TEMPORAL CODING OF NEURAL RESPONSES TO ACOUSTIC STIMULI, by N. S.-Y. Kiang, M. H. Goldstein, Jr., and W. T. Peake. [1961] [7]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Electronics Systems Division; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]; and National Institutes of Health) Unclassified

Published in I.R.E. Trans. on Information Theory, v. IT-8: 113-119, Feb. 1962.

Electric responses to acoustic stimuli have been recorded from the auditory nervous system of cats. Responses of single nerve cells in the cochlear nucleus recorded with microelectrodes, and auditory nerve responses recorded with gross electrodes (which record activity of many cells) are presented as examples of the kinds of data which can be obtained. The behavior of these responses for various changes in stimulus paramsters is illustrated together with several methods of data analysis. The data presented are from studies in auditory physiology in which one aim is a description of the neural coding of the temporal pattern of acousti stimuli. (Contractor's abstract)

NEURAL MECHANISMS WHICH DISCRIMINATE EVENTS ON THE SKIN, by P. D. Wall and R. Malzack. [1961] [6]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Rsssarch, and Signal Corps under [DA 36-039-sc-78108], Bell Telephone Labs., Inc., National Institutes of Hsalth, and Teagle Foundation) Unclassified

Published in I.R.E. Trans. on Information Theory, v. IT-8: 120-125, Feb. 1962.

This review examines the historical devslopment of concepts of nervous system organization with special referencs to ths skin ssnsory system. The commonly held view that the modalitiss of sensation are produced solely by the initial filtsring action of the receptor organs is shown not to fit the observed physiology of ths first and second cells in the sensory pathway. Instsad, it is proposed that every discriminably different cutaneous perssption is producsd by a unique space-tims pattern

of nerve impulses. The mechanisms employed by the nervous system for generating and analyzing space-time patterns of impulses are discussed. (Contractor's abstract)

In order to transmit television pictures over a digital channel, it is necessary to send a binary code which represents the intensity level at each point in the picture. For good picture quality using standard PCM (Pulse Code Modulated) transmission, at least 6 bits are required at each sample point, since the eye is very sensitive to the small intensity steps introduced by quantization. However, by simply adding some noise to the signal before it is quantized and subtracting the same noise at the receiver, the quantization steps can be broken up and the source rate reduced to three bits per sample. Pseudo-random number generators can be synchronized at the transmitter and receiver to provide the identical "noise" which makes the process possible. Thus, with the addition of only a small amount of equipment, the efficiency of a PCM channel can be doubled. (Contractor's abstract)

SPEECH RECOGNITION: A MODEL AND A PROGRAM FOR RESEARCH, by M. Halle and K. [N.] Stevens. [1961] [5]p. incl. diagrs. refs. (Sponsored jointly by Air Force Electronics Systems Division; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]; and National Science Foundation) Unclassified

Published in I.R.E. Trans. on Information Theory, v. IT-8: 155-159, Feb. 1962.

A speech recognition model is proposed in which the transformation from an input speech signal into a sequence of phonemes is carried out largely through an active or feedback process. In this process, patterns are generated internally in the analyzer according to an adaptable sequence of instructions until a best match with the input signal is obtained. Details of the process are given, and the areas where further research is needed are indicated. (Contractor's abstract)

STUDIES OF NASAL CONSONANTS WITH AN ARTICULATORY SPEECH SYNTHESIZER, by M. H. L. Hecker. [1961] [10]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Cambridge Research Labs.; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]; and National Science Foundation) Unclassified

Published in Jour. Acoust. Soc. Amer., v. 34: 179-188, Feb. 1962.

An electrical analog of the nasal cavities has been designed for use in conjunction with a dynamically controllable analog of the vocal tract (Jour. Acoust. Soc. Amer., v. 30: 201, 1958). The acoustical coupling between vocal tract and nasal cavities is electronically variable. Listening tests are conducted to determine the most suitable vocal-tract configurations for producing nasal consonants in consonant-vowel and vowel-consonant syllables. Other listening tests determine the most suitable patterns of temporal variables for these syllables. In general, it is found that more natural-sounding syllables are obtained when the velopharyngeal coupling varies slowly with time compared to changes in vocal-tract configuration. The results compare favorably with recent cineradiological data, and are interpreted to support the view that studies with articulatory synthesizers reveal important details about the production and perception of natural speech. The experiments demonstrate that speech can be synthesized from articulatory information in a straightforward and natural manner. (Contractor's abstract)

LOW-TEMPERATURE ELASTIC CONSTANTS OF GALLIUM ARSENIDE, by C. W. Garland and K. C. Park. [1961] [2]p. incl. tables. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Jour. Appl. Phys., v. 33: 759-760, Feb. 1962.

The adiabatic elastic constants of a single crystal of gallium arsenide were obtained over the temperature range 77.4° to 300°K by measuring the velocities of longitudinal and transverse acoustic waves propagated in the $[1\bar{1}0]$ and [111] directions. For a cubic crystal, the elastic constants are related to the wave velocities (U) in the $[1\bar{1}0]$ direction by:

(1) $\rho U_{l_0}^2 = (c_{11} + c_{12} + 2c_{44})/2$

(2) $\rho U_{t||}^2 = c_{44}$ (polarized $\parallel$ to [001])

(3) $\rho U_{t\perp}^2 = C' = (c_{11} - c_{12})/2$ (polarized $\perp$ to [001]),

where ρ is the density. In the [111] direction,

(4) $\rho U_{l_1}^2 = (c_{11} + 2c_{12} + 4c_{44})/3$

(5) $\rho U_{t_1}^2 = (c_{11} - c_{12} + c_{44})/3$ (any polarization).

A 10-mc ultrasonic pulse-echo technique was used to measure all 5 of the above velocities. At 20°C the distance between a pair of parallel [111] faces was 3.666 cm and the distance between a pair of parallel $[1\bar{1}0]$ faces was 1.285 cm. The elastic constants of c_{11}, c_{12}, and c_{44} were obtained from the values of $\rho U_{t||}^2$, $\rho U_{t\perp}^2$, and $\rho U_{l_1}^2$ since this procedure minimized the uncertainties in the calculated c_{ij} values. Results are presented in tabulated form.

ANOMALOUS DIFFUSION OF A PLASMA ACROSS A MAGNETIC FIELD, by S. Yoshikawa and D. J. Rose. [1961] [7]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and National Science Foundation) Unclassified

Published in Phys. Fluids, v. 5: 334-340, Mar. 1962.

The fluctuation of the density can cause an anomalous diffusion that is inversely proportional to the magnetic field B. The mobility of electrons perpendicular to the magnetic field was measured and supports 1/B diffusion. There is good agreement between the observed mobility and the theoretical one derived from the density fluctuation. The potential fluctuation was found to be an increasing function of the external potential and independent of the magnetic field intensity. This fact also indicates that fluctuation or turbulence plays an important role in the anomalous diffusion.

NUCLEAR SPIN-LATTICE RELAXATION IN SOME FERROELECTRIC AMMONIUM SALTS, by S. R. Miller, R. Blinc and others. [1961] [5]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in Phys. Rev., v. 126: 528-532, Apr. 15, 1962.

The temperature dependence of H^1 and F^{19} spin-lattice relaxation times in polycrystalline $(NH_4)_2SO_4$, $(NH_4)_2BeF_4$, NH_4HSO_4, and $(NH_4)_2H_3IO_6$ have been measured in both the ferroelectric and nonferroelectric phases, using a pulse technique at 30 mc/sec. The spin-lattice relaxation processes were found to be determined by molecular reorientation. Definite changes in the proton relaxation behavior in the neighborhood of the Curie points indicate a change in the state of internal motion at the transition. The same was found to be true for 2 solid solutions of $(NH_4)_2BeF_4$, in $(NH_4)_2SO_4$. The

results suggest that the ferroelectric phase changes in these solids are in general accompanied by a change in lattice structure which alters the potential in which the nuclei move, but do not involve an important change in the degree to which nuclei must cooperate in order to surmount the potential barriers. MODE CONTROL IN RUBY OPTICAL MASERS BY MEANS OF ELASTIC DEFORMATION, by M. S. Lipsett and M. W. P. Strandberg. [1961] [15]p. incl. illus. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Appl. Opt., v. 1: 343-357, May 1962.

A new technique has been applied in experimental work on ruby optical masers with dramatic results. The techniques involved elastically deforming the medium and thereby invoking the stress-optic effect. Strikingly, it permitted optimizing the elastic deformation of any particular ruby specimen to reduce significantly its pumping-energy requirements for the onset of maser oscillations. At the same time, the divergence of the emergent beam could be reduced by a sizable fraction to that characteristic of low-order radiation modes. (Contractor's abstract)

RATE FUNCTIONS FOR AUDITORY NERVE RESPONSES TO BURSTS OF NOISE: EFFECT OF CHANGES IN STIMULUS PARAMETERS, by W. T. Peake, N. Y.-S.

Kiang, and M. H. Goldstein, Jr. [1961] [5]p. incl. diagrs. (Sponsored jointly by Air Force Cambridge Research Labs. under AF 19(604)4112; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108; and National Institutes of Health) Unclassified

Published in Jour. Acoust. Soc. Amer., v. 34: 571-575, May 1962.

Rate functions for the amplitude of neural responses are presented as a function of stimulus parameters, such as burst length, intensity, and stimulus power level. The data show that the rate functions depend on all of these parameters in a manner that does not allow for a simple description. Rate functions are also reported for noise bursts in the presence of various levels of steady masking noise. Near visual detection level these rate functions exhibit characteristics that are well accounted for by a model that deals with the overlapping of successive neural responses. NUCLEAR MAGNETIC RESONANCE STUDY OF COLLAGEN HYDRATION, by H. J. C. Berendsen. [1961] [9]p. incl. diagrs. refs. [Technical rept. no. 398] (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Institutes of Health) Unclassified

Also published in Jour. Chem. Phys., v. 36: 3297-3305, June 15, 1962.

The proton resonance signal of water in partially dried tendon shows 3 peaks for samples equilibrated in an atmosphere of 30%-80% relative humidity (R.H.). The outer-peak splitting (between 0.5 and 1 gauss) has the character of a proton-pair splitting with effective interactions in, or close to, the fiber direction, as concluded from the dependence of the absorption on the angle between the fiber direction and the magnetic field. Chain-like water structures, exhibiting certain proton-reorientation processes, are postualted. At 10% R.H. a narrow peak is observed, which is not angular dependent; this indicates rapid reorientation of water molecules. Above 80%-90% R.H., a single peak is observed, the width of which has a strong angular dependence. A structural relationship between collagen and water exists, by virtue of which the existence of water chains and, possibly, of 3-dimensional water structures, could be stabilized. ALTERNATING-CURRENT GENERATION WITH MOVING CONDUCTING FLUIDS, by H. A. Haus. [1961] [12]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Published in Jour. Appl. Phys., v. 33: 2161-2172, July 1962.

A 1-dimensional, small-amplitude analysis is presented of alternating-current generation by a stationary electromagnetic circuit coupling to waves in a moving, perfectly conducting fluid. In a uniform applied dc magnetic field the waves in the fluid are either compressional waves if the time average velocity v_0 is transverse to the dc magnetic field, or Alfvén waves if it is along the dc magnetic field. It is shown that, for velocities v_0 greater than the velocity of propagation c of the compressional or Alfvén waves, self-excited oscillations may be produced in a resistively loaded coil coupling to the fluid. The results of 2- and 3-dimensional analyses are summarized in order to show that the phenomena predicted by the simplified 1-dimensional analysis occur in less idealized geometries. Possible applications are briefly discussed with reference to ac power generation by using combustion gases or a flow of a high-temperature plasma. (Contractor's abstract, modified)

THE GENERATION OF MICROWAVE PHONONS FOR STUDYING THE SPIN-LATTICE INTERACTION, by P. H. Carr and M. W. P. Strandberg. [1961] [16]p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Jour. Phys. and Chem. Solids, v. 23: 923-937, July 1962.

Microwave phonons have been produced and their interaction with paramagnetic impurity centers in quartz has been studied. Phonon packets were produced by the piezoelectric effect at the end surface of a quartz rod placed in the electric field of a re-entrant cavity. They propagated down the rod, were reflected from the opposite end, and were detected at the generating surface by the inverse effect. The amplitude envelope of the echoes consisted of a series of maxima and minima, or beats superimposed on an exponential decay. From the decay, the average lifetime of the coherent phonons was found to be 10^{-5} sec. The t = 0 intercept of the envelope measured the square of the fraction of the microwave power converted into acoustic power, which was found to be smaller than the computed value of 0.7×10^{-6}. The absorption of phonons by spins produced in the natural quartz by gamma irradiation from Co^{60} source was detected as a partial saturation of the spin electron paramagnetic resonance. The partial saturation, S/S_0, was found to be 0.75 at 1.7°K, 0.75 at 4.2°K, and 0.92 at 20°K, the error in S/S_0 falling between 2 and 5%. These values for S/S_0 were independent of the difference between the microwave and phonon frequencies within 20 mc/s, and at a given temperature were independent of the microwave power. The order of magnitude of the spin-lattice relaxation time T_1 was found to be greater than 3 sec at 1.7°K, 0.3 sec at 4.2°K, and 3×10^{-4} sec at 35°K, and $3. \times 10^{-6}$ sec at 77°K. The spin-resonance absorption saturated in such a manner as to indicate partial inhomogeneous broadening, and cross relaxation took place between the closely spaced, narrow lines of the spectrum. These 2 effects prevented quantitative determination of the spin-phonon transition probability.

ANTISOCIAL BEHAVIOR AND HYPNOSIS: PROBLEMS OF CONTROL AND VALIDATION IN EMPIRICAL STUDIES, by M. T. Orne. [1960] [77]p. incl. refs. (AFOSR-1205) (AF 49(638)728) Unclassified

Also published in Hypnosis: Current Problems; Symposium on Theory and Research Methodology in Specific Fields, Colgate U., Hamilton, N. Y. (Apr. 1-2, 1960), New York and Evanston, Harper and Row, 1962, p. 137-192.

The question of whether a deeply hypnotized individual can be induced to perform antisocial or self-destruction acts is discussed in detail with respect to available data. Attention is given to the difficulty of testing the credibility of a statement either supporting or refuting the question posed above. There are 2 parts to the problem: (1) is there an increase in social control in hypnosis? (2) If such an increase in social control exists, do its parameters include the violation of internalized sanctions? The problem must be considered in terms of social controls if an experimental approach is to be feasible without ethical and moral difficulties. No conclusions are reached but the overall problem is presented in great detail for analysis.

ON THE PHYSIOLOGICAL EFFECTS OF PAINFUL STIMULATION DURING HYPNOTIC ANALGESIA UNDER CONDITIONS DESIGNED TO MINIMIZE ANXIETY, by R. E. Shor. [1960] [37]p. incl. diagr. tables, refs. (AFOSR-2548) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)728, National Institute of Mental Health, and Society for the Investigation of Human Ecology) Unclassified

Also published in Hypnosis: Current Problems; Symposium on Theory and Research Methodology in Specific Fields, Colgate U., Hamilton, N. Y. (Apr. 1-2, 1960), New York and Evanston, Harper and Row, 1962, p. 54-75.

Five experiments dealing with the physiological effect of painful stimulation while under hypnosis are reviewed. Shortcomings of these experiments are pointed out to clarify the necessity for further research. The present state of the evidence is considered along with implications from the author's own research of 3 resulting hypotheses on pain. It is concluded that since the experience of pain is eliminated during hypnotic analgesia, physiological reactions resulting from stressful or threatening qualities (which the pain might otherwise have) do not occur; anything else that minimizes the incidental anxiety component of the total pain experience (such as ego-protective procedures in the waking state) can have an effect on physiological responses to painful stimulation similar to hypnotic analgesia.

THREE DIMENSIONS OF HYPNOTIC DEPTH, by R. E. Shor. [1961] [16]p. (AFOSR-64-0828) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)728, Institute for Experimental Psychiatry, and Society for the Investigation of Human Ecology) AD 438386 Unclassified

Also published in Internat'l. Jour. Clin. Exp. Hypnosis, v. 10: 23-38, Jan. 1962.

Nine additional formal propositions are presented which extend the author's earlier presentation of a dual-factor theory of hypnosis (Amer. Jour. Psychother., v. 13: 582-602, 1959) to include a third factor, archaic involvement, a feature of hypnosis often stressed by psychoanalytically-oriented theorists. Although interactions and interrelationships usually occur among these 3 factors, the 3 are viewed as conceptually separate, i.e., the depth of each may vary independently. Many ramifications of these views are presented. The theory is most properly seen as a synthesis of the enduring insights embedded in many prior theories of hypnosis. (Contractor's abstract)

THE EFFECT OF EXPOSURE TO DICHOTIC NOISE ON THE DISCRIMINATION OF DICHOTIC TIME DIFFERENCES, by S. J. Freedman and D. W. Pfaff. Apr. 1961, 1v. incl. illus. tables, refs. (AFOSR-503) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-61-26] and Wright Air Development Division under AF 33(616)7625) AD 256800 Unclassified

Subjects were exposed, under 3 conditions of motility, to a constantly changing auditory field produced by 2 separate noise-generating systems, each feeding the sound into 1 ear. After 2 hr of continuous exposure, 11 out of 12 ambulatory subjects showed increased variability in an auditory localization task, the discrimination of dichotic time differences. Performance after 2 hr under the same conditions of exposure deteriorated for only 5 out of 12 subjects when body movements were restricted. When the subjects were wheeled in a wheelchair, sitting quietly except for frequent head rotations, 9 out of 12 subjects showed increased variability. That is, self-produced motion of at least the head, while listening to dichotic noise which masked background sounds, was necessary to disrupt accurate auditory localization. (Contractor's abstract)

THE EFFECT OF DICHOTIC NOISE ON AUDITORY

LOCALIZATION, by S. J. Freedman and D. W. Pfaff. [1961] [5]p. incl. diagrs. (AFOSR-J347) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-26 and Wright Air Development Division under AF 33(616)7625) AD 408004 Unclassified

Also published in Jour. Auditory Research, v. 2: 305-310, Oct. 1962.

Two independent, portable noise generators were used supplying continuous stimulation to each of the subject's ears separately. After 2 hr of exposure ambulatory subjects' ability to discriminate small time differences between the two ears was significantly impaired. Performance did not deteriorate for those whose bodily movements had been restricted under the same exposure conditions. (Contractor's abstract)

TRADING RELATIONS BETWEEN DICHOTIC TIME AND INTENSITY DIFFERENCES IN AUDITORY LOCALIZATION, by S. J. Freedman and D. W. Pfaff. [1961] [7]p. incl. diagrs. tables. (AFOSR-J348) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-26 and Wright Air Development Division under AF 33(616)7625) AD 407119 Unclassified

Also published in Jour. Auditory Research, v. 2: 311-318, Oct. 1962.

Balancing dichotic intensity in order to center a click, after various dichotic time differences had been established, yielded an average value of 43 μsec/db for four subjects. The same four subjects gave an average of only 23 μsec/db when dichotic time differences were varied to center the sound, as a function of preset dichotic intensity differences. An implication of this disparity for the localization mechanisms employing dichotic time and dichotic intensity differences is discussed. (Contractor's abstract)

A RE-EXAMINATION OF THE CONCEPT OF "ALPHA BLOCKADE" IN ELECTROENCEPHALOGRAPHY, by A. D. Prince and S. J. Freedman. Dec. 1, 1961, 13p. incl. diagrs. refs. (AFOSR-2080) (AF AFOSR-62-11) AD 436182 Unclassified

This is a stimulus generalization experiment concerned with testing for response to a conditioned stimulus (CS) which varies from the standard CS in the conditioning trials. The main concern is with "alpha blockade" where "alpha" is defined as sinusoidal waves of 8-13 c/sec of 75-100 uv amplitude and "alpha blockade" is at least a 50% amplitude drop of approx 0.3 sec duration as measured by electroencephalography. "Alpha" is produced by a tone which lasts by itself for a sec then is joined by a light for 3 sec. "Alpha blockade" is produced by varying the light intensity. Results (whether or not a definite "alpha blockade" appears) are summarized for the basic experiment and numerous variations.

OXIDATION OF N-AMINODIHYDROISOINDOLLS. SYNTHESIS OF CIS- AND TRANS- 1,2-DIPHENYLBENZOCYCLOBUTENES, by L. A. Carpino. [1961] [6]p. incl. diagrs. table, refs. (Sponsored jointly by [Air Force Office of Scientific Research under AF 18(603)114] and Petroleum Research Fund) Unclassified

Published in Jour. Amer. Chem. Soc., v. 84: 2196-2201, June 5, 1962.

Oxidation of N-aminodihydroisoindole (II) by means of mercuric oxide in methylene dichloride or alkaline degradation of the corresponding p-toluenesulfonhydrazide (III) gave the dimer of o-quinodimethane, isolated as the corresponding dibromide. The related cis- and trans-1,3-diphenyl-2-aminodihydroisoindoles have been prepared from 1,3-diphenyl-1-hydroxyisoindole (XIII) by zinc-acetic acid and lithium aluminum hydride-aluminum chloride reduction, respectively. Conversion of each amine to the corresponding hydrazine through the nitroso compounds proceeded normally. Mercuric oxide oxidation of the trans isomer VIIb yielded the previously reported trans-1,2-diphenylbenzocyclobutene (XVII). Mercuric oxide oxidation of the cis-hydrazine VII a was unsatisfactory, although the use of activated manganese dioxide led to isolation of the previously unknown cis-1,2-diphenylbenzocyclobutene (XVI) in 27% yield. Nuclear magnetic resonance spectral data as well as oxidation, reduction and isomerization studies support the assigned structure. A convenient synthetic route to alkyl o-cyanobenzoates by the one-step dehydration-esterification of phthalamic acid is reported utilizing an alkane-or arenesulfonyl chloride in the presence of pyridine and an alcohol. (Contractor's abstract)

THE MEASUREMENT OF DYNAMIC BIREFRINGENCE, by S. Onogi, D. A. Keedy, and R. S. Stein. [1961] [2]p. incl. diagrs. (AFOSR-78) [AF AFOSR-61-28] AD 248744 Unclassified

Also published in Jour. Polymer Sci., v. 50: S15-S16, Mar. 1961.

The strain and birefringence of a 1.3-mil Spencer polymorphous polyethylene film was studied at room temperature as a function of frequency. The strain and

birefrigence varied with no perceptible phase difference. The variation with frequency of strain-optical coefficient, defined as the ratio of birefrigence to strain is plotted and a decrease in coefficient with increase in frequency is noted. This indicates that the response mechanism is time-dependent and is in contrast to the negligible birefrigence relaxation at longer times.

ON THE DYNAMIC LIGHT SCATTERING FROM POLYMER FILMS, by R. S. Stein. Dec. 1, 1961 [16]p. incl. diagrs. (Technical rept. no. 3) (AFOSR-2736) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-28)and Office of Naval Research) AD 427956 Unclassified

Also published in part in Jour. Polymer Sci., v. 62: S2-S4, Nov. 1962.

Based on previous experimental data, the theory for static light scattering from films is analyzed. An equation $\left(V_v = K\left\{\overline{\eta^2}\int \gamma(r)\frac{\sin hr}{hr}\, r^2\, dr + \frac{4}{45}\,\overline{\delta^2}\int f(r)\left[\frac{\overline{\eta^2}}{\alpha^2}\gamma(r)+1\right]\frac{\sin hr}{hr}\, r^2 dr\right\}\right)$ is solved giving the intensity of light scattering from a polymer film for incident and scattered light beams which are both parallel and polarized. The variation in scattering with elongation and the change in strain in the orientation direction is explained and the proper equations presented. In solving the original equation time-dependence must be considered because in a viscoelastic media birefringence is time dependent and the strain-optical coefficient must be replaced by the strain-optical spectrum which is a function of relaxation time. Attention is given to the theories of constant strain and periodic strain and actual experimental procedures are presented.

THE PUTUITARY STALK AND OVULATION, by G. W. Harris. [1960] 24p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 61(514)953 and National Institutes of Health) Unclassified

Published in Control of Ovulation, Proc. of Conf., Dedham, Mass. (Feb. 26-28, 1960), New York, Pergamon Press, 1961, p. 56-74.

The ripening of an ovarian follicle and its rupture, with discharge of an ovum, is dependent on the secretion of the anterior pituitary gland. Administration of purified follicle-stimulating hormone (FSH) results in follicular enlargement, but such follicles are unable to reach full size or secrete estrogen unless some luteinizing hormone (LH) is also present. Increased illumination, the feedback action of ovarian hormones and anterior hypothalamic lesions increase the discharge of FSH without its being directly administered. The blood level of LH may be increased by infusion of extracts of median eminence tissue directly into the anterior pituitary gland presumably because of some substance in the extract active in causing the discharge of LH (rather than due to damage to anterior pituitary tissue or gonadotrophic material in the extract).

INDUCTION OF OVULATION IN RATS BY DIRECT INTRA-PITUITARY INFUSION OF MEDIAN EMINENCE EXTRACTS, by M. B. Nikitovitch-Winer. [1961] [9]p. incl. illus. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 61(514)953 and Public Health Service) Unclassified

Also published in Endocrinology, v. 70: 350-358, Mar. 1962.

The possible existence of a hypothalamic humoral substance (s) capable of releasing the ovulating hormone from the adenohypophysis was studied. "Pentobarbital blocked" proestrous rats were used, and the effect on ovulation of various materials were determined upon direct intrapituitary infusion. Of 34 animals that received the intrapituitary infusion of borine and rat eminence extracts, 24 ovulated following the infusion. When bovine extracts were administered intravenously the effective dose had to be increased 10 to 48 times that infused into the pituitary, in order to elicit a response. Only 1 out of 28 animals infused with control substances ovulated following the infusion. Additional controls comprised 10 animals that received only pentobarbital, 6 animals in which cannulae were placed into the pituitary in addition to barbituate injections and 17 animals that received infusions of the various substances but in which the pituitary cannulae were unintentionally misplaced. None of these animals ovulated following the various procedures. These findings suggest that the median eminence of the tuber cinereum contains a substance (s) capable of releasing the ovulating hormone from the rat adenohypophysis. NEW FACTORS CONNECTING METABOLIC AND ELECTRICAL EVENTS IN CEREBRAL TISSUES, by H. McIlwain. [1960] [14]p. incl. diagrs. table, refs. (AFOSR-366) (AF 61(052)404) AD 400860 Unclassified

Also published in Ultrastructure and Metabolism of the Nervous System; Proc. Assoc. for Research in Nervous and Mental Disease, New York (Dec. 9-10, 1960), Baltimore, Williams and Wilkins, v. 40: 43-56, 1962.

This contribution describes an aspect of cell structure which is of much importance to neural systems: the utilization of the energy of carbohydrate metabolism in maintaining differential ion concentrations across the nerve cell membrane. The description has 3 parts; the first states the problem of linking carbohydrate metabolism with ion movement giving new data for cerebral tissues; the second indicates how investigation has led us to implicate specific cerebral constituents in these processes; and the third offers a mechanism of active transport. BASIC PROTEINS AND THE POTASSIUM MOVEMENTS AND PHOSPHATES OF CEREBRAL TISSUES, by H. McIlwain, R. J. Woodman, and J. T. Cummins. [1961] [5]p. incl. tables, refs. (AFOSR-3445) [AF 61-(052)404] Unclassified

Also published in Biochem. Jour., v. 81: 79-83, Oct. 1961.

Guinea-pig cerebral cortex was maintained in vitro and its content of potassium salts and phosphocreatine were measured under normal conditions, immediately after applying electrical pulses and during subsequent recovery. Protamine and histone sulfates (0.1 mg/ml) did not affect the loss of potassium induced by pulses, but inhibited recovery of potassium. This inhibition was removed by gangliosides and by suramin. Higher concentrations of portamine diminished tissue potassium in the absence of pulses. Protamine (0.1-0.4 mg/ml) was without effect on phosphocreatine in the absence of pulses, but in their presence it preserved a large part of the phosphocreatine from the loss normally caused by pulses. Protamine and histone are considered to act at a mechanism which utilizes a major part of the energy-rich phosphate of the tissue in ion transport, and suggestions are made about the nature of this mechanism. FLUID CONTENT AND COMPARTMENTS IN ISOLATED CEREBRAL TISSUES, by S. Varon and H. McIlwain. [1961] [14]p. incl. diagrs. tables, refs. (AFOSR-3446) (AF 61(052)404) Unclassified

Also published in Jour. Neurochem., v. 8: 262-275, 1961.

Metabolic experiments with slices of guinea pig cerebral cortex in vitro involve association of additional fluid with the tissue by (1) adhering medium, (2) swelling during preparation of the tissue; and (3) swelling during incubation. Media containing inulin were used to characterize the fluid changes; inulin itself needed 20 min or more to equilibrate with the tissue. The fluid absorbed during preparation was in a space not accessible to inulin, while the fluid absorbed during incubation was accessible to inulin. In incubation media containing protamine, tissue swelling was less than in normal media, while in media containing ganglioside preparations, swelling was greater; both these changes were in fluid accessible to inulin. Application of electrical stimulation for 10 min had little effect on fluids but caused loss of K and gain of Na by the tissue. The chloride of the tissue did not appear to be confined to the space accessible to inulin; it and the Na were concluded to exist intracellularly to a greater extent than in the brain in vivo. RESULTS OF BALLOON FLIGHTS FOR COSMIC RADIATION MEASUREMENTS AT WEISSENAU AND LINDAU (GERMANY), by H. Erbe. Dec. 31, 1961 [14]p. incl. illus. tables, refs. (Technical note no. 3) (AFOSR-2393) (AF 61(052)372) AD 273627 Unclassified

The results of 10 balloon flights with counter telescopes and of 24 flights with single counters are represented. It was found that a nearly unique correlation exists between the counting rate in a certain altitude and the counting rate of the neutron monitor on ground if only galactic radiation impinges at the top of the atmosphere. The counting rates of the single counter scatter in a more pronounced manner with respect to the average expectation values related to the neutron counting rates than those of the telescope. This is considered as due to the influence of meson decay along the very extended paths traversed by particles arriving from strongly inclined directions. These are accepted by the single counter with its larger aperture in contrast to the telescope which responds only to particles arriving in a narrower cone centered around the vertical. EXPERIMENTAL INVESTIGATIONS ON THE SCATTERING OF SOUND BY TURBULENCE, by D. W. Schmidt. July 1961, 60p. incl. diagrs. tables, refs. (AFOSR-1666) (AF 61(514)1143) AD 266564 Unclassified

Experimental investigations of the scattering of sound by turbulence were performed in a wind tunnel. Turbulence was produced by the grids of parallel circular rods (with diameters of 0.1 to 1.0 cm and grid meshlengths of 0.5 to 2.5 cm); the sound frequencies covered a range of 100 to 500 kc. Disturbances of the measurements due to reflections of sound waves at the tunnel walls were avoided by the application of short sound pulses. The dependence of the damping of the sound waves on the sound frequency, the Mach number of the turbulence, the length of the sound path in the turbulent flow and a predominant direction of the turbulent eddies was measured. Theoretical predictions were confirmed and partly extended. In the range of the parameters which is of interest for practical use the most important results are the proportionality of the damping to the square of the sound frequency and to the square of the turbulent Mach number. Based on the measurements and the theoretical considerations, a formula is derived which is applicable to the damping of sound by turbulent scattering in the atmosphere.

THE ENZYMATIC DEGRADATION OF TERPENES, by W. Seubert and U. Remberger. Summary rept. Dec. 14, 1959-Dec. 14, 1961, 47p. incl. illus. diagrs. tables, refs. (AFOSR-2185) (AF 61(052)251) Unclassified

The bacterial degradation of terpenes like citronellol and farnesol is initiated by the oxidation of the primary alcohol group to the carboxyl group. Subsequent degradation to acetyl CoA and acetate of the acid formed occurs at the level of CoA activated intermediates and is associated with the carboxylation of the branched methyl groups in the molecule. The individual steps of this reaction sequence are under investigation. Pyruvate carboxylase employed in these studies has been purified 550 times from crude extracts of Ps. citronellolis. The enzyme catalyzes the ATP and Mg^{++}-dependent carboxylation of pyruvate to oxalacetate. Biotin acts as the prosthetic group of the enzyme. By exchange studies with radioactive compounds a CO_2-biotin-enzyme has been shown to participate in the carboxylation of pyruvate. In contrast to the mammalian pyruvate carboxylase the enzyme isolated from bacteria catalyzes the above reaction in the absence of acetyl CoA. The implication of this observation regarding possible different carboxylation mechanisms in bacterial and mammalian systems is discussed. (Contractor's abstract)

MECHANICAL AND THERMODYNAMICAL ADMISSIBILITY OF STRESS-STRAIN FUNCTIONS, by B. D. Coleman. [1961] [15]p. (AFOSR-1428) (AF 49(638)541) Unclassified

Also published in Arch. Rational Mech. and Anal., v. 9: 172-186, 1962.

A general theory of mechanically admissible stress-strain functions is first considered. A theorem is then proved which characterizes mechanical admissibility in terms of an invariance principle for the rate of work resulting in a new point of view of the thermodynamic requirements on stress-strain functions. Thermodynamical admissibility is defined in terms of an integral inequality for $\hat{S}$ (the stress tensor S at a material point is given by a function $\hat{S}$ of the deformation gradient at that point). It is shown that a stress-strain function both mechanically and thermodynamically admissible from the present point of view must also be compatible with Green's theory of elasticity. A very simple form for the inequalities of $\hat{S}$ necessary and sufficient for thermodynamical admissibility in a perfect fluid is discussed. The concept of partial thermodynamical admissibility (weaker than thermodynamical admissibility) is also introduced to show that if $\hat{S}$ is partially thermodynamically admissible than $\hat{S}$ can be obtained from an energy function.

KINEMATICAL CONCEPTS WITH APPLICATIONS IN THE MECHANICS AND THERMODYNAMICS OF INCOMPRESSIBLE VISCOELASTIC FLUIDS, by B. D. Coleman. Oct. 1961, 63p. incl. refs. (AFOSR-1583) (AF 49(638)541) Unclassified

Also published in Arch. Rational Mech. and Anal., v. 9: 273-300, 1962.

The first part of this paper reviews the theory of simple fluids. In the second part, viscometric flows and substantially stagnant motions are defined, and some theorems on such flows are proved. A class of viscometric flows, called generalized steady helical flows, is discussed. In the third part, the simple fluid concept is generalized to allow dependence of the stress on the internal energy history, and constitutive equations for temperature and entropy are introduced. An inequality to be satisfied by the constitutive functionals is obtained from a principle of positive entropy production. Some consequences of this inequality for isoenergetic substantially stagnant motions and viscometric flows are shown.

INFRARED SPECTROSCOPIC STUDY OF THE PHOTOLYSIS OF CHLORINE AZIDE IN SOLID ARGON AT 4.2°K, by D. E. Milligan. Mar. 10, 1961, 4p. (AFOSR-429) (AF 49(638)542) AD 253425 Unclassified

Also published in Jour. Chem. Phys., v. 35: 372-373, July 1961.

The photolysis of chlorine azide (ClN_3) in solid argon was studied by using infrared spectroscopy; these experiments were undertaken in order to produce the chloroimino radical. Strong bands at 655, 723, 1143 and 2062 cm^{-1} were found in the ClN_3 spectrum, with a weak band at 2137 cm^{-1}. On irradiation the strong bands decreased while the 2137 cm^{-1} band remained unchanged; new bands developed at 818 ± 0.5 and 824 ± 0.5 cm^{-1}. There was evidence of a greenish-blue phosphorescence from the irradiated deposits after the UV light was extinguished.

VIBRATIONAL EXCITONS. II. DEGENERATE VIBRATIONS, by R. M. Hexter. Mar. 17, 1961, 1v. incl. illus. diagr. refs. (AFOSR-472) (AF 49(638)542) AD 253622; PB 155465 Unclassified

Also published in Jour. Chem. Phys., v. 36: 2285-2295, May 1, 1962.

The energy of the first vibrational excited state of a molecular crystal is derived in terms of exciton theory, for the special case of an exciton state derived from a doubly degenerate molecular excited state. We also treat the case where the degeneracy is lost due to the anisotropic environment of the molecule in the crystal. From the several allowed values of such energies, the correlation field splittings in such bands are derived in terms of three-dimensional chain sums. The origin of such splittings in certain cubic crystals is traced to the intermolecular exchange of the sense of vibrational angular momentum. An expression is also derived for site splittings, observable in solid solutions of molecules in their isotopically substituted modifications. A new interpretation of such splittings is offered. Finally, the effects of isotopic substitution in such crystals are discussed and several rules of isotopic invariance are derived. An appendix is included which treats as an example the vibrational fundamentals of crystal benzene derived from the e_{1u} molecular modes. (Contractor's abstract)

INFRARED SPECTROSCOPIC STUDY OF THE PHOTOLYSIS OF METHYL AZIDE AND METHYL-d_3 AZIDE IN SOLID ARGON AND CARBON DIOXIDE, by D. E. Milligan. Mar. 22, 1961 [29]p. incl. diagrs. tables, refs. (AFOSR-533) (AF 49(638)542) AD 254844 Unclassified

Also published in Jour. Chem. Phys., v. 35: 1491-1497, Oct. 1961.

Experiments have been carried out on the photolysis of methyl azide and methyl-d_3 azide at high dilution in solid argon (4.2°K) and carbon dioxide (~50°K). Photolysis of these species in argon and carbon dioxide matrices results in the appearance of a number of new spectral features in the 3300-600 cm^{-1} region. The spectroscopic data for the photolysis products appear to be consistent with the identification of these species as methyleneimine (CH_2:NH) and methyleneimine-d_3 (CD_2:ND). THE INFRARED SPECTRA OF THICK FILMS OF CO_2

AND CO_2 + H_2O AT LOW TEMPERATURES, by M. E. Jacox and D. E. Milligan. [1961] [7]p. incl. diagrs. table. (AFOSR-685) (AF 49(638)542) AD 256499 Unclassified

Abstract published in Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, June 12-16, 1961, p. 34.

Abstract also published in Spectrochim. Acta., v. 17: 1108, Oct. 1961.

Also published in Spectrochim. Acta, v. 17: 1196-1202, Nov. 1961.

High-resolution infrared-absorption studies on thick films of CO_2 and on dilute solid solutions of H_2O in CO_2 were made at 53°K and at 4°K. A spectroscopically observable complex between CO_2 and H_2O is not formed. The isolation of H_2O in the CO_2 matrix at 53°K is quite good. Monomer and dimer absorptions are assigned in the 1600-1650 cm^{-1} region. In very thick films of pure CO_2 ν_1 appears, weakly, at 53°K. In samples deposited at 4°K the ν_1 absorption is markedly intensified, probably because of an increased number of crystal imperfections, and $2\nu_2$ is also observed. Similar systems of lattice vibrations were observed in combination with both ν_2 and ν_3. (Contractor's abstract)

SOLID-STATE VIBRATIONAL SPECTRA OF METHYL AND METHYL-d_3 CYANIDE, by D. E. Milligan and M. E. Jacox. [May 1961] [8]p. incl. diagrs. table, refs. (AFOSR-763) (AF 49(638)542) AD 259393 Unclassified

Also published in Jour. Molec. Spectros., v. 8: 126-133, Feb. 1962.

The vibrational fundamentals of thin films of CH_3CN and CD_3CN at 77°K have been observed using a high-resolution, double-beam grating spectrometer. Evidence is presented for three absorptions, assigned to ν_3, ν_6, and $(\nu_7 + \nu_8)$, in the 1300-1500 cm^{-1} region of the CH_3CN spectrum. Annealing from an initial glassy state to a crystalline form is observed for these deposits. The multiplet structure of the annealed samples indicates that CH_3CN and CD_3CN crystallize in the orthorhombic, tetragonal, or trigonal system. (Contractor's abstract)

SOLID-STATE VIBRATIONAL SPECTRA OF ETHYLENE AND ETHYLENE-d_4, by M. E. Jacox. May 10, 1961 [20]p. incl. diagrs. tables. (AFOSR-764) (AF 49(638)-542) AD 257303 Unclassified

Also published in Jour. Chem. Phys., v. 36: 140-143, Jan. 1, 1962.

High resolution infrared spectra have been obtained for polycrystalline C_2H_4 at 4°K and 53°K and for C_2D_4 at 53°K. The observed multiplet structure of the fundamental vibrations is in good agreement with the group theoretical predictions. In C_2H_4 there is evidence for a gradual phase transition between 4°K and 53°K, involving reorientation of the planes of the H atoms of C_2H_4 molecules in the crystal. The Raman-active fundamentals have been observed, weakly, in thick deposits of C_2H_4 at 4°K. (Contractor's abstract)

INFRARED SPECTROSCOPIC STUDY OF INTERMEDIATES IN THE PHOTOLYSIS OF SEVERAL AZIDES, by D. E. Milligan. [1961] 26p. incl. diagrs. tables, refs. (AFOSR-1524) (AF 49(638)542) AD 264478 Unclassified

Also published in Fifth Internat'l. Symposium on Free Radicals; Preprints of Papers, Uppsala U. (Sweden) (July 6-7, 1961), New York, Gordon and Breach Science Publishers, Inc., 1961, p. 45-1—45-26.

Studies of the photolysis of methyl azide in rigid inert media were undertaken with the hope of producing the methylimino radical (CH_3N) under conditions suitable for infrared spectroscopic study. It was thought that methyl azide would decompose by a free radical mechanism involving the methylimino radical and molecular nitrogen as the primary products. Ultraviolet spectra of gaseous methyl azide indicate 2 regions of absorption, a fairly weak and broad band centered at 2850A which shows evidence of structure and a considerably stronger structureless band beginning near 2400A and extending beyond 1900A. Irradiation of the gaseous material with light falling within the short wavelength band is observed to result in the formation of nitrogen, ammonia and hexamethylene tetramine. The observation of these products in the thermal and photochemical decomposition of methyl azide was interpreted to mean that the photolytic decomposition might likewise proceed through the intermediary of a short-lived methylimino radical. It was thought that the rearrangement reaction postulated in the gas phase might be partially, if not completely,

quenched in the solid state due to rapid removal of the excess energy of the free radical species through collisions with the matrix material.

THE PROTON MAGNETIC RESONANCE SPECTRA OF 2,3-DISUBSTITUTED-N-BUTANES, by A. A. Bothner-By and C. Naar-Colin. [1961] [5]p. incl. diagrs. tables, refs. (AFOSR-1382) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)980, and National Science Foundation) Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 743-747, Mar. 5, 1962.

High resolution proton magnetic resonance spectra have been obtained for the meso- and dl-forms of 2,3-dibromobutane, 2,3-dichlorobutane, 2,3-diacetoxybutane and 2,3-diphenylbutane. The spectra have been analyzed in terms of chemical shifts and coupling constants. From the magnitude of the spin-spin coupling constant between the methine protons, qualitative estimates of rotamer population have been made, and the factors controlling these populations are discussed. A dependence of 1,3-proton coupling in the system $H\text{-}C\text{-}C\text{-}CH_3$ on dihedral angle is demonstrated. (Contractor's abstract)

THE CALCIUM FLUORIDE – RARE EARTH OXIDE SYSTEMS IN A LABORATORY ATMOSPHERE, by K. S. Vorres. [1961] 4p. (AFOSR-4070) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-104 and Institute of Gas Technology of Chicago) Unclassified

Also published in Rare Earth Research; Proc. of Second Conf., Glenwood Springs, Colo. (Sept. 24-27, 1961), New York, Gordon and Breach, 1962, p. 9-13.

A number of materials have structures identical with or somewhat similar to that observed for calcium fluoride—the fluorite structure. Among these compounds are the heavy rare earth sesquioxides such as Gd_2O_3 through Lu_2O_3. The rare earth oxides are known to crystallize in 3 forms designated A, B and C. The A is a hexagonal type, the B is a monoclinic type, and C is a body centered cubic type. The similarity between the C form and the fluorite structure, the similarities in size between the oxide and fluoride ions on the one hand, and the calcium and trivalent rare earth ions on the other hand might lead one to expect that solid solutions or mixed crystals of these materials could be prepared. Furthermore the relative similarities in electronegatives of oxygen and fluorine as well as calcium and the rare earths should give similar bonding characteristics. This study relates the results of a series of experiments with rare earth oxides of the A as well as the C type and CaF_2.

LIMITS AND BOUNDS FOR DIVIDED DIFFERENCES ON A JORDAN CURVE IN THE COMPLEX DOMAIN, by J. H. Curtiss. [1961] [24]p. (AFOSR-1091) (AF 49(638)-862) AD 268336 Unclassified

Also published in Pacific Jour. Math., v. 12: 1217-1233, 1962.

Let Sn + 1 be a set of n + 1 points lying on a Jordan curve C, let f be a function given on C, and let dn denote the divided difference of order n formed for f in the points Sn + 1. It is proved that if the (n-1)-th derivative of f exists and satisfies a Lipschitz condition, and C satisfies a mild smoothness restriction, then /dn/ is uniformly bounded for all choices of Sn + 1 in which the points are distinct. An extension to confluent points is given. In the case in which C is the unit circle, the structure of the bound is displayed. It is also shown for a general C that if the points of the sequence S2, S3, ... become everywhere dense on C in a certain way, then lim as n approaches infinity cn + 1dn equals integral C f dz/2pi i, where c is the transfinite diameter of C. INTERPOLATION BY HARMONIC POLYNOMIALS, by J. H. Curtiss. Dec. 1, 1961, 34p. incl. refs. (AFOSR-1737) (AF 49(638)862) AD 268335 Unclassified

Also published in Jour. Soc. Indus. and Appl. Math., v. 10: 709-736, Dec. 1962.

Let Hn(u; z) denote the harmonic polynomial of degree at most n found by interpolation in 2n + 1 points to a function u given on the boundary C of a region D of the complex z-plane. It is proved that (a) for any bounded D there always exist interpolation points on C so that Hn can be uniquely determined for each n, and (b) for a wide class of Jordan regions D and for boundary data u with a smooth first derivative on C the points of interpolation on C can be chosen so that lim as n approaches infinity Hn(u; z) exists, z epsilon C + D, and gives the solution of the Dirichlet problem for u and D. Explicit formulas are derived for Hn in the case of interpolation on a circle and on an ellipse, and convergence is proved in these cases for arbitrary continuous boundary data. Various generalizations are indicated. (Contractor's abstract)

MAGNETIC FIELD AT THE NUCLEUS IN SPINEL-TYPE CRYSTALS, by W. H. Kelly, V. J. Folen and others. [1961] [5]p. incl. diagr. tables, refs. (AFOSR-409) (AF 49(638)10) AD 447859 Unclassified

Also published in Phys. Rev., v. 124: 80-84, Oct. 1, 1961.

Measurements of magnetic field at the Fe^{57} nucleus were obtained on powder samples at room temperature using the Mössbauer effect for the spinel-type ferrites γ-Fe_2O_3, "ordered" lithium ferrite ($Li_{0.5}Fe_{2.5}O_4$), and "disordered" lithium ferrite giving values of |496 ± 20| koe, |508 ± 20| koe, and |510 ± 20| koe. These compounds contain only trivalent and no divalent iron. The Mössbauer spectra of all of these compounds were very similar and no difference could be detected between the "ordered" and "disordered" compounds. Only 1 set of lines was observed indicating that the field at the octahedral and tetrahedral sites are about the same value. The value of the hyperfine interaction constant A obtained from electron paramagnetic resonance spectrum of the divalent Mn^{55} (isoelectronic with trivalent Fe) impurity in single crystals of the isomorphous spinel-type crystal "disordered" lithium aluminate ($Li_{0.5}Al_{2.5}O_4$) was found to be $|77.2 \pm 1.0 \times| 10^{-4}$ cm^{-1}. The angular variation of the spectrum indicated that the divalent Mn^{55} ions were located substantially on octahedral sites. The corresponding magnetic field for the Mn^{55} nucleus is around 550 koe, which is close to the value obtained elsewhere for the Mn^{55} nucleus located on a tetrahedral site in a spinel-type aluminate. This is in good agreement with the Mössbauer results. (Contractor's abstract)

TEMPERATURE DEPENDENT LUMINESCENCE OF $CaWO_4$ AND $CdWO_4$, by G. B. Beard, W. H. Kelly, and M. L. Mallory. [1961] [16]p. incl. diagrs. table. (AFOSR-870) (AF 49(638)10) AD 263312 Unclassified

Also published in Jour. Appl. Phys., v. 33: 144-147, Jan. 1962.

The relative efficiencies and decay times of alpha particle induced scintillations of $CaWO_4$ and $CdWO_4$ were investigated as a function of temperature in the range 10°K to 375°K. Their behavior at intermediate and high temperature is in agreement with that expected from the Mott-Seitz-Kroger configurational coordinate model. Values of eq thermal quenching energy, of 0.34 and 0.31 ev were found for $CaWO_4$ and $CdWO_4$, respectively. As the temperature was decreased below 60°K, an increase in the decay times and a decrease in the relative efficiences were found. This behavior can be explained quantitatively by assuming the existence of a trapping level. (Contractor's abstract)

MÖSSBAUER EFFECT IN γ-Fe_2O_3 (Abstract), by W. H. Kelly, M. Hass and others. [1961] [1]p. [AF 49-(638)10] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 135, Mar. 20, 1961.

The Mössbauer effect and hyperfine spectrum of Fe^{57} in γ-Fe_2O_3 has been observed. The spectrum is very similar to that of iron metal, giving equally spaced Zeeman levels for the first excited state of Fe^{57} in the crystal. The spectrum can be interpreted in terms of a magnetic field at the nucleus of Fe^{57} of (5.2 ± 0.3) x 10^5 oe. No difference in the field can be observed between the Fe^{+3} ions in the octahedral and tetrahedral sites. Since the Fe^{+3} ions are in S states and located in a cubic field in an insulator, the hyperfine spectrum can be attributed largely to the Fermi contact interaction with the contributions from other effects being small.

PELTIER COOLING BELOW 4°K, by F. J. Blatt. [1961] [5]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)70] and Office of Ordnance Research) Unclassified

Published in Proc. Internat'l. Conf. on High Magnetic Fields, Cambridge, Mass. (Nov. 1-4, 1961), Cambridge, M.I.T. Press and New York, Wiley and Sons, 1962, p. 398-402. (AFOSR-2299)

Peltier cooling at very low temperatures where efficiency of operation is irrelevant depends on the proper selection of thermoelectric materials. The ratio of $\Delta T/T_0$ is the critical parameter, where ΔT is the temperature difference between the hot and cold junction of the Peltier couple and T_0 is the temperature of the cold junction. $\Delta T/T_0$ must be large to be practical and since by a series of approximations $\Delta T/T_0 = S^2/2L$ a semiconductor with a large value of S and relatively small value of L must be found.

MAGNETIZATION AND PROTON RELAXATION TIME IN ANTIFERROMAGNETIC $LiCuCl_3 \cdot 2H_2O$, by R. D. Spence and C. R. K. Murty. [1961] [2]p. incl. diagrs. (AFOSR-3360) [AF 49(638)613] AD 613797 Unclassified

Also published in Jour. Chem. Phys., v. 35: 1912-1913, Nov. 1961.

$LiCuCl_3 \cdot 2H_2O$ is antiferromagnetic at low temperatures and offers an opportunity to study the temperature dependence in a crystal with the same magnetic ion, essentially the same Néel temperature but quite different crystal structure. The temperature dependence is examined and found to be extremely structure sensitive in regard to sublattice magnetization and proton relaxation time. From the experiments it is concluded the temperature range in which the conventional spin-wave theory of antiferromagnetism can be expected to be valid is less than 1/4 of the Néel temperature.

NUCLEAR MAGNETIC RESONANCE IN HEXAMETHYLBENZENE AT LOW TEMPERATURES, by Z. M. El Saffar. [1961] [2]p. incl. diagr. (AFOSR-3583) [AF 49-(638)613] Unclassified

Also published in Jour. Chem. Phys., v. 36: 1093-1094, Feb. 15, 1962.

Polycrystalline hexamethylbenzene has been previously investigated by nuclear magnetic resonance at temperatures above 95°K. The mean-square width S of the resonance absorption spectrum at 96°K was found small (13 gauss) compared with that calculated for a rigid lattice configuration (32.7 gauss). It was concluded that the molecular motion responsible for the spectral narrowing was the reorientation of the methyl groups about their threefold axis. The present work was undertaken to find out whether this motion continues at lower temperatures. In the temperature range from 38° to 80°K, the value of S decreases gradually from 13.5 to 12 gauss. In the temperature range from 1° to 38°K the signal intensity diminshed appreciably with rising temperature. Measured values of S are seen to remain essentially constant at 19 gauss. Here the indication is that the reorientation of the CH_3 groups continues down to 1°K. Measurements of T_1 between 1° and 10°K yielded a constant value of about 1 sec. This behavior departs markedly from that described by a simple activation law, and it seems necessary to take account of the reorientation of the methyl groups by tunneling. The sharp increase in signal strength observed at 38°K could possibly be explained by solid-solid phase transition. The structure is triclinic at higher temperatures, and it presumably remains triclinic below 38°K but with different lattice constants. Such a transformation may result in an increase in the height of the potential barrier and a corresponding decrease in the rate of tunneling of the CH_3 groups.

PROTON MAGNETIC RESONANCE IN IRON (II) CHLORIDE TETRAHYDRATE, by Z. M. El Saffar and C. R. K. Murty. [1961] [4]p. incl. diagr. table. (AFOSR-3584) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)613 and Office of Naval Research) Unclassified

Also published in Acta Cryst., v. 15: 285, Mar. 1962.

In the hydrogen bonding scheme suggested by Penfold and Grigor (Acta Cryst., v. 12: 850, 1959), x-ray studies were used to determine the p-p (proton-proton) directions of $FeCl_2 \cdot 4H_2O$. In the present investigation, resonance diagrams obtained by rotating the crystal about 4 different axes of rotation were used to determine the magnitude and orientation of the p-p vectors. The vectors thereby observed are compared to those of Penfold-Grigor by means of a table and explanation.

INTERACTION OF ELECTROMAGNETIC RADIATION WITH CRYSTAL LATTICES, by D. J. Montgomery. Final rept. May 1, 1959-Oct. 31, 1961. Nov. 30, 1961, 10p. (AFOSR-1906) (AF 49(638)622) AD 270482 Unclassified

The interaction between electromagnetic radiation and crystal lattices is studied, to see how far-infrared radiation is absorbed, transmitted, and reflected by various kinds of crystalline materials. The use of isotopically enriched constituents of crystals for the purpose of identifying effects due to lattice vibrations is described. The studies show that the position of the wavelength for max absorption can be understood on the basis of the simple theory, but that the shape and the depth of the absorption curves cannot be predicted in detail by any current theory. The results of the study may eventually be of value in the development of sources and detectors for scientific and technological application, and in the design of optics and detectors for infrared guidance systems. EFFECT OF TEMPERATURE ON INFRARED ABSORPTION OF SOLID LiH AND LiD (Abstract), by R. H. Misho and D. J. Montgomery. [1961] [1]p. (AFOSR-3555) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)622 and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Also published in Bull. Amer. Phys. Soc., Series II, v. 6: 284 Apr. 24, 1961.

Infrared absorption spectra of thin films of LiH (~97% Li^7, 100% H^1) and LiD (~97% Li^7, ~96% H^2) evaporated on KBr plates were obtained in the range 12.5μ-25μ from 100°K to 400°K in a specially constructed cryostat-oven. The chamber containing the specimen was maintained under vacuum continuously during preparation and observation of the films. At room temperature, the primary feature of the spectrum for each material is a broad peak at 17.0μ for LiH and at 22.5μ for LiD, in agreement with results reported earlier (item no. 1600, Vol. IV). At high temperatures, the peaks flatten to such an extent that it is difficult to establish definitely the existence of a shift. At low temperatures, the peaks become deeper and narrower, and the position of the minimum transmission shifts by only a few tenths of a micron, an amount much smaller than expected by analogy with results on alkali halides. In view of the unexpected nature of the shifts, the experiment is being repeated with different substrates.

EFFECT OF ISOTOPIC COMPOSITION ON INFRARED ABSORPTION SPECTRA OF LITHIUM HYDRIDE AND LITHIUM FLUORIDE (Abstract), by R. H. Misho and D. J. Montgomery. [1961] [1]p. (AFOSR-3556) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)622] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Also published in Bull. Amer. Phys. Soc., Series II, v. 6: 450, Nov. 24, 1961.

Infrared absorption spectra of thin films of LiH containing varying proportions of Li^6, Li^7 and H^1, H^2 evaporated onto a KBr substrate were obtained in the region 10-28μ with a CsBr-prism spectrophotometer. Similar experiments were made in the region 15-36μ on films of LiF containing varying proportions of Li^6, Li^7 and evaporated onto CsBr and polyethylene substrates. For certain compositions spectra were obtained at 300°, 220°, and 120°K. For isotopically-pure materials, the dispersion wavelength at a given temperature varies as the square root of the reduced mass. The introduction of isotopic impurity in LiH changes the shape of the spectrum substantially, and displaces the dispersion wavelength in a complicated manner. In LiF, isotopic impurity changes the shape of the spectrum to a minor degree, and displaces the dispersion wavelength in proportion to the square root of the average reduced mass. At low temperatures, the absorption bands become deeper and narrower, the dispersion wavelength shifting to an extent dependent on the film composition and the substrate. A change in substrate alone produces a measurable shift in dispersion wavelength.

SHROUD DESIGN FOR SIMULATING HYPERSONIC FLOW OVER THE NOSE OF A HEMISPHERE, by R. Dunlap. [1961] [2]p. incl. diagrs. (AFOSR-2839) (AF 49-(638)336) Unclassified

Also published in Jour. Aerospace Sci., v. 29: 757-758, June 1962.

An analytical method for designing a shroud which would generate the hypersonic pressure distribution on a hemisphere is presented. Two steps were involved in the design of the shroud contour: (1) an approximate solution for the incompressible, irrotational flow field in the region $0 \leq n \leq 45°$ was found and (2) the resulting contour was corrected for compressibility near the sonic region, assuming 1-dimensional flow.

TURBULENCE FIELD NEAR THE STAGNATION POINT ON BLUNT BODIES OF REVOLUTION, by A. M. Kuethe, W. W. Willmarth, and G. H. Crocker. [1961] [13]p. incl. diagrs. tables, refs. (AFOSR-3647) (In cooperation with U.S. Air Force Academy, Colorado Springs, Colo.) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)336, and Aeronautical Research Labs.) Unclassified

Also published in Proc. 1961 Heat Transfer and Fluid Mech. Inst., Los Angeles, Calif. (June 19-21, 1961), Stanford, Stanford U. Press, 1961, p. 10-22.

The turbulent fields outside of the boundary layer near the noses of axially symmetric bodies with hemispherical noses have been studied by means of the hot-wire anemometer. Measurements in a low turbulence wind tunnel over a range of Reynolds numbers show that the rms streamwise fluctuations in the nose region are larger than in the free stream. Large negative spatial correlation factors between streamwise fluctuations at ± 7° from the axis at low speeds and in a supersonic tunnel at Mach 2.45 indicate that the fluctuations in the nose region are coupled with a random motion of the stagnation point. The normalized energy spectra of the fluctuations at 7° are found to scale with the wave number n/U_∞, where n is the frequency of the fluctuations, over a 10-fold range in model diameter and a 40-fold range in Reynolds number. These normalized spectra also show a shift toward lower wave numbers compared with free stream turbulence. Possible connection between these phenomena and heat transfer measurements from bodies as affected by turbulence are pointed out. (Contractor's abstract)

AN EXPERIMENTAL AND THEORETICAL STUDY OF STATIONARY GASEOUS DETONATION WAVES, by J. A. Nicholls, E. K. Dabora and others. Oct. 1961 [78]p. incl. illus. diagrs. tables, refs. (Rept. no. 0287-9-F) (AFOSR-1764) (AF 49(638)562) AD 268927 Unclassified

Emphasis was given to the study of the standing detonation wave in a hydrogen-air mixture. The experimental arrangement and procedures employed are described and the experimental results presented. A revised analysis of the ignition delay zone behind the shock is presented which handles the equations. The prediction of the time rate of growth of concentrations of the radicals behind the shock is slightly different than the earlier analysis (item no. 1606, Vol. IV) but the prediction of ignition time delay is unchanged. Vibrational relaxation is considered as it affects the ignition time delay. Preliminary measurements aimed at probing the combustion region of the detonation wave by means of the sodium D-line reversal technique are described. A consideration of some probable 2 dimensional effects behind the shock reveal a possible explanation of uncertain anomalous ignition delay measurements. Consideration is given to the theoretical prediction of magnetogasdynamic effects on plane gaseous detonation waves and to an attempted experimental check on the linearized theory of heat addition in a supersonic stream. KINETICS OF WHISKER GROWTH ON VANADIUM PENTOXIDE, by V. J. Lee and G. Parravano. [1961] [23]p. incl. illus. diagrs. refs. (AFOSR-828) (AF 49(638)-493) AD 613308 Unclassified

The interplay of 3 growth mechanisms responsible for the formation of filaments on solid surfaces is analyzed. These are: short circuit diffusion within the filament body, evaporation from and condensation on the tip of the filament. Kinetic [illegible] for the simultaneous occurrence of the former with the latter processes are developed and typical growth behaviors are characterized. A dislocation core is used as a suitable short circuit path for diffusion. Kinetic evidence is presented to show that whiskers grown on V_2O_5 crystals follow the derived growth patterns. Detailed rate data are reported for temperatures 500 to 650°C in air, steam and vacuum. A value for the preexponential factor for diffusion, $D_0 \cong 10^6$ cm^2/sec, and activation energy of 35-40 kcal/mol can be computed from the kinetic results. Assuming that the diffusing species are cations, the order of magnitude of these values is consistent with values for similar parameters obtained by independent methods on transition metal oxides. Observations on growth morphology of V_2O_5 whiskers are reviewed. Whenever a growing whisker collided with an adjacent crystal, rapid radial growth of the filament resulted. Thus, it is suggested that whisker growth within fine particles or pores of loose aggregates characterizes the first stage of sintering of solid particulate systems. Mathematical expressions for each step of the kinetic sequence from whisker formation to neck growth between sintering particles of vanadium pentoxide are presented. (Contractor's abstract)

PHYSIOLOGICAL IMPLICATIONS OF PSYCHOPHYSICAL DATA, by W. P. Tanner, Jr. [1961] [14]p. incl. diagrs. table. (AF 49(638)369) AD 253050 Unclassified

Also published in Ann. New York Acad. Sci., v. 89: 752-765, Jan. 28, 1961.

An approach to the study of psychophysics that includes the use of mathematical models is presented. While the individual experiments can each be interpreted as a contribution to an area in psychophysics, the program can be interpreted as an experiment testing the feasibility of a profitable use of a particular scientific philosophy in the study of an area of psychology. This philosophy involves the use of mathematical models in manner similar to that of the physicist. It employs, first, the use of simple models describing the relations of only a few observable variables. The measures describing the relations among these variables may be measures of variables that exist only as force and gravity in physics and that can be measured only by observing their consequences. As measurement techniques become more nearly precise or, as the conditions of the experiment are extended to include a wider range, it will likely become apparent that the model had been adequate only because it was tested with coarse measurement over a restricted range of conditions. At this point it will be necessary to expand or modify the model to include the new data. The expanded or modified model should still include the original model as applied to the limited conditions. AN ABSTRACT MODEL FOR THE PATTERN RECOGNITION PROCESS, by D. L. Richards. Apr. 1961, 13p. incl. diagr. (Technical rept. no. 121; rept. no. 3642-1-T) (AFOSR-488) (AF 49(638)884) Unclassified

A general recognition model which can apply to any group of patterns and to any amount of initial knowledge about them is constructed. In the preliminary model which has been developed, the initial knowledge is presented to the recognizer as a list of conditional probabilities; then, given certain characteristics of the sequence of items which has been seen, the most probable correct answer can be selected. Where these conditional probabilities are not known exactly, they are estimated by a primitive earning process. Decisions are based on a posteriori probabilities and on other criteria studied in decision theory. The model is described in precise detail, and some possible goals of additional work are mentioned. STUDY PROGRAM FOR A MAGNETIC TIMER UTILIZING THE PROPAGATION OF DOMAIN WALLS, by W. W. Raymond and D. M. Grimes. July 1961, 49p. incl. diagrs. tables, refs. (Rept. no. 04316-2-T) (AFOSR-949) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)986 and [Diamond Ordnance Fuze Lab.]) AD 259998 Unclassified

Investigations were made of the possible use of controlled domain wall propagation in a magnetic material as a continuously variable time delay device. The equation of domain wall propagation is developed in terms of the fundamental parameters of the magnetic material. Conditions required for precisely controlled wall motion are discussed in terms of the shape and physical characteristics of the media. Those external parameters which influence propagation are elaborated on in view of how they may be controlled to optimize the shape and velocity of the propagating magnetic discontinuity. Available data from the literature on the range in domain wall velocity in various materials are discussed and are compiled in tabulated form. Included are some results of experimental data. Several geometries are suggested for a suitable time delay system. In view of the high domain wall velocities, none of these systems are of use for time delays greater than several seconds. A QUASI-CASCADED PARAMETRIC AMPLIFIER, by W. B. Ribbens. Nov. 1961, 7p. incl. diagr. (Technical note no. 2) (AFOSR-2007) (AF 49(638)986) AD 414052 Unclassified

Also published in Jour. Appl. Phys., v. 33: 757-758, Feb. 1962.

A quasi-cascaded parametric amplifier which uses resonant modes of a single sample is reported. If a sample is parallel pumped above the corresponding thresholds at both Wp and 2Wp, and if modes exist in the sample whose frequencies add properly and which satisfy the orthogonality lations of Denton, it is oossible to increase the amplification over the straight Suhl amplifier. In addition to the usual signal and idler mode which in the present case use the second harmonic of Wp as a reactive coupling, there must be a subsidiary idler mode which will be used to amplify the idler. For this latter pair of modes, Wp will be the pump.

ACTIONS OF THE ROTATION GROUP ON THE 5-SPHERE, by R. W. Richardson, Jr. [1961] [10]p. incl. refs. (AF 49(638)104) Unclassified

Published in Ann. Math., v. 74: 414-423, Sept. 1961.

This paper discusses continuous actions of the 3-dimensional rotational group SO(3) on S^5 which have a 3-dimensional orbit. Up to topological equivalence, there are at least 2, and at most 3 possibilities: (a) One orbit is homeomorphic to S^2, the action is induced by the direct sum of two 3-dimensional irreducible representations. (b) One orbit is homeomorphic to the projective plane, the action is the suspension of the action induced on S^4 by the 5-dimensional irreducible representation of SO(3). (c) If the double suspension of SO(3)/H, where H is the icosahedral group, is S^5, there is a third class in which the orbits either are homeomorphic to SO(3)/H, or are fixed points. (Math. Rev. abstract)

THE BOUNDARY BEHAVIOR OF MEROMORPHIC FUNCTIONS, by W. B. Woolf. [1961] [9]p. incl. refs. (AF 49(638)104) Unclassified

Published in Ann. Acad. Scient. Fenn., Series A. I., No. 305: 3-11, 1961.

Let f be defined in $|z| < 1$, and let P be a point on $|z| = 1$. Then $C(f,P)$, $C_R(f,P)$, and $C_{R-E}(f,P)$ will denote the cluster set of f at P, the radial boundary cluster set of f at P, and the radial boundary cluster set of f at P in the formation of which the radii ending at points of $E \subset \{|z| = 1\}$ are not considered respectively. The author proves 2 theorems which extend extensions of the Gross-Iverson theorem due to Lohwater and Noshire. Theorem 4: If f(z) is meromorphic in $|z| < 1$, and P is a point of $|z| = 1$, then, in each neighborhood of P, f(z) assumes every value of $C(f,P)-C_R(f,P)$ with the possible exception of at most 2 points. Any such exceptional value is an asymptotic value of f(z) at P. Theorem 5: Let f(z) be meromorphic in $|z| < 1$, E a subset of $|z| = 1$ of capacity zero, and P a point of $|z| = 1$. Then f(z) assumes in each neighborhood of P all except possibly 2 values of each component of $C(f,P)-C_{R-E}(f,P)$. Any such exceptional value is an asymptotic value of f(z), either at P or at a sequence of points of E which have P as a limit point. The methods of proof are closely related to techniques of Lohwater and Noshiro. (Math. Rev. abstract)

UNCOUNTABLY MANY NONISOMORPHIC NILPOTENT LIE ALGEBRAS, by C.-Y. Chao. [1961] [4]p. (AF 49-(638)104) Unclassified

Published in Proc. Amer. Math. Soc., v. 13: 903-906, Dec. 1962.

Suppose that L is an algebra over a field F, and that E is a subfield of F. Call L an E-algebra if it has a basis whose multiplication table has coefficients in E. With the stipulation that L be a real Lie algebra with $[[LL]L] = 0$ and sufficiently high dimension, it is possible to construct an uncountable assortment of algebras L which are not rational algebras. The construction also yields, for each dimension ≥ 10, an uncountable number of these algebras which are not isomorphic. A suitable one-dimensional extension of each of these then gives a similar result for a class of solvable algebras.

A RUNGE-KUTTA PROCEDURE FOR THE GOURSAT PROBLEM IN HYPERBOLIC PARTIAL DIFFERENTIAL EQUATIONS, by R. H. Moore. [1960] [27]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)192 and Naval Ordnance Lab.) Unclassified

Published in Arch. Rational Mech. and Anal., v. 7: 37-63, 1961.

A numerical procedure analogous to the Runge-Kutta method is developed for the problem $u_{xy} = f(x,y,u,u_x,u_y)$, $u(x,0) = \sigma(x)$, $u(0,y) = \tau(y)$, $\sigma(0) = \tau(0)$, $0 \leq a$, $0 \leq y \leq b$. The calculation proceeds stepwise in a regular grid with mesh sides $\Delta x = h$, $\Delta y = \varphi h$. Formulas are given for the approximate determination of u, u_x, u_y at $(x_0 + h, y_0 + \varphi h)$. The calculation involves intermediate values in such a way that 18 possible different increments of the coordinates have to be considered simultaneously. With these increments a set of formulas is proposed, which, when written in matrix form, resembles structurally the ordinary Runge-Kutta formulas. The weight factors in these formulas together with the 18 increments are then determined. The resulting conditions are undetermined and permit the imposition of some symmetry and positivity requirements. A particular set of values

for all parameters is proposed which produces a comparatively simple numerical scheme. The discretization error inherent in this method is $0(h^5)$ for sufficiently smooth data. (Math. Rev. abstract)

BOUNDARY FUNCTIONS FOR FUNCTIONS DEFINED IN A DISK, by F. Bagemihl and G. Piranian. [1961] [7]p. (AFOSR-594) (AF 49(638)633) AD 611472 Unclassified

Also published in Michigan Math. Jour., v. 8: 201-207, 1961.

Let C denote the unit circle $|\zeta| = 1$, D the unit disk $|z| < 1$, and let $\varphi(\zeta)$ and f(z) be real-or complex-valued functions defined on C and D, respectively. Then φ is said to be a boundary function for f if for each $\zeta \in C$ there exists an arc $A(\zeta)$, which has ζ as an endpoint and lies except for this endpoint in D, such that $\lim_{z \to \zeta, z \in A(\zeta)} f(z) = \varphi(\zeta)$. The authors first consider the problem of how many different boundary functions a particular function f can have. In particular, they show that an arbitrary function f has at most $2^{\aleph_0}$ boundary functions. They then exhibit a holomorphic function f which belongs to every Hardy class H^p and actually has $2^{\aleph_0}$ boundary functions. The authors next consider the relation between boundary functions and the Baire classification. For example, they show that if 1 of the boundary functions for f is of Baire class $\alpha \geq 3$, then every boundary function for f is of Baire class α. They also construct a bounded continuous function f and then a harmonic function f, each of which has boundary functions of Baire classes 0, 1, and 2. The authors next prove that φ is the boundary function for a continuous f if φ is of Baire class 2 and differs on at most a countable set from a function of Baire class 1. A φ of Baire class 2 is exhibited which is not the boundary function for a continuous f. Finally, the authors prove that the characteristic function of a set $E \subset C$ is the boundary function for a continuous f if and only if both E and $C \setminus E$ are the union of a countable set and a set of type G_δ. The paper is concluded with a number of open questions. (Math. Rev. abstract)

GEOMETRIC ABA-GROUPS, by D. G. Higman and J. E. McLaughlin. [1960] [16]p. incl. refs. [AF 49(638)714] Unclassified

Published in Illinois Jour. Math., v. 5: 382-397, Sept. 1961.

It is proved that only Desarguesian projective planes admitting acutely regular groups of collineations are the planes of orders 2 and 8, and an acutely transitive group on a Desarguesian projective plane, which is not acutely regular, contains the little projective group thus determining all acutely transitive collineation groups of Desarguesian projective planes. This proof follows the following general outline. The concept of geometric ABA-groups, characterized as the finite groups admitting acutely transitive representations on 2-designs as the groups G containing subgroups A and B such that: (1) G = ABA, (2) $AB \cap BA = A + B$, and (3) $A \neq B$ and $B \neq A$. Any doubly transitive group is a geometric ABA-group with $B:A \cap B = 2$, which means that in a geometric ABA-group, A is a maximal subgroup. A projective ABA-group satisfies the condition $A:A \cap B = B:A \cap B \geq 3$. By using the Ostrom-Wagner theorem the additional condition $G = A + A \times A$ is necessary and sufficient for π to be Desarguesian and $\sigma(G)$ to contain the little projective group. If the additional condition $A \cap B = 1$ is satisfied then G is an independent ABA-group and using Singer's theorem the original statement is proved.

PARTIALLY FREE SUBSETS OF EUCLIDEAN N-SPACE, by R. L. Wilder. [1961] [11]p. (AFOSR-J777) (AF 49(638)774) AD 408265 Unclassified

Also published in Michigan Math. Jour., v. 9: 97-107, June 1962.

Let C be a continuum in E^n and T be a closed subset of C. Define C to be T-free if for every $\epsilon > 0$ there exists an ϵ-mapping f: $C \to E^n$ such that $f(C) \cap C \subset T$. When T is empty C is said to be free. The author proved earlier that free continua which separate E^n are (n-1)-generalized manifolds. The present paper continues and generalizes his results by obtaining the same conclusion. C is an (n-1)-gcm, when T is, for example, zero-dimensional. The importance of such generalizations is pointed out by Bing's result that a 2-sphere in E^3 is always T-free, with T being a Cantor set. The main results are stated in Theorems 1-7, each concluding that C is an (n-1)-gcm, but with considerable variations of hypotheses. For example, the hypotheses of Theorem 3 are: (1) C is $1C^k$ with $2k \geq n-1$; (2) C cuts E^n; (3) T is closed and totally disconnected; (4) T is not an r-separating set of C for $r \leq k$; (5) for each $\epsilon > 0$, there is an ϵ transformation f: $C \to (E^n - C) \cup T$ such that $f(C-T) \subset E^n - C$; (6) f is (k-1)-monotone on C-T; (7) $E^n - C$ is semi-(n-r-2)-connected relative to E^n for all $r \leq k$. The hypotheses of Theorem 7 are: (1) C is $1C^{n-2}$; (2) C cuts E^n; (3) for given $\epsilon > 0$ there exist both a totally disconnected subset T of C and an ϵ-transformation f such that (4) T is not a local r-separating set of C for $r \leq n-2$; (5) f(C)-C lies in one component of $E^n - C$. For all of these theorems the hypotheses are shown to imply some degree of uniform local connectedness of $E^n - C$ so that the theorems of Chapter X of the author's book, Topology of Manifolds, may be used to conclude that C is an (n-1)-gcm. SOME CHARACTERIZATION OF HOMOLOGICAL DIMENSION, by Y. Kodama. [1961] [6]p. incl. refs. (AF 49(638)774) Unclassified

Published in Michigan Math. Jour., v. 9: 167-172, June 19[illegible]

Continuing his investigation of test spaces the author proves (Theorems A, B) that for some groups there is a system (T system) of test spaces, though no single test nor finite system. His corollaries are (1) a Bockstein type result (which follows immediately from Bockstein's Theorem), (2) a theorem of Cohen and (3) a result relating the dimension of X, Y and $f^{-1}(y)$ for certain mappings f: $X \to Y$. FLAG-TRANSITIVE COLLINEATION GROUPS OF FINITE PROJECTIVE SPACES, by D. G. Higman. [1961] [13]p. incl. refs. [AF 49(638)774] Unclassified

Also published in Illinois Jour. Math., v. 6: 434-446, Sept. 1962.

In a projective space P, a "flag" is the figure consisting of a point, a line, a plane, ..., a hyperplane, in which each element contains all those of lower dimensions; a "flag-transitive collineation group" is one such that some one of its operations transforms any flag into any other flag; and the "little projective group" is the group generated by "elations," i.e., by products of matrices of the form $1 + ak^T$, where a and k are arbitrary vectors. The order of P is n if there are n + 1 points on a line. The theorem proved is the following: A flag-transitive collineation group G of a Desarguesian projective space P of dimension $d \geq 2$ and finite order n must contain the little projective group of P unless (a) d = 2, n = 2 and $|G| = 3.7$, or (b) d = 2, n = 8 and $|G| = 9.73$, or (c) d = 3, n = 2, and G is isomorphic with the alternating group A_7 of degree 7. FACTORS OF N-SPACE, by K. W. Kwun. [1961] [5]p. incl. refs. (AF 49(638)774) Unclassified

Published in Michigan Math. Jour., v. 9: 207-211, Sept. 1962.

In 1959 Bing showed that 4-space has a factorization $X \times R$ in which X is not a manifold, but it was later found that X is a homotopy manifold. So the question remained as to how "bad" such an X can be. By a result due to Raymond it must be a homology generalized manifold. In this paper the author shows that such an X may fail to have the (local) homotopy-manifold property at any point. Precisely, it is proved that for each $n \geq 3$ there exists an n-dimensional homology such that $X \times R = R^{n+1}$, whereas no open set of X is a homotopy manifold. (Math. Rev. abstract)

THE USE OF THE SHOCK TUBE AS A SPECTROSCOPIC SOURCE WITH AN APPLICATION TO THE MEASUREMENT OF gf-VALUES FOR LINES OF NEUTRAL AND SINGLY IONIZED CHROMIUM, by T. [D.] Wilkerson. June 1961 [281]p. incl. illus. diagrs. tables, refs. (Rept. no. 02822-3-T) (AFOSR-1151) (AF 49-(638)439) AD 262100 Unclassified

With chromium carbonyl as the additive, the gas behind the reflected shock emitted intense lines of neutral and singly ionized chromium (Cr I and Cr II). Line intensities were measured by heterochromatic photometry, using the anode crater of a carbon arc as the primary radiation standard. The state of the gas was computed from shock tube theory, taking account of dissociation, ionization, and excitation. Computed atomic populations were used, in conjunction with the theory of radiative transfer, to derive absolute gf-values of the lines from their observed intensities. The measurements covered 20 lines of Cr I and 8 lines of Cr II in the wavelength region 4500-5000A. The relative magnitudes of the Cr I gf-values were quite different from the relative values previously found in a furnace experiment. The new values rectify the anomalies attributed to Cr I in arcs and the sun on the basis of the previous work. The results of other experiments are compared to a few of the new absolute gf-values of Cr I. The new values are 3 to 5 times greater. The gf-values for Cr II are apparently the first to be measured for this ion. Observations were made of the ionization relaxation of Cr I immediately behind the reflected shock. STRONG LUMINOUS SHOCKS PRODUCED IN SHOCK TUBES, by C. W. Mautz and O. Laporte. Final rept. Nov. 1961, 2p. (AFOSR-1803) (AF 49(638)439) AD 611134 Unclassified

The work reported here has proved the value of the shock tube as a source for spectroscopic measurements. In addition to establishment of the techniques for shock-tube measurement of gf-values, a significant set of values has been determined which will be of importance in astrophysics and in the measurement of excitation temperatures.

IONIZATION OF SHOCK-HEATED Cr I (Abstract), by T. D. Wilkerson. [1961] [1]p. [AF 49(638)439] Unclassified

Presented at meeting of the Amer. Phys. Soc., Colorado Springs, Colo., Nov. 15-18, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 150, Feb. 23, 1962.

The ionization-relaxation of Cr I has been observed in shock-tube experiments on Cr I and Cr II emission behind reflected shock waves. The shock-tube test gas is neon plus small amounts of Cr $(CO)_6$ vapor ($< 0.3\%$).

Transient, high-intensity Cr I emission is seen for a well-defined period $t < 10\ \mu$sec. The subsequent steady emission (lasting $\sim 100\ \mu$sec) is used for line-intensity measurements under conditions of thermal equilibrium. The ionization-relaxation time t behind the reflected shock depends inversely on the electron pressure p_{el} computed for the gas behind the primary shock. Within experimental error, this inverse dependence also applies to the electron density n_{el}, on account of the narrow range of primary flow temperature T_1 (3650 – 4850°K). A typical experiment shows $t \sim 5$ microseconds for $p_{el} \sim 10$ dynes/cm^2, $n_{el} \sim 1.8 \times 10^{13}$ cm^{-3}, $T_1 \sim 4000$°K. From a highly simplified picture of the relaxation process, one estimates an ionization cross section of 10^{-16} to 10^{-15} cm^2 for low-energy electrons on Cr I.

ABSOLUTE LINE STRENGTHS FOR Cr I AND Cr II (Abstract), by T. D. Wilkerson. [1961] [1]p. [AF 49(638)-439] Unclassified

Presented at meeting of the Amer. Phys. Soc., Berkeley, Calif., Nov. 20-22, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 374, Apr. 23, 1962.

Shock-tube experiments have yielded absolute gf values for 20 lines of Cr I and 8 lines of Cr II between 4500-5000A. The test gas is neon with 0.03% Cr $(CO)_6$, and the emission spectra are observed behind reflected shock waves at temperature T_2 = 7500°-10,000°K. The Cr I results supersede a previous report (item no. 1621, Vol. IV) of an apparent anomaly in T_2, which was based on an earlier determination of Cr I relative gf values. The new Cr I values also explain similar discrepancies reported for arcs and the solar atmosphere. The Cr II gf values are apparently the first to be measured for this ion. By means of the shock tube, it should be possible to generate and study the spectra of at least 50 elements under well-defined conditions of abundance and temperature. Such experiments will hopefully provide useful data for various studies of high-temperature gases.

COGNITIVE ASPECTS OF INFORMATION PROCESSING. I. THE FAMILIARITY OF S-R SETS AND SUBSETS, by P. M. Fitts and G. Switzer. [1961] [9]p. incl. diagrs. tables, refs. (AFOSR-279) (AF 49(638)449) Unclassified

Also published in Jour. Exper. Psychol., v. 63: 321-329, Apr. 1962.

The investigation concerned S's ability to reduce his reaction time (RT) on the basis of knowledge that only a small subset of a larger, familiar alphabet would occur as stimuli in a particular experiment. It was predicted that S's could make effective use of this knowledge only when the small subset itself constituted a highly familiar group. The results of 3 experiments were in agreement with the predictions. These results support the view that information-handling rate is in part a function of cognitive sets which reflect the preparation which S makes, in advance, for responding to any 1 of a group of stimuli. Some characteristics of these cognitive sets are discussed, and the notion of related to recent theories of choice behavior.

THE EFFECTS OF LOAD AND ACCESSIBILITY OF INFORMATION UPON PERFORMANCE OF SMALL TEAMS, by H. G. Moore. Oct. 1961 [125]p. incl. diagrs. tables, refs. (Rept. no. 02914-8-T) (AFOSR-1636) (AF 49(638)449) AD 268462 Unclassified

Abstract published in Dissertation Abstracts, v. 23: 301, 1962.

The aim of this research is to relate objective measures of team performance to task: organizational, and information-coding variables in dynamic tasks which must be accomplished under time pressure. The task employed in the present study is a generalized version of the familiar transportation, assignment, or scheduling problem which requires the use of heuristic methods of problem solving. The task also involves a variety of related data processing and record keeping activities. The study is a distinct contribution to the methodology of system research. In addition the study indicates that a considerable amount of work sharing or load balancing can take place between the members of a team that is working under time stress, when visually displayed information is available to both members of a 2-man team and there are minimum restrictions on voice communications. STUDIES ON DRIVE AND INCENTIVE IN PERCEPTION. III. SOME EFFECTS OF DRIVE ON STIMULUS GENERALIZATION OBTAINED WITH A REVISED TRAINING PROCEDURE, by R. B. Zajonc and S. E. Karp. Apr. 1961, 30p. incl. tables, refs. (Technical rept. no. 8) (AFOSR-753) (AF 49(638)367) AD 257895 Unclassified

A procedural modification was developed in order to clarify the results of testing the hypothesis that within certain intensity ranges, the perceived stimulus intensity is a monotonically increasing function of drive and the actual stimulus intensity. This change in procedure prevented the formation of negative gradients which eliminated a possible effect due to variation in the response threshold and the distances between the training stimuli. It was found that there were significant curve shifts under the 2 drive conditions, thus supporting the experimental hypothesis. However, the effects found were generally weaker than those observed under the previously used procedure. (Contractor's abstract)

STUDIES ON DRIVE AND INCENTIVE IN PERCEPTION. IV. SOME EFFECTS OF SOUND AND BACKGROUND BRIGHTNESS ON THE PERCEIVED SIZE OF COINS AND DISCS, by D. D. Dorfman and R. B. Zajonc. Nov. 1961, 14p. incl. diagrs. tables, refs. (Technical rept. no. 12) (AFOSR-1735) (AF 49(638)367) AD 267847 Unclassified

Also published in Jour. Abnorm. and Social Psychol., v. 66: 87-90, Jan. 1963.

The research was designed to test implications of the hypothesis that the Bruner-Goodman phenomenon is an instance of sensory interaction. Rich and poor children estimated the size of coins and discs under sound vs no sound and two levels of background brightness. Contrary to prediction, no relation was found to exist between sound level and size estimation, although such a relation did exist for background brightness. The findings failed to replicate the data of Bruner and Goodman, whereas they were in substantial agreement with those of Carter and Schooler. These results were as follows. (1) Large coins tended to be judged larger, and small coins judged smaller than neutral discs of comparable size; and (2) No differential affect was observed on the estimations of coins and discs as a function of economic status. There was, however, a reliable tendency for the children of lower economic status to overestimate both coins and discs when compared with those of higher status. (Contractor's abstract)

STUDIES ON DRIVE AND INCENTIVE IN PERCEPTION. V. RESPONSE SUPPRESSION IN PERCEPTUAL DEFENSE, by R. [B.] Zajonc. Oct. 1961, 24p. incl. diagrs. tables, refs. (Technical rept. no. 14) (AFOSR-1736) (AF 49(638)367) AD 267848 Unclassified

Also published in Jour. Exper. Psychol., v. 64: 206-214, Sept. 1962.

To examine the relative effects of the stimulus and the response in perceptual defense experiments, recognition thresholds and autonomic reactions were first obtained to 6 neutral and 6 taboo words. Subsequently, Ss learned a list of paired-associates to a criterion of 3 perfect trials, where the original words served as stimulus terms and a new set of 6 neutral and 6 taboo words served as response terms. Half of the neutral stimuli were paired with neutral, and half with taboo responses. The same was true of the 6 taboo stimuli. Following, the paired-associates training recognition thresholds and GSR were again measured. One group of subjects, however, was required to give evidence of recognition by means of the response terms acquired in the paired-associates training and another by means of the original stimulus presented. The results show that stimuli have no effect on either recognition threshold or GSR unless they produce response conflict. Irrespective of the emotionality of the stimulus, recognition threshold and GSR were found to be elevated when subjects were required to give a taboo response. Also, no differences between taboo and neutral stimuli were found when the responses required of the subjects were neutral. The strongest response effects were observed for rapid learners. THE THEORY OF PHONEMIC ANALYSIS, by G. E. Peterson and C. J. Fillmore. [1961] [14]p. incl. diagrs. (AFOSR-2091) (AF 49(638)492) Unclassified

Also published in Proc. Fourth Internat'l. Cong. on Phonetic Sciences, Helsinki (Finland) (Sept. 4-9, 1961), The Hague, Mouton and Co., 1962, p. 476-489.

In this paper, the general nature of a theory of phonemic analysis is considered. A linguistic theory is viewed as a scientific theory, and as such must have the essential properties of any scientific theory. An attempt has been made to delimit phonology within linguistics and to identify those elements essential to a phonological system. Phonetic theory is considered basic to phonemic theory and to the phonological description of specific languages. A general phonemic theory specifies the individual units and the basic relationships among these units in a manner that is equally applicable to various languages. The general properties of phonological descriptions of dialects of specific languages are considered, and formats are discussed in which the phonological description of specific dialects may be presented. Thus a general phonemic theory plus a format for expressing the phonemicization of specific dialects provide the essential components of the theory of phonemic analysis. (Contractor's abstract)

PHONEME SELECTION FOR STUDIES IN AUTOMATIC SPEECH RECOGNITION, by J. E. Shoup. [1961] [8]p. incl. diagrs. tables. (AFOSR-2094) (AF 49(638)492) Unclassified

Also published in Jour. Acoust. Soc. Amer., v. 34: 397-403, Apr. 1962.

Two alternate methods for the selection of speech material to be used in studies in automatic speech recognition are suggested. Preference is given to the selection of a restricted set of phonemes from which words and sentences may be constructed for analysis. The selection can be based on the high frequency of occurrence of the individual phonemes, on the high yield of words by the phonemes, or on some combination of these 2 criteria. A combination of the 2 criteria appears to be most satisfactory. The phoneme selection was derived from the 500 most frequently occurring words, as given by Thorndike and Lorge. Some consideration was also given to the frequencies of occurrence of the phonemes. The phonemes are presented in cumulative order according to the number of words by which the list is increased as each successive phoneme is added. (Contractor's abstract)

THE MEASUREMENT OF SPEECH POWER, by G. E. Peterson and N. P. McKinney. [1961] [20]p. incl. illus. diagrs. refs. (AFOSR-2095) (AF 49(638)492) Unclassified

Also published in Phonetica, v. 7: 65-84, 1961.

The measurement of speech power is basic to research on the acoustic correlates of linguistic stress. Two units essential to speech measurement are a rectifier and a filter. An amplitude compressor is also desirable. Theoretically a square-law rectifier is ideally suited for speech power measurements, but there are considerable practical difficulties in implementing such a circuit. The common "linear rectifier" has been found experimentally to be suitable for this application. A simple filter design may be achieved which is adequate for most applications and which avoids the theoretical and practical difficulties of several other filter designs discussed. Logarithmic amplitude compression of the filter output

is desirable and is easily accomplished with a diode. In making speech power measurements with the circuit developed, an effect previously discussed by House has been observed. (Contractor's abstract)

INTRINSIC CUES AND CONSONANT PERCEPTION, by W. S.-Y. Wang and C. J. Fillmore. [1961] [7]p. incl. tables. (AFOSR-3283) (AF 49(638)492) Unclassified

Also published in Jour. Speech and Hearing Research, v. 4: 130-136, June 1961.

A distinction has been made between secondary cues which are extrinsic and those which are intrinsic. The purpose was to investigate the contribution of some intrinsic cues in consonant perception. Subjects were 10 phonetically trained listeners. Test items were 405 consonant-vowel-consonant syllables consisting of 9 consonants and 5 vowels in all combinations. Results of correct identification of initial consonants suggest that vowel amplitude, degree of formant bend, and vowel nasalization are significant parameters in the vowel for identifying the consonant which precedes it. PARAMAGNETIC RESONANCE OF ZnTe:Mn (Abstract), by G. H. Azarbayejani, C. Kikuchi, and D. Mason. [1961] [1]p. [AF 49(638)987] Unclassified

Presented at meeting of the Amer. Phys. Soc,, Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 117, Mar. 20, 1961.

Spin resonance measurements of ZnTe containing about 0.01% Mn^{++} were carried out to augment the information on Mn^{++} ions in the cubic $A_{II}B_{VI}$ compounds, ZnS and CdTe, reported earlier. The g-value at 77°K is about 2.005. The cubic field parameter 3a is about 0.00348 cm^{-1} at 4.2°K. This is to be compared with 0.00233 cm^{-1} and 0.0084 cm^{-1} for ZnS and CdTe, respectively. Measurements indicate that the hfs coupling constant A is temperature dependent, having the values 62.2, 61.0, and 60.5 gauss at 300°, 77°, and 4.2°K, respectively. This temperature dependence is in contrast to that of CdTe, for which preliminary measurements give 60.6, 61.7, and 61.6 gauss at 300°, 77°, and 4.2°K, respectively.

SPIN RESONANCE PROPERTIES OF ZnTe:Mn AND OF OTHER $A_{II}B_{VI}$ COMPOUNDS, by C. Kikuchi and G. H. Azarbayejani. [1961] [3]p. incl. tables, refs. [AF 49-(638)987] Unclassified

Presented at Internat'l. Conf. on Magnetism and Crystallography, Kyoto (Japan), Sept. 25-30, 1961.

Published in Jour. Phys. Soc. Japan, v. 17, Suppl. B-I: 453-455, Mar. 1962.

The cubic field splittings 3a for ZnTe:Mn and CdSe:Mn are reported. The ground state splittings in ZnTe and CdTe, whose lattice parameters are 6.10 and 6.48A, are 88.9 and 83.1 x $10^{-4}cm^{-1}$, respectively. On the other hand, for CdSe, for which the lattice parameter is 6.05A, the cubic field splitting is 46.3 x $10^{-4}cm^{-1}$. It is suggested that the impurity Mn^{++} ions produce local dilatations such as to be under compression in the zinc $A_{II}B_{VI}$ compounds and under tension in the corresponding cadmium compounds. EXPANSION OF HYPERGEOMETRIC FUNCTIONS IN SERIES OF OTHER HYPERGEOMETRIC FUNCTIONS, by Y. L. Luke and R. L. Coleman. [1960] [5]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)389] and David Taylor Model Basin, Applied Math. Lab.) Unclassified

Published in Math. Comput., v. 15: 233-237, July 1961.

In a previous paper (item no. 1248, Vol. III) an expansion has been developed for the confluent hypergeometric function in series of Bessel functions. A different expansion of the same kind given by Buchholz was also studied. Rice has also developed an expansion of this type, and a fourth expansion of this kind can be deduced from some recent work by Alavi and Wells. In this paper, a multiplication formula is deduced for the Gaussian hypergeometric functions due to Erdélyi. The principal result is specialized to give an expansion of the confluent hypergeometric function in series of Bessel functions which includes the 4 above as special cases. With the aid of the Laplace transform, the latter result is used to derive an expansion of the Gaussian hypergeometric function in series of functions of the same kind with changed argument. This is advantageous since, throughout most of the unit disc, the change in argument leads to more rapidly converging series. For special values of the parameters, the expansion degenerates into known quadratic transformations. (Contractor's abstract)

STUDIES ON RHENIUM COORDINATION COMPOUNDS: HEXAISOCYANIDERHENIUM(I) SALTS, PART I. STUDIES ON IRIDIUM COMPOUNDS: ISOCYANIDE DERIVATIVES OF IRIDIUM. CARBONYL DERIVATIVES OF IRIDIUM IODIDES, PART II, by L. Malatesta. Final technical rept. Mar. 31, 1961 [33]p. incl. tables, refs. (AFOSR-1204) (AF 61(052)83) AD 262065 Unclassified

The reaction of ReI_3 with p-tolylisocyanide at 150° and with ethyl-isocyanide at room temperature gives the triiodide of the hexaisocyaniderhenium(I) cations $[Re(RNC)_6]^+$. Both the aliphatic and aromatic derivatives are stable, diamagnetic substances, from which other salts such as the iodide, the perchlorate, etc., have been prepared. From the reaction of $Ir(CO)_2$(p-toluidine)(Cl) with p-tolylisocyanide (RNC) the cations $[Ir(CO)(RNC)_3]^+$ and $[Ir(RNC)_4]^+$ were obtained in solution and isolated as salts with bromide, perchlorate and iodide anions. These salts are a stable crystalline, diamagnetic substance, of intense blue color, and soluble in polar solvents. (Contractor's abstract)

CATHODIC REDUCTION OF OXYGEN AND HYDROGEN PEROXIDE ON PLATINUM, PALLADIUM AND IRIDIUM SMOOTH ELECTRODES, by G. Bianchi, F. Mazza, and T. Mussini. Dec. 1961 [34]p. incl. diagrs. tables, refs. (Technical scientific note no. 6) (AFOSR-2050) (AF 61(052)260) AD 277394 Unclassified

Polarization curves in acid, neutral and alkaline solutions were drawn by potentiostatic method, for O and H_2O_2 reduction processes and for H_2O_2 oxidation process, on Pt, Ir and Pd electrodes. These curves could be classified as follows: those whose slopes are 0.030 to 0.12, and those with slopes higher than 0.12. The former can be explained through already proposed mechanisms (addition of 1 electron or 1 atom of H to an adsorbed O molecule; or addition of 1 electron to an HO_2 adsorbed radical). The slopes higher than 0.12 involve a slow O or HO_2 radical adsorption which becomes kinetically determining first of all for Ir in both acid and neutral solutions. For Pd in H_2SO_4 solution and for Pt in HCl solution the O adsorption process is very slow, essentially due to the complexing action of the solution with resulting formation of surface complexes which engage the metal atoms, thus preventing or reducing the formation of adsorbed oxide. CATHODIC REDUCTION OF OXYGEN AND HYDROGEN PEROXIDE ON TITANIUM, by G. Bianchi and S. Malaguzzi. [1961] [6]p. (AFOSR-2893) (AF 61(052)260) Unclassified

Also published in Proc. First Internat'l. Cong. on Metallic Corrosion, London (Gt. Brit.) (Apr. 1961) [London] Butterworth, 1962, p. 78-83.

In a study of the behavior of oxygen and hydrogen peroxide on titanium by polarization curves, the metal functions effectively for the cathodic reduction of these 2 materials. The potential for the oxygen reaction is relatively insensitive to pH; at the lowest c. d. in acid solution this potential is ~0.2 - 0.3 v, 0.1 - 0.3 v in neutral solution, and -0.3 - 0 v in alkaline solution. The polarization curves have the same slope in acid, neutral, and alkaline solution (2RT/F). Ti may play a cathodic role to a number of metals and may produce galvanic corrosion, especially in neutral solution in which positivity is stable. In acid solution Ti is similar to Ag, Au, etc., but in alkaline solution the reduction and oxidation reactions occur at -300 mv and on the other metals at 100-200 mv; this may be due to the absorption of OH^- in place of O.

[ABOUT THE ELECTROCHEMICAL BEHAVIOR OF OXYGEN AND HYDROGEN PEROXIDE ON MAGNETITE ELECTRODES] Über das elektrochemische Verhalten von Sauersstoff und Wasserstoffsuperoxyd auf Magnetit-Elektroden, by G. Bianchi, G. Caprioglio and others. [1961] [7]p. incl. diagrs. tables, refs. (AFOSR-4237) (AF 61(052)260) Unclassified

Also published in Werkstoffe Korrosion, v. 13: 413-419, July 1962.

The electrochemical behavior of oxygen and hydrogen peroxide on magnetite electrodes was examined in neutral (0.5 M H_3BO_3 + 0.5 M Na_2SO_4) and alkaline (0.1 M NaOH + 0.5 M Na_2SO_4) solutions. In alkaline solution, the reaction is best described by $H_2O_2 = O_2 + 2H^+ + 2e^-$. In neutral solution, several processes occur including the reaction cited and the reaction $Fe(OH)_3 + 3H^+ + 2e^- = Fe^{+++} + 3H_2O$.

ACTION OF CURARE-LIKE DRUGS ON SHORT AND LONG NEURONAL CIRCUITS, by D. Spinelli, T. Gualtierotti and others. [1958] 1p. (AFOSR-TN-59-1008) (AF 61(052)23) AD 617794 Unclassified

A curare-like non-hyperpolarizing drug, such as succinylcholine, seems to produce an overall facilitation on the nervous centers, involving especially long neuron 1 circuits (polysynaptic spinal reflex activity, rotary afterdischarges of the cerebellar cortex). On the oligosynaptic arc the facilitatory effect was limited to the very beginning of the administration of the drug, being followed later by inhibition. A hyperpolarizing curare drug, on the contrary, seems to induce a suppressory action on long interneuronal circuits such as those involved in the response of the cerebellar activity to a gravitational stimulation of the labyrinth. The increase of spinal reflex responses induced in a first time by this drug, seems to contradict the preceding statement; such an effect, however, may be due to a more marked blocking effect on the Renshaw inhibitory cells; the Renshaw antidromic inhibition is in fact substantially decreased under the action of this drug. (Contractor's abstract)

ROLE OF RENSHAW ANTIDROMIC INHIBITION ON THE EFFERENT ACTIVITY OF THE SPINAL CORD IN MAN, by R. Margaria, T. Gualtierotti, and D. Spinelli. [1957] 1p. (AFOSR-TN-59-1009) (AF 61(052)23) AD 617795 Unclassified

The function of Renshaw antidromic inhibition in the activity of the spinal centers was investigated. It is suggested that there is a link between the rhythm of discharge of the single motoneurons of the spinal cord, the silent period in the muscle, and the Renshaw antidromic inhibition. This last is presumably the main controlling mechanism for the efferent activity of the spinal centers, and it seems responsible for their low frequency of discharge.

[SPINAL REFLEX RESPONSES DURING STRESS AND FATIGUE] by R. Margaria. Final rept. [1961] 13p. incl. refs. (AFOSR-605) (AF 61(052)23) AD 259051 Unclassified

Oligo- and multisynaptic reflexes in the sciatic-gastronemius territory have been studied in men during rest and after exhaustive physical exercise. The general characteristics of the reflex responses have been investigated statistically; motor and sensory conduction speed, total and spinal reflex time, endplate delay and the inhibitory curve have been determined or calculated. During exhaustive physical exercise the only significant change consisted in a decrease of the spinal reflex time. The rhythm of discharge of the single motoneuron in man has been studied by recording the action potentials of the single muscle fiber in ten muscular groups from head to leg muscles. It was concluded that the frequency of discharge is controlled by antidromic inhibition of the motoneurons. The responses of single units of the flocculonodular lobe to rotatory accelerations has been studied and differential discharges have been found. The working of the cerebellar analyzers for accelerations is described.

BODY SUSCEPTIBILITY TO HIGH ACCELERATIONS AND TO ZERO GRAVITY CONDITION, by R. Margaria and T. Gualtierotti. [1961] [23]p. incl. illus. diagrs. table, refs. (AFOSR-2014) (AF 61(052)23) Unclassified

Also published in Advances in Aeronaut. Sci., v. 3-4: 1081-1103, 1961.

Experiments concerning body susceptibility to high accelerations and to zero gravity condition indicate the following results: (1) gravity is but one factor and not the most important acting on the static organs of the labyrinth; (2) the energizer effect on the other nervous structures of labyrinth and cerebellum is largely independent from external stimulation; (3) most of the sensory inflow to the vestibulo-cerebellar system will be maintained through tactile, visual and deep receptor connections; and (4) whatever impairment the absence of the gravitational factor may induce on the static organs, it might easily be overcome after a short training.

RESPONSES OF THE FLOCCULO-NODULAR LOBE OF THE CEREBELLUM TO MINUTE STATIC AND DYNAMIC EXCITATION OF THE LABYRINTH IN THE CURARIZED CAT, by T. Gualtierotti, R. Margaria, and R. Mossa. [1959] [7]p. incl. illus. diagrs. (AFOSR-64-1700) (AF 61(052)23) AD 448272 Unclassified

Also published in Atti Cong. Internaz. Med. Aeronaut. e Spaziale, v. 2: 564-570, Oct. 1959.

In curarized cats the response to acceleration forces of the medial and lateral parts of the left flocculo-nodular lobe of the cerebellum has been recorded. The stimulation was given either (a) by centrifuging the animal at a very low speed, the centrifugal force being maintained at a very low fraction of g, or (b) by changing the position of the animal, the body being tilted from the horizontal to a maximum of 10°, while the head was kept rigidly in the same position in respect to the body; (c) in a third group of experiments the plan of rotation of the centrifuge was inclined 1.5° to 10° to the horizontal, thus combining the 2 kinds of stimulation as described in (a) and (b). Static and dynamic responses are different. Static excitation induces an increase of amplitude of the cerebellar potentials without changes of frequency while dynamic stimulation, observed during rotation, mainly results in a synchronization of the cerebellar potentials with a decrease of frequency from 150-300/sec to 50-80/sec: the slower potentials are much ampler. SURFACE STATES ON CLEAVED SILICON, by D. R. Palmer, S. R. Morrison, and C. E. Dauenbaugh. [1960] [2]p. [AF 49(638)597] Unclassified

Published in Phys. Rev. Ltrs., v. 6: 170-171, Feb. 15, 1961.

Measurements were made of surface band structure on cleaved silicon using the channel methods of Statz. Samples were made by diffusing phosphorus into 80-ohm-cm p-type silicon to form npn units and by diffusing boron into 20-ohm-cm n-type silicon to form pnp units. The base width was 0.04 in. By cleaving, so as to leave the junction intersecting a cleaved surface, it was possible to make measurements of the channel conductance, if any, caused by the cleaved surface. In neither the npn nor the pnp case was the conductivity of the cleaved surface greater than 10^{-2} μmho/sq at 1.5 v bias, indicating there was no channel (inversion layer) present. It is concluded that the dominant surface states are near the center of the gap with a freshly cleaved silicon surface, if it is assumed that the surface state structure is independent of the bulk type.

RESEARCH ON PROPERTIES OF CLEAN SURFACES, by S. R. Morrison, D. R. Palmer, and C. E. Dauenbaugh. Final rept. May 1961, 25p. incl. diagrs. refs. (AFOSR-755) (AF 49(638)597) AD 256262 Unclassified

Experiments to determine the surface band structure of clean surfaces produced by cleavage in ultra-high vacuum have been performed on germanium, silicon, and indium antimonide. A clean Ge surface is highly p-type with the Fermi level at the surface near the valence band. This is brought about by acceptor-like surface states in the valence band with a density of 2-3 x $10^{12}/cm^2$. The density of these low-lying surface states decreases when the surface is exposed to oxygen. A clean Si surface is nearly intrinsic, possibly slightly n-type, indicating that the dominant surface states are near the center of the forbidden gap at the surface. Preliminary results on InSb are reported. (Contractor's abstract)

GROUP THEORY AND THE ENERGY BAND STRUCTURE OF SEMICONDUCTORS, by A. Nussbaum. [1961] [20]p. incl. diagrs. tables, refs. (AFOSR-4250) (AF 49(638)597) Unclassified

Also published in Proc. Inst. Radio Engineers, v. 50: 1763-1781, Aug. 1962.

The purpose of this paper is to present the principles involved in calculating the energy band structures of semiconductors. These calculations can be simplified by the use of group theory, which is a branch of analysis that permits expressing the symmetry properties of crystals in a quantitative manner. Some of the simpler concepts of group theory are explained and then applied to band structure determinations. (Contractor's abstract)

STUDIES OF CLEAVED GERMANIUM SURFACES (Abstract), by S. R. Morrison, D. R. Palmer, and C. E. Dauenbaugh. [1961] [2]p. [AF 49(638)597] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 106-107, Mar. 20, 1961.

The method of Statz and his co-workers has been found particularly adaptable to electrical studies of clean (by cleavage) Ge surfaces. Earlier work (item no. 1662, Vol. IV) has shown that a strongly p-type surface layer is found on clean Ge. Our approach then has been to prepare by diffusion a pnp transistor-like structure, and cleave in such a way as to cleave through the junctions. Then biasing both junctions in the reverse direction, the "channel" resistance across the p-type surface layer is measured. The resistivity upon cleavage has turned out to be the order of 100 μmho/sq with an 0.1-v bias on the junctions. The resistivity variations with oxygen admission are similar to earlier work on argon-bombarded and particularly cleaved Ge surfaces.

GALVANOMAGNETIC COEFFICIENTS OF SINGLE-CRYSTAL TELLURIUM, by A. Nussbaum and R. J. Hager. [1961] [7]p. incl. diagrs. tables, refs. (AFOSR-3387) [AF 49(638)908] AD 613801 Unclassified

Also published in Phys. Rev., v. 123: 1958-1964, Sept. 15, 1961.

The 12 galvanomagnetic coefficients of tellurium crystals grown by the Czochralski method were measured over the temperature range 77°-300°K. The results of these measurements plus previous measurements at 4.2°K and a determination of the effect of pressure on 1 of the Hall coefficients are combined with symmetry characteristics to postulate an energy band structure. This structure differs from those previously proposed on the basis of tight-binding methods or by simple applications of group theory. (Contractor's abstract)

GALVANOMAGNETIC TENSOR FOR PURE TELLURIUM FROM 77° TO 300°K (Abstract), by A. Nussbaum and R. J. Hager. [1961] [1]p. [AF 49(638)908]
Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 130, Mar. 20, 1961.

The elements of the galvanomagnetic tensor of pure, single crystal tellurium were measured from 77° to 300°K. This extends the work of Roth and of Nussbaum and Long by giving the temperature dependence of the following 12 elements: ρ_1, ρ_3, R_1, R_3, ρ_{1111}, ρ_{1133}, ρ_{1122}, ρ_{3333}, ρ_{3311}, ρ_{1313}, ρ_{1123}, and ρ_{2311}. The general behavior of our material, which is purer than Roth's, is about the same for the elements he measured. However, we find that ρ_{1123} and ρ_{2311} over the entire temperature range are essentially zero, and this value is consistent with the hypothesis of ellipsoidal energy surfaces. This result does not agree with that obtained for large crystals grown by the Bridgman method.

FERRIMAGNETIC RESONANCE OF IRON-OXIDE MICROPOWDERS, by A. H. Morrish and E. P. Valstyn. [1961] [4]p. incl. diagrs. table. (AFOSR-1410) [AF 49-(638)803] Unclassified

Presented at Internat'l. Conf. on Magnetism and Crystallography, Kyoto (Japan), Sept. 25-30, 1961.

Also published in Jour. Phys. Soc. Japan, v. 17, Suppl. B-I: 392-395, Mar. 1962.

Ferrimagnetic resonance phenomena of single-domain γ-Fe_2O_3 powders with different particle shape distributions were studied at two frequencies: 24,116 mc and 9,480 mc. One of the powders had particles with close to spherical shape, which made it possible to estimate

the g-factor, the first-order anisotropy constant, and the spin-spin relaxation time of γ-Fe_2O_3. The values obtained are: $g = 1.97 \pm 0.02$, $K_1 = -3.0 \times 10^5$ ergs/cm^3, $\tau_2 = 1.2 \times 10^{-10}$ sec. The resonance field of the acicular powders was lower than that of the spherical powder. The experimental data are in contradiction with theoretical results based on the Stoner-Wohlfarth model. The origin of this discrepancy is discussed.

PRODUCTION OF SMALL SPHERES FROM SUSPENSIONS OF MICROPOWDERS, by E. P. Valstyn, A. H. Morrish, and C. W. Searle. [1961] [1]p. incl. illus. diagr. (AFOSR-1766) [AF 49(638)803] Unclassified

Also published in Rev. Scient. Instr., v. 33: 377-378, Mar. 1962.

A study of the ferrimagnetic resonance phenomena of γ-Fe_2O_3 powders with particle sizes in the micron or submicron range has been carried out in this laboratory. For this investigation it was necessary to produce spherical samples of suspensions of these powders in Lucite or paraffin wax. This required the development of grinding techniques other than the familiar air-blast method. In order to suspend the iron-oxide powders in Lucite, Lucite powder and iron-oxide powders were mixed in the desired proportion. Then acetone, which dissolves the Lucite, was added. The mixture was stirred for several hr until enough of the acetone had evaporated to leave a very viscous suspension, which was then left to dry in the air. If the stirring is carried out in only 1 direction, the acicular particles will become about 80% aligned on account of the shear forces on them. Hence, if a randomized suspension is desired, the stirring has to be done so as to cause a large amount of turbulence. A sphere press was designed with which spheres of 1/16 in. in diam could be produced in a bath of boiling water. The sphere press consisted essentially of 2 parts with hemispherical indentations which were made to fit exactly on top of each other. Thus, due to the joint between the 2 halves, the resulting spheres had a narrow equatorial ridge, which, however, disappeared quickly in the sphere grinder. The samples were then left in the grinder until they had the desired size, which was between 0.05 and 0.1 cm. For spheres from wax suspensions, the small pieces of the suspension were put into the mechanical sphere grinder which was now used without abrasive paper. The blows imparted to the wax particles by the walls of the grinder mold them into spheres.

THE STUDY OF PROCESSES IN GASEOUS PLASMAS WITH THE AID OF A DRIFT-VELOCITY SPECTROMETER, by J. M. Madson and H. J. Oskam. July 1961 [59]p. incl. diagrs. refs. (AFOSR-1395) (AF 49(638)-378) AD 265228 Unclassified

The construction of a drift-velocity spectrometer developed for the measurement of the mobility of positive ions produced in steady state and pulsed gaseous discharges is described. The ions are extracted from the gaseous plasma via a gating system and the time needed to traverse the drift region under the influence of a known electric field is measured. A short survey of the various methods used for the calculation of the ion mobility values is included. Preliminary measurements in helium of the value of the mobility of atomic and molecular helium ions gave the following results: (a) The value for the mobility of He^+ in helium is in excellent agreement with that obtained by other research groups. (b) The value for the mobility of He_2^+ in helium is considerably smaller at low E/P_0 (electric-field-gas pressure ratio) than found by others and seems to be close to the value derived from microwave studies of disintegrating gaseous plasmas. (Contractor's abstract)

APPLICATION OF THE CATAPHORESIS EFFECT IN THE PREPARATION OF GAS FILLED TUBES, by V. R. Mittelstadt and H. J. Oskam. Nov. 6, 1961 [4]p. incl. diagr. [AF 49(638)378] Unclassified

Published in Rev. Scient. Instr., v. 32: 1408, Dec. 1961.

This note describes briefly a method for preparing gas-filled tubes which contain gas of at least the same purity as that for tubes connected permanently to an ultra-high vacuum system. The glass tubing contains restrictions in 2 places (C_1 and C_2). After the conventional bake-off process and heat treatment of the electrodes the tube is filled with gas at the desired pressure and sealed off at C_1, while a dc discharge is maintained with electrode 1 as cathode and electrode 2 as anode. Impurities evolving from the hot glass at C_1 and diffusing in the direction of the measuring tube are ionized and moved toward electrode 1 instead. The discharge between the 2 electrodes is maintained for about 20 hr at a current of at least 20 ma, so that, for instance, the neon contamination in helium is segregated from the helium in the measuring tube by the cataphoresis effect and driven toward the cathode region around electrode 1. As soon as the discharge has been initiated, again using helium as an example, the cathode region of the discharge shows strong neon spectral lines, which indicate that neon in helium is moved preferentially toward the cathode region. After about 20 hr the tube is sealed at C_2 while maintaining the discharge as long as possible. The method has been found to be very useful when it is necessary to carry out measurements on sealed-off gas-filled tubes.

MICROWAVE FREE CARRIER FARADAY EFFECT IN SEMICONDUCTORS. PART I. FIRST ORDER PERTURBATION THEORY FOR GUIDED WAVES, by K. S. Champlin. July 20, 1961, 15p. incl. refs. (AFOSR-1181) (AF 49(638)747) Unclassified

Also published in Physica, v. 28: 1143-1149, Nov. 1962.

The theory of the Faraday effect in degenerate TE-mode waveguides containing semiconductors is formulated for the low magnetic field limit. The effects of losses and of reflections at the sample's surfaces are taken into account in an exact manner. Formulas are derived to determine the 4 terms of the anti-symmetric permittivity tensor from measurements of 4 microwave quantities: attenuation, phase shift, Faraday angle, and Faraday ellipticity. At frequencies much less than the collision frequency these yield the permittivity, conductivity, Hall

angle, and a fourth relationship between the 4 experimental quantities. The last relationship can be used to eliminate 1 of the measurements or to check experimental data to determine the validity of the low field approximation. (Contractor's abstract)

EXPLICIT FORMS FOR THE CONDUCTIVITY AND PERMITTIVITY OF BULK SEMICONDUCTORS IN WAVEGUIDES, by K. S. Champlin and G. B. Armstrong. [1961] [1]p. (AFOSR-3401) (AF 49(638)747) AD 612334 Unclassified

Also published in Proc. Inst. Radio Engineers, v. 50: 232, Feb. 1962.

One application in the analysis of waveguides containing bulk semiconductors is the microwave measurement of electron transport phenomena. In this application, it is desired to find the conductivity and/or permittivity (or changes in these quantities caused by carrier injection, dc electric and magnetic fields, etc.) from measurement of the transmission or reflection coefficient of a waveguide containing the semiconductor. This paper considers TE waves propagating in a waveguide that is perturbed by a semiconductor of arbitrary but uniform cross section between Z = 0 and Z = d.

WAVEGUIDE PERTURBATION TECHNIQUES IN MICROWAVE SEMICONDUCTOR DIAGNOSTICS, by K. S. Champlin. Dec. 28, 1961 [14]p. incl. illus. diagrs. (AFOSR-3733) (AF 49(638)747) Unclassified

Scattering processes in semiconductors are often studied by observing scattering averages with measurements of various dc transport phenomena. With microwaves, the observation frequency can be of the order of the scattering frequency so that the corresponding microwave transport property may be complex. Thus in studying detailed scattering mechanisms, a microwave transport experiment contains potentially more information than the analogous dc experiment. This paper discusses perturbation techniques which are useful in determining the microwave transport properties of a bulk semiconductor contained in a waveguide from measurement of the properties of the transmitted wave. ASYMPTOTIC BEHAVIOR OF SUCCESSIVE COEFFICIENTS OF SOME POWER SERIES, by A. M. Garsia, S. Orey, and E. Rodemich. [1961] [10]p. (AFOSR-J516) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)617] and National Science Foundation) AD 411475 Unclassified

Also published in Illinois Jour. Math., v. 6: 620-629, Dec. 1962.

Let $f_n \geq 0$, $\sum_{n-1}^{\infty} f_n = 1$ and assume that the greatest common division of the indices n for which $f_n > 0$ is 1. Put $u_0 = 1$, $u_{n+1} = \sum_{i=1}^{n+1} f_i u_{n+1-i}$, $r_{n+1} = u_{n+1}/u_n$. Interest is centered in obtaining conditions which insure (1) $\lim_{n\to\infty} r_n = 1$. Among others, it is proved that $\limsup f_{n+1}/f_n \leq 1$ implies (1), but considerably more general, though more complicated conditions are also obtained. Two involved problems are mentioned: (I) Does $\limsup f_{n+1}/f_n < \infty$ imply (1)? (II) Let $u_1, \ldots, u_{N-1}, \lambda$ be real numbers, $u_{N-1} \neq 0$, $\lambda > 0$. Assume that

$$\limsup_{n\to\infty} \frac{f_{n+1} + u_1 f_{n+2} + \cdots + u_{N-1} f_{n+N}}{f_n + u_1 f_{n+1} + \cdots + u_{N-1} f_{n+N-1}} \leq \lambda.$$

Does it then follow that $\limsup_{n\to\infty} u_{n+1}/u_n \leq \max(\lambda, 1)$? (Math. Rev. abstract)

A RENEWAL THEOREM, by W. Feller and S. Orey. [1961] [6]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)617] and Office of Ordnance Research) Unclassified

Published in Jour. Math. and Mech., v. 10: 619-624, July 1961.

Let $\{X_n: n = 1,2,\cdots\}$ be a sequence of independent identically (non-lattice) distributed random variables, with $X_0 = 0$, and let $S_n = \sum_0^n X_k$. For any interval I, let U(I) be the expected number of times S_n visits I. Then either $U(I) = \infty$ for every nondegenerate I (the case of interval-recurrence), or $U(I) < \infty$ for every bounded interval. In the non-recurrent case either (*) $U(I + t) \to \alpha |I|$ and $U(I - t) \to 0$ $(t \to +\infty)$, or (**) $U(I + t) \to 0$ and $U(I - t) \to \alpha |I|$ $(t \to +\infty)$; here $|I|$ denotes the length of I, and α is a non-negative real number. The non-negative real number α is non-zero if and only if $E(|X|) < \infty$ and $E(X) \neq 0$; we will then be in case (*) when $E(X) > 0$, and in case (**) when $E(X) < 0$, and $\alpha = |E(x)|^{-1}$. In the course of the proof (which is a mixture of Fourier analysis and measure theory) the authors obtain an interesting Fourier representation for the symmetrized measure $\frac{1}{2}\{U(dx) + U(-dx)\}$ in terms of the characteristic function $E(e^{itX})$. STRONG RATIO LIMIT PROPERTY, by S. Orey. [1961] [4]p. (AF 49(638)617) Unclassified

Published in Bull. Amer. Math. Soc., v. 67: 571-574, Nov. 1961.

Let $p_{ij}^{(n)}$ be the n-step transition probabilities of a recurrent, irreducible, aperiodic Markov chain. If for a certain index 0 we have $p_{00}^{(n+1)}/p_{00}^{(n)} \to 1$, then for any i, j, k, h, $p_{ij}^{(n)}/p_{kh}^{(n)}$ tends to a limit as $n \to \infty$. The condition can be relaxed by requiring only that the lim sup not exceed 1, and the sequence {n} be replaced by {mn} for any positive integer m. The continuous analogue and the reversible case are also discussed. (Math. Rev. abstract)

CLUSTER SETS OF PSEUDO-MEROMORPHIC FUNCTIONS, by D. A. Storvick. June 1961, 15p. incl. refs. (Technical note no. 1) (AFOSR-935) (AF 49-(638)836) AD 621217 Unclassified

Also published in Nagoya Math. Jour., v. 18: 43-51, Apr. 1961.

The author treats a class of functions which are also called K-quasiconformal, and shows first that if f(z) is a bounded K-quasiconformal function in $|z| < 1$, then the cluster set of f(z) at $e^{i\theta}0$ is contained in the closure of the convex hull of the radial limit values (wherever such exist) on any arc $A = \{e^{i\theta}: \theta_1 < \theta < \theta_2\}$ containing $e^{i\theta_0}$. Denoting the cluster set of f(z) at $e^{i\theta_0}$ by $C(f, e^{i\theta_0})$ and the boundary cluster set of f(z) at $e^{i\theta_0}$ modulo a set E on $|z| = 1$ by $C_{R-E}(f, e^{i\theta_0})$, the author proves that if f(z) is pseudo-meromorphic in $|z| < 1$, and if E is an arbitrary set of capactty zero on $|z| = 1$, then every value of $C(f, e^{i\theta_0}) - C_{R-E}(f, e^{i\theta_0})$ is assumed by f(z) in any neighborhood of $e^{i\theta_0}$ except possibily for a set of capacity zero. A theorem is proved concerning asymptotic values of such functions.

ARITHMETIC PROPERTIES OF BERNOULLI CONVOLUTIONS, by A. M. Garsia. May 1, 1961 [40]p. incl. refs. (Technical note no. 3) (AFOSR-548) (AF 49-(638)857) AD 256761 Unclassified

Distribution functions of the type $F(x,r) = \overset{\infty}{\underset{n=1}{\bigstar}} A(\frac{x}{r_n})$ are discussed, where $\Sigma r_n^2 < \infty$ and the star indicates this convolution operation. The main results obtained are 2 sets of criteria to decide when F(x, r) is singular and when it is absolutely continuous. These criteria are not necessary but they are fruitful in some cases. The results are illustrated by examples. (Contractor's abstract)

A NOTE ON THE MEAN VALUE PROPERTY, by A. [M.] Garsia. May 15, 1961, 9p. (Technical note no. 4) (AFOSR-672) (AF 49(638)857) Unclassified

Also published in Trans. Amer. Math. Soc., v. 102: 181-186, 1962.

An exact bound for the dimension of the space of functions is found satisfying the mean value property with respect to a mass distribution with finite support. The following theorem is proven: If μ concentrates all its mass on a finite set of points $S = P_1 U P_2 U \ldots U P_N$ whose convex hull is not flat and if in addition, setting $\mu_i = \int_{(P_i)} d\mu$ then $\mu_{i_1} + \mu_{i_2} + \ldots \neq 0$ for all $1 \leq i_1 < i_2 < \ldots < i_k \leq N$ then the functions satisfying the mean value property with respect to μ fill only a space of polynomials of degree less than or equal to $\frac{N(N-1)}{2}$.

UNBOUNDED CONVERING OF RIEMANN SURFACE AND EXTENSIONS OF RINGS OF MEROMORPHIC FUNCTIONS, by H. Röhrl. [1961] [27]p. incl. refs. (AFOSR-J1270) [AF 49(638)885] Unclassified

Published in Trans. Amer. Math. Soc., v. 107: 320-346, May 1963.

Using properties of permutation groups, the author extends in the first part some results of Hurwitz about the number of unbounded coverings of a compact Riemann surface which have a prescribed ramification type. Upper and lower bounds for that number are obtained in terms of the degree of the covering, the genus of the base surface, and the local ramification types. The second part deals with extensions of algebraic function fields of one variable whose local splitting is prescribed. It is shown, in particular, that the bounds obtained in the first part of the paper may serve in general as bounds for the number of isomorphy classes of such field extensions. The third part is devoted to a study of the algebraic structure of those extensions of the ring of holomorphic functions

on an open Riemann surface which are defined by an unbounded covering of finite degree. It is shown that they are integrally closed, have no zero divisions, and are free modules of finite rank over the given ring. (Math. Rev. abstract)

A CONVERGENCE EQUIVALENCE RELATED TO POLYNOMIALS ORTHOGONAL ON THE UNIT CIRCLE, by G. Baxter. [1961] [17]p. (AFOSR-231) (AF AFOSR-61-4) Unclassified

Also published in Trans. Amer. Math. Soc., v. 99: 471-487, June 1961.

Here $f(\theta)$ is a complex function, integrable on the interval $[-\pi,\pi]$, with Fourier coefficients c_k. $D_n(f)$ is the Toeplitz determinant $\det(c_{i-j})$, $0 \le i, j \le n$, and if $D_n(f) \neq 0$ for $n \ge 1$, $\alpha_n = (-1)^n D_{n-1}(e^{-i\theta}f)[D_{n-1}(f)]^{-1}$. Finally, if $\log f(\theta)$ has a determination, integrable on $[-\pi,\pi]$, then $G(f) = \exp\{(2\pi)^{-1}\int_{-\pi}^{\pi} \log f(\theta)d\theta\}$. If $\|f\|_\nu = \Sigma_{-\infty}^{\infty} \nu(n)|c_n|$, $\|\alpha\|_\nu = \Sigma_{-\infty}^{\infty}\nu(n)|\alpha_n|$ (here $\nu(n) = \nu(-n)$, $\nu(n) \le \nu(m)\nu(n-m)$ for every n, m, and $\nu(n)n^{-\lambda}\to 0$ as $n \to \infty$ for some $\lambda > 0$) the main result is Theorem 1.1: Let $f(\theta)$ be a real bounded measurable function on $[-\pi,\pi]$ and let $D_n(f) \neq 0$ for $n \ge 0$. Then $\log f(\theta)$ is integrable and $\|\log f\|_\nu < \infty$ if and only if $\|\alpha\|_\nu < \infty$. A related result is Theorem 2.1: Let $f(\theta) > 0$ be continuous on $[-\pi,\pi]$ and let $\Sigma_{-\infty}^{\infty}|k|^{1/2}|c_k| < \infty$. Then $\lim_{n\to\infty} D_n(f)[G(f)]^{-n-1} = \exp\{\Sigma_{m=1}^{\infty} m|d_m|^2\} < \infty$, where $\log f(\theta) \sim \Sigma_{-\infty}^{\infty} d_m e^{im\theta}$

A NORM INEQUALITY FOR A "FINITE-SECTION" WIENER-HOPF EQUATION, by G. Baxter. Aug. 1, 1961, 14p. (Technical note no. 4) (AFOSR-J487) (AF AFOSR-61-4) AD 407877 Unclassified

Also published in Illinois Jour. Math., v. 7: 97-103, Mar. 1963.

Let $f(\theta)$ and $\log f(\theta)$ be integrable functions on $-\pi \le \theta \le \pi$ with Fourier coefficients c_k and d_k, respectively. The equation (1)

$$\frac{1}{2\pi}\int_{-\pi}^{\pi} h(\theta)f(\theta)e^{-ik\theta}d\theta = g_k, \quad (0 \le k \le n),$$

where $h(\theta)$ is a polynomial of at most degree n in $e^{i\theta}$ and where $f(\theta)$ is such that (2) $\Sigma|d_n| < \infty$ is investigated. If we let $g(\theta) = \Sigma_{k=0}^{n} g_k e^{ik\theta}$ and let "g" and h denote the sum of the absolute values of the coefficients in $g(\theta)$ and $h(\theta)$, then the main theorem includes the following as a special case: Theorem: Let $f(\theta)$ satisfy (2). Then, there exists an integer N and a constant M, depending only on $f(\theta)$, such that for every pair $g(\theta)$ and $h(\theta)$ of degree $n \ge N$ satisfying (1), "h" $\le$ M "g". Applications of this theorem to Toeplitz determinants and Szegö polynomials are discussed. (Contractor's abstract)

MEASUREMENT OF HEAT TRANSFER FROM A CIRCULAR CYLINDER TO AN AXIAL STREAM WITH AIR INJECTION INTO A TURBULENT BOUNDARY LAYER, by O. E. Tewfik, E. R. G. Eckert, and L. S. Jurewicz. Aug. 1961, 57p. incl. diagrs. table, refs. (Technical rept. no. 38) (AFOSR-1397) (AF 49(638)558) AD 266568 Unclassified

A 2-in. (outside diam) circular cylinder with porous walls fabricated out of a stainless steel woven wire mesh was aligned with its axis parallel to a low speed air stream. Secondary air was injected through the cylinder walls into the boundary layer at a uniform mass rate per unit area of outside cylinder surface in the range 0.00028 to .00290 of the free stream mass velocity. The boundary layer was turbulent. The heat transfer distribution along the cylinder was measured and is presented as a functional relationship between local Stanton number and Reynolds number with the injection rate as a parameter. Up to about one half reduction in heat transfer compared with zero injection resulted. A macroscopic energy balance at one injection rate was made on 3 portions of the model by appropriate boundary layer velocity and temperature surveys. Its results provided a satisfactory check on the heat transfer measurements. (Contractor's abstract)

SENSITIVITY OF SKIN FRICTION AND DRAG TO THE DISTRIBUTION OF SUCTION OR BLOWING, by E. M. Sparrow and E. R. G. Eckert. [1961] [2]p. incl. diagr. tables. (AFOSR-2343) (AF 49(638)558) Unclassified

Also published in Jour. Aerospace Sci., v. 29: 104-105, Jan. 1962.

Similarity solutions to boundary-layer problems can be obtained by dealing with ordinary differential equations; however, a certain amount of freedom in the choice of boundary conditions may be lost. The purpose of this report is to explore procedures by which the shear-stress and drag results as furnished by the similarity solutions may be extended to apply to other blowing and suction distributions.

ON THE DEFINITION AND PROPERTIES OF CERTAIN VARIATIONAL INTEGRALS, by J. Serrin. [1961] [29]p. incl. refs. (AFOSR-375) (AF 49(638)262)
Unclassified

Also published in Trans. Amer. Math. Soc., v. 101: 139-167, Oct. 1961.

The author is concerned with nonparametric integrals of the form $I[u, R] = (R) \int f(x,u,u_x)\, dx$ where R is an open set of the Euclidean space E_n, $x = (x_1, \cdots, x_n)$, $u = u(x)$, $x \in R$, is a real-valued function, and u_x is the vector of the first partial derivative of u. It is essentially known that, when f(x, u, p) is convex in p, then I[u] can be thought of as an area. The author carries on in the present paper the program of discussing I[u] as an area with the aim of extending Tonelli's theorems on area and lower-semicontinuity, together with their generalizations and modelling the process of surface area theory. The following extension of Tonelli's theorems are given: If R is a bounded open set in E_n, if f(x, u, p) is continuous in (x, u, p), is convex in p for every (x, u), and satisfies $a|p| \leq 1 + f(x, u, p) \leq A|p|$ for every $|p| \geq 1$ and some constants $a, A > 0$, then I[u] is finite if and only if u(x) is weakly differentiable. If this is the case, u is also continuous if f depends on u, then $\mathfrak{J}[u] \geq I[u]$, and the usual Lesbesque derivative $\mathfrak{J}'(x)$ of $\mathfrak{J}[u, R]$ exists everywhere in R, and $\mathfrak{J}'(x) = f(x, u, u_x)$ a.e. in R. Finally $\mathfrak{J}[u] = I[u]$ if and only if u(x) is strongly differentiable in R, or equivalently, if and only if I[u, Q] is an absolutely continuous function of open sets Q in R. Theorems for lower semicontinuity of the functional $\mathfrak{J}[u]$ are then proved.

STRONG CONVERGENCE IN A PRODUCT SPACE, by J. Serrin. [1961] [5]p. (AFOSR-591) (AF 49(638)262) AD 259314
Unclassified

Also published in Proc. Amer. Math. Soc., v. 13: 651-655, Aug. 1962.

The purpose of this note is to present a certain necessary and sufficient condition for strong convergence in L_p over a product space. This result is formulated as Theorem 1 below. Theorem 1: Let $\{u_k\}$ be a sequence of functions of class $L_p(S)$, having joint compact support in S. Suppose that for almost all fixed y the functions $u_k(x, y)$ converge weakly in $L_p(E^n)$, and that (1) $\|u_k\|_x \leq v(y)$, $k = 1, 2, \cdots$, where v(y) is of class $L_p(E^m)$. Then the sequence $\{u_k\}$ converges strongly in $L_p(S)$ if and only if (2) $\lim_{|t|\to 0} \|u_k(x + t, y) - u_k(x, y)\| = 0$ uniformly in k. Theorem 1 includes as a special case a well-known compactness condition of M. Riesz, which is stated in slightly different form as Theorem 2. In the final part of the paper it is shown that Theorem 1 can be used to give very simple proofs of the so-called Rellich lemma of functional analysis.

Also published in Arch. Rational Mech. and Anal., v. 9: 187-195, 1962.

A vector u is called a weak solution of a Navier-Stokes equation of n (an arbitrary number) spatial dimensions in R if it is weakly divergence free and if $\int \{(u, \Phi_t) + (u, \Delta\Phi) + (u, u \text{ grad } \Phi)\}\, dt = -\int (f, \Phi) dt$ for all $\Phi \in D$ (where D denotes the test space of C^∞ vector fields which are divergence-free and have compact support in an open region of space-time. The purpose here is to prove a differentiability theorem for such weak solutions. The order of time differentiability of a weak solution is intimately tied to the amount of time regularity which is originally assumed. It is reasonable to expect, though, that modest assumptions concerning the spacial regularity of a weak solution should be enough to guarantee infinite differentiability with respect to the space variables. This is proved in the resulting main theorem. If u is a weak solution and $u \in L^{2,\infty}(R)$, $\omega \in L^{2,2}(R)$, and $u \in L^{s,s'}(R)$ where the exponents s and s' satisfy the relation $n/s + 2/s' < 1$, then u is of class C^∞ in the space variables and each derivative is bounded in compact subregions of R. The proof of the main theorem is based on 2 equations $\omega = \text{grad } K*g + B$ and $|g| \leq \text{Const.} |u| \cdot |\omega|$.

ON THE ENTROPY CHANGE THROUGH A SHOCK LAYER, by J. Serrin and Y. C. Whang. [1961] [2]p. incl. diagrs. (AFOSR-3843) [AF 49(638)262] Unclassified

Also published in Jour. Aerospace Sci., v. 28: 990-991, Dec. 1961.

When a viscous, heat-conducting gas traverses a shock wave its temperature, density, pressure, and entropy are all increased. It might be supposed, therefore, that during the process of shock transition all of these

quantities increase monotonically from their initial to their final values. It is shown that this is true for the temperature, density, and pressure. It is not true for the entropy. This quantity first increases to a local maximum in the interior of the shock, and then undergoes a decrease to its final value. These conclusions follow from general thermodynamic assumptions, and therefore, apply to all gases of practical interest.

EVAPORATIVE FILM COOLING AT HYPERSONIC VELOCITIES FOR RE-ENTRY VEHICLES, by R. Hermann and W. L. Melnik. Apr. 1961 [32]p. incl. illus. diagrs. refs. (Research rept. no. 178) (AFOSR-669) (AF 49(638)190) AD 286173 Unclassified

Also published in Proc. Sixth Symposium on Ballistic Missile and Aerospace Technology; Re-entry, Los Angeles, Calif. (Aug. 1961), New York, Academic Press, v. 4: 113-144, 1961.

A theoretical analysis of similarity parameters of evaporative film cooling was developed for blunt bodies indicating the effect of mass transfer on heat transfer and skin friction for Prandtl and Lewis numbers unity. Calculated interface temperatures are in good agreement with wall temperatures measured around a hemisphere in a hypersonic wind tunnel. Application of the analysis shows that evaporative film cooling is feasible for typical re-entry vehicles. At circular velocities the effective heat of evaporation of water is as high as 11,000 Btu/lb_m. The significant advantage of evaporative film cooling is that the walls of a vehicle during re-entry are maintained at relatively low temperatures.

POLAROGRAPHY AND VOLTAMMETRY IN DIETHYLSULFOXIDE, by I. M. Kolthoff and T. B. Reddy. June 1, 1961 [6]p. incl. diagrs. tables, refs. (AFOSR-696) (AF 49(638)519) AD 257862 Unclassified

Also published in Jour. Electrochem. Soc., v. 108: 980-985, Oct. 1961.

An exploratory voltammetric study of several acids, some representative metal ions, a few quinones, and oxygen has been made in the solvent dimethylsulfoxide (DMSO). Perchloric, sulfuric, and hydrochloric acids were found to be monoprotic strong acids in DMSO. Cobalt (II) and nickel (II) are reduced irreversibly at the dropping mercury electrode with large overpotentials indicating strong solvation. Polarograms of quinones showed 2 cathodic waves of unequal height in the absence of proton donor. The effect of proton donor on the polarograms of quinones was studied. The mechanism of the reduction of quinones in DMSO is discussed. Rotated platinum and rotated mercury pool electrodes can be used to advantage in DMSO.

ACID-BASE EQUILIBRIA IN ACETONITRILE. SPECTROPHOTOMETRIC AND CONDUCTOMETRIC DETERMINATION OF THE DISSOCIATION OF VARIOUS ACIDS, by I. M. Kolthoff, S. Bruckenstein, and M. K. Chantooni, Jr. [1961] [9]p. incl. diagrs. tables, refs. (AFOSR-699) (AF 49(638)519) AD 258695 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 3927-3935, Oct. 5, 1961.

The indicators o-nitroaniline, o-nitro-p-chloroaniline and o-nitrodiphenylamine are about 5×10^4 as strong in acetonitrile as in water. Perchloric acid behaves as a strong acid, other acids denoted by HA are weak. Except in extremely dilute solutions hydrobromic, sulfuric, nitric and hydrochloric acids dissociate according to $2HA \rightleftharpoons H^+ + AHA^-$. The over-all dissociation constants of these acids have been determined spectrophotometrically with the aid of indicator bases and conductometrically for sulfuric and picric acids. By other suitable methods the stability constants $K_{AHA^-} = [AHA^-]/[HA][A^-]$ have been evaluated. The value of K_{AHA^-} decreases from 1.3×10^3 for sulfuric acid to 2.5×10^2 for hydrobromic, and 2×10^2 for nitric and hydrochloric acids at 25°. From the above data the simple dissociation constants $K_{HA} = [H^+][A^-]/[HA]$ could be evaluated. These values for pK_{HA} are reported: hydrobromic, 5.5; sulfuric, 7.25; nitric and hydrochloric acids, 8.9. Picric acid at concentrations smaller than 0.1 M dissociates into H^+ and Pi^-, and $pK_{HPI} = 8.9$. At higher concentrations the data fit a dissociation $3HPi \rightleftharpoons H^+ + Pi(HPi)_2^-$, $pK_{3(HPI)}$ being 6.1. The ion pair dissociation constants of tetraethylammonium bisulfate and of lithium nitrate were found to be 1.4×10^{-3} and 4.1×10^{-4}, respectively. (Contractor's abstract)

ACID-BASE STRENGTH IN DIMETHYL SULFOXIDE, by I. M. Kolthoff and T. B. Reddy. [1961] [6]p. incl. diagr. tables, refs. (AFOSR-1877) (AF 49(638)519) Unclassified

Also published in Inorg. Chem., v. 1: 189-194, May 1962.

Dimethyl sulfoxide (DMSO) has an autoprotolysis constant of the order of 5×10^{-18}. Its basic strength is comparable to that of water; hydrochloric and sulfuric acids are completely dissociated in this solvent, whereas the acid di-n-butylammonium ion has a dissociation constant about 10 times as large as that in water. Water is an extremely weak base in DMSO. The degree of dissociation of several uncharged acids is quite abnormal. The dissociation constant of picric acid is of the order of 500 times greater than that in water, while that of 2,6-dinitro-4-chlorophenol is of the same order of magnitude in both solvents. Extremely large stabilization of the nitrophenolate ions in DMSO is indicated. On the other hand, acetic acid has a constant which is about 10^{-7} as large in DMSO as in water, while that of benzoic acid is 10^{-6} as large. Brom cresol green and brom thymol blue have constants about 1/250 as large in DMSO as in water, a value close to that predicted for a univalent negatively charged acid on the basis of the difference in dielectric constant between the 2 solvents. The univalent bisulfate ion has a constant 10^{-7} as large in DMSO as in water. (Contractor's abstract)

ELECTRON SPIN RESONANCE STUDIES OF IMPURITY IONS IN MAGNESIUM OXIDE, by J. W. Orton, P. Auzins and others. [1961] [15]p. incl. diagrs. table, refs. [AF 49(638)615] Unclassified

Published in Proc. Phys. Soc. (London), v. 78: 554-568, 1961.

The univalent ions Fe^{1+}, Co^{1+} and Ni^{1+} have been produced by ultra-violet or x-irradiation of impure MgO crystals. The electron spin resonance spectra of these ions are compared with those of the isoelectronic ions Co^{2+}, Ni^{2+} and Cu^{2+} which they resemble closely. The spectra of Fe^{1+}, Co^{1+} and Ni^{2+} show line-width effects which may be interpreted as being due to the presence of small distortions in the cubic crystal lattice. A detailed report of the $3d^9$ configuration in a cubic field is given. There is a transition at low temperature from an isotropic to an anisotropic spectrum, presumably due to the 'freezing in' of Jahn-Teller distortions. Observation of hyperfine structure from Ni^{61} has made it possible to estimate the nuclear moment by comparison with the observed hyperfine structure from Co^{1+}. The ease of formation and stability of these univalent ions is shown to be related to the concentration of positive ion vacancies and to the concentration of trapped hole centers.

It is suggested that negative-ion vacancies in 3 different environments are trapping sites for electrons, and positive-ion vacancies of 2-types are trapping sites for holes. These 2 hole centers are in addition to those types found in crystals which have not been neutron-irradiated. Some of these centers may be induced by grinding and x-irradiation of MgO or other alkaline earth oxides, sulfides or selenides which have the MgO structure. Mechanical working is believed to distribute negative-ion vacancies by dissociation from dislocations which are swept through the crystals. In the neutron-irradiated crystals there is evidence that some local regions are so disrupted that they rearrange to body-centered instead of face-centered packing. Extended heating largely anneals out the neutron-produced structural defects. It is then possible to see esr spectra of defects which are highly sensitive to distortions of cubic symmetry. SPIN RESONANCE OF POINT DEFECTS IN MAGNESIUM OXIDE, by J. E. Wertz, J. W. Orton, and P. Auzins. [1961] [7]p. incl. refs. (AFOSR-3586) [AF 49-(638)683] AD 612336 Unclassified

Presented at Internat'l. Conf. on Chemical Physics of Nonmetallic Crystals, Evanston, Ill., Aug. 28-31, 1961. (AFOSR-2143)

Also published in Jour. Appl. Phys., Suppl., v. 33: 322-328, Jan. 1962.

Transition metal impurity ions and intrinsic defects such as trapped electron and trapped hole centers are readily detected in MgO crystals by electron spin resonance. The valence state of impurity ions may readily be changed by heat treatment or by irradiation. Both 2+ and 1+ states may be observed for Ni and Co. Additional 3+ state is observed for Fe. The extra positive charge

of trivalent ions is usually compensated by positive ion vacancies. Vacancies, either single or in clusters alter the electric field symmetry about an impurity ion or intrinsic defect. Hence they may indicate their presence by altering the symmetry from cubic to tetragonal, rhombic or lower type. The impurities are generally substitutional, but one interstitial type has been found. Isolated positive ion vacancies can trap either one or two holes, in each case producing centers of axial electric field symmetry. Other hole centers are observed after extensive atomic displacements have been produced by neutron irradiation. Negative ion vacancies are difficult to produce except by such irradiation. Electrons trapped at negative ion vacancies are largely localized upon the vacancy, as is evident from the small hyperfine splitting of adjacent Mg ions. If crystals are heated in order to lead to association of vacancies, a second type of F center is formed. With protracted neutron irradiation, yet a third type of F center is produced. Optical studies are being undertaken to learn more about these paramagnetic centers. (Contractor's abstract)

Rates of deoxymercuration by non-halogen acid have been obtained for 4 methoxy mercurials in ethanol-water mixtures and dioxane-water mixtures. All of the rates exhibit a minimum in intermediate solvent compositions, but otherwise the rates are quite different functions of solvent composition. Previously suggested measures of solvent acidity fail to correlate the rate constants quantitatively. (Contractor's abstract)

Also published in Jour. Org. Chem., v. 27: 726-729, Mar. 1962.

Entropies (ΔS^*) and enthalpies (ΔH^*) of activation have been measured for 4 additional deoxymercuration reactions induced by nonhalogen acids. These have been compared with values previously obtained for cyclohexane derivatives and with each other. Variations in ΔH^* and ΔS^* are semiquantitatively predicted by theory if the curve of potential energy vs θ has deep minima at both 0° and 180° and maxima at 90° and 270°. The angle between the carbon-carbon-oxygen plane and the carbon-carbon-mercury plane is θ. This is a reasonable result in view of the likely mechanism for deoxymercuration. (Contractor's abstract)

THE ONE-DIMENSIONAL PLASMA, by S. Prager. [Mar. 1961] [35]p. incl. diagrs. [Technical rept. no. 2] (AFOSR-431) (AF 49(638)720) AD 254140 Unclassified

The interaction of 2 charges in 1 dimension corresponds to the 3 dimensional interaction of 2 uniformly charged parallel plates. The partition function for an electrically neutral system of such charges can be obtained rigorously, without recourse to any approximations. The resulting thermodynamic functions agree with those predicted by the 1-dimensional Debye-Hückel theory in the limit of high pressures, but considerable deviations appear as the pressure is reduced. At very low pressures the system behaves as though made up of neutral molecules. The effect of an external electrostatic field is discussed, and the treatment is also extended to plasma mixtures. ELECTROSTATIC VARIATIONAL PRINCIPLES IN THE CALCULATION OF MOLECULAR ENERGY LEVELS (Abstract), by D. M. Schrader and S. Prager. [1961] [1]p. [AF 49(638)720] Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 432, Nov. 24, 1961.

Thomson's and Dirichlet's variational principles afforded upper and lower bounds, respectively, for the various electronic interaction integrals appearing in molecular energy calculations. A proper use of the 2 principles leads to a modified minimum energy principle in which not only the wave function, but also certain trial electric fields and potentials are varied to obtain a minimum in the total energy. The main advantage of this procedure is that the sixfold electronic interaction integrals that normally appear in molecular energy calculations are replaced by integrals over at most 3 coordinates, thus greatly simplifying the calculation. The total energy of the ground state of the hydrogen molecule was calculated for the wave function $\exp[a(\xi_1 + \xi_2)]g(\eta_1)g(\eta_2)$, where ξ and η are elliptical coordinates, and $g(\eta)$ is completely open. The resulting binding energy was 3.568 ev, which compares favorably with the best SCF energy of 3.636 ev.

ABSORPTION OF ELECTROMAGNETIC RADIATION BY A PERFECTLY RIGID CRYSTAL, by C. A. Mead. Apr. 18, 1961, 24p. (Technical rept. no. 1) (AFOSR-495) (AF 49(638)940) AD 254717 Unclassified

The Fano-Hopfield theory of the dielectric constant predicts that a perfectly rigid crystal (i in which no nuclear vibrations are allowed) should exhibit dispersion without absorption. It is pointed out that this result is in conflict with the Kronig-Kramers relations, and hence cannot possibly be correct. If it is assumed that the Fano-Hopfield theory gives the real part of the dielectric constant correctly, the imaginary part can be calculated by means of the Kronig-Kramers relations. This is done for the long-wave, tight binding case, resulting in an absorption curve with finite width. An unobservable delta-function absorption is obtained only if the energy of an exciton is independent of its wave number, a condition which is never satisfied. Since the Fano-Hopfield procedure really depends on the assumption that no absorption takes place, it follows that the theory is inconsistent. It is suggested that the inconsistency probably arises from a too-literal interpretation of the periodic boundary conditions imposed on the radiation field. (Contractor's abstract)

ON THE RANGE OF THE DIFFERENCE BETWEEN HYPOTHETICAL DISTRIBUTION FUNCTION AND PYKE'S MODIFIED EMPIRICAL DISTRIBUTION FUNCTION, by H. D. Brunk. [1961] [8]p. incl. tables, refs. (AFOSR-1051) (AF 49(638)754) AD 264884 Unclassified

Also published in Ann. Math. Stat., v. 33: 525-532, June 1962.

A study is presented of the statistic used to provide a test of the hypothesis that a population has a prescribed distribution function. Kuiper static (Koninkl. Nederl. Akad. Wetenschap. Proc., Indag. Math., v. 63: 38-47, 1960), modified Kolmogorov statistic (Ann. Math. Stat., v. 30: 568-576, 1959), and one studied by Sherman (Ann. Math. Stat., v. 21: 339-361, 1950) are considered as distances between hypothetical distribution function and empiric distribution function. The Kuiper statistic occupies a position intermediate between the modified Kolmogorov statistic and Sherman's. It appears to yield a test more powerful than Kolmogorov against certain alternatives (different scale parameter, for a symmetric distribution) and less powerful against others (different location parameter). The appendix treats the problem of finding the probability that all the points of the strip will lie between parallel lines of which the lower passes through or below (0,0) and through or above (1,1).

ORBIT FAMILIES OF CONTINUOUS FLOWS, by N. E. Foland. [1961] [28]p. (AFOSR-2795) (AF 49(638)754) AD 428410 Unclassified

The first section of this paper shows the proof of several theorems: (1) If O(x) is the orbit of a point $x \in X$ under ρ, then O(x) is homeomorphic to R, if and only if x is neithrr positively nor negativeiy recurrent. (2) If O(x) is homeomorphic to R, then the flow mapping at any point $y \in O(x)$ is itself a homeomorphism. (3) O(x) is a simple closed curve if and only if x is a non-fixed periodic point. If x is a non-fixed periodic point with primitive period w, then the flow mapping at any point $y \in O(x)$ is a homeomorphism of the set $O < r < w$ onto O(x) when the points O and w are identified. (4) Let X be compact and suppose that, for arbitrarily small r, X contains a point which is fixed under the homeomorphism $\varphi(x,r)$. Then X contains a point which is fixed under the continuous flow φ. In the next section it is shown that under the hypothesis that X is an open or a closed 2-cell, that the only positively or negatively recurrent points of X are the periodic ones. This leads to the conclusion that a 1-1 and continuous image of R can be replaced with a homeomorphic image of R. In proving this it is shown that the orbit curves satisfy conditions of being regular and orientable in a neighborhood of each non-fixed point of X. In the

last section the structure of the orbit family of continuous flows on a 2-cell is discussed with special attention being given to the α and ω limit sets of an orbit.

STEREOTAXIC SURGERY FOR PARKINSONISM. A METHOD OF EVALUATION AND CLINICAL RESULTS, by G. Levin, B. Feinstein and others. [1960] [7]p. incl. illus. diagrs. tables. (AFOSR-1025) (Sponsored jointly by Air Force Office of Scientific Research under AF 18-(603)48, Harry Freund Memorial Foundation, Max C. Fleishmann Foundation of Nevada, Office of Vocational Training, and Oppen Memorial Fund) Unclassified

Also published in Jour. Neurosurg., v. 18: 210-216, Mar. 1961.

This report strives to overcome the difficulty of converting to useful data phenomena that are to any extent determined subjectively. The disease being treated is parkinsonism and the treatment is by stereotaxic surgery. The evaluation of the results is done by essaying a careful quantitative evaluation of certain characteristics of an abnormal state of muscles, and then by statistical means striving to test the validity of the artificial quanta and to examine the results of the study and treatment of some patients with parkinsonism. The first operation is more effective than subsequent procedures. First operations upon the right side of the brain are slightly more apt to improve the patient than those upon the left. The study has offered some encouragement in efforts to relate the effects of electrical stimulation of a large target to the rated effects of a destructive lesion in the same target.

[NON-EQUILIBRIUM FLOW], by L. G. Napolitano. Annual summary rept. no. 1, Mar. 1961, 21p. (I. A. rept. no. 24) (AFOSR-659) (AF 61(052)327) AD 265160 Unclassified

A new thermodynamic approach to the study of non-equilibrium flow is presented. In section 1 the essential concepts of thermodynamics are briefly restated in their modern formulation which is particularly useful in the present contest. In section 2, a new series of thermodynamic potentials is introduced and their properties derived and discussed. In section 3 these potentials are applied to the analysis of non-equilibrium flow of binary gas mixtures. It is shown that their usefulness relies upon the possibilities of: (a) obtaining rather straight-forwardly, exact solutions of particular classes of non-equilibrium flows to which all known techniques are results of classical equilibrium fluid-dynamic which can be easily extended; and (b) devising a number of promising approximate methods of solutions for general non-equilibrium flow fields. ON SOME MATHEMATICAL ASPECTS OF LINEARIZED NON-EQUILIBRIUM FLOW, by L. G. Napolitano. Nov. 1961 [61]p. incl. diagrs. refs. (Technical note no. 1; I. A. rept. no. 39) (AFOSR-2530) (AF 61(052)-327) AD 280129 Unclassified

A general discussion is presented of the thermodynamics and fluid-dynamics of a reacting ideal mixture: the basic equations are derived and subsequently specialized to the linearized case. An analysis of the characteristics of the complete system and of the potential equation (i.e. the third order partial differential equation for the velocity potential) is shown: the various families of characteristics is individuated, the corresponding regularity condition are derived and discussed, the propagation of the discontinuities (up to those of second order in the normal derivatives) along the characteristic lines is obtained and analyzed. A similar analysis of discontinuity surfaces which are physically allowed within the framework of a linearized theory is presented. Existence of discontinuity surfaces for the basic unknown functions is proved, the law of propagation of the jumps derived, their properties discussed and the differences between the subject case and that of inert gases pointed out. A review of the available information on the existence, uniqueness and continuous dependence on the boundary and/or initial data for problems such as Cauchy's, Goursat's and mixed boundary problems is also presented. A generalization of properly set Goursat's and mixed boundary problems for the subject case of multiple characteristics is then shown. The last section deals with the questions connected with a properly set Goursat's problem for the potential equation. These questions arise because the mathematical solutions of the potential equation yield a potential function which is always continuous with its first derivatives while physically pertinent boundary conditions may require discontinuities in the first 2 derivatives of the potential function. A discussion of the situation in which this occurs is given, together with the techniques necessary to cope with them. (Contractor's abstract, modified)

FUNCTIONAL INTERPRETATION OF CEREBELLAR HISTOLOGY, by V. Braitenberg. [1961] [2]p. incl. diagr. (AFOSR-1296) [AF 61(052)96] AD 262252 Unclassified

Also published in Nature, v. 190: 539-540, May 6, 1961.

The nature of the transformation of patterns of excitation within the cerebellar cortex may be explained by the following argument. The cerebellar cortex is a sheet of grey substance with anisotropic structure. Entirely different histological pictures are obtained in sections cut in frontal and sagittal planes. All output fibers arise from 1 type of neurons (Purkinje cells) the dendritic fields of which are characteristically flattened in the laterolateral direction. One set of input fibers (climbing fibers) is connected 1-to-1 with the set of Purkinje cells. Another set of input fibers (mossy fibers) reaches the output (Purkinje) cells via long, very thin, unmyelinated fibers, the so-called parallel fibers, each making the same kind of histological contacts with a long row of Purkinje cells. This histology allows one to predict widely varying delays interposed between the input in 1 fiber system (mossy fibers) and the arrival of activity at different laterolateral distances from the input, while, on the contrary, the other input system (climbing fibers) should influence Purkinje cells after a fixed, short time delay. Direct physiological support for this hypothesis has been provided. By letting $Px(t)$, $Mx(t)$ and $Cx(t)$ be 3 sets of functions of time with common indices x and interpreting them as representatives of activity in Purkinje cells, mossy fibers, and climbing fibers, the hypothesis becomes $Px_0(t) = f[Mx(t - \frac{|x_0 - x|}{v}), Cx_0(t)]$, where v represents the velocity of conduction in parallel fibers which is assumed to be constant. This approach can be used for transforming distances into time intervals; in other words, as a clock. Three possible modes of operation are suggested and explained: (1) an alarm clock, (2) a stop clock, and (3) operation as coincidence and time shift detector.

A SOLVABLE MODEL OF FIELD THEORY, by E. R. Caianiello and A. Campolattaro. [1961] 8p. (Technical note no. 1) (AFOSR-639) (AF 61(052)434) AD 258322 Unclassified

Also published in Nuovo Cimento, Series X, v. 20: 422-426, Apr. 16, 1961.

