PREFACE

Prolegomenous Catechism

Q: What is the purpose and requirement for this publication?
A: The primary purpose of the Library of Congress effort is to provide an independent audit and back-up for AFOSR's documentation control system, delivering indexed abstracts of all AFOSR-sponsored publications. The publication per se accounts for only 5 percent of the cost of the effort, yet multiplies the utility by a factor of 1,000.

Q: Is the $726,000 this project has cost to date a reasonable expenditure of AFOSR research funds?
A: Yes. USAF spends 0.7 percent of its R&D budget on information activities: the total cost of the Bibliography is 0.45 percent of the AFOSR contract/grant budget during the period covered.

Q: Can the requirement for this publication be satisfied more expeditiously by other means?
A: More expeditiously, yes. More accurately and completely, no.

Q: What does this publication accomplish that is not already provided by a combination of other abstracting, indexing and announcement services?
A: Nothing that the skilled user or librarian couldn't do for himself, given sufficient time.

Q: What is the value of a 6-year old organizationally oriented publication to the scientific community?
A: One operational test of value is the market place. The Superintendent of Documents has sold almost 3,000 copies of this publication for a total price of $18,628.

Q: If only AFOSR-sponsored research is reported, is the title correct?
A: It was for Vol. I, covering the period from 1950-1956 when AFOSR had the sole specific basic research mission in the Air Force, but is not strictly correct for later volumes.

Q: What happened to the pictures?
A: Paragraph 25 of "Government Printing and Binding Regulations" provides that "Illustrations shall not be used in departmental...publications unless certified to be functional and to relate entirely to the transaction of public business." The function of providing charming oases amongst the bleak windrows of text could not be so certified.

Q: Can the need for this publication be adequately demonstrated to higher echelons?
A: You never know till you try. It is hoped however that any defense of this publication would start out by emphasizing the independent audit and backstop aspects, then go on to mention the publication per se in terms of current Congressional and White House interest in technology utilization, technology transfer and freedom of information, and conclude by pointing out that the important question is not, "Why is AFOSR doing this?" but rather "Why do not more agencies do this?"

Scope

This is the sixth volume of a continuing bibliographic series, and includes within the limitations of the law of diminishing returns, abstracts of all technical reports, journal articles, books, symposium proceedings, and monographs produced and published by scientists supported in whole or in part by the Air Force Office of Scientific Research during the calendar year 1962. Previous publications in this series have been:

Vol. I (1950-1956), issued in 1961
Vol. II (1957-1958), issued in 1964
Vol. III (1959), issued in 1965
Vol. IV (1960), issued in 1966
Vol. V (1961), issued in 1967

The Air Force Office of Scientific Research supports fundamental research in the five major scientific disciplines: physics, chemistry, engineering sciences (subsuming mechanics and propulsion), life sciences (both biological and behavioral, but not medical), and mathematics (including, during the period of this bibliography, the information sciences). Thus the publications abstracted herein are multi-disciplinary, their common link being task support by AFOSR.

FOREWORD

It is again my pleasure to contribute a foreword to a volume of the Air Force Scientific Research Bibliography. The series is nearly a decade old, prompting me to look back to its origins and to review its purpose and accomplishments. From its inception by Harold Wooster, the Bib has been offered as a basic service both to the users of Air Force research, and to those who help make the product available to the users. The sheer bulk of the volumes in this series would seem to assure their use only by the dedicated. However, their comprehensiveness, organization and indexing also assure that the user will be aided in his efforts to identify specific research, or a paper, author, date, reference or contract number.

The decision to begin the series came from a sense of responsibility to make freely available, in the form of a comprehensive scientific and technical reference service, the written results of research resulting from AFOSR support. Just as we require our scientific investigators to publish their results, we feel an equal burden to show the results of our expenditure of public funds in our support of fundamental research related to Air Force operating needs.

Cataloguing for the first volume in the series was barely begun in time to assure reasonable completeness for the early years of AFOSR. The impetus, it is fair to say, came from the exponential rate of rise in those years of the total Federal research and development expenditures. The growth of Air Force research was somewhat less spectacular, but none-the-less interesting enough to justify the bibliographic effort. At that time the scientific and technical community found high on its list of worries the national threat of being overwhelmed with paper, something called the information explosion. Whether this threat ever quite developed is questioned by Wooster (1) Then, just as the nation had suddenly discovered science a few years before, science, it seemed, discovered documentalists. The only hope according to some analysts of the situation, was to create a vast central information system to put scientists in quick communication with each other, and with the users of their research.

A number of schemes for quick reporting from various central systems fell by the wayside until most persons concerned were ready to agree that the journal was after all a most efficient communication method for scientific information. It was not as generally appreciated then however, that quite good systems existed to handle journal articles, and in fact had functioned well for some time. On closer examination, and after comparison with really centralized systems, as in the USSR, it was found that the U.S. had some of the best indexing and abstracting services for the world scientific literature. It was interesting to see how many subscriptions went to countries with centralized services. Somewhat geared up and bolstered by computer techniques, to be sure, our scientific and technical information systems today appear to be working well, and furthermore, are published in the form of books. Documentalists, in the old days known to putter about in musty stacks, have refurbished their images and are now information systems specialists, and include tightly organized subsets of specialized researchers and technicians. No longer content with their former rear echelon roles, they now tell science much that it did not know about what information is, and what carefully designed systems can do with it.

The important point to me is that the "best" self-contained information system yet developed appears to be a well-organized book, combining compact size with instant accessibility, ease of reading, and a generally moderate cost.

On the bookshelf, volumes one through five measure nearly eleven inches; this is one of the few facts on the Bib that Wooster hasn't already provided in his prefaces. This size is still less than the smallest deskside computer console, or even the software program instructions for some information projects I have seen.

In these days of austere Air Force budgets for research, it is well to ensure that maximum effective use is being made of available resources. The Bibliography is a definite step in this direction, being the logical starting point in any search for research results from Air Force support The Bibliography has been made as useful an instrument as possible, and is distributed to key centers of scientific and technical documentation within the Air Force, the academic and industrial communities, and to selected libraries worldwide, especially in developing nations. Sales through Superintendent of Documents alone are impressive.

In his quest for better information packaging, Wooster laments the regrettable failure of engineers to develop a cuddly microfiche reader (2). This illustrates the truism that all kinds of requirements are imposed upon information systems, many of them unforeseeable by the designers of those systems. Every effort has been made to make the Bibliography useful and we would like to hear from the users how it is being used, how useful it is in present form, and how it could be improved. We are not looking for testimonials, although these do serve useful purposes in these days of increasing needs to justify and document research budget requests. We are especially interested in examples in which this reference service has been of assistance in effectively coupling research to application.

William J. Price
Executive Director
Air Force Office of Scientific Research

PREFACE

Prolegomenous Catechism

Q: What is the purpose and requirement for this publication?
A: The primary purpose of the Library of Congress effort is to provide an independent audit and back-up for AFOSR's documentation control system, delivering indexed abstracts of all AFOSR-sponsored publications. The publication per se accounts for only 5 percent of the cost of the effort, yet multiplies the utility by a factor of 1,000.

Q: Is the $726,000 this project has cost to date a reasonable expenditure of AFOSR research funds?
A. Yes. USAF spends 0.7 percent of its R&D budget on information activities; the total cost of the Bibliography is 0.45 percent of the AFOSR contract, grant budget during the period covered.

Q: Can the requirement for this publication be satisfied more expeditiously by other means?
A: More expeditiously, yes. More accurately and completely, no.

Q: What does this publication accomplish that is not already provided by a combination of other abstracting, indexing and announcement services?
A: Nothing that the skilled user or librarian couldn't do for himself, given sufficient time.

Q: What is the value of a 6-year old organizationally oriented publication to the scientific community?
A: One operational test of value is the market place. The Superintendent of Documents has sold almost 3,000 copies of this publication for a total price of $18,628.

Q: If only AFOSR-sponsored research is reported, is the title correct?
A: It was for Vol. I, covering the period from 1950-1956 when AFOSR had the sole specific basic research mission in the Air Force, but is not strictly correct for later volumes.

Q: What happened to the pictures?
A Paragraph 25 of "Government Printing and Binding Regulations" provides that "Illustrations shall not be used in departmental...publications unless certified to be functional and to relate entirely to the transaction of public business." The function of providing charming oases amongst the bleak windrows of text could not be so certified.

Q: Can the need for this publication be adequately demonstrated to higher echelons?
A: You never know till you try. It is hoped however that any defense of this publication would start out by emphasizing the independent audit and backstop aspects, then go on to mention the publication per se in terms of current Congressional and White House interest in technology utilization, technology transfer and freedom of information, and conclude by pointing out that the important question is not, "Why is AFOSR doing this?" but rather "Why do not more agencies do this?"

Scope

This is the sixth volume of a continuing bibliographic series, and includes within the limitations of the law of diminishing returns, abstracts of all technical reports, journal articles, books, symposium proceedings, and monographs produced and published by scientists supported in whole or in part by the Air Force Office of Scientific Research during the calendar year 1962. Previous publications in this series have been.

Vol. I (1950-1956), issued in 1961
Vol. II (1957-1958), issued in 1964
Vol. III (1959), issued in 1965
Vol. IV (1960), issued in 1966
Vol. V (1961), issued in 1967

The Air Force Office of Scientific Research supports fundamental research in the five major scientific disciplines: physics, chemistry, engineering sciences (subsuming mechanics and propulsion), life sciences (both biological and behavioral, but not medical), and mathematics (including during the period of this bibliography, the information sciences). Thus the publications abstracted herein are multi-disciplinary, their common link being task support by AFOSR.

Sources Searched

References, reports, and clues to the existence of reports were found by searching the indexes and report collection of the Air Force Office of Scientific Research Technical Library, and the collection of the Defense Documentation Center. Detailed searches were made of each contract file in the several AFOSR Directorates. In addition, cover-to-cover searches were made of over 300 scientific journals issued mostly in the time period 1962-1965.

Form of Entry and Arrangement

Inherent in the organization of this book is the concept of the reports within a contract as an unanalyzed monographic series. Reports are posted chronologically and/or alphabetically under contracts, these in turn under departments or laboratories, and these under contractors. This does, in fact, provide a rough subject grouping, with the detailed subject index leading into clusters of like reports.

The abstracts are identified by item numbers and are listed under the numbers in the indexes. The form of entry is, in general, that being used for DDC catalog cards i. e , source of the document, title; personal author, if any; date; pagination; report number; contract number; and accession number. The chief exception to DDC form of entry is that the primary entry is by the parent organization followed by the name of the specific laboratory or important subdivision.

Availability of Reports

The principal accession or control numbers, which indicate the locations of reports in collections are:

AD ASTIA Document or Accessioned Document: (available at DDC Defense Documentation Center), Cameron Station, Alexandria, Virginia 22314.

PB Publication Board for sale by the Clearinghouse for Federal Scientific and Technical Information (CFSTI), Sills Building, 5285 Port Royal Road, Springfield, Virginia 22151.

The fact that a report is abstracted in this book means that a copy of this report existed at the time the abstract was written; it should not be construed to imply that either AFOSR or the Library of Congress necessarily has a copy available for distribution. Those seeking reports should do so from the cited agencies, not from AFOSR.

Indices

A detailed subject index, arranged alphabetically, has been provided. In addition, there are a contract index, an AFOSR control number index, and a personal author index.

Acknowledgments

Many people shared in the production of this volume. The work has been fostered and nurtured by the previous Commanders and Executive Director of Air Force Office of Scientific Research: Brigadier Generals H. F. Gregory and B. G. Holzman; Colonels A. P. Gagge, Jack L. Deets, and Ivan Atkinson; Dr. Knox Millsaps and the present Executive Director, Dr. William Price. During the period of compilation of this volume (not the period of the literature covered) much of the responsibility for documentation within AFOSR was transferred to the Office of the Assistant Executive Director for Research Operations, Lt. Colonel Harry Jaffers. He, his administrative assistant for documentation, Miss Arlene D. Blose, and their intermittently faithful computer have been in large part responsible for providing the AFOSR input to this volume. Alex Nagy, chief designer, and staff artist Pat Shealy, of the Office of Aerospace Research, would have drawn the chapter and plates (if they had been permitted to do so).

Library of Congress, protocol dictates the form and order of acknowledgment of contributions made by LC staff members to a bibliography. Formally, the credit lines read as follows:

"The bibliographic team worked under the guidance and leadership of Dr. Clement R. Brown, Head of the Special Bibliographies Section, Science and Technology Division through December 1967. The chief bibliographers have been, Thomas C. Goodwin, Jr., Acting Head of the Special Bibliographies Section, G. Vernon Hooker, Supervisor of the Air Force Research Unit through February 1968, Doris C. Yates, Parthenia A. Patrick, Alexia H. Hatch, Joyce F. Lindsay, and Norman G. Lamb. A special note of gratitude is due to those who have aided in abstracting and typing, especially Jeanne D. Weber and Lillie M. Frye. Recognition is also due for the invaluable work in preparation of this manuscript, searching and preliminary cataloging done by Mrs. Marion S. Carr and Mrs. Phyllis M. Martin."

Informally, I feel a great loss in the retirement of Clem Brown, Scholar above and beyond anything that could be written in a job description, and Vernon Hooker, whose indefatigable bibliographic zeal set and sets a hard pace for younger men to follow. Si monumentum requiris, circumspice.

ORTHOGONAL POLYNOMIALS IN 2 OR n VARIABLES, by T Busk. Annual summary rept. no. 3, Jan. 1-Dec. 31, 1962, 6p. (AFOSR-4713) (AF 61(052)322) AD 408381 Unclassified

This research has been concerned with the development of a general interpolation formula, valid for an arbitrary set of arguments and not only for arguments which are intersections of sets of parallel lines, and having the following properties: (a) the formula should be symmetric in the arguments, and (b) it should give reasonable results when applied to various special cases. A formula of this type, developed for n-point interpolation in functions of (n-1) variables, is the following:

$$f(X_0) = \sum_{s=1}^{n} \frac{X_1 X_2 \cdots X_{s-1} X_0 X_{s+1} \cdots X_n}{X_1 X_2 \cdots X_{s-1} X_s X_{s+1} \cdots X} f(X_s) ,$$

where the expressions in the fraction denote hypervolumes. While attempts to generalize the above formula to cover 4-point interpolation functions of 2 variables have proved unsatisfactory, more positive results have been obtained for the development of (1) an iterative method for the solution of n non-linear equations in n unknowns, and (2) an iterative method for the solution of an equation in one, complex variable.

CHARACTERISTIC SUBSEQUENCES AND LIMIT LAWS FOR WEIGHTED MEANS, by O. Barndorff-Nielsen. July 26, 1962 [15]p. (Technical note no. 6; rept. no. ASR 3) (AFOSR-3544) (AF 61(052)42) AD 285442 Unclassified

Also published in Trans. Third Prague Conf. on Information Theory, Statistical Decision Functions, Random Processes, Liblice [Czechoslovakia] (June 5-13, 1962), Prague, Czechoslovak Academy of Sciences, 1964, p. 17-27.

In proving limit theorems for sequences $\{Z_n\}$ of random variables, it is a standard method to choose a suitable subsequence $\{Z_{n_i}\}$ of $\{Z_n\}$, verify that if the theorem holds for the subsequence $\{Z_{n_i}\}$ then it holds for $\{Z_n\}$ (so that the subsequence is in a sense 'characteristic' for $\{Z_n\}$ with respect to the convergence property in question) and finally prove the theorem for $\{Z_{n_i}\}$. As a result of analyzing applications of this method, some elementary lemmas of analytic nature have been established which may be used to sharpen well known limit theorems in the theory of probability. This is illustrated by deriving strong laws of large numbers for weighted means of random variables which are either uniformly bounded or have uniformly bounded p-th (absolute) moments and by proving an extension of the arc sin law to certain sequences of nonidentically distributed random variables. (Contractor's abstract)

STRUCTURE OF CALCIUM ALUMINATE, $12CaO.7Al_2O_3$, by J. Jeevaratnam, L. S. D. Glasser, and F. P. Glasser. [1962] [2]p. (AFOSR-4068) [AF 61(052)276] Unclassified

Also published in Nature, v. 194: 764-765, May 26, 1962.

Observed intensity measurements of 56 x-ray reflections from a single crystal of anhydrous $12CaO.7Al_2O_3$ gave good agreement with intensities calculated from the proposed structure of Büssem and Eitel (Zeitschr. Krist., v. 95: 175, 1936). This structure with a = 11.98A, space group $I\bar{4}3d$, Z = 2, apparently leaves 2 "surplus" O ions per unit cell. The structure is being refined to locate these O ions. The high temperature hydrate (approx 12 $CaO.7Al_2O_3.H_2O$) is also being studied to locate the OH^- groups.

THE DEHYDRATION OF HEMIMORPHITE, by H. F. W. Taylor. [1962] [13]p. incl. diagrs. table, refs. (AFOSR-4249) [AF 61(052)276] AD 405525 Unclassified

Also published in Amer. Mineralogist, v. 47: 932-944, July-Aug. 1962.

The thermal dehydration of hemimorphite ($Zn_4Si_2O_7(OH)_2 \cdot H_2O$) has been studied by single-crystal x-ray methods. Loss of the molecular water below 550°C causes only slight change in the rest of the structure. At about 700°C, the hydroxyl water is lost, and there is an oriented conversion to β-Zn_2SiO_4, below 960°C there is a second oriented conversion to α-Zn_2SiO_4 or willemite. γ-Zn_2SiO_4 does not appear to be formed. Both orientation relationships have been established and the unit cell of β-Zn_2SiO_4 is probably derived from a distorted tridymite- or cristobalite-like framework in which half of the silicon is replaced by zinc and additional atoms of zinc introduced into suitable interstices. Possible mechanisms for the 2 oriented conversions are discussed, and are compared with those known or believed to occur in similar reactions of silicates containing other cations. (Contractor's abstract)

REACTIONS IN HEATED LIME-ALUMINA MIXTURES, by A. J. Williamson and F. P. Glasser. [1962] [4]p. incl. diagr. table. (AFOSR-J1083) [AF 61(052)276] AD 422284 Unclassified

Also published in Jour. Appl. Chem., v. 12: 535-538, Dec. 1962.

Results of heating 5 lime-alumina mixtures for 3—120 hr at temperatures from 1045° to 1405° are presented. The mixtures were prepared from mixtures of $CaCO_3$ (calcite) and α-Al_2O_3 and also from co-precipitated hydroxide gels. Significant departures from equilibrium were noted. In general the gel mixtures approached the equilibrium state more rapidly. Unstable $5CaO, 3Al_2O_3$ was not detected. Previous interpretations of x-ray diffraction patterns of heated lime-alumina mixtures are shown to be in error. The mechanism of the reaction cannot be uniquely determined from a study of the bulk reaction products. (Contractor's abstract)

TOPOTACTIC REACTIONS IN INORGANIC OXY-COMPOUNDS, by L. S. D. Glasser, F. P. Glasser, and H. F. W. Taylor. [1962] [22]p. incl. illus. diagrs. tables, refs. (AFOSR-J1092) [AF 61(052)276] AD 420490 Unclassified

Also published in Quart. Rev., v. 16: 343-360, 1962.

In topotactic processes, a single crystal of a starting material is converted into a pseudomorph containing one or more products in a definite crystallographic orientation. For true topotaxy there must be some 3-dimensional correspondence between the structures of the product and its host, in contrast to epitaxy, in which the correspondence need only be 2-dimensional. Factors which may influence the degree of orientation include temperature, pressure, physical state, and time and rate of heating used to induce thermal changes. The sizes and electronegativities of the cations partly decide which ions move and which do not. With small cations, i.e., Mg^{2+}, Al^{3+}, Fe^{3+}, and Si^{4+}, the oxygen framework tends to stay relatively unchanged while cations migrate. The number of oxygen atoms in a given volume tends to remain constant in the regions where topotactic change occurs. At the other extreme, large electronegative cations, i.e., U^{4+} and Pb^{4+}, probably remain fixed while oxygen atoms move. In low-temperature reactions of hydrated calcium silicates, calcium migration is important, but reactions occurring above approx 500° take place mainly by migration of silicon, the Ca-O framework staying nearly unaltered. In high temperature reactions involving silicon, the concept of the silicate anion as the most important element of the structure is not a good starting point for an understanding of these reactions. The packing of oxygen atoms, and of any large cations present, is more important than that of silicon. Caution should be used in applying these generalizations to redox processes involving the metal, i.e., FeO - Fe, because it may be incorrect to use ionic radii. The effects of catalysts have been little studied. Water seems to catalyze silicon migration.

CHEMICAL SCAVENGER PROBE DETERMINATIONS OF ATOM AND EXCITED MOLECULE CONCENTRATIONS IN NONEQUILIBRIUM SUPERSONIC STREAMS OF ACTIVE NITROGEN, by A. Fontijn, D. E. Rosner, and S. C. Kurzius. Aug. 1962 [60]p. incl. diagrs. tables, refs. (Rept. no. TP-40) (AFOSR-4626) (AF 49(638)300) AD 296398 Unclassified

A quartz chemical scavenger probe was developed to study local active species concentrations in a gas expanded from a converging-diverging nozzle glow discharge source. The probe samples a small central portion of the supersonic non-equilibrium jet. Results obtained with active N at one relatively low discharge power output are discussed. The sampled gas mixed and reacted inside the probe with one of the scavenger gases NO, NH_3, or C_2H_4 at 18.8 mm Hg and an average temperature of 500°K. The NO light titration technique and the production of HCN from C_2H_4 set an upper and lower bound respectively for the atom concentration. The observed maximum amount of NO decomposition was 2.1 times as large as the NO light titration end point flow rate. This difference is far in excess of that observed in conventional discharge flow systems and is interpreted as being due to excited N_2 molecules reacting with NO in a reaction slow compared to that between N-atoms and NO. The contribution of the jet was found to be at least comparable to that of the N-atoms. A new analytical technique for quantitative analysis of the undecomposed NO was developed. Decomposition of NH_3 also showed the presence of excited molecules. The NO light titration technique can also be used for composition measurements of the total supersonic jet. SCALE EFFECTS AND CORRELATIONS IN NONEQUILIBRIUM CONVECTIVE HEAT TRANSFER, by D. E. Rosner. [1962] [6]p. incl. diagrs. refs. (AFOSR-J1480) (AF 49(638)1138) AD 427536 Unclassified

Also published in AIAA Jour., v. 1: 1550-1555, July 1963.

The effect of chemical nonequilibrium on the dependence of heat flux on physical scale is illustrated for the case of simultaneous gas-phase and surface-catalyzed-atom recombination. Altitude-velocity regimes in which one can expect appreciable chemical nonequilibrium effects on the heat flux and its scale dependence are displayed and combined with trajectory information for representative hypersonic vehicles. Approximate but rather general correlation equations are suggested for the nonequilibrium boundary-layer regime.

FUNDAMENTAL SOLUTION TO THE DIFFUSION BOUNDARY LAYER EQUATION FOR NEARLY SEPARATED FLOW OVER SOLID SURFACES AT VERY LARGE PRANDTL NUMBERS, by D. E. Rosner. Nov. 1962, 74p. incl. diagrs. tables, refs. (Rept. no. TP-52) (AF 49-(638)1138) AD 291031 Unclassified

Also published in Internat'l. Jour. Heat and Mass Transfer, v. 6: 793-804, Sept. 1963. (AFOSR-J1481; AD 427537)

Using the method of self-similar solutions, an exact fundamental solution to the equation of convective diffusion is obtained for the case of nearly separated flow over a surface when the Prandtl number is very large compared to unity. The driving force for diffusion is assumed to change abruptly from zero to unity at the streamwise location $x = \xi$ and an arbitrary distribution of the velocity profile curvature parameter $(\delta^2 w / \delta y^2)_{y=0}$ is allowed through the use of the von Mises transformation. An integral (profile) method using a cubic polynomial for the dimensionless concentration (temperature) profile is shown to predict the correct functional form of transfer coefficient but overestimates its magnitude by 3.3%. This is more than twice the error of a corresponding integral method solution to the nonseparating flow problem, suggesting once again that for a given number of terms in the approximating polynomial the accuracy of profile methods in general deteriorates as one nears separation of the velocity boundary layer.

INFLUENCE OF THE TURBULENT DIFFUSION BOUNDARY LAYER ON THE APPARENT KINETICS OF SURFACE REACTIONS IN EXTERNAL FLOW SYSTEMS. by D. E. Rosner July 1962, 51p. incl. diagrs. tables, refs. (Rept. no. TP-50) (AF 49(638)1138) AD 291030 Unclassified

Also published in Chem. Eng. Sci., v. 19: 1-17, Jan. 1964. (AFOSR-61-0215, AD 432574)

The occurrence of diffusion boundary layers in the vicinity of solid catalysts in forced-flow systems causes the apparent chemical kinetics of surface reactions to differ from the true interfacial kinetics. The magnitude of this falsification is investigated quantitatively for the case of turbulent incompressible flow within the boundary layer, using the uniform catalytic flat plate as an example. Corresponding results for laminar diffusion layers are included for comparison. Several distinct computational techniques are discussed for diffusional Prandtl numbers of order unity as well as for the asymptotic extreme. Tabular values are given of all pertinent nondimensional reaction rate coefficients over the entire range from reaction rate-to-diffusion control for one-half, first and second order irreversible surface reactions using a rational improvement of the Frank-Kamenetskii quasi-stationary approximation.

RADIATION COOLING OF AERODYNAMICALLY HEATED SURFACES AT HIGH MACH NUMBERS, by D. E. Rosner. Jan. 28, 1962, 48p. incl. diagrs. tables, refs. (Rept. no. TP-60) (AF 49(638)1138) AD 297233 Unclassified

Also published in Supersonic Flow, Chemical Processes and Radiative Transfer; [Proc. AGARD Colloq.], ed. by D. B. Olfe and V. Zakkay. London, Pergamon Press, 1964, p. 439-483. (AFOSR-64-1893; AD 450013)

Several aspects of radiation cooling are discussed, particularly those associated with the occurrence of surface catalyzed atom recombination at high Mach numbers. An analogy between radiation cooling and chemical surface catalysis is explored and the dominant effects resulting from interactions between these two processes are illustrated using simple mathematical models which serve to single out the important nondimensional parameters. In connection with flight applications, altitude velocity maps are presented which provide an over-all picture of the regimes in which chemical nonequilibrium effects should be noticeable. Several unexplored areas of potential interest in the design of hypersonic lifting vehicles are outlined and related to the available literature. Not all of these areas deal with thermochemical effects. Many problems remain unsolved, as illustrated by a brief discussion of the radiation-cooled flat plate (Contractor's abstract)

SCALE EFFECTS FOR NONEQUILIBRIUM CONVECTIVE HEAT TRANSFER WITH SIMULTANEOUS GAS PHASE AND SURFACE CHEMICAL REACTIONS. APPLICATION TO HYPERSONIC FLIGHT AT HIGH ALTITUDES, by D. E. Rosner. Nov. 1962, 19p. incl. diagrs. refs. (Rept. no. TP-54) (AF 49(638)1138) AD 291052 Unclassified

Conceptual division of the general problem of nonequilibrium convective heat transfer into a transfer coefficient and generalized recovery enthalpy driving force fails to confine the dominant influence of fluid dynamic quantities to the coefficients themselves. The Reynold's number dependence of the energy transport rate can exhibit unusual behavior, particularly in the mixed regime in which strongly exothermic gas phase and surface atom recombination reactions are of comparable importance. A class of manned re-entry bodies will experience peak heating rates in altitude-speed

regions where nonequilibrium atom recombination will be the rule. Available calculations indicate that the peak heat flux could differ by a factor of three. A controllable trajectory which has been optimized on the basis of a convective heating rate may be significantly different from the true optimal trajectory taking due account of nonequilibrium phenomena. It has been conjectured that if nonequilibrium recombination were included in certain design calculations there might exist optimum nose radii for minimum heat flux somewhat in analogy to the more familiar case of combined convective and radiative heat transfer.

ISOTOPE EFFECTS AND THE MECHANISM OF ATOM PRODUCTION IN GAMMA-IRRADIATED ICE AT 4.2°K, by H. S. Judeikis, J. M. Flournoy, and S. Siegel. [1962] [7]p incl. diagrs. table. [AF 18(603)-110] Unclassified

Published in Jour. Chem. Phys., v. 37: 2272-2278, Nov. 15, 1962.

The relative intensities of the electron spin resonance spectra of H and D atoms were determined for mixtures of H_2O and D_2O which were irradiated and observed at 4.2°K. A careful analysis of the results indicates that the yield of atoms per unit irradiation dosage exhibits no isotope effect, except for the system containing trace amounts of H_2O in D_2O. The presence of a large isotope effect for a system of D_2O containing approximately 0.1% H_2O is discussed in terms of energy transfer in the solid state. (Contractor's abstract)

HIGH FREQUENCY COMBUSTION INSTABILITY (Abstract), by R. G. Peoples. [1961] [1]p. [AF 49-(638)178] Unclassified

Presented at Fourteenth AFOSR Contractors' meeting on Liquid Rocket Combustion Research, Princeton U., N. J., Sept. 25-26, 1961. (AFOSR-1768; AD 267915)

It has been demonstrated that the inherent stability of a combustion process, as related to basic rocketry, is determined by (a) the magnitude and spatial distribution of pressure-sensitive energy available for release to a given perturbation, and (b) the relationship between the replenishment of this energy and the behavior characteristics of the perturbation. Recent activities have been directed towards the quantitative investigation of the parameters affecting inherent stability. A 2-dimensional, transparent-walled motor was designed, fabricated, and tested to experimentally measure pressure-sensitive energy and to determine the effect of variations in the operating parameters on the magnitude and spatial distribution of this energy. The combustion mechanism is photographically observed to determine gas velocity and relative combustion temperature, and as a result, available energy is determined. Representative experimental data is presented and discussed. The support mechanism for combustion instability and the characteristic behavior of a perturbation have an interdependency which must be considered when investigating either phenomena. The difficulties encountered thus far in the development of an experimentally consistent theory for unstable combustion have been the result of analytical separation of these events. To overcome some of the deficiencies of existing analytical combustion models, the characteristics of an instability, as encountered in a large-scale thrust chamber, are being investigated. Some of the pertinent information gathered is presented and discussed.

KINETICS OF RECOMBINATION PROCESSES, by C. B. Kretschmer. Final technical rept. Apr. 15, 1959-June 14, 1962, 24p. incl. tables. (Rept. no. AN-671) (AFOSR-3200) (AF 49(638)540) AD 283043 Unclassified

Rate coefficients for formation of N_2, NO, H_2, HO_2, H_2O_2, He_2^+, and Ar_2^+ from atoms, atomic ions, or free radicals in triple collisions were measured at 300°K. A theoretical evaluation of the rate coefficient for diatomic molecule formation in triple collisions was carried out, giving results which agreed well with the experimental values. Rate coefficients for several bimolecular reactions involving O atoms, N atoms, or OH radicals were also determined. A theory of positive ion collection by Langmuir probes in gas discharge plasmas at pressures between about 0.1 and 20 mm Hg was developed. Dissociative recombination coefficients of Ar, N, O, Hg, and Cs molecular ions were determined from probe measurements on gas discharge afterglows, using this theory to calculate ion concentrations from probe currents. Recombination coefficients obtained in this manner agreed well with values obtained by microwave techniques. (Contractor's abstract)

KINETICS OF THREE-BODY ATOM RECOMBINATION, by C. B. Kretschmer and H. L. Petersen. June 1962, 22p. incl. illus. tables, refs. (Rept. no. AN-625) (AF 49(638)540) AD 283042 Unclassified

Also published in Jour. Chem. Phys., v. 39: 1772-1778, Oct. 1, 1963. (AFOSR-64-0666; AD 435933)

The following values of the 3-body recombination rate constant in units of $cc^2/mol^2 sec$ were measured at 300° or 350°K:

$$N + N + N_2 \rightarrow N_2 + N_2,\ 8.0 \times 10^{14},$$

$$N + O + N_2 \rightarrow NO + N_2,\ 3.3 \times 10^{15},$$

$$H + H + H_2 \rightarrow H_2 + H_2,\ 8.9 \times 10^{15}.$$

The rate constant for the reaction $N + O_2 \rightarrow NO + O$ was found to be 5×10^7 cc/mol sec at 350°K. A statistical-mechanical calculation of the 3-body recombination rate constant gave values which agreed well with the above experimental results and also reproduced the previously determined value of $< 2.5 \times 10^{14}$ cc^2/mol^2 sec for $O + O + O_2 \rightarrow O_2 + O_2$. The large variation in rate constant for different gases is due mainly to differences in atomic masses and statistical weights. Redissociation of molecules in high vibrational levels is important in reducing the net rate of recombination. At high temperatures, the theory predicts a rate constant varying as T^{-1}.

Between about 0.1 and 20 mm Hg, ion concentration is related to the current collected by a negative cylindrical probe by the equation (in practical units)

$$n = 1.78 \times 10^{12} \lambda_e^{-1} \alpha^{-5/8} (V_p r_p)^{-1/4} i^{5/8},$$

where λ_e is the electron mean free path, α is the ion mobility, V_p and r_p are the probe voltage and radius, and i is the probe current per unit length. The plasma is not perturbed because the probe current is supplied by ionization occurring at the sheath boundary. Using this equation, the following values of the dissociative-recombination coefficient α in cm^3 sec were obtained from pulse discharge afterglow measurements: argon, 3.6×10^{-7} for high excitation and 1.4×10^{-6} for moderate excitation; oxygen, 2.0×10^{-6}; mercury, 3.5×10^{-6}. For nitrogen α was found to be proportional to pressure and equal to 1.7×10^{-7} at 1 mm Hg. For cesium the above equation does not apply, and the value $\alpha = 1.7 \times 10^{-7}$ was obtained from experimental results using conventional probe theory. The frequency of 3-body conversion of atomic to molecular ions was found to be 151 sec^{-1} for argon and 37 sec^{-1} for helium. (Contractor's abstract)

AN INVESTIGATION OF A CHARGED COLLOID PROPULSION SYSTEM, by C. K. Hinrichs. Final technical rept. May 1959-July 1962, 49p. incl. illus. diagrs. refs. (Rept. no. AN-683) (AFOSR-3202) (AF 49(638)656) Unclassified

The electrostatic dispersion of low vapor pressure liquids into highly-charged colloidal particles has been studied with a view to the application of this process in a charged colloid propulsion system for space applications. The liquids were dispersed from various spray tips that were raised to a high electric potential. The atomization of the liquids into charged colloidal particles can be explained by the repulsion of charges on the liquid surface by the high potential of the spray tip. Two methods of charging the liquid have been studied—electron bombardment and ionic conduction. In the absence of these charging methods the liquid does not form a colloidal spray but does undergo a pumping action which may be explained by the weaker effects of dielectrophoresis. Charge-to-mass ratio distributions for the droplets in the spray have been obtained that have average charge-to-mass ratios varying from .1 coulomb kg to 40 coulombs kg. The average charge-to-mass ratio obtained was found to increase with increasing conductivity or spraying voltage or decreasing mass flow rate. It is expected that the application of these effects can increase the charge-to-mass ratio to several hundred to a thousand coulomb kg and make the technique of electrostatic dispersion of liquids applicable to charged colloid propulsion systems.

RATE OF SUBLIMATION OF AMMONIUM HALIDES, by R. F. Chaiken, D. J. Sibbett and others. Mar. 1962 [24]p. incl. diagrs. tables, refs. (Rept. no. TN-43) (AFOSR-2350) (AF 49(638)851) AD 407709, AD 609814 Unclassified

Also published in Jour. Chem. Phys., v. 37 2311-2318, Nov 15, 1962.

The rates of sublimation of ammonium chloride, bromide, iodide, and fluoride have been determined by 2 different techniques over the temperature range of 100-600°C, corresponding to an increase in sublimation rate of 10^4 The 2 methods employed were the isothermal rate of weight loss using a quartz spring balance, and the hot-plate linear pyrolysis method. The low activation energy (about one-third the heat of sublimation) found for ammonium chloride by earlier investigators has been verified and found to extend to the other halides. The frequency factor is also abnormally low for the ammonium halides, by a factor of roughly 10^4, with the exception of fluoride, for which the factor is only about 500. These results are in fair agreement with the Schultz-Dekker mechanism for ammonium halide sublimation. (Contractor's abstract)

A NEW APPROACH TO NONEQUILIBRIUM STATISTICAL MECHANICS OF GASES, by J. E. McCune, G. Sandri, and E. A. Frieman. [1962] [13]p. incl. refs. (AFOSR-3718) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1140 and Office of Naval Research) AD 287145 Unclassified

Also published in Rarefied Gas Dynamics Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press, Suppl. 2, v 1: 102-114, 1963. (AFOSR-5312)

A new technique for the study of multiple-time relaxation processes is applied to the case of a short-range (neutral) dilute gas. A virial expansion of the BBGKY hierarchy is combined with an expansion of the time derivative in such a way that explicit account is taken of both the fast and slow processes occurring. This expansion is made definite by the removal of secular terms on the fast time scale; the first condition for the removal of such secularities is Bogolubov's form of the Boltzmann equation. Generalized conditions for the attainment by a gas of such a kinetic stage are given. The difficulty of generalizing the kinetic equation to allow for 3-body effects is discussed in the light of new developments. (Contractor's abstract)

ON THE RELAXATION OF GASES TOWARD CONTINUUM FLOW, by J. E. McCune, T. F. Morse, and G. Sandri. [1962] [21]p. incl. diagr refs. (AFOSR-J1038) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1140 and Office of Naval Research) Unclassified

Also published in Rarefied Gas Dynamics; Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press, Suppl. 2, v. 1: 115-135, 1963. (AFOSR-5310)

A new method for obtaining kinetic equations from expansions of the BBGKY hierarchy has been developed recently by Frieman and Sandri. This method takes advantage of the multiplicity of time scales appearing naturally in the hierarchy equations, and uses the freedom of these new time parameters to eliminate secular terms and thereby render the expansion uniformly valid for all times. The technique of introducing multiple time scales is also applicable to the Boltzmann equation and its various moments. For a perturbation in small spatial gradients at fixed Mach number it is shown that the second and third approximations to the distribution function necessarily must approach asymptotically the familar Chapman-Enskog results if the expansion is to remain valid for large times. The moment equations asymptotically become the Navier-Stokes and Burnett equations in the corresponding approximations. This pattern follows to all orders. The major new result is to demonstrate the manner in which the various approximations to the distribution function asymptotically approach the Chapman-Enskog values on the fast time scale. To study in detail how this asymptotic damping of transients occurs, the Bhatnager, Gross, Krook collision model is investigated, and explicit forms of the transients in the pressure tensor and heat flow vector calculated through first order. (Contractor's abstract)

THE FOUNDATIONS OF NONEQUILIBRIUM STATISTICAL MECHANICS, I AND II, by G. Sandri. [1962] [86]p. incl. diagrs. tables, refs. (AFOSR-64-0136) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1224 and AF 49(638)1140, and Office of Naval Research) AD 431068 Unclassified

Also published in Ann. Phys., v. 24: 332-418, Oct. 1963.

A novel philosophy of irreversible dynamics is

formulated. This philosophy stems from the claim that the kinetic equations available (Boltzmann, Landau' Bogoliubov-Lenard) are essentially exact and cannot be improved. That is, for kinetic gases (those whose behavior is characterized by that of one typical particle) these equations constitute closed, statistically complete knowledge. This thesis is demonstrated by using a technique that separates completely the different time components exhibited by the evolution of a gas when an appropriate parameter (characteristic of the regime in which the gas is found) is small. The expansion in this parameter is pushed up to its breaking point marked by the presence of an intrinsic divergence. With this technique we can pinch off the series at this point and remain with a closed, finite system of equations. The argument is made compelling by the fact that the same divergence occurs for all gaseous regimes (short-range, weak-coupling, dilute weak-coupling and Debye). When statistical information about a gas is needed beyond that afforded by the knowledge of the motion of the average particle, a new asymptotic expansion of the Liouville equation must be used. For this purpose a pair-kinetic expansion of the Liouville equation is introduced.

ON EXISTENCE AND ON-LINE COMPUTABILITY OF MINIMAL-COST TIME-VARYING GAIN FACTORS OR OPEN-LOOP CONTROL PROGRAMS FOR FINAL-VALUE AUTOMATIC CONTROL SYSTEMS, by R. W. Bass. [1962] [11]p. (AFOSR-1559) [AF 49(638)1003] Unclassified

Let A(t) and K(t) be continuous matrices defined on $0 \le t < +\infty$, and let $0 \le \tau < T$ be any two times. Let x_0 be any vector in E^n, and define x(t) on $\tau \le t \le T$ by $\dot{x} = A(t)x + K(t)c(t)$, $x(\tau) = x_0$, where the "control function" c(t) is any measurable function defined on $\tau \le t \le T$ and such that the "cost of control" integral $I = I(c) = \int_\tau^T c(\sigma)^2 \, d\sigma$ if finite. Based on the above theorem, the following problems are considered: (1) that of finding a control law c(t) such that $x(T) = 0$, and (2) linear feedback control where $c(t) = G(t)x$ and

the gain matrix is any measurable function defined on $\tau \leq t \leq T$ such that $x(T) = 0$ holds and

$$\int_\tau^T G(\sigma)\, x(\sigma)^2\, d\sigma \text{ is finite.}$$

ASPECTS OF GENERAL CONTROL THEORY, by R. W. Bass and P. Mendelson. Aug. 1962. 187p. (AFOSR-2754) (AF 49(638)1003) AD 289486 Unclassified

An elaborate matrix analysis is developed for use as an effective technique for performing the numerical calculations necessary for application of advanced control theory to practical engineering. These new techniques have been applied successfully to a variety of multi-dimensional linear and non-linear control synthesis problems. A number of necessary and sufficient conditions for the stability of linear control system systems have been developed, using Liapunov's direct method, and have been used to derive several synthesis procedures for the selection of gain vectors ensuring stability. It is shown that if a linear system with one undetermined gain vector satisfies a so-called condition of "controllability", then for every possible choice of characteristic roots of the system, there exists precisely one gain vector, which, if chosen, causes the system to have the chosen roots. Further it is shown how this gain vector can be computed directly by a single matrix inversion. Among other topics discussed are: continuous saturating control systems, discontinuous on-off control systems, general nonlinear systems, discontinuous time-optimal control of linear plants, and the maximum principle for synthesis of optimal systems.

ELECTRON-ION RECOMBINATION BY COLLISIONAL AND RADIATIVE PROCESSES, by S. [R.] Byron, R. C. Stabler, and P. I. Bortz. [1962] [4]p. incl. diagrs. tables, refs. (AF 49(638)670) Unclassified

Published in Phys. Rev. Ltrs., v. 8, 376-379, May 1, 1962.

Two physical principles which dominate the electron-ion three-body recombination process of capture into excited states are pointed out and discussed. These principles are used as the basis of a simple general theory for the calculation of the electron temperature and the net rate three-body recombination, α. This theory is used to calculate the value of α in hydrogen at an electron temperature of 16000°K, the result agrees very well with that obtained from the computer program of Bates and Kingston. Calculations of α for several other cases are in general agreement with experiment.

ELECTRON-ION RECOMBINATION IN DISCHARGE AFTER-GLOWS (Abstract), by S. [R.] Byron, R. C. Stabler, and P. [I.] Bortz. [1962] [1]p. [AF 49(638)-670] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 328, Apr. 23, 1962.

The rate-limiting factors in the collisional recombination of electrons and ions in discharge afterglows are (1) the rate of de-excitation by collisions and radiation of the state for which the total equilibrium de-excitation rate has a minimum, and (2) the rate of elastic energy transfer between electrons and ions. The nonequilibrium electron temperature and the recombination rate are obtained from simultaneous solution of the equations for the minimum de-excitation rate and the electron energy balance. The 3-body character of the collisional recombination and de-excitation process is masked by the time rate of change of the electron temperature. The net rate of recombination exhibits a 2-body density dependence ($dN_e/dt = \alpha N_e^2$, where α is independent of N_e) because of the 2-body behavior of the elastic-energy transfer rate. Early results of the application of this theory to recombination in discharge afterglows are given in the following:

Gas	T_e(exp)[1]	N_e	α (th)	α(exp)[1]
argon	3100	3×10^{12}	2×10^{-10}	2×10^{-10}
cesium	2000	5×10^{12}	4×10^{-10}	3.4×10^{-10}
mercury	2000	10^{12}	3×10^{-10}	2.3×10^{-10}

EFFECT OF DRUGS ON THE NORADRENALINE CONTENT OF BRAIN AND PERIPHERAL TISSUES

AND ITS SIGNIFICANCE, by S. Sanan and M. Vogt. [1961] [19]p. incl. tables, refs. (AFOSR-3463) (AF 61-(052)367) Unclassified

Also published in Brit. Jour. Pharmacol. and Chemotherapy v. 18: 109-127, Feb. 1962.

A study was made of the changes in the noradrenaline content of sympathetic ganglia and brain produced by a series of drugs. The first section deals with drugs which have pharmacological actions on different parts of the postsynaptic sympathetic neurones. Two of these drugs, methoserpidine and guanethidine, cause hypotension, and the question arose whether this effect can be explained by changes in the noradrenaline content of the peripheral sympathetic neurones. A second point was to ascertain whether these drugs have any action on the brain. The actions of the 2 other drugs, the nicotine-like compound dimethylphenylpiperazinium iodide, which stimulates sympathetic ganglia, and amphetamine, which stimulates nerve endings, were examined. If this stimulation was accompanied by a loss in noradrenaline from the sympathetic neurone this would support the theory that these substances act by releasing noradrenaline. The second part of this work is concerned with 2 amine oxidase inhibitors known or reputed to raise the noradrenaline content of tissues, particularly of brain; the object was to test whether there is a correlation of such action with effects on behavior.

CHEMICAL AND PHYSIOLOGICAL CHANGES PRODUCED BY ARTERIAL INFUSION OF DIHYDROXYPHENLALANINE INTO ONE CEREBRAL HEMISPHERE OF THE CAT, by R. Dagirmanjian, R. Laverty and others. Jan. 10, 1962 [10]p. incl. tables, refs. (AFOSR-3912) (AF 61(052)367) AD 289865 Unclassified

Also published in Jour. Neurochem. v. 10: 177-182, Mar. 1963 (AFOSR-J843, AD 416500)

Dihydroxyphenylalanine (DOPA), 5 – 20 mg, was infused into one carotid artery of the cats through a catheter tied into one lingual artery. When dilation of the pupil (anaesthetized cats) or encephalographic arousal (cerveau isole preparation) had developed on the side, of the infusion, the brain was removed and catecholamine estimations were carried out in different regions of the 2 cerebral hemispheres. The dopamine content of the caudate nucleus was increased on the side of the infusion, often by more than 100%. The dopamine content of hypothalamus and midbrain-reticular formation of the treated side was increased by a similar proportion. The noradrenaline content of the hypothalamus and the midbrain was not raised by the infusion. The possible relationship of chemical and physiological changes elicited by the infusion is discussed. HYPOGASTRIC NERVE OF THE DOG, by M. Vogt. [1962] [2]p. (AFOSR-J472) [AF EOAR-62-19] AD 407891 Unclassified

Also published in Nature, v. 197: 804-805, Feb. 23, 1963.

Longitudinal serial sections were made of the inferior mesenteric ganglia and the hypogastric nerves of dogs in an effort to ascertain where chromaffine tissue, if such was present, might be localized in such nerves. Analysis of the tissues revealed large chromaffine bodies inside the inferior mesenteric ganglia, but these did not extend into the hypogastric nerve. However, small elongated groups of 5-50 chromaffine cells occurred either within the very core of the nerve or along its surface underneath the epineurium. These groups were usually found in the middle part of the nerve, 2 or more cm away from either the lower pole of the mesenteric ganglion or the beginning of the pelvic plexus. There was no apparent difference in the amount of chromaffine tissue in the nerves of young and of adult dogs. In view of the present interest of pharmacologists in the hypogastic nerve, the fact should be kept in mind that this nerve is a complex structure, varying in composition from species to species, and not just a bundle of postganglionic fibres.

STRONGLY CAROTENOID-DEFICIENT CHROMATIUM-STRAIN D CELLS WITH 'NORMAL' BACTERIOCHLOROPHYLL ABSORPTION PEAKS IN THE 800-850 mμ REGION, by E. C. Wassink and G. H. M. Kronenberg. [1962] [2]p. incl. diagrs. (AFOSR-4183) (AF 61(052)-270) AD 632074 Unclassified

Also published in Nature, v. 194: 553-554, May 12, 196.

Cultures of carotenoid-deficient cells of Chromatium, strain D were prepared by the method devised by Goodwin and Osman, using diphenylamine (DPA). The bacteriochlorophyll absorption max at 850 mμ is of the same order of magnitude, and in some cases even higher than that found in normally grown cells of Chromatium, strain D. The same holds for the pigment-protein complexes, present in extracts of both types, prepared by grinding. In all cases the spectrum shows the shape which is usual for Chromatium, strain D, namely, with an 850 mμ max about 1.2—1.5 times as high as the 800 mμ max. The spectra of the green cells and their extracts tend to show a somewhat decreased 890 mμ absorption as compared with normally grown cells. Observations demonstrate that there is not necessarily a relation between disappearance of carotenoids and disappearance of the 850 mμ bacteriochlorophyll max in Chromatium, strain D.

Agricultural U., Wageningen (Netherlands).

PHYSICAL AND CHEMICAL STUDIES OF CHLOROPHYLL SYSTEMS, by E. C. Wassink and G. H. M. Kronenberg. July 1, 1962 [160]p. incl. diagrs. refs. (AFOSR-4904) (AF 61(052)270) AD 414936 Unclassified

Study has been made of the absorption spectra of bacteriochlorophyll types in purple sulphur bacteria, as manifest by (often 3) absorption maxima in the near infrared (at 800, 850, and 890 mμ). Evidence for considering these absorption maxima as due to 3 or more different pigment-protein complexes is discussed. Preliminary attempts to separate these supposed complexes in their native state by dispersing and topographical methods proved ineffective. Further characterization of the pigment complexes in their native state was made by studying certain effects on harvested cells and during growth of cultures. The main effects considered were light intensity and light quality, temperature, atmosphere, cultivation with diphenylamine, depressing carotenoid formation, and a comparison between differential effects and the extractability of bacteriochlorophyll from the different complexes by organic solvents with variation in concentration and duration of exposure. In general the 850 mμ peak appeared more sensitive than the 800 mμ one. Preliminary observations suggest that the effect of red light, only absorbed by bacteriochlorophyll, is about as effective as that also absorbed by carotenoids.

GAS-SURFACE PHENOMENA, by M. Rogers. Apr. 1962, 139p. incl. illus. diagrs. table, refs. (AFOSR-2342) (In cooperation with Johns Hopkins U., Baltimore, Md.) AD 285845 Unclassified

Presented at meeting on Gas-Surface Phenomena, Air Research and Development Command Hq., Baltimore, Md., Mar. 5, 1956.

This report is based on a transcript of an informal discussion which brought together scientists from the various disciplines (e.g., fluid dynamics, chemistry, and solid state physics) for an exchange of ideas on new concepts in gas-surface phenomena. The main topics of discussion were: Historical perspective and orientation, Viewing the surface, Surface lattice perfection and symmetry; Surface layers; Gas state and flow instability, Energy considerations in gas-surface interactions, The accommodation coefficient, Effect of relative masses and molecular structure on the thermal energy accommodation coefficient, Solid-solid adhesion and Conclusions and recommendations. It was concluded that advances in understanding gas-surface phenomena depend on advances in surface physics and chemistry. Since knowledge of the nature of, and details of, a surface is of interest to many diverse fields, a common forum for the presentation and collection of this knowledge appears warranted. It is therefore recommended that a Journal of Surface Physics be created, so that understanding and perspective obtained in any one area concerned with the problem can be rapidly and efficiently applied in the others.

LONG RANGE RESEARCH IN INFORMATION RETRIEVAL, by H. [A.] Wooster. [1962] [16]p. incl. tables. (AFOSR-4573) AD 428356 Unclassified

Also published in Information Retrieval Today; [Proc. of a Symposium], Minnesota U., Minneapolis (Sept. 19-22, 1962), ed. by W. C. Simonton. Minneapolis, Center for Continuation Study of Minnesota U., 1963, p. 149-164.

This paper is based on a National Science Foundation publication, Current Research and Development in Scientific Documentation, no. 10, dated May 1962, which is considered a valuable tool to those running research programs in the field of information retrieval.

In the 4 yr from Oct. 1958 to Nov. 1962 the publication grew from 76 pages with a total of 55 items to 383 pages with a total of 343 items. In the present note the various chapters are reviewed and analyzed individually, and categorized on the basis of the sources sponsoring research in the particular field covered by a given chapter. The discussions cover the following chapter headings: (1) Information needs and uses, (2) Information storage and retrieval, (3) Mechanical translation, (4) Equipment, (5) Character recognition, (6) Speech analysis and synthesis, (7) Linguistics and lexicography, and (8) Artificial intelligence.

LONG-RANGE RESEARCH IN INFORMATION SCIENCES, by H. [A.] Wooster. [1962] [7]p. (AFOSR-5535) Unclassified

Also published in Information Retrieval in Action; Proc. of a Conf., Western Reserve U., Cleveland, Ohio (Apr. 16-18, 1962), Cleveland, Western Reserve U. Press, 1963, p. 147-153.

The programs, responsibilities, and problems of the Air Force Office of Scientific Research in its role of supporting basic research and promoting accessibility of information concerning its research are discussed. It is suggested that fund-granting agencies should recognize 2 major responsibilities: (1) to report on the inventory of current projects that they are supporting, and (2) to make the results of the research freely available. Two major contributions of the Air Force in this area are publication of Basic Research Resumes, which contains one-paragraph abstracts of all AFOSR and Office of Aerospace Research supported projects; and the Air Force Scientific Research Bibliography, which gives abstracts of every report, journal article, symposium paper, etc., resulting from research supported by AFOSR and published during a given period. Commensurate with its basic research program, the Air Force must be concerned with the storage and retrieval of all forms of information, as well as the methodology and techniques necessary for the acquisition, transmission, evaluation, and interpretation of information. It is suggested that the groundwork be laid for using the great potential of computers in real time command and control operations, decision-making, advanced communication and intelligence processing problems.

THE AFOSR PROGRAM IN INFORMATION SYSTEMS RESEARCH, by R. Swanson. [1962] [10]p. incl. illus. refs. (AFOSR-4602) Unclassified

Also published in Proc. Symposium on Materials Information Retrieval, Wright-Patterson Air Force Base, Ohio (Nov. 28-29, 1962), p. 116-124.

The AFOSR program in information systems research is directed toward the support of fundamental studies having the promise of yielding general principles capable of being applied to information systems for specific purposes with profit to those systems. This program incorporates both empirical and theoretical studies ranging from systems analyses and ad hoc structuring of classification schedules to inquiries into the elements of language, human thought and learning processes, and logic systems for machine reduction — all aimed ultimately toward the better information system, the better concatenation of men and machines to facilitate progress in the advancement and applications of knowledge.

NOTES ON TEST SLED MEASUREMENTS AT THE HOLLOMAN TRACK, by G. Hughes and C. D. Leedham. Jan. 1962, 79p. incl. diagrs. tables, refs. (AFOSR/DRA-62-1) (AFOSR-2607) AD 276108 Unclassified

The quality of seeing at the Holloman track, being basic to all optical measurement methods to be described, has been measured. An analysis of possible optical systems for yaw, pitch, and roll measurement is reported. Based on this analysis, one optical measurement method is proposed for each attitude component. The analysis of space time data for test package vibrations is discussed in terms of the spacing of velocity measuring points along the track. A method is proposed to measure test package velocity rather than sled velocity relative to the track. (Contractor's abstract)

ON ESTIMATES OF LINEAR FUNCTIONS FOR TIME SERIES, by J. Abbott, P. Randolph, and J. Rosenblatt. July 1962, 37p. (AFOSR/DRA-62-12) (AFOSR-3531) AD 283037 Unclassified

The objective of this analysis is to establish a procedure for determining certain linear estimates of time series data. Since the immediate problem that led to this research was that of estimating velocity from position and time measurements, this analysis treats as a special case the problem of estimating velocity. Throughout, the procedures are developed within the framework of statistical decision theory.

SIMILITUDE CONSIDERATIONS IN SPACE

ENVIRONMENTAL SIMULATION, by T Y. Toong. Aug. 1962, 6p. (AFOSR DRA-62-16) (AFOSR-3534) AD 283353 Unclassified

Simulation of space environment has been examined on the basis of similitude considerations. Examples are given to indicate how subgravitational effects can be studied in an earth-bound laboratory. Conjectures are also made as to possible effects of subgravity on human locomotion and heart beat. It appears that much understanding of the subgravity effects on man can also be achieved by the use of similitude rules. The similitude considerations presented in this note can also be applied to the simulation of other more exotic space environmental conditions. (Contractor's abstract)

STUDY ON STRUCTURAL FEASIBILITY OF A FLYWHEEL ACCELERATOR, by R. F. Askew. May 1962, 32p. incl. diagrs. (AFOSR DRA-62-5) (In cooperation with Auburn U., Alabama) AD 276568 Unclassified

To determine the structural feasibility of a flywheel accelerator, this study was divided into 3 basic phases. First, the system was analyzed and configured to determine that satisfactory operation was present for all operational conditions. Second, a stress analysis was conducted to determine the influence of the centrifugal forces on the spokes and the rims of accelerator. The stress analysis considers the use of materials in the spokes and in the rim for the optimization of the weight distribution in the accelerator. Finally, an energy consideration was made for the determination of the power requirements. The equations derived in the third phase combined with the results of the second phase will enable the designer of a flywheel accelerator to meet all operational requirements. STUDY OF SOFT RECOVERY FROM TWO-STAGE VEHICLES. PART II. VERTICAL DESCENT TRAJECTORIES INCLUDING AERODYNAMIC HEATING, by F. P. Ehni and W. F. Haldeman. May 1962, 141p. incl. diagrs. (AFOSR DRA-62-7) (In cooperation with Air Force Missile Development Center, Holloman AFB, Alamagordo, N. Mex.) AD 277911 Unclassified

Vertical descent trajectories are presented in graphical form for bodies entering the earth's atmosphere starting at an altitude of 320,000 ft with entry speeds varying from 35,000 to 7,500 fps. Two sets of trajectories were computed: one with fixed drag-area-to-weight ratios ranging from 10 to .001, and one set, where the drag-area-to-weight ratio is varying to achieve reentry with decelerations limited to 75, 30 and 15 g. The variation of the drag-to-weight ratio during descent was expressed in terms of a drag-area factor C. The computations were performed on an analog computer. Graphs are presented for velocity, deceleration, dynamic pressure, heating rate, total heat, temperatur , and for the limited deceleration case, the drag-area factor, plotted vs time and/or altitude. The physical equations are presented and their analog computer mechanization is discussed. (Contractor's abstract)

ON THE NONLINEAR YAW MOTION OF A ROCKET SLED, by G. W. Braun and H. A. Melkus. July 1962, 43p. incl. illus. diagrs. table. (AFOSR/DRA-62-13) AD 287275 Unclassified

Some results are presented of an analog computer study concerned with the motion of a rocket sled configuration within a prescribed velocity profile. The motion of the sled was sidewise restricted by slippers running on rails. The dynamic properties of the sled were studied under idealized conditions; it was assumed that the moving body has only 2 degrees of freedom: namely, lateral displacement and yaw. The body's weathercock stability was varied from negative to positive values as it was assumed that this aerodynamic property influences the mode of motion. The effects of damping and that of play between slipper and rail were studied to obtain indications as to how these parameters affect the motion. (Contractor's abstract)

A PROPOSED IMPROVEMENT IN OPTIMIZATION TECHNIQUE FOR N-STAGED ROCKETS, by

H. P. Hotz and A. V. Houghton, III. July 1962, 42p. incl. diagrs. (AFOSR/DRA-62-14) (In cooperation with New Mexico U., Albuquerque) AD 287294 Unclassified

In the design of multistaged rockets, an essential feature is the optimization of the stages. This report is a comparison of the methods of Weisbord and Schurmann and the derivation of a new optimization procedure based on the energy rather than upon velocity as in earlier works. The numerical results of this method are compared with those of the earlier papers and it is shown that higher payload energies may be obtained for a given expenditure of fuel when the method of this report is used. Future refinements and improvements are suggested. (Contractor's abstract)

MINIMUM FUEL TRANSITIONS, by J. Thomas. Nov. 1962, 45p. incl. diagrs. tables, refs. (AFOSR DRA-62-21) (In cooperation with New Mexico State U., University Park) AD 294359 Unclassified

The problem of finding the optimum method of transferring from one rocket orbit to another, where the criterion of optimality is that as little fuel as possible be expanded in the maneuver, is examined. Papers devoted to the aspects of this question were reviewed. In some cases, several minor calculations in the process of comparing and contrasting similar papers were carried out. Several numerical calculations are suggested and several questions are asked which, it is hoped, will be good starting points for future research on this program, as well as related questions of a more general mathematical character. (Contractor's abstract)

Air Technology Corp., Cambridge, Mass.

THE OPTICAL EFFECT OF A DETACHED SHOCK WAVE IN FRONT OF A ROUNDED NOSE WINDOW, by R. E. Clapp. May 1962 [47]p. incl. diagrs. tables. (AFOSR/DRA-62-8) (AF 29(600)3070) AD 284588 Unclassified

Optical ray-tracing techniques, using air density distributions provided by NASA, have been used to compute the optical distortion introduced by a detached shock wave. A detailed study for the case of a spherical nose window at Mach 2 showed that the central portion of the shock layer was optically equivalent to a thin lens, slightly diverging, located well back of the nose surface. The optical deflection for a ray near the axis was computed as a function of Mach number for several nose shapes (sphere, paraboloid, and oblate ellipsoid). The results showed that over the window aperture the deflection could be kept within a few sec of angle by a suitable window design. (Contractor's abstract)

SPIN-LATTICE RELAXATION TIMES OF BROMINE PURE QUADRUPOLE RESONANCES AT LOW TEMPERATURES (Abstract), by R. F. Tipsword and W. G. Moulton. [1962] [1]p. [AF AFOSR-61-43] Unclassified

Presented at meeting of the Amer. Phys. Soc., Florida State U., Tallahassee, Apr. 5-7, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 574, Nov. 23, 1962.

The spin-lattice relaxation times for Br^{81} and Br^{79} in p-dibromobenzene and sodium bromate have been measured at 4.2°K. The sample was saturated with a large r.f. power from a regenerative spectrometer and the growth of the signal amplitude with small power incident on the sample was observed. It was found possible to reduce the power well below the saturation level and thus obtain reproducible data. The signal amplitude increases

exponentially with time, as would be expected. By a least-squares fitting, T_1 = 46 ± 2 min for Br^{79} and 75 ± 3 min for Br^{81} in p-dibromobenzene. The data for $NaBrO_3$ cannot be fitted by a single exponential, but require 2 different relaxation times. This phenomenon is tentatively ascribed to the fact that impurity relaxation and quadrupolar relaxation mechanisms may be of the same order in $NaBrO_3$ at 4.2°K. Preliminary analysis yields relaxation times of 120 and 80 min for Br^{81} and 155 and 85 min for Br^{79}. Relaxation mechanisms, the temperature dependence, and measurements on individual Zeeman components are discussed.

AN ANOMALOUS DISSIPATION FACTOR MAXIMUM IN SAPPHIRE, by N. M. Tallan and D. P. Detwiler. [1962] [7]p. incl. diagrs. refs. [AF 49(638)87] AD 416016 Unclassified

Published in Jour. Appl. Phys., v. 34: 1650-1656, June 1963.

The temperature and frequency dependencies of the dielectric properties of sapphire were determined by guarded measurements within the ranges −160° to 400°C and 10^2 to 10^4 cps. A broad dissipation factor maximum, exhibiting apparently anomalous behavior, was observed. Although the frequency at which the maximum occurred was exponentially temperature-dependent, activation energy values calculated on the basis of a dipolar relaxation model varied reversibly between ..2 and 0.5 ev as a function of vacuum heat treatment at 400°C and of exposure to dry hydrogen, dry oxygen, or moist air. The dissipation factor behavior which would result from 2 alternative mechanisms, interfacial polarization and resonance, is discussed briefly on the basis of the possible existence of variable conductivity surface layers and the possible presence of hydrogen in the vicinity of dislocations.

RETENTION OF MATERIAL PRESENTED BY AUTOINSTRUCTIONAL PROGRAMS WHICH VANISH AND WHICH DO NOT VANISH VERBAL CUES, by D. Angell and A. A. Lumsdaine. Aug. 1962 [14]p. incl. tables, refs. (Research rept. no. AIR-C14-8/62-TR) (AFOSR-3540) (AF 49(638)681) AD 285324 Unclassified

Subjects' performance on tests of immediate and delayed retention was measured following instruction by 2 versions of an autoinstructional program: one version employed vanishing (the successive reduction of stimulus support) and the other did not. Classes of 4th-, 5th-, and 6th-grade students served as Ss. No significant difference between the performance of Ss who had used the vanishing and the nonvanishing versions of the program was found on the immediate test. On the test taken 2 weeks after initial training, however, the Ss who had used the vanishing version of the program were found to have retained significantly more than Ss who had used the nonvanishing version. The results are interpreted in terms of the effects of context variables upon retention. (Contractor's abstract)

RESPONSE GUIDANCE, RESPONSE-TERM SIMILARITY, AND TEST TYPE IN THE LEARNING AND RETENTION OF WORD PAIRS, by D. Angell and D. F. Terry. Sept. 1962 [27]p. incl. diagrs. tables, refs. (Research rept. no. AIR-C14-9/62-TR) (AFOSR-3673) (AF 49(638)681) AD 289296 Unclassified

It was hypothesized that: (1) high cueing level would be more effective than low cueing, (2) the influence of cueing would be greater when easily confusable incorrect alternatives were present during training than when less easily confusable alternatives were present, and (3) training with easily confusable alternative response terms would be more effective than training with less confusable alternatives when the criterion behavior required discriminating between the correct response term and the easily confusable alternatives. Both immediate and delayed test results bore out the first hypothesis. The second hypothesis was confirmed by comparisons made on the results of the test coming at the end of the acquisition session. The third hypothesis was confirmed for the high and medium cueing levels but not for the low cueing level. It was also found that Ss who took recall tests during training performed better on the delayed retention tests than Ss who took recognition tests during training. It was concluded that prompting is more effective than anticipating in discrimination training, and that when high probability incorrect alternatives are presented, eliciting only the correct response is efficient training when the criterion behavior involves discriminating among the high probability alternatives. APPLIED MECHANICS REVIEWS: WADEX WORD AND AUTHOR INDEX, VOLUME 15, 1962, by E. A. Ripperger, B. A. Wooster and others. 1963, 576p. (AFOSR-J1551) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-33] and Office of Naval Research) Unclassified

WADEX, a computer-made index, is an experimental information retrieval project of Applied Mechanics Reviews. It is a modified form of the previous Key Word Out of Context (KWOC) indexes, and has been given the name WADEX where the letters stand for Word & Authors inDEX. This index incorporates many excellent features of previously published machine-made indexes and wherever it differs from others, the alterations have been made with specific objectives in mind. Each entry is composed of 3 parts: (1) descriptor, (2) reference numbers, and (3) bibliographical entry. The descriptor is a work or an author's name. The reference number contains the year, month, and item number. Bibliographical entry contains the author(s) name and the full title of the publication. Since WADEX, unlike most machine-made indexes, is an annual publication, it is most suitable to retrospective search, whereas the monthly indexes are more suitable for current awareness information.

1961 TRANSACTIONS OF THE EIGHTH NATIONAL VACUUM SYMPOSIUM COMBINED WITH THE SECOND INTERNATIONAL CONGRESS ON VACUUM SCIENCE AND TECHNOLOGY, VOLUMES 1 AND 2, Washington, D. C., Oct. 16-19, 1961, ed. by L. E. Preuss. New York, Pergamon Press, 1962, 2v. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [MIPR 62-3], Army Research Office, and Office of Naval Research) Unclassified

Approximately 1800 scientists registered for the sessions of the combined vacuum symposium and international congress. Adding to this number a large group who registered separately for a technical exhibit, there was a total attendance of well over 2,000 technical workers, representing approximately 20 nations. Two hundred and one technical papers appear in these transactions. Among the topics covered in the 22 sessions are: limitations in the attainment of ultra-high vacuum, fore pumps, components, vaporizing sources and freeze drying, adsorption, vacuum metallurgy, space simulation, cryopumping, leaks and gas flow, gauges, thin films, mass spectrometers, diffusion pumps, and getter-ion pumps.

ELECTRICAL PROPERTIES OF OXIDES OF SOME LANTHANIDE RARE EARTH ELEMENTS, by C. J. Kevane. Final rept. Feb. 28, 1962, 35p. incl. illus. diagrs. refs. (AFOSR-2230) (AF 49(638)789) AD 274510 Unclassified

Electrical conduction was studied in ceramic CeO_2 and Pr_2O_3 from room temperature to near 600°C. Measurements were primarily 2-contact direct current type although some 2-contact ac measurements were made on CeO_2. Some electrical conductivity effects of departures from stoichiometry were studied in Pr_2O_3 and CeO_2 using a quartz-beam microbalance. At temperatures between 400° and 600°C, the current which flows between Pt electrodes through CeO_2 at constant applied potential showed a decreasing transient. Above 600°C, the low-bias transients became increasing transients and at intermediate biases the transients disappeared. The ac resistance and capacitance of CeO_2 ceramic pellet with Pt electrodes were strongly frequency dependent. The ac sample resistance decreased with frequency as did the capacitance. At low frequency the capacitance became very large and if this capacitance were considered to be a bulk material effect it would correspond to a very large dielectric coefficient at frequencies near 100°C. Sintered ceramic pellets of CeO_2 containing 1% CaO appeared to exhibit ionic conduction and electrolysis under the action of an applied dc potential. (Contractor's abstract)

ELECTROLYTIC CONDUCTION IN CALCIUM-DOPED SOLID CERIUM OXIDE, by C. J. Kevane, E. L. Holverson, and R. D. Watson. [1962] [5]p. incl. illus. diagrs. refs. (AFOSR-J1099) [AF 49(638)789] AD 422261 Unclassified

Also published in Jour. Appl. Phys., v. 34: 2083-2087, July 1963.

At 460°C the passage of direct current through ceramic pellets of cerium dioxide containing one weight percent calcium oxide caused distinct volume discolorations to appear. The current at constant applied bias increased gradually from its initial value during the formation of the discolored regions, finally reaching a new, stable, higher level if sufficient time elapsed. In the latter case, both anode and cathode surfaces were discolored and the discoloration extended completely through the body of a pellet. When insufficient time was allowed for the current to reach a new, stable level, only the cathode surface was discolored and the discoloration extended only part way through the material. The discolorations could always be removed by heating the pellets for 1 hr in air at 600°C and the entire process could be repeated many times. These effects are interpreted to indicate that a significant fraction of the current in this material at this temperature is carried by oxygen ions which move the anode where they are plated-out leaving reduced, discolored material. (Contractor's abstract)

ELECTROLYTIC CONDUCTION IN SOLID CERIUM OXIDE (Abstract), by C. J. Kevane, E. L. Holverson, and R. D. Watson. [1962] [1]p. [AF 49(638)789] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 497, Aug. 27, 1962.

Results of electrical measurements carried out between room temperature and 600°C are tentatively interpreted to indicate significant ionic conduction in solid sintered cerium dioxide. The direct current flowing through sample pellets between platinum-foil electrodes was studied as a function of constant applied voltage, temperature and time. Material studied was pure (99.9 + %) or doped with small amounts of calcium oxide. The pure-oxide samples showed pronounced decreasing transients following application of the voltage. The magnitude of this effect decreased as the temperature increased to 600°C, and at 730°C it had virtually disappeared. The addition of calcium oxide results in great enhancement of conduction. Also, the passage of 10^{-5} to 10^{-3} C charge at 450°C through the calcium-doped samples is accompanied by a decrease of sample resistance and the appearance of discolored regions between the electrodes. The discolored region first appears at the cathode and grows through the sample to the anode. These general effects are taken to be evidence of polarization due to oxygen-ion migration with blocking at the anode and of reduction due to plating-out of oxygen.

DEFINING THE QUERY SPECTRUM— THE BASIS FOR DEVELOPING AND EVALUATING INFORMATION-RETRIEVAL METHODS, by J. W. Perry. [1962] [8]p. incl. diagrs. (AFOSR-64-0563) (AF AFOSR-61-79) AD 434293 Unclassified

Also published in I. E. E. E. Trans. on Eng. Writing and Speech, v. EWS-6: 20-27, Feb. 1963.

In designing a retrieval system for technical information, consideration of what practical benefits will result must be weighed against the costs of its operation. Thus, definitions of what queries to the system and what responses to them will be most useful in a given research, industrial, or management situation are of great importance. In such analysis, there are important factors (such as the actual relation between technological progress and recorded information) that can be defined qualitatively, but that defy precise study and quantitative measurement. Corresponding factors in Patent Office operations offer the possibility of operational study, since queries that the Patent examiner must answer have a similarity to the queries of importance in planning and conducting industrial research and development. COMMUNICATION SYSTEMS. DESIGN AND THEORY, by J. W. Perry. [1962] [34]p. incl. diagrs. refs. (AFOSR-64-0564) (AF AFOSR-61-79) AD 434413 Unclassified

Also published in Proc. Fifth Annual Inst. in Technical and Industrial Communications, Colorado State U., Fort Collins (July 1962), p. 110-114.

The scientific and technological advances of recent decades have been paralleled by continuing increases in the amount and complexity of scientific and technical information. Its effective use is critically important to the national welfare, especially to maintaining and expanding industrial and agricultural productivity, to developing means for exploring outer space, and to attaining adjustments of international tensions. At the end of World War II, it was apparent, at least to the more farsighted, that a severe bottleneck situation had developed in methods for identifying pertinent documents in large files and libraries. Efforts to break this bottleneck during the past 15 yr have made use of various automatic and semi-automatic devices. Parameters are defined in order to specify simularities and differences among various document selection methods. These results, expressed in flowchart form, provide a preliminary mathematical model whose detailed development is outside the scope of this paper. The immediate purpose of this mathematical model is to guide the design of documentation selection systems as well as their administration and management. To serve this purpose, both requirements to be met as well as circumstances of operation must be analyzed in terms of well-defined parameters. The results presented point toward a strategy for the development of a comprehensive theory of communication for understanding. (Contractor's abstract)

TECHNIQUES FOR QUENCHING POINT DEFECTS IN METAL WIRES, by R. M. Emrick. [1962] [22]p incl. diagrs. tables. (AFOSR-2581) (AF 49(638)790) AD 289122 Unclassified

The study of point lattice imperfections is greatly enhanced if the formation and motion of the defects can be observed separately. The quench technique allows the study of point defect formation and motion under a wide variety of physical environments, limited mainly by the ingenuity of the experimenter. The purpose of this paper is to outline some of the techniques which have been developed through the years. The techniques, for the most part have not been developed by the author.

EFFECT OF HYDROSTATIC PRESSURE ON THE RATE OF ATOMIC MOVEMENT IN NOBLE METALS, by C. T. Tomizuka. [1962] [2]p. (AFOSR-J565) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-105 and Atomic Energy Commission) AD 412680 Unclassified

Presented at Internat'l. Conf. on Crystal Lattice Defects, Kyoto (Japan), Sept. 7-12, 1962.

Also published in Jour. Phys Soc. Japan, v. 18, Suppl. II: 228-229, Mar. 1963

The measurement of self-diffusion rates in single crystals of silver at high pressures up to 8KB was carried out in a pressurized argon system. The activation volume thus obtained was 90% of the atomic volume. This value represents the sum of the volume of a vacancy at rest and the volume expansion introduced by the migration of a vacancy into a saddle point configuration. This latter quantity was estimated by Emrick in gold by measuring the pressure effect on the annealing rate of the quenched-in vacancies in gold. The value of 15% of the atomic volume was obtained by this method. If

it can be assumed that a similar value holds for silver, then the static volume of a vacancy in silver is 75% of the atomic volume. It is necessary to perform the quenching experiment under pressure in order to obtain the static vacancy volume directly. This can be accomplished if a sufficiently large quenching rate can be achieved at high pressure. Preliminary experiments indicate that the quenching rate of 10^4 deg. sec is possible at the pressure range of 2.5KB to 9KB. In order to increase the quenching rate and remove some difficulties associated with a dc heating, a pulse heating method is being tested.

ANOMALOUS DIFFUSION RATE FOR SMALL PENETRATION DISTANCE IN COPPER, by D. L. Styris and C. T. Tomizuka. [1962] [1]p. incl. diagr. (AFOSR-J567) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-105 and Atomic Energy Commission) AD 407389 Unclassified

Also published in Jour. Appl. Phys., v. 34: 1001-1002, Apr. 1963.

It is now possible to determine the tracer diffusion coefficient for penetration distances less than one micron by employing a chemical sectioning technique which will be explained in more detail in a future publication. During the course of testing the lower limit of diffusion coefficients which can be measured by this technique, an anomalously small diffusion coefficient was measured for the diffusion of radioactive Zn^{65} in a single crystal of Cu.

OXIDATION OF METALS IN MOLTEN SALTS. SILVER IN SODIUM CHLORIDE, by K. H. Stern. [1962] [7]p. incl. diagrs. table, refs. (AFOSR-3794) (AF 49(638)-653) Unclassified

Presented at 137th Nat'l. meeting of the Amer. Chem. Soc., Cleveland, Ohio, Apr. 1960.

Also published in Jour. Phys. Chem., v. 66: 1311-1317, July 1962.

The rate of oxidation of silver in sodium chloride near 900 has been determined under a variety of conditions. When the rate of O_2 transport to the Ag-NaCl interface is low, the reaction is zero order: when it is high, the rate varies as $\sqrt{\text{time}}$, indicating a rate controlled by the diffusion of products away from the reaction site. Under all conditions the $Ag^+ O^=$ ratio is greater than can be accounted for by the formatio. of Ag_2O. The results can be accounted for by hypothesizing 2 simultaneous reactions, (a) $2Ag + 1\ 2O_2 = 2Ag^+ + O^=$, (b) $Ag^0 + Na^+ - Ag^+ + Na^0$, which produce ionic silver, the relative contributions to total Ag^+ of the reactions depending on conditions. The equilibrium constant for (a) is 8.3×10^{-7} on the mol fraction scale.

POLARIZATION OF OPTICAL RADIATION INDUCED BY ELECTRON IMPACT ON HELIUM, by R. H. Hughes, R. B. Kay, and L. D. Weaver. [1962] [8]p. incl. diagrs. table, refs. (AFOSR-J297) (AF AFOSR-62-159) AD 408041 Unclassified

Also published in Phys. Rev., v. 129: 1630-1637, Feb. 15, 1963.

An investigation of the polarization of the atomic line radiation induced by electron impact on helium has been undertaken. Experimental data have been obtained on the polarization of several lines as a function of both electron energy and pressure. Secondary excitation processes, such as collision of the second kind and radiative transfer (cascade), are found to play an important role in the polarization. Expressions are derived for the analysis of the pressure effects on the polarization. Gas-kinetic collision cross sections involving atoms in excited states have been determined by observing the depolarization as the gas pressure increases.

LINE SHAPES IN THE SPECTRA EMITTED BY A HIGH-DENSITY CESIUM PLASMA (Abstract), by L. W. Fagg. [1962] [1]p. [AF 49(638)651] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 274-275, Apr. 23, 1962.

The spectra emitted from the high-density cesium plasmas ($\sim 10^{16}$ cm. cc) created by thermal excitation in the burning of $CsClO_4$:Al and $CsNO_3$:Al mixtures at atmospheric pressure have been studied with a spectrograph of 5A mm dispersion. The cesium transitions $ns_{1\ 2} - 6p_{1\ 2}$, $6p_{3\ 2}$ and $np_{1\ 2}$, $np_{3\ 2} - 6s_{1\ 2}$ exhibit very asymmetric line shapes; whereas, the $nd_{3\ 2}$, $5\ 2 - 6p_{1\ 2}$, $6p_{3\ 2}$ transitions are relatively symmetric. Comparison of the experimental shapes with those predicted by the theories of Griem et al and of Ecker are made along with a discussion of the discrepancies. Values of the electron density and temperature resulting from the spectrographic observations also are presented.

Presented at ARS Conf. on Ions in Flames and Rocket Exhausts, Palm Springs, Calif., Oct. 10-12, 1962.

Also published in Prog. in Astronaut. and Aeronaut., v. 12: 379-393, 1963.

Electron generators functioning by combustion of a cesium nitrate-aluminum pressed charge have been developed and test-fired in an altitude chamber. Thermodynamic analysis of the combustion and nozzle-expansion process shows that about 10^{20} power electrons are discharged per gram of charge, the gaseous product containing about 2 mol-% electrons. Spectroscopic measurements of the exhaust plume at 40 mm Hg abs confirm electron concentrations of this magnitude via Stark-broadening of cesium emission lines. Details of generator operation are given, and alternate chemical systems for electron generation are discussed.

SOLID PROPELLANT COMBUSTION MECHANISM (Abstract), by R. Friedman and J B. Levy. [1961] [1]p. [AF 49(638)813] Unclassified

Presented at Third AFOSR Contractors' meeting; on Combustion of Solid Propellants, Utah U., Salt Lake City, Jan. 30-31, 1961. (AFOSR-986)

Mechanism studies of pure ammonium perchlorate (AP) deflagration are reported. In view of the strong effect of pressure on AP flame propagation, gaseous kinetics is believed to play an important role. Perchloric acid vapor is probably a critical species, so its reactivity is being studied. Nonflow experiments have been conducted in glass and quartz vessels at 200-350°C, decomposition being followed by variation of optical absorption with time. At least the first half of the decomposition follows first-order kinetics with half-lives ranging from minutes to hours. The reaction is accelerated by light, inhibited by water vapor (a product), unaffected by inert gas addition or initial pressure of reactant over the range studies, and markedly accelerated by the Pyrex container surface in the 200-250°C temperature range (but not above 300) unless the surface is specially prepared before each test. In another series of experiments, the effect of sample diameter on lower pressure limit of deflagration has been studied. Increasing diameter from 4 mm to 25 mm reduces the lower limit only slightly, from 330 psi to 290 psi. This suggests a radiative rather than a conductive or convective heat loss mechanism. Another technique being explored involves combustion studies of pressed AP in which a tiny hole has been drilled and filled with organic polymer, the hole axis being initially normal to the flame front. By interrupting the burning, the angle at the AP-polymer interface can be observed. Under certain conditions a conical AP surface is produced with the polymer at the vertex, the sine of the cone half-angle corresponding to the ratio of flame propagation rates without and with the polymer-filled hole present. Effects of incident radiation, pressure, and hole size on this interaction are being investigated

HIGH-SPEED INFRARED BOLOMETER, by M. Camac and R. [M.] Feinberg. Mar. 1962 [73]p. incl. illus. diagrs. tables, refs. (Research rept. no. 120) (AFOSR-1564) (Sponsored jointly by Air Force Cambridge Research Lab.; and Air Force Office of Scientific Research under AF 49(638)61) AD 275131 Unclassified

Also published in Rev Scient. Instr., v. 33 964-972, Sept. 1962.

A new type of heat transfer gauge that operates in the presence of highly ionized plasmas and in strong electric and magnetic fields has been developed. The principle of its operation is to use a thin opaque surface as the heat transfer element. Aerodynamic and

radiative heating is applied to 1 side of this layer, while measurements are made of the change of the infrared emission from the other side. This system is essentially a boiometer. Components are described of the heat transfer system and the methods are given for calibrating the gauge for heating pulses of long and short duration The response of the system to a variety of heat pulses was calculated. Measurements are presented of the aerodynamic heat transfer from shock heated air, and the response time of the gauge to short heat pulses is evaluated. This infrared heat transfer system worked successfully in the presence of strong electromagnetic fields. side wall heat transfer measurements were made on the Magnetic Annular Shock Tube where the temperature of the hydrogen plasma was in excess of 100,000 °K. CURRENT DISTRIBUTION AND FLOW MODEL FOR LARGE RADIUS-RATIO MAST, by J. C. Keck, F. [J.] Fishman, and H. [E.] Petschek. Jan. 1962, 12p. incl. illus. diagrs. (Research rept. no. 117) (AFOSR-2194) (AF 49(638)659) AD 274094 Unclassified

The non-uniform flow in a magnetic annular shock tube (MAST, with an annular spacing larger than the radius of the inner cylinder is described. Experiments were conducted in a MAST with inner and outer radii of 1 and 3 in. The speed of the disturbance produced in the tube was found to depend upon the polarity of the discharge. The distribution of current in the tube was determined with probe coils, it too, depended on polarity. With the inner electrode positive the current was largely confined to a thin sheet that was strongly canted with respect to the walls, the inner edge leading. A thicker current sheet that was nearly normal to the tube walls was observed in the inverse polarity condition. A model is proposed to explain the operation with positive center electrode. The shape of the forward part of the current sheet is calculated by balancing the magnetic pressure behind the sheet with the gas pressure in front; the Newtonian approximation is used for the gas pressure. The resulting shape, which is approximately parabolic, agrees roughly with experiment It is proposed that the dependence of the flow on polarity is associated with electron emission problems, and that in positive operation ions carry a substantial part of the current. ELECTROSTATIC ACCELERATION OF NEUTRAL PLASMAS—MOMENTUM TRANSFER THROUGH MAGNETIC FIELDS, by G. S. Janes, J. Dotson, and T. Wilson. [1962] [24]p. incl. illus. diagrs. refs. (AFOSR-3887) (AF 49(638)659) AD 290073: AD 405492 Unclassified

Also published in Proc. Third Symposium on Advanced Propulsion Concepts, Cincinnati, Ohio (Oct. 2-4, 1962), New York, Gordon and Breach Science Publishers, v. 1: 153-176, 1963.

Electrostatic plasma accelerators which avoid the space charge limitations of conventional ion rockets are described. Additional advantages for these devices include moderate requirements on magnetic field strength, and on power level. Both classical and anomalous (Bohm type) electron diffusion models are considered. Experiments are described which substantiate the existence of the described mechanism for momentum transfer to neutral plasmas. The experiments are in approximate agreement with the anomalous (Bohm type) diffusion model and are in clear disagreement with the classical diffusion model. The engineering significance of this result and possible approaches for dealing with it are considered.

PLASMA FLOW IN A MAGNETIC ANNULAR ARC NOZZLE, by R. M. Patrick and W. E. Powers. [1962] [22]p. incl. illus. diagrs. table. (AFOSR-3901) (AF 49(638)659) AD 290082 Unclassified

Also published in Proc. Third Symposium on Advanced Propulsion Concepts, Cincinnati, Ohio (Oct. 2-4, 1962), New York, Gordon and Breach Science Publishers, v. 1: 115-136, 1963.

A report is made of an experimental investigation of plasma flow in a magnetic annular arc, emphasizing the flow in the expansion region, in order to study the characteristics of plasma accelerators. The nozzle configurations used are described. It is shown that a stable arc can be made in a coaxial configuration with an axial field which produces a steady, azimuthally uniform plasma, and that plasma flow properties are different in a wide angle nozzle, where the plasma swirl does not dominate the flow. The device used can produce an average exhaust velocity corresponding to a specific impulse of nearly 600 sec, with an overall thrust efficiency of 25%.

CURRENT DISTRIBUTION IN A MAGNETIC ANNULAR SHOCK TUBE, by J. C. Keck. [1962] [3]p. incl. illus. diagrs. (AFOSR-65-0566; (AF 49(538)659) AD 614212 Unclassified

Also published in Phys. Fluids, v. 5: 630-632, May 1962.

Very little is known about the exact mechanism by which the magnetic field accelerates the gas in a shock tube. It is the purpose of this note to give a preliminary report of some studies of the shock shape and current distribution in a magnetic annular shock tube which may assist in achieving an understanding of the above problem, as well as others involving the dynamic interaction of a gas and a magnetic field. The magnetic

field in the tube was mapped out point by point by inserting the probes to axial positions opposite the uv speed detectors and scanning radially in 1-cm steps across the 5-cm gap. It is shown that the current pattern in the shock tube depends on the polarity of operation. For a positive (outward) radial current, the thickness of the current sheet is ~2 cm, while for a negative (inward) current, it is more than twice as thick. Also, the shape of the current sheet changes when the polarity of operation is reversed. For positive operation, the current sheet is severely canted with the inner edge leading the outer edge by 1.5 μsec in time or 8 cm in space. For negative operation the sheet, although not as well defined, is more or less perpendicular to the walls.

ANOMALOUS ELECTRON DIFFUSION IN EM-REGION PLASMA-ACCELERATION EXPERIMENTS (Abstract), by G. S. Janes and T. Wilson. [1962] [1]p. [AF 49-(638)659] Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 149, Feb. 28, 1963.

In the EM region, the mean free path and ion-gyro radius are larger than the apparatus size, while the electron-gyro radius and the Debye shielding distance are still relatively small. Consider cylindrical and annular geometries with axial electric fields and radial magnetic fields. Ions will accelerate axially in the electric field, but the axial drift of electrons is strongly inhibited by magnetic fields. Circumferential electron drifts constitute a current that interacts with the magnetic field. Experiments substantiate this plasma-acceleration mechanism. The magnitude and magnetic field dependence of the observed rates of axial electron drift are well described by the anomalous 1 B (Bohm-type) diffusion model and disagree with the classical 1 B^2 diffusion model. Analysis indicates the fractional energy loss to electron heating will be comparable with the anomalous diffusion constant α times the ratio of the ion gyro radius to the total acceleration length.

MAGNETIC ANNULAR ARC, by W. E. Powers and R. M. Patrick, May 1962, 33p. incl. illus. diagrs. table. (Research rept. no. 129) (AF 49(638)659) AD 409886 Unclassified

Also published in Phys. Fluids, v. 5: 1196-1206, Oct. 1962.

The performance characteristics of an annular-arc configuration under the influence of a magnetic field have been experimentally analyzed, particularly with respect to the effects of tensor conductivity and j x B body forces. In this device the plasma conditions are such that the electrical conductivity is insufficient to prevent the diffusion of the plasma through the magnetic field, i.e., the magnetic Reynolds number was small. Experiments were conducted with this device using helium and argon at power levels up to 50 kw, magnetic field strengths to 10,000 gauss, and particle densities of the order of 10^{16} cm^3 to $10^{17}/cm^3$. The electron gyroradius was smaller than the electron mean free path, i.e., $\omega_e\tau_e > 1$, where ω_e is the gyrofrequency, and τ_e is the time between collisions for electrons. The impedance of the arc in helium was found to vary linearly with $\omega_e\tau_e$. The existence of a circulating azimuthal Hall current was also demonstrated. A yaw probe was employed to measure the angle of the flow due to the j x B Lorentz forces. A good agreement was found between the measured rotation in argon and the predicted value obtained from momentum considerations. (Contractor's abstract)

DEVIATION OF MAST OPERATION FROM ONE-DIMENSIONAL MODEL, by F. J. Fishman and H. E. Petschek. Apr. 1962, 20p. incl diagrs. refs. (Research rept. no. 126) (AFOSR-2948) (AF 49(638)61 and AF 49(638)1129) Unclassified

Also published in Phys. Fluids, v. 5: 1188-1195, Oct. 1962. (AFOSR-65-0567; AD 437164)

In the magnetic annular shock tube (MAST), the gas is pushed axially along the annular space between concentric cylinders by an azimuthal magnetic field. Since a vacuum azimuthal magnetic field varies inversely as the radius, there is a variation in the driving pressure across the annulus, which leads to radial nonuniformities in the flow. These are analyzed for small ratios (ϵ) of the annulus spacing to the radius. This pressure variation across the annulus at the interface between the plasma and the driving field results in a tilting of the interface. This tilting is shown to be completely analogous to the flow resulting from a dam break in shallow water theory and is characterized by a wave of propagation speed $\sqrt{p/\rho}$. The maximum value of ϵ for which the tilted current sheet does not catch up with the shock wave is calculated and it is suggested that only MASTS with ϵ's smaller than this value produce reasonably uniform flow regions. Nonuniformities are also produced at the shock front when an azimuthal magnetic field is present ahead of the shock. These lead to a nonplanar shock front whose shape is calculated, and to nonuniform conditions in the plasma behind the shock. The nonuniformities which persist far behind the shock are computed, these results indicate that for low shock Mach numbers appreciable nonuniformities in pressure and temperature exist even for fairly small values of ϵ. ELECTRONIC AND RADIATIVE HEAT TRANSFER (Abstract), by M. Camac and R. [M.] Feinberg. [1962] [1]p. [AF 49(638)1129] Unclassified

Presented at meeting of the Amer. Phys. Soc., Northwestern U., Evanston, Ill., June 19-21, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 406, June 19, 1962.

An investigation of electronic and radiative heat transfer from plasmas to solid surfaces has been undertaken with the use of the infrared heat-transfer gauge (item no. 74, Vol. V). Argon at an initial pressure of 1 mm Hg was shock-heated in a chemically driven shock tube. The shock velocity ranged from 3 to 6 mm/μsec. Plasma and radiative heat transfer behind the reflective shock was measured at the end plate of the shock tube. The degree of ionization of the argon varied from 10 to 60%. The main contribution to the plasma heat transfer was due to the electronic and ionic components which is more than four times that for neutral argon. The measurements are in good agreement with the theory of Kemp and Fay. The radiation heat transfer from the ionized argon (mainly Kramer's radiation) was also measured, from which the rate of cooling of the argon by radiation was determined.

EXPERIMENTS WITH A MAGNETIC ANNULAR ARC (Abstract), by W. E. Powers and R. M. Patrick. [1962] [1]p. [AF 49(638)1129] Unclassified

Presented at meeting of the Amer. Phys. Soc., Northwestern U., Evanston, Ill., June 19-21, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 413-414, June 19, 1962.

The arc consists of two coaxial electrodes separated by an annular passage through which helium or argon plasma flows with a steady solonoidal magnetic field. The impedance of this device was increased due to Hall effects by factor of 25 with the application of an axial magnetic field. The magnetic Reynolds number was small. The interaction between the plasma currents and the magnetic field has produced directed energy comparable to the thermal energy. The plasma was rotated in a constant area, uniform field configuration. A 10° half-angle nozzle was added and plasma properties were measured at the nozzle exit. Recently, a 50° half-angle nozzle configuration has been studied in which most of the plasma currents flow in the nozzle. Axial energy is produced through the interaction of the circulating Hall currents and the radial component of the magnetic field. Stagnation pressures and local electric potentials were measured in the steady flow. Plasma currents were obtained by measuring the difference between the voltage output of 2 identical coils orientated to give the local magnetic field gradient.

SHOCK TUBES FOR HIGH TEMPERATURE GAS KINETICS, by A. [R.] Kantrowitz. Oct. 1962, 51p. incl. illus. diagrs. tables, refs. (Research rept. no. 141) [AF 49(638)1129] AD 291409 Unclassified

Also published in Energy Transfer in Gases, Twelfth Chemistry Conf. of the Solvay Institute, Brussels (Belgium) (Nov 5-10, 1962), ed. by R. Stoops. New York, Interscience Publishers, 1962, p. 241-285.

The essential advantage of shock tubes over electrical discharge devices is the capability to produce a homogeneous gas sample (HGS) with enthalpy and pressure which can be dependably calculated from the measured shock velocity and the conservation laws. This paper is concerned with setting forth the variety of conditions which can be reached and the precision and dimensions of the HGS which can be produced. Diaphragm type shock tubes are capable of heating gases to temperatures sufficient for the study of all chemical reactions and many electronic processes. The enthalpy and pressure of the gas sample can be calculated from the conservation laws with precision falling from 1 to 10%, moving from lower to higher temperatures. The advent of electromagnetically driven shock tubes opens up the possibility of achieving similar advantages at temperatures up to millions of degrees. An assessment is made in this paper of the degree to which an HGS has been produced in this temperature range.

APPLICATION OF THE SENARMONT POLARISCOPE TO ANALYSIS OF OPTICAL MASER LIGHT, by D Hellerstein. [1962] [5]p. incl. illus. diagrs. (AFOSR-J974) (AF 49(638)1167) AD 417142 Unclassified

Presented at 1963 Spring meeting of the Amer. Opt Soc., Jacksonville, Fla.

Abstract published in Jour. Opt. Soc. Amer., v. 53: 515, Apr. 1963.

Also published in Appl. Opt., v. 2: 801-805, Aug. 1963.

A Senarmont polariscope suitable for optical maser work has been constructed. It employs an optically active wedge and an analyzing polarizer to map the azimuthal angle onto a linear field, indicating this angle by null positions on a photographic plate. It measures the azimuth of linearly polarized light over a range of 180° with an accuracy at present of ± 1.5° and distinguishes between right and left circularly polarized light. This device is compact, relatively inexpensive, and requires no auxiliary electronic apparatus. (Contractor's abstract)

GENERAL THEORY OF PERTURBATIONS IN CLASSICAL MECHANICS, by L. M. Garrido and F. Gascon. [1962] [7]p. incl. diagr. (AFOSR-J916) (AF EOAR-62-89) Unclassified

Also published in Proc. Phys. Soc. (London), v. 81: 1115-1121, June 1, 1963.

An operational method is presented for studying the effect of perturbations in classical mechanics. This method is similar to that used in quantum mechanics. Hamilton's formalism is then used. The most general case when the unperturbed Hamiltonian and the perturbed Hamiltonian depend explicitly on time is explained. This theory is illustrated with an example. (Contractor's abstract)

AN INVESTIGATION OF THE EFFECTS OF VERY HIGH PRESSURE AND TEMPERATURE ON SEMICONDUCTING AND INSULATING MATERIALS, by C. M. Schwartz and A. P. Young. Final rept. June 15, 1958-Dec. 31, 1962 [8]p. (AFOSR-4407) (AF 49(638)-441) AD 295834 Unclassified

This research program is directed towards obtaining fundamental knowledge of the structure and behavior of solid as well as gaining new insight into profitable areas of future research in which new materials may be synthesized in an environment utilizing high pressures and temperatures. In situ measurements of electrical conductivity and thermoelectrical power of such solids as NiO, BeO, etc. having marked differences in zone structure are presented. These data may lead to the selection of additional oxides of the type RO, RO_2, R_2O_X, etc.

SYNTHESIS AND PROPERTIES OF A HIGH-PRESSURE RUTILE-TYPE $AlAsO_4$, by A. P. Young, C. B. Sclar, and C. M. Schwartz. [1962] [10]p. incl. illus. diagrs. tables, refs. (AFOSR-J1598) (AF 49(638)441) AD 427629 Unclassified

Also published in Zeitschr. Krist., v. 118: 223-232, June 1963.

A rutile-type $AlAsO_4$ polymorph with a = 4.359A and c = 2.815A has been synthesized at 90 kbar and 900°C. The density is 5.15 $g\ cm^{-3}$, an increase of 54% over the quartz modification. The indices of refraction of the rutile form of $AlAsO_4$ are ϵ = 1.950, ω = 1.905, both ±0.005. Molar refraction data for the quartz and rutile polymorphs of $AlAsO_4$ show a percentage decrease

of 10.4 relative to the quartz form and fulfill the Dachille-Roy prediction relating molar refraction and cation coordination. The main absorption band of the infrared spectra of the quartz and rutile forms of $AlAsO_4$ shows a shift of 23% in the direction of increasing wavelength with increasing cation coordination. A corresponding shift of the same magnitude is shown by the quartz and rutile forms of SiO_2 and GeO_2. (Contractor's abstract)

SYNTHESIS AND OPTICAL CRYSTALLOGRAPHY OF STISHOVITE, A VERY HIGH PRESSURE POLYMORPH OF SiO_2, by C. B. Sclar, A. P. Young and others. [1962] [6]p. incl. illus. tables, refs. (AFOSR-J1605) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)441 and [Atomic Energy Commission]) AD 427705 Unclassified

Also published in Jour. Geophys. Research, v. 67: 4049-4054, Sept. 1962.

Stishovite, a high-pressure high-density polymorph of SiO_2, isostructural with rutile, was synthesized at pressures between 75 and 125 kb and temperatures greater than 900°C. Significant conversion to the rutile form was obtained in a modified girdle apparatus at 125 kb; trace amounts were obtained in a belt-type apparatus between 75 and 100 kb. Stishovite is colorless, acicular in habit, and uniaxial positive with $\epsilon = 1.845 \pm .005$, $\omega = 1.800 \pm .005$. The optic axis is commonly highly inclined to the morphological axis. The transformation of coesite (4-fold coordination) to stishovite (6-fold coordination) exemplifies the decrease in molar refraction with increasing coordination predicted by Dachille and Roy. HIGH PRESSURE FORMS OF $CrVO_4$ AND $FeVO_4$, by A. F. Young and C. M. Schwartz. [1962] [1]p. incl. tables. (AFOSR-J1606) (AF 49(638)441) AD 427642 Unclassified

Also published in Acta Cryst., v. 15: 1305, Dec. 10, 1962.

$CrVO_4$ and $FeVO_4$ were synthesized by heating mixtures of $Cr_2O_3 + V_2O_5$ and $Fe_2O_3 + V_2O_5$, respectively, at 750°C and 60,000 atm for 24 hr. The high-pressure form of $CrVO_4$ has a rutile structure with a = 4.551, c = 2.884A (1 mol per unit cell). (The normal form is orthorhombic) The normal form of $FeVO_4$ gives a very complicated x-ray diffraction pattern and the crystal structure has not been determined. The high-pressure form, however, gave a much simpler diffraction pattern which can be indexed on the basis of an orthorhombic unit cell with dimensions, a = 4.491, b = 4.900, c = 5.530A (probably 2 mol per unit cell). The density of the high-pressure form of $CrVO_4$ is 13.7% higher than that of the normal form.

TEMPERATURE FLUCTUATIONS DURING GROWTH AND IMPURITY SEGREGATION IN InSb CRYSTALS, by N. Albon. [1962] [2]p. incl illus. (AFOSR-3999) (AF 49(638)959) AD 405501 Unclassified

Also published in Jour. Appl. Phys., v. 33: 2912-2913, Sept. 1962.

A preliminary study of the relation between temperature fluctuations during growth and impurity segregation in InSb crystals has been made. The observations described here, together with measurements of the thermal gradients during growth confirm that temperature changes expected to result from rotation are sufficient to produce the observed striations. In addition, these experiments indicate that an adverse effect on the uniformity of InSb crystals is produced by temperature fluctuations of less than 1°C if the rate of temperature change is sufficiently rapid. They also suggest that by melting temperature changes during crystal growth and precise measurements of the resulting impurity profiles in the growth direction, the relation between rate of growth and supercooling could be determined. This would indicate the growth mechanisms involved.

STUDIES OF THE InSb CRYSTAL-MELT INTERFACE, by N. Albon. [1962] [4]p. incl. illus. refs. (AFOSR-64-2103) (AF 49(638)959) AD 451567 Unclassified

Presented in part at meeting of the Electrochemical Soc., Boston, Mass., Sept. 16-20, 1962.

Abstract published in Jour. Electrochem. Soc., v. 109: 202C, Aug. 1962.

Also published in Jour. Electrochem. Soc., v. 111: 61-64, Jan. 1964.

The InSb interface was studied by microscopical examination of crystals decanted from the melt. Crystals which had been allowed to approach equilibrium at a curved isotherm showed facets on which the features could be correlated with crystal growth mechanisms. On the curved areas of the interface, lines having a regular spacing were observed, which previously have been assumed to be growth steps. The lines were shown to be grooves without a definite crystallographic orientation and evidence against their origin during the crystal growth process was obtained. (Contractor's abstract)

IMPURITY LEVELS ASSOCIATED WITH SUBSIDIARY CONDUCTION BANDS IN NARROW GAP III-V COMPOUNDS (Abstract), by R. T. Bate. [1962] [1]p. [AF 49(638)959] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md , Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 214, Mar. 26, 1962

It is well established that the principal conduction-band minimum occurs at k = 0 in several III-V semiconductors The effective mass in this minimum is relatively small, and shallow impurity levels associated with this minimum are not observed even in the purest samples except in strong magnetic fields, presumably because of overlap of orbits. However, there is considerable evidence for the existence of subsidiary minima at other points in the Brillouin zone in many of these compounds. An extension of the simple theory of shallow impurity states taking these minima into account predicts the occurrence of impurity levels below each minimum but above the principal band edge Because the effective masses in these minima are relatively large, the orbits are smaller and the ionization energies are larger than for the minimum at k = 0. Although removing an electron from one of these bound states does not necessarily require a net increase in its energy if it simultaneously makes a transition to the central band, the bound electrons do not contribute to the conductivity because the interband transition, which requires a large change in wave vector, will not be induced by the electric field.

GRAIN-BOUNDARY DIFFUSION OF GOLD IN COPPER, by A. E. Austin and N. A. Richard. [1962] [6]p. incl. diagrs. tables. (AFOSR-3013) (AF AFOSR-61-107) AD 278377 Unclassified

Also published in Jour. Appl. Phys., v. 33: 3569-3574, Dec. 1962.

The diffusion of Au into the grain boundaries of Cu bicrystals was studied for couples of both a continuous and an instantaneous source. The concentration contours along the grain boundaries were measured by means of electron-probe microanalysis. For the continuous source conditions at 750°C, the ratio of the coefficients of grain-boundary diffusion and lattice decreased from 6×10^5 to about 10^3 with increasing Au concentration from 0.5 to 15 at-% Au. The rate of grain-boundary diffusion decreases even though there is some increase in the rate of lattice diffusion. There was found some contribution of surface diffusion to the couples with an instantaneous or thin source, i.e., 0.5μ thick. The concentration contours observed in these couples agreed generally with the theoretical solutions. (Contractor's abstract)

THEORETICAL SOLUTIONS OF GRAIN-BOUNDARY DIFFUSION PROBLEM. APPROXIMATIONS AND INTERPRETATION OF EXPERIMENTS, by V. E. Wood, A. E. Austin, and F. J. Milford. [1962] [6]p. incl. diagrs. tables. (AFOSR-3014) (AF AFOSR-61-107) AD 280776 Unclassified

Also published in Jour. Appl. Phys., v. 33: 3574-3579, Dec. 1962.

Whipple's exact solution to the idealized grain-boundary diffusion problem has been evaluated numerically for ranges of parameters appropriate to existing and contemplated experiments. From these evaluations the concentration at fixed depth of penetration, and the angle at which isoconcentration contours intersect the grain boundary are obtained. The ranges of validity of approximate solutions obtained by various authors are discussed on the basis of the numerical results, as is the use of the graphs and tables for the interpretation of experimental data.

PSYCHOPHYSICS, REALITY AND HALLUCINATIONS, by S. Goldstone. [1958] [14]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(603)79] and Public Health Service) Unclassified

Published in APA-AAAS Symposium on Hallucinations, Washington, D. C. (Dec. 27-28, 1958), New York, Grune and Stratton, 1962, p. 261-274.

An analysis is made of available data in order to suggest possible basic psychological mechanisms that may underlie the process of hallucinating. Specifically, an attempt is made to present a phychophysical point of view that departs from the classical stimulus-centered sensory psychology, and to demonstrate the potential of the relevant methods and formulations that permit the derivation of quantitative information about the functioning and malfunctioning of internal standards or concepts. In addition, a fanciful excursion departing from data already available will allow the suggestion of 2 mechanisms that may in part account for hallucinations: (1) a partial reduction in intersensory stimulus differentiation such that an adequate stimulus received by one mode may be interpreted in terms of a less appropriate mode and (2) a partial reduction in the subject's ability to make contemporary use of past experience because his internal standard has become less available or less vivid.

[EFFECT OF THYROXINE PRETREATMENT ON THE UPTAKE AND ORGANIFICATION OF RADIOACTIVE IODINE BY INCUBATED THYROID FRAGMENTS OF GUINEA PIGS] Effet du prétraitement à la thyroxine sur la captation et l'organification de l'iode radioactif par segments incubés de thyroïdes de cobayes, by C. Fortier and W. J. Schindler. [1962] [9]p. incl. illus. diagrs. tables. (AFOSR-3473) (In cooperation with Laval U., Quebec (Canada), under AF AFOSR-61-15) (AF 49(638)384) AD 407243 Unclassified

Also published in Laval med., v. 33: 506-515, Sept. 1962.

The uptake and organification of radioactive iodine by the incubated thyroid fragments of guinea pig are accelerated by the addition of thyrotropine. The administration of thyroxine for 10 days markedly increased the amplitude of the response to thyrotropine. Radiochromatographic analysis of incubated thyroid extracts showed that the organification of radioactive iodine, under these conditions, is arrested at the point of monoiodotyrosine and diiodotyrosine and that the iodination of mono- and diiodo-tyrosine is accelerated by thyrotropine. After pretreatment with thyroxine, a linear relation was observed between the response of the incubated thyroid and the logarithm of the dosages of thyrotropine. The system considered forms the basis of a simple, specific and relatively exact method for standardizing thyrotropine.

LOW TEMPERATURE PLASMA PHENOMENA, by R. J. Whalen and K. Pearch. [1959] [19]p. incl. diagrs. table. (AFOSR-3741) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)380 and Wright Air Development Center) Unclassified

The non-equilibrium nozzle expansion process for oxygen and air is examined in 4000°K ≤ to ≤ 14,000°K, $1 \leq \rho \leq 1000$ atm range. Byron's recombination rate law for oxygen is employed throughout the analysis. The influence of variation in the magnitude of the rate constant, and various decay rates are considered. The influence of nozzle geometry is also discussed. It is shown that for large departures from equilibrium the Mach number is significantly larger than the equilibrium value. For ρ_0 = 10 atm, T_0 = 8000°K, M > 100 is obtained. Normal and oblique shock pressure, density, temperature ratios are presented for ρ_0 = 10, 100, and 1,000 and for T_0 = 8000°K. The correlation of fully dissociated flows with γ = 5/3 M prediction is also presented. The large influence on stagnation point heat transfer for a catalytic surface is discussed. The similitude for the inviscid hypersonic flow of a chemically reacting gas about a slender 2-dimensional geometry is presented. Correlation of the equilibrium and nonequilibrium calculation with the similitude offers a procedure for determining M in nonequilibrium gas flows. Finally, the importance and influence of magnetohydrodynamic effects for $V \perp B$, where V = (U, 0, 0), B = (0, B, 0), in the range of temperature and pressure associated with the fully dissociated expansion is presented. RADIATION EFFECTS IN SPACE AND THERMAL EFFECTS OF ATMOSPHERIC ENTRY BY THERMOLUMINESCENCE MEASUREMENTS ON METEORITES, by F. C. Houtermans. Oct. 1, 1962 [30]p. incl. diagrs. tables, refs. (AFOSR-4059) (AF EOAR-61-51) AD 290613 Unclassified

The natural glow-curves of 19 chondrites were

measured and compared with the corresponding artificial glow-curves, obtained after irradiation with a β-dose of 5×10^4 rad. The differences between the natural and the artificial glow-curves as well as the increase of peak-temperature with decreasing peak-intensity, observed for the natural glow-curves of the various chondrites, can be explained by thermal effects. Either a temperature raise occurred before, during, or after the fall of the meteorites, which caused the low-temperature part of the natural glow-curves to fade out, or the shallow, low-energy traps, responsible for the low-temperature part of the natural glow-curves never were filled, due to the low dose rate of cosmic radiation. Larger differences between the glow- curve of achondrites are observed. The artificial glow-curves of the calcium rich, basaltic type achondrites are distinctly different from those the calcium-poor, chondritic type achondrites. A steady decrease of the intensity of the natural thermoluminescence with decreasing Ar k-ages is observed. (Contractor's abstract)

EXACT THEORY OF BUCKLING OF A THICK SLAB, by M. A. Biot. [1961] [16]p. incl. diagrs. (AFOSR-1770) (AF 49(638)837) AD 441479 Unclassified

Also published in Appl. Scient Research, v. 12A: 183-198, 1963.

The incremental elastic coefficients for rubbertype elasticity are inserted in some earlier theories by the author leading to an exact theory for the buckling of a thick slab in finite strain. The critical compression as a function of the wave length shows a continuous variation. The buckling is of the bending type at large wavelengths and becomes a shear type instability for shorter slabs. In the limiting case of vanishing wavelength the buckling degenerates into a surface instability. The formal behavior is analogous to the transition from bending waves to Rayleigh waves in the vibration of elastic plates. The range of validity of the classical Euler theory is discussed and stress distributions across the thickness are evaluated. The problem is also treated by an approximate variational procedure and it is shown that a very simple bending-sheartype deformation yields a remarkable accurate formula through the complete range of wavelengths. (Contractor's abstract)

SURFACE INSTABILITY OF RUBBER IN COMPRESSION, by M. A. Biot. [1961] [15]p. incl. table, refs. (AFOSR-1771) (AF 49(638)837) AD 450005 Unclassified

Also published in Appl. Scient. Research v. 12A: 168-182. 1963.

Expressions for the incremental elastic coefficients of an isotropic medium under initial stress are applied to rubbertype elasticity. As a corollary an exact theory is obtained for the surface instability of such material under compression. It is found that in plane strain the incremental properties remain isotropic and are characterized by a single strain-dependent modulus. In 3-dimensional strain the elastic properties are found to coincide with those of the elastic medium introduced by Green to illustrate the properties of electromagnetic propagation. The apparent rigidity of the surface as a function of strain is evaluated and is shown to result from the combined effect of the variation of rigidity modulus and a membrane effect due to the initial stress. At a critical compression the 2 effects act in opposite directions and the apparent surface rigidity vanishes causing incipient instability. The phenomenon is formally analogous to Rayleigh waves. Attention is also called to the existence of interfacial instability at a surface of discontinuity of 2 elastic media under initial stress in analogy with Stoneley waves. (Contractor's abstract)

INCREMENTAL ELASTIC COEFFICIENTS OF AN ISOTROPIC MEDIUM IN FINITE STRAIN, by M. A Biot. [1961] [17]p. incl. diagrs. (AFOSR-1772) (AF 49-(638)837) AD 452448 Unclassified

Also published in Appl. Scient. Research, v. 12A: 151-167, 1963.

Incremental elastic coefficients are derived for an isotropic medium in a state of finite initial strain. The analysis is based on concepts and methods developed by the author in earlier publications which require only elementary procedures and bring to light the physical significance of the results. Remarkedly simple formulas for the incremental shear coefficients are established. For comparison the same results are derived by an alternate procedure using Riemannian tensors and the calculation is shown to be much more elaborate. Application is made to the particular case of second order elasticity theory and expressions derived for the incremental coefficients including the correction terms of the first order in the initial strain. This provides a complete theory of first order correction for acoustic propagation under initial stress. (Contractor's abstract)

ACOUSTIC-GRAVITY WAVES AS A PARTICULAR CASE OF THE THEORY OF ELASTICITY UNDER INITIAL STRESS, by M. A. Biot. [1962] [3]p. (AFOSR-J1030) (AF 49(638)837) AD 419870 Unclassified

Also published in Phys. Fluids, v. 6: 778-780, June 1963.

General equations for acoustic-gravity waves in a fluid

are derived as a particular case of the theory of elasticity of initially stressed continua. The differential equations for the fluid dynamics and the corresponding variational principles are obtained. The transition from solid to fluid is illustrated for the special case of a constant gravity field. The dynamics of a fluid under initial stress is thus brought within the scope of the theory of elasticity providing a unified treatment of wave propagation in composite fluid-solid systems. (Contractor's abstract)

GENERAL FLUID-DISPLACEMENT EQUATIONS FOR ACOUSTIC-GRAVITY WAVES, by M. A. Biot. [1962] [6]p. (AFOSR-J1031) (AF 49(638)837) AD 419709 Unclassified

Also published in Phys. Fluids, v. 6: 621-626, May 1963.

General equations are derived for the dynamics of a fluid under initial stress in an arbitrary potential field and perturbed from equilibrium. The motion is described in terms of the displacements of the fluid particles from their equilibrium position. A class of equations is obtained which is applicable to large displacements. Complete linearization leads to 2 types of equations. One type called unmodified corresponds to the viewpoint of the theory of elasticity. The modified equations representing the other type are expressed in terms of buoyancy forces. The modified equations lead to a conceptually useful analog model for internal gravity waves in a liquid. For a constant gravity field the linear equations are also applicable to large displacements. Classical examples for a constant gravity field are discussed as illustrations. (Contractor's abstract)

Biot, M. A., New York.

VARIATIONAL PRINCIPLES FOR ACOUSTIC-GRAVITY WAVES, by M. A. Biot. [1962] [7]p. (AFOSR-J1032) (AF 49(638)837) AD 419884 Unclassified

Also published in Phys. Fluids, v. 6: 772-77-, June 1963.

Variational principles are developed for the dynamics of a fluid under initial stress in an arbitrary potential field and disturbed from equilibrium. They are formulated in terms of fluid displacement. Two distinct principles are obtained which are mathematically equivalent but differ fundamentally from the physical viewpoint. The difference results from expressing the potential energy in terms of buoyancy forces or strain energy. A very general stability criterion is obtained. An important new feature is the inclusion of surface integrals in the potential energy. The simplified principle for the case of a liquid is interpreted by means of an analog model. Lagrangian equations and methods of normal coordinates for the evaluation of transient propagation are applicable along with general theorems on the equivalence of group velocity and energy flux. As an illustration the case of a constant gravity field is discussed. (Contractor's abstract)

RESEARCH IN MICROWAVE SPECTROSCOPY, by J. Sheridan, A. P. Cox, and J. K. Tyler. Final rept Jan. 1962 [37]p. incl. diagrs. tables. (AFOSR-2392) (AF 61(052)241) AD 273614 Unclassified

Refinements in methods of generation and detection of microwave harmonics at wavelengths down to the 1 - 2 mm region are discussed. Preferred methods are given for selection, shaping, mounting and adjustment of the point-contact diodes used. Other refinements of instrumentation have allowed the measurement of spectra of unstable and involatile molecules with the ability to resolve important hyperfine structures. New microwave spectroscopic measurements included evaluation of precise interatomic distances in fluorine cyanide and chloroacetylene, of electron-distribution properties of cyanamide and diazomethane from nuclear quadrupole effects, and the first precise structural information regarding nitramide in the gas phase. Refined values of centrifugal distortion constants were obtained for several molecules. (Contractor's abstract)

THE SYSTEM SYSTEM, by J. C. R. Licklider. Jan. 1962 [18]p. (AFOSR-1673) (Bound with its A.FOSR-1127; AD 424284) (AF 49(638)355) AD 424284 Unclassified

Also published in Human Factors in Technology, ed. by E. Bennett, J. Degan, and J. Spiegel. New York, McGraw-Hill. 1963, p. 627-641.

The need for greater coherence in the man-machine and other high-order interactions of our major systems is described, and an approach to achievement of that coherence is proposed. The approach involves a computer-centered meta-system (the 'system system') designed to facilitate communication, coordination, and problem-solving. The needs for, and roles of, such a meta-system in various phases of system design, development, production, and operation are discussed. (Contractor's abstract)

THREE AUDITORY THEORIES, by J. C. R. Licklider. [1959] [104]p. incl. diagrs. tables, refs. [AF 49(638)-355] Unclassified

Published in Psychology: A Study of a Science, ed. by S. Koch. New York, McGraw-Hill, v. 1: 41-144, 1959.

In the field of psychoacoustics there are several "part" theories but no systematically formulated over-all theory. The following "part" theories are discussed in the hope that a common rubric will prepare the way for putting them together into something larger or reveal incompatibilities that stand in the way of synthesis: (1) A theory of signal detection; (2) A theory of speech intelligibility; and (3) A theory of pitch perception.

STUDIES IN THE ORGANIZATION OF MAN-MACHINE SYSTEMS, by J. C. R. Licklider. Dec. 1962 [19]p. incl. refs. (BBN rept. no. 970) (AF 49(638)355) AD 295166 Unclassified

The basic aim of this research has been to find ways of increasing the transfer of knowledge among system programs and ways of relating research results to system applications. The methods used have been an informal mixture of studying, discussing, formulating, writing, and trying to understand and advance to some degree the technique of representing ideas and interrelations in the form of computer programs. The main outcomes of the study of system organization were: (1) Recognition of a close analogy between large-scale military man-machine systems and systems of computer programs; (2) Recognition of computer programs; and (3) A set of ideas about how to exploit the analogy and the capabilities in substantive work on systems.

DIFFERENCES IN THE FUNCTIONS OF THE TWO CEREBRAL HEMISPHERE, by W. D. Neff. [1961] [3]p. (AF 49(638)1142) Unclassified

Published in Conf. on Interhemispheric Relations and Cerebral Dominance (Apr. 23-25, 1961), ed. by V. B. Mountcastle. Baltimore, Johns Hopkins Press, 1962, p. 196-198.

This report represents a brief comment on the contribution of animal experiments to understanding the problem of cerebral dominance. It is noted that experiments on lower animals have not, with few exceptions, contributed appreciably to an understanding of this problem. This may mean that researchers, study. of brain function by means of laboratory experiments on animals, have been concerned with other problems which are more readily attacked, and that they have only recently obtained knowledge and developed techniques which may lead to experiments which will look for interhemispheric differences.

DISCRIMINATORY CAPACITY OF DIFFERENT DIVISIONS OF THE AUDITORY SYSTEM, by W. D. Neff. [1961] [58]p incl. illus. diagrs. tables, refs. (In cooperation with Chicago U., Ill.) (AF 49(638)1142) Unclassified

Published in Brain and Behavior; Proc. of the First Conf., Los Angeles, Calif. (Feb. 19-22, 1961), ed. by M. A. B. Brazier. Washington, American Institute of Biological Sciences, v. 1: 205-262, 1961.

Several experiments involving bilateral ablation of subareas of the auditory cortex, large unilateral cortical ablations, and subcortical transections of auditory pathways are described. In the cat, the following results are obtained after bilateral ablation of subareas of the auditory cortex: (1) The ability to make learned responses to auditory signals is typically lost, if the ablation is made bilaterally in one-stage, but relearning of some discriminations is possible; (2) The capacity to detect onset of sounds at threshold intensities and to discriminate threshold changes in intensity is unchanged; (3) The capacity to respond to large changes in frequency remains; (4) A deficit occurs in capacity to discriminate changes in duration; and (5) A complete loss occurs in capacity to discriminate changes in temporal patterns of tones and to localize sound in

space. Experiments with the monkey produce similar results. Widespread ablation of auditory cortex of one cerebral hemisphere can produce a deficit in the capacity to localize sound in space. No effects of unilateral ablations have been noted in other discriminations. Unilateral transection of the brachium of the inferior colliculus in the cat produces a deficit in ability to localize sound in space. Other discriminations are probably unaffected. Bilateral transection of auditory pathways, at the level of the brachium of the inferior colliculus in the cat produces a change of approximately 10 decibels in the differential threshold for intensity. Bilateral transection at the level of the BIC in the cat does not produce a loss of capability to discriminate large changes in frequency if the lesion is confined to the BIC as defined. When the bilateral transection extends beyond the BIC so as to eliminate evoked responses at the cortex, there is a complete loss in capability to discriminate changes in frequency.

NEURAL STRUCTURES CONCERNED IN LOCALIZATION OF SOUND IN SPACE, by W. D. Neff. [1962] [9]p. incl. illus. diagrs. refs. (Also bound with its AFOSR-64-0966; AD 600222) (In cooperation with Chicago U., Ill.) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1142 and Office of Naval Research) Unclassified

Also published in Psycholog. Beitrage, v. 6: 492-600, 1962.

Results of experiments in which capacity to localize sound in space was measured before and after ablation of auditory cortex or transection of auditory pathways in the tectum are in line with the notion that auditory areas of the cortex (or perhaps, circuits area involving the medial geniculate body and cortical projection areas) are essential for processing information which is coded in terms of time relationships between nerve impulses. It is proposed that: (1) interaction of nerve impulses from the 2 ears must take place at the level of the medulla in order that accurate localization of sound in space can be made; (2) information based upon the interaction of nerve impulses from the 2 ears is transmitted upwards in a part of the auditory system and is coded as time differences between nerve impulses; and (3) the thalamo-cortical part of the auditory system is designed to receive the temporal information and to process it so that appropriate discriminatory behavior may result.

CHEMICAL PROPERTIES OF ACTIVE NITROGEN. I. THE REACTION OF ACTIVE NITROGEN WITH BUTADIENE. II. THE REACTION OF ACTIVE NITROGEN WITH ISOPRENE: A PRELIMINARY STUDY. III. STUDIES OF THE KINETICS OF DECAY OF ACTIVE NITROGEN, by A. Tsukamoto, M. H. Saxe, and J. Goldberg. Final rept. Sept. 1961 [44]p. incl. diagrs. tables, refs. (AFOSR-1459) (AF 49(638)2) Unclassified

Three separate groups of experiments are discussed in this final report. In Part I the gas phase reaction of active nitrogen and 1,3-butadiene was investigated. Pyrrole and cis- and trans-crotonitrile were obtained. They are considered to be the products of nondegradative reaction of active nitrogen. The reaction also yielded cis- and trans-1-cyano-1,3-butadiene and 3-cyano-1-butene. The reaction produces hydrogen cyanide as the major nitrogenous product as in all other hydrocarbon reactions with active nitrogen. Ethylene, acetylene and propylene are also formed. Two 6-carbon unsaturated nitriles were also isolated as was a polymer which contains C, H and N in the ratio C_4H_6N. In Part II the formation of nondegradative products from the reaction of active nitrogen with isoprene was briefly studied. Gas chromatographic analysis revealed that the reaction yields a complicated mixture. Four major products, besides hydrogen cyanide which is the main product of the reaction, were isolated and examined by infrared spectroscopy. Two of the major products were identified as 3-methyl-pyrolle and β-methyl-crotononitrile. Infrared spectra suggest that the other 2 are hydrocarbons. Effect of reaction conditions upon the yields of hydrocarbon cyanide and nondegradative products was briefly studied. Part III deals with the decay mechanism of active nitrogen. Special attention is given to wall decay.

STRUCTURES OF BORON COMPOUNDS, by K. Eriks. Final rept. Sept. 29, 1962 [41]p. incl. diagrs. tables, refs. (AFOSR-3785) (AF 49(638)65) Unclassified

The x-ray diffraction work contained in this report was undertaken to elucidate some of the structural properties of boron. The substances vary in nature, one being a metal boride, 2 being boron hydride derivatives and 2 donor-acceptor complexes of boron trihalides. Specifically the compounds to be described are: phosphine borane ($H_3P.BH_3$), trimethylphosphine borane ($(CH_3)_3P.BH_3$), dimethylsulfoxide-boron trifluoride ($(CH_3)_2SO.BF_3$), pyridine-boron trichloride ($C_5H_5N.BCl_3$), and aluminum dodecaboride (AlB_{12}). Aside from the structural studies this work has resulted in the design and construction of an integrating photodensitometer based on a photoelectric semiconductor, for estimation of intensities on x-ray films.

THE MOLECULAR AND CRYSTAL STRUCTURE OF PHOSPHINE BORANE, $H_3P.BH_3$, by E. L. McGandy and K. Eriks. [1959] [10]p. incl. diagrs. tables, refs. (Bound with its AFOSR-3785) (AF 49(638)65) Unclassified

Presented at Summer meeting of the Amer. Crystallographic Assoc., Ithaca, N. Y., July 1959.

Structural determinations of $H_3N.BH_3$[2] and of $(CH_3)_3NBH_3$[3] have been reported. While trimethylamine borane crystallizes in a space group having threefold symmetry, allowing straightforward determination of all atomic parameters, the space group of ammonia borane is tetragonal and it is concluded that essentially free molecular rotation occurs in crystals of that substance at room temperature. The purpose of this study is to establish to what extent the phosphorous complexes of BH_3 show a similarity to those of nitrogen. Crystals of phosphine borane were prepared and refined. The structure was obtained from the refinement and verified by means of a three-dimensional electron density map and a difference map. Final parameters for the model and observed and calculated structure factors are presented in table form.

MOLECULAR AND CRYSTAL STRUCTURE OF TRIMETHYLPHOSPINE-BORANE $(CH_3)_3P.BH_3$, by R. Thomas and K. Eriks. [1959] [4]p. incl. table. (Bound with its AFOSR-3785) (AF 49(638)65) Unclassified

Presented at Summer meeting of the Amer. Crystallographic Assoc., Ithaca, N. Y., July 1959.

Since preliminary work on trimethylphosphine-borane showed the structure to be disordered, experiments were performed to establish the existence of a different crystal form at lower temperatures. Two dimensional calculations were started first, using 21 observed hol reflections. A Patterson map could be interpreted with 2 alternative models. The models gave identical phases for 13 reflections. A Fourier map calculated with these 13 phases gave an acceptable model for the structure: the 2 molecules in the unit cell are aligned with their P-B axis parallel to the c (=4 fold) axis. The phosphorous atom is tetrahedrally surrounded, the 3 carbon atoms lying in a plane parallel to a - b. The carbon atoms are thought to be distributed over at least 4 equivalent points or, alternatively, to undergo free or hindered rotation around the P-B axis. No distinction can be made between those 2 possibilities on the basis of x-ray data alone. With this model the calculations could be extended to include all hol-reflections. A Fourier map computed after some refinement gave 1.94A for the P-B distance and approximately 1.91A for the P-C distance. Complete three dimensional refinement was undertaken on the statistically distributed model. The lowest value obtained for $R = \Sigma(|Fo| - |Fo|)/\Sigma|Fo|$ was 0.25.

CRYSTAL STRUCTURE OF PYRIDINE-BORON TRICHLORIDE, $C_5H_5N.BCl_3$, by S. A. Brenner. [1962] [5]p. incl. table. (Bound with its AFOSR-3785) (AF 49-(638)65) Unclassified

Crystals of pyridine-boron trichloride were prepared and cell dimensions were obtained by least squaring the parameter values from 31 observed powder peaks. The cell dimensions thus found are: a = 0.04(0)A, b = 15.3(2)A, c = 6.16(1)A, and α = 102°50′. There are 4 molecules of $C_5H_5N.BCl_3$ in this unit cell, leading to a calculated density D_x = 1.58 grcm^{-3}. Absences observed on the Weissenberg films lead to the space group $P^{2_1}/n(C_{2_h}^5)$.

ANTIBODIES TO DENATURED DEOXYRIBONUCLEIC ACID IN LUPUS ERYTHEMATOSUS SERUM. V. MECHANISM OF DNA-ANTI-DNA INHIBITION BY CHLOROQUINE, by D. Stollar and I. Levine. [1962] [7]p. incl. diagrs. tables, refs. (Publication no. 205) (AFOSR-5063) (Sponsored jointly by Air Force Office of Scientific Research, American Cancer Society, and National Institutes of Health) AD 413969 Unclassified

Also published in Arch. Biochem. and Biophys., v. 101: 335-341, May 1963.

Chloroquine inhibits the reaction of denatured DNA with lupus erythematosus sera, as measured by quantitative C' fixation. This inhibition differs from that caused by nucleotides; all DNA immune systems are inhibited by the drug to about the same extent. Inhibition of this reaction by several analogs of chloroquine was studied. The binding of chloroquine and certain structural analogs to DNA was measured. Inhibitory effectiveness is closely correlated with the association constants of the compounds for DNA. Chloroquine also inhibits bacterial transformation by DNA. (Contractor's abstract)

ANTIBODIES TO DENATURED DEOXYRIBONUCLEIC ACID IN A LUPUS ERYTHEMATOSUS SERUM, by D. Stollar and L. Levine. [1961] [8]p. incl. diagrs. refs. (Publication no. 113) (Sponsored jointly by Air Force

Office of Scientific Research, American Cancer Society, National Cancer Institute, and National Institutes of Health) Unclassified

Published in Jour. Immunol., v. 87: 477-484, Oct. 1961.

The reaction between the serum of a patient with disseminated lupus erythematosus and DNA has been studied by quantitative complement fixation. Thermally denatured DNA was shown to be a more reactive antigen than native DNA. Immunologic measurement of melting out and renaturation of the antigen characterized it as DNA. DNase-digested antigen preparations failed to react but were effective inhibitors. Lupus erythematosus (LE) serum detected serologic differences in denatured DNA preparations from various sources.

ANTIBODIES TO DENATURED DEOXYRIBONUCLEIC ACID IN LUPUS ERYTHEMATOSUS SERUM. IV. EVIDENCE FOR PURINE DETERMINANTS IN DNA, by D. Stollar and L. Levine. [1962] [6]p. incl. diagrs. tables, refs. (Publication no. 204) (Sponsored jointly by Air Force Office of Scientific Research, American Cancer Society, and National Institutes of Health) Unclassified

Published in Arch. Biochem. and Biophys., v. 101: 417-422, June 1963.

A lupus serum, G. B., reactive with relatively large amounts of denatured DNA preparations, has been characterized as containing antibodies directed to the DNA. RNA, polyriboadenylic acid, apurinic acid and partially digested DNA fail to react directly by C' fixation, but do react as measured by inhibition. Further inhibition studies show that the specificity of the antibodies in serum G. B. involve purines, and that polymers containing purines are not markedly more reactive than monomeric purines, nucleosides, and nucleotides. (Contractor's abstract)

MOTION OF FOREIGN BODIES IN BOSON SYSTEMS, by E. P. Gross. [1962] [20]p. incl. refs. (AFOSR-4168) (AF 49(638)27) Unclassified

Also published in Ann. Phys., v. 19: 234-253, Aug. 1962.

The system studied is a foreign particle interacting with a gas of bosons. Particular attention is paid to the case of a foreign ion coupled to the atoms by a hard core potential plus a long range polarization potential. The essential features of the problem appear in a self-consistent field approximation. A finite fraction of the atoms is in a single particle state which is spatially inhomogeneous relative to the ion and forms a condensate. There is an enhanced density of bosons near the ion. The velocity flow pattern is such that the ion pushes fluid away directly ahead of itself, but there is a reversed dipolar flow far from the ion. The effective mass is very high; it is greater than the number of atoms contained in a volume $^4/_3\pi b^3$. The parameter b is the distance where the polarization energy becomes comparable to the boson-boson interaction energy. An outline is given of a systematic theory which includes corrections to the above-mentioned results arising from the zero-point energy shift of the oscillations of the coupled ion-boson system. PARTICLE-LIKE SOLUTIONS IN FIELD THEORY, by E. P. Gross. [1962] [15]p. incl. refs. (AFOSR-4169) (AF 49(638)27) Unclassified

Also published in Ann. Phys., v. 19: 219-233, Aug. 1962.

A number of quantum field theories have the property that the field equations, studied as classical equations of motion, have particle-like solutions. These are spatially localized exact solutions, with a definite value of angular momentum. The role of these solutions in a fully quantum theory is the subject of investigation. In particular, the theory of a nonrelativistic scalar nucleon coupled by a local interaction to a scalar meson field is examined. The classical solution (whose spatial extent is a nucleon Bohr radius) is identified with a self-consistent field approximation to the one-nucleon state. However, quantum corrections to this approximation yield the same divergent self-energy as perturbation theory. In this example, the particle-like solutions have nothing to do with the ultraviolet divergences, but are relevant to the treatment of the definite part of the theory for strong coupling. The separation of the infinite part is trivial and is accomplished by a canonical transformation. The particle solutions will exist for the finite part for strong coupling. (Contractor's abstract)

DYNAMICS OF CLASSICAL MANY-BODY SYSTEMS, by E. P. Gross. [1961] [11]p. [AF 49(638)27] Unclassified

Published in Plasma Physics, Accelerators, Thermonuclear Research, v. 2: 173-183, Jan. 1961.

The present state of the theory of the propagation of small amplitude disturbances in monatomic gases and plasmas is discussed. The analysis is based on kinetic equations for 1-particle velocity distributions involving self-consistent field forces and Boltzmann-like collision terms. A microscopic formulation of the classical N-body problem is developed. The theory is used to analyze the meaning of earlier microscopic approaches, and carried to the point where the problem can be treated in a more fundamental way. (Contractor's abstract)

HYDRODYNAMICS OF A SUPERFLUID CONDENSATE, by E. P. Gross. [1962] [13]p. incl. refs. [AF 49(638)-27] Unclassified

Published in Jour. Math. Phys., v. 4: 195-207, Feb. 1963.

The theory of the condensate of a weakly interacting Bose gas is developed. The condensate is described by a wavefunction $\psi(x, t)$ normalized to the number of particles. It obeys a nonlinear self-consistent field equation. The solution in the presence of a rigid wall with the boundary condition of vanishing wavefunction involves a de Broglie length. This length depends on the mean potential energy per particle. The self-consistent field term keeps the density uniform except in localized spatial regions. In the hydrodynamical version, a key role is played by the quantum potential. A theory of quantized vortices and of general potential flows follows immediately. In contrast to classical hydrodynamics, the cores of vortices are completely determined by the de Broglie length and all energies are finite. Nonstationary disturbances of the condensate correspond to phonons, rotons, vortex waves etc. They can exchange momentum with rigid boundaries. This is compatible with the vanishing of the wavefunction at a boundary. This condition fully determines the dynamics of the system. These points are illustrated by considering the motion of a foreign ion in a Bose gas, a rotating container of fluid, and the Landau criterion for superfluidity.

SELECTION RULES IMPOSED BY THE SYMMETRICAL SAKATA MODEL, by C. Iso. [1962] [10]p. incl. tables, refs. (AFOSR-64-0374) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-22 and National Science Foundation) AD 434533 Unclassified

Also published in Ann. Phys., v. 19: 314-322, Aug. 1962.

New selection rules for strangeness nonzero systems based on a symmetrical Sakata model are discussed. New operators, $G_{\Lambda p}$, (exchange of Λ and p) x (charge conjugation), and $G_{\Lambda n}$ (exchange of Λ and n) x (charge conjugation) are defined. It is shown that in some systems these operators define good quantum numbers and that new selection rules are obtained. These selection rules are applied to the processes:
$K^{0*} \to K^{+} + \pi^{-}$, $\bar{\Lambda} + p \to K^{+} + K^{+} + \bar{K}^{-}$ etc.

Some processes are useful for checking these selection rules. (Contractor's abstract)

TWO-NEUTRINO HYPOTHESIS AND LEPTON-BARYON SYMMETRY, by C. Iso. [1962] [3]p. (AFOSR-64-0375) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-22 and National Science Foundation) AD 434503 Unclassified

Also published in Nuovo Cimento, Series X, v. 25: 456-458, July 16, 1962.

The 2 neutrinos of μ- and β-decays are written as a single 4-component neutrino, $\nu = \begin{matrix}\nu_- \\ \nu_+\end{matrix}$, and the Hamiltonian assumed is $H = \xi J^{+} J$, $J = \bar{e} \gamma_\mu (1 + \gamma_5)\nu + \bar{\nu} \gamma_\mu (1 - \gamma_5)\mu^{+}$ + baryon current. The weak baryon current is supposed to be symmetric under the replacements $\mu^{+} \to \Lambda$, $\nu \to p$, $\bar{e} \to n$, leading to the expression $\bar{n}\gamma_\mu(1 + \gamma_5)p + \bar{\Lambda}\gamma_\mu(1 - \gamma_5)p$. Some consequences are pointed out.

CANONICAL ANALYSIS OF GENERAL RELATIVITY, by R. Arnowitt, S. Deser, and C. W. Misner. [1962] [10]p. incl. refs. (AFOSR-64-2545) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-22 and National Science Foundation)
AD 453829 Unclassified

Also published in Recent Developments in General Relativity, New York, Pergamon Press, 1962, p. 127-136.

A brief summary of the results of a program isolating the dynamical features of the gravitational field is presented. By analogy with the parametrized form of particle mechanics, the gravitational field Lagrangian is written in first-order form. The constraint equations are solved in principle by decomposing the variables into transverse and longitudinal parts (of which the latter may be discarded) and imposing coordinate conditions. In the end the action integral is written in terms of 4 canonical variables. Different choices of coordinate conditions lead to different canonical variables. The definition of energy and the self-energy problem are discussed. (Math. Rev. abstract, modified)

THE DYNAMICS OF GENERAL RELATIVITY, by R. Arnowitt, S. Deser, and C. W. Misner. [1962] [39]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-22 and National Science Foundation) Unclassified

Published in Gravitation: An Introduction to Current Research, ed. by L. Witten. New York, John Wiley & Sons, 1962, p. 227-265.

The problem of the dynamics of the gravitational field is outlined in Section I. Section II presents a brief review of parameterized particle mechanics. The Lagrangian of general relativity is cast into Palantini and 3 + 1 dimensional form, and the geometrical significance of the variables is discussed in Section III. It is shown that relativity has a form identical to parameterized mechanics. Section IV completes the analysis, to obtain the canonical variables and their Poisson bracket relations as well as the P. B. equations of motion. It is possible to set up the analysis of gravitational radiation in a fashion closely analogous to electrodynamics by introducing a suitable definition of the wave zone. In this region, gravitational waves propagate as free radiation, independent of the strong field interior sources. The waves obey ordinary wave equations and consequently satisfy superposition. The Poynting vector may also be defined invariantly in the wave zone. In contrast, the Newtonian-like parts of the metric can not be determined within the wave zone; they depend strongly on the interior non-linearities. These points are discussed in Section V. When the analysis is extended to include coupling of other systems to the gravitational field in Section VI, the above definition of energy may be used to discuss self-energy questions. In this way, the static gravitational and electromagnetic self-masses of point particle systems is treated in Section VII. Whether gravitational effects will maintain the finiteness of self-energies in quantum theory is a question which is considered in the final section.

LOW LYING STATES OF A SYSTEM OF INTERACTING BOSONS, by E. P. Gross. [1962] [15]p. (AF AFOSR-61-22) Unclassified

Published in Ann. Phys., v. 20: 44-60, Oct. 1962.

The ground state wave function and energy of a system of interacting bosons is studied. Attention is focused on the real function $S(X_1 \ldots X_N)$ defined by $\Psi = e^S$. S is written as a sum of intrinsic 2-particle, 3-particle, etc. functions. The functions are fully determined by matching intrinsic n-particle terms in the equation obeyed by S. The theory describes both close collisions and the interaction of sets of particles with the surrounding medium. Analysis of the procedure in terms of distribution functions reveals that a linearization of the generalized superposition approximation is the key feature. Excited states of the phonon roton type are found in the form $\Psi = Fe^S$, with F a fully determined sum of terms of different particle numbers. The wave functions are similar to those used by Feynman and Cohen for actual liquid helium, but give a more detailed description of the excitations for the restricted situations where the theory applies. (Contractor's abstract)

WEAK INTERACTION MEDIATED BY REGGE PARTICLES, by C. Iso. [1962] [14]p. incl. diagrs. table, refs. (AF AFOSR-61-22) Unclassified

Published in Ann. Phys., v. 23: 304-317, Aug. 1963.

Under the assumption that the weak interaction is mediated by Regge type particles, the cross section for $\nu + n \to p + \bar{\nu}$ is given. This cross section is remarkably different from that given by the usual weak interaction, if the spin of this particle is one and the slope of the Regge trajectory is comparatively as large as for the strongly interacting particles. Finally, a comparison is made between cross sections for weak interactions and strong interactions at high energy when the weak interaction does not have a Regge behavior. (Contractor's abstract, modified)

RHENIUM CATALYSTS. IV RHENIUM(III) OXIDE FROM PERRHENATE VIA BOROHYDRIDE REDUCTION, by H. S. Broadbent and J. H. Johnson. [1962] [3]p. incl. table. (AFOSR-64-0921) (AF 18(600)1164) AD 439967 Unclassified

Also published in Jour. Org. Chem., v. 27: 4400-4402, Dec. 1962.

The addition of sodium borohydride to cold aqueous solutions of perrhenate and acetic acid produces good yields of very finely divided, black rhenium (III) oxide possessing marked catalytic activity. A summary of some hydrogenations catalyzed by this substance is presented. The oxide is not ordinarily reduced to lower oxides or the metal during the process of hydrogenation. (Contractor's abstract)

RHENIUM CATALYSTS. V. RHENIUM HEPTOXIDE-TETRAHYDROPYRAN COMPLEX, by H. S. Broadbent and J. H. Johnson. [1962] [3]p. incl. table. (AFOSR-64-0922) (AF 18(600)1164) AD 439973 Unclassified

Also published in Jour. Org. Chem., v. 27: 4402-4405, Dec. 1962.

Rhenium (VII) oxide reacts with boiling tetrahydropyran to form a nearly colloidal, black, voluminous, insoluble complex which has unusual activity in catalytic hydrogenations. It is relatively active in promoting saturation of aromatic hydrocarbons whereas nitro compounds are singularly inert under comparable conditions.

RHENIUM CATALYSTS. VII. RHENIUM(VI) OXIDE, by H. S. Broadbent and W. J. Bartley. [1962] [3]p. incl. table. (AFOSR-64-0924) (AF 18(600)1164) AD 440054 Unclassified

Also published in Jour. Org. Chem., v. 28: 2345-2347, Sept. 1963.

Rhenium(VI) oxide is a very efficient catalyst for the hydrogenation of carboxylic acids and carboxamides, being comparable to the rhenium(VII) oxide which is the most efficient catalyst for these purposes yet reported. The former oxide, which can be very easily and simply made from the latter, is nonhygroscopic and stable in air, thus enjoying considerable advantage in handling over the commercially available higher oxide. GENERALIZATIONS OF SOME COMBINATORIAL INEQUALITIES OF H. J. RYSER, by M. Marcus and W. R. Gordon. [1962] [11]p (AFOSR-3334) (AF 49-(638)776) Unclassified

Also published in Ill. Jour. Math., v. 7: 582-592, Dec. 1963.

Let H be a non-negative hermitian matrix of rank e and order v with eigenvalues $\lambda_1, \ldots, \lambda_v$, where $\lambda_1 \geq \ldots \geq \lambda_e > \lambda_{e+1} = \ldots = \lambda_v = 0$. Let h be an integer > 1 and such that $e \geq h \geq v$. Define k and λ by

trace (H) = kh, $\lambda_h = k + (h-1)\lambda = \lambda_1$. Let B be the matrix of order h defined by $B = (k-\lambda)I + \lambda J$, where I is the identity matrix and J is the matrix with all entries equal to 1. Let B_0 be the matrix of order v defined by $B_0 = B + 0$, where the sum is direct and 0 is the zero matrix of over v - h. Next, let $k^* = \text{trace}(H)/v$, $\mu = \sum_{i=1}^{v}\sum_{j=1}^{v} h_{ij}$, $\lambda^* = ((\mu/v) - k^*)/(v-1)$ and let B^* be the matrix of order v defined by $B^* = (k^* - \lambda^*)I + \lambda^* J$. By f we understand a non-negative concave symmetric function on v-tuples of non-negative reals. Suppose that whenever $\theta a + (1-\theta)b \in G_f = \{x: f(x) > 0\}$, $0 < \theta < 1$, then

$$f(\theta a + (1-\theta)b) = \theta f(a) + (1-\theta)f(b)$$

if and only if a and b are proportional. Then f is called strictly concave. Let A be a matrix with eigenvalues $\mu_1 \geq 0, \ldots, \mu_v \geq 0$ and let f(A) denote $f(\mu_1, \ldots, \mu_v)$. The main results are the following. If f is concave, then the matrices H and B_0 satisfy $f(H) \geq f(B_0)$. If f is strictly concave and if $(\lambda_1, \ldots, \lambda_v) \in G_f$, then equality holds if and only if H and B_0 have the same eigenvalues [$H = B^*$]. If f is strictly concave, and if for some integer z, G_f is the set of non-negative vectors with at least z positive coordinates and if $k + (h-1)\lambda \neq 0$ and $z \geq h$ or $k + (h-1)\lambda = 0$ and $z < h$ [$z < v$], then $f(H) = f(B_0)$ and only if H and B_0 have the same eigenvalues. Analogous theorems hold for f convex with $f(H) \leq f(B_0)$. The theorems are generalizations d inequalities on compound and induced matrices. The inequalities are combinatorilly significant and may be applied to directed graphs and (v, k, λ) configurations. (Math. Rev. abstract)

AN INEQUALITY CONNECTING THE P-CONDITION NUMBER AND THE DETERMINANT, by M. Marcus. [1962] [4]p. (AFOSR-3335) (AF 49(638)776) Unclassified

Also published in Numerische Math., v. 4: 350-353, 1962.

For a positive definite, hermitian matrix A of order n, with characteristic values $\lambda_1 \geq \ldots \geq \lambda_n$, the "P-condition number" is defined to be the ratio $p = \lambda_1/\lambda_n$. The author proves an inequality connecting p, the determinant of the matrix, and the principal diagonal entries a_{ii}, namely,

$$\det A \leq q^{n-1} \prod_{i=1}^{n} a_{ii},$$

where $q = 4p/p(p+1)^2$, and shows that equality occurs if and only if A is a diagonal matrix. The proof depends on the Kantorovich inequality and on some properties of symmetric means. Applications are made to certain special classes of matrices. (Math. Rev. abstract)

THE FIELD OF VALUES OF THE HADAMARD PRODUCT, by M. Marcus and R. C. Thompson. [1962] [6]p. (AFOSR-3336) (AF 49(638)776) Unclassified

Also published in Arch. Math., v. 14: 283-288, 1963.

The Hadamard or Schur product A o B of 2 n x n matrices $A = (a_{ik})$, $B = (b_{ik})$ is the matrix $(a_{ik}b_{ik})$. The paper deals (1) with the field of values A o B for A, B normal, in particular if A and B commute. The latter result is applied to A positive definite hermitian and B a scaler function of A, convex, non-increasing on the closed interval determined by the characteristic roots of A. The results of (1) are applied to certain compound matrices and give theorems concerning the location of products of determinants (permanents) of corresponding minors of A and B. The Lyapunov equation $AG + GA^* = K$ is studied. If A is assumed similar to a diagonal then the Lyapunov equation can be trarsformed to $(\alpha_i + \bar{\alpha}_k)g_{ik} = k_j$ which is a Hadamard product. Using this idea a new proof is found for a generalization of Lyapunov's theorem concerning stable matrices. If A is normal then bounds for the characteristic roots of G are also obtained. (Math. Rev. abstract)

ASYMPTOTIC VARIATIONAL FORMULAE FOR EIGENVALUES, by C. A. Swanson. [1962] [11]p. (AFOSR-3259) (AF AFOSR-61-89) AD 400839 Unclassified

Also published in Canad. Math. Bull., v. 6: 15-25, Jan. 1963.

The eigenvalues of a second order self-adjoint elliptic differential operator on Riemannian n-space R are considered. The purpose is to obtain asymptotic variational formulae for the eigenvalues under the topological deformations of (1) removing an ϵ-cell (and adjoining an additional boundary condition on the boundary component thereby introduced), and (2) attaching an ϵ-handle, valid on a half-open interval $0 < \epsilon \leq \epsilon_0$. In particular the formulae exhibit the non-analytic nature of the variation. Similar variational problems for singular ordinary differential operators are considered.

ASYMPTOTIC ESTIMATES FOR LIMIT CIRCLE PROBLEMS, by C. A. Swanson. [1961] [11]p. incl. refs. [AF AFOSR-61-89] Unclassified

Published in Pacific Jour. Math., v. 11: 1549-1559, Winter 1961.

