant sampled-data systems. (Contractor's abstract)

MINIMIZING EFFECTS OF DISTURBING SIGNALS THROUGH MINIMUM SQUARE-ERROR CRITERION, by M. Sobral, Jr. [1960] [6]p. incl. diagr. (Sponsored jointly by [Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122] Unclassified

Published in I. R. E. Trans. on Automatic Control, v. AC-6: 306-311, Sept. 1961.

One of the reasons for using feedback is the improvement in the rejection of disturbing signals. This improvement can be obtained through an analytical design utilizing as a performance index the integral square-error criterion. In the usual technique the sum of the command signal plus the disturbing signal transferred to the input of the system is used as the input signal. When this done, 1 of the 2 compensating transfer functions (for the particular case of a system with 2° of freedom) has to be fixed arbitrarily. Then the optimum over-all transfer function, which minimizes the integral of the square of the error between the desired output and the actual one, is calculated and thus the remaining compensator can be obtained. As the technique does not provide a method for determining one of the compensators, and the transferred disturbing signal is a function of this compensator, a required rejection of the disturbing signal may not be satisfied. The purpose of the present paper is to suggest an analytical technique for determining both of the 2 compensators which have the min band-width necessary to satisfy a desired over-all transfer function and a required rejection of a disturbing signal. In addition, the technique provides physically realizable compensating transmission. (Contractor's abstract)

SOME TECHNIQUES FOR THE ANALYSIS AND SYNTHESIS OF NONSTATIONARY NETWORKS, by J. B. Cruz, Jr. [1961] [9]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122) Unclassified

Presented at I. R. E. Internat'l. Convention, New York, Mar. 20-23, 1961.

Published in I. R. E. Internat'l. Convention Record, Pt. 4: 277-285, 1961.

A class of nonstationary or time-variable linear networks which are realizable as cascades of fixed multi-output networks and multi-input modulators is studied. It is shown that if several of these separable networks are connected in cascade, then under certain conditions, the modulators or time-varying gain amplifiers may be consolidated in one group and the cascade may be realized as a single separable network. Time domain and frequency domain behavior of these networks are examined. Although feedback structures are more difficult to analyze and synthesize, they are potentially advantageous from the standpoint of noise reduction and control of sensitivity due to a component variation. As a starting point in the control of sensitivity in time-varying systems, input-output relationships of interconnected subsystems are formulated using general operators. A sensitivity operator analogous in form to the sensitivity matrix used by Horowitz is then defined and derived for a simple feedback structure. The sensitivity function is quite flexible and may be used in controlling effects of a component variation directly in the time domain, frequency domain, or any other that a designer may choose.

ON NUMERICAL INTEGRATION OF ORDINARY DIFFERENTIAL EQUATIONS, by A. Nordsieck. May 1961, 52p. incl. diagrs. tables. (Rept. no. R-127) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122) Unclassified

Also published in Math. Comput., v. 16: 22-49, Jan. 1962.

A reliable efficient general purpose method for automatic digital computer integration of systems of ordinary differential equations is described. The method operates with the current values of the higher derivatives of a polynomial approximating the solution. It is thoroughly stable under all circumstances, incorporates automatic starting and automatic choice and revision of elementary interval size, approximately minimizes the amount of computation for a specified accuracy of solution, and applies to any system of differential equations with derivatives continuous or piecewise continuous with finite jumps. PLATO: AN AUTOMATIC TEACHING DEVICE, by D. Bitzer, P. Braunfeld, and W. Lichtenberger. [1961] [5]p. incl. illus. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, Ordnance Corps, and Signal Corps under DA 36-039-sc-85122) Unclassified

Presented at WESCON Convention, San Francisco, Calif., Aug. 22-25, 1961.

Published in I. R. E. Trans. on Education, v. E-4: 157-161, Dec. 1961.

PLATO (Programmed Logic for Automatic Teaching Operations) is a device for teaching a number of students individually by means of a single, central, high-speed general-purpose digital computer. Each student is provided with his own keyset and television display. The keyset enables the student to control the sequence of materials presented to him by the machine, as well as to transmit to the computer answers to its questions. The computer communicates to each student by closed circuit television. It selects slides and writes or erases sentences and diagrams on a storage tube. These 2 outputs are superimposed and displayed on the student's television screen. Not only are textual materials presented to each student at a rate determined by that student, but the computer frequently poses questions. The student's answers—which may take the form of numerals, algebraic expressions, or words and phrases— are judged by the computer without revealing the correct answer to the question. Supplementary material is presented by the machine upon request for any question which the student finds difficult. The computer keeps detailed records of each student's progress through the material. Though a 2-student version of PLATO is now in operation, the paper describes in detail an earlier 1-student system. The system has been used to present a variety of subject matters, ranging from mathematics to topics in French grammar. (Contractor's abstract, modified)

LINEAR SYSTEMS WITH TIME-VARYING COMPONENTS, by J. B. Cruz, Jr. [1961] [9]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122) Unclassified

Presented at Nat'l. Electronics Conf., Chicago, Ill., Oct. 9-11, 1961.

Published in Proc. Nat'l. Electronics Conf., v. 17: 71-80, 1961.

A survey is given of concepts and methods used in the analysis and design of linear systems with time-varying components. The significance and usefulness of certain input-output characterizations are discuseed. In particular, impulse responee, frequency responee, and general transfer function methods of completely describing a time-varying system are considered. The most commonly known application of these models ie an approximate analyeis of parametric devices. A more recent and very promising application ie the eynthesis of transfer functions which are theoretically realizable by time-invariant elemente but which are unfeasible practically. In many cases, time-variability may be traded off with certain component requiremente such ae high gain-bandwidth product, extremely high Q, or impractical values. In order to facilitate analog simulation and theoretical etability studies, the equilibrium equations are formulated in normal form using convenient state variables. (Contractor'e abstract)

THE ELECTROSTATIC INSTABILITY OF A BEAM OF CHARGED PARTICLES PENETRATING A PLASMA, by G. Ascoli. [1961], 30p. (Rept. no. R-131) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Reeearch, and Signal Corps under DA 36-039-sc-85122) Unclassified

The stability of an infinite beam of charged particles penetrating a plasma against small amplitude electrostatic perturbations is investigated. In Section A the dispersion relation is derived, taking into account the velocity distribution of the beam particles. In Section B it is shown that in the presence of collisione the electrostatic instabilities can be quenched if the beam particles have a velocity spread. In Section C the results are applied to a beam of finite croes section held together by its own magnetic field. The criteria for the stability of such a beam against electrostatic perturbations is derived. (Contractor's abstract)

THERMAL CONDUCTIVITY OF NORMAL AND SUPERCONDUCTING ALUMINUM, by C. B. Satterthwaite. [1961] [4]p. incl. diagrs. refs. (Sponsored jointly by [Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122]) Unclassified

Published in Phys. Rev., v. 125: 873-878, Feb. 1, 1962.

The thermal conductivity of 3 specimens of Al differing widely in residual reeistivity was measured in the normal and superconducting states. The experimental method yielded quite accurate results of the ratio of the superconducting state thermal conductivity to that in the normal state, k_s/k_n. The ratios k_s/k_n, for specimens differing in electronic mean free path by as much as a factor of 140, were essentially the same over the range of temperature covered by the experiments, 0.32-1.20°K. Agreement of the experimental results with the theoretical predictions of Bardeen, Rickayzen, and Tewordt was quite good. (Contractor's abstract)

A TECHNIQUE FOR THE ADAPTIVE CONTROL OF HIGH-ORDER SYSTEMS, by E. A. Huber. [1961] [8]p. incl. diagrs. (Sponsored jointly by [Air Force Office of Scientific Research, Office of Naval Reeearch], and Signal Corps under DA 36-039-sc-85122) Unclassified

Published in I. R. E. Trans. on Automatic Control, v. AC-7: 22-29, Apr. 1962.

A technique which is a modification of the model-reference method of adaptive control is developed to handle high-order systems. The transfer function of the model is the inverse of the desired transfer function of the closed-loop eystem insofar ae it ie practically realizable. Proper operation is obtained by adjueting the system until the polee of the closed-loop eystem are canceled by the zeros of the model. Special filtere are designed to aid in the detection of thie cancellation. They have a narrow pulse for an impulee response and the dispersion of this pulse is used as the measure of error when an impulse ie applied to the system. The criterion used for the design of the filter is that ite impulse response should have a minimum second moment about the time of the maximum. The technique is applied to a fourth-order pitch-rate control eystem and the results of the computer simulation are given. (Contractor's abstract)

HYPERFINE INTERACTION CONSTANTS OF THE F-CENTER ELECTRON WITH THE LATTICE IN ALKALI HALIDES (WITH NaCl STRUCTURE), by T. E. Feuchtwang. [1961] [12]p. incl. tables, refe. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Reeearch, and Signal Corps under [DA 36-039-sc-85122]) Unclassified

Published in Phys. Rev., v. 126: 1616-1627, June 1, 1962.

On the basis of the de Boer model for the F center, one can obtain expressions for the coupling constants in the hyperfine interaction of the F electron with a nucleus of the lattice. These constants can be determined experimentally by means of electron nuclear double resonance. The comparison of the theoretical expressions and the empirical values permits an estimate of the importance of the several factors determining these coupling constants. The formal similarity between the magnetic dipole-dipole constants and the

contribution of the F electron to the electric quadrupole coupling constants is exploited. The measured magnetic constants are used in the discussion of the quadrupole constants. It is shown that the polarization of the lattice, as a result of the displacement of the ions in the first few shells around the negative-ion vacancy, is important in determining the electric quadrupole coupling constant. This conclusion is in qualitative agreement with Kojima's calculations in LiF. It also explains the fact that while the magnetic interaction shows negligible deviation for axial symmetry at sites of lower symmetry, this is not true for the electric quadrupole interaction. ELECTRON-NUCLEAR DOUBLE RESONANCE SPECTRUM OF AN F-CENTER ELECTRON IN ALKALI HALIDES (WITH NaCl STRUCTURE, by T. E. Feuchtwang. [1961] [8]p. incl. diagrs. tables. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122) Unclassified

Published in Phys. Rev., v. 126: 1628-1635, June 1, 1962.

From the de Boer model of the F center, one can calculate a spin Hamiltonian to describe the hyperfine interaction of the F-center electron with an arbitrary nucleus in the lattice. In this paper this Hamiltonian is used to construct a spin Hamiltonain describing the hyperfine interaction of the F electron with all nuclei in the lattice in the presence of a constant and uniform magnetic field. From this one can deduce the electron-nuclear double resonance spectrum for the F electron. The negative-ion vacancy (in a cubic lattice) is an inversion center, and the magnetic field is a pseudovector. Consequently, nuclei at sites which are mapped into each other by an inversion in the vacancy are physically equivalent. If this fact is accounted for, then the entire electron-nuclear double resonance spectrum may be viewed as a set of spectra, each one of which is associated with the interaction of the F electron with a particular pair of physically equivalent nuclei. This contrasts with the present theory which assumes that the F electron interacts with individual nuclei. The new theory leads to a marked improvement in the agreement between the calculated and observed spectra. An even more interesting result is that the calculated spectrum is now sensitive to the relative sign of the nuclear g factor and the electric quadrupole coupling constant. Thus the experimental data can be used to determine not only the magnitude but also the sign of the electric field gradient at lattice sites closed to the F center. (Contractor's abstract)

THE DIGITAL ADAPTIVE CONTROL OF A LINEAR PROCESS MODULATED BY RANDOM NOISE, by C. Potle. [1961] [87]p. incl. diagrs. refs. (Rept. no R-134) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122) AD 271714 Unclassified

Also published in I. E. E. E. Trans. on Automatic Control, v. AC-8: 228-234, July 1963.

A procedure for the design of a digital controller to compensate a certain class of linear time-varying processes is presented. The process time variation may be rapid compared to the input signals and is assumed to be caused by modulation of a plant with known parameters (perhaps also time-varying) by a number of correlated random disturbances. The general results are applied through digital computer simulation to an example involving a plant modulated at the input by correlated random noise. The adaptive controller employed to compensate this plant is shown to produce far better performance than a nonadaptive fixed controller which cannot take noise correlation into account. Finally, a method of generating sets of correlated gaussian time series with specified cross- and autocorrelation functions is described. Such a technique is required in the simulation study, as well as having important applications in many other fields. (Contractor's abstract)

AUTOMATIC TITRATION OF CALCIUM OR

MAGNESIUM IN BLOOD STREAM, by H. V. Malmstadt and T. P. Hadjiioannou. [1958] [7]p. incl. tables. [AF 18(603)137] Unclassified

Published in Clin Chem., v. 5: 50-56, Feb. 1959.

Direct automatic derivative spectrophotometric EDTA titration procedures for Ca and Mg in blood serum are described. Calcium is automatically titrated in the Sargent-Malmstadt "Spectro" titrator at pH 13 using Calcon as indicator. The results obtained by the automatic method are of the same degree of accuracy and reproducibility as those obtained by the classic permanganate titration of precipitated calcium oxalate. Total Ca and Mg can be titrated automatically at pH 10 with Eriochrome Black T as indicator, and Mg is calculated by difference between total Ca and Mg and Ca only. The average automatic titration time for each Ca determination is about 10 sec and about 15 sec for total Ca and Mg. The total time for the complete procedure for each Ca or Mg determination is about 3 min. (Contractor's abstract)

DETERMINATION OF CALCIUM, MAGNESIUM, AND TOTAL HARDNESS BY AUTOMATIC SPECTROPHOTOMETRIC TITRATION, by H. V. Malmstadt and T. P. Hadjiioannou. [1959] [7]p. incl. tables, refs. [AF 18(603)137] Unclassified

Published in Jour. Amer. Water Works Assoc., v. 51: 411-417, Mar. 1959.

A direct, automatic spectrophotometric EDTA titration for calcium and Mg hardness is described. Calcium is determined in the presence of Mg at pH 13 using Calcon as indicator. The total amounts of Ca and Mg are determined at pH 10 using Eriochrome Black T as indicator. Both titrations are automatically terminated at their equivalence points, and the subjective evaluation of endpoints is eliminated. Interference by heavy metals is presented by adding a few drops of KCN. The automatic-titration method was applied to more than a thousand samples with total hardness from 0.5-600 ppm, and the results were very reproducible and accurate. The time required for an automatic titration varies from a few sec to a few min, depending on the water hardness. Sample preparation and manipulation and buret reading require less than a min/water sample. (Contractor's abstract)

MICRO RANGE IODOMETRY BY COMBINING PRECISION NULL-POINT POTENTIOMETRY AND ELECTROLYTIC GENERATION OF IODINE, by H. V. Malmstadt and H. L. Pardue. [1960] [5]p. incl. diagrs. table, refs. [AF 18(603)137] Unclassified

Published in Anal. Chem., v. 32: 1034-1038, July 1960.

The accurate iodometric determination of oxidants and reductants in the micro range has been difficult because of the necessity for maintaining standard iodine and thiosulfate solutions and the errors associated with the iodine-thiosulfate titration.

Combination of the new precision null-potentiometric technique with electrolytic generation of iodine has eliminated the necessity for using thiosulfate as a titrant for iodine and permitted the partial compensation for a number of the difficulties associated with the iodine-iodide system. Oxidants (or reductants) were reacted with an excess of iodide (or iodine) to liberate (or consume) an equivalent amount of iodine and the change in iodine was measured by the precision null-point potentiometric technique. Oxidants and reductants were determined in concentrations equivalent to 0.5-5 ppm of iodine with accuracy and reproducibility better than 0.02 ppm of iodine. (Contractor's abstract)

SPECIFIC ENZYMATIC DETERMINATION OF ALCOHOL IN BLOOD BY AN AUTOMATIC SPECTROPHOTOMETRIC REACTION RATE METHOD, by H. V. Malmstadt and T. P. Hadjiioannou. [1961] [16]p. incl. diagrs. tables, refs. (AFOSR-1482) (AF 18(603)137) Unclassified

Also published in Anal. Chem., v. 34: 455-458, Apr. 1962.

An automatic spectrophotometric reaction rate method is described for the selective determination of ethyl alcohol in blood. The alcohol is selectively oxidized in the presence of ADH and DPN to form an absorbing species DPNH. The time required for a small fixed (0.06) change in absorbance is measured automatically during the early part of the reaction and the readout value is related directly to alcohol concentration. Measurement times vary from a few sec to a couple of min, and samples vary from 0.1-0.25 ml of blood. The method is sensitive, more rapid than conventional methods and relative errors are only about 2-3% for the entire range of 0.015-0.300 g ethanol/100 ml blood.

1075

Illinois U. Dept. of Chemistry and Chemical Engineering, Urbana.

A NEW AUTOMATIC SPECTROPHOTOMETRIC RATE METHOD FOR SELECTIVE DETERMINATION OF GLUCOSE IN SERUM, PLASMA, OR BLOOD, by H. V. Malmstadt and S. I. Hadjiioannou. [1961] [1]p. incl. diagrs. tables. (AFOSR-1483) (AF 18(603)137) Unclassified

Also published in Anal. Chem., v. 34: 452-455, Apr. 1962.

The instrument used is described. It consists of 5 relatively inexpensive commercial units: a Spectro unit with stable light source, interference filter, sensitive detector, and efficient stirring; a thermostated test tube cell; a measurement unit; control unit; and readout device. Glucose is oxidized selectively in the presence of glucose oxidase and the H_2O_2 produced reacts immediately with iodide in the presence of molybdate catalyst to form tri-iodide which absorbs strongly at about 360 mμ. Near the start of the reaction, the rate of change of the tri-iodide concentration is proportional to the glucose concentration and the time required for a small preset change in tri-iodide concentration is related easily to the glucose in the sample. Glucose is determined in 0.08 ml of serum, plasma, or blood with relative errors within 2% and measurement times are about 1-3 min. The results are tabulated.

DETERMINATION OF GLUCOSE IN BLOOD SERUM BY A NEW RAPID AND SPECIFIC AUTOMATIC SYSTEM, by H. V. Malmstadt and G. P. Hicks. [1959] [5]p. incl. diagrs. tables. (AFOSR-3125) [AF 18(603)-137] Unclassified

Also published in Anal. Chem., v. 32: 394-398, Mar. 1960.

The method is based on the coupled enzyme reaction, in which oxidation of glucose is catalyzed specifically, with the subsequent formation of a colored reaction point. A few sec after the start the rate of formation of the colored reaction product is proportional to glucose concentration, and this rate can be measured accurately and automatically within about 1 min after the reaction begins. An instrument was assembled to measure precisely the extremely small change of absorbance that occurs during the first part of the glucose reaction. A time ratio is obtained which is directly proportional to concentration. A few commercially available basic units and an easily constructed control system and enzyme injector are put together so that the glucose measurement is rapid and simple. Automatic results for the determination of glucose in standards and blood serum show good proportionality and a coefficient of variation of about 25%. (Contractor's abstract)

THE MASS SPECTRUM OF ETHYLLITHIUM VAPOR, by J. Berkowitz, D. A. Bafus, and T. L. Brown. [1961] [4]p. incl. diagr. tables, refs. (AFOSR-220) (AF 49(638)466) AD 253804 Unclassified

Also published in Jour. Phys. Chem., v. 65: 1380-1383, Aug. 1961.

The mass spectrometric results for ethyllithium show that the saturated vapor consists predominantly of a hexamer and a tetramer in roughly equal concentrations at 80-95°C. The presence of hexamer and tetramer suggests a ring structure, rather than a linear configuration. The preferential fragmentation of the C_2H_5 radical during ionization suggests that Li is bonded to more than one atomic center, while C_2H_5 is not. The very high appearance potential of Li^+ in these experiments is further evidence for this conclusion. The majority of freezing point depression studies of ethyllithium in benzene, and in particular those which have been performed with solutes of pure, recrystallized ethyllithium, indicate a degree of association in the range 5-7.

BASIC AND APPLIED RESEARCH ON SEMICONDUCTORS, by E. K. Welse. Final rept. Feb. 28, 1961, 6p. incl. refs. (AFOSR-509) (AF 49(638)212) AD 253674 Unclassified

The results of this contract, concerned with the electrical conductivity properties of magnesium, calcium, strontium, and barium titanates as functions of composition and temperature, are reviewed. Additional details of the work are also presented. Rod shaped samples of magnesium dititanate, magnesium metatitanate, and magnesium orthotitanate were formed by extrusion of the raw material with polyvinylalcohol added as a binder. The results confirm the older discovery of the appearance of a strong magnetic phase in magnesium dititanate at a Ti^{3+} concentration corresponding to 0.18% weight loss. The same compounds were shaped into sintered disc samples for thermoelectric investigations also. Thermoelectric coefficients up to 350 microvolts per degree were found but the correlated electrical resistivities were too high, up to 3000 ohm-cm, for technical applications of these materials for power generation or for refrigeration.

SOME COMMENTS ON THE AUSTENITE-MARTENSITE INTERFACE, by C. M. Wayman. Jan. 1961 [13]p. incl. diagr. refs. (AFOSR-116) (AF 49(638)-420) AD 253150 Unclassified

The formal crystallographic theory developed for the description of martensitic transformations apparently now has more far reaching implications than initially intended. In addition to providing reasonable agreement between theory and experiment in known martensite transformations, application of the basic ideas behind the martensite theory have shown that some order-disorder and precipitation type transformations possibly can be accounted for in a crystallographic sense. It thus appears that there may be some fundamental underlying principles governing these different classes of transformations, i.e., some common interface behavior or dislocation distribution at the interface itself. A more thorough understanding of the geometry of the interface involved would add to the development of a dislocation model for interface propagation. In this report, an observation pertaining to the dilation in such an interface—the austenite-martensite interface—is pointed out.

OBSERVATIONS ON THE GROWTH OF α-IRON SINGLE CRYSTALS BY HALOGEN REDUCTION, by C. M. Wayman. [1961] [8]p. incl. illus. refs. (AFOSR-730) (AF 49(638)420) AD 257331 Unclassified

Also published in Jour. Appl. Phys., v. 32: 1844-1845, Oct. 1961.

By large scale modification of established whisker growing techniques, it was possible to produce single crystals of alpha iron between 1 and 2 mm in diam and up to 80 mm in length. These crystals grew along a <100> axis and had {100} faces. The final size of the crystals appeared to depend upon the quantity of $FeCl_2$ vapor available for reduction. Some growth features are reported.

AUSTENITE-MARTENSITE CRYSTALLOGRAPHY IN Fe-1.51C-3.09Cr, by K. A. Johnson and C. M. Wayman. [Aug. 1961] [24]p. incl. diagrs. table, refs. (AFOSR-1309) (AF 49(638)420) AD 263898 Unclassified

Also published in Acta Cryst., v. 16: 480-490, June 10, 1963. (Title varies)

An alloy of Fe-1.51 wt-%C-3.09 wt-%Cr undergoes an austenite-martensite transformation at -14°C. The lattice parameters of the austenite and martensite, the lattice orientation relationship, and the habit plane for this transformation were experimentally determined. An analysis of the crystallography on the basis of the Wechsler-Lieberman-Read (Trans. AIME, v. 197: 1503, 1953) and Bowles-Mackenzie (Acta Metall., v. 2: 129, 138, 224, 1954) theories showed that the experimental quantities could not be accounted for completely by either theory. Better agreement may be possible by incorporating an anisotropic dilation into the austenite-martensite interface. This more general theory is under consideration at present. (Contractor's abstract)

THE MARTENSITIC TRANSFORMATION IN Fe-31 wt-% Ni, by J. F. Breedis and C. M. Wayman. 1961 [23]p. incl. illus. diagrs. tables, refs. (AFOSR-1979) [AF 49(638)420] AD 270904 Unclassified

Also published in Trans. Metall. Soc. AIME, v. 224: 1128-1133, Dec. 1962.

The crystallography of the martensitic transformation in the Fe-30 Ni alloy was reinvestigated. The scatter in the habit plane as determined from measurements on the mid-rib plane was smaller than reported previously, and the orientation relationship

was determined from a martensite plate having known direction cosines. From agreement with crystallographic theory and from observations of the morphology of the martensite plates, it is suggested that the mid-rib plane represents the starting region of the transformation. (Contractor's abstract)

COMMENTS ON THE DILATION IN THE AUSTENITE-MARTENSITE CONTACT INTERFACE, by C. M. Wayman. [1961] [4]p. incl. diagrs. refs. (AFOSR-2788) (AF 49(638)420) AD 613111 Unclassified

Also published in Acta Metall., v. 9: 912-915, Sept. 1961.

The implications to reach a formal crystallographic theory for the description of martensitic transformations are reviewed. Thus far, a reasonably well developed theory is based on an interface (habit) plane which is essentially macroscopically invariant. In the present case, the amount of interface dilation is variable and chosen so that the theory fits the experimentally determined quantities. If the Bowles-Mackenzie dilation parameter is taken to be unity, as in the case of the $\{259\}_A$ transformation in iron alloys, their theory is equivalent to the other ones. This means that an interface dilation parameter can be incorporated into any of the existing theories. The use of such a parameter amounts to adjusting the lattice parameters of one of the coexistent phases at the plane of contact. Various works done by means of a dilation parameter are discussed.

THERMALLY ACTIVATED DISLOCATION MOBILITY (Abstract), by R. Thomson and M. Meyer. [1961] [1]p. [AF 49(638)420] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 162, Mar. 20, 1961.

The model of Lothe and Hirth has been extended to higher stress regimes where the kink population is highly perturbed by the external stress. The extension over the original model involves a new set of boundary conditions for kink collisions. The results show a linear stress dependence at low stresses which is equivalent to the original treatment of Lothe and Hirth. At higher stresses, the mobility is exponential in the stress. The model is particularly well suited to a crystal like Ge, where the creep data of Van Bueren are adequately described by the theory in terms of the Peierls energy as computed by Celli. Certain types of impurity effects can also be understood in terms of the pinning of kinks on the line.

THE ZENER RELAXATION IN TERNARY Au-Ag-Zn ALLOYS, by A. Pirson and C. Wert. July 3, 1961 [13]p. incl. diagrs. tables. (AFOSR-1112) (AF 49-(638)672) AD 266243 Unclassified

Presented at Conf. on Internal Friction due to Crystal Lattice Imperfections, Cornell U., Ithaca, N. Y., July 10-11, 1961.

Also published in Acta Metall., v. 10: 299-304, Apr. 1962.

Well-formed Zener damping peaks were observed in ternary alloys of Au, Ag and Zn. The relaxation strength across the ternary along a line of constant Zn concentration of 15 at -% goes through a max at about an equal ratio of Au to Ag. This max is large, being nearly 3 times what might have been expected by averaging the effects of the 2 binaries. The relaxation strength at low concentration of Zn for an alloy of equal ratio of Au to Ag increases as the square of the Zn concentration, as is true for binary alloys. (Contractor's abstract)

ANELASTIC MEASUREMENT OF DIFFUSION OF OXYGEN IN HAFNIUM (Abstract), by E. Bisogni and C. Wert. [1961] [1]p. [AF 49(638)672] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 173, Mar. 20, 1961.

The anelastic behavior of hafnium has been measured in the temperature region 25° to 700°C. Two regions of high damping were observed, 1 a distinct damping peak at about 475°C (for 1 cps), the other a region of constantly increasing damping starting at 500°C and increasing steadily with temperature to 700°C, where the measurements stopped. The first of these is identified as being caused by diffusion of oxygen (and possibly nitrogen) in hafnium. The second is believed to be grain boundary damping. These results are similar to those found for alloys of titanium and oxygen by Miller and Weinig and Gupta. In the present investigation most attention was paid to the peak at 475°C. It is enhanced in magnitude by oxidizing treatments. It is also enhanced by nitriding treatment, but this may be caused by oxidation during the nitriding. The activation energy for the peak is 52 to 58 kcal/mol, close to that reported for diffusion of oxygen in hafnium. A model is proposed for the damping effect.

ENERGY-BAND STRUCTURE OF SOLIDS FROM A PERTURBATION ON THE 'EMPTY LATTICE', by F. Bassani and V. Celli. [1960] [12]p. incl. diagrs. tables, refs. (AFOSR-384) (AF 49(638)819) AD 612226 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 20: 64-75, June 1961.

A simple perturbation approach is developed to obtain the energy-band structure of solids. The unperturbed Hamiltonian consists of the kinetic part and of a uniform potential; the perturbing operator is the crystal potential plus a term which originates from the requirement that valence and conduction states be orthogonal to the inner states. This amounts to an approximation to the O. P. W. method. Reasons are given for the validity of such a simple scheme and applications are made to the case of the diamond lattice and of the zincblende lattice. It is shown how features of the energy-band structure depend on the symmetry of the lattice, on the lattice parameter and on the 'core states' of the atomic components. Numerical results obtained for diamond, silicon and BN are in fair agreement with recent calculations. An energy-band structure consistent with experimental information is obtained for Ge and GaAs by fixing the values of a few parameters. (Contractor's abstract)

THE FRENKEL KONTOROVA DISLOCATION IN A DISCRETE LATTICE, by R. Hobart. Apr. 28, 1961, 1v. incl. diagrs. refs. (AFOSR-647) (AF 49(638)-819) AD 258645 Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 163, Mar. 20, 1961.

The drag on a moving dislocation due to buffeting by the Peierls hills is studied. Hart has calculated the drag with an assumption that the dislocation motion is inertially dominated. Arguments are given which cast some doubt on this assumption and show it is critical to the results. An alternative approach is proposed and studied in the Frenkel-Kontorova model. A solution to the F-K nonlinear difference equation is obtained. The effect of the Peierls energy can be localized as due to a force on a single central atom. For a moving dislocation this force acts as a source for outgoing radiation. The problem is studied as a driven normal mode problem in a continuous F-K model. The point driven responds both inertially and resistively. The latter response is directly related to the loss of translational energy to radiation and thus to the buffeting drag. A nonlinear partial differential equation describing a Peierls-Nabarro model is proposed to serve as the basis of a similar calculation in 3 dimensions.

KINETIC THEORY OF DISLOCATION CLIMB. II. STEADY STATE EDGE DISLOCATION CLIMB, by R. W. Balluffi and R. M. Thomson. [1961] [10]p. incl. diagrs. table. (Technical note no. 5) (AFOSR-1277) (AF 49(638)819) AD 456577 Unclassified

Also published in Jour. Appl. Phys., v. 33: 817-826, Mar. 1962.

Quantitative expressions for the steady state climb rate of a straight unconstrained edge dislocation are obtained. The results represent specific solutions to a general kinetic model of climb developed in Part I (item no. 1097, Vol. V). Solutions are obtained for the case where interstitials in the lattice can be neglected compared to vacancies, where the dominant point defects responsible for fast diffusion along dislocation cores are vacancies, and where unlike jogs attract one another. No a priori assumptions are made about the ability of the dislocation or its jogs to maintain local point defect equilibrium. A wide range of conditions is treated including positive and negative climb where the vacancy concentrations may be either near or far from equilibrium. Positive and negative climb are shown to be inherently different processes, and it is found that dislocations tend to get joggy in crystals far from equilibrium. Several brief applications to problems of current interest are given. A need for critical experiments is emphasized. (Contractor's abstract)

KINETIC THEORY OF DISLOCATION CLIMB. I. GENERAL MODELS FOR EDGE AND SCREW DISLOCATIONS, by R. M. Thomson and R. W. Balluffi. [1961] [14]p. incl. diagrs. refs. (Technical note no. 4) (AFOSR-1278) (AF 49(638)819) AD 456578 Unclassified

Also published in Jour. Appl. Phys. v. 33: 803-816, Mar. 1962.

General kinetic models are established for the climb of edge and screw dislocations. The climb of a straight unconstrained edge dislocation is considered in terms of the diffusion of nonequilibrium point defects to (or from) the line and their absorption (emission) and destruction (creation) at the line. The climb is nucleated by the formation of short rows of defects which are attached to the edge of the extra plane and are bounded by jog pairs. Climb occurs by the growth of these aggregates until they destroy each other by mutual collisions. No a priori assumptions are made about the ability of either the dislocation or the jogs to maintain local point defect equilibrium during climb, and account is taken of rapid defect diffusion along the core. Effects of nonequilibrium defects in perturbing the jog population are also included. Equations describing this edge dislocation climb are developed but are left in a general form. Complete solutions are worked out in Part II (item no. 1096, Vol. V). Complications which arise when geometrical constraints and line curvature are present are discussed, and a description of the relationships between curvature, macroscopic line tension, and jog density is given. It is concluded that the results for the unconstrained climb model can be used in many such cases over a considerable range of conditions. The treatment of screw dislocation climb focuses attention on the climb of an initially straight dislocation into a multi-turned helix. The detailed mechanisms are found to depend strongly upon the geometry and mobility of point defects and point defect aggregates on the core, and therefore only a qualitative theory is given. It is suggested that in many crystals vacancies largely dissociate into kinks when they enter the core, and that the helical turns build up rather uniformly along the line by the aggregation of ordered arrangements of these kinks. SURFACE STUDIES IN ULTRAHIGH VACUUM BY

RADIO-TRACER TECHNIQUES, by E. Von Goeler. Jan. 1961, 74p. incl. diagrs. tables, refs. (Rept. no. TN-3) (AFOSR-113) (AF 18(603)49) AD 252022
Unclassified

A number of laboratory techniques relevant to surface research have been developed, most prominent of which is the production of ultrahigh vacuum that can be maintained for indefinite periods of time. One of the basic surface phenomena is the interaction of single atoms or molecules with the surface. Statistical thermodynamics can be used profitably to establish simple relations between the surface forces, the temperature, and the number of particles being adsorbed to the surface. Detection is facilitated by the use of radioactive isotopes. The method is straight-forward and has been repeatedly employed. The results of such experiments are questioned, however, since problems which arise from the necessity for establishing a well defined, uncontaminated surface, have not been solved satisfactorily. An attempt was made to overcome these difficulties and improve the radiotracer method so that it can be considered a respectable tool of clean surface research. (Contractor's abstract)

RECOMBINATION OF ELECTRONS AND DONORS IN SEMICONDUCTORS, by G. Ascarelli and S. Rodriguez. Aug. 1961 [17]p. incl. diagrs. refs. (Technical note no. 7) (AFOSR-1393) (AF 49(638)-579) AD 454655
Unclassified

Presented at the 1961 Internat'l. Conf. on Photoconductivity, Cornell U., Ithaca, N. Y., Aug. 21-24.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 485, Nov. 24, 1961.

Also published in Jour. Phys. and Chem. Solids, v. 22: 57-62, Dec. 1961.

A description is given of a calculation of the recombination of electrons in the conduction band of a semiconductor with ionized donor impurities. The process which is assumed, consists in the initial capture of the electron in an excited state of the donor center followed by a transition to the ground state. This mechanism is most effective in the case in which all transitions are accompanied with emission or absorption of phonons. The results obtained are compared with earlier theoretical calculations and with experiments. The agreement between the present theory and experiment is reasonably good.

MOBILITY OF ELECTRONS IN SILVER CHLORIDE AT HIGH ELECTRIC FIELD, by T. Masumi. Oct. 1961 [9]p. incl. diagrs. refs. (Technical note no. 8) (AFOSR-1706) (AF 49(638)579) AD 267224 Unclassified

Also published in Phys. Rev., v. 129: 2564-2565, Mar. 15, 1963.

The theory of the polaron in ionic crystals usually applies to a slow electron in thermal equilibrium with the crystal lattice. As the electron gains energy from an electric field departing from thermal equilibrium, it is expected that the slow electron concept will begin to fail and, in addition, certain differences in electron scattering will take place. The mobility of electrons in AgCl under high electric field was investigated in order to clarify these points. (Contractor's abstract)

MAGNETORESISTANCE OF THE SILVER HALIDES, by H. H. Tippins. Dec. 1961 [54]p. incl. diagrs. refs. (Technical note no. 10) (AFOSR-2040) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)579 and General Electric Foundation) AD 271393 Unclassified

A study was made of the effect of a magnetic field on the conductivity, i. e., the magnetoresistance effect. The detailed behavior of conduction electrons in a solid in the presence of external fields is determined primarily by 2 factors, the band structure of the material, and the scattering processes which the electrons experience. Comparison of experimental results with the theoretical predictions for various assumed band structures and scattering mechanisms could provide important evidence for the correct band structure and scattering to be associated with the particular material of interest. To obtain the full information available from electronic conduction measurements it was necessary to apply both electric and magnetic fields.

HALL MOBILITY OF ELECTRONS IN PURE SILVER CHLORIDE (Abstract), by T. Masumi and F. C. Brown. [1961] [1]p. [AF 49(638)579] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 131, Mar. 20, 1961.

The Hall mobility of photoelectrons in crystals of AgCl was studied as a function of temperature down to 5°K using pulse techniques as previously reported. (item no. ILL. 08:016, Vol. II). Further measurements for samples of different preparation and purity have been made in an attempt to determine the factors which control electron scattering. Very high purity AgCl was prepared by zone refining in a halogen atmosphere starting with the central portions of previously zone refined ingots. A few crystals containing additions of certain heavy metal impurities were also investigated. The results show that electron mobility below 40°K is a sensitive function of crystal purity. Mobilities in excess of 2×10^4 cm^2/v-sec have been observed in the purest crystals whereas heavy metal additions in concentrations of the order of 1 part in 10^5 reduce the residual mobility to values below 3×10^3 cm^2/v-sec. Optical mode scattering is definitely observed above 40°K in the pure crystals, and, in fact, the Debye temperature associated with longitudinal optical vibrations can be deduced from the mobility experiments for comparison with Reststrahl data.

LOW-FIELD BREAKDOWN IN n-TYPE GERMANIUM, by G. Ascarelli. [1961] [15]p. incl. diagrs. table, refs. (In cooperation with Massachusetts Inst. of Tech., Cambridge) [AF 49(638)579] Unclassified

Published in Nuovo Cimento, Series X, v. 22: 251-265, Oct. 16, 1961.

Measurements of the time necessary to produce low field break-down in n-type germanium have been made as a function of the applied electric field; this time interval is proportional to E^{-2}. The experimental results presented herein, as well as the results obtained from dc measurements can be explained (on the basis of the avalanche multiplication model of breakdown) if it is assumed that the distribution function of the electrons whose energy is smaller than the ionization energy of the impurities is given by $f(x) \propto (1 + px) \exp [-x]$ (where p is proportional to $(\mu_0 E)^2$ with μ_0 equal to the observed low field mobility, $x = \epsilon/kT$, where ϵ is the electron energy) and that the cross-section for impact ionization is constant for $\epsilon > \epsilon_0$ and equal to zero for $\epsilon > \epsilon_0$. LIFETIME EFFECTS IN CONDENSED FERMION SYSTEMS, by A. Bardasis and J. R. Schrieffer. [1961] [3]p. incl. diagr. (AFOSR-1102) [AF 49(638)882] Unclassified

Also published in Phys. Rev. Ltrs., v. 7: 79-81, July 15, 1961.

An integral equation for the energy gap at $T = 0°K$ is obtained using a Green's function method which includes finite-lifetime effects. The effects of damping on this equation are considered. Damping lowers the possible critical temperature T_c of liquid He^3, the value $T_c = 8 \times 10^{-4}°K$ being obtained using a separable effective 2-body potential.

EXCITONS AND PLASMONS IN SUPERCONDUCTORS, PART I. LIFETIME EFFECTS IN CONDENSED FERMION SYSTEMS, PART II, by A. Bardasis. Nov. 1961 [109]p. incl. diagrs. refs. (Technical rept. no. 1) (AFOSR-2045) (AF 49(638)882) AD 271181 Unclassified

The exciton mode in the superconductor as a bound pair of quasi-particles whose center-of-mass propagates with a certain momentum is discussed. The exciton spectrum is investigated through generalized equations of motion involving the quasi-particle operators of Bogoliubov and Valatin rather than c_k, the usual electron operators. In these equations an expansion of the interaction potential in terms of spherical harmonics is presented. It is found that excitons may be characterized by the approximate quantum numbers L and M describing the symmetry of the states with respect to the relative coordinates. The existence of an L-state exciton (corresponding to the p, d, f, ... excitons) is dependent on VL being negative, where VL is the L-wave part of the interaction potential. The plasmon state corresponds to an s-state exciton whose energy is greatly increased by the long-range Coulomb interaction.

TEST OF THE HYPOTHESIS OF PSYCHOLOGICAL REFRACTORY PERIOD, by J. A. Adams. [1961] [8]p. incl. diagrs. tables, refs. (AFOSR-2099) (AF 49(638)371) Unclassified

Also published in Jour. Exper. Psychol., v. 64: 280-287, Sept. 1962.

An experiment was performed to test the hypothesis of psychological refractory period that is offered to account for the established finding that response to the second of 2 closely spaced stimuli shows decrement. One line of explanation argues for a central decision time, where time must be allowed for processing the first stimulus and response before the second sequence can be undertaken. A competing explanation is the expectancy hypothesis which ascribes decrement to S's past experience with the random array of interstimulus intervals that is usually used in experiments on this topic. Through practice, S comes to expect a longer delay and the decrement is because he is not optimally ready to respond. The experiment involved a 2-dimensional, bisensory discrete tracking task. The statistical structure of interstimulus time intervals was the experimental variable aimed towards discriminating between the 2 hypotheses by asking if decrement could be a function of the temporal organization of stimuli. The results supported the expectancy hypothesis. Reliably less decrement was found for Ss who trained on a stimulus series with a predominance of small time intervals and could learn behavior appropriate to them. (Contractor's abstract)

STUDIES IN QUANTUM AND SOLID STATE ELECTRONICS, by R. Strain, R. Swendson, and D. Akitt. Technical operating rept. no. 10, June 1-Nov. 30, 1961. Dec 1, 1961, 8p. (AFOSR-2099) (AF 18-(603)62) Unclassified

Status of the work and plans for the immediate future

are outlined with respect to laser studies, solid state maser, and non-linear quantum mechanics. Work achieved is summarized as follows: (1) Optical pumping: Techniques of Zeeman resonances in Cs were observed with great reliability and sensitivity. (2) A laser facility capable of delivering up to 3200 joules at 4 kv and down to 24 joules at 4000 v has been assembled. (3) A dark-ruby maser has been designed for operation at a frequency of 480 kmc, utilizing transition among the spin levels in the ground state of the Cr-pairs that are responsible for fluorescence at 7010A. Extensive calculations have been made on the behavior of quantum mechanical dipoles in the presence of static and dynamic fields. (4) A new system for the dielectrically loaded Fabry-Perot interferometer shows a high interaction impedance, coupled with a nearly plane wave output, and the capability for frequency selection. (5) An experimental study of Mylar electron beam windows was completed.

MYLAR ELECTRON BEAM WINDOWS, by W. H. Stier. [1961] [2]p. incl. table. (AFOSR-J72) (AF 18-(603)62) AD 400466 Unclassified

Also published in I. R. E. Trans. on Electron Devices, v. ED-8: 436-437, Nov. 1961.

Thin sheets of Mylar have been found a useful material for electron beam windows for beams in the 0.5- to 1.0 mev energy range. The material finds special application in beam excited plasma devices where the plasma and the electron gun are to be held at different pressures. Experiments are described in which the amount of beam scatter and beam debunching caused by the Mylar are determined. Data are presented on the damage to the Mylar caused by the electron beam and the resultant decrease in pressure differential that the bombarded Mylar can withstand. The experiments were also conducted using Mylar sheets coated with 4000-5000 A coatings of aluminum. (Contractor's abstract)

FREQUENCY CONVERSION IN A MICROWAVE DISCHARGE, by J. R. Baird and P. D. Coleman. [1961] [11]p. incl. illus. diagrs. tables. (AFOSR-J74) (Sponsored jointly by Atomic Energy Commission, [Air Force Office of Scientific Research under AF 18-(603)62], and Wright Air Development Division) AD 400468 Unclassified

Also published in Proc. Inst. Radio Engineers, v. 49: 1890-1900, Dec. 1961.

One nonlinear property of a microwave discharge located between 2 closely spaced parallel plates whose dimensions are small compared to the wavelength is analyzed. This discharge geometry, with its small volume, permits the attainment of CW microwave power densities in the discharge of the order of 0.1-1 mw/cm^3. It is concluded that the high power density coupled with the high diffusion rate of the closely spaced parallel plates results in a modulation of the electron density at the microwave frequency. The source of this nonlinearity is postulated to be a modulation of the ionization frequency ν_i whose functional form is taken to be $\nu_i = \alpha|v_d|$ where v_d is the ordered drift velocity and α is a proportionality factor constant in time. The theoretical analysis is compared to experimental results obtained by approximating the assumed geometry in an X-band and K-band frequency multiplier and in an X-band mixer. Harmonics up through the 7th at X band and up through the 4th at K band are studied. Frequency mixing of 9- and 11-kmc signals in s yielded predictable results. Parametric amplification in a discharge is briefly considered. (Contractor's abstract)

Also published in Jour. Appl. Phys., v. 32: 2055-2056, Oct. 1961.

Calculations show that the Fabry-Perot interferometer is a practical resonator for generation of short microwaves by electron beam techniques. An interferometer with dimensions of many wavelengths was used to extract energy from a 1 mv bunched electron beam. Harmonics of 8.15 mm were extracted. The theory of the system is given. The experimental interferometer is 7.6 cm in diam, the Teflon cylinder length is 12.5 cm. This dielectric Fabry-Perot resonator provides a large and easily predicted interaction with a bunched electron beam.

CERENKOV RADIATION APPROACH TO THE SUBMILLIMETER WAVE PROBLEM, by P. D. Coleman. [1961] [19]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 18(603)62 and Wright Air Development Division) Unclassified

Presented at Second Internat'l. Conf. on Quantum Electronics, Berkeley, Calif., Mar. 23-25, 1961.

Published in Advances in Quantum Electronics, New York, Columbia U. Press, 1961, p. 581-594.

Theoretical analysis is given of the generation of coherent Cerenkov radiation by a high energy, tightly space-bunched, electron beam. The charge density and current density of this bunched beam will consist of discrete harmonic terms. A hole in the material medium must be provided for the beam to pass so that the electro-magnetic boundary value problem generally involves the following 3 regions: (1) the beam region of radius R_B, (2) the hole region of radius R_H, and (3) the material medium region. The equations for the scalar potential and vector potential must be solved for each of the 3 regions and their solutions matched at the 2 boundary surfaces. The driven electronic system producing bunched beam is discussed. The S-band Rebatron at the University is used. The method coupling Cerenkov radiation out of the medium is described. Some results obtained from the Cerenkov experiments at 8.31 mm wavelength are described. It is concluded that it is possible to extract nearly all the Cerenkov radiation produced and form it into a predictable radiation pattern when given the appropriately bunched, high energy beam in a simple, scalar, dielectric medium.

GENERATION OF MILLIMETER AND SUBMILLIMETER WAVES, by P. D. Coleman. [1961] [33]p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 18(603)-62, and Wright Air Development Division) Unclassified

Presented at I. R. E. Canadian Electronics Conf., Toronto (Canada), Oct. 2-4, 1961.

The specific problems of frequency conversion in a microwave discharge and an electron beam are analyzed. Only 2 basic momentum transfer and continuity equations are used in this analysis along with the assumption that the ionization frequency is proportional to the absolute value of the drift velocity. If the biasing voltage producing the dc bias field does not exceed the ionization potential of the gas, the power ratio (power in the kth harmonic/fundamental drive power) can be studied as a function of the ratio of the dc field amplitude to rf drive field amplitude. Also, if the discharge is placed in a circuit where the resistances drive frequency and radiation resistance associated with the kth harmonic current) can either be measured or computed, then the absolute power P_k in the kth harmonic can be calculated and compared to measured experimental values. The methods used are described and analyzed.

APPLICATION OF TUNNEL DIODES IN LINEAR NETWORK SYNTHESIS, by B. A. Shenoi. Dec. 1, 1961 [101]p. incl. diagrs. refs. (Technical note no. 17) (AFOSR-1898) (AF 49(638)63) AD 271179 Unclassified

An investigation is presented of the application of tunnel diodes in grounded lossy networks without any transformers for realizing transfer functions with as few restrictions as necessary. After choosing a lumped, linear, small-signal equivalent circuit for the model of the device as a capacitance in parallel with a negative conductance, some properties of networks in which the tunnel diode is embedded are obtained. A systematic study of transfer function synthesis is developed. One of the synthesis techniques gives rise to a cascade connection of an RC and an RL network embedded with at most 2 tunnel diodes. Hence the capacitors and inductors can be provided with different amounts of dissipation. An integral part of this transducer network can be used as the dc bias circuit for the tunnel diodes, thereby assuring no change in the transfer characteristic of the network when the diodes are energized by a single dc supply. DC stability of the diodes is also guaranteed when the network is ac stable. The decomposition of a polynomial such that its zeros can be realized as the natural frequencies of a cascade connection of an RC and an RL network with a tunnel diode in shunt between them is considered. CRITICAL PATH ANALYSIS OF TIME-ORDERED

CONSTRUCTION AND ASSEMBLY PROJECTS, by B. R. Myers. Dec. 29, 1961 [26]p. incl. diagrs. tables. (Technical note no. 19) (AFOSR-2060) (AF 49-(638)63) AD 273034 Unclassified

A method for analyzing time-sequential ordered construction and assembly projects with multiduration jobs and arbitrary job scheduling is presented. The method employs partitioning techniques applied to an oriented linear graph representation of the project. The main principle involves the critical path, which is the longest continuous path from the starting vertex to the finishing vertex in the graph, and therefore represents the minimum time in which the project can possibly be completed. Bounds on project time and number of men required are given. (Contractor's abstract)

SENSITIVITY MINIMIZATION IN ACTIVE RC SYNTHESIS, by D. A. Calahan. [1961] [5]p. incl. diagrs. (AFOSR-3595) (AF 49(638)63) Unclassified

Also published in I. R. E. Trans. on Circuit Theory, v. CT-9: 38-42, Mar. 1962.

Since the majority of active RC synthesis techniques are based upon the partitioning of network functions into subnetwork functions, it was thought to be of interest to discover how this decomposition might be achieved to minimize sensitivity to the active element. This is, then, an extension of the work of Horowitz, Sipress, and others. Two types of active decompositions were considered: RC-NIC and RC-RL. It was shown that, regardless of the degree of the polynomial decomposed, when RC-RL decomposition is possible at all, an RC-RL decomposition can be found which results in a lower zero (pole) sensitivity figure than any RC-NIC decomposition. In the process of obtaining this result, the form of the RC-RL decomposition(s) which minimize(s) zero sensitivity is obtained. It is shown that, in general, there are an infinite number of these RC-RL decompositions with the same minimum sensitivities at all zeros (poles). This is in contrast to the Horowitz decomposition, which uniquely minimizes sensitivity in the RC-NIC case.

RESTRICTIONS ON THE NATURAL FREQUENCIES OF AN RC-RL NETWORK, by D. A. Calahan. [1961] [22]p. incl. diagrs. (AFOSR-3596) (AF 49(638)63) Unclassified

Also published in Jour. Franklin Inst., v. 272: 112-133, Aug. 1961.

The following problem is investigated: given any polynomial $N(s)$ of the form $N(s) = \prod_1^n (s + p_i) \prod_1^m (s + s_\lambda) (s + \delta_i)$ what are the necessary and sufficient conditions that $N(s)$ be formed in the following manner $N(s) = A_0 \Pi (s + a_i) + B_0 \Pi (s + b_i)$ $A_0, B_0 > 0$ where the $-a_i$ and $-b_i$ alternate at most in pairs along the negative real axis. Such formation is necessary for the $-p_i$ and s_i to be the natural frequencies of a network consisting of RC and RL subnetworks joined at two terminals. It is shown that $N(s)$ may be so formed if and only if (a) for $n = 0$, $\sum_1^m \arg s_i \leq \pi/2$; and (b) for $n > 0$, $p_i > 0$ and $\sum_1^m \arg s_i < \pi/2$. Also, a simple method is presented for finding suitable a_i and b_i whenever formation is possible. The result is expected to have application in the synthesis of both passive and active networks. (Contractor's abstract)

NOTES ON THE AUGMENTATION OF POLYNOMIALS, by D. A. Calahan. [1960] [2]p. (AFOSR-3612) (AF 49(638)63) Unclassified

Also published in I. R. E. Trans. on Circuit Theory, V. CT-8: 170-171, June 1961.

The following problem that occurs in the Miyata method of driving-point synthesis is analyzed: $N_1(z) = \sum_0^{2m+n} a_i z^i = \prod_1^n (\delta - p_i) \cdot \prod_1^m (z - z_i)(z - \bar{z}_i)$, where $p_i \neq 0$, $a_{2m+n} = 1$, $a_i < 0$ for any $1 \leq i \leq 2m + n - 1$, find the lowest degree polynomial $N_2(z)$ such that $N_3(z) = N_1(z)N_2(z) = \sum_0^r b_k z^k$, $b_r = 1$ where $b_k \geq 0$ for all k.

A procedure for finding such an $N_2(z)$ is given. The degree of the lowest-order $N_2(z)$ is found to be r' - (l + 2m + n). A more challenging augmentation problem, encountered in transfer function synthesis when $N_2(z)$ is required to be Hurwitz, is also discussed.

THE TCHEBYSHEFF APPROXIMATION OF A PRESCRIBED IMPULSE RESPONSE WITH RC NETWORK REALIZATION, by D. T. Tang. [1961] [7]p. (AFOSR-3856) [AF 49(638)63] Unclassified

Presented at I. R. E. Internat'l. Convention, New York, Mar. 20-23, 1961.

Also published in I. R. E. Internat'l. Convention Record, Pt. 4: 214-220, 1961.

It is shown that for any desired impulse response f(t), bounded and continuous in the interval $t \geq 0$, there always exists a unique RC 2-port with a set of specified negative real poles such that its impulse response $g(t) = \sum_{i=1}^{n} \lambda_i e^{-a_i t}$ approximates f(t) best in Tchebysheff sense. That is, there exists a set of λ's such that, with respect to the set of a's, there is $\max_{t\geq 0} |e(t)| = \max_{t\geq 0} |f(t) - \sum_{i=1}^{n} \lambda_i e^{-a_i t}|$ is a min. If desired, a certain weighting function, w(t) may be considered such that $\max_{t\geq 0} |e'(t)| = \max_{t\geq 0} |w(t)[f(t) - g(t)]|$ is minimized. An iterative procedure requiring successive equalization of maximum error is used to obtain such an approximation. This procedure is proved to be convergent and g(t) may be in a more general form as a linear sum of a set of functions forming a Tchebysheff's system. (Contractor's abstract)

A MICROWAVE TECHNIQUE FOR THE STUDY OF DEVIATIONS FROM OHM'S LAW IN HIGH RESISTIVITY SEMICONDUCTORS, by K. Rose. Jan. 31, 1961, 109p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research as technical note no. 4 under AF 49(638)417 and Signal Corps as technical rept. no. 1 under DA 36-039-sc-78313) AD 277121 Unclassified

The development of a microwave technique for the study of deviations from Ohm's law in high resistivity semiconductors is presented. A high level microwave field is used to produce the deviations as well as measure them. A semiconductor sample is placed in a resonant cavity and the conductivity of the sample is inferred from measurements of transmission through the cavity. Preliminary measurements on samples of high resistivity silicon at temperatures down to the boiling point of liquid nitrogen are reported. Results indicate that the technique in its present form is applicable to semiconductors with resistivities up to 600 ohm-cm. (Contractor's abstract, modified)

DRIFT MOBILITIES OF ELECTRONS AND HOLES AND SPACE-CHARGE-LIMITED CURRENTS IN AMORPHOUS SELENIUM FILMS, by J. L. Hartke. Sept. 1, 1961, 112p. incl. diagrs. tables, refs. (Technical note no. 5) (AFOSR-1416) (AF 49(638)417) AD 267838 Unclassified

Also published in Phys. Rev., v. 125: 1177-1192, Feb. 15, 1962.

The results of drift mobility and space-charge-limited current measurements made on 20 micron thick films of amorphous Se were interpreted using the band model of a semiconducting solid with impurity or imperfection levels in the forbidden energy region between the conduction and valence bands. Drift mobilities were measured in the 220° to 300°K temperature range by determining the time of transit across the films of carriers which were photoinjected at one surface by 10^{-8} sec light pulses. The drift mobilities at 300°K were 0.165 cm^2/v sec for holes and 7.8×10^{-3} cm^2/v sec for electrons. The temperature dependence of hole mobility was exp(-0.14 ev/kT), and that of electrons was exp(-0.285 ev/kT). About 10^{19} cm^{-3} electron traps were present in a 0.285-ev region just below the conduction band edge; about 10^{21} cm^{-3} hole traps occupied a 0.14-ev portion of the gap immediately above the valence band edge. Au and Te electrodes were used to inject holes into amorphous Se, producing space-charge-limited currents at high fields. Electrical conductivities of 10^{-14} to 10^{-16} ohm^{-1} cm^{-1} were obtained at low fields. (Contractor's abstract, modified)

GALVANOMAGNETIC PROPERTIES OF GRAIN BOUNDARIES IN GERMANIUM BICRYSTALS FROM 1.25 TO 240°K, by G. Landwehr and P. Handler. [1961] [16]p. incl. diagrs. refs. (AFOSR-4466) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)417 and Office of Naval Research) Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 23: 891-906, July 1962.

Wide angle grain boundaries of germanium with 20° tilt angles and mean {100} planes exhibit a p-type conductivity over the temperature range 1.25°to 240°K. The behavior of the conductivity, Hall coefficient and magnetoresistance in the temperature range 1°-10°K is found to be the same for n-type, p-type and intrinsic bicrystals. The similarity of results for the 3 different types of doping indicates that the p-type conductivity is an intrinsic property of the mean {100} germanium wide angle grain boundary. The number of holes in the space charge region adjacent to the grain boundary and their mobility were found to be 5×10^{12} per cm^2 and 300 cm^2/v sec respectively. The Hall coefficient is both temperature and magnetic field independent while below 10°K the magnetoresistance exhibits both temperature and magnetic field dependence. (Contractor's abstract)

MICROWAVE MODULATION OF LIGHT USING THE KERR EFFECT, by D. F. Holshouser, H. Von Foerster, and G. L. Clark. [1961] [3]p. incl. illus. diagrs. tables. (AFOSR-701) [AF 49(638)556] AD 611356 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 51: 1360-1365, Dec. 1961.

Modulation of light at 3 and 6 kmc is achieved by applying a superimposed electrostatic and microwave field to a carbon-disulfide Kerr-cell which is incorporated within the high-electric-field region of a resonant cavity. The development of this light shutter requires the analysis of the Kerr effect under circumstances in which the transit time of light is appreciable. A Kerr cell whose length is such that the transit time of light is one-half the period of the modulating microwave field proves to have particular advantages over other designs. The light shutter is realized with a re-entrant microwave cavity with provision for the application of electrostatic as well as microwave fields. At about 26-kv dc and 10-kw pulsed 3-kmc ac power, the system modulates a light beam of several milliwatts radiant power up to 80%. (Contractor's abstract)

ANALYSIS OF DYNAMIC CROSSED-FIELD ELECTRON MULTIPLICATION, by O. L. Caddy and D. F. Holshouser. [1961] [158]p. incl. diagrs. refs. (Technical note no. 1) (AFOSR-1693) (AF 49(638)-556) AD 267839 Unclassified

The general solution for single electron motion in alternating uniform electric fields and crossed steady uniform magnetic fields is presented. Several aspects of the motion are discussed when the electrons are assumed to have zero initial velocities, such as phase focusing, arrival energy, etc. The case when initial electron velocity cannot be ignored is considered, and the effects of initial velocities and velocity distribution is investigated. Some practical considerations, such as gain and power requirements, are investigated. A few of the possible applications in addition to high frequency response photomultiplier are discussed. HIGH-GAIN DYNAMIC MICROWAVE PHOTOMULTIPLIER, by O. L. Gaddy and D. F. Holshouser. Dec. 4, 1961 [2]p. incl. illus. (AFOSR-3291) (AF 49(638)-556) AD 613784 Unclassified

Also published in Proc. Inst. Radio Engineers, v. 50: 207-208, Feb. 1962.

The purpose of the note is to report on recent experimental results with a photomultiplier which is capable of microwave response and to briefly describe the multiplication method which is called dynamic crossed-field electron multiplication (DCFEM). This multiplication method is realized by providing a region of 2 spatially uniform fields—a microwave electric field and a crossed steady magnetic field—bounded by 2 electrodes, 1 having a high secondary emission ratio delta (active electrode), and the other a relatively low delta (inactive electrode). An electron which is present at the surface of the active electrode during a portion of the microwave period gains energy from the electric field and has a path which is curved by the magnetic field so that it is returned to the active electrode, producing secondary electrons upon arrival. This trajectory, labelled 'normal', is repeated by the secondary electrons; and after n such multiplication steps, requiring precisely n microwave periods, delta to n power electrons may be collected and delivered to an external circuit.

NOTES ON THE RATE OF GAS PHASE REACTIONS OF NH_2 FREE RADICALS, by M. H. Hanes and E. J. Bair. Feb. 28, 1961 [4]p. incl. illus. (AFOSR-355) (AF 18(603)93) AD 253825; PB 155623 Unclassified

The reaction of NH_2 radicals following an individual RF discharge pulse through NH_3 was investigated using multiple flash apparatus. The apparatus was extended to give a sequence of ten 5-joule flashes through a quartz capillary of 2.5 mm diam and 5 mm long at crystal controlled intervals from 0.2-2.0 msec. The max initial NH_2 concentration was not strongly dependent on the NH_3 pressure. No N-H radicals were detected although they are readily observed following a discharge through a mixture of H and N. The fluorescence which accompanied the discharge can be represented by the equation $NH_3 \rightarrow NH_2 + H$. The average initial rate was 2nd order with respect to NH_2. (Contractor's abstract)

SPECTROMETRIC STUDIES OF FAST REACTIONS, by E. J. Bair. Descriptive summary, Feb. 28, 1961 [9]p. incl. illus. (AFOSR-356) (AF 18(603)93) AD 253826; PB 155624 Unclassified

The project has been directed toward quantitative high resolution measurements of the rate of free radical reactions in the gas phase. Development of new procedures (chemical modulation and multiple flash kinetics measurements), by which absorption measurements can be made are discussed. Preliminary measurements were made of the reaction involving decomposition of ammonia and the formation of NH_2 radicals. Chemical modulation in the oscilloscope patterns of repeated reactions whereby the ammonia was dissociated by a discharge are illustrated. Multiple flash kinetic measurements allow for the measurement of individual fast reactions at high resolution. Oscilloscope photographs are presented to illustrate results of this method. The lamp will operate at intervals as short as 100 microsec.

FIRST EXCITED $^1\Sigma_g^+$ STATE OF THE HYDROGEN MOLECULE, by E. R. Davidson. Mar. 1, 1961 [85]p. incl. diagrs. tables, refs. (AFOSR-483) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)318 and National Science Foundation) AD 254530 Unclassified

Also published in Jour. Chem. Phys., v. 35: 1189-1202, Oct. 1961.

A variation calculation on the first excited $^1\Sigma_g^+$ state of H_2 has been carried out using an expansion in elliptical coordinates. All results are reported in Hartree atomic units. The potential function resulting from this calculation is characterized by having a minima at R = 1.9 and R = 4.3 and a maximum at R = 3.3. The energy obtained at R = 1.9 using a 20-term, open-shell, covalent-type wave function was -0.7162 as compared with the "experimental" value of -0.7181. Due to convergence difficulties, many more configurations are required to improve this result significantly. At R = 4.3, on the other hand, the best result was obtained with an open-shell wave function including nine ionic terms and nine atomic terms. This result of -0.7007 is below the reported "experimental" value of -0.6935 because the two lowest $(2p\sigma)^2\ ^1\Sigma_g^+$ vibrational levels have not been found experimentally. The energy at the top of the barrier was computed to be -0.6844 and probably is as low as -0.6884. The vibrational levels for this potential function have been computed by a numerical integration technique. The fact that these are in one-to-one correspondence with a combination of the experimental 1s2s and $(2p\sigma)^2$ levels indicates that both of these sets of levels belong to the first excited state. THE CHEMICAL BOND IN MOLECULAR QUANTUM MECHANICS, by T. L. Allen and H. Shull. July 1, 1961 [28]p. incl. diagrs. refs. (AFOSR-494) (AF 49-(638)318) AD 261910 Unclassified

Also published in Jour. Chem. Phys., v. 35: 1644-1651, Nov. 1961.

It is postulated that a properly antisymmetrized product function over geminals (electron-pair wave functions) is adequate for discussion of the principal chemical properties of molecules. By application of the virial theorem, it is shown that such a wave function has both of the properties essential to the bond energy concept; namely (a) the energy of a molecule is the sum of the energies of its individual bonds and (b) the bond energies are invariant from 1 molecule to another. Within the framework of this approximation, bond energies become identified in magnitude with the kinetic energies associated with the respective geminals. The concepts are sufficiently general to include both localized and non-localized bonds, unshared electron pairs, odd electrons, and states of various multiplicities. (Contractor's abstract)

THE CONCEPT OF PARTIAL IONIC CHARACTER, by H. Shull. [1961] [3]p. (AFOSR-3797) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)318] and National Science Foundation) Unclassified

Presented at Internat'l. Conf. on Chemical Physics of Nonmetallic Crystals, Evanston, Ill., Aug. 28-31, 1961. (AFOSR-2143)

Also published in Jour. Appl. Phys., Suppl., v. 33: 290-292, Jan. 1962.