A Dirac spinor field coupled scalarly with a neutral boson field is considered which satisfies conditions partially presented in a previous paper (Nuovo Cimento, Series X, v. 11: 492, 1954). The present model if obtained by replacing throughout the free boson propagator with a positive constant, which without loss of generality may be assumed to be equal to one. The model describes a non-local phonon interaction among spinor particles, such that each point of a given spinor line interacts equally with all past, present and future points of the same and all other lines; the vacuum fluctuations of the spinor field are taken into account correctly. From the standard theory of parabolic equations, the only permissible formal solution which reduces to the free propagator is presented. Even though the solution of parabolic equations is a classical chapter of analysis, the author continues at this point with a discussion of 2 points by the customary heuristic methods and then with greater mathematical care.

INTERFERENCES AMONG FEYNMAN GRAPHS OF DIFFERENT TOPOLOGY, by E. R. Caianiello and K. Y. Shen. Apr. 11, 1961, 7p. incl. illus. (Technical note no. 3) (AFOSR-858) (AF 61(052)434) AD 258255 Unclassified

Also published in Nuovo Cimento, Series X, v. 20: 1038-1041, June 1, 1961.

Whenever approximations are made with a theory that describes interactions of fermion fields - that is, when the graphs of a perturbative expansion which do not belong to some summable classes are dropped or, equivalently, the integral equations which become then the substitute for the exact theory are solved - the equation arises whether the exclusion principle is being treated correctly. If all the graphs which characterize the chosen approximation procedure are duly antisymmetrized in all the intermediate states, this does not suffice in general to secure that the exclusion principle be rigorously respected (as it is in the exact solution). A given graph, or partial sum of graphs, although usually regarded for computational purposes as a compact expression, is in fact a sum of contributions arising from all the individual modes of the free fermion fields; these contributions may be partly, or totally, cancelled by others that belong, in the graphical picture, to diagrams which are disregarded by the approximation chosen. SOME REMARKS ON THE WICK PRODUCT OF INTERACTING FIELDS, by A. Campolattaro and M. Marinaro. [Oct. 1961] 9p. (Technical note no. 4) (AFOSR-1836) [AF 61(052)434] AD 272425 Unclassified

Also published in Nuovo Cimento, Series X, v. 22: 879-883, Nov. 16, 1961.

It is customary to write the Lagrangian or Hamiltonian of a quantized field theory by replacing the ordinary products of wave functions of the non-quantized theory with the Wick products of the corresponding field operators. As is well known, however, when there is interaction, the definition of the Wick product is somewhat artificial and not wholly unambiguous (if at least, as it is usually stated, it is attained by imposing only that it reduce to the one for free fields when the interaction vanishes). The question arises, what difference does it actually make if one changes the definition, or gives up the use of the Wick product. It is shown that if all calculations involving formally divergent integrals are made so as to satisfy some specific consistency requirements, the difference shows up simply as a phase factor. With different physical considerations, the same conclusions hold also for many-body problems (in which case the corresponding integrals are finite, but the proofs still apply).

MEMORY EFFECTS IN IRREVERSIBLE THERMODYNAMICS, by R. Zwanzig. [1961] [10]p. incl. refs. Unclassified

Published in Phys. Rev., v. 124: 983-992, Nov. 15, 1961.

A new generalization of Onsager's theory of irreversible processes is presented. The main purpose is to allow for memory effects or causal time behavior, so that the response to a thermodynamic force comes later than the application of the force. This is accomplished by a statistical mechanical derivation of an exact non-Markoffian kinetic equation for the probability distribution in the space of macroscopic state variables. The memory effect in the resulting transport equations is represented by a time convolution of the thermodynamic forces with memory functions. The latter are time-correlation functions in the rates of change of the phase functions corresponding to macroscopic quantities. The resulting transport equations are not restricted to small deviations from thermal equilibrium. Onsager's theory is shown to be the low-frequency limit of our causal theory. THERMODYNAMIC CONSTANTS FOR ASSOCIATION OF ISOMERIC CHLOROBENZOIC AND TOLUIC ACIDS WITH 1,3-DIPHENYLGUANIDINE IN BENZENE, by M. M. Davis and H. B. Hetzer. [1961] [5]p. incl. diagr. tables, refs. (AFOSR-81) (CSO-670-55-21) Unclassified

Also published in Jour. Research Nat'l. Bur. Stand., v. 65A: 209-213, May-June 1961.

Values of ΔF_{25}, ΔH, and ΔS_{25} for the association of diphenylguanidine with the isomeric monochlorobenzoic acids and the isomeric toluic acids in benzene from spectrophotometric measurements at 25 and 30°C, using bromophthalein magenta E (3', 5', 3'', 5''-tetrabromophenolphthalein ethyl ester) as the indicator are reported. The results are compared with available data for other donor-acceptor associations in aprotic solvents which include the monomer-dimer equilibrium of benzoic acids, the association of tertiary amines with iodine, and the association of certain oxygen bases with phenols. The comparisons indicate that the value of the ratio $\Delta H/298\Delta S$ is approximately constant in the following associations in aprotic solvents: (1) association of phenolic or carboxylic acids with nitrogenous bases to form hydrogen bonded ion-pairs; (2) hydrogen bonding of weakly acidic phenols to nitrogenous bases; (3) association of tertiary amines with iodine. A somewhat smaller value for this ratio seems to apply to most associations of phenols with oxygen bases. Possible applications of these findings include estimation of other thermodynamic constants when 1 of the constants ΔF, ΔH, or ΔS is known, and clarification of the relative importance of ionic and covalent contributions in hydrogen bond formation. THEORY OF AN ACCURATE INTERMEDIARY ORBIT FOR SATELLITE ASTRONOMY, by J. P. Vinti. May 22, 1961, 67p. (NBS rept. no. 7154) (AFOSR-690) [CSO-660-60-2] AD 259506 Unclassified

This paper derives an accurate intermediary orbit of an artificial satellite of an oblate planet. The drag-free motion takes place under the action of a gravitational potential which fits the even zonal harmonics exactly through the second and approximately through the fourth, in the case of the earth. This potential leads to separability of the Hamilton-Jacobi equation. Two alternative sets of orbital elements are set forth. The first set is related directly to initial conditions, but requires numerical factoring of a certain quartic to evaluate some of the integrals. The second set, on the other hand, permits exact factoring of both quartics that appear, but is not related directly to initial conditions, so that its members can best be obtained by a least-square fit of the solution over many orbital revolutions. The final solution is given in terms of certain uniformising variables, whose periodic terms are correct through the second order in the oblateness parameter and whose secular terms are exact, for the intermediary orbit. These exact solutions for the secular terms are expressed by means of certain rapidly converging series. (Contractor's abstract)

INTERMEDIARY EQUATORIAL ORBITS OF AN ARTIFICIAL SATELLITE, by J. P. Vinti. Oct. 1961, 19p. (NBS rept. no. 7345) (AFOSR-1480) (CSO-680-60-2) AD 264755 Unclassified

A previous paper derived the solution for the drag-free motion of an artificial satellite in the gravitational field of an oblate planet. The corresponding potential, expressed in oblate spheroidal coordinates, leads to separability and represents the even zonal harmonics exactly through the second, for any oblate planet, and approximately through the fourth, in the case of the earth. The previous paper contained a restriction on the orbital inclination I, viz., $I_c < I < 180° - I_c$, where I_c might be as large as 1° 54' for an orbit sufficiently close to the earth. The present paper removes this restriction and shows that many of the formulae for the periodic terms may be simplified, when the orbit is equatorial or almost so. The results agree with those obtained by a direct 2-dimensional solution, when the orbit is purely equatorial. (Contractor's abstract)

A MISSILE TECHNIQUE FOR THE STUDY OF DETONATION WAVES, by F. W. Ruegg and W. W. Dorsey. June 28, 1961 [36]p. incl. illus. diagrs. refs. (AFOSR-394) (ISSA-60-6) Unclassified

Also published in Jour. Research Nat'l. Bur. Stand., v. 66C: 51-58, Jan.-Mar. 1962.

Problems and effects of stabilizing combustion and detonation against hypersonic flow were investigated by observation of a 20 mm spherical missile in a stoichiometric mixture of hydrogen and air at rest. Combustion produced detectable effects on the shape and position of the shock wave at Mach numbers between 4 and 6.5, and above pressures of 0.1 atm. Delayed ignition was noted and measured. Strong combustion-driven oscillations originated in front of the sphere, with frequencies up to approx 0.1 mc/sec. These were observed when the Mach number was less than 6 at a pressure of 1/2 atm, and less than 5 at 1/4 atm. A large reduction of the drag coefficient of the missile was noted in one case of intermittent combustion. This reduction was probably caused by combustion which delayed the separation of the flow from the rear half of the sphere.

ANALYSIS OF CONDITIONS FOR SEPARABILITY OF THE VECTOR WAVE EQUATION OF ELASTICITY FOR INHOMOGENEOUS MEDIA, by J. F. Hook. Aug. 1961, 33p. (AFOSR-1207) (AF 49(638)1082) Unclassified

In a previous paper by the author, a generalization of the Helmholtz method was developed for separation of the vector wave equation of elasticity for inhomogeneous media. Waves axially symmetric about the z-axis and waves independent of y were considered. The properties of the media depend on z only. Conditions for separability consisting of a system of non-linear differential equations for the properties of the media were found. Several special solutions of this system were given, but the general solution was not obtained. The present paper gives a more complete analysis of this system. Several cases arise, for all but one of which the general solution is obtained. Some singular solutions are also obtained. An almost complete explicit definition of the class of media for which the vector wave equation is separable by this method is thus obtained. Separation leads to independent P, SV, and SH waves. The SH displacement vector is solenoidal, but in general, certain vectors obtained through multiplication of the P and SV displacement vectors by appropriate functions are irrotational and solenoidal, respectively. Gvozdev has given the vector differential behavior of the displacement at wave fronts for all inhomogeneous media. It is shown that Gvozdev's relations are satisfied everywhere for the separable cases. (Contractor's abstract)

CONTRIBUTIONS TO A THEORY OF SEPARABILITY OF THE VECTOR WAVE EQUATION OF ELASTICITY FOR INHOMOGENEOUS MEDIA, by J. F. Hook. [1961] [8]p. incl. tables, refs. (AFOSR-4379) (AF 49-(638)1082) AD 295951 Unclassified

Also published in Jour. Acoust. Soc. Amer., v. 34: 946-953, July 1962.

In a recent paper, the author introduced a generalization of the Helmholtz theorem for representation of vectors in terms of potential functions. It was shown that use of this generalization leads to separation (in the dependent variables) of the vector wave equation of elasticity for certain inhomogeneous media whose properties are functions of the Cartesian coordinate z. The conditions for separability are a system of nonlinear differential equations for the constitutive

parameters. Only a few special solutions of this system were given. An almost complete catalog of the separable cases is developed in the present paper. The vector differential properties of the field for the separable cases are discussed. It is shown that the P and S fields are irrotational and solenoidal, respectively, provided we regard as the fundamental field vectors the quantities $f_1 u_P$, $f_2 u_{SV}$, and U_{SH} rather than the displacement vectors themselves, where f_1 and f_2 are appropriate weighting functions. The vector differential properties of the displacement vectors themselves are derived and these results compared with similar results obtained by the eikonal method of analysis. The twenty-first Conference of IUPAC held in Montreal in August 1961, presented a favorable opportunity for the Union's Commission on Organic Nomenclature to hold its annual meeting in the United States and thus to become more directly acquainted with the views of the very large number of organic chemists on this side of the Atlantic. To promote this exchange of views the Division of Chemistry and Chemical Technology of the NAS-NRC, in collaboration with the American Chemical Society's Committee on Organic Nomenclature, arranged for the IUPAC Commission to meet in Columbus, Ohio, at the office of Chemical Abstracts Service, during the period July 20-26, and for a Symposium on Nomenclature to follow on July 27-29. This report presents a digest of the proceedings of these 2 fruitful meetings.

NOMENCLATURE OF ORGANIC CHEMISTRY. TENTATIVE RULES FOR SECTION C. CHARACTERISTIC GROUPS CONTAINING CARBON, HYDROGEN, OXYGEN, NITROGEN, HALOGEN, SULFUR, SELENIUM, AND/OR TELLURIUM, July 1961. London, Butterworths, 1962, 238p. incl. diagrs. tables. (AFOSR-5243) [AF AFOSR-61-103] AD 416524 Unclassified

The Tentative Rules, Section C, were presented for consideration by chemists; they were discussed again by the Commission, later, before Definite Rules for this field were issued. As with Sections A and B, efforts were, in the main, confined to codifying sound practice which already had existed, rather than originating new nomenclature-the latter may form a later stage of the Commission's activities. The compounds discussed in Section C have atoms of, or groups containing, carbon, hydrogen, oxygen, nitrogen, halogen, sulfur, selenium, and/or tellurium as constituents. It is intended later to publish rules for compounds in which other elements are attached to carbon, for stereochemical isomers, and for certain classes of compounds such as saccharides where specialized nomenclature is required. Section C thus supercedes almost all of Sections IV, V, and VII, of the Liège rules, and also the relevant parts of the later revision of Section VI.

Also published in Compt Rend. Seances Soc. Biol., v. 155: 1443-1450, July 1961.

The results of this article show that the experiments described are able to explain, at least partially, the effects of stimulation of the striated structures on spontaneous movements or movements provoked by cortical stimulation. Apparently these cause a modification in the properties of the motor cortex. The actions that have been observed on the association cortex are without doubt in rapport with the effects of stimulation of striated structures on the level of awareness.

Also published in Jour. Gen. Physiol., v. 45: 1099-1115, July 1962.

Intracellular and extracellular potentials were simultaneously recorded from the soma and different parts of the axon of the giant cell of Aplysia. Evidence was obtained that for all modes of stimulation the spike originated in the axon at some distance from the cell body. The conduction of the spike is blocked at a distance of 200 to 300 μ from the soma for the

antidromic spike, closer to the soma as a small or A spike. After some delay, a spike is initiated in the resting part of the axon and in the axon hillock; the soma is invaded only afterwards. The response of these 3 parts of the neuron is recorded in the soma as the big or S spike. (Contractor's abstract)

SITE OF ORIGIN AND PROPAGATION OF SPIKE IN THE GIANT NEURON OF APLYSIA, by L. Tauc. [1961] [21]p. incl. illus. diagrs. refs. [AF 61(052)-475] Unclassified

Published in Jour. Gen. Physiol., v. 45: 1077-1097, July 1962.

The form and time sequence of spikes generated by orthodromic, antidromic, and direct stimulation and during spontaneous activity have been studied with intracellular electrodes simultaneously introduced in the soma and in different parts of the axon of the giant nerve cell of Aplysia. Evidence was obtained that under normal conditions of excitability, the spike originates at some distance from the soma in an axonal region with a higher excitability surpassing that of the surrounding membranes. Between the trigger zone and the soma is situated a region of transitional excitability where the conduction of the spike towards the soma may be blocked at a functionally determined and variable locus. The cell body is electrically excitable, but has the highest threshold of all parts of the neuron. The inactivation or even the removal of the cell body does not suppress synaptic transmission. THE LIOUVILLE THEOREM FOR A QUASI-LINEAR ELLIPTIC PARTIAL DIFFERENTIAL EQUATION, by E. Bohn and L. K. Jackson. [1961] [6]p. (AF 49-(638)506) Unclassified

Published in Trans. Amer. Math. Soc., v. 104: 392-397, Sept. 1962.

The following theorem is proved. Consider the equation (*) $L[z] = A(x, y, p, q)r + 2B(x, y, p, q)s + C(x, y, p, q)t = F(x, y, z, p, q)$ (where $p = z_x$, $q = z_y$, $r = z_{xx}$, $s = z_{xy}$, $t = z_{yy}$) which satisfies the following assumptions. (1) A, B, and C are continuous and have continuous first partial derivatives with respect to p and q for all (x, y, p, q). (2) $A > 0$ and $B^2 - AC < 0$ for all (x, y, p, q). There are continuous functions $a(p, q)$ and $c(p, q)$ and a constant $d > 0$ such that $AC - B^2 > d$, $A(x, y, p, q) \leq a(p, q)$ and $C(x, y, p, q) \leq c(p, q)$ for all (x, y) and all (p, q) with $p^2 + q^2 \leq 1$. (3) $F(x, y, z, p)$ is continuous and has continuous first partial derivatives with respect to z, p, and q with $F_z \geq 0$ for all (x, y, z, p, q). Given any $N > 0$ there exists an $H_N > 0$ such that $|F(x, y, z, p, q)| \leq H_N(p^2 + q^2)$ for $|z| \leq N$, $p^2 + q^2 \leq 1$, and all (x, y). A function $z(x, y)$ which is of class $C^{(2)}$ and a solution of (*) throughout the finite plane and which is bounded on one side must be a constant. (Math. Rev. abstract)

The kinetics of the reaction between benzeneboronic acid and basic phenylmercuric perchlorate in aqueous ethanol have been studied. The rate was found to be first order in each reactant. Investigations in buffer systems showed a retardation in the rate by phosphoric acid, acetic acid and dihydrogen phosphate ion. The reaction rate is pH-independent in the range pH 4-8. Above pH 10 the rate decreases with increasing pH. The bearing of these and other observations on the mechanism of the reaction is discussed. (Contractor's abstract)

CONDUCTION THEORIES IN GASEOUS PLASMAS AND SOLIDS. Final rept. Oct. 1, 1959 - Oct. 31, 1961. Dec. 1961, 5p. (AFOSR-1843) (AF 49(638)687) AD 414116 Unclassified

The theoretical studies on the transport properties of ionized media performed have been based entirely on the effective particle approach and have ignored all correlation effects as well as quantum corrections. Within this approximation several specific problems have been treated: the anomalous skin effect, the magneto-acoustic effect, magneto-galvanic resistance, and certain aspects of microwave diagnostics. The first 2 effects are of considerable interest in metals and semi-metals and were studied and extended so as to apply to plasmas. The microwave diagnostic techniques developed here were originally aimed at the interpretation of a specific problem in plasma physics but are of sufficient generality to treat a class of problems involving magneto-hydrodynamic fluids, semi-metals, as well as semi-conductors. EXTENSIVE AIR SHOWERS OF THE COSMIC RADIATION, by J. R. Green. Final rept. Jan. 16, 1961 [59]p. incl. diagrs. tables, refs. (AFOSR-243) (AF 49(638)34) AD 251274 Unclassified

Investigations have been carried out concerning the structure, properties, and interactions of the components of the extensive air showers of the cosmic radiation. Two scintillators having an acceptance area of 7.3 m^2 have been developed together with the circuits necessary to analyze and record the data. An automatic data reduction system with considerable flexibility of function had been designed to give the data in the form of punched cards. Three smaller scintillators with an area of 0.66 m^2 were also constructed. The size spectrum of extensive air showers in the region of 10^4 to 10^8 has been investigated and found to be represented by the power law of the form:

$$K(\geq N) = (2.26 \pm 0.14) \times 10^{-7} (N/10^6)$$

$$\text{sec}^{-1}\text{m}^{-2}\text{str}^{-1}$$

$$-(1.540 \pm 0.006)_{\cos}{}^{6.5}$$

at the elevation of Albuquerque (1575 m. s. l.). A μ-meson telescope was constructed from the three smaller scintillators with a total of 8 in. of lead absorber and was put in operation for a period of 55 days to obtain barometric and temperature coefficients for the μ-mesons and to observe variations in the flux of these particles. A vertical telescope formed from the two larger scintillators was used to find the average energy of the electronic component as a function of distance from the shower core. Results indicate that over the range from 3 m to 30 m the average energy of an electron decreases from 5×10^8 to 10^8 ev. This result indicates a change in distribution of electronic energies between mountain elevation and sea level. A new transition effect for the showers with water as an absorber has been obtained. The transition curves have made it possible to estimate that the relative number of photons to electrons is not far from unity, and that the ratio of the average electron energy varies from about 2 to 5 near the periphery of the shower to approximately unity near the core. ELECTRON-PHOTON ENERGIES IN EXTENSIVE AIR SHOWERS, by J. R. Green and J. R. Barcus. [1961] [16]p. incl. diagrs. tables, refs. (AFOSR-2810) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)34] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Los Angeles, Calif., Dec. 27-29, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 516, Dec. 27, 1961.

Also published in Nuovo Cimento, Series X, v. 23: 708-723, Feb. 16, 1962.

Average electron and photon energies are found at various distances from the cores of extensive air showers by comparing the multiplicities produced under different thicknesses of lead and water absorbers as measured through the use of 2 large scintillators. For distances from 2.3×10^{-2} to 1.4×10^{-1} shower units from the cores of showers of 10^5 to 10^7 particles the total energy carried by electrons and photons per electron is found to be $61(r/r_2)^{-0.74}$ mev per electron. The ratio of the average photon energy to the average electron energy is found to vary from 1.5 to 3.3 at different distances. Transition curves obtained with different thicknesses of water as absorber are used to show that for showers of 4.6×10^4 particles a total of 1.5×10^{12} ev is expended in the production of pions per nuclear interaction to give an inelasticity of 0.33. LATERAL DISTRIBUTION OF THE ENERGY OF THE SOFT COMPONENT OF EXTENSIVE AIR SHOWERS (Abstract), by J. R. Barcus and J. R. Green. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)34] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 52, Feb. 1, 1961.

The multiplicity of shower particles resulting from the traversal of various thicknesses of Pb and of H_2O has been measured using 2 large scintillators. Under certain assumptions regarding the relative number and relative energy of the electrons and photons, the cascade theory can be used to determine the corresponding energies. The observed frequency of occurrence of a given multiplicity then can be compared with the predicted response of the scintillators to showers striking at various distances from the apparatus to show that the average energy of the soft component at the periphery of the showers is of the order of 10^8 ev and increases to more than 10^9 ev within a meter of the shower axis. Measurements of the transition effect in water indicate that the ratio of photons to electrons is approximately unity but that the photons carry more energy at distances of 10 m and beyond than do the electrons. The measurements were made for showers of 10^5 to 10^8 particles; no effects due to size were observed.

SIZE SPECTRUM AND ANNUAL VARIATION OF EXTENSIVE SHOWERS (Abstract), by J. R. Green and J. R. Barcus. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)-34] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 52, Feb. 1, 1961.

Extensive air showers have been observed with a large single scintillator for a period of about 1 yr. The accumulated data lead to an integral size-spectrum of $K(\geq N) = (2.1 \pm 0.3) \times 10^{-7} (N/10^6)^{-(1.540 \pm 0.008)} m^{-2} s^{-1} str^{-1}$ for showers containing from 10^5 to 10^8 particles at 1575 msl. Although the inherent statistical accuracy is high because of the large acceptance area of the scintillator, the calibration of the apparatus introduces errors that restrict the accuracy of comparison of rates over long time intervals. As a result of this limitation, it can be said only that any annual variation in the rate of occurrence of extensive air showers of the order of 10^7 particles must be less than 8%.

1974

New Mexico U. [Dept. of Physics] Albuquerque.

FURTHER MEASUREMENTS OF THE SIZE-SPECTRUM OF EXTENSIVE AIR SHOWERS, by J. R. Green and J. R. Barcus. [1961] [8]p. incl. diagrs. tables. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)34] and National Science Foundation) Unclassified

Published in Nuovo Cimento, Series X, v. 21: 361-368, July 16, 1961.

Measurements on the size-spectrum of extensive air showers have been made over a period of about 1 yr to include approximately 10^5 events. It is found that errors of about 5% in determining the number of particles traversing the scintillator make it impossible to observe time variations of less than 8%. For showers containing a total number of particles $10^5 < N < 10^7$, the spectrum for vertical incidence is $K_0(\geq N) = (2.26 \pm 0.14) \cdot 10^{-7} (N/10^6)^{-(1.540 \pm 0.006)} s^{-1} m^{-2} sr^{-1}$. GLUTAMIC ACID METABOLISM IN BRAIN AND LIVER DURING INFUSION WITH AMMONIA LABELLED WITH NITROGEN-15, by G. Takagaki, S. Berl and others. [1961] [1]p. incl. table. (AFOSR-J246) (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)725] and Public Health Service) AD 400874 Unclassified

Also published in Nature, v. 189: 326, Jan. 28, 1961.

Recent results of in vivo experiments using glutamic acid labelled with carbon-14 were consistent with the hypothesis that the amidation of the administered amino-acid to glutamine represents a metabolic event occurring in a tissue of cellular compartment. N-ammonium acetate was infused into the carotid artery of cats over a period of 8-85 min with simultaneous electroencephalographic and electrocardiographic tracings. The experiments were terminated by exsanguination of the animal, the blood was collected, brain and liver excised and frozen, and the level of glutamic acid and its metabolic derivatives determined in the tissue samples, as well as the concentration of nitrogen-15 in the amino or amide groups respectively of these compounds. The results of a typical experiment of 25-min duration are given in tables.

INCORPORATION OF HISTAMINE INTO LIVER PROTEIN IN VIVO, by I. Wajda, M. Ginsburg, and H. Waelsch. [1961] [2]p. incl. diagr. (AFOSR-J247) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)725], Ford Foundation, National Institute of Neurological Diseases and Blindness, and Research Foundation for Mental Hygiene) AD 400873 Unclassified

Also published in Nature, v. 191: 1204-1205, Sept. 1961.

Whereas there is no difficulty in demonstrating transglutaminase action in vitro, in early experiments attempts to show fixation of administered amines in the liver proteins of mice were unsuccessful

even after experimental liver damage (carbon tetrachloride) or after nephrectomy. The possibility was considered that proteins modified by incorporated amines may have antigenic properties and could be involved in auto-immune reactions. Since H. pertussis vaccine enhances anaphylactic sensitization its effect and that of a lipopolysaccharide from S. typhosa on liver transglutaminase and histamine incorporation into liver proteins was studied. The histamine content of the liver proteins from normal or lipopolysaccharide-treated mice with or without histamine injection was less than could be detected. The liver proteins of lipopolysaccharide-treated animals after histamine injection contain significant amounts of histamine, the quantity of which correlated with transglutaminase-level ($r = 0.9$; $P < 0.001$). In order to demonstrate increased histamine fixation in liver protein of lipopolysaccharide-treated mice, it was necessary to administer large doses of histamine. This raises the question whether histamine is the natural replacing amine and experiments are now in progress to study the conditions of in vivo incorporation of other amines.

PYROLYSIS AND COMBUSTION OF ALUMINUM ALKYLS, by C. J. Marsel, G. Salser, and Y. Tajima. [1961] [1]p. [AF 49(638)173] Unclassified

Presented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech. Armour Research Foundation, Chicago, Sept. 11-12, 1961. (AFOSR-1417; AD 265513)

It has been established that aluminum triethyl (TEA) and aluminum tri-n-propyl (TPA) decompose at 210-250°C by a molecular mechanism. The principal hydrocarbon products are butenes with TEA and propylene with TPA; a marked difference in the pyrolysis of TEA and TPA is that dimers (butenes) form from TEA but dimers (hexenes) do not form from TPA. Addition of oxygen induces a free radical mechanism on the pyrolysis of TEA. Thus, ethane and n-butane appear as products. Further improvements have been incorporated into the New York U. 60° sector mass spectrometer. Machine stability has been vastly improved by use of a transistorized emission regulator, regulated magnet supply, and regulated supply voltage. Ion optical problems concomitant with electrostatic scanning have been resolved by 3-fold increase of the accelerating voltage. The use of strong focusing as a more satisfactory solution is also discussed.

NUMERICAL STUDIES OF TRANSITION FROM LAMINAR TO TURBULENT FLOW OVER A FLAT PLATE, by D. F. DeSanto and H. B. Keller. Final rept. Apr. 1961, 45p. incl. diagr. refs. (AFOSR-723) (AF 18(603)25 and AF 49(638)446) AD 257587 Unclassified

Also published in Jour. Soc. Indus. and Appl. Math., v. 10: 569-595, Dec. 1962.

A finite-difference technique is developed for analyzing the time-dependent 2-dimensional flow of an incompressible viscous fluid over a semi-infinite flat plate. The complete (non-linear) equations of motion for perturbed Blasius flow are numerically integrated with respect to time, and the propagation of disturbances in the boundary layer is determined. An analysis of the theoretical convergence and stability properties of the difference scheme is carried out. The method developed has been employed in 2 test calculations, in which slightly unstable oscillatory disturbances have been introduced at some upstream

point. The numerical solutions exhibit many of the major theoretical and experimentally observed features associated with transition from laminar to turbulent boundary-layer flow. (Contractor's abstract)

STUDY OF THE HYDRODYNAMIC EQUATIONS FOR FREE-RADICAL FLAMES (Abstract), by E. S. Campbell. [1961] [1]p. [AF 49(638)169]
Unclassified

Presented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech. Armour Research Foundation, Chicago, Sept. 11-12, 1961. (AFOSR-1417; AD 265513
Unclassified

In this study of the hydrodynamic equations for the propagation of free-radical flames, methods of solutions have been developed which are appropriate to different temperature ranges and different ranges of deviation from the kinetic steady-state. Alternative hypotheses had been presented as possible explanations for the discrepancy between the calculated flame profiles and profiles which could satisfy the boundary conditions at the flame holder. These hypotheses have now been narrowed to the tentative conclusion that the ozone flame involves 2 eigenvalues. This conclusion, which contradicts the basic assumption of previous treatments of the ozone flame, is being checked. Brief comment is also made on the following topics: (1) significance of the ignition temperature approximation, (2) free-radicals as a means of energy transport, (3) diffusion, flame-velocity, and deviation from the kinetic steady state, (4) study of the heat-flux vector, (5) deviation from the kinetic steady-state and flame-speeds, and (6) flame thickness.

In recent years, the subject of combustion has grown and ramified enormously. In this monograph, an attempt has been made to cover all the aspects of what has proved to be perhaps the most informative single group of methods in making visible, in rapidly recording and in the accurate measurement of processes associated with flame phenomena. The necessary combustion is provided in chapter IV. Elementary revision of the minimum necessary optics is also included. The purposes of this monograph are to establish the form of refractive index fields occurring in combustion, to examine the usefulness of a wide variety of optical systems in this context and supplement their theory as necessary, to provide a compact text, comprehensive yet elementary enough to assist those workers of a variety of academic backgrounds who are using or wish to use such techniques, and to draw the attention of that wider circle who have no previous experience of such methods to their scope, versatility and simplicity for visualization and quantitative measurements of combustion.

An energy transformer is defined as a reversible device which converts free energy of 1 form into another and vice versa. Basic transformer equations are derived for these devices which are good for both steady-state as well as transient operations. Using the transformer analogy, interacting systems can be represented by a single equivalent circuit from which transient and steady-state responses and interacting effects can be calculated. The method is applicable to nonlinear as well as linear systems. Examples are given to illustrate its applications in electromechanical and hydromechanical systems. (Contractor's abstract)

Presented at I. R. E. Internat'l. Convention, New York, Mar. 20-23, 1961.

Also published in I. R. E. Internat'l. Convention Record, Pt. 4: 48-55, 1961.

A digitized version of the maximum principle is derived by a simple and elementary method. In the limit of the discrete time interval approaching zero, the digitized maximum principle is reduced to Pontryagin's maximum principle. The digitized version can be readily programmed on a computer, and all 4 types of optimization problems: (1) minimum time, (2) maximum range, (3) minimum cost between terminal points, and (4) maximum gain (or minimum cost) in a given interval, are solvable by this method. The computation of the optimum process requires relatively little computer memory, and is exact for systems

describable by a set of difference equations. The use of a computer to implement the computed optimum process in various ways is discussed. A more general condition for bang-bang control is also derived. (Contractor's abstract)

SYNTHESIS OF LINEAR CONTROL SYSTEMS WITH LOW SENSITIVITY TO PLANT VARIATIONS, by P. E. Fleischer. May 1961, 147p. incl. diagrs. refs. (Technical rept. no. 400-31) (AFOSR-702) (AF 49-(638)586) AD 269564 Unclassified

This thesis is a study of the design of linear control systems which are insensitive to plant variations. Linear feedback systems, characterized by no direct transmission to the output and plants which have only a single input and a single output, are considered. In such systems, the degree of insensitivity, (with respect to plant variations), that can be achieved is limited only by 3 factors. These are the noise generated by the measuring instrument, the possibility of plant saturation, and the non-minimum phase zeros of the plant. No analysis, presented thus far, has considered any of these factors; consequently, there exists no methods for the rational synthesis of a wide class of control systems. The main purpose of this paper is to derive methods for specifying a system's sensitivity function in the presence of these conflicting requirements. The results are also of value in establishing and limiting the fundamental capability of a passive-adaptive control system to minimize the effects of plant variations. This is of importance if the use of adaptive control is contemplated. Such control is often difficult to implement and is slow in adjusting to the changing environment. For these reasons it should not be used unless a clear superiority over insensitive (i. e., passive-adaptive) systems can be demonstrated. (Contractor's abstract)

DYNAMIC PROGRAMMING AND PONTRYAGIN'S MAXIMUM PRINCIPLE, by S. S. L. Chang. June 1961 [18]p. incl. diagrs. (Technical rept. no. 400-32) (AFOSR-865) (AF 49(638)586) AD 269565 Unclassified

Bellman's dynamic programming and Pontryagin's maximum principle are generally regarded as 2 alternative ways of solving the problem of optimum control of a nonlinear system. A multistage decision process is described and applied to an optimum trajectory. The maximum principle is derived when tries to overcome certain practical difficulties in dynamic programming. OPTIMAL CONTROL IN BOUNDED PHASE SPACE, by S. S. L. Chang. Aug. 1961, 36p. (Technical rept. no. 400-37) (AFOSR-1238) (AF 49(638)586) AD 269566 Unclassified

Also published in Automatica, v. 1: 55-67, Jan.-Mar. 1963.

A bounded phase space condition is derived for a restricted class of problems. The condition is proved to be a necessary condition for optimal control in a fixed time interval with free end point. If the system is linear, and the allowed regions of phase variables and controls are convex, the condition is both necessary and sufficient, for optimal control in a fixed time interval, as well as minimum time control between two fixed points.

NOISE AND RANDOM PROCESSES, by J. R. Ragazzini and S. S. L. Chang. Oct. 1961 [43]p. incl. diagrs. refs. (Technical rept. no. 400-40) (AFOSR-1533) (AF 49(638)586) AD 269567 Unclassified

Also published in Proc. Inst. Radio Engineers, v. 50: 1146-1151, May 1962.

The theory of noise and random processes in electronic devices was developed in 2 stages. The first stage spanning the 2 decades following 1918 brought about the understanding of the nature and effects of noise in vacuum tubes and circuits. The second stage, initiated by Wiener in the early 1940's, established the theoretical basis for synthesizing systems which optimized the transmission and detection of signals in the presence of noise. While the detailed discussion of the detection of weak signals in the presence of noise is contained in a separate paper on information theory, this subject is discussed briefly to demonstrate the similarity in the underlying concepts of optimum transmission and detection. The literature on the subject of noise and random processes is so extensive as to make complete coverage impractical. Only highlights and significant stepping stones in the development of the theory are described.

THEORY OF OPTIMUM MULTIPLE MEASUREMENTS, by J. C. Hung. Aug. 1961, 167p. incl. diagrs. tables, refs. (Technical rept. no. 400-36) (AFOSR-1550) (AF 49(638)586) AD 269568 Unclassified

Multiple measurements with random inputs are studied. Methods of weighting and combining the measured signals are proposed. The relationships between the measured signals and the desired signal

are assumed linear and time-invariant; the random inputs are assumed stationary with rational spectral density functions; the criterion of performance used is to minimize the mean squared value of the continuous error between the estimate and the desired signal; and the weighting operations are assumed linear. Two kinds of single-rate systems are studied: Single-rate multiple measurements with known spectral density functions of signal and noise, and single-rate multiple measurements with known noise but unknown signal spectral density functions. A new method employing the frequency domain optimization theorems together with factorization theorems of rational matrices is proposed for obtaining the optimum system of the first kind. AN INTRODUCTION TO THRESHOLD DEVICES AND THEIR USE IN PATTERN RECOGNITION, by P. Kaszerman. Aug. 1961, 68p. incl. diagrs. tables. (Technical rept. no. 400-44) (AFOSR-2414) (AF 49-(638)586) AD 281760 Unclassified

Introductory concepts are presented of the switching logic which can be realized by threshold devices, and examples are given of the use of these devices in pattern recognition applications. A threshold device is a switching network which realizes a given function by: (1) forming a weighted linear sum on the binary inputs plus a threshold number; and (2) forming a binary output whose value is determined by the value of this sum. It is shown that the complement of a single variable, the AND function of any number of variables and the OR function of any number of variables can be realized by a single threshold device. A necessary condition for realizability by a single threshold device is that the function be completely monotonic; that is, for any 2 groups of values assigned to a common subset of variables, 1 of the reduced functions must imply the other. Various properties of realizable functions are derived and a synthesis procedure is presented without proof. In addition, a geometric approach to the analysis of a single threshold device is given. HYPERFINE STRUCTURE OF THE ROTATIONAL SPECTRUM OF HDO, by E. B. Treacy and Y. Beers. [1961] [8]p. incl. diagrs. tables, refs. (AFOSR-968) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)259] and Office of Naval Research) Unclassified

Also published in Jour. Chem. Phys., v. 36: 1473-1480, Mar. 15, 1962.

The hyperfine structure of the $3_2 - 3_3$ and $5_2 - 5_3$ rotational transitions of HDO, which fall at about 825 and 487 mc, respectively, have been studied using microwave cavities as spectrometers. The experiments illustrated the usefulness of large Q cavities as spectrometers for this kind of work. The $3_2 - 3_3$ transition was resolved into a symmetrical pattern consisting of a strong central line with 6 weak satellites on each side. The minimum full linewidth between half-power points that was achieved was about 10 or 12 kc. The spectrum was fitted with $C_H = -46.6 \pm 0.3$ kc, $C_D = -1.66 \pm 0.3$ kc, and $(eqQ)_{OD} = 310.3 \pm 3$ kc. The $5_2 - 5_3$ transition was resolved into a symmetrical pattern also, with a strong central line and 3 weak satellites on each side. The minimum full linewidth between half-power points was about 6 kc. The spectrum was fitted with $C_H = 47.38 \pm 0.1$ kc, $C_D = -2.42 \pm 0.1$ kc, and $(eqQ)_{OD} = 314.3 \pm 1.5$ kc. A systematic comparison of the results with those obtained elsewhere on the $2_1 - 2_2$ transition in HDO is made. The qualitative features of the spectra are consistent with what one would expect on the basis of existing theory, but the present state of the theory may be inadequate for explaining some of the quantitative details of the magnetic structure.

LOW FREQUENCY ABSORPTION SPECTRA, by Y. Beers. Final rept. Nov. 24, 1961 [11]p. incl. refs. (AFOSR-2057) (AF 49(638)259) AD 289175 Unclassified

This report summarizes work performed under this contract. The purpose of this project is to extend the observation of molecular spectra in gases to the frequency region between 300 and 6000 mc. One of the objectives is to obtain information which can provide a valuable supplement to that obtainable in the conventional microwave region and the infra-red concerning rotational constants and hyperfine splittings.

As the work progressed, it was gradually realized that observation of spectral lines in this region provides a means of observing hyperfine splittings with high resolution since the Doppler width, which generally limits the resolution, decreases in proportion to the frequency of the transition while the hyperfine splitting has a magnitude comparable to that in the conventional microwave region. Much of the recent work has concerned itself with the exploitation of this advantage. An auxiliary objective has been to observe some nuclear quadrupole resonances in the solid state.

COSMIC-RAY INCREASES OBSERVED AT COLLEGE, ALASKA, AT THE TIME OF THE NOVEMBER 1960, EVENTS AND THE ACCELERATION MECHANISM (Abstract), by S. A. Korff. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)635] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Mexico City (Mexico), June 22-24, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 362, June 22, 1961.

Increases in the cosmic-ray intensity observed with a neutron monitor located at College, Alaska, during Nov. 1960, are reported. Three increases were observed, large ones on Nov. 12 and 15 and a small 1 on Nov. 20. Correlation with other geophysical variables are noted. The possible interpretation of the event is considered on the basis that both high-energy particles, and a much larger number of low-energy particles are accelerated and emitted by the sun, possibly with some difference in the direction of emission. The spectrum may be a natural result of the energy distribution of the particles in the sun before the acceleration starts.

MAKE A SENTENCE TEST: AN APPROACH TO OBJECTIVE SCORING OF SENTENCE COMPLETIONS, by E. F. Borgatta. [1959] [63]p. incl. tables, refs. (AF 49(638)195) Unclassified

Published in Genetic Psychol. Monographs, v. 63: 3-65, Feb. 1961.

A report is presented on a sentence completion test administered to college males and females at N. Y. U. The test consists of several introductory phrases of which the subject was to write whatever comes to one's mind first to make a sentence. Twelve possible categories were established, known as the MAST category system, into which the graders placed the

subject depending upon his answers. The categories were, briefly: paranoid, hostile, boastful, bored, common morality, withdrawal, depressive, worry, introspective mood, sickness, euphoric, and unscorable. Some results were that males made significantly more MAST assertive responses; males make significantly more MAST conventional responses; females made significantly more MAST avoidance responses; and females made significantly more MAST anxious responses. An extensive analysis of each category is given.

ROTATION AND STRAIN, by F. John. [1961] [23]p. (AFOSR-339) (AF 49(638)161) Unclassified

Also published in Commun. Pure and Appl. Math., v. 14: 391-413, Aug. 1961.

Let $x = (x_1, \cdots, x_n)$, $\bar{x} = (\bar{x}_1, \cdots, \bar{x}_n)$ denote points of Euclidean n-space and let $\bar{x} = f(x)$ be a mapping defined in an open set R of x-space. Let f' denote the Jacobian matrix $f' = (\partial \bar{x}_i / \partial x_j)$ and let e denote the strain matrix (with (1 + e) positive symmetric) and c the orthogonal rotation matrix in the unique decomposition $f' = c(1 + e)$. Mappings are considered for which $|e(x)| \leq \varepsilon$ for x in R. It is shown that no pointwise estimate for rotations in terms of strains can exist. The above condition is shown to imply the existence of an orthogonal matrix γ and a point x^0 such that: $|f(z) - f(x^0) - \gamma(z - x^0)| \leq \varepsilon A_n$ for z in R, where the constant A_n depends upon R. Further, if R is a cube with volume V, then there exists an orthogonal matrix γ such that $\int_R |f'(x) - \gamma|^2 dv \leq D_n^2 \varepsilon^2 V$, where D_n is a universal constant. The author then remarks that analogous results can be established for regions of sufficiently smooth shape by suitable coverings with cubes. (Math. Rev. abstract)

ASYMPTOTIC ESTIMATES FOR THE STURM-LIOUVILLE SPECTRUM, by H. Hochstadt. Feb. 1961 [26]p. (Research rept. no. BR-36) (AFOSR-276) (AF 49(638)229) AD 257782 Unclassified

Also published in Commun. Pure and Appl. Math., v. 14: 749-764, Nov. 1961.

It is shown that the differential equation $y'' + [\lambda + \Phi(x)] y = 0$ can, under suitable conditions, be solved by assuming a solution of the form $y = A(x) \sin \varphi(x)$ where $\varphi'(x) = \sqrt{\lambda + \Phi(x)} + 1/4 \dfrac{\Phi'(x)}{\lambda + \Phi(x)} \sin 2\varphi(x) A'(x) = -A(x) \dfrac{\Phi'(x)}{2\lambda + 2\Phi(x)} \cos^2 \varphi(x)$. Use of the first equation leads, when boundary conditions are applied, to asymptotic estimates of the eigenvalues. In particular, in the case of Hill's equation, it is shown that the instability intervals vanish faster than any inverse power of k, k being the order of the corresponding eigenvalues, when $\Phi(x)$ is an analytic function. SOME UNIQUENESS THEOREMS FOR THE REDUCED WAVE EQUATION, by L. M. Levine. June 1961, 96p. incl. refs. (Technical rept. no. BR-33) (AFOSR-1017) (AF 49(638)229) AD 265259 Unclassified

Also published in Commun. Pure and Appl. Math., v. 17: 147-176, May 1964.

Various extensions of the Magnus-Rellich uniqueness theorem for the reduced wave equation in infinite domains are treated. The theorem is extended to cover piecewise smooth boundary surfaces of a general kind, and mixed boundary conditions; no auxiliary edge conditions are required at edges or at discontinuities in the boundary conditions - continuity of the wave function in the closure of the domain is sufficient. Another extension treats infinite boundaries; for real values of the propagation constant, these are restricted to surfaces which are (generalized) cones sufficiently far from the origin. STOCHASTIC MODELS FOR MANY-BODY SYSTEMS. I. INFINITE SYSTEMS IN THERMAL EQUILIBRIUM, by R. H. Kraichnan. July 1961, 70p. incl. diagrs. refs. (Research rept. no. HT-9) (AFOSR-1137) (AF 49(638)341) AD 264738 Unclassified

Also published in Jour. Math. Phys., v. 3: 475-495, May-June 1962.

Some model Hamiltonians are proposed for quantum-mechanical many-body systems with pair forces. In the case of an infinite system in thermal equilibrium, they lead to temperature-domain propagator expansions which are expressible by closed, formally exact equations. The expansions are identical with infinite subclasses of terms from the propagator expansion for the true many-body problem. The 2 principal models introduced correspond, respectively, to ring and ladder summations from the true propagator expansions, but augmented by infinite classes of self-energy corrections. The latter are expected to yield damping of single-particle excitations. The eigenvalues of the ring and ladder model Hamiltonians are real, and they are bounded from below if the pair potential obeys certain conditions. The models are formulated for fermions, bosons, and distinguishable particles. In addition to the ring and ladder models, 2 simpler types are discussed, 1 of which yields the Hartree-Fock approximation to the true problem. A novel feature of all model Hamiltonians (except the Hartree-Fock) is that they contain an infinite number of parameters whose phases are fixed by random choices. Explicit closed expressions are obtained for the Helmholtz free energy of all the models in the classical limit. (Contractor's abstract)

STOCHASTIC MODELS FOR MANY-BODY SYSTEMS. II. FINITE SYSTEMS AND STATISTICAL NON-EQUILIBRIUM, by R. H. Kraichnan. Aug. 1961, 88p. incl. diagrs. (Research rept. no. HT-10) (AFOSR-1138) (AF 49(638)341) Unclassified

Also published in Jour. Math. Phys., v. 3: 496-521, May-June 1962.

In a preceding paper (item no. 2005, Vol. V), some model Hamiltonians were proposed for quantum-mechanical many-body systems with pair forces. In the present paper, more general models are formulated which yield formally summable propagator expansions for finite systems. The analysis is extended to correlation and Green's functions defined for nonequilibrium ensembles. The nonequilibrium treatment is developed in the Heisenberg representation in such a way that unlinked diagrams do not arise. A basic convergence question associated with the formal closed equations for the model propagators and correlation functions is examined by means of finite-difference integration of the Heisenberg equations of motion. This procedure appears to converge independently of whether the perturbation expansions for the propagators and correlation functions converge. It yields substantial support for the validity of the formal closed model equations. (Contractor's abstract)

ON CONVECTIVE GROWTH-RATES IN A POLYTROPIC ATMOSPHERE, by E. A. Spiegel and N. Wasaburo. [1961] [5]p. (AFOSR-3526) (In cooperation with Tokyo U. Dept. of Astronomy (Japan) as rept. no. 24) (AF 49(638)341) Unclassified

Also published in Publ. Astronom. Soc. Japan, v. 14: 28-32, 1962.

This paper deals with 2 complicating features of convection theory which have recently received much attention. They are the compressibility and large density variations of the gas in the outer convection zones of late-type stars. An exact asymptotic form of convective growth-rates for large horizontal wave numbers is derived analytically for a polytropic atmosphere without viscosity and conductivity.

A SIMPLIFIED ANALYSIS OF SPHERICAL AND CYLINDRICAL BLAST WAVES, by M. P. Friedman. [1961] [15]p. incl. diagrs. refs. (AFOSR-3403) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)446 and Atomic Energy Commission under AT(30-1)1486) Unclassified

Also published in Jour. Fluid Mech., v. 11: 1-15, Aug. 1961.

Investigations into the behavior of the gas flow behind spherical or cylindrical blasts have shown that secondary shocks arise within the original detonation gases. The secondary shock, at first weak, is carried outward with the expanding gases. Subsequently it strengthens and bends back toward the origin, arriving there with high intensity. By using some recently developed techniques in shock dynamics and extending them where necessary, a theory is developed by which the motion of the main shock wave, as well as the formation and subsequent motion of the secondary shock, are given by explicit formulae. In addition, a method for determining, also by explicit formulae, the location of the contact surface between the detonation gases and the outside atmosphere is given. The results of a specific problem, which has been solved by numerically integrating the total equations of motion, and has also been checked experimentally, are compared with the results of the present theory. DIOPHANTINE SETS OVER POLYNOMIAL RINGS, by M. Davis and H. Putnam. June 1961, 10p. (Rept. no. IMM-NYU 283) (AFOSR-821) (AF 49(638)777) AD 260751 Unclassified

A set S of non-negative integers is called Diophantine over the ring of polynomials $J[\xi]$ with coefficients in J and variables $\xi_1, \xi_2, \cdots$ if S satisfies the following condition: There is a polynomial $p(x, x_1, \cdots, x_n)$ with integral coefficients such that $x \in S$ if and only if there are numbers p and q (depending on x) and polynomials $p_1, \cdots, p_n$ of $J[\xi]$ in the variables $\xi_1, \cdots, \xi_p$ of degree $\leq q$ which satisfy $P(x, p_1, \cdots, p_n) \equiv 0$ identically in $\xi_1, \cdots \xi_p$. For given x and given coefficients of $p_1, \cdots p_n$ this is equivalent to a set of equations in J whose number is uniformly bounded once p and q are given (by equating coefficients in P). It is shown that

if J_0 is the ring of integers, all recursively enumerable (r.e.) sets are Diophantine over $J_0[\xi]$. Let S be called restricted Diophantine over $J[\xi]$ if, in addition, it is required that p and q be bounded uniformly in x. Then, clearly, S is restricted Diophantine over $J_0[\xi]$ if and only if S is Diophantine (over J_0 itself). (Math. Rev. abstract)

THE INITIAL VALUE PROBLEM, SOUND PROPAGATION, AND MODELING IN KINETIC THEORY, by L. Sirovich. Sept. 15, 1961 [91]p. incl. diagrs. tables. (Rept. no. MF-17) (AFOSR-1380) (AF 49(638)1006) AD 264889 Unclassified

The 1 dimensional initial value problem of a monatomic single component gas is considered. Using the linearized Boltzmann equation the dispersion relation is studied. In addition to the usual gas dynamic sound waves one finds an infinity of decaying propagating waves. The phenomenon naturally exhibits itself as a sequence of epochs, the last stage of which is hydrodynamic. With reference to the same problem macroscopic equations such as Euler, Navier-Stokes, Burnett, Grad's moments equations, etc., are considered. In addition the recently considered kinetic models of Gross (Phys. Fluids, v. 2: 432, 1959) are applied to the problem. These various formulations are critically analyzed and compared with each other and with the Boltzmann analysis. Lastly, several alternate molecular and macroscopic equations are offered which remedy some of the shortcomings which appear in the above mentioned approximate theories. (Contractor's abstract)

MAGNETOHYDRODYNAMIC FLOW PAST AN AIRFOIL (Abstract), by E. Cumberbatch, L. Sarason, and H. Weitzner. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)1006] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Berkeley, Calif., Nov. 20-22, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 371, Apr. 23, 1962.

The steady flow of a perfectly conducting magnetohydrodynamic fluid past a thin nonconducting airfoil is studied in the model in which the fluid obeys the Lundquist equations linearized about a constant unperturbed flow. Particular attention is given to "hyperliptic" flows in which hyperbolic and elliptic fields are superimposed. Results of Grad, of McCune and Resler, and of Sears and Resler are extended to the case of an arbitrarily inclined unperturbed field. The general solution contains 4 line singularities along characteristics through the ends of the body, and has 2 arbitrary constants. By a "generalized Kutta-Joukowski condition," these constants are fixed so that 2 of the line singularities disappear. Specifically, it is required that the solution be locally square integrable. Behavior of the exponents of the singularities is investigated by numerical computation and, in limiting cases, by analysis. The singular parts of some flows are investigated numerically.

Also published in Arkiv Fysik, v. 20: 93-115, 1961.

A search for transitions of the type $f_{5/2} \rightarrow f_{1/2}$ has been made in Pb^{205}, Pb^{203} and Hg^{201}. It is shown that this transition in Pb^{205} has an energy of only 2.3 kev and goes directly to the $f_{5/2}$ ground state. In Pb^{203} the corresponding transition has an energy of 126 kev and a half-life of 75 + or - 3 ns. In Pb^{201} and Hg^{201} there was no evidence of a half-life longer than about 2 ns. It was essential to work out methods for a systematic search of half-lives in the ns-region in cases where the production of the nuclides to be studied leads to complicated mixtures of isotopes decaying by electron capture. Changes of the $f_{5/2}$, $p_{3/2}$ and $p_{1/2}$ level spacings and transition probabilities with the nucleon number is studied and compared with theory. The agreement between experiments and the predictions of Kisslinger and Sorenson for Pb^{205} and Pb^{203} is shown to be fairly good.

Abstract published in Semiconductor Nuclear Particle Detectors, Bibliographical series no. 8, Vienna, Internat'l. Atomic Energy Agency, 1962, p. 31.

Also published in Nuclear Electronics; Proc. Internat'l. Atomic Energy Agency Conf., Belgrade (Yugoslavia) (May 15-20, 1961), Vienna, Internat'l. Atomic Energy Agency, v. 1: 535-541, 1962.

The invention of the semiconductor detector for charged nuclear particles has opened up new possibilities in the use of pulse-height spectroscopy techniques for studying nuclear reactions. The high intrinsic resolution of these detectors, both in time and energy measurements, has initiated some developmental work on the associated electronic circuits which is described. In the nuclear research work at the Nobel Inst. a wide range of applications of semiconductor detectors is foreseen. The different experiments demand different types of detectors which generally have a limited life-time. In order to secure a sufficient supply of adaquate units, the production of surface-barrier detectors has been used within the institute. A description of the detectors and the production techniques is given. (Contractor's abstract)

EVIDENCE FOR OCTUPOLE AND QUADRUPOLE VIBRATIONAL STATES IN Pb^{205}, by I. Bergström, E. C. O. Bonacalza, and P. Thieberger. Sept. 1, 1961, 23p. incl. illus. table. (Technical note no. 7) (AFOSR-1565) (In cooperation with Royal Inst. of Technology, Stockholm (Sweden)) (AF 61(052)118) AD 266646
Unclassified

Also published in Arkiv Fysik, v. 22: 95-110, 1962.

It is shown by internal conversion coefficient measurements that the 2610 and 2567 kev states in Pb^{205} are 9/2 +. It is suggested that the upper state is mainly due to the coupling of the 3- octupole core vibrational state and the 5/2-neutron hole ground state. Angular correlation measurements were made between the E1 gamma rays going from the 2610 kev and 2567 kev states to the 703 kev state, and the 703 kev gamma ray de-exciting this state. If the E1 transitions are both assumed to be pure, it follows that the 703 kev gamma ray is due to 98% E2 radiation and 2% M1 radiation. The strong E2 enhancement in the 703 kev ground state transition (7/2- yields 5/2-) suggests that the 703 kev state might be due to 1 phonon quadrupole core vibration coupled to the 5/2-ground state of the odd neutron. There are also some evidences for the 1615 kev state being originated by a similar coupling between the odd neutron ground state and 2 phonon quadrupole core vibration. (Contractor's abstract)

THE DECAY OF ENERGY OF Bi^{205}, by E. C. O. Bonacalza, P. Thieberger, and I. Bergström. Sept. 25, 1961, 21p. incl. illus. (Technical note no. 8) (AFOSR-1566) (In cooperation with Royal Inst. of Technology, Stockholm (Sweden)) (AF 61(052)118) AD 266647
Unclassified

Also published in Arkiv Fysik, v. 22: 111-125, 1962.

The decay energy of Bi^{205} was determined by measuring the K and L x-rays which follow electron capture and feed the 2567 kev and 2610 kev levels. In this way the K to L, K to total and L to total capture ratios were found. Comparing these values with theoretical predictions, a total decay energy of 2703 ± 6 kev was established. This corresponds to a neutrino energy of 46 kev for K-capture to the 2567 kev level. Since this value disagreed with the previously determined maximum positron energy feeding the 703 kev level, the positron spectrum was remeasured and a value of 976 ± 10 kev was found. This yields a total decay energy of 2701 ± 10 kev, in good agreement with the capture value. K and L x-rays feeding the 1766 kev level were measured as a check of the method since, for such a large spacing, the ratios are rather insensitive to energy variations The log

ft values for the E. C. decay to the 2567 kev and 2610 kev levels were calculated yielding values of 6.60 ± 0.05 and 6.34 ± 0.06, respectively. (Contractor's abstract)

INVESTIGATION OF GAMMA RADIATION FROM NUCLEAR REACTIONS, by K. G. Malmfors. Final rept. Jan. 1-Dec. 31, 1960. Mar. 14, 1961, [1]p. incl. diagrs. (AFOSR-539) (AF 61(052)336) AD 262190 Unclassified

Gamma radiation from nuclear reactions was studied by means of a time-of-flight spectrometer (trochoid spectrometer). The spectrometer was used in connection with an 80-cm cyclotron. The reaction $F^{19}(p,\alpha)O^{16}$ was studied. A thick target of CaF_2 was bombarded with 3.5 mev protons and the resulting gamma radiation was allowed to fall upon a converter at a distance of 5 cm from the target. First an aluminum converter was used and the Compton electrons were analyzed according to the flight time in the spectrometer. Electronic equipment was later constructed which made it possible to use the instrument as a pair spectrometer. In this case a gold converter was used and the flight times of the positrons and the negatrons were recorded and combined so that a gamma spectrum could be immediately obtained on a 100-channel pulse-height analyzer. Results of such measurements are shown. In accordance with the well-known level scheme of O^{16} three gamma lines with the energies 6.14, 6.92 and 7.12 mev are observed. These values are taken from the literature and the measurements reported should be considered as a calibration of the spectrometer. (Contractor's abstract)

BOUNDARY LAYER TRANSITION AT SUPERSONIC SPEEDS–THREE DIMENSIONAL ROUGHNESS EFFECTS (SPHERES), by E. R. van Driest and C. B. Blumer. Aug. 15, 1961, 48p. incl. illus. diagrs. tables. (Rept. no. SID-61-275) (AFOSR-1493) (AF 49(638)250) AD 265237 Unclassified

Also published in Jour. Aerospace Sci., v. 29: 909-916, Aug. 1962.

Experiments carried out in the 12-in. supersonic wind tunnel to investigate the effect of 3-dimensional roughness elements (spheres) on boundary-layer transition on a 10° (apex angle) cone without heat transfer are reported. The local Mach number for these tests was 2.71. The data show clearly that the minimum (effective) size of trip required to bring transition to its lowest Reynolds number varies as the one-fourth power of the distance from the apex of the cone to the trip. Use of available data at other Mach numbers indicates that the Mach number influence for effective tripping is taken into account by the simple expression $Re_{\delta^*} = 1025\,(1 + \frac{\gamma-1}{2} M_{\delta}^{2})\,(k/\delta^*)^{-2}$. Some remarks concerning the roughness variation for transition on a blunt body are made. Finally, a general criterion is introduced which gives insight to the transition phenomenon and anticipates effects of external and internal disturbances, Mach number, and heat transfer.

PHYSICAL PROCESSES OF ROCKET COMBUSTION (Abstract), by R. B. Lawhead. [1961] [1]p. [AF 49-(638)617] Unclassified

Presented at Fourteenth AFOSR Contractors' meeting on Liquid Rocket Combustion Research, Princeton U., N. J., Sept. 25-26, 1961. (AFOSR-1766; AD 267915)

Results of research studies of liquid propellant rocket combustion processes and methods for stabilizing destructive acoustic modes of instability are discussed. The results of these studies may be summarized as follows. Dynamic stability as a requirement for all rocket systems. At least 1 method of dynamic stabilization is presently available. An understanding of the physical processes of stabilization is required before stabilization design parameters can be generalized. Present droplet burning model describes steady state combustion in current LOX/Hydrocarbon systems. The model must be expanded to other propellants and operating conditions and unstable operations. Experimental studies must correspond with large engine behavior. Basic physical process data required to confirm and expand analytical models and permit development of design criteria must be investigated.

COPPER AS A PHOTOMETRIC INDICATOR IN THE SELECTIVE CHELOMETRIC TITRATION OF METAL ION MIXTURES, by D. A. Aikens, G. Schmuckler and others. Mar. 2, 1961, 1v. incl. diagrs. tables, refs. (Rept. no. UNC-Chem. no. 6-CNR) (AFOSR-426) (AF 49(636)333) AD 255479 Unclassified

Photometric and point detection permits selective chelometric determination of metal ions in mixtures with much less masking than required for visual or potentiometric techniques. Copper has been found to be a useful photometric indicator for such titrations. Prediction of appropriate titration conditions is readily accomplished with graphical plots of effective chelonate stability. Calcium is determined in the presence of magnesium with ethylene glycol bis(beta-amino-ethyl ether)-N,N-tetraacetic acid in 0.5 M ammonium hydroxide at pH 10. Selective determination of cadmium or of zinc in the presence of the other is carried out with diethylenetriaminepentaacetic acid under the same conditions. Attention is directed to the importance of competitive equilibria which affect chelonate stability, and stability constants for ammonia derivatives of some copper chelonates are reported. A CONSTANT CURRENT MICROCOULOMETRIC TECHNIQUE FOR DROPPING MERCURY ELECTRODES, by H. M. Mark, Jr., E. M. Smith, and C. N. Reilley. May 27, 1961 [25]p. incl. diagrs. tables, refs. (Rept. no. UNC-Chem. no. 9-CNR) (AFOSR-788) (AF 49(638)333) AD 259140 Unclassified

Also published in Jour. Electroanal. Chem., v. 3: 98-111, Feb. 1962.

A constant current microcoulometric method for determining the number of electrons involved in a unit of reaction at a dropping mercury electrode is described in detail. A large capacitor is connected in parallel with the microcell, and a constant current applied to the combination. The results obtained from several tests with both reversible and irreversible reductions are discussed, and the optimum conditions for accurate results with the method are presented. The principal advantage of the amperostatic method over the usual potentiostatic method is the ease with which the number of coulombs passed during the electrolysis can be calculated.

CURRENT-SCAN POLAROGRAPHY. STUDY OF A SYSTEM WHICH EXHIBITS A POLAROGRAPHIC MAXIMUM, by H. B. Mark, Jr. and C. N. Reilley. [1961] [10]p. incl. diagrs. tables, refs. (AFOSR-1322) (AF 49(638)333) AD 441852 Unclassified

Also published in Jour. Electroanal. Chem., v. 3: 353-362, June 1962.

The Ni^{2+} system which gives a polarographic maximum, has also been shown, by this investigation, to give an unusual controlled current-scan polarogram. A dropping mercury electrode and a large capacitor connected in parallel with the electrolysis cell were used. The limiting currents, obtained when an increasing current-scan was applied, were poorly reproducible and were much greater than the average diffusion-controlled current. In contrast, a decreasing current-scan resulted in very precise diffusion-limited current values, which were proportional to concentration over the millimolar range. An explanation of these characteristics is presented in terms of the same phenomenon which caused the potential-scan max. Also, the effects of varying the capacitance, concentration of reducible species, and concentration of a maximum suppressor are discussed. (Contractor's abstract)

CHELOMETRIC TITRATIONS WITH AMPEROMETRIC END-POINT DETECTION, by R. T. Campbell and C. N. Reilley. Aug. 29, 1961 [29]p. incl. diagrs. tables, refs. (Rept. no. UNC-Chem. no. 12-CNR) (AFOSR-1547) (AF 49(638)333) Unclassified

Also published in Talanta, v. 9: 153-167, 1962.

Anodic chelon waves may be used as indicator waves in the amperometric titration of metal ions which exhibit poorly defined reduction waves. By this method, also mixtures of metal ions whose log K values differ by less than 4 units may be selectively titrated. Buffers and chelons may be selected to improve selectivity, and the procedure is more rapid than the usual amperometric methods. Results are given for selected ions and mixtures of ions. The interference of halide ions must be overcome.

DIFFERENTIAL KINETIC ANALYSIS: THE METHOD OF PROPORTIONAL EQUATIONS, by R. G. Garmon and C. N. Reilley. Aug. 11, 1961 [34]p. incl. diagrs. table, refs. (Rept. no. UNC-Chem. no. 11-CNR) (AFOSR-1549) (AF 49(638)333) AD 441849 Unclassified

Also published in Anal. Chem., v. 34: 600-606, May 1962. (Title varies)

The initial concentration of a species undergoing a simple or complex first-order reaction is directly proportional to the amount of product formed at any given time or to any parameter directly proportional to the product. This proportional relationship is utilized in 2 ways. First, measurements of the extent of reaction for several species undergoing completing reactions at a number of times equivalent to the number of species present permits a simultaneous determination of the mixture. Second, the change in the extent of a reaction between any 2 given times is directly proportional to the initial concentration of the reacting species. Judicious selection of a time interval in which to observe the reaction greatly reduces the effect of interfering species. (Contractor's abstract)

THE KINETICS OF EXCHANGE OF COPPER (II) BETWEEN ETHYLENEDIAMINETETRAACETIC ACID AND ERIOCHROME BLUE BLACK R, by D. W. Rogers, D. A. Aikens, and C. N. Reilley. [1961] [5]p. incl. diagrs. refs. (AFOSR-4476) (AF 49(638)-333) AD 441846 Unclassified

Also published in Jour. Phys. Chem., v. 66: 1582-1586, Sept. 1962.

The exchange of Cu (II) between EDTA and Eriochrome Blue Black R, 1-(2-hydroxy-1-naphthylazo)-2-naphthol-4-sulfonic acid, a typical o,o'-dihydroxyazo compound, occurs by acid-catalyzed dissociation of the chelates below pH 5 and by second-order displacement reactions above pH 5. Bonding of the attacking ligand to the Cu chelate followed by competition between the two ligands is postulated for the second-order reactions. (Contractor's abstract)

Unclassified

Also published in Anal. Chem., v. 34: 1198-1213, Sept. 1962.

A series of equations based on a simple principle is developed to describe the shape of chromatographic curves in terms of the mode of sample injection. This principle is used to develop useful parameters to describe step chromatography curves, and comparison is made to the corresponding parameters of impulse chromatography curves. The use of various input functions leads to many novel response shapes, thus considerably broadening the scope of gas chromatographic techniques. Applications of various sample input profiles to quantitative analysis, preparative chromatography, the study of column phenomena, and the monitoring of industrial process streams are discussed. INCREASED SELECTIVITY IN CHELOMETRIC TITRATIONS THROUGH END POINT LOCATION BY LINEAR EXTRAPOLATION. COPPER AS A PHOTOMETRIC INDICATOR, by D. A. Aikens, G. Schmuckler and others. [1961] [8]p. incl. diagrs. tables, refs. (AFOSR-4479) (AF 49(638)333) AD 441843
Unclassified

Also published in Anal. Chem., v. 33: 1664-1671, Nov. 1961.

The inherent selectivity of end point location by linear extrapolation permits selective determinations to be carried out when the difference in effective chelonate stability constants of sought-after and interfering ions is as small as 2 log K units. The necessary masking often can be provided by careful choice of chelon and buffer systems. Photometric titrations with a Cu(II) indicator are presented as an example. Ca is determined in the presence of Mg in 0.5M ammonium hydroxide at pH 10 with ethylene glycol bis(bor 'B'-type beta)-N,N'-tetraacetic acid. Selective determinations of Cd and of Zn in the presence of the other are carried out with diethylenetriaminepentaacetic acid under the same conditions. Analytical and empirical methods for the determination of appropriate solution conditions are presented. (Contractor's abstract)

A NEW PROOF OF THEOREMS OF PERRON AND FRONBENIUS ON NON-NEGATIVE MATRICES. II, by A. Brauer. Sept. 1961, 16p. incl. refs. (Technical rept. no. 14) (AFOSR-1496) (AF 18(603)38)
Unclassified

Also published in Studies in Mathematical Analysis and Related Topics, Stanford, Stanford U. Press, 1962, p. 48-55. (Title varies)

In part 1 of this paper (item no. NCU.03:002, Vol. 1) a new proof of the Theorems of Perron and Frobenius on positive matrices was given and some of their results were improved. Moreover, a method was obtained to compute the greatest positive root of a positive matrix and a characteristic vector belonging to this root as exactly as needed. The same method can be used for non-negative matrices. But the proofs are more difficult than for positive matrices. Therefore, the results were first published for positive matrices and the publication for the case of non-negative matrices is given. The proofs become much simpler and the computation of the greatest root requires a smaller number of steps. (Contractor's abstract)

A STUDY OF DISLOCATIONS IN SILVER CHLORIDE, by M. G. Miller. June 1961, 91p illus. diagrs. refs. (AFOSR-946) (AF 49(638)[illegible]) [illegible]259676
Unclassified

Dislocations in AgCl have been studied through the use of 3 different types of experiments: absorption edge measurements; tensile tests; decoration experiments. A shift of 1A% plastic deformation could have been detected. This is much smaller than the shift of 12A% plastic deformation found by Chiarotti. Experiments on the tensile properties of AgCl show that the history of preparation and impurity content of the crystal affects these properties. Tests were run on copper doped samples which showed that the divalent state exhibited strain aging whereas the crystal containing copper in the monovalent state showed no strain aging. Quenching raises the initial yield point by 350% with the evidence pointing toward a large part of the increase being due to quenched in point defects. Photolytic silver in the interior of AgCl locks dislocations and raises the initial yield stress by 60%. Strain aging was found to be accumulative. Part of the increase in yield stress is irrecoverable.

A technique for decorating dislocations deep in the interior of AgCl crystals using the Haynes-Shockley method was extended. (Contractor's abstract)

EFFECTS OF QUENCHING AND ANNEALING ON IONIC CONDUCTIVITY AND ON DISLOCATION DECORABILITY IN SILVER CHLORIDE, by H. Layer, M. G. Miller, and L. Slifkin. [1961] [18]p. incl. illus. diagr. refs. (AFOSR-1432) (AF 49(638)865) AD 263713 Unclassified

Presented at Internat'l. Conf. on Chemical Physics of Nonmetallic Crystals, Evanston, Ill., Aug. 28-31, 1961. (AFOSR-2143)

Also published in Jour. Appl. Phys., Suppl., v. 33: 478-481, Jan. 1962.

Pure silver chloride crystals, when cooled rapidly from high temperatures, show enhanced ionic conductivity which may be attributed to quenched-in Schottky defects. From the annealing out of this extra conductivity one deduces that for an associated vacancy pair the binding energy is 0.42 ev and the migration energy is ≥ 1.0 ev. The decorability of interior dislocations by swept-in photoelectrons is also discussed and is shown to be sensitive to the purity of the crystal. (Contractor's abstract)

STUDIES OF POINT DEFECTS IN SILVER CHLORIDE, by H. Layer and L. Slifkin. [1961] [11]p. (AFOSR-2644) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)865 and Atomic Energy Commission) AD 289109 Unclassified

Also published in Jour. Phys. Chem., v. 66: 2396-2398, Dec. 1962.

Experiments on excess point defects introduced into single crystals of silver chloride by pulsed plastic extension or by rapid cooling from high temperature yield the following results. Point defects are created by plastic deformation much less efficiently in silver chloride than in other substances that have been studied. Interstitial silver ions so produced have a lifetime of the order of 10^8 jumps. Rapid cooling of very pure silver chloride quenches in approximately 0.1% Schottky defects. The silver and chloride vacancies are almost completely associated at room temperature. These divacancies have an activation energy for migration of 23 kcal/mol and a dissociation energy of 9.8 kcal/mol. (Contractor's abstract)

DISLOCATION DECORATION INSIDE SILVER CHLORIDE CRYSTALS (Abstract), by L. Slifkin and C. B. Childs. [1961] [1]p. [AF 49(638)865] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 23, Feb. 1, 1961.

A method for the decoration of dislocations throughout the interior of large AgCl single crystals which does not require an annealing treatment at elevated temperatures is developed. The crystals are moderately loaded with submicroscopic colloidal Ag by means of the Haynes-Shockely photoelectric technique. They are then allowed to age for several days at room temperature, during which time much of the Ag migrates from random scattering centers into the dislocations. This results in such an increase in the contrast between the decorated dislocations and the background that the dislocation structures then can be examined with ordinary bright-field microscopy and to depths of the order of mm. Photographs of various networks and dislocation structures obtained by this technique will be shown. Since no high-temperature annealing is necessary, this method suggests the possibility of studies of plasticity effects in the cold-worked state without the limitation of surface effects.

DETECTION OF PRIMARY COSMIC-RAY PARTICLES IN LARGE SILVER CHLORIDE SINGLE CRYSTALS (Abstract), by C. B. Childs and L. Slifkin. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)865] and Army Research Office (Durham)] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 52-53, Feb. 1, 1961.

Patterns attributable to tracks of heavy cosmic rays have been developed internally in large single crystals of AgCl. Crystals which had been flown at 120,000 ft were treated according to the procedure of Haynes and Shockley. Pulsed UV radiation produces photoelectrons near the surface of the crystal. If the surface is sufficiently undistorted, these electrons then may be swept into the interior by a synchronous electric field. Some photoelectrons become trapped along imperfections formed by the cosmic-ray track. Silver ions combine with these electrons to form Ag-atoms which then serve as further traps. Ultimately the cosmic-ray track is delineated by microscopic

Ag specks. Preliminary studies show several events which can be attributed to cosmic-ray particles. Possible advantages of this technique are lack of angular distortion during development and high density of the medium.

DISLOCATIONS IN SILVER CHLORIDE CRYSTALS (Abstract), by M. G. Miller and L. Slifkin. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)865] and Army Research Office (Durham)] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 280, Apr. 24, 1961.

Dislocations in AgCl were studied utilizing 2 distinct experimental techniques: (1) Dislocations in the interior of crystals have been decorated by forming internal print-out, using the Haynes Shockley technique; and (2) tensile experiments, using a "hard" tensile machine have been performed to determine the effect of impurities, defects inducted by quenching, and internal print-out on the plastic properties of AgCl. The relative contrast of dislocation decoration has been found to be extremely dependent on impurity content. At the time of writing no evidence has been found for pile-ups although bowed out loops have been observed. In copper-doped crystals, the presence or absence of strain aging has been found to be dependent upon whether the impurity is in the divalent or monovalent state. Crystals containing decorated dislocations have been tested in tension and show a slight increase in initial yield point. Further similar experiments are in progress. Quenching experiments indicate that defects thus produced increase the yield point markedly and also decrease the rate of work hardening.

RENORMALIZATION OF QUANTUM ELECTRODYNAMICS IN A CLASSICAL GRAVITATIONAL FIELD, by R. Utiyama. July 1961, 45p. incl. diagrs. refs. (Publication no. 9) (AFOSR-1349) (AF AFOSR-61-72) AD 269909 Unclassified

Also published in Phys. Rev., v. 125: 1727-1740, Mar. 1, 1962.

The singularities of Green's functions of electrons and photons in a classical gravitational field are investigated. These singularities can be removed by the introduction of some suitable counter terms into the equations of Green's functions. These counter terms can be given by rewriting the conventional renormalization technique in a generally covariant way. The infinite renormalization constants appearing in the conventional quantum electrodynamics are shown to be sufficient for the removal of the singularities of the present system; any other renormalization is not necessary. The segregation of these singularities needs an exclusive use of the transformation properties of Green's functions under general coordinate transformations, Viebein rotations, and gauge transformations. RENORMALIZATION OF A CLASSICAL GRAVITATIONAL FIELD INTERACTING WITH QUANTIZED MATTER FIELDS, by R. Utiyama and B. S. DeWitt. [1961] [11]p. incl. diagrs. (Publication no. 11) (AFOSR-1746) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-72 and Office of Naval Research under Nonr-85507) AD 269910 Unclassified

Also published in Jour. Math. Phys., v. 3: 608-618, July-Aug. 1962.

The behavior of the mean value of the energy-momentum tensor of a set of quantized matter fields interacting with a classical gravitational field which is, in turn, produced by this mean value, is investigated. Singularities appear in the energy-momentum tensor corresponding to divergences of 3 different orders: ∞^4, ∞^2, and $\log \infty$. These can be removed by the introduction of counter terms into Einstein's equation. The ∞^4 singularity is removed by a "cosmological term," the ∞^2 singularity by a renormalization of the gravitation constant, and the $\log \infty$ singularity by a counter term derivable from a Lagrangian which is quadratic in the Riemann tensor. The gravitational Green's function corresponding to this semiclassical approximation to the fully quantized theory is found to have the asymptotic behavior $1/p^4$ instead of $1/p^2$, and thus to have a much weaker singularity in the coordinate representation than the Green's function of the "bare" linearized theory. QUANTIZATION OF FIELDS WITH INFINITE-DIMENSIONAL INVARIANCE GROUPS. II. ANTICOMMUTING FIELDS, by B. S. DeWitt. [1961] [12]p. incl. refs. (Publication no. 12) (AFOSR-2165) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-72 and Office of Naval Research under Nonr-85507) AD 271433 Unclassified

Also published in Jour. Math. Phys., v. 3: 625-636, July-Aug. 1962.

The Green's function approach to the definition of commutators for fields possessing infinite dimensional invariance groups is extended to the case of anticommuting fields. The discussion is restricted to fields which provide linear homogeneous or inhomogeneous representations of the group, a restriction which excludes no case of practical interest and facilitates setting up the formalism in a manifestly covariant way. Self-consistency of supplementary conditions, Huygen's principle and reciprocity relations are established just as for commuting fields. Careful attention must be paid to the ordering of anticommuting factors, particularly in the demonstration of the Poisson-Jacobi identity. The invariance properties of the Poisson bracket are investigated in detail and the notion of conditional invariant is introduced. A special class of conditional invariants called asymptotic invariants, which give a complete physical characterization of initial and final states of the dynamical system, is studied. DEFINITION OF COMMUTATORS VIA THE UNCERTAINTY PRINCIPLE, by B. S. DeWitt. [1961] [6]p. incl. refs. (AFOSR-J21) (AF AFOSR-61-72) AD 297258 Unclassified

Also published in Jour. Math. Phys., v. 3: 619-624, July-Aug. 1962.

A general demonstration is given of the fact that the quantization of any system, as expressed by the uncertainty principle, implies the quantization of all other systems to which it can be coupled. It is also shown that the precise form which the uncertainty principle takes is uniquely specified. That is to say, the uncertainty principle effectively defines the commutator of any pair of observables. The argument serves to detach completely from its canonical origins a previously given definition of the commutator (which is a generalization of one given by Peierls) applicable to systems with infinite-dimensional invariance groups, for which the identification of canonical variables is an inconvenience. The measurements of a single observable and of a pair of observables are analyzed according to the Bohr-Rosenfeld scheme. (Contractor's abstract)

ON THE DEFINITION OF A CERTAIN CLASS OF AUTOMATA, by M. P. Schützenberger. Jan. 1961, 33p. (Mimeograph series no. 273) (AFOSR-87) (AF 49(638)213) AD 260709 Unclassified

This note is concerned with the definition of a class of 1 way tape automata, A, that includes that of finite automata. In a schematic manner an automaton from the class A consists of a 1 way, 1 tape, finite automaton controlling a very elementary computational process in which enter a finite number of finite but not bounded integral parameters. Three main restrictions are introduced. The definitions assure that a good part of Kleene's theory remains valid for the class A. Examples and counterexamples are presented to support the definitions. Kleene's theory is applied to the class A and an intuitive interpretation of the set of words accepted by an automaton of this class is given.

ON THE RECURRENCE OF PATTERNS, by M. P. Schützenberger. Mar. 1961, 14p. (Mimeograph series no. 283) (AFOSR-470) (AF 49(638)213) Unclassified

Consider a Bernoulli process in which the individual outcomes are the letters $x_i \in X$ and a set of words

(or "patterns") $U = u_i$ in these letters. By definition, the event U occurs for the first time at the end of a sequence f of letters if the last letters of f form a word from U and if this occurrence has not happened earlier on f. This type of recurrent event has been considered at some length by W. Feller, especially in the case where U reduces to the word $u = x_1^n$ $(= x_1 x_1 \cdots x_1)$, i.e. in the case of the so called "success run of length n." In the present note Feller's results are developed in order to get a simple expression for the generating function of U when U is a finite set, and with the help of some combinatorial properties of free monoids, more details of the case are discussed where U reduces to a single word.

ON THE CONSTRUCTION OF BOSE-CHAUDHURI MATRICES WITH THE HELP OF ABELIAN GROUP CHARACTERS, by D. C. Fosta. Mar. 1961, 21p. (Mimeograph series no. 278) (AFOSR-489) (AF 49-(638)213) Unclassified

Error-connecting codes or fractionally replicated factorial designs are built by constructing matrices having the P_d-property that any d rows of an n x r matrix A with entries from GF(s) (s prime power) are independent equivalent to the existence of an (n, n-p) s-ary t-error correcting and (t + 1)-error-detecting group code if $d = 2t + 1$, In addition, the Bose proof of the existence of a $\frac{1}{s^{n-p}} \cdot S^n$ fractionally replicated factorial design as being equivalent to $d = 2t$ in which no t-factor or lower order interaction is aliased with any t-factor or lower order interaction is used. Through use of the theory of group characters the results are formulated and it is shown how the Bose-Chaudhuri matrices can be obtained from the character tables of cyclic groups. An analogous construction is obtained with character tables of Abelian groups and hence a new family of matrices having the P_d-property.

ON A SPECIAL CLASS OF RECURRENT EVENTS, by M. P. Schützenberger. June 1961, 15p. (Mimeograph series no. 291) (AFOSR-891) (AF 49(638)213) AD 260711 Unclassified

Also published in Ann. Math. Stat., v. 32: 1201-1213, 1961.

Let F be the set of all finite sequences (words) in the symbols $x \in X$. Let the pair (A, μ), where A is a subset of F and μ a probability measure, be a recurrent event $\mathcal{E}$ as defined by Feller (An introduction to probability theory and its applications, v. 1, ch. VIII, 2nd ed., Wiley, New York, 1957). One says that the event $\mathcal{E} = (A, \mu)$ occurs at the last letter x_{i_n} of a word $f = x_{i_1} x_{i_2} \cdots x_{i_n}$ if and only if f belongs to the set A. A is called the support of $\mathcal{E}$, and the mean recurrence time of the event $\mathcal{E}$ is denoted by $T(A, \mu)$. If the pair (B, μ') defines another recurrent event on F, the pair $(A \cap B, \mu')$ also defines a recurrent event. In accordance with the general theory of Feller [loc. cit.] when $T(B, \mu')$ is finite the ratio $\pi = T(B, \mu')/T(A \cap B, \mu')$ is, in a certain sense, the limit of the conditional probability that a random word $f \in F$ belongs to A when it is known to belong to B. For given arbitrary A, it is in general possible to find infinitely many (B, μ') having finite $T(B, \mu')$ which are such that $\pi = 0$. The main point of this note is the demonstration of the following property: If the support A is such that $T(A \cap B, \mu')$ is finite for every recurrent event (B, μ') having finite $T(B, \mu')$, then for every such (B, μ'), π^{-1} is an integer at most equal to a certain finite number δ^* which depends only upon A.

SOME PROPERTIES OF THE LEAST SQUARES ESTIMATOR IN REGRESSION ANALYSIS WHEN THE INDEPENDENT VARIABLES ARE STOCHASTIC, by P. K. Bhattacharya. June 1961, 15p. (Mimeograph series no. 292) (AFOSR-892) (AF 49(638)213) AD 260713 Unclassified

Also published in Ann. Math. Stat., v. 33: 1365-1374, 1962.

For the linear regression of y on x observations the loss in estimating the true regression function by another function is considered as a loss function. For the loss function, it is shown under certain conditions that if the class of estimates which are linear in y's and have bounded risk is non-empty, then the estimate obtained by the method of least squares belongs to this class and has uniformly minimum risk in this class. A necessary and sufficient condition on the distribution function of x observations is obtained for this class to be non-empty, which unfortunately is not easy to verify in particular cases and is violated in a very simple situation. However, by a sequential modification of the sampling scheme, this condition may always be satisfied at the cost of an arbitrarily small increase in the expected sample size. It is also shown under certain further conditions on the family of admissible distributions that the least squares estimator is minimax in the class of all estimators. (Contractor's abstract)

A REMARK ON FINITE TRANSDUCERS, by M. P.

Schützenberger. June 1961, 15p. (Mimeograph series no. 289) (AFOSR-893) [AF 49(638)213] AD 260714 Unclassified

Also published in Inform and Control, v. 4: 185-196, Sept. 1961.

Right finite automata reading from left to right can realize different input/output transformations from left finite automata, e.g., no right automaton can perform the task of reproducing the input word when it begins with a given letter and of printing nothing when it does not. So the composite operation consisting of first transforming the input word by a right automaton and then transforming again the resulting output word by a left automaton cannot, as a rule, be carried out in one stage. The author calls this a transduction and proves the following. (1) The transductions form a set closed under finite composition and under inversion when this is meaningful. (2) They transform regular events on the input words into regular events on the output words, and any regular event can be obtained in this way. (Math. Rev. abstract)

INVESTIGATIONS ON FACTORIAL DESIGNS, by R. C. Bose and M. S. Patel. Apr. 1961, 218p. incl. tables, refs. (Mimeograph series no. 285) (AFOSR-895) (AF 49(638)213) AD 260716 Unclassified

Fractionally replicated designs are obtained for 2^m, 3^n, and experiments with their product with the number of treatment-combinations just sufficient to estimate the main effects, the 2-factor interactions and the error, without requiring difficult computation. With some additional treatment combinations, designs are also obtained so as to balance the estimates in the sense of the variances. Some of the designs so obtained are arranged into blocks. The analysis, both for the univariate case and the multivariate case is given. (Contractor's abstract)

AN ALGORITHM FOR A MINIMUM COVER OF AN ABSTRACT COMPLEX, by D. K. Ray-Chaudhuri. [1961] [14]p. (AFOSR-897) (AF 49(638)213) AD 260715 Unclassified

Also published in Canad. Jour. Math., v. 15: 11-24, 1963.

Let X be a finite set, and $\mathfrak{A}$ a set of subsets of X; $(X, \mathfrak{A})$ is an abstract complex; it is regular if $|A| = |B|$ for all $A, B \in \mathfrak{A}$. For each $x \in X$ let a positive integer $c(x)$ be given; $\mathfrak{A}_1 \subset \mathfrak{A}$ is a c-cover if each $x \in X$ belongs to at least $c(x)$ members of $\mathfrak{A}_1$. A c-cover $\mathfrak{A}_1$ with $|\mathfrak{A}_1|$ as small as possible is a minimum c-cover. If $\mathfrak{A}_1$ is a minimum c-cover, the number of x's contained in exactly $c(x)$ members of $\mathfrak{A}_1$ is the c-height of $\mathfrak{A}_1$ the smallest value of this for all c-covers $\mathfrak{A}_1 \subset \mathfrak{A}$ is the c-height of $(X, \mathfrak{A})$. By altering the inequalities one obtains maximum c-matchings and c-depth. The author's basic tool is a chain $\{A_1, B_1, \cdots, B_p, A_{p+1}\}$ where $A_i \in \mathfrak{A}_1$ and $B_j \in \mathfrak{A} - \mathfrak{A}_1$, subject to various (complicated) conditions. The first 2 theorems imply algorithms for obtaining (1) a minimum c-cover, (2) all minimum c-covers. Similar methods are then developed for deriving (1) a minimum c-cover of least c-height, (2) all such c-covers. When the complex is regular, it is shown that the algorithms can be shortened by restricting attention to special kinds of chains. Finally, it is pointed out that there is a natural duality between maximum c-matchings and minimum c-covers, with maximum c-depth corresponding to minimum c-height. (Math. Rev. abstract)

A CODING PROBLEM ARISING IN THE TRANSMISSION OF NUMERICAL DATA, by R. C. Bose and I. M. Chakravarti. Apr. 1961, 15p. incl. illus. (Mimeograph series no. 284) (AFOSR-898) (In cooperation with Case Inst. of Tech., Cleveland, Ohio) (AF 49(638)213) AD 260708 Unclassified

Also published in Bull. Inst. Internat'l. Stat., v. 39: 345-355, 1962.

The integers $i = 1, 2 \ldots, 2^n$ are to be encoded (mapped 1-1) as n-bit vectors α of 0's and 1's. If i is encoded as α, if α is sent, and if α' corresponding to i' is received (over some channel), then the error is defined as $|i - i'|$. Under the natural encoding $i \to \alpha = (a_1, \cdots, a_n)$, where $i = \Sigma\, a_r 2^{n-r}$, $a_r = 0$ or 1, the expected error is minimum (assuming only single errors occur, and making some equal-likelihood assumptions). The authors find other encodings which also produce this minimum expected error. They do this by rigidly moving the n-cube to produce several encodings with the same expected error for a given n; then they put two of these encodings together to get one for n + 1. Among such encodings f the authors show (by similar methods) how to find f* such that the minimum expected error among the integers i has the value $p(2^{n+1} + 3n - \delta)/6n$, which is known to be best possible for n = 2 and 3. ($\delta = 1$ [2], n odd [even]; p is the probability of an error in a binary digit). (Math. Rev. abstract)

ON THE EQUATION $a^{2+n} = b^{2+m}c^{2+p}$ IN A FREE GROUP, by M. P. Schützenberger. June 1961, 15p. (Mimeograph series no. 290) (AFOSR-912) (AF 49-(638)213) AD 260710 Unclassified

The problem of proving that in a free group G the equation $a^{2+n} = b^{2+m}c^{2+p}$ (n, m, p ≥ 0) has only trivial solutions has been attacked first by R. G. Lyndon (Mich. Math. Jour., v. 6: 89-95, 1959). E. Schenkman (Ann. Math., v. 70: 562-564, 1959) generalized Lyndon's result and proved by group theoretical arguments that the result is true for all values of n when m and p are equal to n. In this note it is shown that brute force is quite enough in the general case. For this, the equation in G is replaced by 2 equations in F, the free monoid generated by a fixed set of generators of G together with their inverses. Thus, if Φ is the canonical homomorphism F → G, and if |f| denotes the length of the element f ∈ F, F can be provided with an involution f → $\bar{f}$ such that $\Phi\bar{f} = (\Phi f)^{-1}$ and $|f| = |\bar{f}|$. The complement F* of the ideal of F generated by all elements of the form $f\bar{f}$ ($|f| \neq 0$) is just the set of all words which are in reduced form.

APPLICATION OF THE GEOMETRY OF QUADRICS FOR CONSTRUCTING PBIB DESIGNS, by D. K. Ray-Chaudhuri. June 1961, 18p. (Mimeograph series no. 294) (AFOSR-931) (AF 49(638)213) AD 260715 Unclassified

Also published in Ann. Math. Stat., v. 33: 1175-1186, 1962.

The geometry of quadrics is used to construct several series of partially balanced incomplete block (PBIB) designs with 2 associate classes. A brief discussion is given of the properties of quadrics and generators (lines contained in quadrics). Three theorems are proven and used to construct PBIB designs on the basis of configurations of generators and points, configurations of points and generators of a quadric and configurations of generators on generators. An example is given of the construction of a PBIB design with 15 treatments and blocks in blocks of size 3. (Math. Rev. abstract)

SOME TERNARY ERROR CORRECTING CODES AND FRACTIONALLY REPLICATED DESIGNS, by R. C. Bose. May 1961, 14p. (Mimeograph series no. 295) (AFOSR-1090) (AF 49(638)213) AD 260712 Unclassified

The connection between the theory of error correcting codes and the theory of fractionally replicated designs is pointed out. It is shown that the packing problem plays a fundamental role in both theories. This is the problem of finding the maximum possible number of distinct points in the finite projective space PG(r-1, p), where p is a prime or a prime power, so that no d of the points are dependent. [illegible] found a configuration of 12 points in PG(5, 3) so that no 6 are dependent. Ternary error correcting codes and some fractional factorial designs (with or without blocking) are deduced. ON THE DEFINITION OF A FAMILY OF AUTOMATA, by M. P. Schützenberger. Jan. 1961, 33p. (Mimeograph series no. 273) (AF 49(638)213) Unclassified

Published in Inform. and Control, v. 4: 245-270, Sept. 1961.

The definition of a family A of automata derived from the family A_0 of the finite one-way one-tape automata is discussed. In loose terms, the automata from A are among the machines characterized by certain restrictions. The family A is a very elementary modification of A_0 and it is not claimed that it relates usefully to the Turing machines or to the algorithms used in actual computing practice. An automata α ∈ A is given by a (homomorphic) representation μ of the monoid F in the ring Z_N of the integral N X N matrices (N, finite) together with the rule $F\alpha = \{f \in F: \mu f_{1,N} \neq 0\}$ where $\mu f_{1,N}$ denotes the (1, N) entry of the matrix μf. It is verified that the family R of all the sets F_α with α ∈ A has the following property: If F' and F'' belong to R the same is true of their intersection, union, set product F'F''.

ANTE-DEPENDENCE ANALYSIS OF AN ORDERED SET OF VARIABLES, by K. R. Gabriel. [1961] [12]p. (AF 49(638)213) Unclassified

Published in Ann. Math. Stat., v. 33: 201-212, Mar. 1962.

For any set of p ordered variables, X_i, D_s denotes the condition that X_i and $X_{i-s-z-k}$ have zero partial correlation, given all the variables $X_{i-1}, X_{i-2}, \cdots, X_{i-s-z}$ for all non-negative i, s, k, z. This is equivalent for normal variates to each variable, given at least s immediate antecedent variables. The author shows that D_s is equivalent to the 1/2(p-s) (p-s-1) elements in the upper right (and lower left) corner of the inverse covariance matrix being zero. Maximum likelihood estimates under D_s are derived for the normal case, and the likelihood-ratio test of D_s against D_{s+i} is shown to be asymptotically equivalent to X^2 with p-s-1 degrees of freedom. Application to the growth of organisms and to increasingly complex psychological tests are suggested.

ON CONSTRUCTING THE FRACTIONAL REPLICATES OF THE 2^m DESIGNS WITH BLOCKS, by M. S. Patel. [1961] [10]p. (AF 49(638)213) Unclassified

Published in Ann. Math. Stat., v. 33: 1440-1449, Dec. 1962.

In this paper Galois fields and finite Euclidean geometry are employed to develop a procedure for constructing fractional replicate plans for the 2^m experiments. The procedure allows the arrangement of these fractional replicate plans in blocks with relatively few treatment combinations. The plans developed permit the estimation of all main effects, 2-factor interaction effects and block effects with the assumption that 3-factor and higher-order interaction effects are negligible. The estimates of the main-effects and 2-factor interaction effects are correlated (partially confounded) in sets, but are orthogonal to the block contrasts. The plans constructed by the suggested technique require fewer treatment combinations than do comparable plans which yield orthogonal estimates of all the estimable effects. (Math. Rev. abstract)

CENTRAL LIMIT THEOREM FOR SUMS OVER SETS OF RANDOM VARIABLES, by F. Eicker. Mar. 1961, 15p. (Mimeograph series no. 279) (AFOSR-491) (AF 49(638)929) Unclassified

Also published in Ann. Math. Stat., v. 34: 439-446, 1963.

The classical problem of the probabilistic limit laws is to determine conditions for random variables in order that their sums for increasing number of terms tend to a limit law. In statistical estimation the situation occurs frequently where the distributions of these random variables are not exactly known. They may be assumed to be members of a certain family of distribution functions. In a general approach presented in this paper the family is replaced by a set of random variables. Then conditions are given for this set and the linear coefficients occurring in the sums in order that these sums converge for any selection of random variables out of F to a normal law. It seems to be much more difficult if not impossible to find similar simple conditions for the convergence to other limit laws.

THE DESIGN OF A FUNGUS-EATER, by M. Toda. Jan. 1961, 10p. incl. diagr. tables. (Research memo no. 7) (AFOSR-256) (AF 49(638)729) AD 250706 Unclassified

Presented in part at Research Computation Center Seminar, North Carolina U., Chapel Hill, Nov. 2, 1960.

The experimenter has hypothesized a theoretical environment of a uranium-containing planet to be mined by hypothetical fungus-eating robots. Human subjects in a laboratory situation will be used to simulate the fungus-eating robots - perceiving and learning the structure of the environment, solving problems, and making decisions. The experimenter will observe the human behavior and try to find the type of fungus-eater robot that would best simulate it. Through this hypothetical situation, the experimenter intends to develop more precisely the problems of perception, cognition, and learning by specifying in more detail the characteristics of the environment. When the environment is defined, he also intends to study the robot in this environment, together with other robots, leading to problems in social psychology, economics and other problems within psychology which may be synthesized through this hypothetical case study.

BAYES STRATEGIES AS ADAPTIVE BEHAVIOR, by R. A. Wiesen and E. H. Shuford. Oct. 1961, 10p. incl. diagrs. tables. (AFOSR-1491) (AF 49(638)729) Unclassified

Also published in Biological Prototypes and Synthetic Systems; Proc. Second Annual Bionics Symposium, Cornell U., Ithaca, N. Y. (Aug. 30-Sept. 1, 1961), New York, Plenum Press, v. 1: 303-310, 1962.

The central tendency or regression effect is one of the most commonly observed phenomena in psychophysical judgment. Regression effect means that the

subject tends to overestimate the low values in the stimulus distribution and underestimate the high values. On each trial of an experiment the subject sees a 3 x 3 matrix. His task is to estimate the percentage of 1's in a large 16 x 16 matrix. The subject does not see this larger matrix. He sees only the smaller 1 which contains the 9 elements near the center of the large matrix. After the subject records his estimate he is told the actual proportion of 1's in the 16 x 16 matrix and is paid a fixed amount of money for each estimate which is correct to the nearest percentage point. On each trial, the subject's task is analogous to estimating the parameter p of a binomial process, where p is the proportion of 1's in the large matrix. One such estimate is the maximum likelihood estimate which gives $\delta = \frac{x}{n}$, where δ is the estimate, x is the number of 1's in the 3 x 3 matrix and n is the number of elements in the 3 x 3 matrix. Many investigations have shown that the distribution of stimuli over a series of trials affects the relation between stimulus and response. Consideration is given here of a statistical estimation procedure which takes into account this distribution, namely a Bayes procedure. By specifying a normative model for a very specific situation and indicating that this model constitutes a partial description of the situation, it is shown that behavior in a psychophysical judgment task is adaptive and optimal. The general class of Bayes strategies provides a very broad and powerful set of potential models for the analysis of behavior and for the development of adaptive automata.

APPLICATIONS OF BAYESIAN PROCEDURES BASED ON DISCRETE PRIOR DISTRIBUTIONS, by E. H. Shuford. Oct. 1961, 12p. incl. diagrs. (Rept. no. 31) (AFOSR-1492) (AF 49(638)729) Unclassified

Presented at annual convention of the Amer. Psychological Association, New York, Sept. 5, 1961.

There is a characteristic of Bayesian inference which is not widely known, but which is essential to a proper understanding of the relation between Bayesian statistics and statistics as currently practiced. This characteristic is illustrated by comparing in some detail the Bayesian and orthodox analyses of 2 statistical problems: (1) the evaluation of 2 competing theories of behavior in the light of experimental evidence and (2) the experimental evaluation of the proportion of individuals in a population who are of a specified type. In each case it is shown that the orthodox procedure is a special case of the more general Bayesian procedure. It is hoped that Bayesian inference can broaden the range of application of statistics and can yield a more fitting and useful analysis of data.

[HETEROGENEOUS CATALYSIS IN LIQUID SYSTEMS] by R. Ciola, J. Carter and others. Final rept. Oct. 1958-Dec. 1960. Jan. 1961 [27]p. incl. diagrs. tables, refs. (AFOSR-93) (AF 18(603)132) AD 250207; PB 154361 Unclassified

Investigations were aimed at applying the following idea to the determination of the degree of diffusional control in heterogeneous catalytic reactions. In any

catalytic reaction, the reactants must diffuse to the surface, adsorb, react on the surface, desorb and diffuse back to the reactant stream. The diffusional steps have continually befogged attempts to derive the mechanisms of the catalytic reactions themselves. Attempts were made to develop a simple experimental method which would directly reveal the extent of diffusional control. Given the following reaction sequence which occurs on the surface of a heterogeneous catalyst: (1) A-A → A-B; and (2) A-B → B-B, A-A is a molecule containing 2 independent and non-reacting groups. Reaction of each group occurs independently and only 1 group can react during 1 period of residence on the surface. If diffusion within the pores of a catalyst is fast, then at low conversions the only apparent initial product will be A-B. If diffusion is slow, A-B has the chance to react further before escape into the vapor stream and B-B will appear as an initial product and to a degree which diagnoses the degree of diffusion control. The problem, then, is what actual compounds can be used to represent A-A. (Contractor's abstract)

FOURIER TRANSFORMS, by R. R. Goldberg. Final rept. New York, Syndics of the Cambridge U. Press, 1961, 76p. incl. refs. (No. 52) (AFOSR-689) [AF 49(638)383] Unclassified

This tract is designed to provide a background in those classical theorems concerning Fourier transforms on the real line which have found fruitful generalization in abstract harmonic analysis. In chapter I, all the theorems on integration used in subsequent chapters are stated. The Fourier transforms on L^1 are introduced. After determining its functional properties it is proven that an analytic function of a Fourier transform is locally a Fourier transform. An algebraized reformulation of some of the preceding results is given in terms of ideals in a commutative Banach algebra. The generalizations of the theorem proved in Chapter 2 are considered. The problem of whether or not the zeros of the Fourier transform of an L^1 function determine the span of the translates of the function is taken up. Bochner's characterization of Fourier-Stieltjes transforms of non-decreasing bounded functions is the subject of the last chapter. In addition, there is an appendix in which it is pointed out how many of the concepts and theorems can be carried over to an arbitrary locally compact abelian group.

A NEW LIMIT THEOREM FOR RECURRENT EVENTS, by M. Dwass. May 8, 1961, 8p. (AFOSR-602) (AF 49(638)877) AD 259504 Unclassified

Consider a recurrent event on the positive integers. Let N(n) denote the number of recurrences up to and including time n. For $0 < \alpha \leq 1$, it is known that if $EN(n)/n^{\alpha}$ has a limit as $n \to \infty$, then $N(n)/n^{\alpha}$ has a limiting distribution as $n \to \infty$. The limiting distribution is 1 of the so-called Mittag-Leffler distributions. On the other hand, consider the distribution of N(n) under the condition that a recurrence takes place at time n. The purpose of this note is to show that under a slightly stronger condition, $N(n)n/n^{\alpha}$ again has a limiting distribution. Now the limiting distribution is no longer of the Mittag-Leffler type; the distribution is 1 whose Laplace transform is the derivative of the Laplace transform of a Mittag-Leffler distribution. Northwestern U. [Dept. of Mathematics] Evanston, Ill.

A FLUCTUATION THEOREM FOR CYCLIC RANDOM VARIABLES, by M. Dwass. [1961] [5]p. incl. tables. (AFOSR-J24) [AF 49(638)877] AD 610991
Unclassified

Also published in Ann. Math. Stat., v. 33: 1450-1454, Dec. 1962.

A sequence of random variables $X_1, \cdots, X_n$ is said to be cyclic if its distribution law is invariant under all cyclic permutations. If $X_1, \cdots, X_n$ is a cyclic sequence of random variables, with $S_k = X_1 + \cdots + X_k$ for $k = 1, \cdots, n$, $M_n = \max(S_1, \cdots, S_n)$, and x^+ (x^-) denoting the positive (negative) part of x, then it is proved that $E(M_n^- | S_n = s) = s^- | n$. For independent identically distributed random variables it is shown that $E(t^{M_n^+}) = Et^{X_1} Et^{M_{n-1}^+} + P(M_n < 0) - E(T^{M_n} | M_n < 0)$ for $|t| \leq 1$. From this it is deduced that in case $\lim_{n\to\infty} P(M_n < 0) > 0$, then $\lim_{n\to\infty} M_n = M$ is well-defined and $Et^{M^+} = \dfrac{P(M < 0)[1 - E(t^M | M < 0)]}{1 - Et^{X_1}}$.

Also, if $-\infty < EX_1 < 0$, then $E(M | M < 0) = E(X_1)$ and if X_i are integer-valued, then $P(S_k < 0, k = 1, 2, \cdots) = -E(X_1)$. Finally a theorem of Kac and Spitzer, $EM_n^+ - EM_{n-1}^+ = ES_n^+/n$, is extended from an exchangeable to a cyclic sequence of random variables. (Math. Rev. abstract)

CONTINUED FRACTION SOLUTIONS OF THE RICCATI EQUATION, by E. P. Merkes and W. T. Scott. June 1961, 21p. incl. refs. (Technical note no. 3) (AFOSR-903) (AF 49(638)888) AD 259502
Unclassified

Also published in Jour. Math. Anal. and Appl., v. 4: 309-327, Apr. 1962.

Attention is confined to solutions of the general Riccati differential equation with a singular point at the origin. The Riccati differential equation has the formal property that a linear fractional transformation yields a new Riccati differential equation in a new dependent variable. An obvious connection with continued fractions arises from the fact that a continued fraction may be interpreted as a sequence of linear fractional transformations. Attention is focused on those linear fractional transformations which generate a continued fraction.

ON THE USE OF PARAMETERS IN CONTINUED FRACTION TRANSFORMATIONS, by E. P. Merkes. June 1961, 17p. (Technical note no. 4) (AFOSR-1082) (AF 49(638)888) AD 262932 Unclassified

There is a one-to-one correspondence between formal power series $w = 1 + \Sigma_n^\infty = 1\, c_n z^n$ and C-fractions

$$1 + \frac{a_1 z^{\delta_1}}{1} + \frac{a_2 z^{\delta_2}}{1} + \cdots + \frac{a_n z^{\delta_n}}{1} + \cdots,$$

where $\{a_n\}$ is a sequence of complex numbers and $\{\delta_n\}$ is a sequence of positive integers. The problem of obtaining the C-fraction expansion for the image under a transformation of the power series associated with a given C-fraction is difficult even for many elementary cases. When the dependent variable w or the independent variable z is changed by a linear fractional transformation, the C-fraction which corresponds to the image of the power series w is obtained from the C-fraction associated with w in a relatively simple manner for some special cases. An attempt is made to unify the known results on this problem by presenting a systematic method to introduce certain parameters, which, in turn, facilitate the transformation. In some cases the class of continued fractions for which the transformation is known to be applicable has been enlarged. Applications of the transformations are made to the Stieltjes and Hausdorff moment problems. (Contractor's abstract)

THE INTERACTION OF A NONIONIC DETERGENT WITH PROTEIN. I. PHYSICAL PROPERTIES OF THE SAME PROTEIN DETERGENT COMPLEX, by R. M. Dowben and W. R. Koehler. [1960] [5]p. incl. diagrs. table, refs. (AFOSR-23) (AF 49(638)321) Unclassified

Also published in Arch. Biochem. and Biophys., v. 93: 496-500, May 1961.

The addition of Triton X-100, a nonionic detergent, to solutions of bovine plasma albumin resulted in a small but significant increase in intrinsic viscosity and a decrease in electrophoretic mobility. The specific optical rotation of bovine plasma albumin, ribonuclease, and oxidized ribonuclease was unchanged by the addition of detergent. The number of reactive sulfhydryl groups of bovine serum albumin and muscle aldolase was unchanged in the presence of detergent. These data indicate that no gross structural change occurs in the protein but are consistent with the view that the degree of hydration is increased in the presence of detergent. (Contractor's abstract)

THE INTERACTION OF A NONIONIC DETERGENT WITH PROTEIN. II. EFFECTS ON A BOVINE PLASMA ALBUMIN-AZOMERCURIAL COMPLEX, by W. R. Koehler and R. M. Dowben. [1960] [7]p. incl. diagrs. table, refs. (AFOSR-343) (AF 49(638)321) Unclassified

Also published in Arch. Biochem. and Biophys., v. 93: 501-507, May 1961.

The titration curve of bovine plasma albumin showed a slight shift in the acidity constants of the carboxyl groups to higher values in the presence of the polyoxyethylene nonionic detergent, Triton X-100. The pK_a of the dimethylamino group of an azomercurial linked to protein is lowered by addition of Triton X-100 to the solvent. This change is accompanied by a blue shift in the absorption peak of the dye, a shift similar to that observed when such dyes are transferred from an aqueous to a nonaqueous solvent. The change in pK_a and absorption spectrum of the albumin-dye complex are reversed, in part, by the further addition of 8 M urea. These data are consistent with the view that the detergent interacts with the protein reinforcing and enlarging the envelope of structured water around the protein.

KINETICS OF INITIAL SINTERING OF VACUUM-REDUCED TITANIUM DIOXIDE, by D. H. Whitmore and T. Kawai. Dec. 1, 1961 [18]p. incl. diagrs. refs. (AFOSR-1858) (AF 49(638)436) AD 269923 Unclassified

Also published in Jour. Amer. Ceram. Soc., v. 45: 375-379, Aug. 1962.

Observations of sphere-to-plate bonding of vacuum-reduced, monocrystalline rutile were carried out over the temperature range 1200° to 1275°C. The rate law governing the interfacial growth between sphere and plate indicated that the predominate mechanism of material transport in this sintering process was volume diffusion. In the light of the reasonably satisfactory agreement between the oxygen self-diffusion coefficients calculated from the present sintering data and those directly observed by Haul and Just utilizing an isotopic exchange technique, it was indicated that oxygen ion diffusion is the rate-determining step in the sintering experiments described. PRECIPITATE HARDENING IN AN ALUMINUM-COPPER ALLOY, by J. G. Byrne, M. E. Fine, and A. Kelly. Feb. 1961 [31]p. incl. illus. diagrs. refs. (AFOSR-120) (AF 49(638)524) AD 253629 Unclassified

Also published in Philos. Mag., v. 3: 1119-1145, Sept. 1961.

Plasticity studies were made on single crystals (Al-1.7 at-% Cu) at 4.2°, 77°, 198°, 273° and 373° K. The critical resolved shear stress (CRSS), tension stress-strain curves, and the dependence of the flow stress on strain rate were determined for (1) supersaturated α solid solution, (2) α + Guinier-Preston

(GP) Zone 1, (3) α + GP II, (4) $\alpha + \theta'$, and (5) $\alpha + \theta$. The difference between the CRSS at 4.2° and 273°K is large for the first 2 structures, but small with GP II, θ', or θ precipitate. With α, α + GP 1, and α + GP II, a single slip system is operative over a significant portion of the stress-strain curve, and the rate of work hardening is about the same as that for pure Al. With θ and θ' a multiple slip is immediately detected before the yield stress, the work hardening rates are initially very rapid, and fall to small values after some strain so that a plateau occurs in the stress-strain curves. RESISTIVITY CHANGES DUE TO FORMATION OF G. P. ZONES (CLUSTERS RICH IN SOLUTE), by H. Herman and J. B. Cohen. [1961] [3]p. incl. diagrs. (AFOSR-952) (AF 49(638)524) Unclassified

Also published in Nature, v. 191: 63-64, July 1, 1961.

An anomalous increase in resistivity has been observed during formation of G. P. zones (clusters rich in solute) in several aluminum alloys. The object of this research has been to test whether a zone of definite size is associated with the maximum in resistance which occurs during aging. An alloy of aluminum-5.3 at.-% zinc has been studied, using both resistance measurements and small-angle scattering of x-rays. The results show that the resistance maxima are associated with zones of an average size of 10A in diameter.

REVERSION AND REFORMATION OF GP 1 IN Al-1.7 AT. PCT Cu, by H. Herman and M. E. Fine. [1961] [3]p. incl. diagrs. table. (AFOSR-1336) (AF 49(638)-524) Unclassified

Also published in Trans. Metall. Soc. AIME, v. 224: 503-505, June 1962.

Kinetics of reversion and reformation of GP 1 were studied resistometrically in Al-1.7 at. pct Cu. The reversion process is over in roughly 1/2 min at 205°C irrespective of the amount of primary aging. After reversion the occurrence of an incubation time before reaging begins has been substantiated. The reaging kinetics is drastically accelerated by plastic deformation to the specimen. An incubation time is observed only if the specimen is aged before reversion. The incubation time and the effect of plastic deformation indicate that nucleation of GP 1 is heterogeneous. Simple clusters of copper atoms apparently do not act as nuclei for GP 1. (Contractor's abstract)

AN EXPERIMENT ON THE INFLUENCE OF ALLOYING ELEMENTS ON THE INTERNAL FRICTION OF COLD WORKED AND QUENCHED MARTENSITIC IRON AND STEEL, by I. Tamura, T. Mura, and J. O. Brittain. Jan. 12, 1961 [13]p. incl. diagrs. table, refs. (AFOSR-115) (AF 49(638)780) AD 250703 Unclassified

Also published in Trans. Metall. Soc. AIME, v. 221: 1158-1162, Dec. 1961.

Plain carbon steel in the cold worked or martensitic conditions has an internal friction peak at about 250°C at a frequency of 1 cps. The influence of substitutional alloying elements on this peak was examined experimentally. The alloys which were vacuum melted Co-, Cr-, Mo-, Ni-, and Si-iron (about 3% alloying elements), and carburized Si-iron were used as specimens for the determination of internal friction versus temperature as measured by torsional pendulum method. The cold worked alloys had a peak at about 250°C which was much lower in height than that of plain C-iron and steel. Carburized Si-iron

in the quenched condition had a peak which occurred at a slightly lower peak temperature than in quenched plain C-steel, but the height of the peak was substantially greater than that found for the same alloy in the cold worked condition. The activation energy of this peak for martensitic St-steel was about 35 kcal/mol. (Contractor's abstract)

THE EFFECT OF STRESS ON GRAIN BOUNDARY SLIDING IN CREEP, by N. R. Adsit and J. O. Brittain. Feb. 2, 1961 [15]p. incl. illus. diagrs. tables, refs. (AFOSR-282) (AF 49(638)780) AD 252068 Unclassified

A number of zinc bicrystal specimens were tested with the boundary loaded in simple shear. Creep tests were run in a vacuum at 200°C and under an argon atmosphere at 350°C. Results indicated that the maximum amount of grain boundary sliding at a given time was proportional to the resolved shear stress on the slip plane. Curves of grain boundary sliding versus time were found to be cyclic but with no regular periodicity. The magnitude of the grain boundary sliding was not proportional to the grain boundary orientation. A model is proposed that involves ledges in the grain boundary and micromigration of these ledges. STRAIN AGING OF ALPHA-IRON, by E. Lautenschlager and J. O. Brittain. Mar. 10, 1961 [18]p. incl. diagrs. table, refs. (AFOSR-505) (AF 49(638)780) AD 255288 Unclassifted

Also published in Trans. Metall. Soc. AIME, v. 224: 48-53, Feb. 1962. (Title varies)

An investigation was conducted on fine grained alpha-iron wire to measure the influence of the temperature of deformation on strain aging near room temperature. Specimens were deformed various amounts at 77°, 195°, or 273°K; aged; and the strain aging followed by either internal friction or return of the yield point measurements. The results show that strain aging occurs in 3 stages. During the first stage there is small, almost immediate return of the yield point. The solute carbon concentration, as measured by internal friction, remains constant in stage I but is lower than the concentration in the unstrained condition. In the second stage, the solute concentration decreases while the magnitude of the yield point increases. In the third stage, the solute atoms continue to drain from the solution, the yield point approaches a maximum, and the strain hardening coefficient and flow curve increased. The kinetics of the strain aging reaction were not the same for the 2 sets of measurements since the internal friction results lag behind the yield point measurements. However, the strain aging kinetics measured at 44° and 64°C showed no effect due to the difference in initial deformation temperature; nor were the strain aging kinetics influenced by low temperature anneals at 77°, 195° and 273°K. THEORY OF CONTINUOUS DISLOCATION AND ITS APPLICATION, by T. Mura. Apr. 11, 1961 [14]p. incl. diagrs. (AFOSR-581) (AF 49(638)780) AD 255506 Unclassified

A new theory of the continuous dislocation is proposed by introducing the ideas that the stored energy of the continuous dislocation and the kinetic energy can be expressed by deformation tensors and their time derivatives as a natural extension of concepts in the classical theory of dislocations. The slip process in plastic deformation, Frank's network, and the propagation and vibration of dislocations are taken as examples derived from a few fundamental equations which have a correspondence to Maxwell's equations. EFFECT OF PRESTRAIN TEMPERATURE ON THE STRAIN AGING OF ALPHA-IRON, by E. Lautenschlager and J. O. Brittain. Sept. 20, 1961 [15]p. incl. diagrs. refs. (AFOSR-1467) (AF 49-(638)780) AD 263932 Unclassified

Also published in Trans. Metall. Soc. AIME, v. 224: 606-610, June 1962.

Yield point measurements were made on polycrystalline specimens of α-iron deformed various amounts at 77°, 195° and 273°K; aged; and redeformed at 77°, 195°, and 273°K. When the prestrain temperature is lower than that subsequent to aging, the yield point return is suppressed relative to specimens deformed at the same temperature both before and after aging. The degree of suppression is a function of both the magnitude of prestrain at the lower temperature and the difference between the deformation temperatures before and after aging. It is proposed that the suppression is caused by the formation of dislocation barriers during the initial low temperature deformation. The aging kinetics of polycrystalline α-iron wires deformed at 77° or 303°K were studied at 44° and 64°C using internal friction measurements. No change was noted as a result of the difference in prestrain temperature. (Contractor's abstract)

ANALOGY BETWEEN MAXWELL'S EQUATIONS AND A NEW THEORY OF CONTINUOUS DISLOCATION DENSITY (Abstract), by T. Mura. [1961] [1]p. [AF 49(638)780] Unclassified

Presented at meeting of the Amer. Phys. Soc., Los Angeles, Calif., Dec. 27-29, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 521, Dec. 27, 1961.

The potential energy and the kinetic energy of moving dislocations which are distributed through a material are expressed by deformation tensors and their time derivatives as a natural extension of concepts in the usual theory of dislocations. The proposed theory is found to have a number of correspondences with electromagnetic theory, in a different way, however, from that suggested by Kroner. These correspondences are in the strength of the magnetic field and the strength of the dislocation density, the strength of the electric field and the deformation rate, the electric current and the stress, and the velocity of light and the velocity of sound. Thus, the fundamental equations for the dislocation density have the same form as Maxwell's equations of the electromagnetic field.

THE EFFECT OF RADIATION ON SHOCK VELOCITY

ATTENUATION IN ELECTROMAGNETIC SHOCK TUBES, by J. A. Thornton and A. B. Cambel. Apr. 1961, 55p. incl. illus. refs. (AFOSR-1101) (AF 49-(638)879) AD 277360 Unclassified

Observations are reported in a study of effects of radiation on shock velocity attenuation in the conical electromagnetic shock tube. A summary is included of findings which have appeared in the literature along with the approximate blast wave theory, which has become the primary method of making theoretical velocity attenuation calculations. These published observations lead to the question of the effect of radiation on the velocity attenuation in a tube with highly reflective walls such as might be employed in a propulsion system. The approximate blast wave theory is then adapted in developing a modified approximate method for calculating the effect of radiation on shock velocity attenuation. Approximate radiation equations are combined with the velocity attenuation equations and a study is made of factors which might influence the velocity attenuation by radiation. It is concluded that radiation will be an important factor only for strong shocks moving into a dense gas (approximately 1/10 atmosphere or greater and room temperature). A description of the electromagnetic shock tube is given, and some of the velocity attenuation experiments which are being conducted are discussed. No attenuation due to radiation has been noted. These experiments conducted at low velocities and densities thus agree with the predictions of the approximate blast wave theory modified to account for radiation effects. (Contractor's abstract)

THERMOPHYSICAL PROPERTIES OF PLASMAS (Abstract), by C. F. Knopp, J. A. Thornton and others. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)879) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

A long range, systematic study is being conducted to determine the thermophysical properties of argon and air plasmas. The properties are being measured in plasmas with and without magnetic fields. In principal the work is being pursued along three lines, namely (1) the measurement of electrical properties using microwave techniques; (2) the measurement of plasma temperature distribution and physico-chemical composition using spectroscopic techniques; and (3) the determination of the influence of radiation on shock attenuation. The experimental data are being obtained with argon plasma generated in the GDL hyperthermal facility and air plasma generated in the GDL electromagnetic shock tube. Three different microwave techniques have been employed. These are: simple transmission measurements, interferometer measurements, and reflection and transmission measurements. The spectroscopic method of Fowler and Milne has been adapted to determine the temperature of argon plasma produced by an electric arc. A computer program for the IBM-650 is being completed to determine particle densities and partition functions in the temperature range 5000°K to 35,000°K. From the studies of radiation effects on shock attenuation, it was concluded that radiation will be an important factor when strong shocks move into a dense gas, i.e., when the pressure is 0.1 that of atmospheric or greater.

AN ELECTRON DIFFRACTION INVESTIGATION OF THE MOLECULAR STRUCTURE OF BUTATRIENE, by A. Almenningen, O. Bastiansen, and M. Traetteberg. [1961] [14]p. incl. diagrs. tables. (AFOSR-152) (AF 61(052)72) AD 265318 Unclassified

Also published in Acta Chem. Scand., v. 15: 1557-1562, 1961.

The electron diffraction sector method was used to determine the structure of the butatriene molecule in the vapor phase. The molecular parameters are determined to be the following: C – H 1.083A (u = 0.080A), $C_1 = C_2$ 1.318A (u = 0.040A), and $C_2 = C_3$ 1.283A (u = 0.039A). The error limits of all the parameters are approximately ± 0.005A. As in several other molecules with linear equilibrium conformation, a shrinkage effect is observed; i.e., the observed non-bonded CC distances are a trifle shorter than that calculated from the sum of the individual bond distances. The effect is explained by out-of-linearity vibrations. (Contractor's abstract)

THE NATURE OF BONDS BETWEEN CARBON ATOMS. HOW THEY VARY WITH ENVIRONMENT, by O. Bastiansen and M. Traetteberg. [1961] [8]p. incl. diagr. tables, refs. (AFOSR-3921) [AF 61(052)72] Unclassified

Also published in Tetrahedron, v. 17: 147-154, 1962.

Because the whole theory of the chemical bond is based on approximation calculations, a brief recapitulation of bond properties, specifically the carbon-carbon bond is presented. Emphasis is placed on the fact that precision measurement of structure parameters are difficult to carry out, but it is still more difficult to give a realistic evaluation of the error limits. Each molecule presents the investigator with new problems and every new experiment may be obscured by unexpected irregularities. Such parameters as covalent radii for carbon, the resonance effects of the sp^2-sp^2 C-C single bond, influence of negative groups, rings and bent bonds, condensed aromatic ring systems, and free and restricted rotation are discussed.

PRELIMINARY RESULTS OF AN ELECTRON DIFFRACTION REINVESTIGATION OF CYCLOBUTANE AND CYCLOPENTANE, by A. Almenningen, O. Bastiansen, and P. N. Skancke. [1961] [2]p. incl. refs. (AFOSR-3922) [AF 61(052)72] Unclassified

Also published in Acta Chem. Scand., v. 15: 711-712, 1961.

Preliminary results of an investigation of the molecular structure of cyclobutane and cyclopentane by the electron diffraction sector method are presented. For cyclobutane the carbon ring is definitely found to be puckered. The magnitude of the deviation from planarity is not determined with any reasonable accuracy at this stage of the investigation. The question of the existence of an inversion flopping of the carbon ring has not yet been settled unambiguously. The C-C and C-H bond distances were found to be significantly shorter than previously reported. For cyclopentane the ring system is found to deviate from planarity. The amplitude of the puckering, however, has not been determined. Within the limits of error the C-C bond length was found to be the same as that in the chain paraffins.

MINIMUM-EXPECTED-COST FILTERS FOR ARBITRARY COST FUNCTIONS, by J. P. Martino. 1961, 22p. incl. diagr. table, refs (AFOSR-1560) Unclassified

The minimum-expected-cost approach is applied to the following problem: Let the signal and noise be stochastic processes, x_t and y_t, respectively. Both are assumed to be continuous in probability and bounded, and are also assumed to start at t = 0. The desired operation on the signal will be represented by the filter function $\varphi(t)$; the actual operation on the signal (and noise), represented by the filter function f(t). The error is defined to be $e = \int_0^t \varphi(t - T)x_T dT - \int_0^t f(t - T)x_T dT - \int_0^t f(t - T)y_T dT$. Here the first term is the desired output from the receiver, and the sum of the last two is the actual output. Let F(e) be the distribution function for the error e, and C(e) the cost function giving cost of error for the specific application for which the filter f(t) is intended. The object then is to choose f(t) so as to minimize $E[C(e)] = \int_{-\infty}^{\infty} C(e)dF(e)$. Since by assumption F(e) is not known completely, the best that can be done is some approximation to the minimizing f(t). There are basically 2 alternatives. One is to use the partial information about the distributions of x_t and y_t to approximate F(e). The other is to approximate C(e) by a function C*(e) such that E[(C*(e)] can be calculated by using the partial information available. This latter alternative is shown to be possible although tedious from a computational standpoint.

SYNTHESIS OF HIGHLY-HINDERED ALIPHATIC COMPOUNDS, by M. S. Newman. Final rept. Nov. 1961, 6p. incl. diagrs. table. (AFOSR-1767) (AF 33-(616)3412) Unclassified

The synthesis of highly hindered aliphatic nitriles has been studied, triisopropylacetonitrile being the most hindered example obtained. As a side reaction in alkylation of hindered nitriles alkylated ketenimines are formed. Highly hindered aliphatic nitriles were found to be remarkably resistant to hydrolysis under drastic acidic or basic conditions. Hindered amides on alkaline treatment are converted largely into the corresponding nitriles. Di-t-butylacetic acid has been synthesized for the first time, and from it di-t-butylketene has been obtained. Studies of the latter show it to be the most stable ketene yet discovered. Treatment of di-t-butylketene with formaldehyde and boron fluoride etherate yields a β-lactone which on reduction with lithium aluminum hydride yields di-t-butylmethylacetic acid, possibly the most hindered aliphatic acid known. Ionization constants of all the highly hindered aliphatic acids prepared in this work (except for di-t-butylmethylacetic acid) have been determined at 40° in 50% methanol. (Contractor's abstract)

NEUTRON DIFFRACTION STUDY OF SOLID DEUTEROAMMONIA, by J. W. Reed and P. M. Harris. [1961] [8]p. incl. illus. diagrs. tables, refs. (Technical note no. 1) (AFOSR-729) (AF 49(638)397) Unclassified

Also published in Jour. Chem. Phys., v. 35: 1730-1737, Nov. 1961.

The crystal structure of the stable cubic modification of solid deuteroammonia has been determined by neutron diffraction. The space group is $P2_13-T^4$, and at -196°C the positions of the atoms are 4N at (a) with u = 0.2127 ± 0.0021 and 12D at (b) with x = 0.3740 ± 0.0019, y = 0.2632 ± 0.0037, and z = 0.1094 ± 0.0016. Each nitrogen atom is hydrogen bonded to the 6 nearest neighbor nitrogen atoms. There is 1 deuterium atom per site, in contrast to the "half-hydrogen" structure of ice. The N-D bond length of 1.005 ± 0.023 A is indistinguishable from that of the free molecule, while the D-N-D bond angle of 110.4° ± 2.0° is appreciably larger than the free molecule value. RARE EARTHS. III. A MASS-SPECTROMETRIC INVESTIGATION OF THE ISOMOLECULAR OXYGEN-EXCHANGE REACTIONS OF LANTHANUM, CERIUM, PRASEODYMIUM AND NEODYMIUM WITH THEIR MONOXIDES, by P. N. Walsh, D. F. Dever, and D. White. [1961] [4]p. incl. diagr. tables, refs. (AFOSR-4284) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)424] and Office of Naval Research) Unclassified

Also published in Jour. Phys. Chem., v. 65: 1410-1413, Aug. 1961.

The equilibrium constants for the reactions Ce(g) + LaO(g) ⇌ La(g) + CeO(g) (1); Pr(g) + LaO(g) ⇌ La(g) + PrO(g) (2); and Nd(g) + PrO(g) ⇌ Pr(g) + NdO(g) (3) and their temperature dependence have been determined with a time-of-flight mass spectrometer. The heats of the 3 reactions in kcal/mol^{-1} calculated from the results are: ΔH_1 (1870°K) = 1.05 ± 0.20, ΔH_2 (1913°K) = 15.8 ± 0.4, ΔH_3 (1910°K) = 6.9 ± 0.6. These heats of reaction give directly the difference in dissociation energies, at the indicated temperatures, of the 2 gaseous monoxides in each of the reactions. The dissociation energies at absolute zero D_0^0 in ev calculated from these results and appropriate thermal functions are D_0^0 (CeO) = 8.03 ± 0.2, D_0^0 (PrO) = 7.40 ± 0.3, D_0^0 (NdO) = 7.06 ± 0.2. The electronic contributions to the entropy of the gaseous monoxides at elevated temperatures are discussed in terms of the measured entropy changes in the above reactions. (Contractor's abstract)

BERGMAN OPERATORS FOR THE THREE- AND FOUR-DIMENSIONAL LAPLACE EQUATIONS, by E. Kreyszig. Aug. 1961, 21p. (AFOSR-490) (AF 49-(638)362) AD 264875 Unclassified

The function theoretical approach to elliptic partial differential equations, as developed by Bergman and others, leads to a general characterization of various basic properties on the corresponding solutions and may be regarded as a translation principle of results in complex analysis into theorems about those

solutions. Harmonic functions of 3 and 4 real variables are treated. The harmonic functions of 3 variables are represented by a Bergman operator involving a single integration.

PARAMAGNETIC RESONANCE OF IRON IN BERYL (Abstract), by N. L. Milder and L. C. Brown. [1961] [1]p. (AF 18(600)772) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 20, Feb. 1, 1961.

Dvir and Low (see Item no. 807, Vol. 1V) have published data on the EPR spectrum of Fe^{+++} in a single beryl crystal for certain crystal orientations. These spectra at room temperature in a similar beryl crystal have been studied as a function of crystal orientation. The spectra obtained for the Al sites are in substantial agreement with the earlier work. The variations in line positions can be interpreted in terms of 2 equivalent but differently oriented Al sites occupied by Fe^{+++}. A plot of the variation in line position with crystal orientation will be displayed. The question of assignments and the determination of physical constants will be discussed. No attempt was made to analyze the many weaker lines observed.

NUCLEAR MAGNETIC RELAXATION TIMES OF PROTONS IN AQUEOUS AMMONIUM NITRATE SOLUTIONS (Abstract), by F. J. Leech and L. C. Brown. [1961] [1]p. [AF 18(600)772] Unclassified

Presented at meeting of the Amer. Phys. Soc., Ohio U., Athens, Oct. 20-21, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 138, Feb. 23, 1962.

The spin lattice relaxation time T_1 and the spin-spin relaxation T_2 of protons in aqueous solutions of ammonium nitrate were measured. Two types of systems were considered: 1 group of solutions to which no acid was added (unacidulated) and another group of solutions to which small quantities of concentrated HNO_3 were added (acidulated). The variation of T_1 and T_2 with concentration and acidity will be discussed. In general, the high resolution nmr spectra of the proton in the unacidulated solutions were observed to consist of a single broad line. The spectra of the acidulated solutions were found to split into 1 narrow, strong line and 3 weak, narrow lines of equal intensity. In the strongly acidulated solutions 2 characterlstic relaxation times T_2 were measured. Evidently, one of these values of T_2 is associated with the single strong line and the other with the weak lines.

ELECTRONIC STRUCTURE OF THE F CENTER IN LiCl, by R. F. Wood and J. Korringa. Oct. 1961 [7]p. incl. diagrs. tables, refs. (Technical note no. 3) (AFOSR-1544) (AF 49(638)264) AD 448908 Unclassified

Also published in Phys. Rev., v. 123: 1138-1144, Aug. 15, 1961.

The electronic structure of the F-center lattice defect in LiCl is investigated with calculations based on the usual model of the F center proposed by de Boer. The ground- and excited-state wave functions and energies of the trapped electron are determined by 2 different methods. First, the method of linear combination of atomic orbitals (LCAO) is used. This method is capable of yielding good results but the complexity of the necessary calculations is great. In an effort to avoid this complexity the method of vacancy-centered wave functions is investigated. Very simple wave functions are used in this method with satisfactory results. The coefficient of the hyperfine interaction of the F-center electron with the nearest-neighbor lithium ion and the oscillator strength of the optical transition are calculated. The distortions of the lattice in the vicinity of the F center are calculated. A very small outward movement of the first and second nearest neighbors occurs in the ground state. The situation in the excited state is complicated by the p-type symmetry of the F-electron wave function. In this case, the 2 nearest-neighbor lithium ions located on the symmetry axis of the wave function are found to undergo a large displacement outward from the vacancy. (Contractor's abstract)

NUCLEAR MAGNETIC RELAXATION IN THE PRESENCE OF PARAMAGNETIC IONS, by J. S. Dohnanyi. [1961] [8]p. incl. diagr. tables, refs. (AFOSR-3366) [AF 49(638)264] Unclassified

Also published in Phys. Rev., v. 125: 1824-1831, Mar. 15, 1962.

The influence of independent processes of relaxation of paramagnetic ions on nuclear magnetic relaxation in the presence of these ions is discussed theoretically, using the Kubo and Tomita method. The nuclei are assumed to relax as a result of their contact with the ions through the usual dipole-dipole mechanism and this interaction is, in turn, considered to be of negligible influence on the ionic relaxation. Following a suggestion by Abragam, the ionic interactions are described as a coupling of the ionic spins to an effective local field varying randomly in time: this coupling is finally expressed in terms of experimentally more accessible parameters such as the ionic correlation and relaxation times. All dissipative interactions are approximated by autocorrelation functions with simple exponentially decaying time dependence, thereby limiting the applicability of this calculation to liquids and to liquid-like solids. The second-order terms in the perturbation expansion of the relaxation tensor yield contributions to the Bloch relaxation times of the system of nuclear spins that agree with previous calculations by Solomon. The fourth-order terms describing ionic relaxation yield a contribution to the nuclear relaxation times with a narrowing influence, except in the limit of very strong fields when a broadening is produced. VALUE ORIENTATIONS AND PREFERENCE FOR A MINIMAX STRATEGY, by A. Scodel. Jan. 1961 [11]p. incl. tables. (Technical note no. 3) (AFOSR-379) (AF 49(638)317) AD 255652 Unclassified

Also published in Jour. Psychol., v. 52: 55-61, July 1961.

Thirty-five pairs of subjects played a two-person, zero-sum-game with a saddle point. The game ran for 50 trials, and the positions were reversed after the first 25 trials. Each subject had been administered an Allport-Vernon-Lindzey prior to the game. With respect to behavior in the game it was found that the group that was ahead of its opponents at the end of the first half of the game tended to converge more readily on a minimix strategy when the positions of the players were reversed. Players who inclined toward a minimax strategy were lower on the theoretical value and higher on the religious value of the Allport-Vernon-Lindzey than players who avoided such a strategy. The relationships between this study and some other studies involving correlations between values and behavior were briefly discussed. (Contractor's abstract)

COUNSELING AND PSYCHOTHERAPY AS AN INSTANCE OF COALITION, by H. B. Pepinsky. [1961] [16]p. (AFOSR-58) [AF 49(638)373] AD 430660 Unclassified

Also published in Counseling in the Rehabilitation Process, New York, Bureau of Publications, Teachers Coll., Columbia U., 1961, p. 61-76.

Coalitions are temporary alliances for joint action. Their elements are persons, who negotiate agreements that establish and maintain the coalition in an environment. In doing so, the coalition members come to act like a single decision-maker. Counseling and psychotherapy are assumed to be instances of coalition and can be treated in this way. They are, however, representatives of a special case of coalition--the dyad or two-person case. Therapeutic situations, studied as coalitions, can be compared with other kinds of coalition in American society. A variety of perspectives are suggested from which therepeutic and other coalition events can be analyzed and interpreted. Comparative research on counseling or psychotherapy and other kinds of coalition is recommended, and the case study of interaction records is offered as a preliminary step in such research. DISPLAYING AS A PSEUDOPRODUCTIVE ORGANIZATIONAL TASK, by K. E. Weick and H. B. Pepinsky. [1961] [2]p. (AFOSR-944) [AF 49(638)-373] Unclassified

Presented at Sixty-ninth annual convention of the Amer. Psychol. Assoc., New York, Aug. 31-Sept. 6, 1961.

Also published in Amer. Psychol., v. 16: 434-435, July 1961.

The industrial psychologist must learn to understand the human social organization and how it maintains itself in American society. With this in mind, this paper attempts to show how the large organization can promote among its members a kind of pseudoproductivity identified as displaying. Relevant evidence is drawn from interviews with members of 2 research teams and their supervisors in an industrial research institute. Displaying is analyzed and discussed as a task that results from and contributes to autistic thinking of organization members. The task is pseudoproductive because it tends to substitute for the actual performance of an assigned task.

THE GROWTH AND EXTINCTION OF EXPECTANCIES IN CHANCE CONTROLLED AND SKILLED TASKS, by J. R. Rotter, S. Liverant, and D. P. Crowne. July 1961 [17]p. incl. illus. diagrs. tables, refs. (Technical note no. 1) (AFOSR-459) (AF 49-(638)741) AD 260949 Unclassified

Also published in Jour. Psychol., v. 52: 161-177, 1961.

In the present study an attempt was made to study the differences in the growth and extinction of expectancies using 2 different tasks which were hypothesized as skill and chance controlled tasks on the basis of previous cultural experience of the subjects, rather than by instructions. Eight groups of subjects were studied with an apparatus involving a motor skill of steadiness and 1 of guessing cards. For each task a group of 20 subjects were given 25% positive reinforcement, 50% positive reinforcement, 75% positive reinforcement, and 100% positive reinforcement, for 8 training trials. On nonreinforced trials the subjects failed to achieve a criterion score. Following this all groups were given continuous failure until they extinguished by stating expectancies for future success of 1 or 0 for 2 consecutive trials. The general hypothesis tested was that under chance conditions the occurrence of reinforcement leads to less learning in that previous experience is a less stable predictor of the future occurrence of the event. In general, the results strongly supported the 2 hypotheses. First, that under skill conditions positive and

negative reinforcement leads to greater increments and decrements in verbalized expectancies. Second, that the extinction of expectancies under continuous negative reinforcement will reverse under chance and skill conditions so that 50% is more resistant to extinction than 100% reinforcement under chance conditions, and 100% reinforcement is more resistant to extinction than 50% reinforcement under skill conditions.

THE CONDITIONING OF VERBAL BEHAVIOR AS A FUNCTION OF THE NEED FOR SOCIAL APPROVAL, by D. P. Crowne and B. R. Strickland. [1960] [7]p. incl. diagrs. tables, refs. [AF 49(638)741] Unclassified

Published in Jour. Abnorm. and Social Psychol., v. 63: 395-401, Sept. 1961.

An experiment was undertaken to compare the changes in response rate of subjects differing in the strength of need for social approval on a plural nouns verbal conditioning task. The hypotheses were that subjects with a high need for social approval, in contrast to subjects with a weaker approval need, tend to show an increase in the proportion of plural nouns under positive reinforcement and a decrease in the proportion of plural nouns under negative reinforcement. The reinforced groups were also compared with a nonreinforced control group employed to establish the base rate for plural nouns. Results supported the hypotheses, with the high need-for-approval groups increasing the positively reinforced response and inhibiting the response followed by negative reinforcement. No subjects retained in the analysis of the data were able to verbalize the reinforcement contingency. The significant differences obtained were found not to be attributable to intelligence, nor was intelligence related to verbal conditioning. The findings were interpreted as providing support for the inference of need for social approval from a personality inventory measuring the degree of personal endorsement of socially approved characteristics.

LUMINESCENCE IN SEMICONDUCTING DIAMOND, by J. B. Krumme. Jan. 1961, 37p. incl. diagrs. refs. (AFOSR-272) (AF 18(603)40) AD 252995; PB 155100 Unclassified

Luminescence exhibited by semiconducting diamonds is studied and a correlation with other effects in the same stones observed by other investigators is sought. Particular emphasis is placed on the study of luminescence of slow decay in order to definitely establish whether the process corresponds to slow fluorescence or phosphorescence. Some observations of electroluminescence and triboluminescence are made. None of the investigated semiconducting diamonds is found to exhibit fluorescence. Exciting wavelengths used are 364 mμ which excites fluorescence in type I diamond and 225 mμ which is sufficiently energetic to excite carriers across the forbidden energy gap. The temperature dependence of intensity and decay lifetime of the slow decay luminescence indicate that this process is phosphorescence rather than slow fluorescence. No intensity peaks are found in the phosphorescence spectrum to correspond with photoconductive or photovoltaic peaks, nor is it possible to correlate the decay lifetime of phosphorescence with carrier lifetimes. A red phosphorescence was found during the investigation and observations are included. Each of the investigated specimens exhibits triboluminescence. Electroluminescence is found to correspond to carrier injection rather than intrinsic electroluminescence. Inhomogeneity of surface states which was observed in early studies of photovoltaic effect are also observed in the study of electroluminescence. (Contractor's abstract)

ELECTRON SPIN RESONANCE IN SEMICONDUCTING DIAMOND (Abstract), by M. D. Bell and W. J. Leivo. [1961] [1]p. [AF 18(603)40] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 142, Mar. 20, 1961.

Three semiconducting diamonds are being investigated by electron spin-resonance techniques. The p-type diamonds have resistivities of the order of 100 ohm cm. Two different spin-resonance spectra were obtained at room temperature. In an intensely blue

diamond a resonance line of moderate strength occurred with a g value near 2. A second, partially blue diamond showing strong photoconductivity maxima in the visible and unusual red luminescence gave a broad, as yet unresolved resonance different from that of the intensely blue diamond. A good, definable spectrum could not be obtained in the third specimen. Spectra were also obtained on nonconducting diamonds. The spectrum obtained from the intensely blue semiconducting diamond differs from the spectra observed in diamonds containing nitrogen. Optical measurements show that nitrogen is not present in these semiconducting diamonds; however, free carriers are present; also, photoconductivity and lifetime measurements show that there are imperfections which could conceivably exhibit spin resonance.

ATOMIC COLLISIONS, by B. Roth. Interim final rept. Sept. 1, 1960-Aug. 31, 1961 [1]p. (AFOSR-1814) (AF 49(638)907) Unclassified

The scattering of He^+ by He^0 results in a cross section for the production of He^0, He^+ and He^{++}. The cross section for production of He^+, $^0He^+$, is being calculated using only the Coulomb force as an interaction and providing for (a) Antisymmetrization of the electrons (b) Exchange scattering of the electrons (c) Center of mass correction. The calculation is carried out using the Born approximation, and an argument is presented showing it to be valid in this method of calculating, while its validity is doubtful, as is well known, when unsymmetrized functions are used. The results are in good agreement with experiment, although they depend sensitively on the type of He wave function used.

THEORY OF THE MULTIPLE STATE TRANSFER OF EXCITATION OF HELIUM (Abstract), by C. C. Lin and R. G. Fowler. [1960] [1]p. [AF 49(638)41] Unclassified

Presented at Thirteenth Annual Gaseous Electronics Conf., Monterey, Calif., Oct. 12-15, 1960.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 388, June 22, 1961.

A theory is presented to explain the multiple state mechanism for the transfer of excitation from singlet to triplet states in helium atoms proposed by St. John and Fowler. The spin-orbit interactions of the intra- and inter-atomic type are believed to be responsible for the singlet-triplet transfer in the highly excited states. It is shown that a helium atom in an upper nP state, after colliding with a normal atom, transfers primarily into either a P or an F state. Qualitative results derived from this theory are in good agreement with the essential features of the new process.

OSCILLOSCOPE CALIBRATION AT KILOMEGACYCLE PER SECOND FREQUENCIES, by R. I. Duncan. [1961] [2]p. incl. diagr. (AFOSR-2308) [AF 49(638)-639] Unclassified

Also published in Proc. Okla. Acad. Sci., v. 41: 125-126, 1961.

A source of radio-frequency voltage of over 100 v peak-to-peak at a frequency of approximately 1200 mc was needed for calibrating the sweep of a high speed oscilloscope. Ordinary vacuum tube circuits were not considered adequate to provide the amount of voltage required. This paper describes a cavity resonator built for the purpose. In this type of device it is desirable to make the characteristic impedance of the output line as high as practicable. This maximizes the number of reflections in the cavity.

STUDY OF SUPEROXIDIZERS, by F. Martinez and J. A. Wojtowicz Final rept. June 5, 1958-Nov. 5, 1960. Apr. 1961 [79]p. incl. illus. tables, refs. (Rept. no. OMCC-9038-GFR-1) (AFOSR-105) (AF 29(600)1667) AD 256787 Unclassified

The results are presented of studies conducted on the preparation of higher oxides of H. The reaction of ozone with hydrazobenzenes, substituted hydroquinones, isopropyl magnesium chloride and cumene did not produce higher oxides. The reaction of O atoms with secondary butyl alcohol produced a normal peroxide. Electrolysis and uv irradiation of dilute hydrogen peroxide solutions did not produce higher peroxides. The reactions of hydrogen atoms with ozone at -196°C gave rise to superoxides, presumable HO_2 and H_2O_4. These species decomposed at -120° and -90°C, respectively, to give molecular O and H_2O_2.

A mechanism is advanced for the production of these products. The heat of formation of HO_2 is +13 + or - 10 kcal/mol, and -2 + or -10 kcal/mol for H_2O_4.

The products obtained from H_2O and H_2O_2 in a discharge tube and by the reaction of H atoms with O are compared to the peroxides formed in the H atom-ozone reaction. (Contractor's abstract)

Wojtowicz, and H. D. Smith. Dec. 1961 [56]p. incl. illus. tables, refs. (AFOSR/DRA-61-7) (AF 29-(600)2695) AD 272855 Unclassified

Studies were conducted on the preparation and characterization of hydrogen superoxide and superoxidizers such as NF_2O_2, NF_2OONF_2, ClF_5 and Cl_2O_8. Electron spin resonance measurements on the H + O_3 product revealed the presence of a free radical (HO_2) which disappeared in the temperature range -130° to -120°C. Kinetic studies revealed that the decomposition of the H + O_3 product was affected by phase transformations in the frozen matrix. The heat of crystallization of 50 wt % H_2O_2-ice was determined calorimetrically to be 45 cal/g. The mechanism of peroxide formation from dissociated water vapor was investigated. The reactions of tetrafluorohydrazine with O_3, O atoms, NO_2 dioxide, NO, Cl_2O_7 and ClF_3 were investigated. Evidence for low temperature N-O-F-containing complexes was found. THE CHARACTERIZATION OF HYDROGEN SUPEROXIDES IN FROZEN MATRICES, by F. Martinez, J. A. Wojtowicz and J. A. Zaslowsky. [1960] [21]p. incl. diagrs. tables, refs. [AF 29(600)2695] Unclassified

Also published in Fifth Internat'l. Symposium on Free Radicals; Preprints of papers, Uppsala U. (Sweden) (July 6-7, 1961), Stockholm, Almqvist and Wiksell, 1961, p. 42-1—42-21. (AFOSR-1495)

The reaction of atomic hydrogen with liquid ozone at -196°C has been studied. The yields of water, hydrogen peroxide, "formed" and "evolved" oxygen under various conditions are compatible with a radical recombination mechanism. Hydroxyl is the immediate precursor of all the water formed while the fate of some or all of the "formed" oxygen is the formation of prehydroxyl radicals and under certain conditions, hydrogen peroxide. Product yields are a function of hydrogen atom concentration and reactor geometry. Chemical, calorimetric and electron spin resonance evidence is presented to support the contention that the source of the "evolved" oxygen is the decomposition of two species of hydrogen superoxide (HO_2 and H_2O_4). CENTRIFUGAL DISTORTION OF BOND DISTANCES AND BOND ANGLES, by M. Iwasaki and K. Hedberg. [1961] [3]p. incl. tables. (AFOSR-2403) (AF 49(638)-783) Unclassified

Also published in Jour. Chem. Phys., v. 36: 2961-2963, June 1, 1962.

A simple method has been developed to estimate the changes of bond distances and bond angles produced by the centrifugal force arising from rotational motions of molecules. The method has been applied to the PCl_3 molecule and the predicted effect found to be small but significant in comparison to the effect of vibrational motion. The theoretical results for PCl_3 at 300° and 505°K are in good agreement with experimental results from gaseous electron diffraction. (Contractor's abstract)

EFFECT OF TEMPERATURE ON THE STRUCTURE OF GASEOUS MOLECULES. MOLECULAR STRUCTURE OF PCl_3 AT 300° AND 505°K, by K. Hedberg and M. Iwasaki. [1961] [6]p. incl. diagrs. tables, refs. (AFOSR-2677) [AF 49(638)783] AD 408221 Unclassified

Also published in Jour. Chem. Phys., v. 36: 589-594, Feb. 1, 1962.

The molecular structure of PCl_3 was studied by electron diffraction from the vapor at nozzle temperatures of 300° and 505°K. The experimental intensity curves I_E clearly show the effect of temperature on the amplitudes of vibration: the greater over-all damping of the 505°K curve is a reflection of the greater amplitudes for both distances at this temperature, and the lesser prominency of the high-frequency features is a reflection of the greater Cl...Cl amplitude. The final results at 300° and 505°K respectively, are r_{P-Cl} = 2.039 ± 0.0014A and 2.045 ± 0.0016A; $r_{Cl...Cl}$ = 3.130 ± 0.0026A and 3.142 ± 0.0038A; Cl-P-Cl = 100.27° ± 0.09° and 100.40° ± 0.16°; l_{P-Cl} = 0.0501 ± 0.0013A and 0.0594 ± 0.0017A; $l_{Cl...Cl}$ = 0.0834 ± 0.0023A and 0.1097 ± 0.0035A.

THE EFFECT OF TEMPERATURE ON THE STRUCTURE OF GASEOUS MOLECULES, by K. Hedberg and M. Iwasaki. [1961] [3]p. incl. diagrs. tables. (AF 49(638)783) Unclassified

Presented at Internat'l. Conf. on Magnetism and Crystallography, Kyoto (Japan), Sept. 25-30, 1961.

Published in Jour. Phys. Soc. Japan, v. 17, Suppl. B-II: 32-34, Mar. 1962.

The molecular structure of PCl_3 has been studied by electron diffraction from the vapor at nozzle temperatures of 300°K and 505°K. Both the size of the molecule and the displacement of the atoms during molecular vibration are found to be significantly greater at the higher temperature. The P-Cl and Cl...Cl distances are longer by 0.3% and 0.4%, respectively, and the root-mean-square amplitudes associated with these distances are greater by a striking 19% and 31%. Both the increased size of the molecule and increased amplitudes are in very good agreement with prediction from simple theory. The results at 300°K and 505°K, are r_{P-Cl} = 2.039 ± 0.0014A and 2.045 ± 0.0016A; $r_{Cl...Cl}$ = 3.130 ± 0.0026A and 3.142 ± 0.0038A; Cl-P-Cl = 100.27 ± 0.09° and 100.40 ± 0.16°; l_{P-Cl} = 0.0501 ± 0.0013A and 0.0594 ± 0.0017A; $l_{Cl...Cl}$ = 0.0834 ± 0.0023A amd 0.1097 ± 0.0035A. The interatomic distances given are r_a values obtained from the third cycle of least squares refinement of intensity curves and differ from the equilibrium values of r_e by small amounts; the l_{ij} values differ similarly from the l_e values. The estimated standard errors include standard deviations from the least squares procedure, estimates of correlation among the data, uncertainty in the constants of the experiment, and uncertainty in the factors employed in the data reduction. CHROMATOGRAPHIC ADSORPTION OF AZOBENZENES AND AROMATIC NITROGEN HETEROCYCLES ON ALUMINA STUDIES WITH ALUMINA-PREGNATED GLASS PAPER, by L. H. Klemm. P. Antoniades and others. [1961] [9]p. incl. diagr. tables, refs. (AFOSR-221) (AF 49(638)473) AD 611386 Unclassified

Also published in Jour. Chromatog., v. 6: 420-428, Nov. 1961.

A semi-quantitative method is described for chromatography of fluorescent polynuclear aromatic hydrocarbons and aromatic nitrogen heterocycles on alumina-impregnated glass paper. Combining data obtained from such papers with those from alumina columns it is noted that the isomeric azobenzenes and nitrogen heterocycles are more strongly adsorbed than their hydrocarbon analogs (where CH replaces N). It is proposed that adsorption of such nitrogen compounds occurs preferentially by means of the electron pairs on the nitrogen atoms to form n-complexes. If steric hindrance to n-complexation is too great the substrate may form a π-complex or a σn-hybrid complex instead.

INVESTIGATION OF MOLECULAR STRUCTURES, by O. Hassel. Final technical rept. Aug. 21, 1961, 34p. incl. diagrs. table, refs. (AFOSR-1643) (AF 61(052)71) AD 267293 Unclassified

X-ray crystallographic structure determinations were made of solids in which charge transfer bonds were established between different molecules (addition compounds) or between molecules of the same kind. New examples of halogen molecule bridges were found and the rule firmly established that the arrangement donor atom-halogen-halogen-donor atom is always at least nearly linear. Several addition compounds formed by organic halides (acceptor molecule) and varying donor molecules were also studied. In this case an arrangement donor atom-halogen-carbon is observed which is very nearly linear. Interest was focused on structures of crystals built up of a single molecular species that contains both electron accepting and electron donating atoms. It was found that charge transfer bonding occurs joining a particular molecule to the greatest possible number of nearest neighbors. The geometry of the arrangement conforms to the rules already established in the case of addition compounds. (Contractor's abstract)

INVESTIGATION OF MOLECULAR STRUCTURES. I. CRYSTAL STRUCTURE OF THE 1:1 ADDITION COMPOUND DITHIANE-IODOFORM, by T. Bjorvatten and O. Hassel. Aug. 14, 1961 [16]p. incl. diagrs. tables. (Technical scientific note no. 4) (AFOSR-1687) (AF 61(052)71) AD 266611 Unclassified

Also published in Acta Chem. Scand., v. 15: 1429-1436, 1961.

The crystal structure of a new (1:1) addition compound formed by 1,4-dithiane and iodoform has been determined. The crystals have a melting point of 72°C and an observed density of 2.8 g/cm^{-3}. The monoclinic unit cell (space group $P2_1/m$) containing 2 formula units has the parameters a = 6.56A, b = 21.06A, c = 4.47A and β = 104.4°C. The dithiane molecules are situated in centers of symmetry, the iodoform molecules in symmetry planes. Two iodine atoms belonging to a particular iodoform molecule form charge transfer bonds with sulphur atoms belonging to neighboring dithiane molecules and the I-S distance (3.32A) is about 0.7A shorter than anticipated for a van der Waals contact. Each iodoform molecule is therefore linked to 2 neighboring dithiane molecules and vice versa and chains of alternating donor and acceptor molecules are present in the crystal. CHARGE-TRANSFER BONDS IN SOLIDS: CRYSTAL STRUCTURE OF OXALYL BROMIDE, by P. Groth and O. Hassel. [1961] [2]p. incl. diagrs. (AFOSR-3638) [AF 61(052)71] Unclassified

Published in Proc. Chem. Soc. (London): 343-344, Sept. 1961.

The oxalyl bromide crystals are monoclinic, space group $P2_1/c$ with a = 6.18, b = 5.46, c = 7.80A, β = 112°24'. The unit cell contains 2 centrosymmetrical and at least very nearly planar molecules. The structure is based on non-planar sheets in which each molecule is linked to 4 neighbors by charge-transfer bonds between oxygen and bromine of length 3.27A. An electron-density map is described. The shortest distances observed between atoms belonging to neighboring sheets are: Br-O = 3.90, Br-Br = 3.90, and C-O = 3.40A. It is concluded that charge-transfer bonds are mainly responsible for the cohesion within the sheets.

INTERACTION OF VARIOUS AFFERENTS ON CA_1 NEURONS AND DENTATE GRANULE CELLS, by P. Andersen and Y. Lømyning. [1961] [23]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 61(514)1127 and Norwegian Research Council for Science and the Humanities) Unclassified

Published in Physiologie de L'Hippocampe; Colloq. Internationaux du Centre National de la Recherche Scientifique, Montpellier (France) (Aug. 24-26, 1961), Paris, Centre National de la Recherche Scientifique, No. 107: 23-45, 1962.