Characteristic-value problems are considered for the second-order differential operator L defined by (1) $Lx = 1/k(s)\{-d/ds[p(s)dx/ds] + q(s)x\}$ on the open interval $-\infty \leq \omega- < s < \omega+ \leq \infty$, with suitable boundary conditions at $\omega-$, $\omega+$ $\omega-$, $\omega+$ are, in general, singularities of L. The type of result desired is to begin with a regular Sturm-Liouville problem. (2) $Ly = \mu y$, $U_a y = U_b y = 0$, on the closed bounded interval $[a, b] \subset (\omega-, \omega+)$, and obtain estimates which imply that for each characteristic value $\mu = \mu_{ab}$ of (2), the limits of μ_{ab} as a, $b \to \omega-, \omega+$ will exist. Here U_a, U_b are appropriate boundary operators. The estimates are obtained by means of projection mappings on suitable Hilbert spaces. The basic assumption in this paper is that both is that both $\omega-$, $\omega+$ are limit-circle singularities of L. Then estimates are given which imply that for each characteristic value λ of (1), there exists a characteristic value μ_{ab} of (2) near λ for a, b near $\omega-, \omega+$ and $\mu_{ab} \to \lambda$ as a, $b \to \omega-, \omega+$, under suitable restrictions as to the limiting behavior of $U_a x$, $U_b x$ as a, $b \to \omega-, \omega+$. Estimates are also given comparing characteristic functions of (1) and (2). (Math. Rev. abstract, modified)

ON COVERING SYSTEMS, by D. J. Mallory and M. Sion. [1962] [10]p. (AFOSR-64-0670) (AF AFOSR-62-261) AD 436279 Unclassified

Also published in Canad. Jour. Math., v. 16: 18-27, 1964.

The relationships between 3 systems are studied: (1) Vitali systems (V-systems); (2) a modification of the systems having the property (V) introduced by Sion (S-systems); and (3) a modification of the tile systems studied in Hahn and Rosenthal (T-systems). The main results state that V-systems are always S-systems; under certain conditions, V-systems are T-systems under more stringent conditions, S-systems are T-systems. It is then shown that the converses, in general, do not hold. It is also shown that for T-systems, measurable functions are approximately continuous. This result is applied to obtain a density theorem.

EFFICIENCY OF PREDICTOR-CORRECTOR PROCEDURES. by T. E. Hull and A. L. Creemer. [1962] [11]p. incl. diagrs. (AFOSR-J1210) (In cooperation with New York U., N. Y.) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-264 and Defence Research Board of Canada) AD 424171 Unclassified

Also published in Jour. Assoc. Comput. Mach., v. 10: 291-301, July 1963.

This is a study of numerical solution of first-order differential equations by predictor-corrector methods. The study is restricted to methods of the Adams type. Some 17 different differential equations with know analytic solutions were solved on a digital computer. These were done with various step sizes, various predictor-corrector formulas, and with various numbers of iterations of the corrector per step. Several plots of error vs cost (number of evaluations of the differential equation) are shown. It appears that the best predictor-corrector procedures, at least for general purposes, assuming f is fairly complicated, are those which involve 2 evaluations of f and 2 applications of the corrector formula per step. No comparison is made with Runge-Kutta type formulas. (Math. Rev. abstract)

MIXED CONGRUENTIAL RANDOM GENERATORS FOR DECIMAL MACHINES, by J. L. Allard, A. R. Dobell and T. E. Hull. [1962] [11]p. incl. tables, refs. [AF AFOSR-62-264] Unclassified

Published in Jour. Assoc. Comput. Mach., v. 10: 131-141, Apr. 1963.

This paper summarizes the results of extensive testing of random number generators of the mixed congruential type. Most results are for word length 10, and special attention is given to simple multipliers which give fast generators. Results show that these mixed generators, in contrast to the multiplicative ones, are not consistently good from a statistical point of view. The cases which are bad seem to belong to a well-defined class which, unfortunately, includes most of the generators associated with the simple multipliers. However, an unexpected result is that all generators associated with one of the simplest and fastest multipliers, namely 101, turn out to be consistently good for word lengths greater than 7 digits. A final section of the paper suggests a simple theoretical explanation of these experimental results. (Contractor's abstract, modified)

STABILITY IN THE NUMERICAL INTEGRATION OF ORDINARY DIFFERENTIAL EQUATIONS, by T. E. Hull. [1962] [2]p. [AF AFOSR-62-264] Unclassified

Published in Information Processing; Proc. of the Internat'l. Federation for Information Processing Congress, Munich (Germany) (Aug. 27-Sept. 1, 1962). Amsterdam, North-Holland Publishing Co., 1963. p. 211-212.

The purpose of this paper is to consider the stability of predictor-corrector procedures in the numerical integration of the initial value problem for ordinary differential equations. First, a consistent corrector formula is defined as one whose local truncation error is $O(h^2)$ as $h \to 0$. Then, the result, is as follows: the approximate solution generated by a predictor-corrector procedure will converge to the solution of the initial-value problem as $h \to 0$ if and only if the corrector formula is both consistent and stable; moreover, a necessary and sufficient condition for stability is that the zeros of $S^k - \sum a_i S^{k-i}$ are in or on the unit circle, and that if they are on it they are simple. In the second part of this work, h is considered to be small but not equal to zero. The number of iterations is considered to be large (in practice 3 or 4) so that the effect of the predictor formula is negligible. In the third and final section of the paper, the problem is reduced to choosing the step number, the number of iterations per step, and the step-size.

ULTRASONIC ATTENUATION IN SUPERCONDUCTORS: ANISOTROPY OF THE ENERGY GAP (Abstract), by J. R. Leibowitz and R. W. Morse. [1962] [1]p. [AF 49(638)6] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 63, Jan. 24, 1962.

Anisotropy in the superconducting energy gap, observed by means of transverse ultrasonic waves, is reported. On the free-electron model, transverse lattive waves interact more selectively with electrons on the Fermi surface than do longitudinal waves, and hence probe the gap anisotropy more finely. The temperature dependence of superconducting attenuation $\alpha_s(T)$ was measured as a function of orientation in single crystal tin, at frequencies up to 70 m c/sec for all principal propagation directions and all polarization directions permitted by summetry. Amsotropy was found to be associated with change of polarization as well as propagation direction. For all orientations, in addition, $\alpha_s \propto \exp$ was found, within experimental accuracy, to be of exponential form at low reduced temperature as predicted by BCS. Certain features of the anisotropy in apparent energy gap found to be associated with rotation of polarization vector in the (001) plane (the range of gap values being 3.4 to 4.3 kT_c) are believed to be of special interest. Difficulties associated with "real metals effects" are discussed, and some qualitative identifications with Fermi surface structure are treated.

SOME ASPECTS OF GRAIN BOUNDARY MIGRATION IN PLASTICALLY DEFORMED SINGLE CRYSTALS, by B. K. Basu and C. Elbaum. May 1962 [19]p. incl. illus. diagrs. (AFOSR-2643) (AF 49(638)479) AD 286320 Unclassified

The migration of various grain boundaries is studied in Al specimens; these specimens are prepared from single crystals, deformed plastically at room temperature. Boundary velocities are measured (for a given temperature) as a function of boundary rotation and position parameters. Dislocation densities and arrangements are determined in the recrystallized volume of the specimen, by means of an x-ray diffraction technique suitable for this purpose. Large differences have been found in the mobility of grain boundaries, as a function of boundary position (tilt or twist), for a given rotation angle. Correlations between boundary angle and dislocation density in the recrystallized volume are discussed. The passage of certain grain boundaries was found to produce crystals of unusually low dislocation density and very uniform reflecting power for x-rays. Crystals of comparable perfection are frequently encountered in some ionic and covalent solids, but are quite unusual in Al. (Contractor's abstract)

EFFECT OF THERMAL FLUCTUATIONS ON STRAIN-AMPLITUDE-DEPENDENT DAMPING (Abstract), by L. J. Teutonico, A. V. Granato, and K. Lücke. [1962] [1]p. Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)479], Army Ordnance Office, and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 223, Mar. 26, 1962.

Although the mechanical theory of Granato and Lücke for the strain-amplitude-dependent internal friction and modulus changes of solids containing dislocations gives a fair account of many of the observed effects, simple theoretical calculations show that the effect of thermal fluctuations should be very important. To extend the theory to finite temperatures, a detailed study of the possible static-equilibrium configurations of a pinned dislocation as a function of external stress is required. Results are presented for the 2 specific examples of a dislocation with a single pinning point and a continuously pinned dislocation. By considering the kinetics of breakaway, it is shown how the decrement and modulus change can be computed from these results. A qualitative discussion of expected behavior is given.

JUMP FREQUENCY OF A PINNED DISLOCATION SEGMENT (Abstract), by A. V. Granato, K. Lücke, and L. [J.] Teutonico. [1962] [1]p. [Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)479, Army Ordnance Office, and Atomic Energy Commission] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 223-224, Mar. 26, 1962.

The mean time τ required for a pinned dislocation segment to jump away from a pinning point by thermal fluctuations is given by rate theory in the form $\tau^{-1} = \nu_0 \exp(\Delta S/K) \exp(-\Delta U/KT)$, where the symbols have their conventional meanings. A calculation has been made of the effective jump frequency, or the product of the attack frequency ν_0 and the entropy factor $\exp(\Delta S/K)$. This quantity is required in theories of internal friction, creep, and flow stress. Under the assumption that the normal modes of a crystal containing dislocations can be split into the usual Debye waves plus localized modes at the dislocations, the frequencies of the dislocation modes can be computed for both the stable pinned position and the saddle-point position by using the vibrating-string analogy for the dislocation. From these, the attack frequency is found using Vineyard's analysis. The result is that the attack frequency depends only on the pinning-point interaction energy ΔU and not on the length of the dislocation segment, in spite of the fact that ν_0 depends on the dislocation length. For $\Delta U = 0.1$ ev, the jump frequency is of the order 10^{10} sec^{-1}.

NOTE ON SECOND-ORDER W. K. B. PHASE SHIFTS, by S.-I. Choi and J. Ross. [1962] [4]p. incl. diagrs. tables. (Sponsored jointly by Air Force Office of Scientific Research under AF 18(603)87, Alfred P. Sloan Foundation, and National Science Foundation) Unclassified

Published in Proc. Nat'l. Acad. Sci., v. 48: 803-806, May 1962.

The phase shifts for elastic scattering by a spherical potential are obtained by the WKB approximation of the radial wave function up to second-order terms. The difficulties of applying the approximation to the radial Schrodinger equation can be overcome by a transformation as pointed out by Langer. Inspection of the transformation equation suggests that the solution is the same as the normal equation with the substitution of $(l + \frac{1}{2})^2$ for $l(l + 1)$. This was borne out by the calculation of the first order terms. The paper derives the second order WKB phase shifts of the elastic scattering from the transformed radial equation and shows that this simple substitution in the second order solution of the normal equation no longer gives the correct solution. The phase shifts in the 2 cases are tabulated for the Lennard-Jones potential.

THE EXTRACELLULAR SPACE IN THE TOAD RETINA AS DEFINED BY THE DISTRIBUTION OF FERROCYANIDE. A LIGHT AND ELECTRON MICROSCOPE STUDY, by A. Lasansky and F. Wald. [1962] [17]p. incl. illus. refs. (AFOSR-J1050) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-60-5 and Consejo Nacional de Investigaciones Científicas y Técnicas de la República Argentina) Unclassified

Also published in Jour. Cell. Biol., v. 15: 473-479, Dec. 1962.

Measurements of the uptake of compounds that ordinarily do not penetrate into cells have been a source of data on the size of the extracellular space in nervous tissue. The distribution of one such compound, ferrocyanide, has been studied in the toad retina by means of the light and electron microscopes. At the level of the light microscope, ferrocyanide, detected as

Prussian blue, appears to penetrate predominately within the inner processes of Müller cells. A diffuse background staining by Prussian blue can be noticed also at the inner retinal layers. At the level of the electron microscope, Müller cells exhibit an extensively developed system of channels which are formed by infoldings of the plasma membrane. Ferrocyanide, detected as copper ferrocyanide deposits, is found occupying the lumina of these channels and in the narrow intercellular gaps of the retina. These observations indicate that in the toad retina the extracellular medium includes the intercellular spaces plus a glial compartment formed by the infoldings of the plasma membrane of the Müller cells. MITOCHONDRIOGENESIS IN NERVE FIBERS OF THE INFRARED RECEPTOR MEMBRANE OF PIT VIPERS; by E. De Robertis and H. Bleichmar. [1962] [11]p. incl. illus. diagr. refs. (APOSR-J1173) (AF AFOSR-61-40) AD 424259 Unclassified

Also published in Zeitschr. Zellforsch. und Microskop. Anat., v. 57: 572-582, 1962.

The myelinated nerve fibers that innervate the infrared receptor membrane of pit vipers were studied under the electronmicroscope. Along the course of the fiber, toward the nerve terminal, segments of the axon with an increasing concentration of mitochondria were found, and a special region was recognized where an active process of mitochondriogenesis seems to occur. In these regions the axon has varying amounts of mitochondria, is devoid of neuroprotofibrils, and the axoplasmic matrix is dense and contains numerous membranes, some of which can be traced as infoldings of the axolemma. The images observed have led to a tentative postulation of a mechanism of mitochondrial formation, which would start with the infolding of the axolemma, would continue with the curving of 2 parallel membranes around a denser portion of axoplasmic matrix, the development of inner crests, and the final closing of the membrane. The possible electrochemical properties of mitochondrial membranes deriving from an excitable membrane are discussed in relation to the special receptive properties of these nerve fibers.

DIELECTRIC CONSTANT OF HYDROGEN-BONDED LIQUIDS. I. CYANOACETYLENE, by W. Danhauser and A. F. Flueckinger. Aug. 1962, 4p. incl. diagrs. tables, refs. (AFOSR-J241) (AF 49(638)939) AD 400869 Unclassified

Also published in Jour. Chem. Phys., v. 38: 69-72, Jan. 1, 1963.

The dielectric constant of cyanoacetylene was determined over the normal liquid range: $\epsilon(T)$ = (71000/T) -170. Analysis of the data in terms of a hydrogen-bonded linear polymer yields: ΔH = 2.80 kcal; ΔS = 15.8 eu/mol of hydrogen bond. The vapor pressure of solid and liquid HCCCN was measured. Molar enthalpies and entropies of fusion and vaporization are: 3.38 and 6.72 kcal; 12.1 and 21.3 eu, respectively. Hydrogen bonding in this and similar a[illegible] is discussed. 4-FLUOROTOLUENE: CHEMICAL THERMODYNAMIC PROPERTIES, VIBRATIONAL ASSIGNMENT, AND INTERNAL ROTATION, by D. W. Scott, J. F. Messerly and others. [1962] [7]p. incl. tables, refs. (AFOSR-5040) (CSO-680-57-4) AD 456557 Unclassified

Also published in Jour. Chem. Phys., v. 37: 867-873, Aug. 15, 1962.

Thermodynamic data were obtained for 4-fluorotoluene and correlated by methods of statistical mechanics to derive values of the chemical thermodynamic properties in the ideal-gas state from 0° to 1500°K. A vibrational assignment consistent with the calorimetric data was obtained. Integral rotation was shown to be essentially free. Experimental studies provided the following information: values of heat capacity for the solid (13°K to the triple point), the liquid (triple point to 361°K), and the vapor (377° to 500°K); the triple-point temperature; the heat of fusion; thermodynamic functions for the solid and liquid (0° to 390°K); heat of vaporization (347° to 390°K); parameters of the equation of state; and vapor pressure (341° to 428°K). COMBUSTION CALORIMETRY OF ORGANIC FLUORINE COMPOUNDS. THE HEATS OF COMBUSTION AND FORMATION OF THE DIFLUOROBENZENES, 4-FLUOROTOLUENE AND m-TRIFLUOROTOLUIC ACID, by W. D. Good, J. L. Lacina and others. [1962] [4]p. incl. tables. (AFOSR-J56. (CSO-680-57-4) AD 400393 Unclassified

Also published in Jour. Phys. Chem., v. 66: 1529-1532, Aug. 1962.

The heats of combustion of 5 aromatic fluorine compounds were determined by a rotating-bomb method of combustion calorimetry. The suitability of m-trifluorotoluic acid (o-, m-, p-trifluoromethylbenzoic acid) as a reference substance for the combustion calorimetry of organic fluorine compounds was investigated. The following values, in kcal mol^{-1}, are reported for the standard heats of formation, $\Delta Hf^{o}_{298.15}$ from graphite and gaseous hydrogen, oxygen, and fluorine: 4-fluorotoluene(g), -34.01; 1,2-difluorobenzene(g), -67.65; 1,3-difluorobenzene(g), -71.35, 1,4-difluorobenzene(g), -70.69, and m-trifluorotoluic acid(c), -251.78.

AN INCLINED-PISTON DEAD-WEIGHT PRESSURE GAUGE, by D. R. Douslin, J. Toalson and others. Feb. 1962 [20]p. incl. diagrs. table, refs. (Contribution no. 114) (APOSR-2189) (Sponsored jointly by Air Force Office of Scientific Research under CSO-680-59-5 and American Petroleum Inst.) AD 272397
Unclassified

An inclined-piston gauge for accurate vapor-pressure measurements in the range 0.1 to 40 mm was designed and constructed. The gauge operates on the dead-weight principle from a zero pressure datum level. The test measurements on ice and water demonstrate the excellent possibilities the inclined-piston gauge offers as an instrument for very precise and accurate vapor pressure work in the low and intermediate pressure range. Present applications include determining vapor pressures below room temperature for high boiling or unstable organic substances that cannot be studied by other static or ebulliometric methods and for detonable or rare substances which require the use of small samples. From the results, accurate values of the heat and entropy of vaporization and entropy of compression can be calculated. (Contractor's abstract)

STRUCTURE AND PROPAGATION OF TURBULENT BUNSEN FLAMES, by D. Burgess. [1961] 42p. incl. illus. diagrs. tables, refs. (Bull. no. 604) (AFOSR-4405) (CSO-680-58-10) Unclassified

This report presents the results of several experiments which were performed in order to elucidate the problem of turbulent flames. Included are measurements of v' in flames by helium diffusion, electronic probe, and by Toepler photographs; measurements of gas flow patterns by particle track and pitot tube mapping; measurements of reactant and product concentration profiles; spectrographic studies aimed at specifying a reaction path; photographic observations; and many measurements of turbulent burning velocity. From the viewpoint of this report, the important advances lie (1) in a delineation of experimental conditions under which the wrinkled flame is real, (2) in accumulating evidence that the scale of turbulence, or at least the burner dimension, is of importance, and (3) in the recognition of such factors as the core-mixing zone distinction which have caused unfavorable comparisons of burning velocity data in the past.

ON SOME DIFFERENCES IN MODES OF RESEARCH AMONG PSYCHOLOGISTS AND SOCIOLOGISTS, by S. Z. Klausner. [1962] [27]p. incl. tables, refs. (AFOSR-65-0976) (AF 49(638)992) AD 619628 Unclassified

Also published in Trans. of the Fifth World Congress of Sociology, Washington, D. C. (Sept. 2-8, 1962), Louvain (Belgium), Internatl. Sociological Assoc., v. 4: 209-235, 1964.

Studies were made of the differences and similarities in research methods of sociologists and psychologists by comparing research done in the field of religion by 2 sample groups of the 2 professions. Comparisons were made of the system levels with which the research was concerned, the methods of gathering data, the technical terminology used by each, the type of value judgments made, and the modes of inference used. Results indicate that sociologists tend to prefer face-to-face interview methods, to designate their concepts with non-technical terms, to be either neutral or positive in evaluating the behavior they observe, and to think in classificatory and descriptive terms. Psychologists prefer more standardized questionnaire methods of data gathering, use technical terms to designate concepts, are concerned with the negative side of their objects of study, and think in terms of inductive generalizations. These methodological differences no doubt condition whatever substantive differences exist between the fields

DOES THE BOBOLINK NAVIGATE. by W. J. Hamilton, III. [1962] [11]p. (AFOSR-2517) (AF 49(638)825; AD 611342 Unclassified

Also published in Wilson Bull., v. 74: 357-366, Dec. 31, 1962.

On Sept. 1, 1959, a captive adult female Bobolink escaped from captivity a Berkeley, California. This bird had been taken from its breeding locality in North Dakota on Aug. 9, 1959 and shipped to Berkeley where it was held on a light-dark schedule coinciding with the natural photoperiod for its home locality in North Dakota. On the 3 nights prior to escape this bird was held in an experimental cage automatically registering the directional component of migratory activity at night. On the first of these nights the preferred direction almost coincided with the home direction, while on the third the direction was parallel to the natural route of migration of the population from which this bird was derived. The direction on the second night was intermediate. On the first day of June of the following year this same bird was recaptured at the location where it was originally trapped in Kenmare, North Dakota. Since the experimental site in California is not on a migratory pathway of Bobolinks, some navigation capacity permitting the eventual return seems to be implied. The orientation mechanism and the possible travels of this bird prior to recapture are discussed.

EVIDENCE CONCERNING THE FUNCTION OF NOCTURNAL CALL NOTES OF MIGRATORY BIRDS, by W. J. Hamilton, III. [1962] [12]p. incl. diagrs. table, refs. (AFOSR-2518) (AF 49(638)825; AD 299695 Unclassified

Also published in Condor, v. 64: 390-401, Sept. 1962.

Many species of birds migrating at night have characteristic call notes. Species which regularly form flocks during the day have a night migration note apparently indistinguishable from the daytime call note. Other species seem to have a night note so different from the day note that it is often difficult to identify the caller. The most intensive night restlessness of captive caged Bobolinks is reflected by fluttering. Associated with this fluttering is a call note which is apparently the same as the call of migrants. If this call is recorded and played back to caged birds it amplifies the response of birds already showing migratory restlessness and may induce weakly responding birds to greater responsiveness. Birds which have not been responding regularly, and may thus be assumed not to be in physiological migratory condition, usually ignore the stimulus. With the input of additional calls to strongly responding birds, the response is often to fly up even though the bird has previously learned that such action will result in crashing into the lid of the apparatus. The suggestion is made that this behavior, extended to natural migration, may mean that the calls of migrants aloft induce grounded birds to fly up. This suggestion is in part supported by observations and analysis of the temporal pattern of migration. Some species of passerines and some nonpasserines seem to maintain flocks during night migration. These flocks are very open in comparison with flocks of birds noted during daylight and it is suggested that for many species contact is maintained largely by the call note. The night flocks of passerines are often composed of mixed species. Possible ways in which the call notes may serve to provide sufficient orienting cues for flock maintenance are discussed. While the sonagraph analysis shows that each note has characteristics that may enhance its location, more effective corrections for direction would be possible by either hearing the same individual a second time or by using the calls from a flock. Consistent individual differences in structure of notes suggest the feasibility of corrections based on hearing subsequent notes from the same individual.

BOBOLINK MIGRATORY PATHWAYS AND THEIR EXPERIMENTAL ANALYSIS UNDER NIGHT SKIES, by W. J. Hamilton, III. [1962] [26]p. incl. illus. diagrs. refs. (AFOSR-2519) (AF 49(638)825) AD 400051 Unclassified

Also published in The Auk, v. 79: 208-233, Apr. 1962.

By observing or recording automatically the facing direction or the restricted locomotion of a Bobolink confined to an experimental apparatus, the orientation of migratory behavior was analyzed. Birds were largely from a North Dakota breeding population. The experiments were all done in and around San Francisco, California, with the birds held on local San Francisco time either in indoor cages or under the natural sky. A consideration of the course taken by geographically displaced birds suggests that the preferred migration direction depends upon a shifted timing mechanism. Spring-migration trends to the north have so far been obtained only for a population of birds taken in migration in Florida. The responses of these Florida birds showed wide scatter contrasting with the comparatively homogeneous result obtained from the North Dakota population. Experiments indicate that the Bobolink is capable of telling direction by some feature of the clear night sky. Both immature and adult birds are capable of making such directional determinations. The directional choice is probably based on the stars and the internal clock. The clock apparently does not compensate for the advance of the sidereal day in relation to the solar day. Each population of Bobolinks throughout the breeding area may have a unique preferred migration direction, at least until the migration becomes a common pathway in the southeastern United States. While the stars are obviously important to directional choices at night, other orienting cues such as terrain features and other birds of the same species, and perhaps other species in flight at the same time, may provide additional information upon which the directional course is based.

STRUCTURE OF LIQUIDS, by C. J. Pings. Final rept. Mar. 23, 1962 [62]p. incl. diagrs. table, refs. (AFOSR-2423) (AF 49(638)800) Unclassified

Equipmental techniques were developed for the measurement of the x-ray diffraction pattern from pressurized liquids. Initial studies on liquid nitrogen at -193°C and 7 atm have been analyzed and indicate a first order coordination shell of 15 nearest neighbor nitrogen molecules at a distance of 4A. Prior suggestions of the existence of an N_4 molecule have been shown to be unreliable. Apparatus was designed and constructed for the measurement of refractive index of solids and liquids under conditions of controlled temperature and pressure. The device is currently being used for studies of refractive index of solid and liquid argon. Both the x-ray diffraction and refractive index studies are continuing. (Contractor's abstract)

INERT GASES—IDEAL ATOMS FOR RESEARCH, by B. L. Smith. [1962] [6]p. incl. illus. diagrs. [AF AFOSR-62-141] Unclassified

Published in Eng. and Sci., v. 25. 14-19, Jan. 1962.

The suitability of the inert gases, argon, neon, helium, krypton, xenon, and radon, for research in the development of the molecular theory of the physical properties of matter is discussed. The atoms are characterized by full and stable electron shells, which gives them their inert properties. They have been likened to minature 'ping-pong balls' often used in scientific theories—easy to handle mathematically because they are spherically symmetrical in their interactions. With the exception of helium, they are readily liquefied and solidified by normal low temperature methods. They may therefore be studied as gases, liquids, or solids. Work with the inert gases at the California Inst. of Tech. and their applications in other fields of study are discussed.

ELECTROMAGNETIC SURFACE-WAVE PROPAGATION ALONG A DIELECTRIC CYLINDER OF ELLIPTICAL CROSS SECTION, by C. W. H. Yeh. Jan. 1962, 202p. incl. illus. diagrs. table, refs. (Technical rept. no. 27) (AFOSR-1991) (AF 18(600)1113) AD 273988 Unclassified

Also published in Jour. Appl. Phys., v. 33: 3235-3243, Nov. 1962. (Title varies)

The problem of electromagnetic wave propagation along a dielectric rod of elliptical cross section is considered. The field components and the dispersion relations of the principal modes are obtained. The principal modes degenerate to modes of the circular dielectric rod as the eccentricity of the elliptical rod approaches zero. It is found that there are 2 non-degenerate principal modes which possess no cut off frequencies. The boundary conditions for the elliptical rod cannot be satisfied by using a single product term consisting of a radial and a periodic Mathieu function of a specific order to describe the field components in the regions inside and outside the rod. It is believed that an infinite series of such product terms must be used to describe the field components in both regions. It is shown that the boundary conditions may be fulfilled if the field components in 1 of the 2 regions are represented by a single product term consisting of a radial and a periodic Mathieu function of a specific order. The field components in the other region are then represented by an infinite series of such product terms, and the problem is simplified to permit analysis. The propagation characteristics of the dominant principal modes are given theoretically and experimentally. (Contractor's abstract)

A THEORETICAL STUDY OF THE SCATTERING OF ELECTROMAGNETIC IMPULSES BY FINITE OBSTACLES, by W. P. Brown, Jr. June 1962, 144p. incl. illus. (Technical rept. no. 28) (AFOSR-3016) (AF 18(600)1113) AD 282745 Unclassified

A general approach to the solution of pulse scattering by finite obstacles is formulated which features the identification and separate treatment of the individual terms in a wavefront expansion of the transforms of the field vectors. It is demonstrated that the dispersive effect of a finite conductivity in the scattering obstacle can be neglected for all metals but that it may be significant for poorly conducting materials such as dry earth. The wavefront technique is employed to solve the problems of the transmission of a delta pulse through a conducting dielectric slab and the reflection and diffraction of a delta pulse from a perfectly conducting sphere. The transmission problem results provide a convenient example of the usefulness of the wavefront approach. The results for the sphere problem indicate that the nature of the waves observed at a given spatial point change in time. It is shown that the penumbra and the caustic region in the vicinity of the focal line are initially of zero extent. The rates of expansion of these regions with increasing time are obtained by a consideration of the error terms in the asymptotic expansions of the fields. The temporal behavior of the near and far field zones is obtained in a similar manner. (Contractor's abstract)

DOPPLER EFFECTS IN INHOMOGENEOUS

ANISOTROPIC IONIZED GASES, by K. S. H. Lee and C. H Papas. [1962] 22p. incl. diagrs. (AFOSR-J1543) (AF AFOSR-63-70) Unclassified

Also published in Jour. Math. and Phys., v. 42: 189-199, Sept. 1963.

A general formula for the Doppler effect in an inhomogeneous anisotropic medium is derived from field-theoretic considerations. The anisotropy of the medium is assumed to be caused by a magnetostatic field as in the ionosphere. The formula is applied first to the case where the medium is isotropic (zero magnetostatic field) and plane stratified in the direction of propagation, and then to the more general case where the medium is anisotropic (non-zero magnetostatic field) and plane stratified in the direction of propagation. The source of radiation is assumed to be stationary with respect to the medium.

SUMMARY OF RESEARCH. I. VLF PROPAGATION STUDIES. II. LASER STUDIES. Final rept. Mar. 31, 1962. 7p. incl. refs. (AFOSR-2951) (AF 18(600)1552) AD 411862 Unclassified

Early work was concerned with the development of the theory of an unusual VLF antenna utilizing an existing power line as the radiating element. The system was operated successfully at 8.4 kc. Many 24 hr runs were completed and the day-night differences in the propagation mechanism were studied. A detailed analysis of the operation of the antenna system, including the use of a computer was completed. A major effort was undertaken to attempt to create round trip artificial whistler echoes using this transmitter as a source. When no delayed echoes resulted, the VLF phase of the project was dropped in favor of work on lasers. The research on lasers has encompassed 3 main studies: mode structure and radiation patterns, the mercury-zinc gaseous laser, and interactions of high intensity beams of electromagnetic radiation with matter.

DISPERSION OF HYDROMAGNETIC WAVES (Abstract), by R W. Gould. [1962] [1]p. [AF 49(638)820] Unclassified

Presented at meeting of the Amer. Phys. Soc., Texas U., Austin, Feb. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 145, Feb. 23, 1962.

The dispersion of waves generated by a current-carrying loop in a hydromagnetic waveguide has been studied. Attention is focused on the compressional waves (as opposed to the transverse Alfvén waves) which exhibit a low-frequency cutoff and strong dispersion. The impulse response has been obtained as well as the response to a damped sinusoidal driving current. The received wave trains exhibit a behavior similar to that discussed in the classic treatment by Sommerfeld and Brillouin of optical dispersion. The problem of measuring phase velocity with sinusoidal wave trains of finite duration and with pulses will be discussed.

EXPERIMENTAL OBSERVATIONS OF COMPRESSIONAL HYDROMAGNETIC WAVES (Abstract), by D. G. Swanson and R. W. Gould. [1962] [1]p. [AF 49(638)820] Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 152, Feb. 28, 1963.

Observations have been made of the compressional hydromagnetic wave in a Wilcox-type hydrogen plasma-filled waveguide. The impulse response of the system has been measured by using a 50-nsec current pulse through a loop immersed in the plasma and by detecting the signal 20 and 40 cm away with magnetic probes. The Fourier transforms of the resulting oscillograms lead to a dispersion relation that has been compared with a theoretical dispersion relation. The measured waveguide cutoff frequency (ω_0) has been observed to lie consistently lower than the expected value by as much as a factor of 2. The variation of this error with pressure suggests the presence of impurities. This hypothesis is consistent with our measurements on the torsional wave that give the same result for the Alfvén speed as is derived from ω_0. The linear dependence of ω_0 upon the magnetic field has been verified. Theoretical considerations, including effects such as nonuniform density, modified boundary condition at the wall, Hall term in Ohm's Law, generally lead to a higher cutoff frequency, and, therefore, do not seem to explain our result.

AMES TESTS ON THE FLUTTER OF CYLINDRICAL SHELLS, by R. O. Stearman, M. H. Lock, and Y. C. Fung. Dec. 1962 [59]p. incl. illus. diagrs. tables, refs. (Aeroelasticity and Structural Dynamics rept. no. SM 62-37) (AFOSR-4727) (AF AFOSR-62-374) Unclassified

Two series of experiments on the flutter of thin-walled circular cylinders were performed at the Ames Unitary Plan Wind Tunnel. In the first series, although the model had a radius-to-thickness ratio of 1333, and was designed to flutter according to all published theories based on potential flow, no flutter occurred except in the vicinity of buckling conditions. In the second series,

models having radius-to-thickness ratios 1951 and 2509 were tested, and flutter was observed. This paper describes the experimental results and their interpretations. (Contractor's abstract)

FORMULAS FOR THE DETERMINATION OF THE MATERIAL DAMPING OF A CYLINDRICAL SHELL BY A DECAYING FREE VIBRATION. APPENDIX: APPROXIMATION FORMULAS FOR BESSEL- AND HANKEL-FUNCTIONS, by H. Krumhaar. June 1962, 47p. incl. diagr. refs. (Aeroelasticity and Structural Dynamics rept. no. SM 62-31) (AFOSR-2995) (AF 49(638)220) AD 610436 Unclassified

Formulas are given to determine the structural damping of a thin cylindrical shell by a decaying free vibration in still air. The material damping is assumed to be of the viscous type. To account for the elastic forces the linearized Timoshenko equations and Reissner's shallow shell equations were used. To account for the acoustic pressure due to the surrounding air the acoustic pressure derived for a vibrating cylindrical shell of infinite length was employed. The trapezoidal rule is applied to the integral representations of Bessel and Hankel functions. In this way approximation formulas for these functions are obtained. (Contractor's abstract)

EXPERIMENTS ON THE FLUTTER OF FLAT AND SLIGHTLY CURVED PANELS AT MACH NUMBER 2.81, by W. J. Anderson. June 1962, 72p. incl. illus. diagrs. tables, refs. (Aeroelasticity and Structural Dynamics rept. no. SM 62-34) (AFOSR-2996) (AF 49(638)220) AD 419378 Unclassified

The series of panel flutter tests were carried out in the Jet Propulsion Laboratory's 12 in. supersonic wind tunnel. Flat and slightly curved panels were tested at Mach number 2.81. The flat, rectangular panels were designed to study 2-dimensional flutter. They were clamped at front and rear with free sides which extended into the boundary layer at the sides of the tunnel. These panels flutter in a 2-dimensional mode which occurred at a thickness ratio approx 15% different from the predictions of existing theory. One of the panels exhibited a 3-dimensional "rocking" flutter which has not been observed or discussed before. A theory is developed for this type of flutter. The slightly curved panels were shallow circular cylindrical shells with the generators perpendicular to the flow direction. These panels were all of aspect ratio one. It was found that the effect of curvature was destabilizing and that the effect of internal pressurization was stabilizing. (Contractor's abstract)

FLUTTER OF A RING OF PANELS, by R. O. Stearman. July 1962, 59p. incl. diagrs. tables, refs. (Aeroelasticity and Structural Dynamics rept. no. SM 62-35) (AFOSR-3121) (AF 49(638)220) AD 610437 Unclassified

A theoretical investigation was made on the flutter of a grid of panels in a supersonic flow. The problem is formulated by considering this structure as a limiting case of a more general configuration composed of a ring of panels (i.e., an axially stiffened cylindrical shell) whose outer surface is exposed to a supersonic flow parallel to its axis. It is shown that the flutter analysis of this more general configuration can be reduced to the analysis of an 'equivalent' single panel using the circulant matrix idea. The reduction procedure, applicable to most cyclic configurations, allows for all types of inter-element (panel) coupling and is subject to the sole restriction that the dynamic phenomenon be satisfactorily described by linear theory. (Contractor's abstract)

ON CORRUGATION-STIFFENED PANELS, by Y. C. Fung. June 1962, 28p. incl. diagrs. (Aeroelasticity and Structural Dynamics rept. no. SM 62-33) (AFOSR-3122) (AF 49(638)220) AD 429770 Unclassified

A corrugation-stiffened panel consists of a flat plate and a cylindrically corrugated plate welded together along lines of contact. Such a panel appears on air- and space-craft mainly for its thermal-stress relieving characteristics. In some current publications such a plate is treated as an orthotropic plate. It is pointed out that the ordinary plate theory cannot be applied to the corrugation-stiffened panel, because the basic twisting moment relation, $M_{xy} = M_{yx}$ becomes untenable. A difference-differential equation is established here for the corrugation-stiffened panel. In an approximation, the difference-differential equation is written as a partial differential equation which has the same form as the orthotropic plate equation. The present theory tells how to interpret the coefficients as related to the plate geometry. Some consequences with regard to the static deflection and vibration modes and frequencies of corrugation-stiffened panels are discussed. If the formula to correct the experimental envelope of supersonic flutter boundaries given by Kordes, Tuovila, and Guy, is used a somewhat different boundary is obtained but the modification is not large. SOME NONLINEAR VIBRATION AND RESPONSE PROBLEMS OF CYLINDRICAL PANELS AND SHELLS, by B. E. Cummings. June 1962, 131p. incl. diagrs. table, refs. (Aeroelasticity and Structural Dynamics rept. no. SM 62-32) (AFOSR-3123) (AF 49(638)220) AD 432757 Unclassified

Large amplitude vibrations and forced responses of curved panels and shells are studied by the application of the shallow shell equation. The Galerkin procedure is used to reduce the nonlinear partial differential equations to ordinary nonlinear equations. Marked differences are found between the behavior of curved panels and cylindrical shells. Relations for the dependence of the free vibration period on amplitude are given. A 2 mode analysis of the cylindrical shell problem is included. The curved panel is found to exhibit a buckling phenomenon for the simple "breathing" modes. Shock response methods are used to predict dynamic buckling of the curved panel and the predictions are verified by numerical integration. The cylindrical shell vibrations and responses are found to be governed by Duffing's equation and certain of the well-known properties of Duffing's equation are applied to the cylindrical shell dynamics. The 2 mode analysis of the cylindrical shell is shown to exhibit weak coupling, allowing the separate excitation of the coupled modes. Some numerical results are given. (Contractor's abstract)

SUPERSONIC FLUTTER OF TWO-DIMENSIONAL FLAT PANELS: AN EXPERIMENTAL EVALUATION OF THE THEORY, by M. H. Lock. [1962] [7]p. incl. diagrs. (AFOSR-5271) (AF 49(638)220) AD 414799 Unclassified

Also published in Proc. Fourth U. S. Nat'l. Congress Appl. Mech., California U., Berkeley (June 18-21, 1962). New York, Amer. Soc. Mech. Engineers, v. 2: 1351-1357, 1962.

An experimental evaluation of the theory of supersonic flutter of 2-dimensional flat panels was undertaken. Experimental flutter boundaries were obtained between Mach numbers 1.15 and 1.5 and a detailed comparison of theory and experiment carried out. Agreement between the theoretical and experimental flutter boundaries is poor in the lower supersonic Mach number range but improves at the higher Mach numbers. The theory appears to be overconservative for the prediction of flutter boundaries at the lower supersonic Mach numbers. A possible cause of this inadequacy of the theory is discussed.

A NOTE ON THE APPLICATION OF THE QUASI-STEADY SUPERSONIC-FLOW THEORY TO FLUTTER ANALYSIS, by M. H. Lock. [1962] [1]p. [AF 49(638)-220] Unclassified

Published in Jour. Aerospace Sci., v. 29: 1133, Sept. 1962.

Application of the quasi-steady supersonic-flow theory to the problem of the flutter of 2-dimensional panels led to the prediction that all panels would flutter (regardless of stiffness) if the flow Mach number was less than $\sqrt{2}$, whereas analyses that employed the complete linearized supersonic-flow theory indicated that sufficiently stiff panels would not flutter in this range. On the other hand, at Mach numbers above $\sqrt{2}$ there was good agreement between the predictions of flutter analyses employing both aerodynamic theories. The purpose of this note is to clarify this situation.

THE HYPERSONIC APPROXIMATION FOR THE SHOCK STRUCTURE OF A PERFECT GAS WITH THE SUTHERLAND VISCOSITY LAW, by W. B. Bush. Feb. 1962, 24p. incl. diagrs. (AFOSR-2257) (AF 49(638)-476) AD 275884 Unclassified

The classical Navier-Stokes treatment of the shock wave structure is investigated for a perfect gas with constant specific heats. The viscosity of the gas is prescribed according to the Sutherland law. The Prandtl number is 3/4. The limiting forms of the solution as the upstream flow Mach number approaches infinity, with all other parameters held fixed, are studied. Two distinct asymptotic series, as $M_1 \to \infty$, are found for the portions of the shock adjacent to the uniform regions upstream and downstream of the shock and these expansions are matched in an intermediate region of common validity. The leading terms of a uniformly valid expansion are obtained by combining elements from both expansions. Special attention is given to the entropy and the entropy production rate in the shock wave. The effective thickness x of the shock is found and the Reynolds number based on this effective thickness is shown to be: $Re_{shock} = \frac{\rho_1 u_1 x^*}{\mu_1} \sim M_1$ as $M_1 \to \infty$. It is also shown that if the viscosity law is generalized to $\bar{\mu} = \bar{T}^n$, then $Re_{shock} \sim M_1^{2n}$ as $M_1 \to \infty$. (Contractor's abstract)

LIFT OF SLENDER DELTA WINGS ACCORDING TO NEWTONIAN THEORY, by A. F. Messiter. [1962] [9]p. incl. diagrs. refs. (AF 49(638)476) AD 413121 Unclassified

Published in AIAA Jour., v. 1: 794-802, Apr. 1963.

An approximate system of equations is derived to describe the inviscid flow past a flat slender wing at angle of attack, in the limit $\gamma \to 1$ and $M_\infty \sin\alpha \to \infty$. The aspect ratio is required to approach zero at the same rate as the Mach angle in the flow behind the shock wave. Only a single parameter appears in the resulting equations, and a similarity law therefore can be written expressing a correction to the Newtonian normal-force coefficient. For the delta wing, a correlation of experimental data according to the similarity law is shown, and the first terms of the solution are derived under the assumption that the similarity parameter is small (vertex angle much smaller than Mach angle). THE EFFECT OF HEAT TRANSFER ON SEPARATION OF LAMINAR COMPRESSIBLE BOUNDARY LAYERS, by S. B. Savage. June 1, 1962, 43p. incl. diagrs. tables, refs. (Technical rept. no. 2) (AFOSR-2946) (AF 49(638)916) AD 277354 Unclassified

Tani's integral method (Jour. Aeronaut. Sci., v. 21: 487-504, 1954) is extended to treat laminar 2-dimensional compressible boundary layers with heat transfer and arbitrary pressure gradient for both attached and separated flows. A carefully chosen one-parameter family for the velocity profiles and a universal stagnation enthalpy profile are assumed for attached flows. The accuracy of the method is examined by comparing the results with several exact numerical solutions and satisfactory agreement is obtained. For separated flows one-parameter families are assumed for both the velocity and stagnation enthalpy profiles. In this case the accuracy of the method is poor; however, suggestions are made as to how it might be improved within the present framework. (Contractor's abstract)

STABILITY OF THE COMPRESSIBLE LAMINAR BOUNDARY LAYER, by L. Lees and E. Reshotko. [1961] [36]p. incl. diagrs. table, refs. (AFOSR-3208) [AF AFOSR-62-29] Unclassified

Also published in Jour. Fluid Mech., v. 12: 555-590, Apr. 1962.

The present study of the stability of the compressible laminar boundary layer shows that, although the basic stability mechanisms are the same as for incompressible flow, the relative importance of the various mechanisms changes considerably with Mach number. Instead of being nearly constant across the boundary layer, the amplitude of inviscid pressure fluctuations decreases markedly with distance from the plate surface at Mach numbers greater than 3. Because of this behavior the rate of absorption (or production) of disturbance energy near the critical layer is greatly reduced, as compared with subsonic or slightly supersonic flows. At Mach numbers less than about 2, dissipation effects are minor, but they become extremely important at high Mach numbers. The minimum critical Reynolds number for an insulated flat plate boundary layer decreases with increasing Mach number in the range $0 \le M_e \le 3$. Since the wave-number varies like $1/M_e^2$ when $M_e \gg 1$, the minimum critical Reynolds number is likely to increase sharply at hypersonic speeds. Numerical examples illustrating the effects of compressibility, including neutral stability characteristics, are obtained.

MATCHED-CONIC APPROXIMATION TO THE TWO FIXED FORCE-CENTER PROBLEM, by P. A. Lagerstrom and J. Kevorkian. [1962] [9]p. (AFOSR-J801) (In cooperation with Douglas Aircraft Co., Inc., Santa Monica, Calif.) (AF AFOSR-62-256) AD 413865 Unclassified

Presented at Seventeenth annual meeting of the Amer. Rocket Soc., Los Angeles, Calif., Nov. 13, 1962.

Also published in Astronom. Jour., v. 68: 84-92, Mar. 1963.

Planar motion of a particle of negligible mass from the neighborhood of a gravitational center (the "earth") of mass $1-\mu$ to the neighborhood of a second center (the moon) of mass μ is studied by asymptotic methods for the case $\mu \ll 1$. The calculations are carried out for the case of 2 fixed centers. It is pointed out, however,

that the methods used are also applicable to the case of the 2 centers rotating around their center of mass, that is, to the limiting case of the restricted 3-body problem for which the second mass is much smaller than the first. A uniformly valid solution describing the passage from the earth to the moon and the motion in the neighborhood of the moon is obtained. Each part of the motion is in the first approximation a Keplerian conic relative to the earth and moon, respectively. However, these conics cannot be matched directly: In order to determine the second part, as well as the subsequent motion, it is necessary to compute a correction of order μ to the first part. This statement is equally true for the restricted 3-body problem. (Contractor's abstract)

THE TWO VARIABLE EXPANSION PROCEDURE FOR THE APPROXIMATE SOLUTION OF CERTAIN NON-LINEAR DIFFERENTIAL EQUATIONS, by J. Kevorkian. Dec. 13, 1962, 114p. incl. diagrs. refs. (Rept. no. SM 42620) (In cooperation with Douglas Aircraft Co., Inc., Santa Monica, Calif.) (AF AFOSR-62-256) AD 426822; AD 437675 Unclassified

Presented at 1962 Summer Inst. in Dynamical Astronomy, Yale U., New Haven, Conn.

A method is presented for deriving the asymptotic representation valid for large times for the motion of a particle under the influence of a predominantly linear restoring force and small nonlinear perturbations. It is shown that such an asymptotic representation must be a function of two time variables, in order to depict the behavior of the solution. The basic ideas are explained by the liberal use of simple examples, and the method is also applied to two idealized problems in celestial mechanics.

SIMILARITY PARAMETERS FOR REACTING, MULTI-COMPONENT GAS MIXTURES WITH RADIATIVE ENERGY TRANSFER, by S. S. Penner, M. Thomas, and G. Adomeit. [1962] 12p. incl. diagr. [Technical rept. no. 7] (AFOSR-2578) (AF 49(638)984) AD 276279 Unclassified

The similarity groups for multicomponent, reacting gas mixtures with radiative energy transport are identified for a number of special cases that are of practical interest. The results are used to draw conclusions concerning the feasibility for scaling the radiative properties of reacting gas mixtures. It has been concluded that significant model testing of the radiative properties of reacting gas flows is possible for those cases in which radiant energy emission does not produce significant perturbations in the flow field (e.g., transparent gases) provided we are satisfied in scaling the radiative properties per unit area of reacting mixture.

PROCEDURE FOR RELIABLE PREPARATION OF SHOCK TUBE TEST GAS MIXTURES CONTAINING WATER VAPOR, by R. Watson. [1962] [2]p. incl. diagr. [AF 49(638)984] Unclassified

Published in Rev. Scient. Instr., v. 33: 1113-1114, Oct. 1962.

Shock tube spectroscopic measurements of the emission, absorption, and kinetics of H_2O and OH are usually performed with test gas mixtures of water vapor diluted in argon in order to readily achieve high shocked gas temperatures. In addition to the uncertainties of the overall concentration introduced by the surface adsorption of the water vapor, concentration gradients may be set up within the shock tube so that samples drawn from the tube just before firing may not be representative of that in the region of observation. A successful procedure for overcoming these difficulties was arrived at through use of a continuous flushing operation. This system used a regulated argon flow, bubbled continuously through a series of bulbs containing degassed water. A flow meter monitored approximate flow rates, regulation being achieved by bellow valves at the inlet of the system. A cold trap prevented the water vapor from contaminating the vacuum pump oil. A small air conditioning unit recirculating the air within an insulated enclosure allowed controlled temperatures of ~25 °C to be maintained. Analyses made at both ends of the shock tube, 10 min or more after the flushing was completed, showed that adsorption equilibrium was attained since the concentration was uniform and remained constant at the value calculated from the mixing supply conditions.

SIMILARITY PARAMETERS FOR RADIATIVE ENERGY TRANSFER IN ISOTHERMAL AND NON-ISOTHERMAL GAS MIXTURES, by S. S. Penner, M. Thomas, and G. Adomeit. Dec. 1962. 45p. incl. diagrs. (Technical rept. no. 1) (AF AFOSR-63-71) AD 407135 Unclassified

Presented in part at TABSTONE meeting, San Diego, Calif., Jan. 1963.

The similarity groups for multicomponent, reacting gas mixtures with radiative energy transport are derived. The resulting relations are used to consider the feasibility of scaling for flow processes with radiative energy transport under highly simplified conditions. The scaling parameters are derived for radiant energy emission from isobaric and isothermal gases for arbitrary opacities and various spectral line and molecular band models. Scaling parameters for radiant energy emission from isobaric but non-isothermal systems are

discussed for arbitrary opacities and various spectral line and molecular band models under the restrictions imposed on the allowed temperature profiles for dispersion and Doppler lines by the Eddington-Barbier approximation. Finally, the radiative scaling properties for representative temperature profiles are considered for both collision-broadened and Doppler-broadened line profiles on the basis of exact numerical calculations that were performed for a rotational spectral line belonging to a molecular vibration-rotation band. THE INFLUENCE OF TEMPERATURE AND PREFERRED ORIENTATION ON HALL COEFFICIENT AND RESISTIVITY OF PURE TITANIUM, by L. C. Roesch. Nov. 1962. 111p. incl. illus. diagrs. tables, refs. (AFOSR-4001) (AF 49(638)1034) AD 289535 Unclassified

The Hall coefficient is found to depend strongly on temperature and crystalline texture. At room temperature it has a value of -1.8×10^{-11} m^3 coulomb in two specimens, whereas in the third it equals 1.2×10^{-11} m^3 - coulomb. Several factors including impurities, changes in the scattering mechanism, size effects, and crystallographic anisotropy, which could account for the observed differences, are discussed and it is proposed that crystallographic orientation is the most influential factor. From the measured data and a phenomenological theory of the Hall effect developed in the case of single crystals, values of the components of the galvanomagnetic tensor, which replaces the scalar Hall coefficient of isotropic media, are calculated and discussed in connection with a possible model of the Fermi surface of titanium. VACUUM X-RAY DIFFRACTOMETER FOR HIGH TEMPERATURE STUDIES OF METALS SENSITIVE TO CONTAMINATION BY OXYGEN AND NITROGEN, by R. H. Willens. [1962] [8]p. incl. illus. diagrs. table, refs. [AF ?(638)1034] Unclassified

Published in Rev. Scient. Instr., v. 33: 1069-1076, Oct. 1962.

An x-ray diffractometer operating in vacuum has been designed and constructed to study metals sensitive to oxygen and nitrogen contamination at elevated temperature. The instrument operates in a vacuum of 2×10^{-6} mm Hg in which the partial pressure of oxygen and nitrogen is several orders of magnitude lower than the total pressure. The specimen is heated by radiation from a resistance-type furnace to 1200°C. With this instrument it is possible to obtain lattice parameters which are accurate to one part in forty thousand. The thermal expansion of titanium has been investigated up to 650°C. Between room temperature and 400°C the expansion coefficients in directions perpendicular and parallel to the c axis are 9.41×10^{-6} and 11.18×10^{-6}/°C, respectively. For a random polycrystalline sample, the mean expansion coefficient is 10.0×10^{-6}/°C. (Contractor's abstract)

A VACUUM X-RAY DIFFRACTOMETER FOR HIGH TEMPERATURE STUDIES AND AN INVESTIGATION OF THE ALLOTROPIC TRANSFORMATION OF TITANIUM, by R. H. Willens. Final technical rept. Dec. 1961, 131p. incl. illus. diagrs. tables, refs. (AFOSR-1839) (AF 18(600)1561) AD 270632 Unclassified

A vacuum high temperature x-ray diffractometer was constructed to study metals, sensitive to O and N contamination, up to 1200°C. The factors which affect the accuracy of the diffractometer method and the proper choice of extrapolation functions are discussed. It is shown that this instrument can determine lattice parameters with an accuracy of one part in forty thousand. The thermal expansion of titanium was investigated to 650°C and the c/a parameter is found to increase rapidly above 400°C. This variation of c/a is correlated with other properties of Ti to formulate a band model. On the basis of this model it is shown that the electrons can give an appreciable positive contribution to the free energy as the transformation temperature is approached and it is proposed that this is the main factor causing the instability of the low temperature modification of Ti. COMMENTS ON MASS-EJECTION MECHANISMS IN RED GIANTS, by R. Weymann. [1962] [11]p. incl. refs. (AFOSR-2407) (In cooperation with Mount Wilson Observatory, Pasadena, Calif.) (AF 49(638)21) AD 295858 Unclassified

Also published in Astrophys. Jour., v. 136: 476-486, Sept. 1962.

Consideration of the basic energy and momentum requirements, together with the results of observations of the circumstellar lines in α Ori, seems to demand an extensive hot region surrounding the star, if purely hydrodynamic processes are to explain the mass ejection. The amount of Balmer emissions which might be expected from such a hot region is discussed, as is the emission in the ultraviolet lines of C IV at 1550A. At temperatures in excess of 10^5 degrees nearly all the power must be dissipated as radiation, since there is little residual thermal or kinetic energy in the matter great distances from the star. Therefore, one has the problem of disposing of radiation losses of a magnitude

greater than those considered here. Mechanisms involving continuous absorption of radiation are also discussed. No core of CH or CN is visible, both well known as interstellar lines, and whether molecules of grains would form under the conditions in the envelope is not known. To insure sufficient coupling between grains and the gas, it is necessary for the grains to be small enough to scatter as $1/\lambda^4$ in the observable region of the spectrum and in the infrared. This would lead to the envelope being opaque in the far ultraviolet and there is no evidence of this. The energy density for O. C. Ellson's Lyman-α mechanism to operate is such that barium should be completely doubly ionized, in contradiction to the observations. If they are interpreted in terms of a single shell of matter moving only under gravity, rather than as steady flow, the absence of any observable change in velocity [illegible]ngth of the lines would require the matter to be at such a distance from the star that the envelope would be resolvable from the star. No ejection mechanism so far proposed is entirely satisfactory, though the possibilities are far from exhausted. (Contractor's abstract, modified)

PHYSICAL CONDITIONS IN THE CIRCUMSTELLAR ENVELOPE OF α ORIONIS, by R. Weymann. [1962] [22]p. incl. diagrs. tables, refs. (AFOSR-2406) (AF 49(638)21) AD 406807 Unclassified

Also published in Astrophys. Jour., v. 136: 844-865, Nov. 1962.

A curve-of-growth analysis of the circumstellar lines in α Ori based on high-dispersion spectrograms is used to infer the physical conditions in the circumstellar envelope. The number of atoms in the line of sight is of the order of 10^{22} cm^2, while the ejection rate was estimated to be 4×10^{-6} M$_\odot$/yr. Hydrogen is probably neutral and second ionization of the metals probably unimportant. The kinetic temperature is of the order of 1000°K. Except for H and K, the radial velocities of all the neutral and ionized lines are identical. No detectable systematic change in the velocity or strength of the circumstellar has occurred over the last 20 yr. The evidence for an extensive chromospheric region surrounding the star is discussed. A brief discussion of α Herculis and a re-examination of the existence of a high degree of concentration of matter in the envelope into clumps indicate that such concentrations may be very slight, if they exist at all. STUDIES OF THE PECULIAR A STARS. I. THE OXYGEN-ABUNDANCE ANOMALY, by W. L. W. Sargent and L. Searle [1962] [14]p. incl. diagrs. tables, refs. (AFOSR-2446) (In cooperation with Mount Wilson Observatory, Pasadena, Calif.) (AF 49-(638)21) AD 295859 Unclassified

Also published in Astrophys. Jour., v. 136 408-421, Sept. 1962.

This study investigates the oxygen weakness in peculiar A stars, how it correlates with other spectral peculiarities, and whether it is to be regarded as an abundance effect. Equivalent widths of the infrared oxygen blends $\lambda\lambda$ 7772-7775 and λ 8446 have been measured in 20 peculiar A stars and 3 A-type normal stars. The neighboring pair of Mg II lines at λ 7877 and λ 7896 have also been measured. Both the O I and Mg II lines are quite insensitive to temperature and electron pressure and in normal stars behave almost identically in the range B8-F5. The oxygen lines are very much weaker in some peculiar stars than in the standard stars; this effect is strongly correlated with the B - V color. The Mg II lines show no comparable trend. The results are interpreted as indicating abundance variations among the Ap stars. Oxygen is deficient with respect to hydrogen by factors ranging from 8 to more than 100 in all Ap stars of the Si-Eu-Cr, Eu-Cr, Eu-Cr-Sr, and Sr classes, while in the Mn stars the oxygen abundance is normal. Assuming that they originated with a normal composition, the observed spectra of the oxygen-deficient Ap stars demand that, in general, O must have been transmuted into one or more of the elements H, He, C, N, Ne, and perhaps F. Some possible nuclear reactions (which must involve only H, He, and O^{16}) that could be responsible for the inferred oxygen deficiency are discussed. (Contractor's abstract)

RED GIANTS WITH EXTREME METAL DEFICIENCIES, by G. Wallerstein, J. L. Greenstein and others. [1962] [24]p. incl. illus. diagrs. tables, refs. (AFOSR-2475) (AF 49(638)21) AD 406809 Unclassified

Also published in Astrophys. Jour., v. 137: 280-300, Jan. 1963.

The 3 field stars, HD 122563, HD 165195, and HD 221170, similar to giants in metal-poor globular clusters, which have been studied, show decreases in the average metal/hydrogen ratios by factors of 800, 500, and 500, respectively, compared with the sun. The abundance ratios of other elements to iron resemble those in the sun, with important exceptions. Manganese and vanadium are deficient with respect to iron, by a factor of 3. In HD 122563 all elements heavier than zinc are deficient compared with iron by a factor of 50, yielding a total deficiency of about 50,000 for the heavy elements. It is assumed that the elements were synthesized from hydrogen early in the history of our Galaxy. These stars were formed when the interstellar medium was almost entirely hydrogen, between 10^7 and 10^9 yr after star formation began. Their metallic constituents were formed and ejected from massive, rapidly evolving stars of extremely low metal content. Processing at high temperatures synthesized the elements from sodium through nickel which are now present in all 3 stars. The material that went into HD 122563 is drastically deficient in all elements

produced by the addition of neutrons to the iron peak, whereas light elements produced by neutron addition--aluminum and scandium--exist in normal amounts or are only slightly deficient. It has been interpreted to mean that when a flux of free neutrons became available, the progenitors of the light s-process elements were present, but the iron peak elements were rare or absent. The europium in HD 122563 may have been produced by the s-process, a very unexpected result. The presence of europium in HD 165195, in at least the normal ratio to the other elements, raises difficulties concerning r-process nucleosynthesis, since type I supernovae of small mass may not have begun to appear at the early epoch when the star was formed. THE INFRARED OI AND MgII LINES IN THE SPECTRA OF THE METALLIC-LINE STARS, by W. L. W. Sargent and L. Searle. [1962] [4]p. incl. diagr. table, refs. (AFOSR-2476) (AF 49(638)21) AD 295860 Unclassified

Also published in Astrophys. Jour., v. 136: 671-674, Sept. 1962.

A recent study of the infrared OI and MgII lines in 20 peculiar A-type stars (see item no. 246) has revealed striking oxygen-abundance anomalies which are strongly correlated with the type of spectral peculiarity. The 'Mn' stars have a normal oxygen abundance, while the redder Ap stars (the Eu-Cr and the Sr stars) are oxygen-deficient by factors up to 100. The chief aim in this note is to point out that Am and Ap stars of similar colors and absolute magnitudes behave very differently in their infrared O/Mg ratio. This lends support to the view that the anomalous weakness of the OI lines in many of the Ap stars is not a consequence of peculiar atmospheric structures but is due to real abundance deficiencies in these stars. Moreover, these results indicate that there is little hope of explaining the spectral peculiarities in both the Am and Ap stars as being aspects of the same phenomenon.

A DETAILED ANALYSIS OF THE SPECTRUM OF EPSILON VIRGINIS, by G. Cayrel and R. Cayrel. [1962] [39]p. incl. diagrs. tables, refs. (AFOSR-2750) (AF 49(638)21) AD 422787 Unclassified

Also published in Astrophys. Jour., v. 137: 431-469, Feb. 15, 1963.

Lines in the spectral range λλ 4500-8700A have been identified on tracings of the spectrum of ε Virginis ('G6 III'). Three plates had a dispersion of 1 A/mm and 5 plates a dispersion of 2.8 A/mm. The equivalent widths of 1400 lines have been measured. A detailed analysis of the atmosphere has been performed, leading to the values: T_{eff} = 4940°K ± 150°; log g = 2.7 ± 0.2; and log A = log A ☉ ± 0.2 (probable errors). There is a good agreement between the spectroscopic gravity and the value obtained from reasonable values of the mass and the radius of the star. The chemical composition of the atmosphere agrees with the solar composition within the probable error, except perhaps for Na. No systematic enrichment in heavy-element abundance can be detected between the birth of the sun and that of ε Virginis, about 10^9 yr ago. Higher accuracy is needed to reveal any difference that might be less than a factor of 2.

THE LUMINOSITIES AND COMPOSITIONS OF THE HIGH GALACTIC-LATITUDE SUPERGIANTS 89 HERCULIS AND HD 161796, by L. Searle, W. L. W. Sargent, and J. Jugaku. [1962] [12]p. incl. diagr. tables, refs. (AFOSR-3017) (In cooperation with Carnegie Inst. of Washington, D. C.) (AF 49(638)21) AD 406808 Unclassified

Also published in Astrophys. Jour., v. 137: 268-279, Jan. 1963.

A spectrophotometric analysis is made of the high-galactic-latitude supergiants HD 161796 (F3 Ib) and 89 Herculis (F2 Ia), together with the low-latitude standard star ζ Cassiopeiae (F0 Ia). It is found that all 3 stars have normal abundances of the metals and rare earths relative to α Persei. Spectroscopic absolute magnitudes are derived for the high-latitude supergiants, using ζ Cas and α Per as calibration stars. It is concluded that both 89 Her and HD 161796 could have reached their present heights above the galactic plane in times comparable with their estimated times of evolution from the main sequence if they were expelled from the plane at the time of their formation with velocities of the order of 100 km/sec. The spectroscopic data are consistent with the suggestion made by Bonsack and Greenstein (1956) and by Herbig (1958) that the high-galactic-latitude supergiants are evolved "runaway" stars. AN ANALYSIS OF THE ABSOLUTE ENERGY DISTRIBUTION IN THE SPECTRUM OF SU DRACONIS, by J. B. Oke, L. P. Giver, and L. Searle. [1962] [15]p. incl. diagrs. tables, refs. (AFOSR-J121) (AF 49(638)21) AD 406448 Unclassified

Also published in Astrophys. Jour., v. 136: 393-407, Sept. 1962.

Photoelectric spectrum scans of the cluster-type variable SU Dra have been obtained and used to determine the absolute energy distribution in the spectrum at different phases. By comparison with fluxes computed from model atmospheres, the effective temperature and gravity have been derived at each phase. From the

observations and model atmospheres the relative displacement curve R/R_{max} is determined. Slit spectra with a dispersion of 18 A/mm have been obtained and used to determine the radial-velocity curves of the metal lines, Hγ, Hδ, and H and K of Ca II. It is shown that differential motion exists in the atmospheres at all phases. Since the layer which one is observing changes during the cycle, because of changes in opacity, the velocity-curves cannot be interpreted literally, and integration of the velocity-curve does not yield the absolute displacement-curve, $R_{max} - R$. Therefore, the Wenselink-Baade method gives incorrect radii for RR Lyrae stars. It is shown, however, that between phases 0.40 and 0.85 it is possible to determine $R_{max} - R$ from the radial-velocity curve. The γ-velocity which is needed to determine $R_{max} - R$ cannot be obtained unambiguously, but a good estimate is possible. The mean radius of SU Dra is found to be 3.60×10^6 km, or 5.2 solar radii. The uncertainty is approximately 20%. The mean absolute visual magnitude is +0.8, with an uncertainty of roughly 0.4 if the absolute calibration of a Lyr is assumed correct. An alternative calibration of a Lyr yields an absolute visual magnitude which is 0.25 mag brighter. The difference in absolute magnitude of cluster-type variables can be determined with an accuracy of 0.2. The relationship between the effective temperature (actually θ_e) and B − V for SU Dra is given along with the same relationship for a hypothetical star which has no metallic lines.

[EFFECTIVE TEMPERATURE AND SURFACE GRAVITY OF WHITE DWARFS] Effektive Temperatur und Schwerebeschleunigung der Weissen Zwerge, by V. Weidemann. [1962] [30]p. incl. diagrs. tables, refs. (AFOSR-64-0282) (AF 49(638)21) AD 431493 Unclassified

Also published in Zeitschr. Astrophys., v. 57: 87-116, 1963.

Model atmospheres have been calculated in the white dwarf region (log g ≈ 8). For stars of spectral type DA the variety of H_γ-profiles as observed by Greenstein can be explained in terms of differences in effective temperature and surface gravity. The temperature scale is fixed by T_e (40 Eri B) = 13000°K (θ_e = 0.39). The surface gravity determined from the H_γ-profiles for 22 DA-stars is log g = 8.0 ± 0.5, corresponding to log R/R⊙ = −1.90 ± 0.15, M/M⊙ = 0.6 ± 0.3 for μ_e = 2. The results are in accordance with the observed colors. This can be demonstrated in a discussion of the U − B, B − V-diagram. The white dwarfs form 2 separate branches, spectral types DC and DB are located almost exactly on the black-body curve as given by ARP whereas a DA-sequence deviates from it parallel to the main sequence. The transition black-body to line-free star is considered and blanketing vectors are determined for log g = 8 and 4.4. The effective temperature of a white dwarf with given B − V agrees with that of a black-body rather than with that of a main sequence star of equal B−V. Within the limits H : He > 1 1000 at θ_e = 0.4 and > 1 /20 at θ_e = 0.3 the atmospheric abundance ratio H : He remains uncertain. Elements heavier than He can be ruled out as a main constituent. Radii and masses derived spectroscopically do not contradict μ_e = 2. Corresponding to the small scattering in g (or M and R) white dwarfs form a narrow sequence in the $M_{bol} - \theta_e$-diagram and seem to occur in a limited range of completely degenerate configurations only. (Contractor's abstract)

ABUNDANCES IN G DWARFS. VI. A SURVEY OF FIELD STARS (Abstract), by G. Wallerstein. [1962] [1]p. [AF 49(638)21] Unclassified

Published in Astrophys. Jour., v. 135: 310, Jan. 1962.

Data are presented for deriving the abundances of the elements in 21 field stars of very nearly solar type. Iron-to-hydrogen ratios are obtained from curves of growth for which the ionization temperatures are determined by considering both the excitation temperatures and the effective temperatures. The effective temperatures are derived both from the B−V colors (corrected for line blanketing) and the G−R colors of the 6-color photometry system. The abundance ratios of 10 other elements to iron are then derived. This material is combined with results for 13 other G dwarfs already published and is discussed from the point of view both of the nuclear reactions responsible for element building and of problems of galactic structure and stellar populations.

OPTIMUM USE OF INTERSTELLAR REDDENING DATA TO OBTAIN INTRINSIC STELLAR LUMINOSITIES AND COLORS, by R. L. Wildey. [1962] [5]p. incl. diagrs. tables, refs. (In cooperation with Mount Wilson Observatory, Pasadena, Calif.) [AF 49(638)21] Unclassified

Published in Astronom. Jour., v. 68: 190-194, Apr. 1963.

The data relating to the curvature and spectral-type dependence of reddening trajectories in the color-color diagram is discussed. By evaluating integrals over wavelength of the product of UBV response functions, stellar energy distributions, and the interstellar reddening law for various cosmic-dust masses, 2 graphs have been presented with which reddening corrections for stellar magnitudes and colors can be refined. One graph shows the intrinsic 2-color relation for class V stars and their reddening trajectories. The other graph shows $E_{(B-V)}$, $E_{(U-B)}$, and A_V vs the mass (arbitrary

units) per unit cross-sectional area of interstellar matter as 3 families of curves in the parameter $(B-V)_0$. The method of their use is described.

RADIO SOURCES CONTAINING PECULIAR ELLIPTICALS, by J. L. Greenstein. [1961] [6]p. incl. illus. diagrs. table, refs. (In cooperation with Carnegie Inst. of Washington, D. C.) [AF 49(638)21] Unclassified

Published in Astrophys. Jour., v. 135: 679-683, May 1962.

Radial velocities have been obtained for the double galaxies identifiable with the radio sources 3C442 and for the faint galaxy probably identifiable with Her A. The latter is a very distant system, with cz_0 = 46000 km sec; its radio luminosity is exceeded only by Cyg A and 3C295. Its diameter is outstandingly large, 350 kpc. Common peculiarities are weak to moderate [O II] emission in NGC 7237 (3C442) and in Her A. The optical diameters are large, and the gradient of surface brightness near the nucleus is low. The double galaxies in 3C278 and 3C442 are remarkably similar.

RECENT WORK ON ABUNDANCES IN PECULIAR A STARS (Abstract), by W. L. W. Sargent, L. Searle, and J. Jugaku. [1962] [2]p. (In cooperation with Mount Wilson Observatory, Pasadena) (AF 49(638)21) Unclassified

Presented at Victoria meeting of the Astronom. Soc. Pacific, June 21-22, 1962.

Published in Publ. Astronom. Soc. Pacific, v. 74. 408-409, Oct. 1962.

A prelimirary account is given of some results obtained from surveys of the abundances of certain elements in Ap stars. Emphasis has been placed upon the behavior of lines of the abundant light elements, H, He, C, N, O, Ne, Mg, and Si, since these elements can undergo appreciable abundance changes only by means of a relatively restricted number of nuclear reactions with one another. Also, in view of the possible abnormality in the atmospheric structures of these stars, study has been made of pairs of elements having lines that behave in an almost identical manner with changes in pressure and temperature. The work thus far has demonstrated that there are appreciable abundance variations among the Ap stars that are described very inadequately by the present system of classification.

PROPAGATION OF ACOUSTIC-GRAVITY WAVES IN THE ATMOSPHERE, by F. Press and D. Harkrider. [1962] [20]p. incl. diagrs. refs. (AFOSR-J253) (AF 49(638)910) AD 400866 Unclassified

Also published in Jour. Geophys. Research, v. 67: 3889-3908, Sept. 1962.

Homogeneous wave guide theory is used to derive dispersion curves, vertical pressure distributions, and synthetic barograms for atmospheric waves. A complicated mode structure is found involving both gravity and acoustic waves. Various models of the atmosphere are studied to explore seasonal and geographic effects on pulse propagation. The influence of different zones in the atmosphere on the character of the barograms is studied. It is found that the first arriving waves are controlled by the properties of the lower atmospheric channel. Comparison of theoretical results and experimental data from large thermonuclear explosions is made in the time and frequency domains, and the following conclusions are reached: (1) the major features on barograms are due to disperson; (2) superposition of several modes is needed to explain observed features; (3) scatter of data outside the range permitted by extreme atmospheric models shows the influence of winds for A_1, and (4) wind effects and higher modes are less important for A_2 waves. A discussion is included on atmospheric terminations and how these affect disper sion curves.

THE DYNAMIC RESPONSE OF AN ELASTIC HALF-SPACE TO AN EXPLOSION IN A SPHERICAL CAVITY, by A. Ben-Menahem and A. Cisternas. [1962] [14]p. incl. diagr. table. (Contribution no. 1098) (AF 49-(638)910) Unclassified

Published in Jour. Math. and Phys., v. 42: 112-125, June 1963.

A semi-infinite region of homogeneous, isotropic elastic material contains a single spherical cavity of radius a with its center O at a distance h (> a) from the epicenter E (the point of the plane surface or the solid nearest to O). A wave motion which is symmetrical about the axis OE is excited by the application to the surface of the cavity of a uniform impulsive pressure, the plane surface of the solid being assumed to be traction-free. Expressions for the frequency spectra (i.e., the Fourier transforms with respect to time) of the radial and axial displacement components are derived, together with subsidiary equations from which various coefficients appearing in the spectra can be determined. The subsidiary equations are obtained in "best possible" form by expressing the conditions at the free surface in terms of evaluations at the epicenter. In the final section of the paper a method of successive approximations is developed for the case in which the wavelengths associated with the dilatational and rotational components of the disturbance are large compared with a. LONG-PERIOD LOVE WAVES IN A HETEROGENEOUS SPHERICAL EARTH, by R. L. Kovach and D. L. Anderson. [1962] [13]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)910 and National Aeronautics and Space Administration) Unclassified

Published in Jour. Geophys. Research, v. 67: 5243-5255, Dec. 1962.

Periods of torsional eigenvibrations have been computed for heterogeneous spheres corresponding to a variety of earth models, and the periods of oscillation are used to calculate phase and group velocities for the fundamental and first higher modes of Love waves. A comparison is made between velocities computed for different spherical models and for equivalent flat earth structures. The comparison shows (1) that the effect of sphericity is more complicated for fundamental mode Love waves than for Rayleigh waves because of the efficient channeling of waves by low-velocity layers and (2) that the first higher Love mode is more affected by curvature than the fundamental mode. The variation with depth of the relative amplitude of the displacements indicates that the first higher Love mode for periods less than 90 sec is very sensitive to upper-mantle structure in the vicinity of the low-velocity zone. Comparison of the theoretical results with recent phase velocity and torsional oscillation data shows that a Gutenberg type of velocity structure is more satisfactory than either the Lehmann or Jeffreys structures. The use of consistent densities with the Gutenberg model, rather than Bullen A densities, has a small but significant effect on the calculated velocities. For periods greater than 200 sec the calculated phase velocities for various oceanic and continental structures are all within 2% of each other. The calculated group velocities are within 1½% of each other in the range 150 < T < 400 sec, thereby confirming experimental results. Dispersion measurements must therefore be made with precision if significant conclusions are to be inferred about details of earth structure. (Contractor's abstract)

STUDY OF THE EARTH'S CRUST IN SELECTED REGIONS OF THE WORLD. Final rept. Sept. 15, 1962, 63p. incl. diagrs. tables. (AFOSR-4803) (In cooperation with California U., Los Angeles) (AF 49(638)912) AD 407054 Unclassified

During the 2-yr period covered by this report, the Alps, the Western Mediterranean and a portion of Northeastern California were explored for the purpose

of obtaining detailed phase velocity measurements and for crustal study and interpretation. In these regions, a seismic network of 4 observatories was laid out in and around the area to be measured. Each of these stations was equipped with identical instrumentation so as to record uniformly distant teleseisms. As soon as sufficient events had been obtained to give an accurate determination of phase velocities at differing azimuths the network was then moved to a new location where similar measurements could be made. At all stations, the seismograph operated with a nominal 15 sec period and the galvanometer with a nominal 90 sec period. Recordings were made in duplicate; the original went to the United States for analysis and one copy was retained by the observatories. After the records had been examined for suitable events, digitized, and processed by computer, phase spectra at individual stations were determined by harmonic analysis and the resultant phase differences combined with proper instrument and station parameters to obtain phase velocities by the tripartite method.

PROCESSING OF SEISMIC DATA FROM AN AUTOMATIC DIGITAL RECORDER, by R. A. Phinney and S. W. Smith. [1962] [22]p. incl. diagrs. tables. (Contribution no. 1119) (AFOSR-4383) (AF AFOSR-63-25) AD 294914 Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 53: 549-562, Apr. 1963.

Data from a high-speed digital seismograph is given preliminary processing by a special tape-to-tape updating process which makes the information accessible to computer users. The routine nature of the data collection effort makes it necessary for all data to be labeled and entered into a library of digital seismograms. Emphasis is placed on location, corrections, and flagging of errors which occur during the recording and editing processes. Library data is stored on high density binary tapes with 2 data points packed into each computer word. Access to this data is by an interpretive loader which locates desired files by a search code and skips or inputs variable length blocks into memory. By allowing the loader to filter and decimate the data during input it is possible to bring many hr of low frequency data into a single memory domain with a minimum of waste effort. A collection of processing routines is being developed. These include: correction for seismograph response, orbital motion functions, energy computations, bandpass filtering for mode separation, etc. These must be coupled with an adequate graphical display device such as mechanical x-y plotter or a computer-controlled charactron tube.

GENERALIZED TWO-DIMENSIONAL MODEL SEISMOLOGY WITH APPLICATION TO ANISOTROPIC EARTH MODELS, by M. N. Toksoz and D. L. Anderson. Sept. 1962, 1v. incl. diagrs. table. (AFOSR-4748) (AF AFOSR-63-25) AD 408478 Unclassified

Also published in Jour. Geophys. Research, v. 68: 1121-1130, Feb. 15, 1963.

The theory of 2-dimensional seismic modeling is generalized to include the effect of anisotropy. The elastic coefficient matrix for a plate with orthorhombic symmetry is derived and is used to convert 3-dimensional anisotropic problems into corresponding 2-dimensional model problems. This is equivalent to replacing directional body velocities by the directional plate velocities. In addition to the application to seismic modeling, this can be considered a contribution to the basic theory of long waves in anisotropic plates. As such it has application to such problems as long waves in floating ice sheets. A model consisting of an anisotropic layer over an anisotropic half-space is constructed using a formica layer and a grooved aluminum plate. It is shown that rolled metal sheets can be made appreciably anisotropic by machining grooves in the surface. The experimental Rayleigh wave phase velocities are compared with the theoretical dispersion curves computed using isotropic and anisotropic theories. Two-layer circular models of the earth, 1 with an isotropic and the other with an anisotropic upper mantle, are fabricated, and a comparative study of body and surface waves is made. It is found that the relative effect of anisotropy is greater on surface waves than on body waves.

PRECISION DETERMINATION OF FOCAL DEPTHS AND EPICENTERS OF LOCAL SHOCKS IN CALIFORNIA, by A. Cisternas. [1962] [16]p. incl. diagrs. tables, refs. (Contribution no. 1142) (AFOSR-5360) (AF AFOSR-63-25) AD 400168 Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 53: 1075-1083, Oct. 1963.

A program for the location of hypocenters of local shocks by means of an electronic digital computer is described. The P times are corrected for variations in crustal structure to get precision in the determination of depth. An estimate of the accuracy of the method is given for some particular cases. Application of the program to the Kern County series of aftershocks, provides a clearer picture of tetonic mechanism of the White Wolf fault. A future extension of the program to process and correct data automatically is also described. (Contractor's abstract)

A STUDY OF DIAGNOSTIC TECHNIQUES FOR IDENTIFYING EARTHQUAKES, by F. Press, G. Dewart, and R. Gilman. [1962] [20]p. incl. diagrs.

tables, refs. (Contribution no. 1128) (AF AFOSR-63-25) AD 406360 Unclassified

Also published in Jour. Geophys. Research v 68: 2909-2928, May 15, 1963.

Several diagnostic techniques are examined for identifying earthquakes as events distinct from possible underground nuclear explosions. It is found that the typical or 'mean' earthquake differs in a statistically significant way from the 'mean' explosion for most of the techniques. Due to the variability of earthquake signatures, many earthquake parameters fall within the range observed for explosions. Preliminary studies of several diagnostic methods are presented. The purpose is to make a preliminary study of these techniques subject to the obvious limitations of small samples and restricted geographic distribution of sources and detectors. Although most of the techniques discussed are pertinent to a monitoring system with stations on the same continental mass as the seismic source, discovery of differences between earthquake and explosion signatures for this case encourages one to search for other differences applicable when the sources and stations are more widely separated. (Contractor's abstract)

SURFACE WAVES ON A SPHERICAL EARTH. I. UPPER MANTLE STRUCTURE FROM LOVE WAVES, by D. L. Anderson and M. N. Toksoz. [1962] [18]p. incl. diagrs. tables, refs. (Contribution no. 1144) (AF AFOSR-63-25) AD 299060 Unclassified

Also published in Jour. Geophys. Research, v. 68: 3483-3500, June 1, 1963.

The problem of free oscillations of a heterogeneous sphere is reformulated in terms of dispersion over a plane half-space composed of anisotropic layers having a superposed velocity gradient. This transforms the standing wave discrete spectrum to a traveling-wave continuous spectrum and considerably simplifies the analysis of surface waves on a sphere. Minor modifications make it possible to use any Love wave computer program to compute dispersion on a sphere. Results of the method are compared with those obtained from numerical integration of the exact equations of motion. Agreement is generally better than 0.06%. Dispersion for the fundamental and first 7 to 8 higher Love modes is presented for a continental and an oceanic path. The oscillatory nature of the group velocity curves becomes more pronounced when a velocity reversal takes place. Calculations of higher-mode group velocity structure and displacement illustrate the mechanism of propagation of the S_σ wave. By successive modifications of a previously developed mantle structure, a new suboceanic m model is determined which satisfies Love wave and torsional oscillation data.

GENERATION OF SEISMIC WAVES BY UNDERGROUND EXPLOSIONS AND THE COLLAPSE OF CAVITIES, by S. W. Smith. [1962] [7]p. incl diagrs refs. (AF AFOSR-63-26) Unclassified

Published in Jour. Geophys. Research, v. 68: 1477-1483, Mar. 1, 1963.

The occurrence of large collapse features associated with contained underground nuclear tests in alluvial material provides an unusual opportunity to study the effect of source geometry and time history. The explosion is represented by a pressure pulse applied to a buried spherical cavity, and a collapse by a point force normal to the surface. If the time duration for these sources is 0.16 sec and 4 sec, respectively, the resulting spectral ratio for Rayleigh waves is consistent with the experimental data in the frequency range 0.5 to 3.0 cps. The spectral ratios for SH and SV waves indicate that the SH waves are not generated by near-source phenomena such as movement along joints, but by elastic wave conversion within a few wavelengths of the source.

PROCEEDINGS OF THE FOURTH U.S. NATIONAL CONGRESS OF APPLIED MECHANICS, VOLUMES 1 AND 2, CALIFORNIA U., BERKELEY, June 18-21, 1962, ed. by R. M. Rosenberg, M. V. Barton and others. New York, American Society of Mechanical Engineers, 1962, 2v. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-10], Army Research Office (Durham), National Committee on Theoretical and Applied Mechanics, Office of Naval Research and others) Unclassified

The proceedings comprise 4 invited general lectures and complete texts of 153 technical papers presented at the congress. The latter are grouped by subject matter into 4 broad categories: (1) dynamics, vibrations, and elastic waves; (2) elasticity and elastic structures; (3) plasticity, viscoelastic flow, and fracture; and (4) fluid flow, aerodynamics, and heat transfer. Within each category the papers are arranged alphabetically by author. The affiliation and postal address of each author is given.

REACTION OF OXYGEN ATOMS WITH ACETYLENE TO FORM KETENE, by I. Haller and G. C. Pimentel. [1962] 10p. incl. diagrs, tables, refs. (AFOSR-2811) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)944 and American Petroleum Inst.) AD 276563 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 2855-2857, Aug. 5, 1962.

Nitrous oxide, N_2O, was photolyzed at 20°K in solid argon containing acetylene, C_2H_2, or a mixture of C_2D_2 and C_2HD. The photolysis source was a xenon resonance lamp emitting mainly at 1470A. This radiation produces ground state oxygen atoms. Infrared spectra showed that reaction occurred with C_2H_2 to produce absorption at 2143 cm^{-1} and with the deuterated acetylenes to produce absorptions at 2142 and 2117 cm^{-1}. The absorptions are assigned to ketene, thus showing that ground state oxygen atoms can react with acetylene to produce ketene. The activation energy for this reaction is below 8.1 kcal/mol. (Contractor's abstract)

California U. Dept. of Chemistry, Berkeley.

INFRARED SPECTROSCOPIC STUDY OF THE PHOTOLYSIS OF HN_3 IN SOLID CO_2, by D. E. Milligan, M. E. Jacox and others. June 1962 [24]p. incl. diagrs. tables, refs. (AFOSR-2987) (In cooperation with Mellon Inst., Pittsburgh, Pa.) (AF 49(638)542 and AF 49(638)944) AD 282779 Unclassified

Infrared studies were carried out on the photolysis of HN_3 and DN_3 in CO_2 matrices at 20 and 53°K. HNO and DNO were identified as products of the reaction of NH and ND with CO_2. The presence of HNO was confirmed by the detection of absorption at 7600, 7100,

and 6850A in the visible spectral region. Evidence has also been obtained for the production of a 1:1 compound between NH (ND) and CO_2. Several possible structures for this species are discussed. (Contractor's abstract)

278

California U. Dept. of Chemistry, Berkeley.

THE INFRARED SPECTRUM OF ICE: TEMPERATURE DEPENDENCE OF THE HYDROGEN BOND POTENTIAL FUNCTION, by R. Zimmermann and G. C. Pimentel. July 1962, 26p. incl. diagrs. tables, refs. (AFOSR-3670) (AF 49(638)944) AD 284401 Unclassified

The infrared spectrum of ice was studied in the spectral region from 2500 to 200 cm^{-1} and over the temperature range -180 to -20°C. Absorption near 220 cm^{-1} was detected. Infrared spectra of H_2O-D_2O ice mixtures show that crystal splittings are not responsible for the observed frequency of the bending mode of H_2O in ice. Two temperature effects are noted, one an irreversible change evidently caused by annealing. In addition the absorptions near 1600, 800, and 220 cm^{-1} of annealed ice shift with temperature reversibly. A simple normal co-ordinate analysis provides estimates of the potential function for stretching and bending the hydrogen bonds, about 0.16×10^5 and 0.09×10^5 dynes/cm respectively.

279

California U. Dept. of Chemistry, Berkeley.

ISOMERIZATION OF NITROUS ACID: AN INFRARED PHOTOCHEMICAL REACTION, by R. T. Hall and G. G. Pimentel. [1962] [9]p. incl. diagrs. tables, refs. (AFOSR-64-0575) (AF 49(638)944) AD 434306 Unclassified

Also published in Jour. Chem. Phys., v. 38: 1889-1897, Apr. 15, 1963.

Nitrous and deuteronitrous acid suspended in nitrogen matrices at 20°K isomerize when illuminated with infrared light. Kinetic studies indicate that both the cis to trans and the trans to cis isomerizations occur. Filter studies show that a narrow range of frequencies is responsible, 3650-3200 cm^{-1} for HONO and 4100-3500 cm^{-1} for DONO. An isomerization mechanism is proposed that involves a highly efficient intramolecular transfer of energy between vibrational modes. The height of the potential barrier to isomerization is estimated to be 9.7 ± 0.7 kcal/mol in the matrix and 8.7 ± 1 kcal/mol for gaseous HONO. Comparison to methyl nitrite suggests that the bondings in these 2 molecules are quite similar and that the reported structure of methyl nitrite is incorrect.

280

California U. Dept. of Chemistry, Berkeley.

INFRARED SPECTRUM AND VIBRATIONAL POTENTIAL FUNCTION OF KETENE AND THE DEUTERATED KETENES, by C. B. Moore and G. C. Pimentel. [1962] [14]p. (AFOSR-64-0685) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)944, National Science Foundation, and Petroleum Research Fund) AD 436496 Unclassified

Also published in Jour. Chem. Phys., v. 38: 2816-2829, June 15, 1963.

Infrared spectra of solid ketene and ketene in argon revealed a new fundamental at lower frequency (CH_2CO, 438 cm^{-1}; CD_2CO, 371 cm^{-1}; CHDCO, 398 cm^{-1}) than any previously reported. These spectra and additional gas-phase spectra provide a basis for a reassignment of the vibrational spectrum. The vibrational potential function, centrifugal distortion constants, coriolis coupling constants, and thermodynamic properties of ketene have been calculated. The out-of-plane hydrogen bending force constant is found to be surprisingly low, about one-third of that for ethylene. In addition, the analysis of the rotational structure of several perpendicular bands yields improved estimates of the A moment of inertia and hence of the HCH angle (122.3°) and the C-H bond length (1.079A) of ketene. (Contractor's abstract)

California U. Dept. of Chemistry, Berkeley.

ACIDITY OF HYDROCARBONS. VI. METALATION OF NORBORNADIENE WITH BUTYLLITHIUM, by A. Streitwieser, Jr. and R. A. Caldwell. [1962] [2]p. (AFOSR-65-0221) (AF AFOSR-62-175) AD 611600 Unclassified

Also published in Jour. Org. Chem., v. 27: 3360-3361, Sept. 1962.

Experiments were performed in order to obtain evidence relating to the relative acidities of the various hydrogens in norbornadiene. Of particular interest is the relative mobility of the 7-hydrogens (bridge). Norbornadiene was allowed to react with excess butyllithium in refluxing ether-heptane. After quenching with deuterium oxide, the recovered norbornadiene was studied by infrared and nmr. The results demonstrate no significant exchange of bridge hydrogens but do show almost complete metallation of a vinyl position. The availability of norbornadiene makes this procedure acceptable as a preparation of norbornadiene-2-d. In this type of metallation exchange reaction, the vinyl hydrogens of norbornene are clearly much less acidic than those of norbornadiene. One possible explanation is that each double bond in norbornadiene exerts an important inductive effect to enhance the acidity of the other.

283

California U. Dept. of Chemistry, Berkeley.

ACIDITY OF HYDROCARBONS. VII. RATES OF EXCHANGE OF POLYCYCLIC METHYLARENE-α-d's WITH LITHIUM CYCLOHEXYLAMIDE, by A. Streitwieser, Jr. and W. C. Langworthy. [1962] [5]p. incl. diagrs. tables, refs. (AFOSR-65-0222) (AF 49-(638)105 and AF AFOSR-62-175) AD 611343
Unclassified

Also published in Jour. Amer. Chem. Soc., v. 85: 1757-1761, June 20, 1963.

Rates of exchange are reported for various deuteriomethyl derivatives of naphthalene, phenanthrene, anthracene, pyrene and fluoranthene with lithium cyclohexylamide in cyclohexylamine at 49.9°. The relative rates are discussed with reference to the stabilities of corresponding arylmethyl anions and are compared with those of related carbonium ion reactions.

California U. Dept. of Chemistry, Berkeley.

A MOLECULAR ORBITAL STUDY OF THE POLAROGRAPHIC REDUCTION IN DIMETHYLFORMAMIDE OF UNSUBSTITUTED AND METHYL-SUBSTITUTED AROMATIC HYDROCARBONS, by A. Streitwieser, Jr. and I. Schwager. [1962] [5]p. diagrs. tables, refs. (AFOSR-65-0226) (AF AFOSR-62-175) AD 611604
Unclassified

Also published in Jour. Phys. Chem., v. 66: 2316-2320, Dec. 1962.

The half-wave potentials of a number of aromatic compounds have been determined and are found to fit the same type of correlation with the energies of the lowest vacant molecular orbitals in the HMO approximation established in other solvents. The deviation of biphenylene from this correlation can be accounted for in terms of "long bonds" but this explanation fails when applied to 2,3-benzobiphenylene. Azulene and acepleiadylene do not obey the simple theory. The effect of methyl substituents is accounted for successfully in terms of a combination of conjugative (hyperconjugation) and inductive influences. (Contractor's abstract)

California U. Dept. of Chemistry, Berkeley.

MATRIX TECHNIQUE AND ITS APPLICATION IN THE FIELD OF CHEMICAL PHYSICS, by G. C. Pimentel. [1962] [10]p. incl. diagrs. tables, refs. (AFOSR-J665) [AF AFOSR-63-332] AD 415403 Unclassified

Also published in Pure and Appl. Chem., v. 4: 61-70, 1962.

Current applications of the matrix isolation technique to studies of infrared spectroscopy are reviewed. This method involves the spectroscopic detection of a molecular species dispersed in a spectroscopically distinct host matrix, either a crystal or a glass. The purposes are to obtain a particular set of controlled environmental conditions and/or accumulation of a suitable amount of an otherwise inaccessible species. The matrix materials are of 3 classes: ionic cyrstals, inert gas crystals, and molecular solids. Preparation of matrix samples and illustrative examples of their applications are given. A list of 20 references is included.

ON THE COHOMOLOGY GROUPS OF THE CLASSIFYING SPACE FOR THE STABLE SPINOR GROUPS, by E. Thomas. [1962] [13]p. (AFOSR-3348) [AF 49-(638)-79] Unclassified

Also published in Bol. Soc. Mat. Mex., v. 7: 57-69, 1962.

Let Spin = lim Spin (n) be the infinite spinor group, B_{spin} its classifying space. The author determines the mod 2 and integral cohomology of B_{spin}. Let ν: $B_{spin} \to B_{so}$ be the natural map induced by the coverings Spin (n) $\to$ SO(n), and let $W_i \in H^i(B_{so}; Z_2)$, $P_i \in H^{4i}(B_{so}; Z)$ be the Stiefel-Whitney and Pontrjagin classes. Then the results are the following: (1) $H^*(B_{spin}; Z_2)$ is a polynomial algebra on generators $\nu^* W_i (i \neq 2^r + 1)$; (2) $H^*(B_{spin}; Z)$ is the direct sum of a polynomial algebra on generators $\nu^* P_i$ $(i \neq 2^r)$ and a torsion group T; moreover, 2T = 0. The proof of (1) follows fairly easily from the fibration $B_{Z_2} \to B_{spin} \to B_{so}$ and standard consideration of Steenrod squares. The proof of (2) is considerably more complicated and involves, among other things, the Pontrjagin square. (Math. Rev., abstract)

[California U. Dept. of Mathematics, Berkeley]

AXIOMS FOR THE GENERALIZED PONTRYAGIN COHOMOLOGY OPERATIONS, by W. Browder and E. Thomas. [1961] [6]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)79] and National Science Foundation) Unclassified

Published in Quart. Jour. Math. (Oxford), v. 13: 55-60, Mar. 1962.

It is shown that the generalized Pontryagin operation

$$C: H^{2n}(X; Z_p^r) \to H^{2pn}(X; Z_p^{r+1})$$

is characterized by its known properties; these include behavior with respect to coefficient homomorphisms, behavior under suspension, and a formula giving $C(u_1 + u_2) - C(u_1) - C(u_2)$. The proof proceeds via Eilenberg-Mac Lane spaces and their cohomology groups $H^*(\pi, n; G)$, but it is so arranged that the only facts which need to be quoted are those for $G = Z_p$ and $G = Z_p^2$. The corresponding results for $p = 2$ are stated.

THE DEFINITION OF FIELD OF DEFINITION, by M. Rosenlicht. [1962] [8]p. (AFOSR-J127) [AF 49-(638)-603] AD 400449 Unclassified

Also published in Bol. Soc. Mat. Mex., v. 7: 39-46, 1962.

Discussing abstract algebraic varieties and their fields of definition, Weil restricted his attention to those which are irreducible. The author, still using Weil's language and methods, extends the definition of the concept of "rationality over a field k" to (possibly) reducible algebraic sets. As an application, he considers the case of algebraic groups and shows that his concept of rationality is compatible with forming quotient groups and certain quotient spaces. Although the author avowedly avoids from the outset "the vast generality of Grothendieck's system", the reviewer believes that his definitions are most easily expressed in that system. By an "algebraic set V over k", the author means a reduced noetherian scheme over k, locally embeddable in affine n-space over k. For V to be "rational over k" means to be geometrically reduced—that is, V remains reduced after any base-field extension.

DIVERGENCE OF APPROXIMATING POLYNOMIALS, by P. C. Curtis, Jr. [1962] [5]p. (AF 49(638)859) Unclassified

Published in Proc. Amer. Math. Soc., v. 14: 713-717, Oct. 1963.

Let f be a continuous function on the circle and let F_n be a set of $m_n (m_n \geq 2n + 1)$ points equally spaced on the circle. Let $p_n(f, x)$ be the trigonometric polynomial of order n which approximates f best on F_n in the sense of least squares. For each f let P_n be the operator defined by $(P_n f)(x) = p_n(f, x)$. The author investigates when this sequence fails to converge at individual points. His main results are that for each choice of sets F_n the set of points of divergence on the circle is the complement of a set of the first category. And if $\lim \sup_n m_n n > \pi \sqrt{2}$ then every point is a point of divergence. An example is given to show that some growth condition on m_n is necessary to insure divergence at every point. NON-ATOMIC MEASURES ON COMPACT HAUSDORFF SPACES, by M. Hasumi and G. L. Seever. 1962, 9p. (AFOSR-4899) (AF AFOSR-62-140) AD 414047 Unclassified

Rudin has proved that a compact Hausdorff space without perfect subsets is also without non-zero, non-atomic, regular Borel measures. Theorems 1 and 2 of this report state the equivalence of these conditions show further relationship between perfect subsets and non-atomic measures. Dixmier has shown the existence of an infinite Stonian space without normal measures (regular Borel measures which vanish on meager Borel sets). The question arises as to whether an infinite Stonian space has non-zero, non-atomic regular Borel measures. The answer to this is shown in the present note to be affirmative and it is further shown that the dual of a Banach space with the extension property has the lifting property if it is finite-dimensional.

HOMOTOPY-ABELIAN TOPOLOGICAL GROUPS, by I. James and E. Thomas. [1962] [4]p. (AFOSR-J444) [AF AFOSR-62-291] Unclassified

Also published in Topology, v. 1: 237-240, 1962.

The authors say that a topological group G is homotpy-abelian if the commutator map of G x G into G is nul-homotopic. In this note their techniques are combined with a result of Browder (Ann. Math., v. 76: 9-17, 1962) to prove the following. Let G be a countable connected CW-complex with finitely generated singular homology. If G is a homotopy-abelian topological group, then G has the homotopy type of a torus. In particular, if G is simply connected, as well as homotopy-abelian, then G is contractible. (Math. Rev. abstract)

ON THE MOD 2 COHOMOLOGY OF CERTAIN H-SPACES, by E. Thomas. [1962] [9]p. (AFOSR-J445) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-291 and John Simon Guggenheim Foundation) AD 407114 Unclassified

Also published in Comment. Math. Helv., v. 37: 132-140, 1962.

Let X be an H-space whose integral (singular) cohomology groups are all finitely generated, and whose mod 2 cohomology is a primitively generated Hopf algebra of finite dimension. The author shows that in this case, the least positive integer ν such that $H^\nu(X; Z_2) \neq 0$ must be 1, 3, 7, or 15, or else X is acyclic. Furthermore, if X has no 2- torsion, then the value 15 cannot occur. The technique involved is an examination of the behavior of the Steenrod squares in the X-projective plane P_2X, using the Adams secondary cohomology operations decomposing Sq^{2k}, and the fact that the cohomology of P_2X is the direct sum of a truncated polynomial algebra of height 3, and an ideal. SPIN-WAVE INSTABILITY AND PREMATURE SATURATION IN ANTIFERROMAGNETIC RESONANCE, by A. J. Heeger and P. Pincus. [1962] [3]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 18-(603)46] and National Science Foundation) Unclassified

Published in Phys. Rev. Ltrs., v. 10: 53-55, Jan. 15, 1963.

A semiclassical theory of spin-wave instability in antiferromagnetic resonance is developed. The calculation is valid both for simple antiferromagnets and for canted systems when the canting is due either to single ion magnetocrystalline anisotropy or anisotropic exchange. The nonlinear terms leading to the instability are found to originate in the anisotropy and exchange energies. The critical radio frequency for the onset of instability is calculated and in general is given by $h_c = 4\Delta H_0 (\gamma \Delta H_k \omega_0)^{1/2}$, where ΔH_0 and ΔH_k are respectively the uniform mode and spin-wave linewidths; and ω_0 is the zero-field antiferromagnetic resonance frequency. Experimental evidence for the existence of spin-wave instability is attributed to the onset of spin-wave instability. A new technique for the measurement of spin-wave linewidths is described. This technique, which is based on the response of the resonant system to amplitude modulated microwave power, yields results in agreement with the instability theory. The spin-wave linewidth as determined by these experiments is approximately 3 orders of magnitude narrower than the linewidth of the uniform mode, indicating that the broadening mechanisms are grossly different in the 2 cases.

ON THE DISTRIBUTION OF HIGH ENERGY STARS IN SPHERICAL STELLAR SYSTEMS, by R. W. Michie. [1962] [26]p. incl. diagr. (AFOSR-404?) (AF 49(638)-299) AD 290671 Unclassified

Abstract published in Quart. Jour. Roy. Astronom. Soc., v. 4: 323, Sept. 1963.

Also published in Monthly Notices Roy. Astronom. Soc., v. 125: 127-139, 1963.

A distribution function $f(r, v, u; t)$ for isolated spherical stellar systems is obtained from the Boltzmann equation with encounters described by the Fokker-Planck equation. The distribution function is believed to correspond rather closely to actual stellar systems since it is obtained from the Boltzmann equation, the potential is obtained from Poisson's equation, and the stellar orbits are not assumed to be isotropic everywhere but rather are more radial at greater distances from the center. The importance of a careful analysis in the region of phase space at and near the energy of escape is emphasized. In this region, it is shown that the velocity space flux vector is constant, and it is this constancy which allows a solution for f. The distribution of high energy stars is depopulated for (1) those stars whose mass is small compared to the average stellar mass, (2) regions close to the center of the system, and (3) large values of the model parameter C. It is proposed that the method of analysis presented may be used for obtaining a distribution function for rotating stellar systems. (Contractor's abstract)

THEORETICAL PHYSICS OF ELEMENTARY PARTICLES, by R. Karplus. Final rept. Apr. 1, 1958-May 31, 1962, 4p. (AFOSR-2780) (AF 49(638)327) AD 286724 Unclassified

A list is given of articles published during 50 months' work in the theoretical physics of elementary particles. The bulk of the work was concerned with the treatment of the functions used to describe reactions between elementary particles as analytic functions of complex energy and angle variables. Two other types of problems on which work was done were the study of strong and weak interactions of elementary particles to interpret experimental results obtained with the large accelerators and the peculiar effects of interactions among elementary particles in systems containing many such particles.

ANALYTIC PROPERTIES IN ANGULAR MOMENTUM OF THE RELATIVISTIC S MATRIX (Abstract), by A. O. Barut and D. E. Zwanziger. [1962][1]p. [AF 49-(638)327] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 300, Apr. 23, 1962.

From the Mandelstam representation, an analytic continuation in angular momentum ℓ is defined. The kinematical cuts are explicitly separated so that the amplitude has the form

$$A(q^2, \ell) = (q^2 + \mu^2)^{\ell} q^{2\ell} \frac{\cos \pi\ell}{Y(q^2, \ell) \cdot \exp[(\ell + \tfrac{1}{2})\ln(-q^2)]},$$

where $Y(q^2, \ell)$ is a real analytic function of q^2 and ℓ with a cut from $q^2 = -\infty$ to $q^2 = -\mu^2$ only. Thus, $A/q^{2\ell}$ itself is a real analytic function in q^2 and ℓ. From this expression, the analytic properties of the positions $\alpha_n(q^2)$ and the residues $\beta_n(q^2)$ of the poles in the angular-momentum plane (Regge poles) are obtained. The quantities $\sigma_n(q^2) = \beta_n(q^2) \cdot q^{2\ell}$ have a right-hand ($q^2 = 0$ to ∞) and a left-hand cut ($q^2 = -\infty$ to $-\mu^2$). The threshold behavior of $\alpha_n(q^2)$ and $\beta_n(q^2)$ is determined and used in an effective-range approximation based on the dominance of the pole terms.

LOW-ENERGY LIMIT AND REGGE POLES (Abstract), by K. Igi. [1962] [1]p. [AF 49(638)327] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 303, Aug. 27, 1962.

A sum rule was derived under the assumption that no singularities in J with the vacuum-quantum numbers extend above $J = 0$ at $t = 0$, except for the Pomeranchuk-Regge pole. The analysis shows that there must exist another singularity in $1 > ReJ > 0$. We consider the

possibility, within this framework of the Regge-pole hypothesis, that the ABC trajectory might pass above J = 0. This would imply a "ghost" J = 0 state similar to the Pomeranchuk-Regge ghost, and also the possibility that the ABC trajectory might pass through R=+ = 2, giving rise to a spin-2 resonance with the vacuum-quantum numbers, similar to the Pomeranchuk spin-2 resonance. A sum rule was also proposed which enables one to check experimentally whether there exist any singularities between 0 and 1 besides the Pomeranchuk and ABC poles. Preliminary results are presented. A close connection between the slope of the Regge trajectory and the πN s-wave threshold behavior and p-wave scattering length is also discussed.

MAGNETOHYDRODYNAMICS, by K. M. Watson and L. G. Henyey. Final letter rept. Mar. 20, 1962, 4p. (AFOSR-2413) (AF 49(638)508) Unclassified

The work of this project has been concerned with theoretical research in magnetohydrodynamics, and has been concentrated in the fields of physics and astronomy. Publications resulting from the work are listed, by author, and briefly described. Studies have included flow stability and transport of ionized fluids in magnetic fields, and boundary condition effects on the stability of finite regions, experiencing gravitational acceleration. The work has also been extended to approximate transport equations in magnetic fields where binary ionized-particle collisions are not reversible, and to scattering phenomena, second order corrections to adiabatic processes, and to Fermi acceleration.

MAGNETIC SUSCEPTIBILITY OF AN IMPERFECT GAS (Abstract), by T. Soda and A. N. Kaufman. [1962] [1]p. [AF 49(638)508] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 38, Jan. 24, 1962.

The equilibrium magnetic properties of a system of electromagnetically interacting molecules in a weak magnetostatic field $H_0(r)$ are investigated, using a linked cluster expansion technique. When the applied field varies slowly over molecular dimensions, a relation is obtained between magnetization $M(r)$ and the macroscopic field $H(r)$: $M(r) = (4\pi)^{-1} \times (\mu-1)H(r)$. The magnetic "Clausius-Mossotti function" $(\mu-1)/(\mu+1)$ is expressed as a power series in the activity, the coefficients of which are the traces of molecular cluster operators.

CYCLOTRON RESONANCE IN SOLIDS, by A. F. Kip. Final rept. May 1959-May 1962. May 27, 1962 [3]p. (AFOSR-2765) (AF 49(638)500) AD 612127 Unclassified

The method of cyclotron resonance has been demonstrated to be feasible as a means of investigating the Fermi surfaces in metals. Cyclotron resonances have been studied in tin, copper, aluminum, sodium, potassium, and silver. Results give cyclotron masses for various electron orbits in an applied magnetic field, and also contribute to the understanding of Fermi surfaces in these metals. In addition, numerous problems and phenomena connected with the cyclotron resonance technique have been studied. In particular, the effect of the direction of r.f. polarization relative to the externally applied magnetic field has been found to give detailed information about electron orbits. Experiments on tin show the usual Azbel-Kaner subharmonics when the applied field is perpendicular to the metal surface. The circumstances under which this anomalous result occurs have been investigated in some detail. Also under investigation are the signals which appear at low fields (up to 50 gauss), notably in tin. These have been shown not to be cyclotron resonance by their failure to scale with frequency, and their cause is now under investigation. High field oscillations attributable to the

de Haas-Shubnikov effect in both tin and aluminum are also being studied. The effects of field tipping and r.f. polarization on these signals are being considered. Some work has been done on a modification of the usual de Haas-van Alphen experiment, using a conventional lock-in detection scheme with low frequency field modulation.

CYCLOTRON-RESONANCE STUDIES IN Sn (Abstract), by F. Koch and A. F. Kip. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)600] and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 477, Aug. 27, 1962.

Azbel'-Kaner resonance for single crystals of white Sn has been studied at 35 kmc for (100), (101), and (110) surfaces, using linear polarization of rf current both perpendicular and parallel to H. The m^* values and their dependence on the direction of H in these surfaces have been measured. It is found that considerable differences in the relative amplitudes of cyclotron-resonance series observed with H along the same axis but contained in different surfaces. This result is interpreted in terms of the geometry of the Fermi surface and Fermi velocity at the point of the orbit in the skin depth. The maximum signal amplitude is observed when j_{rf} is parallel to the velocity of the electron when it is in the skin. The amplitude varies as the $\cos^2$ of the angle of j_{rf} measured from the maximum. In addition to the usual surface resonances, the Azbel-Kaner resonance was observed in the vicinity of the [100], when this axis was perpendicular or at large angles with respect to the surface.

DYNAMIC EFFECTS OF THE SUHL-NAKAMURA INTERACTION IN MAGNETIC MATERIALS, by P. Pincus, P. G. DeGennes and others. [1962] [2]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)600] and National Science Foundation) Unclassified

Presented at Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Published in Jour. Appl. Phys., v. 34: 1036-1037, Apr. 1963.

In a magnetic material, the nuclear spins are coupled via the exchange of virtual spin waves (Suhl-Nakamura interaction). This long range interaction is known to contribute to the nuclear transverse relaxation time. It also gives rise to a depression of the nuclear resonance frequency and in fact to a complete nuclear spin-wave spectrum. This spectrum is well defined even when the nuclear spins are far from saturation. In materials of sufficiently high concentrations of nuclear spins and at sufficiently low temperatures (helium range) nonlinear effects may occur in the nuclear resonance signal, as have been observed by Heeger, Portis, and Witt in $KMnF_3$. QUANTUM OSCILLATIONS IN THE MICROWAVE SURFACE IMPEDANCE OF ALUMINUM AND TIN (Abstract), by C. C. Grimes, F. W. Spong, and A. F. Kip. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)600] and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 477, Aug. 27, 1962.

Oscillations in the magnetic-field derivative of the microwave surface resistance of single crystals of aluminum and white tin at 1.5°K are reported. Because the oscillations are periodic in reciprocal magnetic field, with periods independent of microwave frequency, they are associated with the quantization of the orbital motion of electrons into Landau levels in a magnetic field, and are fundamentally related to the static effects of de Haas-van Alphen (dH-vA) and Shubnikov-de Haas. The observed periods and anisotropy were in quantitative agreement with some of the dH-vA periods seen by Gunnersen in aluminum and by Gold in tin. However, there appear to be some differences between the 2 effects. In the skin-resistance oscillations, for the

field along the diad axis of aluminum or the tetrad axis of tin, a single period was observed, rather than the beats observed in the dH-vA effect. The oscillations were studied with both longitudinal and transverse linear polarization of the microwave currents, and with the field both parallel and inclined to the surface.

A STUDY OF IONOSPHERIC ABSORPTION PRODUCED BY SOLAR COSMIC RAYS, by R. A. Weir, Jr. [1962] [104]p. incl. diagrs. tables, refs. (AFOSR-4548) (AF 49(638)873) AD 296176 Unclassified

Absorption of cosmic radio noise in the lower ionosphere due to arrival of solar cosmic rays has been calculated for several locations at high magnetic latitudes. Calculation was made in 3 parts: (1) volume production rate of electrons from ionization, (2) equilibrium electron density resulting from competition between production and recombination processes, and (3) absorption of electromagnetic radiation passing through the ionized region. Calculation was made for proton energy spectra in the form of power law as observed by balloon-borne detectors following large solar flares. Calculated absorption was compared with observations obtained by riometers (relative ionospheric opacity meter) at Point Barrow, Fort Yukon, College, and Farewell, Alaska. For the solar proton event of July 14, 1959, the calculated absorption based on balloon data does not agree in magnitude nor latitude variation with the observations obtained by the Alaskan riometers. The lack of agreement in absolute magnitude indicates that the atmospheric coefficients used in obtaining the equilibrium electron density are in error. In particular, the collisional detachment as well as electron attachment coefficients appear to require considerable revision. The lack of agreement in the latitude variation substantiates observations at rocket altitude that the power law energy spectrum flattens considerably at proton energies below 100 mev. California U. Dept. of Physics, Berkeley.

AN AURORAL-ZONE ELECTRON PRECIPITATION EVENT AND ITS RELATIONSHIP TO A MAGNETIC BAY, by R. R. Brown and W. H. Campbell. [1962] [10]p. incl. diagrs. table. (AFOSR-J875) (AF 49(638)-873) Unclassified

Also published in Jour. Geophys. Research, v. 67: 1357-1366, Apr. 1962.

The relationship of an auroral-zone electron precipitation event to a magnetic bay has been examined using simultaneous observations of x-ray intensity at balloon altitudes, ionospheric absorption of cosmic radio noise, geomagnetic micropulsations in the 5- to 30-sec period range, and variations in the geomagnetic elements H, D, and Z. These observations show that an intense electron bombardment of the upper atmosphere was in progress prior to the bay and suggest that the current system of the bay was "triggered" by the sudden intensification and expansion of the electron precipitation. The motion of the current system of the westward electrojet and the electrons precipitating on the atmosphere was toward the north, indicating that processes well out of the lines of force through the auroral zone, rather than local field conditions, were responsible for the movement. A COMPARISON OF AURORAL-ZONE X-RAY OBSERVATIONS FROM PERIODS WITH DIFFERENT LEVELS OF SOLAR ACTIVITY, by R. R. Brown. [1962] [4]p. incl. tables. (AF 49(638)873) Unclassified

Published in Jour. Geophys. Research, v. 67: 2681-2684, July 1962.

A comparison has been made of auroral-zone x-ray observations from balloon flights in the summer months of 1960 and 1961 to examine how electron precipitation varies with solar activity. The results of this study indicate that the frequency of x-ray events diminishes with a decline in solar activity. However, the daily electron flux over the auroral zone in June 1961 was twice as large as that in 1960. This result is attributed to position-motion effects of the electron precipitation.

ELECTRON PRECIPITATION ACCOMPANYING IONOSPHERIC CURRENT SYSTEMS IN THE AURORAL ZONE, by J. R. Barcus and R. R. Brown. [1962] [8]p. incl. diagrs. table. (AF 49(638)873) Unclassified

Published in Jour. Geophys. Research, v. 67: 2673-2680, July 1962.

From examination of x-ray and ionospheric absorption data during magnetic bays in the auroral zone, it has been found that electron precipitation on the atmosphere accompanies auroral-zone electrojets. The position of an electrojet and its associated electron precipitation region, rather than the amount of current in the system, largely controls the magnitude of x-ray and ionospheric absorption effects.

A PULSATING AURORAL-ZONE X-RAY EVENT IN THE 100-SECOND PERIOD RANGE, by D. S. Evans. [1962] [6]p. incl. diagrs. (AF 49(638)873) Unclassified

Published in Jour. Geophys. Research, v. 68: 395-400, Jan. 15, 1963.

The observation of a 100-sec periodicity in x-ray intensity at balloon altitudes during an intense auroral-zone x-ray event is described. The peaks in x-ray intensity are attributed to variations in the flux of electrons incident on the atmosphere rather than to motion effect of the electron precipitation. As such, the variations of the electron flux reflect the dynamics of the mechanism responsible for the precipitation of the electrons into the atmosphere. The relation of this type of periodic electron bombardment to pulsating aurora is considered.

[RESEARCH IN ATOMIC PHYSICS SCATTERING PROCESSES] by K. M. Watson. Final rept. Oct. 1, 1961-Sept. 30, 1962. Oct. 31, 1962, 3p. incl. refs. (AFOSR-4050) (AF AFOSR-62-121) Unclassified

Work discussed in this paper lies within 3 general categories: (1) many body problem and statistical mechanics; (2) atomic physics, and (3) elementary particle physics. This is a computation program to study errors inherent in the Hartree-Fock method which is used in describing scattering phenomena. Other similar computational programs will involve studies in certain atomic scattering problems, such as modification to the Kohn variational principle method.

PION RESONANCES, by F. Zachariasen and C. Zemach. [1962] [10]p. incl. diagrs. refs. (AFOSR-J137) [AF AFOSR-62-121] AD 400188 Unclassified

Also published in Phys. Rev., v. 128: 849-858, Oct. 15, 1962.

A self-consistent calculation of some features of the low-energy pion resonances is performed by a "boot-strap" method which preserves unitarity and the analytic properties of scattering amplitudes and satisfies crossing symmetry approximately. The interaction of 2-pion states with pion-ω meson states is decisive for the properties of the ρ meson. Values of the ρ meson mass and width and the ω-meson width are obtained in terms of the pion and ω meson masses and are in fair agreement with experiment. (Contractor's abstract)

GROUND STATE OF THE HELIUM ATOM, by C. Schwartz. [1962] [3]p. incl. table. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-121, Atomic Energy Commission, and Office of Naval Research) Unclassified

Published in Phys. Rev., v. 128: 1146-1148, Nov. 1, 1962.

Following a recent attempt to analyze the rate of convergence of Rayleigh-Ritz variational calculations on the ground state of helium, a re-investigation is made of the usefulness of inserting fractional powers of the variables into the conventional Hylleraas series. The results are reported to be successfull. With a 164-term trial function containing half-powers of the variable $s = r_1 + r_2$, the best eigenvalue obtained by Pekeris, who used 1078 terms of the conventional type, has been matched. The extrapolated value for the nonrelativistic eigenvalue is -2.9037243771 au, with an estimated uncertainty of about 1.10^{-10} (Contractor's abstract)

UNSTABLE MODES IN THE SOLAR HYDROGEN CONVECTION ZONE, by K.-H. Böhm. [1962] [20]p. incl. diagrs. tables, refs. (AFOSR-J617) (AF AFOSR-62-199) AD 414074 Unclassified

Also published in Astrophys. Jour., v. 137: 881-900, Apr. 1, 1963.

For the model of the solar hydrogen convection zone suggested by Böhm-Vitense (1958), the fundamental modes with horizontal scales in the range 500 km ≤ (λ 2) ≤ 50000 km and their growth rates (degree of instability) have been calculated, using the linearized hydrodynamic equations and including the effects of radiative transfer. The variation of the mean temperature T_0 and density ρ_0 with depth, the dependence of the other thermodynamic functions on T_0 and ρ_0 for a partially ionized mixture of hydrogen and helium, and the detailed depth dependence of the opacity and its derivates have been taken into account. A detailed model of the stable photosphere and a schematic model of the lower parts of the chromosphere have been incorporated in the Böhm-Vitense model, in order to study the penetration of the convective motion into the stable part of the atmosphere. These computations may be considered as a first preparation for a later application of the non-linear convection theory of Ledoux, Schwarzschild, and Spiegel (1961) to the solar hydrogen convection zone. The conclusions from the results of the present calculations are as follows: (1) The growth rates increase approximately linearly with increasing wave number of the perturbation, i.e., much faster than in the case of a polytropic atmosphere. (2) At a scale (λ 2) = 500 km, wer are not yet close to the maximal rate of instability. Consequtnely, the "cutoff" of the unstable modes due to the radiative smoothing of temperature fluctuations must occur only at a considerable smaller (λ 2). This is due to the fact that the modes are mainly driven in layers a few hundred kilometers below the photosphere, where the opacity is some orders of magnitude higher than in the photosphere. (3) Modes of a small horizontal scale are essentially restricted to a (vertically) thin layer at the top of the convection zone; and (4) The overshooting of the convective motion into the stable parts of the atmosphere is larger for modes with larger values of λ. In the stable parts of the atmosphere the convective motion is mainly horizontal. Modes with a horizontal λ larger than about 6000 km probably penetrate a few thousand kilometers into the chromosphere. (Contractor's abstract)

California U. Dept. of Physics, Berkeley.

ANALYTICITY IN ANGULAR MOMENTUM OF THE RELATIVISTIC MANY-CHANNEL S MATRIX FROM DISPERSION RELATIONS AND UNITARITY, by A. O. Barut. [1962] [5]p. incl. refs. (AFOSR-J536) [AF AFOSR-62-373] AD 411909 Unclassified

Also published in Phys. Rev., v. 128: 1959-1963, Nov. 15, 1962.

The analyticity of the scattering amplitude in angular momentum for N-coupled relativistic 2-body channels is investigated on the basis of Mandelstam representation and unitarity. The problem of the proof of the analytic properties of the amplitude is reduced to the boundedness of a particular kernel involving the left-hand discontinuity of the amplitude. The behavior of the Regge trajectories at inelastic thresholds is determined. The results are extended to relativistic models with infinite-dimensional unitarity relation but without crossing symmetry such as the Bethe-Salpeter amplitude. The implications of the results to the exact S-matrix theory are also discussed. (Contractor's abstract)

TWO VACUUM POLES AND PION-NUCLEON SCATTERING by K. Igi. [1962] [8]p. incl. tables, refs. (AFOSR-64-0497) (AF AFOSR-62-373) AD 436378 Unclassified

Also published in Phys. Rev., v. 130: 820-827, Apr. 15, 1963.

A general expression is given for the pion-nucleon non-charge-exchange scattering amplitude for arbitrary energy and small momentum transfer on the assumption that only the vacuum pole P and the second vacuum pole P′ exist in the upper half J plane. Sum rules for non spin-flip and spin-flip amplitudes are derived and used, combined with the analysis of the high-energy π-N cross sections in terms of Regge poles, to investigate the behavior of P and P′ trajectories near t ≈ 0. For this purpose the importance of a precise measurement of the low-energy partial-wave phase shifts is emphasized. A sum rule for the S-wave pion-nucleon non-charge-exchange scattering length can be satisfied with $\alpha_{P'} \approx 0.5$.

ELEMENTARY PARTICLE THEORY OF COMPOSITE PARTICLES, by S. Weinberg. [1962] [6]p. (AFOSR-64-0499) (AF AFOSR-62-373) AD 436366 Unclassified

Also published in Phys. Rev., v. 130: 776-783, Apr. 15, 1963.

Any nonrelativistic theory may be rewritten by introducing fictitious elementary particles with arbitrary properties. No physical predictions are affected, provided that the interaction part of the Hamiltonian is correspondingly modified. The fictitious elementary particle provides a good representation of a real composite particle if the modified interaction is sufficiently weakened for perturbation theory to work. It corresponds to a truly elementary particle with infinite bare mass, and hence with Z = 0. It is shown how the latter condition yields a sum rule for the coupling of a composite particle to its constituents as a function of energy. The sum rule can be used to evaluate such coupling constants as that for the proton-electron-hydrogen vertex. The mathematical method used is that developed by Schmidt for the study of the Fredholm equation, and corresponds to the extraction of a single factor from the full Fredholm determinant.

ANALYTICITY AND UNITARITY OF GENERAL TRANSITION AMPLITUDES, by A. J. Dragt and R. Karplus. [1962] [9]p. incl. refs. (AFOSR-64-0500) (AF AFOSR-62-373) AD 436168 Unclassified

Also published in Nuovo Cimento, Series X, v. 26: 168-176, Oct. 1, 1962.

The analyticity and unitarity hypotheses for a general transition amplitude are formulated carefully for a world containing only 1 type of particle. From these hypotheses follows the conclusion that the general transition amplitude has no singularities on the positive real energy axis other than isolated singularities at physical thresholds. The analytic behavior near each such singularity is exhibited. At thresholds for processes involving an odd number of particles, the behavior is logarithmic.

California U. Dept. of Physics, Berkeley.

UNSTABLE PARTICLES IN S-MATRIX THEORY, by D. Zwanziger. [1962] [11]p. incl. diagrs. refs. (AFOSR-64-0504) (AF AFOSR-62-373) AD 436374 Unclassified

Also published in Phys. Rev., v. 131: 888-898, July 15, 1963.

The consequences of the existence of complex poles in scattering amplitudes, corresponding to resonances or unstable particles, are investigated. Specific examples show that corresponding to such poles are normal threshold cuts lying near the physical region and which cause 'wooly cusps' in scattering cross sections. The discontinuity across such a cut is expressed by a unitarity-like relation in terms of unphysical amplitudes with unstable external particles defined by the residues of the complex poles. More generally, it is shown that the Landau equations for the singularities must be extended to include all unstable as well as stable particles. The Cutkosky formulas specify the corresponding discontinuities in terms of the physical and unphysical amplitudes. (Contractor's abstract)

AURORAL ZONE X-RAY PULSATIONS IN THE 1- TO 15-SECOND PERIOD RANGE, by C. D. Anger, J. R. Barcus and others. [1962] [8]p. incl. diagrs. (AFOSR-J392) (AF AFOSR-62-422) AD 411898 Unclassified

Also published in Jour. Geophys. Research, v. 68: 1023-1039, Feb. 15, 1963.

Auroral zone x-ray pulsation in the 1- to 15-sec period range, observed at Macquarie Island, Australia, on Mar. 5, 1962, and College, Alaska, on June 29, 1962, are described. Both observations indicate that the time intervals between the x-ray bursts are not unique; the average intervals over the pulsation events were 7.8 and 8.8 sec, respectively. These observations indicate that the pulsation periods in this range are determined by acceleration or pitch-angle redistribution processes in the equatorial plane rather than any fundamental, periodic motion of the electrons along lines of force in the geomagnetic field.

California U. Dept. of Physics, Berkeley.

SIMULTANEOUS ELECTRON PRECIPITATION IN THE NORTHERN AND SOUTHERN AURORAL ZONES, by K. A. Anderson, R. R. Brown and others. [1962] [2]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-422, National Science Foundation, and Office of Naval Research) AD 297111 Unclassified

Also published in Jour. Geophys. Research, v. 67: 4075-4077, Sept. 1962.

A series of simultaneous high-altitude balloon flights were carried out from College, Alaska, and Macquarie Island, Australia, for the purpose of comparing features of electron precipitation into the northern and southern auroral zones at approximately the same geomagnetic longitude. Substantial fluxes of auroral zone x-rays were observed in both hemispheres during magnetic bay activity. The x-ray observations indicate that the electron influx in both hemispheres extended over a region 3° wide in latitude and 16° in longitude. The near equality of the x-ray fluxes in both auroral zones suggests that the electron precipitation originated from processes far out on the lines of force, near the equatorial plane. The magnetic and ionospheric disturbances accompanying the x-ray event are discussed.

PHOTODISSOCIATION OF MOLECULES FOR EXCITATION OF AN OPTICAL MASER, by J. R. Singer. Jan. 8. 1962. 7p. incl. diagrs. table. (Series no. 60; issue no. 429) (AFOSR-2251) (AF 49(638)102) AD 403011 Unclassified

In working with optical masers, it is necessary to obtain a very narrow emission source in order to utilize its many possibilities. The best method of obtaining this source is to eliminate doppler broadening by observing atomic transition perpendicular to the path of an atomic beam; this method can be adapted to optical masers. The system studied involves photodissociation of molecules in which 1 dissociated atom appears in an

excited state. General process may be described by the following reactions: (1) $h\nu_0 + AB \rightarrow A^* + B' + K.E.$ and (2) $A^* \rightarrow h\nu_1 + A$, where $h\nu_0$ is a high energy photon interacting with a molecular compound AB composed of atoms A and B.

AN ELECTRON STEAM INSTABILITY, by W. B. Bridges and C. K. Birdsall. Mar. 23, 1962 [202]p. incl. illus. diagrs. tables, refs. (Series no. 60; issue no. 443) (AFOSR-2658) (AF 49(638)102) AD 284291 Unclassified

The dynamic behavior beyond the limit for the stream flowing between and normal to infinite parallel-plane electrodes is treated. The model used to approximate the multivelocity stream consists of a large number of charges which are injected one at a time into the diode and are allowed to move under the influence of their own electric fields and that of the electrodes. The trajectories of the sheets, voltages, currents, and energies were calculated with the help of a digital computer. For streams of finite cross section, circular or rectangular, the static solutions are obtained for the stream flowing normal to infinite parallel plane electrodes. The dynamic behavior obtained is offered to explain some of the effects observed in low-noise microwave tubes and plasma diodes, and is proposed as a fast switching circuit. The peak in diode shot noise at the plasma frequency of the cathode potential minimum appears as the oscillation frequency of the diode treated here. The stream dynamic behavior, considered as a change of state at limiting, is proposed as a 2-state switching element for nanosecond or shorter rates, with possible computer applications. [MICROWAVE ELECTRONICS]. Final rept. Jan. 1, 1957-Sept. 30, 1962, 8p. incl. refs. (AFOSR-4516) (AF 49(638)102) Unclassified

Work has been done on (1) electron streams (focusing, noise properties, instabilities) and (2) quantum electronics (mainly optical masers and investigations of optical maser materials). The electron stream work has been concentrated in instabilities for streams formed and focused in different ways. The transient behavior at limiting current has been obtained for the first time. Results show that part of the classical solutions made decades ago are in serious error. Similar work with streams in drift tubes, in confined flow and in Harris flow (centrifugal electrostatic focusing) are presently being studied in order to understand in detail the onset of instabilities in various electron and ion stream configurations. The quantum electronics projects have covered a number of microwave and optical maser problems such as finding suitable maser materials and new ways of obtaining maser operation, especially in new frequency ranges. The study of 2-level masers has resulted in a general analysis of the interaction between magnetic and electric dipole emitters and the radiation wave. Another research effort of considerable import has been the initiation of studies of a photodissociation optical maser. A list of publications and technical papers presented at conferences is given.

WAVES IN DRIFTING AND ACCELERATING ELECTRON STREAMS IN RADIAL FLOW, by W. B. Bridges and C. K. Birdsall. June 29, 1962, 29p. incl. diagrs. refs. (Series no. 60, issue no. 459) (AFOSR-4557) (AF 49-(638)102) AD 296452 Unclassified

The solutions for space-charge waves obtained by Hahn (1939) and Ramo (1939) for a rectilinear, drifting stream are quite well known. Less well known are the more mathematically complicated solutions obtained when the stream flow is along radial lines and the stream is accelerating for the following cases: (1) first order current for radial drifting flow, (2) current and velocity in accelerating parallel flow, and (3) accelerating radial flow. The present work attempts to unify all of these cases and a few more into one general solution.

TRAVELING WAVE FOCUSING FOR PLASMA CONTAINMENT, by C. K. Birdsall and A. J. Lichtenberg. [1959] [3]p. [AF 49(638)102] Unclassified

Published in Phys. Rev. Ltrs., v. 3: 163-164, Aug. 15, 1959.

The focusing and contraction of low density dc plasma columns carrying currents up to 100 mA were studied under confining field frequencies in the range 3 to 25 mc/sec. The amount of contraction was proportional to the applied power in this range. It is believed that the electrons are being focused by the traveling fields and the ions are contained in the potential well thus formed. With large structures and higher power it should be possible to focus both electrons and ions. At 1000 mc sec, the ionization effects of the high frequency effects were very strong and the plasma was maintained without a dc discharge. No focusing was observed, but this may have been masked by the intense excitation.

California U. Electronics Research Lab., Berkeley.

PREBUNCHED BEAM TRAVELING-WAVE TUBE STUDIES, by A. J. Lichtenberg. [1961] [7]p. incl. diagrs. table. (AF 49(638)102) Unclassified

Published in I. R. E. Trans. on Electron Devices, v. ED-9: 345-351, July 1962.

A traveling wave tube with a prebunched beam is found to have a considerably higher efficiency than the same tube without prebunching. For the particular tube tested, the efficiency is increased from 20 to over 35% at a gain of 8. Computer calculations using a discrete disk model give similar results. The beam is bunched tightly in energy at the position of highest efficiency, indicating that very high efficiency could be obtained with a depressed collector. Both current and velocity modulation are required for prebunching, and are obtained by means of a current grid followed by an inductively tuned velocity modulation cavity. The requirements of the current grid are not great so that operation should be possible at frequencies well above the normal operating region of a microwave triode. The operation of the tube is sensitive to the output match, and it appears to be difficult to obtain a good match with the beam on. (Contractor's abstract)

ARTIFICIAL HIGH TEMPERATURE SOURCES IN NOISE MODELING STUDIES, by J. R. Whinnery and M. A. Bellack. [1962] [6]p. incl. diagrs. table, refs. [AF 49(638)102] Unclassified

Published in Microwaves: Proc. Fourth Internat'l. Cong. on Microwave Tubes, Scheveningen (Netherlands) (Sept. 3-7, 1962). Eindhoven, Centrex Publishing Co., 1963, p. 478-483.

Studies show that noise experiments might be scaled to an order of magnitude lower in frequency and greater in size, with maintenance of similar voltage distributions and transit angles to equivalent positions, if electron sources with equivalent temperatures from 100 to 1000 times usual cathode temperatures were available. A simple idea for obtaining such sources is that of amplifying velocity distributions along an electron stream, say by traveling-wave amplification. The noise amplified might be that originally present in the beam, or additional random noise may be impressed at the amplifier input. In the latter case, distribution, as given by analysis of a simple model, is not half-Maxwellian, but appears to be a reasonable approximation to it in form. A preliminary experiment, carried out on a tube designed for depressed collector operation, showed an effect from the r.f. fields of the helix which was consistent with the known gain of the tube The result-noise temperature of the beam, estimated from retarding field current measurements, corresponded to about 10^6 K, and seemed to have reasonable approximation to a half-Maxwellian distribution.

OPTICAL MASERS UTILIZING MOLECULAR BEAMS (Abstract), by J. R. Singer and I. Gorog. [1962] [1]p. [AF 49(638)102] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 14, Jan. 24, 1962.

Molecular beams optical masers having the advantage of providing a continuous optical emission from molecules which can be excited to an inverted Boltzmann distribution in an irreversible manner. A number of molecules have been chosen, including some alkali halides, as possibilities for obtaining coherent optical emission at various infrared and optical frequencies. Of these, experimental studies of rubidium iodide have been undertaken for a feasibility investigation of the general approach. The excitation of RbI is accomplished by irradiation with a broad 2537-A line of mercury. Rubidium iodide dissociates under the uv into an excited rubidium atom and an iodine atom. The rubidium atoms decay to the ground state with emission of photons of 7600 or 7947A. By providing a Fabry-Perot etalon, it

should be possible to obtain a coherent induced emission output at these wavelengths. The process is general, and a number of other molecular beam masers will also be discussed. Practically all the alkali halides are suitable, and the process presents the advantages of broad-line absorption and narrow-line emission.

APPLICATIONS OF GRAPH THEORY TO SOLUTION OF SOME SYSTEMS OF LINEAR ALGEBRAIC EQUATIONS, by I. Cederbaum. Jan. 23, 1962, 10p. incl. diagrs. tables, refs. (Series no. 60; issue no. 432) (AFOSR-2104) (Sponsored jointly by Air Force Office of Scientific Research, Dept. of the Army, and Office of Naval Research under AF 49(638)1043) AD 278393 Unclassified

Graph-theoretic arguments using the orthogonality of the cut-set, the circuit subspaces and the relation between the nonvanishing terms in the expansion of a determinant and the cycles in the associated graph are applied to render all the binary solutions of systems of linear equations. Application is made to systems of linear algebraic equations and cycles and undirected cut-sets. Since the number of cycles and their duals in a given bounded finite graph may be very high the solutions may be presented in a closed form through the use of an adjacency matrix.

THE MINIMIZATION OF BOOLEAN FUNCTIONS CONTAINING UNEQUAL AND NONLINEAR COST FUNCTIONS, by M. A. Breuer. Jan. 22, 1962, 19p. incl. diagrs. (Series no. 60; issue no. 431) (AFOSR-2445) (Sponsored jointly by Air Force Office of Scientific Research, Dept. of the Army, and Office of Naval Research under AF 49-(638)1043) AD 278392 Unclassified

A method is presented for minimizing Boolean functions by employing linear programming. The classical model of a Boolean function in vector space is presented. From this model, the linear program for the minimization of Boolean functions in prime implicant form with arbitrary constant cost coefficients is formulated. Variable nonlinear cost functions, derived from the fan-out problem are then considered. Methods for taking into consideration lead length, loading, and fan-in restrictions are discussed. In essence, the technique simplifies the Boolean functions to a form which is minimal in cost to implement. (Contractor's abstract)

ANALYSIS OF ERRORS IN THE ESTIMATION OF THE IMPULSIVE RESPONSE, by H. Kwakernaak. Feb. 6, 1962, 33p. incl. diagrs. tables. (Series no. 60, issue no. 434) (AFOSR-2576) (Sponsored jointly by Air Force Office of Scientific Research, Dept. of Army, and Office of Naval Research under AF 49(638)1043) AD 278394 Unclassified

The method of finding the impulsive response of a linear, time-invariant system by the computation of correlation-functions of input and output, is investigated. The effects of (1) truncation of the impulsive response, (2) sampling the data, and (3) additive noise at the output, are studied, especially under asymptotic conditions, i.e., for long observation times. The truncation distorts the actual impulsive response primarily at the endpoints of the interval considered. For this reason, the interval should be chosen sufficiently large. The sampling has a smearing effect on the impulsive response by reducing the resolving power, but on the other hand can have a highly smoothing effect on the noise. The sampling rate also greatly influences the amount of computational work to be carried out. The errors of the estimate due to the noise are proportional to $\sqrt{\frac{1}{T}}$, which is a usual result for this type of estimate. Also it was noted that in many cases the statistical errors depend very much on the sampling interval, and may even become infinite if the sampling interval goes to zero. Some results of a computer-study to check the theoretical results are given. (Contractor's abstract, modified)

STABILITY AND APERIODICITY CONSTRAINTS FOR SYSTEM DESIGN, by E. I. Jury and T. Pavlidis. [1962] [5]p. incl. refs. (AFOSR-J1288) (AF AFOSR-62-70) AD 424359 Unclassified

Also published in I. E. E. E. Trans. on Circuit Theory, v. CT-10: 137-141, Mar. 1963.

Analytic tests of stability are applied for systems design. The continuous system for the general case is discussed in detail and the corresponding critical constraints for stability for the discrete case are derived. The critical constraint for aperiodicity for both continuous and discrete cases are also obtained. The examples show the methods can be extended to higher order systems.

A LITERATURE SURVEY OF BIOCONTROL SYSTEMS, by E. I. Jury and T. Pavlidis. [1962] [8]p. incl. diagrs. refs. (AFOSR-J1602) (AF AFOSR-62-70; AF AFOSR-63-117) AD 427624 Unclassified

Also published in I. R. E. Trans. on Automatic Control. v. AC-8: 210-217, July 1963.

Review of the various aspects of biological control systems and their relation to feedback theory is presented. To systematize the study of biocontrol systems, the material is classified into the following topics: (1) general human operator dynamics; (2) neuromuscular systems; (3) eye dynamics; (4) respiratory and circulatory systems, (5) biological process control; and (6) central nervous systems and brain. Each of the above topics is summarily discussed and separately documented with the pertinent literature and research activities. In the conclusion, the connection between the recent theoretical work in feedback control and the problems of biocontrol systems is discussed. It is hoped that with this survey a new burst of research activities on the part of control scientists in the challenging field of biocontrol systems will be materialized. (Contractor's abstract)

THE OPERATIONAL SOLUTION OF DIFFERENCE-DIFFERENTIAL EQUATIONS USING THE MODIFIED z TRANSFORM, by M. A. Pai. [1962] [2]p. incl. diagr. (AF AFOSR-62-70) Unclassified

Published in I. R. E. Trans. on Automatic Control, v. AC-7: 124-125, Oct. 1962.

In this communication the usefulness of modified z transform has been demonstrated in solving linear constant coefficient difference-differential equations.

It is particularly useful in calculating transient responses of continuous systems having time delays, this method avoids having to evaluate roots of transcendental equations. This method can be easily extended to systems having more than one but otherwise commensurable time delays.

MINIMUM PERIOD OF OSCILLATION OF TUNNEL-DIODE OSCILLATORS, by R. S. Fepper. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-3370) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-62-340) Unclassified

Presented at Western Electronic Show and Convention, Los Angeles, Calif., Aug. 21-24, 1962.

Also published in I. E. E. E. Trans. on Circuit Theory, v. CT-10: 60-66, Mar. 1963. (Title varies)

Consideration is given the general problem of determining the conditions to achieve the minimum period of oscillation, regardless of wave-shape, for simple electronic oscillators. In particular, emphasis is placed on the general minimum period problem for the tunnel-diode oscillator having a series inductive-resistive load. The minimum period of oscillation is established by varying the load's parameters. Various nonlinear analysis techniques show that the minimum period of oscillation is never obtained for a harmonic mode of oscillation. It is shown that the minimum period of oscillation is obtained by using a load resistance approximately equal to zero and no externally added inductance. The results are confirmed by experiment. The conditions are also given for determining whether the tunnel diode will operate as a soft oscillator, hard oscillator, or be truly bistable.

FUEL OPTIMAL CONTROL FOR PULSE-AMPLITUDE-MODULATED TIME-INVARIANT SAMPLED-DATA SYSTEM, by C. T. Lee and C. A. Desoer. [1962] [19]p. incl. diagrs. (AFOSR-64-0314) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-62-340) Unclassified

Also published in Jour. Electronics and Control, v. 15: 363-381, Oct. 1963.

Given a linear time-invariant sampled-data system described by $X_{K+1} = AX_K + BU_{K+1}$, where X_K is the state-vector at the Nth sampling instant, U_{R+1} the control vector, and A, B are n x n and n x r constant matrices, and a number N of sampling periods, the problem is to find a sequence of control vectors that brings the state to the origin in N sampling periods or less with the least consumption of fuel. The fuel consumption is defined by $I = \sum_{i=1}^{N} \sum_{\alpha=1}^{r} |u_i^{(\alpha)}|$. For unbounded controls, this problem is solved, and the optimal feedback is described. For bounded controls, we establish general properties of the optimal control but find the feedback only for a single input second-order system. (Contractor's abstract)

LINEAR TIME VARYING G-C NETWORKS: STABLE AND UNSTABLE, by C. A. Desoer and A. Paige. [1962] [11]p. incl. diagrs. tables. (AFOSR-64-0326) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-62-340; and National Science Foundation) AD 435906 Unclassified

Also published in I. E. E. E. Trans. on Circuit Theory, v. CT-10: 180-190, June 1963.

The stability of linear time varying conductance-capacitance networks was studied. Several sets of sufficient conditions for their stability are given. In particular, instability can occur only if both the G matrix and the C matrix are time varying. In the limit of very large pump frequencies, the stability of periodic piecewise constant networks is determined by a simple relation. The design of unstable G-C networks is explained and illustrated by two examples. In the second example, the q vector (whose components are sums of charges on condensers in certain cut sets) has components that behave like sine waves modulated by increasing exponentials. (Contractor's abstract)

CHANGING THE STATE OF A LINEAR SYSTEM BY USE OF NORMAL FUNCTION AND ITS DERIVATIVES, by S. C. Gupta and L. Hasdorff. [1962] [2]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [AF AFOSR-62-340]) Unclassified

Published in Jour. Electronics and Control, v. 14: 351-359, Mar. 1963.

For a linear system with real poles, 2 problems have been studied: (1) achieving a desired state from ground state in minimum time, and (2) achieving maximum distance from the origin (ground state) when the excitation is magnitude limited. Since the state of a system can be changed in zero time using the impulse-function and its derivatives, the impulse function is approximated by normal function and the above problems are attacked using this normal function and its derivatives. This method shows to what degree the impulse function response can be approximated using this type of excitation and shows the practicality of this type of input. (Contractor's abstract, modified)

THE DETERMINATION OF LYAPUNOV FUNCTIONS WHICH VERIFY AIZERMAN'S CONJECTURE (Abstract), by I. J. Williams. [1962] [2]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-62-340; and Air Research and Development Command) Unclassified

A direct procedure for the determination of Lyapunov functions which verify Aizerman's conjecture concerning the stability of nonlinear systems is presented. This procedure will determine a Lyapunov function of the Lur'e type which will accomplish this result for a particular system if a function of this type exists. The problem of determining the Lyapunov function is reduced to that of determining the function for a family of linear systems. It is shown that the derivative of this function must satisfy certain constraints in order to be a suitable Lyapunov function for this family of linear systems. These constraints require the derivative of the Lyapunov function to be zero along specified vectors determined from the dynamics of the linearized system. The derivative of the Lyapunov function is constructed incorporating these constraints which considerably reduces the number of parameters to be determined. The elements of the Lyapunov function itself are found by solving a set of linear algebraic equations. This procedure is a direct process by which the Lyapunov function can be found if it exists without resorting to trial and error methods and consequently is well suited for application to third and higher order systems. Several third and fourth order examples are presented to demonstrate this procedure. (Contractor's abstract)

LIMITATIONS ON THE TRANSIENT RESPONSE OF POSITIVE REAL FUNCTIONS, by R. A. Rohrer.

[1962] [2]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-62-340) Unclassified

Published in I. E. E. E. Trans. on Circuit Theory, v. CT-10: 110-111, Mar. 1963.

Restrictions on the impulse and step responses associated with positive real network functions have been previously discussed. It is possible to obtain a further set of simple limitations which apply to the even-order transient responses of networks characterized by p. r. functions. The transient responses of a system can be simply designated by $h_k(t) = \frac{1}{2\pi j}\oint_C S^k H(s)ds$, where $h_0(t)$ is the impulse response, $h_{-1}(t)$ the step response. The cosine inequalities introduced by Zeemanian to bound the frequency attenuation for filters with monotonic step response, may be applied here to obtain restrictions on the even-order transient response associated with p. r. system functions.

Two schemes have been described. The first is a 3- or 4-stage (conceptually) processor in which only the last stage is essentially computer dependent. In converting to a new computer, parts of the last stage (assembly program) must be hand modified. In the second scheme a subset of ALGOL with extensions is used to describe the translators and other processors. The translator for this simpler system must be hand modified for a new computer system. The system is sufficiently simple so that this modification consists of changing tables and input-output routines.

AN OPTIMAL OPERATION OF COMMUNICATION NETS, by I. Cederbaum. [1962] [12]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-62-340) Unclassified

Published in Jour. Franklin Inst., v. 274: 130-141, Aug. 1962.

An approach is presented to analysis of communication nets based closely on the theory of single-element-kind but not necessarily linear networks. The potential ability of networks to minimize some form of losses is applied to define an optimal operation of communication nets. The new element introduced in this approach is that it is capable of distributing the flow throughout the network by taking into account both the network topology and the capacities of individual edges. The method may be applied to rather general situations, such as simultaneous multi-node-pair communication with some relative priority weights attached to different pairs. On the computational side it shows a systematic way leading to the solution which may be programmed on a digital computer. (Contractor's abstract)

RELAXATION OSCILLATION NEAR THE THRESHOLD OF INSTABILITY IN YTTRIUM IRON GARNET, by S. Wang and G. E. Bodway. [1962] [3]p. incl. diagrs. (Bound with its AFOSR-5509) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-62-340) Unclassified

Published in Jour. Appl. Phys., v. 33: 3526-3528, Dec. 1962.

Coherent low-frequency relaxation oscillation in the amplitude of the z component of magnetization and the imaginary part of susceptibility has been observed in YIG at a microwave power level slightly above the threshold of instability. The relaxation time associated with the uniform mode has also been measured. The condition for coherent relaxation oscillation depends critically on the magnitude of the dc magnetic field. The low-frequency oscillation is interpreted to be the beat of 2 high-frequency components due to a split in the frequency of the k spin wave $\omega_k \pm \Delta\omega_k$. It is also believed that the period of oscillation is controlled by the relaxation time associated with the uniform mode. (Contractor's abstract)

EXCHANGE NARROWED ESR ABSORPTION LINES AT LOW AND INTERMEDIATE FREQUENCIES, by J. R. Singer. [1962] [5]p. incl. diagrs. tables. (AFOSR-64-2328) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-117 and Army Research Office (Durham)) Unclassified

Also published in Paramagnetic Resonance; Proc. of the First Internat'l. Conf., Jerusalem (Israel) (July 16-20, 1962), New York, Academic Press, v. 2: 577-581, 1963.

The electron spin resonance absorption spectra of DPPH recrystallized from benzene, acetone, methyl ethyl ketone, and selected other ketones were studied at various frequencies from 30 mc to 9 kmc with corresponding magnetic fields from 10 to 3200 gauss. Shifts in g-values

vs power input and vs various solvents are tabulated. The DPPH recrystallized from ketone solutions was found to have a much narrower line than normal DPPH similar to observations from DPPH recrystallized from chloroform solutions. One explanation for this stringy narrowed line is that DPPH recrystallized from benzene incorporates additional benzene rings into the lattice resulting in a decrease in the overlap of the electron wavefunction and a decreased exchange interaction. The DPPH recrystallized from the ketones has greater overlap of the wavefunction and a stronger exchange interaction. In addition, however, the line shapes of some of the crystals indicate a mixture of absorption spectra. This is borne out by a shift in the g values of these crystals, and an interesting variation of line width with r-f input power. At different field strengths and ESR frequencies, the ratios of the line widths between the ketone and benzene recrystallized DPPH change. In addition, the non-symmetrical line shapes indicate the possibility that the recrystallization occurs in several forms from the standpoint of the spin resonance absorption spectra. EXPERIMENTAL STUDY OF INITIAL FLAME ACCELERATION IN A SPARK IGNITED EXPLOSIVE GAS, by A. J. Laderman, P. A. Urtiew, and A. K. Oppenheim. Feb. 1962 [37]p. incl. illus. diagrs. refs. (Technical note no. DR 11) (AFOSR-2190) (AF 49(638)-165) AD 272980 Unclassified

The influence of the geometry of ignition on the initial flame acceleration in spark ignited, stoichiometric hydrogen-oxygen mixtures was investigated. Observations were made using schlieren photography with simultaneous pressure measurement in the vicinity of the ignitor. Distance between the point of ignition and the closed end (backwall) of the tube was varied over the range of limiting cases where (1) the flame was in continuous contact with the backwall to where (2) the flame contacted the sidewalls of the tube before reaching the backwall. It was found that flame acceleration increased with increasing backwall distance until condition 2 was satisfied, after which further increase in backwall distance had no effect. The slower flames associated with the smaller backwall distances were attributed to heat losses to the backwall. Experimental results were interpreted by analysis in which the 3 dimensional flame was considered to act as an equivalent plane flame. Flame acceleration and pressure history computed in this manner for cases 1 and 2 were in fair agreement with experimental observations. The total heat loss to the backwall for case 1 was estimated to be approximately 15% of the total heat release by chemical reaction, or 0.7 cal. (Contractor's abstract)

INTERFEROMETRIC OBSERVATION OF FLAME ACCELERATION IN AN EXPLOSIVE GAS, by A. J. Laderman, P. A. Urtiew, and A. K. Oppenheim. Feb. 1962 [50]p. incl. illus. diagrs. tables, refs. (Technical note no. DR 12) (AFOSR-2191) (AF 49(638)166) AD 273684 Unclassified

Flash photographs of the transition from deflagration to detonation were obtained by means of the Mach-Zehnder interferometer. Experiments were performed using stoichiometric hydrogen-oxygen mixtures in a 1.0 by 1.5 in. detonation tube with 3 methods of ignition: spark discharge, pilot flame, and glow coil. In all cases the ignitor was located at the closed end of the tube. For each set of operating conditions, a series of flash interferograms were taken, 1 on each experiment, which were pieced together on a single time-space plane to yield a cinematographic representation of the process. The individual interferograms revealed considerable information on the shape of the flame front and on the structure of the reaction zone, while the sequence of photographs yielded an insight into the breakdown of the combustion front from a laminar to a turbulent flame. THE ONSET OF RETONATION, by A. K. Oppenheim, A. J. Laderman, and P. A. Urtiew. [1962] [5]p. incl. illus. diagrs. table. (AFOSR-J1081) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)166 and National Aeronautics and Space Administration) AD 420933 Unclassified

Also published in Combustion and Flame, v. 6: 193-197, Sept. 1962.