The theoretical definition of partial ionic character is considered. The basic requirements which the author feels must be met before a satisfactory theoretical definition can be found are outlined. It is shown that current models for defining partial ionic character fall short of meeting these criteria. Suggestions are made as to the directions in which one must look for better models. In particular, it is emphasized that the dual requirements of orthogonal concepts based upon models which are invariant to arbitrary choices of basis functions must be met. (Contractor's abstract)

POTENTIAL CURVES FOR H_2^-, by E. R. Davidson. [1961] [1]p. (AFOSR-3800) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)318] and National Science Foundation) Unclassified

Also published in Jour. Chem. Phys., v. 36: 1080, Feb. 15, 1962.

Recently theoretical calculations on H_2 have been performed by Fischer-Hjalmars (Arkiv Fysik, v. 16: 33, 1959) in an attempt to explain the experimental results for the cross section of formation of H^- by electron impact on H_2. The potential curves found in these theoretical calculations were obtained by applying the variational method to the electronic Hamiltonian for H_2^-. A rather subtle error seems to be present, though, in the results of Fischer-Hjalmars which invalidates most of this author's conclusions. Since at every internuclear distance and for all doublet states this Hamiltonian has a solution corresponding to normal H_2 plus a free electron, no variationally obtained potential curve for a doublet state can lie above the potential curve for H_2 if a complete set of basis functions is used. Even if only a limited basis set is used, an upper bound to the best energy obtainable by variation of scale factors still exists. The author shows that the Fischer-Hjalmars results appear to be substantially correct at internuclear distances sufficiently large that an energy below the energy of H_2 can be obtained. Also, by the same reasoning utilized, the Fischer-Hjalmars results for all of the $^4\Sigma_{u,g}^+$ states can be made to lie at least as low as the valence bond approximation to the potential curve for $^3\Sigma_u^+$ state of H_2 by proper adjustment of scale factors.

CONFIGURATION INTERACTION STUDY OF THE LITHIUM HYDRIDE MOLECULE, by D. D. Ebbing. [1961] [10]p. incl. diagr. tables, refs. (AFOSR-64-1523) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)318] and National Science Foundation) AD 446372 Unclassified

Also published in Jour. Chem. Phys., v. 36: 1361-1371, Mar. 1, 1962.

A set of orbitals in elliptical coordinates has been used as basis in a self-consistent field configuration interaction (SCF-CI) study of the electronic structure of the ground state ($^1\Sigma^+$) of the lithium hydride molecule. The importance of various configurations is studied, and it is found that those configurations are most important which have either the inner-shell molecular orbital or the valence-shell molecular orbital doubly occupied. The results of each configuration interaction calculation have been analyzed into contributions to the inner-shell and outer-shell correlation energies, and in this way the importance of

various orbitals is studied and related to correlation effects. It appears that LiH could be well described by a product of electron-pair wave functions. A study of the numerical stability of the calculations shows that considerable care must be exercised in the choice of a basis in order for the results to be meaningful. Instability of a calculation is due to near linear dependency of the orbital basis. The best total energy obtained, using 53 configurations formed from a basis of 7σ and 3π orbitals, is -8.04128H at an internuclear distance of 2.99B. This should be compared with the experimental energy of -8.0703H. The dipole moment was calculated to be 5.96D, and the ratio of dipole moment to dipole derivative is $\mu_e/(\partial\mu/\partial r)_e r_e = 1.53$ (experimental values are 5.88D and 1.8 ± 0.3 respectively). MAXIMAL IDEALS IN AN ALGEBRA OF BOUNDED ANALYTIC FUNCTIONS, by I. J. Schark. [1961] [12]p. (AF 18(603)118) Unclassified

Published in Jour. Math. and Mech., v. 10: 735-746, Sept. 1961.

The space H of complex homomorphisms (maximum ideals) of the algebra B, as well as the Gelfand isomorphism $f \to \hat{f}$ of B with a uniformly closed algebra of continuous functions on H is introduced. There is a natural projection π of H onto the closed disc in the plane, obtained by sending each complex homomorphism into its value on the coordinate function Z. This map π is one-one over the open disc D, and shows that the natural injection of D into H, which sends λ into the homomorphism "evaluation at λ", is a homeomorphism of D onto an open subset Δ of H. The remaining closed set of homomorphisms is mapped by π onto the unit circle C. The Silov boundary for the algebra B is identified and described and further results on the fibers H_α are discussed. It is proven that each fiber H_α contains a homeomorphic replica of the entire maximal ideal space H.

ON COMPACT, LOCALLY SYMMETRIC KÄHLER MANIFOLDS, by E. Calabi and E. Vesentini. [1959] [36]p. incl. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)-253] and National Science Foundation) Unclassified

Published in Ann. Math., v. 71: 472-507, May 1960.

Certain aspects of the structure of the compact, complex manifolds X that can be uniformized by bounded, symmetric, homogeneous subdomains of the space C^n of n complex variables (Cartan domains) are studied. The purpose is to gather information on the cohomology groups of these manifolds with coefficients in the sheaf $\mathcal{H}$ of germs of holomorphic tangent vector fields. A brief summary of all the general differential geometric methods applied in the sequel is given. The basic approach to the problem is through the relation between non-existence of nontrivial harmonic tensor fields and the vanishing of certain cohomology groups $H^q(X, \mathcal{H})$. The case of compact Kähler manifolds that are uniformizable by Cartan

domains is considered because for these spaces there are especially simple methods to calculate the curvature tensors. The main result is stated in the following theorem: Let D be a Cartan domain, reducible or not, whose irreducible factors have at least 2 complex dimensions; let G be the group of all holomorphic (isometric) transformations of D, represented as an algebraic group of real matrices, and let Γ be a discrete subgroup of G acting on D with compact quotient space. Then there is an inner automorphism of G, such that the components of all the matrices representing the transform of Γ generate a simple algebraic extension of the rational number field.

[ON THE HOLOMORPHIC MAP OF PROJECTIVE-ALGEBRAIC MANIFOLDS IN COMPLEX SPACE] Über holomorphe Abbildungen projektiv-algebraischer Mannigfaltigkeiten auf komplexe Räume, by R. Remmert and T. van de Ven. [1960] [34]p. incl. refs. (AF 49(638)213) Unclassified

Published in Math. Ann., v. 142: 453-486, Feb. 15, 1961.

Let A be a d-dimensional complex projective non-singular algebraic variety. Denote by $b_i^a(A)$ its ith analytic Betti number, i.e., the number of independent analytic cycles. Thus $b^a_{2d-2}(A) = \rho(A)$, the Picard number of A. The authors ask when is a non-trivial holomorphic map $\tau: A \to B$ of A onto a connected, normal complex space B a (ramified) covering? They prove the following: (1) If $\rho(A) = 1$, then dimB = dimA. (2) If $\rho(A) = 1$ and $b_1(A) = 0$, the degeneration (or fundamental) locus on A is at most (d-2) dimensional. (3) If in addition to the above, $b_2^a(A) = 1$ and B is not singular, then τ is a covering and B is projective algebraic. The proofs are simple, and come more or less from the fact that if τ has fibers of positive dimension, these will give analytic cycles on A which must be independent of the standard linear sections, since they have different intersection properties. Examples are given of (3) by taking in turn for A a Grassmannian, a complete intersection of dimension ≥ 3, a general surface in P_3 of order ≥ 4, and, by a different argument, a general abelian variety. Another example shows that B must be non-singular: a hypersurface of order 5 in P_4 is given which contains a line that can be collapsed to a point — the point will be singular and the image B will not be algebraic. Other examples are given where A is a surface and B an algebraic curve. For instance, if A is in P_3 and it contains a line, one can project it from this line to get a holomorphic $\tau: A \to P_1$. With respect to (1), it is shown that quadratic transforms of a wide class of surface in P_3 cannot be mapped onto a curve, yet have $\rho(A) \to 1$.

ON STABILITY OF COMPACT SUBMANIFOLDS OF COMPLEX MANIFOLDS, by K. Kodaira. July 1961 [20]p. (AFOSR-1147) (AF 49(638)253) AD 261355 Unclassified

Also published in Amer. Jour. Math., v. 85: 79-94, [Jan.] 1963.

Stability of compact submanifolds of complex manifolds and some related topics are discussed. A compact submanifold V of a complex manifold W is said to be stable if any small deformation W_t of W contains a small deformation V_t of V. Let ψ be the sheaf over V of germs of holomorphic sections of the normal bundle of V in W. If the first cohomology group $H^1(V, \psi)$ vanishes then V is a stable submanifold of W. A fiber structure of a compact fibered complex manifold M is said to be stable if any small deformation M_t of M retains a fiber structure. If each fiber of M is regular then the fiber structure of M is stable. Some examples illustrating the theorems are discussed. (Contractor's abstract)

THE PIECEWISE-LINEAR STRUCTURE OF EUCLIDEAN SPACE, by J. Stallings. [1961] [8]p. incl. refs. (AFOSR-3304) (AF 49(638)253) Unclassified

Also published in Proc. Cambridge. Philos. Soc., v. 58: 481-488, July 1962.

A space X is 1-connected at infinity if for every compact $C \subset X$, there is a compact D where $C \subset D \subset X$ such that X-D is 1-connected. The main theorem is that if a contractible piecewise linear manifold M^n, $n \geq 5$, is 1-connected at infinity, then it is piecewise linearly homeomorphic to Euclidean space R^n. Corollary 1: R^n has a unique piecewise linear structure if $n \geq 5$ (previously this known only for $n \geq 3$). Corollary 2: If X, Y are contractible piecewise-linear manifolds of dimension x, y, where x, $y \geq 1$ and $x + y \geq 5$, the X x Y is piecewise linearly homeomorphic to R^{x+y}. Using a theorem of Munkres the same results hold for differential theory. The proof depends on the following "engulfing theorem": Let M^n be a piecewise linear manifold, U an open subset, and P^p a subpolyhedron such that $p \leq n - 3$, (M, U) is p-connected, $P \cap (M-U)$ is compact. Then there is a piecewise linear homeomorphism $h: M \to M$ with compact support such that $hU \supset P$. In other words U can move amoeba-like so as to engulf P. The "engulfing theorem" has become a key tool in the subject, and the author has used it to prove other notable results including the Poincaré conjecture, $n \geq 5$, and the topological unknotting of spheres of codimension ≥ 3. In this paper he gives a concise and elegant proof of the engulfing theorem.

A BOUNDARY VALUE PROBLEM FOR NONLINEAR ORDINARY DIFFERENTIAL EQUATIONS, by M. Lees. [1961] [8]p. incl. refs. (AF 49(638)253) Unclassified

Published in Jour. Math. and Mech., v. 10: 423-430, May 1961.

The following theorem is proved: Let $f(x, z, p)$ be a continuous function defined in the region $0 \leq x \leq 1$, $-\infty < z, p < +\infty$. Assume that (1) $f(x, z_1, p) \geq f(x, z_2, p)$ for $z_1 \geq z_2$ and (2) $|f(x, z, p_1) - f(x, z, p_2)| \leq K|p_1 - p_2|$. Then there exists a unique twice continuously differentiable function $z(x)$, defined for $0 \leq x \leq 1$, such that (3) $z(0) - z_0 = z(1) - z_1 = 0$ and (4) $z''(x) = f(x, z(x), z'(x))$ $\left(' = \frac{d}{dx}\right)$. With the aid of certain a priori estimates, standard compactness arguments are used to prove that, as the mesh is refined to zero, the solutions of the finite-difference problems converge to a solution of 3 and 4.

SOME HILBERT SPACES OF ENTIRE FUNCTIONS. III, by L. de Branges. [1961] [43]p. incl. refs. (AF 49(638)253) Unclassified

Published in Trans. Amer. Math. Soc., v. 100: 73-115, July 1961.

A study of generalizations of the Paley-Wiener Theorem on entire functions of exponential type which are in $L^2(-\infty, \infty)$ is continued (see item no. 949, Vol. IV). In theorem 1, the concept of a one-parameter family of Hilbert spaces of entire functions in analogy with the family $E(a, z) = \exp(-iaz)$ is developed. In theorem 2, it is shown that such a family is present whenever a single Hilbert space of entire functions and a measure which determines its norm are given. The theorem 3 is the proper generalization of the Fourier transform in the Paley-Wiener fashion. It also describes the significance of this transformation for the underlying self-adjoint transformation H. Thus, from a single Hilbert space of entire functions, a whole family of such Hilbert spaces with isometric inclusions are to be extrapolated. A series of theorems are stated and their proofs are given.

ON FOURIER TRANSFORMS OF MEASURES WITH COMPACT SUPPORT, by A. Beurling and P. Malliavin. [1961] [19]p. (AF 49(638)253) Unclassified

Published in Acta Math., v. 107: 291-309, 1962.

Let $\mathfrak{M}$ be the set of (non-identically zero) measures with compact support defined on the real line, and let $\mathfrak{M}_a$ be the set of those (non-identically zero) measures whose support is contained in $[-a, a]$. $\hat{\mathfrak{M}}$ denotes the set of Fourier transforms $\hat{\mu}$ for $\mu \in \mathfrak{M}$. Let $w(x) \geq 1$ be a measurable function on the reals and define L_w^p to be the space of measurable functions $f(x)$ with the norm defined by $\|f\| = \{\int_{-\infty}^{\infty} |f(x)|^p w(x)^p dx\}^{1/p}$. The first main result of this paper is concerned with the determination (for given p) of the set W_p of all weight functions $w(x) \geq 1$ which satisfy (i) the translation operators $f(x) \to f(x + t)$ are bounded in L_w^p and (ii) for each $a > 0$, L_w^p contains elements of $\hat{\mathfrak{M}}_a$. Theorem 1: The sets W_p are independent of p and consist of all weight functions $1 \leq w(x) = \exp \omega(x)$ which satisfy the following conditions: (1) true max $\{\omega(x + t) - \omega(x)|$ for $-\infty < x < \infty\}$ is finite; (2) $J(\omega) = \int_{-\infty}^{\infty} \omega(x)/(1 + x^2)\, dx < \infty$. The next important result is Theorem 2: Let $g \not\equiv 0$ be an entire function of exponential type such that $J(\log^+ |g|) < \infty$; then each $\hat{\mathfrak{M}}_a$ contains an element $\hat{\mu}$ such that $\hat{\mu}(x)g(x) \in \hat{\mathfrak{M}}$. A more striking formulation of Theorem 2 is that the set $\{f(x)$: f entire, $f = \hat{\nu}/\hat{\mu}$, $\hat{\nu}$, $\hat{\mu} \leq \hat{\mathfrak{M}}\}$ and the set $\{f(x)$: f entire of exponential type, $J(\log|f|) < \infty\}$ are identical. This version of Theorem 2 exhibits the analogy to a classical result of R. Nevanlinna to the effect that a meromorphic function with bounded characteristic in the unit disc can be represented as the quotient of two bounded analytic functions. The proofs leading to Theorems 1 and 2 are powerful, elegant and function-theoretic, i. e., some deep results on harmonic functions, Poisson integrals and Dirichlet integrals are the effective tools. Especially noteworthy among the new techniques which are introduced in this paper is the solution of a variational problem in a certain Hilbert space of functions. (Math. Rev. abstract)

APPLICATION OF NUCLEON-NUCLEON

DISPERSION RELATIONS TO NUCLEAR MANY-BODY PROBLEMS, by I. Hamamoto and H. Miyazawa. [1961] [5]p. incl. diagr. table, refs. (AFOSR-1453) [AF AFOSR-61-19] Unclassified

Also published in Phys. Rev., v. 123: 1860-1864, Sept. 1, 1961.

A method is given of obtaining the nucleon-nucleon scattering amplitude within nuclear matter, when the nucleon-nucleon dispersion relations are known. This is attained by establishing the dispersion relation for the scattering amplitude under the influence of the Pauli exclusion principle in intermediate states. With this modified amplitude the binding energy of the nucleus is calculated using Brueckner's method. The binding energy per nucleon turned out to be -13.2 mev, if the contribution of the 3-pion exchange potential is adjusted to give the correct nuclear density. The implication of these results is discussed. (Contractor's abstract)

INELASTIC COLLISIONS AND THRESHOLD EFFECTS, by L. Fonda. [1961] [30]p. incl. diagrs. refs. (AFOSR-2783) (AF AFOSR-61-19) D 612313 Unclassified

Also published in Nuovo Cimento, Series X, Suppl., v. 20: 116-145, 1961.

The many-channel problem has been discussed with particular emphasis on the anomalous energy dependence which is observed in the scattering and reaction cross-sections at the threshold of a new inelastic process. The phenomena is reviewed by introducing a method based on thorough investigation of the properties of the complete Green's function which describes the multi-channel system. The method is used to describe both non-Coulomb and Coulomb effects. The general time-independent scattering theory, which covers the case of Coulomb forces and many channels, is considered in detail. The low energy properties of scattering and reaction cross-sections are reviewed. Threshold effects are discussed with reference to the importance of such phenomena for the determination of relative parities and spins of the reaction products, of scattering phase shifts, of cross-sections which are not often feasible experimentally, and in the search for new particles.

ISOSCALAR NUCLEON STRUCTURE, by R. Blankenbecler and J. Tarski. [1961] [9]p. incl. diagrs. refs. (AFOSR-2784) [AF AFOSR-61-19] Unclassified

Also published in Phys. Rev., v. 125: 782-790, Jan. 15, 1962.

The 3-pion contribution to the isoscalar nucleon structure is examined in dispersion theory. It is assumed that the amplitudes (photon → 3 pions) and (3 pions → nucleon pair) are characterized by the pions interacting in pairs. This interaction is taken to be the low energy $J = T = 1$ resonance, which consequently dominates the picture. The effects of a 3-pion interaction are included so as to satisfy an extended unitarity condition. The lowest mass singularities, including the complex ones, are discussed and interpreted. If the π-π resonance is at $10\mu^2$, then a reasonable radius can be easily obtained. On the other hand, if the resonance is at $20\mu^2$ or higher, then a strong intrinsic 3-pion resonance or a bound state seems to be needed for agreement with experiment. (Contractor's abstract)

CONSIDERATIONS ON THE HISTOLOGICAL BASES OF NEUROPHYSIOLOGY, by C. Estable. [1959] [26]p. incl. illus. diagr. (AFOSR-1192) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)585 and Rockefeller Foundation) Unclassified

Also published in Brain Mechanisms and Learning; A Symposium, Montevideo (Uruguay) (Aug. 2-8, 1959), Oxford, Blackwell Scientific Publications, 1961, p. 309-334. (AFOSR-1191)

The purpose of this report is to insist upon the frequent presence, in many species, and centers, of interneuronal contacts that (1) are as close as classically accepted synapses and (2) exhibit the same variable submicroscopic structure. These contacts are dendro-dendritic, dendro-somatic, somato-somatic and axo-axonic. No valid morphological reason enables one to deny that these contacts are operant and, to accept that regular axo-dendritic contacts are functional. Two formulae sum up the facts: (1) Pre- and post-synaptic pars of a different nature are functionally polarization synapses; and (2) Pre- and post-synaptic pars of a similar nature are reversibility synapses, which means functional alternance between the receptor and the effector pars. No submicroscopic entity (chondrioma, microvesicules, etc.) is typical of a functional contact. Only discontinuity and contiguity are always present.

STRUCTURAL STABILITY ON TWO-DIMENSIONAL MANIFOLDS, by M. M. Peixoto. [1961] [20]p. incl. diagrs. refs. (AFOSR-J44) [AF AFOSR-61-75] AD 610671 Unclassified

Abstract published in Bol. Soc. Matem. Mexicana, v. 5: 188-189, 1960.

Also published in Topology, v. 1: 101-120, Apr.-June 1962.

Let M^2 be a compact differentiable two-manifold and let B be the Banach space of all C^1-vector fields on M^2, using the C^1-topology. A vector field $X \in B$ is structurally stable whenever for each $\epsilon > 0$ there is a neighborhood U of X in B such that for each $Y \in U$ there exists an ϵ-homeomorphism of M^2 onto itself carrying the trajectories of X onto those of Y. The author announces the following theorem characterizing structurally stable vector fields. Theorem: A necessary and sufficient condition for X to be structurally stable on M^2 is that (1) X has only simple singularities, the real parts of the characteristic roots being different from zero; (2) X has only a finite number of closed orbits and the stability index of each of these is different from zero; (3) no trajectory joins saddle points; (4) the α- and the ω-limit set of each trajectory is either a singular point or a closed orbit. Using this characterization, the author finds that the set Σ of all structurally stable vector fields is open in B and proposes the problem of proving that Σ is dense in B. (Math. Rev. abstract)

CHANGES ON EEG BACKGROUND ACTIVITY DURING PHOTOC HABITUATION IN MAN, by E. García-Austt, J. Bogacz and A. Vanzulli. [1961] [9]p. incl. diagrs. (AFOSR-1369) (AF AFOSR-61-65) AD 449991 Unclassified

Also published in Acta Neurol. Latinoamer., v. 7: 82-90, 1961.

A study was conducted of changes in background activity of EEG in a group of normal subjects during

continuous flicker stimulation and discontinuous flicker stimulation. Background activity was modified in a definite fashion in every single case, according to a sequence described in detail. The changes in the levels of wakefulness and sleep are correlated with habituation to luminuous stimulation and the period of darkness (perception of time). The variations experienced by the visual evoked potential during habituation are more marked and faster than those of background activity. It is shown that the afterdischarge is due to triggering of alpha rhythm, always at the same point of the cycle. (Contractor's abstract)

EVOKED RESPONSES IN MAN. III. AUDITORY RESPONSES, by A. Vanzulli, J. Bogacz, and E. García-Austt. [1961] [7]p. incl. diagrs. refs. (AFOSR-3933) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-65 and Rockefeller Foundation) AD 416597 Unclassified

Also published in Acta. Neurol. Latinoamer., v. 7: 303-309, 1961.

A study was carried out of the scalp auditory evoked response (AER) in 44 normal adults, awake and asleep. The AER was recorded by an averaging photo-optico-electronic method. The electrode placement of the 10/20 system was used. In wakefulness AER was made up of a succession of waves with varying amplitude and duration. The most frequent pattern was negative-positive-negative. The response was recorded only from T2, T4, T6 tympanic, pharyngeal and nasal electrodes when Fz was employed as a common reference. The amplitude was frequently higher in the tympanic electrode. Continuous auditory stimulation provoked sleep in nearly every subject. Sleep determined the appearance of AER or increased the amplitude of all its components, particularly of positive waves. The significance of AER is discussed and differences are established with the visual evoked response. (Contractor's abstract)

SULPHURATION OF COPPER AND SILVER WITH BENZENE SOLUTIONS OF SULPHUR, by J. Llopis, J. M. Gamboa, and L. Arizmendi. [1960] [12]p. incl. illus. diagrs. tables, refs. [AF 61(514)1330] Unclassified

Published in Electrochim. Acta, v. 7: 294-305, Aug. 1961.

The surface reactions of copper and silver with benzene solutions of sulfur have been studied. In the first case the rate of corrosion is high and corrosion takes place by pitting, giving porous films that easily scale off. However, the reaction of silver is much slower and yields coherent films showing interference colors; the kinetic law is linear with time and the experimental energy of activation is rather high, $\Delta H_r^* = 20.6$ kcal/mol. SEMICONDUCTIVITY AND CATALYTIC ACTIVITY. THE DEHYDROGENATION OF ISOPROPYL ALCOHOL ON ZnO-Cr_2O_3 CATALYSTS, by J. F. García de la Banda. [1961] [15]p. incl. diagrs. tables, refs. (AFOSR-3753) [AF 61(514)1330] Unclassified

Also published in Jour. Catalysis, v. 1: 136-150, May 1962.

Kinetics of isopropyl alcohol dehydrogenation on Cr_2O_3 prepared by decomposition of the corresponding hydroxide in air at 400°C has been studied. Experimental results point to a change in the semiconductor type of the Cr_2O_3 catalyst during the reaction. In order to confirm this hypothesis, the H_2 and O_2 adsorption on both types of Cr_2O_3, as well as the modification of the electrical resistance, at constant temperature, versus hydrogen pressure and versus feed during the reaction have been studied. Results are in agreement with the existence of 2 forms of Cr_2O_3 which, in principle, behave as p (oxidized form) and n (reduced form) semiconductors. The study of isopropyl alcohol dehydrogenation kinetics on $ZnCr_2O_4$ leads us to the conclusion that this possible p → n transition is not a quality which is exclusive for Cr_2O_3. These points are discussed and their importance and possible implications on future work duly considered. (Contractor's abstract)

THE SULPHURATION OF COPPER WITH SOLUTIONS OF DIPHENYLTHIOUREA, by J. Llopis, J. M. Gamboa, and L. Arizmendi. [1959] [8]p. incl. diagrs. tables, refs. (AFOSR-4316) (AF 61(514)1330) Unclassified

Presented at Eleventh meeting of the Comité Internat'l. Thermodynamique et de Cinétique Electrochimiques, Vienna (Austria), Sept. 1959.

Also published in Electrochim. Acta, v. 3: 75-82, July 1960.

The kinetics of the copper corrosion with solutions of diphenylthiourea labeled with S^{35} in xylene was followed by the isotopic exchange method. The reaction yields coherent sulfide films, showing uniform interference colors. The reactivity of the diphenylthiourea with copper is lower than that of thiourea in aqueous

solution. The rate of film growth is constant; the experimental energy of activation is 14.2 kcal/mol. It is suggested that adsorption of diphenylthiourea at the sulfide film surface plays a major role in the kinetics of this sulfuration reaction. (Contractor's abstract. modified)

SURFACE REACTION OF COPPER WITH SOLUTIONS OF METHYLTHIOUREA, by J. Llopis, J. M. Gamboa, and L. Arizmendi. [1960] [10]p. incl. diagrs. tables. (AFOSR-4317) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(514)1330] and Fundación Juan March) Unclassified

Also published in Anal. Real Soc. Espan. Fís. y Quím., v. 56B: 499-508, May 1960.

The surface reaction of Cu with aqueous solution of methylthiourea was studied radiochemically by means of $C^{35}S_2$. A large effect of dissolved O on the kinetics of the reaction is noted. With aerated solutions, the rate goes through a min with increasing methylthiourea concentration. At low methylthiourea concentration the kinetics is approximately linear except at low temperature; at high concentrations the kinetics is 2nd order in temperature range (10°C-70°C) studied. The activation energy is 7.4 kcal/mol, independent of methylthiourea concentration.

ON THE INTERNAL STRUCTURE OF LAMINAR DIFFUSION FLAMES, by A. Linán. Nov. 10, 1961 [67]p. incl. diagrs. refs. (Technical note no. 3) (AFOSR-2111) (AF 61(052)221) AD 273069 Unclassified

A study was carried out on the influence of chemical kinetics on laminar diffusion flames. In most of the flames of practical interest, the reaction zone is of negligible thickness, making it possible to obtain a solution of the boundary layer type. At each side of the reaction zone the temperature and concentration distributions may be determined by using the Burke-Schumann assumption of infinitely fast reaction rate. In the reaction zone, or chemical boundary layer, the convection effects may be neglected as compared with chemical reaction, conduction and diffusion effects. The equations governing this layer take then a simple form; and from their solution a criterion for the validity of Burke-Schumann assumption and for flame extinction may be obtained. TIME ESTIMATION IN BOOLEAN INDEX SEARCHING, by E. Wong. Dec. 1961 [16]p. (AFOSR-1987) (Also bound with its AFOSR-2817; AD 285255) (AF 49(638)-1062) AD 285255 Unclassified

In many document retrieval systems, the retrieval operation consists of 3 steps. First, the query is represented as a sequence of index terms connected by logical connections. Secondly, the lists of documents indexed by the terms in the query are found. Thirdly, these lists are operated upon according to the logical connectives in the query. The average processing time required for a query is estimated here. Explicit expressions for the average processing time are obtained in terms of the complexity of the query and the parameters of the indexing system. (Contractor's abstract)

OSCILLATION CRITERIA FOR SELF-ADJOINT DIFFERENTIAL SYSTEMS, by W. T. Reid. Jan. 1961. 21p. incl. refs. (Technical rept. no. 1) (AFOSR-132) (AF 49(638)994) AD 254704 Unclassified

Also published in Trans. Amer. Math. Soc., v. 101: 91-106, Oct. 1961.

For a differential system with complex coefficients, that is of the general form of the accessory differential equations for a calculus of variations problem of Lagrange or Bolza type that is identically normal, variational methods are employed to establish certain oscillation criteria involving associated two-point boundary problems. In particular, application of these general results to special systems which are equivalent to self-adjoint scalar quasi-differential equations of even order yields corresponding criteria for these scalar equations. It is to be emphasized that for such scalar equations the definitions of conjugate point and oscillation employed here are the restrictive ones arising from the corresponding concepts for the associated system, and they lack the generality corresponding to the definitions introduced by Leighton and Nehari, (Trans. Amer. Math. Soc., v. 89: 325-377, 1958) for real fourth order differential equations (1) $(r(x)u'')'' - p(x)u = 0$. In view of a result of the cited paper of Leighton and Nehari, however, application of a criterion of the present paper does provide a variational proof of a recent result of H. Howard, (Trans. Amer. Math. Soc., v. 96: 296-311, 1960), to the effect that if $r(x)$ and $p(x)$ are real-valued positive functions with $r(x) \in C'(o, \infty)$, $p(x) \in C(c, \infty)$, and for $a > o$ we have $\int_a^\infty [r(x)]^{-1}dx = \infty$, then (1) is non-oscillatory on (a, ∞) if and only if for $b > a$ the smallest proper value λ_b of the boundary problem $(r(x)u'')'' - \lambda p(x)u = 0$, $u = u' = o$ at $x = a$, $ru'' = (ru'')' = o$ at $x = b$, satisfies $\lambda_b > 1$. The criteria here derived also include as special cases some of the results for a fourth order quasi-differential equation $[(r(x)u'')' + q(x)u']' - p(x)u = o$ recently established by J. H. Barrett, (Mathematical Reserve Center Technical Summary Report no. 150, April 1960). (Contractor's abstract)

ORDINARY LINEAR DIFFERENTIAL OPERATORS OF MINIMUM NORM, by W. T. Reid. [1961] [16]p. incl. refs. (AFOSR-3735) (AF 49(638)994) Unclassified

Also published in Duke Math. Jour., v. 29: 591-606, Dec. 1962.

This paper is concerned with linear vector ordinary differential operators of the form $L[y] = A_1(t)y'(t) + A_0(t)y(t) + b(t)$, $t \in I = [a, b]$, where $y(t)$ is in the set $\mathfrak{A}(I)$ of absolutely continuous vector functions on I, $A_1(t)$ is non-singular, and $A_1^{-1}(t)A_0(t)$ and $A_1^{-1}(t)b(t)$ are Lebesgue integrable on I. For a given measurable matrix function $B(t)$ on I, and any of several Lebesgue normed linear spaces $\mathfrak{B}$, the problem considered is that of characterizing the elements $x(t) \in \mathfrak{B}$ of minimum norm $\mathfrak{N}[x]$ and belonging to the set $\Gamma = \{x(t) \mid \exists\ y(t) \in \mathfrak{A}(I)$ with $L(y) = B(t)x(t)$, $y(a) = \xi^a$, $y(b) = \xi^b\}$, ξ^a and ξ^b being constant vectors. The author shows that this problem is equivalent to the determination of an "extremal" solution of a finite moment problem, and obtains an explicit solution for this moment problem. Several particular cases of the problem are also examined, among them that in which $B(t)$ is such that $B_{ij}(t) = 0$ $(i \neq j)$, $B_{ii}(t) = \delta(t, J^i)$ $(i = 1, \ldots, n)$, where $\delta(t, J^i)$ is the characteristic function of the measurable subset of J^i of I.

VIBRATIONAL RELAXATION TIMES FOR GAS MIXTURES, by L. M. Valley and S. Legvold. [1960] [1]p. incl. tables. [AF 49(638)731] Unclassified

Published in Phys. Fluids, v. 3: 831, Sept.-Oct. 1960.

A relationship is derived for the vibrational relaxation times of gas mixtures which exhibit single dispersion of sound. This relationship is then tested against the data of several experiments. Consider a mixture of 2 singly dispersive gases A and B. Let k_{10}^{AA} and k_{01}^{AA} be the number of transitions, $1 \to 0$ and $0 \to 1$, per A molecule per second occuring in this mixture due to AA collisions. It is known that the number of transitions per molecule per second in a gas is proportional to the pressure. It is also known that $1/\theta_{AA} = k_{10}^{AA} - k_{01}^{AA}$, where θ_{AA} is the relaxation time of the pure gas A at 1 atm pressure. So in a mixture with mole fraction X of gas B present $k_{10}^{AA} - k_{01}^{AA} = (1 - X)/\theta_{AA}$. The final form of the equation is:

$$\frac{1}{\theta} = \frac{(1 - X)^2}{\theta_{AA}} + \frac{(1 - X)X}{\theta_{AB}} + \frac{X^2}{\theta_{BB}} + \frac{X(1 - X)}{\theta_{BA}}.$$

In the limit where the number of transitions in gas B goes to zero, the last 2 terms drop out. Thus for various mixtures of 2 dispersive gases the quantity $(1/\theta_{AB} + 1/\theta_{BA})$ should be constant, or if gas B is nondispersive θ_{AB} should be constant. The relationship derived is given strong support by the data provided by other research.

HEAT CAPACITY LAG IN HEAVY GASES, by S. Legvold and J. R. Olson. Final rept. July 1961, 2p. (AFOSR-1077) (AF 49(638)731) AD 289435; AD 611364 Unclassified

The examination and interpretation of the dispersion of sound in heavy vapors is presented using the polar gases, CH_2F_2, CHF_3 and C_2H_4 which have a high medium and zero dipole moment respectively. The gases were examined in various electric field strengths with the maximum field being 9000 v/cm. Argon, which has no dipole moment and no dispersion, was examined to insure that the electric field produced no other effect on the velocity than that due to molecular alignment. No measurable effect on the velocity was found for any of the gases examined, hence, it is concluded that an electric field of this strength has no effect on the relaxation times of heavy polar gases.

SMALL SAMPLE BEHAVIOR OF SLOPE ESTIMATORS IN A LINEAR FUNCTIONAL RELATION, by M. Dorff and J. Gurland. Feb. 1961 [29]p. incl. tables, refs. (MRC technical summary rept. no. 214) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)43 and U. S. Army under DA 11-022-ORD-2059) AD 253141 Unclassified

Also published in Biometrics, v. 17: 283-298, June 1961.

The slope parameter is estimated in a linear functional relation between 2 variables which are not observable since both are subject to error. Such problems occur in many contexts. As a matter of fact, in virtually all applications of fitting a functional relation errors of observation occur in all variables. Very frequently errors can be neglected in the independent variables in comparison with the errors in the dependent variable, but it is always the case. In particular, it is often desirable to use a relatively inexpensive technique in place of a very costly one, where the results given by the 2, apart from errors, are linearly related. For example, the evaluation of rocket grains by static test techniques is relatively inexpensive compared to the procedure of utilizing dynamic or flight testing. (Contractor's abstract)

THE POISSON PASCAL DISTRIBUTION, by S. K. Katti and J. Gurland. [1961] [12]p. incl. tables, refs. [AF 49(638)43] Unclassified

Published in Biometrics, v. 17: 527-538, Dec. 1961.

The aim is to study what may be called the Poisson Pascal distribution which includes the Neyman Type A and negative binomial as particular limiting cases and serves as a natural complement of the Poisson binomial. Some properties of the Poisson Pascal distribution are discussed. Several ad hoc methods used to estimate the efficiency in fitting Poisson Pascal distribution are evaluated. It is observed that the Poisson Pascal distribution acts as a bridge between the Neyman Type A and the negative binomial distributions and may be used with advantage when the latter distributions are inadequate to represent the population accurately. Techniques for choosing one of the many ad hoc methods on the basis of the sample will be discussed.

ESTIMATION OF THE PARAMETERS OF A LINEAR

FUNCTIONAL RELATION, by M. Dorff and J. Gurland. [1961] [11]p. [AF 49(638)43]
Unclassified

Published in Jour. Roy. Stat. Soc., v. 23B: 160-170, 1961.

(X_i, Y_i) are pairs of sure unobservable variables related by $Y_i = \alpha + \beta X_i$ and $x_{ih} = X_i + e_{ih}$, $y_{ik} = Y_i + f_{ik}$ $(i = 1, 2, \ldots, n; h = 1, 2, \ldots, r_i; k = 1, 2, \ldots, s_i)$ are observed values of random variables, the e's and f's being errors of observation with zero means. Four estimates of β, based on sum of squares, which are available when replication is present ($r_i > 1$, $s_j > 1$ for some i, j), some of which also require $r_i/s_i = g =$ constant are considered. They determine the asymptotic ($n \to \infty$) variances of the estimates, when the errors are independent, and remark that these depend on the spacing of the X's. In many cases they all have the same value, but with other spacings the max likelihood estimate has the least asymptotic variance. There is also some discussion of the case of correlated errors. Estimates of the form $\Sigma w_i y_i / \Sigma w_i x_i$ are also considered, where w_i are weights. It is concluded that for best estimation, it needs an extra assumption about the spacing of the X's.

THE MATRICES OF LINEAR LEAST-SQUARES IMAGE ANALYSIS, by L. Guttman. [1960] [10]p. incl. refs. (Sponsored jointly by [Air Force Office of Scientific Research under AF 61(052)121] and Lucius N. Littauer Foundation) Unclassified

Published in Brit. Jour. Stat. Psychol., v. 13: 109-118, Nov. 1960.

By the 'image' of a variable is meant the multiple regression of that variable on all the other variables in the data to be analyzed, and its 'anti-image' the error of estimate. It is then shown that an expression for R, the ordinary matrix of covariances or correlations, can be obtained in terms of the covariance matrices of the images and anti-images respectively. Various theorems and identities are deduced which lead to new structural theories for R and for data in the social sciences generally. In particular, fresh light is thrown on the problems of parsimony and rank. (Contractor's abstract)

THE STRUCTURING OF SOCIOLOGICAL SPACES, by L. Guttman. Dec. 1961 [15]p. incl. tables. (Technical note no. 3) (AFOSR-2835) (AF 61(052)121) AD 284326 Unclassified

The concept of level in social theory is discussed by participants (Professors Guttman, Suppes, Lazarsfeld, and Langerhans) at a seminar on the mathematics of social theory. The existence of a common space for the ordering of theories is questioned, and various approaches to the problem of relating social theories to empirical data are presented. (Contractor's abstract)

ON THE NATURE OF RADIATION DAMAGE DUE TO FAST NEUTRON BOMBARDMENT IN FERROMAGNETIC MATERIALS: VERY HIGH PERMEABILITY PURE IRON AND NICKEL, by G. Biorci, A. Ferro, and G. Montalenti. [1961] [21]p. incl. diagrs. table, refs. [AF 61(514)1331] Unclassified

Published in Nuovo Cimento, Series X, v. 20: 617-637, May 16, 1961.

The effects of fast neutron irradiation with doses of 10^{18} nvt on permeability, coercive force and approach to saturation of very high permeability pure iron and nickel were studied. No significant changes were noted on nickel (max permeability 5000). On iron (max permeability about 150 000, H_c 2.5 A/m) coercive force increased by about 0.8 A/m, max permeability decreased by about 30%, and no change was noted in the curve of approach to saturation and hence in the anisotropy energy. After annealing the irradiated iron specimens at 100°C, a further increase of coercive force was observed, and after annealing at 200°C, on 1 of the specimens a loop with strong wasp-waisted form was noted. Finally most of the changes in magnetic properties due to irradiation were almost completely recovered below 250°C. The possible theoretical interpretations of the results are discussed. The kinetics of the annealing leads to exclude that the effects are due to free iron interstitials and probably also to dislocation loops. Hence it is thought that these are anisotropic point defects which interact with the magnetization vector and move with an activation energy of about 1.2 ev at temperatures of (100 - 200°C. EXPERIMENTS ON MAGNETIC VISCOSITY DUE TO DIFFERENT SOLUTE ATOM PAIRS IN IRON ALLOYS, by A. Ferro, P. Mazzetti, and G. Montalenti. [1961] [12]p. incl. diagrs. table, refs. [AF 61(514)1331] Unclassified

Published in Nuovo Cimento, Series X, v. 23: 280-291, Jan. 16, 1962.

This work covers measurements of the interaction energy with magnetization of couples of solute atoms in several iron alloys. (This value is the last unknown factor in the theories of magnetic viscosity and of annealing in a magnetic field). The values of the interaction energy are obtained from measurements of magnetic viscosity field at about 450°C. The alloys considered are: Fe-V; Fe-Co; Fe-Cr; Fe-Ni; Fe-Al; Fe-Si; Fe-Mo. The interaction energy of a couple of solute atoms with vector J_s results to be little dependent upon the nature of the solute atoms, and at about 450°C, is of the order $(1 - 2) \cdot 10^{16}$ erg/atom for all types of solute. It is pointed out that in iron binary solid solutions, many other magnetic properties only depend upon the number of solute atoms and not upon their nature. (Contractor's abstract)

ELECTRON MICROSCOPE INVESTIGATION ON THE NATURE OF TRACKS OF FISSION PRODUCTS IN MICA, by G. Bonfiglioli, A. Ferro, and A. Mojoni. May 1961 [17]p. incl. illus. diagr. table, refs. (Technical note no. 3) (AFOSR-981) (AF 61(052)328) AD 262178 Unclassified

Also published in Jour. Appl. Phys., v. 32: 2499-2503, Dec. 1961.

Specimens of biotite, muscovite, artificial fluorophlogopite, and muscovite annealed at 900°C were examined using an electron microscope after having been covered with a uranium layer and irradiated in a reactor. Tracks due to fission products appeared on every specimen except biotite, and the respective diameters were put into correspondence with the resistance of the various micas to thermal decomposition. The tracks were larger in muscovite (240 A), thinner in fluorophlogopite (150 A), and still more in dehydrated muscovite (115 A). The writers believe that the mechanism of damage has its origin in the heat released by the heavy ionizing particles. Peculiar recovery effects were often observed. (Contractor's abstract)

PRELIMINARY EXPERIMENTS ON ELECTROLUMINESCENCE OF ZINC SULFIDE, by G. Bonfiglioli, P. Brovetto, and C. Cortese. [1961] [23]p. incl. diagrs. refs. (Technical note no. 4) (AFOSR-1835) (AF 61(052)328) Unclassified

A short literature review is given on the subject. The analysis is limited to phosphors of (activated) ZnS type and to so called "intrinsic" electroluminescence (EL) (EL excited in condenser type cells, filled with powder phosphors embedded in a good dielectric medium). A new technique is suggested for studying the behavior of the EL. It consists of applying to the cells single transients of voltage (respectively rising or falling) with a constant rate of variation vs time. This, roughly speaking, allows the separation of the effect of the electric field and of its time derivative by changing independently the max voltage and its rate of variation. The circuits used are described. The results obtained with commercial EL cells are also given and are of rather good quantitative character and may be more suited to a physical investigation of the basic phenomena involved in EL than the results of the studies reported in the literature and obtained by conventional techniques. Some final remarks concerning the technical improvements of the equipment and further experiments are given. (Contractor's abstract, modified)

SEARCH FOR AN EFFECT OF SURFACE CHARGING ON THE SUPERCONDUCTING TRANSITION

TEMPERATURE OF TIN FILMS, by G. Bonfiglioli, R. Malvano, and B. B. Goodman. Oct. 1961 [12]p. incl. diagrs. tables. (Technical note no. 6) (AFOSR-2012) (AF 61(052)328) AD 272233 Unclassified

Also published in Jour. Appl. Phys., v. 33: 2564-2566, Aug. 1962.

An attempt has been made to measure the rate of change of superconducting transition temperature T_c, as a function of surface charge density σ, in tin films. For films having thicknesses of 190, 670 and 1460A $|dT_c/d\sigma|$ was found in all cases to be less than 30° cm^2. $coulomb^{-1}$, the limit of sensitivity of the present apparatus. This negative result is compared with Glover and Sherrill's finding that in a tin film 70A thick $dT_c/d\sigma = -460°$ cm^2 $coulomb^{-1}$. (Contractor's abstract)

APPARATUS FOR THERMOLUMINESCENCE, by G. Bonfiglioli, P. Brovetto, and C. Cortese. Summary rept. Part A, Dec. 1961 [30]p. incl. diagrs. illus. (AFOSR-2321, Pt. A) (AF 61(052)328) AD 274007 Unclassified

Also published in Rev. Scient. Instr., v. 33: 1095-1100, Oct. 1962.

A detailed description is given of an apparatus for thermoluminescence (above room temperature, i. e. up to about 350°C), having the following peculiar features: the linear rate of warming is obtained through a cam-actuated Variac transformer; the light detection makes use of phase rectification; the apparatus is provided with a special furnace for recording glow current curves. The possibility of rendering flat the spectral response of the photomultiplier between 2000- 6000A through a composite filter is investigated and the method of calculating such a filter is developed. The performances of the apparatus were satisfactory.

FIELD EFFECT IN METALLIC FILMS, by G. Bonfiglioli and R. Malvano. [1961] [8]p. incl. diagrs. table. (AFOSR-4580) [AF 61(052)328] Unclassified

Also published in [Electric and Magnetic Properties of Thin Metallic Layers] Elektrische en Magnetische Eigenschappen van Dunne Metaallaagjes; a Symposium, Liege (Belgium) (Sept. 4-7, 1961), Brussels, Paleis der Acad., 1961, p. 50-57.

It is well known that the application of a transverse electric field (TEFE) to a sheet of a semiconductor changes appreciably its conductivity. The effect is extensively used to study some features of the interface between semiconductor and dielectric, and in particular the electronic surface states. The same effect has been found here in various metals (Au, Bi, Al, Ag, Sb). The thin film technique has been used to detect the effect which is many orders of magnitude smaller than in semiconductors. Measurements have been carried out in several different metals, the sign and the magnitude of the effect varying from one metal to another. Also the behavior vs temperature has been studied, clearly evidencing in this way a complete difference between the behavior of the film as a whole and of the surface conductivity. A schematic model is introduced to explain qualitatively the effect, at least of monovalent metals. Many points however need deeper insight, before getting definite answers about TEFE in metals; they are points of technical concern (such as improvements as to the reproducibility of the specimens)--or of theoretical concern (such as better knowledge of surface states in metals). BASIC RESEARCH IN THE FIELD OF VISION, by A. Fiorentini, L. Ronchi and others. Annual summary rept. no. 1, Oct. 31, 1960 [20]p. incl. diagrs. refs. (AFOSR-235) (AF 61(052)80) AD 251238 Unclassified

The results are summarized of various investigations on some basic characteristics of vision. The subjects of the investigations are the following: (1) disappearance of a stabilized image with intermittent illumination; (2) influence of a vibrating movement on the vision of an image with fuzzy contours; (3) some methods for improving the perception of signals in extrafoveal vision; (4) is the pulsating illumination actually advantageous, in practice, with respect to steady illumination; (5) blue-green interaction at mesopic levels; (6) blue-green electroretinographic responses; and (7) the perception of size in ambients of different color and by correcting the chromatic aberration of the eye. ON THE COURSE OF PERCEIVED PATTERN AT TWILIGHT LUMINANCES. I. SMALL CIRCULAR GREEN SPOT IN EXTRAFOVEAL VISION, by L. Ronchi and G. F. Mori. [1961] [9]p. incl. diagrs. refs. (AFOSR-1198) (AF 61(052)80) AD 262264 Unclassified

Also published in Atti Fondazione G. Ronchi, v. 16: 139-147, Mar.-Apr. 1961.

A small green circular spot (12 min arc) was projected 7° nasal in the center of an adapting field 2(1/2)° diam. The exposure time relative to the spot was limited (60 msec), while that relative to the adapting field was unlimited. The task consisted in specifying the perceived pattern under the impoverishment of viewing conditions. The transition from the perception of the circle as such to the mere light perception corresponds to the appearance either of an irregular pattern with fuzzy contours, or of a small point. Just in this transition range, the double patterns are likely to occur, consisting of a pair of the above described patterns well separated in space. In addition, the said patterns may appear either as steady or as (illusory) moving, and often they are localized out of the center of the adapting field. (Contractor's abstract)

TRAINING AND ELECTRORETINOGRAPHIC RESPONSES, by L. Ronchi and A. M. Ercoles. [1961] [6]p. incl. diagrs. (AFOSR-1257) (AF 61-(052)80) AD 262266 Unclassified

Presented at Symposium of the Internat'l. Soc. for Clinical Electroretinography, Stockholm (Sweden), June 1-3, 1961.

Also published in Atti Fondazione G. Ronchi, v. 16: 518-531, Sept.-Oct. 1961.

A number of records are reported which seem to show a paradoxical influence of "expectation" on the electroretinographic responses. In particular, the initial records obtained from an untrained subject show a negative feature which tends to disappear during the various successive experimental sets, while the size of the positive feature tends to increase. It is tentatively suggested that the above reported changes correspond to the release, during incoming training, of central suppression which is known to counteract the stimulation produced by intraocular scatter. (Contractor's abstract)

Istituto Nazionale di Ottica, Florence (Italy).

MAY A SINGLE STIMULUS EVOKE TWO SENSATIONS SEPARATE IN SPACE? by L. Ronchi. [1961] [4]p. incl. diagrs. (AFOSR-1261) (AF 61(052)80) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 16: 77-80, Jan.-Feb. 1961.

There are some experimental conditions where there is a certain likelihood that 2 contemporaneous and distinct patterns are perceived, in spite of the fact that the retina is stimulated by a single flash. An explanation of such an apparently paradoxical effect is difficult to be drawn, partly because of the limited number of available experimental data. The attempt is made of inserting the reported effect in the frame of the retinal organization on the basis of some recent findings. (Contractor's abstract)

1201

Istituto Nazionale di Ottica, Florence (Italy).

NOTE ON THE ELECTRORETINOGRAPHIC INTENSITY FUNCTION, by A. M. Ercoles. [1961] [2]p. incl. diagr. (AFOSR-1260) (AF 61(052)80) AD 262267 Unclassified

Also published in Atti Fondazione G. Ronchi, v. 16: 49-50, Jan.-Feb. 1961.

The variation of the height of the b-wave as a function of the intensity of the stimulating light has been studied previously (see item no. 772, Vol. III; and item nos. 999, 1003, and 1008, Vol. IV). The main result obtained is that the intensity function may be considered as consisting of a sequence of linear branches of various slopes. Here, however, a hump should be expected also at those levels where the saturation of the intensity curve begins to appear. The results obtained from 2 well trained and normal subjects are analyzed by means of the Maxwellian view. The presence of the expected hump has been tested in all recorded intensity functions. The behavior of the electroretinographic human intensity function extends over a very wide intensity range.

ON THE FLUCTUATION OF VISUAL RESOLUTION, by M. Conticelli. [1961] [5]p. incl. diagrs. table. (AFOSR-2016) (AF 61(052)80) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 16: 257-261, May-June 1961.

A figure viewed under a small viewing angle is seen to fluctuate in shape under poor illumination. The number of fluctuations/min is found to decrease with increasing luminance, if fixation is not obliged. When fixation is obliged, in a slightly extrafoveal point, fluctuation seems to be independent from the luminance level, in the range considered by the author. In addition, by the aid of a suitable effort, the observer is able to exert a sort of control on the peripheral factors responsible for fluctuation, so as to reduce its amount. (Contractor's abstract)

SPEED OF READING AND DIFFERENTIAL

BINOCULAR ADAPTATION. I. PRELIMINARY REPORT, by M. Conticelli. [1961] [7]p. incl. diagrs. (AFOSR-2018) (AF 61(052)80) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 16: 381-387, July-Aug. 1961.

The speed of reading, a test above the threshold of visibility in monocular vision, is found to be influenced by the state of adaptation of the other eye. Such an effect is tested for luminances of the target falling in the range where a decrease in luminance corresponds to a decrease in the speed of reading. The individual differences are correlated with eye dominance and discussed. (Contractor's abstract)

1205

Istituto Nazionale di Ottica, Florence (Italy).

ON THE COURSE OF PERCEIVED SHAPE AT TWILIGHT LUMINANCES. II. BLUE, RED, GREEN SPOTS IN EXTRAFOVEAL VISION, by L. Ronchi. [1961] [7]p. incl. diagrs. tables. (AFOSR-2019) (AF 61(052)80) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 16: 388-394, July-Aug. 1961.

The threshold of perception relative to a small circular patch viewed, in extrafoveal vision, for a brief time, upon a background of mesopic luminance, implies the transition from the perception of the circular patch as such to a vague light sensation; the intermediate patterns consist of a small point (as if the circle would be concentrated in its center), or of a thin streak, or of an irregular figure with fuzzy contours. Sometimes the said figures are seen to move across the background, and often they are seen as decentered, in spite of the fact that they are actually steady and projected just in the center of the background. Last, the stimulus sometimes appears as consisting of 2 patterns well separate in space, of the singleness of the physical stimulation. The above reported effects do not differ substantially when the spectral composition of light is changed from red to blue. As differences of higher order, we might emphasize that the frequency of occurrence of the < illusory motion > for green light is slightly greater than for the other 2 colors (steadiest patterns are seen under blue stimulation); in addition, the percent number of double responses is slightly greater for blue than for green, while red stimulation is in an intermediate position. BASIC RESEARCH IN THE FIELD OF VISION, by A. Fiorentini and M. Bittini. Oct. 31, 1961 [15]p. incl. diagrs. (Technical rept. - Part II) (AFOSR-2238, Pt. II) (AF 61(052)80) Unclassified

As has been previously reported, the subjective brightness of a field viewed by one eye decreases soon after strong illumination of a non-corresponding retinal area of the opposite eye (inducing eye). This binocular interaction effect can be prevented if the objective luminance of the first field is increased by a suitable amount synchronously with the illumination of the inducing eye. In the present work the apparent brightness decrement occurring at illumination of the inducing eye has been compared with the brightness decrement produced by an objective luminance decrease in the field viewed by the first eye, when the other eye is not stimulated. Next, it has been ascertained that the illumination of one eye does not impair detectability of a small test patch by the other eye, when the test patch is flashed against a steady background synchronously with the onset of illumination in the opposite eye. Last, some time characteristics of the binocular interaction effect have been investigated. (Contractor's abstract)

THE "FADING OUT" OF A FIXATED TEST-FIELD. MONOCULAR AND BINOCULAR EXPERIMENTS, by L. Ronchi and M. Conticelli. [1961] [11]p. incl. illus. diagrs. tables, refs. (AFOSR-2879) (AF 61-(052)80) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 16: 643-653, Nov.-Dec. 1961.

A centrally fixated 10° diam luminous field, surrounded by dark, is seen to fade out rhythmically in monocular vision, while the same does not happen in binocular vision, where only a faint fluctuation of the apparent brightness is tested. When presented with an unlimited uniformly illuminated test-field (empty field, Ganzfeld) in general the monocular rhythm persists for a few min only, after the beginning of exposure. Then, the field seems to become more-or less uniform, apart from the presence of small patches varying both in size and in shape. Note that such a final situation in general for 1 eye is strongly different with respect to that of the other eye. Binocular vision in an empty field first of all is found to be characterized by a narrowing of the visual field, presumably as a consequence of the fact that the overlapping of the 2 monocular fields is only partial. SPECTRA OF LIGHT SCATTERED IN THE ATMOSPHERE AT THE HEIGHTS OF 5 AND 16 km, by G. Noci. [1961] [4]p. incl. diagrs. table. (AFOSR-2881) (AF 61(052)80) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 16: 625-628, Nov.-Dec. 1961.

The spectral distribution of the scattered sunlight, at 5000 and 16000 m above sea level has been calculated on the basis of some simplifying hypothesis. The approximations used are discussed and justified, and the method adopted for calculations is described. No considerable differences are found between the spectrum at 5000 m and the one at 16000 m, respectively; in addition, these spectra do not agree with the blackbody spectra. Such a comparison is shown graphically. (Contractor's abstract)

1211

Istituto Nazionale di Ottica, Florence (Italy).

SPEED OF READING UNDER RED AND WHITE ILLUMINATIONS, by M. Conticelli. [1961] [9]p. incl. diagrs. tables. (AFOSR-2899) (AF 61(052)80) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 16: 509-517, Sept.-Oct. 1961.

A card-board where some rows of figures are typewritten is presented in monocular vision at a suitable viewing distance, and the speed of reading is determined. If the subject is dark-adapted and performs, say, 10 readings, each one lasting about 30 sec, and intervalled from one another by dark periods of 30 sec, the behavior of the speed of reading shows a sort of rhythm, which corresponds to a subjective impression of greater or lesser weariness. Such a rhythm is found to differ under red illumination with respect to white illumination, and, in addition noticeable troubles are tested when light-adapting the eye as described in the text. ON THE SIZE OF THE HUMAN ERG AFTER BLOOD DONATION "ONE CASE REPORT", by G. Abbozzo. [1961] [2]p. incl. diagr. (AF 61(052)80) Unclassified

Published in Atti Fondazione G. Ronchi, v. 16: 51-52, Jan.-Feb. 1961.

The subject was a young male trained to give electroretinographic responses every other day, for a period of 3 yr. The standard deviation of his responses is about 20 μv. However, his electroretinographic response was found to be significantly decreased with respect to the norm whenever he had given about 300 cc of blood. The height of the scotopic b-wave is plotted against the log of stimulus intensity about 36 hr after the blood donation.

PERIPHERAL DIFFERENTIAL THRESHOLD UNDER PROLONGED FIXATION, by A. M. Ercoles. [1961] [3]p. incl. diagr. (AF 61(052)80) Unclassified

Published in Atti Fondazione G. Ronchi, v. 16: 477-479, Sept.-Oct. 1961.

A plot is given of the perception probability against the time during which fixation was prolonged by avoiding as far as possible eye movements (average of 25 responses). The main result is that if the luminance of the test field is not too low, the sensitivity to brightness differences is in some way impaired when the test field is just disappearing by virtue of the "fading" process, and it is again restored when the test field has disappeared, so that the patch is seen

as it would be projected on a dark background. The following test was given to check the ability of the subject to keep his eye in fixed position and to intentionally avoid any voluntary eye movement: the subject fitted a contact lens wearing a small plane mirror; a light beam, reflected at this mirror impinged on a graduate scale placed at the distance of 1 m with respect to the eye. By taking as zero the position of the reflected beam at the beginning of fixation, no deflections greater than ± 15 min of arc were tested during prolonged fixations lasting about 20 sec. It is concluded that the incoming refractoriness accompanying the peripheral fading relative to a given test field decreases the probability of perception relative to a small patch projected on it; hence, in current experiments devoted to threshold determination, care should be taken in order to maintain the "normal" fixation of the eye.

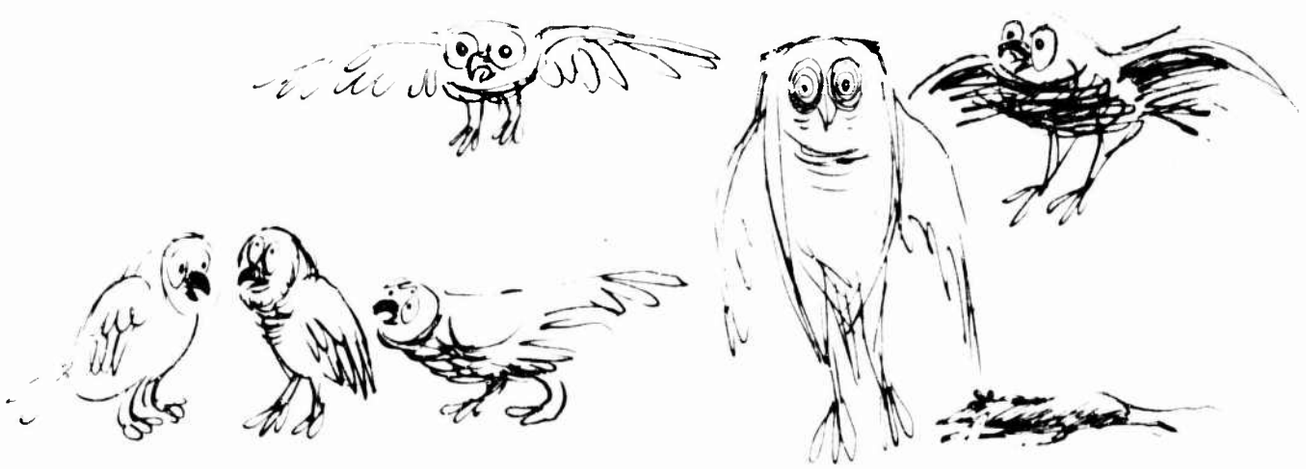
A NEUROPHARMACOLOGICAL INVESTIGATION OF THE CONVULSANT ACTION OF 4-PHENYL-4-FORMYL-N-METHYL PIPERIDINE (1762 IS), by V. G. Longo and A. P. Corrado. Annual summary rept. July 1, 1961 [10]p. incl. diagrs. (AFOSR-1200) (AF 61(052)399) AD 264820 Unclassified

Also published in Proc. Soc. Exper. Biol. and Med., v. 107: 272-274, June 1961.



A detailed analysis of the action of 1762 IS was made. The usual pharmacological procedures were used as well as a more specific technique which included a study of the modifications of the electrical activity at the various levels of the cerebro-spinal axis, the effects of the application to the cerebral and cerebellar cortex of the substance on the cortical electrical activity and its action on spinal integratory mechanisms. In preliminary toxicity studies, a synthetic compound, 4-formyl-4-phenyl-N-methyl-piperidine (1762 IS) showed convulsant properties very similar to those of strychnine. More detailed neuropharmacological investigations dealing with the action of 1762 IS on the cerebral electrical activity, on the mono-and polysynaptic reflexes and on the 'primary' spinal inhibition have confirmed the similarities between this compound and strychnine. Some relationships between structure and pharmacological properties are discussed. (Contractor's abstract)

CENTRAL ACTION OF ADRENERGIC-BLOCKING DRUGS, by F. R. Domer. Oct. 1, 1961 [22]p. incl. diagrs. refs. (AFOSR-1726) (AF 61(052)469) AD 272419 Unclassified

Intravenous infusion of 5-hydroxytryptophan in the rabbit caused a flattening of the electrocorticogram and the development of a 30-40 c/sec discharge in the rhinencephalon. Premedication with β-methyl dihydroxyphenylalanine or chlorpromazine delayed the onset of this action while premedication with the monoamine oxidase inhibitors JB 516 or 2596 IS or with reserpine or atropine did affect the onset of full development of the rhinencephalic discharge. After the discharge activity was fully developed, it was greatly depressed or abolished by administration of pentobarbitone or myanesin. Strychnine caused the hippocampal spiking to be replaced for a short time. Agents which had no effect on the existing discharge were: 5-hydroxytryptamine, adrenaline, d-amphetamine and eserine. Intravenous injection of tryptamine also caused a cortical flattening and rhinencephalic discharge similar to that provoked by 5-hydroxytryptophan. Microelectrode recordings from the rabbit hippocampus are also described. Preliminary experiments studying the potentiation of neuromuscular blocking agents by SKF 525A indicate that the circulating C^{14} level of C^{14} labeled 1815 IS is increased following premedication with the potentiating agent. APPEARANCE AND IONIZATION POTENTIALS OF SELECTED FRAGMENTS FROM DECABORANE, $B^{11}{}_{10}H_{14}$, by J. J. Kaufman, W. S. Koski and others. [1960] [8]p. incl. diagr. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 18-(600)1526] and Office of Naval Research) Unclassified

Presented in part at 138th Nat'l. meeting of the Amer. Chem. Soc., Sept. 1960.

Published in Jour. Amer. Chem. Soc., v. 84: 4198-4205, Nov. 20, 1962.

The appearance potentials of selected ions from decaborane $B^{11}{}_{10}H_{14}$ (99.68% B^{11}) were measured by mass spectroscopy. A set of apparently self-consistent ionization potentials for decaborane and various $B_{10}H_n$ fragments were calculated from these appearance potentials, using what little thermochemical bond energy data are available, combined with the authors' interpretation of the processes taking place on ionization and fragmentation. An IBM 7090 computer program to calculate monoisotopic fragmentation patterns from mass spectral raw data was written. From the mass spectrum of $B^{11}{}_{10}H_{14}$ at 70 ev the monoisotopic fragmentation pattern of decaborane was calculated. For comparison, from mass spectral raw data at 70 ev of decaborane containing normal isotopic abundances of B^{10} and B^{11}, several different monoisotopic fragmentation patterns of decaborane were calculated which varied depending upon the method of choice of the original percentage of B^{10} in the molecule. B^{11} QUADRUPOLE COUPLING CONSTANTS IN TRIMETHOXYBOROXINE AND N-TRIMETHYLBORAZOLE, by M. A. Ring and W. S. Koski. [1961] 4p. incl. diagrs. table. (Technical note no. 15) (AFOSR-926) (AF 18-(600)1526) AD 259310 Unclassified

Also published in Jour. Chem. Phys., v. 35: 381-382, July 1961.