The interaction of entorhinal and commissural afferent impulses on dentate granule cells and CA1 neurons have been studied. Interaction experiments were performed with afferents from the ipsilateral Ca1, ipsilateral entorhinal area, ipsilateral septum and the contralateral CA3 field on the CA1 neurons. Entorhinal impulses regularly resulted in the discharge of the granule cells, but was less effective than the commissural impulses in this respect. Granule cells were refractory to a new entorhinal activation for about 8 msec, while the corresponding figure for commissural activation was about 1-2 msec. Results indicate that peripherally located synapses are less effective than are synapses located near the cell body in discharging the cell. Entorhinal afferents could not make the CA1 neurons discharge but they lowered the threshold for simultaneous activation through other synapses ending on CA1 neurons, especially for the commissural afferents. The commissural, septal and local volleys could all discharge the CA1 neurons, the commissural being the most effective one. Results show that the spikes elicited by one of

the above mentioned afferent volleys inhibit the production of similar spikes by another afferent volley for some msec. When 2 of these afferent volleys arrive simultaneously to the recording electrode, the effect summated giving an increased amplitude of the spikes. The results are interpreted as if the entorhinal, local, septal and commissural volleys converge on the same population of neurons, and assist each other in the firing of the CA1 neurons. No signs of inhibition other than those due to refractoriness were observed. (Contractor's abstract)

THE EFFECT OF ISOLATION FROM THE FATHER ON THE BEHAVIOR OF MALE THREE-SPINED STICKLEBACKS TO MODELS, by E. Cullen. Final technical rept. Mar. 30, 1961, 22p. incl. diagrs. tables, refs. (AFOSR-1033) (AF 61(052)29)
AD 262189 Unclassified

The main experiment which has been carried out shows that three-spined Sticklebacks which have been prevented from seeing their fathers discriminate between male and female models no differently from controls. Whether experience gained during the breeding season can modify this discrimination remains unsettled. An experiment involving beating up males with one or other model, showed that changes in the response of the fish to the models immediately afterwards affected both models and not just the one used for beating, and therefore did not alter the discrimination. However the unnaturalness of the beating is fully realized. More realistic experience with live fish should be tried. There will be fewer practical difficulties in making such experiments, now that it has been established that the sight of the father does not materially affect the discrimination, for there will then be no need to rear the young under stringent conditions of isolation. Indeed the young need not be raised in the laboratory at all, but could be collected in the field in their first winter.

THE INFLUENCE OF GROWTH SUBSTRATES ON METABOLIC PATHWAYS IN MICROCOCCUS DENTRIFICANS, by H. L. Kornberg, J. F. Collins, and D. Bigley. 1959 [16]p. incl. diagrs. tables, refs. (AF 61(514)1180) Unclassified

Published in Biochim. et Biophys. Acta, v. 39: 91, 9-24, Mar. 1960.

Autotrophically grown M.denitrificans incorporated C^{14} from $C^{14}O_2$ initially into phosphorylated compounds, the chief component of this fraction being 3-phosphoglyceric acid. Extracts of such cells catalyzed the incorporation of isotope from $NaHC^{14}O_3$ into 3-phosphoglyceric acid, in the presence of ribulose 1,5-diphosphate, or of ribose 5-phosphate + adenosine triphosphate (ATP). These results show that autotrophic growth of the organism involves the Calvin cycle of assimilation of carbon dioxide. Extracts of the organisms grown on acetate did not catalyze the incorporation of isotope from $NaHC^{14}O_3$ described above, indicating that the Calvin cycle did not operate under these conditions. Extracts of M.denitrificans grown autotrophically or on a variety of carbon substrates differed in their ability to effect the component reactions of the glyoxylate cycle. While all extracts were qualitatively shown to contain citrate condensing enzyme and malate synthetase, only those from acetate-grown cells contained high isocitratase activity. The activity of glyoxylate cycle enzymes in acetate-grown cells was sufficiently high to account for the growth of M.denitrificans on acetate as sole carbon source. These findings show that change in the mode of growth, from autotrophy to growth on acetate, was accompanied by an alteration of metabolic pathways from Calvin cycle to glyoxylate cycle, and suggest that isocitratase is under adaptive control. Studies on the effect of other carbon sources on the isocitratase formed by acetate-grown cells indicate that they control both the activity and formation of the enzyme by feed-back mechanisms. It is suggested that such feed-back mechanisms control the intracellular operation of the glyoxylate cycle. (Contractor's abstract)

CRYSTALLINE TARTRONIC SEMIALDEHYDE REDUCTASE FROM PSEUDOMONAS OVALIS CHESTER, by A. M. Gotto and H. L. Kornberg. [1961] [2]p. incl. table. (AFOSR-1722) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)-180, Public Health Service, and Rockefeller Foundation) Unclassified

Also published in Biochim. et Biophys. Acta, v. 48: 604-605, Apr. 15, 1961.

Pseudomonas spp. growing on glycollate as sole carbon source adaptively form enzymes which catalyze the conversion of glyoxylate to glycerate. This process is the sum of 2 reactions, catalyzed by glyoxylate carboligase and by tartronic semialdehyde reductase. The purpose of this report is to describe a method for the preparation of crystalline tartronic semialdehyde reductase.

THE METABOLISM OF C_1- AND C_2- COMPOUNDS IN MICROORGANISMS, by H. L. Kornberg, J. R. Quayle, and H. Krebs. Annual summary rept. no. 1, Sept 1, 1960-Aug. 31, 1961. Sept. 31, 1961 [14]p. incl. diagr. refs. (AFOSR-1986) (AF 61(052)180) Unclassified

The glyoxylate cycle, which has been shown to be a necessary pathway for the net formation of cell constituents in most aerobic organisms growing on acetate as sole carbon source, has now been demonstrated in the obligatorily photosynthetic and anaerobic purple sulfur bacterium chromatium. The cycle operates only during growth on acetate and key enzymes of the cycle are not formed when the organism grows on malate or carbon dioxide.

THE METABOLISM OF C_2 COMPOUNDS IN MICROORGANISMS. 7. PREPARATION AND PROPERTIES OF CRYSTALLINE TARTRONIC SEMIALDEHYDE REDUCTASE, by A. M. Gotto and H. L. Kornberg. [1961] [12]p. incl. illus. diagrs. tables, refs. (AFOSR-2020) (AF 61(052)180) Unclassified

Also published in Biochem. Jour., v. 81: 273-284, Nov. 1961.

Tartronic semialdehyde reductase was purified 200-fold and crystallized from glycollate-grown Pseudomonas ovalis Chester. The enzyme catalyzed the reduction of tartronic semialdehyde to glyceric acid with reduced di- or tri-phosphopyridine nucleotide as electron donor. K_m for tartronic semialdehyde at pH 8·5 was measured to be 2×10^{-4} M. K_m for reduced diphosphopyridine nucleotide under these conditions was 2×10^{-5} M and for reduced triphosphopyridine nucleotide 5×10^{-5} M. The crystalline enzyme oxidized 160 µmol of reduced diphosphopyridine nucleotide/min/mg of protein at pH 8·5, 23° in the presence of tartronic semialdehyde. On the basis of the measured weight-average molecular weight M_w of 91,000, this gave a turnover number of 14,600 mol of reduced diphosphopyridine nucleotide oxidized/min/mol of enzyme. The enzyme was shown also to catalyze the oxidation of glycerate with concomitant reduction of oxidized diphosphopyridine nucleotide. The equilibrium constant K at 23° was 2×10^{-6} at pH 7·5 and $1·6 \times 10^{-5}$ at pH 8·5; K_H was calculated to be $5·1 \times 10^{-14}$ M. From these data, $\Delta G'$ at pH 7, 25°, was determined as 8·6 kcal/mol and $\Delta G°$ as 18 kcal/mol. Similarly, the oxidation-reduction potential for the reaction Glycerate$^-$ ⇌ tartronic semialdehyde$^-$ + 2H + 2e was found to be E'_0 = -0·092v at 25° and pH 7. The enzymic oxidation of glycerate to tartronic semialdehyde was also demonstrated by coupling it to the reduction of pyruvate to lactate, in the presence of oxidized diphosphopyridine nucleotide and crystalline lactic dehydrogenase, and to the reduction of 2:6-dichlorophenol-indophenol in the presence of oxidized diphosphopyridine nucleotide and reduced diphosphopyridine nucleotide dehydrogenase. The latter system served as a convenient assay of the enzyme. The enzyme catalyzed the reduction only of C_3 compounds of structure CHO·R·CO_2H, where R = CH·OH, CH_2 or CO. Tartronic semialdehyde (R = CH·OH) reacted more than 5 times as fast as any other substrate. The enzyme catalyzed the oxidation only of glyceric acid and of hydroxypyruvate. The significance of these findings to the pathways of biosynthesis from glyoxylate is discussed. (Contractor's abstract)

THE METABOLISM OF C_2-COMPOUNDS IN MICROORGANISMS. 8. A DICARBOXYLIC ACID CYCLE AS A ROUTE FOR THE OXIDATION OF GLYCOLLATE BY ESCHERICHIA COLI, by H. L. Kornberg and J. R. Sadler. [1961] [11]p. incl. diagrs. tables, refs. (AFOSR-2625) (AF 61(052)130) Unclassified

Also published in Biochem. Jour., v. 81: 503-513, Dec. 1961.

Although the tricarboxylic acid cycle has been established as the major route for the oxidation of acetate, and of compounds catabolized to acetate, in a wide variety of organisms, little is known of the pathways of oxidation of C_2 compounds more highly oxidized than acetate, such as glycollate or glyoxylate. The main purpose of this paper is to show that, whereas the tricarboxylic acid cycle plays an essential role in the growth of Escherichia coli on glycollate as sole carbon source, this cycle is not necessary for glycollate oxidation. The results obtained with the mutant M22-64 of E. coli, strain w, which is devoid of the citrate-forming condensing enzyme, and with its parent wild type, support the view that glyoxylate, derived from the oxidation of glycollate, can be oxidized completely via a dicarboxylic acid cycle in which glyoxylate condenses with acetyl-coenzyme A to form malate, which is oxidized via oxaloacetate and pyruvate to regenerate the acetyl-coenzyme A required for the initial condensation.

MICROBIAL GROWTH ON C_1 COMPOUNDS. 1. ISOLATION AND CHARACTERIZATION OF PSEUDOMONAS AM 1, by D. Peel and J. R. Quayle. [1961] [5]p. incl. illus. diagr. tables, refs. (AFOSR-2627) (AF 61(052)180) Unclassified

Also published in Biochem. Jour., v. 81: 465-469, Dec. 1961.

An organism has been isolated which grows aerobically on methylamine, methanol, formate or formamide as sole sources of carbon and energy. Neither methane nor formaldehyde serves as growth substrate, nor can the organism grow autotrophically at the expense of oxidation of hydrogen. Certain mono- and di-carboxylic acids, amino acids, amines and glucose will also support growth in an otherwise mineral medium. The organism is a pink-colored, Gram-negative, motile rod (0.8 μ x 2.0 μ) with a single polar flagellum. It is identified as a species of Pseudomonas and is referred to as Pseudomonas AM 1. With methanol as growth substrate, the optimum growth conditions of Pseudomonas AM 1 are obtained at pH 7, at a temperature of 30°, and at a methanol concentration of 0.5-1% (v/v). No requirement for any growth factor was found. The oxidative abilities of the methanol-, formate- and succinate-grown organism have been examined manometrically. The solubility and spectral characteristics of the pink pigments suggest that they are unsaturated carotenoids.

MICROBIAL GROWTH ON C_1 COMPOUNDS. 3. DISTRIBUTION OF RADIOACTIVITY IN METABOLITES OF METHANOL-GROWN PSEUDOMONAS AM1 AFTER INCUBATION WITH [^{14}C] METHANOL AND [^{14}C] BICARBONATE, by P. J. Large, D. Peel, and J. R. Quayle. [1961] [6]p. incl. diagr. tables, refs. (AFOSR-3454) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)180, Public Health Service, and Rockefeller Foundation) Unclassified

Also published in Biochem. Jour., v. 82: 483-488, 1962.

The distribution of radioactivity in glycine, serine, phosphoglyceric acid and malic acid isolated from methanol-grown Pseudomonas AM1 after incubation with C^{14} methanol or C^{14} bicarbonate has been investigated. The data indicate that the carboxyl group of glycine is mainly derived from carbon dioxide, and the methylene carbon from methanol. The hydroxylmethyl group of serine is derived mainly from methanol, whereas the distribution of radioactivity between C-1 and C-2 of serine is the same under all conditions as that between C-1 and C-2 of glycine. The labelling patterns of serine and malate are consistent with the formation of malate by carboxylation of a C_3 fragment derived from serine, rather than with the reverse reaction. Two possible schemes for synthesis of cell constituents from methanol are outlined. Both schemes implicate hydroxymethylation of glycine to give serine as the major step in the synthesis of C_3 compounds. Alternative means whereby the glycine necessary for such a reaction might be made from methanol are discussed.

CHEMICAL SYNTHESIS OF OXALYL-COENZYME A AND ITS ENZYMIC REDUCTION TO GLYOXYLATE, by J. R. Quayle. [1961] [3]p. incl. table, refs. (AFOSR-3455) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)180, Public Health Service, and Rockefeller Foundation) Unclassified

Also published in Biochim. et Biophys. Acta, v. 57: 398-400, 1962.

The existence of oxalyl-coenzyme A as an intermediate in the conversion of cell constituents into oxalate has been a matter of supported speculation. Confirmation of its postulated mechanism has awaited its synthesis. It is the purpose of this communication to report the chemical synthesis of oxalyl-coenzyme A and its enzymic reduction to glyoxylate. It was prepared by ester interchange between thiocresyl-oxalic acid and coenzyme A at pH 7.2. Extraction with ether, which removed the thiocresol formed, resulted in yields of 90-100%. The identity of oxalyl-coenzyme A was established by its rapid hydrolysis in 0.1 N NaOH at room temperature to oxalate and coenzyme A, and its reaction with neutral hydroxylamine

to give oxalyl monohydroxamate. In view of the suggested metabolic role in the reduction of oxalyl-coenzyme A rather than in the oxidation of glyoxylate, the enzyme is better termed oxalyl-coenzyme A reductase rather than glyoxylate dehydrogenase.

RESEARCH ON NEURAL MECHANISMS UNDERLYING PERCEPTION, by G. K. Wallace. Aug. 30, 1961, 23p. incl. diagrs. tables, refs. (Technical note no. 4) (AFOSR-2986) (In cooperation with Reading U. Inst. of Experimental Psychology, Oxford (Gt. Brit.)) (AF 61(052)114 and AF 61(052)420) AD 288411 Unclassified

The problem is raised concerning the mechanisms underlying visually controlled orientation in the Desert Locust. The experiments are concerned with 3 aspects of this problem; inhibition of information from, or response to, irrelevant stimuli; the processes of orientation to 1 of several possible stimuli; the maintenance of direction once locomotion is initiated. Lack of response to irrelevant stimuli appears to be due to a mutual exclusion of responses at the motor level. There is no evidence of centrifugal sensory inhibition. The behavior observed while the insect becomes oriented to 1 of 2 stimuli is described and an explanation given in terms of varying thresholds for the release of jumping and turning responses. A tracking experiment is described which shows that direction of locomotion is not maintained under certain circumstances. The experimental results are embodied in a tentative description of the processes underlying orientation. (Contractor's abstract)

MAZE LEARNING AND DISCRIMINATION IN ANTS, by D. M. Vowles. May 30, 1961, 36p. incl. diagrs. refs. (Technical note no. 1) (AFOSR-3220) (In cooperation with Reading U. Inst. of Experimental Psychology, Oxford (Gt. Brit.)) (AF 61(052)114 and AF 61(052)420) AD 288454 Unclassified

A technique is described for training ants in a T-maze. The walls of the maze are covered with patterns which serve as cues for the correct solution of the maze. These patterns can be varied in order to test the visual discrimination of the ant. It was found that ants would discriminate between vertical and diagonal stripes, but not between diagonal stripes of opposite slope. In an experiment on generalization between stripes of different sizes, the ants appeared able to generalize satisfactorily. The implications of these experiments for insect pattern vision are discussed.

THE ELECTRORETINOGRAM IN THE COMPOUND EYE OF THE DESERT LOCUST (SCHISTOCERCA GREGARIA FORSKAL), by D. M. Vowles. July 1, 1961, 28p. incl. diagrs. tables, refs. (Technical note no. 2) (AFOSR-3221) (AF 61(052)420) AD 288416 Unclassified

The form of the locust electroretinogram is reported. This depends upon the type of electrode used, and the contact of the electrode with the retina. The critical flicker frequency (c.f.f.) was measured. This is of the order of 30-40 c/sec under the conditions of illumination used. The c.f.f. is higher when the flicker is produced by a moving shadow than when produced by stroboscopic illumination. Dark adaptation takes about 30 min. If the ventral region of the eye is illuminated the threshold for the dorsal region of the eye is raised. The results are compared with those of previous workers and in the light of Autrum's categories of slow and fast types of compound eye.

MAZE LEARNING AND BRAIN LESIONS IN ANTS, by D. M. Vowles. Sept. 21, 1961, 76p. incl. diagrs. tables, refs. (Technical note no. 3) (AFOSR-3222) (In cooperation with Reading U. Inst. of Experimental Psychology, Oxford (Gt. Brit.)) (AF 61(052)114 and AF 61(052)420) AD 288453 Unclassified

A method is described for training ants in simple and difficult visual discriminations. The ants are tested for interocular transfer, monocular blinding following binocular training, and binocular testing following monocular training. In a simple problem no disturbance is caused by the experimental changes. In the difficult problem all 3 changes produce a disturbance. The effect of severing the tracts unilaterally between the optic ganglia and the mushroom bodies following binocular and monocular training in both a difficult and a simple problem was studied. With one exception a disturbance in learned performance was caused by the operation, even if on the blinded side. The exception was following binocular training in the simple problem. Control lesions did not produce any disturbance. Lesions to the optic ganglia showed that these were involved in the engram. A hypothesis based on neurophysiological evidence is proposed to explain all of the results.

OLFACTORY LEARNING AND BRAIN LESIONS IN THE WOOD ANT (FORMICA RUFA), by D. M. Vowles. Sept. 30, 1961 [25]p. incl. diagrs. tables. (Rept. no. 6) (AFOSR-3462) (In cooperation with Reading U., Dept. of Psychology (Gt. Brit.)) (AF 61-(052)420 and AF 61(052)114) AD 284348 Unclassified

Also published in Jour. Compar. and Physiol. Psychol., v. 58: 105-111, 1964.

A technique is described for training ants in a T-maze, using olfactory cues. True olfactory learning occurs and amputation of the antenna prevents the use of olfactory cues. Amputation of one antenna causes a slight falling off in performance, but the ants still perform well above chance level after the operation. After ants have been trained in an olfactory discrimination, the effect of brain lesions on performance is studied. Severing the tracts between both antennal lobes and the alpha lobes of the mushroom bodies causes performance to fall back to chance level. Severing the tracts on only 1 side of the brain, or lesions placed elsewhere, does not disturb performance. Results are discussed in relation to the involvement of the mushroom bodies and antennal lobes in learning. (Contractor's abstract)

EFFECTS OF NITRATE ON THE ELECTRICAL AND MECHANICAL ACTIVITY OF INTESTINAL SMOOTH MUSCLE, by J. Axelsson. [1961] [1]p. (AFOSR-J305) (AF 61(052)476) AD 408047 Unclassified

Also published in Biochem. Pharmacol., v. 8: 1, Aug. 1961.

Replacement of chloride with nitrate increases the frequency of spontaneous spike discharge which partly explains the increased tension in nitrate solution. In experiments in which no change in spike frequency was observed, the increased tension might still have been secondary to a change of spike duration and configuration. However, indirect evidence indicated that nitrate might have an effect on tension apart from its effect on the electrical activity. At 37°C the taenia coli maintained tension only as long as spike discharge persisted and usually it did not respond with a contracture to a depolarization with high KCl. Exposure to 10-20 times the normal concentration of KCl caused depolarization, stopped spikes and the muscle relaxed. When all the NaCl has been replaced by KCl, replacement of KCl with KNO_3 caused repolarization and initiated spikes, in spite of the 27 times the normal K concentration. However, in solution in which solid KCl was added or NaCl was only partly substituted, replacement of NaCl with $NaNO_3$ caused a slow increase in tension while the muscle remained depolarized and no spikes were recorded. It is therefore likely that nitrate has an effect on tension which is not mediated by its effect on the electrical activity. (Contractor's abstract)

SODIUM EXCHANGE IN SMOOTH MUSCLE, by P. J. Goodford. [1961] [1]p. (AFOSR-J306) (AF 61(052)-476) AD 408046 Unclassified

Also published in Biochem. Pharmacol., v. 8: 1, Aug. 1961.

Nearly all the Na in the tissue exchanged with a half-life of 0.5 min when the bathing solution had been labelled with 4Na, and this exchange was too rapid to permit any resolution into intracellular and extracellular components. Other pieces of taenia were equilibrated in a normal Ringer's solution and then transferred to 1 in which all the Na salts had been replaced by Li; the Na again washed out of the tissue with an initial half-life of 0.5 min but a portion remained in the muscle during the 1 hr immersion in the Li Ringer. The experiment in Li solution was repeated at that temperature and the proportion of non-exchangeable Na was then much greater. It is suggested that the Na which remained in the tissue in the presence of Li was intracellular. The low content of bound Na at 35°C would then indicate a low intracellular concentration, which, however, approached the concentration in the external solution at 4°C. (Contractor's abstract)

THE UPTAKE OF ETHANESULPHONATE-S^{35} IONS BY MUSCULAR TISSUE, by P. J. Goodford and H. Lüllman. [1961] [8]p. incl. diagrs. table, refs. (AFOSR-J307) (AF 61(052)476) AD 408049 Unclassified

Also published in Jour. Physiol. (London), v. 161: 54-61, Apr. 1962.

The uptake of radioactivity at different times, by pieces of skeletal, atrial and smooth muscle immersed in a physiological saline solution containing 3 mM ethanesulphonate-S^{35}, has been measured. Uptake occurred at 2 rates, a rapid phase completed in a few minutes (corresponding in magnitude to the extracellular space) and a much slower phase. After 3 hr immersion the intracellular concentration of ethanesulphonate-S^{35} was about 1/3 of the concentration in the bathing fluid. The extracellular spaces calculated from the results were: rat diaphragm, 21 ml/100 g wet wt; guinea-pig atria, 26 ml/100 g wet wt; guinea-pig taenia coli, 30 or 41 ml/100 g wet wt; depending on the method used to remove superficial saline from the tissue. The results suggested that ethanesulphonate was a relatively impermeant ion. (Contractor's abstract)

SPIKE GENERATION BY INTESTINAL SMOOTH MUSCLE DURING COMPLETE ABSENCE OF SODIUM IN THE EXTERNAL MEDIUM, by E. Bülbring and H. Kuriyama. [1961] [1]p. (AFOSR-J308) (AF 61(052)476) AD 408050 Unclassified

Presented at First Internat'l. Pharmacological meeting, Stockholm (Sweden), Aug. 22-25, 1961.

Published in Biochem. Pharmacol., v. 8: 154, Aug. 1961.

Sucrose decreases membrane activity which ceases after 20-40 min. Choline depolarizes the membrane and rapidly abolishes spike generation but in the presence of atropine, choline increases membrane activity and spikes do not cease for 30 min or more. Lithium, after transient depression, increases discharge frequency. Membrane potential and spike height are slightly decreased, but spike generation continues for 1 hr or more. Tetraethylammonium transiently increases spike height, then it depolarizes, reduces spike height and prolongs the spike duration 100 times. Within 5 min spike discharge ceases. Tris(hydroxymethyl)aminomethane increases spike frequency and sometimes spike height. Spike generation continues for 30-60 min. Decreased membrane activity in sodium-free solutions may not be primarily due to sodium lack but to a change of membrane permeability or of metabolic processes by the substances used as substitutes. Spike generation in taenia coli may be independent of sodium. On the other hand, the substitutes used may maintain activity for short periods by acting in place of sodium. (Contractor's abstract)

MOTILITY OF THE INTESTINE, by E. Bülbring. [1961] [3]p. incl. refs. (AFOSR-J309) [AF 61(052)-476] AD 408051 Unclassified

Also published in Proc. Royal Soc. Med., v. 54: 773-775, Sept. 1961.

It is clear that in rhythmically active smooth muscle of the intestine the rate of metabolic energy supply is an important factor influencing membrane potential and excitability. The tissue which is continuously in a condition of excitation requires a very active mechanism for keeping up the differences in ionic concentration. The tendency to depolarize (due to the peculiar properties of the membrane, particularly its high sodium permeability) is constantly opposed by forces which try to stabilize the membrane.

ELECTRICAL ACTIVITY IN INTESTINAL SMOOTH MUSCLE, by E. Bülbring. [1961] [19]p. incl. illus. refs. (AFOSR-J311) (AF 61(052)476) AD 408053 Unclassified

Also published in Physiol. Rev., v. 42: 160-178, July 1962.

Evidence is given in support of the idea that mechanical changes are associated with the initiation of impulses, that the cause for discharge of impulses is probably the depolarization of the cell surface and that this in turn is due to a change in metabolism. The properties of smooth muscle are discussed. It is pointed out that the complicated pattern of activity is the consequence of the smooth muscle cell being much less specialized than other excitable tissue. Each cell is rather like a primitive organism combining several functional possibilities within one and the same cell. An explanation of control of the membrane potential is given dealing with such questions as what processes cause the fluctuations of the mean level of the membrane potential and the changes in excitability, and what is the ionic basis for the electrical activity. The role that acetylcholine plays in depolarization is also investigated. It is pointed out that the mode of action of adrenaline has thrown new light on the behavior of this interesting muscle, mainly because of the ability to measure biophysical and biochemical changes in parallel and to correlate them with changes in ion movements. The future holds many experimental possibilities of this kind before an understanding of the fascinating oscillating system and the servo-mechanism contained in the cells of intestinal smooth muscle can be achieved.

THE DISTRIBUTION OF 5-HYDROXYTRYPTAMINE AND ADENOSINETRIPHOSPHATE IN CYTOPLASMIC PARTICLES OF THE DOG'S SMALL INTESTINE, by W. H. Prusoff. [1960] [5]p. incl. diagrs. refs. (AFOSR-252) (AF 61(052)235) AD 253884 Unclassified

Also published in Brit. Jour. Pharmacol. and Chemotherapy, v. 15: 520-524, Dec. 1960.

The distribution of 5-hydroxytryptamine, adenosinetriphosphate, and succinic dehydrogenase in sucrose homogenates of the dog's small intestine has been studied. The adenosinetriphosphate was present in 2 different layers which could be separated by density gradient centrifugation. The upper layer contained also much succinic dehydrogenase, but no amine; it is probably composed of mitochondria. The lower layer contained not only adenosinetriphosphate but also the major portion of the particle-held 5-hydroxytryptamine. The mean molar ratio, amine: adenosinetriphosphate, in the lower layer was 2.6. The experiments suggest that adenosinetriphosphate in the intestine is of importance in the storage of 5-hydroxytryptamine, resembling the function of adenosinetriphosphate in the storage of the catechol amines of the adrenal medulla. COMPARATIVE STUDY OF HYDROXYINDOLE OXIDASES, by H. Blaschko and W. G. Levine. [1960] [9]p. incl. diagrs. tables, refs. (AFOSR-253) (AF 61(052)235) AD 253839 Unclassified

Also published in Brit. Jour. Pharmacol. and Chemotherapy, v. 15: 625-633, Dec. 1960.

A comparative study has been carried out of the oxidation of 5-hydroxytryptamine and related compounds by the oxidase present in the gill plates of Mytilus edulis and of caeruloplasmin, the copper containing oxidase of mammalian plasma. Both preparations oxidized indole derivatives carrying a hydroxyl group in the 4-, 5-, 6-, or 7- position. The oxidation of bufotenine was compared with that of its 4- and 6-hydroxy analogues; the 4-hydroxy analogue is psil ocine, a naturally occurring hallucinogenic compound. The evidence suggests that the 2 enzymes catalyse the same reactions, but that the substrate specificity of the mammalian oxidase is somewhat more restricted. Both enzymes are hydroxyindole oxidases, not specific for 5-hydroxyindoles alone. Inhibitors of the Mytilus oxidase included inhibitors of copper enzymes but not edetate or carbon monoxide. The action of pig serum on 5-hydroxytryptamine was due to caeruloplasmin and not to amine oxidase. (Contractor's abstract)

SEPARATION OF CELL COMPONENTS BY DIFFERENTIAL CENTRIFUGATION, by H. Blaschko. [1961] [5]p. incl. diagr. refs. (AFOSR-2022) [AF 61(052)-235] AD 455615 Unclassified

The use of a centrifuge tube called a chondriocrit is described. It enables one to get a measure of the volume of a sediment and also makes it possible to see if a sediment is homogeneous; different layers show up readily in the capillary part at the bottom of the tube. In this experiment one was able to see that the so-called mitochondrial sediment from the bovine adrenal medulla was not homogeneous. An upper and lower layer could be distinguished; the lower layer was found richer in catechol amines and the upper richer in succinic oxidase. A mitochondrial sediment was prepared in 0.3 M sucrose. It was resuspended in sucrose of the same concentration, and layered over a sucrose density gradient. In these experiments the gradient was prepared from sucrose solutions, beginning with 2.25 M sucrose at the bottom and 1.6 M sucrose at the top. High-speed centrifugation in the Spinco ultracentrifuge led to a resolution of the mitochondrial sediment. A very conspicuous opaque layer was seen at the top of the gradient and more opaque layers were recovered from the lower part of the tube. Three enzymes were studied in these experiments: succinic dehydrogenase, fumarase and amine oxidase. All 3 were found to be present in the opaque layer of particles at the top of the gradient. This layer did not contain catechol amines. The amines were recovered in the lower layers of the gradient; these layers did not contain significant amounts of the 3 enzymes. In the experiments with the bovine adrenal medulla, adenosine triphosphate (ATP) was also determined. In the density gradient, the distribution of the ATP so closely followed that of the catechol amines that there can be little doubt that amines and ATP are present in 1 and the same granule. This work is in good agreement with recent cytological studies of the adrenal medulla. Similar procedures were used to determine a resolution of the particulate material isolated from the Harding-Passey mouse melanoma. Electron micrographs were prepared from the fractions isolated using again the Schuster cutter. The grey opaque layer contained a practically pure suspension of typical mitochondria; the intensity black layers at the bottom of the sucrose gradient contained melanin granules. The study of the distribution of the 2 enzymes showed that a very satisfactory separation had been achieved.

EFFECT OF RESERPINE ON THE 5-HYDROXYTRYPTAMINE AND ADENOSINETRIPHOSPHATE OF THE DOG INTESTINAL MUCOSA, by W. H. Prusoff. [1961] [5]p. incl. diagrs. tables, refs. (AFOSR-2023) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)235] and National Institute of Neurological Diseases and Blindness) Unclassified

Also published in Brit. Jour. Pharmacol. and Chemotherapy, v. 17: 87-91, Aug. 1961.

Homogenates were prepared of the mucous membrane of the small intestine from dogs previously treated with high doses of reserpine. The granular material sedimented from these homogenates was centrifuged over a density gradient. The dense fraction usually rich in adenosinetriphosphate and 5-hydroxytryptamine contained little amine and no nucleotide; on the other hand, the less dense material, believed to consist mainly of mitochondria, contained amounts of adenosinetriphosphate similar to those found in animals not treated with reserpine.

SPERMINE OXIDASE AND BENZYLAMINE OXIDASE. DISTRIBUTION, DEVELOPMENT AND SUBSTRATE SPECIFICITY, by H. Blaschko and R. Bonney. [1961] [12]p. incl. diagrs. tables, refs. (AFOSR-3615) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)235] and [British] Agricultural Research Council) Unclassified

Also published in Proc. Royal Soc. (London), v. 156B: 268-279, 1962.

A survey has been made of the distribution of the 2 types of amine oxidase that occur in mammalian blood plasma. Spermine oxidase has been found in all ruminants (Ruminantia and Tylopoda) examined, and also in the hippopotamus and 2 members of the order Hyracoidea. Benzylamine oxidase has a much wider distribution; it occurs not only in Ungulates and Carnivores, but has also been found in some Primates. Benzylamine oxidase was not found in the blood

plasma of newborn pigiets; in newborn foals the enzymic activity was low. Spermine oxidase activity, absent or very low in the newborn kid, developed at similar rates in kids kept with the mother, bedded on straw, and in those removed from the mother and bedded on wood shavings. The plasma amine oxidases differ from the intracellular amine oxidase in that they are unable to oxidize N-methylated secondary amines. (Contractor's abstract)

THE APPLICATION OF PHASE SPACE CONCEPTS TO THE DESIGN OF AN ELECTRON LINAC BUNCHER, by A. J. Lichtenberg. [1961] [70]p. incl. diagrs. (Technical note no. 9) (AFOSR-2245) (AF 61(514)1183) AD 289466 Unclassified

The report covers the preliminary design of a linac buncher to produce relativistic electrons for injection into an undulator. The function of a buncher is to confine the electrons within a narrow axial distance, while keeping the axial momentum spread as small as possible. In this paper it is proposed to vary the parameters in a manner such that the axial ratio changes exponentially. It is suggested by the transformation properties of the axial ratio that this would lead to a rational design method for field and velocity change along the structure to ensure good bunching. Mathematically this procedure leads to a differential equation which is solved numerically for the design parameters. With these parameters the equations of particle motions are solved, also numerically, and good agreement with the expected performance is found. The effect of beam loading on the extent of the phase-areas containing the particles is taken into account. A pre-bunching cavity is proposed in order to match the electron gun output phase area (emittance) to the bunching section input phase area (acceptance), the cavity thus acting as a phase-space transformer. Finally, the effects on particle orbits of errors in beam velocity, synchronous wave velocity, and electric field are investigated.

ELECTROMAGNETIC RADIATION FROM SOURCES EMBEDDED IN AN INFINITE ANISOTROPIC MEDIUM AND THE SIGNIFICANCE OF THE POYNTING VECTOR, by H. Kogelnik and H. Motz. [1961] 29p. incl. diagr. refs. (AFOSR-4756) (AF 61(514)1183) AD 408350 Unclassified

Examples of the power radiated by a modulated ion beam and that of an elementary magnetic dipole are treated. Problems of radiation from sources in the infinite medium can be readily reduced to elementary matrix operations and integrations by the method employed herein. Without further special assumptions the imaginary part of the power radiated diverges in most cases. Radiation fields at a large distance from the sources are computed. It is shown that the wave normal need not be parallel to the direction of propagation i. e. to the group velocity. In addition, although the polarization vectors may carry out a complicated motion, the direction of the average Poynting vector is nevertheless the same as that of the group velocity.

THE REACTION OF ATOMS AND RADICALS WITH VARIOUS MOLECULES, by J. W. Linnett. Final technical rept. Feb. 1, 1957-Oct. 31, 1961. Nov. 26, 1961, 12p. (AFOSR-2029) (AF 61(514)1117) AD 272022 Unclassified

Emission spectra from flames of organic substances burning in active nitrogen at low pressures revealed a group of bands near 3290A only when the organic material contained H. Further analysis indicated that the emitter contained C and N and at least 3 atoms. From experiments with isotopic C, it was shown that the emitter was NCN. It was found that only the 4315A system of the CH emission is observed in flames supported by N atoms; when atomic O is used, the 3889A system is observed as well. Recombination of O and H atoms on the surfaces of catalysts, and the recombination of O atoms in the gas phase are discussed.

INVESTIGATION OF RECOMBINATION RADIATIONS FROM SEMICONDUCTORS, by C. Benoit a la Guillaume. May 15, 1961 [21]p. incl. diagrs. tables, refs. (AFOSR-1042) (AF 61(052)370) AD 262073 Unclassified

Recombination radiation from semi-conductors, mainly germanium have been studied at low temperatures (2°K to 20°K) with a resolving power of 1000 to 3000. A careful study of the intrinsic lines in Ge including magneto-optical effects proves that, at low temperature, they are due to exciton annihilation, and that the minimum of the conduction band is exactly at the edge of the Brillouin zone in the (111) direction. Lines due to shallow impurities in Ge have been studied. Two types of transition are observed: (1) recombination of a free carrier of opposite sign bounded to the impurity; (2) annihilation of an exciton from a 4 particles complex involving a neutral impurity plus an exciton. In both cases, first order and second order transitions are observed, and one can deduce the value of the $k = 0$ component of the wave function of the electron bounded to donors. Some results have been obtained in an attempt to visualize the dislocations in Ge by their own recombination radiation. (Contractor's abstract)

DOUBLE PHONON PROCESSES IN CADMIUM SULFIDE, by M. Balkanski and J. M. Besson. [1961] [6]p. incl. diagrs. tables, refs. (AFOSR-2107) [AF 61(052)572] Unclassified

Also published in Jour. Appl. Phys. Suppl., v. 32: 2292-2297, Oct. 1961.

Also published in Semiconducting Compounds; Proc. of the Conf., Schenectady, N. Y. (June 14-16, 1961), New York, W. A. Benjamin, Inc., 1961, p. 2292-2297. (AFOSR-955)

The bands of infrared absorption in hexagonal cadmium sulfide have been studied over a wide range of temperatures and are assigned to double-phonon processes. An analysis of these absorption peaks on the basis of four frequencies is proposed. The temperature-dependence of the location and intensity of these bands give indications upon the anharmonic parameter and Grüneisen constant of the crystal. Anharmonic forces are shown to be responsible for the coupling between normal vibrational modes. (Contractor's abstract)

ENERGY TRANSFER IN SEMICONDUCTORS, by M. Balkanski. [1958] [3]p. (AFOSR-4575) [AF 61(052)-572] AD 400843 Unclassified

Also published in Proc. 1958 Internat'l. Conf. on Semiconductors, Rochester, N. Y. (Aug. 18-22, 1958), New York, Pergamon Press, 1958, p. 179-181.

Also published in Jour. Phys. and Chem. Solids, v. 8: 179-181, Jan. 1959.

When an exciton produced in a semiconductor annihilates after propagation by returning in its fundamental state emitting a photon, this photon can be reabsorbed creating a new exciton if its frequency corresponds to the resonance energy. The processes can repeat

themselves as long as the photon emission takes place in the interior of the crystal at a few λ beneath the surface. The energy propagates by alternative creation and annihilation of excitons coupled by the radiation field until the excited state reaches the surface where the proton is emitted out of the system and detected. The mechanism proposed here to describe the energy transfer at great distances includes 2 successive steps repeated alternately. (1) Absorption of light and creation of an electron-hole pair strongly interacting between them whose zeroth order excited wave function can be constructed. (2) The excited electron returning to its ground state emits a photon. The emitted photon can be reabsorbed regenerating the excitation wave. The propagation of the excitation energy can be considered as exciton diffusion if the following conditions are satisfied: (1) The excitation wave conserves the wave vector over the whole process. (2) The multiple diffusion of the photon by the excitation waves is a coherent process. It is shown that in the solids where reabsorption of the emitted photon is possible one should find the apparent lifetime of the exciton greater than that given by simple estimation on one excited state. Because this multiple process is possible it is also natural to find great diffusion length. This explains the known experimental results.

ABAC CHART FOR FAST CALCULATION OF THE ABSORPTION AND REFLECTION COEFFICIENTS, by W. Nazarewicz, P. Rolland, and M. Balkanski. [1961] [2]p. incl. diagr. (AFOSR-J32) [AF 61(052)-572] AD 297143 Unclassified

Also published in Appl. Opt., v. 1: 369-370, May 1962.

Simultaneous transmission and reflection measurements on a thick absorbent layer permit 1 to obtain the absorption and reflection coefficients. A fast calculation is proposed by using a double coordinate system abac chart. The proposed abac chart permits 1 to obtain rapidly the transmission and the reflection coefficients of thick layers. Its usefulness is evident in the systematic study of the optical properties of such materials as semiconductors, which are neither perfectly transparent nor opaque, and which it is difficult to obtain in homogeneous volumes great enough to permit 1 to cut prisms in them, and for which the absorption coefficient is related to important properties such as the nature and the concentration of the impurities.

THE LOW ENERGY PION-PION INTERACTION I, by J. G. Taylor. Jan. 1961, 4p. (Technical note no. 23) (AFOSR-655) (Also bound with its AFOSR-1829; AD 272440) (AF 61(052)173) AD 258324 Unclassified

There has been a great deal of interest recently in the pion-pion interaction, both theoretically and practically. Here a derivation of the pion-pion amplitude from CAU (program of determining strong interactions by means of the properties of analyticity, unitarity, and crossing symmetry) which does not presuppose the resonance of Frazer-Fulco. The inverse amplitude is used to derive the most general form of pion-pion amplitude satisfying CAU. Results are obtained concerning the high energy behavior of the interaction, and a general discussion of possible resonances in the S and P waves is given. An account is given of the CAU properties in which some of the higher particle states are taken into account on the left hand cut (negative energy range), but only S and P waves are kept in all absorption parts. The high energy behavior of the S and P phase shifts can be determined unambiguously, showing that within the present approximation the I = 0 and 1 effective potentials are attractive at short distances and the I = 2 potential is repulsive. This result is used to discuss the possibility of resonances arising under the approximations.

THE PION-PION INTERACTION AND HIGH ENERGY p + d COLLISIONS, by J. G. Taylor. Jan. 1961, 5p. incl. refs. (Technical note no. 24) (AFOSR-656) (Also bound with its AFOSR-1829; AD 272440) (AF 61(052)173) AD 258448 Unclassified

Also published in Phys. Rev. Ltrs., v. 6: 237-238, Mar. 1, 1961.

A possible explanation of the anomaly found in meson production in proton-deuteron collisions is that put forward by Tubis and Uretsky (Phys. Rev. Ltrs., v. 5: 513, 1960). They suggest that if a final state P wave pion-pion interaction, described in the scattering length approximation, is added to the statistical model of Abashian et al (Ibid., v. 5: 258, 1960), a P wave scattering length of magnitude 2.5 pion Compton wavelengths explains the anomaly. Evidence is given that does not agree with such a large value for this scattering length. This evidence comes from equations relating the 3 scattering lengths as derived from crossing symmetry, and from the experimental evidence on the asymmetry of the pion momentum spectrum in tau decay. SOME REMARKS ABOUT THE PHOTOPRODUCTION OF STRANGE PARTICLES, by M. Gourdin. Feb. 1961, 6p. incl. refs. (Technical note no. 25) (AFOSR-1567) (AF 61(052)173) AD 267241 Unclassified

Published in Nuovo Cimento, Series X, v. 20: 1035-1037, June 1, 1961.

An elementary description of strange particles photoproduction by adding to the Born terms some contributions due to resonances is presented. For Channel I (intermediate nucleons) and III (intermediate hyperons), the situation is exactly the same as for the associated production amplitude. For the Channel II (intermediate k-mesons) we have the possibility of an intermediate pi-K state. If we call k' the observed resonance, we replace the cut corresponding to the pi K intermediate state by a pole at the resonance energy.

THE LEFT-HAND CUT DISCONTINUITY AND EQUIVALENT POTENTIALS, by K. Chadan. Dec. 1961, 6p. (Technical note no. 1) (AFOSR-2223) (AF EOAR-62-10) Unclassified

Also published in Nuovo Cimento, Series X, v. 24: 379-384, May 1, 1962.

It was shown by Martin (Nuovo Cimento, Series X, v. 19: 1257-1265, 1961) that for a superposition of Yukawa potentials the left-hand discontinuity of the partial wave amplitude determines uniquely both the amplitude and the potential. The author extends the proof to the case when there is a bound state superimposed on the left-hand cut. It is also shown that the potential so obtained is one member of the family of phase-equivalent potentials obtained from the phase shifts. If there are no bound states on the left-hand cut, the potential obtained from the left-hand discontinuity is that particular member of the family which decreases fastest at infinity; no such statement can be made if there is a bound state below the left-hand branch point. SHOCK WAVE STRUCTURE IN A FULLY IONIZED GAS BASED ON MULTI-COMPONENT FLUID THEORY, by H. Li and R. D. Mathieu. Sept. 1961 [54]p. incl. diagrs. refs. (Technical rept. no. 14) (AFOSR-1018) (AF 49(638)647) AD 266620 Unclassified

The multi-component continuous approach for the investigation of the gasdynamics of a plasma is presented. More information about the flow properties of a plasma can be obtained than from the classical magnetohydrodynamic approach. Also, the resulting equations appear to be more easily solved than the Boltzmann equation of classical kinetic theory. The basic macroscopic conservation equations for a non-reacting multi-component plasma are presented. The fluid properties of each component are referred to the mean velocity of that component. Therefore, no limitations are placed on the magnitude of the diffusion velocities. The effects of electric and magnetic fields are included. The equations for a 2-component mixture are used to study the structure of a shock wave in a fully-ionized hydrogen gas. It is assumed that the momentum exchange and energy exchange between the ions and electrons are important because of the strong Coulomb forces present. Thus, the effects of viscosity and thermal conductivity are neglected. The phenomenon of charge separation gives rise to an induced electric field within the plasma. For a Mach number of 1.12 and typical plasma conditions, the electric field is of the order of 12,000 v/cm. At this low Mach number, the fluid properties of the ions and electrons vary in an oscillatory manner through the shock wave. As the mean-free path between particles decreases, the oscillations damp out more rapidly and at the same time the oscillations become less frequent. (Contractor's abstract)

GASDYNAMICS OF PLASMAS (Abstract), by H. Li and R. D. Mathieu. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)647) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

The multi-component continuum approach is used to investigate the fluid properties through the transition region of a shock wave in a fully ionized plasma. The plasma is considered to consist of electrons and one type of positive ions which are singly charged. A set of continuum equations is written for the ions and a set for the electrons. It is assumed that the ions and electrons are in a local thermodynamic equilibrium with themselves but not with each other. Only the effects of diffusion due to the self-induced electric field and to gradients in the pressure, density, and temperature are included. The effects of viscosity and thermal conductivity are neglected. The justification for this is the presence of the long range electrostatic Coulomb forces which become important when the Debye length is on the order of or greater than the mean free path. Uniform conditions for the electron and ion gas mixture are assumed far ahead and far behind the shock front. This implies that there is no current flow through the shock transition region if there is no external electric field. Thus, there is no dissipation to Joule heating. No assumptions are made concerning the difference in mass, number density, velocity, pressure, or temperature between the ions and electrons. Also, no assumption has been made concerning the magnitude of the diffusion velocities. The equations and expressions used are good for large diffusion velocities as well as for small diffusion velocities.

PHOTOOXIDASE ACTIVITY OF HEATED CHROMATOPHORES OF RHODOSPIRILLUM RUBRUM, by E. S. Lindstrom. [1961] [3]p. incl. diagr. tabl., refs. (AFOSR-J700) (Sponsored jointly by [Air Force Office of Scientific Research under AF AFOSR-61-42], Charles F. Kettering Foundation, and National Science Foundation) AD 413399 Unclassified

Also published in Plant Physiol., v. 37: 127-129, Mar. 1962.

Mild heat treatments of the chromatophore of Rhodospirillum rubrum (Esmarch) caused a more rapid decline in the rate of photooxidation of reduced indophenol than a destruction of the far-red absorption band of bacteriochlorophyll. This indicated that such photooxidations were not simply a passage of electrons from the reduced indophenol to the nascent photooxidized bacteriochlorophyll as other heat labile factors were also necessary for the photooxidation of the reduced indophenol. The rates of these photooxidations on a bacteriochlorophyll basis were comparable to the rates of the photoreduction of exogenous DPN. It is suggested that such photooxidations are valid measurements for the oxidant in bacterial photosynthesis. (Contractor's abstract)

EFFECTS OF TRIAXIAL STRESSES ON MECHANICAL PROPERTIES OF METALS UNDER HIGH PRESSURE, by L. W. Hu, E. E. Headington and others. Final rept. Sept. 1961, 144p. incl. diagrs. tables, refs. (AFOSR-1716) (AF 49(638)676) AD 266887 Unclassified

The studies of the effects of triaxial stresses on the mechanical properties of metals under hydrostatic pressure conducted under this contract during the past 2 yr included 2 main parts. The results of the first part were negative and are not reported here. The second part consisted of the following 6 sections all of which are reviewed individually: (1) The influence of hydrostatic pressure on the fatigue life of an aluminum alloy 7075-T6 was investigated. It was found that the fatigue life of notched cantilever specimens increased with the intensity of superimposed hydrostatic pressure. (2) An experimental investigation was made to study the effect of tensile plastic deformation on the 3-dimensional yield surface of a mild steel. A significant conclusion which can be drawn from the test results was a local bulge produced on the yield surface by the loading program prescribed. (3) To determine the plastic stress-strain relations in tension for an aluminum alloy 2017-T4, an experimental program was conducted. The test results confirmed the previous findings that the hydrostatic stress state has no significant effect on the plastic behavior of aluminum alloys, although the area reduction at fracture was found to increase with the intensity of hydrostatic pressure. (4) A program to study the mechanical properties of wires drawn under hydrostatic pressure was initiated and it is not reported here. (5) Analytical studies were made on the inclusion of hydrostatic stress component in the formulation of the yield condition for metals. The implication of the inclusion of the hydrostatic stress component for plastic stress-strain relations was discussed. (6) One type of yield condition in particular was studied, and its application to the determination of the load carrying capacity of thick-walled spherical shells was made.

EFFECT OF TENSILE PLASTIC DEFORMATION ON THREE DIMENSIONAL YIELD SURFACE, by L. W. Hu, H. E. Shull, and K. D. Pae. Sept. 1961 [26]p. incl. diagrs. tables. (Bound with its AFOSR-1716; AD 266887) (AF 49(638)676) Unclassified

The tensile yield stress of the cylindrical specimens prestressed in tension decreases when the intensity of the superimposed hydrostatic pressure increases. The experimental results disprove the assumption that hydrostatic pressure of moderate intensity has no effect on the plastic flow of metals. When the results of this investigation and the yield corner formation found in biaxial stress experiments are taken into consideration, straining plastically along the loading path appears to produce a local bulge on the initial yield surface.

THE INCLUSION OF HYDROSTATIC STRESS COMPONENT IN YIELD CONDITION AND APPLICATION, by L. W. Hu and K. D. Pae. Sept. 1961 [2]p. incl. diagrs. (Bound with its AFOSR-1716; AD 266877) (AF 49(638)676) Unclassified

Also published in Jour. Franklin Inst., v. 275: 491-502, June 1963.

The inclusion of the hydrostatic stress component in the formulation of the yield condition for metals is discussed. Many experimental observations in combined stress experiments can be described satisfactorily by a yield condition of the form $J_2 = K^2 + \alpha J_1 + \beta J_1^2$. A further approximation of this yield condition can be used in biaxial stress problems for many materials and it depends on the relative magnitude of the material constants k, α and β. An application of the above yield condition to the determination of the load carrying capacity of thick-walled spherical shells was given.

AN INVESTIGATION OF THE INFLUENCE OF HYDROSTATIC PRESSURE ON THE FATIGUE LIFE OF AN ALUMINUM ALLOY 7075-T6, by L. W. Hu, R. H. Hoffman, and J. Schreiber. Sept. 1961 [32]p. incl. diagrs. tables. (Bound with its AFOSR-1716; AD 266887) (AF 49(638)676) Unclassified

An investigation on the influence of hydrostatic pressure on the fatigue life of an aluminum alloy 7075-T6 was conducted by a specially designed fatigue testing unit of constant deflection type. It was found that the fatigue life increased significantly as the intensity of hydrostatic pressure increased but the scatter of experimental results appeared not to be affected by the superimposed pressure. In other words, it was found that in the formulation of a general theory of fatigue strength, it is incorrect to assume that the hydrostatic stress state has no effect on the fatigue strength of metals. The representation of the influence of hydrostatic pressure on the effect of the mean stress on fatigue strength of metals was discussed.

A NOTE ON PLASTIC STRESS-STRAIN RELATIONS IN TENSION OF 2017-T4 ALUMINUM ALLOY UNDER HYDROSTATIC PRESSURE, by L. W. Hu and H. E. Shull. [Sept. 1961] 9p. incl. diagrs. (Bound with its AFOSR-1716; AD 266877) (AF 49(638)676) Unclassified

For the material 2017-T4 tested in tension under hydrostatic pressure up to 50,000 psi, the following conclusions can be made: (1) The tensile plastic stress-strain relations were not affected by the presence of hydrostatic pressure. (2) The necking of the specimen at fracture became more localized as the intensity of superimposed hydrostatic pressure increased. (3) The area reduction of fracture increased as the intensity of pressure increased.

PLASTIC STRESS-STRAIN RELATIONS AND HYDROSTATIC STRESS, by L. W. Hu. Sept. 1961 [14]p. incl. diagrs. refs. (Bound with its AFOSR-1716; AD 266887) (AF 49(638)676) Unclassified

It has been shown that the plastic stress strain relations for metals can be formulated to include the effects of hydrostatic component of stress. If the plastic potential is assumed to be the same as the yield criterion, it is necessary to consider the volume change caused by plastic deformation. The uniqueness of solution for elastic-plastic bodies can be shown in the exact similar way as the proof of uniqueness theorem by Melan. The significance of the inclusion of the first stress invariant in yield criterion lies not only in the fact that it represents physical phenomena correctly, but also that it may lead to new view points in the stress analysis of elastic-plastic bodies.

STRESS DISTRIBUTION IN A COMPOUND CYLINDER SUBJECTED TO TENSION, by L. W. Hu and E. E. Headington. Sept. 1961 [33]p. incl. diagrs. table, refs. (Bound with its AFOSR-1716; AD 266877) (AF 49(638)676) Unclassified

An elastic solution for a compound cylindrical bar subjected to tension was obtained by the stress function method. The numerical example for a bar with alt = 1000 appears to give a poor approximation to the solution. This poor approximation may be attributed to the fact that only the first 2 terms of the series solution were taken.

COORDINATE SYSTEMS IN CONTINUUM MECHANICS, by W. Jaunzemis. Aug. 1961, 41p. incl. refs. (Technical rept. no. 3) (AFOSR-1867) (AF AFOSR-62-115) AD 270541 Unclassified

The use of space, body, and variable reference coordinate systems in problems of continuum mechanics is reviewed, and certain results regarding tensor fields are summarized. Specifically, the advantages of body coordinate systems for characterization of constitutive equations, and the description of permanent deformation with the aid of a variable reference system are discussed, with a view towards the study of thermal stresses and deformations in the high temperature range. The various forms of the equations of motion are discussed, and reference is made to certain conflicting statements in the recent literature.

PROGRESS IN FIELD EMISSION WORK-FUNCTION MEASUREMENTS OF ATOMICALLY PERFECT CRYSTAL PLANES, by R. D. Young and E. W. Müller. [1961] [5]p. incl. illus. diagrs. refs. (AFOSR-1096) (AF 49(638)504) Unclassified

Presented at Twenty-first annual M. I. T. Conf., on Physical Electronics, Mar. 1961.

Also published in Jour. Appl. Phys., v. 33: 91-95, Jan. 1962.

The field electron microscope has been used previously to measure the work function of thermally smoothed single-crystal tungsten planes. In this work the field ion microscope is used to create atomically perfect single-crystal planes by field evaporation and then to observe and preserve these clean surfaces. The slope of the field emission Fowler-Nordheim plot then gives the ratio of the three halves power of the work function to the field. Two techniques have been developed in order to obtain a second relationship between work function and field: (1) temperature dependence of field-emission current density and (2) energy distribution of field-emitted electrons. While investigating temperature dependence it was found that a reinterpretation of the Gel'berg et al data for the work function temperature dependence of molybdenum up to 1100°K revealed the following unexpected cubic temperature dependence: $\varphi_T = \varphi_0 + 0.44 \times 10^{-10} T^3$ ev. DETERMINATION OF FIELD STRENGTH FOR FIELD EVAPORATION AND IONIZATION IN THE FIELD ION MICROSCOPE, by E. W. Müller and R. D. Young. [1961] [4]p. incl. diagrs. (AFOSR-3519) [AF 49(638)504] Unclassified

Also published in Jour. Appl. Phys., v. 32: 2425-2428, Nov. 1961.

The field strength required for field evaporation of tungsten and for best image conditions in the field ion microscope is measured by comparison with field electron emission of the same emitter. The evaporation field is independent of emitter radius except for radii below 150 A where the influence of free surface energy becomes noticeable. The field for the best conditions of a helium ion image of a typical emitter of 1000 A radius is 440 mv/cm. This field increases gradually with decreasing tip radius, so that the ratio of evaporation field to best image field for tungsten decreases from 1.27 at 1000 A radius to 1.0 at about 40 A radius. The radius dependence of this ratio can be calculated by assuming that the time a hopping atom spends in the critical ionization zone is a constant fraction of the ionization time. Practical implications are that large tip radii are preferable for easily evaporating emitter materials, and small radii may be useful when field evaporation is to be studied under best image conditions. DIRECT OBSERVATION OF CRYSTAL IMPERFECTIONS BY FIELD ION MICROSCOPY, by E. W. Müller. [1961] [23]p. incl. illus. diagrs. table, refs. (AFOSR-J277) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)504], Office of Naval Research, and Wright Air Development Division) AD 408482 Unclassified

Also published in Direct Observation of Imperfections in Crystals; Proc. of a Technical Conf., St. Louis, Mo. (Mar. 1-2, 1961), New York, Interscience Publishers, 1962, p. 77-99.

The field ion microscope is a new version of the field electron microscope which depicts the evenly curved cap of a fine metal tip on a fluorescent screen with the help of electrons radially emitted under the influence of the high electric field at the tip. The magnification of this arrangement is essentially equal to the ratio of screen distance to tip radius. For tip radii below 10^{-5} cm the magnification can easily be made to exceed one million diameters. Resolution is determined by the field distribution on the atomically structured specimen surface itself, and by the fact that the ions originate in free space in a zone slightly above the surface. Individual defects of various crystal imperfections are presented showing the capabilities of the field ion microscope. Further research areas for future study are also outlined.

BOMBARDMENT OF TUNGSTEN WITH 20 KEV HELIUM ATOMS IN A FIELD ION MICROSCOPE, by M. K. Sinha and E. W. Müller. Dec. 1961 [42]p. incl. illus. diagrs. refs. (Bound with its AFOSR-1910; AD 270227 (AF 49(638)504) Unclassified

Also published in Jour. Appl. Phys., v. 35: 1256-1261, Apr. 1964.

Fast helium atoms are shot into the emitter tip of a field ion microscope, and the resulting damage is shown to consist of vacancies, interstitials and their clusters. A large portion of defects created in the interior appears at the surface. This is due to the high field stress and the long range of interstitials by focusing collisions. Mobility of interstitials in tungsten was observed directly and occurs slowly at 21°K, and fast at 90°K.

A NEW CODE FOR REPRESENTATION OF ORGANIC STRUCTURAL FORMULAE ON PUNCHED CARDS AND MAGNETIC TAPE, FOR COMPUTER STORAGE AND PROCESSING, by V. Vand and R. Pepinsky. Jan. 15, 1961 [84]p. incl. diagrs. tables. (Rept. no. 75) (AFOSR-181) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)416 and Atomic Energy Commission under AT(30-1)1516) AD 279807 Unclassified

A new system has been developed for concise topological coding of organic structural formulae, using punched card input for small-machine processing or for transfer to magnetic tape for large machines. The code is specifically suited for storage and retrieval of structural formulae and all stereochemical features on standard small-scale machines. The small-machine print-outs are designed for IBM

Cardatypes with arithmetic units. Print-outs are in upper and lower case, with standard symbols for all chemical elements, chemical subscripts, etc. The Groth Institute upper-lower case control system for card- or tape-controlled typewriters is fundamental to the coding. This system can be transferred to an IBM 1401 printer with replaceable chains, or to the Pepinsky high-speed printer. The code does not involve numbering of atoms in the molecule and is only an intermediate step towards the Dyson Cipher and the logical chemical name. Conversion to the Dyson code is possible on large-scale machines. Small-scale machine systems suitable for this processing are discussed. (Contractor's abstract, modified)

A CONCISE TOPOLOGICAL CODE FOR ORGANIC STRUCTURAL FORMULAE, SUITABLE FOR SMALL-SCALE MACHINE RETRIEVAL, by R. Pepinsky and V. Vand. [1961] 3p. (AF 49(638)416) Unclassified

Presented at Symposium on New Machine Methods in Chemical Information Retrieval, St. Louis, Mo., Mar. 27, 1961.

A new system has been developed for concise topological coding of organic structural formulae, using punched card input for small-machine processing or for transfer to magnetic tape for large machines. The code is developed in stages of increasing conciseness, and complete linearization is possible. The code is specifically suited for storage of structural formulae and all stereochemical features on standard small-scale machines. The code, although completely topological, does not involve numbering of atoms in the molecules, and hence is only an intermediate toward a unique code such as the Dyson Cipher or Wiswesser code. The fact that retrieval centers, equipped with no more than a complement of small-scale machines which include a Cardatype and Sorter or Collator, can now process their own and outside-generated files, is of major importance. A system of automatic data exchange between centers of various sizes is proposed, in which the large centers also automatically convert the present topological coding to Dyson or other unique Ciphers and furnish the logical chemical name for each compound. The Groth Inst. code has been devised not only with the aim of simple topological representation of organic structures, but also to permit coding of inorganic and organic crystal structures, and to represent chemical reactions.

DEVELOPMENTS IN INFORMATION RETRIEVAL METHODS FOR SMALL-SCALE AND LARGE-SCALE MACHINE SYSTEMS, by R. Pepinsky. [1961] [3]p. (AF 49(638)416) Unclassified

Presented at Symposium on New Machine Methods in Chemical Information Retrieval, St. Louis, Mo., Mar. 27, 1961.

Input data is coded for machine processing, and transferred to IBM cards. At least one card is used for each property where a property signifies any class of information: e.g., name, formula, molecular weight, crystal symmetry, density, cell dimensions, atomic coordinates (many cards), etc. Peek-a-boo cards are automatically produced for each property in sets of 500 crystalline species; and higher-order numbers identify sets of 500 species, sets of sets, etc. The Cardatypes are also programmed to rotate sentences, parts of chemical names and formulae, etc., to permit sorting on any of these components and to produce key-word-in-context entries for concordances and special searches. A complete, manageable retrieval system for mega-item files, using only small-scale machines is thus provided. Many large-machine programs have been developed, and include those for almost all calculations required in crystallography. The merged, variously-processed collection of data from all critical collations will be distributed to editors in other centers, to facilitate consideration of preparation of monographs on special subjects, suitable for later incorporation into an encyclopedia. Several special retrieval projects are in progress, the chief of which involves computation, storage and evaluation of powder diffraction data for identification purposes. Another program is concerned with consolidation of all information on polymorphism and crystal transitions. A third project involves processing and prepublication of a new edition of Donnay's Crystal Data.

RESEARCH ON THE CRYSTAL-STRUCTURAL BASES

FOR SOME PHYSICAL PROPERTIES OF CRYSTALLINE SOLIDS, by R. Pepinsky. Final rept. Jan. 31, 1961, 18p. incl. refs. (AFOSR-528) (AF 18(603)35) Unclassified

A summary of research activities concerning research on the crystal-structure bases for some physical properties of crystalline solids is presented along with instrumentation projects necessary for these research activities. Attention has been directed particularly to structures showing piezoelectric and ferroelectric properties, dielectric anomalies, and polymorphic transitions in the solid phase. Investigation techniques have involved development of new chemical and crystal-preparative methods, new methods for optical studies at low temperatures, new methods for dielectric observations, high-sensitivity piezoelectric measurements over wide temperature ranges, new x-ray structural methods, and extensive studies involving x-ray and neutron diffraction techniques.

CLASSES OF PERIODIC SEQUENCES, by N. J. Fine. [1957] [18]p. incl. tables. (AFOSR-5042) [AF 18-(603)65] AD 414025 Unclassified

Also published in Illinois Jour. Math., v. 2: 285-302, June 1958.

Let q symbols 1, 2, $\cdots$, q be given and consider all sequences of length n; place 2 sequences in the same equivalence class if they can be obtained from 1 another by merely renaming the symbols or by starting the 1 sequence at a different point. For example, if q = 3, n = 4, the sequences (1123), (3312), and (3123) are all equivalent. From these finite sequences, we may build up infinite sequences by repetition; the primitive period of such an infinite sequence is either n or a smaller integer. Thus, in the example, (1111) has primitive period 1. The author uses $F_q(n)$ to denote the number of equivalence classes with primitive period n and $F_q^*(n)$ to denote the total number of classes with period n (whether primitive or not). He then shows how to compute $F_q(n)$, but the formulae are too complicated to quote here. (Math. Rev. abstract)

A NEW THEORY OF WORKHARDENING, by D. Kuhlmann-Wilsdorf. Sept. 1961, 45p. incl. refs. (AFOSR-1956) (AF 49(638)435) AD 269940 Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 210, Mar. 26, 1962.

Also published in Trans. Metall. Soc. AIME, v. 224: 1047-1061, Oct. 1962.

The experimental evidence on mechanical behavior of fcc, bcc and hcp metals is briefly reviewed. Extended linear hardening, largely independent of temperature, strain rate and other testing conditions, is found not only in all fcc metals (stage II) and in Ge but also in polycrystalline Fe and simple steels. The average value of the shear modulus by work hardening coefficient in the linear range is about 300 in fcc metals and 500 in steels. The corresponding value for hcp metals is by far larger, and it is concluded that the linear hardening in them cannot be compared to that in fcc and bcc metals. A qualitative theory of easy glide is presented. Linear hardening in stage II is explained on the basis of 3 simple assumptions. The resultant theory is applicable to a great variety of materials, testing conditions and dislocation arrangements, and in particular also to the tangled dislocation structures which are believed to be due to interactions between point defects and dislocations.

SOME SUGGESTED MECHANIZED INDEXING INVESTIGATIONS WHICH REQUIRE NO MACHINES, by J. O'Connor. [1960] 18p. (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under [Nonr-55135]) AD 240040 Unclassified

Published in Amer. Doc., v. 12: 198-203, July 1961.

This paper describes some investigations on mechanized indexing requiring no computers. Indexing here means an assignment to a document of a list of expressions to express its content for purposes of retrieval. The equipment required for the investigations suggested in this paper is a vocabulary of indexing terms, and a document collection to which they have been applied and are being used for retrieval. The process involves selecting a term from the indexing vocabulary of the retrieval to be used. Assume f to be T. A rule may be that this term is to be used when it appears in a document. Next, the degree of overassigning and underassigning must be calculated and a tolerance for both established. Thought must be given to the possibility of the term T appearing in a report as a reference, but which is only coincidently mentioned and whose relation to the paper as a whole is not important. A solution might be to assign T to the report only when it appears f number of times. If f is large enough overassigning can be eliminated but underassigning becomes a real problem. A solution then might be to assign T when the terms T and X appear in a report. Another solution may be to assign T when T-synonyms appear at least f times. Also T-indicators may be the appearing phases in a report which would best fit the indexing task to be completed. After consideration of these possibilities a check must be made to see if the application of any of these rules properly assigns the correct term to a report within the tolerance on overassigning and underassigning that has been excepted.

[REVIEW OF TWO REPORTS ON THE CRANFIELD

INDEXING EXPERIMENT], by J. O'Connor. [1961] [10]p. (AFOSR-887) (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under Nonr-55135) Unclassified

Also published in Jour. Doc., v. 17: 252-261, Dec. 1961.

All documents indexed were from the field of aeronautics and published since 1948. Eighteen thousand documents were collected. A set of one hundred of these documents constituted a 'document group'. In each group half were in the special field of high-speed aerodynamics, and the other half ranged over the rest of aeronautics. Further, in each group half the documents were journal articles and half were reports, and the documents were also divided equally between American papers and those of other countries. Presumably each group of one hundred documents was formed by random selection subject to the indicated restrictions, but this is not explicitly stated in the reports.

SOME REMARKS ON MECHANIZED INDEXING AND SOME SMALL-SCALE EMPIRICAL RESULTS, by J. O'Connor. [1961] [14]p. incl. tables. (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under Nonr-55135) Unclassified

Published in Machine Indexing: Progress and Problems; Proc. of Third Institute on Information Storage and Retrieval, American U., Washington, D. C. (Feb. 13-17, 1961), [Washington] American U. School of Government and Public Administration, 1961, p. 266-279.

The problems of indexing, especially in the face of an ever increasing volume of published literature, is discussed and the possibility of utilizing machine indexing as a means to combat this problem is presented. The rules that would have to be set up in order to assign applicable terms and the statistical percentage of reports that would be missed as a result of a particular set of indexing rules is also discussed. It seems evident that machine indexing can be a useful approach to the indexing problem

THE TREATMENT OF AMBIGUITY AND PARADOX IN MECHANICAL LANGUAGES, by S. Gorn. Apr. 1961 [33]p. incl. diagr. (AFOSR-603) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)951 and National Science Foundation) AD 259782 Unclassified

Also published in Recursive Function Theory; Proc. of Symposium in Pure Mathematics, New York (Apr. 5-7, 1961), Providence, R. I., Amer. Math. Soc., v. 5: 201-218, 1962.

A summary is given of the basic definitions of the theory of mechanical languages, and of the main processors for the prefix languages. A discussion is given of language extension with the examples of hierarchies of extensions in prefix languages. The relationship is established between language extension and increase in control ambiguity. A language of syntactic ambiguity descriptions is designed and the effective processor translating from this language to the derived-language naming language is specified. The concepts of recognition depth for both syntactic ambiguities and analyzability of mechanical languages are developed, and examples are given to show the existence of both types at all depths, including infinite depth. Examples of control ambiguity are developed ranging from the extremely useful to the paradoxical. Among the paradoxes analyzed in this way are the Epimenides paradox, the Lewis Carroll Tortoise and Achilles paradox, and the Russell paradox.

SPECIFICATION LANGUAGES FOR MECHANICAL LANGUAGES AND THEIR PROCESSORS - A BAKER'S DOZEN, by S. Gorn. Dec. 1961 [11]p. incl. diagrs. table, refs. (AFOSR-1537) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)-951 and National Science Foundation) Unclassified

Also published in Commun. Assoc. Computing Mach., v. 4: 532-542, Dec. 1961.

This paper describes several languages which can be used to specify the syntax for many mechanical languages. The paper shows to what extent these languages are capable of specifying such mechanical languages or their processors, and to what extent these specifying languages can be translated from one to another. A simple example is used in each case in order to specify these syntactical languages.

PRODUCTION OF DIABETES INSIPIDUS IN HYPOPHYSECTOMIZED RATS BY HYPOTHALAMIC LESIONS, by C. C. Gale, S. Taleisnik, and S. M. McCann. [1961] [4]p. incl. diagr. tables, refs. (AFOSR-844) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)685 and National Institutes of Health) Unclassified

Also published in Amer. Jour. Physiol., v. 201: 811-814, Nov. 1961.

Lesions in the median eminence produced permanent diabetes insipidus (DI) in chronically hypophysectomized rats. Water turnover in these animals, however, was only about half of that observed when lesions were made in rats with intact pituitaries and was further characterized by absence of the normal interphase. Conversely, when hypophysectomy was performed in rats with DI, an immediate and sustained 50% reduction in water intake occurred. Administration of adrenocorticotropin to hypophysectomized rats with lesions caused significant augmentation of DI, but to levels with DI and intact pituitaries. Neither somatotrophic hormone (STH) nor triiodothyronine increased water turnover when given to hypophysectomized animals with DI. Lesions in the median eminence of hypophysectomized rats induced an immediate increase in urine volume in the absence of water intake, which indicates that primary polyuria was responsible at least in part for the development of DI in hypophysectomized rats with lesions. A HYPOTHALAMIC LUTEINIZING-HORMONE RELEASING FACTOR, by S. M. McCann. [1961] [8]p. incl. diagrs. refs. (AFOSR-1456) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)685 and National Institutes of Health) Unclassified

Presented at Forty-third meeting of the Endocrine Society, New York, 1961.

Also published in Amer. Jour. Physiol., v. 202: 395-400, Mar. 1962.

Crude acidic extracts of rat stalk-median eminence tissue evoked an ovarian ascorbic acid depletion on intravenous injection into immature rats pretreated with gonadotropins. Response was linearly related to logarithm of the dose. Various parts of the hypothalamus were extracted, and the major activity was found to reside in the stalk-median eminence region. Activity of this stalk-median eminence extract (SME) was relatively heat stable compared to luteinizing hormone (LH) activity of rat anterior pituitary extract. SME extract was partially inactivated by pepsin and completely inactivated by tryptic digestion. Intravenous SME did not elevate the already high plasma LH levels in untreated ovariectomized, estrogenized donors, whereas an extract of cerebral cortex was ineffective in this latter type of test animal. Pitressin also failed to influence LH titer of such donors. Increasing doses of estrogen or estrogen plus progesterone failed to block the effect of SME. SME also increased LH activity in plasma of ovariectomized rats in which release of LH had been blocked by lesions in the median eminence. It elevated LH activity in plasma of normal donors but had no significant effect on plasma LH activity of hypophysectomized animals. It was concluded that a hypophysial LH-releasing factor resides in stalk-median eminence tissue, and reasons were advanced for believing this to be a hormonal effect. (Contractor's abstract)

EFFECT OF PROGESTERONE ON PLASMA LUTEINIZING HORMONE ACTIVITY, by S. M. McCann. [1961] [4]p. incl. diagrs. table, refs. (AFOSR-1713) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)685 and National Institutes of Health) Unclassified

Also published in Amer. Jour. Physiol., v. 202: 601-604, Apr. 1962.

The luteinizing hormone (LH) activity of ovariectomized rat plasma was estimated by the ovarian ascorbic acid depletion technique. A single subcutaneous injection of 25 mg of progesterone produced a slight decrease in this LH activity which was first demonstrable 2 days after injection of progesterone. If a second injection of 25 mg of progesterone was given 2 days after the first, a marked decrease in LH activity was found on testing a day later. Three daily subcutaneous injections of 5 mg of progesterone failed to significantly depress the LH activity in ovariectomized rat plasma. Pretreatment of these ovariectomized rats with estradiol benzoate rendered them more sensitive to the effects of progesterone in that 4 mg progesterone/day was then able to significantly depress the LH activity in their plasma. It was concluded that progesterone alone has a feeble inhibitory effect on the secretion of LH but that estrogen pretreatment sensitizes the animal to this inhibitory action of progesterone.

ALTERATIONS IN FOOD AND WATER INTAKE AFTER HYPOTHALAMIC LESIONS IN THE RAT, by R. W. Smith and S. M. McCann. [1961] [5]p. incl. diagrs. refs. (AFOSR-1942) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)685 and National Institutes of Health) AD 453571 Unclassified

Also published in Amer. Jour. Physiol., v. 203: 366-370, Aug. 1962.

Electrolytic lesions in the lateral hypothalamus produced aphagia and adipsia. One rat remained adipsic until sacrifice 283 days after operation; 11 rats with lesions continued to drink water while refusing ground laboratory chow. This effect lasted until sacrifice, 8-13 days post-lesions, suggesting that areas regulating water and food intake are separable. Lesions designed to induce diabetes insipidus were produced in rats in which variable renal water loss had been eliminated by prior nephrectomy. Rats with lesions drank significantly more than nephrectomized controls during the 2-day observation period. The experiment was repeated, but food was withheld and controls were subjected to sham hypothalamic operation. In this group water intake was greater and weight loss less in rats with lesions than in sham-operated controls, though the difference was less than

that in the presence of food. Although the difference in water intake was small, the results suggest that destruction of an inhibitory drinking center may contribute to polydipsia in diabetes insipidus. Water intake may be stimulated by lateral and inhibited by medial areas in the hypothalamus. (Contractor's abstract)

HORMONAL BASIS FOR IMPAIRMENTS IN MILK SYNTHESIS AND MILK EJECTION FOLLOWING HYPOTHALAMIC LESIONS, by C. C. Gale, S. Taleisnik and others. [1961] [14]p. incl. diagrs. table, refs. (AFOSR-2186) (Sponsored jcintly by Air Force Office of Scientific Research under AF 49(638)685 and Public Health Service) AD 453602 Unclassified

Also published in Jour. Endocrinol., v. 23: 303-316, 1961.

The placing of electrolytic lesions in the median eminence of the hypothalamic tuber cinereum induces severe impairment of lactation in rats by causing deficiencies in pituitary secretion of adrenocorticotrophic hormone (ACTH; essential for milk synthesis) and of oxytocin (necessary for milk ejection). Thus, in rats with lesions given oxytocin x 2/day to permit milk ejection, it was observed that: (1) the severity of impairment in lactation correlated significantly with the degree of atrophy of the dams' adrenal glands; (2) administration of luteotrophin (LTH) failed to repair this defect in lactation; (3) when cortisol was administered milk production was markedly improved—to about 70-80% of normal for days 5-10—(a further slight increase in milk yield resulted when oxytocin injections were given every 4 hr. 'around the clock' to rats receiving cortisol therapy); and (4) administration of regimens consisting of either LTH and cortisol, or LTH, growth hormone (GH), and cortisol failed to improve lactation beyond levels attained with cortisol therapy alone. In hypophysectomized rats replacement with cortisol and LTH, plus oxytocin x 2/day, permitted substantial synthesis which was not significantly improved further when GH was added to the regimen, and which promptly declined when LTH therapy was withdrawn. Since no deficiency in secretion of LTH could be demonstrated in lactating rats with lesions given hormonal replacement, these data provide evidence that elimination of hypothalamic regulatory mechanisms by hypothalamic lesions is compatible with secretion of large amounts of LTH. This demonstration that lesions in the median eminence block release of ACTH while permitting continued secretion of LTH indicates that the hypothalamic mechanisms regulating their release are not identical. APHAGIA, ADIPSIA AND POLYDIPSIA FOLLOWING HYPOTHALAMIC LESIONS IN THE RAT (Abstract), by R. W. Smith and S. M. McCann. [1961] [1]p. (AF 49(638)685) Unclassified

Presented at Forty-fifth annual meeting of the Fed. Amer. Soc. for Experimental Biol., Atlantic City, N. J., Apr. 10-14, 1961.

Published in Fed. Proc., v. 20: 333, Mar. 1961.

Electrolytic lesions in the lateral hypothalamus produced aphagia and adipsia. One rat remained adipsic until sacrifice 9 1/2 mo after operation. Seven rats with lesions in the lateral hypothalamus continued to drink water while refusing ground laboratory chow. This effect lasted until sacrifice, 8-13 days post-lesions, suggesting that areas regulating water intake and food intake are separable. To see if primary polydipsia is present in diabetes insipidus, lesions designed to induce diabetes insipidus were produced in rats in which variable renal water loss had been eliminated by prior nephrectomy. Rats with lesions drank significantly more than nephrectomized controls during the two day observation period. The experiment was repeated, but food was withheld and controls were subjected to sham hypothalamic operation (passing electrode into dorsal hypothalamus). In this group water intake was greater and weight loss less in rats with lesions than in sham operated controls, though the difference was less than that seen in presence of food. Although the difference in water intake was small, the results suggest that destruction of an inhibitory drinking center may contribute to polydipsia in diabetes insipidus. Water intake may be stimulated by medial areas in the hypothalamus.

THE EFFECT OF OVARIAN HORMONES ON PLASMA LUTEINIZING HORMONE (LH) ACTIVITY IN THE OVARIECTOMIZED RAT (Abstract), by S. M. McCann. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)685 and Public Health Service) Unclassified

Published in Physiologist, v. 4: 72, Aug. 1961.

Using the ovarian ascorbic acid assay for LH, no LH could be detected in plasma from normal donor females, but detectable quantities were found in plasma of ovariectomized donors. This activity was decreased by single subcutaneous (sc) injections of estradiol benzoate (Eb). This effect was demonstrable within a day of injection of large doses and was maximal 3 days after injection, at which time the minimal effective dose to produce a decrease in LH activity was of the order of 0.1 μg. A slight decrease in LH activity was demonstrable within 1 hr of a massive intravenous dose of estradiol. Decreased LH activity was found in the absence of proestrous or estrous vaginal smears but was always found if the smear was in proestrous or estrous stage. A large dose (25 mg) of progesterone (P) sc produced a slight depression of LH activity in ovariectomized rat plasma on

assay 2-3 days later; a marked depression of activity resulted only if a second injection of 25 mg of P was given 2 days after the first with estimation of the activity on the third day. Five mg of P a day for 3 days had no significant effect. Large doses of Eb or Eb plus P failed to block the action of a hypothalamic extract with LH-releasing activity which suggests that the inhibitory effects of these steroids on LH secretion are mediated at some point proximal to the pituitary, presumably the hypothalamus.

A TOPOLOGICAL PROPERTY OF RUNGE PAIRS, by A. Andreotti and R. Narasimhan. [1961] [11]p. incl. refs. (AFOSR-J442) (AF EOAR-62-35) AD 413771 Unclassified

Also published in Ann. Math., v. 76: 499-509, Nov. 1962.

Let X be a complex space and $\mathcal{H}(X)$ the ring of holomorphic functions on X equipped with the topology of compact convergence. Given an open subset Y of X, the pair (X, Y) is called a Runge pair if the image of $\mathcal{H}(X)$ under the restriction map is dense in $\mathcal{H}(Y)$. The main theorem of this paper is: Given a Runge pair (X, Y) of n-dimensional holomorphically convex spaces, where X is obtained from a holomorphically complete space with isolated singularities by blowing up a discrete set and where Y contains the blown-up set, it is proven that if $n = \dim_c X$, then $H_r(X \bmod Y, Z) = 0$ if $r > n$, and is torsion free if $r = n$. Moreover, if Y is relatively compact with smooth boundary, $H_n(X \bmod Y, Z)$ is even free. This theorem is applied to a certain class of holomorph-convex spaces in order to get information concerning their homology structure. The basic tool in the proof of the above theorem is the Morse theory.

[SOME PROBLEM IN THE AERODYNAMICS OF AIRFOILS IN NON-UNIFORM FLOW] Alcuni problemi dell'aerodinamica di profili in correnti non uniformi, by E. Pistolesi and M. Marini. [1960] [16]p. incl. diagrs. (AF 61(514)1051) Unclassified

Published in Aerotecnica, v. 40: 178-193, June 1960.

The characteristics are studied of an airfoil in a 2-dimensional flow of a compressible fluid at subsonic velocity, bordered by another 2-dimensional flow of a compressible fluid at supersonic velocity. The analysis considers the cases of (1) 2 adjacent semi-infinite flows; (2) a semi-infinite subsonic flow bordering a supersonic flow bounded by a rigid wall; and (3) an infinite subsonic flow with a transverse supersonic jet. Also studied are the characteristics of an airfoil in a 2-dimensional supersonic flow adjacent to another supersonic flow for the cases of (1) 2 adjacent semi-infinite flows; and (2) an infinite flow with a transverse supersonic jet. The effects of the nonuniformity of the flow on the values of the lift of an airfoil of zero thickness are determined, for the case in which the airfoil is placed at a small angle of incidence to the flow, as functions of the characteristic geometry of the flow and of the relation of velocities of the 2 flows.

LINEARIZED SUPERSONIC FLOW IN AN AXISYMMETRIC JET ISSUING IN AIR AT REST, by E. Pistolesi and M. Marini. Mar. 1961, 1v. incl. illus. (Technical rept. no. 1) (AFOSR-852) (AF 61-(052)209) AD 258232 Unclassified

Study concerns the aerodynamic characteristics of a wing disposed in a supersonic stream at some finite distance from the discharge of an axisymmetric supersonic jet. Such research requires that the flow field around an axisymmetric supersonic jet issuing from a nozzle in a supersonic stream be known. A new method was used to study the flow in the jet, based on the use of particular singularities, called pseudosources, disposed on the jet axis. The main aspects of this method are developed and the method itself is applied to the simple case of a supersonic axisymmetric jet issuing in air at rest. The jet shape was determined and some of the main characteristics of the flow in the jet are examined. Satisfactory results were obtained.

ELECTROENCEPHALOGRAM-SYNCHRONIZING STRUCTURES IN THE LOWER BRAIN STEM, by J. Magnes, G. Moruzzi, and O. Pompeiano. [1960] [29]p. incl. diagrs. refs. [AF 61(052)107] Unclassified

Published in Ciba Foundation Symposium on Nature of Sleep, London (Gt. Brit.) (June 27-29, 1960), Boston, Little, Brown, and Co. [1961] p. 57-85.

Electrical stimulation in the lower part of the medulla was carried out in acute encéphale isolé cats. Stimulation in the region of the nucleus of the solitary tract and of nucleus reticularis ventralis at low frequencies resulted in the appearance of large amplitude, slow waves on the surface of the cerebral cortex, bilaterally, in frontal, parietal, temporal and occipital leads. In most cases the repetition rate of the EEG waves was uninfluenced by changing the frequency of stimulation provided the pulse rate did not greatly exceed the inherent rhythm. Still higher rates produced EEG activity. Whereas in certain cases synchronization of the EEG ceased as soon as stimulation was over, in others it continued for varying periods of time subsequent to the end of

stimulation. These synchronizing effects were most easily elicited when the spontaneous background of the EEG was not fully activated. When intense activation was present spontaneously or was induced by sensory stimulation these effects could not be elicited or were abolished. It has been established that the results are not due to stimulation of the posterior column nuclei or fibers of the medial lemniscus. The relation of these findings to the possible functions of the brain stem synchronizing structures is discussed.

SYNCHRONIZATION OF THE EEG PRODUCED BY LOW-FREQUENCY ELECTRICAL STIMULATION OF THE REGION OF THE SOLITARY TRACT, by J. Magnes, G. Moruzzi, and O. Pompeiano. [1961] [35]p. incl. diagrs. refs. (AFOSR-353) (AF 61(052)-107) AD 258877 Unclassified

Also published in Arch. Ital. Biol., v. 99: 33-67, 1961.

In acute encéphale isolé cats, low frequency electrical stimulation (1-16/sec) in the region of the nucleus of the solitary tract and of nucleus reticularis ventralis, resulted in synchronization of the EEG. The resultant pattern of electrical activity was one of large amplitude slow waves distributed bilaterally in frontal, parietal, temporal and occipital leads. These effects were most easily elicited when the endogenous background of the EEG was not fully desynchronized. In most cases the repetition rate of the EEG waves was identical with that of the inherent EEG rhythm. However, when the frequency of stimulation exceeded the autogenous spindling rate, the frequency of the elicited waves was apt to follow the rate of stimulation. EEG activation ensued almost constantly when the pulse rate was higher than 30/sec. Low frequency stimulation (1-1/sec) of neighboring points in the same region of the medulla was found to produce EEG arousal. It has been established that the results with regard to synchronization of the EEG are not due to stimulation of the posterior column nuclei or fibers of the medial lemniscus, nor of fastigio-bulbar fibers running closely to the region of the solitary tract. Experiments performed on cats with acute or chronic lesions of the brain stem indicate that induced EEG synchronization may be obtained when only the medial part of the pons or of the mid-brain are spared by the lesion. [VISUAL PERCEPTION], by G. Moruzzi. Annual summary rept. June 15, 1960-June 14, 1961. July 5, 1961, 19p. incl. refs. (AFOSR-1196) (AF 61(052)-107) AD 262072 Unclassified

The habituation and the dishabituation of the visual responses to repetitive light flashes were investigated in the cerveau isole cat. The hypothesis of the habituation and of the release from dishabituation of the evoked visual potentials hinges upon the demonstration that the light striking the retina remains rigorously constant. The experiments on the relations between neurophysiology and animal behavior were concerned with the ocular manifestation of sleep in the owl placed in a dark, silent room. Experiments on the central influence of the retinal black-out on the central nervous system show that EEG synchronization increases following bilateral withdrawal of the retinal dark discharge in the cerveau isole cat, and following complete postcollicular transection, EEG activating structures, are still at work in the isolated cerebrum. The study of the effect of diffuse light and of the retinal black-out on the responses of the visual cortex elicited by lateral geniculate shocks led to the hypothesis that the effect of steady light is related with a decrease of the retinal dark discharge. Data suggest that steady light decreases the total retinal bombardment which was present in the dark adapted eye.

ENHANCEMENT OF CORTICAL RESPONSES TO SHOCKS DELIVERED TO LATERAL GENICULATE BODY. LOCALIZATION AND MECHANISM OF THE EFFECTS, by A. Arduini and M. H. Goldstein, Jr. [1961] [16]p. incl. diagrs. tables, refs. (AFOSR-2829) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)107 and Rockefeller Foundation) Unclassified

Also published in Arch. Ital. Biol., v. 99: 397-412, Nov. 1961.

The experimental results are summarized: (1) Retinal conditions (deafferentation and illumination) which produce an enhancement of the responses led from the visual cortex following single shocks applied to the lateral geniculate body, do not significantly increase the responses of the auditory cortex to a medial geniculate volley. Thus, these effects are less generalized than the changes of EEG patterns which follow retinal deafferentation in the midpontine pretrigeminal preparation. (2) Even within the visual system, no enhancement is observed when the stimulating electrode is in the anterior quarter of the lateral geniculate nucleus. (3) If flickering light is used, at high rates of flicker (above 50/sec) results are the same as with steady illumination. As the flicker rate is decreased the amplitude of the shock evoked responses decreases until, at low rates of flicker, the responses are smaller than those obtained with the retinas dark-adapted. These findings support the hypothesis that enhancement effects obtained during steady retinal illumination or deafferentation result from a decrease in the neural traffic in the optic tracts. In control conditions (dark-adapted retinas) this neural traffic originates in the retinal dark discharge. A reduction or the complete temporary abolition of the retinal dark discharge may increase the shock evoked cortical response by releasing the geniculo-cortical system from a tonic inhibitory influence exerted by the dark discharge or by reducing or abolishing the occlusion phenomena produced by tonic activity. EEG SYNCHRONIZATION FROM MEDULLARY STRUCTURES (Abstract), by J. Magnes, G. Moruzzi and O. Pompeiano. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 61-(052)107 and Rockefeller Foundation) Unclassified

Presented at Forty-fifth annual meeting of the Fed. Amer. Soc. for Experimental Biol., Atlantic City, N. J., Apr. 10-14, 1961.

Published in Fed. Proc. v. 20: 336, Mar. 1961.

In the encéphale isolé cat low frequency electrical stimulation (1-16/sec) in the region of the nucleus of the solitary tract and of the nucleus reticularis ventralis results in synchronization of the EEG, frequently outlasting the period of stimulation. EEG activation occurs when pulse rate is higher than 30/sec. Low frequency stimulation of neighboring points is either ineffective or produces low voltage fast activity.

THE POLYHEDRAL CLATHRATE HYDRATES. PART 2. STRUCTURE OF THE HYDRATE OF TETRA

ISO-AMYL AMMONIUM FLUORIDE, by D. Feil and G. A. Jeffrey. [1961] [11]p. incl. illus. diagrs. tables, refs. (AFOSR-534) (AF 49(638)456) AD 265853 Unclassified

Also published in Jour. Chem. Phys., v. 35: 1863-1873, Nov. 1961.

The hydrate $[i\text{-}C_5H_{11}]_4N^+ \cdot F^- \cdot 38H_2O$ belongs to a type of polyhedral clathrate structure in which the water molecules and the anions form the "host" structure and the cations are the "guests". The structural unit of the hydrogen-bonded clathrate cage is the $H_{40}O_{20}$ pentagonal dodecahedron. These dodecahedra are regularly associated in the crystal lattice by sharing faces, giving rise, therefore, to other polyhedra. In this hydrate, the other polyhedra are the tetrakaidecahedron and pentakaidecahedron, which form the cages enclosing the cations. A detailed 3-dimensional single crystal structure analysis has been completed. (Contractor's abstract)

THE OXIDATION OF EPOXIDES BY DIMETHYL SULFOXIDE. A SIMPLE SYNTHESIS OF α-HYDROXY KETONES, by T. Cohen and T. Tsuji. [1961] [1]p. incl. refs. (AFOSR-249) (AF 49(638)788) Unclassified

Also published in Jour. Org. Chem., v. 26: 1691, May 1961.

A procedure is given for the oxidation of epoxides by dimethyl sulfoxide if catalytic quantities of boron trifluoride are present. In accord with the results obtained with halides and tosylates, the products are α-hydroxy ketones and dimethyl sulfide. Although the same reaction occurs in the absence of catalyst, much longer reaction periods are required and the yields are seriously reduced.

INTERMETALLIC COMPOUNDS BETWEEN LANTHANOUS AND TRANSITION METALS OF THE FIRST LONG PERIOD. II. FERRIMAGNETISM OF AB_5 COBALT COMPOUND, by K. Nassau, L. V. Cherry, and W. E. Wallace. [1959] [7]p. incl. diagrs. tables. [AF 49(638)979] Unclassified

Published in Jour. Phys. and Chem. Solids, v. 16: 131-137, Nov. 1960.

Magnetizations were determined at various temperatures for a series of substances represented by the type formula ACo_5 in which A is either Ce, Sm, Gd, Dy, Ho, Y or a mixture of Gd and Y. The purpose of the study was to ascertain whether the atomic moments are aligned, at sufficiently low temperatures, and if so to elucidate as far as possible the nature of the alignment. The magnetization-temperature curves for YCo_5 and $SmCo_5$ indicate them to be normal ferromagnetic compounds at least down to 80°K, with Curie points at 975° and 1015°K, respectively. Their saturation magnetic moments indicate that the cobalt moments are aligned ferromagnetically. The curves for the other compounds show well defined Curie temperatures ranging from 685° to 1125°K but are unusual in that below a certain temperature, ranging up to 575°K, magnetization shows an anomalous fall with diminishing temperature. Analysis of these results and the observed saturation magnetizations show that the moments are aligned, but not ferromagnetically. The compounds appear to be ferrimagnetic. A discussion of the possible modes of alignment is presented. Thermomagnetic analysis shows that in most instances the compounds decompose when heated to the point at which the alignment of the atomic moments is destroyed. (Contractor's abstract)

MAGNETIC STUDIES OF SOME INTERMETALLIC COMPOUNDS BETWEEN COBALT AND THE LANTHANIDE ELEMENTS, by L. V. Cherry and W. E. Wallace. [1961] [3]p. incl. diagr. (AFOSR-1391) (AF 49(638)979) Unclassified

Also published in Jour. Appl. Phys., v. 33: 1515-1517, Apr. 1962.

Thermomagnetic studies of intermetallic compounds having the stoichiometry ACo_5, in which A represents yttrium or a lanthanide element, have been extended to liquid helium temperatures. At applied magnetic

fields of 2600 and 7200 oe, anomalies not appearing at high fields have been observed in the behavior of $PrCo_5$ and $NdCo_5$. These anomalies are an apparent second (low-temperature) Curie point at about 126°K in $PrCo_5$ and a maximum in the thermomagnetic curve of $NdCo_5$ in the vicinity of 270°K. The data obtained for other ACo_5 compounds are consistent with those reported recently by Nesbitt et al. Results for $PrCo_5$ and $NdCo_5$ indicate ferromagnetic coupling of the cobalt moments on cooling below 910° and 925°K, respectively, while in each case at low fields, the lanthanide moments remain disordered. With $PrCo_5$ the data indicate ferromagnetic coupling of the Pr and Co moments below 126°K. Data for $NdCo_5$ suggest that on cooling, a similar type of coupling develops at about 270°K, but this is almost immediately superseded by antiferromagnetic coupling of the Nd moments with one another at lower temperatures. ON INTERMEDIATE PHASES IN LANTHANON-MANGANESE SYSTEMS, by L. V. Cherry and W. E. Wallace. [1961] [2]p. incl. diagr. table. (AFOSR-1394) (AF 49(638)979) Unclassified

Also published in Jour. Appl. Phys., v. 33: 1619-1620, Apr. 1962.

Alloys involving 75 to 90 at. % Mn have been investigated. Both the x-ray and magnetic data obtained for these alloys suggest that the entity responsible for the observed behavior of $GdMn_5$ may actually be $GdMn_4$, and the former may be a mixture of the latter and either elemental Mn or some phase richer in Mn than $GdMn_5$. The chief x-ray evidence in favor of this possibility is the fact that 1 weak line, attributed to a trace of manganese in the $GdMn_5$ pattern, is absent in the $GdMn_4$ pattern, otherwise the 2 x-ray patterns are virtually the same.

INTERMETALLIC COMPOUNDS BETWEEN LANTHANONS AND TRANSITION METALS OF THE FIRST LONG PERIOD. I. PREPARATION, EXISTENCE AND STRUCTURAL STUDIES, by K. Nassau, L. V. Cherry, and W. E. Wallace. [1959] [7]p. incl. tables, refs. (AFOSR-J182) (AF 49(638)979) AD 400076 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 16: 123-130, Nov. 1960.

Alloys have been prepared with compositions corresponding to the formulas AB_5, AB_2, AB and A_3B, in which A is Y, La, Ce, Sm, Gd, Dy or Ho and B is Mn, Fe, Co, or Ni. Samples were prepared by the technique of levitation melting. Powder diffraction patterns were obtained to establish whether or not the various alloys existed in the form of intermetallic compounds. Extensive compound formation tendency was exhibited by all the lanthanons except La. All AB_2 type compounds were found to exist in the $MgCu_2$ structure. The AB_5 type compounds occurred either in the $CaCu_5$ structure or in an unsolved orthorhombic structure. Some AB and A_3B compounds may exist. Confirmation awaits interpretation of their diffraction patterns. Factors affecting the existence of these compounds and their structural parameters are discussed. (Contractor's abstract)

MAGNETIC CHARACTERISTICS OF SOME INTERMETALLIC COMPOUNDS BETWEEN MANGANESE AND THE LANTHANIDE METALS, by L. V. Cherry and W. E. Wallace. [1960] [2]p. incl. diagr. table. (AFOSR-J225) (AF 49(638)979) Unclassified

Presented at Sixth Conf. on Magnetism and Magnetic Materials, New York, Nov. 14-17, 1960.

Also published in Jour. Appl. Phys., v. 32: 340S-341S, Mar. 1961.

Two types of magnetic measurements have been made. First, saturation magnetizations were determined at room temperature (298°K) and liquid nitrogen temperature (80°K). Second, the magnetization-temperature behavior at constant fields of about 2500 and 7000 oe was ascertained from 80° to about 500°K. For the saturation measurements, extrapolation to infinite field strength was made with the use of data extending to 20 koe at 298°K, but to only 10 koe at 80°K. The Curie points, read from the magnetization temperature curves at low fields, and the saturation magnetizations are given.

DIRECT FIELD EFFECTS IN ELECTRON PARAMAGNETIC RESONANCE HYPERFINE SPECTRA, by J. A. Weil and J. H. Anderson. [1961] [8]p. incl. diagrs. refs. (AFOSR-437) (Sponsored jointly by Air Force Office of Scientific Research and Atomic Energy Commission under AF 49(638)323) Unclassified

Also published in Jour. Chem. Phys., v. 35: 1410-1417, Oct. 1961.

The electron paramagnetic resonance spectrum exhibiting hyperfine effects from one nucleus is discussed for the case when the nuclear spin interacts appreciably not only with the electron magnetic moment but also directly with the applied magnetic field. The predicted hyperfine structure consists, in general, of $2S(2I + 1)^2$ lines. The angular dependence of the intensities and splittings is investigated; nodes in the splitting are found to be possible even when the eigenvalues of the hyperfine splitting tensor are nonzero. When the direct-field interaction is large, $2I + 1$ principal hyperfine lines occur, flanked by weaker "outrider" lines. Another mechanism for producing outrider lines in high direct fields, the nuclear quadrupole interaction with an electric field gradient, is discussed. Magnetic resonance studies of color centers in germanium-doped quartz demonstrate some of the predicted effects. (Contractor's abstract)

PARAMAGNETIC CENTERS IN POTASSIUM AZIDE IRRADIATED AT LOW TEMPERATURE, by R. B. Horst, J. H. Anderson, and D. E. Milligan. [1961] [4]p. incl. diagr. table. (AFOSR-504) (AF 49(638)-323) Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 23: 157-160, Jan.-Feb. 1962.

Electron spin resonance measurements have been made on single crystals of KN_3 which were irradiated and maintained at 77°K. Irradiations were made with unfiltered light from a G. E. H85-C3 lamp with a rated output of 0.49 W in the range 250-280 mμ. Irradiation times varied from 10 to 1080 min. Spin resonance measurements were made at frequencies of 9.33 and 23.9 kmc/s. Three types of paramagnetic centers were found. Two of these were identified from the hyperfine structure as consisting of an unpaired spin associated with nitrogen nuclei: the N_2 center and the N_4 center. The notation N_i denotes a paramagnetic center consisting of i nitrogen nuclei interacting with an unpaired spin. These centers form the main subject of this paper. The third center gives rise to a highly anisotropic resonance line which can be observed only when the magnetic field is nearly parallel to the c-axis (four-fold symmetry axis) of the crystal. This line appears to be composed of unresolved hyperfine lines.

HALL EFFECT IN IMPURITY CONDUCTION, by T. Holstein. [1961] [19]p. incl. refs. (AFOSR-1052) [AF 49(638)323] Unclassified

Also published in Phys. Rev., v. 124: 1329-1347, Dec. 1, 1961.

The existence of a nonvanishing Hall effect in the impurity conduction regime of a semiconductor is demonstrated. In this regime (prevalent at low temperatures and at low impurity concentrations) the dominant electron transport mechanism is the phonon-induced hopping of charge carriers from occupied to unoccupied majority sites. The basic element of the theory is the existence of a (magnetic) field-dependent contribution to the jump probability between two sites. This contribution is computed and is shown to arise from the interference between the amplitude for a direct transition between the initial and final sites and the amplitude for an indirect, second-order transition, involving intermediate occupancy of a third site. The theory is applied to the case of an ac applied electric field. For values of the physical parameters representative of those occurring, for example in the ac measurements of Pollak and Geballe, the maximum Hall angle, though small ($\sim 10^{-6}$), is found to exceed the normal value $[(H/c)\mu_{drift}]$ by a factor $\sim 10^2$.

PARAMAGNETIC RESONANCE IN POTASSIUM AZIDE IRRADIATED AT 77°K, by R. B. Horst, J. H. Anderson, and D. E. Milligan. [1961] 31p. incl. diagrs. table, refs. (AFOSR-1760) (AF 49(638)323) Unclassified

Single crystals of potassium azide have been irradiated at 77°K with ultraviolet light. Two new paramagnetic centers, N_2 and A, have been found. A third center, N_4, appears to be the same as that discovered by Shuskus, Young, Gilliam, and Levy in potassium azide irradiated at room temperature. The g tensor for the N_2 center has only orthorhombic symmetry. Its principal values are $g_x = 2.0008$, $g_y = 2.0027$, $g_z = 1.9832$. The x axis is parallel to the [001] crystal axis and the y and z axis are parallel to the [1$\bar{1}$0] and [110] axes respectively. The hyperfine tensor is approximately axially symmetric with $T_x = 3.8$G, $T_y = 12$G, $T_z = 4.0$G. The models N_2^- and N_2^+ for this center are discussed. Although they explain many features of the resonance, neither model can

account for the signs of the g shifts. It is concluded that the center probably consists of an unpaired spin trapped by 2 nitrogen atoms associated with a lattice defect. The paramagnetic center thus formed lacks a center of symmetry. (Contractor's abstract)

THE MORIYA INTERACTION AND THE PROBLEM OF THE SPIN ARRANGEMENTS IN βMnS, by F. Keffer. [1961] [19]p. incl. diagrs. refs. (AFOSR-2536) (AF 49(638)323) Unclassified

Also published in Phys. Rev., v. 126: 896-900, May 1, 1962.

A study is made of the nature of the anisotropic superexchange interaction of the form $D_{ij} \cdot S_i \times S_j$ recently proposed by Moriya. This interaction is permitted in βMnS, with symmetry requiring that D_{ij} be normal to the plane defined by i, j, and the single intervening anion. It is conjectured that this interaction leads to a screw spin arrangement, with a 90° screw angle; in crystals considered heretofore the Moriya energy produces only a slight canting. The observed powder neutron diffraction pattern has been interpreted as indicating ordering of the 3rd kind with spins normal to the ordering axis; this arrangement, however, does not have minimum dipolar energy. The present proposed arrangement leads to the same diffraction pattern, and the Moriya energy probably overbalances the dipolar. (Contractor's abstract)

THEORY OF EXCHANGE RESONANCE IN ANTIFERROMAGNETIC $CuCl_2 \cdot 2H_2O$, by R. J. Joenk. [1961] [8]p. incl. diagrs. table, refs. (AFOSR-2538) [AF 49(638)323] Unclassified

Also published in Phys. Rev., v. 126: 565-572, Apr. 15, 1962.

The low crystal symmetry of antiferromagnetic $CuCl_2 \cdot 2H_2O$ allows an antisymmetric, anisotropic, superexchange interaction (Moriya interaction) of the form $D_{12} \cdot [S_1 \times S_2]$ between corner and base-center copper ions. The classical magnetic-resonance frequencies and spin-wave frequencies have been derived for a 4-sublattice model from a spin Hamiltonian consisting of nearest-and next-nearest-neighbor isotropic superexchange interactions, the Moriya interaction, and orthorhombic anisotropy energy. A set of high-frequency exchange modes was obtained in addition to the usual antiferromagnetic resonance modes. The former are characterized by the beating in opposition of ferromagnetic sublattices which would be degenerate in the absence of the Moriya interaction. The exchange frequencies are proportional to the geometric average of the ferromagnetic and antiferromagnetic exchange fields and are an order of magnitude larger than the antiferromagnetic frequencies. A resonance absorption experiment is proposed to detect the exchange modes; zero field magnetic resonance is expected at about 0.7 mm. (Contractor's abstract)

ANISOTROPIC SUPEREXCHANGE IN βMnS, by J. J. Pearson. [1961] 45p. incl. diagrs. table, refs. (AFOSR-2539) (AF 49(638)323) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 280, Apr. 24, 1961.

Also published in Phys. Rev., v. 126: 901-911, May 1, 1962.

The suggestion by Keffer (item no. 2276, Vol. V) of an anisotropic superexchange of the Moriya type in βMnS led to the present detailed calculation. Whereas Moriya's work was confined to ions with 1 electron in the 3d shell and to cases of low symmetry, this calculation was performed for a half-filled 3d shell and tetrahedral symmetry. The unperturbed state was taken to consist of 2 Mn^{++} ions together with their common S^{--} nearest neighbor, each in a tetrahedral crystal field. The perturbing Hamiltonian contained the electronic spin-orbit interaction and the Coulomb interaction between electrons on neighboring ions. The mechanism involved going from the ground state to an excited crystal field state on 1 Mn^{++} ion by the spin-orbit effect, then back to the ground state by superexchange between the Mn's. The direction of the D vector was found to be perpendicular to the plane of the 3 ions, and its magnitude of the order of a superexchange integral times the spin-orbit parameter over a crystal field splitting energy. The existence of the effect depends importantly upon π overlap between the Mn and S orbitals. (Contractor's abstract)

PROPOSED SPIN ARRANGEMENT IN βMnS (Abstract), by F. Keffer. [1961] [1]p. [AF 49(638)323] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 280, Apr. 24, 1961.

In βMnS each anion is surrounded tetrahedrally by 4 magnetic cations. Any state with the 4 spins summing to zero will have lowest near-neighbor antiferromagnetic superexchange energy. Absence of inversion

symmetry allows a Moriya coupling of the form $D_{ij} \cdot S_i \times S_j$, with symmetry requiring D_{ij} normal to the plane defined by i, j, and the anion. The lowest energy arrangement consistent with translation symmetry is then $S_1 = -S_2$ and both orthogonal to $S_3 = -S_4$. (In crystals considered heretofore, the Moriya energy produces only a slight canting). The observed powder neutron diffraction pattern has been interpreted as indicating ordering of the 3rd kind with spins normal to the ordering axis; this arrangement however does not have minimum dipolar energy. The present proposed arrangement leads to the same diffraction pattern, and the Moriya energy easily overbalances the dipolar. Neutron diffraction in MnS_2 indicates an arrangement with minimum dipolar energy. This is not surprising since the pyrite structure allows no Moriya coupling. (Contractor's abstract)

HALL MOBILITY OF THE SMALL POLARON (Abstract), by L. Friedman and T. Holstein. [1961] [2]p. [AF 49(638)323] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., v. 6: 302-303, Apr. 24, 1961.

In insulators of sufficiently narrow conduction-bandwidth, an excess electron tends to get trapped at atomic sites by self-induced lattice distortion. Thermal vibrations give rise to jumps between 2 such sites by causing momentary coincidences of electronic energies, thereby allowing the electronic-overlap jump mechanism to become operative. A modification of the elementary jump probability by an applied magnetic field occurs for those events in which the energies of 3 sites are simultaneously coincident. The effect arises from the interference between 2 sites and that for a second-order jump involving intermediate occupancy of the third site. For H = O, the 2 amplitudes are 90° out of phase and do not interfere; for H = O, the phase difference is altered by an amount proportional to the magnetic flux enclosed by the triangle defined by the site centroids. The resulting Hall mobility is found to be greater than or comparable to the normal value, according to whether or not the 3 sites are nearest neighbors.

IONIZATION IN AN ELECTRODELESS DISCHARGE, by R. P. Treat. Mar. 15, 1961, 62p. incl. diagrs. refs. (Rept. no. TN-031-655) (AFOSR-473) (AF 49-(638)655) AD 256216 Unclassified

An analytical study has been made of the ionization occurring in a weakly pre-ionized molecular hydrogen gas. The configuration studied consists of a long cylindrical gas column subjected to a strong, fast rising axial magnetic field which is initially zero. The investigation has shown that in practice it is possible to obtain a large number of ionization collisions in a time t_m during which the plasma mass motion and the magnetic field are negligible. For this time interval, if electron losses are neglected, the increase in ionization fraction depends only on the voltage induced around the discharge tube and on the ratio of the circumference of the tube to the electron free path. Quantitative order of magnitude results are given for this relation. For a fixed voltage around the discharge tube, maximum ionization during the mass motion time t_m occurs if the energy gained by an electron in a force path is about equal to the threshold energy for ionization. IONIZATION PROCESSES IN GASES, by H. G. Loos. Final rept. Mar. 31, 1961 [14]p. incl. diagrs. (Rept. no. FR-031-655) (AFOSR-998) (AF 49(638)655) AD 261202 Unclassified

The ionization occurring during the initial phase of an axisymmetric electrodeless discharge has been investigated. In the axisymmetric electrodeless discharge considered, the electric field and the currents are in the azimuthal direction, while the magnetic field is axial. If the capacitor bank is switched on in a time small compared with the period of the discharge, the electric field rises to its full value in a time during which the magnetic field is still very small. Then, a model is appropriate in which at the time zero the electric field is instantly present at its full value, while the magnetic field is zero. Therefore, there must exist a time interval for which the magnetic field can be neglected. This time interval is called the initial phase; it ends at time, t_m, which is defined as the time for which the magnetic force on an electron is 1/10 of the electric force. Since it is shown that during t_m the plasma does not move much in the radial direction, t_m is called the mass motion time. The analytical investigation has been restricted to the initial phase; the magnetic field has been neglected, but the electric field induced by the change of magnetic field is accounted for.

AN EXPERIMENTAL INVESTIGATION OF THE BEHAVIOR OF AN ARC POSITIVE COLUMN IN THE PRESENCE OF FORCED CONVECTION, by P. G.

Thiene, J. E. Chambers, and W. Jaskovsky. Apr. 29, 1961, 94p. incl. illus. diagrs. refs. (Rept. no. T-4TN031-334) (AFOSR-682) (AF 49(638)334) AD 260648 Unclassified

An experimental investigation has been made of the behavior of low-current arc positive columns in the presence of subsonic, laminar forced convection. Columns in argon at atmospheric pressure were drawn between collinear electrodes and deflected by convection normal to the interelectrodes axis. Photographs of deflected columns over a current range 2 to 6 amp for various incident convection velocities up to approximately 200 cm/sec were taken and analyzed. The results are compared with theoretical predictions. In addition, a cursory investigation was conducted into the effect of a magnetic field applied transverse to the column so as to oppose the forced convection. (Contractor's abstract)

BASIC STUDY OF ENERGY EXCHANGE PROCESS BETWEEN AN ELECTRIC ARC AND A GAS FLOW, by P. G. Thiene. Final rept. Mar. 1, 1958 - Jan. 31, 1961. Feb. 23, 1961, 14p. incl. diagrs. (Rept. no. 1FR021-334) (AFOSR-1264) (AF 49(638)334) AD 263203 Unclassified

Three experimental studies were conducted. The first demonstrated photographically the stabilization of a spark by a gas vortex during the initial phase of the electrical breakdown. A relatively thorough investigation of the radial pressure distribution in the vortex was conducted. A photographic study was carried out to give data on the expansion of the spark channel with time and to note if instabilities develop in the spark. For the second study the plasma-flow facility has a flow of gas heated by a gas-stabilized arc capable of heating flow of argon to more than 10,000°K. An attempt was made to measure the average electrical conductivity of the plasma over the cross section of the tube. The conductivity was on the order of 1 mho/cm. Two simple experiments were performed which demonstrate the usefulness of the plasma-flow facility as a tool for studying magnetohydrodynamic interactions. During the third study it was found that when a planar zone of ohmic heating is subjected to a uniform normal flow, an asymmetrical temperature distribution develops with a shift of the peak downstream. It appeared that the resulting curvature of the zone would give rise to 2 local reactions.

MAGNETOHYDRODYNAMIC SHEAR HEATING, by M. C. Gourdine. Feb. 2, 1961, 17p. incl. illus. diagrs. (Rept. no. PLR-93) (AFOSR-497) (AF 49-(638)335) AD 255737 Unclassified

Also published in Engineering Aspects of Magnetohydrodynamics; Proc. Second Symposium, Philadelphia, Pa. (Mar. 9-10, 1961), New York, Columbia U. Press, 1962, p. 521-528.

The preliminary results of a theoretical and experimental investigation of MHD shear heating in mercury are presented. Mercury is a convenient working fluid because its properties are well known, and it is relatively simple to use. A preliminary theory based on a crude model is presented which checks quite well with experiments.

MHD FLOW CONSTRUCTIONS WITH FUNDAMENTAL SOLUTIONS (Abstract), by M. C. Gourdine. [1961] [1]p. [AF 49(638)33?] Unclassified

Presented at meeting of the Amer. Phys. Soc., Mexico City (Mexico), June 22-24, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 340, June 22, 1961.

In this paper steady flows of an incompressible, viscous, electrically conducting fluid are constructed from fundamental solutions of magnetohydrodynamics – the applied magnetic field is parallel to the velocity at infinity. The flat plate and the sphere are considered as examples, and approximate solutions are presented for the limiting cases of large and small Reynolds and magnetic Reynolds numbers. The effects of currents in the body are also considered,

and it is found that unless the magnetic Prandtl number is larger than unity, currents in the body have negligible effect on the flow.

EFFECTS OF A BODY FORCE ON GAS-DYNAMIC DISCONTINUITIES (Abstract), by M. C. Gourdine. [1961] [1]p. [AF 49(638)335] Unclassified

Presented at meeting of the Amer. Phys. Soc., Berkeley, Calif., Nov. 20-22, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 373, Apr. 23, 1962.

A simple theory which describes the effects of a body force on the jump conditions across gas-dynamic discontinuities—such as shock, detonation, or deflagration waves—is presented. The equations for the model are algebraic, and semigraphical methods are used to illustrate the physical implications of the solutions. The results of this theory agree qualitatively and quantitatively with experimental results on the effects of electrostatic fields on the propagation velocity of detonations in carbon monoxide and oxygen. An electric field of 5500 v/cm reduces the Mach number of the detonation from $M_1 = 6$ to $M_1 = 3$. A body force F, assumed to exist uniformly throughout the burning front of thickness l, has an appreciable effect on the propagation velocity whenever the parameter Fl/p_1 is of order one or larger, where p_1 is the pressure in front of the discontinuity. The theory also predicts the existence of subsonic detonations and stable detonations that violate the Chapman-Jouget condition.

[RESEARCH ON HIGH INTENSITY PLASMA JETS]. Apr. 30, 1961, 107p. incl. illus. diagrs. tables. (AFOSR-1011) (AF 49(638)766) Unclassified

The experimental results of this investigation cover the period from October 1, 1959 to April 30, 1961. General descriptions of the thrust measuring facility are given and include illustrations and diagrams of all apparatus used in testing of the gases hydrogen, helium and ammonia. Tabulated results of all tests are given with the inclusion of (1) efficiency and losses (2) losses in conversion from electrical to thermal energy (3) losses to obtain uniformity of heating and (4) losses to obtain uniformity of direction.

HIGH INTENSITY IONIC JETS (Abstract), by A. C. Ducati. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)766) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

The operation of plasma jets using helium, hydrogen or hydrogen compounds as propellants has been studied at Plasmadyne during past years and the results obtained have been described. During the last year, work has been mainly concentrated on the systematic experimental study of various propellants, particularly hydrogen. Electrode configurations have been studied with special emphasis to conditions favorable to long life. An evaluation of the relative overall performance of mixing chambers and nozzles in function of the maximum specific impulse obtainable was experimentally conducted and preliminary data obtained. Measurements were improved to give 1% accuracy for any one parameter and with overall accuracy of 5%. Representative experimental data obtained are presented.

STUDY OF SOME OF THE PROPERTIES OF AN rf-GENERATED PLASMA (Abstract), by D. D. Hollister. [1961] [1]p. [AF 49(638)766] Unclassified

Presented at meeting of the Amer. Phys. Soc., Berkeley, Calif., Nov. 20-22, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 373, Apr. 23, 1962.

In order to investigate the properties of the ring discharge, a series of Langmuir probe measurements of electron temperature and concentration were carried out. The discharge was produced by a Hartley oscillator whose ringing frequency is dependent on the conductivity of the plasma. A method of determining plasma conductivity and power adsorption from the ringing frequency is considered, and the basic theory of the electrodeless ring discharge is discussed.

[INVESTIGATION OF THE PHENOMENON OF OVERVOLTAGE IN MOLTEN SALTS] Recherches sur les phénomènes de surtension en de sels fondus, by R. Piontelli, G. Sternheim and others. [1961] 15p. incl. diagrs. refs. (AF 61(514)733-C) Unclassified

Published in Soviet Eletrochem.; Proc. Fourth Conf. on Electrochem., Moscow (USSR) (Oct. 1-6, 1956), New York, Consultants Bureau, v. 1: 90-94, 1961.

Experimental techniques for measuring the individual overloads on the electrodes of an electrolytic cell with salt solutions are presented and the significance of the results (apparent voltage overloads) is discussed. Experimental results are presented to include the excess voltage due to ion transfer in a chlorine suspension at a sufficiently elevated temperature even for intermediate metals and for aluminum in a cryolitic medium. The cathode deposit of aluminum in industrial cells is the direct result of an electrochemical reaction. Also among dissolved salts, phenomena rendering the metal inactive are due to the presence or formation of overlapping layers (occasionally oscillatory). This inactivation characteristic is eliminated by the fusion of the metal.

SIMULTANEOUS TRANSFER OF MOMENTUM, HEAT AND MASS. PART II. GAS-VAPOUR MIXTURES, by G. Jarre. Feb. 1961, 15p. incl. diagrs. (Technical note no. 19) (AFOSR-16) (AF 61(052)208) AD 258111 Unclassified

Study was made of the analogy between the velocity, temperature and concentration fields and the analogy between the momentum, heat and mass transfers, in high speed streams of moist gases over surface where evaporation or condensation can occur. The deduced transfer analogy is an extension of the classical Colburn analogy (Ind. Eng. Chem., v. 22: 967, 1930). The following factors were considered: (1) high speed, (2) high vapor concentration, (3) different gas and vapor specific heats, and (4) full range of flow regimes from the laminar Couette flow to the fully turbulent boundary layer flow. SIMULTANEOUS TRANSFER OF MOMENTUM, HEAT AND MASS. PART III. EVAPORATIVE COOLING AT HIGH SPEED, by G. Jarre. Apr. 1961, 1v. incl. diagrs. tables. (Technical note no. 20) (AFOSR-1161) (AF 61(052)208) AD 262068 Unclassified

The opposite effects of evaporative cooling and of aerodynamic heating at high speed are investigated. The evaporative cooling is a very effective process to strongly reduce the friction heating produced by high speeds. The wet bulb of a psychrometer describes the adiabatic case of evaporative cooling. The field of low vapor concentration is thoroughly analyzed and simple graphical methods are derived. Numerical examples illustrate the obtained results. The stability of laminar flow under evaporative cooling is eventually discussed. (Contractor's abstract)

INFRARED STIMULATION AND QUENCHING OF PHOTOCONDUCTION IN SINGLE CRYSTAL ZnS:Cu (Abstract), by F. G. Ullman and J. J. Dropkin. [1958] 3p. [AF 18(600)692] Unclassified

Presented at meeting of the Electrochem. Soc., New York, Apr. 1958.

The crystals studied were grown from the vapor phase and are colorless, transparent, and non-luminescent. Photoconduction measurements were made in a vacuum at pressures of about 10^{-4} mm of mercury and with silver paste electrodes. The UV and IR photocurrents obey Ohm's law for both polarities up to 1000 v. Slight deviations from Ohm's law are found below 10 v. Measurements were made at 440 v where these effects are negligible. Space charge polarization effects are also observed but are small. The UV photocurrent (2537A or 2650A) rises slowly (~30 sec) to a steady value and decays in about the same time when excitation ceases. The rise and decay of the IR photocurrent is somewhat faster but shows the same behavior. The IR and UV photocurrents vary linearly with light intensity except for 2537A excitation where square root dependence is found. This implies the existence of large numbers of empty recombination centers other than luminescent centers as would be expected for a non-luminescent crystal. Two types of crystals have been studied, those in which the UV photocurrent is decreased by IR and those in which it is increased. It is concluded that IR quenching phenomena in ZnS:Cu arises from the same excitation mechanism as the IR phenomena. This mechanism must be hole excitation since the UV photocurrent which has been shown to be carried by conduction band electrons is quenched by the IR photocurrent.

Presented at ARS Internat'l. Hypersonic Conf., Cambridge, Mass., Aug. 16-18, 1961.

Also published in Prog. in Astronaut. and Rocketry, v. 7: 205-254, 1962.

The report gives an account of advances and problems in the area of chemically reacting continua. Emphasis is placed on external flows about axisymmetric hypersonic vehicles at zero incidence. The analysis and correlation of observables in complete inviscid flows assuming either chemical equilibrium or composition frozen at post-shock equilibrium conditions is presented. An assessment of rate processes in these flows is performed by means of 1-dimensional rate calculations along streamlines. It is shown that the latter calculations and the frozen model may be used in tandem to obtain estimates of observables in practical situations. The behavior of non-equilibrium boundary layer flows over bodies is discussed with emphasis on the quenching effect of a cold non-catalytic wall. A quantitative study of wakes behind the vehicles is presented, the influence of shock induced vorticity and of inner core is considered for both laminar and turbulent flows. (Contractor's abstract)

HYPERSONIC APPROXIMATION FOR THE INVISCID FLOW OVER CONICAL BODIES WITHOUT AXIAL SYMMETRY AND COMPARISON WITH TESTS AT MACH 8, by C. R. Ortloff. Jan. 1961, 50p. incl. illus. tables, refs. (PIBAL rept. no. 728) (AFOSR-1634) (AF 49(638)217) AD 270609 Unclassified

A successive approximation method, based on assumptions valid for hypersonic free stream Mach numbers, is developed for analysis of the inviscid perfect gas flow in the shock layer of non-axisymmetric conical bodies at angles of attack and/or yaw. First and second order analyses for determining shock geometry, and the resulting body pressure distribution, are based upon satisfying the flow tangency condition at the body surface by series expansions about first and second approximation shock waves, respectively; small differences added by superimposed second order corrections indicate rapid convergence of the method, so that first approximation shock geometry and pressure distribution results are sufficient to represent the flow field. First order hypersonic approximation results for an elliptic cone (a/b = 1.78), over a large range of angles of attack and yaw, at M1 = 8.00, indicate accuracy comparable to more complex theoretical methods, and in good agreement with experimental data for lower values of these angles. CREEP ANALYSIS OF ANNULAR PLATES, by B. Venkatraman and S. A. Patel. Mar. 1961, 1v. incl. diagrs. tables. (PIBAL rept. no. 588) (AFOSR-518) (AF 49(638)302) AD 255156 Unclassified

Also published in Jour. Franklin Inst., v. 275: 13-23, Jan. 1963.

The paper presents analyses of creep in annular plates subjected to uniform lateral pressures. These analyses are based upon creep flow laws associated with the maximum shearing stress criterion. It is assumed that the creep rate is a power function of moment multiplied by a function of time. Annular plates with four specific edge conditions are considered. These are: free inner edge and simply supported, or clamped outer edge; free outer edge and simply supported, or clamped inner edge. In all cases expressions for moments and deformations are obtained in closed form.

OPTIMUM ORBITAL TRANSFER BY HIGH THRUST ROCKETS, by L. Ting. Feb. 1961, 1v. incl. diagrs. (PIBAL rept. no. 633) (AFOSR-163) (AF 49(638)-445) AD 253306 Unclassified

For a high thrust rocket, the specific impulse is of the order of or larger than the local circular orbital velocity, and the fuel consumption rate is so large that the dimensionless parameter, ϵ, defined as the ratio of the product of initial weight and specific impulse to that of the fuel consumption rate and a reference radial distance to the earth's center of the common focus, is much less than unity. The solution of transfer by a single impulse is shown to be equivalent to the true optimum transfer by a high thrust rocket when terms of the order of ϵ are neglected. With the aid of the approximate theory for variational problems, developed in a previous paper, the solution of transfer by a single impulse is improved so that the result will differ from the true optimum by the order of ϵ squared only. Explicit formulas for the improvements in the total burning time and in the thrust angle program are obtained. With application of these formulas to each impulse transfer, it is shown that an optimum solution of transfer by N-impulse can be improved. (Contractor's abstract)

PRELIMINARY EXPERIMENTAL INVESTIGATION OF FLOW ABOUT A BLUNT BODY WITH FLOW-SEPARATION SPIKES AT $M_\infty = 7.9$, by V. Zakkay. Feb. 1961 [23]p. incl. diagrs. (PIBAL rept. no. 631) (AFOSR-219) (AF 49(638)445) AD 253200; PB 155480 Unclassified

The pressure and heat transfer distribution about a hemispherically-capped cone having a cone half angle of 50° and a bluntness ratio of 0.667, equipped with flow-separation spikes, is presented. The measurements were made at $M = 7.9$ and a Reynolds number from 0.3 million to 0.5 million. Two different configurations were chosen for this investigation. The over-all reduction of drag and heat transfer with the spike to that without the spike is compared to the recent results obtained for a spiked-nose hemisphere cylinder. For both configurations the results with the spikes indicate a reduction in drag. The heat transfer over the spherical portion of the model was reduced by the addition of the spike; however, heat transfer coefficients as much as 3 times the stagnation point value were reached at the backward portion of the cone. The heat transfer to the cylindrical portion of the model was increased for both configurations. (Contractor's abstract)

AXIALLY SYMMETRIC LAMINAR FREE MIXING WITH LARGE SWIRL, by M. H. Steiger and M. H. Bloom. [1961] 22p. incl. diagrs. (PIBAL rept. no. 636) (AFOSR-400) (AF 49(638)445) AD 254528; PB 155803 Unclassified

Presented at Winter annual meeting of the Amer. Soc. Mech. Engineers, New York, Nov. 26-Dec. 1, 1961.

Also published in Jour. Heat Transfer, v. 84: 370-374, Nov. 1962.

Viscous laminar axially-symmetric free mixing with large swirl is investigated by a boundary layer type of analysis with integral methods. Large swirl generates axial pressure gradients as well as large radial pressure gradients, and therefore alters the streamwise flow. Examples calculated for both incompressible and compressible flow show that the wake may be significantly lengthened by large swirl. However, this effect is shown to be diminished in the compressible case where higher freestream Mach numbers lead to decreased densities, and to decreased centrifugal effects, decreased radial pressure gradients, and decreased axial pressure gradients. In the limiting special case of small or moderate swirl the results agree with those previously obtained by Steiger and Bloom in an analysis wherein the induced pressure gradients were neglected a priori. APPROXIMATE SOLUTIONS FOR REENTRY TRAJECTORIES WITH AERODYNAMIC FORCES, by K. Wang and L. Ting. May 1961 [29]p. incl. diagrs. refs. (PIBAL rept. no. 647) (AFOSR-684) (AF 49-(638)445) AD 257618 Unclassified

Also published in Astronaut. Acta, v. 8: 28-41, 1962.

When the motion of the reentry vehicle is expressed in 2 equations for the components in the instantaneous trajectory plane, and 1 for the component normal to the plane, the former equations are uncoupled from the latter. Thus, the problem of a nonplanar trajectory is reduced to an equivalent planar trajectory. Approximate analytic solutions for planar trajectories with constant lift and drag coefficients are obtained by improving and extending existing analytic solutions. The present solutions are not subjected to the restrictions which are valid for drag-only vehicles at large entry angle, nor for lifting vehicle entering the atmosphere at near circular orbit velocity and shallow angles. They are derived in a closed form of simple functions expressing the relations between the velocity, the angle of inclination and the density, or elevation. Using these relations, the acceleration experienced by the pilot can be calculated and the peak value determined. The numerical results calculated for these cases, where the above restrictions are violated, show good agreement with the machine results by direct integration of the equations of motion. ON LINEARIZED SWIRLING WAKES, by M. H. Steiger and M. H. Bloom. July 1961, 17p. incl. diagr. (PIBAL rept. no. 706) (AFOSR-1054) (AF 49-(638)445) AD 261547 Unclassified

Mathematically exact solutions for axisymmetric wakes with small swirl in a constant-property medium are derived by 2 methods. The first depicts the eigenvalue problem associated with the method of separation of variables and includes the so-called similar solution. The second technique utilizes Fourier methods and Hankel transforms, and solutions are given for both the axial and circumferential velocities in terms of arbitrary initial conditions. The solution produces an infinite continuous set of eigenvalues and eigenfunctions that satisfy the appropriate boundary conditions at the axis and infinity. This is consistent with the fact that a solution is unique only if an initial distribution or eigenvalue is prescribed a priori. The question of what type of flow can be produced physically at an initial station arises and also is discussed, and their importance to experimental observations noted. (Contractor's abstract)

PRACTICAL ASPECTS OF REENTRY PROBLEMS, by A. Ferri and L. Ting. July 1961 [39]p. incl. diagrs. refs. (PIBAL rept. no. 705) (AFOSR-1178) (AF 49(638)445) AD 262452 Unclassified

Presented at Internat'l. Symposium on Space Flight and Re-entry Trajectories, Louveciennes, June 19-21, 1961.

Also published in Astronaut. Acta, v. 8: 63-81, 1962.

Entry trajectories for vehicles without and with lift are investigated. The existence and the significance of the second peak deceleration in reentry trajectories are presented. The second peak may be greater than the first one. For a given entry velocity, the first peak deceleration can be a discontinuous function of entry angle. With proper lift modulation of the body-type vehicle, i. e. by changing the angle of attack of the vehicle, the range of the entry angle for non-skip trajectories can be increased significantly, while the first peak deceleration remains less than 5 times the gravitational acceleration. A constant elevation maneuver is presented and its effectiveness in reducing the second peak deceleration is explained. This maneuver, followed by a constant lift modulation, permits the control of the point of landing over a wide range. The practical application of the rate of change of deceleration in deciding the proper lift modulation is demonstrated. (Contractor's abstract)

REVIEW OF ELECTROMAGNETIC EFFECTS ON SPACE VEHICLES, by K. P. Chopra. Mar. 17, 1961, 8p. incl. refs. (PIBAL rept. no. 716) (AFOSR-1635) (AF 49(638)445) Unclassified

Presented at the Amer. Astronaut. Soc. Symposium on Interactions of Space Vehicles with Ionized Atmosphere, Washington, D. C., Mar. 17, 1961.

Published in Jour. Astronaut. Sci., v. 9: 10-17, 1962.

The various electromagnetic effects on space vehicles moving in an ionized atmosphere pervaded by a magnetic field are reviewed. These effects may be divided into 2 broad categories according to whether the electric currents are induced inside the space vehicle or in the surrounding medium. The effects falling in the second category may be analyzed from the point of

view of the atmosphere being treated either as a continuum or as a noncontinuum. The nature of the ionized medium in the immediate neighborhood of the space vehicle is of great significance. A physical model is proposed in which the ionized cloud is composed of a spherical ion belt surrounding a negatively charged space vehicle and an ionized column in its front. The characteristic features of this model are high drag and large radar cross sections of the space vehicles, the acceleration of electrons in the initial frontal column to high energies before impact, and the excitation of plasma waves. These features have a certain bearing on the interpretation of the observations on artificial earth satellites.

THEORETICAL AND EXPERIMENTAL INVESTIGATION OF THE LAMINAR HEAT TRANSFER DOWNSTREAM OF A SHARP CORNER, by V. Zakkay and T. Tani. Oct. 1961 [39]p. incl. illus. (PIBAL rept. no. 708) (AFOSR-1640) (AF 49(638)445) AD 266621 Unclassified

An experimental and theoretical investigation of the laminar heat transfer downstream of a sharp convex corner is presented. The flow field in the region of the discontinuity is divided into 2 parts: the flow field upstream of the discontinuity, obtained from standard viscous and inviscid techniques, and the flow immediately downstream of the sharp discontinuity, obtained by expanding both the supersonic and subsonic flow fields upstream of the discontinuity inviscidly around the corner. Downstream of the discontinuity the flow is represented by a viscous non-similar sublayer which starts at the discontinuity, and by a viscous shear layer at the outer edge which has the inviscid profiles immediately downstream of the discontinuity as initial conditions. The boundary conditions for the viscous sublayer at the outer edge are defined by the shear viscous layer.

ON VISCOUS WAKES OF YAWED INFINITE CYLINDERS AND ANALOGOUS JETS, by M. H. Bloom. Nov. 1961, 4p. (PIBAL rept. no. 730) (AFOSR-1731) (AF 49(638)445) AD 268352 Unclassified

Also published in Jour. Aerospace Sci., v. 29: 492, Apr. 1962.

Boundary layers over yawed infinite cylinders whose inviscid properties are spanwise-invariant, and whose surface conditions are uniform, have received considerable attention. Analogous treatment may be accorded the viscous wakes of such cylinders, which are of interest, for instance, in connection with flame holders or observables of high speed bodies at angle-of-attack.

APPROXIMATE SOLUTIONS FOR AERODYNAMIC HEATING OF REENTRY VEHICLES, by C. J. Ruger. Nov. 1961, 18p. (PIBAL rept. no. 729) (AFOSR-1761) (AF 49(638)445) AD 268826 Unclassified

Aerodynamic heating of space vehicles during reentry with constant aerodynamic coefficients is considered. General relations for the conditions at the maximum heating rate, and for the total heat input at the stagnation point from entry to any point in the trajectory, are developed. The relations are not subject to the restrictions of skip or exit trajectories with entry velocity greater than the circular speed. The relation presented for the heat input has 2 parts. The first, which is the most significant part of the heat input, is of closed form. The second part is left in terms of an integral and evaluated by Simpson's rule. Only a small number of steps are required in the numerical evaluation of this integral, thus making this solution much shorter than direct numerical integration. The numerical results calculated from this solution show good agreement with those from the direct numerical integration. (Contractor's abstract)

LINEARIZED DIFFUSION IN A RELAXING GAS, by P. M. Sforza and M. H. Bloom. Nov. 1961 [42]p. incl. illus. (PIBAL rept. no. 736) (AFOSR-1769) (AF 49(638)445) AD 268827 Unclassified

The linearized model of a gas with diffusion processes and rate reaction is applied to 1-dimensional unsteady motion generated by initial non-uniformities of state and velocity. The time-dependent system resembles that of steady free mixing of jet or wake type, with 2 space coordinates. The time-wise character of the profiles of flow variables is studied analytically under 2 sets of conditions: (1) Zero mass-motion with

state non-uniformity in slab-like, cylindrical and spherical configurations; this corresponds to steady flow with a non-dissipating step-function velocity profile. (2) Mass-motion with uniform temperature in slab-like configuration; this corresponds to 2-dimensional viscous isothermal free mixing with the variations of concentration and enthalpy.

LINEARIZED SWIRLING WAKES, by M. H. Steiger and M. H. Bloom. [196-] [6]p. incl. diagr. refs. (AFOSR-J55) (AF 49(638)445) AD 400392 Unclassified

Also published in Phys. Fluids, v. 5: 1027-1032, Sept. 1962.

Exact similar and nonsimilar solutions for axisymmetric wakes with small swirl in a constant-property medium are derived. Emphasis is placed on the similar solutions, particularly those associated with the swirl. A unique similar solution for the axial velocity is distinguished from a possible infinite set by invoking the auxiliary condition of invariance of the axial momentum defect. Likewise, for the circumferential velocity only 1 of the large number of possible similar solutions is shown to satisfy the conditions that the circumferential mass flow, momentum flux, and higher moments are bounded. FREQUENCY RESPONSE OF ADSORPTION ON SOLID CATALYSTS, by L. M. Naphtali. Final rept. July 31, 1961. (AFOSR-1216) (AF 49(638)337) Unclassified

This work was undertaken to apply control engineering techniques for characterizing system dynamics to problems in adsorption on catalysts. The theoretical methods were advanced to develop techniques of numerically converting transient data to frequency response data; to interpret frequency response data; to compute frequency response from convenient experiments, and to analyze data to determine distribution functions of number versus rate constant. The apparatus for measuring frequency response was developed. It was used to study the effects of oxygen and reduction temperature on the H_2-Ni system.

MODIFICATION OF SPECTRAL AND SEMICONDUCTING PROPERTIES OF POLYVINYLIDENE CHLORIDE BY ULTRAVIOLET LIGHT OF SPECIFIC WAVELENGTHS, by G. Oster, G. K. Oster and M. Kryszewski. [1961] [9]p. incl. diagrs. refs. (AF 49-(638)293) Unclassified

Published in Jour. Polymer Sci., v. 57: 937-947, Mar. 1962.

Polyvinylidenechloride-polyvinylchloride copolymer (saran) when irradiated with 254 mμ light produces a species which absorbs maximally at 285 mμ and has a tail in the spectrum which extends into the visible region. Irradiated samples show a further increase in absorption when heated at 100°C, while unirradiated samples are unaffected by such heating. Irradiation at 254 mμ results in crosslinking which is further increased on heating. On the other hand, heating destroys the Carr-Price reaction exhibited by irradiated material. Heating also destroys the electron spin resonance signal of the irradiated material. Irradiated films are photoconducting but this property is destroyed by heating. The compound produced by irradiation at 254 mμ is destroyed by irradiation at 310 and 365 mμ, but the products are different in the 2 cases and depend on the presence of oxygen.

A SPRAY COMBUSTION MODEL WITH DROPLET BREAKUP INCLUDING GAS DYNAMIC COUPLING, by S. Z. Burstein, S. S. Hammer, and V. D. Agosta. June 1961, 35p. incl. diagrs. refs. (AFOSR-433) (AF 49(638)165) AD 258231 Unclassified

Presented at the ARS Propellants Combustion and Liquid Rockets Conf., Palm Beach, Fla., Apr. 26-28, 1961.

Also published in Prog. in Astronaut. and Rocketry, v. 6: 243-267, 1962. (Title varies)

A simplified model is proposed for the combustion of a bi-propellant spray. The model considers 2 subsystems, the spray, and the combusted gases. These subsystems are coupled together by heat transfer, mass transfer and momentum transfer. The solution of the problem relies upon the integration of a system of 7 nonlinear differential equations. Under the given boundary conditions a co-operative evaporation process occurs, in which increased velocity gradients cause increased evaporation which increases the velocity gradient. Tests were made on a 2-in. diam, variable length rocket motor, using JP-5A and liquid oxygen. A simple converging diverging nozzle is employed to give high chamber exit Mach numbers (.4 to .5). For a given set of injection parameters, under stable operating conditions, the results indicate that the steepest portion of the gradient, which corresponds to evaporation of the major portion of the fuel, is always found in a fixed region of the chamber, independent of the absolute length of the chamber. Results appear to be in agreement with theory.

HIGH FREQUENCY OSCILLATING COMBUSTION IN ROCKET MOTORS (Abstract), by V. D. Agosta. [1961] [1]p. [AF 49(638)165] Unclassified

Presented at Fourteenth AFOSR Contractors' meeting on Liquid Rocket Combustion Research, Princeton, U., N. J., Sept. 25-26, 1961. (AFOSR-1768; AD 267915)

A simplified steady state mathematical model is proposed for the combustion of a monopropellant spray in a rocket chamber. The solution of the problem relies upon the integration of a system of 7 nonlinear total differential equations. The integration is performed using the IBM 704 digital computer. The data generated from this program are the initial conditions for the non-steady analysis. The time dependent conservation laws of the combustion gases and liquid droplets are coupled together and solved. The method of characteristics is used as the technique of solution since the partial differential equations by appropriate transformations, are reduced to first order ordinary differential equations along the bicharacteristics, gas particle path, and liquid particle path. The bicharacteristic equations are solved by the Runge-Kutta-Gill technique. Arbitrary pressure pulses are introduced into the combustion chamber and the amplification or attenuation of these pulses and their interaction with the combustion zone is ascertained. An analysis has been made of shock wave propagation in a rocket engine having the above physical characteristics. The shock wave equations contain terms to account for the drag, evaporation and subsequent combustion of the liquid fuel drops. These equations have been coded for the IBM 650 computer and the program is currently being debugged. An experimental wave generator has been developed that introduces a predetermined shape pulse into the rocket chamber. At present a half sine wave of 1 μsec duration is being employed. The shape and size of the pulse can be varied by modifying the ports in the generator and size of the explosive actuator.

DAMPING OF FLEXURAL VIBRATIONS OF SANDWICH PLATES, by Y.-Y. Yu. May 1961, 36p. incl. diagrs. (Technical note no. 10) (AFOSR-838) (AF 49(638)453) Unclassified

Also published in Jour. Aerospace Sci., v. 29: 790-803, July 1962.

For the analysis of the effect of structural damping on the flexural vibrations of infinite and simply supported rectangular sandwich plates, the general 2-dimensional equations of a sandwich-plate theory are first presented. As in the 1-dimensional case (item no. PIB. 15:001, Vol. II), the theory takes into account the thickness-shear deformation and imposes no limitations upon the ratios between the densities, elastic moduli, and thicknesses of the core and face

layers of the sandwich. The unrestricted nature of the theory makes a thorough analysis of damping possible, and the results obtained are in fact applicable to any symmetrically constructed 3-layered composite plate. (Contractor's abstract)

SIZE EFFECT IN THE MEASUREMENT OF MICROWAVE PERMEABILITY OF FERRITES, by B. Maher and L. [M.] Silber. [1960] [1]p. incl. diagrs. [AF 18-(600)1505] Unclassified

Published in I. R. E. Trans. on Microwave Theory and Techniques, v. MTT-9: 96, Jan. 1961.

Measurements were made on spheres of 2 typical polycrystalline ferrites R-1, a magnesium manganese ferrite and yttrium iron garnet. The measurements were made by mounting the sample in the center of an X-band TE_{102} rectangular cavity; and the change in the insertion loss as a function of the applied magnetic field was measured. The quantity obtained is u'', the imaginary part of the diagonal element of the permeability tensor. The values of u'' were calculated from the equation: $u'' = \left(\frac{V_o}{V} - 1\right) \frac{V_c}{4Q_u V_s - \left[1 - \left(\frac{\lambda_o}{2a}\right)^2\right]}$ where V_o/V_1 is determined from the ratio of the insertion loss of the cavity at very large static field to the insertion loss at a particular field; Q_u is the unloaded Q of the cavity; V_c and V_s are volume of the cavity and the sample, respectively. The formula gave values of U''_{max} and line width which were independent of size, within experimental uncertainty, for all the samples.

AN INVESTIGATION OF THE JUNGLE GYM PERIODIC STRUCTURE, by B. Mohr. May 9, 1961, 65p. incl. diagrs. refs. (Research rept. no. PIBMRI-892-61) (AFOSR-792) (AF 18(600)1505) AD 258702 Unclassified

A jungle gym periodic structure, an array of square bars contained within a square waveguide is discussed; it is suitable for use, both, as a linear accelerator, and for high power traveling wave tubes, since heat can be conducted directly to the walls of the guide. Characteristics of the jungle gym, determined experimentally, are the propagation characteristics, internal Q, and coupling impedance. Resonance frequency measurement tangent method, and the perturbation technique, necessary in order to obtain the above-mentioned characteristics, are given. In addition, a structure, the wire loaded cylindrical guide structure, closely related to the jungle gym, is described. Both structures exhibit a slow backward fundamental space harmonic and large bandwidth. Bandwidths obtained for the jungle gym structure, dependent on its periodic length, range from about 2000 to 3600 mc, with an approximate midband frequency of 4700 mc.

A REPRESENTATION OF MICROWAVE ONE-PORT CAVITIES, by G. Persky. May 4, 1961, 65p. incl. diagrs. (Research rept. no. PIBMRI-912-61) (AFOSR-797) (AF 18(600)1505) AD 258949 Unclassified

The theoretical basis for representing 1-port cavities by means of a modified Wheeler representation, i.e., a representation which includes transformers, transmission lines, and ideal attenuators, and which more closely resembles a physical cavity, is given. Formulas and techniques for abstracting the pertinent parameters from experimental data are also presented. Two configurations are considered: a simple (empty) cavity and one which is partially loaded with a dielectric material. It is shown that in practical cases both of these cavities, and by inference more complicated ones, can be represented by the same simple network. Experimental results substantiating the theory have been offered. In contrast to the usual RLC representation, the present representation makes it possible to obtain the network parameters, when necessary, from a knowledge of the physical cavity components. In addition, because of the direct relationship which the network parameters bear to the cavity components, the effect on cavity behavior which results when the values of individual components are changed can be readily determined. EIGENWAVES ON A LATTICE OF SMALL SCATTERERS, by H. Kurss. July 17, 1961, 21p. (Research rept. no. PIBMRI-936-61) (AFOSR-1140) (AF 18(600)1505) AD 261387 Unclassified

Previously, the quantum mechanical Bloch waves in a cubic crystal were analyzed by a cavity or structure constant approach by J. Korringa, W. Kohn (Physica, v. 13: 392, 1947) and N. Rostoker, et al (Phys. Rev., v. 94: 1111, 1954). In the present report, the above method is reformulated to permit the analysis of electromagnetic Bloch waves in artificial dielectrics as well as electromagnetic surface waves on open periodic structures. The analysis, which is particularly appropriate for small scatterers, proceeds as follows. It is shown that a lossless scatterer embedded in a lossless medium can be characterized by a Hermitian matrix R. The lattice structure is then characterized by a structure constant matrix Γ which, in the eigenwave region, is also Hermitian. A dispersion relation for eigenwaves is then obtained as the condition that the determinant of $R-\Gamma$ vanishes. (Contractor's abstract)

THE MEASUREMENT OF ARBITRARY LINEAR MICROWAVE TWO-PORTS, by H. M. Altshuler. July 27, 1961, 32p. incl. illus. tables. (Research rept. no. PIBMRI-935-61) (AFOSR-1169) (AF 18(600)1505) AD 264042 Unclassified

Presented at Conf. on Microwave Measurement Techniques, London (Gt. Brit.), Sept. 1961.

Also published in Proc. Inst. Elec. Engineers (London), v. 109B, Suppl. 23: 704-712, 1962.

The measurement of the scattering parameters of linear, but otherwise arbitrary, 2-ports (active, lossless or dissipative and reciprocal or non-reciprocal) by means of an interference bridge is described. Since the measured data form circular loci from which the parameters are then derived, known precision curve fitting techniques are applicable. The various loci which may occur and their characteristics are discussed together with the methods available for distinguishing the proper locus from its inverse. Various methods of balancing the bridge and many of the errors associated with bridge balancing are given. Finally, the deliberate use of bridge imbalance for increasing measurement accuracy is considered.

ABSTRACT OPERATOR METHODS IN ELECTROMAGNETIC DIFFRACTION, by N. Marcuvitz. Aug. 22, 1961, 19p. (Research rept. no. PIBMRI-939-61) (AFOSR-1838) (AF 18(600)1505) AD 273025 Unclassified

The essence of a diffraction problem lies in the determination of a far scattered field from a prescribed incident field. In abstract terms, this relation is provided by a transformation operator, the explicit evaluation of which is the central problem of the abstract operator theory. Solution of this problem requires the inversion of an operator characterizing both the scattering region and the scatterer. For general classes of scattering problems it is possible to exhibit certain abstract features of the relevant operators and to derive abstractly therefrom the information corresponding to these features. Examples of such abstract procedures are discussed.

BANDWIDTH LIMITING EFFECTS OF FREQUENCY SELECTIVE FADING OVER TROPOSPHERIC SCATTER PATHS, by P. D. Shaft. June 1961, 105p. incl. diagrs. tables, refs. (Research rept. no. PIBMRI-979-61) (AFOSR-1570) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and [Signal Corps] under AF 18(600)1505) AD 282967 Unclassified

A set of design curves of intermodulation distortion due to frequency selective fading was derived for tropospheric scatter systems. These curves are applicable to systems frequency modulated with frequency division multiplexed telephone and telegraph channels. The reduction in distortion due to the use of diversity reception was not calculated, but a general discussion of some of the problems involved in determining the reduction is given. A 2-ray model was selected to derive general results. This, however, restricts the use of the design curves to the region where the information bandwidth is less than the propagation bandwidth. Equations for intermodulation distortion are evaluated using the parameter normally encountered in tropospheric scatter systems. A method of obtaining a probability distribution of distortion is indicated, and an example is worked out in detail. The design curves are compared to experimental measurements of intermodulation distortion due to propagation and agree to a first order approximation. The principal result is the development of design curves which can be used to predict the intermodulation distortion introduced by the tropospheric scatter medium. The intermodulation distortion will exceed thermal noise in many systems. (Contractor's abstract)

EFFECTS OF IMPULSE NOISE ON DIGITAL DATA TRANSMISSION, by A. B. Bodonyi. Dec. 11, 1961 [30]p. incl. diagrs. refs. (Research rept. no. PIBMRI-975-61) (AFOSR-1989) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and [Signal Corps] under AF 18(600)-1505) AD 285511 Unclassified

Represented are the basic characteristics of impulse noise and effects of impulse noise on various types of binary data transmission systems. The sources and properties of such impulse noise, in contrast with gaussian noise are discussed. A method is described for the experimental comparative evaluation of bit error rates in presence of additive impulsive noise. The method is shown to permit unique comparison between the 3 modulation schemes tested, namely on/off carrier, frequency shift and diphase (phase several keying, with coherent detection). The major conclusions drawn for these experiments are: (1) The choice of modulation scheme has a greater effect on the overall error rates in presence of impulse noise than it does for the gaussian case. (2) The simple error-detecting and error-correcting systems, designed to combat the effects of gaussian noise, can be utilized only to a fraction of their theoretical advantage in case of impulse noise. (3) The best results can be obtained from the coherent PSK system at high signal-to-noise ratios. (Contractor's abstract)

MOTION OF A CHARGED PARTICLE IN AN AXIALLY SYMMETRIC MAGNETOSTATIC FIELD, by E. Mishkin and C. Rader. [1961] [1]p. [AF 18(600)1505] Unclassified

Published in Phys. Fluids, v. 4: 783, June 1961.

Motion of a particle of mass m and charge q in an axially symmetric magnetostatic field is considered. The magnetic field is defined by a single component vector potential and it is assumed that the field variations over a Larmor radius are small. The motion of the particle consists of the cyclotron rotation around a guiding center, the trajectory of which is derivable from a scalar potential V. The Lagrangian of this magnetic field leads to 3 equations of motion.

SOME MODELS FOR PULSE-INTERVAL MODULATION SYSTEMS, by H. J. Hunt. [1961] [3]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under AF 18(600)1505) Unclassified

Published in Biological Prototypes and Synthetic Systems; Proc. Second Annual Bionics Symposium, Cornell U., Ithaca, N. Y. (Aug. 30-Sept. 1, 1961), New York, Plenum Press, v. 1: 291-293, 1962.

One of the common approaches taken by researchers in bionics interested in translating biological functions into electronic systems is the development of models which simulate various types of biological phenomena. The present work describes the development and operation of a model of a "neuromime". The approach used is that of simulating some of the functions of sensory receptors as closely as possible with an electronic device. The model consists of a pulse generator, a sweep-generator feedback element which is triggered from output pulses, and a summer. To simulate a spontaneously operating neuron or receptor, all that is required is to apply a single constant dc input sufficient to raise the output of the summer above the threshold. To simulate an adapting type of receptor, decaying exponentials are used as inputs. Multiple pulse inputs are used to simulate neural functions. In general, to simulate almost any neural output pattern that has been observed, it is usually sufficient to calculate beforehand the required input that will give rise to the desired response.

DISSIPATION IN UNIFORM (DIELECTRIC FILLED) WAVEGUIDES, by G. Persky. Oct. 17, 1961, 9p. (Research rept. no. PIBMRI-946-61) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under AF 18(600)1505) Unclassified

Standing waves in a waveguide with dielectric and/or metal wall losses generally give rise to expressions for power dissipation per unit length containing a term which is a sinusoidal function of the distance along the waveguide. In the present memorandum this phenomenon is explained and expressions of the dissipation are derived. The development is carried out for TE and TM modes in a uniform dielectric filled waveguide or arbitrary cross section, and then again from the standpoint of transmission line theory. The practical implications of the results are discussed.

STABILITY AND CONVERGENCE PROPERTIES OF MODEL-REFERENCE ADAPTIVE CONTROL SYSTEMS, by J. J. Bongiorno, Jr. [1961] [12]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under AF 18(600)1505) Unclassified

Published in I. R. E. Trans. on Automatic Control, v. AC-7: 36-41, Apr. 1962.

An approach to adaptive control system design which does not involve a direct measurement or identification of the variable process parameters is investigated. Convergence-time relationships and sufficient conditions for system stability are developed when the process is characterized by a variable gain or variable time-constant, and fixed dynamics of any order. The adaptive capability is achieved by employing a model as a reference element and by means of appropriate adaptive circuitry. The adaptive circuitry is simple, easily instrumented, and does not require successive differentiations; the primary function of the adaptive circuitry is one of integration. (Contractor's abstract)

SHORT-TIME STABILITY IN LINEAR TIME-VARYING SYSTEMS, by P. Dorato. May 9, 1961, 61p. incl. diagrs. (Research rept. no. PIBMRI-908-61) (AFOSR-748) (AF 18(603)105) AD 258397 Unclassified

Presented at I. R. E. Internat'l. Convention, New York, N. Y., Mar. 20-23, 1961.

Also published in I. R. E. Internat'l, Convention Record, Pt. 4: 83-87, 1961.

Short-time stability is investigated in linear time-varying systems. Elements of linear time-varying analysis required are reviewed and special emphasis is placed on the impulse response w(t, τ) and the representation of undriven systems in the matrix differential form: $\dot{y} = \underset{\sim}{A}(t)\,\underset{\sim}{y}$. Undriven systems are discussed as an extension of Chzhan-sy-in's work in linear time varying systems. Sufficient conditions for short-time stability are expressed in terms of the coefficient matrix $\underset{\sim}{A}(t)$. Necessary and sufficient conditions for short-time stability are stated in terms of the impulse response, w(t, τ) for driven systems. The concept of short-time C-equivalence, essentially a structural stability concept, is introduced and conditions for the C-equivalence of 2 systems are given in terms of their impulse responses. Examples are included to illustrate the various theorems and indicate the range of applicability of the concept of short-time stability. Proofs of theorems used are given and an analysis of the results obtained along with suggestions for additional study are presented.

STABILITY ANALYSIS OF TWO-PARAMETER CONTROL SYSTEMS, by M. L. Shooman. June 1961, 96p. incl. diagrs. tables, refs. (Research rept. no. PIBMRI-920-61) (AFOSR-997) (AF 18(600)1505 and AF 18(603)105) AD 260044 Unclassified

This dissertation treats the problem of stability in 2 parameter control systems. The 2 parameters may be loop-gains, time constants, natural frequencies, damping constants, or describing function gains representing system nonlinearities. The limitations of single parameter analysis techniques are discussed and parameter plane analysis introduced. The 2 system parameters are plotted along the coordinate axes in the parameter plane. The left-half-plane and the j omega axis of the s-plane are mapped into a stable region and a stability boundary respectively, in the parameter plane. The parameter plane plot delineates the ranges of the 2 system parameters that yield stable operation. The Routh Table or other similar stability criteria are used to obtain the stability boundary in the parameter plane. Using appropriate mapping transforms, performance boundaries may be obtained. These transformations allow a mapping of lines of constant sigma in the left-half plane into the parameter plane. Analog computer methods are discussed that allow experimental location of stability and performance boundaries in complex problems. The parameter plane method of analysis was applied to a system with 2 nonlinearities. Three means of analyzing 3 and more parameter systems are also discussed.

ON THE OPTIMUM DESIGN OF PREDICTOR CONTROL SYSTEMS, by S. Horing. Aug. 24, 1961, 79p. incl. diagrs. refs. (Research rept. no. PIBMRI-945-61) (AFOSR-1412) (AF 18(603)105) AD 265275 Unclassified

The basic optimization problem of Predictor Control Systems is viewed, in very general terms, as a problem in decision theory. Based on available information. the decision must be made as to which of the allowable control signals should be applied to the plant in order to achieve the optimum performance. A sum of squared error criterion is used to define the optimum in order to reduce the problem to a problem in linear decision theory. A piecewise-linear Control Boundary is found which can be used to generate the desired control signal. The realization of this Control Boundary is shown to be straight-forward and inexpensive. This technique can be applied to fixed linear plants of arbitrary order. A linear approximation to the optimum Control Boundary is discussed. The practical advantages of such an approximation are shown to be considerable.