The purpose of this paper is to report on optical observations made recently that seem to unravel some of the mysteries still surrounding the formation of detonation in a gaseous medium. The onset of the retonation wave in a stoichiometric hydrogen-oxygen mixture contained in a 1 x 1.5 in. tube has been observed by means of schlieren streaks and instantaneous photographs. Some interesting details of transverse oscillation characteristics of spin which accompany this even have been revealed. Experimental record have been interpreted by means of a wave dynamic analysis to determine the state of the medium where the oscillations are set in. Their frequency has been found to be in agreement with the eigenvalue solution of the linear wave equation. It appears that the process has been initiated by a point explosion that is preceded by a deflagrative implosion. In this respect the phenomenon bears an interesting similarity to high frequency combustion instabilities in rocket thrust chambers, promising thus to serve as a useful tool for the study of their physicochemical aspects. DETERMINATION OF THE DETONATION WAVE STRUCTURE, by A. K. Oppenheim and J. Rosciszewski. [1962] [18]p. incl. diagrs. tables, refs. (AFOSR-J1086) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)166 and National Aeronautics and Space Administration) AD 420688 Unclassified

Also published in Ninth Symposium (Internat'l.) on Combustion, Cornell U., Ithaca, N. Y. (Aug. 27-Sept. 1, 1962), New York, Academic Press, 1963, p. 424-441.

In order to investigate the influence of transport properties on the coupling between the shock and deflagration that may occur in a steady, plane detonation wave, the structure of the laminar detonation wave in ozone has been determined for 3 fundamental models: the coupled-wave, the von Neumann-Döring-Zeldovich model, and the decoupled deflagration wave. The results have been compared from th point of view of the approximation proposed by Spalding. The validity of the continuum treatment has been checked by evaluating the variation throughout the wave of the average number of intermolecular collisions per molecule of product. It appears from this that, although the theory may not be realistically close to the hot boundary, it is certainly quite reasonable in the regime of coupling between the shock and deflagration—the primary object of the investigation. In conclusion it is contended that only a thorough understanding of the so-called laminar wave structure can provide proper basis for the assessment of the effects of turbulence and other time dependent and multidimensional phenomena that may accompany the detonation process.

EFFECT OF IGNITION GEOMETRY ON INITIAL FLAME ACCELERATION IN A SPARK IGNITED EXPLOSIVE GAS, by A. J. Laderman, P. A. Urtiew, and A. K. Oppenheim. [1962] [11]p. incl. illus. diagrs. refs. (AFOSR-J1087) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)166 and National Aeronautics and Space Administration) AD 420643 Unclassified

Also published in Combustion and Flame, v. 6: 325-335, Dec. 1962.

The influence of the geometry of ignition on the initial flame acceleration in spark ignited, stoichiometric hydrogen-oxygen mixtures at n. t. p. was investigated experimentally. Observations were made using schlieren photography with simultaneous pressure measurements in the vicinity of the igniter. It was found that flame acceleration increased when the distance between the ignition source and the backwall became larger provided that the flame was in continuous contact with the backwall. When the ignition source was extended farther into the tube so that the flame contacted the sidewalls before reaching the back end, its acceleration became independent of the distance of the point of ignition from the backwall. Experimental results were interpreted quite satisfactorily by means of a one-dimensional gas wave dynamic analysis, demonstrating a significantly larger dependence of the flame acceleration process upon the normal burning velocity than on the net amount of heat released per unit mass. ON THE GENERATION OF A SHOCK WAVE BY FLAME IN AN EXPLOSIVE GAS, by A. J. Laderman, P. A. Urtiew, and A. K. Oppenheim. [1962] [19]p. incl. illus. diagrs. table, refs. (AFOSR-J1088) (AF 49(638)166) AD 420649 Unclassified

Also published in Ninth Symposium (Internat'l.) on Combustion, Cornell U., Ithaca, N. Y. (Aug. 27-Sept. 1, 1962), New York, Academic Press, 1963, p. 265-274.

This paper provides experimental as well as theoretical proof that a laminar flame can generate a shock front quite early in the course of its initial acceleration. The flame at this stage of the process is wrinkled laminar, and it propagates at a velocity which is only a few times larger than the normal burning speed. However, no mechanism other than the break-up of the flame front into a cellular structure is necessary for this purpose, nor as it observed. (Contractor's abstract)

SHOCK INTERACTION WITH AN ELECTROMAGNETIC FIELD, by J. Rosciszewski and A. K. Oppenheim. [1962] [10]p. incl. illus. diagrs. refs. (AFOSR-J1093) (AF 49(638)166) AD 421118 Unclassified

Also published in Phys. Fluids, v. 6: 689-698, May 1963.

The interaction between a traveling shock wave and a stationary magnetic field is analyzed for the simplest case of 1-dimensional flow across a rectangular system of a magnetic and an electric field, while the flowing substance is a plasma of finite conductivity but associated with a sufficiently small magnetic Reynolds number to render the induced magnetic effects negligible. The acceleration of the shock wave produced by a constant electric field applied across the duct walls in the presence of a perpendicular magnetic field as well as its attenuation due to a distributed system of outside resistances connecting a series of electrodes on the sidewalls of the duct, have been calculated by quadratures. The flow field behind the wave has been determined by means of a perturbation technique whose validity is restricted to cases of small Lorentz forces and moderate Joule heating effects. To gain more familiarity with the interaction process a hydraulic analog is proposed, based on the use of a piston driven, free surface, mercury channel. In this connection, a general solution is

consequently obtained for the interaction of a hydraulic jump traveling in a conducting liquid with a vertical magnetic field in the presence of a horizontal electric field. (Contractor's abstract)

MEASUREMENT OF PRESSURE FIELD GENERATED AT THE INITIATION OF EXPLOSION, by A. J. Laderman, P. A. Urtiew, and A. K. Oppenheim. [1962] [4]p. incl. illus. diagrs. (AFOSR-J1149) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)166 and National Aeronautics and Space Administration) AD 423126 Unclassified

Also published in Symposium on Measurement in Unsteady Flow, Worcester, Mass. (May 21-23, 1962), New York, American Society of Mechanical Engineers, 1962, p. 32-35.

A record obtained by the use of a piezo-electric pressure gauge, substantiated with a schlieren photograph, permits a complete determination of the pressure field in the time-space domain during the initial phases of an explosion. The experiments were performed in a detonation tube of 1" x 1½" rectangular cross-section containing a stoichiometric mixture of hydrogen and oxygen. By correlating a single pressure record with a simultaneously obtained schlieren streak photograph, the character of the transient pressure profile observed ahead of an accelerating flame is established as one corresponding to a simple wave. The property of this wave is then used to transform the measured time variation of pressure at a fixed section in the tube to the distribution of pressure in space at any time. On this basis, the variation of the pressure profile with time and the collapse of the pressure fan into a shock wave is traced in detail. (Contractor's abstract)

THIN FILM THERMOMETRY IN DETONATION RESEARCH, by A. J. Laderman, G. J. Hecht, and A. K. Oppenheim. [1961] [5]p. incl. illus. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)166 and National Aeronautics and Space Administration) Unclassified

Published in Temperature: Its Measurement and Control in Science and Industry; a Symposium, Columbus, Ohio (Mar. 27-31, 1961), ed. by A. I. Dahl. New York, Reinhold Publishing Corp., v. 3 (pt. 2): 943-947, 1962.

The present work concerns the development of thin film resistance thermometers for the measurement of detonation velocities, shock and flame velocities in the pre-detonation regime, and the local heat transfer rate to the walls of the detonation tube. Construction details of a thin film resistance thermometer which utilizes a ceramic backing rather than glass or quartz are described. Performance of the thermometer is shown to compare favorably with that of the glass- or quartz-backed instrument. Measurements at several positions along the detonation tube indicate that the time variations of the local heat transfer rates to the wall are nearly identical throughout the development of detonation. In addition, since the gauge responds to both shocks and flames, it represents a promising method for studying the development of the pressure wave preceding the flame during the transition to detonation.

SHOCK WAVE STRUCTURE IN PARTIALLY IONIZED GASES, by M. S. Grewal. Doctoral thesis, May 1962 [67]p. incl. illus. diagrs. refs. (Rept. no. HE-150-198; series no. 132, issue no. 5) (AFOSR-2949) (AF 49(638)502) AD 277603 Unclassified

Also published in Jour. Fluid. Mech., v. 16: 273-284, Aug. 1963.

The structure of a shock wave in a partially ionized gas, which is in thermal non-equilibrium ahead of the shock wave, is investigated. A method is developed to solve this problem by separating it into 2 parts. First the structure of the shock wave associated with the mixture of ions and atoms, which are assumed to behave alike through the shock transition, is taken to be of the Mott-Smith form. Then the behavior of electrons as they pass through this ion-atom shock is analyzed. Using this method, calculations are made for the shock wave structure in partially ionized argon for Mach numbers equal to 8, 10 and 12, and for the values of the electron-ion temperature ratio ahead of the shock wave equal to 3, 5 and 8. An essential feature of the shock profiles is found to be the existence of a broad zone of elevated electron temperature ahead of the electron compression region, caused by high thermal conductivity in the electron gas.

TRANSITION FLOW (A SURVEY OF EXPERIMENTAL RESULTS AND METHODS FOR THE TRANSITION REGIONS OF RAREFIED GAS DYNAMICS), by F. S.

Sherman Aug. 15, 1962 [63]p. incl. diagrs. refs. (Rept. no. HE-150-201; series no. 132, issue no. 7) (AFOSR-3984) (AF 49(638)502) AD 284480 Unclassified

A survey of experimental data in the transition regime of rarefied gas dynamics utilized to indicate the status of present experimental and theoretical capabilities and some areas of interest for future research. Successful correlation technique for subsonic transition flow data is given. The limitations of low-density wind tunnels are discussed and a suggestion for free-jet testing as a means of achieving higher Mach numbers and lower Reynolds numbers without excessive boundary-layer difficulties is put forth. Several characteristics of axisymmetric jets issuing from sonic orifices are reviewed in this context. Finally, a few selected instrumentation problems are reviewed and a plea is made for certain technological advances which would greatly ease the burden of the rarefied gas experimentalist. SPECTROSCOPIC STUDY OF RECOMBINATION IN A He PLASMA (Abstract), by F. Robben. [1962] [1]p. AF 49(638,502) Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 163, Feb. 28, 1963.

Recent work on ion-electron recombination has shown that a collisional-radiative mechanism leads to values of the recombination rate in good agreement with experiment. Absolute-intensity measurements have been made of all the lines of He emitted from a recombining plasma in the visible and near ultraviolet, from which the number densities of the various excited states of He have been calculated. These measurements are in excellent agreement with the collisional-radiative mechanism, and lead to values for the collisional de-excitation rate of an excited He atom, which is in good agreement with semi-classical calculations of the cross sections. The plasma is generated by passing He through a high-current electric arc, and then expanding it in a low-density wind tunnel. The fractional ionization of the plasma is about 2%, and the electron densities are in the range of 10^{13} per cm^3.

AN ALGORITHM FOR THE TRANSLATION OF ALGOL STATEMENTS, by W. M. Keese, Jr. and H. D. Huskey. [1962] [5]p. incl. tables. (AFOSR-64-2005) (AF AFOSR-62-156) AD 451225 Unclassified

Also published in Information Processing; Proc. of the Internat'l. Fed. for Information Processing Cong., Munich (Germany) (Aug. 27-Sept. 1, 1962), ed. by C. M. Popplewell. Amsterdam, North-Holland Publishing Co., 1963, p. 498-502.

This paper describes a simplified version of the translator portion of a 3-stage compiler, which handles virtually all ALGOL 60 statements of a static nature, not involving lists of recursiveness. The output is a machine-independent intermediate language, designed for efficient assembly into the particular language of any individual computer. The translator is aware, at any given moment, of no more than 4 entities from the source language. There is neither back-up nor look ahead. Translation occurs through the use of a push-down list of operators and associated addresses, the process being governed by a comparison of the strengths of the operators. This comparison is mainly effected by the numerical relationship of the internal representations of the operators, and usually occurs without having to determine the identity of either operator. The operation part of a command is normally generated by automatic manipulation of the responsible operator, again making it unnecessary to identify the operator. The complete ordering, representation, and placement lists on which automation of the process depends are given and the algebraic system is developed in detail. (Contractor's abstract)

SUPERSONIC FLOW PAST WEDGES OF VARIABLE ANGLE, by M. Holt and B. Yim. [1962] [13]p. incl. diagrs. tables. (AFOSR-3139) (In cooperation with Brown U., Providence, R. I.) (AF 49(638)232 and AF AFOSR-62-277) AD 413747 Unclassified

Also published in Proc. Fourth U. S. Nat'l. Cong. Appl. Mech., California U., Berkeley (June 18-21, 1962), New York, Amer. Soc. Mech. Engineers, v. 2: 1301-1313, 1962.

The problem of supersonic flow past a double wedge wing of constant chord and thickness varying along the span is considered. The major part of the paper is concerned with the flow field near the forward faces. This is a small rotational perturbation of uniform flow and the additional pressure satisfies the wave equation. The solution determining this flow field is derived in 2 cases corresponding to a variation of maximum thickness which is (a) linear, (b) sinusoidal in the spanwise coordinate. The flow problem near the forward faces can be reduced to that of finding the function defining the departure of the shock surface from its plane, 2-dimensional form (corresponding to a wedge of uniform thickness). In case (a) it is shown that the shock surface is wedge-like with a thickness proportional to that of the solid wedge. In each plane normal to the span the flow follows the 2-dimensional pattern. In case (b) an integrodifferential difference equation is derived for the shock distortion function. The solution of this is shown to exist and to be unique and is given in the form of a series expansion in chordwise distance from the shock. Formulae giving the pressure and velocity components in terms of the shock distortion function are derived. The pressure and chordwise velocity component on the surface are

computed for a range of wedge angles between 5° and 20° and Mach numbers between 3.0 and 4.2. The continuation of the flow field through the centered expansions at the shoulders and past the rear wedge faces is discussed. This can be calculated by a linearized method of characteristics which is much simpler in case (b) than in case (a). (Contractor's abstract)

CYLINDER DRAG IN THE TRANSITION FROM CONTINUUM TO FREE-MOLECULE FLOW, by G. J. Maslach and S. A. Schaaf. [1962] [18]p. incl. illus. diagrs. table, refs. (Rept. no. HE-150-194; series no. 20; issue no. 138) (AFOSR-3744) (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245) AD 274385 Unclassified

Also published in Phys. Fluids, v. 6: 315-321, Mar. 1963.

The drag coefficients for cylinders normal to the flow have been determined experimentally at approximately Mach ~ 2, Mach ~ 4, and Mach ~6 with Knudsen numbers extending from continuum conditions to free molecule flow conditions. The results indicate a smooth transition from inviscid values at low Knudsen numbers to free molecule flow predictions for diffuse reflections at high Knudsen number. Small departure theories which are applicable to the near free molecule flow regime are compared to the experimental data. (Contractor's abstract)

DIFFUSIVE SEPARATION OF A GAS MIXTURE APPROACHING A SAMPLING PROBE, by B. S. Masson Oct. 31, 1962, 57p. incl. diagrs. refs. (Rept. no. HE-150-206; series no. 20; issue no. 141) (AFOSR-4166) (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245) AD 288657 Unclassified

The effect of inserting a probe into a flow field of a flowing gas mixture to obtain localized concentration measurements is considered. The diffusion mechanisms, due to the baro-diffusion and the thermal diffusion effects that cause the concentration variations in the original flow field, cause further changes in the mixture composition during the sampling process. The corrections in the measured composition due to the presence of the probe are calculated for a specific experiment using air as the gas mixture. The corrections are presented as curves for Mach numbers of the approaching stream between 0.1 and 0.4, and Reynolds numbers of the probe between 0.4 and 40. The corrections are based upon the numerical integration of the diffusion equation derived in the Chapman-Enskog Kinetic Theory. The fluid dynamic effects due to the composition change are ignored by using existing pure flow solutions in the flow model. Baro-diffusion is retained as the primary component-separating mechanism in the sampling region. The variation in the composition of the mixture along the stagnation streamline of the approaching flow is found. The total change in composition found here is taken as the correction desired for the probe presence. (Contractor's abstract)

AERO-FORCES ACTING ON A BLUNT BODY WITH SEPARATED FLOW, by T. S. Yuen. Oct. 30, 1962, 50p. incl. illus. diagrs. tables, refs. (Rept. no. HE-150-203; series no. 20; issue no. 140) (AFOSR-4167) (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245) AD 288656 Unclassified

Normal and axial force coefficients were calculated theoretically for a blunt body. Concurrently, aerodynamic forces acting on a model of the same body type were measured in a supersonic rarefied gas flow at a Reynolds number of 2260/in. and nominal Mach number of 4.0, so that the laminar separation was involved in the area bounded by the cylinder and cone. Two parameters were under consideration, the angle of attack varying from zero to 20°, and the position of the skirt relative to the tip of the central cylindrical body changing from z = 0.092 to 1.429 in. The experimental results, plotted in coefficient form, were compared to the theoretical predictions which consisted of Newtonian hypersonic theory with viscous corrections. The axial force coefficients based on the experimental data were within 3% of the predicted values at low angles of attack (less than 6°). The experimental normal force coefficients

were adequately predicted with a similar trend by the theoretical analysis with a maximum error of about 15% over the entire range of both angle of attack and center body position. (Contractor's abstract)

ON THE MOLECULAR INTERACTIONS BETWEEN GASES AND SOLIDS, by F. C. Hurlbut. Nov. 15, 1962 [31]p. incl. diagr. tables, refs. (Rept. no. HE-150-208; series no. 20; issue. no. 142) (AFOSR-4981) (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245) AD 295409 Unclassified

Also published in Symposium on Dynamics of Manned Lifting Planetary Entry, Philadelphia, Pa. (Oct. 1962), ed. by S. M. Scala, A. C. Harrison, and M. Rogers. New York, John Wiley & Sons, 1963, p. 754-777.

Problems of energy and momentum transfer between the gas particle and the surface are examined with attention given to those processes which directly influence the flow under free molecule and near free molecule conditions. A review of early and also very recent scattering studies reveals consistent trends in the reflected angular distribution in particle flux from cleaved and degassed alkali halide crystals and from certain degassed metal surfaces. These observations lend support to a dynamical model of the lattice in interaction with the gas particle. In connection with the discussion of this model three broad regimes of interaction in the presence of attractive forces are defined. (Contractor's abstract)

HYPERSONIC FLOW OVER A SLENDER CONE WITH GAS INJECTION, by H. H. King. Nov. 5, 1962, 105p. incl. illus. diagrs. tables, refs. (Rept. no. HE-150-205. series no. 196; issue no. 1) (AFOSR-4985) (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245; and General Electric Co.) AD 295154 Unclassified

The main object of the present study was the experimental investigation of the effect of gas injection on the drag and pressure distribution on a 5° half-angle porous cone. Both helium and air injection were employed at two Mach-Reynolds number combinations attainable in the Berkeley low density wind tunnel. The first part of the report presents a general discussion of the experiment, the experimental data obtained, and the comparison of these data with theory. Section 2 is a detailed discussion of the experimental procedure and the methods of data reduction, while Section 3 presents the approximate boundary layer analysis which is useful for interpreting the experimental data. A discussion of the accuracy of the various experimental results and tabulations of data appear in the Appendix. (Contractor's abstract)

AN EXPERIMENTAL INVESTIGATION OF FREE MOLECULE MOMENTUM TRANSFER BETWEEN GASES AND METALLIC SURFACES by R. E. Stickney Doctoral thesis, Jan. 25, 1962, 145p. incl. illus. diagrs. tables, refs. (Rept. no. HE-150-182; series no. 20; issue no. 134) (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245) AD 273495 Unclassified

Published in part in Phys. Fluids, v. 5: 1617-1624, Dec. 1962. (Title varies)

Measurements of the normal momentum transfer between gases and metallic surfaces were obtained under conditions of free molecule flow by means of a torsion balance and molecular beam apparatus. Helium, hydrogen, neon, nitrogen, argon, and carbon dioxide were investigated on tungsten, platinum-blackened-tungsten, platinum, and aluminum surfaces which were most likely contaminated with oxides and adsorbed gases. Momentum transfer measurements were obtained with the surface at various temperatures, the range being from 25 to 550°C. The efficiency of the momentum transfer process increases with the molecular weight of the test gas and the roughness of the test surface, but is relatively independent of the surface material under the present conditions. The momentum transfer rates for helium and hydrogen are significantly less than for the heavier gases. The accommodation to the surface temperature is incomplete except, possibly, for argon and carbon dioxide. The results were used to estimate the values of the coefficient of translational energy transfer and a modified form of the coefficient of normal momentum transfer. (Contractor's abstract)

SPHERE DRAG IN A LOW-DENSITY SUPERSONIC FLOW, by J. Aroesty. [1962] [17]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under [Nonr-22245]) Unclassified

Published in Rarefied Gas Dynamic; Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press, Suppl. 2, v. 2: 261-277, 1963. (AFOSR-5310)

Sphere drag coefficients were measured at Mach numbers of 2, 4, and 6, and free stream Reynolds numbers between 10 and 10,000 for both insulated and cold wall conditions. The measurements indicate that sphere drag in this regime is strongly dependent on the Reynolds number behind a normal shock wave, and only weakly dependent on Mach number. In addition, it was found that a decrease in T_w/T_0 from 1 to 0.26 was accompanied by a 5-10% decrease in the drag coefficient. (Contractor's abstract)

STUDIES OF NORMAL MOMENTUM TRANSFER BY MOLECULAR BEAM TECHNIQUES, by R. E. Stickney and F. C. Hurlbut. [1962] [16]p. incl. illus. diagrs. (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under [Nonr-22245]) Unclassified

Published in Rarefied Gas Dynamics; Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press, Suppl. 2, v. 1: 454-469, 1963. (AFOSR-5310)

The transfer of normal momentum between gases and metallic surfaces has been studied under conditions of free molecular flow by means of a torsion balance and molecular beam apparatus. Thermal beams of helium, hydrogen, neon, nitrogen, carbon dioxide, and argon were directed against surfaces of tungsten, platinum blackened tungsten, platinum and aluminum with surface temperatures in the range 25° to 550°C. The efficiency of momentum transfer is found to increase with the molecular weight of the test gas and the roughness of the test surface, but is relatively independent of the substrate material, under present conditions. The momentum transfer rates for helium and hydrogen are significantly equal. The momentum accommodation of the test gases appears to be incomplete except, possibly, for argon and carbon dioxide. The results are used to estimate the value of a modified coefficient of momentum transfer for each gas-surface combination. (Contractor's abstract)

THE EFFECT OF GRAIN BOUNDARIES ON THE MECHANICAL PROPERTIES OF IONIC CRYSTALS, by S. Feuerstein and E. R. Parker. Jan. 1962 [63]p. incl. illus. diagrs. table, refs. (Technical rept. no. 5; series no. 150; issue no. 5) (AFOSR-2169) (AF 49(638)-601) AD 273425 Unclassified

Room temperature tensile tests were conducted on single crystal, bicrystal, and polycrystalline LiF. Their mechanical behaviors were compared and the effects resulting from the presence of grain boundaries evaluated. The fracture processes of single crystal and bicrystal specimens were also investigated. Favorably oriented, chemically-milled single crystals attained tensile strains as high as 27% before failing. Ductile fractures resulted from internal sources, but fractures from low strains were due to surface sources. Stress-strain curves of bicrystals indicated that grain boundaries in ionic crystals were not inherently weak. Plastic deformation in at least one grain always preceded fracture. The presence of a grain boundary afforded a strong barrier to dislocation motion, becoming more effective the greater the degree of bicrystal misorientation. Evidence of slip lines on only one side of matching intergranular surfaces revealed that transmission of slip across a grain boundary was difficult. Failures took place in a brittle fashion predominantly along an inter- and transgranular path. Strains at fracture seldom exceeded 2-1/2%. Small amounts of ductibility were observed in deformed, fine-grained polycrystalline specimens. A sharp rise in fracture stress was apparent in specimens whose average grain diameters approach 0.02 millimeters. (Contractor's abstract)

DUCTILE CERAMICS RESEARCH, by E. R. Parker, J. A. Pask, and J. Washburn. Final rept. Aug. 1962, 6p. incl. refs. (Series no. 150; issue no. 6) (AFOSR-3502) (AF 49(638)601) AD 283585 Unclassified

Work was confined to studies of cubic crystal ductility. Such material is highly ductile at room temperature when tested in single crystal form. Surface effects are extremely important and good ductility can be obtained only with specimens having carefully prepared chemically polished surfaces. It was found that MgO single crystals are ductile at room temperature and values of elongation in excess of 10% were obtained regularly. Alloying of ionic solids increased their strength. Recent work concerned grain boundary effects on the ductility of ionic solids; experiments indicated the smaller the grain size, the higher the strength, and the greater the probability of significant deformation before fracture. High purity is essential. Extrusion was chosen as a means of fabricating fine-grained LiF and slightly ductile specimens were obtained.

FRACTURE OF NONMETALLIC CRYSTALS, by T. L. Johnston and E. R. Parker. [1962] [21]p. incl. illus. diagrs. refs. (AF 49(638)601) Unclassified

Published in Fracture of Solids: Proc. Internat'l. Conf., Maple Valley, Washington (Aug. 21-24, 1962), ed. by D. C. Drucker and J. J. Gilman. New York, Interscience Publishers, 1963, p. 267-287.

Investigations with nonmetallic crystals have been more fruitful than those with metals in revealing the role played by dislocations in initiating cracks. There is clear experimental evidence that cracks can form in a number of ways as a consequence of heterogeneous plastic flow. It has been demonstrated that the applied stress required to form a crack at the grain boundary in a magnesium oxide bicrystal depends inversely on the distance between the grain boundary and the nucleation site of the glide band causing the crack, as suggested by theory. The choice of nucleation mechanism and the amount of deformation preceding fracture is associated phenomenologically with the character of slip band formation which is governed primarily by the temperature. Although single nonmetallic crystals can often be deformed readily at low temperatures, polycrystalline aggregates are notably more brittle. Recent experiments with lithium fluoride have shown that, under certain conditions, even polycrystalline material can possess limited tensile elongation at room temperature (values in excess of 1/2% have recently been obtained).

INTERNAL STRESSES IN MODEL CERAMIC SYSTEMS III, by R. M. Fulrath and J. A. Pask. Final rept. Nov. 1, 1962, 15p. incl. refs. (Series no. 119; issue no. 3) (AFOSR-4439) (AF 49(638)4) AD 291849 Unclassified

A unique fabrication procedure of vacuum hot-pressing multicomponent systems was used to form model ceramic systems for studying internal stresses. Methods of analysis of internal stress combining the microstructural features and x-ray diffraction patterns were developed. Three different particle shapes dispersed in glassy matrices were studied. Internal stresses were found to be of secondary importance in systems with strong interfacial bonds and of primary importance in systems in which strong interfacial bonds were not developed.

HEAT CONTENT OF PLATINUM, by R. Hultgren, W. B. Kendall, and R. L. Orr. [1962] [3]p. incl. diagrs. tables, refs. (Materials Science Series Contribution no. 149; I. E. R. Reprint no. 10-63) (AFOSR-J342) (AF 49(638)83) AD 408022; AD 404959 Unclassified

Also published in Jour. Chem. and Eng. Data, v. 7: 515-518, Oct. 1962.

Chemical inertness, high melting point, and freedom from allotropic and magnetic transformations give platinum obvious advantages as a secondary standard for calibrating high-temperature calorimeters. However, currently accepted tables of the heat content of platinum can be criticized because the values below 500°K are too high to join smoothly with reliable low-temperature (< 298°K) heat capacity data, and because the tables are based mainly on the drop calorimetry of Jaeger and others in which the heat lost by the sample during the drop was not properly taken into account. The performance of a diphenyl ether calorimeter used in the laboratory is routinely checked by dropping samples of platinum. The results so obtained scatter considerably more than those by Jaeger and others from larger samples, but they do show clearly that the over-all systematic error in Jaeger's work is very small. They also show the previously tabulated heat contents at 400° and 500°K are somewhat too high. (Contractor's abstract)

SOME OBSERVATIONS ON THE PHYSIOLOGICAL EFFECTS OF GASEOUS IONS, by A. P. Krueger, S. Kotaka, and P. C. Andriese. [1962] [16]p. incl. diagrs. tables, refs. (AFOSR-J264) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)-669 and Public Health Service) AD 400888; AD 416072 Unclassified

Also published in Internat'l. Jour. Biometeor., v. 6: 33-48, 1962.

This paper reviews some of the evidence pertaining to the biological effects of gaseous ions. It appears that experimental data now available warrant the conclusion that reproducible biological effects occur in a variety of living forms including microorganisms, higher plants, insects, animals and man. The responses generally are limited in extent and to indict air ions as their sole cause requires great care in defining the experimental conditions. Some progress has been made in detecting the fundamental biochemical reactions associated with ion-induced physiological changes. The ready availability of excellent apparatus for generation and measurement of air-ions, coupled with present day knowledge about their properties, makes critical experimentation possible. COMPUTER LOCATION OF LOCAL EARTHQUAKES WITHIN THE BERKELEY SEISMOGRAPHIC NETWORK, by B. A. Bolt and T. Turcotte. [1962] [15]p. incl. diagrs. (AF 49(638)904) AD 439072 Unclassified

Also published in Computers in the Mineral Industries: Proc. Third annual Conf., Stanford U., Calif. (June 24-29, 1963), ed. by G. A. Parks. Stanford, School of Earth Sciences, Pt. 2: 561-576, 1964.

Since 1887 the Berkeley seismographic station has been used for the study of earthquake occurrence in central and northern California. The present network consists of some 20 stations in California and Nevada. Eight new stations telemeter signals directly to Berkeley. The present network allows a much more precise determination of the position and origin-time of earthquakes within the region than previously possible. Measurements of the main recorded seismic phases are placed by station staff directly onto Hollerith format sheets. A program has been coded for an IBM 7090 which sorts out the travel-times from a provisional earthquake focus

to each station for the main observed phases. A 2-layered crust is assumed based on earlier work by Byerly; the layer parameters may be varied at will. One run of the program can accommodate data from as many as 50 stations for any number of earthquakes. It uses only P-wave arrival times, but computes also theoretical times for the various S-wave arrivals for the assumed structure. (Contractor's abstract)

THE INTERSECTION OF FIBONACCI SEQUENCES, by S. K. Stein. [1962] [4]p. (AFOSR-J530) (AF AFOSR-62-299) AD 407872 Unclassified

Also published in Michigan Math. Jour., v. 9: 399-402, 1963.

For the construction of a groupoid satisfying the identity $a((a \cdot ba)a) = b$ but not the identity $(a(ab \cdot a))a = b$, it was necessary to examine the intersection of Fibonacci sequences. If n is a positive integer and $F_1, F_2 \ldots, F_s$ are Fibonacci sequences, then there is an integer $m > n$ such that $\bar{F}(n, m) \cap \bar{F}_i$ consists of at most the element n, for each $i = 1, 2, \ldots s$. It is proven that 2 Fibonacci sequences generally do not meet and that if they do meet at least 3 times, then one is simply the tail of the other.

FINITE MODELS OF IDENTITIES, by S. K. Stein. [1962] [7]p. [AF AFOSR-62-259] Unclassified

Published in Proc. Amer. Math. Soc., v. 14: 216-222, Apr. 1963.

If Φ is a set of identities on a groupoid (a set closed under a binary operation), the $nV(\Phi)$ denotes the variety, i.e., the class of groupoids, satisfying Φ. A number-theoretic construction is used to exhibit an infinite with a nontrivial $V(\Phi)$ which has only one finite member. Another type of example shows that with Φ consisting of just one identity, varieties can be constructed which, though possessing an infinite set of finite members, are not determined by them. These latter examples are based upon identities obtained by equating compositions of so-called translations, that is, mappings $R_a : x \to xa$ and $L_a : x \to ax$. (Math. Rev. abstract)

DIFFICULTY IN THE METHOD OF GREEN'S FUNCTIONS FOR A MANY-BODY SYSTEM, by R. Ballian, L. H. Nosanow, and N. R. Werthamer. [1962] [4]p. incl. refs. (AFOSR-2559) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)-1038 and Atomic Energy Commission) Unclassified

Also published in Phys. Rev. Ltrs., v. 8: 372-375, May 1, 1962.

The method of Green's functions based on the infinite set (S) of coupled equations (with boundary conditions) satisfied by the sequence of n-particle Green's functions, has been used extensively in the theory of superconductivity. It has been shown, by solving an example exactly that (S) may possess spurious solutions, some of which lead to an energy lower than the true ground-state energy and so do not correspond to any state wave function. Thus the Green's function method as usually formulated is not a complete dynamical description of the system, and requires in addition some criterion to distinguish these extraneous solutions from the correct one. This work was developed in order to choose between the contradictory theories of the possible superfluid phase of He^3.

SUPERCONDUCTIVITY WITH COMBINED PARALLEL AND ANTIPARALLEL SPIN PAIRING, by N. R. Werthamer, H. Suhl, and T. Soda. [1962] [3]p. incl. refs. (AFOSR-3661) (AF 49(638)1038) Unclassified

Also published in Proc. Eighth Internat'l. Conf. on Low Temperature Phys., London (Gt. Brit.) (Sept. 16-22, 1962), Washington, D. C., Butterworths, 1963, p. 140-142.

In this paper the conditions on the interparticle potential are relaxed and the superconducting phase is investigated when allowing pairs with both even and odd angular momentum, and correspondingly both singlet and triplet spin states. Because of the presence of pairs with parallel spins, the paramagnetic ground state exhibits a nonvanishing spin susceptibility, and also is free from undesirable circulation orbital currents. Although a variety of formalisms exist in which to generalize the spin pairing in superconductors, the most convenient and compact seems to be that using Green's functions.

SUPERCONDUCTIVITY NEAR IMPURITIES, by H. Suhl, D. R. Fredkin and others. [1962] [3]p. incl. refs. (AFOSR-3662) (AF 49(638)1038) AD 612340 Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 63-65, July 15, 1962.

Resonant scattering of conduction electrons by transition element impurities in dilute solid solution, and localization of a magnetic moment around the impurity can lead to a localized region of coherent pairing of electrons. In this report, the author speculates that resonance effects could also lead to a similarly localized region of coherent pairing of electrons. A model is considered in which the impurity potential is strongly

localized (has a constant matrix element) and the one-electron conduction band is characterized by a single peak in its density-of-states curve.

ENHANCEMENT OF HYDRODYNAMIC STABILITY BY MODULATION, by R. J. Donnelly, F. Reif, and H. Suhl. [1962] [3]p. incl. diagrs. (AFOSR-J105) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1038 and Office of Naval Research) AD 400465 Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 363-365, Nov. 1, 1962.

A rotating cylinder viscometer, with metal cylinders, and filled with CCl_4 was built, in which the inner cylinder rotates and an electrical bias can be applied to a short insulated section of the outer cylinder. This outer cylinder can be moved axially so that the distribution of velocity in the liquid can be studied as a function of the current collected by the electrode at the particular axial position, the motion of the fluid producing changes in the current which also depends on the mobility of the ion species present and their diffusion constants. The speed of the inner cylinder can be modulated by sinusoidal variation about a controlled steady speed and conditions of modulation were determined which show a marked enhancement of stability. It is suggested that this method might be applied to boundary-layer control.

A NOTE ON THE SHORT-RANGE ORDER AT THE FERROMAGNETIC CURIE POINT, by D. R. Fredkin and H. Suhl. [1962] [2]p. (AFOSR-J590) (AF 49(638)-1038) AD 413749 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 24: 217-218, Feb. 1963.

Ordinary thermodynamic fluctuation theory, which assumes a Gaussian fluctuation ensemble, leads to complete ordering of a Heisenberg ferromagnet at the Curie point. It is shown that a simple extension of the usual theory, utilizing Landau's phenomenological theory of second-order phase transitions, remedies this difficulty. The relation of this approach to molecular field theory is discussed.

SATURATION OF FERRIMAGNETIC RESONANCE WITH PARALLEL PUMPING (Abstract), by F. Gottlieb and H. Suhl. [1962] [1]p. [AF 49(638)1038] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 279, Apr. 23, 1962.

The microwave susceptibility for subsidiary ferrimagnetic resonance with parallel pumping is calculated from the saturation amplitude of the unstable spinwaves. The saturation is caused by the nonlinear damping effects of the three, four, and higher-number magnon interactions. The rate of energy dissipation due to these interactions is proportional to the amplitude of each magnon participating: if two or more magnons belong to the unstable group, the dissipation rate will be nonlinear in the unstable spin-wave amplitude. The requirement that two or more of the magnons be of the same frequency can only be satisfied below a certain dc magnetic field. As the order of the interaction (number of participating magnons) increases, the strength of the interaction decreases, but the limiting upper field increases so that each of these interactions is important for a specific range of dc magnetic field, and this gives rise to a step-shaped curve for the susceptibility. The location of these steps as a function of magnetic field is found to agree with the experimental results of Hartwick and Peressini.

THE SECOND ORDER EFFECT OF APPLIED ELECTRIC FIELDS ON THE ELECTRON SPIN RESONANCE OF IMPURITY IONS IN Al_2O_3 AND IN MgO (Abstract), by M. Weger and E. Feher. [1962] [1]p. (AF 49(638)1040) Unclassified

The first order Stark effect of the Cr^{+++} ions in Al_2O_3 has been first observed in the $\frac{3}{2} \rightleftharpoons \frac{1}{2}$ transitions by Arumen and Murphy. The second order Stark effect in the $\frac{1}{2} \rightleftharpoons \frac{1}{2}$ transition of Cr^{+++} in Al_2O_3 and in MgO was observed. The effect exhibits itself as a shift in the electron spin resonance line, proportional to the electric field squared. The shifts were estimated by modulating the electric field and comparing the signal with the one obtained with magnetic field modulation. The signal obtained with a field modulation of 10^5 v/cm had the same amplitude as was obtained with magnetic field modulation of 100 milligauss for Cr^{+++} in Al_2O_3 and of 4 milligauss for Cr^{+++} in MgO. The second order Stark effect was also observed in the resonance spectrum of Fe^{+++} and Mn^{++} in MgO. The experiments were performed at 10^{10} cps and at 300°K.

EFFECTS OF STRAIN ON THE SUPERCONDUCTING TRANSITION IN THE MERCURY-INDIUM SYSTEM, by M. F. Merriam and M. A. Jensen. [1962] [8]p. incl. diagrs. (AFOSR-J579) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-344 and National Science Foundation) Unclassified

Also published in Cryogenics, v. 2: 301-304, Sept. 1962.

Investigating superconductivity in the Hg-In system, it was found that the superconducting transition temperature can be increased considerably by strain. Under the most favorable conditions, this increase is more than 1°K. The most important condition for a large increase in superconducting transition temperature (T_c) to occur is that the sample has a composition corresponding to a 2-phase or solid solution region of the phase diagram. The increase in T_c is very small for the 2 intermetallic compounds in this sytem, as well as for pure Hg and In.

SUPERCONDUCTIVITY IN SOME MERCURY COMPOUNDS WITH FEWER THAN TWO VALENCE ELECTRONS PER ATOM (Abstract), by M. F. Merriam. [1962] [1]p. [AF AFOSR-62-344] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 474, Aug. 27, 1962.

Superconductivity has not been found so far in elements with fewer than two valence electrons per atom. In order to determine whether this situation can be correlated simply with a deficiency of valence electrons or whether other variables are more important, several compounds of Hg with alkali metals and noble metals have been studied for superconductivity. The superconducting transition temperatures of the compounds of mercury with any given element decrease monotonically with decreasing electron concentration; other chemical variables (structure, volume per electron, etc.) appear less important. Superconducting transition temperatures fall below 1°K at about 1.5 valence electrons per atom. The following approximate transition temperatures were obtained: Hg_4Na, 3.0°K; Hg_2Na, 1.6°K; Hg_3Li, 1.8°K; and Hg_4Pt, 3.5°K. Compounds found not superconducting at 1.1°K included Hg_2Na_3, Hg_2Pt, and $Hg_{0.57}Ag_{0.43}$ (γ-brass phase).

California U. [Dept. of Physics] La Jolla.

SUPERCONDUCTIVITY IN THE SYSTEM MERCURY-INDIUM (Abstract), by M. F. Merriam and M. A. Jensen. [1962] [1]p. [AF AFOSR-62-344] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 176, Mar. 26, 1962.

Alloys covering the composition range from pure Hg to 85 at. % In have been prepared by quenching the melt in liquid nitrogen from 200-250°C. Superconductivity was detected by measuring the self-inductance of a coil containing the specimen and was observed at all compositions. Transition temperatures ranged from below 3.2°K for 20 at. % In to above 6.0°K for 80 at. % In, and varied strongly as a function of composition. A single, reasonably sharp, superconducting transition was taken as indication of a homogeneous composition. Transition widths varied from a few hundredths to a few tenths of a degree.

PRESSURE VARIATIONS ACCOMPANYING A PLANE WAVE PROPAGATED ALONG THE OCEAN BOTTOM, by H. Bradner. [1962] [3]p. incl. diagrs. (AFOSR-4382) (Sponsored jointly by Advance Research Projects Agency and Air Force Office of Scientific Research under AF 49(638)905) AD 295963 Unclassified

Also published in Jour. Geophys. Research, v. 67: 3631-3633, Aug. 1962.

The use of pressure transducers instead of seismographs on the ocean floor has been suggested as a way to detect small vertical bottom motions. The following valid argument has been used to estimate the ratio, in the limiting case of waves that are long compared with the water depth; the water above a given section of the bottom rises and falls as a cylinder. The pressure variations will then be just the force required to accelerate a column of water of length equal to the ocean depth. The ratio of pressure to velocity for other cases than the long wavelength limit is estimated by looking at the solution for plane wave propagation in a uniform liquid layer above a semi-infinite uniform solid bottom.

COMPARATIVE SPECTRA OF MICROSEISMS AND

SWELL, by R. A. Haubrich, W. H. Munk and F. E. Snodgrass. [1962] [11]p. incl. diagrs. refs. (AFOSR-J251) (AF 49(638)905) AD 400864 Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 53: 27-37, Jan. 1963.

Spectra of seismic and ocean wave recordings near San Diego, Calif., show closely related features. The wave spectra consist of a sharp peak whose frequency, f(t), increases linearly with time and consistent with the expected dispersive behavior from a source at 6150 nautical mi (presumably a storm in the Ross Sea). The seismic spectra show peaks at f(t) and at 2 f(t); the double frequency peak contains 100 times the energy of the peak at the primary frequency. A comparison between the peak frequencies and band widths of the seismic and ocean wave spectra, and an estimate of the direction and beam width of the seismic radiation leads to the following conclusions: that the microseismic generation area is predominantly local, being confined to distance of 100 mi up or down the coast. For the primary frequencies the generative strip is presumably confined to shallow water; for the double frequencies it extends 200 mi seaward.

EFFECTS OF LSD-25, PSILOCYBIN, AND PSILOCIN ON TEMPORAL LOBE EEG PATTERNS AND LEARNED BEHAVIOR IN THE CAT, by W. R. Adey, F. R. Bell, and B. J. Dennis. [1962] [12]p. incl. illus. diagrs. refs. (AFOSR-J1060) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)686 and Public Health Service) AD 420289 Unclassified

Also published in Neurology, v. 12: 591-602, Sept. 1962.

With 25 to 100 μg of LSD-25 cats adopted a wide-based "kangaroo" posture with tail extended, and exhibited staring, head shaking and sprawling with claws extended. There was a loss of normal affective response. With LSD-25 dosage around 25 μg per kg brief seizure-like episodes were seen in EEG records in a quiet environment. These seizures seemed critically dependent on reduction of visual and auditory sensory influences. At higher doses of LSD-25 (around 100 μg per kg) seizures persisted in well-lit environments and disrupted a delayed response performance. Tolerance of LSD-25 appeared with frequently repeated doses (intervals less than 7-10 days). Psilocybin and psilocin resembled LSD-25 in general effects but differed in the brevity of their action and the frequency of severe autonomic reactions (vomiting, pupillary dilatation, etc.). These findings and their relation to physiologic mechanisms in the memory trace and to problems of sensory deprivation are discussed.

SELF-MAINTAINED VISUAL STIMULATION IN MONKEYS AFTER LONG-TERM VISUAL DEPRIVATION, by R. H. Wendt, D. F. Lindsley and others. [1962] [2]p. incl. diagr. (AFOSR-J1065) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)686 and Public Health Service) AD 419439 Unclassified

Also published in Science, v. 139: 336-338, Jan. 25, 1963.

Newborn monkeys reared in darkness for 16 months, except for daily 1-hr periods of exposure to unpatterned light, were allowed to press a lever to obtain unpatterned light. The animals showed apparently insatiable responding, at rates that were extremely high as compared with rates for normally reared control animals. (Contractor's abstract)

SPECTRA AND AVERAGE SHAPES OF SLOW WAVES IN THE HIPPOCAMPAL SYSTEM DURING TRAINING (Abetract), by D. O. Walter. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)686 and Public Health Service) Unclassified

Presented at Forty-fifth annual meeting of the Fed. of Amer. Soc. for Exper. Biol., Atlantic City, N. J., Apr. 10-14, 1961.

Published in Fed. Proc., v. 20: 335, Mar. 1961.

The objective evaluation of EEG data by machine computation was utilized by Adey, Dunlop and Hendrix in auto- and cross-correlating slow waves seen in training records from regions of the hippocampal system. The present study includes auto- and cross-spectra, phase angles and coherence of similar data. These functions are applied in confirming those authors' result that hippocampal entorhinal phase angles differ in early vs late stages in acquisition of a conditioned discrimination. They are now shown to differ during correct vs incorrect responses, at the same stage. An

analytic method, suggested by Remond, has also been applied, which times the sampling of each EEG channel by upward zero-crossings of a chosen channel. With this technique evidence has been sought for a pace-maker of varying period, producing rhythmic phenomena in separate regions of the hippocampal system. Since this method retains harmonic relations within each trace, it has allowed an extension and clarification of the "phase-comparator" action proposed for rhinencephalic structures by the above authors. (Contractor s abstract)

BRAIN FUNCTION. VOL. II. RNA AND BRAIN FUNCTION; MEMORY AND LEARNING, PROCEEDINGS OF THE SECOND CONFERENCE, Los Angeles, Calif., 1962, ed. by M. A. B. Brazier, Berkeley and Los Angeles, California U. Press, 1964, 360p. incl. illus. diagrs. tables, refs. (UCLA Forum in Medical Sciences no. 2) (AFOSR-65-1499) (AF AFOSR-61-77) Unclassified

The UCLA Forum in Medical Sciences was created to review, synthesize and analyze topics, from various areas of biology, chemistry and physics to applied medical arts. This second volume deals with the exploration of brain mechanisms underlying the phenomena of learning and memory, with particular reference to the contrast between information storage in genetic and in memory processes. The state of nucleic acid coding in genetics was reviewed, earlier efforts to identify such a nucleic acid base for information storage and retrieval in the nervous system was re-examined, and an attempt was made to evaluate the justification for carrying over some of the advances in genetic coding to the processes of learning and memory.

POTENTIAL FOR TELEMETRY IN THE RECORDING OF BRAIN WAVES FROM ANIMALS AND MEN EXPOSED TO THE STRESSES OF SPACE FLIGHT, by W. R. Adey. [1962] [14]p. incl. illus. diagrs. (AFOSR-5345) (AF AFOSR-61-81) AD 421749 Unclassified

Published in Bio-Telemetry; Proc. of Interdisciplinary Conf. on the Use of Telemetry in Animal Behavior and Physiology in Relation to Ecological Problems, New York (Mar. 28-31, 1962), ed. by L. E. Slater. New York, Pergamon Press, 1963, p. 289-302.

The feasibility of EEG telemetry from animals and men in space flight is discussed. Prime consideration is given to the development of an appropriate implantation technique to permit recording from deep brain waves, development of special hardware for the EEG recording, special testing involved in the environmental aspect of centrifuging and shaking during recording, and data analysis in flight to minimize telemetry.

EEG IN SIMULATED STRESSES OF SPACE FLIGHT WITH SPECIAL REFERENCE TO PROBLEMS OF VIBRATION, by W. R. Adey, W. D. Winters and others. [1962] [16]p. incl. illus. table, refs. (AFOSR-5346) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-81 and National Aeronautics and Space Administration) AD 421729 Unclassified

Presented at meeting of the Amer. Electroencephalographic Soc., Atlantic City, N. J., June 1962.

Also published in Electroencephalog. and Clin. Neurophysiol., v. 15: 305-320, Apr. 1963.

The effects of shaking on the electrical brain activity in cortical and subcortical structures were examined in 4 pig-tailed macaques. Shaking was performed over a continuous spectrum from 5-40 cps at a peak acceleration of 2 g over the greater part of the spectrum. Driving of brain rhythms at the shaking frequency, primarily 9-15 cps, was noted in the midbrain reticular formation, the nucleus centrum medianum, the visual cortex, and the hippocampal system. An essentially different distribution of driving was produced by photic stimulation.

INFLUENCE OF SIMULATED ALTITUDE (18,000 FEET) ON FORMATION OF EXPERIMENTAL VESICAL CALCULI IN MALE RATS, by A. T. K. Cockett. [1962] [4]p. incl. illus. tables. (AFOSR-31453) (AF AFOSR-61-81) AD 427527 Unclassified

Also published in Jour. Urol., 89: 676-679, May 1963.

A method for the formation of vesical calculi in male rats at simulated altitudes is presented. Weight of bladder calculi formed experimentally in male rats at low barometric pressure without hypoxia (18,000 ft) is not significantly greater than calculi formed experimentally in rats at ground level. The significance of dehydration rather than altitude in flying personnel is mentioned. The possibility of urinary calculi as a result of extended space flight must await studies performed under altitude and prolonged weightless conditions. (Contractor's abstract)

APPLICATION OF PHASE DETECTION AND AVERAGING TECHNIQUES IN COMPUTER ANALYSIS OF EEG RECORDS IN THE CAT, by W. R. Adey and D. O. Walter. [1962] [24]p. incl. diagrs. refs. (AFOSR-64-1193) (Sponsored jointly by Air Force Office of Scientific

Research under AF AFOSR-61-81, National Aeronautics and Space Administration and Nadonal Institutes of Health) AD 442998 Unclassified

Also published in Exper. Neurol., v. 7: 186-209, Jan. 1963.

Consistency of phase patterns in EEG records from the hippocampal system and midbrain reticular formation have been examined in the course of behavioral training in 5 cats with implanted electrodes. These studies have involved novel application of computing techniques, including continuous measurement of phase and amplitude characteristics of single wave trains by digital filtering techniques, the use of cross-spectral analyses with calculation of complex transfer functions, and averaging of records during repeated behavioral performances with calculation of coherence functions in cross-spectral examinations. It was found that rhythmicity appeared in the computed average at the rate of the dominant EEG frequency as T-maze performance reached a high level, and was related to a reduction in scatter in phase patterns at high performance levels. Reversal of behavioral cues was associated with an immediate brief increase in rhythmicity of the average, then a decline followed by a progressive reemergence of rhythmicity at the end of retraining. Continuous phase-and-amplitude examinations during delayed response performance indicated a rhythmic phase modulation on wave trains with an apparently single frequency appearing during periods of discrimination. Comparison of probability bounds in cross-spectral analysis with use of a polar coordinate display have indicated major differences in phase relations between different hippocampal regions between correct responses in certain circumstances, with consistency in different examinations. These findings are discussed in relation to a stochastic model of the cerebral system, with reference to the possible role of the wave process in handling and storage of information.

HIPPOCAMPAL MECHANISMS IN PROCESSES OF MEMORY: THOUGHTS ON A MODEL OF CEREBRAL ORGANIZATION IN LEARNING, by W. R. Adey. [1962] [44]p. incl. diagrs. refs. (AFOSR-65-1502) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-81 and National Institutes of Health) AD 623060 Unclassified

Also published in Brain Function: RNA and Brain Function; Memory and Learning: Proc. Second Conf., Los Angeles, Calif., 1962, ed. by M. A. B. Brazier. Berkeley and Los Angeles, California U. Press, v. 2: 243-276, 1964. (AFOSR-65-1499)

A discussion is presented of the ablation and drug studies of the system organization of the hippocampus in animals. These studies support the idea that the hippocampal system is vitally concerned in the continued capability to make a discriminative performance involving the integrity of both recent and long-term memory functions. Computer analyses of various aspects of wave processes during discriminative learning indicated strong support of the hypothesis of conveyance of information on the basis of graded analog wave processes. Physicochemical changes in learning were directly monitored by application of impedance measuring techniques to the learning process. (Contractor's abstract)

DIFFERING EEG SLEEP STAGES AND THEIR RESPONSE TO TONE STIMULATION IN THE CHIMP, by J. M. Rhodes, W. R. Adey and others. [1962] [1]p. (AF AFOSR-61-81) Unclassified

Presented at Fall meeting of the Amer. Physiol. Soc., Buffalo U., N. Y., Aug. 28-31, 1962.

Published in The Physiologist, v. 5: 264, Aug. 1963.

By the use of stereotaxically implanted electrodes in subcortical areas of the brain and screw electrodes over the cortex. It has been possible to study the relationships between cortical and subcortical areas during 30 all-night sleep sessions with 3 chimpanzees. Clicks were presented at different stages of sleep and averaged evoked responses calculated. The general pattern of sleep stages is similar to that found in humans. In contrast to that found with lower animals, hippocampal leads failed to show reciprocal rhythms with the cortical leads. During "paradoxical" stages, 2 patterns were noted which could be differentiated primarily by the presence or absence of amygdaloid "spindling". The responses to clicks varied with the different stages and, though decreased, continued to be seen in the "paradoxical" stage. The results suggest: (1) the possibility of a higher level of sleep control for primates than previously thought, and (2) "paradoxical" sleep may have at least 2 types, one of which may involve internalization of attention rather than deep sleep.

MUTUAL INFORMATION OF TWO PHYSIOLOGICAL RECORDS (Abstract), by D. O. Walter and D. Brown. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-81, National Aeronautics and Space Administration, and Public Health Service) Unclassified

Presented at Fall meeting of the Amer. Physiol. Soc., Buffalo U., N. Y., Aug. 28-31, 1962.

Published in The Physiologist, v. 6: 293, Nov. 1963.

The mutual information connecting 2 partially random functions is a general measure of interaction, and can be numerically estimated from physiological data. For two gaussian processes, i.e., those whose distribution of amplitudes follows the normal curve, the only relations possible are linear ones; here the cross-correlation function is sufficient to define the mutual information. Correlation, however, underestimates the mutual information for other distributions of amplitudes, or for such physiologically interesting relationships as

non-proportional response, or modulation of one signal by another. Lagged mutual information generalizes the cross-correlation function, and can be assembled into a cross-information function. Additional insight is provided by calculating the multivariate mutual information at several lags at once, these lags to be selected on the basis of the cross-information function. The degree of relationship indicated by cross-correlation vs that indicated by lagged and multivariate mutual information, between pairs of related electroencephalographic traces, will be compared, and the additional insight due to the new technique explained. The direct extension of such calculations to process additional parameters derived from EEG traces, such as filter outputs, will be shown to provide material for direct study of the cerebral coding of information transfer.

THE CRYSTAL STRUCTURE OF THE DIOLEFIN OF [2,2]PARACYCLOPHANE, by C. L. Coulter and K. N. Trueblood. [1962] [10]p. incl. diagrs. tables, refs. (AFOSR-65-2161) (AF 49(638)719) AD 627513
Unclassified

Also published in Acta Cryst., v. 16: 667-676, July 1963.

The diolefin of [2,2]paracyclophane ($C_{16}H_{12}$) forms monoclinic crystals with a_0 = 6.866, b_0 = 11.636, c_0 7.640A, β = 116.9°, and 2 molecules in the unit cell in space group $P2_1$ c. The structure has been refined by full matrix 3-dimensional least-squares methods, and the final parameters include small corrections for molecular libration. The aromatic rings are bent into a boat form about 14° at each end, and the bonds to the α-carbons are bent an additional 15° from the plane of the edge of each aromatic ring. The ring deformation may also be described as a folding of 16° about a line between the p-substituted atoms. The exocyclic single bond distance is 1.51A, at least 0.02A longer than normal. The lengthening is attributed in part to the orthogonality of the π-systems in the molecule and in part to intramolecular strain. Other distances are normal. The distribution of strain in the molecule is discussed.

THE CRYSTAL STRUCTURE OF TRIMETHYLOXOSULFONIUM PERCHLORATE $[(CH_3)_3SO]^+ClO_4^-$, by C. L. Coulter, P. K. Gantzel, and J. D. McCullough. [1962] [6]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)719 and National Science Foundation)
Unclassified

Published in Acta Cryst., v. 16: 676-681, July 1963.

Crystals of $[(CH_3)_3SO]^+ClO_4^-$ display tetragonal symmetry with unit cell dimensions a = 11.66 ± 0.01A and c = 5.99 ± 0.01A. The space group is $P\bar{4}2_1m$ with Z = 4. A satisfactory trial structure was found by use of a 3-dimensional Patterson summation and the refinement was carried out by means of 3-dimensional difference syntheses and least-squares routine on the IBM 7090. The $[(CH_3)_3SO^+$ ion is required crystallographically to have the symmetry m but it approximates the symmetry 3m. The perchlorate ions are cyrstallographically of 2 types, one with required symmetry $\bar{4}$ and the other with required symmetry mm2. However, the perchlorate ions of the second type achieve the required symmetry in a statistical (disordered) manner. Bond distances and angles in the trimethyloxosulfonium ion are:

S-C(1) = 1.78 ± 0.01A, S-C(2) = 1.76 ± 0.01A, S-O = 1.45 ± 0.01A, C(1)-S-C(1) = 105.6 ± 0.7°, C(1)-S-C(2) = 105.7 ± 0.5°, C(1)-S-O = 112.1 ± 0.5°, C(2)-S-O = 114.8 ± 0.6°. In the ordered perchlorate ions: Cl-O = 1.45 ± 0.01A, O-Cl-O = 111.5 ± 0.9° and 108.8 ± 0.9°. (Contractor's abstract)

HIGH PRESSURE CHEMISTRY. I. ULTRA RAPID RATES AT VERY HIGH PRESSURES, by W. F. Libby. [1962] [6]p. incl. refs. (AFOSR-2923) (AF 49(638)991)
Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 48: 1475-1480, Sept. 1962.

It appears to be true that strong shocks can cause chemical changes in solids at rates much higher than any known diffusion or nucleation growth mechanism can give. It is suggested that the extreme compressions caused by extreme pressures in the megabar region can convert

essentially the entire crystalline mass into a single activated complex which may be the often suggested metallic state all matter must give at extreme compression. Whether the transition state be metallic or not, the release of pressure following the passage of the shock wave causes the system to expand and thus to produce that form of ordinary matter which is stablest at the degree of expansion where the transition state ceases to be stable (in the case of the metallic manifestation, where it ceases to be metallic). Thus large masses of matter might be made to undergo certain special chemical changes at the incredible speeds corresponding to the duration of shock pressures. The special conditions are that compression of the original substance should give the same (metallic) transition state that compression of the product to the same density would have given and that the product be stabler at the conditions of compression, pressure, and temperature just following the passage of the shock wave and which first causes the (metallic) transition state to revert to an ordinary low pressure form. A particular case is thought to be the conversion of rhombohedral graphite to diamond by explosive shock. Another may be the formation of diamonds on impact in such meteorites as Canyon Diablo.

CHEMISTRY OF POSITIVE IONS. II. ION-MOLECULE REACTIONS IN RADIOLYSIS OF N-HEXANE AT LOW TEMPERATURES, by L. Kevan and W. F. Libby. [1962] [2]p. incl. table. (AFOSR-J452) (Also bound with its AFOSR-4864; AD 414457) (AF 49(638)901)
Unclassified

Also published in Jour. Chem. Phys., v. 37: 2496-2497, Nov. 15, 1962.

Tabulated results of Co^{60} radiolysis of n-hexane at various temperatures are presented. Analyses were carried out by gas chromatography using a flame ionization detector. It was also found that the yield of n-dodecane at room temperature was not affected by 0.03 M added iodine or by 1% added pentene, both of which have been widely used as radical scavengers. In addition, 8 mol % propylamine did not reduce the yield. This strongly indicates that carbonium ions formed by loss of atomic hydrogen from the original parent-ion radicals formed by the radiation are not important. The carbonium ions would be strongly acidic. The scavenger results at room temperature indicate that n-dodecane is formed by an ionic process involving the original ion radicals. The increase in yield shows that this process becomes more efficient at low temperatures.

ELECTRON TRANSFER AMONG THE TRANSITION ELEMENTS: THE CONTROLLING ROLE OF THE FRANCK-CONDON PRINCIPLE ON RATES, by W. F. Liffy. [1962] [16]p. incl. table, refs. (AFOSR-64-0027) (Also bound with its AFOSR-4864; AD 414457) (AF 49(638)901) AD 435953 Unclassified

Also published in Jour. Chem. Phys., v. 38: 420-425, Jan. 15, 1963.

The principle that electrons cannot be readily exchanged between aqueous ions of different valence, unless they possess sufficient geometrical similarity to reduce to a minimum the energy transfer required by the simultaneous and instantaneous conversion of an ion of one valence to another while a second is changed in the exact opposite way, has been firmly established. The Franck-Condon principle as applied to electron movement as well as to optical transitions thus has been found to be completely commanding in the case of electron exchange reactions transition element ions in aqueous solution, e.g., Fe^{2+} and Fe^{3+} exchange electrons slowly while $Fe(CN)_6^{4-}$ and $Fe(CN)_6^{3-}$ exchange very rapidly. Rapid electron exchange occurs also between MnO_4^{2-} and MnO_4^- even though the oxygen atoms do not exchange. Thus a type of tunneling of electrons is firmly proved to occur when the source and sink (reducing and oxidizing) ions (or molecules) satisfy the requirement of the Franck-Condon principle of being sufficiently similar geometrically to leave little need for change in hydration energy after the electron transfer. This principle should apply also to oxidation and reduction reactions among the transition elements, and the present work examines the available kinetic data (particularly those of Taube and co-workers) to establish the extent of this applicability which appears to be substantial.

THEORY OF METALLIC DIAMOND, by W. F. Libby. [1962] [5]p. (AFOSR-64-0030) (Also bound with its AFOSR-4864; AD 414457) (AF 49(638)901) AD 435951
Unclassified

Also published in Phys. Rev., v. 130: 548-549, April 15, 1963.

The fact that compression of Group IV elements and of Groups III-V and II-VI binary compounds forms new denser phases with 6 near neighbor body-centered tetragonal lattices which are metallic requires theoretical explanation. We think of this new set of metals as being typified by the expected new metallic phase of carbon to be obtained by compression of diamond which is called metallic diamond. It is proposed that this new class of metals of which tin is the only present example under ordinary conditions, and which may include a new metallic form of carbon denser than diamond called metallic diamond, can be understood as a 3-dimensional analog of the 2 dimensional metal graphite. The excess number of geometrically equivalent nearest neighbors over the 4 bonds possible from the available electrons and orbitals causes crystal-wide resonance which gives the metallic properties. California U. Dept. of Engineering, Los Angeles.

A MODEL REFERENCED PARAMETER TRACKING TECHNIQUE FOR ADAPTIVE CONTROL SYSTEMS. II. STABILITY ANALYSIS BY THE SECOND METHOD OF LYAPUNOV, by D. D. Donalson and C. T. Leondes. [1961] [19]p. incl. diagrs. (AFOSR-64-0972) (AF 49-(638)438) AD 440598 Unclassified

Presented at Winter general meeting of the Amer. Inst. Elec. Engineers, New York, Jan. 28-Feb. 2, 1962.

Also published in IEEE Trans. on Appl. and Indus., v. 82: 252-262, Sept. 1963.

The purpose of this paper is to develop stability analysis results for the type of adaptive control systems described in a companion paper. By their very nature such systems are in general nonautonomous since the inputs may be arbitrary functions of the time. The second method of Lyapunov supplies the principal tools for this stability analysis, while fairly general techniques are presented for generating the required Lyapunov functions for these systems. Although the analysis is carried out in detail for certain specific types of inputs, it is applicable to other types as well.

THE USE OF THE TECHNIQUE OF LINEAR BOUNDS FOR APPLYING THE DIRECT METHOD OF LYAPUNOV TO A CLASS OF NONLINEAR AND TIME VARYING SYSTEMS, by R. A. Nesbit. [1962] [26]p. incl. diagrs. (Theory paper no. 420) (AFOSR-4218) (AF AFOSR-62-68) AD 292302 Unclassified

Presented at Second Internat'l. Cong. of the Internat'l. Fed. of Automatic Control, Basle (Switzerland) 1963.

Also published in Automatic and Remote Control, v. 2: 568-575, 1964.

The stability of a class of systems is shown by the use of the basic theorems of the direct method. This set of inequalities defines a region, and if the nonlinear or time varying part of the system remains inside this region, then the stability of the system is assured. The usual methods of approximating the time response may be used, and thus this technique can be used to aid the design of control systems. The technique is applied to second and third order examples and is compared to the 'variable gradient' method of solving these problems. (Contractor's abstract)

California U. [Dept. of Engineering] Los Angeles.

THE PROBLEM OF OPTIMAL MODE SWITCHING, by R. A. Nesbit. Sept. 10, 1962, 19p. incl. diagrs. refs. (AFOSR-4219) (In cooperation with Aerospace Corp., El Segundo, Calif.) (AF AFOSR-62-68) AD 293152 Unclassified

Also published in Proc. Optimum System Synthesis Conf. Aeronautical Systems Division, Wright Patterson AFB, Sept. 11-13, 1962, p. 41-54.

A steepest descent modification of the switching times of a mode switching control system can be based on first variation computations, and the computer storage requirement less than that required for functional descent. By introducing control variables the mode switching system can be put in the format usually used in the study of control optimization. The application of the maximum principle yields a necessary condition for optimum switching and a necessary condition for chattering. If the switching problem is relaxed to assure the existence of an optimal solution, the computational problem of finding this optimum is not simplified by the switching approach although mechanization of the control system may be simplified. The use of steepest descent procedure for determining the suboptimal control, using a fixed number of switches, is only based upon differential arguments. Some knowledge of the global properties of the trajectory is required to assure the usefulness of the procedure. (Contractor's abstract)

SYNTHESIS OF OPTIMUM MULTIVARIABLE CONTROL SYSTEMS BY THE METHOD OF STEEPEST DESCENT, by H. C. Hsieh. [1962] [6]p. incl. diagrs. tables, refs. (AFOSR-J149) (AF AFOSR-62-68) AD 400377 Unclassified

Presented at Winter general meeting of the Inst. Elec. and Electron. Engineers, New York, Jan. 27-Feb. 1, 1963.

Also published in IEEE Trans. on Appl. and Indus., v. 82: 125-130, May 1963.

The optimum synthesis of multivariable control systems with generalized quadratic error criterion is solved by using the method of steepest descent in the Hilbert space. Apart from the conventional minimization techniques, this approach works directly on the functional of the error criterion itself so that the optimal solution can be determined through successive approximations. Since this solution can be obtained at high speed and with high accuracy by using a digital computer, this method is particularly useful in solving the actuation problem of adaptive control systems. REDUCIBILITY OF LINEAR SYSTEMS, by A. R. Stubberud. [1962] [6]p. (AFOSR-J1619) (AF AFOSR-62-68) AD 427713 Unclassified

Presented at Winter general meeting of the Inst. Elec. and Electron. Engineers, New York, Jan. 27-Feb. 1, 1963.

Also published in IEEE Trans. on Appl. and Indus., v. 82: 214-219, July 1963.

The concept of reducibility of linear differential equations is discussed. Reducibility is defined as the property which allows a differential equation to be reduced to an equivalent lower order differential equation. A criterion for reducibility and a technique for the reduction of linear differential equations are presented. A system for which this reduction is possible shall be called reducible and the property of being reducible shall be called reducibility.

A SUBOPTIMAL ON-LINE DISCRETE CONTROLLER WITH BOUNDED CONTROL VARIABLES, by F. H. Kishi. [1962] [7]p. incl. diagrs. table. (AFOSR-65-0619) (AF AFOSR-62-68) AD 615182 Unclassified

Presented at IEEE Pacific annual meeting, Spokane, Wash., Aug. 26-29, 1963

Also published in IEEE Trans. on Appl. and Indus., v. 83: 216-222, July 1964.

A method to synthesize the control signal on-line, by using the form of an optimization problem is examined. Control of linear processes is considered, and bounds or inequality constraints on the control variable are attacked directly, without assigning penalties on the performance criterion. The optimal-control problem is formulated as a nonlinear programming problem, and the solution is obtained through a co-ordinate-wise gradient method. Simulation of the on-line controller is performed; a marked improvement in accuracy over conventional sampled data systems is shown. The method as presently employed, can consider bounds on the magnitude or on the ratio of change of the control variable. (Contractor's abstract)

A SIMPLE TREATMENT OF NUCLEAR DIRECT INTERACTION PROCESSES, by I. E. McCarthy and D. L. Pursey [1960] [4]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)717] and National Science Foundation) Unclassified

Published in Proc. Internat'l. Conf. on Nuclear Structure, Kingston, Ontario (Canada) (Aug. 29-Sept. 3, 1960) Toronto U. Press, 1960, p. 381-384.

Physical arguments are used to predict the effect on differential cross-sections of various types of distortion of the wave-functions used in the distorted-wave Born approximation treatment of direct interactions. A simple but fairly realistic model for α-particle wave-functions gives reasonable agreement with observed cross-sections for (α,α') scattering.

BARYON MASS SPLITTING AND WEAK AND STRONG COUPLINGS, by K. Mahanthappa and W. Ramsay. [1962] [4]p. incl. diagrs. table. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)717] and National Science Foundation) Unclassified

Published in Phys. Rev., v. 129: 2755-2758, Mar. 15, 1963.

The mass difference between various barvons is attributed to the presence of bosons weakly coupled to a primary baryon. As an example, the case of $\Sigma\Lambda$is treated assuming the Σ - Λ parity to be even. An eigenvalue condition derived by Albright, Blackenbecler, and Goldberger, using the N/D method is rederived in a simple manner. This derivation not only clarifies the assumptions, but makes the algebraic handling of the problem very simple. (Contractor's abstract)

REACTION MATRIX THEORY FOR A FINITE NUCLEUS BY THE SEPARATION METHOD, by H. S. Köhler. [1962] [25]p. incl. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)717] and National Science Foundation) Unclassified

Published in Nuclear Phys., v. 38: 661-685, Nov. 1962.

Binding energy, single particle energies and rad.as of oxygen-16 were calculated by the reaction matrix method. The single particle wave-functions were taken to be those of a harmonic oscillator. For the nucleon-nucleon potential, a hard core repulsion of radius 0.4 fm and an exponential shaped attraction with intrinsic range 2.5 fm and infinite scattering length were taken. This spin-independent potential was assumed to act only in s-states. The reaction matrix was calculated by the separation method. Saturation was obtained at an r.m.s. radius of 2.74 fm and a binding energy of 3.4 mev per nucleon. The experimental values are 2.58 fm and 8 mev per nucleon. The above potential will give too little binding also for infinite nuclear matter, at somewhat too small density. The characteristic features of the reaction matrix is discussed and an approximate but explicit expression given. It is brought out that the correlation between 2 nucleons depends mainly on the states or potential energies of the 2 nucleons and is larger of 2 nucleons deep down in the Fermi sea than at the top. It was concluded that this would lead to peculiar properties of nuclear matter. With the total energy given in the reaction matrix approximation the variational method gives a shell model potential consisting of essentially 3 parts. One corresponds to the ordinary Hartree-Fock potential. Another has closely the same form as the Hartree-Fock potential and decreases the strength of this by about 15% for infinite nuclear matter of normal density. The weakest part is proportional to the square of the local density and is at normal density $\approx$ -1 mev. The rearrangement energy for a nucleon at the top of the Fermi sea is thus obtained to be $\approx$ 8 mev. The single particle energies of oxygen-16 come out in fair agreement with experiments. The rearrangement energy, usually neglected when calculating the reaction matrix, gives a correction of $\approx$ -1 mev per nucleon in infinite nuclear matter and $\approx$ -0.1 mev per nucleon for oxygen-16.

SIMPLE TREATMENT OF PRODUCTION AMPLITUDES. I (Abstract), by C. Fronsdal, K. T. Mahanthappa, and R. E. Norton. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)-717] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 299-300, Apr. 23, 1962.

The Cini-Fubini approximate version of the Mandelstam representation can be easily derived directly, that is, without assuming the Mandelstam representation. This treatment has been extended to production amplitudes. The resulting representation may be viewed as an approximation to the as yet unknown complete representation for the production amplitudes. The method explicitly takes into account the 2-particle and 3-particle intermediate states; the higher particle number intermediate-state contributions are not entirely neglected When unitarity is imposed, soluble integral equations are obtained.

SIMPLIFIED TWO-DIMENSIONAL MODEL FOR NUCLEAR-COUPLING SCHEMES (Abstract), by S. A. Moszkowski. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)-717], Army Research Office (Durham), and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 348, Apr. 23, 1962.

In order to gain insight into the relation of nuclear-coupling schemes to the basic 2 nucleon interactions, it may be instructive to consider a 2-dimensional analog of the nucleus. This model contains all the essential features of actual nuclei, such as saturation, shell structure, nuclear deformation, and pairing effects; it is much simpler to treat, although it lacks some detailed features of reality. The calculations become particularly simple in the case of short-range interactions with harmonic-oscillator wave functions. A basic interaction of the following form is assumed:

$$V = c_0\delta(r_{ij}) + c_1[p_{ij}^2\delta(r_{ij}) + \delta(r_{ij})p_{ij}^2] +$$

$$c_2 p_{ij}\delta(r_{ij})p_{ij} + c_3\delta(r_{ij})\delta(r_{ik})\delta(r_{jk}).$$

The 4 parameters are constrained by the requirement that the total nuclear energy is a minimum. The total energy turns out to be exactly 3/9 as large as for uniform matter of the mean-square radius as the oscillator distribution, regardless of the values of the parameters. Also, the energy lowering due to any quadrupole moment implies that the effective quadrupole-quadrupole interaction is very nearly of the strength required to give rotational spectra with $\mathcal{J} = \mathcal{J}_{rigid}$, where it not for pairing effects.

THE WEAK AND THE STRONG COUPLINGS AND GENERAL COVARIANCE, by R. Finkelstein and W. Ramsay. [1962] [26]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)717] and National Science Foundation) Unclassified

Also published in Ann. Phys., v. 21: 406-433, Feb. 1963.

General covariance implies that the physical continuum is characterized by its connection, as well as by its local structure, and therefore by the symmetries of the connection, as well as of the local Lorentz and gauge groups. The connection of the local Lorentz group is as usual associated with the gravitational field; the corresponding connection of the gauge group is associated with the universal weak and electromagnetic couplings. The strong couplings have the complete symmetry of the local gauge group. The weak couplings have the lesser symmetry of the connection, which in turn corresponds to a subgroup of the local gauge group. There are 4 weak, charged vector bosons, associated in pairs with the right and left-handed connections of the gauge group; the only neutral vector is the photon. (Contractor's abstract)

EXCHANGE NARROWING OF d BANDS IN FERROMAGNETS, by T. Wolfram and J. Callaway. [1962] [7]p. incl. refs. (APOSR-4069) (AF AFOSR-61-70) Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 219, Mar. 26, 1962.

Also published in Phys. Rev., v. 127: 1605-1611, Sept. 1, 1962.

A semiphenomenological Hamiltonian based on the generalized Hartree-Fock equations for a 2-component spinor is developed which describes the interaction of an electron in the d band with the spin waves of a ferromagnet. Solutions to the effective Hamiltonian are examined in the tight-binding approximation using a self-consistent separation of the electron and spin wave variables. The dynamic interaction of the electron with the spin waves gives rise to a band-narrowing factor $\exp(-\zeta)$ analogous to that obtained by Yamashita and Kurosawa for the polaron. ζ increases with temperature and estimates show that it may be on the order of unity for a typical ferromagnet at low temperatures.

MOMENT SINGULARITY EXPANSION FOR THE DENSITY OF STATES, by J. Callaway and A. J. Hughes. [1962] [5]p. incl. diagrs. tables, refs. (AFOSR-J35) (AF AFOSR-61-70) AD 297117 Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 219, Mar. 26, 1962.

Also published in Phys. Rev., v. 128: 134-138, Oct. 1, 1962.

A systematic approximation procedure is developed to determine the density of states associated with a particular energy band. The density of states is expressed as the sum of 2 functions, 1 of which contains the discontinuous derivatives produced by critical points, and is determined once the effective masses at these points are known; the other is smooth, and is expanded in Jacobi polynomials. The coefficients in this expansion are determined from the moments of the distribution. Two applications of the method are given.

SPIN-WAVE CONTRIBUTION TO THE SPECIFIC HEAT OF EuS, by D. C. McCollum, Jr. and J. Callaway. [1962] [2]p. incl. diagrs. (AFOSR-J52) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-70 and National Science Foundation) AD 400390 Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 376-377, Nov. 1, 1962.

Ferromagnetism has recently been reported in EuS and in other insulating europium salts. EuS has the NaCl structure, the europium ion being in an S state with $S = 7/2$. The nature of the ferromagnetic exchange coupling has not been clear since direct exchange through overlap of the 4f electron wave functions is unlikely to be important. A possible indirect exchange coupling mechanism has been proposed. Specific heat measurements on EuS were undertaken in order that the results might be compared with the predictions of spinwave theory.

PSEUDOPOTENTIAL FOR SODIUM (Abstract), by A. J. Hughes. [1962] [1]p. [AF AFOSR-61-70] Unclassified

Presented at meeting of the Amer. Phys. Soc., Stanford U., Calif., Dec. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 611, Dec. 27, 1962.

The potential energy of a valence electron in sodium is represented by the function $V(r) = -2/r + Qe^{-Br}/r$. The second term is repulsive and includes the effects of orthogonality of the valence electron to the core electrons. The following method was used to determine the parameters Q and B. The 3s and 3p radial equations were integrated numerically with trial values of Q and B out to a radius in the Coulombic region. The logarithmic derivatives were then calculated and compared to those required by the Coulomb wave equation for the experimental eigenvalues. The Coulomb logarithmic derivatives were computed from a semiconvergent expansion in decreasing powers of r and valid at large r. The parameters were then varied until agreement between logarithmic derivatives was obtained. The final values for Q and B were found to be 20.915 and 2.0644, respectively. Using these values for the potential, the eigenvalues for the 4s, 4p and 5s, 5p states were determined and found to agree with experimental values to within 1.5%.

SPIN WAVE THERMAL CONDUCTIVITY (Abstract), by J. Callaway and T. Wolfram. [1962] [1]p. [AF AFOSR-61-70] Unclassified

Presented at meeting of the Amer. Phys. Soc., Stanford U., Calif., Dec. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 619, Dec. 27, 1962.

In insulating ferromagnets and in garnets, thermal conduction at low temperatures may proceed primarily through spin waves. The thermal conductivity due to spin waves has been calculated under the assumption that the waves are scattered by boundaries and by point imperfections and compared with the conductivity due to phonons. The mean free path for the scattering of spin waves by point defects has been calculated and found to be proportional to k^{-4} for long wavelengths. The conductivity is proportional to T^2 at the lowest temperatures where boundary scattering is dominant, with corrections of order T^3 and T^4 resulting from dispersion and defect scattering.

ULTRAVIOLET ABSORPTION BANDS IN COLD-WORKED KCl (Abstract), by R. W. Wild and A. N. Jette. [1962] [1]p. [AF AFOSR-61-70] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 178, Mar. 26, 1962.

A series of uv absorption bands has been observed in single crystals of Harshaw KCl at low temperature. Some of these bands occur at the same wave lengths as those reported by Lüty for additively colored KCl. The intensity of the observed bands in the additively

colored crystals was proportional to the F-center concentration; the authors observed them in the virgin Harshaw crystals where no measurable F concentration was found. The fact that the intensity appears to depend on the degree of cold work and a diffusion time lead the authors to interpret this as a low-temperature collector of point defects along dislocation lines. These centers have been observed to be stable in the temperature range from 78° to 193°K but disappear at higher temperatures.

SPIN WAVE-ELECTRON INTERACTIONS IN MAGNETIC SOLIDS, by T. Wolfram Doctoral thesis, Aug. 1962, 146p. incl. diagrs. refs. (AFOSR-4073) (AF AFOSR-61-70 and AF AFOSR-62-318) AD 291499 Unclassified

The formal theory of spin waves in ferro- and antiferromagnetic insulators is reviewed. Some recent experiments which have established the existence of the spin wave and its associated quantum of energy, the magnon, are discussed. Slater's band theory of spin waves in insulators and its generalization by Edwards to ferromagnetic metals is considered. The band-type states interact dynamically with the spin wave states. A semiphenomenological theory describing the interaction of electrons and spin waves is formulated. The intraatomic exchange arising in the Hartree-Fock equations is treated as an operator which couples the 'itinerant' electron to the spin wave system. The coupled Hamiltonian is then separated into effective electron and spin wave Hamiltonians. The average effect of the spin waves on the electron in both the ferro and antiferromagnet is shown to result in a dynamic interaction which gives rise to a localization of the electron and a narrowing of the d-band width. The electronic band width depends parametrically upon the state of excitation of the spin system, and decreases with temperature. In the ferromagnet this interaction can cause an asymmetry in the density of states: the density of states for the spin 'down' sub-band being larger than that of spin 'up' sub-band. INDIRECT EXCHANGE FERROMAGNETISM IN INSULATORS, by J. Callaway. [1962] [3]p. (AFOSR-J259) (AF AFOSR-62-318) AD 400885 Unclassified

Also published in Nuovo Cimento, Series X, v. 26: 625-627, Nov. 1, 1962.

The discovery of insultating ferromagnetism including EuO, EuH2. and EuS (1-3) has raised questions concerning the nature of the exchange interaction responsible for the alignment of 4f electron spins. Direct exchange between 4f electons on differing lattice sites is not likely to be important, nor is the standard energy band theory of ferromagnetism applicable. An indirect coupling mechanism which may be responsible for ferromagnetism in these materials is described qualitatively.

RESEARCH ON INFORMATION STRUCTURE, by E. W. Bastin. Annual rept. no. 2, Jan. 1-Dec. 31, 1961. Mar. 12, 1962 [25]p. incl. diagrs. refs. (AFOSR-2533) (AF 61(052)331) AD 289450 Unclassified

It is shown how the PACE analogue representation of an information structure can be used to calculate numbers that are of the right sort to interpret as elementary particle constants. This method of calculation is related to that employed by Heisenberg using a non-linear wave equation. The first part of the report describes how an important case of the application and use of an information structure is to be found in the analysis of the origin and nature of the fundamental constants of elementary particle physics. The second part relates the process of calculation of such constants from the properties of an information structure to the non-linear wave equation technique being used by Heisenberg.

A THEORY OF THE ORIGIN OF MASS WITHIN A CONTROL MODEL OF THE ELEMENTARY PARTICLES, by E. W. Bastin and A. Woodside. Feb. 20, 1962 [12]p. incl. diagrs. (AFOSR-2702) (Also bound with its AFOSR-2533; AD 289450) (AF 61(052)331) AD 275843 Unclassified

A new method is shown for calculating elementary particle constants because the current method is appropriate only when some constants, which will be called primary constants, are assumed to be known already. The experimental computing method for deriving numbers which have the right logical form to be interpreted as the primary type of constant characteristic of elementary particles is described. A summary of the theoretical status of the results obtained is presented. The theoretical step that still has to be taken is that of defining combinations of systems, which will be done by developing the interpretation of the described model to include the idea of partitioning the sets of elements in a single level to provide quasi-independent sub-systems. This concept of a physically measurable quantity is extended from the field of natural numbers to the field of rationals.

THE CALCULATION OF CONSTANTS OF THE STABLE PARTICLES, by E. W. Bastin and A. F. Parker-Rhodes. 1962, 21p. incl. diagrs. (Rept. no. ISU 8) (AFOSR-5050) (AF 61(052)331) AD 414082 Unclassified

The algebra of Descriptive Heirarchy is used to deduce the basic dimensionless ratios relating to the stable elementary particle system (the proton/electron system). To carry out these deductions, a control system (a basis for a general picture of the physical world) is introduced based on the ordinary idea of a constant of nature. From this it is eventually shown that there must exist quantities which underlie measurement but are not themselves particular values of a potentially continuous variate. The fact that there exists universal units (e.g. of charge or spin) forces a distinction between the classical constants of nature and protarithms to be made.

PRESENTATION OF THE HEISENBERG REQUIREMENT OF NON-DECOMPOSABILITY IN PARTICLE THEORY BY USE OF OVERALL FEEDBACK IN A CONTROL SYSTEM, INSTEAD OF BY THE USE OF NON-LINEARITY IN DIFFERENTIAL EQUATIONS, by E. W. Bastin and C. W. Kilmister. [1962] [8]p. incl. diagr. (Bound with its AFOSR-2533; AD 289450) [AF 61(052)-331] Unclassified

A discussion is presented of the relationship between the CASPAR method of calculating constants characteristic of elementary particles and current quantum mechanical methods. The approach used here is distinct from quantum field theory (Heisenberg's non-linear theory) in that if particle constants are to be calculated then the calculation must depend in an essential way upon the existence of interactions between the modes of representation of the particles. The CASPAR theory is based upon the idea of a control system and the types of mathematical deduction that are admitted within it have themselves ultimately to be built up from this idea. It will be apparent that there is a basic formal difference between the theory that is being described and quantum mechanics. For if one describes the control system in terms of a differential equation, then this equation will be in one independent variable whereas the wave equation of quantum mechanics is a partial differential equation in 4 independent variables. The various arguments given in this article are the basis for the use of control systems which are being used in designing the next PACE experiment. If the forthcoming experiment is successful it will then be possible to initiate discussion with the Heisenberg school on the further potentialities of the control technique.

THE DEPENDENCE OF CROSS-SLIP ON STACKING-FAULT ENERGY IN FACE-CENTERED CUBIC METALS AND ALLOYS, by P. R. Thornton, T. E. Mitchell, and P. B. Hirsch. Annual summary rept. no. 3, July 9, 1962. 17p. incl. diagrs. tables, refs. (AFOSR-2934) (AF 61(052)98) AD 289147 Unclassified

Also published in Philos. Mag., v. 7: 1349-1369, Aug. 1962.

The results of an experimental study of the temperature and strain-rate dependence of τ_{III} for Cu-Zn alloys are described and interpreted in terms of Seeger's theoretical analysis of τ_{III}. The values of the stacking-fault energy, γ, derived in this way are compared with the estimates of γ for the same alloys obtained directly from electron microscope observations of dislocation nodes. The two sets of values are found to disagree, and the nature of the discrepancy is such as to throw serious doubts on the applicability of the Seeger analysis to Cu-based alloys with $e/a > 1{\cdot}10$. The lower limits of γ for pure Cu and Ag, from electron microscope data, are ~ 60 ergs/cm^2 and ~ 20 ergs/cm^2; the values of γ deduced from Seeger's τ_{III} analysis are ~ 170 ergs/cm^2 and ~ 30 ergs/cm^2, respectively. The lower limit of γ for Cu is inconsistent with the previously accepted figure based on the assumption that γ is twice the twin boundary energy, and this assumption is now held to be invalid. Seeger's model of cross-slip at Lomer-Cottrell barriers is examined critically, and found to be incompatible with the observations in Cu and Al that screws are held up preferentially. It is proposed that screws are stopped by becoming heavily jogged in the dense tangles observed by transmission microscopy, and that cross-slip occurs at these tangles by processes controlled by jogs. THE ALUMINUM-RHENIUM AND ALUMINUM-TECHNETIUM SYSTEMS: THE NEW PHASES $ReAl_6$ AND $TcAl_6$, by L. M. D'Alte Da Veiga. [1962] [2]p. (AFOSR-3817) (AF EOAR-61-24) Unclassified

Also published in Philos. Mag., v. 7: 1247-1248, July 1962.

Two previously unreported phases, $ReAl_6$ and $TcAl_6$, were found and appear to be isostructural with $MnAl_6$. Powder photographs of the 3 systems are similar and the systematic absences for $ReAl_6$ and $TcAl_6$ are consistent with the space group Cemm previously proposed for $MnAl_6$. The crystals are prismatic needles of the form (110) and cell dimensions are a = 6.59, b = 7.61, and c = 9.02A for $ReAl_6$; and a = 6.58, b = 7.63, and c = 9.00A for $TcAl_6$.

THE ELECTRON DISTRIBUTION IN CHROMIUM, by M. J. Cooper. [1962] [6]p. incl. tables, refs. (AFOSR-J43) (AF EOAR-61-24) AD 297113 Unclassified

Also published in Philos. Mag., v. 7: 2059-2064, Dec. 1962.

X-ray intensity measurements for Cr powder, AgKα radiation, were placed on an absolute scale by direct measurement of the power in the incident beam. Effects due to preferred orientation, surface roughness and extinction were shown to be negligible and measurements using CuKα radiation confirmed the absence of effects which vary with wavelength. The experimental scattering factors determined from the intensity measurements were found to agree with the theoretical values for the ground-state free atom on a relative scale, but to be about 5% lower on an absolute scale. This is similar to the 4% difference reported by Batterman, Chipman and DeMarco for measurements on Fe, Cu and Al, and comparison of measurements from a sample of this Cu with those from Cr confirmed the agreement of the absolute scales. THE STRUCTURE OF THE σ-PHASE Co_2Mo_3, by J. B. Forsyth and L. M. D'Alte Da Veiga. [1962] [4]p. incl. diagrs. tables, refs. (AFOSR-J741) (AF EOAR-61-24) AD 413642 Unclassified

Also published in Acta Cryst., v. 16: 509-512, June 10, 1963.

The σ-phase structure of Co_2Mo_3 has been confirmed by single-crystal measurements. The structure has been refined and the interatomic distances compared with those in Co_7Mo_6 and 3 other σ-phases. The distribution of atoms in the available sites has been determined:

cobalt occupies the 12-fold, molybdenum the 15-fold, and a mixture of Co and Mo the 14-fold coordinated positions. (Contractor's abstract)

FINAL-STATE INTERACTIONS IN THE ELECTRO-DISINTEGRATION OF DEUTERIUM, by J. Nuttall and M. L. Whippman. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-64-0369) (AF EOAR-63-79) AD 434524 Unclassified

Also published in Phys. Rev., v. 130: 2495-2501, June 15, 1963.

The cross-section for the inelastic-deuteron scattering process is calculated using a semirelativistic approximation. The final-state interaction between the outgoing nucleons is estimated using approximate wave functions derived from the Gammel-Thaler potential. The rescattering correction is found to lead to a decrease in the peak value of the cross section, varying from about -5% at an electron momentum transfer of $1.4F^{-1}$ to about -2% at a momentum transfer of $4F^{-1}$. Various relativistic corrections are considered, and an ambiguity in the normalization of the semirelativistic wave functions is discussed. Finally, the neutron form factors are re determined.

ON THE ANALYTIC CONTINUATION OF THE SCATTERING AMPLITUDE THROUGH A THREE-PARTICLE CUT, by D. I. Olive [1962] [19]p. incl. diagrs. refs. (AFOSR-64-0378) (AF EOAR-63-79) AD 434535 Unclassified

Also published in Nuovo Cimento, Series X, v. 28: 1318-1336, June 16, 1963.

The scattering amplitude is analyzed onto the sheet reached by encircling the lowest 3-particle singularity in an anticlockwise direction by using generalized normal threshold discontinuity formulae derived from unitarity. The integral equation is not Fredholm because of the connectedness structure of the 3-particle amplitude but this difficulty is overcome by a manipulation which introduces extra integrations in which complex normal thresholds may occur. If there is a 2-particle state 2' with a particle in common with the 3-particle state, then the normal threshold corresponding to the state 2', which vanishes on this particular 3-particle sheet, is verified. Three-particle sheets reached by different routes are also considered.

UNITARITY AND THE EVALUATION OF DISCONTINUITIES. II, by D. I. Olive. [1962] [10]p. incl. refs. (AFOSR-64-0379) (AF EOAR-63-79) AD 434534 Unclassified

Also published in Nuovo Cimento, Series X, v. 29: 326-335, July 16, 1963.

The discontinuity across the cut due to the normal threshold N in the scattering amplitude is found to be a modification of the term in unitarity involving the state N. The result shows that it is easiest to continue onto the unphysical sheet reached by encircling the normal threshold in an anticlockwise direction and enables unitarity to be replaced by a system of simpler equations. The result is understood in perturbation theory and is presented in terms of a specially introduced path notation for unphysical sheets. Although the argument is mainly restricted to 2-particle thresholds, it permits the analytic continuation round the lowest 3-particle cut. The difficulties in extending the analysis to multiparticle processes are reviewed. (Contractor's abstract)

STUDY OF THE DEVELOPMENT AND INTEGRATION OF NEST-BUILDING SKILLS IN CANARIES. THE EFFECT OF ABLATION OF THE FOREBRAIN ON AVIAN BEHAVIOUR. CURIOSITY AND FEAR RESPONSES TO STRANGE STIMULI, by R. A. Hinde. [Final rept.] 1962 [7]p. incl. refs. (AFOSR-2504) (AF 61(052)97) AD 280104 Unclassified

The development and integration of nest-building skills in canaries was studied by manipulation of environmental stimuli and control of the hormonal state. Special attention was given to the short-term and long-term aspects of interaction between environmental and internal factors. The effects of forebrain ablations on discrimination learning and general activity in pigeons and on the reproductive development of canaries were studied. The nature of approach-avoidance conflict is now being studied.

TEMPORAL RELATIONS OF BROOD PATCH DEVELOPMENT IN DEOMESTICATED CANARIES, by R. A. Hinde. [1961] [9]p. incl. illus. diagrs. refs. (AF 61(052)97) AD 632081 Unclassified

Published in Ibis, v. 104: 90-97, Jan. 1962.

An attempt has been made to trace the temporal course of brood patch development in some detail, and to assess its relationship with the changes in reproductive behavior which occur as the breeding cycle progresses. The temporal relations between the loss of feathers, vascularization, nest-building, egg-laying and incubation indicate the extent to which these different aspects of reproductive development share causal factors. In order that such temporal correlations should be meaningful, it was necessary that they should be based on birds showing a reasonable variability in their reproductive cycles. This was ensured by providing sub-optimal breeding conditions: if canaries are not allowed to build nests, many of the females undergo a protracted reproductive development, and many of the clutches laid are not incubated. EFFECTS OF FRONTAL CORTEX LESIONS ON OBJECT DISCRIMINATION LEARNING BY MONKEYS, by J. Oxbury and L. Weiskrantz. [1962] [2]p. incl. diagrs. table (AFOSR-3321) (AF 61(052)185) AD 632629 Unclassified

Also published in Nature, v. 195: 310-311, July 21, 1962.

The domination of stimulus preference factors in the performances of monkeys with frontal lesions was tested in a modified version of the Wisconsin general testing apparatus. The test was designed specifically to provide data in a form amenable to mathematical analysis of the frequency with which various strategies were adopted. There appears to be a discrepancy between the results presented here and previous data which indicated that frontal monkeys are impaired on object discrimination problems. Reasons argued in explanation include a recently proposed hypothesis that frontal lesions may result in an inability to maintain selective attention.

VISUAL FIELD DEFECTS IN MONKEYS, by A. Cowey. [1962] [1]p. (AFOSR-3522) (AF 61(052)185) Unclassified

Also published in Nature, v. 193: 302, Jan. 20, 1962.

The visual fields of rhesus monkeys have been studied perimetrically before and after removal of parts of the striate cortex. Four rhesus monkeys were tested several months; 3 had the macular projection area removed bilaterally and the 4th an entire occipital lobe removed. Visual field defects of expected size, shapes and position were produced but the animal's ability to respond to a flash of light was not abolished. It is concluded that up to half the striate cortex may be removed in the monkey without producing a region of total blindness in the visual field. The monkey may therefore be very different from man in this respect; the explanation for the residual vision is far from clear. Further electrophysiological and behavioral experiments are in progress in an effort to resolve this problem.

EFFECTS OF STIMULATION ON FRONTAL CORTEX AND HIPPOCAMPUS ON BEHAVIOUR IN THE MONKEY, by L. Weiskrantz, Lj. Mihailović, and C. G. Gross

[1962] [19]p. incl. illus. diagrs. refs. (AFOSR-4180) (AF 61(052)185) AD 632630 Unclassified

Also published in Brain, v. 85: 487-504, 1962.

The effects of stimulation of various regions at intensities below the threshold for overt motor responses, was studied on a variety of behavioral tasks, with the following results: (1) A reversible deficit in delayed alternation was obtained by bilateral stimulation in the region of sulcus principalis. During stimulation, performance approached chance levels; (2) Unilateral stimulation in the region of sulcus principalis produced a significant and reversible deficit in delayed alternation, although the decrement was not as greast as that produced by bilateral stimulation; (3) No such deficit was obtained from stimulation of regions near sulcus arcuatus; (4) No effect of frontal stimulation on auditory discrimination performance could be found; (5) Hippocampal stimulation had a slight effect on both delayed alternation and auditory discrimination; and (6) Unilateral or bilateral stimulation near sulcus principalis produced a decrement in the speed with which object discrimination tasks were solved. No such decrement was obtained for the more difficult 2-dimensional pattern discrimination problems. (Contractor's abstract)

EVIDENCE FOR DISSOCIATION OF IMPAIRMENT ON AUDITORY DISCRIMINATION AND DELAYED RESPONSE FOLLOWING LATERAL FRONTAL LESIONS IN MONKEYS, by C. G. Cross and L. Weiskrantz. 1962. [24]p. incl. diagrs. tables, refs. (AF 61(052)-185 AD 632631 Unclassified

Published in Exper. Neurol., v. 5: 453-476, June 1962.

Impairments on both delayed-response and auditory-discrimination tasks have been reported to follow lateral frontal cortical lesions in monkeys. The present study is primarily concerned with the relationship of these 2 deficits. Three monkeys received ablations of sulcus principalis: 3 received ablations of lateral frontal cortex excluding sulcus principalis. Acquisition and retention of auditory-discrimination, delayed-response, and visual-discrimination tasks by the 2 groups were compared. Sulcus principalis lesions produced greater impairment on the delayed-response tasks. The lesions sparing sulcus principalis produced greater impairment on the auditory-discrimination tasks. The performance of the groups did not differ on the visual-discrimination tasks. These results suggest that the delayed-response deficit and the deficit in auditory discrimination that follow large frontal lesions may be dissociated by smaller frontal lesions. The results confirm that the focus for impairment on tests of the delayed-response type is in the region of sulcus principalis. The experimental data do not indicate the focus (if any) for the auditory-discrimination deficit, nor do they permit the definition of the nature of this deficit. (Contractor's abstract)

VISUAL ILLUSIONS IN SPACE, by R. Gregory. [1962] [4]p. incl. illus. diagrs. (AFOSR-J59) [AF EOAR-61-13] AD 400095 Unclassified

Also published in New Scientist, v. 15: 446-449, Aug. 30, 1962.

Some of the environmental conditions expected in space are simulated in the laboratory to test their effect on the visual perception of man. Investigations are conducted on perceptually reversed lattice figures during movement, object ambiguity, effects of oblique lighting, and reversals in depth. Results suggest that manned space operations will be subject to inconvenience and error arising from visual illusions. With all its limitations, the perceptual system of man appears to be far more efficient at identifying objects against a confused background than any instruments yet developed.

UNIT ACTIVITY IN THE HYPOTHALAMUS AND THE SYMPATHETIC RESPONSE TO HYPOXIA AND HYPERCAPNIA, by B. A. Cross and I. A. Silver. [1962] [19]p. incl. illus. refs. (AFOSR-J839) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)301 and Public Health Service) AD 416515 Unclassified

Also published in: Exper. Neurol., v. 7: 373-383, May 1963

The activity of 232 neurons in the hypothalamus and other forebrain regions was recorded with stereotaxically oriented steel microelectrodes in rabbits under light urethane anesthesia. Inhalation of N_2 or N_2O for 10 to 30 sec reduced brain oxygen tension by 30 to 90% and accelerated the firing rate of 27% of neurons tested. Slowing to hypoxia occurred in 36%. Inhalation of 80% CO_2 and 20% O_2 for 5 to 15 sec elevated brain oxygen tension and 99% of the neurons tested gave a response to this stimulus. In the hypothalamus, 31 to 46 neurons were accelerated by hypercapnia. A high proportion of tested neurons in the posterior and lateral areas of the hypothalamus were excited by hypoxia, hypercapnia and pain or auditory stimuli. In addition to the effects on neuron firing, hypoxia and hypercapnia produced a rise in arterial pressure, bradycardia and an activation of the electrocorticogram. Similar changes were elicited by electrical stimulation of the sympathetic zone of the hypothalamus. It is suggested that the cerebrovascular supply may be regulated in part by sympathetic neurons in the hypothalamus responsive to hypoxia or hypercapnia. (Contractor's abstract)

UNIT ACTIVITY IN THE HYPOTHALAMUS OF THE CYCLIC FEMALE RAT: EFFECT OF GENITAL STIMULI AND PROGESTERONE, by C. A. Barraclough and B. A. Cross. [1962] [21]p. incl. illus. diagrs. tables, refs. (AFOSR-3953) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)301 and Public Health Service) AD 415825 Unclassified

Also published in Jour. Endocrinol., v. 26: 339-359, June 1963.

Unit activity in the hypothalamus and other diencephalic regions was recorded with stereotaxically oriented steel microelectrodes in adult female rats under light urethane anesthesia. Spontaneous firing rates of neurones varied from < 1 10 sec to 50 sec, but the majority fired at 1-10 sec. Some variations in the pattern of firing are described. Acceleration of firing rate was most readily induced by pain stimuli (64 % of neurones) and then by cold (60 %), probing the cervix (47 %), smell (20 %), light (5 %) and noise (3 %) in that order. A minority of neurones were inhibited by the stimuli. Many neurones responded to several different stimuli, most commonly by acceleration to cervical probing, cold and pain. Inhibitory convergence was also observed, e.g., blockade of the response to cervical probing by an olfactory stimulus, and inhibition by cervical probing of the response to cold or pain. The proportion of neurones excited by smell in prooestrous rats was more than double that in oestrous or dioestrous rats. Oestrous rats had relatively more neurones which were unresponsive or inhibited by the test stimuli. Slow intravenous injection of 400 µg.progesterone induced a selective depression of the response of lateral hypothalamic neurones to cervical probing. The effect was maximal at about 30 min and full recovery occurred in 1 hr. The possible significance of these observations is discussed with particular reference to the neural control of luteotrophin secretion.

NERVOUS AND HORMONAL INFLUENCES ON THE RESPONSE OF SINGLE HYPOTHALAMIC NEURONES TO GENITAL STIMULATION IN THE RAT (Abstract), by C. A. Barraclough and B. A. Cross. [1962] [1]p. [AF 61(052)301] Unclassified

Presented at annual Conf. of the Society for the Study of Fertility, London (Gt. Brit.., June 27-30, 1962.

Published in Jour. Reprod. Fertil., v. 4: 213, Oct. 1962.

Microelectrodes were placed in the lateral hypothalamic area, and impulse activity in individual neurones to genital and sensory stimuli were displayed on an oscilloscope and simultaneously recorded with commentary on tape. The amplitude, waveform, and firing frequency of 306 neurones were examined and the percentage response to the various stimuli were computed. Results indicate that the cervix was the most sensitive site and with few exceptions neurones responding to genital stimuli were also affected by one or more other sensory modalities. Some interactions noted were: one stimuli suppressing the response to another, and a gradual loss of response to cervix stimulation produced by the slow intravenous injection of progesterone in propylene glycol. Control injections of propylene glycol were without effect.

ON AN INEQUALITY OF LYAPUNOV, by Z. Nehari. [1962] [6]p. (AFOSR-3343) (AF 49(638)227) AD 414029 Unclassified

Also published in Studies in Mathematical Analysis and Related Topics, ed. by G. Szegö, C. Loewner and others, Stanford U. Press, 1962, p. 256-261.

Using the methods of study of positive matrices, the following result is derived. Let $a_{ik}(x)$ (i, k = 1, ..., n) be continuous functions of x in the interval $a \leq x \leq b$, and set $A_{ik} = \int_a^b a_{ik}(x)\,dx$. If the system of differential equations $y_i'(x) = \sum_{k=1}^n a_{ik}(x)y_k(x)$ (i = 1, ..., n) has a solution $y_1(x), \ldots, y_n(x)$ such that every function $y_i(x)$ has a zero in [a, b] (but does not vanish there identically), then one of the roots of the equation $\det(A_{ik} - \lambda\delta_{ik}) = 0$ is larger than unity. This result is then used to derive, besides another, the following important theorem. Let $p_1(x)$ be real and continuous in $a \leq x \leq b$. If the differential equation $y^{(n)} + p_n(x)y^{(n-1)} + \ldots + p_1(x)y = 0$ has a non-trivial solution y(x) that has n zeros in [a, b], then $\sum_{k=1}^n 2^k(b-a)^{n-k}\int_a^b p_k(x)\,dx > 2^{n-1}$. This result is the analogue of Lyapunov's

well-known result for the second-order equation $y'' + p(x)y = 0$, that if $p(x)$ is continuous in $[a, b]$ and there is a solution $y(x)$ that vanishes at 2 points of $[a, b]$, then $y(x)$ satisfies the inequality $(b-a)^2 \int_a^b p(x)^2 dx > 4$. (Math. Rev. abstract)

THE EFFECT OF SYSTEMATIC AND NONSYSTEMATIC PRESENTATION OF STIMULI ON PERIPHERAL VISUAL ACUITY, by H. W. Karn, L. W. Gregg, and G. F. Pitz. [1962] [7]p. incl. diagrs. table. (AFOSR-2549) (AF 49-(638)770) Unclassified

Also published in Jour. Psychol., v. 53: 491-497, Apr. 1962.

The present investigation is one of a series of studies concerned with the role of experiential variables on the perceptual response. Viewing the acuity response as a perceptual phenomenon, the present experiment was designed to determine the effect of specific perceptual cue on acuity measures in the peripheral retina. The critical feature of the experiment was the systematic and nonsystematic presentation of acuity targets at varying exposure times. Differences obtained on systematic vs nonsystematic modes of presentation would indicate the presence of a specific experiential factor contributing to the perceptual act. The main conclusion drawn for these experiments is that, when called upon to make a visual acuity response, S will resort to behaviors which experience has shown will yield a maximum resolution of visual detail. Thus, the superior resolving power of the central over the peripheral retina causes S to view peripheral stimuli centrally, and prior knowledge of stimulus loci facilitates the perceptual act.

PERCEPTUAL RESPONSE AS A FUNCTION OF THE SEQUENTIAL PROPERTIES OF MULTIPLE VISUAL STIMULI, by L. W. Gregg and H. W. Karn. [1962] [7]p. incl. diagrs. tables. (AFOSR-2913) (AF 49(638)-770; AD 414297 Unclassified

Also published in Jour. Exper. Psychol., v. 65: 124-130, Feb. 1963.

Circles located at the points of a triangle were differentially loaded with runs of dots and no dots averaging 2, 4, and 8 in length. Different combinations of loading and location were tachistoscopically presented to 3 experimental groups with a control group receiving random dot and no-dot combinations at all locations. Experimental groups performed significantly better in terms of error reduction than did the control group. However, variance analysis failed to show an effect of run length, per se. Despite the statistical results, an effect of run length is suggested by an analysis in which straight lines were fitted to the data by the method of least squares.

PART I. NUCLEATION AND GROWTH IN DEPOSITION OF METALS FROM VAPOR AND OXIDATION OF ALLOYS. PART II. THE THERMODYNAMIC PROPERTIES OF SOLID GOLD-NICKEL ALLOYS AT 775-935°C, by R. D. Gretz, G. M. Pound and others. Final rept. June 30, 1962 [37]p. incl. diagrs. tables, refs. (AFOSR-3007) (AF 18(600)1572) AD 278068 Unclassified

Part I. The time required to build up a critical concentration of adsorbed Ag on a tungsten substrate has been measured for several impingent fluxes. The following conclusions have been made from observations: (1) Ag increases or decreases the work function of the substrate depending on which area of the substrate is observed. (2) Work function changes due to adsorption are the same for all impingent fluxes used, but occur either sooner or later depending on whether the flux is large or small; (3) Ag diffuses to the side of the substrate which is not in the direct path of the impingent beam; (4) The initial site at which nucleation occurs is approximately the (310) plane of the substrate; (5) The apparent critical concentration of adsorbate required to produce nucleation decreases with increasing impingent flux, tending to an asymptotic value of 1.5×10^{14} atoms cm^2 sec; and (6) The true critical concentration required to produce nucleation is the same for all fluxes and is 1.5×10^{14} atoms cm^2 sec. Part II. Emf measurements have been made on 10 Au-Ni alloys at temperatures 775°, 825°, 900°, and 935°C. The derived activities of both Ni and Au show large positive deviations for Raoult's law. The enthalpies of mixing are positive, and both the free energy and entropy of mixing are positively in excess of the ideal values at all compositions. These results are consistent with the miscibility gap in the system and are qualitatively interpreted in terms of the large size difference and electronic interactions between Au and Ni. Tabulated values of the activities, free energies, entropies, and enthalpies of mixing are given in the appendix. (Contractor's abstract, modified)

THERMAL ETCH PITS AT DISLOCATIONS IN LITHIUM FLUORIDE, by T. Ejima, J. P. Hirth, and W. H. Robinson. Sept. 10, 1962 [12]p. (AFOSR-958) (Also bound with its AFOSR-3994; AD 290305) (AF 49-(638)551) Unclassified

A study of the thermal etching of lithium fluoride has shown that, under certain conditions of temperature, pressure, and time, thermal etch pits can be produced at dislocation sides on the surface of lithium fluoride. The dependence of the pits on these conditions and their development is correlated with the theory of crystal dissolution. The existence of the thermal etch pits at dislocation sites has been correlated with chemical etch pits formed at dislocation sites in lithium fluoride. A treatment of the nucleation of a disc-shaped hole in a low index surface at a dislocation is given.

A CHEMICAL POLISHING TECHNIQUE FOR SILVER, by H. J. Levinstein and W. H. Robinson. [1962] [2]p. incl. illus. (AFOSR-4475) (AF 49(638)551) AD 295954 Unclassified

Also published in Trans. Metall. Soc. AIME, v. 224: 1292-1293, Dec. 1962.

A method of chemically polishing Ag for metallographic examination has been developed. The samples are prepared by polishing on 0, 2 0, 3 0 paper. They are then polished on 600 micro-cut paper, followed by a final mechanical polish on a cloth containing 5 μ diamond paste. The samples are then chemically polished in a solution of 100 cc of saturated chromic acid and 5 cc of a 5% HCl solution. The chemical polishing is performed by swabbing with a cotton ball saturated with the solution. During the chemical polishing, the sample is rinsed frequently in running water. Polishing in this manner for 5 min is sufficient to remove the strained material from the previous polishing operations. The amount of material removed is approximately 4 μ min. The surface obtained is flat and free of pits. If the solution employed is of improper HCl content, an interference color film will form on the sample. This film can be removed either by swabbing with a cotton ball saturated with ortho-phosphoric acid or by wiping the surface under running water with a soft tissue

ETCH PITS AT DISLOCATIONS IN SILVER SINGLE CRYSTALS, by H. J. Levinstein and W. H. Robinson. [1962] [4]p. incl. illus. refs. (AFOSR-J15 (AF 49-(638)551) AD 297114 Unclassified

Also published in Jour. Appl. Phys., v. 33: 3149-3151, Nov. 1962.

A chemical etching solution has been found which results in etch pit formation at dislocations in the {100} and {111} surfaces of silver single crystals. Etch pits as small as 500 to 2000A may be obtained in the {111} surface of silver permitting the observation of dislocation densities of as high as 10^{10} lines cm^{2}. The slip band structure of deformed silver has been examined by this technique and has been found to be cellular in appearance. Contractor's abstract

DISLOCATION CONFIGURATIONS IN DEFORMED SILVER SINGLE CRYSTALS, by H. J. Levinstein and W. H. Robinson. Sept. 10, 1962 [33]p. incl. illus. diagrs. table, refs. (Also bound with its AFOSR-3994; AD 290305) (AF 49(638)551) Unclassified

Published in The Relation Between the Structure and Mechanical Properties of Metals. Proc. of the Conf., Teddington (Gt. Brit.) (Jan. 7-9, 1963), London, Her Majesty's Stationery Office, v. 1: 179-203, 1963

Silver single crystals oriented for single slip were deformed incrementally in both simple shear and tension, and the dislocation arrangements were observed after each increment of strain by optical examination of the etch pitted surface or by examining replicas of these surfaces by electron microscopy. In addition, some observations were made on specimens deformed in compression. For a given specimen, several increments of strain were made during Stage I of the deformation and also during stage II. Stage I is characterized by slip bands consisting of clusters of dislocations which are cellular in appearance, that is regions having high dislocation density arranged in cell walls, or boundaries surrounding regions of very low dislocation density. As deformation in stage I progressed, the number of

slip bands increased while the width of the bands remained virtually constant at a size depending on the initial dislocation density of the as-grown crystal. Stage II of the deformation curve began when the entire gauge length of the specimen had acquired a uniform cellular array of dislocations of the same density as in the slip bands occurring initially in stage I. The cellular arrangement of dislocations persists throughout stage II, the size of the clusters decreasing with increasing strain.

LOW TEMPERATURE STUDY OF THE ELECTRONIC BAND STRUCTURE OF METALS AND THEIR DILUTE ALLOYS, by W. L. Gordon and T. G. Eck. Final rept. Jan. 1962 [42]p. incl. illus. diagrs. refs. (AFOSR-2041. (AF 49(638)-621: AD 273018 Unclassified

The original objective of this research was to investigate the band structure of several pure metals through the combined techniques of de Haas-van Alphen (DHVA) effect and cyclotron resonance of the type suggested by Azbel and Kaner. With this information available, it was hoped that DHVA studies in sufficiently dilute alloys of these metals would permit a study of the changes in band structure with alloying. A combination of interesting and useful results in pure metals together with difficulty in preparation of metallurgically trustworthy alloy single crystals led to a shift of emphasis to pure metals. At the same time, another tool for studying band structure was employed, galvanomagnetic effects, particularly the variation with magnetic field strength of the components of electric field parallel and transverse to the electric current in the limit of high magnetic field.

MAGNETORESISTANCE INVESTIGATION OF THE FERMI SURFACE OF MAGNESIUM, by R. W. Stark, T. G. Eck and others. [1962] [3]p. incl. diagrs. AFOSR-3120) (AF AFOSR-62-222) AD 613857 Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 231, Mar. 26, 1962 (Title varies)

Also published in Phys. Rev. Ltrs., v. 8: 360-362, May 1, 1962.

A detailed study of the transverse magnetoresistance of several single-crystal specimens of magnesium has been made in fields up to 22000 gauss. The residual-resistance ratios ($R_{300\,^{\circ}K}$ $R_{4.2\,^{\circ}K}$) of these specimens were in the range from 450 to 900. The results of this study are in agreement with the gross features reported by Alekseevskii and Gaidukov. Results are interpreted in terms of the nearly-free-electron model of the Fermi surface as modified by the unpublished band calculation of L. Falicov. The connectivity of the hole arms along the hexagonal axis due to spin-orbit coupling as discussed by Cohen and Falicov, does not appear to be present at these magnetic fields.

OSCILLATORY MAGNETIC BREAKDOWN IN ZINC, by R. W. Stark. [1962] [4]p. incl. diagrs. (AFOSR-J562) (AF AFOSR-62-222) AD 412694 Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 482-485, Dec. 15, 1962.

The results of transverse magnetoresistance studies of single crystals of Zn are reported. An argument is given to infer that periodic magnetic breakdown occurs, which accounts for the large amplitude of the Shubnikov-de Haas effect. The part played by the needle portion of the third band electron surface is discussed in detail.

GALVANOMAGNETIC PROPERTIES AND FERMI SURFACE OF ZINC (Abstract), by R. W. Stark. [1962] [1]p. [AF AFOSR-62-222] Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio. Nov. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 546. Nov. 23, 1962.

A detailed investigation of the galvanomagnetic properties of several single-crystal specimens of Zn has been completed in magnetic-field strengths of 23000 G. These specimens all had residual-resistance ratios ($R_{300\,^{\circ}K}$ $R_{4.2\,^{\circ}K}$) of 23000. The results of this investigation indicate that the Fermi surface of Zn supports discrete bands of open trajectories along the [0001], [10$\bar{1}$0], and [11$\bar{2}$0] directions. An additional solid angle of magnetic-field directions within 1.3° of the c axis produces open trajectories parallel to the basal plane. This same small solid angle of magnetic-field directions gives rise to de Haas-Schubnikov oscillations in the transverse magnetoresistance, which are of unexpectedly large amplitude. The data, including the large amplitude of the de Haas-Schubnikov oscillations, can be explained on the basis of a free-electron model for the Fermi surface of Zn modified to include magnetic breakdown effects between the second-band hole surface and the third-band electron surfaces, such as those already observed in Mg.

LOW-FIELD de HAAS-van ALPHEN STUDIES OF BERYLLIUM (Abstract), by R. Gensberg [1962] [1]p. [AF AFOSR-62-222] Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 546, Nov. 23, 1962.

Portions of the Fermi surface of Be have been studied by de Haas-van Alphen methods in magnetic fields up to 23 kG over the temperature range of 2° to 4.2°K. A null-deflection torsion balance was employed to present automatic recording of the oscillations in the diamagnetic susceptibility as a function of field. There are 2 groups of strong oscillations present: one having maximum period 9×10^{-6} G^{-1} arising from nearly cylindrical sections lying in the basal plane, and the other corresponding to 2 extremal portions with maximum periods of 10.2×10^{-8} and 10.5×10^{-8} observed with H along the hexagonal axis in crystals of sufficiently high purity (R_{300} $R_{4.2°K}$ of 200 or higher). Other groups of oscillations appear with much lower amplitude. A more complete description is presented of all the Fermi surface portions observed. Preliminary results of other investigators also show isolated periods in these ranges.

RECURRENCE RELATIONS FOR THE FIRST TWO INVERSE MOMENTS OF THE POSITIVE BINOMIAL VARIABLE, by Z. Govindarajulu. May 1962, 6p. incl. table. (Publication no. 1063) (AFOSR-3162) (AF AFOSR-62-72) AD 285527 Unclassified

Also published in Jour. Amer. Stat. Assoc., v. 58: 468-473, June 1963. (Title varies)

Recurrence formula for the second inverse moments of the positive binomial variable was derived. The method of obtaining recurrence formulae for its higher inverse moments was indicated. The cumulative rounding error propagated by using these formulae recurrently was considered. Bounds for the propagated rounding error were obtained. By comparing some of the moments evaluated by the use of recurrence formulae, with the true values, it is noted that the rounding error involved in the first 2 inverse moments will be at most 1 unit in the last decimal place and the error will be practically zero when p is large. (Contractor's abstract)

THE FIRST TWO MOMENTS OF THE RECIPROCAL OF THE POSITIVE HYPERGEOMETRIC VARIABLE, by Z. Govindarajulu. May 1962 [44]p. incl. tables. (Publication no. 1061) (AFOSR-3163) (AF AFOSR-62-72) AD 281730 Unclassified

Starting from the definitions, the first 2 inverse moments of a positive hypergeometric variable have been computed accurate to 5 decimal places for: N = 1(1)20, M = 1(1)N, n = 1(1)M; N = 25(5)50, M, N = 5%(5%)100%, n = 1(1)M; N = 55(5)100(10)140, M, N = 5%(5%)100%, n, N (< M, N) = 5%(5%)100%. Many theoretical results of interest, recurrence formulae among the inverse moments, and various approximations for the first 2 inverse moments have been obtained. The rounding error involved in using the formulae recurrently, in order to compute the moments, is at most 1-2 units in the last decimal place. The approximate values have been compared with the true values for some sets of values of N, M and n. For large values of N and n, the Beta approximations are accurate up to 2-3 decimal places, provided they exist. (Contractor's abstract)

EXACT POWER OF SOME TWO-SAMPLE AND C-SAMPLE NON-PARAMAGNETIC STATISTICAL PROCEDURES, by G. E. Haynam. Doctoral thesis, June 1962, 103p. incl. diagrs. tables, refs. (Rept. no. 1064) (AFCSR-3164) (AF AFOSR-62-72) Unclassified

Expressions for the exact power of the 2-sample Mann-Whitney-Wilcoxon U test procedure against alternatives of exponential and rectangular populations have been derived. Several examples for total sample sizes of 11 and 15 have been compared with Mood's median test. Mood's test is more powerful than the U test in all instances in which the number of observations from the null population exceeds the number from the alternative population. The converse is true when the number of observations from the null population is less than the number from the alternative. Expressions for the asymptotic efficiency of the Mann-Whitney-Wilxoxon U test relative to Mood's and Massey's tests and the likelihood ratio test have been derived for exponential populations. The asymptotic efficiency of the U test relative to the likelihood ratio test is zero. Mood's and Massey's test procedures for 2 samples have been extended to the case of discriminating among populations on the basis of c ordered samples. Expressions for the exact power have been derived for Mood's test with exponential and rectangular populations and for Massey's test with exponential populations. With exponential translation alternatives, the tests are biased. The exact null distributions of goodness of fit tests for 1-way and 2-way contingency tables indicate that even for samples as small as 10, the exact distribution is closely approximated by a chi-square distribution with the appropriate degrees of freedom. (Contractor's abstract)

PERCENTILE POINTS OF ORDER STATISTICS IN SAMPLES FROM BETA, NORMAL, CHI (1 D. F.) POPULATIONS, by Z. Govindarajulu and N. W. Hubacker. Nov. 1962, 41p. incl. tables, refs. (Publication no. 101) (AFOSR-4698) (AF AFOSR-62-72) AD 296221 Unclassified

If $p(\alpha, i, N)$ denotes the αth probability point of the ith smallest order statistic in random samples of size N drawn from the Beta distribution, $I(\alpha, i, N)$ is computed accurate to 8 decimal places for $N = 1(1)30(5)60$, $i = 1(1)1+[N/2]$ and $\alpha = 0.01, 0.02, 0.10, 0.25, 0.50, 0.75, 0.90, 0.975, 0.99$. Also, the 25th, 50th and 75th percentile points of the Beta distribution for $N = 65(5)100$, $i = 1(1)1+[N/2]$ are computed with the same accuracy. Using the above values the percentile points of the normal, chi (1 d.f.) and Weibull order statistics in samples of sizes up to and including 30 are computed accurate to 4 or 5 decimal places. (Contractor's abstract, modified)

BEST LINEAR UNBIASED ESTIMATION OF LOCATION AND SCALE PARAMETERS OF WEIBULL DISTRIBUTION USING ORDERED OBSERVATIONS, by Z. Govindarajulu and M. Joshi. Nov. 1962, 37p. incl. tables, refs. (Publication no. 102) (AFOSR-4699) (AF AFOSR-62-72) AD 296220 Unclassified

Best linear unbiased estimation of location and scale parameters of the Weibull distributions using ordered observations of a random sample is considered. It is assumed that the shape parameter of the Weibull distribution is known. For sample sizes up to and including 5, all possible censoring is considered. For sample sizes greater than 5, one-sided censoring is considered. The coefficients are tabulated. For each sample size and the value of the shape parameter, the first row of coefficients corresponds to the best linear unbiased of the location parameter and the second row of coefficients

corresponds to the best estimation of the scale parameter. The expected values and the variances of the Weibull order statistics are computed accurate to 4 or 5 decimal places. For each combination of N and i, the first row gives the expected values and the second row gives the variances. Product moments and covariances are presented. The accuracy is 4 to 5 decimal places except for sample sizes 11 and 12 where the accuracy is 3 decimal places. Each column of values corresponds to a certain value of the shape parameter. Throughout, the same values of practical interest are considered for the shape parameter of the Weibull distribution. (Contractor's abstract, modified)

CUMULATIVE SUM CONTROL CHARTS. MATHEMATICAL PRINCIPLES APPLIED TO THEIR CONSTRUCTION AND USE. PART I, by N. L. Johnson and F. C. Leone. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-65-2603, pt. 1) (AF AFOSR-62-72) AD 628431 Unclassified

Also published in Indus. Quality Control, v. 18: 15-21, June 1962.

The cumulative sum control chart (CSCC) is considered in relation to the standard Shewhart control chart. The authors in no way contend that the CSCC will replace the standard control chart, but show that it has definite areas of applicability. In particular, by comparison of average run length (ARL) for different types of charts, some indication is given as to the situations in which one system is likely to be advantageous as compared with the other. It appears that the CSCC is especially well adapted to detecting abrupt changes in a parameter value (e.g., in mean or in proportion defective).

526

Case Inst. of Tech. [Statistical Lab.] Cleveland, Ohio.

CUMULATIVE SUM CONTROL CHARTS. MATHEMATICAL PRINCIPLES APPLIED TO THEIR CONSTRUCTION AND USE. PART II, by N. L. Johnson and F. C. Leone. [1962] [8]p. incl. diagrs. tables. (AFOSR-65-2603, pt. 2) (AF AFOSR-62-72) AD 628431 Unclassified

Also published in Indus. Quality Control, v. 19: 29-36, July 1962.

Cumulative sum control charts based on sample variances, and ranges are considered. In the case of variances, a rather general technique is described which allows incorporation of results from samples of different sizes in the same CSCC. For ranges, the usual case of uniform sample size is treated.

527

Case Inst. of Tech. [Statistical Lab.] Cleveland, Ohio.

CUMULATIVE SUM CONTROL CHARTS. MATHEMATICAL PRINCIPLES APPLIED TO THEIR CONSTRUCTION AND USE. PART III, by N. L. Johnson and F. C. Leone. [1962] [7]p. incl. diagrs. tables. (AFOSR-65-2603, pt. 3) (AF AFOSR-62-72) AD 628431 Unclassified

Also published in Indus. Quality Control, v. 19: 22-28, Aug. 1962.

An example is presented comparing cumulative sum control (Poisson and binomial variables) and standrad range charts. Tables are given to aid in selecting parameters for constructing a mask for control limits.

THE INFLUENCE OF WATER ON THE RATE OF TRANSMISSION OF HYDROGEN THROUGH PALLADIUM, by W. E. Reid, Jr. 1962, 50p. incl. diagrs. tables, refs. (AFOSR-4682) (AF 49(638)475) AD 408357 Unclassified

The transmission rate of H_2 through Pd was studied by electrodepositing H_2 on the surface of thin Pd foils and determining the evolution rate on the opposite side of the foils. The transmission rates were studied as functions of current density and foil thickness for environments of dry H_2 at 1 atm and liquid water respectively on the diffusion side of the foils. The Pd foil separated 2 compartments of a Teflon cell. The polarization compartment contained 2N H_2SO_4 saturated with H_2 at 1 atm. The steady state evolution of H_2 from the diffusion side of the foils was measured volumetrically as a function of the polarization or deposition current i and expressed equivalently as a current j. The resulting curves had an initial straight line portion and became more horizontal at higher values of current density. The reciprocal values of the initial slopes as well as the values of $i_{j_{max}}$ varied linearly with foil thickness. The transmission rates at the higher current densities for H_2 at 1 atm on the diffusion side of the foils were approximately 3 times those obtained when water was on the diffusion side. A comparison of possible mechanisms for the H_2 evolution reaction on palladium indicates that the slow step in this reaction is the discharge of

hydronium ions. If H_2 at 1 atm is on the diffusion side of the foil, the calculated value of the diffusion coefficient is $D = 3.16 \times 10^{-7}$ cm^2 sec at 25°C. This value is in good agreement with the value used by Barrer using the time lag method. If water is on the diffusion side of the foil, the calculated value is $D = 0.42 \times 10^{-7}$ cm^2 sec at 25°C. (Contractor's abstract)

THE MAXIMUM RATE OF DIFFUSION OF ELECTROLYTIC HYDROGEN THROUGH PALLADIUM AND PALLADIUM-SILVER ALLOY DIAPHRAGMS, by J. A. Pauley. 1962 [37]p. incl. diagrs. tables, refs. (AFOSR-4683) (AF 49(638)475) AD 407019 Unclassified

The limiting current of H_2 through Pd and Ag-Pd alloys was measured and was found to decrease with increasing Ag content of the alloy and with the thickness of the diaphragm. The diffusion coefficient was calculated for Pd and the 20% and 30% Ag-Pd alloys and the values of the exchange currents, i_{40}, for various values of θ (fraction of the surface sites available for H_2 adsorption) were calculated. The results of these computations are presented in table form. Increasing the Ag content of the alloy decreases the rate of the jump of H_2 into the bulk of the metal and this step assumes greater importance in the diffusion of H_2 through Pd as the Ag content is increased to 30%.

THE EFFECT OF TEMPERATURE AND PRESSURE ON THE MAXIMUM DIFFUSION RATE OF HYDROGEN THROUGH PALLADIUM, by P. L. Damour. 1962, 54p incl. diagrs. tables, refs. (AFOSR-4685) (AF 49(638)-475) AD 407670 Unclassified

The transmission rate of H_2 through Pd foil has been studied for a series of foil thickness at 4 temperatures and 4 pressures. The results support the assumption that the rate of the combination reaction of H_2 atoms on the face of the foil is extremely large. Proof is presented that as the foil becomes poisoned this surface combination reaction is retarded, and can be slowed down to such a value that the penetration reaction becomes the fastest. The diffusion constant, D, was evaluated; the extrapolated value at 25°C is $D = 8.1 \times 10^{-7}$ cm^2 sec. The activation energy of the diffusion reaction was found to be 6.6 ± 1.0 kcal. The diffusion constant over the temperature range, 5.6° to 15.3°C, is represented by $D = 0.023 \exp(-6600/RT)$ cm^2 sec.

ON IDENTICALLY DISTRIBUTED STOCHASTIC INTEGRALS, by R. G. Laha and E. Lukacs. [1962] [8]p. (AFOSR-64-1607) (sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-32 and National Science Foundation) AD 446898 Unclassified

Also published in Trans. Third Prague Conf. on Information Theory, Statistical Decision Functions, Random Processes, Liblice [Czechoslovakia] (June 5-13, 1962), Prague, Czechoslovak Academy of Sciences, 1964, p. 467-474.

Let $X(t)$, $t \in [a, b] \subset R$, be a process with independent increments, all moments finite, and mean value and variance functions of bounded variation on $[a, b]$. Form the integrals in quadratic mean $Y = \int_a^b a(t)dX(t)$, $Z = \int_a^b b(t)dX(t)$, where $a(t)$ and $b(t)$ are continuous in $t \in [a, b]$ with $\max_t |a(t)| \neq \max_t |b(t)|$. It is proved that Y and Z are identically distributed if and only if X(t) is a Wiener process and $\int_a^b [a(t)]^k dt = \int_a^b [b(t)]^k dt$ for $k = 1$ and 2. Then a similar theorem is established for $t \in [a, \infty]$. (Math. Rev. abstract)

QUANTUM MECHANICS OF BEATS BETWEEN WEAKLY COUPLED OSCILLATORS, by P. H. E. Meijer and T. Tanaka. [1962] [5]p. (AFOSR-3556) (AF 49(638)452) AD 408580 Unclassified

Also published in Amer. Jour. Phys., v. 31: 161-165, Mar. 1963.

Although the weakly coupled double pendulum seems to be a standard illustration in classical mechanics, it is seldom mentioned in quantum mechanics. It shares this fate with the damped harmonic oscillator, but while there is a good reason for avoiding the last one in quantum mechanics, the first can be treated with the same procedure as in classical mechanics. The exact solution is then compared with the solutions obtained by time-independent and time-dependent perturbation methods. It turns out that there are some additional steps to be taken, compared to the usual textbook treatment of the time-independent perturbation theory, due to the fact that all the levels of the unperturbed problem are degenerate. It is shown that the diagonalization of the secular matrix in the time-independent problem is equivalent to a problem of rotation of angular momentum operators in function space. The time-dependent problem needs, again, additional steps due to the degeneracy, and it yields the well-known beat-behavior. (Contractor's abstract)

CONFIGURATION INTERACTION IN Be_2 (Abstract), by H. C. Warren and V. F. Griffing. [1962] [1]p. [AF 49-(638)906] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 204, Mar. 26, 1962.

The energy of a single-determinant $^1\Sigma_g^+$, ground-state, wave function for Be_2 was improved by superposition of determinant spin configurations constructed using virtual orbitals from the same ground-state, SCF calculations. Coefficients and molecular energy were obtained by the variational procedure at each of seven internuclear distances, and for superpositions of 10, 15, 20, 25, 30, and 37 configurations. Binding in the ground state was indicated when up to 20 configurations were mixed, but disappeared upon more-extensive mixing. The ground-state energy at the largest distance closely approached the spectroscopically determined energy of 2 unexcited, beryllium atoms. Some stable, excited $^1\Sigma_g^+$ states were indicated. The same virtual orbitals were used to construct configurations of $^3\Pi_g$, $^3\Pi_u$, $^3\Sigma_g^+$, and $^3\Sigma_u^+$ symmetries. For each of these, the lowest-lying state resulting from mixing configurations at the largest distance approached to within 1 ev the energy of the separate atoms calculated from spectroscopic data. Some stable, triplet states were indicated.

MOLECULAR ORBITAL STUDY OF THE SYMMETRIC LINEAR H_4 COMPLEX (Abstract), by P. F. Piper and V. F. Griffing. [1962] [1]p. [AF 49(638)906] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys Soc., Series II, v. 7: 204, Mar. 26, 1962.

LCAO-MO-SCF calculations of the energies of a series of symmetric, linear configurations of H_4 in the $^1\Sigma_g^+$ state were carried out on a digital computer in order to obtain improved, approximate, wave functions. Molecular orbitals were constructed as linear combinations of modified Slater orbitals for the following sets of atomic-basis functions: 1s on each nucleus, 1s and $2p\sigma$ on each nucleus, and 1s, 2s, $2p\sigma$ and $2p\pi$ on each nucleus. For each of the AO's, the value 1.1 was used for the screening parameter. It was found that, using 1s AO's only, the energy was lowered with respect to a previous claculation done with the screening parameter equal to 1. The virtual orbitals obtained from the SCF calculation on the extended-basis set are being used to construct determinantal spin functions for a ground-state configuration-interaction study.

THEORETICAL INVESTIGATION OF THE GROUND STATE OF LINEAR H_3 (Abstract), by S. H. Brown and V. F. Griffing. [1962] [1]p. [AF 49(638)906] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 204, Mar. 26, 1962.

The approximate wave functions and molecular energies of the state of H_3 are now being calculated by making linear combinations of configurations which are constructed using virtual orbitals from a single, ground-state, LCAO-MO-SCF calculation. These are based on modified Slater-type 1s, 2s, $2p\sigma$, $2p\pi$ atomic orbitals. Thirty-eight configurations are taken for 4 internuclear distances of asymmetric H_3 and 6 internuclear distances of symmetric H_3.

PARTIAL AND TOTAL CAPTURE PROBABILITIES OF NEGATIVE MUONS BY C^{12}, by M. Ruel and J. G. Brennan. [1962] [4]p. incl. tables, refs. (AFOSR-J317) (AF AFOSR-62-56) AD 408026 Unclassified

Also published in Phys. Rev., v. 129: 866-869, Jan. 15, 1963

The capture probability of negative muons by the C^{12} nucleus is calculated as a sum of partial transition rates to the individual levels of B^{12}. The calculation is based on an extreme single-particle shell model. The calculation is in application of the general formalism developed by Morita and Fujii for predicting the transition rate between 2 definite nuclear states, following muon capture. Regarding bound-state captures, the agreement between theory and experiment is good. An exception is the prediction concerning the 1.67-mev level of B^{12}, the calculated transition rate being too large by a factor whose lower limit is about 2. This casts some doubt on the spin and parity assignments currently accepted for this level. The total capture probability is too small by a factor of 2, as is the ratio of unbound-to-bound captures. The discrepancy is accounted for in part by the existence of little-known, highly excited virtual state of B^{12}. These conclusions are of limited scope because of the use of the single-particle shell model.

THE IN VITRO EFFECT OF PROGESTERONE AND ESTROGENS ON THE OXYTOCIN RESPONSE OF RAT UTERUS, by L. Barnafi and H. Croxatto. [1962] [4]p. incl. diagrs. (AFOSR-1941) (AF 49(638)584) Unclassified

Also published in Acta Physiol. Latinoamer., v. 13: 26-29, 1963.

The in vitro effect of progesterone, estrogens, testosterone, and desoxycorticosterone acetate was studied on 32 isolated non-pregnant rat uteri before and after oxytocin stimulation. All of these substances block the response to oxytocin. It is suggested that this inhibitory effect is due to a change on the premeability of the myometrial cell membrane.

[NEUROPHYSIOLOGY OF APLYSIA GANGLION], by A. Arvanitaki-Chalazonitis and N. Chalazonitis. Final rept. Apr. 1, 1961-Mar. 31, 1962 [4]p (AFOSR-J1052) (AF EOAR-61-30) AD 420034 Unclassified

The studies have been performed on identifiable neurons of the nerve centers of Aplysia, either initially spontaneously active, or submitted to excitatory or inhibitory synaptic actions at various frequencies, impinging the center through different pathways. The individual activities of 2 to 4 cells were simultaneously recorded through 2 to 4 independent microelectrodes and dc amplifier channels. Emphasis was placed on the input-output relationships and on the bases underlying organization of spatio-thermal patterns of activity, basically implied in function and behavior.

STUDY OF THE EARTH AS A SEISMIC ELECTRIC TRANSDUCER, by S. D. Buchanan. Semiannual technical summary rept. June 15, 1962, [21]p. incl. diagrs. tables. (AF 49(638)1085) AD 412484 Unclassified

Tests were conducted in 5 areas whose electroseismicity was known from work performed previously in conjunction with quarry tests. Tests consisted of shooting charges of one pound of dynamite or less at distances not in excess of 1,000 ft from the measuring site. Results obtained in the good E. S. areas were compared with those obtained in the bad E. S. areas. From this comparison a basis for measuring the electroseismicity of an area resulted. The electroseismicity of 14 Nevada test site areas was determined using the comparison criteria established above. Using the results obtained 2 areas were selected from which 2 nuclear blasts were measured. A series of controlled experiments was made in conjunction with small blasts of the order of one pound of dynamite. These experiments were performed at one of the better local E. S. areas and consisted of an evaluation of a 3-dimensional E. S. array. Electrode arrangements for these tests are shown. A self potential and resistivity log was made of one of the holes in order that the E. S. results might be correlated with local geology. Additional tests were made to determine the feasibility of a model study of the phenomenon. (Contractor's abstract)

STUDY OF THE EARTH AS A SEISMIC ELECTRIC TRANSDUCER, by S. D. Buchanan, D. P Hearn and others. Final rept. Oct. 25, 1962 [80]p. incl. diagrs. tables, refs. (AF 49(638)1085) AD 298996 Unclassified

For quarry blasts of the type and size encountered in this investigation (600 to 13,000 pounds), a detection range of approximately 10 miles is indicated. Ripple firing of the quarry blasts considerably reduced the maximum distance at which the electroseismic signal produced by these blasts could be detected. There is extreme variability in the ability of different areas to produce an electroseismic signal. Creek bottoms, in general, were found to be more active as electroseismic transducers than hilltops or barren tableland. The inability to find active electroseismic areas near the GNOME blast or the Nevada Test Site precluded the possibility of making a determination of the true potential of the electroseismic technique as a tool for detecting nuclear blasts. However, it is felt that had suitable areas been found, a signal could have been recorded at both stations for the GNOME blast and at Location 7 in Nevada. A vertical electrode span was found to offer an improvement in S/N ratio of 15:1 over that for a surface electrode span. The maximum signal on a vertical electrode span occurred when the down hole electrode was at the sand-shale interface. For the model study, the electroseismic signal amplitude increased as the percent of sand in a sand-shale mixture was increased. The effect of changing the conductivity of the interstitial water on the amplitude of the electroseismic signal was found to be minimal.

STUDIES IN MATHEMATICAL BIOPSYCHOLOGY, by H. D. Landahl and H. White. Final rept. Apr. 1, 1962, 29p. incl. diagrs. refs. (AFOSR-2451) (AF 49(638)-414) AD 287857 Unclassified

A brief report on a study of visual adaptation is given Principal results are a second order differential equation for the concentration of rhodopsin, a model that explains how the sensitivity of the rod depends on the concentration, a model that explains the shape of the b-wave of the electroretinogram, and the fitting of some data on illumination thresholds on the basis of these models. The problems of real and apparent movement are discussed in terms of simple neural nets. An expression is derived for maximum distances between stimuli for various time intervals and stimuli intensities. Results compare favorably with available data so preliminary results on the simplest possible mechanism give an output which depends on the velocity and the width of a sharply defined stimulus, there being a maximum with respect to velocity. Movement of a poorly defined stimulus, e.g., intensity $S = 0$ for $x < 0$, $S = x$ for $0 \leq x \leq A$, and S constant for $x > A$ gives an output proportional to the velocity of movement and to S, and independent of A. CHURCH'S THESIS AND ITS RELATION TO THE CONCEPT OF REALIZABILITY IN BIOLOGY AND PHYSICS, by R. Rosen. [1962] [19]p. incl. refs. (AFOSR-3206) (AF 49(638)917) AD 400659 AD 403590 Unclassified

Also published in Bull. Math. Biophys., v. 24: 375-393, Dec. 1962.

An attempt to characterize the physical realizability of an abstract mapping process in terms of the Turing computability of an associated numerical function is described. Such an approach rests heavily on the validity of Church's thesis for physical systems capable of computing numerical functions. This means in effect that one must investigate in what manner Church's thesis can be converted into an assertion concerning the nonexistence of a certain class of physical processes (namely, those processes which are capable of calculating the values of numerical functions which are not Turing-computable). A formulation which may be plausible is suggested, and it is then shown that the truth of Church's thesis in this form is closely connected with the effectiveness of theoretical descriptions of physical systems. It is shown that the falsity of this form of Church's thesis is related to a fundamental incompleteness in the possibility of describing physical systems, much like the incompleteness which Gödel showed to be inherent in axiomatizations of elementary arithmetic. Various implications of these matters are briefly discussed. (Contractor's abstract)

REACTIVE INTERMEDIATES IN CYCLOPROPANE CHEMISTRY, by W. G. Brown. Final rept. Dec. 31, 1962, 6p. incl. diagrs. (AFOSR-4875) (AF 49(638)784) AD 413469 Unclassified

Studies were made of the chemistry of 1,1-dimethyl-2,3-dinitrocyclopropane. Unlike the mono-nitro compound, the ring hydrogens are liable to acetate ion, – catalyzed hydrogen - deuterium exchange. With a stronger base, hydroxyl ion, the compound readily undergoes a ring cleavage similar to those known for nitrocyclopropyl ketones. Further studies were made on the photochemical transformations of aryl ketones containing cyclopropyl substituents, as well as analogous compounds with larger rings. The preliminary findings disclose patterns of photolytic reactions not hitherto exemplified. One example is the formation of 2-methyl-4-benzoyl-1-butene upon UV irradiation of 1-benzoyl-2,2-dimethylcyclopropane. (Contractor's abstract, modified)

β,β-DIMETHYL-δ,δ-DIPHENYL-δ-VALEROLACTONE, by W. G. Brown and F. Greenberg. [1962] [1]p. [AF 49(638)784] Unclassified

Published in Jour. Org. Chem., v. 28: 599, Feb. 1963.

Stetter and Krause described the preparation of a compound believed to be 1,3-dibenzoyl-2,2-dimethylpropane by a Friedel-Crafts condensation of 3,3-dimethylglutaryl chloride (I) with C_6H_6. A repetition of this work showed that the product actually was β-β-dimethyl-δ-δ-diphenyl-δ-valerolactone(II). I(20.8g), treated with 29g of $AlCl_3$ in 150 ml C_6H_6 at 0°, the mixture stirred 2 hr at room temperature, and the product crystallized, gave 5.8g of II, which melted at 91.7-92.2°. The Grignard synthesis from 0.95g diethyl 3,3-dimethylglutarate (0.95g) gave 1.02g of II. Successive treatment of II with NH_2OH, HCl, and $FeCl_3$ gave the wine color for esters and lactones. Infrared and nuclear magnetic resonance spectra were given for II.

ON ONE-SIDED LOCALIZATION OF TRIGONOMETRIC SERIES, by A. Zygmund. [1962] [13]p. (AFOSR-J449) (AF 49(638)551) Unclassified

Also published in Studies in Mathematical Analysis and Related Topics, ed. by G. Szegö, C. Loewner and others. Stanford U. Press, 1962, p. 435-447.

Let S be a trigonometric series $\sum c_n e^{inx}$ with coefficients c_n tending to 0 as $n \to \pm \infty$. The series S is

localizable at the point x_0 to the right if there is another trigonometric series T such that for some $\epsilon > 0$, (1) T is equiconvergent with S in the interior of $(x_0, x_0 + \epsilon)$; (2) T converges to 0 in the interior of $(x_0 - \epsilon, x_0)$. In this definition S is necessarily localizable at x_0 to the left. The main theorem is as follows. A necessary and sufficient condition for $S = \Sigma c_n e^{inx}$ to be localizable at x_0 is that the integrated series

$$S_1 = c_0 x + C_0 + \sum' (c_n / in) e^{inx} \text{ converges at } x_0,$$

and $\lim_{n \to \pm\infty} \sum_{|k| \le |n|/2} \frac{c_{n-k} \exp i(n+k)x_0}{k} = 0$

Some related theorems are also given. (Math. Rev. abstract)

ON GENERALIZED (ZT)-GROUPS, by M. Suzuki. [1962] [4]p. [AF 49(638)858] Unclassified

Published in Arch. Math., v. 13: 199-202, 1962.

Doubly transitive permutation groups which satisfy the following conditions are studied: (1) the degree of G is $1 + n$ where n is a power of 2. (2) the subgroup H consisting of elements which leave one fixed symbol invariant contains a normal subgroup Q which is regular on the remaining n symbols; (3) the subgroup consisting of elements leaving 2 distinct symbols invariant is a cycle group of odd order. A class of groups satisfying conditions 1 - 3 can be constructed as follows: Let $\sigma(x, y) = x_1, y_1^q + x_2, y_2^q + x_3, y_3^q$ be the hermitian defined over GF (q^2), where q is a power of 2, the projective unitary group contains a normal simple subgroup of index 1 or 3 denoted by HO $(3, q^2)$. Then HO $(3, q^2)$ acts as a permutation group on the points $x = (x_1, x_2, x_3)$ in the projective plane with $\sigma(x, x) = 0$. It can then be verified that HO $(3, q^2)$ satisfies 1 - 3 with $n = q^3$. In addition, some groups of semilinear transformations over near fields of special character satisfy these same 3 conditions. The following theorem is proved: Let G be a doubly transitive permutation group satisfying conditions 1 - 3 Then G is one of the groups discussed above. (Math. Rev. abstr. .)

[Chicago U. Dept. of Mathematics, Ill.]

ON THE STABILITY OF A MACLAURIN SPHEROID OF SMALL VISCOSITY, by P. H. Roberts and K. Stewartson. [1962] [14]p. incl. refs. (AFOSR-J865) (Sponsored jointly by Air Force [Office of Scientific Research] under AF AFOSR-62-136 and Army [Research Office (Durham)]) AD 415835 Unclassified

Also published in Astrophys Jour., v. 137: 777-790, Apr. 1, 1963.

The stability of a viscous Maclaurin spheroid is solved asymptotically for small kinematic viscosity, ν. It is shown that, in this limit, the frequency of oscillation, n, with respect to the mode which becomes neutrally stable in the absence of viscosity at the point of bifurcation (where the eccentricity, e, of the meridional section is approximately 0.8127), is

$$n = n_0 + i \frac{5\nu n_0^2}{a^2 Q(e)} + O(\nu).$$

In the foregoing formula n_0 denotes the frequency in the absence of viscosity, a is the radius of the equatorial section, and Q(e) is a certain function of e which changes sign at $e = 0.8127$ and is positive for smaller values of e. From equation (1) it follows that the Maclaurin spheroid is indeed unstable beyond the point of bifurcation when viscosity is present.

ON HIGHLY ROTATING POLYTROPES. I, by P. H. Roberts [1962] [13]p. incl. diagrs. (AFOSR-1277) (AF AFOSR-62-136) AD 424346 Unclassified

Also published in Astrophys. Jour., v. 137: 1129-1141, May 15, 1963.

This paper is concerned with the equilibrium of a highly rotating mass of fluid which obeys a polytropic equation of state. Since exact solutions are possible only when the angular velocity Ω of the configuration is small compared with $(G\rho)^{1/2}$, where ρ is the mean density and G is the gravitational constant, the methods expounded in this paper are necessarily approximate. It is supposed that the equidensity surfaces are similar and similarly situated oblate spheroids, and the problem is reduced to finding the appropriate eccentricity of these spheroids and the variation of density with equatorial radius. Three methods of making these determinations are proposed and are examined in detail for the polytrope of index unity. These methods, respectively, depend on (1) a variational principle,

(2) satisfying hydrostatic equilibrium exactly in the equatorial plane, and (3) satisfying hydrostatic equilibrium exactly on the polar axis. Method 1 is shown to lead to results which are a compromise between those of methods 2 and 3. Some attention is given to the question of whether or not, as Ω is increased, the polytrope will bifurcate to a Jacobi form before equilibrium is broken by centrifugal forces at the equator. It is concluded that if the polytropic index is less than unity (approximately), bifurcation will indeed occur.

NOTE ON A NONLINEAR EIGENVALUE PROBLEM, by M. Shinbrot. [1962] [7]p. (AFOSR-J1622) (AF AFOSR-62-136) AD 429262 Unclassified

Also published in Proc. Amer. Math. Soc., v. 14: 552-558, Aug. 1963.