NMR (nuclear magnetic resonance) broad-band spectra of trimethoxyboroxine (I) and N-trimeth...borazole (II) were obtained from precooled samples as they warmed to just below their melting points. From these spectra the B^{11} nuclear electrical quadrupole interaction was measured. In both compounds the quadrupole interaction split the central transition $m = \frac{1}{2} \rightarrow \frac{3}{2}$. The distances between the derivative max(mc) for I was 0.0434, II, 0.0278; ν_0 values were 13.70 mc for both compounds.

BORON HYDRIDE CHEMISTRY, by W. S. Koski. Final rept. July 1961, 23p. incl. refs. (AFOSR-1458) (AF 18-(600)1526) Unclassified

The research of this project is reported in 4 parts. The first part involves isotopic exchange in the boron hydrides. These studies demonstrate the important intermediates involved in the reactions of boron hydrides, especially the role played by borane. The second phase of the work deals with the measurement of appearance

potentials and fragmentation patterns of various molecules under electron bombardment. The influence of substitution on ionization potentials was studied and the average bond energy of the B-I bond in BI_3 was determined. In the third part, the work on nuclear quadrupole resonances is summarized. In the final phase of the report, a summary is given of 2 new analytical techniques developed during this study: application of thermal conductivity to the isotopic analysis of such materials as diborane, and application of neutron absorption to the B^{10} isotopic analysis in boron-containing compounds. A cumulative list of publications resulting from the work is included.

FAR INFRARED SPECTRA OF SOLID METHYL HALIDES, by W. J. Lafferty and D. W. Robinson. [1961] [4]p. incl. diagrs. table, refs. (AFOSR-1221) (AF 49(638)468) AD 453607 Unclassified

Also published in Jour. Chem. Phys., v. 36: 83-86, Jan. 1, 1962.

The infrared spectra of solid CH_3Cl, CH_3Br, CH_3I, CD_3Cl, CD_3Br, and CD_3I have been measured in the spectral region from 130 to 30 cm^{-1} at 78°K. Two sharp bands were found in the cases of the chloride and bromide, and 3 in the case of the iodide. These absorptions are interpreted as arising from lattice vibrational modes. The isotopic shifts exclude libration about the symmetry axis as a possible assignment for any of the bands, however, definite assignments to B-axis librations or translational modes cannot be made with confidence.

THE FAR INFRARED SPECTRUM OF TETRAHYDROFURAN, by W. J. Lafferty and D. W. Robinson. [1961] 8p. (AFOSR-2366) (AF 49(638)468) AD 611193 Unclassified

An examination of the vapor-phase spectrum of tetrahydrofuran between 30/cm and 400/cm revealed a series of fairly broad bands at 34.25, 40.5, 47.5, 54.0, 59.6, 66.8, and 81.2/cm. The absorption peaks are tentatively attributed to the transitions of a pseudo-rotator. An intense broad band with sharp peaks at 233, 243, 276, and 279/cm is assigned to the "ordinary" ring puckering mode and is thought to be the result of the upper stage transitions of this vibration.

Abstract published in Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, June 12-16, 1961, p. 56.

Also published in Jour. Chem. Phys., v. 35: 1045-1050, Sept. 1961.

Abstract also published in Spectrochim. Acta, v. 17: 1129, Oct. 1961.

The infrared spectrum of CF_3SF_5 has been measured and analyzed between 30 and 4000 cm^{-1}. A band found at 218.5 cm^{-1} is believed responsible for satellite lines observed previously in the microwave spectrum; the barrier to internal rotation might then be much lower than obtained previously by assuming these satellites were due to torsional oscillation. Twelve of the 17 fundamentals were assigned in the infrared spectrum and estimates are given for the others. A plausible assignment is given for the overtone and combination bands also observed; this gives no evidence for any of the inactive fundamentals. (Contractor's abstract)

NUCLEAR QUADRUPOLE RESONANCE SPECTRA OF BORON-IODINE COMPOUNDS, by W. G. Laurita and W. S. Koski. [1961] [12]p. incl. tables, refs. (AFOSR-4320) [AF 49(638)481] AD 405307 Unclassified

Presented at Colloque; Application à la Biochimie et à la Chimie Structurale de la Spectroscopie des Radiofréquences, Brussels (Belgium), Apr. 6-7, 1961.

Also published in Mem. Acad. Roy. Belg. Cl. Sci., v. 33: 321-332, 1961.

The iodine nuclear quadrupole resonance spectrum of boron triiodide has been studied. The frequencies of the $1/2 \rightarrow 3/2$ and the $3/2 \rightarrow 5/2$ transitions were measured as 212.6 and 340.1 mc/sec, respectively. Each of the resonances was a doublet with a separation of 24 ± 2 mc/sec for the lower frequency transition and 43 ± 3 mc/sec for the higher frequency transition. The quadrupole coupling constant (eQq) was found to be 1176 mc/sec and the asymmetry parameter was 0.456. The large asymmetry parameter was interpreted as due to π-bond character of the boron-iodine bond. The splittings of the iodine resonances in BI_3 were found to be in semi-quantitative agreement with theoretical expectations. The $1/2 \rightarrow 3/2$ iodine nuclear quadrupole transitions in iododecaborane and the iodopentaborane have been observed at 190.8 and 196.2 mc/sec, respectively. The $3/2 \rightarrow 5/2$ transitions were not observed. The splittings of the iodine resonances in the iodoboranes are believed to be smaller than the resolution of the equipment and consequently have not been detected. The quadrupole coupling constants are interpreted in terms of the electronic structure of the boron-iodine bonds in these compounds. (Contractor's abstract)

ON CERTAIN MONOTONE FUNCTIONS AND PRODUCTS OF INDEPENDENT FUNCTIONS, by P. Hartman. Apr. 1961, 23p. incl. refs. (Technical note no. 21) (AFOSR-515) (AF 18(603)41) AD 254909 Unclassified

Also published in Rend. Circ. Matem. Palermo, v. 10: 193-211, 1961.

Let $\varphi_1(t), \varphi_2(t), \ldots$ be positive functions almost everywhere on $0 \le t \le 1$ which are independent in the sense of Steinhaus and have the expected value 1. Let $f_n(x) = \int_0^x \prod_{k=1}^{n} \varphi_k(t)dt$ and f(x) be a (pointwise) limit of a subsequence of $f_1, f_2, \ldots$. It is shown that if the infinite product of $\varphi_1, \varphi_2, \ldots$ is convergent almost everywhere, then f(x) is absolutely continuous, and that if the infinite product is divergent almost everywhere and the functions φ_n satisfy certain supplementary conditions, then f(x) is purely singular. Corresponding results hold for the inverse function $x = f^{-1}(y)$. (Contractor's abstract)

AN EXPERIMENTAL STUDY OF THE INTERRELATION BETWEEN THE THEORY OF DISLOCATIONS IN POLYCRYSTALLINE MEDIA AND FINITE AMPLITUDE WAVE PROPAGATION IN SOLIDS, by J. F. Bell. Mar. 1961 [43]p. incl. diagrs. refs. (Technical rept. no. 7) (AFOSR-422) (AF 49(638)423) AD 255212 Unclassified

Also published in Jour. Appl. Phys., v. 32: 1982-1993, Oct. 1961.

A detailed verification is given for the G. I. Taylor theory of dislocations (1934) in polycrystalline annealed aluminum. Applying the finite amplitude wave theory, with a theoretical parabolic stress-strain curve obtained from dislocation theory, experimental and theoretical correlations within approx 1% were obtained for the velocities of strain propagation, max strain, largest distance of penetration of max strain, dynamic stress levels in the first diam, time of contact, coefficient of restitution, mushrooming in the first diam, and an energy balance before and after impact. Variations in the plastic wave development and dynamic stress behavior below the Karman critical velocity were considered in terms of a difference in the initial elastic reflection behavior below the critical velocity. Plastic deformation was independent of strain rate, even at experimentally determined values of 2000 in./in./sec. The subsequent development of dispersive plastic wave fronts following the passage of the initial shock, were also in accordance with predictions based upon dislocation theory. The equipartition of energy in the vicinity of the impact face was related to the reflection behavior of these initial shock fronts at the lateral surface of the rod. (Contractor's abstract)

CORPUS CALLOSUM AND ANTERIOR COMMISSURE CONNECTIONS IN THE CAT (Abstract), by F. F. Ebner and R. E. Myers. [1961] [1]p. (AF AFOSR-61-38) Unclassified

Published in Physiologist, v. 4: 32, Aug. 1961.

The cortical distribution of the interconnecting fibers of the forebrain commissures were studied using the

Nauta-Gygax silver impregnation technique. After total commissuratomy the striate cortex or visual area I was remarkably free of degenerating fibers while peristriate or visual area II demonstrated them in dense profusion. The somatic sensory arm area appeared degeneration free while the leg and face areas revealed heavy degeneration. The somatic motor area of the anterior sigmoid gyrus also contained dense degeneration. The auditory areas I and II both showed diffuse and relatively heavy degeneration while auditory area III which is approx coextensive with somatic area II was degeneration free. Cingulate cortex was only very sparsely infiltrated with commissural fibers while the ventral portions of the ectosylvian complex remained entirely free of such fibers. These results will be discussed in relation to similar findings in the raccoon.

CREATION AND DESTRUCTION OF CHARGED PARTICLES AND EXCITED STATES IN HELIUM (Abstract), by D. E. Kerr and C. S. Leffell, Jr. [1961] [1]p. [AF 18(600)363] Unclassified

Presented at meeting of the Amer. Phys. Soc., Schenectady, N. Y., Oct. 11-13, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 131, Feb. 23, 1962.

Consequences of measurements of magnitude and time dependence of electron concentration and of spectrally resolved atomic and molecular radiation at pressures of 0.25 to 20 mm Hg are summarized. These measurements provide better knowledge and control of gas purity, greater dynamic range, and much greater spectroscopic detail than those of previous work. Microwave-cavity measurements of ambipolar diffusion loss rates infer ionic mobility at pressures below 3 mm to be that of the atomic ion, reduced by diffusion cooling, and above that of the molecular ion. The mobilities at 300°K are 10.7 and 16.2 cm^2/v-sec, respectively, agreeing with drift-tube measurements for the atomic ion, but 20% lower for the molecular ion. Limits on recombination coefficient α are: for pressure about 1 mm, $\alpha > 2 \times 10^{-10}$ cm^3/sec; above 15 mm, $3 \times 10^{-10} < \alpha < 2 \times 10^{-9}$. Attempts to reconcile these and other detailed results with currently popular theories of recombination and of processes for production of radiating excited states reveal ambiguities or internal conflicts. Suggestions for additional theory and measurements are given.

THE DIFFUSION EQUATION WITH A QUADRATIC LOSS TERM APPLIED TO ELECTRON-ION VOLUME RECOMBINATION IN A PLASMA, by E. P. Gray and D. E. Kerr. [1961] [25]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(600)363] and Office of Naval Research under NOrd-7386) Unclassified

Published in Ann. Phys., v. 17: 276-300, Feb. 1962.

The diffusion equation for charged particles in a plasma, with an additional recombination loss term has been solved numerically for plasmas in containers having the shape of an infinite cylinder and a sphere. This equation applies to a decaying plasma in thermal equilibrium, with no sources of ionization, no loss mechanisms other than diffusion and volume recombination, and containing no negative and only one species of positive ion. The solutions have been used to assess the limits of applicability and the accuracy of the microwave cavity method for determining the recombination coefficient α as the slope of a plot of the reciprocal of the measured electron concentration vs time. It is found that a linear region in this plot can exist even for $\beta = 0$, and that the slope is therefore unrelated to α for sufficiently small β. Only if β is very large, and if the linear region is sufficiently extended, does the slope constitute a reasonable approximation to α. A criterion is established for the validity of this method of determining α, and is applied to a number of previous experiments. It is found that although some experiments satisfy this criterion and presumably yield good values of α, others do not, and yield values that are too large. (Contractor's abstract, modified)

COUPLING THE HELIUM CHAMBER TO THE 800 MEV/C K^- BEAM, by P. E. Schlein and T. E. Toohig. Mar. 1961 [17]p. incl. diagrs. (AFOSR-407) (AF 18-(603)143) Unclassified

The problems relevant to positioning the He chamber in the 800 mev/c K^- beam and the problems involved in shielding about the last 4 ft of the beam from the stray field of the Helmholz coils are discussed. Three sections of the field are considered. Region A extends from the 10 gauss field region (~85 in. from chamber center) downstream to the vertical focal plane. Region B extends from this 40 in. point downstream to a point 15.1 in. from chamber center. Region C extends from this field point to the chamber center. The best procedure for positioning the chamber seems to be the following: Decide by means of a bug orbit plot just what x_j (distance of the trajectory measured at the downstream end of

section B) is needed. Then correct to account for the presence of the magnetic shields to decide what x_1 is desired. The chamber is then positioned accordingly. The production of the 2 magnetic shields has been completed and a brief description of them is given.

DUKE HELIUM CHAMBER: K^- RUN OPTICAL SYSTEM AND FIDUCIAL MARK DATA, by T. E. Toohig. Mar. 1961 [6]p. incl. tables. (AFOSR-754) [AF 18-(603)143] Unclassified

Optical data for the K^- run are presented with accompanying sketches and film clips. The film clips were taken at room temperature. All glassware measurements are given as mean values of 4 measurements using a vernier caliper. The bubble chamber depth measurement was also made with the vernier. The relative positions of the fiducial marks when mounted on the chamber were determined by mounting the chamber on an optical bench, the telescope of which was aligned relative to the ways to within 20 in. of arc over the entire 2-meter bench. The chamber itself was aligned relative to the x and y motions of the measuring head to within .0001 in. to 1 cm of travel. The measurements are given in tabular form.

EVIDENCE FOR A THREE-PION RESONANCE NEAR 550 MEV, by A. Pevsner, R. Kraemer and others. [1961] [8]p. incl. diagrs. refs. (AFOSR-1754) (In cooperation with Northwestern U., Evanston, Ill.) (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(603)143], National Science Foundation, and Office of Naval Research) AD 267986 Unclassified

Also published in Phys. Rev. Ltrs., v. 7: 421-423, Dec. 1, 1961.

Further data for a study of multipion resonances in $\pi^+ + d$ reactions observed in the Lawrence Radiation Lab. 72-in. bubble chamber exposed to a 1.23 bev/c pion beam from the Bevatron indicates the existence of a second neutral 3-pion resonance with a mass of ~550 mev. The reaction $\pi^+ + d \rightarrow p + p + \pi^+ + \pi^- + \pi^0$ in which both protons are visible and at least one proton stops in the chamber with a range less than 15 cm is considered. An ideogram for the first 199 events and a histogram for all 233 events are presented. An average mass uncertainty on a given event is ~ ± 20 mev. A large peak near 770 mev is the ω^0. Another large peak in the 3-pion mass plot is found near 550 mev, which strongly suggests the existence of a second 3-pion resonance, the η.

SCATTERING MATRIX APPROACH TO THE Λ - π RESONANCE, by K. C. Wali, T. Fulton, and G. Feldman. [1961] [2]p. incl. refs. (Sponsored jointly by [Air Force] Office of Scientific Research under [AF 18(603)143] and National Science Foundation) Unclassified

Published in Phys. Rev. Ltrs., v. 6: 644-645, June 1, 1961.

An attempt is made to analyze the data involving the 3 channels $\bar{K}N$, $\Sigma\pi$, $\Lambda\pi$, in the I = 1 state in the total energy range $m_\Lambda + m_\pi$ to $m_N + m_K$ by means of an effective-range theory derived from a dispersion approach (analogous to the Chew-Low approximation in the

one-channel case). Assuming that the relative parity is odd, and Λ - K odd, it is shown that there can exist a resonance in the I = 1, J = ($\frac{3}{2}$-) state and all of the known data can be fitted to a reasonable set of renormalized coupling constants. A brief outline of the method of calculation is given.

TEST OF CHARGE SYMMETRY OF K^+ AND K^0 MESONS (Abstract), by R. Kraemer, M. Nussbaum and others. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(603)143] and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., Mexico City (Mexico), June 22-24, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 350, June 22, 1961.

A test of the charge symmetry of the K^+ and K^0 mesons has been made by comparing the reactions (a) $\pi^+ + d \rightarrow p + \Lambda$ (or Σ^0) + K^+ and (b) $\pi^- + d \rightarrow n + \Lambda$ (or Σ^0) + K^0. Beams of positive and negative pions at 1.23 bev/c were directed into the 72-in. bubble chamber, and filled with liquid deuterium. About 140 events in the π^+ film and approximately 3 times that many in the π^- film have been measured. The cross sections for processes (a) and (b) were found to be the same within 20%. Distributions in momentum and angle of the lambdas and of the K mesons and also lambda decay asymmetries have been compared. No large deviations from charge symmetry have been observed.

PHOTOELECTRIC EFFECT AND PAIR ANNIHILATION WITH LARGE MOMENTUM TRANSFER, by D. S. Moroi. [1959] [8]p. incl. refs. [AF 18(603)143] Unclassified

Published in Phys. Rev., v. 123: 167-174, July 1, 1961.

Photoelectric effect and pair annihilation in hydrogen with large momentum transfer are studied, taking into account the recoil and anomalous magnetic moment of proton, in an effort to determine whether these processes can be used to probe quantum electrodynamics at small distances. A negative result is obtained. For an incident energy of 100 mev the important term containing the electron propagator, which is sensitive to small distance modifications, is about 0.5% of the term, which is insensitive to them. The proton structure is described by 2 covariant form factors determined by the electron-proton scattering. The differential cross sections are calculated in the Born approximation in the laboratory system. The results are analyzed in the extreme relativistic energy range and in the special case that the outgoing electron (photon) comes off perpendicular to the incident beam. (Contractor's abstract)

THREE-PION RESONANCES IN $\pi^+ + d$ REACTIONS (Abstract), by A. Pevsner, R. Kraemer and others. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(603)143], Office of Naval Research, and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 433, Nov. 24, 1961.

At the present time, 700 candidates for the reaction $\pi^+ + d \rightarrow p + p + \pi^+ + \pi^- + \pi^0$ with a beam momentum of 1.23 bev/c have been examined in the film from the Alvarez 72-in. chamber. Of these candidates, 160 fit the reaction with a $x^2 < 6$ using the Berkeley PANG and KICK programs. A histogram of the effective mass of the 3-pion system reveals 85 events in the region 740-800 mev. The peak of the resonance is 4 standard deviations above phase space. A Dalitz plot of the events in the peak is presented. The absence of this peak in the $n + p + \pi^+ + \pi^+ + \pi^-$ final state indicates that this is T = 0 resonance. These results corroborate

the 787 ± 15 mev resonance of Maglić, et al. The data also indicate a second bump at about 550 mev, but only 17 events in the bump.

THE SPECTRUM OF DOUBLY IONIZED PRASEODYMIUM, by J. Sugar. Dec. 1961, 59p. incl. illus. diagrs. tables, refs. (Spectroscopic rept. no. 22) (AFOSR-4543) (AF 49(638)535) AD 609418
Unclassified

The spectrum of Pr^{2+} (PrIII) produced by a low-energy spark discharge in helium was observed from 2025A to 10716A. The resulting line-list contains about 4,000 entries, some 1600 of which have been classified in an energy level scheme consisting of 118 odd and 130 even levels. Almost all the expected levels of the $4f^3$, $4f^2 5d$, $4f^2 6p$ configurations have been located, as well as some levels of the $4f5d^2$ and $4f^2 6d$ groups. The ground state of the ion was found to be the $^4I_{9/2}$ level of the $4f^3$ configuration. The structure of the $4f^2 6s$ and $4f^2 6p$ groups indicate well developed $J_1 j$-coupling, while the remaining configurations were interpreted in terms of LS-coupling. An ionization potential of 23.2 v was obtained from levels of the 2 member $4f^2 nd$ series. (Contractor's abstract)

THE SPECTRA OF DOUBLY AND TRIPLY IONIZED YTTERBIUM, by B. W. Bryant. Sept. 1961, 50p. incl. diagrs. tables, refs. (Spectroscopic rept. no. 21) (AFOSR-4544) (AF 49(638)535) AD 609419
Unclassified

The emission spectrum of ytterbium was photographed under varied conditions from 600A to 11,000A in order to obtain a complete description of the spectra of the doubly and triply ionized species. The main transition arrays of these species were identified, and where feasible, the analysis carried through. All 41 energy levels, 28 odd and 13 even, belonging to the $4f^{14}$, $4f^{13}5d$, $4f^{13}6s$, $4f^{13}6p$ and $4f^{13}7s$ configurations of YbIII were experimentally determined along with the appropriate quantum numbers. Eleven of 20 possible $4f^{13}6d$ levels and their quantum numbers were also determined. One hundred ninety three lines were classified in the YbIII energy level scheme with an average deviation of ± 0.05 cm^{-1}. All the YbIII levels are supported by intermediate coupling calculations. (Contractor's abstract)

The two $4f^{13}$ levels of YbIV were determined in addition to 20 of a possible 107 $4f^{12}5d$ levels, of which a few are expected to be fortuitous. (Contractor's abstract)

TIME-RESOLVED SPECTRA OF RARE-EARTH IONS, by W. A. Hovis, Jr. [1961] [7]p. incl. diagrs. (AFOSR-J103) [AF 49(638)535] AD 400070 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 52: 649-655, June 1962.

An apparatus has been developed for the study of the afterglow of a rare-earth spark with a time resolution of 0.1 μsec. A hydrogen thyratron controls a rapidly firing spark gap and the spectrum of the afterglow is recorded with pulsed photomultipliers and ratio techniques. Tests with praseodymium have shown that it is possible to separate lines according to the ion of origin for the second, third, and fourth spectra, according to confirmation of origin in the third spectrum of praseodymium, for example, the emission lines of the $4f^2 6p$-$4f^2 6s$ and $4f^2 5d$-$4f^3$ transitions. In the case of the $4f^2 5d$-$4f^3$ transition, some terms of the $4f^2 5d$ configuration are indicated from the more intense lines. The methods developed with praseodymium have been applied to neodymium, and some preliminary results are reported. (Contractor's abstract)

[SINGLE UNIT CORTICAL AND SUBCORTICAL FUNCTION IN UNRESTRAINED ANIMALS] by V. B. Mountcastle. Final technical rept. [1961] [13]p. incl. table. (AFOSR-1691) (AF 49(638)499) AD 267093 Unclassified

A study of the second somatic area of the cerebral cortex in the cat was made using the method of single unit analysis. Cells of the anterior portion of this area possess properties that are lemniscal in nature, resembling those of the first somatic area. Cells of more posterior parts of this area possess properties similar to those of the posterior nuclear group of the thalamus; they are neither mode nor place specific; and auditory and somatic inputs interact upon them. Clear evidence was obtained that the somatic sub-mode of pain projects upon the second somatic area. Part of the study dealt with the design and construction of an automatic data-reducing system for neurophysiological investigations. The system allows automatic measurement of intervals between nerve impulses, preserves the temporal order of the data, labels each interval measured in re its relation to sensory stimuli, and presents data readout ready for computer input. (Contractor's abstract)

AN AUTOMATIC SYSTEM FOR PROCESSING MICRO-ELECTRODE DATA, by E. M. Glaser. [1961] [5]p. incl. diagrs. (AFOSR-64-1078) (AF AFOSR-62-31) AD 441466 Unclassified

Also published in I.R.E. Trans. on Bio-Med. Electronics, v. BME-9: 190-194, July 1962.

A data processing system has been designed and built which converts single unit microelectrode recordings obtained on analog magnetic tape into a punched paper tape record. The conversion process preserves the exact time sequence in which the neurological events occur. The punched paper tape record can be used to obtain hard copy via a "flexowriter" and to punch IBM cards for computation on any one of a number of digital computing machines. It thereby permits detailed study by digital computers of such phenomena as spontaneous activity and adaptive cell processes during and after periods of stimulation. The basic method for obtaining the paper tape record is to slow down the playback of the original tape record by a factor of 50 or 100. This permits continuous analog to digital conversion of the intervals by a compact digital subsystem designed for this purpose. The measurements are encoded and presented to a tape perforator operating at 110 characters/sec. A code character is inserted at the end of each interval measurement to identify the intervals as: stimulus-response, response-response, response-stimulus, stimulus-stimulus. Other uses of this coding symbol are possible. (Contractor's abstract)

UNSTEADY INTERACTION OF A SHOCK WAVE WITH A CELLULAR VORTEX FIELD, by J. E. Werner. [1960] [14]p. incl. diagrs. (AF 18(600)757) Unclassified

Published in Jour. Fluid Mech., v. 10: 195-208, Mar. 1961.

The transient effects generated when a shock wave is suddenly disturbed by a field of cellular vortices have been studied. Both the pressure disturbance on the shock and the local shock velocity are found to be strong functions of the cell geometry. Disturbances are resolved into transient components and sinusoidal components of constant amplitude. The transients are found to die out as $t^{-3/2}$, t being the interaction time, except for one particular case of the cell geometry for which they diminish as $t^{-1/2}$. Furthermore, the analysis indicates that the initial magnitude of the transient components may be quite appreciable in comparison with the sinusoidal component. The theory is extended to treat the convection through the shock of a single column of vortex cells. (Contractor's abstract)

FAR-INFRARED INTERFEROMETRIC MODULATION AT THE JOHNS HOPKINS UNIVERSITY (Abstract), by G. A. Vanasse. [1959] [1]p. [AF 18(600)1307] Unclassified

Presented at Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, June 15-19, 1959.

Published in Spectrochim. Acta, No. 9: 773, 1959.

Interferometric modulation is a technique for obtaining spectral information in the far-infrared region of the spectrum, where detector noise limits the resolution that can be obtained with diffraction gratings. The observations consist of obtaining a plot of the illumination resulting from the interference of 2 coherent beams of radiation as a function of their path difference. The transformation from observed data to spectra is discussed, and the "scanning" function for an interferometric modulator, similar to the diffraction grating "scanning" function is arrived at. The resolving power to be expected from this interferometric technique is shown to be proportional to the maximum path difference between the interfering beams. The lamellar-grating type interferometer and auxiliary apparatus is described. Far-infrared spectra, obtained with the instrument, indicating $\sim (1/4)\ cm^{-1}$ resolution, are presented.

OUTLINE OF A GENERAL THEORY OF INDEX TERMINOLOGY AND INDEXING METHODS, by F. Jonker. Oct. 1961, 1v. incl. diagrs. (AFOSR-1911) (AF 49(638)961) AD 272820 Unclassified

In indexing it is necessary to distinguish between the problem of index terminology, and that of index methods. The former pertains to the choice of terms without regard to any connection between the terms. The latter pertains to connections between terms. The present theory is based upon 2 insights; namely, that all terminology forms a continuum and that all modes of connections between terms form a continuum. It analyzes the problems of index terminology and index methods separately, and then unites them into a 2-dimensional continuum.

SPECTROPHOTOMETRIC DETERMINATION OF KETONES BY BOROHYDRIDE REDUCTION, by I. Lichtenstein and C. A. Reynolds. [1961] [6]p. incl. table. [AF 49(638)472] Unclassified

Published in Trans. Kansas Acad. Sci., v. 64: 315-320, 1961.

This paper presents a method of spectrophotometric determination of ketones based on an adaptation of a borohydride reaction to a simple photometric determination of a wide variety of ketones. The procedure goes as follows: An aliquot of the sample to be determined, in an appropriate solvent, is treated with a large excess of $Na\,BH_4$ (sodium borohydride). The solution is allowed to stand for a while to permit the reaction to proceed. This solution and a blank containing only the sample are then heated to reflux. A comparison of the optical density of the ketone blank solution with that of the reaction solution at the wavelength of maximum absorption of the ketone, λ max, then gives a measure of the concentration of ketone which has disappeared in the latter solution by reaction with borohydride. From this net optical density, the optical density of the ketone blank minus that of the reaction solution at λ max, the concentration of ketone in the sample can be calculated.

ELECTROLYTIC GENERATION OF RADICAL IONS IN AQUEOUS SOLUTION, by L. H. Piette, P. Ludwig, and R. N. Adams. [1961] [2]p. incl. diagr. table. (AFOSR-1596) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)822] and Atomic Energy Commission) Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 3909-3910, Sept. 20, 1961.

This paper reports the successful generation of both cation and anion radicals and especially negative ions from aliphatic nitro compounds in ordinary aqueous solutions. The electrolysis vessel consisted of a rectangular aqueous cell inserted in the cavity of a standard Varian V-4500 EPR spectrometer using 100 kc field modulation. The supporting electrolyte was 0.1 M lithium perchlorate or 0.5 M potassium chloride or acetate buffer. The mono-negative ions of o-, m-, and p-nitroanisole; o-, m-, and p-nitrophenol, p-nitroanisole, p-nitrodimethylaniline and nitrobenzene itself were generated and detected at a mercury pool electrode. It was observed that the radical ions decayed by a first order reaction when the current was turned off. Such a decay strongly suggests reaction with the solvent and not with another ion. The spectra of the mono negative ions of aliphatic nitro compounds show a very strong N^{14} coupling and, in addition, coupling of the unpaired electron with protons on the carbon adjacent to the nitrogen. The widespread feeling that radical anions are too unstable per se to be observed by electrogeneration in aqueous media is rendered untenable by the present studies.

ON THE MOLECULAR BASIS OF SOME CURRENT THEORIES OF DIFFUSION, by R. J. Bearman. [1961] [8]p. incl. refs. (AFOSR-1367) [AF AFOSR-61-7] Unclassified

Also published in Jour. Phys. Chem., v. 65: 1961-1968, Nov. 1961.

The equations of Eyring and his collaborators, of Hartley and Crank, and of Gordon for the concentration dependence of diffusion coefficients in liquid solutions are examined from the point of view of statistical mechanics. Although there are some ambiguities in the original derivations, the equations are basically equivalent and are valid for solutions which are regular. It is shown that the concept of intrinsic diffusion coefficient is unnecessary for the understanding of diffusion processes. (Contractor's abstract)

RATIO OF SELF-DIFFUSION COEFFICIENTS IN LIQUID ARGON-KRYPTON MIXTURES, by R. J. Bearman. [1961] [1]p. incl. table. (AFOSR-2861) [AF AFOSR-61-7] Unclassified

Also published in Jour. Phys. Chem., v. 66: 379, Feb. 1962.

A statistical mechanical theory of diffusion in binary liquid solutions is developed. This theory predicts that the ratio of the self-diffusion coefficients of the 2 species should be in the inverse ratio of their molar volumes, providing that the intermolecular potentials are spherically symmetric and similar, the volumes are additive, and the sizes of the molecules are sufficiently close that radical distribution functions are independent of composition. The published measurements of Cini-Castagnoli and Ricci (Nuovo Cimento, Series X, v. 15: 795, 1960) on self-diffusion data for argon and krypton in pure argon are used with an estimated experimental error of 6%. It was decided to evaluate the molar volume ratios from thermodynamic data in the liquid phase for comparison with the theory and also to re-estimate the atomic radii for comparison with predictions from the Stokes-Einstein equation. Density data for liquid argon exist in the neighborhood of the temperatures utilized in the diffusion experiments. For krypton, values are extrapolated to 90.0°K giving liquid argon at 1.37 g/cc and liquid krypton as 2.61 g/cc. The atomic radius values r of 1.91A for argon and 2.01A for krypton are used. The diameters σ calculated from gas phase properties for argon are used (3.41A); for krypton the diameter depends on whether second virial data or gas phase transport data are used. For this calculation it is averaged between the two. 3.59A. For a third measure of the ratio of the radii, the cube root of the ratio of the molar volumes in the liquid phase is used. It appears that the inverse ratio of the molar volumes agrees with the ratio of diffusion coefficients within experimental error. The 3 reasonable estimates of the inverse ratio of the atomic radii are in substantial agreement and differ from the ratio of the diffusion coefficients by an amount which appears to be slightly beyond experimental error. It is concluded that the data of Cini-Castagnoli and Ricci do provide a verification of the proposed theory.

NONEQUILIBRIUM THERMODYNAMICS OF THE SIMPLE MOVING BOUNDARY EXPERIMENT, by R. J. Bearman. [1961] [5]p. incl. diagrs. (AFOSR-3757) (AF AFOSR-61-7) Unclassified

Also published in Jour. Chem. Phys., v. 36: 2432-2436, May 1, 1962.

The usual equations for the moving boundary experiment are derived from the equations of the thermodynamics of irreversible processes. It is shown that the assumption that the partial molar volumes are constant through the liquid junction is implicit in the Lewis correction for the solvent velocity. The use of the correction has doubtful validity when there are appreciable volume changes upon mixing. (Contractor's abstract)

LIFETIME OF POSITRONS IN LIQUIDS AT HIGH PRESSURE, by R. K. Wilson, P. O. Johnson, and R. Stump. Final rept. [1961] [33]p. incl. diagrs. tables, refs. (AFOSR-1588) (AF AFOSR-60-17) AD 264957 Unclassified

The progress made under this contract is briefly reviewed. The examination of the microscopic nature of a liquid by the use of positronium lifetime is unique in that the positronium lifetime depends on the size of regions of low density whereas x-ray and neutron diffraction depend on where the molecules are most dense. The reversal of the sign of the temperature effect on the lifetime is the most unusual effect observed. Further work

on x-ray diffraction at high pressure on liquids would help in the interpretation of the present results.

INFLUENCE OF PRESSURE ON THE MEAN LIFE-TIME OF POSITRONS IN LIQUIDS (Abstract), by R. Stump. [1961] [1]p. [AF AFOSR-60-17] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phyz. Soc., Series II, v. 6: 240, Apr. 24, 1961.

The mean life of positrons forming positronium has been measured in a number of liquids as a function of pressure and temperature. Liquids used include water, isopropyl alcohol, benzene, and glycerine. Pressure ranged from 1-6000 atm, temperatures from 0° to 300° C. The results may be summarized as follows: the number of positrons in the long lived-component (o-positronium) is essentially independent of pressure, whereas the lifetime decreases linearly with the volume of the liquid.

EFFECTS OF DIFFERENT TYPES OF VASODILATOR MECHANISMS ON VASCULAR TONUS AND ON TRANS-CAPILLARY EXCHANGE OF DIFFUSIBLE MATERIAL IN SKELETAL MUSCLE, by E. M. Renkin and S. Rosell. [1961] [11]p. incl. diagrs. refs. (AFOSR-J464) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)502 and National Institutes of Health) AD 407117 Unclassified

Also published in Acta Physiol. Scand., v. 54: 241-251, 1962.

Pressure-flow curves, representing various states of vascular tonus were obtained in isolated skeletal muscles of dogs and cats perfused with blood at constant flow. The arteriovenous (A-V) extraction of rubidium^{86} was also continuously recorded. Metabolic vasodilatation and vasodilation due to inhibition of the activity in the vasoconstrictor nerves induced a decrease of vascular tonus and an augmented blood-tissue transport. Vasodilatation due to excitation of cholinergic vasodilator nerves produced a decrease in peripheral resistance amounting to about 70% of the decrease caused by metabolic vasodilatation. Vasodilator nerve activity did not produce any consistent change in blood tissue transport. It is considered that vasodilator nerve activity produces an arteriolar dilatation, whereas vasodilatation due to inhibition of vasoconstrictor nerve impulses or followed by muscular contraction induces relaxation of smooth muscles in both arterioles and precapillary sphincters. THE INFLUENCE OF SYMPATHETIC ADRENERGIC VASOCONSTRICTOR NERVES ON TRANSPORT TO DIFFUSIBLE SOLUTES FROM BLOOD TO TISSUES IN SKELETAL MUSCLE, by E. M. Renkin and S. Rosell. [1961] [18]p. incl. diagrs. tables, refs. (AFOSR-J465) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)502, National Institutes of Health, and Swedish National Association against Heart and Chest Diseases) AD 407118 Unclassified

Also published in Acta Physiol. Scand., v. 54: 223-240, 1962.

Arteriovenous (A-V) extraction of rubidium^{86} was continuously recorded in isolated skeletal muscles of dogs and cats perfused with blood at constant flow. In a few experiments, A-V extraction of oxygen was measured also. The sympathetic trunk, still connected to the muscle, was stimulated electrically under various conditions. Excitation of sympathetic adrenergic vasoconstrictor nerves produced an increase in vascular resistance and a decrease in Rb^{86} and O_2 transport. These effects were graded in relation to stimulus frequency, persistent throughout continued stimulation and large enough to be of importance at low, physiological frequencies. The changes in vascular resistance and blood-tissue transport are mechanically independent. Both are mediated by preganglionic fibers of similar properties, but it is not possible to tell if the same or different fibers are involved. The reduction in transport is considered to result mainly from restriction of the number of open capillaries, due to closure of precapillary sphincters, with some contribution from a decrease in the uniformity of circulation through those parts of the capillary network remaining open. ELECTRICAL ACTIVITY AND CELL DENSITY IN THE CLAUSTRO-INSULAR AREA OF THE RABBIT, by P. Valleala. [1961] 61p. incl. illus. diagrs. tables, refs. (AFOSR-2132) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)21, Emil Aaltonen Foundation, and Swedish Institute) Unclassified

Also published in Acta Physiol. Scand., v. 52, Suppl. 152: 1-61, 1961.

In the present investigation the distribution of the spike and slow wave activities was studied with an extracellular microelectrode technique in different layers throughout the entire cortical depth. The spike and slow wave activity was led off with a KCl-filled glass capillary electrode which was inserted in stepwise fashion to different depths in the claustro-insular area of the rabbit. The slow potentials at each electrode position were integrated electronically during fixed intervals of time, and the probability of the appearance of positive spike potentials during the same time periods was estimated. Diagrams of time integral values for the slow wave activity plotted against the probability of appearance of positive spike potentials show a distribution in depth of these 2 types of cortical activity. On the basis of the electrophysiological data obtained, a significant negative correlation was found between the appearance of slow activity and spike potentials both in light and in deep anesthesia. On the basis of the electrophysiological and the histological material the distribution of the spike and slow wave activities was correlated with the density of claustro-insular cells. A positive correlation between spike activity and cell density was found to be highly significant in the animals under deep anesthesia. This positive correlation was non-significant in the animals under light anesthesia. The difference between light and deep anesthesia as regards the distribution of spike activity and slow activity seems not to concern the superficial and deep cortical layers uniformly, since it is found that the large insular pyramidal cells in layer V C did not react to changes in anesthesia as critically as the large claustral cells. On the basis of the results obtained, the dendritic origin of the slow wave activity was discussed.

STUDIES ON THE RELATION BETWEEN THE PIGMENT MIGRATION AND THE SENSITIVITY CHANGES DURING DARK ADAPTATION IN DIURNAL AND NOCTURNAL LEPIDOPTERA, by C. G. Bernhard and D. Ottoson. [1960] [11]p. incl. illus. diagrs. refs. (AFOSR-2852) (AF 51(052)21) AD 275803 Unclassified

Also published in Jour. Gen. Physiol., v. 44: 205-215, Sept. 1960.

The functional significance of the pigment migration in the compound insect eye during dark adaptation has been studied in diurnal and nocturnal Lepidoptera. Measurements of the photomechanical changes were made on sections of eyes which had been dark-adapted for varying periods of time. In some experiments the sensitivity changes during dark adaptation were first determined before the eye was placed in the fixation solution. No change in the position of the retinal pigment occurred in Cerapteryx graminis until the eye had been dark-adapted for about 5 min. The start of the migration was accompanied by the appearance of a break in the dark adaptation curve. During longer periods of dark adaptation the outward movement of the pigment proceeded in parallel with the change in sensitivity, the migration as well as the adaptive process being completed within about 30 min. In the diurnal insects chosen for the present study (Erebia, Argynnis) the positional changes of the retinal pigment were insignificant in comparison with the movement of the distal pigment in Cerapteryx graminis. On the basis of these observations the tentative hypothesis is put forward that the second phase of adaptive change in nocturnal Lepidoptera is mediated by the migration of the retinal pigment while the first phase is assumed to be produced by the resynthesis of some photochemical substance. In diurnal insects which have no appreciable pigment migration the biochemical events alone appear to be responsible for the increase in sensitivity during dark adaptation. (Contractor's abstract)

COMPARATIVE STUDIES ON DARK ADAPTATION IN THE COMPOUND EYES OF NOCTURNAL AND DIURNAL LEPIDOPTERA, by C. G. Bernhard and D. Ottoson. [1960] [9]p. incl. diagrs. refs. (AFOSR-2853) (AF 61-(052)21) Unclassified

Also published in Jour. Gen. Physiol., v. 44: 195-203, Sept. 1960.

A comparative analysis has been carried out of the time course and range of dark adaptation in the compound eyes of some common butterflies and noctuid moths (Lepidoptera). The change in sensitivity of the eye during dark adaptation was determined by measurements of the intensity of illumination necessary to elicit an electrical response of a given magnitude of the eye. It was found that the curve for dark adaptation in the diurnal species was smooth. The range of adaptive change varied in different species but usually did not cover more than 1 to

1.5 log units. In the nocturnal species the dark adaptation was found to proceed in 2 phases. The first phase was usually completed in less than 10 min and covered a range of 1 to 1.5 log units. The second phase was more prolonged and covered a range of 2 to 3 log units. In some of the experiments on nocturnal species the second phase failed to appear. Measurements of the size of the response at different intensities showed that the intensity/amplitude relationship was the same in the light-adapted eye as in the dark-adapted eye. In the nocturnal insects the response of the eye in the light-adapted condition was about 20% of that in the dark-adapted eye, while in diurnal insects it was about 60%. (Contractor's abstract)

THE STRUCTURE OF α-KERATIN, by G. Swanbeck. [1961] [3]p. incl. diagr. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 61-(052)21, National Institutes of Health, and Office of Naval Research) Unclassified

Published in Exper. Cell Research, v. 23: 420-422, Mar. 1961.

A model for the structural arrangements of the protein chains in α-keratin has been proposed on the basis of the differential pattern of porcupine quill tips. The model implies that the protein chains are basically of the α-helix configuration but are supercoiled and packed in 5 concentric layers. The supercoiling in the different layers makes 1 turn in 198A along the axis of the tonofilament. The number of chains in the different layers are 3, 7, 10, 16, and 19. This arrangement that is based on the diffraction pattern gives a diameter of the tonofilament that is in agreement with electron microscopic data.

CORRELATION OF ION EXCHANGE COLUMN WITH MOLECULAR STRUCTURE OF BONE, by D. Carlström. Annual summary rept. no. 1, Nov. 1, 1960-Oct. 31, 1961. Dec. 19, 1961, 2p. (AFOSR-2089) (AF 61(052)-386) AD 272230 Unclassified

During the past year of the contract period, the work on the ultrastructural organization of calcified tissues and related compounds has advanced satisfactorily. Special attention has been paid to the nature of the inorganic salts in bone and teeth and among the unsolved problems in this connection, the question of the state of the carbonate has been most thoroughly investigated. By means of x-ray diffraction the small changes in unit cell dimensions have been studied and these changes have been compared to those in synthetic apatites where certain ions have been replaced by the introduction of foreign ions. Single crystals of mineral apatites containing carbonate groups have for the first time been analyzed with single crystal x-ray methods. The unique collection of carbonate containing apatites has also been investigated with other physical methods such as polarized light microscopy and in some cases also x-ray absorption. Infrared absorption spectra on the whole material have been compared with spectra from a great number of other carbonate containing compounds in order to elucidate the state of the carbonate. A unique interpretation of the data has so far not been possible but it is anticipated that calculations from the single crystal data will give the final answer to the question of the state of the carbonate. Besides this work, minor investigations within the scope of this contract have also been undertaken. A brief description of each is given.

NORADRENALINE RELEASE FROM ISOLATED NERVE GRANULES, by U. S. von Euler and F. Lishajko. [1960] [11]p. incl. diagrs. tables, refs. (AFOSR-1240) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)309 and Swedish Medical Research Council) AD 262056 Unclassified

Also published in Acta Physicl. Scand., v. 51: 193-203, 1961.

Some properties of isolated transmitter granules obtained by high g centrifugation of press juice from bovine

splenic nerves have been studied. Of the total noradrenaline present in the press juice 20-35% was recovered in the sediment. The granules are stable for several hours at + 4°C but rapidly lose their noradrenaline on incubation in isotonic neutral media at 37°C. Noradrenaline is rapidly released even at low temperature at pH 4 and below, and by detergents. Hypo- and hyperosmotic solutions and freezing and thawing had a moderate releasing effect. Acetylcholine, nicotine, serotonin and GABA had no detectable effect on the noradrenaline release from the granules. Nerve granules are more sensitive to temperature than adrenal medullary granules but show higher resistance to freezing and thawing and osmotic changes. (Contractor's abstract)

By the addition of small amounts of ethylene diamine (EDA) to the alkali-ascorbic acid mixture used in the trihydroxyindole (THI) method the discoloration of reaction mixture and instability of fluorescence can be prevented, allowing blanks to maintain their fluorescence values for several hours. The lutines obtained from adrenaline and noradrenaline standards and from alumina eluates are stable over a period of at least 1 hr. Optimal fluorescence values are obtained when the volume of alkali-ascorbic-acid—EDA exceeds the volume of the sample by 1 ml. A proportional increase in fluorescence is observed with sample volumes up to 3 ml. The technique used for estimation of catecholamines in urine and organ extracts is described. The importance of the acidity for the release of catecholamines from conjugates in urine at room temperature is emphasized. (Contractor's abstract)

ADRENALINE EXCRETION DURING RESTING CONDITIONS AND AFTER INSULIN IN ADRENALECTOMIZED HUMAN SUBJECTS, by U. S. von Euler, D. Ikkos, and R. Luft. [1961] [8]p. incl. tables, refs. (AFOSR-2088) (AF 61(052)309) AD 611470 Unclassified

Also published in Acta Endocrinol., v. 38: 441-448, 1961.

The effect of insulin on the urinary excretion of adrenaline was studied in 10 bilaterally adrenalectomized patients receiving cortisone and in 8 healthy volunteers. The resting excretion of adrenaline was the same in both groups. Insulin administration to the adrenalectomized patients led to an increase in adrenaline excretion from the control level (mean ± S.E.) of 2.42 ± 0.33 to 5.01 ± 0.98 ng per min ($P < 0.02$) during the second hr, and 6.61 ± 0.82 ng per min ($P < 0.001$) during the third hr. In the normal subjects the maximum adrenaline excretion (21.7 ± 3.49 ng per min) was observed during the first hr. The response of the blood glucose level to insulin was the same in both groups. It is concluded that extra-adrenal chromaffin cells produce adrenaline and respond to insulin. It is suggested that hypoglycaemia may not be the principal cause of this response. CATECHOLAMINE PRODUCTION AND RELEASE IN EXPOSURE AND ACCLIMATION TO COLD, by J. Leduc. 1961, 101p. incl. diagrs. tables, refs. (AFOSR-2336) [AF 61(052)309] AD 611475 Unclassified

Also published in Acta Physiol. Scand., v. 53, Suppl. 183: 1-101, 1961.

Warm- and cold-acclimated rats could not withstand prolonged exposure to cold after restriction of food. Their catecholamine excretion rapidly attained maximal values and animals died in hypothermia. The same happened with warm-acclimated rats whose insulation has been reduced by removal of the fur. Cold-acclimated clipped rats survived in the cold, but their catecholamine response was much more intense than that of intact cold-acclimated animals. These two series of experiments strongly support the view that acclimation to cold is limited by the finite capacity of the organism to produce and/or secrete sufficient amounts of catecholamines to maintain thermal balance. They also emphasize the necessity for cold-acclimation when conditions are changed. The previous degree of acclimation increases the chances to attain that new state of equilibrium by virtue of an increased sensitivity of cold-acclimated rats to catecholamines, thus extending the time at which the catecholamine production and/or secretion becomes saturated. Finally, the importance of adrenaline as a supplementary hormone of defense against cold is shown by the lower ability that adrenalectomized corticoids maintained rats to support cold exposure under severe conditions. Karolinska Inst. Dept. of Physiology, Stockholm (Sweden).

EFFECT OF RESERPINE ON THE RELEASE OF CATECHOLAMINES FROM ISOLATED NERVE AND CHROMAFFIN CELL GRANULES, by U. S. von Euler and F. Lishajko. [1960] [9]p. incl. diagrs. tables, refs. (AFOSR-2338) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)309 and Swedish Medical Research Council) AD 611296 Unclassified

Also published in Acta Physiol. Scand., v. 52: 137-145, 1961.

In a suspension of bovine splenic nerve granules, reserpine in concentrations of $10^{-8} - 10^{-5}$ M strongly inhibits the spontaneous release of noradrenaline. The catecholamine releasing action of tyramine on nerve granules is unaffected by low concentrations of reserpine, but is almost completely blocked by concentrations of 10^{-5} M. Reserpine is less active as inhibitor on suprarenal medullary granules from the rabbit and still less on cats' medullary granules. The spontaneous release occurs at a lower rate in rabbit's medullary granules than in those from the cat. No difference in the rate of release was found between adrenaline and noradrenaline from the cat's medullary granules. After administration of dopa 100 mg/kg i.v. in the rabbit the rate of release from the medullary granules was greatly enhanced. The possible action of reserpine as enzyme inhibitor is briefly discussed. (Contractor's abstract)

UPTAKE OF CATECHOLAMINES BY ADRENERGIC NERVE GRANULES, by U. S. von Euler and F. Lishajko. [1961] [1]p. (AFOSR-3447) (AF 61(052)309) Unclassified

Also published in Acta Physiol. Scand., v. 53: 196, 1961.

Nerve granules were prepared from bovine splenic nerves and incubated at room temperature and pH 7.0 in isotonic potassium phosphate to which catecholamines had been added in different concentrations. In the presence of 10 μg noradrenaline (NA) per ml in the incubation fluid no spontaneous loss of the granule-bound NA was noted in 60 min at 20°C as against a loss of 67% when the NA concentration was 1 μg/ml or less in the incubation fluid. No loss was observed after incubation even for 120 min in NA 20 μg/ml; with 5 μg/ml NA the loss was 50% during the same time. After previous incubation of the granules for 120 min, causing a depeletion of about 80%, and subsequent incubation for 60 min with NA after sedimentation and resuspension of the granules, an uptake of NA was observed. With 20 μg/ml NA in the incubation fluid the granules were repleted up to 95% of the original amount whereas the controls had lost over 80% of their NA. Reserpine 10 μg/ml did not prevent the uptake of NA by depleted granules. Adrenaline was taken up by nerve granules in similar amounts as NA. The results show that isolated nerve granules can take up catecholamines, which had previously been shown to occur for dopamine in adrenal medullary granules. Assuming similar conditions in vivo as in vitro, it might be hypothesized that while NA is retained in the storage granules when the concentration in the axoplasm is about 10 μg/ml as actually found in vivo, it may be released from the granules at lower extragranular concentrations following NA flux through the axon membrane during nerve stimulation.

STUDIES ON CATECHOLAMINE-CONTAINING GRANULES OF SPECIFIC CELLS IN CYCLOSTOME HEARTS, by G. Bloom, E. Östlund and others. [1961] [34]p. incl. illus. diagrs. tables, refs. (AFOSR-3448) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)309, Public Health Service, and Swedish Medical Research Council) Unclassified

Also published in Acta Physiol. Scand., v. 53, Suppl. 185: 1-34, 1961.

Heart tissue of cyclostomes Petromyzon fluviatilis (lamprey) and Myxine glutinosa (hagfish) contains large amounts of adrenaline and noradrenaline which are characteristically distributed in the different parts of the heart. A combined light and electron microscopical study of the hearts of the 2 cyclostomes has revealed the presence of a large number of specific granular cells similar to those of the adrenal medulla in higher vertebrates. The cell granules which are regarded as storage sites for catecholamines are strongly osmiophilic and have a diam of about 0.15 μ. The specific cells and the

granules are described in detail as well as their appearance after various staining procedures. Isolated granules show properties similar to those of adrenal medullary cells but differ in some respects from those of adrenergic nerves. The distribution of noradrenaline and adrenaline in the different parts of the heart of Myxine and Petromyzon has been verified by chromatographic separation. Only small amounts of other catechol compounds have been found in extracts of these hearts. Tests for 5-HT and histamine in extracts of the cyclostome hearts showed that these amines were not present in significant amounts. Reserpine treatment of the animals causes considerable depletion of the catecholamine stores of the heart. On isolated granules reserpine causes increased release in higher and inhibition of release in lower concentrations. The hearts from reserpine treated animals show only a very weak staining of the granular cells. Cyclostome hearts are almost insensitive to catecholamine but after pretreatment with reserpine a stimulating action of these amines could be demonstrated. (Contractor's abstract)

URINARY EXCRETION OF CATECHOLAMINES IN ENDOTOXIN-INDUCED FEVER IN RABBITS, by N. Serafimov. [1961] [5]p. incl. table, refs. (AFOSR-4174) (AF 61(052)309) Unclassified

Also published in Acta Physiol. Scand., v. 54: 354-358, 1962.

The urinary excretion of adrenaline and noradrenaline has been measured in rabbits after induction of fever with Salmonella Aequi endotoxin (Pyrexal). This treatment greatly increased the adrenaline excretion as compared with the control period. Noradrenaline excretion was only slightly increased. Splanchnectomy prevented the catecholamine release, but not the temperature increase following administration of endotoxin. The increase of catecholamine excretion was considered as a concomitant adreno-medullar response phenomenon to endotoxin, not indispensable for the increase of body temperature. INHIBITION BY GANGLIONIC BLOCKING AGENTS OF THE MOTOR RESPONSE OF THE ISOLATED GUINEA-PIG VAS DEFERENS TO HYPOGASTRIC NERVE STIMULATION, by N. O. Sjöstrand. [1961] [10]p. incl. diagrs. refs. (AFOSR-4175) (AF 61(052)309) Unclassified

Also published in Acta Physiol. Scand., v. 54: 306-315, 1962.

The effect of nerve stimulation was studied on the isolated nerve-vas deferens preparation from the guinea-pig suspended in Tyrode solution to which various drugs were added. Azamethonium, hexamethonium, tetraethylammonium, lobeline and nicotine in ganglionic blocking concentrations inhibited the response to hypogastric nerve stimulation. The block caused by nicotine was generally preceded by a period of potentiation. The other substances produced inhibition without potentiation. The site of action of the ganglionic blocking agents is discussed and it is considered that they may act on (1) a synapse proper, (2) chromaffin cells, or (3) "non-specifically" on the nerve terminals. EFFECT OF SOME DRUGS ON THE RELEASE OF NORADRENALINE FROM ISOLATED NERVE GRANULES, by U. S. von Euler and F. Lishajko. 1961 [8]p. incl. diagrs. refs. (AFOSR-J416) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)309 and Swedish Medical Research Council) AD 427579 Unclassified

Also published in Proc. First Internat'l. Pharmacological Meeting, Stockholm (Sweden) (Aug. 22-25, 1961), New York, Pergamon Press, v. 5: 77-84, 1963.

The rate of spontaneous release of noradrenaline from a suspension of nerve catecholamine storage granules at 20°C, can be readily influenced by a number of drugs. It is noteworthy that autonomic drugs like acetylcholine, nicotine and histamine have no effect in this respect and thus presumably do not exert their action on the granules. Other drugs like reserpine, xylocholine and others have, at least in lower concentrations, an effect which may be regarded as specific and possibly related to the known pharmacodynamical effect of these substances on the transmitter release in vivo. On the other hand it appears probable that the effects, seen on incubation with, for example, reserpine and cocaine in higher concentrations, are to a large part unspecific and presumably of limited significance. ALPHA TYPES OF RELEASE STUDIED IN TENSION-EXTENSION DIAGRAMS FORM CAT'S FORELIMB TRICEPS MUSCLE, by O. Pompeiano. [1960] [26]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)115], Rockefeller Foundation, and Swedish Medical Research Council) Unclassified

Published in Arch. Ital. Biol., v. 98: 92-117, Feb. 20, 1960.

The relation between active tension and extension was observed when stretch was applied at both slow and fast constant rates. This relation tended to be linear. Postbrachial section of the spinal cord, deafferentation of the contralateral forelimb and complete cerebellectomy or bilateral destruction of the fastigial nuclei, made on a background of Sherringtonian rigidity, produced an increase of the tonic stretch reflex. These changes in the slope of the curve were sometimes accompanied by slight lowering of the threshold of the reflex so that the muscle already at zero extension developed some tension. All the effects on the tension-extension curve were present with slow stretch and emphasized by increasing the rate of pull. All varieties of release added to the stretch reflex of the triceps by augmenting gain as judged by the slope of the curve. The effects of postbrachial section of the spinal cord and of cerebellectomy on the tension-extension curves of triceps could also be obtained against a background of pure α rigidity. However, the release of the stretch reflex from cerebellar and spinal cord ascending inhibition is tied to the integrity of the afferent input. In the acutely spinal animal the stretch reflex of the triceps was absent but could be obtained after postbrachial section of the spinal cord or contralateral deafferentation.

The heat of hydrolysis of triethyl aluminum has been measured. A known weight of water vapor was allowed to react with an excess of liquid triethyl aluminum in an isothermal calorimeter at 25°C. The measured heat, $\Delta H = 154.8 \pm 2.0$ kcal/mol, is taken to refer to the reaction

$(C_2H_5)_3Al$ (liq) + $3H_2O$ (g) → $Al(OH)_3$ (amorph) + $3C_2H_6$ (g). The heat of formation $\Delta Hf°[(C_2H_5)_3Al, liq] = -36.5 \pm 5.5$ kcal/mol is calculated. (Contractor's abstract)

PREPARATION OF 2,1,3-BENZOTHIADIAZOLES USING DIMETHYLFORMAMIDE-SULFUR DIOXIDE REAGENT, by W. T. Smith, Jr. and W.-Y. Chen. [1961] [1]p. (AFOSR-1320) (AF 49(638)49) AD 445073
Unclassified

Also published in Jour. Org. Chem., v. 27: 676, 1962.

The use of solutions of sulfur dioxide in dimethylformamide in place of sulfurous acid was investigated and found to be a convenient method for preparing 2,1,3-benzothiadiazole, 5-methyl- and 5-chloro-2,1,3-benzothiadiazole and 2', 3'-naphtho-2,1,3-thiadiazole in yields of 15-40%. While the yields are not high, the method has the convenience of being carried out in ordinary, open apparatus at temperatures of 70-115° and of being easy to work up. From 3,3'-diamino-benzidine no bis-2.1,3-benzothiadiazole was obtained but 5-(3', 4'-diaminophenyl)-2,1,3-benzothiadiazole was isolated in 2.5% yield. This compound is of particular interest since it represents an important type of starting material for preparing certain heterocyclic analogs of steroids. (Contractor's abstract)

Phenyl-N-sulfinylhydrazines were prepared by the reaction of phenylhydrazines with thionyl chloride, with sulfur dioxide in benzene, and with N-sulfinylaniline. It is found that a solution of sulfur dioxide in dimethylformamide provides a convenient reagent for the preparation of these compounds. The method is simple and direct

and is used to prepare phenyl-, 4-carboxyphenyl-, 2- and 4-nitrophenyl-, and 4-bromophenyl-N-sulfinylhydrazines in yields of 16—55%. The phenylhydrazine (2.2 g, 0.02 mol) and 60 ml of a saturated solution of sulfur dioxide in dimethylformamide are placed in a flask fitted with stirrer, condenser and calcium chloride tube. The solution is heated at 75—80° for 5 hr, cooled, diluted with 30 ml of benzene and sufficient water to give 2 layers. The benzene is separated and the aqueous layer is extracted with 2 additional 30 ml portions of benzene. The combined benzene extracts are washed with water and evaporated to dryness to give 1.7 g (55%) of product, m p 104-106°.

IN VITRO PRETREATED GUINEA PIG THYROID ASSAY, by C. Fortier and W. J. Schindler. [1960] [23]p. incl. illus. diagrs. tables. (AFOSR-J701) (AF AFOSR-61-15) Unclassified

Presented at First Internat'l. Congress of Endocrinology, Copenhagen (Denmark), July 1960.

Also published in Proc. Conf. on Thyrotropin, Arden House, Harriman, N. Y. (1962), Springfield, Charles C. Thomas, 1962, p. 258-273.

This project was aimed at finding a parameter of in vitro thyroid function suitable for thyrotropin assay. To summarize, uptake or organic binding of I-131 by incubated thyroid segments from the thyroxine-pretreated guinea pig provides the basis for a simple, specific and accurate assay for thyrotropin, particularly well suited for work with pituitary extracts. However, its low sensitivity (0.64 mu/10 mg of incubated tissue) and the small allowable volume (0.2 ml) of the material to be tested preclude its utilization with blood, unless it first be fractionated by an appropriate procedure. Further work with this system or a modification thereof involving a different medium and a longer period of incubation, and resulting in greater sensitivity, revealed, in addition to considerable differences in the responsitivity to TSH of guinea pigs obtained from various breeders, the presence of a factor, as yet unidentified, in hypophysectomized rat serum or plasma which, though inactive by itself, markedly influences the PBI^{131} response to TSH.

ON THE QUANTUM STATISTICAL BASIS OF NON-EQUILIBRIUM THERMODYNAMICS. I, by J. Vlieger, P. Mazur, and S. R. de Groot. [1960] [20]p. incl. refs. (AFOSR-1040) (AF 61(052)16) AD 262070 Unclassified

Also published in Physica, v. 27: 353-372, Apr. 1961.

The quantum statistical theory of Wigner distribution functions is developed to serve as a basis for the derivation of the Onsager reciprocal relations in non-equilibrium thermodynamics. The theory is closely analogous to the classical treatment, given by de Groot and Mazur. The present paper is concerned with the following topics: (1) Time dependence of Wigner distribution functions, which is described by means of a propagator. The properties of this propagator are studied. (2) Equilibrium distribution function of a set of extensive state variables, which provide a macroscopic description of the system, assuming that these variables are represented by commuting operators in quantum theory. This probability distribution function is expressed in terms of the Wigner distribution function of the microcanonical ensemble, representing thermodynamic equilibrium. The properties of distribution functions of extensive variables, in particular those with regard to the even or odd character of these variables, are studied. (3) Definition of a set of intensive thermodynamic variables, conjugate to the extensive state variables, by means of Boltzmann's entropy postulate. The theory is developed in the present paper only for Maxwell-Boltzmann statistics.

RESEARCH ON STATISTICAL MECHANICS AND THERMODYNAMICS OF IRREVERSIBLE PROCESSES, by S. R. de Groot. Annual summary rept. no. 1, June 1, 1960 - May 31, 1961. June 22, 1961, 6p. (AFOSR-1041) (AF 61(052)16) Unclassified

A summary of the investigations conducted under this contract are reviewed. The investigations involved 2 problems: properties of the Wigner distribution function and statistical mechanics of irreversible processes: chemical kinetics. The quantum statistical theory of Wigner distribution functions is developed to serve as a basis for the derivation of the Onsager reciprocal relations in non-equilibrium thermodynamics. The properties of ordinary Wigner distribution functions and their propagations and the equilibrium distribution function of a set of extensive state variables are discussed. It is shown that joint equilibrium distribution functions, which do not in general represent a probability, are joint probabilities, if the set of quantum mechanical operators, which correspond to the extensive state variables, is of a special class. The purpose of the statistical mechanics of irreversible processes study is the formulation of some deductions from a formal theory of chemical kinetics for homogeneous, bimolecular gas phase reactions. The model adopted consists of an iso-thermal ideal gas phase in which a chemical reaction as well as its reverse reaction proceeds. It is shown that the zeroth order solution leads to the usual phenomenological

rate expression with a rate coefficient independent of time or affinity, and hence to the law of mass action. Higher order solutions, however, introduce an affinity and time dependence in the rate coefficient and the law of mass action becomes inadequate to the extent of the contribution of the effects of the perturbations. Similar results are obtained for reacting systems with internal degrees of freedom. The entropy production for chemically reacting systems to the various orders of the perturbation solution is derived.

ON THE QUANTUM STATISTICAL BASIS OF NON-EQUILIBRIUM THERMODYNAMICS. II, by J. Vlieger, P. Mazur, and S. R. de Groot. [1961] [17]p. (AFOSR-1847) [AF 61(052)16] AD 456583 Unclassified

Also published in Physica, v. 27: 957-973, Oct. 1961.