STABILIZATION OF MULTILOOP SYSTEMS VIA THE SENSITIVITY FUNCTION, by R. Haddad. Aug. 30, 1961, 120p. incl. diagrs. tables. (Research rept. no. PIBMRI-944-61) (AFOSR-1420) (AF 18(603)105) AD 265276 Unclassified

The stabilization of multiloop systems against individual variations in 1 or more of the system parameters is studied. A correlation between the stability of a multiloop configuration and the real-frequency behavior of the sensitivity function is derived. From this relationship, a set of stability margins is developed which provide a quantitative measure of the destabilizing effects of variations in each parameter. The margins, referred to as parameter gain and phase margins are shown to be generalizations of the familiar gain and phase margins of the single-loop, servo system. The design objective is the realization of a set of specified stability margins; the relationship between these margins and the real-frequency behavior of the associated sensitivity functions gives rise to specification of the sinusoidal response of compensation networks at a set of discrete frequencies. THE SIGNIFICANCE OF SENSITIVITY IN FEEDBACK

SYSTEM STUDIES, by W. A. Lynch and J. G. Truxal. June 1, 1961, 107p. incl. diagrs. (Research rept. no. PIBMRI-866-60) (AFOSR-1540) (AF 18(603)105) AD 273024 Unclassified

The sensitivity function is the fundamental measure of the effectiveness of feedback, in controlling the effects of both parameter variations and unwanted noise signals. After a preliminary discussion of the significance of the sensitivity function, methods for the simple calculation of the sensitivity are presented: methods valid whenever the over-all transmission is a bilinear function of the varying parameter (thus, whenever the parameter is a circuit element or the transmittance of a controlled source). The sensitivity function yields simple evaluations of the parameter margins, the amount by which specific parameters must be varied to cause system instability. The parameter margins can be evaluated directly from the frequency-domain plots utilized in normal system design. This interpretation of the sensitivity function is of importance not only in the logical design for simultaneous control of several sensitivity functions, but also in the identification problem. Extensions to the study of nonlinear systems can be effected if a frequency-independent describing function can be defined. (Contractor's abstract)

ULTRASOFT X-RAY MICROSCOPY, by B. L. Henke. May 1961, 20p. incl. illus. diagrs. table, refs. (Technical rept. no. 4) (AFOSR-970) (AF 49(638)-394) AD 258678 Unclassified

Also published in Encyclopedia of Microscopy, New York, Reinhold Publishing Corp., 1961, p. 675-693.

The resolution of projection and contact x-ray microscopy is comparable to that of light microscopy. Nevertheless both forms of x-ray microscopy have had the traditional advantages: (1) capability for measurement of structural detail within optically opaque materials, (2) capability for measurement of thickness and depth of microscopic structure through stereographic analysis by virtue of a very great depth of field; and (3) capability for quantitative measurement of mass and elementary chemistry of microscopic systems through microabsorption techniques. These advantages are gained for micron-sized systems and for the lighter element materials through the use of x-radiations in the 10 to 50A region. With the ultra-soft x-rays the necessary absorption signal is obtained along with a greatly simplified relationship between sample transmission and the sample mass and chemistry. Methods and instruments which have been developed for quantitative contact microradiographic analysis are described here.

[CHARGE STORAGE AND IRRADIATION EFFECTS IN SOLID DIELECTRICS] by B. Gross. Final rept. Dec. 21, 1961, 16p. incl. diagrs. tables. (AF AFOSR-60-6) Unclassified

Measurements on the volume polarization of the electret clearly indicate that all sections of a polarized sample, when reheated under identical conditions, release the same amount of charge as the corresponding non-sectioned sample; therefore, their polarizations must all have been identical. It follows that the electret possesses a uniform volume polarization. The present measurements have brought out this fact for the first time. Depolarization of electrets by gamma radiation was accomplished and physical measurements indicate that irradiation depolarizes the electret according to an exponential law. A dose of 1 megaroentgen reduces the original polarization roughly to a fraction 1/e.

STABILIZATION OF ENERGY-RICH MOLECULES. II. ENERGY TRANSFER WITH PARAFFIN HYDROCARBONS, by B. Stevens and M. Boudart. Jan. 1961 [24]p. incl. diagrs. refs. (AFOSR-158) (AF 49(638)-32 and AF 33(038)23976) AD 255157 Unclassified

The energy transfer between vibrationally excited β-naphthylamine vapor and paraffin hydrocarbons (CH_4 to C_6H_{14}) was studied by measuring the enhancement of fluorescence of the aromatic molecule due to stabilizing collisions. The accomodation coefficient characterizing the efficiency of energy transfer in this type of collision increases linearly with the molecular weight when the vibrational modes of the stabilizing gas participate significantly in the exchange of energy. This result was previously found in the case of thermal accommodation of paraffins at nickel surfaces. The parallelism between the two phenomena is emphasized. (Contractor's abstract)

HIGH SPEED AERODYNAMICS AND JET PROPULSION. VOLUME IV. THEORY OF LAMINAR FLOW, ed. by F. K. Moore. Princeton U. Press, 1964 [1960] 869p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research Office of Naval Research, and Office of Ordnance Research under Nonr-03201) Unclassified

The present volume is concerned with fluid motions which are influenced in an important way by viscosity and heat conductivity of the flowing substance. The fluid is regarded as a continuum in which the resistance to shearing motion and the conduction of heat arise by exchange processes occurring on a molecular scale. When viscous and conductive effects arise from this cause, the motion is said to be laminar, as distinct from turbulent motion, in which macroscopic eddies are responsible for high rates of transfer of momentum and energy. These turbulent motions are treated in Volume V of the High Speed Aerodynamics and Jet Propulsion series. (Item no. 2375, Vol. V).

HIGH SPEED AERODYNAMICS AND JET PROPULSION. VOLUME V. TURBULENT FLOWS AND HEAT TRANSFER, ed. by C. C. Lin. Princeton U. Press, 1959, 549p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Office of Ordnance Research under Nonr-03201) Unclassified

This volume deals with the interrelated problems of turbulent flow and heat transfer. It begins with an article on transition from laminar to turbulent flow. This is followed by a discussion of the problem of shear flow from the experimental and semi-empirical points of view and of the statistical theory of turbulence from a deductive point of view. Future developments in knowledge should result in the merging of these 2 approaches into a comprehensive and unified treatment. The 3 modes of heat transfer - conduction, convection, and radiation - are presented in the remaining part of this volume. These articles are especially oriented toward high speed flows with high temperature differences. Free convection due to gravitational forces is considered in this portion of the volume only in connection with boiling heat transfer. In the sections on the physical basis of radiation and on the method of engineering calculations in radiant heat exchange, it is an interesting reflection on the current status of the knowledge in this important field that these phases of the problem are presented from somewhat different points of view.

HIGH SPEED AERODYNAMICS AND JET PROPULSION. VOLUME VIII. HIGH SPEED PROBLEMS OF AIRCRAFT AND EXPERIMENTAL METHODS, ed. by A. F. Donovan, H. R. Lawrence and others. Princeton U. Press, 1961, 976p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Office of Ordnance Research under Nonr-03201) Unclassified

This volume of the Princeton series has as its intention the completion of the present discussion of the aerodynamics of high speed aircraft and missiles which starts in Volume VI (item no. PRL 12:001, Vol. I) and is carried further in Volume VII (item no. PRL 12:005, Vol. II). The first portion is concerned with aircraft design problems that are particularly associated with high speeds. An introductory discussion of the type of performance calculation peculiar to high speed aircraft is followed by a section devoted to the problems of stability and control at high speeds. The final section of this portion is a rather complete treatise on the problems of aeroelasticity which are encountered with high speed aircraft. The second portion of the volume is concerned with the techniques of aerodynamic testing in wind tunnels and shock tubes. Consideration is given not only to testing techniques in the 3 speed ranges - transonic, supersonic, and hypersonic - but also to facilities for testing in the regime of rarefied gas dynamics. The final portion of the volume is devoted to a discussion of free flight techniques. A discussion of the basic techniques of instrumented rocketry is followed by a section on the testing of piloted aircraft. The final section is a treatise on free flight range techniques.

HIGH SPEED AERODYNAMICS AND JET PROPULSION. VOLUME X. AERODYNAMICS OF TURBINES AND COMPRESSORS, ed. by W. R. Hawthorne. Princeton U. Press, 1964 [1960] 616p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Office of Ordnance Research under Nonr-03201) Unclassified

This volume deals with the problems of the flows in gas turbines and compressors. Such flows are complex, and there is an obvious difficulty in any attempt to describe comprehensively the flow in say, a compressor or a turbine in an exact and rigorous fashion. The choice of topics for the Sections and each author's treatment of any one topic reflect this difficulty. Originally, the application of aerodynamic theory to flow through axial compressors and turbines followed

the blade element theory of propellers. Sections B, E, G, and K which discuss sub- and supersonic flow and unsteady flow in cascades develop this approach. The next step, that of describing the 3-dimensional aspects of the flow, is exemplified in the ideal flow theory developed in Section C. In Sections F and H the attempt is made to describe more completely the flow in axial compressor and turbine stages. With each step toward the final goal the approximations required increase and the unsatisfactory gaps in exact knowledge become more obvious.

HIGH SPEED AERODYNAMICS AND JET PROPULSION. VOLUME XI. DESIGN AND PERFORMANCE OF GAS TURBINE POWER PLANTS, ed. by W. R. Hawthorne and W. T. Olson. Princeton, Princeton U. Press, 1960, 563p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Office of Ordnance Research under Nonr-03201) Unclassified

This volume, XI, and its companion, Volume X (item no. 2377, Vol. V) comprise a treatment of the aircraft gas turbine power plant. In particular, the 2 volumes discuss the major engine components - compressor, combustor, turbine, and controls - with a view toward describing, explaining, and interpreting the basic phenomena influencing their design and operation. The main subjects in Volume XI are combustion, mechanical and metallurgical aspects, and performance and control.

HIGH SPEED AERODYNAMICS AND JET PROPULSION. VOLUME XII. JET PROPULSION ENGINES, ed. by O. E. Lancaster. Princeton U. Press, 1959, 799p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Office of Ordnance Research under Nonr-03201) Unclassified

This volume considers those principles and problems encountered in combining components to form a complete engine. It relies heavily upon the other volumes which deal with basic principles or principles and problems related to components of an engine. Section A gives a concise history of the development of rockets and air flow jet engines. Section B gives definitions of thrust and various efficiencies and derives relationships for the performance of the different jet propulsion systems. Section C gives the performance analysis of turbojets based on the internal solution of matching the compressor, combustor, turbine, and nozzle. It includes a discussion of off-design performance and describes the problems of control and testing which are unique to a complete unit. Section D treats the turboprop in a somewhat similar manner. It gives the logic for interest in a turboprop and discusses the additional complications. Section E is devoted to the ramjet, its performance, controls, and methods of testing. Section F discusses the wave engines in general, and in particular the pulse jet and the comprex. Section G treats the liquid rocket engine, from the consideration of appropriate fuels to the designing and testing of the motor. Section H gives a similar treatment for solid propelled rockets, with special stress on the stability and characteristics of burning. The possibility of a variety of hybrid engines, part rocket, part turbine, or more generally, part jet and part rotating machinery, is introduced in Section I and J which treat 2 such cases - the ramjet and the jet rotor. Each section derives the possible performance and outlines the possible use of these engines. Section K deals with the problems in making a nuclear jet power plant suitable for aircraft. It gives the theory related to the shielding, heat transfer, and the production and control of a small lightweight reactor. The final section does not quite give a peek into the future, but it gives a systematic procedure for exploring the many possibilities of the types of jet engines.

THEORETICAL SOLUTIONS TO SOME NEARLY FREE MOLECULAR PROBLEMS, by D. R. Willis. [1960] [12]p. incl. table. (AFOSR-3417) (AF 18(600)498) Unclassified

Also published in Rarefied Gas Dynamics; Proc. First Symposium, Nice (France) (July 1960), New York, Pergamon Press, v. 3: 246-257, 1961.

In this paper, the problem of Couette flow is solved using integral methods and a general method of attacking problems in the nearly free molecular regime is proposed. This method is based on a limited collision model. It appears equivalent to a first approximation to the integral type of solution, valid for nearly free molecular conditions.

ANALYSIS OF LONGITUDINAL HIGH FREQUENCY COMBUSTION INSTABILITY IN A GAS FUELED ROCKET MOTOR, by H. G. Bortzmeyer and L. Crocco. Dec. 5, 1961 [44]p. incl. diagrs. refs. (Rept. no. 587) (AFOSR-1957) (AF 18(600)1527) AD 270745 Unclassified

A theoretical investigation of the stability boundary for longitudinal high frequency oscillations in a gas fueled rocket motor has been carried out. It was based on the following assumptions: (1) the mechanism responsible for combustion instability involves oscillatory heat transfer to the injector plate; and (2) the rates of chemical reactions in homogeneous gas phase are high enough to enable the chemical system to respond without phase lag to periodic variations of the conditions

in the chamber. Under these assumptions the equations governing the propagation of small pressure perturbations in the combustion chamber were derived, and oscillatory solutions of the type were found. By applying proper boundary conditions to these solutions a so-called characteristic equation for the unknown complex quantity s has been derived. Numerical solutions have been carried out for the relatively simple case of moderate frequency oscillations taking place in a chamber ended by a short nozzle.

COMBUSTION PROCESSES IN LIQUID PROPELLANT ROCKET MOTORS, by I. Glassman. Final rept. Sept. 1, 1955 - Aug. 31, 1960. Dec. 20, 1961, 5p. incl. refs. (AFOSR-2059) (AF 18(600)1527) AD 272924 Unclassified

The high pressure combustion process of liquid sprays, the light scattering technique for the measurement of droplet spray characteristics, the chemical reaction rate data of fundamental reactions, and the use of gaseous propellants to determine chemical influences on combustion instability were studied. An apparatus was developed that permits the investigation of the combustion of droplet sprays under a wide range of pressure and temperature conditions. In order to follow the history of the burning droplets a light scattering technique was developed which permits the determination of a mean droplet size and concentration. In the course of the light scattering work significant contributions were made to the field of photographic photometry. A new type flow reactor was developed for the measurement of high temperature reaction kinetics. Thorough experimental and analytical investigations of ethylene oxide decomposition were carried out. Similarly high temperature hydrogen-oxygen kinetic rates were determined. The range of temperature covered was the same as that of interest to those working in the field of supersonic combustion. Although the handling of gaseous hydrazine proved very difficult and no experimental results could be obtained within the period of the subject contract, concern with this subject led to a complete theoretical investigation of hydrazine that has proved of great interest to those working in the propellant field. It became evident during the course of the investigation on chemical influences in combustion instability that chemical kinetics could not be a controlling influence, but that some physical phenomenon like heat transfer to the injector was the important factor. Some recirculation effects were investigated as well.

THE IGNITION MECHANISM OF COMPOSITE SOLID PROPELLANTS, by R. F. McAlevy, III. June 1, 1961 [139]p. incl. illus. diagrs. tables, refs. (Rept. no. 557) (AFOSR-1220) (AF 49(638)411) AD 263440 Unclassified

Evidence points to gas phase heat evolution as the controlling mechanism for the steady-state deflagration process of solid propellants. Generally, this takes the form of a measured decrease of the ignition time lag with increasing oxygen concentration of the ignition gas. The study of this effect in the ignition of NH_4ClO_4 composite propellants is discussed. The shock tube was selected as the basic tool for this research. All of the quantitative experiments, designed to verify the gas phase ignition theory were executed by exposing small specimens of propellants to an instantaneous, controlled, heat input. This was accomplished by reflecting impinging shock waves from their exposed, flat, surfaces. As the igniting gas composition was vitiated with N the measured ignition time lags increased from a few hundred microseconds in a mixture of 100% O2, 0% N2, to 5 milliseconds in a mixture of 40% O2, 60% N2. This evidence led to an ignition mechanism based on a gas phase heat release due to the reaction between the vaporized fuel component of the propellant and the oxygen component of the ignition gas. RESEARCH ON THE IGNITION OF SOLID PROPELLANTS, by C. E. Hermance, J. Wenograd, and K. P. Hall. Final technical rept. May 15, 1958 - Sept. 30, 1961. Dec. 1961, 8p. (Rept. no. 588) (AFOSR-1960) (AF 49(638)411) AD 270112 Unclassified

Studies of the mechanism of solid propellant ignition have been in progress at Princeton for four and one-half yr. The most significant achievement has been the development of a theory which postulates that the site of a runaway exothermic reaction which constitutes ignition is in the gas phase. Previous theories have assumed that ignition occurs as a consequence of self heating within the solid phase. During the course of the contract a body of data has been acquired which strongly supports this gas phase ignition theory.

FUNDAMENTAL STUDIES OF SOLID PROPELLANT IGNITION (Abstract), by M. Summerfield, R. F. McAlevy, III and others. [1961] [2]p. incl. table. [AF 49(638)411] Unclassified

Presented at Third AFOSR Contractors' meeting on Combustion of Solid Propellants, Utah U., Salt Lake City, Jan. 30-31, 1961. (AFOSR-986)

The mechanism of ignition of solid propellants has been under investigation at Princeton since 1957. To date, the energy source for ignition has been hot gas generated in a shock tube. The authors feel that the discrepancies in magnitude between the predicted and observed exponents of Z_o (effect of oxygen weight fraction) and p probably are indications that the assumption of second order gas phase kinetics is too

simplified. It is felt that the data lend powerful support to the gas phase ignition theory. Conductive heating ignition experiments have also been performed on a typical double base propellant. For this case, τ (ignition time) is dependent upon Z_o suggesting that double base ignition also involves a gas phase mechanism. In an effort to extend experiments into a regime of higher heat input, so that the gas phase ignition concept may be tested under conditions more closely resembling those in a practical rocket motor, a new experiment configuration is being developed in which a sting-mounted round-nose propellant model will be exposed to convective heating by a supersonic gas downstream of the nozzle of a shock tunnel.

PROPELLANT IGNITION AND IGNITER CHARACTERISTICS (Abstract), by M. Summerfield, R. W. Lancaster and others. [1961] [2]p. incl. diagr. [AF 49(638)411] Unclassified

Presented at Third AFOSR Contractors' meeting on Combustion of Solid Propellants, Utah U., Salt Lake City, Jan. 30-31, 1961. (AFOSR-986)

The objective being pursued under this contract is to study in a well-controlled fashion the ignition of small solid propellant grains in a configuration which resembles that in a practical solid rocket motor. A gaseous ignition system was selected as the ignition stimulus for the first phase of this research. Appropriate mixtures of methane, oxygen, and nitrogen are injected into a small gas rocket and ignited by a spark. The combustion products emerging from the nozzle of the gas motor then will flow through the inner perforation of a small case-bonded internal burning solid propellant grain, and will ignite it by convective heating. By selection of appropriate values of the mass flow rate of gas, the gas composition, the throat area of the exhaust nozzle downstream of the solid propellant grain, and the port diameter of the grain itself, the following parameters can be independently and readily controlled: (1) the chemical reactivity of the igniting gases, (2) the dummy chamber pressure, (3) the temperature of the igniting gas, and (4) the gas velocity over the propellant surface. An apparatus utilizing such an ignition system has been constructed, test propellant grains have been fabricated successfully, and testing will begin shortly.

SOLID PROPELLANT ROCKET INSTABILITY AND RELATED FUNDAMENTAL EXPERIMENTS (Abstract), by M. Summerfield and R. H. W. Waesche. [1961] [1]p. [AF 49(638)411] Unclassified

Presented at Fourteenth AFOSR Contractors' meeting on Liquid Rocket Combustion Research, Princeton U., N. J., Sept. 25-26, 1961. (AFOSR-1768; AD 267915)

The instability observed in the past in solid propellant rocket motors can be conveniently divided into 3 classes, according to the frequencies observed. The high frequency class spans the range from 500 to 30,000 cps and more, and has been associated with transverse acoustic modes. The intermediate range runs from 50 to 1500 cps and is associated with the longitudinal modes. The low frequency class is usually less than 100 cps and is much lower than an identifiable acoustic frequency. To understand the basic process that leads to unstable burning and the mechanism of action of the various suppressants, a number of important experiments have been performed. One shows that the region of interaction between the acoustic field and the combustion process lies in the reaction zone near the burning propellant surface. Another shows that the pressure inaction is much more powerful for building up the oscillations than a velocity interaction. A third shows that the contribution to the acoustic energy from combustion interactions in the burned gas in the chamber port is probably negligible. All this evidence points to the necessity of determining the nature of the interaction between the burning process at the surface and the acoustic field in the chamber in a quantitative manner. The pertinent property is the acoustic impedance of the flame zone, or what has been termed the response ratio. The present indications are that quantitative measurements above 1000 cps will be extremely difficult to achieve.

IGNITION OF DOUBLE BASE SOLID ROCKET PROPELLANTS, by R. F. McAlevy, III, and M. Summerfield. [1961] [4]p. incl. diagrs. refs. (AF 49-(638)411) Unclassified

Published in ARS Jour., v. 32: 270-273, Feb. 1962.

The results of ignition tests of 3 different double base propellants performed by means of a shock tube technique are presented. The measured ignition delay of these propellants decreased with increasing chemical reactivity and with increasing pressure level of the surrounding gaseous environment. This behavior is strikingly similar to that previously observed when a series of composite propellants were so tested. Recently, it was demonstrated that the ignition of composite propellants takes place via a gas phase, vis-a-vis solid phase, heat release mechanism. The present results constitute strong evidence that double base propellants also ignite via a gas phase mechanism and that oxygen in the igniting gas participates in this mechanism.

A STUDY OF THE LEADING EDGE OF A SHOCK INDUCED BOUNDARY LAYER, by M. Sichel. Mar. 1961 [115]p. incl. diagrs. tables, refs. (Rept. no. 540) (AFOSR-628) (AF 49(638)465) AD 260911 Unclassified

An investigation of the flow at the leading edge of the boundary layer generated by a weak shock wave moving past a flat plate is presented. It is postulated that the leading edge flow can be divided into a shear layer near the wall dominated by the transverse viscous shear and into a free stream or shock region outside the shear layer which is dominated by the longitudinal viscous stress. By expending flow parameters in the shock strength parameter and by stretching coordinates, simplified equations for the shear layer and the shock region were derived from the Navier-Stokes or continuum equations. Such a shock strength expansion was also applied to the normal shock in the free stream and the results were found to be excellent agreement with exact analytical solutions of the Navier-Stokes equations. The vertical velocity generated within the shear layer is of sufficient magnitude to affect the shock region flow; therefore, the two regions interact. Outside the shear layer there is a region of non-Hugoniot flow where the shock is not normal or oblique but where the shock structure is 2-dimensional. An approximate solution of the leading edge interaction was obtained by replacing the shock region with an oblique shock, which is approximately matched to the shear layer. (Contractor's abstract)

VARIATIONAL PRINCIPLES IN PLASMA DYNAMICS, by C.-H. Su. [1961] [3]p. (AFOSR-942) [AF 49-(638)465] Unclassified

Also published in Phys. Fluids, v. 4: 1376-1378, Nov. 1961.

A Lagrangian density is constructed for a multifluid system. Maxwell's equations and flow equations for inviscid, barotropic, and infinitely electrical conducting fluid are obtained from the Lagrangian density through the use of the well-known Lagrange-Euler equations. Flow equations for plasma consisting of electrons and ions are derived from the equations of different species. In this way, in addition to the usual equations of momentum and continuity, a generalized Ohm's law is also obtained. (Contractor's abstract)

A STUDY OF THE EQUATION $\varphi_{xxx}-\varphi_x\varphi_{xx}+\varphi_{yy}=0$ WHICH DESCRIBES THE STRUCTURE OF WEAK NON-HUGONIOT SHOCK WAVES, by M. Sichel. Mar. 1961, 105p. incl. refs. (Rept. no. 541) (AFOSR-1166) (AF 49(638)465) Unclassified

This is a study of a previously derived "viscous transonic" equation. The equation is used to derive an equation for the perturbation to the structure of a weak normal shock wave caused by a small disturbance within the shock wave. Proofs of uniqueness, for a finite domain, are developed for both equations. By the introduction of a certain variable, an exact similarity solution of the "viscous transonic" equation is obtained. A similarity solution which is closely related to the solution of Tomotika and Tamada for the transonic flow near the throat of a Laval nozzle is also obtained.

ON A BOUNDARY VALUE PROBLEM IN THE KINETIC THEORY OF BROWNIAN MOTION, by I. M. Cohen. July 1961, 14p. (Rept. no. 568) (AFOSR-1454) (AF 49(638)465) AD 267517 Unclassified

The proposed boundary value problem in the kinetic theory of Brownian movement has been solved. It is, in principle, possible to calculate the velocity distribution of the Brownian particles as a function of distance from 1 of the 2 walls. In particular, if 1 wall is an absorbing barrier (for example, at $\xi = 0$, $f_1 = 0$ for $\eta > 0$), one may calculate how the distribution in velocities is skewed as the absorbing wall is approached. This particular solution may have some relevance to the theory of plasma probes. (Contractor's abstract)

THE MEASUREMENT AND COMPARISON WITH THEORY OF HEAT TRANSFER FROM SIMILAR LAMINAR BOUNDARY LAYERS TO AERODYNAMIC BODIES IN SUPERSONIC AND HYPERSONIC GAS STREAMS, by W. G. Reinecke. [1961] [169]p. incl. illus. diagrs. tables, refs. (Rept. no. 569) (AFOSR-1521) (AF 49(638)465) AD 273311 Unclassified

This analysis describes the experimental measurement of small rates of heat transfer to wind tunnel models from laminar compressible similar boundary layers at supersonic and hypersonic free stream Mach numbers. Wind tunnel models were developed having surface Mach number distributions corresponding to those required by the similar boundary layer solutions of Cohen and Reshotko. Then a method, using fairly simple equipment, was tested for measuring isothermal heat transfer to cold wind tunnel models with good accuracy and repeatability. Measurements were made of the recovery temperature and heat transfer rates on cold models with similar boundary layers in both favorable and adverse pressure gradients at a free stream Mach number of 2. Tests were also conducted at a free stream Mach number of 11 on a hot body having a favorable surface pressure gradient compatible with the similarity requirement. The assumptions of the similarity analysis were fulfilled in varying degrees by the different test configurations.

ON THE VISCOUS FLOW NEAR THE STAGNATION

POINT ON AN INTERFACE, by W. J. Prosnak. June 1961 [49]p. incl. diagrs. tables. (Rept. no. 563) (AFOSR-1592) (AF 49(638)465) AD 269684 Unclassified

The viscous flow near the stagnation point on an interface between 2 liquids with different densities is studied. The use of a model allows some fairly general results to be readily obtained as a result of a mathematical analysis. Moreover, although the model is obviously not in full accordance with re-entry phenomena, it is believed that it is not oversimplified, and that solutions of real problems obtained on the basis of the results of the present study will be at least qualitatively correct. Equations governing the stated problem can be transformed to those describing the stagnation point flow at a rigid wall, but the boundary conditions are different. Results concerning the velocity and temperature fields based on a numerical integration of these equations are given. Also presented are approximate formulas for heat transfer, displacement thickness, momentum thickness, boundary layer thickness, and temperature layer thickness.

EXPLORATORY STUDIES OF A LOW GAMMA, HIGH MACH NUMBER WIND TUNNEL USING FREON 14 AS THE WORKING FLUID, by A. R. George. Dec. 1961, 33p. incl. refs. (Rept. no. 591) (AFOSR-1876) (AF 49(638)465) AD 272140 Unclassified

The design of a low gamma, high Mach number wind tunnel was studied as a possible facility in which to obtain knowledge of gamma effects on hypersonic flow fields. The impetus for this study stems from an interest in low gamma effects for the extrapolation of helium wind tunnel data and because of the fundamental gamma influences in hypersonic flow theory. The inherent problems in designing such a wind tunnel were investigated and a particular practical design outline presented for a system using heated Freon 14. It would operate with gamma near 1.1, maximum Mach numbers from 7 to 9, at low Reynolds numbers, and with mean free paths from 0.002 to 1.2 in. at the design point. The feasibility of the unorthodox design features has been demonstrated in exploratory experiments but substantial engineering development is still required. (Contractor's abstract)

A GRAPHITE RESISTANCE HEATER FOR A HYPERSONIC WIND TUNNEL USING NITROGEN. I. DESCRIPTION OF TUNNEL AND HEATER, by R. P. Shreeve, W. T. Lord, and others. [June 1961] [13]p. incl. diagrs. table, refs. (AFOSR-1028a) (AF 49-(638)709) Unclassified

Also published in Internat'l. Jour. Heat and Mass Transfer, v. 5: 1081-1093, Nov. 1962.

A heater system has been developed for a hypersonic wind tunnel which uses nitrogen as the test gas, and operates continuously at Mach numbers up to 20. The system uses a small electrically heated graphite element containing a spiral gas passage. The tunnel is designed to operate ultimately at a gas stagnation pressure of 10,000 lbf/in^2, although the work described here refers to operation up to 1,000 lbf/in^2. The stagnation temperature required to avoid condensation of the nitrogen in the test section at a Mach number of 20 is about 5000°R. The major problem encountered in achieving such a temperature are given.

A GRAPHITE RESISTANCE HEATER FOR A HYPERSONIC WIND TUNNEL USING NITROGEN. II. ANALYSIS OF HEATER PERFORMANCE, by W. T. Lord, R. P. Shreeve, and S. J. Boersen. [June 1961] [10]p. incl. diagrs. (AFOSR-1028b) (AF 49-(638)709) Unclassified

Also published in Internat'l. Jour. Heat and Mass Transfer, v. 5: 1095-1104, Nov. 1962.

A formula is derived for the rise in total temperature of nitrogen flowing through an electric resistance element made of graphite. The derivation of the formula involves the consideration of an idealized heating system based on a simple graphite tube and the assumption that the solution of the internal heat transfer problem possesses certain properties. The formula provides a useful basis for the analysis of experimental results from practical heating systems which resemble the idealized system. Such a practical system is exemplified by the graphite heater in the pilot hypersonic nitrogen tunnel at Princeton University (as described in Part I), and the results obtained with this heater are shown to be well represented by the formula. COMBUSTION INSTABILITY IN LIQUID PROPELLANT ROCKET MOTORS (Abstract), by L. Crocco and D. T. Harrje. [1961] [2]p. [AF 49(638)938] Unclassified

Presented at Fourteenth AFOSR Contractors' meeting on Liquid Rocket Combustion Research, Princeton U., N. J., Sept. 25-26, 1961. (AFOSR-1768; AD 267915)

Two research programs in combustion instability in liquid propellant rocket motors are currently being carried out at Princeton. One, the linear program deals with spontaneously originating instability. Theoretical and experimental influences on the unstable operation of various liquid rocket motors are presented. The importance of barriers to the velocity effects are explained and future study of velocity effects outlined. Correlations between the tangential and longitudinally determined pressure-sensitive combustion parameters are discussed together with experimental and theoretical data. The second combustion instability research concerns nonlinear phenomena – in this case instability requires energy addition for initiation. Since such energy input is an important part of the problem, one phase of the research is the study of what a shock pulse fired into a rocket chamber actually produces within the chamber. High frequency response crystal gages and a velocity probe are being used in the measurement of pressure and velocity. Even with a tangentially oriented pulse the shock wave is shown to travel across the chamber while smaller amplitude periodic velocity and pressure disturbances travel in the tangential direction.

COMBUSTION PHENOMENA IN ROCKET MOTORS (Abstract), by M. Webb, I. Glassman, and L. Crocco. [1961] [2]p. [AF 49(638)938] Unclassified

Presented at Fourteenth AFOSR Contractors' meeting on Liquid Rocket Combustion Research, Princeton U., N. J., Sept. 25-26, 1961. (AFOSR-1768; AD 267915)

Using the optical light scattering technique developed for measuring the Sauter mean diameter of a polydispersion of liquid droplets, characteristics of a swirl atomizer have been studied. With water as the working fluid the effects of atomizer pressure drop, ambient gas density and viscosity on cold sprays were investigated. The complex surfaces of Sauter mean diameter for the above parameters have been mapped. It was found that for a fixed atomizer pressure drop a maximum droplet diameter occurs at about the same kinematic viscosity for each gas. In the application of the same optical technique for the measurement of droplet size and concentration in a high temperature – high pressure flow reactor disturbances of the collimated optical beam by turbulence occurs. A theoretical investigation of the stability boundaries for high frequency longitudinal oscillations in a premixed gas rocket motor has been carried out. By applying appropriate boundary conditions a so-called characteristic equation was deduced. Solutions have been carried out for a relatively simple case of moderate oscillations in a chamber with a short nozzle. These solutions show that the frequencies of oscillation are always close to the natural frequencies of the chamber; that for each value of propellant mixture ratio a minimum value of chamber length exists below which no unstable combustion can take place and beyond which the rocket is always unstable; and that this minimum does not exist and hence combustion never becomes unstable in a range of mixture ratio values extending around stoichiometric. These results are in good qualitative agreement with experimental data recently obtained. Unstable regions were mapped for thick plate injectors which have 10 separate orifices. In 1 injector these orifices were located evenly across the injector face and in the other they were all located in one-half of the face. The instability regions for these 2 configurations were found to be practically identical. A third injector employing 5 orifices with a total area equivalent to the 10 and evenly distributed also gave regions of unstability essentially the same as the others. One could conclude from these results that the recirculation characteristics of the injector do not appear to affect instability in gas rocket motors.

EXPERIMENTAL INVESTIGATION OF THE IGNITION PROCESS OF SOLID PROPELLANTS IN A PRACTICAL MOTOR CONFIGURATION, by R. W. Lancaster. May 3, 1961 [48]p. incl. illus. diagrs. tables, refs. (Rept. no. 548) (AFOSR-836) (AF 49(638)960) AD 259409 Unclassified

A study of the ignition process of a composite solid propellant (80 wt-% NH_4ClO_4 plus 20 wt-% P-13 resin and additives) was made in a combustion chamber whose configuration resembled that of a practical solid propellant motor. A small gas rocket chamber generated high temperature gaseous products, which in turn supplied the ignition energy to the internal surface of a cylindrical thin-web, case-bonded solid propellant grain. The ignition delay, the time between ignition of the gas igniter and the first ignition of the solid propellant grain, was measured as a function of the temperature, pressure, the chemical reactivity of the hot gases, and the velocity of these gases over the solid propellant surface. The ignition times were measured by means of a strain-gage pressure transducer inserted in the solid propellant motor chamber. For the composite solid propellant, values for the ignition delay time ranged from 4.5 to 40 msec, depending upon the mass velocity of the ignition gas in the solid propellant cavity. For constant igniter gas composition, the data fitted an empirical relationship where the result, derivable from transient heating theory, suggests that for constant igniter composition the ignition delay is simply the time required for the attainment of a particular surface temperature at which the incipient reaction runs away. An examination of the linear pyrolysis rates for P-13

resin and ammonium perchlorate also suggests that the attainment of a particular surface temperature is necessary to obtain a combustible mixture of solid propellant vapors adjacent to the propellant surface. (Contractor's abstract)

RESEARCH ON SOLID PROPELLANT IGNITABILITY AND IGNITER CHARACTERISTICS, by R. W. Lancaster and K. P. Hall. Second and third quarterly progress repts. Feb. 1 - July 31, 1961. Nov. 1, 1961 [7]p. incl. diagrs. (Rept. no. 538-b and -c) (AF 49-(638)960) Unclassified

During the last few years a continuing program of solid propellant ignition research has been carried on at Princeton U. Experimentally, a laboratory shock tube technique has been employed to produce controllable ignition of solid propellant test specimens. A gas phase ignition theory has been developed which quantitatively correlates the data of these experiments. The research described in this report deals with the controlled ignition of thermal-burning solid propellant grains in a practical motor configuration. The objective is to examine the applicability of the gas phase ignition concept to the practical problem of initiating burning in a solid rocket engine. At the present stage of the subject research the ignition stimulus is supplied by hot gas convectively heating the surface of the propellant in which mixtures of methane, oxygen, and nitrogen are burned, to yield hot combustion product gases whose chemical reactivity, temperature, and mass flow rate are readily controlled. The configuration of the apparatus and data obtained for 1 composite propellant (80% ammonium perchlorate - 20% polyester-styrene resin) under a limited range of exposure conditions have been presented. The chemical reactivity and temperature parameters of the hot igniting gases were held constant while the mass velocity of the hot gases was varied.

AN EXPERIMENTAL INVESTIGATION OF LONGITUDINAL COMBUSTION INSTABILITY IN A ROCKET MOTOR USING PREMIXED GASEOUS PROPELLANTS, by R. Reiss, L. Glassman, and M. Webb. Dec. 1961, 27p. incl. diagrs. refs. (Rept. no. 589) (AFOSR-1968) (AF AFOSR-62-90) AD 270113 Unclassified

Longitudinal combustion instability in a premixed gaseous propellant rocket motor was studied. The chamber length was varied continuously between 3 and 48 in. A porous media injection plate was used to approximate uniform 1-dimensional propellant injection. A showerhead injector was used to determine the influence of combustion zone recirculation on combustion instability. Two propellant combinations were used, methane - (40% O + 60% N) and H - air. Results, in the form of instability maps, are presented for combination of the propellants and injection schemes. The 2 existing gas rocket instability driving mechanisms are presented and discussed. The influence of chemical kinetics on the instability seems to be unimportant and the driving mechanism is an oscillating heat transfer to the injector couples with a pressure oscillation in the combustion chamber to produce unstable combustion. ON TEMPORAL ORGANIZATION IN LIVING SYSTEMS, by C. S. Pittendrigh. [1961] [33]p. incl. illus. diagrs. refs. (AFOSR-2380) [AF 49(638)587] Unclassified

Also published in Harvey Lectures, Series no. 56: 93-125, 1961.

The vast majority of biological periodicity is not forced in any simple sense by the cycle of physical conditions to which it is adaptively oriented. It depends on an elaborate oscillatory organization in the living system that has been wrought by selection to accomplish a far more diversified adjustment to the external oscillation in conditions than can be achieved by the direct forcing of metabolic change. Discussion

of this oscillatory organization is limited to the daily case where the facts are most fully know. It is well established that innate tidal and lunar oscillations are also present in many organisms and the daily oscillations of organisms are possibly involved in recognizing the phase of the annual cycle.

A STUDY OF THREE MODELS FOR THE INTERPRETATION OF INTENSITIES OF VIBRATIONAL BANDS OF DIATOMIC MOLECULES, by D. Garvin. [1961] 23p. incl. illus. tables, refs. (AFOSR-1267) (AF 18(603)134) AD 261205 Unclassified

Transition probabilities for the rotating Morse oscillator have been calculated for dipole functions expressed as power series and as analytical expressions having the expected behavior with internuclear distance, using previously developed methods. Comparison with experimental data suggests that mu prime (reduced mass) for HCl is decreasing at the equilibrium internuclear distance. The general treatment used for the rotational perturbation of the vibrational transition probability is shown to reproduce the experimental data poorly. It is suggested that a recent approximation of this theory is unsatisfactory. (Contractor's abstract)

LIMITS AND SPECTRAL SEQUENCES, by S. Eilenberg and J. C. Moore. [1961] [23]p. incl. diagrs. (AFOSR-64-1602) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)431, National Science Foundation and Office of Naval Research) AD 446530 Unclassified

Also published in Topology, v. 1: 1-23, Jan.-Mar. 1962.

The authors tackle the thorny question that the spectral sequence E(A) of a filtered complex A does not cast much light on the homology group H(A), unless for example the filtration is finite in each degree. If the filtration is infinite, things can go wrong in the limit, and it is possible to have for instance $\lim E^r(A) = 0$ but $H(A) \neq 0$. Working in an arbitrary abelian category (in which the countable product of epimorphisms is epimorphic, and the countable sum of monomorphisms monomorphic), the authors introduce the notion of a complete filtration. With each filtered complex is associated a completion having the same spectral sequence. For complete filtrations the relations between the spectral sequence and homology group are much closer, and the main result is that if $f: A \to B$ is a (filtration-preserving) map between complete filtered complexes, and if f induces an isomorphism $E^r(A) \to E^r(B)$ for some $r > 1$, then $H(f): H(A) \to H(B)$ is an isomorphism. Thus in a sense E(A) determines H(A). The authors promise useful and natural examples in a subsequent paper. (Math. Rev. abstract)

SUBORDINATION OF NON-GAUSSIAN STOCHASTIC PROCESSES, by S. Bochner. [1961] [3]p. (AFOSR-J325) [AF 49(638)578] Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 48: 19-22, Jan. 1962.

Let $\{X_t\}$ and $\{Y_t\}$ be infinitely divisible stochastic processes for which $E\{\exp(i\alpha X_t)\} = \exp(-t\Psi(\alpha))$ and $E\{\exp(i\alpha Y_t)\} = \exp(-t\Phi(\alpha))$. The process $\{Y_t\}$ is said to be subordinate to the process $\{X_t\}$ if and only if there is $\Phi(\alpha) = c\Psi(\alpha) + \int_{+0}^{\infty}(1 - e^{-t\Psi(\alpha)})d\rho(t)$, where $c \geq 0$, $d\rho(t) \geq 0$, $\int_{+0}^{1} t\,d\rho(t) + \int_{1}^{\infty} d\rho(t) < \infty$. It is proved that (1) if $\{Y_t\}$ has no Poisson part, then $\{Y_t\}$ cannot be subordinate to any other process $\{X_t\}$ but itself, i.e., $\Phi(\alpha) = c\bar{\Psi}(\alpha)$, and (2) if the Poisson part of $\{Y_t\}$ has compact support and if the process $\{Y_t\}$ is subordinate to some process $\{X_t\}$ other than itself, then the Gaussian part of $\{Y_t\}$ is 0, and $\{X_t\}$ is a pure Bernoulli process.

UNIFORM CONVERGENCE OF MONOTONE SEQUENCES OF FUNCTIONS, by S. Bochner. [1961] [4]p. [AF 49(638)578] Unclassified

Published in Proc. Nat'l. Acad. Sci., v. 47: 582-585, Apr. 1961.

Let T be a set, S a subset of T endowed with a topology under which it is sequently compact; let further A be a group of permutations of T such that for each $y \in T$, there exists $x \in S$ satisfying $y = \sigma x$ for some $\sigma \in A$. A real function f on T is called almost automorphic if every sequence $\{\alpha_n\}$ in A contains a subsequence $\{\beta_n\}$ with these properties: (i) $\{f\circ\beta_n\}$ is convergent, and if f_β is the limit function, then $\{f_\beta\circ\beta_k^{-1}\}$ converges to f; (ii) the sequence $\{f\circ\beta_k\}$ is uniformly bounded on S, and (iii) is sequentially-continuously convergent on S. Theorem: If $\{f_n\}$ is a decreasing sequence, bounded below, of almost automorphic functions and if for every sequence $\{\beta_k\}$ in A satisfying (i)-(iii) for all f_n simultaneously, the limit $F_\beta = \lim_{n=\infty} f_{n,\beta}$ is almost automorphic, then $\{f_n\}$ converges uniformly on T. This merges a theorem of U. Dini (A = {e}, S = T) with a theorem of L. Amerio concerning almost periodic functions and corresponding to the case when S contains a single point and A is transitive on T.

SUSPENSIONS AND CHARACTERISTIC MAPS FOR SYMMETRIC SPACES, by B. Harris. [1961] [11]p. incl. refs. (AF 49(638)919) Unclassified

Published in Ann. Math., v. 76: 295-305, Nov. 1962.

The theorem given in a previous paper (see item no. 2242, Vol. IV) is generalized as follows: Let G be a compact, connected, simply-connected Lie group with an involutory automorphism σ, K the identity component of the fixed point set of σ. Thus, the first main theorem is stated that relates the homotopy groups of G, K, and G/K and, in particular, gives a split exact sequence relating these groups which is analogous to a known split exact sequence for the corresponding Lie algebras. For the second theorem it is also necessary to have a Lie group L which contains G and in which σ is inner. Then under certain conditions there is a split exact sequence relating the homotopy groups of L/K, L/G, and G/K.

DUALITY IN NOETHERIAN RINGS, by J. P. Jans. [1961] [14]p. (AFOSR-392) (In cooperation with Washington U., Seattle) (AF 49(638)921) AD 261318 Unclassified

Also published in Proc. Amer. Math. Soc., v. 12: 829-835, Oct. 1961.

A series of corollaries of the 'shifting theorem' of H. Bass (Trans. Amer. Math. Soc., v. 95: 466-488, 1960) are given. Let A be a finitely generated module over a left and right Noetherian ring R. The dual of A is $A^* = \mathrm{Hom}_R(A, R)$, and σ_A: $A \to A^{**}$ is the natural homomorphism. Following the terminology of Bass, A is said to be torsionless if σ_A is a monomorphism, reflexive if σ_A is an isomorphism. Then if A is a torsionless module, there exists B, torsionless of the opposite band from A, such that $\mathrm{Coker}\,\sigma_A = \mathrm{Ext}^1(B, R)$ and $\mathrm{Coker}\,\sigma_B = \mathrm{Ext}^1(A, R)$. The following are equivalent: (1) $A = A^{**}$ for every torsionless left module A; (2) the right injective dimension of R is ≤ 1. Those rings for which the dual of every left module, is reflexive may be characterized as those rings R such that $[\mathrm{Ext}^2(C, R)]^* = 0$ for all right modules C. If $\dim A = n$ for $1 \leq n \leq \infty$, then $[\mathrm{Ext}^n(A, R)]^* = 0$. Finally, if $A^* = 0$, then there exists B, of dimension ≤ 1, such that $A = \mathrm{Ext}^1(B, R)$.

MILITARY TRAINING AND PRINCIPLES OF

LEARNING, by R. M. Gagné. [1961] 25p. incl. refs. (AFOSR-1805) (AF 49(638)975) AD 445001 Unclassified

Presented at Sixty-ninth annual Convention of the Amer. Psychological Association, New York, N. Y., Sept. 5, 1961.

This presentation stresses the importance of such learning techniques as task analysis, component task achievement, intra-task transfer, and sequencing of subtask learning as ideas of great usefulness in the design of effective training. The author feels that these techniques are more useful than the well-known learning principles like reinforcement, distribution of practice, and response familiarity. The problem is simply how can what one knows about learning as an event, or a process, be put to use in designing training so that it will be maximally effective. The answer to this question is, in the author's opinion, by the use of techniques described.

IONIC COPOLYMERIZATION OF SUBSTITUTED STYRENES, by A. V. Tobolsky and R. J. Boudreau. Apr. 4, 1961 [11]p. incl. diagrs. tables, refs. (AFOSR-486) (AF 49(638)974) AD 254273 Unclassified

Also published in Jour. Polymer Sci., Suppl., v. 51: S53-S56, 1961.

An effort to determine the effect of monomer structure, solvent, and initiator composition in ionic copolymerization is made by investigating the monomer pairs: styrene-α-methylstyrene, styrene-p-methylstyrene, styrene-p-methoxystyrene, and p-methylstyrene-p-methoxystyrene. Several Lewis acids and bases were used as initiators in various solvents. The joshi method was used to calculate reactivity ratios and their standard deviations. It is shown that the composition of the copolymers is dependent on the solvent and counter ion for the monomer studied. The data, presented in table form, reveal that $r_1 r_2 = \pm 1$. When this occurs, the two possible ion-pairs do not have identical reactivities. It is also found that the electrophilic substituent constants, σ^+, of Brown (Jour. Amer. Chem. Soc., v. 74: 4848, 1952) are superior to Hammett σ values in correlating reactivity ratios in ionic copolymerizations; and the reaction constant is positive for anionic, nucleophilic copolymerizations.

STUDIES IN IONIC COPOLYMERIZATION, by A. V. Tobolsky and R. J. Boudreau. Apr. 11, 1961, 103p. incl. diagrs. tables, refs. (AFOSR-487) (AF 49-(638)974) AD 254168; AD 609697 Unclassified

The copolymerization of styrene—isoprene with Lewis bases and isobutyl-p-chorostyrene with Lewis acids shows a dependence of copolymer composition on solvents and counterions. The work reported in this thesis was designed to shed light on two questions: (1) Is the effect of solvent and catalyst of general significance in ionic copolymerization. (2) Are ionic copolymerizations generally ideal. Copolymerizations were performed with styrene-α-methylstyrene, styrene-p-methylstyrene, styrene-p-methoxystyrene, and p-methylstyrene-p-methoxystyrene. Various Lewis acids and bases were used in several solvents. Reactivity ratios were calculated for all but the styrene-α-methylstyrene copolymers. The results show that copolymer composition is affected by specific solvents and initiators. Furthermore the extent of this effect is a function of the relative reactivities of the propagating ion-pairs. Evidence is presented to show that in many cases the copolymerizations were non-ideal: $r_1 r_2 \neq 1$. Reactivity ratios for the systems studied are interpreted in terms of the Hammett equation. Electrophilic substituent constants, σ^+, were superior in all cases to Hammett σ values in correlating monomer reactivity with structure. The value of the Alfrey-Price Q and e parameters in ionic copolymerization is examined. The relationship between monomer dipole moments and the electrostatic parameter, σ, is also discussed. It was found that all of these treatments are inadequate to describe ionic copolymerization since they all ignore the effect of solvent and counterion on the charge distribution in the ion-pair. The effect of solvent and counterion on the reactivity of ion-pairs is shown for ionic reactions generally, ionic copolymerization, and ionic diene polymerization. For ionic copolymerization, some generalizations are advanced concerning the effect of substituents, solvents and counterions on the reactivity of ion-pairs and the effect of reactivity on the ideality of copolymerization. In conclusion, the possibility of calculating the charge distribution in the reactive ion-pairs is examined. (Contractor's abstract)

RADICAL-ANION POLYMERIZATION, by A. V. Tobolsky and D. B. Hartley. [1961] [8]p. incl. diagrs. table, refs. (AFOSR-1784) [AF 49(638)974] AD 400858 Unclassified

Also published in Jour. Polymer Sci., Part A, v. 1: 15-22, Jan. 1963.

Two cases of initiation of vinyl polymerization by radical-ions are considered. In the 1 case the transfer from radical-ion to monomer is instantaneous and virtually complete. Here the relative amount of free radical propagation as compared to anionic propagation is negligibly small. In the second case a continuous feed of radical-ion initiator is considered. Here the relative amount of free radical propagation as compared to anionic propagation may be considerable. Exact expressions are developed for this relative radical versus ionic propagation as a function of conversion. It is suggested that the results of

lithium-initiated copolymerization of methyl methacrylate and styrene may be understood in terms of a model similar to the second case of radical-ion initiation considered in this paper. (Contractor's abstract)

SOME ANALYTIC PROPERTIES OF A DECAY AMPLITUDE WITH FINAL STATE INTERACTIONS. I. THE VERTEX DIAGRAMS IN K $\rightarrow 3\pi$ DECAY, by G. Barton and C. Kacser. [1961] [12]p. incl. diagrs. refs. (AFOSR-778) (AF 49(638)304) Unclassified

Also published in Nuovo Cimento, Series X, v. 21: 593-604, Aug. 16, 1961.

The simplest vertex-type diagrams for $K \rightarrow 3\pi$ decay contain an internal double pion line; when the total rest-mass parameter λ of this line is taken as discrete, the amplitude possesses on the physical sheet an anomalous branch point above the normal one, subject to the condition $(M^2-\mu^2)/2 < \lambda^2 < (M-\mu)^2$, with M the kaon and μ the pion mass. On integrating over λ^2 this singularity is eliminated. In order to understand the amplitude fully, it must be temporarily considered as a function of 2 complex variables, in which a double dispersion representation is found to hold. The spectral functions are examined in semiclosed form to exemplify these statements, and to give a perturbation-theory illustration of some of the popular approximations in calculations on this decay. (Contractor's abstract)

SOME PROPERTIES OF THE FIVE - POINT FUNCTION IN PERTURBATION THEORY, by L. F. Cook, Jr. and J. Tarski. [1961] [30]p. incl. diagrs. table, refs. (AFOSR-779) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)304 and Atomic Energy Commission) Unclassified

Also published in Jour. Math. Phys., v. 3: 1-30, Jan.-Feb. 1962.

A preliminary investigation of the 5-point function in its dependence on 2 complex variables is presented. Only single-loop diagrams are examined. The approach involves a determination of the singularity curves and of their regular and singular parts. The geometrical properties of singularity curves are described in detail; in particular, a method for determining the tangency of 2 curves is given. The following general conclusions are drawn: First, real and complex vertex singularities are near the physical regions and, therefore, can produce significant experimental effects. On the other hand, scattering singularities and 5-point poles seem to be further removed from the physical regions. Second, it is not likely that a simple scheme can be found for the description of the analytical properties of the 5-point function. A short discussion of scattering singularities involving unstable masses is also given. (Contractor's abstract)

BEHAVIOR OF SCATTERING AMPLITUDES AT HIGH ENERGIES, BOUND STATES, AND RESONANCES, by R. Blankenbecler and M. L. Goldberger. [1961] [21]p. incl. diagrs. refs. (AFOSR-3215) [AF 49(638)304] AD 413494 Unclassified

Also published in Phys. Rev., v. 126: 766-786, Apr. 15, 1962.

An exact Fourier-Bessel representation of the scattering amplitude is introduced and discussed for potential scattering and field theory. It is shown to contain the Mandelstam representation as a special case. The representation automatically satisfies unitarity exactly in the high-energy limit even in the many-channel situation. The behavior of the scattering amplitude for large momentum transfers is discussed and it is demonstrated that this limit is directly connected with the formation of bound states and resonances. A selection rule governing the ordering of resonances is derived. A variational principle for calculating the asymptotic dependence on momentum transfer in potential scattering is formulated. Some interesting relations between the asymptotic behaviors of π-π, π-N, and N-N are developed, and related to the single-particle poles and low-energy resonances. (Contractor's abstract)

PION PRODUCTION IN THE LOW ENERGY LIMIT, by Y. S. Kim. [1961] [7]p. incl. diagrs. (AFOSR-J803) [AF 49(638)304] AD 413503 Unclassified

Also published in Phys. Rev., v. 125: 1771-1777, Mar. 1962.

The low-energy production reaction $\pi + N \rightarrow \pi + \pi + N$ is discussed in the framework of a simplified kinematics. The discussion is based on the Khuri-Treiman representation for processes with a 3-particle final state. Under the assumption that the pion-pion rescattering term is dominant, branching ratios are derived for various processes. Under the same assumption, a quantitative analysis is given for the effect of the final-state pion-pion interaction on the 3-particle distribution functions. (Contractor's abstract)

REMARKS ON A HILBERT SPACE OF ANALYTIC FUNCTIONS, by V. Bargmann. [1961] [5]p. (AFOSR-J813) (AF 49(638)304) AD 412992 Unclassified

Published in Proc. Nat'l. Acad. Sci., v. 48: 199-204, Feb. 1961.

In an earlier paper (Comm. Pure Appl. Math., v. 14: 187-214, 1961), it is shown that complex analytic functions f(z) on an n-dimensional complex analytic space ($z \in C_n$) subject to the condition $(f,f) \equiv \int_{C_n} |f(z)|^2 d\mu_n(z) < \infty$, with $d\mu_n(z) = \pi^{-n} \exp(-\sum_{k=1}^{n} |z_k|^2) \prod_{k=1}^{n} dx_k dy_k$ ($z_k = x_k + iy_k$) form a separable Hilbert space $\mathfrak{H}_n$. The properties of $\mathfrak{H}_\infty$ which is defined as the closed linear sum of the spaces $\mathfrak{H}_n$ are studied. The space $\mathfrak{H}_\infty$ can be characterized by analytic functions on an infinite-dimensional Euclidean space C_∞ subject to a norm condition which is the obvious generalization of the condition for the finite case. In this space there is a natural realization of creation and annihilation operators in the form of differential and multiplication operation. The connection of this realization with usual Fock-space representation of these operators is worked out in detail.

THE UNREASONABLE EFFECTIVENESS OF MATHEMATICS IN THE NATURAL SCIENCES, by E. P. Wigner. [1959] [14]p. (AFOSR-J820) [AF 49(638)-304] Unclassified

Also published in Commun. Pure and Appl. Math., v. 13: 1-14, Feb. 1960.

The usefulness of mathematics as a tool for the

formation of the laws of physics is emphasized. Its application in physical theories is discussed even though it may be poorly understood. The laws of nature must be already formulated in the language of mathematics to be an object for the use of applied mathematics. The axioms of quantum mechanics as formulated by the great mathematician von Neumann, or, implicitly, by the great physicist, Dirac, are 2 basic concepts in quantum mechanics, states and observables. The states are vectors in Hilbert space, the observables self-adjoint operators on these vectors. Physics chooses certain mathematical concepts for the formulation of the laws of nature, frequently developed independently by the physicist only to find that these concepts have been part of the language of mathematics for years. The role of mathematics in physics will surely increase as the applicability of concepts becomes more apparent, such as the use of analytic functions in the formulation of quantum theory.

ON THE SPECTRAL FUNCTION OF SOME [FEYNMAN] DIAGRAMS IN K → 3π DECAY (Abstract), by C. Kacser and G. Barton. [1961] [1]p. [AF 49(638)304] Unclassified

Presented at meeting of the Amer. Phys. Soc. Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 256, Apr. 24, 1961.

In perturbation theory the discontinuities across the branch cuts arising from the first few diagrams are examined in an attempt to disentangle effects depending on the K mass from those of the ππ interaction. For instance, in the vertex-type diagrams, when the mass parameter λ of the internal double pion line lies in the range $M^2 - \mu^2 < 2\lambda^2 < 2(M - \mu)^2$, an additional, anomalous, branch point appears above the normal threshold. This happens only when the K is unstable. On integrating over λ this anomalous branch point moves down to the normal threshold at $s = 4\mu^2$, but may nevertheless affect the discontinuity across the cut.

SINGULARITIES OF SCATTERING AMPLITUDES ON UNPHYSICAL SHEETS AND THEIR INTERPRETATION, by R. Blankenbecler, M. L. Goldberger and others. [1961] [8]p. incl. diagrs. [AF 49(638)304] Unclassified

Published in Phys. Rev., v. 123: 692-699, July 15, 1961.

The analytic structure of 2-particle scattering amplitudes on the unphysical sheet of the Riemann surface reached by crossing the 2-particle cut is discussed. The singularities of the amplitudes there are shown to be poles and their physical interpretation is studied. The way in which bound states appear on the physical sheet in the Mandelstam representation, both as isolated poles and as cuts, is traced in detail. The properties of partial wave amplitudes and of the full amplitudes as a function of energy and angle and of energy and momentum are discussed. Finally, a few remarks are made in connection with unstable states. (Contractor's abstract)

BOUND-STATE MODEL OF WEAK AND STRONG INTERACTIONS, by C. H. Albright, R. Blankenbecler, and M. L. Goldberger. [1961] [11]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)304] and Atomic Energy Commission) Unclassified

Published in Phys. Rev., v. 124: 624-638, Oct. 15, 1961.

The pion-nucleon coupling constant is calculated from first principles by use of the N/D matrix method. Three models are introduced which contain pions, nucleons, and weakly interacting intermediate bosons of the scalar, pseudoscalar, and vector variety. The basic interactions are taken to be parity and isotopic spin conserving. Certain physical assumptions in the nature of boundary conditions and the known fact that the weak coupling is very weak, together with the Born approximation for N are used to obtain an eigenvalue equation which expresses the pion-nucleon coupling constant in terms of the 3 masses in the problem. The correct value for g_π^2 can be obtained for an intermediate vector meson of mass comparable to the nucleon mass with essentially no cutoff employed; on the other hand, the experimental value is also obtained with a spin-zero boson and a relatively small cutoff energy. ANALYTICITY PROPERTIES OF THE MOMENTUM-SPACE VERTEX FUNCTION, by W. S. Brown. [1961] [15]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)-304] and National Science Foundation) Unclassified

Published in Jour. Math. Phys., v. 3: 221-235, Mar.-Apr. 1962.

The problem of finding the maximal domain of analyticity of the momentum-space vertex function implied solely by Lorentz covariance, local commutativity, and mass spectrum with thresholds not all zero, is restated as a holomorphy envelope problem. If only 1 of the threshold masses is nonzero, the problem can be divided into 2 simpler problems. The triangle diagram suggests the holomorphy envelope of 1 but

only gives an upper bound on the holomorphy envelope of the other. It is shown that the boundary of the latter most probably consists of the 3 cuts and a single quasi-analytic hypersurface with certain specified properties. If 2 of the threshold masses are equal and the third vanishes, an appealing conjecture suggested by the triangle diagram is shown to contradict a generalization of Jost's example. In the general case some upper and lower bounds are obtained. The Källén-Toll representation and conjecture are discussed. The relation of the first 3 terms in the representation of the position-space vertex function to the Mercedes diagram in perturbation theory is displayed, and it is shown that there is no analogous relation of the fourth term. In the single threshold case this fourth term must account for the singularities of the momentum-space vertex, function of the quasi-analytic hypersurface which bounds the holomorphy envelope. The motivation for studying the analyticity of vertex diagrams is discussed, and the simplest totally symmetric ones are investigated. (Contractor's abstract)

ANALYTIC PROPERTIES OF PRODUCTS OF FIELD OPERATORS, by R. F. Streater. [1961] [6]p. incl. diagr. refs. [AF 49(638)304] Unclassified

Published in Jour. Math. Phys., v. 3: 256-261, Mar.-Apr. 1962.

It is shown that any function of n-1 four-vectors which is analytic in the forward tube, the backward tube, and some neighborhood of the Jost points has a 1-valued continuation into the extended tube. The theorem is applied to products of field operators between arbitrary states. It is shown that each matrix element of the product is analytic in the envelope of holomorphy of the union of the permuted extended tubes (the domain of analyticity of the most general causal vacuum expectation value). Thus the product of field operators may be regarded as having analytic properties. (Contractor's abstract)

FIXED AZIMUTH SWEEP FREQUENCY BACKSCATTER OBSERVATIONS FROM 27 TO 54 MC/S, by B. Dueño. 1961 [33]p. incl. illus. diagrs. (Research rept. no. 4) (AFOSR-1573) (AF 49(638)172) AD 266015 Unclassified

As a result of a fixed azimuth sweep frequency, backscatter observations from 27 to 54 mc/s performed from December 1960 to June 1961, it was found that transequatorial echoes are of 2 types: (1) simple 2 hop propagation supported by high density concentrations at geographic latitudes 5° north and 35° south and (2) propagation of low angle rays supported by the decreasing ionization gradient on the far side of the 5° latitude concentration and the increasing gradient side of the 35° latitude concentration. Also, echoes at F-2 layer heights whose range is independent of frequency were observed frequently in the south direction looking from Puerto Rico. These echoes are explained in terms of high density irregularities imbedded in the F-2 layer having durations from a few min to a few hours. These irregularities are more frequent on the lower edge of the layer. (Contractor's abstract)

ON THE SPECTRA OF UNITARY HALF-SCATTERING OPERATORS, by C. R. Putnam. [1961] [4]p. incl. refs. (AFOSR-930) (AF 18(603)139) Unclassified

Also published in Quart. Appl. Math., v. 20: 85-88, Apr. 1962.

The following theorem is proved: Let H_0 and H_1 denote the free and perturbed Hamiltonian 1-dimensional wave mechanical operators $H_0 = -d^2/dx^2$, $H_1 = H_0 + V(x)$ on the Hilbert space $L^2(-\infty, \infty)$, and suppose that $V(x)$ is continuous on $-\infty < x < \infty$, satisfies $0 \leq V(x) \leq$ const. on $-\infty < x < \infty$, and that $\int_{-\infty}^{\infty} V(x)dx < \infty$. Then H_0 and H_1 are absolutely continuous and the strong limits U_+ and U_- of $U_t = \exp(itH_1)\exp(-itH_0)$ exist as unitary operators which satisfy $H_1 = U_+H_0U_+^*$ and $H_1 = U_-H_0U_-^*$. If, in addition $\liminf_{b-a\to\infty} (b-a)^{-3} \int_a^b xV(x)dx = 0$, then the spectrum of each operator U_+ and U_- is the entire unit circle $|z| = 1$.

ABSOLUTE CONTINUITY OF CERTAIN UNITARY AND

HALF-SCATTERING OPERATORS, by C. R. Putnam. [1961] [3]p. [AF 18(603)139] Unclassified

Published in Proc. Amer. Math. Soc., v. 13: 844-846, Dec. 1962.

The study of spectrum of unitary operators which effect a unitary equivalence between given pairs of self-adjoint operators acting on a Hilbert space (see item no. 1785, Vol. III; item no. 2279, Vol. IV; and item no. 2437, Vol. V) is continued. It is now shown that if A and D are self-adjoint, with A semi-bounded and D bounded and [domain A ∩ range $D^{\frac{1}{2}}$] dense in H, and if A + D = UAU* with U unitary, then U has a spectral measure which is absolutely continuous to Lebesgue measure on the unit circle. Applications of this result to the wave operators (half-scattering operators) of potential scattering theory are briefly discussed.

THE HEATS OF COMBUSTION OF ReS_2 AND Re_2S_7 AND THE THERMODYNAMIC FUNCTIONS FOR TRANSITION METAL SULFIDES, by J. E. McDonald and J. W. Cobble. [1961] [4]p. incl. tables, refs. (AFOSR-3751) (AF 18(600)1525) Unclassified

Also published in Jour. Phys. Chem., v. 66: 791-794, May 1962.

The heats of combustion of ReS_2 and Re_2S_7 have been measured by bomb calorimetry. The heat and free energy of formation at 25° of ReS_2 are -42.7 ± 1.2 kcal mol^{-1} and -41.5 ± 1.2 kcal mol^{-1}, respectively. The similar quantities for Re_2S_7 are -107.9 ± 1.8 kcal mol^{-1} and 101.0 ± 1.8 kcal mol^{-1}, respectively. With data on these key sulfides, along with recalculated heats of formation from previous vapor pressure measurements, it has been possible to estimate the thermodynamic functions for a number of sulfides not previously available. RARE EARTH OXIDE SYSTEMS. PART I. A COMPARISON OF THE HYSTERESIS EFFECTS IN PRASEODYMIUM OXIDE AND EVERETT'S THEORY OF HYSTERESIS, by P. A. Faeth and A. F. Clifford. Mar. 17, 1961, 13p. incl. refs (AFOSR-549) (AF 18(603)45) AD 255160 Unclassified

Presented at meeting of the Amer. Chem. Soc., New York, Sept. 1960.

Also published in Jour. Phys. Chem., v. 67: 1453-1457, July 1963. (Title varies).

The composition-pressure diagram of the Pr-O system has been studied between 10^{-5} and 150 mm oxygen pressure using a quartz beam microbalance. The isotherms between 400 and 500°C show hysteresis between $PrO_{1.80}$ $PrO_{1.83}$ as the pressure varies. At 465°C a hysteresis loop extends over the entire pressure range. Everett's theory of hysteresis is compared to the Pr-O isotherms at 465°C. The seven theorems proposed by Everett are cited and discussed with reference to the Pr-O data. In general the agreement between the properties of Everett's theoretical model of a domain system is good. The behavior of the praseodymium oxide system is thought to be a result of its being composed of domains of various stable compositions, $PrO_{1.83}$, $PrO_{1.80}$, etc. The domains change compositions as a function of the oxygen pressure. (Contractor's abstract)

RARE EARTH OXIDE SYSTEMS. PART II. THE INFRARED SPECTRA OF PRASEODYMIUM OXIDE AND

PRASEODYMIUM CARBONATE, by P. A. Faeth and A. F. Clifford. Apr. 17, 1961, 17p. incl. diagrs. table, refs. (AFOSR-724) (Also bound with its AFOSR-1897; AD 269098) (AF 18(603)45) AD 258252 Unclassified

Also published in Rare Earth Research; Proc. Second Conf., Glenwood Springs, Colo. (Sept. 24-27, 1961), New York, Gordon and Breach, 1962, p. 35-45.

Several samples of PrO_x have been prepared which have x values between 1.50 and 1.83; by decomposing $PrO_{1.83}$ in vacuo any x value could be prepared. The preparations were analyzed for infrared absorption activity in the region 2-16 microns. An absorption band at about 15 microns appeared for all samples if the specimens were permitted access to the atmosphere. No band appeared in this region if the samples were analyzed immediately after their preparation. Infrared analysis of samples of praseodymium carbonate and praseodymium hydroxide showed absorption activity in the same regions where activity was noted for air-exposed praseodymium oxide samples. It is concluded that the absorption band at 15 microns for the air-exposed oxides is due to hydration-carbonation effects. A sample of praseodymium carbonate was decomposed in vacuo and the spectrum of the resultant compound was observed. A differential thermal analysis of the carbonate in air showed that the dehydration probably is complete below 300°C; the carbonate loses CO_2 at 470°C and 630°C and is subsequently converted to the oxide Pr_6O_{11} near 400°C. (Contractor's abstract)

THE OXIDATION AND STOICHIOMETRY OF PRASEODYMIUM AND CERIUM OXIDES, by A. F. Clifford. Final rept. Aug. 31, 1961 [63]p. incl. diagrs. tables, refs. (AFOSR-1897) (AF 18(603)45) AD 269098 Unclassified

The lack of research in naturally occurring semiconductors (oxides) is noted. The stable intermediates between Pr_2O_3 and Pr_6O_{11} are considered and the isotherms of the Pr-O system investigated at temperatures between 400° and 1000°C. The authors then propose that praseodymium oxide is a system composed of domains. A domain is viewed here as a specific number of Pr atoms which act as a unit. The Pr atoms in the domain are subject to reaction with oxygen under certain conditions. In general, the agreement of the properties of the Pr-O system and Everett's hysteresis theory is good.

A PRASEODYMIUM-OXIDE OXYGEN GENERATOR, by P. A. Faeth and A. F. Clifford. Aug. 31, 1961 [2]p. (Bound with its AFOSR-1897; AD 269098) (AF 18(603)45) Unclassified

Also published in Jour. Chem. Education, v. 40: 150-151, Mar. 1963.

The use of the Pr-O system as a source of research quantities of oxygen and the possibility of the regeneration of the oxide reactant in situ are investigated. The generation of oxygen using praseodymium oxide has several advantages. (1) The starting material may be regenerated by simple and economical means. (2) The initial investment of Pr_6O_{11} is never lost as it is in the case of $KMnO_4$ for example. (3) The actual time spent by the operator to perform the generation is small. (4) The equipment needed for the generation is conveniently found in most laboratories with the exceptions of the silica tube and possibly the Toepler pump. A suggested additional use of the oxide is as a source of oxygen at relatively constant pressure to be used in conjunction with the constant oxygen pressure studies of other systems.

COORDINATION CHAIN REACTIONS, by D. C. Olson and D. W. Margerum. [1961] [2]p. (AFOSR-2739) [AF 49(638)60] AD 441694 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 680-681, Feb. 20, 1962.

The exchange reaction between the complex ions triethylenetetramine-nickel (II), NiT^{+2}, and ethylenediaminetetraacetato-cuprate (II), CuY^{-2}, that is $NiT^{+2} + CuY^{-2} \rightarrow CuT^{+2} + NiY^{-2}$, is found to proceed by a chain reaction mechanism. The reaction is initiated by the trace concentration of free triethylenetetramine ($T_T = H_3T^{+3} + H_2T^{+2} + HT + T$) which is in equilibrium with the complex $NiT^{+2} \rightleftharpoons Ni^{+2} + T_T$. This trace of T_T attacks the CuY^{-2} complex, greatly accelerating the rate of EDTA displacement. The trace of EDTA liberated in turn attacks the NiT^{+2} greatly accelerating the rate of triethylenetetramine displacement. Thus the chain propagating steps are $T_T + CuY^{-2} \rightleftharpoons CuT^{+2} + Y_T$ and $Y_T + NiT^{+2} \rightarrow NiY^{-2} + T_T$. Traces of metal ions which can complex triethylenetetramine or EDTA act as chain inhibitors. The Ni^{+2} may act as a chain terminator by the reactions $Ni^{+2} + T_T \; NiT^{+2}$ and $Ni^{+2} + Y_T \rightarrow NiY^{-2}$. These reaction orders are consistent with the proposed mechanism and the detailed kinetic arguments as well as the evaluation of the individual rate constants published. Furthermore, the chain initiating step and the chain terminating step both may be eliminated from the exchange rate by the addition of excess of either trien and EDTA.

p-Toluenthiol adds to 1-p-tolylsulfonyl-cyclohexene, under mildly basic conditions, in a trans manner giving cis-2-p-tolylmercapto-1-p-tolylsulfonyl-cyclohexane. The stereochemistry of the adduct was confirmed by independent synthesis and supported by n m r spectra. A mechanism for the addition is proposed and evidence presented to support it. Published in Studia Math., v. 20: 347-357, 1961.

Let (Ω, B, μ) be a measure space, $L_{1/r}$ the usual Lebesgue space with respect to μ for $0 < r \leq 1$, and L^0 the collection of measurable step functions. If H is a bounded operator on $L_{1/2}$ and if the restriction, H^0, of H to L^0 is bounded in the operator norm defined by $L_{1/r}$, then H^0 has a continuous extension to $L_{1/r}$ called the refraction of H; its norm is denoted by $|H|_r$. Suppose H is self-adjoint and its resolution of the identity satisfies $\sup_\lambda |E(\lambda)|_r < \infty$ for $0 < r < 1$. Let J be a compact interval of the real line, $W_p(J)$ the Wiener class consisting of functions which satisfy $\sup \sum_{k=1}^{n} |f(t_k) - f(t_{k-1})|^{1/p} < \infty$, where the sup is taken over all partitions of J, and $F_r(J) = \cup\{W_p(J): 2|r-1/2| < p \leq 1\}$. The author's main result states that the limit of the Riemann-Stieltjes sums formed from $f \in F_r$ and $E(\lambda)$ exist in the uniform operator topology of the bounded operators on $L_{1/r}$. The proof is an application of the Riesz-Thorin convexity theorem and a Hölder-type inequality.

DIMENSIONALITY OF CHARGE SPACE, by D. C. Peaslee. [1956] [2]p. (Sponsored jointly by [Air Force Office of Scientific Research under AF 18(600)-1579] and Atomic Energy Commission)
Unclassified

Published in Nuovo Cimento, Series X, v. 4: 1583-1584, Dec. 1, 1956.

Though there is no lack of experimental evidence to indicate that real space-time is a 4-dimensional manifold, there is much less certainty in attributing dimensions to the charge space of heavy particles. Various hypotheses on the subject are reviewed. Experimental evidence on the dimensionality of charge space becomes increasingly tenuous with increasing n. The 4-dimensional scheme cannot readily account for the Ξ, N mass difference but has a number of formal attractions and is accessible to further experimental study. The possibility of some 5-dimensional charge symmetry is not yet ruled out, but would require the Λ and N to have identical spins and parities. The 6-dimensional hypothesis would require increased statistics on anomalous V-decays for verification.

ENERGY RELEASE FROM THE DECAY OF FISSION PRODUCTS, by J. F. Perkins and R. W. King. [1957] [21]p. incl. diagrs. tables, refs. [AF 18(600)-1579] Unclassified

Published in Nuclear Sci. and Engineering, v. 3: 726-748, June 1958.

The total disintegration rates, rates of beta- and gamma-energy release, and gamma-ray spectrum, are calculated for fission products due to thermal neutron fission of U^{235}. Information on decay schemes was largely obtained from the compilations of the Nuclear Data Group of the National Research Council of July, 1957. Total fission yields are from Katcoff and from Steinberg and Glendenin Nuclear charge distributions are taken from Pappas' work, which includes the effect of closed shells. Reactor operating times of 1, 10, 100, and 1000 hr are treated, and the results plotted for decay times ranging from 10^2 to 10^8 sec. In addition, results for instantaneous operation are compared to other calculations and measurements. The present results fall below Way and Wigner's predictions of both disintegration rate and total energy release over the entire range of decay times, though they do agree satisfactorily with the Way-Wigner rule-of thumb expressions. The present results are in very good agreement with experimental measurements. The gamma spectrum is found to vary considerably with decay time but to be only a weak function of reactor operating time. The total beta and antineutrino energies per fission are found to be 7.6 ± 0.5 and 10.0 ± 0.7, respectively. (Contractor's abstract)

GENERAL COVARIANCE AND THE PARTICLE SPECTRUM, by D. W. Joseph. [1960] 22p. (AFOSR-TN-60-1239) (AF 18(600)1579) AD 416349 Unclassified

It is postulated that the wave function of a quantum mechanical system be non-trivially covariant under all transformations among some set of coordinate systems appropriate to our curved space-time. It is next shown that this set can probably not be taken to be the curvilinear coordinate systems of general relativity theory. It is then suggested that a "physically distinguishable" set of coordinates be determined. This amounts to embedding space-time in a pseudo-Euclidean space of dimension n. An example is presented of a model with n = 8 to illustrate how the increase in the number of components of spinors and the requirement that the wave functions vanish at any appreciable distance from the space-time manifold can lead to a spectrum of elementary particles, with a possible prediction of their masses. S-WAVE PION-NUCLEON SCATTERING, by J. L. Uretsky. [1960] [6]p. incl. diagr. refs. (AFOSR-879) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)767], Atomic Energy Commission, and National Science Foundation) Unclassified

Also published in Phys. Rev., v. 123: 1459-1464, Aug. 15, 1961.

The Mandelstam relations for pion-nucleon scattering are used to obtain equations for the s-wave partial wave amplitudes in the 2 isotopic spin states. The solutions of these equations are investigated in the approximation where only the 1-nucleon contributions and the unitarity integral are kept. It is found that there are no solutions of the form N/D without complex zeros, and that this is a consequence of the large size of the 1-nucleon terms. A comparison with experiment is made which suggests that the dominant contribution to the T = 3/2 s-wave amplitude (other than the 1-nucleon contribution) comes from a region of the complex energy plane that is outside the physical region for the related processes (π-π into NN and "crossed" π-N scattering). An appendix is devoted to discussing the available experimental data and they are found to be consistent with a scattering length (δ/k at threshold) of 0.098 ± 0.004 in the T = 3/2 state. ON A VARIATIONAL PRINCIPLE FOR A CLASSICAL PLASMA, by S. Gartenhaus. [1961] [9]p. incl. refs. [AF 49(638)767] Unclassified

Published in Phys. Fluids, v. 4: 1122-1130, Sept. 1961.

A time-dependent version of the Hartree-Fock method is set up for a classical system, by making use of the formal similarity between Liouville's equation for such a system and the Schrödinger equation. The use of a product trial function in the resultant variational principle produces, for a plasma, the collisionless Boltzmann equation. A second application is made to a system for which short-range correlations are small but not negligible. It is found that regardless of the range of the interparticle forces and the magnitude of the density, equilibrium is described only by a Maxwellian velocity distribution.

COORDINATE COVARIANCE AND THE PARTICLE SPECTRUM, by D. W. Joseph. [1961] [5]p. incl. refs. (AFOSR-J1253) (AF AFOSR-62-132) AD 424315 Unclassified

Also published in Phys. Rev., v. 126: 319-323, Apr. 1, 1962.

An attempt is made to find an analog, for the quantum mechanics of non-Euclidean space-time, to the classification of representations of the Lorentz group. The difficulty of obtaining any such classification in terms of curvilinear coordinates is pointed out, and the use of a higher-dimensional set of pseudo-Euclidean coordinates is chosen as an alternative mode of attack. A class of representations then follows easily. On the basis of an intuitive approximation it is found that spectra of elementary particles, with conservation of quantities of the nature of isotopic spin, seem to arise from these representations.

LUMINOSITY AND PRESSURE OSCILLATIONS OBSERVED WITH LONGITUDINAL AND TRANSVERSE MODES OF COMBUSTION INSTABILITY, by M. J. Zucrow, J. R. Osborn, and A. C. Pinchak. [1959] [4]p. incl. illus. diagr. (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)-756] and Office of Naval Research under N7onr-39418) Unclassified

Published in ARS Jour., v. 30: 758-761, Aug. 1960.

Combustion pressure oscillations were observed in 2 experimental gaseous bipropellant rocket motors. The geometries of the 2 motors were different so that 1 rocket motor tended to exhibit only the longitudinal mode while the other displayed only transverse modes of oscillations. The local pressure and the luminosity of the combustion gases were simultaneously recorded while the rocket motors were operating with combustion pressure oscillations. The results indicate that the reaction mechanism which sustains the longitudinal mode is similar to the aerothermodynamic interaction which supports the transverse modes of combustion pressure oscillation. In addition, the results are in agreement with and support the shock or pressure wave mechanism of combustion pressure-oscillations as postulated by Zucrow and Osborn.

UNSTABLE BURNING IN LIQUID AND SOLID PROPELLANT ROCKET MOTORS, by M. J. Zucrow and J. R. Osborn. [1961] [13]p. incl. diagrs. tables, refs. [AF 49(638)756] Unclassified

Published in Proc. Bureau of Naval Weapons, Missiles and Rockets Symposium, Concord, Calif. (Apr. 13-21, 1961), Concord, U. S. Naval Ammunition Depot, 1961, p. 153-165.

The desired solution to the problem of unstable combustion in either liquid or solid propellant rocket engines is one which provides either design criteria or a procedure that can be applied by the rocket engine designer so that a rocket motor can be designed with assurance that unstable combustion will be avoided.

It appears that considerably more research effort, experimental and theoretical, will be required before such an ideal solution will be even approached. A better understanding is still needed of the cause and effect mechanisms, and without such knowledge sound theoretical developments are seriously hampered. (Contractor's abstract)

COMBUSTION INSTABILITY IN GASEOUS BIPROPELLANT ROCKET MOTORS (Abstract), by J. R. Osborn. [1961] [1]p. [AF 49(638)756] Unclassified

Presented at Fourteenth AFOSR Contractors' meeting on Liquid Rocket Combustion Research, Princeton U., N. J., Sept. 25-26, 1961. (AFOSR-1768; AD 267915)

An experimental program is being conducted at Purdue U. for determining the manner in which basic variables influence high-frequency combustion pressure oscillations. The experiments were conducted with gaseous bipropellant rocket motors in which the fuel and oxidizer were thoroughly mixed prior to their injection into the combustion chamber. Additional experiments are being initiated with gaseous bipropellant rocket motors in which the fuel and oxidizer are injected separately into the combustion chamber. One of the basic variables that has been investigated for the premixed gaseous motors is the location of the injection point of the combustible materials. Three locations were investigated: (1) at the head end of the combustion chamber, (2) along the length of the combustion chamber, and (3) at the nozzle end of the combustion chamber. The results indicate that the mode of oscillation is influenced by the location of the injection point. Other experimental results discussed include those obtained from a 3 in. diameter motor having a semi-porous injector. That motor was employed for studying the longitudinal mode.

ANALYSIS OF A PROPOSED SYSTEM FOR CONVERTING ROTARY MOTION INTO UNIDIRECTIONAL MOTION, by J. Rabinow. May 24, 1961 [24]p. incl. illus. diagrs. tables. (AFOSR-938) (AF 49(638)1075) Unclassified

A proposed mechanism is analyzed and presented. The results show that the system does not have any unusual properties, nor does it contradict Newtonian laws of mechanics. The system may have application as an impact machine or vibrator but cannot produce a unidirectional impulse without an equal and opposite impulse. However, the device tested is not an efficient design for an impact or vibration machine. The demonstration device gives the illusion of generating a force without an equal and opposite reaction by making use of the static friction of the load against the floor or other support to absorb the reaction. It cannot perform as claimed in the absence of static friction against an outside reference body. There is no way in which the principle employed in the device can be adapted to provide a space drive. (Contractor's abstract)

SMALL-SIGNAL THEORY OF HIGH IMPEDANCE RF-FORCE PLASMA DEVICES, by H. W. Lorber. [1961] [7]p. incl. diagrs. refs. (AFOSR-1156) (AF 49-(638)658) Unclassified

Also published in Phys. Fluids, v. 5: 1003-1009, Aug. 1962. (Title varies)

Levitation, propulsion, and power-generation devices have been proposed which make use of the dynamic properties of an rf electromagnetic field for exerting a steady force on a plasma. This force, which acts for the most part on the plasma electrons, is due to the time averages of the not-quite sinusoidal electric fields seen by the electrons during their motion through the plasma. The analysis of an rf-force device can be thought of as the simultaneous solution of an electromagnetic-field problem, an rf-force problem, and a fluid-mechanics problem, together with other problems which are beyond the scope of the present discussion. It is shown that in the absence of a magnetostatic field, in the case of small signal and high impedance, the force of the rf field on the plasma can be expressed rather simply, being essentially proportional to the energy density gradient of the rf electric field. An example is presented in which the rf-force expression is applied to a simple plasma propulsion problem involving a plasma and an electrode structure, both of finite extent. The solution is consistent with experimental results. (Contractor's abstract)

PLASMA ACCELERATION BY ELECTRIC FIELD GRADIENT (Abstract), by T. T. Reboul, G. A. Swartz, and G. D. Gordon. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)658) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

Previous work has shown that a plasma can be

accelerated by an rf field gradient. Experimental confirmation was obtained by measuring the transit time of plasma electrons between two probes. In the most recent work, the transit time of the plasma ions was measured. The ion velocity showed a hyperbolic dependence on the maximum rf field amplitude which is consistent with the previous theory. To determine the frequency dependence, measurements were made at 140 mc and 330 mc; the kinetic energy imparted by the rf field was found to be inversely proportional to the applied frequency. A comparison of the experimental data with the theory indicates that the ratio of the plasma frequency to the applied frequency was approximately unity. The collision frequency which limits the acceleration in the test apparatus is approximately 6 mc. A 2.45 kmc rf system has been constructed and future work will involve experiments at this accelerating frequency. Since a plasma of higher density than previously used may be accelerated at this frequency, it is anticipated that the thrust exerted by the rf technique may be measured.

Also published in Proc. Internat'l. Conf. on Machine Translation of Languages and Applied Language Analysis, Teddington (Gt. Brit.) (Sept. 5-8, 1961), London, Her Majesty's Stationery Office, v. 2: 725-735, 1962.

A major advantage of the transformational approach to syntactic structure is that the investigator is no longer bound to the low levels of generality inherent in the morphological detail of actual sentences. Instead, he can regard syntax as a dynamic, addressor-oriented process, the units of which form a hierarchy of functional abstractions. This conception is illustrated by an analysis of Russian constructions containing genitive substantives that must be modified by another unit, although the exact form (adjective or substantive) of this second unit is irrelevant. The transformationally determined varieties of such constructions are cataloged, and it is shown that all such constructions contain either an actual or an implied predication. In sentence-structure determination, values are tentatively defined as numbers assigned to types of syntactic relations in such a way that connections of higher value are established in preference to connections of lower value. For a text in which sentence structures are known the values of some syntactic relations can be estimated by the following plan: assign value 1 to a relation provided no relation is known to have lower value; assign value 2 to a relation provided all relations known to have lower value are also known to have value 1; etc. The same procedure can be used for assigning adjectives to order classes, and for other similar purposes. VORTEX FLOW IN A DISSOCIATING GAS, by K. C. Wang. Sept. 1961 [11]p. incl. diagrs. table. (Rept. no. TR-AE-6108) (AFOSR-1512) (AF 49(638)977) AD 267888 Unclassified

Also published in Jour. Aerospace Sci., v. 29: 623-624, May 1962.

Analysis concerns a simple vortex flow in a compressible, inviscid, dissociating gas. Numerical results for frozen flow and equilibrium flow have been obtained using Lighthill's ideal dissociating gas model. The differences in pressure and density between these two limiting cases are large, however, it is relatively small in temperature. For the nonequilibrium flow case, there does not exist a simple vortex flow of the conventional type. (Contractor's abstract)

THE LOSS OF MECHANICAL ENERGY IN THE FLOW OF A DISSOCIATION GAS, by K. Kusukawa and T. Y. Li. Dec. 1961, 20p. incl. diagrs. (Rept. no. TR-AE-6111) (AFOSR-1967) (AF 49(638)977) AD 274317 Unclassified

The problem of nonequilibrium drag is applied to an arbitrary body in steady adiabatic subsonic dissociating gas flow, viscosity, heat conduction and diffusion being neglected. The basic equations are: thermal and caloric equations of state, chemical relaxation equation, general equation of thermodynamic change, and first law of thermodynamics. These basic equations describe completely the thermodynamic behavior of the moving material element subjected to the effects of dissociation and recombination. (Contractor's abstract)

OXIDE FORMATION ON CdTe AND ZnTe (Abstract), by H. D. Coghill, R. K. DiCerbo and others. [1961] [1]p. [AF 49(638)53] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 312, Apr. 24. 1961.

Irreversible changes in the electrical and optical properties of surfaces of single crystals of CdTe and ZnTe occur on exposure to air. The reaction rate increases with increasing temperature. Electron diffraction measurements have established that these changes are due in part to the formation of TeO_2 surface films. This behavior is consistent with the oxygen-sulfide (e.g., ZnS) reaction in which SO_2 is an initial reaction product. Beneath the transparent surface oxide film the oxygen interaction produces a "diffused impurity" layer which also has optical and electrical properties different from the initial sample. One might anticipate n-type conductivity in a layer containing Te vacancies or oxygen substituted for Te. However, p-type conductivity is observed. TeO_2 formation does not simply fit into previously proposed mechanisms for the interaction of oxygen with CdTe. Alternative mechanisms remain to be established.

PHASE EQUILIBRIA IN THE SYSTEM Cd-Te, by M. R. Lorenz. [1961] [9]p. incl. diagrs. tables. [AF 49-(638)50] Unclassified

Published in Jour. Phys. and Chem. Solids, v. 23: 939-947, July 1962.

The system Cd-Te was studied as a function of composition temperature and component pressure over the entire range. The maximum controlled Cd pressure that may be imposed on solid CdTe is 6.7 atm. Similarly for Te_2 pressure, the limit is about 1.6 atm.

The consequence of such a maximum pressure, which also applies to the liquidus, is discussed. The present results then form a foundation for a basic investigation of the semiconductor properties of CdTe in a thermodynamically better understood system. (Contractor's abstract)

THE OXIDATION OF TETRABORANE, by K. H. Ludlum, S. E. Wiberley, and W. H. Bauer. June 1961, 1v. incl. diagrs. tables, refs. (AFOSR-401) (AF 49(638)897) AD 259093 Unclassified

An investigation of the explosive oxidation of tetraborane and the partial oxidation of tetraborane was undertaken. Mixtures of tetraborane with O, and with O and inert gas were prepared at known pressures and temperatures in the reaction bulbs; these mixtures exploded on heating. The data obtained indicated a branching chain reaction with chain initiation in the gas phase and chain breaking on the wall of the vessel. The entire range of pressures and temperatures investigated shows the behavior generally attributed to the first explosion limit of a branching chain reaction. Lead tetraethyl was found to inhibit the reaction erratically and in some cases prevented explosion. The partial oxidation of tetraborane was brought about by the slow addition of O to tetraborane in the IR gas reaction cell. A reaction occurred which produced diborane, partial oxidation product, H, and boric acid anhydride. Mixtures of tetraborane and diborane to which O was slowly added reacted similarly. Argon had no effect on the system under the conditions studied. (Contractor's abstract)

THE OXIDATION OF SYM-DIETHYLDIBORANE, by E. I. Sandvik. Mar. 1961, 80p. incl. diagrs. tables, refs. (AFOSR-710) (AF 49(638)897) AD 259091 Unclassified

The gas phase oxidation of sym-diethyldiborane has been studied under both explosive and non-explosive conditions. The non-explosive partial oxidation has been studied in the temperature region from 40° to 80°C. The overall reaction observed in the partial oxidation is: $(C_2H_5BH_2)_2 + 2O_2 - 2C_2H_5OBO + 2H_2$. Comparison of the relative rates of sym-diethyldiborane consumption, oxygen consumption and hydrogen formation indicates that 2 intermediate partial oxidation products are present. One of these has a peroxide structure. The rate of disappearance of sym-diethyldiborane in the partial oxidation was found experimentally to be zero order in oxygen and first to three-halves order in sym-diethyldiborane. This rate was found to have a temperature dependence corresponding to an activation energy of 32.5 ± 1.5 kcal/mol. The products of explosions with mixtures of 9 oxygen to 1 sym-diethyldiborane were observed to be CO_2, H_2O and a white solid, presumably B_2O_3. The effect of helium and argon on the explosion pressure clearly indicates that the mechanism causing explosion is primarily thermal. The enthalpy change of the partial oxidation reaction has been estimated, using literature values of bond energies and heats of formation, to be approximately 150 kilocal/mol. The explosive oxidation is believed to be an initial rapid partial oxidation reaction generating enough heat to cause complete combustion. A mechanism is proposed for the partial oxidation. The first three reaction steps of this mechanism can give a rate expression three-halves order in sym-diethyldiborane and zero order in oxygen, in agreement with the experimentally observed orders. KINETICS OF THE OXIDATION OF BORANES AND

BORANE DERIVATIVES (Abstract), by W. H. Bauer, S. E. Wiberley, and R. L. Strong. [1961] [2]p. [AF 49(638)897] Unclassified

Presented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech. Armour Research Foundation, Chicago, Sept. 11-12, 1961. (AFOSR-1417; AD 265513)

The explosive oxidation of tetraborane has been studied in glass bulbs of varying diameter with tetraborane-oxygen mixtures in the ratio of 1 to 5. The effects on the explosion limits of added inert gases as well as lead tetraethyl which has also been investigated shows the behavior generally attributed to the first explosive limit of a branching chain reaction. Upon slow addition of tetraborane to oxygen, a partial oxidation occurs, yielding B_2H_6 and $H_2B_2O_3$, with the latter substance decomposing to B_2O_3 and hydrogen. A general mechanism to explain the explosive and partial oxidation of tetraborane has been prepared. Studies similar to those described for tetraborane have been conducted on sym-diethyldiborane. Sym-diethyldiborane may be oxidized at measurable rates to form ethyl metaborate and hydrogen. With the proper conditions of concentration, temperature, and vessel geometry, the heat generated by this reaction may accelerate the reaction until an explosion results. No autoacceleration of the partial oxidation, as was found in the diborane oxidation, was ever observed. Results indicate that the explosive mechanism is predominantly thermal and not chain branching. However, the oxidation reaction is not completely homogeneous which causes deviations from the simple thermal explosive limit theory of Semenoff. The overall reaction observed in the partial oxidation is: $(C_2H_5BH_2)_2 + 2\ O_2 \rightarrow 2\ C_2H_5OBO + 2H_2$.

SURFACE CATALYZED EXCITATION WITH N AND O ATOMS, by G. G. Mannella, R. R. Reeves, and P. Harteck. [1960] [2]p. (AFOSR-2804) (Sponsored jointly by Air Force Cambridge Research Center; and [Air Force Office of Scientific Research under AF 49(638)928]) Unclassified

Also published in Jour. Chem. Phys., v. 33: 636-637, Aug. 1960.

In a previous publication (Jour. Chem. Phys., v. 32: 946, 1960) the formation of electronically excited species by atom recombination on a cool surface (about 300° K) and subsequent radiation or reaction of the excited species was reported. This surface catalyzed excitation (SCE) was, specifically, observed when N and O atoms were passed over Co, Ni, or prepared Ag at about 1 mm pressure and room temperature. With Ni, the glow was measured at about 5 mm thickness. The lifetime of the excited species calculated from the thickness of these glows was just long enough to fit with the upper limit of the lifetime of $NO(B^2\Pi)$ which is about 10^{-6} sec. The glow over Co is enhanced when a very low O atom concentration is used and when photographed through a blue filter, practically no blue NO radiation is seen, indicating that in the case of Co, an excited N_2 is the primary product being formed. It is possible to explain both the long lifetime of the species responsible for the glow and the intensity of the bands from $v' = 8$ and 6 by assuming that the primary excited molecule is an $N_2(A^3\Sigma_u^+)$. The small amount of O atoms which are necessary to enhance the glow over Co are probably required to condition the surface of the metal and permit the absorbed N atoms which form the excited N_2 molecule to be attached with a binding energy of about 1 ev or less. The $N_2(A^3\Sigma_u^+)$ and $N_2(B^3\Pi_g)$ potential curves cross at about 8.5—9.0 ev or $v = 6—8$. The meta-stable $N_2(A^3\Sigma_u^+)$, which is the upper level of the well-known Vegard-Kaplan system, forms on the metal surface, diffuses into the gas phase and by collision, crosses into the $(B^3\Pi_g)$ state at $v = 8$ and 6 and then radiates immediately from the $(B^3\Pi_g)$ back to the $(A^3\Sigma_u^+)$. When the glow over Ni is photographed through red and blue filters the observations make it logical to conclude that 2 separate mechanisms are involved: the formation of $N_2(A^3\Sigma_u^+)$ and the formation of $NO(B^2\Pi)$. A red glow similar to those produced over Ag, Ni, and Co can also be produced over Cu. But, if N atoms alone are passed over a Cu plate the blue glow of the second positive system of nitrogen appears $(C^3\Pi_u \rightarrow B^3\Pi_g)$. Thus it appears that what was believed to be a rather singular phenomenon now must include the formation of $NO(B^2\Pi)$, $N_2(A^3\Sigma_u^+)$, and even $N_2(C^3\Pi_u)$.

SURFACE-CATALYZED ATOM RECOMBINATIONS THAT PRODUCE MOLECULES, by P. Harteck, R. R. Reeves, and G. [G.] Mannella. [1960] [4]p. incl. refs. (AFOSR-2805) (Sponsored jointly by Air Force Cambridge Research Center; and [Air Force Office of Scientific Research under AF 49(638)928]) Unclassified

Presented at Symposium on Fundamental Aspects of Atomic Reactions, McGill U., Montreal, Quebec (Canada), Sept. 1960.

Also published in Canad. Jour. Chem., v. 38: 1648-1651, Oct. 1960.

Various metal surfaces such as nickel, cobalt, copper, and silver give rise to a reddish luminosity in a stream of N- and O-atoms. Spectroscopic and photographic analysis of these glows indicate the formation of electronically excited molecules on the metal surface which diffuse into the gas phase and radiate. Two parallel

processes are involved: the formation of an NO($B\ ^2\Pi$), which results in NO β radiation, and the formation of an $N_2(A\ ^3\Sigma_u^+)$, which, in collision, crosses into the $N_2(B\ ^3\Pi_g)$ state and then radiates back to the $A\ ^3\Sigma_u^+$, giving the N_2 first positive system. The N_2 first positive system observed here shows the strongest bands from $v' = 8$ and 6; these vibrational levels straddle the $A\ ^3\Sigma_u^+ - B\ ^3\Pi_g$ potential energy curve crossing point. This crossing-over of N_2 molecules into the ($B\ ^3\Pi_g$) at this point may explain the observed strong $v' = 6$ transition in normal N-atom recombination if it is assumed that some of the N-atoms recombine into the $A\ ^3\Sigma_u^+$ in addition to the $^5\Sigma_g^+$ state. The N_2 second positive system ($C\ ^3\Pi_u \rightarrow B\ ^3\Pi_g$) has also been observed over copper in an N- and O-atom stream. This is most surprising since the $N_2(C\ ^3\Pi_u)$ has about 1.4 ev more than D_{N_2}. (Contractor's abstract)

PHYSICAL PROPERTIES AND STRUCTURE OF MOLTEN SALTS, by G. J. Janz. [1961] [9]p. incl. diagrs. tables, refs. (AFOSR-446) [AF 49(638)978] Unclassified

Presented at Symposium on Recent Advances in the Chemistry of Fused Salts, 139th Amer. Chem. Soc. Nat'l meeting, St. Louis, Mo., Mar. 1961.

Also published in Jour. Chem. Education, v. 39: 59-67, Feb. 1962.

This report gives an indication of the research activity in molten salts for the time interval 1900 to the present date. The enhanced interest in the chemistry of molten salts over the period of the past 2 decades may be attributed, in no small part, to the problems raised by the inadequate knowledge of high-temperature chemistry. It is apparent from this survey that only a small fraction of these investigations were directed to studies of physical properties, and that relatively few of the contributions of this fraction meet the limits of accuracy and precision imposed by the requirements of modern theoretical treatments. The physical properties, techniques of high temperature experimentation, and structure of the molten salts are given.

VIBRATIONS OF A CIRCULAR ELASTIC PLATE UNDER UNIFORM TENSION, by C. J. Martin. [1960] [8]p. incl. tables. (AF 18(600)1586) Unclassified

Published in Proc. Fourth U.S. Nat'l. Cong. of Appl. Mech., California U., Berkeley (June 18-21, 1962), New York, Amer. Soc. Mech. Engineers, v. 1: 277-284, 1962.

The eigenvalue problem, associated with the free vibrations of a circular elastic plate under uniform tension, is solved by means of perturbation expansions in powers of a parameter directly proportional to the tension. For small values of the parameter, the standard technique is employed. For large values, a singular perturbation technique is used to obtain an expansion in reciprocal powers of this parameter. Results obtained are compared with those found by energy techniques. (Contractor's abstract)

LIMITED SUPERPOSITION IN PIECEWISE-LINEAR SYSTEMS, by B. A. Fleishman. July 14, 1961, 12p. (Math. rept. no. 45) (AFOSR-1222) (AF 49(638)514) AD 262829 Unclassified

Piecewise-linear systems of the type that arise in relay servomechanisms or problems involving Coulomb friction, which are usually regarded as nonlinear, are shown here to exhibit certain linear behavior. Specifically, for certain sets of input signals (or forcing functions) and associated responses, the responses are linear in the inputs with respect to convex linear combinations; equivalently, the average of a set of inputs has, as its response, the average of the associated responses. The result is illustrated by means of an explicit formula for periodic responses in a second-order on-off control system. (Contractor's abstract)

WAVE PROPAGATION IN NON-LINEAR MEDIA, by B. A. Fleishman. [1961] [7]p. (AFOSR-3674) (AF 49(638)514) AD 612335 Unclassified

Also published in Proc. Internat'l. Symposium on Nonlinear Differential Equations and Nonlinear Mechanics, Air Force Academy, Colorado Springs, Colo. (July 31-Aug. 4, 1961), New York, Academic Press, 1963, p. 211-217.

The purpose of this paper is to develop some general properties of wave solutions of the equations $u_{tt} - u_{xx} = f(u, u_x, u_t)$ for certain classes of function $f(u, u_x, u_t)$. It is assumed that the variables t, x and u and the parameter c are dimensionless and real-valued. Only functions $f(u, u_x, u_t)$ which are continuous in their arguments are considered, and solutions are sought which are defined for all x and t and which, except when $|c| = 1$, are continuous and bounded and have continuous first and second partial derivatives.

THE BENDING OF COLUMNS UNDER AXIAL LOADS OF RANDOM ECCENTRICITY, by W. E. Boyce. May 22, 1961, 16p. incl. diagrs. table. (Math. rept. no. 43) (AFOSR-703) (AF 49(638)962) AD 258422 Unclassified

Also published in Developments in Mechanics; Proc. Seventh Midwestern Mechanics Conf., Michigan State U. (Sept. 6-8, 1961), New York, Plenum Press, v. 1: 143-152, 1961.

An initially straight, homogeneous, isotropic, elastic column is subjected to axial loads whose location with respect to the center line of the column is given by a random eccentricity at each end. Methods are advanced which, on the basis of assumptions concerning the statistical distribution of the eccentricities, provide answers to the following questions: (1) What is the probability that the maximum transverse column displacement occurs in a given interval of the column? (2) For a given load (or for a given absolute midspan displacement) what is the probability that the absolute midspan displacement (or load) lies between preassigned bounds? (Contractor's abstract)

PPL-60-15(160)) (AFOSR-164) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)552 and Office of Naval Research under Nonr-285100) AD 252113 Unclassified

Since 1957 Republic Aviation has been conducting extensive theoretical and experimental investigations in plasma physics. In order to properly supplement this area of investigation the Lab. has designed, constructed and tested several test units specifically built and instrumented for research in the field of plasma physics. Some of the principal test units that have been used for these programs are: Test Rig no. 1, Test Rig no. 2, Triggered Gap Switch, and Fast Acting Gas Value all of which are described in this report. In order to properly design a device that will provide thrust for a specified mission efficiently so that the total weight of the propulsion system is minimized, it is necessary to be knowledgeable in all subsystem areas pertinent to the engine. An explanation of this diagnostic equipment and pertinent specific test data is presented. Also presented are specific experimental results which were obtained at the Plasma Propulsion Lab., and which are pertinent to the understanding and evaluation of a space propulsion system utilizing the pinch process.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 309, Apr. 24, 1961.

Also published in Phys. Fluids, v. 4: 1015-1025, Aug. 1961.

Also published in Proc. Symposium on Electromagnetics and Fluid Dynamics of Gaseous Plasma, New York (Apr. 4-6, 1961), Brooklyn, Polytechnic Press, 1962, p. 415-441. (AFOSR-3388) (Title varies)

The diffusion of electromagnetic energy into a cylindrical plasma column due to the discharge of the energy stored in a capacitor is formulated taking into account the effects of the capacitance and inductance of the discharge circuit. The discharge circuit reflects the linear pinch geometry in that the energy source is a charged condenser and the return lead is a perfectly conducting cylindrical shell concentric with and surrounding the plasma column. The plasma properties enter the formulation through an extended Ohm's law which includes the time rate of change of current density. Under the assumption that changes in the ionization density and collision frequency may be neglected, Maxwell's equations lead to a third-order linear partial differential equation for the diffusion current. An exact solution is obtained by Laplace transform techniques using appropriate initial and boundary conditions which take into account the finite external circuitry. The spatial and temporal behavior of the current density distribution as functions of the parameters which characterize both the circuit and the plasma are discussed and compared with that of an ordinary conductor obeying the simple Ohm's law (Contractor's abstract)

THE ELECTROMAGNETIC DETONATION CONCEPT, by K. M. Foreman. Mar. 30, 1961 [20]p. incl. diagrs. refs. (Rept. no. PPL-TR-61-10) (AFOSR-564) (AF 49(638)552) AD 450160 Unclassified

Presented at the ARS Propellants, Combustion and Liquid Rockets Conf., Palm Beach, Fla., Apr. 26-28, 1961.

The linear pinch process results from the discharge of a high-frequency, large-magnitude electric current in a low pressure gas contained in the cylindrical envelope of 2 parallel electrodes. The effect is to produce a sheath of plasma at the outer periphery of the cylinder (skin effect) which is forced to move radially inward by virtue of its self-induced magnetic field, in the manner of an inertialess magnetic piston. The motion of the electromagnetic piston in a combustible mixture produces a shock front, in advance of the piston, of sufficient strength to induce detonation. The electromagnetic and gasdynamic details of the concept of electromagnetic piston-supported detonation are described. The required characteristics of the electrical power supply are specified. Some aspects of the experimental investigation are discussed including the diagnostic equipment. Finally, speculations are advanced for the application of the concept to electrical atmospheric propulsion and MHD electric power generation devices. (Contractor's abstract)

PARAMETRIC STUDIES OF STRONG GASEOUS DETONATIONS, by K. M. Foreman, H. Pevney, and R. MacMillan. Mar. 30, 1961 [22]p. incl. diagrs. (Rept. no. PPL-TR-61-11) (AFOSR-565) (AF 49(638)-552) AD 445977 Unclassified

Presented at the ARS Propellants, Combustion and Liquid Rockets Conf., Palm Beach, Fla., Apr. 26-28, 1961.

Also published in Prog. in Astronaut. and Rocketry, v. 6: 47-63, 1962.

A computer program used for a parametric study of gaseous detonations is described. In addition to being able to define the thermodynamic and gas dynamic properties of the equilibrium, one-dimensional process it is possible to investigate the energy released. On the basis that the net energy release of the detonation equals the changes of enthalpy and kinetic energy of the reactants as they change to reaction products, it is seen that exothermic reactions soon become overridden by endothermic processes as the strong detonation wave velocity increases. Parametric studies of oxygen-hydrogen and air-hydrogen detonations have been conducted for a wide range of initial temperatures and pressures. Typical variations of equilibrium product gas composition and temperature with wave velocity are presented and discussed. For oxygen-hydrogen detonations it is seen that the Chapman-Jouguet condition for the stoichiometric mixture produces the maximum energy release. The limits of detonations are broadened by higher reactant pressures and narrowed and shifted to lower velocities by higher reactant temperatures. (Contractor's abstract)

A SUPERSONIC PLASMA BEAM, by H. Malamud and B. Bederson. June 1961 [30]p. incl. diagrs. refs. (Rept. no. PPL-TR-61-17(398)) (AFOSR-1429) (AF 49(638)552) AD 286910 Unclassified

The theory and design of a cold plasma beam facility are described. A supersonic beam of alkali metal vapor is produced by conventional wind tunnel techniques. The vapor is ionized to a high degree by the process of surface ionization on the heated (tungsten) walls of the acceleration nozzle, which also acts as an electron emitter to provide charge neutralization in the beam. The limitation on the plasma flux is the effect of particle recombination in the nonequilibrium situation existing in the nozzle. Estimates based on the presently available data on recombination rates give a maximum beam flux of 10^{17} ion/cm^2-sec. (Contractor's abstract)

MAGNETIC FIELD MEASUREMENTS IN A CYLINDRICAL PINCH TUBE, by T. Donner and L. Aronowitz. Aug. 8, 1961 [31]p. incl. illus. diagrs. tables. (Rept. no. PPL-TR-61-18(415)) (AFOSR-1762) (AF 49(638)-552) AD 272935 Unclassified

Magnetic field measurements in a cylindrical linear pinch tube with magnetic probes and a device named the D-loop are described. Tests were performed with a discharge current frequency of 20 kc in nitrogen at an initial pressure of 0.1 mm Hg. Initial capacitor voltage was varied from 1000 to 5000 v. Plots of the magnetic field distribution, the radial current distribution and the current density in the pinch tube are presented. Experimental results indicate that the discharges are symmetric above 2000 v. The symmetric discharges have the following characteristics. At the start of the discharge, current flows near the outer periphery of the pinch tube. A portion of the current concentrates in a thin shell which moves towards the axis at a high velocity. The remainder of the current flows between the rapidly advancing shell and the outer radius of the pinch tube. There is some evidence that after the formation of the first shell a second shell is formed and moves toward the axis. It appears that magnetic probes sometimes cause perturbations in the discharge which influence their output. (Contractor's abstract)

CHEMICAL DETONATIONS IN THE UPPER ATMOSPHERE, by K. M. Foreman and P. Wilson. Oct. 20, 1961. 27p. incl. diagrs. table, refs. (Rept. no. PPL-TR-61-24(477)) (AFOSR-1763) (AF 49(638)552) AD 270927 Unclassified

Also published in Proc. Twelfth Internat'l. Astronaut. Cong., Washington, D. C. (Oct. 1, 1961), New York, Academic Press, v. 1: 476-497, 1963.

Detonation characteristics of hydrogen-air mixtures in the 1959 ARDC Model Atmosphere environment, including atomic oxygen and nitrogen, are computed to 450,000 ft assuming 1-dimensional, inviscid, real-gas conditions. The velocity limits of strong detonations (based on total enthalpy change) are discussed. Atomic oxygen reactant suppresses the exothermic reaction to H_2O in favor of recombination, making hydrogen use above 400,000 ft unattractive. Equilibrium temperature and pressure ratios across detonations decrease with altitude, especially above 350,000 ft; they are extremely sensitive, and inversely proportional, to reactant temperature, and pressure exhibits a secondary effect. For comparable detonation conditions, acetylene appears almost as good an energy source as hydrogen. (Contractor's absiract)

TEMPERATURE AND MIXTURE VARIATION OF STRONG-DETONATION LIMITS, by K. M. Foreman. [1961] [1]p. incl. diagrs. (AFOSR-2842) (AF 49(638)-552) Unclassified

Also published in Jour. Aerospace Sci., v. 29: 469, Apr. 1962.

The extent of the regime of strong gaseous detonations of hydrogen and air is markedly diminished by a decrease in initial pressure or an increase in temperature, and slightly increased by an increase in equivalence ratio.

PRESSURE VARIATION OF STRONG-DETONATION LIMITS, by K. M. Foreman. [1961] [1]p. incl. diagr. (AFOSR-2843) (AF 49(638)552) Unclassified

Also published in Jour. Aerospace Sci., v. 29: 240, Feb. 1962.

Pressure characteristics of detonation velocity limits are discussed: the upper limit, when the kinetic energy change is equal in magnitude to the enthalpy change, and the Chapman-Jouguet condition associated with minimum prewave velocity and maximum energy release. Through a series of approximations and equations and the use of a digital computer program the real-gas properties (velocity limits) of hydrogen-air detonations are determined.

ELECTROMAGNETICALLY INDUCED DETONATIONS (Abstract), by W. McIlroy. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)552) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

The results of a parametric study, using an IBM 704 digital computer program, are shown to define the limits of exothermic reactions and indicate the conditions for a significant experiment. The theoretical effort has been concerned with analyzing the circuit needs to meet the required ramp type current wave form, while the experimental effort has been directed toward improving the diagnostic equipment in preparation for a new detonation test stand whose design was completed in January 1961. The current wave form for meeting Chapman-Jouguet detonation conditions has been found producible by a single simple R-L-C circuit. The requirements for magnetically supported strong detonations have been approximated, with the aid of a Fourier analysis computer program, by a 10-branch L-C circuit. Experiments using the original RAC pinch effect device have revealed that the electrode material significantly influences the nature of the pinched discharge and that vaporous electrode material probably plays an important role in the initial phases of the process.

REPETITIVE PINCH ACCELERATION (Abstract), by W. J. Guman. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)552 and Office of Naval Research under Nonr-285100) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

Since it has become apparent that, for pulsed engine applications, the minimum pinch conditions (i.e., energy, voltage) must be known, a study has been made to determine the various physical mechanisms involved. The discharge initiation phase, the subsequent sheet information and the initial motions of the sheet and gas motions are described. The gas dynamic motions of the current sheet or "magnetic piston" are described using the latest results of the slug, snowplow and gas dynamic models. The following experimental studies are reported: (1) studies of the basic phenomena; e.g., pinch initiation, sheet motions and symmetry, coordination of gas motion and circuit oscillation, and (2) determination of basic engine parameters; thrust, specific impulse, mass conservation and energy conversion efficiency. A description of the plasma pinch engine now undergoing tests at WADD is presented.

TRANSIENTS IN THE FORMATION OF A CURRENT SHEATH AT A PLASMA BOUNDARY (Abstract), by L. Kraus. [1961] [1]p. [AF 49(638)552] Unclassified

Presented at meeting of the Amer. Phys. Soc., Mexico City, Mex., June 22-24, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 371, June 22, 1961.

The formation of a conducting sheath at a plasma boundary due to a strong electromagnetic field is analyzed. The case where the plasma properties do not change was treated previously. Here a simple model of a plasma is used in which the effects of the field on the plasma is taken into account and divided into electron heating, ionization, and ion heating. Each of these phases is treated separately and the problems are reduced to nonlinear diffusion-like equations. Analytic and numerical solutions then provide a time history of the growth of the current sheath and the associated magnetic field. Conditions will be discussed which determine whether the sheath will eventually become a steady state discharge or a dynamic pinch.

ON LINEAR DIFFERENTIAL EQUATIONS WITH A SMALL PARAMETER, by C. Imaz. Mar. 1961, 60p. incl. diagrs. refs. (Technical rept. no. 61-2) (AFOSR-496) (AF 49(638)382) AD 256353 Unclassified

Also published in Bol. Soc. Mat. Mexicana, v. 6: 19-51, 1961.

The purpose of this paper is to study the system (1) $\dot{w} = Aw + \epsilon\Phi(t)w$, w an n-vector, A a constant n-matrix, Φ a periodic matrix of period T which is Lebesgue integrable over a period. By means of a linear (non-constant) change of variables, it is shown that (1) may be reduced to the form (2) $\dot{x} = Hx + \delta\psi(t, \delta, \beta)x$, where $\delta > 0$ is a small parameter (a certain root of ϵ), β a constant parameter, and $H = \text{diag}(0, \Sigma)$, where 0 represents the $\mu \times \mu$ zero matrix, $\mu \leq n$, and Σ has elements $\sigma_i \neq 0 \bmod (2\pi i/T)$ on the main diagonal, elements 0 or 1 on the line above the diagonal, and 0 elsewhere. It is shown that if $e^{-\Sigma T} - I$ is not singular, there exists $\delta_0 > 0$ such that if $0 \leq \delta \leq \delta_0$ there exists a periodic function x which is a solution of (2) provided that β (and other parameters) satisfy a certain system of "bifurcation" equations (which depend on x); the values of β obtained in this way provide some of the characteristic exponents of (1). The problem thus stated may be attacked by a method of successive approximations which is adapted to actual computations. If A is assumed to have all its main diagonal elements equal to ρ, all the elements of the line above the diagonal are 1, and are 0 elsewhere, and if Φ satisfies certain restrictions (one case being, for instance, that $\int_0^T \Phi\, dt = 0$), a precise description of the characteristic exponents is obtained. Theorems on stability and instability, and methods for the computation of the characteristic roots of constant perturbed matrices are also derived as applications of the general method. (Math. Rev. abstract)

ASYMPTOTIC BEHAVIOR OF SOLUTIONS OF A SYSTEM OF DIFFERENTIAL EQUATIONS, by T. Yoshizawa. [1961] [17]p. incl refs. (AFOSR-749) (AF 49(638)382) Unclassified

Also published in Contrib. Differential Equations, v. 1: 371-387, 1963.

Consider a system of differential equations: (1) $x' = F(t, x) + G(t, x)$ $\left(1 = \frac{d}{dt}\right)$, where $F(t, x)$ and $G(t, x)$ are continuous in $I \times Q$ (I: $0 \leq t < \infty$, Q an open set in n-dimensional Euclidean space R^n). Assuming that if x(t) is continuous and bounded on $t_0 \leq t < \infty$; that is $x(t) \subset Q^*$, (Q^*: a compact set in Q),

(2) $\int_{t_0}^{\infty} G(s, x(s))\, ds < \infty$. The asymptotic behavior of solutions of the system (1) is discussed using the following notations: $\bar{A}$ is the closure of a set A; $d(p, A)$ is the distance between a point p and a set A, that is $d(p, A) = \inf \{ |p - a| ; a \in A \}$. $U(A, \epsilon)$ denotes the ϵ-neighborhood of a set A, that is, $U(A, \epsilon) = \{x; d(x, A) < \epsilon\}$. $C_0(x)$ is the set of functions which satisfy locally a Lipschitz condition with respect to x.

ASYMPTOTIC BEHAVIOR OF SOLUTIONS OF ORDINARY DIFFERENTIAL EQUATIONS NEAR SETS, by T. Yoshizawa. [1961] 21p. incl. refs. (Technical rept. no. 61-5) (AFOSR-992) (AF 49(638)382) AD 262349 Unclassified

In this paper the asymptotic stability of a set is discussed, and by constructing a Liapunov function the relationships between the solutions of an unperturbed system are considered. To simplify the problems, an autonomous system is considered an unperturbed system. A Liapunov function is constructed for the asymptotic stability in the large of a set. From this result, a Liapunov function is obtained for the asymptotic stability of a set. These results include as a special case, asymptotic stability in the sense of Liapunov and orbital stability. The behavior of solutions of a perturbed system is discussed in which a perturbation term is a combination of the case where it tends to zero as it approaches infinity and the case where it is integrable.

LOCALLY ONE-TO-ONE MAPPINGS AND A CLASSICAL THEOREM ON SCHLICHT FUNCTIONS, by G. H. Meisters and C. Olech. [1961] 29p. incl. diagrs. refs. (Technical rept. no. 61-4) (AFOSR-1086) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)382 and Army Research Office (Durham) under DA 36-034-ORD-3220) AD 262080 Unclassified

Also published in Duke Math. Jour., v. 30: 63-80, Mar. 1963.

The following classical theorem from the theory of functions of a complex variable has been attributed to Gaston Darboux. If f(x) is single-valued and holomorphic in a simply connected open subset R of complex plane and if f(z) takes no values more than once on some rectifiable simple closed curve C lying in R, then f(z) is schlicht on the compact set X consisting of C and its interior. In this paper some topological theorems are given which are similar to Darboux's theorem and from one of which Darboux's theorem is easily deduced. Theorem 1 differs from the above in 3 aspects: First, it applies to mappings of compact subsets X of n-dimensional Euclidean space E_n (for $n > 2$), and is therefore not restricted to mappings of the complex plane. Secondly, the requirement of analyticity in Darboux's theorem is replaced by the requirement that f be locally one-to-one at each point of its domain X except possibly on a small subset Z. Finally, in theorem 1, it is not required that the boundary of the schlicht region X be a rectifiable Jordan curve, but merely an irreducible separating set of E_n. In theorem 2, by further restricting the set Z, it is enough to require that the boundary of the schlicht region X be connected. Moreover, in

this case, X need no longer be a subset of E_n, but can be an arbitrary compact subset of an n-dimensional manifold M_n (for $n \geq 2$).

PROLONGATIONS AND GENERALIZED LIAPUNOV FUNCTIONS, by J. Auslander and P. Seibert. [1961] [26]p. (Technical rept. no. 61-7) (AFOSR-1119) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)382 and Army Research Office (Durham) under DA 36-034-ORD-3220) AD 262350 Unclassified

Also published in Proc. Internat'l. Symposium on Nonlinear Differential Equations and Nonlinear Mechanics, Air Force Academy, Colorado Springs, Colo. (July 31-Aug. 4, 1961), New York, Academic Press, 1963, p. 454-462.

Abstract published in Qualitative Methods in the Theory of Non-linear Vibrations; Proc. Internat'l. Symposium on Non-linear Vibrations, Kiev (USSR) (Sept. 12-18, 1961), Kiev Academy of Sciences, v. 2: 332, 1963.

The purpose of this note is to study various types of stability in autonomous systems by means of generalized Liapunov functions in the sense of S. Lefschetz and prolongations in the sense of T. Ura and Funkcialaj Ekavcioj. The concept of prolongation leads to a whole hierarchy of new types of stability, all of which occupy an intermediate place between stability in the sense of Liapunov and asymptotic stability. The most significant among them, called absolute stability, is characterized by the existence of a continuous generalized Liapunov function with a non-positive generalized total derivative. If the latter is strictly negative, asymptotic stability is achieved. The second part of the report is devoted to stability under permanent perturbations or total stability with small bounded perturbation terms. Total stability is characterized as invariance under a certain map which has essential properties in common with Ura's concept of prolongation. In order to study properties of different kinds of stability simultaneously, prolongations abstractly are defined, and their invariant sets considered, thus obtaining stability theorems as corollaries.

CONTROLLABILITY OF LINEAR DYNAMICAL SYSTEMS, by R. E. Kalman, Y. C. Ho, and K. S. Narendra. [1961] [25]p. incl. refs. (AFOSR-1120) (Sponsored jointly by Air Force [Office of Scientific Research] under AF 49(638)382 and AF 33(616)6952, and Office of Naval Research under Nonr-186616) Unclassified

Also published in Contrib. Differential Equations, v. 1: 189-213, 1963.

Various characterizations of controllability are obtained for linear dynamical systems with finite-dimensional state space. An explicit expression is given for transferring a given state as close as possible to any desired state using minimal control energy. Additional criteria of controllability are obtained in the special case of constant systems. Controllability of discrete-time systems is also treated, including a rigorous proof of the Kalman-Bertram criterion for the controllability of a constant linear system after the introduction of sampling. Finally, figures of merit based on minimal control energy are introduced which serve as a numerical measure of the controllability of a given system. (Contractor's absiract)

ON THE GLOBAL STABILITY OF AN AUTONOMOUS SYSTEM ON THE PLANE, by C. Olech. [1961] 16p. (Technical rept. no. 61-12) (AFOSR-1130) (AF 49(638)-382) AD 264606 Unclassified

Also published in Contrib. Differential Equations, v. 1: 389-400, 1963.

Consider an autonomous system (S) $x' = f(x)$ ($' = d/dt$) where $x = (x_1, x_2)$, $f(x) = (f_1(x_1 x_2), f_2(x_1 x_2))$ is a class of C^1 on E^2. Suppose $x = 0 = (0, 0)$ is a singular point of (S), and assume that the Jacobian matrix $J(x) = (\partial f_j/\partial x_k)$ has, at each point of E^2, characteristic roots with negative real parts; that is, assume
(i) $\operatorname{tr} J(x) = \partial f_1/\partial x_1 + \partial f_2/\partial x_2 < 0$ on E^2, and
(ii) $\det J(x) = (\partial f_1/\partial x_1)(\partial f_2/\partial x_2) - (\partial f_1/\partial x_2)(\partial f_2/\partial x_1) > 0$ on E^2. Is then the solution $x = 0$ of (S) asymptotically stable in the large, or, in other words, does each solution curve of (S) approach 0 as $t \to \infty$?

A GEOMETRIC INTERPRETATION OF PONTRYAGIN'S MAXIMUM PRINCIPLE, by E. Roxin. [1961] [28]p. incl. diagrs. refs. (Technical rept. no. 61-15) (AFOSR-1751) (AF 49(638)382) AD 268269 Unclassified

Also published in Proc. Internat'l. Symposium on Nonlinear Differential Equations and Nonlinear Mechanics Air Force Academy, Colorado Springs, Colo. (July 31-Aug. 4, 1961), New York, Academic Press, 1963, p. 303-324.

In connection with problems of control mechanisms, there have been studied systems of differential equations in which some more or less arbitrary control functions appear. An important question is how to choose those control functions to minimize (or maximize) a certain functional of the solution. Physically speaking, this may mean to operate the system in the best possible way, minimizing a cost function or simply the time of operation. Pontryagin and his collaborators pointed out a general principle (the maximum principle), which applies. The problem of what can be accomplished by adequate election of the control function, disregarding the optimization problem, was studied independently by Kalman and the author. In this analysis these problems are considered from a geometrical point of view; the aim is to show interesting relations which remain hidden in a more analytical treatment, like that of Pontryagin, Boltyanskii and Gamkrelidze.

CRITERIA FOR THE REALITY OF MATRIX EIGENVALUES, by M. P. Drazin and E. V. Haynsworth. [1961] [4]p. (AFOSR-2282) (AF 49(638)-382) Unclassified

Also published in Math. Zeitschr., v. 78: 449-452, Mar. 1962.

All capital letters denote linear transformations on an n-dimensional unitary space V with inner product (x, y). Assume that $H = AS$ is hermitian, where S is positive definite hermitian. Let $S^{1/2}$ be the unique positive definite hermitian determination of the square root of S. Then $S^{-1/2}HS^{-1/2} = S^{-1/2}AS^{1/2}$, and hence A is similar to a hermitian transformation. Thus A has n real eigenvalues with corresponding linearly independent eigenvectors. Similarly, if $ASA^* = S$, then $(S^{-1/2}AS^{1/2})(S^{-1/2}AS^{1/2})^* = 1$, and A is similar to a unitary transformation. From this it follows that A has n eigenvalues of modulus 1 with a corresponding set of n linearly independent eigenvectors. The authors generalize these results (and a similar result for skew-hermitian transformations). For example, they obtain Theorem 1: A necessary and sufficient condition for A to have m real eigenvalues with a corresponding set of m linearly independent eigenvectors is that there exist a positive semi-definite hermitian S of rank m such that AS is hermitian. The proof of necessity is direct.

ON GLOBAL ASYMPTOTIC STABILITY OF SOLUTIONS OF DIFFERENTIAL EQUATIONS, by P. Hartman and C. Olech. [1961] [25]p. (AFOSR-2837) (In cooperation with Johns Hopkins U. Dept. of Mathematics, Baltimore, Md.) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)382 and AF 18(603)41, and Army Ballistic Missile Agency under DA 36-034-ORD-3514) AD 298161 Unclassified

Also published in Trans. Amer. Math. Soc., v. 104: 154-178, July 1962.

Consider a system of real differential equations for $x = (x^1, \ldots, x^n)$, $(1.1)\ x' = f(x)$ in which $f(x)$ is of class C^1 on E^n. The first part of this paper deals with a generalization of the fact that if $x = 0$ is a locally asymptotically stable solution of (1.1) and the conditions $\operatorname{tr} J(x) = \operatorname{tr} H(x) \leq 0$ and $|f(x)| \geq \text{Const.} > 0$ for $|x| \geq \text{const.} > 0$, then $x = 0$ is a globally asymptotically stable solution of (1.1) to the case of arbitrary $n \geq 2$. The second part of the paper concerns the orbital stability of bounded, nontrivial, solutions of (1.1) and is related to a result dealing with a bounded solution $x = x_0(t)$ of (1.1) in a portion D of E^n where $|f(x)| \geq \text{Const.} > 0$ and $\gamma < 0$. $\gamma(x) < 0$. In the third part of the paper some of the results are extended to nonautonomous systems using the principles of Ważewski (Proc. Internat'l. Cong. Math. (Amsterdam), v. 3: 132-139, 1954). This method can also be used to obtain some of the results of part 2.

CANONICAL STRUCTURE OF LINEAR DYNAMICAL SYSTEMS, by R. E. Kalman [1961] [5]p. incl. diagrs. (AFOSR-2997) (AF 49(638)382 and AF 33(616)6952) Unclassified

Published in Proc. Nat'l. Acad. Sci., v. 48: 596-600, Apr. 1962.

The usual notion of a dynamical system abstracts the properties of motions (solutions) defined by a system of differential equations and embodies the principal of causality of classical mechanics. The abstract definition given here retains these features but views a dynamical system in terms of observable relation between inputs (stimuli) and outputs (responses). This paper is concerned principally with finite-dimensional linear dynamical systems, and these can be described by a system of differential equations $\dot{x}(t) = F(t)x(t) + G(t)u(t)$ and a relation $y(t) = H(t)x(t)$. The state $x(t)$ is an n-vector, the input $u(t)$ is an m-vector, the output $y(t)$ is a p-vector and $F(t)$, $G(t)$, and $H(t)$ are matrices. The functions, u, F, G and H are continuous. It is then shown that relative to an initial time every such system

can be decomposed in an invariant manner into 4 parts. Only one of these parts, the part which is "completely controllable" and "completely observable", can in general be identified from external observation (impulse response, for example), and that part can be determined in a manner which is essentially unique. This paper is a brief report which defines basic concepts and states some of the important results.

THE EXISTENCE OF OPTIMAL CONTROLS, by E. Roxin. [1961] [11]p. incl. diagrs. (AFOSR-3845) (AF 49(638)382) Unclassified

Also published in Mich. Math. Jour., v. 9: 109-119, 1962.

In this paper the author gives existence theorems for problems of optimal control. Given a differential system (*) $dx/dt = f(t,x,u)$, $t \in E^1$, $x \in E^n$, $f \in E^n$, $u \in U \subset E^m$, with $x(t_0) = x_0$, t_0, x_0 fixed, assume that $f(t,x,u)$, $(t,x,u) \in E^1 \times E^n \times U$, is continuous in (x,u), uniformly Lipschitzian in x, measurable in t for all (x,u), with $f \leq (A|x| + B)u(t)$ (A, B constants, u(t) locally L-integrable). The main assumptions are that U is a fixed compact subset of E^m and $f(t,x,U)$ is convex for every $(t,x) \in E^1 \times E^n$. By assuming in (*) that u is any function u(t), $u(t) \in U$ for all $t_0 \leq t \leq t_1$, t_1 undetermined, $t_1 \geq t_0$, u(t) measurable in $[t_0, t_1]$, one obtains corresponding solutions x(t), $t_0 \leq t \leq t_1$. The set R of all final points $(t_1, x(t_1))$ is a subset of $E^1 \times E^n$. Main theorem: The set R is closed. From here existence theorems follow. For instance, the problem of maximum speed of response has a solution.

STABILITY UNDER PERTURBATIONS IN GENERALIZED DYNAMICAL SYSTEMS, by P. Seibert. [1961] [11]p. incl. refs. (AFOSR-4487) (AF 49(638)-382) AD 424045 Unclassified

Also published in Proc. Internat'l. Symposium on Nonlinear Differential Equations and Nonlinear Mechanics, Air Force Academy, Colorado Springs, Colo. (July 31-Aug. 4, 1961), New York, Academic Press, 1963, p. 463-473.

It is an important problem in the theory of stability, to what extent small but permanently acting disturbances affect stability properties of dynamical systems. In this note one theorem on ultimate boundedness under perturbations, and a second which contains the theorem of Malkin-Gorsin are proven. The concept of strong stability under perturbations is introduced which is equivalent to uniform asymptotic stability, and therefore, implies total stability. All results for a class of systems similar to the general systems of Zubov are proven allowing more than 1 solution with given initial conditions. The restrictions on the perturbations are formulated in terms of the maximal deviation within time intervals of given length of a perturbed motion from an unperturbed 1 with the same initial values. This method allows consideration of cases where the derivatives themselves remain close together. Furthermore, it gives rise to a new absolute concept of total stability, 1 which is free of the element of arbitrariness inherent in other methods of restricting the perturbation, such as bounds on the norm of the perturbation term.

A method is given of successive approximations for the determination of theorems for the existence of periodic solutions of weakly nonlinear differential systems and for the determinations of boundedness theorems for linear periodic differential systems. The majority of this paper deals with almost linear systems; however, a brief description of how to generalize the method to more general systems is stated. The method can also be applied to differential-difference equations and to cases where the eigenvalues of the coefficient matrix of the linear part of the differential system do not have simple elementary divisors.

ASYMPTOTIC SYSTEM OF A PERTURBED SYSTEM, by T. Yoshizawa. [1961] [8]p. (AF 49(638)382) Unclassified

Published in Proc. Internat'l. Symposium on Nonlinear Differential Equations and Nonlinear Mechanics, Air Force Academy, Colorado Springs, Colo. (July 31-Aug. 4, 1961), New York, Academic Press, 1963, p. 80-85.

The relationships between solutions of a perturbed system and solutions of the unperturbed system are discussed. Under consideration is a system of differential equations $x' = F(t, x) + G(t, x)$, where $G(t, x)$ is an integrable perturbation term. A set of conditions are presented under which the following 2 theorems are proven: (1) It is assumed that $F(t, x)$ and $G(t, x)$ are continuous in $I \times Q$ and that Γ^+ is nonempty. Then $\tau = +\infty$. (2) It is assumed that Γ^+ is nonempty and $x(t; x_0 t_0) \to \Omega$ as $t \to \infty$, where Ω is a closed set in the space Q and that $F(t, x)$ satisfies the conditions (a) $F(t, x)$ tends to a function $H(x)$ for $x \in \Omega$ as $t \to \infty$ and on any compact set in Ω this convergence is uniform so that $H(x)$ is a continuous function on Ω and (b) corresponding to each $\epsilon > 0$ and each $y \in \Omega$, there exist positive numbers $\delta(y)$ and $T(y)$ such that if $\|x - y\| < \delta(y)$ and $t \geq T(y)$, then $\|F(t, x) - F(t, y)\| < \epsilon$, and $G(t, x)$ satisfies the condition $\int_{t_0}^{\infty} \|G(s, x(s))\| \, ds < \infty$. Then Γ^+ is the union of solutions of the equation $x' = H(x)$, when $x \in \Omega$.

PERIODIC FUNCTIONS GENERATED AS SOLUTIONS OF NONLINEAR DIFFERENTIAL-DIFFERENCE EQUATIONS, by G. S. Jones. [1961] [8]p. incl. diagrs. refs. (AF 49(638)382) Unclassified

Published in Proc. Internat'l. Symposium on Nonlinear Differential Equations and Nonlinear Mechanics Air Force Academy, Colorado Springs, Colo. (July 31-Aug. 4, 1961), New York, Academic Press, 1963, p. 105-112.

Consider a scalar differential-difference equation (1) $f'(x) = \alpha \sum_{i=1}^{n} \lambda_i f(x - \tau_i)[af^2(x) + bf(x) + 1]$, where $0 < \tau_1 < \tau_2 < \ldots < \tau_n$ and α, a, b and λ_i are real parameters. If φ is an arbitrary function belonging to the space C of continuous functions on $[-\tau_n, 0]$, then one can define a continuous function $f(x, \varphi)$ defined for $-\tau_n \leq x < A$, $A > 0$ which coincides with φ on $[-\tau_n, 0]$ and satisfies equation (1) for $x > 0$. For any fixed $x > 0$, one can define a mapping $T(x)$ taking C into C by the relation $(T(x)\varphi)(\theta) = f(x + \theta, \varphi)$, $-\tau_n \leq \theta \leq 0$. $T(x)$ is completely continuous for $x \geq \tau_n$. For suitable choices of the parameters in (1), the author defines a convex subset S of C and a continuous functional λ taking C into the reals, such that $\lambda(\varphi) \geq \tau_n$ and for φ in S, $T(\lambda(\varphi))\varphi$ belongs to S. The set S is determined by the oscillatory properties of the solutions about $x = 0$. Additional conditions involving the stability properties of the solution $x = 0$ imply the existence of a fixed point of S, which is not a constant function, and thereby the existence of a nonconstant periodic solution of (1). Bounds on the periods, as well as other properties of these solutions are discussed together with some specific cases of (1).

NUMERICAL STUDY OF PERIODIC SOLUTIONS OF THE VAN DER POL EQUATION, by M. Urabe. [1961] [9]p. incl. diagrs. tables, refs. (AF 49(638)382) Unclassified

Published in Proc. Internat'l. Symposium on Nonlinear Differential Equations and Nonlinear Mechanics, Air Force Academy, Colorado Springs, Colo. (July 31-Aug. 4, 1961), New York, Academic Press, 1963, p. 184-192.

This paper is concerned with the numerical study of van der Pol's equation $\frac{d^2x}{dt^2} - \lambda (1 - x^2) \frac{dx}{dt} + x = 0$ when $\lambda > 0$. In this paper a new method of computing the periodic solutions of van der Pol's equation is sketched and the main results compared with those obtained by a previous method. The results of the comparison show that there exists a maximum point of the amplitude between $\lambda = 3$ and $\lambda = 4$. The present method is based on the numerical solution of a certain equation by means of Newton's method. Consequently, it guarantees the existence of a true periodic solution besides giving a numerical solution.

STRUCTURES TRANSVERSE TO A VECTOR FIELD, by B. L Reinhart. [1961] [3]p. (AF 49(638)382) Unclassified

Published in Proc. Internat'l. Symposium on Nonlinear Differential Equations and Nonlinear Mechanics, Air Force Academy, Colorado Springs, Colo. (July 31-Aug. 4, 1961), New York, Academic Press, 1963, p. 442-444.

If a vector field is defined on a manifold M, the orbit space of the 1-parameter pseudogroup it generates has some sort of generalized-manifold-with-singularities structure. One line of research has been to consider additional geometric structures on M which pass to the quotient and see what global consequences can be deduced. For example, the theory of invariant integrals due to Poincaré and Cartan is of this nature, and serves as a prototype for further theories. In this short note the author reviews past work along these lines and suggests new directions emphasizing geometric ways to describe the cohomology of the orbit space. (Math. Rev. abstract)

FURTHER COMMENTS ON THE DERIVATION OF TRAUBE'S RULE, by R. H. Aranow and L. Witten. [1961] [2]p. (AFOSR-2031) [AF 49(638)735] Unclassified

Also published in Jour. Chem. Phys., v. 35: 1504-1505, Oct. 1961.

The change in free energy of the water-hydrocarbon system when a hydrocarbon molecule moves from the interior of the water to the surface is contributed to by 2 factors. One factor is the interaction energy and the other factor lies in the possibility of an entropy change. An estimate of the entropy contribution has been made. The effect of the entropy contribution is to lower the free-energy change by almost the same amount for each CH_2 group added to the molecule, the amount being approximately RT ℓn3. The exact integer 3 comes about by assuming the energy levels to be triply degenerate. Analysis shows that the entropy effects cannot be ignored and may be large. Calculations predict that the entropy change is approximately R ℓn3 plus a small temperature-dependent term.

INTERNATIONAL SYMPOSIUM ON NONLINEAR DIFFERENTIAL EQUATIONS AND NONLINEAR MECHANICS, United States Air Force Academy, Colorado Springs, Colo., July 31-Aug. 4, 1961, ed. by J. P. LaSalle and S. Lefschetz. New York, Academic Press, 1963, 505p. incl. diagrs. tables, refs. [AF 49(638)930] Unclassified

This symposium brought together a group of pure and applied mathematicians interested in nonlinear differential equations, nonlinear mechanics, control theory, and other related topics. Much of the meeting was devoted to round table discussions on the following subjects: "Oscillations and Asymptotic Behavior", chaired by J. K. Hale; "Applications of Differential Equations", chaired by R. Bellman; "Control and Stability", chaired by R. E. Kaplan; and "Qualitative Theory", chaired by S. Sternberg. Each day concluded a relatively short session of contributed papers.

SIGNIFICANCE OF P_{700} AS AN INTERMEDIATE IN PHOTOSYNTHESIS, by B. Kok. [1961] [9]p. incl. diagr. refs. (AFOSR-J1429) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)947 and National Institutes of Health) AD 427571 Unclassified

Also published in Proc. of Fifth Internat'l. Cong. of Biochemistry; Mechanism of Photosynthesis, Moscow (USSR) (Aug. 10-16, 1961), New York, Pergamon Press, v. 6: 73-81, 1963.

Kinetic experiments have indicated that in photosynthesis the pigment molecules which absorb the light outnumber the actual trapping centers and associated enzyme chains by several hundred-fold. A small amount of pigment with an absorption band on the long wavelength side of this peak could efficiently collect photons received by an excess of neighboring chlorophyll a molecules. Such a pigment could function as the mediator between light collection and light conversion — or even be the convertor itself. A band at about 700 mμ is found in green plants as well as in brown, red and blue-green algae and the pigment ("P_{700}") responsible for it thus seems to occur as ubiquitously as chlorophyll a. The bleaching of P_{700} appears a direct photochemical step, which is mainly sensitized by chlorophyll a and possibly carotenoid. The bleached form spontaneously returns to the absorbing form in darkness. The most likely mechanism consistent with the results is the following:

(1) P_{700} (red) + X(ox) $\xrightarrow{\text{light, chlorophyll a}}$ P_{700}(ox) + X(red); (2) P_{700}(ox) + Cyt. c(red) $\xrightarrow{\text{photooxidase}}$ P_{700} (red) + Cyt. c(ox); (3) X(red) + Viologen(ox) ⟶ X + Viologen(red); (4) Viologen(red) + O_2 ⟶ Viologen(ox) + H_2O.

THE PROPERTIES OF CONDUCTION ELECTRONS IN ALKALI HALIDE CRYSTALS. II. A HARMONIC ANALYSIS OF THE ALTERNATING CURRENT SOLUTIONS OF THE EQUATION FOR MOTION OF MOBILE NEGATIVE CHARGE CARRIERS IN ADDITIVELY COLORED ALKALI HALIDE CRYSTALS, by L. Haines and D. Kahn. Nov. 1961 [67]p. incl. tables. (Technical rept. no. 61-16) (AFOSR-1752) (AF 49(638)1017) AD 269112 Unclassified

The equations of motion for space charge limited carrier diffusion in a trap free crystal are discussed. Boundary conditions equivalent to current blocking electrodes are introduced and only the negative charge carrier is assumed mobile. A sinusoidal voltage is applied to the crystal electrodes at $\pm L/2$, where L is the crystal length. A general expression for the qth harmonic of the space average current and the negative charge carrier concentration at the electrode is given. It is shown that for a sinusoidal applied voltage and current blocking electrodes, the field and carrier concentrations have a definite parity which alternates with the order of the harmonic, and the even harmonics of the space average current are zero. Numerical solutions of the current and negative charge carrier concentration at the electrodes show that the harmonic content at low frequencies (less than 100 cps) is very large for an applied voltage greater than kT/e. At frequencies above approximately 100 cps, the so-called small signal linearized theory is applicable. Experimental measurements of the harmonic content at low frequencies (2-20 cps) and large applied voltages (80 vrms) have shown the actual harmonic content to be less than 0.5%. The reason for this discrepancy is being investigated. (Contractor's abstract)

THE GEOMETRY OF FUNCTIONS HOLOMORPHIC IN THE UNIT CIRCLE, OF ARBITRARILY SLOW GROWTH, WHICH TEND TO INFINITY ON A SEQUENCE OF CURVES APPROACHING THE CIRCUMFERENCE, by G. R. MacLane. [Apr. 1961] [13]p. (Technical note no. 4) (AFOSR-589) (AF 49(638)205) AD 257057 Unclassified

Also published in Duke Math. Jour., v. 29: 191-197, June 1962.

Let $\{\rho_n\}$ be a given sequence of constants satisfying $0 < \rho_n \uparrow \infty$. Let $\mu(r)$, defined on $[0,1]$, satisfy $\rho_1 < \mu(r) \uparrow \infty$ $(r \uparrow 1)$. The author proves that there exist a function $H(\zeta)$, regular in $|\zeta| < 1$ and satisfying $|H(\zeta)| < \mu(r)$ for $|\zeta| = r$, $0 \leq r < 1$, and an expanding sequence of Jordan curves $\{C_n\}$ with the properties: (i) for $n > n_0(\epsilon)$, C_n is contained in, and separates the circles bounding, the annulus $1 - \epsilon < |\zeta| < 1$; (ii) $|H(\zeta)| = \rho_n$ for all ζ on C_n. The construction is geometrical; H is obtained as a function mapping $|\zeta| < 1$ onto a suitable hyperbolic Riemann surface. (Math. Rev. abstract)

HOLOMORPHIC FUNCTIONS, OF ARBITRARILY SLOW GROWTH, WITHOUT RADIAL LIMITS, by G. R. MacLane. July 1961 [8]p. (AFOSR-3260) (AF 49(638)205) AD 611398 Unclassified

Also published in Michigan Math. Jour., v. 9: 21-34, Feb. 1962.

This paper exhibits a holomorphic function F in D such that M(r, F) tends to infinity with preassigned slowness and such that, for each θ,

$$\limsup_{r \to 1} F(re^{i\theta}) = \infty, \quad \liminf_{r \to 1} F(re^{i\theta}) = 0.$$

For his construction, the author first chooses two disjoint arcs C_{-1} and C_1 in $D \setminus \{0\}$ such that each radius of D meets both of these arcs. There exists a polynomial $\psi(z) = az + \cdots$ whose real part is less than -1 on C_{-1} and greater than 1 on C_1. A function of the form $F(z) = \Sigma A_n \psi(z^k n)$ has the required properties.

THE DETERMINATION OF COEFFICIENTS IN PARABOLIC DIFFERENTIAL EQUATIONS BY MEASUREMENTS IN THE INTERIOR OF THE MEDIUM, by B. F. Jones, Jr. July 1961, 7p. (AFOSR-1153) (AF 49(638)632) AD 264427 Unclassified

Consider the heat equation $\frac{\partial u}{\partial t} = a(t) \frac{\partial^2 u}{\partial x^2}$ in either a bounded medium with zero boundary values or in an infinite rod. Here both a(t) and u(x, t) are unknown. If certain initial values for u(x, t) are prescribed and if $u(x_o, t)$ is measured for all t and for some fixed x_o, then there is exactly one pair, a(t), u(x, t) satisfying the differential equation together with the boundary and initial conditions, and such that u(x, t) takes the required values at $x = x_o$. (Contractor's abstract)

NUMERICAL METHODS FOR INTEGRO-DIFFERENTIAL EQUATIONS OF PARABOLIC AND HYPERBOLIC TYPES, by J. Douglas, Jr. and B. F. Jones, Jr. [1961] [6]p. (AFOSR-1447) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)632 and Atomic Energy Commission) AD 407273 Unclassified

Also published in Numerische Math., v. 4: 96-102, 1962.

In a discussion on integro-differential equations which arise from physical problems, Volterra was led to the discussion of a parabolic integro-differential equation of the type:

$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + \int_0^t g(x, t)u(x, t)dt$. In this paper this equation is generalized and numerical procedures are given for finding u that are generalizations of the backward and Crank-Nicolson methods for differential equation . A somewhat similar hyperbolic integro-differential equation shall also be treated. The analyses are based on the energy methods of Lees for parabolic and hyperbolic partial differential equations. COLLISIONAL TRANSFER OF ELECTRONIC ENERGY BETWEEN CERTAIN POLYATOMIC MOLECULES (Abstract), by D. S. Weir, N. Ichikawa and others. [1961] [2]p. (AFOSR-247) [AF 49(638)679] Unclassified

Also published in Abstracts of Scientific Papers presented at Eighteenth Internat'l. Cong. of Pure and Applied Chemistry, Montreal (Canada) (Aug. 1961), Toronto U. Press, 1961, p. 33-34.

The acetone-sensitized fluorescent and phosphorescent emission of biacetyl has been known for many years. More recently Weir has shown that biacetyl emission

results when a mixture of 3-pentanone and biacetyl is exposed to radiation absorbed almost solely by the pentanone. As biacetyl emission increases, pentanone decomposition decreases so that energy transfer by collision of the second kind is strongly indicated. Since oxygen destroys triplet states of biacetyl and acetone either by chemical reaction or by quenching or by both, the generalization might be made that oxygen always prevents the oxygen-free behavior of triplet states. This assumption needs investigation. In mixtures of biacetyl and 2-hexanone the Norrish Type II process is not inhibited but triplet emission from biacetyl occurs. This suggests the presence of appreciable quantities of triplet-state molecules of 2-hexanone. Since dissociation into radicals (Norrish Type I) is a very minor process at room temperature, either there is a large amount of unidentified product (formed with a quantum yield greater than 0.5) or the majority of the triplet-state molecules undergo internal conversion to the ground state in the absence of biacetyl. Benzene in the singlet state produced at 2337A is very little self-quenched. The addition of biacetyl causes biacetyl emission with an efficiency which passes through a maximum as a function of pressure. In this case energy transfer from the singlet state of benzene to the biacetyl is probable. Acetaldehyde is very effective in sensitizing phosphorescent emission from biacetyl. On the other hand, there are peculiarities as a function of wavelength which are hard to understand. All of these sensitized emissions can be related to photochemical behavior. Tentatively certain generalizations about steric effects may be made.

A SIMPLE SYNTHESIS OF BICYCLO[2.1.1] HEXANE, by R. Srinivasan. [1961] [2]p. (AFOSR-597) [AF 49-(638)679] Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 2590-2591, June 5, 1961.

A new route for the synthesis of bicyclo[2.1.1]hexane is presented which may be particularly applicable to the hydrocarbons of this series. It was found that the vapor phase photolysis of norcamphor led to the formation of bicyclo[2.1.1]hexane , 1,5-hexadiene, and carbon monoxide. Bicyclo[2.1.1]hexane was separated from the other products by distillation and vapor phase chromatography. Structure and properties of the hexane are given as well as the possible application of this synthetic technique to other compounds.

MERCURY PHOTOSENSITIZED DECOMPOSITION OF NORCAMPHOR AND d-CAMPHOR, by W. A. Noyes, Jr. [1961] [5]p. incl. diagrs. refs. (AFOSR-1268) (AF 49(638)679) Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 4923-4927, Dec. 20, 1961.

The mercury photosensitized decomposition of norcamphor has been found to lead to carbon monoxide, 3 hydrocarbons of formula C_6H_{10} and a polymer as the major products. The 3 hydrocarbons have been identified as 1,5-hexadiene, allylcyclopropane and bicyclo[2.1.1]-hexane, respectively. The minor products included bicyclo[2.2.0]hexane and nortricyclene. The formation of 1,5-hexadiene and bicyclo[2.1.1]hexane along with CO is analogous to the formation of ethylene cyclobutane and CO in the photolysis of cyclopentanone. The mechanism of the formation of allylcyclopropane was traced by the use of norcamphor deuterated in the α-methylene group. The process probably involes a symmetric intermediate which can rearrange in 1 or 2 equivalent ways to give allylcyclopropane. Mercury sensitized decomposition of d-camphor gave carbon monoxide, 1,5,5-trimethylbicyclo[2.1.1]hexane, 5,6-dimethylheptadiene-1, 5 and a polymer as products. The bicyclic hydrocarbon was found to be optically active. The mercury sensitized decomposition of ketones derived from bicyclo[2.2.1]-heptane may be a useful route to the synthesis of hydrocarbons derived frombicyclo[2.1.1]hexane. (Contractor's abstract)

PHOTOCHEMISTRY OF CYCLOPENTANONE. I. DETAILS OF THE PRIMARY PROCESS, by R. Srinivasan. [1961] [4]p. incl. diagrs. tables, refs. (AFOSR-J684) (AF 49(638)679) AD 414921 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 4344-4347, Nov. 5, 1961.

In the photochemistry of cyclopentanone, three processes are known to be important. These lead to CO + $2C_2H_4$ (1), CO + $\overline{CH_2CH_2CH_2CH_2}$ (2) and 4-pentenal (3), respectively. Evidence is now presented to show that since there is no detectable light emission from cyclopentanone when excited at 3130A, and since oxygen does not suppress any of the processes, these processes probably do not arise from a triplet state. Photolysis of cyclopentanone in the presence of O_2^{18} does not lead to detectable amounts of cyclopentanone-O^{18}. The effect of pressure or of the addition of a foreign gas on the distribution of the products has been interpreted to mean that the relative importance of the three photochemical processes (which probably occur from the same upper singlet state) is dependent on the vibrational energy possessed by the molecule at the instant of decomposition. It is estimated that the lowest vibrational level at which the processes leading to carbon monoxide, i.e., (1) and (2) can still occur differ by 2.5 kcal from the lowest vibrational level from which process (3) can occur. The lack of a scavenging effect on the products through the addition of even 35.5 mm of oxygen suggests that the previously postulated diradical hypothesis for (1) and (2) should be reconsidered. (Contractor's abstract)

PHOTOCHEMISTRY OF CYCLOPENTANONE. II. TRANSFER OF VIBRATIONAL ENERGY FROM THE EXCITED STATE, by R. Srinivasan. [1961] [3]p. incl. diagr. tables. (AFOSR-J685) (AF 49(638)679) AD 414922 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 4348-4350, Nov. 5, 1961.

The photochemical production of carbon monoxide, ethylene, cyclobutane and 4-pentenal from cyclopentanone at constant temperature, pressure and wave length (3130A) have been studied as a function of the pressure of inert gases. Argon, hydrogen, methane, carbon dioxide, cyclopropane and cyclobutane have been used as inert gases. In all cases, over the pressure ranges used (10 to 400 mm), the amount of ketone photolyzed, as determined by mass balance, was independent of the total pressure. The results have been interpreted to mean that the vibrational energy of the ketone molecule is lost gradually (one or a few quanta at a time). From a quantitative interpretation of the data, relative efficiencies for the inert gases for the transfer of vibrational energy from cyclopentanone have been obtained. (Contractor's abstract)

BAND STRUCTURE OF SOLID ARGON (Abstract), by R. S. Knox and F. Bassani. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)679] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 293, Apr. 24, 1961.

The OPW method, as modified by Bassani and Celli has been used to compute the lowest-lying conduction states in (fcc) solid argon at the symmetry points Γ, X, L, and K. The 3s and 3p valence bands have been treated by simple tight binding theory. The potential consists of a sum of effective atomic potentials, where a free electron-like expression is used for the exchange contribution. The lowest conduction state appears to be Γ_1, lying 12.4 ev above the highest valence state (Γ_{15}). The reliability of the potential used will be discussed, and the results of the computation will be compared with present experimental and theoretical knowledge of the electronic structure of the solid rare gases.

PHOTOCHEMICAL PRIMARY PROCESS IN BIACETYL VAPOR AT 4358A, by W. A. Noyes, Jr., W. A. Mulac, and M. S. Matheson. [1961] [7]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)679] and Atomic Energy Commission) Unclassified

Published in Jour. Chem. Phys., v. 36: 880-886, Feb. 15, 1962.

At 4358A at room temperature the quantum yield for the primary dissociation of biacetyl increases with intensity. It is thus implied that the primary process is second order in some active species. By use of the rotating sector it is shown that the species responsible for this effect has a mean life close to that ascribed to an excited triplet state for biacetyl. At higher temperatures this intensity effect disappears and one of the products strongly inhibits both the phosphorescence and the primary dissociation. At these temperatures the data may best be treated by assuming that the triplet state of biacetyl undergoes a unimolecular dissociation with an activation energy of about 15 kcal. CAMERON-MARTIN TRANSLATION THEOREMS IN THE WIENER SPACE OF FUNCTIONS OF TWO VARIABLES, by J. J. Yeh. [1961] [12]p. (AFOSR-J1293) (AF 49(638)1046) AD 424218 Unclassified

Also published in Trans. Amer. Math. Soc., v 107: 409-420, June 1963.

The Cameron-Martin translation theorems have proved useful in the evaluation of various Wiener integrals. The analogue of 1 of these theorems for the integration of continuous functionals in the Wiener space of functions of 2 variables was considered by Kitagawa. In this article a rigorous statement together with a proof for the theorem of Kitagawa and the translation theorem for Wiener measurable sets and Wiener integrals of arbitrary measurable functionals are given.

A SURVEY OF NEUTRAL HYDROGEN AT HIGH GALACTIC LATITUDES, by W. C. Erickson, H. L. Helfer, and H. E. Tatel. [1958] [8]p. incl. diagrs. table. (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)52] and Convair Scientific Research Lab.) Unclassified

Published in Paris Symposium on Radio Astronomy. Cite U., Paris (France) (July 30-Aug. 6, 1958). Stanford, Stanford U. Press, 1959, p. 390-397. (AFOSR-4512)

Approximately 1000 observations of neutral hydrogen have been obtained with the 54-channel H-line receiver and the Würzburg antenna of the Carnegie Inst. of Washington. H-line profiles have been observed at 10

intervals along the ±20, ±30, and ±40 degree parallels of galactic latitude; at 20° intervals along the ±50 and ±60 degree parallels; at 40° intervals along the ±70 and ±80 degree parallels and at the poles. Approximately 2 dozen observations have been taken at points near the galactic plane in order to correlate these observations with the Leiden survey. The beamwidth of the Würzburg antenna was about 2°. The observations were taken in 2 series, one series during the summer of 1957, and the other during January 1958. The video frequency bandwidth of the receiver is 12 kc/sec. The profiles consist of averages of from 2 to 6 scans with integration times from 4.8 to 7.5 min. (Contractor's abstract)

ON THE VELOCITY FIELD OF THE NEARBY INTERSTELLAR HYDROGEN (Abstract), by H. L. Helfer. [1959] [1]p. (AF 49(638)52) Unclassified

Published in Astronom. Jour., v. 64: 128, May 1959.