The author considers the equation $\lambda u = Au + \lambda^{\alpha} B_{\lambda} u$ in a Hilbert space H where: (1) A is a compact symmetric operator with simple eigenvalues u_n. Its eigenfunctions v_n span H. Moreover, if $\delta_n = \min_{j \neq n} u_n - u_j$, then $\sum u_n^{\alpha} \delta_n^{2} < \infty$. Here $\alpha > 1$. (2) B_{λ} is an operator defined for all λ in the disk $\lambda \leq (\alpha \alpha - 1))^{1} A$. B_{λ} is uniformly bounded by "B" in that disk and satisfies a Lipschitz condition $B_{\lambda} - B_{\mu} \leq L' \lambda - u$. He proves the theorem: There exist infinitely many eigenvalues λ_n and eigenfunctions u_n of the above equation. The sequence $\{\lambda_n\}$ approaches zero. Moreover, there is an integer N such that $K_N \supset H_N$ and, if x is any element of H, it can be represented in the form

$$x = \sum_{1}^{N-1} \xi_n v_n + \sum_{N}^{\infty} \xi_n u_n.$$

Finally, if A and the series given in (1) above are small enough, N may be taken as unity, so that the sequence $\{u_n\}$ is complete in H. Here H_N denotes the subspace spanned by $\{v_N, v_{N-1}, \ldots\}$ and K_N denotes the subspace spanned by all but the first N - 1 of the eigenfunctions of the equation, if infinitely many such exist. In order to establish the series expansion of the theorem, an existence proof including many estimates is needed. Also needed here is a theorem of Paley and Wiener. An application is made to the equation

$$Lu = \frac{d}{dx} p \frac{du}{dx}.$$

ON HIGHLY ROTATING POLYTROPES. II, by P. H. Roberts. [1962] [11]p. (AFOSR-64-0978) (AF AFOSR-62-136) AD 440152 Unclassified

Also published in Astrophys. Jour., v. 138: 809-819, Oct. 1, 1963.

In Part I (item no. 555, Vol. VI) a variational method was given for determining approximately the structure of a rotating polytrope. On specifying an n-parameter family of equidensity surfaces, the variational method gave the "best" values for these n-parameters and the "best" density to assign to each surface. In this paper a two-parameter family of surfaces, namely, oblate spheroids of variable eccentricity is assumed. The variational method is used to derive differential equations for the eccentricity e(m) and the density p(m), as a function of the equatorial radius m. It is proved that, for small e, the theory agrees with that of Clairaut and also with that of Chandrasekhar for a slightly distorted polytrope.

FREQUENCY DISCRIMINATION AFTER BILATERAL SECTION OF THE BRACHIUM OF THE INFERIOR COLLICULUS, by J. M. Goldberg and W. D. Neff. [1961] [26]p. incl. illus diagrs. tables, refs. (Sponsored

jointly by Air Force Office of Scientific Research under [AF 49(638 925] and Office of Naval Research]
Unclassified

Published in Jour. Compar. Neurol., v. 116: 265-280, 1961.

Nine cats were trained to make an auditory frequency discrimination. The brachium of the inferior colliculus was then sectioned bilaterally and after recovering from operation the animals were retrained. The cats could be divided into 3 groups: (1) evoked potential to click stimuli were recorded from auditory cortex at time of sacrifice and microscopic examination of the brain stem sections revealed that the brachium of the inferior colliculus was not completely sectioned; (2) evoked potentials were recorded from auditory cortex even though the brachium was completely sectioned; and (3) auditory cortex was not electrically responsive to click stimuli and the brachium was completely sectioned. It is concluded that animals in which the auditory system is completely sectioned at the level of the brachium of the inferior colliculus cannot relearn in 1000 trials the same frequency discrimination that animals in which the geniculo-cortical auditory system is eliminated by ablation of auditory cortex can relearn in less than 300 trials.

[NUCLEAR EMULSION STUDIES OF THE PROPERTIES OF HYPERNUCLEI] by R. Levi-Setti and V. L. Telegdi. Final rept. [1962] [12]p. incl. refs. (AFOSR-4298) (AF 49(638)209) AD 293985 Unclassified

Considerable information concerning the properties of hypernuclei has been determined. It has been established that the Λ-nucleon interaction is charge symmetric, namely the Λ-n interaction is essentially as strong as the Λ-p interaction. This conclusion is drawn from the study of the binding energy of mirror hypernuclei. Also established was the fact that the Λ-n interaction is spin dependent. This conclusion stems from both the analysis of the binding energies, and from the experimental determination of the spins of hypernuclei like $_{\Lambda}H^{3}$, $_{\Lambda}H^{4}$, and $_{\Lambda}Li^{8}$. The Λ-nucleon interaction is found to be stronger in the antiparallel orientation of the Λ and N spins, in contrast with the opposite situation for the nucleon-nucleon (N-N) interaction. It also became possible to estimate the depth D_{Λ} of the potential well experienced by a Λ hyperon in infinite nuclear matter from an analysis of the binding energy of very heavy hyperfragments — a value of [illegible] mev was found. The weak Λ-nucleon interaction was explored in studies of the decay modes and lifetimes of hypernuclei. Several new checks concerning the so-called $\Delta T = \frac{1}{2}$ rule have been supplied. The lifetime of $_{\Lambda}H^{4}$ was measured yielding a result which confirmed the spin assignment $J = 0$ for $_{\Lambda}H^{4}$. The slow Λ-N de-excitation processes $\Lambda + N \rightarrow N + N$, and $\Lambda + p \rightarrow N + p$ were investigated showing that these 2 processes occur with comparable frequency. Several properties bearing on the nuclear-physics aspects of hypernuclei were explored including phenomena of final state interaction as well as production processes of hyperfragments. It was also shown that (Σ^-n) hyperfragments do not exist. Finally, several improvements in measuring techniques are reported.

A DETERMINATION OF THE SPIN OF $_{\Lambda}Li^{8}$, by D. H. Davis, R. Levi-Setti, and M. Raymund. [1962] [5]p. incl. diagrs. table, refs. (AFOSR-65-0464) (AF 49-(638)209) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 469, Aug. 27, 1962.

Also published in Nuclear Phys., v. 41: 73-77, Feb. 1963.

The available data on ${}_{\Lambda}Li^{8} \rightarrow \pi^{-} + He^{4} + He^{4}$ decay have been analyzed in terms of intermediate Be^{8} states. Out of 41 events, 32 are interpreted as involving the 2^{+}, 2.9-mev level of Be^{8}, while the remainder seem to proceed through other Be^{8} states (including the ground state). The center-of-mass angular distribution of the two He^{4} nuclei (relative to the π direction) has been studied for the 32 decays to the 2^{+} state of Be^{8}. A comparison with the theoretical prediction of Dalitz indicates that the spin of ${}_{\Lambda}Li^{8}$ is most likely unity.

BINDING ENERGY OF Λ^{0} HYPERONS IN HEAVY HYPERNUCLEI (60 < A < 100), by D. H. Davis, R. Levi-Setti and others. [1962] [3]p. incl. diagrs. table. (AFOSR-65-0837) (AF 49(638)209) AD 617044 Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 464-466, Dec. 1, 1962.

From a study of the total visible energy release in the non-mesonic decays of Λ-hypernuclei in emulsion, which are the spallation products of silver and bromine with masses in the range A = 80 to A = 100, an upper limit of about 35 mev is placed on the value of the binding energy B. From the observation of 5 π^{-} mesonic decays, which are attributed to hyperfragments of the same order of mass, a more precise estimation of this limit is made, namely, about 25 mev. These fragments resulted from the interactions of K^{-} mesons of 800 mev/c and 1.5 gev/c. At 800 mev/c 3 examples of mesonic decay were accompanied by about 1100 non-mesonic disintegrations.

MESIC DECAYS OF HYPERNUCLEI FROM K^- INTERACTIONS AT REST AND AT ~ 800 Mev c (Abstract) by N. Crayton, D. H. Davis and others. [1962] [1]p. (In cooperation with Northwestern U., Evanston, Ill.) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)209] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer Phys Soc., Series II, v. 7 49, Jan. 24, 1962.

Two emulsion stacks have been exposed to the 800 mev c separated K^- beam at the Bevatron. Both stacks are built up of ~ 1.2 mm thick K-5 pellicles. Stack 1 consists of 82 such pellicles of area 4 in. x 6 in. and contains ~ 6×10^4 stopping K^-. Stack 2 consists of 117 pellicles of area 6 in. x 8 in. and was exposed to ~ 10^6 K^- incident at ~800 mev/c. To date ~ 400 mesic hyperfragments (MHF) have been found in stack 1 and ~ 100 MHF in stack 2. Measurements on these events are now in progress, and preliminary results will be presented. In particular a comparison of MHF production by K^- at rest and in flight will be attempted. In addition data will be presented bearing on the binding energy (B_Λ) for those hypernuclei where B_Λ is rather poorly known, as well as on rare decay modes of hyperfragments. If sufficient data are available by then, an estimate will also be given for the lifetime of the Λ bound in nuclear matter.

HIGH ENERGY ELECTRONS OF SOLAR ORIGIN, by P. Meyer and R. Vogt. Apr. 1962 [8]p. incl. diagrs. (AFOSR-2970) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1008, National Aeronautics and Space Administration, and National Science Foundation) Unclassified

Also published in Phys. Rev. Ltrs., v. 8: 387-389. May 1962.

The existence of electrons in the primary cosmic radiation has been established over the past yr. The question, whether these electrons have their origin in the galaxy, within the solar system, or both, has remained open. Attempts were made to investigate whether electrons in the energy range from 100 mev to several bev may be emitted by the sun during solar flares which are known to produce protons of similar energy. An observation is reported here which shows that electrons may be emitted by the sun during a solar flare and that the active region, which passed center meridian on July 14, 1961 did indeed emit electrons with energies about 100 mev which could be observed at the earth.

PRIMARY COSMIC RAY AND SOLAR PROTONS II by P. Meyer and R. Vogt. [1962] [5]p. incl. diagrs. table, refs. (AFOSR-J461) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-23, National Aeronautics and Space Administration, National Science Foundation, and Office of Naval Research; and Royal Canadian Air Force) AD 407 ..
Unclassified

Also published in Phys. Rev., v. 129: 2275-2279, Mar. 1, 1963.

During July and Aug. 1961, the energy spectrum of primary cosmic-ray protons was investigated in the energy range from 80 to 350 mev. The observations were made in 5 high-altitude balloon flights at geomagnetic latitudes $\lambda \geq 73$ N. Solar flare and quiet day spectra were obtained. A comparison of the 1960 and 1961 results leads to the following conclusions: (1) A significant flux of low-energy protons is continually present in the primary radiation in the years of high solar activity. (2) This flux decreases with the declining level of solar activity as the galactic cosmic-ray flux increases. It is, therefore, suggested that it is of solar origin. (3) The time dependence of the observed proton flux suggests the following alternatives: (a) the particles are produced or released more or less continuously by the sun and do not originate only in the large flare events; or (b) the particles are produced in individual large solar flares and subsequently stored over long periods of time. This second alternative would require a new and as yet unknown storage mechanism with a characteristic time of about 30 or more days. (Contractor's abstract)

THE PHYSICAL SIGNIFICANCE AND APPLICATION OF L, B_0, AND R_0 TO GEOMAGNETICALLY TRAPPED PARTICLES, by E. C. Stone [1962] [10]p. incl. diagrs. (AFOSR-J1552) (AF AFOSR-62-23) AD 427408
Unclassified

Also published in Jour. Geophys. Research, v. 68: 4157-4166, July 15, 1963.

In a dipole field, many different invariant shells (L, B_m) share exactly the same lines of force. These invariant shells are therefore members of a degenerate system. In the geomagnetic field, which is assumed static and without electric field, these degenerate systems are split by azimuthal asymmetry. A distinction is made, therefore, between the use of parameters as invariants of charged particle motion (invariant representation) and their use as constants for all particles on a line of force (degenerate representation). It is found that McIlwain's L value associates nondegenerate geomagnetic shells with dipole degenerate systems if L at a point in space is redefined to apply only to particles mirroring at that point. Emphasis is placed on the redefined L as an invariant parameter of particle motion

and on the near equality of the L value of a particle and the equatorial radius R_0 of the line of force on which the particle is mirroring. Although the original definition of L resulted in a very useful parameter, the present definition allows a physical interpretation of L as originally applied and extends its usefulness beyond that allowed by the original definition. With the present definition, the different values of L along a line of force can be identified with the radial separation of particles mirroring on that line as they drift in longitude. This separation is $\approx 2\bar{\epsilon}$ of the shell radius and represents the accuracy with which a single magnetic field parameter, such as the minimum field intensity B_0 of a line, describes all particles on the line (a degenerate representation). Beyond 3 earth radii, it is found that R_0 gives a representation of comparable accuracy. However, an invariant representation (L, B_m) or (I, B_m) is limited only by the accuracy of the determination of the mirror field B_m and the longitudinal invariant I, both of which depend on the accuracy of the magnetic field representation. LOADING OF EMULSIONS STACKS WITH AQUEOUS SOLUTIONS OF LITHIUM ACETATE, by D. H. Davis, R. Levi-Setti and others. [1962] [13]p. incl. illus. diagrs. tables. (AFOSR-64-0510) [AF AFOSR-62-358] AD 436375 Unclassified

Also published in Nuovo Cimento, Series X, Suppl. no. 3, v. 26: 345-357, 1962

It is shown that thick pellicles can be loaded with lithium acetate solutions still maintaining all the desirable geometrical and physical properties of normal emulsion. Aside from the main purpose of the method, that of introducing lithium atoms in the emulsion the loaded pellicles offer a number of interesting properties which may be helpful in various applications. Loading with lithium acetate increases appreciably the relative content of light elements in the emulsion. Experiments in which water loading was previously required can be carried out with the advantage of a better track image, using these emulsions. The production of hyperfragments from K^- capture stars will be undoubtedly enhanced, while the decreased stopping power (with respect to normal emulsions) may prove useful in lifetime studies. Additional advantages arise from the fact that pellicles originally 1200 μ m. This may serve to increase the density of tracks by almost a factor of 2, of some value in the presence of beams of low intensity. The effort in tracing long tracks through the stack is reduced and the efficiency in detecting connected events in a single pellicle is correspondingly increased.

EXPERIMENTAL AND THEORETICAL INVESTIGATION OF THE ELECTRONIC PROPERTIES OF GERMANIUM SEMICONDUCTORS AT HELIUM TEMPERATURES, by H. Fritzsche. Final technical rept. Feb. 20, 1962, 14p. incl. refs. (AFOSR-2277) (AF 49(638)802) AD 283261 Unclassified

Germanium semiconductors were prepared by transmutation-doping. In this method, pure Ge or Ge containing a known impurity concentration is irradiated with slow neutrons. Ge^{70} and Ge^{74} capture these neutrons and transmute into Ga^{71} and As^{75}, respectively, in a ratio which depends on the isotropic abundances and capture cross sections. The advantages are: the compensation ratio is accurately known; one can prepare series of samples in which either the compensation ratio is held constant and the impurity concentration varies, or the minority impurity concentration is fixed and the majority impurity concentration is varied, or the majority impurity concentration is fixed and the minority impurity concentration is varied; and the samples are homogeneous.

MOBILITY OF IONS IN LIQUID He^4 I AND He^3 AS A FUNCTION OF PRESSURE AND TEMPERATURE, by L. Meyer, H. T. Davis and others. [1962] [8]p. incl. diagrs. tables, refs. (AFOSR-1777) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-52 and National Science Foundation) Unclassified

Also published in Phys. Rev., v. 126: 1927-1934, June 15, 1962.

An experimental study is presented of the pressure and temperature dependence of the mobility of the positive and negative species of charged particles in liquid He^4 above the λ transition and in liquid He^3. The mobility of the positive species in He^4 decreases linearly with increasing density, and the Stokes radius of the positive species is inversely proportional to $T^{\frac{1}{2}}$. The mobility of the negative species initially increases with

increasing density and then falls off linearly with further increase in density. The Stokes radius of the negative species increases with increasing temperature. At constant density the mobilities of both species in He^4 and He^3 vary very slowly with temperature. At the vapor pressure and around 2.2°K there is a larger temperature dependence than indicated above, but this is probably due to the approach of the λ transition. The mobility of the positive species in He^4 and He^3 at 3.0°K is a linear function of density, independent of the isotope. (Contractor's abstract, modified)

KINETIC THEORY OF DENSE FLUIDS. XII. ELECTRONIC AND IONIC MOTION IN LIQUID He^4 I AND LIQUID He^3, by H. T. Davis, S. A. Rice, and L. Meyer. [1962] [7]p. incl. tables, refs. (AFOSR 375, (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-52, National Science Foundation, Petroleum Research Fund of the American Chemical Society, and Public Health Service) Unclassified

Also published in Jour. Chem. Phys., v. 37: 1521-1527, Oct. 1, 1962.

The mobilities of positive and negative charge carriers in liquid He^3 and He^4I are calculated and the resultant agreement with experiment is excellent. The negative carrier is taken to be an electron. Due to electrostriction and density fluctuations the effective mass of the electron is of the order of 100 electron masses. In addition, the disorder of the liquid leads to incoherences in the scattering of the electron from atomic pseudopotentials. The positive carrier is taken to be He_2^+. An extension of the theory of Rice and Allnatt leads to a formula for the mobility in terms of a quantum-mechanical temperature. Electrostriction increases the density about an ion and the dissipation arises about equally from the short-range repulsive forces and the Coulomb and van der Waals attractive forces. Both calculations involve only basic considerations and there are no adjustable parameters in the theory. The computed effective mass of the negative carrier in He^3 at 3.00°K and 2-atm pressure is 105 electron masses: The observed effective mass is 97 electron masses. For the negative carrier in He^4I at 4.2°K and 1-atm pressure the computed and observed effective masses are 149 and 128 electron masses, respectively. In the case of the positive ion, the observed mobility at 2.2°K and 1-atm pressure in He^4 is $5.6 \times 10^{-2} cm^2 V^{-1} sec^{-1}$ while the computed value is $5.2 \times 10^{-2} cm^2 V^{-1} sec^{-1}$. EXCITON-EXCITON INTERACTIONS AND PHOTOCONDUCTIVITY IN CRYSTALLINE ANTHRACENE. by S. Choi and S. A. Rice. [1962] [8]p. incl. diagr. table, refs. (AFOSR-J376) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-52, National Science Foundation, and Public Health Service) Unclassified

Also published in Jour. Chem. Phys., v. 38: 366-373, Jan. 15, 1963. (AFOSR-64-2183; AD 452415)

In this paper the mechanism of photoconductivity in crystalline anthracene is considered. It is shown that 2 excitons may interact to form a pair of charge carriers and an unexcited molecule. The computed rate of generation of charge carriers is 3.7×10^8 cm^{-3} sec^{-1}, in satisfactory agreement with the (approximate) experimental value of 7.2×10^8 cm^{-3} sec^{-1} when the exciton concentration is 1.2×10^{10} cm^{-3}. Other qualitative features of the proposed mechanism are in agreement with observation if electron-hole recombination is accounted for. Recent experiments by Silver demonstrating a photocurrent proportional to the square of the light intensity, and by McGlynn demonstrating the necessity for singlet states as the kinetic intermediate in charge-carrier generation are in agreement with the model proposed. EXCITON-EXCITON INTERACTIONS AND PHOTOCONDUCTIVITY IN ORGANIC CRYSTAL, by S. Choi and S. A. Rice. [1962] [3]p. (AFOSR-J377) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-52 and National Science Foundation) Unclassified

Also published in Phys. Rev. Ltrs., v. 8: 410-412, May 15, 1962.

Northrop and Simpson (Proc. Roy. Soc. (London), v. 244A: 377-389, Mar. 25, 1958) suggest that photoconductivity in doped anthracene may be due to exciton-exciton interaction. This possibility is investigated by considering the properties of a lattice of hydrogen atoms, in which it is found that there is a finite probability of transfer of exciton energy between degenerate states. It is suggested that in the case of an organic crystal this process may be even more likely.

ON THE KINETIC THEORY OF SIMPLE DENSE FLUIDS. XI. EXPERIMENTAL AND THEORETICAL STUDIES OF POSITIVE ION MOBILITY IN LIQUID Ar, Kr, AND Xe, by H. T. Davis, S. A. Rice, and L. Meyer. [1962] [10]p. incl. diagrs. tables, refs. (AFOSR-J37-9) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-52, National Science Foundation, and Petroleum Research Fund of the American Chemical Society) Unclassified

Also published in Jour. Chem. Phys., v. 37: 947-956, Sept. 1, 1962.

Measurement of the mobility of positive ions in liquid Ar, Kr, and Xe at various temperatures and pressures is reported. The magnitude, the pressure dependence, and the temperature dependence of the positive ion mobility in liquid Ar, Kr, and Xe can be quantitatively accounted for by an extension of the theory of Rice and Allnatt. It is found that negative contributions to the momentum autocorrelation function are of dominant importance. Modification of the simple Nernst-Einstein relationship between the charge mobility and the self-diffusion constant of the parent atom by inclusion of the effects of polarization leads to quantitative agreement between theory and experiment. The effect of the long range Coulomb potential is to increase the local density about the ion and thereby to increase the frictional forces arising from the short range interaction potential. The rate of dissipation of energy directly by the long-range Coulomb potential is small compared to the rate of energy dissipation by the short range potential. Agreement between experiment and theory is very satisfactory if the positive ion is Ar_2^+, Kr_2^+, or Xe_2^+ and it is suggested that this is the ionic species present. Agreement is much poorer if a different ionic species is postulated. If the ions are regarded as probes to alter and study the liquid structure it can be deduced that the current theory of liquids seriously miscalculates the change in the equilibrium pair correlation as a function of temperature and pressure. It is believed that the error arises from either a premature truncation of a slowly convergent series used in the solution to an integral equation, or at worst, that the assumed series expansion is invalid. (Contractor's abstract, modified)

IONS AS PROBES INTO QUANTUM FLUIDS, by L. Meyer, S. A. Rice, and H. T. Davis. [1962] [3]p. incl. diagr. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-61-52], National Science Foundation, and Public Health Service) Unclassified

Also published in Proc. Eighth Internat'l. Conf. on Low Temperature Phys., London (Gt. Brit.) (Sept. 16-22, 1962), Washington, D. C., Butterworths, 1963. p. 53-55.

Measurements of the mobilities of positive and negative ions in liquid He^3 at temperatures between 1° and 3°K, and pressures between 1 and 3 atm are reported. Using the Stokes formula for the mobility of a sphere the authors deduced the radius of the positive ion to be 5A at 3.2°K, and that of the negative ion to be 14A at 3.2°K and 9A at 1.2°K. To interpret these results the positive ion is assumed to be He_2^+ and the negative ion to be an electron. A theory is outlined which treats the positive ions by a semiclassical friction-constant-method and the negative ions by considering scattering by long-wavelength-density fluctuations and using an effective mass estimated from polaron theory.

ON THE THERMODYNAMIC PROPERTIES OF SOLUTIONS OF POLARPOLYMERS. A COMPARISON OF EXPERIMENT AND THEORY, by R. Corneliussen, S. A. Rice, and H. Yamakawa. [1962] [11]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-61-52], Atomic Energy Commission, and National Science Foundation) Unclassified

Published in Jour. Chem. Phys., v. 38: 1768-1778, Apr. 1, 1963.

A comparison of experimental and theoretical studies of the thermodynamic properties of solutions of polar

polymers is presented: (a) A new method of achieving isopiestic equilibrium is described in detail. (b) The excess free energies of solutions of toluene with poly-p-methylstyrene, poly-p-bromostyrene and several copolymers of p-methyl and p-bromostyrene are reported and analyzed. (c) The continuum model of concentrated solutions of polar polymers presented in the following paper is shown to be accurate for $\phi_1 > 0.4$, for the polymers studied. (d) The perturbation theory of dilute solutions of polar polymers presented in the following paper shown to predict the proper behavior in the limit of zero polymer concentration. (e) The properties of copolymers with small skeletal concentration of polar subunits is shown to agree with the predictions of the perturbation theory presented in the following paper. (f) The fundamental assumption of the continuum theory concerning the relationship between dipolar orientation and chain connectivity is examined and shown to agree with experiment. (g) Deviations between theory and experiment are briefly discussed in terms of the basic assumptions of the model, and methods by which the theory can be improved are described. (Contractor's abstract)

ON THE THERMODYNAMIC PROPERTIES OF SOLUTIONS OF POLAR POLYMERS. THEORY, by H. Yamakawa, S. A. Rice and others. [1962] [9]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-61-52], Atomic Energy Commission, and National Science Foundation) Unclassified

Published in Jour. Chem. Phys., v. 38: 1759-1767, Apr. 1, 1963.

A simple analysis of the thermodynamic properties of solutions of polar polymers is presented. It is found that: (a) In the dilute solution regime, a cluster analysis identical with that used in the theory of solutions of nonpolar polymers can be developed, but with the thermodynamic parameter z now dependent on the dipole moment, dielectric constant, etc. (b) In the concentrated solution regime, a continuum theory can be developed based on the assumption of uniform mixing of polymer chains and the use of cavity field and reaction field arguments. (c) For dilute solutions of a polar polymer in a nonpolar solvent, or a nonpolarizable polar polymer in a polar solvent, the system is equivalent to an ordinary nonpolar polymer-poor solvent system. (d) It is generally true that the solvent becomes poorer as the dipole moment and or polarizability of the segment are increased. Also, the solvent becomes better as its dielectric constant increases. (e) In the case of concentrated solutions of a polar polymer in a nonpolar solvent, the polar contribution to the Flory-Huggins free-energy parameter, χ_p, decreases with increasing concentration. (f) In the case of concentrated solutions of a nonpolar polymer in a polar solvent, χ_p increases with increasing concentration. (g) The dilute solution theory and concentrated solution theory predict the same functional form for χ_p in the limit of zero polymer concentration, but the numerical coefficients differ. (h) The results of extensive digital computer calculations are presented in terms of the predicted concentration dependence of χ_p with varying properties of both polymer and solvent. Agreement between theory and experiment is examined in detail in the preceding paper. (Contractor's abstract)

THEORY OF ELECTRONIC AND IONIC MOBILITY IN LIQUID He^4I AND LIQUID He^3, by H. T. Davis, S. A. Rice, and L. Meyer. [1962] [3]p. incl. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-61-52], National Science Foundation, and Public Health Service) Unclassified

Published in Phys. Rev. Ltrs., v. 9: 81-83. Aug. 1, 1962.

A theoretical derivation of electronic and ionic (He_2^+) mobility in liquids He^4I and He^3 is given. For the former it is assumed that: (1) the electron polarizes its surroundings and this state of the medium follows its motion causing thereby an increase in its effective mass, (2) the quasi-free electron is scattered from the atoms of the surrounding fluid, the coherence of scattering being determined by the distribution of the atomic centers. In the ionic case the mobility expression is obtained by the derivation of the results on the transport phenomena of Rice and Allnatt (Jour. Chem. Phys., v. 34: 2144, 1961) using the procedure of Mazo and Kirkwood for quantum fluids (Proc. Nat'l. Acad. Sci., v. 41: 205, 1955).

INTRA- AND INTERVALLEY SCATTERING AND THE TAILING OF THE CONDUCTION BAND IN IMPURE N-TYPE GERMANIUM, by H. Fritzsche and M. Cuevas. [1962] [6]p. (AFOSR-3569) [AF AFOSR-62-178] AD 612234 Unclassified

Also published in Proc. Internat'l. Conf on the Physics of Semiconductors, Exeter (Gt. Brit.), July 1962, p. 29-34.

The piezoresistance of degenerate n-type germanium doped with arsenic has been measured at 1.3°K using uniaxial compression along (110) and (111). The largest stress was 5×10^9 dyn/sq cm. The results are compared with a simple degenerate model which includes intra- and intervalley scattering but which neglects the possibility of tail states. An appreciable contribution to intervalley scattering was found. The mobility due to intravalley scattering appears to be independent of impurity concentration between 8×10^{17} and 5×10^{18} cm^3. HALL COEFFICIENTS OF LIQUID METALS, by A. J. Greenfield. [1962] [2]p. incl. diagr. table. (AFOSR-J574) [AF AFOSR-62-178] AD 415204 Unclassified

Also published in Phys. Ltrs., v. 3: 121-122, Dec. 15, 1962.

An experimental technique having an error a factor of 4 less than that of previous work has been developed for measurement of the Hall coefficients, R, of liquid metals. Results obtained on Hg, In, Tl, and Pb are reported in the present note. For Hg and In, the measured Hall coefficient is equal to the free electron value, i.e., the value obtained from an electron concentration equal to the atomic concentration times the valency 2 for Hg and 3 for In. For Tl and Pb, however, the measured Hall coefficients are about 18% and 32% smaller than the respective free electron values corresponding to a valency of 3 for Tl and 4 for Pb.

EFFECT OF ELASTIC STRAIN ON INTERBAND TUNNELING IN Sb-DOPED GERMANIUM, by H Fritzsche and J. J. Tiemann. [1962] [10]p. incl. diagrs. table, refs. (AFOSR-J892) (AF AFOSR-62-178) AD 416536 Unclassified

Also published in Phys. Rev., v. 129: 617-626, Apr. 15, 1963.

The effects of uniaxial compression and of hydrostatic pressure on the direct and indirect tunneling processes in germanium tunnel diodes have been studied experimentally under forward and reverse bias at 4.2 K and compared with Kane's theory. The diodes were formed by alloying indium doped with 3.8% gallium on (100) and (110) faces of germanium bars containing an antimony concentration of 5.5×10^{18} cm^{-3}. The first order change of the tunneling current with stress was measured at fixed bias voltages. For biases smaller than 8 mv the current is direct and not affected by the relative shifts of the (111) conduction band valleys. In the bias range of indirect tunneling the anisotropic tunneling from the (111) valleys was observed in agreement with theory. In the range of direct tunneling to the (000) conduction band the current change is correlated with the stress induced change of the direct band gap and of the energy separation between the (111) and (000) conduction bands. This separation was found to be 0.160 ± 0.005 ev at zero stress in agreement with optical measurements on degenerate germanium. Some details of the bias dependence of the pressure effect including some fine structure at small biases remain unexplained.

EXPERIMENTAL INVESTIGATIONS OF TRANSPORT PROPERTIES OF PARTIALLY IONIZED GASES, by P. J. Dickerman. Final rept., Feb. 15, 1961-Feb. 15, 1962. Mar. 1962, 59p. incl. illus. diagrs. tables, refs. (Rept. no. LAS-TR-207-2) (AFOSR-2432) (AF 49(638)-1033) Unclassified

Recent advances in electric arc research and development allow stable high-temperature environments to be obtained over extended periods of time in the laboratory. By making use of the known relationships between temperature and conductivity in such arc discharges and by experimentally measuring the current density, electron density, and temperature, the effective cross section of atoms which impede the electron flow can be determined. Thus, atom-electron collision cross sections can now be measured in the interesting energy range of 1 to 2 ev, lower than heretofore possible using conventional beam apparatus. Techniques involved in making the necessary spectroscopic and electrical measurements are given, and results obtained for 3 gases (argon, helium, and nitrogen) are presented. These results are then used to determine several of the transport properties for these partially ionized gases. (Contractor's abstract)

ATOMIC SELF-CONSISTENT FIELD CALCULATIONS BY THE EXPANSION METHOD, by C. C. J. Roothaan and P. S. Bagus. [1962] [59]p. incl. tables, refs. (AFOSR-4040) (AF 49(638)1068) AD 290668 Unclassified

The expansion technique is extended to a class of atomic states which may have one open shell for each symmetry species. The equations which are derived then are the answer to the question of finding the determinant (or sometimes sum of determinants) of lowest total energy, under the constraint that this total wave function has the appropriate symmetry and spin properties. A computer program, written for the IBM 7090, and based on the expansion method, is described. The following topics are discussed: general theory, calculation of integrals, eigenvectors and eigenvalues, SCF iterations and extrapolations, convergence control, exponent variation, output format and options, input format and conventions, and limitations of the program.

ANATOMICAL BASIS OF PATTERN RECOGNITION, by H. R. Maturana. Final rept. [1962] 6p. (AFOSR-5250) [AF AFOSR-61-44] AD 416510 Unclassified

Work on the visual system of the pigeon is summarized. The classes of retinal cells are defined by the description of the optimal stimulus configuration to which the cells respond. The cells of each class, however show some variability with respect to the size of the response and its microstructure. The size of the response depends in general on the direction and intensity of contrast and the speed of movement. That the various classes of cells are retinal is shown by the fact that it is possible to register their activity from a cut optic nerve. It is only in relation to the verticality detectors that proof cannot be offered. Color vision experiments indicated that in mammals both form and color vision are mediated by the same elements which project to the lateral geniculate body, and from there to the cerebral cortex. In birds and amphibians they are separated. Form vision is mediated by cells that project to the tectum, while color vision appears mediated by cells that project to the diencephalon at a nucleus homologous to the lateral geniculate body.

UNIDIRECTIONAL RESPONSE TO ANGULAR ACCELERATION RECORDED FROM THE MIDDLE CRISTAL NERVE IN THE STATOCYST OF OCTOPUS VULGARIS, by H. R. Maturana and S. Sperling. [1962] [2]p. incl. illus. (AFOSR-J842) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-61-44], National Science Foundation, and Office of Naval Research) AD 416520 Unclassified

Also published in Nature, v. 197: 815-816, Feb. 23, 1963.

In these experiments, recordings were made from the left statocyst of 13 animals, and more than 60 units, isolated or in groups, were studied. The results indicated 2 main facts: (1) That the same unit responds to 2 modes of stimulation, namely, to low-frequency vibration and to angular acceleration. These differences in response pattern could be used for their central distinction. A similar duality of response is found in statocyst receptors of crustaceans. (2) That there is no resting activity and that the response to angular acceleration is unidirectional. Whether this unidirectionality is due to a mechanical property of the statocyst, the cupula or the hair cells, or to the interaction of the latter with local neurones, is not yet known, but this property and the absence of resting activity make this system different from the known equilibrium systems of vertebrates and crustaceans.

FUNCTIONAL ORGANIZATION OF THE PIGEON RETINA, by H. R. Maturana. [1962] [9]p. incl. diagrs. (AFOSR-65-1963) (AF AFOSR-61-44) AD 626389 Unclassified

Also published in Proc. Internat'l. Union of Physiological Sciences; Twenty-second Internat'l. Cong., Leyden (Netherlands) (Sept. 10-17, 1962). Amsterdam, Excerpta Medica Foundation, v. 3: 170-178, 1962.

The response of the retinal ganglion cells of pigeons is studied when stimulated by specific visual configurations rather than luminous points. The cells are found to be grouped into 6 classes: verticality detectors, horizontality detectors, general edge detectors, directional moving edge detectors, convex edge detectors, and luminosity detectors. The first 5 do not respond to luminous stimuli in most cases but only to an adequate visual configuration. The retinal ganglion cells of the pigeon are compared to those of the cat and it is thought that they represent 2 types of visual systems: (1) a deterministic system in amphibians, reptiles and birds in which the function of the ganglion cells is highly specialized and unambiguous; and (2) an indeterministic system in mammals in which the function is unsepcific and ambiguous. It is also suggested that complex cell functions are not achieved by simple algebraic summation of excitatory and inhibitory processes, but that these processes play a role of components in the configuration of afferent impulses.

CONDITIONED DEFENSIVE MOTOR REFLEXES IN CATS. ELECTROENCEPHALOGRAPHIC, ELECTROCARDIOGRAPHIC AND RESPIRATORY CONCOMITANTS (Abstract), by G. Santibanez-H. [1962] [1]p. [AF AFOSR-62-393] Unclassified

Published in Proc. Internat'l. Union of Physiological Sciences; Twenty-second Internat'l. Cong., Leyden (Netherlands) (Sept. 10-17, 1962), Amsterdam, Excerpta Medica Foundation, v. 2: Abstract no. 1182, 1962.

Observations were made of the motor, respiratory and cardiac reactions and of the cortical and subcortical electroencephalographic responses. The association between an indifferent stimulus and a discharge in the paw was used to indicate conditioned excitatory activity. Two inhibitory conditioned reflexes were established.

one of differentiation and one of conditioned inhibition. Before regeneration, there was generally no cardiac or respiratory response. Evoked potentials always occurred in the reticular formation, hippocampus and cortex when the animal focused its attention on the stimulus. The discharge in the paw produced defense movements, an increase in heart rate and a decrease in respiratory rate and amplitude. After regeneration most of the cats passively awaited the electric shock and the conditional stimulus produced bradycardia and hypopnoea. In the case of conditioned inhibitory reflexes, differentiation could be established perfectly from the cardio-respiratory point of view. On the other hand, in spite of the many sessions gone through with some animals, it was not possible to establish conditioned inhibition.

GEOLOGICAL AND THERMODYNAMIC ASPECTS OF LUNAR ROCKS, by P. C. Badgley, F. C. Jaffe and others. July 1962. 86p. incl. illus. refs. (AFOSR DRA-62-11) (AF 29(600)2878) AD 287886 Unclassified

Geological and thermodynamic aspects of lunar rocks are studied. Several basic problems of lunar geology are examined with the main purpose of assembling the regional information needed to establish a list of possible lunar mineral deposits and to postulate on the origin of the Moon with emphasis on probable composion. Important problems related to the structural pattern of the Moon are discussed. A special study is devoted to the Vredefort Ring structure (South Africa), which has been recently interpreted as a convincing example of asteroidal impacts on the Earth. The distribution of craterlets is analyzed by statistical methods, in order to establish whether these typical lunar features are originated by volcanic activity or impact phenomena. The thermodynamic aspects are an attempt to provide a broad reconnaissance of the stability of rock-forming mineral oxides with respect to pressure and temperature. (Contractor's abstract)

STURM-LIOUVILLE SYSTEMS THAT GENERATE FAMILIES, by F. M. Stein. [1962] [8]p. (AFOSR-64-1322) [AF AFOSR-62-219] AD 444138 Unclassified

Also published in SIAM Rev., v. 6: 12-19, Jan. 1964.

A family of Sturm-Liouville boundary-value problems is defined to be the collection of all Sturm-Liouville boundary-value problems which can be obtained from a given one by repeatedly differentiating or integrating the differential equation space and applying the given boundary conditions. The author gives a necessary and sufficient condition that a Sturm-Liouville problem generates a family. He also shows that the derivatives of the eigenfunctions of a Sturm-Liouville problem, which generates a family, are orthogonal with respect to a weight function which can be calculated explicitly. A TCHEBYCHEFF TYPE INEQUALITY FOR GAMMA, by T. L. Connell and F. A. Graybill. [1962] 9p. incl. diagr. [AF AFOSR-62-220] Unclassified

An attempt is made to find an inequality that is an improvement of Tchebycheff's inequality for a random variable that is distributed as gamma with parameters r and λ. This necessitates showing that

$$\int_{1-a}^{1+a} f_1(v)\,dv > 1-e^{-a\sqrt{n-1}},$$

for all $a > 0$ and $n \geq 1$, where $f_1(\cdot)$ is the density of a chi-square divided by n, its degree of freedom. Tchebycheff's inequality is $P[|v-1| \geq a] \geq 1-2/a^2n$, the "improved" inequality established in this paper is $P[|v-1| \geq a] \geq 1-e^{-a\sqrt{n-1}}/\sqrt{e}$.

SAMPLE SIZE REQUIRED TO ESTIMATE THE RATIO OF VARIANCES WITH BOUNDED RELATIVE ERROR, by F. A. Graybill and T. L. Connell. [1962] [4]p. incl. table. (AFOSR-64-1641) [AF AFOSR-63-469] AD 446874 Unclassified

Also published in Jour. Amer. Stat. Assoc., v. 59: 1044-1047, Dec. 1963.

This concerns an estimate of the ratio of variances of 2 independent normal populations. The estimator deviates from the true ratio by less than a given proportion p of the ratio, with a prescribed probability. The purpose of this paper is to present a table that can be used to determine the sample size required to meet these specifications for values of p = .2, .25, .33, .4, .5, .6, .75, 1.0, 1.5, 2.0 and for probability levels 1-a-.90, .95, .99. BIREFRINGENCE IN A STRAINED VISCOELASTIC FLUID UNDER STEADY-STATE ROTARY CONDITIONS. II, by S. J. Gill and F. R. Dintzis. [1962] [12]p. incl. diagrs. (AFOSR-1148) (AF 49(638)310) AD 441850 Unclassified

Also published in Jour. Polymer Sci., v. 57: 251-262, 1962

A rotary strain device for introducing a calculable amount of strain into a viscoelastic fluid under essentially zero flow conditions has been built and tested. The principle of the device is based upon the continuous deformation of a flexible Teflon tube which is rotated within a closely fitting, stationary, rigid metal tube that has an elliptical cross section. A polymer solution placed in such a rotating tube is subjected to an alternating strain and rotation of the bulk material. Under such conditions a steady-state situation occurs where the material has well defined anisotropic properties. This anisotropic state is characterized by measuring both the retardation and orientation of the principle axes of the induced birefringence. Measurements made on fluid systems at rotations of approximately 50-200 rpm yield experimental results that agree with theoretical requirements. Mooney has analyzed the analogous situation of a microscopic rotating region. This analysis, when applied to measurements made in the rotary strain device, permits calculation of functions proportional to the storage modulus, the loss modulus, and the relaxation function of the polymer. Measurements and calculations are presented for carboxymethyl cellulose solutions in water. (Contractor's abstract)

STRAIN BIREFRINGENCE OF A SOLUTION OF ROD-SHAPED MOLECULES, by S. J. Gill and F. R. Dintzis. [1962] [4]p. incl. diagrs. table, refs. (AFOSR-2149) (AF 49(638)310) AD 295967 Unclassified

Presented in part at 141st Nat'l. meeting of the Amer. Chem. Soc., Washington, D. C., Mar. 1962.

Also published in Jour. Phys. Chem., v. 66: 2046-2049, Oct. 1962.

A theoretical calculation is made for birefringence induced in a system of rod-shaped molecules which have been subjected to a 2 dimensional strain of constant area. A series expression is developed for the orientation of a system of rods which have the particular optical and geometrical properties of the strained system; then the birefringence of this system is given by an expression developed from assumptions of Peterlin and Stuart. This expression is used in conjunction with birefringence measurements to obtain the optical factor, $g_1 - g_2$, for concentrated solutions of poly-γ-benzyl-l-glutamate in 1, 2-dichloroethane. An average optical factor of $(5.4 \pm 1.0) \times 10^{-3}$ was obtained for these solutions; this compares with a value of about $(4.0 \pm 0.1) \times 10^{-3}$ obtained from flow birefringence measurements (by Doty) and electric birefringence (by O'Konski) on dilute solutions. VISCOELASTIC PROPERTIES OF POLYMER SOLUTIONS AND GELS, by S. J. Gill. Final rept. Mar. 1, 1958-Feb. 23, 1962. Mar. 1, 1962, 1v. incl. illus. diagrs. tables, refs. (AFOSR-2301) (AF 49(638)310) Unclassified

A summary of investigations on the physical properties of concentrated polymer solutions is given. These materials in a highly viscous to near gel state provide the concentration bridge between solid forms and very dilute solutions. A number of experimental devices which enable the exploration of the correlation between concentration, temperature and polymer structure are described.

THEORETICAL CALCULATIONS OF STRESS RELAXATION IN CONCENTRATED SOLUTIONS, by R. Toggenburger, K. Beck, and S. J. Gill. [1962] [9]p. incl. diagrs. refs. (AFOSR-J661) (AF 49(638)310) AD 414924 Unclassified

Also published in Jour. Polymer Sci., Part A, v. 1: 1779-1787, May 1963.

The Mooney theory for stress relaxation of polymer materials has been numerically evaluated in unmodified and modified forms. The modified expressions include such effects as molecular weight distributions and entanglement or polymer interaction distributions. The relaxation behavior was found to be highly dependent upon the number of interaction points per chain molecule particularly for small numbers. The distributions in molecular sizes and in the number of interaction points have a much smaller effect on the shapes of the relaxation curves. A comparison of the theoretical stress relaxation behavior is made with birefringence relaxation data. The region of correlation indicates a number of 5 interaction points per molecule of polystyrene at 10 wt% in benzene.

ANISOTROPIC PROPERTIES OF STRAINED VISCOELASTIC FLUIDS. III. BIREFRINGENCE OF POLYSTYRENE SOLUTIONS, by R. Toggenburger and S. J. Gill. [1962] [14]p. incl. diagrs. tables, refs. (AFOSR-J662) (AF 49(638)319) AD 415175 Unclassified

Also published in Jour. Polymer Sci., Part A, v. 1: 1765-1778, May 1963.

Birefringence relaxation has been studied in concentrated polystyrene solutions. The birefringent state is induced by a sudden application of strains and the subsequent relaxation effect is observed by photoelectric monitoring. The effect of temperature concentration on the decay of induced birefringence follows the general patterns observed for stress relaxation. Samples of different molecular weights and different molecular weight distributions have been studied. A particularly simple empirical result was found to express the relaxation behavior of highly fractionated materials. In such instances the birefringence decays with exponential dependence upon the square root of time. The results for samples with broad distributions show curvature when plotted in a similar fashion. This simple relaxation behavior has a simple LaPlace transform, so that a comparison of the exact relaxation distribution function with approximate methods can be made. The general behavior of birefringence relaxation distribution functions is similar to that noted for stress relaxation functions. The method of reduced variables likewise is applicable to bring the birefringence relaxation results into correspondence at different temperatures.

BRIDGED POLYCYCLIC COMPOUNDS. XIX. SOME ADDITION AND SOLVOLYSIS REACTIONS IN NORBORNANE SYSTEMS, by S. J. Cristol, W. K. Seifert and others. [1962] [8]p. incl. diagrs. table. (AFOSR-4353) (AF AFOSR-62-79) AD 295872 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 3915-3925, Oct. 20, 1962.

Acid-catalyzed additions of acetic acid, formic acid and water to endo-dihydrodicyclopentadiene lead to products in which almost complete ring isomerizations have occurred. On the other hand, addition of methanol (or of water in methanol solvent) to dicyclopentadiene, followed by hydrogenation, gives a mixture containing about 1 part of endo skeleton unrearranged product to 6 parts of exo skeleton product. Solvolysis of the toluenesulfonates in methanol both give a large preponderance of exo product. Addition of methanol or of acetic acid to norbornadiene gives substantially more dehydronorbornyl methyl ether, or dehydronorbornyl acetate in the mixture with nortricyclyl products than solvolysis of the p-bromobenzenesulfonate. Possible explanations of these results are discussed. (Contractor's abstract)

BRIDGED POLYCYCLIC COMPOUNDS. XX. THE CIS-STEREOCHEMISTRY OF THE ADDITION OF METHANOL AND WATER TO ENDO-TRIMETHYLENE-NORBORNENE, by S. J. Cristol, L. K. Gaston, and D. W. Johnson. [1962] [5]p. incl. diagr. (AFOSR-J723) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-79 and National Science Foundation) AD 414097 Unclassified

Also published in Tetrahedron Ltrs., No. 4: 185-189, Feb. 1963.

Sulfuric acid-catalyzed additions of methanol (or of water in methanol) to the isomeric endo- and exo-trimethylenenorbornenes give differing ratios of endo- and exo-ring skeleton ethers (or alcohols). It is now shown that reactions with the isomeric endo-trimethylenenorbornenes are entirely cis-exo additions. The expected products resulting from the endo-protonated π complex reacting directly with a solvent molecule or by the equivalent of trans ring opening (by addition of CH_3OD

and D_2O), as well as noninvolvement in the reaction sequence are discussed. Attempts to distinguish these products are made by gas phase chromatography and nuclear magnetic resonance spectral studies. These results show clearly that cis-exo addition of both the H and Y (OCH_3, OH, OTs, $OCOC_6H_4NO_2$) portions of the addenda occurs, and exclude the endo-protonated π complex as a significant intermediate in the addition reaction. It is suggested that at least one of the intermediates involved is a classical ion, or that a cis addition 4-center transition state is involved, in which no carbonium ion is developed.

NUCLEAR RESONANCE OF Al IN SYNTHETIC RUBY, by W. H. Tanttila. Final rept June 1962 9p. incl. refs. (AFOSR-2768) (AF 49(638)611) AD 278429 Unclassified

Initial studies on the nuclear magnetic resonance of Al in ruby are summarized. LiCl containing Mn ion impurities was prepared. Nuclear resonance studies were performed on the Li at room temperature, liquid N and liquid He temperature. Electron paramagnetic resonance studies were performed at room temperature on the Mn ions. The Mn appeared to exist in the crystal in 2 phases, dilute and concentrated. In the dilute phase the Mn ion concentration in the host LiCl was 0.2 mol-%; in the concentrated phase the Mn ion concentration was 10%. LiF with Mn ion impurity was also prepared. The microwave spectrum indicated that up to concentrations of 10 mol-% of Mn there is no tendency of the Mn ions to form 2 phases or to precipitate separately from the LiF; there was no measurable diffusion of ions at room temperature. Other experiments included a search for an electric hexadecapole moment in In and Sb. (Contractor's abstract)

NUCLEAR MAGNETIC DIPOLE MOMENT OF Ca^{41}, by E. Brun, J. J. Kraushaar and others. [1962] [2]p. (AFOSR-4574) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)611 and Atomic Energy Commission) AD 400844 Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 166-167, Aug. 15, 1962.

The nuclear magnetic dipole spin resonance of Ca^{41} was observed in a saturated aqueous solution of $Ca(NO_3)_2$, using a Varian crossed-coil, c.w. spectrometer. The observed ratio of the Ca^{41} resonance frequency to that of the deuteron in the same field was $\nu(Ca^{41})/\nu(D^2) = 0.530631 \pm 0.000003$, implying an uncorrected nuclear dipole moment of -1.59235 ± 0.00002 nm for Ca^{41}, using the values of $\mu(H^1)/\mu(D^2) = 3.257199 \pm 0.0000012$ and $\mu(H^1) = 2.79268 \pm 0.00003$ nm. Taking into account diamagnetic shielding of the nucleus by orbital electrons, $(\mu(Ca^{41}) = -1.5946$ nm. The value obtained is discussed in the light of the de-Shalit mechanism.

ELECTRICALLY INDUCED $\Delta M = \pm 2$ NUCLEAR SPIN TRANSITIONS IN A GaAs SINGLE CRYSTAL (Abstract), by E. Brun, W. L. Pierce, and W. H. Tanttila. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)611] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 482, Aug. 27, 1962.

Direct electrical induction of $\Delta M = \pm 2$ nuclear quadrupole spin transitions in a GaAs crystal has been previously reported. A fairly detailed investigation using pulsed NMR techniques has now been made of these transitions for the isotopes Ga^{69}, Ga^{71}, and As^{75} in a high-resistivity single crystal of GaAs as a function of the relative orientations of the crystalline symmetry axes, the oscillating electric field, and the static magnetic field. It is found that a very simple theoretical model assuming a 1-parameter 3-rank tensor to describe the interaction of the crystal with the applied electric field, is capable of explaining the symmetry properties of the observed phenomena well, and the parameter which determines the components of this interaction tensor has been measured.

NMR AND EPR STUDIES IN LiCl (Abstract), by D. A. Jennings and W. H. Tanttila. [1962] [1]p. [AF 49(638)-611] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 84, Jan. 24, 1962.

The linewidth of the Li nuclear magnetic resonance in LiCl powder doped with Mn^{++} have been measured at 300°, 77°, and 4°K. The nominal Mn^{++} ion concentration ranged from 10^{-4} to 10^{-1}. Assuming a Gaussian shape for the experimental absorption, the experimental second moments are compared with the second moments calculated from Van Vleck's theory. Deviations from the predicted dependence of the second moment on the Mn^{++} concentration are found at low temperatures and high concentration. The electron paramagnetic resonance line structure of the Mn^{++} ion shows that the Mn^{++}

ions are present in a crystal in 2 widely different concentrations. The nuclear resonance linewidths will be explained in terms of a model that gives a consistent interpretation of the Mn^{++} ion linewidth.

NUCLEAR SPIN LATTICE RELAXATION IN LiCl (Abstract), by G. Arnold, D. A. Jennings and others. [1962] [1]p. [AF 49(638)611] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 85, Jan. 24, 1962.

The Li nuclear spin lattice relaxation times have been measured in LiCl as a function of temperature and Mn^{++} ion concentration. Samples were prepared by rapidly quenching melted mixtures of LiCl and $MnCl_2$. Immediate examination of the Mn^{++} x-band spectra at x-band frequencies provide a check on the relative concentration of Mn^{++} going into the mixture and gives a qualitative indication of their distribution within the LiCl lattice. Pulsed nuclear induction techniques were used to measure the relaxation at 4°, 77°, and 300°K in samples containing up to 10% Mn^{++} concentration. The nuclear spin lattice relaxation is sensitive to the dispersion of impurities within the lattice. Diffusion of the Mn^{++} occurs with sample aging and causes large changes in the Li spin lattice relaxation time. In addition to studying the nuclear spin lattice relaxation process, the measurements also provide insight into the various phases of the LiCl-$MnCl_2$ system.

PHONON-INDUCED NUCLEAR SPIN TRANSITIONS IN SOME INTERMETALLIC COMPOUNDS (Abstract), by A. B. Denison and H. P. Mahon, Jr. [1962] [1]p. [AF 49-(638)611] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 482-483, Aug. 27, 1962.

Phonon excitation of $\Delta m = \pm 2$ nuclear spin transitions is studied in crystals of GaAs and InSb. Phonons are introduced by a 15 mc/sec transducer. Using pulsed nuclear-induction techniques at 7.5 mc/sec, the line width $\Delta\nu$ is obtained at constant transducer voltage V and T_1 is obtained from signal recovery with time after ultrasonic saturation. This latter method overcomes spurious effects due to skin depth. M/M_0 vs V^2 (phonon intensity) is interpreted using a point-charge lattice model. The phonon-induced transition probability is $W = FQ^2\nu_1^2GV^2/\Delta\nu$. Q is the quadrupole moment, F a spin-dependent factor, and G is a number dependent upon lattice parameters and is the same for all nuclear species in each crystal. ν_1 is the Van Kranendonk charge-multiplication factor for the 1st-order process. A theory which would satisfactorily describe ionic, covalent, and charge-overlap phenomena in these crystals should give this value of ν_1. The ratios of the ν_1 for the nuclear constituents in these crystals are $\nu(Ga^{69})/\nu(As^{75}) = 0.42$ and $\nu(In^{115})/\nu(Sb^{121}) = 0.96$. This ratio for the gallium isotopes is, within experimental error, equal to one.

Also published in Phys. Rev., v. 129: 1965-1970, Mar. 1, 1963.

The direct induction of nuclear E2 spin transitions in a gallium arsenide single crystal by application of an external oscillatory electric field has been previously reported by some of the authors. This paper gives the results of a further investigation of the same phenomenon. Theoretical expressions are given for the equilibrium nuclear magnetization in a crystalline lattice under the combined influence of a static magnetic field, externally induced electric field gradients, and thermal spin-lattices interactions, for various relative orientations of the applied fields and the crystalline symmetry axes. The theoretical predictions were tested for the 3 nuclides Ga^{69}, Ga^{71}, and As^{75} by using pulsed nuclear magnetic resonance techniques to sample the equilibrium magnetization in a GaAs crystal at 77°K under the influence of a uniform, externally applied, radio-frequency, electric field. A description of the experimental apparatus is given. The dependence of the quadrupolar saturation on both the electric field amplitude and the crystal

orientation was measured. The angular dependence of the saturation was found to be in reasonable agreement with the theory. (Contractor's abstract)

OPTICAL DOUBLE-PHOTON ABSORPTION IN CESIUM VAPOR (Abstract), by I. D. Abella and C. H. Townes. [1962] [1]p. [AF 49(638)507] Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-24, 1962.

Published in Bull. Amer. Phys.Soc., Series II, v 7: 554, Nov. 23, 1962.

Observations have been made, using a pulsed ruby optical maser, of the $6S_{1/2}-9D_{3/2}$ double-quantum absorption in cesium vapor ($\Delta\omega$ = 28 828 cm^{-1}) and the subsequent reemission via the $9D_{3/2}-6P_{3/2}$ transition at 5847A. The narrow absorption width of the $9D_{3/2}$ state requires careful thermal tuning of the ruby source to obtain coincidence, which occurs at λ(ruby) = 6935.6 ± 0.05A as measured on grating spectrograph plates. The observed fluorescence is, however, 2 orders of magnitude below the calculated value, but quenching Cs-Cs collisions can be expected to reduce the yield in the $9D_{3/2}$ decay.

HYPERFINE STRUCTURE OF THE METASTABLE $(4p)^5(5s)^3P_2$ STATE OF $_{36}Kr^{83}$, by W. L. Faust and L. Y. Chow Chiu. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-J432) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)557], and Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78330]) AD 407901 Unclassified

Also published in Phys. Rev., v. 129: 1214-1220, Feb. 1, 1963.

The hyperfine structure (hfs) of the metastable $(4p)^5(5s)\ ^3P_2$ state of $_{36}Kr^{83}$ (I = 9/2) has been measured by the atomic beam magnetic resonance method. The zero magnetic field intervals are: f(11/2 - 13/2) = 1830.7236(5) mc/sec, f(9/2 - 11/2) = 1341.8217(2) mc/sec f(7/2 - 9/2) = 956.5583(2) mc/sec, and f(5/2 - 7/2) = 656.0844(30) mc/sec. The 4 frequencies (after correction for second-order hyperfine interaction) are expected to be linearly related to only 3 interaction constants: A', B', and C' (respectively dipole, quadrupole, and octupole). The fit is satisfactory if, and only if, second-order hyperfine interaction is taken into account. The quadrupole and octupole moments of $_{36}Kr^{83}$ are Ω = 0.18(6)nm b (nuclear magneton barn) and Q = + 0.270(13) b. These values include no polarization corrections or corrections for any effects of configuration mixing. (Contractor's abstract)

MICROWAVE SPECTRUM, SPECTROSCOPIC CONSTANTS, AND ELECTRIC DIPOLE MOMENT OF Li^6F^{19}, by L. Wharton, W. Klemperer and others. [1962] [8]p. incl. diagrs. tables, refs. (AFOSR-J434) (In cooperation with Harvard U., Cambridge, Mass. and Martin Co., Orlando, Fla.) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)557] and Atomic Energy Commission) AD 407113 Unclassified

Also published in Jour. Chem. Phys., v 38: 1203-1210, Mar. 1, 1963.

Transitions between the J = 1 and J = 0 rotational states of Li^6F^{19} have been measured by means of the molecular-beam electric resonance method in the 4 lowest vibrational states. By this means the rotational constants of Li^6F^{19} were determined. These enabled one to properly assign the rotationally resolved infrared vibration-rotation spectrum of Li^7F^{19} observed by Vidale and to determine the correct vibrational constants. Transitions between the M = 0 and M = 1 orientations of the J = 1 rotational state of Li^6F^{19} in the 4 lowest vibrational states in a strong electric field were measured to high precision, which enabled one to determine the dipole moments accurately and to observe a nonlinear variation of dipole moment with vibrational state. The molecular constants obtained for Li^6F^{19} were:

$B_\nu = 45.2308111 - 0.7223089(\nu + \frac{1}{2}) + 0.0058270(\nu + \frac{1}{2})^2 \pm$ 0.0000050 Gc, $\omega_\nu = 964.07 - 8.895(\nu + \frac{1}{2})\ cm^{-1}$,

$r_e = 1.563892 \pm 0.000050A$,

LEVEL CROSSING IN THE $(5s5p)\ ^3P_1$ STATE OF 6.7 HOUR Cd^{107} (Abstract), by M. N. McDermott and P. Thaddeus. [1962] [1]p. (AFOSR-3271) [AF 49(638)936] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Also published in Bull. Amer. Phys. Soc. Series II, v. 7: 433, Aug. 27, 1962.

Two crossings of the Zeeman levels of the hyperfine structure of the $(5s5p)\ ^3P_1$ state of Cd^{107} (I = 5/2) have been detected by observing the change in intensity with magnetic field of the resonance fluorescence of the 2261A intercombination line. The isotope was produced

by the reaction $Ag^{107}(p, n)\ Cd^{107}$ in the Pupin cyclotron. The strongest crossing, that of the $|F, m_F> = |7/2, 7/2>$ and $|5/2, 3/2>$ levels, was observed at 1218.80(5) gauss, and the crossing of the $|5/2, 3/2>$ and $|5/2, -1/2>$ levels at 1036.3(2) gauss. A sample containing more atoms of the isotope may produce an increase in signal strength of 10 or more, allowing detection of the 2 additional $\Delta m_F = 2$ crossings already observed for Cd^{109}. Using these crossing fields, and the value of g_J obtained from a level crossing experiment on the stable Cd isotopes, we calculate, neglecting second order interactions due to neighboring fine structure levels, the hyperfine coupling constants to be: A = -853.59(2) mc/sec, and B = -163.8(2) mc/sec, in agreement with the results of a double resonance experiment.

DETECTION OF LEVEL CROSSINGS IN BACK-SCATTERING (Abstract), by R. J. Goshen, A. Landman, and R. Novick. [1962] [1]p. (AFOSR-3272) [AF 49-(638)936] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Also published in Bull. Amer. Phys. Soc., Series II, v. 7: 433, Aug. 27, 1962.

Multiple scattering limits the maximum vapor density in the normal level crossing and double resonance experiments. The signal strength decreases precipitously as the optical density of the vapor is increased beyond that corresponding to about one absorption depth in the cell. This limitation can be overcome by observing the fluorescence in the backward direction. At high density and in the absence of collisions, substantially all of the incident light is backscattered, and one would expect that the signals would be independent of temperature. The observation of level crossing and double resonance at high density would allow the study of self-broadening and the study of isotopically dilute radioactive species. We have observed level crossing signals in the $(5s5p)^1P_1$ state of cadmium with backscattering and Cd pressures up to 2×10^{-2} mm Hg. This pressure is 200 times greater than that at which level crossings are observable with either forward or 90° scattering. The observed signal strength is substantially independent of pressure from 10^{-5} mm Hg (the lowest investigated) to 2×10^{-2} mm Hg. At the higher pressures we have observed self-broadening.

COHERENCE-NARROWING, PRESSURE-BROADENING AND WALL COLLISION-BROADENING OF THE $(5s5p)^3P_1$ STATE OF CADMIUM (Abstract), by F. Byron, M. N. McDermott, and R. Novick. [1962] [1]p. [AF 49(638)-936] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 26, 1962.

The optical double resonance method has been used to study the temperature dependence of the width of Zeeman resonance in the $(5s5p)\ ^3P_1$ state of cadmium. For relatively low temperatures (100°-150°C) the half-width, extrapolated to zero rf-field, is found to be 138 ± 2kc. As the temperature is increased beyond this region, the line narrows until a minimum half-width of about 100 kc is found near 240°C. Beyond this temperature the width increases and grows very rapidly above 300°C. The initial constant value is interpreted to be the natural half-width of the line, apart from the effect of collisions with the walls. When a correction is made for the effect of wall collisions, the natural half-width is found to be 131 ± 3 kc, which gives a radiative lifetime of $(2.43 \pm 0.03) \times 10^{-6}$ sec. The line narrowing is believed to be the result of coherence-narrowing. The broadening at higher temperatures is proportional to $P/\sqrt{T}$ and yields an apparent collision cross-section of 4×10^{-14} cm^2; difficulties in determining vapor pressure make this number uncertain by a factor of about 2. This rather large cross-section may be interpreted as the result of a dipole-dipole collision interaction (Holtzmark-broadening).

LEVEL CROSSINGS IN THE $(5s5p)\ ^3P_1$ STATE OF RADIOACTIVE Cd^{109} (Abstract), by P. Thaddeus and M. N. McDermott. [1962] [1]p. [AF 49(638)936] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 25, Jan. 24, 1962.

Four crossings of the Zeeman levels of the hyperfine structure of the $(5s5p)\ ^3P_1$ state of Cd^{109} (I = 5/2) have been detected by observing the change in intensity of the resonance fluorescence of the 3261A intercombination line. This isotope has a half life of 470 days and was produced by the reaction $Ag^{109}(p, n)Cd^{109}$ in the Columbia cyclotron. The magnetic field at which crossing occurs in units of the NMR frequency of protons in mineral oil, together with the low field assignments of the crossing levels are: $|F, m_F> = |7/2, 7/2>$ and $|5/2, 3/2>$ at 6986.995(6)kc/sec, $|5/2, 3/2>$ and $|5/2, -1/2>$ at 6177.49(6)kc/sec, $|5/2, 1/2>$ and $|5/2, -3/2>$ at 5593.84(16)kc/sec, and $|5/2, -1/2>$ and $|5/2, -5/2>$ at 5007.73(24)kc/sec. These crossing fields are consistent with the hyperfine intervals of the $(5s5p)\ ^3P_1$ state as determined by a double resonance experiment, and should permit a more precise determination of the hyperfine constants.

NUCLEAR MOMENTS OF Cd^{107} (Abstract), by M. N. McDermott, F. Byron, and R. Novick. [1962] [1]p. [AF 49(638)936] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II v. 7. 25, Jan. 24, 1962.

Earlier work (item no. 559, Vol. V) on the radioisotope, Cd^{107}, has been extended to include a determination of the hyperfine structure in the 5^3P_1 state. An optical double resonance method was used as before. However, considerable improvement in experimental technique has made it possible to observe Zeeman resonances in both the F = 7/2 and F = 3/2 hyperfine structure levels with a good signal-to-noise ratio. The hyperfine intervals derived from Zeeman transitions observed at 2 different frequencies are F = 7/2 ↔ F = 5/2, ν = 3164(9) mc/sec and F = 5/2 ↔ F = 3/2, ν = 1894(9) mc/sec. The hyperfine interaction constants derived from these intervals are A = -855(2) mc/sec and B = -163(5) mc/sec. The negative sign for A was determined by a subsidiary experiment. From the hyperfine constants, values for the nuclear dipole moment $\mu = -0.617(2)\mu_N$ and nuclear quadrupole moment Q = +0.78(0) barns are obtained. In addition, the new measurements have further confirmed the nuclear spin assignment of I = 5/2.

NUCLEAR SPIN AND MOMENTS OF 245 DAY Zn^{65} (Abstract), by M N. McDermott, B. Perry, and R. Novick. [1962] [1]p. [AF 49(638)936] Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 533, Nov. 23, 1962.

The nuclear spin and hyperfine interactions constants of 245 day Zn^{65} have been determined by the optical double-resonance technique in the $(4s4p)^3P_1$ atomic state. The nuclear spin I, magnetic dipole constant A, and electric quadrupole coupling constant B, are I = 5/2, A = 535.08(12) mc/sec, and B = 3.3(5) mc/sec. The signs of A and B have been determined with circularly polarized light. Neglecting nuclear structure and quadrupole antishielding corrections, the corresponding nuclear moments are μ = 0.76944(17)nm and Q = -0.027(4)b. The Zn^{65} was produced by a (p, n) reaction on 99.99% pure copper. Approximately 2×10^{15} atoms were used in the experiment. The Zn^{65} magnetic moment is 12% smaller than that of Zn^{67} (I = 5/2). The Zn^{67} quadrupole moment has the opposite sign and is a factor of 7 larger than that of Zn^{65}

NUCLEAR SPIN AND MOMENTS OF Cd^{115m} (Abstract), by B. Perry, M. N. McDermott, and R. Novick. [1962] [1]p. [AF 49(638)936] Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 533, Nov. 23. 1962.

The nuclear spin and hyperfine structure constants of 43 day Cd^{115m} have been determined by the optical double-resonance technique in the $(5s5p)^3P_1$ state. The nuclear spin I, magnetic dipole constant A, and electric quadrupole coupling constant B, are I = 11/2, A = (−)648(6) mc/sec, and B = (+)149(12) mc/sec. The sign of A/B has been determined to be negative in the present experiment, but the separate signs of A and B have not yet been directly determined. Assuming an $h_{11/2}$ odd-neutron assignment, a negative μ is expected. With this assumption and the known sign of the ratio A/B, a negative Q is found. Neglecting nuclear structure and quadrupole antishielding corrections, the nuclear moments are μ = -1.028(10)nm, Q = -0.68(5)b. The Cd^{115m} was produced by a (n, γ) reaction on separated Cd^{114}. After irradiation, the Cd^{115m} was separated from the Cd^{114} in the electromagnetic mass separator at the Argonne National Laboratories. Approximately 1.5×10^{11} atoms were used in the experiment.

OPTICAL DETECTION OF LEVEL CROSSINGS IN Zn^{65} (Abstract), by A. Landman and M N. McDermott. [1962] [1]p. [AF 49(638)936] Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 533, Nov. 23, 1962.

The crossings of the F = 7/2, m = -7/2 and F = 5/2, m = -3/2 levels of the $(4s4p)^3P_1$ state of Zn^{65} (I = 5/2) has been detected by observing the change in the angular distribution of resonance fluorescence in the Zn 3076 intercombination line. The crossing field was found to be 764.12 ± 0.02 G. Another crossing, believed to be that of the F = 5/2, m = 1/2 and F = 5/2, m = -3/2 levels, was observed at 756.7 G. These results, together with the value for g_J of 1.50096 obtained previously in the case of Zn^{67}, lead to the following values for the hyperfine interaction constants: A = 535.08 ± 0.02 mc/sec and B = +5 ± 1 mc/sec. These results are consistent with the double-resonance measurements of McDermott et al. (see item no. 640, Vol. VI).

Hfs OF THE $^1P_1$ STATE OF Cd^{111} (Abstract), by R. Novick and A. Lurio. [1962] [1]p. [AF 49(638)996] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 258-259, Apr. 23, 1962.

The magnetic field at which the $F = \frac{1}{2}, m_F = -\frac{1}{2}$ and the $F = \frac{3}{2}, m_F = +\frac{3}{2}$ Zeeman levels (A assumed negative) in the $^1P_1$ state of Cd^{111} become degenerate has been determined by the level-crossing technique. A quartz cell containing 92% Cd^{111} was irradiated with the 2288-A ($^1S_0 - {}^1P_1$) resonance line, and the scattered radiation was observed at 90° to the incoming radiation. The scattered-light intensity was recorded as a function of magnetic field at the cell. The field was perpendicular to the plane formed by the incident and outgoing photons. Intensity changes corresponding to level crossings at zero field and at a field of 122 ± 12 gauss were observed. The 12-gauss uncertainty includes allowance for the possible shift resulting from the fact that the 122-gauss crossing is superimposed on the wings of the zero-field crossing. An exact calculation of the combined zero field and the 122-gauss field-crossing effects is in progress. From the values of the magnetic field at the crossing, the dipole-coupling constant of the $^1P_1$ state of Cd^{111} is found to be $|A| = g_J \mu_0 H = 171$ mc. The theory of the hfs of the 5s5p configuration combined with other experimental results yields a predicted value of $A(^1P_1)$ of -122 mc.

AN INTENSE SOURCE OF MONOENERGETIC METASTABLE HELIUM IONS (Abstract), by M. Lipeles, L. Gampel, and R. Novick. [1962] [1]p. [AF 49(638)996] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 69, Jan. 24, 1962.

A 10-m long slow (10 ev) metastable helium ion beam apparatus is being constructed for the determination of the radiative lifetime of the 2S state of hydrogenic atoms. Ultra-high vacuum techniques and differential pumping are being employed to reduce the loss of metastable ions by either Stark quenching or collision quenching. The ions are produced in an electrostatically focussed electron bombardment ion source. Ions that drift out of a 4-mm gridded hole in the source are accelerated by a converging spherical condenser and pass through a 1 cm long, 2.3 mm diam channel. This narrow channel provides a pressure reduction ratio of 35:1 between the source chamber and a vacuum separating chamber. Total ion currents of 5×10^{-8} amp at 10-ev beam energy have been obtained. The energy spread in the beam is less than 1 ev and about 1% of the ions are in the metastable state.

LIFETIME OF THE $5s5p\,^1P_1$ STATE OF Cd AND COHERENCE NARROWING OF THE 228A ($^1S_0 - {}^1P_1$) LEVEL CROSSING RESONANCE SIGNAL (Abstract), by R. Novick, P. Horwitz and others. [1962] [1]p. [AF 49(638)996] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Amer. Phys. Soc., Series II, v. 7: 258, Apr. 23, 1962.

The zero magnetic-field level crossing (Hanle effect) in the $5s5p\,^1P_1$ state of Cd^{114} has been used to determine the lifetime of the Cd $^1P_1$ atomic state. A quartz cell containing 98.2% Cd^{114} was irradiated with 2288-A resonance radiation. The intensity of the fluorescence emitted at 90° was observed as a function of the cell temperature and magnetic field. A Lorentzian level-crossing signal was observed at zero field; no other crossings were detected as the field was swept from +150 to -150 gauss. The field width of the crossing signal decreased as the cell temperature was increased.

The lifetime of the $^1P_1$ state is determined to be $1.59 \pm 0.08 \times 10^{-9}$ sec by extrapolating the width of the crossing signal to zero cadmium density. This value is significantly lower than earlier values.

Columbia U. [Columbia Radiation Lab.] New York.

LIFETIME OF THE METASTABLE HELIUM ION (Abstract), by E. Commins, L. Gampel and others. [1962] [1]p. [AF 49(638)996] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 258, Apr. 23, 1962.

The apparatus described previously has been used to make a preliminary determination of the lifetime of the 2S state of the helium ion. The metastable component of the beam is modulated by allowing the ions to pass through a microwave-quenching field that is turned on and off at 280 cps. The metastable and ground-state ions are detected on a surface detector that can be moved over the full length of the apparatus. The ground-state ions give rise to a steady detector current, while the metastables produce a 280-cps signal through the surface Auger effect. The ac metastable signal is normalized against the dc ground-state signal to eliminate many of the systematic errors that might otherwise occur. The normalized metastable signal decreases by about 20% during the 400-μsec transit time in the apparatus. This is consistent with the 1.9-msec radiative lifetime predicted for the 2S state of He^+.

OPTICAL DETECTION OF LEVEL CROSSINGS IN Zn^{67} (Abstract), by A. Landman, P. Thaddeus, and R. Novick. [1962] [1]p. [AF 49(638)996] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 26, Jan. 24, 1962.

The crossing of the F = 7/2, m = -7/2 and F = 5/2, m = -3/2 levels of the $(4s41)^3P_1$ state of Zn^{67} (I = 5/2) has been detected by observing the change in the angular distribution of resonance fluorescence in the Zn 3076 intercombination line. The crossing field was found to lie near 870 gauss. This result is consistent with the double resonance measurements of Böckmann et al. The crossing was observed in natural zinc (4% Zn^{67}) with narrow-band phase sensitive detection. More precise measurements are in progress with enriched Zn^{67} and an analysis is being made of the second-order fine structure corrections to the theoretical position of the crossing.

OPTICAL HARMONIC FREQUENCY RADIO MEASUREMENTS, by I. D. Abella. [1962] [2]p. (AFOSR-J87) [AF AFOSR-62-49] AD 400455 Unclassified

Also published in Proc. Inst. Radio Engineers, v. 50: 1824-1825, Aug. 1962.

Harmonics of the output of a ruby laser were generated by focusing the output on a KDP crystal at 45° to the X-Y axis and normal to the Z axis, with the object of checking reports of discrepancy in the expected 2:1 ratio between harmonic and fundamental frequency. Near the threshold, the expected 2:1 ratio was observed, but at higher intensities, the harmonic line was displaced towards the blue by as much as 10 ppm. This result is consistent with the hypothesis of thermal tuning in the maser.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 613, Dec. 27, 1962. (Title varies)

Also published in Paramagnetic Resonance; Proc. of the First Internat'l. Conf., Jerusalem (Israel) (July 16-20, 1962), New York, Academic Press, v. 2: 687-688, 1963.

The isotropic g ≃ 2 spectrum on slightly reduced single-crystal rutile consisted of strong Ti^{3+}, medium OH, and 2 other weak-color center lines. The hydrogen-reduced and deuterium-reduced samples showed an OH line at 3280 cm^{-1} and an OD line at 2450 cm^{-1}, respectively. The fine structures in both Ti^{3+} and OH lines show that these are frequently coupled as a pair isotropically. The coupling is due to the exchange interaction $JS_1.S_2$ between electron spins; J was estimated to be about 3.5×10^{-4} cm^{-1}. $I \cdot S_2$ coupling was observed in the OH spectrum as an anisotropic hyperfine structure. Another 2 weak isotropic lines of g ≃ 1.96 and g ≃ 1.88 (at θ = 0, φ = 0) are suspected to be due to the color centers at oxygen vacancies. Very weak isotropic lines were observed at exactly half the magnetic field of g ≃ 2 line. The line structure was much simpler than g ≃ 2 lines, and no fine structure was observed. The lines were interpreted as due to $\Delta M_S = 2$, $\Delta M_F = 1$ (where F = I + S) transitions, and 3 single lines in the reduced sample were interpreted as OH-OH and Ti^{3+}-O-Ti^{3+} and Ti^{3+}-O-H pairs. The line shape of several spectra did not satisfy the Kramer-Kronig relations even if the lines were not saturated.

LIFETIMES OF THE $^1P_1$ STATES OF Ca, Sr AND Zn (Abstract), by R. DeZafra, R. J. Goshen and others. [1962] [1]p. (AFOSR-5468) (Sponsored jointly by [Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78330]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Also published in Bull. Amer. Phys. Soc., Series II, v. 7: 433, Aug. 27, 1962.

The lifetimes of the $^1P_1$ states of Zn, Sr, and Ca were determined by observing zero field level crossings (Hanle effect). The Zn was studied in a quartz cell, the Sr in an atomic beam, and the Ca in a beam and also in a single crystal magnesium oxide cell. Flow lamps were used as the source of resonance radiation. Phase sensitive detection was employed for the cell observations and direct photo-electric recording for the beam studies. Coherence narrowing was observed in all cases. Level crossing curves of Lorentzian shape and good signal-to-noise ratio were observed for each element. The lifetimes of the $(4s4p)^1P_1$ state of Ca and Zn are $(4.8 \pm 0.5) \times 10^{-9}$ sec and $(1.36 \pm 0.10) \times 10^{-9}$ sec, respectively. The lifetime of the $(5s5p)^1P_1$ state of Sr is $(6.1 \pm 0.6) \times 10^{-9}$ sec. All of these lifetimes are appreciably shorter than those obtained in earlier work. However, the Ca and Sr values are in good agreement with recent optical results obtained by Ostrovskii et al.

A HIGH ENERGY LASER USING A MULTI-ELLIPTICAL CAVITY, by H. Z. Cummins. [1962] [2]p. (AFOSR-J1393) ([Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78330]) Unclassified

Also published in Proc. Inst. Elec. and Electron. Engineers, v. 51: 254-255, Jan. 1963.

Consider an infinitely long source located at one focus of a perfectly reflecting elliptical cylinder and assume that the thickness of the source is negligibly small compared to the dimensions of the ellipse. An object located at the second focus will then receive all the energy radiated by the source and will, in the absence of any loss mechanisms, come to thermal equilibrium with the source. Under these conditions, modification of the geometry to the multi-elliptical design can produce no gain. Optically, this conclusion follows from the consideration that the radiant flux received by a point on the image axis depends on the solid angle subtended by the ellipse at that point, and is the same for a single source or a multi-source geometry. The same conclusion follows from the second law of thermodynamics. According to C. Bowness et al, Proc. IRE, v. 50: 1704-1705, July 1962, the structure could have 4 black-body sources of temperature T located on the 4 source axes. If then, as the authors state, the efficiency of each of the 4 cavities can be 75% of that of a single ellipse, a line object located on the common focal axis would attain an equilibrium temperature greater than T, in clear violation of thermodynamic principles. The authors' remark that the loss in efficiency is caused by the removal of the cavity wall in the region about the axis common to all the ellipses. The loss, however, is not 25% (solid angle lost viewed from the source) as they conclude, but 75% (solid angle lost viewed from the image), so that the total efficiency is (ideally) 25% per ellipse, and nothing has been gained.

HYPERFINE STRUCTURE IN $O^{17}H$ AND THE OH DIPOLE MOMENT, by G. Ehrenstein. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-J1405) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78330) Unclassified

Also published in Phys. Rev., v. 130: 669-675, Apr. 15, 1963.

A microwave spectrometer for the study of free radicals or other reactive species is described; it can be used with either Stark or Zeeman modulation. This spectrometer was used to determine the hyperfine structure of $O^{17}H$. Four main lines of the $^2\pi_{3/2}$, J = 7/2 A-doubling transition were definitely observed, and there is evidence that 1 satellite line was also detected. Quantum number assignments were made for the 4 main lines, which are divided into 2 doublets. In the course of establishing the uniqueness of these assignments, the A-doubling frequency for the $^2\pi_{3/2}$, J = 7/2 state of $O^{18}H$ was experimentally determined. The separation between doublets in the $O^{17}H$ spectrum was used to determine the hyperfine constant d associated with the O^{17} nucleus. The constant d was also computed theoretically from a simple molecular model of OH in which a single unpaired pπ electron about the O^{17} nucleus is assumed. The experimental value is about 8% greater in magnitude than the theoretical value, and this difference is discussed. The same spectrometer was used for the determination of the electric dipole moment of OH by measuring the Stark shift of the $^2\pi_{3/2}$, J = 7/2, M = 4 A-doubling line of $O^{16}H$ at a known electric field. The OH dipole moment was found to be 1.60 ± 0.12 D. (Contractor's abstract)

A number of projects involving the optical detection of energy level crossings are described, including work on various isotopic species of Zn and Cd. Results are given for the lifetimes of certain of these states. A new experiment is described for the measurement of the hyperfine structure of Li ions. Several optical double-resonance studies are reported, including work on Na and radioactive Cd. New experimental programs are described in microwave spectroscopy of molecules, the production of cryogenic magnets, and a Rb "atomic clock". Final results are given for measurements of the $O^{17}H$ free radical. Microwave and optical maser research is discussed. A new experiment for measuring the microwave properties of simulated planetary atmospheres is in progress.

Several modifications of the 30-ft beam apparatus which will be used to measure the lifetime of the metastable state of helium ions are described. Level crossing experiments utilizing optical methods (double resonance methods) have been employed to measure the hyperfine Zeeman structure of isotopes of Zn, Na, Rb, and Cd. Complete results are given for the radiative lifetime of the $^3P_1$ state of Cd. A new experiment for measuring the electronic fine structure of ionized Li is under way. Similar experiments are proposed for various states of Ca and Sr. Several radioactive species were studied by the double resonance technique, principally Cd and Ca. Progress is described on several molecular physics projects, including molecular beams experiments employing velocity selection and electric resonance, and microwave and maser spectroscopy. Several advances in the optical maser program are described. (Contractor's abstract, in part)

A new program for the study of defects in solids by electron-nuclear double resonance techniques is reported. A precise value of the O^{15} magnetic moment has been obtained and compared with the known moment of the mirror nucleus N^{15}. A 47 000 gauss superconducting magnet has been successfully operated. Precise values for the hyperfine splitting of a rotational transition in the HDS have been obtained with the maser beam spectrometer. Final results are reported on the microwave spectrum of $O^{17}H$. Precise values for the lifetimes of the first excited resonance state of Cd, Zn, Ca, and Sr have been obtained by level crossing spectroscopy. A new method of level crossing spectroscopy is reported in which backscattered signals are utilized to observe crossings in the presence of heavy trapping. This technique is being applied to the study of atomic collision phenomena in resonance states. A new molecular beam electric resonance apparatus is being constructed for the study of molecular hyperfine structure. The high pressure microwave absorption of CO_2 has been determined. This information will be used in connection with a study of the atmosphere of Venus.

Double photon excitation of the $6S_{1/2}$-$9D_{3/2}$ transition in atomic cesium has been observed when the vapor is illuminated with the intense light of a pulsed ruby laser. These observations provide a simple and direct test of the theory of 2 photon processes. New values are reported for the spin, magnetic moment, and quadrupole moment of 245 day Zn^{65} and 43 day of Cd^{115m} These results were obtained by optical double resonance. New precise values of the level crossing fields in 6.7 hour Cd^{107} and 245 day Zn^{65} are reported. A program of solid state research involving a study of the demagnetized state has been initiated. The demagnetized state will be achieved by adiabatic demagnetization in the rotating frame; it is expected that this technique will be useful in the study of rare spins. Polarization studies at S band have been made on a number of radio sources with the NRL radio telescope and a 9.4 cm maser preamplifier that was designed and constructed at CRL. Large polarization was found in Hercules A, 3C 433, and 3C 295. (Contractor's abstract)

Evidence has been found for the existence of the $(1s2s2p)\,^4P_{5/2}$ metastable state of the lithium atom. This state decays by authorization with a lifetime of about 10 μsec. In addition to its intrinsic interest, this state and similar states in other atoms warrant study because they may serve as useful sources of polarized electrons and ions. Final results are reported on the magnetic moment of O^{15}. Precise values for the zero field hyperfine intervals and the level crossing fields of 245 day Zn^{65} are reported. The spin, magnetic moment, and quadrupole moment of 43 day Cd^{115m} have been determined by optical double resonance. Theoretical calculations of the moments of the cadmium and zinc isotopes have been made on the basis of the configuration mixing model; these are compared with the experimental values. New precise values of the HDS molecular parameters have been deduced from the measurements reported previously. Initial results are reported on the optical maser spectroscopy program. In the cooperative radio-astronomy program with the Naval Research Lab., it has been found that the 3200 mc/sec radiation from Saturn is linearly polarized and that the magnetic poles of Saturn appear to be located in the equatorial plane of the planet. ALTERNATING LINEWIDTHS IN THE ESR SPECTRA OF DINITROBENZENE ANION RADICALS, by J. H. Freed, P. H. Rieger, and G. K. Fraenkel. [1962] [2]p. incl. diagr. (AFOSR-J321) (AF 49(638)520) Unclassified

Also published in Jour. Chem. Phys., v. 37: 1881-1882, Oct. 15, 1962.

An alternation of line-widths in the hyperfine structure due to 2 equivalent nitrogen nuclei is found in m-, dinitrobenzene but not in para and ortho derivatives. This is interpreted in terms of a time dependent fluctuation in the difference of the splitting constants for each separate nucleus. The time dependence is supposed to arise from collisions with solvent molecules and from the formation of short-lived complexes with the solvent molecules.

ANOMALOUS ALTERNATING LINEWIDTHS IN ESR SPECTRA, by J. H. Freed and G. K. Fraenkel. [1962] [2]p. incl. illus. (AFOSR-J322) (AF 49(638)520) AD 453519 Unclassified

Also published in Jour. Chem. Phys., v. 37: 1156-1157, Sept. 1, 1962.

An anomalous alteration in the widths of the hyperfine components was found in the ESR spectrum of the 1, 4-dinitrotetramethylbenzene anion radical. A mechanism which explains this effect is discussed which involves the modulation of the hyperfine interaction with the nitrogen nuclei by a correlated hindered rotation of the pair of nitro groups.

ELECTRON SPIN RESONANCE OF AZULENE ANION RADICALS, by I. Bernal, P. H. Rieger, and G. K. Fraenkel. [1962] [7]p. incl. illus. diagrs. tables, refs. (AFOSR-J323) (AF 49(638)520) AD 453520 Unclassified

Also published in Jour. Chem. Phys., v. 37: 1489-1495, Oct. 1, 1962.

The electron spin resonance spectra of the anion radical azulene, azulene-1, 3-d_2, 4, 6, 8-trimethylazulene, and 4, 6, 8-trimethylazulene-1, 3-d_2 have been examined. These hydrocarbons are nonalternant and have aromatic ring structures with C–C–C bond angles that depart from 120°. Sigma-pi-interaction calculations of the parameter Q_{CH}^{H} [in the relation $a_i^H = Q_{CH}^{H} \rho_i^{\pi}$ between the isotropic proton hyperfine splitting (a_i^H) and pi-electron spin density (ρ_i^{π})] have been performed as a

function of the bond angles at the carbon atom bonded to the proton. These calculations indicate a strong dependence of this parameter on angle. By using recent x-ray data on azulene, predictions could be made of the Q's at the different positions in the radicals. In contrast, the proton splitting at a methyl-group substituent, determined by the parameter $Q_{CCH_3}^{H}$, is predicted to be independent of the bond angles at the carbon atom of the aromatic system. Calculations of the pi-electron spin density were made in both the simple Hückel and the McLachlan extended self-consistent field molecular-orbital theory approximations. These calculations were used with the experimental splitting constants to make a comparison with the predicted bond-angle variation of sigma-pi interaction parameters (Q's). The McLachlan procedure gives much more satisfactory results than the Hückel calculations, but the agreement with experiment involving use of the predicted dependence of Q_{CH}^{H} on bond angle, is only approximate. The theoretical estimates of the variation of Q_{CH}^{H} with bond angle, and of the constancy of $Q_{CCH_3}^{H}$, appears to be qualitatively correct. Applications of the theory for the change of Q_{CH}^{H} with angle may in some instances necessitate taking into account bent bonds. (Contractor's abstract)

ELECTRON SPIN RESONANCE LINEWIDTHS IN MULTISUBSTITUTED BENZENE RADICALS (Abstract), by J. [H.] Freed, I. Bernal, and G. K. Fraenkel. [1962] [1]p. [AF 49(638)520] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 44, Jan. 24, 1962.

An unusual linewidth pattern has been observed in the electron spin resonance spectrum of dilute liquid solutions of certain multisubstituted benzene radicals. This effect is observed at a field of 9200 mc/sec and consists of a regular alternation of sharp and broadened hyperfine lines. These hyperfine splittings, which arise from the isotropic interactions between the unpaired electron and the magnetic nuclei, are proportional to the odd-electron spin densities at these nuclei. The broadened lines correspond to odd values of the z component of the total nuclear spin of equivalent nuclei. The equivalent nitro groups in radicals such as the dinitrodurene and dinitromesitylene anions give rise to this linewidth alternation, as do the equivalent methyl groups in protonated durosemiquinone positive ion. In related radical anions, such as mononitrodurene, mononitromesitylene, 2-nitrometaxylene, and unprotonated durosemiquinone, no such effect has been distinguished. The phenomenon is attributed to the steric hindrance between the ring substituents and hence to their coupled hindered motions leading to a nuclear-spin-dependent intromolecular line broadening process. Temperature-dependence linewidth studies show an enhancement of this effect at low temperatures.

ELECTRON SPIN RESONANCE SPECTRA OF CARBONYL ANION RADICALS, by P. H. Rieger and G. K. Fraenkel. [1962] [21]p. incl. diagrs. tables, refs. (AF 49(638)520) Unclassified

Published in Jour. Chem. Phys., v. 37: 2811-2831, Dec. 15, 1962.

Electron spin resonance studies are reported on the anion radicals of single-ring aromatic compounds containing aldehyde, acetyl, or amide groups, as well as other substituents. Many of the radicals have spectra which indicate that the carbonyl group is locked in a conformation planar with the ring for times of the order of a μsec or longer. The para dicarbonyls and the 3-cyanoacetophenone anion were found to be present in both the cis and trans modifications. A simple modification of conventional molecular-orbital theory has been used with considerable success to account for the loss of symmetry in the pi-electron spin density for compounds with a locked carbonyl group, and the calculated energy differences for the cis and trans isomers are in good agreement with experiment. Molecular-orbital calculations of spin densities were made for most of the radicals and comparisons are made with the predictions of valence-bond theory. The benzaldehyde, acetophenone, and 4-fluoroacetophenone anions have spectra with abnormally small ring-proton splitting constants. The appearance or nonappearance in all the radicals but these 3, of twofold symmetry in the pattern of splitting constants, is interpreted qualitatively in terms of competing effects determined by the order of the bond between the ring and carbonyl group, and steric factors in the neighborhood of the carbonyl group. A number of features of the experimentally determined spin density distributions have been correlated with the relative electron-with-drawing effects of the substituents. (Contractor's abstract)

ELECTRON SPIN RESONANCE OF ELECTROLYTICALLY GENERATED NITRILE RADICALS, by P. H. Rieger, I. Bernal and others. [1962] [11]p. incl. diagr. tables, refs. [AF 49(638)520] Unclassified

Presented at Delaware Valley Regional meeting of the Amer. Chem. Soc., Philadelphia, Pa., Jan. 26, 1962.

Published in Jour. Amer. Chem. Soc., v. 85: 683-693, Mar. 20, 1963.

Electron spin resonance spectra have been obtained for a series of anion radicals of aromatic and aliphatic nitriles. The radicals were generated by electrolytic reduction in N, N-dimethylformamide solution.

Polarographic investigations, both conventional and oscillographic, were also performed. In obtaining the ESR spectra, techniques were employed by which the starting material could be almost completely reduced to the radical, and thus the broadening of the lines in the spectra that arises from intermolecular electron exchange was largely eliminated. In most cases, a well-resolved ESR spectrum was obtained from the radical expected as the product of a simple reduction process, but in some reductions complex reactions took place. In a few reductions, unresolvable spectra, or no spectra at all, were obtained. Many of the radicals were stable for long periods of time (several hr or more), but a few decayed quite rapidly (a few min or less). Some of the compounds were reduced at potentials corresponding to several different polarographic waves and resulted in more than one type of radical from a single starting material. A number of reduction mechanisms were elucidated by a comparison of polarographic and ESR data. The majority of the spectra were completely interpreted and assignment of the splitting constants to the appropriate nuclei (H, N^{14}, N^{15}, C^{13}) in the molecule was possible. Qualitative observations of electron exchange reactions and of solvent effects were also made.

OPTICAL AND ELECTRON SPIN RESONANCE SPECTRA OF AMMONIUM VANADYL TARTRATE (Abstract), by I. Bernal and P. H. Rieger. [1962] [1]p. [AF 49(638)-520] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 45, Jan. 24, 1962.

Ammonium vanadyl tartrate, a violet solid, was recently studied by Jorgensen as part of an optical investigation of vanadyl compounds. In contrast to the results obtained on most of these compounds, in which 2 or 3 bands are observed in the visible region, the tartrate gives 4. Jorgensen suggested, therefore, that the upper E state is split by a distortion of the ligand geometry to an approximate C_s configuration. The optical and ESR spectra of this material in aqueous solutions over a range of hydrogen ion concentrations was investigated. In concentrated HCl, the complex decomposes and one observes spectra that are the same as those of vanadyl chloride. As the acid concentration is lowered (pH = 1), new bands appear in the visible spectrum and finally (above pH = 3) the only species observed is that described by Jorgensen. The ESR spectrum of the aqueous solution of the violet compound shows 10 clearly resolved lines and a number of shoulders which can be readily interpreted as the superposition of 2 groups of 8 lines, each group arising from the splitting of the V nucleus (I = 7/2). The solution of the violet compound must therefore contain 2 distinct vanadyl ions in different environments.

SOLVENT EFFECTS IN ELECTRON SPIN RESONANCE SPECTRA, by J. Gendell, J. H. Freed, and G. K. Fraenkel. [1962] [10]p. incl. diagrs. tables, refs. (AF 49(638)520) Unclassified

Published in Jour. Chem. Phys., v. 37: 2832-2841, Dec. 15, 1962.

The purpose of this report is to assess the significance of solvent interactions, to determine under what circumstances they are likely to be appreciable, and to ascertain their effect on the theoretical interpretation of the spin-density distributions determined from ESR spectra. In Section II, the authors consider in a qualitative fashion how solvent interactions affect the hyperfine splittings and indicate why some splittings are much more strongly influenced than others. In Section III the dynamics of the exchange phenomena between different types of solvent-radical complexes are discussed, and it is shown how the splittings vary with the composition of mixed solvents. In Section IV, a simple model based on conventional molecular-orbital calculations is employed to account for the solvent variation of the pi-electron spin densities in the semiquinones. In the Appendix, the treatment of the exchange reaction by use of the modified Bloch equations is compared with the spectral density method. The contributions to the linewidths from random solvent interactions are also discussed.

SOLVENT EFFECTS ON THE OPTICAL AND ELECTRON SPIN RESONANCE SPECTRA OF VANADYL ACETYLACETONATE, by I. Bernal and P. H. Rieger. [1962] [5]p. incl. diagrs. tables, refs. AF 49(638)-520] Unclassified

Published in Inorg. Chem., v. 2: 256-260, Apr. 1963.

The positions of certain bands in the optical absorption spectrum, as well as the vanadium nuclear hyperfine splitting constant in the ESR spectrum, of vanadyl acetylacetonate are found to be sensitive to changes in the solvent. The solvent effects on the optical spectrum are in good agreement with molecular orbital predictions of Ballhausen and Gray for vanadyl ion. The optical data may be used to calculate g-values in good agreement with the ESR results. A qualitative study of line widths in the ESR spectra shows that the anisotropy of the nuclear hyperfine interaction tensor also varies with changes in solvent. (Contractor's abstract)

SPIN-DENSITY DISTRIBUTION IN NITRILE ANION RADICALS, by P. H. Rieger and G. K. Fraenkel. [1962] [16]p. incl. diagrs. tables, refs. (AF 49(638)-520) Unclassified

Published in Jour. Chem. Phys., v. 37: 2795-2810, Dec. 15, 1962.

Molecular-orbital calculations of the pi-electron spin densities in a series of aromatic and aliphatic nitrile anion radicals have been performed using the Hückel-LCAO method and the approximate configuration-interaction correction of McLachlan. Coulomb and resonance integrals for the nitrile group were estimated by comparing calculated spin densities with proton and C^{13} hyperfine splittings obtained from electron-spin resonance measurements. The predicted spin densities were in generally good agreement with the experimental results, but for some of the compounds it is impossible to get an exact fit between theory and experiment within the framework of the simple valence-theory calculations, if the sigma-pi interaction parameters relating splittings to spin densities are taken as fixed quantities. Semiempirical treatments of the N^{14} and C^{13} splittings in the cyano groups give excellent correlations of the experimental splittings with the calculated spin densities, and estimates have been made of some of the sigma-pi interaction parameters relating to the N^{14} splitting. Polarographic half-wave potentials have also been compared with calculated pi-electron energies. A discussion is given of the relation between the spin densities predicted by the valence-bond and molecular-orbital theories. (Contractor's abstract)

DISORIENTATION CROSS SECTIONS IN OPTICAL PUMPING, by R. J. McNeal. [1962] [2]p. incl. diagr. table. (AFOSR J183) (AF 49(638)785) AD 400071 Unclassified

Also published in Jour. Chem. Phys., v. 37: 2726-2727, Dec. 1, 1962.

The disorientation cross sections and diffusion coefficients for rubidium atoms in methane, ethane, ethylene, cyclohexane, hydrogen, and nitrogen are given with applicable pressure ranges and temperature. The relaxation time was obtained at no fewer than 5 pressures for each gas, and at least 4 measurements were made at each pressure. The measurements of the relaxation time were reproducible to within 20% in most cases. The variation of σ (disorientation cross section) with the total number of buffer gas electrons for all gases reported to date is shown in graph form. Choosing this parameter as abscissa reveals the regular variation of σ rare-gas atomic number and the more irregular behavior observed with the other gases. The number of buffer gas electrons is not expected to be the only important parameter for description of the disorientation process.

MICROWAVE SPECTRUM OF BROMOCYCLOBUTANE, by B. P. Dailey and W. G. Rothschild. [1962] [10]p. incl. diagrs. tables, refs. (AFOSR-J166) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)953 and National Science Foundation) AD 400098 Unclassified

Also published in Jour. Chem. Phys., v. 36: 2931-2940, June 1, 1962.

Rotational transitions of 4 isotopic species of bromocyclobutane have been observed. For $C_4H_7Br^{79}$, the rotational constants are A = 10 003.4 ± 13 mc, B = 1629.41 ± 0.03 mc, C = 1488.48 ± 0.03 mc; for $C_4H_7Br^{81}$, A = 10 002.6 ± 13 mc, B = 1615.14 ± 0.03 mc, and C = 1476.50 ± 0.03 mc. The values for the α-deuterated compound are, for $C_3H_6CDBr^{79}$, A = 9534.7 ± 13 mc, B = 1613.67 ± 0.03 mc, and C = 1486.24 ± 0.03 mc; for $C_3H_6CDBr^{81}$, A = 9533.4 ± 13 mc, B = 1599.55 ± 0.03 mc, and C = 1474.24 ± 0.03 mc. A set of structural parameters which reproduce these constants within 1.8 mc were obtained with an electronic computer: bond distances $C_\alpha - C_\beta$ = 1.540 ± 0.003A, $C_\beta - C_\gamma$ = 1.548 ± 0.003A, C—Br = 1.939A, C—H = 1.096A, and C—D = 1.087A; bond angles $C_\beta C_\gamma C_\beta$ = 88° 06′ ± 08′, $C_\beta C_\alpha C_\beta$ = 88° 41′ ± 08′, $HC_\gamma H$ = 110°44′, $HC_\beta H$ = 108°44′, $HC_\alpha Br$ = 111°, angle of $C_\beta C_\alpha C_\beta$ plane with C—Br = 131°00′ ± 08′, and dihedral angle = 29°22′ ± 08′ (the dihedral angle is the angle made by the normals of the $C_\beta C_\alpha C_\beta$ and $C_\beta C_\gamma C_\beta$ planes). The quadrupole-coupling constant of $C_4H_7Br^{79}$ along the C—Br bond direction is 512.2 ± 50 mc and the asymmetry parameter η_{bond} is -0.002 ± 0.014 mc. From frequency and intensity measurements of rotational satellites a low-lying vibrational mode was identified. Its effect is a displacement of all atoms in the molecule (out-of-plane bending). Its first and second excited states are 120 ± 25 and 251 ± 56 cm^{-1}, respectively, above ground level. The 3 lowest levels of the vibrational mode were shown to be large-amplitude vibrations of the molecule about a dynamical equilibrium dihedral angle of 25° to 29°. Highly excited vibrational states, which cause increasing planarity of the carbon ring, are expected to lead to

tunneling through the potential barrier to the less stable axial isomer of bromocyclobutane. The existence of the axial isomer by direct observation could not be established due to instrumental difficulties.

VALENCE THEORY AND NUCLEAR RESONANCE, by J. F. Verdieck. Final rept. Nov. 13, 1962, 2p. (AFOSR-4051) (AF AFOSR-60-26) Unclassified

The applications of optical masers to problems in chemical physics are discussed. Principal among these applications is that of optical harmonic generation in high molecular weight polymers, such as DNA. Elementary calculations indicated that the angular distribution of the scattered harmonic light does not exhibit a functional form different from that of normal scattered light. Another application considered is that of double quantum absorption. A laser system was obtained to investigate the processes mentioned above. At the present time, efforts are being made to eliminate difficulties with the instrument.

HYDROMAGNETIC KELVIN-HELMHOLTZ INSTABILITY SURFACE WAVES AND GEOMAGNETIC MICROPULSATIONS, by A. K. Sen. Final rept. June 15, 1962 [76]p. incl. diagrs. table, refs. (Rept. no. CU-20-62 AF350-EE) (AFOSR-2764) (AF 49(638)350) AD 283988 Unclassified

The most general form of hydromagnetic Kelvin-Helmholtz discontinuity in ideal incompressible fluids has been considered. The stability of the hydromagnetic flow of 2 uniform infinite streams with planar interface exhibiting this type of discontinuity has been analyzed in detail. Necessary and sufficient criteria for its stability have been obtained. A disturbance of the stable interface is seen to propagate as hydromagnetic surface waves. Instability of the interface leads to growing surface waves. These results are used to develop a new theory of geomagnetic micropulsations, in which the solar wind-exosphere interface is viewed as a surface of hydromagnetic Kelvin-Helmholtz discontinuity. It is shown that the sunlit side of this interface is unstable under most conditions of solar activity. Only during moderate and intense solar activity, the unstable waves thus generated may leave the interface along the lines of force of the earth's magnetic field and travel towards the earth's surface (in the Alfve'n mode) as micropulsations. Some of the important features of micropulsations, such as the bandwidth and higher occurrence frequency in the daylight hours and in the auroral zones, are explained by the theory. A critical examination of the single fluid approximations of the plasma equations has been made. A rigorous derivation of the boundary conditions in an ideal incompressible hydromagnetic fluid is also given. (Contractor's abstract)

PROCESS IDENTIFICATION IN ADAPTIVE CONTROL SYSTEMS, by S. C. Bigelow. Jan. 31, 1962 [14]p. incl. diagr. refs. (Technical rept. no. 73; rept. no. CU-7-62AF998-EE) (AFOSR-2274) (AF 49(638)998) Unclassified

A study of the shortcomings of an adaptive control system by Kalman is presented. A modification of the computational scheme permitting determination of the order of the plant characteristic equations and methods of eliminating undesirable characteristics of the system under steady-state conditions is given. It is shown that a time-domain characterization is better suited than plant frequency-domain to characterize the plant dynamics. Such a characterization is developed and presented in detail.

CONTRIBUTIONS TO THE THEORY OF TIME-OPTIMAL CONTROL, by E. Kreindler. May 1, 1962 [60]p. incl. diagrs. refs. (Technical rept. no. 76) (AFOSR-2340) (AF 49(638)998) AD 282361 Unclassified

Also published in Jour. Franklin Inst., v. 275: 314-344, Apr. 1963.

A unified theory for the time-optimal control of general linear, not necessarily normal (a restriction usually imposed) plants, with generalized constraints on the control variable is developed. The approach is geometrical, thereby providing new insight and interpretation for some results obtained by methods of functional analysis. Some other known results are generalized and, as a rule, derived in a simpler fashion. The special cases of amplitude, energy, and area constraints are studied in detail, clarifying some points that remained hitherto obscure. An approximate synthesis procedure is proposed and an example is analyzed. (Contractor's abstract)

PEIERLS STRESS FOR AN IDEALIZED CRYSTAL MODEL, by W. T. Sanders. [1962] [10]p. incl. diagrs. table, refs. (AFOSR-J42) (AF 49(638)909) AD 297112 Unclassified

Also published in Phys. Rev., v. 128: 1540-1549, Nov. 15, 1962.

An analytical investigation is made of the geometry of an edge dislocation in a simple atomic model of an infinite crystal, and the effect on the dislocation of externally applied shear stress. This study indicates that in dislocation theory significant results may be obtained from the discrete model, on which accurate analysis is possible. Even the simple model used here seems to be sufficiently realistic to yield meaningful results. The width, w of the dislocation, in this model, is proportional to γ^{-1}, where γ is the shear strength of a perfect crystal. The Peierls-Nabarro (P-N) stress has a large cyclic variation as γ is changed, but is proportional, in the average, to e^{-w}. This differs markedly from the result, $\sigma_{PN} \propto e^{-4\pi w}$, found from the continuum analysis. The values of the P-N stress ranged from 10^{-3} to 10^{-5}, in units of the shear modulus. In the analysis, the doubly infinite set of difference equations, derived from force balances on the atoms, is first reduced, by a type of Fourier series transform, to an infinite system of equations, which is then solved by the method of reduction. (Contractor's abstract)

AN EXPERIMENTAL STUDY OF HEAT TRANSFER AT HIGH TEMPERATURE DIFFERENCES IN TURBULENT AIR FLOW BETWEEN A ROTATING CYLINDER AND A STATIONARY CONCENTRIC OUTER CYLINDER, by G. S. Longobardo and H. G. Elrod. Final rept. Aug. 1962, 327p. incl. illus. diagrs. tables, refs. (AFOSR-3207) (AF 49(638)1001) AD 407505 Unclassified

A study was made of convective heat transfer between a rotating cylinder and a stationary, concentric outer cylinder for the Taylor number range 2000 to 9000, and for rotor surface temperatures in the range 80° to 439°F. Measurements were made of over-all heat transfer, and velocity and temperature distributions in the gap between the 2 cylinders. A hot wire anemometer was used to determine whether secondary flows exist in the gap in the Taylor number range of the investiation. Principal results are given.

[RADIO ASTRONOMY AT MILLIMETER WAVELENGTH] Final rept. Apr. 16, 1959-Apr. 30, 1962. 16p. incl. refs. (AFOSR-3201) (AF 49(638)631) AD 612131 Unclassified

A complete M-band radiotelescope was built for application of techniques of millimeter-band radioastronomy to studies of (1) behavior of oxygen in the earth's high atmosphere and (2) the precise frequency of the coronal radiation due to the hfs transition of sextuply ionized atomic nitrogen. The radiotelescope had an equatorial mount capable of steering a 180-lb, 5-ft parabolic antenna with a millimeter-band Dicke radiometer. The temperature of the high atmosphere to which the peak of the oxygen line is sensitive varied enough on different days to produce changes of oxygen absorption. Calculations also showed that if the temperature of the atmosphere was 260°K up to a height of 30 km and 240°K above 80 km, the ν_{27-} line would not be detectable by the radiotelescope used at that time. A millimeter-wavelength maser oscillator was constructed by using Fe^{3+} in rutile. The structure of the lowest energy levels of Fe^{3+} in rutile was accurately determined and the spin-lattice relaxation times and line width of some of the transitions were determined accurately.

DETECTION OF THE MICROWAVE ν_{27-} LINE OF MOLECULAR OXYGEN PRODUCED IN THE HIGH ATMOSPHERE, by W. Kahan. [1962] [3]p. incl. diagrs. refs. (AFOSR-J85) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-50 and Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78330]) AD 400457 Unclassified

Also published in Nature, v. 195: 30-32, July 7, 1962.

Radiotelescope observations of atmospheric absorption of solar millimeter wave radiation have resulted in the detection of the ν_{27-} telluric molecular oxygen line at 53,070 mc/s. Measurements made on different days have shown that the peak of the ν_{27-} molecular oxygen absorption varies in intensity, presumably as a result of temperature variations in the Earth's high atmosphere where the pressure is low enough to produce the line peak observed. The results of the experiments are discussed.

AN APPLICATION OF FUNCTIONAL ANALYSIS TO THE OPTIMAL CONTROL PROBLEM, by G. M. Krane and P. E. Sarachik. Jan. 22, 1962, 26p. incl. refs. (Technical rept. no. 72; rept. no. CU-6-62AF998-EE) (AFOSR-2102) (AF 49(638)998) Unclassified

In the classical formulation of the time optimal problem, an input signal is sought which causes the state of a dynamic system to change in the least time from its initial value to the final, desired one. It is assumed that this input signal is constrained by limitations imposed on its amplitude or energy, etc. Several different approaches, such as, variational techniques, dynamic programming,

or Pontryagin's maximum principle have been used to obtain the solution to this problem. The present paper presents yet another method which is applied to obtain generalization of the previously published results to the case of a time optimal nth order system with r inputs.

ULTRASONIC DELAY LINE DEVELOPMENT, by L. B. Lambert. Technical progress rept. July 1-Dec. 31, 1961. Jan. 2, 1962, 43p. incl. diagrs. refs. (Technical rept. no. P-1/178; rept. no. CU-1-62AF1113-ERL) (AFOSR-1905) (Sponsored jointly by Advanced Research Projects Agency, Air Force Office of Scientific Research under AF 49(638)1113, and Rome Air Development Center) AD 271710 Unclassified

Progress on ultrasonic delay line research is discussed. The results of a continued study of lead as a bonding and backing material for ultrasonic delay lines are presented. The triple-travel response level was reduced below the level of spurious responses due to diffraction for a majority of delay line applications. The results of an investigation of the diffraction field, in a solid medium, of an ultrasonic transducer are presented. The experimental results indicated that the assumptions made in the mathematical description of acoustic diffraction phenomena are valid. Design techniques for polygonal delay lines are discussed in terms of spurious response levels. A theoretical analysis, based on Fresnel diffraction theory, is presented, which results in the determination of the optimum transducer length for minimum spurious response level. (Contractor's abstract, in part)

TWO-DIMENSIONAL FILTERING (Unclassified title), by L. B. Lambert. Technical progress rept. July 1-Dec. 31, 1961. Jan. 2, 1962, 66p. incl. illus. diagrs. refs. (Technical rept. no. P-1/179; rept. no. CU-2-62AF1113-ERL) (AFOSR-1912) (Sponsored jointly by Advanced Research Projects Agency, Air Force Office of Scientific Research under AF 49(638)1113, and Rome Air Development Center) AD 329253 Confidential

A summary review of the theory and experimental results for the electro-optical, 2-dimensional filter is presented for the convenience of the reader. The measured characteristics of the 6-in. water delay line system are used in typical examples. By employing a ruby optical maser as a light source for the coherent optical system, frequency and time resolutions were measured. For a linear, frequency modulated input signal having a duration of 100 μsec and a bandwidth of 10 mc, a frequency resolution of 13 kc and a time (range-delay) resolution of better than 0.15 μsec were obtained. Progress is also reported concerning the implementation of the improved 4-lens, diffraction limited system which has been designed to increase the integration efficiency and dynamic range for a time-bandwidth product of 1000. (Unclassified)

STABILITY OF HYDROMAGNETIC KELVIN-HELMHOLTZ DISCONTINUITY, by A. K. Sen. [1962] [10]p. incl. diagrs. refs. (AFOSR-5508) (AF 49(638)350 and AF 49-(638)1113) Unclassified

Also published in Phys. Fluids, v. 6: 1154-1163, Aug. 1963.

The most general form of hydromagnetic Kelvin-Helmholtz discontinuity in ideal incompressible fluids has been considered. The presence of surface tension on the surface of discontinuity and gravity is also assumed. The stability of the hydromagnetic flow of 2 uniform infinite streams with planar interface exhibiting this type of discontinuity, has been analyzed in detail. Two necessary and sufficient criteria for its stability have been obtained, in contrast to only one that is usually given. The stabilizing effect of magnetic field is strongly dependent on its discontinuity at the interface and its orientation relative to that of streaming. The consideration of the stability to a single mode of perturbation leads to the conclusion that this is dependent on the above mentioned factors, as well as the following ones. The effect of surface tension and gravity is dependent on the wavelength, while that of the magnetic field is dependent on the direction of propagation of perturbation. (Contractor's abstract)

THE EIGENVALUES OF HILL'S EQUATION, by L. E. Blumenson. June 15, 1962, 41p. incl. refs. (Technical rept. no. T-1/180; rept. no. CU-6-62AF1113-ERL) (Sponsored jointly by Advanced Research Projects Agency and Air Force Office of Scientific Research under AF 49(638)1113) AD 295616 Unclassified

Restrictions for the eigenvalues of Hill's equation have been found by Liapunoff, Borg and others. It is shown here that they can assume certain extreme values only if Hill's equation reduces to a trivial case. Effective iteration schemes for the computation of the first eigenvalue and the corresponding eigensolution are derived. All eigenvalues are expressed as an infimum of an integral, with very simple side conditions involving the zeros of a corresponding eigensolution, and bounds for the eigenvalues are then obtained. The case of equally spaced zeros is investigated in detail, and again it is shown that certain extremal cases can occur only if the differential equation is of a trivial type. ELECTRO-OPTICAL TRANSFER CHARACTERISTICS OF LIQUID DELAY-LINE LIGHT MODULATORS, by M. Arm, L. B. Lambert, and B. Silverberg. [1962] [11]p. incl. diagrs. [AF 49(638)1113] Unclassified

Presented at 1962 I. R. E. Internat'l. Convention, Mar. 26-29, 1962, New York.

Abstract published in Proc. Inst. Radio Engineers, v. 50: 345, Mar. 1962.

Published in I. R. E. Internat'l. Convention Record, Pt. 6: 79-89, 1962.

The Debye-Sears effect in a water delay line is utilized to obtain spatial light modulation in real time. The

design, implementation, and measurement techniques which have been employed to optimize the electro-optical transfer characteristic of this light modulator are presented. Insertion loss, bandwidth and phase response are theoretically determined for the case of the back-loaded transducer and the case of the quarter-wave matching section. These results are then compared with corresponding experimental results. It is shown that a low insertion loss can be obtained with a 50% bandwidth by employing a quarter-wave matching section technique. Techniques which have been successful in producing quarter-wave matching sections 30μ thick adhered to 20-mc, transducers, are described and experimental results are presented. A NOTE ON INPUT-OUTPUT SPECTRAL DENSITIES, by K. S. Miller. [1962] [4]p. (AF 49(638)1113) Unclassified

Published in Quart. Appl. Math., v. 21: 249-252, Oct. 1963.

This note derives a variant on the well known formula by which the power spectral density of the output of a stationary linear system can be obtained from that of the input and the frequency response of the system. The variant applies to a situation in which the input is a stationary random process (possessing a power spectral density) multiplied by a finite Fourier series. Such situations are encountered in communications engineering. (Math. Rev. abstract)

SEQUENTIAL DESIGN OF EXPERIMENTS WITH TWO RANDOM VARIABLES, by L. R. Abramson. Sept. 20, 1962, 107p. incl. refs. (Technical rept. no. T-2/180; rept. no. CU-7-62AF1113-ERL) (Sponsored jointly by Advanced Research Projects Agency and Air Force Office of Scientific Research under AF 49(638)1113) AD 295617 Unclassified

Given 2 independent random variables with densities f_1 and f_2 the following hypotheses are tested, H_1: $f_1 = f_{11}$, $f_2 = f_{12}$ vs H_2: $f_1 = f_{21}$, $f_2 = f_{22}$, where the f_{ij} $(i, j = 1, 2)$ are known densities. Bayes sequential procedures are studied and proof presented to show that a Bayes a Bayes decision rule always exists. The asymptotic case where the cost of each observation approaches zero is considered. An asymptotic expression for the Bayes risk is found and necessary and sufficient conditions for a decision rule to be asymptotically Bayes are derived. The properties of a class of tests called tandem tests are studied and necessary and sufficient conditions found for a tandem test to be asymptotically Bayes. (A tandem test is a sequence of at most 2 Wald tests, the first performed on one of the random variables and the second (which may depend on the outcome of the first) performed on the other.) WIDE-BAND, INSTANTANEOUS SPECTRUM ANALYZERS EMPLOYING DELAY-LINE LIGHT MODULATORS, by L. B. Lambert. [1962] [10]p. incl. diagrs. refs. [AF 49(638)1113] Unclassified

Presented at 1962 I. R. E. Internat'l. Convention, Mar. 26-29, 1962, New York.

Abstract published in Proc. Inst. Radio Engineers, v. 50: 345, Mar. 1962.

Published in I.R.E. Internat'l. Convention Record, Pt. 6: 69-78, 1962.

Fast-acting spectrum analyzers which provide a large number of resolution elements covering a large frequency band are synthesized by suitably combining ultrasonic, electronic, and optical techniques. The Debye-Sears effect in a transparent, ultrasonic delay line is utilized to convert an electrical input signal to a proportional spatial pattern. This pattern modulates coherent light which is then spatially integrated by a lens configuration. The Fourier transform of the input signal is obtained as a distribution of light amplitude in the focal plane of the integrating lens. The realizable frequency coverage, number of resolution elements, and dynamic range are discussed. Adaptation techniques are described and typical results are presented which indicate the improvement that can be obtained by employing an optical maser as a light source. (Contractor's abstract)

DEFORMATION AND FRACTURE OF POLYCRYSTALLINE CADMIUM, by N. S. Stoloff and M. Gensamer.

[1962] [11]p. incl. illus. diagrs. tables, refs. (AFOSR-J164) (AF 49(638)406) AD 400088 Unclassified

Also published in Trans. Metall. Soc. AIME, v. 227: 70-80, Feb. 1963.

The effects of temperature, grain size, and magnesium content on the strength and ductility of cadmium were studied in the range -269° to 23°C. A sharp drop in ductility between -140° and -190°C marked a transition in fracture mode from ductile shear to intergranular fracture. The addition of up to 15.35 wt % Mg in solid solution raised the transition temperature, and for 2 compositions produced basal cleavages. The relatively high ductility of unalloyed cadmium at cryogenic temperatures is attributed to temperature independence of the yield stress and the absence of dislocation locking. INTERSPECIES COMMUNICATION, by J. C. Lilly. [1962] [3]p. incl. illus. (AFOSR-2623) [AF AFOSR-61-62] Unclassified

Also published in McGraw-Hill Yearbook of Sci. and Tech., 1962, p. 279-281.

The suitability of the bottle-nosed dolphin (Tursiops truncatus) for verbal interspecies communication research is discussed. Exchanges between individuals of the species in which each animal transmits and then waits for the transmission from the other animal have been found. Alternations between 2 individuals seem to be the rule for the whistles and clicks emitted by the animals. Tursiops emits high-pitched sounds which have been variously described as quacks, squawks, wails, bleats, barks, and buzzings. The tendency of some of the species to produce many humanoid sounds while hearing human speech has been interpreted as mimicking. Neurophysiological studies of the dolphin's brain reveals some similarity to the human one (as opposed to smaller-brained animals) with respect to vast silent areas, a restricted motor strip which causes muscle movements when stimulated and large and well-differentiated areas for eye movement.

OPERANT CONDITIONING OF THE BOTTLENOSE DOLPHIN WITH ELECTRICAL STIMULATION OF THE BRAIN, by J. C. Lilly and A. M. Miller. [1961] [7]p. incl. illus. diagrs. refs. (AFOSR-2624) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-62, National Institutes of Health, and Office of Naval Research) AD 612326 Unclassified

Also published in Jour. Compar. and Physiol. Psychol., v. 55: 73-79, Feb. 1962.

It is shown that it is feasible to place electrodes into the large brain of the w[illegible]sthetized bottlenose dolphin (Tursiops truncatus). Using roving electrodes, one can demonstrate separate zones of the brain which are positively and negatively reinforcing, i.e., in which 'self-start' and 'self-stop' activity can be elicited. It is shown that the dolphin learns these tasks more rapidly than does the monkey. It is also shown that in a rewarding or positively reinforcing zone, the animal tends to vocalize in complex and startling ways. It vocalizes when first stimulated in this area or when stimulation is withdrawn after a period of 'self-start' activity. Thus, it is concluded that the behavior of the bottlenose dolphin differs from that of the monkey in the following respects: Like the monkey, the dolphin uses any available external somatic motor output in order to push switches to stimulate its own brain for a wanted, or positive, or rewarding stimulus or to cut off an unwanted, or negative, or punishing stimulation started by the apparatus. In contrast with the monkey, the dolphin uses its vocal output when this is effective in order to modify the responses obtained from the environment (in terms of brain stimulation). The dolphin can inhibit violent escape behavior caused by 'punishing' brain stimulation; the macaque does not.

VOCAL BEHAVIOR OF THE BOTTLENOSE DOLPHIN, by J. C. Lilly. [1962] [10]p. incl. illus. diagr. refs. (AFOSR-J207) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-61-62], Coyle Foundation, National Institutes of Health, National Science Foundation, Office of Naval Research, and Office of Science of the Department of Defense) AD 400179 Unclassified

Also published in Proc. Amer. Philos. Soc., v. 106: 520-529, Dec. 1962.

The bottlenose dolphin (Tursiops truncatus Montagu) emits several different classes of complex sounds. Some of these sounds are encountered in the natural state, others are acquired during long periods of captivity in close contact with scientific investigators. Some of these sounds are emitted under water without loss of air, others are emitted in air with the open blowhole above the water. The naturally occurring underwater sounds consist of several classes including whistles, clicks, barks, creakings, etc. All of these sounds are relatively high pitched compared to those of the human voice and extend from 2 kcps to approx 150 kcps. When a dolphin opens its blowhole and emits these sounds, the characteristics frequencies heard are lower than those heard simultaneously under water. A dolphin can be induced by various means to emit another class of sounds in air. Because of their resemblance to the sounds of human speech these sounds have been named "humanoid emissions." Analysis by means of the sound spectrograph and oscillographic methods demonstrates that these sounds are basically white-noise-hissings and/or high-pitched buzzings, modulated in selective frequency bands by the efforts of the animal.

INTEGRAL NORMS OF SUBADDITIVE FUNCTIONS, by R. P. Gosselin. [1962] [5]p. (AFOSR-J861) (AF 49-(638)608) AD 416017 Unclassified

Also published in Bull. Amer. Math. Soc., v. 69: 255-259, Mar. 1963.

The fact that certain integral norms for positive, measurable, subadditive functions of a single real variable are comparable is here extended to functions on Euclidean n-space E^n. It is shown also that an integral norm taken over E^n is equivalent to one taken over one-dimensional space, and thus n-dimensional analogues of inequalities for one dimension are obtained. Let σ be positive, measurable, and subadditive on E^n, $n > 1$, let $\omega_1, \omega_2, \ldots, \omega_n$ be linearly independent unit vectors, and let $0 < p < \infty$ and $\sigma p > -1$. Then there exist constants A and B, depending only on σ, p, and n, such that

$$\int_{E^n} \frac{\sigma^p(x)}{|x|^{n+p\sigma}}dx \leq A \sum_{i=1}^{n} \int_{E^1} \frac{\sigma^p(r\omega_i)}{|r|^{1+p\sigma}}\,dr \leq B \int_{E^n} \frac{\sigma^p(x)}{|x|^{n+p\sigma}}dx.$$

The restriction $\sigma p > -1$ can be omitted for the second inequality. (Math. Rev. abstract)

ON THE L^p THEORY OF CARDINAL SERIES, by R. P. Gosselin. [1962] [15]p. (AFOSR-64-0208) [AF AFOSR-62-142] AD 432691 Unclassified

Also published in Ann. Math., v. 78: 567-581, Nov. 1963.

Let R^k be k-dimensional Euclidean space, and let $K(x) \in L^2(R^k)$ be such that $|K(x+m)|_{-\infty}^{\infty}$ is a complex orthonormal set. The author shows that this is equivalent to the condition $\Sigma_n |K^\wedge(x+2\pi n)|^2 = (2\pi)^{-k}$ for almost all x, the summation being taken over all integral lattice points $n = (n_1, \ldots, n_k)$ in R^k. Let T_K be the closure in $L^2(R^k)$ of this orthonormal set. If $F \in T_K$ then, in $L^2(R^k)$, $F(x) = \Sigma_m a_m K(x+m)$, where $a_m = \int_{R^k} F(x)\overline{K(x+m)}dx$. (Actually, much more can be said about the mode of convergence of this series.) T_K is said to be translation-invariant if $F(x) \in T_K$ implies $F(x-a) \in T_K$ for all $a \in R^k$. It is shown that T_K is translation-invariant if and only if every $F \in L^2(R^k)$ such that supp $F \subset$ supp K belongs to T_K, and that both of these conditions are equivalent to $|K^\wedge(x)| = (2\pi)^{-k/2}$ on supp $K^\wedge$. Moreover, in this case, if $f \in T_K$ then $\Sigma_m F(x+m)\overline{K(x+m+n)} = a_n$ a.e., and $\Sigma_m |F(x+m)|^2 = \Sigma_m |a_m|^2$ a.e. In the concluding pages of this paper the author considers l^p analogues of these l^2 results. Let $k = 1$ and let supp $K \subset [-\pi, \pi]$. Then $K^\wedge(x)$ can be written in the form $(2\pi)^{-1/2}e^{ig(x)}$, g real, for $x \in [-\pi, \pi]$. Assume now, in addition, that g(x) is of bounded total variation on $[-\pi, \pi]$. Let $1 < p < \infty$. If $\Sigma_m |a_m|^p < \infty$, then the series $\Sigma_m a_m K(x+m)$ converges everywhere to a function F(x) which satisfies $\|F(x)\|_p \leq C(\Sigma_m |a_m|^p)^{1/p}$ for some constant C. Conversely, if $F \in T_K^p$, the closure in $L^p(R^1)$ of $\{K(x+m)\}_{-\infty}^{\infty}$, and if $a_m = \int F(x)\overline{K(x+m)}\,dx$, then $(\Sigma_m |a_m|^p)^{1/p} \leq C' \|F(x)\|_p$ and $\Sigma_m a_m K(x+m)$ converges a.e. to F(x). Moreover, $a_n = \Sigma_m F(x+m)\overline{K(x+n+m)}$ a.e. (Math. Rev. abstract)

PREPARATION OF ^{18}O-LABELLED FURAN, by B. Bak, J. T. Nielsen, and M. Schöttlander. [1962] [1]p. (AFOSR-3808) [AF 61(052)73] Unclassified

Also published in Acta Chem. Scand., v. 16: 771, 1962.

3-Bromocoumalic acid Me ester (I) (1.10 g), disolved in a solution of 2.20 g KOH in 4.55 g H_2O (enriched to 32% in O^{18}), the mixture refluxed 20 min under dry N at 120°, cooled to liquid air temperature, and treated in vacuo with 44 mmol dry HCl gas, the temperature of the mixture slowly elevated while it was magnetically stirring, stirring continued at room temperature 30 min, and the mixture evaported in vacuo at room temperature (HCl, H_2O, and MeOH collected in trap 1) gave 2,4-furandicarboxylic acid O-labeled in the hetero O and the carboxyl groups as a residue (together with KBr and KCl). Conversion of this acid to furan-O^{18} (II) was carried out as previously (item no. 597, Vol. V), except the heating was for 1 hr at 250-275°. After cooling, the CO_2 evolved was removed at -80° in vacuo and collected at liquid air temperature (trap 2). The yield of II was 26%, based on I; infrared and microwave gas-spectra showed II contained 25% O^{18}. Mass spectroscopy showed the contents of trap 1 had about the same O^{18}-abundance as II, but that of trap 2 had about half this value; these data indicate that the carbonyl O of the labeled diacid was not exchanged against O^{18}. Introduction of O^{18} into the the 2 CO_2H groups of the diacid took place during the saponification of the carbomethoxy and lactone groups.

SOME FINDINGS ON CENTRAL NERVOUS SYSTEM ORGANIZATION WITH RESPECT TO COLOR, by M. A. Lennox-Buchthal. [1960] [6]p. incl. illus. diagrs. refs. (AFOSR-714) (AF 61(052)189) AD 632073 Unclassified

Also published in The Visual System: Neurophysiology and Psychophysics; a Symposium, Freiburg (Germany) (Aug. 28-Sept. 9, 1960), ed. by R. Jung and H. Kornhuber. Berlin, Springer-Verlag, 1961, p. 191-196.

Evidence is reviewed that reorganization of visual messages with respect to color occurs in the central nervous system. In man, cat-fish and cat blue and red stimuli of equal brightness appear to undergo temporal differentiation in that red stimuli are transmitted more rapidly than blue. This has not been confirmed for monkeys. In monkey cortex (the eye light adapted) more than half the single units responding to light did so with narrow spectral responsiveness. Different units responded to flashes through only 1 of 4 broad pass filters peaked at 450, 515, 587 or > 600 mμ. All single units with narrow spectral responsiveness to 560 mμ responded as well to 1 or 2 adjacent filters. The response of the same cells to optic nerve stimulation suggested that they lay on a one to one pathway from optic nerve to cortex. The different experimental conditions from those used in studies of monkey geniculate do not appear sufficient to explain the difference in results. It seems likely that the information available to single cortical cells is different from that at geniculate and that it is simpler. (Contractor's abstract)

RESPONSES OF SINGLE CORTICAL CELLS OF MONKEY TO MONOCHROMATIC FLASHES, by M. [A.] Lennox-Buchthal. Jan. 1962 [7]p. incl. diagrs. (Technical note no. 3) (AFOSR-2505) (AF 61(052)189) AD 280014 Unclassified

In an attempt to elucidate the role of the central nervous system and especially of the cortex in color vision, a study was carried out on monkeys to ascertain whether or not single cortical cells respond selectively to different colors. The results are discussed relative to the following theories of color vision: Is color vision trichromatic as postulated by Young and Helmholtz depending on 3 primary colors, or is it trichromatic depending on color pairs of which one is white-black as postulated by Hering? No single units were found which responded to white but not to colors, excluding, it would seem, this portion of the Hering theory. Some single cells responded to blue, green or red in agreement with the trichromatic theory, but the precise limits of the response range were variable from cell to cell and from time to time for each cell. On the other hand, certain other single cortical cells responded to color pairs, sometimes to roughly complementary colors and then often to white, sometimes to colors not complementary (green and red) and then not to white. It would appear that there may be several mechanisms for color vision, as proposed by the theory of von Kries.

THE λ-METHOD FOR AEOLOTROPIC RECTANGULAR AND SKEW PLATES, by P. M. Quinlan. Apr. 1962, 37p. incl. diagrs. table. (Technical note no. 15) (AFOSR-2683) (AF EOAR-61-4) AD 275841 Unclassified

A simplified derivation of the basic equations of aeolotropic elasticity, with at least one plane of symmetry, is presented. A solution to the concentrated load case, the Green's function of the problem, is obtained involving double Fourier series, which are then summed to a pair of singly infinite series. The necessary calculus for integration and differentiation is established leading to particular integrals for line and distributed loadings and also for concentrated moments, and for all derived functions (slopes, moments, shears) of these loadings. Singly infinite series of complementary functions are then obtained, a great effort being made to simplify and coordinate the resulting algebraic formulas with the maximum use of algebraic symmetry. Complementary functions for all boundary conditions are reduced to a general form, wherein they are specified by 2 parameters q' and q, and 2 corresponding sets of functions $h_q(s)$ and $f_q(s)$. On equating like harmonics on the boundaries, a general truncated set of simultaneous equations is obtained that is readily adapted to all loadings and all boundary conditions. These can be generated and solved in an electronic computer. Finally,

extension is made to the case of an aeolotropic skew plate, which is reduced to the same algebraic form as that for the rectangular plate. (Contractor's abstract)

AN AXIALLY-SYMMETRIC AEOLOTROPIC MEDIUM, by P. M. Quinlan. Mar. 1962, 65p. incl. diagrs. tables, refs. (Technical note no. 14) (AFOSR-2689) (AF EOAR-61-4) AD 275842 Unclassified

The study is in 2 parts, the first dealing with plane strain problems in a semi-infinite and in an infinite aeolotropic medium which is transversely isotropic. The second part deals with axially-symmetric loadings in the same media. Solutions are presented for line and point loads normal to the surface of a semi-infinite body, for loads at an interior point of such a body, and for Kelvin's problem in an infinite body. Image systems are developed and applied to give relaxation type solutions to an aeolotropic layer on a rigid base, and to multi-layer systems. (Contractor's abstract)

THE λ-METHOD FOR SKEW PLATES, by P. M. Quinlan. [1962] [18]p. incl. diagr. table. (AFOSR-4224) (AF EOAR-61-4) AD 431130 Unclassified

Also published in Proc. Fourth U.S. Nat'l. Cong. Appl. Mech., California U., Berkeley (June 18-21, 1962), New York, Amer. Soc. Mech. Engineers, v. 2: 733-750, 1962.

A comprehensive method of setting up the skew-plate problem, under all boundary conditions and loadings, is presented. The results, for the concentrated load case, are given in the form of a single infinite series involving root functions. The necessary calculus for differentiating and integrating these functions is then established, leading to the deduction of the distributed load whether distributed over a line or over a parallelogram similar to the plate. By treating a concentrated moment as a force pair, this case follows by differentiation of the concentrated load case. Finally, the boundary conditions are reduced to a truncated set of simultaneous equations, which can be programmed for solution on an electronic computer. (Contractor's abstract)

CATALYTIC SURFACE RECOMBINATION IN BOUNDARY-LAYER PROFILES OF THE FALKNER-SKAN TYPE, by W. J. Rae. Sept. 1962, 58p. incl. diagrs. tables, refs. (Rept. no. AF-1412-A-1) (AFOSR-2071) (AF 49(638)782) AD 288024 Unclassified

Reactant concentrations in the diffusion-controlled flow over a surface of constant catalycity are calculated for the Falkner-Skan family of profiles. The heat release due to surface recombination is found to be insensitive to the pressure gradient when the wall is relatively non-catalytic; for catalytic walls a decreasing pressure gradient (i.e., more strongly accelerated flow) tends to increase the heat transfer. TRANSIENT HEAT-TRANSFER MEASUREMENTS OF CATALYTIC RECOMBINATION IN A STEP-FUNCTION FLOW OF ATOMIC OXYGEN, by A. L. Myerson. Interim rept. Aug. 1962 [33]p. incl. illus. diagrs. refs. (Rept. no. AF-1412-A-2) (AFOSR-3203) (AF 49(638)-782) AD 412362 Unclassified

Heat transfer measurements were made by means of thin-film resistance thermometry which show simultaneously, catalytic and noncatalytic transient heating. These transients are observed with msec resolution during a well-defined step-function of atomic oxygen concentration in a subsonic flow. The differences are observable because of the short response time of the probe and are thus in significant contrast with the behavior determined by the extant steady-state techniques. Differences in the behavior of the heat-transfer rate as a function of time are noted for conditioned and unconditioned surfaces. (Contractor's abstract)

SILVER-CATALYZED SURFACE RECOMBINATION IN A STEP-FUNCTION FLOW OF ATOMIC OXYGEN, by A. L. Myerson. [1962] [3]p. incl. diagrs. refs. (AFOSR-64-0140) (AF 49(638)782) AD 431070 Unclassified

Also published in Jour. Chem. Phys., v. 38: 2043-2045, Apr. 15, 1963.

The heating of a Ag film was determined as a function of time prior to and following the arrival of atomic oxygen at the film. The rate of heating of a film never before exposed to atomic oxygen was much less in the early stages, and no sudden jump in temperature was observed upon arrival of atomic oxygen as in the case of films previously exposed to oxygen. The usual rise in temperature did not occur until approximately 65 msec after the arrival of atomic oxygen. Metallic Ag was essentially noncatalytic to oxygen atomic recombination. The high catalytic activity was attributed to Ag oxide.

CATALYSIS OF RECOMBINATION IN NONEQUILIBRIUM NOZZLE FLOWS, by A. Q. Eschenroeder and J. A. Lordi. [1962] [16]p. incl. diagrs. tables, refs. (Sponsored jointly by [Air Force Office of Scientific Research

under AF 49(638)782] and National Aeronautics and Space Administration) Unclassified

Published in Ninth Symposium (Internat'l.) on Combustion, Cornell U., Ithaca, N. Y. (Aug. 27-Sept. 1, 1962) New York, Academic Press, 1963, p. 241-256.

The effects of a chemically active additive were investigated for nonequilibrium expansions of a dissociating gas. Numerical solutions were obtained in order to assess the catalytic influence of free radicals formed by bonding between the additive element and atoms of the dissociating gas. High-enthalpy nozzle flows of hydrogen with small quantities of carbon addition were studied over a range of equilibrium reservoir conditions appropriate to nuclear and electrothermal rocket operation. A chemical kinetic model consisting of 8 species and 12 reaction steps evolved from studies of composition histories based on various finite-rate reaction schemes. Through 2-body abstraction and association reactions between hydrogen atoms and hydrocarbon species, more of the energy in hydrogen dissociation is released than would kinetically be available in the absence of carbon. In some cases, this effect counterbalances the increased molecular weight so that the specific impulse of the system exceeds that of pure hydrogen in finite-rate nonequilibrium flows. (Contractor's abstract)

LOCAL ATOM CONCENTRATIONS IN HYPERSONIC DISSOCIATED FLOWS AT LOW DENSITIES, by R. A. Hartunian. [1962] [6]p. incl. diagrs. refs. [AF 49-(638)782] Unclassified

Published in Phys. Fluids, v. 6: 343-348, Mar. 1963.

The theory of a probe to measure local atom concentrations in hypersonic flows of a dissociated gas at low densities is presented. The probe operates on a principle of measuring the differential heat transfer between catalytic and noncatalytic gauges immediately adjacent to one another on the stagnation line of a cylindrical model. The theoretical performance of the probe in the free molecule, the viscous shock layer, and the boundary layer regimes, respectively, is considered. It is shown that the probe cannot be operated successfully in the free molecule regime, except under unusual circumstances. In continuum flow, it is shown that under those conditions necessary for the atoms in the free stream to reach the surface of the probe (chemically frozen shock layer and boundary layer), we are always working in the viscous shock layer regime. Accordingly, it is this flow regime in which the probe measurements can be interpreted readily. The results of detailed calculations which relate to the application of this probe to measure local atom concentrations in nonequilibrium, hypersonic nozzle flows are presented. SURFACE-RECOMBINATION EFFICIENCIES IN A STEP-FUNCTION FLOW OF ATOMIC OXYGEN (Abstract), by L. L. Myerson. [1962] [1]p. [AF 49(638)-782] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 447, Aug. 24, 1962.

Heat-transfer measurements have been made, by means of thin-film resistance thermometry, which show simultaneously catalytic and noncatalytic transient surface heating. These transients are the first to be observed with millisecond resolution for a well-defined step function of atomic-oxygen concentration in a subsonic flow. The measurements have been achieved by mounting cylindrical probes perpendicular to a flow of undissociated oxygen. Radiofrequency energy then was suddenly imposed on the upstream flow. The transient heating effects of the step-function increase in atomic oxygen were observed on 2 concomitant oscilloscope traces. The excess of catalytic heating, due to the surface recombination of atomic oxygen, over the noncatalytic heating was clearly evident at all times. All catalytic heat-transfer rates showed a rapid rise to a peak value. After this, different types of behavior were noted, apparently dependent on the conditioning and treatment of the catalytic surface. In some cases, the rate of heat transfer remained constant, while in others it dropped from a peak value and then leveled off. Surface-recombination efficiencies have been calculated for various values of the instantaneous heat-transfer rates.

Analyses have been made of the effects of coupled chemical rate processes in external and internal inviscid hypersonic airflows at high enthalpy levels. Exact (numerical) solutions have been obtained by the inverse method for inviscid airflow over a blunt nose under flight conditions where chemical nonequilibrium prevails through the nose region. Numerical solutions have also been obtained for nonequilibrium expansions of air from initial equilibrium states appropriate to afterbody flows in flight and to hypersonic nozzle airflows. The results illustrate the general importance of the coupling among the reactions considered. These included dissociation-recombination, bimolecular exchange, and ionization reactions. EFFECTS OF STREAM NONUNIFORMITIES IN HYPERSONIC FLOW (Abstract), by J. G. Hall. [1962] [1]p. [AF 49(638)792] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 446, Aug. 27, 1962.

Conical or wedge-type hypersonic nozzles produce test flows having divergence and axial gradients which can substantially affect the test-model flow field. Previous considerations of consequent effects on surface pressures have been either empirical or by digital machine solutions of specific cases. An analytic approach was taken and general closed-form results obtained for a variety of situations. The simplest approach, which has a broad range of application, involves use of Newtonian flow concepts. The Newton-Busemann relation for surface pressures is shown to give an accurate correction for ambient-flow nonuniformity on comparison with more-accurate analytic solutions obtained, in the present work, for sharp-nosed hypersonic wedges and cones. Blunt-nosed slender-body flows, which are not amenable to Newtonian theory, are handled with perturbation analysis by adapting a detached shock-layer theory previously developed by Cheng for combined bluntness-viscous interaction effects. Closed-form solutions for effects of nonuniform flow on shock shape and surface pressure are obtained for slender blunt plates and cylinders. The effects of both angular divergence and axial gradients in the ambient flow are shown to be significant.

NONEQUILIBRIUM EXPANSIONS OF AIR WITH COUPLED CHEMICAL REACTIONS, by A. Q. Eschenroeder, D. W. Boyer, and J. G. Hall. [1962] [10]p. incl. diagrs. table, refs. (AF 49(638)792) Unclassified

Published in Phys. Fluids, v. 5: 615-624, May 1962.

Analysis and solutions of the streamtube gas dynamics involving coupled chemical rate equations are carried out. Results are presented for airflows along the surface of blunt bodies and through hypersonic nozzles. Speeds and altitudes corresponding to re-entry were selected to obtain initial conditions for the external flow calculations. Conditions appropriate to hypersonic tunnel testing were chosen for the nozzle flow calculations. Composition histories are shown for a kinetic mechanism including 6 species and 14 reactions. Gas-dynamic effects of nonequilibrium processes qualitatively resemble those reported earlier. However, the freezing process is complicated by the coupling of the nitric oxide shuffle reactions with the dissociation-recombination reactions. In many cases of hypersonic nozzle flows where the energy in nitrogen dissociation is significant, the fast shuffle reactions prevent nitrogen-atom freezing which would otherwise occur if 3-body recombination were the only process operating. Nitrix oxide concentrations undershoot the equilibrium values if the ratio of nitric oxide to oxygen molecule concentrations exceeds unity in the freezing region. This depletion of nitric oxide leads to nitrogen-atom freezing. (Contractor's abstract)

THERMAL AND CHEMICAL NONEQUILIBRIUM IN EXPANDING GAS FLOWS (Abstract), by A. Russo, I. Hurle and others. [1962] [1]p. [AF 49(638)792] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 447, Aug. 27, 1962.

Experimental studies are underway on nonequilibrium expansions of high-temperature gases from initial equilibrium states. Here finite-rate deexcitation occurs in contrast to the excitation of shock-wave flow. A

supersonic nozzle is driven by a high-temperature shock tube to explain steady expansions of millisecond duration sufficient for pressure and spectroscopic measurements. Static-pressure distributions have been measured along 15° wedge and conical nozzles for expansions of undissociated N_2 from 4000°K and 50 atm pressure, and expansions of dissociated H_2 plus 92% Ar from 6000°K and 27 to 130 atm. Corrected for wall boundary layer, static pressures show consistent reduction from equilibrium values attributed to freezing of N_2 vibration and H_2 dissociation, respectively. H recombination rates deduced are in order-of-magnitude agreement with shock-wave dissociation results. N_2 vibration freezing is further evidenced by line-reversal temperatures measured along the wedge nozzle using chromium carbonyl as additive. Assuming line reversal gives vibrational temperature, the latter becomes constant along the nozzle as vibration freezes on flow expansion. Vibrational relaxation rates deduced agree reasonably well with shock-wave excitation results.

SHOCK TUNNEL STUDIES OF HIGH-ENTHALPY IONIZED AIRFLOWS, by A. Q. Eschenroeder, J. W. Daiber and others. July 1962, 72p. incl. illus. diagrs. tables, refs. (Rept. no. AF-1500-A-1) (AFOSR-3025) (AF 49(638)952) AD 283991 Unclassified

The Cornell Aeronautical Lab. 6-ft shock tunnel is described, the effects of nonequilibrium flow in such a device are assessed, and high-enthalpy experiments involving nozzle ionization are discussed. The shock tunnel utilizes heated high-pressure hydrogen for a driver gas to obtain hypersonic airflows at high temperatures and pressures. Reflected shock operation is used with the tailored-interface technique to maximize the duration of steady flow. A significant portion of re-entry flight conditions can be duplicated for various hypersonic vehicles; however, partial simulation may be used to cover a far wider range of velocity and altitude. A general numerical code has been developed for an IBM 704 computer to solve quasi-one-dimensional flows with coupled rate processes. Such theoretical studies are essential for planning and interpreting experiments in high-temperature tunnel flows. Solutions have been obtained for airflows with atoms, molecules, electrons, and ions reacting simultaneously. Investigations of various ion kinetic mechanisms have shown that processes such as charge transfer, impact ionization and mutual neutralization may play significant roles under certain conditions of hypersonic flow in shock tunnels and about blunt bodies in flight. Preliminary experiments carried out in the shock tunnel have dealt with nonequilibrium ionization. Phase shift of microwaves passed through the airflow in the tunnel nozzle has yielded information on deionization kinetics and on the duration of useful test flow. Critical frequencies far below the microwave band are indicated for the gas over the entire range of conditions. These experiments have shown that flows of high enthalpy can be generated by shock tunnels for the detailed study of the ionized shock layer on a hypersonic vehicle. HYPERSONIC LOW-DENSITY STUDIES OF BLUNT AND SLENDER BODIES, by R. J. Vidal and C. E. Wittliff. [1962] [69]p. incl. illus. diagrs. refs. (AFOSR-3699) (Sponsored jointly by Aeronautical Research Lab.; and Air Force Office of Scientific Research under AF 49(638)952) Unclassified

Low density experimental data obtained with blunt axisymmetric and 2-dimensional bodies, and with a sharp flat plate are presented and compared with existing theories to define the transitions from the classical thin boundary layer regimes to a flow situation approaching free-molecule flow. The results of the blunt body investigations agree well with continuum theory down to the lowest test density, Knudsen number of about one. The results of the sharp flat plate demonstrate that weak interaction theory is accurate through the transition to the strong interaction regime, establish limits on the transition and on the extent of the strong interaction regime, and indicate that slip effects, as opposed to the vorticity interaction and shock wave heating effects, govern the departures from the strong interaction regime. A NOTE ON RELIGIOUS GROUP DIFFERENCES IN INTERACTION PROFILES: A REPLICATION STUDY, by B. Crowther. [1962] [6]p. incl. table. (AFOSR-2081) (In cooperation with Wisconsin U., Madison, AF AFOSR-62-161) (AF AFOSR-61-30) Unclassified

Also published in Psychol. Repts., v. 10: 459-464, Apr. 1962.

This report presents a replication of Stimson's research (1960), which demonstrated several differences among religious group members (a) in their interaction rates as measured by a revision of Bales' Interaction Process Analysis and (b) in their peer and self rankings. Several differences in the procedures of the 2 studies should be noted. Three major religious groups were defined in

the current study, but only 2 groups (Protestants and Jews) were large enough for meaningful comparisons. Stimson defined 7 different ethnic-religious groups in his study. In addition, information was gathered on several variables not mentioned in Stimson's report. While only one of the differences reported here achieved statistical significance, in general the findings are in accord with Stimson's, who found that Jews tended to have the highest rate of interaction and were seen and saw themselves as high in rankings of assertiveness. Their self perceptions of sociability and emotionality were not in accord with peer assessments; they tended to rank themselves high on sociability and low on emotionality, while others ranked them low and high, respectively. Catholics and Protestants tended to be low on rate of interaction and higher than Jews on social acknowledgment. Catholics were high in acts of self analysis. Protestants on the other hand, had low interaction rates in most of the categories. Stimson described Protestants as being reserved and contributing relatively little to the interaction. PROPERTIES OF Bi_2Te_3 - Sb_2Te_3 ALLOYS, by M. J. Smith, R. J. Knight, and C. W. Spencer. [1962] [20]p. incl. diagrs. tables, refs. (AFOSR-2479) (AF 49(638)-480) AD 295867 Unclassified

Also published in Jour. Appl. Phys., v. 33: 2186-2190, July 1962.

The phase diagram for the Bi_2Te_3-Sb_2Te_3 pseudobinary system is of the solid-solution type, where the distribution coefficient k is equal to unity at 33 [illegible] 66.7 mol % Sb_2Te_3. The c lattice parameter remains essentially constant across the diagram at 30 [illegible] for both slowly crystallized and quenched alloys. For quenched alloys the a lattice parameter decreases almost linearly, from a value of 4.48A, for pure Bi_2Te_3, to a value of 4.275A, for pure Sb_2Te_3; however, a significant contraction from linear variation is found in slowly crystallized materials. E_G diminishes in an essentially linear fashion from 0.16 ev, for pure Bi_2Te_3, to 0.12 ev at 24.2 mol % Sb_2Te_3 in both slowly crystallized and quenched materials. E_G remains approximately constant from 24.2 to 66.7 mol % Sb_2Te_3 for slowly crystallized materials but continues to drop for quenched materials. (Contractor's abstract)

EFFECT OF CRYSTALLINE IMPERFECTIONS UPON THE ELECTRICAL PROPERTIES OF SEMICONDUCTING INTERMETALLIC COMPOUNDS, by C. W. Spencer. Final rept. Oct. 15, 1962, 4p. incl. table. (AFOSR-4007) (AF 49(638)480) AD 289056 Unclassified

Two new experimental techniques were developed which made it possible to measure electrical properties at elevated temperatures or under high hydrostatic pressures. A device which enables the measurement of conductivity of Hall constant at temperatures above 600°C was developed. Pressure vessels were constructed to measure resistivity under hydrostatic pressures up to 30,000 atoms and temperatures above 100°C. The properties of Bi_2Te_3 were studied as a function of pressure and alloy composition. For the alloy study, systems of Bi_2Te_3-Sb_2Te_3 and Bi_2Te_3-Bi_2Se_3 were chosen so that systematic substitution at different layers of the Bi_2Te_3 structure was obtained. The properties observed show strong correlation with the anisotropic layer structure of this system. (Contractor's abstract)

HYDROGEN NEAR THE MOON, by R. J. Gould. Apr. 1962, 6p. (Rept. no. CRSR 114) (AFOSR-2567) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)915] and National Aeronautics and Space Administration) AD 276448 Unclassified

Relative to the detection of hydrogen in the temporary atmosphere of the moon, it is important to know whether the re-evaporated gas will be in molecular or atomic form. The most favorable case for molecule formation, namely, that in which the hydrogen atoms diffuse randomly is considered. The other possibility is that the incoming protons produce a crack and diffuse back out along this crack. It is concluded that molecule formation would be a minor process and the majority of outgoing hydrogen would leave the surface at thermal velocity and in atomic form.