The quantum statistical theory of Wigner distribution functions, presented in the previous paper (item no. 1300, Vol. V) on the foundations of non-equilibrium thermodynamics, is used in order to develop the theory of "joint Wigner distribution functions," which may be employed for the calculation of quantum mechanical correlation functions. The joint equilibrium distribution function of a set of extensive state variables is defined. This distribution function is expressed in terms of the joint Wigner distribution function of the micro-canonical ensemble. The properties of joint equilibrium distribution functions of extensive variables, in particular the so-called property of detailed balance are studied. It is shown that joint equilibrium distribution functions, which in general do not represent a probability, are joint probabilities, if the set of quantum mechanical operators, corresponding to the extensive state variables, is of a certain class. The theory of distribution functions of extensive state variables thus obtained, which is formally the same as developed previously on the basis of classical statistical mechanics, is used for the derivation of the Onsager reciprocal relations in non-equilibrium thermodynamics. The theory is developed in the present paper for Maxwell-Boltzmann statistics. (Contractor's abstract)

AIR FORCE SCIENTIFIC RESEARCH BIBLIOGRAPHY. Vol. I: 1950-1956, by G. V. Hooker, M. H. Duffner and others. 1961, 1150p. incl. refs. (AFOSR-700) (ISSA-60-4) AD 265450 Unclassified

This bibliography includes abstracts of all publications supported in whole or in part by the Air Force Office of Scientific Research during the period 1954 through 1956. It also includes all earlier reports supported by AFOSR or its anlage found during this search back through 1950. The Air Force Office of Scientific Research supports fundamental research in the five major scientific disciplines: physics, chemistry, engineering sciences (subsuming mechanics and propulsion), life sciences (both biological and behavioral, but not medical), and mathematics. References, reports, and clues to the existence of reports were found by searching the indexes and report collections of the AFOSR Technical Library, and the Armed Services Technical Information Agency. Reports are posted chronologically and/or alphabetically under contracts, these in turn under laboratories, and these under contractors. The abstracts are coded for future machine searching. A detailed subject index, arranged alphabetically, is provided. Because of the high percentage of mathematical papers included in this volume, a separate mathematical classification is included. In addition to the subject indexes, a contract index, an AFOSR control number index, and a personal author index are provided.

ASYMPTOTIC BEHAVIOR OF THE SPECTRAL MATRIX OF THE OPERATOR OF ELASTICITY, by F. J. Bureau and E. J. Pellicciaro. Jan. 1961, 30p. incl. refs. (Technical scientific note no. 5) (AFOSR-296) (In cooperation with Delaware U.) (AF 61(052)-86) AD 258240 Unclassified

Presented at meeting of the Amer. Math. Soc., Washington, D. C., Jan. 23-26, 1961.

Also published in Jour. Soc. Indus. and Appl. Math., v. 10: 1-18, Mar. 1962.

Let the operator $Mu = -b^2 \text{ grad (div } v) + a^2 \text{ rot(rot } v)$ be applied to smooth vector functions $v(x) = [v_1(x), v_2(x), v_3(x)]$ which vanish on the boundary of a regular region in 3-space. Let $0 < \lambda_1 \leq \lambda_2 \leq \ldots$ be the eigenvalues, and $v(x, \lambda_k)$ the eigenvectors of the boundary-value problem $Mv = \lambda v$. The spectral function is

$\psi(x, \lambda) = \Sigma\, v(x, \lambda_k) \cdot v(x, \lambda_k)$, summed over all eigenvalues $< \lambda$, and normalized by $2\psi(x, \lambda) = \psi(x, \lambda - 0) + \psi(x, \lambda + 0)$. Bureau has obtained the asymptotic behavior of the spectral function of an elliptic vector operator M, using a knowledge of the solution of the Cauchy problem for the related hyperbolic equation $\partial^2 u/\partial t^2 = Mu$ (item no. 855, Vol. III). In the present work this method is applied to the specific operator M defined above. For this operator the Cauchy problem has an explicit solution. The main result is that

$$\psi(x, \lambda) \sim \frac{1}{6\pi^2} \left(\frac{2}{a^3} + \frac{1}{b^3}\right) \lambda^{3/2}.$$ (Math. Rev. abstract)

Liège U. (Belgium).

RESEARCH IN HYPERBOLIC DIFFERENTIAL EQUATIONS, by F. J. Bureau. Annual summary rept. no. 3, Mar. 15, 1961, 4p. (AFOSR-799) (AF 61 (052)86) AD 258235 Unclassified

The following problems are studied during the period of Mar. 15, 1960 to Mar. 14, 1961: (1) Investigate the Cauchy problem for partial differential equations of order $n > 2$ and $p > 2$ independent variables. In particular, consideration is given to linear operators connected with integrals otherwise divergent. (2) investigate boundary value problems for totally hyperbolic equations in several independent variables. (3) Investigate problems which are not specifically described in (1) and (2) above, but are suggested by and related to the research conducted under this contract. Two technical reports were issued (see item nos. 1097 and 1099, Vol. IV). A third report is also published in this period (see item no. 1305, Vol. V). The results obtained are summarized.

1308

Liège U. (Belgium).

ASYMPTOTIC REPRESENTATION OF THE SPECTRAL FUNCTION OF SELF-ADJOINT ELLIPTIC OPERATORS OF THE SECOND ORDER WITH VARIABLE COEFFICIENTS. II, by F. J. Bureau. Nov. 1961, 17p. incl. refs. (Technical scientific note no. 7) (AFOSR-1874) (AF 61(052)86) AD 272014 Unclassified

Also published in Jour. Math. Anal. and Appl., v. 4: 181-192, 1962.

The results of the previous paper (see item no. 855, Vol. III) are extended. The following expression of the asymptotic behavior of $\theta(x, x; \lambda)$ is improved:

$$\theta(x, x; \lambda) = \frac{A(x)}{\pi^{p/2} 2^p \Gamma(1/2p + 1)} \lambda^{p/2}[1 + R(\lambda)],$$ where

$R(\lambda) = 0(1/\log)$, when $L = \Delta$, $R(\lambda) = 0(\lambda^{-1/2})$.

EFFECT OF GAMMA AND NEUTRON RADIATION UPON MOLECULAR AND IONIC CRYSTALS BY PURE NUCLEAR QUADRUPOLE SPECTROSCOPY, by J. Duchesne. [1958] [4]p. incl. table, refs. (AFOSR-5124) (AF 61(514)1212) AD 413648 Unclassified

Also published in Proc. Second United Nations Geneva Conf., Geneva (Switzerland) (Sept. 1958), London, Pergamon Press, [1958] p. 348-351.

Nuclear quadrupole spectroscopy is used to determine the effect of gamma and neutron radiation upon p-dibromobenzene, $NaClO_3$, $CHI_3 \cdot 3S_8$, and other benzene derivatives. It is found that halogen derivatives of the same species are much more resistant to radiation damage in the case of aromatic compounds than in that of allphatic compounds upon being exposed to gamma radiation of Co^{60}. Iodoform exhibits a high resistance to damage and it is believed that the sulfur might act as a shield. The resistance of aromatic compounds is attributed to the delocalization properties of their π electrons and geometric symmetry. In comparing the quantities of energy necessary to reduce the intensity of the quadrupole line corresponding to Cl^{35} by 40% either by gamma or neutron irradiation it is found that the latter is more efficient in producing damage. Irradiation of $CHI_3 \cdot 3S_8$ by Co^{60} in the presence of oxygen produces a resonance line, the intensity of which is practically time invariant

NUCLEAR QUADRUPOLE RESONANCE IN IRRADIATED CRYSTALS AND IN A SEMI-CONDUCTOR. ORIGIN OF FREE RADICALS IN CARBONACEOUS ROCKS, by J. Duchesne, M. Read and others. Final technical rept. Jan. 15, 1961, 49p. incl. diagrs. tables, refs. (AFOSR-416) (AF 61(052)167) AD 254956 Unclassified

Part I: The intensity decrease of quadrupole lines is used as a method for the study of the damage induced by high energy radiation in solid matter. The method is successfully applied to a semi-conductor and, by the study of $AsBr_3$, the results have been shown to be independent of the nucleus, the line of which is chosen for the measurement. Thermally treated irradiated compounds, which are thereafter re-irradiated, are especially considered; the origin of radioprotection phenomena and the behavior of the interactions between centers perturbed by irradiation are studied further. A generalization is proposed for this method by substituting the study of solid solutions for that of pure compounds, thus allowing the determination of radioresistance of any compound inclusive of the polymers. Part II: The problem of the genesis of free radicals encountered in coals, lignites, peats and petroleum is analyzed. Two hypotheses concerned with the botanical origin and the effect of natural radioactivity are put forward. (Contractor's abstract)

ORIGIN OF FREE RADICALS IN CARBONACEOUS ROCKS, by J. Duchesne, J. Depireux, and J. M. van der Kaa. [1960] [10]p. incl. diagrs. table, refs. (AFOSR-J669) (AF 61(052)167) AD 415402 Unclassified

Also published in Geochim. et Cosmochim. Acta, v. 23: 209-218, May 1961.

The problem of the genesis of free radicals encountered in coals, lignites, peats and petroleum is analyzed. Two hypotheses concerned with the botanical origin and the effect of natural radioactivity are put forward. Whereas the former is able to give account of the facts for peats, the latter, combined with the geothermal hypothesis, allows us to afford a general solution for this problem. RESEARCH ON COMPARISON OF CELL ACTIVITY IN DIFFERENT BRAIN STRUCTURES, by J. D. Schlag. Final technical rept. Nov. 20, 1961 [40]p. incl. diagrs. table, refs. (AFOSR-2013) (AF 61(052)22) AD 272372 Unclassified

Reticular neurons never display grouped discharges related to spindles, but they respond to thalamic recruiting stimuli. Thalamoreticular connections are demonstrated. EEG arousal elicited by stimulation of thalamic unspecific nuclei must be mediated by the reticular formation. The notion of a thalamic reticular system is discussed. (Contractor's abstract)

THALAMIC RETICULAR SYSTEM AND CORTICAL AROUSAL, by J. D. Schlag, F. Chaillet, and J.-P. Herzet. [1961] [2]p. incl. diagr. (AFOSR-2620) [AF 61(052)22] Unclassified

Also published in Science, v. 134: 1691-1692, Nov. 17, 1961.

By electrocoagulation of the thalamic posterior commissure, the electroencephalographic arousal by high frequency stimulation of the thalamic unspecified nuclei was prevented, whereas the synchronizing influence on the cerebral cortex remained intact. On this ground, the role of the thalamic reticular system in the control of the cerebral rhythms is discussed. It is indicated that the unspecified thalamic system is mainly or solely concerned with the production of slow cortical activity. It is also suggested that the thalamocortical mechanism of synchronization is not frequency-dependent with regard to the modalities of its activation. The results also give direct evidence that the recruiting and arousing systems of the brain are separated functional units.

RECRUITING RESPONSES IN THE BRAIN STEM RETICULAR FORMATION, by J. [D.] Schlag and J. Faidherbe. [1961] [28]p. incl. illus. diagrs. refs. (AF 61(052)22) Unclassified

Published in Arch. Ital. Biol., v. 99: 135-162, Apr. 1961.

Experiments were performed in order to analyze the properties of recruiting responses induced in the mesencephalic and bulbar reticular formation by a repetitive stimulation of the unspecific thalamic nuclei, in unanesthetized cats. Classical requirements (pattern organization, latency, optimum frequency of stimulation, sites of stimulation) were fulfilled to permit the identification of the reticular responses as a typical recruitment phenomenon. A clear-cut distinction was made with other repetitive responses having a different significance. Evidence was afforded that the cerebral cortex is not necessarily implicated in the transmission of the recruiting impulses from the thalamus to the brain stem. On the contrary selective coagulations inside the thalamus tended to demonstrate that the pathway of conduction is a direct one, passing at the level of the upper portion of the center median. Microelectrode recordings from mesencephalic and bulbar units showed very complex patterns of responses which were described in detail. A study of the convergence of thalamic and somesthetic impulses on reticular neurons discloses some properties of such an interaction. Lastly, the occurrence of recruiting responses in the mesencephalic reticular formation was compared with the slightness of spontaneous spindle bursts in the mesencephalon, under the conditions of these experiments. EXPERIMENTAL INVESTIGATION OF DETONATION IN UNCONFINED GASEOUS HYDROGEN-OXYGEN-NITROGEN MIXTURES, by L. H. Cassutt. [1960] [7]p. incl. diagrs. (AF 18(600)1687) Unclassified

Published in ARS Jour., v. 31: 1122-1128, Aug. 1961.

An experimental program has been conducted to determine the detonability of unconfined hydrogen-oxygen-nitrogen mixtures during venting of a missile employing liquid hydrogen as a fuel or during an accidental spill from a storage or missile propellant tank. The mixtures investigated ranged from those formed by hydrogen combining with air to those in which there is no nitrogen dilution. During the tests, the gaseous mixtures were contained in 100-cu ft latex balloons; and upon initiation, measurements were made of the resulting peak overpressures. Initiation was accomplished by ignitors varying in strength from electric sparks to 100-gm explosive charges. The results of the experimental program have demonstrated that any mixture capable of sustaining a stable detonation wave when confined in a tube will detonate under unconfined conditions if the initiating impulse is sufficiently intense. For many hydrogen-oxygen compositions with no nitrogen dilution, initiation by a spark or flame source can produce full deotnation. For hydrogen-air mixtures, detonation requires initiation by at least a 2-gm explosive charge.

THE IGNITION OF GASES BY ELECTRICALLY HEATED WIRES, by L. E. Ashman and A. Büchler. [1960] [9]p. incl. illus. diagrs. tables, refs. (AF 18-(603)109) Unclassified

Published in Combustion and Flame, v. 5: 113-121, June 1961.

Experimental studies have been conducted on the ignition of gases with constant temperature wire ignition sources. The wire is heated to the desired temperature in a period of microseconds by means of a condenser discharge. Thereafter, its temperature is maintained constant by a unique feedback control circuit, incorporating a photomultiplier tube that monitors radiation from the center of the wire. With this apparatus experimental studies of ignition temperature and ignition delay have been made on stoichiometric methane-air and hydrogen-air mixtures. With the methane-air mixture, an exothermic reaction occurs during the pre-ignition period. This pre-ignition reaction occurs at a velocity and for a period of time that depend upon the temperature of the wire. Near the end of this pre-ignition period, the reaction accelerates to a more rapidly propagating flame front. In the hydrogen-air mixture, on the other hand, no measurable reaction occurs during the pre-ignition period. The behavior of the hydrogen-air ignition conforms to the theory of Semenov on the ignition of gases by small ignition sources. The methane-air ignition properties do not conform to the theory, possibly because the ignition temperature is sufficiently high in the presence of small sources for the corresponding high reaction rate to reduce significantly the concentration of reactants near the source. Some effects of wire size, wire composition and gas pressure on the ignition delay have been investigated for the hydrogen-air mixture. For a given wire temperature, the ignition delay increases when either the diameter of the wire or the gas pressure is reduced. The magnitude of this reduction in ignition delay agrees, at least to a first approximation, with theoretical considerations of the effect of wire size and gas pressure on ignition delay. EXPERIMENTAL RESULTS CONCERNING THE ELECTROMAGNETIC ACCELERATION OF PLASMA TOROIDS (Abstract), by A. S. Penfold. [1961] [1]p. (Bound with its AFOSR-582; AD 257892) (AF 49(638)-579) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

Plasma toroids have been formed and accelerated (perpendicular to the plane of the toroids) to velocities of about 1.2×10^7 cm/sec. The velocity measurements were made with a 22 kmc microwave doppler system. The toroids emerge from the accelerator structure into a field-free region where the diagnostic measurements are made. The undisturbed flight time through the diagnostic region was as long as 1.5 msec, and during this time the toroids did not appear to suffer instability break-up. The ambient pressure in the diagnostic region was about 3×10^{-5} mm Hg. Most of the data is for nitrogen gas, but some has also been obtained for hydrogen and argon. A one-turn magnetic pick-up coil was placed on the axis of the accelerator to detect the self magnetic field of the toroids. The strength and shape of the signals from the pickup coil determined that: (1) the toroids have strong ring currents flowing in them, (2) the ring currents are sometimes right-handed and sometimes left-handed, and (3) the ring currents are at least as large as several hundred amp. Photographic evidence indicates that the toroids are structures whose minor diameter is determined by the pinch effect. A 10-msec Kerr cell shutter was used to obtain information about the behavior of the toroids in the diagnostic region of the machine. The Kerr cell photographs show that several toroids are formed by the machine for each firing.

ON THE ANALYSIS OF LINEAR PYROLYSIS EXPERIMENTS, by W. Nachbar and F. A. Williams. June 1961 [41]p. incl. diagrs. refs. (Rept. no. LMSD-3-64-61-1) (AFOSR-683) (AF 49(638)412) AD 260379 Unclassified

Part I also published in Ninth Symposium (Internat'l.) on Combustion, Cornell U., Ithaca, N. Y. (Aug. 27-Sept. 1, 1962), New York, Academic Press, 1963, p. 345-357.

Part 1—A Modified Linear Pyrolysis Experiment: A linear pyrolysis experiment utilizing a heated porous plate is proposed and analyzed. Simple and chain-like surface gasification processes are defined and discussed. The conditions under which the surface process is a rate process or 1 of near equilibrium are determined in the general case and for chainlike processes. It is shown that pyrolysis measurements yield the forward gasification rate in the limit of a surface rate process and the equilibrium vapor pressure in the limit of surface equilibrium. The pyrolysis rate of potassium chloride is calculated. Part 2—Remarks on the Interpretation of Pyrolysis Experiments on Ammonia Salts: Previous interpretations by other investigators of linear pyrolysis rate measurements for NH_4Cl, NH_4NO_3 and NH_4ClO_4, assumed that the surface process is an unopposed rate process. An alternative interpretation of pyrolysis experiments is presented which may be valid even when the surface process is near equilibrium. Features of Part 1 are employed to demonstrate that the difference between the plate temperature and the surface temperature of the solid may be large enough to affect seriously the activation energies which were calculated from the previous linear pyroly data. PROGRESS IN THE THEORY OF COMPOSITE PROPELLANT BURNING (Abstract), by W. Nachbar. [1961] [1]p. [AF 49(638)412] Unclassified

Presented at Third AFOSR Contractors meeting on Combustion of Solid Propellants, Utah U., Salt Lake City, Jan. 30-31, 1961. (AFOSR-986)

The theory of steady laminar flames with normal diffusion is being applied to construct an analytical combustion model for solid propellants having essential features of the composite propellant. For purposes of a particular application to the theory of a 2-dimensional sandwich propellant having a monopropellant oxidizer, properties of solutions of the equations governing nonadiabatic, linear deflagration of solid propellant have been studied in detail. Some new results of these studies are presented which relate to predicted behavior of burning rates and pressure deflagration limits in linear monopropellant deflagration under energy addition and losses, non-equilibrium surface conditions, and incomplete combustion.

LEARNING AND DISCRIMINATION IN THE OCTOPUS, by J. Z. Young. [1960] [65]p. incl. diagrs. tables,

refs. (AFOSR-2939) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)256] and Nuffield Foundation) Unclassified

Also published in Biol. Rev. Cambridge Philos. Soc., v. 36: 32-96, Feb. 1961.

Experimental techniques used to set up representations of learning processes that promote or prevent attack by octopus are described. The results are summarized in the following categories: (1) Visual responses and the mechanism of visual discrimination with respect to untrained animals; effects of feeding on tendency to attack, representations that prevent attack, visual discrimination, the dimensions used for shape discrimination, visual discrimination after statocyst removal, and anatomical signs of vertical and horizontal organization in the visual system; (2) Chemi-tactile discrimination learning with respect to the anatomy of its learning system; its tactile responses after section of optic nerves and removal of optic lobes, to accept edible and reject inedible objects, chemical and tactile discrimination, and effects of removal of the inferior frontal and subfrontal lobes. (3) Effects of removal of the vertical lobes with regard to the anatomy of the vertical lobe system; changes in behavior to visual stimuli after vertical lobe removal, learning discrimination between figures after vertical lobe removal, accuracy of performance as a function of amount of vertical lobe tissue, tactile discrimination after vertical lobe removal, and reversal of responses with and without vertical lobes.

EVIDENCE FOR THE INTRAOCULAR DISCRIMINATION OF VERTICALLY AND HORIZONTALLY POLARIZED LIGHT BY OCTOPUS, by M. F. Moody. [1961] [10]p. incl. illus. diagrs. table, refs. (AFOSR-2990) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)256] and Nuffield Foundation) Unclassified

Also published in Jour. Exper. Biol., v. 39: 21-30, Mar. 1962.

Four octopus groups (3 each) were trained to discriminate between vertically and horizontally plane-polarized light. Two different sources of polarized light were used: a torch, and a disk of polaroid backed by white plastic. Half the octopuses were trained using the former source, and half using the latter. With each polarized light source, discrimination could be based on a reflection or scattering pattern, but the extra-ocular cues would be different for the 2 sources. After training, each octopus was shown, without reward or punishment, the polarized light source with which it was not trained. The aggregate score shows efficient transfer, and 3 of the 4 groups showed a significant preference for the new source when the plane of polarization was the same as that which they were trained to attack. It is concluded that the discrimination is not based on extra-ocular patterns, i.e., that the analysis of the polarized light occurs within the octopus's eye. (Contractor's abstract)

THE DISCRIMINATION OF POLARIZED LIGHT BY OCTOPUS; A BEHAVIOURAL AND MORPHOLOGICAL STUDY, by M. F. Moody and J. R. Parriss. [1960] [24]p. incl. illus. diagrs. tables, refs. (AFOSR-2991) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)256] and Nuffield Foundation) Unclassified

Also published in Zeitschr. vergleichende Physiol., v. 44: 268-291, 1961.

Groups of octopuses were trained to discriminate between different directions of the electric vector of plane polarized light. Discrimination was shown between vertical and horizontal and 45° and 135° oblique directions of the electric vector. The discriminations probably involve specialized retinal photoreceptors. Theoretical reasons are given for supposing that the rhabdomere tubules show dichroism.

THE RETINA OF CEPHALOPODS AND ITS DEGENERATION AFTER OPTIC NERVE SECTION, by J. Z. Young. [1961] [18]p. incl. illus. diagrs. table, refs. (AFOSR-2992a) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)256] and Nuffield Foundation) Unclassified

Also published in Philos. Trans. Roy. Soc. London, v. 245B: 1-18, 1962.

Each retinal cell of octopus carries a rhabdomere on 2 opposite faces. Rhabdomeres from 4 cells combine to make a square rhabdome. The cells are mainly arranged with their axes in approximately either the vertical or horizontal plane as the eye is usually held in the head. After severing the optic nerves to any region of the retina all the retinal cells undergo retrograde degeneration, leaving only the supporting cells intact. The retinal nerve plexus disappears almost completely, but a few fibers remain. At the boundary between a region with severed and intact nerves the plexus continues for some distance into the denervated region. After removal of all the optic lobe except a portion of its outermost (plexiform) zone the retinal receptors do not degenerate completely but are reduced in length. Their axons have not been interrupted by the operation and this is therefore a partial transneuronal retrograde degeneration. (Contractor's abstract in part)

THE OPTIC LOBES OF OCTOPUS VULGARIS, by J. Z. Young. [1961] [48]p. incl. illus. diagrs.

tables. refs. (AFOSR-2992) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61-(052)256] and Nuffield Foundation) Unclassified

Also published in Philos. Trans. Roy. Soc. London, v. 245B: 19-58, 1962.

The optic lobes provide a system for coding the visual input, for storing a record of it and for decoding to produce particular motor responses. There are at least 3 types of optic nerve fibers ending at different depths in the layered dendritic systems of the plexiform zone. The optic nerve fibers meet the branches of at least 4 types of cells. (1) Centripetal cells passing excitation inwards. (2) Numerous amacrine cells, with cone-shaped dendritic fields but no determinable axon. (3) Centrifugal cells conducting back to the retina. (4) Commissural fibers from the opposite optic lobe, and other afferents. After section of the optic nerves the plexiform layer of the corresponding part of the optic lobe becomes reduced, but the tangential layers of dendrites remain. There is a reduction in the thickness of the layers of amacrine and other cells and a shrinkage of the whole lobe. Conversely the tangential layers can be degenerated, leaving the optic nerve fibers, by serving the arteries to the optic lobe. It is suggested that the variety of shapes of the dendritic trees within the optic lobes provides the elements of the coding system by which visual input is classified. HOW CAN THE MEMORY OF THE NERVOUS SYSTEM BE STUDIED? by J. Z. Young. [1961] [19]p. incl. diagrs. refs. (AFOSR-J1054) (AF EOAR-61-39) Unclassified

Also published in Experimental Methods in Biology from Vallisnori to Today, Symposium on Tri-Centennial of the Birth of Antonio Vallisnori, Padova (Italy) (1961), Padova, Societa Cooperativa Topografica, 1962, p. 1-21.

Part of this paper is concerned with the location of the memory within the nervous system of octopuses. From certain experiments it was concluded that the actual representation that constitutes a record of the outcome of past visual events is stored in the optic lobes of the animal, whereas the tactile experience is stored in the inferior frontal lobe. An octopus records relevant features of the visual input by a type of coding and storage in which he makes a selection among a pre-arranged set, which may be called a code or language and which allows the octopus to respond to a particular feature of a situation. A hypothesis is suggested to correlate this assumption to the fact that the dendrites of cells at the surface of the optic lobes do not run at random in all directions; they tend to run nearly straight for long distances. The rest of the paper is devoted to a detailed study of the lobes themselves and their physiological role in the memory system.

d-ORBITALS IN SOME CHEMICAL BONDS, by D. P. Craig and C. Zauli. Final rept. Jan. 1, 1959-Dec. 31, 1960. Jan. 31, 1961, 110p. incl. diagrs. tables. (AFOSR-653) (AF 61(052)61) AD 258970 Unclassified

It has been generally accepted that elements of the second row of the periodic table, such as S and P, expand the octet in certain of their compounds, and that 3d orbitals are used in the bonds. It has been suggested that the ligand field can produce a contraction of the 3d orbitals to a size compatible with the formation of strong spd hybrids, and the proposal was supported by calculations in which the ligands were represented by positive point charges. The problem of the perturbation of d orbitals by various ligand atoms was examined. Electrostatic potentials were calculated for H, C, F, and Cl atoms, and used in a calculation of the perturbing effect of the atoms on the 3d electrons. Optimum parameters have been found for the 3d electrons, and values found for the electrostatic terms in the total energy. The perturbing effect of C towards second row elements, as for example in $-CH_3$, is unexpectedly strong, comparable to that of Cl. On the other hand H has a quite negligible effect. MECHANISM OF BENZIDINE AND SEMIDINE REARRANGEMENTS. PART I. KINETIC DICHOTOMY: KINETICS, SOLVENT-ISOTOPE EFFECT, AND PRODUCTS OF ACID REARRANGEMENT OF 1,1'-HYDRAZONAPHTHALENE, by D. V. Banthorpe, E. D. Hughes, and C. Ingold. [1961] [16]p. incl. diagrs. tables, refs. (AFOSR-64-1806) [AF 61(052)-66] AD 449067 Unclassified

Also published in Jour. Chem. Soc. (London): 2386-2401, June 1962.

The established quadratic dependence on hydrogen-ion concentration of the rate of the acid-catalyzed rearrangements of hydrazobenzene, and of a number of its simpler derivatives, is conceived as characterizing 1 limiting kinetic form of a range of forms belonging to this group of rearrangements as whole. The first example of the anticipated second limit, that involving linear dependence of the rate on hydrogen ions, is established over a range of 10,000 in hydrogen-ion concentration, in the rearrangement of 1,1'-hydrazonaphthalene in 60% aqueous dioxan. The change in kinetic type from the benzene to the naphthalene derivatives is associated with a change in solvent isotopic effect. Replacement of the water in the medium by deuterium oxide accelerates the rearrangement of hydrazobenzene by 4-7 times. It accelerates that of 1,1'-hydrazonaphthalene by only 2-3 times. Both rearrangements are accelerated by salts and by extra

water. There are signs of an incipient change of kinetic form in the rearrangement of 1,1'-hydrazonaphthalene in a much more nearly anhydrous solvent. The rearrangement products are listed and discussed. (Contractor's abstract in part)

MECHANISM OF BENZIDINE AND SEMIDINE REARRANGEMENTS. PART II. KINETICS AND PRODUCTS OF ACID REARRANGEMENT OF 1,2'-HYDRAZONAPHTHALENE, by D. V. Banthorpe and E. D. Hughes. [1961] [5]p. incl. diagrs. tables, refs. (AFOSR-64-1807) [AF 61(052)66] AD 449076 Unclassified

Also published in Jour. Chem. Soc. (London): 2402-2406, June 1962.

1,2'-Hydrazonaphthalene rearranges somewhat more slowly than does the 1,1'-isomer in like conditions in aqueous dioxan at low acidities. However, in "70%" aqueous dioxan in the presence of perchloric acid up to 0·15N, the 1,2'-compound rearranges according to the new rate, i.e., with linear, rather than a quadratic rate-dependence on hydrogen-ion concentration. The products are the ortho-linked primary diamine (I) and the dibenzocarbazole (II). The latter was produced by cyclization of the former, but could not be so produced under the conditions of the experiments in which the 2 compounds were formed together by rearrangement. The only other rearrangement product was about 1% of a second diamine. No concurrent disproportionation was observed. At somewhat higher acidities than those over which the kinetics were established, a shift in product composition towards diamine and away from carbazole was found. This is in contrast to the rearrangement of 1,1'-hydrazonaphthalene, which shows such a shift only in a much higher acidity range. A possible interpretation of these facts is suggested. (Contractor's abstract)

London U. Coll. [Dept. of Chemistry] (Gt. Brit.).

MECHANISM OF BENZIDINE AND SEMIDINE REARRANGEMENTS. PART III. KINETICS AND PRODUCTS OF ACID REARRANGEMENT OF 2,2'-HYDRAZONAPHTHALENE, by D. V. Banthorpe. [1961] [7]p. incl. diagrs. tables, refs. (AFOSR-64-1808) [AF 61(052)66] AD 449097 Unclassified

Also published in Jour. Chem. Soc. (London): 2407-2413, June 1962.

The acid rearrangement of 2,2'-hydrazonaphthalene proceeds somewhat more slowly than those of the 1,1'- and the 1,2'-isomer. It follows approximately, but not exactly, the same kinetics. In 60-70% aqueous dioxan, with perchloric acid in the range 0.01-0.1N, the formal kinetic order in acid is 1.15. It is suggested that transitional kinetics are just beginning to emerge in this example. The solvent effect on the rate in a series of dioxan-water mixtures is qualitatively similar to that of the rearrangement of hydrazobenzene in a series of ethanol-water mixtures (Croce and Gettler), despite the difference of kinetic form, if in both cases we relate the free-energy of activation of the reaction to the dielectric constant of the medium. It is suggested that the rearrangements develop their characteristic polarity after uptake of the necessary number of protons, whether one or two. The products of the rearrangement of 2,2'-hydrazonaphthalene are the diamine (I) and the carbazole (II), along with traces of an unidentified amine, but no disproportionation products. Increasing in acidity above the kinetic range appears to shift the product proportions away from carbazole and towards diamine. At a sufficient acidity, no carbazole is formed. This finding is hypothetically linked with the suggested incursion of transitional kinetics. (Contractor's abstract)

London U. Coll. [Dept. of Chemistry] (Gt. Brit.).

MECHANISM OF BENZIDINE AND SEMIDINE REARRANGEMENTS. PART IV. CROSSING TESTS ON PRODUCTS OF ACID REARRANGEMENTS OF MIXTURES OF HYDRAZONAPHTHALENES, by D. V. Banthorpe. [1961] [6]p. incl. tables, refs. [AF 61-(052)66] Unclassified

Published in Jour. Chem. Soc. (London): 2413-2418, June 1962.

The newly disclosed kinetic dichotomy of acid-catalyzed benzidine rearrangements has led to re-opening the question of their inter- or intra-molecularity by extending to the hydrazonaphthalene series of the non-crossing tests which formed the basis of an earlier conclusion favoring intra-molecularity in the hydrazobenzene series, in conditions of undetermined kinetics. The rearrangement in "60-70%" aqueous dioxan at 0°C, conditions in which the relevant kinetics are fully known, of mixtures of pairs of the 3 isometric hydrazonaphthalenes is examined. The product of each such mixed rearrangement was a mixture in the expected proportions of the products of the 2 individual rearrangements, which had thus been made to run concurrently, with none of any product of the individual rearrangement of the 3rd hydrazo-isomer, or, indeed, of any product foreign to the component rearrangements. Matters of accuracy and significance are discussed, and a conditional conclusion in favor of intramolecularity for the linear-acid-dependent rearrangements is drawn. (Contractor's abstract)

MECHANISM OF BENZIDINE AND SEMIDINE REARRANGEMENTS. PART V. TRANSITIONAL KINETICS AND PRODUCTS OF ACID REARRANGEMENT OF

N-1-NAPHTHYL-N'-PHENYLHYDRAZINE, by D. V. Banthorpe, E. D. Hughes, and C. Ingold. [1961] [11]p. incl. diagrs. tables, refs. [AF 61(052)66] Unclassified

Published in Jour. Chem. Soc. (London): 2418-2428, June 1962.

The rearrangement of N-1-naphthyl-N'-phenylhydrazine in acidified "60%" aqueous dioxan has been followed over a 6000-fold range of hydrogen-ion concentration. In the lower part of that range, i.e., from 10^{-4} to 10^{-3} N-hydrogen-ion, a sub-range mainly covered with the aid of buffers, the kinetic order in hydrogen-ion was 1.0. In the upper part, viz., from 10^{-3}-0.4N-acid, a sub-range in which the acidity was set with perchloric acid, often with lithium perchlorate added to provide more comparable conditions of ionic strength, the kinetic order in acid rose with increasing acidity, from 1.0 at the lower end of the sub-range to near 2 at the upper end, the observed upper limits being 1.9 with acidities in concentration units, and 2.1 or 2.2 when they were reckoned on the basis of Hammett scales. The form in which the order in acid changes with acidity is in good agreement with a theoretical suggestion by Blackadder and Hinshelwood concerning non-integral orders in benzidine-type rearrangements. The main products of rearrangement are the diamine (I) involving 4,4'-biaryl coupling, and the diamine (II) involving 2,2'-coupling; and these along with a smaller amount of the carbazole (III), also 2,2'-coupled, accounted for the total material, in which no 2,4'-coupled compound was found. Thus, a single naphthalene residue in an aromatic hydrazo-compound suffices to exclude 2,4'-coupling. With increasing acidity, the proportions of products shift in favor of 4,4'-coupling, and against carbazole formation. Disproportionation to fission amines and azo-products was absent or unimportant. MECHANISM OF BENZIDINE AND SEMIDINE REARRANGEMENTS. PART VI. TRANSITIONAL KINETICS AND SOLVENT-ISOTOPE EFFECT IN ACID REARRANGEMENT OF N-2-NAPHTHYL-N'-PHENYLHYDRAZINE, by D. V. Banthorpe. [1961] [7]p. incl. diagrs. tables. [AF 61(052)66] Unclassified

Published in Jour. Chem. Soc. (London): 2429-2435, June 1962.

The rearrangement of N-2-naphthyl-N'-phenylhydrazine in the presence of acid in "60%" or "70%" aqueous dioxan has been followed over a 600-fold range of hydrogen-ion concentration. Throughout a broad central part of the range, the reaction has a non-integral kinetic order in acid which rises with increasing acidity. Thus in the "70%" solvent at constant total electrolyte concentration, and at acidities from 0·02N to 0·30N in perchloric acid, the order in acid rose from 1·15 to 1·85. At lower hydrogen-ion concentrations to 0·01N, mostly maintained by buffers, the order in hydrogen ions was close to unity. At higher acidities to 0·6N perchloric acid in the "60%" solvent, the rates were so related to Hammett's H_0 function as to show that the order in acid was substantially equal to 2. The manner in which the order in acid changes with acidity is in quantitative accord with a suggestion by Hinshelwood concerning hydrazo-rearrangements generally. When the water in the "60%" dioxan solvent was replaced by deuterium oxide, the rearrangement was accelerated, but by different factors according to the acidity, and hence according to the kinetic order in acid. In 0·02 N-acid, when, in the "60%" solvent, the order in acid was 1·15, the factor of acceleration was 2·6. In 0·30N-acid, when the order was 1·75, the factor was 3·8. On comparison with data for other hydrazo-compounds, it appears that the solvent isotope effect is nearly the same for these substrates when the kinetic order is the same, and is essentially correlated with kinetic order. It is concluded that the protons, whether 1 or 2, which catalyze hydrazo-rearrangements are in these examples transferred to their transition states to a similar extent, and are therefore probably completely so transferred. The rearrangement gives 1 main product, 1-o-aminophenyl-2-naphthyl-amine (I), which was recovered in yields up to 99%. The chief by-product was 3,4-benzocarbazole (0·5%). Disproportionation to fission amines and azo-compound was not detected in the conditions of the rearrangements.

MECHANISM OF BENZIDINE AND SEMIDINE REARRANGEMENTS. PART VII. TRANSITIONAL KINETICS AND SOLVENT-ISOTOPE EFFECT IN ACID REARRANGEMENT OF O-HYDRAZOTOLUENE, by D. V. Banthorpe, C. Ingold and others. [1961] [9]p. incl. diagrs. tables. [AF 61(052)66] Unclassified

Published in Jour. Chem. Soc. (London): 2436-2444, June 1962.

Carlin and Odioso had shown that the rearrangement of o-hydrazotoluene with hydrogen chloride in "95%" ethanol has the kinetic order 1·6 in acid over the acid-concentration range 0·03—0·10N. Using perchloric acid in "60%" aqueous dioxan as the reaction medium, it is found that the order does average 1·6 in this range, though it is rising, from 1·4 to 1·8, and will continue rising to 2·0 as the acidity continues to rise to 0·25N. Moreover, the functional form of the change of order with acidity is in quantitative agreement with the requirements of the hypothesis, first advanced by Blackadder and Hinshelwood in explanation of Carlin and Odioso's fractional kinetic order, that 2 independent processes of rearrangement, 1 linear and the other quadratic in hydrogen-ion dependence, are here running concurrently. At acidities higher than 0·25N, Hammett's H_0 diverges markedly from the negative logarithm of the stoichiometric acidity, and only the former is now correlated simply with rate. Using H_0 values for conditions of constant total electrolyte, as adopted in kinetics in order to avoid including a

general salt effect in the sought specific effect of acid, we found the plot of the specific rate against $-H_0$ to be linear, with slope 2·2, up to 0·5N-acid, the limit of the kinetic investigation. When the water in the aqueous dioxan solvent was replaced by deuterium oxide, rearrangement was faster, but by factors which increased with the kinetic order in acid, as controlled by the acidity. Thus the factor was 2·1 when the order in acid was 1·3, but was 3·5 at a higher acidity at which the order was 1·9. These results are compared with those obtained (Parts I and VI) for hydrazobenzene, 1,1'-hydrazonaphthalene, and N-2-naphthyl-N'-phenylhydrazine. The rearrangement, over the whole range of conditions of the kinetic record, gives essentially one product, o-tolidine. At low acidities, disproportionation becomes a considerable competitor, and for that reason the kinetic study was not extended to acidities below 0·02N.

EVIDENCE FOR PION-PION INTERACTIONS FROM S-WAVE PION-NUCLEON SCATTERING, by J. Hamilton, P. Menotti and others. Feb. 10, 1961, 17p. incl. diagrs. table, refs. (Technical scientific note no. 1) (AFOSR-641) (AF 61(052)468) AD 258417 Unclassified

Also published in Nuovo Cimento, Series X, v. 20: 519-528, May 1, 1961.

By fitting the s-wave partial amplitudes for π-N scattering, in an unphysical region, the energy range over which the contribution from the process $\pi + \pi \rightarrow N + \bar{N}$ can be examined has been greatly extended. The method shows up contributions from this process in states of isotopic spin T = 0 and T = 1. The energies $t^{\frac{1}{2}}$ for which this process is important can be estimated. The form of these contributions is just what would be expected from considerations of angular momentum. Estimates of the amplitudes for $\pi + \pi \rightarrow N + \bar{N}$ are deduced. The T = 0 amplitude is large, but in the T = 1 case the amplitude is much smaller than the values which have been predicted from the nucleon isovector form factors. (Contractor's abstract)

S-WAVE PION-NUCLEON SCATTERING AND PION-PION INTERACTIONS, by J. Hamilton, T. D. Spearman, and W. S. Woolcock. [1961] [40]p. incl. diagrs. tables, refs. (AFOSR-2129) [AF 61(052)468] AD 611609 Unclassified

Also published in Ann. Phys., v. 17: 1-40, Jan. 1962.

Using a partial wave dispersion relation, it is shown how the low-energy s-wave π-N interactions can be separated into long range and short range parts. The phase shifts used in deriving our previously reported results are examined, and a critical survey of the errors and uncertainties in the method is given. The results show how s-wave π-N scattering can be resolved into 4 main constituents: core scattering, T = 0 and T = 1 π-π scattering, and rescattering. Our conclusions on T = 0 and T = 1 π-π scattering are compared with other experimental and theoretical data, and shown to be in reasonable agreement. (Contractor's abstract)

FIXED ANGLE DISPERSION RELATIONS FOR NUCLEON COMPTON SCATTERING. I., by A. C. Hearn and E. Leader. Oct. 2, 1961 [49]p. incl. diagrs. refs. (Technical note no. 3) (AFOSR-2141) (AF 61(052)468) AD 279060 Unclassified

Also published in Phys. Rev., v. 126: 789-805, Apr. 15, 1962.

The Mandelstam representation is used to derive fixed-angle dispersion relations for the 12 scalar amplitudes describing the process $\gamma + N \rightarrow \gamma + N$. The electromagnetic interaction is calculated to order e^2. The strong interactions are estimated by including 1- and 2-pion exchange on the left-hand cut. These depend on the $\pi^0 \rightarrow 2\gamma$ decay lifetime and on the $T = 0_{\pi\pi}$ phase shift and the total cross section for photoproduction of pions on pions, respectively. The right-hand cut is estimated by allowing the exchange of a pion-nucleon pair, which depend on the amplitude for meson photoproduction on nucleons. The low-energy limit theorem provides an important tool for estimating the subtractions required in the dispersion relations. It is hoped that the representation will be accurate for barycentric photon energies up to approximately 300 mev. (Contractor's abstract)

SINGULARITIES IN PARTIAL-WAVE AMPLITUDES FOR TWO-INGOING AND TWO OUTGOING PARTICLES, by J. Kennedy and T. D. Spearman. Dec. 20, 1961 [24]p. incl. diagrs. (AFOSR-2692) (AF 61(052)-468) AD 289145 Unclassified

Also published in Phys. Rev., v. 126: 1596-1602, May 15, 1962.

The singularities which appear in the energy plane of a partial-wave amplitude are investigated for the general process with 2 ingoing and 2 outgoing particles. These lie either on the real axis or on curves symmetrical about the real axis. The equations of these curves and the conditions under which they occur are obtained; also the ranges in the energy spectra of the crossed channels to which they correspond. These general results are applied to the particular cases of pion-nucleon scattering and pion photoproduction from nucleons. (Contractor's abstract)

PERCEPTION OF DISTANCE IN ANIMAL ECHO-LOCATION, by J. D. Pye. [1961] [2]p. (AFOSR-2026) [AF 61(052)271] Unclassified

Also published in Nature, v. 190: 362-363, Apr. 22, 1961.

The theory of range perception in animal echo-location (such as in the bat) is further explained by a description of close range perception. The bat, feeding on flying insects which may be taking evasive action, presumably can obtain information down to the last few centimeters. This investigator suggests that at close range, when the echo overlaps with the emitted pulse, the bat can obtain information from beat-notes between the 2 signals. The refractory period is then not involved. The frequency-modulated pulses of Vespertilionids will give range and directional information, while the very constant-frequency pulses of Rhinolophids will measure the Doppler shift and so indicate the relative velocity. The Vespertilionids appear to have accuracy at over 50 cm. Possibly location is initially achieved by the time-difference apparatus, while at close range the beat-notes are used. The long, unmodulated pulses and low repetition-rates of the Rhinolophids do not appear to lend themselves to time-difference measurement. This author agrees with the opinion that they obtain information from the direction and loudness of the echoes. The beat-note mechanism makes this possible by avoiding masking. The complex pulses of other echo-locating animals will not form useful beat-notes. Direct echo-delay measurement, by a process such as that indicated by the time-difference tone, appears to be the only possible mechanism for these cases at present.

TRINIDAD EXPEDITION. 1961, by J. D. Pye and A. Pye. Final rept. Nov. 1961 [8]p. incl. refs. (AFOSR-2183) (AF 61(052)271 and AF EOAR-61-40) AD 271650 Unclassified

Electrophysiological experiments on the cochlea and middle ear of bats, with reference to the mechanism of echolocation were performed. The results justify criticisms of earlier theories and support the hypothesis of peripheral information handling at close range. The ultrasonic cries of certain moths were examined briefly and the response of the bat's ear to these was recorded. Orientation cries of several bats were recorded on magnetic tape. A large collection of bats and other vertebrates was photographed and specimens were fixed by an intravital method for subsequent histological and anatomical examination. The problem of location of underwater prey by the fishing bat Noctilio was also investigated. (Contractor's abstract)

EFFECT OF ISONICOTINYL HYDRAZINE ON THE PATH OF CARBON IN PHOTOSYNTHESIS, by G. G. Pritchard, C. P. Whittingham, and W. J. Griffin. [1959] [3]p. incl. diagr. table. (AFOSR-1642) (AF 61(052)245) AD 611509 Unclassified

Also published in Nature, v. 190: 553-554, May 6, 1961.

In a study of the pathways of incorporation of carbon-14 from labeled carbon dioxide into the amino-acids glycine and serine during photosynthesis, the compound isonicotinyl hydrazide (isoniazid) was used. Isoniazid had only a small effect on the total fixation of carbon-14 and on the distribution between the ethanol-soluble and ethanol-insoluble fractions. The incorporation of carbon-14 into sugar phosphates, phosphoglyceric acid, phosphoenol pyruvic acid, aspartic acid, malic acid, fumaric acid and alanine is considerably reduced by treatment with isoniazid. Incorporation into sucrose is stimulated at the lower concentration and slightly inhibited at the higher concentration. Incorporation into glycollic acid and glycine, is stimulated about 5- to 8-fold by treatment with 0.01 M isoniazid. Incorporation into serine is inhibited to the same extent as that into sugar phosphates, phosphoglyceric acid, etc. The results do not indicate specific inhibition of transaminases by isoniazid but suggest a different site of action.

THE EFFECT OF CARBON DIOXIDE CONCENTRATION, LIGHT INTENSITY AND ISONICOTINYL HYDRAZIDE ON THE PHOTOSYNTHETIC PRODUCTION OF GLYCOLLIC ACID BY CHLORELLA, by G. G. Pritchard, W. J. Griffin, and C. P. Whittingham. Nov. 14, 1961 [13]p. incl. diagrs. refs. (Technical note no. 2) (AFOSR-2024) (AF 61(052)245) AD 271578 Unclassified

Also published in Jour. Exper. Botany, v. 13: 176-184, May 1962.

Glycolic acid production by Chlorella was measured by colorimetric determination of the acid excreted into the medium. Glycolic acid production was at a max at a low concentration of carbon dioxide but it tended toward zero as the rate of photosynthesis approached carbon dioxide saturation. The production of the acid became measurable at light intensities approaching that required to saturate photosynthesis and increased steadily with further increase in intensity. Treatment with isonicotinyl hydrazide resulted in an approximately 3-fold stimulation of glycolic acid concentration over the range of conditions used. It is suggested that the precursor of glycolic acid is ribulose diphosphate, and that isonicotinyl hydrazide acts by inhibiting the further metabolism of glycolic acid. (Contractor's abstract)

THERMOELASTIC STABILITY, STRESSES AND DEFLECTIONS OF THIN PLATES, by F. Buckens. Aug. 1961 [99]p. incl. diagrs. tables, refs. (Technical note no. 1) (AFOSR-1510) (AF 61(052)499) AD 266465 Unclassified

An approximate solution of the problem of the stability of an homogeneous simply connected thin plate is given, for any thermal stress distributions assuming the edges to be unrestrained in the plane. Under special conditions this gives a lower bound for the critical level of temperature, when its increase is assumed to incur no change in its relative distribution. Comparison with exact solutions for circular plates gives excellent verifications. A reasonably simple method is also described to study post-buckling behavior when the temperature has increased beyond its critical level; it gives the changing pattern of stress distribution and, less directly, the changing shapes and amplitudes of deflection. The effect of initial deflections is studied and an approximate method developed, suggested by previously used properties of Airy functions at critical levels. Practical application is here far more cumbersome. The effect of restrictions at the edges are taken care of by applying an approximate formula which makes use of the critical levels of temperature determined without them. (Contractor's abstract)

RESEARCH ON RESPONSE TO PAIN, by A. E. McKenna and J. Colle. Final rept. Nov. 1, 1961, 1v. incl. illus. tables, refs. (AFOSR-2831) (AF 61(514)-1101) AD 276719 Unclassified

A modification on the Hardy-Wolff-Gooddell method of stimulation by thermal radiation was used. Thresholds of pain sensation were obtained in the usual manner but response was measured, not only by the judgement of subjects, but by the reactions in a group of physiological variables as well; these included EEG, EKG, PGR and change in respiration. Threshold values obtained in terms of skin temperatures at stimulus site after irradiation were higher (47.3 - 48.6°C) than those reported in most of the previous investigations. Plotting magnitude of responses against physical intensity of stimulus for pain and non-pain categories reveals that intensity and duration of reactions in pain is not mainly determined by physical intensity of stimulus but the determinant is presumably to be found in central factors within the subject himself. Implications of the findings for the pain experience in the true life situation are discussed. (Contractor's abstract)

EFFECTS OF MOTOR INACTIVATION ON THE CHEMICAL SENSITIVITY OF SKELETAL MUSCLE, by T. R. Johns and S. Thesleff. [1960] [6]p. incl. illus. diagr. table, refs. (AFOSR-1245) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)-106], Muscular Dystrophy Associations of America, Inc., and National Institute of Neurological Diseases and Blindness) AD 262290 Unclassified

Also published in Acta Physiol. Scand., v. 51: 136-141, 1961.

In order to determine whether the lack of motor nerve impulses, without denervation per se, alters the chemically sensitive area in skeletal muscle, the size of the ACh-sensitive areas in muscle fibers of cat tenuissimus were measured after isolation of the motor neurones by severance of the dorsal roots below a lumbar cord transection. The sensitivity of the individual muscle fiber to ACh was determined by iontophoretic micro-application of the drug, and by intracellular recording of the potential change. The frequency of miniature end-plate potentials, their amplitude, and their time course, were relatively unaffected by the isolation procedure. The procedure also caused little increase in the size of the ACh-sensitive surface. Therefore, inactivation per se did not alter the chemically sensitive area. (Contractor's abstract)

AN ELECTROPHYSIOLOGIC STUDY OF THE NEUROMUSCULAR JUNCTION IN MYASTHENIA GRAVIS, by O. Dahlbäck, D. Elmqvist and others. [1960] [8]p. incl. illus. (AFOSR-1246) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)106], Muscular Dystrophy Associations of America, Inc., and National Institute of Neurological Diseases and Blindness) AD 262291 Unclassified

Also published in Jour. Physiol. (London), v. 156: 336-343, Apr. 1961.

Some of the electrophysiological properties of the neuromuscular junction have been studied by the use of intracellular electrodes in isolated intercostal muscles obtained from patients with myasthenia gravis and from those with no known neuromuscular disorder. Spontaneous pre-junctional activity, recorded as miniature end-plate potentials (m. e. p. p. s) was decreased in frequency in muscles from myasthenic patients. The application of a solution containing 10-40 mm potassium produced no increase in the frequency of m. e. p. p. s in myasthenic muscles, whereas in normal muscle it caused a hundred-to thousandfold increase in the discharge frequency of m. e. p. p. s. In normal muscle a short period of high-frequency nerve stimulation produced a marked post-tetanic facilitation of the amplitude of the end-plate potential (e. p. p.). In myasthenic muscle no post-tetanic facilitation, or only slight and short-lasting facilitation, was observed. During tetanic nerve stimulation the amplitude of successive subthreshold e. p. p. s in myasthenic muscles fluctuated at random without a progressive decline. (Contractor's abstract)

ELECTROMYOGRAPHIC FINDINGS IN EXPERIMENTAL BOTULINUM INTOXICATION, by J. -O. Josefsson and S. Thesleff. [1960] [6]p. incl. illus. refs. (AFOSR-1284) (AF 61(052)106) AD 262293 Unclassified

Also published in Acta Physiol. Scand., v. 51: 163-168, 1961.

The electrical activity of botulinum intoxicated skeletal muscle was examined in the rabbit by the use of electromyography. Five to 6 days after an intramuscular injection of the toxin, fibrillation potentials appeared and persisted for a period of at least 60 days. The potentials were similar in amplitude and time course to those recorded following motor nerve degeneration. Botulinum toxin, however, is known not to affect the morphological structure of the motor nerve and its terminals. Its sole action is to block transmitter release selectively from cholinergic nerve endings. Results therefore suggest that in nerve degeneration lack of transmitter release is primarily responsible for initiating the process which produces the electromyographic pattern typical of denervation. (Contractor's abstract)

THE NATURE OF THE NEUROMUSCULAR BLOCK PRODUCED BY NEOMYCINE, by D. Elmqvist and J. -O. Josefsson. [1961] [6]p. incl. illus. diagrs. refs. (AFOSR-3459) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)106], Muscular Dystrophy Association of America, Inc., and Public Health Service) Unclassified

Also published in Acta Physiol. Scand., v. 54: 105-110, 1962.

The neuromuscular block produced by neomycine has been studied in the rat diaphragm and the frog sartorius by means of intra- and extracellular recording techniques. The block is due to a reduction in the amplitude of the end-plate potential. This reduction is partly caused by a neomycine induced decrease in the sensitivity of the post-junctional end-plate membrane to the depolarizing action of acetylcholine. Neomycine reduces the amount of transmitter released from the motor nerve in response to a nerve volley or to a high external potassium concentration. This prejunctional effect of neomycine is antagonized by an excess of Ca ions. (Contractor's abstract)

Lund U. Dept. of Pharmacology (Sweden).

EFFECT OF RESERPINE ON THE STORAGE OF NEW-FORMED CATECHOLAMINES IN THE ADRENAL MEDULLA, by A. Bertler, N.-A. Hillarp, and E. Rosengren. [1961] [5]p. incl. tables, refs. (AFOSR-1255) (AF 61(052)247) AD 262475 Unclassified

Also published in Acta Physiol. Scand., v. 52: 44-48, 1961.

When L-dopa (100 mg/kg body wt) was given i v to reserpinized (5 mg/kg) rabbits, appreciable amounts of dopamine and noradrenaline rapidly formed in the adrenal medulla. The results support the view that reserpine does not – at least not to a great extent – interfere directly with the decarboxylating and beta-hydroxylating steps in the amine synthesis. To a great extent, however, the drug prevented the new-formed amines from being incorporated in the storage granules, an incorporation which in normal animals is a very rapid and efficient process. It seems reasonable to assume that reserpine in some way blocks the process of monoamine storage. This may well be the main site of action of the drug. (Contractor's abstract)

THERMOCHEMISTRY OF FREE RADICALS (Abstract), by S. Sunner. [1961] [2]p. [AF 61(052)46] Unclassified

Presented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech. Armour Research Foundation, Chicago, Sept. 11-12, 1961. (AFOSR-1417; AD 265513

An experimental study of the possibilities of determining bond formation energies by direct measurement of the enthalpy change accompanying the radical recombination process 2 RX → R_2 must start with the elucidation of the conditions under which one specified, known radical can be produced, quantitatively determined and stored for a sufficiently long period of time. Thus, it is obvious that the homolytic splitting of symmetrical compounds, R - R, should be studied in the first place. It has been stated in the literature that disulfides upon irradiation or pyrolysis can be split to form intermediate thiyl radicals: R_2S_2 → 2 RSX. Therefore, it seemed reasonable to assume that the photolysis of simple disulfides under conditions favorable for the stabilization of intermediate products formed, might lead to the isolation and characterization of thiyl radicals. The technique chosen was to photolyze the disulfide in a rigid organic matrix at 77°K and to study, primarily, the changes of the ultraviolet and visible spectra. The present study is mainly concerned with investigations of aliphatic disulfides, for obvious reasons — the spectra being much less complicated, the bond energy situation being cleaner, and the analysis of possible primary and secondary reaction products being easier to perform.

[VARIATIONS IN ELECTRICAL RESPONSES OF THE THALAMUS OF MAN DURING A PERIOD OF CONCENTRATION] Variations des réponses électriques somesthésique au niveau du thalamus chez l'Homme, au cours de l'attention, by M. Jouvet and C. Lapras. [1959] [4]p. incl. diagrs. [AF 61(514)1206] Unclassified

Some somesthetic responses have been collected at the level of the ventro-posterior-lateral nerve of the thalamus, during stereotaxic intervention in the conscious subject. These responses increase in amplitude when the subject turns his attention towards somesthetic stimulation. They decrease and can disappear when the subject's attention is attracted towards another sensory modality.

Published in Compt. Rend. Séances Soc. Biol., v. 153: 422-425, June 1959.

From observations on the rhythms of activity of the cat brain after removal of cortex and mesencephalic regions, it is believed that the phenomenon of sleep is of telencephalic origin which is responsible for the inhibition of normal activity. A 2nd phase has a rhombencephalic origin.

[RESEARCH ON THE NEUROPHYSIOLOGICAL MECHANISMS OF SLEEP AND NEGATIVE EXPERIENCE] Recherches sur les mécanismes neurophysiologiques du sommeil et de l'apprentissage négatif, by M. Jouvet. [1959] [35]p. incl. illus. diagrs. (AFOSR-1193) (AF 61(052)109) Unclassified

Also published in Brain Mechanisms and Learning; A Symposium, Montevideo (Uruguay) (Aug. 2-8, 1959), Oxford, Blackwell Scientific Publications, 1961, p. 445-479. (AFOSR-1191)

Since the problem of falling asleep is intimately related with negative learning, some experimental facts which suggest that 2 different mechanisms at least act during sleep are considered. Then some evidence is described which concerns the intervention of 1 of these mechanisms during 2 types of negative learning: the habituation of the arousal reaction and the habituation of the orientation reaction.

Investigations on normal human subjects confirm that dreaming is associated with the stage of sleep with rapid eye movements. A specific EEG rhythm is described during this stage. Results obtained on chronic decorticate and decerebrate human subjects have confirmed the main results obtained in the cat, and lead to the conclusion that the stage of sleep with rapid eye movements in humans is similar to the Rhombencephalic phase of sleep. Results suggest that dreaming occurs periodically during sleep when a ponto-limbic system is brought into play probably by a neuro humoral mechanism.

TELENCEPHALIC AND RHOMBENCEPHALIC SLEEP IN THE CAT, by M. Jouvet. [1960] [19]p. incl. illus. diagrs. refs. (AF 61(052)109) Unclassified

Published in Ciba Foundation Symposium on the Nature of Sleep, London (Gt. Brit.) (June 27-29, 1960), Boston, Little, Brown and Company [1961], p. 188-206.

The EEG tracing of decorticate or mesencephalic cats shows no slow phase whereas periods of "rhombencephalic sleep" persist. In the cats with a pontile reticular formation (R. F.) lesion, on the other hand, only the phase of "slow sleep" appears, without any paradoxical phase (p. p.). These facts lead to the acceptance of the intervention of 2 different systems during physiological sleep in the cat. (1) The first system appears to intervene during "spindles and

slow waves" sleep in the intact animal. It requires the presence of the neocortex which is responsible for the slow activity. This corticifugal slow activity expresses an inhibition phenomenon since the arousal threshold produced by direct stimulation of the R. F. rises during this stage which may therefore be described as telencephalic sleep. This telencephalic stage may represent a stage which is acquired during telencephalization and which could be described as "neosleep". (2) The phase of "rapid" sleep (p. p.) which is proposed to call the "rhombencephalic phase" is dependent upon a totally different system, situated at the level of the pontile reticular formation. It controls, through the inhibitory R. F., the somato-vegetative phenomena (disappearance of all muscular tonic activity even in the cases of decerebration or decerebellation hypertony, variation in respiratory and cardiac rhythms). The rapid cortical activity which accompanies this phase is not suppressed by the interruption of the activating reticular system. This phase of sleep which only exists in mesencephalic or pontile cats could be likened to an "archisleep". It is more profound than the first one as the threshold of awakening is increased in comparison with that of the slow wave phase of sleep. Finally, it can be triggered off in animals by stimulating the lower part of the brain stem, and it is suggested that this phase depends upon a neurohumoral mechanism. (Contractor's abstract)

[BEGINNING OF THE PARADOXAL PHASE OF SLEEP BY STIMULATION OF THE CEREBRAL STEM IN THE INTACT AND CHRONICALLY MESENCEPHALIC CAT] Déclenchement de la phase paradoxale du sommeil par stimulation du tronc cérébral chez le Chat intact et mésencéphalique chronique, by M. Jouvet and F. Michel. [1960] [8]p. incl. illus. (AF 61(052)109) Unclassified

Published in Compt. Rend. Soc. Séances Biol., v. 154: 636-641, 1960.

By stimulation of the reticular formation, one notices the extinction of EMG activity of the muscles at the nape of the neck and at the forehead. A slow rhythmic activity appears at the level of the differential reticular formation. Prolonged stimulation of the differential reticular formation during a period of deep sleep, brings about the appearance of a typical paradoxal phase with rapid cortical activity, respiratory acceleration, and eye movement.

Also published in Jour. Electrochem. Soc., v. 109: 1023-1026, Nov. 1962.

An investigation is reported on the oxidation of an iron-5% chromium alloy over the temperature range 600-850°C. The film on abraded specimens underwent transformation by nodular-type growths to produce a scale containing iron chromite and ferric-chromic oxide. The alloy underlying iron chromite was susceptible to internal oxidation. These phenomena combined with mechanical breakdown of oxides gave rise to nonreproducible oxidation rate curves.

THE OXIDATION AND REDUCTION KINETICS OF IRON AND IRON OXIDES, by W. W. Smeltzer. [1960] [6]p. incl. diagrs. tables, refs. [AF 49(638)734] Unclassified

Presented at Hamilton Branch meeting of the Canadian Inst. of Mining and Metallurgy, Sept. 1960.

Published in Trans. Canad. Inst. Mining and Metall., v. 54: 445-450, 1961.

The scientific basis for the reaction mechanisms of iron and oxides with oxidizing and reducing atmospheres has been emphasized. It has been shown that the magnitudes of the parabolic oxidation rates at high temperatures may be predicted from values for the diffusivity of lattice defects, and oxide compositions from the iron-oxygen phase diagram. It is known that the rates are controlled to constant values by a chemisorption reaction. The rate controlling steps are the dissociation of the gaseous reactant and movement of lattice defects at the oxide surface. Moreover, the reduction of oxides may be explained by a surface controlled reaction when the iron product is porous.

THERMAL MOTION IN MOLECULAR CRYSTALS (Abstract), by M. L. Canut and J. L. Amorós. [1960] [1]p. (AF 49(638)193) Unclassified

Presented at Fifth Internat'l. Cong. of Crystallography, Cambridge (Gt. Brit.), Aug. 15-24, 1960.

Published in Acta Cryst., v. 13: 1106, Dec. 10, 1960.

Results indicate that the shape and location of the extended diffuse domains are correlated with the shape and orientation of the individual molecules. The agreement obtained when theoretical isodiffusion contours are compared with the observed values shows that these diffuse regions arise from independent (out of phase) molecular motion with vibrational frequencies of the optical type, being the kind of diffuse scattering, a function of $(1-\exp/-2B \sin^2\theta/\lambda^2/)$ that was first predicted by Debye, and it has the same nature as the electron diffuse scattering bands found in anthracene by Charlesby, Finch and Wilman.

TEMPERATURE DEPENDENCE OF THE X-RAY DIFFUSE SCATTERING OF MOLECULAR CRYSTALS: NAPHTHALENE, by M. L. Canut and J. L. Amorós. [Mar. 15, 1961] [11]p. incl. illus. diagrs. refs. (AFOSR-4272) (AF 61(052)193) AD 408212 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 21: 146-155, 1961.

For molecular crystals a theoretical analysis has been made on the thermal dependence of the Laval functions TDS_1, TDS_2, TDS_3 and our difference Fourier transform function DFT. The temperature factor of TDS_1 has been computed for naphthalene at several temperatures by assuming constancy of Θ-D and also with the assumption that the frequencies increase 7.6% in 100°K by lowering the temperature. In both cases the inversion phenomenon appears, being observable at low temperatures. The DFT form function of naphthalene has also been computed at several temperatures, in terms of Θ-E and the isodiffusion lines corresponding to the extended regions G and C are shown at 300° and 130°K. The reciprocal space regions more temperature-sensitive according to the different diffuse scattering functions are also shown. It is emphasized that experimental work on the thermal behavior of the diffuse scattering at low temperatures and high values of the reciprocal vector is of the most interest. Experimental tests in naphthalene have shown the inversion of TDS_1 and that the continuous diffuse regions do not correspond to a one-photon scattering. (Contractor's abstract)

PERMUTATIONS WITH CONFINED DISPLACEMENTS, by N. S. Mendelsohn. [1960] [12]p. incl. table, refs. (AF 49(638)860) Unclassified

Published in Canad. Math. Bull., v. 4: 29-38, 1961.