This is a progress report upon the analysis of the 21-cm survey for $|b| \geq 20°$, undertaken at the Dept. of Terrestrial Magnetism, Carnegie Inst. of Washington. Rough agreement between Shain's local magnetic pole of the Galaxy, and the crudely defined pole of the high-latitude interstellar hydrogen suggests that the distribution of the interstellar gas is quite dependent upon the local magnetic field and that the possibility that the velocity-distance relation for the gas is different from that of the stars cannot be ignored. A solution for the velocity-distance relation of the nearby gas is attempted. Including only first order terms one may write for the radial velocity: $V(l,b) = a + sR$, where R is the distance and $s = K + \cos^2 b\,(C + B_1 \sin 2l + B_2 \cos 2l)\,(A_1 \sin l + A_2 \cos l) \sin 2b$, $a = W_1 \cos l \cos b + W_2 \sin l \cos b + W_3 \sin b$. The preliminary values are $K = 1.000$, $C = 0.820$, $B_1 = 0.311$, $B_2 = -0.182$, $A_1 = 0.743$, and $A_2 = -0.322$. The values of W_1, W_2, W_3, determined from the value of $V(1,b) - V(1 + 180°, -b)$ are found to be 1.24 km/sec, 2.62 km/sec, and -1.60 km/sec, respectively, but these values are quite crude. If accepted literally, this would suggest that the circular velocity of the local gas is about 3 km/sec faster than that of the stars.

EARLY EVOLUTION AT MASS TEN, by M. P. Savedoff and S. R. van Dyck. [1960] [5]p. incl. diagrs. [AF 49-(638)52] Unclassified

Published in Mem. Soc. Roy. Sci. Liege, Series 5, v. 3: 523-527, 1960.

An evolutionary sequence of star models has been computed assuming initially a homogeneous star of 10 solar masses with a composition X = .70, Y = .27, and Z = .03. With the inclusion of radiation pressure, numerical integrations were performed and it was found that the mass of the star interior to the point where the envelope becomes convectively unstable increases with time. The dominance of electron scattering at the inner boundary of the envelope means that a sudden decrease of the hydrogen content, presumably resulting from convective mixing, implies a stable temperature gradient. In summary, within numerical limitations and physical limitations imposed by rough treatment of the opacity, the sequence of models presented represents an evolutionary sequence which renders core hydrogen contents below X = .005 before any contractional energy sources appear. No large change in the estimated evolutionary time scale is indicated other than that anticipated for the difference assumed in composition.

THE KINEMATICS OF THE LOCAL GAS SYSTEM, by H. L. Helfer. [1961] [9]p. incl. diagrs. tables, refs. (AFOSR-127) (AF 49(638)52) Unclassified

Also published in Astronom. Jour., v. 66: 160-168, May 1961.

Some features of the 21-cm velocity measurements of hydrogen gas for $|b| \geq 20°$ are analyzed. An argument is presented for consideration of an expression for the residual velocity-distance relation of the form

R. V. (km/sec) $= 1.24 \cos l^I \cos b^I + 2.62 \sin l^I \cos b^I - 1.60 \sin b^I - Sr\{1 - [1.1 + \sin 2(l^I + 53°)] \cos^2 b^I + 0.25 \sin(l^I - 48°) \sin 2b^I\}$, where r is the distance and S is an unknown (positive) scale factor. Crude arguments suggest $S \sim 10$ km sec^{-1} kpc^{-1}. Some implications of these numerical values and of the assumption that the local gas system is associated with the stellar Gould's belt system are briefly discussed. (Contractor's abstract)

GAS DYNAMICS ON COSMIC SCALES, by M. L. Savedoff. Final rept Dec. 1, 1956-Nov. 30, 1961. 7p. incl. refs. (AFOSR-3055) (AF 49(638)52) Unclassified

The research of the various projects supported in whole or in part by this contract is briefly reviewed. H. L. Helfer and his collaborators have examined the detailed observational tests of current theories of nuclear genesis. By studying a large number of stars (now about 30) it has been shown that statistically significant abundances can be obtained for individual elements. From studies of high galactic latitude 21 cm emission of neutral hydrogen, a detailed model for the local notions of this gas was obtained. The virial theorem paper is an attempt to evaluate the reliability of masses of clusters of galaxies obtained from comparison of their dimensions and kinetic energies in the

absence of knowledge of their distribution of intergalactic matter. As the precise results depend significantly on the distribution of this matter one can explain the anomalously high masses deduced by these methods. M. L. Savedoff and S. R. van Dyck discovered that the Kushwaha models for the evolution of stars of 10 solar masses were inadequate in their representation of the extent of the internal convection zone. With S. Vila, savedoff has studied the stability of particular simple gas dynamic motion in the presence of a self-gravitational field. It is shown that the classical theory of Jeans does not lead to correct results. In fact, for a gas flow for which the pressure and density are related by $P \propto \rho^{\gamma}$, instability is found for $\gamma < 5/3$ during uniform collapse ($r \propto r$). Helfer and Savedoff found that in observing weak hydrogen signals, the uncertainties in the base line precluded any real determination of signal size. Current evidence for He^3/He^4 ratios in planetary and galactic nebulae shows no indications of He^3 as abundant as observed in Cosmic Rays by Appa Rao. Savedoff and Helfer have also discovered the possibility of an exponential term in the gravitational potential. This term would occur if the gravitational potential has a finite range.

THE INFLUENCE OF ISOTOPIC COMPOSITION ON THE MAXIMUM IN THE COSMIC RAY ENERGY SPECTRA, by M. V. K. Appa Rao and M. F. Kaplon. May 8, 1961 [10]p. incl. diagrs. refs. (AFOSR-875) [AF 49(638)303] AD 446541 Unclassified

Also published in Nuovo Cimento, Series X, v. 21: 369-372, July 16, 1961.

One of the interesting results obtained from measurements on the quiescent primary cosmic ray beam is the observation that the differential rigidity spectrum of the doubly charged component is similar to that of the singly charged component. Additionally, the observation of a maximum at low energies has been attributed as being due to a magnetic mechanism whose intensity is associated with the solar cycle. The possibility is examined that this maximum may arise in part from a misinterpretation of the data due to oversimplifying assumptions about the composition of the beam. It has recently been observed that the doubly charged component of cosmic rays contains an appreciable abundance of He^3-nuclei. The influence of this composition on the usual interpretation of the measurements, which do not recognize it, is examined here. It is shown that this leads, in part, to a maximum in the spectrum as conventionally deduced from observations. It is also shown that a maximum or the enhancement of 1 occurs due to plotting spectra on a basis of energy per nucleon instead of rigidity. It is shown that a maximum arises due to the lack of recognition of the He^3 component in the usual measurements coupled with the assumption that these are He^4.

ISOTOPIC COMPOSITION OF THE LOW-ENERGY HELIUM NUCLEI IN THE PRIMARY COSMIC RADIATION, by M. V. K. Appa Rao. [1961] [6]p. incl. diagrs. tables, refs. (AFOSR-4121) (AF 49(638)303) AD 446540 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 53, Feb. 1, 1961.

Also published in Phys. Rev., v. 123: 295-300, July 1, 1961.

The isotopic composition of the low-energy helium nuclei in the primary cosmic radiation has been determined by using the "constant sagitta" scattering method on the tracks of helium nuclei stopping in a nuclear-emulsion stack flown at a geomagnetic latitude $\lambda = 55°N$ and at a mean atmospheric depth of 8.5 g/cm^2; tracks with zenith angles less than 30° were accepted. The ratio of $He^3/(He^3 + He^4)$ for the same energy per nucleon (between 200 and 400 mev) is found to be 0.41 ± 0.09 at flight altitude. The correction for production of secondary He^3 in the residual atmosphere is calculated to be 4%. If one assumes that no He^3 nuclei are present at the source, the observed ratio corresponds to a traversal of 14 ± 3 g of interstellar matter by the low-energy helium nuclei. The value of $He^3/(He^3 + He^4)$ corresponding to the same magnetic rigidity (between 1.3 and 1.6 bv) is found to be 0.36 ± 0.11 which corresponds to a traversal of 12.2 ± 3.5 g of interstellar matter. The observed ratio may indicate the presence of He^3 at the source of cosmic rays, or may be a reflection of local production within the solar system. (Contractor's abstract)

THE $He^3/(He^3 + He^4)$ RATIO IN PRIMARY COSMIC RADIATION, by M. V. K. Appa Rao. [1961] [5]p. incl. diagrs. tables. (AFOSR-4124) [AF 49(638)303] AD 446539 Unclassified

Also published in Jour. Geophys. Research, v. 67: 1289-1293, Apr. 1962.

The ratio $R = He^3/(He^3 + He^4)$ is determined using a nuclear emulsion stack exposed at the geomagnetic latitude 61°N on August 3, 1958, under 3.8 g/cm^2 of matter. The ratio R found at the top of the atmosphere is 0.31 ± 0.08 for the same energy per nucleon (160-355 mev) and 0.33 ± 0.08 for the same rigidity (1.05 - 1.48 bv). These values are lower than previous observations, but in agreement within the statistical errors, thus implying very little or no time variation in the ratio R over a period of one year. PHOTON DEGENERACY IN LIGHT FROM OPTICAL MASER AND OTHER SOURCES, by L. Mandel. [1961] [2]p. incl. refs. (Technical note no. 6) (AFOSR-91) [AF 49(638)602] Unclassified

Also published in Jour. Opt. Soc. Amer., v. 51: 797-798, July 1961.

The purpose of this note is to compare δ (the average number of photons in the light beam which are to be found in the same quantum state, or in the same cell of phase space) for a number of sources and to draw attention to the very large values of δ which can now be obtained for visible light from recently developed optical masers. The expression is shown to be in good approximation by the Einstein expression for degeneracy of black body radiation in an enclosure. It follows that, for normal incandescent sources at temperatures of a few thousand degrees K, beams have degeneracies of the order 3×10^{-4}, while values of 10^{-3} are obtainable from gas discharge sources. In optical masers, on the other hand, with surface coherence across the source, degeneracies as high as 5×10^7 are observed. Suggestions are made as to how this property will be of great value in laboratory experiments involving photon correlation.

NOTE ON THE PROOF OF "GABOR'S EXPANSION THEOREM", by K. Miyamoto. [1961] [2]p. (Technical note no. 7) (AFOSR-411) (AF 49(638)602) Unclassified

Also published in Jour. Opt. Soc. Amer., v. 51: 910-911, Aug. 1961.

A note of clarification is added to the author's article, "On Gabor's Expansion Theorem" (item no. 2407, Vol. IV). It is pointed out that the formula $u(x, y, z) = \sum_{j=1}^{\infty} a_j(z) f_j(x, y)$ and the formula $k^2(s_x^2 + s_y^2) = \beta_j$ are valid only in the neighborhood of the object area. A different expansion of $u(x, y, z)$ is needed for the region between the object area and the aperture. A mathematical analysis of the transition from the object area to the aperture is then presented.

SOME PROPERTIES OF COHERENT LIGHT, by L.

Mandel and E. Wolf. [1961] [5]p. incl. diagr. (Technical note no. 8) (AFOSR-412) (AF 49(638)602) Unclassified

Also published in Jour. Opt. Soc. Amer., v. 51: 815-819, Aug. 1961.

The present paper is concerned with the study of some general properties of coherent light. A clear definition of coherence is given, which appears to be preferable to definitions previously proposed by other authors. Several new theorems relating to correlation functions and the spectral density functions of coherent light are derived. The results are used to establish the Huygens-Fresnel principle for a coherent optical field. This principle has previously been freely apolied to such a field, although the validity of the principle has only been justified for the much more idealized (and physically unrealizable) case of a field which is strictly monochromatic. The present formulation of the Huygens-Fresnel principle involves only observable quantities and not the instantaneous amplitudes and the instantaneous phases of the light vibrations. CONCEPT OF CROSS-SPECTRAL PURITY IN COHERENCE THEORY, by L. Mandel. [1961] [9]p. incl. diagrs. tables, refs. (Technical note no. 11) (AFOSR-570) (AF 49(638)602) Unclassified

Also published in Jour. Opt. Soc. Amer., v. 51: 1342-1350, Dec. 1961.

An examination of the conditions under which the normalized coherence function $\gamma(x_1, x_2, \tau)$, at 2 points x_1 and x_2 in an optical field, is reducible to the product of a function of x_1, x_2 and a function of τ leads to the concept of spectral purity. Spectrally pure beams of light are characterized by the property that their coherence function is so reducible and, operationally, by the fact that superposition does not affect the spectral distribution. Light beams that do not have this property are spectrally impure and it is shown to be characteristic of such beams that the interference fringes exhibit a detailed periodic coloring. A measure of the departure from spectral purity is introduced and evaluated in some special cases. It is shown by an example that spectrally pure and spectrally impure beams of light may be derived from the same source with similar optical components. Moreover, these beams may be identical as regards their intensity, their spectral distribution and their degree of coherence and differ only as regards their state of spectral purity.

COHERENCE PROPERTIES OF ELECTROMAGNETIC RADIATION; REPORT ON CONFERENCE, Rochester U. Inst. of Optics, June 27-29, 1960, ed. by R. E. Hopkins and E. Wolf. Apr. 1961, 125p. incl. illus diagrs. refs. (Technical note no. 5) (AF 49(638)602) AD 256057 Unclassified

Published in part in Phys. Today, v. 14: 28-34, May 1961.

The aim of this conference was to provide a forum for the exchange of ideas between scientists carrying out research on various aspects of coherence, especially in connection with coherent scattering, stimulated emission, propagation of partially coherent light, intensity interferometry, and coherence problems of instrumental optics and of radio astronomy. The committee aimed at arranging a conference of an informal nature and for this reason no written contributions were solicited. However, to meet at least partially the numerous requests for some permanent record of the conference, the present report was prepared. It consists of a preprint of a review article which appeared in "Physics Today" (see above) an account of the introductory talk and abstracts or condensed version of the majority of the papers presented at the meeting.

GENERALIZATION OF THE MAGGI-RUBINOWICZ THEORY OF THE BOUNDARY DIFFRACTION WAVE. PART I, by K. Miyamoto and E. Wolf. [1961] [11]p. incl. diagrs. refs. (Technical note no. 9) (AFOSR-793a) (AF 49(638)602) Unclassified

Also published in Jour. Opt. Soc. Amer., v. 52: 615-625, June 1962.

As a first step towards a generalization of the Maggi-Rubinowicz theory of the boundary diffraction wave, a new vector potential W(Q, P) is associated with any monochromatic scalar wavefield U(P). This potential has the property that the normal component of its curl, taken with respect to the coordinates of any point Q on a closed surface S surrounding a field point P, is equal to the integrand of the Helmholtz-Kirchhoff integral; that is,

$$\mathrm{curl}_Q W(Q, P)\cdot n = \frac{1}{4\pi}\left\{U(Q)\frac{\partial}{\partial n}\left(\frac{\exp(iks)}{s}\right) - \frac{\exp(iks)}{s}\frac{\partial}{\partial n}U(Q)\right\},$$

where s is the distance QP and $\partial/\partial n$ denotes the differentiation along the inward unit normal n to S. Further it is shown that the vector potential always has singularities at some points Q on S and that the field at P may be rigorously expressed as the sum of disturbances propagated from these points alone. A closed expression for the vector potential associated with any given monochromatic wavefield that obeys the Sommerfeld radiation condition at infinity is derived and it is shown that in the special case when U is a spherical wave, this expression reduces to that found by G. A. Maggi and A. Rubinowicz in their researches on the boundary diffraction wave.

Rochester U. Dept. of Physics and Astronomy, N. Y.

GENERALIZATION OF THE MAGGI-RUBINOWICZ THEORY OF THE BOUNDARY DIFFRACTION WAVE, PART II, by K. Miyamoto and E. Wolf. [1961] [12]p. incl. diagrs. refs. (Technical note no. 10) (AFOSR-793b) (AF 49(638)602) Unclassified

Also published in Jour. Opt. Soc. Amer., v. 52: 626-637, June 1962.

With the help of the results derived in Part I of this investigation, a new representation is obtained for the field arising from diffraction of a monochromatic wave by an aperture in an opaque screen. It is shown that within the accuracy of the Kirchhoff diffraction theory, the diffracted field $U_K(P)$ may be expressed under very general conditions in the form

$$U_K(P) = U^{(B)}(P) + \Sigma_j F_j(P).$$

Here $U^{(B)}$ represents a disturbance originating at each point of the boundary of the aperture and $\Sigma_j F_j(P)$ represents the total effect of disturbances propagated from certain special points Q_j in the aperture. Expressions for $U^{(B)}$ and $F_j(P)$ are given, in terms of the new vector potential which was introduced in the previous paper (item no. 2569, Vol. 7). In the special case when the wave incident upon the aperture is plane or spherical, the last term in (1) is found to represent a wave disturbance $U^{(G)}(P)$ which obeys the laws of geometrical optics. The formula (1) then becomes equivalent to a classical result of Maggi and Rubinowicz, which may be regarded as a mathematical refinement of early ideas of Young about the nature of diffraction. It is shown further, that even when the incident wave is not plane or spherical, the last term in (1) is, at least approximately, equal to a "geometrical wave." The results suggest a new approach to the solution of certain types of diffraction problems and provide a new insight into the process of diffraction.

CORRELATION IN THE FLUCTUATING OUTPUTS FROM TWO SQUARE-LAW DETECTORS ILLUMINATED BY LIGHT OF ANY STATE OF COHERENCE AND POLARIZATION, by L. Mandel and E. Wolf. [1961] [7]p. incl. refs. (Technical note no. 12) (AFOSR-1152) (AF 49(638)602) Unclassified

Also published in Phys. Rev., v. 124: 1696-1702, Dec. 15, 1961.

By treating light fluctuations as a random process (stationary and Gaussian to second order), an expression is derived for the correlation in the output fluctuations of two square-law detectors which are illuminated by a plane light wave of any state of coherence and polarization. The expression takes a particularly simple form when, as is usually the case, the light is spectrally pure in the sense of a definition introduced elsewhere. The solution yields as a special case, the basic formula relating to the Hanbury Brown-Twiss effect. The generalization discussed here is of particular interest for correlation experiments performed with light beams from optical maser sources. Moreover, the present analysis appears to be simpler than other treatments previously given in connection with more restricted cases. (Contractor's abstract)

CONSISTENCY OF RAYLEIGH'S DIFFRACTION FORMULAS WITH KIRCHHOFF'S BOUNDARY CONDITIONS, by N. Mukunda. [1961] [2]p. incl. diagrs. (AFOSR-1180) [AF 49(638)602] Unclassified

Also published in Jour. Opt. Soc. Amer., v. 52: 336-337, Mar. 1962.

The purpose of this report is to clear up a point concerning Rayleigh's diffraction formulas and Kirchoff's boundary conditions. As is well known, when the Helmholtz-Kirchhoff integral formula is applied to the problem of determining the field diffracted by an aperture, and the field in the plane of the aperture is approximated by Kirchhoff's boundary conditions, a solution is obtained which is mathematically inconsistent. The inconsistency arises from the fact that in this formulation the boundary values for the wave function U and its normal derivative $\partial U/\partial n$ are specified on the plane of the screen independently; however, under circumstances the specification of either U or $\partial U/\partial n$ is sufficient to determine the solution uniquely and so these 2 quantities may not be prescribed independently. The inconsistency is clearly manifested by the fact that the solution U(P) given by the Helmholtz-Kirchhoff formula (plus Kirchhoff's boundary condition) does not recover the assumed boundary values as the point P approaches the plane of the aperture. However, from the analysis it follows that the discontinuous normal derivative assumed in Kirchhoff's boundary conditions is recovered by the second Rayleigh formula. A detailed example of this point is given.

EQUATIONS GOVERNING THE PROPAGATION OF SECOND-ORDER CORRELATIONS IN NON-STATIONARY ELECTROMAGNETIC FIELDS, by Y. Kano. [1961] 18p. (AFOSR-1474) (AF 49(638)602) Unclassified

Also published in Nuovo Cimento, Series X, v. 23: 328-338, Jan. 16, 1962.

The main results of E. Wolf and P. Roman relating to the propagation of second-order correlations in electromagnetic fields are generalized to the case of a non-stationary field containing currents and charges. The basic differential equations relating the correlations are derived. They fall into 2 groups, one of which contains only differential equations of the first order, but involves

certain parameters that seem difficult to be determined experimentally. When these quantities are eliminated a second set of equations is obtained. Equations of this set are of a higher order but they contain only the electric and magnetic correlation tensors and a tensor characterizing the correlation in the electric currents. FLUCTUATIONS OF LIGHT BEAMS, by L. Mandel. [1961] [106]p. incl. diagrs. refs. (AFOSR-1714) (AF 49(638)602) Unclassified

Also published in Prog. in Opt., v. 2: 183-248, 1963.

The subject of radiation fluctuations is discussed in some detail starting with an historical introduction followed by a discussion of the wave picture of light, practical applications, and a section on the particle picture. Two appendices are included dealing with the connection between the correlations of real and complex wave functions and the derivation of the distribution p(n, T, t). The representation of the wave amplitude, envelope and intensity fluctuations, intensity correlations in partially coherent fields, the effect of partial polarization, and the spectral density of the intensity fluctuations are well discussed. The practical applications of the wave picture include the measurement of intensity correlation, correlation between band limited signals, the problem of noise, stellar correlation interferometry, and the determination of spectral line profiles. The section on the particle picture includes parts on the photon wave function in configuration space and the probability of photo-emission, the probability distribution of the photo-electric counts, correlation between counting fluctuations, partially polarized light beams, and bunching effects and excess counting coincidence.

THE BOUNDARY DIFFRACTION WAVE IN THE PRESENCE OF ABERRATIONS (Abstract), by K. Miyamoto and E. Wolf. [1961] [1]p. [AF 49(638)602] Unclassified

Presented at meeting of the Opt. Soc. Amer., Pittsburgh, Pa., Mar. 3, 1961.

Published in Jour. Opt. Soc. Amer., v. 51: 478, Apr. 1961.

In a paper presented at the previous meeting of the Opt. Soc. of Amer., it was shown that diffraction of any wave by an aperture may be regarded as interference between a wave originating in the boundary of the aperture (boundary wave) with waves propagated from certain special points within the aperture. In the present paper the generalized theory of the boundary diffraction wave is applied to the useful case where the wave incident upon the aperture is adequately represented by geometrical optics. A simple expression is derived for the associated vector potential. The asymptotic behavior of the solution, for large value of the propagation constant $k = 2\pi/\lambda$ (λ being the wave length) is examined and is compared with the asymptotic behavior of the solution based on Kirchhoff's diffraction theory. It is shown that the effect of the special points in the aperture is precisely the same as that of the critical points of the first kind in Kirchhoff's theory and that the leading terms in the expansion of the boundary wave are the same as the contributions from critical points of the second and third kind.

THE HUYGENS-FRESNEL PRINCIPLE FOR COHERENT WAVE FIELDS (Abstract), by L. Mandel and E. Wolf. [1961] [1]p. [AF 49(638)602] Unclassified

Presented at meeting of the Opt. Soc. Amer., Pittsburgh, Pa., Mar. 3, 1961.

Published in Jour. Opt. Soc. Amer., v. 51: 478, Apr. 1961.

Although the Huygens-Fresnel Principle (in its elementary form) is usually justified as an approximate propagation law for strictly monochromatic fields, it is in fact applied in practice to a much broader class of fields, namely to those which are coherent. A justification of the validity of the Huygens-Fresnel Principle for such fields will be discussed from the standpoint of modern coherence theory. For this purpose the concept of full coherence will be re-examined and a generalization will be given about the form of the mutual coherence function of a fully coherent wavefield. The results are also useful in determining the limiting forms of certain theorems (e.g. those relating to frequency response analysis for partially coherent illumination) which were established in the field of partial coherence in recent years.

PROPAGATION OF MUTUAL COHERENCE IN A MATERIAL MEDIUM (Abstract), by J. C. Urbach. [1961] [1]p. [AF 49(638)602] Unclassified

Presented at meeting of the Opt. Soc. Amer., Pittsburgh, Pa., Mar. 3, 1961.

Published in Jour. Opt. Soc. Amer., v. 51: 478, Apr. 1961.

It is known that the mutual coherence function in vacuo obeys 2 wave equations. A question arises as to the behavior of mutual coherence in a dispersive material medium. It is shown that in a homogeneous isotropic medium the mutual coherence function obeys an integro-differential equation. In the case of certain non-dissipative media, the kernel of the integral in this equation can be found explicitly. Approximate forms of the equation are derived, these may prove useful in some applications.

BAND STRUCTURE OF SOLID ARGON, by R. S. Knox and F. Bassani. Apr. 1961, 23p. incl. diagr. tables, refs. (Technical rept. no. 8) (AFOSR-950) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)432 and Atomic Energy Commission) AD 259698 Unclassified

Also published in Phys. Rev., v. 124: 652-657, Nov. 1961.

The orthogonalized plane wave method in the perturbation approximation of Bassani and Celli is used to compute the lowest-lying conduction states in (f. c. c.) solid argon at the symmetry points Γ, X, L, and K. The 3s and 3p valence bands are treated by tight-binding theory. The potential used in the computation consists of a sum of effective atomic potentials in which a free-electron-like expression is used for the exchange contribution. The lowest conduction state appears to be s-like (Γ_1), lying 12.4 ev above the highest valence state (Γ_{15}). The results of the computation are compared with present theoretical and experimental knowledge of the electronic structure of solid rare gases. (Contractor's abstract)

[OPTICAL AND ELECTRICAL PROPERTIES OF SOLIDS], by D. L. Dexter and R. M. Blakney. Final rept. Sept. 1, 1958-Aug. 31, 1961 [14]p. incl. refs. (AFOSR-1485) (AF 49(638)433) AD 268434 Unclassified

The central aim of the research accomplished under this contract has been an increased understanding of the processes of optical excitation and energy transfer in insulators and semiconductors, based on experimental studies of absorption, luminescence, photoconductivity, and photo-emission. Emphasis has been placed on those phenomena which are properties of the pure material, or of the simpler kinds of lattice imperfections. This report summarizes the work done along these lines at the Inst. of Optics during the past 3 years.

PHOTOCONDUCTIVITY IN RbI AND KI, by Y. Nakai and K. Teegarden. [1961] [5]p. incl. diagrs. (AFOSR-2150) [AF 49(638)433] Unclassified

Presented at the 1961 Internat'l. Conf. on Photoconductivity, Cornell U., Ithaca, N. Y., Aug. 21-24.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 483, Nov. 24, 1961.

Also published in Jour. Phys. and Chem. Solids, v. 22: 327-331, Dec. 1961.

A threshold for intrinsic photoconductivity has been observed in RbI and KI at room temperature and lower temperatures. These experiments were carried out with an electrode arrangement quite different from that employed previously by Teegarden and in a considerably cleaner vacuum. Photoconductivity occurs on the short wavelength side of the first exciton band in the region of the shoulder previously ascribed to the onset of band-to-band transitions. Photoconductivity also can occur on the long wavelength side of the first exciton peak when F-centers or other kinds of electron-surplus centers, formed by irradiation with ultraviolet light, are present in the crystals. PHOTOCONDUCTIVITY AND THE EXTERNAL PHOTOELECTRIC EFFECT IN PbS, by A. Smith and D. Dutton. [1961] [13]p. incl. diagrs. refs. (AFOSR-2151) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)433] and National Aeronautics and Space Administration) Unclassified

Presented at the 1961 Internat'l. Conf. on Photoconductivity, Cornell U., Ithaca, N. Y., Aug. 21-24.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 484, Nov. 24, 1961.

Also published in Jour. Phys. and Chem. Solids, v. 22: 351-363, Dec. 1961.

The yields for photoconductivity and external photoemission in the vacuum UV spectral region, 584-3000A, were measured using polycrystalline layers and natural crystals. The photoconductive yield in PbS layers rises approximately linearly with incident photon energy $h\nu$ up to 7.5 ev; further extension of the measurement was thwarted by the magnitude of the external photocurrent. The rise in yield, as reported previously (see item no. ROC.04:009, Vol. III), is attributed to collision multiplication beginning as $h\nu_t = 2$ ev. The observed photoelectric threshold for galena crystals was ~ 5 ev, and for

layers ~ 6 ev. Both kinds of specimen exhibit very large external photoyields at high hν: 10-20% at hν = 14.5 ev. The energy distribution of emitted electrons was examined using retarding-potential methods. The high photoelectric thresholds imply that any electron with sufficient energy to escape would be subject to scattering due to collision multiplication, an effect expected normally to limit the attainable photoelectric yield. From the observed high ultimate yields as well as the changes in the energy distribution of the emerging electrons with increasing hν, it is concluded that scattering by collision multiplication, considered as a function of hν, is not a monotonically rising function, but has a max. The data suggest strongly that this occurs for incident photon energies of slightly more than 9 ev. (Contractor's abstract)

CREATIVE THINKING AND COMPUTING MACHINES IN OPTICAL DESIGN, by R. E. Hopkins and G. Spencer. [1961] [5]p. incl. diagrs. tables. (AFOSR-J40) [AF 49-(638)668] AD 297159 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 52: 172-176, Feb. 1962.

Present optical programs of the Rochester U. Inst. of Optics, are made up of a group of subroutines which may be used in a large variety of ways. These routines are automatic first- and third-order aberration, fifth-order aberration, ray tracing, energy distribution, and tolerance analysis. The design procedure is to string these routines together into iterative loops. As the design nears completion a high and higher degree of automation is possible. Perhaps the greatest value of the computer is that it enables designers to explore some of their wildest ideas. The program is flexible enough to allow individual differences in the method of approaching the design. (Contractor's abstract)

ON GUIDANCE AND LANDING ACCURACY REQUIREMENTS IN RE-ENTRY TRAJECTORIES, by L. Broglio. June 1961, 51p. incl. diagrs. (Technical note no. 5; SIARgraph no. 63) (AFOSR-2726) (AF 61(052)198) AD 294976 Unclassified

Problems referring to re-entry trajectory guidance requirements are solved. Errors is velocity and angles, represented by means of errors in limiting conic parameters, produce variations in maximum deceleration, total heat transferred, angular ranges, etc. Charts to evaluate such variations are described. Perturbations with respect to the simplifying assumptions are considered, and general small-perturbations theory is developed. Any perturbation gives rise to changes in the limiting conic parameters; by considering the effect of a unit perturbation, the effect of a distributed set of them is obtained by simple integration. APPLICATIONS OF THE THEORY OF THE GENERAL HODOGRAPH EQUATION. PART I. KIRCHHOFF-HELMHOLTZ FLOW PAST A WEDGE, by A. G. Mackie. [1961] [7]p. incl. diagr. (AF 61(514)1170)
Unclassified

Published in Proc. Cambridge Philos. Soc., v. 58: 631-637, Oct. 1962.

The solutions of the equation $\frac{\partial^2 \psi}{\partial \sigma^2} + k(\sigma)\frac{\partial^2 \psi}{\partial \theta^2} = 0$ obtained by the author are applied to determine the Kirchhoff-Helmholtz flow past a wedge in which the free stream Mach number has any value from 0 to 1 inclusive. For small wedge angles the results are developed further and expressions are found for the drag coefficient and for the asymptotic shape of the free streamlines far downstream. While general formulae are obtained for an arbitrary function $k(\sigma)$, more detailed results are given for the particular function $k(\sigma)$ which corresponds to the case of a polytropic gas. APPLICATIONS OF THE THEORY OF THE GENERAL HODOGRAPH EQUATION. PART II. THE NON-SYMMETRIC FLOW AT SONIC SPEED PAST A FLAT PLATE, by A. G. Mackie. [1961] [8]p. incl. diagrs. table. (AF 61(514)1170) Unclassified

Published in Proc. Cambridge Philos. Soc., v. 58: 638-645, Oct. 1962.

For a gas with a general equation of state the stream function for the flow past a flat plate is determined when the plate is held at an angle $(1/2)\pi - \alpha$ to the stream. At infinity the Mach number $M_1 = 1$, extend from the edges of the plate to infinity downstream. The method of solution requires the determination of the correct singularity corresponding to the free stream and the subsequent satisfying of the boundary conditions. The drag coefficient is determined in the form of a contour integral and the computational problems in evaluating the drag are discussed. The integral is evaluated for small values of α for a gas with an equation of state as given by Tomotika and Tamada. (Contractor's abstract)

FURTHER STUDIES ON THE HODOGRAPH METHOD IN GAS DYNAMICS, by D. C. Pack, J. B. Helliwell, and A. G. Mackie. Final technical rept. June 1961. 5p. (AFOSR-917) (AF 61(052)407) AD 264002
Unclassified

The flow of a free stream past a wedge profile at incidence has been examined for the Roshko and Weinstein-Cole models, with the stagnation point forced to be at the tip of the wedge. The free stream singularity consisted of a dipole and a simple pole. The solution of the boundary value problem for a wedge placed centrally in a channel was formulated in terms of dual integral equations. Lift coefficients and the dimensions of the profile have been computed as functions of the transonic similarity parameter. The generalized hodograph equation has been solved to determine the Kirchhoff-Helmholtz flow past a wedge with free stream Mach number between zero and unity. The variation of drag coefficient with Mach number has been studied and asymptotic forms found for the free streamlines downstream. The stream function has also been found for the flow of a general gas past a flat plate held at an angle of incidence in a sonic stream, and the drag coefficient expressed in analytical form. A FLOW PATTERN AT HIGH SUBSONIC SPEEDS PAST A WEDGE AT INCIDENCE IN A FREE STREAM AND A CHOKED CHANNEL, by J. B. Helliwell. Aug. 1961, 22p. incl. diagrs. tables, refs. (Technical note no. 2) (AFOSR-2213) (AF 61(052)407) AD 613747
Unclassified

Also published in Jour. Math. and Phys., v. 40: 1-22, Apr. 1961.

The flow pattern past a thin wedge-like profile set at a small angle of attack in a gas flowing with high subsonic velocity is discussed on the transonic approximation, by the hodograph method. In the model considered, the flow has a stagnation point at the nose of the wedge and limit

lines (on which the velocity is sonic) extend from the shoulders of the wedge normally into the free stream; the distances from the nose to the shoulders are unequal. The problem leads to dual integral equations with Bessel function kernels, which are solved for the cases where the wedge is in an unbounded stream and in a channel completely choked by the limit lines. The lift and drag coefficients are calculated. (Math. Rev. abstract)

[LIQUID FLOW IN TUBES. VI.] VISCOSITY DATA ON FLOWS OF DILUTED WATER THROUGH CYLINDRICAL PIPES, by E. R. Lindgren. Dec. 1, 1961 [24]p. incl. illus. diagrs. refs. (Technical note no. 3) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)375, Swedish Natural Science Research Council, and Swedish State Council of Technical Research) AD 271796 Unclassified

Also published in Arkiv Fysik, v. 22: 503-515, 1962.

This report deals with pressure drop measurements on flows of distilled water through cylindrical, plexiglass pipes. In some cases there is an increase of the apparent dynamic viscosity with increasing rates of flow. However, the present experiments indicate a systematic decrease of this effect with decreasing tube diameter, so that even a decrease of the viscosity with increasing flow rate has been recorded. Furthermore, the experiments indicate a systematic increase of the absolute viscosity values with increasing tube diameter. Altogether the present experiments give a rather confused picture of the viscous properties of Aqua Distillata. There is an urgent need for other independent investigations, in order to check the findings of the present experiments. (Contractor's abstract)

STUDIES ON THE HYDROLYSIS OF METAL IONS. PART 35. THE HYDROLYSIS OF THE LANTHANUM ION, La^{+3}, by G. Biedermann and L. Ciavatta. [1961] [20]p. incl. diagrs. tables, refs. (Technical note no. 12) (AFOSR-198) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)162 and Swedish Natural Science Research Council) AD 611300 Unclassified

Also published in Acta Chem. Scand., v. 15: 1347-1366, 1961.

The hydrolysis equilibria of the La^{+3} ion have been studied at 25°C by hydrogen ion concentration measurements. The total $[La^{+3}]$ ion concentration was varied between 0.1 and 1.0 while the ClO_4^- ion was held constant at 3 M by the addition of $LiClO_4$. These data, which indicate a slight hydrolysis in the log h range -6.5 to -8.1, can be explained by assuming the equilibria

$$La^{+3} + H_2O \rightleftharpoons LaOH^{+2} + H^+ \qquad \log\beta_{1,1} = -10.1 \pm 0.1 \quad (1)$$

$$2La^{+3} + 11_2O \rightleftharpoons La_2OH^{+5} + H^+ \qquad \log\beta_{1,2} = -9.9_5 \pm 0.1 \quad (2)$$

$$5La^{+3} + 9H_2O \rightleftharpoons La_5(OH)_9^{+6} + 9H^+ \qquad \log\beta_{9,5} = 71.4_5 \pm 0.1 \quad (3)$$

Equally good agreement with the data is obtained by replacing equilibrium (3) with

$$6La^{+3} + 10H_2O \rightleftharpoons La_6(OH)_{10}^{+8} + 10H^+ \qquad \log\beta_{10,6} = 78.7_5 \pm 0.1 \quad (4)$$

No other mechanism involving the formation of only three hydrolyzed species, could be found which would explain the experimental data. (Contractor's abstract, modified)

HIGH-SPEED COMPUTERS AS A SUPPLEMENT TO GRAPHICAL METHODS. I. FUNCTIONAL BEHAVIOR OF THE ERROR SQUARE SUM, by L. G. Sillén. [1961] [14]p. incl. diagrs. refs. (Technical note no. 14) (AFOSR-3216) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)162, Swedish Atomic Energy Research Council, and Swedish Natural Science Research Council) AD 287117 Unclassified

Also published in Acta Chem. Scand., v. 16: 159-172, 1962.

The paper discusses the principles underlying "LETAGROP", a computer program being used for calculating, from experimental data (y_i, a_{1i}, a_{2i}...), (i = 1... n), a set of unknown constants k_r (r = 1,...N), assuming a functional relationship $y = f(k_r, a_1, a_2...)$. The "best" values k_r'' searched for, are those that minimize the error square sum U. The method may be described as a generalized least-squares method, valid also for non-linear and implicit functions, which are hard to treat by the standard treatment for linear functions or by the Gauss' approximation method. The functional behavior of U ($k_1 \ldots k_N$) is discussed for the general linear case, and for N = 1 and N = 2. The standard deviations D_r are interpreted geometrically by means of the extreme values $k_r'' \pm D_r$ of each k_r on the D boundary, defined by $U - U_0 = \sigma^2$. A high-speed computer can very easily map U ($k_1 \ldots k_N$), even for non-linear and implicit functions. As an approximation it is assumed that U is a second-degree function of the k_r; then $\frac{1}{2}(N + 1)(N + 2)$ points suffice to calculate the position of the minimum and the D boundary. Starting from a first, approximate set k_r', the best values k_r'' are reached by (usually only 2 or a few) successive approximations. The need for choosing the k_r as independent as possible is pointed out. The limitations of the whole least squares approach are discussed. At present there seems to be still more need for better chemical work than for better statistical treatment. (Contractor's abstract)

HIGH-SPEED COMPUTERS AS A SUPPLEMENT TO GRAPHICAL METHODS. II. SOME COMPUTER PROGRAMS FOR STUDIES OF COMPLEX FORMATION EQUILIBRIA, by N. Ingri and L. G. Sillén. [1961] [19]p. incl. diagrs. table. (Technical note no. 15) (AFOSR-3217) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)162, Swedish Atomic Energy Research Council, and Swedish Natural Science Research Council) Unclassified

Also published in Acta Chem. Scand., v. 16: 173-191, 1962.

A series of programs for high-speed electronic computers have proved useful in investigations on equilibria with polynuclear complexes. The programs are so constructed, that, when a new system is to be studied, only a small part (the "SP") needs to be rewritten (and this is easily done) whereas the main part (the "HP") can be used without change. It could also be used for problems from other fields, chemical or not. The programs KUSKA, PROKAUS, PROKAIS, HALTA and LETAGROP are given in full — written in Ferranti Mercury Autocode — their principles are discussed, and some initial difficulties of a general interest are pointed out. LETAGROP may be called a generalized least-squares method for finding a set of unknown constants from experimental data, even with a non-linear and implicit functional relationship. The principles of LETAGROP were indicated in part I. (Contractor's abstract)

The crystal structures of a basic aluminum sulfate, $Al_2O_3 \cdot 2SO_3 \cdot 11H_2O$, and the isomorphous selenate have been investigated by means of x-ray crystallographic methods. The crystals are monoclinic and the space group, $P2_1/n$. The unit cell dimensions are: a = 8.15A, b = 12.48A, c = 8.40A, β = 101.9° for the sulfate and a = 8.26A, b = 12.76A, c = 8.48A, β = 102.1° for selenate. The structure contains discrete aluminum-oxygen complexes of the composition Al_2O_{10}, which are built up from 2 AlO_6 octahedra sharing an edge. The hydrogen atoms have been located by indirect methods. Their positions indicate that the formula for the Al_2O_{10} group should be written $[Al_2(OH)_2(H_2O)_8]^{4+}$. These ions are joined by means of hydrogen bonds to the oxygen atoms of the sulfate or the selenate groups and the water molecules. (Contractor's abstract)

ON THE CRYSTAL STRUCTURE OF $Na_4Ge_9O_{20}$, by N. Ingri and G. Lundgren. [1961] [9]p. incl. diagrs. tables, refs. (Technical note no. 18) (AFOSR-3773) (AF 61-(052)162) Unclassified

Also published in Arkiv Kemi, v. 18: 479-487, 1961.

An x-ray investigation of the crystal structure of $Na_4Ge_9O_{20}$ has been started. The crystals are tetragonal ($a = 14.98 \pm 0.01A$, $c = 7.384 \pm 0.005A$) and belong to space group no. 88, $I4_1/a$. The positions of the 36 germanium atoms in the unit cell have been determined. The positions of the sodium and oxygen atoms will be given in a forthcoming publication; until then it is not possible to decide whether the structure contains discrete polyanions or not. (Contractor's abstract)

STUDIES ON THE HYDROLYSIS OF METAL IONS. PART 38. THE HYDROLYSIS OF MERCURY(II) IN PERCHLORATE MEDIUM, by I. Ahlberg. [1961] [16]p. incl. diagrs. tables, refs. (Technical note no. 19) (AFOSR-3774) (AF 61(052)162) Unclassified

Also published in Acta Chem. Scand., v. 16: 887-902, 1962.

The hydrolysis of Hg(II) has been studied at 25.0°C with the media 3.0 M $(Na)ClO_4$, $(Ca)ClO_4$ and $(Mg)ClO_4$. $[H^+]$ was measured with a glass electrode and in the more dilute solutions $[Hg^{2+}]$ was measured with a redox electrode, Hg_2^{2+}, Hg^{2+}/Pt. The data for $(Mg)ClO_4$ and $(Ca)ClO_4$ media coincide and differences for $(Na)ClO_4$ are attributed to variations in activity factors. (Contractors's abstract)

THE MONONUCLEAR HYDROLYSIS OF VANADIUM(V), by D. Dyrssen and T. Sekine. [1961] [2]p. incl. diagrs. (Technical note no. 20) (AFOSR-3775) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)162 and Swedish Council for Atomic Research) Unclassified

Also published in Acta Chem. Scand., v. 15: 1399-1400, 1961.

The purpose of the present work was to study the mononuclear hydrolysis of vanadium(V) in the lower pH range to determine the acidity constants of the following equilibria at 25°C: $VO_2^+ + H_2O \rightleftharpoons HVO_3 + H^+$; K_{a1} and $HVO_3 \rightleftharpoons VO_3^- + H^+$; K_{a2}. The following results can be drawn from the data. The slope derived shows the existence of an uncharged vanadium species in the hexol phase with one proton less than $VO_2(H_2O)_n^+$ and that there exists a monovalent negative vanadium ion in the aqueous phase with one proton less than the uncharged complex in the organic phase. It also shows that the stability range of the uncharged complex is not very large. In each run, about the same amount of V^{48} was added to the system and, therefore, the total vanadium concentration in each phase varies with the distribution ratio. Still the limiting slopes are exactly +1 and -1. This indicates that no polynuclear species are formed. The following values of λ, K_{a1} and K_{a2} were determined: $\log\lambda = 2.10$; $pK_{a1} = 3.30$; $pK_{a2} = 3.70$.

EQUILIBRIUM STUDIES ON POLYANIONS. 9. THE FIRST STEPS OF ACIDIFICATION OF CHROMATE ION IN 3 M $Na(ClO_4)$ MEDIUM AT 25°C, by Y. Sasaki. [1961] [16]p. incl. diagrs. tables, refs. (AFOSR-3776) [AF 61-(052)162] Unclassified

Also published in Acta Chem. Scand., v. 16: 719-734, 1962.

Emf data (glass electrode, 25°C, 3 M $Na(ClO_4)$) on the reaction of CrO_4^{2-} with H^+ indicated the 2 products $HCrO_4^-$ and $Cr_2O_7^{2-}$ but gave no evidence for other products, for $[H^+] < 0.03$ M. Spectrophotometric data, with the same medium, gave practically the same equilibrium constants. $H^+ + CrO_4^{2-} \rightleftharpoons HCrO_4^-$, $\log \beta_{11} = \log K_1 =$

5.89 ± 0.02 for emf and 5.91 ± 0.01 for spectra. $2HCrO_4^- \rightleftharpoons Cr_2O_7^{2-} + H_2O$, $\log K_{22} = 2.20 \pm 0.02$ for emf and 2.18 ± 0.06 for spectra. For higher acidities, both spectrophotometric and emf data gave small deviations which might be due to new complexes. (Contractor's abstract)

NMR MEASUREMENTS OF SELF-DIFFUSION IN NORMAL HYDROGEN GAS FROM 55°K TO 90°K, by M. Lipsicas. Oct. 1961 [13]p. incl. diagrs. tables, refs. (AFOSR-1584) (AF 49(638)755) AD 266315 Unclassified

Also published in Jour. Chem. Phys., v. 36: 1235-1237, Mar. 1, 1962.

An absolute measurement of the self-diffusion coefficient, D_{11}, in hydrogen gas has been made at 78°K and 117 Amagats. Relative measurements have been made of D_{11} as a function of gas density at 55°, 78°, and 90°K, up to a maximum density of 650 Amagats. The experimental results are compared with viscosity data and with the theories of Buckingham and Mason. The observed density dependence of D_{11} is in marked disagreement with the Enskog dense-gas theory. (Contractor's abstract)

NUCLEAR SPIN-SPIN RELAXATION, by M. Lipsicas and A. Hartland. [1961] [1]p. (AFOSR-2560) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)755] and National Science Foundation) Unclassified

Also published in Canad. Jour. Phys., v. 40: 382, Mar. 1962.

An accurate and reliable measurement of T_2 in hydrogen gas at 77.5°K, on a gas sample of approximately 100 Amagats density has been made and it was found that T_1 (spin-lattice relaxation time) and T_2 (nuclear spin-spin relaxation time) are equal to within ±4%. The gas sample was sealed in a thick-walled, 4 mm inner diam. glass capillary tube. A 2-pulse nuclear magnetic resonance experiment ($\pi, \pi/2$) was performed to determine T_1, and the multiple echo technique was used to determine T_2. Using coherent pulses of radio frequency at 30.2 mc/s and a magnet capable of providing a homogeneous magnetic field over the 0.15 cc volume of the sample, induction decay following a single $\pi/2$ pulse was found to be exponential and gave a value of $T_2^* = 8.25$ mμ sec. A multiple echo experiment gave a value of $T_2 = 11.75$ mμ sec ± 4%, as compared with $T_1 = 12.0$ mμ sec ± 4% obtained from a 2-pulse experiment. The discrepancy between present results and the earlier measurements serve to illustrate the difficulty of obtaining a reliable value for T_2 when the sample is not spatially well defined and the magnetic field over the sample is not sufficiently homogeneous.

HARMONIC GENERATION AT MILLIMETER WAVELENGTHS, by R. G. Pecina. Final technical rept. Feb. 1, 1960-Aug. 31, 1961. Oct. 1961 [189]p. incl. illus. diagrs. tables, refs. (AFOSR-1532) (AF 49(638)-554) AD 267553 Unclassified

The dependence of the complex dielectric constant of several polycrystalline ferroelectric ceramics upon an applied dc electric bias field over the frequency range from 3.0 to 9.5 kmc is determined. Bias fields of 0, 5 and 10 kv/cm were employed. The ceramic ferroelectrics investigated were barium-strontium titanate mixtures with and without the addition of small percentages of Fe_2O_3 and Ni. An admittance type of measurement has been selected to measure the relative complex dielectric constant. In this method the complex dielectric constant of a material is related to a measured admittance. The complete design of the experimental apparatus is given and the limitations of the measuring technique are evaluated. (Contractor's abstract)

APPROXIMATE CROSS-SECTIONS FOR INELASTIC COLLISIONS OF ELECTRONS WITH ATOMS. II. FORBIDDEN TRANSITIONS, by J. H. Scanlon and S. N. Milford. [1961] [9]p. incl. diagrs. tables. (AFOSR-3894) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-10 and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 13, Feb. 1, 1961. (Title varies)

Also published in Astrophys. Jour., v. 134: 724-732, Nov. 1961.

A simple approximate formula is derived for the max cross-section σ for quadrupole transitions resulting from electron-atom collisions. An expression for the Bethe cutoff is found in terms of the energy, ϵ_1, at which the maximum occurs. The multipole expansion gives a simple approximate formula for the cross-section σ, in the region $\epsilon > \epsilon_1$, in terms of the quadrupole moment determined from experiment or calculation; the threshold shape is adopted for $\epsilon < \epsilon_1$. The curve for $\sigma(\epsilon_1)$ is found to cross the Born curves with 10% of the Born maxima for several forbidden transitions in hydrogen. Results indicate that the use of this formula may be limited to specific types of transition unless there is a more accurate method to predict the energy at which the maximum occurs. Born and Bethe cross-sections were calculated for 7 forbidden and 3 allowed transitions in hydrogen, namely 1s-2s, 3s; 2s-3s, 3p, 3d; 4s; 2p-3s, 3p, 3d, 4f. (Contractor's abstract, modified)

BORN CROSS SECTIONS FOR INELASTIC SCATTERING OF ELECTRONS BY HYDROGEN ATOMS. IV. APPROXIMATE VALUES FOR ALLOWED TRANSITIONS UP TO n = 10, by G. C. McCoyd and S. N. Milford. [1961] [5]p. incl. diagrs. tables. (AFOSR-3697) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-10 and Office of Naval Research) AD 414171 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 13, Feb. 1, 1961. (Title varies)

Also published in Phys. Rev., v. 130: 206-210, Apr. 1, 1963.

The Born total cross section is calculated for the inelastic scattering of electrons by hydrogen atoms undergoing the transitions: 10s → 11p and 10,9 → 11,10. By means of interpolation and extrapolation the cutoff momentum $K_c a_o$ is estimated for all transitions of the type $\Delta n = +1$, $+2$, $\Delta l = +1$, for n = 1 through 10. These are used to construct tables which provide a simple estimate of the Bethe total cross section. (Contractor's abstract)

ON THE ENERGY RANGE OF VALIDITY OF THE FIRST BORN APPROXIMATION FOR ELECTRON-ATOM COLLISIONS (Abstract), by S. N. Milford and F. R. Pomilla. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-10 and Office of Naval Research) Unclassified

Published in Second Internat'l. Conf. on Physics of Electronic and Atomic Collisions; Abstracts of Papers, Colorado U., Boulder (June 12-15, 1961), New York, W. A. Benjamin, 1961, p. 137-138. (AFOSR-1327)

It is the aim of the present work to find the energy $E(\chi)$ at which the first Born approximation σ_{B1} differs from the correct cross section σ by the fractional amount χ, i.e.,

$$\sigma - \sigma_{B1} = \chi\sigma \quad (1)$$

Since first order perturbation calculations are almost exact at high scattering energies, the second order calculations give a very small correction which can then be used as a measure of the departure of the first order calculation of the cross section from the true cross section. Thus, if the cross section σ at high energy is expanded in a series of Born terms

$$\sigma = \sigma_{B1} + \sigma_{B2} + \sigma_{B3} + \cdots \quad (2)$$
$$= \sigma_{B1} + y_2\sigma_{B1} + y_3\sigma_{B1} + \cdots$$

where it is assumed that

$$|y_n| \ll 1, \quad y_{n+1} \leq 0\,(y_n^2), \qquad n \geq 2$$

then it follows that

$$\chi = y_2 + 0(y_2^2) \qquad (3).$$

Although (3) is general, it appears that it can be used for specific scattering problems only by carrying through the first and second order Born calculations in detail. The first calculation is made for the total scattering (elastic, inelastic and ionization) of electrons from the 1s and 2s states of hydrogen. By employing the optical theorem, these total cross sections can be found from the second Born differential elastic scattering amplitude at zero scattering angle, thus avoiding extensive angle integrations. The second Born cross sections thus obtained for high energy scattering can then be compared with the first Born results already available, thus giving values for y and subsequently χ from equation (3). Although the above total scattering cross sections give some idea of the probable validity of results for individual inelastic transitions, for example, only an actual calculation of individual transitions will give difinitive results. Hence the first and second Born approximations for inelastic transitions between levels 1 and 2 are compared with those for levels 2 and 3.

THEORETICAL STUDY OF PROBLEMS CONNECTED WITH THE SOLID STATE RASER. PART I. EIGENVALUES AND INDUCED TRANSITION PROBABILITIES FOR AN ANISOTROPIC SPIN HAMILTONIAN, by R. Neusel. PART II. EFFECT OF FINITE PROBABILITY ASSOCIATED WITH THE DETECTION FIELD ON THE ENHANCEMENT OF A RASER, by M. Lal Narchal. Nov. 1, 1961, 44p. incl. diagrs. tables, refs. (AFOSR-1794) (AF 49(638)812) AD 289455 Unclassified

Part I. The approximate energy eigenvalues of the spin Hamiltonian of the type derived by Abragam and Pryce (Proc. Roy. Soc. (London), v. 205A: 135, 1951), and the induced transition probabilities, are given. No restrictions (such as axial symmetry) are made on the elements of the tensors of second rank in the Hamiltonian. The results are valid for an orientation of the external fields with respect to the crystal axes. The electron Zeeman interaction is taken as the dominant interaction and the remaining interactions as a perturbation, except for the quadrupole interaction which is neglected. Part II. The method of partial distributions has been applied to study the effect of the input signal field strength on the enhancement and signal power output of a 4 level RASER amplifier. The enhancement is always found to have a finite value and is relatively insensitive to the input signal field strength for Overhauser effect experiments. For Jefferies-Abragam effect experiments, the limiting enhancement is a function of the relative strength of flip-flip and flip-flop type of thermal relaxations. The dominance of electron paramagnetic relaxations and output increases from zero to a maximum value when the input signal field strength increases from 0 to ∞.

DYNAMIC NUCLEAR POLARIZATION, by W. A. Barker. [1961] [22]p. incl. diagrs. tables, refs. (AFOSR-1799) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)612] and Atomic Energy Commission) AD 295905 Unclassified

Also published in Rev. Mod. Phys., v. 34: 173-185, Apr. 1962.

The interest in the production and detection of nuclear polarization in atomic, nuclear and elementary particle physics as well as in solid state and low temperature physics is demonstrated by 7 examples. The mechanism of dynamic polarization is discussed and a nuclear polarization chart is produced tabulating the energy level scheme, population distribution, enhancement of nuclear magnetic resonance, nuclear polarization and electronic polarization for 4 static and 24 dynamic cases. The construction and utility of the chart are discussed in detail together with its limitations. Finally a table of experimental results keyed to the polarization chart is provided and the methods of detection of dynamic polarization are compared. The techniques of dynamic nuclear polarization are compared with static methods and their limitations considered.

NUCLEAR POLARIZATION (Abstract), by W. A. Barker. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)612] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 75, Feb. 1, 1961.

The population distribution and nuclear polarization

achieved by static or dynamic methods depends on several factors: (1) the magnitude of the nuclear Zeeman energy as compared to the hyperfine interaction energy; (2) the algebraic sign of the nuclear magnetic moment; (3) the algebraic sign of the hyperfine interaction constant; (4) the magnitude and orientation of the pumping radiation; and (5) the type and relative magnitude of the relaxation mechanisms. Four static and 24 dynamic cases will be discussed.

ON THE NATURE OF SOLAR EMISSION OF IONISED MATTER ASSOCIATED WITH FORBUSH DECREASES, by I. Escobar, N. W. Nerurkar and others. [1961] [9]p. incl. tables. (AFOSR-1307) (AF 49(638)290) Unclassified

The recovery characteristics of the Forbush decreases have been analyzed for the solar coordinates of the associated emission of ionized matter. It is found that the recovery is fast or slow depending upon whether the emission is near or far from the central meridian. It is suggested that the solar emission is either in narrow cones or omnidirectional and its magnetic field configuration is similar to that suggested by Gold (Jour. Geophys. Research, v. 64: 1655, 1959). In addition, the interaction between 2 magnetic bottles and its effect on cosmic ray intensity are discussed. (Contractor's abstract)

THE RECOVERY CHARACTERISTICS OF FORBUSH DECREASES AND THE CONFIGURATION OF THE ASSOCIATED SOLAR EMISSION, by I. Escobar, N. W. Nerurkar and others. [1961] [6]p. incl. diagrs. tables. (AFOSR-2800) (AF 49(638)290) Unclassified

Presented at Internat'l. Conf. on Cosmic Rays and the Earth Storm, Kyoto (Japan), Sept. 4-15, 1961.

Also published in Jour. Phys. Soc. Japan, v. 17, Suppl. A-II: 422-427, Jan. 1962.

Forbush decreases accompany a single magnetic storm and vary from a few fractions of a percent to as high as 30%. The recovery rate varies from a few minutes to 15 days and is dependent on the intensity of the magnetic storm. The recovery rates of the mixed Forbush decreases appear to be related with the volume occupied space by the emission associated with magnetic storms. It is suggested that these emissions of solar matter are of 2 types: in narrow cones and omnidirectionally. It is shown that this explains satisfactorily the wide range of recovery rates of Forbush decreases and also aids in understanding the total absence of magnetic storms after some large solar disturbance.

[ANALYSIS OF DECREASING INTENSITY OF COSMIC RADIATION DURING THE SHORT INTERVAL OCCURRING NOVEMBER 13, 1960] Analisis del descenso de intensidad de la radiacion cosmica de corto intervalo ocurrido el 13 Noviembre de 1960, by I. Escobar, N. W. Nerurkar and others. [1960] [4]p. incl. diagr. (AF 49-(638)290) Unclassified

Presented at joint meeting of the Amer. Phys. Soc. and Sociedad Mexicana de Fisica, Mexico City, June 1961.

Published in Resumen de Labores, 1960, La Paz (Bolivia) Laboratorio de Fisica Cosmica, Mar. 1961, p. 51-53.

Also published in Proc. Nat'l. Acad. Sci., v. 47: 1873-1875, Dec. 1961. (Title varies)

The records of a neutron monitor operated on Chacaltaya mountain in Bolivia show, superimposed on a Forbush decrease, a sudden decrease of about 4% lasting about 1½ hr. From data from other stations it is concluded that the effect was world-wide and had the same energy

dependence as the Forbush effect. It is suggested that the effect is due to a well-defined comparatively small region of higher than average magnetic field strength, in a cloud of ionized solar gas, which is responsible for the Forbush decrease.

UNDERDEVELOPED COUNTRIES AND THE SCIENTIFIC RESEARCH, by I. Escobar. [1961] 4p. [AF 49(638)290] Unclassified

Presented at Centennial Conf. on Science and Engineering Education, Massachusetts Inst. of Tech., Cambridge, Apr. 1961.

The question that faces underdeveloped countries is, "Should these countries limit the effort entirely to the solution of the basic educational problems such as the elimination of illiteracy, the improvement of the level of its universities and the development of technological training; or should they also initiate significant programs of modern scientific research"? The author takes the position that this question should be ansered in favor of the creation of a few and specialized centers of research without overlooking the obvious needs for development of fundamental education. The author believes that this is the only way that it is possible to improve the scientific and engineering teaching and at the same time to develop a national conscience of the importance of science which is indispensable for the growth and survival of the country. The Cosmic Physics Laboratory of Chacaltaya in La Paz, Bolivia is used as an example to support the author's point of view, showing the advantages of this type of institution and the problems it must face.

ON A SHORT-LIVED COSMIC RAY DECREASE ON NOVEMBER 13, 1960, by I. Escobar, N. W. Nerurkar and others. [1961] [4]p. incl. diagr. (AF 49(638)290) Unclassified

Reported here is a very abrupt and short lived cosmic ray decrease observed on November 13, 1960, with data analyzed on short-time intervals. It is reported that immediately after a magnetic storm of sudden commencement at 10h21m UT, the cosmic ray intensity started decreasing rapidly for the first hr and gradually thereafter following the general pattern of the Forbush decrease. A little later than 1300 UT the cosmic ray intensity at Chacaltaya dropped suddenly, remained 3 to 4% below for about 1½ hr and jumped suddenly to predrop value. Later it continued decreasing slowly for more than 6 hr following the profile of the first decrease. The striking features of these events may be summarized as the very rapid decrease, equally fast recovery and very short duration. The analysis of the November event shows in addition that it was world wide in character and had energy dependence same as the Forbush effect. Cosmic ray decreases associated with magnetic storms are believed to be caused by a cloud of ionized solar gas with magnetic fields enveloping the earth. It is suggested that clouds responsible for big magnetic storms contain within them well defined regions, where the magnetic field strength is higher and consequently cosmic ray intensity is lower than the rest of the cloud. When such a region is passing the earth the cosmic ray intensity registers an additional decrease. Because of comparatively small dimensions the decrease lasts for an hr or so and because of its well-defined limits both the decrease and the recovery are very fast.

EXTENSIVE AIR SHOWERS AT 4200m, by J. Hersil, I. Escobar and others. [1961] [4]p. incl. diagrs. (AFOSR-3372) (In cooperation with Massachusetts Inst. of Tech. Lab. for Nuclear Science, Cambridge) [AF AFOSR-62-395] Unclassified

Presented at Internat'l. Conf. on Cosmic Rays and the Earth Storm, Kyoto (Japan), Sept. 4-15, 1961.

Also published in Jour. Phys. Soc. Japan, v. 17, Suppl. A-III: 243-246, Jan. 1962.

Extensive air showers at an altitude of 4200 m (El Alto, near La Paz, Bolivia) were studied. It is concluded that the average atmospheric depth of maximum development for showers with a maximum of 2×10^8 particles is about 800 g cm^{-2}. The average lateral distribution at distances greater than 30 m from the core is markedly steeper than at sea level and, unlike the distribution at sea level, it varies significantly with zenith angle. In addition, a map is obtained of the celestial arrival directions of 195 showers with $N > 10^8$ and 6 with $N > 10^9$ corresponding to primary energies in excess of 10^{17} ev and 10^{18} ev respectively. Because of the geographic location most of the events come from the southern hemisphere. No anistropy is evident. (Contractor's abstract)

INTERACTION BETWEEN THE SPECIFIC VISUAL SYSTEM AND THE RETICULAR FORMATION, by M. R. Covain and R. F. Marseillan. [1961] [9]p. incl. diagrs. refs. (AFOSR-1423) (AF AFOSR-60-15) AD 416559 Unclassified

Also published in Perspectives in Biology, New York, Elsevier Publishing Co., 1963, p. 439-447.

The effect of the unspecific system upon the visual evoked cortical potential elicited by a flash light has been studied by single shock conditioning stimulation of the mesencephalic reticular formation at various intervals in cats under chloralose anesthesia. The conclusions arrived at during these experiments were the following: There was a differential interaction of the postsynaptic components of the evoked response. An increase of the surface-negative phase was observed. This interaction seems to take place principally at cortical level. The heterosynaptic convergence of the specific and unspecific systems in cortical neurons is given as a possible basis for the mechanism underlying this interaction.

CEREBELLO-RETICULAR INTERACTION ON SPINAL REFLEXES (Abstract), by C. Timo-Iaria and J. Antunes-Rodrigues. [1961] [1]p. (AFOSR-1434) (AF AFOSR-60-15) Unclassified

Presented at Fourth Reunion of the Asociacion Latino-Americana de Ciencias Fisiologicas, Sao Paulo (Brazil), July 4-8, 1961.

Also published in Acta Physiol. Latinoamer., v. 11: 299, 1961.

In order to investigate some interactions between cerebellum and the mesencephalic reticular formation the following experiments were performed: group Ia afferents of either the gastrocnemius or tibialis nerves of adult cats were stimulated by single pulses of 2 msec duration and voltage just enough to evoke 50% of the maximal monosynaptic potential recorded from L_7 ventral root; previous stimulation of the ipsilateral reticular formation at definite intervals between 0 and 200 msec induces striking changes of the excitability of the monosynaptic arc; such changes follow a polyphasic and complex time course. After extirpation of some cerebellar areas such effects are significantly noted. Destruction of the ipsilateral anterior lobe usually enhances the late facilitation; ablation of the ipsilateral paramedian lobe strongly depresses such facilitation and destruction of the whole posterior lobe has similar effects on the excitability curve. It seems that a cerebellar component is present in the mesencephalic reticular influences on the investigated spinal reflexes; such component is detected within the 30-50 msec range in a great number of experiments.

EFFECT OF SEXUAL HORMONES ON A CONDITIONED AVOIDANCE RESPONSE OF RATS (Abstract), by M. C. Licc. [1961] [2]p. (AFOSR-1435) (AF AFOSR-60-15) Unclassified

Presented at Fourth Reunion of the Asociacion Latino-Americana de Ciencias Fisiologicas, Sao Paulo (Brazil). July 4-8, 1961.

Also published in Acta Physiol. Latinoamer., v. 11: 302-303, 1961.

Sexual hormones are known to alter the electroshock seizure threshold in rats. The question was raised whether those hormones would influence also the acquisition and retention of an avoidance response. Sixty white rats were divided into the following groups of 10 animals each: (1) Males daily treated with 500 μg of testosterone propionate, subcutaneously injected from eve of beginning to just the end of 10 days of training. Since then, injections were administered with intervals of 36 hr. (2) Females treated with 50 μg of estradiol benzoate injected following the same schedule as the previous group. (3) Castrated males. (4) Castrated females. (5) Control males. (6) Control females. A surprisingly higher degree of efficiency was observed in all animals at the first retention test compared with final performance of the training period. Extinction of the conditioned response was early among both castrated and androgen-treated rats. These experiments suggest an evident action of sexual hormones on central mechanisms controlling learning. According to performances of hormone-treated rats, androgens would evoke inhibition and estrogens, facilitation of learning. But the lower performances of both castrated groups point out a more complex interrelationship.

EFFECTS OF INTRAVENTRICULAR ADMINISTRATION OF ACETYLCHOLINE, ADRENALINE AND D-TUBOCURARINE IN THE RAT (Abstract), by R. F. Marseillan and A. P. Corrado. [1961] [1]p. (AFOSR-1436) (AF AFOSR-60-15) Unclassified

Presented at Fourth Reunion of the Asociacion Latino-Americana de Ciencias Fisiologicas, Sao Paulo (Brazil), July 4-8, 1961.

Also published in Acta Physiol. Latinoamer., v. 11: 269, 1961.

The motor, vegetative and behavioral effects produced by injection of acetylcholine, adrenaline, and d-tubocurarine in the lateral ventricle were studied in the white rat. The drug, d-tubocurarine produced immediately after the injection a state of excitation varying from increased motor activity to generalized convulsions. With a 5 μg dose the animal showed tachypnea, tremors, extension of the tail, mastication, and restlessness; 1 to 3 min afterwards, clonic movements of a periodic character appeared in 1 of the legs. Some animals had with this dose, generalized seizure with complete recovery later. Larger doses, 10 μg or more, always resulted in intense and sustained tonic-clonic generalized convulsions. The injection of acetylcholine, from 30 to 50 μg, developed an immediate state of depression characterized by diminished motor activity and postural tonus, the animal lying on its side. After some minutes, the rat passed through a phase of catatonia of variable intensity; in this condition, it could be placed and remained in the most absurd positions. No effect was observed with 10 to 30 μg of adrenaline. When larger doses were injected (30-100 μg), the animal appeared depressed, with reduced reflex and motor activity and in some animals signs of a light hypnosis.

INTERACTION BETWEEN THE SPECIFIC VISUAL SYSTEM AND THE RETICULAR FORMATION (Abstract), by M. R. Covian and R. F. Marseillan. [1961] [2]p. (AFOSR-1438) (AF AFOSR-60-15) Unclassified

Presented at Fourth Reunion of the Asociacion Latino-Americana de Ciencias Fisiologicas, Sao Paulo (Brazil), July 4-8, 1961.

Also published in Acta Physiol. Latinoamer., v. 11: 296-297, 1961.

Reticular stimulation has been shown to affect the sensory discharge at various levels in the central nervous system. The conclusions have been that the reticular formation plays an important role in the integrative function of the brain. It has been shown previously that a single conditioning shock applied to the reticular formation preceding at a convenient interval the specific test stimulus (tactile) determined a reduction of the negative component of the evoked cortical potential and sometimes an increase of the positive wave. The present work is an attempt to determine the effect of mesencephalic reticular formation stimulation upon the visual evoked potential in order to ascertain if there was a differential effect upon both components of the response. There was a differential interaction of the postsynaptic components of the evoked response. An increase of the surface-positive, and a decrease of the surface-negative phase were observed. This interaction seems to take place principally at cortical level. The heterosynaptic convergence of the specific and unspecific systems in cortical neurons is given as a possible basis for the mechanism underlying this interaction.

INFLUENCE OF LIMBIC SYSTEM ON BLOOD PRESSURE AND RESPIRATION RESPONSES IN THE RAT, by M. R. Covian, J. Antunes-Rodrigues, and D. V. Mendonca. [1961] [7]p. incl. diagrs. table, refs. (AFOSR-J949) (AF AFOSR-60-15) AD 415841 Unclassified

Presented at Fourth Reunion of the Asociacion Latino-Americana de Ciencias Fisiologicas, Sao Paulo (Brazil), July 4-8, 1961.

Abstract published in Acta Physiol. Latinoamer., v. 11: 296, 1961.

Also published in Acta Physiol. Latinoamer., v. 12: 115-121, 1962.

Previous studies have shown that stimulation of limbic structures of animals and man can produce several kinds of autonomic responses. In the present paper the cardiovascular and respiratory changes elicited by the electrical stimulation of different parts of the rat's limbic system are studied. The following structures were stimulated: orbital cortex of the frontal lobe; olfactory tubercle; pyriform cortex; amygdaloid complex; hippocampus; fornix; entorhinal area. The results obtained were as follows: A fall in blood pressure was most frequently observed; only in 2 animals in which the medial nucleus of the anygdala was stimulated, a rise was elicited. The respiratory response consisted, generally, of an increase in amplitude. No consistent change in heart rate was observed. The results reported seem to be mediated through the parasympathetic division of the autonomic nervous system; however, the inhibition of the sympathetic division cannot be disregarded.

THE AUTONOMIC HEART RATE REGULATION OF RATS WITH CHRONIC CHAGAS DISEASE (Abstract), by E. M. Krieger and F. G. Alcantara. [1961] [1]p. (AF AFOSR-60-15) Unclassified

Presented at Fourth Reunion of the Asociacion Latino-Americana de Ciencias Fisiologicas, Sao Paulo (Brazil), July 4-8, 1961.

Published in Acta Physiol. Latinoamer., v. 11: 260, 1961.

In two groups of 6 and 8 rats which subsisted the acute form of the disease determined by the inoculation of the T. cruzi the autonomic regulation of the heart rate was studied. During the acute phase the animals presented the typical manifestation of the disease. Electrical stimulation (gross stimulation of the cervical sympathetic system) and the administration of epinephrine were used to test the sympathetic effects on the heart rate. The heart rate responses of the rats with chronic Chagas disease were no different from those presented by the control group. When the vagus nerve was stimulated, the threshold voltages (40/sec - 10 sec total duration) for the bradycardic responses production were almost the same in the control group and in the inoculated animals. However, the bradycardia determined by supramaximal stimuli (with less than 30 sec total duration) was greater in the rats with Chagas disease. The bradycardia produced by the injection of acetylcholine and mecholyl chloride was also more intense in the inoculated rats, although the duration of the effects was almost the same.

THE OXIDATION OF REDUCED FLAVIN MONONUCLEOTIDE BY MOLECULAR OXYGEN, by Q. H. Gibson and J. W. Hastings. [1961] [10]p. incl. diagrs. refs. (AFOSR-4187) [AF EOAR-61-2] Unclassified

Also published in Biochem. Jour., v. 83: 368-377, May 1962.

The work described in this paper was undertaken as a preliminary to a study of the kinetics of the bacterial luminescent system. The results show that the oxidation of reduced flavin mononucleotide by molecular oxygen is autocatalytic. Autocatalysis is due to an interaction between oxidized and reduced flavin mononucleotides which yields a compound able to react with oxygen. The compounds described by Beinert (Jour. Amer. Chem. Soc., v. 78: 5323, 1956) in equilibrium mixtures of oxidized and reduced flavins (with absorption at 570 and 900 mμ) are formed rapidly during flavin oxidation. In the presence of luminol, flavin oxidation is accompanied by light-production. There is an initial flash lasting for about 5 msec, followed by a light-emission extending over 0.2 sec. The secondary light-emission is ascribed to the formation of hydrogen peroxide in the reaction mixture. A scheme representing the reaction has been developed and compared with observation by an analogue computer.

[TONIC PARTICIPATION OF EXTRA-AORTIC VAGAL AFFERENTS IN THE REGULATION OF ARTERIAL PRESSURE IN THE CAT] Partecipazione tonica di afferenze vagali extra-aortiche alla regolazione della pressione arteriosa nel gatto, by M. Guazzi, A. Libretti, and A. Zanchetti. [1960] [2]p. (AFOSR-1250) (AF 61-(052)253) AD 262139 Unclassified

Also published in Boll. Soc. Ital. Biol. Sper., v. 36: 1635-1636, 1960.

In cats decerebrated at the midcollicular level, the height of the pressor response to carotid occlusion is further increased by functional (cold blockade) or surgical interruption of the cervical vagi, even when both aortic nerves have previously been severed. Administration of fully vagolytic doses of atropine at the beginning of the experiment rules out the intervention of the efferent fibers. It has been demonstrated, furthermore, that the potentiating effect of vagal section is not due to respiratory changes, as it is observed also when alveolar CO_2 concentration remains unmodified (continuous recording by an infrared gas analyzer) and/or respiratory movements are controlled by curarization and artificial ventilation. Since the potentiating effect of interrupting extra-aortic vagal afferents can be observed also on the basal arterial pressure level (both sino-carotid and aortic nerves being severed), it is suggested that baroceptive afferents coming from thoracic areas outside the aortic arch (pulmonary bed, atria, etc.) participate in the normal regulation of arterial pressure in the cat.

REFLEX MECHANISMS REGULATING HYPOTHALAMIC AUTONOMIC ACTIVITY AND EMOTIONAL BEHAVIOUR. THEIR IMPORTANCE IN CIRCULATORY HOMEOSTATIS, by A. Zanchetti. [1960] [8]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)253, Rockefeller Foundation, and Wright Air Development Center) Unclassified

Published in Proc. Joint W. H. O.-Czechoslovak Cardiological Soc. Symposium on the Pathogenesis of Essential Hypertension, Prague (Czechoslovakia) (May 22-29, 1960), Prague, State Medical Publishing House, 1961, p. 191-198.

This paper discusses the role of posterior hypothalamic centers on circulatory homeostasis, particularly whether these centers are under a tonic inhibitory influence from the sinocarotid and aortic pressoreceptors. All observations were performed in acute preparations, whose hypothalamic activity was released by means of a prechiasmatic decerebration. Previous to brain transection,

both carotid sinuses were prepared by the blind sac technique, by carefully tying all vascular branches arising from them. It was observed that transient interruption of pressoreceptive activity resulted in outbursts of sham rage in the decorticate animal suggesting the hypothalamic centers are under a tonic continuous influence, maintained by the continuous flow of pressoreceptive impulses along the sinocarotid nerves. More evidence on the effectiveness of the pressoreceptive activity was gathered by experiments in which the intrasinus pressure was artificially increased from 0 to 200 mm Hg. It was observed that spontaneous, but not peripherally evoked outbursts of sham rage could be blocked by pressoreceptive stimulation. It was concluded that while pressoreceptive discharges exert an effective inhibitory influence on the spontaneous rhythmic activity of the nervous centers which are responsible for rage behavior, this reflex inhibitory control is easily overwhelmed by simultaneous stimulation of sensory afferents having excitatory action on the same brain mechanism.

INHIBITORY CONTROL OF SINOCAROTID PRESSOCEPTIVE AFFERENTS ON HYPOTHALAMIC AUTONOMIC ACTIVITY AND SHAM RAGE BEHAVIOR, by C. Bartorelli, E. Bizzi and others. [1960] [19]p. incl. illus. refs. (Sponsored jointly by [Air Force Office of Scientific Research under AF 61(052)253] and Rockefeller Foundation) Unclassified

Published in Arch. Ital. Biol., v. 98: 308-326, July 31, 1960.

In acute decorticate cats, carotid occulsion below a carotid sinus blind-sac induced outbursts of sham rage which were potentiated by bilateral cervical vagotomy, and abolished by section of Hering's nerves. Sham rage outbursts followed carotid occlusion even when carotid body chemoceptors had been inactivated by embolization with a lycopodium suspension, a finding showing that this effect of carotid occlusion results from transient suppression of pressoceptive discharges, independently of chemoceptive co-excitation. Upper brain mechanisms are indispensable for the appearance of sham rage patterns upon carotid occlusion since the latter procedure failed to evoke any pseudoaffective reactions when midbrain and diencephalon were temporarily inactivated by injection of a minute dose of Thiopental into the external carotid circulation. Pressoceptive stimulation by increasing intrastnusal pressure succeeded in blocking spontaneously occurring outbursts of sham rage, but appeared much less effective in influencing evoked pseudoaffective activity. It is concluded that the central neural mechanisms responsible for sham rage behavior are also within the sphere of the inhibitory influence of sinocarotid pressoceptors.

UPPER ATMOSPHERIC STELLAR IMAGE STUDY, by G. J. Nielson. Final rept. July 1, 1961, 3p. (AFOSR-1406) (AF 49(638)609) Unclassified

This report summarizes the activities within the project for the period April 24, 1959 until October 1, 1960, when the program was moved from the Smithsonian Astrophysical Observatory (SAO), Cambridge, Mass. to the Astronomy Department, Northwestern U., Evanston, Ill. As early as 1957, the staff of the SAO became actively interested in manned-balloon astronomy. In 1959 it appeared that balloons using the Air Force "HIGH DIVE" gondola would be available for 3 flights to 100,000 ft. The SAO proposed to utilize a 12.5 in. Cassegrain telescope mounted on a 2-gimbal configuration and controlled by a stellar stabilization system. The SAO felt that more experiments should be added to the flights in order to increase the number of observations per hr and thereby gain more data. A critical study of possible experiments to detect radiation in regions of special wavelengths was undertaken. Also under consideration were methods of mounting the telescope assembly to prevent defocusing of the image through expansion and contraction of the telescope over the range of temperatures to be encountered between the ground and 100,000 ft altitude. Progress on the experimentation, stabilization system and gondola and life-support systems were reported on at the first AF609 planning conference in Cambridge, Mass., Sept. 9, 1959. During the summer of 1960 the balloon astronomy activities were transferred from the Smithsonian to Northwestern U.

NON-WAVEGUIDE TRANSMISSION OF MILLIMETER WAVES, by R. G. Fellers, S. T. Moseley, and S. Litman. Final rept. Aug. 7, 1961, 35p. incl. diagrs. tables, refs. (AFOSR-1172) (AF 18(603)43) AD 262463 Unclassified

Research was continued on the development of non-waveguide transmission of millimeter waves. Test results have demonstrated successfully that a free-space transmission system can be operated with much lower attenuation than a conventional waveguide system. It has also been shown that transmission around corners can be accomplished at attenuation figures lower than those for straight line transmission. A number of devices including duplexers, directional couplers, attenuators, wavemeters, and reflectometers have been developed and operated in the free space medium. Theoretical computation of near zone fields and of transmission loss have only been commenced and no definitive results have been obtained. Future work in this field should include extension of the work to higher frequencies, development of additional devices and further pursuit of the theoretical computations. (Contractor's abstract)

RESEARCH ON STEREOCHEMISTRY OF CO-ORDINATION NUMBER FIVE, by G. W. A. Fowles. Final technical rept. Jan. 1, 1960-Dec. 31, 1961, 29p. incl. diagrs. tables. (AFOSR-2373) (AF 61(052)318) AD 279473 Unclassified

This report pays particular attention to compounds formed by the following elements: titanium, vanadium, molybdenum, and tungsten; a few experiments have also been carried out on compounds of zirconium, niobium, and tantalum. Concerning the compounds of the tervalent elements of co-ordination numbers 5 and 6, most of the compounds are those formed in the reaction of titanium (III) and vanadium(III) halides with a range of monodentate ligands. The true co-ordination number has not been determined with certainty for all of those compounds, particularly those which are insoluble in the usual organic solvents. Niobium(III) halides did not react with these ligands. Molybdenum(III) chloride and bromide formed complexes (MoX_3, 3L) with pyridine and tetrahydrofuran. Concerning the oxyhalide complexes of quinquevalent molybdenum and tungsten, a number of oxyhalogene complexes of molybdenum have been made in which the metal atom is apparently covalently bonded to only 5 other atoms. These salts have been made in a variety of ways. Spectral and magnetic susceptibility measurements on these compounds are consistent with their formulation as tetragonal pyramids. Attempts have been made to prepare co-ordination compounds of vanadium(IV) chloride with primary and secondary altphatic amines, but although such compounds can be formed at low temperatures, solvolysis occurs at room temperature with the formation of aminobasic vanadium(IV) chlorides $VCl_2(NHR)_2$, $4NH_2R$ and $VCl_2(NR_2)_2$. Consideration of spectra indicate that in these compounds the vanadium atoms have co-ordination numbers of 8 and 6 respectively.

SULPHENYL NITRATES AND SULPHINYL RADICALS, by R. M. Topping and N. Kharasch. [1960] [2]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)718] and Stauffer Chemical Co.) Unclassified

Published in Chem. and Indus. (London), No. 6: 178-179, Feb. 11, 1961.

In seeking routes to substances of generating sulfinyl radicals, RSO·, a series of sulfenyl nitrates, RSO·NO_2, a new class of sulfenyl derivatives, of both theoretical and practical interest has been prepared. Physical and chemical properties of the nitrates are given. A convenient synthesis involves the sulfenyl chlorides and silver nitrate, in cold acetonitrile solutions; silver chloride precipitates quantitatively, and the sulfenyl nitrates remain dissolved. The synthetic technique is being extended to the synthesis of nitrates from other active chlorides (such as ArSeCl, ArS(O)Cl, $Ar_2P(O)Cl$ and $ArSO_2Cl$) and to the preparations of new classes of sulfenyl compounds by the interactions of sulfenyl halides with various silver salts (such as $AgNO_2$, AgCN, AgOCN, Ag_2CrO_4 and $AgClO_4$).

TRICHLOROMETHANESULFENYL CHLORIDE AND TRICHLOROMETHANESULFONYL CHLORIDE, by F. A. Drahowzal. [1961] [14]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)718], Office of Naval Research, and Stauffer Chemical Co.) Unclassified

Published in Organic Sulfur Compounds, ed. by N. Kharasch, New York, Pergamon Press, v. 1, Chap. 31: 361-374, 1961.

Trichloromethanesulfenyl chloride, Cl_3CsCl, 1, has the distinction of being the first of the sulfenyl chlorides to be prepared (Rathke, 1870) and of now being the member of this series of greatest technological and biochemical interest. In its reactions, both ionic and free radical reacttons may be involved. Its preparation by controlled chlorination of carbon disulfide makes it readily available in quantity. The recent review of G. Sosnovsky on trichloromethanesulfenyl chloride (I) is cited and relied on in this chapter; but because of the uniqueness of this substance, and continuing work elsewhere and by the author, to the date of publication, a brief resumé is given. The conversions of the sulfenyl chloride to the sulfenyl esters, RSOR'—the so-called "thioperoxides"—as well as certain properties of the latter are noted. Trichloromethanesulfonyl chloride, Cl_3CSO_2Cl, (II) obtainable by oxidation of the sulfenyl chloride, is also a technically-available substance. Recorded work on this compound is reviewed and the need for further study noted. (Contractor's abstract)

THE CORRELATION OF SOLVENT EFFECTS ON THE STEREOSELECTIVITIES OF DIELS-ALDER REACTIONS BY MEANS OF LINEAR FREE ENERGY RELATIONSHIPS. A NEW EMPIRICAL MEASURE OF SOLVENT POLARITY, by J. A. Berson, Z. Hamlet, and W. A. Mueller. [1961] [8]p. incl. diagrs. tables, refs. (AFOSR-1371) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)828, Alfred P. Sloan Foundation, and Petroleum Research Fund) Unclassified

Also published in Jour. Amer Chem. Soc., v. 84: 297-304, Jan. 20, 1962.

The logarithms of the ratios of stereoisomeric products in the kinetically controlled Diels-Alder additions of cyclopentadiene to methyl methacrylate and methyl trans-crotonate in various solvents are linearly related to a solvent parameter, Ω, defined as the logarithm of the endo/exo product ratio for the cyclopentadiene-methyl acrylate addition. The Alder Rule of "maximum accumulation of unsaturation" is of minor importance in determining the ratios of products; methyl acrylate obeys the rule in all solvents, methyl methacrylate violates it in all solvents, and methyl trans-crotonate shows borderline behavior, conforming to the rule in polar solvents but not in non-polar solvents. The solvent effects are correlated fairly well in quantitative terms by the Kirkwood-Onsager theory. The qualitative trend of the solvent effects is explicable in terms of an interaction between the permanent dipoles of the diene and dienophile. The parameter Ω is a new empirical measure of solvent polarity; it is linear in Z, in $\log k_{ion}$ for p-methoxyneophyl p-toluenesulfonate, and in $\log k_{rearr}$ for the Curtius rearrangement of benzoyl azide. PROPERTIES OF SOME CYCLOPENTADIENYLIDENE ANHYDRO-BASES, by J. A. Berson and E. M. Evleth. [1961] [2]p. incl. diagrs. table. (AFOSR-1372) (AF 49-(638)828) Unclassified

Also published in Chem. and Indus., No. 34: 1362-1363, Aug. 26, 1961.

Protonation of N-methyl-2-cyclopentadienylidene-1,2-dihydropyridine (I) gives a mixture of the 2 cations (IIa) and (IIb). The 60 mc proton magnetic resonance

spectrum of compound (I) in trifluoroacetic acid solvent shows, in addition to aromatic and olefinic proton absorption, 2 N-methyl peaks at 268 and 263 c/sec. The structure of the N-benzyl-x-cyclopentadienylidene-1, x-dihydropyridine obtained from N-benzylpyridinium chloride and cyclopentadienyllithium (and assigned the structure (IIIa)) has now been confirmed by an independent synthesis of (IIIa) and the only reasonable alternative, (IVa): 4-bromo-N-benzylpyridinium bromide reacts with cyclopentadienylsodium in 1, 2-dimethoxyethane to give compound (IIIa), golden yellow plates from benzene. This substance decomposes above 200° and has infrared, visible, and ultraviolet spectra identical with those of a sample prepared from N-benzylpyridinium bromide and cyclopentadienylsodium (Found: C, 87.44; H, 6.57, N, 6.07%). The analogue (IIIb) is obtained from (i) N-methylpyridinium iodide and cyclopentadienylsodium in 1, 2-dimethoxyethane after 24 hr at room temperature, and from (ii) N-methyl-4-bromopyridinium iodide and cyclopentadienylsodium in 1, 2-dimethoxyethane as golden yellow plates from boiling benzene, decomposing above 200° (Found: C, 83.97; H, 7.11; N, 8.86%). These properties and others of these compounds are to be correlated with those calculated by the method of molecular orbitals.

Also published in Jour. Amer. Chem. Soc., v. 83: 3986-3997, Oct. 5, 1961.

Absolute configurations and maximum rotations are deduced for 46 norbornane derivatives by conversion of 2-endo-norborneol to fenchone and of the 2-methyl-5-norbornene-2-carboxylic acids to camphenilane. Optical resolutions of both epimeric 2-methyl-5-norbornene-2-carboxylic acids are described, that of the exo-acid being apparently virtually complete. The conformational asymmetry model correctly predicts the signs of rotation for a number of these substances, but gives incorrect predictions for 6 norbornane derivatives, the configurations of which can be deduced from information in the literature. ELECTROMAGNETIC RADIATION FROM A DIPOLE IN AN ANISOTROPIC PLASMA, by H. H. Kuehl. Sept. 1961, 113p. incl. diagrs. refs. (USCEC rept. no. 79-203) (AFOSR-1582) (AF 49(638)522) AD 266993 Unclassified

The general solution to the problem of the radiation of an electric dipole in a magnetically-biased cold plasma is presented. Several waves exist which travel in different directions with different indices of refraction. These waves interfere to produce beats and amplitude modulation and cause the resultant time-average energy flow to have components in other than the radial direction, contrary to the isotropic case. The propagation direction for the waves was determined. For the lossless case considered, the field was unbounded in certain directions for certain values of the plasma frequency and gyro-frequency. An equation is given for the directions of these singularities. The time-average Poynting vector and the group velocity for an individual wave are shown to be purely radial although the resultant Poynting vector due to all waves in the far zone has other components. Various limiting cases are amenable to solution. The case of a high operating frequency is treated; it is shown that the radiation pattern is approximately identical to the isotropic case. THEORY OF A PLASMA NEGATIVE RESISTANCE

AMPLIFIER, by J. Y. Wada and Z. A. Kaprielian. [1961] [12]p. incl. diagrs. (AFOSR-2869) (AF 49(638)-522) Unclassified

Also published in Jour. Appl. Phys., v. 33: 1551-1562, Apr. 1962.

The purpose of this paper is to present the theory of a plasma negative resistance amplifier based on an approximate quasi-electrostatic model of a modified quadrupole cavity containing a plasma column and hyperbolic quadrupole electrodes with side resonators. The theory is extended to plasmas with finite collision frequencies in a finite magnetic field. By use of a nonlinear equation of the electron motion obtained by expanding the time varying applied electric field in Taylor's series, it is shown that the electrons in a plasma column behave as a nonlinear reactance and that a net signal amplification can be realized when sufficient pump-power is properly applied. It is also shown that the effective noise contributed from the plasma can be reduced by decreasing the plasma electron collision frequency or the plasma density. A preliminary experimental result which indicates the presence of a nonlinear plasma interaction is described. (Contractor's abstract)

INTERACTION BETWEEN A RADIO WAVE AND A PLASMA IN THE PRESENCE OF A UNIFORM MAGNETIC FIELD, by T. Koga. Jan. 1961, 45p. (USCEC rept. no. 83-204) (AFOSR-283) (AF 49(638)831) AD 253452 Unclassified

Also published in Phys. Fluids, v. 5: 1552-1557, Dec. 1962.

Because of the imposed magnetic field, the effect of movements of ions is not to be neglected. Considering a plausible model of plasmas where molecules are partly ionized, Boltzmann type equations are proposed for ions and electrons. By introducing generalized moments of the distribution functions of electrons and of ions, it is easy to solve the equations, obtaining the conductivity of a plasma to an oscillating electric field. The propagation of a radio wave in the plasma is investigated. There are 7 frequencies which characterize the phenomena: (1) Larmor's frequencies of electrons and of ions, (2) frequency of radio wave, (3) plasma frequency and a similar one defined with respect to ions, and (4) collision frequencies of electrons and of ions. The first approximation is treated where frequency (3) is negligibly small compared with frequency (2). In other words, the electric field induced by the group displacements of electrons and of ions is neglected. As special cases, Alfven's theory of hydromagnetic waves and Margenau's theory of radio waves in plasmas with no imposed magnetic field are included in the theory. For the second approximation, the field induced by the group displacements of electrons and of ions may be taken into account. (Contractor's abstract)

EXPERIMENTS IN CRYOPUMPING CO_2, by R. W. Moore, Jr. Mar. 1961 [16]p. incl. illus. diagrs. (USCEC rept. no. 83-205) (AFOSR-561) (AF 49(638)831) AD 256769 Unclassified

Experiments in cryopumping CO_2 were carried out to observe the relationship between the flow rate and the pressure, the formation of the deposit on the condenser and the effects of noncondensables. A steady flow of CO_2 was cryopumped by a condenser cooled to liquid N temperatures. Noncondensable gases (presumably air) in the tube exerted a strong and by far the predominant influence on the pressure upstream of the condenser and on the nature of the deposit. With tube pressures in the range of 0.005 to 0.5 mm Hg, the flow of CO_2, from the inlet at 1 end of the tube to the condenser at the other end, swept the noncondensables downstream causing them to accumulate near the condensing surface. For certain condenser geometries this phenomena caused all or parts of the condenser surface to be blanketed by a noncondensable gas layer through which the condensing gases must diffuse. In some cases the presence of this gas layer caused a considerable increase in the pressure upstream of the condenser. The noncondensable gases were apparently introduced as impurities in the CO_2 and entered the tube along with it. Consequently, when no attempt was made to continuously remove them, the pressure in the tube steadily rose. If any trapping of noncondensables by the condensate occurred, its rate was too small to be observed. (Contractor's abstract)

AN ELASTIC COLLISION MODEL FOR THE KINETIC THEORY OF GASES, by T. Koga. June 1961, 38p. incl. diagrs. refs. (USCEC rept. no. 83-206) (AFOSR-823) (AF 49(638)831) AD 259381 Unclassified

From investigation of studies of impact phenomena of various types of particles and considering the convenience of kinetic theoretical treatment of gases, a semi-empirical model of elastic collisions is proposed. With respect to encounters of charged particles, binary collision is defined in a new sense. In this model, the collision probability (total cross section) of 2 particles may be a function of their relative velocity. With respect to a gas composed of 2 or more types of particles, partitions of momentum and of energy after collisions are plausibly determined, and the conditions which secure the stability of the Maxwell distribution are considered. By this model, analytical treatments of the Boltzmann equation are simplified. The equation may be solved without losing the main characteristics of the pertinent phenomena, even when the state of a gas deviates considerably from thermal equilibrium. (Contractor's abstract)

ELECTRON-HEAVY PARTICLE COLLISION MODEL IN A PLASMA, by T. Koga, J. G. Everton, and P. C. Wilber. [1961] [2]p. incl. table. (AFOSR-1681) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)831] and Office of Naval Research) Unclassified

Also published in Phys. Fluids, v. 4: 1057-1058, Aug. 1961.

Although the usual concept of binary collision is not valid, the "binary collision" may, in an approximate sense, be separated from "group interaction" if $3/2\ kT > e^2 n^{1/3}$, where 3/2 kT is the average energy of motion of a particle, e the electronic charge, and n the number density of charged particles. Assuming that the heavy particle has a much greater mass and smaller speed than the electron and may be ar[illegible] of netural molecule, a collision model is propo[illegible]mple, ionization, and rec[illegible]mbination collisions are considered.

TRANSPORT PHENOMENA IN A FULLY IONIZED GAS CONFINED IN A STRONG MAGNETIC FIELD, by T. Koga. [1959] [8]p. incl. diagrs. (AFOSR-1682) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)831] and Office of Naval Research) Unclassified

Also published in Phys. Fluids, v. 4: 834-841, July 1961.

In the present paper, the distributions of ions and of electrons in the presence of a strong magnetic field in the z direction are not assumed as being almost Maxwellian. Instead, $f^{(0)}(c_x^2 + c_y^2, c_z, x \pm r c_y/c)$ is taken for the distributions in the zeroth approximation with respect to the ratio (Larmor radius r)/(free path length λ), and an iteration method is developed for solving the Boltzmann equation. First, defining the density of guiding centers of particles, $f^{(0)}$ is expanded into powers of $(r\,\partial f^{(0)}/\partial x)/f^{(0)}$. By coarse-graining the Boltzmann equation over one cycle of Larmor's gyration, equations of moments in the first approximation with respect to r/λ are derived. The simple mode of collision proposed by Bhatnagar et al is assumed. A special case is studied in detail in order to compare the present theory with those of other authors who assume distributions to be almost Maxwellian. The agreement is good. The effects of drifts of guiding centers caused by the spacial nonuniformity of a magnetic field and/or by a static electric field in the presence of a uniform magnetic field are investigated. ON TRANSPORT PROCESSES IN A PLASMA (KINETIC EQUATION FOR A PLASMA), by T. Koga. Oct. 1961, 18p. incl. diagrs. (USCEC rept. no. 83-209) (AFOSR-1744) (AF 49(638)831) AD 268355 Unclassified

Authors usually neglect the effect of Coulomb field in the space of radius e2/(3kT/2) surrounding a charged particle, and derive equations of the Fokker-Planck type from the Liouville equation of a plasma. The effect of the inner core field, neglected usually, is shown to be present in an equation of the Fokker-Planck type as an additional term similar to the collision term in an equation of the Boltzmann type. It is shown that the order of this additional term may easily be larger than those of the friction and diffusion terms, the effect of the outer core field. When the effect of the outer core field is larger than that of the inner core field, the assumption of binary interaction is shown to be not feasible. The possible nonlinear and non-Markovian behavior of a particle is neglected. (Contractor's abstract)

THE DISTRIBUTION OF CHARGED PARTICLES NEAR A CHARGED SPHERICAL BODY IN MOTION, by T. Koga. Nov. 1961, 13p. incl. diagrs. (USCEC rept. no. 83-210) (AFOSR-1870) (AF 49(638)831) AD 270431 Unclassified

The distribution function is calculated of charged particles near a charged spherical body, by assuming that (1) at infinite distances, particles are in a Maxwellian distribution, and (2) the spherical body is in motion relative to the gas at infinite distances. By these assumptions, a unique solution of the Boltzmann equation for the distribution is obtained when the force between the sphere and a particle is repulsive, and the trajectory of a particle is hyperbolic. When the force is attractive, however, the solution is not unique. In this case, the trajectory of a particle may be a hyperbola, or a parabola, or an ellipse. It is shown that $dc_x dc_y dc_z dx\, dy\, dz$ is invariant along a trajectory since the motion of a particle is subject to canonical equations. Further, since there are no collisions, the distribution function f itself is to be invariant along a trajectory.

INTERACTION BETWEEN A RADIO WAVE AND A PLASMA, by T. Koga. [1961] [5]p. incl. diagrs. refs. (AFOSR-3988) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)831] and Office of Naval Research) Unclassified

Also published in Phys. Fluids, v. 4: 1162-1166, Sept. 1961.

The interaction between a radio wave and a plasma is studied based on the Boltzmann equation for electrons. Collisions between electrons and heavy particles and the electric field caused by the group displacement of electrons are taken into account. The relation between the current density and the oscillating electric field is obtained. The solution is exact so far as the proposed Boltzmann equation for electrons is concerned. According to the result, the propagation of the radio wave in the plasma is investigated. As the electric field caused by the group displacement of electrons becomes negligibly weak, the results approach those obtained by Margenau. (Contractor's abstract)

BLAST WAVES PRODUCED BY EXPLODING WIRES, by K. Oshima. [1961] [16]p. incl. diagrs. tables. (AF 49-(638)831) Unclassified

Published in Exploding Wires; Proc. of Conf. on the Exploding Wire Phenomenon, Boston, Mass. (Nov. 13-15, 1961), New York, Plenum Press, v. 2: 159-174, 1962.

This paper is concerned with the cylindrical blast wave produced by a wire explosion. In order to obtain a strong blast wave, the wire was exploded in a shock chamber evacuated to various low pressures. Density distributions of air were observed with a Mach-Zehnder interferometer. The processes of formation and propagation as well as the internal structure of the blast wave were analyzed.

In the analysis of these data, Taylor-Lin-Sakurai's first approximation and Sakurai's second approximation for strong cylindrical blast waves were used. For the analysis of moderately strong blast waves, a newly presented theory, called quasi-similarity theory, was applied. This theory is based on the assumption that the distributions of the flow velocity, density, and pressure are locally similar. Agreement of experimental results with the corresponding theoretical predictions was satisfactory.

ON TRANSPORT PROCESSES IN FULLY IONIZED GASES (Abstract), by T. Koga. [1961] [1]p. [AF 49-(638)831] Unclassified

Presented at meeting of the Amer. Phys. Soc., Colorado Springs, Colo., Nov. 15-18, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 149, Feb. 23, 1962.

By means of the so-called BBGKY method, transport processes in fully ionized gases have been investigated by several authors (Tchen, Rostoker and Rosenbluth, Prigogine and Balescu). The Liouville equation is reduced to equations of the Fokker-Planck type which describe the evolution of the distribution function and establish the basis for investigating the incoherent radiation of plasmas (Simon and Harris). From the viewpoint of macroscopic gasdynamics of comparatively low temperature plasmas, some course-graining of these equations is desirable. In this paper a proposed method of course-graining results in equations of distribution functions in which the effect of strong interactions of short-period correlations is described by "collision" terms (which are characteristic of the Boltzmann equation) and the effect of weak interactions of long-period correlations is described by friction and diffusion terms (which are characteristic of the Fokker-Planck equation). Depending on specific conditions, the relative significance of these terms may change. These conditions are considered.

MOMENT EQUATIONS AND BOUNDARY CONDITIONS FOR MAGNETO-GAS DYNAMICS, by H. T. Yang. [1961] [10]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)831 and Office of Naval Research) Unclassified

Published in Phys. Fluids, v. 5: 1580-1539, Dec. 1962.

Moment equations are obtained from the Boltzmann equation for a conducting gas in electric and magnetic fields. Relatively simple stress and heat-flux equations yielding 1-fluid description of a slightly ionized gas mixture have been obtained. The associated boundary conditions are obtained by applying conservation laws near the wall. These moment equations and boundary conditions together with Maxwell's electromagnetic equations and their boundary conditions form a determinate system to describe the dynamics of a rarefied conducting gas in electric and magnetic fields. This system includes, as limiting cases, both the Grad 13 moment equations for rarefied gases and the usual continuum magneto-gasdynamic equations. (Contractor's abstract)

A COMPARISON OF DICTIONARY USE WITHIN TWO INFORMATION RETRIEVAL SYSTEMS, by C. K. Schultz, P. D. Schwartz, and L. Steinberg. [1961] [7]p. incl. diagrs. table. (AFOSR-3515) (AF 49(638)835) Unclassified

Also published in Amer. Doc., v. 12: 247-253, Oct. 1961.

The use of the same computer routines to generate analytical data about the use of the dictionary in 2 information retrieval systems has given the following results: (1) In both systems the shape of the curve for the occurrence of single descriptors in the sample is one-half of a U. The same is true for the occurrence of pairs of descriptors. (2) One system generates many more double, triple, and quadruple combinations of descriptors than the other. This is because that system has a higher number of descriptors per document. Descriptors are ordinarily searched for in triple and quadruple combinations. Whether or not the system providing the higher number of descriptor combinations has the more useful file remains to be proved. (3) A curve has been drawn for each system, measuring the use of single descriptors in terms of the average number of uses of descriptors in that system. The two curves nearly coincide. It is hypothesized that the shape of the curve (nearly a straight line for cumulated frequency of use of descriptors) is an intrinsic characteristic of dictionary use, to which dictionary use in all systems can be related.

More systems will have to be analyzed before an acceptable standard can be chosen for interpreting the meaning of deviations in the curves of individual systems. (Contractor's abstract)

LUMINESCENCE OF SOLIDS PRODUCED BY SURFACE RECOMBINATION OF ATOMS, by K. M. Sancier, W. J. Fredericks, and H. Wise. Final rept. Aug. 1, 1961 [51]p. incl. diagrs. tables, refs. (AFOSR-1514) (AF 49(638)-353) AD 264453 Unclassified

The objective of this research was to investigate the mechanism by which energy released during heterogeneous recombination of atoms is converted in the lumophor to energies of luminescence and heat. The results of this program will contribute to the knowledge of energy transfer between gases and solids, and of the fundamentals of surface catalysis. An experimental program was launched to obtain quantitative information necessary to develop a detailed understanding of the energy processes involved. The bulk of the work was done with calcium oxide lumophors which were excited by heterogeneous recombination of nitrogen atoms.

INTERACTION OF 0.2 TO 4.0-EV ELECTRON BEAMS WITH CLEAVED MgO, by C. J. Cook and W. J. Fredericks. [1961] [4]p. incl. diagrs. refs. (AFOSR-3574) [AF 49(638)353] Unclassified

Also published in Jour. Chem. Phys., v. 36: 608-611, Feb. 1, 1962.

An attempt was made to determine the absorption coefficient δ_a for electrons incident on MgO and irradiated MgO for the impacting energy range, 0.2 ev through the conduction band (about 7.3 ev). It was found that electron trapping was so severe that the crystals would not thermally discharge at temperatures below 350°C. Consequently, the charged crystals were neutralized by a less satisfactory technique, high energy electron bombardment. δ_a was reproducible only at energies less than 4 ev. Sharp slope changes were observed at about 1.80 and 3.00 ev. These lines correspond to luminescence spectra obtained for catalytic recombination of N on MgO. Since slow electrons have been observed to interact predominantly with crystal defects, the data support the suggestion that defects can play a dominant role in catalytic reactions. LUMINESCENCE OF SOLIDS EXCITED BY ENERGETIC SPECIES FROM A GASEOUS DISCHARGE. I. LUMINESCENSE SPECTRA, by K. M. Sancier, W. J. Fredericks, and H. Wise. Aug. 1, 1961, 25p. incl. diagrs. tables, refs. (AFOSR-4013) (Also bound with its AFOSR-1514; AD 264453) (AF 49(638)353) Unclassified

Also published in Jour. Chem. Phys., v. 37: 854-860, Aug. 15, 1962. (Title varies)

The luminescence spectra of the lumophors CaO, CaO:Mn, CaO:Bi, MgO, and MgO:Sb excited by heterogeneous recombination of nitrogen atoms were studied. The photoexcitation and photoemission spectra of CaO:Mn are compared with those of atom excitation. The spectra produced by atom excitation are found to be strongly dependent upon lumophor temperature and exposure time to atoms, whereas photoluminescence is not affected by these parameters. The results of atom-excited luminescence are discussed in terms of surface-adsorbed nitrogen atoms in weakly and in strongly bound states whose populations are strongly temperature dependent and subject to surface poisoning. LUMINESCENCE OF SOLIDS EXCITED BY ENERGETIC SPECIES FROM A GASEOUS DISCHARGE. II. RECOMBINATION COEFFICIENTS, by K. M. Sancier, W. J. Fredericks, and H. Wise. Aug. 1, 1961, 17p. incl. diagrs. tables. (AFOSR-4014) (Also bound with its AFOSR-1514; AD 264453) (AF 49(638)353) Unclassified

Also published in Jour. Chem. Phys., v 37: 860-864, Aug. 15, 1962. (Title varies)

The nitrogen atom recombination coefficients of the lumophors CaO and CaO:Mn for release of luminescence and heat by the lumophor were evaluated from an analysis of the atom concentration profile, established in a cylinder of finite length into which the atoms diffuse because of the catalytic activities of the walls and the lumophor surfaces. The kinetics of the recombination leading to luminescence and heat are found to be first order. The values of the recombination coefficients determined for heat appear to be slightly larger than those for luminescence, but this difference is probably no greater than the precision of the measurements. The possibility that the difference arises from the presence of more than one active species in the gas is discussed. The value of the recombination coefficient of Pyrex glass for nitrogen atoms was determined and found to be in good agreement with published values. (Contractor's abstract)

LUMINESCENCE OF SOLIDS EXCITED BY ENERGETIC SPECIES FROM A GASEOUS DISCHARGE. III. MEASUREMENT OF ABSOLUTE ENERGIES AS LUMINESCENCE AND HEAT, by K. M. Sancier, W. J. Fredericks, and H. Wise. [1961] [3]p. incl. diagr. table. (AFOSR-4015) (Also bound with its AFOSR-1514; AD 264453) (AF 49(638)353) Unclassified

Also published in Jour. Chem. Phys., v. 37: 865-867, Aug. 15, 1962. (Title varies)

The absolute energies of luminescence and heat produced by heterogeneous nitrogen atom recombination on CaO were measured by actinometry and calorimetry, respectively. The heat energy produced on MgO was also measured, and the luminescence energy was estimated from its luminescence intensity relative to CaO. The ratio of energy released as luminescence to that as heat is about 2×10^{-3} for CaO, and about 8×10^{-5} for MgO. The rate of heat production in CaO and MgO may be explained in terms of heterogeneous atom recombination.

RECOMBINATION COEFFICIENTS OF CaO LUMOPHORS FOR NITROGEN ATOMS (Abstract), by K. M. Sancier, J. L. Hatchett and others. [1961] [1]p. [AF 49(638)353] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 111, Mar. 20, 1961.

A lumophor such as CaO may be made to luminesce when nitrogen atoms recombine heterogeneously on its surface. Simultaneously some of the energy released in the recombination process appears as thermal energy of the solid. Experimentally, the quantity of heat released and the intensity of luminescence produced in the heterogeneous recombination were measured as a function of distance from the atom source, an electrodeless, rf discharge in dry nitrogen. From these measurements the recombination coefficients for heat and light production (γ^H, γ^L) were evaluated. For pure CaO the values of γ^H and γ^L were found to be different. Activation of CaO with manganese produced a second luminescence band at longer wave length with $\gamma CaO{:}Mn^L$ different from γCaO^L. These results suggest different mechanisms of recombination-energy transfer and conversion in the production of luminescence and heat.

CHEMICAL REACTIONS IN THE LOWER AND UPPER ATMOSPHERE; PROCEEDINGS OF AN INTERNATIONAL SYMPOSIUM, San Francisco, Calif., Apr. 18-20, 1961, ed. by R. D. Cadle. New York, Interscience Publishers, 1961, 390p. incl. illus. diagrs. tables, refs. (AFOSR-2047) (Sponsored jointly by Advanced Research Projects Agency, Air Force Office of Scientific Research under [AF 49(638)955], Atomic Energy Commission, National Institutes of Health, and National Science Foundation) Unclassified

Each day of this symposium was devoted to one of the three aspects described below: Ionospheric research, Geochemistry of the troposphere and stratosphere, and Chemistry of contaminated atmospheres. The first includes the large number of chemical processes being studied by physicists and physical chemists with field measurements, laboratory measurements, and theoretical considerations. The second category includes the chemistry of the ozone region and of condensation and freezing nuclei. The last section includes the problems of city smog which, until about a decade ago, was ignored as an area of scientific investigation. Because of the fact that scientists working in one of the above fields may be totally ignorant of the progress in the other two, this symposium was created in order to open the lines of communication between researchers in these areas.

MANUAL OF ON-SITE INSPECTION OF UNIDENTIFIED SEISMIC EVENTS, by R. M. Foose, S. Rubin and others. June 30, 1961, 188p. incl. illus. diagrs. tables, refs. [AF 49(638)955] AD 401858 Unclassified

The objective of a manual for on-site inspection operations is to provide a reference for actual field operations of an inspection or exploration of the site of an unidentified seismic event detected by a teleseismic network. It supplements and is a continuation of the Syllabus of On-Site Inspection which deals with an evaluation of specific methods of on-site inspection. This manual is intended to provide a starting point in the planning of field operations. Preparation of the Manual has been carried out in a manner similar to, and concurrent with, the preparation of the Syllabus of On-Site Inspection. Since its completion was critically dependent on having in hand the maximum available information for each of the inspection methods, a special meeting of the evaluation panel was convened after the Syllabus was completed to discuss the optimal plans for using those methods in an actual on-site inspection. It is anticipated that those who are interested in on-site inspection will use the Syllabus and the Manual together even though they have been prepared as separate publications.

THE STRUCTURE AND ANALYSIS OF COMPLEX SYSTEM PROBLEMS, by K. H. Schaeffer and A. Shapero. May 1961, 25p. incl. diagrs. tables. (AFOSR-810) (AF 49(638)1020) AD 260063 Unclassified

Presented at Nineteenth Nat'l. meeting of the Operations Research Soc. of Amer., Chicago, Ill., May 25-26, 1961.

Many complex systems consist of too many different types of elements and are influenced by too many factors to lend themselves readily to conceptualization through mathematical models, without introducing unrealistic oversimplifications. To structure such systems realistically, an approach has been developed which begins with the classification of the elements affecting the system and the determination of the existence of certain

types of relations between these elements. The approach which is known as the System Analysis and Integration Model (SAIM) has been applied to the analysis of a number of system problems concerning weapon system development, including command and control. Other problem areas to which the method has been applied are the analysis of postattack recovery, political conflicts, and large-scale organizations. The paper concludes with a discussion of the function of this general approach in the development of formal models which realistically represent complex system problems. (Contractor's abstract)

DISTURBANCES AT THE SURFACE OF BURNING SOLID PROPELLANTS, by G. A. Agoston. Apr. 24, 1961, 36p. incl. illus. diagrs. tables, refs. (Technical note no. 1) (AFOSR-915) (AF 49(638)565) AD 260407 Unclassified

A study was initiated of the changes in conditions near the surface of burning liquid ethyl nitrate following the impact of a weak plane shock wave (amplitude 0.5 psi) moving in a direction normal to the surface. The technique employed the schlieren photography of a plane probe wave introduced in a direction parallel to the burning surface. The preliminary data obtained suggest an influence on the flame structure by the normal wave between 109 and 230/μ sec following the impact. (Contractor's abstract)

DISTURBANCES IN BURNING SOLID PROPELLANTS (Abstract), by G. A. Agoston. [1961] [1]p. [AF 49-(638)565] Unclassified

Presented at Third AFOSR Contractors' meeting on Combustion of Solid Propellants, Utah U., Salt Lake City, Jan. 30-31, 1961. (AFOSR-980)

Originally the objective of this research emphasized observations of the amplification or attenuation of shock waves (or pressure pulses) occurring within the zone of high temperature and concentration gradients close to a burning propellant surface. Recently a shift of emphasis has developed which allows a more direct approach to the experimental elucidation of the mechanisms of combustion instability. The new approach involves a study of (1) the over-all change of the pressure-time profile of an incident shock wave upon reflection from a burning surface and (2) local changes in conditions following the impact of a plane shock wave moving to a surface. From phase 1 it is possible not only to demonstrate amplification or attenuation but also to calculate the acoustic admittance of the burning propellant as a function of frequency. An analysis has been performed which indicates that the determination of the acoustic admittance is feasible even when appreciable random noise is superimposed upon the pressure-time profiles. Phase 2 has been pursued with the utilization of the schlieren photographic technique employed principally in the early stages of this program. The temperature profile can be estimated from the sonic velocity profile determined from the photographs and from values of the specific heat ratio applicable to the flame. From such experiments it has been hoped that detailed time-dependent temperature profiles would be obtained which in turn would yield time lag information peculiar to the characteristics of the incident normal shock wave and the combustion system.

ACOUSTIC ADMITTANCE OF BURNING SOLID PROPELLANT SURFACE. Apr. 1-June 30, 1961, 18p. (Technical operating rept. no. 10) (AF 49(638)565) AD 609885 Unclassified

Progress is being made in perfecting the proposed single pulse method to a point where it can be employed to obtain the admittance-frequency curve for assorted materials (without combustion in this initial phase of the study). A spark is used to generate a weak shock wave which becomes planar in its travel down a long tube of rectangular cross section. At the end of the tube the wave meets the surface of the solid being tested and is reflected back up the tube. A transducer flush-mounted in the tube picks up the pressure-time profiles of the incident and reflected waves. This information in the form of photographs of the oscilloscope traces is used in the machine calculation of the complex acoustic admittance.

ON THE POSSIBILITY OF DETECTING SHOCK-INDUCED SECOND-ORDER PHASE TRANSITIONS IN SOLIDS. THE EQUATION OF STATE OF INVAR, by D. R. Curran. [1961] [4] p. incl. illus. diagrs. table, refs. (AFOSR-2000) [AF 49(638)625] Unclassified

Also published in Jour. Appl. Phys., v. 32: 1811-1814, Oct. 1961.

First-order phase changes in shock-loaded solids have been previously detected from the formation of multiple wave structures in the solids. It is shown theoretically that a multiple-shock structure under shock loading also may be produced by a second-order phase transition. Accordingly, the possibility of detecting shock-induced demagnetization of ferromagnetic metals and alloys is discussed and an experimental attempt to detect such a demagnetization in shock-loaded Invar (64 Fe, 36 Ni) is reported. Extrapolation of data by Patrick suggests a Curie point transition in Invar in the neighborhood of 50 kbar. The Hugoniot equation of state of Invar has been obtained over a pressure range of 35 to 160 kbar. No double-shock structure was observed, but a decrease in compressibility observed in the neighborhood of 60 kbar is thought to be evidence of demagnetization. (Contractor's abstract)

SHOCK WAVE STABILITY IN SOLIDS, by G. E. Duvall. [1961] [18]p. incl. illus. diagrs. table, refs. (AFOSR-3659) [AF 49(638)625] Unclassified

Also published in Les Ondes de Detonation; Proc. Coll. Internat'l. du Centre Nat'l. de la Recherche Sci. Gif-sur-Yvette (France) (Aug. 28-Sept. 2, 1961), Paris, Edit. du Centre Nat'l. de la Recherche Sci., No. 109: 337-352, 1962.

Extensive measurements of shock wave parameters in solids have been made in various laboratories and the results converted into information about stress-strain relations; this conversion is based on assumptions of shock wave stability. In this paper conditions for shock wave stability are derived dynamically and the adiabatic stress-strain relations are classified according to their curvatures. A distinction is made between complete shock stability and restricted stability, and procedures are described for constructing the form of the finite amplitude wave corresponding to any stress-strain curve which is time-independent. These are found to be made of compression shocks, rarefaction shocks, simple compression waves and simple rarefaction waves joined by simple continuity conditions. Illustrations are given and some experimental results are discussed in the light of these ideas. (Contractor's abstract)

ASYMPTOTIC MULTIVARIATE OCCUPATION TIME DISTRIBUTIONS FOR SEMI-MARKOV PROCESSES, by R. G. Miller, Jr. May 15, 1961, 25p. (Technical rept. no. 70) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22552) AD 256670 Unclassified

Asymptotic bivariate normality is established for the cumulative occupation times of two states in a semi-Markov process with countable state space and also for the cumulative sums of functions defined on the occupation

times. The asymptotic moments are given explicitly for a general semi-Markov process with three possible states and a semi-Markov process with countable state space in which $F_{ij} = F_i$, i.e., F_{ij} independent of j. These results are applied to the zero and one states in a simple M/M/1 queue. (Contractor's abstract)

STORAGE POLICY FOR INCOMPLETE RECORD-KEEPING, by H. Chernoff and G. Schwarz. July 2, 1961 [18]p. incl. diagrs. (Technical rept. no. 71) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22552) AD 261409 Unclassified

A depot is considered which stores and supplies a certain item. When a demand or request for this item is submitted, it is met by the depot. The transaction is recorded and the balance (the amount recorded to be in storage) is diminished by the amount supplied. However, it is possible that, by oversight, the transaction fails to be recorded. Because of possible failures to record transactions it may be that the stock is considerably less than the balance. In that case the stock is reordered but the inability to supply the demand leads to a loss whose average value c may be substantial. If the reorder point is low, the unfilled demand may prove costly. On the other hand, if it is high, there will be unnecessarily frequent inventories and reorderings which also lead to considerable cost. It is desirable to evaluate the expected cost per transaction and to see how it depends on the choice of the reorder point. This evaluation can then be applied to an optimal reorder point. The problem of finding an optimal reorder point is presented formally and the graphs which indicate approximations to the solution are described. Two distinct cases are treated in the derivations: the case where the demand is constant and the case where it is a random variable with known mean and variance.

THE EFFECTS OF TEMPERATURE AND TIME ON AIRCRAFT AND MISSILE STRUCTURES, by N. J. Hoff. Jan. 1961, 88p. incl. illus. tables. (SUDAER no. 99) (AFOSR-646) (AF 49(638)223) AD 259372 Unclassified

A survey is made of the new problems introduced in the structural analysis of airplanes and missiles by the high temperatures caused by aerodynamic heating. Thermal stresses, thermal buckling, the effect of creep on stress distribution and stability, and ablation are discussed and special attention is paid to the behavior of the pure shells used in missiles. It is concluded that the modern structural analyst must acquire a knowledge of many disciplines that were of no interest to his predecessor working before World War II. Among these disciplines are thermodynamics, metallurgy, and the physics of the solid state. In all the new problems 2 parameters appear that did not enter classical structural analysis. The first is temperature which is the cause of all the difficulties of the modern structural designer and analyst. The second is time, because at high temperatures no structure can carry loads for indefinitely long periods. One of the most important tasks of the analyst of missiles is the determination of the lifetime of the structure. (Contractor's abstract)

DEFORMATION OF HEATED SHELLS, by W. S. Hemp. Apr. 1961, 94p. incl. illus. (SUDAER no. 103) (AFOSR-770) (AF 49(638)223) AD 259373 Unclassified

Methods were investigated for the analysis of deformation and stresses induced by heating of thin shells. The general theory of thin shells is reviewed. The shell is defined in terms of its middle surface and thickness and its properties, both before and after deformation, are defined by metric and curvature tensors which satisfy the Gauss and Codazzi equations of surfaces. The state of strain is defined in terms of these quantities and equations are derived for membrane strains and curvature changes. This kinetic basis may be combined with either the principle of stationary free energy or with the equilibrium equations to form a complete theory of shells Extensional solutions which are found to be stress-free are first investigated and then departures from these solutions are considered. The special problem of buckling induced by compressive stresses in an edge effect is investigated, and an energy method of solution is given.

Stanford U. [Dept. of Aeronautical Engineering] Calif.

THERMAL BUCKLING OF CENTRALLY HEATED CIRCULAR PLATES, by A. Queinec. June 1961, 29p. incl. illus. tables. (SUDAER no. 106) (AFOSR-989) (AF 49(638)223) AD 264493 Unclassified

The behavior of a centrally heated flat circular plate with axisymmetric temperature distribution and free edge conditions is investigated theoretically and checked experimentally. Thermal stresses occur when the temperature is not uniform and cause buckling if the temperature rise is sufficiently large. The buckling mode is axisymmetric. Large deflections are obtained for temperatures above the critical value. Theoretical calculations include solutions of the buckling problem as well as the post-buckling behavior of the plate. Attempts are made to introduce the effect of initial irregularities in the plate and to solve the large deflection problem. Experimental data give temperature distributions and deflected shapes. The results obtained from the theory are checked with a satisfactory degree of accuracy. (Contractor's abstract)

BUCKLING OF THIN SHELLS, by N. J. Hoff. [1961] 86p. incl. illus. diagrs. tables, refs. (Rept. no. 114) (AFOSR-1422) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)223 and National Aeronautics and Space Administration) AD 264495 Unclassified

Also published in Proc. of Aerospace Scientific Symposium of Distinguished Lecturers in honor of Dr. Theodore von Kármán on his 80th anniversary, Washington, D. C. (May 11, 1961), New York, Inst. of Aerospace Sci., 1962, p. 1-86.

A historic review of the development of our ideas on buckling is presented. It continues with a report of work on the stability of thin shells now under way at Stanford U. The results obtained so far in this investigation can be presented under 3 headings: First, a new solution is found to the classical small-deflection equations of the stability of thin-walled circular cylindrical shells. The second part deals with the large displacements developing when the thin circular cylindrical shell suddenly snaps through into a polyhedral buckled shape often designated as the diamond shape. In the final part the transmission of the axial load through the fully buckled circular cylindrical shell is studied. (Contractor's abstract)

SECOND-ORDER COMPRESSIBLE BOUNDARY LAYER THEORY WITH APPLICATION TO BLUNT BODIES IN HYPERSONIC FLOW, by M. Van Dyke. July 1961, 50p. incl. diagrs. refs. (SUDAER no. 112) (AFOSR-1270) (AF 49(638)965) AD 267859 Unclassified

Presented at ARS Internat'l. Hypersonic Conf., Cambridge, Mass., Aug. 16-18, 1961.

Also published in Prog. in Astronaut. and Rocketry, v. 7: 37-76, 1962.

Viscous hypersonic flow near the nose of a blunt body is considered on the basis of the Navier-Stokes equations. Conventional boundary-layer theory is embedded in a systematic expansion scheme. The general theory of the second approximation is developed. Seven second-order effects are identified: longitudinal curvature, transverse curvature, slip, temperature jump, entropy gradient, stagnation enthalpy gradient, and displacement. Their evaluation for a blunt body is outlined, and numerical results given for the stagnation region of a cooled sphere at infinite Mach number. In that example the increase in heat transfer due to entropy gradient is reduced one third by the other second-order effects. (Contractor's abstract)

THEORY OF ENTROPY LAYERS AND NOSE BLUNTNESS IN HYPERSONIC FLOW, by J. K. Yakura. July 1961 77p. incl. diagrs. refs. (SUDAER no. 110) (AFOSR-1271) (AF 49(638)965) AD 264494 Unclassified

Presented at ARS Internat'l. Hypersonic Conf., Cambridge, Mass., Aug. 16-18, 1961.

Also published in Prog. in Astronaut. and Rocketry, v. 7: 421-470, 1962.

The method of inner and outer expansions was used in obtaining uniformly-valid solutions far downstream from the blunt nose of slender bodies in hypersonic flow. Application of this technique on the inverse problem, which prescribes the shock wave leaving the body to be determined, results in a unique treatment of the flow field. The influence of nose (shock) bluntness on the flow field and body shape is found to be significant due to the formation of a layer of low density, high entropy air enveloping the body. This entropy layer is in many respects analogous to Prandtl's viscous boundary layer. Analytical solutions, which assume an inviscid perfect gas and infinite Mach number were obtained for hyper-

bolic and power-law shock wave shapes. The hyperbolic shocks correspond to flows past blunted wedges and cones in 2 and 3 dimensions, respectively. The second-order results for these 2 cases yield a displacement thickness due to the entropy layer. The blunt body that produces a paraboloidal shock is found to grow as a small power of the distance. (Contractor's abstract)

AN X-RAY DIFFRACTION STUDY OF LIQUID STRUCTURE, by H. H. Paalman and C. J. Pings. Final rept. June 1961, 143p. incl. illus. diagrs. tables, refs. (AFOSR-811) (AF 49(638)469) AD 261731
Unclassified

A comprehensive program is presented for the study of liquid-state structure. Through the application of x-ray diffraction techniques, the pair distribution function may be obtained for a given state of a liquid system. This information is basic to the theoretical treatment of liquids by statistical mechanical methods. Experimental apparatus was fabricated for carrying on diffraction experiments over an extensive range of pressure and temperature. A cylindrical beryllium cell, capable of withstanding several hundred psi, was used. The components were designed for the study of condensed low atomic weight elements at cryogenic temperatures. Control systems maintained the desired pressure and temperature within 0.5 psi and 0.2°C, respectively. The theory for the interpretation of liquid diffraction data was critically reviewed. A synthesis of the important recent developments is presented in a general analytical scheme. Liquid nitrogen was studied at 100 psia and -193.5°C. The results compared favorably with earlier work reported in the literature. (Contractor's abstract)

HEAT OF ISOMERIZATION OF PEROXYNITRITE TO NITRATE AND KINETICS OF ISOMERIZATION OF PEROXYNITROUS ACID TO NITRIC ACID, by J. D. Ray. [1959] [4]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)286 and National Science Foundation) Unclassified

Published in Jour. Inorg. and Nuclear Chem., v. 24: 1159-1162, Dec. 1962.

The reaction between hydrogen peroxide and nitrous acid at 0° results in high yields of the rapidly formed intermediate peroxynitrous acid which isomerizes to nitric acid at a slower rate. By stopping the reaction with the addition of base at various times and measuring the total heat evolved in a calorimeter it was possible to determine the rate constant for isomerization to be 0.099 sec^{-1} at 1°. The heat of isomerization of the peroxynitrite ion to the nitrate ion was deduced to be -38.8 ± 2 kcal/mol in dilute aqueous solution at 1°.

KINETICS OF THE THERMAL DECOMPOSITION OF NITRIC ACID VAPOR. IV. A SHOCK TUBE STUDY BETWEEN 800-1200°K, by H. Harrison, H. S. Johnston, and E. R. Hardwick. [1961] [5]p. incl. diagrs. tables, refs. (AF 49(638)306) Unclassified

Published in Jour. Amer. Chem. Soc., v. 84: 2478-2482, July 5, 1962.

The decomposition of nitric acid vapor in excess argon was studied in a shock tube between 800 and 1200°K. The reaction was followed in terms of the appearance of nitrogen dioxide and of the appearance and disappearance of the intermediate, NO_3. At total concentrations near 10^{-5} mol/cc the decomposition is controlled by the unimolecular reaction $M + HNO_3 \xrightarrow{a} HO + NO_2 + M$ near its second order limit, with

$$\log a = (15.2 \pm 1.0) - \frac{30.6 \pm 1.8}{2.303\,R} \cdot \frac{1000}{T} \text{ (mol/cc)}^{-1}\ \text{sec}^{-1}.$$

The presence in this system of NO_3 and its rate of disappearance are consistent with previous work on the decomposition kinetics of nitric acid and nitrogen pentoxide. (Contractor's abstract)

SOME ASPECTS OF DEFORMATION IN SINGLE CRYSTALS AND BICRYSTALS OF ALUMINUM AT ELEVATED TEMPERATURES, by R. H. Bush, A. N. Lord and others. Final rept. June 1961, 141p. incl. illus. diagrs. tables, refs. (AFOSR-1073) (AF 18(603)-66) AD 262462 Unclassified

A study was made to evaluate the kinematics of grain boundary shear and to compare the results pertaining to crystallographic deformation with those reported in the literature. Melt-grown single crystals and bicrystals of high purity Al were tested in tension at extension rates

of 8.20×10^{-6} to 10^{-4} cm/sec (strain rates of approximately 2.3 to 230%/hr) and at temperatures of 538 to 650°C. The bicrystal samples contained pure, symmetrical tilt or twist boundaries of 10, 32, 40, 88, and 90°. Continuous stress and total extension and intermittent shear displacement data were obtained as a function of time. A yield point phenomenon which is caused by a small amount of pre-test deformation was observed for single crystals and to a reduced extent for bicrystals. Its presence is explained by a model based upon dislocation multiplication and the stress dependent velocity of dislocations. A yield stress for grain boundary shear which is associated with a thermally activated process was also observed.

THEORETICAL AND EXPERIMENTAL INVESTIGATION OF FLOW OVER SINGLE AND DOUBLE BACKWARD FACING STEPS, by D. E. Abbott and S. J. Kline. June 1961, 106p. incl. illus. tables, refs. (Rept. no. MD-5) (AFOSR-890) (AF 49(638)201) AD 262145
Unclassified

A semi-empirical analysis is developed for the over-all flow pattern of subsonic turbulent flow over backward facing steps. Good agreement is found between theory and experiment for the prediction of 2-dimensional reattachment length for small values of step height to throat width ratio; an asymptotic solution for large values of step height is also given and discussed. Mean velocity profiles calculated by the present analysis are shown; they require an empirical fit at one point. Good agreement with experiment is found in the region near the step face, but agreement is poor near the reattachment region. Experimental results are represented for flow patterns over backward facing steps covering a wide range of geometric variables. Velocity profile measurements are given for both single and double steps. The stall region is shown to consist of a complex pattern involving 3 distinct regions. The double step contains an asymmetry for large expansions, but approaches the single-step configuration with symmetric stall regions for small values of area ratio. No effect on flow pattern or reattachment length is found for a wide range of Reynolds numbers and turbulence intensities, provided the flow is fully turbulent before the step.

Also published in Phys. Rev. Ltrs., v. 6: 462-463, May 1, 1961.

In examining the ESR (electron spin resonance) spectrum of polycrystalline samples of the organic free radicals picryl-n-amino carbazyl (PAC), 1-3-bisdiphenylene-2-phenyl allyl (BDPA), and Wurster's blue perchlorate (WB) at low temperatures and low frequencies, a resonance was observed at g = 4. This line may have arisen from a forbidden transition made possible by the dipolar interaction between spins. In the frequency range from 20 mc to 200 mc the g-value is 4 to within 3% independent of temperature. At fixed temperature the ratio of the peak intensity of the g = 4 resonance absorption to that of the g = 2 absorption decreases with the increasing frequency. At fixed frequency the intensity ratio decreases with increasing temperature and vanishes above a temperature T characteristic of the particular free radical. The intensity ratio decreases with increasing values of the radio-frequency power. The width of the g = 4 resonance appears to be essentially independent of temperature and is of the same order of magnitude as that of the g = 2 resonance. In some cases there is evidence for a g = 6 resonance in the form of a weak bump on the low field side of the g = 4 resonance.

DYNAMIC POLARIZATION ANOMALIES IN ORGANIC FREE RADICALS, by R. H. Webb. [1961] [9]p. incl. diagrs. (Technical note no. 12) (AFOSR-725) [AF 18-(603)131] AD 261506 Unclassified

Also published in Phys. Rev. Ltrs., v. 6: 611-613, June 1961.

As a part of a broader study of exchange effects in various paramagnetic substances, an organic free radical in which the Overhauser effect gives way to a Solid effect at low temperature has been found, and1 in which the 2 effects are present simultaneously. The Overhauser effect is produced by saturation of the electronic transition (ESR) in a system in which the nuclei are coupled to the electrons by a hyperfine interaction. The Solid effect, on the other hand, depends on dipole-dipole coupling between the electrons and nuclei in a solid and requires the saturation of the forbidden transition at $\nu = (|\gamma_e \pm \gamma_n)H_0$, where ν is the microwave frequency and γ_e and γ_n are the electronic and nuclear gyromagnetic ratios. The Overhauser effect is relatively well known in the organic free radical diphenylpicryl hydrazyl (DPPH). Picryl amino carbazyl (PAC) resembles DPPH and Wursters' Blue perchlorate (WB) in its electron spectrum at room temperature. It has one of the larger g-factor anisotropies among the organic free radicals. It exhibits both Solid and Overhauser effects at 300°K and 77°K, with a pure Solid effect at 4.2°K and below. PAC and WB differ from DPPH in the temperature dependence of their susceptibilities. They also are known to show g = 4 satellite lines below a characteristic temperature T* which is higher in WB. The transition between the 2 types of dynamic polarization which is observed comes above T* in PAC below it in WB. However, the existence of the g = 4 lines is apparently due to the presence of dipolar coupling, which is in turn related to the decrease in susceptibility and its consequent effective magnetic dilution. It is this effective magnetic dilution which is suggested as providing for the nuclear-electron dipolar coupling which gives rise to the Solid effect.

PROTON RESONANCE SHIFTS AND ELECTRON SUSCEPTIBILITIES IN 1,3-BISDIPHENYLENE 2-PHENYL ALLYL, by M. E. Anderson, R. S. Rhodes, and G. E. Pake. [1961] [6]p. incl. diagr. (Technical note no. 13) (AFOSR-929) [AF 18(603)131] AD 261506 Unclassified

Also published in Jour. Chem. Phys., v. 35: 1527-1528, Oct. 1961.

The proton resonance shifts in polycrystalline samples of the organic free radical, 1,3-bisdiphenylene 2-phenyl allyl (BDPA) have been measured and both the hyperfine constant and the temperature dependence of the electron susceptibility have been obtained. In the liquid helium temperature range 2 components are observed. At a fixed frequency of 22.8 mc/sec the more intense component occurs at a field $H_0 = \frac{\omega_0}{\gamma_p}$, the proton Larmor field. The other component is shifted upfield and occurs at $H = H_0 + \Delta H$. The sign of the hyperfine constant, A, for these shifted protons is negative. Integration of the derivative spectrum and resolution into components gives a ratio of 68:32 for the intensities of the unshifted components. From ESR in BDPA in liquid solution a 9 line spectrum with relative intensities characteristic of a splitting by 8 equivalent unidentified protons is reported. If these protons are tentatively identified with the shifted component of the proton spectrum, the intensity of this component is expected to be 8/(21 + 6) of the total intensity. The intensity ratio of unshifted components would then be 19/27 : 8/27 = 70:30. In order to obtain the magnitude of A, one needs to know the temperature dependence of the electron susceptibility. A is obtained as equal to 3.7 ± 0.5 mc/sec or 1.3 ± 0.3 oe. It is seen that the hyperfine constants of liquids and solids do not differ greatly. At room temperature the proton-proton dipole interaction appears to be the main source of line broadening. As exchange ordering sets in, the rate of electron spin fluctuation decreases and the hyperfine contribution to the width becomes more important. The shape of the shifted component is approximately Lorentzian, suggesting that the hyperfine contribution is dominant. For temperatures down to 1.4°K the unshifted component does not change appreciably in width nor deviate from a short-tailed lineshape.

THERMODYNAMIC PROPERTIES OF FINITE CHAINS OF EXCHANGE-COUPLED ATOMS, by R. B. Griffiths. Dec. 1961 [39]p. incl. diagrs. tables, refs. (Technical note no. 17) (AFOSR-1934) (AF 18(603)131) Unclassified

The energy, entropy, specific heat, and susceptibility (all in the limit of zero external magnetic field) are

computed for finite chains (actually closed "rings") of spin 1/2 atoms coupled by an isotropic exchange interaction between nearest neighbors. The calculations are carried out for chains containing 2, 3, 4, ..., 10 atoms, and for both ferro- and antiferromagnetic coupling. The convergence as the number of atoms (N) in the chain increases suggests that the thermodynamic quantities obtained for a 9 or 10 spin chain provide a fairly good approximation to the same quantities in the limiting case of an infinite chain, at temperatures above $|J|/k$ (J = exchange integral), and in some cases even for slightly lower temperatures. Also, it is found that at any fixed temperature, the energy, Helmholtz free energy, and susceptibility as a function of N are monotone increasing (ferromagnetic case) or monotone increasing for N even and monotone decreasing for N odd (antiferromagnetic case). A similar monotone behavior is found for the antiferromagnetic entropy and specific heat (the latter only for N odd). Numerical values for energy, entropy, specific heat, and susceptibility are given for N = 9, 10. Finite chains with Ising interaction are also briefly discussed, and the thermodynamic quantities are shown to exhibit several of the monotonicity properties found for the isotropic interaction. THEORY OF MAGNETIC EXCHANGE-LATTICE RELAXATION IN TWO ORGANIC FREE RADICALS, by R. B. Griffiths. July 1961 [8]p. incl. diagr. tables, refs. (Technical note no. 16) (AFOSR-1971) (AF 18(603)131) Unclassified

Also published in Phys. Rev., v. 124: 1023-1030, Nov. 15, 1961.

A calculation of the spin-lattice relaxation rate is made for conditions appropriate to certain organic free radicals with exchange-narrowed paramagnetic resonance lines, at temperatures well above the Néel temperature. The relaxation is supposed to be a 2-step process: 1. Energy is transferred from the "Zeeman" system to the "exchange" system by spin-spin relaxation. 2. The energy is then transferred from the "exchange" system to the lattice. It is the rate of energy transfer in the latter process which is here computed, assuming that the exchange-lattice coupling is due to (a) the variation of exchange energy when the distance between 2 adjacent spins is changed or (b) the corresponding variation of magnetic dipolar energy. The calculation shows that in the case of diphenyl picryl hydrazyl (DPPH) and bisdiphenylene phenyl allyl (BDPA) the exchange-lattice relaxation rate above liquid nitrogen temperatures is rapid enough (under the usual experimental conditions) to make the experimental spin-"lattice" relaxation time equal to the Zeeman-exchange relaxation time and hence temperature independent, as experimentally observed. MODIFIED CW TECHNIQUE FOR SPIN-LATTICE RELAXATION TIME MEASUREMENTS, by M. Mandel. [1961] [2]p. incl. diagrs. (AFOSR-2772) [AF 18(603)-131] Unclassified

Also published in Rev. Scient. Instr., v. 33: 247-248, Feb. 1962.

A modulated continuous wave (CW) method is described in which the microwave power remains on for more than ample time for the electrons to reach equilibrium with the microwaves. This characteristic time, obtained by solving the rate equations for a spin 1/2 system is given by $T_1/(1 + {}^2H_1{}^2T_1T_2)$. An X-band bridge spectrometer is used. The technique has been used to measure the relaxation time of pol. crystalline α,α-diphenyl β-picryl hydrazyl (DPPH) and α,γ-bisdiphenylene β-phenyl allyl (BDPA). At 300 and 77°K, both the usual and the modulated CW methods gave the same results; $T_1 \sim 5 \times 10^{-8}$ sec for DPPH and $\sim 1 \times 10^{-7}$ sec for BDPA. Previous microwave measurements on DPPH and BDPA at 1.5°K, using both CW and high power pulse techniques, had given values of T_1 around 10^{-6} sec. The modulated method gives $T_1 \sim 10^{-8}$ sec.

LATTICE HEATING EFFECTS IN SPIN-LATTICE RELAXATION TIME MEASUREMENTS (Abstract), by M. Mandel, G. E. Pake, and J. P. Goldsborough. [1961] [1]p. [AF 18(603)131] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 141, Mar. 20, 1961.

In the measurement of paramagnetic relaxation times by CW methods at liquid helium temperatures, one is often faced with the problem of lattice heating. A modulated CW method is developed to study this effect. The microwave power remains on for a time long compared to that necessary to saturate the electrons, but the duty cycle is such that the average power is not sufficient to appreciably heat the lattice. This method is particularly appropriate in cases of short T_1 for which high rf power is required for saturation. This technique has been applied to measure the realxation time of DPPH. At 300°K, both the usual CW and the modulated CW methods give the same result, $T_1 \sim 5 \times 10^{-8}$ sec. However, at 1.5°K, where the lattice specific heat is very small, CW saturation and the recovery time of Mz from a high power pulse give a T_1 of $\sim 10^{-6}$ sec, while the modulated CW method gives $T_1 \sim 10^{-8}$ sec. Similar decreases in apparent T_1 of $Cu(SO_4) \cdot 5H_2O$ on reducing the average power are also observed.

OBSERVATION OF ELECTRON SPIN RESONANCE AT g = 4 IN CRYSTALLINE ORGANIC RADICALS (Abstract), by J. H. Burgess and R. S. Rhodes. [1961] [1]p. [AF 18(603)131] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 151, Mar. 20, 1961.

A transition is observed at g = 4 at low temperatures and low frequencies in the ESR spectrum of each of the free radicals picryl-n-amino-carbazyl, 1,3-bisdiphenylene-2-phenyl allyl and Wurster's blue. In a frequency range from 20-200 mc/sec the g value is 4 within 3% and is independent of temperature. However, at a fixed frequency the intensity of the absorption decreases at higher temperatures and vanishes above a temperature T* characteristic of the particular free radical. Because of antiferromagnetic exchange coupling, the static susceptibility of the free radicals exhibits a max as a function of temperature. In all cases T* falls below the temperature of this max indicating that "exchange motion" is effective in averaging out the interactions responsible for the g = 4 transition. At fixed temperature the resonance decreases in intensity of higher frequencies and has not been observed above 200 mc/sec. In all cases, there is an indication of an unresolved resonance at g = 6. Since the dipolar interaction between electron spins is of the order of 200 mc/sec these resonances may be related to the satellite lines discussed by Van Vleck (see Phys. Rev., v. 74: 1168, 1948).

MAGNETIC DISPERSION CORRECTIONS TO ELASTIC ELECTRON SCATTERING, by A. Goldberg. Mar. 1961 [24]p. incl. tables, refs. (Technical note no. 33) (AFOSR-662) (AF 49(638)388) AD 451538 Unclassified

Also published in Nuovo Cimento, Series X, v. 20: 1191-1204, June 16, 1961.

The scattering of high energy electrons by He^4 may be used as a test of quantum electrodynamics if the approximate calculation of the cross section, i.e., Born approximation, is correct. This is examined by evaluating the next order approximation in which the He^4 nucleus is virtually excited for a short time during the scattering. This next approximation is found to contribute a 5% correction to the cross section, which is within the limit of experimental accuracy. (Contractor's abstract)

TRANSFER OF HELICITY IN RADIATION AND ABSORPTION OF HIGH-ENERGY PHOTONS, by R. H. Pratt. Mar. 1961 [13]p. incl. refs. (Technical note no. 37) (AFOSR-663) (AF 49(638)388) AD 258208 Unclassified

Also published in Phys Rev., v. 123: 1508-1510, Aug. 15, 1961.

Nearly complete transfer of momentum between a high-energy electron (or positron) and a photon in a Coulomb field implies that helicity is also transferred. This is not a consequence of conservation of total angular momentum but, rather, of spin angular momentum, and follows from a demonstration that it is possible to use free-particle spinors (though not free wave functions) for the high-energy particles. Polarization correlations of the lower-energy particle in such a process are discussed. Applications are made to bremsstrahlung, pair production, photo-effect, and one-photon pair annihilation. ANALYTIC PROPERTIES AND RESCATTERING CORRECTION TO THE BORN APPROXIMATION FOR TRANSITION MATRIX ELEMENTS, by B. Bosco. Mar. 1961 [23]p. incl. diagr. refs. (Technical note no. 38) (AFOSR-664) (AF 49(638)388) AD 258209 Unclassified

Also published in Phys. Rev., v. 123: 1072-1076, Aug. 1, 1961.

The analytic properties of a matrix element of a general operator between a bound state and a scattering state are studied in the framework of Schrödinger theory. It is shown that the singularities of such a matrix element are easily inferred from those of the Born approximation. Using the fact that the possible singularities which are not contained in the Born approximation are located far apart from those included in the lowest approximation, a simple formula is derived which allows one to obtain the rescattering correction to the Born approximation using explicitly the phase shifts. THE GROUND STATE OF SOLID He^3, by E. M. Saunders. May 1961, 58p. incl. diagrs. refs. (Technical note no. 39) (AFOSR-783) (AF 49(638)388) AD 258210 Unclassified

Also published in Phys. Rev., v. 126: 1725-1736, June 1, 1962.

A ground-state wave function for solid He^3 in the body centered cubic phase is calculated in the form of a product of single-particle orbitals and pair correlations. The correlation part is an eigenfunction of the Pluvinage Hamiltonian with each pair in a state of zero energy in a frame in which their center of mass is at rest. Assuming that exchange effects are small, an approximate single-particle probability function from this wave function is obtained. The many-body energy is obtained from this single-particle probability function from basic principles by a plausibility argument, and leads to a pressure-volume relation that is in good agreement with observation. Exchange effects arise from the original wave function, when suitably antisymmetrized. This predicts an exchange energy of about 0.005 °K near the melting curve. This exchange energy favors antiferromagnetic alignment. (Contractor's abstract)

ROTATIONAL SPECTRA IN THE NUCLEAR SHELL MODEL, by R. S. Willey. May 1961, 28p. incl. refs. (Technical note no. 40) (AFOSR-832) (AF 49(638)388) AD 260929 Unclassified

The relation between 2 different models used to explain the properties of complex nuclei at low energies is treated. One is the nuclear shell model which starts from the picture of nucleons moving independently of each other in a central potential which represents the average effect of all the interactions between the different nucleons. The second is the collective rotational model which pictures the nucleus as a rigid body deformed from spherical shape. The free rotation of this rigid body leads to rotational spectra $E = \text{constant} + L(L+1)/2I$. The problem is solved of how to introduce an extra (residual) interaction between particles into the shell model Hamiltonian to obtain rotational spectra within the framework of a shell model calculation. COHERENT PHOTOPRODUCTION OF π^0 FROM DEUTERIUM, by F. T. Hadjioannou. [1961] [8]p. incl. diagrs. table. (AFOSR-919) [AF 49(638)388] Unclassified

Also published in Phys. Rev., v. 125: 1414-1421, Feb. 15, 1962.

The calculation of elastic photoproduction of π^0 from deuterium, $\gamma + d \rightarrow \pi^0 + d$, is carried out in the impulse approximation at photon energies around 500 mev. The single nucleon photoproduction amplitudes are taken from dispersion formulas and are corrected for kinematic effects due to internal momentum of the nucleons in the deuteron. The D-state part of the deuteron wave function is included and different models are used with Yukawa type or repulsive core wave functions. Formulas connecting the cross section with the dueteron form factors are given. For small momentum transfers the formulas are model independent and reduce to the usual ones. The presence of a 7% D state in a repulsive-core model leads to a cross section which falls typically more slowly at high momentum transfers, e.g., at a momentum transfer 2.74 f^{-1}, the cross section is larger by about 40% than the cross section calculated in the absence of the D state. The experimental points favor this model. (Contractor's abstract)

QUASI-ELASTIC PEAK IN HIGH ENERGY NUCLEON-NUCLEON SCATTERING, by S. D. Drell and K. Hida. Aug. 1961 [16]p. incl. diagrs. refs. (Technical note no. 43) (AFOSR-1218) (AF 49(638)368) AD 262850 Unclassified

Also published in Phys. Rev. Ltrs., v. 7: 199-202, Sept. 1, 1961.

In the scattering of very high-energy protons from the nucleons within target nuclei, it is found that the scattered protons have a distribution of energies. These experiments, performed at CERN, show a sharp peak in the energy distribution which corresponds to elastic scattering of the incident protons, and also a broader peak at somewhat lower energy which corresponds to nearly elastic scattering of the incident protons. An explanation of this latter quasi-elastic peak is offered in terms of the diffraction scattering of one of the pions in the cloud of the target nucleon. This diffraction scattering of the pion by the incident nucleon results in a moderate energy loss of the nucleon, so that it emerges in the quasi-elastic peak.

THE EFFECT OF THE 3π RESONANCE ON THE 2π RESONANCE, by R. Blankenbecler. Aug. 1961 [27]p. incl. diagrs. refs. (Technical note no. 45) (AFOSR-1385) (AF 49(638)388) AD 264805 Unclassified

Also published in Phys. Rev., v. 125: 755-760, Jan. 15, 1962.

It is shown that the 4π intermediate state in π-π scattering plays an important role in determining the position and perhaps even the existence of the π-π resonance. This large effect occurs by virtue of the 3π resonance. Quantitative estimates are given. The effect of this result on the nucleon form factors is briefly discussed and a simple model for these functions is proposed. The possibility of higher energy pion resonances is also considered.

PARTICLE THEORY APPROACH TO THE TWO-PION AND THREE-PION SYSTEMS, by L. I. Schiff. Aug. 1961, 21p. incl. diagrs. refs. (Technical note no. 46) (AFOSR-1398) (AF 49(638)388) AD 264806 Unclassified

Also published in Phys. Rev., v. 125: 777-781, Jan. 15, 1962.

The relation between the 2-pion and 3-pion resonances is discussed in terms of a model in which the motion of the pions is described by a partially relativistic Schrödinger-type wave equation, and the interaction between them is represented by a static potential. An attractive square-well potential that is almost strong enough to bind the di-pion gives a satisfactory account of the observed P-wave pion-pion scattering. If this potential is assumed to be additive between all pairs in the 3-pion $I = 0$, $J = 1^-$ state, it produces far too much binding to agree with observation. As an alternative to additivity, the interaction may be assumed to saturate, so that the total potential never exceeds that between any pair of pions. It is found that the model provides a qualitatively consistent explanation both of pion-pion scattering and the 3-pion system if the pair interactions saturate or nearly saturate. EXTRAPOLATION TO CUTS AND THE SCATTERING OF ELECTRONS AND POSITRONS, by S. D. Drell and R. H. Pratt. Aug. 1961, 21p. incl. diagrs. tables, refs. (Technical note no. 42) (AFOSR-1408) (AF 49(638)388) AD 264804 Unclassified

Also published in Phys. Rev., v. 125: 1394-1399, Feb. 15, 1962.

The low momentum transfer region of strong interaction processes may be discussed in terms of 1-pion-exchange graphs. This success of extrapolation to poles suggests, as an extension, extrapolation to cuts corresponding to low mass intermediate states containing two or more particles. It is found that this extrapolation may be performed in the case of electromagnetic interactions, owing to the vanishing photon mass. For small-angle scattering of relativistic electrons in a pure Coulomb field $(\sin^4\theta/2)(d\sigma/d\Omega) = a_0 + a_1 \sin\theta/2 + \ldots$, where a_0 is given precisely by one photon pole and a_1 (obtained exactly to all orders in $Z\alpha$) comes from the many photon terms. For scattering by finite nuclei it is further found that, for fixed momentum transfer, the ratio of second to first Born approximation decreases as $(\text{energy})^{-1}$ at high energies. This leads to a simple approximate formula for the ratio $R = (\sigma_- - \sigma_+)/(\sigma_- + \sigma_+)$ of electron and positron scattering, and to a simple method of determining the charge form factors of intermediate Z nuclei. ELECTRON SCATTERING FROM A QUANTIZED LIQUID DROP, by J. D. Walecka. Aug. 1961 [43]p. incl. diagrs. table, refs. (Technical note no. 48) (AFOSR-1498) (AF 49(638)388) AD 265566 Unclassified

Also published in Phys Rev., v. 126: 653-662, Apr. 15, 1962.

The theory of an electron interacting with a quantized liquid drop is examined, the Hamiltonian being consistently written to second order in the parameters describing the distortion. When second-order terms are kept, some care is necessary in defining the observable value of the radius. Form factors, calculated in Born approximation, for all of the transitions in the drop model are given, as well as the probabilities for real photon emission. The correction to Coulomb scattering coming from the exchange of a transverse photon is also calculated. A model is made of the contribution of the nuclear magnetization to the transverse photon exchange. In general, the Coulomb scattering will dominate. Spherically symmetric compressional oscillations of a drop with surface tension are also discussed and the form factors for transitions are calculated. (Contractor's abstract)

ELECTROMAGNETIC PROPERTIES OF THE LOW-LYING STATES OF $_6C_6^{12}$ IN THE OSCILLATING DROP MODEL, by J. D. Walecka. Aug. 1961 [34]p. incl. diagrs. table, refs. (Technical note no. 49) (AFOSR-1499) (AF 49(638)388) AD 265567 Unclassified

Also published in Phys. Rev., v. 126: 663-670, Apr. 15, 1962.

The electromagnetic properties of the first 4 states of $_6C_6^{12}$ are discussed within the framework of the incompressible drop model. The radius of the drop is determined by the elastic electron scattering from the ground state. By adjusting the mass and surface tension of the drop to fit the energy and lifetime for γ-decay of the first excited state, one obtains agreement with the inelastic scattering cross sections from both the first and second excited states. The third excited state is interpreted as an octupole vibration through the inelastic electron scattering cross section. The total electromagnetic decay width of the second excited state, which is of astrophysical interest, is also calculated. (Contractor's abstract)

EFFECT OF π-K INTERACTION ON NUCLEON FORM FACTORS; THE PROCESSES $\pi\pi \to KK$ AND $\pi\pi \to \pi\pi$, by M.-C. Chen. Oct. 1961 [24]p. incl. diagrs. (Technical note no. 47) (AFOSR-1683) (AF 49(638)388) AD 266681 Unclassified

Also published in Phys. Rev., v. 125: 2125-2129, Mar. 15, 1962.

An evaluation is made of the relative contributions of 2K and 2π intermediate states to the isovector part of the nucleon's electromagnetic form factor. Dispersion theory is used, and spin and unphysical branch cuts are neglected. It is assumed that the K meson and the nucleon N, are coupled indirectly through the K-π and π-N couplings only. Approximate integrations are carried out for different limiting cases. With the exception of situations where there is not a well-defined trend, all cases show that the 2K-state contribution to the nucleon vector form factor is small. Maximum cross sections and resonance energies for the processes $\pi\pi \to \pi\pi$ and $\pi\pi \to KK$ are also evaluated. (Contractor's abstract)

A CALCULATION OF THE LEVEL SPECTRUM O^{18} FROM THE FREE TWO-NUCLEON POTENTIAL, by J. F. Dawson, I. Talmi, and J. D. Walecka. Jan. 1962 [56]p. incl. diagrs. tables, refs. (Technical note no. 54) (AFOSR-2203) (AF 49(638)388) AD 276243
Unclassified

Presented at meeting of the Amer. Phys. Soc., Los Angeles, Calif., Dec. 27-29, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 504, Dec. 27, 1961. (Title varies)

The 2-neutron binding energy and excitation spectrum of O^{18} are computed using the free nucleon-nucleon potential of Brueckner-Gammel-Thaler (which contains a hard core). The problem is discussed within the framework of the Bethe-Goldstone theory using harmonic oscillator wave functions as the unperturbed solutions. The interaction is diagonalized among the degenerate states and matrix elements are computed by a transformation to relative and center-of-mass coordinates. The energies in relative s-states are obtained by a numerical integration of the relative s-wave Schrödinger equation and then corrected for the presence of the filled levels. The ordering of the first 5 states of O^{18} is given correctly and the binding energy and level spacings are quite close to the experimental values. (Contractor's abstract)

IS ISOTOPIC SPIN A GOOD QUANTUM NUMBER FOR THE NEW ISOBARS?, by S. L. Glashow. [1961] 7p. (Technical note no. 52) (AFOSR-2205) (AF 49(638)388)
Unclassified

Also published in Phys. Rev. Ltrs., v. 7: 469-470, Dec. 15, 1961.

Several relatively long-lived "elementary particles" have recently been discovered. Some of these particles have very nearby masses (whether coincidentally or for some deep reason is not now known). In either case, the existence of 2 particles identical in essential quantum numbers and with neighboring masses can cause a novel enhancement of electromagnetic effects. These effects are estimated for the system of neutral vector mesons, ρ^0 and ω, and for neutral hyperon resonances, $Y_0^{(1)}$ and $Y^{(0)}$, a measurable breakdown of the law of isotopic spin conservation in the decays of these particles is predicted.

NUCLEAR ROTATIONAL SPECTRA, THE ELLIOTT, AND THE P_2 FORCE, by R. S. Willey. [1961] [12]p. incl. diagrs. table, refs. (AFOSR-3713) [AF 49(638)-388]
Unclassified

Also published in Phys. Rev., v. 126: 1127-1138, May 1, 1962.