DUST, RADIATION PRESSURE AND STAR FORMATION, by M. Harwit. May 1962, 24p. incl. refs. (Rept. no. CRSR 119) (AFOSR-2590) (AF 49(638)915) AD 276449 Unclassified

Also published in Astrophys. Jour., v. 136: 832-843, Nov. 1962.

Spitzer (Astrophys. Jour., v. 94: 232, 1941) has shown that radiation can produce inverse square law attractive forces between absorbing interstellar grains. Whipple (Astrophys. Jour., v. 104: 1, 1946) and Savedoff (Gas Dynamics of Cosmic Clouds, North Holland Publ. Co., Amsterdam, p. 218, 1955) examined whether these forces could cause dust to flow through ambient gas and form dense clouds from which stars would form. Savedoff concluded that appreciable concentration of dust was not to be expected and that radiative effects would be small partly because grains have a high albedo. The problem is here reexamined by considering (1) that instability analogous to gravitational instability can be produced by radiation and (2) that in the neighborhood of hot stars, grains are subjected to high intensity, near ultraviolet irradiation for which the albedo probably is low. On this assumption the minimum mass of a cloud that becomes unstable at the center of an O association can be estimated. It is suggested that O clusters are formed in this manner. The process is of comparable efficiency to Oort's (ibid, p. 147) suggested compression by HII regions and, moreover, does not entail partial destruction of the cloud through ultraviolet ionization. Spitzer's radiative attraction does not appear to play a role with the free radical grains described by Platt (Astrophys. Jour., v. 123: 486, 1956), since these grains effectively scatter but do not absorb radiation. They may, however, be subject to scattering pressures. A laboratory experiment to detect the radiative instability is proposed. It is shown that, near hot stars, radiation pressures can accelerate clouds to speeds comparable to the velocity of interstellar clouds and members of stellar association. Radiation pressures could also account for outflows of gas from galactic nuclei. (Contractor's abstract)

PLASMA SHEATHS AND THEIR EFFECTS ON ANTENNAS, by S. J. Peale. May 1962, 63p. incl. diagrs. refs. (Rept. no. CRSR 116) (AFOSR-2960) (AF 49(638)915) AD 278683 Unclassified

It is shown that the lack of conservation of particles does not allow the establishment of Maxwell density distribution for either electrons or ions in a plasma sheath. However, it is seen that even in this steady state case the electrons assume a distribution that is almost Maxwellian. Thus, in situations where a finite body is moving at a velocity comparable to ion thermal velocities, the ion density will be approximately constant and equal to that in the undisturbed plasma, while the electrons can be approximated by a Maxwell density distribution with only a small error. MAGNETIC EFFECTS OF GEOMAGNETICALLY TRAPPED PARTICLES, by M. L. Dwarkin. May 1962, 41p. incl. diagrs. tables, refs. (Rept. no. CRSR 117) (AFOSR-3003) (AF 49(638)915 AD 278650 Unclassified

Analysis and calculations of the fields at the surface of the earth due to narrow belts of trapped particles provide a basis for discussing some magnetic effects of geomagnetically trapped particles. The assumption that the particles are trapped in a centered dipole field guarantees the symmetry of magnetic sources about the geomagnetic equatorial plane as well as about the geomagnetic axis, and therefore the same symmetries obtain for the magnetic field at the surface of the earth due to the motion of the particles. Hence, only the field along an arbitrary meridian in one hemisphere is considered. The symmetries of the magnetic source are exactly those of sets of coaxial Helmholtz coils. (Contractor's abstract)

DENSITY FLUCTUATIONS IN A NONEQUILIBRIUM PLASMA, by E. E. Salpeter. [1962] [13]p. incl. refs. (AF 49(638)1156) Unclassified

Published in Jour. Geophys. Research, v. 68: 1321-1333, Mar. 1, 1963.

A dilute ionized gas is considered, for which electron-ion collisions can be neglected and which deviates from thermal equilibrium by having an ion temperature T_i different from the electron temperature T_e. These conditions apply to the ionosphere in the F layer and above. Methods are reviewed for treating statistical mechanics at thermal equilibrium and the Boltzmann equation for general problems. The electron-electron, electron-ion, and ion-ion pair correlation functions are derived for general T_e/T_i and an arbitrary time-independent magnetic field. The total cross section for scattering of an electromagnetic wave from such a gas is derived for general T_e/T_i. The results are shown to agree with the integral of the theoretical frequency spectrum derived previously by a number of authors. For long wavelength and $T_i/T_e \ll 1$ the cross section is proportional to T_i/T_e. The sources of error for an incorrect result stated by Renau are explained. (Contractor's abstract)

EXPECTED NEAR INFRARED RADIATION FROM INTERSTELLAR MOLECULAR HYDROGEN, by R. J. Gould and M. Harwit. Aug. 31, 1962 [4]p. incl. table, refs. (AFOSR-J370) (AF AFOSR-62-191) AD 408582 Unclassified

Also published in Astrophys. Jour., v. 137: 694-697, Feb. 15, 1963.

Stellar radiation excites hydrogen molecules into excited electronic states. These molecules then revert to the ground electronic state and can be left in an excited vibrational state. Radiation emitted in the transition from these excited states down to the ground vibrational state produces lines at 2.12μ and 2.22μ which are observable through the earth's atmosphere. A calculation of the expected flux received at the earth's surface in these lines suggests that conventional infrared detectors should be capable of detecting such radiation from bright emission nebulae, thus enabling the H_2 density in these regions to be determined.

ORIGINS OF THE ZODIACAL DUST CLOUD, by M. Harwit. [1962] [10]p. incl. diagr. refs. (AFOSR-J716) (AF AFOSR-62-191) AD 414129 Unclassified

Also published in Jour. Geophys. Research, v. 68: 2171-2180, Apr. 15, 1963.

The total intensity of light scattered by interplanetary dust has usually been directly related to the dust mass lost because of the Poynting-Robertson effect. The scattered light intensity thus would appear to define a dust supply rate that must be maintained if the dust intensity is to remain constant. This work suggests that comets apparently cannot supply this quantity of dust to the cloud, because radiative pressures prevent most of the comet debris and its secondary collision fragments from entering closed orbits about the sun. More observations on the actual emission rates of very-short-period comets may be needed before this can be conclusively established. It is shown that asteroidal collisions can provide sufficient debris, but the injection rate is extremely variable because most of the debris must be produced in very rare collisions between the largest asteroids. It is concluded that no current theory is capable of accounting for a steady cloud. A possible solution might be found in processes that would counter in Poynting-Robertson drag and permit grains to be long lived. The present comet dust supply rate might then be adequate to account for a stationary cloud. An alternative is a highly variable cloud, with dust produced in asteroidal collisions. The present epoch would then have to be one of unusually high dust density. (Contractor's abstract)

THE BIOSYNTHESIS OF CAFFEINE IN THE COFFEE PLANT, by L. Anderson and M. Gibbs. [1962] [4]p. incl. table, refs. (AFOSR-2208) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)798, Atomic Energy Commission, and National Science Foundation) Unclassified

Also published in Jour. Biol. Chem., v. 237: 1941-1944, June 1962.

It was concluded that the xanthine base of caffeine is synthesized from the same precursors as are purines in all of the other systems which have been studied. The xanthine is converted to 7 (or 3)-methylxanthine and, in turn, to theobromine and caffeine. The 8-carbon atom of glycine, formaldehyde, formate, methanol, and the methyl carbon atom of methionine are active precursors of the N-1, N-3, or both methyl carbon atoms of caffeine. The primary effect of light is an enhancement of purine ring formation. The methyl carbon atom of methionine is not a precursor of the ureido carbons of caffeine.

MAGNETIC RESONANCE STUDIES OF LITHIUM VANADIUM BRONZE, by J. Gendell, R. M. Cotts, and M. J. Sienko. Jan. 16, 1962. 27p. incl. diagrs. tables, refs. (AFOSR-1959) (AF 49(638)191) AD 275086 Unclassified

Also published in Jour. Chem. Phys., v. 37: 220-225, July 15, 1962.

The nuclear magnetic resonance of Li^7 in $Li_xV_2O_5$ shows no Knight shift, but there is a small diamagnetic shift relative to LiCl solution, amounting to 0.0023 and 0.0058% at 296° and 77°K, respectively. The spin-lattice relaxation time T_1 as measured by pulse experiments, decreases from 0.16 sec at 296°K to a minimum of 0.060 sec at 163°K and then rises to 0.13 sec at 77°K. The free-induction decay half-width decreases from 850 μ sec at 296°K to 100 μ sec at 77°K. The minimum in T_1 is attributed to back-and-forth motion of the lithium ions within but normal to the axis of channels in the oxygen framework; the line narrowing, to diffusion along the channel from 1 unit cell to an adjacent one. EPR studies give Lorentzian-shaped lines, centered at g = 1.96, of intensity proportional to 1/T. Results are consistent with a model in which lithium atoms in a host V_2O_5 structure are completely ionized to give Li^+ ions and electrons which are almost, but not completely, localized as V^{4+} centers. RESEARCH ON NEW SOLID STATE DEFECT STRUCTURES BASED ON WO_3 AND ON V_2O_5, by M. J. Sienko. Final rept. Sept. 30, 1962, 12p. (AFOSR-3911) (AF 49-(638)191) AD 407150; AD 414435 Unclassified

The project was initiated to follow up the discovery that in the tungsten bronze series (M_xWO_3, $0 < x \leq 1$, M = univalent metal) the copper tungsten bronzes (M = Cu) behaved as semiconductors whereas the alkali tungsten bronzes were metallic. An excitation energy which might be a function of the ionization potential of M is suggested along with the possibility that with appropriate choice of M in WO_3 one might develop a series of materials, based on the same host matrix which would represent a continuous gradation in properties from insulating to metallic. The problem dissolved into one of an attempt to define the current carriers in Cu_xWO_3, their concentration, and their mobility as a function of temperature.

ELECTRICAL AND MAGNETIC PROPERTIES OF POTASSIUM TUNGSTEN BRONZE AND RUBIDIUM TUNGSTEN BRONZE, by M. J. Sienko and S. M. Morehouse. Sept. 1962 [20]p. incl. diagrs. tables, refs. (AFOSR-5003) (AF 49(638)191) AD 408532 Unclassified

Also published in Inorg. Chem., v. 2: 485-489, June 1963.

Single crystal conductivities have been measured for $K_{0.40}WO_3$ and $Rb_{0.32}WO_3$ in the range 150° to 370°K. Carrier mobilities, which are somewhat higher than in the Li and Na tungsten bronzes, closely follow a $T \sinh^2(\theta/2T)$ dependence. Calculations on the basis of the theory of Howarth and Sondheimer strongly support the assumption that the thermal part of the carrier mobility in the tungsten bronzes is primarily determined by polar scattering from optical mode lattice vibrations. Magnetic susceptibilities also have been measured at room temperature for $Rb_{0.26}WO_3$ and $K_{0.23\text{-}0.45}WO_3$. Results are as predicted by the Pauli-Peierls theory for quasi-free electrons. (Contractor's abstract)

SOME SOLID-STATE STUDIES OF TUNGSTEN TRIOXIDE AND THEIR SIGNIFICANCE TO TUNGSTEN BRONZE THEORY, by B. L. Crowder and M. J. Sienko. [1962] [8]p. incl. diagrs. tables, refs. (AFOSR-J1103) (AF 49(638)191) AD 420623 Unclassified

Also published in Jour. Chem. Phys., v. 38: 1576-1583, Apr. 1, 1963.

The Hall voltage, resistivity, and thermoelectric power have been measured on single crystals of tungstic oxide (γ phase, 10° to 330°C). The electrical transport properties can be explained quantitatively on the basis of a shallow donor model ($E_D = 0.04$ ev) in which carrier mobility is limited primarily by polar scattering from optical mode lattice vibrations. The interaction between electron and phonon is described by the perturbation theory of Howarth and Sondheimer (replacing the effective mass by the polaron mass) or by the intermediate coupling theory of Lee, Low, and Pines. The model has been extended successfully to calculate the thermal and composition dependences of resistivity and Seebeck coefficient for the cubic sodium tungsten bronzes.

ELECTRON-SPIN RESONANCE STUDY OF PARTIALLY REDUCED VANADIUM PENTOXIDE, by J. L. Ragle. Sept. 7, 1962, 21p. incl. diagrs. refs. (AF 49(638)191) AD 406288 Unclassified

Published in Jour. Chem. Phys., v. 38: 2020-2024, Apr. 15, 1963. (AFOSR-J1556; AD 427402)

Single crystals of partially reduced vanadium pentoxide have been prepared in the form $Cu_xV_2O_5$ with $0 \leq x \leq 0.040$, and 2 distinct types of paramagnetic species have been observed by ESR techniques. Neither of these species is associated with copper (II). For $0 \leq x \leq 0.0058$, the dominant species is 1 in which the electron is localized, the hyperfine structure indicating interaction with 2 equivalent vanadium nuclei. This center is apparently identical to that observable in ordinary laboratory reagent grades of vanadium pentoxide. In addition, for $0.0078 \leq x$, the spectra show a superimposed single narrow line of total width 10-20 G. The g tensor of this species show that it is still primarily associated with the vanadium sites, but the lack of hyperfine structure indicates a considerable mobility. The latter species is not observed in pure vanadium pentoxide but is very similar to the mobile species observed in vanadium bronzes. (Contractor's abstract)

A RAMAN STUDY OF GALLIUM BROMIDE SOLUTIONS, by J. Nixon and R. A. Plane. [1962] [4]p. incl. diagrs. tables, refs. (AFOSR-64-1402) (AF 49(638)279) AD 444453 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 4445-4448, Dec. 5, 1962.

Raman spectral intensity measurements were made for gallium bromide solutions which contained various ratios of these 2 ions. The only spectrum evident was that of the tetrahedral $GaBr_4^-$ ions. The frequencies, depolarization ratios and intensities relative to ν_1 of this species were found. From Raman intensities, the concentration of $GaBr_4^-$ in a variety of solutions at temperatures up to 95° was found and used to evaluate the thermodynamics parameters for its formation in composition. The enthalpy and entropy values were found to be independent of temperature but varied somewhat with solution composition. At an ionic strength of 10M, the enthalpy of formation was found to be +9.5 kcal/mol and the entropy 12.5 cal/mol-degree. Because of partial cancellation of the ionic strength, changes of entropy and enthalpy the association equilibrium quotient was reasonably constant. At 25°, the average value for the log of the association quotient was determined to be -4.3. Finally, the entropy of hydration of $GaBr_4^-$ was evaluated as -63 cal/mol-degree. RAMAN SPECTRA OF AQUEOUS SOLUTIONS OF INDIUM SULFATE, NITRATE, AND PERCHLORATE, by R. E. Hester, R. A. Plane, and G. E. Walrafen. Aug. 1962, 2p. incl. tables, refs. (AFOSR-64-1403) (AF 49(638)279) AD 444954 Unclassified

Also published in Jour. Chem. Phys., v. 38: 249-250, Jan. 1, 1963.

For a series of metal-ion sulfate solutions investigated, only In^{3+} showed Raman spectral evidence of association with $SO_4^=$. The evidence consisted of the appearance in indium sulfate solutions of 4 new polarized lines in the Raman spectrum. Raman intensity data, particularly in mixed indium sulfate-indium perchlorate solutions, verified the new species as an indium-sulfate complex; however, these data did not permit a decision between the presence of $InSO_4^+$, $In(SO_4)_2^-$, or a mixture of the two. The fact that the 255 cm^{-1} line was found to be highly polarized suggested that a linear $In(SO_4)_2^-$ species might be of major importance. Finally, all indium solutions, even those with ClO_4^- as the only anion, showed a broad polarized band near 400 cm^{-1} which probably resulted from hydrated In^{3+}.

ANALYTICAL APPLICATIONS OF FLAME SPECTROSCOPY, by W. D. Cooke. Final rept. [1962] 3p. (AFOSR-4307) (AF 49(638)484) Unclassified

For the first time atomic emission intensities of spectral lines have been predicted from flame sources. A quantitative explanation of the role of organic solvents in the enhancement of atomic emission is offered. Research was also undertaken to investigate chemi-excitation processes in flames. It was shown that tin atoms are not in thermal equilibrium in a flame and that this fact is the cause of the abnormally high line intensities.

EXCITATION PROCESSES IN FLAME SPECTROMETRY, by J. H. Gibson, W. E. L. Grossman, and W. D. Cooke. [1962] [12]p. incl. diagrs. refs. (AFOSR-J584) (AF 49-(638)484) AD 415210 Unclassified

Also published in Anal. Chem., v. 35: 266-267, Mar. 1963.

Experimental procedures have been devised through which it is possible to understand quantitatively some of the fundamental processes of flame spectrometry. The effect of various parameters involved in the enhancement of emission by organic solvents can be evaluated quantitatively. In the case of sodium and calcium, the enhancement is caused partially by more rapid evaporation of solvent and partially by an increase in flame temperature. In the case of tin, a further contribution of chemiluminescence is noted. By flame temperature measurements, population distributions and ground state concentrations, it is possible to predict flame emissivity to a few per cent. The rate of solvent evaporation, oxide formation, and flame dilution effects are discussed in relation to their effect on emission. Some possible mechanisms for the excitation of tin by collisions with free radicals are discussed. (Contractor's abstract)

EVIDENCE FOR THE FORMATION OF BIPHENYL BY INTRAMOLECULAR DIMERIZATION IN THE ELECTROOXIDATION OF TETRAPHENYLBORATE ION, by D. H. Geske. [1962] [1]p. incl. diagr. (AFOSR-2526) (AF AFOSR-61-18) Unclassified

Also published in Jour. Phys. Chem., v. 66: 1743-1744, Sept. 1962.

The electrooxidation of tetraphenylborate ion at a platinum electrode in acetonitrile has previously been reported (Jour. Phys. Chem., v. 63: 1062-1070, July 1959). Further work has now been done which suggests that the 2 phenyl radicals in the transition state of oxidized tetraphenylborate undergo intramolecular dimerization. Acetonitrile solution mixtures of tetramethylammonium perdeuteriotetraphenylborate,

$(CH_3)_4N^+B(C_6D_5)_4^-$, and ordinary tetramethylammonium tetraphenylborate were electrolyzed. Mass spectral examination of the biphenyl compounds produced showed that only $(C_6H_5)_2$ and $(C_6D_5)_2$ were formed, a result consistent with the intramolecular dimerization mechanism. It seems entirely reasonable to reject the suggestion that there are certain electrode sites on which the perdeuteriotetraphenylborate ion oxidation occurs and other sites on which ordinary tetraphenylborate ion oxidizes. The evidence points unequivocally to the intramolecular dimerization mechanism as the correct one.

THE OXIDATION OF COPPER SINGLE CRYSTALS, by E. Yoda and B. M. Siegel. [1962] [2]p. (AFOSR-3389) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under AF AFOSR-62-7) AD 427649 Unclassified

Also published in Electron Microscopy, Fifth Internat'l. Cong., Philadelphia, Pa. (Aug. 29-Sept. 5, 1962), New York, Academic Press, v. 1: C-6, 1962. (AFOSR-3384)

The oxidation of Cu single crystals at low partial pressures of oxygen has been investigated by direct observation of the changing reflection electron diffraction patterns during the reaction. Changes in the integrated intensities of Kikuchi lines and diffracted spots from the different phases have been followed and related to the kinetics of the reaction. The model for the mechanism of nucleation and growth of the oxide phase has been taken from observations made by electron microscopy through replication of the oxidized single crystals. The electron micrographs of the replicated surfaces showed widely spaced, isolated crystallites, leaving large areas between the crystallites apparently unchanged or only slightly rougher than the original surface. The crystallites are interpreted to be the Cu_2O phase. Electron diffraction patterns taken at various stages of oxidation

gave spot patterns for the Cu_2O with a preferred orientation of the crystallites in which the [100] of the oxide was parallel to the [100] of the Cu single crystal. The electron diffraction pattern from the Cu crystals before exposure to high temperature oxidation showed only well defined Kikuchi patterns with a few spots from Cu. After exposure to oxygen, the Kikuchi pattern and spots from the Cu were weak and some strong spots corresponding to the reflections from the Cu_2O phase were observed. When the same oxidized specimen was heated in a vacuum, diffraction patterns showed increasing intensity in the Cu Kikuchi pattern as well as some increase in the integrated intensity in the Cu_2O spots.

INTENSITY INCREASE OF KIKUCHI LINES DURING ELECTRON BOMBARDMENT, by E. Yoda. [1961] [2]p. incl. diagr. (AFOSR-64-0380) [AF AFOSR-62-7] AD 433073 Unclassified

Also published in Jour. Appl. Phys., v. 33: 764-765, Feb. 1962.

The change of intensity profiles of Kikuchi lines obtained in reflection electron diffraction from freshly cleaved surfaces of NaCl were followed as a function of time of exposure of the crystal to the electron beam. The reduced data taken from microphotometer traces of photographic exposures gave values accurate to about ± 3%. At first, there is a slight, but definite, increase with time. The increment is about 5% after 3 min of electron bombardment with a beam density of 3μ amp/cm^2. The intensity decreased rapidly after 3 min at this exposure density.

REDUCTION OF CONTAMINATION IN REFLECTION ELECTRON DIFFRACTION, by E. Yoda and B. M. Siegel. [1961] [4]p. incl. diagrs. (AFOSR-64-0381) [AF AFOSR-62-7] AD 433071 Unclassified

Also published in Jour. Appl. Phys., v. 33: 1419-1422, Apr. 1962.

The rate at which contamination forms on surfaces exposed to electron beams in reflection electron diffraction has been investigated for electropolished single crystals of copper and cleavage faces of alkali halide crystals by observing the decrease of the intensity in the diffraction pattern. It was found that a cold chamber at liquid nitrogen temperatures surrounding the specimen reduces the contamination rate on copper by an amount directly proportional to the solid angle through which the specimen is exposed to the vacuum system, and at the smallest aperture, lowers the rate by as much as 2 orders of magnitude. Color centers were produced in the alkali halide crystals exposed to the electron beam. The resultant imperfections in the crystal lattice apparently affected the diffraction spot intensity, making measurement of contamin[illegible] rates by this method unsatisfactory.

PRODUCTS OF INDECOMPOSABLE, APERIODIC, STOCHASTIC MATRICES, by J. Wolfowitz. [1962] [5]p. [AF 49(638)226] Unclassified

Presented at meeting of the Amer. Math. Soc. June 6, 1962.

Published in Proc. Amer. Math. Soc., v. 14: 733-737, Oct. 1963.

An n x n matrix $P = \{p_{ij}\}$ is called stochastic indecomposable aperiodic (SIA) if all $p_{ij} \geq 0$, all $\Sigma_j p_{ij} = 1$ and $Q = \lim_{n \to \infty} P^n$ exists and has all rows equal. The author proves that if $A_1, \ldots, A_k$ are n x n matrices any finite product of which (in any order) is SIA, then for $\epsilon > 0$ there is an integer $\nu(\epsilon)$ such that $n \geq \nu(\epsilon)$ implies that every product of n A_i's has rows which differ by at most ϵ. Under certain conditions, infinitely many A_i may be considered. The result is related on one of Sarymsakov but includes cases not treated in the latter. The author also discusses simplifying a method of Thomasian for verifying the hypothesis of the theorem. (Math. Rev. abstract)

THEORY OF THE X-RAY ABSORPTION SPECTRUM OF ARGON, by T. Watanabe. Apr. 10, 1962 [10]p. incl. diagrs. tables. (Research rept. no. 12) (AFOSR-2254) (AF 49(638)402) AD 281731 Unclassified

The oscillator strengths of the 1s - 4p and 1s - 5p x-ray transitions in atomic argon were calculated using Hartree-Fock wavefunctions. It was assumed that (1) the effect of the 1s-hole is to reduce electronic screening by unity so that the final orbital of the ejected electron is essentially that in a simply excited potassium atom, (2) the remaining electrons retain essentially their respective radial positions before and after production of the 1s-hole, and (3) the coupling between the 1s-hole and the 4p or 5p electron is small. The oscillator strengths, based on the dipole moment expressions, were found to be 0.0016 for the 1s - 4p and 0.00053 for the 1s - 5p transitions, respectively. Experimental values, viz, 0.0018 and 0.00057, are in good agreement. Although the reality of assumptions made is not clear in view of the very short life time of the K state of argon, the agreement between the calculated and the experimental values suggests some interesting speculations. SPURIOUS SPECTRAL EFFECTS AND ALIGNMENT PROCEDURES IN X-RAY SPECTROMETRY, by H. W. Schnopper. Apr. 15, 1962, 82p. incl. diagrs. refs. (Research rept. no. 13) (AFOSR-2418) (AF 49(638)402) AD 278811 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 504, Aug. 27, 1962.

The spurious spectral effects of (1) vertical divergence and (2) improper spectrometer alignment (crystals and x-ray beam) are discussed. The distortions produced in such spectral features, as Bragg angle, line shape, width and asymmetry are illustrated both theoretically and experimentally. A new method is described for aligning the crystals, which makes use of the non-dispersive (1, -1) position, and which is independent of vertical divergence. Significant new conclusions of this study are (1) the crystal alignment and the beam alignment must be treated separately and with equal care, and (2) perfect crystal alignment cannot be conveniently achieved in the presence of vertical divergence. Quantitative discussion is given of the spectral distortions which arise from vertical divergence even for perfect alignment of the crystals and of the x-ray beam. (Contractor's abstract)

Kβ EMISSION SPECTRUM OF ARGON GAS (Abstract), by R. D. Deslattes. [1962] [1]p. [AF 49(638)402] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 86, Jan. 24, 1962.

Primary radiation from an x-ray tube with a tin target operated at 3 kw was admitted to a cell containing argon gas by means of a tin beryllium window. Fluorescent radiation which left the cell through a second beryllium window was analyzed by a 2-crystal spectrometer accepting 8 parallel beams of limited vertical divergence. Intensities were measured by means of a large flowing-gas proportional counter. Data acquisition was carried out by means of automatic devices and the information stored in punched tape for subsequent computer reduction. Detailed measurements are here reported of the Kβ region of the argon spectrum. In addition to the already known $\beta_{1,3}$ and β' lines, a line which corresponds to β'' in neighboring elements, has been observed. It is also clear from this data, but not from previous measurements, that β' is complex. The energy positions of the satellite lines of $\beta_{1,3}$ are consistent with those which would arise from single photon production of double initial vacancies. It is finally of some interest to note that this argon spectrum resembles closely the spectra of Cl^- and K^+ as observed in KCl.

K-SERIES VALENCE-EMISSION BAND OF CHLORINE IN KCl—EFFECT OF EXCITATION ENERGY (Abstract), by R. D. Deslattes. [1962] [1]p. (Sponsored jointly by Advanced Research Projects Agency; Air Force Office of Scientific Research under [AF 49(638)402], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 221, Mar. 26, 1962.

The spectral region near the K-series valence-emission band of chlorine in solid KCl has been studied in fluorescence with a variety of primary x-ray beams. Specifically, the fluorescent spectrum was excited by primary radiation from the L series of Pd, Ag, and Sn and the K series of Ti. In this way, excess energies above the threshold for Cl K-series emission, ranging from approximately 1.5 to 100 rydbergs, were employed. The spectra were analyzed by means of a 2-crystal vacuum spectrometer. Intensities were measured by a flowing-gas proportional counter driving conventional electronic circuitry. Two principal effects are reported. First, the intensity of the prominent, high-energy satellite β_x relative to that of the main band decreased with decreasing excess energy in a fashion consistent with a KM_1 initial state for this satellite transition. Second, the main band $K\beta_{1,3}$ varied in shape; its width and asymmetry increased with increasing excess energy. This suggests the presence of almost-degenerate satellite transitions.

MULTIPLE EXCITATION AND IONIZATION OF INNER ATOMIC SHELLS BY X-RAYS (Abstract), by H. W. Schnopper and L. G. Parratt. [1962] [1]p. [AF 49(638)-402] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 338, Apr. 23, 1962.

Reinvestigation of the argon-K absorption-edge region has revealed a new resonance-absorption structure followed by a new continuum. These new features may be interpreted as arising from double-electron-excitation processes in which an M electron as well as a K electron takes part in the transitions. The first new resonance line lies about 23 ev above the first line in the previously observed single-electron excitation-resonance structure. No additional resonance structure was found in the region zero to about 50 ev. The results of this experiment are particularly interesting, since the physical system dealt with is such a simple, theoretical case, viz, a monatomic noninteracting atom; however, no significant theoretical predictions of multiple excitation or ionization of inner shells have yet been made.

X-RAY OSCILLATOR STRENGTHS OF THE 1s $\longrightarrow$ n p TRANSITIONS IN ARGON (Abstract), by T. Watanabe. [1962] [1]p. [AF 49(638)402] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 339, Apr. 23, 1962.

With Hartree-Fock wavefunctions, the oscillator strengths of 1s - 4p and 1s - 5p x-ray transitions were calculated. It was assumed that: (1) the effect of the 1s hole is simply to reduce electronic screening by unity so that the final state is essentially that of the excited potassium atom; (2) the remaining electrons retain essentially their respective radial positions upon production of the 1s hole; and (3) the coupling between the 1s hole and an np electron is small. The oscillator strengths, based on the dipole-moment expressions, were found to 0.0016 for the 1s - 4p and 0.00753 for the 1s - 5p transitions, respectively. Experimental values of these strengths from the latest measurements of K x-ray absorption spectra of argon are in good agreement with these calculated values. This agreement is interpreted as supporting the validity of the assumptions made. The use of Hartree-Fock wavefunctions in further calculations of atomic systems having a 1s-electron vacancy are encouraged.

A STUDY OF MAGNETOHYDRODYNAMIC INDUCTION DEVICES, by J. M. Lyons and D. L. Turcotte. Feb. 1962 [57]p. incl. diagrs. tables. (AFOSR-1864) (AF 49(638)544) AD 272082 Unclassified

The performance of a laminar-flow induction pump driven by a propagating sinusoidal magnetic field is investigated. It is assumed that the fluid is incompressible with scalar conductivity, that induced magnetic effects and the ratio of channel height to wave length are small, and that the magnetohydrodynamic interaction is large. No assumptions are made concerning the velocity profiles and no components of the magnetic fields are neglected. An inviscid solution containing the first-order perturbations due to induced currents and fringing of the applied magnetic field is obtained. Viscous effects are investigated and found restricted to boundary layers along the channel walls. Therefore, the inviscid results should be applicable to the inner core of a laminar-flow pump. It is concluded that the induced magnetic fields do not affect the performance of the pump to first order. However, the fringing of the magnetic field caused by separation of the pole pieces reduces the pump performance. The efficiency reduction is of the same magnitude as the laminar skin-friction loss. The relative reduction in pressure head is slightly greater than the reduction in efficiency. (Contractor's abstract)

SOME ASPECTS OF MAGNETOHYDRODYNAMIC FLOW ABOUT A BLUNT BODY, by B. P. Leonard. June 1962 [56]p. incl. diagrs. refs. (AFOSR-2714) (AF 49(638)-544) AD 281879 Unclassified

Electromagnetic body forces are nonconservative. The effects of such forces are studied here in the case of inviscid incompressible flow about a blunt body. The nonlinear simultaneous partial differential equations

describing the flow can be solved in various regimes corresponding to certain values of 2 parameters: Rm, the magnetic Reynolds number, and A where A to the -1/2 power is the Alfven number. For the case of small Rm, and small magnetic force coefficient, S, equations can be derived which are linear and independent. These are solved for some particular unsteady flows, and the results show that, in these cases, vorticity is introduced in such a way that it is independent of time. The equations are linearized by using the velocity field of ordinary hydrodynamics (OHD) in the convective derivatives. This technique is valid for all Rm provided either A or S is small. For large Rm, it results in a solution showing a boundary-layer character. Two results are of interest. First, the appearance of the downstream non-diffusive trail of vorticity in the small Rm, small S case. Secondly, the fact that for all cases studied the region of significant current density is close to the body, and any wake-like effect is either highly diffusive (small Rm) or extremely weak (large Rm). THE THEORY OF ALIGNED-FIELDS MAGNETOGASDYNAMIC FLOWS, by A. R. Seebass. June 1962, 85p. incl. diagrs. refs. (AFOSR-2715) (AF 49(638)544) AD 281880 Unclassified

The isentropic flow of an ideal conductor in the presence of a magnetic field is treated for the case of aligned fields. Particular attention is paid to flow regimes where the existing linearized theory fails because of a change in character of the governing equations. The equations for the stream function and a new potential function are derived, and the behavior of their characteristics determined. These equations are then transformed to hodograph variables, in which they become linear. Several exact solutions are considered in detail. Separation of variables in these hodograph equations results in a complicated differential equation, which is discussed briefly. Finally, the approximate equations appropriate to each transition are derived, and simple solutions exhibiting these transitions are given. (Contractor's abstract)

AN EXPERIMENTAL STUDY OF THE SURFACE WAVES GENERATED BY A TIME VARYING MAGNETIC FIELD. Master's thesis, by G. C. Light. Feb. 1962 [45]p. incl. illus. diagrs. (AFOSR-2956) (AF 49(638)544) AD 277712 Unclassified

Surface waves have been generated on a circular pool of mercury by means of induced currents. A discharge through a pair of coaxial coils generates induced currents in the mercury; these currents in turn interact with the currents in the coils to produce a force. The geometry constitutes the free-surface analogy of the circular pinch. The height of the free surface is analogous to the density in an infinite column of compressible gas. In the experiments reported here, only weak disturbances are considered. A theoretical relation for the height of the disturbances is derived from the analogous gas-dynamic problem. The theory is in good agreement with the measured values of the disturbance height. The success of these initial experiments indicates the possibility of obtaining useful information on the containment problem by exploitation of the free-surface analogy. (Contractor's abstract)

STAGNATION POINT FLOW OF A VARIABLE PROPERTY FLUID AT LOW REYNOLDS NUMBERS, by M. Lenard. June 1962, 168p. incl. diagrs. tables. (AFOSR-2981) (AF 49(638)544) AD 404488 Unclassified

Steady viscous, 2-dimensional and axially symmetric stagnation-point flows of a gas are considered for the case when the Reynolds number is too low for the applicability of the classical boundary-layer theory. It is assumed that the low-density gas is still a continuous fluid, permitting the use of the Navier-Stokes and associated equations as the basis of the problem. The effects of low Reynolds number are determined by applying an expansion procedure to the fluid-dynamical equations. (Contractor's abstract)

A PERIODIC BOUNDARY-LAYER FLOW IN MAGNETOHYDRODYNAMICS, by D. L. Turcotte and J. M. Lyons. [1962] [10]p. incl. diagrs. (AFOSR-4245) (AF 49(638)-544) Unclassified

Also published in Jour. Fluid Mech., v. 13: 519-528, Aug. 1962.

An attempt is made to solve a boundary-value problem posed by induction electromagnetic pumps and generators. Solutions are obtained by an expansion technique and a

momentum method for the laminar, incompressible flow problem. For large values of the interaction parameter ($\mu^2\sigma H_0^2\lambda/\rho u_e$) viscous effects are shown to be restricted to periodic boundary layers. In regions of high-field strength, a local Hartmann solution is valid. Where the applied field is weak an inertial boundary layer is present which thickens in the upstream direction. A logical explanation of this phenomenon is given. The condition that a boundary-layer type flow exist is obtained and is shown to be in general satisfied. The results show that inviscid theory may be used to calculate the overall performance of electromagnetic pumps and generators while the boundary-layer theory developed here may be used to obtain the wall shear stress. ELECTRICAL RESISTANCE AND SHEATH POTENTIAL ASSOCIATED WITH A COLD ELECTRODE, by D. L. Turcotte and J. Gillespie. [1962] [7]p. incl. diagrs. refs. (AFOSR-5121) (AF 49(638)544) AD 438558 Unclassified

Presented at Seventeenth annual meeting of the Amer. Rocket Soc., Los Angeles, Calif., Nov. 13-18, 1962.

Also published in AIAA Jour., v. 1: 2293-2299, Oct. 1963.

The boundary-layer resistance and the difference in sheath potentials between a pair of electrodes have been measured in a shock tube. Using a small, square electrode and a strip electrode flush with the wall of the shock tube, the electric current that could be drawn across the shock tube was measured as a function of the shock wave position for several applied voltages and load resistances. All measurements were made in air at a shock speed of 4.35 mm/μ sec and an initial pressure of 1 mm Hg. In the range of applied voltages considered, the boundary-layer resistance was not a function of the current level. The change in the sheath potential was of the order of several volts. A continuum theory is developed to predict the boundary-layer resistance for small current levels and the sheath potential. The sheath solution is separated from the convective compressible boundary-layer problem where ambipolar diffusion dominates. In the sheath, the transport equations for ions and electrons in an electric field are solved numerically. Resulting integrals for the dimensionless boundary-layer resistance and sheath potential are evaluated, both in the sheath and in the compressible boundary layer, to obtain results that can be compared with experiment. Values of the resistance obtained assuming the ionization reaction to be frozen, are not in agreement with experiment. Reasonable agreement between theory and experiment is obtained for the magnitude of the sheath potential. (Contractor's abstract)

STRUCTURE OF COLLISION-FREE MAGNETOHYDRODYNAMIC WAVES, by T. A. Wilson. [1962] [5]p. incl. diagrs. (AFOSR-J734) (AF 49(638)544) AD 414078 Unclassified

Also published in Phys. Fluids, v. 5: 1451-1455, Nov. 1962.

Properties of the 2-fluid plasma equations which lead to a partial theoretical model for the collisionless shock wave are investigated. First, a nonlinear symmetric-pulse solution to the 2-fluid equations for a cold collisionless plasma is described. The propagation speed of the pulse is between the Alfvén speed and the fast-wave speed, and the pulse thickness is of the order of $(m_i c^2/4\pi e^2 N)^{\frac{1}{2}}$, except for geometries in which the wave normal makes an angle of the order of $(m_e/m_i)^{\frac{1}{2}}$ or less with the upstream magnetic field. An effective conductivity is then introduced in the equations of motion of the plasma and a shock thickness is estimated. The calculated dependence of shock thickness on Mach number is shown to agree with the available experimental data. Finally, the growth of a sinusoidal pinch instability of a current-carrying plasma is shown to have the average effect of a finite conductivity as was postulated. (Contractor's abstract)

CURRENT-LAYER DIFFUSION IN A ONE-DIMENSIONAL PINCH, by T. J. Falk and D. L. Turcotte. [1962] [5]p. incl. diagrs. refs. (AFOSR-J735) (AF 49(638)544) AD 414120 Unclassified

Also published in Phys. Fluids, v. 5: 1288-1292, Oct. 1962.

Diffusion of the current layer at the surface of a compressible electrically conducting gas in a 1-dimensional pinch is analyzed in the limit of large time. Magnetohydrodynamic equations including finite scalar electrical and thermal conductivities are used, and the degree of ionization is taken to be constant. A parameter, which is proportional to the diffusion speed divided by the sound speed, is used to show that the inertia terms may be discarded in large-time high-electrical-conductivity problems. Some numerical results for the temperature, velocity, and magnetic field within the current layer are presented in terms of a similarity variable. In the cases analyzed, the gas boundary is displaced from its infinite conductivity position by an amount which is of the order of magnitude of the current-layer thickness. Comparison of constant conductivity with temperature-dependent conductivity results shows that Joule heating at the gas boundary improves confinement if the initial conductivities are low.

A GENERAL TRANSFER-EQUATION APPROACH FOR THE TRANSITION REGIME OF RAREFIED-GAS FLOWS AND SOME OF ITS APPLICATIONS, by S. F. Shen. [1962] [20]p. incl. diagrs. table, refs. (AFOSR-J1045) (AF 49(638)544 and AF AFOSR-62-201) Unclassified

Also published in Rarefied Gas Dynamics, Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press, 1963, Suppl. 2, v. 2: 113-131, 1963. (AFOSR-5310)

For solving the boundary-value problem of the Boltzmann equation at arbitrary Knudsen number, it is proposed to use the transfer equations with approximate distribution functions that exhibit the proper collision effects. Such a distribution function is deduced by an elementary analysis of the simpler Krook equation. It may be regarded as of the relaxation type, changing from the free-molecule limit to the continuum limit exponentially with the number of collisions. Applications to the linearized plane and cylindrical Couette flows are made. Though more cumbersome than earlier, simpler approaches, the present theory is fundamentally more defensible and seems to yield better details in the Knudsen layer. (Contractor's abstract)

A THEORY FOR UNSTEADY MOTIONS OF JET-FLAPPED THIN AIRFOILS, by J. C. Erickson, Jr. Sept. 1962. 200p. incl. refs. (AF 49(638)544) AD 407504 Unclassified

A linearized model for the incompressible, inviscid, irrotational, and unsteady flow about a thin airfoil with jet-flap is formulated. The unsteady problems considered are the transient and oscillatory deflection of the jet, plunging and pitching of the airfoil, deflection of a blown-flap, and also the penetration of a sharp-edged gust. Justification is given for representation of the jet, in the limit of high speed, small thickness, and constant momentum-flux strength, by a vortex sheet, across which there is a pressure difference proportional to the momentum-flux strength and inversely proportional to the local radius of curvature of the jet. The dynamic and kinematic interaction of the main stream with the vortex sheets representing the airfoil and jet are shown to be described by a coupled set of equations consisting of a third-order partial differential equation and a singular integral equation, along with appropriate boundary conditions. The properties of these equations and their relationship to classical unsteady thin-airfoil theory and steady jet-flap theory are discussed.

TRANSONIC FLOW OF A PERFECTLY CONDUCTING GAS WITH ALIGNED MAGNETIC FIELD, by K. Tamada. [1962] [8]p. incl. diagrs. (AFOSR-4247) (AF 49(638)-674) Unclassified

Also published in Phys. Fluids, v. 5: 871-878, Aug. 1962.

The 2-dimensional transonic flow of a perfectly conducting, inviscid, compressible fluid past thin body with aligned magnetic field is studied by developing a small-perturbation theory in the hodograph plane. It is shown that the equations of motion as well as the conditions for possible shock waves can be reduced to those of ordinary flow by a suitable affine-transformation. Thus, von Kármán's transonic similarity law is extended to the present class of magneto-gas-dynamic flow. In this extension, super-Alfvénic flows (flow speed larger than Alfvén wave speed) are found to be similar to the corresponding ordinary flow, while sub-Alfvénic flows are related to the ordinary flow with reversed flow direction. The flow over a half-wedge at Mach number 1 is considered in detail. (Contractor's abstract)

FLOW OF A SLIGHTLY CONDUCTING FLUID PAST A CIRCULAR CYLINDER WITH STRONG, ALIGNED MAGNETIC FIELD, by K. Tamada. [1962] [7]p. incl. diagrs. refs. (AFOSR-4248) (AF 49(638)674) Unclassified

Also published in Phys. Fluids, v. 5: 817-823, July 1962.

The induced magnetic field is neglected owing to the small conductivity of the fluid. The effect of the magnetic field upon the flow is also assumed to be so small that it can be treated as a perturbation. Thus, the first-order correction to the nonmagnetic potential flow is obtained by a simple perturbation technique. The solution indicates existence of a nondiffusive, vortical, velocity deficiency which extends indefinitely downstream of the

cylinder. The flow field at great distances is also reconsidered as a problem of singular perturbation. (Contractor's abstract)

MAGNETOGASDYNAMIC FLOWS WITH SHOCK WAVES, by N. Geffen. [1962] [5]p. incl. diagrs. refs. [AF 49-(638)674] Unclassified

Published in Phys. Fluids, v. 6: 566-571, Apr. 1963.

A consistent small-perturbation theory for the aligned-fields, steady, magnetogasdynamic 2-dimensional and axisymmetric flow of an inviscid conductor in the sonic, Alfvénic, and hypercritical regimes is developed, and approximate shock relations derived by a simple method. This results in nonlinear relatively simple systems of equations and shock relations for mixed flows around bodies in the transition regimes. It is found that transonic magnetogasdynamic problems can be reduced to gasdynamic ones; each gasdynamic transonic flow around a given body implies an infinite number of magnetogasdynamic patterns around the same body for all values of Alfvén numbers different from zero and one, and each of these, in turn, yields another family of flows around similar bodies, according to a modified von Kármán similarity rule. The hypercritical and transonic systems are mathematically similar and obey the same similarity rule. An explicit correspondence between specific transonic and hypercritical flows does not exist, but transonic arguments and methods can be used to infer qualitative properties of hypercritical flows and to obtain exact solutions of hypercritical flow patterns. INVESTIGATION OF CONDENSATION PROCESSES BEHIND NORMAL SHOCKS BY OPTICAL METHODS—A FEASIBILITY ANALYSIS, by Y. Timnat and S. H. Bauer. Mar. 1962 [19]p. incl. diagrs. tables, refs. (AFOSR-2789) (AF 49(638)716) AD 274515 Unclassified

The objective of this report is to analyze the conditions under which solid particles, formed in a shock tube by thermal decomposition of selected compounds, may be detected and to propose experimental methods for determining the induction time for the initial condensation, the number of particles formed per unit volume, and their rate of growth. Examples of substances which are proposed for experimental study are benzene, lead tetraethyl, and chromium carbonyl. The principles of light scattering by small particles are reviewed briefly in Section I and their application to condensation problems in a shock tube is dealt with in Section II. An analysis of the second parameter to be measured is presented in Section III, and in the final section, specific proposals for experiments are discussed, taking into account a few order of magnitude results which have been obtained.

MECHANISMS FOR VIBRATIONAL RELAXATION AT HIGH TEMPERATURES, by S. H. Bauer and S. C. Tsang. Apr. 1962 [21]p. incl. diagrs. refs. (AFOSR-2790) (AF 49(638)716) AD 274467 Unclassified

Also published in Phys. Fluids, v. 6: 182-189, Feb. 1963.

Attention is called to several mechanisms which effectively couple translational and vibrational motions through the intermediary of chemical reactions. It was proposed that these processes lead to shorter relaxation times than those expected from direct energy exchange via inelastic collisions. Semiquantitative estimates were made, and relaxation times for these different processes were compared as a function of the reciprocal temperatures. At high temperatures, it was proposed that the transfer of energy from rotations to vibrations at approximately constant total energy could be induced by distant collisions. These serve only to balance the change in rotational angular momentum. Such events provide alternate paths for rapid vibrational relaxation, particularly for the upper vibrational levels, and may account for the discrepancy between the observed and calculated rates of dissociation. RATE OF DECOMPOSITION OF AZOMETHANE IN A SHOCK TUBE, by G. Chiltz, C. F. Aten, Jr., and S. H. Bauer. [1962] [17]p. incl. diagrs. tables, refs. (AFOSR-3675) (AF 49(638)716) Unclassified

Also published in Jour. Phys. Chem., v. 66: 1426-1431, Aug. 1962.

The prolysis of azomethane was studied in a shock tube over the temperature range 800° to 1300°K. Concentrations of the azomethane of 1-3% in argon were used. The rate of decomposition in the incident shock region was followed spectrophotometrically at λ 338 mμ. It was estimated that under shock conditions the depletion of the reactant via a chain mechanism was negligible compared to that due to the unimolecular decomposition. Due to the exothermicity of the over-all reaction (products, N_2 and C_2H_6), only average rate constants could be evaluated from the recorded oscilloscope traces. These were found to fall well within the extrapolations of the 2 most recent low-temperature studies, based on a strict Arrhenius temperature dependence. (Contractor's abstract)

STUDIES WITH A SINGLE-PULSE SHOCK TUBE. I. THE CIS-TRANS ISOMERIZATION OF BUTENE-2, by A. Lifshitz, S. H. Bauer, and E. L. Resler, Jr. [1962] [8]p. incl diagrs. tables, refs. (AF 49(638)716) Unclassified

Published in Jour. Chem. Phys., v. 38: 2056-2063, May 1, 1963.

The cis-trans isomerization of butene-2 was investigated behind reflected shocks in a single-pulse shock tube of a novel design. The temperature range covered was 1000° to 1250°K. and concentrations of 1% and 6% of the butene in argon were used. Analyses were made by vapor-phase chromatography. The first-order rate constants obtained in this work fall slightly above the extrapolated Arrhenius curves of 2 recent low-temperature studies. An activation energy of 65, rather than 62.8 kcal/mol, is obtained when a straight line is drawn between the high and the low temperature data. The rate constant obtained is $k_{cis} = 3.5 \times 10^{14} \exp(-65 \times 10^3/RT)$. Possible sources of errors in evaluating reaction times in the single-pulse shock tube are discussed. MAGNETO-FLUID-DYNAMIC NOZZLE FLOW, by W. R. Sears, A. R. Seebass, and S. G. Rubin. [1962] [6]p. incl. diagrs. table, refs. (AFOSR-J1034) [AF AFOSR-62-201] Unclassified

Also published in Ninth Symposium (Internat'l.) on Combustion, Cornell U., Ithaca, N. Y. (Aug. 27-Sept. 1, 1962), New York, Academic Press, 1963, p. 827-832.

Studies are reported of both crossed-fields and aligned fields channel flows to ascertain whether and under what conditions the various transitions between elliptic and hyperbolic behavior can be crossed smoothly in steady flow and whether such nozzle and diffuser flows are stable to propagating disturbances. Within the limits of various necessary approximations it is concluded (1) that smooth transitions occur in steady flow provided that choking at the speed of sound is avoided by meeting necessary design conditions, (2) that the resulting nozzle flows are stable to sufficiently small disturbances, (3) that aligned-field diffusers are unstable at the speed of sound and may also be unstable at the Alfvén speed, and (4) that crossed-field diffusers are generally unstable at a critical supersonic speed but may be stabilized by a divergence of area and the presence of a strong magnetic field. THEORETICAL AND EXPERIMENTAL STUDY OF HEAT AND MASS TRANSFER FROM NON-ISOTHERMAL SURFACES, by A. G. Smith and V. L. Shah. Nov. 1962 [74]p. incl. illus. diagrs. tables, refs. (CoA note no. 135) (AFOSR-4755) (AF 61(052)267) AD 409624 Unclassified

The numerical solution of the partial differential equation in the incompressible turbulent boundary layer has been obtained for step $\frac{q''w}{\rho u_1 C_p \sqrt{Q_1/2}}$ and for Prandtl numbers 0.7, 1 and 7. The Schmidt method of integration was used and the integration was carried out on a Ferranti Pegasus digital computer. A method has been developed to apply this numerical solution for obtaining surface and fluid temperature for the case of arbitrary distribution of heat flux at the surface. Simultaneously approximate equations for calculating heat transfer over a flat plate with arbitrary heat flux are derived for laminar and turbulent flow. To verify the theoretical solution, experiments were made in which the concentration profiles of the injected gas (carbon dioxide) at different stations were measured when the pipe had another gas (air) flowing turbulently through in the axial direction, and the gas injected was passed through a porous section of the tube wall. ['THE OXIDATION OF IRON AND ITS ALLOYS AT HIGH TEMPERATURE] L'oxydation du fer et de ses alliages a haute température, by C. E. Birchenall. [1962] [9]p. incl. refs. (AFOSR-64-0759) (AF AFOSR-62-174) AD 438241 Unclassified

Presented at Conf. Internationale des Arts chimiques, (Apr. 25-May 4, 1962), Paris (France).

Also published in Corrosion et Anticorrosion, v. 10: 319-327, Oct. 1962.

The mechanism and kinetics of the oxidation of pure iron are outlined by experiments which show the principal process of diffusion interfering in the growth of each layer of oxide, the sulfurization of iron and the effects of cracks and pores. The effects of the oxidizing gas and of the constituents on Fe-O system were studied. The importance of the mobility of the cations is explained. The ductibility of the corrosion of the corrosion film depends on the mobility of the ions which cause the growth, since the creep of a higher oxide is governed by ionic diffusion. Recent results concerning the effects of magnetic phenomena on the diffusion of Fe and its alloys are given.

THE NEWCOMER'S ACCEPTANCE IN OPEN AND CLOSED GROUPS, by R. C. Ziller. [1962] [8]p. (AFOSR-J425) (AF AFOSR-62-95) AD 407716 Unclassified

Also published in Personnel Admin., v. 25: 24-31, Sept.-Oct. 1962.

Results indicate that closed groups and those which have a history of success are likely to reject the ideas of knowledgeable outsiders. It is proposed that groups with less well-defined boundaries, as opposed to those with well-defined boundaries, are more amenable to membership changes. It is hypothesized that a broadly defined group can embrace a greater variety of persons than a narrowly defined group, and the cost to the group in the process of establishing the newcomer is diminished. Implications for group survival are discussed.

A NOTE ON OBVERSION, by R. M. Jones. [1962] [2]p. (AFOSR-J244) [AF 49(638)1146] Unclassified

Also published in Mind, v. 71: 541-542, Oct. 1962.

Recently a logic has been proposed by Leonard that admits singular terms that denote nothing. In such a logic there is a certain problem concerning obversion. Suppose that statements of the form fx are interpreted in such a way that they are true if and only if the term that plays the role of x denotes something to which the term that plays the role of f is applicable, but false if the condition is not fulfilled. Consider the following 2 sentences: (1) ~ Mc and (2) $\hat{x}$(~ Mx)c. A logic that allows non-denoting terms can without harm permit an inference from (2) to (1), since in this case the premise is false if the singular term in question does not denote, while the inference is valid in the usual way if that term does denote. The difficulty of disallowing an inference such as that from (1) to (2) can be met by adopting Quine's device of construing all singular terms as abbreviations for definite descriptions. This device will not, however, meet the following difficulty which is very similar to the one above concerning obversion. Consider the sentence "Pericles worshipped Zeus" which might be abbreviated as follows: (3) Wpz. By a logical principal very similar to that by which one passes from (1) to (2), we may pass from (3) to: (4) $\hat{x}$(Wpx)z. If we still hold to the first agreement above concerning the conditions under which a statement of the form fx is true, then (4) is false since z denotes nothing. If the device of taking all singular terms as abbreviations for definite descriptions is adopted, then (3) and (4) have the same truth value, and all such statements as (3) are false.

THE NATURE OF SODIUM EXCHANGES IN ISOLATED FROG SARTORII, by D. Conway, M. G. Harrington, and M. Mullaney. [1962] [20]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)435] and Public Health Service) Unclassified

Published in Jour. Physiol. (London), v. 165: 246-265, Feb. 1963.

The entrance of Na ions into isolated frog sartorii has been studied at approx 0°C and over a 24 hr period. The external fluid was of the Ringer-Conway type. The Na content was usually 120 mM and the K content was varied from 0 to 20 mM. With an external Na of 120 mM and a K content of 0 or 2.5 mM, the net entrance of Na ions occurred in 2 phases. Phase 1 brought the Na content to about 40 m-equiv/kg and was ended in 3-4 hr. Phase 2, after a further 20 hr, brought the muscle to about 50-59 m-equiv/kg. The inclusion of ouabain in the external fluid had no appreciable effect on the Na entrance. With an external K value of 5 mM or more, the first phase is decreased and the second phase does not occur. Evidence is presented indicating that the first phase of such Na entrance arises from increased permeability involving an outer compartment of the fibers, or the whole fiber in a special group, while the second phase of Na entrance occurs through pores of normal dimensions into an inner compartment of the fiber. Normally the outer compartment, if this exists, would appear only as a potential space. From studies of the membrane potentials, potassium and water content, and interfiber space measurements, additional evidence is presented for the Conway membrane theory. It is shown that the recent results of Steinbach, using the sartorii of the Rana pipiens, provide further evidence for the concept of a critical energy barrier to the secretion of Na ions from Na-loaded sartorii.

SOLUTIONS OF THE EQUATIONS OF THERMOELASTIC EQUILIBRIUM, by I. N. Sneddon. [1961] [13]p. incl. refs. (AFOSR-J728) (AF 18(600)1341) AD 413968 Unclassified

Also published in Arch. Mech. Stosowanej, v. 14: 113-125, 1962.

A solution is given of the equations of thermoelastic equilibrium appropriate to problems in which the conditions $\tau_{xz} = \tau_{yz} = 0$, on $z = 0$, are imposed. It is not assumed that the normal component of stress is zero. It is shown that the stress and temperature fields can be expressed in terms of 3 harmonic functions ϕ, ψ, and χ. Lurye's solution is shown to be derivable from this general solution by taking $\chi = 0$ and making ψ proportional to $\partial\phi/\partial z$. The form of solution for problems with axial symmetry is derived and solutions suitable for the analysis of problems about semi-infinite solids, semi-infinite circular cylinders, and elastic layer are written down. Finally, solutions of 2-dimensional problems are discussed.

RESEARCH IN PARTIAL DIFFERENTIAL EQUATIONS, by J. J. Gergen. Final rept. Feb. 23, 1962, 7p. (AFOSR-2224) (AF 49(638)892) Unclassified

A summary of research done on partial differential equations is presented. Topics considered include: the applied mathematics aspects of partial differential equations, the perturbation of 1-parameter group unitary representations, and Poisson approximating functions. In addition, the following theorem is proved: A compact near-ring with zero radical is the complete cartesian product of a family of finite simple near-rings.

WEAK EIGENVECTORS AND THE FUNCTIONAL CALCULUS, by R. T. Harris. [1962] [18]p. incl. refs. (AFOSR-3141) (AF AFOSR-61-51) AD 436179 Unclassified

Also published in Trans. Amer. Math. Soc., v. 109: 367-384, Dec. 1963.

This article constitutes a substantial generalization of the theory of weak eigenvectors defined by extensions of a space. Let $D \subset E \subset E' \subset D'$ be separable Banach spaces; let $\mathfrak{R}$ be the set of strongly continuous representations of the additive group of reals in $L(E)$, $\mathfrak{R}$ the set of $r \in \mathfrak{R}$ such that $p_r(t) = |r(t)|_{L(D, D')}$ is integrable and $\langle r(t)a, b\rangle$ is integrable for each $a, b \in D$, $\mathfrak{R}_1$ the subspace for which $|r(t)|_{L(E)}$ is continuous and $\int (\log^+ |r(t)|/(1+t^2))\, dt < \infty$. Let $w_r(t) = \sup(|r(t)|_{L(E)}, |r(-t)|_{L(E)}, 1)$ and let $\mathfrak{S}(r)$ be the algebra of functions f which are each Fourier transforms of a measure m_f on the line such that $\int w_r\, dm_f < \infty$. If N is dense in D and $r(t)N = N$, then $\mathfrak{E}_\lambda$ is the set $\{e : e \in D', \langle r(t)a, e\rangle = e^{i\lambda t}\langle a, e\rangle\}$ for all $a \in N$, and $\mathfrak{E}_\lambda$ is the set of λ for which $r(t)e = e^{i\lambda t}e$. If $r \in \mathfrak{R}$, $f \in \mathfrak{S}(r)$, then $T_f x = \int f(t)x\, dm_f(t)$ defines a transform on E such that T_f commutes with $r(t)$ and $f \to T_f$ is a continuous homomorphism to a subalgebra of $L(E)$. If $r \in \mathfrak{R}$, there is a unique map $\lambda \to T_\lambda \in L(D, D')$ such that $\int f\langle a, T_\lambda b\rangle\, d\lambda = \langle T_f a, b\rangle$ if $f \in \mathfrak{S}(r)$. If $r \in \mathfrak{R}$, $f \in \mathfrak{S}(r)$, $e \in \mathfrak{E}_\lambda$, then $T_f e = f(\lambda)e$; the set $\mathfrak{E}_\lambda$ corresponds to the set of eigenvectors, the set of λ such that $\mathfrak{E}_\lambda \neq 0$ to the spectrum. Similarities between the spectral properties of $r \in \mathfrak{R}_1$ and those for

spectral operators of scalar type are exhibited. It is proved also that if $r \in S$, the range of T_λ is contained in $\mathfrak{R}_\lambda$, and for operators of cyclic type this range is $\mathfrak{S}_\lambda$. Representation theorems for subunitary operators and other concrete examples are given. (Math. Rev. abstract)

CONVERGENCE OF EXTENDED BERNSTEIN POLYNOMIALS IN THE COMPLEX PLANE, by J. J. Gergen, W. G. Dressel, and W. H. Purcell, Jr. [1962] [10]p. incl. refs. (AFOSR-64-0730) (AF AFOSR-61-51) AD 436515 Unclassified

Also published in Pacific Jour. Math., v. 13: 1171-1180, 1963.

The following theorem is proved: Suppose that $f(z)$ is analytic and has property B in p(d), where d is a positive number. Then the functions $P_k(z;f) = e^{-kz} \sum_{\lambda=0}^{\infty} \frac{(kz)^\lambda}{\lambda!} f\left(\frac{\lambda}{k}\right)$, $0 < k$, satisfy the following 4 conditions. (1) $P_k(z;f)$ is an entire function of z for each k. (2) $P_k(z;f) \to f(z)$ as $k \to \infty$ in p(d). (3) The convergence in (2) is uniform on each compact subset of p(d). (4) The functions $\{P_k(z/X_k;f)\}_{0<k}$, where $X_k = \exp[1/(2k)]$, have property B uniformly in p(d).

PSYCHOPHYSIOLOGICAL STUDIES IN ALTERED SENSORY ENVIRONMENTS, by S. I. Cohen, A. J. Silverman, and B. M. Shmavonian. [1962] [23]p. incl. diagrs. tables, refs. (AFOSR-J372) (AF 49(638)354) AD 403612; AD 406452 Unclassified

Presented at Fifth European Conf. for Psychosomatic Research, Apr. 23, 1962, Madrid (Spain).

Also published in Jour. Psychosomat. Research, v. 6: 259-281, 1962.

Body- and field-oriented subjects were tested for 2 hr in a low sensory input experiment. Subjects who were field-oriented showed (1) the most intense psychological discomfort; (2) a higher incidence of visual and auditory imagery; (3) more evidence of disorganization of thought; (4) greater discomfort with body sensations; (5) less ability to discriminate somato-sensory cues; and (6) EEG and skin resistance evidence of a higher level of alerting. Next, subjects received either a sedative, stimulant, or placebo capsule and were tested in the same manner. The response patterns of both groups with a placebo were similar to those observed in the previous experiment. The response of the subjects to the sedative and to the stimulant was different in that the field subjects showed a decrease in central nervous system activation and a more relaxed psychological state as the experiment progressed while body subjects showed alerting to the stimulant and mixed response to sedative. Hence, altering the internal state of the 2 subjects changed their response patterns to the experimental environment. In another study the responses of subjects given LSD during a 2-hr low sensory input experiment were compared to responses of subjects given a placebo. The effects in the LSD subjects were very similar to the responses of field subjects in the previous study. Possible neurohormonal and neurophysiological differences in addition to perceptual mode and personality differences in body- and field-oriented subjects are discussed. The possible application of the experimental results to clinical diagnostic and therapeutic problems and selection and training problems in aerospace research are reviewed.

PERCEPTUAL AND ENVIRONMENTAL INFLUENCES ON PSYCHOPHYSIOLOGICAL RESPONSES, by A. J. Silverman, S. I. Cohen, and B. M. Shmavonian. [1962] [18]p. incl. tables, refs. (AFOSR-J699) (AF 49(638)-354) AD 413630 Unclassified

Also published in Recent Advances in Biological Psychiatry; Proc. of the Seventeenth Annual Convention and Scientific Program of the Society of Biological Psychiatry, Toronto (Canada) (May 4-6, 1962), ed. by J. Wortis. New York, Plenum Press, v. 5: 347-364, 1963.

Body (field-independent) and field (field-dependent) subjects were exposed to 2 experiments characterized by uncertainty, immobility, social isolation, and low sensory inputs. In the second experiment a pill (either a stimulant, sedative, or placebo) was given just before the experiment began. Field subjects remained more aroused than body subjects during the 2-hr experiment. Middle subjects were least aroused in general. Interview data revealed more evidence of ego disorganization among field subjects with more discomfort and restlessness, projection, imagery, and time distortion. Field subjects with placebo show more CNS activation than body subjects with placebo. The effect of the pill in this experimental setting appeared to be a general lowering of CNS activation. This lowering was more pronounced in the body than in the field group. Field subjects are more sedated with a sedative than body subjects. Field subjects show decreased CNS activation with a stimulant; body subjects show increased activation. Body subjects show more activation with stimulant and less activation with sedative than with placebo. Field subjects show most activation with placebo. The effects of perceptual and environmental influences on pre-experimental population differences were discussed.

MILLIMETER WAVE MOLECULAR BEAM SPECTROSCOPY: ALKALI BROMIDES AND IODIDES, by J. R. Rank and W. Gordy. [1962] [14]p. incl. illus. diagrs. tables, refs. (AFOSR-3931) [AF 49(638)765] Unclassified

Also published in Phys. Rev., v. 127: 817-830, Aug. 1, 1962.

The pure rotational spectra of the alkali bromides and the alkali iodides were investigated in the 1.5 to 5.0 mm range of the microwave region. The experiment was performed by passing a beam of molecules in the vapor state from an oven, capable of producing temperatures up to 1000°C, into an oversized section of wave guide so that the direction of incident microwave radiation was at right angles to the flow direction of the molecular beam. In this way linewidths less than 100 kc/sec at 100,000 mc/sec were easily achieved. The line frequencies were measured with a precision better than one part in 10^6. The apparatus was developed as a series of modifications on an earlier experiment. Dunham's theory for diatomic molecules was applied in interpretation of the data. In most cases, the values for B_e, α_e, and γ_e were known although less accurately, but D_e and β_e were found for the first time. From the latter two, accurate determinations were made for the first time of ω_e and $\omega_e x_e$. From these values, information has been obtained about the potential functions, which suitably describe these diatomic alkali halides. In addition, centrifugal distortion constants, isotope mass ratios, moments of inertia, and internuclear distances have been accurately evaluated for each molecule. (Contractor's abstract)

ELECTRON SPIN RESONANCE OF A γ-IRRADIATED SINGLE CRYSTAL OF N-ACETYL METHIONINE, by E. Cipollini and W. Gordy. [1962] [5]p. incl. diagrs. (AFOSR-3934) (AF 49(638)765) Unclassified

Also published in Jour. Chem. Phys., v. 37: 13-17, July 1, 1962.

Free radicals produced by γ-irradiation of single crystals of N-acetyl methionine have been investigated through their electron spin resonance patterns for different orientations in the magnetic field. Two chemically different free radicals have been found, both relatively stable at room temperature. One of them has an ESR pattern very similar to that of cystine dihydrochloride. The g tensor for this radical is anisotropic with principal values 2.004, 2.029, and 2.064. An isotropic doublet hyperfine structure of 9.5-gauss spacing is observed. The second resonance has a complex, incompletely resolved, hyperfine structure with a total spread of about 26 gauss. Its almost isotropic g tensor with principal values from 2.002 to 2.005 indicates that the electron spin density is concentrated on a carbon. Structures for both free radicals are proposed. ISOTOPIC EFFECT ON THE RELEASE OF ATOMS BY IRRADIATION OF MOLECULES AT LOW TEMPERATURE (Abstract), by W. [V.] Bouldin and W. Gordy. [1962] [1]p. [AF 49(638)765] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 271-272, Apr. 23, 1962.

This work was suggested by an earlier experiment in this laboratory which indicated that H is much more easily removed by γ irradiation of mixed isotopic species of ice at 4.2°K than is D. Partially deuterated methanes have been γ-irradiated at 4.2°K, both pure and in argon and krypton matrices, and it has been found in each instance that the release of an H atom from a CH bond is 4 to 8 times more probable than the release of a D atom from a corresponding CD bond. The relative abundance of H to D was measured by a comparison of the relative strength of the ESR signals of H and D. Some effect of mass on the probability of escape would be expected to result from the appreciable difference in zero-point and from excited vibrational energies which would favor the barrier-tunneling ability of the lighter isotope. Theoretical prediction of the expected differences would be difficult and would seemingly require more knowledge than is available of the barriers to escape from the parent molecule in the different matrices. Nevertheless, use can be made of the H/D production ratios to compare the barriers in different matrices.

MILLIMETER WAVE SPECTRA OF HNCS AND HNCO (Abstract), by R. Kewley, K. V. L. N. Sastry, and M. Winnewisser. [1962] [1]p. [AF 49(638)765]
Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 272, Apr. 23, 1962.

The millimeter wave spectra of isothiocyanic (HNCS) and of isocyanic acid (HNCO) have been studied. Both molecules are slightly asymmetric rotors and were expected to have centrifugal distortion K patterns which would fit the normal centrifugal-distortion expression for a symmetric rotor, if corrections for small asymmetry are taken into account. However, it is found that, whereas the HNCO spectrum fits very closely with the symmetric-rotor expression with normal positive values of D_J and D_{JK}, the K patterns for HNCS and DNCS have an irregular arrangement. The lines K = 0, 1, 2 for the J = 10 - 9, 9 - 8, and 8 - 7 transitions of HNCS and DNCS have been identified. The center frequencies both of the K = 1 components and also of the K = 2 components are displaced towards higher frequencies relative to K = 0, and also do not fit the centrifugal-distortion formula for a symmetric rotor. The possibility of Coriolis interactions due to high rotational energy around the molecular α axis is being investigated. Values of rotational constants are: HNCS: B_0 = 5883.40 mc/sec, C_0 = 5845.62 mc/sec, A_0 = 1,620,000 mc/sec. DNCS: B_0 = 5500.52 mc/sec, C_0 = 5445.01 mc/sec, A_0 = 661,300 mc/sec. HNCO: B_0 = 11070.97 mc/sec, C_0 = 10910.76 mc/sec.

ELECTRON SPIN RESONANCE STUDIES OF IRRADIATED SINGLE CRYSTALS OF D-FRUCTOSE AND L-SORBOSE, by H. Ueda. [1962] [3]p. incl. diagrs. tables. (AFOSR-J784) (AF AFOSR-62-327) AD 413563 Unclassified

Also published in Jour. Phys. Chem., v. 67: 966-968, May 1963.

Among the polycrystalline sugars, only D-fructose and L-sorbose, when irradiated, are known to give an e.s.r. spectrum of 4 lines. When irradiated polycrystalline L-sorbose was heated to 100°, it gave a spectrum identical with that of irradiated D-fructose which had not been heated. In the present work, the results obtained from polycrystalline materials were studied in more detail using single crystals. Irradiation at 77°K followed by heating revealed that a radical transformation occurs in these sugars, which is caused by the deformation of the pyranose ring. The free radical produced is $-CH(OH)-\dot{C}(OH)-CH_2-O-$. (Contractor's abstract)

ELECTRON SPIN RESONANCE STUDIES OF RADIATION EFFECTS ON POLYAMINO ACIDS, by R. C. Drew and W. Gordy. [1962] [28]p. incl. diagrs. refs. (AFOSR-J785) (AF AFOSR-62-327) AD 408390 Unclassified

Also published in Radiation Research, v. 18: 552-579, Apr. 1963.

Effects of ionizing radiation on 18 polyamino acids have been examined with the ESR method. In about half of these it was found possible to interpret the ESR observed at room temperature as arising from free radicals formed by loss of the H from the -CHR- group of the polypeptide chain. In the others, the room temperature ESR signals seem to arise from a damaged side chain or R group. The ESR obtained at 77°K are generally different from those obtained in room temperature experiments and may arise often from charged or ionized molecules. Oxygen was found to alter or quench the ESR of all the polyamino acids studied, some more rapidly than others. The elimination of the signal is thought to be caused by a conversion of the radical X to peroxide radicals X-O-O. The later decay of the signal probably results from the release of the H atoms, which escape through the lattice, and the consequent conversion of the polymeric free radicals to stable radicals.

THE MILLIMETER WAVE SPECTRA OF ISOCYANIC AND ISOTHIOCYANIC ACIDS, by R. Kewley, K. V. L. N. Sastry, and M. Winnewisser. [1962] [24]p. incl. diagrs. tables, refs. (AFOSR-J1298) (AF AFOSR-62-327) AD 424101 Unclassified

Also published in Jour. Molec. Spectros., v. 10: 418-441, June 1963.

An investigation of the mm-wave rotational spectra of the very slightly asymmetric tops HNCS, DNCS, HNCO, and DNCO has been carried out in the frequency range 80,000-190,000 mc/sec. Several R-branch, a-type, transitions were observed for each molecule and the rotational constants A_0, B_0, and C_0 were determined for the 4 species containing the most abundant isotopes of N, C, O, or S. The centrifugal distortion K-patterns is different in character for each of the 4 molecules. Agreement between calculation and experiment is obtained for HNCO and DNCO. This expression gives a poor fit for DNCS and no fit for HNCS, and at present no treatment has been found to fit or explain satisfactorily the K-pattern for these 2 molecules. A number of lines due to rotational transitions of vibrationally excited molecules were also observed and are assigned to the states $v_5 = 1$ and $v_6 = 1$ for HNCS and HNCO and probably, in addition, $v_4 = 1$ for DNCS. A CYCLOTRON RESONANCE STUDY OF IONIZATION IN LOW-PRESSURE FLAMES, by E. M. Bulewicz and P. J. Padley. [1962] [9]p. incl. diagrs. table, refs. (AFOSR-J1296) (AF AFOSR-62-327) AD 424213 Unclassified

Also published in Ninth Symposium (International) on Combustion, Cornell U., Ithaca, N. Y. (Aug. 27-Sept. 1, 1962) New York, Academic Press, 1963, p. 638-646.

Electron concentrations and electron-molecule collision cross sections have been measured by the cyclotron resonance method on flames of hydrocarbons, alcohols, esters, ketones, and ethers, all at reduced pressure. The main observations made in the reaction zone are: (1) The average electron-flame gas molecule collision cross section varies little from fuel to fuel; (2) The electron concentration in hydrocarbon flames is proportional to the total pressure; (3) A plot of the ratio of the electron concentration per molecule of fuel to the total burned flame gas concentration against the number of carbon atoms in the molecule shows the following regularities: points for saturated hydrocarbons lie on a smooth curve; those for unsaturated hydrocarbons lie on various smooth curves displaced upwards to greater ionization levels; if the fuel contains one oxygen atom the ionization is lowered by an approximately constant amount with respect to the corresponding saturated hydrocarbon; when 2 oxygen atoms are present the effect is doubled; and (4) The effect of inert additives such as argon, and of nonhydrocarbon fuel additives such as hydrogen was studied. Results suggest that a very important step in the process of ion production is the reaction $CH + O \rightarrow CHO^+ + e^-$. Polymerization reactions as a means of ion production appear to be of secondary importance. (Contractor's abstract)

A STUDY OF IONIZATION IN CYANOGEN FLAMES AT REDUCED PRESSURES BY THE CYCLOTRON RESONANCE METHOD, by E. M. Bulewicz and P. J. Padley. [1962] [12]p. incl. diagrs. table, refs. (AFOSR-J1300) (AF AFOSR-62-327) AD 424224 Unclassified

Also published in Ninth Symposium (International) on Combustion, Cornell U., Ithaca, N. Y. (Aug. 27-Sept. 1, 1962) New York, Academic Press, 1963, p. 647-658.

The ionization in the reaction zone of cyanogen-oxygen flames at reduced pressure was studied by the method of cyclotron resonance. Although the temperatures of these flames are sufficiently high for thermal ionization of nitric oxide to account for the observed free electron concentrations, other characteristics of the ionization are consistent only with the operation of nonthermal processes. These processes, however, appear to be different from those inferred to be taking place in hydro-carbon-oxygen flames, and seem to involve energetic 3-body reactions. Some auxiliary spectral evidence is also presented. When traces of hydrogen are added, the electron concentration decreases considerably — particularly for fuel-lean flames. As the concentration of cyanogen in the fuel is reduced to about 20%, a second ionization maximum appears, associated with a greenish glow from the burned gases. It is shown that attempts to explain this effect simply in terms of reactions occurring in hydrocarbon-oxygen flames meet with difficulties which cannot be resolved at this stage. STARK EFFECT AND DIPOLE MOMENT OF METHYL FLUORIDE, by D. M. Larkin and W. Gordy. [1962] [5]p. incl. illus. diagr. tables. (AFOSR-J1301) (AF AFOSR-62-327) AD 424225 Unclassified

Also published in Jour. Chem. Phys., v. 38: 2329-2333, May 15, 1963.

High-precision Stark effect measurements have been made on the $J = 1 \rightarrow 2$ transition of methyl fluoride in the shorter millimeter wave region. A parallel-plate Stark cell employing silver-coated glass plates held apart by optically ground quartz spacers was used. Millimeter wave power was fed between the plates by 2 sets of horns, one of which allowed for measurement of the $\Delta M = 0$ transitions and the other for measurement of the $\Delta M = \pm 1$ transitions. The dc voltage across the Stark plates was measured with a standard potentiometer. Both the first- and second-order effects were measured. The resulting value for the dipole moment of CH_3F is $\mu = 1.8555 \pm 0.0015$ D for the ground vibrational state. (Contractor's abstract)

FLUORINE HYPERFINE INTERACTION IN THE ESR OF IRRADIATED ORGANIC SINGLE CRYSTALS, by R. Lontz and W. Gordy. [1962] [10]p. incl. diagrs. table. (AFOSR-64-0049) (AF AFOSR-62-327) AD 431145 Unclassified

Also published in Paramagnetic Resonance; Proc. of the First Internat'l. Conf., Jerusalem (Israel) (July 16-20, 1962), New York, Academic Press, v. 2: 705-804, 1963.

Analysis of the F^{19} hyperfine structure of the free radical produced by γ-irradiation of CF_3CONH_2 indicates that this radical, except for the H atoms, is planar. Although the structure of the crystal is unknown, the planes of the radicals are found to have 2 orientations 68° apart, both parallel to crystal faces. The F^{19} couplings of the 2 F atoms are equivalent and are anisotropic, with principal values of $A_1 = A_2 = 24$ and $A_3 = 178$ gauss. Its axial symmetry indicates that the

coupling arises primarily from electron spin density in an F orbital which has an axis of symmetry perpendicular to the plane of the radical. $CF_3CF_2CONH_2$ was also γ-irradiated. The F^{19} coupling of the CF group is similar to that found in the CF_2CONH_2 radical, but the coupling in the CF_3 group is different and arises partly through hyperconjugation interaction with the σ bonds and partly through π bonding to the F atoms. Surprisingly, at room temperature the F's of the CF_3 group have equivalent coupling, which seems to indicate that the CF_3 group is rotating. The ESR of the irradiated $CF_3CF_2CONH_2$ decays rapidly in air, whereas that of irradiated CF_3CONH_2 does not. (Contractor's abstract, modified)

DEUTERIUM EXCHANGE BETWEEN DEUTERIODIBORANE AND ALUMINUM BOROHYDRIDE, by P. C. Maybury and J. C. Larrabee. Oct. 1962 [6]p. incl. diagrs. tables. refs. (AFOSR-J1524) (AF 18(603)119) AD 427510 Unclassified

Also published in Inorg. Chem v. 2: 885-890, Oct. 1963.

The kinetics of the exchange of deuterium between diborane and aluminum borohydride were studied over a temperature range of -7 to 20°, and the orders of reaction were found to be dependent on the relative proportions of B_2D_6 and $Al(BH_4)_3$. When the pressure of B_2D_6 is less than 4 times the $Al(BH_4)_3$ pressure, the reaction order was found to be 0.52 with respect to $Al(BH_4)_3$ and 1.2 with respect to B_2D_6. At ratios greater than 4 the order of reaction with respect to $Al(BH_4)_3$ changed to 0.8 and the order with respect to B_2D_6 changed to -1.2. The activation energy was found to be 14 ± 1 kcal/mol. A mechanism is proposed involving the thermal dissociation of both $Al(BH_4)_3$ and B_2D_6 followed by a rate-determining collision of B_2D_6 with borane radicals. The changing orders of reaction are consistent with a derived steady-state expression for this exchange. Direct experimental evidence was obtained to prove that the boron atoms are undergoing exchange in this reaction by the use of boron-10 enriched B_2D_6. (Contractor's abstract)

THE EFFECTS OF STILBESTROL AND PROGESTERONE, AND OF RENAL DENERVATION ON THE RESPONSE OF THE KIDNEYS TO VASOPRESSIN AND OXYTOCIN, by R. P. Deis, S. Lloyd, and M. Pickford. [1962] [10]p. incl. diagrs. refs. [AF 61(052)277] Unclassified

Published in Jour. Physiol. (London), v. 165: 348-357, Feb. 1963.

Dogs were given daily subcutaneous injections of stilbestrol or progesterone, or both together, and the effect of these substances on the renal responses to vasopressin and oxytocin examined. Stilbestrol and progesterone did not significantly affect the antidiuretic effect of either vasopressin or oxytocin. Stilbestrol depressed the rise in electrolyte excretion normally seen on giving vasopressin. After administration of stilbestrol intravenous oxytocin sometimes led to a small immediate increase in Na and Cl excretion, but the normal delayed increase was absent or markedly depressed. The delayed rise was present if oxytocin was given in smaller doses into the carotid artery. Progesterone did not affect the renal response to either vasopressin or oxytocin. When both stilbestrol and progesterone were given, the effects were like those seen when stilbestrol alone was given. It is suggested that stilbestrol affects Na retention by an action on the tissues more than on the kidney, and that its power to change the response to vasopressin and oxytocin may be related to an increased sensitivity of the renal vessels to the constrictor properties of vasopressin and oxytocin. Renal denervation of itself seemed not to affect the responses to oxytocin and vasopressin; the temporary changes noted may have been non-specific and due to surgical interference.

VASCULAR RESPONSES OF THE RAT TO BRADYKININ, by S. Lloyd. [1962] [5]p. incl. illus. (AFOSR-J175) (AF EOAR-62-79) AD 400427 Unclassified

Also published in Brit. Jour. Pharmacol. and Chemotherapy, v. 19: 503-507, Dec. 1962.

The effects of oestrogens and of sympathetic blockade on the vascular response of rats to bradykinin were studied. No difference in response was found between males and oestrous or dioestrous females. The previous administration of an oestrogen did not affect the response. An augmentation of the depressor response to bradykinin was seen in both sexes after the intravenous administration of either dihydroergotamine or hexamethonium, but not after atropine. Pithing reduced the response to bradykinin. The differences between these results and those previously obtained with oxytocin are discussed. (Contractor's abstract)

THE EFFECT OF OXYTOCIN ON HAND BLOOD FLOW IN MAN FOLLOWING TOTAL AND SYMPATHETIC NERVE BLOCK, by R. P. Deis, A. H. Kitchin, and M. Pickford. [1962] [7]p. incl. diagrs. (AFOSR-J941) (AF EOAR-62-79) AD 415878 Unclassified

Also published in Jour. Physiol. (London), v. 166: 489-495, 1963.

Measurements made by venous occlusion plethysmography confirmed previous observations that intravenous or intra-arterial oxytocin caused an increase in blood flow in normal hands of both men and women. Following acute denervation due to infiltration of lignocaine around the nerves of one arm, intravascular oxytocin caused a decrease in blood flow on the side of the block, and the normal increase on the unblocked side. After sympathetic block produced by infusion of bretylium tosylate into the brachial artery of one arm, oxytocin decreased hand blood flow on that side, or had no effect on the flow, or in one case, considerably reduced the increase in flow seen before bretylium. Arguments are

put forward showing that the reduction in hand blood after total or sympathetic nerve block must be due to a direct vasoconstrictor effect of oxytocin. These results are similar to those previously noted in rats and dogs.

THE DYNAMICS OF SPINNING BODIES AT LARGE ANGLE OF ATTACK, by J. E. Brunk, W. L. Davidson, and R. W. Rakestraw. Jan. 1962 [152]p. incl. diagrs. tables, refs. (AFOSR/DRA-62-3) (AFOSR-2786) (AF 29(600)2936) Unclassified

A theoretical study was conducted to determine the motion of nonstabilized rolling and spinning bodies at very large angles of attack. From numerical integration of the non-linear six-degrees-of-freedom equations of motion it was found that a rolling cone-cylinder body could achieve a self sustained spinning motion for large ranges of both center-of-gravity position and Reynolds number. The stability of the autorotative motion was investigated using linear theory. For configurations representative of current small missiles descent, velocities as low as approx 100 ft/sec were achieved with spinning motion. Stable spins could be initiated from small angle of attack either by supplying a pitch impulse or effecting aerodynamic destabilization. (Contractor's abstract)

[ON MODIFICATIONS OF EXCEPTIONAL ANALYTICAL SETS] Über Modifikationen und exzeptionelle analytische Mengen, by H. Grauert. [1961] [38]p. incl. refs. (AFOSR-3837) (AF EOAR-61-50) Unclassified

Also published in Math. Ann., v. 146: 331-369, 1962.

Let X be a complex space and A ⊂ X be a compact analytic subset. The set A is called exceptional if there exists a modification Y of X such that the set A shrinks down to a point y, i.e., X - A = Y - y. The main theme of this paper is the characterization of the exceptional analytic sets and their applications to the theory of manifolds. In Section I, there are given some preparatory notions such as plurisubharmonic functions, pseudo-convexity, and holomorph-convexity for complex spaces. In Section II, Remmert's reduction theorem and its sharpened form by H. Cartan are given. Using these results, a criterion of the exceptional analytic set is given. In Section III, other criteria are given using the coherent analytic sheaf m whose zero-set coincides with the analytic set A. In the final section, the main topic is the complex structure of the neighborhood of an exceptional analytic subset A, especially when X is a complex manifold and A is an analytic subset of codimension 1 without singularity. [ON COMPACT HOMOGENEOUS COMPLEX

MANIFOLDS] Über kompakte homogene komplexe Mannigfaltigkeiten, by H. Grauert and R. Remmert. [1962] [10]p. incl. refs. (AFOSR-4571) (AF EOAR-61-50) AD 455645 Unclassified

Also published in Arch. Math., v. 13: 498-507, 1962.

For a complex analytic manifold V which is connected, the transcendence degree of the field of meromorphic functions is called the algebraic dimension of V. Then the main result is stated as follows: A connected compact homogeneous complex manifold is a projective (algebraic) variety if its complex dimension coincides with the algebraic dimension. The above theorem is actually proved in a generalized form. Furthermore, the authors discuss the structure of a connected, homogeneous complex manifold V as a fiber variety over a homogeneous projective variety W such that dim W = algebraic dimension of V. The main result above is a generalization of the compact case of a theorem of Chow which asserts that a homogeneous abstract algebraic variety can be imbedded in a projective space. (Math. Rev. abstract)

ASSOCIATION CONSTANTS AND NMR ASSOCIATION SHIFTS FOR SEVERAL CHLOROFORM-BASE HYDROGEN-BONDED COMPLEXES, by B. B. Howard, C. F. Jumper, and M. T. Emerson. [1962] [14]p. incl. diagr. tables, refs. (AFOSR-J1378) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)278, Atomic Energy Commission, and Research Corp.) AD 429774 Unclassified

Also published in Jour. Molec. Spectros., v. 10: 117-130, Feb. 1963.

The chemical shifts of chloroform in solutions with several hydrogen bonding bases in either cyclohexane or carbon tetrachloride as solvent were measured at 25° with a precision of ±0.002 ppm. Chloroform-base association constants and association shifts were calculated. Corrections were applied for the effects of dispersion interaction and self- and solvent association. Listing the base, association constant, and association shift in ppm to low field in that order, the resulting values are: triethylamine, 4.70, 1.472; diethyl ether, 3.76, 0.905; diethyl ether, 1.46, 1.266; isopropyl ether, 2.08, 1.126; acetonitrile, 1.14, 0.973; acetone, 2.07, 1.419; and pyridine, 1.90, 2.271. The first 2 are in cyclohexane, the rest in CCl_4. The difference between the association constants of diethyl ether in the 2 solvents is noted as being anomalously large. The effect of the anisotropy of the base can readily be seen in the association shifts of the pyridine and acetonitrile complexes. (Contractor's abstract)

ENERGY TRANSFER MECHANISMS AND THE MOLECULAR EXCITON MODEL FOR MOLECULAR AGGREGATES, by M. Kasha. [1962] [16]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)712] and Atomic Energy Commission) Unclassified

Presented at Tenth Annual meeting of the Radiation Research Soc., Colorado Springs, May 20-23, 1962.

Published in Radiation Research, v. 20: 55-70, Sept. 1963.

This paper is devoted to the laying down of a further perspective for the discrimination and understanding of the main types of excitation energy transfer. A necessary introduction to such a discussion will be the

examination of detailed differences in types of intermolecular electronic interaction. The present treatment will be a strictly nonmathematical one. The 5 sections that will be discussed are: the molecular exciton model, comparison of energy transfer mechanisms, vibrational-electronic coupling cases, exciton band structure for strong coupling, and the rates of energy transfer for various mechanisms. Much emphasis is placed on the need for new discriminative experimental work.

BASIC SEQUENCES AND THE PALEY-WIENER CRITERION, by J. R. Retherford. [1962] [19]p. incl. refs. (AF AFOSR-62-27) Unclassified

Also published in Pacific Jour. Math., v. 14: 1019-1027, Fall, 1964.

The paper under review is devoted to generalizing the Paley-Wiener type and similar stability criteria for bases and basic sequences in Hilbert and Banach spaces to the case of bases and basic sequences of subspaces. A typical result is the following theorem: Suppose $\{M_i\}_{i=1}^{\infty}$ and $\{N_i\}_{i=1}^{\infty}$ are sequences of nontrivial subspaces of a linear complete metric space X and suppose that T_i is a one-to-one linear transformation of M_i onto N_i $(i = 1, 2, \ldots)$. Suppose further that there is a C $(0 < C < 1)$ such that

$$\left\| \sum_{i=1}^{n} (x_i - T_i x_i) \right\| \le C\left(\left\| \sum_{i=1}^{n} x_i \right\| + \left\| \sum_{i=1}^{n} T_i x_i \right\| \right)$$

for arbitrary x_i in M_i $(i = 1, 2, \ldots, n; n = 1, 2, \ldots)$. Then (a) there is a linear homeomorphism T of $[M_i]$ onto $[N_i]$ such that T restricted to M_i equals T_i for each i; (b) $\{M_i\}_{i=1}^{\infty}$ is an [unconditional] basic sequence of subspaces if and only if $\{N_i\}_{i=1}^{\infty}$ is an [unconditional] basic sequence of subspaces. The case of basic sequences in Banach spaces is considered separately, and a new modification of the Paley-Wiener criterion is given. (Math. Rev. abstract, modified)

GENERALIZED SCHAUDER BASES, by C. W. McArthur. [1962] 25p. incl. refs. (AF AFOSR-62-27) Unclassified

Presented at meeting of the Amer. Phys. Soc., Tallahassee, Fla., Nov. 16-17, 1962.

Let X be a complete metric linear space and $\{M_s\}_{s \in S}$ an infinite family of nontrivial subspaces of X. $\{M_s\}_{s \in S}$ is an unordered basis for X, if corresponding to each $x \in S$ there exists a unique family $\{x_s\}_{s \in S}$ $x_s \in M_s$, such that x is the unordered sum of the series $\sum_{s \in S} x_s$. $\{M_s\}_{s \in \omega}$ is a basis for X, if corresponding to each $x \in X$ there is a unique sequence $\{x_i\}_{i \in \omega}$, $x_i \in M_i$, such that $x = \sum_{i=1}^{\infty} x_i$. In either case letting $E_s(x) = x_s$, a projection of X onto M_s is defined. Theorem: Suppose $\{M_s\}_{s \in S}$ is a basis for X in either of the above senses. Then E_s is continuous for each $s \in S$, if and only if M_s is closed for each $s \in S$. Theorem: Suppose X is a Banach space, (i) An infinite family $\{M_s\}_{s \in S}$ of nontrivial, closed, S-independent subspaces of X is an unordered basis for X, if and only if there exists $M \ge 1$ such that for arbitrary finite $F \subset S$ and arbitrary $x_s \in M_s$ $\left\| \sum_{s \in F'} x_s \right\| \le M \left\| \sum_{s \in F} x_s \right\|$ if $F' \subset F$. (ii) A sequence $\{M_i\}_{i \in \omega}$ of nontrivial, closed, ω-independent subspaces of X is a basis for X, if and only if there exists $M \ge 1$ such that for arbitrary $q \in \omega$ and arbitrary $x_i \in M_i$, $\left\| \sum_{i=1}^{p} x_i \right\| \le M \left\| \sum_{i=1}^{q} x_i \right\|$ if $p \le q$. ON A GENERALIZATION OF THE SCHAUDER BASIS CONCEPT, by B. L. Sanders. 1962, 3p. (AF AFOSR-62-27) Unclassified

It is shown that a Schauder decomposition of a Banach space X induces a Schauder decomposition of a closed subspace of X^*; that this subspace is all of X^* if the decomposition has a property called shrinking; and that the subspaces, in this induced decomposition, form a Schauder decomposition for all of X^* under the weak topology. The final theorem gives necessary and sufficient conditions for a Banach space with a Schauder decomposition to be reflexive. This is a generalization

of a result of R. C. James which he used in showing that a certain Banach space, which is isometrically isomorphic to its second conjugate, is not reflexive. This characterization of reflexive Banach spaces and the theorem on weak decompositions appear to be the main results of this work.

ANGULAR DISTRIBUTION OF γ RADIATION FOLLOWING DIRECT NUCLEAR REACTION, by M. Nemoto. [1962] [5]p. incl. diagrs. refs. (AFOSR-971) (AF 49-(638)427) Unclassified

Also published in Phys. Rev., v. 127: 1693-1697, Sept. 1, 1962.

The γ-ray angular distributions following the direct reaction $C^{12}(p,p'\gamma_{4.43\,mev})C^{12}$ have been calculated for two cases of single-particle excitation and collective excitation using Glendenning's optical potential and the surface interaction model. In the case of particle excitation, the effective 2-body potential has been assumed to have the form $V_0(|r_p-r_n|)[a_0+a_1\,\sigma(p)\cdot\sigma(n)]$. Comparison with experiments for incident proton energies E_p = 6.69, 8.46, 8.71, and 9.72 mev shows remarkably good fits for $a_1/a_0 = \pm 0.67$. For the case of collective excitation, the agreement has been found to be poor. The planewave Born approximation for the incoming and outgoing waves does not yield satisfactory results for either mechanism. (Contractor's abstract)

MULTI-LEVEL AND MULTI-CHANNEL ANALYSIS OF ELASTIC SCATTERING, by G. E. Mitchell. May 1962 [20]p. incl. refs. (Technical rept. no. 4) (AFOSR-2871) (AF 49(638)427) AD 227282 Unclassified

A review is made of the various approximations for the collision matrix that are relevant for elastic scattering analysis. A brief discussion is given on qualitative and semiquantitative techniques. The 1 level, 1 channel, the 2 level, 1 channel; and n level, 1 channel approximations are derived. The 1 level, n channel problem is treated; it is shown that, with the addition of 1 parameter, ordinary phase shift analysis is applicable. The 2 level, 2 channel approximation is derived from 2 different approaches to illustrate the extension to more levels and channels. (Contractor's abstract)

ON THE POSSIBILITY OF RESONANT TRANSFER PROCESSES IN NUCLEAR REACTIONS, by G. M. Temmer. [1962] [3]p. (AFOSR-3957) (AF 49(638)427) Unclassified

Also published in Phys. Lttrs., v. 1: 10-12, Apr. 1, 1962.

Ziemba and Everhart first established the existence in atomic physics of the resonant transfer of electrons back and forth between helium ions, traversing helium gas, and the atoms of the gas. The author speculates about the possibility of such effects occurring in nuclear reactions. Several examples are suggested which might be tested experimentally.

ALLOWED AND SUPERALLOWED DECAY OF Sc^{42} AND INVERSION OF ISOMERIC STATES (Abstract) by J. D. Oberholtzer, J. W. Nelson, and H. S. Plendl. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 286, Apr. 23, 1962.

Formation of an isomeric state in Sc^{42} via $K^{39}(\alpha,n)$ and its positron decay in coincidence with 3 γ-rays of equal intensity was previously reported. Thresholds and half-lives observed for this allowed decay and for the superallowed ground-state decay are: superallowed decay (8.220 ± 0.50 thresh. (mev); 0.064 ± 0.06 $T_{1/2}$(sec); and 5.525 ± 0.050 E_{max} (mev)); allowed decay (8.800 ± 0.020 thresh. (mev); 62 ± 2.5 $T_{1/2}$(sec); and 2.820 ± 0.040 E_{max} (mev)). E_{max} values are computed from our results and from stable mass values and agree with measured values. The results are compared with recent measurements at MIT and elsewhere. Decay schemes and probable-spin assignments for two-particle excitation levels in Sc^{42} and Ca^{42} are presented. The results indicate that the isomeric state has T = 0 and is 526 kev above the T = 1 ground state, i.e., inversion as in Cl^{34}. The observed isomerism and inversion can be accounted for by jj-coupling considerations.

(α,n) REACTIONS IN C^{12}, Si^{28}, AND S^{32} AND THE (p,n) REACTION ON Cl^{35} (Abstract), by J. W. Nelson, E. B. Carter and others. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 286, Apr. 23, 1962.

Neutron thresholds for α particles incident on C^{12}, Si^{28}, and S^{32} have been previously reported (item no. 737, Vol. V). These measurements have been extended using improved apparatus. The excitation curve for

$C^{12}(\alpha, n)O^{15}$ has been measured for incident α-particle energies from threshold (11.33 mev) to 19 mev. The outstanding feature of this curve is a resonance at α energy 14.8 mev of half-width 400 kev corresponding to a level at 18.25 mev in O^{16}. The ground-state thresholds for C^{12} and Si^{28} targets are in agreement with values in the 1960 Nuclear Data Tables. In contrast, the $S^{32}(\alpha, n)A^{35}$ threshold (9.864 ± 0.035 mev) is higher than the calculated value by 140 kev. As a check on the A^{35} positron end point, the $Cl^{35}(p, n)A^{35}$ threshold was measured to be 6.942 ± 0.020 mev, which agrees with the end point. The results of half-life determinations for all 3 cases are presented.

ARE THERE RESONANT TRANSFER PROCESSES IN NUCLEAR REACTIONS? (Abstract), by G. M. Temmer. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Florida State U., Tallahassee, Apr. 5-7, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 569-570, Nov. 23, 1962.

If a system, consisting of 2 subunits A' and B, is bombarded by a beam of A, the possibility exists of transferring B from A' to A without expenditure of energy (A' = A). The "transfer time" τ is a quantity determined by the binding energy of B to A, and the distance R between A' and A. The presence of A produces a splitting ΔE of the ground state of B in the field of A, which increases with decreasing separation R of systems (A' + B) and A, $h/4\pi\Delta E = \tau$. This is a well-known problem in atomic and molecular physics (e.g., inversion spectrum of NH_3). If the "time of passage" T of A traversing (A' + B) equals $n\tau$, where n = 1, 2, 3, . . . , one, two, three, etc., transfers of B between the 2 equivalent sites A may occur. A most beautiful demonstration of this effect was given by Everhart et al for the systems $He^+ + He^0$ and $H^+ + H^0$ for the transfer of an electron, revealing a relative neutral-atom yield at a fixed scattering angle varying as $\sin^2(k/E^{1/2})$ over a large range of ion energies E (k = const). In view of the successful description of many nuclear states in terms of cluster configurations, we examined a typical case: $Li^6(\alpha + d)$, bombarded by α. Using a naive, 1-dimensional square-well model for Li^6, we estimate $\tau \approx 7 \times 10^{-22}$ sec for R = 2 F. T for a 4-mev α across Li^6 is $\approx 5 \times 10^{-22}$ sec (i.e., $\tau \approx T$), hence there exists the possibility of observing peaks and valleys in the relative yields of the 2 systems, during elastic scattering. Other favorable examples are $p + d$, $He^3 + He^4$, $Li^6 + Li^7$, $O^{16} + N^{15}$, $O^{16} - F^{19}$, $O^{16} + Ne^{20}$, etc. Possible applications to high-energy physics are discussed.

$Be^9(p, \alpha)Li^6$: TEST CASE FOR DIRECT REACTION THEORY (Abstract) by R. R. Blieden, G. M. Temmer, and K. L. Warsh. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Florida State U., Tallahassee, Apr. 5-7, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 570, Nov. 23, 1962.

The monotonic behavior of the total cross section and the remarkably energy-independent angular distributions for α_0 and α_1 in the previously reported reaction $Be^9(p, \alpha_0)Li^6$ imply that it is a direct process. Data was obtained on the elastic scattering in the incident and exit channels which further support this conclusion. The excitation curves for $Be^9(p, p)Be^9$ and $Li^6(\alpha, \alpha)Li^6$ are quite smooth in the region from 10- to 14-mev excitation energy in B^{10}. Angular distributions and excitation curves for these reactions as well as for $Be^9(p, p')Be^{9*}$ (2.43) and $Be^9(p, d_0)Be^8$ are presented. Preliminary fits by G. R. Satchler to the (p, α) data using the SALLY computer code for the distorted-wave theory of direct reactions are encouraging and are presented.

$C^{12}(d, p\gamma)$ PROTON-GAMMA ANGULAR CORRELATIONS, by N. R. Fletcher, D. R. Tilley, and R. M. Williamson. [1962] [15]p. incl. diagrs. tables, refs. [AF 49(638)427] Unclassified

Published in Nuclear Phys., v. 38: 18-32, Oct. 1962.

The $C^{12}(d, p\gamma)C^{13}$ angular correlations through the second and third excited states of C^{13} have been measured at reaction angles near the stripping maximum with bombarding energies of 2.80, 3.23, and 3.70 mev. Both correlations have the angular symmetries of direct reactions. The energy dependence of these correlations, which involve negative Q value reactions, is much less than that of positive Q value (d, pγ) reactions measured in this energy region. The p_2-γ angular correlation has been measured in the azimuthal plane and at several different proton angles in the reaction plane to determine the extent of applicability of the distorted wave stripping theory. The stripping character of both the $C^{12}(d, p_2)$ and $C^{12}(d, p_3)$ reactions appears to be modified by compound nucleus formation. Tentative multipole mixtures assigned are $\Gamma(E2)/\Gamma_\gamma \lesssim 5\%$ for the 3.68 mev radiation and $\Gamma(E3)/\Gamma_\gamma \lesssim 2\%$ for the 3.85 mev radiation.

$Cl^{35}(\alpha, n)K^{38}$ REACTION THRESHOLDS (Abstract), by J. W. Nelson, A. L. Elattar and others. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Florida State U., Tallahassee, Apr. 5-7, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 571, Nov. 23, 1962.

Thresholds for the formation via $Cl^{35}(\alpha, n)$ of the lowest T = 0 and T = 1 states in K^{38} were determined by observing the onset of the superallowed and allowed β^+ activities following bombardment of AgCl with α's (6.0-7.5 mev) from the FSU tandem Van de Graaff accelerator. Maximum β^+ energies computed from these results and stable mass values compare with previous determinations as follows:

Activity	Threshold (mev)
allowed (T = 0)	6.610 ± 0.035
superallowed (T = 1)	6.828 ± 0.035

E_{max} (mev) from threshold	E_{max} (mev) prev. det.
2.815 ± 0.045	2.68 ± 0.03
5.170 ± 0.035	4.57 ± 0.13 or 5.06 ± 0.11

The previously inferred sequence of the lowest T = 0 and T = 1 levels in K^{38} is herewith confirmed. The separation of these levels appears to be 196 kev, i.e., larger than previously assumed.

DISTORTED WAVE ANALYSIS OF THE (p, α) REACTION ON Be^9 (Abstract), by H. R. Blieden, G. M. Temmer, and K. L. Warsh. [1962] [1]p. [AF 49(638)-427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 434, Aug. 27, 1962.

Using the optical parameters discussed in the following paper (item no. 868) for the elastic scattering in the incident and exit channels of the reaction $Be^9(p, \alpha)Li^6$, a distorted-wave calculation for this reaction is made using the computer program of R. H. Bassel et al. The reaction is assumed to occur via the pickup of a triton by the incident proton. It is found that sets of optical parameters that give equivalent fits to the elastic-scattering data give considerably different results for $Be^9(p, \alpha)Li^6$ when used in the DWBA calculation. The possibility of spin-orbit coupling effects has also been examined with the computer program JULIE. A detailed comparison is made of these calculations with the experimental results reported earlier.

ELASTIC AND INELASTIC SCATTERING FROM Li^6 AND Be^9 (Abstract), by G. M. Temmer and H. R. Blieden. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 434, Aug. 27, 1962.

Angular distributions and excitation functions for the elastic scattering of α particles from Li^6 and for the inelastic scattering to the 2.184-mev state of Li^6 have been obtained in the region $10.00 \leq E_\alpha \leq 12.54$ mev. The elastic scattering of protons from Be^9 and the inelastic scattering to the 2.43-mev state of Be^9 have also been studied for $6.00 \leq E_p \leq 8.00$ mev. The elastic scattering in each case has been analyzed in terms of a local optical-model calculation. On the basis of the optical parameters obtained a DWBA calculation is made for each inelastic process. Finally, the combined elastic and inelastic scattering are calculated in the strong-coupling approximation by assuming a quadrupole collective excitation for the inelastic scattering. A comparison of the calculations with the experimental results is presented.

ELASTIC SCATTERING OF ALPHA PARTICLES BY O^{15} FROM 6.0 MEV TO 10.0 MEV (Abstract), by W. E. Hunt, M. K. Mehta, and R. H. Davis. [1962] [2]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 71-72, Jan. 24, 1962.

Excitation curves have been measured at 10 angles in the bombarding energy range 6.0 to 10.0 mev. Below 10 mev only the elastic scattering channel is significant in the bombardment of O^{16} with alpha particles, since the inelastic scattering cross section is negligible. Solid targets have been fabricated by evaporating lithium metal onto thin carbon foils and subsequently forming LiOH by exposure to air. At least 15 resonances have been resolved in the region of Ne^{20} excitation energy 9.53 to 12.73 mev. By obtaining the behavior of the differential cross section at angles corresponding to the zeros of the first 8 Legendre polynomials several

tentative spin and parity assignments can be made. In addition to the excitation curves, angular distributions have been measured in steps of 3 degrees at bombarding energies 8.63 and 9.92 mev. Both detailed angular distributions exhibit diffraction patterns; there is a marked increase in the number of maxima at 9.92 mev over that at 8.63 mev.

ELASTIC SCATTERING OF α PARTICLES FROM Al^{27} (Abstract), by M. A. Ijaz, P. W. Weiss, and R. H. Davis. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 532, Nov. 23, 1962.

The differential cross section for elastic scattering of α particles from natural aluminum targets (150 kev thick for 10-mev α-particles) has been measured for incident α-particle energies between 7 and 19 mev at laboratory angles of 81.7°, 118.5°, 135°, and 158°. Throughout this energy region, these excitation curves display many unresolved resonances and some broad structure. Nine angular distributions have been measured in this energy range. The principal feature of these angular distributions has been their moderate backward peaking, the cross section rising to 10 times that of Rutherford scattering at 170° (lab). The shapes of the excitation curves and angular distributions differ markedly from those taken on the neighboring nucleus Si^{28}, which display many strong resonances in the excitation function, and pronounced diffraction patterns in the angular distributions. Preliminary results of an optical-model analysis are presented.

ELASTIC SCATTERING OF α PARTICLES FROM Si^{28} (Abstract), by P. B. Weiss, N. R. Fletcher, and R. H. Davis. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Florida State U., Tallahassee, Apr. 5-7, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 570, Nov. 23, 1962.

Alpha particles have been elastically scattered from self-supporting SiO and Si foils of thickness corresponding approximately to 50 kev for a bombarding energy of 10 mev. The scattered yield was detected and analyzed in solid-state charged-particle counters. Preliminary investigation of the excitation function at several angles in the bombarding energy range of 8-17 mev shows strong anomalies at about 8.8, 7.9, 8.6, 11.8, 12.8, and 13.8 mev. Many overlapping resonances have been observed throughout the range of bombarding energy. Angular distributions have been measured at 1-mev intervals from 8-18 mev inclusive with several additional distributions in the vicinity of strong anomalies. Angular distributions change slowly with bombarding energy except at prominent resonances. Here, the variation is more abrupt; additional structure of marked shifts in its angular location found. Interference effects with strong backward peaking are prominent in all angular distributions.

EXCITATION CURVE AND ANGULAR DISTRIBUTION OF THE $F^{19}(p,\alpha_0)O^{16}$ REACTIONS (Abstract), by K. L. Warsh, H. R. Blieden, and G. M. Temmer. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 300, Apr. 23, 1962.

Using the proton beam from our Tandem accelerator, we have measured the yield of the reaction $F^{19}(p,\alpha_0)O^{16}$ at θ(laboratory) = 70° from 3.3 to 12.1 mev bombarding energy with junction counters. Large yields in the excitation curve are observed in the vicinity of 5.0 and 7.7 mev with considerable structure over the whole range of excitation. Angular distributions taken at intervals throughout this range show a wide variation of shapes, including large yields at backward angles. The data taken at the higher energies confirmed the measurements of Ogata, while the data at lower energies agree with the results of Teplov et al. Absolute cross sections have been measured by means of a gas target.

EXCITATION FUNCTION AND ANGULAR DISTRIBUTIONS FOR THE $Li^6(d,\alpha)\alpha$ REACTION (Abstract), by I. G. Han and N. P. Heydenburg. [1962] [1]p. [AF 49-(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Florida State U., Tallahassee, Apr. 5-7, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 570, Nov. 23, 1962.

The $Li^6(d,\alpha)\alpha$ reaction has been studied for deuteron-bombarding energies between 2 and 12 mev. This corresponds to an excitation region in Be^8 from 23.7 to 31.3 mev, which overlaps and extends the region previously investigated with the $Li^7(p,\alpha)\alpha$ reaction. The targets were of 95% Li^6 evaporated on thin carbon backing material. The α particles were detected with a solid-state counter. The excitation function at 90° (lab)

shows a prominent peak at 3.85 mev corresponding to a level in Be^6 at 25.16 mev. This level was observed as a weak resonance in our previous work on the $Li^7(p,\alpha)\alpha$ reaction. A tentative assignment of $J = 2^+$ has been given to this level by M. Nomoto. Beyond the resonance, the yield diminishes slowly with increasing energy. Angular distributions are shown in the region of the resonance and at the higher energies.

Florida State U. Dept. of Physics, Tallahassee.

EXCITATION FUNCTION AND ANGULAR DISTRIBUTIONS FOR THE $Li^6(p,He^3)He^4$ REACTION (Abstract), by N. P. Heydenberg and I. G. Han. [1962] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 58, Jan. 24, 1962.

The $Li^6(p,He^3)He^4$ reaction with an enriched target has been studied, using junction counter detection of the He^3 and alpha particles, and proton bombarding energies between 3.0 mev and 12.5 mev with a tandem Van de Graaff accelerator. The excitation function at 70° is a monotonically decreasing function with increasing energy. The angular distributions from 7.0 to 12.0 mev show a strong forward peak and a small backward peak indicating the possible presence of a direct reaction. As the bombarding energy decreases, the broad maximum at about 100° which was observed in the angular distributions at the higher energies disappears at about 6.0 mev, and an additional maximum at about 50° appears at about 7.5 mev.

GAMMA-RAY ANGULAR DISTRIBUTION FOLLOWING DIRECT REACTION IN C^{12} (Abstract), by M. Nomoto. [1962] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 60, Jan. 24, 1962.

The gamma-ray angular distributions following the reaction $C^{12}(p,p\gamma_{4.43}\text{ mev})C^{12}$ were measured for several incident proton energies in the vicinity of 7 and 9 mev where the excitation curve shows no pronounced compound-nucleus resonances. These distributions were analyzed using Glendinning's optical potential in addition to the Coulomb potential assuming a direct process. The analysis was made for the cases of single-particle excitation and collective excitation. In the former case, the theoretical gamma-angular distribution curve for a spin-flip two-body potential and a non-spin-flip potential differ considerably; remarkably good fits to 4 experimental curves were obtained for the same potential with an approximate Rosenfeld mixture, neglecting the exchange integral. For the case of collective excitation, the agreement was found to be poor. The analysis also showed that the plane-wave Born approximation does not yield satisfactory results for either mechanism.

γ-RAYS FROM THE REACTION $Be^9(\alpha, n_1\gamma_{4.43})C^{12}$ (Abstract), by J. B. Seaborn, G. E. Mitchell and others. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 269, Apr. 23, 1962.

The excitation function for the reaction $Be^9(\alpha,n_1\gamma_{4.43})C^{12}$ has been measured at 0° and 90° (laboratory angle) for α energies from 3.3 to 9.3 mev. The 4.43-mev γ-rays produced in a thin (~0.1 mg/cm^2) beryllium target were detected with 3 in. x 3 in. NaI(Tl) crystals. In addition to the previously reported resonance at 3.99 mev, there is a very broad (~2 mev) resonance or series of resonances at about 5.0 mev. Above this large resonance, the yield decreases nearly monotonically. At 9.5 mev and above, there is a large contribution to the yield from the $C^{12}(\alpha,\alpha_1\gamma_{4.43})C^{12}$ reaction due to carbon contamination; in addition, the high-energy neutrons increasingly obscure the γ spectra. Thirteen angular distributions were measured between 3.3 and 7.6 mev. At 5.25 mev and below, the angular distributions have a maximum near 0°. Above this energy, the maximum yield occurs between 15° and 30°. All angular distributions show minimum values at 90°.

GIANT RESONANCE IN THE $B^{11}(p,\gamma_1)C^{12}$ REACTION AT 11.7 MEV (Abstract), by J. A. Becker and J. D. Fox. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Florida State U., Tallahassee, Apr. 5-7, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 570, Nov. 23, 1962.

The yield of γ-rays resulting from proton capture by B^{11} leading to the ground state (γ_0) and first excited state (γ_1) of C^{12} has been studied for proton energies from 6-13.2 mev. The proton beam, held to less than 1 μA to reduce pileup, was focused on the natural boron target and stopped in graphite 3 m from the target. The

γ-rays from the target were collimated to a beam 5 cm in diam and entered a 5-in.-diam by 4-in.-thick NaI(Tl) detector axially. Electronic pileup was reduced by using a biased preamplifier. All measurements were made with the detector at 90° to the incident beam and 30 cm from the target. The yield of γ_0 exhibits 1 strong maximum near 7.2 mev (22.56 mev in C^{12}) and falls off at higher energies. It is found that the yield of γ_1 exhibits maxima at 6.75, 8.4, 10.4, and 11.9 mev; the last probably is the analog to the giant dipole resonance for γ_0.

MAGNETIC SPECTROGRAPHIC SATURATION EFFECT ON SEVERAL Q_0-VALUES (Abstract), by A. R. Tajera. [1962] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., Florida State U., Tallahassee, Apr. 5-7, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 570, Nov. 23, 1962.

The effects were studied of the main and fringing fields of a spectrograph at high field strengths on a group of high Q_0 values which had large discrepancies when compared with those computed in recent nuclear-mass tables. An experimental correction curve was obtained from well-known lower Q values at unsaturated and saturated fields. The Q_0 values so corrected are: $He^3(d,p)He^4$, $Q_0 = 18.380 \pm 0.010$ mev; $Li^6(d,\alpha)He^4$, $Q_0 = 22.403 \pm 0.012$ mev; $B^{10}(d,\alpha)$-Be^8, $Q = 17.830 \pm 0.006$ mev; and $N^{14}(d,\alpha)C^{12}$, $Q = 13.579 \pm 0.006$ mev. The energy-cycle closure errors were satisfactorily improved for (He, Li) and Be, B) cycles. The (N, C) cycle was well closed with MIT's $N^{15}(d,\alpha)C^{13}$ and $N^{15}(p,\alpha)C^{12}$ Q_0 values. The N^{15} target seems relatively thick.

PROTON-INDUCED FISSION OF Th^{232} AND U^{238} BELOW 12 MEV (Abstract), by J. R. Meriwether, J. D. Fox, and G. R. Choppin. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)427] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 303, Apr. 23, 1962.

The excitation functions for the fission of U^{238} and Th^{232} by protons of energy between 3 and 12 mev have been measured using a recoil-catching technique. The proton beam was obtained from the Florida State U. Tandem Van de Graaff. The cross section varies from about 0.00015 mb at 3 mev to 120 mb at 12 mev in the case of Th^{232} and from about 0.0007 mb at 3 mev and 140 mb at 12 mev in the case of U^{238}. The peak-to-valley ratios of the kinetic-energy spectrum of the fission fragments have been measured as a function of proton energy using p-n junction counters. A plot of these ratios as a function of proton energy shows a general decrease in the ratio of asymmetric to symmetric fission as the energy is increased with the exception of 3 upward breaks in the curve. In the bombardment of Th^{232}, these breaks occurred at 7.50, 9.25, and 11.25 mev, and in the bombardment of U^{238} they occurred at 6.75, 8.25, and 10.50 mev.

SURVEY OF THE $N^{15}(p,\alpha)C^{12}$ REACTION UP TO 12.6 MEV (Abstract), by G. Roy, H. S. Adams, and G. M. Temmer. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Florida State U., Tallahassee, Apr. 5-7, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 570, Nov. 23, 1962.

The excitation functions were measured for the reactions $N^{15}(p,\alpha_0)C^{12}$ and $N^{15}(p,\alpha_1)C^{12*}$ [and (p,α_2) to the O^+ state, at the higher energies] for proton energies between 3.3 and 12.6 mev, using enriched N^{15} gas (97.2%) contained in a gas cell between nickel foils and a junction counter fixed at 90° to the beam to detect the α particles. The region of excitation covered in O^{16} ranges from 15.2 to 24.0 mev. It should be noted that the ground-state transition (as well as the transition to the 7.65-mev state) can only be fed from natural parity states in O^{16}, whereas all types of compound states (except O^-) can contribute to the 4.43-mev (2^+) state transitions. A very pronounced resonant structure was observed up to about 20-mev excitation in O^{16}, after which the excitation curve becomes considerably smoother, although some structure is still present. The absolute differential cross section was obtained at 90° by comparing with elastic photon-helium scattering which is well known at several energies. The cross section ranges from 20 mb/sr at $E_p = 5$ mev to 2 mb/sr at the highest bombarding energy. To the extent that isotopic spin conservation holds, only $T = 0$ compound states should be observable. A detailed comparison of the reaction will be made with the $N^{15}(p,\gamma_0)O^{16}$ inverse photonuclear reaction in which the strongest contributions are expected to be from $I = 1^-$, $T = 1$ dipole states.

SYMMETRY SELECTION RULES FOR TESTING NUCLEAR CLUSTER STRUCTURE: APPLICATION TO Be^8 (Abstract), by G. M. Temmer. [1962] [1]p. (AF 49(638)427) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 59, Jan. 24, 1962.

Recent work on $Li^7(p,\alpha)\alpha$ located two narrow states (width ~1 mev) at 20- and 22-mev excitation in Be^8. Despite their mode of observation, they are clearly not $(\alpha + \alpha)$ states. The ratio of $\Gamma_n \div \Gamma_p \div \Gamma_\alpha = 70 \div 25 \div 1$ indicates that the descriptions $(Be^7 + n)$ are also inappropriate. It is believed that these sharp states in Be^8 are indeed s-state $(Le^6 + d)$ configurations, lying below the actual $Li^6 + d$ threshold.

THRESHOLDS OBSERVED IN THE $C^{12}(\alpha,n)O^{15}$, $Si^{28}(\alpha,n)S^{31}$, $S^{32}(\alpha,n)Ar^{35}$, $S^{34}(\alpha,n)Ar^{37}$, AND $Cl^{35}(p,n)Ar^{35}$ REACTIONS, by J. W. Nelson, E. B. Carter and others. [1962] [5]p. incl. diagrs. refs. [AF 49(638)427] Unclassified

Published in Phys. Rev., v. 129: 1723-1727, Feb. 15, 1963.

The following thresholds have been measured in the (α,n) reaction: C^{12} 11.341 ± 0.015; Si^{28} 9.30 ± 0.05, 10.55 ± 0.05, 11.83 ± 0.05, 12.78 ± 0.05; S^{32} 9.846 ± 0.020, 10.69 ± 0.05, 11.97 ± 0.06; S^{34} 5.17 ± 0.10, 5.96 ± 0.05, 6.90 ± 0.05, 8.04 ± 0.05, 9.09 ± 0.05, 10.09 ± 0.05, 10.31 ± 0.05 mev. These results are in agreement with previously published results except for the $S^{32}(\alpha,n)Ar^{35}$ ground threshold which is 140 kev higher than expected. To confirm the value of the mass Ar^{35}, the $Cl^{35}(p,n)Ar^{35}$ threshold energy was measured and is 6.942 ± 0.020 mev. Since this result agrees with the accepted value of the Ar^{35} mass, the 140-kev discrepancy was not resolved. In the $C^{12}(\alpha,n)O^{15}$ excitation curve a prominent resonance of half-width 220 ± 60 kev was found corresponding to a level in O^{16} of excitation 18.10 ± 0.06 mev. The cross section rises to about 22 mb at the peak of this resonance. Half-life determinations yielded the values: O^{15} 122.6 ± 1.0, S^{31} 2.56 ± 0.10, and Ar^{35} 1.76 ± 0.03 sec.

YIELD OF THE $Na^{23}(p,\alpha)Ne^{20}$ REACTION (Abstract), by K. L. Warsh, H. R. Blieden, and G. M. Temmer. [1962] [1]p. [AF 49(638)427] Unclassified

Presented at meeting of the Amer. Phys. Soc., Florida State U., Tallahassee, Apr. 5-7, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 569, Nov. 23, 1962.

The reaction $Na^{23}(p,\alpha)N^{20}$ has been studied using our tandem and junction counters. The counters were biased so thin as to register pulses proportional to the energy for α's but only small pulses for protons. The targets used were metallic sodium evaporated on carbon backing. The spectrum seen includes the new states in Ne^{20} at 5.80 and 7.02 whose character was determined by the Chalk River group. The yields to the ground state and first-excited state of Ne^{20} have been measured at 90° (lab) from 3.2 to 12.2 mev and 3.8 to 12.2 mev, respectively. The angular distributions for several states of Ne^{20} have been measured at 10.0 mev. The angular distributions show a wide variation of shapes, including large forward and backward peaking.

CAPTURE OF PROTONS BY B^{11} IN THE GIANT RESONANCE REGION, by J. A. Becker and J. D. Fox. [1962] [7]p. incl. diagrs. table. (AFOSR-4153) (AF AFOSR-62-123) AD 418060 Unclassified

Also published in Nuclear Phys., v. 42: 609-675, Apr. 1963.

The yield of γ-rays resulting from proton capture by B^{11} leading to the ground state (γ_0) and first excited state (γ_1) of C^{12} has been studied for proton energies from 6 to 13.2 mev. The proton beam, held to less than 1 μA to reduce pileup, was focussed on the natural boron target and stopped in graphite 3 m from the target. The γ-rays from the target were collimated to a beam 5 cm in diam and entered a 12.7 cm diam by 10.2 cm thick NaI(Tl) detector axially. Electronic pileup was reduced by using a biased preamplifier. All measurements were made with the detector at 90° to the incident beam and 30 cm from the target. The yield of γ_0 exhibits one strong maximum near 7.2 mev (23.56 mev in C^{12}) and decreases steadily at higher energies, except for a small anomaly at 10.4 mev. The yield of γ_1 exhibits maxima at the incident proton energies 6.75, 8.4, 10.4 and 11.9 mev. The experimental results are compared with the predicted T = 1 states of C^{12}. He^-, H_2^-, AND OTHER NEGATIVE ION BEAMS AVAILABLE FROM A DUOPLASMATRON ION SOURCE WITH GAS CHARGE EXCHANGE, by E. B. Carter and R. H. Davis. [1962] [4]p. incl. diagrs. tables, refs. (AFOSR-J963) (AF AFOSR-62-423) AD 418222 Unclassified

Also published in Rev. Scient. Instr., v. 34: 93-96, Jan. 1963.

Negative helium-ion beams have been produced in a commercial negative-ion source in which positively charged beams from a duoplasmatron ion source are converted in a gas charge exchange canal. Beams of negative helium ions with currents up to 30 mμA have been injected into a tandem Van de Graaff accelerator, and α-particle beams have been obtained from the accelerator with energies up to 19 mev and currents up to 2½ mμA. The results of several experiments which were performed to determine the source operating characteristics for negative helium ions are presented. In addition to the peak corresponding to the He^- beam, many other peaks are observed in the momentum distribution of the beam from the negative ion source. Confirming evidence has been found for the existence of the H_2^- ion.

AN EXPERIMENTAL STUDY OF THE INTERACTION OF PLASMONS AND FAST ELECTRONS IN METALS AND A STUDY OF ELECTRON TUNNELING THROUGH THIN INSULATING FILMS, by W. B. Ard, Jr. Final rept. Oct. 15, 1960 - June 14, 1962 [86]p. incl. diagrs. tables, refs. (AFOSR-2937) (AF 49(638)956) AD 282138 Unclassified

The characteristic energy losses observed when a beam of energetic electrons passes through a thin film of metal have been studied by using the retarded potential method of energy analysis. The spectrum for aluminum, magnesium, antimony, tin and indium appears in multiples of an energy which is approximately equal to the free electron plasmon energy while the spectrum of the other metals shows no such regular pattern. The mean free path and cross section for plasmon production have been determined and compared with the Bohm and Pines theory. Good agreement was found for aluminum and magnesium. These quantities, cross sections and mean free paths, were found to be independent of film thickness but did have the predicted dependence on incident electron energy. The second part of this report discusses the energy gaps and the density of electronic states in metal films, from 500 to 5000A thick, that have been obtained from electron tunneling experiments.

The negative resistance region which occurs when both metals are superconducting was observed as a hysteresis loop. The variation of the energy gap and density of states has also been studied, and the experimental results agree closely with the Bardeen, Cooper, Schrieffer theory. (Contractor's abstract, modified)

ELECTRON TUNNELING THROUGH THIN INSULATING LAYERS (Abstract), by M. F. Panczyk, H. J. Watson, and W. B. Ard, Jr. [1962] [1]p. (Bound with its AFOSR-2937) (AF 49(638)956) Unclassified

The resistance of aluminum oxide films has been determined by recording the current penetrating through the film as a function of the voltage applied across the film. Qualitative agreement with calculations made by Holm has been obtained. For low voltages the current-voltage curve is linear while for higher potentials the current increases rapidly with increasing voltage. Quantitative agreement may be obtained by assuming an effective electron mass of 1/10, which shows that the resistance of the films is lower than the calculated values for vacuum. Work is also being carried out at low temperature where one or both of the metals is in a superconducting phase. (Contractor's abstract)

PLASMA EXCITATIONS BY FAST ELECTRONS IN METALLIC FILMS (Abstract), by H. J. Watson, M. F. Panczyk, and W. B. Ard, Jr. [1962] [1]p. [AF 49-(638)956] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 344, Apr. 23, 1962.

The characteristic electron energy-loss spectra in various metals has been measured by an electron-transmission method. The resolution obtainable with the apparatus allows a determination of the shape of the characteristic-loss lines. Theoretical treatment of the electron-plasmon interaction gives an expression for the dependence of the cross section for plasmon excitation on plasmon wavelength. This together with the dispersion relation for plasmons allows one to predict the shape of a characteristic-loss line due to plasmon excitation. Lines with the expected shape are observed in some metals, particularly aluminum and magnesium, substantiating that the major energy losses in these metals is due to plasmon excitation. However, some lines observed in other metals have shapes that indicate that they are due to some other loss mechanism, possibly an atomic or band-to-band transition.

NUCLEOPHILIC REACTIONS OF SEMIIONIC OXYGEN. THE REACTION OF ALIPHATIC AND HETEROCYCLIC N-OXIDES WITH α-HALOESTERS (Abstract), by J. M. Tien, I. M. Hunsberger, and A. M. Haveliana. [1959] [1]p. [AF 18(603)127] Unclassified

Presented at meeting of the Org. Chem. Div. of the Amer. Chem. Soc., Boston, Mass., Apr. 5-10, 1959.

Published in 135th meeting of the Amer. Chem. Soc. Abstract of Papers, 1959, p. 76-O.

The oxidation of a halogen compound to the corresponding carbonyl compound by means of dimethyl sulfoxide apparently proceeds via an ionic intermediate, $(Me_2\overset{\oplus}{S}OCH\langle^{R_2}_{R_1})Br^{\ominus}$, formed by nucleophilic displacement of the halogen by the sulfoxide oxygen. The present work was undertaken as the first part of an attempt to demonstrate that a variety of compounds containing semiionic oxygen atoms can replace dimethyl sulfoxide in such reactions. Thus, both 4-methoxypyridine 1-oxide (I) and trimethylamine N-oxide (II) are able to convert ethyl bromoacetate to ethyl glyoxylate, although the detailed nature of the 2 reactions is different. The striking variations in reactivity toward α-haloesters exhibited by azoxybenzene, I, II, and the N-oxides of N-methyl-morpholine, triethylamine, tributylamine, N,N-dimethylaniline, pyridine, and 4-nitropyridine are discussed in terms of electronic and steric effects on the nucleophilicity of the semiionic oxygen of the N-oxide link.

SYNTHESIS AND PROOF OF STRUCTURE OF 9-HYDROXYALDEHYDES AND 9-HYDROXYKETONES IN THE ANTHRACENE SERIES (Abstract), by J. L. Ferrari and I. M. Hunsberger. [1959] [1]p. [AF 18-(603)127] Unclassified

Presented at meeting of the Org. Chem. Div. of the Amer. Chem. Soc., Atlantic City, N. J., Sept. 13-18, 1959.

Published in 136th meeting of the Amer. Chem. Soc., Abstracts of Papers, 1959, p. 21-P.

Previous studies of double-bond character in aromatic systems have been extended to anthracene. The work here indicates that substances such as 2-anthrol can be transformed readily into both 2,1- and 3,2-disubstituted anthracenes. Apparently the end rings of anthracene are more benzenoid than either ring of naphthalene, in rough agreement with valence-bond calculations based on canonical structures which include Dewar types.

SYNTHESIS OF SOME SUBSTITUTED PYRIDYLSYDNONES (Abstract), by C. V. Greco and I. M. Hunsberger. [1960] [1]p. [AF 19(603)127] Unclassified

Presented at meeting of the Org. Chem. Div. of the Amer. Chem. Soc., Cleveland, Ohio, Apr. 5-14, 1960.

Published in 137th meeting of the Amer. Chem. Soc., Abstracts of Papers, 1960, p. 71-O.

The phenomenon of phototropy unexpectedly was exhibited by the first N-heteroaryl derivative of a sydnone, i.e. N-(3-pyridyl)sydnone (I). Synthesis of the 1-oxide (II) of N-(3-pyridyl)sydnone, of N-(5-bromo-3-pyridyl)sydnone (III), and of the 1-oxide (IV) of N-(5-bromo-3-pyridyl)sydnone were undertaken in order to study the effect on phototropy exerted by substituents on the pyridine ring. Compounds II and III were prepared via the corresponding aminopyridines and N-pyridylglycines by the general procedure used earlier to prepare I. The required 3-aminopyridine 1-oxide and 3-amino-5-bromopyridine were obtained by Hofmann rearrangement of the corresponding amides. An excellent preparation of 5-bromonicotinamide from nicotinic acid was developed which involves bromination in thionyl chloride, followed by reaction of the bromoacid chloride with ammonia in chloroform. Proof of structure II and III was accomplished by acid hydrolysis to the corresponding hydrazines which were isolated, as acetophenone 3-pyridylhydrazone 1-oxide and as 5-bromo-3-pyridylhydrazine hydrochloride. These products were identical with samples prepared by reduction of the respective diazotized atoms. Although 3-amino-5-bromonicotinamide 1-oxide was prepared conveniently from 5-bromonicotinamide 1-oxide, attempts to prepare the corresponding glycine by catalytic hydrogenation of a mixture of the amine and butyl glyoxylate afforded, in acid solution N-(3-pyridyl)glycine and, in neutral or alkaline solution, the 1-oxide of N-(3-pyridyl)glycine. Both these products resulted from a reductive cleavage of the bromine atom. Neither II nor III was phototropic. Infrared absorption bands characteristic of the CH of the sydnone ring have been identified.

STUDY OF PROPERTIES OF MEDIUM-WEIGHT NUCLEI, by D. M. Van Patter, R. Rikmenspoel and others. Final rept. Nov. 1, 1958 - Oct. 31, 1962, Dec. 31, 1962 [69]p. incl. diagrs. tables, refs. (AFOSR-4422) (AF 49(638)512) AD 297041 Unclassified

The properties of low-lying levels of medium-weight nuclei were of primary interest in these investigations. Initially, comprehensive surveys were carried out of available experimental information concerning the γ-ray decay properties of the first two 2^+ states of the even-even nuclei, together with comparisons to available theoretical predictions, such as provided by the asymmetric rotor model of Davydov and Filippov. The experimental program of γ-ray scintillation spectroscopy began with a feasibility study of γ-radiations from inelastic proton scattering, since it was not known if the γ-ray decay properties of the second 2^+ states of medium-weight nuclei could be investigated by this method. It was found that the yield of such radiations was quite favorable at proton energies of about 5 mev, provided that the (p,n) threshold for the target isotope exceeded about 4.5 - 5.0 mev. An initial survey of (p, p'γ) spectra from isotopes of Zn, Ge, and Se was then carried out, and later extended to the isotopes of Ni. This work provided evidence for several new levels in these isotopes, as well as information concerning the γ-ray branching of second 2^+ levels. The γ-ray spectra from some of these short-lived activities (such as Cu^{62}, Ga^{68}, Br^{78}, and Br^{80}) were subjected to close scrutiny to discover if any new information would be revealed. In the case of the 18-min Br^{80} activity, 5 new γ-ray's were detected. This resulted in a considerable revision of the Br^{80} decay scheme, and provided estimates of the log ft values for allowed beta-transitions from Br^{80} (1+) to the ground-state and first 2 excited states of Se^{80} and Kr^{80}.

ANGULAR DISTRIBUTIONS OF (p, p'γ) RADIATIONS FROM Ni^{60} AND Ni^{62} (Abstract), by A. K. Sen Gupta, P. N. Trehan, and D. M. Van Patter. [1962] [1]p. [AF AFOSR-62-217] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 81, Jan. 24, 1962.

Self-supporting foils of enriched Ni^{60}(99.2%) and Ni^{62}(97.7%) of 2.6 mgs/cm^2 have been bombarded by protons with E_p = 4.4 to 5.0 mev, incident at an angle of 46°. The target thicknesses were chosen to attempt to provide statistical averaging over many compound states. Angular distributions of prominent (p, p'γ) radiations have been measured for θ = 0 to 150°, using a 3 x 3 in. NaI(Tl) crystal at 14 cm. The observed angular distributions of the ground-state transitions from the 1.33- and 2.16-mev levels of Ni^{60}, and the 1.17- and 2.30-mev levels in Ni^{62}, were similar in nature. The angular distribution of the 0.83-mev cascade γ-ray from the second 2^+ state of Ni^{60} at 2.16 mev showed a considerably greater yield at 0 than at 90°. The angular distribution of the 0.88-mev cascade γ-ray from the second level of Ni^{62} at 2.05 mev appeared to be roughly isotropic. This observation, together with the lack of an observed 2.05 mev ground-state transition (< 0.03 of the intensity of the 0.88-mev γ-ray), is consistent with the possibility that the 2.05-mev level may be 0^+, and that the 2.30-mev level may be the second 2^+ state. The 2.05-mev γ-ray reported previously at $E_p \geq 5.0$ mev should be assigned to the decay of a higher state.

FIELD DEPENDENCE OF THE SUSCEPTIBILITY IN ANTIFERROMAGNETS (Abstract), by S. Shtrikman. [1962] [1]p. [AF 49(638)159] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 279, Apr. 23, 1962.

The relevance of the second-order terms in the field dependence of the magnetization for the study of weak ferromagnetism has been recently recognized by Treves. Symmetry considerations show that such non-linearity (the "treves effect") may also appear in antiferromagnets. Out of the 59 antiferromagnetic classes, it is allowed in 27. The symmetry of the effect which is closely related to that ferromagnetic effect is in this case either of 2 types, cubic or hexagonal. A classical estimate showed that the magnitude of the Treves effect of 0°K is 10^{-10} emu/ccoe^2 and 4×10^{-8} emu/ccoe^2 for FeF_2 and CoF_2, respectively. From the Landau theory of second-order phase transitions, it was found that near the Néel temperature the Treves effect should vary linearly with the sublattice magnetization. A method which would enable the measurement of this effect on a polycrystal is described.

OBSERVATION BY ELECTRON MICROSCOPY OF THE FERROMAGNETIC PRECIPITATE IN GOLD-NICKEL SINGLE CRYSTALS, by F. R. L. Schoening and P. J. Flanders. [1962] [3]p. incl. illus. table. [AF 49(638)-158] Unclassified

Published in Philos. Mag., v. 7: 1069-1071, June 1962.

Recent magnetic experiments with gold-nickel specimens have indicated that the Ni-rich precipitates are elongated in the ⟨111⟩ directions of the original supersaturated crystal. The electron microscope study was undertaken in order to obtain an independent test of the interpretation of the magnetic data. The results discussed complicate the interpretation of the magnetic data, since not only the elongated shape but also the plate-like shape of the particles should be taken into account. The previous interpretation of the magnetic data had been based on the assumption of single domain particles. Some of the particles observed appear to be larger than the critical single domain size. It seems, however, appropriate to postpone a discussion of the magnetic results until not only the size and shape but also the orientation of the precipitates has been observed directly by thin film techniques.

A VARIATIONAL APPROACH TO THE THEORY OF THE EFFECTIVE MAGNETIC PERMEABILITY OF MULTIPHASE MATERIALS, by Z. Hashin and S. Shtrikman. [1962] [7]p. incl. diagrs. [AF 49(638)159] Unclassified

Published in Jour. Appl. Phys., v. 33: 3125-3131, Oct. 1962.

Variational theorems are established and applied to the derivation of bounds for the effective magnetic permeability of macroscopically homogeneous and isotropic multiphase materials. For reasons of mathematical analogy the results are also valid for the dielectric constant, electric conductivity, heat conductivity, and diffusivity of such materials. For the case of 2 phase materials, the bounds derived are the most restrictive ones that can be given in terms of the phase permeabilities and volume fractions. Comparison of present theoretical results with existing experimental data shows good agreement. (Contractor's abstract)

A STUDY OF THE PLASTIC DEFORMATION OF METALS BY THE OBSERVATION OF SINGLE DISLOCATIONS, by H. G. F. Wilsdorf. Final rept. Dec. 21, 1956 - Feb. 28, 1962 [60]p. incl. illus. diagrs. tables, refs. (Rept. no. F-A2027) (AFOSR-2777) (AF 49(638)-162) AD 278554 Unclassified

Research was aimed to further the understanding of the mechanism of plastic flow in metals. This goal was approached by making use of new submicroscopical techniques which allow atomistic lattice defects to become visible to the naked eye, and by utilizing macroscopic measurements of highest sensitivity. The development and the efforts to perfect 3 selected experimental techniques, namely, 2 methods for observing dislocations directly as well as microstrain measurements, are discussed. The results explain the plastic behavior of alpha - brass in terms of glide dislocations which are most important lattice defects responsible for plastic flow in this metal. For the first time, it has been possible to obtain quantitative data pertaining to the general behavior and the motion of dislocations, including the frictional force acting on the dislocations, during glide. DISLOCATION MECHANISMS IN 70/30 CuZn DEDUCED FROM PRECISION STRESS-STRAIN MEASUREMENTS (Abstract), by P. R. Strutt. [1962] [1]p. [AF 49(638)-162] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 198, Mar. 26, 1962.

Accurate stress-strain measurements have been made on single crystals of 70/30 CuZn of diameter 0.5-0.6 mm with a 2-cm gauge length. The smallest measurable strain is $\sim 10^{-6}$, and the pre-yield microstrain and yield-point regions have been examined at high-strain sensitivities. There is a departure from the elastic-unloading curve before zero load is reached, and a closed hysteresis loop is formed on reapplication of the load. This anelastic behavior is attributed to relaxing groups of dislocations, and the frictional force can be evaluated. To gain further insight on dislocation distributions and interactions, electron-transmission studies have been made on thin films prepared from bulk specimens. These confirm the concept that dislocations are arranged in groups and that sets of dislocations on nearby slip planes strongly interact elastically. Heavy deformation can occur in isolated regions at a strain of only $\sim 10^{-3}$, and several systems may operate. Dislocations of different systems can react to form sub-boundaries. Generally, however, single slip greatly predominates even for crystal strained 10^{-1} near a crystallographic-symmetry position.

RESEARCH IN THE GENERAL FIELD OF SUBSTRUCTURE AND DISLOCATION NETWORKS IN METALLIC CRYSTALS, by V. V. Damiano, G. S. Tint, and M. Herman. Final rept. Apr. 1, 1960 - Apr. 30, 1962, 44p. incl. illus. diagrs. refs. (AFOSR-2574) (AF 49-(638)821) Unclassified

The three dimensional aspects of dislocation substructures were studied in cadmium doped zinc crystals grown from the melt. Precipitates delineating the dislocations were revealed by etching a surface closely parallel to the slip plane. Using a technique of continuous etching and cinephotomicrography, the course of the dislocations was followed through the crystal. Tangles of dislocations were observed in deformed crystals. After annealing, a rearrangement of dislocations into low-angle and hexagonal networks was evidenced. Closed loops and spiral dislocations were found to be associated with large inclusions. A mechanism for the multiplication of dislocations at inclusions was proposed. Dislocation reactions accounting for the observed substructures have been proposed. (Contractor's abstract)

EXPERIMENTAL DETERMINATION OF STABILITY BOUNDARIES FOR AN EXTERNALLY PRESSURIZED, GAS-LUBRICATED THRUST BEARING, by C. Stevenson and L. Licht. Feb. 1962, 35p. incl. diagrs. tables. (Rept. no. I-A2049-19) (Sponsored jointly by [Air Force Office of Scientific Research] and Office of Naval Research under Nonr-234200, Atomic Energy Commission, Dept. of Defense, Maritime Administration, and National Aeronautics and Space Administration) AD 272899 Unclassified

Stability boundaries are determined experimentally for a circular, externally-pressurized air-lubricated thrust bearing. The loci are presented on load vs supply pressure plots, showing the effects of variation of the following parameters on the stability of a 5 in. diameter bearing with a 1 in. diameter, centrally located recess; (1) recess depth, (2) total throat area of supply nozzles, and (3) rotor mass. The influence of entrance effects in the region of admission of the bearing gap is investigated qualitatively. Results are discussed with reference to stable bearing design and operation and recommendations are made for future theoretical and experimental work. (Contractor's abstract)

AUDITORY-EVOKED POTENTIALS FROM COCHLEA TO CORTEX AS INFLUENCED BY ACTIVATION OF THE EFFERENT OLIVO-COCHLEAR BUNDLE, by J. E. Desmedt. [1962] [19]p. incl. illus. diagrs. refs. (AFOSR-J169) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)120 and National Institute of Neurological Diseases and Blindness) AD 400431 Unclassified

Also published in Jour. Acoust. Soc. Amer., v. 34: 1478-1496, Sept. 1962.

The crossed olivo-cochlear bundle (OCB) of Rasmussen was stimulated stereotaxically on cats immobilized by Flaxedil and prepared either under pentobarbital, or chloralose, or with a high-spinal section. Middle-ear muscles were cauterized. The efferent effects on sound-evoked potentials were titrated as equivalent dB changes in sound energy by a matching procedure taking into account the intensity function of the responses to sound alone. Maximal inhibition of the N_1 auditory-nerve response to clicks was equivalent to a ~25-dB decrease. The potentials evoked in cochlear nucleus, superior olive, inferior colliculus, medial geniculate, and auditory I area of the cerebral cortex when expressed similarly in equivalent dB changes, disclosed a decrease proportional to that of N_1. The anomalous Ruben-Sekula effect was shown not to involve the OCB inhibition but to depend on a cortical refractory state subsequent to spurious stimulation of second-order auditory axons by inadequately placed electrodes. With suitable precaution, pure OCB stimulation was achieved in most of the experiments, and interference from this effect thus excluded. The OCB activation also paradoxically potentiates the cochlear microphonic potential, but the change amounted at most to a +4 equivalent-dB increase in sound energy. Various parameters of OCB

effects were analyzed in detail; voltage, duration, frequency and number of shocks delivered to the bundle and interval between the conditioning stimulation and the testing sound. More than 3 shocks at a frequency higher than 50/sec are needed to produce detectable changes in N_1 or CM and 40 shocks at 400/sec will generally produce maximal effects. (Contractor's abstract)

[MECHANISM OF THE ACTION OF THE RETICULAR FORMATION ON THE REACTIVE ACTIVITY OF THE CEREBRAL CORTEX] Mécanisme d'action de la formation réticulaire sur l'activité réactionnelle de l'écorce cérébrale, by V. Bonnet. [1962] [3]p. incl illus. (AFOSR-J407) (AF 61(052)120) Unclassified

Also published in Compt. Rend. Séances Acad. Sci., v. 254: 2081-2083, Mar. 1962.

The work devoted to the effects of the ascending reticular system on the spontaneous electrical potentials and its evoked derivatives on the surface of the cerebral neocortex have not established the nature of the working mechanism. The important points of the mechanism are registered in the depth of the cortex, thus making a different approach necessary. The observations of this paper are carried out on different sensory areas of the cat. The electrical activity was caused, by the stripped end of a steel microelectrode. Under these conditions, the participation in the discharge of the most numerous neurons may be attributed to the lowering of the observed discharge of the nerve on the facil response. This reduction of critical voltage in the discharge of the nerve cells seems to be the base of the facilitation pheonn.enon, resulting in the superposition of the reactive synpatic potential to a preliminary dipolarization.

[STUDY OF AN INHIBITORY PHENOMENON OF WEDENSKI AT THE CORTICAL LEVEL] Étude d'un phénomène d'inhibition de Wedenski au niveau cortical, by F. Bremer and N. Stoupel. [1962] [16]p. incl. illus. refs. (AFOSR-J413) [AF 61(052)120] AD 414180 Unclassified

Also published in Arch. Ital. Biol., v. 100: 399-414, Oct. 1962.

In the cat, the response of the primary auditory area to repetitive sensory stimulation is presented, starting at a frequency of about 10 clicks per sec. At this frequency, Wedenski inhibition appears and is characterized by the disappearance of the highly amplified surface-negative component and by the indefinite persistance of very short surface-positive potentials. The mechanism of an intracortical, homosynaptic blockage of sensory influxes and the mechanism of its self-maintenance are discussed.

[ELECTROPHYSIOLOGICAL STUDY OF BINOCULAR INTERACTION IN THE CORTICAL VISUAL AREA OF THE CAT] Étude électrophysiologique de l'interaction binoculaire dans l'aire visuelle corticale du Chat, by F. Bremer. [1962] [4]p. incl. illus. (AFOSR-J419) (AF 61(052)120) AD 414188 Unclassified

Also published in Compt. Rend. Séances Acad. Sci., v. 255: 2040-2043, Oct. 1962.

Photic stimulation of the cat's retina or electrical shock of the optic nerves confirms the fact that the binocular interaction is very important to the cortical level. The neuron convergence contrasts with the segregation maintenance of the visual influx in the lateral geniculate body. One of the most interesting manifestations of this convergence is the marked facilitation of the cortical response produced by the slow addition of 2 shocks to the optic nerve applied simultaneously or at very short intervals. The characteristics of this phenomenon are very similar to those of the facilitation of the monosynaptic spinal reflex through heterosynaptic convergence.

ON THE EXISTENCE OF CROSS FLOWS IN SEPARATED SUPERSONIC STREAMS, by J. J. Ginoux. Feb. 1962 [75]p. incl. illus. diagrs. table. (Technical note no. 2) (AFOSR-3422) (AF 61(052)350) AD 274761 Unclassified

An experimental investigation was made on laminar separated supersonic streams using 2-dimensional backward-facing step models. It was shown that a cross-flow existed in the separated region of the flow which is associated with the side wall boundary-layers. Its effect is to decrease the base pressure and increase the pressure gradient at reattachment even for large values of the model-span to step-height ratio. It is shown that the commonly accepted assumption that a 2-dimensional flow exists when there is no measurable spanwise pressure variation is a necessary but not sufficient condition. In the turbulent case, it is generally found that the measured base pressure is lower than is theoretically predicted. This is explained by the existence of a cross-flow (suction) produced by strong vertical vortices near the side walls. (Contractor's abstract)

EFFECT OF GAS INJECTION IN SEPARATED SUPERSONIC FLOWS, by J. J. Ginoux. Final rept. Feb. 1962 [36]p. incl. illus. diagrs. table, refs. (Technical rept. no. 7) (AFOSR-3764) (AF 61(052)350) Unclassified

An experimental investigation has been made at a Mach number of 2.21 on the effect of air injection in separated supersonic flows using 2-dimensional backward facing step models. This effect, in a laminar flow, was found to be independent of the particular technique of injection when the rate of injection was small. Air injection raises the base pressure and decreases the pressure gradient at reattachment. At high rates of injection, considerable differences are found between the results obtained for various techniques of injection. It was also shown that the increase of the base-pressure is larger in the turbulent case than for a laminar boundary layer. When freon gas was injected, it produced the opposite effect, namely of decreasing the base-pressure at low rates of injection. (Contractor's abstract)

ON THE OCCURRENCE OF BACTERIAL MUTATIONS PERMITTING LYSOGENIZATION BY CLEAR VARIANTS OF TEMPERATE BACTERIOPHAGES, by R. Thomas and L. Lambert. [1962] [2]p. incl. refs. (AFOSR-3179) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-62-17, Belgian Fonds National de la Recherche Scientifique, and Euratom) AD 400341 Unclassified

Also published in Jour. Molec. Biol., v. 5: 373-374, Sept. 1962.

This paper describes a class of single-step bacterial mutations (temperator mutations) which alter the response after infection. The mutated strains can be lysogenized by the clear mutant λC_{72}, which belongs to class c_1 and does not lysogenize the indicator strain C600 to any measurable extent under the usual conditions. A streptomycin resistant (Sm^r) derivative of C600 was found to yield turbid plaques when used as an indicator for λC_{72}. From such turbid plaques, and also from survivors of a multiple infection with λC_{72} in liquid medium, strains of C600 were isolated which could be shown to be lysogenic for λC_{72}. After repeated single colony isolations and 2 treatments with specific antiserum, these strains have the following properties: (1) they are immune to λ which does not produce plaques on these bacteria; (2) each colony produces a halo when replica-plated onto a sensitive strain; (3) they can be induced to lyse, liberating phages which are apparently identical with λC_{72}, and (4) derivatives unable to adsorb λ still liberate phage, a fact which excludes the hypothesis of a carrier state.