This report is concerned with the enumeration of permutations by displacements; if $(p_1, p_2, \ldots, p_n)$ is a permutation of elements 1 to n, then the displacement associated with p_i is $p_i - i \pmod n$. More exactly, the enumeration is of permutations with s displacements equal to or greater than r, a number demoted by φ (n, r, s), for the first few values of r. The complementary character of the chessboards expressing forbidden positions for r and n - r shows that φ (n, r, s) = φ (n, n - r, n - s). Hence, if $\varphi(t; r) = \varphi(n, r, o) + \varphi(n, r, 1)t + \ldots$, then $\varphi(t; n - r) = t^n \varphi(t^{-1}; r)$. The main results are: $\varphi(t; n - 1) = D_n(t)$, the recontre hit polynomial, and $\varphi(t; n - 2) = U_n(t)$, the ménage hit polynomial. (Math. Rev. abstract)

ON THE INVERSION OF SPARSE MATRICES, by A. L. Dulmage and N. S. Mendelsohn. [1961] [3]p. (AFOSR-4399) (AF AFOSR-62-235) AD 413841 Unclassified

Also published in Math. Comput., v. 16: 494-496, Oct. 1962.

Given a nonsingular square matrix A, it is desired to find permutation matrices P, Q so that PAQ is reduced to a triangular matrix. For this the authors suggest using their own algorithm (see no. 1392, Vol. V) to find the irreducible components of a bipartite graph associated with A. As an alternative, they suggest adaptation of a related algorithm by F. Harary which was limited to the case $Q = P^{-1}$. (Math. Rev. abstract)

MATRICES ASSOCIATED WITH THE HITCHCOCK PROBLEM, by A. L. Dulmage and N. S. Mendelsohn. [1961] [10]p. incl. refs. (AFOSR-J49) [AF AFOSR-62-235] Unclassified

Also published in Jour. Assoc. Comput. Mach., v. 9: 409-418, Oct. 1962.

This paper is concerned with convexity properties of m x n matrices whose entries are non-negative real numbers and whose row and column sums are specified positive numbers. Such matrices make their appearance in an important linear programming problem known as the Hitchcock or transportation problem. The determination of the vertices of such sets of matrices enables 1 to obtain all solutions of the transportation problem when the solution is not uniquely determined. (Contractor's abstract)

TWO ALGORITHMS FOR BIPARTITE GRAPHS, by A. L. Dulmage and N. S. Mendelsohn. [1961] [12]p. incl. diagrs. (AFOSR-J748) (AF AFOSR-62-235) AD 413645 Unclassified

Also published in Jour. Soc. Indus. and Appl. Math., v. 11: 183-194, Mar. 1963.

A bipartite graph K has 2 finite sets of vertices S and T and a set of edges. Each edge is a pair (s_i, t_j), $s_i \in S$, $t_j \in T$. The adjacency matrix A of K has $a_{ij} = 1$ if (s_i, t_j) is an edge in K, and $a_{ij} = 0$ otherwise. Two algorithms are given: the transversal algorithm and the decomposition algorithm. A transversal (or set of independent edges) of K is a collection of edges which are pairwise vertex-disjoint. A maximum transversal has the greatest possible number of independent edges. The transversal algorithm provides a method for finding a maximum transversal. This gives a way of calculating the term rank of a matrix, introduced by Ryser and also affords a constructive proof of König's theorem that the order of a maximum transversal of K is equal to its "coverance". The decomposition algorithm shows how to decompose the matrix A of K into minimal block submatrices. (Math. Rev. abstract)

CHEMICAL SYNTHESIS WITH MONOENERGETIC IONS (Abstract), by S. Singer, C. Bodai, and L. K. Branson. [1961] [2]p. [AF 49(638)913] Unclassified

Presented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech., Armour Research Foundation, Chicago, Sept. 11-12, 1961. (AFOSR-1417; AD 265513)

This study is concerned with the reaction of low-energy polyatomic ions in the gas phase with free-radical or stable target molecules. Several unusual and possibly sensitive compounds are accessible by the reaction of such fragments, and the reaction conditions appear to favor preparation of substances which would be difficult to obtain by ordinary chemical methods. In addition, the monoenergetic ion beam can ultimately give reaction rate parameters similar to those determined in ordinary gas- or liquid-phase kinetics. To obtain the quantities sufficient for characterization of new compounds, ion currents of approximately 0.5 milliampere are required. At such currents the product yield from a reaction of high cross-section is of the order of 5 ml of gas in 24 hr. The products are removed continuously from the reaction zone into a collection and analysis system which provides for gas-liquid chromatography, molecular weight determination, etc.

Auto-rhythmic ganglion cells of Aplysia have been used to show the long-lasting frequency changes of the pacemaker that survive the immediate effects of a brief tetanus applied to an afferent tract. A satisfactory test of the facilitation transfer mechanism has been applied to the disynaptic system of neurones that control the discharges of electric organs in Torpedo. Pyramidal cells in Hippocampus have also been proved to be able to reveal potentiation transfers when activated through different pathways that converge on to the intermediate polysynaptic structures leading to them.

[EVIDENCE, IN THE FREELY AWAKENED CAT, OF THE ASSOCIATIVE CORTICAL ACTIVITIES APPEARING IN THE INATTENTIVE ANIMAL] Mise en évidence, chez le Chat éveillé libre, d'activités corticales associatives n'apparaissant que chez l'animal inattentif, by D. Albe-Fessard, A. Mallart, and P. Aléonard. [1961] [4]p. incl. illus. (AFOSR-743) (AF 61(052)103) Unclassified

Also published in Compt. Rend. Séances Acad. Sci., v. 252: 1060-1062, Feb. 13, 1961.

The results of a study on the origin of impulses which provoke 2 types of evoked cortical potentials are presented. Observations of the inattentive animal show responses whose amplitude is of the order of magnitude of amplitudes observed under chloralose (0.5-1 mv). These responses totally disappear in the attentive animal. The evoked potential observed in the primary somatic area consists of 2 phases. During attentive behavior the second phase is practically eliminated whereas the first is not seriously diminished further.

[REDUCTION DURING ATTENTIVE BEHAVIOR OF THE AMPLITUDE OF EVOKED RESPONSES IN THE CENTRAL MEDIAN OF THE THALAMUS OF THE FREELY AWAKENED CAT, CARRIER OF FIXED ELECTRODES] Réduction au cours du comportement attentif de l'amplitude des réponses évoquées dans le centre médian du thalamus chez le Chat éveillé libre, porteur d'électrodes à demeure, by D. Albe-Fessard, A. Mallart, and P. Aléonard. [1961] [3]p. incl. illus. (AFOSR-744) (AF 61(052)103) Unclassified

Also published in Compt. Rend. Séances Acad. Sci., v. 252: 187-189, Jan. 4, 1961.

A visible correlation exists between the fluctuations of the average frequency of the waves which constitute the corticogram and the fluctuations of the amplitude of the response derived in the central median. One can see that these responses are not ample when the principal waves of the cortical activity have a frequency equal or lower than 10-12 s. It has been verified that the variations of amplitude observed in the CM is not due to an external cause bringing about a modification of the stimulation in the cat. The specific response provoked by the same stimulation is not exhibited with an appreciable variation in amplitude during an attentive reaction bringing about a reduction of the response from the CM.

[OBSERVATIONS ON INSTRUMENTAL ALIMENTARY CONDITIONING IN THE CAT] Observations sur le conditionnement instrumental alimentaire chez le Chat, by P. Buser and A. Rougeul. [1959] [28]p. incl. illus. diagrs. (AFOSR-1194) (AF 61(052)103) Unclassified

Also published in Brain Mechanisms and Learning; A Symposium, Montevideo (Uruguay) (Aug. 2-8, 1959), Oxford, Blackwell Scientific Publications, 1961, p. 527-554. (AFOSR-1191)

A study was performed concerning the effects of the removal of the sensorimotor cortex on learning and executing the lever -pressing movement to a signal stimulus, in an instrumental conditioning situation. After total bilateral removal of sensorimotor cortex normal scores may still be obtained, but most of the observed movements are disturbed in several ways which have been analyzed. In sensorimotor deprived animals statistical dispersion of latency values is much larger than in normal animals. In time also, individual delays for deprived animals appear mostly variable in the course of one session. Spontaneous conditioned movement appears less frequent in ablated than in normal animals. Two types of qualitative disturbances of movements, automatic hyperactivity and disorientation phases, are described. None of the previously described disturbances are definitely observed following other cortical removals. These results are discussed in relation to neurophysiological data on afferent projections to and integrative properties of the motor cortex in the cat.

RESEARCH ON NERVOUS PROCESSES UNDERLYING LEARNING BEHAVIOR, by A. E. Fessard. Final rept. May 1, 1958-Apr. 30, 1961, 15p. incl. refs. (AFOSR-1195) (AF 61(052)103) AD 262908 Unclassified

These investigations deal with some important points related to nervous processes underlying learning behavior. They have contributed to a better knowledge of the anatomical-functional organizations which, in mammalian brains, are responsible for associative operations, on the one hand, and for integrative motor activites on the other. In addition, a new line of theoretical considerations associated with some experimental approach has been initiated in order to obtain a better understanding of how activity traces occur and persist within the central nervous system.

[AFFERENT CONVERGENCES OF CORTICAL AND PERIPHERAL ORIGIN AT THE CENTRUM MEDIANUM OF THE ANESTHETIZED AND AWAKENED CAT] Convergences d'afferences d'origines corticale et peripherique vers le Centre Médian du Chat anesthesie ou éveillé, by D. Albe-Fessard and E. Gillett. [1960] [13]p. incl. illus. refs. (AFOSR-2178) (AF 61(052)103) Unclassified

Also published in Electroencephalog. and Clin. Neurophysiol. Jour., v. 13: 257-269, 1961.

Activities evoked in the Centrum Medianum (CM) by applying isolated electric shocks to homo- and contralateral cortices were picked up with macroelectrodes. The lowest threshold response is elicited by stimulating the motor, S II and inferior temporal areas (4 V vs 7V for for the suprasylvian region). Zona incerta and the suprasylvian cortical sites into which the CM-relayed ascending impulses project are also activated. Impulses generated by peripheral and cortical stimulations mutually occlude within CM and suprasylvian cortex. Convergences of impulses from various peripheral and cortical origins could be observed on single units in the 2 kinds of preparations. The different kinds of interactions between these converging impulses suggest that the long-lasting depressions are not due to true refractory periods but to a phase of inhibition. [SUPPRESSIVE ACTION OF THE CAUDATE NUCLEUS ON THE REFLEX REACTIVITY OF THE PYRAMIDAL SYSTEM IN THE CAT] Action suppressive du noyau caudé sur la reactivité réflexe du systeme pyramidal chez le Chat, by P. Buser, H. Encabo, and P. Borenstein. [1961] [3]p. incl. illus. refs. (AFOSR-2684) (AF 61-(052)103) Unclassified

Also published in Compt. Rend. Séances Acad. Sci. v. 253: 538-540, July 17, 1961.

The suppressive action of the caudate nucleus on the reflex reactivity of the pyramidal system is studied in the anesthetized and unanesthetized cat. The oscillographic analysis is carried on simultaneously on the motor cortex and on the corresponding pyramidal tractus. The peripheral stimulations are of the current type and the electrical central stimulations (thalamic and caudate) are applied by bipolar stereotaxic electrodes. Four sets of results are presented: Set 1 shows the existence of a cortical response to the isolated sensory stimulation; Set 2 shows the existence of a cortical response to electrical stimulation, but an absence of the characteristic pyramidal discharge; Set 3 indicates more suppression (or less complete suppression) of the pyramidal discharge when the sensory stimulus is preceded by a caudate stimulation; Set 4 shows consecutive controls as a result of sensory stimulation.

SENSORY RESPONSES OF THE AMYGDALA WITH SPECIAL REFERENCE TO SOMATIC AFFERENT PATHWAYS, by R. Wendt and D. Albe-Fessard. [1961] [37]p. incl. illus. diagrs. refs. (AFOSR-J636) (AF 61-(052)103) AD 414069 Unclassified

Also published in Physiologie de L'Hippocampe; Colloques Internationaux du Centre National de la Recherche Scientifique, Montpellier (France) (Aug. 24-26, 1961), Paris, Centre National de la Recherche Scientifique, No. 107: 171-200, 1962.

The presence of evoked responses to somatic, visual, and auditory stimuli, previously reported by others under different conditions, has been confirmed. Responses to these 3 modalities have a similar waveform and occur in the same area of the amygdala and prepiriform cortex, but with different spatial extent. The lateral and basal nuclei of the amygdala and the prepiriform cortex showed responses to the most extensive regions of the body surface as well as to visual and auditory stimulation. Evoked responses are bilateral, do not show somatotopic organization and occur at a relatively brief latency. Barbiturate anesthesia greatly reduced responses to somatic stimulation. Evidence is presented that (1) the pathway which mediates the amygdaloid response to contralateral anterior limb stimulation relays in the ipsilateral thalamus at the level of the VPL and then in the ipsilateral somatic area II of the cortex; (2) the pathway for the response to the ipsilateral anterior limb stimulation relays in the contralateral thalamus at the level of the VPL, in the contralateral area SII and in the ipsilateral area SII, in that order. Responses in the amygdala to light flash directed in the eye were bilateral and were independent of the pathways which mediate the somatic responses. (Contractor's abstract)

ON PRODUCTS OF STARLIKE FUNCTIONS, by E. P. Merkes, M. S. Robertson, and W. T. Scott. [1961] [5]p. (AFOSR-2814) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-34 and National Science Foundation) Unclassified

Also published in Proc. Amer. Math. Soc., v. 13: 960-964, Dec. 1962.

A function f(z) regular in $|z| < 1$ is starlike of order α if $\mathrm{Re}\{zf'(z)/f(z)\} \geq \alpha$ for $|z| < 1$. It is shown that if $f_n(z)$ is starlike of order $1-d_n \geq 0$ for $n = 1,2, \ldots$, then $F(z) = z\Pi_{n=1}^{\infty} z^{-1} f_n(z)$ is starlike of order $1 - \Sigma_1^{\infty} d_n$ if the product converges uniformly in every subdisk. Application is made to the radius of univalence of a class of entire functions, giving a generalization of a theorem of H. S. Wilf (Ill. Jour. Math., v. 6: 242-244, June 1962).

[SEARCH FOR A METHOD OF STUDYING THE NEUROPHYSIOLOGICAL ACTION OF PSYCHOTROPIC DRUGS IN MAN] Recherche d'une methode d'approche de l'action neurophysiologique de diverses drogues psychotropes chez l'Homme, by J. Paillard, J. Bert and others. [1961] [2]p. (AFOSR-1723) (AF 61(052)95) Unclassified

Also published in Rev. Neurol., v. 104: 227-228, 1961.

A study of the action of various psychotropic drugs (Largactil, 20-28 MD Delelande, and Meprobromate) have been undertaken by simultaneous recording of the EEG and reflex responses of the triceps surae muscles set up by mechanical percussion of the tendon and electrical stimulation of the posterior tibial nerve. The EEG have been subjected to frequences analysis and the use of two test reflexes allowed a differentiation to be made between agents effecting the motoneurons innervating the muscle spindles. The most striking results were seen with 20-28 where in 13 out of 14 subjects the tendon reflexes were rapidly depressed. In 7 cases the Hoffmann reflexes were also depressed although later. The effects are less marked and less constant with Largactil. A slowing of the frequency of the EEG is seen first followed by a depression of the tendon reflexes and afterwards by depression of the Hoffmann reflex. The Meprobromate tends to increase the reactivity of

the monosynaptic reflex and also to increase the variability. Changes in the EEG are constant but occur later. (Contractor's abstract)

THE CONTINUOUS DEPENDENCE OF GENERALIZED SOLUTIONS OF NON-LINEAR PARTIAL DIFFERENTIAL EQUATIONS UPON INITIAL DATA, by A. Douglis. [1961] [18]p. incl. refs. (AFOSR-3299) (AF 49(638)590) Unclassified

Also published in Commun. on Pure and Appl. Math., v. 14: 267-284, Aug. 1961.

In this paper the author considers the Cauchy problem with an initial condition at $t = 0$ for an equation of the form $u_t + F(x, t, u, u_x) = 0$ under the hypothesis that the smooth function $F(x,t,u,p)$ satisfies the condition $F_{pp} \geq 0$. The author defines a generalized solution of the Cauchy problem for this equation in the class of continuous functions, allowing a discontinuity of the first derivative, and for two generalized solutions $u_1(x,t)$, $u_2(x,t)$ of the Cauchy problem he obtains the bound $|u_1(x,t)-u_2(x,t)| \leq e^{ct} \sup |u_1(x,0)-u_2(x,0)|$. From this bound he obtains a uniqueness theorem for the Cauchy problem in the class of discontinuous functions for a quasi-linear equation of the form $u_t + (F(x, t, u))_x = 0$. Consideration is also given to the Cauchy problem for a hyperbolic system of the form $u_t + F(x, t, v_x) = G_1(u, v)$, $v_t - u_x = G_2(u, v)$, where the smooth function F satisfies the conditions $F_p \leq a_0 < 0$, $F_{pp} > 0$, and $G_i(u,v) = A_i(x, t, u, v) + \int_\xi^x K_i(x,t,\xi, x', u(x',t), v(x',t))dx$, $i = 1, 2$. For two generalized solutions u_1, v_1 and u_2, v_2 of the Cauchy problem for this system in the region D, it is established that $I(t) \leq CI(0)$, where $D = \{\alpha + At \leq x \leq \beta - At, 0 \leq t \leq \tau\}$, $A = \max |F_v|$, the constant C depends only on the maximum modulus of u_1, v_1 and u_2, v_2.

$$I(t_1) = \int \left[\left(\frac{u_1(x,t_1)-u_2(x,t_1)}{f(x,t_1)} \right)^2 + (v_1(x, t_1)-v_2)x,t_1))^2 \right] dx,$$

where the integral is taken along the intersection of D with the line $t = t_1$, and $f(x,t) \geq \sqrt{(-a_0)}$. From this theorem a proof is obtained of the uniqueness of a generalized solution of the Cauchy problem in a certain class of discontinuous functions for a quasi-linear system of the form

$$u_t + (F(x,t,v))_x = A(x,t)u + B(x,t)v + E_1(x,t),$$

$$v_t - u_x = C(x,t)u + D(x,t)v + E_2(x,t)$$

under the condition that $F_v < 0$, $F_{vv} > 0$. The author considers generalized solutions having at most discontinuities of shock-wave type. (Math. Rev. abstract)

A NOTE ON REARRANGEMENT COLLISIONS, by T. B. Day, L. S. Rodberg and others. Mar. 22, 1961, 9p. (Technical rept. no. 208) (AFOSR-771) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)24, Atomic Energy Commission, and National Science Foundation) AD 259315 Unclassified

Also published in Phys. Rev., v. 123: 1051-1053, Aug. 1, 1961.

The conventional Born approximation formula for rearrangement collisions is used extensively in both atomic and nuclear physics. This formula contains a direct contribution from the heavy particle or core interaction. A straight forward demonstration shows that for the usual case of a massive core this contribution does not appear, so that the only effect of this interaction is to distort the incident and outgoing waves. Such problems as the post-prior discrepancy are clarified. (Contractor's abstract)

TWO-POINT FUNCTION AND GENERALIZED FREE FIELDS, by A. L. Licht and J. S. Toll. Apr. 8, 1961 [16]p. (Technical rept. no. 210) (AFOSR-772) (AF 49-(638)24) AD 259316 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 59, Feb. 1, 1961.

Also published in Nuovo Cimento, Series X, v. 21: 346-351, July 16, 1961.

Several theorems are proven which relate to the possibility of constructing a noninteracting field with an arbitrary 2-point Wightman function. They are: (a) if $\varphi(x)$ is a complete local field, and $[\varphi(x), \varphi(y)] = D(x - y)$, where D is an arbitrary operator depending on x and y only through their difference, then D is a c-number function; (b) such fields are generalized free fields, as defined by Greenberg; (c) any generalized free field is unitarily equivalent to a superposition of Klein Gordon fields, and moreover the asymptotic condition and unitarity restrict this to a superposition of ordinary free fields with different discrete masses. ASYMMETRY PARAMETER OF Λ DECAY AND THE INTERMEDIATE BOSON OF WEAK INTERACTIONS, by S. Oneda, J. C. Pati, and B. Sakita. [1960] [3]p. incl. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)24], Atomic Energy Commission, and Wisconsin U. Research Committee) Unclassified

Published in Phys. Rev. Ltrs., v. 6: 24-26, Jan. 1, 1961.

It is pointed out that the negative sign of the asymmetry parameter α^- of the $\Lambda \rightarrow p + \pi^-$ decay provides a favorable argument for the conjecture that the V-A four-fermion interaction may be mediated by a vector boson. A related problem has already been discussed in previous work (see item no. 1189, Vol. IV). There, however the arguments were developed under the assumption that the sign of α^- is positive, which was believed to be true at that time. The purpose of the present note is to stress the implications of the negative sign.

ON THE COMMUTATOR OF A FREE KLEIN-GORDON FIELD OPERATOR WITH AN "ARBITRARY" HEISENBERG FIELD OPERATOR (Abstract), by Z. Fried, A. L. Licht, and J. S. Toll. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)24 and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 59-60, Feb. 1, 1961.

The following theorem will be proved: Let $\varphi(x)$ be a free field operator satisfying the Klein Gordon equation with some arbitrary mass m. Then $[\varphi(x), B(y)] = \langle 0|[\varphi(x),B(y)]|0\rangle$, provided that (a) $[B(y),B(z)]_{y_0=z_0} = 0$; (b) $[\varphi(y),B(z)]_{y_0=z_0} = 0$; (c) $[\varphi(x), \Box_y B(y)]_{x_0=y_0} = 0$; and (d) that $\varphi(x),B(y)$ together are complete, i.e., that any operator which commutes with φ and B is a c function.

TEST OF GLOBAL SYMMETRY IN PION-BARYON INTERACTIONS BY K^- + p REACTIONS, by J. C. Pati. [1961] [6]p. incl. refs. [AF 49(638)24] Unclassified

Published in Phys. Rev., v. 123: 705-710, July 15, 1961.

Under the hypothesis that the K-meson interactions do not mask the symmetries of the pion-baryon interactions appreciably, the branching ratios of the K^- + p reactions are studied to test the validity of global symmetry. The T^{-1}-matrix formalism of Matthews and Salam is adopted to calculate the branching ratios. The new Dalitz-Tuan solutions for $\bar{K}N$ scattering lengths, which incorporate the (K^+,

K^0) mass difference and the new branching ratios of the various K^- + p reactions, presented at Kiev, are adopted in the analysis. The errors in the experimental branching ratios are so chosen as to satisfy the Amati-Vitale inequality. It is found that the a^- and b^+ (also a^+, though poorly) Dalitz-Tuan solutions can explain the branching ratios for K^- captured at rest. The extension of the analysis to 30-mev incident K^- mesons under the zero-range approximation leads to very poor agreement with experiments. (Contractor's abstract)

POSSIBILITY OF A SPIN WAVE MAGNETIC MOMENT DETECTOR, by T. B. Day and J. Sucher. [1961] [2]p. (Technical rept. no. 201) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)24 and National Science Foundation) Unclassified

Published in Jour. Appl. Phys., v. 32: 1788-1789, Sept. 1961.

The possibility of a device which would electromagnetically signal the presence of a neutral particle is considered by using the solutions of the combined Maxwell and spin-wave equations. Results indicate that the usual "radiative pole" $k^2 = n^2\omega^2$, is found to be a pole in the integrand of the Green's function only at a direction of observation perpendicular to the applied field H_0. Moreover, at that angle of observation (90°) and in that mode ($k^2 = n^2\omega^2$), it is found that for point charges or magnetic moments, the radiation field vanishes due to the vanishing numerator of the integrand of the Green's function. At another angle of interest, viz. 0° (along H_0), there exist modes which are almost "radiative" and for which the Green's function resonates at a particular frequency. The characteristic modes, and hence the frequencies at which the system "rings" depend on the polar angle of the direction of observation as measured from the direction of H_0. Thus, unless the point charge or point dipole moment is moving in the x direction, so that the Čerenkov cone coincides with a cone of constant polar angle of observation, the "ringing" frequency is expected to be different at different azimuthal angles about the direction of motion of the particle. Finally, while the dependence of the opening angle of the Čerenkov cone on the particle velocity is the same as usual, it is also expected that the resonant radiation will be polarized, that is that the resonant radiation will be met in one of circular polarization H_+ of H_-, but not in both.

THE CONFIGURATION AVERAGE OF THE GROUND STATE ENERGY OF AN ISOTOPICALLY DISORDERED LATTICE, INCLUDING THE CONTRIBUTION FROM CUBIC AND ANHARMONIC TERMS IN THE POTENTIAL ENERGY OF THE LATTICE. APPLICATION TO A LINEAR CHAIN AND THE PARTICULAR CASE OF A HYDROGEN-DEUTERIUM MIXTURE, by R. A. Coldwell-Horsfall and A. A. Maradudin. July 1961 [51]p. (Technical rept. no. 219) (AFOSR-1165) (AF 49(638)399) AD 261438 Unclassified

Deviations from the laws of perfect solutions have been observed in mixtures of light isotopes such as H_2 - D_2 and He^3 - He^4 mixtures. The free energy of the disordered state appears to be always greater than that of the pure isotopes so that phase separation occurs below a certain critical temperature. An expression is obtained for the configuration average of the ground state energy of an isotopically disordered lattice, taking into account the cubic and quartic anharmonic terms in the expansion of the potential energy of the lattice in powers of the nuclear displacements. The obtained result is applied to the case of a linear chain and have calculated the difference between the ground state energy of a disordered linear chain and that of the separated components, for the particular case of an equimolecular mixture of hydrogen and deuterium. The calculation has been carried out to second order in the parameter μ which represents the deviation of the isotopic masses from the mean mass of the lattice. This enables us to compare our result with that of Prigogine et al. It is found that the difference between the ground state energy of the disordered state and that of the separated phases has the value 10.38 cal/mol. The anharmonic contribution to the ground state energy causes this difference to be less than in the harmonic approximation. (Contractor's abstract)

THEORY OF SPIN WAVE INTERACTIONS IN FERROMAGNETISM, by N. I. Greenberg. July 1961 [148]p. incl. refs. (Technical rept. no. 222) (AFOSR-1331) (AF 49(638)399) AD 263805 Unclassified

The interactions of spin waves in an ideal Heisenberg model of a ferromagnet are studied. In particular, the effect of spin wave interactions on the free energy and spontaneous magnetization are examined. Treating a spin wave as a local phenomena, only binary collisions between spin waves need be considered at low temperature. The free energy of the system is developed as an expansion in terms of a binary kernal function; this binary kernal function is determined from the 2 particle propagator, which can formally be evaluated. When the free energy expansion is evaluated, the results of Dyson are obtained. That is, the lowest order correction term introduced in the spontaneous magnetization by spin wave interactions is of order T^4. (Contractor's abstract)

THE FERMI SURFACE FOR AN INTERACTING ELECTRON GAS, by P. Fulde. July 1961 [6]p. incl. diagr. (Technical rept. no. 218) (AFOSR-1908) (AF 49(638)-399) AD 269076 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 35, Feb. 1, 1961.

According to Migdal's theorem the magnitude of the discontinuity in the momentum distribution of an interacting degenerate electron gas is equal to the single-particle renormalization constant. The latter has been calculated from the study of the self-energy of a single-electron excitation. In a similar fashion, the Green's function method also can be applied to the calculation of the entire momentum distribution. The results for the momentum distribution can be compared with those of Daniel and Vosko and of Goldstone obtained by a different method. As a check on the results for the momentum distribution, the total kinetic energy can be calculated. From this, by means of the Virial theorem, the actual ground-state energy can be obtained and compared with the direct calculation by Gell-Mann and Brueckner. (Contractor's abstract)

TRANSVERSE COLLECTIVE OSCILLATIONS IN SUPERCONDUCTORS (Abstract), by R. A. Ferrell. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)399 and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 65, Feb. 1, 1961.

Transverse collective waves in superconductors can be treated similarly to plasmons in a degenerate electron gas. A discrete exciton can separate from the continuum and be pulled down into the energy gap without phonon exchange or Coulomb interaction but as a result of only the magnetic interaction of the quasi-particle and hole. This type of exciton is not an eigenstate of the BCS Hamiltonian and occurs only when the magnetic interaction terms are added to the Hamiltonian. The criterion for the exciton to separate from the continuum is identical to that for free propagation of light at a frequency below the gap frequency. It requires that the positive polarizability due to absorptions above the gap be strong enough to cancel the negative London polarizability. Although more complicated, such an electromagnetic window in the gap is analogous to the well-known optical window of silver films in the near ultraviolet. A further nonnegligible electromagnetic collective effect in superconductors is the excitation of ordinary transverse phonons.

ANHARMONIC CONTRIBUTION TO THE ENERGY OF A DILUTE ELECTRON GAS INTERPOLATION FOR THE CORRELATION ENERGY (Abstract), by W. J. Carr, Jr., R. A. Coldwell-Horsfall, and A. E. Fein. [1961] [1]p. (AF 49(638)399) Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 119, Mar. 20, 1961.

The first anharmonic contribution to the ground state energy of a bcc lattice of electrons, oscillating in a uniform background positive charge, has been calculated. The result is $-0.73r_s^{-2}$ ry, with r_s the radius, in Bohr units, of the sphere equivalent in volume to that occupied per electron. Combining this term with previous results gives for the ground state energy of a dilute electron gas the expression

$$E = E_{exp} - 1.792r_s^{-1} + 2.65r_s - \frac{3}{2} - 0.73r_s^{-2} + 0)r_s - \frac{5}{2}), \text{ where}$$

E_{exp} comes from the overlapping of electronic wave functions and falls off exponentially with $r_s^{\frac{1}{2}}$; while the $r_s^{-\frac{3}{2}}$ terms are, respectively, the Coulomb energy of a bcc lattice and the zero point energy of the electrons. The "correlation" energy corresponding to the above expression as well as the kinetic and potential parts, has been plotted and an interpolation has been made between the low-density curve and the high-density expression of Gell-Mann and Brueckner. The magnitude of the correlation energy so obtained for the intermediate region $2 < r_s < 6$ is approximately 15 to 30% smaller than previous estimates. The interpolated curves give strong evidence that the next term in the above low-density expansion for E is approximately $-0.81r_s^{-\frac{5}{2}}$. On the assumption that the high-density expression is rapidly converging near $r_s = 1$, it also is predicted that the r_s term in the high-density expansion will be approximately $-0.02r_s$.

EFFECTIVE CHARGE OF QUASI-PARTICLES IN A METAL (Abstract), by E. R. Burke and R. A. Ferrell. [1961] [2]p. (AF 49(638)399) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 242-243, Apr. 24, 1961.

According to Stern the charge of a quasi-particle in a metal e* is related to the effective mass m* by the equation $e^*/m^* = e/m$, when only electron-electron interactions play a role and lattice effects can be ignored. The unstarred quantities are the free charge and mass of an electron. Stern has further pointed out that this simple relationship no longer holds when electron-phonon interactions are taking place. An explicit calculation in lowest order perturbation theory of the deviation from Stern's formula has been performed and numerical results will be presented, in which the percentage deviation is expressed in terms of the percentage contribution to the effective mass due to electron-phonon emission and absorption. Since the e/m ratio is modified by the electron-phonon interactions, it is clear that the latter can significantly influence the cyclotron resonance frequency in a metal.

TIME-DEPENDENT PAIR CORRELATION FUNCTION FOR A DEGENERATE FERMION GAS (Abstract), by J. R. Cullen and R. A. Ferrell. [1961] [1]p. (AF 49(638)-399) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 245, Apr. 24, 1961.

Let P^1 be a single-particle projection operator in a

small region of configuration space centered about point 1 and $P_2(t)$ be a corresponding operator at point 2 and at the later time t in the Heisenberg picture. Then van Hove's time-dependent pair correlation function, defined in connection with the scattering properties of the fermion gas, is given essentially by the vacuum expectation value $\langle P_2(t)P_1 \rangle$. On the other hand, the true joint probability of finding a particle at point 1 and, in addition, another particle at point 2 time t later is given by $\langle P_1P_2(t)P_1 \rangle$. These 2 functions can be expected to be identical only for the case t = O, for which the projection operators commute (and $P_1^2 = P_1$). Explicit expressions can be exhibited for the one-dimensional free-fermion gas.

NEUTRON SCATTERING BY CONDUCTION ELECTRONS AS A PROBE OF THE SUPERCONDUCTIVITY ENERGY GAP (Abstract), by W. H. Lupton and R. A. Ferrell. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)399 and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 262, Apr. 24, 1961.

A consideration of the inelastic scattering of neutrons by the conduction electrons in a metal reveals a cross section that is peaked in the forward direction due to the interaction of the neutron magnetic moment with the electronic currents. A phenomenological treatment shows that the cross section is related to the frequency and wave number-dependent conductivity. A degenerate electron gas is used as a model for the normal state of a metal. In a superconductor an electron must receive enough energy to surmount the energy gap, hence the small angle cross section is reduced. The ratio of the cross sections in the superconducting and normal states has been estimated from the conductivity reported by Glover and Tinkham. The scattering by the nuclei of the crystal lattice is also analyzed since it would be an important competing process in a proposed experiment.

GEOMAGNETICALLY TRAPPED ELECTRONS FROM COSMIC RAY ALBEDO NEUTRONS, by A. M. Lenchek, S. F. Singer, and R. C. Wentworth. May 1961 [58]p. incl. diagrs. tables, refs. (AFOSR-677) (AF 49(638)530) AD 258732 Unclassified

Also published in Jour. Geophys. Research, v. 66: 4027-4046, Dec. 1961.

The ability of the cosmic ray neutron albedo mechanism to account for geomagnetically trapped electrons is investigated quantitatively. Injection as a function of energy, pitch angle and altitude is computed from a reasonable neutron albedo model. Loss mechanisms based on Coulomb interactions with the residual atmosphere are considered to act both independently and simultaneously. Slowing down is generally dominant. The electron belt which results has (a) an intensity whose energy spectrum shows a sharp peak at approximately 200 kev, (b) an angular distribution which is approximately isotropic up to the loss cone and (c) an omni-directional, integral intensity in the geomagnetic equatorial plane which is approximately constant vs altitude. The effect of the Capetown magnetic anomaly is shown to produce a slot of only 2% in the equatorial plane. Only a small fraction of the trapped electrons can be accounted for in terms of neutron albedo, essentially all trapped electrons exceeding 400 kev. An auroral component of low energy electrons is also present.

GEOMAGNETICALLY TRAPPED PROTONS FROM COSMIC-RAY ALBEDO NEUTRONS, by A. M. Lenchek and S. F. Singer. July 1961 [93]p. incl. diagrs. tables, refs. (AFOSR-1179) (AF 49(638)530) AD 262797 Unclassified

Also published in Jour. Geophys. Research, v. 67: 1263-1287, Apr. 1962.

Albedo neutrons from galactic cosmic rays are shown to account for the gross features of the observed geomagnetically trapped protons. This source leads to an equilibrium intensity (at altitudes up to several thousand km and at low latitudes) that compares quite favorably with observations, in the shape of the energy spectrum in the spatial distribution, and in the absolute intensity. In

this analysis we take account of the anisotropic emergence of neutrons (above 50 mev) and of nuclear interactions in the oxygen exosphere (above 300 mev). The anisotropy of the albedo in effect steepens the neutron energy spectrum significantly. More detailed features, such as the angular distribution, may also be computed from the neutron albedo theory, but no observations are available for comparison at present. The phenomenon responsible for the absence of trapped protons beyond about 2 earth radii is not yet understood. A number of nonadiabatic mechanisms are compared. Injection resulting from the neutron albedo from solar high-energy particles and the consequent transfer of charged albedo particles from polar latitudes to middle latitudes is examined. PITCH ANGLE DIFFUSION IN A MAGNETIC MIRROR GEOMETRY, by R. C. Wentworth and W. M. MacDonald. [1961] [12]p. (Technical rept. no. 220) (AFOSR-1345) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)530 and Office of Naval Research) AD 263807 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 53, Feb. 1, 1961.

The diffusion in pitch angle produced by Coulomb collisions of charged particles in a magnetic mirror was discussed using a variety of distribution functions and corresponding diffusion equations. A new derivation of an appropriate diffusion equation is presented by considering the random motion of particles on a sphere in momentum space. The effect of scattering at different points of the periodic particle orbit must be considered and leads to corrections on this problem. One result is that with a reflecting barrier instead of a loss-cone, the equilibrium flux tends toward an isotropic pitch angle distribution. (Contractor's abstract)

GEOMAGNETICALLY TRAPPED RADIATION, by S. F. Singer and A. M. Lenchek. Aug. 1961, 137p. incl. diagrs. tables, refs. (Technical rept. no. 224) (AFOSR-1518) (AF 49(638)530) AD 265769 Unclassified

Also published in Prog. in Cosmic Ray Phys., v. 6: 245-335, 1962.

The neutron albedo theory is reviewed in detail with respect to protons and electrons to show to what extent it can account for the photographic emulsion and electron spectrometer experiments in rockets. The general principles of charged particle motion in the geomagnetic field are discussed by employing the adiabatic invariants. The general relations between unidirectional intensity, angular distributions and omnidirectional intensity are summarized. The properties of the upper atmosphere and exosphere are summarized since they are of prime importance in determining the distribution of trapped radiation. Cosmic ray neutron albedo theory, a specific mode of origin for electrons, is investigated quantitatively. It is concluded that only trapped electrons >400 kev (a very small fraction of the trapped electrons) can be accounted for by this theory. The factors determining the lifetimes of trapped protons are discussed and the contribution to the trapped protons by albedo from solar flare cosmic rays has been estimated.

THEORY OF MAGNETIC STORMS, by S. F. Singer. [1961] [9]p. incl. diagrs. refs. [Technical rept. no. 233] (AF 49(638)530) Unclassified

Presented at Internat'l. Conf. on Cosmic Rays and the Earth Storm, Kyoto (Japan), Sept. 4-15, 1961.

Published in Jour. Phys. Soc. Japan, v. 17, Suppl. A-I: 329-337, Jan. 1962.

This present paper stems from an earlier one, which put forward a new model of the magnetic storm—certain hypotheses of the earlier paper were the subject of controversy and others were proved incorrect. These are pointed out in the present work. The suggestion that

charged particles may become permanently trapped in the geomagnetic field has, however, been widely accepted. Objections to the ring current theory are considered, as is the shock wave mechanism of generation of the sudden commencement (SC). The effects of the distorted non-dipole field of the earth are also approached. It is suggested that satellite observations may fix the position of the SC current system.

INJECTION OF TRAPPED PROTONS FROM SOLAR FLARE PARTICLES, by A. M. Lenchek and S. F. Singer. [1961] [5]p. incl. diagrs. (AF 49(638)530) Unclassified

Presented at Internat'l. Conf. on Cosmic Rays and the Earth Storm, Kyoto (Japan), Sept. 4-15, 1961.

Published in Jour. Phys. Soc. Japan, v. 17, Suppl. A-II: 123-127, Jan. 1962.

Protons coming from the sun cannot be trapped directly. An injection mechanism is calculated as follows: Solar protons arriving at the polar cap produce albedo neutrons, some of which decay within the geomagnetic field at lower latitudes. In the decay, protons are released, most of which are dumped into the atmosphere at lower latitudes but some of which are trapped. The injection coefficients of these two cases are calculated as well as absolute intensities for typical solar events. The newly trapped protons show some peculiar properties when compared to the protons injected by the galactic cosmic rays. They exhibit a peculiar angle distribution and therefore spatial distribution with a depression of omnidirectional intensity in the equatorial plane. Their decay proceeds with the development of a peak in the energy spectrum which moves upward as time progresses. (Contractor's abstract)

NATURE AND ORIGIN OF RADIATION BELTS, by S. F. Singer. [1961] [7]p. incl. diagrs. refs. (AF 49(638)-530) Unclassified

Presented at Internat'l. Conf. on Cosmic Rays and the Earth Storm, Kyoto (Japan), Sept. 4-15, 1961.

Published in Jour. Phys. Soc. Japan, v. 17, Suppl. A-II: 187-193, Jan. 1962.

Recent developments in the neutron albedo theory are reported and the results are compared with observational data. For protons the calculated energy spectrum agrees extremely well with the observed spectra, provided nuclear interactions and an anisotropic emission of albedo neutrons are taken into account. The spatial distribution is calculated on the basis of the determination of geometric injection coefficients. The lifetime is assumed to be controlled by exospheric densities close to the earth and determined by the breakdown of the adiabatic invariance of magnetic moment at larger distances. This leads to a maximum intensity at about 1½ earth radii and a virtual disappearance of protons at about 2 earth radii. The absolute intensities of trapped protons calculated from neutron albedo theory and the most reasonable exospheric models are in very good agreement with observations in nuclear emulsions. From neutron albedo calculations are made of the properties of the resulting trapped electrons. The lifetime is a particularly challenging problem. It is concluded that only a fraction of the observed trapped electrons can be of neutron albedo origin. The remainder, and particularly the large bulk of low energy electrons are locally accelerated, with the energy ultimately derived from the sun. (Contractor's abstract)

Presented at Internat'l. Conf. on Cosmic Rays and the Earth Storm, Kyoto (Japan), Sept. 4-15, 1961.

Published in Jour. Phys. Soc. Japan, v. 17, Suppl. A-II: 583-586, Jan. 1962.

Transient decreases in the intensity of galactic cosmic radiation are known to be associated with the arrival at the earth of large clouds of magnetized solar plasma. The large scale of the phenomenon indicates that the clouds expand significantly while crossing the solar system. An interpretation is given based on the assumption that the plasma is magnetically turbulent. Cosmic rays which enter the coud then execute a random-walk motion in space. While within the expanding cloud they must lose energy in an inverse Fermi mechanism and by betatron action in the weakening magnetic field. The energy spectrum within the cloud is depressed below the galactic spectrum. The spectrum is calculated in the isotropic approximation using age-diffusion theory, considering only the effects of spatial diffusion and energy-loss. Convection is neglected. Several prominent features of observed decreases are thereby accounted for. (Contractor's abstract)

PLASMA SHEATH AND SCREENING AROUND A RAPIDLY MOVING BODY, by E. H. Walker. Mar. 1961 [27]p. incl. diagrs. (AFOSR-460) (AF 49(638)899) AD 253850 Unclassified

Presented at meeting of the Amer. Astronaut. Soc., Washington, D. C., Mar. 17, 1961.

The distribution of the potential and the charge density is derived quite generally for a stationary charged sphere and for a charged body moving rapidly through a plasma. Previous treatments were restricted to the cases where either the body's potential was small, being limited to less than 5 times the plasma temperature, or the body was small compared to the Debye length, or the body was moving slowly compared to the ion velocity. (Contractor's abstract)

IONOSPHERE OF THE MOON (Abstract), by S. F. Singer and E. H. Walker. [1961] [2]p. (AF 49(638)899) Unclassified

Published in Program Joint Meeting of the Internat'l. Scientific Radio Union, U.S.A. Nat'l. Committee, and Inst. of Radio Engineers, Georgetown U., Washington, D. C., May 1-4, 1961.

A peculiar kind of "ionosphere" is shown to exist near the lunar surface. Unlike the usual ionosphere, the lunar electron layer is not caused by photoionization of an existing neutral atmospheric gas. Instead bombardment by solar UV photons leads to photo emission from the lunar surface and to the formation of a space charge limited "electronosphere" having a density of $\sim 10^4$ cm^3 at the surface. The electric field produced can exert considerable forces on positively charged dust particles which may exist near the lunar surface and be liberated by meteor impact. With an appreciable density of dust particles, the space charge is reduced and the ionosphere can expand to altitudes of several meters with enhanced electron densities. Therefore, on the moon there exists a dust ionosphere made up of positively charged dust particles and negative electrons. (Contractor's abstract)

ELECTROSTATIC SCREENING OF BODIES IN SPACE, by S. F. Singer and E. H. Walker. Sept. 1961 [16]p. incl. diagrs. (Technical rept. no. 226) (AFOSR-1399) (AF AFOSR-61-57) AD 263806 Unclassified

Also published in Icarus, v. 1: 7-12, May 1962. (Title varies)

Bodies in space subject to the solar ultraviolet flux will emit photoelectrons. A certain number of these escape and are balanced by the accretion of thermal electrons from the surrounding plasma. For a positively charged body, a much larger number of photoelectrons is released from the surface but do not escape because their energy is insufficient to do so. Their effect is to produce an inner screening of the body's electric charge. This screening is calculated for spherical bodies as a function of size. For large bodies the space charge density of photoelectrons becomes quite large; in the case of the Moon it reaches a value of the order of 10^3 to 10^4 electrons/cm^3 just above the lunar surface. For small dust particles, however, the photoelectric cloud becomes negligible. (Contractor's abstract)

INTERACTION OF WEST FORD NEEDLES WITH EARTH'S MAGNETOSPHERE AND THEIR LIFETIME, by S. F. Singer. 1961, 10p. incl. tables, refs. (Technical rept. no. 227) (AFOSR-1400) (AF AFOSR-61-57) AD 263649 Unclassified

Also published in Nature, v. 192: 303-306, Oct. 28, 1961.

Certain aspects of the interaction of the West Ford medium with the exosphere, in particular the interaction of the electric charge, which the needles are certain to carry with the ionized portion of the exosphere are examined. The possibility of making unique observations which can help establish the important parameters of this interaction is pointed out. Numerical predictions of orbit changes and a useful modification of the experiment are suggested.

INTERACTION OF WEST FORD NEEDLES WITH EARTH'S MAGNETOSPHERE AND THEIR LIFETIME, by S. F. Singer. [1961] [2]p. (AFOSR-1400A) (Bound with its AFOSR-1400; AD 263649) (AF AFOSR-61-57) Unclassified

Also published in Nature, v. 192: 1061, Dec. 1961.

It is generally believed that the pressure of solar radiation will bring down the copper needles which were to be placed in orbit for the West Ford experiment in about 7 yr provided they are launched into a resonant orbit. Shapiro and Jones (Science, v. 134: 973, 1961) show that if the semi-major axis of the orbit is changed by more than 150 km, the resonance would be destroyed and the lifetime greatly increased. The author corrects a previous publication value on the problem of the drag of a charged body moving through a plasma (item no. 1446, Vol. V) and arrives at the conclusion that not only will the drag spoil the resonance but also it will, in all likelihood, provide an upper limit for the lifetime which amounts to a few months, possibly as much as 3 years.

ON CALCULATING WEAK SOLUTIONS OF QUASI-LINEAR, FIRST-ORDER PARTIAL DIFFERENTIAL EQUATIONS, by A. Douglis. [1961] [36]p. incl. refs. (AF 18(600)573) Unclassified

Published in Contrib. Differential Equations, v. 1: 59-94, 1963.

To establish convergence, some results of independent interest in the theory of semi-monotonic functions are developed which satisfy a one-sided Lipschitz condition of the form $(f(x'') - f(x'))/f(x'' - x') \leq A$, or else a similar inequality with the direction reversed. It is shown that for $f(x,t)$ defined on the square $0 \leq x \leq 1$, $0 \leq t \leq 1$ and satisfying $f(x,t) \leq A/2$, and for $f(x,t)$ semi-monotonic in t for fixed x, and semi-monotonic in x for fixed t, the Riemann integral of $f(x,t)$ exists on S. RADIATION BY A LARGE-AMPLITUDE PLASMA OSCILLATION, by D. A. Tidman and G. H. Weiss. Mar. 1961, 10p. (Technical note no. BN-236) (AFOSR-479) (AF 18(600)1315) AD 254031 Unclassified

Also published in Phys. Fluids, v. 4: 866-868, July 1961.

The amount of energy radiated away by a longitudinal wave localized in a zero-temperature plasma and oscillating with the plasma frequency $\omega_e = [4\pi N_0 e^2/m]^{\frac{1}{2}}$ is calculated. This radiation process is treated by carrying the perturbation theory for small-amplitude waves to second order. In second order the coupling of the longitudinal oscillating electric field E_L and the transverse field E_T enter into the linear theory in such a way that the radiation emitted comes off at the second harmonic, $2\omega_e$, of the plasma frequency.

ON MAGNETOHYDRODYNAMIC STABILITY OF A SELF-GRAVITATING PLASMA, by R. K. Jaggi. Feb. 1961, 25p. incl. tables. (Technical note no. BN-231) (AFOSR-747) (AF 18(600)1315) AD 257449 Unclassified

Also published in Zeitschr. Astrophys., v. 54: 190-199, 1962.

Boundary conditions are deduced which apply on the free surface of a self-gravitating plasma. These equations are applied to study the stability problems of a self-gravitating plasma. It is proved that the stable length of the compression waves in an infinite homogeneous plasma is increased by the presence of a uniform magnetic field. The stability of a self-gravitating plasma cylinder of infinite length is worked out and it is seen that a magnetic field of the order of 5.10^{-6} gauss increases the stable length of the plasma cylinder by more than 10 times. STATISTICAL PROPERTIES OF LOW-DENSITY TRAFFIC, by G. [H.] Weiss and R. Herman. July 1961 [18]p. incl. diagrs. refs. (Technical note no. BN-254) (AFOSR-1080) (AF 18(600)1315) AD 262260 Unclassified

Also published in Quart. Appl. Math., v. 20: 121-130, July 1962.

An infinitely long line of traffic moving on a highway without traffic lights or other inhomogeneities is studied. It is assumed that each car travels at a constant speed which is a random variable. A further assumption is that when one car overtakes another, passing is always possible and occurs without change of speed. It is shown that any initial headway distribution must relax to a negative exponential distribution in the limit of t becoming infinite. The statistics of passing events are examined, and it is shown that the probability of passing or being passed by n cars in time t is described by a Poisson distribution. (Contractor's abstract)

THE RELAXATION OF MOMENTS DERIVED FROM A MASTER EQUATION, by K. E. Shuler, K. Andersen, and G. H. Weiss. Nov. 1961, 22p. (Technical note no. BN-264) (AFOSR-1688) (In cooperation with National Bureau of Standards) (AF 18(600)1315) AD 266574 Unclassified

Also published in Jour. Math. Phys., v. 3: 550-556, May-June 1962.

A study has been made of the relaxation of the moments of probability distributions whose time evolutions are governed by a master equation. The necessary and sufficient condition for the first moment, $M_1(t)$, to undergo a simple exponential relaxation is found to be $\sum_{n=0}^{\infty} nA_{nm} = \beta m + \gamma$, where A_{nm} is the transition probability per unit time for transitions from state m to n, and where β and γ are constants. The necessary and sufficient condition under which the first k moments, $M_1(t)$, $M_2(t)$ ... $M_k(t)$, satisfy a closed system of linear equations is found to be $\sum_{n=0}^{\infty} n^r A_{nm} = \sum_{i=0}^{k} \beta_{ri} m^i$. Near equilibrium all the moments $M_r(t)$ obey, to a good approximation, a simple exponential relaxation law irrespective of the form of the A_{nm}. For systems described by the Fokker-Planck equation

$$\frac{\partial P(x,t)}{\partial t} = -\frac{\partial}{\partial x}\left[b_1(x)\,P(x,t)\right] + \tfrac{1}{2}\frac{\partial^2}{\partial x^2}\left[b_2(x)P(x,t)\right],$$

the necessary and sufficient condition that the first moment $M_1(t)$ undergo a simple exponential relaxation is found to be $b_1(x) = \beta X + \gamma$ and the necessary and sufficient condition for the second moment, $M_2(t)$ to have a simple exponential relaxation is $2 \times b_1(x) + b_2 = \beta_{22}x^2 + \gamma_2$. It is shown that these conditions are equivalent to the conditions on the A_{nm} stated above.

COMMENTS ON RADIATION BY PLASMA OSCILLATIONS, by D. A. Tidman. [1961] [1]p. (AFOSR-1806) (AF 18(600)1315) Unclassified

Also published in Phys. Fluids, v. 4: 1186, Sept. 1961.

In a recent paper (item no. 1449, Vol. V), it is found that the amount of electromagnetic radiation produced by plasma oscillations colliding with a small inhomogeneity in a plasma became exponentially small for wavelengths of the plasma oscillations less than the density gradient scale L. An appreciable amount of radiation from this gradient-coupling would presumably only be produced by plasma oscillations incident on steep gradients, for example, at the boundaries of a plasma or at shock surfaces in the plasma. The purpose of this report is to correct an algebraic error, which in no way alters the above conclusion, and to make some additional comments on this problem.

THE STABILITY OF THE PINCH WITH ANISOTROPIC

PRESSURE, by R. K. Jaggi. Dec. 1961 [27]p. incl. diagr. refs. (Technical note no. BN-269) (AFOSR-1896) (AF 18(600)1315) AD 269252 Unclassified

Also published in Nuclear Fusion, v. 2: 78-83, Sept. 1962.

A dispersion equation is obtained for the stability of the pinch from the hydromagnetic equations supplemented by an equation for the pressure tensor of the ions. The dispersion equation is obtained for the marginal instability case only. It is observed that this dispersion equation coincides with the dispersion equation obtained from the Chew, Goldberger and Low equations for the marginal instability case. It is concluded that the region of stability predicted from the equations which were used is slightly more than that given by the kinetic equation used by Chandrasekhar, Kaufmann and Watson.

LIMITING OPTICAL FREQUENCIES IN ALKALI HALIDE CRYSTALS, by A. A. Maradudin and G. H. Weiss. [1961] [9]p. incl. refs. [AF 18(600)1315] Unclassified

Published in Phys. Rev., v. 123: 1968-1976, Sept. 15, 1961.

Rosenstock has pointed out that on the basis of symmetry arguments that the frequencies of the 3 optical branches of an ionic crystal in the limit of infinite wavelengths are all equal. This result is in contrast with the relation $(\omega_l/\omega_t) = (\epsilon_0/\epsilon_\infty)^{\frac{1}{2}}$ due to Lyddane, Sachs, and Teller, where ω_l and ω_t are the limiting longitudinal and transverse frequencies and ϵ_0 and ϵ_∞ are the static and high-frequency dielectric constants, respectively. By use of Kellermann's model for NaCl, the small-k expansions of the elements of the dynamical matrix for a finite spherical crystal of radius R are obtained. It is found that, if the limit $k \to 0$ is taken before the limit $R \to \infty$, the 3 optical frequencies are all equal, while if the order of taking limits is reversed the result of Lyddane, Sachs, and Teller is obtained. These conclusions are in agreement with Rosenstock's result, and with remarks of Fröhlich, and provide an explicit expression for the infrared frequency in the finite-crystal case. A similar calculation for Wigner's low density electron crystal yields the result that in a finite spherical crystal the limiting frequencies of the 2 transverse branches and the 1 "longitudinal" branch are all equal. The possibility of the experimental observation of these effects is discussed. (Contractor's abstract)

EXTENSION OF THE RANGE OF VALIDITY OF THIRRING'S EXPANSION FOR THE SPECIFIC HEAT OF CRYSTALS, by R. A. Sack, A. A. Maradudin, and G. H. Weiss. [1961] [5]p. incl. tables, refs. (Sponsored jointly by [Air Force Office of Scientific Research under AF 18(600)1315] and National Science Foundation) Unclassified

Published in Phys. Rev., v. 124: 717-722, Nov. 1, 1961.

In 1913, Thirring obtained an expansion for the vibrational contribution to the specific heat of a crystalline solid in powers of $1/T^2$. The coefficients of this series are proportional to successive moments of the frequency spectrum. In its original form, Thirring's expansion converges only for $T > T_a$, where $T_a = \hbar\omega_L/2\pi k$ and ω_L is the max normal mode frequency, and because of slow convergence, it is useless from a numerical point of view for $T < 4T_a/3$. The range of convergence of the expansion can be extended to absolute zero and its computational usefulness down to $T \approx 2T_a/3$ by means of a Euler transformation, which effectively converts it into

an expansion in $1/(T^2 + T_b^2)$ with $T_b \approx T_a$. The improvement in convergence is so efficient that, usually, only the first 6 or 7 even moments are required to obtain 4-figure accuracy at $T = T_a$. Alternatively, nonlinear transformations can be applied if the specific heat is to be calculated for a few values of temperature only. Some examples of the use of these methods are presented. Conversely, Euler's transformation provides a means for a more detailed description of the frequency distribution from specific heat measurements. (Contractor's abstract)

EFFECT OF COULOMB SCATTERING ON TWO-STREAM INSTABILITIES IN A PLASMA (Abstract), by D. A. Tidman. [1961] [1]p. [AF 18(600)1315] Unclassified

Presented at meeting of the Amer. Phys. Soc., Colorado Springs, Colo., Nov. 15-18, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 140, Feb. 23, 1962.

A theoretical study has been made of the effect that a small amount of 2-body scattering has on the 2-stream instability that occurs in a plasma of contrastreaming electrons and ions. This was done by making a perturbation expansion in the electron-ion collision frequency and then calculating the correction to the perturbation electric field of an unstable wave to first order in the collision frequency. It is found that as the streaming kinetic energy is thermalized, enhanced Landau damping competes with the growth of an unstable perturbation. This takes the form of a loss of energy of a perturbation through an interaction between the electric field of a wave and scattered electrons in the stream. The Fokker-Planck scattering formulae were used to account for the gradual thermalization of the electron stream through a large number of distant Coulomb encounters. Simple relaxation scattering formulae which do not contain this diffusion nature in velocity space of the thermalization of the streams may give misleading results.

INSTABILITY OF CONTRASTREAMING PLASMAS WITH RESONANCE DISTRIBUTION FUNCTIONS, by F. Ek, S. L. Kahalas, and D. A. Tidman. [1961] [6]p. incl. diagrs. table, refs. [AF 18(600)1315] Unclassified

Published in Phys. Fluids, v. 5: 328-323, Mar. 1962.

An analysis is made of the instability of waves in contrastreaming plasmas. The unperturbed distribution function, which occurs in the dispersion relation, is taken to be a resonance function of the form $f_0(v) = (v^2 + V^2)^{-3}$, where V is related to the thermal velocity. The case of identical contrastreaming plasmas is analyzed in 2 phases: an electron instability which may arrest the streaming motion and an electron-ion instability involving the static, heated electrons and the ion streams. Critical temperatures for these instabilities are determined and compared with results obtained from Maxwellian distribution functions. Stability criteria for arbitrary temperatures are obtained with the resonance function. Growth rates over the band of allowed wave numbers are given for both phases of instability. SOME INTEGRAL INEQUALITIES FOR UNIFORMLY ELLIPTIC OPERATORS, by J. H. Bramble and L. E. Payne. Apr. 1961, 11p. (Technical note no. BN-239) (AFOSR-556) (AF 49(638)228) AD 255477 Unclassified

Also published in Contrib. Differential Equations, v. 1: 129-135, 1963.

Certain inequalities are derived which lead to bounds for solutions of mixed boundary value problems for second order elliptic partial differential equations. (Contractor's abstract)

1470

Maryland U. Inst. for Fluid Dynamics and Applied Mathematics, College Park.

BOUNDS FOR SOLUTIONS OF SECOND ORDER ELLIPTIC PARTIAL DIFFERENTIAL EQUATIONS, by J. H. Bramble and L. E. Payne. Apr. 1961, 53p. incl. refs. (Technical note no. BN-237) (AFOSR-590) (AF 49(638)228) AD 256019 Unclassified

Also published in Contrib. Differential Equations, v. 1: 95-127, 1963.

Pointwise a priori bounds are obtained for the solution of the Dirichlet problem associated with a rather general second order elliptic differential operator. These bounds involve only integrals of the data itself and not of its derivatives. Furthermore, the bounds obtained are applicable at any point in the domain of definition (i.e., up to the boundary of the region). (Contractor's abstract)

1471

Maryland U. Inst. for Fluid Dynamics and Applied Mathematics, College Park.

SOME HIGHER ORDER INTEGRAL IDENTITIES WITH APPLICATION TO BOUNDING TECHNIQUES, by J. H. Bramble and B. E. Hubbard. Apr. 1961, 32p. (Technical note no. BN-241) (AFOSR-759) (In cooperation with Naval Ordnance Lab., Silver Spring, Md.) (AF 49(638)228) AD 256902 Unclassified

Also published in Jour. Research Nat'l. Bur. Stand., v. 65B: 261-268, 1961.

A certain class of integral identities is derived. These identities relate integrals of derivatives of a function u over the boundary C of a region R to integrals of derivatives of $\frac{u}{R}$. The highest order derivatives appear in the form of derivatives of a certain differential operator. An application of the identities to the problem of obtaining bounds for the derivatives of the solution of a certain boundary value problem is given. (Contractor's abstract)

1472

Maryland U. Inst. for Fluid Dynamics and Applied Mathematics, College Park.

POINTWISE BOUNDS IN PARABOLIC AND ELLIPTIC PARTIAL DIFFERENTIAL EQUATIONS, by F. J. Bellar, Jr. May 1961, 148p. incl. refs. (Technical note no. BN-246) (AFOSR-760) (AF 49(638)228) AD 256984 Unclassified

A method is presented for obtaining explicit upper and lower pointwise bounds for the solution of rather general interior boundary value problems. The differential equations associated with these problems are of the elliptic type in certain sections while both linear and non-linear parabolic equations are the subject of investigation in other sections. The bounds which are obtained are in terms of the integrals of the squares of known functions and hence, in the linear case, improvement is possible using the Rayleigh-Ritz technique. (Contractor's abstract)

1473

Maryland U. Inst. for Fluid Dynamics and Applied Mathematics, College Park.

ON A CLASS OF SINGULAR SOLUTIONS OF THE EULER-POISSON-DARBOUX EQUATION, by D. K. Suschowk. Apr. 1961, 30p. incl. refs. (Technical note no. BN-238) (AFOSR-634) (AF 49(638)228) AD 258929 Unclassified

Also published in Arch. Rational Mech. Anal., v. 11: 50-61, 1962.

The relations between a class of singular solutions of the Euler-Poisson-Darboux equation and the (regular) solutions of Weinstein-Lions are investigated. A modified radiation problem is formulated and reduced to Weinstein's generalized radiation problem. Finally, another problem is exhibited, which admits a uniquely determined solution in the case where neither the generalized nor the classical radiation problem has a non-trivial solution. This problem, moreover, is always possible, as long as the real part of the parameter occurring in the Euler-Poisson-Darboux equation is positive.

Maryland U. Inst. for Fluid Dynamics and Applied Mathematics, College Park.

BOUNDS ON APSIDAL ANGLES, by F. T. Metcalf. July 1961, 58p. incl. refs. (Technical note no. BN-250) (AFOSR-967) (AF 49(638)228) AD 259978 Unclassified

A new technique is developed for obtaining upper and lower bounds on the apsidal angle which occurs in certain problems of mechanics. The motion of a particle on a surface of revolution may be shown to take place between 2 horizontal planes cutting the surface. The particle moves periodically from 1 level to the other and then back again. As the particle moves from the lowest level of motion to the highest, the corresponding increase in the azimuth is called the apsidal angle. For the spherical pendulum the bounds which are derived constitute the well-known inequalities of Puiseux and Halphen. In the case of the heavy symmetrical top the bounds obtained by W. Kohn are derived. In both instances the advantage of this method is a simplification due to the elimination of the need for contour integration. This technique also permits new cases to be considered; namely, the motion of a particle on a paraboloid of revolution and on a spheroid. A result concerning motion on an arbitrary surface of revolution is also obtained. (Contractor's abstract)

ON THE GEOMETRIC CHARACTER OF SINGULARITY

MANIFOLDS FOR HARMONIC FUNCTIONS IN THREE VARIABLES. I, by R. P. Gilbert. Sept. 1961, 18p. (Technical note no. BN-256) (AFOSR-1405) (AF 49-(638)228) AD 263809 Unclassified

Also published in Arch. Rational Mech. Anal., v. 9: 352-360, 1962.

The singularities of harmonic functions in three variables is investigated. This is done by considering harmonic functions generated by the Whittaker-Bergman operator, and the connections between the singularities of these functions and those of the associated functions of two complex variables. Several theorems are obtained concerning the nature of these singularities by using the methods of projective differential geometry. (Contractor's abstract)

SOME UNIQUENESS THEOREMS IN THE THEORY OF ELASTICITY, by J. H. Bramble and L. E. Payne. Oct. 1961, 21p. incl. refs. (Technical note no. BN-261) (AFOSR-1530) (AF 49(638)228) AD 264661 Unclassified

Also published in Arch. Rational Mech. Anal., v. 9: 319-328, 1962.