The essential features of the Elliott model with the momentum-dependent quadrupole-quadrupole operator which leads to L(L+1) rotational spectra are reviewed. The operator is reduced to a momentum-independent residual interaction which differs somewhat from the P_2 interaction. The model Hamiltonian is separated into a rotational Hamiltonian, a deformed "intrinsic" Hamiltonian, and a perturbation term. The eigenfunctions and eigenvalues of the "intrinsic" Hamiltonian are found and used in Inglis' cranking model formula to calculate the moment of inertia. The model is modified, in a simple configuration, by taking a mixture of the long-range "P_2" interaction with the short-range δ-function force. For an intermediate mixture the spectrum obtained resembles the spectrum predicted by the collective vibrational Model. Finally, the implications of a P_2 residual interaction for direct-interaction inelastic scattering processes are considered. The question is discussed whether one can actually see the P_2 residual interaction in rotational nuclei, and, if so, whether the strength of the P_2 interaction determined from such scattering experiments is consistent with the strength determined from the observed rotational spectra. Within the rough approximations made, the few experimental results available are not inconsistent with the calculation. (Contractor's abstract)

Also published in Proc. Tenth Annual Conf. on High Energy Nuclear Physics, Rochester, N. Y. [1961], New York, Interscience Publishers, 1961, p. 771-774.

The primary object of this experiment is to test the validity of QED at small distances, or to find out if an electron has any finite size. The calculations are based upon the following conditions: The experiment was done with 2 intersecting 500 mev electron beams. The detectors for the scattered electrons are Cerenkov counters facing each other with equal apertures subtending the same solid angle and arranged for coincidence. The possible effects due to the breakdown of QED at small distances is investigated. The radiative corrections are calculated. The results indicate that the calculations need a careful analysis of the experimental conditions.

EQUIVALENCE PRINCIPLE "PARADOX" IN THE MOTION OF A GYROSCOPE, by L. I. Schiff. [1960] [2]p. (AFOSR-J678) [AF 49(638)388] AD 415775 Unclassified

Also published in Nuovo Cimento, Series X, v. 17: 124-125, July 1, 1960.

Investigations are described of the magnetically supported gyroscope, to verify previous predictions that an electromagnetic gyroscope was within the present state of the art. The objective of the program was to develop an airborne model of an electromagnetically supported gyro, utilizing a nonuniform field, for use in long-time-of-flight vehicles. A prototype gyroscope has been designed and constructed which employs a gimbal structure as a test table. The support servo has been tested and found to be satisfactory for the pseudo 3D gyro. The spin axis orientation servo tested in a static mode has the required characteristics; testing in the dynamic mode has not been completed. It has been concluded that the concept of a magnetically supported gyro is sound; however, it is recommended that studies be initiated to develop a method, other than optical, for determination of rotor position and spin axis orientation. In addition, further research is necessary to fully characterize the rotor performance in a nonuniform magnetic field. (Contractor's abstract)

THE BINDING ENERGY OF Λ-PARTICLES IN NUCLEAR MATTER, by J. D. Walecka. [1960] [8]p. incl. diagr. refs. (AFOSR-J679) [AF 49(638)388] AD 413624 Unclassified

Also published in Nuovo Cimento, Series X, v. 16: 342-349, Apr. 16, 1960.

From an analysis of the existing data on the binding energy of Λ particles in hyperfragments a fairly reliable value of the binding energy of Λ particles in nuclear matter can be obtained. This value is $V_0 \approx 22$ mev. It is proposed that this number gives an independent check on the validity of potentials deduced from the very light hyperfragments. Some simple calculations using the techniques of Brueckner et al are carried out with the potential of Lichtenberg and Kovacs (which contains a hard core). It is found that if only s wave interactions are considered one finds good agreement with the above number. If higher partial waves are included one obtains far too much binding energy and it is suggested that the Λ-nucleon interaction may be weakened by an exchange force in these states. EXCHANGE ENERGY OF A PAIR OF He^3 ATOMS IN AN ELONGATED POTENTIAL WELL (Abstract), by E. M. Saunders. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)388] and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 121, Mar. 20, 1961.

By calculating the exchange energy of an idealized model, and then applying a perturbation to represent the effects of neighbors, the exchange energy of solid He^3 is studied semiquantitatively. At zero temperature, because of the zero-point energy inherent in systems of weakly interacting particles of small mass, interparticle correlation plays an essential role in the exchange energy calculation. The problem of 2 atoms held in a volume of appropriate size by an ellipsoidal harmonic oscillator potential is considered, by using a 2-particle separation of the wave function. The interparticle coordinate is introduced in a fashion similar to that described by Walsh and Borowitz (Phys. Rev., v. 119: 1274, Aug. 15, 1960). The idealized system shows ferromagnetism. A first-order perturbation is applied to distort the model so as to include correlation effects of neighbors in the solid. The result is an antiferromagnetic alignment.

THEORY OF ELECTRON SPIN RESONANCE OF FREE RADICALS IN SOLUTION (Abstract), by J. D. Currin. [1961] [1]p. [AF 49(638)388] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 151, Mar. 20, 1961.

The electron spin resonance spectrum of the free radical 1,3-biindiphenylene 2-phenyl allyl exhibits, in solution, a hyperfine structure due to the coupling of an unpaired electron with 8 equivalent protons. Hausser has found that the resolution, proceeding from a temperature at which the lines are well separated, becomes progressively poorer as the temperature is increased, until the hyperfine structure dtsappears altogether. The total width of the spectrum remains constant throughout. A calculation of the spectrum has been made under the assumption of random flipping of the proton spins, as in the random frequency modulatton theory of Anderson and Weiss (Jour. Phys. Soc. Japan, v. 9: 888, 1954). The computed specira for increasing values of the proton sptn flip rate agree quite well with those obtained by Hausser for increasing temperatures. Ordinary mechanisms of nuclear spin relaxation in solutions of paramagnetic ions do not, however, appear to provide relaxation times short enough to account for the effect.

QUASI-ELASTIC PEAKS IN HIGH-ENERGY NUCLEON-NUCLEON AND PION-NUCLEON SCATTERINGS (Abstract), by S. D. Drell and K. Hiida. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)388] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 434, Nov. 24, 1961.

A bump in the energy spectrum of inelastically scattered protons emerging from proton-nucleus collisions for incident energies in the range 9-25 bev and for scattering angles of 20-60 mrad has been reported by Cocconi et al. at CERN. Their recent experiment on C and CH_2 shows a possible structure in the inelastic peak in the form of camel humps. The present aim is to suggest a mechanism giving rise to the bump. This mechanism is the diffraction scattering of a pion in the cloud of the target nucleon. The main results of calculations for the conditions of observation at CERN are presented. Further, it is suggested that there should be a quasi-electric diffraction peak in the process $\pi + N \rightarrow \pi + \pi + N$. The results of calculations will be compared with an experiment at CERN.

HIGH-FREQUENCY REGION OF THE BREMSSTRAHLUNG SPECTRUM (Abstract), by R. J. Jabbur and R. H. Pratt. [1961] [1]p. [AF 49(638)388] Unclassified

Presented at meeting of the Amer. Phys. Soc., Los Angeles, Calif., Dec. 27-29, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 514, Dec. 27, 1961.

Special techniques are required to calculate the cross section σ_{tip} for a bremsstrahlung process in which most of the energy of the incident electron is transferred to the photon. Fano noted that this process is closely related to atomic photoeffect, and it has since been shown that, neglecting contrtbutions to the cross section of relattve order $a^2 \equiv (Z\alpha)^2$, σ_{tip} can be obtained from the photoeffect cross section σK (see item no. 2550, Vol. IV). A more accurate calculation for the high-energy limit of σK is available (see item no. 449, Vol. IV). Here, similar techniques are used to obtain the cross section σ_{tip} from high-energy electrons, neglecting only relative order a^4. This requires a summation over final s and p electrons, but neglects d, f, etc., states. Results will be compared with the recent experiments of Hall and Hanson. Applications to photoeffect and pair production will be noted.

THE OPTIMUM RESPONSE OF FULL THIRD ORDER SYSTEMS WITH CONTACTOR CONTROL, by I. Flügge-Lotz and H. A. Titus, Jr. Mar. 15, 1961. 34p. incl. diagrs. tables. (Technical rept. no. 129) (AFOSR-442) (AF 49(638)513) AD 256061 Unclassified

Presented at Winter annual meeting of the Amer. Soc. Mech. Engineers, New York, Nov. 26-Dec. 1, 1961.

Also published in Jour. Basic Eng., v. 84: 554-558, Dec. 1962.

In the full third order problem it was desirable to modify the iteration procedure used in the periodic approximation method that was developed in solving the optimum problem of the second-order velocity controlled system. A number of examples illustrate the new method. The examples were first constructed in reverse time by employing the true optimum switching times satisfying the optimum switching function which was developed by the methods of Pontrjagin. The obtained final values of error and error derivatives gave the initial values for the approximate method. Periodic approximations of the optimum switching times were then obtained. It was found that for less than 3 switchings the approximate method leads to identical results. Reasonably small differences occur when 3 or more switchings are needed to reduce the initial disturbance to zero.

PONTRYAGIN'S MAXIMUM PRINCIPLE AND OPTIMAL CONTROL, by I. Flügge-Lotz and H. Halkin. Sept. 15, 1961, 65p. incl. diagrs. refs. (Technical rept. no. 130) (AFOSR-1489) (AF 49(638)513) AD 267860
Unclassified

The mathematical formulation of the most general problem of Optimal Control can be considered as a problem of Mayer subjected to unilateral constraints, i.e., to certain restrictions expressible in terms of inequalities. Results of the classical calculus of variations in their usual forms cannot give a general solution to this problem because, among other things, the fundamental relation of the calculus of variations, i.e., the equation of Euler-Lagrange, is valid only in the case of points interior to the set of admissible points. The most general solution is given by the Maximum Principle of Pontryagin, but in its present form this principle cannot be applied in certain situations, and its validity has been proved in particular cases only. A derivation of this principle for the most general case is given.

Also published in Phys. Rev., v. 123: 1840-1850, Sept. 1, 1961.

The electron-electron differential scattering cross section was measured with the use of a 500-mev electron beam from the Stanford Mark III linear electron accelerator. Deviations were sought from the theoretical cross section as calculated in first-order perturbation theory. (Møller scattering). The experimental results were compared with the Møller formula as corrected to the next order in perturbation theory by the work of Tsai. Atomic electrons in a beryllium target foil constituted the target for the electron-electron scattering. The scattered electrons passed through a slit system which defined the angle of scattering and the solid angle. After the particles passed through the slit system, they entered a double-focusing magnetic spectrometer, which analyzed the scattered particles in momentum. The electrons emerging from the spectrometer were detected by a liquid Čerenkov counter. The incident beam was monitored with the use of a Faraday cup and an electronic current integrator. In order to enhance the accuracy of the experiment, the experimental electron-electron scattering was compared to the elastic electron scattering from the target nuclei (Mott scattering). The cross section was measured at approximately 2.6, 3.5, and 4.5 degrees in the laboratory system. These angles correspond to approximately 90°, 107°, and 120° in the center-of-mass system, respectively. The theoretical magnitude of the radiative corrections is -5.5, -4.9, and -4.9% for the scattering angles 2.6, 3.5, and 4.5°, respectively. The average experimental deviation from the Møller formula found for the above angles was -3.0 (±2.3)%, -3.5 (±2.9)%, and -5.9(±2.3)%, respectively, where the error cited is total statistical error. In addition to the statistical error there is a max estimated ±2% possible systematic error. (Contractor's abstract)

PION PHOTOPRODUCTION AT BACKWARD ANGLES NEAR THE SECOND NUCLEON-PION RESONANCE, by L. N. Hand and C. Schaerf. [1961] [3]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [N6onr-25116])
Unclassified

Published in Phys. Rev. Ltrs., v. 6: 229-231, Mar. 1, 1961.

The present experiment measures with good statistics the photoproduction cross sections under the following 2 conditions: (1) photon energy 500-820 mev, laboratory angle 180°; (2) photon energy 500-770 mev, laboratory

angle 135° (i.e., cm angle from 149° to 152°). The results are presented graphically and the following conclusions are drawn: At 180° there is strong evidence for a peak at a photon energy of 700 ± 7 mev (corrected for ionization energy loss in the target). The width of the peak observed at 180° could be instrumental. At 135° the peak is larger and broader than at 180°; the width is approximately 50 mev. It appears shifted upwards, relative to the 180° data, by 10 mev.

ELECTRON SCATTERING STUDY OF NUCLEAR LEVELS IN COBALT, NICKEL, LEAD, AND BISMUTH, by H. Crannell, R. Helm and others. Mar. 8, 1961 [70]p. incl. diagrs. tables, refs. (Rept. no. HEPL-219) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [N6onr-25116]) Unclassified

Published in Phys. Rev., v. 123: 923-938, Aug. 1, 1961.

Inelastic scattering of 183-mev electrons has been observed through angles of 35°-90° leading to excitation of discrete nuclear excited states in Ni^{58}, Co^{59}, Ni^{60}, Pb^{208}, and Bi^{209}. The excitation energies were below 8 mev. Born-approximation analysis of the measured inelastic form factors was used to deduce the multipolarities λ, and by extrapolation, the transition rates, for 15 corresponding gamma transitions. A number of groups of electric transitions for $\lambda = 2$, 3, and 4 were observed, each group having strikingly similar form factors. In all but 1 of these groups the ratios G of the observed gamma transition rates to the single-particle predictions were greater than 15, and for some transitions from 30 to over 100. One of the groups, in cobalt and the nickels, contains the 1.33-mev E2 transition to the first excited state of Ni^{60}. Another group consists of fast E3 transitions, seen in all 5 nuclei, from states known as the anomalous levels. They included the transition to the first excited state of Pb^{208} and a transition in Bi^{209} identical in energy and form factor. Among 3 slow E4 transitions in cobalt and the nickels was the 2.50-mev $4^+ \rightarrow 0^+$ transition in Ni^{60}. The E4, E3, and an E2 transition in Co^{59} identify states analogous to the 4^+, 3^-, and 2^+ seen in the neighboring even-even nuclei. The last 2 transitions are strongly enhanced. A pair of fast 4.30-mev transitions was observed in Pb^{208} and Bi^{209}; their speed (G = 37) indicates they may constitute the lowest-energy configuration of 16-pole mode of excitation of the nuclear surface. Values of the collective vibrational parameters C_λ and B_λ and the degree to which some of the transitions exhaust ordinary sum rules support the conclusion that the inelastic scattering process is strongly exciting nuclear collective excitations. Some of the observed results are expected on the basis of the theory of collective vibrational excited states; some are the consequence of unidentified configurations. (Contractor's abstract)

PRELIMINARY RESULTS ON NEUTRON FORM FACTORS (Abstract), by R. Hofstadter, C. de Vries, and D. Aitken. [1961] [1]p. [Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 149, Mar. 22, 1961.

High-energy inelastic electron scattering experiments were made recently on the dueteron in conjunction with

comparison elastic scattering measurements on the proton. In this way absolute values can be assigned to the deuteron peak cross sections at pairs of energies and angles at the same value of the momentum transfer (q). The results have been analyzed in terms of the modified Jankus theory, incorporating Dirac (F_{1N}, F_{1P}) and Pauli (F_{2N}, F_{2P}) form factors of the neutron and proton. The values of F_{1N} and F_{2N} were found by the method of intersecting ellipses assuming known values of F_{1P} and F_{2P}. Meson-exchange effects and final-state interactions have been neglected in the analysis. Preliminary results are that $F_{1N} \neq 0$ at large values of q^2, is negative and is approximateiy -0.40 at $q^2 = 15\ f^{-2}$. These preliminary results also indicate that F_{2N} is close to, but lies below F_{2P} and that F_{2N} goes to zero near $q^2 = 17\ f^{-2}$. An ambiguity in the signs and values of F_{1N} and F_{2N} will be discussed. Since final state interactions and other corrections have been evaluated only approximately, the results are approximate and should be used only to indicate trends of the neutron form factors. Further work is in progress.

ELECTROMAGNETIC FORM FACTORS OF THE PROTON AND NEUTRON (Abstract), by R. Herman and R. Hofstadter. [1961] [1]p. [Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 288, Apr. 24, 1961.

The new information on the electromagnetic form factors of the neutron taken together with the split form factors of the proton form a consistent body of data from which the structure of the proton and neutron can be deduced. Using the idea that the proton and neutron correspond to 2 orientations of the z component of the isotopic spin of the nucleon we have developed 4 basic isotopic form factors, namely, F_{1S}, F_{1V}, F_{2S}, and F_{2V}. Taking sums and differences of the basic isotopic form factors one can obtain proton and neutron charge distributions. The latter prove to be consistent with known experimental facts including the rms radii of the 2 fundamental particles. The neutron appears to have a positive outer fringe of charge. We have developed also the density distributions of the magnetic moments of the proton and neutrons, which again are consistent with known experimental facts.

NEW INFORMATION ABOUT THE ELECTROMAGNETIC STRUCTURE OF THE NEUTRON (Abstract), by C. de Vries and R. Hofstadter. [1961] [1]p. [Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 288, Apr. 24, 1961.

Inelastic electron-deuteron scattering experiments have been made at values of the momentum transfer q, ranging from $q^2 = 8.5\ f^{-2}$ to $q^2 = 21\ f^{-2}$. Absolute peak cross sections for the deuteron are obtained by comparison measurements on the proton, employing absolute cross sections for the proton. Meson exchange effects have been neglected. The modified Jankus theory, incorporating the Dirac (F_{1N}, F_{1P}) and Pauli (F_{2N}, F_{2P}) form factors of the neutron and proton, has been applied. Combining data taken at different energies and angles but at the same q value, absolute values of F_{1N} and F_2N are obtained. Inherent in the analysis are 4 possible choices of these form factors. All choices indicate that the charge distribution of the neutron is not identically zero. The arguments given in the accompanying paper favor 1 of the 4 possible cases as the natural choice.

ELECTROMAGNETIC FORM FACTORS OF THE PROTON, by F. Bumiller, M. Croissiaux and others. July 1961 [39]p. incl. diagrs. tables, refs. (Rept. no. HEPL-243) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116) Unclassified

Also published in Phys. Rev., v. 124: 1623-1631, Dec. 1, 1961.

The experimental results of the Dirac (F_1) and Pauli (F_2) form factors of the proton are described. The form factors are obtained by means of using the Rosenbluth formula and the method of intersecting ellipses in analyzing the elastic electron-proton scattering cross sections. A range of energies covering the interval 200-1000 mev for the incident electrons is explored. Scattering angles vary from 35° to 145°. Values as high as $q^2 = 31\ f^{-2}$ (q = energy-momentum transfer) are investigated, but form factors can be reliably determined only up to about $q^2 = 25\ f^{-2}$. Splitting of the form factors is confirmed. The newly measured data are in good agreement with earlier Stanford data on the form factors and also with predictions of a recent theoretical model of the proton. Consistency in determining the values of the form factors at different energies and angles gives support to the techniques of quantum electrodynamics up to $q^2 = 25\ f^{-2}$. At the extreme conditions of this experiment (975 mev, 145°) the behavior of the form factors may be exhibiting some anomaly. (Contractor's abstract)

PHOTOPROTONS FROM CARBON, by V. J. Vanhuyse and W. C. Barber. [1961] [17]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [N6onr-25116]) Unclassified

Published in Nuclear Phys., v. 26: 233-249, Aug. 1961.

Energy and angular distributions of protons ejected from C^{12} targets bombarded by the beam of the Stanford Mark II accelerator have been measured by means of a magnetic spectrometer. The energy distributions, which are peaked at 6.0 mev, show a structure that cannot be explained by a single resonance. Supposing that all transitions leave the residual nucleus in the ground state, the analysis of the proton distributions leads to a cross section which has a peak value of (12.7 ± 2.5)mb and values of (41 ± 9)mev·mb and (77 ± 18)mev·mb when integrated from 0 to 24 and 40 mev, respectively. Except for the peak value, the cross section curve is very similar to that of the $C^{12}(\gamma, n)$ reaction. The angular distributions of the (γ, p) and $(e, e'p)$ reactions have been measured for different proton energy groups at an electron energy of 40 mev. Except for a $\cos\theta$ term, the distributions are in agreement with the independent particle picture of the giant resonance, p- to d-wave transitions being the important ones. The results are also a confirmation of the theory of electron induced reactions. Yield curves as a function of electron energy were measured up to 40 mev for different proton energy groups and at different angles. Analysis of the yield curves leads to differential cross sections as a function of photon energy. The main property of these cross sections is to support to some extent the assumption of exclusively ground state transitions. (Contractor's abstract)

INELASTIC ELECTRON SCATTERING FROM THE DUETERON, by G. A. Peterson and W. C. Barber. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [N6onr-25116]) Unclassified

Published in Proc. Rutherford Jubilee Internat'l. Conf., Manchester (Gt. Brit.) (Sept. 4-8, 1961), New York, Academic Press, 1961, p. 831-832.

The magnetic dipole disintegration of the deuteron has been studied by the inelastic scattering of 41.4 mev electrons from C, CD_2, and CH_2 targets at 132°, 160°, and 180°. The measurements at 180° were made by using a new technique with minimizes the background radiative tail arising from elastic scattering. The magnitude of the deuteron inelastic cross section was obtained by finding the ratio of the inelastic scattering from the deuteron to the elastic scattering from the proton. Near threshold the results are in agreement with the theory of Jankus, but at high excitation energies a discrepancy is observed. (Contractor's abstract)

HIGH-ENERGY INTERFERENCE EFFECT OF BREMSSTRAHLUNG PRODUCTION IN A SINGLE CRYSTAL OF SILICON, by A. N. Saxena. Sept. 5, 1961 [26]p. incl. diagrs. refs. (Rept. no. HEPL-244) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [N6onr-25116]) Unclassified

Published in Phys. Rev., v. 125: 1720-1726, Mar. 1, 1962.

In an experiment performed to look for the interference effect of the bremsstrahlung production by 575-mev electrons in a single crystal of silicon, the ratio of the charges collected in the two halves of a double ion chamber were used to detect the enhancement of the soft component of the bremsstrahlung. The data, presented in the form of a 3-dimensional plot of the ratio vs the angles of rotation between the lattice normal and the electron beam about the horizontal and the vertical axes, clearly showed the enhancement. Comparison of the experimental result and the theory showed good agreement. The resolution of this experiment was poor; hence the central minimum predicted by the theory could not be observed. MEASUREMENT OF THE NEUTRON-PROTON FINAL-STATE INTERACTION IN THE ELECTRODISINTEGRATION OF DEUTERIUM, by H. W. Kendall, J. I. Friedman and others. [1961] [6]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [N6onr-25116]) Unclassified

Published in Phys. Rev., v. 124: 1596-1601, Dec. 1, 1961.

Measurements have been made of the inelastic differential cross sections for electrodisintegration of deuterium for ϵ in the range from 0-12 mev, where ϵ is the energy in the n-p center-of-mass system in the final state. Primary electron energies were in the range from 204-500 mev. The process was studied for momentum transfers from 1.8–2.8 f^{-1}. The n-p interaction in the unbound state gives rise to a peak in the differential cross sections for ϵ near zero for transitions to the ^1S and ^3S states of the n-p system. The high momentum transfers available make the results sensitive to the short range structure of the unbound n-p wave functions. The results fail to agree with the predictions of Jankus even at the lowest momentum transfers, when a central attractive force is assumed from the n-p force. At the highest

momentum transfers the predicted cross sections are approximately 50% greater than the measured ones. The experimental results agree with theory if a repulsive core of the radius required to fit the elastic scattering data is used both in the bound and unbound n-p states. The extent to which relativistic corrections alter this conclusion is not known at present. (Contractor's abstract)

π^0 PHOTOPRODUCTION WITH POLARIZED BREMSSTRAHLUNG (Abstract), by D. Drickey and R. F. Mozley. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116) Unclassified

Presented at meeting of the Amer. Phys. Soc., Los Angeles, Calif., Dec. 27-29, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 523, Dec. 27, 1961.

Measurements have been made of the asymmetry of π^0 photoproduction along and perpendicular to the electric field vector using a polarized bremsstrahlung beam. Measurements have been made at 2 points corresponding to the conditions 330-mev photon energy, 90° pion cm angle and 235-mev photon energy, 120° pion cm angle. The resonant energy point (330mev) can be used to determine the bremsstrahlung polarization using a purely phenomenological analysis and known photoproduction cross sections measured with unpolarized bremsstrahlung. The measurement at 235 mev tests the need for additional terms in the dispersion theory due to the 2-pion and 3-pion resonances.

PRODUCTION OF POSITRONS WITH THE STANFORD MARK III ACCELERATOR, by D. Yount and J. Pine. [1961] [17]p. incl. diagrs. refs. (Rept. no. HEPL-249) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [N6onr-25116]) Unclassified

Published in Nucl. Instr. and Methods, v. 15: 45-50, Feb. 1962.

As a result of this work it is possible to attain a beam intensity of 7×10^6 positrons/pulse (60 pulses/sec) through a ½ in. collimator at the end of the accelerator. This is for a positron energy of 300 mev with an energy spread of ± 1% defined by the analyzing magnet system. A typical electron beam under these conditions is about 5×10^{10} electrons/pulse, while the electron beam incident on the positron radiator is about 1.5×10^{11} electrons pulse. The net conversion efficiency from electrons to relatively mono-energetic positrons is thus about 5×10^{-5}, while the ratio of energy-analyzed beams is about 1.4×10^{-4}. (Contractor's abstract)

IRREVERSIBLE PROCESSES IN CONSERVATIVE DYNAMICAL SYSTEMS, by P. A. Sturrock. Jan. 1961, 10p. incl. refs. (ML rept. no. 784) (AFOSR-216) (AF 49(638)342) AD 254552 Unclassified

A model of a conservative dynamical system with a very large number of degrees of freedom is set up in the linear approximation and discussed by the methods of classical mechanics. One may associate with an external force an admittance function (with frequency as argument); there is in general a real part to this function which represents a generalization of the dissipation process known as Landau damping. The assumption of equipartition of energy among the normal modes now leads to the fluctuation-dissipation theorem which is a generalization of Nyquist's theorem. Analysis of this system also brings out the fact that the admittance function satisfies the Kramers-Kronig relations, and that, if one considers a number of forces and currents, the resulting admittance matrix satisfies the Onsager relations. ON THE THERMAL GENERATION OF TOROIDAL MAGNETIC FIELDS IN ROTATING STARS, by L. Mestel and I. W. Roxburgh. Aug. 1961, 22p. (ML rept. no. 837) (AFOSR-1386) (AF 49(638)342) AD 266323 Unclassified

Also published in Astrophys. Jour., v. 136: 615-626, Sept. 1962.

It has been shown that in a rotating star without any initial magnetic field, the electron partial pressure slowly generates a toroidal magnetic field of considerable strength. The problem is here reconsidered, assuming the star to have a primeval magnetic field, with its

poloidal component very much weaker than the toroidal field. It is shown that the interaction of the magnetic torque and the rotation field is sufficient to ensure that the electron pressure has negligible effect, whether or not there is meridian circulation of matter inside the star. GENERATION OF RADIO NOISE IN THE VICINITY OF THE EARTH, by P. A. Sturrock. Sept. 1961, 12p. incl. refs. (ML rept. no. 840) (AFOSR-1427) (AF 49-(638)342) AD 266321 Unclassified

Also published in Jour. Research Nat'l. Bur. Stand., v. 66D: 153-157, Mar.-Apr. 1962.

A tentative classification of possible sources of radio noise in the vicinity of the earth may be obtained by examining separately available source of power and known mechanisms for conversion of this power. Among the former we may list high-energy electrons such as those trapped in the Van Allen belts; the solar wind; bursts of high-energy particles ejected by the sun; shock waves in the interplanetary medium originating on the sun; and the rotational energy of the earth. Mechanisms of conversion may be classified as direct, such as synchrotron and Cerenkov radiation, and indirect. Indirect conversion involves the excitation of an intermediate state by the available sources of power and subsequent radiation by this state. This intermediate state may be localized heating, the formation of unstable current patterns, the acceleration of particles, or the generation of waves which are themselves nonradiative, such as plasma oscillations. The following mechanisms which are relevant to the generation of radio noise receive special attention: Cerenkov radiation, 2-stream instability, and the coupling of waves by inhomogeneity and nonlinearity. SPECTRAL CHARACTERISTICS OF TYPE II SOLAR RADIO BURSTS, by P. A. Sturrock. [1961] [3]p. (ML rept. no. 838) (AFOSR-J22) (AF 49(638)342) AD 297428 Unclassified

Also published in Nature, v. 192: 58, Oct. 1961.

It has been recognized for some time that Type II solar radio bursts are due to the excitation of plasma oscillations in the solar corona by some exciting agency which moves through the corona. Roberts (Austral. Jour. Phys., v. 12: 327, 1959), in reviewing observations and theories of these phenomena, leaves unexplained 2 salient characteristics: (1) the appearance of radiation at the fundamental and second harmonic at comparable powers and the lack of radiation at all higher harmonics; (2) the frequent splitting of each of these 2 lines into a pair of lines, the fractional splitting of each of these 2 pairs being the same, typically a few percent. In a homogeneous plasma, such coupling occurs only through nonlinearity of the field and dynamical equations. It has pointed out that the dominant coupling process is between 2 plasma-oscillation modes and 1 electromagnetic wave, which leads to radiation at $2\omega_p$, that is, twice the plasma frequency ω_p, where $\omega_p^2 = 4\pi ne^2/m$, and that this is the key to understanding of point (1). In order to understand point (2), the plasma to be permeated by a magnetic field should be considered. In the electrostatic approximation, $\omega/k \ll c$, the dispersion relation has the from: $\omega^2 = \frac{1}{2}\left[\omega_p^2 + \omega_g^2 \pm (\omega_p^4 + \omega_g^4 - 2\omega_p^4 \omega_g^2 \cos 2\theta)^{\frac{1}{2}}\right]$ where θ is the angle between the wave vector k and the magnetic field vector B, and ω_g is the electron gyrofrequency eB/mc. For $\omega_g < \omega_p$, this separates into 2 bands, one extending from 0 to ω_g and the other from ω_p to $(\omega_p^2 + \omega_g^2)^{\frac{1}{2}}$, the former of which one would not expect to radiate through the corona. Considering only the upper band, it is expected that the frequencies ω_p and $(\omega_p^2 + \omega_g^2)^{\frac{1}{2}}$ would be preferentially excited. It is proposed that these are the 2 frequencies of the observed spectrum when it is split. The separation is seen to be approximately $\frac{1}{2}\omega_g^2/\omega_p$. The observed frequency ratio of first harmonic is slightly less than 2:1.

PROPAGATION AT MICROWAVE FREQUENCIES ALONG A FLUCTUATING PLASMA COLUMN (Abstract), by M. A. Allen and G. S. Kino. [1960] [1]p. [AF 49-(638)415] Unclassified

Presented at Thirteenth Annual Gaseous Electronics Conf., Monterey, Calif., Oct. 12-15, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 388, June 22, 1961.

Random fluctuations of plasma number density, which are present as standing or traveling waves in an arc discharge plasma column, affect the dispersion characteristics of a microwave signal propagating along the column. The examination on a spectrum analyzer of the signal, as it propagates along the column, reveals a transfer of energy into sidebands of the original frequency. This degradation of the microwave signal is shown to be due to phase modulation of the signal caused principally by the strong fluctuation which occurs in mercury-arc discharges at about 100 kc/sec. The phase modulation was examined in detail, both with this internally produced modulation and an externally applied modulation of the number density. The results obtained were explained by the theory of phase modulation, with the depth of modulation being independently measured by means of cavity resonator techniques.

MEASUREMENTS ON A CESIUM PLASMA (Abstract), by M. A. Allen, G. S. Kino, and J. S. Lawson. [1960] [1]p. [AF 49(638)415] Unclassified

Presented at Second annual meeting of the Div. of Plasma Physics, Gatlinburg, Tenn., Nov. 2-5, 1960.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 191, Mar. 20, 1961.

A plasma has been found with positive ions being produced by conversion of cesium atoms to cesium ions at tungsten surfaces and electrons being produced by thermionic emission from the same surfaces. Plasma densities of over 10^{11}/cc have been measured in columns 25 cm long. Low-frequency impedance measurements of the columns yield impedance within a factor of 2 of the Spitzer- Härm values for a fully ionized plasma. External capacitative probe measurements show that fluctuations occur within the plasma columns, mainly in the range of 10 kc to 100 kc.

PLASMA SHEATH FORMATION BY RF FIELDS, by H. S. Butler. Apr. 1961, 84p. incl. illus. diagrs. table, refs. (ML rept. no. 820) (AFOSR-673) (AF 49(638)415) AD 260088 Unclassified

It has been observed experimentally that the application of a radiofrequency voltage (10 kc/sec - 30 mc/sec) to any 1 of several electrode configurations around the outside of a plasma discharge tube results in a constriction of the light-emitting portion of the plasma away from the inner walls of the glass tube. This phenomenon was initially thought to be the result of the rf confinement mechanism. However this investigation has established that the phenomenon is not rf confinement but rather the result of an interaction between the externally applied rf voltage and the plasma which leads to the formation of a dc positive ion sheath. Four experimental measurements together with a description of the equipment utilized in obtaining them are presented. It is shown how results of experiments using square waves instead of sine waves for the input signal suggests that the whole system—plasma, glass wall and generator—can be reduced to a simple circuit. The key step in this reduction is the representing of the plasma as the resultant of 2 voltage-dependent current sources, 1 relating to the dc probe characteristic of the plasma, the other to the physical movement of a body of electrons toward and away from the wall. This recognition of the plasma as a current source together with the knowledge that there must be no average net current flowing to an insulator (the wall) provides the basis of a physical mechanism which explains how the interaction occurs and why it leads to the visual observations. This physical mechanism is described mathematically in terms of a differential equation. An approximation to the differential equation is derived whose solution is shown to fit qualitatively all the general characteristics of the phenomenon with regard to its dependence on arc current and on the frequency and amplitude of the applied rf voltage. Finally the differential equation is solved in its most general form and the solution is shown to fit the experimental observations quantitatively for both square and sine wave inputs. An application of this phenomenon as a possible external diagnostic probe technique is proposed.

MICROWAVE PROPERTIES OF CERAMIC NON-LINEAR DIELECTRICS, by D. A. Johnson. July 1961, 118p. incl. illus. diagrs. refs. (ML rept. no. 825) (AFOSR-1149) (AF 49(638)415) AD 263393 Unclassified

This investigation was undertaken to develop and apply new measurement techniques for obtaining the small-signal and large-signal microwave characteristics of ceramic nonlinear dielectrics. A transmission method for measuring the small-signal complex dielectric constant was derived and is described in detail. Measurements were made on representative ceramics in the x-band frequency range, and the results are given as curves of the real part of the relative dielectric constant and of the loss tangent as functions of temperature with dc bias levels up to 32 kv/cm. An experimental curve of the relative dielectric constant of a 73% barium titanate-27% strontium titanate ceramic was obtained for the frequency range of 3 kmc to 270 kmc. A curve showing the per cent change of the relative dielectric constant over the temperature range from 95°F to 123°F (the Curie temperature is approximately 72°F) was also obtained. The large-signal microwave characteristics of a non-linear dielectric were measured at 3 kmc by using a re-entrant coaxial cavity in which a cylindrical post of the ceramic was placed in the region of high electric field intensity. NON-LINEAR EFFECTS IN ELECTRON PLASMAS, by P. A. Sturrock. [1961] [6]p. incl. refs. [AF 49(638)-415] Unclassified

Published in Plasma Physics, Accelerators, Thermonuclear Research, v. 2: 158-163, Jan. 1961.

Two theorems concerning wave interaction are proved. The first relates energy-transfer between a group of interacting waves to the frequency of these waves. The second theorem relates the frequency-displacements of a group of interaction waves to the energies of these waves. The properties of electron plasmas undergoing longitudinal oscillations are re-examined in the light of the preceding theorems. Interaction terms may be classed as coherent and incoherent: the former do not result in energy transfer but only frequency displacement which may be characterized by a dispersion relation. The second group leads to transfer of energy between waves and hence to spectral decay. The interaction between longitudinal (electrostatic) and transverse (electromagnetic) waves in plasmas is considered and it is shown that in a uniform plasma in the absence of magnetic fields, the dominant interaction couples 2 longitudinal waves with 1 transverse wave. Hence, one would anticipate that the dominant non-linear mechanism for radiation from excited plasmas leads to emission at twice the plasma frequency. (Contractor's abstract)

HARMONIC GENERATION BY MEANS OF MULTIPLE QUANTUM TRANSITIONS, by J. Fontana, R. [H.] Pantell, and R. Smith. [1961] [7]p. (Sponsored jointly by [Air Force Office of Scientific Research], Office of Naval Research, and Signal Corps under [N6onr-25123] and National Science Foundation) Unclassified

Presented at Second Internat'l. Conf. on Quantum Electronics, Berkeley, Calif., Mar. 23-25, 1961.

Published in Advances in Quantum Electronics, ed. by J. R. Singer, New York, Columbia U. Press, 1961, p. 612-618.

The use of multiple quantum transitions is considered as a procedure for producing high-power, high-efficiency harmonic generation, and one which would be applicable at very short wavelengths. The method of solution presented is valid over a range of pumping levels sufficient for all the required effects to appear and to be calculated numerically. It is shown that the equations have to be completed by introducing loss terms and by including an appropriate circuit equation. A frequency-shifting effect is encountered in the solution: the output frequency (harmonic of the pump) and the natural transition frequency are not the same, and the difference can be considerable at the large pump amplitudes required for good efficiency. An example given indicates the possibility of generating several watts of cw power using the 3,3, line in ammonia. The model considered is a two-energy level system with an applied rf signal at a submultiple of the natural transition frequency.

FIELD-THEORY ANALOGS OF THE LAGRANGE AND POINCARE INVARIANTS, by P. A. Sturrock. [1960] [8]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-22548]) Unclassified

Published in Jour. Math. Phys., v. 3: 43-50, Jan.-Feb. 1962.

The Lagrange differential invariant and the Poincare integral invariant of classical dynamics have as their analogs in Lagrangian field theory "a differential divergence-free vector" and an "integral divergence-free vector". The former, which is expressible as a divergence-free vector-bracket expression, may be used to derive conservation relations associated with the transformation properties of a given system. It is not necessary that these transformations should be infinitesimal; by way of example, conservation theorems are established for systems which are periodic and for systems which are invariant under spatial inversion. The differential divergence-free vector may also be used to establish reciprocity and orthogonality relations: simple examples which are here discussed are Betti's reciprocal theorem of elasticity and Lorentz's reciprocal relation of electromagnetic theory. An extended form of the differential divergence-free vector allows for variation not only of the dependent variables but also of the independent variables. The integral divergence-free vector associates a conserved quantity with any closed 1-parameter family of solutions of the field equations. The theorem of classical dynamics relating a complete set of Poisson brackets to a complete set of Lagrange brackets cannot be extended to the present formalism. The formula which represents the obvious extension of the classical formula for the Poisson bracket is of no interest since it can be shown not to be canonically invariant.

USE OF THE DISPLACEMENT VECTOR IN ELECTROMAGNETIC THEORY, by K. G. Dedrick and R. N. Wilson. Apr. 1961, 33p. incl. diagr. (ML rept. no. 814) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22548) AD 258550 Unclassified

Also published in Jour. Math. Phys., v. 3: 97-105, Jan.-Feb. 1962.

Problems in the electrodynamics of charged fluids often require calculation of the charge and current densities, given prior knowledge of the initial distributions and the displacement vector field. In this paper, solutions are obtained for these new distributions, with the property that if the initial distributions have a sharply defined boundary, terms arise which can be interpreted as distributions of electric charge and current multipoles located on the initial boundary surface. These solutions can not be considered valid near the initial boundary, but prove to be useful in that many of their properties are given correctly. The electromagnetic potentials due to the charge and current densities in the displaced configuration are calculated, and form the basis for a discussion of the complicated boundary value problem

encountered in the description of the electrodynamics near the boundary surface. The results are directly applicable to the theory of high frequency electron tubes, and certain formulae are of use in hydrodynamics and elasticity. (Contractor's abstract)

BEAM PLASMA AMPLIFIERS, by M. A. Allen and G. S. Kino. July 1961, 19p. incl. diagrs (ML rept. no. 833) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22548) AD 263390 Unclassified

Presented at Wescon, San Francisco, Calif., Aug. 22-25, 1961.

Recent experiments on electron beam-plasma interaction have been performed using a thermally generated cesium plasma. The experimental results obtained are in excellent agreement with the theoretical predictions. These experiments show that the possibilities of using this interaction for the amplification of microwaves may, in the future, provide significant advantages over the existing devices now available. There is a possibility of obtaining high efficiencies at high-power levels. Because no circuit is used, and because it may be possible to couple to the beam in radically new ways, millimeter wavelength amplifiers and oscillators based on beam-plasma interaction look extremely promising. The problems involved in the design of such devices are discussed. (Contractor's abstract)

PARAMETRIC EFFECTS IN A TWO-LEVEL ELECTRIC DIPOLE SYSTEM, by J. Fontana, R. H. Pantell, and R. Smith. Oct. 1961, 11p. incl. refs. (ML rept. no. 849) (Sponsored jointly by Air Force [Office of Scientific Research], Office of Naval Research, and Signal Corps under [Nonr-22548]) AD 267027 Unclassified

Also published in Jour. Appl. Phys., v. 33: 2085-2088, June 1962.

In a 2-level system with induced electrical dipole properties the relationship between an externally applied electric field and the expectation value of the dipole moment is expressed by a differential equation in which one coefficient is proportional to the instantaneous system energy. The nonlinear properties arising from this relationship allow parametric amplification of signals by pumping at another frequency, in the presence of a material containing active systems of this type. No population inversion is necessary. For optimum operation, both the pump and the signal should be within a few per cent of the natural frequency of the system. The electromagnetic Q required for parametric oscillations in a device of this sort is inversely proportional to the on-frequency absorption coefficient for the material. A numerical example shows that, at 1 mm wavelength, parametric oscillations will occur with a Q of 12,000 and a pump field of 10 kv/cm in the gas.

PARAMETRIC EXCITATION OF ELASTIC MODES IN YTTRIUM IRON GARNET, by R. L. Comstock. Nov. 1961, 155p. incl. illus. diagrs. refs. (ML rept no. 850) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22548) Unclassified

One aspect of the magnetostrictive coupling between the magnetization and the elastic strain in ferrimagnetic insulators is investigated. When the nonlinear part of the magnetostrictive coupling is driven with a large amplitude time-varying pump magnetization, the elastic and magnetostatic modes of a ferrimagnetic sample can be parametrically excited. The conditions under which this excitation is possible are discussed and in particular the threshold pump magnetization is calculated. The result can be expressed as $(A_p)_{th}^2 = \frac{M_s^2}{Q_a Q F^2}$, where A_p is the amplitude of the pump magnetization at frequency ω_p, M_s is the saturation magnetization, Q_a and Q are the quality factors of the elastic mode (ω_2) and magnetostatic mode (ω_1) and F is an appropriate filling or overlap factor between modes satisfying $\omega_p = \omega_1 + \omega_2$. Experiments were performed to measure the elastic mode Q, the results being used in the theoretical threshold calculation. Measurements were also made of the effects of nonlinearities in the elastic and magnetostatic modes. Amplitude jumps and oscillation hysteresis were observed and compared to theoretical predictions. An analysis of the parametric coupling between longitudinal elastic and electromagnetic waves in an infinite ferrite medium is discussed. The parametric coupling is predicted to be much smaller than in the resonant case. A traveling-wave elastic amplifier is proposed using this interaction, and the gain for an idealized version is calculated. (Contractor's abstract, modified)

INTERACTION OF AN ELECTRON BEAM WITH A CESIUM PLASMA (Abstract), by M. A. Allen, G. S. Kino and others. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-22548]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Colorado Springs, Colo., Nov. 15-18, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 158, Feb. 23, 1962.

An experimental and theoretical study of the interaction of an rf modulated electron beam with a highly ionized plasma is described. The theory takes into account the finite diameters of both the electron beam and the plasma column in the presence of a finite magnetic field. It is assumed that the velocity of the beam is much greater than the mean thermal velocity of the plasma electrons. Under these conditions, the finite nature of the system provides the main limitations on the magnitude of the rf gain. The working medium used in the experiment, is a highly ionized thermal cesium plasma. The measured rf gain is in good agreement with the theory over a wide range of values of the parameters.

FERROELECTRIC HARMONIC GENERATOR AND THE LARGE-SIGNAL MICROWAVE CHARACTERISTICS OF A FERROELECTRIC CERAMIC, by M. DiDomenico, Jr., D. A. Johnson, and R. H. Pantell. [1961] [10]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force [Office of Scientific Research], Office of Naval Research, and Signal Corps under [Nonr-22548]) Unclassified

Published in Jour. Appl. Phys., v. 33: 1697-1706, May 1962.

At microwave frequencies, ferroelectric ceramics behave as nonlinear dielectrics and exhibit large signal scalar nonlinear characteristics in both the dielectric constant and the rf conductivity. The nonlinear behavior of a ceramic of 73% $BaTiO_3$-27% $SrTiO_3$ has been used to construct a harmonic generator operating from 3 kmc to 9 kmc. An efficiency of 8.5% for a peak input power of 2200 w was attained. In addition, a new measurement technique has been developed for measuring the large signal properties of this ceramic as well as for other nonlinear materials. This technique makes explicit use of the anharmonic response of a resonant system that contains a nonlinear element. The analysis of both the harmonic generator and the nonlinear resonant system takes into account nonlinear reactance as well as nonlinear resistance. Measurements of the large signal dielectric constant and rf conductivity are given for temperatures about 30° above the Curie temperature. The results obtained at 3 kmc were found to be valid up to field strengths of 20 kv/cm. (Contractor's abstract, modified)

STANFORD MICROWAVE SPECTROHELIOGRAMS FOR 1960 MAY, by G. Swarup. Jan. 15, 1961, 34p. incl. illus. diagrs. (Scientific rept. no. 10; Stanford Radio Astronomy Inst. publ. no. 10) (AFOSR-264) (AF 18-(603)53) AD 252914 Unclassified

A series of maps of the sun are presented showing the disk distribution of solar radio emission at a wavelength of 9.1 cm by means of radioisophotes, or lines of constant brightness temperature. The contour interval, which varies from map to map, is usually about 80,000° K, and is determined after the map is drawn by reference to the measured flux density of the whole sun. A circle shows the photosphere; a correction has been applied for the variation of the sun's semidiameter, so that the photospheric circle is reproduced with a constant diameter of 15 cm.

STUDIES OF SOLAR MICROWAVE EMISSION USING A HIGHLY DIRECTIONAL ANTENNA, by G. Swarup. Feb. 6, 1961, 110p. incl. diagrs, tables, refs. (Scientific rept. no. 13) (AFOSR-265) (AF 18(603)53) AD 252915 Unclassified

The brightness distribution across the sun has been studied at a wavelength of 9.1 cm using a highly directional antenna. The antenna, which consists of 32 10-ft paraboloids in the form of a Mills cross, provides pencil beams which are only 1/10th of the size of the sun. With the rotation of the earth, these scan the solar disk in a television fashion providing a 2-dimensional map of the sun in a period of about an hr. In spite of a high level of activity during the period of observations, the quiet sun component could be identified because of the high resolution of the pencil-beam antenna. The quiet sun at 9.1-cm wavelength has a marked deviation from circular symmetry, the brightness temperature being about 3×10^4° K at the poles. The sources of the slowly varying component of solar radio emission are closely associated with the chromospheric plages, as has been shown. But in contrast, present observations indicate that the peak of 9.1 cm emission lies above the center of gravity of a support group and not that of the plage. Also the size of the region is smaller at 9.1 than at longer wavelengths. It is concluded that the electron density distribution above a plage region is non-uniform, with higher density in the vicinity of sunspots. At 9.1 cm, a typical source of slowly varying component during the period of observation had a diameter of about 3.5 min of arc, a brightness temperature of 4.5×10^5° K and a height of 20,000 km. The variation of the radio emission as the region moved with rotation of the sun from the center to the limb was broader than the cosine variation expected for a disk-shaped emitting region. Observations suggest that the electron densities above an active region are about 10 times the normal values above the quiet sun, and are about 2 times the values assumed by Newkirk in his model of an active region.

TRANSMISSION SYSTEM OF THE STANFORD MICROWAVE SPECTROHELIOGRAPH, by K. S. Yang. Mar. 20, 1961, 91p. incl. diagrs. table, refs. (Scientific rept. no. 14) (AFOSR-481) (AF 18(603)53) AD 254800 Unclassified

The Microwave Spectroheliograph is an instrument for obtaining pictures of monochromatic electromagnetic radiation of the sun. Operating at 9.1 cm, it provides a family of pencil beams of 2.3 min of arc for scanning the solar disk in a television-like fashion. The aerial system consists of thirty-two 10-ft paraboloidal reflectors, arranged in the form of a cross. The transmission system provides the microwave link between the reflector feed-horns and the input to the receiver. A rectangular S-band copper waveguide constitutes the bulk of the transmission system. The waveguide is arranged in a branched system which permits equal electrical path length from all aerials to the receiver, thus offering superior phase stability and wider operating-frequency band. The techniques for measurement and adjustment of amplitude and phase of each aerial are described. A newly developed scheme of phase measurement is given for rapid comparison of aerials thousands of wave-lengths apart by using modulated gas discharge tubes. Attention is given to choice of broadband components for the entire transmission system. Final evaluation of the transmission line system was made through actual observations of the sun. PROPOSAL LEADING TO FUTURE LARGE RADIO TELESCOPES, by R. N. Bracewell. May 12, 1961, 31p. incl. diagrs. (Scientific rept. no. 15; Stanford Radio Astronomy Inst. publ. no. 14) (AFOSR-1601) (AF 18-(603)53) AD 257821 Unclassified

Investigations were concerned with the design of a radio telescope with a one-minute-of-arc beam. The feasibility of a one-minute-of-arc in one dimension was established. However, only a relatively small collecting area was used. To increase the area and to form a pencil beam, while keeping the structure close to the ground, one is led to consider echelon configurations. A multifocus arrangement of tiltable cylinders, stacked like the slats of a venetian blind was studied. The suppression of grating responses can be accomplished by a new tilt-independent technique in which a staggered pair of elements is switched against the remaining elements. The collecting area of a system in which some of the elements are switched, proves to be reasonable. Problems of interconnecting the tiltable elements so as to counteract the jump in path from one element to the next were partly met in achieving a one-minute fan beam. Multibeaming, a technique of halving observing time by doubling the investment in electronic equipment, is justified when the antenna cost is high and the beamwidth extremely narrow. INTERFEROMETRY OF CENTAURUS A, by R. N. Bracewell. June 30, 1961, 14p. incl. illus. tables. (Scientific rept. no. 16; Stanford Radio Astronomy Inst. publ. no. 15) (AFOSR-1602) (AF 18(603)53) AD 261737 Unclassified

Fan beam observations with a beamwidth of 2.3 min have revealed 2 distinct components to the central concentration of Centaurus A. Earlier interferometric data had shown an equivalent elliptical distribution oriented with the major axis in position angle 130°, and it seemed possible that the 2-dimensional arrangement of the 2 components might be determined by the earlier data. The expected complex visibility has been calculated for different models that are compatible with the fan beam observations, and compared with interferometric data of Mills (Austral. Jour. Phys., v. 6: 452-470, 1952) and Twiss, Carter and Little (The Observatory, v. 80: 153-159, 1960), and Moffet. The possible arrangements of the components have been narrowed down to 2, each quite plausible on other grounds. The validity of interferometry for unraveling source distribution is confirmed, especially if a wise choice of spacings and azimuths is made. The calculated visibilities furnish a guide to future observations. (Contractor's abstract)

EXTENSION OF NOSE WHISTLER ANALYSIS, by R. L. Smith and D. L. Carpenter. Apr. 26, 1961, 11p. incl. illus. table. (Technical rept. no. 8) (AFOSR-615) (AF 18(603)126) AD 256955 Unclassified

A method is outlined for obtaining F_N and T_N, the nose frequency and the time delay to the nose, for whistlers that do not exhibit a nose on the spectrographic records. The method is based upon a universal whistler dispersion function which is a function of f/F_N only. Two time-delay measurements, at widely separated frequencies, are made on a whistler trace, and from this information and the universal dispersion function, F_N and T_N are obtained. Results of applying the method to actual nose whistlers are tabulated and show good agreement between calculated and measured values of F_N and T_N. A method of whistler-source identification is outlined which utilizes approximate information on nose frequency and is particularly useful for middle-latitude whistlers. (Contractor's abstract)

THE EFFECT OF THE EARTH-IONOSPHERE WAVEGUIDE ON WHISTLERS, by J. H. Crary. July 17, 1961, 172p. incl. illus. diagrs. tables, refs. (Technical rept. no. 9) (AFOSR-1092) (AF 18(603)126) AD 262348 Unclassified

The possibility of locating the point at which the energy enters the waveguide (the exit point) by direction-finding (d-f) measuements at spaced stations is investigated by expressing the theoretical intensity, polarization, and apparent direction of arrival of the received signal as the sum of multiply-reflected rays propagating in the earth-ionosphere waveguide. Curves (parametric in frequency, distance, and waveguide parameters) of the response of a vertical monopole and of crossed loops are shown. The ratio of the crossed-loop voltages and the null-bearing errors are determined for comparison with experimental data. Qualitative agreement is found between the calculated and the previously unexplained experimental data on crossed-loop voltage ratios. From the theoretical work it was found that apparent lateral deviation of bearing can be caused by the presence of multiple rays, even though all the rays travel in the great-circle plane containing the source and the receiver. Another new result is that either a normal vertical loop or vertical monopole may receive a higher field strength when multiple rays are present. A 2-station d-f experiment was performed, using crossed vertical loops, a vertical monopole, and a goniometer device. The individual latitude differences between the geomagnetic latitudes and the latitudes calculated independently from whistler-dispersion data were as great as 18°, although the average difference is only 3.1°. THE STANFORD UNIVERSITY REAL-TIME SPECTRUM ANALYZER, by R. A. Helliwell, J. H. Crary and others. Nov. 10, 1961, 20p. incl. illus. diagrs. (Technical rept. no. 10) (AFOSR-1804) (AF 18(603)126) AD 269747 Unclassified

The selection of the best method for analysis of VLF phenomena, such as whistlers and VLF emissions, is discussed. The most common and probably the most useful measurement required in the analysis of VLF phenomena is the frequency-vs-time characteristic. A comb-filter measurement arrangement is readily adapted to real-time spectrum analysis. A particularly effective instrument of this type is called the Rayspan. In the analysis system developed at Stanford the commutator-output intensity modulates an oscilloscope. The beam is swept at the proper rate to provide a frequency axis in 1 direction. A continuously moving film or photosensitive paper photographs the resulting trace and provides a real-time sweep.

WHISTLER DATA ON THE CHANGE OF BASE-LEVEL IONIZATION IN THE WHISTLER MEDIUM FOLLOWING MAGNETIC STORMS (Abstract), by D. L. Carpenter. [1961] [2]p. (AF 18(603)126) Unclassified

Abstract published in Program Joint Meeting of the Internat'l. Scientific Radio Union, U.S.A. Nat'l. Committee, and Inst. of Radio Engineers, Georgetown U., Washington, D. C., May 1-4, 1961, p. 20-21.

Using nose whistler theory, it is possible to calculate

the nose frequency and nose frequency time delay of ordinary whistler traces. From these data information is obtained on the locations of the paths corresponding to particular whistler traces and on base-level ionization in the whistler medium as a function of latitude and time. Recent measurements show that whistler time delays drop substantially following sudden commencement magnetic storms, with the onset of the drop occurring roughly 3-24 hr after the sudden commencement. This decrease may last from 1-3 or possibly more days following the end of the storm. (Contractor's abstract, in part)

SYNOPTIC OBSERVATIONS OF WHISTLER-MODE SIGNALS FROM VLF TRANSMITTERS (Abstract), by R. A. Helliwell, J. Katsufrakis, and G. Carpenter. [1961] [2]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 18(603)126 and Office of Naval Research under Nonr-22527) Unclassified

Abstract published in Program Joint Meeting of the Internat'l. Scientific Radio Union. U.S.A. Nat'l. Committee, and Inst. of Radio Engineers, Georgetown U., Washington, D. C., May 1-4, 1961, p. 21-22.

Various receiving sites which have obtained whistler-mode signals from Navy VLF stations are given. Whistler-mode activity is highest at night and at middle latitude receiving stations in agreement with whistler results. Marked asymmetries are found in some of the diurnal curves. An explanation is advanced based on the different rates of attenuation over land and sea paths. NPG echo time delays observed at Stanford are compared with whistlers from Stanford and Seattle. The agreement is better with the Stanford whistlers suggesting that the important ducts were closer to the receiver than to the transmitter. A detailed theory of coupling between the magneti-ionic ducts and the earth-ionosphere waveguide provides an explanation for this result. Echo amplitude fading is often regular with a modal value of about 40 sec. The fading is explained in terms of interference between multiple paths. NSS observations at Greenbank, Ushuaia, and Byrd are presented to show the influence of season on time delays and activity. (Contractor's abstract)

CALCULATION AND INTERPRETATION OF VLF FIELD STRENGHTS, POLARIZATIONS AND ANGLES OF ARRIVAL (Abstract), by J. H. Crary and R. A. Helliwell. [1961] [2]p. (AF 18(603)126) Unclassified

Abstract published in Program Joint Meeting of the Internat'l. Scientific Radio Union, U.S.A. Nat'l. Committee, and Inst. of Radio Engineers, Georgetown U., Washington, D. C., May 1-4, 1961, p. 40-41.

Recent studies of whistlers and VLF emissions indicate that these signals travel in ducts of enhanced ionization in the outer ionosphere. They propagate by means of multiple reflections between earth and ionosphere over the path between the antenna and the duct termination in the lower ionosphere. A system of equations has been developed, by the use of the QL approximation and other simplifying assumptions, which utilizes the principles of geometrical optics to calculate some of the properties of transmitted fields of VLF signals. Two different problems have been studied: (1) the total field transmitted into a whistler "duct" from a transmitting antenna at a ground distance D km away, and (2) the voltage induced in an antenna system on the ground resulting from a wave traveling in the whistler mode. These calculations may be used to determine a value for the transmission loss over an entire whistler path, and a measure for the "effective area" of a whistler. The results are interpreted in terms of experimental data on field strength, polarization, direction of arrival, etc. (Contractor's abstract)

PROPAGATION CHARACTERISTICS OF WHISTLERS TRAPPED IN FIELD-ALIGNED COLUMNS OF ENHANCED IONIZATION, by R. L. Smith. [1961] [9]p. incl. illus. diagrs. table, refs. (AF 18(603)126) Unclassified

Published in Jour. Geophys. Research, v. 66: 3699-3707, Nov. 1961.

Evidence from whistlers shows that the outer ionosphere contains columns or ducts of enhanced ionization. The theory of propagation in these ducts shows an upper cutoff frequency at one-half the gyrofrequency. The average propagation velocity for whistlers trapped in the ducts can be approximated by assuming that the energy follows along the ionization maximum with wave normals aligned with the magnetic field. NEW EXPERIMENTAL EVIDENCE OF THE EFFECT OF MAGNETIC STORMS ON THE MAGNETOSPHERE, by D. L. Carpenter. [1961] [11]p. incl. diagrs. tables. (AF 18(603)126) Unclassified

Published in Jour. Geophys. Research, v. 67: 135-145, Jan. 1962.

New methods of whistler analysis have recently been developed and have been used to study the effect of magnetic storms on the magnetosphere. It is found that whistler observations preceded within 72 hr by a 3-hr K_p level of 6 or more show relatively low values of time delay at typical whistler nose frequencies. During the main phase and recovery phase of several severe magnetic storms, depressions in nose frequency time delays on the order of 2:1 are observed. Evidence is presented that the depressions in whistler delays may be interpreted as reductions in electron density in the magnetosphere. The depression in electron density during several severe storms is then on the order of 4:1.

INSTABILITY OF ELECTRONS DRIFTING THROUGH IONS ACROSS A MAGNETIC FIELD, by O. Buneman. [July 20, 1961] [15]p. incl. diagrs. (Technical rept. no. 251-1) (AFOSR-878) (AF 49(638)660) AD 261898 Unclassified

Also published in Plasma Phys., Accelerators, Thermonuclear Research, v. 4: 111-117, Apr. 1962.

It is shown that the drift motion of the electrons across the ions results in the usual 2-stream instability and that the magnetic field, while reducing the growth rate to some extent, is unable to inhibit the instability effectively. The time scale is lengthened like $B^{1/3}$ and not as in collisional diffusion theory, like B^2. Typically, it can be predicted that if an electric field were applied to a plasma in a magnetic field, to reach its full value within a time rather less than an ion gyro-period, the ions would never complete such a period; their interaction with the drifting electrons would have led to a state in which the ions and electrons shared their mean momentum. It is suggested that, in the case of shock or sheath models, the instability and resulting turbulence would account for the entropy change across the shock, while in PIG-type discharges it might account for the observed enhanced cross-field diffusion.

DIRECT OBSERVATION OF MICROWAVE-FREQUENCY BEATS DUE TO PHOTOMIXING OF RUBY-OPTICAL-MASER MODES, by B. J. McMurtry and A. E. Siegman. Aug. 25, 1961, 5p. incl. illus. (Technical rept. no. 177-1) (AFOSR-1350) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)660 and Signal Corps under DA 36-039-sc-85387) AD 264455 Unclassified

Observations were made of microwave signals produced by photomixing of near-neighbor axial-mode components in the output spectrum of a ruby optical maser (laser). The observations were made by focusing the laser output onto the oxide cathode of an operating 2500-4000 mc traveling-wave tube. Mixing (heterodyning) between the simultaneous, discrete optical frequencies in the laser output occurs in the TWT cathode, producing microwave amplitude modulation of the beam current. This amplitude modulation is amplified in the helix section, producing easily observable microwave signals in the TWT output. Within the TWT bandwidth, discrete signals were observed at 1800 ± 20, 2140 ± 3, 3000 ± 20, and 3600 ± 20 mc, representing the 'photo-beats' between third- through sixth-nearest neighbors in the laser-mode spectrum. This method of observation is a powerful tool for study of optical masers, and also has significant implications for communications employing microwave-modulated light. It verifies a number of suggestions for constructing microwave phototubes outlined by the authors at a recent conference (Phys. Rev., v. 99: 1691, 1955). (Contractor's abstract)

PHOTOMIXING EXPERIMENTS WITH A RUBY OPTICAL MASER AND A TRAVELING-WAVE MICROWAVE PHOTOTUBE, by B. J. McMurtry and A. E. Siegman. [1961] [3]p. incl. illus. (AFOSR-J75) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)660 and Signal Corps under DA 36-039 sc-85387) AD 400084 Unclassified

Also published in Appl. Opt., v. 1: 51-53, Jan. 1962.

Also published in Appl. Opt. Suppl. on Optical Masers, No. 1: 133-135, 1962.

A standard oxide-cathode S-band traveling-wave tube has been used as an improvised microwave phototube to study the coherent light output from a ruby optical maser (laser). The laser's output consists of simultaneous, discrete optical components separated by the mode interval of 600 mc/s between axial modes in the 12.5 cm laser rod. These components heterodyne in the TWT cathode to produce easily observed microwave outputs within the TWT bandwidth, corresponding to photobeats between third- through seventh-nearest-neighbor axial modes. This technique is a powerful tool for the study of optical masers, and also has important implications for communications via microwave-modulated light. (Contractor's abstract)

A CODING CRITERION FOR CONTINUOUS CHANNELS DERIVED FROM LIKELIHOOD ESTIMATION, by T. L. Grettenberg. Feb. 17, 1961, 32p. incl. illus. (Technical rept. no. 2004-1) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 253548 Unclassified

The divergence between hypotheses is investigated as a criterion for signal selection, and is shown to be useful whenever the probability of error cannot be directly evaluated. After a brief discussion of the divergence in hypothesis-testing problems, the relation between the divergence and the information transfer of the channel is determined. As an illustration of the use of the divergence as a coding criterion, the criterion is applied to a finite set of known signals in additive noise. The divergence is evaluated for this example and compared with the probability of error in a maximum-likelihood receiver. (Contractor's abstract)

MACHINE LEARNING AND AUTOMATIC PATTERN RECOGNITION, by D. J. Braverman. Feb. 17, 1961, 83p. incl. illus. refs. (Technical rept. no. 2003-1) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 253925 Unclassified

The machine recognition of the class of an object when objects in each class possess a common property which is unknown to the machine is discussed. The recognition is based upon the measurement of a set of characteristics of the object to be recognized and a collection of learning observations. Optimum, or Bayes, decision rules for recognition minimize the expectation of an arbitrary, preassigned function which measures the consequences of errors in recognition. Optimum decision rules are obtained as functions of the measurements of the characteristics of the object to be recognized and the learning observations with the aid of Statistical Decision Theory. The manner in which the learning observations must be used in optimum recognition systems, the inductive properties of optimum recognition systems, and the method of extraction of relevant information from the learning observations are also discussed. Examples of recognition systems for the minimization of the probability of incorrect recognition of one of a set of unknown, fixed signals in the presence of noise are presented to illustrate the theoretical development. The probability of incorrect recognition is obtained as a function of the number of learning observations, in order to evaluate the learning rate. (Contractor's abstract)

AN INVESTIGATION OF SURFACE STATES AT A SILICON-OXIDE INTERFACE EMPLOYING M-O-S DIODES, by L. M. Terman. Feb. 23, 1961, 96p. incl. illus. table, refs. (Technical rept. no. 1655-1) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 253926 Unclassified

Also published in Solid-State Electron, v. 1, 285-299, 1932.

An investigation was made of the densities and time constants of surface states at a silicon silicon-oxide interface. The tool used for this investigation was the M-O-S diode, a new solid-state device which, besides being useful for fundamental research of the type presented, also offers at least some potential as a circuit device due to its highly voltage-sensitive capacitance. Since an understanding of the M-O-S diode is essential, a general picture is given of its mode of operation and characteristics. The description given of the operation of the device is intuitive rather than mathematical, to enable the reader to obtain a physical feel for its operation. A comparison of the capacitance-vs-voltage curves of an idealized M-O-S diode and p-n step junction is presented, and reasons are given for the more rapid change of capacitance with voltage in the M-O-S diode. The effect of the possible existence of surface states at the silicon/silicon-oxide interface is discussed. (Contractor's abstract)

EXPERIMENTAL INQUIRY INTO THE PRODUCTION OF LOW-NOISE MICROWAVE ELECTRON BEAMS, by W. R. Turner. Mar. 24, 1961, 103p. incl. illus. tables, refs. (Technical rept. no. 401-3) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 254866 Unclassified

The investigation was concerned with the production of low-noise electron beams by the use of low-potential drift regions. Methods of calculating the noise current as a function of distance along the beam are indicated. Experimental attempts were made to use a virtual cathode in the establishment of a low-noise beam. It was found possible to reduce the beam noisiness to a value below that of full shot noise. However, more conventional operation of the gun, in which the beam was gradually accelerated away from the cathode, was even more successful. Noise experiments for a total of eight traveling-wave tubes at L-band and two traveling-wave tubes at C-band are presented. Noise figures of 4.1 db at L-band (1200 mc) and 5.2 db at C-band (5160 mc) were obtained. The design of a readily interchangeable cathode for studies of the relation of noise figure to cathode activity is described. (Contractor's abstract)

THE NEURISTOR, by H. D. Crane. Apr. 21, 1961 [2]p. incl. diagrs. (In cooperation with Stanford Research Inst., Menlo Park, Calif.) (Bound with its Technical rept. no. 1507-2) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524 and Nonr-22551; Office of Naval Research under Nonr-32100, and Wright Air Development Division under AF 33(616)7567) Unclassified

Presented at Internat'l. Solid-State Circuits Conf., Philadelphia, Pa., Feb. 1961.

Neuristor, derived from neuron, is a term assigned to a class of structures that exhibits attenuationless signal propagation, as in the attenuationless propagation of the chemical burning zone along a simple fuse, or the attenuationless propagation of the ionic discharge along the axon of a nerve fiber. There appear to be 2 fundamental methods of interconnection of lines in order to form neuristor networks. In a T-junction, connected portions of 2 or more lines become simultaneously activated, or triggered, as in a knitted bundle of fuses, so that as a discharge zone arrives at the junction on any line, a corresponding signal is generated on each of the other connecting lines. In an R-junction, connected portions exhibit mutual refractoriness, but not mutual triggering. Although primary interest is with totally distributed electronic lines, the basic line technique and methods of interconnection are demonstrated here in terms of simple relay lines.

INVESTIGATIONS OF MAGNETICALLY TUNABLE NARROW BANDPASS NONRECIPROCAL FILTERS USING FERRIMAGNETIC RESONATORS, by C. N. Patel. Apr. 24, 1961, 141p. incl. illus. refs. (Technical rept. no. 411-1) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 255743 Unclassified

The possibility of a narrow-bandwidth, small-insertion-loss microwave filter with nonreciprocal characteristics is studied, and the findings are reported. The discussion is limited to single-resonance transmission-type filters. In order to obtain tunability over a wide band of frequencies, samples of ferrimagnetic materials such as crystals of yttrium iron garnet, are used as high-Q microwave resonators. An analysis is presented of an equivalent circuit for coupling between 2 microwave circuits using a YIG sphere as the coupling element when the RF magnetic fields due to the 2 circuits are circularly or, in general, elliptically polarized. The experimental device consisted of a cross guide coupler, like a Bethe hole coupler, with only one off-axis aperture which contained the YIG sphere. The experimental results on various filters with different off-axis locations of the aperture are reported. The filters are tunable over the entire x-band by changing the dc magnetic field. The experimental results obtained are in good agreement with those predicted from the theory. (Contractor's abstract)

JACOBIAN ELLIPTIC AND OTHER FUNCTIONS AS APPROXIMATE SOLUTIONS TO A CLASS OF GROSSLY NONLINEAR DIFFERENTIAL EQUATIONS, by A. C. Soudack. Apr. 24, 1961, 114p. incl. illus. refs. (Technical rept. no. 2054-1) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 255856 Unclassified

Research is concerned with grossly non-linear systems, the characteristics of which are lost in the process of linearization or quasi-linearization. To this end, methods are here developed for approximating directly the solution to differential equations of the $CH'' + GH' + F(H) = 0$ or $Lq'' + Rq' + g(q) = 0$ where C = capacitance, G = conductance, L = inductance, R = resistance, H = flux, q = charge, and f(H) and g(q) are polynomials with constant coefficients. These equations represent, respectively, electric circuits with non-linear inductor and non-linear capacitor. Conservative systems are considered where R or G = 0. The approximate solution emerges in the form of Jacobian elliptic functions. The approximations are compared quantitatively with those obtained by the Ritz averaging method. Dissipative systems are also considered wherein R or $G \neq 0$. A study of the machine solutions led to some tentative approximations in which f(H) or g(q) contains a linear term and a cubic term only. (Contractor's abstract)

OPTIMUM DESIGN OF SAMPLED-DATA SYSTEMS WITH RANDOM PARAMETERS, by T. L. Gunckel, II. Apr. 24, 1961, 70p. incl. illus. tables, refs. (Technical rept. no. 2102-2) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 255857 Unclassified

Three problem areas associated with the design of linear sampled-data systems are considered. The first arises from having the transition and distribution matrices of the system be random variables, i.e., the random parameter problem; the second, having multiplicative noise at the input to the system. this being a special case of the first problem area; and the third from being unable to measure the state vector of the system exactly. In each of these 3 areas, the performance of the system is measured by using either a generalized sum-squared-error, a final-value, or a minimum-time criterion. The design procedures are based either upon minimizing the expected

value of the performance index or upon minimizing the performance index in the presence of worst-case variations within the system, e.g., minimizing the expected value of the sumsquared-error. In general, the results are in the form of feedback coefficients which relate the value of the optimum input to the value of the state vector of the system. (Contractor's abstract)

CHANNEL UTILIZATION BY INTERMITTENT TRANSMITTERS, by F. F. Fulton, Jr. May 12, 1961, 91p. incl. illus. tables, refs. (Technical rept. no. 2004-2) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 258998 Unclassified

The usual method of allocating spectrum space to various users does not take into account the extent to which the allocations are actually utilized. If only a fraction of the transmitters are simultaneously active, calculation of the possible signaling rates, assuming mutually interfering operation, shows that better methods of spectrum utilization certainly exist if the fraction is small enough, and some systems can be implemented to retain a portion of this advantage while reducing the coding problem to manageable proportions. By studying the theoretical limit of channel utilization, however, it is shown that in fact better utilization is possible if the active fraction of the transmitters is merely less than one. The limit of channel utilization is studied by postulating a model of a band-limited, noisy channel that incorporates the feature of random selection of a subset of transmitters to be multiplexed within the bandwidth. It is shown by a random coding argument that sets of waveforms certainly exist that can provide operation without interference for any finite number of transmitters assigned to the channel, provided only that the total information transmitted by any subset of transmitters be appropriate for the signal powers involved. APPLICATION OF THE POTENTIAL ANALOGY TO BODE'S LINEAR-PHASE FILTER DESIGN, by E. H. Luthman. May 26, 1961, 61p. incl. illus. tables, refs. (Technical rept. no. 097-1) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 257941 Unclassified

The design of linear-phase filters has assumed a role of increasing importance to the network synthesizer. Research is concerned with the design techniques for such filters by investigating the possibility of applying the potential analogy to Bode's well-known method of parameter determination for linear-phase filters. The potential analogy is applied to 2 typical Bode filters: the first has 3 critical frequencies in the transmission band and 1 in the transition region, while the second has 5 critical frequencies in the transmission band and 1 in the transition region. Flux plots for a negatively charged plate lying in the passband region of the frequency axis, and positive charges located in the finite p-plane, are drawn. The method of quantizing the negative charges on an equipotential is employed, from which a quantized image transfer function for each filter is obtained. The phase and attenuation characteristics of these transfer functions are studied and compared with similar characteristics of other linear-phase filter designs. Several realizing techniques are applied to these transfer functions and the resulting networks are shown. (Contractor's abstract)

BIRTH, LIFE, AND DEATH IN MICROELECTRIC SYSTEMS, by B. Widrow, W. H. Pierce, and J. B. Angell. May 30, 1961, 33p. incl. illus. diagrs. refs. (Technical rept. no. 1552-2) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 259538 Unclassified

An adaptive vote-taker is proposed which compares the outputs of paralleled redundant system parts in a binary system and determines the most probable answer based on past performance of the separate parts. Initially, the vote-taker assigns equal significance to each redundant part, and (in a binary system) requires that a simple majority of the parts be correct. With experience, the vote-taker continually reduces the weight (significance) of the outputs from those parts that makes mistakes, thereby gradually eliminating the defective parts. Thus the vote-takers (which may also be paralleled if they are unreliable) as as automatic repairmen which delete defective parts of a system. System dependability and life expectancy can be made to exceed the dependability and average life expectancy of the component parts. The heart of an adaptive vote-taker is an element providing variable gain with memory. A variable resistor with memory (memistor) which uses electrochemical deposition or removal of copper to achieve the variable memory was successfully appied to this function.

THE USE OF WEIGHT FUNCTIONS IN THE TRANSIENT ANALYSIS OF LIGHTLY DAMPED NONLINEAR SYSTEMS, by C.-S. Yen. [June 8, 1961] [82]p. incl. tables, refs. (Technical rept. no. 2052-1) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 257943 Unclassified

Also published in part in Proc. Fourth U.S. Nat'l. Cong. of Appl. Mech., California U., Berkeley (June 18-21, 1962), New York, Amer. Soc. Mech. Engineers, v. 1: 433-439, 1962.

Light damping is described by a second-order differential equation for a nonlinear electric circuit. Using the principle of variation of parameters, a reduction is made of

given equation to 2 first-order differential equations. A weight function method is applied to these 2 equations. The result of this analysis is presented by 2 transient-response curves. Three systems of equations are studied. For the first 2 systems, the results obtained are either better or comparable to those of Kryloff and Bogoliuboff's method. Some improvement of Kryloff and Bogoliuboff's method, using the results of the weight function method, is considered, and excellent results are obtained. The third system is an example of use of the undamped frequency in the assumed solution, which is a generalization of the Kryloff and Bogoliuboff method. For the single-term approximation, error increases with increasing nonlinearity due to the presence of higher harmonics. (Contractor's abstract)

ADAPTIVE BINARY DETECTORS, by R. F. Daly. June 26, 1961, 25p. incl. illus. (Technical rept. no. 2003-2) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 258861 Unclassified

A sequential binary detection problem is considered in which it is required to detect the presence or absence of a stochastic signal in each member of a sequence of observations perturbed by additive noise. The problem is formulated so that the decision rule for the (k1) observation depends on a memory function of the previous k observations. The resulting decision rule which minimizes the probability of making a detection error is complicated by the fact that it is not known which of the past observations actually contain the unknown signal. A time-varying linear predictor of the unknown signal is introduced as the memory function, and a binary detector with a variable structure depending on the linear predictor is discussed. THE TRANSIENT BEHAVIOR OF CONDUCTIVITY IN PHOTOCONDUCTORS, by I. Wunderman. June 28, 1961, 34p. incl. illus. (Technical rept. no. 1511-1) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 261112 Unclassified

Research was concerned with measuring and understanding the variations of electrical conductivity with time in a sintered-layer cadmium-sulfoselenide photoconductor. Primary interest was focused on the decay of conductivity after a known illuminating source is suddenly removed. Suitable apparatus was assembled to perform the necessary measurements. The techniques employed and the associated limitations are discussed. A study of the basic photoconductivity mechanism in photoconductors was undertaken, and several theories were tested. A physical model was found which can explain the salient characteristics of the data. The theory differs from the one currently favored in the literature in that the conventional concepts of free carrier lifetime and traps are avoided. Instead, a rigorous solution to equations describing the free-electron recombination rate was derived. Several observations, based upon the evolved concepts, were made and correlated to the measured data. The most surprising of these is the implication that the hole concentration does not reach equilibrium when light is removed, for perhaps as long as a year. (Contractor's abstract)

RANDOM SIGNAL CODING FOR FINITE MESSAGE SETS, by T. L. Grettenberg. June 30, 1961, 65p. (Technical rept. no. 2004-3) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 262357 Unclassified

The divergence between statistical hypotheses is used as a criterion for selection of a finite transmitter alphabet in a communications system. The members of the transmitter alphabet are sample functions from 1 of a finite set of normally distributed random processes. The receiver uses a maximum-likelihood decoding procedure, and the probability of error is evaluated for this receiver for a class of codes having orthogonal covariance functions. The codes with maximum divergence between alternate hypotheses are shown to be a special case of the codes with orthogonal covariance functions. The error probabilities of the maximum-divergence codes are then compared with the other codes having orthogonal covariance functions. (Contractor's abstract)

IMPROVING RELIABILITY OF DIGITAL SYSTEMS BY REDUNDANCY AND ADAPTION, by W. H. Pierce. July 17, 1961, 121p. incl. illus. tables, refs. (Technical rept. no. 1552-3) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 261113 Unclassified

Redundancy and adaption will have engineering value in improving the reliability of digital systems if they can provide reliability not otherwise attainable, or if they can provide reliability more economically than other methods. The specific methods of using linearly separable decision elements proposed in this thesis show promise of value by both of the above criteria. Decision elements provide a means of overcoming the non-zero failure probability which will always be associated with every component of a digital system. They also permit systems with various amounts of component reliability to meet the same system reliability specifications by using appropriate amounts of redundancy and adaption. A given system reliability may be attained most economically by a redundancy greater than one. The examples calculated for system yield and lifetime show that the factor of increase in system yield or lifetime can be considerably more than the factor by which the redundancy is increased. The examples also indicate the possibility

that the factor of increase in reliability of adaptive circuits over unadaptive ones could exceed the cost factor of the adaptive circuits. (Contractor's abstract)

THE SELECTION PROBLEM FOR MINIMAL-STATE SEQUENTIAL CIRCUITS, by W. H. Davidson. July 20, 1961, 22p. incl. illus. tables. (Technical rept. no. 1901-2) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 260782 Unclassified

A technique is discussed that will select from the set of minimal-state circuits those which will have the lowest expected logic cost. The relation between information content and the expected cost of the logic is clearly demonstrated for the cases discussed. This indicates that if circuits can be designed that have small information contents, they will also have inexpensive associated logic. It may be possible to find design procedures that will generate circuits with small information contents and thus with low-cost logic. Also, it seems reasonable to expect that a relation should exist between an appropriately defined information content for the circuit's input-output sequences and its information content. RATE OF ADAPTATION IN CONTROL SYSTEMS, by B. Widrow. [1961] [8]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) Unclassified

Presented at ARS Guidance, Control, and Navigation Conf., Stanford, Calif., Aug. 7-9, 1961.

Published in ARS Jour., v. 32: 1378-1385, Sept. 1962.

Adaptive control systems are capable of giving near optimum performance in the face of changing input command and noise characteristics, changing dynamics of the controlled processes, and changing goal or mission requirements. The principles of feedback control are used by the adaptation mechanism to control the structure of systems. The quality of adaptation is given by the system "misadjustment," the ratio of the mean increase in mean square error (from adjustments based on finite statistical data) divided by the minimum mean square error. A control system can adapt to a major change in process statistics in about 10 times the impulse response time of the system itself, with a misadjustment of only 20%. Faster adaptation is possible with pattern-recognizing adaptive control systems that use longer term experiences. Pattern-recognizing filters may be composed of adaptive Adaline "neurons." A new electric circuit element called the "memistor" (a resistor with memory) has been devised to facilitate the realization of the Adaline neuron. It is a compact rugged electrochemical element whose resistance can be controlled reversibly by electroplating. The experiences of the neuron are stored in resistance values in a simple and directly usable form. (Contractor's abstract)

ANALYSIS OF A NONLINEAR TRANSMISSION LINE, by R. B. Riley. Apr. 21, 1961 [2]p. incl. diagrs. (Bound with its Technical rept. no. 1507-2) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22531) Unclassified

Presented at Internat'l. Solid-State Circuits Conf., Philadelphia, Pa., Feb. 1961.

A transmission line is shown which includes non-constant capacitance which is voltage-dependent. It can be shown, for a wave propagating in 1 direction, that each voltage value propagates with velocity given by $v = 1/\sqrt{LC(V)}$. In case there are waves propagating in both directions, the situation is much more complex. However, the nonlinear transmission line equations can be transformed into a set of 4 characteristic equations which can be interpreted in terms of the conditions described. Methods of analyzing a nonlinear transmission line in terms of its properties are described.

GENERAL AREA OF PLASMA DYNAMICS IN MAGNETIC FIELDS, by W. H. Bostick. Final rept. Jan. 1961, 1v. incl. illus. diagrs. refs. (AFOSR-55) (AF 49(638)156) AD 265302 Unclassified

The final report on work pursued in the general area of plasma dynamics in magnetic fields is covered mainly by previously published papers. These reports can be noted in earlier volumes of the AFOSR Bibliography. Reports from which the following abstracts have been

taken reappear in this final report: item nos. 2034, 2035, Vol. III and item nos. 2650, 2652-2655, Vol. IV. Further work is proceeding in the study of the coaxial crater gun and on the interaction of plasmas projected at one another along a magnetic field in mirror and cusp geometries.

EXPERIMENTAL STUDY OF RAYLEIGH-TAYLOR INSTABILITY IN PLASMA, by H. Dickinson, W. H. Bostick and others. [1960] [9]p. incl. illus. diagrs. table, refs. (AFOSR-J81) (Sponsored jointly by Air Force Cambridge Research Labs. under AF 19(604)4086, Air Force Office of Scientific Research under AF 49(638)-156, and Atomic Energy Commission under AT(30-1)-1921) AD 400469 Unclassified

Also published in Phys. Fluids, v. 5: 1048-1056, Sept. 1962.

A clear experimental observation of Rayleigh-Taylor, flute-type instability in a high-temperature plasma expanding across a magnetic field has been made with time-delay, Kerr cell, sequence photography. The wavelength and growth rate of the instability are measured as a function of time for various values of external magnetic field and background gas pressure. With interface decelerations of about 10^9 m/sec^2 the instability develops in 1-4 μ sec with wavelengths of about 10^{-2} m. After 1-4 μ sec the flutes grow with constant velocity. STUDIES OF PROPULSION OF PLASMA BY MEANS OF A PULSED CRATER GUN (Abstract), by W. H. Bostick. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)1051) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

A pulsed crater gun (or series plasma motor) constructed of a small diameter center wire imbedded in a small hole at the apex of a ceramic conical shell surrounded by an outer conductor has been demonstrated to have an overall conversion efficiency of about 30% and a specific impulse of about 2000, with energy inputs of 5 to 30 joules. Experiments to ascertain the details of the propulsion mechanism are underway: Kerr cell photographs and double probe measurements of the gun in skeletal form operating without the ceramic conical shell show the plasma spreading over a large angle (± 60°), thereby showing very little directivity. Kerr cell photographs also show sausage type (m = 0) instability occurring near the opening of the crater and the plasma emanating from this region with a large lateral velocity. The addition of a conical shell to this skeletal gun projects the plasma predominantly in one direction. The preliminary inference is that the cone acts as a mechanical velocity-direction-conversion device.

ESTIMATE OF THE POSSIBILITY FOR A $\bar{K}$-Λ COMPOUND, by O. Brulin and B. E. Laurent. [1960] [5]p. (AF 61(052)47) Unclassified

Published in Arkiv Fysik, v. 20: 383-387, 1961.

An investigation of the possibility that ($\bar{K}$, Λ) compounds are formed as a result of interactions is conducted. A static potential in a nonrelativistic 2-particle Schroedinger equation is used. When the intermediate particle is a nucleon, an exchange potential changing the boson K^- to the fermion Λ and vice versa is obtained. An attractive potential in states with odd orbital angular momentum is found. The sign of the potential is changed if the angular momentum is taken to be even or if the interaction is taken to be scalar. The mass of the ground state is found to be equal to the Ξ mass if the coupling constant is chosen so that $G^2/4\pi = 4$ in the scalar and $G^2/4\pi = 10$ in the pseudoscalar case.

LOW-ENERGY K^--NUCLEON SCATTERING AND ODD ($\Sigma\Lambda$) PARITY, by M. Roos. [1961] [3]p. incl. diagr. table, refs. (AF 61(052)47) Unclassified

Published in Arkiv Fysik, v. 20: 539-541, 1962.

It is suggested that examination of the K^--p elastic scattering cross sections at momenta down to about 62 mev/c, and at large scattering angles, might be used to make a choice between the (a+) and (a-) solutions predicted for the cross sections by the zero-effective-range theory. It is noted, however, that in order to make any theoretical conclusions regarding the cross sections below 172 mev/c the $\Sigma\Lambda$ parity must be known. Under the assumption of odd $\Sigma\Lambda$ parity, the (a+) and (a-) solutions are compared as functions of scattering angle and of momentum from 62 to 172 mev/c. At 62 mev/c the (a+) solutions for even and odd $\Sigma\Lambda$ parity are compared and shown to differ.

RESEARCH ON HIGH ENERGY ANTIPARTICLE INTERACTIONS, by J. Allan, P. J. Carlson and others. Sept. 1, 1961, 55p. incl. illus. diagrs. tables, refs. (AFOSR-1728) (AF 61(052)452) AD 272320 Unclassified

One of the main lines of the research presented concerns the interaction of antiprotons of 2 gev/c momentum with the nuclei of nuclear emulsions. The final analysis has to be preceded by an extensive analysis of interactions caused by negative pions of the same momentum. These results together with the angular and the energy distribution of the secondary pions and the energy distribution of knock-on protons agree quite well with a cascade calculation based on a knowledge of elementary processes, mainly pion scattering, production and absorption. The new experimental results thus remove the necessity to consider as severe the bad agreement between an earlier experiment and the cascade calculations. Further the observation of K-mesons produced by pions indicates a low cross section for K-meson production. A progress report on an experiment with about 25,000 negative K-mesons at rest and 10,000 in flight at 400 mev is given. Preliminary results of an investigation of the cross section for pion electron scattering with negative pions of 16 gev energy is also reported. (Contractor's abstract, modified)

Stockholm U. Psychological Lab. (Sweden).

A PSYCHOPHYSICAL STUDY OF CARTOGRAPHIC SYMBOLS, by G. Ekman, R. Lindman, and W. William-Olsson. Feb. 18, 1961, 13p. incl. dtagrs. table. refs. (Technical scientific note no. 6) (AFOSR-1247) (AF 61(052)300) AD 262154 Unclassified

In 2 experiments the subjective volume of certain cartographic symbols was studied by the method of magnitude estimation. The stimulus matertal consisted of several sets of cubes and spheres, drawn with perspecttve and shadow. The total range of stimulus volume was 1:3,500. Psychophysical power functions ytelded a good fit to all experimental data. The exponents varted from 0.56 to 0.82, most of them being close to the average value, 0.69. The results substantiate the tentative conclusion from a previous study, according to which volume estimates in the case of small projected solids essenttally reflect perception of area, and this concluston ts further confirmed by a third experiment designed to throw addittonal light on thts particular question. (Contractor's abstract)

Stockholm U. [Psychological Lab.] (Sweden).

ON THE VALIDITY OF SCALES DERIVED BY RATIO AND MAGNITUDE ESTIMATION METHODS, by M. Mashhour. Nov. 14, 1961, 14p. incl. illus. tables, refs. (Technical scientific note no. 7) (AFOSR-2547) (AF 61-(052)300) AD 276385 Unclassified

The procedure for scale construction by ratio estimation is analyzed and discussed. A brief summary of procedures for scale construction with magnitude estimation is given. Different procedures for testing the internal consistency of ratio matrices are reviewed. Two procedures for submitting ratio matrices to rigorous consistency tests are proposed. It is shown that under special experimental conditions, scales derived by magnitude estimation can likewise be subjected to these tests. The tests are illustrated by data from a series of experiments on velocity perception with both methods. (Contractor's abstract)

RESEARCH ON THE EXCITED STATES OF LIGHT ATOMIC NUCLEI, by S. Gorodetzky. Jan. 15, 1961, 13p. incl. refs. (AFOSR-420) (AF 61(514)1400) AD 255004 Unclassified

Work concerned studies and experimental investigations of the states of light atomic nuclei, mainly with regard to spins, parities, and transitions between energy levels. The investigation was made by means of measurement of angular correlation of internal conversion electron pairs or monopolar pairs. This method gives the multipolarity of a transition by the comparison of the experimental correlation with calculated correlations. The knowledge of the multipolarity gives indications on the spin and the parity of the corresponding levels. (Contractor's abstract)

CHARACTERISTICS OF HIGH-ENERGY NUCLEAR INTERACTIONS AT AND ABOVE 10^{14} ev, by A. Ueda and C. B. A. McCusker. [1961] [17]p. incl. diagrs. tables, refs. (AFOSR-3618) (AF 49(638)942) AD 424219 Unclassified

Also published in Nuclear Phys., v. 26: 35-51, July 1961.

An attempt has been made to explain (a) the changes in slope of the γ ray energy spectrum around γ energies of 1000 gev at 220 gm/cm^2 and 740 g/cm^2 from the top of the atmosphere, (b) the change in slope of the extensive air shower density spectrum at sea level at densities of about 1000 particles/m^2, (c) the double change in slope of the energy spectrum of γ rays from local nuclear interactions at 220 g/cm^2, (d) the absence of such a change at sea level, and (e) the μ-meson spectrum at sea level. The cascade theory developed by Fukuda, Ogita and Ueda has been used together with the following basic hypotheses: (1) in a nucleon-nucleon collision the maximum pion energy in the CMS is about 25 gev, (2) the fractional energy going into the pion component decreases with increasing primary energy (from 30% at 500 gev to 5% at 5×10^7 gev), (3) at very high energies a large fraction of the energy goes into a few heavier particles and then some of this, via the Σ^0, into the electromagnetic cascade. Good agreement between theoretical predictions and experimental results has been obtained. (Contractor's abstract)

EXTENSIVE AIR SHOWERS AND THE CHARACTERISTICS OF HIGH-ENERGY NUCLEAR INTERACTIONS AT AND ABOVE 10^{14} EV, by A. Ueda and C. B. A. McCusker. [1961] [14]p. incl. diagrs. tables, refs. (AFOSR-1828) (AF AFOSR-61-92) AD 427647 Unclassified

Also published in Nuovo Cimento, Series X, v. 23: 877-890, Mar. 1, 1962.

Various characteristics of extensive air showers have been deduced using the cascade model of Ueda and McCusker which contains certain assumptions regarding nuclear interactions at high energies. These have previously been successful in explaining the energy spectra of vartous components. It has also been assumed that all primary particles are protons having an incident energy spectrum represented by a power law. The model can successfully predict many features of air showers including: (1) the zenith angle dependence at sea level and mountain altitudes; (2) the size dependence of nuclear active particles of energy greater than a given (low) value; (3) the change in slope of the size spectrum at sea level; (4) the near independence of the attenuation length on shower size; (5) the energy spectrum of nuclear active particles. Suggestions are made for the improvement of the model in some respects. (Contractor's abstract)

THE FLOW ABOUT A MOVING BODY IN THE UPPER IONOSPHERE, by G. A. Bird. [1961] [7]p. incl. diagrs. refs. (AFOSR-3991) (AF AFOSR-61-93) Unclassified

Also published in Jour. Aerospace Sci., v. 29: 808-814, July 1962.

A particle approach is used to study the flow pattern around a body moving in the upper layers of the ionosphere. The effects of distant encounters between charged particles (dynamic friction) and of the earth's magnetic field are taken into account. It is shown that when the magnetic lines of force are parallel to the direction of motion of the body, there may be a marked concentration of charged particles in the vicinity of the body and a considerable fraction of the reflected or deflected charged particles may reimpinge on the body surface. A numerical example is given for the size and shape of the charged-particle-density contours in the flow field surrounding a circular disc, and these are compared with the corresponding neutral-particle contours.

INFRARED OBSERVATION OF THE O-H BAND OF PURE ETHANOL AND ETHANOL SOLUTIONS TO THE CRITICAL TEMPERATURE, by E. Fishman. [1961] [5]p. incl. diagrs. tables, refs. (AFOSR-1418) (AF 49(638)3) Unclassified

Also published in Jour. Phys. Chem., v. 65: 2204-2208, Dec. 1961.

The infrared absorption of pure ethanol and dilute solutions of ethanol dissolved in ethyl ether, ethyl vinyl ether, acetone, acetonitrile, pentane, carbon disulfide and carbon tetrachloride has been determined in the 3μ region from room temperature to the cirtical temperatures of the liquids. In the active solvents there is a continuous, linear shift in frequency of the polymer band and no evidence of an equilibrium with free alcohol molecules. The slopes of the frequency vs temperature lines vary from 0.89 for pure alcohol to 0.14 for diethyl ether solution. In the inert solvents, the polymer band behaves as in pure alcohol up to the temperature of its disappearance, but the dimer band seems to depend on the solvent for its frequency and temperature behavior. These observations are discussed in terms of the dimer-polymer models proposed by Pimentel, et al, and the hydrogen bond theory of Finch and Lippincott.

BOUNDARIES FOR π-CONTINUOUS MARKOV CHAINS AND REPRESENTATIONS OF EXCESSIVE FUNCTIONS, by S.-T. C. Moy. Dec. 1961, 22p. [AF 49(638)265] Unclassified

In this paper the boundaries for Markov chains with a general state space are treated. A condition of π-continuity is imposed on the transition function. A transition function is π-continuous if the transition probabilities admit a density function representation with respect to some probability measure π. If the state space is countable any transition function is π-continuous for an appropriate π. A kernel K(x, y) and a boundary based on the kernel are introduced. The boundary is not necessarily metrizable or separable, hence, the potential theory apparatus is not available. However, Hunt's probability approach can be extensively used in this case. Similar convergence theorem and representation theorem of excessive functions are proved. (Contractor's abstract, modified)

MEROMORPHIC FUNCTIONS WITH SECTORS FREE OF ZEROS AND POLES, by S. Hellerstein. Jan. 1961, 15p. (AFOSR-222) (AF 49(638)571) AD 255904
Unclassified

Let f(z) be a meromorphic function which is not a polynomial. Assume that all the zeros and poles of f lie on the real axis. Let ϵ (> 0) be given and denote by $n_\epsilon(r, k)$ the number of zeros of $f^{(k)}(z)$ (taking multiplicities into account) which lie in the disk $z \leq r$ and outside the angles $-\epsilon < \arg z < \epsilon$; $\pi - \epsilon < \arg z < \pi + \epsilon$. Then for functions of finite order and r sufficiently large, $n_\epsilon(r, k) < (K/\epsilon)r$, where K depends only on f and k. For functions of infinite order $n_\epsilon(r, k) < (K/\epsilon)r^2 \log r \log^2 T(r, f)$, provided r avoids the values of an exceptional set of finite measure. (T(r, f) is the Nevanlinna characteristic of f). The theorem is a consequence of a more general 1 for meromorphic functions with 1 sector S free of zeros and poles. Here again it is possible to prove that a sector interior to S contains few zeros of the successive derivatives of f.

BOUNDS FOR THE NUMBER OF DEFICIENT VALUES OF CERTAIN CLASSES OF MEROMORPHIC FUNCTIONS by A. Edrei and W. H. J. Fuchs. [1961] [30]p. incl. refs. (AFOSR-281) (In cooperation with Cornell U., Ithaca, N. Y.) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)571 and National Science Foundation) AD 255969 Unclassified

Also published in Proc. London Math. Soc., v. 12: 315-344, Apr. 1962.

An aspect of Nevanlinna's theory of meromorphic functions is considered. It is shown that it is possible to bound the number of deficient values if the zeros and poles obey geometrical restrictions on their position in certain rather slender annuli only. Stated in intuitive and somewhat imprecise form, it is concluded that the number of deficient values remains finite unless the moduli as well as the arguments of the zeros and poles are well scattered. MEROMORPHIC FUNCTIONS WITH TWO VALUES DISTRIBUTED ON A FINITE NUMBER OF PATHS EXTENDING TO INFINITY, by A. Endrei. May 1961, 43p. (AFOSR-815) (AF 49(638)571) AD 267853
Unclassified

Let f(z) be a meromorphic function such that all its zeros and poles lie on a finite number of regular, separated paths extending to infinity. (The exact definitions of regular and separated are defined.) It is shown that if T (T does not equal zero, T does not equal infinity) is a deficient value (in the sense of Nevanlinna) of f(z), or of any 1 of its derivatives, there must exist severe restrictions on the order λ of f(z). In fact, λ must be finite and cannot exceed a bound depending only on the configuration of the paths carrying the zeros and poles of f(z). This shows that, if 3 distinct values, finite or infinite, are distributed on a finite number of paths and if the order of f(z) is infinite, or finite but large enough, then no value, finite or infinite, may be deficient. In particular, entire functions of infinite order cannot have 2 finite values distributed on a finite number of regular, separated paths.

ON A CLASS OF MEROMORPHIC FUNCTIONS WITH DEFICIENT ZEROS AND POLES, by S. Hellerstein. [1961] [10]p. (AFOSR-4623) (AF 49(638)571) AD 611741 Unclassified

Also published in Pacific Jour. Math., v. 13: 115-124, Spring 1963.

Let f(z) be a meromorphic function all of whose zeros a_μ lie on a finite number of rays arg z = const and all of whose poles b_ν lie on a finite number of rays arg z = const. If the arguments and zeros satisfy a linear independence condition (over the rational), so that for a suitable integer L all the numbers a_μ^L lie in a small sector around arg z = 0 while the numbers b_ν^L lie in a small sector around arg z = π, then there is a positive number K depending only on the configuration of rays such that under the condition

$\Sigma|a_\mu|^{-K} + \Sigma|b_\nu|^{-K} = \infty$, $\Sigma|a_\mu|^{-\xi} + \Sigma|b_\nu|^{-\xi} < \infty$ for some $\xi > K$, $\limsup (N(r, f) + N(r, 1/f))/T(r, f) < 1/(1 + A)$, where A is an absolute constant. The conclusion remains valid, even if there are zeros a′ and poles b′ not on the configuration of rays, provided that

$\Sigma|a'|^{-\eta} + \Sigma|b'|^{-\eta} < \infty$ for some $\eta < B$, where B is an absolute constant.

ON MEROMORPHIC FUNCTIONS WITH REGIONS FREE OF POLES AND ZEROS, by A. Edrei and W. H. J. Fuchs. Nov. 1961, 47p. (AFOSR-3328) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)571 and National Science Foundation)
AD 428408 Unclassified

Also published in Acta Math., v. 108: 113-145, Dec. 1962.

Let f(z) be an entire function of finite order. Assume that most of its zeros lie on a finite number of regular paths extending to infinity and determining curvilinear sectors of opening $\geq c > 0$. Then f(z) cannot have more deficient values than twice the numerical value of the order of the function (in the sense of R. Nevanlinna) other than 0 and ∞. The proof of this result depends on a number of lemmas and methods which also yield a simpler proof of theorem which asserts that if F(z) is a meromorphic function, if all its zeros and poles lie on the regular paths described above and if F(z), or any 1 of its derivatives, has a deficient value other than 0 and ∞, then the order of f(z) is necessarily finite and cannot exceed a bound depending only on the configuration of the paths carrying the zeros and poles.

Also published in Amer. Math. Monthly, v. 69: 469-485, June-July 1962.

The purpose of this paper is to give an introduction to some recent developments connected with properties of compact sets of continuous functions. These developments, because of their importance on one hand and their simple and basic character on the other deserve to be more widely known. It is impossible in this paper to give complete proofs. This is an excellent model of an expository paper. It clarifies the underlying ideas and occasionally provides useful details missing from the original papers as well as additions to them. The presentation of Kolmogorov's theorem on the representation of continuous functions of many variables as compositions of continuous functions of fewer variables is extremely illuminating and helpful in reading the concise original paper. Published in Amer. Jour. Math., v. 83: 513-532, July 1961.

Let $\{z_n\}$ $(n = 1, 2, \ldots)$ be a sequence of points in the open unit disc. Let T_p be the transformation taking $f(z)$ in H_p into the sequence $\{f(z_j)(1 - |z_n|)^{1/p}\}$. By Banach space method, it is shown that TH_p is equal to the sequence space ℓ_p if and only if $\{z_n\}$ satisfies the conditions (C) $\Pi_{n \neq k} |z_k - z_n)/(1 - \bar{z}_n z_k)| \geq \delta > 0$ $(k = 1, 2, \ldots)$. For $p = \infty$, this result specializes to the solution of a problem of R. C. Buck by L. Carleson (Amer. Jour. Math., v. 80: 921-990, 1958). For $p = 2$, it is shown that the above result can be used to obtain interpolation theorems for various Hilbert spaces of analytic functions, in particular, for the Hilbert space of analytic functions square integrable over a strip, results obtained by B. Epstein, D. S. Greenstein, and J. Minker (Ann. Acad. Sci. Fenn. Ser. AI, no. 250/10, 1958) for equally spaced points are shown to hold for points z_n satisfying $|z_m - z_n| \geq d > 0$.

IMPURITY SPIN RELAXATION VIA THE CONDUCTION ELECTRONS IN SILICON (Abstract), by A. Honig. [1958] [1]p. (AF 18(603)50) Unclassified

Presented at Kamerlingh Onnes Conf. on Low Temperature Phys., Leiden (Netherlands), June 23-28, 1958.

Published in Physica, Suppl., v. 24: S163, Sept. 1958.

The impurity electron spin relaxation time in phosphorus doped silicon was measured as a function of incident infrared radiation power having a room temperature black body spectral distribution. This relaxation is presumably brought about by the conduction electrons produced by photoionization of the impurity atoms. Among existing interaction mechanisms, Pines, Bardeen and Slichter's mechanism yields the largest relaxation rate. For an incident infrared power of 4×10^{-9} watt, the bound electron spin relaxation time was reduced from 15 min (zero infrared radiation power) to 4 min. Assuming a photon absorption probability of unity, one obtains the $\sim 10^6/cm^3$ conduction electron concentration required by the spin exchange mechanism for a 4 min relaxation time if the conduction electron lifetime against trapping is about 0.5 μsec. This trapping lifetime appears reasonable, though no direct measurements have yet been made. It has also been found that the relaxation rate is proportional to the incident infrared power, and hence to the concentration of conduction electrons.

INFRARED INDUCED PARAMAGNETIC EXCITED STATE IN PHOSPHORUS-DOPED SILICON (Abstract), by A. Honig. [1961] [1]p. (AF 18(603)50)
Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 118, Mar. 20, 1961.

For a particular crystal of Si containing $\sim 10^{15}$ phosphorus impurities/cm^3, an excited state has been appreciably populated by photoionizing the neutral phosphorus impurities, and electron spin resonance in the excited state has been observed. The lifetime of an electron in the excited state exceeds several hr at liquid helium temperatures, but the state can be rapidly emptied by infrared radiation of wavelength greater than $\sim 30\mu$. This radiation has insufficient energy to photoionize phosphorus impurities from their ground state, but has sufficient energy to depopulate the excited state. The electron spin resonance associated with this excited state is a single line at $g \cong 1.998$, and the spin-lattice relaxation time is only slightly shorter than the relatively long times associated with the 2 hyperfine lines of the ground-state spin resonance. Identifications of this excited state as part of the fivefold nearly degenerate 1S state in the Kohn-Luttinger theory of impurity states in Si is suggested by the experiments. Other conceivable identifications will be discussed, as well as possible explanations of why most Si samples do not exhibit this photoinduced resonance.

COMPENSATION DEPENDENT ELECTRON SPIN RELAXATION IN N-TYPE SILICON (Abstract), by G. Yang and A. Honig. [1961] [1]p. (AF 18(603)50)
Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 20, Feb. 1, 1961.

Spin-lattice relaxation of phosphorus donor electrons in a compensated Si sample containing 6×10^{15}/cm^3 phosphorus impurities and 2×10^{15}/cm^3 boron impurities has been investigated at liquid He temperatures. By subtracting from the measured relaxation probability the relaxation probabilities due to mechanisms found in uncompensated samples, the relaxation probability due to compensation is obtained. The temperature and magnetic field dependences for this compensation dependent mechanism have been determined. In addition, the dependence of this relaxation probability on concentration of charged impurities has been obtained by a recently developed technique. This technique permits control of the concentration of ionized impurities in compensated samples by supplying charged impurities with photo-excited electrons and holes from the valence band. The results of these experiments are consistent with a previously suggested interpretation (see item no. 2060, Vol. III) that relaxation results from spin diffusion from relaxation centers consisting of phosphorus ion-phosphorus neutral pairs, i.e., the analog of the hydrogen molecular ion.

"GAUGE-INVARIANT" VARIABLES IN GENERAL RELATIVITY, by P. G. Bergmann. [1961] [16]p. (AFOSR-972) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)461], National Science Foundation, and Wright Air Development Division) AD 261030 Unclassified

Also published in Phys. Rev., v. 124: 274-278, Oct. 1, 1961.

Einstein's field equations for the gravitational field possess solutions having a large variety of topological properties; among them there are solutions whose curvature goes asymptotically to zero at spatial infinity. If restricted to solutions that are asymptotically Minkowskian, then it is tempting to try to divide the effects of curvilinear coordinate transformations into those that correspond to a Lorentz transformation and those that represent gauge-type effects. The group-theoretical aspects of such schemes are analyzed. Making a definite assumption concerning the group of curvilinear transformations that will preserve the asymptotic Minkowski character of the metric field, it is concluded that the reduction to a Lorentz-covariant theory

is in fact impossible. The course of the analysis suggests, however, that this negative result depends on the initial group of transformations adopted; it is conceivable that a slightly different invariance group would be compatible with a special-relativistic formulation of the theory. ASYMPTOTIC PROPERTIES OF A SYSTEM WITH NON-ZERO TOTAL MASS, by P. G. Bergmann, I. Robinson, and E. Schücking. [1961] [5]p. (AFOSR-3870) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)461] and Wright Air Development Division) Unclassified

Also published in Phys. Rev., v. 126: 1227-1231, May 1, 1962.

When certain geometrical figures, which in a flat space would be closed, such as parallelograms of geodesics, are constructed far from the massive source of a gravitational field, they will fail to close in the Riemann-Einstein manifold considered here. If, on removing such a figure to infinity it is scaled up proportionally to its distance from the source, the size of the gap will have an asymptotic value of the order of the Schwarzschild radius of the massive source. Accordingly one cannot construct an asymptotically geodesic coordinate system in the whole region far from the source that will mesh properly everywhere at spatial infinity. Coordinate systems in actual use are not as nearly geodesic as would be compatible with the local curvature of the manifold. (Contractor's abstract)

GROUP THEORETICAL CONSIDERATIONS CONCERNING THE CONSTRUCTION OF LORENTZ-COVARIANT "OBSERVABLES" IN GENERAL RELATIVITY (Abstract), by P. G. Bergmann. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)461], National Science Foundation, and Wright Air Development Division) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 305, Apr. 24, 1961.

It has been suggested that the dynamical variables of general relativity should preferably be invariant with respect to gauge-type coordinate transformations, but noninvariant with respect to Lorentz-type transformations, both homogeneous and inhomogeneous. Such a program is feasible only if the totality of all transformations to be considered is a nonsimple group, that is, one which contains the gauge-type transformations as a normal subgroup. Such nonsimple groups can in fact be found, though there is some question as to whether they have the structure desired. The construction of dynamical variables with the transformation properties indicated is also discussed.

REMARKS ON FORCE-CONSTANT MODELS FOR LATTICE DYNAMICS, by H. Kaplan. [1961] [16]p. incl. diagr. refs. (AFOSR-1707) (AF 49(638)642) AD 270140 Unclassified

Also published in Phys. Rev., v. 125: 1905-1910, Mar. 15, 1962.

It is shown that the need to specify the equilibrium pressure may impose a restriction on the force constants used in calculating lattice vibration spectra. The existence of such a restriction depends upon the lattice under consideration and the generality of the force-constant model that is used. For a model including general interactions with sufficiently distant neighbors (third neighbors will usually be sufficient), specification of the equilibrium

pressure imposes no restrictions. For the cubic crystals explicitly studied, one can conclude that models including third neighbor force constants are not restricted, whereas some second neighbor models and almost all nearest neighbor models are restricted. This is true even if long-range Coulomb forces are included in addition to the short-range force constants. An argument is presented to show that the Cauchy relations of elasticity theory depend upon the vanishing of external stresses in equilibrium, contrary to the conclusions of other published work. The equilibrium atomic spacing near the surface of a crystal is studied and it is shown that this has no influence upon the relation between the equilibrium pressure and the force constants well within the bulk of the crystal. EFFECT OF AN IMPURITY LAYER ON SURFACE WAVES, by H. Kaplan. [1961] [6]p. incl. diagr. tables, refs. [AF 49(638)642] Unclassified

Also published in Phys. Rev., v. 125: 1271-1276, Feb. 15, 1962.

The effects of a homogeneous impurity mass layer on the surface waves of a semi-infinite monatomic square lattice with nearest and next nearest neighbor central springs are studied. In the long-wavelength limit the impurity layer does not alter the surface waves from those of a pure semi-infinite lattice. However, depending upon the ratio of the impurity mass to the host mass, and for wavelengths shorter than a critical wavelength, the long-wavelength surface wave may disappear and new surface waves with frequencies either higher or lower than the spectrum of the pure infinite lattice may appear. The relationship of this model to the analogous 1- and 3-dimensional problems is discussed. This theory is expected to be applicable to problems such as the effect of an oxide layer on the surface vibrations of a crystal. (Contractor's abstract)

LATTICE VIBRATIONS OF ZINCBLENDE STRUCTURE CRYSTALS WITH APPLICATION TO ZnS, by H. Kaplan and J. J. Sullivan. [1961] [32]p. incl. diagrs. tables, refs. (AFOSR-2309) (AF 49(638)642) AD 274955 Unclassified

The vibrations of the zincblende lattice were studied using the shell model of Dick and Overhauser and of Cochran. Only nearest neighbor short range force constants of core-core, core-shell and shell-shell types were included in the model in addition to the coulomb forces between the charged shells and cores. The model was applied to ZnS for which only long wavelength experimental data is available. It was established that the effective ionic charge of the Zn ion in ZnS (the sum of the core and shell charges of the ion) is probably near + 0.1 electronic charges. After the long wavelength data were included in the model enough freedom remained to fit a wide variety of short wavelength data. The short wavelength transverse frequencies in the (100) direction in the Brillouin zone were particularly sensitive to the ratio of electronic polarizabilities of the 2 ions, tending to be depressed when the polarizabilities were made more nearly equal. The present calculation is compared with other calculations of the vibration spectrum of ZnS. (Contractor's abstract)

LATTICE VIBRATIONS OF ZINCBLENDE STRUCTURE CRYSTALS (Abstract), by H. Kaplan and J. J. Sullivan. [1961] [2]p. [AF 49(638)642] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 279-280, Apr. 24, 1961.

A calculation is made of the lattice vibration spectrum of zincblende structure crystals in symmetry directions in the Brillouin zone, using the shell model previously used by Cochran et al to study germanium and alkali halide crystals. The parameters of the model (shell and core charges, shell springs and short range force constants) are adjusted to fit the elastic, piezoelectric and high and low frequency dielectric constants. Care is taken to ensure that the model corresponds to zero pressure in equilibrium. The zincblende structure differs from the alkali halides in that the polarizabilities affect the elastic constant C_{44}. A comparison calculation using the Born and Huang model, which includes long-range but not short-range polarization effects, reveals the same instability for short wave lengths in the <100> directions as was found earlier for the alkali halides. This work is compared with that of Merten which used a rigid ion model.

PHOTOCONDUCTIVITY IN P-TYPE INDIUM ANTIMONIDE WITH DEEP ACCEPTOR IMPURITIES, by W. Engeler, H. Levinstein, and C. Stannard, Jr. [1961] [6]p. incl. diagrs. table. [AF 49(638)642] Unclassified

Presented at the 1961 Internat'l. Conf. on Photoconductivity, Cornell U., Ithaca, N. Y., Aug. 21-24.

Abstract published in Bull. Amer. Phys. Soc., Series II. v. 6: 481-482, Nov. 24, 1961. (Title varies)

Also published in Jour. Phys. and Chem. Solids, v. 22: 249-254, Dec. 1961.

The addition of Au, Ag or Cu impurities to InSb may be expected to produce 2 acceptor levels in InSb when these atoms with 1 valence electron replace In in the crystal lattice. The location of the energy levels has been

determined by observing the extrinsic photoconductivity produced by the excitation of electrons from the valence band to the impurity levels and from the levels to the conduction band. The energy levels for Ag are in close agreement with those calculated by assuming a simple He atom model. The greater divergence for Au is attributed to the lattice distortion introduced when the larger Au atom replaces In in the crystal lattice. Oscillatory behavior of photoconductivity associated with charge carrier excitation to the lower level of all 3 impurities has been attributed to the successive emission of longitudinal optical phonons. DOUBLE HYPERFRAGMENTS AND RELATIVE PARITY OF Λ AND Σ HYPERONS, by S. Iwao. [1961] [9]p. incl. diagrs. table. (AFOSR-177) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)801 and National Science Foundation) AD 611362
Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 33, Feb. 1, 1961.

Also published in Nuclear Phys., v. 26: 1-9, July 1961.

In a previous paper (see Phys. Rev. Ltrs., v. 4: 140, 1960), a theory of hyperfragments was developed. The parameters of the 2-body N-Λ interaction were determined from the observed binding energies of the Λ hyperon. They explained well the present experimental status of hyperfragments. Hence, this method is applied to the so-called "double hyperfragments". The double hyperfragments are bound states of 2 Λ particles and ordinary nuclei. Such systems might be expected to be produced by the absorption of high-energy K^- mesons by complex nuclei or by Ξ^- absorption. Only one additional parameter in the $^1S_0$ state is not previously determined by the single hyperfragment analysis. With the use of global symmetry, it is expected that double hyperfragments should exist for $A \gtrsim 4$. The binding energies of the double hyperfragments are of interest because the sign of the $^1S_0$ potential for the Λ-Λ interaction is closely related to the relative parity of the Λ and Σ particle. Thus the two-pion exchange potential gives an attractive force here for the same parity while zero for opposite parity. For opposite parity bound states will form for $A \gtrsim 5$.

PRELIMINARY DETERMINATION OF Σ - Λ PARITY USING POLOLOGY, by S. Iwao. [1961] [10]p. incl. tables, refs. (AFOSR-3827) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)-801] and National Science Foundation) Unclassified

Also published in Nuovo Cimento, Series X, v. 23: 516-525, Feb. 1, 1962.

A convenient expression for the normalization of the T-matrix pole term is given. The method of pology is applied to various processes. The coupling constant of the N Λ K interaction is determined from the $\bar{p} + p \rightarrow \Lambda + \bar{\Lambda}$ angular distribution. Further application of the method to $\Sigma^0 - K^0$ production from $\pi^- - p$ interactions and $\Sigma^- + \pi^+$ production from $K^- + p$ interactions indicate that the Σ - Λ relative parity is even, although this conclusion cannot be considered firm. This constitutes support for the hypothesis of global symmetry. Some additional applications of pology are suggested and discussed. (Contractor's abstract)

LOW TEMPERATURE ELECTRON TRAPPING LIFETIMES AND EXTRINSIC PHOTOCONDUCTIVITY IN N-TYPE SILICON DOPED WITH SHALLOW IMPURITIES, by R. Levitt and A. Honig. Aug. 1, 1961, 16p. incl. diagrs. tables, refs. (Technical note no. 1) (AFOSR-1433) (AF 49(638)966) AD 264468 Unclassified

Presented at the 1961 Internat'l. Conf. on Photoconductivity, Cornell U., Ithaca, N. Y., Aug. 21-24.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 482, Nov. 24, 1961.

Also published in Jour. Phys. and Chem. Solids, v. 22: 269-284, Dec. 1961.

The trapping lifetimes of conduction electrons photoexcited from shallow impurities have been measured in the liquid helium temperature range for samples of n-type silicon whose donor and compensating acceptor concentrations vary from 10^{13} to 10^{16} impurities/cm^3. A steady state method was employed, in which the conduction electron lifetime t_L is equal to $n_e \tau^i / N_D^O$. n_e is the conduction electron concentration which is determined from low temperature photo-Hall measurements, and $N_D^O \tau^i$ is the electron generation rate. The neutral donor concentration N_D^O is measured by the Hall effect and τ^i, the lifetime against photoionization of a neutral donor, is obtained directly by an electron spin resonance technique. The trapping lifetimes t_L are generally independent of temperature between 4.2°K and 1.2°K, and are inversely proportional to the compensating acceptor concentration. This latter was determined using a recently developed combined infrared radiation and spin resonance method. The trapping cross-section result for phosphorus donors is about 5×10^{-12} cm^2 at 3°K. This is about an order of magnitude larger than the value obtained from the giant trap theory of Lax. Also, the concentration independence of the cross-section in the region of temperature independent t_L is not easily accounted for. The mobility of electrons photoexcited with 2 micron radiation considerably exceeds the mobility of electrons photoexcited with 8-25 micron radiation. This suggests the possibility of excitation to another band or minimum by the 2 micron radiation, as is also suggested by the free carrier absorption peak near 2 microns found in n-type silicon by Spitzer and Fan.

INVESTIGATION OF A POSSIBLE DIFFERENCE IN THE ELECTRIC CHARGES OF THE ELECTRON AND THE PROTON, by J. W. Trischka. Final rept. Oct. 1961 [20]p. incl. diagrs. (AFOSR-1698) (AF AFOSR-60-23A) Unclassified

The hypothesis that the expansion of the universe could be explained if the ratio of electron and proton charges differed from unity by a few parts in 10^{18} has long been disproven. Interest still exists in the measurement of the charge difference, however, and the author seeks possible ways of detecting that difference by the use of 2 methods: (1) the Vertical Electrical Field Apparatus in which an iron sphere is suspended by a vertical magnetic field, and a vertical electric field is used to produce motion in the charged sphere, and (2) the Horizontal Electric Field Apparatus which has a magnetic field which is very weak in 1 horizontal direction and the electric field in the same horizontal direction. It should be noted that these methods must detect charges whose magnitude is a fraction (e.g. 0.1) of the electronic charge. Thus far, however, neither method has been able to detect charges of this magnitude. However, much knowledge has been gained from the use of these apparatus and this report reviews them. They are: (1) a noise reducing circuit which improved the signal to noise ratio in measurements made with the VEFA; (2) an oscillation damper which prevents horizontal oscillations of the suspended sphere; and (3) a method for making iron spheres of the order of 0.003 in. in diameter. PRELIMINARY RESULTS ON THE HELICITY OF THE PROTON (Abstract), by J. Leitner, E. M. Harth and others. [1961] [1]p. [AF 49(638)588] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 63, Feb. 1, 1961.

Parity nonconservation in Λ decay induces a longitudinal polarization of the proton in the Λ rest frame. In the laboratory frame this appears as a transverse polarization proportional to α, the Λ decay asymmetry parameter. If the decay proton undergoes a subsequent elastic nuclear scattering, the transverse polarization can be detected by measuring the right-left asymmetry in an azimuthal scatter angular distribution. Previous experiments which measured this asymmetry in p-iron and p-carbon scattering have yielded contradictory results. Both experiments, however, are subject to a possible contamination by inelastic scattering. From an exposure of the helium bubble chamber to a low-energy K beam at the Bevatron, a sample is obtained of about 20-Λ decay protons which undergo subsequent scattering from helium. Since there are no excited states of helium, and since the scattered proton energy is low enough to be measured accurately by means of range, it is possible to rule out all inelastic contamination. The observed sample has an average transverse polarization of -0.80 α. Within the acceptance criteria, the observed average analyzing polarization is ~35%. The sample is being analyzed to obtain the sign of α (the negative of the proton helicity).

RESEARCH ON PROPERTIES OF LASER DEVICES, by M. C. Neustein. [1960] 1v. (Rept. no. 134TR2) (AFOSR-TN-60-370) (AF 49(638)673) AD 452586 Unclassified

The theoretical and experimental progress of a program to produce working models of LASER devices is presented. The theoretical performance of the oscillator is described and criteria are given which insure that the power output can be focussed to a Frauhofer spot. The first objective of the program is to demonstrate a population inversion by the coherent amplification of an optical signal. Various schemes are described. These include both gaseous and condensed systems. (Contractor's abstract, modified)

RESEARCH ON PROPERTIES OF LASER DEVICES, by R. T. Daly, G. Gould and others. Jan. 9, 1961, 80p. incl. illus. diagrs. (Rept. no. TRG-134-TR-4) (AFOSR-79) (AF 49(638)673) AD 401714 Unclassified

The progress of a program to produce working models of LASER devices is presented. Narrow-beam pulsed oscillations were observed at 6943A (R_1 line) from ruby crystals. The highest power observed corresponded to a brightness of nearly 10^8 watts/cm^2/ster/angstrom or about 10^9 times the brightness of the sun at this wavelength. Two satellite levels of concentrated ruby were determined to have sufficient population for Laser operation by absolute intensity measurements under pulsed excitation. On the basis of fluorescence measurements, certain rare earth ions appear suitable for CW operation if they can be obtained in suitable crystalline materials. The preparation of some of the more likely materials has been undertaken. The possibility of oscillation at 3 and 7 microns was investigated with optically pumped cesium vapor. The measurement of fluorescence at 3 microns with low-intensity lamps indicates that operation will be possible when the available high-intensity lamps are used. The radiative emission measurements at infrared and visible frequencies emitted by the Hg-Kr system using discharge excitation indicated a population inversion of about 10^6 atoms/cc for the 1.8 micron transition. An additional factor of 20 is required in this population excess to obtain the oscillation threshold. (Contractor's abstract)

CROSSED ROOF PRISM INTERFEROMETER, by G. Gould, S. Jacobs and others. [1961] [2]p. incl. diagrs. refs. (AFOSR-2069) (AF 49(638)673) Unclassified

Also published in Appl. Opt., v. 1: 533-534, July 1962.

A modification of the Fabry-Perot resonator with relaxed alignment tolerances is described. Experimentally, fringes have been observed with a single roof reflector vs flat, as well as with 2 crossed roof reflectors. In the first case 2 front-surface mirrors were mounted at a right angle, forming a roof reflector. These opposed a 95%-reflecting multilayer flat. Two sets of fringes were observed; 1 set polarized normal and 1 parallel to the plane of incidence. Fringes were also observed when the roof reflector was replaced with a roof prism, making use of total internal reflection. In the second case the flat was replaced with a second roof reflector, oriented at right angles to the first roof reflector. A single set of fringes was observed in this case. Reflection loss has been virtually eliminated by employing total internal reflection in a prism; Fresnel losses were reduced by constructing the entrance faces at or near Brewster's angle.

RESEARCH ON CROSS STRESSES IN THE FLOW OF RAREFIED AIR, by M. Reiner. Mar. 1, 1961, 1v. incl. illus. diagrs. tables, refs. (AFOSR-44) (AF 61-(052)223) AD 258433 Unclassified

The research conducted under this contract is briefly reviewed. It may be assumed that every liquid, including homogeneous simple liquids, possesses an elasticity of shape which gives rise to cross-effects for which the Navier-Stokes equations cannot account. The law of elasticity has not yet been determined and may be different for homogeneous simple liquids and high polymers. Cross-stresses are present in the laminar flow of di-atomic gases. These stresses diminish with diminishing ambient pressure. Therefore the Navier-Stokes equations cannot account for them. The cross-stresses act in both directions of plane laminar flow, namely the direction of flow, and the direction of the gradient flow. The first is a tension, the second a pressure. Both are second order effects, and are quantitatively proportional to the square of the velocity gradient. There does not exist a kinetic theory of gases which can account for them. The prevailing theories give a second order pressure in the direction of flow, which in addition should increase with diminishing ambient pressure. A theory attempted at by Reiner gives a second order tension in the direction of flow. The kinetic theories refer to monatomic gases. Further experimental investigations with mono- and polyatomic gases are required in order to check the existing kinetic theories for monatomic gases and provide further empirical data for a kinetic theory for di-and polyatomic gases. CROSS-STRESSES IN THE LAMINAR FLOW OF GASES IN ACCORDANCE WITH MAXWELL'S DYNAMICAL THEORY, by M. Reiner. Mar. 1, 1961, 15p. incl. diagrs. (Bound with its AFOSR-44; AD 258433) (AF 61(052)223) Unclassified

It is shown that the cross-stresses in the laminar flow of gases seems to follow from the dynamical theory as developed by Maxwell without assuming non-Newtonian or cohesional forces. It is found that the second order stress superimposed upon the first order stress of classical hydrodynamics which appears in plane laminar shearing flow, is a tension in the direction of flow. In other words, the pressure in this direction is reduced. In torsional flow this implies a centripetal pumping effect. The pressure is always positive. This implies a self supporting thrust bearing action.

Technion - Israel Inst. of Tech., Haifa.

SECOND-ORDER EFFECTS IN THE TORSIONAL FLOW OF A GAS IN ACCORDANCE WITH THE KINETIC THEORY, by M. Bentwich and M. Reiner. Mar. 1, 1961, 8p. (Bound with its AFOSR-44; AD 258433) (AF 61(052)223) Unclassified

If air is sheared in torsional flow between 2 discs, 1

stationary, the other rotating with constant velocity ω, and the distance d between both discs is very small (some microns) so that the velocity gradient ω/d is large, then Reiner has shown that the air is drawn inside between the discs in a centripetal manner, and that at the same time a thrust bearing pressure is developed between both plates. The purpose of this paper is to investigate whether an appropriate theory can be based on a kinetic theory of gases which takes account of second order effects. It is concluded that the phenomenon revealed in the experiments cannot be explained by kinetic theory.

REAL AND COMPLEX DIFFERENTIAL SYSTEMS, by B. Schwarz. Final technical rept. Jan. 1961 [27]p. incl. diagr. (AFOSR-640) (AF 61(052)323) AD 258233 Unclassified

Some results on the frequencies of nonhomogeneous rods are presented. Two results are proved for the principal frequency of clamped nonhomogeneous rods; 1 corresponds to a theorem of P. R. Beesack and the other to a theorem of M. G. Krein for nonhomogeneous strings. An inequality is proved for the minima of the n-th frequency, $n = 2^k$, of clamped rods with equimeasurable density. The least positive eigenvalue for 2 classes of integral equations is considered. The L^2 kernels are symmetric and non-negative ($K(x, y) = K(y, x) \geq 0$, $0 \leq xy, y \leq a$). The maximum of the least positive eigenvalue λ_1 of the corresponding Fredholm equation for any equimeasurable class of these kernels is found. For the (larger) class of all these kernels which have a given L^2 norm and for which $K(x, y)$ is bounded by given non-negative constants h and H ($h \leq k(x, y) \leq H$, $0 \leq x, y \leq a$) both extrema of λ_1 are found. (Contractor's abstract)

ON THE LEAST POSITIVE EIGENVALUE OF INTEGRAL EQUATIONS WITH EQUIMEASURABLE KERNELS, by B. Schwarz. [1961] [7]p. (AF 61(052)-323) Unclassified

Published in Trans. Amer. Math. Soc., v. 104: 488-494, Sept. 1962.

Let $K(x, y)$ be a non-negative, symmetric L^2 kernel defined for $0 \leq x, y \leq a$ with $0 < a < \infty$. Assume that $K(x, y) > 0$ on a set of positive measure. Let E(K) be the class of all symmetric kernels $M(x, y)$ equimeasurable to $K(x, y)$. For each $M \in E(K)$, let $\lambda_1(M)$ be the least positive eigenvalue of the integral equation $\varphi = \lambda M\varphi$. The author proves that $\max_{M \in E(K)} \lambda_1(M) = \{a^{-1} \int_0^a \int_0^a K(x, y)\,dxdy\}^{-1}$. The proof involves the construction of a kernel $K^*(x, y)$ in E(K) which is constant on each line parallel to the diagonal $y = x$. It is shown that the desired minimum is not unique; in fact, it is attained for a large subclass of E(K). The minimum is equal to the reciprocal of the L^2 norm of $K(x, y)$ if and only if E(K) contains a kernel of rank one, which is not generally the case. The author concludes with some remarks about the analogous problem for matrices. (Math. Rev. abstract)

BUCKLING OF THIN CIRCULAR CONICAL SHELLS SUBJECTED TO AXISYMMETRICAL TEMPERATURE DISTRIBUTIONS AND EXTERNAL PRESSURE, by J. Singer. July 1961 [24]p. incl. diagrs. (Technical note no. 3) (AFOSR-859) (AF 61(052)339) AD 273070 Unclassified

A method for the analysis of the instability of conical shells under external pressure is applied to the problem of buckling due to axisymmetrical temperature distributions. The method is based on a solution of the Donnell type stability equations, derived by Seide, and rederived in a modified form to facilitate solution by the Galerkin method. The solution implies slightly relaxed boundary conditions for the u and v displacements, but for the w displacements the usual conditions of simple supports are enforced rigorously. The procedure for the calculation of a critical temperature parameter is described in detail and the method is then extended to the case of a shell subjected simultaneously to external pressure and axisymmetrical temperature distributions. The thermal stresses needed for the stability analysis are computed with the aid of a solution of Meissner equations, in the presence of axisymmetrical temperature distributions, developed by Huth. Typical cases are analyzed. (Contractor's abstract)

MAGNETIZATION PROCESS AND DOMAIN STRUCTURE FROM MAGNETORESISTANCE MEASUREMENTS IN THIN NICKEL WIRES, by A. A. Hirsch, N. Friedman, and G. Gorodetsky. [1961] [3]p. incl. diagrs. (AFOSR-J576) (AF 61(052)481) AD 414024 Unclassified

Presented at Internat'l. Conf. on Magnetism and Crystallography, Kyoto (Japan), Sept. 25-30, 1961.

Also published in Jour. Phys. Soc. Japan, v. 17: Suppl. B-I: 651-653, Mar. 1962.

From measurements of the magnetoresistance effect in thin nickel wires, conclusions are drawn about the mechanism of the magnetization process and the possible domain structure. The experimental data for the hysteresis loops of magnetoresistance are given at liquid air and room temperatures when a single magnetic field or 2 crossed magnetic ones are applied. The theoretical analysis using a simple model of single domain structure indicated that this is true if the magnetic anisotropy is made up of a uniaxial and a cubic magnetocrystalline component. The formation of magnetization curves composed of 2 or 3 closed loops at low temperatures is interpreted. (Contractor's abstract)

TEMPERATURE DEPENDENCE OF COERCIVITY AND DOMAIN STRUCTURE IN THIN FERROMAGNETIC LAYERS, by A. A. Hirsch. [1961] [12]p. incl. diagrs. refs. (AFOSR-J577) (AF 61(052)491) AD 414126 Unclassified

Also published in [Electric and Magnetic Properties of Thin Metallic Layers] Elektrische en Magnetische Eigenschappen van Dunne Metaallaagjes; a Symposium, Liège (Belgium) (Sept. 4-7, 1961), Brussels, Paleis der Acad., 1961, p. 128-138.

The temperature dependence of coercivity for static reversals which has been observed in some ferromagnetic layers is different from that expected from theories describing the layers as built from single domain particles, in which the magnetization process occurs by rotation in unison of electron spins. In a previous paper (Physica, v. 25: 581, 1959) the author suggested a possible explanation for the same phenomenon, supposing that thermal fluctuations can contribute to a process of large magnetization jumps. This work has now been extended also to transient effects of magnetization which are observed in layers submitted to dynamical asymmetrical changes of the external magnetic field. It has been shown that the origin of both phenomena may be related to the same mechanism of transition of the magnetization vector from metastable equilibrium states to stable ones. Calculations of theoretical reversals have indicated that the occurrence of the metastable equilibrium states are possible in a magnetic structure composed of domains with mixed crystalline and uniaxial anisotropies. A possible explanation for observed apparent paramagnetic layers has been outlined briefly. (Contractor's abstract)

DYNAMICS OF STRUCTURES BY TRANSFER MATRICES, by E. Pestel. Final rept. June 1961 [260]p. incl. diagrs. tables. (AFOSR-1449) (AF 61-(052)302) AD 265036 Unclassified

The method of transfer matrices is applied to the static and kinetic treatment of multicell-box-girders. Such structures generally consist of a rectangular system of straight beams, which are interconnected by thin upper and lower cover-plates. The substitute system is an orthogonal grid of spars and bulkheads to which at their crossing points torque boxes are hinged. The elements of the state vector, i.e. the deflection w, the slope φ, the bending moment M and the shear Q, are assembled for all spars at 1 boundary of the system in a single state vector. The transfer of these elements takes place over the entire width of the system through repeated multiplications of square matrices, which are set up for each section between successive bulkheads. The product of all transfer matrices interconnects the 2 state vectors at the 2 boundaries of the system. For the investigation of the natural vibration of the structure, the boundary conditions yield a system of homogeneous linear equations, the determinant of which is set equal to zero in order to obtain the frequency equation. THIN-WALLED COMPRESSION MEMBERS, by A. Pflüger. Mar. 1961, 33p. incl. diagrs. (Technical rept. no. 3) (AFOSR-1160) (AF 61(052)365) AD 262195 Unclassified

Research was concerned with the postbuckling behavior of thin-walled columns. The instability in the elastic and plastic range was considered in previous reports (item nos. 2085 and 2086, Vol. III). Also, the effect of elevated temperature on buckling was investigated. The ultimate or crippling strength of thin-walled columns, the Euler buckling strength of locally buckled columns, and the failure load of angle sections were determined experimentally. Graphs were prepared to provide for an easy application of the results. A method was proposed for approximately determining the buckling loads of columns at raised temperatures by properly reducing the values at room temperature. These considerations were based on test results taken from the available literature. (Contractor's abstract)

[CHANGES IN THE POOL SIZES OF VARIOUS INTERMEDIATES DURING PHOTOSYNTHESIS IN CHLORELLA] Veränderungen von Zwischenstoffkonzentrationen bei der Grünälge Chlorella in Abhängigkeit von der Photosynthese, by I. Liesenkotter. Nov. 1961 [110]p. incl. illus. diagrs. tables, refs. (AFOSR-4350) (AF 61(052)244) Unclassified

The first part of the present report describes experiments in which the influence of external factors (such as glucose-feeding, light-dark transition and different gas phases) on the pool sizes of intermediates in respiration and photosynthesis of Chlorella is investigated. In the second part the influence of different metabolic inhibitors (MJAA, Arsenate, 2, 4-DNP, and KCN) is reported. Some experiments with C^{14} were carried out in order to obtain a more complete picture.

[A DIFFERENCE METHOD FOR APPROXIMATE SOLUTIONS OF INITIAL-VALUE PROBLEMS FOR HALF-LINEAR PARTIAL DIFFERENTIAL EQUATIONS. I. AXIOMS] Ein Differenzenverfahren zur näherungsweisen Lösung des Anfangswertproblems für Systeme halblinearer partieller Differentialgleichungen. I. Ordnung, by R. Albrecht and W. Urich. [1960] [16]p. (AFOSR-3423) (AF EOAR-61-21) Unclassified

Also published in Numerische Math., v. 3: 131-140, 1961.

Consider the initial-value problem (*) $a_{ik}{}^{0}\frac{\partial u^k}{\partial t} + a_{ik}{}^{\nu}(t,x)\frac{\partial u^k}{\partial x^\nu} = b_i(t,x,u)$, $u^k(0,x) = \bar{u}^k(x)$, where $i, k = 1, 2, \ldots, m$; $\nu = 1, 2, \ldots, n$; $a_{ik}{}^{0} = \text{const} \neq 0$; $\det(a_{ik}{}^{0}) \neq 0$; $x = (x^1, \ldots, x^n)$; $u = (u^1, \ldots, u^m)$; and where we have used the summation convention. It is assumed that (*) has at most one solution and that the $a_{ik}{}^{\nu}$, b_i and $\bar{u}^k$ are of class C^1 in all arguments. The authors write the system (*) in the form (**)

$a_{ik}{}^{0}\left(\frac{\partial u^k}{dt}\right)_{(ik)} = b_i(t, x, u)$ (no summation over indices in parenthesis), where $\left(\frac{\partial u^k}{dt}\right)_{(ik)} = \frac{\partial u^k}{\partial t} + \frac{\partial u^k}{\partial x^\nu}\left(\frac{a^\nu{}_{(ik)}}{a^0{}_{(ik)}}\right)$. Let $x^\nu = x^\nu{}_{(ik)}(t, \tau, \xi)$ be the solution of $dx^\nu/dt = a^\nu{}_{(ik)}/a^0{}_{(ik)}$ through the point (τ, ξ). The authors approximate (**) by replacing $(du^k/dt)_{(ik)}$ by $(\tau-\tau_0)^{-1}\{U^k\}(\tau;\xi) - U^k(\tau_0; x_{(ik)}(\tau_0, \tau, \xi))$. Let $U_N{}^k(x, t)$ denote the approximation obtained by the scheme described above corresponding to the subdivision of the t-interval $[0, \delta]$ into N equal parts. The authors prove that if the assumptions stated above are satisfied and if the $\partial U_N{}^k/\partial x^\nu$ form an equicontinuous family, then the $U_N{}^k$ converge uniformly to the solution of (*) as $N \to \infty$. CONDUCT THEORETICAL AND EXPERIMENTAL INVESTIGATIONS ON THE AERODYNAMICS OF THE MIXING OF COOLING AIR WITH COMBUSTION PRODUCTS IN A COMBUSTION CHAMBER WITH THE OBJECTIVE OF ESTABLISHING THE MOST EFFICIENT AND EFFECTIVE COMBINATION OF CHAMBER DIAMETER, CHAMBER LENGTH AND E-FUNCTION SHAPE OF THE SWIRL PLANE, by W. Rogner. Final technical rept. Apr. 1-May 31, 1961. June 30, 1961, 39p. incl. illus. (AFOSR-1354) (AF 61(052)-385) AD 264082 Unclassified

The 2 most important operational requirements were considered to be: (1) uniform temperature distribution in the flue at the combustion chamber exit; and (2) good combustion and combustion chamber efficiency. Air quantities injected were: the primary air used for combustion of atomized fuel; the secondary air for cooling hot combustion gases and the pipe wall; and the tertiary air used to maintain uniform temperature at the exit. Problems concerned with maintaining a total air quantity of 320 kg/h and efficient balance of the 3 air quantities are discussed. Experiments with combustion chambers of differing sizes resulted in the conclusions that greater constructional length would increase the chamber efficiency, and larger inlet and exit cross-sections would have an adverse effect due to the reduction of flow velocity. RECOMBINATION OF IONS IN FLAMES. EFFECT OF TEMPERATURE, by I. R. King. Aug. 1, 1961, 5p. incl. diagrs. (Technical publ. no. 165A; EXP-278) (AFOSR-463) (AF 49(638)650) AD 454648 Unclassified

Also published in Jour. Chem. Phys., v. 37: 74-80, July 1, 1962.

Some results are reported in which the recombination coefficient of natural flame ions has been determined as a function of flame temperature. Measurements were conducted with an alternate-probe technique in a propane-air flame. Flame temperatures were varied by (a) varying the fuel-air ratio, (b) diluting the flame with nitrogen, (c) using a water-cooled burner grid to extract heat from the flame, and (d) replacing the nitrogen in the air with argon. Although the temperature range covered was fairly small (400°K) and a certain amount of scatter in the results was unavoidable, the results showed a definite trend: the recombination rate increases slightly with increasing temperature. The order of magnitude of the recombination coefficient (10^{-7} cm^3/sec) indicates either third-body or dissociative recombination must be the predominant process in these flames. An ion-ion process agreeing with the Langevin prediction is indicated.

RECOMBINATION OF IONS IN FLAMES, by I. R. King. Dec. 15, 1961, 30p. incl. diagrs. tables, refs. (Technical publ. no. 174A: EXP-278) (AFOSR-596) (AF 49(638)650) AD 271360 Unclassified

A technique for measuring recombination rates in flames is described and some results showing the effect of temperature, pressure, and the presence of electronegative gases on recombination are presented. Experimental results are compared with predictions based on present-day theories of recombination. Results are interpreted in terms of an ion-ion process with recombination occurring most probably between an OH(-) and an $H_3O(+)$ ion. The importance of electron attachment in such a process is emphasized.

RECOMBINATION RATES OF ALKALI METAL IONS, by I. R. King. Dec. 1, 1961, 5p. incl. table. (Technical publ. no. 168A; EXP-278) (AFOSR-1519) (AF 49(638)650) Unclassified

Also published in Jour. Chem. Phys., v. 36: 553-554, Jan. 1962.

Recombination rates of a number of alkali metal ions have been determined at a temperature of 1970°K and a pressure of 1 atm. Results show that recombination coefficients vary in the same order as the ionization potentials of the ionized species. Generally speaking, the chloride compounds gave somewhat lower values than the carbonates. The chloride compounds also gave more positive ions than the carbonates. This is in good agreement with results obtained when chlorine gas was added to a hydrocarbon-air flame. That is, the chlorine caused an increase in positive-ion concentration and a decrease in electron concentration at a fixed point in the flame. Of considerable interest is the fact that the recombination coefficients not only vary from salt to salt but they also correlate roughly with the ionization potential of the salts. In all cases the recombination coefficients in flames containing alkali metal salts were some 2 orders of magnitude smaller than those for natural ions, which indicate that recombination is most likely occurring between an ion and an electron rather than between 2 ions.

TRANSLATIONAL AND ROTATIONAL CONTRIBUTIONS TO NUCLEAR SPIN-LATTICE RELAXATION IN BENZENE (Abstract), by M. Eisner and R. W. Mitchell. [1961] [1]p. [AF 18(600)1300] Unclassified

Presented at meeting of the Amer. Phys. Soc., Mexico City (Mexico), June 22-24, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 363, June 22, 1961.

T_1 measurements have been made on protons in C_6H_6-C_6D_6 solutions. The rotational contribution to the relaxation of benzene protons is obtained from the infinite dilution value inferred by extrapolation. $1/T_1$ is found to be a linear function of volume fraction and the translational contribution is found from the difference of $1/T_1$ for the pure C_6H_6 and the infinite dilution $1/T_1$. The rotational and translational relaxation times found in this manner are 60 and 30 sec, respectively. The rotational correlation time is calculated and found to be 2.0×10^{-12} sec in reasonable agreement with $2.3 \text{ sec} \times 10^{-12}$ sec, the value inferred from the rotational relaxation time. Using the value of the diffusion coefficient measured by spin-echo techniques, a translational relaxation time of 30 sec is obtained assuming the distance of closest approach during collision to be 5.0×10^{-8} cm.

THE DOUBLE MINIMUM POTENTIAL OF H_2CO (Abstract), by N. W. Naugle, Jr., R. Henderson, and J. B. Coon. [1959] [1]p. [AF 49(638)593] Unclassified

Presented at Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, June 15-19, 1959.

Published in Spectrochim. Acta, v. 15: 753, Oct. 1959.

The energy levels and wave functions have been obtained for a convenient double minimum potential function with 2 parameters. The problem has been solved in dimensionless form so as to be applicable to any double minimum problem. As a test case the O^+, 1^+ and 1^- levels known for NH_3 lead to a barrier height within 5%, and a displacement of the N atom from the H plane within 10%, of the known values. For the low barriers of H_2CO the present method is expected to give better results than for the high barrier of NH_3. The barrier height B and the angle θ_m of out-of-plane bending, are determined for the $^1A_2$ electronic state of H_2CO and D_2CO using values of the O^+, O^- and 1^+ levels given by Robinson. The results are $B(H_2CO) = 379 \text{ cm}^{-1}$, $B(D_2CO) = 376 \text{ cm}^{-1}$, $\theta_m(H_2CO) = 30.94°$ and $\theta_m(D_2CO) = 31.16°$. If the 1^- level is given a weight equal to that of the other levels a barrier more than 100 cm^{-1} higher is obtained. However, it is reasonable that the lower levels should lead to the best barrier height. The levels O^+, O^- and 1^+, known for the $^3A_2$ state of H_2CO, lead to a barrier height $B = 793 \text{ cm}^{-1}$ and a bending angle $\theta_m = 40.0°$.

THE FRANCK-CONDON PRINCIPLE AND THE STRUCTURES OF EXCITED ELECTRONIC STATES OF MOLECULES, by J. B. Coon, R. E. DeWames, and C. M. Loyd. [1961] [15]p. incl. diagrs. tables, refs. (AFOSR-1313) (AF 49(638)593) AD 412609 Unclassified

Also published in Jour. Molec. Spectros., v. 8: 285-299, Apr. 1962.

An approximate method is described for quantitatively applying the Franck-Condon principle to the problem of determining the structure of an excited electronic state of a simple polyatomic molecule. The method is applicable to an electronic transition for which both electronic states have structures of the same symmetry. Necessary information includes the geometrical structure and the totally symmetrical frequencies of the ground state, as well as the vibrational analysis of a vibronic band system and the resulting information about the totally symmetrical frequencies of the excited state. The relative intensities of a few selected vibronic bands must be measured. One dimensional Condon overlap integrals for these bands are expressed in terms of parameters which depend on the change of the geometrical structure with the electronic transition. A comparison of the squares of the overlap integrals with the band intensities permits the evaluation of the geometrical parameters. In an initial calculation the normal coordinates of the excited state are assumed to be parallel to those known for the ground state. The approximate excited state structure calculated on this basis is used to determine more exact normal coordinates of the excited state. A final calculation based on these coordinates yields an improved excited state structure. Actually there are always several excited state structures consistent with band intensities. It is therefore necessary to have some additional information from the band envelopes. As examples, the structures of 1 excited state of ClO_2 and of 2 excited states of SO_2 are determined. THE FRANCK-CONDON PRINCIPLE AND THE 3600A SYSTEM OF CO_2 (Abstract), by J. B. Coon, R. E. DeWames and others. [1961] [1]p. [AF 49(638)593] Unclassified

Published in Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, June 12-16, 1961, p. 18.

Also published in Spectrochim. Acta, v. 17: 1093, Oct. 1961.

A simple method of applying the Franck-Condon principle to polyatomic molecules leads to the geometrical structure of the excited electronic state of the 3600A system of ClO_2. The calculation is based on the photographically measured relative intensities of the vibronic bands (ν'_1, ν'_2, O) where $\nu'_1 = 0, 1, 2$ and $\nu'_2 = 0, 1$. Of the 4 excited state structures consistent with observed intensities the structure ($r' = 1{\cdot}623A$, $2\alpha' = 107°46'$) agrees well with the structure known from the rotational spectra of the vibronic bands, ($r' = 1{\cdot}620A$, $2\alpha' = 107°24'$). The structure of the ground state used in this calculation is ($r'' = 1{\cdot}472A$, $2\alpha'' = 117°24'$). Certain excited state vibrational levels have been previously interpreted as 1^+ and 2^+ of a double minimum potential in the anti-symmetrical coordinate Q'_3. A double minimum potential function consistent with the observed levels has been found. A Franck-Condon calculation using the wave functions of these levels explains the relative intensities of some of the most prominent bands.

NUCLEAR MAGNETIC RELAXATION OF A THREE-SPIN ASYMMETRIC MOLECULE IN A LIQUID, by G. W. Kattawar and M. Eisner. [1961] [3]p. incl. diagr. (AFOSR-J220) (AF AFOSR-62-151) AD 400439 Unclassified

Also published in Phys. Rev., v. 126: 1054-1056, May 1, 1962.

The semiclassical density-matrix theory of relaxation is employed to calculate the relaxation of the z component of nuclear magnetization of molecules in a liquid for the case in which 3 identical nuclei of spin 1/2 are arranged at the vertices of an isosceles triangle whose angles are 30°, 30°, and 120°. It is found that, if the initial state of the spin systems is characterized by a spin temperature, the relaxation consists of the sum of a 7 terms which decay exponentially with different time constants. It is also found that even though the z component of the magnetization is a function of 7 distinct time constants, a plot of $\ln(M_z - M_{eq})$ can be approximated by a single straight line for regions of experimental interest. The time constant for this straight line differs less than 1% from the average relaxation time calculated from the formulas of Gutowsky and Woessner. (Contractor's abstract)

THE KINETICS AND HEATS OF OLATION OF SOME HYDROXOAQUOTETRAMMINECOBALT(III) COMPLEXES, by W. W. Wendlandt and J. K. Fisher. [1961] [4]p. incl. diagrs. table, refs. (AF 49(638)-787) Unclassified

Published in Jour. Inorg. and Nuclear Chem., v. 24: 1685-1688, Dec. 1962.

It is known that when hydroxoaquotetramminecobalt(III) complexes are heated to about 100°C, the following olation reaction takes place: $2[(NH_3)_4Co(OH)OH_2]X_2 \rightarrow [(NH_3)_4Co(OH)_2Co(NH_3)_4]X_4 + 2H_2O$. The products are water vapor and the binuclear cobalt(III) complex containing 2 -OH bridging groups. Similar reactions have been observed for the hydroxoaquobis(ethylenediamine)cobalt(III) and chromium(III) complexes. More recently, the olation process has been used to explain the partial heterogeneous dehydration of various salt hydrates. Since most processes have been observed in solution, it was of interest to examine the solid-state olation reaction in the cobalt(III) complexes and to determine the kinetics and heat of olation by the technique of differential thermal analysis. A STUDY OF NEODYMIUM SUBSTITUTED YTTRIUM IRON GARNET, by T. H. Ramsey, Jr., H. Steinfink, and E. J. Weiss. [1961] [6]p. incl. diagrs. tables, refs. (AFOSR-J36) (Sponsored jointly by [Air Force Office of Scientific Research under AF AFOSR-62-237] and Edward Orton, Jr. Ceramic Foundation) Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 23: 1105-1110, Aug. 1962.

Yttrium iron garnet ($3Y_2O_3$, $5Fe_2O_3$), a ceramic magnetic material, belongs to the ferrite family. This research has made a study of this garnet in which a portion of the yttrium has been replaced with neodymium, causing a ferro rather than a ferri magnetic alignment of moments. Precision determination of lattice parameters showed that 1.95Nd could substitute for Y. Electrical and magnetic evaluations were made for several substituted compositions. Resistivities were 10^7-10^{11} Ω-cm, depending on processing. For the NdYIG series, the maximum curie temperature was 295°C, and the maximum saturation magnetization was 2100G. The initial permeability, μ_o, varied from 24-38 depending on composition.

PRESSURE AND SOLVENT EFFECTS ON THE ABSORPTION SPECTRUM OF AZULENE (Abstract), by W. W. Robertson, O. E. Weigang, Jr., and A. D. King, Jr. [1959] [1]p. (AF 49(638)35) Unclassified

Presented at Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, June 15-19, 1959.

Published in Spectrochim. Acta, No. 9: 757, Oct. 1959.

Calculations by Pariser (Jour. Chem. Phys., v. 25: 1112, 1956) have shown azulene to have excited state dipole moments opposed to that of the ground state. If so, one might expect polar solvents to shift the azulene absorption spectrum to shorter wavelengths and the compression of such solutions to result in additional blue shifts. To test these ideas the spectrum of azulene has been recorded in both polar and nonpolar solvents at temperatures down to -80°C and at pressures up to several thousand atmospheres. For comparison the spectrum of naphthalene was recorded under similar conditions. Results are only partly as anticipated. The 3 azulene transitions, ^1L_b, ^1L_a and ^1B_b, shift to the blue upon solution in polar solvents. However, upon compression the ^1L_a and ^1B_b bands undergo progressive red shifts with increasing solvent density. The ^1L_b shows a blue shift from vapor to solution in nonpolar solvents and an additional blue shift with increasing optical polarizability of the solvent or with increasing solvent density. Upon decreasing the temperature of the polar solvent, the rate of red shift with solvent density is less for the ^1L_a and ^1B_b than in the compressed solvent, as is the rate of blue shift of the ^1L_b. The characteristic rates of shift of the various transitions with solvent density tend to verify Pariser's assignment of the band falling at 4.05 ev as a separate transition from the ^1B_b.

AN ELECTRON MICROSCOPE STUDY OF CARBON FORMATION IN THE PYROLYSIS OF HYDROCARBONS, by G. L. Johnson. [1961] [11]p. incl. illus. tables. (AFOSR-3972) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)-560 and Petroleum Research Fund) Unclassified

Also published in Proc. Fifth Conf. on Carbon, New York, Pergamon Press, 1962, p. 395-405.

Studies of the pyrolysis of various hydrocarbon vapors were made in a flow system under conditions such that electron micrographs of the particles formed might be correlated with gas chromatographic data on the nature of the reaction products. Tests were made with various types of hydrocarbons, but acetylene was used most extensively. The nature and size of particles formed were investigated as functions of the concentration of hydrocarbon (in mixtures with helium as an inert component) temperature over the range of 500-1000°C, and contact time up to 40 sec in the flow reactor; and the corresponding reaction stages--particularly appearance of H_2 and CH_4-- were followed. The effects of additives such as H_2, O_2, Cl_2, and H_2O were tested. Differences in carbon formation in gas phase and on ordinary surfaces were checked, especially in the transition range from polymerization to formation of solid particles. Results indicate that hydrogen formation is important in the early stages of carbon formation, with methane formation occurring as a secondary reaction; also that physical condensation of polymer to liquid droplets is a secondary process occurring on cooling of reaction products rather than a precursor of carbon formation. A chemical condensation process for nucleation of solid particles is indicated. (Contractor's abstract)

THE REPRESSION-SENSITIZATION SCALE: RATIONALE, RELIABILITY, AND VALIDITY, by D. Byrne. [1961] [16]p. incl. tables, refs. (AFOSR-145) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)460 and Texas U. Research Inst.) Unclassified

Also published in Jour. Personality, v. 29: 334-349, Sept. 1961.

Work in the area of perceptual defense has led to the concept of a behavior dimension comprising psychological defenses ranging from regression to sensitization. Several scales of the MMPI have been found to be related to this dimension, and the present test consists of a combination of 6 of these scales. Normative data for the R-S scale are presented from a college population. Concurrent and/or construct validity for the R-S scale is supported by a series of correlational studies with Ullmann's facilitation. Inhibition scale, the California F scale, and other measures. Thus the R-S scale appears to be a reliable test, and the evidence suggests that it is a measure of defensive behavior.

ARBITRARINESS OF FRUSTRATION AND ITS CONSEQUENCES FOR AGGRESSION IN A SOCIAL SITUATION, by E. Burnstein and P. Worchel. [1961] [13]p. incl. tables. (AFOSR-203) (AF 49(638)460) AD 295918 Unclassified

Also published in Jour. Personality, v. 30: 528-540, Dec. 1962.

The reduction in aggressive responses under nonarbitrary as compared to arbitrary frustration was studied as a result of response inhibition or lowered instigation of aggression. One hundred male Ss selected from the different sections of the elementary course in psychology served in small groups of 3 to 5 Ss. All groups were given "The Case of Johnny Rocco" to discuss under 3 different conditions of frustration: (a) arbitrary, (b) nonarbitrary, and (c) no frustration. There was no significant difference in the private expression of negative feelings towards the confederate on the questionnaire between the experimental groups but both groups were significantly

more negative than the no-frustration group. With a decrease in the strength of the inhibiting social norms there was an increase in direct aggression (rejection of confederate) in both the arbitrary and nonarbitrary conditions. There was significantly greater displacement of aggression towards the E and the self under nonarbitrary than under the arbitrary frustration. Decreasing the strength of the postulated inhibitory forces for expressing aggression under nonarbitrary frustration resulted in lesser displacement of aggression towards the E.

RACIAL PREJUDICE, INTERPERSONAL ATTRACTION, AND ASSUMED DISSIMILARITY OF ATTITUDES, by D. Byrne and T. J. Wong. [1961] 16p. incl. tables, refs. (AFOSR-J689) (AF 49(638)460) AD 413778 Unclassified

Also published in Jour. Abnorm. and Social Psychol., v. 65: 246-253, 1962.