STATISTICAL MECHANICS OF NON-EQUILIBRIUM PROCESSES, by I. Prigogine. Final rept. Apr. 1, 1962, 1v. incl. diagrs. refs. (AFOSR-2690) (AF 61(052)179) AD 289161 Unclassified

A general theory of irreversibility is constructed from the perturbation analysis of the Liouville equation in Fourier space, which essentially takes the form of a dynamics of correlations. General kinetic equations valid to all orders of the parameters of the system are derived and a generalized H-theorem is proved. The extension of the theory to inhomogeneous systems is made. The formal analogy between the Liouville and the Von Neumann equations provides the basis for the complete transposition of the theory to quantum mechanics. In its applications to plasmas, both quantum and classical, the theory leads in particular to kinetic equations which give a rigorous expression of the collective nature of the Coulomb interactions. The Liouville formalism also finds interesting applications in classical electrodynamics. An example, a non-markoffian equation for electron motion is derived which exhibits none of the unphysical solutions usually encountered. (Contractor's abstract)

KINETIC EQUATION FOR AN UNSTABLE PLASMA, by R. Balescu. 1962, 39p. incl. illus. refs. (AFOSR-3487) (AF EOAR-62-16) AD 285451 Unclassified

A kinetic equation is derived for the description of the evolution in time of the distribution of velocities in a spatially homogeneous ionized gas which at the initial time is able to sustain exponentially growing oscillations. This equation is expressed in terms of a functional of the velocity distribution which obeys the same integral equation as in the stable case. The nature of the solution changes radically under unstable conditions

is shown. This integral equation is solved exactly and hence an explicit form of the kinetic equation is obtained. The latter contains the 'normal' collision term and a new additional term describing the stabilization of the plasma. The latter acts through friction and diffusion and brings the plasma into a state in which the velocity distribution is on the verge of stability. The stabilizing term vanishes and the plasma evolves towards thermal equilibrium under the action of the normal collision term alone. (Contractor's abstract)

CORRELATIONS IN A NON-ISOTHERMAL PLASMA, by I. Prigogine and P. de Gottal. [1962] [8]p. (AFOSR-3944) (AF EOAR-62-16) AD 290053 Unclassified

Also published in Physica, v. 29: 706-711, June 1963.

It is well known that ions and electrons at different temperatures can coexist in a plasma at low enough pressure. The canonical distribution cannot then be used to calculate electron-ion correlations or the equation of state. Nevertheless, the method developed by Prigogine and co-workers can still be used to calculate these quantities in terms of the corresponding creation diagrams. In this method, the correlations are seen as due to the mutual scattering of ions and electrons with the double Maxwell distribution as an asymptotic condition. (Contractor's abstract)

MOTION OF A RELATIVISTIC CHARGED PARTICLE, by I. Prigogine and F. Henin. [1962] [22]p. incl. diagrs. refs. (AFOSR-64-0057) (AF EOAR-62-16) AD 431165 Unclassified

Also published in Physica, v. 28: 667-688, July 1962.

A covariant formalism is developed which contains both relativistic Lorentz-Dirac (point-particle) electrodynamics and the Sommerfield electron theory as special cases. Since this is a proper relativistic generalization of the extended charge model, difficulties concerned with run-away solutions, negative definite energies, and auxiliary fields are avoided ab initio. The essential point of this approach is to cut off the momentum representation of the vector potential in an invariant way- the scalar product of the velocity and wave 4-vectors is used to fix this quantity. Various dynamical consequences of the formalism are discussed. In particular, it is pointed out that for times short compared to the electron transit time, force free self-oscillations may appear.

ROLE OF SULFHYDRYL AND DISULFIDE GROUPS, by J. Brachet. Final rept. Feb. 1, 1960-Mar. 31, 1962. Apr. 31, 1962, 21p. incl. refs. (AFOSR-2668) (AF 61(052)356) AD 401257 Unclassified

Research was conducted to extend previous observations of the effects of -SH and -SS-groups on some biological systems and to analyze in greater detail the

results regarding the role of thiol groups in morphogenesis. The possible effects of mercaptoethanol and dithiodiglycol on cell division in systems which had not yet been examined in this respect were also studied. The aim of these latter experiments was to find out whether mercaptoethanol inhibits cell division by a specific action on the mitotic apparatus, as suggested by Mazia.

EFFECTS OF β-MERCAPTOETHANOL AND LIPOIC ACID ON MORPHOGENESIS, by J. Brachet. [1962] [3]p. (AFOSR-3457) (AF 61(052)356) Unclassified

Also published in Nature, v. 193: 87-88, Jan. 1962.

The new observations concerning the biological and biochemical effects of mercaptoethanol and lipoic acid on developing amphibian eggs are discussed. It can be concluded from the experiments described that lipoic acid, if used at a sufficient concentration, is as efficient as mercaptoethanol in stopping morphogenesis; the biochemical mode of action of the 2 substances is certainly complex and it remains to be seen whether they act on the same metabolic step or not.

[THE EFFECTS OF β-MERCAPTOETHANOL AND DITHIODIGLYCOL ON THE GROWTH OF ESCHERICHIA COLI AND OF SACCHAROMYCES CEREVISIAL] Les effets du β-mercaptoethanol et du dithiodiglycol sur la croissance of eschericia coli et de saccharomyces cerevisiae, by S. Limbosch-Rolin. [1962] [12]p. incl. diagrs. tables, refs. (AFOSR-J466) (AF 61(052)356) AD 412872 Unclassified

Also published in Exper. Cell Research, v. 29: 61-72, Jan. 1962.

The effects of β-mercaptoethanol, a reducing substance with a -SH group, on the growth and redox potential of bacterial and yeast cultures have been studied. Both substances inhibited cell division in these microorganisms, but this action does not appear to be due to any change in the redox potential of the culture medium. The reduction of dithiodiglycol to mercaptoethanol in the presence of bacteria and yeasts can be attributed to the action of a disulfide reductase identified in yeasts by Thompson. The respiratory process does not appear to be the essential target of mercaptoethanol inhibition, since the latter occurs whether the yeast cells are able to respire or not.

Also published in Develop. Biol., v. 6: 113-131, Feb. 1963.

The biochemical effects of β-mercaptoethanol (which inhibits neural tube closure) have been studied in amphibian gastrulae and neurulae, and in the alga Acetabularia. It has been found that: (1) Total and acid soluble -SH groups definitely increase in mercaptoethanol-treated eggs, (2) S^{35}-Mercaptoethanol is incorporated into the proteins of both amphibian embryos and Acetabularia. The radioactivity of the proteins represent 25% of the total radioactivity in the treated eggs and varies between 10 and 25%, according to culture conditions, in Acetabularia; (3) Autoradiography observations and work on homogenates have shown that S^{35}-mercaptoethanol is incorporated mainly into the pigment granules and yolk platelets of the animal half and later, of the dorsal half of the embryo. In Acetabularia, the incorporation is highest in the nucleus and in the apical part of the stem; (4) It was not possible to detect by electrophoresis the appearance of a new soluble -SH-containing protein in mercaptoethanol-treated eggs. Most of the radioactivity is found in the basic protein fraction after treatment with S^{35}-mercaptoethanol of amphibian eggs; and (5) Amphibian eggs contain no ecto-ATPase, and mercaptoethanol treatment has no appreciable effect on their endo-ATPase. The significance of these results for an explanation of the morphostatic effects of mercaptoethanol is discussed.

[SULFHYDRIL GROUPS AND MORPHOGENESIS. IV. EFFECTS OF β-MERCAPTOETHANOL AND α-LIPOIC ACID ON THE METABOLISM OF NUCLEIC ACIDS IN AMPHIBIAN AND CHICKEN EMBRYOS] Groupes sulfhydriles et morphogénèse IV. Effets du Mercaptoéthanol et de L'acide-α-Lipoique sur le métabolisme des acides nucléiques chez les embryons de batracien et de Poulet, by V. Pohl and J. Ouertier. [1962] [13]p. incl. tables, refs. (AFOSR-J569) (AF 61-(052)356) AD 407386 Unclassified

Also published in Jour Embryol. and Exper. Morphol., v. 11: 293-305, Mar. 1963.

A study was made of the incorporation of nucleic acid precursors (thymidine, uridine, cytidine) in 2 embryonic materials: Pleurodeles and Chicken, in the presence of 2 substances known to have a morphostatic effect on the closure of the neural plate: β-mercaptoethanol and lipoic acid. The results reveal a marked similarity of action. Thymidine incorporation into DNA is stimulated by mercaptoethanol and lipoic acid. Both substances also stimulate the incorporation of cytidine and uridine into RNA. But there is a difference in the case of DNA: mercaptoethanol has a slight stimulatory effect on the incorporation of the 2 nucleosides, whereas lipoic acid is definitely inhibitory. All the evidence suggests a specific effect of lipoic acid on the reduction of ribonucleosides to deoxyribonucleosides. (Contractor's abstract)

SULFHYDRYL GROUPS AND MORPHOGENESIS. I. EFFECTS OF β-MERCAPTOETHANOL, α-LIPOIC ACID, ATP, AND OXALOACETATE ON EMBRYONIC DEVELOPMENT IN AMPHIBIANS] Groupes sulfhydriles et morphogénese. I. Effets du β-mercaptoéthanol, de l'acide α-lipoique, de l'acide adénosinetriphosphorique et de l'oxaloacétate sur le développement embryonnaire des Batraciens, by J. Brachet. [1962] [18]p. incl. illus. refs. (AFOSR-65-2244) (AF 61(052)356) AD 629461 Unclassified

Also published in Develop. Biol., v. 7: 348-364, Mar. 1963.

The effects of mercaptoethanol, lipoic acid, ATP and oxaloacetate, alone or in combination, have been studied in eggs of 4 different species of amphibians. The effects of mercaptoethanol (M/100) and lipoic acid (30-30mg/ml) are remarkably similar; cleavage is little affected, but gastrulation and neural plate closure are strongly inhibited. At lower concentrations, the outgrowth of the tail is strongly reduced. Mercaptoethanol and lipoic acid, if mixed together, have additive effects. ATP, which speeds up neural plate closure, is antagonistic to both mercaptoethanol and lipoic acid so far as neurulation is concerned. It has no effect on the outgrowth of the tail. Oxaloacetate, like other tricarboxylic cycle intermediates, has unfavorable effects on neural tube closure. It often improves the elongation of the tail in lipoic acid-treated embryos. [KIDNEY FUNCTION DURING BILATERAL CLAMPING OF THE CAROTID ARTERIES IN THE DOG] Die Nierenfunktion wahrend doppelseitiger Carotisabklemmung am wachen Hund, by L. Sommyay, H. L. Thron and others. [1962] [25]p. incl. diagrs. tables, refs. (AFOSR-J458) Unclassified

Also published in Pflugers Arch. Physiol., v. 276: 117-141, 1962.

The effect of occluding both common carotid arteries for 90-150 min on PAH- and inulin-clearance, on excretion of urine, Na, K, Cl and total solids, and on urine osmolarity was studied. The results were as follows: (1) During occlusion of the carotid arteries, the NaCl-excretion as well as the osmolar clearance increases significantly, the magnitude of the rise depending on the level of electrolyte excretion before the occlusion. K-excretion showed a slight increase. The changes in Na-Cl-excretion were promptly reversible after ending the occlusion; (2) Neither urine excretion, osmotic U/P ration nor excretion resp. reabsorption of osmotic free water revealed definite changes. From these results, it remains questionable if changes in renal medullary blood flow are mainly involved in the kidney's response to carotid occlusion; and (3) With renal blood flow remaining nearly unchanged, glomerular filtration rate as well as filtration fraction increased definitely in most of the experiments, in which NaCl-excretion showed an increase too. The increase in electrolyte excretion during carotid occlusion is discussed as being caused mainly by the observed increase in glomerular filtration rate which itself is induced by the rise in arterial blood pressure.

[THE ELIMINATION FUNCTION OF THE KIDNEY AFTER RAPID INFUSION OF COOKING SALT AND COOKING SALT FREE SOLUTION] Die ausscheidungsfunktion der niere nach schneller infusion kochsalzhaltiger und kochsalzfreier lösung, by K. Pabst. [1961] [10]p. incl. diagrs. tables, refs. (AF 61(052)31) Unclassified

Also published in Pflügers Arch. ges Physiol., v. 273: 315-324, July 1961.

Renal function was investigated in unanesthetized dogs during rapid expansion of blood volume and extracellular fluid volume by rapid infusion of isotonic saline and hypotonic dextrose solutions. The typical excretion pattern could be divided into 3 phases (phase 1 (1-30 min), phase 2 (31-90 min), and phase 3 (91-300 min) after beginning of infusion. Phase 1 was characterized by a fast rise of glomerular filtration rate and renal plasma flow and an increase in urine volume and sodium excretion in both groups. In phase 2 and 3, the influence of GFR and RPF was reduced, and a study of the excretion patterns suggests predominance of hormone mechanisms (ADH and aldosterone) probably activated by volume regulatory or osmoregulatory stimuli. The rise in GFR and RPF may be caused by reduction of blood viscosity combined with a rise in arterial blood pressure. A reflex vasodilatation of renal vessels may tentatively be attributed to a rise in central venous pressure. (Contractor's abstract)

CIRCULATORY BASIS OF FLUID VOLUME CONTROL, by O. H. Gauer and J. P. Henry. [1962] [59]p. incl. illus. tables, refs. (AF 61(052)31) Unclassified

Published in Physiol. Rev., v. 43: 423-481, July 1963.

The status of the high-pressure or arterial system is primarily determined by the regulation of cardiac output and the tone of the resistance vessels. It is proposed that corresponding parameters for the low-pressure system are the blood volume and the tone of the capacitance vessels, which together determine the "fullness of the blood stream." The fullness of the blood stream is an important determinant of cardiac performance. The concept is also advanced that volume regulation is an integral part of over-all cardiovascular regulation, the latter of which has hitherto been primarily considered with regard to adjustments of pressor or depressor activity affecting the heart and vascular wall tension. The control of the 2 systems seems to depend on the total sensory input from receptors in both low- and high-pressure regions. Evidence is presented which suggests that this input may be integrated into information describing the performance of the heart in relation to the load imposed on it ("competence" of the heart). In the case of the low-pressure system the adjustment of the contained volume is

of greater importance for homeostasis than the adjustment of capacity. The latter appears to have an emergency function. Volume regulatory activity has been judged from changes of mineral and water excretion by the kidney. It is concluded that the controls of water and mineral excretion are relatively indpendent, and that the system responsible for the regulation of water excretion are more sensitive and react faster than do those concerned with minerals. The equally important parameters of regulation of plasma proteins and blood cell volume have not been considered.

SPHERICALLY SYMMETRIC MODELS IN RELATIVISTIC AND NEWTONIAN COSMOLOGY, by K. Just and K. Kraus. [1962] [10½p. incl. refs. (AFOSR-3926) (AF 61(052)335) Unclassified

Also published in Zeitschr. Astrophys., v. 55: 127-136, June 1962.

The spherically symmetric solutions of Einstein's equation for an ideal fluid without pressure, having been found by several authors, are discussed. Special emphasis is laid on the specification of a particular model by initial conditions with an immediate meaning. The use of those local solutions for constructing global models with or without spherical symmetry is subject to interesting restrictions. These have practical importance for an inhomogeneous model, supposed to represent the universe somewhat better than Friedmann's homogeneous models. Here the new condition requires a density depression around each big cluster of galaxies. This however is very plausible, if one assumes the clusters to have concentrated from a homogeneous distribution; and it seems not to contradict the observations. The obvious defects of this treatment, that the cluster models are exactly spherical and must not rotate or overlap, cannot be removed so easily. But the most serious neglect seems to be that of pressure, thus it will be necessary to try to account for this at least approximately. It is shown that apart from its inherent incompleteness the Newtonian cosmology yields exactly the same local solutions, while the global models lead to questions of topology.

THEORETICAL RESEARCH STUDIES BY REACTING PLASMAS, by G. Ludwig. Final rept. July 31, 1962, 3p. (AFOSR-3537) (AF EOAR-61-48) AD 460156 Unclassified

The purpose of this paper was to adapt macroscopical equations for describing plasmas, starting from classical mechanics. This was achieved in the following ways: (1) Macroscopical Markovian flows in Γ -space were considered and the transition probabilities of the master equation, which holds for macroscopical Markovian flows, for the special case of a dilute gas were calculated; (2) Macroscopical determinated flows in Γ-space were considered and the Boltzmann-equation, a derivation of which was previously given, was generalized by taking into account collisions of the third order; and (3) Supposing some generalized Boltzmann equations, which are derived by intuitive methods and which describe a 2 component reacting system, the equations of motion for some macroscopical observables of interest were calculated. The basic Boltzmann equations are formulated by means of the multi-channel formalism of the classical mechanics.

SPECTROPHOTOMETRIC STUDIES OF SOME RED ALGAL CONSTITUENTS, by C. ÓhEocha. [1960] [14]p. incl. diagrs. table, refs. (AFOSR-2622) (AF 61(052)-409) Unclassified

Also published in Chimie et Physioco-chimie des Principes Immédiats tirés des Algues, Dinard (France) (Sept. 20-25, 1960), Paris, Centre National de la Recherche Scientifique, 1961, p. 121-134.

The fluorescent substances which have been described are added to the list of unusual products of red algal, particularly Rhodomelacean, metabolism. However, much further work will be required before they are fully characterized. That their distribution may be of taxonomic significance is indicated by the striking correlation between UV spectra of extracts and the accepted generic grouping of the Rhodomelaceae examined. However, because of their lability and the seasonal variation in their abundance, taxonomic inferences based on the distribution of these compounds must await a more detailed study. Similar caution applies to many other constituents of the red algae which undergo seasonal variation, e.g. peptides and brominated phenols. Nevertheless, results to date, including Yaphe's survey of red algal polysaccharides, indicate the potential usefulness of a thorough chemical survey of the red algae as an aid in their classification.

ZINC COMPLEX SALT FORMATION BY BILIRUBIN AND MESOBILIRUBIN, by P. O'Carra. [1962] [3]p. incl. diagr. (AFOSR-2911) (AF 61(052)409) AD 405539 Unclassified

Also published in Nature, v. 195: 899-900, Sept. 1, 1962.

It is generally accepted that rubins do not form zinc complexes since most bile pigments form brilliantly florescent zinc salts and the rubins did not fluoresce. Evidence is presented that addition of 2% methanolic zinc acetate to bilirubin changed the color from yellow (absorption max, 452 mμ) to saffron, (absorption max, 476 mμ), this process was reversible. Similar results were obtained with mesobilirubin. Since only acid-reversible reaction of the zinc ions with the rubins could be responsible for the spectral shifts (control experiments having shown that the acetate ions were not), this evidence indicates that bilirubin and mesobilirubin form nonfluorescent zinc complexes.

THE PHYCOBILINS, by C. ÓhEocha. [1962] [1]p. (AFOSR-4244) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)409 and National Science Foundation) Unclassified

Presented at 419th meeting of the Biochem. Soc., Inst of Rural Science, Penglais, Aberystwyth (Wales), Sept. 13-14, 1962.

Also published in Biochem. Jour., v. 85: 2P-3P, Nov 1962.

HCl (12N) is required to effect a release of protein-free pigment from C-phycocyanin, although the protein is readily denatured with loss of fluorescence by EtOH, urea, and acid. The difference spectrum of C-phycocyanin denatured with EtOH at pH 2.7 and 8.0 is identical with that of phycobilin 630 in the same solutions indicating that the prosthetic group of the biliprotein is phycobilin 630. Heating for 20 min in concentrated HCl, or standing for 7 hr in 12N HCl at 25° converts phycobilin 630 to a pigment having spectral properties similar to those of mesobiliviolin. On standing in 9-11N HCl, phycobilin 630 is converted to a pigment termed phycobilin 655, different in properties from mesobiliviolin. This pigment was also isolated from 12N HCl hydrolyzate of C-phycocyanin neutralized berore extraction into organic solvents. The difference spectrum of this pigment at pH 2.7 and 8.0 shows a max at 675 mμ compared with 658 mμ for phycobilin 630 and denatured C-phycobilin. Phycobilin 655 is dibasic with its diprotonated form dissociating with a pK of 3.5 and its monoprotonated form with a pK of 5.7. It is suggested that phycobilin 630 is hydrated on the vinyl side chains. R-phycoerythrin contains 2 dissimilar phycobilins, one of which is released by acid. The resulting phycoerythrobilin is a rhodinoid bile pigment isomerized by acid to a labile urobilin which forms unhydrolyzable linkages with compounds containing -SH groups in the protein of phycoerythrin. Ethyl mercaptan competes with the protein-SH groups.

PHYCOBILINS, by C. ÓhEocha. [1962] [12]p. incl. diagrs. tables, refs. (AFOSR-J702) (AF 61(052)409) AD 413637 Unclassified

Also published in Physiology and Biochemistry of Algae, ed. by R. A. Lewin. New York, Academic Press, 1962, p. 421-435.

Photosynthetically active red and blue biliproteins, called phycoerythrins and phycocyanins, respectively, have been isolated only from algae. Their prosthetic groups or chromophores are tetrapyrroles known as phycobilins. Unlike the chlorophylls, phycobilins are not readily released from associated proteins; hence biliproteins have been most generally studied. In this review, emphasis is placed on recent works. The study is in 5 parts: (1) Distribution and formation of the phycobilin-proteins (biliproteins), (2) Isolation and purification of the biliproteins, (3) Physical properties of the biliproteins, (4) Amino-acid composition of the proteins, (5) Preparation and properties of the phycobilins, and (6) Phycobilin-protein linkages.

THE STRUCTURE OF THE PHYCOBILINS, by C. OhEocha. Final rept. Sept. 29, 1962, 48p. incl. diagrs. tables, refs. (AF 61(052)409) AD 292679 Unclassified

The literature concerned with the chemistry of algal biliproteins is surveyed. Amino acid analyses of carefully purified samples of R- and C-phycoerythrin and of C-phycocyanin were performed. All 3 are characterized by a high percentage of dibasic and of hydrophobic amino acids. R-, B- and C-phycoerythrins were found to contain methionine as their N-terminal amino acid residue. A proteolytic enzyme preparation was obtained from the blue-green alga Phormidium persicinum. The phycoerythrobilin prosthetic group of R-phycoerythrin was purified and some of its physical and chemical properties determined. The urobilin obtained on isomerization of phycoerythrobilin in concentrated hydrochloric acid was studied, and a number of useful derivatives prepared. It was shown that 12N HCl is required to liberate the native prosthetic group of C-phycocyanin. Two other closely related pigments were isolated from this biliprotein and their physical and chemical properties studied. R-phycocyanin was shown to be a homogeneous chromoprotein containing subunits characteristic of phycoerythrin and of C-phycocyanin. (Contractor's abstract)

ACOUSTIC FIELD OF A CYLINDRICAL JET DUE TO A DISTRIBUTION OF RANDOM SOURCES OR QUADRUPOLES, by S. Slutsky. Feb. 1962, 58p. incl. diagrs. (Technical rept. no. 281) (AFOSR-2455) (AF 49(638)-194) AD 276032 Unclassified

A method is used to describe the field of a single harmonic oscillator to the description of the far field of a random distribution of sources and quadrupoles arising in an axisymmetric steady flow field. The random source distribution is described in terms of a spatial and temporal correlation function. Expressions are obtained for the mean square intensity and power spectral density of the acoustic noise field. The effect of eddy convection is not included. It is found that the assumption of a source mechanism results in a far field distribution which resembles those experimentally available, whereas the lateral quadrupole mechanism fails in this respect. (Contractor's abstract)

LINEARIZED FREE-MIXING WITH PRESSURE GRADIENT, by M. H. Steiger and M. H. Bloom. Apr. 1962, 26p. incl. diagrs. refs. (Technical rept. no. 285) (AFOSR-2613) (AF 49(638)991) Unclassified

The velocity fields of compressible 2-dimensional and incompressible axisymmetric viscous free-mixing regions with streamwise pressure gradients are examined with the use of the boundary layer approximations and Oseen's linearization of the convective terms. Solutions are derived for both wake-like flows (that is, velocities within the viscous region less than those in the external free stream), and jet-like flows (wherein the velocities in the viscous region are greater than those in the external free stream). In compressible cases, the energy equation admits a Crocco integral when the Lewis and Prandtl numbers are equal to unity, and a similar integral of the concentration equation is derived for $Le/\sigma = 1$ and $W_i \to 0$. However, only the condition of uniform stagnation enthalpy and an approximate equation of state (relating density to enthalpy) is utilized in the analysis. It is shown that the solution, for both 2-dimensional and axially symmetric flow, produces an infinite continuous set of eigenvalues and associated eigenfunctions that satisfy the appropriate boundary conditions at the axis and infinity. This is consistent with the fact that a solution is unique only if an initial distribution or eigenvalue is prescribed a priori. For completeness, only solutions that behave exponentially at large n are admitted and these results are discussed. (Contractor's abstract)

APPROXIMATE ANALYSIS OF THE SLOT INJECTION OF A GAS IN LAMINAR FLOW, by P. A. Libby and J. A. Schetz. [1962] [6]p. incl. diagrs. refs. (AF 49-(638)991) Unclassified

Published in AIAA Jour., v. 1: 1056-1061, May 1963.

The laminar diffusion and combustion of a gas injected into a high-speed uniform stream by means of a wall slot are considered. The Dorodnitzin-Howarth transformation is employed to reduce the boundary layer equations to incompressible form; the nonsimilar flow field is treated by a modified Oseen approximation in conjunction with the integral method. Thermal boundary conditions corresponding to an adiabatic wall and to constant wall enthalpy are discussed. The injection of homogeneous, heterogeneous, nonreactive, and reactive gases is treated. For the latter case, the models usually employed for chemical behavior, namely, frozen and equilibrium flow, are considered. The analysis is applicable to a wide variety of laminar flows, e.g., those

involving cooling, thermal protection, skin-friction reduction, and supersonic deflagration. A numerical example of practical interest in connection with the venting of gaseous hydrogen boiloff from a rocket booster is presented. (Contractor's abstract)

EXPERIMENTAL RESULTS ON SUPERSONIC COMBUSTION, by J. Tamagno and O. Lindemann. Dec. 1962, 35p. incl. illus. diagrs. (Technical rept. no. 322) (AF 49(638)991) AD 294809 Unclassified

Experiments on spontaneous combustion characteristics of hydrogen injected into a supersonic stream of hot air are described in detail. The results are presented and compared with a theory developed for premixed reactants. The experimental data show that if the initial static temperature and the static pressure of the air stream are high enough then diffusion will be rate controlling and a mixing theory using equilibrium chemistry could be used in analyzing the combustion process. If the chemical reactions are slow, the behavior of the combustion process can be studied as a system where mixing and diffusive effects are absent. The ignition delay times inferred from the initiation of the pressure rise along the burner are in good agreement with those predicted by the empirical correlation. The static temperature exerts a greater influence on the ignition delay time than the static pressure. The static pressure level is an important parameter in determining the time for complete combustion. (Contractor's abstract)

LOW-ENERGY GAMMA RAYS PRODUCED IN AIR AND IN LEAD BY COSMIC RAYS, by J. I. Vette. [1962] [8]p. incl. diagrs. tables, refs. (AF 49(638)561) Unclassified

Published in Jour. Geophys. Research, v. 67: 1731-1739, May 1962.

Measurements have been made at 40.5°N geomagnetic latitude of γ rays produced in lead and in air within the energy range 25-1060 kev up to altitudes of 5.4 g/cm^2 by means of balloon-borne scintillation counters. The γ rays of atmospheric origin exhibit a transition curve that peaks at 70 g/cm^2 and is similar to transition curves measured with other omnidirectional detectors. The measurements give a flux of 17.3 photons/cm^2/sec at the peak of the transition curve; extrapolation to the top of the atmosphere gives an albedo of 5.7 photons/cm^2/sec. The spectra of the photons produced in lead and in air are very similar, and the production per gram of lead is found to be about 2.7 times that per gram of air. The power contained in γ rays up to 1 mev is estimated to be 7% of the incoming power from primary cosmic rays. Because of this large intensity the origin of the photons is difficult to explain in terms of the nucleonic component but is compatible with an explanation based on an electromagnetic origin.

CHEMICAL REACTIONS USING MODULATED FREE RADICAL BEAMS. PART A. THE VAPOR PRESSURE OF SOLID HYDROGEN IN THE TEMPERATURE RANGE FROM 4.7K TO 11.1K. PART B, by H. Harrison, W. L. Fite, and G. L. Guthrie. Final rept. Feb. 1, 1961 - Jan. 31, 1962. Feb. 28, 1962 [62]p. incl. diagrs. tables, refs. (Rept. no. GA-2972) (AFOSR-2357) (AF 49(638)301) AD 277010 Unclassified

Modulated, crossed molecular beams were employed to study the chemical kinetics of several free-radical reactions. For the hydrogen-isotope exchange ($H + D^2 \rightarrow HD + D$) signals were detected which correspond to a reaction cross-section of $\sim 10^{-19}$ cm^2. Elastic scattering complicates the interpretation. The promises, methods, and difficulties of the crossed-beam technique are discussed. Measurements were made of the vapor pressure of solid H, of a nominal 75% orthohydrogen composition, from 4.7° to 11.1°K. The results were fitted to Kirchoff's equation. A suitable expression for the vapor pressure was found to be $\log P_{(mm)} = -43.39/T + 5/2_{\log}$, $T(°K) + 2.047$ from 4.7 to 13.95°K.

REFLECTION AND DISSOCIATION OF H_2 ON TUNGSTEN, by J. N. Smith, Jr., and W. L. Fite. [1962] [7]p. incl. diagrs. refs. (AFOSR-2611) (AF 49(638)-356) AD 276645 Unclassified

Also published in Jour. Chem. Phys., v. 37: 898-904, Aug. 15, 1962.

Through the use of modulated atomic beam techniques, the reflection and dissociation of H_2 at a W surface above 2500°K was studied. Two experimental configurations were employed. In the first configuration, a collimated beam of molecular hydrogen was directed at the W surface, and the angular distribution of particles evaporating from the surface was examined mass-spectrometrically. In the second configuration, the W test surface was located in the first of 3 differentially pumped vacuum chambers. H_2 was admitted into this chamber thereby providing an isotropic source of incident particles. Particles evaporating from the surface were collimated and examined mass-spectrometrically in the third chamber. From these experiments it is observed that at high temperatures the angular distribution of atomic hydrogen evaporating from the target surface obeys the cosine law. However, the angular distribution of reflected H_2 displays a shift toward the specular ray. Above 2500°K the sticking probability of H_2 on W approaches a limiting value of 0.3. (Contractor's abstract)

INTERACTION OF ATOMS WITH SURFACES, by J. N. Smith, Jr. and W. L. Fite. Final rept. Apr. 1, 1958 - Sept. 30, 1962. Nov. 6, 1962, 11p. (Rept. no. GA-3615) (AFOSR-411C) (AF 49(638)356) AD 292963 Unclassified

Experimental modulated atomic beam techniques, adapted for the study of gas-surface interactions, are summarized. The scope and purpose of research conducted, using these techniques, are outlined. Several types of interactions between molecules and atoms at thermal velocities and solid surfaces are discussed. In particular, the dissociation of H_2 on W, the scattering of H_2 on Ni, and the chemical reaction between Cl_2 and Ni are mentioned. Various other experimental observations and measurements are catalogued. (Contractor's abstract)

RECENT INVESTIGATIONS OF GAS-SURFACE INTERACTIONS USING MODULATED-ATOMIC-BEAM TECHNIQUES, by J. N. Smith, Jr. and W. L. Fite. [1962] [24]p. incl. diagrs. (AFOSR-J1044) (AF 49(638)356) Unclassified

Also published in Rarefied Gas Dynamics; Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press, Suppl. 2, v. 1: 420-453, 1963. (AFOSR-5310)

This research was directed toward gaining a more complete knowledge of the effect of the interaction between individual gas particles and the surfaces of space vehicles on the aerodynamics of the upper atmosphere. The first experiment discussed is that of the scattering of molecular hydrogen by polycrystalline Ni. It was found that with certain specific pretreatments, near specular scattering of the incident H_2 beam was obtained. In addition, an angular variation in the thermal-accommodation coefficient was observed. In the second experiment, the reflection and dissociation of hydrogen on W at high temperatures were examined. Near specular scattering of the incident H_2 was found at W temperatures above 1800°K. The angular distribution of H_2 evaporating from the target followed the cosine law, indicative of diffuse emission. Above 2500°K, the sticking probability for H_2 on W was found to be temperature-independent at a value of 0.3. The last experiment discussed involved the reaction of Cl_2 and Ni to form Ni chlorides. The reaction products NiCl and $NiCl_2$ were observed. Of particular interest is the fact that phase-sensitive detection of the ac signals permits measurement of the reaction-residence time for the formation of NiCl. (Contractor's abstract)

DIRECT OBSERVATION OF INDIVIDUAL ADATOMS: NITROGEN ON TUNGSTEN, by G. Ehrlich and F. G. Hudda. [1962] [13]p. incl. illus. diagrs. refs. (AFOSR-2601) (AF 49(638)791) AD 435179 Unclassified

Also published in Jour. Chem. Phys., v. 36: 3233-3247, June 15, 1962.

The utility of the field ion microscope for adsorption studies has been explored by examining the interaction of nitrogen with an atomically smooth tungsten surface. Individual nitrogen adatoms are shown to be visible, and it is demonstrated that adsorption fails to perturb the lattice permanently. In probing the room-temperature distribution of adsorbed material, the closely packed (110) is found to remain bare, even when exposed to nitrogen at $p = 2 \times 10^{-3}$ mm for 2 hr. All the other planes, with the possible exception of the {100} and {130}, are irreversibly covered. Nitrogen, presumably in the form of atoms, is bound on the (110) only at $T < 190°K$. Adsorption on this plane at higher temperatures is limited not by an activation barrier but rather by thermodynamics: the binding energy on the (110) is only 5.1 ev, compared with 6.7 ev elsewhere on the surface. TRAPPING AND ENERGY TRANSFER IN ATOMIC COLLISIONS WITH A CRYSTAL SURFACE, by B. McCarroll and G. Ehrlich. [1962] [10]p. incl. diagrs. refs. (AFOSR-J346) (AF 49(638)791) AD 435180 Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-24, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 555, Nov. 23, 1962.

Also published in Jour. Chem. Phys., v. 38: 523-532, Jan. 15, 1963.

The condensation of atoms on a solid is examined by calculating the critical energy for trapping of a particle of arbitrary mass and force constant colliding with a linear lattice. In the harmonic approximation and using classical mechanics, the maximum kinetic energy for trapping is found to depend strongly upon the well depth, in qualitative agreement with experiment.

ON THE ATOMIZATION AND ENTRAINMENT OF LIQUID FILMS IN SHEAR FLOW, by N. Zuber. Sept. 1962 [53]p. incl. diagrs. refs. (AFOSR-3989) (Rept. no. 62GL153) (AF 49(638)1153) Unclassified

The concept of critical boundary shear is used to describe the conditions leading to the destruction of a liquid film by high velocity gases flowing through a duct. From this concept, several similarity criteria are derived for predicting the onset of film destruction and of drop entrainment as function of the flow conditions in both phases. The transition in the 2-phase flow regimes (from annular film flow to droplet flow) predicted by these similarity criteria are shown to be in satisfactory agreement with experimental data available in the literature. Some similarity criteria for separators of special geometries are presented also. The significance of the results to the problem of film cooling of rocket engines and to the burnout problem in nuclear reactors is discussed. (Contractor's abstract)

STEADY STATE AND TRANSIENT VOID FRACTION OF BUBBLING SYSTEMS AND THEIR OPERATING LIMITS, PART II: TRANSIENT RESPONSE, by N. Zuber and J. Hench. July 1962 [44]p. incl. diagrs. (Rept. no. 62GL111) (AFOSR-3990) (AF 49(638)1153) Unclassified

The result of an analytical and experimental investigation of the transient response of a 2-phase (bubbling) flow system are reported. Good agreement of predicted values with experimental results is shown. The theory of kinematic (continuity) waves is used to analyze transients in 2-phase systems. It is shown that changes in the vapor (void fraction) are propagated through the 2-phase mixture by kinematic waves. Kinematic shock waves are used to analyze the propagation of large discontinuities of vapor concentration. The results show that the transient response of a 2-phase mixture depends upon the flow regimes. The characteristics of the response can change completely, when a change in the 2-phase flow regimes occurs. The effect of kinematics (continuity) waves on the changes of the 2-phase flow regimes is discussed. The analysis indicates that, in a 2-phase flow system, a diffusion by the kinematic wave process takes place. The diffusion coefficient for this process can be determined from the kinematic wave theory. The significance of the results presented in this paper to nuclear technology, reactor kinetics and chemical process systems is noted. (Contractor's abstract)

ANALYTICAL ASPECTS OF APPLIED CELESTIAL MECHANICS (Abstract), by V. G. Szebehely. [1961] [1]p. (AFOSR-3695) (AF 49(638)814) Unclassified

The central problem of celestial mechanics is to find the general solution of the differential equations describing the motion of bodies in a gravitational field. This problem is readily solved for 2 bodies moving in the field created by their mutual gravitational attraction. When the number of bodies is increased, the solution can not be represented in closed form. The reasons for the involvability are discussed along with questions of existence of the solution. A critical review is presented of new and old techniques to obtain particular solutions of particular problems for limited ranges of the variables involved. Power and Fourier series solutions, regularization, special and general perturbation, known integrals, Cauchy's Poincare's, Brun's and Mineur's theorems are discussed. It is shown that orbit and trajectory determination related to space travel, a field often called applied celestial mechanics, space mechanics or astrodynamics faces the same basic difficulties as classical celestial mechanics. Some new problems, emerging as the result of recent emphasis on space exploration are discussed and promising areas of future research are indicated.

General Electric Co. Space Sciences Lab., Philadelphia, Pa.

PROBLEMS ON APPLIED CELESTIAL MECHANICS (Abstract), by V. G. Szebehely. [1961] [1]p. (AFOSR-3696) (AF 49(638)814) Unclassified

Celestial mechanics deals with the determination of the motion of celestial bodies and until recently only members of the solar system were of interest. The 2 directions in which celestial mechanics is expanding are: (1) study of the motion of artificial satellites, planetoids and other space probes in force fields not purely gravitational including drag and radiation pressure effects and (2) an investigation of the dynamics of bodies outside the solar system such as the determination of the density distribution of binary stars. The first item, often referred to as applied celestial mechanics, space mechanics or astrodynamics, is the subject of this research. The central problem of astrodynamics is introduced via the celebrated 3-body problem, and its insolvability is discussed. Several special problems of great interest awaiting solution are described such as the 2 point boundary value problem of interplanetary missions, stability of motion near libration points in the Earth-Moon system, possibility of establishing

permanent Earth-Moon satellites, stability of lunar satellite motion, utilization of solar radiation pressure, etc. The problem of Earth-Venus trajectories is treated in detail.

REVIEW OF APPLIED CELESTIAL MECHANICS (Abstract), by V. G. Szebehely. [1961] [1]p. (AFOSR-3697) (AF 49(638)814) Unclassified

A systematic review is presented of the field which is often referred to as space trajectories, space mechanics, astrodynamics or applied celestial mechanics. The major aim of this scientific discipline is to find the general solution of the problem of the motion of bodies in a gravitational field. Inasmuch as this general problem possesses no general solution, the review of the multitude of special problems is organized according to their application to space research engineering. The first major problem group is termed orbit and trajectory determination. Solution is based on celstial mechanics utilizing powerful modern numerical techniques and computer technology. The second major group is termed guidance which is discussed in its most general aspects as the inverse of the first problem. A critical review of recent significant advances in space mechanics emphasizes the necessity of familiarity with the results and techniques of classical celestial mechanics. Without this knowledge, an avalanche of re-inventions and poor modifications of well established results are presently being reproduced. The lecture is concluded with references to geographical centers of technical compitance in astrodynamics, to the few important publications and to some problems currently considered as urgent, significant and yet unsolved.

RENAISSANCE OF CELESTIAL MECHANICS-SPACE MECHANICS (Abstract), by V. G. Szebehely. [1961] [1]p. (AFOSR-3698) (AF 49(638)814) Unclassified

The 3 major objectives of space mechanics are orbit determination from observations, trajectory calculation, and guidance analysis. The 3 major missions of space exploration are earth satellites, lunar research vehicles, and interplanetary space probes. The 9 elements of the 3 x 3 matrix defined by the 3 missions and 3 objectives will be discussed with examples. The most significant advances, the present state of the art, the unsolved problems, future expectations, and the contributions of classical celestial mechanics, engineering, and numerical analysis will be outlined. The proper weight assigned to these fields of scientific endeavor is shown to be the key to the progress in space mechanics, often referred to as astrodynamics of applied celestial mechanics; the last name indicating the important role played by this classical science in modern space research. Earth-Venus trajectories, with the aid of a motion picture, will be discussed in some detail.

ZERO VELOCITY CURVES AND ORBITS IN THE RESTRICTED PROBLEM OF THREE BODIES, by V. G. Szebehely. [1962] [5]p. (AFOSR-J763) (AF 49(638)814) AD 413885 Unclassified

Also published in Astronom. Jour., v. 68: 147-151, Apr. 1963.

Relations between zero velocity curves and orbits are investigated for the restricted problem of 3 bodies. A condition which the force function must satisfy is derived, giving a criterion for identifying certain periodic orbits with zero velocity curves. This general result is applied to the limiting case of the problem ($\mu = 0$), and to case of "small" μ, i.e., when terms of the order of μ^2 are neglected. It is shown that, in the latter case, perturbations of the order of r^2 for the satellite motion ($r << 1$) and of the order of r^{-3} for the planetary case ($r >> 1$) limit the applicability of the general results. (Contractor's abstract)

END LOSSES IN MAGNETOHYDRODYNAMIC CHANNELS WITH TENSOR ELECTRICAL CONDUCTIVITY AND SEGMENTED ELECTRODES, by G. W. Sutton. Mar. 1962 [33]p. incl. diagrs. (Rept. no. R62SD35) (AFOSR-3897) (AF 49(638)914) AD 277257 Unclassified

Also published in Jour. Appl. Phys., v. 34: 396-403, Feb. 1963.

End losses of an inviscid magnetohydrodynamic channel having tensor conductivity and segmented electrodes were calculated for a magnetohydrodynamic power generator of this geometry. It was found that the constant-current configuration is more efficient than the constant potential difference case. The efficiencies increase with increasing Hall effect, but constant magnitude extensions to the magnetic field have very little effect. The theoretical efficiency for an aspect ratio of 10 and $\omega\tau = 2$ is only 74%. (Contractor's abstract)

THE THEORY OF MAGNETOHYDRODYNAMIC POWER GENERATORS, by G. W. Sutton. Dec. 1962, 205p. incl. diagrs. tables, refs. (Rept. no. R62SD990) (AFOSR-4635) (AF 49(638)914) AD 296430 Unclassified

The theory of magnetohydrodynamic power generators is presented. The topics covered are: electrical conductivity in MHD generators, optimum seed ratio, local analyses of the continuous and segmented electrode geometries; Hall geometry, helical flow geometry; magnetically induced ionization; polytropic efficiencies; compressible analyses of the constant velocity, temperature, Mach number, pressure and cross-sectional area flows; end losses; AC generation; cycle efficiencies; and a summary of experiments. Geometries other than linear are not considered herein; the most important of those omitted is the vortex generator. (Contractor's abstract)

EXACT SOLUTIONS FOR MAGNETOHYDRODYNAMIC CHANNEL FLOWS, by A. Sherman. Dec. 1962, 66p. incl. diagrs. refs. (Rept. no. R62SD991) (AFOSR-4638) (AF 49(638)914) AD 294378 Unclassified

Also published in Engineering Magnetohydrodynamics, by G. W. Sutton and A. Sherman, New York, McGraw-Hill, 1965, p. 340-388.

Simplified MHD Channel Flow problems for which exact solutions can be found are discussed. Both steady state and transient problems are considered, and account is taken of heat flux as well as velocity distributions. Secondary flows are also discussed. The bulk of the solutions are valid for arbitrary Magnetic Reynolds numbers, although some channel flows with non-uniform magnetic fields and small Magnetic Reynolds numbers are discussed. ELECTRON CONDUCTIVITY AT CYCLOTRON RESONANCE, by D. J. BenDaniel, H. Hurwitz, Jr., and G. W. Sutton. [1962] [2]p. incl. diagrs. (AF 49(638)-914) Unclassified

Publishediin Phys. Fluids, v. 6: 884-885, June 1963.

The integral giving the component σ on the electron conductivity in the direction of the electric vector for e. m. radiation of circular frequency ω polarized in the right-handed sense, propagating along a uniform magnetic field, is evaluated, at finite temperatures, in the vicinity of cyclotron resonance for (1) isotropic monoenergetic electrons and (2) electrons with a Maxwell distribution of velocities. In both cases, as the collision frequency tends to zero, the real part of the conductivity approaches, at resonance, the value $\sigma_0 = ne^2V_{th}/\alpha$ km, where V_{th} is the thermal speed of the electrons, α is a number of order unity and the other symbols have their usual meaning. At resonance for a Maxwell distribution, σ is well approximated by the expression $1/\sigma = 1/\sigma_0 + 1/\sigma_{dc}$.

HIGH ALTITUDE SHOCK WAVE STRUCTURE. PART I. SHOCK WAVE STRUCTURE WITH ROTATIONAL AND VIBRATIONAL RELAXATION. PART II. A SHOCK TUBE STUDY OF THE THERMAL DISSOCIATION OF NITROGEN, by S. M. Scala, L. Talbot, and B. B. Cary. Oct. 1962 [124]p. incl. illus. diagrs. tables, refs. (Rept. no. R62SD32) (AFOSR-2748) (AF 49(638)-931) AD 285619 Unclassified

A theoretical model is developed for the structure of a shock wave in a diatomic gas including rotational and vibrational relaxation phenomena. Experiments are carried out in a combustion driven shock tube. Experimental data for vibrational relaxation times and dissociation rates are obtained for nitrogen. Estimates are provided for the distribution of translational temperature through a normal shock wave obtained with the neglect of relaxation phenomena. Realistic values of the thickness of the shock transition also are obtained. Coupling between the internal degrees of freedom is investigated. Combustion generated shock is used for

shock structure studies. The relative efficiency of nitrogen atoms and molecules is determined. The data indicate that vibrational relaxation and dissociation may be treated in an uncoupled manner. Results were compared with the data obtained by earlier investigators.

SHOCK WAVE STRUCTURE WITH ROTATIONAL AND VIBRATIONAL RELAXATION, by S. M. Scala and L. Talbot. [1962] [18]p. incl. diagrs. tables. (AFOSR-J1042) (AF 49(638)931) Unclassified

Also published in Rarefied Gas Dynamics; Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press; Suppl. 2, v. 1: 297-314, 1963. (AFOSR-5310)

A new theoretical model for shock wave structure in a diatomic gas with rotational and vibrational excitations was developed, and numerical integrations have been carried out employing high speed electronic computing equipment. The model which is based on the use of symmetric relaxation equations yields results which seem reasonable for the full range of relaxation times and Mach numbers treated. More realistic estimates are provided for the distribution of translation temperature through a normal shock wave than would have been obtained with the neglect of relaxation phenomena. These results will be of use in further theoretical studies of the rates of chemical reactions (e.g., thermal dissociation) in strong shocks. The new calculations also give more realistic values for the effective thickness of the shock transition, which should yield better criteria for the determination of the condition of viscous merging at the nose of a blunt body in high altitude hypersonic flow.

EXPERIMENTAL PLANETARY ENTRY RESEARCH FOR MARS AND VENUS - 1962, by T. K. Pygmire. Final rept. Oct. 1962 [164]p. incl. illus. diagrs. tables, refs. (TIS rept. no. R62SD84) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)931 and National Aeronautics and Space Administration) AD 400326 Unclassified

The program for planetary entry research for Mars and Venus was jointly coordinated between theoretical and experimental studies. The material reported is a final report of the 1962 experimental studies. The Martian and Venusian model atmospheres utilized, followed those given in a preliminary engineering estimate. As the characteristics of these atmospheres are not known precisely, probable bounds were established. These bounds for the Martian and Venusian atmospheres as well as the planetary dynamic data for the 2 planets are tabulated. As the Venusian atmosphere data was given in terms of temperature and pressure, the density was calculated and is plotted as a function of altitude. (Contractor's abstract)

SURFACE CRACKING CAUSED BY ELECTROMAGNETIC WAVE ABSORPTION, by R. C. Good, Jr. [1962] [32]p. incl. illus. diagrs. table, refs. (AFOSR-2295) (AF 49(638)1030) AD 273970 Unclassified

An Exploding Wire Facility has been used to irradiate glass disks to determine any damaging effects. At power levels of 10^7 watts deposited in the wire, the glass surface became crazed. Photomicrographs and profilimeter measurements of the surface are presented to support the following conjectures as to the cause of cracking: the energy radiated by the hot wire is absorbed by a thin surface layer of the glass, the temperature rises creating thermal stresses, flaws below the glass surface form stress raisers according to the Griffith crack theory, and the cracks propagate to the surface. The theoretical derivation of the adapted thermoelastic stress theory predicts the dimensions of the cracks and the power levels required if the absorption coefficient is at least 10^3 cm^{-1}. STRUCTURAL RESPONSE TO INTENSE ELECTROMAGNETIC RADIATION, by R. C. Good, Jr. Annual technical rept. no. 1, Mar. 1, 1961 - Feb. 28, 1962, 62p. incl. illus. diagrs. tables, refs. (AFOSR-2483) (AF 49(638)1030) AD 275042 Unclassified

An exploding wire facility was used as the source of electro-magnetic radiation. Power levels of 10^7 watts were deposited in the wire and the radiation pulse was focused on small specimens of selected materials through reflection in an ellipsoidal mirror. For glass samples, the surface crazed to a depth of 10^{-3} cm. Photomicrographs and profilometer measurements of the surface are presented to support the following conjectures as to the cause of cracking: the energy radiated by the hot wire is absorbed by a thin surface layer of the glass, the associated temperature rise generates thermal stresses, flaws below the glass surface form stress raisers according to the Griffith crack theory, and the cracks subsequently propagate to the surface. The theoretical derivation of the adapted thermoelastic stress theory predicts the dimensions of the cracks and the power levels required if the absorption coefficient is at least 10^3 cm^{-1}. DESTRUCTIVE EFFECTS OF PLASMAS GENERATED BY EXPLODING WIRES, by R. C. Good, Jr. [1962] [6]p. incl. illus. diagrs. refs. (AFOSR-J1238) (AF 49-(638)1030) AD 424367 Unclassified

Presented at Seventeenth annual meeting of the Amer. Rocket Soc., Los Angeles, Calif., Nov. 13-18, 1962.

Also published in AIAA Jour., v. 1: 1397-1402, June 1962.

A nominal 10-kj capacitor bank is discharged through a 2-mil tungsten wire in an evacuated chamber. The wire material is heated to about 10,000°K in the first microsecond. A plasma forms with an ion pair density of about 10^{17} ions/cm^3. Nearby glass walls on the chamber are heated to a condition in which microcracks form on the front surface. Electromagnetic waves from the plasma were focused by an ellipsoidal mirror on a glass surface, and craze-cracks were observed. Photomicrographs of the surfaces show that the number of cracks increases as the energy stored in the capacitors is increased from 400 to 3000 joules. Four main processes are postulated for energy transfer to the glass surface: (1) the hot plasma radiate electromagnetic waves; (2) shock waves form, the strength and propagation characteristics of which depend upon the surrounding media; (3) the hot plasma expands to contact the glass surface; (4) wire particles impact on the surface, creating crater-like pock marks. These processes have been separated, and the effects are reported.

EFFECTS OF ELECTROMAGNETIC WAVES RADIATED BY AN EXPLODING WIRE (Abstract), by R. C. Good, Jr. [1962] [1]p. [AF 49(638)1030] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 501, Aug. 27, 1962.

A 10-kj capacitor bank is discharged through a 2-mil tungsten wire in an evacuated ellipsoidal chamber. The short wire passes through one focal point and a glass specimen is placed at the second focal point for irradiation. Surface crazing occurs when a 10-μsec pulse of oscillatory current discharges more than 400 J. Photomicrographs of the sample surface show that the number of craze lines increases as the stored energy increases. Measured crack depths corroborate the explanation proposed: Short electromagnetic waves are absorbed by the glass, planar stresses build up from local heating of the surface, and cracks form at internal flaws. Griffith's theory of cracking is adapted to our case by noting that tensile stresses occur at the ends of a narrow fault in a compressive stress field. For the results to be self-consistent, the overall coefficient of absorption must be at least 1000 cm^{-1}.

THE ATTACK BY CESIUM VAPOR ON IMPURE ALUMINUM BODIES AT TEMPERATURES UP TO 1500°C, by E. Feingold. [1962] [6]p. incl. illus. diagrs. tables, refs. (Bound with its Final rept July 1, 1961 - July 31, 1962; AD 284958) (AF 49(638)1092) Unclassified

The purpose of this study was to systematically investigate the phenomena of attack by Cs vapor on alumina. It was determined that: (a) High density, high purity alumina bodies are compatible with cesium vapor for long periods at 1500°C; (b) Silica concentrations on the order of 0.1 w/o or less do not appreciably alter the compatibility of alumina with cesium vapor; (c) Silica concentrations greater than 1 w/o are deleterious and render alumina bodies susceptable to Cs vapor attack at 1050°C; (d) The reaction product resulting when Cs vapor attacks alumina bodies containing silica is $CsAlSiO_4$; (e) the presence of MgO and CaO in concentrations of 1 w/o or less do not alter the compatibility of alumina bodies with Cs vapor; and (f) The reaction product when Cs vapor reacts with fused silica is a Cs_2O-SiO_2 glass. A reactor vessel suitable for carrying out alkali metal attack studies was designed and is described. (Contractor's abstract)

CROSSED FIELD MHD PUMP EXPERIMENTS, by T. Nayden, W. Westendorp and H. Hurwitz, Jr. [1962] [12]p. incl. illus. diagrs. table. (Bound with its Final rept. July 1, 1961 - July 31, 1962; AD 284958) (AF 49(638)1092) Unclassified

The success achieved in making operable the crossed field electrical discharge pump illustrates that it is a workable concept and that sonic and supersonic gas velocities can be readily produced if adequate over-all system conductivity is available. At fixed magnetic field and system geometry, gas velocity is determined solely by the current passing between the electrodes. It would seem that almost any gas, including air, could be pumped in this manner if it has the proper electrical characteristics or if it can be properly seeded.

THE MHD CONTINUOUS FLOW EXPERIMENT, by F. Shair. [1962] [19]p. incl. illus. diagrs. (Bound with its Final rept. July 1, 1961 - July 31, 1962; AD 284958) (AF 49(638)1092) Unclassified

The object of this research program is to investigate various techniques by which the electrical conductivity of a plasma may be greatly enhanced in the temperature range 1200° - 1700°C. A continuous flow system, (similar to one which will be used for ground, space, and submarine applications), is being developed in order to study the creation and effect of non-equilibrium conditions of the electrons in a plasma. The system has been designed in order that many various measurements of the plasma properties may be obtained. Along with the basic research into MHD power generation, the overall performance and operating characteristics of each unit is being determined as it is integrated into the MHD cycle; finally the cycle will be closed by means of a cooler and compressor. SHOCK TUBE STUDIES OF NON-EQUILIBRIUM IONIZATION IN A MAGNETIC FIELD, by B. Zauderer. [1962] [15]p. incl. illus. diagrs. (Bound with its Final rept. July 1, 1961 - July 31, 1962; AD 284958) (AF 49(638)1092) Unclassified

In designing the shock tube, it was desired to approximate as closely as possible a steady state MHD generator. Therefore, the following variables were fixed arbitrarily; driven gas - argon plus 1% cesium, temperature behind the shock - 2500°K, pressure - 1 atmosphere. To obtain a non-equilibrium ionization effect it was calculated that a field of 30,000 gauss was needed. In addition the electrode configuration should approximate an actual generator and the gas slug length should be several times longer than the length of the channel. The above experiment is assembled from a series of distinct pieces of apparatus, each of which has to be constructed and tested individually. These items are: the shock tube and its vacuum system; instrumentation to determine the gas dynamic behavior of the shock tube; the magnetic field coil; the electrode assembly; and the diagnostics for the nonequilibrium ionization.

General Electric Co. Space Sciences Lab., Philadelphia, Pa.

THEORY OF A PLASMA IN A STRONG MAGNETIC FIELD, by J. Smith. [1962] [23]p. incl. diagr. refs. (Bound with its Final rept. July 1, 1961 - July 31, 1962; AD 284958) (AF 49(638)1092) Unclassified

Inherent to the extension of the Boltzmann equation into the area of the ionized gas is the splitting of the range of interaction into 2 parts; so that, beyond a certain length the interaction is described in terms of an ensemble averaged electric field and within this length the interaction is described as a binary collision. The length over which one can consider the interaction to be purely binary is some distance less than the average interparticle distance and the length beyond which one can speak of the interaction as an ensemble average must be such that the interaction is between many bodies. Thus, there is an ill-defined region, in which 3,4,... bodied interactions are predominate. Therefore, the general assumption is to approximate this ill-defined region by extending the binary region some

distance into the region and do likewise with the ensemble averaged region by assuming that an appropriate division occurs at the Debye length. It is further shown, necessary to the Boltzmann representation, that within the binary range, the external forces are negligible in comparison to the interparticle force. It is the purpose of this report to investigate this latter condition. It is concluded that, at least for the situation in which the distribution functions have cylindrical symmetry about the direction of the magnetic field, the apparent divergence at large impact parameters no longer exists, and therefore that a magnetic field cut-off has in some way been introduced.

ELECTRON EXCITATION APPLIED TO THE EXPERIMENTAL INVESTIGATION OF RAREFIED GAS FLOWS, by E. P. Muntz and D. J. Marsden. [1962] [32]p. incl. illus. diagrs. tables, refs. (AFOSR-J1048) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1152 and Defence Research Board of Canada) Unclassified

Also published in Rarefied Gas Dynamics; Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press, Suppl. 2, v. 2: 495-526, 1963. (AFOSR-5310)

When high energy electrons pass through a gas, inelastic collisions between the electrons and the gas atoms result in a characteristic emission spectrum. The intensity and spectral details of the emission are related to the nature, density, and temperature of the gas, as well as to the energy and number density of the electrons. As a consequence of this, the electroluminescence produced by a known and controlled stream of electrons may be used to determine some otherwise difficult to measure properties of rarefied gas flows. These include: the number density of a particular species, and for some gases the vibrational and rotational temperatures of the molecules in the flow. (Contractor's abstract)

SYMPOSIUM ON DYNAMICS OF MANNED LIFTING PLANETARY ENTRY, Philadelphia, Pa., Oct. 1962, ed. by S. M. Scala, A. C. Harrison, and M. Rogers. New York, Wiley and Sons, 1963, 980p. incl. illus. diagrs. table, refs. [AF 49(638)1157] Unclassified

This symposium considered 6 inter-related topics on the dynamics of manned lifting planetary entry. The first session dealt with planetary atmosphere models which are needed to predict the nature of the environment to be encountered by a space vehicle. The subject of the second session was aerodynamic plasma which is formed by shock-wave heating of the gas; it is the determination of the conditions produced by the atmosphere interaction with the space craft. The third session dealt with energy management; the determination of an optimum family of trajectories which will minimize the time-integrated aerodynamic and radiative heating, along with thermal shield requirements. In the fourth session, a series of papers were presented dealing with the full spectrum of aerothermoelastic effects arising from weak to strong thermal coupling. In the fifth session, papers were presented on a wide range of configurations which can be used for the terminal phase of re-entry. The final session on hypervelocity flows dealt with the more rarefied aspects of hypervelocity phenomena, including molecular interactions between gases and solids and effects of surface on thermal accommodation.

THERMAL IONIZATION AND RESISTIVITY OF COPPER GAS PLASMA, by G. M. Palmer. May 1961 [16]p. incl. diagrs. (Engineering Dept. rept. no. 2187) (AFOSR-1280) (AF 49(638)864) Unclassified

During a study on the energy efficiency of exploding copper wires for use in rail accelerators, a need arose for the resistivity of copper gas plasma as a function of temperature and pressure. This study was instigated to determine a functional variation of the resistivity. A necessary step along the way is the determination of the ionization level as a function of temperature and pressure and is therefore included as a separate result.

AN ABSTRACT MACHINE BASED ON CLASSICAL ASSOCIATION PSYCHOLOGY, by R. [F.] Reiss. [1962] [18]p. incl. diagrs. refs. (AFOSR-2618) (AF 49(638)1039) Unclassified

Also published in Proc. 1962 Spring Joint Computer Conf., San Francisco, Calif. (May 1-3, 1962), Palo Alto, National Press, v. 21: 53-70, 1962.

The theories of classical association psychology (~1750-1900) attempted to explain human thought processes in terms of certain mechanistic forces operating on discrete entities called sensations, images, and ideas. Although these theories have become unfashionable since the turn of the century, due to their ambiguity and the difficulty of experimental verification, and whereas they may never prove adequate for human psychology, it is possible that they may provide a fruitful basis for some types of artificial intelligence. One method of exploring ramification of the classical theories is the formulation of an abstract machine which constitutes an interpretation of the theories and whose behavior can be examined in any desired detail. In this paper such a machine is partially constructed, and some of its behavioral features and problems are discussed. (Contractor's abstract)

[INDUCTION OF DEEP SLEEP IN CATS BY MEANS OF ELECTRICAL STIMULATION OF THE RETICULAR FORMATION OF THE BRAIN-STEM] Induzione del sonno profondo nel gatto mediante stimolzione elettrica della sostanza reticolare del tronco encefalico, by E. Favale, A. Giussani, and G. F. Rossi. [1961] [2]p. incl. refs. (AFOSR-745) (AF 61(052)461) AD 258871 Unclassified

Also published in Boll. Soc. Ital. Biol. Sper., v. 37: 265-266, 1961.

The results obtained were the following: (1) stimulation of the reticular formation capable of arousing the animal from a light sleep became ineffective during medium sleep; (2) the same reticular stimulation during the awakening stage of a medium sleep (when the EEG and EMG activity patterns suggested a transition towards deep sleep) evoked the appearance of typical EEG and EMG patterns of deep sleep; (3) the marked rise of the arousal threshold to sensory auditory stimuli showed that a real deep sleep was induced by reticular stimulation; (4) the induced deep sleep was of similar duration to the natural deep sleep (15-20 min); and (5) the induction of deep sleep was produced by the stimulation of the reticular structure of the mesencephalation, the pons and the medulla oblagata.

BLOOD PRESSURE DURING NATURAL SLEEP AND DURING SLEEP INDUCED BY ELECTRICAL STIMULATION OF THE BRAIN STEM RETICULAR FORMATION, by O. Candia, E. Favale and others. [1962] [18]p. incl. illus. refs. (AFOSR-4170) (AF 61(052)461) Unclassified

Also published in Arch. Ital. Biol., v. 100: 216-233, Mar. 1962.

Arterial blood pressure was recorded in intact, unanesthetized, free moving cats through a cannula permanently inserted into the carotid or femoral artery. The cats were also carrying implanted electrodes for EEG and EMG recording and for electrical stimulation of peripheral and central nervous structures. Blood pressure changes during sleep were analyzed and compared with those occurring in the electrocortical rhythms and in the electrical activity of the posterior cervical muscles. A constant and marked blood pressure fall is observed during deep sleep, when the EEG rhythms are desynchronized and the EMG becomes completely flat. The threshold of arousing stimuli is related to the level of the blood pressure, reaching its highest values in coincidence with the lowest pressure levels and viceversa. The behavior of the blood pressure during deep sleep episodes induced by electrical stimulation of the brain stem reticular formation is similar to the one observed during the natural episodes of deep sleep. The conclusion is reached that the study of the blood pressure provides important information

on the depth of sleep. Electrocortical rhythms, electrical activity of the posterior cervical muscles and blood pressure should be recorded simultaneously in order to obtain a correct and reliable evaluation of the deepness of sleep. On the basis of the present and of previous results, sleep is subdivided into 2 fundamental phases: (1) light sleep, characterized by EEG synchronization, moderate muscular tonus and basal blood pressure level and (3) deep sleep which is characterized by EEG desynchronization, complete muscular relaxation and marked decrease of the blood pressure.

ELECTROPHYSIOLOGICAL STUDY OF THE NEURAL MECHANISMS OF SLEEP, by G. F. Rossi. Final rept. Oct. 1960 - Sept. 1962. Oct. 1962, 10p. incl. refs. (AFOSR-4189) (AF 61(052)461) AD 292999
Unclassified

The aim of the research was to study with electrophysiological techniques the neural mechanisms underlying sleep. The findings obtained were summarized: (1) 2 phases of stages of sleep having very well distinguished electrocortical and somato-visceral characteristics can be recognized in the cat; (2) the desynchronized activity present during the second phase of sleep, or deep sleep, seems to result from a depression of the subcortical EEG synchronizing systems produced by the action of an inhibitory mechanism; (3) adequate electrical excitation of the brain stem reticular formation is followed by the appearance of deep sleep; (4) a transverse unilateral hemisection of the brain stem at pontine level prevents the appearance of the electrocortical rhythms of deep sleep on the ipsilateral cerebral hemisphere; and (5) the same transection decreases or even suppresses deep sleep itself. Findings lead to the following conclusions: (1) the second phase of sleep, or deep sleep, has an active origin, being produced by an inhibitory or sleep-inducing influence; and (2) the inhibitory or sleep-inducing influence responsible for deep sleep takes origin from the caudal brain stem, probably from structures of the rostral half of the pons.

[STUDY OF THE MECHANISMS OF SLEEP IN CATS. EFFECT OF UNILATERAL LESIONS OF THE BRAINSTEM ON EEG] Studio dei meccanismi del sonno nel gatto. Effetti elettroencefalografici di lesioni unilaterali del tronco dell' encefalo, by K. Minobe, O. Candia, and G. F. Rossi. [1962] [3]p. (AFOSR-J196) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)461, Consiglio Nazionale delle Richerche, and Rockefeller Foundation)
Unclassified

Also published in Boll. Soc. Ital. Biol. Sper., v. 38: 1137-1139, 1962.

Interpretation of EEG asymmetries occurring at the onset of sleep, observed during deep sleep, seemed to lead to the following conclusions: (1) conformation of the hypothesis of the origin of EEG activity characteristic of deep sleep and therefore the existence of an active sleep mechanism;and (2) that the ascendant impulses responsible for EEG patterns originated from a narrow zone of the brainstem situated between the rostral and middle part of the brainstem.

Also published in Boll. Soc. Ital. Biol. Sper., v. 38: 1139-1141, 1962.

Experiments made with cats to study EEG variations due to unilateral lesions of the brainstem show that lesions situated on the anterior of the rostral pons increase the amount of sleep and those situated in the posterior level decrease the amount of sleep. Variation in light sleep may increase or decrease, and deep sleep decreases or is at least suppressed. The hypnogenetic influence responsible for that phase of deep sleep originated from the rostral half of the pons or a point situated directly posteriorly at the same level.

Unclassified

Also published in Boll. Soc. Ital. Biol. Sper., v. 38 1300-1302, 1962.

From the results obtained during these experiments it can be inferred that the most reliable indication of the depth of sleep in the rabbit is presented by the synchronization of EEG fluctuations. Unlike the dog and cat it is impossible to distinguish the 2 stages of sleep in the rabbit. The rabbit's behavior (relative uniformity of the arousal threshold, no occurrence of complete muscular relaxation and marked decrease of blood pressure at the same time as an increase of arousal threshold) led one to believe that the depth of sleep in the rabbit is never that attained in the cat and dog.

[LIGHT AND DEEP SLEEP IN DOGS (STUDY OF THE ELECTROENCEPHALOGRAM, ELECTROMYOGRAM AND BLOOD PRESSURE] Sonno superficiale e sonno profondo nel cane. (Studio elettroencefalografico, elettromiografico e pressorio), by F. Bonamini, V. De Carolis and others. [1962] [3]p. (AFOSR-J263) (AF 61(052)461) Unclassified

Also published in Boll. Soc. Ital. Biol. Sper., v. 38: 1298-1300, 1962.

Studies on cats showed that physiological sleep presented 2 major forms: light sleep and deep sleep, each having characteristic EEG patterns. Experiments were also carried out with dogs. Results showed that 2 stages in the depth of sleep have characteristic EEG, EMG, and blood pressure similar to that encountered in cats which could be inferred that the explanation of the mechanism of cats sleep could also be applied to the dog.

[ELECTROPHYSIOLOGICAL RESEARCH ON SLEEP IN THE DOG AND RABBIT] Richerche elettrofisiologiche sul sonno del cane e del coniglio, by F. Bonamini, V. De Carolis and others. [1962] [20]p. incl. illus. diagrs. refs. (AFOSR-J703) (AF 61(052)461) AD 612870 Unclassified

Also published in Riv. Neurobiol., v. 8: 394-413, Oct.-Dec. 1962.

The sleep of the normal dog and rabbit has been studied. The electrical neocortical rhythms, the electrical activity of the posterior cervical muscles, the blood pressure level and the behavior of the animals during sleep have been analyzed and related to the threshold of arousal by electrical subcutaneous stimulation. Two phases of sleep of different depth, quite similar to those previously observed in the cat, have been found in the dog: a light sleep phase characterized by synchronized EEG rhythms, moderate EMG activity and normal blood pressure level; a deep sleep phase, characterized by desynchronized EEG, flattening of the EMG, very low blood pressure level and twitching of the facial muscles. This subdivision of sleep in 2 phases is not possible in the rabbit. The most reliable index of the occurrence and depth of sleep in this animal has been identified with the occurrence of EEG synchronization. The sleep of the rabbit does not appear to reach the depth of that of the dog or cat. The partial disagreement between the present findings and those obtained in other laboratories is pointed out and discussed. Two possible explanatory hypothesis are advanced. (Contractor's abstract)

[NEW CONSIDERATIONS ON THE PHYSIOPATHOLOGICAL MECHANISMS IN THE VARIATIONS OF CONSCIOUSNESS] Nuove considerazioni sui meccanismi fisiopatologici delle variazioni di coscienza, by G. F. Rossi. [1962] [36]p. incl. refs. (AFOSR-J381) (AF EOAR-62-106) Unclassified

Also published in Minerva Neurochirurgica, v. 6: 129-141, Oct.-Dec. 1962.

Recent experimental research on the problem of neurogenic mechanisms in the quantitative changes of consciousness shows that, apart from the well-known brainstem activating mechanisms, there also exist inhibiting or hypnogenic mechanisms in the brainstem. The hypothesis is advanced that a lowering of the level of consciousness may be the result of a twofold mechanism: one by passive action through hypoactivity of the activating systems, and on the other by active action through hyperactivity of the inhibiting or hypnogenic systems. Although the clinical findings reported in the literature confirm the existence of activating mechanisms, they only reveal a few factors pointing to the existence of mechanisms which inhibit the level of consciousness. The apparent discrepancy between clinical and experimental findings is discussed and some interpretations are suggested.

A STUDY OF THE REACTIONS BETWEEN ALKALI METALS AND CARBON MONOXIDE, by W. F. Sager Final rept. Feb. 14, 1962, 2p. (AFOSR-2226) (AF 49-(638)325) Unclassified

The reaction between metallic potassium and carbon monoxide is found to proceed according to the following stage: $K + CO \rightarrow (K_2C_2O_2)_n \rightarrow (KCO)_n$. This substance, $(KCO)_n$ when heated in the presence of CO_1 is converted to the potassium salt of hexahydroxy benzene. When KCO is treated with methyl iodide or a solution of methyl iodide, it yields a product of molecular formula $C_8H_{12}O_4$ possessing 2 methoxyl groups and showing carbonyl absorption in the infrared spectrum.

A THEORETICAL STUDY OF THE VIBRATIONAL ENERGY LEVELS OF DIATOMIC MOLECULES, by C. L. Beckel. Final rept. Jan. 1960 - June 1962, 6p. (AFOSR-3031) (AF AFOSR-60-1) AD 613375 Unclassified

The lowest vibrational levels associated with both the Heitler-London (HL) potential, and the 2 potentials for ionic molecules were found by a power series expansion

method which revealed considerably more information than anticipated. In particular, the convergence of the covalent vibrational energies was very different from that of the ionic energies. The WKB method was used to find all vibrations associated with the rapid convergence characteristic of covalent molecules. The behavior of the higher HL vibrations was very nearly the same as that of the experimental levels of H_2; this behavior coupled with near-equilibrium data led to a predicted dissociation energy which is 99% of the experimental value. The higher vibrational levels of the ionic molecules converged very slowly and approached hydrogen atom-like levels. This fact was used to obtain equations for the theoretical vibrational energies valid for all vibrational quantum numbers. The equations were applied to LiI, NaCl, and InF. Two additional steps were undertaken which were not originally proposed: (1) Eleven theoretical potential curves for H_2 were made available and were vibrationally analyzed; and (2) The application of the WKB method to radial problems was studied. The substitution of $(J + 1/2)^2$ for $J(J + 1)$ in the effective potential was shown to be justified for the first-order WKB approximation only. The second-order approximation requires a far smaller correction. This result was applied to the vibrating rotator problem and was used in the vibrational analyses.

APPLICATION OF THE SECOND-ORDER WEAK APPROXIMATION TO RADIAL PROBLEMS (Abstract), by J. Nakhleh and C. L. Beckel. [1962] [1]p. [AF AFOSR-60-1] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 215, Mar. 26, 1962.

Theoretical considerations and a number of actual examples have shown that the WBK approximation applied to radial problems requires use of $(J + 1/2)^2$ in place of $J(J + 1)$ in the effective potential. However, all previous examples have taken account of the first-order WBK approximation only. The second-order WBK wave function obeys a differential equation which approaches Schrödinger's as $r \to 0$, if one uses $J(J + 1) - 1/[64J(J + 1)]$ in place of $J(J + 1)$ in the effective potential whenever $J \neq 0$. Solution of the second-order WBK energy integrals and comparison with exact results for the H atom and the radial, harmonic oscillator confirms use of $J(J + 1) - 1/[64J(J + 1)]$. Thus, it appears that at each level of WBK approximation a different effective potential is to be used. Implications with regard to Dunham's treatment of the rotating-vibrator are discussed.

VIBRATIONAL ANALYSIS OF THE HEITLER-LONDON POTENTIAL OF H_2, by C. L. Beckel. [1962] [1]p. [AF AFOSR-60-1] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 215, Mar. 26, 1962.

The vibrational levels associated with the Heitler-London potential of H_2 have been found through use of the WBK approximation. The ΔG (first vibrational-energy difference) vs v (vibrational quantum number) curve has a negative curvature at all v. This contrasts with the experimental curve which has a slight positive curvature at low v, and indicates that ionic contributions are responsible for the positive curvature. At high v, the Heitler-London vibrational levels show the rapid-convergence characteristic of H_2 and other covalent molecules. A comparison is made of the rate of convergence of the experimental, Heitler-London, and Weinbaum vibrational levels of H_2.

VIBRATIONAL CONSTANTS FOR THE GROUND STATE OF H_2, by M. Shafi and C. L. Beckel. [1962] [2]p. incl. tables. (AFOSR-J16) (AF AFOSR-62-160) AD 297257 Unclassified

Also published in Jour. Chem. Phys., v. 37: 2732-2733, Dec. 1, 1962.

The expression $\Delta G = [A-B(v + 1/2)]/[1-C(v + a)^n]$ (1) was found to fit the experimental ΔG values of H_2 more satisfactorily than the usual power series. The ΔG's are the first vibrational energy differences, and A, B, C, a, and n are adjustable parameters. Since slight changes in a and n do not produce significant changes in the results, a simplified least square method was used to fit equation 1 to the experimental ΔG's. An exact fit to 5 points was used to obtain the value of n. With this n, an exact fit to 4 points gave a. With these values of a and n, a least squares calculation yielded A, B, and C. Results of fitting this expression at 7 and at 10 points are presented in tabular form. Comparison of the 5-constant, 10-point fit of the expression with the 4-constant, 8-point power series fit shows the superiority of equation 1. For both, the above equation represents the experimental ΔG's within the range of fit except at $1\frac{1}{2}$ and $2\frac{1}{2}$.

THEORETICAL VIBRATIONAL ENERGY LEVELS OF

H_2 ASSOCIATED WITH VARIOUS COMBINATIONS OF MOLECULAR-ORBITAL CONFIGURATIONS, by G. M. Leies. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-J80) (AF AFOSR-62-160) AD 400461 Unclassified

Also published in Jour. Chem. Phys., v. 37: 1418-1424, Oct. 1, 1962.

A theoretical examination has been made of the influence of MO configurations on the spacing of the vibrational levels of H_2. Eleven previously determined potential curves for the H_2 ground state, based upon LC STO MO wave functions with configuration interaction, have been used to calculate vibrational-energy levels and their first differences ΔG. Comparison of the 11 curves of ΔG vs vibrational quantum number v shows that only when the wave function contains the configuration $(\sigma_\mu 1s\sigma_\mu 1s')$ does the ΔG curve have a shape similar to that of the experimental ΔG curve. The combination of $(\sigma_g 1s\sigma_g 1s')$ and $(\sigma_\mu 1s\sigma_\mu 1s')$ provides left-right correlation of variable ionicity and this ionicity is found to vary in the same manner as the curvature of the ΔG curve. The addition of $(\sigma_g \zeta s\sigma_g 2p)$ which gives in-out correlation, and $(\tau\mu\ 2p\ \overline{\nu}\ \mu\ 2p)$, which provides angular correlation, to the wave function raises the ΔG curve especially at large V. The use of ΔG curves obtained from simple wave functions to estimate dissociation energies is discussed.

MECHANISM OF THE PHASE TRANSITION IN QUARTZ, by R. A. Young. Final rept. Apr. 30, 1962, 156p. incl. diagrs. tables. (AFOSR-2569) (AF 49(638)624) AD 276235 Unclassified

The α-β phase transition at 573°C is shown to be directly occasioned by the oxygen atom's thermal vibrations normal to the Si-O-Si plane and to be a first order transition, not an order-disorder type. The α-β transition proper is generally preceded by a special type of secondary transition, consisting of extensive small scale Dauphiné twinning. The extensive twinning often produces enough strain to give considerable extinction relief and is probably responsible for the fuzzing of optical signals and occasional suggestions in the literature that a phase intermediate between α and β exists. In this x-ray study, the coordinate parameters and thermal ellipsoids were determined as a function of temperature by least squares refinements at 8 temperatures from 450° to 650°C. R-factors are generally less than 4%. Specially collected data allowed a particularly good determination of the 600°C β-structure to be made (x = 0.4137 ± 0.0015). Study of individual reflection intensities as continuous functions of temperature, throughout a range including the transition, made the following possible: (1) the unambiguous choice of a single over a double minimum model for the configurational potential energy of the β-phase and (2) the detection and study of the Dauphiné twinning (long range order) aspect of the overall transition. SIMULTANEOUS INDEPENDENT MEASUREMENT OF THE MOBILITIES AND DIFFUSION COEFFICIENTS OF IONS IN NITROGEN (Abstract), by D. W. Martin, W. S. Barnes and others. [1962] [1]p. [AF AFOSR-62-306] Unclassified

Presented at meeting of the Amer. Phys. Soc., Boulder, Colo., Oct. 10-12, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 634, Dec. 27, 1962.

The mobilities and diffusion coefficients of various ions in nitrogen are measured by a time-analysis method in which ion pulses are generated at 1 of 3 sources located along the axis of a tube containing nitrogen at pressures from 0.05 - 1.0 Torr. The ions formed are drawn by a weak electric field of 1-4 v/cm toward 1 end of the tube where they are swept into a mass spectrometer. The output of the spectrometer is time-analyzed to determine the drift time and spread of each ion pulse. From an analysis of the time spectra, the mobilities and diffusion coefficients can be separately determined. Data on the primary ions N^+ and N_2^+ are presented, and the formation and transport properties of secondary ions (N_3^+, N^{4+}) produced in ion-molecule reactions are discussed.

THE REACTION OF BLINDED GOLDFISH TO ROTATION IN A CENTRIFUGE, by H. C. Howland and B. Howland. [1962] [12]p. incl. diagrs. tables. (AFOSR-4324) (AF 49(638)1011) Unclassified

Also published in Jour. Exper. Biol., v. 39: 491-502, Dec. 1962.

Blinded goldfish behave in a centrifuge as if they were orienting to absolute rotation by means of a Foucault pendulum. That is, they swim so as to compensate the rate of imposed rotation about the apparent vertical. The blinded goldfish swim in the centrifuge in a plane essentially orthogonal to the apparent vertical at low accelerations and low rates of rotation. With higher rates of rotation, the axis about which the fish swims leans away from the apparent vertical and towards the axis of rotation of the centrifuge. Analysis of the physics of the centrifuge shows that if the fish rotates about any axis relative to the cab of the moving centrifuge with a rate of rotation within the physiological range of its semicircular canals it will receive signals from its otocysts and its semicircular canals which would reflect contradictory information in a non-rotating environment. This fact, together with the fish's response to absolute rotation, affords a method for quantitatively assessing the relative roles of the otocysts and the semicircular canals in orienting the free-swimming fish.

THE IMPACT OF TECHNOLOGICAL CHANGE ON THE STRUCTURE AND FUNCTION OF LARGE-SCALE ORGANIZATIONS, by S. P. Greenspon. [1961] 88p. (AFOSR-2246) (AF 49(638)804) AD 612195 Unclassified

This study is a part of a project proposing to study the introduction of technological change and its impact on the career professionals and executives who run large-scale organizations technically and administratively. The study undertakes the task of analyzing the independent variable, i. e. the technological change variable. Concern is with 2 sources of innovations: those generated by research in the physical sciences, and those generated by research in the social sciences. There is reason to believe that each type will tend to have a somewhat different impact on a large-scale organization, or may well affect the components of the organization in a somewhat different sequence The typology has 2 distinguishable categories: the mechanical-technical variety as generated by the physical sciences, and the administrative-social variety as generated by the social sciences. To study the impact of such innovations on large-scale organizations, it will also be necessary to have an organizational model of the basic components which comprise an organization. The components to be included are: organizational goals; the formal organization which includes the distribution of functional activities and the formal authority structure; the informal organization; and the reward system. Case studies of various large-scale organizations into which such change was introduced are examined. Represented in these case studies are: industry, the military, hospitals, prisons, and the governmental agencies.

AN EMPIRICAL INVESTIGATION OF SOME HYPOTHESES TAKEN FROM THE LONELY CROWD, by J. R. Alewine. Aug. 1962, 54p. incl. tables, refs. (AFOSR-4[illegible]2) (AF 49(638)804) AD 289800 Unclassified

Certain hypotheses which were derived from The Lonely Crowd were empirically tested. The hypotheses were divided into 2 groups. Group I contains 5 hypotheses concerning childhood socialization experiences: (1) the inner-directed person is more likely to have been reared to be more self-reliant; (2) more interested in thrift; (3) more ambitious; and (4) more interested in work; and (5) reared by stricter parents than the other-directed person. The 4 hypotheses of Group II concerning demographic factors were: (1) the older people today are more likely to be inner-directed; (2) inner-directed people were more likely to have been reared in rural and small town areas than other-directed people; (3) the fathers of inner-directed respondents are likely to have had less formal education than fathers of other-directed respondents; and (4) the fathers of inner-directed respondents were more likely to have been self-employed than the fathers of other-directed respondents. DETAILED INSTRUCTIONS FOR THE USE OF PREVIOUSLY PUBLISHED DECAY-DAMPING RELATIONSHIPS, by A. G. Fonda. Apr. 1962 [40]p. incl. diagrs. (AFOSR-2849) (AF 49(638)1015) AD 276570 Unclassified

A practical and accurate method of converting conventionally computed flutter data into the roots of aeroelastic system dynamic response is presented. These latter are currently found almost exclusively by test and almost never analytically because of severe computational difficulties. The differences and similarities between these 2 sets of parameters are delineated and discussed. The computational procedure presented in this report related the flutter roots to the system

dynamic response roots by establishing, in closed form, the rate of change of the latter with the former. As is shown, this rate of change is fortunately tolerant of aerodynamic complexity, and furthermore it can be calculated with little or no knowledge of the original system; that it is purely from the conventional flutter data itself. Step-by-step rules to guide this transformation are given in the first section of this report, accompanied by appropriate suggestions and aids to practical use. These are then demonstrated in typical use. A second section proves the algebraic validity of the method. This section is presented separately so that the step-by-step procedure of the first section can be set forth with maximum clarity.

NEW DYNAMIC SYSTEM CONCEPTS AND THEIR APPLICATION TO AEROELASTIC SYSTEM APPROXIMATIONS, by M. B. Zisfein and F. J. Frueh. [1961] [25]p. incl. diagrs. (AFOSR-3732) (AF 49(638)1015) Unclassified

A resume of the conception and early development of certain logical concepts germane to dynamic systems is presented. The base curve, high damping asymptotes, and high decay asymptote are introduced and it is shown how these particular concepts may be combined with existing dynamics technology to derive new aeroelastic system approximations. To demonstrate their validity, these approximations are compared to rather tedious numerical solutions and, where available, to experiment. Future efforts will consist of generalization of these techniques plus exploration for additional approximate solutions which may be of further value.

Giannini Controls Corp. [Astromechanics Research Div., Malvern, Pa.]

PARAMETRIC ACCURACY STUDY OF A PREVIOUSLY PUBLISHED DECAY-DAMPING RELATIONSHIP, by A. G. Fonda. Dec. 1962 [104]p. incl. diagrs. tables. (Rept. no. ARD TR-02-003) (AFOSR-4615) (AF 49(638)1015) AD 292343 Unclassified

A method has been previously published, with algebraic proof, for the approximation of the motion decay coefficients of aeroelastic systems from their conventionally computed required damping coefficients. Results found by this method, for many combinations of conditions, are compared with exact results found by otherwise less satisfactory methods. Recent refinements of the original technique are presented. The decay-damping relationship proves extremely accurate in most instances. Large errors prove to be strongly correlated with certain parameters of the solution, forming dependable error indicators within the method. The decay-damping transformation extends the conventional flutter solution technique into a full predictor of classical system response; the present report completes a series of reports introducing this method for general use. RADIO TRANSMITTED UNIT ACTIVITY IN THE BRAINSTEM OF CONSCIOUS, UNRESTRAINED CATS, by R. von Baumgarten. Final rept. Oct. 30, 1962, 19p. incl. refs. (AFOSR-4181) (AF 61(052)470) AD 292972 Unclassified

A technique of wireless transmission of single nerve cell activity from the brain of unrestrained, freely-moving cats to a recording system was developed. With this new method, specific patterns were recorded in all parts of the cortex, the basal ganglia, the thalamus, and the ammonshorn. The differences in the firing pattern of single nerve cells were studied in the cortex of conscious and subsequently anesthetized cats. The pattern in unanesthetized preparations is much more irregular than that in the anesthetized. Changes in the firing pattern were compared with changes in the motor behavior. In the sensorimotor cortex of cats, units could be recorded which discharged only when the cat walked and ceased firing when it stopped walking. In the globulus pallidus, units were recorded which were facilitated during turning movements of the cat toward the contralateral side. The effect of optical and acoustical stimulation in the awake animal was studied. Typical optical effects were restricted to the visual areas, whereas strong acoustic stimulation caused a temporary general inhibition of unit activity over most of the cortical areas. Histological controls of the site of the microelectrode tip were performed regularly. This data, together with the corresponding specific unit patterns and the protocolled behavior during recording will be used in the preparation of a new neurophysiological brain atlas.

INTRANEURONAL MECHANISMS FOR INFORMATION STORAGE. THE BIOCHEMICAL RELATIONSHIP BETWEEN NEURON AND GLIA, by H. Hydén. Final rept. Apr. 1, 1959 - Mar. 31, 1962. Apr. 30, 1962, 13p. incl. tables, refs. (AFOSR-2672) (AF 61(052)248) AD 276234 Unclassified

A conspicuous feature of the neurons is their capacity to produce ribonucleic acids (RNA) and proteins on a large scale. This activity was as characteristic of neurons as is the generation of bioelectric potentials and is intimately linked with the specialized nervous function. When the stimulation of a group of neurons is increased, production of RNA and proteins also increases. The neuron is structurally and biochemically similar to an enormous gland cell. Sensory deprivation showed that stimuli are equally important for the maintenance of the nervous function during the life cycle. An intimate morphological relationship between the glial cells and the neurons is discussed. A

distinction was made between neutronal glia (mainly oligodendrocytes) and capillary glia (mainly astrocytes). On stimulation, glial potentials have been obtained which are 700 to 1000 times slower than those generated by the neurons. In cultures glial cells have been observed to climb along neurons like spiders, suggesting a pronounced affinity. The glia have been shown to exhibit pinocytosis and to react with structural changes earlier than did the neurons under experimental conditions. (Contractor's abstract)

NUCLEAR RNA CHANGES OF NERVE CELLS DURING A LEARNING EXPERIMENT IN RATS, by H. Hydén and E. Egyházi. [1962] [8]p. incl. illus. tables, refs. (AFOSR-2887) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)248 and National Multiple Sclerosis Society) Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 48: 1366-1372, Aug. 1962.

Increases occurred in the adenine/uracil ratio of nuclear RNA and in the amount of RNA/cell during the learning process. These changes in the nuclear RNA of the nerve cell were not due to demands on the neural function per se. Nuclear RNA changes during learning are considered to be due to activation of regions on the chromosomes with the production of nuclear (chromosomal) RNA with highly specific base ratios.

Also published in Jour. Cell Biol., v. 15: 37-44, Oct. 1962.

Nuclei from isolated nerve cells were sampled by microdissection. Analyses, were made of control nerve cells and of cells in which an enhanced RNA and protein production had been induced by chemical means, tricyano-amino-propene. The nuclear RNA content of the control nerve cells was 56 $\mu\mu$g. The base ratios were: adenine 21.3, guanine 26.6, cytosine 30.8, uracil 21.3. Purine-pyrimidine analyses showed that the nuclear RNA differed significantly from the cytoplasmic RNA in having higher adenine and uracil values. The guanine and cytosine values were high, however, and the ratio G/C was 0.86 as compared with 1.16 for the cytoplasmic RNA. During the 60 min. of enhanced neuronal RNA production (+25%) the guanine value increased and the uracil value decreased significantly in the nuclear RNA. In the cytoplasmic RNA the guanine value also increased although not so much as the nuclear guanine. The cytoplasmic cytosine value decreased. The results indicated that the production of the characteristic cytoplasmic RNA had been influenced by the change in the nuclear RNA. (Contractor's abstract, modified)

THE NEURON AND ITS GLIA - A BIOCHEMICAL AND FUNCTIONAL UNIT, by F. H. Hydén. [1962] [12]p. incl. illus. diagrs. tables, refs. (AFOSR-J471) (AF EOAR-62-29) AD 407893 Unclassified

Also published in Endeavour, v. 21: 144-155, Oct. 1962.

The investigations in neurochemistry are of interest not only because of their fundamental significance for the understanding of nervous function but because of the extreme delicacy of the biological and biochemical manipulations. The experimental evidence indicates a very close relationship between the neuron and its glia, the latter apparently constituting an effective feedback mechanism co-ordinating the electrical and biochemical processed in the neuron. NEW EVIDENCE FOR THE LOCALIZATION OF NORADRENALIN IN THE ADRENERGIC NERVE TERMINALS, by B. Falck and A. Torp. [1962] [4]p. incl. refs. (AFOSR-4202) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-61-44 and Public Health Service) Unclassified

Also published in Med. Exper., v. 6: 169-172, 1962.

By means of an essential modification of a previously developed fluorescence method, it now seems possible to demonstrate directly the adrenergic transmitter, noradrenalin, in the adrenergic nerve terminals. The method is based upon the principle that the amine in freeze dried tissues can be condensed with formaldehyde under nearly dry conditions to intensely fluorescent products. OBSERVATIONS ON THE POSSIBILITIES OF THE CELLULAR LOCALIZATION OF MONOAMINES BY A FLUORESCENCE METHOD, by B. Falck. [1962] [21]p. incl. illus. refs. (AFOSR-4327) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-61-44, Public Health Service, and Swedish Medical Research Council) Unclassified

Also published in Acta Physiol. Scand., v. 56: 7-24, 1962.

Catecholamines and 5-hydroxytryptamine form highly fluorescent condensation products when treated with formaldehyde. If freeze-dried preparations are treated with dry formaldehyde gas at approximately 80° for 1 hr, these condensation products are formed in tissues. There are no discernable signs of diffusion of the amines from their cellular localizations. The methodology has been described and data on the specificity and sensitivity discussed. Applications of this method include the demonstration of catecholamines and 5-hydroxytryptamine in neurons and 5-hydroxytryptamine in mast cells (rat and mouse) and blood platelets.

CELLULAR LOCALIZATION OF BRAIN MONOAMINES, by A. Carlsson, B. Falck, and N.-Å. Hillarp. [1962] [24]p. incl. illus. tables, refs. (AFOSR-4328) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-61-44, Public Health Service, and Swedish Medical Research Council) Unclassified

Also published in Acta Physiol. Scand., v. 56: 8-26, 1962.

The cellular localization of brain monoamines has been studied with the use of a fluorescence method for histochemical demonstration of certain catecholamines and tryptamines in combination with a pharmacological approach. Mainly the hypothalamus and caudate nucleus of mouse and rat were examined. The following are the most important results. Noradrenaline in the hypothalamus shows a high accumulation in fine varicose fibres which are present almost everywhere but highly concentrated in a large area of the preoptic region, the supraoptic and paraventricular nuclei, and the periventricular nuclei in the anterior hypothalamus. There is good evidence that these fibres represent the terminal parts of axons forming synaptic contacts. Similar fibres are present also in other parts of the central nervous system, including the spinal cord. There is good evidence that the perikarya and processes of some nerve cells in the hypothalamus contain a catecholamine in low concentrations. There also good evidence that a catecholamine is accumulated in high concentration in the superficial zone of the median eminence. Some circumscribed and more or less continuous areas, including the amygdala, surrounding the anterior hypothalamus and preoptic region develop a fluorescence which seems to be due to the presence of a catecholamine, possibly both noradrenaline and dopamine. The caudate nucleus as a whole develops a fairly high fluorescence.

TABLES OF NORMAL AND LOG NORMAL RANDOM DEVIATES, PART I, by H. Hyrenius and R. Gustafsson. 1962, 83p. incl. diagrs. tables. (AFOSR-3179, pt. 1) (AF 61(052)459) AD 282196 Unclassified

The construction of random deviates from existing tables of random digits opened up the possibility of elucidating many statistical problems in cases where exact solutions cannot be obtained. For the purpose of deriving deviates of non-normal distribution two distributions seem to be of special interest, namely the type-III distribution and the logarithmico-normal. In smaller series the former seemed to produce strong disturbances due to the extreme deviates. As a result it was decided to concentrate on the logarithmico-normal distribution. In this respect the following are covered: Transformation of normal deviates to log-normal deviates; Derivation of distribution-corrected normal deviates in series of different size; Randomization of series; Comments on derived series of distribution-corrected random normal deviates; and Derivation of series of random log-normal deviates.

AIR VEHICLE FLIGHT PATH OPTIMIZATION. VOL. I OF II, by H. J. Kelley, M Falco, and D. J. Ball. Feb. 1962 [57]p. incl. diagrs. tables. (AFOSR/DRA-62-4, (AFOSR-2267, v. 1) (AF 29(600)2671) Unclassified

The analytical development of gradient techniques for air vehicle optimal performance calculations is attempted. The method of gradients, a direct variational procedure, is applied to the optimization of vehicle attitude and throttle programs which extremize the fuel, range, and time performance of air-breathing vehicles. The inequality constraint on thrust $0 \leq T \leq T_{Max}$ is treated by introduction of an appropriate throttle variable having limited variation and by a corresponding modification of the gradient process. A "penalty function" concept for convenient handling of certain types of constraints is presented. An integral form of the penalty function is introduced for use with 2 limit boundaries in the altitude-Mach number chart: one a minimum altitude limit and the second a Mach number-Altitude envelope imposed by powerplant and structural limitations. Another form of the penalty function is employed in connection with specified terminal conditions on the state variables. A run termination criterion sufficiently flexible for use in a large variety of problems is developed on the basis of a one-dimensional search for optimal terminal time performed concurrently with trajectory integration. Maximum range climb profiles for a hypothetical Mach 3 turbojet vehicle operating at full throttle are presented. (Contractor's abstract, modified)

AIR VEHICLE FLIGHT PATH OPTIMIZATION. DETAILS OF COMPUTER PROGRAM. VOL. II OF II, by H. J. Kelley, M. Falco, and D. J. Ball. Feb. 1962 [187]p. incl. diagrs. tables. (AFOSR/DRA-62-4) (AFOSR-2267, v. 2) (AF 29(600)2671) AD 272318 Unclassified

In the course of development of a digital computation technique for calculations of minimum fuel, max range, and minimum time air vehicle flight paths, 2 computer programs emerged. In both programs 2 control variables, vehicle attitude and throttle, are utilized to shape the successive approximations to the optimal path. This first program employs a penalty function procedure to move in the direction of steepest descent of a modified performance quantity to be minimized. The second employs alternating cycles of this penalty technique and projection in the negative direction of gradient of the performance quantity. An analysis of computer time and storage requirements for both double control programs led to a recommendation that a 32K core EDPM be employed. The double control variable programs are written in FORTRAN language for operation on the 32K type machine. A double control variable version of the penalty function scheme is described in FORTRAN for operation with 8K core type computers.

TOPICS IN OPTIMIZATION THEORY, by H. J. Kelley, H. G. Moyer and others. Final rept. June 1962, 118p. incl. diagrs. refs. (Rept. no. RE-159) (AFOSR-4322) (AF 29(600)2733) AD 293940 Unclassified

Practical trajectory optimization problems are usually so complex as to require numerical rather than analytical approaches to solution. Consequently, it was necessary to grant first priority and a great deal of effort to means for computing optimal trajectories which satisfy prescribed boundary conditions. This was pursued primarily along the lines of the indirect method, the inference of a solution from the first 3 conditions of the classical theory, and by direct methods, mainly successive approximations. Relatively little was done in applying the necessary conditions associated with the second variation or in determining the characteristics of families of optimal trajectories, or fields of extremals, to employ variational terminology. These matters are of interest not only in ensuring selection of a truly optimal trajectory for operational use but are of primary interest in connection with the problem of guidance. A number of loosely connected studies in this general area is presented. (Contractor's abstract)

GUIDANCE THEORY AND EXTERNAL FIELDS, by H. J. Kelley. [1962] [8]p. incl. diagrs. refs. (AFOSR-J358) (AF 29(600)2733) AD 408032 Unclassified

Presented at Nat'l. Aerospace Electronics Conf., Dayton, Ohio, May 14-16, 1962.

Also published in I. R. E. Trans. on Automatic Control, v. AC-7, 75-82, Oct. 1962.

A guidance concept employing properties of optimal flight paths is developed on the basis of Jacobi's accessory minimum problem for the second variation. The

analysis is equivalent to construction of a field of extremals in the neighborhood of a predetermined extremal serving as a nominal trajectory. In the absence of inequality constraints on the control variables, a linear terminal control scheme with time-varying gains is realized. The addition of inequality constraints leads to nonlinear control behavior. Certain propulsion system parameters are characterized as state variables as a convenient means for providing adaptive behavior in respect to in-flight changes in propulsion system performance. An application is given to an intercept problem sufficiently simple to allow analytical solution, and some numerical results comparing optimal and approximately optimal guidance in their effects on flight performance are presented. Treatment of a certain type of problem arising in rocket applications is discussed. (Contractor's abstract)

ON STOCHASTIC APPROXIMATION METHOD AND OPTIMAL FILTERING THEORY, by Y.-C. Ho. Oct. 25, 1962, 5p. (Technical rept. no. 387) (AFOSR-J612) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616 and Rand Corp.) AD 400128 Unclassified

Also published in Jour. Math. Anal. and Appl., v. 6: 152-154, Feb. 1963.

The purpose of this report is to establish some connections among the maximum likelihood estimate, the optimal filtering and the stochastic approximation solutions to the following well-known problem. Consider the vector-matrix equations: $Ax + v_k = b_k$, $k = 1, 2, \ldots$, where A is a given rxn matrix, x is an unknown n-vector, v_k is a random r-vector with $E(v_k) = 0$, and $E(v_k v_j') = I\delta(k - j)$, and b_k is an r-vector of observation. One wishes to determine an estimate x for the unknown parameter x which is optimal in some sense. The author shows that a recursive technique for computing the maximum likelihood estimate of x is, for large values of k, equivalent to a multidimensional stochastic approximation method.

NONLINEAR OPTICAL PROPERTIES OF SOLIDS: ENERGY CONSIDERATIONS, by P. S. Pershan. Nov. 14, 1962 [38]p. incl. diagrs. tables, refs. (Technical rept. no. 393) (AFOSR-J1614) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616) AD 295762 Unclassified

Also published in Phys. Rev., v. 130: 919-929, May 1, 1963.

It is shown that the interaction between macroscopic, non-dissipative media, and time-varying electromagnetic fields can be described by a time-averaged potential function. From this function it is possible to derive phenomenologically the tensors that describe any of the usual electro- and magneto-optic effects for electric and magnetic fields of any frequency. In addition, these same potential functions describe the various optical nonlinearities like harmonic generation in KDP (potassium dihydrogen phosphate), and harmonic generation by electric quadrupole and magnetic dipole nonlinearities. The symmetry relations first derived by Armstrong, Bloembergen, Ducuing, and Pershan for electric dipole nonlinearities follow directly from the methods presented. In addition, analogous relations for electric quadrupole and magnetic dipole nonlinearities can be derived. These relations also demonstrate the reciprocal nature of the linear electro-optic effect and rectification of light. The Faraday effect and the production of a dc magnetization due to incident circularly polarized light are also reciprocal effects.

SPIN-LATTICE RELAXATION OF PARAMAGNETIC IONS IN DIAMAGNETIC GARNETS, by L. Svare and G. Seidel. [1962] [9]p. incl. diagrs. table. (AFOSR-64-2326) [Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616] Unclassified

Also published in Paramagnetic Resonance; Proc. of the First Internat'l. Conf., Jerusalem (Israel) (July 16-20, 1962), New York, Academic Press, v. 2: 430-438, 1963.

The spin-lattice relaxation time T_1, of several different paramagnetic rare earth ions having a 1% concentration in a variety of diamagnetic garnets has been measured at 9 kmc/sec between 1.2° and 77°K. As expected, T_1 is inversely proportional to T at the lowest temperatures where the direct, single phonon process is the main mechanism by which the spins are coupled to the lattice. At higher temperatures, T_1 varies more rapidly with T, and in some cases $T_1 \sim e^{\Delta/kT}$ indicating that the relaxation is predominately by a process involving 2 phonons in resonance with the first excited state. By observing the temperature dependence of T_1, it has been possible to determine the energy splitting of the first excited state of Er^{3+} and Dy^{3+} in a number of garnets. In other cases, evidence is found for relaxation via impurities, and the exponential temperature dependence is masked. The measure T_1 of Yb^{3+} is anomalously short in view of the known position of the first excited state. (Contractor's abstract)

TEMPERATURE DEPENDENCE OF PARAMAGNETIC RESONANCE LINES, by G. Seidel and L. Svare. [1962] [14]p. incl. diagrs. refs. (AFOSR-64-2327) (Sponsored jointly by [Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616]) Unclassified

Also published in Paramagnetic Resonance; Proc. of the First Internat'l. Conf., Jerusalem (Israel) (July 16-20, 1962), New York, Academic Press, v. 2: 468-481, 1963.

Paramagnetic resonance measurements are usually performed at temperatures where the various energy levels giving rise to the absorption have only a small separation as compared to the thermal energy.

However, a new type of phenomenon, which is dependent upon spin-spin interactions, manifests itself at sufficiently low temperatures where there is an appreciable variation of the average occupation numbers of the energy levels of the absorbing system. Recently, McMillan and Opechowski have pointed out that while the Van Vleck moment calculation is a high temperature approximation in that equal occupation of the energy levels is assumed, when $h\nu \gtrsim kT$, the moments of paramagnetic resonance lines may have a significant temperature dependence. Measurements have been performed on several crystals at 30 kmc/sec down to 0.3°K. In certain favorable cases, it is possible to deduce not only the magnitude but also the sign of the exchange interactions. This paper is devoted to a discussion of the observation and significance of these effects. (Contractor's abstract)

ELECTRIC SHIFT OF THE Cr^{3+} MAGNETIC RESONANCE IN RUBY, by N. Bloembergen and E. B. Royce. [1962] [13]p. incl. diagrs. table, refs. (AFOSR-64-2329) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-186616]) Unclassified

Also published in Paramagnetic Resonance; Proc. of the First Internat'l. Conf., Jerusalem (Israel) (July 16-20, 1962), New York, Academic Press, v. 2: 607-619, 1963.

The general phenomenological relationships and the basic physical mechanisms responsible for the occurrence of electrically induced shifts of paramagnetic resonance lines are given. The effects are illustrated in the case of C_3 symmetry for the Cr^{3+} ions in ruby. A linear splitting of the paramagnetic resonance lines is observed at about 14 kmc/sec, for several orientations of the electric and magnetic dc fields. The splitting corresponds to an equal and opposite shift of the Cr^{3+} spin levels at 2 sites related to each other by inversion. The complete angular dependence of this shift has been determined. It is described by additional terms in the spin Hamiltonian $\mathcal{H}_{E,S} = \Sigma \pm R_{ijk} E_i (S_j S_k + S_k S_j)$. The 5 independent non-vanishing coefficients of the third order R-tensor in C_3 symmetry have been measured and a qualitative interpretation in terms of crystal field structure is given. ELECTRIC SHIFT OF THE F^{19} HYPERFINE INTERACTION IN ANTIFERROMAGNETIC MnF_2, by P. S. Pershan and N. Bloembergen. [1962] [9]p. incl. diagrs. refs. (AFOSR-64-2330) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-186616]) Unclassified

Also published in Paramagnetic Resonance; Proc. of the First Internat'l. Conf., Jerusalem (Israel) (July 16-20, 1962), New York, Academic Press, v. 2: 656-664, 1963.

Linear effects of an electric field on the hyperfine interaction of Mn^{++} 3d electrons with F^{19} nuclei are detected as shifts of the nuclear magnetic resonance frequency of the F^{19} nuclei. An electric field in the [110] direction shifts the resonant frequency for 2 F^{19} sites in the unit cell by ± 70 kc per sec/100 kv cm^{-1} and leaves the other 2 sites unaffected. This is a new parameter to be fitted by the theory for the F^{19} hyperfine interaction in MnF_2. With a combination of electric and magnetic fields, it is possible to investigate the presence of antiferromagnetic domain walls in MnF_2. In a crystal 1 mm x 4.8 mm x 7.9 mm with the [110] direction normal to the broad face, no evidence was found for domain walls. Signal to noise level limits the certainty with which one can say domain walls are completely absent. In these experiments, at least 80% of the crystal was of one domain. This situation has recently been confirmed by scattering of polarized neutron beams. (Contractor's abstract)

CERTAIN RESULTS IN PULSE TRANSMISSION THEORY, by D. W. Tufts. Feb. 5, 1962 [52]p. incl. diagrs. refs. (Technical rept. no. 355) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616) AD 275564 Unclassified

Some results that pertain to the problem of controlling intersymbol interference and additive noise interference in a certain type of pulse transmission system are discussed. An amplitude modulated, periodic pulse train is the input to a noisy, linear, and time invariant transmission medium. At the receiver, the amplitude of each transmitted pulse is estimated by performing a weighted integration of the received waveform. A pulse code modulation link is a special case of such a system. Considering interference to be the mean square difference between a transmitted pulse amplitude and the receiver's estimate of this amplitude, an expression is derived for the minimum interference that is possible in the case of transmitted pulses of finite energy. An explicit method is also presented for specifying a transmitted pulse shape and a receiver weighting function which permit the minimum interference to be obtained. The ways in which the minimum interference is affected by the transmitted data rate, the type of transmission medium, the noise power density spectrum, and the transmitted pulse energy are explored and compared with previous results. LIGHT HARMONICS AT THE BOUNDARY OF A NONLINEAR DIELECTRIC (Abstract), by N. Bloembergen and P. S. Pershan. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-186615]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 259, Apr. 23, 1962.

The Fresnel formulas for the reflection and refraction of light are generalized to include nonlinearities of the dielectric medium. Harmonics appear both in the reflected and refracted waves, with distinct intensity and polarization characteristics. The theory predicts the phase shifts in the harmonics on reflection of the light beam going from vacuum to dielectric and vice versa, as well as the interference of harmonics in a nonlinear sheet. It is straightforward to generalize the results to anisotropic nonlinear dielectrics. In the case that 2 plane waves at frequencies ω_1 and ω_2 are incident on a plane boundary from different directions, sum and difference frequencies are created in directions which do not coincide, in general, with the directions of the reflected and refracted fundamental waves. If the nonlinear medium lacks an inversion center, the effects of atomic surface layers of width a are smaller than the boundary harmonics by a factor $(a/\lambda)^2$. The surface-layer effect is comparable in magnitude to electric-quadrupole and magnetic-dipole boundary harmonics in crystals with inversion center.

LIGHT WAVES AT THE BOUNDARY OF NONLINEAR MEDIA, by N. Bloembergen and P. S. Pershan. May 15, 1962, 5[illegible] incl. illus. refs. (Technical rept. no. 377) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616) AD 277658 Unclassified

Also published in Phys. Rev., v. 128: 606-622, Oct. 1962.

Solutions to Maxwell's equations in nonlinear dielectrics are presented which satisfy the boundary conditions at a plane interface between a linear and nonlinear medium. Harmonic waves emanate from the boundary. Generalizations of the well-known laws of reflection and refraction give the direction of the boundary harmonic waves. Their intensity and polarization conditions are described by generalizations of the Fresnel formulae. The equivalent Brewster angle for harmonic waves is derived. The various conditions for total reflection and transmission of boundary harmonics are discussed. The solution of the nonlinear plane parallel slab is presented which describes the harmonic generation in experimental situations. An integral equation formulation for wave propagation in nonlinear media is sketched. Implications of the nonlinear boundary theory for experimental systems and devices are pointed out. LINEAR STARK SPLITTING OF NUCLEAR SPIN LEVELS IN GaAs, by D. Gill and N. Bloembergen. [1962] [6]p. incl. illus. diagrs. table, refs. [Technical rept. no. 414] (Sponsored jointly by Advanced Research Projects Agency; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616) AD 409539; AD 410418 Unclassified

Also published in Phys. Rev., v. 129: 2398-2403, Mar. 15, 1963.

A quadrupole splitting of the fourfold-degenerate nuclear spin levels of Ga^{69}, Ga^{71}, and As^{75} in a single crystal of GaAs has been induced by the application of a dc electric field along the [111] direction. The splitting of the nuclear magnetic resonance has been observed and the coupling constants R_{14} between the induced gradient tensor and the applied homogeneous electric field have been determined. The results are $R_{14}(Ga^{69}) = 1.05 \times 10^{10} cm^{-1}$, $R_{14}(Ga^{71}) = 0.9 \times 10^{10} cm^{-1}$, and $R_{14}(As^{75}) = 1.55 \times 10^{10} cm^{-1}$. A simple theoretical model explains the physical origin of this effect quite well. (Contractor's abstract)

PARAMAGNETIC RESONANCE LINES AT LOW TEMPERATURE, by I. Svare and G. Seidel. Sept. 5, 1962 [178]p. incl. diagrs. tables, refs. (Technical rept. no. 378) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186816) AD 295897
Unclassified

A number of paramagnetic resonance lineshapes have been analyzed and explained in terms of spin-spin interaction. It is shown that this technique may be an important supplement to other methods of investigating interaction in paramagnetic salts. The advantages of the line moment method at low temperature are: (1) The exchange interaction can be found in sign and magnitude; possible anisotropy of the exchange can be detected; (2) Exchange interaction between unlike neighbors only can be measured; if the total exchange is known from other data, the exchange between like neighbors can be separated out; and (3) The method works best at rather weak interaction where specific heat and susceptibility experiments are difficult to perform with sufficient accuracy. The disadvantages of the method are: (1) A complex He^3 cryostat is needed and it is difficult to mount the sample inside the cavity in good heat contact with the He^3 reservoir; and (2) Spherical samples are needed to avoid demagnetizing effects; however, magnetostatic modes are easily excited in spheres, and this may obscure the true lineshape. RELAXATION TIME MEASUREMENTS IN RUBY BY A DC MAGNETIZATION TECHNIQUE, by S.-Y. Feng. June 1, 1962, 56p. incl. diagrs. refs. (Technical rept. no. 371) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186616) AD 291503
Unclassified

A method of measuring the relaxation time of paramagnetic substances was developed. The change in the z-component of the magnetization was detected by a pick-up coil and the signal was amplified, integrated, and displayed on an oscilloscope. The method was much simpler than any of the other methods, and the reliability of data was, therefore, better. By this technique, the cross-relaxation and spin-lattice relaxation times were measured for ruby crystals. High-order cross-relaxation processes involving 3, 4, and 5 spins were observed, and the relaxation signal could be described fairly well by the solution of a set of rate equations appropriate to the particular process. Spin-lattice relaxation times were measured at different temperatures and concentrations. A Bloembergen-Pershan model, involving an inverted Orbach-Wolf mechanism, could satisfactorily explain the observed data. The dependence on concentration, magnetic field strength was also discussed. A qualitative explanation, due to Orbach, was given and the result was compared with the existing data. It seems that there is a mild field dependence, approximately linear with H, at high magnetic fields. (Contractor's abstract)

RELAXATION TIME MEASUREMENTS IN RUBY BY A DC MAGNETIZATION TECHNIQUE, by S.-Y. Feng and N. Bloembergen. [1962] [5]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-186616]) Unclassified

Published in Phys. Rev., v. 130: 531-535, Apr. 15, 1963.

Relaxation time measurements by observation of the recovery of the z component of the dc magnetization have been carried out in ruby. Harmonic cross-relaxation processes, involving 2, 4, and 5 spins, have been identified. The cross-relaxation time for the 5-spin process is found to be proportional to $f^{-2.6}$, where f = Cr:Al atom ratio. The spin-lattice relaxation time is proportional to f^{-1} for small f, but decreases faster at higher concentrations. The temperature dependence as T^{-1} or T^{-2} can be explained by a model of cross relaxation between single ions and exchange coupled pairs. The magnetic field dependence is small.

Control systems that exhibit a capacity to learn, in the sense of meaningful self-alteration based on experience are studied. The relation between learning, adaptation, and self-organization in control systems and in animals is discussed. A system capable of synthesizing its controllers without explicit knowledge of the process or the spectra of the inputs is described. The synthesis is based on the cross-correlation between a signal representing the desired output state and the various components of the tentative input signal. The system, in a general way, exemplifies the principles of learning used in programming a computer to play checkers. Results of computer simulation of the system are presented. The purpose is to present the motivation and the physical reasoning on which the system was based. Results of computer simulation of a self-organizing system are presented to demonstrate the feasibility of the design. (Contractor's abstract)

TRANSIENTS IN CYLINDRICAL ANTENNAS, by H. J. Schmitt. Jan. 5, 1959 [52]p. incl. illus. diagrs. refs. (Technical rept. no. 296) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186628) AD 216884 Unclassified

Transients in cylindrical antennas are investigated for the particular case of a step-function excitation. The transient response of the radiation field of a driven antenna and the induced transient voltage on a loaded receiving antenna are considered. The theoretical analysis makes use of Fourier's theorem to express the response as an integral over the response to all individual frequency components. The response as a function of time, obtained by graphical integration, shows rapid oscillations with a periodicity determined by the first resonance frequency of the antennas. Transient times are discussed in their relation to the bandwidth of the antenna. By proper loading of the dipole, transient times of the order of the time needed for a wave to travel along the dipole axis can be obtained. The response of a receiving antenna and the response of a transmitting antenna for any kind of excitation are shown to be connected by a differentiation or integration process. An experimental investigation is described in which the reception of a transient field due to a shock-excited distant transmitting antenna is observed. The measured results are in very good agreement with the theoretical prediction. (Contractor's abstract)

ELECTROMAGNETIC FIELD PROBES, by H. Whiteside. Oct. 25, 1962 [251]p. incl. illus. diagrs. tables, refs. (Technical rept. no. 377) (AFOSR-J1613) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632) AD 400131 Unclassified

The behavior of probes in the electromagnetic field is limited by the averaging of the measured field over the finite size of the probe. This is the major restriction on the use of the receiving dipole as an electric probe. The usual magnetic probe, a shielded loop, suffers in addition from a less well-known source of error. Such a loop, even for moderate size, will sustain currents that are proportional to the tangential electric field, not to the normal magnetic field as desired. These electric mode currents are studied in some detail, and methods of avoiding or reducing them are proposed and tested. In addition, the behavior of loop probes is studied in general, both theoretically and experimentally, varying all the relevant parameters such as loop size, shape, wire size, and load. DIFFRACTION BY A CIRCULAR APERTURE IN A UNIDIRECTIONALLY CONDUCTING SCREEN, by S. R. Seshadri and T. T. Wu. Apr. 10, 1962 [32]p. incl. diagrs. (Technical rept. no. 360) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632, and National Science Foundation) AD 275334 Unclassified

The diffraction of a normally incident plane electromagnetic wave with wave number k by a circular aperture of radius a in an unidirectionally conducting plane screen of zero thickness and infinite extent is considered. In the limit of large ka, the ratio of the transmission cross section to the geometrical optics value πa^2 is found up to the order $(ka)^{-3/2}$. A new feature of this problem is that a set of rays in the sense of Keller's geometrical theory of diffraction emanates from the regions of the aperture rim to which the current on the screen is nearly tangential and proceeds in all directions. However, for the case of normal incidence, these rays do not contribute to the transmission cross section up to the order $(ka)^{-3/2}$. (Contractor's abstract)

EXCITATION OF PLASMA WAVES IN AN UNBOUNDED HOMOGENEOUS PLASMA BY A LINE SOURCE, by S. R. Seshadri. July 23, 1962 [37]p. incl. diagrs. (Technical rept. no. 373) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632) AD 283830 Unclassified

The radiation characteristics of a line source of magnetic current embedded in a homogeneous electron plasma of infinite extent are investigated for the case in which a uniform magnetic field is impressed externally throughout the medium in the direction of the source. The single-fluid theory of magnetohydrodynamics is employed. A very simple model is assumed for the plasmas. Under this assumption, it is found that there are 2 modes of propagation of waves of small amplitude. By examining the behavior of these modes in the limiting cases of vanishing external magnetic field or infinite source frequency, they are identifiable as the modified forms of the usual plasma and optical modes which exist in an isotropic electron plasma. The dispersion relations for these 2 modes are discussed. The power radiated in each of the 2 modes is also evaluated. It is found that the power radiated in the optical mode is always lower than that due to the line source in free space, whereas the power radiated in the plasma mode is higher than that value for certain ranges of the source frequency. EXCITATION OF SURFACE WAVES ON A PERFECTLY CONDUCTING SCREEN COVERED WITH ANISOTROPIC PLASMA, by S. R. Seshadri. May 7, 1962 [24]p. incl. diagrs. (Technical rept. no. 366) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632, and National Science Foundation) AD 282293 Unclassified

The field due to a line source of magnetic current situated in a lossless plasma region above a perfectly conducting screen is considered when a uniform static magnetic field is impressed throughout the plasma region parallel to the direction of the line source. It is shown that under certain conditions surface waves are excited on the screen. The dependence of the efficiency of excitation of surface waves on the distance d of the line source from the ground screen is examined. Also, the asymptotic series for the radiation field is derived, and its leading term is shown to vanish for a particular value of d. Under these conditions, a strong surface-wave field is maintained near the guiding surface. (Contractor's abstract)

INPUT ADMITTANCE OF INFINITELY LONG DIPOLE ANTENNAS DRIVEN FROM COAXIAL LINES, by T. T. Wu. Apr. 17, 1962 [11]p. incl. diagrs. (Technical rept. no. 362) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632, and National Science Foundation) AD 277657 Unclassified

Also published in Jour. Math. Phys., v. 3: 1298-1301, Nov.-Dec. 1962.

For an infinitely long dipole antenna driven from a coaxial line, the reflection coefficient and hence the apparent terminal admittance are determined approximately when the radii of the coaxial line are small compared with the wavelength. This result is useful because the differences of admittances for antennas with identical geometry near the driving point are less sensitive to the driving condition and hence can be found approximately by many existing theories. (Contractor's abstract)

INPUT ADMITTANCE OF LINEAR ANTENNAS DRIVEN FROM A COAXIAL LINE, by T. T. Wu. Mar. 15, 1962 [19]p. incl. diagrs. (Technical rept. no. 357) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632, and National Science Foundation) AD 275332 Unclassified

In 2 cases of a linear antenna driven from a coaxial line, it is shown that the apparent terminal admittance to the coaxial line can be additively separated into 2 parts when the transverse dimensions are small compared with the wavelength. One of these 2 parts depends only on the wavelength and the dimensions of the antenna, while the other part can be interpreted as a capacitance that depends only on the radii of the coaxial line. This capacitance may be found exactly from the solution of an integral equation, in the sense that further corrections cannot be interpreted simply as a capacitance. (Contractor's abstract)

INTERACTIONS BETWEEN LIGHT WAVES IN A NONLINEAR DIELECTRIC, by J. A. Armstrong, N. Bloembergen and others. Mar. 20, 1962 [74]p. incl. diagrs. refs. (Technical rept. no. 358) (Sponsored jointly by Advanced Projects Research Agency; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-186632]) AD 275333 Unclassified

Also published in Phys. Rev., v. 127: 1918-1939, Sept. 15, 1962.

The induced nonlinear electric dipole and higher moments in an atomic system, irradiated simultaneously by 2 or 3 light waves, are calculated by quantum mechanical perturbation theory. Terms quadratic and cubic in the field amplitudes are included. An important permutation symmetry relation for the nonlinear polarizability is derived and its frequency dependence is discussed. The nonlinear microscopic properties are related to an effective macroscopic nonlinear polarization, which may be incorporated into Maxwell's equations for an infinite, homogeneous, anisotropic, nonlinear, dielectric medium. Energy and power relationships are derived for the nonlinear dielectric which correspond to the Manley-Rowe relations in the theory of parametric amplifiers. Explicit solutions are obtained for the coupled amplitude equations, which describe the interaction between a plane light wave and its second harmonic or the interaction between 3 plane electromagnetic waves, which satisfy the energy relationship $\omega_3 = \omega_1 + \omega_2$, and the approximate momentum relationship $k_3 = k_1 + k_2 + \Delta k$. Third-harmonic generation and interaction between more waves is mentioned. Applications of the theory to the dc and microwave Kerr effect, light modulation, harmonic generation, and parametric conversion are discussed. (Contractor's abstract)

THE LONG, CYLINDRICAL ANTENNA: CURRENT AND ADMITTANCE, by K. Iizuka, R. W. P. King, and S. Prasad. Jan. 25, 1962 [43]p. incl. diagrs. refs. (Technical rept. no. 351) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632, and National Science Foundation) AD 275563 Unclassified

A study was made of the long, cylindrical antenna. The driving-point admittance, the relative amplitude, and the phase distributions of the current are given for long cylindrical dipole antennas ranging in electrical half-length from $\beta h = 0.3$ to $\beta h = 63.1$, when driven by a 2-wire line. The measured values of the driving-point admittance are in good agreement with the King-Middleton second-order-theory for the shorter lengths of antennas and with Wu's theory for the longer lengths. Particular care was taken to determine the influence of an unbalanced feeding line on both the driving-point admittance and the current distribution on the antenna. The measured driving-point admittance of the long antenna was extrapolated to that of the infinite length. The current distributions on the halves of the antenna, when driven by symmetric currents (completely unbalanced line) and by anti-symmetric currents (balanced line), are compared. A METHOD OF MEASURING THE TIME-DEPENDENT IMPEDANCE OF THE LOAD, by K. Iizuka. Apr. 20, 1962 [17]p. incl. diagrs. table. (Technical rept. no. 364) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632) AD 282292 Unclassified

By processing a sequence of scope pictures of the output from the probe of a standing-wave detector placed successively at a sequence of positions along a slotted coaxial line, the instantaneous values of a nonstationary load impedance terminating a coaxial line may be measured. This method was applied to measure the instantaneous values of the impedance of a fast-response Cadmium Selenide photo-cell which has a rise and decay time of the order of milliseconds. The experiments were performed at 600 mc. The experimental results were satisfactory and a change that took place in a few milliseconds could easily be measured. On the other hand, a change that occurs in a few tenths of a microsecond would be near the present limit of measurement. This technique could be extended to the measurement of the dynamic impedance of a plasma tube during the rise and decay period of the plasma intensity, or to the measurement of dynamic conductivities, or electric and magnetic susceptibilities in general. A NEW TECHNIQUE FOR MEASURING AN ELECTROMAGNETIC FIELD BY A COIL SPRING, by K. Iizuka. June 19, 1962 [22]p. incl. diagrs. table, refs. (Technical rept. no. 365) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632, and National Science Foundation) AD 287037 Unclassified

Also published in I. E. E. E. Trans. on Microwave Theory and Techniques, v. MTT-11: 496-505, Nov. 1963.

A thin coil spring whose length can be varied periodically by mechanical means was used as a probe to measure the electric field intensity. The vibrating probe acts as a re-radiating antenna with periodically varying length that modulates and scatters the component of the E field which is parallel to the axis of the spring. The scattered signal is picked up by a receiving antenna (the sending antenna was used also as a receiving antenna) and amplified with an amplifier that is locked-in with the frequency of the mechanical vibration of the coil. Measurements were made with coil springs of 3 different dimensions, and a gain constant K, which should be independent of the product of the axial length of the coil and the magnitude of the vibration, was experimentally checked. Measurements of the field of a half-wave dipole antenna as measured with the spring probe are in general agreement with theory. An expression for the gain of the system is obtained based upon the field-pattern method, and the approximations involved in the reciprocity-theorem method are clarified. It is also demonstrated that the effective length of a thin helical antenna equals the axial length of the helix. (Contractor's abstract)

A PHOTOCONDUCTIVE PROBE FOR MEASURING ELECTROMAGNETIC FIELDS, by K. Iizuka. July 25, 1962 [31]p. incl. illus. diagrs. refs. (Technical rept. no. 374) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632) AD 287035 Unclassified

Also published in Proc. Inst. Elec. Engineers (London), v. 110: 1747-1754, Oct. 1963.

Probes were constructed for measuring the intensity of the electromagnetic field in which the usual connecting leads between the probe and the detector are eliminated. The new devices are modulated reradiating or scattering antennas that consist of either a small dipole (for measuring E) or a small shielded loop (for measuring H) center-loaded with a photo cell illuminated by a chopped beam of light. The modulated scattered signal from the probe is proportional to either the component of the E field which is parallel to the axis of the dipole, or to the component of the H field which is perpendicular to the plane of the shielded loop. The scattered signal is received by an additional antenna or by the same antenna as is used for transmission. The received signal is amplified by a lock-in amplifier. The same principle was applied to the measurement of the distribution of current along an antenna with arbitrary shape. Both the near-field pattern of a half-wave dipole

antenna and the distribution of current along the antenna as measured with those optical probes are in general agreement with the theory. The properties of several other types of probes based on the same principle were also explored. (Contractor's abstract)

Also published in Canad. Jour. Phys., v. 41: 246-257, Feb. 1963.

Two problems of radiation in a magnetized, incompressible plasma are investigated. The radiation characteristics of a line source of magnetic current are studied for the case in which the external magnetic field is infinite and is oriented in a direction perpendicular to that of the source. The second problem that is treated is the radiation from a uniformly moving line charge. Two cases are considered: (1) when the motion of the line charge is parallel and (2) when it is perpendicular to the direction of the external magnetic field. In each case it is found that there is a Cerenkov-type radiation for frequencies less than the plasma frequency. The frequency and the angular spectrum, as well as the total energy radiated per unit path length, are determined for both cases. (Contractor's abstract)

Also published in I. E. E. E. Trans. on Microwave Theory and Techniques, v. MTT-11: 462-471, Nov. 1963.

The radiation from a point charge moving uniformly in a plasma is investigated when the charge is moving in the direction of an external magnetic field. In general, there are 2 modes, for each of which all the components of the electric and magnetic field are present. The 2 parameters of interest in this problem are the ratio u/c_0 of the velocity of the charges to the free-space velocity of electromagnetic waves and the ratio R of the gyromagnetic frequency to the plasma frequency of the electrons. For 2 sets of values of these parameters, the frequency and the angular spectrum of the emitted radiation are obtained. In certain cases, as many as 3 Cerenkov rays are found to propagate in the same direction; these multiple rays, however, correspond to different modes of propagation. (Contractor's abstract)

SCATTERING BY DISCONTINUITIES OF SURFACE WAVES ON A UNIDIRECTIONALLY CONDUCTING SCREEN, by S. R. Seshadri. Jan. 15, 1962 [31]p. incl. diagrs. (Technical rept. no. 349) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632, and National Science Foundation) AD 274142
Unclassified

The propagation of electromagnetic waves in waveguides with anisotropic walls has in recent years assumed practical importance in long-distance waveguide communication. It is shown that an anisotropic planar surface can support a guided wave which is attenuated exponentially in the direction normal to the surface. The spread of the field in this surface waveguide decreases as the angle between the direction of propagation and the direction of the wires becomes close to $\pi/2$. Appropriate boundary conditions applicable at the surface of such a unidirectionally conducting screen are given. Radiation from the open end of such a semi-infinite surface waveguide is treated. The electromagnetic fields produced at the junction of 2 semi-infinite surface waveguides are examined; the wires composing the 2 surface waveguides are assumed to be in different directions. A treatment is given for the problem of radiation from the junction formed by a semi-infinite surface waveguide and a perfectly conducting half-plane.

For this case, the power reflection coefficient and the radiation pattern are found to be the same as for the open-ended waveguide. (Contractor's abstract)

THE SMALL LOOP ANTENNA IMMERSED IN A DISSIPATIVE MEDIUM, by C.-L. Chen. May 20, 1962 [7]p. incl. diagr. (Technical rept. no. 369) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632, and National Science Foundation) AD 283827 Unclassified

The problem of a thin loop antenna in free space has been studied extensively by Storer. The Hallin integral equation for the current is solved by means of a Fourier Series. The problem considered in this report as the input admittance of a small thin-wire loop antenna immersed in a dissipative medium. The following equation is derived: input admittance $= Y_{in} = \frac{I(o)}{V} =$

$$-J\frac{\ell_o}{\gamma_e}\,\frac{1}{120\pi^2}\,\frac{1}{8b}\left[\frac{1}{k_1}+\frac{4}{k_0+k_2-\frac{2}{(kb)^2}\,k_1}\right].$$

TERMINAL ZONE CORRECTIONS FOR A DIPOLE DRIVEN BY A TWO-WIRE LINE, by K. Iizuka and R. W. P. King. Feb. 25, 1962 [23]p. incl. diagrs. tables, refs. (Technical rept. no. 352) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632) AD 277663 Unclassified

The terminal-zone effects on the dipole antenna driven by a 2-wire transmission line have been re-examined. A series inductive correction together with other terminal-zone corrections is found necessary to reduce the measured apparent admittance of the antenna terminating the 2-wire line with the ideal admittance of the dipole antenna when driven by a delta-function generator. The series inductive correction takes account of the absence of the antenna wire in the gap between the 2-wires of the transmission line. With this additional correction, the measured apparent admittance of a dipole antenna may be brought into excellent agreement with theoretical values and also reconciled with the quite different values measured with a coaxial line for an antenna consisting of the vertical inner conductor of the line extended over a horizontal ground plane. TRANSIENT RESPONSE OF LINEAR ANTENNAS DRIVEN FROM A COAXIAL LINE, by T. T. Wu and R. W. P. King. May 25, 1962 [26]p. incl. diagrs. (Technical rept. no. 370) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-186632) AD 287038 Unclassified

The initial transient response of straight wires connected to coaxial lines is studied theoretically for the case where a pulse is applied to the coaxial line. The wave form of the return pulse is first found approximately for the case of a pulse of zero rise time. Since this does not correspond to any feasible experimental situation, the effect of a finite rise time is considered in detail. Numerical results are obtained for several special cases. CASIMIDINE, A FRAGMENT OF CASIMIROEDINE CONTAINING β-GLUCOSE AND N-METHYLHISTAMINE, by S. Raman, J. Reddy and W. N. Lipscomb. [1962] [6]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)809 and National Institutes of Health) Unclassified

Published in Acta Cryst., v. 16: 364-369, Apr. 10, 1963.

The molecular and crystal structure of the dihydrochloride of the alkaloid casimidine has been elucidated. A β-glucose residue is established and is shown to the point of attachment of the $CH_2CH_2NHCH_3$ group of N-methylhistamine. The H-bonding scheme suggests that the other 2 N atoms of the dihydrochloride ($C_{12}H_{21}N_3O_5 \cdot 2HCl$) are protonated. There are 4 formula weights in a unit cell of dimensions a = 27.81, b = 10.76 and c = 5.76 A, and the space group is $P2_12_12_1$. The final value of $R = \Sigma||F_o|-|F_c||/\Sigma|F_o|$ is 0.12 for the 1036 observed reflections. (Contractor's abstract)

STRUCTURE OF $Cu_2B_{10}H_{10}$, by R. D. Dobrott and W. N. Lipscomb. [1962] [6]p. incl. diagrs. tables, refs (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)809] and National Institutes of Health) Unclassified

Published in Jour. Chem. Phys., v. 37: 1779-1784, Oct. 15, 1962.

An x-ray diffraction study of the crystal structure of $Cu_2B_{10}H_{10}$ shows that the earlier proposal that the $B_{10}H_{10}^{-2}$ ion has D_{4d} symmetry is correct, and further establishes the covalent nature of the interactions of Cu^I with B atoms forming the edges of the polyhedron. There are 8 $Cu_2B_{10}H_{10}$ in a unit cell having dimensions a = 10.11, b = 11.36, and c = 14.50, and the space group is Pcab. Bonds within a tetragonal pyramid are 1.73 A (to apex) and 1.86 A (along base), while B-B bonds between the tetragonal pyramids are 1.81 A in length. The closest Cu···B distances range from 2.14 to 2.33 A in length.

STRUCTURE OF THE ALKALOID CASIMIROEDINE, by S. Raman, J. Reddy and others. [1962] [4]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)809] and National Institutes of Health) Unclassified

Published in Tetrahedron Ltrs., No 9: 357-360, May 1962.

Casimidine (I) was acetylated with Ac_2O-C_5H_5N at 25° and cleaved for 1.5 hr at 40° in 40% aqueous HBr-AcOH-CH_2Cl_2. The bromo sugar was extracted with CH_2Cl_2, and hydrolyzed with Ag_2CO_3. Acetylation of the crude product and chromatography yielded 28% β-D-glucose pentaacetate, mp 130-131°, $[\alpha]_D^{25}$ +3° ($CHCl_3$). The result suggested the presence of an N-glycosidic linkage and showed that casimiroedine (I) is one of a number of possible N-D-glucosides of N-cinnamoyl-N-methylhistamine in which the configuration of the anomeric center, the size of the sugar ring, and the N atom linked to the sugar are indeterminate. Crystallographic examination of I.2HCl established the glucose residue, except for absolute configuration, and further showed that β-glucose (all 5 ring H atoms in the axial configuration) is attached by equatorial bond to the histamine ring at the N atom further from the CH_2CH_2NHMe group. I.2HCl has space group $P2_12_12_1$ and unit cell dimensions a = 27.81, b = 10.76, and c = 5.76A. The available organic chemistry and x-ray evidence complete the structure of II except for the question of trans or cis configuration of the cinnamoyl group.

ANALYTIC MAPS BETWEEN RIEMANN SURFACES, by D. H. Hustmoller. [1961] [5]p. [AF 18(600)1461] Unclassified

Published in Proc. Amer. Math. Soc., v. 13: 412-416, June 1962.

Let X, Y be Riemann surfaces whose universal covering surfaces are unit disks, X^0, Y^0. If x_0y_0 [respectively, $0, 0$] are fixed in X, Y[X^0, Y^0] let A(X, Y) [A(X^0, Y^0)]

be the set of analytic maps from X into Y[X^0 into Y^0] which carry x_0 onto y_0[0 onto 0]. By a natural lifting A(X, Y) can be viewed as a subset of $A(X^0, Y^0)$. The author proves that A(X, Y) is a closed subset of $A(X^0, Y^0)$ where the latter is given the topology of uniform convergence on compact sets. In the proof, an approximation theorem is used which gives a criterion for $f_n \in A(W_n, Y)$ to converge to some $f \in A(X, Y)$, where $\{W_n\}$ is an increasing sequence of "simply embedded" subsurfaces of X. The criterion concerns the nature of the group homomorphisms induced by the (natural liftings of the) f_n. (Math. Rev. abstract)

ON SOME CONJECTURES CONCERNING FINITE SIMPLE GROUPS, by R. Brauer. [1962] [8]p. incl. refs. [AF 49(638)287] Unclassified

Published in Studies in Mathematical Analysis and Related Topics, ed. by G. Szego, C. Loewner, and others. Stanford U. Press, 1962, p. 56-61.

Several interesting conjectures in the theory of finite groups are stated. Each of these conjectures is accompanied by several theorems which verify the truth of these conjectures in special cases. The proofs of most of these theorems are omitted. Conjecture (A): There exist only finitely many simple groups of G whose order g is divisible by exactly 3 distinct primes. Conjecture (B): Let G be a simple group or order $g = p^a q^b g_0$, where p and q are distinct primes (a > 0, b > 0) and where g_0 is an integer prime to p. Conjecture (C): If the order of a noncyclic simple finite group G is divisible by p^2, p a prime, then $g > p^{cp}$. The final conjecture, which is a modification of (A), is based on the observation that the order g of each type of known classical group of degree n over the finite field of m elements seems to have a factorization $g = p_{1^{a_1}} \cdots p_{r^{a_r}}$, where $p_1, \ldots p_r$ are integers so that the characters of the group G behave as though these factors were primes. Conjecture (A*): There exist only finitely many simple groups G whose order is divisible by exactly r distinct primes and which do not belong to a class of classical groups for which the number r does not exceed n. SOME FUNDAMENTAL LEMMAS ON PROJECTIVE SCHEMES, by Y. Nakai. [1962] [7]p. [AF 49(638)494] Unclassified

Published in Trans. Amer. Math. Soc., v. 109: 296-302, Nov. 1963.

Let X be a projective scheme over an infinite field k. Let $\mathcal{O}$ be the structure sheaf of X, and let $\mathcal{K}$ be the sheaf of total quotient rings of $\mathcal{O}$. Let $\mathcal{O}^*$ and $\mathcal{K}^*$ denote the sheaves of invertible elements of $\mathcal{O}$ and $\mathcal{K}$, respectively. Then the natural map $\delta: H^0(X, \mathcal{K}^*/\mathcal{O}^*) \to H^1(X, \mathcal{O}^*)$ deduced from the exact sequence $0 \to \mathcal{O}^* \to \mathcal{K}^* \to \mathcal{K}^*/\mathcal{O}^* \to 0$ is surjective. In other words, every invertible sheaf on X comes from a Cartier divisor class. If X is integral (i.e., irreducible and without nilpotent elements) one knows that $\mathcal{K}^*$ is a flasque sheaf, and so $H^1(X, \mathcal{K}^*) = 0$. This proof does not work in the general case, so the author shows directly that δ is surjective. For an example of a scheme X where $H^1(X, \mathcal{K}^*) \neq 0$, take the plane with two embedded points: X = Spec A, where $A = k[x, y, z]/(z^2, zx, zy(y - 1))$. (Math. Rev. abstract)

GEODESIC CURVATURE AND AREA, by L. V. Ahlfors. [1962] [7]p. (AFOSR-4673) (AF 49(638)574) AD 407866 Unclassified

Also published in Studies in Mathematical Analysis and Related Topics, ed. by G. Szego, C. Loewner, and others. Stanford U. Press, 1962, p. 1-7.

When dealing with the conformal mapping of portions of a surface, one finds in general that the more negative the Gauss curvature, the more the surface will contract under conformal maps. A very precise form is given to this statement by showing that if one has a simply connected region with a conformal metric, then upper and lower bounds for its conformal radius can be obtained in terms of inequalities between the area and the total Gauss curvature of subregions. The method uses a comparison of area with total geodesic curvature which is equivalent to total Gauss curvature, by the Gauss-Bonnet formula, in a manner analogous to the author's previous applications of the length-area method. The method actually yields explicit expressions for the conformal radius as an extremum over the totality of conformal metrics on the region. (Math. Rev. abstract)

A NOTE ON THE KO-THEORY OF SPHERE-BUNDLES, by R. Bott. [1962] [6]p. (AFOSR-3968) (AF 49(638)-1035) Unclassified

Also published in Bull. Amer. Math. Soc., v. 68: 395-400, July 1962.

Two vector bundles E and F over the finite connected CW complex X are J-equivalent, if their sphere-bundles S(E) and S(F) are of the same fiber-homotopy type. If they become J-equivalent after a suitable number of trivial bundles is added to both of them, they are stably J-equivalent. This note concerns itself with a new stable J-invariant $\theta(E)$, which was suggested by the recent work of Atiyah-Hirzebruch and F. Adams. In fact, $\theta(E)$ bears the same relation to the Adams operation ψ_i as the Stiefel-Whitney class, a known J-invariant, bears to the Steenrod operations.

LECTURES ON K(X), by R. Bott. [1962] [150]p. incl. diagrs. tables, refs. (AFOSR-3969) (AF 49(638)1035) Unclassified

The primary aim of these notes is to discuss a J-invariant of vector bundles $\theta(E)$, which is computable once the group of stable bundles over X, - that is K(X) - is known. The invariant $\theta(E)$ is clearly suggested by recent work. The guiding principle of these notes is then to construct the analogue of the theory of characteristic classes in the K-theory and as this analogue is much simpler in the KU-theory, it is discussed in the first 8 sections. The remainder of the report discusses such aspects as: (1) sphere-bundles, (2) Gysin sequence, (3) real projective bundles, (4) Thom isomorphism and (5) induced representations.

POLYNOMIALS OF BEST APPROXIMATION ON AN INTERVAL, II, by J. L. Walsh and T. S. Motzkin. [1962] [5]p. (AFOSR-J27) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-198 and Office of Naval Research) AD 629538 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 46: 1533-1537, Sept. 1962.

The purpose of this note is to prove the following theorem: Let the real function f(x) be analytic on the interval E: $0 \leq x \leq 1$, and let $p_n(x) \not\equiv f(x)$ on E) be a polynomial of degree n which for some p, $0 < p < 1$, minimizes $\int_E |f(x) - p_n(x)|^p dx$ over all polynomials of

degree n. Let the zeros of $f(x) - p_n(x)$ on E have respective multiplicities k_j, $1 \le j \le r$, and let k_j^* be the smallest integer $\ge [(1 - p)k_j]$ and which for zeros interior to E is also of the same parity as k_j. Then one obtains the expression $\sum_{j=1}^{r} k_j^* > n$. Here, $[\sigma]$ denotes generically the largest integer not greater than σ. It follows that $k_j^* \le k_j$. The analyticity of f(x) merely to shorten the proof is required if f(z) is of class C^{n+1} provided $f - p_n$ has no zeros of multiplicity greater than n.

THE ROLE OF THE APPELL TRANSFORMATION IN THE THEORY OF HEAT CONDUCTION, by D. V. Widder. [1962] [14]p. (AFOSR-64-1622) (AF AFOSR-62-198) AD 446881 Unclassified

Also published in Trans. Amer. Math. Soc., v. 109: 121-134, Oct. 1963.

A function $u(x, t) \in H$ for $a < t < b$ if and only if it is a class C^2 solution of the heat equation $u_{xx} = u_t$ for $-\infty < x < \infty$, $a < t < b$. $u(x, t) \in H^*$ for $a < t < b$ if and only if for every t, t' ($a < t' < t < b$) we have $u(x, t) = \int_{-\infty}^{\infty} k(x - y, t - t')u(y, t')\,dy$, the integral converging absolutely. Here $k(x, t) = e^{-x^2/4t}(4\pi)^{-1/2}$. The Appell transformation is $A[v] = k(x, t)v(xt^{-1}, -t^{-1})$. It transforms the family of solutions of the heat equation into itself. Two typical results are the following: (i) a function u(x, t) is of the form $u(x, t) = \int_{-\infty}^{\infty} e^{ixy - ty^2}\phi(y)dy$, where ϕ is entire order 2, type $1/\sigma$, if and only if $v(x, t) \in H^*$ for $|t| < \sigma$, where $v = A[u]$; (ii) $v(x, t) \in H$ for $t < 0$ and satisfies $v \ge 0$ there if and only if $v(x, t) = \int_{-\infty}^{\infty} e^{xy + ty^2}\,d\sigma(y)$ $t < 0$, with $\sigma(y)$ increasing. RESEARCH STUDY TO CONSIDER THE ESTABLISHMENT OF AN OBSERVATORY FOR PLANETARY STUDIES NEAR CLOUDCROFT, NEW MEXICO, by B. Bell. Final rept. Apr. 30, 1962 [25]p. incl. diagrs. table. (AFOSR-2809) (AF 49(638)1155) AD 281227 Unclassified

A conference was held in Cloudcroft, New Mexico, to evaluate the suitability of a site near Cloudcroft for a planetary observatory, and to advise the Air Force on a program of planetary research. This report details the proceedings and the conclusions of the conference. The members of the committee inspected the proposed site, both from the air and in detail from the ground. This inspection yielded 2 impressions adverse to the location as a site for a major planetary observatory. In the experience of the committee, best seeing tends to be found on hills and even rather sharp peaks, not in the valley or swale type of terrain characterizing the Cloudcroft site. The committee agreed that the program described to them, including observations from rockets and balloons, fully warranted the establishment of a supporting ground facility of the type proposed by the Air Force. In view of the great expense and time required for the development of a new site, the committee suggests that consideration be given to the erection of the Air Force planetary observatory at one of the high-profile sites already developed in the southwestern United States.

INELASTIC ELECTRON SCATTERING FROM FLUCTUATIONS IN THE NUCLEAR CHARGE DISTRIBUTION, by W. Czyz and K. Gottfried. [1962] [25]p. incl. diagrs. tables, refs. (AFOSR-2757) (AF 49(638)589) AD 400862 Unclassified

Also published in Ann. Phys., v. 21: 47-71, Jan 1963.

This paper concerns itself with the cross section $\sigma(q, \omega)$ for scattering of electrons through momentum transfer q and energy loss ω from heavy nuclei. This cross section is related to the 4-dimensional Fourier transform of the nuclear time-dependent pair correlation function; this latter function gives a measure of the fluctuation of the charge density about its mean value. In an infinite medium there are regions of the q, ω plane where scattering is possible only if dynamical (in contrast to statistical) correlations are present. An argument concludes that for finite nuclei there is a well defined boundary outside of which the scattering is due solely to correlations impressed on the ground state by nuclear forces. Since one would only carry out such experiments on heavy nuclei, the break down of the Born approximation is also discussed, and it is concluded that one may readily and quite reliably correct for this. A general discussion of some possible methods for computing the relevant correlation function is given. A detailed calculation of the cross section $\sigma(q, \omega)$ for scattering from a gas of nucleons with hard core interactions is presented. This is expected to give the qualitative features of the cross section for real nuclei when the values of q and ω are properly chosen. Furthermore, it leads to estimates of the relative importance of diagrams which should be useful in more realistic nuclear models. (Contractor's abstract)

THE DETERMINATION OF THE NUCLEAR PAIR CORRELATION FUNCTION AND MOMENTUM DISTRIBUTION, by K. Gottfried. [1962] [18]p. incl. diagrs. refs. (AFOSR-2758) (AF 49(638)589) AD 400861 Unclassified

Also published in Ann. Phys., v. 21: 29-46, Jan 1963.

This paper presents a critical discussion of some of the suggestions which have been put forward for measuring the nuclear momentum distribution F(p) and pair correlation function $C(r_1 r_2)$. On the basis of qualitative arguments, it has been concluded that a majority of the measurements of F and C are based on dubious analysis of the experimental data. In particular, the use of the impulse approximation in these analyses has been brought into question. Although the conclusion that F(p) has many high momentum components is not questioned, it is argued that there is no reliable quantitative knowledge regarding F(p) at this time. Various experiments related to the measurement of C, in particular inelastic electron scattering, and the (γpn) reaction are discussed. Here too it is concluded that the present knowledge is virtually nil. Some rigorous formulae for the cross sections measured in pursuit of F and C are also given. (Contractor's abstract)

NON-ABELIAN GAUGE FIELDS. RELATIVISTIC INVARIANCE, by J. Schwinger. [1962] [7]p. (AFOSR-4085) (AF 49(638)589) AD 407534 Unclassified

Also published in Phys. Rev., v. 127: 324-330, July 1, 1962.

A simple criterion for Lorentz invariance in quantum field theory is stated as a commutator condition relating the energy density to the momentum density. With its aid a relativistically invariant radiation-gauge formulation is devised for a non-Abelian vector-gauge field coupled to a spin-1 2 Fermi field. (Contractor's abstract)

VARIATIONAL FORMULATIONS OF EQUILIBRIUM STATISTICAL MECHANICS, by C. De Dominicis. [1962] [20]p. incl. diagrs. refs. (AFOSR-J219) (AF 49(638)589) AD 449988 Unclassified

Also published in Jour. Math. Phys., v. 3: 983-1002, Sept.-Oct. 1962.

Thermodynamical functions for classical and quantum systems are expressed in terms of the 1-particle density n_1 and the 2-particle correlation matrix C_{12}. Use is made of topological relations valid for the diagram representations of the grand partition function expansions. The result considered as a functional of n_1 and C_{12} is stationary under independent variations. The entropy functional of a classical system no longer contains any reference to the equilibrium parameters and the second functional derivative is a negative definite matrix. The entropy functional of a quantum system conserves traces of the equilibrium parameters in the Lee-Yang formulation; the Green's function formulation does not, but in this case the second functional derivative is no longer a negative definite matrix. ENERGY AND MOMENTUM DENSITY IN FIELD THEORY, by J. Schwinger. [1962] [6]p. (AFOSR-J691) (AF 49(638)589) AD 413476 Unclassified

Also published in Phys. Rev., v. 130: 800-805, Apr. 15, 1963.

It is shown that the energy density commutator condition in its simplest form is valid for interacting spin 0, 1/2, 1 field systems, but not for higher spin fields. The action principle is extended, for this purpose, to arbitrary coordinate frames. There is a discussion of 4 categories of fields and some explicit consideration of spin 3/2 as the simplest example that gives additional terms in the energy density commutator. As the fundamental equation of relativistic quantum field theory, the commutator condition makes explicit the greatest physical complexity of higher spin fields (Contractor's abstract)

QUANTIZED GRAVITATIONAL FIELD, by J. Schwinger. [1962] [6]p. (AFOSR-J705) (AF 49(638)589) AD 413639 Unclassified

Also published in Phys. Rev., v. 130: 1253-1258, May 1, 1963.