It is known that in the first boundary value problem of classical elasticity the range of values of Poisson's ratio for which the solution is unique may be extended to include values outside the range of physical interest. It is shown that certain other interesting boundary value problems in classical elasticity have unique solutions for an extended range of values of Poisson's ratio. Such results may prove useful in non-linear elasticity. (Contractor's abstract)

ON A MIXED BOUNDARY-VALUE PROBLEM FOR LINEAR HYPERBOLIC PARTIAL DIFFERENTIAL EQUATIONS IN TWO INDEPENDENT VARIABLES, by A. K. Aziz and J. B. Diaz. [1961] [28]p. incl. table, refs. (AFOSR-3156) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(6' ?)228, National Science Foundation, and Naval Ordnance Lab.) Unclassified

Also published in Arch. Rational Mech. Anal., v. 10: 1-28, 1962.

The hyperbolic equation $u_{xy} + au_x + bu_y + cu = d$, where a, b, c, d are continuous functions of (x,y) is considered. The following boundary-value problem is considered: Let R be a closed rectangle in the (x,y)-plane with sides parallel to the axes and opposite vertices at (0,0) and (x, y) in the first quadrant. Let Γ_1, Γ_2 be continuous curves issuing from the origin, with equations $y = f_1(x)$, $0 \le x \le x_0$, $x = f_2(y)$, $0 \le y \le y_0$, and lying entirely in R. It is required to find a solution in R of the differential equation, which is of class C′ with continuous mixed derivative u_{xy}, and which is subject to the boundary conditions $\alpha_0 u + \alpha_1 u_x + \alpha_2 u_y = \sigma$ on Γ_1; $\beta_1 u + \beta_1 u_x + \beta_2 u_y = t$ on Γ_2, $u(0,0) = \gamma$. The coefficients α_k, σ; β_k, t vary continuously on Γ_1, Γ_2 respectively. Existence and uniqueness theorems in each of three classes are obtained. In class I, α_1 and β_2 are non-vanishing; α_2 and β_1 vanish identically. In class II, α_1 and β_2 are non-vanishing; the coefficients satisfy compatability conditions at the origin. In class III, α_1, α_2, β_1, β_2 all vanish identically. In addition, a critique of previous solutions and purported solutions of a number of special cases of the boundary-value problems is presented. (Math. Rev. abstract)

ON A MEAN-VALUED THEOREM OF THE DIFFERENTIAL CALCULUS OF VECTOR-VALUED FUNCTIONS, AND UNIQUENESS THEOREMS FOR ORDINARY DIFFERENTIAL EQUATIONS IN A LINEAR-NORMED SPACE, by A. K. Aziz and J. B. Diaz. [1961] [19]p. incl. refs. (AFOSR-J426) (AF 49(638)228) AD 407247 Unclassified

Presented at meeting of the Amer. Math. Soc., Jan. 25, 1961.

Also published in Contrib. Differential Equations, v. 1: 251-269, 1963.

Let x be a mapping of a compact interval $\bar{I} = [a, b]$ into a (real or complex) normed space X which is differentiable in I and such that $\lim_{t \to a} x(t) = x(a)$, $\lim_{t \to b} x(t) = x(b)$. It is shown that under these assumptions there exists a $\xi \in I$ for which $\|[x(b) - x(a)]/(b-a)\| \leq \|x'(\xi)\|$. This result is used to prove the following uniqueness theorems for differential equations $x' = f(t,x)$ in which f is a mapping of $J \times X$ into X, where $J = (t_0, t_0 + a)$. Let $x_0 \in X$ be arbitrary. Suppose either there is a constant $L \geq 0$ such that $\|f(t,x) - f(t,x_1)\| \leq L\|x-x_1\|$ for every $t \in J$ and every x, x_1 in X, or $\|f(t,x)-f(t,x_1)\| \leq (t-t_0)^{-1}\|x-x_1\|$ for every $t \in J$ and every x, x_1 in X and f has a limit at (t_0, x_0). Then there is at most one continuous mapping x of $(t_0, t_0 + a)$ into X which is differentiable in J such that $x'(t) = f(t, x(t))$ for every $t \in J$ and $x(t_0) = x_0$. An analogous result is also proved when, in addition, the value of the derivative of x at t_0 is prescribed. (Math. Rev. abstract)

EXISTENCE OF SOLUTIONS OF AN n^{-th} ORDER HYPERBOLIC PARTIAL DIFFERENTIAL EQUATION, by J. Conlan and J. B. Diaz. [1960] [13]p. (AFOSR-64-0359) (AF 49(638)228) AD 434506 Unclassified

Presented at meeting of the Amer. Math. Soc., Pasadena, Calif., Nov. 1960.

Also published in Contrib. Differential Equations, v. 2: 277-289, 1963.

The existence of a solution of the classical initial value problem for an ordinary differential equation can be proved by, among other methods, Picard's method of successive approximations, by the Euler-Cauchy polygon method, and by what may be called the method of Weierstrass approximating polynomials. In Picard's method, the function f(x,y) is assumed to be continuous in (x,y) and to satisfy a Lipshitz condition in the variable y; and it is proved that a solution of the given equation exists and is unique. In the Euler-Cauchy polygon method, the function f(x,y) is only assumed to be continuous, and the existence of at least one solution is proved (uniqueness need not hold in this case). In the third method the function f(x,y), as in the Euler-Cauchy polygon method, is only supposed to be continuous in (x,y). Hence, from Weierstrass' theorem concerning the approximation of continuous functions by polynomials, there is a sequence of polynomials which converges uniformly to f(x,y). By the Picard method of proof (or by any other method of proving existence of a solution of the given equation which employs the Lipshitz condition) it follows that there exists a sequence of solutions. The sequence on functions is equibounded and equicontinuous. (Contractor's abstract)

A SPHERE THEOREM FOR THE EQUATIONS OF ELASTICITY, by J. H. Bramble. [1961] [6]p. [AF 49-(638)228] Unclassified

Published in Zeitschr. Angew. Math. und Phys., v. 12: 1-6, Jan. 25, 1961.

The problem of the sphere with an elastically supported boundary is treated. The solutions for the interior problem, rather than the exterior problem are given, although the two are not essentially different. The free and mixed boundary cases, given by Collins, are limiting cases of the elastically supported boundary. These are included also since the forms of the solutions are quite different from those given by Collins. The components of the displacement and stress are dealt with in rectangular coordinates and because of the symmetry of the sphere the 3 components of the displacement vector are given as a single indexed quantity. SHOCK WAVES IN RADIATION-MAGNETO-GAS DYNAMICS, by S. I. Pai and A. I. Speth. [1961] [17]p. incl. diagrs. (Technical note no. BN-223) (AFOSR-38) [AF 49(638)401] AD 249846 Unclassified

Also published in Phys. Fluids, v. 4: 1232-1237, Oct. 1961.

The general Rankine-Hugoniot relations for a normal shock wave in radiation-magnetogasdynamics are investigated. These relations differ considerably from those without radiation effects, particularly for the case that the gas is initially so hot that the radiation pressure is not negligible. For a given strength of the shock wave, the temperature jump across the shock with radiation effect is much smaller than that without radiation effect. Various limiting cases are discussed. In certain cases, the results may be expressed in terms of an effective ratio of specific heats and an effective gas pressure. A general method of solution by successive approximations is given and some numerical results are obtained. (Contractor's abstract)

THE WAVE MOTIONS OF SMALL AMPLITUDE IN A FULLY IONIZED PLASMA. III. WITH A TRANSVERSE APPLIED MAGNETIC FIELD, by S. I. Pai. [1961]1v. incl. illus. (Technical note no. BN-235) (AFOSR-542) (AF 49(638)401) AD 254957 Unclassified

Wave motions of infinitesimal amplitude in a fully ionized plasma under a uniform transverse magnetic field have been analyzed by means of a 2-fluid theory. One basic transverse wave and 2 basic longitudinal waves, as they were found for the case without external magnetic field, appear to interact with one another through the influence of this applied magnetic field and there are 3 resultant waves. In an ideal plasma, in the low frequency range, only 1 of the 3 resultant waves is undamped. When the ion cyclotron frequency is much smaller than the ion plasma frequency, this undamped wave reduces to the effective sound wave of ordinary magnetogasdynamics. If the ion cyclotron frequency is not small, the speed of propagation of this wave is larger than the effective sound speed of magnetogasdynamics. On the very high frequency range, all the 3 waves are undamped. In a certain intermediate frequency range 2 of the waves are undamped. Finally the effects of finite electrical conductivity on these waves are briefly discussed. (Contractor's abstract)

THE EFFECT OF COULOMB SCATTERING ON TWO-STREAM INSTABILITIES IN A PLASMA, by D. A. Tidman. [1961] 34p. incl. refs. (Technical note no. BN-242) (AFOSR-665) (AF 49(638)401) AD 255687 Unclassified

Also published in Phys. Fluids, v. 4: 1379-1386, Nov. 1961.

The effect of a small amount of 2-body scattering on the 2-stream instability that occurs in a plasma of contra-streaming electrons and ions is investigated mathematically. This is done by assuming the electron-ion collision frequency is small and making a perturbation expansion in this quantity. The Fokker-Planck scattering formula for the Coulomb interaction is used. As the ordered streaming energy of the electrons is thermalized enhanced Landau damping competes with the growth of the instability. (Contractor's abstract)

DIFFUSION FROM A SLIGHTLY IONIZED REGION IN A UNIFORM FLOW, by A. C. Pipkin. Apr. 1961, 19p. (Technical note no. BN-240) (AFOSR-707) (AF 49(638)-401) AD 258226 Unclassified

Also published in Phys. Fluids, v. 4: 1298-1302, Oct. 1961.

A neutral gas is considered in steady one-dimensional motion, passing through a zone in which ionization takes place at a small given rate. The diffusion of the ions from the place where they are formed is investigated, with particular attention to the upstream diffusion. The neutral atom stream is regarded as a uniform background in which the ion diffusion takes place. Of great importance is the determination of the electric field which results from the diffusion of the ions and strongly

influences their motion. The application of the results to the case where a shock is present is discussed. (Contractor's abstract)

ON TH[illegible]PLICATION OF TWO-PARTICLE DISTRIBUTION FUNCTIONS, by J. M. Burgers. [1961] 29p. (Technical note no. BN-243) (AFOSR-750) (AF 49(638)401) AD 258227 Unclassified

Also published in Proc. Symposium on Electromagnetics and Fluid Dynamics of Gaseous Plasma, New York (Apr. 4-6. 1961), Brooklyn, Polytechnic Press, v. 11: 81-96, 1962. (AFOSR-3388)

An expression for the electric conductivity of a fully ionized gas is derived by making use of the two-particle distribution function. The gas is subjected to a uniform time-independent electric field and magnetic fields are absent. The application of the two-particle distribution function is prompted by the hope that it will give a good evaluation of the aggregate effect of weak interactions, which in the case of Coulomb forces are more important than the effects of single collisions. The basic equation is the Boltzmann equation in which the usual expression for the effect of binary collisions is replaced by an integral depending upon the two-particle distribution function. THE USE OF A T-TUBE TO PRODUCE SHOCK-HEATED PLASMAS IN AN X-BAND WAVEGUIDE, by J. M. Schecher. [1961] 38p. incl. illus. (Technical note no. BN-245) (AFOSR-757) (AF 49(638)401) AD 258737 Unclassified

The shock wave produced by a T-tube with a sidearm expansion tube of 10-mm square cross section is investigated in order to determine whether it might be used to produce shock-heated plasmas in an X-band waveguide. Only weak shocks of Mach number less than 15 in argon at ambient pressures from 0.12 mm to 2 mm of mercury was studied. The theoretical and experimental results obtained by previous studies of strong shocks in T-tubes are applied to this tube where it is possible. Experimental studies were also made on the tube. At Mach numbers less than 16 the velocity of the shock front varies as the inverse square of the initial pressure and as the square of the applied voltage. The maximum volume of the shock-heated test plasma is found by theoretical considerations to be less than 1.2 cc. Drum camera pictures reveal the presence of additional fronts which move slightly faster than the shock front itself. Several shocks are produced by the ringing of the discharge circuit. A summary is given of the knowledge of the thermodynamic variables of the test gas behind the shock front which can be obtained from drum camera photographs. (Contractor's abstract, modified)

THE INTERACTION BETWEEN A MAGNETIC FIELD AND AN ELECTRICALLY PRODUCED SHOCK WAVE, by J. P. Barach. [July 1961] 66p. incl. illus. tables. (Technical note no. BN-255) (AFOSR-1381) [AF 49-(638)401] AD 263247 Unclassified

Also published in Phys. Fluids, v. 4: 1474-1477, Dec. 1961.

Shock wave flows of speeds up to 1 cm/μ sec in krypton have been observed to interact with a magnetic field of 5700 gauss. A reflected shock is observed and the deceleration of the flow is measured. Gas flows of up to Mach 63 are produced by an annular electric shock tube powered by a discharge of long time constant. A radial magnetic field provides closed paths within the gas flow for the induced currents. The speed of the wave reflected off the magnetic field is found to increase with interaction strength. The flow momentum lost per particle as the flow traverses the field region, is calculated and compared to the impulse delivered each particle by the magnetic field. Agreement is found over a wide range of experimental conditions, validating the magnetohydrodynamic picture of the interaction and the use of the scalar gas conductivity. (Contractor's abstract)

CONSIDERATIONS ON THE OPTICS OF THE INTEGRATING SCHLIEREN INSTRUMENT, by P. C. T. de Boer and J. M. Burgers. Sept. 1961, 66p. incl. diagrs. (Technical note no. BN-258) (AFOSR-1857) (AF 49-(638)401) AD 268915 Unclassified

An analysis is presented of the optics encountered in the integrating schlieren arrangement as first described by Resler and Scheibe. Expressions were developed for the signal which will be received on the photomultiplier, both for the instrumentation using an inclined knife edge and for that which uses a vertical knife edge. Attention is given to the conditions which must be satisfied to guarantee that the response of the photomultiplier shall be proportional to the difference in refractive index at the beginning and the end of the test section. The signal to be expected in the case of a sudden discontinuity in refractive index, which is partly reflecting, partly transmitting, was calculated and is compared with the signal

obtained with a continuous change of refractive index. Throughout the analysis it is supposed that lens aberrations can be neglected and that diffraction phenomena may be left out of account. (Contractor's abstract)

THE TWO-FLUID THEORY OF MAGNETOGASDYNAMICS AND ITS APPLICATIONS TO WAVE MOTION, by S. I. Pai. [1961] [19]p. incl. diagrs. (AFOSR-2405) (AF 49(638)401) Unclassified

Also published in Developments in Mechanics; Proc. of Seventh Midwestern Mechanics Conf., Michigan State U. (Sept. 6-8, 1961), New York, Plenum Press, v. 1: 484-502, 1961.

Some basic concepts of multifluid theory of magnetogasdynamics, especially the 2 fluid theory for the case of a fully ionized plasma are discussed. The relations between the 2-fluid theory and the "classical" single-fluid theory are analyzed and the limitations of the classical single-fluid theory are described explicitly. The 2-fluid theory is then applied to the investigation of wave motions of small amplitude in a fully ionized plasma under an arbitrarily orientated uniform magnetic field. It has been found that the interactions between plasma oscillations (which are not obtained in the single-fluid theory) and sound waves and Alfven waves are very important. They significantly affect the resultant wave motion, especially when both the frequency of the wave and the magnetic field strength are large. (Contractor's abstract, modified) P

GASDYNAMIC EFFECTS ON ELECTRIC CURRENT DENSITY IN MAGNETOGASDYNAMICS, by S. I. Pai. [1961] [1]p. (AFOSR-2812) (AF 49(638)401) Unclassified

Also published in Jour. Aero/Space Sci., v. 29: 483-484, Apr. 1962.

In order to show the effect of the gasdynamic forces on the electric current density as well as the final flow field, a comparison is made between the results of a flow problem based on classical magnetogasdynamics and the corresponding results based on the 2-fluid theory of magnetogasdynamics. A uniform stream of a fully ionized plasma consisting of electrons and singly charged ions of a velocity U and under a uniform magnetic field of strength H_x in the direction of the U, passing over a thin body is considered. The flow is assumed to be 2-dimensional and steady so that all variables are functions of spatial coordinates x and y only. The fluid is assumed to be an ideal plasma which is inviscid, non-heat-conducting and infinitely electrically conducting.

ON LANDAU DAMPING IN A FULLY IONIZED PLASMA AND ITS COMBINATION WITH COLLISIONAL DAMPING, by J. M. Burgers. [1961] [25]p. (AFOSR-J740) (AF 49-(638)401) Unclassified

Also published in Proc. Symposium on Fluid Dynamics and Applied Mathematics, College Park, Md. (Apr. 28-29, 1961), New York, Gordon and Breach Science Publishers, 1962, p. 79-103.

The purpose of the paper is to deduce the dispersion equation for free electron oscillations in a fully ionized plasma, not influenced by a magnetic field, the positive ions being fixed, without making use of integrals in a complex plane; and to find out how a small collisional damping combines with the Landau damping. For this purpose the Boltzmann equation for the electrons, with a collision term modeled on the linear approximation of Bhatnagar and Krook, is solved with an initial condition for the perturbation of the distribution function. It is asked how the initial condition must be chosen in order that free oscillations with a given spatial frequency shall result. The application of Poisson's equation gives a Fourier transform of the perturbation function; the condition that this transform must vanish at infinity leads to the dispersion equation. This equation is expressed by means of integrals over real variables, and combines terms responsible for Landau damping with terms dependent upon the collision frequency. The solution of this equation is discussed; for the case of vanishing collision frequency it agrees with the usual results for the electron plasma frequency and the Landau damping. SHOCK WAVES IN RADIATION-MAGNETOGASDYNAMICS (Abstract), by S. I. Pai and A. I. Speth. [1961] [1]p. [AF 49(638)401] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 41, Feb. 1, 1961.

The general Rankine-Hugoniot relations of a shock wave including both the electromagnetic forces and the radiation effect are presented. These results differ

considerably from those without radiation effect. It has been known that if the shock strength is very large, the radiation effect on the shock wave is noticeable. From the results, it is found that even the shock strength is very weak; the shock wave relations with radiation effect differ considerably from those without radiation effect, provided that the initial temperature of the medium is very high and that the radiation parameter is not small. The main effect of radiation on the shock wave is that the jump of temperature across a shock is reduced greatly because of the radiation effect. Some numerical examples were presented.

STABILITY AND TRANSITION OF THE FREE-CONVECTION LAYER ALONG A VERTICAL FLAT PLATE, by A. A. Szewczyk. May 1961, 82p. incl. illus. diagrs. table, refs. (Technical note no. BN-247) (AFOSR-765) (AF 49(638)645) AD 258750 Unclassified

Presented at Eighty-second Winter annual meeting of the Amer. Soc. Mech. Engineers, New York, Nov. 26-30, 1961. (Paper no. 61-WA-338)

Also published in Internat'l. Jour. Heat and Mass Transfer, v. 5: 903-914, Oct. 1962.

The free-convection layer along a vertical flat plate is investigated theoretically and experimentally with a view to studying its instability and natural transition from laminar to turbulent flow. Stability calculations are carried out based upon the small perturbation theory for the exact velocity profile for the Prandtl number 10. Temperature profiles are measured along a vertical electrically-heated brass plate. By the use of a dye technique the natural transition mechanism is investigated, i.e., discrete vortex lines and their subsequent distortion into 3-dimensional pattern and eventual breakdown is carefully studied. In addition a double-row vortex system, which arises in the free-convection layer, is investigated. Its mechanics and over-all effect on the stability and transition of the free-convection layer are discussed. (Contractor's abstract)

STREAKLINES IN A PERTURBED SHEAR FLOW, by F. R. Hama. [1961] [7]p. incl. diagrs. (AFOSR-1795) (AF 49(638)645) Unclassified

Presented at meeting of the Amer. Phys. Soc., Berkeley, Calif., Nov. 20-22, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 370, Apr. 23, 1962.

Also published in Phys. Fluids, v. 5: 644-650, June 1962.

Streaklines are numerically obtained for a shear flow perturbed by an unamplifying traveling sinusoidal wave. It is shown that, if a dye is injected from near the critical layer, the streaklines have an appearance of amplification and rolling as if to indicate that the flow develops into discrete vortices. The rolling-up of a streakline cannot therefore constitute a positive identification of the presence of discrete vortices. Away from the critical layer, the streaklines appear to show an alternating amplification and damping. Apparent wavelength and wave velocity are both incorrect except in the critical layer. Further, any information due to pathlines or obtained by tracing marked particles is equally improper in regard to the wave motion.

PRODUCTION OF SECONDARY VORTICES IN THE FIELD OF A PRIMARY VORTEX, by J. R. Weske and T. M. Rankin. Apr. 1961, 24p. incl. illus. (Technical note no. BN-244) (AFOSR-623) (AF AFOSR-61-3) AD 255688 Unclassified

Conjectures based upon observations of the decay of larger vortices in shear flow, such as those which occur during transition in boundary layers, were confirmed when a range of secondary vortices were produced by imposing divergence upon the vortex tube in 2 controlled experiments for steady and nonsteady flow, respectively. Secondary vortex patterns were analyzed theoretically and experimentally. These flow patterns represent a possible mechanism for the transfer of energy from primary vortices to motions of higher wave number. (Contractor's abstract)

THE EEG IN OPEN-HEART SURGERY AND IN SURGERY FOR AORTIC AND CEREBRAL ANEURYSMS, by M. A. B. Brazier. [1959] [12]p. incl. diagrs. refs. (In cooperation with Harvard Medical School, Cambridge, Mass. and Massachusetts Inst. of Tech., Cambridge) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)98], Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], National Institute of Neurological Diseases and Blindness, and Office of Naval Research) Unclassified

Published in Cerebral Anoxia and the Electroencephalogram, Internat'l. Colloq. on Anoxia and the EEG, Marseille (Oct. 5-9, 1959), Springfield, Ill., Charles C. Thomas, 1961, p. 256-267.

Experience in recording the EEG's of human subjects with extracorporeal circulation leads to the conclusion that there need be no adverse effect on the brain but that it is desirable to monitor the EEG for the unexpected mishap. In operations at normal body temperatures it has been found that slowing of the EEG is most usually the sign of hypoxia, though if this becomes severe it will be followed by flattening. A sudden drop of amplitude without the intermediate stage of slow waves is more usually the sign of acidosis, and gives the appearance of an activated record. A rather sharp and oversimplified differentiation has been made in this report between the effects of hypoxia and hypercapnia in these cases, but it shoud be remembered that the living organism will not tolerate the isolation of a single variable, and as soon as one factor begins to change, compensatory mechanisms are marshalled by the body to restore homeostasis. Artificial manipulations with hypothermia and anesthesia impede and impair but do not abolish the restoration of this balance, and hence it would be an exaggeration to describe a given EEG change as solely due to hypoxia and another as solely due to CO_2 accumulation. The differentiation suggested here is presented for what practical use it may be to electroencephalographers charged with monitoring cases in the operating room. (Contractor's abstract, modified)

Subjective reports from patients and clinical observations suggest that some drugs which act on the central nervous system modify man's capacity to attend maximally to environmental stimuli. This paper is a report of a study of the effects of methamphetamine, pentobarbital, and saline placebo, administered intravenously, in a double-blind experimental situation on 2 parameters of attention in human subjects. A test of running memory span was used to measure the efficiency of short term storage of simple stimuli, 1 limit of man's capacity to process information. The Stroop test was used as a measure of the breadth of focus of attention in a replication of a study carried out by Callaway. This investigation was undertaken with the twofold objective of contributing to an understanding of these drugs and of clarifying the concept of attention. (Contractor's abstract)

THE PERCEPTION OF PAIN, by R. Melzack. [1961] [9]p. incl. illus. diagrs. (AFOSR-1388) (AF 49(638)898) Unclassified

Also published in Scient. Amer., v. 204: 41-49, Feb. 1962.

Psychological evidence strongly supports the view of pain as a perceptual experience whose quality and intensity is influenced by the unique past history of the individual, by the meaning he gives to the pain-producing situation and by his state of mind at the moment. It is believed that all these factors play a role in determining the actual patterns of nerve impulses ascending to the brain and traveling with the brain itself. In this way pain becomes a function of the whole individual, including his present thoughts and fears as well as his hopes for the future.

TENSILE DEFORMATION AND FRACTURE OF BRAZED JOINTS, by W. G. Moffatt and J. Wulff. Sept. 1961 [11]p. incl. illus. diagrs. tables, refs. (ASRL-TR-94-1) (AFOSR-2292) (AF 49(638)775) AD 275282 Unclassified

Presented at Nat'l. fall meeting of the Amer. Welding Soc., Milwaukee, Wis., Oct. 1-4, 1962.

Also published in Welding Jour. Research Suppl., p. 115s-125s, Mar. 1963.

A study is being made on the nature of stress distribution in the brazed joint and the mechanism of joint failure. The tensile deformation of a prototype composite material, the brazed joint, was measured. Highly localized non-uniform straining in the axial direction was observed. Cleavage facets were detected on fracture surfaces in the case of silver filler and void formation in the case of lead filler, using mild steel as the base material. These voids, as indicated in microradiographs, are elongated and have a preferred orientation within an individual grain; it is suspected that the x-ray indications are of voids which originated in small patches of brittle fracture and opened up by plastic deformation, rather than of voids which nucleated and grew entirely by plastic deformation. THERMAL EFFECTS ON A TRANSPIRATION COOLED HEMISPHERE, by A. F. Golinick, Jr. [1961] [9]p. incl. diagrs. (AFOSR-137) (AF 49(638)245) AD 255911 Unclassified

Also published in Jour. Aerospace Sci., v. 29: 583-590, 595, May 1962.

An approximate method is used to obtain the injection distribution which would exist on an isothermal, transpiration-cooled hemisphere in a supersonic stream. This distribution is the same for both air and helium injection, and is independent of the blowing level. A model having this distribution was tested at a Mach number of 3.53. It is concluded that the design technique is reasonably accurate. Data taken near the nose are compared with the theories for helium and air injection. The agreement in the case of the reduction in heat-transfer coefficient is good. The values of insulated wall temperature obtained near the nose with helium injection are 8% above the local stagnation temperature and largely independent of injection rate. It is believed that this phenomenon may be attributed to the thermal diffusion of the helium within the boundary layer. Air injection causes a slight reduction in the insulated wall temperature. It is shown that injection of either air or helium at the hemisphere nose considerably reduces the heat flux at the surface. The additional reduction in the flux resulting from helium injection as opposed to air injection, and predicted by existing theory is largely absent. (Contractor's abstract)

AN INTEGRAL METHOD FOR LAMINAR BOUNDARY LAYER CALCULATIONS: MOMENTUM THICKNESS AND MASS TRANSFER WITH ZERO PRESSURE GRADIENT, by F. E. C. Culick. July 1961, 37p. incl. diagrs. refs. (Technical rept. no. 10) (AFOSR-1411) (AF 49-(638)245) AD 265771 Unclassified

Work by Rott and Crabtree and by Hill is the basis of an integral method solution to the equation for the concentration of species in the binary mixture boundary layer. The principal result is a relatively simple integral relationship between wall concentration and surface mass transfer rate for arbitrary mass transfer distributions. Only the case of helium injection into an undissociated airstream, with zero pressure gradient,

is treated in detail but the method can be applied to problems involving other gases. The results agree quite well with exact similarity solutions and with numerical results for the problem of a solid leading edge followed by a porous region. Solution to the upstream-mass-transfer-problem is also obtained easily. (Contractor's abstract)

THERMODYNAMIC COUPLING IN BOUNDARY LAYERS, by J. R. Baron. Oct. 1961 [29]p. incl. diagrs. refs. (Technical rept. no. 28) (AFOSR-1693) (AF 49-(638)245) AD 273308 Unclassified

Presented at ARS Space Flight Report to the Nation, New York, Oct. 9-15, 1961.

Also published in ARS Jour., v. 32: 1053-1059, July 1962.

Experimental results gathered in recent years for binary mixture mass transfer models are shown to yield consistent evidence of discrepancies with analytic considerations. Specifically, measured recovery temperatures are appreciably higher than those predicted, while heat transfer coefficients are satisfactorily reproduced. It is shown on the basis of both approximate and exact solutions for plates and stagnation points that the discrepancies are related to thermal diffusion effects, a major influence being apparent in application of the surface boundary condition for an adiabatic wall. As a result, some reexamination is necessary of past criteria for mass addition effects as they pertain to specific injected media. A prime example is the "equivalence" of helium and air as coolants despite the heretofore suggested preference for low density injectants on a perfect gas basis.

AN INTEGRAL METHOD FOR LAMINAR BOUNDARY LAYER CALCULATIONS: HEAT AND MASS TRANSFER WITH ZERO PRESSURE GRADIENT, by F. E. C. Culick. Dec. 1961, 48p. incl. diagrs. refs. (Technical rept. no. 16) (AFOSR-2146) (AF 49(638)245) AF 275145 Unclassified

An integral method previously used successfully in several kinds of boundary layer problems has been extended to cover simultaneous heat and mass transfer in a binary mixture boundary layer when the pressure is uniform. The principal result is a pair of dual integral relationships connecting the surface temperature and heat transfer rate in the presence of surface mass transfer. In particular these formulas are applied to the leading edge cooling problem in which a finite injection region is followed downstream by an insulated impermeable surface. The approximate results agree quite well with measurements on a cone, for both helium and air injection, and with a numerical solution for air injection. (Contractor's abstract)

OPTIMUM SOFT LANDING TRAJECTORIES. PART I. ANALYSIS, by L. J. Berman. Mar. 30, 1961, 29p. incl. tables. (AFOSR-519, Pt. 1) (AF 49(638)363) AD 258668 Unclassified

A variational calculus solution is obtained for the thrust program for minimum propellant consumption to achieve landing of a rocket vehicle from a space orbit with zero relative velocity at touchdown, under the simplifying assumptions of no atmospheric forces and a uniform (i.e., flat-earth) gravitational field. These assumptions are appropriate for lunar landing of a moderately high thrust rocket. The results of the variational solution are interpreted to provide an appreciation of the physical nature of the requirements established by different initial conditions, as specified by initial altitude and velocity vector. Representing the initial conditions parametrically by an equivalent energy altitude and the actual altitude, five different regimes are identified and the corresponding thrust programs described. OPTIMUM SOFT LANDING TRAJECTORIES. PART II. NUMERICAL RESULTS, by L. J. Berman. [Oct. 31, 1961] [33]p. incl. diagrs. tables. (AFOSR-519, Pt. 2) (AF 49(638)363) AD 267881 Unclassified

The optimum steering program for landing on an airless body is examined numerically with particular emphasis on the change in the form of the steering program and the degradation of performance under the influence of a restraint on the ignition altitude. It is found that for ignition altitudes not far below the optimum, the performance loss is small, and that the ignition altitude for which the optimum steering program is at a constant angle falls within this range. Thus it is concluded that the constant-thrust-angle trajectory is optimum in an operational system. This conclusion is valid only for relatively steep approach trajectories. (Contractor's abstract)

OPTIMUM SOFT LANDING TRAJECTORIES, by L. J. Berman. [1961] [15]p. incl. diagrs. table, refs. (AF 49-(638)363) Unclassified

Published in Proc. Twelfth Internat'l. Astronaut. Cong., Washington, D. C., (Oct. 1961) Vienna, Springer-Verlag and New York, Academic Press, v. 1: 353-367, 1963.

The problem of optimizing the landing trajectory of a rocket vehicle on an airless planet is considered. Under simplifying assumptions, the variational calculus yields an analytic solution to the steering program, and shows that the thrust program is of the on-off type, consisting of at most 2 sub-arcs. The absolute optimum trajectory is determined, and local optima are found for the cases when the actual altitude for starting the control process is less than the absolute optimum. In the real situation, it is found that the "absolute optimum" defined using the approximations is not only not the absolute optimum, but is not even the best member of the simple family. More important, however, the use of a constant thrust-angle trajectory causes only very small losses. Since this trajectory requires the simplest control system, it is, from a practical point of view, the optimum trajectory. (Contractor's abstract)

HOMOTOPY ASSOCIATIVITY OF H-SPACES. I, by J. D. Stasheff. [1959] [18]p. incl. diagr. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)42] and Marshall Aid Commemorative Commission) Unclassified

Presented at Sixty-fifth annual meeting of the Amer. Math. Soc., Philadelphia, Pa., Jan. 20-22, 1959. (Title varies)

Presented at 557th meeting of the Amer. Math. Soc., New York, Apr. 23-25, 1959. (Title varies)

Published in Trans. Amer. Math. Soc., v. 108: 275-292, Aug. 1963.

The author defines a nested sequence of homotopy associativity conditions and calls a space an A_n-space if it satisfies the n-th condition. Every space is an A_1-space, every H-space is A_2, and every homotopy associative H-space is A_3. The main result is that a space is an A_n-space if and only if it admits an A_n-structure. (Math. Rev. abstract)

HOMOTOPY ASSOCIATIVITY OF H-SPACES. II, by J. D. Stasheff. [1959] [20]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)42] and Marshall Aid Commemorative Commission) Unclassified

Presented at Sixty-fifth annual meeting of the Amer. Math. Soc., Philadelphia, Pa., Jan. 20-22, 1959. (Title varies)

Presented at 557th meeting of the Amer. Math. Soc., New York, Apr. 23-25, 1959. (Title varies)

Published in Trans. Amer. Math. Soc., v. 108: 293-312, Aug. 1963.

The author defines the tilde construction, an algebraic analogue of the geometric construction, which bears the same relation to the geometry involved as the bar construction has to the Dold-Lashof construction. Homology constructions called the Yessam operations are defined. These are analogous to the Massey operations in cohomology. In addition, maps of A_n-spaces are defined and studied. Several applications are made to the suspension homomorphism in cohomology and to 2-stage Postnikov systems. (Math. Rev. abstract)

ON HOMOTOPY ABELIAN H-SPACES, by J. D. Stasheff. [1961] [12]p. incl. refs. (AFOSR-587) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)42 and Marshall Aid Commemorative Commission) AD 258250 Unclassified

Also published in Proc. Cambridge Philos. Soc., v. 57: 734-745, 1961.

Given an H-space X with multiplication $m : X \times X \to X$, the X-projective plane $XP(2)$ is defined as follows: Let $p: E \to SX$ be the quasi-fibration of Dold and Lashof in which E has the homotopy type of $X * X$. Then $XP(2) = CEU_p SX$, the collapsed mapping cyclinder of the map p. Criteria for X to be homotopy abelian are given in terms of $XP(2)$, and by using them it is shown that the space of loops on complex projective 3-space is homotopy abelian. (Math. Rev. abstract)

ON MAXIMAL SOLUTIONS OF THE CAUCHY INITIAL

VALUE PROBLEM (FOR INTEGRAL MANIFOLDS OF NON-INVOLUTIVE DISTRIBUTIONS), by P. L. Dombrowski. June 1961, 33p. (AFOSR-888) (AF 49-(638)42) AD 260745 Unclassified

This analysis is mainly concerned with the problem of determining integral manifolds of non-involutive distribution on manifolds, more precisely how to obtain by the methods of Cauchy characteristic from a given initial, low dimensional integral manifold a higher dimensional integral manifold, which includes the initial one. The main objective is to investigate, under which conditions one may get by this procedure a maximal integral manifold. (Contractor's abstract)

ON SUPER-POTENTIALS IN THE THEORY OF NEWTONIAN GRAVITATION, by S. Chandrasekhar and N. R. Lebovitz. [1961] [10]p. (AFOSR-3293) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)42 and Office of Naval Research) Unclassified

Also published in Astrophys. Jour., v. 135: 238-247, Jan. 1962.

The character of the gravitational equilibrium of bodies in rotation and with prevalent magnetic fields depends on the tensor potential,

$$\mathfrak{B}_{ij} = G \int_V \rho(x') \frac{(x_i - x'_i)(x_j - x'_j)}{|x - x'|^3} dx',$$

and the associated tensors,

$$\mathfrak{B}_{ij} = -\frac{1}{2} \int_V \rho \mathfrak{B}_{ij} dx \text{ and } \mathfrak{B}_{pq,ij} = \int_V \rho x_p \frac{\partial \mathfrak{B}_{ij}}{\partial x_q} dx.$$

This paper is devoted to a consideration of these fundamental tensors. It is shown, in particular, that the tensor potential can be expressed in the form

$$\mathfrak{B}_{ij} = \mathfrak{B}\delta_{ij} + \frac{\partial^2 \chi}{\partial x_i \partial x_j},$$

where $\mathfrak{B}$ is the gravitational potential as usually defined and χ is a super-potential determined by the equation

$$\nabla^2 \chi = -2\mathfrak{B}.$$

EIGENVALUES OF JORDAN PRODUCTS, by W. G. Strang. [1961] [4]p. (AFOSR-3296) (AF 49(638)42) Unclassified

Also published in Amer. Math. Monthly, v. 69: 37-40, Jan. 1962.

The problem is to bound the eigenvalues of AB + BA, where A,B are Hermitian matrices with eigenvalues in the intervals $m \le \lambda(A) \le M$, $n \le \lambda(B) \le N$. The eigenvalues are the extreme values of $((AB + BA)x, x)$, x a vector of unit length. The author associates with the matrix A and the vector x another unit vector y and a real constant $0 \le \rho \le 1$ such that $Ax = mx + \rho(M-m)(x,y)y$; similarly, a vector z and a constant ρ' for B. A transformation of the three vectors thus involved to an orthogonal triad yields ultimately a simple expression in two variables whose extreme values have to be studied. These turn out to be either the expected cases 2MN, 2Mn, 2mN, 2mn or $[16\,MmNn-(M-m)^2(N-n)^2]/4(M+m)(N+n)$. The author also studies AB - BA and the set of all (Ax, Bx) for m = 0, M=1=N. (Math. Rev. abstract)

COMMUTING BOOLEAN ALGEBRAS OF PROJECTIONS, by C. A. McCarthy. [1959] [13]p. (AFOSR-3297) (AF 49(638)42) Unclassified

Also published in Pacific Jour. Math., v. 11: 295-307, 1961.

Let X be a Banach space, E and F two bounded Boolean algebras of projection on X such that EF = FE for all $E \in E$, $F \in F$. Let G be the Boolean algebra of projections generated by E on F. In general, G is not bounded. A case when G is bounded has already been given by J. Werner (Pacific Jour. Math., v. 4: 355-361, 1954). In the present paper another such case is given. For this it is assumed that E is complete in the sense of W. G. Bade (Trans. Amer. Math. Soc., v. 80: 345-360, 1955) and fulfills a certain condition of finite spectral multiplicity. (Math. Rev. abstract)

ON GLOBAL SOLUTIONS FOR PARTIAL DIFFERENTIAL EQUATIONS OF FIRST ORDER, by P. Dombrowski. [1960] [4]p. (AFOSR-65-0086) (AF 49-(638)42) Unclassified

Also published in Bull. Amer. Math. Soc., v. 67: 202-205, Mar. 1961.

A theorem is presented and carried through to a proof which guarantees the existence and uniqueness of a global solution for the Cauchy initial value problem for a complete, regular system of partial differential equations of the first order for one unknown function on a manifold—all data being of class C^{∞}. This result depends on one hand on an investigation of the following problem for a m-dimensional C^{∞}-manifold W, which is foliated by r-dimensional leaves, the leaf passing through $w \in W$ being denoted by $C_{(w)}$: Given a k-dimensional submanifold A of W with $k + r \leq m$, find a foliated C^{∞}-manifold S and a C^{∞}-immersion $j : S \to W$ such that (i) $j(S) = U_{a \in A} C_{(a)}$, (ii) each leaf of S is mapped under j onto a leaf of W. Concerning this problem it is proved that: If for all $a \in A$ the tangent spaces of A and $C_{(a)}$ at the point a have only the zero vector in common, and if — in case $r > 1$ — for all $a \in A$ the leaf $C_{(a)}$ is simply connected, then there exist S and j with the desired properties. From this result and from the theory of characteristics for the above mentioned systems the announced theorem is obtained

TOPOLOGICAL OBJECTS AND SHEAVES, by Y. N. Clifton and J. W. Smith. [1961] [17]p. incl. diagrs. (AFOSR-65-0087) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)42 and National Science Foundation) Unclassified

Also published in Trans. Amer. Math. Soc., v. 105: 436-452, Dec. 1962.

In a previous publication the authors have introduced a category $\mathfrak{S}$ extending the category of topological spaces, and intended to provide an appropriate context for studying such structures as foliations. Here they redefine this category in more intrinsic form. If X is a space and G the sheaf of germs of maps of X into itself then the points of the espace étalé are the morphisms of a category, using the obvious composition, and this category is provided with the usual topology from a sheaf theory. An open subcategory J defines an object (X, J) of $\mathfrak{S}$ if it satisfies the extension condition: a diagram $\uparrow \leftarrow$ in J can be extended to a commutative diagram $\uparrow \sqsubset \vec{\uparrow}$ in J, and the closure condition. $\bar{\sigma} \circ \in J$ implies $\sigma \in J$. Maps in $\mathfrak{S}$ are defined in the same spirit. Similiar procedures may be applied to subcategories of the category of topological spaces, giving subcategories of $\mathfrak{S}$. If $(X, J) \in \mathfrak{S}$, identify points of X having the same image under same $\alpha, \beta \in J$. This gives a functor on $\mathfrak{S}$ to topological spaces, making $\mathfrak{S}$ a local category. It thus has a natural Grothendieck topology and the notion of a sheaf on $\mathfrak{S}$ is defined accordingly. There is a canonical extension of a sheaf on the category of topological spaces to one on $\mathfrak{S}$. The authors provide an example to show that this extension is not exact and thus define homological invariants measuring the deviation of an object of $\mathfrak{S}$ from a topological space. (Math. Rev. Abstract)

ADDITIVE FUNCTIONALS ON GROUPS, by A. Hayes. [1961] [10]p. incl. refs. (AF 49(638)42) Unclassified

Published in Proc. Cambridge Philos. Soc., v. 58: 196-205, Apr. 1962.

The author studies the homomorphisms of a group G into the additive group of the real numbers by relating them to the semigroups in G. For such a homomorphism φ, let $S(\varphi) = \{x \in G: \varphi(x) \geq 0\}$, $S^0(\varphi) = \{x \in G = \varphi(x) > 0\}$. It is proved that for any group G the sets $S(\varphi)$ corresponding to nontrivial φ are characterized as the invariant maximal proper semigroups in G, and that φ is determined by $S(\varphi)$ up to a positive multiple. For an abelian group G this result is strengthened, and a characterization is also given for the sets $S^0(\varphi)$. Applications are given to partially ordered and lattice-ordered groups to their representation by groups of real functions, and to a proof of the Hahn-Banach theory for Abelian groups. (Math. Rev. abstract)

ON EXTENSIONS OF H-SPACES, by J. D. Stasheff. [1959] [10]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)42 and National Science Foundation) Unclassified

Presented at meeting of the Amer. Math. Soc., Jan. 22, 1959. (Title varies)

Published in Trans. Amer. Math. Soc., v. 105: 126-135, Oct. 1962.

The basic theorem presented is: Let Y be a space with

only two nonvanishing homotopy groups, $\pi_p(Y) = \pi$, $\pi_q(Y) = G$, $q > p$. Y admits a multiplication if and only if the k-invariant $k \in H^{q+1}(\pi,p;G)$ is primitive. The four main purposes of this paper are: (1) to give multiplications on Y explicitly in terms of a sputnik homotopy for a map representing k, (2) to examine more general conditions under which it is possible to define a multiplication in this way, (3) to relate these multiplications to additive secondary cohomology operations, and (4) to extend the results to homotopy associative H-spaces.

GROUP VELOCITY AND ENERGY PROPAGATION FOR THREE-DIMENSIONAL WAVES, by G. B. Whitham. [1961] [17]p. incl. diagrs. refs. (AFOSR-2461) (AF 49-(638)708) Unclassified

Also published in Commun. Pure and Appl. Math., v. 14: 675-691, Aug. 1961.

The generalization to two and three-dimensional wave motions is considered. The results can be described as an analogue of simple geometrical optics. For a non-dispersive medium high frequency waves and discontinuities propagate in a certain sense along the rays which are the curves orthogonal to the surfaces of constant phase. The waves propagate along these rays with the phase velocity, and the amplitude variation agrees with the law that the flux of energy down a ray tube remains constant.

SIMILARITY SOLUTION FOR A CYLINDRICAL SHOCK-MAGNETIC FIELD INTERACTION, by H. P. Greenspan. [1961] [5]p. incl. diagrs. table. (AFOSR-3085) (AF 49-(638)708) AD 451549 Unclassified

Also published in Phys. Fluids, v. 5: 255-259, Mar. 1962.

A similarity solution is developed describing the propagation of a strong cylindrical shock in an applied azimuthal magnetic field. The stationary gas is nonconductive and the shocked gas is taken to have a finite electrical conductivity. The total axial current is maintained constant by external means. Upon comparison of flows for which the total gas energy is the same, it is found that the interaction reduces the shock velocity by only a few percent although the pressure distributions differ markedly. SOME EXACT SOLUTIONS OF MAGNETO-HYDRODYNAMIC VISCOUS FLOW PROBLEMS, by H. P. Greenspan and L. A. Peletier. [1961] [16]p. incl. diagrs. (AFOSR-3144) (AF 49(638)708) Unclassified

Also published in Jour. Math. and Phys., v. 41: 116-131, June 1962.

Two problems involving longitudinal motion in an obliquely incident applied magnetic field are discussed: the steady motion of a perfectly conducting semi-infinite plate and the oscillatory motion of a nonconducting plate. Both concern the propagation along magnetic field lines of diffusing Alfven waves which carry the disturbances produced at the plate into the fluid. The induced current, for steady motion, flows toward the plate edge from infinity, and completes a closed circuit by returning through the internal boundary layers. The magnitude of this current and the structure of the shear layers are unaffected by the inclination of the magnetic field. The dependence of the current distributions, drag per unit length and other important quantities on the basic parameters are discussed and compared. An exact oscillating plate solution is presented.

MASS, MOMENTUM AND ENERGY FLUX IN WATER WAVES, by G. B. Whitham. [1961] [13]p. (AFOSR-3599) (AF 49(638)708) Unclassified

Also published in Jour. Fluid Mech., v. 12: 135-147, 1962.

Longuet-Higgins and Stewart studied the amplitude variation of waves on a non-uniform steady stream and showed that work done by the "radiation stress" must be included in the wave-energy balance. The precise form of this work was not obvious and needed a long argument. In the present paper these and other results are derived more simpl, and naturally by considering the balance of mass momentum and energy of stream-plus-wave and taking suitable combinations. The results depend also on the assumptions made about the influx of momentum and energy. In the final section of the paper time-dependent propagation is treated. (Math. Rev. abstract)

MATHEMATICAL CHARACTERIZATION OF THE PHYSICAL VACUUM FOR A LINEAR BOSE-EINSTEIN FIELD (FOUNDATIONS OF THE DYNAMICS OF INFINITE SYSTEMS, III), by I. E. Segal. [1961] [24]p. incl. refs. (AF 49(638)945) Unclassified

Published in Illinois Jour. Math., v. 6: 500-523, Sept. 1962.

It has been strongly conjectured that Lorentz-invariance alone uniquely determines the vacuum state of a quantized field. In this paper a counter-example is exhibited and expanded to an explicit construction of all states invariant under the action of the group of unitary transformations of the corresponding classical system. The case treated is that of a boson field admitting a free-field structure. Uniqueness is restored by a proof that among these invariant states only one, the usual frock vacuum, leads to a representation of the algebra of observables in which the Hamiltonian can be made positive definite.

THE THERMODYNAMIC PROPERTIES OF THE PRODUCTS OF H_2-O_2 COMBUSTION AT ELEVATED TEMPERATURES, by W. C. Moffatt, F. D. Skinner and R. J. Zaworski. [1959] [10]p. incl. diagrs. (AF 49(638)375) Unclassified

Presented at Fall meeting, Western States Section, The Combustion Inst., Los Angeles, Calif., Nov. 2-5, 1959.

Published in Conf. on Kinetics, Equilibria, and Performance of High Temperature Systems, Los Angeles, Calif. (Nov. 2-5, 1959), Pacific Palisades, The Combustion Inst., 1959, Paper 59-24, p. 1-10.

A program has been developed for use in the IBM 704 Computer which yields the composition and thermodynamic properties of the products of combustion of stoichiometric hydrogen-oxygen mixtures. The calculations were based on the existence of 6 species in the products: H_2O, H_2, O_2, H, O, and OH, and covered temperature and pressure ranges of 1600 to 6000°K and .01 to 1000 atm respectively. The standard Newton-Raphson iteration procedure was employed to determine the composition, and corrected iterations were performed until the maximum error in any composition was less than 0.1%. The thermodynamic properties (enthalpy, entropy and composition) were then calculated directly. To facilitate presentation of the data in the form of a Mollier Chart, temperature and pressure were selected as the independent variables. Also, interpolation of this data was carried out to determine the properties for incremental values of density and Z (the ratio of the molecular weights of undissociated and dissociated products) at each temperature. In all cases the computed values of enthalpy and entropy were found in dimensionless form, permitting the use of any appropriate set of units. The present computation was based on a stoichiometric mixture of hydrogen and oxygen, but provision was made in the program so that properties and compositions corresponding to other proportions might be readily found. SOME EFFECTS OF INJECTION OF FOREIGN GASES IN A DECELERATING LAMINAR BOUNDARY LAYER IN SUPERSONIC FLOW, by S. W. Gouse, Jr., G. A. Brown, and J. Kaye. [1961] [10]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)442 and Office of Naval Research under N5ori-07897) Unclassified

Published in Jour. Aerospace Sci., v. 29: 1250-1259, Oct. 1962.

The purpose of this research program was to investigate the effects of a diffusion field on a laminar boundary layer in a supersonic flow. Specifically, helium, nitrogen and argon were uniformly injected into the laminar boundary layer of a high-speed flow in a tube with the objective of determining the effects of such injection on the pressure, temperature and recovery factor distribution along and downstream of the injection region. A continuously operating axially-symmetric wind tunnel has been designed, constructed and operated. The experimental results of 38 runs (13 with zero injection, 12 with helium injection, 8 with nitrogen injection, and 5 with argon injection) are presented. For uniform injection of helium, nitrogen or argon gas, it was found that there was about a 1% change in the recovery factor and adiabatic wall temperature for the range of variables investigated. The effect of foreign gas injection on the pressure distribution was to increase an already adverse pressure gradient. (Contractor's abstract, modified)

RANDOM VIBRATION OF BEAMS, by S. H. Crandall and A. Yildiz. Apr. 1961 [34]p. incl. diagrs. tables, refs. (AFOSR-484) (AF 49(638)564) AD 256549 Unclassified

Presented at Winter annual meeting of the Amer. Soc. Mech. Engineers, New York, Nov. 26-Dec. 1, 1961.

Also published in Jour. Appl. Mech., v. 29: 267-275, June 1962.

The mean square deflections, slopes, bending moments and shear forces were compared for 4 different dynamical models with 3 different damping mechanisms, subjected to a distributed transverse loading process which was uncorrelated space-wise and which was either ideally, white time-wise or band-limited with an upper cut-off frequency. The dynamic models were the Bernoulli-Euler beam, the Timoshenko beam and 2 intermediate models, the Rayleigh beam, and a beam which has the shear flexibility of the Timoshenko beam but not the rotatory inertia. The damping mechanisms were transverse viscous damping, rotatory viscous damping, and Voigt visco-elasticity. Many of the mean square response quantities were finite when the excitation was ideally white (i.e., when the input has infinite mean square), however some of the responses were unbounded. For these cases the rate of growth of the response was obtained as the cut-off frequency of the excitation was increased. (Contractor's abstract)

RANDOM VIBRATION OF SYSTEMS WITH NONLINEAR RESTORING FORCES, by S. H. Crandall. June 1961, 15p. incl. refs. (AFOSR-708) (AF 49(638)564) AD 259493 Unclassified

Also published in Proc. Internat'l. Symposium on Nonlinear Oscillations, Kiev (USSR) (1961), Kiev, Izdatel'stvo Akademia Nauk (USSR), 1963, p. 306-313.

Two procedures are discussed for studying the response of nonlinear systems to random excitation. The Fokker-Planck method is potentially applicable to a wide class of problems but the integrations required have only been effected in a few special cases. The equivalent linearization method is easy to carry out but is limited to small nonlinearities. It is demonstrated that to first order in the nonlinearity the equivalent linearization estimate of mean square stationary response is identical with that provided by the Fokker-Planck equation. A new equivalent linearization procedure for estimating the expected frequency of zero crossings in the random response is described and shown to give the same result as the Fokker-Planck equation. RANDOM VIBRATION OF A NONLINEAR SYSTEM WITH A SET-UP SPRING, by S. H. Crandall. [1961] [31]p. incl. diagrs. refs. (AFOSR-709) (AF 49(638)564) AD 259320 Unclassified

Presented at Winter annual meeting of the Amer. Soc. Mech. Engineers, New York, Nov. 26-Dec. 1, 1961.

Also published in Jour. Appl. Mech., v. 29: 477-482, Sept. 1962.

Several aspects of the problem of random vibration in nonlinear systems are discussed in terms of a particular set-up spring system. Exact solutions for the mean square response and the expected frequency of zero crossings are obtained by means of the Fokker-Planck equation. These are compared with approximate solutions obtained from equivalent linearization techniques. The distribution of response peaks is then studied and a probability density is derived for the peaks on a relative frequency basis. The probability density of the response envelope is also obtained and the relationship between the 2 distributions is discussed. (Contractor's abstract)

DYNAMIC RESPONSE OF SYSTEMS WITH STRUCTURAL DAMPING, by S. H. Crandall. Oct. 1961 [25]p. incl. diagrs. refs. (AFOSR-1561) (AF 49(638)564) AD 266299 Unclassified

Ths response of simple vibratory systems containing structural damping is studied analytically when ths excitation is an impulse and when the excitation is stationary random vibration. It is found that in a strict ssnss the assumption of ideal structural damping represents a physically unrealizabls model because a small prscursor response occurs before the application of an impulsive load. For stationary random excitation exact solutions for the mean square response are compared with approximate solutions obtained from two increasingly accurate equivalent viscous substitutes for structural damping. INTERACTIONS AMONG BURNING FUEL DROPLETS AND THEIR EFFECTS ON COMBUSTION STABILITY AND ROUGHNESS (Abstract), by T.-Y. Toong. [1961] [2]p. [AF 49(638)629] Unclassified

Presented at Fourteenth AFOSR Constractors' meeting on Liquid Rocket Combustion Research, Princeton U., N. J., Sept. 25-26, 1961. (AFOSR-1768; AD 267915)

The main objective of this research program is to further a basic understanding of the general problem of combustion instability through a study of the effects of interactions among burning fuel droplets on combustion stability and roughness. In the steady-state phase, the mechanisms of interactions between 2 burning fuel cylinders wsre studied theoretically and experimentally. Thsse 2 cylindsrs were placsd parallel to each other with their axes in a horizontal plane and burning in an air stream which flows vsrtically upward. Local rates of evaporation and combustion for burning fuel cylinders wers predicted by the use of Meksyn's method on ths basis of potential-flow solutions obtained by means of an electrical analog and of boundary-layer solutions for wedge flow. Good quantitative agrssmsnt was observed between theoretical prsdictions and experimental rssults. It was also found that for small Reynolds numbsrs and large hsat ratios, interactions can become important even at rather large spacings betwsen the cylindsrs. In the oscillating phase, both forced and sslf-sustained oscillations of an array of candle flames were investigated. The flames of an array of candles uniformly spaced in a horizontal plane and burning in a natural-convective field were found to oscillate cyclically at a well-defined frequency, the value of which depends on the number of candles in the array, their arrangement and their spacing. The regular pattsrn of these oscillations disappeared when they were subjscted to external disturbances, random or otherwiss. However, for arrays of a large number of candles at rather small spacings, the intensity of disturbances required was quite high. In the case of fuel cylinders burning in a forced convective field, streak schlieren photography was employed to obtain the phase relationships betwsen the oscillating flame front and outer edge of the thermal boundary layer at different frequencies. A hot-wire anemometer was also used to measure velocity oscillations in the neighborhood of the oscillating flames.

HEAT TRANSFER TO COLD ELECTRODES IN A FLOWING IONIZED GAS, by J. A. Fay and W. T. Hogan. [1961] 14p. incl. illus. diagrs. (Rept. no. 61-2) (AFOSR-595) (AF 49(638)643) AD 258251 Unclassified

Also published in Phys. Fluids, v. 5: 885-890, Aug. 1962.

A slightly ionized gas was formed in the wake of a detonation wave in a shock tube by seeding with a potassium salt. Wire electrodes were placed with axes normal to the shock-tube axis and separated by a variable distance along the tube axis. The heating of each electrode was measured by determining the rate of change of electrical resistance of the electrode. Electrode heating in excess of that due to aerodynamic heat transfer was only observable in the range of 10^2 to 10^3 A/cm^2 and was found to be proportional to the current. The excess heating rate divided by the total current was measured to be 4.9 v for the anode and 3.2 v for the cathode. By varying the spacing of the electrodes, it was found that the gas resistance could be accounted for by the geometric effects alone in combination with the gas conductivity as measured by Basu for this mixture. PLASMA BOUNDARY LAYERS, by J. A. Fay. June 1961 [18]p. incl. diagrs. (Rept. no. 61-8) (AFOSR-994) (AF 49(638)643) AD 260664 Unclassified

Also published in Proc. of Fourth Biennial Gas Dynamics Symposium on Magnetohydrodynamics, Northwestern U., Evanston, Ill. (Aug. 23-25, 1961), Evanston, Northwestern U. Press, 1962, p. 337-348. (AFOSR-2787)

Some aspects are considered of boundary layer type flows in gases which are partially or wholly ionized. The change in transport properties due to ionization are

estimated and the resulting effects on heat transfer in a monatomic gas are determined. A type of magnetohydrodynamic boundary layer encountered in channel flows where there exists an applied magnetic field normal to the wall is considered. Finally, the laminar diffusive mixing of a magnetic field and a compressible plasma are studied. (Contractor's abstract)

HEAT TRANSFER IN A COMPLETELY IONIZED GAS, by B.-M. Jepson. July 1961, 20p. incl. diagrs. (Rept. no. 61-7) (AFOSR-1562) (AF 49(638)643) AD 268459 Unclassified

Heat transfer rates and temperature profiles were calculated for a completely ionized gas in laminar boundary layer flow over a flat plate. Using the assumptions of low Mach number, zero Prandtl number, and no pressure gradient, the solutions were obtained by numerical integration of the differential energy equation utilizing an iterative method of solution. The gas considered was treated as a homogeneous perfect gas under no electric or magnetic fields. The thermal conductivity of the gas was assumed to vary as the absolute temperature to the B power. Solutions were obtained for B = 5/2 (completely ionized gas) as well as B = 1 and 1/2 for comparison with other solutions. By an approximate method of solution, a simple relationship for the heat transfer rate was found which depends upon B and the ratio of wall temperature to free stream temperature. OSR-SPONSORED STUDIED ON UNSTEADY AERODYNAMIC AND NONLINEAR STRUCTURAL PROBLEMS OF AIRCRAFT AT MIT, 1957-1960, by H. Ashley and T. H. H. Pian. Final rept. Apr. 1961, 39p. incl. diagrs. refs. (MIT Fluid Dynamics Research Lab. rept. no. 61-4) (ASRL rept. no. 76-6) (AFOSR-588) (In cooperation with MIT Aeroelastic and Structures Research Lab.) (AF 49(638)160) AD 259048 Unclassified

The principal areas of effort presented under the aerodynamic phase are the following: the shock layer adjacent to an oscillating blunt nose in a hypersonic airstream; Prandtl-Meyer expansions in dissociational equilibrium; unsteady transonic airloads in the presence of a strong shock; the stability of combustion zones; the boundary-layer under conditions of time-dependent external flow; and radiation effects in hypersonic flow of real gases. The principal topics treated under the structural phase are the following: large deflections of curved strips and plates under thermal and pressure loadings; deflection and snap buckling of shallow spherical shells; yield conditions of plates and shells under combined bending moments and membrane stresses; inelastic diffusions of stiffened panels; dynamic response of rigid-plastic curved beams; dynamic buckling of shallow spherical shells; straight-crested waves in plates; and finite deflections of shallow arches taking shear deformation into consideration. A THEORY OF TRANSONIC AILERON BUZZ, NEGLECTING VISCOUS EFFECTS, by W. Eckhaus. [1961] [7]p. incl. diagrs. tables. (AFOSR-2838) (AF 49(638)-160) Unclassified

Also published in Jour. Aerospace Sci., v. 29: 712-718, June 1962.

Unsteady perturbations of two-dimensional transonic flow around an airfoil are considered, the situation being such that local supersonic regions terminated by shock waves are present in the vicinity of the airfoil. Viscous effects are neglected, and a linearized theory of the perturbations due to harmonic oscillations of an aileron is developed. A series solution for the pressure distribution is obtained, and numerical results for the nonsteady hinge moment, from the first approximation to the solution, are presented. As a result of flutter analysis a stability boundary for transonic aileron buzz is obtained. Comparison of the theoretical results with experimental observations shows satisfactory agreement. A MONTE CARLO SOLUTION FOR HEAT TRANSFER IN RAREFIED GASES, by M. L. Lavin. May 1961 [151]p. incl. illus. (MIT Fluid Dynamics Research [Group] rept. no. 61-3) (AFOSR-627) (AF 49(638)207) AD 259049 Unclassified

The nonlinear heat transfer problem in the transition regime between free molecule and continuum flow is solved by an iterative Monte Carlo method, and the results are compared with both linear and nonlinear analytical solutions. The statistical procedure consists of constructing an improved distribution function by recording the history of a single test molecule which wanders through a phase space populated by molecules of the previous iterate. Molecular wanderings are determined by selecting events at random from the probability distributions that govern the interaction process. For a nominal Knudsen number of 2.0 and a temperature ratio of 4:1, the Monte Carlo results differ from both the linear and nonlinear analytical solutions by no more

than 10-15%. Moreover, these statistical results seem to substantiate Mott-Smith's prediction of a Knudsen layer adjacent to the boundary. (Contractor's abstract)

ON UNDAMPED WAVES IN AN INFINITELY LONG PLASMA JET, by L. Trilling and R. E. Kaplan. [1961] 24p. incl. illus. (AFOSR-695) (AF 49(638)207)
AD 298869 Unclassified

This paper discusses the conditions required for the existence of undamped small amplitude waves in an infinitely long plasma jet. The analysis consists of 3 steps: First, the equations of motion are derived for the perturbations from a uniform flow both inside and outside the jet, and appropriate solutions for cylindrical, harmonically oscillating waves are obtained. Then the boundary conditions and matching conditions are specified to relate the flow inside and outside the jet. Finally the neutral stability condition arises as the solution of an eigenvalue problem for certain dimensionless parameters of the system, and the stability boundaries in the (M, B) plane are drawn for a number of simple special cases. This paper investigates the perturbation modes of the steady parallel flow of a compressible fluid of finite constant viscosity and electrical conductivity in a uniform arbitrary oriented magnetic field. In particular, in addition to the classical fast and slow sound and Alfvén modes, some waves are obtained whose amplitude is finite whenever the diffusive coefficients are finite and which resemble the diffusion of vorticity from stream surfaces in classical hydrodynamics. This paper also re-interprets upward facing MHD waves and upstream wakes in a new way. (Contractor's abstract)

EXPANSION AND DIFFUSION OF A LAYER OF HOT GAS IN THE PRESENCE OF THERMAL RADIATION, by C.-Y. Chow. Mar. 1961, 41p. incl. diagrs. tables. (MIT Fluid Dynamics Research Group rept. no. 61-2) (AFOSR-979) (Sponsored jointly by Air Force Cambridge Research Lab. under AF 19(604)5698 and Air Force Office of Scientific Research under AF 49(638)207)
AD 259050 Unclassified

A radiating gas slab at very high temperature and moderate pressure expands and diffuses into the surrounding cold atmosphere. Under the assumption that the effect of adiabatic cooling is small compared to that of radiation cooling, and that the energy flux radiated from the interior of the gas slab is much greater than the influx, the equations of motion are solved to obtain the distributions of temperature, density, pressure, particle velocity and radiation flux inside the slab as functions of time and space coordinate. The positions and velocities of the slab's bounding surface at different times are also obtained. The magnitude of the neglected adiabatic cooling term in the energy equation is then computed and compared with the radiation term to show that it can be neglected. (Contractor's abstract)

SOME STEADY AND UNSTEADY INVISCID HYPERSONIC FLOWS PAST BLUFF BODIES, by H. Kennet. [1961] 168p. incl. illus. tables, refs. (MIT Fluid Dynamics Research Lab. rept. no. 61-1) (AFOSR-1031) (AF 49(638)933) AD 267955 Unclassified

Both steady and unsteady inviscid fluid motion in detached hypersonic shock layers about axisymmetric bluff bodies are investigated, utilizing a variety of mathematical techniques. Time-dependent flows are determined from a power-series solution of the differential equations-of-change, by postulating small harmonic perturbations superposed on an approximate steady field. The direct problem of chemically reacting and thermally radiating transparent equilibrium air flow in time-independent inviscid shock layers is solved by extending the method of integral relations to non-isoenergetic imperfect gas flows. A two-parameter iteration scheme is developed for the first approximation, where both the shock stand-off distance at the axis and one of the state variables at the stagnation point are found from a singularity condition at the sonic point on the body. A variation principle applicable to three-dimensional time-dependent rotational flows is derived, utilizing the concept of particle functions of which three are required to determine each particle's motion. The possibility of extending the method of integral relations and the variational principle to time-dependent hypersonic flows is discussed. (Contractor's abstract)

ON THE STABILITY OF A LAMINAR INCOMPRESSIBLE BOUNDARY LAYER OVER A FLEXIBLE SURFACE, by M. T. Landahl. [1961] [24]p. incl. diagrs. refs. (AFOSR-3936) (AF 49(638)933) Unclassified

Also published in Jour. Fluid Mech., v. 13: 609-632, Aug. 1962.