This investigation was undertaken in order to (a) test hypotheses dealing with assumed attitude dissimilarity as a function of racial prejudice and (b) to explore the interactive effects of race, racial prejudice, and attitude similarity-dissimilarity in determining interpersonal attraction. In the first experiment, highly prejudiced subjects were found to assume greater attitude dissimilarity between themselves and a Negro stranger than between themselves and a white stranger; for subjects low in prejudice the assumed dissimilarity scores for whites and Negroes did not differ. In the second experiment, similarity of attitudes resulted in positive ratings and dissimilarity of attitudes resulted in negative ratings, regardless of the prejudice of the subjects or the race of the stranger.

THE ELECTRICAL PROPERTIES OF IONIZED FLAMES. PART I. STUDY OF FLAME IONIZATION, by T. H. Dimmock and W. R. Kineyko. Aug. 1961, 34p. incl. diagrs. tables. (AFOSR-825) (AF 49(638)-305) AD 262367 Unclassified

The concentration and distribution of the ions in high-temperature flames enriched with easily ionized additives was determined. Ionization densities up to 10^{14}/cc were measured by Langmuir probes. Other methods of measuring flame ionization, such as double probes and microwave attenuation were employed and corroborated single probe measurements. For these tests, hydrogen flames were burned with both oxygen and nitric oxide. Measurements of ionization in the H_2/O_2 flames reached 10^{14}/cc and agreed with theoretical values. Measurements in the H_2/NO flame never surpassed 10^{13}/cc and were found to depend critically upon propellant flow rate and burner geometry. A large cold gas boundary layer which exists in the nitric oxide flames forms a thermal barrier to the passage of electrons from the burner into the flame and influences probe measurements.

THE ELECTRICAL PROPERTIES OF IONIZED FLAMES. PART II. ELECTROSTATIC AND MAGNETOHYDRODYNAMIC DEFLECTION, by T. H. Dimmock, C. G. Miller and others. Aug. 1961, 34p. incl. diagrs. tables. (AFOSR-990) (AF 49(638)305) AD 262368 Unclassified

The electrical properties of highly ionized, high temperature flames have been investigated to determine the interaction of the flame with electric and/or magnetic fields. With electric fields alone, no deflection is obtained because the field intensity within the flame is too small whether the field electrodes are outside or inside of the flame. Most of the potential drop between the electrodes occurs at the boundary layer on the electrodes. (With the unseeded flame, however, electrostatic deflection up to 45 degrees was readily obtained). A combination of transverse electric and longitudinal magnetic fields produced a Lorentz force on the flame of 10 newtons/cu m this force deflected a highly ionized flame up to 45 degrees. The deflection is proportional to the Lorentz force and inversely proportional to the inertial force. The magnitude of the flame conductivity (i. e., ionization) determines the power supply requirements for the electric field; the power required for the electric field decreases with increasing flame conductivity. FLAME DEFLECTION AND ELECTRICAL EFFECTS ON FLAMES (Abstract), by H. G. Wolfhard and T. H. Dimmock. [1961] [1]p. (Bound with AFOSR-582; AD 257892) (AF 49(638)305) Unclassified

Presented at Fourth annual AFOSR Contractors' meeting on Ion and Plasma Acceleration, Beverly Hills, Calif., Apr. 20-21, 1961.

An experimental program is being conducted to measure the distribution and intensity of ionization in seeded high temperature flames. The investigation can be divided into the following 3 phases: (1) the production and diagnostics of flames with controlled, high ionization; (2) the study of the electric field gradients within flames burning under the influence of external electric fields; and (3) the deflection of highly ionized flames by interaction with electric and magnetic fields. It is shown that measured limits of ionization depend critically on the thickness of cold gas boundary layers and the quenching diameter of the propellants used. Flames burning with nitric oxide (NO) never reached

ionization values predicted by the Saha equation as did flames burning with oxygen. Measurements of the distribution and intensity of ionization in flames are presented. When an external magnetic field is impressed upon a highly ionized atmospheric flame, the magnetic body forces are small compared to the inertial forces, (irrespective of mass flow rate) and no flame deflection is possible. With an impressed electric field transverse to such a magnetic field however, deflections up to 45° were obtained. The deflection is dependent on the field arrangements and field intensities and is inversely proportional to the kinetic energy of the flame species.

THE ELECTRICAL PROPERTIES OF IONIZED FLAMES, by T. H. Dimmock. [1961] [13]p. incl. illus. diagrs. (AF 49(638)305) Unclassified

Published in Proc. of the Fourth Biennial Gas Dynamics Symposium on Magnetohydrodynamics, Northwestern U., Evanston, Ill. (Aug. 23-25, 1961), Evanston, Northwestern U. Press, 1962, p. 159-171. (AFOSR-2787)

The ionization in seeded, high temperature, atmospheric flames has been measured by probe and microwave methods. For KA-band microwaves, the range of ionization was measured to be 10^{10}-10^{12}/cc. In this range all diagnostic methods were in agreement. Langmuir probe measurements in hydrogen-nitric oxide flames showed a level of ionization well below the theoretical value. In addition single probe measurements were found to depend critically on the cold gas layer between the flame and burner, which in turn is dependent upon flame impingement and propellant quenching diameter. External electric and magnetic fields were employed with seeded and pure flames to measure their interaction with the field. With the electric field alone the interaction is small as the highest field intensity in the flame is about 1 v/cm. By using electrodes within the flame and transverse magnetic field, a seeded flame can be deflected by Lorentz forces. The deflection is directly proportional to Lorentz force and inversely proportional to flame inertia. (Contractor's abstract)

ELECTRICAL EFFECTS IN ROCKET COMBUSTION PRODUCTS (Abstract), by T. H. Dimmock. [1961] [1]p. [AF 49(638)305] Unclassified

Presented at Fourteenth AFOSR Contractors' meeting on Liquid Rocket Combustion Research, Princeton U., N. J., Sept. 25-26, 1961. (AFOSR-1768; AD 267915)

An experimental program has been conducted to measure the ionization distribution in seeded high temperature flames. The burnt gases in these flames closely resembled the combustion products in a rocket exhaust. In the atmospheric flame studies, it was found that ionization densities, measured by probes, depended critically on the thickness of the boundary layer between the flame and burner. The thickness of this layer in turn depended upon propellant quenching diameter, burning rate, turbulence, and impingement. Densities measured by Langmuir probes, microwaves and double probes were in good agreement. External and internal electrostatic fields were applied to pure and seeded atmospheric flames, and Lorentz force fields were applied to seeded flames. The deflection which resulted was limited by the shielding influence of the boundary layer, the inertia of the flame, the buoyancy of the atmosphere, and the available supply of electrical power.

THE CLIMATIC AND HYDROLOGIC FACTORS AFFECTING THE REDISTRIBUTION OF SR^{90}, by J. R. Mather, J. K. Nakamura and C. W. Thornthwaite. Final rept. Sept. 1961 [11]p. incl. diagrs. tables, refs. (Technical rept. no. 1) (AFOSR-1623) (AF 49-(638)887) AD 266676 Unclassified

Measurements have been made of the strontium content in the soil and these results are used to explain the observed distribution of strontium with depth in the soil. A mathematical model was formulated to reproduce laboratory results showing that strontium moves downward in the soil as a wave of decreasing amplitude. The available measured data is presented and also measurements of the daily balance between precipitation and evaporation. Precipitation in excess of evaporation when the soil is at or above field capacity will constitute surplus water available for leaching strontium and other materials downward through the soil. The relation between leaching efficiency, soils and climate, the relation between precipitation and water surplus, use of high speed computer techniques to determine water surplus and strontium movement, and the application of the mathematical model to the movement of calcium in an agricultural soil are explained. Maps of contamination risk and strontium removal time are presented.

AN INVESTIGATION OF THE FLUCTUATING FORCES ACTING ON A STATIONARY CIRCULAR CYLINDER IN A SUBSONIC STREAM, AND OF THE ASSOCIATED SOUND FIELD, by R. T. Keefe. Sept. 1961 [104]p. incl. illus. diagrs. refs. (UTIA rept. no. 76) (AFOSR-2147) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)249 and Defence Research Board of Canada) Unclassified

Also published in part in Jour. Acoust. Soc. Amer., v. 34: 1711-1714, Nov. 1962.

An experimental investigation has been made of the fluctuating forces acting on a short segment of a 1 1/8 in diam stationary circular cylinder placed in the UTIA subsonic wind tunnel. The fluctuating lift was measured over a range of Reynold's numbers from 5000 to 100,000 and the fluctuating drag over a range of 20,000 to 100,000. A large increase in the lift coefficient occurred when 2 circular disks were fastened to the cylinder in close proximity to the force transducer. The measurements of the acoustic radiation from cylinders placed in a subsonic air jet showed great sensitivity to the cylinder end conditions. Experiments were performed to arrive at an understanding of the end effects, with limited success. A comparison of a theoretical estimate of the acoustic radiation using the results of the force measurements presented herein and correlation data obtained previously at UTIA shows good agreement with the acoustic measurements on 1 of the configurations tested, and with those of other researchers using a whirling arm apparatus. "INCOMPRESSIBLE" ACOUSTIC NEAR FIELD AS A SPATIAL DISTRIBUTION OF SOURCES GENERATING THE FAR FIELD (Abstract), by H. S. Ribner. [1961] [1]p. [AF 49(638)249] Unclassified

Presented at Sixty-first meeting of the Acoust. Soc. Amer., Philadelphia, Pa., May 10-13, 1961.

Published in Jour. Acoust. Soc. Amer., v. 33: 650, June 1961.

Suppose one calculates an "incompressible" flow (pressure field $p^{(0)}$) by substituting Laplace's equation for the wave equation in a given acoustic problem. Then the far field $p^{(1)}$ is a solution of the wave equation for a spatial distribution of matter sources of strength $-C_o^{-2}\partial p^{(0)}/\partial t$. (Boundary condition: zero normal velocity). This is readily demonstrated. Physical significance: Since the fluid is actually compressible, isentropy gives $-C_o^{-2}\partial p^{(0)}/\partial t = \partial p^{(0)}/\partial t$.

This density fluctuation is precisely equivalent to a volume fluctuation of the fluid elements. Pulsating sphere: A pulsating sphere generating an "incompressible" field $p^{(0)}$ may be replaced by a rigid sphere surrounded by a cloud of sources of strength $-C_o^{-2}$ $\partial p^{(0)}/\partial t$; this will generate the far field $p^{(1)}$. Aeolian tones: The principle helps explain nonvanishing generation of sound by a stationary rod in an air jet. The sound energy flow at a stationary surface must be zero: the sound is actually emitted from the region of fluctuating compression surrounding the rod. Jet noise: The "incompressible" approximation to the field within the jet is $p^{(0)}$. Source-like pulsations of the fluid elements in response to $p^{(0)}$ are considered to generate the far-field sound $p^{(1)}$. The source strength, modified for convection, is $-C_o^{-2}\,Dp^{(0)}/Dt$.

PRESSURE PROBES IN FREE MOLECULE FLOW, by K. R. Enkenhus, E. L. Harris, and G. N. Patterson. July 1961, 13p. incl. diagrs. refs. (UTIA review no. 19) (AFOSR-1677) (AF 49(638)281) AD 265547 Unclassified

When the mean free path becomes a significant fraction of a characteristic dimension of a pressure probe, the usual continuum formulae relating the measured pressure to the free-stream pressure and Mach number are no longer valid. The case where the mean free path is so large compared with the probe diam that intermo ecular collisions may be neglected is treated. This is the condition for free molecule flow. Theoretical expressions are given for the pressure measured in a flowing gas with an orifice probe and a long-tube pressure probe. Experimental investigations were conducted using a low-density wind tunnel and a rotating-arm apparatus. Agreement between theory and experiment was quite satisfactory. Although this work was done primarily in connection with the flow of low density gases over models in the laboratory, the results are equally applicable to situations encountered in upper atmospheric research. ON A RELATIVELY COOL TRANSITION FROM A SATELLITE ORBIT TO AN EQUILIBRIUM GLIDE, by B. Etkin. June 1961 [52]p. incl. diagrs. (UTIA rept. no. 75) (AFOSR-1383) (AF 49(638)761) AD 265550 Unclassified

One family of solutions is presented for a monotonic transition from a circular orbit to an equilibrium glide. It is performed at high lift coefficient and low L/D, and terminates at a match point where the prescribed conditions of the glide are met. The vehicle then continues on the glide at a higher value of L/D. The high drag required during transition entails the use of a large auxiliary light-weight drag body, which is jettisoned upon arrival at the match point. The presence of this drag body results in a reduction of the total heat load on the vehicle itself. The exact amount of this reduction depends on the details of the design, but it can be typically of the order of 3/4 in an entry with a peak acceleration of the order of 7 g. As a result, the max average vehicle temperature can be made relatively low, with consequent advantages in the structural design, and in the thermal protection of the payload. LANGMUIR PROBES IN A FLOWING LOW DENSITY PLASMA, by J. B. French. Aug. 1961 [66]p. incl. illus. diagrs. tables, refs. (UTIA rept. no. 79) (AFOSR-2159) (AF 49(638)823) AD 273698
Unclassified

Presented at meeting of the Amer. Phys. Soc., Berkeley, Calif., Nov. 20-22, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 372, Apr. 23, 1962.

Two aspects of the use of Langmuir probes were investigated. First, a Langmuir probe free-molecular with respect to all species, and in a plasma in which the ion temperature is higher than the electron temperature, is considered. Theoretical predictions are that both the ion current and the electron current outside the retarding field region are controlled by ion energy, instead of electron energy. Hence, directed ion energy in the form of plasma mass motion is expected to influence collection. The retarding field method of measuring electron temperature is uninfluenced. Comparisons between ion collecting cylindrical probes parallel and transverse to the supersonic plasma stream agree quantitatively with these predictions. Second, the situation is considered in which the electrons have much higher thermal energy than the ions, and in which the probe is free-molecular with respect to neutral particles but in continuum flow with respect to the ions and electrons. The smaller electron and ion mean free paths are calculated to have little effect on the current collected by the probe, unless mass motion is present. Experiments indicate that a region of increased ion density exists in front of a probe biased to reflect ions back into the oncoming stream. (Contractor's abstract)

ON THE ENERGY LOSS AND SPECIFIC IONIZATION OF A RELATIVISTIC PARTICLE IN A POLARIZABLE MEDIUM, by P. Budini, L. Taffara and C. Viola. Final rept. Jan. 31, 1961, 68p. incl. diagrs. tables, refs. (AFOSR-567) (AF 61(052)211) AD 258965
Unclassified

The dispersive and absorptive properties of a given medium are studied in order to deduce formulae to be used in the theory of energy loss suffered by a ionizing particle traversing the medium and of ionization produced by it in the medium. Specific energy loss is calculated for electrons and positrons in H and He at different pressure and at liquid state trying to put in evidence the different behavior of the 2 particles. Primary specific ionization is studied and a theory is given for the calculation of ionization of the further generations. Summing the results, total specific ionization can be calculated. The results are applied to some particular cases and compared with experimental results. The problem of mixtures of elements is discussed. In this case a new effect is theoretically foreseen, which should be due to the reabsorption by 1 of the components of the mixture of Cerenkov radiation emitted by the other. This effect could give a pronounced enhancement of relativistic increase of primary specific ionization as it is shown in 2 particular cases. (Contractor's abstract)

ON PROBABILITY MEASURES RELATED TO THE NAVIER-STOKES EQUATIONS IN THE 3-DIMENSIONAL CASE, by G. Prodi. July 28, 1961, 48p. incl. refs. (Technical note no. 2) (AFOSR-1500) (AF 61-(052)414) AD 266672 Unclassified

For the Navier Stokes system in 3-dimensional case, no theorem is known about existence and uniqueness in the large. The notion of half-invariant measure, based on the only prerequisite of a local existence and uniqueness theorem is introduced. Under certain hypothesis for a half-invariant measure, the existence and uniqueness theorem holds for almost all initial values, and the measure is invariant. The research is concluded by giving 2 criteria for the existence of half-invariant measures. (Contractor's abstract)

[CONCERNING A PROBLEM ON THE RELATIVE OUTLINE ON THE SYSTEM OF STOKES EQUATIONS] Su uno problema al contorno relativo al sistema di equazioni di Stokes, by L. Cattabriga. [1961] [33]p. (AFOSR-1665) (AF 61(052)414) Unclassified

Also published in Rend. Sem. Matem. Univ. Padova, v. 31: 308-340, 1961.

The author considers a suitably regular open $\Omega \subset R$ and defines $|u|_{j, L_q} = (\sum_{|\beta| = j} \int_\Omega |D^\beta u|^q dx)^{1/q}$; $D\beta = \partial\beta/\partial x_1\beta_1 \partial x_2\beta_2 \partial x_3\beta_3$, $|D^\beta u| = (\sum_1^3 |D\beta u_1|^2)^{1/2}$ for u a vector function; $\|u\|_{1, L_q} = (\sum_{j \le 1} (|u|_{j, L_q})^q)^{1/q}$; $H_{1, L_q}(\Omega)$ is the Banach space obtained by completion of the C^∞ (vector) functions in $\bar{\Omega}$ with respect to $\| \|_{1, L_q}$; $\overset{o}{H}_{1, L_q}(\Omega)$ is the Banach space obtained by completion under $\| \|_{1, L_q}$ of the C^∞ functions in Ω with compact support; $H_{-1, L_q}(\Omega)$ is the dual of $\overset{o}{H}_{1, L_{q'}}(\Omega)$ $(1/q + 1/q' = 1)$; if Ω is bounded, $H_{1, L_q}(\Omega)/K$ is the quotient of $H_{1, L_q}(\Omega)$ by the space K of constant functions in Ω; for $j > 0$ and functions (or vectors) φ defined on $\dot{\Omega}$ set $|\varphi|_{j-1/q, L_q} = \inf |\nu|_{j, L_q}$ and $\|\varphi\|_{j-1/q, L_q} = \inf \|\nu\|_{j, L_q}$, where the inf is over all functions (or vectors) $\nu \in H_{j, L_q}(\Omega)$ whose trace $\gamma\nu$ on $\dot{\Omega}$ equals φ, and let $H_{j-1/q, L_q}(\dot{\Omega})$ be the Banach space of functions (or vectors) φ such that $\|\varphi\|_{j-1/q, L_q} < \infty$. The system $\Delta u - \operatorname{grad} p = f$, $\operatorname{div} u = g$ in Ω with $u = \varphi$ on $\dot{\Omega}$, is studied, where the vector u and the function p are unknowns. Here $u \in H_{1, L_q}(\Omega)$, $p \in L_q(\Omega)$, and thus $\operatorname{div} u = g$ and $u = \varphi$ are meant in the usual sense, while the first equation has the weak sense $\int (\sum_1^3 D_j u_i D_j \nu_i - p \operatorname{div} \nu) dx = \langle f, \nu \rangle$ for all $\nu \in \overset{o}{H}_{1, L_{q'}}(\Omega)$. Then it is proved that if Ω is of class C^s, $s = \max(1, 2)$, $f \in H_{1-2, L_q}(\Omega)$, $g \in H_{1-1, L_q}(\Omega)$, $\varphi \in H_{1-1/q, L_q}(\dot{\Omega})$, $1 \ne 1$, $1 < q < \infty$, $\int_\Omega g\, dx = \int_{\dot{\Omega}} \varphi \cdot n\, d\sigma$, then there exists a unique $u \in H_{1, L_q}(\Omega)$ and $p \in H_{1-1, L_q}(\Omega)/K$ solving the above equations and, moreover, $\|u\|_1 + \|p\|_{1-1} \le C(\|f\|_{1-2} + \|g\|_{1-1} + \|\varphi\|_{1-1/q})$, where C depends only on 1, q, and Ω. Personnel responsible for the human factors considerations in the design and development of equipment have a major need for rapid and easy access to the literature pertinent to their work. The fact that the literature associated with human engineering derived from many different journals and periodicals as well as a host of publications from governmental, industrial, and academic laboratories presents a compelling requirement for the development of useful bibliographic aids. This bibliography is 1 of a planned series of annual bibliographies of literature pertinent to human engineering which has been designed to meet this requirement. Two major considerations – ease of use and appropriate selections of material - strongly influenced this bibliography. As a result, 5 main parts exist: (1) a topical outline which defines over 300 topic headings established for this bibliography, (2) an index which associates the approximately 1900 bibliographic entries with the topic headings, (3) an alphabetical index of the common search terms which would aid those using this bibliography but who are unfamiliar with the topic headings, (4) an annotated bibliography of some 1900 citations, and (5) an index of the authors of these citations.

PROPERTIES OF THE S-MATRIX AS A FUNCTION OF THE COMPLEX ANGULAR MOMENTUM FOR THE MANY-CHANNEL CASE AND FOR THE DIRAC EQUATION, by L. Favella and M. T. Reineri. [1961] [25]p. [AF 61(052)230] Unclassified

Published in Nuovo Cimento, Series X, v. 23: 616-640, Feb. 1, 1962.

A study of the analytical behavior of the potential scattering amplitude at fixed real energy in the complex plane of the angular momentum has been made in correspondence to a Dirac equation of motion and a Schrödinger's many-channel problem. In both cases the boundary of the region where the singularities are located has been determined. It is proven that in the many-channel case the poles are confined to a strip parallel to the imaginary axis. (Contractor's abstract)

POTENTIAL SCATTERING FOR COMPLEX ENERGY AND ANGULAR MOMENTUM, by A. Bottino, A. M. Longoni, and T. Regge. [1961] [51]p. incl. diagrs. table, refs. [AF 61(052)230] Unclassified

Published in Nuovo Cimento, Series X, v. 23: 954-1004, Mar. 16, 1962.

The analytic properties of the partial wave scattering amplitude for potential scattering in the pair of variables k (wave number) and $\lambda = l + 1/2$ have been derived when both variables are complex. Several results on the location of the poles of the S-matrix follow from a procedure of analytic completion. The scattering process is then considered as described by the variables λ and k, instead of s and t, as in Mandelstam's work. The set of properties of $S(\lambda, k) = \exp[2i\delta(\lambda, k)]$ here derived is exactly equivalent to the double dispersion formulas for energy and momentum transfer. (Contractor's abstract)

DECAY STUDIES OF THE EVEN-EVEN ISOTOPES, Er^{172} AND Dy^{166}, by R. Gunnink and A. W. Stoner. [1961] [17]p. incl. diagrs. table, refs. (AFOSR-1900) [AF 49(638)815] AD 278597 Unclassified

Also published in Phys. Rev., v. 126: 642-646, Apr. 15, 1962.

Er^{172} and Dy^{166}, with half-lives of 48.7 ± 0.5 hr and 81.8 ± 0.5 hr, respectively, were produced by double neutron capture from Er^{170} and Dy^{164}. Gamma rays of the following energies were found in the decay of Er^{172}: 2 coincident 50-kev radiations, 72, 128, 170, 200, 410, 440, and 610 kev. The proposed energy levels for Tm^{172} consistent with the data are as follows: 410, 440, 482, 538, and 610 kev. Log ft values of beta transitions indicate that the 538- and 610-kev levels have spin assignments of 0 or 1 with positive parity. The following gamma transitions were found in the decay of Dy^{166}: 84, 291, 343, 373, and 427 kev. In addition to showing conversion electrons of the 84-kev transition, permanent-magnet spectrometer studies revealed the presence of 2 additional transitions of 30 and 54 kev which were not observed in scintillation studies. The multi-polarity of the low-energy transitions are as follows: 30 kev-M1, 54 kev-E2, and 84 kev-M1. The proposed energy levels for Ho^{166} are at 54, 84, 375, and 427 kev. (Contractor's abstract)

INFLUENCE OF LOCAL TEMPERATURE CHANGES IN THE PREOPTIC AREA AND ROSTRAL HYPOTHALAMUS ON THE REGULATION OF FOOD AND WATER INTAKE, by B. Andersson and B. Larsson. Feb. 1, 1961 [22]p. incl. illus. diagrs. refs. (Technical note no. 2) (AFOSR-2670) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)183 and Swedish Medical Research Council) Unclassified

Also published in Acta Physiol. Scand., v. 52: 75-89, 1961.

Local cooling of the preoptic area and rostral hypothalamus was found to induce eating in the fed goat. When the same animal was dehydrated to the state of aphagia, cooling of this area inhibited the animal's urge to drink and at the same time induced eating. Although in a normal goat feeding practically stops when the rectal temperature exceeds 40°C (Appleman and Delouche, 1958), local cooling of the preoptic area and the rostral hypothalamus was found to induce the goat to eat hay with a seemingly good appetite at body temperature above 41°C. Warming the same area inhibited eating in the previously hungry animal and at the same time induced the goat to drink large quantities of water. In another goat the preoptic heat loss center had been permanently inactivated by proton irradiation. This animal became adipsic due to the lesion but was seen to continue to eat hay with a seemingly good appetite at body temperatures above 41°C. The anorexic effect of warming the preoptic area thus does not seem to be due to a direct thermal effect on the hypothalamic appetite center. The results provide direct evidence in favor of Brobeck's thermostatic theory of the regulation of food intake and justify the further extension of this theory to involve also the regulation of water intake. (Contractor's abstract)

THE CRYSTAL STRUCTURE OF Pd_3P, by S. Rundqvist and L.-O. Guilman. Jan. 3, 1961 [3]p. incl. table. (Technical note no. 21) (AFOSR-151) (AF 61-(052)40) AD 258416 Unclassified

An x-ray investigation of the Pd-P system was initiated. Preliminary results indicated the apparent existence of at least 4 intermediate phases in the range of 0 to 25 at-%P. The existence of a phase near the composition Pd_3P was confirmed. The homogeneity range determined from alloys quenched from 740°C extended from about $Pd_3P_{0.75}$ to Pd_3P_1. The crystal structure was determined by examination of single-crystals selected from an alloy with the approximate composition $Pd_3P_{0.95}$. The following structural data for $Pd_3P_{0.95}$ were obtained: a = 5.947, b = 7.451, c = 5.170, and U = 229.1A. (Contractor's abstract)

DIPHOSPHIDES OF THE GROUP VIII TRANSITION METALS, by S. Rundqvist. [1961] [3]p. incl. tables,

refs. (Technical note no. 22) (AFOSR-195) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)40 and Swedish State Council for Technical Research) AD 258415 Unclassified

Also published in Acta Chem. Scand., v. 15: 451-453, 1961.

RhP_2, IrP_2, NiP_2, and PdP_2 were synthesized by heating mixtures of metal powder and red phosphorus in evacuated and sealed silica tubes between 800 and 1100°C. Analysis of the x-ray powder patterns indicated that the diffraction lines can be indexed on the basis of monoclinic unit cells. Powder data indicated that RhP_2 and IrP_2 are isostructural. NiP_2 and PdP_2 are also isostructural, and appear to have face-centered unit cells.

2966

Uppsala U. Inst. of Chemistry (Sweden).

THE CRYSTAL STRUCTURE OF Ru_2Si, by B. Aronsson and J. Asellus. [1961] [4]p. incl. tables. (Technical note no. 23) (AFOSR-380) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)40 and Swedish State Council for Technical Research) AD 258414 Unclassified

Also published in Acta Chem. Scand., v. 15: 1571-1574, 1961.

The crystal structure of Ru_2Si has been refined from single crystal data. The unit cell dimensions are a = 5.27_9A, b = 4.00_5A and c = 7.41_8A. The space group is Pnma and the atoms are situated in 4(c) positions with the following atomic parameters: Ru_I: x = 0.8319, z = 0.0650; Ru_{II}: x = 0.9820, z = 0.7119; Si: x = 0.2964, z = 0.1013. Interatomic distances in the isomorphic phases Co_2P, Co_2Si, and Ru_2P and Ru_2Si are discussed. (Contractor's abstract)

2967

Uppsala U. Inst. of Chemistry (Sweden).

THE CRYSTAL STRUCTURE OF Cr_3B_4, by M. Elfström. [1961] [1]p. incl. tables. (Technical note no. 25) (AFOSR-691) (AF 61(052)40) AD 262205 Unclassified

Also published in Acta Chem. Scand., v. 15: 1178, 1961.

Lattice parameters, atomic parameters, and interatomic distances of Cr_3B_4 alloy were investigated. The results of lattice parameter determinations agree with those of Anderson and Kiessling (Acta Chem. Scand., v. 4: 160, 1950). The space group Immm derived by Kiessling in the study of Ta_3B_4 was confirmed. The difference between the 2 shortest nonequivalent boron-boron distances was not significant. Thus, Cr_3B_4 has no abnormally short boron-boron distances as was suggested by Kiessling.

X-RAY INVESTIGATIONS OF THE TERNARY SYSTEM Fe-P-B. SOME FEATURES OF THE SYSTEMS Cr-P-B, Mn-P-B, Co-P-B AND Ni-P-B, by S. Rundqvist. June 17, 1961, 43p. incl. diagrs. tables, refs. (Technical note no. 24) (AFOSR-692) (AF 61-(052)40) AD 262199 Unclassified

Also published in Acta Chem. Scand., v. 16: 1-19, 1962.

The solid region of the Fe-P-B system has been investigated in the range Fe-FeP_2-BP-FeB-Fe by means of x-ray and chemical analyses. The main features of an isothermal section at 1000°C have been determined. Boron substitutes for phosphorus to a large extent in Fe_3P and to a smaller extent in Fe_2P and FeP. Two ternary phases exist, viz. Fe_5PB_2, homogeneous in a relatively narrow composition range, and $Fe_3P_{1-x}B_x$ (denoted ϵ_1), homogeneous in the approximate range $0.48 < x < 1$ at 1000°C. Solid solubility of boron is appreciable in Cr_3P and Mn_3P, but is very restricted in Ni_3P. The ternary phase Mn_5PB_2 is isostructural with Fe_5PB_2. In the Co-P-B system, 3 ternary phases have been found, viz. $Co_3P_{1-x}B_x$, homogeneous in a narrow range near x = 0.7 and isostructural with the ϵ_1 phase in the Fe-P-B system, $Co_3P_{1-y}B_y$, homogeneous in a narrow range near y = 0.5 and isostructural with Fe_3P, and finally Co_5PB_2, isostructural with Fe_5PB_2 and Mn_5PB_2. The crystal structures of Fe_3P, ϵ_1 (with the composition $Fe_3P_{0.37}B_{0.63}$), and Fe_5PB_2 have been determined and refined using single-crystal methods. The space-group of the ϵ_1 structure is $P\,4_2/n$ with 24 iron atoms in 3 sets of eightfold positions. The boron and phosphorus atoms are randomly distributed in 1 eightfold position. The structure is very closely related to that of Fe_3P. Fe_5PB_2 has the Cr_5B_3 ($D\,8_1$)-type structure. The distribution of the boron and phosphorus atoms is essentially ordered. (Contractor's abstract)

Uppsala U. Inst. of Chemistry (Sweden).

THE CRYSTAL STRUCTURES OF TWO THORIUM GERMANIDE PHASES WITH COMPOSITIONS APPROXIMATING TO $Th_{0.9}Ge_2$ AND $ThGe_2$, by A. Brown. Sept. 18, 1961 [23]p. incl. diagrs. tables, refs. (Technical note no. 27) (AFOSR-1384) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)40 and Swedish State Council of Technical Research) AD 272435 Unclassified

Also published in Acta Cryst., v. 15: 652-656, July 1962.

The structure of two germanium-rich thorium germanides have been found to have C-face-centered orthorhombic symmetry. One of the phases represents a new structure type; the second has the C49 ($ZrSi_2$)-type structure, is isostructural with UGe_2 and is probably stoichiometric $ThGe_2$. The first structure can be derived from the second by a simple crystallographic translation of some of the component atoms. The structures are discussed in the light of their close relationship with the anti-C38 (Fe_2As)-type phases $ThAs_2$, $ThSb_2$ and $ThBi_2$ and their similarity to the polymorphs of $ThSi_2$. The first phase is thought to have a defect structure and a composition close to $Th_{0.9}Ge_2$. (Contractor's abstract)

Uppsala U. Inst. of Chemistry (Sweden).

PHOSPHIDES OF THE B (MnP) STRUCTURE TYPE, by S. Rundqvist. Oct. 4, 1961 [14]p. incl. diagr. tables, refs. (Technical note no. 28) (AFOSR-1387) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)40 and Swedish State Council of Technical Research) AD 272328 Unclassified

Also published in Acta Chem. Scand., v. 16: 287-292, Apr. 1962.

The mono-phosphides of Cr, Mn, Fe, Co, W, and Ru crystallize in the B 31 (MnP) structure type. The unit cell dimensions of these phosphides have been measured, and the structures of MnP, FeP and CoP have been determined accurately by single-crystal methods. Some data for unit cell variations accompanying isomorphous substitution are presented and discussed. (Contractor's abstract)

2972

Uppsala U. Inst. of Chemistry (Sweden).

STRUCTURAL FEATURES OF SOME PHASES RELATED TO CEMENTITE, by B. Aronsson and R. Rundqvist. [1961] [10]p. incl. diagrs. tables, refs. (AFOSR-1447) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)40 and Swedish State Council of Technical Research) Unclassified

Also published in Acta Cryst., v. 15: 878-887, Sept. 1962.

Investigations during the last few years have shown that a number of phases, especially borides, of the seventh and eighth group metals are isomorphous with cementite or crystallize in structures closely related to that of cementite. In this paper the recently obtained structural data are summarized and discussed. The influence of the radius ratio on trends in interatomic distances and latttice parameters is particularly considered. On basis of the presented data some general remarks on 'complicated' interstitial phases are also made. (Contractor's abstract)

2973

Uppsala U. Inst. of Chemistry (Sweden).

X-RAY INVESTIGATIONS OF Mn_3P, Mn_2P AND Ni_2P, by S. Rundqvist. Dec. 27, 1961 [16]p. incl. tables, refs. (Technical note no. 30) (AFOSR-1921) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)40 and Swedish State Council of Technical Research) AD 274278 Unclassified

Also published in Acta Chem. Scand., v. 16: 992-998, 1962.

The crystal structures of Mn_3P(Fe_3P type) Mn_2P and Ni_2P (revised C 22 type) were refined by single-crystal methods. Both Mn_2P and Ni_2P have appreciable homogeneity ranges. X-ray power investigations in the Mn-P system indicate that the existence of the phase described as Mn_3P_2 is doubtful. Some phase-analytical data for the MnP system are discussed. (Contractor's abstract)

2974

Uppsala U. Inst. of Chemistry (Sweden).

REFINEMENT OF THE Ni_3P STRUCTURE, by S. Rundqvist, E. Hassler, and L. Lundvik. [1961] [2]p. incl. tables. (AFOSR-1922) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)-40 and Swedish Technical Research Council) Unclassified

Also published in Acta Chem. Scand., v. 16: 242-243, 1962.

Structure data for Ni_3P was obtained by single-crystal

methods. The space group is $I\bar{4}$ ($-S_4^2$); Z = 8. The unit cell dimensions were determined from powder photographs recorded in Guinier-type focusing camera with CuKa and CrKa$_1$ radiation using silicon as the internal calibration standard. The standard derivations for the atomic positions and the interatomic distances are presented in table form.

2975

ON THE CRYSTAL STRUCTURE OF HYDRATED SODIUM PEROXOBORATE, by A. Hansson. [1961] [2]p. incl. diagrs. tables. (AFOSR-J28) (AF 61(052)-40) AD 297174 Unclassified

Also published in Acta Chem. Scand., v. 15: 934-935, 1961.

There is some controversy about the nature of the compound that crystallized from a water solution of sodium borate and hydrogen peroxide. It has been described both as $NaBO_2 . H_2O_2 . 3H_2O$ and as $NaBO_3 . 4H_2O$.

Crystals of the compound were obtained from a solution of 3.5 g borax, 0.35 g NaOH and 9 ml 30% H_2O_2 in 125 ml water. Analyses of the sodium, boron, and active oxygen contents of the crystals were in agreement with the composition given by the above formulae. Weissenberg photographs were taken of 2 single crystals rotated around different axes. Comparison of single crystal photographs and powder photographs established that only 1 substance had crystallized from the solution. The intensities of 500 independent reflections were estimated. The triclinic unit cell contains 1 formula unit $Na_2B_2(O_2)_2-(OH)_4 . 6H_2O$ and has the dimensions a = 7.34A, b = 6.81A, c = 8.15A, with $\alpha = 101°$, $\beta = 110°$ and $\gamma = 120°$. The space group is $P\bar{1}$. The unrefined parameters of Na, O and B atoms, the bond distances within the peroxoborate ion and the bond distances between sodium and oxygen atoms are presented in table form.

Uppsala U. Inst. of Chemistry (Sweden).

THE OCTAHEDRAL COORDINATION IN ADDUCT MOLECULES. BOND LENGTHS AND BOND ANGLES, by C.-I. Brändén, A. Hansson and others. Apr. 20, 1961 [8]p. incl. diagrs. tables. (Technical note no. 13) (AFOSR-476) (AF 61(052)43) AD 265316 Unclassified

The crystal structures $SbCl_5 . POCl_3$ (I), $SbCl_5 . MePO$ (II), $SbCl_5 . Ph_2SO$ (III), $SnCl_4 . 2SeOCl_2$, and $(TiCl_4 . POCl_3)_2$ were determined. Bonds to Cl atoms opposite to donor-acceptor bonds are generally stronger than the other bonds from the acceptor atom to Cl atoms. Bond angles in compounds I, II, and III respectively are O-Sb-Cl, 85, 88, 85°; Cl-Sb-Cl, 90, 90, 90°; Cl-Sb-Cl*, 95, 92, 95° (Cl* is the Cl atom situated opposite to a donor atom). All these deviations from ideal octahedral coordination are due to two steric factors: van der Waals radii of ligand atoms and their distances from the central atom.

Uppsala U. Inst. of Chemistry (Sweden).

THE CRYSTAL STRUCTURE OF $SbCl_5 . SO(C_6H_5)_2$, by A. Hansson and M. Vanngard. Apr. 20, 1961 [15]p. incl. diagrs. tables, refs. (Technical note no. 14) (AFOSR-477) (AF 61(052)43) AD 264819 Unclassified

The crystal structure of $SbCl_5 . SO(C_6H_5)_2$ was determined from 3-dimensional x-ray data. The crystals were prepared from a mixture of a solution of 0.40g $(C_6H_5)_2SO$ dissolved in 30 ml CCl_4 and a solution of 0.25 ml $SbCl_5$ in 30 ml CCl_4. The structure was made up of $SbCl_5 . SO(C_6H_5)_2$ molecules, and coordination around the Sb atom was octahedral. The O and Sb atoms in $(C_6H_5)_2SO$ and $SbCl_5$ functioned as donor and acceptor atoms, respectively. Coordinate, bond angle, and molecular distance data are given. The bond between the O and Sb atoms was weak. The stability of the addition compound was attributed to secondary effects.

THE FIFTH INTERNATIONAL SYMPOSIUM ON FREE RADICALS, Uppsala U., July 6-7, 1961. Stockholm Almqvist and Wiksell [1961] [825]p. incl. diagrs. tables, refs. (AFOSR-1495) (Sponsored jointly by Air Force Office of Scientific Research, Dept. of the Army, and Swedish Ministry of Education) AD 262103 Unclassified

Various aspects of free radicals are discussed. The symposium is divided into the following major categories: free radical reactions at low temperatures, spectroscopic studies on free radicals, electron spin resonance studies on free radicals, properties and reactions of radicals produced by high energy radiation and photochemical studies on free radicals.

HIGH INTENSITY PHOTOLYSIS STUDIES OF ACETONE AND SOME ALIPHATIC ALDEHYDES, by G. Wettermark. [1961] 78p. incl. illus. diagrs. tables, refs. (AFOSR-4288) (AF 61(052)70) Unclassified

Also published in Arkiv Kemi, v. 18: 1-78, 1961.

The vapor phase photolysis of acetone, acetaldehyde,

propionaldehyde, n-butyraldehyde and isobutyraldehyde has been investigated at very high light intensities. It was found that reactions which are first order with respect to radical concentration could be satisfactorily eliminated. This resulted in a striking simplification of the reaction schemes and has led to new information concerning the primary photochemical mechanisms and the reactions of the formed radicals. RESEARCH ON REACTIONS BETWEEN EXCITED MOLECULES AND MOLECULAR FRAGMENTS, by S. Claesson. Annual summary rept. no. 3. Mar. 1, 1960 - Feb. 28, 1961. Mar. 29, 1961 [9]p. (AF 61-(052)70) AD 419223 Unclassified

Reactions between excited molecules and molecular fragments have been studied. The vapor phase photolysis of acetone, acetaldehyde, propionaldehyde, n-butyraldehyde and isobutyraldehyde has been investigated at very high temperatures. A large number of data has been collected from the flash heating studies of benzene, mesitylene, ethylbenzene and phenantrene. Mass spectrographic studies have also been undertaken.

REACTIONS BETWEEN EXCITED MOLECULES AND MOLECULAR FRAGMENTS, by S. Claesson. [1961] [1]p. [AF 61(052)70] Unclassified

Presented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech. Armour Research Foundation, Chicago, Sept. 11-12, 1961. (AFOSR-1417; AD 265513)

High intensity photolysis has been carried out on a number of ketones and aldehydes in vapor phase. Analyses for all the major products formed have been performed by means of gas-chromatography and mass-spectrometry. By using parallel light of high intensity it has also been possible to study the quantum yield as a function of light intensity over a wide range of intensities. The quantum yield shows a pronounced decrease as the light intensity increases. This is certainly due to the fact that long-lived electronically excited molecules are formed which are deactivated to the ground state in collisions between 2 such molecules. From the quantitative analyses of the products the relative importance of the different possible reactions have been calculated. Also a number of relations between the ratio of rate constants for various free radical reactions have been calculated from these data. Furthermore some high intensity pyrolysis work has been performed placing the sample in a quartz capillary directly in the middle of the discharge. From aromatic hydrocarbons the products formed are mainly carbon, hydrogen and hydrocarbons with 1 and 2 carbon atoms.

PENETRATION MATRIX ELEMENTS AND NUCLEAR STRUCTURE EFFECTS IN Tl^{203}, by T. R. Gerholm, B.-G. Pettersson and others. [1961] [19]p. incl. diagrs. tables, refs. [AF 61(052)13] Unclassified

Published in Nuclear Phys., v. 24: 177-195, Apr. 1961. 1961.

Gamma-gamma, electron-gamma and gamma-electron directional correlation experiments on the $d_{5/2}$ (400 kev) $d_{3/2}$ (279 kev)$S_{1/2}$ cascade in Tl^{203} are reported. The following results were obtained: $A_2(\gamma\gamma) = -0.130 \pm 0.006$, $A_2(2\gamma) = -0.011 \pm 0.004$, $A_2(\gamma e) = -0.030 \pm 0.003$. In addition the K-conversion coefficient of the 400 kev transition was determined from the coincidence experiments. The value obtained is $\beta_1 k$ (400 kev) $= 0.145 \pm 0.007$. The experiments were performed in order to search for nuclear structure effects in the M1 internal conversion process. These effects are expected to be negligible in the l-allowed (400 kev) transition. This is confirmed by the experiments which are in perfect agreement with the theory assuming no nuclear structure effects. Large nuclear structure effects are to be expected for the strongly retarded l-forbidden (279 kev) transitions. This is also confirmed by the angular correlation experiments. It is shown that all experimental data are consistent with a λ-value of $+76 \pm 1$, where λ is defined as the ratio of the penetration matrix element and the normal γ ray matrix element. The value for the weighting factor $C(Z, k)$ was taken to be 0.0260. The errors for λ given here do not include the uncertainty in the weighting factor which is supposed to be known to within $\pm$ 10%. The agreement between the theory and the experimental results is further improved if the particle parameters are corrected for the finite size of the nucleus in the E2 conversion process. PENETRATION MATRIX ELEMENTS AND NUCLEAR STRUCTURE EFFECTS IN Tl^{201}, by B.-G. Pettersson, T. R. Gerholm and others. [1961] [27]p. incl. diagrs. tables, refs. (Sponsored jointly by [Air Force Office of Scientific Research under AF 61(052)-13] Swedish Atomic Energy Commission, and Swedish National Research Council) Unclassified

Published in Nuclear Phys., v. 24: 196-222, Apr. 1961.

It is concluded that the present formulation of the theory of internal conversion, including nuclear structure dependent factors, is fully consistent with the experimental data. Experimentally determined penetration matrix elements provide new pieces of information

about the nuclear structure. It is shown that in order to get a unique determination of the λ-parameter it is necessary to determine both the internal conversion coefficient and the electron-gamma angular correlation. (Contractor's abstract, modified)

MAGNETIC AND QUADRUPOLE INTERACTIONS IN Hg^{197m} ANGULAR CORRELATIONS, by B.-G. Pettersson, J. E. Thun, and T. R. Gerholm. [1961] [20]p. incl. diagrs. tables, refs. [AF 61(052)13] Unclassified

Published in Nuclear Phys., v. 24: 223-242, Apr. 1961.

A series of electron-gamma angular correlation studies of the 165 kev-134 kev cascade in Hg^{197m} and the 130 kev-279 kev cascade in the decay-product Au^{197m} are reported. For the Au^{197m} cascade no observable attenuations of the angular correlation pattern were found due to the short lifetime of the intermediate level. In Hg^{197m} the correlation was found to be attenuated by a static quadrupole interaction for carrier-free sources deposited onto different metal and insulator backings. No measurable attenuation due to an interaction with the electron core was seen for metallic source backings. However, an additional attenuation attributed to the after-effects of the conversion-process was found for sources embedded in insulating environments. The interplay between the 2 different types of interaction gives a complicated attenuation mechanism, which, however can be disentangled by means of time-differential angular correlations. A direct proof of the existence of an attenuation-effect due to the excitation of the electron core is furnished by a magnetic decoupling experiment, confirming the results obtained in the correlation experiments. EXPERIMENTAL DETERMINATION OF THE CONVERSION COEFFICIENT OF THE 412 KEV E2 TRANSITION IN Hg^{198}, by B.-G. Pettersson, J. E. Thun, and T. R. Gerholm. [1961] [8]p. incl. table, refs. [AF 61(052)13] Unclassified

Published in Nuclear Phys., v. 24: 243-250, Apr. 1961.

The K-conversion coefficient of the 412 kev transition in Hg^{198} has been measured using a coincidence method. The result obtained $\alpha_K = 0.0305 \pm 0.0010$ is in agreement with the theoretical value for a pure E2 transition as calculated by Rose and by Silv and Band. The authors disagree with recent results obtained by the internal-external conversion method.

PENETRATION MATRIX ELEMENTS AND NUCLEAR STRUCTURE EFFECTS IN Ta^{181}, by Z. Grabowski, B.-G. Pettersson and others. [1961] [18]p. incl. diagrs. tables, refs. [AF 61(052)13] Unclassified

Published in Nuclear Phys., v. 24: 251-268, Apr. 1961.

Gamma-gamma and electron-gamma angular correlations in Ta^{181} are measured. The following results are obtained: $G_2A_2(133\gamma + 137\gamma - 482\gamma) = 0.065 \pm 0.003$, $G_2A_2(137\gamma - 482\gamma) = -0.04 \pm 0.015$, $G_2A_2(133K - 482\gamma) = -0.118 \pm 0.005$, $G_2A_2(137K - 482\gamma) = +0.030 \pm 0.013$, $G_2A_2(133\gamma + 137\gamma - 482K) = -0.005 \pm 0.003$, and $A_2(346\gamma - 136K) = +0.02 \pm 0.01$. The quadrupole attenuation factor G_2 is determined by delayed angular correlations and found to be the same in the gamma-gamma and electron-gamma correlations. The value obtained is $G_2 = 0.22 \pm 0.015$. An independent determination of G_2 gives $G_2 = 0.23 \pm 0.015$. Two conversion coefficients were determined from electron-gamma coincidence data: $\alpha_K(133) = 0.54 \pm 0.08$ and $\alpha_K(482) = 0.026 \pm 0.002$. The results are used to analyze the 482 kev conversion process in terms of nuclear structure dependent conversion matrix elements. The 482 kev transition is of mixed E2/m1 character. The mixing ratio becomes $\delta(482) = 6.4 \pm 0.8$. The M1 conversion process is strongly affected by the penetration terms. The M1 conversion coefficient is about 10 times larger than the normal finite size corrected value. From the conversion coefficient and the angular correlations the parameter λ, defined as the ratio of the penetration matrix element and the normal gamma-ray matrix element, becomes $-70 \geq \lambda \geq -125$. The large λ-value is a consequence of the large retardation of the 482 kev M1 transition. For the strongly retarded 133 kev E2 transition, however, the conversion process is found to be normal. It is concluded that the spin of the 619 kev level is + 5/2 in disagreement with earlier tentative assignments. (Contractor's abstract)

POSSIBLE NUCLEAR STRUCTURE EFFECTS IN Lu^{175}, by J. E. Thun, Z. Grabowski and others. [1961] [12]p. incl. diagrs. refs. [AF 61(052)13] Unclassified

Published in Nuclear Phys., v. 29: 1-12, Jan. 1962.

Electron-gamma, gamma-electron and gamma-gamma angular correlations in Lu^{175} have been measured. The following results were obtained: $A_2(282\gamma - 114\gamma) =$

0.240 ± 0.004, $A_2(282\gamma\text{-}114K) = 0.02 \pm 0.01$, $A_2(282K\text{-}114\gamma) = 0.015 \pm 0.030$. No perturbation, due to quadrupole interaction, was found. The following conversion coefficients were determined from coincidence and single counting rates: $\alpha_K(114) = 1.6 \pm 0.3$; $\alpha_K(282) = 0.030 \pm 0.007$. The result of the 282K-114γ angular correlation measurement is greatly diminished from normal. This may be understood in terms of the presence of penetration matrix elements in the conversion process of the retarded 282 kev E1 + M2 transition. The measured K-conversion coefficients show no deviation from the tabulated values. (Contractor's abstract)

ANGULAR CORRELATION AND RESONANT SCATTERING IN Sn^{117}, by W. D. Hamilton, Z. Grabowski and others. [1961] [12]p. incl. diagrs. refs. [AF 61-(052)13] Unclassified

Published in Nuclear Phys., v. 29: 21-32, Jan. 1962.

Electron-gamma and gamma-gamma correlation measurements have been made of the decay cascade in Sn^{117m}. The following correlation coefficients were determined: $A_2(159\gamma\text{-}161\gamma) = -0.146 \pm 0.010$, $A_2(159K\text{-}161\gamma) = -0.160 \pm 0.008$. These confirm the M4 (159 kev) and M1 (161 kev) multipolarities, and indicate that both transitions are essentially pure. The resonant scattering condition for the 161 kev γ-ray was provided by the thermal method. Matched Sn and Cd scatterers were used and the resonant cross-section was determined relative to that for Rayleigh scattering. The total mean-life of the 161 kev level has the value $\tau = (1.6 \pm 0.5) \times 10^{-10}$ sec, and corresponds to a hindrance factor of 24 ± 8 for the l-forbidden M1 transition. DECAY OF Sm^{153} TO Eu^{153}, by T. Suter, P. Reyes-Suter and others. [1961] [33]p. incl. diagrs. tables, refs. [AF 61(052)13] Unclassified

Published in Nuclear Phys., v. 29: 33-65, Jan. 1962.

The decay of Sm^{153} to Eu^{153} has been investigated by means of an iron yoke double focusing spectrometer, gamma-gamma and electron-gamma coincidence spectrometers. A precision measurement of the 69.672 kev line has been performed with an iron-free double focusing spectrometer. Internal conversion lines and photo-electric lines of the following transitions have been measured and their energies determined with a precision of a few parts in 10^4: 69.672; 75.34; 83.37; 89.47; 97.45; 103.174; ~ 104.8; 172.85 kev. Conversion electron and gamma intensities, multipolarities, mixing ratios and conversion coefficients are given. Using the photo-electron method, 16 other weak transitions were measured with a resolution of 0.5% to 0.25%: 151.5; 411.5; 424.3; 437.7; 449.7; 463.6; 521.3; 531.4; 533.2; 539.1; 555.2; 578.6; 596.9; 603.1; 609.1; 636.0 kev. Difficulties in the computations of intensities of low energy γ-rays from external conversion measurements are briefly discussed. A decay scheme is proposed on the basis of the energy data and a quantitative analysis of the gamma-gamma and electron-gamma coincidences. Excited levels at the following energies have been established: 83.37; 97.45; 103.17; 172.85; (191 4); 634.6; 636.4; (694.3); (706.4) kev. (Contractor's abstract)

DIRECT MEASUREMENTS OF CONVERSION LINES IN THE EV SCALE (Abstract), by S. Hagström, C. Nordling, and K. Siegbahn. [1961] [1]p. [AF EOAR-62-123] Unclassified

Presented at the Eleventh General Physics Conf., Lund U. (Sweden), June 2-4, 1961.

Published in Arkiv Fysik, v. 22: 408, 1962.

The calibration lines used in beta- and electron-spectroscopy are in some way or other related to x-ray spectroscopy measurements and thus founded on the x-unit. A suitable calibration line with its energy known directly in electron volts has been obtained by accelerating thermionic electrons through a very well-defined electric potential. The B_e-resolution of this thermionic electron line is 2×10^{-4} with an accelerating voltage of about 3 kv. The absolute value of this voltage is known with high accuracy. Some preliminary calibration measurements on conversion lines in the ThB spectrum have been made. The thermionic current can be adjusted to give a counting rate appropriate for GM detection which means that all geometric parameters can be kept the same in both types of measurement.

PRECISION MEASUREMENTS OF AUGER LINES AND L LEVEL ENERGIES IN THE ELEMENTS Sr^{38} Ag^{47} (Abstract), by C. Hörnfeldt and A. Fahlman. [1961] [1]p. [AF EOAR-62-123] Unclassified

Presented at the Eleventh General Physics Conf., Lund U. (Sweden), June 2-4, 1961.

Published in Arkiv Fysik, v. 22: 412, 1962.

The energies of the KLL Auger lines of Sr^{38} and Mo^{42} have been determined. For both elements, 7 components could be established in the KLL group. The energy of the strongest line, due to the $KL_{II}L_{III}$ transition, has further been determined in the elements Y^{39} - Nb^{41} and Ru^{44} - Ag^{47}. The experimental data concerning the absolute energies deviate systematically by 59-75 ev from those predicted by Asaad and Burhop, which may be attributed to neglect of relativity in the theory. The relative energies are in good agreement. Further, the L_I, L_{II} and L_{III} level energies in the same elements have been measured with the photo electron method. Only a minority of the corresponding x-ray absorption edges for pure metals have been observed and a comparison shows some discrepancies. (Contractor's abstract)

APPLICATION OF THE PHOTOELECTRON METHOD TO A STUDY OF THE FUNDAMENTAL CONSTANT COMBINATION h/e (Abstract), by C. Nordling, S. Hagström, and K. Siegbahn. [1961] [1]p. [AF EOAR-62-123] Unclassified

Presented at the Eleventh General Physics Conf., Lund U. (Sweden), June 2-4, 1961.

Published in Arkiv Fysik, v. 22: 428, 1962.

Experimental determinations of the fundamental constant combination h/e have previously been made from studies of the x-ray short-wavelength limit. These measurements yield values of h/e which are at variance with the value obtained from a least squares adjustment of the atomic constants. Preliminary results obtained with a new method for the determination of h/e are presented. The principle of the method is as follows. Two conversion lines are recorded in a beta-spectrometer. An earthed electrode is placed in front of the source and an electrical potential can be given to the source. This will shift the position of both electron lines, and for a certain value of the applied potential the low-energy line coincides with the former position of the high-energy line. In this way the energy difference between the electron lines can be measured in the ev scale. If, for instance, the 2 electron lines involved are due to photoelectric effect of x-rays in 2 different shells of an element, the energy difference between the lines can be obtained from x-ray spectroscopy data in terms of frequency. Equating the energy difference, measured in electron volts, to the corresponding energy in units of hv gives h/e.

OSCILLATORY ELECTROPHORESIS IN ION EXCHANGE MEMBRANES, by T. Teorell. [1961] [8]p. incl. diagrs. refs. (AFOSR-3451) (AF 61(052)363) Unclassified

Also published in Arkiv Kemi, v. 18: 401-408, 1961.

Experiments with electrophoresis of a homogeneous electrolyte solution across a bed (membrane) of ion exchange gels show, under appropriate conditions, oscillatory variations, with time, of voltage resistance and electro-osmotic bulk flow. A tentative discussion is given in terms of the author's earlier theories for the membrane oscillator which suggest how the electrolyte/membrane system can develop negative conductances and hence instability and oscillations. This type of oscillation may be relevant to the excitability phenomena exhibited by living tissues such as the nerves. (Contractor's abstract)

AN ANALYSIS OF THE CURRENT-VOLTAGE RELATIONSHIP IN EXCITABLE NITELLA CELLS, by T. Tecrell. [1961] [6]p. incl. diagrs. refs. (AFOSR-3452) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)363, Swedish Cancer Association, and Swedish Medical Research Council) Unclassified

Also published in Acta Physiol. Scand., v. 53: 1-6, 1961.

Experiments were performed on cells of the fresh water algae Nitella using triangular waves of varying frequencies, i.e. depolarizing-hyperpolarizing currents with varying, linear slopes. With very low frequencies one obtains steady state rectification curves, but with intermediate frequencies instability phenomena are revealed. The experimental findings of dynamic current-voltage characteristics are compared with the theoretical results, which can be predicted from the author's electrohydraulic hypothesis for excitability phenomena. It is suggested that electro-osmotic processes, arising from presence of membrane fixed charges, may play a part in the excitability of Nitella. (Contractor's abstract)

EXCITABILITY PHENOMENA IN ARTIFICIAL

MEMBRANES, by T. Teorell. [1961] [26]p. incl. illus. diagrs. table, refs. (AFOSR-J177) (AF 61(052)-363) AD 400430 Unclassified

Presented at Internat'l. Biophysics Cong., Symposium on Molecular Aspects of Viral Replication, Stockholm (Sweden), July 31-Aug. 4, 1961.

Also published in Biophys. Jour., v. 2: 27-52, Mar. 1962. (Supplement)

A wet physicochemical system is described which is designed to represent the cell conditions and exhibits excitability that is like many of the physiological events. This report deals with electrolyte solution separated by a boundary, the membrane, which includes a feature, which is of importance, namely the presence of immobile or fixed ionic groups in the porous matrix. The system can be supplied with energy, and can be stimulated by an electric current. This analog is also sensitive to pressure stimuli and may offer some viewpoints of another important physiological problem, namely the mechano-electrical transduction.

IGNITION AND COMBUSTION OF SOLID PROPELLANTS, by R. C. Mitchell, J. A. Keller and others. Final technical rept. Mar. 1957-Sept. 30, 1961 [77]p. incl. illus. diagrs. tables, refs. (AFOSR-2225) (AF 49(638)170) AD 274624 Unclassified

The response was studied of propellant ignition to externally supplied heat flux. Both radiant flux from electrically heated tube furnaces and convective flux from shock-heated gas were employed, the former giving fluxes in the range 5 to 50, the latter, 100 to 300 Btu/sec., sq. ft. The results, ignition delay time as a function of heat flux are correlated. The theory predicts the effect of initial propellant temperature on the ignition time-heat flux relationship, but is noncommittal with respect to the effect of pressure. The effect of pressure on the ignition delay time of perchlorate propellants is a function of heat flux level, being very slight, for the propellants studied, at flux levels above 20 Btu/sec., sq. ft. Exploratory studies concerned flame spread, effects of aerodynamic transients on burning propellant, and the diffusion flame between large bodies of fuel and oxidant. One firm conclusion is that flame spread across fresh surface, unassisted by external heat flux to that surface, is too slow to be an important factor in the over-all ignition process. As one aspect of the aerodynamic transient studies, a theory of the rarefaction tube was developed. (Contractor's abstract)

IGNITION OF COMPOSITE PROPELLANTS (Abstract), by N. W. Ryan. [1961] [1]p. [AF 49(638)170] Unclassified

Presented at Third AFOSR Contractors' meeting on Combustion of Solid Propellants, Utah U., Salt Lake City, Jan. 30-31, 1961. (AFOSR-986)

Ignition of composite propellants by high-flux convective heating with shock-heated gases has been extended to higher flux levels (300 plus Btu/(hr, sq ft, deg F)) and shorter ignition times than previously reported from this project. The increase in range has been achieved by increasing gas velocities to a level such that stable ignition cannot be attained with propellants that are intrinsically difficult to ignite. A detailed study of heat flux under the conditions employed has been necessary. Computer programs have been written for the tedious parts of the calculations. Burning strands 1/2 in. in diameter have been subjected to rarefaction waves of controlled strength, the burning surface being observed by a photocell. There is no evidence that there is a critical rarefaction strength. Generalizations, based on tests with 3 propellants, are (1) the most easily ignited propellants recover most rapidly from the quenching effects of the rarefactions, and (2) the property of the rarefaction determining the response of a given propellant is the fractional pressure drop. Close-up, high-speed photography of the burning surface of metallized propellant shows that when present in a concentration of only 2%, the aluminum particles burst while still on the surface. When present at 16%, the particles are carried away from the surface before they burst. To the present, such observations have been made only for burning at atmospheric pressure. A program of chemical arc study, in which large bodies of fuel and oxidizer are brought together and the diffusion flame between them observed has been begun. Exploratory tests indicate that the diffusion flame can be established in a steady state.

THE ANOMALOUS BEHAVIOR OF LEAD-TO-LEAD IMPACT, by H. B. Vanfleet, W. S. Partridge, and E. T. Cannon. [1958] [25]p. incl. illus. diagrs. table. (AF 49(638)462) Unclassified

Published in Proc. Third Symposium of Hypervelocity Impact, Chicago, Ill. (Oct. 7-9, 1958), v. 1: 115-139, Feb. 1959.

Results indicate that over a limited energy range of lead-to-lead impact a linear relationship between crater volume and impact energy seems to apply, but that over a larger range of energy the relationship seems to be $V = V_0(1-e^{-CE})$. The area of the crater in the surface of the target is linearly related to the area and the volume per unit area is linearly related to the penetration or depth of the crater. The extrapolation of these relationships to high energy leads to craters which are large in area but shallow in depth. The volume and energy relationship noticed in lead-to-lead impact is also observed where spheres of other materials are impacted into lead. (Contractor's abstract)

HIGH VELOCITY IMPACT STUDIES, by R. W. Grow. Final rept. Oct. 31, 1961, 14p. incl. refs. (Technical rept. no. 24) (AFOSR-1937) (AF 49(638)462) AD 271470 Unclassified

Various aspects of the field of high velocity impact are studied. Topics covered are: impact-flash and spray-particle investigations, spectral analysis, impact of copper spheres into copper targets, meteor physics, light-gas gun development, electrostatic acceleration of small particles, and impact and cratering investigations on steel and aluminum in space.

PRECISION MEASUREMENT OF LEAD-TO-LEAD IMPACT, by C.-h. Chiou, R. W. Grow, and E. P. Palmer. Oct. 31, 1961, 67p. incl. illus. diagrs. tables, refs. (Technical rept. no. 23) (AFOSR-1938) (AF 49(638)462) AD 270009 Unclassified

Lead spheres having a diameter of 3/16 in. were impacted normally upon lead targets at different temperatures. The volume, area, and depth of resulting craters were measured and plotted as a function of either the pellet impacting energy, the pellet momentum, or the pellet velocity. Two sets of experiments were performed. The original results that V/E decreases with the increase of pellet velocity and the later results that crater depth is proportional to the 2/3 power of pellet velocity contradict each other. But the fact that the decrease of V/E at high velocities is less at high temperatures and thus the volume vs energy plot tends to be a straight line show that the contradiction is probably caused by measurement error. The error is greater for high velocities and low target temperatures. A relationship was found to exist between the initial V/E and the target temperature. A linear relationship between the crater area and the pellet momentum was found to exist. (Contractor's abstract)

A LABORATORY INVESTIGATION OF METEOR PHYSICS, by J. R. Jensen and E. P. Palmer. Oct. 15, 1961, 57p. incl. illus. diagrs. tables, refs. (Technical rept. no. 22) (AFOSR-1939) (AF 49(638)-462) AD 270181 Unclassified

Equations of motion for a single particle traveling in a constant density atmosphere are derived. The aerodynamic drag on the particle and the atmosphere-particle energy transfer resulting in loss of particle mass are considered. It is assumed as an initial condition that steady-state ablation is occurring. Emphasis is placed on determining particle size and absolute luminosity from measurements of distance versus time. Micron-size particles, which travel at velocities in lower meteor range of 10 to 20 km/sec, are produced by impact of spherical steel pellets on a steel target. The leading edge of a cloud of particles was detected and velocities to 15 km/sec were measured. By applying the theory to deceleration measurements, the size of the particles was estimated at approximately 1.0 micron diameter. An improved vacuum firing range was designed to correct for the vacuum and size limitations. An experiment is proposed to utilize the improved system to detect and measure individual particles. Data from the experiments can be compared with theory and the results applied directly to determine in detail the physical phenomena occurring in meteor flight. (Contractor's abstract)

CHARGING, INITIAL ACCELERATION AND DETECTION OF MICRON DIAMETER PARTICLES, by E. P. Palmer, D. R. Harrison, and R. W. Grow. Dec. 5, 1961 [34]p. incl. diagrs. refs. (Technical rept. no. 21) 21) (AFOSR-1940) (AF 49(638)462) AD 270047 Unclassified

One method by which small particles may be accelerated to high-velocities is to charge the particles electrically and then accelerate them through a high voltage such as that produced by a Van de Graaff generator. Besides producing a high voltage, the chief problems met in electrostatic acceleration are those concerned with handling the particles, placing a charge on them, maximizing their charge-to-mass ratio and measuring particle size and velocity. A system to solve these problems is developed. A measure of the over-all effectiveness of the charging system is given by the particle charge-to-mass ratio since this determines the velocity which can be attained. It was found that for carbonyl-iron spheres of 0.2 to 1.1-micron radius, the attainable charge to mass ratio is given by the expression 6.13×10^6 quantity divided by r, where q is charge, m is mass and r is particle radius. M.K.S. units are used. It is believed that this represents close to the practical maximum value attainable using contact charging and that the limit is imposed by electrical stresses in the particle surface causing surface disruption and ion emission. MICROSECOND FRAMING CAMERA OBSERVATIONS OF HIGH VELOCITY, by M. A. Cook and R. T. Keyes. [1958] [27]p. incl. illus. diagrs. table, refs. (AF 18-(603)100) Unclassified

Published in Proc. Third Symposium on Hypervelocity Impact, Chicago, Ill. (Oct. 7-9, 1958), v. 1: 5-31, Feb. 1959.

This paper describes results of high speed photographic studies of cratering, the primary objectives being to look for possible explosions of targets and projectiles in ultra-high velocity impact, and to determine, if possible, the conditions under which these explosions occurred in various metals. In addition, ablation was studied qualitatively by observing characteristics of the wakes from the ultra-high-speed projectiles in various gaseous media. Also some observations of penetration of high speed jets into lucite are described showing the relationships between the penetration and the shocks produced in the type c range of penetration. Finally a correlation between theoretical and experimental hole volumes in cratering in the high velocity (plastic deformation) range is presented.

THE EFFECT OF PRESSURE ON IONIZATION IN GASEOUS DETONATION, by M. A. Cook, P. P. Bracke, and R. T. Keyes. Mar. 31, 1961, 30p. incl. diagrs. tables. (AFOSR-704) (AF 18(603)100) AD 258247 Unclassified

Electrical conduction measurements within detonation waves in the gaseous systems, $2H_2 - O_2 - 0.002\ N_2$, $2H_2 - O_2 - N_2$, and $2CO - O_2$ were carried out over a range of detonation pressures up to 340 atm in order to determine the effect of pressure on ion density. Experimentally determined conductivities were compared with theoretical values. In the case of the $2H_2 - O_2 - 0.002\ N_2$ and $2H_2 - O_2 - N_2$ systems theory and experiment were found to agree at low pressure. However, a relatively abrupt rise with pressure of the experimental values above the theoretical ones occurred at about 20 atm and 50 atm for the $2H_2$-O_2-$0.002\ N_2$ and the $2H_2$-O_2-N_2 systems, respectively. This rise was not noted in the $2CO$-O_2 system. Two explanations for the excess ionization at high pressures in the $2H_2$-O_2-N_2 systems were investigated, the first being the increased predominance of H_3O^+ as pressure is increased, and the second was based on the assumption of a tendency toward existence of ions in a quasi-lattice structure in the detonation wave which leads to a cohesive energy for the ions and the electrons that increases with ion density. The existence of a significant cohesive energy in turn leads to a decreased effective ionization potential. Increased predominance of H_3O^+ formation proved unable to account for the experimental results. However, the conductivity vs pressure results were reproduced satisfactorily by the quasi-lattice mechanism. (Contractor's abstract)

IONIZATION WAVES FROM FREE SURFACES OF DETONATING EXPLOSIVES, by A. Bauer, M. A. Cook, and L. A. Rogers. Sept. 7, 1961 [41]p. incl. illus. diagrs. tables, refs. (AFOSR-1335) (AF 18-(603)100) AD 266788 Unclassified

Presented at the Western States Section of the Combustion Inst., Berkeley, Calif., Sept. 7-8, 1961.

Ionization waves ejected from the free surface of condensed high explosives in various gaseous media at ambient about (645 mm) and 0.5 mm Hg pressures are described. Framing camera and streak camera photographs correlated with electrical conduction measurements showed a highly ionized, either highly luminous or completely transparent, precursor wave led both the shock wave and the main products of detonation propagated from the free surface. At 0.5 mm

Hg this wave was transparent and non-luminous, but it always produced a burst of luminosity upon collision with the endplate of the vacuum chamber several microseconds before the opaque detonation products impacted the end plate. Measured ionization wave pressures were in general several times greater than the pressures computed by shock wave theory for the observed velocity and initial pressure and up to 20 times greater than for the shock computed by the impedance mismatch equation. The waves from the explosive free surface appear to be highly ionized material radiated from the free surface of the explosive. (Contractor's abstract)

EFFECTS OF EDGE MATERIAL ON WIDE ANGLE DIFFRACTION, by G. R. Orme. June 1961 [64]p. incl. illus. diagrs. tables, refs. (AFOSR-822) (AF 49-(638)799) AD 260251 Unclassified

Precision photometric traces of light diffracted 70° into the shadow region were made for 4 different diffracting edges. Two of the half planes were gold plated, 1 silver plated and 1 copper plated. Light of wavelengths 4358A or 5461A was normally incident on the edge for all cases. Intensity traces as a function of diffracting angle were made for light polarized perpendicularly and parallel to the edge for both wave-lengths. The distance from the edge to the photometer was 19.5 cm. The diffracted light was measured by a liquid-nitrogen-cooled 1P21 electron photomultiplier photometer. A new solid state amplifier system was used to lend high stability to the measurements taken. Although experimental conditions do not rigorously satisfy Sommerfeld boundary conditions, comparison is made with Sommerfeld theory to show in general how the patterns for the different metals vary. The light intensity ranged over 10^9 part of that observed at the geometrical shadow. In general the traces agree to within an order of magnitude with Sommerfeld theory. The different metals and wavelengths exhibit a pronounced effect on the intensity distribution and polarization of the light diffracted into the shadow region. (Contractor's abstract)

THE KINETICS OF THE PYROLYSIS OF CARBON MONOXIDE BORANE, by Y.-C. Fu and G. R. Hill. [1961] [5]p. incl. diagrs. tables. (AFOSR-1212) (AF 49(638)28) AD 456585 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 353-357, Feb. 5, 1962.

An infrared spectrometer study was carried out on the decomposition of carbon monoxide borane in a heated infrared cell. The concentration of each component, carbon monoxide borane and diborane, was followed by means of infrared spectrometric analysis, and the total pressure change was followed simultaneously by means of a pressure transducer attached to the heating cell. The effects of surface, photolysis by the infrared beam, the presence of diborane and the addition of carbon monoxide and hydrogen on the rate of the decomposition were observed. A mechanism for the decomposition of carbon monoxide borane is proposed. This mechanism involves as the slow step, $OCBH_3 \rightarrow BH_3 + CO$, and the equilibrium $BH_3 + BH_3 = B_2H_6$ is followed by the relatively rapid reactions $BH_3 + CO \rightarrow OCBH_3$ and $BH_3 + OCBH_3 \rightarrow B_2H_6 + CO$. The disappearance of $OCBH_3$ is expressed by the rate equation

$\frac{-d(OCBH_3)}{dt} = \frac{2k_1(OCBH_3)^2}{(CO) + (OCBH_3)}$. This is confirmed by linear second order plots with the slopes inversely proportional to the sum of the existing $OCBH_3$ and CO pressures (constant for a given run) at 54 to 64°C.

Small amounts of hydrogen and higher boron hydrides are also formed as the result of the decomposition. The intial first order rate constant for the decomposition of $OCBH_3$ is expressed by the Eyring absolute rate equation $k' = 1.25 \times 10^{12} T \exp(-28,400/RT) \exp(10.2/R)$ min.$^{-1}$. ON THE PARITY NONCONSERVATION INDUCED BY THE UNIVERSAL FERMI INTERACTIONS IN THE PION-NUCLEON VERTEX, by D. Flamm and P. G. O. Freund. May 10, 1961, 12p. incl. diagrs. refs. (Scientific note no. 9) (AFOSR-854) (AF 61(052)265) AD 264840 Unclassified

Also published in Phys. Rev., v. 125: 385-387, Jan. 1, 1962.

The problem whether the interpretation of strong interactions as high energy effects of the Universal Fermi Interactions (UFI) is consistent with experimental evidence on parity conservation in low energy nuclear physics is investigated. The parity non-conserving part of the one nucleon off shell pi-N vertex, which originates in the UFI (which we consider smeared out with a heavy vector boson of such a mass, that they bind an extreme relativistic nucleon-antinucleon pair into a pion) of the nucleons, is evaluated using dispersion methods and is found to have a relative magnitude of order 1/100,000 10-5 when compared with the parity conserving part. This yields a parity non-conserving pi-N scattering amplitude of the same relative order of magnitude, a result which does not contradict the existing experimental data.

SYMMETRIES IN QUANTUM FIELD THEORIES, by W. [E.] Thirring, C. Villi, and J. Wess. Nov. 1961, 54p. incl. refs. (Scientific note no. 10) (AFOSR-1886) (AF 61(052)265) AD 272169 Unclassified

There is a great deal of work on symmetries and conservation laws in field theory. Although much of it differs by language and method most of it is identical or equivalent to the original paper by E. Noether. Noether's results were generalized by Schwinger to quantum field theory. The first 2 sections of this paper deal with this formal background. We also discuss what consequences can be derived from the parts of the invariance group which are not continuously connected with unity and for which the methods of Noether and Schwinger do not directly apply. This formalism is illustrated. The groups usually considered fall in 2 categories, those which involve space-time transformations and those which transform only field components belonging to the same

space-time point. Of the former we discuss from our point of view the Galilei-, the Lorentz- and the conformal group. Our general procedure is directly applicable to all 3 examples.

HIGH ENERGY PHYSICS, by W. [E.] Thirring. Annual rept. July 1, 1960 - June 30, 1961, 3p. (Technical rept. no. 4) (AFOSR-1043) (AF 61(052)-433) AD 262129 Unclassified

The results obtained under this contract to date are briefly reviewed. The search for elastic scattering events has been carried on and finished. All 2 prong stars have been measured. A rough estimate of the differential cross-section has been made. Concerning the ICEF-program a cascade found in 1 part of the stack has been measured and calculated. The primary particle was a boron nucleus with an energy of 1.7×10^{12} ev/nucleon. It induced a jet of the type (20 + 193) hp. The Castagnoli energy of this event has been calculated and a Walker-Duller plot drawn. Two secondary events in the inner core of type (0 + 7) p and (22 + 8) n have been evaluated also. The work on the projector was started in March. 2700 pictures of 16 bev π^- in a 30 cm hydrogen bubble chamber have been scanned, and evaluated. About 356 events have been found. This gives an interaction mean free path of $(1.05 \pm 0.07) \times 10^3$ cm and a total cross-section of (27.2 ± 2.2) mb for pion-proton interactions. The mean multiplicity of the shower particles turned out to be $n_s = 3.7 \pm 0.5$.

STUDIES OF ANTIOXIDANTS AND INHIBITION MECHANISMS AT ELEVATED TEMPERATURES, by J. W. Cole, Jr. Apr. 25, 1961, 73p. incl. diagrs. tables, refs. (AFOSR-554) (AF 18(603)103) AD 260345 Unclassified

A study was made of the behavior of some antioxidants and corrosion inhibitors in di(2-ethylhexyl) sebacate under oxidizing conditions at 204°C alone and in the presence of metallic Cu and Cu compounds. Considerable attention was given to kinetic-mechanistic studies with phenothiazine and its derivatives, with phenothiazines containing radioactive S-35 and with N-C-14-methyl phenothiazine. Oxidations with some amines and pyridine derivatives, especially the dipyridylamines were also studied. The presence of Cu and certain Cu compounds enhanced the oxidation inhibiting properties of the additives. Metal coordination complexes appear to be a factor in the mechanism. The syntheses and behavior of 27 new compounds are described.

COMPRESSIBILITY AND UNIFORM CONVERGENCE, by G. T. Whyburn. [1961] [5]p. (AFOSR-3239) (AF 49(638)72) AD 456581 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 47: 1843-1847, Nov. 1961.

Various conditions are given for a sequency of maps $f_n: X \to Y$ to converge uniformly to a map $f: X \to Y$. With terminology as in Whyburn's Analytic Topology (American Mathematical Society, Colloquium Publication, v. 28: 1942) one sufficient condition follows: Let X be a simple closed curve and Y a boundary curve, and let the sequence of non-alternating mappings $f(X)_n = Y_n \subset Y$ converge point-wise on an everywhere dense set in X to a mapping $f(X) = Y' \subset Y$ and suppose the sets Y_n converge 0-regularly to Y'. Then $f_n \to f$ uniformly on X. Applications to functions harmonic on a disk are discussed.

ANGULAR DISTRIBUTION OF FAST PHOTONEUTRONS, by G. C. Reinhardt and W. D. Whitehead. [1961] [14]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)176] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II. v. 6: 251, Apr. 24, 1961.

Also published in Nuclear Phys., v. 30: 201-214, Feb. 1962.

The angular distribution of photoneutrons with energies above the ($Si^{28}n, p\ Al^{28}$) threshold has been measured for several elements between yttrium and bismuth. Neutrons were detected at nine angles from 30° to 150° by cylindrical containers holding 50 g of pure silicon, and the 2.54-min Al^{28} activity was measured with geiger counters. Angular distributions were anisotropic and showed marked forward asymmetry. A least squares fit of the data to curves of the type $A + B \sin^2\theta + C \cos\theta$ showed B somewhat smaller and C larger than values determined at bremsstrahlung energies lower than 55 mev. There is evidence in support of previously reported peaking of the ratio B/A at N = 82 and 126. (Contractor's abstract)

IONIZATION YIELD OF LOW-ENERGY HEAVY IONS IN ARGON, by J. A. Phipps, R. A. Lowry, and J. W. Boring. Final rept. Feb. 1961, 29p. incl. illus. diagrs. tables. (Rept. no. EP-4419-106-61U) (AFOSR-202) (AF 49(638)22) AD 251199; PB 154734 Unclassified

A cylindrical ionization chamber with a differentially pumped open window has been used to measure the total ionization yield of low energy heavy ions stopped in argon gas. Measurements have been made in the energy range 8-100 kev for hydrogen, helium, carbon, nitrogen, oxygen, and argon ions. The average energy loss per ion pairs ranges from 26.8 ev/ip for 50 kev hydrogen ions to 91.8 ev/ip for 25 kev argon ions. A comparison of the ionization yields in argon of various ions having velocities in the same region is presented. (Contractor's abstract)

ON A METHOD FOR MEASURING THE BASE PRESSURE. MEASUREMENT AND VISUALIZATION ON A

CONE CYLINDER MAGNETICALLY SUSPENDED AT M_o = 7.6, by G. Dubois and C. Rouge, tr. by R. N. Zapata. May 1961 [30]p. incl. illus. diagrs. tables, refs. (Rept. no. AST-4443-102-61U) (AFOSR-1020) [AF 49(638)1022] AD 260634 Unclassified

Also published in Recherche Aeronaut., v. 79: 35-44, Nov.-Dec. 1960.

This paper is concerned with a method for measuring the base pressure of an axially symmetrical body. This method avoids material supports through the use of the magnetic suspension O. N. E. R. A. for keeping the model on the axis of the stream at the test section. Thus, the base pressure is measured, with no interactions, by means of an optical manometer located inside the model. At the same time, the flow can be visualized by a schlieren system. This paper specifies the conditions required for the applicability of the method, analyzes the precision of the measurements, discusses the results obtained with and without sting, and compares them to those previously obtained at lower Mach numbers.

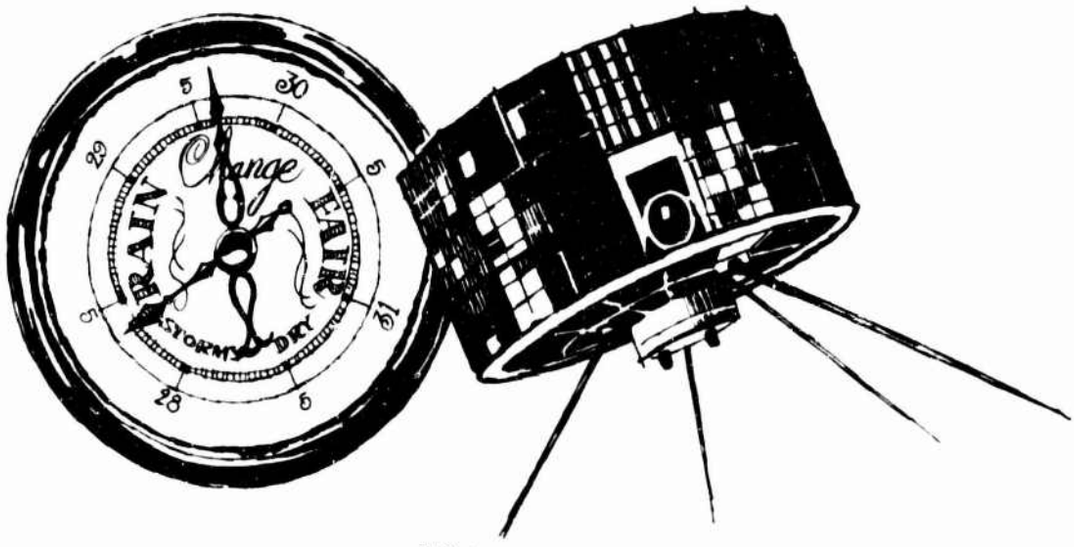
CONTINUOUS ACCELERATION OF PLASMA GENERATED BY THE HIGH-INTENSITY ARC, by C. Sheer, J. A. Cooney and others. Sept. 29, 1961 [84]p. incl. illus. diagrs. refs. (Technical rept. VL-2120-12-0) (AFOSR-1517) (AF 49(638)329) AD 267866 Unclassified



A plasma propulsion system concept is proposed featuring the vaporization of a solid plasma propellant in a high-intensity arc to generate a refractory vapor jet in the maximum field region of a magnetic nozzle. Acceleration of the vapor plasma jet occurs as a result of its interaction with a diverging magnetic field. The theoretical work reviews the single particle case, and proposes a method for developing the more applicable continuum model. The single-particle approach provides a rational model for the conversion of plasma enthalpy into jet kinetic energy by means of the diverging magnetic field. The experimental work concerned design, construction and operation of an accelerator facility to prove the basic technique. Carbon is used exclusively as the propellant. The operational feasibility of the system is proven. The most significant finding is the strong dependence of specific impulse on ambient pressure. Although the maximum I_{sp} obtained is 300 sec at 4 microns pressure, the shape of the Specific Impulse vs pressure curve indicates values in the range of 1,000 to 3,000 sec are obtainable in the high vacuum of outer space.

ENERGY EXCHANGE IN THE HIGH-INTENSITY ARC PLASMA, by C. Sheer, J. A. Cooney and others. June 16, 1961, 195p. incl. illus. diagrs. tables, refs. (Technical note no. 1) (AFOSR-860) (AF 49(638)477) AD 266847 Unclassified

Arc phenomena are discussed for the purpose of orientation and definition. Emphasis is placed on the distinction between low-intensity and high-intensity modes of arc operation. Following the preliminary discussion, the fundamental premises for the concept of a fluid transpiration arc are laid down. This concept relates to an arc discharge subject to the forced convection of a fluid medium, but differentiated from other systems of this type by the fact that the fluid is injected into the arc conduction zone via the anodic terminus through a porous anode structure. The postulated effectiveness criteria for this technique of arc heating require (1) that the average pore size be less than the anode fall space thickness, (2) that the transpiration surface be integrally congruent with the anodic discharge boundary, and (3) that the injected gas particle flux density have the same order of magnitude as the opposing drift electron flux density within the anode sheath region. A 2-phase experimental program is described, the first being concerned with the validation of the basic concept and the second with a study of intrinsic characteristics.

ATTEMPTS TO DETECT LYCOPERSENE IN CAROTENOGENIC SYSTEMS (Abstract), by B. H. Davies, T. W. Goodwin, and E. I. Mercer. [1961] [1]p. (AFOSR-3407) (AF 61(052)355) Unclassified

Presented at the 409th meeting of the Biochem. Soc., London (Gt. Brit)., Oct. 6-7, 1961.

Also published in Biochem. Jour., v. 81: 40P, 1961.

In the biosynthesis of triterpenes, isoprene units are built up to form the C_{30} precursor, squalence, which then cyclizes. By analogy, the C_{40} precursor of the carotenoids would be lycopersene. A method is developed for the separation, detection and identification of small quantities of lycopersene, squalene, and related hydrocarbons, and used in attempts to detect lycopersene in carotenogenic systems. The hydrocarbons are separated by ascending adsorption chromatography on thin layers of Kieselgel G supported on glass plates. With light petroleum as solvent, the R_F values of squalene, lycopersene, phytoene and phytofluene are 0.41, 0.30, 0.21 and 0.12, respectively. The plates are stained with iodine vapor, and as little as 0.05% µg of any component can be detected as a yellow or brown spot. By this method, the presence of squalene, phytoene and phytofluene has been demonstrated in the unsaponifiable fraction of cells of Rhodospirillum rubrum in which normal carotenogenesis has been inhibited by diphenylamine. These substances do not occur in the normally pigmented bacteria. Squalene is also present in etiolated maize seedings, carrot root and ripening tomatoes. Lycopersene has not been detected in any of these systems. [2-C^{14}]Mevalonic acid, an effective terpenoid precursor, is incorporated into the hydrocarbon fraction of etiolated maize seedlings. While squalene is heavily labelled, no significant radioactivity could be detected in the 'lycopersene' fraction. The significance of these findings in relation to the problem of carotenogenesis was discussed. (Contractor's abstract)

THE REACTIONS OF FREE RADICALS CONTAINING NITROGEN, by A. F. Trotman-Dickenson. Oct. 28, 1961, 2p. (Technical rept. no. 1) (AFOSR-2211) (AF 61(052)406) Unclassified

The pyrolysis of benzylamine, N-methylbenzylamine, and the hydrazines has been investigated in an attempt to establish a body of results comparable to that available for alkyl radicals, for the nitrogen-containing free radicals. A value of 60 kcal for D(C-N) in benzylamine has been confirmed by pyrolysis with an improved technique using a toluene-carrier apparatus. The reactions of the dimethylamino radicals have been studied by investigating the photolysis of tetramethylurea and tetramethyltetrazene. These radicals have been found to disproportionate readily.

REACTIONS OF FREE RADICALS CONTAINING NITROGEN (Abstract), by A. F. Trotman-Dickenson. [1961] [1]p. [AF 61(052)406] Unclassified

Presented at Second AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, Illinois Inst. of Tech. Armour Research Foundation, Chicago, Sept. 11-12, 1961. (AFOSR-1417; AD 265513)

The purpose of th work being done under this contract presently is to eliminate the lack of knowledge concerning the properties and behavior of small free radicals containing nitrogen and provide convenient sources of the radicals. The 2 sources investigated were the photolysis of tetramethyltetrazene and tetramethylurea. Both are rather involatile, both yield in the primary act the dimethylamino radical, and both yield inert gas that can be conveniently used as an internal actinometer. At low conversions, the major products of both photolyses are dimethylamine and tetramethylhydrazine. It was concluded that the reactions were partially heterogeneous, as is that of hydrazine itself to a lesser extent.

A RAPID METHOD OF QUALITATIVE AND QUANTITATIVE ANALYSIS OF PRODUCTS FROM PYROLYSIS, by G. G. Smith, W. H. Wetzel, and B. Kösters. [1961] [4]p. incl. diagrs. tables. (AFOSR-3078) (AF 49(638)616) AD 441848 Unclassified

Also published in Analyst, v. 86: 480-483, July 1961.

In a study of the effects of structure on the pyrolysis of esters, a direct method was developed for determining the extent of decomposition and the products from pyrolysis of many compounds. The products from the pyrolysis of micro amounts of organic material were analyzed directly by a gas-chromatographic column attached to a temperature-controlled pyrolysis reactor. Since the method proved particularly suited to a qualitative and quantitative study of pyrolysis products from small amounts (2 to 10 mg) of liquids (or solids that can be dissolved in suitable solvents), it is submitted as a general method for studying the pyrolysis of esters or of other compounds with similar properties. The method is accurate (error ± 2%) and requires only a few min for each test.

VARIATION DIMINISHING TRANSFORMATIONS AND ORTHOGONAL POLYNOMIALS, by I. I. Hirschman, Jr. [1961] [17]p. incl. refs. (AFOSR-3357) (AF 49-(638)218) Unclassified

Also published in Jour. Anal. Math. (Jerusalem), v. 9: 177-193, 1961.

Let $P_n^{(\alpha,\beta)}(x)$ be the Jacobi polynomials in the usual normalization. Put $h_{\alpha,\beta}(n) = \frac{2^{\alpha+\beta+1}\Gamma(n+\alpha+1)\Gamma(n+\beta+1)}{(2n+\alpha+\beta+1)n!\,\Gamma(n+\alpha+\beta+1)}$, and $\Omega_{\alpha,\beta}(x) = (1-x)^{\alpha}(1+x)^{\beta}$. Let $l^2_{\alpha,\beta}$ consist of those real functions $f(n)$ defined for $n = 0, 1, 2, \dots$ for which $\|f\|_2 = [\sum_{n=0}^{\infty} |f(n)|^2 h_{\alpha,\beta}(n)]^{1/2} < \infty$. For $f \in l^2_{\alpha,\beta}$ it is defined as $T_M f^{\wedge}(n) = [h_{\alpha,\beta}(n)]^{-1} \int_{-1}^{1} f^{\wedge}(x) P_n^{(\alpha,\beta)}(x) M(x) \Omega_{\alpha,\beta}(x)dx$. Transformations of the form T_M (which are bounded transformations of $l^2_{\alpha,\beta}$ into itself) are called multiplier transformations in $l^2_{\alpha,\beta}$. Let $V[f]$ be the number of changes of sign of $f(n)$ for $n = 0, 1, 2, \dots$ $M(x)$ will be called variation diminishing multiplier if, for every $f \in l^2_{\alpha,\beta}$, $V[T_M f] = V[f]$. It is shown here that $M(x)$ is variation diminishing in $l^2_{\alpha,\beta}$ if and only if it is of the form $M(x) = de^{cx} \prod_{k=1}^{\infty}(1 + a_k x)/\prod_{k=1}^{\infty}(1 - b_k x)$, where $c \geq 0$, $1 \geq a_k \geq 0$, $1 > b_k \geq 0$ and $\sum(a_k + b_k) < +\infty$. Analogous results are also obtained for Laguerre and Hermite polynomials.

MULTIPLIER TRANSFORMATIONS. III., by I. I. Hirschman, Jr. [1961] 11p. (AF 49(638)218) Unclassified

Published in Proc. Amer. Math. Soc., v. 13: 851-857, Dec. 1962.

Let F belong to the family S of all complex-valued functions on $\omega = \{0, \pm 1, \pm 2, \pm 3, \dots\}$; set $N_\alpha[F] = [\sum_{n=-\infty}^{\infty} |F(n)|^2(|n|+1)^{2\alpha}]^{1/2}$, and denote by N_α the space of

all $F \in S$ such that $N_\alpha[F] < \infty$. Allow α to be in the open interval $(-1/2, 1/2)$. A β-variation condition is given to ensure the boundedness of multiplier transformations on N_α. Let g be a bounded, complex-valued, measurable function defined on $T = [0,1]$ with $g(0) = g(1)$. If $f \in N_\alpha$, define $P_g(F)$ as the sequence $(a_n)_{n \in \omega}$ such that $a_n = \int_T e^{-2\pi i n\theta} g(\theta)F\hat{}(\theta)d\theta$, where $F\hat{}$ denotes the Fourier transformation of the sequence F. Let P_g denote the multiplier transformation $[F \to P_g(F)]$ defined for all F in $N_\alpha \cap N_0$. Now follows the main result. If $\beta \geq 2$ and if g is of bounded β-variation (as defined below), the P_g is a unique extension which is a bounded endomorphism of N_α whenever $|\alpha| < 1/\beta$. Thus, the entire permissible range of α is obtained when $\beta = 2$. The function g is said to be of "bounded β-variation" if there exists a number $M_0 > 0$ such that $\sum_{k=0}^{m} |f(x_{k+1}) - f(x_k)|^\beta \leq M_0$ whenever $0 \leq x_0 < \ldots < x_{k+1} < \ldots < x_m \leq 1$. The notion of β-variation has been applied to similar purpose in a previous paper (see item no. WAS. 02:034, Vol. II). It is concluded with an attempt to replace the β-variation condition by the following one: There exists a finite number $K_\beta > 0$ such that any $\epsilon > 0$ gives rise to a function g_ϵ on T such that $\operatorname{var} g_\epsilon \leq K_\beta \epsilon^{1-\beta}$ and $\sup_{\lambda \in T} |g(\lambda) - g_\epsilon(\lambda)| \leq \epsilon$; here $\operatorname{var} g_\epsilon$ denotes the total variation of g_ϵ on $[0,1] = T$.

VARIATION DIMINISHING TRANSFORMATIONS AND STURM-LIOUVILLE SYSTEMS, by I. I. Hirschman, Jr. [1961] [20]p. incl. refs. (AFOSR-3292) (AF 49-(638)846) Unclassified

Also published in Comment. Math. Helv., v. 36: 214-233, 1961.

The results have been presented in an earlier paper (Compt. Rend. Séances Acad. Sci., v. 252: 3699-3701, June 1961) without proof. Let $y(x,\lambda)$ be a solution of the differential equation $Ty = \lambda y$, $T = q(x) - d^2/dx^2$, $0 \leq x < \infty$, satisfying initial conditions at $x = 0$. If $q(x)$ is continuous and bounded for $0 \leq x < \infty$, and $\int_0^\infty (1 + x^2)|q(x)|dx < \infty$, the spectrum $S(T)$ of T consists of $0 \leq \lambda < \infty$, all points of which belong to the continuous spectrum and the points $\lambda = -L_j^2$, $j = 1, 2, \ldots, m$, all belong to the point spectrum. Let H and $H\hat{}$ denote, respectively, the space of all real Lebesque measureable functions $u(x)$ and $g(\lambda)$, $\lambda \in S(T)$, with defined $\|u\|$ and $\|g\|$. For the elements of H and $H\hat{}$, it is defined that the mappings $f \to f\hat{}$ and $g \to g\check{}$, by $f\hat{}(x) = \int_0^\infty y(x,\lambda)f(x)dx$, $\lambda \in S(T)$. $g\check{}(x) = (1/\pi) \int_0^\infty y(x,\lambda)g(\lambda)\lambda^{-1/2}|M(\lambda^{1/2})|^{-2}d\lambda + \sum_{k=1}^{m} y(x, -L_k^2)g(-L_k^2)P_k$, where $P_k \int_0^\infty [y(x, -L_k^2)]^2 dx = 1$, $k = 1, \ldots, m$, and $2siM(s) = s \sin\alpha - i\cos\alpha + i\int_0^\infty e^{isx} q(x)y(x, s^2)dx$, $\lambda = s^2$, $-\pi < \alpha \leq 0$. These mappings give rise to an operational calculus which is used to give an elegant demonstration of the following: If $\Lambda^-(T) = \operatorname{Sup}\{-\lambda / \lambda \in S(T)\} < b_1 \leq b_2 \leq \ldots$, $\sum_k b_k^{-1} < \infty$, $c \geq 0$, and if (*) $\varphi(\lambda) = [e^{c\lambda}\prod_k (1 + \lambda(b_k))]^{-1}$, $\lambda \in S(T)$, then (**) $V[\omega(T)u] \leq V(u)$, for all $u \in H$, where $V(a)$ denotes the number of changes of sign of $a(x)$ for $-\infty < x < \infty$. Conversely, every bounded and measurable function ω defined for $\lambda \in S(T)$ and satisfying (**) is essentially of the form (*).

POSITRON LIFETIMES AGAINST ANNIHILATION IN METAL AND ALKALI HALIDES, by B. L. D. Poliak. Mar. 1961, 72p. incl. diagrs. tables, refs. (Technical rept. no. 43) (AFOSR-785) (Sponsored jointly by Air Force Office of Scientific Research under AF 18-(603)108 and [Army Research Office] AD 259383 Unclassified

The positron lifetimes against annihilation in 3 metals (Cu, Ag, Mg) and 10 alkali halide crystals (LiF, NaF, NaCl, NaBr, NaI, KCl, KBr, KI, CsBr, CsI) were determined. The lifetimes obtained are in qualitative agreement with the simple theory discussed in Chapter III. Chapter II serves as a general introduction to the use of the phenomenon of positron-electron annihilation as a tool to explore the electronic structure of solids. Chapter III summarizes the work (experimental and theoretical) which is pertinent to the subject of this thesis. Chapter IV describes the experimental technique and the equipment. Analysis of the data is also treated in this section. A summary of the results of this experiment is given in Chapter V. Chapter VI consists of a discussion of the data and comparison with other data as well as the rough theory described in Chapter III for the alkali halides. This section also contains suggestions for further work on the alkali halides.

VARIATIONAL CALCULATION OF THE SCATTERING LENGTHS IN ELECTRON-HYDROGEN SCATTERING, by Y. Hara, T. Ohmura, and T. Yamanouchi. [1960] [8]p. incl. tables, refs. [AF 18(603)108] Unclassified

Published in Prog. Theoret. Phys. (Japan), v. 25: 467-474, Mar. 1961.

The non-relativistic Schrödinger equation of electron plus hydrogen-atom system is solved by the Hulthén type variational method at the limit of zero incident electron energy. Eight and 5 parameter trial functions are used for the singlet and triplet states respectively, and the following upper bounds on the scattering length a are obtained, $a_s \leq 6.217\ a_0$ (singlet), $a_t \leq 2.272\ a_0$ (triplet), where a_0 is the Bohr radius. Some discussions are given on the accuracy of the result. It is shown that the relation $a_{OH} > a_{SH} > a_K > a(\text{true})$ holds for trial functions of the same form if a(true) is positive. ELECTRON PARAMAGNETIC RESONANCE STUDY OF DIPHENYL NITRIC OXIDE IN SINGLE CRYSTALS, by Y. Deguchi. [1961] [25]p. incl. diagrs. refs. (AFOSR-133) [AF 49(638)464] AD 288773 Unclassified

Also published in Bull. Chem. Soc., Japan, v. 35: 910-916, July 1961.

Electron paramagnetic resonance experiments of diphenyl nitric oxide single crystals were performed. Variation of exchange narrowed line was measured by changing the magnitude of magnetic dilution in crystals. Angular variations of g-value and of hyperfine spectra were investigated. The value of the exchange integral in pure crystal and the spin density on N^{14} atom in the molecule were determined. From these results and the crystallographic orientation of the benzophenone molecules, it can be concluded that the p-orbital of a nitrogen atom in diphenyl nitric oxide molecule would be almost parallel to 1 crystal axis of the bulk crystal.

SPIN AND CHARGE EXCHANGE IN ANIONS OF BIPHENLYL ETHER, by D. H. Eargle, Jr. and S. I. Weissman. Feb. 20, 1961 [1]p. incl. diagrs. (Technical rept. no. 36) (AFOSR-304) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)464 and Office of Naval Research) AD 450824 Unclassified

Also published in Jour. Chem. Phys., v. 34: 1840, May 1961.

In order to test whether the slow spin exchange in the substance formed by joining together 2 triphenylmethyls by an oxygen atom is due to an "insulating" property of the oxygen bridge, the singly and doubly charged anion of biphenlyl ether was investigated. Reduction of the ether by sodium or potassium in 1,2-dimethoxyethane or tetrahydrofuran led first to an orange paramagnetic substance then to a green diamagnetic one. The latter showed no ESR absorption over a wide range of magnetic fields. Treatment of the completely reduced green substance with an equivalent quantity of the unreduced ether led to immediate restoration of the orange paramagnetic material. The orange substance is probably the uninegative anion, the green 1 the dinegative ion. The ESR spectrum of the uninegative ion exhibited 179 resolved components in a span of about 15 gauss. The spectra of the Na and K salts were indistinguishable. The number of lines indicated that the spin migrates rapidly between the biphenyl groups. An odd number of lines could be produced by 1 accidental degeneracy.

NOTE ON MEASUREMENTS OF RATES OF ELECTRON TRANSFER PROCESSES BY BROADENING OF ESR LINES, by P. J. Zandstra and S. I. Weissman. [1961] [2]p. incl. table. (Technical rept. no. 38) (AFOSR-617) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)464] and Office of Naval Research) AD 611391 Unclassified

Also published in Jour. Chem. Phys., v. 35: 757, Aug. 1961.

Measurements were made of the relative broadenings of several of the ESR lines of naphthalene negative ion in the presence of naphthalene. The results impiy that the electron exchange rate does not depend on nuclear spin states and that the magnetic pulses during transit do not contribute to line breadth.

BIRADICALS IN THE KETYL SERIES, by N. Hirota and S. I. Weissman. [1961] [1]p. (AFOSR-1095) [AF 49(638)464] Unclassified

Also published in Jour. Amer. Chem. Soc., v. 83: 3533, Aug. 20, 1961.

Reduction of xanthone or benzophenone by Mg, Ca, or Ba in ethereal solvents gave a single paramagnetic species with hyperfine couplings to the protons in 1 mol of original ketone and no trace of dissociated ions was observed. Use of 93% Mg^{25} showed splitting by one Mg^{25} nucleus (I = 5/2) in the case of benzophenone magnesium ketyl. The interval between adjacent components was 0.3 gauss. The other ketyls with Mg^{25} exhibited a broadening of all lines, but no well-resolved Mg^{25} splitting.

ELECTRON-SPIN RESONANCE INVESTIGATIONS OF THE NEGATIVE IONS OF FOUR ORGANOSILICON COMPOUNDS, by M. G. Townsend. [1961] [8]p. incl. diagrs. (Technical rept. no. 41) (AFOSR-2478) (AF 49(638)464) AD 278252 Unclassified

Also published in Jour. Chem. Soc. (London): 51-55, Jan. 1962.

Electron-spin resonance spectra of the negative ions of 4-biphenylyltriphenylsilane, di-(4-biphenlyl)diphenylsilane, tetraphenylsilane and tetra-4-biphenylylsilane have been recorded. The unpaired electron is located almost exclusively on the biphenyl substituent in the first radical, but is thought to exchange rapidly between all groups in the third. It has not been

possible to determine the electron distribution in the second and fourth. An analogous all-carbon compound, tetraphenylmethane, is spontaneously reduced to the non-magnetic dinegative ion, which is stable only at low temperature and rearranges rapidly at room temperature to produce the biphenylyl mononegative ion. THEORY OF RESONANCE ABSORPTION OF ENERGY BY A ROTATING SOLID, by J. [F.] Dreitlein and H. Kessemeier. [1961] [18]p. incl. diagr. refs. (Technical rept. no. 1) (AFOSR-1334) (AF 49(638)808) AD 450841 Unclassified

Also published in Phys. Rev., v. 123: 835-52, Aug. 1, 1961.

The theory of both nuclear resonance energy absorption and the relaxation of a coherent magnetization transverse to an applied external magnetic field is developed for nuclei in a mechanically rotating solid. The consequences of the formalism in the simple case of a solid composed of effectively isolated nuclear pairs is presented. For the more general nuclear lattice, a procedure for isolating and experimentally measuring the exchange interaction between the nuclei in the solid is proposed. Finally, the moments of the energy absorption line shape for the rotating solid are investigated and the second and fourth moments are explicitly calculated. (Contractor's abstract)

PERTURBATION METHOD FOR LOW STATES OF A MANY PARTICLE BOSON SYSTEM, by H. W. Jackson and E. Feenberg. [1961] 50p. incl. diagrs. refs. (Technical rept. no. 1) (AFOSR-315) (AF 49(638)834) Unclassified

Also published in Ann. Phys., v. 15: 266-295, Aug. 1961.

The many particle boson system is studied under the assumption of a strong repulsive force when 2 particles approach closely. A theoretical description of the ground state and low excited states of liquid He^4 is developed in terms of a set of correlated basis functions. A simple correlated trial function ψ_0 and a set of model functions φ_n are used to construct a set, $\psi_n = \psi_0\varphi_n$, of linearly independent correlated basis functions. Matrix elements of the identity and Hamiltonian operator are evaluated by systematic application of a generalized superposition approximation. A normalized, orthogonal basis $|e_n\rangle$ is constructed from linear combinations of the functions ψ_m; the associated matrix elements $\langle e_n|H|e_m\rangle$ vanish everywhere except on the 3 diagonals $m = n$, $n \pm 1$. A final approximate diagonalization, neglecting phonon-phonon interaction, yields explicit formulas for the ground state energy and the momentum dependence of the phonon energy. The analogy with Bogoliubov's treatment of the boson system, using uncorrelated basis functions is very close as is also the relation to Feynman's theory of the excitation energies. A parallel analysis is successful with ψ_0 taken to be the correct ground-state eigenfunction. In this case the matrix elements of the phonon-phonon interaction can be expressed completely in terms of the elementary liquid structure function as given by the analysis of x-ray diffraction at low temperatures. The way is open to an accurate evaluation of the phonon energy as a function of momentum (the Landau curve) and a corresponding accurate evaluation of the thermodynamic properties of the liquid at low temperatures. VARIATIONAL METHOD FOR SCATTERING LENGTH, by T. Ohmura. [1961] [5]p. incl. diagr. table. (Technical rept. no. 2) (AFOSR-1718) (AF 49(638)834)
Unclassified

Also published in Phys. Rev., v. 124: 130-134, Oct. 1, 1961.

The properties of the scattering length obtained by Kohn's method, which is 1 of Hulthen's variational methods, are studied by assuming a linear trial function with n adjustable parameters. The scattering length $A^{(n)}$ decreases monotonically as the number of adjustable parameters n increases, if there is no bound state in the system. This conclusion essentially comes from the upper bound theorem of Spruch and Rosenberg. When the system has m bound states, the scattering length increases in value only m times, and otherwise decreases monotonically. Therefore, after verification that the presence of m increases, the calculated value is certain to give an upper bound on the scattering length. The connection between the result above and the condition of Rosenberg, Spruch, and O'Malley is considered. In an appendix, comparison is made of the scattering length $A^{(n)}$ obtained by Hulthen's original method and Kohn's method when m bound states exist in general. (Contractor's abstract)

ON THE EINSTEIN CONDENSATION, by C. T. Chen-Tsai and E. T. Jaynes. [1961] [14]p. incl. diagrs. (AFOSR-2565) [AF 49(638)834]
Unclassified

Exact series expressions for the thermodynamic quantities of an ideal Bose gas are found in terms of the theta function of Jacobi. The Einstein condensation thus can be treated by rigorous mathematical argument. The nature of the "integral approximation" and its modification, employed in the usual treatment of the problem, is clearly revealed. For finite volume, the exact expansions of pressure and density in powers of the activity converge in an entirely different way than do the integral approximation expansions. The modified integral approximation, however, becomes exact in the limit $V \to \infty$, $N \to \infty$, V/N - const. (Contractor's abstract)

Any particle with intrinsic spin ($s \neq 0$) can align its spin axis in certain directions relative to an axis of quantization. Beams of identical particles will in general have all possible spin directions randomly represented unless some sorting mechanism has been employed. A beam of particles that has all spin directions represented with equal probability is said to be unpolarized. If all spins align up along some preferred direction we call the beam completely polarized. If some spin direction is more preferred than others we have a partially polarized beam. In order that polarization be a useful concept we must define it in a more systematic way – give it a quantitative measure for the above expressed qualitative ideas. Polarization experiments limited mostly to nuclear scattering are discussed. Physical ideas are used to explain the mathematical formalism. Attention is concentrated on discussing the scattering matrix $M(\theta, \varphi)$. (Contractor's abstract)

A MEASUREMENT OF THE LONGITUDINAL POLARIZATION OF NEON-19 POSITRONS, by J. [V.] Jovanovich. Aug. 1961 [83]p. incl. diagrs. (Technical rept. no. 3) (AFOSR-1099) (AF 49(638)843) AD 261907
Unclassified

An experiment whose object is to measure the energy dependence of helicity of positrons emitted from Ne-19 is described. The positron helicity is measured indirectly by transferring it to the annihilation-in-flight photons, whose transmission through a magnetized iron cylinder is dependent on their polarization. The positron helicity therefore results in a difference of the counting rates for opposed directions of the magnetic field. The measured dependence of this asymmetry with pulseheight is compared with a computation which assumes the validity of the 2 component neutrino theory of β decay and neglects the depolarization of positrons. A good fit of theoretical curve to the experimental points is obtained for pulseheights larger than about 1.3 mev. A strong disagreement is found in the pulseheight range between 0.75 and 1.0 mev, where the experimental asymmetries

are much lower than the prediction. The measurement of the asymmetry of bremsstrahlung produced in copper by electrons from a Sr-Y-90 source is used in order to measure the effective number of aligned electrons in the magnetized iron cylinder. (Contractor's abstract)

RESONANCE ABSORPTION OF GAMMA RAYS IN NORMAL AND SUPERCONDUCTING TIN, by M. Yaqub and C. Hohenemser. [1961] [34]p. incl. diagrs. refs. (AFOSR-1232) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)843 and National Science Foundation) AD 289844
Unclassified

Also published in Phys. Rev., v. 127: 2028-2035, Sept. 15, 1962.

A study of the resonant absorption of the 23.8-kev γ-rays in Sn^{119} has been made between 373° and 1.1°K by using the Sb^{119} K-capture parent. The source was prepared by bombarding natural Sn with 10-mev deuterons in a cyclotron, and was thick enough to absorb resonantly a large portion of the recoilless photons emitted. By studying the self-absorption in this source between 373° and 60°K and taking into account the contributions to the intensity due to resonant scattering, an average value of the Debye temperature θ has been derived. In order to see if the phonon spectrum undergoes a change in passing from the superconducting to the normal phase, the counting rate was measured at several temperatures between 4.2° and 1.1°K, with and without a magnetic field strong enough to destroy the superconductivity of the source. Using the derived value of 140°K for θ, it was concluded that the change in θ between the 2 phases could not be more than 0.76°K. (Contractor's abstract)

POLARIZATION OF SPIN ONE PARTICLES SCATTERED FROM SPIN ZERO NUCLEI, by J. Wesolowski. Aug. 1961 [26]p. incl. diagrs. (Technical rept. no. 2) (AFOSR-1346) (AF 49(638)843) AD 264836
Unclassified

This discussion is 2-fold; first, it is to summarize the theoretical work concerning the polarization of spin 1 particles scattered from spin zero nuclei; second, it is to explicitly relate the theoretical formulas to possible double scattering experiments. The discussion will clarify and expand partially upon the work of Stapp (Phys. Rev., v. 107: 607-615, July 1957) who derives the theoretical formula for the differential cross section of a spin one particle twice scattered from a relatively heavy spin zero nucleus.

LONGITUDINAL POLARIZATION OF POSITRONS FROM NEON-19 (Abstract), by J. V. Jovanovich, E. D. Lambe and others. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)843], National Science Foundation, and Research Corporation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 50, Feb. 1, 1961.

The longitudinal polarization of Ne^{19} positrons is measured by transmitting the annihilation-in-flight γ-rays through magnetized iron. The experimental method previously described (see item no. 2187, Vol. III) is unchanged except for the detectors and the associated electronics. In the new experiment two (3 x 3) in. NaI crystals and 50-channel pulse-height analyzers are used to measure the energy dependence of the circular polarization of γ-rays from which the energy dependence of positron polarization is inferred. The experimental asymmetries vary from zero to about 3% depending on the measured pulse-height range. The method will be described and results compared with the predication of the 2-component neutrino theory.

SLIP FLOW IN THE LAMINAR BOUNDARY LAYER OVER A FLAT PLATE AT HYPERSONIC SPEEDS, by R. E. Street. Final technical rept. July 1, 1959-Dec. 31, 1960. Apr. 1961 [46]p. incl. diagrs. tables, refs. (AFOSR-558) (AF 49(638)440) AD 257834
Unclassified

First order slip in the boundary layer on a flat plate is obtained by adding on to the no slip solution the normal derivative of the no slip solution multiplied by a suitably small parameter. Although carried out only for the similar solution obtained when the pressure gradient is inversely proportional to the square root of distance along the plate, the method can be extended to non-similar solutions. Two cases of hypersonic flow in differing ambient temperature environment were calculated and they indicated the effects of slip to cover a considerable extent of flow for an inch or 2 downstream of the leading edge. The results were essentially the same as those obtained by Cassaccio. It was found that there is a dependence of the coefficients in the slip boundary conditions upon the form of the similarity transformation of the boundary layer equations. (Contractor's abstract)

THE PRESENT STATUS OF THE VIBRONIC ANALYSIS OF THE VISIBLE $n \rightarrow \pi^*$ BAND SYSTEMS OF s-TETRAZINE VAPOR (Abstract), by G. H. Spencer, P. C. Cross, and K. B. Wiberg. [1959] [1]p. (AF 18-(600)1522) Unclassified

Presented at Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, June 15-19, 1959.

Published in Spectrochim. Acta, No. 9: 757-758, Oct. 1959.

The red color that visually characterizes a room temperature assembly of s-tetrazine ($C_2H_2N_4$) molecules is thought to be the collective, chromatic consequence of the lowest singled $n \rightarrow \pi^*$ transitions. Using the third diffraction order of a 21-ft grating spectrograph, vapor path lengths from 0.05 to 48 m, and vapor temperatures from -70 to 70°C, high resolution spectra of s-tetrazine vapor has been photoelectrically recorded. The frequencies of 514 of the best resolved absorption peaks were measured to within one cm^{-1} in the region of 4500-6100A. The outstanding feature of the visible spectrum is a set of 4 vibronic band progressions, each of which is propagated by the consecutive excitation of the same fundamental vibration. This vibration, believed to be the totally symmetric mode 6a, has a ground electronic state frequency of 737 and 720 cm^{-1} for s-tetrazine-d_0 and s-tetrazine-d_2, respectively; in the $n \rightarrow \pi^*$ states, these frequencies drop to about 700 and 690 cm^{-1}, respectively. Although a successful vibronic analysis has not yet been obtained, the presence of 3 relatively intense $n \rightarrow \pi^*$ singlet transitions that are electronically forbidden by molecular symmetry as well as the allowed $^1B_{1u} \rightarrow A_g$ transition is strongly suspected. Theoretical studies pertaining to the electronic-vibrational interaction of the lowest singlet, almost accidentally degenerate, $n \rightarrow \pi^*$ states of the azines have been initiated and will be discussed in terms of simple MO theory.

INFRARED SPECTRUM AND THERMODYNAMIC PROPERTIES OF GASEOUS SULFUR TRIOXIDE, by R. W. Lovejoy, J. H. Colwell and others. [1961] [6]p. incl. diagrs. tables, refs. (AFOSR-1211) (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(600)1522], Office of Naval Research, and Petroleum Research Fund of Amer. Chem. Soc.) Unclassified

Presented at meeting of the Phys. Chem. Div. of the Amer. Chem. Soc., Chicago, Ill., Sept. 3-8, 1961.

Abstract published in 140th meeting of the Amer. Chem. Soc. Abstracts of Papers, 1961, p. 13T.

Also published in Jour. Chem. Phys., v. 36: 612-617, Feb. 1, 1962.

The infrared spectrum of sulfur trioxide was obtained under prism resolution in the gaseous state and in xenon matrices at liquid-nitrogen temperature. In both cases a satisfactory vibrational assignment of the monomeric SO_3 spectrum could be made on the basis of a simple D_{3h} symmetry model. The observed gas phase fundamentals were $\nu_3(e') = 1391$, $\nu_4(e') = 529$, and $\nu_2(a_2'') = 495$ cm^{-1}. The matrix fundamentals were essentially the same as those of the gas phase except that the $\nu_2(a_2'')$ mode was shifted to 464 cm^{-1}. A normal coordinate treatment of the SO_3 molecule was carried out and potential constants were determined for both Urey-Bradley and simplified valence force fields. Three weak absorption bands of S_3O_9 were also detected in the gas-phase spectrum. From the temperature and pressure variation of the intensities of these bands it was estimated that for the trimerization reaction at 298°K, K_p was approx 1 atm^{-2} and ΔH_{298° was approx 30 kcal/mol of S_3O_9. The values of the thermodynamic properties of monomeric SO_3 were computed for the ideal gaseous state using the rigid rotor harmonic oscillator approximation at 1 atm from 100° to 1500°K. INFRARED SPECTRUM OF CF_3SF_5, by D. F. Eggers, Jr., H. E. Wright, and D. W. Robinson. [1961] [6]p. incl. diagrs. tables, refs. (AFOSR-2821) (In cooperation with Johns Hopkins U., Baltimore, Md.) (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)1522 and National Science Foundation) AD 295922 Unclassified

Abstract published in Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, June 12-16, 1961, p. 56.

Also published in Jour. Chem. Phys., v. 35: 1045-1050, Sept. 1961.

Abstract published in Spectrochim. Acta, v. 17: 1129, Oct. 1961.

The infrared spectrum of CF_3SF_5 has been measured and analyzed between 30 and 4000 cm^{-1}. A band found at 218.5 cm^{-1} is believed responsible for satellite lines observed previously in the microwave spectrum; the barrier to internal rotation might then be much lower than obtained previously by assuming these satellites were due to torsional oscillation. Twelve of the 17 fundamentals were assigned in the infrared spectrum and estimates are given for the others. A plausible assignment is given for the overtone and combination bands also observed; this gives no evidence for any of the inactive fundamentals. (Contractor's abstract)

ASSIGNMENT OF ELECTRONIC TRANSITIONS IN AZO DYE PROTOTYPES, by M. B. Robin and W. T. Simpson. [1960] [9]p. incl. diagrs. tables, refs. (AFOSR-766) [AF 49(638)677] Unclassified

Presented at Molecular Structure Symposium of the Amer. Chem. Soc., Seattle, Wash., June 1960.

Also published in Jour. Chem. Phys., v. 36: 580-588, Feb. 1, 1962.

Quantitative calculations of the absorption frequency, transition moment length, and polarization of the first strong absorption band in the series of compounds $C_6H_5N{=}N(C_6H_4N{=}N)_xC_6H_5$ have been successfully carried out using a model employing delocalization of electronic excitation energy rather than delocalization of electrons. It is found that the compounds can be treated as azo-perturbed phenyl groups interacting with both an electrostatic force and through conjugation. Because of the electrostatic part of the interaction, there results a demonstrable heat of single bond isomerization in phenyl-β-naphthalene, its conformational isomers possessing different colorband spectra. The n-π^* transition in the azo dyes is shown to be, in all probability, the low-frequency component of 2 previously degenerate n-π^* bands which have split. The intensity and polarization of the formally forbidden, low-frequency n-π^* band can be explained by assuming a mixing of the n-π^* band with a strong, low frequency band responsible for the color in azo dyes. A high-frequency band found at 44 kk (kilokayser or 10^3 cm^{-1}) having a constant intensity throughout the series of dyes investigated has been shown to be isolated within the end phenyl groups. INFRARED SPECTRUM AND THERMODYNAMIC PROPERTIES OF GASEOUS SULFUR TRIOXIDE, by R. W. Lovejoy, J. H. Colwell and others. [1961] [6]p. incl. diagrs. tables, refs. (AFOSR-1227) (AF 49(638)723) Unclassified

Also published in Jour. Chem. Phys., v. 36: 612-617, Feb. 1, 1962.

The infrared spectrum of sulfur trioxide was obtained under prism resolution in the gaseous state and in xenon matrices at liquid-nitrogen temperature. In both cases a satisfactory vibrational assignment of the monomeric SO_3 spectrum could be made on the basis of a simple D_{3h} symmetry model. The observed gas phase fundamentals were $\nu_3(e') = 1391$, $\nu_4(e') = 529$, and $\nu_2(a_2'') = 495$ cm^{-1}. The matrix fundamentals were essentially the same as those of the gas phase except that the $\nu_2(a_2'')$ mode was shifted to 464 cm^{-1}. A normal coordinate treatment of the SO_3 molecule was carried out and potential constants were determined for both Urey-Bradley and simplified valence force fields. Three weak absorption bands of S_3O_9 were also detected in the gas-phase spectrum. From

the temperature and pressure variation of the intensities of these bands it was estimated that for the trimerization reaction at 298°K, K_p was approximately 1 atm^{-2} and $\Delta H_{298°}$ was approximately 30 kcal/mol of S_3O_9. The values of the thermodynamic properties of monomeric SO_3 were computed for the ideal gaseous state using the rigid rotor harmonic oscillator approximation at 1 atm from 100° to 1500°K. THIRD- AND FOURTH-ORDER INTERACTIONS OF ARGON WITH A GRAPHITIZED CARBON BLACK, by J. R. Sams, Jr., G. Constabaris, and G. D. Halsey, Jr. [1961] [6]p. incl. diagrs. tables, refs. (AFOSR-2604) [AF 49(638)723] AD 612347 Unclassified

Also published in Jour. Chem. Phys., v. 36: 1334-1339, Mar. 1962.

Data for the third- and fourth-order interactions of argon with the highly graphitized carbon black P33 (2700°) are presented. These data have been analyzed by means of a 2-dimensional gas model to give an estimate of the interaction energy between the adsorbed atoms, and a new method for determining the surface area of the adsorbent. Relations between the 2-dimensional gas model and a model which assumes pairwise additivity of potentials are discussed. (Contractor's abstract)

SECOND VIRIAL COEFFICIENTS OF ARGON, KRYPTON, AND ARGON-KRYPTON MIXTURES AT LOW TEMPERATURES, by B. E. F. Fender and G. D. Halsey, Jr. [1961] [8]p. incl. diagrs. tables, refs. (AFOSR-3026) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)723] and Petroleum Research Fund) Unclassified

Also published in Jour. Chem. Phys., v. 36: 1881-1888, Apr. 1962.

Second virial coefficients of argon between 80-125°K, and krypton (105-140°K) have been measured. The experimental values are 5-15% larger in magnitude than those calculated from 12-6 or exp-6 potential functions by the substitution of parameters assigned to describe high-ten perature virial coefficients. Second virial coefficients calculated from the potential-distance relationship proposed by Guggenheim and McGlashan are within 1% of the experimental values for argon, but are about 4% smaller in magnitude than the measured krypton coefficients. Argon-krypton mixed virial coefficients have been determined between 105-125°K. These experimental results are best expressed by a 12-6 potential energy parameter combining rule $\epsilon_{12} = 2\epsilon_1\epsilon_2/\epsilon_1 + \epsilon_2$. (Contractor's abstract)

GAS ADSORPTION NEAR THE BULK CRITICAL TEMPERATURE, by G. D. Halsey, Jr. [1961] [1]p. incl. diagrs. [AF 49(638)723] Unclassified

Published in Jour. Chem. Phys., v. 36: 1688, Mar. 15, 1962.

An experimental estimate of the 2-dimensional critical temperature of an argon film is $T_{2c} = 68°$. There is no measured value of the 1-dimensional virial coefficient B_1, but it can be calculated readily on the basis of the Lennard-Jones 12-6 interaction law for the van der Waals interaction of atoms. On this basis, a calculation shows that $T_{10} = 0.454\ T_{20}$, or 69°K. The critical temperature is near the temperature at which attraction and repulsions are just balanced for pair interactions in the phase boundary.

RANDOM MOTION OF DEUTERONS IN KD_2PO_4, by V. H. Schmidt and E. A. Uehling. [1961] [11]p. incl. diagrs. tables, refs. (AFOSR-1704) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)92] and National Science Foundation) Unclassified

Also published in Phys. Rev., v. 126: 447-457, Apr. 15, 1962.

Magnetic resonance studies of the deuteron in KD_2PO_4 have been conducted which show the existence of deuteron jumping between and within hydrogen bonds. The experimental results help to explain electrical conductivity and ferroelectric phenomena in crystals of this type. Pulse magnetic resonance experiments show that the lifetime T_{XY} against deuteron jumping between X- and Y-oriented hydrogen bonds is 15 msec at 70°C with a jump activation energy of approximately 0. 58 ev. The c-axis electrical conductivity of KD_2PO_4 is found to have the same activation energy, with a value of 1.16×10^{-10} (ohm cm)$^{-1}$ at 25°C. The $\Delta m = 1(P_1)$ and $\Delta m = 2(P_2)$ deuteron spin-lattice relaxation transition probabilities due to X-Y jumps have been calculated from the known values of T_{XY} and the electric field gradient tensors at X and Y deuteron sites. Their magnitudes and the dependences of these magnitudes on magnetic field, temperature, and orientation are in good agreement with experiment. Further measurements of P_1 and P_2 separately give a component of transition probability proportional to exp(0. 078 ev/kT) and independent of magnetic field. The orientation dependences of P_1 and P_2 for this component indicate quadrupolar relaxation due to deuteron jumps along hydrogen bonds, with a jump time of order 10^{-11} sec at 215°K. The existence of intrabond jumps governed by an activation energy is shown to be consistent with the Slater theory of KH_2PO_4 as modified by Takagi. (Contractor's abstract)

NUCLEAR QUADRUPOLE RESONANCE OF As^{75} IN $Na_2HAsO_4 \cdot 7H_2O$, by E. D. Jones and E. A. Uehling. [1961] [2]p. (AFOSR-3810) [AF 49(638)92] Unclassified

Also published in Jour. Chem. Phys., v. 36: 1690-1691, Mar. 1962.

The As^{75} pure nuclear quadrupole resonance (NQR) has been observed at room temperature and 77°K in $Na_2HAsO_4 \cdot 7H_2O$ (sodium arsenate). The frequency is approximately 44. 2 mc/sec at the higher temperature and decreases by almost 2 mc/sec in going to the lower temperature. The resonance was nearly resolved at 77°K. This indicates a linewidth $\Delta\nu \sim 50$ kv which decreases appreciably with decreasing temperature. The arsenic atom in sodium arsenate is in the pentavalent state. An attempt to observe the pure quadrupole resonance of Na_3AsO_4 was also reported. The failure to observe this resonance is consistent with expectations based on the tetrahedral symmetry of isolated AsO_4 groups and the small contributions to field gradients arising from ionically bonded sodium atoms.

NUCLEAR MAGNETIC RESONANCE OF ARSENIC AND ANTIMONY IN LIQUID AsF_5 AND $SbCl_5$, by E. D. Jones and E. A. Uehling. [1961] [1]p. (AFOSR-3811) [AF 49(638)92] Unclassified

Also published in Jour. Chem. Phys., v. 36: 1691, Mar. 1962.

The arsenic and antimony nuclear magnetic resonance (NMR) have been observed in liquid AsF_5 and liquid $SbCl_5$ at room temperatures. The As^{75} NMR was observed using a Knight high-level spectrometer at a frequency of 8. 8 mc/sec and associated lock-in techniques. The linewidth of the resonance was approximately 15 gauss. Both the NMR of the Sb^{121} and Sb^{123} isotopes were easily observed using a self-quenching superregenerative spectrometer. For a measurement of the Sb^{121} linewidth the Knight spectrometer was used, along with associated lock-in equipment, at 11 mc/sec. The observed linewidth for the Sb^{121} resonance was approximately 15 gauss.

ON A THEOREM OF YANO AND NAGANO, by S. I. Goldberg. July 1961, 11p. (AFOSR-1084) (AF 49-(638)967) AD 263313 Unclassified

A complete connected Einstein space of dimension $m > 2$ on which there exists a vector field generating globally a 1-parameter group of non-homothetic transformations is homeomorphic with the m-sphere. This statement is valid for any complete, connected Riemannian manifold if it were known for a manifold of (positive) constant scalar curvature. Evidence is presented strengthening this conjecture. It is shown that if M is a compact Riemannian manifold which is not a homology sphere, then an infinitesimal conformal transformation of M is an infinitesimal isometry. In particular, if a compact, simply connected symmetric space of a connected Lie group admits a non-homothetic transformation (belonging to the connected component of the group of conformal transformations of M) then M is isometric with the m-sphere. THE CONFORMAL TRANSFORMATION GROUP OF A COMPACT RIEMANNIAN MANIFOLD, by S. I. Goldberg and S. Kobayashi. [1961] [5]p. (AFOSR-3252) (AF 49(638)967) Unclassified

Published in Amer. Jour. Math., v. 84: 170-174, Jan. 1962.

Let M be a Riemannian manifold, $C_0(M)$ the largest connected group of conformal group of isometries of M. The aim here is to prove the following theorem: Let M be a complete Riemannian manifold. If $C_0(M) \neq I_0(M)$, then there exists no harmonic form of degree p, $0 < p < \dim M$, whose length is a non-zero constant. From this theorem, a corollary is deduced: Let M be a compact homogeneous Riemannian manifold. If $C_0(M) \neq I_0(M)$, then M is a relative homology sphere.

THE DIFFUSION OF HYDROGEN IN SINGLE-CRYSTAL GERMANIUM, by R. C. Frank and J. E. Thomas, Jr. [1960] [8]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)158] and General Motors Laboratories) Unclassified

Published in Jour. Phys. and Chem. Solids, v. 16: 144-151, Nov. 1960.

Single-crystal germanium diffusion specimens were prepared by a special process of drilling and crystal growing. The hollow cylindrical specimen was sealed at 1 end and attached to a mass spectrometer at the other. By surrounding the thin cylinder with hydrogen gas and observing it diffuse through into the mass spectrometer permeation rates and diffusion coefficients were measured in the temperature range of 800 to 910°C. The excellent agreement between diffusion coefficients measured by the "time lag" and decay curve methods indicates that trapping effects by lattice defects were small or non-existent. The activation energy for diffusion is 8.7 ± 0.8 kcal/g atom and the heat of solution is 52.8 ± 1.4 kcal/g atom. The permeation rate was found to vary as the square root of the gas pressure, which indicates that the hydrogen exists in the germanium lattice as hydrogen atoms or ions. (Contractor's abstract)

EFFECT OF GASEOUS AMBIENTS UPON 1/f NOISE IN GERMANIUM FILAMENTS, by V. E. Noble and J. E. Thomas, Jr. [1960] [6]p. incl. diagrs. [AF 49-(638)158] Unclassified

Published in Jour. Appl. Phys., v. 32: 1709-1714, Sept. 1961.

The variation of low frequency noise in thin, single crystal germanium filaments was investigated by using gaseous ambients to change the surface potential of the sample. The noise samples, having a thickness of only 4 μ, were extremely sensitive to variations in the surface potential and exhibited large fractional changes of the total sample conductance as a result of the surface conductance fluctuations which were interpreted as the 1/f noise. These results showed a definite noise minimum when the sample surface potential corresponded to the sample conductance minimum. The rms conductance fluctuation varied roughly linearly with ΔG, where ΔG is the increase of the sample conductance with respect to the minimum value. The slope of the curve for the condition of an accumulation layer on the sample surface was an order of magnitude less than that for the inversion layer. The amplitude of the accumulation noise agreed (within a factor of two) with the prediction of McWhorter's majority carrier trapping effect, but the inversion noise was an order of magnitude greater. METAL-TO-GLASS VACUUM SEAL FOR LOW TEMPERATURES, by N. H. Horwitz and H. V. Bohm. [1961] [2]p. incl. diagr. (AFOSR-959) [AF 49(638)-932] AD 451554 Unclassified

Also published in Rev. Scient. Instr., v. 32: 857-858, July 1961.

A mechanical glass-to-metal seal is used which is vacuum tight (even when immersed in a helium II bath), and can readily be taken apart when access to the interior of the experimental chamber is desired. In common with some other demountable vacuum seals an indium O-ring is employed. The construction of this seal is shown. A standard wall Pyrex tube of approximately 1 in. diam is sealed off at 1 end, and the other end is thickened and flared to provide a collar. The face of this collar is ground flat, after which a 15° bevel is lapped around the outer edge. The tube is carefully annealed. The glass tube mates with a brass cap assembly. A locking ring compresses the indium O-ring between the collar of the glass tube and the inner surface of the cap. A phosphor bronze wave washer between the locking ring and the glass collar maintains pressure and also allows for slippage between ring and collar during tightening. Alternatively, one might consider using a bolted flange instead of the threaded ring.

MAGNETOACOUSTIC MEASUREMENTS IN SILVER, COPPER, AND GOLD AT 200 TO 350 MC (Abstract), by H. V. Bohm and V. J. Easterling. [1961] [1]p. [AF 49(638)832] Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 436, Nov. 24, 1961.

Magnetoacoustic measurements are reported on all 3 noble metals with both transverse and longitudinal sound waves at frequencies up to 350 mc. Plots of the ultrasonic pulse height, h, vs the reciprocal of the magnetic field strength, 1/H, show 15 or more maxima and minima for several orientations in each metal. The Fermi surface dimensions calculated from the

periods in the 1/H of the magnetoacoustic oscillations are interpreted in terms of the Pippard type Fermi surface model, and details of the Fermi surface topology in some regions are presented. Some anomalous results obtained with sound propagated along the 111 direction are discussed. The positions of pulse height extrema in the h vs 1/H plots are compared with theory.

ULTRASONIC ATTENUATION MEASUREMENTS IN ALUMINUM (Abstract), by G. N. Kamm and H. V. Bohm. [1961] [1]p. [AF 49(638)832] Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Nov. 24-25, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 438, Nov. 24, 1961.

Magnetoacoustic oscillations of the ultrasonic attenuation in ultra-high purity aluminum single crystals have been studied at 4.2°K and at frequencies between 200 and 350 mc. Three crystal samples were prepared with opposite faces accurately parallel to the (100), (110), and (111) planes. Longitudinal sound waves were propagated perpendicular to the sample faces while a variable magnetic field was rotated in the plane of the faces. The precision of the measurements permits a more detailed comparison with the free electron model Fermi surface. The topology of the second zone of this simple model is confirmed in considerable detail. A variety of oscillations is observed at all angles, and interpreted as central orbits, off-center orbits, and orbits in the third zone. The rf system, sample holder, and automatic recording system used in the measurements is described briefly.

TRIPLE PRODUCT INTEGRALS OF LAGUERRE FUNCTIONS, by J. Gillis and M. Shimshoni. [1961] [13]p. incl. tables. [AF 61(052)352] Unclassified

Published in Math. Comput., v. 16: 50-62, Jan. 1962.

This paper is concerned with the quantities $C_{rst} = \int_0^\infty \lambda_r(x)\lambda_s(x)\lambda_t(x)\,dx$, which are required in the solution of mildly non-linear ordinary differential equations, in semi-indefinite intervals, in series of Laguerre functions $\lambda_n(x) = e^{-x/2}L_n(x)$, $n = 0, 1, 2, \ldots$ Explicit expressions and recurrence relations are derived for the C_{rst}, and generation on an automatic computer by means of the recurrence relations is discussed. An 8-decimal table of C_{rst} is given for $t = 0(1)10$, $s = 0(1)t$ and $r = 0(1)s$, together with explicit expressions for the C_{rst} as functions of t when $s = 0(1)3$ and $r = 0(1)s$. The Blasius equation $y''' + yy'' = 0$, with the conditions $y(0) = y'(0) = 0$ and $y'(\infty) = 2$, is chosen as an example. The computation of the coefficients of successive approximations in series of the $\lambda_n(x)$ is described, and numerical values of y obtained this way are compared with values obtained by Hamel's method.

THE MECHANISM OF PHOTOPHOSPHORYLATION IN CHLOROPLASTS, by M. Avron. Apr. 30, 1961, 13p. incl. refs. (Technical rept. no. 1) (AFOSR-1032) (AF 61(052)390) AD 262091 Unclassified

Utilizing O^{18} labelled substrates, it was established that 1 atom of O enters from the water of the medium into each ATP molecule produced. In addition the location of the phosphate oxygens, the possibility of interfering side reactions and the source of the new bridging oxygen atom in the ATP molecule were determined. The inhibitory effect of UV irradiation on the Hill reaction and photophosphorylation was quantitatively determined. A positive correlation was established between the destruction of the coenzyme Q_{255} and the inactivation of the photosynthetic reactions brought about by UV irradiation. By taking advantage of the properties of a photophosphorylative system, ATP or ADP labelled at specific and different sites with P^{32} labelled compounds was synthesized. Light activated Pi-ATP exchange was discovered to be present in chloroplasts. (Contractor's abstract)

PREPARATION, PROPERTIES AND APPLICATIONS OF SOME WATER-INSOLUBLE DERIVATIVES OF PROTEOLYTIC ENZYMES, by E. Katchalski. [1961] [7]p. incl. refs. (AFOSR-4186) (AF 61(052)391) Unclassified

Also published in Polyamino Acids, Polypeptides, and Proteins; Proc. Internat'l. Symposium, Madison, Wis. (June 19-24, 1961), Madison, Wisconsin U. Press, 1962, p. 283-289.

A description is given of the preparation, properties, and applications of some water-insoluble derivatives of proteolytic enzymes. Wherever possible, their use in protein and polypeptide research is illustrated. To insure high enzymatic activity different synthetic procedures are employed in the preparation of the various water-insoluble proteolytic enzymes. A direct coupling of the enzyme with the chemically reactive polymer has been carried out in the case of papain. A water-insoluble pepsin has been obtained by reacting pepsinogen with a water-insoluble polymer and subsequent acid activation of the insoluble pro-enzyme. The attachment of the enzyme to the carrier by polymeric side chains which ensure free movement of the catalyst molecules in the reaction mixture has been used in the case of trypsin and chymotrypsin. In all the enzymatic preparations investigated a copolymer of p-amino-DL-phenylalanine and L-leucine has been used as a carrier.

THE HYDRODYNAMIC BEHAVIOR AND MOLECULAR CONFIGURATION OF POLY -ε, N-CARBOBENZOXY-L-LYSINE IN DIMETHYLFORMAMIDE SOLUTION, by E. Daniel and E. Katchalski. [1961] [11]p. incl. diagrs. tables, refs. [AF 61(052)391] Unclassified

Published in Polyamino Acids, Polypeptides, and Proteins; Proc. Internat'l. Symposium, Madison, Wis. (June 19-24, 1961), Madison, Wisconsin U. Press, 1962, p. 183-193.

A survey is given of the viscosity, sedimentation, and diffusion behavior in dimethylformamide (DMF) of 9 samples of poly-ε, N-carbobenzoxy-L-lysine (PCBL) in the molecular weight range of 20,000 to 500,000.

An analysis of the molecular weight dependence of the various hydrodynamic parameters obtained was carried out taking into account the various theories dealing with corpuscular particles and flexible threadlike molecules. From this analysis it was concluded that the PCBL molecules exist in DMF solution as helical rods possessing a marked flexibility.

COLLECTIVE MOTION IN MANY-PARTICLE SYSTEMS. PART I. THE VIOLATION OF CONSERVATION LAWS, by H. J. Lipkin. [1959] [20]p. incl. refs. (Sponsored jointly by [Air Force Office of Scientific Research under AF 61(052)337], Atomic Energy Commission, and Office of Naval Research) Unclassified

Published in Ann. Phys., v. 9: 272-291, Feb. 1960.

A method for treating collective motion is proposed which allows the use of wave functions violating conservation laws which are valid for the system. The reasons for the use of such wave functions are discussed and a simple physical interpretation is given. The method is illustrated by applications to center-of-mass motion, the electron gas in the random phase approximation, nuclear rotation, and the violation of the conservation of the number of particles. SOME SIMPLE FEATURES OF THE MÖSSBAUER EFFECT, by H. J. Lipkin. [1959] [8]p. (Sponsored jointly by [Air Force Office of Scientific Research under AF 61(052)337], Atomic Energy Commission, and Office of Naval Research) Unclassified

Published in Ann. Phys., v. 9: 332-339, Feb. 1960.

A simple description is given in the state of a crystal lattice upon emission or absorption of a nuclear gamma ray. A sum rule is derived for the average energy transfer to the lattice. The probability of zero energy transfer is calculated. The results are general and do not assume a particular model for the crystal. Conclusions are presented as simple principles which may be useful as a guide to experimentalists. (Contractor's abstract)

ON THE USE OF FORMAL OPERATOR TECHNIQUES IN QUANTUM STATISTICAL MECHANICS, by A. S. Reiner. Apr. 1, 1960, 27p. incl. refs. (Technical note no. 3) (AFOSR-TN-60-727) (AF 61-(052)337) AD 244302 Unclassified

Also published in Physica, v. 26: 700-716, Sept. 1962.

An alternative derivation of the linked cluster expansions for the partition function of a grand canonical ensemble is given. It is shown that the cluster coefficients in that expansion are related to connected Bloch diagrams. In a time-independent approach the contributions of those diagrams may be expressed in terms of the generalized scattering matrix of Watson. This t-matrix for a hard core interaction has been applied in a calculation of the first 3 cluster coefficients of a boson gas of inpenetrable spheres. The results accord with those obtained by the binary collision methods. The relation and differences in the various approaches are discussed. (Contractor's abstract)

LINEAR RESPONSE FUNCTION OF A MANY FERMION SYSTEM, by A. J. Glick. May 1, 1961, incl. diagrs. refs. (Technical note no. 10) (AFOSR-1163) (AF 61(052)337) AD 262092 Unclassified

Also published in Ann. Phys., v. 17: 61-92, Jan. 1962.

The properties of a many body system are studied by means of a linear response function which depends on frequency and wave number. It is shown how the expectation value of two body operators, the rate of transitions induced by one body operators or weak external fields acting on the system, and information about the energy spectrum can be found from this function. As a result, the formalism suggests many relationships between apparently dissimilar quantities, and suggests indirect ways of experimentally

measuring internal properties of a system. In the present formalism, all of the difficulties inherent in many body calculations are related to the determination of the response function. However, there exist some rules and a priori conditons on this function which can be used to estimate the validity of approximate calculations and to indicate what must be done to improve the results. The response function is calculated for a Fermi gas by using a combined diagrammatic perturbation theory and Green's function technique. (Contractor's abstract)

THE ANALYTIC STRUCTURE OF MANY-BODY PERTURBATION THEORY, by A. Katz. May 10, 1961 [33]p. incl. diagrs. (Technical note no. 11) (AFOSR-1164) (AF 61(052)337) AD 262093 Unclassified

Also published in Nuclear Phys., v. 29: 353-372, Jan. 1962.

The Goldstone linked cluster expansion is used to determine the energy as an analytic function of the coupling constant. This function is many valued and describes the various energy levels of the system. The energy of each level can be obtained from the Goldstone expansion by continuing it analytically along a properly chosen path in the complex plane. The Brueckner ladder approximation is shown to be an approximation to an analytic continuation along a path which always leads to the normal state—the state in which no binding occurs. ELECTRON EXCITATION OF COLLECTIVE NUCLEAR TRANSITIONS (Abstract), by L. J. Tassie and A. S. Reiner. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)337] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 57, Feb. 1, 1961.

The form factors for the inelastic scattering of high-energy electrons are calculated by use of the collective model of the nucleus. For large momentum transfers the scattering depends on the form of the nuclear charge density. If it is assumed that the collective nuclear motion is irrotational and incompressible, the usual collective model can be extended to an arbitrary static charge distribution, and the inelastic scattering thus can be related to this charge distribution. Experiments are suggested which should provide a test of the assumption of nuclear incompressibility. In particular, electric monopole excitation is considered, as this should be the most sensitive to any compression effects.

MANY-BODY PERTURBATION METHODS IN A SOLUBLE MODEL, by A. J. Glick, H. J. Lipkin, and N. Meshkov. [1961] [2]p. incl. diagr. [AF 61(052)337] Unclassified

Published in Proc. Rutherford Jubilee Internat'l. Conf., Manchester (Gt. Brit.) (Sept. 4-8, 1961), New York, Academic Press, 1961, p. 299-300.

A model with particles in 2 shells with a monopole-monopole force is solved exactly and by the following many-body perturbation methods: (a) ordinary second order perturbation theory, and (b) summation of bubble graphs to all orders. Results indicate that although the bubble sum should be a good approximation when the number of particles is large, it is not so good when the number is small, as in light nuclei. Exact results for systems up to 8 particles indicate that second order perturbation theory gives better results than the bubble sum, and extrapolation indicates that this should hold up to about 20 particles. THE IRRADIATION OF UNSATURATED SULTONES, by E. Henmo, P. de Mayo and others. [1961] [2]p. incl. diagrs. (AFOSR-769) (AF AFOSR-61-6) Unclassified

Published in Proc. Chem. Soc. (London): 238-239, July 1961.

Irradiation of unsaturated diphenyl sultones in methanol produces ring cleavage yielding a methyl sulfonic ester which can be identified from its hydrolysis compound. Ozonolysis followed by cyclization with warm alkali produces the known phenalene derivatives. The products in all cases were characterized by the preparation of derivatives and by nuclear magnetic resonance spectra, infrared and ultraviolet spectra. The cyclic dimethyl sultone $C_6H_8SO_3$, upon irradiation gave the open-chain unstable keto-sulfonic ester $C_6H_9SO_3X$, where X = OCH_3, which was characterized by its 2,4-dinitrophenylhydrazone derivative and also by the previously mentioned spectrophotometric methods.

EXCITATION OF THE FIRST NEGATIVE SYSTEM OF O_2^+ BY A PROTON BEAM IN AIR AND OXYGEN, by L. Herman, H. I. S. Ferguson, and R. W. Nichols. [1961] [2]p. incl. illus. refs. (AFOSR-209) [AF 49-(638)640] Unclassified

Also published in Canad. Jour. Phys., v. 39: 476, Mar. 1961.

The excitation of the bands of the O_2^+ first negative ($b^4\Sigma_g^- - a^4\Pi_u$) system by 40-kev proton beams in air and oxygen at low pressures is discussed. The resulting emission spectra are investigated over the pressure range 10^{-1} to 10^{-3} mm Hg, and over the wavelength range 2300 to 7000A. The identified spectral features indicate that the main emitters are N^+, O^+, N_2^+, and O_2^+. The leading two or three bands in each of the $\Delta v = -2$, -1, and 0 sequences of the N_2^+ first negative ($B^2\Sigma - X^2\Sigma$) system, and of the $\Delta v = -1$, 0, and +1 sequences of the O_2^+ first negative ($b^4\Sigma_g^- - a^4\Pi_u$) system are excited together with lines of NII, OII, and HI. In air, the O_2^+ bands are much weaker than those of N_2^+. The proton beam is very sharply defined at these low pressures and the bands arise from the center of the beam, evidently from direct proton excitation.

INTENSITY MEASUREMENTS IN EMISSION ON 29 BANDS OF THE O_2 SCHUMANN-RUNGE SYSTEM, by G. R. Hébert and R. W. Nicholls. [1961] [14]p. incl. diagrs. tables, refs. (AFOSR-J113) (Sponsored jointly by Air Force Cambridge Research Center, Air Force Office of Scientific Research under [AF 49(638)640], National Research Council of Canada, Office of Naval Research, and Ontario Research Foundation) AD 400054 Unclassified

Also published in Proc. Phys. Soc. (London), v. 78: 1024-1037, Nov. 15, 1961.

Relative integrated photoelectric intensity measurements have been made upon each of the $v' = 0$, $v'' = 9$-19; $v' = 1$, $v'' = 8$-12; 16-20; $v' = 2$, $v'' = 7$-9, 15, 16, 19-21, bands of the Schumann-Runge System. These measurements have been interpreted, with the aid of Franck-Condon factors $q_{v'v''}$ and r-centroids $\bar{r}_{v'v''}$, to determine the variation of electronic transition moment $R_e(r)$ with internuclear separation r as $R_e(r) = \text{const.}\ (1 - 1.1807r + 0.35047r^2)$; $1.44(A) < r < 1.76(A)$. A 'smoothed' array of relative vibrational transition probabilities $p_{v'v''} = R_e^2 \bar{r}_{v'v''} \lambda_{v'v''}$ and band oscillator strengths $f_{v'v''}$ have thereby been determined for all bands of the system between 2450 and 5000A. (Contractor's abstract)

THE SCATTERING OF LOW-ENERGY ORTHO-POSITRONIUM BY HYDROGEN ATOMS, by P. A. Fraser. [1960] [23]p. incl. diagrs. tables. (AFOSR-J518) [AF 49(638)640] AD 414432 Unclassified

Also published in Proc. Phys. Soc. (London), v. 78: 329-347, Sept. 1, 1961.

When ortho-positronium collides with a hydrogen atom not only may it be scattered, but there is also the possibility of conversion of the ortho-positronium to para-positronium by electron exchange. The total elastic cross section and the conversion cross section have been calculated for positronium kinetic energies 0 to 9.8 ev, for the $l = 0$ partial wave only. A particular choice of trial wave function explicitly satisfying the Pauli principle and a variational argument lead to integro-differential equations, with no 'ordinary force', from which the phase shifts have been obtained by a numerical method. The cross sections are very strongly energy dependent: the total cross section ranges from $192\pi_0^2$ at zero energy to $2.92\pi a_0^2$ at 6.8 ev, while the (conversion)/(total) ratio ranges from 0.176

to 0.070 over these energies. These ratios are well below the value 1/4 expected at high energies from the Born approximation. The total cross section results of Massey and Mohr for this problem using Born approximation were $230\pi a_0^2$ at zero energy and $25\pi a_0^2$ at 6.8 ev, with the (conversion)/(total) ratio 1/4. (Contractor's abstract)

THE EFFECT OF VIRTUAL EXCITATION OF THE 2s STATE ON THE ELASTIC SCATTERING OF ELECTRONS BY ATOMIC HYDROGEN, by K. Smith, R. P. McEachran and P. A. Fraser. [1961] [25]p. incl. diagrs. tables, refs. (AFOSR-1403) (Sponsored jointly by Air Force Cambridge Research Center, Air Force Office of Scientific Research under [AF AFOSR-61-88] Atomic Energy Commission, Defence Research Board of Canada, Department of Defence Production of Canada, National Research Council of Canada, Office of Naval Research and Ontario Research Foundation) Unclassified

Also published in Phys. Rev., v. 125: 553-556, Jan. 15, 1962.

The elastic scattering of electrons by hydrogen atoms, for electron energies below the first threshold of excitation of the atom (10.2 ev), is investigated numerically making full allowance for exchange and for the virtual excitation of the 2s state. Singlet and triplet phases for the s, p, and d partial waves have been obtained. While the calculation is essentially preliminary to a more extensive eigenfunction expansion calculation for this problem, which would allow for non-spherical distortion of the atom, the results do show that significant changes from the first exchange approximation may be expected as more states are included in the expansion. In particular, just below the n = 2 excitation threshold the singlet s phase and the triplet p phases begin to increase sharply, and what may be a Wigner cusp shows in the total cross section. Predicted angular distributions are compared with the recent measurements of Gilbody, Stebbings, and Fite. The phase shifts are compared with those of the exchange approximation, and also with those of Geltman, who performed a variational calculation allowing for the virtual excitation of the 2s and 3s states. EMISSION SPECTRA FROM SOLIDS CONDENSED AT VERY LOW TEMPERATURES FROM THE ELECTRICAL DISCHARGE PRODUCTS OF NITROGEN-CARBON MONOXIDE AND NITROGEN ACETYLENE MIXTURES, by S. L. N. G. Krishnamachari, R. W. Nicholls, and H. P. Broida. [1961] [9]p. incl. illus. diagrs. tables. [AF AFOSR-61-88] Unclassified

Published in Proc. Indian Acad. Sci., v. 54A: 61-68, Aug. 1961.

Two unidentified series of emission bands (sharp and diffuse) between 4900 and 4900A were observed at 4.2° and 20.4°K. These bands were emitted from the condensed products of microwave discharges in carbon monoxide and nitrogen-acetylene mixtures. The sharp series are characterized by a frequency difference of 2280 cm^{-1} and the diffuse series by a frequency of 670 cm^{-1}. Isotopic substitution shows at least one carbon atom is present in the emitting species. (Contractor's abstract)

PAIRING PLUS LONG RANGE FORCE FOR SINGLE CLOSED SHELL NUCLEI, by L. S. Kisslinger. [1960] [82]p. (AF 18(603)61) Unclassified

Published in Kgl. Danske Selskab, Mat.-Fys. Skrifter, v. 32: 1960.

The low energy properties of nuclei are calculated, using a model which combines certain important features of the unified nuclear model and the independent-particle model with a 2-body residual interaction. The residual interaction used has 2 parts, a pairing force and a long-range part. Calculations are made for nuclei with major closed proton or neutron shell, A > 48, for various values of the 2 strength parameters, using single-particle levels taken from experimental results. In each region, the calculated energy levels and spins agree in considerable detail with systematic experimental data. In addition, the even-odd A mass difference, the electromagnetic transition rates, and other properties are calculated and compared with experiments. The approximate 1/A dependence of the parameters is consistent with a volume force.

A STUDY OF THE GAMMA-RAY SPECTRUM OF Sn^{113}, by R. E. McGaughy. [1961] 82p. incl. diagrs. tables, refs. (AFOSR-96) (AF 18(603)61) Unclassified

The gamma-ray spectrum of 112-day Sn^{113} was measured with a NaI(Tl) crystal scintillation spectrometer using a 60-channel pulse height analyzer. The intensity of the 225-kev gamma-ray relative to the strong 393-kev transition was found with a 4-pi summing spectrometer to be (3.45 ± 0.43)%, after correcting for absorption in the aluminum covering of the crystal, total detection efficiency, and our measured peak-to-peak ratios. Using this quantity along with other information the value of the K conversion coefficient for the 255-kev transition was found to be (3.02 ± 0.45) x 10^{-2} and the branching ratio to be (2.36 ± 0.3)%. Next, a measurement of the gamma-ray spectrum of Sn^{113} in coincidence with In x-rays was made, and the intensity of the 255-kev coincidence peak was compared with the 393-kev non-coincidence peak. From this ratio the probability that the electron capture transition to the 648-kev state of In^{113} is a K capture was calculated. After correcting for capture from higher shells than the L shell and neglecting the internal bremsstrahlung intensity, the ratio of L to K is found to be 2.41 + 0.77 or -0.64. This indicates that the energy of the electron capture transition is 35.6 + 1.8 or -1.2. Therefore the log ft value for this transition is found to be 5.26 + 0.21 or -0.07, whereas the log ft value for the electron capture transition to the 393-kev state in In^{113} is 6.31. It is concluded from the systematics of odd-A tin nuclei that the ground state of Sn^{113} is a $1/2^+$ state. Since the conversion coefficient for the 255-kev gamma-ray transition to the 393-kev state, which is known to be $1/2^-$, clearly indicates M1 transition (involving no change in parity), it follows that the 648-kev state must be odd, with a spin of 1/2 or possibly 3/2. It is concluded that both electron capture transitions are first forbidden even though a value of log ft = 5.26 is rather low for first forbidden transitions in general. The total energy of the decay $Sn^{113} + e^- \rightarrow In^{113} + \nu$ is found to be 648-kev. (Contractor's abstract)

MAGNETIC DIPOLE MOMENTS OF ODD-A NUCLEI IN THE SPHERICAL REGION, by N. Freed and L. S. Kisslinger. [1961] [22]p. incl. diagrs. refs. (AFOSR-173) (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(603)61] and National Science Foundation) AD 255930 Unclassified

Also published in Nuclear Phys., v. 25: 611-623, June 1961.

The magnetic dipole moment of odd-A nuclei are calculated and compared to the experimental data for nuclei with particles in the 28-126 shells, except for the deformed region where 150 ≤ A ≤ 190. The wave functions upon which the calculation is based are admixtures of seniority one wave functions produced by a pairing interaction and obtained by projecting eigenfunctions of the number operator out of Bardeen-type wave functions. Perturbation theory is used to compute the seniority-three admixtures produced by a delta-function residual interaction. (Contractor's abstract)

INTERMEDIATE LANGUAGES IN RETRIEVAL AND TRANSLATION SYSTEMS, by J. W. Perry. [1959] [14]p. incl. refs. (AF 49(638)357) Unclassified

Presented at Internat'l. Conf. for Standards on a Common Language for Machine Searching and Translation, Cleveland, Ohio, Sept. 6-12, 1959.

Published in Advances in Doc. and Library Sci., v. 3(Pt. 2): 1145-1158, 1961.

The development of intermediate languages, which is perhaps the single most important phase in developing practical systems for retrieval or translation employing automatic equipment, must take into account a variety of factors, some practical in nature, others of an intellectual or philosophical character. The practical factors indicate that a family of compatible languages rather than a single all-purpose language is the realistic goal. It seems likely that, in the future, this family of languages will include members based on Boolean algebra and others based on other non-Boolean algebras and related logics. In formulating such languages it is necessary to take into account not only the inherent impossibility of achieving complete precision in assigning meaning to the operations to be performed by machines as well as in attaining complete uniformity and reliability in the performance – particularly the human performance of the various operations involved in information retrieval and in translation.