A gravitational action operator is constructed that is invariant under general coordinate transformations and local Lorentz (gauge) transformations. To interpret the formalism the arbitrariness in description must be restricted by introducing gauge conditions and coordinate conditions. The time gauge is defined by locking the time axis of the local coordinate systems to the general coordinate time axis. The resulting form of the action operator, including the contribution of a spinless matter field, enables canonical pairs of variables to be identified. There are 4 field variables that lock canonical partners, in virtue of differential constraint equations, which can be interpreted as space-time coordinate displacements. In a physically distinguished class of coordinate system the gravitational field variables are not explicit functions of the coordinate displacement parameters. There remains the freedom of Lorentz transformation. The generators of spatial translations and rotations have the correct commutation properties. The question of Lorentz invariance is left undecided since the energy density operator is only given implicitly

DENSITY-CORRELATION FUNCTION IN A DILUTE CONDENSED BOSE GAS (Abstract), by P. C. Hohenberg. [1962] [1]p. [AF 49(638)589] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 267, Apr. 23, 1962.

Using mass-operator perturbation theory modified to take into account the macroscopic occupation of the k=0 mode, calculations have been made on the true density excitations of a dilute Bose gas with weak short-range repulsive interactions at low temperatures, in the approximation beyond Bogoliubov in the parameter $(n_0 a^3)^{\frac{1}{2}}$. These excitations identified in the poles of the density-correlation function $L(k, \omega)$, are the ones which are measured in slow neutron-scattering experiments, as opposed to the phonons calculated by previous authors, associated with the single-particle Green's function. $L(k, \omega)$ is obtained by solving a set of coupled matrix equations which insure that the conservation laws and sum rule are satisfied in analogy with the calculation of collective excitations in superconductors. For low wavenumbers, the resulting spectrum of $L(k, \omega)$ reduces to the phonon spectrum calculated at zero temperature by Beliaev. Thus, at zero temperature, it yields density waves with the compressional velocity as calculated from thermodynamics.

SILICON-SILICON BOND DISSOCIATION ENERGIES IN DISILANE AND HEXACHLORODISILANE, by W. C. Steele and F. G. A. Stone. [1962] [2]p. incl. table. (AFOSR-J240) (AF 49(638)518) Unclassified

Also published in Jour. Amer Chem Soc., v. 84: 3599-3600, Sept. 20, 1962.

Bonds formed by silicon to other elements are generally stronger than those formed by carbon. Moreover, chemical evidence exists suggesting that Si-Si bonds are in some cases more stable thermally than corresponding C-C bonds. Limited thermochemical data for the Si-Si bond, on the other hand, have given the impression that this bond is considerably weaker than a C-C bond. Thus, a thermochemical bond energy E(Si-Si) = 46.4 kcal. mol^{-1} has been calculated for disilane, and the activation energy for pyrolysis of disilane has been taken to imply a value for $D(H_3Si\text{-}SiH_3)$ of ~50 kcal mol^{-1}. For ethane, $D(H_3C\text{-}CH_3)$ = 83 kcal mol^{-1}. The dissociation energies of the Si-Si bonds in disilane and hexachlorodisilane have been measured by electron impact, and have found that they are comparable in strength to C-C bonds. The higher values for D(Si-Si) reported here permit a better understanding of recent observations of the properties of several substances with Si-Si bonds than the earlier results.

SHAPE AND ARRANGEMENT OF COLUMNS IN CAT'S STRIATE CORTEX, by D. H. Hubel and T. N. Wiesel. [1962] [12]p. incl. illus. diagrs. (AFOSR-J534) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-76 and Public Health Service)
Unclassified

Also published in Jour. Physiol (London), v. 165: 559-568, Mar. 1963.

Previous studies have shown that the striate cortex of the cat is subdivided into columnar regions of cells having a common receptive-field axis orientation. The present paper describes further observations on the shape and arrangement of the columns. From multiple parallel penetrations the walls of columns appear to be parallel to the radial fiber bundles of the cortex and perpendicular to the cortical layers. The surface mosaic formed by the intersection of the columnar walls with the cortical surface is highly irregular. Some columns appear to be compact in shape (more or less round or oval), while others seem to be very long and narrow. In some parts of the cortex columns are arranged in a very regular manner. Here the discrete shifts in orientation as one moves along the cortical surface in a straight line are small, and the direction of the shifts may be the same, clockwise or counterclockwise, over long sequences. In these ordered regions the columns are especially likely to be long and narrow. In other parts of the cortex there appears to be little if any order to the arrangement of neighboring columns.

COMMON SECANTS FOR FAMILIES OF POLYHEDRA, by B. Grünbaum. Dec. 1961, 10p. incl. diagrs (Technical scientific note no. 23) (AFOSR-2698) (AF 61(052)187) AD 280291 Unclassified

Also published in Arch. Math., v. 15: 78-80, 1962

Definitions. (1) A convex cone C with vertex at the origin is called the associated cone of a convex polyhedron $P \subset E^n$ with respect to the vertex v of P if $v + C$ is the union of all half-lines with endpoint v which contain at least one point of P different from v. A polyhedron P' is related to a polyhedron P provided each associated cone of P' is an intersection of associated cones of P. A family $\mathcal{P}$ of polyhedra is related to P if each member of $\mathcal{P}$ is related to P. (2) A family $\mathcal{P}$ of polyhedra in E^n is said to have property S if there exists a hyperplane intersecting every member of P; the family $\mathcal{P}$ is said to have property S(k) if every k-membered subfamily of $\mathcal{P}$ has property S. With these definitions the author proves the following theorems: (1) For families $\mathcal{P}$ related to a centrally symmetric convex polyhedron $P \subset E^n$ with 2p vertices, S(p(n + 1)) implies S. (2) For every positive integer k there exists a $t = t(k, n)$ such that for families $\mathcal{P}$ related to a convex polyhedron $P \subset E^n$ with k vertices, S(t) implies S; moreover, one may take $t(k, n) \leq \binom{k}{2}(n + 1)$. (3) Let a centrally symmetric convex body $K \subset E^2$ have the property that S(t) implies S for families of positive homothets of K, where t depends on K only; then K is a polygon. (Math. Rev. abstract)

CHARACTERISATION OF C(Ω), by Y. Katznelson. Feb. 1962, 5p. (Technical scientific note no. 25) (AFOSR-2700) (AF 61(052)187) AD 280980
Unclassified

Consider a Banach algebra B of continuous functions on a compact Hausdorff space Ω. The purpose of this note is to prove the following theorem which generalizes the main result of a prior publication (Bull. Amer. Math. Soc., v. 66: 313-315, 1960). Theorem: Assume that for every closed subset F of Ω, there exists a positive number $\xi = \xi(F)$ such that whenever N is both closed and open in F, B contains an element h of norm one satisfying $\mathrm{Re}(h(M)) < 0$ for $M \in N$, $\mathrm{Re}(h(M)) > \xi$ for $M \in F - N$. Then $B = C(\Omega)$. The main difference between the present result and that of the previous publication is that here, the assumption that B is self adjoint and regular is discarded, and instead of assuming the boundedness of idempotents, a uniform separation of parts of F by elements of B of norm one for every closed $F \subset \Omega$ is assumed.

TAUBERIAN CONSTANTS FOR THE ABEL AND CESARO TRANSFORMATIONS, by A. Jakimovski. 1962] 15p. (Technical note no 26) (AFOSR-2914) (AF 61(052)187) AD 277488 Unclassified

Also published in Proc. Amer Math. Soc., v. 14: 228-238, Apr. 1963.

Let S_n, $S_n = a_0 + a_1 + \cdots + a_n$, be a real or complex sequence. Let $t(x) = \sum_0^\infty a_m x^m$, the Abel transform of S_n. Speaking very generally, this paper concerns itself with the estimation of $\limsup |S_n - t(x)|$ as $n \to \infty$, $x \to 1$, $n(1-x) \to q > 0$. If the sequence S_n is replaced by a Cesaro transform of order $\alpha > -1$, $C_n^{(\alpha)}$, where

$$C_n^{(\alpha)} = \binom{n+\alpha}{n}^{-1} \sum_{m=0}^{n} \binom{n-m+\alpha-1}{n-m} S_m,$$

similar questions are raised. Let $a_n^{(\alpha)}$ denote the Cesaro transform of order $\alpha > -1$ of the sequence na_n. Two of the principal results are: (I) Suppose β and q are such that $q > 0$, $0 \le \beta \le 1$. Then for S_n satisfying $|a_n^{(\beta)}| \le K < +\infty$, we have $\limsup_{n\to\infty, x\to 1, n(1-x)\to q} |S_n - t(x)| \le A_q^{(\beta)} \limsup_{n\to\infty} |a_n^{(\beta)}|$, where

$$A_q^{(\beta)} = \gamma + \log q + \frac{2}{\Gamma(\beta+1)} \int_q^\infty v^\beta e^{-v} \log(v/q)\, dv.$$

The constant $A_q^{(\beta)}$ is best in the sense that there is a real sequence $\{S_n\}$ such that $0 < \limsup_{n\to\infty} |a_n^{(\beta)}| < +\infty$ and we have equality in (*). (II) Suppose α, β, q are such that $q > 0$ and $-1 < \alpha \le \beta \le \alpha + 1$. Then for S_n as in (I) we have (**) $\limsup_{n\to\infty, x\to 1, n(1-x)\to q}$ where

$$|C_n^{(\alpha)} - t(x)| \le C_q^{(\alpha,\beta)} \limsup |a_n^{(\beta)}|, \quad C_q^{(\alpha,\beta)} = \gamma + \log q - \int_0^1 \frac{1-(1-u)^\alpha}{u}\, du$$

$$+ \frac{2}{\Gamma(\alpha+1)} \int_q^\infty v^\beta e^{-v} \log(v/q)\, dv.$$

The constant $C_q^{(\alpha,\beta)}$ is best possible in the sense that there is a S_n as in (I) for which (**) is an equality. Another theorem is given which similarly estimates $\limsup_{n\to\infty} |C_n^{(\alpha)} - C_n^{(\beta)}|$.

These results are applied to investigate some relations between the limit points of sequences and those of their Abel transforms. The estimates given are considerable generalizations of previous results of R. P. Agnew (Math. Rev. abstract)

POSITIVITY INTERVALS OF STABLE PROCESSES, by H. Kesten. [1962] [26]p. incl. refs. [AF 61(052)187] Unclassified

Published in Jour. Math. and Mech., v. 12: 391-410, May 1963.

Suppose $\{x_t(\omega)\}$ is a separable symmetric stable process of index $\sigma \in (0,2]$; take $x_0 = 0$. Let $A(\omega) = \{t: 0 \le t \le 1$ and $x_t(\omega) > 0\}$. With probability 1, the positivity set $A(\omega)$ has a unique representation as a union of maximal disjoint intervals. Write $N(\epsilon, \omega)$ for the number of these intervals of length at least ϵ. The three main results of this paper give the limiting distributions for $N(\epsilon, \omega) f_\alpha^{-1}(\epsilon)$ as $\epsilon \to 0$ in the cases $1 < \alpha \le 2$, $\alpha = 1$ and $0 < \alpha < 1$. Here $f_\alpha(\epsilon)$ is a normalizing factor which is proportional to $\epsilon^{(1/\sigma)-1}$ when $\sigma > 1$, to $(\log \epsilon)^2$ when $\sigma = 1$ and to

log x for $\alpha < 1$. The distributions are of the Mittag-Leffler type in the first case, and degenerate at a positive constant in the third. It is pointed out that in all 3 cases the form of the normalizing function and of the limiting distribution agrees with asymptotic results on the number of changes of sign by partial sums of independent, stable random variables.

[NEW PARAMAGNETIC RESONANCE SPECTRA OF RARE EARTH IONS IN CALCIUM FLUORIDE] Nouveau spectre de résonance paramagnétique d'ions de terres rares dans le fluorure de calcium, by W. Low and U. Rosenberger. [1962] [3]p. incl. refs. (AFOSR-4306) (AF 61(052)59) AD 405009 Unclassified

Also published in Compt. Rend. Seances Acad. Sci., v. 254: 1771-1773, Mar. 1962.

The paramagnetic resonance of Yb^{3+} in calcium fluoride is described. The spectrum has a triangular symmetry and may be represented by a Hamiltonian spin $H = g_{\parallel} \beta H S_z + g_{\perp} \beta(H_x S_x - H_y S_y) + A S_z I_z + B(S_x I_x + S_y I_y) + Q'(I_z^2 - 1/3\, I(I+1))$ - with $g_{\parallel} = 1.323 \pm 0.001$, $g_{\perp} = 4.389 \pm 0.004$, $A_{171} = 359 \pm 3$, $A_{173} = 96 \pm 1$, $B_{171} = 1174 \pm 5$, $B_{173} = 320 \pm 3$, $Q' = 85 \pm 4$, all in $10^{-4}cm^{-1}$. The estimated magnetic moments are $\mu^{171} = 8.43$, $\mu^{173} = 0.59$ and Q is nearly 2.4 barns. (Contractor's abstract)

ELECTRON SPIN RESONANCE IN THE CUBIC CRYSTALLINE FIELD OF CALCIUM OXIDE by W. Low and R. S. Rubins. June 1962, 3p. incl. tables, refs. (Technical note no. 20) (AFOSR-4589) (AF 61(052)59) AD 434395 Unclassified

Also published in Phys. Ltrs., v. 1: 316-317, July 1962.

Electron spin resonance measurements are reported for V^{2+}, Cr^{3+}, Mn^{2+}, Fe^{3+}, Co^{2+} and Ni^{2+} in single crystal CaO and compared with the results for these ions in Mg and CaF_2. Although some of the results can be interpreted by postulating a crystalline field smaller than MgO, there remains a number of unexplained anomalies.

PARAMAGNETIC RESONANCE SPECTRUM OF GADOLINIUM IN $LaAlO_3$, by W. Low and A. Zusman. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-64-0471) [AF 61(052)59] AD 435656 Unclassified

Also published in Phys. Rev., v. 130: 144-150, Apr. 1, 1963.

The resonance spectrum of Gd^{3+} in $LaAlO_3$ was investigated as a function of the temperature. It was found that the trigonal parameter b_2^0 changes smoothly from $67 \times 10^{-4}cm^{-1}$ at 689°K to $421 \times 10^{-4}cm^{-1}$ at 20°K. The transition to cubic phase is found by extrapolation to be at 720 ± 15°K. The spin Hamiltonian appropriate to the trigonal phase is given by $H = g\beta H \cdot S + B_2^0 O_2^0 + B_4^0 O_4^0 + B_6^0 O_6^0 + B_4^3 O_4^3 + B_6^3 O_6^3 + B_6^6 O_6^6$. The evaluation of the magnitude of the various parameters B_m^n is presented.

EFFECT OF RADIATION AND HEAT TREATMENT ON THE PARAMAGNETIC RESONANCE SPECTRUM OF Yb^{3+} IN CaF_2, by W. Low and U. Ranon. [1962] 7p. (AF 61(052)59) Unclassified

A single crystal of CaF_2 of reddish color, containing 0.05 - 0.5% ytterbium was investigated at 20°K and 3 cm wavelength. Four sets of 2 lines were seen, each doublet having trigonal symmetry along one of the body diagonals. Each of the 8 strong lines was accompanied by a hyperfine structure from the 2 odd isotopes 171 and 173 with spin 1/2 and 5/2, respectively. After heating in hydrogen for several hours, an additional spectrum with trigonal symmetry appeared. Irradiation with light diminishes its intensity and strengthens the intensity of the original trigonal spectrum. The crystal with the trigonal spectrum was irradiated with γ rays. The original spectrum disappeared nearly completely and the color of the crystal changed to a deep green. A new isotopic paramagnetic resonance spectrum of considerable intensity appeared which has the same parameters in the spin Hamiltonian as those reported by Low. The isotopic spectrum disappeared completely when the irradiated crystal was heated in vacuum to about 500°C. The low intensity trigonal spectrum remained; the crystal itself became transparent. On irradiation with γ rays, the isotropic spectrum reappeared. The irradiated spectrum showed a sharp absorption line at about 10365 cm^{-1}, characteristic of the cubic field spectrum. In addition, there are a number of very strong absorption bands in the visible and ultraviolet spectrum.

INFLUENCE OF A RESONANT ABSORBER WHOSE THICKNESS VARIES LINEARLY WITH TIME ON THE

SPECTRAL SHAPE OF AN INCIDENT LORENTZIAN WAVE PACKET, by I. Nowik. Jan. 1962 [9]p. incl. diagrs. (Technical note no. 5) (AF 61(052)347) AD 280024 Unclassified

Also published in Phys. Rev., v. 126: 1878-1879, June 1, 1962.

The influence of a resonant absorber whose thickness varies linearly with time on the spectral shape of an incident Lorentzian wave packet is discussed, using classical dispersion theory. The resonant line is broadened and, for high enough velocities with which the thickness of the absorber changes, the line is split into 2 bands with a minimum at the resonant frequency ω_0. HYPERFINE INTERACTIONS IN THE 2+ ROTATIONAL STATE OF Dy^{160} IN DYSPROSIUM IRON GARNET, by R. Bauminger, S. G. Cohen and others. Feb. 1962 [27]p. incl. diagrs. refs. (Technical note no. 6) (AFOSR-2535) (AF 61(052)347) AD 274553 Unclassified

The hyperfine interactions of the 2+ rotational level of Dy^{160} at 87 kev in dysprosium iron garnet have been measured at 94°K using the technique of Mössbauer absorption. The results are $g\mu_n H_{eff}$ = (930 ± 50) mcs/sec and eqQ/4 = (-77 ± 15) mcs/sec. A comparison with previous similar measurements in Dy^{161} together with the knowledge of the g factor of the Dy^{161} ground state from spin resonance experiments gives a value of 0.48 ± 0.07 for the g factor of the 2+ rotational level of Dy^{160}, assuming Judd and Lindgren's values for $< 1/r^3 >$. The sign of the spectroscopic quadrupole moment of this state is found to be negative, as to be expected as a consequence of the nuclear collective rotation. The ratio of quadrupole moments $Q_{160}(2+)$. Q_{161} (ground state) was found to be -0.77 ± 0.25. Comparing a model dependent estimate of $Q_{160}(2+)$ with a value of Q obtained from the experimental results a value of about 0.2 is obtained for the Sternheimer shielding factor. A STUDY OF THE INTERNAL FIELDS ACTING ON NUCLEI IN SOLIDS USING THE TECHNIQUES OF THE MÖSSBAUER ABSORPTION AND PERTURBATION OF γ-γ CASCADES, by S. G. Cohen. Annual summary rept. Jan. 1, 1960 - Dec. 31, 1961. Jan. 22, 1962, 8p. (AFOSR-2929) (AF 61(052)347) AD 277610 Unclassified

Internal fields acting on nuclei in solids are determined using the techniques of recoil-free resonance absorption and the perturbation of the angular correlation of gamma-ray cascades. Such measurements provide information concerning the following: (1) The internal magnetic fields acting on rare earth nuclei in garnets and other ferrimagnetic materials, (2) The effective electric field gradients acting on rare earth nuclei and their temperature dependence and correlation with bulk magnetic properties; (3) The chemical and isomeric shift in Mössbauer absorption spectra of rare earth nuclei in different solids, leading to knowledge of the atomic s-like wave functions; and (4) the internal magnetic fields acting on iron nuclei in magnetite through the transition temperature region.

HYPERFINE INTERACTIONS OF THE 2+ STATE IN Dy^{160} SITUATED IN DYSPROSIUM IRON GARNET USING γ-γ ANGULAR CORRELATION TECHNIQUE, by S. G. Cohen and G. Gilat. June 1962 [22]p. incl. diagrs. table, refs. (Technical note no. 7) (AFOSR-3441) (AF 61(052)347) AD 284411 Unclassified

Also published in Nuclear Phys., v. 38: 1-10, Oct. 1962. (AFOSR-4446; AD 295852) (Title varies)

The hyperfine interaction of the 2+ state in Dy^{160} situated in ferrimagnetic dysprosium iron garnet (DIG) has been studied at room temperature by measuring the perturbation of the angular correlation of γ-cascades passing through this state. A large rotation of the angular correlation pattern was observed when the domains are aligned in an external magnetic field perpendicular to the plane of the counters. A longitudinal external field was used to decouple the effectively static part of the hyperfine interaction and isolate the time dependent interactions. $g\mu_n H_{eff}$ h is found to be (160 ± 50) mc/s. Assuming H_{eff} equals to 6 0 x 10^5 Oe from recoil-free experiments one obtains for the g factor of the 2+ state 0.32 ± 0.10. The relaxation times characterizing the time dependent perturbations are estimated to be 1.5 ± 0.5) x 10^{-12} sec for DIG and (0.9 ± 0.3) x 10^{-12} sec for aqueous solution of $TbCl_3$. HYPERFINE INTERACTIONS IN THE GROUND STATE AND FIRST EXCITED STATE OF Tm^{169} IN THULIUM IRON GARNET, by I. Nowik and S. Ofer. [1962] [3]p incl. diagrs. table, refs. (AFOSR-J265) (AF 61(052)-347) AD 400887 Unclassified

Also published in Phys. Ltrs., v. 3: 192-194, Nov. 1962.

The Mössbauer spectrum of the 8.6 kev γ-ray from the first excited state of Tm^{169} ($\tau_{1/2} = 6.6 \times 10^{-9}$ sec) in thulium iron garnet was observed at 90°K and 300°K. The results at 90°K were fitted to parameters in the equation for the splitting of each level energy, $W = \Delta E + mg\beta_n H_{eff} + 1/4\ eqQ[3m^2-I(I+1)]/[I(2I-1)]$, including a possible axially symmetric quadrupole term for the 8.6 kev level, as well as hyperfine interaction with an internal field H_{eff} (effective magnetic field) due to spontaneous magnetization of the rare earth sublattice, and a chemical shift. The result for H_{eff} at 90°K is $(3.8 \pm 0.8) \times 10^5$Oe compared with $(3.5 \pm 0.5) \times 10^6$Oe for H_{eff} in dysprosium iron garnet. This difference may be accounted for by the theory of quenching of orbital angular momentum of the Tm ion. A value of $+0.73 \pm 0.16$ is obtained for the magnetic moment of the 8.6 kev 3^2 level. The 300°K results indicate a ration $H_{eff}(300°K)\ H_{eff}(90°K) = 0.42 \pm 0.10$.

THE DESIGN AND USE OF A MILLIMETER WAVE FABRY PEROT INTERFEROMETER FOR SHOCK WAVE DIAGNOSTICS, by E. Ravid, J. Alon, and W. Low. [1962] [4]p. (Bound with its AFOSR-4061; AD 290667) (AF 61(052)401) Unclassified

The interaction of a shock wave and e.m. wave can be defined in terms of the complex, time varying permittivity of the shock wave region $\mathcal{E}^* = \mathcal{E}' - j\mathcal{E}''$. From this point of view, the use of a Fabry Perot interferometer offers the advantage of having a highly pure plane wave act as the probing field. In analogy with its optical counterpart, a millimeter wave Fabry Perot interferometer consists of 2 parallel plates, either of lossless dielectric or of perforated sheet metal. These plates can be moved with respect to each other and at certain discrete distances the plates offer a matched system, i.e., they are equivalent to a tuned cavity and a peak in the output is obtained. Any change in the characteristics of the medium between the plates destroys the resonance condition and causes a shift in the amplitude and phase of the emerging wave.

POSSIBLE SOLID-STATE EFFECT ON THE DEGREE OF IONIZATION OBTAINED IN A VACUUM SPARK, by B. S. Fraenkel. [1962] [1]p. incl. table. (AFOSR-3656) (AF EOAR-62-33) Unclassified

Also published in Jour. Appl. Phys., v. 33: 2141, June 1962.

A predicted triplet state, $3d^5\ ^6S\text{-}4p\ ^6P$ of Zn VIII at 160 A appears when a brass electrode is used, but not with a pure zinc electrode. This suggests an influence of the crystal structure (pure Zn against Zn in brass crystal) on the degree of ionization in the vacuum spark. Although the difference of the binding energy of Zn atoms in the 2 crystals is only of the order of one electron volt, the difference in ionization energy obtained is of the order of hundreds of electron volts. No theory is proposed as yet to explain this effect.

THE IMPACT OF PERSONAL ATTRIBUTES. HUMAN QUALITIES AND PRIMORDIAL TIES ON ROLE BEHAVIOUR, by H. R. Shlonsky. Sept. 1962, 12p. (Technical note no. 5) (AFOSR-4957) (AF 61(052)480) AD 290680 Unclassified

This study is intended as a preliminary attempt to explore precisely those attributes of the individual which are in a way prior to the formal definitions of roles and are at the same time not only starting points for individuals' motivation for role taking and role performance, but may also influence the very processes of crystallization of social behavior into roles and the differentiation of roles on the basis of their respective content. This study was begun by delineating the area for exploration. A number of phenomena which did not fit into accepted sociological categories and constituted a residual category, including different aspects of social behavior with a vague common denominator were pointed out. Three kinds of attributes for preliminary investigation were then specified: biological attributes, group membership qualities, and personal traits. These may be looked upon as certain aspects of an individual's human image. Their common denominator is that they reflect some qualities of man as givens or primordials, that is to say, as evaluations of man's possible resources, or his potential. The human image is not conceived here as an isolated psychological variable but, rather, as a pattern (or system), of attributes toward basic aspects of man and human activity which is significant in regulating the meeting point between personality and social roles and groups. IMAGES PERTAINING TO CHOICE OF OCCUPATION, THEIR SOURCES AND THEIR INFLUENCE ON THIS CHOICE, by H. Weihl and E. Yuchtmann. Oct. 1962, 42p. incl. tables, refs. (Technical note no. 6) (AFOSR-4164) (AF 61(052)480) AD 292251 Unclassified

Having regard to a model of role as its general framework, the potential influence of certain pre-situational factors on role functioning is discussed. This report deals mainly with motivation as one of such factors, aiming to locate some of the factors contributing to its formation. A examination of the relationship between pre-situational factors and actual role-performance would have necessitated a follow-up study of the respondents on their taking up their various occupational roles. Though such a study was not available, the existing empirical material enabled us to show that without considering pre-situational factors such as motivation, no clear understanding of proper role functioning, as well as of motives governing choice of an occupational role (or any role), could be achieved. VORTEX DEVELOPMENT IN A SEPARATED BOUNDARY LAYER, by H. Schade and A. Michalke. May 31, 1962 [20]p. incl. illus. diagrs. table, refs. (Annual summary rept. no. 2) (AFOSR-3191) (AF 61(052)412) AD 282426 Unclassified

An attempt is made to explain the development of vortices in a separated boundary layer by investigating the axisymmetrical jet downstream of a special nozzle. According to stability theory, a shear profile of finite thickness is unstable against wavy disturbances of certain frequencies and wavelengths. If such wavy disturbances are present in the shear layer, it rolls up into discrete vortices according to Rosenhead's analysis. It is found that viscosity, though responsible for the formation of a shear layer, plays no significant role in the process of rolling up at high Reynolds numbers. The frequency of the natural fluctuations and the relation between frequency and wavelength for artificial excitation have been measured; the results are in good agreement with the theory. THE DETERMINATION OF USER NEEDS FOR THE DESIGN OF INFORMATION SYSTEMS, by S. Herner. [1962] [14]p. incl. refs. (AFOSR-3362) (AF 49(638)-1182) AD 407890 Unclassified

Also published in Information Systems Workshop: The Designer's Responsibility and His Methodology, Washington, Spartan Books, 1962, p. 47-60.

This study was conducted to establish, or restate, that user requirements, rigorously defined and evaluated, can be a factor in the design of information systems. Not only can real user requirements furnish insights as to what should be included in a projected system and how it will most probably be queried or searched, but, perhaps even more important, a knowledge of requirements can tell us what does not have to be included in the system and what it does not have to do. As also noted, the problem is first one of segregating and eliminating information that is not needed or is obtainable by other satisfactory means, second of defining information that is needed and is not otherwise obtainable, and third of defining the best channels for making this critical information available, currently or retroactively. These considerations, which are keyed to use-patterns, should form the basis for the design of any information storage and retrieval system.

DENSITY AND ENERGY OF SURFACE STATES ON CLEAVED SURFACES OF GERMANIUM, by D. R. Palmer, S. R. Morrison, and C. E. Dauenbaugh. [1962] [6]p. incl. diagrs. refs [AF 49(638)597] Unclassified

Published in Phys. Rev., v. 129: 608-613, Jan. 15, 1963.

The channel technique has been successfully applied to measurement of the properties of cleaved germanium surfaces. A clean germanium surface is highly p type with the Fermi level near the valence band at the surface. This is brought about by acceptor-like surface states close to the edge of the valence band with a density of at least $1.5 \times 10^{12}/cm^2$. The density of these low-lying surface states decreases when the surface is exposed to oxygen. A comparison is made between results on cleaved surfaces and surfaces cleaned by ion bombardment. THE OPTICAL AND ELECTRICAL PROPERTIES OF SINGLE CRYSTAL TELLURIUM. Final rept. May 31, 1962 [70]p. incl. illus. diagrs. tables, refs (AFOSR-2648) (AF 49(638)908) AD 281927 Unclassified

Work on zone purification and growth of doped and undoped single crystals is noted. Mechanical properties plastic damage, and identification of dislocations by etch pits are briefly covered. A section on optical properties notes the discovery of optical activity in tellurium, and details the work on intrinsic optical absorption, showing how this implies a "vertical" transition at the absorption edge, which is allowed for $E \perp C$ and forbidden for $E \parallel C$. The report recapitulates the progress made in understanding recombination processes in tellurium (both flaw processes and band-to-band processes). A section on transport effects outlines the extensive studies made of magnetoresistance, and the

recent measurements of hole mobility at low temperatures in doped and undoped crystals. Finally, some of the expectations concerning the energy band structure of tellurium are reviewed. (Contractor's abstract)

INTRINSIC OPTICAL ABSORPTION IN TELLURIUM, by J. S. Blakemore and K. C. Nomura. [1962] [6]p. incl. diagrs. table, refs. [AF 49(638)908] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 221, Mar. 26, 1962.

Measurements of intrinsic optical absorption have been made at 100 and 300°K by transmission techniques, covering a range of absorption coefficient from 0.01 cm^{-1} to 1900 cm^{-1} for radiation polarized E C, and to 5000 cm^{-1} for E⊥ C. These results suggest that the edge is set by vertical transitions, the transition being allowed for the polarization E⊥ C but forbidden for E C. Absorption above the intrinsic threshold is apparently influenced by electron-hole interaction, as postulated by Elliott. In the actual edge region, absorption falls off exponentially with decreasing photon energy, the steepness at 300°K being 197 ev^{-1} for E C and 267 ev^{-1} for E⊥ C. The steepness for each polarization increases by only 14% on cooling to 100°K. (Contractor's abstract)

THE SELF-INHIBITION OF GASEOUS EXPLOSIONS, by R. R. Baldwin, N. S. Corney and others. [1962] [9]p. incl. diagrs. refs. (AFOSR-64-2022) [AF EOAR-63-31] AD 614884 Unclassified

Also published in Ninth Symposium (Internat'l.) on Combustion, Cornell U., Ithaca, N. Y. (Aug. 27-Sept. 1, 1962), New York, Academic Press, 1963, p. 184-192.

In discussing the conditions under which branched-chain reactions can give rise to isothermal explosions, it is usually assumed that the initial values of the parameters determine whether the system is stable or explosive. If, however, a reaction product can inhibit the reaction, substantial modification of the explosion condition may result. Two types of mechanism are discussed which illustrate this point. In the case of linear branching, it is shown that the original isothermal limit may be modified to a chain-thermal boundary. Thus, whereas ethane, propane, and butane inhibit the second explosion limit of H_2 and O_2 by direct chain-terminating reactions with H, OH, and O, methane and neopentane can inhibit only via their reaction products. Such products are formed in significant concentrations only after the uninhibited explosion boundary has been crossed and incipient explosion is developing. A variety of evidence supports the view that the character of the explosion changes from the original isothermal chain-branching explosion to a chain-thermal explosion with these 2 hydrocarbons. The second type of inhibiting mechanism, applicable when quadratic branching occurs, is exemplified by the self-inhibition of the H_2-O_2 reaction, as shown by the effect of withdrawal rate on the second limit. SYSTEMS OF INFORMATION IN SMALL GROUP RESEARCH STUDIES, by J. E. McGrath. Apr. 1962, 28p. incl. diagrs. tables, refs. (Rept. no. HSR-TN-62/2-GN; technical rept. no. 7) (AFOSR-2416) (AF 49(638)-256) AD 276858 Unclassified

Also published in Human Relations, v. 16: 263-277, Aug. 1963.

Results clearly support the validity of the classification system for systematic organization of small group research information. The findings suggest that the small group literature contains 6 relatively distinct systems of information, namely; (1) structural characteristics of group members; (2) dynamic characteristics of members; (3) structural properties of the group itself; (4) behavioral or dynamic properties of the group; (5) structural characteristics of the group's environment; and (6) environmental processes. The findings of the validation study indicate that variables within each of these 6 subsystems show consistent interrelationships, while relatively few significant relationships hold between variables from different subsystems. (Contractor's abstract)

A SUMMARY OF SMALL GROUP RESEARCH STUDIES,

by J. E. McGrath. [Final rept.] June 1962 [146]p. incl. refs. (Rept. no. HSR-TN-62/3-GN) (AFOSR-2709) (AF 49(638)256) AD 276860 Unclassified

The main purpose of this research program has been to develop and apply methods for systematic classification and integration of research information contained in small group research investigations. In the present report an attempt is made to formulate a series of broad, empirically-supported generalizations which have been induced from the information compiled during the program. Appendix A presents in detail the development of a simplified classification system, using substantive rather than operational labels for variables, and applies this system to the recompilation of small group research information collected during the program. Chapter I describes the revised, substantively based classification of variables. Chapter II presents a summary of the general propositions, or major empirical generalizations induced from the research information. The third and final chapter discusses some of the implications of these results for small group research and theory.

INTEGRATION OF SMALL GROUP RESEARCH INFORMATION: PROGRAM REPORT, by J. E. McGrath. June 1962 [6]p. (AFOSR-3009) (AF 49(638)256) Unclassified

The aims and accomplishments of a research program designed to develop and apply methods by which research findings from different small group studies could be combined into an integrated body of scientific knowledge, are described. The first task of the program was development of a comprehensive system for classifying small group research information, which was then applied to approx 250 small group research studies, yielding a detailed set of coded information on nearly 12,000 research relationships contained in the studies. Among the products of this program which are considered to be of direct usefulness to researchers in this field are: a rather extensive bibliography on small group research, brief annotations of each of the 250 studies coded, and a systematic catalog of the major variables of the small group research field. The variable catalog describes the operational and substantive properties of each major variable contained in the coded studies, actuarial information about the frequency and distribution of its use, and detailed evidence about its relationships with other major variables of the field. A list of reports resulting from this program is appended.

ORGANIC SEMICONDUCTORS, by C. Sosnovsky. Final rept. Mar. 15, 1959-Mar. 14, 1962. 56p. incl. diagrs. tables, refs. (Technical rept. no. ARF 3142-12) (AFOSR-2663) (AF 49(638)576) AD 278123 Unclassified

The dielectric, spectroscopic, and photoconductive properties of selected addition compounds and their donor and acceptor components were investigated. The study of dielectric properties entailed measurements of dielectric losses, dielectric constants, and dielectric resistivities on compressed powders. The data indicate that polarization effects caused by migrating charges are probably responsible for the high loss regions found at low frequencies At higher frequencies bimodal temperature-dependent loss curves were found for some addition compounds. The spectral response of photoconduction in single crystals of 2 addition compounds and their components was measured as a function of field direction, applied voltage, light intensity, and time of illumination. The results show that space-charge build-up effects set up by travelling charge carriers dominate the conduction mechanism. The correlation of spectral response data with spectroscopic data was variable. (Contractor's abstract)

THERMOCHEMICAL AND STRUCTURAL STUDIES ON ALKALI METAL OZONIDES. by A. J. Kacmarek Final rept. [1962] 22p incl. diagrs tables, refs. (Rept. no. ARF 3151-11) (AFOSR-2983) (AF 49(638)618) AD 427772 Unclassified

Physical and chemical properties of alkali metal ozonides were determined. Two new alkali metal-like ozonides, $(CH_3)_4NO_3$ and NH_4O_3, were prepared and also characterized The conventional method of preparing ozonides was improved Three solvents which dissolve ozonides were found, liquid ammonia, methylamine, and dimethylformamide (in order of decreasing efficiency). Electron paramagnetic resonance studies revealed unpaired electrons of the same nature in the ozonides. Visible absorption spectra of the ozonides showed λ_{max} near 450 mμ and a fine structure of 5 other peaks. New apparatus was designed for powder x-ray diffraction analysis of KO_3 The crystal structure of KO_3 was not isostructural with KN_3. NaO_3 probably exists in at least 2 crystalline forms. One is soluble in liquid ammonia and unstable at room temperature, while the other is insoluble in liquid ammonia and stable at room temperature. (Contractor's abstract modified)

FEASIBILITY OF NEUTRON DIFFRACTION STUDIES IN HIGH PRESSURE, by G. H. Wolfe and L. Reiffel. Final rept. May 10, 1962, 21p incl. illus. diagrs. table. (Rept. no. ARF 1183-4) (AF 49(638)1010) AD 277846 Unclassified

Studies were conducted to establish the technical feasibility of obtaining neutron diffraction data on specimens under high hydrostatic pressure. Laue patterns of RbI and RbCl were obtained at pressures up to 80, 000 psi in a uniquely designed pressure bomb. The RbI transformed completely at 60, 000 psi, but only an incomplete transition was observed in RbCl. There are indications of possible differences in the transformation mechanism for these materials. It is concluded that neutron Laue patterns are feasible at pressures up to 80, 000 psi and that the method could be extended to perhaps 150, 000 psi. (Contractor's abstract)

DISCRIMINATORY ANALYSIS APPLIED TO CLASSIFICATION OF SEISMIC PHENOMENA, by P. Gunther. Final rept. May 1, 1961 - Apr. 30, 1962, June 30, 1962. 76p. incl. illus. diagrs. tables, refs. (AFOSR-3172) (AF 49(638)1066) AD 458000 Unclassified

This study proposes a mathematical-statistical model for discrimination between earthquakes and nuclear explosions. The initial formulation defines the source parameters relating to geometry of the focus and of the source mechanism, the earth layering and heterogeneity parameters, and the principal types of waves that are propagated. A method of analysis of seismograms is proposed which can extract information from

sources not ordinarily used, namely arrival times and amplitudes of secondary body phases. The principal problem areas relating to identification of phases and precision station calibration are discussed in detail. Finally, methods for probability evaluation of the discrimination procedures are discussed. (Contractor's abstract)

ELECTRONIC ENTROPY IN LIQUID METAL SOLUTIONS, by L. M. Webber. Jan. 1962. 53p. incl. diagrs. tables, refs. (AFOSR-1353) (AF 49(638)346) AD 282435 Unclassified

The entropy of mixing of binary metallic solutions is studied. The contribution to the entropy of mixing arising from the change in the statistical distribution of electrons is the primary interest when 2 metallic components were mixed. The general nature of the deviations of the measured entropy of the mixing from the ideal behavior is recognizable from the nature of the assumptions involved in reducing the complete statistical formulation to the simple form of equation, which is based on the assumption of a completely random distribution of the 2 components of the solution. For metals, theoretical treatments indicate that the electronic heat capacity is linearly dependent on the absolute temperature. Consequently, integration to the temperature of measurement of the thermodynamic entropy is possible and can lead to the contribution of the electrons to the entropy of mixing. DEFORMATION AND DUCTILE FRACTURES OF METALS IN TORSION AND TENSION, by N. H. Polakowski and S. Mostovoy. Final rept. Feb. 1962 [67]p. incl. illus. diagrs. refs. (AFOSR-2276) (AF 49(638)308) Unclassified

The various types of shear fractures are classified and it is suggested that the cup-and-cone type occurs when an axisymmetrical stress gradient or a likewise orientation exists. Attention is also drawn to the constancy of the fracture stress within a broad range of initial prestrain by methods other than tension. Transient deformation instability in torsion is studied. The increase of ductility of work hardened FCC metals at low temperatures is discussed and it is concluded that this spectacular change is caused by the increase of the strain-hardening exponent. The Swift fracture in tension is shown to often deviate from the plane of the torsional prestrain helix. It was possible to localize a Swift fracture to a single shear band which resulted in an "end mill" type fracture which progressed violently without penetrating, however, into the metal outside the band. DIRECTIONAL PROPERTIES OF A MODIFIED 5% Cr TOOL STEEL AUSFORMED BY TORSION, by R. G. Toth and N. H. Polakowski. [1962] [9]p. incl. illus. diagrs. table. (AFOSR-4012) (AF 49(638)308) Unclassified

Also published in Trans. Amer. Soc. Metals, v. 55: 426-428, Sept. 1962.

A modified 5% Cr tool steel (0.35% C, 5% Cr-Mo-W-V) was quenched into a hot bath at 800° to 900° F, twisted in the austenitic bay range and air cooled to produce martensite. Room-temperature torsion tests in the pretwist direction showed a nominal fracture shear stress of up to 320,000 psi compared with 245,000 after ordinary hardening. The fracture changed from brittle (45°) to the shear type after pretwisting in excess of $\gamma_p = 1$. Reversed torsion or axial tension on pretwisted material invariably gave brittle fractures and a lower fracture stress than quenching alone. These results are indicative of a transverse weakness of ausformed steel. On the other hand, strengthening by torsion may be useful in applications involving substantially unidirectional torsional loads. (Contractor's abstract)

CHARGED PARTICLE PROPULSION: A DOUBLE ENERGY-CONVERSION PROBLEM, by C. D. Hendricks. [1962] [11]p. incl. illus. diagrs. (AF AFOSR-63-107) Unclassified

The electric propulsion of space vehicles is a problem which, at first glance, is rather straightforward and simple. A beam of charged particles is formed, accelerated by an electric field, neutralized, and permitted to leave the vehicle in much the same manner as does the high-velocity gas from a jet engine of a chemical rocket. Therefore, it is necessary to substitute electrical means of accelerating the particles for chemical means and to change the particles from hydrocarbons, water, oxides of carbon or nitrogen, and other molecules to atoms or ions of cesium, rubidium or other alkali metals or to multiatomic particles of carbon, mercury, glycerol or other convenient material. This report discusses: (1) energy conversion concept, (2) electrical mechanical conversion, (3) methods of producing charged particles, (4) efficiency considerations, (5) electrical spraying of liquids, and (6) specific-charge distributions.

ANTENNA IMAGE QUALITY CRITERIA, by J. J. Myers. Dec. 1958 [72]p. incl. diagrs. tables, refs. (Rept. no. R-108) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-56695) Unclassified

This report is the first of a series of 3 reports giving the results of a study of antenna resolution and image quality as related to the aperture illumination. The results of a mathematical evaluation based on various image quality criteria that have been suggested by antenna and optical theory are given. Each of the criteria was analyzed to determine its essentials and to find the relationships between the various criteria. The results of this analysis led to a catalog of image quality criteria useful in antenna theory. An investigation was made of the class of aperture illuminations given by $(1 + A \cos 2\pi x/L)$, where x is the aperture coordinate, L is the antenna length, and A is an aperture illumination parameter defined over the interval (-1, 1). The optimum of the class was determined for each of the criteria. The study led to the conclusion that image quality is not highly sensitive to aperture illumination and that a uniform illumination is close to optimum for an important class of applications. ANTENNA RESOLUTION AS LIMITED BY ATMOSPHERIC TURBULENCE, by C. M. Angulo and J. P. Ruina. July 1957 [37]p. incl. diagrs. table (Rept. no. R-96) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-56695) Unclassified

Spatial variations of the index of refraction of the atmosphere introduce fluctuations in the phase and amplitude of a wave propagating through it. The effect of these fluctuations on the resolution capability of microwave antennas is discussed. The measure of resolution used in the calculations is the beamwidth which is defined as the square root of the second moment about the mean of the normalized antenna pattern. This measure simplifies the calculations greatly and results in a simple expression for the beam broadening due to the variation of the refractive index. This broadening is dependent on the distance to the target, the scale of the turbulence, the variance of the refractive index and is relatively insensitive to the shape of the spatial correlation function of the refractive index. Measurements by others, of the nature of the refractive index spatial variation, are then used to obtain numerical estimates of the ultimate resolution capability of a microwave antenna as limited by atmospheric turbulence. (Contractor's abstract)

ASSESSMENT OF ANTENNA IMAGE QUALITY BY A MECHANICAL OBSERVER, by J. J. Myers. Dec. 1958 [36]p. incl. diagrs. table. (Rept. no. R-110) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-56695) Unclassified

An experimental evaluation of the effect of aperture illumination on the resulting image of a high-resolution antenna was made using a mechanical observer for assessing quality. The mechanical observer consisted of ILLIAC, the University of Illinois digital computer, programmed for the purpose. The evaluation was intended to complement an experimental evaluation of antenna image quality made by human observers, and a mathematical study of quality criteria. A close connection between image quality and aperture illumination was found by the mechanical observer as measured by its ability to analyze the images presented to it for assessment. The data show that a uniform aperture illumination is close to optimum. This result agrees with the result obtained in the experiment of item 1184. Results obtained from an assessment of a representative class of aperture illuminations are presented, and a detailed description of the mechanical observer and a block diagram of the logic used are given. (Contractor's abstract)

Illinois U. [Coordinated Science Lab.] Urbana.

HUMAN PERFORMANCE IN INFORMATION TRANSMISSION PART VI. EVIDENCES OF PERIODICITY IN INFORMATION PROCESSING, by L. G. Augenstine. Dec. 1958 [37]p. incl. diagrs. tables. (Rept. no. R-75) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-56695) Unclassified

Information transduction requires at least 3 operations; data input, data processing and responding. An

attempt has been made to specify some of the properties associated with data processing. Subjects were presented a variety of tasks chosen so that: (1) In the majority, either a single response or very simple responses were required, (2) The stimuli consisted of simple and familiar symbols or situations, (3) Each response could be formulated by making a sequence of simple unequivocal decisions, (4) Each response required many such decisions and (5) The tasks were self-paced. Analysis of the response times indicated that the performance of these simple tasks is undoubtedly quantized in units of 100 msec. However, it is not clear if this is the fundamental quantum associated with data processing. Rather, this may represent a grouping of 3 more fundamental quanta of 33 msec duration and within which one act of either data processing or input can be performed. Also there are indications that a 265 msec periodicity, possibly linked to eye movements, is associated with those tasks requiring vertical scanning.

1184

Illinois U. [Coordinated Science Lab.] Urbana.

OPTICAL SIMULATION OF ANTENNA IMAGES, by J. J. Myers and B. D. Elliot. Dec. 1958 [28]p. incl. illus. diagrs. table, refs. (Rept. no. R-109) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-56695) Unclassified

An experimental evaluation of antenna image quality as related to the aperture illumination of a high resolution antenna was made. An optical method of simulating antenna images was employed to form photographs that were evaluated by human observers. A representative class of illuminations was studied and the optimum of the class determined. The conclusion drawn from the evaluation was that antenna image quality is not highly sensitive to aperture illumination and that a uniform illumination is close to optimum for the import class of applications investigated. A detailed description of the experimental procedure is given and reproductions of some of the images analyzed are included. The results of the experiment are presented in the form of graphs showing relative image quality as a function of the variation in the antenna illumination parameter.

1185

Illinois U. [Coordinated Science Lab.] Urbana.

BINARY QUANTIZATION OF SIGNAL AMPLITUDES: EFFECT FOR RADAR ANGULAR ACCURACY, by D. H. Cooper. May 1959 [26]p. incl. diagrs. (Rept no. R-102) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-56695) Unclassified

An investigation determining the limits that receiver noise imposes upon the accuracy with which the angular position of a target may be estimated by means of a pulsed search radar, is extended to determine additional accuracy limitations imposed by the quantization of signal strengths prior to angle estimation. The results are presented in graphs. For many cases of practical interest, the additional limitation in accuracy may be neglected. (Contractor's abstract)

1186

Illinois U. [Coordinated Science Lab.] Urbana.

AN ELEMENTARY DESCRIPTION OF TASC, A TRACKING AND SORTING COMPUTER, by J. Divilbiss. June 1959 [31]p. incl diagrs. tables. (Rept. no. R-114) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-56695) Unclassified

The tracking logic of TASC consists of a number of elementary arithmetic operations which individually are easily defined. Three of these are: (1) Initiation, which starts a track on the basis of a radar position report; (2) Association, which corrects an existing track as the result of a position report; and (3) Extrapolation, which is essentially dead reckoning between position reports. These operations are introduced by simple examples which show the interdependence of the operations. It is this interdependence which is the essential part of tracking logic. In the second part of the report, more complicated tracking problems are treated. Attention is given to logical circuits which have been added to TASC to deal with turning tracks. Certain other aspects of the machine design such as the selection of tracking parameters and the sequencing of operations are covered. (Contractor's abstract)

Illinois U. Coordinated Research Lab., Urbana.

SIGNAL AMPLITUDE LIMITING AND PHASE QUANTIZATION IN ANTENNA SYSTEMS, by D. L. Bitzer. Dec. 1959, 97p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-56695) Unclassified

The effects of 2 different types of quantization on the antenna system which can be used to steer and focus with the required speed are investigated. The first type of quantization consists of introducing discrete phase shifts in the signals at each of the antenna elements such that the antenna beam can be steered and focused electrically. The second type of quantization investigated is described with the use of the complex plane and is non-linear. The investigation is limited to a one-dimentional linear array with the elements equally spaced.

Illinois U. Coordinated Science Lab., Urbana.

ELECTROMAGNETIC MASS AND THE INERTIAL PROPERTIES OF NUCLEI, by C. W. Sherwin and R. D. Rawcliffe. Mar. 14, 1960 [19]p. incl diagr. (Rept. no. I-92) Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-56695) AD 625706 Unclassified

According to the theory of relativity the inertial mass of any physical system should be a scalar quantity (no matter how distorted its electromagnetic structure) and the excess inertial mass of electromagnetic origin should not be observable. Experimental evidence on both these points was examined for nuclei. It is found that the inertial mass of a distorted nucleus, as measured by a mass spectrometer, has no observable asymmetry to an accuracy of 1 part in 100 of the asymmetry which is calculated to exist as a consequence of the electromagnetic energy. It is found that a comparison of nuclear mass differences (as measured by the mass spectrometer and by nuclear reactions) shows that the 'excess' electromagnetic inertial mass is not observable, to an accuracy of 1 part in 600. (Contractor's abstract, modified)

RESONANT BINARY SHIFTING REGISTER, by I. Weissman. Thesis, 1960, 152p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-56695) Unclassified

The principal objectives of the research described herein are: (1) to investigate the underlying principles of operation of the SRSR (Synchronous Resonant Shifting Register), and (2) to develop an experimental SRSR and demonstrate its feasibility. From the standpoint of simplicity and economy it seems clear that one would like the state of a single capacitor at a given time to represent 1 bit of information. In addition it is desirable that the switches be the simplest possible devices capable of performing the required switching function at the required speed.

TUNNEL DIODE DETECTOR, by T. Yasui and W. Mayeda. May 1962, 34p. incl. illus. diagrs. refs. (Rept. no. R-128) (AFOSR-3426) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) AD 282917 Unclassified

By use of a tunnel diode, it is possible to design a detector which is capable of amplifying a detected signal. Suppose input signal is an amplitude modulated signal whose modulating signal is $e_s \sin \omega_i t$ and the degree of modulation is very small. From the experimental results, the insertion gain,

$$g_s = \left| \frac{e_o}{e'_o} \right|,$$

is larger than 14 where e_o is the peak value of output signal corresponding to e_s with a tunnel diode being active and e'_o is the peak value of output signal corresponding to e_s with the tunnel diode being shorted.

Illinois U. Coordinated Science Lab., Urbana.

PROPERTIES OF SOME ALL-POLE TRANSFER FUNCTIONS, by D. A. Calahan. [1962] [12]p. incl. diagrs. tables. (AFOSR-4223) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-126; Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) AD 293153 Unclassified

The simplicity in realizing all-pole functions and their relative insensitivity to element change has caused a study of such transfer functions with both Tchebycheff and weighted passband responses to be made. Certain closed form expressions associated with these functions are found. A simple relationship between the residues at the poles of a Tchebycheff all-pole transfer function and the poles themselves is derived. A variation on the work of Bennett, Helman, and others is shown to yield an all-pole function with weighted passband response. (Contractor's abstract)

THE ELECTRON NUCLEAR DOUBLE RESONANCE SPECTRUM OF AN F-CENTER IN ALKALI HALIDES, by T. E. Feuchtwang. [1962] [9]p. incl. diagrs. table. (AFOSR-64-2332) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-65122) Unclassified

Also published in Paramagnetic Resonance; Proc. of the First Internat'l. Conf., Jerusalem (Israel) (July 16-20, 1962), New York, Academic Press, v. 2: 740-748, 1963.

The spin-Hamiltonian describing the hyperfine interaction of an F-electron with all nuclei in the lattice, in the presence of a constant and uniform magnetic field is reduced to an equivalent nuclear spin-

Hamiltonian. Because of the relative size of the isotropic magnetic hyperfine constant and the electric quadrupole coupling constant it is necessary to include in this calculation the contribution of the isotropic interaction to second order in the electron spin operator. This fact has 2 interesting consequences: (1) The electron nuclear double resonance spectrum calculated from the effective spin-Hamiltonian is sensitive to the sign of the product of the nuclear g-factor and the electric quadrupole coupling constant. (2) If one accounts for the physical equivalence of pairs of nuclei mapped into each other by an inversion in the center of the vacancy, then the effective Hamiltonian includes an electron mediated indirect coupling between the pairs of equivalent nuclei. This in turn leads to a considerably larger number of electron double resonance lines than predicted by Feher's theory. The theory was tested by fitting an observed spectrum. The agreement was remarkable. The determination of the sign of the electric quadrupole coupling was completely unambiguous. (Contractor's abstract)

THE ELECTRIC FIELD GRADIENT SEEN BY NUCLEI IN THE FIRST FEW SHELLS ABOUT THE VACANCY ASSOCIATED WITH AN F-CENTER IN ALKALI HALIDES, by T. E. Feuchtwang. [1962] [6]p. (AFOSR-64-2333) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122) Unclassified

Also published in Paramagnetic Resonance: Proc. of the First Internat'l. Conf., Jerusalem (Israel) July 16-20, 1962), New York, Academic Press, v. 2: 749-754, 1963.

Three factors contribute to the electric field gradient tensor seen by nuclei in the neighborhood of the negative ion vacancy associated with an F-center: (1) the net positive charge associated with the vacancy, (2) the F-electron charge density, and (3) the polarization of the lattice. Assuming that the theoretical value of the Sternheimer nuclear antishielding factor is correct, then the contribution of the first term is known. The contribution of the second term can be estimated from the magnetic dipole-dipole coupling constant of the hyperfine interaction between the F-electron and a given nucleus, provided one has an estimate of the spherically symmetric part of the F-electron charge density. The electron nuclear double resonance data lead to an experimental determination of the sign and magnitude of the field gradient tensor seen by a given nucleus. Hence, the sign and magnitude of the field gradient due to the polarization effects can be estimated. Assuming that the only important effects are associated with ion displacement, it is shown that the sign of the polarization f. g. is the same as that of the displacement of the ions i. the first shell (inward displacement is positive). Theoretical calculations for LiF and experimental data for KCl show that polarization effects are important and that ions displace into the vacancy. (Contractor's abstract)

ADSORPTION OF MOLECULAR GASES ON SURFACES AND ITS EFFECT ON PRESSURE MEASUREMENT, by D. Lee, H. Tomaschke, and D. Alpert. [1961] [9]p incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) Unclassified

Also published in 1961 Trans. Eighth Nat'l. Vacuum Symposium combined with Second Internat'l. Cong. on Vacuum Science and Technology, Washington, D. C. (Oct. 16-19, 1961), ed. by L. E. Preuss. New York, Pergamon Press, v. 1: 151-159, 1962.

Measurements of the rate of adsorption of various molecular gases on clean metallic surfaces have been related to measured values for the pumping speeds of a well-outgassed ionization gage. Estimates have been made of the nature and magnitude of errors in pressure measurement attributable to adsorption on the surfaces of ionization manometers. For some gases, such as nitrogen, the necessary correction is negligible; for others, such as carbon monoxide, the correction may be large and unpredictable. Experiments to detect surface ionization in a normally-outgassed Bayard-Alpert gage have failed to yield a detectable effect, even when the electrodes have been subsequently saturated with carbon monoxide. In general ultra-high vacuum ion ionization manometers, whether for total or partial pressures, properly measure the volume density within the gage. However, if the conductance to the system volume is small, the pressure within the gage may not be identical to that in the system. Reasonable corrections can be made if the reactions between gases and gage surfaces are understood. (Contractor's abstract)

CONTRIBUTIONS FOR THE EASTON CONFERENCE ON OCEAN WAVE SPECTRA. I. ESTIMATION OF THE SPECTRUM FUNCTION FOR SMALL WIND WAVES. II. PREPARED DISCUSSION OF CONFERENCE PAPERS, by B. L. Hicks. Mar. 1961 [27]p. incl. diagrs. tables, refs. (Rept. no. M-94) (Sponsored jointly by Air Force Office of Scientific Research Office of Naval Research and Signal Corps under DA 36-039-sc-85122) Unclassified

In the studies of wave spectra, values of mean square energy e_m in octave-wide frequency bands were obtained in "real time" measurements through the use of

analog devices. Illiac, the University of Illinois digital computer, was then used to effect a least squares fit to an integral of a parameterized spectrum function $\phi_c(\lambda_n)$ and to estimate the probable errors of the parameters λ_n. The CSL data covers the ranges $0.15 \leq V \leq 10.2$ m/sec, $5 \leq F \leq 625$ m, and $0.5 \leq f \leq 16$ cps, where V, F, and f are the average wind speed, average fetch, and wave frequency, respectively. A similar analysis was made of Burling's data, which covers a smaller range but more accurately. The least squares calculation of the values of the parameters λ_n and their probable errors ν_n affords an objective basis for comparing the 2 sets of data with each other and with data from other sources, for estimating the uncertainty of derived quantities such as the rms wave elevation, and for specifying for the first time the effect of wind speed and fetch upon the energy spectra of small waves on the water over a large range of each independent variable. EQUIPMENT REPORT ON AN MRO QUANTIZED VIDEO PROCESSOR AND PRINCIPAL DELAY NETWORK, by B. Voth. Mar. 1961 [49]p. incl diagrs (Rept. no. I-101) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) Unclassified

The particular objective of this report is to explain in detail the operation of the video processor and the multi-channel delay network. In reaching this objective, descriptions of circuit functions accompanied by block diagrams will be given. The descriptions will encompass circuit functions which seem to be individual in nature and will be presented in an order which is thought to lead most easily to an understanding of the processor. That is, for example, pulse generation and frequency control will begin the description, thereby giving a feeling for timing and delay helpful in the understanding of certain subsequently discussed circuitry. Also to facilitate the continuity of the discussion of individual circuits, an abbreviated block diagram of the processor is now shown.

A NOTE ON A METHOD OF DETERMINING PERTINENT AUGMENTATION OF POLYNOMIALS, by F. Miyata. Mar. 1961, 14p. incl. table. (Rept. no. R-125) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) Unclassified

Miyata's method on synthesis of driving point impedances brought about the problem of determining pertinent augmentation of polynomials. On this point, D. A. Calahan has offered 1 method. Assume that $N_1(z)$ is a given polynomial and $N_2(z)$ is a pertinent augmentation such that,

$$N_3(z) = N_1(z) \cdot N_2(z) = b_r z^r$$

where $b_r \geq 0$ for all r. However, this method requires the knowledge of z_1 (the zeros of $N_1(z)$) and this makes the method impractical. This report shows that the use of zeros of the original polynomials should be avoided, if it is possible.

ON ORIENTED COMMUNICATION NETS, by W. Mayeda. June 1961, 25p. incl diagrs. (Rept. no. R-128) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) Unclassified

Published in I. R. E. Trans. on Circuit Theory, v. CT- 9: 261-7, Sept. 1962.

This paper gives the solution to an important problem associated with an oriented communication net which is to obtain the maximum number of different values of terminal capacities in the net. Tang and Chien give an interesting condition for realizability of terminal capacity matrices of oriented communication nets. This paper shows that this condition is not sufficient. A sufficient condition for realizability of terminal capacity matrices of oriented communication nets is given which is more general than the necessary and sufficient conditions for the non-oriented communication net. The net whose terminal capacity matrix satisfies the above sufficient condition can have at most 2 (v-1) different terminal capacities where v is the number of vertices in the net. Notice that there are at most v-1 different terminal capacities in a non-oriented communication net. (Contractor's abstract)

SYNTHESIS OF THRESHOLD NET WORKS BY ALOGIC FUNCTIONS, by W. Mayeda. Mar. 1961, 27p. incl diagrs. refs. (Rept. no. R-124) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122) Unclassified

By the use of functions called alogic functions consisting of logic operations as well as algebraic operations, the synthesis of threshold or majority networks becomes simple especially for the realization of a switching function by a single threshold or a single majority element. The first section introduces a particular

threshold element called a W-element and shows that W-elements and scalar multipliers are sufficient to represent any threshold or majority networks. The second section shows the properties of alogic functions and clarifies that the synthesis of threshold or majority networks is equivalent, to obtain a suitable alogic function from a switching function. The third section gives a rather simple method for the realization of a switching function by a single threshold or a single majority element. An n-dimensional cube associated with n switching variables and n-1 dimensional hyperplanes has been used by others for the investigation of the properties of threshold or majority elements. In the last section, it is shown that an alogic function of the form $\Sigma a_i x_i - k$ represents an n-1 dimensional hyper-plane. The extension of applications of alogic functions to synthesis of sequential circuits is promising. (Contractor's abstract)

A TECHNIQUE OF LINEAR SYSTEM IDENTIFICATION USING CORRELATED FILTERS, by W. W. Lichtenberger [1961] [17]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) Unclassified

Presented at Joint Automatic Control Conf., Colorado U., Boulder, June 28-30, 1961.

Published in I. R. E. Trans. on Automatic Control: v. AC-6: 183-199, May 1966.

A technique for measuring the impulse response of linear processes while they are on line is described. A testing signal and correlating filter are employed after the manner of Turin. Such a procedure requires no multiplier, and the output of the filter is the impulse response as a continuous function of real time To reduce accompanying output noise, the method of adding coherently the results of a number of tests made in succession is proposed and applied to the measurement of a member of an ensemble of slowly varying impulse response. Optimum design of both the correlating filter and the necessary test signal is determined on the basis of minimum mean-square error of the resulting estimate. The general results are applied to the case of a single, slowly time-varying process. In addition to optimum design, normalized curves showing the optimum number of tests for a particular mode of variation are included. A second application is made to the problem of measuring a member of an ensemble of fixed process. (Contractor's abstract modified)

APPARATUS FOR THE STUDY OF EJECTION OF AUGER ELECTRONS FROM SOLID SURFACES, by F. M. Propst and E. Lüscher. [1962] [6]p. incl. illus. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) Unclassified

Published in Rev. Scient. Instr., v. 34: 574-579, May 1963.

A stainless steel apparatus for the study of the ejection of electrons from solid surfaces is described. The bakeable vacuum system consists of three sections and is capable of maintaining pressure in the 10^{-10} mm Hg region. Each of the three sections is pumped via a liquid nitrogen trap by a mercury diffusion pump. Typical pressures under operating conditions are 10^{-9} mm Hg in the target section and 10^{-6} mm Hg in the ion-source section. The ion-lens system is described and a convenient method of construction of ion lenses is illustrated. A description of a simple analog computer that determines the yield and the energy distribution of the ejected electrons is given.

AUTOMATIC AIR TRAFFIC CONTROL. PART I. A PROJECTED SYSTEM, by L. S. Kypta. Aug. 1962 [37]p. incl. diagrs. (Rept. no. R-145) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) AD 286887 Unclassified

The automatic air traffic control system described consists of automatic control centers for en route control and small satellite computers for approach-departure control. Each automatic control center is composed of 5 automatic sections providing the following functions: (1) position gathering and tracking

(2) internal communication (3) manual input and display, (4) control, and (5) information storage. An automatic center is capable of controlling over 1000 aircraft simultaneously. Each satellite computer is intended to control approaching and departing aircraft for one airport and is capable of controlling 50 flights simultaneously. The goal in the design of the system is to provide a system that in no way hinders traffic flow and also is safe and simple to use. To achieve this goal, it is necessary to automate all processes in which information flows in large quantities or is rapidly changing. The most important process falling in this category is decision making; consequently, decision making has been automated. All processes in which information is slowly changing or infrequently exchanged are to be executed manually. (Contractor's abstract)

COLLISION CROSS SECTION OF SLOW ELECTRONS AND IONS WITH CESIUM ATOMS, by C. L. Chen and M. Raether. May 1962, 23p. incl. illus. diagrs. refs. (Rept. no. R-137) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) AD 278563 Unclassified

Also published in Phys. Rev., v. 128: 2679-2683, Dec. 15, 1962.

Microwave interferometry is adopted to measure the effective collision cross section for momentum transfer $\bar{Q}_m$ of thermal electrons (of mean energies of ~0.06 to 0.071 ev) with cesium atoms in the afterglow of pure cesium and helium-cesium discharges. The momentum transfer cross section $\bar{Q}_m$ is found to be best represented by $1.61 \times 10^{-10} T_e^{-1} - 9.03 \times 10^{-12} T_e^{-1/2} + 2.03 \times 10^{-13}$ cm^2 in the temperature range of approximately 450° to 550°K. The energy dependence of the elastic electron-cesium-atom collision probability for momentum transfer is determined to be $P_m = 997 u^{-1} - 4810 u^{-1/2} + 7230$ cm^{-1} where u is the energy of the electrons in electron volts. This shows a smooth tendency to join Brode's data at higher electron energies. Mobilities of Cs^+ ions in helium and in cesium have been determined from the helium-cesium mixture experiments in the same temperature range. They are

$\mu(Cs^+ \text{ in He}) = 18.5 \pm 0.5$ cm^2/v-sec, and

$\mu(Cs^+ \text{ in Cs}) = 0.4 \pm 0.05$ cm^2/v-sec referred to standard gas density (i.e., 2.69×10^{19}/cm^3). (Contractor's abstract)

DISTRIBUTION RC NETWORKS WITH RATIONAL TRANSFER FUNCTIONS, by K. W. Heizer. Sept. 1962, 83p. incl diagrs. tables, refs. (Rept. no. R-153) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) AD 611008 Unclassified

A distributed RC circuit analogous to a continuously tapped transmission line can be made to have a rational short-circuit transfer admittance and rational short-circuit driving-point admittance. A subcircuit of the same structure has a rational open circuit transfer impedance and 1 rational open circuit driving-point impedance. Hence, rational transfer functions may be obtained while considering either generator impedance or load impedance. The functions have poles only along the negative real axis. Although the number of poles is arbitrary, only 2 may be chosen with complete freedom in a single unit. The residue of a pole in the short-circuit transfer admittance is related to the corresponding residue of the rational driving-point short-circuit admittance. A wide class of transfer functions may be realized by placing a distributed circuit in parallel with the output of another distributed circuit. The loss and total capacity required are often the same order of magnitude as those for lumped circuits. Complex zeroes may readily be obtained with these circuits. In many cases, active elements may be used to an advantage in the same manner as with lumped RC networks. (Contractor's abstract)

DUAL MODE OF COMPENSATION FOR A CLASS OF RANDOM PROCESSES, by D. P. Snyder. Feb 1, 1962, 51p. incl. diagrs. tables. (Rept. no. R-133) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) AD 271715 Unclassified

In recent years there has been a marked interest in the analysis and design of various types of control systems. In particular, there has been a growing interest in those systems which are characterized by randomly varying parameters. It is assumed that the randomness of the system may be adequately described by a 2-level quantization. A 2-level quantization

means that the system alternates between 2 known configurations at random times. The philosophy and technique developed by Shaw are employed to deal with a problem of compensation for a system whose randomness is describable by a 2-level quantization. (Contractor's abstract)

ENERGY DISTRIBUTION OF ELECTRONS EJECTED FROM TUNGSTEN BY He^+, by F. M. Propst. July 1962, 19p. incl. diagrs. refs. (Rept. no. R-147) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) AD 283015 Unclassified

Also published in Phys. Rev., v. 129: 7-11, Jan. 1, 1963.

The results of a calculation of the energy distribution of electrons ejected from tungsten by low energy He^+ are presented. The calculation is based on a mechanistic model of the process in which the ejected electrons are divided into 2 groups: (1) the electrons excited in the primary process that can escape directly; and (2) the electrons that escape because of interactions between the primary electrons and those of the band structure of the solid. Secondary electron data are used to predict the portion resulting from this second mechanism.

EXPERIMENTAL TEST OF THE CLUMP HYPOTHESIS OF VACUUM BREAKDOWN FOR LOW VOLTAGES, by M. Raether. July 1962, 5p. incl. diagr. refs. (Rept. no. R-148) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) AD 263287 Unclassified

It has been suggested that electrical breakdown in high vacuum between metal electrodes is caused by clumps of loosely adherent material on the surfaces. In order to test this, an experiment was designed which intended to demonstrate clump induced breakdown in a realistic situation. Although no positive conclusions can be drawn from this experiment concerning the mechanism of vacuum breakdown, it is believed that the failure to verify the clump hypothesis indicates that for small gaps (for which breakdown voltage is proportioned to the field strength) the explanation for vacuum breakdown under ultra-high vacuum conditions should be sought in field emission phenomena.

HYPERFINE STRUCTURE OF ATOMIC NITROGEN, by W. W. Holloway, Jr., E. Lüscher, and R. Novick. [1962] [7]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-85122] and National Science Foundation) Unclassified

Published in Phys. Rev., v. 126: 2109-2115, June 15, 1962.

The hyperfine structure of the ground state of N^{14} and N^{15} has been determined by optical pumping with spin exchange. A circulation system which forced the nitrogen through an electrodeless rf discharge into the resonance bulb, provided a continuous source of atomic nitrogen. Optically-pumped cesium was used to polarize and analyze the nitrogen. The zero-field intervals extrapolated to zero pressure are

N^{14}, $\nu(\frac{5}{2}-\frac{3}{2})$ = 26 127 288±40cps; N^{14}, $\nu(\frac{3}{2}-\frac{1}{2})$= 15 676 390 ±40 cps; and N^{15}, $\nu(2-1)$ = 29 290 902 ± 40 cps. The hyperfine constants are A^{14} = (+) 10 450 925 ± 20 cps, B^{14} = (-) 7 ± 20 cps, and A^{15} = (-) 14 645 441 ± 20 cps. These results include small corrections for second-order hyperfine interactions. A pressure shift of +1.9 ± 0.4 cps/mm Hg of N_2 was established for the N^{14} magnetic dipole interaction constant (A^{14}). The hyperfine structure anomaly is $\Delta = (A^{14} g_I^{15}/A^{15} g_I^{14}) - 1 = +(1.002 \pm 0.004) \times 10^{-3}$. The effect of spin-orbit and spin-spin mixing of the ^4S, ^2D, and ^2P states is discussed. (Contractor's abstract, modified)

THE IDENTIFICATION OF LINEAR SYSTEM WITH AN ASSESSMENT COMPUTER, by M. E. Suhre, Jr. May 1, 1962, 43p. incl. diagrs. refs. (Rept. no. R-139) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122) Unclassified

A method of determining the impulse response of a linear system is applied to process identification for adaptive control. The method uses a special test signal and a corresponding estimating filter. The noise present at the output of the estimating filter is reduced by an assessment computer. The assessment computer does no processing until the entire estimate is available. Thus it is able to interpolate to estimate the noise. The effectiveness of the assessment computer is analyzed using knowledge of the statistics of the noise. Finally, the optimum test signal spectrum is obtained by minimizing the expected mean square error for a specified assessment policy.

A NUMERICAL APPROXIMATION TECHNIQUE FOR FILTER FUNCTIONS, by W. F. McGee. Aug. 1962, 62p. incl. diagrs. tables, refs. (Rept. no. R-151) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) AD 611009 Unclassified

A new method is proposed for generating amplitude-frequency filter transfer functions of the usual type. The method consists of 2 algorithms based on modifications of the second method of Remez. Using this method, it is shown how to generate the following types of filter functions: (1) the low-pass equi-ripple polynomial filter function with zeros at the origin; (2) the low pass equi-ripple filter function with a variable number of zeros in the pass-band and a variable number of poles in the stop-band; (3) the asymmetrical equi-ripple band-pass filter function; and (4) the double band-pass equi-ripple filter function. The parameters that must be specified are discussed. Modifications to the basic methods that make them more useful to the filter designer are also presented. A discussion is given of the convergence of the proposed algorithms along with some examples. It is expected that these methods will be useful in filter design. (Contractor's abstract, modified)

ON PHYSICAL REALIZABILITY OF SIGNAL FLOW GRAPHS AND REALIZATION TECHNIQUES, by M. Lal. Dec. 1962 [51]p. incl. diagrs. (Rept. no. R-157) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under Da 36-039-sc-85122) AD 611098 Unclassified

The problem of physical realizability of the signal flow graphs is taken up and 2 classes of signal flow graphs are defined. It is shown that the class A encompasses all networks with independent sources, excluding mutual inductances. The realizability condition for this class is given and a realization technique established. Class B is shown to cover a very large class of active networks. The realizability condition and a realization technique for this class are given. The importance of these results for the network analysis and synthesis is discussed. Some aspects of the network synthesis problem are also considered and certain advantages of the synthesis through signal flow graph are pointed out. An attempt is made to establish an algorithm for deriving a member of class A or class B of signal flow graphs from the specified network function. Some difficulties in the way of achieving this are brought out. (Contractor's abstract)

A PATTERN RECOGNITION COMPUTER USING ALL-MAGNETIC LOGIC, by J. Divilbiss. Thesis, May 1962, 153p. incl. diagrs. tables, refs. (Rept. no. R-141) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) AD 285694 Unclassified

The development of a pattern recognition computer consisting of a control computer and a pattern recognition unit (PRU) is described. The role of the PRU in the combined system is analogous to that of the arithmetic unit in a conventional digital computer. The 3 principal divisions of the PRU are (1) a dimensional shift register of N x N bits, (2) a k-word memory with N squared bits per word, and (3) a bubbler consisting of N squared bubble registers of length r. Each bubble register is a linear

'self-ordering' register, that is, a register in which a fixed number of identical operations will order the information with all ones at one end of the register, all zeros at the other end. The control computer is of conventional design and is not treated at length. Examples of simple pattern recognition routines are given. (Contractor's abstract)

STATISTICAL DESIGN OF LINEAR MULTIVARIABLE SAMPLED DATA FEEDBACK CONTROL SYSTEMS, by M. Sobral. Feb. 1, 1962, 31p. incl. diagrs. refs. (Rept. no. R-132) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-85122) Unclassified

A linear multivariable sampled data feedback control problem has been studied. The problem is to design physically realizable controllers for multivariable plants subject to disturbances, satisfying a prescribed degree of rejection of the disturbing signals and over-all performances indexes. The system inputs are stochastic in nature and are characterized by their auto-correlation functions. Both the degree of rejection of the disturbances and the over-all performance indexes are given as upper bounds for mean square values. The technique presented is valid for non-minimum-phase plants, i.e., plants for which det P(z) has zeros outside the unit circle in the z-plane (P(z)being the plant matrix). It is, however, restricted to stable plants.

THE USE OF AN AUTOMATIC COMPUTER SYSTEM IN TEACHING, by P. G. Braunfeld and L. D. Fosdick. Sept. 1962, 36p. incl. illus. diagrs. tables. (Rept. no. R-160) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-85122) AD 611097 Unclassified

Published in I. R. E. Trans. on Education, v. E-5: 156-167, Sept. 1962.

PLATO II is an automatic teaching device designed to teach a number of students concurrently, but independently, by means of a single, central, high-speed computer. Only 2 student sites have been constructed thus far, but, in principal, the number of students that can be taught by PLATO II is limited only by the capacity and speed of the central computer. The power of such a computer-based teaching system stems from its ability to ask complex questions, judge the students' answers to these questions, and take an appropriate course of action on the basis of student responses. The computer also keeps detailed and accurate records of student performance, which are extremely useful guides to improving course content. The paper reports in some detail a study using PLATO II to teach 9 undergraduate students a portion of a course on computer programming. Some analysis and interpretation of data gathered by the computer during the study are represented. The apparent effectiveness of PLATO II as a teacher, as well as the kinds of problems encountered in preparing lesson material for an automatic system, is discussed. (Contractor's abstract)

INFRARED AND NUCLEAR MAGNETIC RESONANCE SPECTRA OF METHYLTIN COMPOUNDS, by T. L. Brown and G. L. Morgan. [1962] [5]p. incl. diagrs. tables, refs. (AFOSR-J1094) (AF 49(638)-166) AD 420679 Unclassified

Also published in Inorg. Chem., v. 2: 736-740, Aug. 1963.

The infrared and nmr spectra of a number of methyltin compounds containing tin-tin bonds have been studied. Polydimethyltin, $[Sn(CH_3)_2]_x$, prepared from the reaction of dimethyltin dichloride and sodium in liquid ammonia, consists of linear chains containing from 12 to 20 catenated tin atoms. A second form of polydimethyltin has been characterized as possessing a cyclic, six-membered ring of tin atoms (dodecamethylcyclohexatin). Observation of the ^{117}Sn and ^{119}Sn-proton couplings reveals that increasing catentation results in a decrease in J_{Sn-CH_3} and an increase in $J_{Sn-Sn-CH_3}$. An empirical relationship between J_{Sn-CH_3} and both the symmetric and asymmetric tin-carbon stretching modes for a series of methyltin compounds is proposed, employing data taken from the literature. The infrared and nmr data for hexamethylditin and linear polydimethyltin fit the empirical relationship. (Contractor's abstract)

THE CRYSTALLOGRAPHY OF THE AUSTENITE-MARTENSITE TRANSFORMATION IN AN Fe-Cr-C ALLOY, by K. A. Johnson and C. M. Wayman. [1962] [6]p. incl. diagrs. table, refs. (AFOSR-J743) (AF 49(638)420) AD 413641 Unclassified

Also published in Acta. Cryst., v. 16: 480-485, June 10, 1963.

An analysis of the crystallography of the austenite-martensite transformation in a high purity Fe-Cr-C alloy was made. Lattice parameters of the 2 phases, the austenite-martensite orientation relationship and the habit plane of the martensite were determined experimentally. Considerably less scatter in habit plane poles was observed than has been reported by others for a similar alloy. None of the existing crystallographic theories adequately explains the results, and it is suggested that an additional anisotropic interface distortion be incorporated into the theory. An inverse method of analysis for determining the pattern of inhomogeneity is discussed, with particular reference to the orientation relationship, and it is shown that the orientation relationship is a comparatively inaccurate quantity when used in theoretical calculations. METAL-GAS EQUILIBRIUM AND THE NIOBIUM-NITROGEN SOLID SOLUTION, by J. R. Cost and C. Wert. Jan. 15, 1962 [46]p. incl. diagrs. tables, refs. (AFOSR-2067) (AF 49(638)672) AD 273232 Unclassified

A method is developed for displaying in a 3-dimensional plot the pressure-temperature-composition equilibrium for a metal-gas system. The coordinates used are log P, 1/T, and log x. In this coordinate system, several simplications result over the ordinary P-T-x plot. A series of measurements on Nb-N equilibrium were made to see how well this real metal-gas system obeys the ideal system. The Nb-N binary obeyed the rules for ideal behavior very well. The major features of the binary may be described by a small number of thermodynamic parameters. (Contractor's abstract)

EMISSIVITIES OF NIOBIUM (COLUMBIUM) AND NIOBIUM-NITROGEN SOLIDS SOLUTIONS, by J. R. Cost. [1962] [2]p. incl. tables. (AFOSR-4251) (AF 49(638)672) Unclassified

Also published in Trans. Metall. Soc. AIME, v. 224: 634-635, June 1962.

Measurements were made on the outer surface of the specimen of the apparent specimen temperature, S, and on the inner blackbody surface of the true specimen temperature, T. The spectral emissivity, ϵ_λ, for 0.65 u radiation was then obtained from the relation $(1/T) - (1/S) = (\lambda/C_2) \ln \epsilon_\lambda$, where $C_2 = 1.438$ cm °K is the second radiation constant. The total emissivity, ϵ_t, was obtained from the Stefan-Boltzman total radiation law, $\epsilon_t = (P/\sigma T^4 A)$. In this expression $\sigma = 5.67 \times 10^{-12}$ watts cm^{-2}, A is the surface area of the specimen, and P is the power. It is observed that the spectral emissivity shows very little variation with temperature. The average ϵ_λ value is 0.345 with a standard deviation for the measurement of 0.0075. The total emissivity is found to increase with temperature.

DIFFUSION OF CLUSTERS OF NITROGEN ATOMS IN IRON (Abstract), by D. Keefer and C. Wert. [1962] [1]p. [AF 49(638)672] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 234, Mar. 26, 1962.

Association of interstitial nitrogen in iron has been examined by determining the anelastic spectrum of the solid solution. Four distinct relaxations were observed. One of these is that of single nitrogen atoms, the Snoek effect. Diffusion coefficients calculated from this effect agree well with values reported in the literature. A second relaxation is thought to be associated with pairs of N atoms. These pairs diffuse about 10 times more slowly than do singles at the same temperature. A third relaxation is thought to be a cluster-of-three, a tri-interstitial. They diffuse about 10 times more slowly than do pairs at the same temperature. A fourth relaxation is so far unidentified with a particular

model. The atoms in this configuration move through the lattice with relaxation time only a little slower than the singles do. Binding energies of the clusters of two and of three can be estimated. They are about 0.1 and 0.35 ev, respectively.

PIPE DIFFUSION IN LiF, by R. Tucker, A. Lasker, and R. Thomson. [1962] [4]p. incl. diagrs. (AFOSR-J760) (AF 49(638)819) AD 414079 Unclassified

Presented at Internatl. Cong. on Crystal Lattice Defects, Kyoto (Japan), Sept 7-12, 1962.

Also published in Jour. Appl. Phys., v. 34: 445-452, Mar. 1963.

Also published in Jour. Phys. Soc. Japan, v. 18, Suppl. III: 120-123, Mar. 1963.

Impurity diffusion of Na ions along dislocations in LiF has been studied by both DC and transient techniques. The Na impurity is injected into the LiF by plating NaCl on 1 surface of the LiF and placing a potential across the crystal at an elevated temperature. Large scale diffusion with Na dendrite formation is observable in a dc arrangement and the diffusion can be measured by either radioactive tracer methods or measurement of charge transport. Transient experiments yield an activation energy for diffusion of approximately 0.3 ev for both edge and screw dislocations, and $D_0 = 0.01$ cm^2/sec. Analysis of the charge effects in the core of the dislocations leads one to propose a very large vacancy density in the core, and the experiments are even best understood in terms of a hollow of atomic dimensions along the dislocation core. DISLOCATION MOBILITY IN GERMANIUM (Abstract), by M. Kabler. [1962] [1]p. [AF 49(638)819] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 65, Jan. 27, 1962.

The motion of dislocations in pure germanium crystals has been investigated via etch pit techniques similar to those utilized by Johnston and Gilman on LiF. Stresses were applied by simple bending, and care was taken to avoid possible effects from chemical contamination. Within the experimentally accessible velocity range from 10^{-7} to 10^{-2} cm/sec, an empirical dependence of dislocation velocity on stress and temperature has been obtained. At 730°K, the velocity of screw and 60-deg dislocations is the same under 8 kg/mm^2 shear stress; however, under 0.5 kg/mm^2, screw dislocations move distinctly faster than 60-deg dislocations. At this lower stress, screws moving in a certain direction often cross-glide, while screws moving in the opposite direction do not. Under high stress, a screw which has previously cross-glided at low stress is observed to return rapidly to its original glide plane, along which it proceeds at its normal glide velocity. Possible explanations for this and related behavior will be discussed.

DISLOCATION MOBILITY IN GERMANIUM (Abstract), by M. Kabler, V. Celli, and R. Thomson. [1962] [1]p. [AF 49(638)819] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 211, Mar. 26, 1962.

By means of an etch-pit technique, the temperature and stress dependence of the velocity of individual screw and 60-deg dislocations in pure germanium has been measured directly. On a log-velocity-vs-reciprocal-stress plot (over three decades in stress), the data depart somewhat from a straight line, being slightly concave upward. At constant stress, the velocity varies with temperature in a way indicating a thermally activated process with activation energies around 1.5 ev. Moving dislocations tend strongly to straighten out in [110] directions. This is taken as evidence that the Peierls force has an important influence upon the motion. On this basis, various modifications of simple-kink theory and their relevance to the present data are discussed.

ELECTRONIC STATES ON SCREW DISLOCATIONS (Abstract), by A. Gold, V. Celli, and R. Thomson. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)819] and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 65, Jan. 24, 1962.

Bound states for an electron in a many valley semiconductor arising from the strain field of a screw dislocation have been investigated within the framework of elastic continuum, effective mass, and deformation potential theories. If the valence band is centered at k = 0 there will be no spatially coincident trapping state for holes. Upper and lower limits for the lowest state of an electron bound to a screw dislocation in Ge have been calculated. These closely bracket the acceptor level which is observed to lie about 0.2 ev below the conduction band in deformed crystals. The results indicate that the customary "dangling bond" model need not be invoked in the description of dislocation states and that they may be envisioned as arising from the strain field alone. The cases of edge and 60° dislocations are also discussed.

DIFFUSION RATES IN FACE-CENTERED CUBIC COPPER- ZINC ALLOYS DURING TORSIONAL DEFORMATION, by D. H. Killpatrick and R. W. Balluffi. [1962] [8]p. incl. diagrs. tables, refs [AF 49(638)880] Unclassified

Published in Acta Metall., v. 11: 439-446, May, 1963.

Chemical diffusion rates were obtained in a 13 at-% zinc-87 at % copper alloy as a function of torsional strain rate by measuring the rate of loss of the highly volatile zinc during vacuum heating. High purity, randomly oriented single crystals were strained at constant rates in the range 809-549°C under vacua < 10^{-5} torr. Strain rates in the range 1.4 x 10^{-5} sec^{-1} to 598 x 10^{-5} sec^{-1}, and strains up to 16.1 were employed. At the higher temperatures mean diffusion penetrations of the order of the order of 10-100 μ were achieved, while at the lower temperatures the penetrations were of the order of 1-20μ. Changes in specimen structure were observed by x-ray and metallographic methods. Diffusion anneals at zero strain rate were carried out in order to test the validity of the experimental technique. It was found that: (1) the weight loss technique employed was sufficiently reliable for the purposes at hand; (2) in no case was any detectable enhancement of true bulk diffusion found as a result of the deformation; (3) at sufficiently large strains recrystallization occurred leading to large amounts of in intercrystalline cracking. The cracking led to apparent enhanced diffusion according to the weight loss technique used because of rapid short-circuiting loss of the volatile zinc along the cracks. (Contractor's abstract)

ON STRAIN-ENHANCED DIFFUSION IN METALS. I. POINT DEFECT MODELS, by R. W. Balluffi and A. L. Ruoff. [1962] [14]p. incl. refs. [AF 49(638)880] Unclassified

Published in Jour. Appl. Phys., v. 34: 1634-1647, June 1963.

Plastic deformation may affect bulk diffusion by altering the rates of point defect production and annihilation. A detailed analysis of this phenomenon is given with particular emphasis upon possible upper limits for the magnitude of the effect at elevated diffusion temperatures where bulk diffusion occurs over macroscopic distances. In order to consider all possibilities from this point of view the following 3 models are analyzed: (I) vacancies may be created or destroyed at jogs on gliding screw dislocations and climbing edge dislocations. These possible vacancy sources and sinks are intermixed within crystal subgrains and the net source or sink action is zero over representative subgrain volumes; (II) a net vacancy source (or sink) action is required within the subgrains in order to support the required nonconservative dislocation motion. The required excess vacancies are destroyed (created) at the subgrain boundaries where the concentration is maintained in equilibrium; and (III) large numbers of vacancies are readily created everywhere during deformation but are destroyed everywhere in the specimen volume only with difficulty. It is concluded that model I is probably the most realistic. In addition to the analysis of the above 3 models, detailed discussion is given of the following aspects of the diffusion-deformation problem: (1) effect of surface vacancy sinks on diffusion-deformation experiments carried out near a free surface; (2) diffusion enhancement expressed in terms of the number of excess vacancy jumps; (3) temperature dependence of the diffusional effects of deformation; (4) mechanical work required to maintain nonequilibrium vacancy concentrations; (5) the relationship between macroscopic creep behavior and nonequilibrium vacancies: (6) the possibilities of interstitial production. ON THE MAGNITUDE OF VACANCY SUPERSATURATIONS IN SILVER DURING DEFORMATION AT ELEVATED TEMPERATURES, by R. B. Minch and R. W. Balluffi. [1962] [9]p. incl. diagrs. tables, refs. [AF 49(638)880] Unclassified

Published in Jour. Phys. and Chem. Solids v. 24: 443-451, Mar. 1963.

The electrical resistivity of large silver single crystals was measured during and directly after plastic deformation under essentially isothermal conditions near 700 and 800°C. Strain rates of 11.6 x 10^{-5} and 58.3 x 10^{-5} sec^{-1}, and total strains between 0.07 nad 0.09 were employed. Particular efforts were made to detect transient resistivity decays directly after the cessation

of deformation such as would be produced by the possible decay of deformation-induced crystal defects. In 2 runs no resistivity decay greater than the experimental sensitivity of about 2.6×10^{-10} Ωcm was found. In 3 runs extremely small apparent decays of the order of 10^{-9} Ω cm were found. These small effects could conceivably have been due, in whole or part, to: (1) experimental factors not related to the actual relaxation of defects in the specimens; (2) decay of excess dislocations; and (3) decay of excess point defects. Possibility (1) could not be confirmed or rejected by any independent means. Possibility (2) was practically eliminated by approximate calculations which indicated that the resistivity due to the excess dislocations was well below the level of detection. Possibility (3) was shown to correspond to vacancy supersaturations in the specimens during deformation no larger than those in the range between 6 and 90%. The experimental results are therefore completely consistent with the diffusion-deformation measurements of Savitskii and Darby et al which predict vacancy supersaturations less than ~ 50% during similar deformation in silver but are in marked disagreement with the diffusion-deformation experiments of Forestieri and Girifalco and Lee and Maddin which imply supersaturations at least 2 orders-of-magnitude larger.

STRAIN-ENHANCED DIFFUSION IN METALS. II. DISLOCATION AND GRAIN-BOUNDARY SHORT-CIRCUITING MODELS, by A. L. Ruoff and R. W. Balluffi. [1962] [6]p. incl. diagr. refs. (Sponsored jointly by Advanced Research Projects Agency, Air Force Office of Scientific Research under [AF 49(638)880], Atomic Energy Commission, and National Science Foundation) Unclassified

Published in Jour. Appl. Phys., v. 34: 1848-1853 July 1963.

Rapid diffusion along dislocation cores generally enhances the average bulk diffusion in a dislocated crystal. If each diffusing atom has at least several opportunities to make rapid excursions along various dislocation cores, Hart has shown that $D_T/D_T^0 = 1 + f D_p/D_T^0$. D_T is the average bulk diffusivity, D_T^0 is the diffusivity in the dislocation-free lattice, f is the fraction of atoms in dislocation pipes, and D_p is the diffusivity along dislocation pipes. Under these conditions, the diffusion-penetration is increased by the short-circuiting but the general shape of the penetration curve is unaffected. When the dislocations are static, each diffusing atom must visit a number of dislocations, and a necessary condition for the Hart relation to hold is $2(D_T^0 t)^{1/2} > l_d$, where t is the diffusion time, and l_d is the dislocation spacing. When this condition fails (for example, at lower temperatures), and when the dislocations are static, it is demonstrated that the amount of short-circuiting is greatly reduced and that the dislocations become essentially "clogged." A parallel development is given for short-circuiting due to grain boundaries. In particular, it is shown that grain boundary migration and recrystallization, which occurs repeatedly during deformation of metals with low stacking fault energy, can, for temperatures equal to or less than about half the melting temperature, lead to a greatly increased diffusion coefficient without altering the general shape of the penetration curve.

MOBILITY OF DISLOCATIONS IN GERMANIUM, by V. Celli, M. Kabler and others. [1962] [4]p. incl. diagrs. (AFOSR-J580) (AF AFOSR-62-179) AD 415209 Unclassified

Presented at Internat'l. Conf. on Crystal Lattice Defects, Tokyo (Japan), Sept. 3-4, 1962.

Also published in Jour. Phys. Soc. Japan, v. 18, Suppl. I: 20-23, Mar. 1963.

Experimental curves obtained by Kabler can be best plotted as $v = v_0 \exp(-E/kT - \tau_0/\tau)$. In order to explain this law, it is supposed that kinks are nucleated on segments of the line between pinning points. At the pinning points, the kinks are momentarily stopped until a fluctuation of sufficient size is available. If the segment is short or the stress low, the activation barrier for kink collapse is less than the barrier for forward motion beyond the pinning point, and the segment cannot supply successful kinks to the line. If the segment is sufficiently long, successful kinks can be created. Two ranges of velocity are obtained; the first valid in the kink collision range and the second when the ends of the dislocation represent the kink sinks. (Contractor's abstract)

THE CLUSTERING OF N IN B. C. C. IRON, by D. Keefer and C. Wert. [1962] [9]p. incl. diagrs. tables, refs. [AF AFOSR-62-192] Unclassified

Published in Acta Metall., v. 11: 489-497, June 1963.

The clustering of N in b.c.c. Fe has been studied using the anelastic behavior of the solid solution. The data are interpreted as showing that N exists near room temperature as dispersed single atoms, in pairs and in triplets. The mobility of these clusters is lower than that for singles at a given temperature. The clusters exist in more than random numbers; work must be done to separate them into single isolated atoms in the lattice. Their work is estimated to be 1500 cal/mol for pairs and 5000 cal/mol for triplets. (Contractor's abstract)

SURFACE STUDIES BY RADIOACTIVE METHODS, by H. Frauenfelder. Final rept. Mar. 1962 [14]p. incl. diagrs. refs. (AFOSR-2377) (AF 18(603)49) AD 411814 Unclassified

The basic aim of the work performed under this contract can be summarized as a study of surface properties in ultrahigh vacuum with radioisotopes. At certain times interest was switched onto new fields. Superconducting properties, for example, were studied and the discovery of the Mössbauer effect added a new dimension to possible experiments. Topics covered include: the magnetic field in superconductors; nuclear resonance absorption and nuclear Zeeman effect in Fe^{57}; search for the anisotropy of inertia; radiotracer studies of adsorption and desorption at clean solid surfaces; desorption measurements with Sb^{124} and In^{111}; angular correlation Cd^{111} on surfaces; and recoil studies with Cd^{107}, Ga^{67}, and Zn^{62}.

THE MÖSSBAUER EFFECT, by H. Lustig. [1960] [18]p. incl. diagrs. refs. (Sponsored jointly by [Air Force Office of Scientific Research under AF 18(603)49], Atomic Energy Commission, and Office of Naval Research) Unclassified

Published in Amer. Jour. Phys., v. 29: 1-18, Jan. 1961.

Recent discovery and several important applications of recoilless gamma-ray fluorescence are reviewed. Its main purpose is to give to nonspecialists a self-contained introduction to this currently very lively field of research. The importance of the fluorescence technique and its limitations, before Mössbauer's discovery, are discussed. Mössbauer's pioneering gamma-ray emission is presented. From among the large number of recent experiments which make use of the Mössbauer effect, two groups are selected for discussion. The first is concerned with the discovery of nuclear and magnetic properties of Fe^{57}; the other with a test of the principle of equivalence in general relativity, by a measurement of the gravitational shift in the frequency of radiation.

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 26, Jan. 24, 1962.

The hyperfine structure of the ground state of N^{14} and N^{15} have been determined by optical pumping with spin exchange. A circulation system, which forced the nitrogen through an electrodeless rf discharge into the resonance bulb, provided a continuous source of atomic nitrogen. Optically pumped cesium was used to polarize and analyze the nitrogen. The zero field intervals extrapolated to zero pressure are $N^{14}\nu(\frac{5}{2}-\frac{3}{2}) = 26\,127\,325 \pm 45$ cps, $N^{14}\nu(\frac{2}{3}-\frac{1}{2}) = 15\,676\,394 \pm 40$ cps, and $N^{15}\nu(2\text{-}1) = 29\,290\,962 \pm 25$ cps. The hyperfine constants are $A^{14} = 10\,450\,930 \pm 20$ cps, $B^{14} = 0 \pm 17$ cps, and $A^{15} = 14\,645\,451 \pm 25$ cps. The results for N^{15} differ from the earlier values reported by Anderson et al. A pressure shift of $+1.8 \pm 0.4$ cps/mm Hg of N_2 was established for the N^{14} magnetic dipole hyperfine interaction constant (A^{14}). This result is consistent with the observations of Jen and co-workers on trapped N atoms.

ELEMENTARY EXCITATIONS IN LIQUID HELIUM, by A. Miller, D. Pines, and P. Nozières. [1962] [12]p. incl. diagrs. refs. (AFOSR-2582) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)528 and Army Research Office (Durham)) Unclassified

Also published in Phys. Rev., v. 127: 1452-1464, Sept. 1, 1962.

An analysis of some experimental and theoretical investigations of the elementary excitation spectrum of liquid He II is carried out. The spectrum density fluctuations is shown to consist of 2 parts: direct excitation of single quasi-particles from the condensed zero-momentum state; and excitation of more complex configurations arising from the interaction of 2, 3, or more quasi-particles. It is demonstrated that: (1) in the long-wavelength limit, a single quasi-particle excitation exhausts the f-sum rule; (2) this asymptotic behavior of the density fluctuatuation spectrum may be used to normalize the experimental results of Henshaw and Woods; one thereby obtains a somewhat altered liquid structure-factor curve, detailed information on the efficiency of quasi-particle excitation from the condensed state of an incident slow neutron, and an estimate of the depletion of the zero-momentum state as a consequence of particle interaction; (3) the backflow introduced by Feynman and Cohen corresponds to taking into account the coupling between a Feynman excitation and higher configurations involving several elementary excitations. It is shown that in the Bogoliubov approximation the backflow around the impurity atom corresponds to a cloud of moving virtual-phonon excitations which act to increase the impurity effective mass as well as to conserve current in the system. The generalization of these results to higher-order approximations, and to the coupling between quasi-particles in liquid helium, is discussed. The importance of accounting properly for depletion effects in a microscopic theory is emphasized. (Contractor's abstract, modified)

FORMATION OF HYDROXYL ION AND U CENTERS IN ADDITIVELY COLORED POTASSIUM BROMIDE CRYSTALS, by R. S. Crandall. [1962] [2]p. incl. diagr. (AFOSR-64-0752) (AF 49(638)529) AD 436518 Unclassified

Also published in Jour. Chem. Phys., v. 38: 1036-1037, Feb. 15, 1963.

Harshaw KBr crystals were additively colored and the absorption spectra of thin sections investigated. It was found that whereas OH^- centers were only formed near to the crystal surface, the U centers also occurred in the interior. It is proposed that the potassium formed on the surface during the thermal bleaching of the F-centers reacts with the water in the air forming potassium hydroxide and hydrogen. A fraction of these diffuse into the crystal, the hydroxyl ions substituting the halides and the hydrogen reacting with the F-centers to form U-centers.

ZONE MELTING OF POTASSIUM CHLORIDE, by T. M. Srinivasan. Dec. 1962 [15]p. incl. diagrs. table. (Technical note no. 3) (AF 49(638)529) AD 294013 Unclassified

It is possible by straightforward, reproducible, and relatively simple zone refining procedures to produce potassium chloride crystals of a purity superior to that commercially available. The zone refining can be carried out in silica crucibles but should be performed in an atmosphere of chlorine gas to prevent adhesion of the salt to the crucible. Prior to zone refining, the salt should be baked in an atmosphere of chlorine gas. The purity obtained as a result of the zone refining operation depends upon the number of zones passed through the salt ingot but the impurity improves only slightly if more than ten passes are used. The results obtained are similar to those of Grundig but were achieved with a smaller number of zone passes. Potassium chloride that was zone refined in high purity graphite crucibles had graphite specks adhering on or near the surface. Also, it was difficult to cleave single crystals from the ingot for conductivity measurements. The purity of the crystals was of the same order of magnitude as that of the commercially available crystals.

RESEARCH ON THE ELECTRONIC PROPERTIES OF THE SILVER AND ALKALI HALIDES, by F. C. Brown. Final rept. Jan. 31, 1959-Jan. 31, 1962. Feb. 1962 [11]p. (AFOSR-2272) (AF 49(638)579) Unclassified

A summary of work completed while studying the electronic properties of suitably prepared silver and alkali halides by means of electrical and optical measurements at temperatures down to that of liquid helium is given. Also summarized is the understanding gained of such phenomena: (1) electron trapping, (2) the factors which affect the mobility of electrons and holes, and (3) scattering processes.

LIFETIMES OF EXCITED STATES IN ALKALI HALIDE CRYSTALS CONTAINING F-CENTERS, by R. K. Swank. June 1962, 163p. incl. diagrs. tables, refs. (Technical note no. 2) (AFOSR-3043) (AF 49(638)579) Unclassified

Measurements were made of the lifetimes of excited F-centers in KCl, NaCl, KBr, and KI crystals by observing the time dependence of the fluorescence and photoconductivity following excitation by a short pulse

of light. A special flash lamp was developed for use as the exciting source. It has a width at half max of 18 nsec and a useful output of 10^{13} photons in the range 2 to 6 ev. The behavior of the lifetime of the excited F-center as a function of temperature can be interpreted in terms of a simple model in which the only 2 modes of decay are by radiative transition to the ground state or thermally induced ionization. Using the model, the radiative lifetime of the excited F-center is found to be: KCl - 0.58 μsec, NaCl - 1.00 μsec, KBr - 1.11 μ sec, KI - 2.22 μ sec. The activation energy for thermal decomposition of the excited F-center in KCl is found to be 0.15 ev. The lifetime of the F-center fluoresence in KCl is independent of concentration below 2×10^{-16} F-centers/cm^3, but is 20% smaller at 3×10^{17} F-centers/cm^3. It is not influenced by the presence of M-centers unless the concentration of the latter is high, in which case the F-luminescence is almost completely quenched and is replaced by M-luminescence. The decay constant of the latter is 60 nsec.

HALL MOBILITY OF HOLES IN SILVER BROMIDE, by R. C. Hanson. [1962] [5]p. incl. diagrs. table, refs. (AFOSR-J871) (AF 49(638)579) AD 415880 Unclassified

Also published in Jour. Phys. Chem., v. 66: 2376-2380, Dec. 1962.

Hall mobility measurements have been made on holes introduced into AgBr by a bromine atmosphere in the temperature range from room temperature to 150°. These measurements were made using conventional electrode geometry and sensitive high impedance ac techniques similar to those used by Macdonald and Robinson. The Hall mobility for holes varied from 2.0 ± 0.5 cm^2/v. sec at room temperature (27°) to 0.5 ± 0.15 cm^2/v. sec at 150°. The hole mobility is about 1/30 as large as the electron mobility determined by other workers at room temperature. The temperature dependence of the hole mobility is about T^{-4}. This is much steeper than the temperature dependence of the electron mobility in this region. (Contractor's abstract)

MOBILITY OF PHOTOELECTRONS IN THE SILVER HALIDES AT HIGH ELECTRIC FIELD (Abstract), by T. Masumi. [1962] [1]p. [AF 49(638)579] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 39, Jan. 24, 1962.

The mobility of electrons in AgCl and AgBr has been studied as a function of electric field or temperatures down to 4°K in an attempt to clarify the scattering mechanism of fast or hot electrons. High purity crystals prepared by zone refining in a halogen atmosphere were used to obtain high electron mobility, above 10,000 cm^2/volt sec at low temperature. A fast pulse technique was adopted to observe both the transient photoconductivity and the Hall mobility for photoelectrons. The results show that the mobility of fast electrons at low temperatures is a decreasing function of electric field. An energy dissipation mechanism similar to acoustic scattering is suggested for the fast electrons.

RESEARCH ON THE PHOTOPRODUCTION OF MESONS IN LIQUID HYDROGEN BUBBLE CHAMBER, by E. L. Goldwasser. Final rept. June 1, 1959-May 31, 1962, 5p. (AFOSR-3182) (AF 49(638)594) AD 283452 Unclassified

The prime purpose of this work has been to obtain some reliable data on the photoproduction of π mesons in the region near the threshold. The plan has been to operate the bubble chamber with hydrogen as a working liquid and to observe the production of positive π mesons by passing the x-ray beam through the liquid of the chamber. Measurements are to be made which will give information on the ranges and angles of production of the π mesons. Only those mesons which stop in the liquid of the chamber are to be used. In order that this information be more reliable than any that now exists, the projects for improving knowledge about the x-ray beam were undertaken. It is now believed that the uncertainties involved in x-ray beam flux and in its maximum energy are of the same order of magnitude as other uncertainties which are involved in the experiment. NEGATIVE PION PROTON ELASTIC SCATTERING IN THE ENERGY RANGE 200 TO 1450 MEV, by L. Lavatelli. Final rept. June 1, 1959-May 31, 1962, 17p. incl. diagrs. table, refs. (AFOSR-3538) (AF 49(638)661) Unclassified

The results of a fairly systematic survey of the energy dependence of the differential elastic scattering of negative pions by protons for laboratory kinetic energies of the pions from 200 mev to 1450 mev are presented. The data for the 23 measurements that have been used in the survey in this energy region have been taken from

published articles, notes, and reports. The data have been consistently fitted with Legendre polynomials rather than powers of cos θ^*, where θ^* is the angle of the scattered pion in the center of mass system. No attempt has been made to give a theoretical interpretation of the results.

LIFETIME OF THE EXCITED F CENTER, by R. K. Swank and F. C. Brown. [1962] [8]p. incl. diagrs. table, refs. (AFOSR-J867) (AF AFOSR-62-215) AD 415881 Unclassified

Also published in Phys. Rev., v. 130: 34-41, Apr. 1, 1963.

An investigation was carried out on the excited state of the F center in various alkali halide crystals as a function of temperature. Results are presented on the time dependence of photoconductivity and luminescence following excitation by a very short, 10^{-8} sec, pulse of light. The data can be interpreted in terms of a simple energy-level diagram of the F center consisting of a ground state and an excited state. Estimates are given of the depth of the excited state below the conduction band ΔE, the frequency factor for thermal ionization $1/\tau_0$, and the radiative lifetime τ_R, for KCl, KBr, KI, and NaCl. The radiative lifetime τ_R depends upon the alkali halide, but may be as long as 10^{-8} sec. Suggestions are made for understanding this long lifetime in view of the large oscillator strength of the F center. The effect of F-center concentration and also of an admixture of M centers is discussed.

MAGNETORESISTANCE OF SILVER BROMIDE, by H. H. Tippins and F. C. Brown. [1962] [9]p. incl. diagrs. table, refs. (AFOSR-J869) (AF AFOSR-62-215) AD 415885 Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 221, Mar. 26, 1962.

Also published in Phys. Rev., v. 129: 2554-2562, Mar. 15, 1963.

The magnetoresistance effect was investigated in high-purity zone-refined AgBr in order to obtain information about the conduction band structure in this material. The measurements were performed at 2°K and in magnetic fields up to 18 kG. The rate-of-drift method using a sensitive electrometer was employed to observe the transient photoconductivity both in the presence and absence of a magnetic field. Results of the experiments are consistent with the assumption of a spherically symmetric conduction band centered at $k = 0$ as well as with an electron relaxation time of the form: $\tau = \tau_0(\epsilon/KT)^{3/2}$, with $\tau_0 = 1.1 \times 10^{-12}$ sec.

During the course of the magnetoresistance measurements, a deviation from Ohm's law at high electric fields was noted. Some data on this "hot electron" effect are presented and briefly discussed.

PROPRIOCEPTION VARIABLES AS DETERMINERS OF ANTICIPATORY TIMING BEHAVIOR, by J. A. Adams and L. R. Creamer. [1962] [6]p. incl. diagr. refs. (AFOSR-1407) (AF 49(638)371) AD 451535 Unclassified

Also published in Human Factors, v. 4: 217-222, Aug. 1962.

Anticipatory timing, where the human operator initiates an accurate response before the actual occurrence of the environmental event, is one of the most striking and least studied aspects of skilled motor performance. An experiment was performed on temporal and control system variables that could influence the timing of responses in a tracking task. Verification was sought for a proprioceptive trace hypothesis that holds the time-varying proprioceptive after-effects of movements to be the internal trace that persists in time and cues the occurrence of a future response. Ninety-six subjects participated. A 2 x 2 x 2 randomized factorial design used 2 values each of movement amplitude, spring loading, and signal duration as a means of manipulating proprioceptive stimuli and their time trace. Results supported the hypothesis. Signal duration and spring loading of the control induced significant effects for the number of beneficial anticipations, but movement amplitude had no significant effect. It was concluded that proprioception has a role in response timing, in addition to its traditional one of informative feedback. (Contractor's abstract)

DATA PROCESSING CAPABILITIES OF THE HUMAN OPERATOR, by J. A. Adams and L. R. Creamer. [1962] [10]p. incl. diagrs. table, refs. (AFOSR-2859) (AF 49(638)371) AD 406865 Unclassified

Also published in Jour. Eng. Psychol., v. 1: 150-158, Oct. 1962.

An experiment was conducted on human data processing capabilities, and a test was made of the hypothesis that the human operator has a 1-channel decision center whose function is resolving event uncertainties. The bisensory discrete matching task was used, where discrete audio and visual stimuli were jointly presented for concurrent responses by the 2 hands. The visual stimulus series in the bisensory task always had event uncertainty to occupy the 1-channel central decision mechanism in accordance with the hypothesis, and concurrent audio stimuli were either partly or completely redundant. Comparison of performance under these 2 bisensory conditions was with a unisensory control condition that only practiced the visual stimulus series. There were 15 Ss in each of the 3 conditions. The results showed impairment for both bisensory conditions, and it was concluded, that the human operator can be considered a 1-channel system providing this channel is taken to be concerned with the resolution of event uncertainty. Automatization of responses to completely redundant stimuli was questioned.

EVENT UNCERTAINTY, PSYCHOLOGICAL REFRACTORY PERIOD, AND HUMAN DATA PROCESSING, by L. R. Creamer. [1962] [8]p. incl. diagrs. tables, refs. (AF 49(638)371) Unclassified

Published in Jour. Exper. Psychol., v. 66: 187-194, Aug. 1963.

An experiment was performed to (a) test the psychological refractory period (PRP) hypothesis of the human S as a 1-channel data processing system with an event uncertain-time certain stimulus series, and (b) determine the combined effect of time and event uncertainty. To test the PRP hypothesis, 5 groups of 12 Ss had 5 different time intervals between visual and audio stimuli (0, 100, 200, 400, and 800 msec). The visual S-R sequence produced a delay in audio responses that was significant at 0-, 100-, and 200-msec intervals. The human apparently responds as a 1-channel system when he processes event uncertain-time certain data. Another group of 12 Ss had the 5 interstimulus intervals with both time and event uncertainty. Their bisensory audio impairment was similar to the 5 time certain groups. (Contractor's abstract)

APPLICATIONS OF LINEAR GRAPH THEORY TO PROBABILISTIC COMMUNICATION NETWORKS, by Y. Fu. Jan. 10, 1962 [58]p. incl. diagrs. refs. (Technical note no. 18) (AFOSR-1993) (AF 49(638)63) AD 271973 Unclassified

Probabilistic communication networks under study are assumed to consist of a finite number of stations and links, each having a specified value of reliability and capacity, and each statistically independent of all others.

The expected value of the terminal capacity between 2 specified terminals of the network is studied. A method for determining the expected value of terminal capacity as well as its upper and lower bounds is described. The influence due to variation of branch capacity and reliability on the expected value of terminal capacity is also investigated. Structures of networks composed of identical elements having maximum values of expected values of terminal capacity under different given conditions are described, and the structure of a network having maximum total expected values of terminal capacity with minimum reliability is given. ELECTRICAL AND OPTICAL PROPERTIES OF VITREOUS SELENIUM, by H. P. D. Lanyon. [1962] [10]p. incl. diagrs. table, refs. (AFOSR-64-2099) (AF 49(638)417) AD 451345 Unclassified

Also published in Phys. Rev., v. 130: 134-143, Apr. 1, 1963.

The space-charge limited current-voltage-characteristics of evaporated layers of vitreous selenium from 2.4 to 60 μ thick are described. It is shown that both an exponential and a Gaussian distribution of states will explain these characteristics. An analytic solution is derived for the case of the exponential distribution of states: $N(\epsilon) = N_0 e^{-\epsilon/\Delta}$, where N_0 is the density of states at the valence band edge which is taken to be the origin of energy. This solution, with $N_0 \sim 10^{20}/cm^3 ev$ and $\Delta = 0.067$ ev, will account for the characteristics of all the specimens independent of thickness. The model will also account for the results of the optical absorption, electron bombardment, quenching, and positive and negative photoresponse experiments of other workers. It is not possible to obtain an analytic solution for any of these cases for a Gaussian distribution of states: $N(E) = N_0 \exp\{-(E-E_{max})^2/\Delta^2\}$. However, it is shown that the distribution in energy of these states with $E_{max} = 2.35$ ev and $\Delta = 0.25$ ev fits the experimental results as well as does the exponential distribution. A Gaussian distribution of states would be expected theoretically in a disordered material such as vitreous selenium.

OBSERVATION OF SURFACE AND IMPURITY STATES IN SILICON BY OXIDE LAYER TUNNELING, bu P. V. Gray. [1962] [4]p. incl. diagrs. (AFOSR 64-2100) (AF 49(638)417) AD 451346 Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 302-305, Oct. 1, 1962.

Conductance and differential capacitances were measured as a function of frequency and bias for a number of silicon-silicon oxide-aluminum sandwiches; data are derived regarding the density and energy states near the silicon-silicon oxide interface. Conductance is due to electron tunneling transitions between aluminum and silicon. The density of interface states from low-frequency capacitance measurements is $\simeq 2 \times 10^{-12}$ states/ev cm^2. Impurity bands were detectable in heavily doped samples; lightly doped samples showed impurity bands due to boron.

SOME ELECTRICAL PROPERTIES OF AMORPHOUS SELENIUM (Abstract), by J. L. Hartke. [1962] [1]p. [AF 49(638)417] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 90, Jan. 24, 1962.

Hole and electron drift mobilities measured in pure amorphous selenium films agreed well with previous results (Proc. Phys. Soc. (London) B70: 669, 1957; B76: 826, 1950). Some evidence was obtained that the shallow electron and hole traps which are assumed to limit the drift mobilities were due to imperfections, a continuous distribution in energy of these levels being preferred. The addition of arsenic increased the concentration of imperfections which produce shallow electron traps, but the arsenic atoms themselves were apparently electrically inactive. Hole ranges were temperature independent, while electron ranges decreased with decreasing temperature measurements of space-charge-limited currents carried by holes were interpreted using a model of deep hole capture centers distributed uniformly in energy. The lowest observed value of electrical conductivity agreed well with values extrapolated from liquid selenium.

PHOTOMULTIPLIER DETECTION OF MICROWAVE MODULATED LIGHT, by O. L. Grady and D. F. Holshouser. [1962] [4]p. incl. illus. (AFOSR-2306) (AF 49(638)556) AD 611355 Unclassified

Also published in Proc. Inst. Radio Engineers, v. 50: 1525, June 1962.

A recent report (see item no. 1133; Vol. V) described the principles of dynamic crossed-field electron multiplication (DCFEM) and its use in the detection of light modulated at intermediate frequencies. This paper reports a subsequent experiment in which this method was used in a photomultiplier which directly detects light modulated at microwave frequencies. By driving the photomultiplier at a frequency f, which is close to the light modulation frequency f_s, the heterodyne detection is realized by observing the photomultiplier output current which is modulated at the difference frequency $f_d = |f - f_s|$.

A GENERAL SYNTHESIS OF TUNNEL DIODE AMPLIFIERS AND SENSITIVITY MINIMIZATION, by B. A. Shenoi. [1962] [13]p. incl. refs. (AFOSR-3860) AF 49(638)63 and AF AFOSR-62-126) Unclassified

Presented at Nat'l. Electronics Conf., Chicago, Ill., Oct. 8-10, 1962.

Also published in Proc. Nat'l. Electronics Conf., v. 18: 114-124, Oct. 1962.

Several authors have studied lossless networks with 1 or more tunnel diodes embedded as active elements. In this paper, a different technique of synthesizing a grounded network which (1) is lossy, (2) realizes transfer function poles and zeros anywhere in the finite s-plane, (3) requires at most 2 tunnel diodes and (4) can be provided with different amounts of dissipation in the capacitors and inductors, is described. The transfer characteristic of the network so designed is not affected by biasing the diodes, since a DC bias can be applied to them through an integral part of the network. A decomposition of a given polynomial N(s) to realize its zeros as the natural frequencies of a lossy network is described such that (1) the ratio $|\frac{-G}{C}|$ of the diode embedded in it and (2) the coefficient sensitivity of N(s) due to variation in -G are simultaneously minimized. Necessary and sufficient conditions for realizability of these natural frequencies by a tunnel diode with prescribed parameters C and -G are derived. Minimization of the zero sensitivity due to variation in -G, for the above decomposition of N(s) is also investigated. (Contractor's abstract)

MILLIMETER WAVE CAVITY COUPLING BY QUARTER-WAVE TRANSFORMER, by R. J. Strain and P. D. Coleman. [1962] [3]p. incl. diagrs. tables. (AFOSR-J507) (AF AFOSR-62-287) AD 407875 Unclassified

Also published in I. R. E. Trans. on Microwave Theory and Techniques, v. MTT-10: 612-614, Nov. 1962.

In order to use high mode-order microwave cavities to achieve either field intensities or high selectivity with low transmission losses, it is necessary to couple power into the resonators efficiently. This may be

accomplished if the coupling system acts as a transformer matching the lossy elements of the cavity to a source of input power, and if the coupling system has an aperature large enough to make diffraction losses negligible. This note describes an easily designed coupler which satisfies these requirements. It is essentially a series iteration of parallel plane waveguides, each $\lambda/4$ long. The fundamental design principles of this coupler are described to the particular case of a bisected confocal resonator. Experimental evaluation verifies the efficacy of both the transformer and the approximations used in its design.

ULTRAMICROWAVE RESEARCH AT THE UNIVERSITY OF ILLINOIS, by M. D. Sirkis. [1962] [34]p. incl. illus. diagrs. refs. (AF AFOSR-62-287) Unclassified

The difficulties associated with the extension of conventional vacuum tube techniques to the generation of ultramicrowaves arise principally from the small physical size of the component parts of the resulting devices. This is a report on how the microwave group at the University of Illinois solved the major problems for self-excited devices: (1) The fabrication of the devices is difficult because of the small size of the component parts; (2) The required beam current densities become extremely high as the cathode area is decreased; (3) The circuit losses increase in inverse proportion to the square root of the wavelength; and (4) Adequate cooling of the small internal structures becomes increasingly difficult as the wavelength is decreased.

STATISTICAL THEORY OF THE ERROR IN APPROXIMATE WAVEFUNCTIONS, by G. G. Hall. [1962] [5]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638) 318] and National Science Foundation) Unclassified

Published in Jour. Chem. Phys., v. 38: 1104-1108, Mar. 1, 1963.

The theory of how a probability distribution may be estimated by sampling is applied to the problem of using approximate wavefunctions for quantum mechanical systems and estimating the errors involved. The most probable wavefunction of given mean energy is considered and some of its properties found. The energy variance, which gives a lower bound to the true energy, can be calculated. The theory is applied to the simple harmonic oscillator and the predicted relation between mean energy and variance is compared with the actual relations found using 2 different types of approximate wavefunction.

REACTIONS OF NITROGEN-HYDROGEN RADICALS. I. NH_2 RECOMBINATION IN THE DECOMPOSITION OF AMMONIA, by M. H. Hanes and E. J. Bair. [1962] [5]p. incl. diagrs. table, refs. (AFOSR-J617) [AF AFOSR-62-38] Unclassified

Also published in Jour. Chem. Phys., v. 38: 672-676, Feb. 1, 1963.

Photoelectric measurements of NH_2 absorption as a function of time following an rf discharge pulse through ammonia are described. The extinction coefficient of the strong vibration-rotation line at 16725. 40 cm^{-1} is found to be $1.02 \pm 0.10 \times 10^3$ liter mol^{-1} cm^{-1} as an upper limit. Under the proper conditions, the kinetics of NH_2 disappearance is second order with respect to NH_2. Arguments attribute the initial stages of the observed reaction to NH_2 recombination to form hydrazine. The recombination rate constant is $2.33 \pm 0.20 \times 10^9$ liter mol^{-1} sec^{-1} and is independent of the total pressure in the range 425 to 850 μ.

THEORY OF THE EFFECT OF TEMPERATURE ON THE ELECTRON DIFFRACTION PATTERNS OF DIATOMIC MOLECULES, by R. A. Bonham and J. L. Peacher. [1962] [7]p. incl. tables, refs. (Contribution no. 1106) (AFOSR-64-1501) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-322 and Atomic Energy Commission) AD 446360 Unclassified

Also published in Jour. Chem. Phys., v. 38: 2319-2325, May 15, 1963.

The effect of temperature on the electron diffraction pattern of a diatomic molecule is considered from the standpoint of the simple kinematic scattering theory utilizing a quartic vibrational potential. The potential is obtained by an expression of

$$h^2 J(J+1)/2\mu r^2 + D \exp[-2a(r-r_e)] - 2D \exp[-a(r-r_e)]$$

about its minimum value r_0. The second-order wavefunction for the n'th vibrational and J'th rotational state of the system has been obtained, and expressions for the electron diffraction quantities r_g, l_e^2 and (Ms) have been computed. General results for the quantity M(s) utilizing the approximate eigenfunctions of the complete Morse potential and incorporating an approximate treatment of the effect of centrifugal stretching are also presented. Explicit expressions for M(s) for the first 3 vibrational states as derived by this treatment are given. Appropriate sums over all the vibrational and rotational states have been carried out to obtain the temperature dependence for the above quantities. Estimates of the effect of temperature on the parameters r_q and l_e^2 at 300° and 1500°K for representative diatomic molecules are given. (Contractor's abstract)

GROUND STATE OF THE HeH^+ MOLECULE ION by B. G. Anex. [1962] [11]p. incl. tables, refs. (AFOSR-64-1524) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-362 and National Science Foundation) AD 446373 Unclassified

Also published in Jour. Chem. Phys., v. 38: 1651-1662, Apr. 1, 1963.

Configuration interaction calculations have been carried out for the system HeH+ using 1-electron basis functions in confocal elliptical coordinates. Four internuclear separations, R = 1.00, 1.40, 1.80, and 2.20 bohrs (B) were studied rather intensively. One of these, R = 1.40 B, lies very close to the equilibrium R and the energies found in this region represent the lowest thus far reported for HeH^+. Self-consistent field calculations were also made and in combination with the configuration interaction results lead to an estimation of correlation energies. The binding energy, the equilibrium internuclear separation, and the first few vibrational energies for the system were also estimated. The center of negative charge, which is closely related to the dipole moment, was studied as a function of R and of the size of the 1-electron basis. (Contractor's abstract)

THE NATURE OF THE TWO-ELECTRON CHEMICAL BOND. II. THE HETEROPOLAR CASE, by H. Shull. [1962] [5]p. incl. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-362] and National Science Foundation) Unclassified

Published in Jour. Phys., Chem. v. 66: 2320-2324, Dec. 1962.

By using the artifice of dividing space into 2 parts by means of a plane perpendicular to the internuclear axis and passing through its mid-point, it is shown that there is possible a division of a 2-configuration 2-electron wave function into 3 orthogonal parts each of which has optimum properties associated with the plane intuitively corresponding to the names ionic and atomic. The heteropolar case is considered, and it is shown that there arises a natural mathematical quantity, θ, which is a function of 3 integrals over natural orbitals over half space. The quantity, θ, seems to bear a considerable resemblance to electronegativity

difference. An example is given for the simple diatomic hydride 2-electron system, $HZ^{(Z-1)+}$, at a fixed internuclear distance. Finally it is pointed out that the treatment is a special case of the use of a much more general weight factor. Suitable choices of the latter may make it possible to relate functionally the large number of different electronegativity scales. (Contractor's abstract)

AXIOMATIC PERTURBATION THEORY FOR RETARDED FUNCTIONS, by H. M. Fried. [1962] [9]p. (AFOSR-64-0778) (AF AFOSR-61-19) AD 438243 Unclassified

Also published in Jour. Math. Phys., v. 3: 1107-1115, Nov.-Dec. 1962.

A construction of the retarded n-point functions of perturbation theory is given within the Lehmann, Symanzik, and Zimmerman framework and without the specification of an interaction Lagrangian. An intermediate-state expansion of retarded functionals is employed to define a systematic set of equations representing approximations to the (integral) unitarity conditions; the requirement of symmetry of the n- 1 retarded coordinates of an n-point retarded function enters in an essential way. The class of solutions to these equations contains the renormalized perturbation theory retarded functions corresponding to local renormalizable Lagrangian interactions, as well as more singular functions corresponding to nonrenormalizable interactions; if the latter are excluded all the n-point functions may be successively determined to all orders in the renormalized coupling constants. The construction is explicity performed for the first radiative corrections to the 2- and 3-point functions of a self-interacting neutral scalar boson field, yielding the finite renormalized results of perturbation theory. Similar but slightly singular results are quoted for the π - π scattering amplitude. (Contractor's abstract)

PI-NUCLEON SCATTERING WITH INELASTIC CONTRIBUTIONS, by L. F. Cook, Jr. and B. W. Lee. [1962] [15]p. incl. diagrs. refs. (AFOSR-64-0780) (In cooperation with Princeton U., N. J.) (AF AFOSR-61-19) AD 438245 Unclassified

Also published in Phys. Rev., v. 127: 297-311, July 1, 1962.

The N/D formulation of the unitarity S matrix, valid for reactions involving production processes, is applied to the reactions, $\pi + N \to \pi + N$, $\pi + N \to \pi + \pi + N$, $\pi + \pi + N \to \pi + \pi + N$, in the energy region of the higher resonances. A model is constructed in which the 2-pions in 3-particle states interact in only 1 state, and the left-hand discontinuities of the elastic and 3-particle scattering amplitudes are neglected while the left-hand discontinuities of the production amplitude are approximated by a pole. The elastic amplitude is driven through unitarity by the inelastic amplitude. The general properties of this model are investigated, and the procedure is applied to the D- and F-wave scattering of the π - N system. The comparison between the experimental data and the model presented here is quite favorable. (Contractor's abstract)

REGGE POLES AND HIGH-ENERGY LIMITS IN FIELD THEORY, by B. W. Lee and R. F. Sawyer. [1962] [8]p. incl. refs. (AFOSR-64-0782) (In cooperation with Pennsylvania U., Philadelphia and Wisconsin U., Madison) (AF AFOSR-61-19) AD 438247 Unclassified

Also published in Phys. Rev., v. 127: 2266-2273, Sept. 15, 1962.

It is shown that the Bethe-Salpeter scattering amplitude in the ladder approximation is meromorphic in the complex angular momentum half-plane, Rel > - 3/2. There is always at least 1 Regge pole in this region. The connection between the Regge poles of the ladder graphs and the high-energy behavior of the strip graphs is discussed. In the $\lambda\varphi^3$ theory it is shown that the

second-order expression for the leading Regge trajectory, for the sum of the ladder graphs, determines the leading term in the high-energy limit of the n'th order strip graph. This relationship has been checked in fourth-order perturbation theory, and is evidence for the consistency of a perturbation approach to the calculation of Regge trajectories. THEORY OF THE $J = \frac{3}{2}$, $I = \frac{3}{2}$ π N RESONANCE, by V. Singh and B. M. Udgaonkar. [1962] [3]p. incl. diagr. refs. (AFOSR-64-0800) (AF AFOSR-63-42) AD 436476 Unclassified

Also published in Phys. Rev., v. 130: 1177-1179, May 1, 1963.

Calculations are made on the position W_R and width γ_{33} of the $J = \frac{3}{2}$, $I = \frac{3}{2}$ P-wave π N resonance, using partial-wave dispersion relations. In the present calculation, the nucleon and ρ-meson masses and coupling constants, which determine the long-range part of the forces, are treated as given. The parameters which characterize the distant part of the left-hand cut, are fixed by using the expressions for the $(\frac{3}{2}, \frac{3}{2})$ P-wave πN state given by fixed energy dispersion relations, in a region where they are valid without substractions, in a way used by Balázs for the $\pi\pi$ problem. The self-consistency demands that the position and width of the $(\frac{3}{2}, \frac{3}{2})$ resonance used as input values in the crossed channel in the fixed-energy dispersion relation be the same as the calculated values of the position and width. The preliminary results of the calculation are $W_R \approx m + 2.35$ and $\gamma_{33} \approx 0.14$. The experimental values are $W_R = m + 2.17$ and $\gamma_{33} \approx 0.12$, (where m is the nucleon mass and we use units in which $\hbar = c = m_\pi = 1$). These results constitute the first part of the intended self-consistent calculation of the nucleon mass and $(\frac{3}{2}, \frac{3}{2})$ resonance position, exploiting the "reciprocal bootstrap" mechanism discussed by Chew. Some difficulties in getting answers as to what should a retrieval system for scientific information do are sketched. For example, there exists a lack of knowledge about the true relationship of scientific literature and scientific discovery, and the differences in form and language used in various specialized fields. Some areas of needed research on retrieval systems for scientific information are suggested.

[THE SOLUTION OF A FUNDAMENTAL PROBLEM IN THE THEORY OF DIFFERENTIAL EQUATIONS] Sobre o problema fundamental de teoria das equacoes diferenciais, by M. M. Peixoto. [1962] [5]p. (AFOSR 66-0031) [AF AFOSR-62-334] AD 631133
Unclassified

Also published in Summa Brazil. Math., v. 5: 190-194, 1962.

The importance of the concept of structural stability in the general theory of differential equations on a manifold is illustrated. An explicit proof is given for the fact that in a compact manifold there are only denumerable many topologically distinct types of structurally stable systems.

Also published in Electroencephalog. and Clin. Neurophysiol., v. 15: 281-286, Apr. 1963.

Changes of visual evoked response (VER) were studied in 24 experiments carried out in 21 normal men, in 2 patients with congenital aniridia, and in one with complete ocular paralysis. The pupillary diameter was controlled, in all the experiments performed in normals, photographically, pharmacologically or with a 2-mm artificial pupil. The unchanged position of the head, eyeballs and eyelids was photographically checked throughout the experiments. One eye was stimulated with flashes of light at 0.5-1/sec and at a constant intensity. The response was recorded from the scalp and averaged with a photoelectric method. Waning of VER accompanying habituation was observed with maximal fixed miosis or mydriasis provoked by drugs and also with an artificial pupil. Patients with congenital aniridia and with complete ocular paralysis showed a significant reduction of VER amplitude during habituation. The same changes elicited by habituation were observed either with eyes open or closed. Under the experimental conditions established, the pupillary diameter did not undergo spontaneous changes during habituation. It is concluded that in man the pre-receptor elements do not participate decisively in the mechanism of VER reduction observed during photic habituation.

ON THE CENTER-LIMB EFFECT OF SOLAR FLARE AREA, by O. Takahashi. 1962, 37p. incl. diagrs. tables, refs. (AF 49(638)637) AD 423787; AD 437507
Unclassified

The visual flare area has been corrected to obtain a real flare area. As the result of this correction, however, great discrepancy was brought into the distribution of flare area with respect to central distance on disk, and this discrepancy has been explained as due to the flare height. This paper gives an actual proof of the existence of 2 different parts in the foreshortening effect of flare visual area and then gives the normalized correction of flare area, from the distribution of the flare counted number with respect to the central distance on disk. These 2 different parts are the well-known geometrical distorsion and the vanishing effect near the limb. (Contractor's abstract)

STATISTICS OF SOLAR FLARES. PART I, by O. Takahashi. 1962, 15p. incl. diagrs. tables. (AF 49(638)637) AD 433789; AD 437509
Unclassified

The purpose of this note is to provide more detailed information on various characteristics of solar flares,

by means of statistical methods, to help in a better theoretical understanding of them. The solar flare's lifetime, area, H-α width, development curve, associated filament activation and associated sunspot group characteristics are analyzed for each of 685 flares observed. Correlation of these parameters with one another and with flare importance and solar activity is shown, as well as the frequency distribution. (Contractor's abstract)

ON THE INFLUENCE OF CHEMICAL KINETICS ON THE COMBUSTION OF FUEL DROPLETS, by C. S. Tarifa. Mar. 10, 1962 [39]p. incl. illus. diagrs. refs. (Technical note no. 5) (AFOSR-2836) (AF 61(052)221) AD 277299 Unclassified

Presented at Internat'l Cong. of Combustion Engines, Copenhagen (Denmark), June 1962.

The influence of chemical kinetics on the combustion of fuel droplets is studied by means of a theoretical model of the process which considers spherical symmetry and quasi-stationary conditions. Chemical kinetics is approximated by means of a second-order over-all reaction rate. Results are expressed as a function of the product pr_g, where p is the pressure and r_g the droplet radius. It is shown that there exists a minimum value of such product under which an individual droplet cannot sustain a flame. An experimental investigation was also carried out, by burning in air at variable pressure fuel droplets suspended of thin quartz fibres. The laws of variation of both flame and droplet diameter as functions of time were obtained as well as the minimum values of the droplet diameters for combustion as a function of pressure. It is shown that all experimental results are in excellent qualitative agreement with those predicted by theory. (Contractor's abstract)

COMBUSTION OF SOLID AND LIQUID PROPELLANTS AND FLAME THEORY, by C. S. Tarifa. Final rept. Feb. 1, 1959-Mar. 31, 1962. May 1, 1962, 15p. incl. refs. (AFOSR-3197) (AF 61(052)221) AD 282440 Unclassified

An analytical study on the influence of chemical kinetics on the combustion of liquid bipropellant in droplets, was undertaken. The influence of chemical kinetics on premixed and diffusion spherico-symmetrical flames has also been theoretically and experimentally studied. A research facility was constructed and experiments were carried out in order to study the influence of pressure and temperature of the surrounding atmosphere on solid propellant combustion. A theoretical study on the influence of heat losses and radical diffusion on the structure of premixed flames was carried out. A criterion for the validity of the steady state assumption for radical concentration has been obtained. And, in order to study the influence of chemical kinetics on laminar diffusion flames, their external and internal structures have been analyzed. As a result a criterion for flame extinction was obtained. (Contractor's abstract)

CHEMICAL NON-EQUILIBRIUM EFFECTS IN HYPERSONIC AERODYNAMICS, by A. Linan and I. Da Riva. [1962] 31p. incl. diagrs. refs. (AFOSR-4365) (AF 61(052)221) AD 294638 Unclassified

Presented at Third Internat'l. Cong. in the Aeronautical Sciences, Stockholm (Sweden), Aug. 27-31, 1962.

The influence of chemical non-equilibrium on hypersonic flows is considered in the following cases: recombination and dissociation in the boundary layer. It is pointed out that since in the region of maximum convective heating, the outer inviscid flow is in equilibrium, departures from equilibrium occur only close to the wall, and this makes possible the obtention of a simple analytical solution in which the effects of arbitrary reaction rates, body shapes and flight regimes are clearly shown. Chemical reactions between the air constituents and any injected or vaporized material from the wall. In this case, the assumption is made that the chemical reaction is so fast thati it takes place in a very thin region. This simplifies the obtention of an analytical solution for finite reaction rate. A criterium for flame extinction is given. (Contractor's abstract)

ON THE STRUCTURE OF PREMIXED AND DIFFUSION LAMINAR SPHERICO-SYMMETRICAL FLAMES, by Pefez del Notario and C. S. Tarifa. [1962] [7]p. incl. diagrs. table, refs. (AFOSR-3196) (AF EOAR-62-90) AD 282387 Unclassified

Also published in Ninth Symposium (International) on Combustion, Cornell U., Ithaca, N. Y. (Aug. 27-Sept. 1, 1962), New York, Academic Press, 1963, p. 65-71.

Premixed and diffusion laminar spherico-symmetrical flames are studied by means of a non-adiabatic model

which considers variable temperature at infinity. The flame is supposed to be maintained by a porous sphere through which the gaseous mixture or one of the reactant gases is injected. Stationary conditions are assumed and chemical kinetics of the process is approximated by means of an overall reaction rate. Solution of the problem is achieved by means of an approximate analytical method. Flame temperature, mass flow per unit area at the flame surface, thickness and radius of the flame and temperature at the sphere surface are given as functions of the mass flow. The influence of the main parameters of the process: temperature at infinity, dimensionless ratio of the activation energy to the heat of reaction and sphere radius is also considered. Some experimental results for diffusion flames are also given. (Contractor's abstract)

SUPERSONIC FLOW ABOUT AXIALLY SYMMETRICAL DIFFUSERS, by J. Sielawa. Nov. 20, 1962, 68p. incl. diagrs. (AFOSR-4729) (AF 49(638)581)
AD 406433 Unclassified

This report describes applications of the method of characteristics to supersonic flow about axially symmetrical, open-nosed bodies, such as diffusers. A general procedure is given for the computation of velocity distributions on the external surface of axially symmetrical diffusers of arbitrary shape. The case of straight-line diffusers is developed in more detail, including the case with incidence. A special function is introduced which allows a quick analytical solution of the problem of straight-line diffusers. (Contractor's abstract)

HIGH-SPEED DOCUMENT PERUSAL, by M. Kochen, C. T. Abraham and others. Final technical rept. Apr. 1, 1961-Apr. 1, 1962. May 1, 1962 [92]p. incl. diagrs. table, refs. (AFOSR-2817) (AF 49(638)1062)
AD 285255 Unclassified

Five results concerning the possibility of high-speed document perusal are given. These are: (1) derivation of a formula for the average time to search an index; (2) algorithms for translating English-like sentences into logic-like sentences; (3) development of efficient techniques for grouping similar texts; (4) implementation of a high-speed automatic dictionary lookup procedure; and (5) construction of computer programs for constructing representative abstracts and index terms. These constitute some first steps toward experimentally demonstrating the feasibility of a cooperative man-machine system for high-quality, high-speed perusal of large document collections; also, toward solving some of the basic logico-linguistic problems in the way of more completely automatic, high-quality perusal. AN ENGLISH-LIKE EXTENSION OF AN APPLIED PREDICATE CALCULUS, by H. Bohnert. Feb. 1962 [14]p. (Bound with its AFOSR-2817; AD 285255) (AF 49(638)1062) Unclassified

While full translation of natural language into symbolic logic may be unattainable, translation of an artificial language resembling English should be possible. As a first step toward developing such an artificial, English-like language, the present paper develops an extension of an applied logic, LII, in which phrases like "every ship", "any port", "a business-man", "some weapon", "no missle" (which Quine has called indefinite singular terms) act syntactically like names but are not candidates for logical substitution. An algorithm is given for translating sentences of LII into LI, thereby making explicit the variables and the logical quantifications implicit in the original English (-like) locutions.

BISTABLE SYSTEMS OF DIFFERENTIAL EQUATIONS WITH APPLICATIONS TO TUNNEL DIODE CIRCUITS, by J. K. Moser. [1961] [15]p. incl. diagrs. (AFOSR-3705) [AF 49(638)1139] Unclassified

Also published in IBM Jour. Research and Develop., v. 5: 226-240, July 1961.

A mathematical analysis is developed for nonlinear circuits which have at least 2 stable steady states, and therefore are of interest as computing or memory elements. Circuits containing 1 or 2 tunnel diodes are analyzed in detail as applications of the theory. The method is based on the study of a certain potential function whose extrema are the steady states of the circuit and whose minima correspond to the stable switching states. This study leads to a qualitative description of all solutions in the large and results in quantitative restrictions on the parameters (R, L, C and nonlinear characteristics) which seem of practical importance. AUTOXIDATION AND CONDENSATION REACTIONS OF CARBANIONS IN DIMETHYL SULFOXIDE SOLUTION, by G. A. Russell, E. G. Janzen and others. [1962] [2]p. incl. tables. (AFOSR-J1154) (Supported jointly by Air Force Office of Scientific Research under AF 49(638)678 and Petroleum Research Fund) AD 423129 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 2652-2653, July 5, 1962.

A study was made of the condensation and addition reactions involving dimethyl sulfoxide (DMSO). The results indicated that the reaction of an active methylene compound with an aldehyde in t-BuOK-DMSO solution proceeded via the aldehyde-dimethyl sulfoxide adduct if the acidic methylene compound was a very weak acid, but when a more acidic methylene compound was used, direct condensation between the aldehyde and the active methylene compound occurred. Attempts to bring about similar condensations using diaryl ketones in place of benzaldehydes gave only the ketone or the dimethyl sulfoxide adduct of the ketone, regardless of the nature of the methylene group.

ELECTRIC FIELD EFFECT ON SOUND DISPERSION, by J. R. Olson, R. R. Boade and S. Legvold. [1962] [1]p. (AFOSR-1975) [AF AFOSR-61-87] Unclassified

Also published in Jour. Chem. Phys., v. 36: 2233, Apr. 15, 1962.

A study was made of the effect of an electric field on the vibrational relaxation times of some heavy gases at 300°K. An electric field of up to 9 kv/cm was applied in the hope of producing partial alignment of the polar molecules. In all of the gases examined, no detectable change in node position occurred. It was concluded that an electric field of this strength had no appreciable effect, but did not preclude the possibility that a stronger field might affect the relaxation time.

HEAT CAPACITY LAG IN HEAVY GASES, by S. Legvold and J. R. Olson. Final rept. June 1962, 2p. (AFOSR-2766) (AF AFOSR-61-87) AD289435 Unclassified

The aim of this investigation was to determine which of the following equations relating the relaxation times should be used to describe mixtures of non-dispersive gases with dispersive gases. The equations are:

$$\frac{1}{\theta} = \frac{1-x}{\theta_{AA}} + \frac{x}{\theta_{AB}} \quad (1) \quad \text{and} \quad \frac{1}{\theta} = \frac{(1-x)^2}{\theta_{AA}} + \frac{x(x-1)}{\theta_{AB}} \quad (2).$$

Argon, neon, and helium were the non-dispersive gases

used in this study while ethylene, carbon tetrafluoride, fluoroform, and dichlorodifluoro-methane were the dispersive gases. Various per cent mixtures were examined at room temperature. From results tabulated, it appears as if equation (1) is the better equation although some of the mixtures fit either equation equally as well.

1322

Iowa State U. [of Science and Tech.] Dept. of Physics, Ames.

SOUND DISPERSION IN ETHANE-ETHYLENE MIXTURES AND IN HALO-ETHANE GASES, by L. M. Valley and S. Legvold. [1962] [5]p. incl. diagrs. tables, refs. [AF AFOSR-61-87] Unclassified

Published in Jour. Chem. Phys., v. 36: 481-485, Jan. 15, 1962.

Sound dispersion is examined in ethane-ethylene mixtures, in 3 halo-ethane gases, and in a C_2H_6-CH_3CHF_2 mixture at room temperature. Double dispersion is observed whenever ethane is present and single dispersion for all other gases. The relaxation times and collision lifetimes are reported along with some discussion on the effectiveness of ethane-ethane versus ethane-ethylene collisions. For the halo-ethane gases, the exchange mode used should be the lowest mode of regular vibration, not the mode of hindered rotation. The free flow of energy that occurs between modes of vibration in the same molecule does not occur between the modes of vibration of 2 different molecules (C_2H_6- CH_3CHF_2) while in collision. (Contractor's abstract)

FACET DESIGN AND ANALYSIS OF DATA ON PERSONALITY AND ATTITUDES RELATED TO HUMAN ORGANIZATION, by U. G. Foa and L. Guttman. Final rept. Mar. 1962, 16p. incl. table, refs. (AFOSR-3763) (AF 61(052)121) AD 288054 Unclassified

The structure of interpersonal behavior and the dynamics of social interaction were studied. Results achieved were: (1) The application of facet design and analysis led to theoretical developments which were strongly confirmed by empirical results; (2) The concept of semantic principal component developed has strengthened the potential value of facet theory; (3) The new structure of interpersonal behavior, which was found, has classified, systematized and integrated a good deal of previous work in this area; (4) Some concepts for a better understanding of the way people deal with each other were provided; and (5) The model of social interaction developed and tested has narrowed the gap between laboratory models and real life situations.

THE STRUCTURE OF INTERPERSONAL BEHAVIOR IN THE DYAD, by U. G. Foa. [1962] 14p. incl. tables. (AFOSR-J256) (AF 61(052)121) AD 407860 Unclassified

Also published in Mathematical Methods in Small Group Processes; A Symposium, Stanford U., Calif. (June 20-23, 1961), ed. by J. H. Criswell, H. Solomon and P. Suppes. Stanford U. Press, 1962, p. 166-179.

Recent findings in support of the structural theory are presented. The contiguity principle is modified by introducing the new concept of semantic principal component and applied to behavior in the dyadic relation. In substance, the problem is to devise concepts for classifying behavior in such a way that the definition of the categories and the use of a metatheoretical principle will predict their statistical interrelation. The main findings concluded by this study are: (1) A new concept for ordering variables, the semantic principal component, has been introduced and its usefulness proved; (2) A close fitting of the theoretical and empirical structure of interpersonal behavior has been achieved; and (3) The circle of interpersonal behavior provides a starting point for extending the map of the interpersonal relations to include other variables such as general and sexual satisfactions.

ON THE RELATION BETWEEN FROZEN POLARIZATION AND ELECTROLUMINESCENCE OF ZnS CELLS, by G. Bonfiglioli, P. Brovetto, and R. Malvano. Summary rept. Part B, Jan. 1962 [20]p. incl. diagrs. (AFOSR-2321, pt. B) (AF 61(052)328) AD 274008 Unclassified

The kinetics of the decay of the frozen polarization shown by an electroluminescent cell (ELC) after excitation with a suitable waveform of electrical potential has been studied as a function of temperature between 7° and 42.5°C. The order of the kinetics was evaluated as well as the thermal activation energy, which turned out to be around 2.5 ev. This figure corresponds closely to the ionization energy of Cu^+ impurities in ZnS(Cu) phosphor. The kinetics of the decay of the amount of light which an ELC gives out under excitation by a single linear voltage transient retarded on variable amounts with respect to a previous excitation were investigated. The latter consisted of a train of linear transients long enough to saturate the cell. The phenomenon has been followed from -44.5° to +47.5°C, and again an activation energy has been found of roughly 1.5 ev. The connection between these 2 experiments and its possible implications are briefly discussed to cast some light on the mechanism of barrier injection of carriers in EL phosphors. (Contractor's abstract)

CALCULATIONS ABOUT BARRIER-INJECTION ELECTROLUMINESCENCE, by G. Bonfiglioli, P. Brovetto, and A. Suardo. July 1962, 22p. incl. diagrs. (Technicl note no. 7) (AFOSR-3442) AF 61(052)328) AD 284386 Unclassified

A calculation is given of the current flowing across a condenser- type electroluminescent cell excited with a constant- slope voltage transient. This is the waveform used in preliminary experiments. The theory followed in this calculation is that advanced by Zalm, whereby tunnel effect at a surface barrier of finite cross extension is invoked. On these grounds, equations are developed which give the shape of the light pulse produced by the EL cell undergoing a linear transient of electrical potential. (Contractor's abstract)

ELECTROLUMINESCENCE OF ZnS EXCITED WITH LINEAR VOLTAGE TRANSIENTS, by G. Bonfiglioli, P. Brovetto, and C. Cortese. [1962] [7]p. incl. diagrs. (AFOSR-3767) (AF 61(052)328) AD 611506 Unclassified

Also published in Luminescence of Organic and Inorganic Materials; Internat'l. Conf., New York U., N. Y. [1961] ed. by H. P. Kallmann and G. M. Spruch. New York, Wiley & Sons, 1962, p. 605-611.

Commercial cells of ZnS: Cu, Cl, mostly cubic phase, were excited with single transients of voltage, both rising and falling, where dv/dt was constant. The max voltages were 120-220, and the constant dv/dt values were 10 to 10^3 v/msec. The cell was viewed by a 14-dynode photomultiplier through a 150-A -wide interference filter, honeycomb collimator, and either a green-5200 or blue 4700-A filter. The light pulses lasted ~1 msec. The green light emitted was constantly ~5 times the blue in intensity, and the light max for rising voltage were about double those for falling voltage. When the time between voltage pulses is less than 1 sec, the light output is bigger by a factor of several hundred over that obtained at each pulse at intervals of 10 - 15 min. Sufficient recovery was shown at 7-min intervals between single-pulse experiments. The potential barrier at the sulfide grain surface seems modified during the passage of the current.

EYE DOMINANCE IN AN EMPTY FIELD, by G. F. Mori. [1962] [7]p. incl. tables. (AFOSR-2880) (AF 61(052)80) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 55-61, Jan.-Feb. 1962.

Eye dominance is tested by the aid of a series of tests such as the bionocular test, the Jasper's test, the persistency of after images, etc. In addition, the proposal is advanced of testing the differences between the 2 eyes on the basis of the differences between the fluctuations in perception occurring under

prolonged fixation of a test field, with the right eye and with the left eye, respectively. In addition, when faced with an empty field, the subjects perceive the above said fluctuation for a limited number of minutes only, after the beginning of exposure; then, a final situation occurs which, in general, is found to be different for one eye with respect to the other. The discrepancies between the responses obtained by the aid of the various tests are discussed. (Contractor's abstract)

BINOCULAR INTERACTION EFFECT II: INVESTIGATION ON THE TIME BEHAVIOR OF MONOCULAR SENSITIVITY DURING CONTRALATERAL STIMULATION, by A. Fiorentini and M. Bittini. [1962] [16]p. incl. diagrs. tables, refs. (AFOSR-4172) (AF 61(052)80) AD 632026 Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 286-301, May-June 1962.

Illumination of 1 eye has 2 effects on sensitivity in a disparate area of the visual field of the other eye, namely depresses apparent brightness and impairs sensitivity to time increments of luminance. The time courses of both monocular brightness sensitivity and increment sensitivity were investigated in an interval of time including the onset of illumination of the disparate area of the other eye. A comparison is made with the time course of monocular sensitivity during an interval of time including stimulation of a different area of the same eye. In the case of contralateral stimulation, the apparent brightness of a steadily illuminated monocular field is found to decrease by a smaller amount and with a longer delay than in the case of unilateral stimulation. The comparison between the time course of increment monocular sensitivity during contralateral stimulation and the time course of monocular sensitivity during unilateral stimulation shows that, even in the latter case, the changes in differential sensitivity induced by presentation of a conditioning field are partly attributable to nonperipheral inhibitory mechanisms.

TRAINING AND RETINAL LOCATION AFFECTING THE PERIODIC FLUCTUATION OF APPARENT BRIGHTNESS DURING PROLONGED FIXATION, by M. Conticelli. [1962] [9]p. incl. diagrs. table. (AFOSR-4195) (AF EOAR-61-34) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 396-404, July-Aug. 1962.