The stability of small 2-dimensional traveling wave disturbances in an incompressible laminar boundary layer over a flexible surface is considered. A characteristic equation is deduced which, in the limit of zero wall flexibility, reduces to that occurring in the ordinary stability theory of Tollmien and Schlichting. Graphical methods are developed to determine the curve of neutral stability, as well as to identify the various modes of instability classified by Benjamin. A method is devised whereby the optimum combination of surface effective mass, wave speed, and damping required to stabilize any given unstable Tollmien-Schlichting wave can be determined by a simple geometrical construction in the complex wall-admittance plane. A complete physical explanation for the influence of an infinite flexible wall on boundary-layer stability is presented. The effect of damping in the wall is discussed. The seemingly paradoxical result that damping destabilizes class A waves is explained by considering the related problem of flutter of an infinite panel in incompressible potential flow, for which damping has the same qualitative effect. It is shown that class A waves are associated with a decrease of the total kinetic and elastic energy of the fluid and the wall, so that any dissipation of energy in the wall will only make the wave amplitude increase to compensate for the lowered energy level. The examples presented show that the increase in the critical Reynolds number that can be achieved with a wall of moderate flexibility is modest, and that some other explanation for the experimentally observed effects of a flexible wall on the friction drag must be considered. STUDIES OF THE OPTICAL ABSORPTION SPECTRUM OF RUTILE SINGLE CRYSTALS, by B. H. Soffer. Aug. 1959, 24p. incl. diagrs. refs. (Technical rept. no. 140) (Sponsored jointly by [Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-184110] and Atomic Energy Commission) AD 227945 Unclassified

Published in Jour. Chem. Phys., v. 35: 940-945, Sept. 1961. (Title varies)

The optical absorption of single crystals of synthetic rutile was investigated in the spectral range 1200-2500 cm^{-1} and from room temperature to 1000°C. The electronic absorption exhibits dichronic behavior. The edge moves toward lower energies as temperature is increased, with the shift depending upon the absorption coefficient; for a decadic absorption coefficient (α) of 400 cm^{-1}, the shift is 7.1 x 10^{-4} ev/°K, while at 1 cm^{-1} it is 9.5 x 10^{-4} ev/°K. The broad band in the region of 6850 cm^{-1}, which occurs in reduced rutile, does not appear in fully oxidized rutile, even at high temperature. At high temperatures an additional wavelength-independent absorption appears which can be correlated in good agreement with dc conductivity by applying the Drude-Zener theory of free carrier absorption. New

bands in the 3300 cm^{-1} region are shown to stem from O-H valence vibrations. The main bands are unusually sharp, with peaks at 3277 and 3322 cm^{-1} and half-widths of 28 and 13 cm^{-1}. A satellite structure of combination and difference bands was also detected. Deuterium substitution produces an absorption band at 2442 cm^{-1}. The entire structure shows a marked dependence of the absorption on the polarization direction of the light. Some evidence is presented that these O-H groups cause a dielectric dispersion. Changes in carrier density were detected in transmission measurements on a current carrying crystal. (Contractor's abstract)

MICROWAVE RESPONSE OF ETHANOL AND BROMOETHANE AND ITS PRESSURE DEPENDENCE, by E. B. Littlefield. July 1961 [31]p. incl. diagrs. tables, refs. (Technical rept. no. 165) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-184110)
AD 262026 Unclassified

Equipment has been designed for measuring the dielectric constant and loss of high-loss liquids from 3 x 10^8 to 5 x 10^9 cycles/sec at pressures up to 1000 atm. Bromoethane showed a pressure sensitivity for dielectric relaxation $\Delta \log \tau/atm$ about 5 times that of ethanol. This suggested that the relative insensitivity of ethanol is due to its H-bonded structure. Solutions of ethanol in cyclohexane, down to 25 mol-% ethanol, show a max in relaxation time near equimolar composition. This behavior is contrary to the prediction of the usual Debye theory, since the viscosity of the solution decreases monotonically in this composition range on dilution with cyclohexane. DIELECTRIC RELAXATION IN HYDROGEN-BONDED LIQUIDS, by M. W. Sagal. Oct. 1961, 23p. incl. diagrs. tables. (Technical rept. no. 166) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-184110)
AD 266376 Unclassified

Published in Jour. Chem. Phys., v. 36: 2437-2442, May 1, 1962. (Title varies)

The temperature dependence of the dielectric relaxation time has been investigated from -5° to 50°C for ethanol-cyclohexane solutions from 1.0 to 0.25 mol fraction ethanol. The previously observed maximum in the relaxation time around equimolar composition is explained by a hydrogen-bonded switching mechanism. Measurements of dielectric relaxation from 5° to 50°C have been carried out on the 3 isomeric butanediols which differ in the separation of the 2 OH groups along the carbon skeleton. The differences in relaxation time among the 3 isomers can be explained by the switching mechanism suggested by the results for the ethanol-cyclohexane solutions. The dielectric relaxation times of n-butanol from 5° to 50°C have also been determined. The chain-length dependence of the dielectric relaxation time of the normal aliphatic alcohols is discussed in terms of the proposed mechanism. (Contractor's abstract)

Presented at Internat'l. Conf. on Chemical Physics of Nonmetallic Crystals, Evanston, Ill., Aug. 28-31, 1961. (AFOSR-2143)

Published in Jour. Appl. Phys., Suppl., v. 33: 453-455, Jan. 1962.

Mixed crystals of KCl and KBr show strong internal strain evidenced by cracking. The minimum of the melting point occurs between 63 and 65 mol-% KBr. The microhardness between 25 and 65 mol-% KBr is more than twice that of either component. The lattice constant changes linearly with composition. The macrodensity deviates by several percent, indicating a high concentration of defects. The intensity of coloration by electrons shows that defects are not mainly due to vacancies, but presumably to larger aggregates of submicroscopic size or interstitials. The broadening of exciton bands, as measured by shifts of the ultraviolet absorption edge, is greatest at a 2:1 KCl-KBr ratio. This may indicate a certain short-range order in KCl-KBr mixed crystals (Contractor's abstract)

PROTONS, DIPOLES, AND CHARGE CARRIERS IN RUTILE, by A. Von Hippel, J. Kalnajs and W. P. Westphal. [1961] [22]p. incl. illus. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under [Nonr-184110]) Unclassified

Published in Jour. Phys. and Chem. Solids, v. 23: 779-799, June 1962.

After a short discussion of structure and infrared-vibration data of rutile, the presence of protons, replaceable by deuterons, is determined by the OH and OD stretching vibration and traced to specific lattice sites. Various reactions in hydrogen and oxygen and the effects of reduction on electron mobilization and the optical absorption spectrum are considered. Absorption spectra at high temperature and quenching experiments clarify the interrelation between absorption spectra, vacancies and conductivity. Space-charge polarization and blocking-layer effects are elucidated by dielectric relaxation spectra, discharge characteristics and the influence of prehistory and addition agents. Electron injection into the empty conduction band transforms unreduced rutile from an insulator into a very good conductor; incandescence and thermal breakdown at low voltage results; impulse voltage produces much higher electric strength. All observations show the extremely anisotropic conduction of unreduced rutile single crystals, with preference by orders of magnitude in the optic-axis direction, as expected from the crystal structure. This preference is being systematically destroyed by progressive reduction. Rutile is both an n- and a p-type conductor; the experiments reported here together with the facts known previously lead to a consistent picture of its properties. (Contractor's abstract)

Measurements obtained at Deep River, Canada, from 2 large neutron monitors, and at Cambridge, Mass., from a high counting rate meson monitor, during the solar cosmic-ray injections of Nov. 12 and 14, 1960, are reported. In addition, rate-meter pen traces of the neutron increases and a magnetometer trace of H, obtained at Deep River, are reproduced. A unique feature of the solar cosmic-ray increase of Nov. 12 was the occurrence of a sharp Forbush decrease. Half an hr before the onset of the Forbush decrease, and coincident with a conspicuous increase of H, the intensity of the solar cosmic radiation doubled and then exhibited strong rapid oscillations. Arguments are advanced that the changes of intensity of the solar cosmic rays observed at high latitudes at the time of the magnetic disturbance and Forbush decrease are due to the earth sampling solar

cosmic rays trapped in the gas cloud responstble for these latter effects. The events of Nov. 12 and 15 are both shown to be in agreement with a recent model for the magnetic fields in the inner solar system. At the time of the solar cosmic-ray increase of Nov. 15, the earth was already inside a trapping region, and periodic oscillations of the solar cosmic-ray intenstty were observed lasting for about 2 hr. It is suggested that these oscillations may be closely connected wtth the storage mechanism. (Contractor's abstract)

THE NUMERICAL SOLUTION OF COUPLED INTEGRO-DIFFERENTIAL EQUATIONS, by M. M. Pennell and L. M. Delves. [1960] [6]p. incl. diagrs. (In cooperation with Clarendon Lab., Oxford (Gt. Brtt.)) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclasstfied

Published tn Math. Comput., v. 15: 243-249, July 1961.

The purpose of this paper is to report on a method for the numerical solution of simultaneous integro-differential equations of the form

$$\int_0^{\infty} \sum_{n=0}^{n_{max}} ({}_1k_n(x,g)g^{(n)}(r))\,dy = \sum_{n=0}^{n_{max}} {}_1P_n(x)f^{(n)}(x)$$

$$\int_0^{\infty} \sum_{n=0}^{n_{max}} ({}_2k_n(r,\theta)f^{(n)}(x))\,d\theta = \sum_{n=0}^{n_{max}} {}_2P_n(r)g^{(n)}(r)$$

where the asymptotic forms of f(x) and g(r) are known; and where ${}_1k_n$ and ${}_2k_n$ are the kernels. The method, which is reasonably simple to program for a computer, has been tested on a problem arising in nuclear physics and yielded reasonable results.

EXPERIMENTAL LIMIT ON THE "CHARGE" OF THE PHOTON (Abstract), by L. Grodzins, D. Engelberg, and W. Bertozzi. [1961] [1]p. (Sponsored jotntly by Air Force Office of Scientific Research, Atomic Energy Commtsston, and Office of Naval Research under [AT(30-1)2098]) Unclasstfied

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 63, Feb. 1, 1961.

The effect of an electric field on the energy of 14.4 kev photons emitted from Fe^{57} is betng tnvestigated with the use of recotiless resonance scattertng. The source, ~ 1 cm Co^{57} plated onto iron, is stationary, and 0.6-mtl natural iron absorber moves back and forth at a speed of 0.0107 cm/sec, the max slope point of the resonance absorption line. The counting rates for forward and backward motions are stored in separate scalers. An electric potential of +20,000 v on the source is periodically swttched off; the counttng rate wtth and wlthout potential are stored in separate registers. Neither an energy shift nor a line broadening has been observed due to the electric field. If a charge q_{ph}, is attributed to the photon which would lead to an energy shift $q_{ph}V$ as the photon crosses the potential V, then our present expertmental limtt on such a charge ts

$$q_{photon} \leq 1 \times 10^{-15} q_{electron}.$$

THE LARGE SCALE FEATURES OF THE INTERPLANETARY MAGNETIC FIELD AS DEDUCED FROM COSMIC RAY OBSERVATIONS, by K. G. McCraken. [1961] [15]p. tncl. diagrs. table, refs. (Sponsored jointly by Atr Force Office of Scienttfic Research, Atomtc Energy Commtsston, and Office of Naval Research under AT(30-1)2098, and National Science Foundation) Unclasstfied

Published ln Space Research II; Proc. Second Internat'l. Space Science Sympostum, Florence (Italy) (Apr. 10-14, 1961), Amsterdam, North-Holland Publishtng Co., 1961, p. 813-827.

Observations of cosmic-rays produced in a solar flare can be used as an indirect method for determtning the general features of the interplanetary magnetic fteld, because the times of flight, the directions of arrtval and the degree of tsotropy of the cosmtc-ray flux at the earth are strongly influenced by thts fteld. The observattons of 8 solar flare effects by ground level cosmtc-ray detectors, and approx 30 by radio techniques are reviewed. They lead to a well-defined model for the magnettc fteld between the sun and the earth, whtch is further confirmed by the flare effects of May and Nov. 1960. On May 4 and Nov. 15 the interplanetary magnetic fteld stretched from the western portion of the solar disk and was inclined to the earth-sun line by about 60° at the orbtt of the earth. The overall configuration of the field is examined in the ltght of the observed decay ttmes. All observations are in good accord with a theorettcal model which envisages solar magnetic fields being carrted from the sun by the outflow of solar plasma. The various features of the model are summarized and suggestions are made for further experiments using satellites and space probes. (Contractor's abstract)

g-VALUE OF THE 0.123 MEV STATE OF Sm^{152} (Abstract), by R. W. Bauer and M. Deutsch. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 224, Apr. 24, 1961.

Recently published measurements of this g value have given contradictory results, largely because of the difficulty of evaluating the paramagnetic correction to the magnetic field. The rotation has been measured in a magnetic field of 26 k gauss, of the gamma ray angular correlation from liquid sources of Eu^{152} at 4 temperatures: 300°K (aqueous solution of $EuCl_3$), 1100°K, 1300°K and 1500°K (melt of $EuCl_3$). The rotation appeared to be independent of temperature within an experimental uncertainty of about 15%. This suggests that the paramagnetic correction is quite small, as suggested by the calculations of Karamori and Sugimoto. Without correction the weighted mean of our measurements is $g = 0.375 \pm 0.03$.

COMPUTER SCANNING OF HODOSCOPE PICTURES (Abstract), by L. Q. Niemela and A. Boyarski. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 242, Apr. 24, 1961.

Machine scanning of hodoscope pictures is in progress, using the MIT TX-0 computer. A small search caster hunts for events; upon finding one, approximate measurements are made to locate the position of the event on the film. A programmed spot scan then interrogates each possible light position. The machine is programmed to recognize and analyze only interesting events, to make cross checks and to print out range curves, angular correlations, and complete data on rare events.

TIME-OF-FLIGHT MEASUREMENTS OF PHOTONEUTRON ENERGY SPECTRA IN THE KILOVOLT REGION. I. TECHNIQUE AND THE (n, γ) CROSS SECTION OF Ag (Abstract), by D. B. McConnell, W. Bertozzi and others. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commision, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 251, Apr. 24, 1961.

A modification of the time-of-flight technique developed at the M.I.T. Linear Accelerator has allowed measurements to be undertaken in the kilovolt region of neutron energy spectra produced by nuclear photodisintegration. Neutron flight times over a 1.6 m flight path are measured with a timing resolution of about 10^{-8} sec. Neutrons are detected with the aid of large liquid scintillators, by the (n, γ) reaction in silver. Using the known Be^9 (γ, n) cross section results are presented for the energy dependence of the (n, γ) cross section of silver in the energy range 10-500 kev.

TIME-OF-FLIGHT MEASUREMENTS OF PHOTONEUTRON ENERGY SPECTRA. II. SPECTRA FROM Pb AND Bi IN THE KILOVOLT REGION (Abstract), by W. Turchinetz, W. Bertozzi and others. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 251, Apr. 24, 1961.

The technique described in the preceding abstract has been used to extend to the kilovolt region the earlier measurements of photoneutron energy spectra from Pb and Bi. The neutron spectra produced by the absorption of 10-mev bremsstrahlung have been measured from 10-500 kev. Several lines appear in the Pb spectrum at about (20), (30), 40, 95, (120), 180, and 250 kev. The Bi spectrum is almost smooth. Data is related to the results of other experiments. The implications of such measurements in the determination of $\Gamma_{\gamma 0}$ and D are discussed.

MULTIPLE-GAP SPECTROGRAPH FOR CHARGED-PARTICLE REACTION STUDIES (Abstract), by H. A. Enge and W. W. Buechner. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 253, Apr. 24, 1961.

An 11-ton magnetic iron ring with magnetizing coils and 25 gaps provide magnetic fields for 25 broad-range magnetic spectrographs simultaneously facing a target in the center of the ring. Gaps are 7.5° apart, accepting reaction products at from zero to 172.5° in 7.5° steps. Geometry of each gap and associated nuclear-track plateholder is similar to the MIT-broad-range, single-gap spectrograph. An electrostatic quadrupole lens focuses a reduced image of the energy-defining slit for the electrostatic generator onto a rotating gas or solid target. The whole spectrograph is enclosed in a vacuum tank.

POLARIZATION OF COSMIC-RAY Mu MESONS UNDERGROUND AND AT SEA LEVEL (Abstract), by H. V. Bradt and G. W. Clark. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 263, Apr. 24, 1961.

The polarization of cosmic-ray mu mesons that come to rest in a brass absorber has been measured at sea level with less than 20 g/cm^2 of material above the absorber and underground with about 3700 g/cm^2 of rock cover. The polarization was determined from the degree of asymmetry in the distribution of directions of decay electrons. The ratio of polarizations at the underground and sea level sites Pu/Ps was found to be 0.98 ± 0.18. A determination of the absolute polarizations from the observed effect was Pu = Ps = 0.26 ± 0.03. According

to the theory of Hayakawa the measured polarization depends, in part, on the proportion of K mesons among the parents of stopped muons. It is concluded that the measured results impose an upper limit on the K/π production ratio at the underground site.

POSITIVE PARITY STATES OF Be^9 AND C^{13}, by F. C. Barker. [1961] [26]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 313, Apr. 24, 1961.

Also published in Nuclear Phys., v. 28: 96-121, Nov. 1961.

The states produced by weakly coupling a 2s- or 1d-neutron to a core consisting of the ground or first excited state of C^{12} are mixed by means of a 2-body spin-orbit interaction of the type normally used in intermediated-coupling calculations, to provide the low-lying positive-parity eigenstates of C^{13}. However, in order to obtain agreement with other data involving E1 radiative widths the single particle shell model wave functions must be modified so as to have the correct asymptotic forms. Similar calculations are performed for the Be^9 positive-parity states.

EXTREMELY ENERGETIC COSMIC-RAY EVENT, by J. Linsley, L. Scarsi, and B. Rossi. [1961] [3]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Phys. Rev. Ltrs., v. 6: 485-487, May 1, 1961.

A large extensive air shower was observed with an array of scintillation counters covering an area of 2 km^2, at altitude 5800 ft. The size was derived as 5.5×10^9 particles, using a lateral distribution function found for smaller showers, and is probably underestimated. The primary energy is estimated to be at least 10^{19} ev, corresponding, for a proton, to a radius of curvature in the galaxy of 10^4 light yr. Arrival times of particles at distant detectors imply a shower radius greater than 7 km, but delayed particles observed up to 4μ sec late. It is concluded that the primary particle acquired its energy outside the galaxy.

SOLUTION OF THE EQUATIONS FOR THE GREEN'S FUNCTIONS OF A TWO DIMENSIONAL RELATIVISTIC FIELD THEORY, by K. Johnson. [1961] [18]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Nuovo Cimento, Series X, v. 20: 773-790, May 16, 1961.

The explicit solution of the coupled set of equations for the Green's functions for the self-coupled field theory model of Thirring is given. It is found that the infrared problem causes no special difficulty. The question of how to define products of singular field operators at coincident space-time points arises and it is shown that the commutation relations for such products are not consistently given by making use of the formal expressions and the canonical commutation relations. The problem of gauge invariance in an external field is

studied and it is shown that: (a) the current and charge density do not commute at equal times, and (b) this is necessary for and consistent with the gauge invariance of the field equations. (Contractor's abstract)

The applicability of the modified boundary condition model to the extensive proton-proton scattering data in the energy range extending up to 350 mev has been investigated. The success obtained with the model using a field-theoretical potential indicates the validity of the one- and two-pion exchange potentials in their appropriate range, and the physical significance of the energy-independent boundary condition employed to represent the shorter range interaction. The precision fit obtained requires only 9 parameters plus the acceptance of the usual fourth-order static "perturbation" theory results for the potential tail.

NUCLEAR MAGNETIC MOMENT OF THE 158-KEV $5/2^-$ STATE OF Hg^{199}, by L. Grodzins, R. W. Bauer, and H. H. Wilson. [1961] [2]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Proc. Rutherford Jubilee Internat'l. Conf., Manchester (Gt. Brit.) (Sept. 4-8, 1961), New York, Academic Press, 1961, p. 285-286.

Published in Phys. Rev., v. 124: 1897-1898, Dec. 15, 1961.

The nuclear magnetic moment of the 158-kev $5/2^-$ state has been measured by precessing, in a solid gold environment, the $3/2^-$ (334 kev) $5/2^-$ (158 kev) $1/2^-$ gamma ray-gamma ray angular correlation in an external magnetic field of 26,000 gauss. The value obtained, $\mu 5/2 = +1.03 \pm 0.08$ nm, includes a 5% correction for quadrupole attenuation as determined by studying the angular correlation as a function of the delay of the intermediate state. The value is compared to the recent prediction of de Shalit assuming that the $5/2^-$ state originates from the coupling of the $1/2^-$ ground state ($\mu_p = +0.504$ nm) with the 2+ excitation of the core. The magnetic moment of the core excitation was obtained from the M1 gamma-ray mean life of the 50-kev transition between the $3/2^-$ (208 kev) and $5/2^-$ (158 kev) core particle doublet. The mean life, determined to be $\tau_\gamma(50) = (4.46 \pm 1.0) \times 10^{-9}$ sec, leads to predicted magnetic moments of $\mu_{core} = (+0.33_{-0.25}^{+0.17})$ nm and $\mu_{5/2} = (+0.84_{-0.25}^{+0.17})$ nm.

THE NUCLEAR MANY BODY PROBLEM IN THE BOUNDARY CONDITION MODEL, by E. L. Lomon. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Proc. Rutherford Jubilee Internat'l. Conf., Manchester (Gt. Brit.) (Sept. 4-8, 1961), New York, Academic Press, 1961, p. 413-414.

The boundary condition model (BCM) is applied to the nuclear many body problem. The successful application of the BCM to the nuclear two body problem raises the question of its predictions for nuclear binding energy, etc. A pseudo-potential is used to exactly replace the boundary condition after which Brueckner equations can be applied, modified for "hole-hole" interactions. The simple solution of the short-range interaction allows for a reasonable numerical programme. The simplicity of the short-range contribution is further utilized to examine the size of various "correction" terms. (Contractor's abstract)

ENERGY SPECTRUM AND STRUCTURE OF LARGE AIR SHOWERS, by J. Linsley, L. Scarsi, and B. Rossi. [1961] [12]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098] and National Science Foundation) Unclassified

Presented at Internat'l. Conf. on Cosmic Rays and the Earth Storm, Kyoto (Japan), Sept. 4-15, 1961.

Published in Jour. Phys. Soc. Japan, v. 17, Suppl. A-III: 91-102, Jan. 1962.

Preliminary results obtained during a 4000 hr running period in 1959-1960 at the MIT station Albuquerque, New

Mexico, latitude 35°N, at an elevation of 5800 ft (atmospheric depth 820 g cm^{-2}) are given. The results are discussed under the following headings: the lateral distribution of particle density; the proportion of penetrating particles; variation of shower intensity with atmospheric depth; shower size spectrum for atmospheric depth equivalent to sea level; largest shower; primary cosmic-ray energy spectrum; and isotropy of the primary cosmic radiation.

PHOTOGRAPHY OF EXTENSIVE AIR SHOWERS IN CERENKOV LIGHT, by N. A. Porter and D. A. Hill. [1961] [3]p. incl. illus. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)-2098]) Unclassified

Presented at Internat'l. Conf. on Cosmic Rays and the Earth Storm, Kyoto (Japan), Sept. 4-15, 1961.

Published in Jour. Phys. Soc. Japan, v. 17, Suppl. A-III: 112-114, Jan. 1962.

An attempt to photograph the Čerenkov light from air showers directly is described. The apparatus consisted of an image intensifier system triggered by amplified pulses from a 5-in. photomultiplier. A Schmidt mirror of 30 cm diam, nominal aperture f/0.5, and an acceptance cone of half-angle 17° about the zenith, was focused for infinity on the photocathode of the image intensifier. The minimum detectable pulse corresponded to a shower size of about 5×10^4 particles at sea level.

Massachusetts Inst. of Tech. Lab. for Nuclear Science, Cambridge.

THE POLARIZATION OF COSMIC RAY Mu-MESONS, by H. V. Bradt and G. W. Clark. [1961] [5]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at Internat'l. Conf. on Cosmic Rays and the Earth Storm, Kyoto (Japan), Sept. 4-15, 1961.

Published in Jour. Phys. Soc. Japan, v. 17; Suppl. A-III: 300-304, Jan. 1962.

The polarization of muons which come to rest in a brass absorber was measured at sea-level with 12,700 and 3,700 g/cm^2 (air equivalent) of cover above the absorber. The results obtained are compared with those of other workers and it is concluded that all of the results are consistent with there being no change in the polarization as the cover over the absorber is varied from 12 to 3700 gm/cm^2 (air equivalent).

HIGH RESOLUTION STUDY OF THE $Bi^{209}(d,p)Bi^{210}$ REACTION (Abstract), by J. R. Erskine, W. W. Buechner, and H. A. Enge. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 441, Nov. 24, 1961.

The $Bi^{209}(d,p)Bi^{210}$ reaction has been studied with 12-kev resolution using a multiple-gap magnetic spectrograph. The ground-state Q value was measured to be 2.362 ± 0.010 mev. The Q values and angular distributions of more than 38 energy levels have been obtained. The 7.5-mev bombarding energy which was used is much less than the size of the Coulomb barrier. The angular distributions are all peaked in the backwards direction with maxima at 180 degrees, as would be expected when the conditions for Oppenheimer-Phillips stripping are well met. The first 10 groups are well separated from the remainder, and on the assumption that their intensities follow the (2J + 1) rule they appear to arise from the expected $h_{9/2}g_{9/2}$ configuration. The best fit for the order of the spins starting with the ground state is J = 1, 0, 9, 2, 3, 5, 8, 4, 6, and 7. This order corresponds reasonably well with predictions which have been made using a zero-range interaction. The relative intensities of the different configurations show a dependence on the l value of the orbit into which the neutron is captured. This may furnish a new spectroscopic tool, since it may be possible to calculate this dependence on l.

GENERALIZED FREE FIELDS AND MODELS OF LOCAL FIELD THEORY, by O. W. Greenberg. [1961] [19]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Ann. Phys., v. 16: 158-176, Nov. 1961.

Generalized free fields are a generalization of the free field in which the commutator is a c-number but does not satisfy a homogeneous Klein-Gordon equation. Some properties of generalized free fields are examined including the appropriate generators of the inhomogeneous Lorentz group, the number operator, spectrum, locality, and asymptotic fields. These generalized free fields are used to construct a family of local field theory models which is not unitarily equivalent to any (generalized) free field. (Contractor's abstract)

SCINTILLATION DETECTOR OF 4-M^2 AREA AND TRANSISTORIZED AMPLIFIER WITH LOGARITHMIC RESPONSE, by K. Suga, G. [W.] Clark, and I. Escobar. [1961] [3]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)-2098]) Unclassified

Published in Rev. Scient. Instr., v. 32: 1187-1189, Nov. 1961.

A scintillation detector with an area of 4 m^2 and a transistorized amplifier with a logarithmic height-to-time converter are described. The detector employs tapered sheets of plastic scintillator and a single 16-in. photomultiplier mounted in a pyramidal can, coated inside with a commercial 90% reflecting white paint. The response is uniform to within 5% over the entire sensitive surface. A traversal by 1 relativistic charged particle (energy loss ~10 mev) generates approximately 20 photoelectrons in the photomultiplier. The amplifier and converter yield a rectangular pulse whose duration is accurately proportional to the logarithm of the input pulse amplitude over a range of 4 decades. The gain is constant to 1 db from 10 to 45°C, and the equivalent noise input is 200 μv. (Contractor's abstract)

LIMIT ON HIGH-ENERGY CROSS SECTION FROM ANALYTICITY IN LEHMANN ELLIPSES, by O. W. Greenberg and F. E. Low. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Phys. Rev., v. 124: 2047-2048, Dec. 15, 1961.

High-energy limits on the scattering amplitude and the total cross section follow from that analyticity of the scattering amplitude in ellipses in $\cos\theta_{cm}$ which has been proved rigorously by Lehmann, together with unitarity. The limits for the scattering amplitude are $|T| < (\text{const})W^4 \ln^2 W$, for the forward and backward directions, and $|T| < (\text{const})W^3 \ln^{3/2} W$ for other fixed directions, where W is the total center of mass (cm) energy. For the total cross section the limit is $\sigma < (\text{const})W^2 \ln^2 W$. (Contractor's abstract)

EXPERIMENTAL NUCLEAR ENERGY LEVELS OF Mg^{25} AND THEIR INTERPRETATION, by R. K. Sheline and R. A. Harlan. [1961] [22]p. incl. diagrs. tables, refs. (In cooperation with Florida State U., Tallahassee) (Sponsored jointly by [Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098 and Atomic Energy Commission under AT(40-1)2434]) Unclassified

Published in Nuclear Phys., v. 29: 177-198, Jan. 1962.

Using the reaction $Al^{27}(d,\alpha)Mg^{25}$ and a magnetic spectrograph, 66 levels in Mg^{25} have been determined below 8.7 mev excitation. An interpretation of the levels utilizing the Bohr-Mottelson collective model and an empirical rule is attempted. Results indicate that below 4.4 mev, agreement with the model is good, while above this energy, deviations from experimental level density and energies can be qualitatively explained by additional intrinsic and vibrational states, Cariolis coupling and the uncoupling of paired nucleons in higher-spin rotational states. A statistical treatment, used in determining the nuclear temperature of Mg^{25} as $\approx$ 2.45 mev, indicates that the level spacing begins to become smaller than experimental energy resolution above 7.7 mev. THE COSMIC-RAY FLARE EFFECT. II. THE FLARE EFFECTS OF MAY 4, NOVEMBER 12, AND NOVEMBER 15, 1960, by K. G. McCracken. [1961] [12]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)-2098]) Unclassified

Published in Jour. Geophys. Research, v. 67: 435-446, Feb. 1962.

The observations of the flare effects of May 4 and Nov. 12 and 15, 1960, are analyzed, particular attention being given to obtaining an understanding of the anisotropies that existed in the cosmic-ray fluxes during the events. For each event it is found that the flux was greatest from a direction to the west of the sun. During the May 4 event the flux was greatest from, and symmetrical about, a direction 55° to the west of the sun, and 10° north of the ecliptic, for more than 9 hr after the commencement of the flare effect. The differential rigidity spectrum is investigated, the power-law exponent being calculated to be -5.0 at 1045 UT, and shown to be decreasing with time. For the Nov. 12 event, it is shown that an anisotropy persisted until about 1900 UT, when the radiation rapidly became isotropic. At this same time, the counting rates of all neutron detectors increased very suddenly and a Forbush decrease was observed by meson detectors. It is shown that at about 1600 UT an additional anisotropic flux of radiation arrived at the earth from within the hemisphere centered upon the sun, and between 1700 and 1800 UT an additional anisotropic flux arrived from the opposite direction. For the Nov. 15 event, it is shown that the radiation became isotropic within about 90 min of the commencement of the flare effect. The anisotropies at early times are studied, the most important observation being that particles were arriving from some directions in space for approx 30 min before any arriving from the opposite direction. THE COSMIC-RAY FLARE EFFECT. III. DEDUCTIONS REGARDING THE INTERPLANETARY MAGNETIC FIELD, by K. G. McCracken. [1961] [12]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Jour. Geophys. Research, v. 67: 447-458, Feb. 1962.

The observations of cosmic-ray flare effects made at sea level are used to investigate the magnetic fields within the inner solar system. Considering the temporal dependence of intensity, the degree of anisotropy, and the direction in space from which the fluxes were greatest, it is concluded that when a large, active sunspot group is on the far western portion of the solar disk, magnetic lines of force essentially connect the sunspot group to the earth. It is shown that small-scale irregularities exist in these lines of force. The over-all configuration of the magnetic field regime is investigated; the trapping of cosmic rays injected by solar flares and the exclusion of galactic cosmic rays are discussed. The relative merits of two contemporary theoretical models of the interplanetary fields established by solar activity are discussed. (Contractor's abstract)

A NOTE ON THE VERTICAL CUTOFF RIGIDITIES OF COSMIC RAYS IN THE GEOMAGNETIC FIELD, by A. Freon and K. G. McCracken. [1961] [3]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Jour. Geophys. Research, v. 67: 888-890, Feb. 1962.

Flare effects of Nov. 1960 provided the opportunity to test the Quenby and Webber approximation (1959). The equations of motion of a negatively charged particle in the Finch and Leaton (1957) simulation of the geomagnetic field were integrated numerically, the particle trajectory being computed from the point of interest on the surface of the earth to a point beyond which the geomagnetic field has an insignificant influence on the motion of the particles. It seems clear that the trajectory of the negatively charged particle leaving the point of observation P, and initially moving vertically away from the earth is identical to that of a positive particle of the same rigidity arriving at P from the vertical. Repeating this computation for numerous rigidities, it was found that at low rigidities the negative particle cannot escape from the earth. The maximum value for this situation is taken as an approximate lower limit for the vertical cutoff rigidity. The least value for which the particle escapes is taken as an approximate upper limit. The vertical cutoff rigidity at Port aux Francais

was calculated to be within the limits 1.27 bv ≤ R ≤ 1.30 bv. Discrepancies between Quenby and Webber estimates and the present estimates are indicated.

THEORY OF INTERBAND FARADAY ROTATION IN SEMICONDUCTORS, by B. Lax and Y. Nishina. [1961] [4]p. incl. diagrs. (AFOSR-493) (Sponsored jointly by Air Force [Office of Scientific Research, Office of Naval Research, and Signal Corps] under AF 19(604)7344) Unclassified

Also published in Phys. Rev. Ltrs., v. 6: 464-467, May 1, 1961.

It is shown that calculations similar to a quantum mechanical approach to interpretation of large changes in rotation occurring at energies close to the energy gap can be made for the indirect and direct forbidden transitions to determine the interband Faraday rotation and its dependency on wavelength. The theory is approximate and makes a number of assumptions. One assumption is that the bands are quadratic and extend to large k values without changing the curvature. The theory also neglects the losses which can be taken into account phenomenologically in the final expressions. For more accurate analysis of the Faraday rotation in p-type Ge, it is also necessary to take statistics into account since the dispersion must be weighted by the number of empty states. In spite of these assumptions, however, the results obtained seem to be reasonable because they can explain the major features of the experimental observations, whereas the classical theory for bound electrons cannot.

INTERBAND FARADAY ROTATION IN III-V COMPOUNDS, by B. Lax and Y. Nishina. [1961] [4]p. incl. diagrs. refs. (AFOSR-948) (AF 19(604)7344) Unclassified

Also published in Jour. Appl. Phys., Suppl., v. 32: 2128-2131, Oct. 1961.

Also published in Semiconducting Compounds; Proc. of Conf., Schenectady, N. Y. (June 14-16, 1961), New York, W. A. Benjamin, Inc., 1961, p. 2128-2131. (AFOSR-2010)

Experimental investigation of Faraday rotation in III-V compounds has exhibited a striking singularity at photon frequencies just below the energy gap. A quantum theoretical result associated with the direct transition has been developed to explain the phenomenon. The treatment has been extended to include forbidden transitions which are readily applicable to such materials as InAs, GaAs, and GaSb where interband transitions between the split-off valence bands have been observed. The treatment for observing Faraday rotation by reflection has also been considered and experimental results in InSb at optical frequencies will be presented. The calculations have also been performed for degenerate semiconductors at low temperature. (Contractor's abstract)

HIGH MAGNETIC FIELD RESEARCH, by B. Lax. [1961] [5]p. incl. diagrs. (AFOSR-3567) (AF 19(604)-7344) AD 612325 Unclassified

Presented at Seventh Conf. on Magnetism and Magnetic Materials, Phoenix, Ariz., Nov. 13-16, 1961.

Also published in Jour. Appl. Phys., Suppl., v. 33: 1025-1029, Mar. 1962.

The use of high magnetic fields as a research tool for a wide variety of physical phenomena is clearly recognized today and the subject of an International Symposium at Cambridge this fall. Another important step in promoting research with the help of large magnetic fields has been the sponsorship of the M.I.T. National Magnet Lab. by the Air Force. This paper reviews the highlights of the conference which included papers on research in plasma physics, low temperatures, solid state and the latest developments for generating high magnetic fields. The plans and objectives of the National Magnet Lab. and description of the physical facilities will be presented. In addition, a brief review will be given of a number of experiments already performed in the existing Magnet Lab. at M.I.T.

HYDROMAGNET: A SELF-GENERATING LIQUID CONDUCTOR ELECTROMAGNET, by H. H. Kolm. [1961] [9]p. incl. illus. diagrs. table refs. (AFOSR-3630) (AF 19(604)7344) Unclassified

Also published in Jour. Appl. Phys., v. 32: 1296-1304, July 1961.

A novel liquid electromagnet is investigated in which the exciting current is generated within the solenoid by forcing the liquid conductor radially inward through the space between 2 coaxial cylinders placed in an axial magnetic field. The tangential current thus generated within the flowing conductor adds to the initial applied field so that the device behaves like a self-excited, short-circuited homopolar generator. It is shown theoretically that for low values of the magnetic Reynolds

number, the amplification of the magnetic field is a quadratic function of this number and that the total dissipation depends on the square of the amplification and on the cube of the hydrodynamic Reynolds number. The experimental findings are in reasonable agreement with the theory. (Contractor's abstract)

WATER COOLED MAGNETS, by F. Bitter. [1961] [8]p. incl. illus. diagrs. tables. (AFOSR-2631) (AF 19-(604)7344) Unclassified

Also published in Rev. Scient. Instr., v. 33: 342-349, Mar. 1962.

Also published in Proc. Internat'l. Conf. on High Magnetic Fields, Cambridge, Mass. (Nov. 1-4, 1961), Cambridge, M.I.T. Press and New York, Wiley and Sons, 1962, p. 85-99. (AFOSR-2299)

This paper discusses the construction of water cooled solenoids at power levels ranging from 1 to 100 mw and with cylindrical inner working spaces having radii ranging from 1 to 10 cm. A first limitation is due to the fact that the power density in the magnet cannot exceed a value set by the surface cooling rate allowable in the water passages. Present designs go up to a power density of 1.5×10^4 w/cm^3 and a surface cooling rate of 1.5×10^3 w/cm^2. With these limitations, useful coils can be built operating at power levels ranging from 1 to 10 mw and giving fields ranging from 100 to 250 kgauss. In the range of 200 to 300 kgauss, Zr-Cu or Cr-Cu alloys may be used to avoid plastic deformation at the inner surface. The strengthening and cooling of coils to operate at higher power levels is discussed. A preliminary design is presented for a high precision magnet for nuclear magnetic resonance experiments.

ADVANCES IN THE GENERATION AND USE OF VERY HIGH, CONTINUOUS MAGNETIC FIELDS, by H. H. Kolm. [1961] [8]p. incl. illus. diagr. (AFOSR-3632) (AF 19(604)7344) Unclassified

Also published in Nature, v. 192: 299-302, Oct. 28, 1961.

A brief account is given of the applications of high magnetic fields, and of the difficulties of generating high continuous fields, especially over a large volume. Kapitza's work on pulsed fields is mentioned, and magnets invented by Bitter which can give 100 kgauss continuously are discussed. More recently, studies of cyclotron resonance have necessitated higher fields, and a solenoidal electromagnet has been built which is capable of giving 130 kgauss continuously. A new laboratory is under construction at which fields up to 250 kgauss will be available.

PULSED CRITICAL FIELD MEASUREMENTS IN MAGNETIC SYSTEMS, by S. Foner and S.-L. Hou. [1961] [2]p. incl. diagrs. (AFOSR-3633) (AF 19(604)7344) Unclassified

Presented at Seventh Conf. on Magnetism and Magnetic Materials, Phoenix, Ariz., Nov. 13-16, 1961.

Also published in Jour. Appl. Phys., Suppl., v. 33: 1289-1290, Mar. 1962.

Pulsed field magnetic moment measurements in several magnetic systems are briefly summarized. Particularly high sensitivity is attained for systems which exhibit a nonlinear variation of magnetization versus applied field, e.g., "spin-flop." Changes of magnetization as small as 0.1 gauss could be observed with applied fields of over 100 kgauss under favorable circumstances. Critical fields for Cr_2O_3 and $(Cr_2O_3)_{0.9}\cdot(Al_2O_3)_{0.1}$ from 4.2°K to about 0.95 T_N and the corresponding calculated values of $(2\lambda K)^{\frac{1}{2}}$ are presented, where λ is the exchange constant and K is the anisotropy energy. The values of $(2\lambda K)^{\frac{1}{2}}$ agree with earlier antiferromagnetic resonance measurements in similar crystals. Results of measurements in antiferromagnetic MnF_2, CoF_2, and $FeTiO_3$, and in metamagnetic $FeCl_2$ and $CoCl_2$ are briefly discussed. Application of the method to paramagnets is also indicated. CYCLOTRON RESONANCE, by B. Lax. [1961] [8]p. incl. diagrs. refs. (AFOSR-3655) [AF 19(604)7344] Unclassified

Also published in Science, v. 134: 1333-1340, Oct. 27, 1961.

Cyclotron resonance (or electrical resonance) is used in the study of electronic energy bands in solids. Cyclotron resonance experiments may be performed with gases but different information is gained. With germanium and silicon the existence of "holes" in semiconductors was proved. A while later the difficulties posed by an impure semiconductor were overcome and the existence of "holes" in them proved with the aid of cyclotron resonance. From the study of cyclotron resonance, devices are being

designed which may make possible the scientific investigation of the far-infrared region of the electromagnetic spectrum. Plans for a cyclotron resonance maser are underway.

IRON MAGNET DESIGN, by D. B. Montgomery. [1961] [14]p. incl. diagrs. [AF 19(604)7344] Unclassified

Published in Proc. Internat'l. Conf. on High Magnetic Fields, Cambridge, Mass. (Nov. 1-4, 1961), Cambridge, M.I.T. Press and New York, Wiley and Sons, 1962, p. 180-193. (AFOSR-2299)

The calculation of gap fields in iron magnets by means of equivalent surface poles has been explored by several authors. This work has been enlarged and the results are compared with the performance of a wide range of commercial magnets. Magnet circuits can also be analyzed by a volume integral of dipoles. This removes the restriction of uniform magnetization and allows the optimum direction of magnetization to be explored. (Contractor's abstract)

A NIOBIUM-TIN SUPERCONDUCTING MAGNET, by L. C. Salter, S. H. Autler and others. [1961] [4]p. incl. diagr. table. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [AF 19(604)7344] and Advanced Research Projects Agency and National Science Foundation) Unclassified

Published in Proc. Internat'l. Conf. on High Magnetic Fields, Cambridge, Mass. (Nov. 1-4, 1961), Cambridge, M.I.T. Press and New York, Wiley and Sons, 1962, p. 344-347. (AFOSR-2299)

Measurements reported on short samples of niobium tin-core wire indicate that this material should be useful for the fabrication of high-field superconducting magnets. It is necessary to wind the magnet in its final form and insulate it before the heat treatment because of the brittle nature of the niobium-tin core. It was necessary to develop techniques for insulating and protecting the wire with a material which would withstand the high-temperature treatment, without liberating chemically incompatible decomposition products. It was found possible to fabricate a magnet from niobium-tin core wire which can generate significant magnetic fields.

THE NATIONAL MAGNET LABORATORY, by D. T. Stevenson. [1961] [5]p. incl. illus. diagr. tables. [AF 19-(604)7344] Unclassified

Published in Proc. Internat'l. Conf. on High Magnetic Fields, Cambridge, Mass. (Nov. 1-4, 1961), Cambridge, M.I.T. Press and New York, Wiley and Sons, 1962, p. 398-402. (AFOSR-2299)

The National Magnet Lab. is a research laboratory sponsored by the Air Force Office of Scientific Research and operated by M.I.T. The major research activity will be in solid-state, low-temperature, and related fields of physics. In addition, there will be a strong program of research and development in magnetic field generation. The laboratory is described with reference to its floor plan, power supply and the type of magnets to be included. A brief listing of the projects under the laboratory's research program is given.

Massachusetts Inst. of Tech. National Magnet Lab., Cambridge.

PULSED-FIELD RESONANCE MEASUREMENTS, by S. Foner. [1961] [10]p. incl. illus. diagrs. refs. [AF 19(604)7344] Unclassified

Published in Proc. Internat'l. Conf. on High Magnetic Fields, Cambridge, Mass. (Nov. 1-4, 1961), Cambridge, M.I.T. Press and New York, Wiley and Sons, 1962, p. 489-498. (AFOSR-2299)

This paper summarizes a number of resonance experiments that were performed with high magnetic fields. Pulsed fields were used for most of the experiments although in many cases d-c fields could also have been employed. Specific examples are chosen to illustrate some of the advantages and limitations of these high-field resonance experiments. Related high-field magnetization measurements are also briefly discussed since, at times, they can augment the resonance experiments.

PERFORMANCE DATA ON COOLING TURBINE SYSTEM FOR MASS TRANSFER CONES, by B. Rockower. June 9, 1959 [13]p. incl. diagrs. tables. (MTP-TM-31) (AFOSR-4086) (AF 49(638)245) Unclassified

This report contains a summary of performance data taken on the cooling turbine system which is to be used in testing porous cones. Most of the data was taken using air with some check point using helium. Two nozzles were used, one with a circular cross sectional area of 0.00581 in.^{2} and the other with a rectangular cross sectional area of 0.01275 in.^{2}.

CALIBRATION OF COOLING TURBINE NOZZLE WITH RECTANGULAR SECTION (Dwg. D-7-290) USED IN MASS TRANSFER EXPERIMENT, by B. Rockower. June 16, 1959 [9]p. incl. diagrs. tables. (MTP-TM-29) (AFOSR-4087) (AF 49(638)245) Unclassified

This report contains information on the calibration of the turbine nozzle with rectangular section. The nozzle was designed and built in order to obtain a greater temperature drop in the cooling medium, helium, which flows through the porous cone. The sectional throat area is 0.01275 in.^{2} as compared to 0.00581 in.^{2} for the nozzle (Dwg. B-7-209A) with circular section.

TRANSPORT PROPERTIES FOR MIXTURE BOUNDARY LAYER WEDGE SOLUTIONS, by P. B. Scott. June 29, 1959 [28]p. incl. diagrs. tables, refs. (MTP-TM-32) (AFOSR-4088) (AF 49(638)245) Unclassified

Preliminary to the machine solution of the binary mixture, non-vanishing pressure gradient, boundary layer equations, it is necessary to decide on some means of representation of the transport properties of the gas mixtures to be considered in the calculations. Mathematical relations representing the following fluid properties are considered: viscosity parameter, derivative of the viscosity parameter, Schmidt number, Prandtl number, and specific heat.

EFFECT OF VARIABLE WALL THICKNESS ON INJECTION RATE-FLAT PLATE AND HEMISPHERE, by J. P. Moran. July 20, 1959, 29p. incl. diagrs. tables. (MTP-TM-34) (AFOSR-4089) (AF 49(638)245) Unclassified

There are 2 methods of approach used in this report to determine the geometric shape required to satisfy both pressure and velocity boundary conditions. The first is a general solution of the 2 dimensional Laplace equation and the second is a 1-dimensional solution based on the assumption that the velocity in the primary flow direction is everywhere much greater than the velocity component normal to that direction. Two simple geometric shapes are considered in this analysis, a flat plate and a hemispherical shell, both of varying thicknesses. By fixing geometric and pressure boundary conditions a comparison of the 1-dimensional and Laplace solutions of thickness variation for the same mass flux at the outside surface is made for both geometric shapes. A cross comparison of the thickness variation for the same mass flux is made between the incompressible and isothermal solutions for both the flate plate and the hemispherical shell.

BINARY BOUNDARY LAYER SOLUTIONS BY MEANS OF A FINITE DIFFERENCE METHOD, by P. B. Scott. July 24, 1959, 33p. incl. diagrs. (MTP-TM-33) (AFOSR-2090) (AF 49(638)245) Unclassified

The equations of the binary boundary layer in the absence of thermal diffusion are considered. In this report only the Crocco formulation, which is applicable to many of the interesting situations, is discussed.

1644

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

FINITE DIFFERENCE FORMULATION OF THE BINARY BOUNDARY LAYER WITH VELOCITY OVERSHCOT, by P. B. Scott. Aug. 3, 1959 [15]p. incl. diagr. (MTP-TM-35) (AFOSR-4091) (AF 49(638)245) Unclassified

A general formulation for the solution of the binary boundary layer equations is presented. The major advantage of the general formulation is its applicability to cases of velocity over-shoot. In addition, an implicit difference representation is used, which allows a relaxation of the mesh size restrictions imposed by stability considerations.

1645

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

RECALCULATION OF THE DISTRIBUTION OF THE LOCAL BLOWING RATE ON AN ISOTHERMAL, POROUS HEMISPHERE, by A. F. Gollnick, Jr. Sept. 3, 1959 [13]p. incl. diagrs. tabls. (MTP-TM-37) (AFOSR-4092) (AF 49(638)245) Unclassified

In another paper (see item no. 1656, Vol. V), an approximate method for calculating the local blowing rate on a porous hemisphere with constant skin temperature was discussed. It is now known that these solutions are incorrect. New wedge solutions have been computed, using much the same computer program as before, with a few minor exceptions. These changes are in regard to the mathematical representation of the transport properties of the binary mixture.

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

I.B.M. 704 PROGRAM FOR BINARY MIXTURES, PRESSURE GRADIENT BOUNDARY LAYER EQUATIONS, by C. V. McCarthy. Aug. 27, 1959, 2p. (MTP-TM-36) (AFOSR-4093) (AF 49(638)245) Unclassified

A program has been written for the IBM 704 computing machine to give a solution to the 3 simultaneous boundary layer equations of momentum, concentration and energy. The method used for forward integration is the Gill-Kutta method.

1647

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

MASS FLOW AND COOLING REQUIREMENTS FOR A POROUS HEMISPHERE, by A. F. Gollnick, Jr. Sept. 25, 1959, 12p. incl. diagrs. (MTP-TM-38) (AFOSR-4094) (AF 49(638)245) Unclassified

In a later paper (see item no. 1656, Vol. V) an approximate method for obtaining the injection distribution required to maintain a constant wall temperature on a hemisphere is discussed. In another paper (see item no. 1645; AFOSR-4092) the normalized distribution corresponding to free stream conditions of $M_\infty = 3.50$ and $T_0 = 570°$ R was computed. A model having the specified distribution is under construction, and will be tested at the appropriate conditions. The accuracy of the pressure gradient of Ref. 1 will be checked, together with the effect of different gases as coolants at various stagnation blowing rates. The purpose of this report is to indicate the mass flow levels necessary for the test, the coolant temperatures required, and the pressure drops through the hemisphere wall. The effect of tunnel operating conditions on these quantities will be evaluated. (Contractor's abstract)

1648

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

INCORPORATION OF THE EXISTING GAS COOLING AND SUPPLY SYSTEM IN THE TEST OF A POROUS HEMISPHERE, by A. F. Gollnick, Jr. Nov. 3, 1959, 12p. incl. diagrs. tables. (MTP-TM-39) (AFOSR-4095) (AF 49(638)245) Unclassified

It is concluded that, on the basis of the available data, the nozzle-turbine cooling system can furnish sufficient cooling, in conjunction with an alcohol-dry ice heat exchanger, over the desired range of flow rates. In order to operate at low rates, it will be necessary to run the turbine at its optimum inlet pressure, and dump the surplus coolant into the boundary layer scavenging system. This is particularly true for helium.

1649

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

THE CALIBRATION OF POROUS WEDGES, by A. F. Gollnick, Jr. Dec. 9, 1959, 12p. incl. diagrs. tables. (MTP-TM-40) (AFOSR-4096) (AF 49(638)245) Unclassified

This report describes the second step in the preliminary study intended to evaluate the slip casting of a suitable stainless steel powder as a possible technique for

fabricating a variably permeable hemisphere to be tested in the supersonic tunnel. The thickness variation predicted on the hemisphere for α (resistance coefficient) was built into a series of wedge-shaped samples. The calibration of 3 such wedges is discussed.

1650

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

AN EXPLICIT FINITE DIFFERENCE FORMULATION ON SPACE COORDINATES APPLIED TO THE BINARY BOUNDARY LAYER EQUATION, by J. Moran. Feb. 15, 1960, 15p. incl. diagr. (MTP-TM-43) (AFOSR-4097) (AF 49(638)245) Unclassified

An explicit finite difference formulation on space coordinates as applied to the binary boundary layer equation is considered. This formulation becomes more stable as $\frac{\partial u}{\partial y}/W$ increases; this is the reverse of the trend in the Crocco formulation. This program will therefore be unstable near separation while the Crocco form has no defined stability requirements at separation. By employing the proper program it should be possible to solve all possible flow configurations. It should be noted that the wall values which are expanded in power series will be in greatest error under condition of maximum stability.

1651

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

COOLANT INJECTION PARAMETERS FOR COOLING OF HYPERSONIC NOZZLE, by R. P. Bernicker. Dec. 23, 1959, 13p. incl. diagrs. (MTP-TM-42) (AFOSR-4098) (AF 49(639)245) Unclassified

It is the purpose of this report to investigate the dependence of the reduction in adiabatic wall temperature near the throat upon the type of injection used in the upstream subsonic region. In particular, the parameters to be examined will be the ratio of coolant supply temperature to tunnel stagnation temperature, the position of the injection section (local Mach number in the external flow field), and the ratio of coolant mass flow to mainstream mass flow. No attempt will be made to evaluate the effects of such parameters upon the exit plane of the nozzle: the experimental investigation will be restricted to the neighborhood of the throat and a small length in the expansion section. It is necessary to estimate the amount of coolant required for given conditions, and to predict the injection distribution for a given nozzle.

1652

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

NOZZLE DESIGN FOR CONSTANT PRESSURE GRADIENT PARAMETER β, by R. [P.] Bernicker. Dec. 15, 1959, 19p. incl. diagrs. tables. (MTP-TM-41) (AFOSR-4099) (AF 49(638)245) Unclassified

It is the purpose of this report to determine geometric conditions such that the pressure gradient parameter β will be constant. In particular, analysis will be directed towards a nozzle geometry, though the requirements that β be constant depend only on the external flow field, and by the somewhat arbitrary choice of an origin for the s coordinate.

1653

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

FLOW CALIBRATION OF POROUS HEMISPHERES WITH NONUNIFORM WALL THICKNESS, by A. F. Gollnick, Jr. Apr. 18, 1960, 25p. incl. diagrs. (MTP-TM-44) (AFOSR-4100) (AF 49(638)245) Unclassified

This report describes the completion of the design study for a porous hemispherical wind tunnel model, as well as the calibration of the actual model tested in the supersonic tunnel. The work described falls into 2 parts. First a 6 in. diam hemisphere was designed. Four hemispheres based on this design were delivered by Mott Metallurgical Corp., Hartford, Conn. These were calibrated and a revised thickness distribution was based upon this data. New molds were fabricated and 2 new hemispheres were obtained. One of these, upon calibration, became the actual model used in the tunnel.

1654

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

PREDICTED POROUS CONE AND COOLANT TEMPERATURES UNDER TUNNEL TEST CONDITIONS, by R. [P.] Bernicker. June 10, 1959, 13p. incl. diagrs. tables. (MTP-TM-30) (AFOSR-4101) (AF 49(638)245) Unclassified

It is the purpose of this report to apply the procedures and results of a previous paper (item no. 1071, Vol. III) to a porous cone under tunnel operating conditions, and thereby to predict the equilibrium temperatures under given conditions of coolant supply temperature and injection rate. This analysis will be applied, both for air and helium as coolants, for 2 sections; 1 near the nose (x = 3.0 in.), and 1 farther downstream toward the base (x = 12 in.). The correlation for Nusselt number

as a function of Peclet number and porosity obtained previously will be extrapolated to the range of Peclet numbers involved in the cone test, and the results obtained for air will be assumed to be valid for helium as well.

1655

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

THICKNESS EFFECTS IN FLUID FLOW THROUGH POROUS DISCS, by A. F. Gollnick, Jr. May 1, 1959 [13]p. incl. diagrs. tables. (MTP-TM-27) (AFOSR-4102) (AF 49(638)245) Unclassified

Results indicate the desired level of α, the viscous resistance coefficient, cannot be achieved using the material of which these discs were made: a stainless steel powder consisting of particles which will pass through a No. 325 sieve. The variation of the flow resistance properties on each disc is under 5% and is satisfactory. Unless geometric shape has some effect, this is the order of magnitude that might be expected on the final model at a given station relative to the nose. In other words, in the absence of thickness settling effects, the properties should be constant to within 5%. It is concluded that the flow resistance coefficient α is independent of thickness.

1656

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge

REQUIRED VARIATION OF THE LOCAL BLOWING RATE OVER AN ISOTHERMAL, POROUS HEMISPHERE, by A. F. Gollnick, Jr. Mar. 24, 1959 [44]p. incl. diagrs. tables. (MTP-TM-26) (AFOSR-4103) (AF 49(638)245) Unclassified

It is the purpose of this paper to calculate the distribution of blowing rate necessary to maintain a constant skin temperature on a porous hemisphere. It is assumed that the hemisphere is to be tested in the supersonic tunnel, with helium and possibly air being used as the coolant. The method used is an approximate one first used by Stine and Wanless to calculate heat transfer rates on an isothermal hemisphere at high speed, and extended by C. J. Scott to include air injection. In this report the analysis is further extended to treat the problem in which gases other than air are used as coolants. Briefly, the analysis takes the equations of motion for the boundary layer on an axisymmetric body and makes use of a Mangler transformation to obtain the corresponding 2-dimensional equations. It is then assumed that at every station on the transformed hemisphere, or cylinder, the local flow may be replaced by some wedge type flow, in which the free stream velocity varies as a power of the streamwise distance. The appropriate wedge is obtained by equating the distance along the wedge, the free stream velocity, and the free stream velocity gradient to the corresponding quantities at the station on the cylinder at which matching is to take place. At this point the problem is reduced to that of obtaining a number of wedge solutions for compressible flow, with the appropriate boundary conditions.

1657

Massachusetts Inst. of Tech. Naval Supersonic Lab., Cambridge.

THE LAMINAR ISOTHERMAL BOUNDARY LAYER ON A FLAT PLATE WITH UNIFORM INJECTION, by A. F. Gollnick, Jr. Mar. 24, 1958, 11p. incl. diagrs. table. (MTP-TM-18) (AFOSR-4104) (AF 49(638)245) Unclassified

The laminar isothermal boundary layer on a flat plate with uniform injection is analyzed mathematically. The validity of the analysis must rest on experimental verification. In addition, the restriction to an isothermal layer is severe, and limits the practical usefulness. In view of the simplicity of the actual computations, it would appear worth while to look into both an experimental program, and the extension of the method to non-isothermal boundary layers.

EXPERIMENTAL STUDY OF A PLASMA COLUMN IN A MICROWAVE CAVITY, by S. J. Buchsbaum, E. I. Gordon, and S. C. Brown. [1959] [4]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and Atomic Energy Commission) Unclassified

Presented at 1959 Internat'l. Plasma Physics Institute, Washington U., Seattle, Aug. 31-Sept. 5, 1959.

Published in Plasma Physics, Accelerators, Thermonuclear Research, v. 2: 164-168, Jan. 1961.

Experiments designed to study the production of a steady-state plasma column by microwave cavity means are described. At low plasma densities electrons are heated by cyclotron resonance in crossed microwave electric and static magnetic fields. Phenomena associated with large energies which the electrons possess near cyclotron resonance are discussed. Large plasma densities are achieved by resonating the plasma column by suitably varying the static magnetic field, the microwave frequency and the input power. In this manner, densities of the order of 10^{12} cm^{-3} are obtained at a neutral gas pressure in the micron range. (Contractor's abstract)

LINEAR SPACE-CHARGE THEORY OF GAP INTERACTION BETWEEN AN ELECTRON BEAM AND ELECTROMAGNETIC FIELDS, by A. Bers. [1960] [8]p. incl. illus. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Microwave Tubes, Proc. of the Third Internat'l. Cong., Munich (Germany) (June 7-11, 1960), New York, Academic Press, 1961, p. 53-60.

The system under consideration consists of a waveguide with perfectly conducting walls having a gap. External to the gapped waveguide is an electromagnetic circuit (usually a resonator) which can support electromagnetic fields. Inside the waveguide an electron stream is assumed in either confined or Brillouin flow, with uniform time-average density and drift velocity across its cross section. Collisions are neglected and a zero temperature stream is assumed. Results are presented which are restricted to electron beams with $\omega_p/\omega \ll 1$ and gaps whose extent is short compared to a free-space wavelength. The weak coupling approach used here describes the fields of the circuit in the absence of the beam, and the electron beam waves in the absence of the circuit. Subsequently, the fields of these 2 systems are coupled by considering the motion of the electron stream under the influence of the circuit fields. Only the case of longitudinal interaction is considered.

This report is comprised of five parts. Part 1 is concerned with contributions centering on Shannon's theory and the theory of coding. Part 2 deals with those results in the theory of random processes which are of relevance to communication problems. Part 3 surveys advances of a basic nature in pattern recognition. Part 4 is concerned primarily with the detection of signals in noise. Part 5 is given over to prediction and filtering, centering on Wiener's theory and its extensions.

THE THERMIONIC CONVERSION OF HEAT TO ELECTRICITY, by W. B. Nottingham. [1960] [5]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) AD 260110 Unclassified

Published in Advances in Electron Tube Techniques, Proc. of the Fifth Nat'l. Conf. (Sept. 1960), New York, Pergamon Press, p. 72-76.

A thermionic converter is a diode with an electron emitter and an electron collector. The emitter must be at a higher temperature than the collector and the net electrical flow correspond to an electron current flowing from the emitter to the collector. Energy, in the form of heat, is supplied to the emitter and a smaller amount of heat energy must be removed from the collector, either by radiation or by means of a heat sink which can conduct the excess heat away, possibly for use in some other heat conversion device. The difference between the heat supplied and the heat removed is available for the direct conversion of heat to electricity. The importance is described of the emitter properties and the transport properties of the interelectrode space in the determination of the current that can flow across the thermionic diode. A better understanding of the lowering of surface work-function by the presence of absorbed cesium will, through its control of the collector work-function, increase the voltage available in the converter. The voltage output thus depends both on the transport mechanism and the surface potential of the collector relative to its Fermi level. (Contractor's abstract)

Presented at the Thirteenth Annual Gaseous Electronics Conf., Monterey, Calif., Oct. 12-15, 1960.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 385, June 22, 1961.

A highly ionized plasma is made by the prescription: gas flow (H_2, He, A, N_2) 0.3-2 cc STP/sec through a refractory hollow cathode tube; any anode; 30-200 v dc. An axial induction 100-1000 gauss is used for collimation and assistance in rf starting; the induction can be removed during operation. The discharge runs from the cathode interior, where $p_0 d \approx 1$ cm x mm Hg. If the ions sputter or vaporize the cathode material, the cathode interior forms a cavity. Typical conditions are: 3-mm diam cathode, 50-amp, 35-v, 0.5-cc/sec argon, external pressure 3×10^{-4} mm Hg, cavity pressure 40 mm Hg, cathode temperature 2500°C, electron temperature 1-2 ev with high energy tail. Currents 2-200 amp have been run; the configuration can be modified considerably at will. Charge densities are 10^{13}-10^{14}/cm^3 in the exterior plasma and 10^{16}-10^{17}/cm^3 inside the cavity. Calculations show that a neutral gas molecule has little chance of reaching the external plasma without being ionized, consistent with observations.

Published in I.R.E. Trans. on Microwave Theory and Tech., v. MTT-9: 79-82, Jan. 1961.

The propagation of electromagnetic waves in a plasma in a magnetic field as given by the Appleton-Hartree theory is discussed in terms of the wave normal surfaces instead of the more conventional propagation vector plots, and the ordinary and extraordinary waves are defined in terms of their polarizations instead of using a continuity argument. This gives a different picture of a wave which has some advantages. In particular, whistlers become obvious, as are regions of high reflection and high absorption. The Appleton-Hartree theory is then extended to include the effect of electron temperature, and this results in a third wave whose velocity is of the order of electron thermal motions. Also published in Arch. Ital. Biol., v. 99: 105-120, Apr. 1961.