TEST PROGRAM FOR EVALUATING PROCEDURES FOR THE EXPLOITATION OF LITERATURE OF INTEREST TO METALLURGISTS. V. THE SEMANTIC CODE TODAY, by J. L. Melton. [1961] [92]p. incl. diagrs. tables, refs. (AFOSR-1210) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)357 and National Science Foundation) AD 263126 Unclassified

A study was made of the semantic factors used in the Western Reserve U. system, to determine the incidence of new terms in the semantic code dictionary, the type of semantic factor most frequently appearing in encoded abstracts, and the type of factor most frequently appearing in encoded questions. There is a low incidence of new terms, less than 1% over a 2 yr period, decreasing to less than one half of 1%, at the end of that period, of the total terms encoded. There is a close correlation between the factors most often used in the abstracts and those most used in the questions. Tables showing the results of analyses are provided.

MATHEMATICAL MODELS IN SYSTEMS DESIGN FOR INFORMATION RETRIEVAL (Abstract), by J. Verhoeff, W. Goffman and J. Belzer. May 16, 1961 [2]p. (AFOSR-1645) (AF 49(638)357) Unclassified

After discussing the nature of mathematical models in general, 4 probabilistic models are constructed relating to 4 different situations in information retrieval. In the first case (linear), the evaluation function is given in terms of a merit for giving "relevant" documents and a penalty for giving "irrelevant" ones. It is shown when a document should go into an answer in terms of the merits and penalties. Case 2 considers the situation in which a customer probes the answer to a given question and stops when he finds a document which satisfies his need. The evaluation function is given in terms of a merit times the chance of success and a penalty times the average number of probings. If the answer was required to contain documents, the best answer consists of the documents with the highest probabilities. It was proved that this function can be maximalized, for if adding a document makes the answer worse, it will continue to get worse no matter how many documents are added. Situation 3 considers the case of partial success since it is assumed here that it requires more than 1 document to satisfy the need. The evaluation function differs from that of case 2 since the customer must now probe the entire answer. Merit is given in terms of the degree of success. The fourth case takes up the situation in which the customer wants to have an exhaustive reference list or none at all. This is shown to be unrealistic since trying to maximalize the evaluation function leads to nonsensical results. A mixed strategy is discussed in order to evaluate a situation in which the customers fall into the different cases. It is finally proved that in the linear case for complex questions the Boolean relations do not hold, although the order is preserved. (Contractor's abstract, modified)

INEFFICIENCY OF THE USE OF BOOLEAN FUNCTIONS FOR INFORMATION RETRIEVAL SYSTEMS, by J. Berhoeff, W. Goffman, and J. Belzer. [1961] [3]p. (AFOSR-1775) (AF 49(638)357) AD 612853 Unclassified

Also published in Commun. Assoc. Computing Mach., v. 4: 557-559, Dec. 1961.

This paper points out why Boolean functions are in general not applicable in information retrieval systems. The following theorem is proved. The optimal answer satisfies the following inequalities. $A(a \wedge b) \subseteq A(a) \cap A(b)$ and $A(a) \cup A(b) \subseteq A(a \vee b)$. This means that if the system responds to a conjunction by giving the intersection it is giving too much irrelevant material and if it responds to a disjunction by giving the union it risks leaving out relevant material.

ISOLATED BRAIN AND ACTH RELEASE IN CATS (Abstract), by E. S. Redgate, S. Yoshida and M. de la Lastro. [1961] [1]p. (AFOSR-1648) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)443 and National Institutes of Health) Unclassified

Also published in Physiologist, v. 4: 92, Aug. 1961.

The concept that rapid release of ACTH is under control of neural structures located in the hypothalamus has been tested by several investigators in experiments involving lesions and stimulations in preparations with intact central nervous systems. One of the problems involved in the interpretation of the results of these experiments is that direct effects of the lesion or stimulation be distinguished from indirect effects. To overcome this difficulty experiments have been carried out in cats 90 min after C_1 cord section, carotid sinus denervation and high cervical vagosympathetic nerve section. Adenohypophyseal ACTH release has been estimated by collecting jugular vein blood samples from which ACTH is extracted by resin chromatography and assayed in hypophysectomized rats by the adrenal ascorbic acid depletion method. This method of ACTH assay in a standardized preparation (the hypophysectomized rat) avoided the problem of alteration in sensitivity of the adrenal of the assay animal during the course of an experiment involving extensive surgery. Blood pressure was recorded and remained constant during the experimental procedures by injecting defibrinated donor cat blood. EEG activity and cortical evoked potentials were monitored. Results indicate: (1) that ACTH output in the partially isolated brain in absence of inhibitory input from baroceptors is not maximal, (2) stimulation through an electrode near the central tegmental tract in the midbrain reticular formation elicits an elevation of jugular vein blood ACTH levels, (3) stimulation under the same conditions in the pes pedunculus does not elicit elevation in jugular vein blood ACTH.

SPINAL CORD AND ACTH RELEASE IN ADRENALECTOMIZED RATS (Abstract), by E. S. Redgate. [1961] [1]p. (AFOSR-1649) (AF 49(638)443) Unclassified

Presented at Forty-fifth annual meeting Fed of Amer. Soc. for Experimental Biol., Atlantic City, N. J., Apr. 10-14, 1961.

Published in Fed. Proc., v. 20: 185, Mar. 1961.

The role of spinal cord pathways in regulation of ACTH release has been investigated in 2 wk adrenalectomized rats. Rats with intact cords were compared with 3, 19, 48 hr and 21 day cord-sectioned rats and were subjected to either forepaw or hindpaw electrical stimulation or no experimental treatment. ACTH content of aortic blood samples of donor rats was assayed in hypophysectomized recipient rats by adrenal ascorbic acid depletion (AAAD) method. The aortic blood samples were obtained immediately after stimulation and decapitation with a large forceps. Blood samples from intact rats with no experimental treatment induced 14 ± 12(9) mg AAAD per 100 gm adrenal; forepaw stimulated rats, 115 ± 13(8); hindpaw stimulated rats, 106 ± 15(9). In contrast, blood samples from 3 hr cord-sectioned rats with no experimental treatment induced 40 ± 8(14) AAAD; forepaw stimulated, 94 ± 10(9); hindpaw stimulated, 39 ± 6(17). The absence of ACTH release after hindpaw stimulation indicates the neural paths in the cord are essential for rapid ACTH release. Blood ACTH levels did not respond to forepaw stimulation in the 19 and 48 hr cord-sectioned rats. This depression in ACTH release is partially relieved at 21 days.

FAILURE OF ANGIOTENSIN TO DEPLETE ADRENAL ASCORBIC ACID (Abstract), by D. S. Gann and E. S. Redgate. [1961] [1]p. (AFOSR-1650) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)443, Cleveland Area Heart Society, and National Institutes of Health) Unclassified

Also published in Physiologist, v. 4: 39, Aug. 1961.

It has been shown recently that angiotensin II stimulates secretion of hydrocortisone, corticosterone and

aldosterone in hypophysectomized nephrectomized dog. Since ACTH has similar effects, the present study was undertaken to see if angiotensin induces adrenal ascorbic acid depletion in hypophysectomized rats, a standard assay for ACTH. Both aspartyl (Bumpus, Cleveland) and asparaginyl (CIBA) angiotensin II were assayed. Neither form of angiotensin induced significant ascorbic acid depletion with doses ranging from 0.1 to 40 μg per rat. This is in marked contrast to the effect seen with ACTH. The angiotensin preparations used were assayed for pressor response in dogs and rats and corticosteroid response in dogs, and were effective in all cases. Maximum doses of angiotensin (10 μg) and ACTH (1 unit) produced comparable rates of corticosteroid secretion in nephrectomized dogs. The results suggest that angiotensin and ACTH may act at different sites to stimulate corticosteroid biosynthesis. The adrenal ascorbic acid depletion test affords a useful means of distinguishing the 2 substances in crude mixtures such as plasma.

ISOLATION OF VASOPRESSIN-CONTAINING GRANULES FROM THE NEUROHYPOPHYSIS OF THE DOG, by H. Weinstein, S. Malamed, and H. Sachs. [1961] [4]p. incl. illus. table, refs. (AFOSR-J283) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)764 and National Institutes of Health) AD 400878 Unclassified

Also published in Biochim. et Biophys. Acta, v. 50: 386-389, June 24, 1961.

Electron micrographs of the mammalian neurohypophysis have indicated that the nerve fibers contain membrane-bound vesicles that range from 0.1 - 0.2μ in diam. These structures have been interpreted as neurosecretory granules which may contain oxytocin and vasopressin. Attempts were made to isolate these granules from sucrose homogenates of rat or rabbit neurohypophysis by means of differential centrifugation at forces ranging from 3000 gravity to 30,000 gravity. Although particulate preparations, containing vasopressin and oxytocin were obtained, no evidence was presented concerning the chemical, biochemical, or morphological characteristics of these particles. In this communication the results of research report on the isolation and characterization of a particulate fraction which is rich in vasopressin, morphologically identical with the neurosecretory granules, and apparently free of other known cellular organelles are presented. These particles were isolated by means of differential and density-gradient centrifugation procedures. The various stages of purification were followed by electron microscopy and simultaneous assays for vasopressin, protein, cytochrome oxidase, nucleic acids, and β-glucuronidase. INACTIVATION OF ARGININE VASOPRESSIN BY RAT-KIDNEY SLICES, by M. W. Smith and H. Sachs. [1960] [7]p. incl. diagrs. table, refs. (AFOSR-J284) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)764, Foundation for the Study of Diabetes and Related Metabolic Disorders, and National Institutes of Health) AD 400876 Unclassified

Also published in Biochem. Jour., v. 79: 663-669, June 1961.

Highly purified arginine vasopressin, in the presence of rat-kidney slices, was shown to disappear at a rapid rate from the incubation medium. The disappearance of vasopressin from the incubation medium was not due to the presence of degradative enzymes in the medium which were liberated from either broken or intact cells. The apparent first-order rate constant was consistently reproducible with slices taken from different animals on successive days and was shown to be proportional to the weight of kidney tissue. Below pH 6.0, little or no loss of vasopressin occurred, whereas the optimum rate of disappearance of hormone was observed over the pH range 7-10. The vasopressin which disappeared from the incubation medium could not be recovered from the kidney slice and had apparently undergone inactivation. This was confirmed by the use of [^{35}S] vasopressin prepared biosynthetically.

ISOLATION AND CHARACTERIZATION OF VASOPRESSIN CONTAINING PARTICLES (Abstract), by H. Weinstein, S. Malamed and H. Sachs. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)764 and Public Health Service) Unclassified

Presented at Forty-fifth annual meeting Fed. of Amer. Soc. for Experimental Biol., Atlantic City, N. J., Apr. 10-14, 1961.

Published in Fed. Proc., v. 20: 195, Mar. 1961.

Differential centrifugation of dog hypothalamic or neurohypophysial homogenates in 0.4 or 0.8 M sucrose yields a particulate fraction containing relatively little RNA but rich in both pressor activity and cytochrome oxidase. Separation of the cytochrome oxidase from the pressor activity in this particulate fraction was achieved by means of density gradient centrifugation methods. The maximum concentration of vasopressin was always associated with the more dense material. Similar findings were obtained with either hypothalamic or neurohypophysial homogenates. Vasopressin containing particles isolated by isopycnic density gradient centrifugation have been studied with respect to their morphologic, chemical and enzymic properties. Data dealing with the manner in which vasopressin is contained within and released from these particles will be presented.

VASOPRESSIN BIOSYNTHESIS II. IN VIVO STUDIES (Abstract), by H. Sachs, H. Weinstein, and E. S. Redgate. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)764 and Public Health Service) Unclassified

Presented at Forty-fifth annual meeting Fed. of Amer. Soc. for Experimental Biol., Atlantic City, N. J., Apr. 10-14, 1961.

Published in Fed. Proc., v. 20: 195, Mar. 1961.

In order to study the path of vasopressin from biosynthesis, to storage, to release, it was necessary to first define the nature of vasopressin within the cell and secondly, to devise a test system and isotope methods amenable to such investigations. Physiological and morphological studies have indicated that intracellular vasopressin is largely contained within neurosecretory particles. By means of differential and density gradient centrifugation procedures, these neurosecretory particles (contained in homogenates of dog hypothalamic and neurohypophysial tissue) have been isolated, purified and characterized. The distribution of vasopressin among a number of other cell organelles was also studied. Subsequently, the specific activity of S^{35}-labelled vasopressin associated with the various cell fractions was determined after relatively short term incorporation experiments. Extensive labeling of the vasopressin fractions was achieved by the use of highly labelled, S^{35} cysteine (prepared biosynthetically) which was infused directly into the third ventricle of the dog. Each labelled vasopressin fraction was purified to constant specific activity by a variety of ion exchange and degradative procedures.

[FUNDAMENTAL RESEARCH ON THE STUDY OF MECHANISMS OF DENDRITIC CRYSTAL GROWTH IN THE ZINCBLENDE LATTICE], by R. L. Longini and A. I. Bennett. Final rept. June 7, 1961 [9]p. incl. diagr. table. (AFOSR-960) (AF 49(638)599) AD 262598 Unclassified

Research was concerned with crystal growth mechanisms through the study of dendritic growth in diamond-lattice semiconductors, specifically germanium, silicon, and indium antimonide. Dendrites of these materials grow, in a supercooled melt, as long, narrow ribbons having a central core of twin planes. The ribbon faces can be made to be nearly atomically flat. The process of elongation of the dendrite involves the twinned core structure as a necessary part of the growth. Thickening and widening appear to depend on other growth mechanisms which do not involve the twin planes. The presence of impurities at concentrations of the order of 10^{18} atoms/cc or more affect the growth habit in a fashion not yet quantitatively understood. (Contractor's abstract)

PRINCIPLES OF SOLIDIFICATION, by W. A. Tiller. Nov. 14, 1961, 137p. incl. illus. diagrs. tables, refs. (AFOSR-2221) (AF 49(638)1029) AD 272048 Unclassified

The term "solidification" is commonly understood to imply the formation of a crystalline phase from a liquid or melt, although, to be general the nutrient phase could also be gaseous. In this article we are concerned only with the formation of a solid from a melt. Here, the phase transformation is driven by the extraction of heat from the melt and the progress of the transformation is properly separated into 2 parts: (1) the initial nucleation of crystals and (2) the growth of these initial nuclei by the accretion of atoms from the melt. The main concern of this article is with the growth of a crystal once it has been formed. Attention has been given to 3 important aspects of crystal growth from the melt: (1) solute manipulation during crystal growth, (2) solid-liquid interface morphologies and (3) defects introduced during crystal growth. SEEING DISLOCATIONS WITH X-RAY MICROGRAPHY, by J. M. Schultz and R. W. Armstrong. [1961] [4]p. incl. illus. (AFOSR-3813) [AF 49(638)1029] Unclassified

Also published in Direct Observation of Imperfections in Crystals; Proc. of a Technical Conf., St. Louis, Mo. (Mar. 1-2, 1961), New York, Interscience Publishers, 1961, p. 569-572.

This report describes some details of the procedure used and some of the observations of dislocations in zinc crystals. These results on zinc, in addition to the results on other materials, substantiate the view that, at least, some elements with intermediate or high atomic number can be favorable for detailed studies with the Berg-Barrett x-ray technique. The low penetration of x-rays in zinc permits good resolution of dislocations by allowing only a limited superposition of the many dislocations which occur in depth below the crystal surface.

PREFERRED ORIENTATIONS DEVELOPED DURING

THE SOLIDIFICATION OF HIGH-PURITY LEAD, by G. F. Bolling, J. J. Kramer, and W. A. Tiller. [1961] [5]p. incl. illus. diagrs. (AFOSR-J602) (AF 49-(638)1029) AD 414007 Unclassified

Also published in Trans. Metall. Soc. AIME, v. 227: 47-51, Feb. 1963.

The solidification of polycrystalline zone-refined lead has been examined. A novel casting technique was used, with several advantages such as unidirectional heat flow, atmosphere control, and decanting of the liquid during any stage of growth. The experimental results show the separate existence of 2 textures, a {111} surface texture at the chill surface and a <111> texture in the columnar zone, in the absence of conditions which would produce dendritic growth. SPECIAL REPORT ON DRUGS AND SENSORY-FEEDBACK ANALYSIS IN SPACE SCIENCE, by R. U. Smith. [1961] [40]p. incl. diagrs. refs. (AFOSR-4882) (AF AFOSR-61-56) AD 415117 Unclassified

The present project constitutes an initial program in the science of developmental psychopharmacology. This program has emphasized application of new methods of environmental research and computer-controlled methods of motion study as the foundation of systematic research on brain biochemistry, development, and aging. A primary program with specific experimental objectives has included studies in three main areas: (a) biochemical analysis of brain neurohormones in development; (b) drug depletion of brain neurohormones in development and aging, using reserpine to deplete the brain catecholamines; and (c) development of analytic sensory feedback systems in animals and in man for studies on drugs and development and aging. New techniques of computer-controlled delayed and displaced sensor-feedback analysis of motions in man have been developed under this project and work is being completed in constructing these systems for drug studies as well as for general investigations of motion in man.

STUDIES ON THE KINETICS OF PROTEIN SYNTHESIS IN YEAST, by R. J. Young, H. K. Kihara and H. O. Halvorson. [1961] [9]p. incl. diagrs. tables, refs. (AFOSR-1789) (AF 49(638)314) Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 47: 1415-1423, Sept. 1961.

Curves were made to show the kinetics of incorporation of $S^{35}O_4^=$ and totally labeled C^{14} amino acids into exponentially growing yeast. Distribution of S^{35} in yeast ribosomes, in % weight was 0.30 in structural ribosomes containing 96% protein, and 0.53 in solid ribosomes with 4% protein. The isotopes were incorporated into protein within a few seconds, first in the ribosomes as nascent protein. After 80 sec exposure of the yeast to C^{14} or S^{35}, the addition of unlabeled cysteine, methionine, and $SO_4^=$ caused a rapid decrease in C^{14} or S^{35} held by ribosomes. Results indicated that nascent protein, a small fraction of the ribosomes, has a turnover rate sufficient to account for the over-all rate of protein synthesis of the cell.

THE ROLE OF A LARGE PARTICLE FRACTION FROM YEAST IN PROTEIN SYNTHESIS, by J. G. Hauge and H. O. Halvorson. [1961] [7]p. incl. illus. diagr. tables, refs. (AFOSR-4230) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)314, National Institutes of Health, and National Science Foundation) Unclassified

Presented at 418th meeting of the Biochem. Soc., Cambridge (Gt. Brit.), July 12-13, 1962.

Also published in Biochim. et Biophys. Acta, v. 61: 101-107, Aug. 1962.

Also published in Biochem. Jour., v. 84: 108P-109P, Sept. 1962.

Yeast cells were observed to incorporate in vivo radioactive sulfate into the proteins of a lipo-protein particulate fraction at rates several times that of the ribosomal particles. Over half the newly incorporated sulfate was rapidly displaced by the addition of unlabelled sulfur amino acids. The lipo-protein fraction is rich in mitochondrial fragments and membranes with attached ribosomal particles. (Contractor's abstract)

THE EFFECT OF GLUCOSE REPRESSION ON THE LEVEL OF RIBOSOMAL-BOUND β-GLUCOSIDASE, by J. G. Hauge, A. M. MacQuillan and others. [1961] [3]p. incl. table. (AFOSR-4291) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)314, National Institutes of Health, and National Science Foundation) Unclassified

Also published in Biochem. and Biophys. Research Commun., v. 5: 267-269, July 26, 1961.

The effect of glucose inhibition on β-glucosidase synthesis was examined in the yeast diploid Saccharomyces dobzanskii grown in a synthetic-succinate or synthetic-glucose (2%) medium. Glucose reduced the level of solution of β-glucosidase concentration from 1480 to an average of 142 units/mg protein. The ribosomal level was increased from 0.009 to 0.019

β-glucosidase units/ml/E_{260}. Control of β-glucosidase formation, at glucose concentrations = 10^{-3} M, operates through blocking release of finished β-glucosidase from the ribosome.

A STEREOCHEMICAL FACTOR IN CYCLOPROPYL CONJUGATION, by E. M. Kosower and M. Ito. [1961] [2]p. incl. diagrs. tables, refs. (AFOSR-64-1400) (AF 49(638)282) AD 444448 Unclassified

Also published in Proc. Chem. Soc. (London): 25-26, Jan. 1962.

Ultraviolet absorption data on spiro[4.2]heptan-1-one (I) and bicyclo-[3.1.0]hexane-2-one (II) indicated that interaction between a cyclopropyl ring and a C:O group is most effective when the plane of the ring and the p-orbitals of the C:O groups are parallel, as in I. Thus the $\pi \rightarrow \pi^*$ transition energy (E_T) for II was 5.1 kcal/mol > E_T for I in isooctane. Differences in E_T values for RCH:CHCO⁻ system in spiro [2.5]octa-1,4-dien-3-one, 1-dehydrocyclooctanone, and a related 5,9-cyclosteroid.

ELECTRONIC ABSORPTION SPECTRA OF IODO- AND BROMOMETHANES, by M. Ito, P.-K. C. Huang, and E. M. Kosower. [1961] [12]p. incl. diagrs. tables, refs. (AF 49(638)282) Unclassified

Published in Trans. Faraday Soc., v. 57: 1662-1673, Oct. 1961.

A careful study has been made of the light absorption of the iodomethanes in the spectroscopic region between 1900-5000A. The compounds used, methyl iodide, methylene iodide, iodoform, and carbon tetraiodide, were all carefully purified and precautions were taken against photolytic decomposition prior to the spectroscopic measurements. It was possible to resolve the absorption curves for the last 3 iodomethanes into Gaussian components with the aid of an analog computer designed for this purpose. Using the resolved components as a guide to count the number of electronic transitions, a symmetry treatment yielded results in satisfactory qualitative agreement with experiment. Solvent effects were studied, the results being consistent with an assignment of all of the "low-intensity" bands to $n \rightarrow \sigma^*$ transitions, in agreement with the previous assignments for methyl iodide. The bromomethanes, methylene bromide, bromoform, and carbon tetrabromide were also examined in a series of solvents, with results that appeared to fit the expectations for the iodomethanes. (Contractor's abstract)

THE PREPARATION AND CHARACTERIZATION OF THE CIS- AND TRANS-METHYLSILYLCYCLOHEXANES, by T. G. Selin and R. West. [1961] [4]p. incl. table, refs. (AFOSR-1577) (AF 49(638)285) Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 1858-1859, May 1962.

The pure cis and trans isomers of 1-methyl-2-silylcyclohexane, 1-methyl-3-silylcyclohexane and 1-methyl-4-silylcyclohexane have been prepared and characterized. Hydrogenation of the various tolyltriethoxysilanes over Raney nickel followed by lithium aluminum hydride reduction to the free silanes produced principally the cis isomers. The coupling of the 3- and 4-methylcyclohexyl Grignard reagents with silicon tetrachloride again followed by reduction to the silane yielded predominantly the diequatorial isomers. The methylsilylcyclohexanes were resolved and purified by means of preparative gas chromatography. Configurational assignments were made using the modified von Auwers-Skita rule, and were consistent with predictions based on the mode of synthesis. The Grignard reagents from 1- and 2-methylcyclohexyl halides did not couple with silicon tetrachloride but instead reacted to form olefins and Si-H containing products. 1-Methylcyclohexylmagnesium chloride also reacted abnormally with tetraethoxysilane. (Contractor's abstract)

Wisconsin U. Dept. of Chemistry, Madison.

STEREOCHEMISTRY AND MECHANISM OF SILANE ADDITION TO OLEFINS. I. ADDITION OF TRICHLOROSILANE TO 1-METHYLCYCLOHEXANE UNDER FREE RADICAL AND THERMAL CONDITIONS, by T. G. Selin and R. West. [1961] [4]p. incl. diagrs. tables, refs. (AF 49(638)285) Unclassified

Published in Jour. Amer. Chem. Soc., v. 84: 1860-1863, May 1962.

The addition of trichlorosilane to 1-methylcyclohexane initiated with peroxides or ultraviolet light proceeds stereoselectively yielding principally cis-1-methyl-2-(trichlorosilyl)-cyclohexane. Thermal additions with and without free radical inhibitors were less selective and yielded some (cyclohexylmethyl)-trichlorosilane in addition to cis- and trans-1-methyl-2-(trichlorosilyl)-cyclohexane. Based on the observed stereochemistry, mechanisms are proposed for the various reactions. (Contractor's abstract)

STEREOCHEMISTRY AND MECHANISM OF SILANE ADDITIONS TO OLEFINS. II. CHLOROPLATINIC

ACID-CATALYZED ADDITION OF TRICHLOROSILANE TO ALKYLCYCLOHEXENES, by T. G. Selin and R. West. [1961] [6]p. incl. diagrs. table, refs. (AF 49-(638)285) Unclassified

Published in Jour. Amer. Chem. Soc., v. 84: 1863-1868, May 1962.

The addition of trichlorosilane to a number of alkylcyclohexenes was examined using chloroplatinic acid as a catalyst. Terminal adducts were obtained exclusively with 4-methylcyclohexene, 1-methylcyclohexene and 1-ethylcyclohexene. The addition to 4-methylcyclohexene proceeded through rearrangement to 1-methylcyclohexene. Both 1-n-propylcyclohexene and 1-n-octylcyclohexene were unreactive under the same conditions. A product resulting from addition to the ring was obtained from 4,4-dimethylcyclohexene. The reaction of trichlorosilane and 1-methyl-d_3-cyclohexene yielded (cyclohexylmethyl-d_3)-trichlorosilane and trans-1-methyl-d_3-2-(trichlorosilyl)-cyclohexane indicating that the addition proceeded with complete retention of deuterium and stereospecific cis addition of trichlorosilane to the ring. Mechanisms are proposed to account for the above observations. (Contractor's abstract)

[ON THE ANALYTICAL FUNCTIONS DEFINED BY THE HERMITE SERIES] Sur les fonctions analytiques définies par des séries d'Hermite, by E. Hille. [1961] [6]p. (AFOSR-3052) (AF 49(638)224) Unclassified

Also published in Jour. Math. Pures et Appl., v. 40: 337-342, Oct.-Dec. 1961.

Two theorems belonging to the same order of ideas as a previous work on Hermitian series (Trans. Amer. Math. Soc., v. 47: 80-94, 1940) are proved. Define $h_n(z) = (-1)^n \exp(\frac{1}{2}z^2)(d/dz)^n \exp(-z^2)$. $A_n = +\{h_n(0)^2 + (2n+1)^{-1}h_n'(0)^2\}^{\frac{1}{2}}$. Let G(t) be regular in the right half-plane, and suppose that there are positive constants A and B such that, for $|\theta| < \frac{1}{2}\pi$, $\lim_{r\to\infty} \sup r^{-\frac{1}{2}} \log|G(re^{i\theta})| \leq A(\tan|\theta|^{\frac{1}{2}} - B$. Then $\Sigma A_n^{-1} G(n) h_n(z)$ converges for $|y| < 2^{-\frac{1}{2}} B$ ($z = x + iy$) and represents an integral function. A similar theorem is proved for series $\Sigma t^n A_n^{-1} G(n) h_n(z)$, which in general are shown to represent functions having singularities in the finite part of the plane.

GREEN'S TRANSFORMS AND SINGULAR BOUNDARY VALUE PROBLEMS, by E. Hille. [1958] [19]p. incl. refs. (AFOSR-65-0346) (AF 49(638)224) Unclassified

Presented at Internat'l. Cong. of Mathematicians, Edinburgh (Gt. Brit.), Aug. 14-21, 1958.

Also published in Jour. Math. Pures et Appl., v. 42: 431-449, Oct.-Dec. 1961

H. Weyl's singular boundary problem, $u'' - [\lambda + q(x)] = 0$ ($0 \leq x < \infty$), $\cos\alpha\, u(0,\lambda) + \sin\alpha\, u'(0,\lambda) = 0$, $u(x,\lambda) \in L_2(0,\infty)$, is studied. Here $q(x)$ is assumed to be real and continuous. The Green's transform of the boundary problem is $[\overline{u(x,\lambda)}u'(x,\lambda)]_a^b - \int_a^b |u'(s,\lambda)|^2 ds - \int_a^b [\lambda - q(s)]|u(s,\lambda)|^2 ds = 0$. Taking the imaginary part, one obtains an expression which is basic in Weyl's methods. The author proposes to exploit the companion expression which is the real part of the Green's transform. Thus, new proofs are obtained of known facts about the boundary problem, especially when $q(x)$ is bounded below, e.g., some properties of the spectrum; and the behavior at ∞ of the solution u. The following result seems to be new: Let $m(\lambda, \alpha)$ be Weyl's limit point function and let $\lambda = i\nu$ be pure imaginary. Then when $\alpha \neq 0 \pmod{\pi}$, the expression $\nu^{\frac{1}{2}}[m(i\nu,\alpha) + \cot\alpha]$ is bounded away from zero and infinity as $\nu \to +\infty$. When $\alpha = 0$, the expression $\nu^{-\frac{1}{2}}|m(i\nu,\alpha)|$ is similary bounded.

A NOTE ON AUTOMORPHISMS OF LIE ALGEBRAS, by N. Jacobson. [1961] [13]p. (AFOSR-J629) (AF 49(638)-515) AD 415130 Unclassified

Also published in Pacific Jour. Math., v. 12: 303-315, 1962.

F. Gantmacher (Mat. Sbornik, v. 5: 101-146, 1939) made a thorough study of automorphisms of semi-simple Lie algebras over the field of complex numbers. Among other things, he defined the index $n(G_i)$ of a connected component G_i of the automorphism group $G = G(\mathfrak{L})$ as the minimum multiplicity of the characteristic root 1 for elements of G_i. The main purpose of this note is the determination of these indices. It is somewhat surprising that this does not appear in Gantmacher's paper since all the methods for deriving the formula for index G_i are available in his paper. The secondary purpose of this note is to extend Gantmacher's theory to the case of Lie algebras over algebraically closed base fields of characteristic O. This can be done by using algebraic group concepts and techniques which are by now well known. Nevertheless, it seems worthwhile to carry out the program in detail since Gantmacher's results give a real insight into the action of an automorphism in a semi-simple Lie algebra. For example, as we indicate, they can be used to give a new derivation and sharpening of theorems on fixed points which are due to Borel and Mostow. (Contractor's abstract)

DERIVED FUNCTORS IN ABELIAN CATEGORIES, by S. A. Amitsur. [1961] [24]p. (AF 49(638)515) Unclassified

Published in Jour. Math. and Mech., v. 10: 971-994, 1961.

Homological algebra as an abstract theory of functions from one (domain) category to a second (range) category is developed here by placing the burden of proof on the range category approach. This approach uses direct limits as a substitution to the projectives and injectives which are the corner stones for the theory of the derived functions. The idea of direct limits is not sufficient and a generalization of directed sets and direct limits (with their duals) which is introduced in the first section seems to be the right tool to develop abstract homological algebra from this point of view and thus avoid the use of projectives and injectives. The main idea is to consider for a given object A the class of all (right) complexes X augmented by A. If T is a (covariant) functor then the collection of all homology groups of the complexes T(X) forms a directed subcategory, the above mentioned generalization of directed set, and the limit of this class, if it exists, constitutes the value of the derived functor at A. The existence of these limits is obtained by modifying the definition of the generalized

limits, with the obvious advantage of preserving the duality procedure within the categories involved, but thus losing the fundamental property of the existence of the derived functors. The latter is replaced by the statement that the derived functors, when they exist, have the required properties. For applications it will remain to prove only the existence of these limits which could be obtained, e.g., by proving the existence of injectives (or projectives) in the domain category; or the existence of the limits in range-category. An example of the latter is provided.

THEORY OF PRESSURE SHIFTS OF HCl LINES CAUSED BY NOBLE GASES, by H. Margenau and E. C. Jacobson. [1961] 5p. (AFOSR-J462) (AF 18(603)15) AD 288587; AD 407896 Unclassified

Presented in part at Conf. on Molecular Line Shapes, Rehovoth (Israel), Aug. 1961.

Also published in Jour. Chem. Phys., v. 38: 1259-1260, Mar. 1, 1963.

Observed shifts cannot be explained solely in terms of long-range forces. Exchange forces may be included by choosing a Lennard-Jones potential $\Delta E_l = 4\epsilon_l\left[(\sigma_l/R)^{12} - (\sigma_l/R)^6\right]$ in which ϵ_l and σ_l are allowed to depend on J and on M. Qualitative arguments suggest the inequalities $\sigma(J, |M|) > \sigma(J, |M|+1)$, $\sigma(J, M) < \sigma(J+1, M)$ and similar inequalities for ϵ. Shifts of the R(0) and P(1) lines of HCl caused by argon are reproduced in detail with $\sigma \sim 3A$, $\epsilon \sim 156°K$. The combination rules for Lennard-Jones parameters, $\sigma = \frac{1}{2}(\sigma_1 + \sigma_2)$, $\epsilon = (\epsilon_1 \epsilon_2)^{\frac{1}{2}}$ do not reproduce the observed shifts.

[PROPERTIES OF HELIUM 3], by J. N. Kidder. Interim final rept. Dec. 21, 1961 [1]p. (AFOSR-1917) (AF 49(638)690) Unclassified

Progress made to date under this contract is reported. An apparatus has been built for measuring the density of solid He^3 in the temperature range of 0.35°K to 3.5°K and over the pressure range of 0 to 200 atmospheres. The thermodynamic properties of the solid that will be calculated from the detailed measurements of the density include the thermal expansion coefficient, the isothermal compressibility, the entropy, and the specific heat. Most of the experimental apparatus has been completed, but before data can be taken some construction details will have to be refined. It is expected that this will take about 1 to 2 months. The apparatus consists of (1) a He^3 and He^4 cryostat for obtaining the desired low temperatures, (2) a system for applying and measuring high pressures, including a secondary gauge system that will measure the pressure directly on the sample, (3) a glass system for holding and transferring the sample of He^3 gas, and (4) microwave electronics for measuring the resonant frequency of the sample cavity containing He^3

COMPARISON OF THE SCATTERING OF POSITRONS AND ELECTRONS FROM NUCLEAR CHARGE DISTRIBUTIONS, by G. H. Rawitscher and C. R. Fischer. [1961] [8]p. incl. diagrs. table. (AFOSR-175) [AF 49(638)752] Unclassified

Also published in Phys. Rev., v. 122: 1330-1337, May 15, 1961.

Elastic scattering cross sections of 183-mev positrons and electrons are calculated for various charge distributions of the Ca and Au nuclei. The combined use of positron and electron scattering measurements can lead to a determination of the nuclear charge distribution which is more accurate than that derived from either one of the scattering cross sections when used by itself. The scattered particles obey Dirac's equation and the nuclei are assumed to be static spherically symmetric charge distributions whose radial dependence is given in terms of a 3-parameter family of curves. [ELECTRON NUCLEAR INTERACTIONS AND RELATED ASPECTS OF NUCLEAR STRUCTURE], by G. Breit. Final rept. June 1-Dec. 1, 1961, 47p. incl. table, refs. (AFOSR-2349) (AF 49(638)752) AD 289484 Unclassified

This report contains abstracts of papers which have been published under the auspices of this contract. Several categories of work have been done. Included here is work done under the No Cost Extension which covered the period June 1, 1961 to Dec. 1, 1961. In some instances the publications deal with more or less isolated problems. In the few cases for which short notes have been published without abstracts the notes are reproduced in full. The categories under which the reports fall are: Coulomb Excitation; Hyperfine Structure and Isotope Shift; Proton-Proton and Proton-Neutron Scattering; Electron, Positron and Muon Nuclear Scattering; Photodisintegration of the Deuteron; Interaction of the Electronic System $1s2s\ ^3S_1$ of He I with the Nucleus; and Miscellaneous.

ATOMIC PROCESSES INVOLVING ANTIMUONIUM; POSSIBLE METHOD OF DETECTING ANTIMUONIUM (Abstract), by V. W. Hughes. [1961] [1]p. [AF 49-(638)752] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 301, Apr. 24, 1961.

Muonium can be produced by stopping positive muons in argon gas, and, if an interaction coupling M to $\overline{M}$ exists, a certain fraction of the decays will occur from the $\overline{M}$ component of the wavefunction. The presence of the argon Ar atoms inhibits the development of the $\overline{M}$ component of the wavefunction due to the different electrostatic interactions of M and $\overline{M}$ in elastic collisions with Ar. The μ^- from $\overline{M}$ can be captured by an Ar atom or the e^+ can annihilate with an electron in an Ar atom, and the rates of these processes in the high-pressure gas are much greater than the muon decay rate. The characteristic feature of $\overline{M}$ disappearance which is probably most easy to detect experimentally is the $2p \rightarrow 1s$ argon mu mesonic x-ray.

SCATTERING CROSS SECTIONS OF Mu MESONS BY THE EXTENDED NUCLEUS OF BROMINE (Abstract), by G. H. Rawitscher. [1961] [1]p. (AF 49(638)752)

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 301, Apr. 24, 1961.

Recent measurements of the scattering of μ^- mesons in nuclear emulsions were compared with calculations based on the assumption that μ^+ mesons are heavy positrons, and good agreement was found. Differential μ^+ and μ^- scattering cross sections, calculated for the comparison mentioned above, will be presented. The ratio v/c lies between 0.2 and 0.7. The dependence of the cross section σ on the atomic number Z and transfer momentum q will be compared for μ^+ and μ^- mesons. The plot of σ vs q is fairly insensitive to v/c for μ^+_N and not for μ^-. For the latter the plot of σ/σ_{point} vs q is useful in the comparison of different Z at the same v/c, enabling one to extrapolate to Z = 47 (silver) from values for Z = 80 and 48 available in the literature.

PHOTODISINTEGRATION OF POLARIZED AND ALIGNED DEUTERON, by W. Zickendraht, D. J. Andrews, and M. L. Rustgi. [1961] [4]p. incl. diagrs. table. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)752] and Atomic Energy Commission) Unclassified

Published in Phys. Rev. Ltrs., v. 7: 252-255, Sept. 15, 1961.

Information regarding dynamic and electromagnetic properties of the 2-nucleon system obtainable for the photodisintegration of the deuteron can be extended by employing aligned and polarized deuterons. In the present note a partial and preliminary survey of the possibilities is attempted by confining oneself to unpolarized

gamma rays and to differential cross sections without a consideration of the polarization of elected nucleons. It is hoped that the assumptions underlying the usual theories of the photodisintegration process can receive a more thorough test by comparison of theory and experiment even to the limited extent gone into here. The differential cross-section is calculated for ejected protons, on the basis of a modified Signell-Marshak potential, for six photon energies from 22 to 77 mev, and for different polarizations and alignments of the deuteron magnetic moment. Population numbers w_μ, of the magnetic substates μ, are used to define the polarization parameter $P_1 = w_1 - w_{-1}$ and the alignment parameter $P_2 = w_1 - 2w_0 + w_{-1}$. The differential cross-sections are expressed in terms of 19 coefficients of P_1, P_2 and the polar scattering angles. A table of the coefficients is presented together with specimen differential cross-sections at E_γ = 22.2 mev and 102 mev for deuterons aligned with and perpendicular to the incident photon direction.

THE GEOMETRY OF INTERSECTING LATTICES, by R. L. Moment and R. B. Gordon. [1961] 27p. incl. diagrs. tables. (AFOSR-1586) (AF 49(638)786) Unclassified

The geometry of the intersection of crystalline lattices is investigated. In particular the range of orientations giving unique configurations of points in the boundary plane are related to the symmetry elements of each lattice, and the conditions for which the boundary is a net are obtained. Equations are worked out for the calculation of the angles at which periodic boundary structures occur in [100], [110], and [111] tilts in simple cubic and face centered cubic lattices. Solutions of the equations are difficult in general, but results are given for the simple and face centered cubic [100] tilts showing those angles for which the boundaries of higher periodicity occur. These results are discussed with respect to their application to real crystals and in particular those of ionic structure. (Contractor's abstract)

PHOTODISINTEGRATION OF POLARIZED AND ALIGNED DEUTERONS, by W. Zickendraht, D. J. Andrews, and M. L. Rustgi. [1961] [4]p. incl. diagrs. table. (AFOSR-1318) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-61-23] and Atomic Energy Commission) AD 449990 Unclassified

Also published in Phys. Rev. Ltrs., v. 7: 252-255, Sept. 15, 1961.

The topic is examined theoretically to assess the additional information which might be obtained from experiment. This note is confined to unpolarized photons and does not consider the polarization of the ejected nucleons. The differential cross-section is calculated for ejected protons, on the basis of a modified Signell-Marshak potential, for 6 photon energies from 22-177 mev, and for different polarizations and alignments of the deuteron magnetic moment. Population numbers w_μ, of the magnetic substances μ, are used to define the polarization parameter $P_1 = w_1 - w_{-1}$ and the alignment parameter $P_2 = w_1 - 2w_0 + w_{-1}$. The differential cross-sections are expressed in terms of 19 coefficients of P_1, P_2 and the polar scattering angles. A table of the coefficients is presented together with specimen differential cross-sections at E_γ = 22.2 mev and 102 mev for deuterons aligned with and perpendicular to the incident photon direction.

EXCITON STRUCTURE AND ZEEMAN EFFECTS IN CADMIUM SELENIDE, by J. O. Dimmock and R. G. Wheeler. June 12, 1961 [26]p. incl. diagrs. refs. (AFOSR-829) (AF 49(638)503) AD 258198 Unclassified

Also published in Jour. Appl. Phys. Suppl., v. 32: 2271-2277, Oct. 1961.

Also published in Semiconducting Compounds, Proc. of the Conf., Schenectady, N. Y. (June 14-16, 1961), New York, W.A. Benjamin, Inc., 1961, p. 2271-2277. (AFOSR-2010)

Observations were made of the exciton spectra in wurtzite cadmium selenide. The identification and subsequent interpretation was facilitated by measurements of the magneto-optical effects of the spectra. A qualitative understanding of the spectra is obtained from a review of the allowed band symmetries at K = 0, 0, 0 in crystals of C_{6V}^4 symmetry. The exciton symmetries and selection rules are obtained group theoretically. A quantitative comparison with an anistropic exciton mass theory, which will be outlined, permits evaluation of the electron and hole mass and g value parameters.

EXCITON STRUCTURE AND ZEEMAN EFFECTS IN CADMIUM SELENIDE, by R. G. Wheeler and J. O. Dimmock. [1961] [11]p. incl. diagrs. tables, refs. (AFOSR-3171) [AF 49(638)503] AD 405014 Unclassified

Also published in Phys. Rev., v. 125: 1805-1815, Mar. 15, 1962.

An interpretation of the observed exciton spectra of CdSe and determination of the effective mass parameters of the conduction and valence bands was made. Good quantitative agreement was obtained with few exceptions which can be attributed to toroidal energy surfaces. The significant difference between this spectra and that of CdS is that in CdSe the crystal field splitting is greater than the exciton binding energy, while in CdS it is not. Thus the evidence that transitions are observed in CdS forbidden by the group theoretical optical selection rules considering isolated bands, while in CdSe only allowed transitions are observed supports the assumption of less valence band mixing due to the exciton states in CdSe than in CdS.

TIME DEPENDENT IONIC POLARIZATION OF NaCl CRYSTALS (Abstract), by P. H. Sutter and A. S. Nowick. [1961] [1]p. [AF 49(638)503] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v 6: 131, Mar. 20, 1961.

It is widely believed that the time dependent polarization which occurs upon application of a dc field to alkali halide crystals is due to the blocking of ionic discharge at the electrodes, the quantitative theory for which was given by Jaffé. Jaffé's equations are nonlinear and predict severe deviation from Ohm's law and failure of the superposition principle for ordinary values of applied potential. The present work covers the range 25° to 200°C for pure NaCl crystals. The polarization is found to be structure sensitive, depending on annealing, cold working, and impurity content. It is consistently found, however, that Ohm's law and the superposition principle are obeyed. The temperature dependence of the polarization is studied and it is found that the polarization magnitude is approximately independent of temperature but that the process occurs more rapidly at higher temperatures in accord with an activation energy of about 1.1 ev. The following conclusions are drawn: (1) Polarization in this range is not related to electrode effects but originates in a time dependent volume polarization phenomenon. (2) The true ionic conductivity is that obtained from the final current, i.e., after the transient polarization process has ceased.

EXCITON SPECTRA AND ZEEMAN EFFECTS IN CADMIUM SELENIDE (Abstract), by R. G. Wheeler and J. O. Dimmock. [1961] [1]p. [AF 49(638)503] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 148, Mar. 20, 1961.

The exciton spectra of cadmium selenide has been observed and identified by optical reflection, absorption, and Zeeman effects at 1.8°K. The results of the reflection experiments indicate the presence of 2 nonoverlapping exciton series. From the observed optical selection rules relative to the crystal C axis, the conduction band is identified as having a Γ_7 symmetry. The 2 series correspond to the $\Gamma_9 - \Gamma_7$ valence band splitting of approximately 210 cm^{-1}. The absorption and magnetic effects have identified the n = 1; n = 2, p_z, p_{xy}; n = 3 states of the lowest energy series. By using the analysis of item no. 3185, Vol. V., the following band parameters have been obtained:
E_g = 14851 cm^{-1}; the exciton mass $m_{ex\perp}^* = 0.11m_e$, $m_{ex\parallel}^* = 0.14m_e$; the electron mass $m_e^* = 0.13m_e$; the hole mass $m_h^* \sim 0.5m_e$. The electron g values are anisotropic with $g_\parallel = |1.65|$ and $g_\perp = |0.45|$. It is also estimated that $g_\parallel$ must be negative implying a spin-orbit splitting of the valence band of the order of 5000 cm^{-1}. The effect of the finite photon momentum is observed in the Zeeman splitting of the n = 2p states upon 180° rotation of the magnetic field perpendicular to the crystal C axis.

EXCITON STRUCTURE AND ZEEMAN EFFECTS IN UNIAXIAL CRYSTALS OF SMALL ANISOTROPY (Abstract), by J. O. Dimmock and R. G. Wheeler. [1961] [1]p. [AF 49(638)503] Unclassified

Presented at meeting of the Amer. Phys. Soc., Monterey, Calif., Mar. 20-23, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 148, Mar. 20, 1961.

The presence of an external magnetic field has been included in a Hamiltonian for the exciton system in the effective mass approximation obtained by Dresselhaus. This has been approximated to the case of uniaxial crystals of small anisotropy by the assumption that the effective mass tensor for both the electron and hole is diagonal, the transverse mass components are equal within each tensor, the remaining anisotropy is small, and the anisotropy in the dielectric constant is cylindrical and small. A brief calculation puts the resulting Hamiltonian in a form sufficiently close to that of the Hamiltonian for the hydrogen atom that first order perturbation techniques may be employed to obtain the zero field deviation of the spectrum from hydrogen-like in terms of the mass and dielectric anisotropies. If the components of the dielectric constant are presumed known, the magnetic field perturbations for H parallel and perpendicular to the crystal C axis depend only on the longitudinal and transverse electron and hole masses such that a comparison of this theory with experiment will yield values for the electron and hole mass tensors in the above approximation.

RADIO-FREQUENCY ZEEMAN TRANSITIONS IN THE $2^3P_{2,1}$ STATES OF He^4 (Abstract), by B. B. Aubrey, L. Y. Chow and others. [1961] [1]p. [AF 49(638)545] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 248, Apr. 24, 1961.

The optical-rf atomic beam magnetic resonance method has been used to observe rf transitions between the Zeeman sublevels of the $2^3P_{2,1}$ states of helium in weak magnetic fields. A beam of helium atoms in the metastable 2^3S_1 state is formed. The C-field region is illuminated with resonance radiation for the $2^3S \leftrightarrow 2^3P$ transition so that atoms are excited to the 2^3P states in which they have a lifetime of about 10^{-7} sec. The excitation of the atoms to the ^3P states and their subsequent decay back to the $^3S_1$ state produces a "light flop". While the atoms are in the 2^3P state they are subjected to a radio-frequency magnetic field so that transitions are induced between the Zeeman sublevels of the 2^3P states and can be observed as changes in the light flop. At the weak magnetic fields of 10 to 30 gauss employed, the transitions between the $^3S_1$ Zeeman sublevels are not resolved, and the observed line shape is not a simple superposition of independent Zeeman transitions in the ^3P and $^3S_1$ levels, but indicates interference effects which must arise from the strong coupling by optical and radio-frequency fields between all the states.

THE KINETICS OF THE THERMAL DECOMPOSITION OF METHYLENECYCLOBUTANE, by J. P. Chesick. [1961] [4]p. incl. diagrs. table, refs. (AFOSR-974) (AF 49(638)722) AD 611451 Unclassified

Also published in Jour. Phys. Chem., v. 65: 2170-2173, Dec. 1961.

Methylenecyclobutane undergoes a homogeneous thermal decomposition to allene and ethylene. This reaction has been studied in the gas phase by static methods from 430 to 470° over a pressure of 0.1 to 25 mm. The reaction is first order with a high pressure rate constant $k = 4.76 \times 10^{15} \exp(-63.3 \text{ kcal/RT}) \text{ sec}^{-1}$. At low pressures the rate decreases as predicted for unimolecular reactions in pressure regions where collisional activation starts to become rate controlling. Added nitrogen has the effect of increasing the rate in the low pressure region. (Contractor's abstract)

THE KINETICS OF THE THERMAL DECOMPOSITION OF [2,2,1] BICYCLOHEPTADIENE, by J. H. Birely and

J. P. Chesick. [1961] [3]p. incl. tab'e. (AFOSR-1553) (AF 49(638)722) AD 611450 Unclassified

Also published in Jour. Phys. Chem., v. 66: 568-570, Mar. 1962.

An approximately equimolar mixture of acetylene and cyclopentadiene was prepared and heated at 360° for a time which would correspond to 50% decomposition of BCH (bicycloheptadiene), and at a total pressure of 1 cm. Sixteen runs at BCH pressures between 0.3 and 1.2 cm were made at 353° and were analyzed using the hexamethylphosphoramide column to check the cyclopentadiene-acetylene ratio. The cyclopentadiene-acetylene ratio was 0.93 with a rms deviation of 2.0%. A plot of -log (fraction BCH unreacted) vs time for a series of runs at 352.0° and another series at 356.7° gave straight lines with deviations of less than 2% from linearity except for 2 runs at 62 and 67% conversion which were off by 7% each. It was concluded that the disappearance of BCH is a first-order reaction. An absence of important polymerization reactions is found in the total chromatogram peak areas. Two runs were made at 329.8° with the reaction vessel packed with 4-mm diameter glass beads which increased the surface to volume ratio by a factor of 55. The apparent first-order rate constant for production of cyclopentadiene plus acetylene was unchanged, and the rate constant for formation of toluene + CHT was increased by 12%. It therefore seemed safe to conclude that the reaction observed in the unpacked vessel is homogeneous. It proved difficult to sort out trends in the toluene formation except that it increased relative to CHT with an increase in temperature. Four runs were made with added nitrogen. The chief result was the increase in CHT formation rate by 12%. Activation energies were calculated for the first-order formation of cyclopentadiene plus acetylene from BCH and cycloheptatriene formation from BCH.

ABSORPTION SPECTRUM OF GASEOUS Cl^- AND ELECTRON AFFINITY OF CHLORINE, by R. S. Berry, C. W. Reimann, and G. N. Spokes. [1961] [2]p. (AFOSR-1413) [AF AFOSR-61-25] Unclassified

Also published in Jour. Chem. Phys., v. 35: 2237-2238, Dec. 1961.

Observations of ultraviolet absorption spectra of several alkali halide vapors heated by shock waves are reported. The shock tube is conventional. Salt samples (0.1 - 1.0 g) are introduced into the shock tube as dried deposits on strips of cellulose tissue or on thin perforated aluminum foil, which are placed across the shock tube about 90 cm upstream from the observation window. The most intense absorption has come with the strongest shocks. In all cases comparison spectra of the flash lamp have been taken. Spectra of shock-heated alkali vapors display the principal series of the alkalis; the rubidium series to 14p, and the cesium series to 16p have definitely been observed. In the case of both the chloride salts, 2 sharp decreases in plate density appear, at 3424 and 3225A. The intensity of the continuous absorption is significantly greater for CsCl than for RbCl. The conditions under which the absorption is found, its 2 sharp thresholds with their seemingly constant relative intensity, and the energy separation between the thresholds all lead to the assignment of the spectrum to the photodetachment process of the chloride ion. The lower threshold obtained with a Debye-Hückel correction of 0.7 ± 0.4 kcal/mol is 84.2 ± 0.4 kcal/mol.

ELECTRON TRANSPORT IN A SEMICONDUCTOR, by H. L. Frisch and J. L. Lebowitz. [1961] [34]p. (AFOSR-434) (AF 49(638)753) AD 252636 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 28, Feb. 1, 1961.

The linear transport properties of electrons in a solid are investigated when both phonon and impurity scattering are important. The problem is treated for the case where Maxwellian statistics apply and the electrons are described by a classical distribution function in position and velocity. f(r, v) satisfying a space dependent equation in which the phonon scattering only is described by a linear Boltzmann type collision term. This equation is solved formally in the presence of a weak external electric field in a form convenient for perturbation expansions in the relative strength of the different scattering mechanisms, some of which are carried out explicitly. When the kernel describing collision with phonons is randomizing the change in mobility due to the presence of impurities is always negative. (Contractor's abstract)

ELECTRON TRANSPORT AT HIGH TEMPERATURES IN THE PRESENCE OF IMPURITIES, by H. L. Frisch and J. L. Lebowitz. [1961] [8]p. (AFOSR-1451) (AF 49(638)753) Unclassified

Presented at meeting of the Amer. Phys. Soc., Mexico City (Mexico), June 22-24, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 360, June 22, 1961.

Also published in Phys. Rev., v. 123: 1542-1549. Sept. 1, 1961.

The electrical transport properties of a solid at high temperature are often determined primarily by the scattering of electrons by phonons and impurities. The problem is treated for the case where Maxwellian statistics apply and the electrons are described by a classical distribution function in position and velocity, f(r, v). This function satisfies a space-dependent equation in which the interaction with the impurities is treated as part of the Hamiltonian and the phonon scattering is described by a linear Boltzmann-type collision term. This equation is solved formally in the presence of a weak external electric field in a form convenient for perturbation expansions in the relative strength of the different scattering mechanisms, some of which are carried out explicitly. It is also shown rigorously that the change in conductivity due to the presence of impurities is negative. (Contractor's abstract)

THERMODYNAMIC PROPERTIES OF SMALL SYSTEMS, by J. L. Lebowitz and J. K. Percus. [1961] [9]p. (AFOSR-4113) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)753 and Atomic Energy Commission) Unclassified

Also published in Phys. Rev., v. 124: 1673-1681, Dec. 15, 1961.

The dependence of the pressure of a homogeneous system is investigated at a given density ρ and temperature T, on the number of particles N. The particles of the system are assumed to interact via forces of finite range a and are confined to a periodic cube of volume L^3, $\rho = N/L^3$. It is found that there are generally 2 types of N dependencies in the pressure and other intensive properties of the system. There is a simple dependence which goes essentially as a power series in (1/N) and may be computed explicitly in terms of the grand-ensemble averages of these properties where it is absent. The other, more complex, dependence comes from the volume dependence of those cluster integrals which are large enough to wind at one around the periodic torus. These do not appear in a virial expansion for terms $k \leq (N/\rho a^3)^{1/3}$. They play however a dominant role in the N dependence observed by Alder and Wainwright in their machine computations on a hard-sphere gas. While the explicit calculation of these terms is very difficult and has been carried through only in a few special cases, they may be related, approximately at least, to the radial distribution function in an infinite system. An expression is also derived for the correlation between the particles of an ideal gas represented by a microcanonical ensemble. (Contractor's abstract)

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 14, Feb. 1, 1961. (Title varies)

Published in Phys. Rev., v. 128: 1945-1958, Nov. 15, 1962.

Kubo's treatment of isolated nonequilibrium systems to open systems in contact with thermal reservoirs is generalized. When the system is in contact with 1 reservoir and is subject to a weak external field, the deviation of the average of any quantity from its equilibrium value is related to a time-correlation function which incorporates the effect of the reservoir. A corollary is an isothermal fluctuation-dissipation theorem, which gives an explicit expression in terms of a time-correlation function for the rate at which energy flows from the driving field into the reservoir via the system. As an application, the complex conductivity of a Lorentz gas is computed. An expression is obtained for the stationary nonequilibrium distribution of a system in contact with several reservoirs at slightly differing temperatures and chemical potentials. The Onsager coefficients, which relate the heat and particle fluxes to the differences among the reservoir parameters, are then explicitly expressed in terms of suitable time-correlation functions and their symmetry is exhibited. The validity of perturbation theory in finding the linear deviation from equilibrium of the Γ-space ensemble density is also discussed. (Contractor's abstract)

N-DEPENDENCE OF LOW-ORDER DISTRIBUTION FUNCTINNS (Abstract), by J. L. Lebowitz and J. K. Percus. [1961] [1]p. [AF 49(638)753] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Feb. 1-4, 1961

Published in Bull. Amer. Phys. Soc., Series II, v. 6: 15, Feb. 1, 1961

One of the features characterizing a fluid is the existence of a finite correlation length λ. For molecular separations large compared to λ the low-order Ursell functions F_n approach values which are of o(N): in a closed system containing N particles. A simple general expression is obtained for the N^{-1} term in this asymptotic region and used it to prove the local nature of the low-order distributions in an inhomogeneous system. For systems with periodic boundary conditions there are no shape-dependent corrections to F_2, and the N^{-1} correction applies also to small separations. This should be detectable, in principle, in the recent machine computations of the radial distribution function for a wide range of values of N. The asymptotic value of the radial distribution function also may be used to obtain the high-temperature equation of state of a fluid consisting of particles having a hard core and a wide shallow square well potential. H-THEOREM AND VARIATIONAL PRINCIPLES FOR PLASMAS, by J. L. Lebowitz and E. Morris. [1961] [4]p. (Bound with its AFOSR-1869; AD 269142) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)753 and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 24-27, 1961.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 6: 289, Apr. 24, 1961.

The distribution functions $f^i(r, \xi)$ of the components of an ionized plasma are generally assumed to obey a Fokker-Planck type equation. This equation like the Boltzmann equation is quadratic in the distribution functions. Unlike the Boltzmann equation, however, the distribution functions do not enter symmetrically here and it becomes somewhat complicated to prove the H theorem for these equations. The proof results showed that the rate of entropy production due to collisions is proportional to $\Sigma \int d\xi \int d\eta \{(\eta - \xi) \times [\nabla \ln f^i(\xi)/m_i - \nabla \ln f^j(\eta)/m_j]\}^2$ which is positive and vanishes only for the case of Maxwellian distributions. The extension of the H theroem for more general equations of this form and the use of some variational principles for obtaining solutions of these equations will also be discussed. ACTION PRINCIPLE FOR CLASSICAL MECHANICS, by L. M. Garrido. [1961] 22p. (AFOSR-302) (AF 61-(052)438) AD 253350; PB 155425 Unclassified

Also published in Jour. Math. Anal. and Appl., v. 3: 295-314, Oct. 1961.

A differential action principle is presented which yields Hamilton's equations of motion and provides a general method of treating perturbations in classical mechanics. (Contractor's abstract)

APPROXIMATE CONSTANCY OF ADIABATIC INVARIANTS IN PLASMA PHYSICS, by L. M. Garrido and F. Gascon. [1961] 15p. (AFOSR-924) (AF 61(052)-438) AD 262957 Unclassified

Also published in Prog. Theoret. Phys. (Japan), v. 28: 573-584, Oct. 1962.

The interaction representation is introduced for classical mechanics starting from an operational formulation of the same. General criteria are given to be satisfied by a slowly time dependent Hamiltonian in order to possess adiabatic invariants of m^{th} order, and a general method is presented based on techniques similar to those used to evaluate time dependent perturbations in quantum mechanics to calculate the degree of approximate constancy of such adiabatic invariants for Hamiltonians depending slowly but at a finite rate on time. Finally these methods are applied to the adiabatic invariants that appear in thermonuclear plasma, evaluating the errors made in the guiding center approximation. (Contractor's abstract)

APPROXIMATE CONSTANCY OF ADIABATIC INVARIANTS, by L. M. Garrido. [1959] 21p. (AFOSR-1039) (AF 61(052)438) AD 262956 Unclassified

Also published in Prog. Theoret. Phys. (Japan), v. 26: 577-588, Nov. 1961.

The approximate constancy of adiabatic invariants is explored through application of harmonic oscillations of charged particles in a magnetic field. (Contractor's abstract)

Zaragoza U. (Spain).

DEGREE OF APPROXIMATE VALIDITY OF THE ADIABATIC INVARIANCE IN QUANTUM MECHANICS, by L. M. Garrido and F. J. Sancho. [1961] 15p. (AFOSR-1825) (AF EOAR-61-33) AD 272165 Unclassified

Also published in Physica, v. 28: 553-560, June 1962.

The conditions that make the quantum mechanical adiabatic theorem valid to m^{th} order and the degree of approximate validity of the same when the time-dependent Hamiltonian varies at a slow though finite rate are studied. (Contractor's abstract)

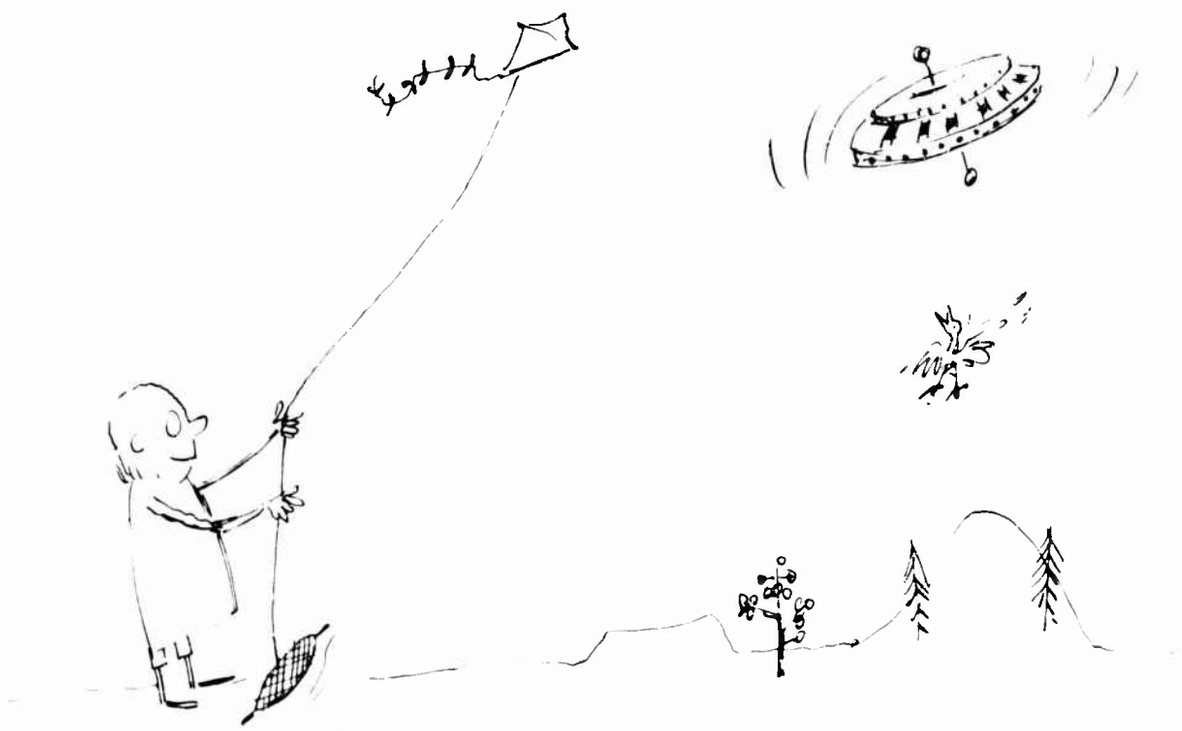
RESEARCH IN INDUCTIVE INFERENCE, by R. J. Solomonoff. Progress rept. Apr. 1, 1959-Nov. 30, 1960. Jan. 1961, 18p. incl. refs. (Rept. no. ZTB-139) (AFOSR-160) (AF 49(638)376) AD 252446 Unclassified



The principal progress made was in the discovery of what are apparently several equivalent formal solutions to the general inductive inference problem. These solutions are applicable to numerical and/or non-numerical and/or analog and/or digital data. Any type of information that is available can be made part of the evidence upon which the inferences are made. These general induction methods were applied to several specific problems in non-numerical prediction. Some computer programs were written for the discovery of regularities in English text and any other sequence of symbols. Some work was done toward programming a computer to learn to assign descriptors to documents. Before the new inference methods were discovered, much time was spent on the problem of discovering the grammars of phrase structure languages from a body of text alone. Since then, the general inference methods have cleared up a serious point of difficulty in this problem. Another problem upon which considerable progress was made is the problem of programming a computer to improve its own inference methods.

Zator Co., Cambridge, Mass.

A CODING METHOD FOR INDUCTIVE INFERENCE, by R. J. Solomonoff. Apr. 1961, 11p. (Rept. no. ZTB-140) (AFOSR-510) (AF 49(638)376) AD 256886
Unclassified

A new general inductive inference method has been described in which the a-priori probability of a sequence of symbols is computed on the basis of the lengths of various code strings that could be used to describe that sequence to a universal Turing machine. A coding method is displayed for a simple Bernoulli sequence and the inference technique is applied to the computation of probabilities of symbols in that sequence. The results obtained in this case are shown to be identical to Laplace's rule of succession. The probabilities correspond to Shannon's entropy if the Bernoulli sequence is a very long one. (Contractor's abstract)

1408

AF AFOSR-61-38
Johns Hopkins U. Dept. of Medicine, Baltimore, Md.
1235

AF AFOSR-61-40
Buenos Aires U. Inst. de Anatomía General y Embriologia (Argentina)
137

AF AFOSR-61-42
Pennsylvania State U. Dept. of Biology, University Park
2206

AF AFOSR-61-46
Institute for Advanced Study, Princeton, N. J.
1158

AF AFOSR-61-47
Institute of the Aerospace Sciences, Inc., New York
1159

AF AFOSR-61-50
Denver U. Research Inst., Colo.
673

AF AFOSR-61-52
Chicago U. Inst. for the Study of Metals, Ill.
501-506

AF AFOSR-61-56
Wisconsin U., Madison
3155

AF AFOSR-61-57
Maryland U. Dept. of Physics, College Park
1445-1447

AF AFOSR-61-62
Communication Research Inst., Miami, Fla.
589, 590

AF AFOSR-61-65
Instituto de Neurologia, Montevideo (Uruguay)
1162, 1163

AF AFOSR-61-72
North Carolina U. Dept. of Physics, Chapel Hill
2046-2050

AF AFOSR-61-75
Instituto de Matematica Pura e Aplicada, Rio de Janeiro (Brazil)
1161

AF AFOSR-61-76
Northwestern U., Evanston, Ill.
2073

AF AFOSR-61-88
Western Ontario U. Dept. of Physics, London (Canada)
3123-3127

AF AFOSR-61-89
British Columbia U. Dept. of Mathematics, Vancouver (Canada)
116

AF AFOSR-61-91
British Columbia U. Dept. of Physics, Vancouver (Canada)
117

AF AFOSR-61-92
Sydney U. School of Physics (Australia)
2845

AF AFOSR-61-93
Sydney U. School of Physics (Australia)
2846

AF AFOSR-61-103
National Research Council. National Academy of Sciences, Washington, D. C.
1961, 1962

AF AFOSR-61-104
Miami U. Dept. of Chemistry, Coral Gables, Fla.
1815

AF AFOSR-62-11
Massachusetts Mental Health Center, Boston
1781

AF AFOSR-62-31
Johns Hopkins U. Dept. of Physiology, Baltimore, Md.
1256

AF AFOSR-62-32
Rochester U. Dept. of Physics and Astronomy, N. Y.
2578

AF AFOSR-62-70
California U. Electronics Research Lab., Berkeley
299-302

AF AFOSR-62-90
Princeton U. Dept. of Aeronautical Engineering, N. J.
2404

AF AFOSR-62-115
Pennsylvania State U. Dept. of Engineering Mechanics, University Park
2214

AF AFOSR-62-121
California U. Dept. of Physics, Berkeley
253-258

AF AFOSR-62-132
Purdue U. Dept. of Physics, Lafayette, Ind.
2463, 2464

AF AFOSR-62-151
Texas A. and M. Coll. Dept. of Physics, College Station
2922

AF AFOSR-62-198
Harvard U. Dept. of Mathematics, Cambridge, Mass.
957

AF AFOSR-62-222
Case Inst. of Tech. Dept. of Physics, Cleveland, Ohio
424

AF AFOSR-62-228
Columbia U. Dept. of Chemistry, New York
570

AF AFOSR-62-235
Manitoba U. Dept. of Mathematics, Winnepeg (Canada)
1390-1392

AF AFOSR-62-237
Texas U. Dept. of Chemical Engineering, Austin
2925

AF AFOSR-62-252
Minnesota U., Minneapolis
1903

AF AFOSR-62-368
American Soc. of Mechanical Engineers, New York
55A

AF AFOSR-62-395
San Andres U. Laboratorio de Fisica Cosmica de Chacaltaya, La Paz (Bolivia)
2629

AF EOAR-61-2
Sheffield U. (Gt. Brit.)
2637

AF EOAR-61-4
Cork U. Coll. (Ireland)
601

AF EOAR-61-13
Cambridge U. Psychological Lab. (Gt. Brit.)
398

AF EOAR-61-21
Technische Hochschule. Mathematical Inst., Munich (Germany)
2910, 2911

AF EOAR-61-30
Centre National de la Recherche Scientifique, Paris (France)
446, 447

AF EOAR-61-33
Zaragoza U. (Spain)
3204, 3205

AF EOAR-61-39
London U. Coll. Dept. of Anatomy (Gt. Brit.)
1327

AF EOAR-61-44
Göteborg U. Dept. of Pharmacology (Sweden)
901-906

AF EOAR-62-10
Paris U. Lab. de Physique Théorique et Hautes Energies (France)
2203

AF EOAR-62-16
Free U. of Brussels. Dept. of Chemical Physics (Belgium)
808

AF EOAR-62-35
Pisa U. (Italy)
2251

AF EOAR-62-44
Cambridge U. Dept. of Zoology (Gt. Brit.)
394

AF EOAR-62-62
Oxford U. Engineering Lab. (Gt. Brit.)
2187

AF EOAR-62-123
Uppsala U. Inst. of Physics (Sweden)
2991-2993

AT(30-1)2098
Massachusetts Inst. of Tech. Lab. for Nuclear Science, Cambridge
1573-1621

CSO-670-55-21
National Bureau of Standards, Washington, D. C.
1953

Contract Index

CSO-680-59-7
National Bureau of Standards, Washington, D. C.
1954

CSO-680-59-8
Bureau of Mines, Bartlesville, Okla.
140

CSO-680-60-2
National Bureau of Standards, Washington, D. C.
1955-1957

DA 36-039-sc-56695
Illinois U. Coordinated Science Lab., Urbana
1047, 1048

DA 36-039-sc-73279
Columbia U. Columbia Radiation Lab., New York
540-546

DA 36-039-sc-78108
Massachusetts Inst. of Tech. Research Lab. of Electronics, Cambridge
1660-1773

Bromine isotopes (Radioactive) - Decay
753, 758
Bromite ions - Entropy
2439
Bromomethanes - Electronic transitions
3160
Bromomethanes - Spectroscopic analysis
3160
Bubble chambers - Optical data
1239
Buckling - Pressure
2895
Butadiene - Chemical reactions
97
Butanes - Free radicals
64
Butanes - Magnetic resonance spectra
1814
Butanol solutions - Dielectric relaxation time
1569
Butatriene molecule - Structure
2104

Cadmium - Magnetic properties
421
Cadmium bromide - Raman spectroscopy
629
Cadmium compounds - Phase equilibrium
2484
Cadmium compounds - Surface properties
2483
Cadmium crystals - Deformation
587, 588
Cadmium crystals - Fracture
587
Cadmium isotopes - Hyperfine structure
560
Cadmium isotopes - Level crossing fields
557, 560
Cadmium isotopes (Radioactive) - Nuclear spins
558, 559
Cadmium isotopes (Radioactive) - Zeeman resonance
559
Cadmium selenide - Zeeman effects
3179, 3182, 3184
Cadmium sulfide - Crystal analysis
2192
Cadmium sulfide crystals - Electron density
1044
Cadmium tungstate - Luminescence
1824
Calcite - Spectrographic analysis
282
Calcite crystals - Nuclear spins
279
Calcium - Volumetric analysis
1067, 1068, 1070
Calcium chromite - Polymorphism
6
Calcium compounds - Crystal fields
995
Calcium compounds - Surface catalysis
2674, 2679
Calcium magnesium carbonates - Chemical analysis
1067
Calcium nuclei - Elastic scattering
3171
Calcium systems - Polymorphism
4
Calcium titanates - Conduction properties
1082
Calcium tungstate - Luminescence
1824
Calcium-barium-silicon-oxides - Crystallographic analysis
5
Calorimeters - Applications
140
Camphor - Decomposition
2547
Canaries - Nest building
394
Captivity - Bibliography
143
Carbides - Crystal structure
2236, 2237
Carbides - Structural analysis
2972
Carbon - Atomic orbitals
522
Carbon - Electromagnetic properties
2734
Carbon - Production
161
Carbon - Proton scattering
372

Carbon alloys - Phase studies
1085
Carbon bonds - Properties
2106
Carbon compounds - Entropy
2532
Carbon compounds - Growth requirements
2164
Carbon compounds - Pyrolysis
633
Carbon dioxide - Cross sections
713
Carbon dioxide - Cryogenic pumping
2658
Carbon dioxide - Infrared spectra
1810
Carbon dioxide - Molecular structure
1810
Carbon dioxide - Proton bombardment
749
Carbon disulfide - Photolysis
1357
Carbon isotopes - Bombardment
731
Carbon isotopes - Electron spin resonance
561, 562, 565
Carbon isotopes - Electron transitions
2763
Carbon isotopes - Energy levels
736, 737, 745, 2435
Carbon isotopes - Hyperfine splitting
561, 562, 565
Carbon isotopes - Metabolic analysis
2165
Carbon isotopes - Neutron cross sections
1579
Carbon isotopes - Parity states
1587
Carbon isotopes - Polarization
3066
Carbon isotopes (Radioactive) - Applications
3032
Carbon monoxide - Spectrographic analysis
199, 3127
Carbon monoxide borane - Photolysis
3012
Carbon nitride - Molecular structure
525
Carbon tetrachloride - Nuclear magnetic resonance
718
Carbonaceous rocks - Free radicals
1312
Carbon-metal bonds - Kinetics
529
Carbons - Electrons
641
Carbonyl sulfide - Molecular structure
524
Carbonyls - Fluorocarbon derivatives
969
Carbonyls - Organosulfur derivatives
967
Carboxylation - Mechanism
1801
Carboxylic acids - Stereochemistry
2652
Carboxymethyl cellulose solutions - Refraction
534
Cardiovascular system - Blood pressure
2638
Cardiovascular system - Central nervous system
2635
Cardiovascular system - Homeostasis
2639
Cardiovascular system - Local regulation
399
Cardiovascular system - Mammary gland function
400
Cardiovascular system - Neural mechanisms
2640
Carotenoids - Biochemical analysis
3032
Catalysis - Autocatalytic mechanisms
2637
Catalysis - Theory
1165
Catalysts - Adsorption
2324
Catalysts - Surface properties
2074
Catechol amines - Condensation
906
Catechol amines - Detection
1351
Catechol amines - Determination
1281
Catechol amines - Distribution
1284
Catechol amines - Fluorescence
906, 1281
Catechol amines - Heart metabolism
1287
Catechol amines - Reserpine effect
1285
Catechol amines - Secretion
1283, 1352
Catechol amines - Storage
1351, 1353
Catechol amines - Synthesis
1353
Catechol amines - Uptake
1286
Catechol amines - Urinary excretion
1288
Cathode ray tubes - Analysis
1667
Cathode ray tubes - Design
1674
Cats - Psychomotor tests
327
Caudate nucleus - Neo-cortical activities
1405
Caudate nucleus - Suppressive action
1403
Cavitation - Physical effects
118
Cavitation - Sound transmissions
119
Cavity resonators - Theory
2337
Celestial mechanics - Orbit determination
861
Cell structure - Carbohydrate metabolism
1792
Cells (Biology) - Function
817

Subject Index

Cells (Biology) - Mitochondria
137
Cells (Biology) - Morphology
817
Cells (Biology) - Physiology
1313, 1348, 1352
Cementite - Structural analysis
2972
Central median - Evoked responses
1397, 1400
Central nervous system - Analysis
790
Central nervous system - Bionics
398
Central nervous system - Drug effects
1515
Central nervous system - Physiology
322
Central nervous system - Psychological tests
686
Central nervous system - Stimulation
2635, 2833
Central nervous system (Cat) - Stimulation
876
Centrifuge - Application
2180
Cephalization - Mathematical analysis
56
Ceramic materials - Corrosion
75
Ceramic materials - Dielectric properties
1571, 2787
Ceramic materials - Magnetic properties
2925
Ceramic materials - Microwave properties
2778
Ceramic materials - Stress
313
Ceramic materials - Structural properties
1571
Cerebello-cerebral functions - Electrophysiology
786
Cerebellum (Cat) - Stimulation
1887
Cerebral cortex - Afferent impulses
775, 782
Cerebral cortex - Analysis
781
Cerebral cortex - Arousal mechanism
774, 781, 2154
Cerebral cortex - Electrical potentials
784
Cerebral cortex - Electrophysiological study
786
Cerebral cortex - Functional properties
1255
Cerebral cortex - Lesion compensation
397
Cerebral cortex - Nerve cells
1313
Cerebral cortex - Nerve regulation
780
Cerebral cortex - Neurophysiological mechanisms
774
Cerebral cortex - Potentials
772
Cerebral cortex - Receptor potentials
782
Cerebral cortex - Stimulation
396, 1404, 1795
Cerebral cortex - Wedenski inhibition
776
Cerebral cortex (Cat) - Electrical responses
776
Cerebral cortex (Cat) - Motor discharges
1401
Cerebral cortex (Cat) - Projection areas
771
Cerebral cortex (Cat) - Stimulation
1401, 1669
Cerebral cortex (Guinea pig) - Chemical analysis
1793
Cerebral cortex (Guinea pig) - Fluid content
1794
Cerebral cortex (Guinea pig) - Phosphocretine content
1793
Cerebral cortex (Guinea pig) - Physiology
1794
Cerebral cortex (Guinea pig) - Potassium salt contents
1793
Cerenkov radiation - Detectors
2741, 2742
Cerenkov radiation - Photography
1599
Cerenkov radiation - Theory
546
Cerium oxides - Domain theory
2444
Cesium - Optical properties
550
Cesium - Zeeman resonance
1112
Cesium halides - Spectra
699
Cesium plasmas - Electric fields
2472
Cesium plasmas - Ionization
2786
Cesium plasmas - Oscillation
2783
Cesium plasmas - Thermionic emission
2775
Cesium systems - Combustion properties
66
Cesium systems - Plasma sources
65
Cesium vapors - Electron transitions
2885
Cetacea - Vocal behavior
589, 590
Channels - Analysis
1764
Charge space - Theory
2456
Charged particles - Electrostatic fields
1061
Charged particles - Motion
795, 1435, 1687, 1750, 1765
Chelate compounds - Exchange reactions
2035
Chelate compounds - Titration procedures
2038
Chemical analysis - Methods
2029, 2033, 2038
Chemical bonds - Analysis
925, 926, 933, 934, 1328, 2105, 2146

Chemical bonds - Atomic orbitals
1137
Chemical bonds - Distortion
2140
Chemical bonds - Infrared spectroscopy
199
Chemical bonds - Kinetics
529
Chemical bonds - Measurement
2106, 2150
Chemical bonds - Properties
2106, 2264
Chemical bonds - Theory
1138
Chemical equilibrium - Analysis
1928
Chemical equilibrium - Mathematical analysis
223
Chemical indicators - Chelon waves
2033
Chemical indicators - Copper
2029, 2038
Chemical kinetics - Concentration factors
2034
Chemical kinetics - Solvent effects
1934
Chemical kinetics - Temperature factors
1167
Chemical kinetics - Time factors
2034
Chemical properties - Theory
662
Chemical reactions
see also specific types of reactions, e.g., Oxidation - reduction reactions
Chemical reactions - Addition
2454
Chemical reactions - Chain reactions
35
Chemical reactions - Decomposition
22, 23, 168, 339, 1036, 2646, 2704
Chemical reactions - Deoxymercuration
1934
Chemical reactions - Electrophilic displacement
1967, 1968
Chemical reactions - Exchange reactions
204-208, 1219, 2035
Chemical reactions - Fermentation
618
Chemical reactions - Free radicals
852
Chemical reactions - Isomerization
831
Chemical reactions - Kinetics
67, 132, 339, 836, 1135, 1165, 1967, 2034, 2035, 2113, 2485
Chemical reactions - Measurement
1135
Chemical reactions - Mechanism
97, 836, 1038, 2453, 2454, 3035, 3162, 3163
Chemical reactions - Oxidation-reduction
1376, 1879-1882, 2637, 3052
Chemical reactions - Photolysis
1807, 1809, 1813, 3033, 3034
Chemical reactions - Polarographic analysis
2030
Chemical reactions - Polymerization
2420
Chemical reactions - Preparation
1878
Chemical reactions - Pyrolysis
1320, 1978, 1979, 3033, 3035, 3036
Chemical reactions - Spectroscopic analysis
634, 1807, 1809, 2451
Chemical reactions - Stereoselectivity
2650
Chemical reactions - Sulfination
1294
Chemical reactions - Synthesis
1293, 1295, 1393, 2075, 2109, 2110, 2166, 2588
Chemical reactions - Thermal decomposition
3188, 3189
Chemical Reactions in the Atmosphere - Symposium
2680
Chemical reactors - Design
603
Chemicals - Electron irradiation
1031
Chemicals - Gamma radiation
1031
Chemicals - Radiation effects
1032
Chemoreceptors - Physiological factors
1009
Chlorella - Photosynthesis
2907
Chlorides - Qualitative analysis
1069
Chlorides - Volumetric analysis
1071
Chlorine - Absorption spectra
3191
Chlorine - Dissociation
338
Chlorine - Electron properties
3191
Chlorine azide - Photolysis
1807
Chlorine compounds - Pyrolysis
633
Chlorine copolymers - Irradiation
2325
Chlorine dioxide - Electronic state
2921
Chlorine isotopes - Magnetic properties
921
Chloroacetylalanine - Electron spin resonance
710
Chloroethylenes - Chemical reactions
2452
Chloroform - Nuclear magnetic resonance
718
Chloroplasts - Carbon dioxide fixation
622
Chloroplasts - Oxidation-reduction reactions
619, 620
Chloroplasts - Photosynthetic reactions
3101
Chloroplasts - Triphosphopyridine nucleotide reduction
622
Chromate ions - Acidification
2604
Chromatography columns - Azobenzenes
2144
Chromium alloys - Crystal structure
2968

Subject Index

Chromium alloys - Electron distribution
384
Chromium alloys - Phase studies
1085
Chromium alloys - Phase transitions
2969
Chromium boride - Crystal structure
2967
Chromium ions - Relaxation time
1863
Chromium ions - Spectrographic analysis
993, 1861, 1863, 1864, 1875
Chromium isotopes - Decay
734
Chromium isotopes - Hyperfine structure
1875
Chromium oxide - Reaction kinetics
1165
Circadian rhythms - Oscillatory systems
2406
Circuit theory - Mathematical analysis
928
Classical mechanics - Action principle
3201, 3205
Classical mechanics - Applications
2769
Classical mechanics - Relativity theory
1155
Classification systems - Documentation
1260
Claustro-insular area - Stimulation
1273
Cleaning compounds - Reactions
2084, 2085
Closing reflex (Mouth) - Reticular control
1018
Clouds - Unstable condensing
1545
Coals - Free radicals
1312
Cobalt - Surface reactions
2488
Cobalt alloys - Crystal structure
2968
Cobalt complexes - Reaction kinetics
2923, 2924
Cobalt compounds - Ferrimagnetism
2266
Cobalt compounds - Ferromagnetism
2267
Cobalt compounds - Polymerization
630
Cobalt ions - Electron spin resonance
1931
Cobalt ions - Polarographic analysis
1927
Cobalt isotopes - Transition states
2756
Cobalt isotopes (Radioactive) - Energy levels
732
Cobalt-aluminum alloys - Electron distribution
384
Cobalt-molybdenum alloys - Crystal structure
385
Coding - Mathematical analysis
1747, 3207
Coding - Theory
1665
Coils - Design
1624
Coils - Magnetic fields
893
Coils - Mathematical analysis
1624
Cold war - Alignments
580
Colemanite - Ferroelectric properties

Cosmic rays - Intensity
1433, 1436, 1574, 1577, 1588, 1603, 1605, 1617, 1618, 1994, 1996
Cosmic rays - Interaction
1970
Cosmic rays - Isotopic composition
2559, 2561, 2563
Cosmic rays - Local time dependence
1436
Cosmic rays - Magnetic disturbances
1797
Cosmic rays - Mathematical analysis
1432
Cosmic rays - Measurement
1436, 1796, 1798, 2613, 2625, 3047
Cosmic rays - Neutron albedo theory
1435, 1439, 1441
Cosmic rays - New Mexico
1603
Cosmic rays - Nuclear interactions
483
Cosmic rays - Observations
2641
Cosmic rays - Photographic analysis
1604
Cosmic rays - Photon energy
1971
Cosmic rays - Physical effects
1972
Cosmic rays - Polarization
1606
Cosmic rays - Properties
1438, 1439, 1616, 1970
Cosmic rays - Proton flux
481, 487
Cosmic rays - Primary
1355, 1603, 1605, 2044, 3022
Cosmic rays - Research
2626, 3022
Cosmic rays - Satellite observation
1995
Cosmic rays - Scanning devices
1355
Cosmic rays - Spectrographic analysis
1603
Cosmic rays - Statistical analysis
1973, 1974
Cosmic rays - Structure
1970
Cosmic Rays - Symposium summary
2563
Couette flow - Mathematical analysis
657
Coupled antennas - Reception
286
Crab nebula - Occultation
839
Creep - Mathematical analysis
2304, 2305
Cryogenics - Carbon dioxide
2658
Cryogenics - Superconductors
965
Crystal lattice defects - Electromagnetic theory
2099

Crystal lattices - Ground state energy
1427
Crystal structure - Analysis
1464
Crystal structure - Determination
5, 6, 2150
Crystal structure - Double phonon process
2192
Crystal structure - Electromagnetic properties
2340
Crystal structure - Field ion microscopy
2216, 2220
Crystal structure - Mathematical analysis
1426, 1431, 1463, 1713, 1895, 2095, 2132
Crystal structure - Mössbauer effects
3105
Crystal structure - Neutron diffraction analysis
2111, 2231
Crystal structure - Phase studies
387
Crystal structure - Pressure effects
57
Crystal structure - Relaxation
57
Crystal structure - Spectrographic analysis
1105, 1570, 1808, 1820, 1931, 1933, 2867, 3048
Crystal structure - Vibrations
2869, 2870
Crystal structure - X-ray diffraction analysis
413, 414, 933, 1101, 1932, 2332, 2964, 2968, 2973, 2977
Crystallization - Analysis
3151
Crystallography - Scientific research
1378
Crystals
see also Single crystals
see also specific crystals, e.g., Sodium chloride crystals
Crystals - Atomic structure
2297
Crystals - Deformation
1094, 1096, 1097, 1570, 2095, 2867
Crystals - Dislocation boundaries
2235
Crystals - Elastic constants
1760
Crystals - Electrical properties

Crystals - Electromagnetic properties
1939
Crystals - Electron spin resonance
703, 708
Crystals - Energy
672
Crystals - Excitation structure
3185
Crystals - Growth
3151
Crystals - Hall mobility
2280
Crystals - Hyperfine structure
1220
Crystals - Impurities
2868
Crystals - Lattices
337, 1421, 1424, 1426, 1431, 1463, 1713, 1815, 1836, 2095, 3178
Crystals - Magnetic properties
1713, 1895, 1896
Crystals - Magnetic resonance
1631
Crystals - Mathematical analysis
1093, 1095, 1939
Crystals - Nuclear quadrupole resonance
1310, 1311
Crystals - Optical properties
1463, 1893, 1894
Crystals - Paramagnetic resonance
2121
Crystals - Phonon scattering
1378
Crystals - Physical properties
1570, 2230
Crystals - Radiation effects
1836, 1932
Crystals - Relaxation time
544
Crystals - Temperature factors
1378, 1431
Crystals - Thermal diffusion
1377, 1380
Crystals - Thermodynamic properties
4, 7, 1424, 1464
Crystals - Vibrational energy
1808
Crystals - Vibrational frequency spectra
1424
Crystals - X-ray diffraction analysis
1043-1045, 1384
Crystals - Zeeman effects
3185
Cupric ions - Substitution reactions
2447
Cyanide complexes - Raman spectroscopy
631
Cyanide molecules - Reaction kinetics
132
Cyanogen flames - Cyclotron resonance
693
Cybernetics - Learning
2069
Cybernetics - Mathematical analysis
914
Cyclic compounds - Properties
2650, 3163
Cyclic compounds - Synthesis
1038
Cyclic compounds - Thermal decomposition
3189
Cyclobutane - Molecular structure
2107
Cyclohexanes - Exchange reactions
205-208
Cyclohexanes - Nuclear magnetic resonance
718
Cyclohexanes - Preparation
3161
Cyclohexanes - Synthesis
2546
Cyclohexenes - Chemical reactions
2453
Cycloketones - Molecular structure
2110
Cycloketones - Synthesis
2110

Cyclooctatetraene - Hyperfine splitting
562
Cyclooctatetraenyl anion - Electron spin resonance
564
Cyclopentadienyl derivatives - Chemical reactions
2588
Cyclopentane - Molecular structure
2107
Cyclopentanone - Energy levels
2549
Cyclopentanone - Photochemistry
2548
Cyclopentatriene - Thermal decomposition
3189
Cycloserine - Chemical reactions
1359
Cyclotron resonance
see also a subdivision, e.g., Metals - Cyclotron resonance
Cyclotron resonance - Measurement
1676
Cyclotron resonance - Theory
1632
Cylinders - Heat transfer
853
Cylindrical bodies - Aerodynamics
2318
Cylindrical bodies - Boundary layer control
591
Cylindrical bodies - Deformation
2896
Cylindrical bodies - Echo
287
Cylindrical bodies - Elasticity
2213
Cylindrical bodies - Electromagnetic fields
931
Cylindrical bodies - Fluid flow

Data processing systems - Design
884, 1256
Data processing systems - Electronic circuits
2825
Data processing systems - Information retrieval
3132-3136
Data processing systems - Machine translation
2476
Data processing systems - Sampling
1171
Data processing systems - Statistical analysis
1696, 1697
Data processing systems - Techniques
1170
Data storage systems - Coding
2228
Data storage systems - Design
674, 675
Data Storage Systems - Symposium
38
Data transmission - Digital systems
2346
Data transmission - Signal-to-noise ratio
2345
Decaborane - Ionization potentials
1217
Decay schemes - Analysis
1586, 3044
Decay schemes - Mathematical analysis
3019
Decay schemes - Matrices
366
Decay times - Time studies
1246
Decision making - Stress
2931
Decision making - Systems analysis
2361
Decomposition reactions - Kinetics
3188, 3189
Decomposition reactions - Mechanism
1978, 1979
Decomposition reactions - Pressure effects
3188
Defense mechanisms - Reliability tests
2930
Deformation - Buckling
2699, 2895, 2897
Deformation - Kinetic theory
1096, 1097
Deformation - Mathematical analysis
1094, 1476, 2214, 2304, 2328
Deformation - Mechanics
587
Deformation - Pressure
2896
Deformation - Shear
2706
Deformation - Stress
2696
Deformation - Theory
1098, 2095, 2235
Deformation - Thermal stress
2697

Subject Index

Deformation - Thickness stretch
2330
Deformation - X-ray analysis
3153
Dehydrogenation - Reaction kinetics
1165
Delay lines - Magnetic cores
264
Desoxyribonucleic acids - Coding
453
Detonation waves - Electromagnetic factors
2507
Detonation waves - Mathematical analysis
1842
Detonation waves - Stabilization
1958
Detonations - Computer analysis
2500
Detonations - Electric charges
2499
Detonations - Inhibition
1027
Detonations - Pressure effects
2503, 2505
Detonations - Pressure variations
2505
Detonations - Temperature effects
2503
Detonations - Velocity limits
2505
Detonations - Wave properties
304
Deuterated compounds - Crystal structure
2111
Deuterated compounds - Infrared spectra
1809, 1837
Deuterated compounds - Magnetic properties
3081
Deuterated compounds - Photolysis
1809
Deuterated compounds - Spectra
1977, 1992
Deuterated compounds - Structure
1977
Deuterated compounds - Vibrational spectra
1811, 1812
Deuterium - Applications
2111, 2919
Deuterium - Hyperfine structure
542
Deuterium - Nuclear reactions
2726, 2766
Deuterium - Substitution reactions
690
Deuterium - Tracer applications
1219
Deuterium atoms - Microwave discharge
598
Deuteroammonia - Neutron diffraction analysis
2111
Deuterons - Cross sections
3177
Deuterons - Disintegration
1573, 2764
Deuterons - Elastic scattering
1600
Deuterons - Electron bombardment
2735
Deuterons - Inelastic scattering
2759, 2761
Deuterons - Magnetic field
1462
Deuterons - Magnetic properties
3081
Deuterons - Nuclear reactions
2562, 3178A
Deuterons - Photodisintegration
727, 1607, 3177, 3178A
Deuterons - Polarization
3173
Deuterons - Sources
181
Diabetes - Hormonal influence
2244
Diaminomaleonitrile - X-ray diffraction analysis
933
Diamonds - Conduction properties
2132, 2133
Diaphragm (Cat) - Contraction
1013
Diatomic molecules - Dissociation
1041
Diatomic molecules - Molecular structure
169, 507, 509, 520
Diatomic molecules - Spectroscopic analysis
3115, 3119, 3121, 3126
Dibenzene chromium vapor - Spectrographic analysis
3190
Diboranes - Oxidation reactions
3486
Dicarbonyldinitrosyliron - Synthesis
971
Dichlorogermanium phthalocyanine - Synthesis
416
Dictionaries - Information retrieval
2673
Dielectric properties - Calculation
3185
Dielectric properties - Measurement
576, 1568
Dielectric properties - Temperature effects
1569
Dielectrics - Electrical charges
2370
Dielectrics - Electrical irradiation
2369
Dielectrics - Electroluminescence

Digital systems - Applications
1056, 1066
Digital systems - Reliability
2819, 2824
Digital-to-analog converters - Design
1058
Diglycolic acid - Electron spin resonance
712
Dihydrogen potassium phosphate - Whisker formation
1382
Dimethylnitramine - Pyrolysis
22
Dimethylsulfoxide - Chemical reactions
1927, 1930
Dimethylsulfoxide - Oxidation properties
2265
Dinitropropane - Pyrolysis
23
Diodes - Applications
1119, 2810, 3131
Diodes - Design
1666, 1700
Diodes - Noise reduction
274
Diodes - Properties
1666
Diodes - Space charge
275
Diodes - Thermionic emission
1666
Diphenylbenzocyclobutene - Synthesis
1782
Diphenylmethane dyes - Electronic spectra
3069
Diphenylnitric acid - Electron spin resonance
3055, 3058
Diphenylsultones - Irradiation
3114
Dipole moments - Measurement
575
Dipole moments - Theory
2407
Dipole moments - Wave transmission
149
Directional couplers - Mathematical analysis
2338
Directional couplers - Theory
2351
Discharge tubes - Applications
1907
Discharge tubes - Magnetic field
2502
Diseases - Diabetes insipidus
2244
Disks - Resistance properties
1655
Disks - Thermal stress
2697
Dispersion relations - Mathematical analysis
1061
Dispersion theory - Mathematical analysis
1230, 1243
Dissociation constants - Analysis
1930
Dissociation constants - Determination
1928
Distribution and Motion of Interstellar Matter in Galaxies - Symposium
1158
Distribution functions - Applications
1503
Distribution functions - Quantum statistical theory
1300, 1302, 1303
Disulfides - Biochemical properties
809
Disynaptic system - Transport mechanism
1394
Dithlodiglycol - Biochemical properties
810
Dithiodiglycol - Mitotic effects
813
Diuresis - Angiotensin effect
443
Diuresis - Blood volume influences
824
Diuresis (Dog) - Sodium chloride
822

Subject Index

Diuresis (Rat) - Tonephin properties

Classification, p. 945
Scattering - Cerenkov counters
2741
Scattering - Energy
284
Scattering - Mathematical analysis
267, 1380, 2340, 2723, 2743, 2873, 2874, 2959
2960
Scattering - Temperature dependence
1384
Scattering amplitude - High energy limits
1613
Scattering theory - Applications
3171, 3172
Scattering theory - Mathematical analysis
3171, 3172, 3176
Science - Underdeveloped nations
2626, 2627
Scientific information - Electrophysiological data
1743
Scientific instruments - Construction
1633
Scientific instruments - Design
1297, 1317, 1410, 1419, 1566, 1612, 1614, 1629
1602, 1603, 1907, 2100, 3170
Scientific research - Adrenocorticotropic hormone
1789
Scientific research - Antennas
1770
Scientific research - Atomic energy levels
1672
Scientific Research - Bibliography
1304
Scientific research - Biomedical engineering
1721
Scientific research - Cosmic ray showers
3022
Scientific research - Gas ionization
1802
Scientific research - Hypnosis
1774
Scientific research - Ionospheric propagation
929
Scientific research - Information theory
1665
Scientific research - Magnetic fields
1626
Scientific research - Magnetic fields
1627, 1630, 1637, 1638
Scientific research - Neuroendocrine relations
1768
Scientific research - Noise
1968
Scientific research - Nuclear reactions
3026
Scientific research - Particle interactions
3013, 3017
Scientific research - Plasma physics
1906
Scientific research - Surfaces
1669
Scientific research - Thyrotrophic hormone
1769
Scintillation counters - Applications
1588, 1970-1974
Scintillation counters - Design
1612
Seismic events - Inspection
2661
Seismic waves - Chile
189
Seismic waves - Detection
446
Seismic waves - Dispersion
187, 192, 195
Seismic waves - Fourier analysis
189, 194
Seismic waves - Huancayo, Peru
195
Seismic waves - Mathematical analysis
186, 190
Seismic waves - Outer Mongolia
194
Seismic waves - Propagation
186, 190, 197
Seismic waves - Sources
185, 190, 191, 193, 196
Seismographs - Analysis
197
Seismological stations - Design
316, 448
Seismology - Computers
187, 192
Seismology - Inspection manual
2681
Seismology - Marine geology
197
Seismology - Structural geology
186, 190, 195, 197
Seismology - Wave transmission
196
Selenium - Copolymerization
2421
Selenium - Dissociation energies
1041
Selenium - Electron donor
81
Selenium - Semiconducting films
1127
Selenium isotopes - Bombardment
753
Selenium isotopes - Nuclear reactions
756
Semantic Problems in Language - Symposium
383
Semiconductor devices - Applications
2019
Semiconductors - Band structures
1890
Semiconductors - Boundary properties
1129
Semiconductors - Conference
860

Subject Index

Semiconductors - Electric field effects
1108
Semiconductors - Electrical properties
1082, 1098
Semiconductors - Electromagnetic properties
80, 117
Semiconductors - Electron spin resonance
2133
Semiconductors - Electronic reactions
1103
Semiconductors - Energy transfer
2193
Semiconductors - Faraday effect
1908
Semiconductors - Faraday rotation
1622, 1623
Semiconductors - Germanium
500
Semiconductors - Hall effect
2274, 2358
Semiconductors - Impurities
80, 498, 499, 3192, 3193
Semiconductors - Luminescence
2132
Semiconductors - Magnetic properties
81
Semiconductors - Mathematical analysis
1890
Semiconductors - Microwave conductivity
1909
Semiconductors - Nuclear quadrupole resonance
1310
Semiconductors - Paramagnetic resonance
2859
Semiconductors - Physical properties
1130
Semiconductors - Properties
2580
Semiconductors - Recombination radiation
2190, 2191
Semiconductors - Resistance
1126
Semiconductors - Surfaces
2810
Semiconductors Transport properties
1165, 1910
Semidine rearrangement - Mechanism
1329-1335
Semipermeable membranes - Excitability
2996
Semipermeable membranes - Ion exchange
2994
Semipermeable membranes - Sodium transport
685
Semiquinones - Hyperfine splitting
562
Sense organs - Physiology
1274
Sensorimotor cortex (Cat) - Removal
1398
Sensory deprivation - Psychological factor
1775, 1777
Sensory mechanisms - Scientific research
1274
Sensory mechanisms (Bats) - Anatomy
1340
Sensory perception - Cortical lesions
397
Sensory perception - Disc size
1868
Sensory perception - Electrical responses
1740
Sensory perception - Neurophysiological factors
472
Sensory perception - Stimulation
1869
Sensory perception - Tactile stimulation
1753
Sensory perception - Test methods
1755
Sensory perception - Theory
1733, 1755
Sensory perception - Visual
1740
Sensory perception (Auditory) - Noise
1778-1780
Sensory perception (Auditory) - Stimulation
1733, 1867
Sensory reception - Environmental conditions
411
Sensory receptors - Electronic devices
2350
Sequences
see also separate Mathematical Subject Classification, p. 945
Sequences - Programming
3206, 3207
Sequential analysis
see also separate Mathematical Subject Classification, p. 945
Sequential analysis - Sampling
666
Sequential analysis - Significant differences
667
Serine crystals - Hyperfine structure
694
Serum albumin - Detergent effect
2084, 2085
Serum albumin - Properties
2084, 2085
Serum albumin - Spectra
2085
Servo systems - Applications
1054
Servo systems - Design
2362
Servo systems - Functional analysis
1757
Servo systems - Mathematical analysis
917, 1047, 1050
Servo systems - Stability
2360, 2362
Servo systems - Torque
1990
Servomechanisms - Physics
378
Sham rage - Sinocarotid pressoceptors
2640
Shear - Vibrational analysis
2331
Shear waves - Excitation
191
Sheaths - Electrical fields
2777
Sheets - Deformation
2304, 2305

Sheets - Elasticity
752
Sheets - Hydrodynamics
2708
Sheets - Hypersonic flow
155
Shells - Deformation
1557, 2696, 2699
Shells - Thermal stress
2912, 2913
Shielding - Mathematical analysis
1445
Shock tubes - Application
338, 1006, 1861-1864
Shock tubes - Chemical engineering
603
Shock tubes - Decomposition reactions
161
Shock tubes - Design
36, 613A, 1504, 2101
Shock tubes - Heat transfer
72, 74
Shock tubes - High temperature research
609
Shock tubes - Instrumentation
166
Shock tubes - Magnetic arcs
77, 79
Shock tubes - Molecular beam source
611
Shock tubes - Performance
602
Shock tubes - Pyrolytic reactions
1035
Shock waves - Analysis
69, 72-74, 2669
Shock waves - Attenuation
2101, 2103
Shock waves - Boundary layer
159, 2389
Shock waves - Chemical reactions
133
Shock waves - Combustion
25
Shock waves - Decomposition reactions
168
Shock waves - Electromagnetic fields
2101
Shock waves - Entropy gradient
34
Shock waves - Flow patterns
1502, 1505
Shock waves - Gas ionization
170, 171, 1005, 1006
Shock waves - Hard spheres
1563
Shock waves - Heat transfer
2308
Shock waves - Hypersonic flow
154
Shock waves - Magnetic effects
128
Shock waves - Magnetic fields
69, 71, 1505
Shock waves - Mathematical analysis
124, 127, 645, 1499, 1510, 2009
Shock waves - Perturbation
2391
Shock waves - Photographic analysis
1958
Shock waves - Pressure distribution
122, 1257
Shock waves - Production
1504
Shock waves - Pyrolytic reactions
132
Shock waves - Radiation effects
1499, 1510, 2101, 2103
Shock waves - Rare gases
131
Shock waves - Spectrographic analysis
170, 171
Shock waves - Stability
2683, 2684
Shock waves - Stress
2689
Shock waves - Temperature measurements
167
Shock waves - Transient effects
1257
Shock waves - Velocity measurements
36
Shock waves - Wedges
644
Signal detection - Applications
1683, 1697
Signal detection - Error rate
1697, 1703, 1707
Signal detection - Frequency variation
1722
Signal detection - Psychophysiological factors
1707
Signal detection - Theory
1683, 1704, 1988
Signals - Applications
1756
Signals - Multiplex properties
2344
Signals - Propagation
2813
Signal-to-noise ratio - Analysis
2345
Signal-to-noise ratio - Mathematical analysis
286, 2811
Signal-to-noise ratio - Statistical analysis
299
Silane compounds - Addition reactions
3162, 3163
Silica - Thermodynamic properties
140
Silicates - Thermodynamic properties
7
Silicides - Crystal structure
2332, 2966
Silicon - Band structure
1888, 1889
Silicon - Conductivity
2810
Silicon - Nuclear spins
279
Silicon - Spectrographic analysis
2190
Silicon - Surface properties
1128
Silicon - Transistors
293

Subject Index

Silicon compounds - Electron spin resonance
3054
Silicon compounds - Properties
418
Silicon compounds - Spectroscopic analysis
3120
Silicon compounds - Synthesis
417
Silicon crystals - Conductivity
1128
Silicon crystals - Deformation
1043, 1044
Silicon crystals - Electron spin relaxation
2858-2861
Silicon crystals - Impurities
2858-2861, 2878
Silicon crystals - Neutron irradiation
1033
Silicon crystals - Radiation
2765
Silicon ions - Spectrographic analysis
1000
Silicon isotopes - Energy levels
737
Silicon oxide - Thermodynamic properties
140
Silicon systems - Thermal factors
7
Silogermanium phthalocyanine - Synthesis
416
Siloxane compounds - Decomposition
419
Silver - Acoustic attenuation
3093
Silver - Neutron energy spectra
1581
Silver - Nuclear reactions
3172
Silver - Quantitative analysis
1073
Silver - Surface reactions
1164, 2488
Silver chloride crystals - Cooling effects
2042
Silver chloride crystals - Conductivity
2041
Silver chloride crystals - Deformation
2040, 2042
Silver chloride crystals - Dislocations
2043, 2045
Silver chloride crystals - Electron mobility
1107
Silver chloride crystals - Impurity effects
2045
Silver chloride crystals - Ionization
2044
Silver chloride crystals - Photoconductivity
1104
Silver chloride crystals - Plastic properties
2045
Silver chloride crystals - Structure
2042
Silver crystals - Deformation
413, 414
Silver crystals - Diffusion rate
57
Silver halide crystals - Electrical properties
1106
Silver halide crystals - Magnetoresistance
1106
Silver halides - Photoconductivity
1102
Silver iodide crystals - Activation energies
1046
Silver powders - Heat vibrations
63
Silver wires - Conductivity
717
Silver-zinc systems - Diffusion rate
58
Silylcyclohexane - Preparation
3161
Single crystals - Anisotropy
188
Single crystals - Conductivity
628
Single crystals - Deformation
312, 344, 390, 413, 414, 588, 1043, 1044, 1231, 2706
Single crystals - Diffusion rate
57
Single crystals - Dislocations
3153
Single crystals - Elastic constants
1839
Single crystals - Elasticity
2090
Single crystals - Electromagnetic properties
420
Single crystals - Electron spin resonance
695, 697, 698, 702, 704, 709
Single crystals - Electron transitions
1130
Single crystals - Field ion microscopy
2217
Single crystals - Growth
1084, 1379
Single crystals - Hydrogen diffusion
3090
Single crystals - Hyperfine structure
694
Single crystals - Impurities
1379
Single crystals - Lattice defects
3090
Single crystals - Magnetic resonance
997
Single crystals - Metallic conductivity
626
Single crystals - Nuclear quadrupole resonance
921
Single crystals - Optical properties
998
Single crystals - Photoconduction
2296
Single crystals - Physical properties
2043
Single crystals - Plastic deformation
303
Single crystals - Plasticity
343, 345, 2042, 2087, 2091
Single crystals - Radiation
2765
Single crystals - Rotation
344

Single crystals - Self-diffusion
303
Single crystals - Spectra
997, 3090
Single crystals - Structural analysis
6, 1046, 1278, 1893, 1894
Single crystals - Temperature factors
2043
Single crystals - Thermodynamic properties
1046
Single crystals - Unit cell dimensions
2971
Single crystals - X-ray diffraction analysis
1033, 2189, 2964
Sinocarotid pressoceptors - Inhibitory control
2640
Sintering - Kinetics
2086
Skeletal muscle relaxants - Test methods
1347, 1349, 1350
Skin - Acoustical response
1749
Skin - Sensitivity
1740, 1755
Sleep - Cerebral activity
1367
Sleep - Electroencephalographic analysis
1363
Sleep - Eye closure
2258
Sleep - Mechanisms
877A, 1015, 1363, 1364, 1367, 1368
Sleep - Negative learning
1364
Sleep - Psychometrics
1775
Sleep (Cat) - Blood pressure
877
Sleep (Cat) - Cortical activity
1371
Sleep (Cat) - Electroencephalographic analysis
877A, 1362, 1368
Sleep (Cat) - Initiation
1370
Sleep (Cat) - Lesions
1372
Sleep (Cat) - Mechanisms
1361, 1362, 1366, 1370, 1371
Sleep (Cat) - Muscle activity
976
Sleep (Cat) - Stimulation
876
Smooth muscle - Electrical properties
2177
Smooth muscle - Membrane properties
2175
Social behavior - Theory
145
Societies - Comparative studies
582
Sociology - Social communication
2127
Sociology - Statistical analysis
1183
Sodium arsenate - Nuclear quadrupole resonance
3082
Sodium borohydride - Titration procedures
1261
Sodium chloride - Energy levels
881
Sodium chloride - Excretion
822
Sodium chloride crystals - Polarization
3183
Sodium decry sulfate - Synthesis
2645
Sodium iodide thallium crystals - Photopeak counting
2961
Sodium peroxoborate - Crystal structure
2975
Sodium propiolate - Chemical reactions
2451
Sodium thiosulfate pentahydrates - Magnetic resonance
1832
Sodium toluenethiolate - Chemical reactions
2451
Sodium vapors - Corrosive properties
75
Sodium-germanium crystals - Molecular structure
2601
Soil - Radioisotopes
2938
Soil - Water content
2939
Solar atmosphere - Cosmic rays
1574
Solar atmosphere - Electron flux
479, 480
Solar atmosphere - Ionization
477
Solar atmosphere - Metal abundances
181
Solar atmosphere - Particles
476
Solar atmosphere - Shock waves
183
Solar corona - Crab nebula
839
Solar corona - Ionization
477
Solar disturbances - Measurement
838, 839
Solar emissions - Cosmic rays
2620-2622, 2628
Solar flares - Analysis
1577
Solar flares - Intensity
1617
Solar flares - Ionospheric effects
252
Solar flares - Particle acceleration
1994
Solar flares - Properties
1616
Solar protons - Energy
481
Solar radiation - Gamma rays
478
Solar radiation - Mapping
2788, 2791
Solar radiation - Neutron monitors
1616
Solar radiation - Spectrographic analysis
2790

Subject Index

Solar radio waves - Plasma oscillations
2773
Solar spectrum - Mathematical analysis
1210
Solar system - Magnetic fields
1577, 1618
Solar system - Metal abundances
177, 179
Solar system - Nuclear reactions
179, 181
Solar system - Origin
172, 177
Solenoids - Construction
1633
Solenoids - Cryogenics
1724
Solenoids - Design
1624, 1629, 1724
Solenoids - Magnetic fields
1724
Solid Propellant Combustion - Symposium
2997
Solid rocket propellants - Combustion
68, 792, 2387, 2683-2687, 2998
Solid rocket propellants - Ignition
2383-2386, 2388, 2401-2403, 2999
Solid rocket propellants - Irregular burning
793
Solid rocket propellants - Oxidation
33
Solid rocket propellants - Plasma source
65
Solid rocket propellants - Theory
1321
Solid state physics - Application
2828
Solid state physics - Diodes
2810
Solid state physics - Masers
2806
Solid state physics - Mathematical analysis
920, 3180, 3181
Solid state physics - Point groups
3180, 3181
Solid state physics - Rasers
2616, 2617
Solid state physics - Review
2812
Solid state physics - Semiconductors
2132, 2133
Solid state physics - Theory
1420, 1421, 1424
Solid state physics - Zinc crystals
421, 422, 424
Solidification - Crystallizing
3151
Solidification - Freezing
3152, 3154
Solids
see also separate Mathematical Subject Classification, p. 945
Solids - Absorption spectra
3057
Solids - Atom recombination
2488, 2489, 2677
Solids - Atomic structure
2151
Solids - Crystal structure
2230
Solids - Dielectric properties
47
Solids - Electrical properties
1571
Solids - Electron transitions
1098
Solids - Electronic structure
1932
Solids - Heat transfer
48, 49
Solids - Magnetic properties

Subject Index

Statistics - Applications
2052, 2053
Steam - Viscosity measurements
123
Steel - Alloying effects
2092, 2097
Steel - Impact properties
3002
Steel - Interface
1083
Steel - Phase transitions
1086, 1087
Steel - Silver solders
1519
Stellar evolution - Mathematical evolution
222
Stellar masses - Mathematical analysis
2555
Stellar winds - Supersonic flow
476
Stimulation - Physiological effects
2833
Stimulation - Reaction time
1111
Storage - Mathematical analysis
2693
Storage tubes - Signal-to-noise ratio
138
Stress - Applications
1921
Stress - Copper crystals
388-390
Stress - Deformation
388, 389
Stress - Dislocation mobility
1089
Stress - Hydrostatic properties
2212
Stress - Mathematical analysis
313, 343, 345, 586, 840, 1805, 2209, 2214
Stress - Measurement
588
Stress - Psychophysiological responses
687
Stress - Theory
1231
Stress - Thermo-mechanics
1233, 1234
Stress - Wave function
497
Stress - Zinc crystals
388, 389
Stress (Physiology) - Spinal reflex
1885
Stress (Psychology) - Adjustment
144
Striated muscles - Permeability
684
Stripping effects - Theory
750
Stripping reactions - Angular correlations
2927
Strontium - Energy levels
2992
Strontium isotopes - Energy levels
732
Strontium isotopes (Radioactive) - Soil distribution
2938
Strontium titanates - Conduction properties
1082
Structural beams - Buckling
2906
Structural geology - Andes
195
Structural properties - Electron diffraction analysis
2105
Structural shells - Deformation
2696, 2699
Structures - Symposium
39
Structures - Thermal stress
2695, 2697
Structures - Transfer matrices
2305
Strychnine - Inhibitory properties
787
Styrenes - Copolymerization
2417, 2418
Styrenes - Molecular structure
535
Submillimeter waves - Production
1117, 1118
Subsonic flow - Mathematical analysis
2940
Subsonic flow - Noise
751
Sulfamides - Serum
767
Sulfate crystals - Molecular structure
2595, 2599, 2600, 2605
Sulfate solutions - Conductivity
2644
Sulfenium compounds - Chemical properties
2647
Sulfenyl compounds - Chemical properties
2647-2649
Sulfenyl esters - Chemical properties
2646
Sulfenyl esters - Chemical reactions
2649
Sulfenyl nitrates - Chemical properties
2648
Sulfhydril compounds - Growth properties
819
Sulfhydryl - Biochemical properties
809
Sulfides - Crystal structure
2869
Sulfinyl radicals - Synthesis
2648
Sulfinylamines - Grignard reagents
1294
Sulfonyl chlorides - Chemical properties
2649
Sulfoxides - Crystal structure
2977
Sulfur - Copolymerization
2421
Sulfur - Dissociation energies
1041
Sulfur compounds - Infrared spectra
1225
Sulfur crystals - X-ray analysis
2148
Sulfur isotopes - Energy levels
737

Sulfur isotopes (Radioactive) - Applications
1166
Sulfur trioxide - Thermodynamic properties
3071, 3075
Sulfuric acid - Voltametric analysis
1927
Sultones - Irradiation
3114
Sun - Microwaves
2789
Sun - Solar disturbances
1618
Sun - Spectroheliograms
2788, 2790, 2791
Sunspots - Frequency distribution
2153
Superaerodynamics - Shock waves
2606
Superaerodynamics - Thermal radiation
9
Superconductivity - Magnetic factors
1109, 1110, 2727
Superconductivity - Mathematical analysis
960, 1421, 1424, 2746, 3113
Superconductivity - Spectrographic analysis
1421
Superconductivity - Temperature effects
3064
Superconductivity - Thermodynamics
3110
Superconductivity - Ultrasonic wave attenuation
121
Superconductors - Temperature factors
965
Superconductors - Thermodynamic properties
960, 1421, 1425
Superoxidizers - Properties
2138, 2139
Supersonic flight - Aerodynamics
2376
Supersonic flight - Flutter
152
Supersonic flow - Aerodynamics
531, 2253
Supersonic flow - Atom density
16
Supersonic flow - Entropy gradient
34
Supersonic flow - Gas ionization
307
Supersonic flow - Laminar boundary layer
2393
Supersonic flow - Mathematical analysis
656, 1641, 2909
Supersonic flow - Measurement
306
Supersonic flow - Nozzles
1639, 1640
Supersonic flow - Wind tunnels
791
Supersonic wind tunnel - Schematic outline
1548
Supersonics - Experimental data
2025
Supersonics - Gas ionization
1557
Supersonics - Turbulence
2025
Surface properties - Reaction kinetics
14
Surfaces - Atomic properties
640
Surfaces - Boundary layers
2293
Surfaces - Catalytic reactions
2488
Surfaces - Electrical properties
1888, 1889, 1891
Surfaces - Heat transfer
9, 12, 2373
Surfaces - Mass transfer
2373
Surfaces - Stress
2208
Surfaces - Thermionic emissions
663
Surfaces - Thin films
2644
Surfaces - Vacuum systems
1099
Switching circuits - Capabilities
1121
Switching circuits - Mathematical analysis
1991
Switching circuits - Pattern recognition
1991
Symmetrical flow - Mathematical analysis
2313
Symmetrical flow - Wakes
2322
Sympathetic nervous system - Vasoconstriction
401
Sympathetic responses - Drug effects
2636
Sympatholytic agents - Physiological effects
1216
Symposia - Aerodynamically heated structures
39
Symposia - Aerospace
40
Symposia - Aerospace science
1159
Symposia - Analytical astrodynamics
862
Symposia - Astronautics
336
Symposia - Brain function
332
Symposia - Brain mechanisms and learning
668
Symposia - Chemical reactions in the atmosphere
2680
Symposia - Combustion of solid propellants
2997
Symposia - Convexity
55
Symposia - Coordination chemistry
3085
Symposia - Distribution and motion of interstellar matter in galaxies
1158
Symposia - Electromagnetic radiation
2568
Symposia - Electromagnetics and fluid dynamics of gaseous plasma
2347

Subject Index

Symposia - Fluid dynamics
1489
Symposia - Free radicals
2978
Symposia - Hypersonic flow
1516
Symposia - Inhibition in the nervous system
530
Symposia - Interstellar matter
1158
Symposia - Ion and plasma acceleration
1318
Symposia - Liquid rocket combustion
2398
Symposia - Magnetic fields
1518
Symposia - Magnetohydrodynamics
2072
Symposia - Medical sciences
1699
Symposia - Nonlinear differential equations and nonlinear mechanics
2533
Symposia - Nonmetallic crystals
2073
Symposia - Organic nomenclature
1961
Symposia - Partial differential equations
54
Symposia - Physics of electronic and atomic collisions
532
Symposia - Pure mathematics
55
Symposia - Rarefied gas dynamics
198
Symposia - Semantic problems in language
383
Symposia - Semiconductors
860
Symposia - Temperature measurement and control
2339
Synapses - Analysis
1160
Synthesis (Chemistry) - Analysis
1295, 1393
Systems theory - Analysis
294

Tactual perception - Machine aids
1753
Tantalum gallate - Collimetric analysis
46
Tantalum isotopes (Radioactive) - Nuclear structure effects
2986
Targets - Design
1614
Targets - Particle emission
1591, 1592
Tartaric acid - Electron spin resonance
697, 704
Tartronic semialdehyde reductase - Preparation
2158, 2160, 2161
Teaching devices - Design
1057
Technetium - Chemical properties
2440
Tectonic strain - Theory
191
Teeth - Apatite crystals
1279
Teeth - Ultrastructure
1278
Teflon - Applications
577
Telephone signals - Multiplex properties
2344
Telescopes - Properties
2792
Telluride crystals - Semiconductor properties
2484
Telluride crystals - Surface properties
2483
Tellurium - Dissociation energies
1041
Tellurium crystals - Physical properties
1892-1896
Tellurium crystals - Structural analysis
1892, 1895
Tellurium isotopes - Spectrographic analysis
59
Temperature - Spectrographic analysis
167
Temperature Measurement and Control - Symposium
2339
Tensor analysis - Mathematical analysis
367
Tensor analysis - Nuclear physics
362, 367
Terpenes - Enzymatic degradation
1800
Terrestrial magnetism - Analysis
1437
Terrestrial magnetism - Drag
1446, 1447
Terrestrial magnetism - Intensity
1577
Terrestrial magnetism - Mathematical analysis
1434
Terrestrial magnetism - Particles
475
Testes - Circulatory regulation
399
Testes - Oxygen tension
401, 402
Testosterone - Learning influence
2632
Tetraborane - Oxidation
2485
Tetracyanoethylene derivatives - Electron spin resonance
563
Tetrahydrofuran - Infrared spectra
1224
Tetraiso-amyl ammonium fluoride - Clathrate structure
2263
Tetramethylurea - Photolysis
3033, 3034
Tetrazine vapor - Spectrographic analysis
3070
Textbooks - Sampled-data control systems
259
Thalamic properties - Inhibition
768
Thalamic reticular system - Stimulation
1314

Thalamus - Somesthetic responses
1360
Thallium - Diffusion properties
494
Thallium isotopes - Alpha activities
2023
Thallium isotopes - Hyperfine structure
1769
Thallium isotopes - Isotope shifts
1769
Thallium isotopes - Nuclear structure effects
2982
Thallium isotopes - Spectrographic analysis
1769
Thallium isotopes (Radioactive) - Nuclear structure effects
2983
Thallium isotopes (Radioactive) - Spectrographic analysis
1682, 1690
Thermal conductivity - Determination
1062
Thermal conductivity - Mathematical analysis
2306, 2307
Thermal properties - Measurement
1761
Thermal stress - Breakdown time
2913
Thermal stress - Elasticity
1233
Thermal stress - Mathematical analysis
1345, 2912
Thermodynamics - Entropy change
1925
Thermodynamics - Heat transfer
2770
Thermodynamics - Mathematical analysis
48, 49, 1805, 1935, 1944, 1945, 1952, 3195-3199
Thermodynamics - Moving boundary
1267
Thermodynamics - Quantum statistics
2770
Thermoelasticity - Mathematical analysis
1345
Thermoelectric materials - Transport properties
1827
Thermoluminescence - Measurement
1190, 1192
Thermometric measurement - Titration
2408
Thermoreceptors (Reptiles) - Morphology
137
Thiazoles - Synthesis
1293
Thin films - Adsorption
859
Thin films - Electrical conduction
859
Thin films - Explosive properties
716
Thin films - Ferromagnetic resonance
1901, 2355
Thin films - Physical properties
1296, 1677
Thin films - Preparation
1296, 1677
Thin films - Spectrographic analysis
1901
Thin films - Thickness properties
2644
Thin films - Vibrational spectra
1811
Thin layers - Domain structure
2904
Thin wires - Domain structure
2903
Thin wires - Magnetization
2903
Thin-walled columns - Buckling
2906
Thiols - Addition reactions
2452
Thioperoxides - Chemical properties
2646
Thioperoxides - Chemical reactions
2649
Thiophenes - Molecular structure
594
Thirst - Lesion effects
2247, 2249
Thorium germanide crystals - Phase transitions
2970
Thorium perchlorate - Dissociation
1929
Thyrotropic hormone - Biological assay
1299, 1785, 1787
Thyrotropic hormone - Secretion
1789
Thyrotropin - Thyroid assay
1299
Time sense - Measurement
1778-1780
Time studies - Ionization decay
1246
Time-varying systems - Stability
2359
Tin - Superconductivity
1189
Tin compounds - Crystal structure
2976
Tin isotopes - Resonance absorption
3064
Tin isotopes - Superconductivity
3064
Tin isotopes (Radioactive) - Conversion coefficients
3129
Tin isotopes (Radioactive) - Resonant scattering
2989
Tin sulfate crystals - Molecular structure
2596
Tissues - Histochemistry
1351
Tissues - Metabolism
2174
Titanates - Crystal structure
2189
Titanium compounds - Shock waves
170, 171
Titanium compounds - Spectrographic analysis
171
Titanium iodide - Spectrographic analysis
170
Titanium isotopes - Energy levels
732
Titration - Heat of reaction
2408

Subject Index

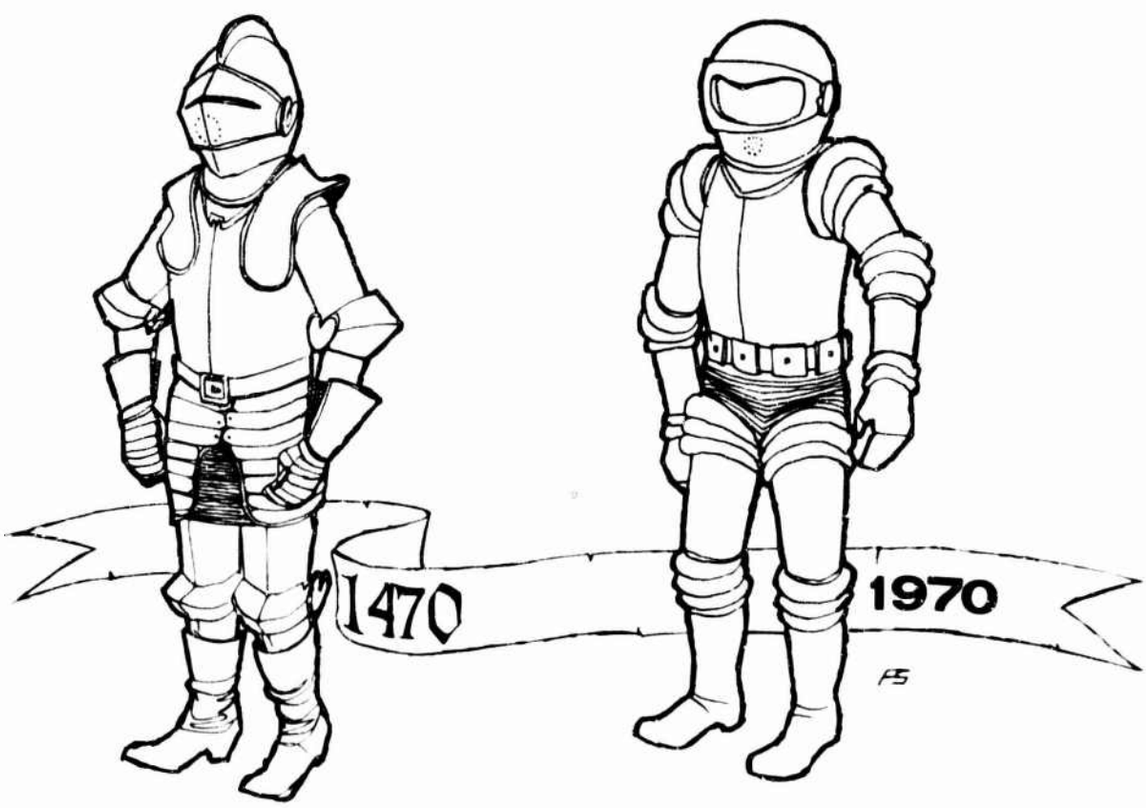
Titration equipment - Applications
1067, 1068, 1070
Toluenethiol - Chemical reactions
2453
Tonal threshold - Statistical analysis
2690
Tonephin - Diuretic effects
823
Topology
see separate Mathematical Subject Classification, p. 945
Torque - Mathematical analysis
931, 1483
Toxins - Physiological effects
1349
Tracer studies - Vacuum systems
1099
Trachea - Gaseous ions
315
Traffic - Statistical processes
1454
Training - Ants
2170, 2171
Training - Aural presentation
51
Training - Effectiveness
52
Training - Maze
2168
Training - Neurosurgical effects
2170
Training - Test methods
50, 52
Tranquilizers - Auditory perception
395
Tranquilizers - Physiological effects
94, 96
Transducers - Analysis
2057
Transformations
see separate Mathematical Subject Classification, p. 945
Transformers - Mathematical analysis
1983
Transients - Mathematical analysis
930
Transistor amplifiers - Design
331
Transistors - Applications
1058
Transistors - Low frequency measurements
293
Transistors - Mathematical analysis
289
Transistors - Operation
291
Transistors - Physical properties
293
Transistors - Silicon
289
Transition elements - Preparation
2965
Transition metal alloys - Electron distribution
384
Transition metal alloys - Magnetic properties
388
Transition metals - Chemical reactions
2568
Transition metals - Colorimetric procedures
46
Transition temperature - Determination
1001
Transmission - Electrical circuits
2364
Transmission lines - Wave propagation
2827
Transonic airfoils - Stability boundary
1558
Transonic flight - Aerodynamics
2376
Transonic flow
see also Hypersonic flow
Transonic flow - Mathematical analysis
2391
Transport coefficients - Theory
805-807
Transport mechanism - Mathematical analysis
2670
Transport mechanisms - Theory
130
Transport properties - Mathematical analysis
2664
Transport properties - Statistical mechanics
3195, 3197-3199
Trapping devices - Design
1729, 1730
Traube's rule - Theory
2532
Traveling wave tubes - Circuits
277
Traveling wave tubes - Noise
2811
Traveling wave tubes - Structure
2336
Triethyl aluminum - Heat of formation
1292
Triethyl aluminum - Pyrolysis
1978
Trifluoroacetamide - Electron spin resonance
698
Trifluoromethane - Nuclear reactions
1716
Trimethylborazole - Nuclear magnetic resonance
1218
Trimethoxyboroxine - Nuclear magnetic resonance
1218
Tritium - Fallout
341
Trivinylboranes - Preparation
3080
Tungsten - Adsorption
858
Tungsten - Corrosion
2222
Tungsten - Deformation
2221
Tungsten - Field ion microscopy
2219
Tungsten compounds - Conductivity
628
Tungsten compounds - Crystal structure
2236, 2237
Tungsten crystals - Field ion microscopy
2217
Tungsten oxide - Magnetodynamics
627

Tungsten surfaces - Hydrogen ions
2225
Tungsten tips - Electropolishing
2224
Turbine power - Engine components
2378
Turbines - Gas flow
2377
Turbulence - Mathematical analysis
835
Turbulence - Spectrographic analysis
1841
Turbulence - Theory
1230
Turbulent boundary layer - Heat transfer
1920, 2293
Turbulent boundary layer - Mass transfer
2293
Turbulent boundary layer - Phase transitions
2025
Turbulent boundary layer - Photographic analysis
1020
Turbulent flow - Analysis
2311
Turbulent flow - Jet flow
2298
Turbulent flow - Mathematical analysis
2707
Turbulent flow - Properties
2375
Turbulent flow - Transition properties
2708
Turbulent flow - Wakes
2301
Twinning (Crystallography) - X-ray diffraction analysis
889

Ultrasonic radiation - Application
120
Ultrasonic radiation - Attenuation
121
Ultraviolet radiation - Detection
166
Ultraviolet radiation - Instruments
555
Ultraviolet spectra - Analysis
3190
Underground explosions - Tectonic strain
191
Underwater sound - Determination
119
Upper atmosphere - Chemical detonations
2503
Upper atmosphere - Cosmic rays
1441
Upper atmosphere - Stellar observations
2641
Upper ionosphere - Particle movement
2845
Uranium ions - Spectra
996
Urea oxalate - Electron spin resonance
695

Vacuum apparatus - Analysis
1685
Vacuum apparatus - Design
1685, 1803, 3092
Vacuum systems - Laboratory techniques
1099
Vacuum systems - Pressure
2942
Vacuum tubes - Noise
283
Valine - Electron spin resonance
702
Van Allen radiation - Electron intensity
484
Vanadium gallate - Colorimetric analysis
46
Vanadium ions - Hydrolysis
2603
Vanadium isotopes (Radioactive) - Energy levels
732
Vanadium pentoxide - Nuclear magnetic resonance
625
Vanadium pentoxide - Whisker formation
1843
Vapor pressure - Measurement
1039
Vapors - Ionization
2501
Vasopressin - Diuretic effects
823
Vasopressin - Inactivation
3141
Vasopressin - Metabolism
3143
Vasopressin - Neurohypophysial storage
3140, 3142
Vasopressin - Structural changes
445
Vector analysis - Nuclear physics
367
Velocity - Wind tunnel tests
593
Veins - Distensibility
827
Venous blood pressure - Hand measurements
826
Venous blood pressure - Hypoxia
825
Venous smooth muscle - Distensibility
827
Venus - Astronomical observations
44
Vertex functions - Analyticity properties
2433
Very low frequencies - Analysis
2800
Very low frequencies - Propagation
2801
Vestibular response (Pigeon) - Illumination effects
785
Vibrations - Damping
1552
Vibrations - Electron diffraction analysis
2142
Vibrations - Mathematical analysis
127, 1549-1551
Video amplifiers - Electronic circuits
289
Video networks - Phase shifters
2818

Video signals - Transmission
1756
Vinyl compounds - Spectrographic analysis
1725
Vinyl radicals - Physical properties
3079
Viscosimeters - Application
123
Viscosity
see also as a subdivision, e.g., Air - Viscosity
see also separate Mathematical Subject Classification, p. 945
Viscosity - Mathematical analysis
610
Viscosity - Measurement
2593, 2594
Viscous flow - Mathematical analysis
3096
Viscous fluids - Diffusion properties
502
Viscous fluids - Kinetic theory
505
Vision - Drug effects
1197
Vision - Eye tests
1275, 1276
Vision - Illumination
1193, 1194, 1198, 1202, 1203, 1205-1208, 1211
Vision - Test methods
1195, 1196, 1204, 1209, 1214
Vision (Cat) - Physiological factors
975, 977
Vision (Octopus) - Form discrimination
1322
Vision (Octopus) - Light discrimination
1323
Vision (Octopus) - Physiological factors
1322, 1325, 1326
Visual acuity - Cortical lesions
396
Visual acuity - Test methods
1193, 1197, 1206, 1207
Visual cortex - Evoked potentials
783
Visual cortex (Cat) - Responses
2261
Visual perception - Adaptation
2256
Visual perception - Errors
411
Visual perception - Map reading
2839
Visual perception - Orientation
2167
Visual perception - Photosensitivity
1162
Visual perception - Physical factors
1198, 1202-1204, 1208, 1209, 1212, 1214
Visual perception - Physiological factors
1213
Visual perception - Sensitivity
1214
Visual perception - Stimulus factors
86
Visual perception - Test methods
82, 1193-1195, 1199, 1200, 1202, 1203, 1205-1207, 1211, 1212
Visual perception - Training
410, 412
Visual responses - Analysis
1196, 1199, 1200, 1202, 1212, 1213
Visual responses - Test methods
1213
Visual system - Analysis
1199
Visual system - Reticular influence
2630, 2634
Visual thresholds - Measurement
1214
Visual thresholds - Test methods
1204, 1209
Vocabulary - Analysis
1711
Voice communications systems - Design
1686
Voltage - Electrode overload
2292
Voltage - Measurement
1268
Vortices - Mathematical analysis
1513
Vortices - Motion
100, 1512, 1513
Vortices - Production
1513



Water - Chemical analysis
1070, 1071, 1076
Water - Chemical reactions
1024
Water - Cross sections
713
Water - Hyperfine structure
541
Water - Molecular structure
1832
Water - Organic content
2409, 2410
Water - Spectrographic analysis
541
Water - Viscosity measurements
123, 2593
Water balance - Computer analysis
2939
Water intake - Hypothalamic influence
2963
Water vapor - Corrosion properties
2222
Water waves - Mathematical analysis
1544
Water waves - Statistical analysis
1049
Wave fields - Applications
2576
Wave functions - Mathematical analysis
321, 519
Wave mechanics - Mathematical analysis
2431
Wave mechanics - Orbital functions
508, 509, 518, 521-526
Wave motion - Theory
2750
Wave propagation - Mathematical analysis
1500

Wave propagation - Theory
1668
Wave transmission - Electromagnetic properties
1708
Wave transmission - Ionosphere
838
Wave transmission - Mathematical analysis
188, 196
Wave transmission - Test methods
2642
Wave velocities - Crystal structure
1760
Waveforms - Theoretical analysis
2498
Waveguides - Analysis
1663, 1909
Waveguides - Design
573, 577
Waveguides - Directional coupler
2338
Waveguides - Mathematical analysis
1708, 2798
Waveguides - Periodic structure
2336
Waveguides - Wave dissipation
2353
Waves - Boundary diffraction
2575
Waves - Interactions
304
Waves - Propagation
2827
Waves - Properties
2750
Weather acclimation - Catecholamine metabolism
1283
Weather forecasting - Mathematical analysis
601
Wedges - Calibration
1649
Wedges - Fluid mechanics
2589, 2591, 2592
Wedges - Hypersonics
644
Whiskers (Crystals) - Analysis
1382
Whiskers (Crystals) - Growth
1084, 1843
Whiskers (Crystals) - Mathematical analysis
1843
Whiskers (Crystals)- Periodic bond theory
1382
Whistler frequencies - Analysis
2798-2800
Whistler frequencies - Propagation
2801, 2802
Whistlers - Analysis
2796, 2803
Whistlers - Detection
1668
Wind tunnels
see also Hypersonic wind tunnels; Supersonic wind tunnels
Wind tunnels - Freon
2395
Wind tunnels - Heating system
2396, 2397
Wind tunnels - Turbulent flow
1799
Wings - Hypersonic flow
155
Wings - Pressure distribution
34
Wings - Supersonic flow
2253
Wings - Thermal stress
2912
Wires - Explosive properties
715-717
Wires - Resistance
715

X-ray absorption analysis - Applications
147
X-ray diffraction analysis - Applications
63, 148, 413, 414, 626, 643, 889, 933, 1033, 1043-1045, 1101, 1269, 1278, 1279, 1383, 1384, 1932, 2112, 2146-2148, 2152, 2189, 2332, 2777, 2964, 2968, 2973
X-ray diffraction studies - Analysis
2236
X-ray microscopy - Applications
1088
X-ray microscopy - Radiographic analysis
2365
X-ray tubes - Design
2366
X-rays - Detection
837
X-rays - Interaction coefficients
2366
X-rays - Reflection
998
X-rays - Solar flares
837
X-rays - Thermal diffusion
1380
Xenon - Ionization
131
Xenon isotopes - Hyperfine structure
552
Xenon isotopes (Radioactive) - Nuclear magnetic resonance
2609

Yeasts - Protein synthesis
3156-3158
Yoga exercises - Analysis
878
Ytterbium - Spectra
1249
Yttrium disilicide crystals - X-ray diffraction analysis
2332
Yttrium iron garnet - Atomic structure
2297
Yttrium iron garnet - Magnetic properties
2925
Yttrium iron garnet - Parametric excitation
2785
Yttrium isotopes (Radioactive) - Energy levels
732
Yttrium isotopes (Radioactive) - Nuclear moments
244
Yttrium isotopes (Radioactive) - Nuclear spin
243, 244

Zinc - Magnetic properties
421, 422, 424
Zinc alloys - Deformation
388, 389
Zinc alloys - Phase studies
1090
Zinc bromide - Raman spectroscopy
629
Zinc compounds - Crystal structure
2869, 2870
Zinc crystals - Dislocations
3153
Zinc isotopes - Nuclear reactions
756
Zinc oxide crystals - Diffusion
1046
Zinc oxide crystals - Electron density
1044
Zinc sulfide - Electroluminescence
1188
Zinc sulfide copper crystals - Photoconduction
2296
Zinc sulfide crystals - Structure models
2869
Zirconium - Spectrographic analysis
999
Zirconium ions - Spectrographic analysis
1000
Zone refinement apparatus - Design
1378, 1379

Mathematical Subject Classification

ALGEBRA

Algebras:
Lie algebras
213, 1848, 1851, 3167
Combinatorial Analysis
463, 1385, 1389, 2058, 2232
Fields, Rings:
Fields
572
Rings
217
Groups and Generalizations
464-466, 1388, 2061, 2411
Abelian groups
409A, 1386, 1538
Finite groups (including finite abelian)
456, 936, 937
Matrix groups, representation, characters
982
Homological algebra
2415, 3168
Linear Algebra:
Eigenvalues and eigenvectors
1533, 2520
Forms and transformations
213
Inequalities for matrices
113, 115, 1182
Matrices
114, 379, 724, 808, 828, 916, 2039, 2054
Partial Order, Lattices:
Boolean rings and algebras
1534
Polynomials
572
Algebraic equations, roots
300, 302

FOUNDATIONS, SETS, AND LOGIC:

Applications of Logic
2145
Philosophy of Mathematics and Physics
2012
Set theory
2010, 2013, 2952

GENERAL

Collection of Papers
54, 55
Reports of Meetings
2533

GEOMETRY

Abstract Algebraic Geometry:
Algebraic functions
938
Special varieties, curves, surfaces
218, 939, 940
Algebraic Geometry
219
Convex Domains, Distance Geometries
55
Differential Geometry
1475
Projective different geometry
1479
Riemannian manifolds
3067-3089
Geometries, Euclidean and Other:
Circles, spheres, inversive geometry
1468
Finite geometries, configurations, regular figures, divisions of space
1855
Projective geometries
1859

MATHEMATICAL ANALYSIS

Applications
981, 989
Approximations and Expansions
2856
Interpolation, general theory
943
Polynomial approximation
953
Calculus of Variations:
Applications
41, 377, 1172, 1525-1527
Theory in the large, topological methods
1922
Difference Equations, Functional Equations:
Finite differences and difference equations
1478, 2910, 2911
Differential Equations: Ordinary
1173, 2082, 2510, 2511, 2515, 2519, 2529, 2530
Approximation of solutions
2527
Asymptotic behavior of solutions
116, 571, 1141, 2512, 2513, 2517, 2518, 2528
Boundary value problems, spectra, expansions in eigenfunctions
409, 1150, 2003, 3166
Dynamical systems, topological properties
462
Linear equations: second order
915, 1048, 2001, 3042
Stability of solutions
1161, 1229, 2521, 2525
Differential Equations: Partial
54, 1477, 1924, 2002, 2516, 2522, 2524, 2953-2955
Eigenvalues, eigenfunctions
1484, 1494
Elliptic equations, boundary value problems
1305, 1469-1472, 1474, 1487, 1899, 1966, 2116, 2117
Elliptic operators
1308
First order equations
1448, 1536
Hyperbolic equations, Cauchy problem
1306, 1307, 1487, 1488, 1492
Mixed equations
1490

Mathematical Subject Classification

MATHEMATICAL ANALYSIS (cont'd)

- Non-linear equations, special types
  158, 677, 846, 1411, 1412, 1481, 2494, 2815
- Parabolic equations
  1149, 1472, 2541-2543
- Fourier Analysis
  189, 194, 1912, 1918, 1919, 3146
  - Convergence, summability
    2898
- Functional Analysis
  1915, 2455
  - Applications of functional analysis
    1750, 1765, 3041
  - Banach algebras of analytic functions
    992
  - Perturbation theory
    1415
- Functions of Complex Variables
  935, 941, 942, 956, 1817, 2537, 2538, 3165
  - Behavior on the boundary
    1850, 1853
  - Complex interpolation and approximation
    955, 957, 2857
  - Conformal mapping, special problems
    945, 949, 954, 1142, 2514, 2526
  - Distribution of values, Nevanlinna theory
    2852
  - Entire functions, functions of exponential type
    1151
  - Functions of several complex variables
    2552
  - Maximum principles, Schwartz lemma, Phragmén-Lindelöf theorem
    1486
  - Meromorphic functions
    1850, 1917, 2536, 2851, 2853-2855
  - Polynomials
    948, 950
  - Power series
    537, 944, 1854, 2083, 2894
  - Quasi-conformal functions
    952, 1914
  - Riemann surfaces and functions on them
    951
  - Univalent and p-valent functions
    1408
- Functions of Real Variables
  592
  - Calculus, mean-value theorems, inequalities
    1491, 1495
  - Representation of functions by integrals
    592A
- Harmonic Functions, Convex Functions
  600, 2539
  - Harmonic forms and integrals
    599
  - Harmonic functions, potential theory
    1482, 1485, 1497, 1818, 1916
- Integral and Integrodifferential Equations:
  - Integrodifferential equations
    1575
  - Singular integral equations
    1473
  - Special integral equations
    679, 683, 2892, 2893
- Integral Transforms:
  - Inversion formulas, self-reciprocal functions
    638
  - Laplace and Fourier transforms
    680, 1152, 2076
  - Other transforms, Hilbert, Mellen, Hankel
    680
- Measure and Integration
  1228, 3037
- Sequences, Series, Summability
  2055, 2079, 3038
  - Convergence and summability
    536, 1856, 1923, 2413
  - Operations on series and sequences
    1
  - Power and factorial series
    1911
  - Tauberian theorems
    983, 988
- Special Functions:
  - Bessel functions
    3148
  - Hypergeometric functions and generalizations
    1877
  - Polynomials as functions, orthogonal polynomials
    3039, 3040

NUMERICAL ANALYSIS

- Computing Machines
  3136
  - Digital computers: coding and programming
    187, 192, 193, 666, 676, 919, 2011
  - Digital computers: logic and design
    1742
  - Results of computation by machine
    1547, 2346, 2597, 2598, 2939
- Numerical Methods
  1388
  - Difference and functional equations
    1480
  - Integral and integrodifferential equations
    2544
  - Interpolation, smoothing, least-squares, curve fitting
    168
  - Linear equations, determinants, matrices
    1390
  - Monte Carlo methods
    1559, 1563
  - Ordinary differential equations
    1056, 2000
  - Partial differential equations
    1852
  - Tables
    3097

OTHER APPLICATIONS OF MATHEMATICS

- Biology and Behavioral Sciences
  1699
  - Biology
    56, 449, 455
  - Genetics
    452-454
  - Nervous networks
    85, 87, 292, 450, 451, 1946
  - Psychology
    376, 1844, 1865, 2840

OTHER APPLICATIONS OF MATHEMATICS (cont'd)

Sociology
1183
Economics, Operations Research, Games
1391
Games
2069
Highway traffic
1454
Management science, operations research
1120, 1450, 2682
Geophysics:
Meteorology
601
Seismology
186, 187, 189, 190, 192-194, 196
Information, Communication, Control
2108, 2229
Automata
377, 674, 675, 1693, 2051, 2057, 2064, 2809, 2824, 3134
Codes, decoding
415, 1747, 2060, 2063, 2226, 2228, 2823, 3207
Control systems
259, 261, 263, 265-268, 272, 294, 299, 301, 346, 347, 349-351, 353-355, 357, 383, 384, 1047, 1051, 1055, 1066, 1984, 1990, 2335, 2361, 2363, 2751, 2816
Data processing
415, 1170, 1171
Foundations, coding theorem
635, 636
Linguistics, machine translation
380, 382, 2476, 2477, 3132, 3206
Optimal control
914, 1986, 1987, 1989, 2752
Pattern recognition
1845
Servomechanisms
378, 917, 1050, 1054, 2362, 2493
Stability of control systems
269-271, 273, 290, 348, 2359, 2360
Statistical theory of communication channels, filters
352, 356, 639, 1696, 1697, 2808, 2817-2819, 2821
Switching theory, relays
1991, 2825

PHYSICAL APPLICATIONS OF MATHEMATICS

Astronomy
1532
Celestial mechanics
861, 3144
Cosmology
229
Radio astronomy
2771, 2773, 2796, 2797, 2799, 2801
Special problems
1545
Stellar atmospheres, radiative transfer
476, 477
Stellar structure
222
Classical Thermodynamics, Heat Transfer:
Classical thermodynamics
1524, 1935
Combustion
792, 1168, 1320, 2326, 2998, 2999
Heat and mass transfer
48, 49, 669, 1562
Heat transfer
946, 947, 1556, 1559, 1563, 1829, 1920, 2293, 2303, 2306, 2307, 2323, 2397, 3194
Mass transfer
1522
Elasticity, Plasticity
1839, 2213
Anisotropic bodies
759, 760, 762
Beams and rods
1520, 2495
Foundations of mechanics of deformable solids
678
Plane stress and strain
313, 343, 345, 408, 752, 840, 1476, 1493, 1999, 2209, 2328
Plasticity, creep
2304, 2305
Plates, shells and membranes
153, 586, 752
Soil mechanics
2938
Stability, buckling, failure
1551, 2697, 2895, 2897, 2906
Thermo-mechanics
681, 682, 840, 1233, 1345, 1805, 2912
Three-dimensional problems
1496
Torsion and bending
1483, 2495
Vibrations, structural dynamics
1549, 1550, 1552, 2329, 2492, 2905
Visco-elasticity
1904, 2913
Viscous fluids
2394
Wave propagation
188
Fluid Mechanics, Acoustics
504-506, 534, 643, 854, 1541, 1543, 1806, 1959, 1960, 3096
Acoustics
834, 2027
Airfoil theory
2252
Boundary layer theory
159, 160, 1511, 1513, 1643, 1644, 1650, 2299, 2300, 2319, 2389, 2700, 3068
Compressible fluids: subsonic flow
2940
Compressible fluids: supersonic and hypersonic flow
122, 660, 2908, 2909
Compressible fluids: transonic flow
1558
Diffusion, filtration
2321
Free surface flow, water waves, jets, wakes
14, 751, 834, 1049, 1544, 1560, 1840, 2253, 2298, 2303, 2313, 2318, 2322
Incompressible fluids with special boundaries
157, 653, 659, 2941

Mathematical Subject Classification

PHYSICAL APPLICATIONS OF MATHEMATICS (cont'd)

- Magnetohydrodynamics
  151A, 647, 649, 655, 658, 848, 885, 867, 868, 1453, 1456, 1482, 1499, 1500, 1507, 1555, 1581, 1828, 1691, 2018
- Shock waves
  34, 124, 127, 645, 1504, 1510, 1512, 1542, 2204, 2808, 2669
- Stability of flow
  126, 128, 156, 813, 657, 1465, 1466, 1501, 1508, 1565, 1566, 2589-2592
- Turbulence
  835, 1980, 2311, 2707

Mechanics of Particles and Systems
  892, 2523, 2789, 3004, 3201, 3205
- Dynamics
  1548
- Exterior ballistics, artificial satellites
  1955-1957, 2312, 2320, 2586, 2947, 2948, 3145, 3147
- Kinematics, mechanics, linkages
  2556
- Variable mass, rockets
  2309, 2381

Optics, Electromagnetic theory, Circuits
  1508, 1622, 2184, 2194, 2342, 2564-2568, 2856
- Antennas, waveguides
  288, 295, 298, 930, 1708, 2338
- Circuits, networks
  260, 277, 289, 297, 928, 1060, 1121-1125, 1846, 1983, 2337, 2338, 2341, 2348, 2352, 2358, 2367, 2814, 2820
- Diffraction, scattering
  1784, 2572
- Electromagnetic theory
  841, 848, 848, 873, 1824, 1825, 2184, 2343, 2573, 2782
- Electro- and magnetostatics
  931
- Technical applications
  2777, 2778, 2811
- Waves and radiation
  278, 287, 288, 296, 1449, 1452, 1457, 1540, 2569, 2570, 2576, 2577, 2853, 2657, 2880

Quantum Mechanics
  391, 392, 958, 1948, 2203, 2340, 2423, 2424, 2617, 2668, 2730, 2732, 2784, 3204
- Atomic physics
  433, 434, 513-515, 518, 519, 558, 568, 570, 844, 882, 1103, 1251, 1254, 1328, 2738, 2748, 3098, 3100, 3186
- Dispersion relations
  374, 375, 1061, 1230, 1480
- Elastic scattering
  2731
- Elementary particles
  224, 229, 232, 247, 254, 475, 1154, 2463, 2659, 2665, 2735, 2873, 2877, 3020, 3058
- General theory
  101, 110, 1590, 2951
- Molecular physics
  432, 435, 508-510, 512, 516, 517, 520-522, 524-528, 880, 883, 1136, 1938, 2380, 2407, 2921, 3116, 3117, 3120, 3123, 3125, 3126
- Nuclear physics
  237, 385, 367, 370, 569, 579, 741, 742, 795, 924, 927, 1243, 1598, 1597, 1664, 1676, 1705, 2123-2125, 2195, 2198, 2427, 2430, 2432, 2461, 2484, 2724, 2725, 2768, 2835, 2838, 2842, 2872, 2874-2878, 2922, 3016, 3019, 3045, 3065, 3122, 3130, 3173, 3177, 3178A
- Quantum field theory
  100, 112, 232, 256, 321, 364, 388, 439, 441, 920, 922, 959, 981, 963, 964, 1112, 1117, 1118, 1157, 1414, 1598, 1811, 1947, 1949, 1950, 2046-2050, 2425, 2781, 3018
- Quantum mechanics of many-bodied systems
  319, 373, 719, 802, 1153, 2005, 2006, 3104, 3109
- Quantum statistical mechanics
  233, 253, 797, 798, 801, 803, 804, 849, 1109, 1110, 1300-1303, 1422, 2004, 2008, 2014, 3106-3108
- Scattering theory
  151, 228-228, 231, 234, 246, 255, 257, 258, 380, 519, 623, 624, 724, 731, 962, 1156, 1338-1339, 1413, 1434, 1451, 1461, 1594, 1609, 1813, 1820, 2199, 2437, 2438, 2812, 2614, 2615, 2662, 2667, 2720, 2721, 2723, 2728, 2733, 2734, 2736, 2737, 2742, 2743, 2748, 2759, 2837, 2959, 2980, 3046, 3059, 3060, 3062, 3111, 3124, 3171, 3172, 3178, 3192, 3193
- Superconductivity and superfluidity
  980, 965, 3110, 3113
- Weak interactions
  1423, 1503

Relativity
  2902, 3014, 3015
- General relativity
  102-109, 111, 1155, 2862, 2883, 2865, 2886, 2899
- Other relativistic theories
  1589

Review and Predictions
  2429

Statistical Physics, Structure of Matter
  1458, 1890
- Crystals
  998, 1093-1097, 1259, 1421, 1428, 1431, 1463, 1484, 1713, 1895, 2122, 2276, 2278, 2867, 2870, 3178
- Gases
  1174, 3061, 3196, 3197
- Irreversible thermodynamics
  438, 1267, 1944, 1945, 1952, 2770
- Kinetic theory of gases
  437, 799, 2392
- Liquids
  501, 502, 1265, 1266, 3198
- Metals
  1826, 1828
- Plasma
  1237, 1509, 1597, 1675, 1762, 1938, 1937, 2205, 2390, 2482, 2863, 2884, 2886, 2901, 3199, 3202, 3203
- Quantum statistical mechanics
  98, 99, 130, 3195
- Solids
  2868, 3180, 3181

PHYSICAL APPLICATIONS OF MATHEMATICS (cont'd)

Statistical thermodynamics
2714
Transport processes
610, 800, 805-807, 2670

PROBABILITY

Applications
45, 637, 1450, 1681
Distributions
2
Elementary theory
2
Limit Theorems
2067, 2077, 3164
Markov Processes
262, 984-986, 1816, 1898, 1913, 2849, 2850
Stochastic Processes, General Theory
3, 1897, 1903, 2412

STATISTICS

Applications
431, 1176, 1177, 1179, 1181, 2053, 2062, 2065, 2070, 2071
Decision Theory
2068
Design and Analysis of Experiments
2052
Distribution of Statistical Functions
425, 426, 428, 436, 1940, 2078, 2080, 2691. 2692
Estimation Theory: Parametric Case
358, 359, 1180, 2066
Multistage Decision Procedures, Sequential
667
Sampling Surveys
427, 429, 430, 1178, 2056, 2690, 2694

THEORY OF NUMBERS

Theory of Numbers: General
Diophantine equations
887
Elementary number theory
723

TOPOLOGICAL ALGEBRAIC STRUCTURES

Lattices
458
Topological Groups
212
Topological Groups and Lie Theory
1849
Topological Vector Spaces, Functional Analysis
1143, 1417, 1537
Applications of functional analysis, analysis of differential and integral operators
990
Banach spaces
2120, 991
Hilbert spaces
2428

TOPOLOGY

Differential Topology:
Complex manifolds
1146
Complex manifolds (Kähler, almost complex Hermitian)
1144, 1145
Topology: Algebraic
211, 214, 215, 457, 459, 2233, 2251, 2540, 3086
Complexes and polyhedra
2059
Dimension theory
461
Graphs, four color problem
1387, 1392, 1949
Homology
1858
Homology and cohomology
460
Homotopy
216
Homotopy, general theory
2414
Manifolds
1147, 1531
Topology of group spaces and H-spaces
1528-1530, 1539
Transformations and special mappings
1941, 1942, 2081
Topology: General
1860, 3024, 3025
Sets on a line and in Euclidean space
1148, 1857

TOPOLOGY AND GEOMETRY OF DIFFERENTIABLE MANIFOLDS

Topology of vector and tensor fields
2531