The effects of various stimulus parameters in evoking auditory off-responses are investigated. It is found that off-responses do occur when the terminal transient of the stimulus covers a broad band of frequencies. A simple model has been proposed to explain the phenomena as they occur with low-intensity stimuli. Another model has been proposed to account for off-responses that are seen when high-intensity stimuli are used. This latter model incorporates the idea of an inhibitory "halo" surrounding a[illegible] area of intense local activation of the cortex. (Contractor's abstract)

ELECTROHYDRODYNAMIC AND MAGNETOHYDRODYNAMIC SURFACE WAVES AND INSTABILITIES, by J. R. Melcher. [1961] [7]p. incl. illus. diagrs. refs. (AFOSR-3375) (Sponsored jointly by Air Force Flight Accessories Lab.; and Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Also published in Phys. Fluids, v. 4: 1348-1354, Nov. 1961.

Low-frequency dynamics of a plane fluid interface stressed by tangential or perpendicular electric or magnetic fields is studied emphasizing the duality of the magnetic and electric cases. Both configurations are shown to be controlled by an effective Alfvén velocity for the magnetic cases, and by an electrohydrodynamic dual to this velocity for the electric cases. A wavelength and threshold for instability are predicted for a surface stressed by a perpendicular field, and correlated with experimental results. This makes possible a critical experiment to determine the nature of interfacial electrostriction in dielectrics. A dielectric interface stressed by a tangential electric field supports incompressible electrohydrodynamic transverse waves that propagate along the lines of electric field intensity at a velocity strongly influenced by interfacial electrostriction. Experimental results indicate the existence of such waves. (Contractor's abstract)

ELECTROHYDRODYNAMIC SURFACE RESONATORS by J. R. Melcher. [1961] [2]p. incl. diagrs. (AFOSR-J122) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and Air Force Systems Command, Aeronautical Systems Division under AF 33(616)7624) AD 400079 Unclassified

Also published in Phys. Fluids, v. 5: 1130-1131, Sept. 1962.

A fluid-fluid interface stressed by an electric field supports electrohydrodynamic surface waves that depend intimately on the electromechanical surface traction. The properties of these waves in resonance are considered for a planar surface bounded by a rigid rectangular box with an unperturbed electric field that is perpendicular (type I) or tangential (type II) to the interface. Resonances of both types were measured and verify earlier experimental results. The resonators were constructed with care taken to avoid fringing fields. The surface was excited by vibrating the resonator, and the resulting waves were illuminated by a point source to detect the resonant frequency.

HIGHLY IONIZED HOLLOW CATHODE DISCHARGE, by L. M. Lidsky, S. D. Rothleder and others. [1961] [8]p. incl. diagrs. table, refs. (AFOSR-J993) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Also published in Jour. Appl. Phys., v. 33: 2490-2497, Aug. 1962.

A hollow cathode discharge (HCD) is described that produces a highly ionized steady state plasma ($n_e \approx 10^{13}$-10^{14}/cm^3) at a temperature 1-10 ev, in a volume as large as 10^4 cm^3, with background neutral gas density $\approx 10^{13}$/cm^3. The HCD is generated by the prescription; gas flow (H_2, He, A, or N_2) 0.05-2 cc STP/sec through a refractory metal hollow cathode tube into a vacuum; any anode; 20-200 v dc applied. An axial induction 100-1000 G is used to collimate the discharge and to aid in starting by rf excitation. The HCD runs from the cathode interior. deep enough that $p_0 d \approx 1$ cm x mm Hg. Current range is 2.0-300 A. Various electrode configurations and a wide range of operating parameters have been studied. The external plasma density and temperature were measured by Langmuir probes. A discussion is given of the confinement mechanism and of the energy balance, both in the external plasma and in the region of the cathode itself. (Contractor's abstract)

Also published in Nuclear Fusion, v. 2: 49-53, Sept. 1962.

The coupling between electromagnetic and electron plasma waves in a uniform plasma in the presence of a static magnetic field is studied. The transport equations are used to represent the plasma and Maxwell's equations to represent the fields. These yield a dispersion relation which is discussed here only for ions of infinite mass. Eight topologically different phase velocity surfaces suffice to represent the system of combined electromagnetic and electron waves for all values of plasma density and magnetic field strength. The plasma waves have cutoffs (phase velocity infinite) wherever the electromagnetic wave has a resonance (phase velocity zero); the coupling between the 2 waves is strong there and their respective velocity surfaces join smoothly one onto the other. Elsewhere the waves are distinct. (Contractor's abstract)

RADIOFREQUENCY EMISSION FROM PLASMAS NOT IN THERMODYNAMIC EQUILIBRIUM, by S. C. Brown and G. Bekefi. [1961] [11]p. incl. diagrs. table, refs. (AFOSR-J1544) (Sponsored jointly by Air Force Command and Control Development Division under AF 19-(604)5992, Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and Atomic Energy Commission) Unclassified

Presented at Conf. on Plasma Physics and Controlled Nuclear Fusion Research, Salzburg (Austria), Sept. 4-9, 1961.

Also published in Nuclear Fusion, Suppl., Pt. 3: 1089-1099, 1962.

Calculations of the propagation constant of a plane

electromagnetic wave in a tenuous unbounded plasma show that under suitable conditions the wave grows exponentially in amplitude. For this to happen (a) the population of electrons should increase with increasing energy and (b) the emission cross-section for the process in question must decrease sufficiently rapidly with increasing energy. Detailed calculations of the rate of amplification and the range of frequencies in which it occurs are given for bremsstrahlung and cyclotron emission. Amplification of bremsstrahlung occurs in plasmas of low ionization and for low electron energies. Amplification of cyclotron emission is particularly favorable in highly ionized, high-energy plasmas. Here even small departures of the electron distribution of energies from Maxwellian distribution lead to a very significant increase of cyclotron emission. Experiments, designed to measure the amplification of cyclotron emission, are described. (Contractor's abstract)

DEPOSITION OF METALLIC FILMS BY ELECTRON IMPACT DECOMPOSITION OF ORGANOMETALLIC VAPORS, by A. G. Baker and W. C. Morris. Jan. 13, 1961 [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and Bureau of Ships) AD 258157 Unclassified

Also published in Rev. Scient. Instr., v. 32: 458, Apr. 1961.

An electron beam with a current density of approximately 5 ma/cm^2 operated with potentials between 50 v and 1 kv has been used to decompose organometallic vapors to produce thin metallic films. Two modes of operation have been investigated. A molecular starving is achieved by having more electrons arrive in unit time than are needed to decompose the molecules arriving at the substrate during that time. This mode gives films which do not show the nonuniformity of the electron beam. A second mode of operation can be realized by allowing more molecules to strike the substrate than the electron beam can accommodate. The films produced with this mode of operation show nonuniformities which appear to be due to the nonuniform beam density. Films between 50 and 1500 A in thickness have been produced. Highly reflecting tin films with surface resistances from 50 ohms per sq to about 1000 ohms per sq have been made. Other films have resistances as high as 1 meg per sq and have a brown appearance.

SOME REQUIREMENTS FOR THE OPERATION OF MAGNETOHYDRODYNAMIC INDUCTION GENERATORS, by H. H. Woodson and A. T. Lewis. [1961] [17]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and Wright Air Development Division under AF 33(616)3984) Unclassified

Published in Engineering Aspects of Magnetohydrodynamics; Proc. Second Symposium, Philadelphia, Pa. (Mar. 9-10, 1961), New York, Columbia U. Press, 1962, p. 277-293.

The usual analysis of an MHD induction generator starts with assumed gas properties and proceeds to the terminal properties. In this investigation the process is reversed. Here, it is assumed that single-frequency ac power is to be generated. This leads to an equivalent circuit that is necessary to satisfy this assumption. Analysis of the equivalent circuit shows some general properties of the system in terms of circuit parameters, and circuit parameters are shown to be related to gas properties by using experimental results obtained with magnetically driven shock tubes. This process yields an unambiguous specification of the gas properties (mainly magnetic Reynolds number) that must be achieved to obtain certain performance characteristics. More exact data on gas behavior are needed to make the analysis accurate enough for engineering design.

A MAGNETOHYDRODYNAMIC POWER CONVERTER, by W. D. Jackson, E. S. Pierson, and D. A. East. [1961] [13]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]; National Science Foundation: and Wright Air Development Division under AF 33(616)7624) Unclassified

Published in Engineering Aspects of Magnetohydrodynamics; Proc. Second Symposium, Philadelphia, Pa. (Mar. 9-10, 1961), New York, Columbia U. Press, 1962, p. 294-306.

The interchange of electrical power between dc systems having different voltage levels is currently achieved with a variety of schemes involving rotating machinery, controlled mercury-arc rectifiers, or solid-state devices. The method proposed and examined in this paper has been termed magnetohydrodynamic power conversion and uses a channeled, electrically conducting fluid, an electromagnetic pump, and a MHD generator to replace, respectively, the mechanical coupling, drive motor and generator of a conventional rotating machine converter set. Consideration is restricted to the case of voltage transformation in dc systems and to MHD converters in which a liquid metal serves as the working fluid. The pump and generator sections for this type of converter

are essentially homopolar machines in which the rotating disc of Faraday's original unipolar inductor has been replaced by a flowing fluid.

PRODUCTION OF A PLASMA WITH HIGH-POWER, PULSED MICROWAVES, by T. Fessenden. Aug. 29, 1961 [13]p. incl. illus. diagrs. table. (Technical rept. no. 389) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-73108], and National Science Foundation) Unclassified

Published in Engineering Aspects of Magnetohydrodynamics; Proc. Second Symposium, Philadelphia, Pa. (Mar. 9-10, 1961), New York, Columbia U. Press, 1962, p. 529-544.

A dense plasma in a resonant cavity can be produced in a few microseconds by a high-power pulse of microwave energy. The cavity should be excited at frequencies near the resonant frequency of a cavity mode obtained when the volume normally occupied by the plasma is replaced by a perfect conductor. That is, a cavity mode should be used that requires the presence of the plasma for its existence. The electron density and collision frequency of a dense plasma in a resonant cavity can be related to the amount of detuning produced by the plasma. A perturbation theory that assumes that the plasma is a perfect conductor in the unperturbed case can be used for calculating the parameters of the plasma from measurements of the detuning of the cavity.

APPLICATION OF STOCHASTIC APPROXIMATION METHODS TO OPTIMUM FILTER DESIGN, by D. J. Sakrison. [1961] [9]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Presented at I.R.E. Internat'l. Convention, New York, Mar. 20-23, 1961.

Published in I.R.E. Internat'l. Convention Record, Pt. 4: 127-135, 1961.

For a filter containing a number of variable parameters, the input and desired output of which are the outputs of stationary ergodic sources, it is required that a parameter setting be selected which minimizes the average value of some positive function of the error (not necessarily the mean square error). An iterative approach is made to the problem and conditions guaranteeing convergence are discussed, as well as estimates made of the rate of convergence. The iterative procedure is stated to be approximate and to involve considerable computing but has the advantages (1) of minimizing any convex function of the error, not just the mean error, and (2) it does not require the preliminary measurement of correlation functions or other statistics.

HYPERFINE-STRUCTURE SEPARATIONS, ISOTOPE SHIFTS, AND NUCLEAR MAGNETIC MOMENTS OF THE RADIOACTIVE ISOTOPES Tl^{199}, Tl^{200}, Tl^{201}, Tl^{202}, AND Tl^{204}, by R. J. Hull and H. H. Stroke. Mar. 1961 [10]p. incl. illus. diagrs. tables, refs. (Technical rept. no. 393) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) AD 268488 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 51: 1203-1212, Nov. 1961.

The hyperfine structure and isotope shift of 5 radioactive isotopes of thallium were measured spectroscopically. Thallium-199 (7.4 hr) and thallium-200 (27 hr) were produced by alpha bombardment of gold; thallium-201 (3 day), thallium-202 (12 day), and thallium-204 (4 yr) were produced by deuteron bombardment of liquid mercury. The isotopes were excited in electrodeless-discharge lamps. Previously measured values of the nuclear spins of the odd-even isotopes were verified. Nuclear magnetic moments or upper limits on the moments were calculated by comparison of the hyperfine splittings of the radioactive isotopes with the known splittings and moments of the stable thallium isotopes. A definite dependence of the relative isotope shifts on neutron number was observed.

COLLISION FREQUENCY OF A PLASMA AS A FUNCTION OF APPLIED ac FREQUENCY (Abstract), by S. Yoshikawa. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 290, Apr. 24, 1961.

The Coulomb collision frequency, ν_c, was calculated by means of the time-dependent Fokker-Planck equation derived from the 6N-dimensional Liouville equation. The collision frequency was found to depend on the frequency, ω, of the applied external field. The first-order approximation leads to the result previously obtained by Ginsburg in dc external field. The frequency dependence is contained only inside the Coulomb logarithm, Λ, which is replaced by $\Lambda\omega_p/\omega$ whenever ω exceeds the plasma frequency, ω_p. The result can be interpreted as a decrease of the effective radius of the Debye sphere. Before an electron can travel a distance v_0/ω the external field reverses its sign; hence the lesser of v_0/ω and the Debye length v_0/ω_p should enter as the cutoff of the Coulomb interaction. The former becomes shorter, if $\omega > \omega_p$.

COMMENTS ON THE BARNES COLD CATHODE GAUGE, by W. B. Nottingham. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in Rev. Scient. Instr., v. 32: 464-465, Apr. 1961.

Two papers have been published by Dr. G. Barnes (Rev. Scient. Instr., v. 31: 608, 1960, and v. 31: 1121, 1960) which were intended to describe the construction and properties of a new type of vacuum gauge. For such communications to be of value, a new gauge design should incorporate features which either give greater simplicity in the gauge construction itself or its auxiliary measuring equipment or offer higher reliability, greater ease of calibration, or greater extension in the range of pressure which it can evaluate. It is not at all clear from these 2 papers that Dr. Barnes has accomplished any of these purposes. The Barnes device is useless as a means of evaluating vacuum conditions and no evidence presented in these papers is valid as a scientific evaluation of the usefulness and accuracy of Bayard-Alpert type gauges.

THE RECOGNITION OF SPEECH BY MACHINE, by G. W. Hughes. May 1, 1961 [62]p. incl. illus. tables, refs. (Technical rept. no. 395) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) AD 268489 Unclassified

The problem of engineering a mechanical (automatic) speech recognition system is discussed in its theoretical and practical aspects. Performance of such a system is judged in terms of its ability to act as a parallel channel to human speech recognition. The linguistic framework of phonemes as the atomical units of speech, together with their distinctive feature description, provides the necessary unification of abstract representation and acoustic manifestation. A partial solution to phoneme recognition, based on acoustic feature tracking, is derived, implemented, and tested. Results appear to justify the fundamental assumption that there exist several acoustic features that are stable over a wide range of voice inputs and phonetic environments. (Contractor's abstract)

Also published in Phys. Rev. Ltrs., v. 6: 446-448, May 1, 1961.

A helix gives rise to a field which can perturb an initially axial field causing a steady change in the transverse energy of particles in the field, and hence their magnetic moment. This may allow trapping of a high-energy beam

injected axially into a mirror device. There must be a close match between the pitch of the helix locally and the particle trajectory. The particles are thus trapped by a resonance effect whereas losses will occur by random scattering. It is hoped that the difference between trapping and loss mechanisms will allow increased containment times by modifications to the basic configuration. The necessary equations are derived briefly. Trapping was observed in the experiments on an electron beam.

EFFECTS OF VOWEL CONTEXT ON THE ARTICULATION OF STOP CONSONANTS (Abstract), by O. Fujimura. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Presented at Sixty-first meeting of the Acoust. Soc. Amer., Philadelphia, Pa., May 10-13, 1961.

Published in Jour. Acoust. Soc. Amer., v. 33: 842-843, June 1961.

Movements of the lips and the mandible were studied by means of a stroboscopic motion picture technique during the production of intervocalic velar (palatal) and alveolar stop consonants. Three subjects pronounced English words like veto, echo, cookie, okay, etc., in which significantly different labial articulations are required for the first vowel and the second vowel. A film speed of 50 frames/sec was employed for the experiment. Results indicate that during the closure period of nonlabial stops, the labial configuration changes considerably in anticipation of the following vowel. In echo, for example, the lips start to close during the production of the first vowel, and the most conspicuous change in their shape occurs during the closure period of /k/. In general, there is substantial disagreement between the movement of the lips and that of the mandible. Some details of the relation between the articulatory movement and the boundaries found in the sound spectrogram are given. Implications concerning the acoustic structures of the output sound, such as the "target" of formant transition, are discussed.

ON THE PROPERTIES OF VOICELESS FRICATIVE CONSONANTS, by J. M. Heinz and K. N. Stevens. [1961] [8]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in Jour. Acoust. Soc. Amer., v. 33: 589-596, May 1961.

According to an acoustical theory of speech production, the spectra of voiceless fricatives can be characterized by poles and zeros whose frequency locations are dependent on the vocal-tract configuration and on the location of the source of excitation within the vocal tract. The locations of the important poles and zeros in the spectra of fricatives can be determined by a matching process whereby comparison spectra synthesized by electric circuits are matched against the spectra under analysis. This method has been used to determine the frequencies and bandwidths of the important poles and zeros for several versions of /f/, /s/, and /S/. Based on these findings, a simplified electrical model is developed for the synthesis of voiceless fricatives. The model consists of a noise-excited electric circuit characterized by a pole and a zero whose frequency locations can be varied. Stimuli generated by this model, both in isolation and in syllables, are presented to listeners for identification. The results of the listening tests are consistent with the data from the acoustic analyses and with the findings of other investigators. (Contractor's abstract)

Published in Phys. Rev., v. 122: 1574-1575, June 1, 1961.

The hyperfine-structure separations and isotope shifts of several radioactive isotopes of thallium have been measured by optical spectroscopic techniques. The results are: $\mu^{193} = 1.57$ nm; $\mu^{201} = 1.58$ nm; and both $|\mu^{200}|$ and $|\mu^{202}| \leq 0.15$ nm. The isotope shift measurements, which include the first data of this kind obtained for heavy odd-odd nuclei, permitted a comparison of the relative isotope shifts for isotopes in mercury and thallium. A marked similarity in the shifts was observed. (Contractor's abstract)

LOCAL MAGNETOHYDRODYNAMIC INSTABILITIES IN A COLLISIONLESS PLASMA WITH ANISOTROPIC PRESSURE, by K. F. Voyenli. June 8, 1961, 19p. incl. diagrs. (Technical rept. no. 388) (Sponsored jointly by Air Force

Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and Royal Norwegian Council for Scientific and Industrial Research) AD 264725 Unclassified

The local magnetohydrodynamic stability of static equilibrium states in a collisionless plasma in a magnetic field with anisotropic pressure is discussed by using an energy principle. The discussion is mainly limited to 1 class of static equilibrium states. In this class the difference between the components of the pressure perpendicular and parallel to the magnetic field is proportional, along each field line, to the square of the magnetic field strength. For each equilibrium state in this class it is possible to define an associated equilibrium state with isotropic pressure, in terms of which the possible equilibrium states can be completely discussed. It is also shown that the stability of any anisotropic equilibrium state can conveniently be discussed in terms of the stability of its associated isotropic state. Complete conditions for stability are found for the uniform equilibrium state. The additional complications that are introduced by nonuniformity of the equilibrium state can be completely understood from the associated isotropic state. Certain comparison theorems for nonuniform equilibrium states are found and, finally, a class of nonuniform equilibrium states with straight field lines is discussed, for which it is shown that stability conditions are the same as in the uniform case. MANY-VALUED LOGICS AND RELIABLE AUTOMATA, by J. D. Cowan. [1961] [45]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Principles of Self-Organization, Trans. of the Ill. U. Symposium on Self-Organization, Robert Allerton Park (June 8-9, 1961), New York, Pergamon Press, v. 9: 135-179, 1962.

Many-valued logics are used to analyze discrete noisy automata. It is shown that the functionally incomplete logic of Lewis, in which not all truth-values are informationally significant, provides an appropriate model for the description of the redundant automata of von Neumann and Elias. A study is made of methods of reducing the redundancy in such automata, and it is shown that the functionally incomplete Lukasiewicz logic, and the functionally complete Post logics provide models for the description of the more efficient automata of McCulloch et al. Advantage is taken of the fact that these logics have varying structures corresponding to different ways of coding and processing information. An approach is made to the problem of achieving arbitrarily high reliability of computation with nets of unreliable components, so that these nets are not completely redundant. No solution is obtained to this problem, but it is concluded that the functionally complete Post logics may provide one. (Contractor's abstract)

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 363, June 22, 1961. (Title varies)

Published in Jour. Chem. Phys., v. 36: 2266-2272, May 1, 1962.

The proton spin-lattice relaxation time T_1 has been measured in normal hydrogen and in mixtures with 12 other gases as a function of density and composition at room temperature. Cross sections for m_J transitions of the H_2 molecule deduced from the Bloembergen-Schwinger formula are interpreted qualitatively on the basis of electric multipole moments as measures of the anisotropy of the intermolecular forces, using the transient approximation. This approximation is justified in the case of H_2-CO_2 mixtures on the basis of the temperature

dependence of T_1. The assumptions of the Bloembergen-Schwinger formula are discussed, and an experiment is proposed to determine the connection between two correlation times which appear in the theory. (Contractor's abstract)

DIGITAL RADIOMETER, by S. Weinreb. [1961] [1]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-73108], and National Science Foundation) AD 260109 Unclassified

Also published in Proc. Inst. Radio Engineers, v. 49: 1099, June 1961.

This note describes a system that combines the Dicke radiometer, digital data processing, and 2 concepts from statistical communication theory to form a multichannel radiometer that shows promise of achieving very high stability. The 2 concepts are summarized as follows: (1) Instead of measuring an estimate of the power spectrum directly, an estimate of the Fourier transform, the autocorrelation function is measured and then transformed to give an estimate of the power spectrum. Its utility lies in the fact that it can be instrumented digitally quite easily and accurately, especially when the second concept is brought into use. (2) By making use of the Gaussian statistics of the input signal (a rather safe assumption for all signals now being observed in radio astronomy), it is possible to obtain the autocorrelation function of the signal only from a knowledge of the polarity of the signal relative to its mean.

DISCRETE REPRESENTATIONS OF RANDOM SIGNALS, by K. L. Jordan, Jr. July 14, 1961, 87p. incl. illus. refs. (Technical rept. no. 378) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108)
AD 274492 Unclassified

An investigation of the possibility of efficient, discrete representations of random signals is discussed. In many problems a conversion is necessary between a signal of continuous form and a signal of discrete form. This conversion should take place with small loss of information but still in as efficient a manner as possible. Optimum representations are found for a finite time interval. The asymptotic behavior of the error in the stationary case is related to the spectrum of the process. Optimal solutions can also be found when the representation is made in the presence of noise. These solutions are closely connected with the theory of optimum linear systems. Some experimental results have been obtained by using these optimum representations. (Contractor's abstract)

Published in Science, v. 134: 168-177, July 21, 1961.

In measuring sensitivity it is desirable to manipulate the response criterion so that it lies in a range where it can be measured, to include enough catch trials to obtain a good estimate of this response criterion, and to use a method of analysis that yields independent measures of sensitivity and the response criterion. Estimation of the response criterion in a forced-choice experiment may be eliminated. Under the forced-choice procedure, few observers show a bias in their responses large enough to affect the sensitivity index d' appreciably. Those who do show such a bias initially can overcome it with little difficulty. As a result, the observer can be viewed as choosing the interval most likely to contain a signal, without regard to any criterion. For this reason, the forced-choice procedure may be used to advantage in studies having an emphasis on sensory, rather than on motivational or response processes.

THERMIONIC CONVERSION OF HEAT TO ELECTRICITY, by W. B. Nottingham, G. N. Hatsopoulos, and E. N. Carabateas. [1961] [6]p. incl. illus. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Aerospace Eng., v. 20: 14-15, 82-85, July 1961.

Direct conversion of heat to electricity demand a device which accepts heat at its input, rejects excess heat at its output, and generates a driving voltage which can put current through an external load. The thermionic diode is such a device. It has an electron emitter which accepts the heat and delivers electrons for transport through an intervening space to the electron collector. The collector also receives heat which must be discharged by some cooling mechanism. A detailed discussion of each of the 3 essential components of the thermionic diode energy converter is presented.

A THERMISTOR FLOWMETER FOR BLOOD FLOW MEASUREMENT, by D. H. Pruslin and W. D. Jackson. [1961] [1]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in Digest Fourth Internat'l. Conf. on Medical Electronics, New York, N. Y. (July 1961), Conf. Comm. for Publication, 1961, p. 87.

Thermistors are solid-state, temperature-sensitive resistors with large negative temperature coefficients and have been applied to instrumentation situations in which the detection of small temperature changes is required. The ability of a thermistor flowmeter to detect flows in the range encountered in blood flow measurements has been confirmed experimentally using a flow system of the recirculating type with tap water as the working fluid. A bead thermistor of 0.01 in. diam was mounted in the center of a section of plastic tubing of 3/8 in. internal diam and was connected in the one arm of an equal-arm Wheatstone bridge. The results show that the thermistor flowmeter can provide a nonlinear indication of flow rate, although several factors must be taken into account in developing a flowmeter with an accurate and reliable calibration. The quantitative treatment of the experimental situation may be made in terms of heat transfer across a laminar boundary layer. The thermistor flowmeter is sensitive to changes in both location of the bead relative to the channel center and the temperature of the fluid. In the latter case, a change of 1°C produced a bridge voltage change equal to that of the max recorded flow rate. The thermistor-flowmeter principle has characteristics which make it an attractive candidate for development as a catheter-flowmeter for clinical application, but, it is pointed out, much work is required to produce an instrument of acceptable overall performance.

DETECTION OF AUDITORY SINUSOIDS OF UNCERTAIN FREQUENCY, by D. M. Green. [1961] [7]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Jour. Acoust. Soc. Amer., v. 33: 897-903, July 1961.

The decrease in the detectability of a gated sinusoidal signal in noise caused by deliberately introducing uncertainty about the signal's frequency is no greater than 3 db, even in an extreme condition of uncertainty. In this extreme condition the signal duration is 0.1 sec, and the signal frequency is varied between 500 and 4000 cps. This effect is not critically dependent on signal duration. Moreover, the observers not only detect the signal but display at least gross information about the frequency of the signal in the uncertain frequency conditions. Several models, suggested in previous studies, are considered. The magnitude of the decrease observed in the data falls far short of the predictions of these models. An interpretation suggested by the data is that the observers in a detection task, even when a signal of fixed frequency is used, are highly uncertain as to the exact physical parameters of the signal. Another way of stating this assumption is to say that the observer never tests for the presence or absence of a signal on the basis of one simple hypothesis. From this assumption little decrease is expected in detectability from deliberately introducing frequency uncertainty. This interpretation would suggest the same result would be obtained if time were the major experimental variable. (Contractor's abstract)

CONFIGURATION MIXING AND THE EFFECTS OF DISTRIBUTED NUCLEAR MAGNETIZATION ON HYPERFINE STRUCTURE IN ODD-A NUCLEI, by H. H. Stroke, R. J. Blin-Stoyle, and V. Jaccarino. Aug. 15, 1961 [23]p. incl. diagrs. tables, refs. (Technical rept. no. 392) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Phys. Rev., v. 123: 1326-1348, Aug. 15, 1961.

The theory of Blin-Stoyle and of Arima and Horie, in which the deviations of the nuclear magnetic moments from the single-particle model Schmidt limits are ascribed to configuration mixing, is used as a model to account quantitatively for the effects of the distribution of nuclear magnetization on hyperfine structure (Bohr-Weisskopf effect). A diffuse nuclear charge distribution, as approximated by the trapezoidal Hofstadter model, is used to calculate the required radial electron wave functions. A table of single-particle matrix elements of R^2 and R^4 in a Saxon-Woods type of potential well is included. Explicit formulas are derived to permit comparison with experiment. For all of the available data satisfactory agreement is found. The possibility of using hyperfine structure measurements sensitive to the distribution of nuclear magnetization in a semiphenomenological treatment in order to obtain information on nuclear configurations is indicated. MICROWAVE MEASUREMENTS OF THE RADIATION TEMPERATURE OF A PLASMA IN A MAGNETIC FIELD, by H. Fields, G. Bekefi, and S. C. Brown. [1961] [9]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], Air Force Command and Control Development Division under AF 19(604)5992, and Atomic Energy Commission) Unclassified

Published in Proc. Fifth Internat'l. Conf. on Ionization Phenomena in Gases, Munich (Germany) (Aug. 28-Sept. 1, 1961), Amsterdam, North-Holland Publishing Co., v. 1: 367-375, 1962.

The microwave-frequency emission from the positive column of a dc glow discharge has been used to determine its radiation temperature. The positive column was subjected to an axial magnetic field not exceeding 2000 gauss. The emission was measured with a radiometer at a frequency of 3000 mc/sec, and a technique was adopted that rendered the interpretation of the

temperature independent of the plasma absorptivity. The main departure of the measured radiation temperature from the predicted electron temperature is observed at a frequency equal to the electron cyclotron frequency. Here large resonances of the radiation temperatures were observed in neon, argon, and xenon, while no resonances were observed in hydrogen and helium. These results are shown to be consistent with calculations of the radiation temperature from plasmas with non-Maxwellian electron distributions. (Contractor's abstract)

DEPENDENCE OF SUCCESSIVE JUDGMENTS IN DETECTION TASKS: CORRECTNESS OF THE RESPONSE, by E. F. Shipley. [1961] [2]p. incl. tables. (In cooperation with Pennsylvania U.) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Jour. Acoust. Soc. Amer., v. 33: 1142-1143, Aug. 1961.

Greater-than-chance temporal grouping of correct and of incorrect responses was found in both forced-choice and yes-no detection tasks. This dependence is small. The findings suggest that criterion correction contributes to the phenomena: (1) more dependence (more positive r_1's) with tone than with noise signals and (2) more dependence (larger r_1's) with higher intensity signals. The larger effect with higher intensity signals is not incompatible with the finding that giving the subject information about the signal has a greater effect with lower intensity signals on the overall proportion of correct responses. Those results indicate that the same information has a greater effect with low-intensity signals, but the results here can be interpreted as showing that high-intensity signals offer more information. POWER AND ENERGY RELATIONS IN BIDIRECTIONAL WAVEGUIDES, by P. Chorney. Sept. 1, 1961 [65]p. incl. illus. tables, refs. (Technical note no. 396) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) AD 277030 Unclassified

A broad class of uniform waveguides is defined as bidirectional because the waves supported by these waveguides propagate with the same dispersion relation in either direction along the waveguide axis. The requirements for bidirectionality are defined, and several examples of bidirectional waveguides are given; typical examples are waveguides containing isotropic media, and waveguides containing properly oriented magnetized ferrites and plasmas. For lossless, passive bidirectional waveguides, some general theorems are derived which relate the power carried by the waves with a quantity called pseudo energy. The energy-like terms in the complex Poynting theorem do not truly represent energy when a medium is dispersive: hence, the name, pseudo energy. The theorems apply to 3 types of waves: (a) purely propagating, (b) cutoff, and (c) complex. Several examples are given which illustrate the physical implications of the theory. A good deal of attention is paid to waves having complex propagation constants in lossless, passive waveguides. (Contractor's abstract)

STRUCTURE AT THE LEXICAL LEVEL AND ITS IMPLICATIONS FOR TRANSFER GRAMMAR, by E. S. Klima. [1961] [12]p. (Paper no. 13) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Published in Proc. Internat'l. Conf. on Machine Translation of Languages and Applied Language Analysis, Teddington (Gt. Brit.) (Sept. 5-8, 1961), London, Her Majesty's Stationery Office, v. 1: 97-109, 1962.

Preliminary results are presented from an investigation

of structuring within the lexicon of a language. The results suggest that in certain areas of the lexicon, lexical items must be characterized in terms of the presence or absence of specific recurring lexico-semantic components. Furthermore, there seems to be some promise that correspondence between lexical items of different languages may be reducible to mutual correspondence between their more discrete lexico-semantic components. In this discussion, the more detailed descriptive statements about English as well as the general remarks about correspondence between English sentences and those of other languages are considered in the framework of transfer grammar. Attention is directed toward possible refinements in correspondence analysis entailed by further structural characterization of lexical items, and in particular, of verbs in terms of their relationship to subject and object.

A method is described which applies the techniques of modern symbolic logic, for giving a semantical interpretation to those entities of natural language systems that function in a structural capacity. Such entities do not perform the task of denoting the individuals, properties, and relations of those individuals a language talks about; they are linguistic devices that serve to combine the denotative terms into meaningful utterances. They function in many ways, such as to express syntactic relations and to express generality. Words like "each", "all", "either-or", "any", "ago" are a few examples of terms that belong in this category. Because these words are analogs in the natural language systems of logical constants in the symbolic language systems, they are called here "structural constants". For the purposes of this discussion, a structural constant is defined as an entity whose meaning is known only when its proper use is known; therefore it can be defined only by a set of rules determining its behavior.

APPLICATION OF THERMODYNAMIC GREEN'S FUNCTION FORMALISM TO FERROMAGNETISM, by G. W. Pratt, Jr. and R. D. Puff. [1961] [4]p. incl. table. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Presented at Internat'l. Conf. on Magnetism and Crystallography, Kyoto (Japan), Sept. 25-30, 1961.

Published in Jour. Phys. Soc. Japan, v. 17, Suppl. B-I: 60-63, Mar. 1962.

The magnetic behavior of a lattice where there is a single localized orbital at each lattice site which is either vacant, singly, or doubly occupied is studied. The principal interactions are nearest neighbor exchange and the Coulomb repulsion which tends to prevent doubly occupied sites. The description is in terms of 1 and 2 particle thermodynamic Green's functions. Three different treatments of the correlations are used in finding the 2 particle Green's functions. Writing G_2 as a product of 1 particle Green's functions G_1 reduces to the Heisenberg first approximation when there are no ionic states. A second approximation where $G_2 = \Omega G_1 G_1$, Ω being a correlation matrix, results in a theory to some extent similar to the constant coupling method. Results are given for Curie point for several different lattices. A third approximation capable of accurately describing the limit of very large Coulomb repulsion is briefly discussed. ON VOWEL DURATION IN ENGLISH, by A. S. House. [1961] [4]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office Cambridge Research Labs.; and Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Jour. Acoust. Soc. Amer., v. 33: 1174-1178, Sept. 1961.

Average durations of 12 vowels of American English measured in bisyllabic nonsense utterances are reported. The vowels occurred in 14 symmetrical consonantal environments and the utterances were produced by 3 male talkers. The consonant environments consisted of the voiced and voiceless versions of 3 stop, 1 affricate, and 3 fricative consonant articulations. Four determinants of the characteristic durations of stressed vowels are identified and discussed. The hypothesis is advanced that the primary lengthening of vowels in English—that found in tense vowels and in vowels before consonants—is a part of the phonology of the language and is learned by speakers of the language, and that the secondary lengthening of vowels in English—that found in open vowels and in vowels before fricative constants—is a function of the articulatory process itself. AVAILABLE POWER FROM A NONIDEAL THERMAL SOURCE, by P. Penfield, Jr. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Jour. Appl. Phys., v. 32: 1793-1794, Sept. 1961.

The efficiency under optimum power-output conditions is independent of the total thermal resistance. Since all physical sources may be expected to have some finite thermal resistance, it appears that if a Carnot (reversible) engine is operated between practical heat reservoirs in such a way as to have a maximum power-output, then the efficiency must be reduced from the Carnot efficiency calculated from the reservoir temperatures, regardless of the size of the thermal resistances.

BILABIAL STOP AND NASAL CONSONANTS: A MOTION PICTURE STUDY AND ITS ACOUSTICAL IMPLICATIONS, by O. Fujimura. [1961] [15]p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and National Science Foundation) Unclassified

Published in Jour. Speech and Hearing Research, v. 4: 233-247, Sept. 1961.

The movements of the lips when bilabial stops and nasals are produced in various phonetic environments have been photographed for study by means of a stroboscopic technique. It has been found that immediately following the plosion the rate of increase in the lip opening is relatively high. A significant portion of the change of the resonant frequencies of the vocal tract, in consequence, takes place in 5 or 10 msec, and in this brief interval the acoustic output cannot be characterized by transitions of formants that are described in a quasi-static manner. The effect of the environment of the consonant upon the initial speed of the lip opening process is considerable; the movement is particularly rapid when a tense bilabial stop consonant is in work-initial position. There is a significant difference in the physical mechanism of the motion of the lips during the production of the nasal bilabial, compared to that for the stops, because of the overpressure built up behind the closure in the case of stops. The relation of the articulatory data to the acoustic structure of the output speech signals has been discussed in some detail. (Contractor's abstract)

Presented at meeting of the Amer. Phys. Soc., Schenectady, N. Y., Oct. 11-13, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 134, Feb. 23, 1962.

The magnetoambipolar diffusion theory of a plasma in a conducting cavity has been derived by several authors. In this paper the relationship between the boundary conditions at the walls and the required ionization frequency to maintain a steady-state plasma is shown. The interesting conditions are the Simon and Allis diffusion limits, the congruence and short circuit limits, and 2 other limits obtained when the radial ion current or axial electron current is equal to zero. The theory is checked by measurements of the diffusion currents made in a vacuum, metal, cylindrical cavity whose end walls are insulated from the radial wall. The cavity is also fed with microwave to produce the steady-state plasma, and wall probes have been placed throughout the cavity to monitor the current distributions.

PLASMA GENERATION AND CONFINEMENT MECHANISMS IN THE HOLLOW-CATHODE DISCHARGE (Abstract), by L. M. Lidsky, S. D. Rothleder and others. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Schenectady, N. Y., Oct. 11-13, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 134, Feb. 23, 1962.

A description of the hollow-cathode discharge plasma source has previously been presented (see item no. 1667, Vol. V). Recent experimental data confirm that the exterior plasma is generated in the interior of the hollow cathode and that ionization in the exterior region plays a small secondary role. Analysis of the cathode power balance indicates that the probability of ionization of the input gas in the cathode interior is very high. The external plasma (of characteristic density $10^{13}/cm^3$) is confined by low magnetic fields (100-500 gauss). Application of the hydromagnetic momentum conservation equations demonstrates that a hybrid confinement mechanism operates with electrons confined by the magnetic field and ions trapped in the resulting space-charge field. The solution of the hydromagnetic equations in the special case of constant temperature indicates a simple scheme for independent measurement of ion temperature. Relations between the ion and electron temperatures are shown both experimentally and by analysis of the steady-state energy transfer equations.

Published in Trans. Amer. Inst. Elec. Engineers, v. 80 (Part I): 648-652, 1961.

The model of a communication channel used in the study of binary codes, its relation to real data transmission channels, and assumptions about noise, is reviewed briefly. Several error-correcting codes are listed with brief description of their error-correcting capabilities and feasibility of their implementation. The most promising class of codes for implementation at present are cyclic codes. The burst-error-correcting cyclic codes are especially attractive from the point of view of implementation and a simplified block diagram for implementing a practical example of such a code is shown and discussed. PERCEPTION OF SOUNDS CHARACTERIZED BY A RAPIDLY CHANGING RESONANT FREQUENCY, by P. T. Brady, A. S. House, and K. N. Stevens. [1961] [6]p. incl. illus. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and National Science Foundation) Unclassified

Published in Jour. Acoust. Soc. Amer., v. 33: 1357-1362, Oct. 1961.

The perception of sounds characterized by a moving resonance was investigated. Stimuli were generated by exciting a tuned circuit with a short train of pulses of repetition rate 100/sec. The resonant frequency of the tuned circuit was changed in a piecewise-linear manner over a 500-cps range. Subjects matched the test stimuli by adjusting the resonant frequency of a fixed (i.e., nonvarying in time) resonant circuit until the test and comparison stimuli were judged to be most alike. The results indicate a strong tendency for subjects to adjust the frequency of the fixed resonant circuit until it is close to the terminal resonant frequency of the time-varying circuit. This tendency depended to some extent on the directional and rate of the frequency change in the test stimulus. The implications of the results for auditory theory and speech perception are discussed briefly. (Contractor's abstract)

Presented at Sixty-second meeting of the Acoust. Soc. of Amer., Cincinnati, Ohio, Nov. 8-11, 1961.

Published in Jour. Acoust. Soc. Amer., v. 33: 1665, Nov. 1961.

During the past few yr an electrical dynamic analog of the vocal tract and various experiments performed with this equipment have been reported. The control system of the synthesizer specifies articulatory parameters such as the configuration of the vocal tract, glottal excitation, fundamental frequency, noise excitation, and velopharyngeal coupling as piece-wise functions of time. Previous reports have described the synthesis of some fricative, stop, and nasal consonants in a few vowel environments usually in consonant vowel syllables. The vocabulary has

now been extended to include a larger number of consonants and vowels arranged in a variety of 1- and 2-syllable structures. Advantages and limitations of the present synthesizer and control system are discussed. The acoustic output of the device is demonstrated by means of a tape recording of samples of syllabic utterances and of short sentences constructed from groups of these utterances.

ARTICULATORY ANALOG OF THE VOCAL TRACT AND NASAL CAVITIES (Abstract), by M. H. L. Hecker. [1961] [1]p. (Sponsored jointly by Air Force Cambridge Research Labs.; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]; and National Science Foundation) Unclassified

Presented at Sixty-second meeting of the Acoust. Soc. of Amer., Cincinnati, Ohio, Nov. 8-11, 1961.

Published in Jour. Acoust. Soc. Amer., v. 33: 1665, Nov. 1961.

A modified version of the dynamically controllable electrical analog of the vocal tract (G. Rosen, Jour. Acoust. Soc. Amer., v. 30: 201-209, 1958) that includes a recently developed analog of the nasal cavities is described. The acoustical coupling between the vocal tract and the nasal cavities is electronically varied in the same way as the effective cross-sectional area of each section making up the transmission line representing the vocal tract. Formal listening tests have been conducted to determine the most suitable vocal-tract configurations for the production of nasal consonants in consonant-vowel and vowel-consonant syllables. Other listening tests have determined the most suitable patterns of temporal variables for the production of these syllables. In general, it is found that more natural-sounding syllables are obtained when the velopharyngeal coupling varies slowly with time compared to changes in the configuration of the vocal tract. The results compare favorably with cineradiological data recently reported and are interpreted to support the point of view that studies of the performance of an articulatory synthesizer reveal important details concerning the production and perception of natural speech. The experiments demonstrate that speech can by synthesized from articulatory information in a straightforward and natural manner.

SHORT-TIME AFTEREFFECTS OF NOISE ON AUDITORY NERVE RESPONSES (Abstract), by W. T. Peake and J. F. Buoncristiani. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Presented at Sixty-second meeting of the Acoust. Soc. Amer., Cincinnati, Ohio, Nov. 8-11, 1961.

Published in Jour. Acoust. Soc. Amer., v. 33: 1670, Nov. 1961.

Auditory nerve responses to clicks have been recorded from cats by means of a gross electrode placed near the round window of the cochlea. If the clicks are preceded by a burst of wideband noise, the amplitude of the click response is reduced. The amplitude of N_1 as a function of noise-burst intensity I_N, noise-burst duration D, time interval between the cessation of the noise and the occurrence of the click T, and intensity I_C have been measured. The ranges of I_N and D were restricted so as to produce aftereffects lasting less than 10 sec. For fixed values of T and I_C, a family of values of I_N and D can be found which produce equivalent aftereffects on N_1. Results show, however, that pairs of D and I_N values which are equivalent at 1 value of T are not equivalent for other values. In particular, recovery to a long, low-intensity burst takes place more slowly than recovery to the "equivalent" short, high-intensity burst. Also, equivalence for a given value of I_C does not necessarily imply equivalence for other click intensities.

ANALYTIC DESCRIPTION OF A CORKSCREW TRAP (Abstract), by R. C. Wingerson, J. S. Tulenko, and D. J. Rose. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Colorado Springs, Colo., Nov 15-18, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 153, Feb. 23, 1962.

A properly designed modified helical field source (a corkscrew) can perturb the midregion of a magnetic mirror pair to form an effective trap for particles injected through a mirror with appropriate momentum. The handedness of the corkscrew, in combination with a resonance condition between field and particle, results in a trap approaching the ideal, i.e., injected particles initially experience a strong non-adiabatic effect that leads to their entrapment, but thereafter have only small velocity changes that look much like an almost random "scatter." An analytic solution for the "scatter" (based on expansion in powers of the field perturbation) has been obtained that leads to an optimum design in which the magnitude of the field perturbation increases linearly from zero at the ends of the corkscrew, the spatial period of the structure changes quadratically at the ends, and particles are injected with as large a magnetic moment as is feasible.

PROPOSED THERMONUCLEAR MIRROR WITH CORKSCREW TRAP (Abstract), by D. J. Rose, J. S. Tulenko, and R. C. Wingerson. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Colorado Springs, Colo., Nov. 15-18, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 153, Feb. 23, 1962.

A steady-state thermonuclear plasma experiment is proposed, based on the properties of the corkscrew trapping field. The device resembles DCX-2 or OGRA except for the axial injection of molecular ions which are almost all temporarily trapped by the twisted field of length L in the midregion of the mirror pair. Molecular ion containment time ($\tau_m \propto L^2$) is about 0.01 sec for a device on the scale of OGRA. The corkscrew field "scatters" atomic ions after breakup at a rate ($\tau_a \propto L^4$) negligible compared to conventional scattering. Preliminary burnout and plasma buildup calculations indicate that the long molecular ion containment results not only in efficient ion breakup, but contributes substantially to burnout through charge transfer and collisions of other types. Optimum injection energy is thus lower than in DCX-2 or OGRA and a dense ($\approx 10^{12}$/cc) plasma can be obtained from 50 ma molecular ion current at about 100 kev with a background pressure of 3×10^{-8} mm Hg.

STRONG INTERACTIONS BETWEEN AN ELECTRON BEAM AND A PLASMA (Abstract), by W. D. Getty and L. D. Smullin. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Colorado Springs, Colo., Nov. 15-18, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 157, Feb. 23, 1962.

Strong interactions have been observed between an electron beam and a plasma through which it drifts. In these experiments a 10-kv, 1-amp, 3 1/2-μsec pulsed beam is projected into a drift region containing Ar at about 1 μ pressure. The beam gradually builds up a plasma by ionizing collisions with the neutral gas. After a time delay of about 1 μsec, an intense burst of radio frequency power, a strong burst of light, and essentially complete scattering of the 10-kv beam is observed. Frequencies between 500 and 2000 mc/sec are observed. A theoretical model of a beam drifting through a plasma where $\omega_{pe} < \omega_{ce}$ predicts a backward-wave amplifying mechanism that appears to describe our experimental results.

OBSERVATION OF 1/B DIFFUSION ACROSS A MAGNETIC FIELD (Abstract), by S. Yoshikawa. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Colorado Springs, Colo., Nov. 15-18, 1961.

Published in Bull Amer. Phys. Soc., Series II, v. 7: 158, Feb. 23, 1962.

The diffusion of electrons across a magnetic field B is measured in a hollow-cathode discharge. The linear discharge parallel to B is maintained between a hot cathode of diameter 3 mm and an anode. The auxiliary ring anode of major diameter 6 cm collects electrons across B. It is found that for sufficiently small radial currents, there is a proportionality between applied potential and radial current. The mobility thus measured is converted to a diffusion coefficient by means of the Einstein relation. The diffusion coefficient is found to be proportional to 1/B. The fluctuation of the floating potential is seen to increase as the radial current increases, in spite of the fact that the radial current is less than 10% of the axial current. The theoretical interpretation, which relates the diffusion with density fluctuation, will also be presented.

STIMULUS VS RESPONSE UNCERTAINTY IN RECOGNITION, by J. A. Swets and S. T. Sewall. [1961] [7]p. incl. diagrs. refs. (Technical rept. no. AFCCDD-TR-60-44) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and Air Force Operational Applications Lab.) Unclassified

Published in Jour. Acoust. Soc. Amer., v. 33: 1586-1592, Nov. 1961.

The question of the relative efficacy of specifying the stimulus alternatives before and after the stimulus is raised. Experiments show information given before the observation to facilitate recognition and information given after the observation to have little, if any, effect. It is concluded that the facilitative effect of restricting alternatives, in the task studied, depends on a perceptual mechanism rather than on a response mechanism. These experiments are discussed in connection with 2 current psychological theories: (1) the theory of signal detectability (essentially a perceptual theory), and (2) the theory of individual choice behavior (essentially a response theory). The results of another experiment, the only other experiment discovered to date for which these 2 theories make different predictions, are also reported. In this experiment, too, the results are in agreement with the detection theory. (Contractor's abstract)

PROTON MAGNETIC RESONANCE STUDY OF FERROELECTRIC POTASSIUM FERROCYANIDE TRIHYDRATE, by R. Blinc, M. Brenman, and J. S. Waugh. [1961] [6]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in Jour. Chem. Phys., v. 35: 1770-1775, Nov. 1961.

Proton magnetic resonance and vibrational spectra of potassium ferrocyanide trihydrate have been studied between 77° and 300°K. From the observed 2 sets of O—H stretching frequencies it has been possible to suggest the probable positions of 4 previously undetermined water molecules in the unit cell. Changes in the vibrational spectra and in the proton resonance second moment in the neighborhood of the Curie point indicate that the onset of ferroelectric behavior is associated with a dynamical orientational ordering of the hydrogen-bonded water molecules. Apparently there is also a contribution to the spontaneous polarization and internal field from displacements and polarizability of the K^+ and $Fe(CN)_6^{-4}$ ions. (Contractor's abstract)

NUCLEAR RELAXATION IN GASES: MIXTURES OF METHANE AND OXYGEN, by C. S. Johnson, Jr. and J. S. Waugh. [1961] [5]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Published in Jour. Chem. Phys., v. 35: 2020-2024, Nov. 1961.

Three previously proposed mechanisms of nuclear relaxation in fluids are qualitatively discussed: (1) modulation of intramolecular fields by collisions, (2) transient, and (3) diffusively modulated dipolar interactions with paramagnetic impurities. It is shown that the dependence of T_1 for the protons in methane-oxygen mixtures on composition, density, and temperature is adequately described by a superposition of these contributions to $1/T_1$, and that the magnitudes involved are consistent with a priori estimates. It is suggested that the spin-rotation interaction provides an important relaxation mechanism in both gaseous and liquid methane. (Contractor's abstract)

REDUCTION OF SPEECH SPECTRA BY ANALYSIS-BY-SYNTHESIS TECHNIQUES, by C. G. Bell, H. Fujisake and others. [1961] [12]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Cambridge Research Labs.; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Jour. Acoust. Soc. Amer., v. 33: 1725-1736, Dec. 1961.

Procedures are described for reducing the speech wave to a specification in terms of the time-varying vocal-tract resonances and source characteristics. The basic method, which has been called analysis by synthesis, involves the comparison of speech spectra with a series of spectra that are synthesized within the analyzer. Each comparison spectrum is generated according to a set of rules based on an acoustical theory of speech production. The result of the analysis of each input spectrum is a set of parameters that describes the synthesized spectrum providing the best match. In 1 version of the method convergence towards the best match is controlled by the experimenter; in another version convergence to a match is accomplished automatically without the intervention of the experimenter. All the operations have been programmed on a general purpose digital computer and have been applied to the analysis of vowels and some consonants. The advantages of the analysis techniques are discussed. (Contractor's abstract)

ATTAINMENT OF HIGH-RESOLUTION GRATINGS BY RULING UNDER INTERFEROMETRIC CONTROL, by G. W. Stroke. [1961] [19]p. incl. illus. diagrs. refs. (In cooperation with Inst. d'Optique, Paris) (Sponsored jointly by Air Force Cambridge Research Center; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in Jour. Opt. Soc. Amer., v. 51: 1321-1339, Dec. 1961.

Outstanding high-resolution gratings have now been obtained by ruling under interferometric control on the M.I.T. ruling engine, as a result of considerable improvements which have followed the application of 2 separate studies carried out for this purpose: (1) a general theory of the effects of grating errors on the distribution of light in the spectral images; and (2) a theory of the uncalled-for corrections introduced into an interferometric servomechanism by incorrect translation of the grating-blank motion into representative interferometric fringe signals. The errors found to be most detrimental to high-resolution gratings, in that they affect the close neighborhood of the line centers, are rather extended small-amplitude deviations in the wave fronts. These can be caused in particular by errors of run in the ruling, as a result of inadequate temperature and servocontrol, by defects in flatness of the grating blanks and of the aluminum coatings, as well as by incorrect adjustments of the control interferometers. Reduction of these errors to less than $\lambda/10$ at 5431A and corresponding improvements in the diamond-carriage adjustments have resulted in improvements on the order of 4 to 9 in the spectral quality of the high-angle gratings when compared to the 10-in. gratings previously described by G. R. Harrison and G. W. Stroke (Jour. Opt. Soc. Amer., v. 50: 1153, 1960). Precision replicas of these gratings permit high-resolution studies in spectrometers as short as 1 m and in spectrographs with as few as 10^{12} atoms in the source. Considerable further gains in luminosity, compactness and resolution should result from the use of gratings and echelles blazed at 76° in autocollimation rather than at 64°, as has been customary so far. AN ALIGNMENT INTERFEROMETER FOR PRECISION STRAIGHTNESS-MEASUREMENTS AND CONTROL EVEN OF RAPIDLY MOVING CARRIAGES, by G. W. Stroke. [1961] [2]p. incl. diagr. refs. (Sponsored jointly by Air Force Cambridge Research Center; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in Jour. Opt. Soc. Amer., v. 51: 340-1341, Dec. 1961.

A new, easily adjusted and very stable interferometer, defining a semistatic fringe field by reflection on 2 mirrors, has permitted a simple solution to the problem of rapid and accurate alignment of moving carriages, of

fixed reference beams, and of carriage-ways in the interferometric domain. Precisions in the 0.1-sec-of-arc range are easily obtained in visual work in rotations up to minutes of arc, without the usual limitations of slow fringe counting and of loss of fringe-contrast at large path differences in particular. In fact, the fringe contrast is independent of the distance from the reference-support to the moving mirrors in this interferometer, and permits measurements and alignments over traverses and distances of many feet if required. Precisions in the 0.01-sec-of-arc range and better can be obtained with the help of electronic location of interference fringes. Experiments with carriages moving at rates up to 1-ft/sec and over distances of the order of 1½ ft have demonstrated the versatility of the alignment interferometer in various applications, in particular in the alignment of ways on a velocity-of-light apparatus and on ruling engines. LINEAR MODELS FOR CONTRAST PHENOMENA, by J. C. Bliss and W. B. Macurdy. [1961] [7]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 33-039-sc-78108]) Unclassified

Published in Jour. Opt. Soc. Amer., v. 51: 1373-1379, Dec. 1961.

Discrete and continuous linear models are defined to describe contrast phenomena such as Mach bands. Two-sided z transforms are used to describe the discrete systems and Fourier transforms are used to describe continuous systems. A psychological model is defined based on the work of v. Békésy on skin and vision which suggests a "neural unit" consisting of an area of sensation surrounded by an area of inhibition. A physiological model is also defined based on the experiments of Hartline et al , describing lateral neural interaction in the eye of Limulus. It is shown that the physiological model is related to the psychological model and that the form of the physiological inhibitory coefficients k_p uniquely specify the form of the psychological neural unit h_p, and vice versa. Also, by assuming a "blurring" of the stimulus spatial distribution as the excitation distribution of the receptors, a neural unit is obtained from the physiological model which is similar to the psychological neural unit suggested by the experiments of v. Békésy. Illustrative examples are given. (Contractor's abstract)

AN ACOUSTICAL THEORY OF VOWEL PRODUCTION AND SOME OF ITS IMPLICATIONS, by K. N. Stevens and A. S. House. [1961] [18]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Cambridge Research Center; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in Jour. Speech and Hearing Research, v. 4: 303-320, Dec. 1961.

A contemporary acoustical theory of vowel production is outlined and certain implications of the theory are discussed. The theory considers a vowel sound to be the result of excitation of a linear acoustic system by a quasi-periodic volume velocity source. The transfer function of the acoustic system is completely described by a number of poles whose frequency locations depend on the vocal-tract configuration. It is shown that the theory is compatible with data relevant to the over-all intensity of vowels, amplitude relations within syllables, and questions of balance in the vowel spectrum. Finally it is proposed that the traditional term formant be restricted to mean a normal mode of vibration of the vocal system. (Contractor's abstract)

ITERATIVE ARRAYS OF LOGICAL CIRCUITS, by F. C. Hennie, III. [1960] 242p. incl. diagrs. refs. (Special technical rept. no. 3) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and General Electric Research Lab.) Unclassified

Several techniques are described for those who are interested in data processing, computer design, and switching theory and who may find usefulness in the design of iterative networks. That there can be no general procedures for the analysis and synthesis of even relatively simple types of iterative [illegible]s are demonstrated. Finally, an appreciation of the [illegible]abilities and limitation of the methods presented here may facilitate the development of other, more powerful, approaches.

COCHLEAR RESPONSES TO CONDENSATION AND RARE-FACTION CLICKS, by W. T. Peake and N. Y.-S. Kiang. [1961] [12]p. incl. diagrs. refs. (Sponsored jointly by Air Force Cambridge Research Center under AF 19(604)4112; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108; and National Institutes of Health) Unclassified

Published in Biophys. Jour., v. 2: 23-34, Jan. 1962.

Auditory nerve responses to condensation and rarefaction clicks (CC and RC) have been recorded over a wide intensity range with gross electrodes. At low intensities the RC responses are nearly identical to CC responses. At high intensities RC and CC response waveforms are similar, but the latency of the N_1 peak in the RC response is 0.2 msec shorter than that for the corresponding CC response. At intermediate intensities the RC and CC response waveforms are quite different. These results can be interpreted in terms of a model in which there are 2 excitatory mechanisms for the neural response, which are operative in different intensity ranges. The cochlear microphonic potential and a "slow" potential are suggested as possible excitatory mechanisms. (Contractor's abstract)

THE RELATION BETWEEN THE TRANSPORT AND THE ORBIT MODELS FOR A PLASMA, by S. Frankenthal and W. P. Allis. [1961] [9]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, Atomic Energy Commission, and National Science Foundation) Unclassified

Published in I.R.E. Trans. on Antennas and Propagation, v. AP-10: 15-23, Jan. 1962.

Starting with the Boltzmann equation and the dynamic equation of a charged particle, a transport (particle) model for the plasma, as well as an orbit (guiding-center) model which is valid for arbitrarily large orbits is developed. The development facilitates the interpretation of the difference between the 2 models, and sets the stage for the derivation of the conditions under which the 2 become interchangeable. These conditions include restrictions of the particle distribution and on the field gradients. The role of each model in the formulation of the self-consistent-field problem in the plasma is discussed. (Contractor's abstract)

CONSERVATION PRINCIPLES FOR PLASMAS AND RELATIVISTIC ELECTRON BEAMS, by A. Bers and P. Penfield, Jr. [1961] [15]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in I.R.E. Trans. on Electron Devices, v. ED-9: 12-26, Jan. 1962.

Many useful conservation theorems are derived for relativistic electron beams and anisotropic plasmas. All these theorems are valid for confined-flow and irrotational-flow devices, and cold, collisionless plasmas. All the theorems are derived in a similar way, and a generalization of this method, using linear operators, is given. Among the power theorems discussed are: Tonk's theorem, the instantaneous and sinusoidal small-signal theorems, the energy theorem, a large-disturbance theorem, the Manley-Rowe formulas, an ac power theorem, and a cross-correlation theorem. Contributions to power and energy from surface waves are included. Allowing for relativistic flow and writing all equations in the laboratory frame does not significantly complicate the theorems, and in fact clarifies them somewhat. Many simple applications are discussed, although not in detail. Among these are: small-signal energy, power, and passivity; energy velocity in electron beam and plasma wave-guides; and a conservation theorem for multiple electron beams and electron beam-plasma interactions. LOW-DENSITY PARITY-CHECK CODES, by R. G. Gallager. [1961] [8]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in I.R.E. Trans. on Information Theory, v. IT-8: 21-28, Jan. 1962.

The code words of a parity-check code are formed by combining a block of binary information digits with a block of check digits. Each check digit is the modulo 2 sum of a prespecified set of information digits. These formation rules for the check digits can be conveniently represented by a parity-check matrix. This matrix represents a set of linear homogeneous modulo 2

equations called parity-check equations, and the set of code words is the set of solutions of these equations. This paper describes a class of coding and decoding schemes that can utilize the long block lengths necessary for low error probability without requiring excessive equipment or computation.

ON THE WIDTH OF CRITICAL BANDS, by J. A. Swets, D. M. Green, and W. P. Tanner, Jr. [1961] [5]p. incl. diagrs. table, refs. (In cooperation with Michigan U., Ann Arbor) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Jour. Acoust. Soc. Amer., v. 34: 108-113, Jan. 1962.

A different technique of analysis is applied to the experiment suggested by Harvey Fletcher for measuring the width of the critical band. This experiment determines the ability of noise bands of different widths to mask a pure tone centered in the band. The analysis considers 2 filters in series, 1 outside and 1 inside the observer. The width of the second filter (the critical band) can be estimated from measurements of the reduction on the noise power at the detector which is effected by the pair of filters. The width of the critical band is estimated under 4 different assumptions about the shape of the band. The results provide a context for discussing the reasons that may underlie the widely varying estimates of the critical bandwidth which have been obtained in previous studies. SCATTERING LOSS FROM MAGNETIC MIRROR SYSTEMS. I, by D. J. BenDaniel and W. P. Allis. [1961] [21]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], Atomic Energy Commission, and National Science Foundation) Unclassified

Published in Plasma Phys., Accelerators, Thermonuclear Research, v. 4: 31-51, Jan. 1962.

The problem of scattering loss of a plasma of singly-charged ions and electrons from magnetic mirror confinement is considered. Using the adiabatic approximation for the behavior of a charged particle in the absence of collisions, a method is developed in which collisions are treated as a perturbation. The time behavior of the distribution function of the ions everywhere in the system is found from the 'reference distribution' at the mid-plane. The 'square well' approximation is treated in detail. An approximation to the Rosenbluth equation is developed which permits the problem to be treated in terms of angular modes and transport coefficients. The transport coefficients involve integrals over the speed distribution of the ions; this speed distribution is the solution of a highly non-linear equation and numerical solutions are given for several mirror ratios. The asymptotic form of the distribution function in both angle and speed is discussed. (Contractor's abstract)

THE EFFECT OF COLOR CENTERS ON THE NUCLEAR SPIN-LATTICE RELAXATION TIME IN LITHIUM FLUORIDE, by B. Josephson, Jr. and M. W. P. Strandberg. [1961] [7]p. incl. diagrs. refs. (Technical rept. no. 386) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Jour. Phys. and Chem. Solids, v. 23: 67-73, Jan.-Feb. 1962.

The dependence of the spin-lattice relaxation time of fluorine nuclei in lithium fluoride on the concentration of radiation-induced color centers has been investigated under rigidly controlled conditions. F-center concentrations have been determined from ultraviolet absorption spectra. The data agree with the theoretical predictions for diffusion-limited relaxation, with respect to the dependence on both the concentration of color centers and the diffusion constant for nuclear-spin diffusion. Some linewidth measurements were made for the fluorine resonance; data were obtained with the [110] crystalline axis parallel to the dc magnetic field.

PROTON SPIN-LATTICE RELAXATION IN FERROELECTRIC COLEMANITE, by R. Blinc, M. Brenman and others. [1961] [2]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Jour. Phys. and Chem. Solids, v. 23: 156-157, Jan.-Feb. 1962.

In order to throw further light on the role of hydrogen atoms in the ferroelectric behavior of Colemanite, measurements of the proton spin-lattice relaxation time T_1 have been performed over the range 150°-300° K, using a pulse technique. Experimental results are illustrated in graph form in which the presence of a strong relaxation mechanism connected with dipolar motion is evident. An Arrhenius plot of the temperature dependence of the correlation time is consistent with a single thermally activated motion, and leads to an activation energy of 4.9 kcal/mol.

KINESTHETIC-TACTILE COMMUNICATIONS, by J. C. Bliss. [1961] [8]p. incl. illus. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in I.R.E. Trans. on Information Theory, v. IT-8: 92-99, Feb. 1962.

Machine aids to kinesthetic-tactile communication aim at maximizing the information-transfer rate from an external source to the human user. The display is the central problem. Source messages might be recoded into equal information units presented ons at a time to the user, or a temporal or spatial display of the message may permit the user to recode the message perceptually into manageable units. The performance of these alternatives has been examined using a kinesthetic-tactile display for English text. This device consists of 8 finger rests, each of which can move in 26 directions in 3-dimensional space. Two methods of programming this device to present information were investigated. In the "traveling-wave" presentation, a 3-dimensional traveling wave of finger movements moves across the display representing a sequence of symbols. This presentation is an example of the case in which the user recodes the source messages perceptually. In the "typewriter" presentation, the subject's fingers are moved corresponding to the way he would actively move them if he were typing. The latter proved to be the more effective, yielding a transmission rate of 4.5 bits/sec. (Contractor's abstract)