A 10° in diameter uniform field, surrounded by dark, is steadily gazed in monocular vision, and a cyclical variation of apparent brightness is reported. As indexes of such an effect, both the frequency of the fluctuation and the LDR ratio (that is, the ratio of the time through which the field is seen as bright to the time through which it is seen as dark), are assumed. During the training period of an unexperienced subject, the frequency of the fluctuation is found to increase (starting from zero value on), while the LDR tends to decrease. No significant differences are tested between the LDR for the right eye and that for the left eye, if the fixation point lies at the center of the 10° field. But, if the fixation is brought at one extreme of the horizontal diameter, different LDR are recorded, within one of the eyes, according to the half retina (either right or left) stimulated. When the 10° field is fixated, in binocular vision, the apparent brightness is seen to fluctuate, but the total black-out is never reported. A small contrast difference is perceived only for a fraction of the time of presentation. The amount of the decrease in brightness, during the course of fluctuation, might be evaluated once assumed that a decrease in apparent brightness involves a decrease in liminal contrast (by analogy with Fechner's law concerning the variation of contrast threshold as a function of adapting luminances).

ADAPTATIONAL EFFECTS AT PHOTOPIC AND

MESOPIC LUMINANCES AS A FUNCTION OF CONTRAST, by L. Ronchi and A. M. Ercoles. [1962] [12]p. incl. diagrs. refs. (AFOSR-4196) (AF EOAR-61-34) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 185-196, Mar. Apr. 1962.

The eye is first presented with a bipartite field, consisting of 2 adjacent fields of different luminances, the relative contrast being c; after a given adaptation time T, the eye is presented with a field of uniform luminance upon which, if steady fixation is maintained, a difference of brightness is seen to persist for a given time t. For given values of both T and c, the behavior of t as a function of log luminance has been recorded; t is found to vary from a few seconds to, say, 150 sec. For low values of c, the difference of brightness appears appears after a latency time of a few seconds. Last, the transition between the 2 zones of different brightness appears as delimitated by a dark band. In addition to such a slow effect, a rapid bright band is seen to appear for a brief time after the onset of the gradient of brightness. The likelihood of perceiving such a band, as determined by collecting the responses recorded in a number of successive presentations, is found to be good at photopic levels, if contrast exceeds, say, 0.50; for lower contrast the perception of the band is counteracted by the above reported slow effect. From a theoretical stand point, the attempt is made to correlate both the bright and the dark bands due to a difference of brightness with the bright and the dark Mach bands due to a difference of luminance; in other words, a tentative explanation of Mach phenomenon in terms of adaptational effects is suggested.

ON THE SHARPNESS OF DEFOCUSSED CONTOURS, by L. Ronchi and I. Adachi. [1962] [7]p. incl. diagrs. table. (AFOSR-4197) (AF EOAR-61-34) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 405-411, July-Aug. 1962.

A step of luminance is brought out of focus and the threshold of disappearance of the Mach bands, delimitating the graded zone between the 2 plateaus, is determined. This depth of focus (pupil diam 2.5 mm) is found to be of the order of 3.5 dt, and, in addition, it is found to increase when contrast is increased. By adopting a quite different criterion, but with about the same pupil (3 mm) Campbell finds that his depth of focus (of about 0.4 dt) decreases when contrast is increased. This contradiction, however, is only partial, in that, in both the experiments, the slope of the spatial gradient of luminance, at the retina, needed for reporting a sharp vision, is the lower the lesser the contrast difference is. The results are discussed in terms of local adaptation mechanisms.

SUBJECTIVE SHARPNESS AND CONTRAST THRESHOLD, by M. Bittini. [1962] [9]p. incl. diagrs. refs. (AFOSR-4199) (AF EOAR-61-34) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 387-395, July-Aug. 1962.

The threshold of visibility and of subjective sharpness of objectively sharp contoured targets have been determined at various luminance levels. Subjective sharpness threshold relative to corresponding contrast threshold is constant at photopic levels, while, in the range of scotopic luminances, it increases with decreasing luminance.

ON THE VARIABILITY OF THE RATES OF RISE AND DECAY OF THE SCOTOPIC B-WAVE, by A. M. Ercoles and E. Masci. [1962] [4]p. incl. illus. diagrs. (AFOSR-4204) (AF EOAR-61-34) Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 362-365, July-Aug. 1962.

Typical electroretinographic responses were examined under the following experimental conditions: Maxwellian view, focal area 3°, exposition time = 40 msec. It is shown that the standard deviation of the scotopic b-wave is of the same order of magnitude for both the mean rate of rise and of decay, respectively. It is concluded that when a long time constant (0.8 sec) is used, the ERG response as a whole may give indications about the component of adaptation to light of the scoptopic retina.

MEMORY FOR BRIGHTNESS: STIMULI OF SMALL SIZE, SURROUNDED BY DARK, by M. Conticelli.

[1962] [10]p. [Series no. 4; rept. no. 386] (AFOSR-J203) [AF EOAR-61-34] AD 400064 Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 497-506, Sept.-Oct. 1962.

Two stimuli, of different luminances (both mesopic), in a dark room were delivered to the central retina either contemporaneously or in succession. Subjects are instructed to express their judgement about the relative difference of brightnesses. In the first part of the experiment, the luminance of the former stimulus differed with respect to that of the latter by 0.1 log units; in the second part, 0.2 log units. In the latter case, the number of wrong responses was found to increase rapidly when passing from the simultaneous match to the memory match, corresponding to a time interval of 8 sec. If such an interval is increased from 8 sec to 60 sec, a slow increase in the number of wrong responses is found. Once accepted that an adaptational process affecting the trace left by the former stimulus is at work, the time constant of such a process can be evaluated.

VISUAL EFFECTS PRODUCED BY A STIMULUS CONSISTING OF A NUMBER OF BLACK LINE SEGMENTS VIEWED ON A BRIGHT BACKGROUND, by L. Ronchi and G. Bottai. [1962] [16]p. [Series no. 2; rept. no. 997] (AFOSR-J204) [AF EOAR-61-34] AD 400446 Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 507-522, Sept.-Oct. 1962.

The brightness enchancements and depressions occurring when filling in a blank bright sheet with a variable number of black straight line segments, all parallel and lying in a fronto-parallel plane, are reported; the measurement of the observed effects is performed by a method based on the determination of the threshold of flicker relative to a small exploring spot. In addition, by bending a thin straight line segment to a greater or lesser extent, various configuratica are created and a method for classifying the various letters of the alphabet is suggested. The results are discussed in terms of the current theories of retinal interactions.

A COMPARISON BETWEEN FOVEAL AND PERIPHERAL FLICKER SENSITIVITY FOR COLORED LIGHTS, AT PHOTOPIC LEVELS, by M. Bittini. [1962] [5]p. incl. diagrs. (AFOSR-J233) (AF EOAR-61-34) AD 400850 Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 623-627, Nov.-Dec. 1962.

Classical findings are confirmed as far as red, green and white lights are concerned, in that sensitivity to flicker is once more tested to be greater for the fovea than for the periphery at high luminance levels. A peculiar effect is tested in the case of blue light, in that the maximum sensitivity is tested at 15° to 20° of eccentricity at both lower frequencies (up to 15 to 18 cps) and higher frequencies (greater than 30 cps). In the intermediate range, foveal sensitivity to flicker is found to be greater than peripheral sensitivity. Results are discussed. As a practical implication, the narrowing of the visual field at high speeds of driving is taken into account. (Contractor's abstract)

QUANTITATIVE ASPECTS OF THE BLUR-TO-SHARP TRANSITION, by L. Ronchi. [1962] [25]p. incl. diagrs. table, refs. (AFOSR-J234) (AF EOAR-61-34) AD 400868 Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 646-670, Nov.-Dec. 1962.

The effects produced by a graded distribution of luminance delimitated by 2 uniform fields of different luminances are discussed, on the basis of experimental data produced by a number of authors. The main finding is that the slope of the graded zone, at the threshold of visibility of the bright Mach band, increases when the difference between the luminances of the 2 uniform fields is increased. Thus, one cannot speak of limiting slope in an absolute sense. It is considered that the early distinction between border and surface contrast is abolished and it is assumed that sensation of sharpness, Mach phenomenon and simultaneous contrast effect might by subserved by the same mechanism. An attempt is made to explaining the reported results in terms of rapid local adaptation. Such an effect seems to play the major role when the width of the penumbra is lesser than, say, 24'. For larger penumbrae (up to about 5°), the Mach phenomenon ceases to appear sharp or vivid. The perception of sharpness in the case of a thin stripe is discussed, and some problems connected with the visual resolving power, as determined by the aid of a grating, are emphasized. (Contractor's abstract)

RED AND BLUE ELECTRORETINOGRAMS AT VARIOUS LUMINANCES, by A. M. Ercoles. [1962] [10]p. incl. diagrs. table. (AFOSR-J235) (AF EOAR-61-34) AD 400867 Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 628-637, Nov.-Dec. 1962.

Electroretinographic intensity functions are recorded from a dark-adapted eye stimulated by 2 beams: one red, the other blue with variable relative angular extents. The comparison of these curves with those obtained by a red stimulus or by a blue stimulus, shows that the simultaneous presentation of 2 stimuli far apart in the spectrum produces a complex electroretinographic response and evokes a series of inhibition and facilitation effects.

VISIBILITY OF A STEADILY FIXATED OR STABILIZED TEST OBJECT AS A FUNCTION OF EXCENTRICITY, by A. M. Ercoles and A. Fiorentini. [1962] [8]p. incl. diagrs. table. (AFOSR-J236) (AF EOAR-61-34) AD 400870 Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 638-645, Nov.-Dec. 1962.

A narrow black line on a bright background intermittently disappears when the subject tries to keep his eye steady by voluntary fixation or when the effects of both voluntary and involuntary eye movements are prevented (stabilized retinal images). The time of visibility of the line as a fraction of the total observation time was measured for various retinal eccentricities of the line, from 6 to 150 min arc. The total time of visibility is found to decrease with increasing eccentricity both with voluntary fixation and with stabilized image. This result can be probably ascribed to 2 facts. First, in the total constraint of movement, the visibility of a detail decays more rapidly in the parafovea than in the fovea. Second, the change in retinal stimulation produced by a movement of a given amplitude is more effective in maintaining the visibility of the detail when this is imaged in the fovea than in the parafovea.

CERENKOV RADIATION IN A LAYERED MEDIUM, (Abstract), by L. Ronchi and G. T. di Francia. [1962] [1]p. [AF EOAR-61-34] Unclassified

Presented at annual meeting of the Opt. Soc. Amer., Rochester, N. Y. [1962].

Published in Jour. Opt. Soc. Amer., v. 52: 1315, Nov. 1962.

The medium considered consists of a set of equispaced metal films, imbedded in a dielectric whose refractive index is such that the velocity of the charged particle is above threshold for Čerenkov radiation. The first and last films are in contact with vacuum. The radiated field results from a complicated combination of transition radiation and Čerenkov radiation. Due to the finite size of the system in the direction of the particle velocity, diffraction also must be taken into account. However, it is possible to give the solution in a finite form for any number of films. Some computations have been performed in order to plot the gain over pure Čerenkov radiation for a number of values of the several parameters.

SINGLE-CRYSTAL ELASTIC CONSTANTS OF POTASSIUM (Abstract), by W. Marquardt, J. Trivisonno, and T. Klucher. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-224] and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 548, Nov. 23, 1962.

The single-crystal elastic constants of potassium have been measured as a function of temperature by the ultrasonic pulse-echo technique. The crystals were grown in air by a modified Bridgman technique. A discussion of the growth process and the preparation of the acoustic specimens is presented. The values of the measured stiffness constants at 195°K are $(C_{11} + C_{12} + 2C_{44})/2 = 0.527$, $C_{44} = 0.207$, and $(C_{11}-C_{12})/2 = 0.032$ in units of 10^{11} dyn/cm^2. The bulk modulus computed from the measured stiffness has the value of 0.31×10 dyn/cm^2.

FAR INFRARED SPECTRA OF FREE RADICALS AND REACTIVE MOLECULES AT 4°K, by D. W. Robinson. Final rept. Sept. 15, 1962 [9]p. incl. table, refs. (AFOSR-3613) (AF 49(638)468) Unclassified

The absorption spectra of several symmetric-top molecules, $(CH_3CN$, $H_3CC{\equiv}CH$, $(CH_3)_3N$, and F_3CH have been investigated. From this study, it was possible to estimate a previously undetermined centrifugal distortion constant, $D_J = 1.45 \pm 0.3 \times 10^{-7}$ cm for methyl cyanide. Crystals of benzene, chloroform, carbon dioxide, nitrogen dioxide, and iodoform were analyzed. Chloroform, iodoform, and nitrogen dioxide absorbed between 70 and 30 cm^{-1}, but no features sharp enough to measure were seen. Benzene and carbon dioxide crystals were transparent. Hydrogen chloride and hydrogen deuteride have also been studied, a band has been found at 87 cm^{-1} which does not shift appreciably when the hydrogen is replaced by deuterium. At long wavelength, acetaldehyde was found to give a spectrum like that expected of a symmetric top. Other molecules tested included F_5CSF_5, disiloxane, and $H_3C\text{-}C{\equiv}C\text{-}SiH_3$.

ON DICHOTOMIES FOR SOLUTIONS OF N-TH ORDER LINEAR DIFFERENTIAL EQUATIONS, by P. Hartman. [1962] [4]p. incl. refs. (AFOSR-3836) (AF 49(638)-970) Unclassified

Also published in Math. Ann., v. 147: 378-421, 1962.

Much of the general theory (Part I) is a transcription of some of the results of Massera and Schäffer from a first order differential operator to a more general operator. The results of Parts II (higher order differential equations) and III (second order differential equations) are deduced from Part I. An appendix deals with a real scalar, second order linear equation. It is shown that the methods used in Part III give oscillation and non-oscillation theorems and a new criterion for Weyl's limit-point case.

ON UNBOUNDED TOEPLITZ MATRICES, by P. Hartman. [1962] [20]p. incl. refs. (AFOSR-J1525) (AF AFOSR-62-45) AD 427525 Unclassified

Also published in Amer. Jour. Math., v. 85: 59-78, Jan. 1963.

Let $g(\varphi)$ be a real-valued function in L^2 $(0, 2\pi)$ with Fourier series $\Sigma_{-\infty}^{\infty} g_n e^{in\varphi}$, and let $T(g) = (g_{n-m})$, $n, m = 0, 1, \ldots$, be the associated, formally Hermitian Toeplitz matrix. $T(g)$ is regarded as a transformation in L^{2+}, the space of functions in L^2 whose negative Fourier coefficients vanish. Finding necessary and sufficient conditions on g that $T(g)$ be self-adjoint is equivalent to the solution of a closure problem. If f is in L^2 let $M(f)$ be the closed span of $f e^{in\varphi}$, $n = 0, 1, \ldots$, and let $N(f)$ be the closure of the projection of $M(f)$ onto L^{2+}. Then $T(g)$ is self-adjoint if and only if $N(g \pm i) = L^{2+}$. Sufficient conditions on f for $N(f) = L^{2+}$ lead to conditions on g that $T(g)$ be self-adjoint. For example, $T(g)$ is self-adjoint if there is a determination $\theta(\varphi) = \arctan 1/g(\varphi)$ having a conjugate function $\psi(\varphi)$ such that $\exp(|\psi(\varphi)| - (1 + |g(\varphi)|))$ is in L^1. ON THE LOCAL LINEARIZATION OF DIFFERENTIAL EQUATIONS, by P. Hartman. [1962] [8]p. (AFOSR-J1527) (AF AFOSR-62-45) AD 426515 Unclassified

Also published in Proc. Amer. Soc., v. 14: 568-573, Aug. 1963.

Consider the autonomous system of real differential equations (1) $x' = Ex + F(x)$, where x is an n-vector, E a constant matrix and the perturbation $F(x) = 0(|x|)$ as $x \to 0$. The following result is proved in the paper. If $F(x)$ in (1) is of class C^1 for small $|x|$ (or uniformly Lipschitz continuous with a Lipschitz constant for $|x| \leq \epsilon$ which tends to zero as $\epsilon \to 0$) and each eigenvalue of E has real part different from zero, then there exists a topological map $R; u = u(x)$ of a neighborhood of $x = 0$ onto a neighborhood of $u = 0$ such that solutions of (1) are mapped onto solutions of the linear system $u' = Eu$. The analogue of this result was proved previously by the author under the assumption that F is of class C^2. (Math. Rev. abstract)

A SWIRLING ROUND TURBULENT JET. I. MEAN-FLOW MEASUREMENTS, by W. G. Rose. [1962] [11]p. incl. illus. diagrs. refs. (AFOSR-1516) (AF 49(638)-248) AD 406817 Unclassified

Presented at Winter annual meeting of the Amer. Soc. Mech. Engineers, New York, Nov. 25-30, 1962.

Also published in Jour. Appl. Mech., v. 29: 615-625, Dec. 1962.

A swirling jet of air is generated for this work by flow issuing from a rotating pipe into a reservoir of motionless air. At the pipe discharge, the flow is roughly a fully developed, turbulent pipe flow in solid-body rotation. Owing to the very rapid decay of the swirl, measurements are confined to a region extending from the pipe discharge out to a distance of 15 pipe diameters. Mean-velocity magnitudes and mean directions are the primary results; in addition, one turbulence intensity component is included. All velocities and intensities were measured with a constant-temperature hot-wire anemometer having a linearized response, and all mean values were determined by electronic integration. Contrasted with the nonswirling jet, the jet with swirl spreads at a larger angle, entrains reservoir fluid more rapidly, and consequently displays a more rapid reduction of mean-velocity and growth of turbulence intensity. In its gross features, at large distances from the orifice, the measured swirling jet agrees with the predictions of "weak-swirl" analyses. (Contractor's abstract)

GENERATION OF A "STRONGLY" SWIRLING JET AND PRELIMINARY EXPERIMENTS ON THE EFFECT ON ITS DEVELOPMENT OF INITIAL SWIRL DISTRIBUTION, by W. G. Rose. June 1962 [27]p. incl. illus. diagrs. table. (AFOSR-2552) (AF 49(638)248) AD 292300 Unclassified

A description is given of a device designed to generate a strongly swirling turbulent jet with an initial swirl distribution which is roughly a vortex with a core in solid body rotation. Experimental results are reported of measurements taken at the discharge of the unit (the jet origin) and along the axis of the jet issuing from it. All measurements were taken on the jet axis and include mean-velocities, axial turbulence intensity components, and mean static-pressure distributions. Based on the results, the device, or swirl generator, performs successfully. Although no radial distributions were measured, the classification strong swirl is justified in part by the magnitude of static-pressure differences generated between ambient conditions and those on the jet axis at its origin, and in part by the low values of Rossby number that are established. The experiments on the effect of initial swirl distribution demonstrate the need for a more extensive and systematic investigation to separate swirl effects from Reynolds number effects. It should be possible to establish the range of Reynolds numbers and swirl strengths required with the swirl generator as it is presently constructed. (Contractor's abstract)

CORRECTIONS TO AVERAGE MEASUREMENTS IN UNSTEADY FLOW, by W. G. Rose. [1962] [5]p. incl. diagrs. [AF 49(638)248] Unclassified

Published in Symposium on Measurement in Unsteady Flow, Worchester, Mass. (May 21-23, 1962) New York, Amer. Soc. of Mech. Engineers, 1962, p. 85-89.

Results of 2 derivations are presented: (1) the linearized response of a constant-temperature hot-wire anemometer, and (2) the relationship between mean-flow direction and mean direction of flow. The response equation includes the effects of variations in fluid temperature and flow direction. Corrected equations for outputs in terms of mean velocity, turbulence intensity, and shear stress are also presented. The relationship obtained for the 2 directions gives their difference proportional to a velocity correlation, and is correct to within the second order in the velocity fluctuations. EXPERIMENTAL STUDY OF DYNAMIC PLASTICITY AT ELEVATED TEMPERATURES, by J. F. Bell. [1961] [7]p. incl. illus. diagrs. refs. [AF 49(638)423] Unclassified

Presented at Spring meeting of the Soc. for Experimental Stress Analysis, Philadelphia, Pa., May 10-12, 1961.

Published in Exper. Mech., v. 2: 181-186, June 1962.

It is shown that the diffraction-grating technique and the optical-displacement used for the study of plastic wave propagation at room temperature, may both be extended to within 100° F of the melting point of aluminum. In addition to the measurement of stress history at the impact face obtained by the extension of the load-bar technique to elevated temperatures, strain-time, surface angle-time, time of contact, coefficient of restitution, and displacement-time behavior at the free end of the struck specimen may all be determined at elevated temperatures. Typical strain-time behavior is shown at 800°, 1000°, and 1100° F, for 2 types of impact situations. (Contractor's abstract)

APPLICABILITY OF THE TAYLOR THEORY OF THE POLYCRYSTALLINE AGGREGATE TO FINITE AMPLITUDE WAVE PROPAGATION IN ANNEALED COPPER, by J. F. Bell and W. M. Werner. [1962] [10]p. incl. diagrs. table, refs. [AF 49(638)423] Unclassified

Published in Jour. Appl. Phys., v. 33: 2416-2425, Aug. 1962.

This paper provides additional experimental evidence for the Taylor theory of dislocations and the Taylor theory of the polycrystalline aggregate. For annealed copper the governing stress-strain curve for plastic wave propagation is a parabola, as predicted by the Taylor theory of dislocations. Using the Taylor theory of the polycrystalline aggregate, the parabolic stress-strain law for annealed copper is determinable from compression stress-strain curves for single crystals. These experimental data in annealed copper are obtained from the free-flight constant-velocity impact of identical specimens using the diffraction-grating technique for the measurement of strain and surface angle. From the results given in this paper, together with those obtained earlier by Bell for annealed aluminum and the recent results of Sperrazza for pure lead, it may be concluded that strain rate does not play a significant role in the dynamic plasticity of these annealed face-centered-cubic metals. As in annealed aluminum and pure lead, plastic strain propagation velocities, maximum strain amplitude, surface angle behavior, time of contact, and the coefficient of restitution for annealed polycrystalline copper are found to be given by the strain-rate independent theory of plastic wave propagation. CONCEPT OF FIELD MODES AND THE BEHAVIOR OF THE MAGNETOHYDRODYNAMIC FIELD, by F. H. Clauser. [1962] [23]p. incl. diagrs. tables, refs. (AFOSR-J764) (AF 49(638)496) AD 414028; AD 409962 Unclassified

Also published in Phys. Fluids, v. 6: 231-253, Feb. 1963.

A method for studying the behavior of fields by splitting their behavior into independent field modes is presented. The method is used to explore the characteristics of steady, 2-dimensional, linearized magnetohydrodynamic fields with finite viscosity and resistivity and arbitrary orientation of the magnetic vector relative to the velocity vector. It is shown that in general boundary layers and wakes cease to exist in magnetohydrodynamics. Their place is taken by diffusing waves which, in reality, are the fields of a set of viscous-resistive sources, vortices, poles and currents whose field lines are strongly oriented along the characteristic wave directions. When the viscosity and resistivity are equal, these waves diffuse in a simple and independent way, but when these quantities are not equal, the diffusing waves generate a new kind of wake which is located, veil-like, in the fan-shaped region between the 2 wave directions. These wakes are fed from the differential diffusion of the primary waves. In the special case for which the resistivity is much greater than the viscosity, a new type of pseudo boundary layer is shown to exist in the velocity field. When the viscosity is much greater than the resistivity, this pseudo boundary layer occurs in the magnetic field. (Contractor's abstract)

LIQUID FLOW IN TUBES. VIII. INFLUENCE OF ROUGHNESS UPON THE TRANSITION PROCESS, by E. R. Lindgren. [1962] [15]p. incl. diagrs. refs. (AFOSR-J766) (AF 49(638)496) AD 413373 Unclassified

Also published in Arkiv Fysik, v. 24: 269-283, 1963.

Recently, report was made on experiments indicating

that uniform, close packed wall roughness elements of the sand type do not seem to influence the mechanism of breakdown ("spike" formation) in steady pipe flow. The present study on the other hand indicates a strong influence by the same wall roughness upon the transition process that follows, once breakdown has taken place. The relative propagation velocity of the rear of the turbulent slugs or streaks, appears to decrease monotonically with increasing roughness, even when the roughness grains are an order of magnitude smaller than the estimated thickness of the viscous sublayer in the turbulent slugs or streaks. The relative front velocity, of the same slugs or streaks also appears to be sensitive to variations of wall roughness within the same flow regions, though in a non-monotonic manner. This is in agreement with a previous report on change due to variations of microscopic wall roughness in cylindrical pipes. (Contractor's abstract)

LIQUID FLOW IN TUBES. VII. MOMENTUM PERTURBATION AND BREAKDOWN OF STEADY FLOW IN RELATION TO WALL ROUGHNESS, by E. R. Lindgren. [1962] [7]p. incl. diagr. (AFOSR-64-0859) (AF 49(638)496) AD 438597 Unclassified

Also published in Arkiv Fysik, v. 23: 403-409, 1963.

Experiments show that breakdown of laminar pipe flow is not uniquely correlated to the amount of disturbance momentum imposed on the flow within the refinement of the present experimental technique, nor does the breakdown in any way seem to be dependent on the surface properties of the tube walls in the case of closely packed, evenly distributed roughness elements even when they are rather large. The breakdown of the flow is related apparently to some kind of disturbance magnitude, though its appropriate measure is not clear. The breakdown is found to occur as a violent spike formation far away from the walls, in agreement with findings on boundary layer breakdown. The spikes may or may not cause the development of turbulent slugs, which in turn may or may not be self-maintaining in the lower transition Reynolds number region. (Contractor's abstract)

DESLIP IN ALUMINUM SINGLE CRYSTAL SPECIMENS, by R. B. Pond and E. Harrison. Final rept. Jan. 1962 [40]p. incl. diagrs. tables. (AFOSR-2304) (AF 49-(638)509) AD 274107 Unclassified

By the technique of interferometric cinemicrography, deslip in Al single crystals was observed as a result of reversing the stress. An explanation of the phenomenon is presented. The technique is also used to evaluate the effects of temperature over the range -250° to +225°F, on the velocity of slip. Unslip of a band during continuing deformation was observed. The deslip phenomenon is not dependent on time, extent of strain, or orientation, but may be dependent on lattice bending. The velocity of slip between -150° and 225° is relatively unaffected by the mechanical property changes, but is primarily dependent on the frequency of co-active slip bands. Unslip is explained by lattice bending of the elastic type.

THE DYNAMIC OVERSTRESS AND THE HYDRODYNAMIC TRANSITION VELOCITY IN THE SYMMETRICAL FREE FLIGHT PLASTIC IMPACT OF ANNEALED ALUMINUM, by J. F. Bell and J. H. Suckling. [1962] [7]p. incl. diagrs. refs. (AFOSR-5299) (AF 49(638)-1067) Unclassified

Also published in Proc. Fourth U. S. Nat'l. Cong. Appl. Mech., California U., Berkeley (June 18-21, 1962), New York, Amer. Soc. Mech. Engineers, v. 2: 877-883, 1962.

The dynamic overstress and the initial peak stress are determined in dead annealed aluminum for a symmetrical, free flight impact without the introduction of hard elastic load bars, piezo crystals, etc. By determining the time of contact for specimens of varying length, the stress-time history at the impact face is found to be consistent with the theoretical and experimental correlations of J. F. Bell. The transition velocity between plastic and hydrodynamic regimes, suggested 49 years ago by B. Hopkinson and more recently by H. G. Hopkins and H. Kolsky, is experimentally identified. The initial peak stress and the dynamic overstress decrease in time to the maximum of the parabolic stress-strain law in a manner consistent with the strain rate independent interpretation.

SINGLE, TEMPERATURE-DEPENDENT STRESS-STRAIN LAW FOR THE DYNAMIC PLASTIC DEFORMATION OF ANNEALED FACE-CENTERED CUBIC METALS, by J. F. Bell. [1962] [8]p. incl. diagrs. refs. (AFOSR-64-1031) (AF 49(638)1067) AD 440985 Unclassified

Also published in Jour. Appl. Phys., v. 34: 134-141, Jan. 1963.

Large amplitude wave propagation in annealed aluminum is studied experimentally to within 70°C of the melting point of the metal. The strain-rate-independent, finite amplitude wave theory is found to apply at all temperatures. The governing stress-strain law in each instance is parabolic. The coefficient of the parabolic stress-strain law varies linearly with the absolute temperature. The annealed, face-centered cubic metals of aluminum, copper, lead, gold, and silver are all found to have the same parabolic stress-strain law at absolute zero. Thus, from experiments using the author's diffraction grating

technique, a single stress-strain law is found which is applicable at any temperature to any of these annealed metals whose melting point is specified. (Contractor's abstract)

COUPLED THERMOPLASTICITY, by O. W. Dillon, Jr. [1962] [13]p. incl. diagrs. (AFOSR-4480) (AF AFOSR-62-204) Unclassified

Also published in Jour. Mech. and Phys. Solids, v. 11: 21-33, Jan.-Feb. 1963.

Experimental stress, strain and temperature histories are reported for annealed aluminum tubes undergoing torsional oscillations. These data show that heat is generated when aluminum responds as a non-linear material. It is necessary, therefore to consider the coupling between the thermal and mechanical fields. A derivation of the coupled heat-conduction equation, with the rate of doing plastic work as a source term, is also presented. This equation is a generalization of the experimental results. It has an advantage over isothermal plasticity, in that conservation of energy is considered. (Contractor's abstract)

TEMPERATURE GENERATED IN ALUMINUM RODS UNDERGOING TORSIONAL OSCILLATIONS, by O. W. Dillon, Jr. [1962] [6]p. incl. illus. diagrs. (AFOSR-J54) [AF AFOSR-62-204] AD 400391 Unclassified

Also published in Jour. Appl. Phys., v. 33: 3100-3105, Oct. 1962.

Experimental data on the heat generated during torsional oscillations of annealed aluminum rods are presented. These results demonstrate the necessity of including coupling between the temperature field and the deviatoric components of strain when the material is deformed beyond the linear elastic region. The experiments are of sufficient duration that an approximate balance of the heat generation and the losses by conduction is finally reached. Temperatures in excess of 500°F are observed. It is also found that heat is generated during the loading parts of the cycle but that none is created when the material is unloading. (Contractor's abstract)

THE GOITROGENIC ACTIVITY OF PEROXIDASE, by J. P. Isaacs, J. C. Lamb and others. [1962] [1]p. (AFOSR-3443) (AF 49(638)580) AD 612455 Unclassified

Also published in Bull. Johns Hopkins Hosp., v. 110: 232, 1962.

Peroxidase was administered to rabbits in oral dosages of 1-2 mg/kg body weight per day. The peroxidase has been fed in form of cabbage, horseradish root, water extract of horse-radish root, and lyophilized horseradish peroxidase. Each of these has caused (a) follicular epithelial hyperplasia in the thyroid and (b) graded increases in thyroid weight with graded increases in dosage of peroxidase. It has been possible to measure spectrophotometrically a several fold increase in peroxidase activity in the thyroid glands of animals fed the above materials. Peroxidase levels in the blood of these animals is also increased. By way of control observations, 1-5 vinylthiomazolidone, n-propylthiouracil, etc. inhibit peroxidase activity in vivo and in vitro. The lyophilized peroxidase when heated to cause denaturation does not exert a goitrogenic effect. 1-5 vinylthiomazolidone is poorly soluble in water, yet the water extract of horse-radish containing peroxidase in dosages of 2 mg/kg day is very goitrogenic, producing a 50% increase in thyroid weight in 14 days. Intravenous peroxidase in 1/100th the oral dosages (0.02 mg/kg/day) causes goiters and increases thyroid peroxidase activity. For the present, the observation is advanced that oral exogenous peroxidase is goitrogenic. Additional studies are being pursued with the object of linking more definitely the intrathyroidal mechanism of goitrogenesis with the thyroid peroxidase.

STRIATE CORTEX CONNECTIONS IN THE MONKEY (Abstract), by R. E. Myers. [1962] [1]p. (AFOSR-66-1116) (AF AFOSR-61-38) AD 640671 Unclassified

Presented at Forty-sixth annual meeting of the Federation of American Societies for Experimental Biology, Atlantic City, N. J., Apr. 14-18, 1962.

Also published in Federation Proc., v. 21: 352, Mar.-Apr. 1962.

Patterns of degeneration were studied in monkeys after removal of small extents of the striate cortex. The Nauta-Gygax technique demonstrated degenerating fibers streaming from the lesion areas through the white matter to distribute densely in cortex of neighboring sectors of area 19. Either no fibers or extremely few fibers

were found to pass into intervening area 18. Within area 17 itself degenerating fibers were found only in immediate relation to the lesions usually coursing horizontally within the granular layers without passing through the white matter. No degenerating fibers entered the corpus callosum nor did any distribute in the opposite hemisphere. Other contingents of fibers passed toward the brainstem to end in circumscribed areas of the lateral geniculate nucleus, the suprageniculate nucleus and the inferior and lateral subdivisions of the pulvinar. Other fibers coursed through the thalamus to end in restricted areas of the superior colliculus. A very few fibers passed into the zona incerta.

COMMISSURAL CONNECTIONS IN THE NEOCORTEX OF MONKEY (Abstract), by F. F. Ebner and R. E. Myers. [1962] [1]p. (AFOSR-66-1117) (AF AFOSR-61-38) AD 641147 Unclassified

Also published in Proc. Internat'l. Union of Physiological Sciences: Twenty-second Internat'l. Cong., Leyden (Netherlands) (Sept. 10-17, 1962), Amsterdam, Excerpta Medica Foundation, v. 2: Abstract no. 1096, 1962.

Patterns of fiber degeneration were studied after transection of corpus callosum, anterior commissure and psalterium in the monkey. Using the Nauta-Gygax technique each lobe of the cerebrum was found to receive commissural fibers. The frontal lobe was distinguished by diffuse, relatively dense degeneration throughout the cortical areas. Small degeneration-free foci were found only on the medial and orbital surfaces, and buried in the central fissure. The parietal lobe exhibited richer contrasts with especially dense degeneration throughout inferior parietal gyrus (area 7) while degeneration-free zones characterized the hand and foot subdivisions of postcentral gyrus and dorsal and medial surfaces of superior parietal gyrus. The temporal lobe was remarkable for the general paucity of degeneration. Only in cortex bordering the depths of superior temporal sulcus and in the cortex of more superior reaches of superior and inferior temporal gyri were more dense foci found. The occipital lobe was largely free of degeneration except for those regions approximately coextensive with cortical area 18. The insular cortex exhibited degenerating fibers in profusion in its posterior superior quadrant, in moderate numbers in its anterior superior quadrant, and in small numbers in its inferior quadrants. The cingulate gyrus received degenerating fibers mainly in its dorsal half. Anterior commissure fibers could be clearly traced into the region of inferior temporal convolution.

CONNECTIONS OF OCCIPITAL LOBE IN THE MONKEY (Abstract), by P. Black and R. E. Myers. [1962] [1]p. (AFOSR-66-1118) (AF AFOSR-61-38) AD 639511 Unclassified

Also published in Anat. Rec., v. 142: 216-217, 1962.

The cortical and subcortical patterns of connection were studied after total extirpation of the left occipital lobe in a Macaca mulatta. The removal was limited to areas 17, 18, and 19. In the ipsilateral hemisphere, the Nauta-Gygax technique revealed degeneration in cortex of (a) the inferior temporal gyrus extending into the depths of superior temporal sulcus, (b) the angular gyrus extending into the depths of the posterior portion in the intraparietal sulcus, (c) the arcuate gyrus, (d) lightly over medial surface of superior parietal gyrus bordering the lesion, and (e) in the subculum of temporal lobe. In the contralateral hemisphere, while degeneration was less pronounced, the pattern resembled that described for the ipsilateral hemisphere. A notable exception occurred in the inferior temporal gyrus where only scattered loci of degeneration were noted. The occipital lobe contralateral to the lesion was entirely free of degeneration apart from that zone corresponding to area 18. Study of subcortical structures revealed degeneration in (a) the entire tail and in dorsolateral portions of the body of caudate, (b) the entire claustrum, (c) small posterior superior portions of putamen, (d) posterior portions of reticular nucleus of thalamus and in zona inerta, (e) in the inferior and lateral pulvinar nuclei, lateral geniculate nucleus, lateral posterior nucleus, and dorsomedial nucleus of thalamus, (f) in superior colliculus and pretectal region, and (g) in rostrolateral portions of pontine nucleus.

[NEW PARTICLES AND THEIR INTERACTION WITH NUCLEONS] Final rept. July 1, 1956 - Dec. 31, 1962 [13]p. incl. refs. (AFOSR-2661) (AF 18(603)143) AD 277922 Unclassified

This report is a summary of the work accomplished in high energy physics under this contract. The primary purpose of the proposed program was the study of the properties of the new particles that had been discovered in cosmic rays and at high energy accelerators. One by-product of the study was the actual discovery of one of the new particles. The initial technique used was that of photographic nuclear emulsion, but as the nature of the field changed, the newer technique of the bubble chamber was more frequently used.

AN ANALYSIS OF THE PRODUCTION OF η AND ω MESONS BY THE INTERACTIONS OF PIONS WITH DEUTERIUM, by T. Toohig, R. Kraemer and others. [1962] [4]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(603)143], National Science Foundation, and Office of Naval Research) Unclassified

Published in Proc. 1962 Internat'l. Conf. on High-Energy Physics at CERN, Geneva (Switzerland) (July 4-11, 1962), Geneva, CERN, Scientific Information Service, 1962, p. 99-102.

The 72-in. bubble chamber filled with liquid deuterium was used to study multi-pion resonances occurring in π-D interactions at a beam momentum of 1230 mev/c. The effective mass distribution for the 3-pion system from events fitting the reaction $\pi^+ + d \rightarrow p + p + \pi^+ + \pi^- + \pi^0$ is shown. The peak of the η meson is at 546 mev; the peak of the ω meson, 769 mev. The impulse model of nuclear reactions was used to analyze the events as π-N interactions. The number of η's and ω's produced as a function of the total energy in the π-N center of mass and the production angular distribution of η's and ω's are shown. The absolute cross sections for the production of η's and ω's at this beam momentum, that subsequently decay by charged modes were determined to be σ_η = 0.22 ± 0.06 mb and σ_ω = 1.3 ± 0.4 mb.

THE DECAYS OF THE η AND THE ω MESONS, by M. Meer, R. Strand and others. [1962] [5]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(603)143] National Science Foundation, and Office of Naval Research) Unclassified

Published in Proc. 1962 Internat'l. Conf. on High-Energy Physics at CERN, Geneva (Switzerland) (July 4-11, 1962), Geneva, CERN, Scientific Information Service, 1962, p. 103-107.

The decays of the η and the ω mesons were studied in the reactions $\pi^+ + d \rightarrow p + p + \pi^+ + \pi^- + \pi^0$ and $\pi^+ + d \rightarrow p + p +$ neutrals. The total cross section for production of η mesons that subsequently decay by a neutral mode was found to be 0.68 ± 0.2 mb. The neutral-to-charged decay ratio for η is 3.1 ± 1.2. The upper limit on the corresponding ratio for ω is 7 ± 6%, and for ω 6 ± 40%. Possible spin and parity assignments for ω and η are suggested.

INVESTIGATION OF THE REACTION $K^- + He^4 \rightarrow Y_1^{*-} + He^3$ (Abstract), by M. Meer, A. Pevsner and others. [1962] [1]p. (In cooperation with Northwestern U., Evanston, Ill.). (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(603)143], National Science Foundation, and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 49, Jan. 25, 1962.

The at-rest reaction $K^- + He^4 \rightarrow \Lambda^0 + \pi^- + He^3$(1) is being investigated in a helium bubble chamber exposed to a slow K^- beam at the Bevatron. Strong evidence has already been found in reaction (1) for the production of Y_1^{*-} via $K^- + He^4 \rightarrow Y_1^{*-} + He^3$, $Y_1^{*-} \rightarrow \pi^- + \Lambda^0$, and our new data confirm this effect. If the kaon is pseudoscalar and the absorption occurs in an s state, then the angular distribution of the decay products of the Y^* (in its rest frame) is isotropic for a Y^* of spin 1/2, whereas it is $1 + 3\cos^2\theta$ for spin 3/2. The above argument neglects final state interactions. The original data suggested isotropy. New experimental results of higher statistical confidence will be presented.

SYSTEMATICS OF Σ PRODUCTION FROM THE INTERACTIONS OF PIONS WITH DEUTERIUM, by R. Kraemer, M. Nussbaum and others. [1962] [4]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(603)143] and National Science Foundation) Unclassified

Published in Proc. 1962 Internat'l. Conf. on High-Energy Physics at CERN, Geneva (Switzerland) (July 4-11, 1962), Geneva, CERN, Scientific Information Service, 1962, p. 273-276.

The Berkeley bevatron and the Alvarez 72 in. bubble chamber filled with deuterium were used in investigating charged Σ hyperon production in $\pi^\pm$-deuterium interactions. Invariant mass histograms for the reactions $\pi^+ + d \rightarrow \Sigma^+ + K^+ + n$ and $\pi^- + d \rightarrow \Sigma^- + K^+ + n$ are shown. Comparison of experimental distributions with phase space predictions indicates that strong final state interactions are small if present at all in these processes. Total cross sections were determined as follows: for $\pi^+ + p + (n_s) \rightarrow \Sigma^+ + K^+ + (n_s)$, (0.171 ± 0.031) mb; for $\pi^+ + n + (p_s) \rightarrow \Sigma^+ + K^0 + (p_s)$, (0.177 ± 0.033) mb; for $\pi^- + p + (n_s) \rightarrow \Sigma^- + K^+ (n_s)$, 0.200 ± 0.028 mb; and for $\pi^- + n + (p_s) \Sigma^- + K^0 + (p_s)$, (0.185 ± 0.035) mb, where n_s and p_s represent the non-interacting nucleon.

TWO-PION RESONANCES BELOW MASS 900 MEV, by C. Richardson, R. Kraemer and others. [1962] [3]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(603)143] National Science Foundation, and Office of Naval Research) Unclassified

Published in Proc. 1962 Internat'l. Conf. on High-Energy Physics at CERN, Geneva (Switzerland) (July 4-11, 1962), Geneva, CERN, Scientific Information Service, 1962, p. 96-98.

The reactions $\pi^+ + d \rightarrow p + p + \pi^+ + \pi^-$ (1) and $\pi^- + d \rightarrow p + p + \pi^- + \pi^-$ (2) were observed in the Lawrence Radiation Lab. 72 in. bubble chamber exposed to 1.23 gev/c pions from the bevatron. Histograms of the invariant mass of the $\pi^+ \pi^-$ system in reaction (1) are shown. The ρ meson is seen in the vicinity of 700 mev and higher. There are departures from phase-space in the 620-650 mev and 550-600 mev regions of the order of 2 standard deviations, but the statistics are insufficient to draw firm conclusions. A 3-standard-deviation departure from the smoothed background is seen at about 420 mev. A histogram of the invariant mass of the $\pi^- \pi^-$ system in reaction (2) shows a 3-standard-deviation bump near 600 mev.

THE SPECTRA OF RARE EARTH IONS, by G. H. Dieke. Final rept. Jan. 31, 1962 [16]p. incl. diagrs. refs. (AFOSR-2305) (AF 49(638)535) AD 611157 Unclassified

The primary purpose of the work was to obtain the energy levels and other data of the free trivalent rare earth ions in order to have a sound basis for comparison with the levels of the same ions in solid state matter. The procedure of attacking the problem was to establish first the proper experimental conditions for obtaining and separating the various stages of ionization. A new method was developed by studying the time decay of the individual lines in the afterglow of a spark with time resolution of the order of 10^{-7} sec. The third and fourth spectra of the following rare earths were photographed extensively: Pr, Nd, Gd, Ho, Er, Yb. Exploratory results were achieved on the remaining ones (except Pm). Wave length measurements, often 20,000 to 30,000 lines per element, were made on most of the 6 elements. The spectra of divalent ions of Pr and Yb were also analyzed.

INTENSITIES OF CRYSTAL SPECTRA OF RARE-EARTH IONS, by G. S. Ofelt. [1962] [10]p. incl. table, refs. (AFOSR-J102) (AF 49(638)535) AD 400174 Unclassified

Also published in Jour. Chem. Phys., v. 37: 511-520, Aug. 1, 1962.

Magnetic and electric dipole transitions between levels of the $4f^x$ configuration perturbed by a static crystalline field are treated. The expression obtained for the pure-electronic electric-dipole transition probability involves matrix elements of an even-order unit tensor between two $4f^x$ states involved in the transition. The contributions to the transition probability from interactions, via the crystalline field, with the $nd^9 4f^{x-1}$, $4f^{x-1}nd$, $4f^{x-1}ng$ configurations are shown to add linearly, in such a way as to multiply each odd k crystal-field parameter A_k^q by a constant. If J mixing in the $4f^x$ configuration is neglected then ΔJ between the upper and lower $4f^x$ levels is restricted to 6 units or less. If L mixing is neglected then ΔL is also restricted to 6 units or less. Application is made to the fluorescence spectra of $PrCl_3$ and $EuCl_3$. Many of the missing and weak transitions are explained. (Contractor's abstract)

INTERPRETATION OF RARE-EARTH AND ACTINIDE SPECTRA (Abstract), by B. G. Wybourne. [1962] [1]p. [AF 49(638)535] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 238, Mar. 26, 1962.

Using the complete electrostatic and spin-orbit interaction matrices of the 3 highest multiplicities of the f^n electron configurations, an interpretation of the spectra of several rare-earth and actinide spectra has been made. Several new assignments are reported. The excited states of the rare-earth and actinide ions are shown to exhibit large deviations from Russel-Saunders coupling. The ground states of several actinide ions are shown to contain appreciable admixtures of states of the third highest multiplicity, which have hitherto been overlooked. In view of the large departures from Russell-Saunders coupling, revised parameters are given for the actinide ions. The significance of configuration interaction is considered.

NUCLEAR MOMENTS AND INTERMEDIATE COUPLING, by B. G. Wybourne. [1962] [5]p. incl. refs. [AF 49-(638)535] Unclassified

Published in Jour. Chem. Phys., v. 37: 1807-1811, Oct. 15, 1962.

The effect of intermediate coupling on the calculation of the nuclear moments of the rare earths from analyses of hyperfine structure is examined. It is shown that the observed hyperfine splittings may be satisfactorily interpreted as due to the interaction of the spin and orbital moments of 4f electrons with the nuclear magnetic and electric quadrupole moments. The interaction of the electron-spin moments with the nuclear magnetic moment is shown to be very sensitive to the form of the coupling. The consistency of the measurements of nuclear moments by atomic-beam and paramagnetic resonances is discussed. Instead of using the more usual spin-Hamiltonian formalism, the matrix elements of the interactions are calculated explicitly in terms of the actual quantum numbers of the states involved. Calculations are presented for Pr^{141} and Ho^{165}.

THE SPECTRA OF DOUBLE AND TRIPLY IONIZED RARE EARTHS, by G. H. Dieke. Final rept. Dec. 31, 1962 [2]p. (AFOSR-4820) (AF AFOSR-62-238) AD 412 AD 412671 Unclassified

The object of this research was the production, analysis, and interpretation of the spectra of the doubly and triply ionized rare earths. The main purpose was the establishment of the energy level systems of the $4f^n$ configuration of these ions so that they can be compared with the analogous levels of the ions in crystal lattices.

SPECTRUM OF DOUBLY IONIZED GADOLINIUM, by W. R. Callahan. [1962] [6]p. incl. illus. diagrs. tables, refs. (AFOSR-J882) (AF AFOSR-62-238) AD 415778 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 53: 695-700, June 1963.

The spectrum of doubly ionized gadolinium was photographed and measured over the region 1900-12,000 A. The following transitions involving 18 levels and 42 lines were classified: $4f^7(^8S_{7/2})6s$-$6p$ and $4f^7(^8S_{7/2})5d$-$6p$. The Coulombic and spin-orbit matrix elements of the $f^7(^8(S_{7/2})l$ states were evaluated and the energy levels calculated. Close agreement was obtained between the calculated and experimental values. These calculations indicate that the $4f^7(^8S_{7/2})6p$ states are close to J_{1j} coupling while those of $4f^7(^8S_{7/2})5d$ are close to LS coupling. (Contractor's abstract)

STRUCTURE OF THE f^6 CONFIGURATION WITH APPLICATION TO RARE-EARTH IONS, by G. S. Ofelt. [1962] [10]p. incl. diagrs. tables, refs. (AFOSR-J883) (AF AFOSR-62-238) AD 415852 Unclassified

Also published in Jour. Chem. Phys., v. 38: 2171-2180, May 1, 1963.

Free-ion energy-level schemes for the $4f^6$ and $4f^8$ configurations of Eu^{3+}, Sm^{2+}, and Tb^{3+} are given, which have been calculated from energy matrices including interactions among the 3 highest multiplicities. The values obtained for the parameters are $F_2 = 401\ cm^{-1}$, $\zeta = 1320\ cm^{-1}$ for Eu^{3+}; $F_2 = 330\ cm^{-1}$, $\zeta = 1050\ cm^{-1}$ for Sm^{2+}; and $F_2 = 434\ cm^{-1}$, $\zeta = 1705\ cm^{-1}$ for Tb^{3+}. The wavefunctions and g values for levels to 40,000 cm^{-1} are tabulated for Eu^{3+} and Tb^{3+}. Application of the free-ion wavefunctions to the Stark splitting of $EuCl_3$ and $TbCl_3$ is discussed. (Contractor's abstract)

ANALYSIS OF THE THIRD SPECTRUM OF PRASEODYMIUM, by J. Sugar. [1962] [9]p. incl. illus. diagrs. tables, refs. (AFOSR-J972) [AF AFOSR-62-238] AD 417144 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 53: 831-838, July 1963.

The spectrum of doubly ionized praseodymium was recorded and analyzed, with the result that 118 energy levels of odd parity and 130 levels of even parity were derived. These include nearly all the levels of the $4f^3$, $4f^25d$, $4f^26s$, and $4f^26p$ configurations as well as some low levels of the $4f5d^2$ and $4f^26d$ configurations. Electrostatic and spin-orbit parameters were determined for the $4f^26s$ configuration. From the hfs of the $4f^26s$ levels, a magnetic dipole interaction constant of 0.46 cm^{-1} was obtained. An ionization potential of 23.2 v was calculated from levels of the $4f^25d$ and $4f^26d$ series. (Contractor's abstract)

FUNCTIONAL PROPERTIES OF NEURONS OF THE ANTERIOR ECTOSYLVIAN GYRUS OF THE CAT, by M. Carreras and S. A. Anderson. [1963] [27]p. incl. illus. diagrs. tables, refs. (AFOSR-64-1087) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)493, and Public Health Service) AD 441483 Unclassified

Also published in Jour. Neurophysiol., v. 26: 100-126, Jan. 1963.

A single-unit analysis study of the anterior ectosylvian gyrus has been performed on cats lightly anesthetized with barbiturates. The second somatic area contains a large population of cells called modality-place-specific. They are activated in large majority from the skin of the contralateral side of the body, and they subtend small, constant contralateral receptive fields. Taken together

these receptive fields compose a richly detailed representation of the entire body surface. Although a few cells were encountered which were activated from deep tissues only, no single cell was observed which was activated by the gentle rotation of joints, a finding in striking contrast to those previously made in the first somatic area (SI). The second somatic area contains another population of cells which are labeled place-modality-nonspecific. These number about 20% of the total number of cells studied. They are found more commonly as the recording site is translated posteriorly and superiorly along the axis of the anterior ectosylvian gyrus. Their distribution zone overlaps the hind-leg zone of SII and they are found very commonly in that narrow zone of cytoarchitectural transition between SII and AII.

A FINITE DIFFERENCE ANALYSIS OF LAMINAR MAGNETOHYDRODYNAMIC FLOW IN THE ENTRANCE REGION OF A FLAT RECTANGULAR DUCT, by C. L. Hwang and L. T. Fan. [1962] [15]p. incl. diagrs. tables, refs. (AFOSR-65-1430) [AF AFOSR-64-463] AD 623061 Unclassified

Also published in Appl. Scient. Research, v. 10B: 329-343, 1962.

The development of the velocity profile, from a uniform one at the entrance, for an electrically conducting fluid entering a semi-infinite flat duct with a transversely applied magnetic field is investigated. It is assumed that the fluid has constant physical properties, the duct walls are electrically non-conducting, a uniform magnetic field is imposed perpendicular to the duct walls, and there can be a net electrical current flow parallel to the walls and perpendicular to the flow direction with a variable external resistance connecting the 2 side plates, which are displaced at infinity. The basic governing continuity and momentum equations are expressed in finite difference form and solved numerically on a high-speed digital computer with a mesh network superimposed on the flow field. A practical mesh size ratio suitable for computation was determined. Results were obtained for the variations of velocity and pressure distribution between the inlet and the region for the fully developed velocity profile for Hartmann numbers of 0, 4 and 10. ANALYSIS OF THE EPR SPECTRUM OF N,N'-TETRAMETHYLBENZIDINE POSITIVE ION, by Z. Gales and R. N. Adams. [1962] [1]p. (AFOSR-3758) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)822 and Atomic Energy Commission) Unclassified

Also published in Jour. Chem. Phys., v. 36: 2814, May 15, 1962.

The ion was prepared by anodic oxidation of N,N'-tetramethylbenzidine at a Pt electrode in 50% acetone-aqueous buffer at pH 3.8. The spectrum consisted of 11 major groups, each split into 6 lines. Crystal violet was deuterated and the corresponding ring-deuterated N,N'-tetramethylbenzidine was prepared by chemical oxidation. This spectrum confirmed that the major coupling in the ion is due to Me protons.

ELECTRON PARAMAGNETIC RESONANCE AND ELECTROCHEMISTRY. STUDIES OF ELECTROCHEMICALLY GENERATED RADICAL IONS IN AQUEOUS SOLUTION, by L. H. Piette, P. Ludwig, and R. N. Adams. [1962] [6]p. incl. illus. diagrs. refs. (AFOSR-3759) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)822] and Atomic Energy Commission) Unclassified

Also published in Anal. Chem., v. 34: 916-921, July 1962.

The electrochemical generation of radical ions directly in the microwave cavity of an EPR spectrometer has been applied to a variety of processes in aqueous media with considerable success. Cyclic voltammetry coupled with the EPR technique is particularly useful in studying complex organic electrode reactions. Rather unusual stabilities for radical anions of aromatic and aliphatic nitro compounds in aqueous solutions have been found. The utility of EPR in elucidating organic electrode reactions of electroanalytical significance is indicated. (Contractor's abstract)

THE POLAROGRAPHIC DIFFUSION COEFFICIENT, by R. J. Bearman. [1962] [2]p. (AFOSR-J755) [AF AFOSR-61-7] AD 414042 Unclassified

Also published in Jour. Phys. Chem., v. 66: 2072-2073, Oct. 1962.

For the purpose of comparing the polarographic diffusion coefficients with other diffusion coefficients, the derivation of Fick's law as it applies to common polarography experiments is investigated. It is found that the polarographic diffusion coefficient is closely related to the tracer diffusion coefficient of the electroactive ion. Strictly speaking, the 2 coefficients are not equal. Nevertheless, it may be found in practice that they are identical within the limits of validity of the limiting current equations themselves.

THERMOGRAVITATIONAL THERMAL DIFFUSION IN LIQUIDS. I. THE FORMAL THEORY. THERMOGRAVITATIONAL THERMAL DIFFUSION IN LIQUIDS II. EXPERIMENTAL THERMAL DIFFUSION FACTORS FOR CARBON TETRACHLORIDE-CYCLOHEXANE AT 25°C, by F. H. Horne and R. J. Bearman. [1962] [31]p. incl. diagrs. tables, refs. (AFOSR-J756) (AF AFOSR-61-7) AD 414291 Unclassified

Also published in Jour. Chem. Phys., v. 37: 2842-2872, Dec. 15, 1962.

The formal theory of the steady state thermogravitational thermal diffusion in binary liquid mixtures is developed. Although the general approach of Furry, Jones, and Onsager is followed, full use of all hydrodynamic and thermodynamic transport equations permits the explicit statement and the subsequent re-examination of the simplifying approximations. The resulting differential and integral equations are solved subject to boundary conditions imposed by the vanishing of all velocities at the apparatus walls. Inclusion of the temperature and composition dependences of the thermodynamic properties of the fluid leads to the appearance in the final equations of a term which quantitatively takes account of the forgotten effect as well as the ordinarily negligible correction terms. The final working equation is valid for the arithmetic mean experimental temperature and the initial uniform composition of the mixture. It is shown that an easily measured composition difference can be substituted for the steady-state vertical composition gradient. In Section II, an experimental investigation of thermogravitational thermal diffusion in carbon tetrachloride-cyclohexane at 25°C is described and thermal diffusion factors for this system are calculated. The procedure for determining the required compositions involves a special weighing technique and Rayleigh interference refractometry. A new method for using the latter is presented. The design, construction, and use of a cylindrical thermogravitational apparatus are discussed. Small numerical corrections are made for the production and thermal diffusion of impurities. Calculated thermal diffusion factors agree well for most compositions with results of pure thermal diffusion measurements. (Contractor's abstract)

THEORY OF THE SORET EFFECT IN ELECTROLYTIC SOLUTIONS, by E. Helfand, R. J. Bearman, and V. S. Vaidhyanathan. Sept. 1962, 6p. incl. refs. (AFOSR-J830) (In cooperation with Bell Telephone Labs., Inc., Murray Hill, N. J.) (AF AFOSR-61-7) AD 416514 Unclassified

Also published in Jour. Math. Phys., v. 4: 160-165, Feb. 1963.

The limiting law for the square-root concentration dependence of the heat of transport of a simple electrolyte is calculated by considering the Soret effect. The calculation is accomplished by relating the intermolecular forces arising from the temperature gradient in the nonuniform Soret stationary state to the equilibrium gradients of chemical potential required to maintain the same concentration gradients. The contribution arising from ion-ion interactions is identical with that determined by Helfand and Kirkwood from a consideration of heat flow accompanying diffusion. Hence, the present work provides a verification of the heat-matter reciprocal relation without explicitly invoking time-reversal invariance.

SYMPATHETIC VASODILATOR OUTFLOW, by B. Uvnäs. Final technical rept. Aug. 28, 1962 [6]p. incl. illus. (AFOSR-64-0985) (AF EOAR-63-15) AD 600380 Unclassified

Electrodes were implanted into the hypothalamus of dogs. Blood flow was measured in the femoral artery with an electromagnetic flow recorder. The circulation of the paw was cut off with a pneumatic cuff to ensure as pure muscle blood flow as possible. The electrodes were cemented into place when the sympathetic vasodilator area was reached as evident from the stimulatory response. Electrical activation of the sympathetic vasodilator area was repeated on the unanesthetized dogs. The circulatory responses and the behavior reactions were simultaneously recorded. As a final step, the animal was again anesthetized and the sympathetic vasodilator system activated to ensure that the electrodes were still in place. The dogs were then sacrificed and the hypothalamus removed for histological examination. (Contractor's abstract)

DETERMINATION OF ^{90}SR AND STABLE STRONTIUM IN BONES FROM SHEEP EWES AND THEIR FETUSES, by S. Häggroth and G. Höglund. [1962] [8]p. incl. diagr. tables, refs. (AFOSR-2131) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)21, and National Institutes of Health) AD 630185 Unclassified

Also published in Exper. Cell Research, v. 24: 80-87, June 1961.

The concentrations of Sr^{90} and stable strontium were measured in the bone ash from pregnant sheep ewes and their fetuses. The fetuses weighed from 125 g (Sr^{90}) and 110 g (stable strontium) to 2650 g. In the ewes the average concentration of Sr^{90} was 40.4 (s.d. 6.4) pc/g calcium in the metatarsal diaphyses and 38.4 (s.d. 3.9) pc/g calcium in the vertebrae. The average concentration of stable strontium was 321 (s.d. 37) ppm in the metatarsal diaphyses and 324 (s.d. 26) ppm in the vertebrae. No significant difference between the 2 bones in the concentrations of either Sr^{90} or stable strontium was found. In the fetuses the average concentrations of Sr^{90} and stable strontium in the ash from the ossified parts of the long bone diaphyses was 16.2 (s.d. 2.5) pc/g calcium and 152 (s.d. 27) ppm respectively. The average ratio between the strontium concentrations in the long bones of each fetus and the metatarsal bones of its mother was 0.41 (s.d. 0.06) for Sr^{90} and 0.48 (s.d. 0.08) for stable strontium. The strontium concentrations in the fetal and maternal bone ash, and the ratio between these concentrations, were essentially independent of fetal weight and sacrifice date. (Contractor's abstract)

X-RAY DIFFRACTION STUDIES ON PERIPHERAL NERVE MYELIN, by G. Höglund and H. Ringertz. [1961] [6]p. incl. illus. diagrs. table, refs. (AFOSR-2133) (AF 61(052)21) AD 630187 Unclassified

Also published in Acta Physiol. Scand., v. 51: 290-295, 1961.

The dimension of the radial repeating unit was measured on peripheral nerve from 15 species belonging to 4 vertebrate classes. In the fishes the dimension was 161 ± 3A and in the birds 172 ± 5A. In the mammalian and amphibian species the dimensions were in agreement with earlier work (145 ± 3A, and 171 ± 3A, respectively). Diffraction patterns from brachial plexus nerves of sheep fetuses were obtained from a gestation age of approximately 90 days. Weak lines indicating a lower number of regularly arranged radial repeating units compared to older fetuses were obtained from fetuses

between 90 and 105 days gestation age. The diffraction patterns from fetuses older than approximately 105 days gestation age were similar to those from peripheral nerves of adult sheep. (Contractor's abstract)

PIGMENT POSITION AND LIGHT SENSITIVITY IN THE COMPOUND EYE OF NOCTUID MOTHS, by C. G Bernhard and D. Ottoson. [1962] [2½]p. (AFOSR-2851) (AF 61(052)21) Unclassified

Also published in Acta Physiol. Scand., v. 54: 95-96, 1962.

In electrophysiological and histological investigations on the noctuid moth (Cerapteryx graminis) the relation between pigment position and light sensitivity has been studied at varying adapting light intensities covering 7 log units. Electrophysiological studies demonstrated that adaptation to light intensities above -4. 6 is not followed by a second phase in the adaptation curve and there is no pigment migration. The adaptation curves obtained at different light intensities below -4, on the the other hand, are characterized by a second phase and the final threshold value of this phase decreases with decreasing intensity of the adpating light between -4 and -7. At intensities below -7 there is no further decrease of the final threshold value which is equal to that obtained after dark adaptation. A direct relationship was found between the intensity of the adapting light and the maximum sensitivity reached at the end of the second phase of the adaptation curve. Histological studies showed that whereas the pigment in eyes adapted to light above -4 remained in the extreme light-adapted position, the pigment of the eyes adapted to light intensities below -7 showed the extreme dark-adapted position.

ANALYSIS OF PRENATAL SPINAL REFLEX ACTIVITY IN SHEEP, by L. Änggard, R. Bergström, and C. G. Bernhard. [1961] [9]p. incl. diagrs. table, refs. (AFOSR-65-1571) (AF 61(052)21) AD 629561 Unclassified

Also published in Acta Physiol. Scand., v. 53: 128-136, 1961.

An electrophysiological analysis was made of the prenatal development of the reflex muscular response to stretch in 17 non-anesthetized sheep fetuses (calculated gestational age 53-132 days) kept in placental contact with the decerebrate ewe. Electrical muscle activity recorded with needle electrodes in the gastrocnemius muscle in response to stretch of the muscle appeared around the 60th day and was shown to be of reflex order. Antagonistic inhibition and inhibition evoked by skin stimulation were not found until later on, there being a short period in which no signs of central inhibition were obtained. Decerebrate rigidity was not obtained until the end of the gestation period, the total length of which is about 150 days in sheep. (Contractor's abstract)

OBSERVATIONS ON THE FUNCTIONAL DEVELOPMENT OF THE NEUROMUSCULAR APPARATUS IN FETAL SHEEP, by L. Änggard and D. Ottoson. [1962] [11]p. incl. illus. diagrs. refs. (AF 61(052)21) Unclassified

Published in Exper. Neurol., v. 7: 294-304, Apr. 1963.

The present paper describes the results of a study on the prenatal development of muscle activity in the sheep. Recordings have been made of the mechanical and electrical responses of the gastrocnemius muscle in fetuses (weight 0. 24-1930 gm) in placental contact with the ewe. In the earliest part of the active period of the fetus, the duration of the mechanical response of the gastrocnemius muscle is about 0. 8 to 1 sec and the latency of the response about 6 msec. With increasing gestational age, contraction time and relaxation time become shorter and the latency of the response decreases. About the one-hundredth day of the gestational period, the twitch takes less than 0. 3 sec and the latency of the response has decreased to 1. 5 or 2 msec. Parallel with these changes, there is an increase in frequency of the stimulation required to obtain fusion of contraction. As development proceeds, the conduction velocity of the nerves rises from values less than 1 m/sec during the early stage of the active period to 35 to 75 m/sec after the one-hundredth day. This change coincides with the myelination of the nerve fibers.

STUDIES ON THE ULTRASTRUCTURE OF CALCIFIED TISSUES, by J.-E. Glas. 1962, 24p. incl. refs. (AFOSR-4572) [AF 61(052)386] AD 400846 Unclassified

The mineral phase of bone dentin and enamel has been studied by means of various biophysical methods such as x-ray crystallography, polarized light microscopy and microradiography. Incidentally other methods of investigation have also been applied, i.e., infrared spectroscopy, x-ray fluorescence spectroscopy as well as conventional chemical methods. By means of x-ray crystallography the size and shape of the apatite crystallites in bone and enamel have been determined using the line-broadening technique. The reactivity pattern of the apatite crystallites in hard tissues against foreign ions incorporated in these tissues were studied using most of the methods given in the first paragraph. Studies on crystallite orientation in normal human tooth enamel have been performed by aid of micro x-ray diffraction and polarized light microscopy. In order to get complete information about the 3-dimensional orientation of the apatite crystallites, a new micro x-ray diffraction technique was developed. The degree of mineralization of enamel from normal permanent human teeth was studied on a microscopical level using quantitative microradiography. Polarized light microscopy investigations on corresponding enamel regions were also performed. On the basis of results obtained on the ultrastructure of dental enamel, an extensive discussion was given on the different factors influencing the polarized light microscopy picture of enamel.

STUDIES ON THE ULTRASTRUCTURE OF DENTAL ENAMEL. VI CRYSTAL CHEMISTRY OF SHARK'S TEETH, by J.-E. Glas. [1962] [12]p. incl. illus. diagrs. table, refs. (AFOSR-3211) [AF 61(052)386] AD 400171 Unclassified

Also published in Odontol. Revy, v. 13: 315-326, 1962.

Shark's teeth were investigated by means of various biophysical and chemical methods. The size and orientation of the apatite crystallites in the hard layer covering the teeth as well as the degree of mineralization of this layer was found to be very much the same as in true enamel. In contrast to the hydroxyapatite occurring in enamel of higher vertebrates the inorganic phase of shark's "enamel" consists of an almost pure fluorapatite.

A CORNEAL NIPPLE PATTERN IN INSECT COMPOUND EYES, by C. G. Bernhard and W. H. Miller. [1962] [2]p. incl. illus. (AFOSR-J607) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-62-13, Public Health Service, and Swedish Medical Research council) AD 414374 Unclassified

Also published in Acta Physiol. Scand., v. 56: 385-386, 1962.

In electron microscope studies, it has been found that the corneal surface of the facets of certain insect compound eyes contain congruent cone-shaped protuberances. These nipples are arranged in a more or less perfect hexagonal array that completely covers the corneal surface. They are absent in extracorneal chitin. Both the altitude of the nipples and their center-to-center distance are approx 200 mu. This nipple pattern has been found on the corneas of compound eyes from insects belonging to Lepidoptera, i.e., butterflies and moths (Prodenia, Cerapteryx, Vanessa); Neuroptera, i.e., net flies (Myrmeleon); and Trichoptera, i.e., caddis flies (Phryganea). The pattern is absent in corneas of compound eyes of specimens belonging to Hymenoptera, i.e., bees, etc. (Apis, Bombus); Coleoptera, i.e., beetles (Coccinella); and Odonata, i.e., dragon flies (Sympetron). Furthermore, where the pattern is absent the front surfaces of these corneas appear smooth under the electron microscope. Further investigations of the distribution and functional significance of the nipple pattern are in progress.

PROTECTIVE EFFECT OF BRETYLIUM ON NORADRENALINE STORES IN ORGANS, by G. Ryd. [1962] [4]p. incl. tables. (AFOSR-4344) (AF 61(052)309) Unclassified

Also published in Acta Physiol. Scand., v. 56: 90-93, 1962.

The noradrenaline content of the liver, heart and kidney of the guinea-pig was increased after an intraperitoneal dose of 50 mg bretylium, given 1/2 to 4 hr previously. No increase was found in the brain. In liver, spleen and heart the depleting action of reserpine on noradrenaline was partially prevented by bretylium, but no effect was noted in the kidney and brain. In organs analyzed 24 hr after injection of bretylium the amounts of catecholamines did not differ from the controls.

SOME ASPECTS OF THE ACTIONS OF NATURALLY OCCURRING PRESSOR AMINES, by U. S. von Euler. [1962] [4]p. incl. refs. (AFOSR-4345) (AF 61(052)309) Unclassified

Also published in Canad. Med. Assoc. Jour., v. 86: 981-984, May 26, 1962.

A review is given of some properties of the naturally occurring pressor amines, adrenaline and noradrenaline. Similarities and differences between the 2 amines are pointed out, particularly as regards the actions on the cardiovascular system. The effect of pressor amines on the blood flow in different vascular areas at different initial pressure levels is discussed. It is emphasized that the effects of generalized vasomotor activity and those of circulating noradrenaline may differ in different vascular areas. Indications for the therapeutic use of pressor amines are briefly considered, particularly with respect to conditions of hypotension and shock. It is pointed out that pressor amines may exert a variety of actions in addition to those on the cardiovascular system. Special mention is made of the inhibitory action on ganglionic transmission. Finally some recent results concerning the storage and uptake of catecholamines in nerves and organs are briefly discussed.

INFLUENCE OF pH ON UPTAKE AND RELEASE OF NORADRENALINE IN ADRENERGIC NERVE GRANULES, by U. S. von Euler and F. Lishajko. [1962] [5]p. incl. diagrs. refs. (AFOSR-J1420) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)309, Swedish Medical Research Council, and Wallenberg Foundation) AD 427580
Unclassified

Also published in Jour. Neurochem., v. 10: 145-149, Mar. 1963.

The depletion rate of noradrenaline from bovine splenic storage granules in isotonic potassium phosphate decreases as the pH is increased from 7.0 to 8.5. Conversely, the uptake of noradrenaline in partially depleted granules increases as the pH is increased over the range 6.5-8.5, but is relatively independent of temperature between 20° and 37°. The release rate of exogenous noradrenaline, taken up during incubation with the amine in a concentration of 20 µg/ml, follows the course characteristic of the release of the endogenous amine.

QUANTITATIVE MEASUREMENTS OF GLUCOSE UPTAKE AND BLOOD FLOW IN NEURONALLY ISOLATED CAT CORTEX (Abstract), by U. Söderberg. [1962] [1]p. (AFOSR-2903) (AF 61(052)119) Unclassified

Also published in Proc. Internat'l. Union of Physiological Sciences; Twenty-second Internat'l. Cong., Leyden (Netherlands) (Sept. 10-17, 1962), Amsterdam, Excerpta Medica Foundation, v. 2: 1118. 1962.

Blood flow and arterial-venus diffusion for glucose were measured in neuronally isolated cortical slabs. An operative procedure by Jöbsis and Söderberg was used and performed in 2 stages. First, the slab is isolated neuronally, all draining veins except the superior sagittal sinus are interrupted and EEG electrodes are mounted with acrylate. In the 2nd stage, after recovery, the sinus is cannulated and the rate of venous outflow measured. Arterial and sigittal sinus blood is repeatedly analyzed for glucose. The glucose uptake was not closely related to the electrical activity in these short-term experiments. A sudden rise in arterial glucose concentration increased the uptake temporarily, probably until the equilibrium between blood and brain was re-established. Insulin increased the cortical glucose clearance. Hypoventilation and low blood pressure reduced or even reversed the uptake. It seems as if the exchange of glucose between blood and brain in the present experiments closely resembles a diffusion process. Changes in size of the cerebral glucose space probably occur in response to various stimuli. Simple uptake measurements do not tell whether glucose that enters the brain will be metabolized immediately or converted to glycogen or to other substances.

THE EFFECT OF BLOOD-BORNE INFLUENCES OF THE CEREBRAL CORTEX IN WAKEFULNESS AND SLEEP, by U. Söderberg. [1962] [7]p. incl. refs. (AFOSR-2904) (AF 61(052)119) AD 405415
Unclassified

Also published in Proc. Internat'l. Union of Physiological Sciences; Twenty-second Internat'l. Cong., Leyden (Netherlands) (Sept. 10-17, 1962), Amsterdam, Excerpta Medica Foundation, v. 1 (Pt. 1): 457-463, 1962.

As part of the difficult problem to find the differences between wakefulness and sleep; this investigation into the basic problem to determine whether changes in body fluids can be transfered to the central nervous system and their effect, uses the neuronally isolated cortex

slab to measure electrical activity in relation to raised CO_2, and changes in body temperature. The former was not as clear cut as had been expected. Only significant vasodilatation could be obtained in marked contrast to the findings in the intact brain. Changes in the body temperature within physiological limits sometimes altered the electrical activity of the slab, but not as regularly as has been reported to be the case in the cortex of an intact brain. Hypoglycemia has only been studied in a few experiments. The isolated and the intact cortex seem to have essentially the same tolerance, the depression and convulsive activity appeared nearly simultaneously in both. The work of various other experimentors in related areas is reviewed.

BLOOD PRESSURE AND PULSE-WAVES IN SMALL CEREBRAL ARTERIES DETERMINED WITH MANOMETERS WITH STIFF MEMBRANES (Abstract), by U. Söderberg. [1961] [2]p. (AFOSR-2906) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)119 and Therese och Johan Anderssons Minne) Unclassified

Also published in Internat'l. Biophys. Cong., Stockholm (Sweden) (July 31-Aug. 4, 1961), Abstracts of Contributed Papers, 1961, p. 129-130.

Earlier attempts to measure the blood pressure in cerebral arteries of cats with strain-gauge manometers have shown that there is a pressure drop from the common carotid artery to the circle of Willis that significantly influences the cerebral blood flow (Söderberg and Weckman: Experientia, v. 15: 346, 1959). However, in the previous experiments, even with the best available manometers, only the mean pressure could be recorded from the narrow brain arteries which demand such narrow catheters that the natural frequency of these previous manometer systems was lowered too much. In order to obtain better temporal resolution a quartz crystal pressure transducer (Kistler/Vibrometer) has, therefore, been used in the present work. This manometer, which never seems to have been utilized for biological measurements before, has a natural frequency of 80,000 cps. This property rules out some of the difficulties encountered in having to use narrow bore catheters. Thus, good pulsations were recorded even from branches of the Arteria cerebri media on the surface of the parietal and temporal lobes. The results of testing the manometer system and of using it for the recording of pulse-waves in small brain arteries as an index of cerebral vasomotor activities are briefly summarized.

HEATS OF FORMATION AND BOND ENERGIES OF ORGANOMETALLIC COMPOUNDS, N-BUTYL-LITHIUM, TRIMETHYLALUMINIUM AND TRIETHYLALUMINIUM, by C. T. Mortimer. Final rept. Dec. 31, 1962, 30p. incl. illus. diagr. tables, refs. (AFOSR-4583) (AF 61(052)307) AD 299990 Unclassified

The heats of hydrolysis of n-butyl-lithium and triethylaluminium have been measured, using a Dewar-vessel calorimeter, and the data used to calculate the values ΔHf° (n-BuLi, liq) = 31.4 ± 0.7 kcal/mol, and $\Delta Hf^\circ(Et_3Al, liq)$ = 36.5 ± 5.5 kcal/mol. Using a rotating-bomb calorimeter, the heat of reaction of trimethylaluminium and acetic acid has been determined. The heat of solution of aluminium triacetate in hydrochloric acid has also been obtained. These measurements are used to calculate the values $\Delta Hf^\circ(Me_3Al, liq)$ = 36.1 ± 1.6 kcal/mol and $\Delta Hf^\circ[(CH_3COO)_3Al, cryst]$ = -451.8 ± 0.8 kcal/mol. The mean bond dissociation energies $\bar{D}$(Li-Bu) = 54 ± 9, $\bar{D}$(Al-Et) = 56.8 ± 4.0, and $\bar{D}$(Al-Me) = 64.5 ± 2.0 kcal/mol are derived.

1426

[Keele U.] Staffordshire (Gt. Brit.).

HEATS OF FORMATION AND BOND ENERGIES. PART V. N-BUTYL-LITHIUM, by P. A. Fowell and C. T. Mortimer. [1961] [4]p. incl. table, refs. [AF 61(052)307] Unclassified

Published in Jour. Chem. Soc. (London), No. 735: 3793-3796, Sept. 1961.

The heats of the following reactions of n-butyl-lithium have been measured calorimetrically: $LiC_4H_9(liq) + H_2O(g) - LiOH(cryst) + C_4H_{10}(g)$, ΔH = 57.4 ± 0.7 kcal/mol and $LiC_4H_9(liq) + C_6H_5 \cdot CH_2Br(liq) - LiBr(cryst) + C_6H_5 \cdot C_5H_{11}(liq)$, ΔH = 80.8 ± 2.6

kcal/mol. From these, the heats of formation are calculated: $\Delta H_f^\circ(LiC_4H_9, liq) = 21 \cdot 4 \pm 0 \cdot 7$ kcal/mol, and $\Delta H_f^\circ(C_6H_5 \cdot CH_2Br, liq) = +7 \cdot 1 \pm 3 \cdot 3$ kcal/mol. The value $D(li\text{-}C_4H_9) = 54 \pm 9$ kcal/mol is derived. (Contractor's abstract)

CHEMISTRY OF N-SULFINYLAMINES, by W. T. Smith, Jr. Final rept. Aug. 31, 1952, 13p. (AFOSR-3469) (AF 49(638)49) AD 284908 Unclassified

Three general methods of preparation of N-sulfinylamines were studied. The first involved the direct reaction of the amine with thionyl chloride in an inert solvent. The second method involved the use of a tertiary base such as pyridine in the reaction mixture to take up the HCl and drive the reaction towards completion. The third method makes use of the trans-sulfinylation reaction. This reaction usually involves the reaction of an aromatic N-sulfinylamine with an aliphatic amine to give the aliphatic N-sulfinylamine and aromatic amine. The second method (use of pyridine) is usually the best method and gives good yields from aliphatic and aromatic amines at room temperature. The kinetics of the trans-sulfinylation reaction has been studied extensively. A number of substituted N-sulfinylanilines were prepared by a direct method in yields over 90%. The pyridine method gave a 60% yield in N-sulfinyl-1-heptylamine. The trans-sulfinylation reaction with N-sulfinylaniline and 1 butylamine gave only an 18% yield of N-sulfinyl-1-butylamine.

NON-SPECIFICITY OF THE IN VITRO I^{131} RELEASE METHOD FOR PLASMA THYROTROPIN (TSH) DETERMINATIONS IN THE RAT (Abstract), by C. Rerup, G. P. Van Rees and others. [1962] [1]p. (AFOSR-2628) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-15 and National Institutes of Health) Unclassified

Presented at Fifth annual meeting of the Canad. Fed. Biol. Soc., Laval U., Quebec (Canada), June 6-8, 1962.

Also published in Proc. Canad. Fed. Biol. Soc., v. 5: 66, 1962.

Bottari and Donovan's in vitro TSH assay based on I^{131}-release by incubated guinea pig thyroid slices, is the most sensitive method hitherto recorded, and has been used for the measurement of plasma TSH in man. Lack of information pertaining to the specificity of the method for TSH prompted a comparative study of the effects of plasma from rats hypophysectomized 6-10 days earlier (hypox plasma), of normal rat plasma and of the incubation medium on the in-vitro response parameter. Pooled hypox plasma evidenced a clear, and concentration-dependent, I^{131}-releasing activity. On the basis of 4-point-2 dose assays against U.S.P. Reference Standard Thyrotropin, this activity was assessed at 86 mU/100 ml, as compared to 170 mU/100 ml for a pool of normal rat plasma. Heparin was inactive, and the activity of hypox rat serum was comparable to that of hypox plasma. This TSH-like activity of extra-pituitary origin raises a question as to the applicability of the in-vitro method for TSH measurements in rat plasma or serum.

EFFECT OF AGE ON THE CONCENTRATION OF NUCLEIC ACIDS AND THE INCORPORATION OF C^{14} LEUCINE INTO THE RNA-PROTEIN COMPLEX OF THE RAT ADENOHYPOPHYSIS (Abstract), by A. Devi and G. Saucier. [1962] [1]p. (AFOSR-2629) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-15 and National Institutes of Health) Unclassified

Presented at Fifth annual meeting of the Canad. Fed. Biol. Soc., Laval U., Quebec (Canada), June 6-8, 1962.

Also published in Proc. Canad. Fed. Biol. Soc., v. 5: 24, 1962.

The concentration of nucleic acids in the rat adenohypophysis was found to be remarkably high, as compared to other tissues, and to vary with age. A progressive rise of the RNA concentration from 0.910 to 1.205 gm/100 gm of tissue, and of the RNA/DNA ration from 2.22 to 3.0, observed over a weight span of 45 to 300 gm, approximately corresponding to an age span of 8-10 days to 8 weeks, was followed by a slow and gradual decline to 0.88 gm of RNA, and a RNA/DNA ratio of 2.41, for rats of 500-550 gm or 27-30 weeks of age. The in-vitro incorporation of C^{14}-leucine into the RNA-protein complex was likewise related to age and showed a parallel pattern. These age-related changes, however, did not characterize the adenohypophysis, since they were concurrently evidenced, with minor differences in pattern, by other tissues (neurophypophysis, hypothalamus and midbrain). They would thus appear to reflect growth and senescence rather than specific alterations of hormonal synthesis.

PARALLEL AND CENTRAL TRANSFORMATIONS OF RIEMANNIAN MANIFOLDS, by C. C. Hsiung and H. I. Nassar. Aug. 1961, 51p. incl. refs. (Technical rept. no. 1) (AFOSR-2816) (AF 49(638)1009) Unclassified

Let M^n, M^{*n} be 2 Riemannian manifolds of dimension n (≥ 2) immersed in a Euclidean space E^{n+m} of dimension $n+m$ ($m > 0$). By a parallel transformation f between the manifolds M^n, M^{*n} in the direction of a fixed unit vector E in the space E^{n+m} is meant a diffeomorphism $f: M^n \to M^{*n}$ such that the line joining every pair of corresponding points P, P^* of the manifolds M^n, M^{*n} under f is parallel to the vector E. By a central transformation f between the manifolds M^n, M^{*n} is meant a diffeomorphism $f: M^n \to M^{*n}$ such that the line joining every pair of corresponding points P, P^* of the manifolds M^n, M^{*n} under f passes through a fixed point in the space E^{n+m}. Let Y, Y^* be the position vectors of the points P, P^* in the space E^{n+m}. Then a central transformation of the manifolds M^n, M^{*n} can be given by $Y^* = kY$, and is called a homotheticity if k is constant. Let H_{rp} (respectively H^*_{rp}) be the p-th ($1 \leq p \leq n$) mean curvature of the manifolds M^n (respectively M^{*n}) relative to a unit normal vector e_r (respectively e^*_r) at the point P (respectively P^*).

Various authors have been able to find conditions on the mean curvatures H_{rp} and H^*_{rp} of 2 compact oriented manifolds M^n and M^{*n} immersed in the space E^{n+m} under a parallel (respectively central) transformation f of class C^3 such that f be a translation (respectively homotheticity). The present work discusses parallel transformations for the most general case where n, m, p all can be arbitrary. (Contractor's abstract, modified)

VECTOR FIELDS AND INFINITESIMAL TRANSFORMATIONS ON ALMOST-HERMITIAN MANIFOLDS WITH BOUNDARY, by A. L. Hilt and C. C. Hsiung. Sept. 1961, 55p. incl. refs. (Technical rept. no. 2) (AFOSR-3419) (AF 49(638)1009) Unclassified

An investigation is made of vector fields and infinitesimal transformations on almost-Hermitian manifolds with boundary. Riemannian manifolds are considered, as well as Lie derivatives over the manifolds, local boundary geodesic co-ordinates, and integral formulas. A Killing vector field on a compact orientable Riemannian manifold is discussed, and almost-Hermitian, almost-semi Kahlerian, and almost-Kahlerian structures are defined. Contravariant analytic vector fields are given consideration on an almost-Hermitian manifold M(n) with boundary B(n-1), together with their relations to Killing, projective Killing, and conformal Killing vector fields. Covariant analytic vector fields on an almost-Hermitian manifold with boundary are studied as well as vector fields on an almost-Kahlerian manifold with boundary.

DISCONTINUITY OF AMIDASE FORMATION BY PSEUDOMONAS AERUGINOSA, by M. Kelly and H. L. Kornberg. [1962] [3]p. incl. diagrs. (AFOSR-4346) (AF EOAR-61-12) Unclassified

Also published in Biochim. et Biophys. Acta, v. 59: 517-510, 1962.

It is shown that the formation of amidase by Pseudomonas aeruginosa 8602/A during growth on acetamide proceeds in 2 distinct phases, and it is suggested that either the nature of the amidase formed, or the mode of its formation, is different when elicited by non-substrate inducers than when elicited by acetamide. When the succinate-grown P. aeruginosa were placed in fresh medium containing 50 mM acetamide as sole source of C and N, the onset of growth was preceded by the formation of amidase, which thereafter continued over 2 generations, at a rate proportional to the increase in cell density. When the concentration of acetamide in the medium, which fell rapidly as a consequence of amidase action, had decreased to less than 1/2 of that initially present, amidase formation ceased. However, a second phase of rapid amidase formation began when acetamide could no longer be detected in the medium and continued throughout the subsequent growth of the cells. The 2 phases of amidase formation could be observed independently of one another.

IDENTIFICATION OF ENZYMES INVOLVED IN THE FORMATION OF PYRUVATE FROM ITACONYL-COENZYME A, by R. A. Cooper and H. L. Kornberg. [1962] [3]p. incl. table. (AFOSR-4347) (AF EOAR-61-12) Unclassified

Also published in Biochim. et Biophys. Acta, v. 62: 438-440, 1962.

It is reported (see item no. 1439, Vol. VI) that sonic extracts of itaconate-grown Pseudomonas B_2 aba catalyzed the formation of equimolar quantities of acetyl-CoA and pyruvate either from itaconate, ATP and CoA or from itaconyl-CoA, but that similar formation of acetyl-CoA and pyruvate from citramalate, ATP and CoA necessitated the further addition of succinate. It is the aim of this communication to confirm and extend these findings and to report the separation and identification of the enzymes involved in these reactions.

FORMATION OF PYRUVATE AND ACETYL-COENZYME A FROM ITACONYL-COENZYME A BY PSEUDOMONAS SP., by R. A. Cooper and H. L. Kornberg. [1962] [2]p. incl. refs. (AFOSR-4348) (AF EOAR-61-12) Unclassified

Also published in Biochim. et Biophys. Acta, v. 59: 480-481, 1962.

Pseudomonas B_2aba grew readily on a medium containing 25 mM itaconate as sole C source, and washed suspensions of cells, thus grown, readily oxidized itaconate. However, sonic extracts of such cells failed to oxidize or utilize itaconate unless they were supplemented with $MgCl_2$, ATP and CoA. Under these conditions, 1.8 µmol of pyruvate were formed/h/mg of protein from itaconate. The formation of pyruvate was measured spectrophotometrically. The results indicate that a major pathway for the utilization of itaconate by Pseudomonas B_2aba involves a prior activation of itaconate to itaconyl-CoA and the subsequent transformation of this compound to equimolar amounts of acetyl-CoA and pyruvate. This pathway is therefore different from that postulated by Brightman and Martin (Jour. Bacteriol., v. 82: 376, 1961) and appears to be similar to the mode of itaconate utilization demonstrated to occur in liver mitochondria. Since the extracts of the itaconate-grown organism also catalyzed the formation of pyruvate from citramalate plus cofactors and were rich in pyruvate transacetase, it is likely that the transformation of itaconyl-CoA to pyruvate and acetyl-CoA involves its hydration to citramalyl-CoA.

AMIDASE FROM PSEUDOMONAS AERUGINOSA: A MULTI-HEADED ENZYME, by M. Kelly and H. L. Kornberg. [1962] [2]p. incl. diagr. table. (AFOSR-4349) (AF EOAR-61-12) Unclassified

Also published in Biochim. et Biophys. Acta, v. 64: 190-191, 1962.

It has been reported that Pseudomonas aeruginosa, during later stages of growth on acetate as sole C source, forms large quantities of an enzyme which is specific for the hydrolysis of several aliphatic amides: $R \cdot CONH_2 + HOH \rightarrow R \cdot COOH + NH_3$ (Reaction 1). Sonic extracts of the organism rich in this enzyme have been found to be capable also of effecting the transfer of the acyl moiety of such amides to hydroxylamine: $R \cdot CONH_2 + NH_2OH \rightarrow R \cdot CONHOH + NH_3$ (Reaction 2). It was found that urea at low concentrations was a powerful inhibitor of amidase activity (Reaction 1) but exerted a negligible effect on transferase activity (Reaction 2). At a concentration of 2.10^{-3} M urea and using propionamide as substrate, the transferase activity of the purified enzyme was identical with that observed in the absence of urea, though no amidase activity was detected. Conversely, the addition of KF affected transferase activity more powerfully than amidase activity. In the presence of 0.1 M KF, the amidase activity was 96% of that in the absence of fluoride where as the transferase activity had been reduced to 18%. The results indicate that 2 enzymic reactions are catalyzed at different rates. If, as seems likely, they are indeed brought about by one enzyme, this enzyme must be regarded as a "multi-headed" enzyme.

THE INFLUENCE OF GROWTH SUBSTRATES ON OXALOACETATE FORMATION FROM β-HYDROXYASPAR[T]ATE BY MICROCOCCUS DENITRIFICANS, by H. L. Kornberg and J. G. Morris. [1962] [3]p. incl. diagrs. (AFOSR-J200) (AF EOAR-62-77) AD 400057 Unclassified

Also published in Biochim. et Biophys. Acta, v. 65: 378-380, 1962.

Micrococcus denitrificans were grown aerobically in a medium containing sodium glycollate as sole C source. After harvesting, the cells were resuspended in fresh growth media, containing either 25 mM sodium glycollate or 25 mM sodium succinate as sole C source. It was found that when glycollate-grown M. denitrificans continued to grow on glycollate as C source, the rate of hydroxyaspartate dehydratase formation was linearly related to the increase in cell mass. However, when the glycollate-grown cells grew further on succinate as sole C source, the initial hydroxyaspartate dehydratase content of the culture increased only slightly during 3 generations of growth. When succinate-grown M. denitrificans were placed in fresh growth medium containing 25 mM glycollate as sole C source, no growth was detected for the first 2.5 h. However, the initial low hydroxyaspartate dehydratase level rose rapidly. When succinate-grown M. denitrificans were placed in fresh growth medium containing both succinate and glycollate there was only slight hydroxyaspartate dehydratase formation. The results indicate that the enzymic formation of oxaloacetate from erythro β-hydroxyaspartate occurs to a quantitatively negligible extent during the growth of M. denitrificans on succinate but is of importance in this organism's growth on glycollate as sole C source.

RESEARCH IN HYPERBOLIC DIFFERENTIAL EQUATIONS, by F. J. Bureau. Final rept. Mar. 15, 1962, 7p. (AFOSR-2704) (AF 61(052)86) Unclassified

The specific objective of the proposed research was to conduct a program of investigation on the existence and properties of solutions of elliptic and hyperbolic, linear and non-linear, partial differential equations.

In particular, a group of researchers was centered on the initial value problem (problem of Cauchy) for linear totally hyperbolic partial differential equations. The object of the second group of researchers was to determine the asymptotic behavior of the spectral functions associated with a boundary value problem for totally hyperbolic equations in several independent variables. The final result concerning this spectral function depends on a certain Tauberian theorem whose first form was finally completed in order to give a precise estimate of the remainder term. The main result is that the asymptotic behavior of the spectral function depends only on the values of the coefficients of L_x at the point x and is independent of the boundary conditions. The same method was used to investigate the asymptotic behavior of the spectral matrix of the operator of elasticity. A comprehensive research program on partial differential equations was also initiated with the view of obtaining new results or new methods for known results. It appears that the properties of the finite part and of the logarithmic part of certain divergent integrals are basic for an adequate study of the problems considered.

RESPONSE OF A BURNING SOLID TO SMALL-AMPLITUDE PRESSURE OSCILLATIONS, by F. A. Williams. [1962] [14]p. incl. diagrs. table, refs. [AF 49(638)-412] Unclassified

Published in Jour. Appl. Phys., v. 33: 3153-3166, Nov. 1962.

The acoustic response for waves normally incident upon a burning surface region is analyzed. The combustion process involves heat conduction within the solid, an irreversible surface pyrolysis process, and a distributed gas-phase reaction zone with conduction and diffusion. Linear differential equations determining the acoustic response are derived for arbitrary frequencies and simplified to a single second-order equation for the case in which the frequency is small compared to the reciprocal of a characteristic gaseous reaction time. An approximate analytical solution to this last equation, valid when the over-all activation energy for the gaseous reaction is large, is shown to yield a simple formula for the admittance, which determines the acoustic response. This admittance formula implies that sound waves are attenuated at low frequencies and, in most cases, amplified only when the frequency approaches the reciprocal of the reaction time. In particular, it is inferred that a pure solid ammonium perchlorate deflagration will not amplify acoustic vibrations, and therefore, presumably, will not experience oscillatory combustion. FIELDS SATISFYING THE ASYMPTOTIC CONDITION, by R. F. Streater. [1962] [13]p. incl. refs. (AFOSR-3713) (AF EOAR-61-87) Unclassified

Also published in Nuovo Cimento, Series X, v. 25: 274-286, July 16, 1962.

It is proved that a necessary and sufficient condition that a local current should be the current of a local field satisfying the asymptotic condition is that the time-ordered products of the current should have the same 1-particle singularities as come from all Feynman graphs which can be disconnected by cutting 1 internal line. It is shown that a field theory with a unique vacuum and 1-particle state, and satisfying the asymptotic condition, is defined by its set of reduced Wightman functions (whose spectra begin at the threshold of the 2-particle continuum). The problem of ensuring that the space of states has a positive definite metric is not solved.

DISPERSION THEORY OF THE DEUTERON FORM FACTOR AND ELASTIC e-d SCATTERING, by H. F. Jones. [1962] [13]p. incl. diagrs. table, refs. (AFOSR-J143) (AF EOAR-62-87) AD 400090 Unclassified

Also published in Nuovo Cimento, Series X, v. 26: 790-802, Nov. 16, 1962.

The anomalous threshold discontinuities of the deuteron form factors are calculated by an extension of Cutkosky's method to the spinor case. The form factors are then evaluated in a tail approximation and substituted into the single photon exchange term for elastic e-d scattering. The resulting expression is very similar to the Jankus formula, but shows that the usual modification $e \to eF_1^S$ should more correctly be

$e - eF^{S}_{ch}(1 - s/4m_d^2)^{-1}$. The bare form factors should also be multiplied by $(1 - s/4m_d^2)^{-1}$. Small angle scattering is re-analyzed with the new formula; the changes are largely masked by the experimental uncertainties, but result in a small increase in the neutron form factor F^{n}_{1}.

PRODUCTION OF STRANGE PARTICLES IN PROTON-NEUTRON COLLISIONS, by W. D. Curtis. [1962] [14]p. incl. diagrs. tables, refs. (AFOSR-J318) (AF EOAR -62-87) AD 408025 Unclassified

Also published in Nuovo Cimento, Series X, v. 27: 164-177, Jan. 1, 1963.

Strange particle production in proton-neutron collisions is calculated by means of the 1-pion exchange (O. P. E.) model for an incoming neutron with a kinetic energy of 3 gev in the laboratory frame. The calculation takes into account 2 Feynman diagrams and includes the interference term. Use is made of the Ferrari-Selleri cut-off function $C(\alpha, q^2)$ and these results are compared with those that do not take this into account. The lab. energy spectra of the outgoing nucleons are drawn for the 6 p n processes, and their total cross-sections evaluated. From these results the total cross-section values for the 4 corresponding p, p reactions are deduced and compared with their known experimental values at 2.85 gev. Good agreement is shown in 3 of these cases, but the theoretical result for the fourth one is somewhat small. (Contractor's abstract)

CORRELATED ORIENTATIONS SOUNDS AND EAR MOVEMENTS OF HORSESHOE RATS, by J. D. Pye, M. Flinn and others. [1962] [4]p. incl. diagrs. (AFOSR-J208) (In cooperation with Harvard U., Cambridge, Mass. and Mass. Inst. of Tech., Lexington) (AF EOAR-61-40) AD 400179 Unclassified

Also published in Nature, v. 196: 1185-1188, Dec. 1962.

Horseshoe bats emit a buzz of rapidly repeated and

shortened orientation sounds when echo-locating objects at close range. Motion pictures and synchronized tape recordings were taken of this species, some at 768 frames/sec and others at 64 frames/sec. There was a close, though not perfect, correlation between the emission of the short pulses and the alternating movements of the ears. If these bats are deprived of the use of these muscles that move the pinnae, they compensate by nodding the head vigorously. A brief investigation of the muscles responsible for ear movements was undertaken. The speed of contraction of the superficial cervico-auricularis muscle when loaded with the pinna was tested with direct electrical stimulation. It was shown that the auricular muscles are capable of moving the pinna by separate contractions within the normal speed range of the active bat. Present results are compatible with the hypothesis that Rhinolophus is able to use the Doppler shifts which the moving ears impose on returning echoes of its own orientation sounds. THE LIMITS OF TRANSFER OF A LEARNED DISCRIMINATION TO FIGURES OF LARGER AND SMALLER SIZES, by J. R. Parriss and J. Z. Young. [1962] [18]p. incl. diagrs. tables. (AFOSR-J936) [AF EOAR-61-39] AD 415872 Unclassified

Also published in Zeitschr. verglichende Physiol., v. 45: 618-635, 1962.

The hypothesis was tested in Octopus that the capacity to transfer to figures of various sizes depends upon experience of different sizes of retinal image during training. During training to discriminate between vertical and horizontal rectangles, discrimination was always better for larger than for smaller figures. Rectangles 22 x 4.5 mm, when seen at 1000 mm, are near the limit of discrimination. Some groups of animals were given wide retinal experience. They were either allowed to approach the figures during training, or were trained in 3 fixed positions. Other groups were given limited retinal experience, being trained in one position and not allowed to move towards the figures. Transfer was found to be greater in the groups where the transfer figures were within retinal experience, especially for transfer downwards. The animals showed some capacity to recognize figures outside retinal experience larger than the training figure, when the training figure was small and at a distance. However, there was very little recognition of retinal images smaller than any seen during training. Octopuses trained with small figures a short distance away cannot recognize larger figures. As recorded in other species, transfer was always better to figures 2 and 4 times the size used in training than to half and a quarter the size used in training. Outside these limits transfer decreased rapidly.

SIMULTANEOUS SHAPE DISCRIMINATION IN OCTOPUS AFTER REMOVAL OF THE VERTICAL LOBE, by W. R. A. Muntz, N. S. Sutherland, and J. Z. Young. [1962] [10]p. incl. tables, refs. (AFOSR-J937) (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-61-39] and Office of Naval Research) Unclassified

Also published in Jour. Exper. Biol., v. 39: 557-566, Dec. 1962.

Octopuses from which the vertical or median superior frontal lobes had been removed were able to discriminate between objects shown simultaneously, although they could not distinguish them when shown successively. Discrimination by operated animals was always less accurate than by controls. A very difficult simultaneous discrimination could not be performed without the vertical lobes (although the same animal was able to make it before operation). A discrimination learned by the simultaneous method before operation continues to appear (though less accurately) after vertical lobe removal. The experiments therefore confirm previous evidence that the representations that ensure correct visual responses do not lie mainly in the vertical lobes, but elsewhere (probably in the optic lobes). The function of the vertical lobes is considered to be to stabilize and perhaps lower the level of tendency to attack.

STUDIES ON THE RECEPTORS IN THE CEREBRAL VESICLE OF THE ASCIDIAN TADPOLE. I. THE OTOLITH, by P. N. Dilly. [1962] [6]p. incl. illus. diagr. (AFOSR-J939) [AF EOAR-61-39] AD 415867 Unclassified

Also published in Quart. Jour. Microscopic Sci., v. 103: 393-398, 1962.

Electron microscope observations of the gravity receptor of the tadpole larva of Ciona intestinalis show that the otolith is unicellular. The nucleus of the otolith persists for the entire life of the tadpole. The pigment mass of the otolith is intracellular, and it appears to be built up by fusion of granules. The otolith cell has a free part within the cavity of the cerebral vesicle, and a foot part which is contained within a mound of cells on the ventral wall of the cerebral vesicle. The junction between these 2 parts is probably the transducer region. The transducer region is a complex system of folded cell membrane. Distortion of this system during rotation of the tadpole while swimming probably evokes changes in the neurones which surround the foot process of the otolith cell. One of these neurones is connected to the cerebral ganglion by a process which may be an axon. Fibrils extend from the transducer region of the otolith cell to the basement membrane, and probably serve to resist distortion of the transducer region. The foot process of the otolith cell

is connected to the surrounding cells by specializations of the cell membrane similar to attachment plaques. The observations suggest that the otolith has been evolved from a cilium.

d-ORBITALS IN COMPOUNDS OF SECOND-ROW ELEMENTS. I. SF_6, by D. P. Craig and C. Zauli. [1962] [8]p. incl. tables, refs. (AFOSR-J6) (AF 61(052)61) AD 400382 Unclassified

Also published in Jour. Chem. Phys., v. 37: 601-608, Aug. 1, 1962.

Optimum exponent values for 3s, 3p, and 3d orbitals of sulfur in SF_6 have been calculated in an electrostatic approximation. The sulfur electrons are perturbed by fluorine potentials appropriate to self-consistent field wave functions for the fluorine orbitals, and the energy minimized with respect to wave-function exponents. The optimum values are $k_{3s} = 2.0$, $k_{3p} = 1.6$, and $k_{3d} = 1.2$, corresponding to expansion of 3s and 3p orbitals, and contraction of 3d, compared with free-atom values. The values are remarkably stable to changes in valence-orbital configurations as between SF_6, $S^+F_6^-$, $S^{++}F_6^{--}$, and even $S^-F_6^+$. They are also little affected by change in hybridization at fluorine, and should therefore be suitable for use in the construction of molecular wave functions. Although the calculated energies include no exchange terms they are still of some interest since they suggest, for example, that the promotion energy to the configuration sp^3d^2 of sulfur (estimated to be 25-31 ev) can be compensated by the energy of molecule formation. d-ORBITALS IN COMPOUNDS OF SECOND-ROW ELEMENTS. II. COMPARISON OF H, C, F, AND Cl AS LIGANDS, by D. P. Craig and C. Zauli. [1962] [7]p. incl. diagrs. tables. (AFOSR-J10) (AF 61(052)61) AD 400387 Unclassified

Also published in Jour. Chem. Phys., v. 37: 609-615, Aug. 1, 1962.

Calculations have been made to contrast the effects of H, C, F, and Cl as ligands on loosely bound d orbitals of second-row elements. Sets of 1, 2 (at right angles), 4 (square), and 6 (octahedral) identical atoms are compared. The approximation is electrostatic, with the use of potentials derived from self-consistent field wave functions. The order of effectiveness is F > Cl > C >> H. The first 3 are more nearly equal in their perturbing power than expected from their electronegativities, and hydrogen is surprisingly ineffective. The conclusions lend themselves to some generalization to the conditions of binding in second-row elements. These are discussed, and some examples given. (Contractor's abstract)

MECHANISM OF BENZIDINE AND SEMIDINE REARRANGEMENTS. PART X. SUBSTRATE-ISOTOPE EFFECTS ON KINETICS AND PRODUCTS OF ACID REARRANGEMENT OF THE HYDRAZOBENZENES, by D. V. Banthorpe and E. D. Hughes. [1962] [6]p. incl. tables. (AFOSR-64-1554) [AF 61(052)66] AD 446117 Unclassified

Also published in Jour. Chem. Soc. (London), No. 654: 3308-3313, Sept. 1962.

Hydrazobenzene, its 4,4'-dideutero-derivatives, and a derivative C-deuterated everywhere except in 4,4'-positions, have been rearranged with acid in aqueous dioxan and in aqueous and anhydrous ethanol; and comparisons have been made of the rearrangement rates and product proportions. The products are benzidine 76-72%, and diphenyline 24-28%, the small variation depending on the solvent. Neither in para- nor in ortho-positions does deuteration make a detectable difference either to reaction rates or to product ratios. The aromatic proton losses are concluded to occur after the activation barrier for rearrangement has been surmounted, and after the mechanism has decisively branched towards the individual products. MECHANISM OF BENZIDINE AND SEMIDINE REARRANGEMENTS. PART IX. SUBSTRATE-ISOTOPE EFFECTS ON KINETICS AND PRODUCTS OF ACID REARRANGEMENT OF 1,1'-HYDRAZONAPHTHALENE by D. V. Banthorpe, E. D. Hughes and others. [1962] [9]p. incl. tables, refs. (AFOSR-64-1809) [AF 61-(052)66] AD 449096 Unclassified

Also published in Jour. Chem. Soc. (London), No. 653: 3299-3308, Sept. 1962.

1,1'-Hydrazonaphthalene, as well as its 2,2'- and 4,4'-dideutero-derivatives, the preparation of which is described, have been rearranged with acid in 60% aqueous dioxan, and comparisons have been made of rearrangement rates and product proportions. The same hydrazo-compounds have been rearranged with acid in 95% aqueous ether-ethanol, and comparisons have been made of product proportions. In the conditions of these comparisons, 3 products alone are formed, the single 4,4'-ring-coupled product, naphthidine, and the pair of 2,2'-ring-coupled products, dinaphthyline, and its cyclised relative, dibenzocarbazole, all in substantial, easily measurable, amounts. In the dioxan solvent, neither 2-deuteration nor 4-deuteration affects the overall rate of rearrangement.

In both solvents, neither 2- nor 4-deuteration affects the ratio of 4,4'- to total 2,2'-ring-coupled products. In both solvents, 2-deuteration, but not 4-deuteration, does change the internal ratio of the two 2,2'-ring-coupled products, the shift being large, and in favor of the carbazole. ANGULAR CORRELATIONS IN A BETA DECAY, by L. Egardt. July 4, 1962 [19]p. incl. diagrs. table. (Technical note no. 7) (AFOSR-3548) (AF EOAR-62-3) AD 285294 Unclassified

Also published in Nuovo Cimento, Series X, v. 27: 357-367, Jan. 16, 1963.

A current-current type of interaction is assumed with the conventional lepton current coupled to a general hyperon current involving 6 unknown form factors. The expression obtained for the electron proton angular correlation is to a large extent dominated by phase space and for reasonable assumptions about the form factors the angular distribution of electrons with respect to the proton momentum is always peaked in the backward direction. This also holds true for a scalar, pseudoscalar or a tensor interaction. Some comments are made on the effect of an intermediate particle.

PION-PION INTERACTIONS IN THE STATES T = 0 AND T = 1, by T. D. Spearman. Aug. 29, 1962 [47]p. incl. diagrs. tables, refs. (Technical note no. 9) (AFOSR-4063) (AF EOAR-62-3) AD 290624 Unclassified

Also published in Phys. Rev., v. 129: 1847-1857, Feb. 15, 1963.

New dispersion relations are derived for the s-wave pion-nucleon scattering amplitudes. These relations are specifically chosen to facilitate the task of separating the 2-pion exchange term from the other effects contributing to low energy pion-nucleon scattering. In these equations the contribution from the unknown short range terms is markedly suppressed, a greater emphasis is placed on the experimentally better established very low energy pion-nucleon data, (in particular, on the scattering lengths), and in the contribution of the 2-pion exchange term, the lower energies are more heavily stressed. The terms due to the 2-pion exchange, which we isolate, are very clearly recognized by their characteristic energy dependences. The 2-pion exchange terms are analyzed in terms of the interaction between the 2 pions. The values obtained for these terms are made to yield information

about the phase-shifts for pion-pion scattering in the T = 1 and T = 0 states. In the T = 1 state the data are well fitted with a narrow resonance in the pion-pion system at 750 mev Taking the results of electron-nucleon scattering experiments in conjunction with the present data, the half-width of this resonance is found to lie between 40 and 60 mev, in agreement with the experimental data for the observed P-meson.

(Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-73, Atomic Energy Commission, National Institutes of Health, National Science Foundation, and Rockefeller Foundation) Unclassified

This symposium was devoted to the role of genetic material as an information code in protein synthesis and the mechanism of information transfer from DNA to the site of synthesis. Major attention was given to cellular mechanisms governing the rates of enzyme activity and enzyme synthesis. While most of the research presented dealt with microorganisms, the significance of these efforts in questions of normal and abnormal growth and development in multicellular forms is apparent.

BASIC MECHANISMS IN ANIMAL VIRUS BIOLOGY. 27TH COLD SPRING HARBOR SYMPOSIUM ON QUANTITATIVE BIOLOGY. Final summary rept. June 7-13, 1962 [6]p. (AFOSR-5108) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-276, Atomic Energy Commission, National Institutes of Health, National Science Foundation, and Rockefeller Foundation) AD 413871 Unclassified

Papers dealing with various aspects of animal virus biology were presented. One paper discussed virus structure from the viewpoint of the crystallographer. Two papers that were completely spontaneous resulted from the recognition that the field was infused with ideas for which there was no uniform nomenclature. A series of proposals for these ideas, as well as a system for grouping viruses according to recognized properties, were formulated. From several laboratories, there were papers applying the new concepts of molecular biology to diverse animal viruses. In some papers, the traditional question of the host-parent relationship was brought to the level of cell biology. Several papers were concerned with the mechanisms by which viral agents may induce tumors.

THE EFFECT OF CERTAIN VARIABLES ON THE ULTRASONIC CLEAVAGE OF PHENOL AND OF PYRIDINE, by D. L. Currell, G. Wilheim, and S. Nagy. [1962] [4]p. incl. tables, refs. (AFOSR-J781) (AF 49(639)471) AD 412978 Unclassified

Presented at Pacific Southwest Regional meeting of the Amer. Chem. Soc., Los Angeles, Calif., Dec. 1960.

Also published in Jour. Amer. Chem. Soc., v. 85: 127-130, Jan. 20, 1963.

The effect of pH and dissolved gases on the ultrasonic reaction of aqueous solutions of phenol and of pyridine to produce acetylene has been investigated. Phenol in alkaline solution and pyridine in acid solution are essentially unaffected by ultrasonic waves. The rate of production of acetylene is dependent upon the ratio of specific heats of the dissolved gases. The rate of the ultrasonic cleavage of the pyridine ring was shown to be independent of the surface tension of the reaction solution. The significance of these results is discussed in terms of possible mechanisms for the chemical effect of ultrasonic waves.

INTERVAL CLANS WITH NONDEGENERATE KERNEL, by R. C. Phillips. [1962] [5]p. (AF 18(603)89) Unclassified

Published in Proc. Amer. Math. Soc., v. 14: 396-400, June 1963.

Let S be a compact, connected semigroup with identity (i.e., a clan) whose underlying space is an ordered space (homeomorphic to an interval of real numbers). The author calls such semigroups interval clans. Suppose further that the kernel K is proper and nondegenerate. From known results, K consists of either all left zeros or all right zeros. It is assumed that these are all right zeros; in the case of left zeros, the result is analogous. The author characterizes such semigroups in terms of an interval semigroup with zero S' and a mapping h as follows. Let u denote the identity, d the other point, and 0 the zero of S'. Then there exists an idempotent $e \in (0,u]$ such that $de = 0$, and h is a continuous mapping of $[0,u]$ on a compact connected ordered space inducing a congruence on the standard thread (= I-semigroup $[0,e]$. The construction for retrieving the semigroups S from S' and h requires a number of defining relations which are too complicated to reproduce here. The semigroup S' is simply the Rees quotient of S. Although the paper considers only separable spaces, the proofs seem not to depend on the separability. (Math. Rev. abstract)

PRESSURE DEPENDENCE OF THE RESISTIVITY OF GERMANIUM, by A. Van Itterbeek, O. Verbeke, and F. Theeuwes. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-64-0767) (AF EOAR-63-40) AD 436488 Unclassified

Also published in Physica, v. 29: 757-763, June 1963.

The specific resistivity of a germanium n-type monocrystal of high resistivity (76 ohm-cm at 15°C has been measured as a function of pressure and temperature. Calculations are carried out on the pressure and temperature dependence of the intrinsic energy gap and electron mobility. The pressure dependence has been measured with hydrostatic pressures upto 1000 km/cm^2 in a temperature range of 328.8°K to 174°K. Measurements of the specific resistivity as a function of temperature were carried out down to liquid hydrogen temperatures.

LOW FIELD EPR MEASUREMENTS IN DPPH AT LOW TEMPERATURES, by L. Van Gerven, A. Van Itterbeek, and L. De Laet. [1962] [14]p. incl. illus. diagrs. tables. (AFOSR-64-2532) [AF EOAR-63-40] Unclassified

Also published in Paramagnetic Resonance, Proc. of the First Internat'l. Conf., Jerusalem (Israel) (July 16-20, 1962), New York, Academic Press, v. 2: 905-918, 1963.

The g-factor, the line width and the relaxation time of DPPH have been measured at 28 MHz between liquid helium temperatures and room temperature. At very low temperatures, the g-factor displays a peculiar temperature dependence, which is possibly due to uncertainties in the demagnetization corrections. The shape of the DPPH absorption lines has been investigated by means of graphical comparison. In the whole temperature range they display a generalized Lorentzian shape. In the whole temperature range, the line width values are rather low, compared to those in the literature. The line width increases sharply between 50° and 20°K, in agreement with Singer's and the authors' previous measurements. Furthermore, a maximum in the line width vs temperature curve is found around 10°K. Using the dependence of the line width on H_1, preliminary and rough measurements have been made of the relaxation time between 1.7° and 300°K. (Contractor's abstract, modified)

A KINETIC STUDY OF HYDROCARBON-OXYGEN-NITROGEN FLAME SYSTEMS AND MOLECULAR WEIGHTS OF CHAIN CARRIERS, by W. E. Falconer and A. van Tiggelen. [1962] [14]p. incl. diagrs. tables, refs. (AFOSR-J1014) [AF EOAR-63-42] Unclassified

Also published in Ninth Symposium (Internat'l.) on Combustion, Cornell U., Ithaca, N. Y. (Aug. 27-Sept. 1, 1962), New York, Academic Press, 1963, p. 689-702.

The over-all activation energy (E_T) of the branching process and the mean molecular weight (M) of the chain carriers have been derived for flames of n-butane, isobutane, and neopentane. The results are respectively: n-butane: M = 23; E_T = 33 kcal; isobutane: M = 24; E_T = 31 kcal; and neopentane: M = 28; E_T = 38 kcal. These results are compared to analogous data obtained previously with other hydrocarbons and an interesting relation is observed between the bond energy CH and the activation energy of the branching process at least for saturated hydrocarbon compounds. Furthermore the rather low value of the mean molecular weight of the chain carriers constitutes an argument in favor of a rapid destruction of the alkyl radicals in their reaction with molecular oxygen; so peroxy radicals persist at the higher temperatures of the flame as compared to the temperature in slow oxidations. RESEARCH ON EFFECTS OF ACETYLCHOLINE ON THE MAMMALIAN MOTOR END-PLATE, by S. Thesleff. Final technical rept. Aug. 25, 1962 [5]p. incl. refs. (AFOSR-3479) (AF 61(052)108) AD 284909 Unclassified

Investigations of the electrophysiological properties of the mammalian motor end-plate reveal: (1) Prolonged or intermittent application of acetylcholine desensitizes the chemoreceptors of the motor end-plate, (2) The motor nerve controls the size of the chemosensitive surface in muscle fiber, presumably through the release of a chemical mediator, and (3) The chemical sensitivity of end-plate receptors in muscles from patients with myasthenia gravis is normal, suggesting that the neuromuscular defect in this disease is of prejunctional origin. (Contractor's abstract)

NERVOUS CONTROL OF CHEMOSENSITIVITY IN MUSCLE, by S. Thesleff. [1961] [12]p. incl. illus. diagrs. tables, refs. (Sponsored jointly by [Air Force Office of Scientific Research under AF 61(052)106], Muscular Dystrophy Associations of America, Inc., and Public Health Service) Unclassified

Published in Ann. New York Acad. Sci., v. 94: 535-548, Sept. 8, 1961.

Experiments on isolated mammalian skeletal muscle by electrical micromethods indicated that muscle fibers have a high uniform sensitivity to acetylcholine (ACH) and that upon innervation, the chemosensitive area decreases in size until it covers only the end-plate region. According to this view, the motor nerve has 2 functions: (1) to initiate mechanical activity in muscle, and (2) to control the size of its chemo-receptor surface. Since inactivity cannot explain the global chemosensitivity of denervated muscle fibers, it is assumed that lack of some chemical agent released by the nerve is responsible for the extension of the receptor surface.

PRIMARY COSMIC RADIATION AND VERY HIGH ENERGY INTERACTIONS, by S. von Friesen. Administrative rept. no. 1, June 1-Nov. 30, 1962, 3p. (AFOSR-4815) (AF EOAR-62-71) Unclassified

Cosmic ray particles undergoing collisions with emulsion nuclei are being used in an analysis of nucleus-nucleus collisions. The analysis involves determination of the nature of the secondary particles, their energy and angular distribution. A procedure for measuring the charge of low-energetic heavy particles stopping in the emulsion is being tested. For this, an instrument which registers the profile of the tracks as a function of residual range has been constructed. A comparative study of the determination of particle charge by the integral blob length method as given by Barkas and a photometric method already being used in this laboratory is being made. A theoretical calculation has been performed of the spectra of the iron group with different assumptions about the acceleration mechanism, and the experimental spectrum has been compared with the calculated distribution. Work on the tracing of tracks found in one of the stacks exposed at Guam in 1959 is continuing.

THERMOCHEMISTRY OF SELECTED RADICAL RECOMBINATION REACTIONS, by S. Sunner. Final rept. Jan. 15, 1962, 10p. incl. refs. (AFOSR-2237) (AF 61(052)46) AD 274252 Unclassified

The photolysis of primary or secondary aliphatic disulfides in an organic matrix at 77°K quantitatively leads to the reaction $R_1R_2CHSSCHR_1R_2 \rightarrow R_1R_2C = S + HSCHR_1R_2$. Strong evidence is presented for the formation of stabilized thionyl radicals when a thiol is photolyzed. A few other compounds were studied strengthening the view that 2 fairly large radicals cannot simultaneously be formed and separately trapped in the system studied. Thus, one of the basic difficulties cannot be overcome in developing a method for the determination of radical recombination energies by warming up a solid solution of trapped, identical radicals, generated in situ. This statement should be valid in dealing with simple, not highly resonance-stabilized molecules. (Contractor's abstract)

A STUDY ON CONTRACTION, RELATIVE VISCOSITY AND MELTING CURVES OF SOME GLASS-FORMING HYDROCARBON MIXTURES, by K. Rosengren. Jan. 15, 1962 [9]p. incl. diagrs. table. (Technical note no. 7) (AFOSR-2327, pt. 1) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)-46, Swedish Natural Research Council, and Swedish Technical Research Council) AD 274160 Unclassified

Also published in Acta Chem. Scand., v. 16: 1421-1425, 1962.

The contraction, relative viscosity and melting curves have been studied for a number of hydrocarbon mixtures that form glassy states upon freezing at 77°K. The commonly used iso-pentane - 3-methyl pentane glasses as well as 3 new mixtures have been studied. The very smooth curves obtained for the iso-pentane - 3-methyl pentane glasses studied conclusively prove the absence of a microcrystalline structure, which might undergo phase transformation below 150°K. SOME NEW GLASS-FORMING HYDROCARBON MIXTURES, by K. Rosengren and S. Sunner. Jan. 15, 1962 [4]p. (Technical note no. 8) (AFOSR-2327, pt. 2) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)46, Swedish Natural Research Council, and Swedish Technical Research Council) AD 274160 Unclassified

Also published in Acta Chem. Scand., v. 16: 5[illegible], 1962.

Binary and ternary mixtures of hydrocarbons have been tested on their ability to form transparent glasses at liquid nitrogen temperature. Three parts of n-pentane and 8 parts of neo-hexane gave a stable glass, considered to be more inert towards radical attack than previously known glass-forming mixtures, which all contain hydrocarbons with tertiary carbon atoms. (Contractor's abstract)

A SYSTEMATIC STUDY OF THE PHOTOLYSIS OF SOME DIALKYL DISULFIDES IN A RIGID GLASS AT 77°K, by K. Rosengren. Jan. 15, 1962 [28]p. incl. diagrs. tables, refs. (Technical note no. 9) (AFOSR-2327, pt. 3) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)46, Swedish Natural Research Council, and Swedish Technical Research Council) AD 274160 Unclassified

Also published in Acta Chem. Scand., v. 16: 1401-1417, 1962.

A number of primary, secondary and tertiary aliphatic disulfides have been photolyzed in a hydrocarbon matrix at 77°K using super high-pressure mercury lamps together with appropriate filter. The spectral changes have been recorded and the reaction products, obtained after warm-up, have been identified using gas-liquid chromatography. All primary and secondary disulfides (except Me_2S_2) behave in an analogous stoichiometrically simple way (in contrast to tertiary butyldisulfide). Strong evidence is presented for the view that the only detectable overall reaction occurring during photolysis is $R_1R_2CHSSCHR_1R_2 \rightarrow R_1R_2C{=}S + HSCHR_1R_2$. The presence of both reaction products has been established. The spectral changes during the photolysis of dimethyl disulfide are only initially analogous to those of the other primary disulfides. Upon prolonged irradiation unknown reactions occur, leading to the formation of carbonomonosulfide, among other products. (Contractor's abstract)

THE PHOTOLYSIS OF ALKANETHIOLS IN A RIGID GLASS AT 77°K WITH THE POSSIBLE FORMATION OF THIYL RADICALS, by K. Rosengren. Jan. 15, 1962 [6]p. incl. diagr. (Technical note no. 10) (AFOSR-2327, pt. 4) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)46, Swedish Natural Research Council, and Swedish Technical Research Council) AD 274160 Unclassified

Also published in Acta Chem. Scand., v. 16: 1418-1420, 1962.

The photolysis of diethyl-, di-isopropyl-, and di-normal-butyl disulfide in an organic matrix at 77°K leads to the formation of a rather sharp and fairly stable absorption peak at about 25 kc/cm. After warming to room temperature, considerable quantities of disulfide were found in the solution. From this and additional experimental evidence, it is concluded that this peak best can be assigned to the thiyl radical. (Contractor's abstract)

ELECTRONIC ABSORPTION SPECTRA OF UNCONJUGATED ALKYL THIALS AND THIONES, by K. Rosengren. Apr. 3, 1962 [13]p. incl. diagrs. table, refs. (Technical note no. 12) (AFOSR-2705) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)46, Swedish Natural Science Research Council, and Swedish Technical Research Council) AD 280979 Unclassified

Also published in Acta Chem. Scand., v. 16: 2284-2292, 1962.

The electronic spectra of a number of simple aliphatic thials and thiones have been evaluated. The C=S compounds were obtained together with the corresponding thiols by photolysis of disulfides in hydrocarbon glasses at 77°K. Besides the previously known absorption in the visible region ($n \rightarrow \pi^X$ transition, 2 peaks were recorded in the far ultraviolet, one of which was seen only at room temperature. By comparison with analogous oxygen compounds, the 2 peaks were attributed to $n \rightarrow \sigma^X$ and $\pi \rightarrow \pi^X$ transitions, respectively, the latter, disappearing at 77°K, occurring from a vibrationally excited level. When the solutions were stored at room temperature, the intensity of the thiocarbonyl absorption gradually disappeared. For ethanethial, the disappearance was shown to correspond to a simultaneous formation of the trimer, 2,4,6-trimethyl trithiane. (Contractor's abstract)

PHOTOLYSIS OF DIALKYL DISULFIDES IN AN ORGANIC MATRIX AT 77°K (Abstract), by K. Rosengren. [1962] [2]p. (AF 61(052)46) Unclassified

Also published in Bull. Soc. C' 'n. Belg., v. 71: 855-856, Nov.-Dec. 1962.

A number of disulfides $(R_1R_2CHS)_2$, where R_1 = Alkyl and R_2 = Alkyl or H, have been photolyzed in a hydrocarbon matrix at 77°K using high-pressure mercury lamps together with appropriate filters. The spectral changes have been recorded and the reaction products, obtained after warm-up, have been identified. It has been postulated that the only detectable reaction occurring is $R_1R_2CHSSCHR_1R_2 \rightarrow R_1R_2C{=}S + HSCHR_1R_2$. Some of the main facts supporting this view are the following: (1) During photolysis of all primary and secondary disulfides the disulfide maximum at 40 kc cm^{-1} diminished, and absorption peak grew up in the region 44-45 kc cm^{-1} and a well-defined isobestic point was recorded; (2) With more concentrated solutions a faint red color appeared, peak maximum at about 19.5 kc cm^{-1}; (3) When the photolyzed samples were analyzed using gas-liquid-chromatography (GLC) mercaptan was found in amounts varying with the time of photolysis; and (4) Using GLC it was also demonstrated that photolysis at 77°K of a solution containing 2 different disulfides gave no mixed disulfide.

[RESEARCH ON THE NERVOUS STRUCTURES AND THE MECHANISMS RESPONSIBLE FOR THE DIFFERENT PHASES OF PHYSIOLOGICAL SLEEP] Recherches sur les structures nerveuses et les mecanismes reponsables des differentes phases du sommeil physiologique, by M. Jouvet. [1962] [2]p. incl. illus. diagrs. table, refs. (AFOSR-4179) (AF 61(052)109) Unclassified

Also published in Arch. Ital. Biol., v. 100: 125-206, Mar. 1962.

The results of this paper support the idea that 2 structures are responsible for the different phases of sleep. It revealed, on one hand that necessary role of the neocortex in the appeance of the synchronization phenomenon in sleep and on the other hand, the hypnotic system situated at the pontine reticular formation in relationship with the bordering system which is responsible for the period of rapid cortical activity during sleep. In the first part of the report, an electroencephalographic analysis of the different phases of physiological sleep in cats is presented. The second chapter deals with the threshold of wakefulness. The third concerns the different phases of sleep induced by stimulation. The fourth section is dedicated to evoked response during sleep, and the final chapter discusses the different effects of a variety of drugs.

RESEARCH ON THE NEUROPHYSIOLOGICAL MECHANISMS OF SLEEP, by M. Jouvet. Final technical rept. Jan.-Dec. 1961. May 1962, 24p. incl. refs. (AFOSR-2886) (AF 61(052)472) AD 288435 Unclassified

Investigations on new-born kittens nave shown that the rhombencephalic phase of sleep is the first pattern of behavioral sleep observed after birth and that the fast cortical activity during sleep precedes for some days the appearance of the fast cortical activity during arousal. Polygraphic recordings of EEG and EMG of the neck muscles have shown the periodical appearance of a regular theta cortical activity with a total decrease of muscular tonus, during behavioral sleep. These periods are analogous to the rhombencephalic sleep in the cat. Injection of sodium-γ-hydroxybutyrate and

sodium-γ-butyrolacton induces a sleep like state in normal cats which is different from physiological sleep. In decorticate cats however, these drugs may induce rhombencephalic sleep.

THE HIGH-TEMPERATURE OXIDATION KINETICS OF ZIRCONIUM, by K. H. Akram and W. W. Smeltzer. [1962] [17]p. incl. illus. diagrs. tables, refs. (AFOSR-3559) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)734 and Defence Research Board of Canada) AD 612238 Unclassified

Also published in Canad. Metall. Quart., v. 1: 51-57, July-Sept. 1962.

An investigation of the parabolic-linear oxidation of zirconium at 800° and 850°C is reported. It was found that irrespective of the oxygen concentration in the metal substrate, parabolic kinetics represent the growth of the initial compact oxide scale while linear kinetics represent the later stages of growth. Metallographic observations indicated a transition from a compact to compact plus porous oxide scale. Accompanying hardness measurements demonstrated that oxygen penetrated into the metal via a steady concentration profile during linear oxidation. An exponential solution of the diffusion equation fitted to the concentration profile gave evaluations of the oxygen diffusion constant in the metal which are in good agreement with such evaluations from diffusion experiments. Several features of the oxidation kinetics of zirconium and titanium were correlated as further elucidation of the properties of metals in Periodic Subgroup IVB.

Presented at Annual general meeting of the Canad. Inst. Mining and Metall., Ottawa, Ont., Apr. 1962.

Also published in Canad. Mining and Metall. Bull., v. 55: 759-764, Dec. 1962.

Also published in Trans. Canad. Inst. Mining and Metall., v. 65: 371-376, Dec. 1962.

The utilization of alloys in metallurgical dust collection systems is commonly determined by their resistance to the attack of corrosive atmospheres. The steels developed to meet the trends toward higher operating temperatures fall within the ferritic chromium and the austenitic chromium-nickel classifications. This paper presents a survey of the principles governing the corrosion resistance of these alloys in oxidizing atmospheres, and reviews the corrosion mechanisms which contribute to the deterioration of this resistance at high temperatures.

ENERGY LOSS IN CONDENSED MATTER OF H^1 AND He^4 IN THE ENERGY RANGE 4 < E < 30 KEV, by A. Van Wijngaarden and H. E. Duckworth. [1962] [16]p. incl. diagrs. tables, refs. (AFOSR-J45) (AF AFOSR-62-33) AD 297160 Unclassified

Also published in Canad. Jour. Phys., v. 40: 1749-1764, Dec. 1962.

Measurements are reported of the energy loss suffered by H^1 and He^4 particles, of 4- to 30-kev energy, in passing through thin films of carbon, aluminum oxide, and VYNS. Only those particles that emerged in the forward direction were studied. Evidence is presented for identifying the stopping cross sections per atom observed in this way with S_e, the electronic component of the total stopping cross section per atom. It appears that the calculated energy dependence of $S_e(\propto \sqrt{E})$ is somewhat in error, and that the magnitudes of the S_e's for He^4 are systematically too small by 10-15%. [THERMAL EXPANSION OF OXALIC ACID DIHYDRATE IN THE TEMPERATURE RANGE -185°C AND +50°C AND THE PROCESS OF DEHYDRATION] Dilatación térmica del ácido oxálico dihidratado entre -185°C y +50°C y proceso de deshidratación, by E. Neira and M. L. Canut. [1962] [17]p. incl. illus. diagrs. tables, refs. (AFOSR-J272) (AF EOAR-62-92) AD 401098 Unclassified

Also published in Bol. R. Soc. Esp. Hist. Nat. (G), v. 60: 195-210, 1962.

The thermal expansion of the oxalic acid dihydrate has been studied by Weissenberg technique in the temperature range -185°C and +50°C. Above 50°C the dehydration begins to take place and the crystal transforms into the α-oxalic acid anhydrous. At 60°C coexistence of the dihydrate and anhydrous phases can be seen in the x-ray rotation photographs, the dihydrate phase appearing in a single crystal form, but the anhydrous polycrystalline with some preferred orientation. As the temperature rises the texture disappears and the whole crystal becomes α-form, polycrystalline. After waiting 15 min the rotation diagram shows again, coexistence of both phases. After 24 hr the whole polycrystal belongs to dihydrate form. These x-ray results are supported by thermograms, from which at 85°C the 2 water molecules have gone out. The 3 mean sections of the thermal expansion surfaces as deduced by least squares from the experimental data have been analyzed with the corresponding projection of the structure. The maximum of the expansion is along (010) and the minimum normal to the projection of the hydrogen bonds in (010) linking the oxalic acid through the water molecules. The values of the mean expansion coefficients are: $\alpha_{11} = -1.5$, $\alpha_{22} = 147.3$, and $\alpha_{33} = 57.09 \times 10^{-6}$ (between -185°C and 20°C) and $\alpha_{11} = -1.3$.

Also published in Jour. Math. Pures et Appl., v. 42: 167-193, 1963.

Let G be a domain whose boundary C is a rectifiable Jordan curve which has finite total length, passes through 0 and contains 1 as an interior point. Let a sequence of positive numbers $\{m_n\}$ be given, and designate by $C_0(m_n, G)$ and $D_0(m_n, G)$ the sets of functions f(z) that are regular in G and satisfy relatively $\sup_{z \in G} |f(z)z^{-n}| < ck^n m_n$ or $\int_C |f(z)z^{-n}|^2 |dz| < C_1 k_1^{2n} m_n^2$ (n = 0, 1, ...). The constants c, c_1, k, k_1 are independent of n and the integral is interpreted as $\lim_{r \to 1^-} \cdot C_r$, where C_r are level curves interior to G.

The sequence $\{m_n\}$ is said to verify the condition C(G) or D(G) if the sets $C_0(m_n, G)$ or $D_0(m_n, G)$ are, respectively, empty. These conditions are relevant to the study of uniqueness classes for asymptotic expansion of analytic functions in general domains. Employing bounds which he had previously established, together

with well-known properties of conformal maps, the author establishes the equivalence of conditions C(G) and D(G) for some extensive classes of domains G. (Math. Rev. abstract, modified)

DIELECTRIC LOSS IN THE LIQUID CRYSTAL p-AZOXYANISOLE, by E. F. Carr. [1962] [3]p. incl. diagrs. (AFOSR-2113) (AF AFOSR-61-45) Unclassified

Also published in Jour. Chem. Phys., v. 37: 104-106, July 1, 1962.

The real and imaginary parts of the complex dielectric constant of the normal liquid phase of p-azoxyanisole were measured at a temperature of 140°C for a frequency range from 900 mc to 24 kmc. A plot of the complex dielectric constant in the complex plane satisfies the requirements for a Cole-Cole representation reasonably well. The temperature dependence of the dielectric loss at a frequency of 6 kmc shows an absorption maximum in the neighborhood of the clearing point (135°C) for both the anisotropic and normal liquid phases. Measurements of the dielectric loss at frequencies 500 and 900 mc indicate an increase in the dielectric loss as the sample changes from the anisotropic to the normal liquid phase. This change could not be established for measurements at other frequencies reported in this paper. (Contractor's abstract)

INFLUENCE OF ELECTRIC AND MAGNETIC FIELDS ON THE DIELECTRIC CONSTANT AND LOSS OF THE LIQUID CRYSTAL ANISALDAZINE, by E. F. Carr. [1962] [5]p. incl. diagrs. refs. (AFOSR-J 688) (AF AFOSR-61-45) AD 413629 Unclassified

Also published in Jour. Chem. Phys., v. 38: 1536-1540, Apr. 1, 1963.

The real and imaginary parts of the complex dielectric constant of the normal liquid phase of anisaldazine were measured at a temperature of 185°C for a frequency range from 900 mc to 24 kmc. A plot of the complex dielectric constant in the complex plane satisfies the requirements for the Cole-Cole representation reasonably well. The temperature dependence of the dielectric loss at frequencies 6, 15, and 24 kmc indicates that any changes in the dielectric loss for a random orientation are very small as anisaldazine passes from its anisotropic to normal liquid phase. This implies that a plot of the complex dielectric constant in the complex plane for the anisotropic phase would probably satisfy the requirements for a Cole-Cole plot. Measurements of the dielectric loss in the presence of an external electrostatic field show that an ordering exists with the long axes of the molecules parallel to the external electric field. THE EXPONENT OF A PRIMITIVE MATRIX, by A. L. Dulmage and N. S. Mendelsohn. [1962] [4]p. (AFOSR-J50) (AF AFOSR-62-235) Unclassified

Also published in Canad. Math. Bull., v. 5: 241-244, Sept. 1962.

Let A be a non-negative irreducible (primitive) n by n matrix. If matrix A contains r non-zero entries along its main diagonal then its exponent is at most $2n - r - 1$. If all the diagonal entries of A are zero but its graph K_A contains a cycle of length d, then the exponent of A is at most $D(2n - d - 1)$. For the case where $d \neq n/2$ this improves Wielandt's result.

REMARKS ON SOLUTIONS OF THE OPTIMAL ASSIGNMENT PROBLEM, by A. L. Dulmage and N. S. Mendelsohn. [1962] [7]p. (AFOSR-64-0671) (AF AFOSR-62-235) AD 436365 Unclassified

Also published in Jour. Soc. Indus. and Appl. Math., v. 11: 1103-1109, Dec. 1963.

The canonical decomposition of a bipartite graph is used to reduce the problem of finding all dual solutions of an optimal assignment problem to the problem of finding all dual solutions when there is only one primal solution. The dimension of the space of dual solutions is shown to be equal to the number of irreducible subgraphs in the core of a certain bipartite graph.

THE CHARACTERISTIC EQUATION OF AN IMPRIMITIVE MATRIX, by A. L. Dulmage and N. S. Mendelsohn. [1962] [12]p. incl. refs. (AFOSR-64-0672) (AF AFOSR-62-235) AD 436364 Unclassified

Also published in Jour. Soc. Indus. and Appl. Math., v. 11: 1034-1045, Dec. 1963.

If A is a nonnegative cyclic matrix of index d, then there exists a permutation matrix P such that $P^{-1}A^dP = \text{diag}(A_1, A_2, \ldots, A_d)$. It is known that each A_i is primitive with the same root of maximum modulus.

In this paper, it is shown, if A is weakly cyclic of index k, that the matrices $A_1, A_2, \ldots, A_k$ have the same nonzero characteristic roots with identical multiplicities. Further, if α is a characteristic root of A_1 and if $\alpha_1, \alpha_2, \ldots, \alpha_k$ are the distinct kth roots of α and if $W^{(1)}$ is a characteristic vector of A_1 which corresponds to α, then, for i = 1, 2, ..., k, a construction is given expressing the characteristic vector of A which corresponds to α_j in terms of $W^{(1)}$ and the cyclic components of A. This construction is reversible and implies that the vector spaces of $A_1, A_2, \ldots, A_k$ corresponding to a nonzero characteristic root α have the same dimensionality. The theory of direct graphs is used to investigate the connection between the irreducibility of $A_1, A_2, \ldots, A_k$ and the irreducibility of A. There is an application to Markov chains. The fixed vector of the transition matrix A of an irregular ergodic Markov chain is expressed in terms of the fixed vector of A_1 and the cyclic components of A.

A REMARK ON A RESULT OF MARVIN MARCUS, by A. L. Dulmage and N. S. Mendelsohn. [1962] [3]p. (AF AFOSR-62-235) Unclassified

Published in Canad. Math. Bull., v. 6: 11-13, Jan. 1963.

Suppose A is a non-negative normal matrix satisfying $p(A) = 0$ in which $p(\lambda)$ is a monic polynomial no 2 of whose nonzero roots have the same modulus. Then there exists a permutation matrix P such that PAP^* is a direct sum, $PAP^* = A_1 \oplus A_2 \oplus \ldots \oplus A_m$, in which each A_i is either O or primitive. This note gives a generalization of this result, dropping the non-negative assumption and weakening the normality assumption. (Contractor's abstract)

[PRIMARY NEUROPHYSIOLOGICAL APPLICATIONS OF A METHOD ALLOWING EFFECTIVE AND REVERSIBLE BLOCKADE OF CENTRAL STRUCTURES BY LOCALIZED COOLING] Premières applications neurophysiologiques d'une méthode permettant le blocage electif et réversible de structures centrales par réfrigération localisée, by M. Dondey, D. Albe-Fessard, and J. Le Beau. [1962] [6]p. incl. illus. diagrs. (AFOSR-J639) (AF 61(052)103) AD 414038; AD 832142 Unclassified

Also published in Electroencephalog. and Clin. Neurophysiol., v. 14: 758-763, 1962.

A technique for local cooling of deep structures has been applied to block the somesthetic thalamic relay in cats; it utilizes the expansion of a compressed gas at the tip of a probe. Isotherms have been determined in vitro. The time course of temperatures could be traced in vivo for points at various distances from the probe by means of stereotaxic placement of thermocouples and for different durations of fluid expansion, using either butane or propane. Alterations of the transmission through the VPL nucleus have been monitored by recording the cortical evoked potentials at the level of SI; activity of the VPL was also recorded. The cortical potential vanished when the temperature in VPL fell below 20°C, and reappeared when it rose above 28°C; the response did not disappear until about 8°C, after having displayed a phase of augmentation. The block of transmission thus produced was reversible. Histological controls revealed no tissue damage provided the temperature had not fallen lower than 0°C, whereas a more intense cooling resulted in extensive lesion in the tissue around the probe. A delayed depression that occurs several minutes after the cooling phase has been observed at times; it is analogous to the spreading depression of Leao.

[MODIFICATION OF SENSORY CORTICAL RESPONSES BY STIMULATION OF THE DORSAL HIPPOCAMPUS OF THE RABBIT] Modification des réponses sensorielles corticales par stimulation del'hippocampe dorsal chez le Lapin, by P. Cazard and P. Buser. [1962] [13]p. incl. illus. diagrs. refs. (AFOSR-64-0171) (AF 61(052)103) AD 432736 Unclassified

Also published in Electroencephalog. and Clin. Neurophysiol., v. 15: 413-425, June 1963.

This study has been performed on 20 rabbits, either under deep chloralose anesthesia, or immobilized with curare and having only local anesthesia, as well as on 7 free implanted animals. In either type of preparation a short, repetitive, non-epileptogenic stimulation of the dorsal hippocampus elicits an increase in amplitude of sensory cortical responses to peripheral stimuli, especially of those recorded from the motor cortex. This effect develops progressively from the end of the

hippocampal stimulation; it may last for up to several minutes. However, it is a labile phenomenon which sometimes fails to appear; hippocampal tetanization is then only followed by a depression. In unanesthetized preparations (curarized or free), hippocampal stimulation also elicits large amplitude, slow electrocortical rhythms. However, no close correlation has been noticed between these electrocortical changes and the amplification of the evoked potentials. In free implanted animals, hippocampal stimulation produces moreover an attentive or searching behavior. In free animals, also, repeated associations of peripheral and hippocampal stimulations have led to long term facilitatory effects on sensory evoked potentials.

[SENSORY RESPONSES RECORDED FROM THE MOTOR CORTEX OF THE RABBIT] Réponses sensorielles recueillies au niveau du cortex moteur chez le Lapin, by P. Cazard and P. Buser. [1962] [10]p. incl. illus. diagrs. refs. (AFOSR-64-0172) (AF 61-(052)103) AD 432737 Unclassified

Also published in Electroencephalog. and Clin. Neurophysiol., v. 15: 403-412, June 1963.

The characteristics of non-primary sensory responses recorded from the rabbit's neocortex have been investigated. Three types of preparations were used: deep chloralose anesthesia, local anesthesia associated with curarization, and free implanted animals. Responses may be elicited on the motor cortex by somesthetic, auditory and visual stimulations. These nonprimary responses are easily observed in normal implanted animals; in acute preparations, somesthetic responses are well developed, whereas auditory and visual ones are usually small. Evoked potentials from the motor area are distinguished from primary sensory responses by various characteristics, such as a longer latency, a higher sensitivity to repetition of the stimuli, or to depressive actions. In unanesthetized preparations (curarized or free), their amplitude depends upon the general electrocortical activity, in that arousal reactions abolish them. These responses closely resemble phenomena recorded from the cat's motor area. In the rabbit, also, the motor cortex thus appears as a polysensory area.

CHOLINERGIC TRANSMISSION MECHANISMS FOR BOTH EXCITATION AND INHIBITION IN MOLLUSCAN CENTRAL SYNAPSES, by L. Tauc and H. M. Gerschenfeld. [1961] [2]p. incl. illus. diagrs. refs. [AF 61(052)103] AD 632612 Unclassified

Also published in Nature, v. 192: 366-367, Oct. 28, 1961.

Conclusions are summarized as follows: (1) In earlier papers by the authors, acetylcholine, by its effects on Aplysia depilans neurones, enables one to distinguish 2 types of cells: D-cells, depolarized and excited by the drug, and H-cells, hyperpolarized and inhibited. The D-neurones only show excitatory synaptic input, whereas H-neurones present both excitatory and inhibitory synaptic input. (2) In D-neurones, the synaptic excitatory input may be considered as cholinergic. (3) In H-neurones, inhibitory input is also very likely cholinergic, but the excitatory input in these cells appears to depend on another, unknown chemical transmitter. Hence, the character of synaptic transmission, excitatory in D-cells and inhibitory in H-cells, does not depend solely on the nature of the chemical transmitter-acetylcholine in both cases—but on physicochemical differences in the postsynaptic membrane that react in a specific way to the transmitter. (4) Existence of interneurones which would simultaneously induce excitatory and inhibitory synaptic actions in different postsynaptic neurones is a real possibility.

[DUALITY OF SENSORY AFFERENT STIMULATION CONTROLLING THE ACTIVITY OF THE RED NUCLEUS] Dualité des voies sensorielles afférentes controlant l'activité du noyau rouge, by J. Massion and D. Albe-Fessard. [1962] [20]p. incl. illus. diagr. table, refs. [AF 61(052)103] Unclassified

Published in Electroencephalog. and Clin. Neurophysiol., v. 15: 435-454, June 1963.

In the cat under chloralose, evoked responses to somatic, visual and auditory stimulation were studied in the red nucleus with microelectrodes and concentric macro-electrodes. In the parvocellular portion, unit responses most often have a short latency and are followed by a phase of inhibition; the units of this region are the site of heterosensory convergence. In the magnocellular portion, sensory stimulation, like stimulation of the sensorimotor cortex, induces a short latency response followed by a phase of inhibition and finally by renewed long latency and prolonged activation. Sensory convergence is less marked in the units of the magnocellular portion. Some of them are the site of clearly somatotopic projections. Experiments with total and then localized ablation of the cerebellum have shown that the afferent influx reaches the magnocellular portion by 2 different neural paths. Stimulation of the intermediate part of the contralateral anterior lobe induces selectively the late elements of the response of the red nucleus to sensory stimulation. Stimulation of the nucleus interpositus induces an excitatory monosynaptic response in the contralateral magnocellular portion. After cerebellectomy, the spontaneous activity of the neurones of the magnocellular portion is strongly depressed. The natural somatic stimulation capable of influencing the activity of the neurons of the magnocellular portion consists in a brief mechanical shock applied to the skin or the aponeuroses. The excitation of Group I fibers of muscular origin has no discernible effect on the cells of the magnocellular portion. In the cat maintained awake under local anesthesia, somatic stimulation can evoke the same unit reactions as in the chloralose anesthetized cat; but this same stimulus can also induce a prolonged unit activation not preceded by a phase of inhibition. The characteristics of the reflex and tonic actions of the cerebellum on the red nucleus are analyzed in the discussion.

Ablation of the primary fields corresponding with a given sensory modality does not abolish the root discharges to stimulation of the modality. Following local strychnine application to one sensory area, the increase in amplitude of both phases of the primary evoked potential is usually accompanied by an increase of the corresponding root discharge. This effect is specific, discharges to stimulations of other sensory modalities remaining unaffected. In other experiments functional depressions of one area were obtained either by local application of KCl or by local cooling. In all cases the reduction or disappearance of the evoked potential, thus produced, was accompanied by a reduction or disappearance of root discharges to stimulation of the corresponding modality. In these instances as well the effects were modality-specific, discharges to other stimuli remaining unchanged. The detailed characteristics of these cortical actions vary with the sensory modality dealt with: whereas the whole visual cortex seems to influence elaboration of responses to light, only resitricted areas of the acoustic field seem to act upon discharges to sound. With somaesthetic responses, the specificity is such that the somatotopic organization of area I also exists for efferent effects. Results seem to indicate that for each sensory modality considered, the primary cortical exerts a non-compulsory and specific influence upon subcortical centers for sensory-motor reverberation.

INFLUENCES OF THE VISUAL CORTEX UPON POSTEROMEDIAL THALAMUS IN THE CAT, by P. Buser, J. Bruner, and R. Sindberg. [1962] [15]p. incl. illus. refs. [AF 61(052)103] Unclassified

Published in Jour. Neurophysiol., v. 26: 677-691, Sept. 1963.

Two groups of related experiments were carried out to study the control by the visual cortex over visual responses in a posteromedial thalamic region comprised of the centrum medianum and adjacent structures. In the first series of experiments the primary visual cortex was stimulated electrically, while this area of the thalamus was mapped with concentric recording electrodes. A short-latency response field was found in this region, approximately coinciding with the area reported by several other investigators to respond to light, sound, and somesthetic stimulation. These data were taken to indicate the presence of rather short latency pathways through which cortical control could be exerted. Another group of experiments was devoted to studying the effects of modifying cortical excitability by drugs and by local cooling. Strychninization of the visual cortex, while producing an augmentation of responses in the cortex also increased the response in the posteromedial thalamus. On the other hand, application of KCl or of a local cooling agent to the cortex decreased or eliminated such responses. From the data obtained, it is suggested that cortical influence takes place by determining the amount of descending corticifugal outflow which is triggered by the incoming specific corticipetal volley.

CHRONOGRAPHIC AND TOPOGRAPHIC STUDY OF CEREBRAL POTENTIALS EVOKED BY PHOTIC STIMULATION IN MAN AND IN CAT, by H. Gastaut. Apr. 30, 1962 [101]p. incl. illus. diagrs. tables, refs. (AFOSR-3219) (AF 61(052)20) AD 282541 Unclassified

Research was done in man and in the cat on the problem of evoked potentials to light. Consideration was made of the variation in form, amplitude, latency, and areas of distribution. This was done in relation to the following 3 types of factors: (a) variations of the physical characteristics of the stimulus; (b) variation of the psyche-affective state of the subject; and (c) repetition of visual stimuli to achieve habituation or conditioning. Results in man describe the character of evoked potentials for different frequencies of intermittent light stimulus. In animals results show the modifications of potentials evoked by light when the reticular formation is stimulated and during habituation and conditioning.

STRESS-STRAIN BEHAVIOR OF ALUMINUM CRYSTALS AT LOW PRESSURES, by I. R. Kramer and S. Podlaseck. [1962] [2]p. incl. diagr. table. (AFOSR-J1236) (AF 49-(638)946) AD 424290 Unclassified

Also published in Acta Metall., v. 11: 70-71, Jan. 1963.

Aluminum crystals were deformed at strain rates of 0.4×10^{-5} sec^{-1} at 24°C and at pressures of 760 to 10^{-8} mm Hg to give stress strain relationships. At atmospheric pressure, stage I of the relationship was absent but this appeared at 10^{-5} mm Hg, stage II was present under both conditions. Neither the critical resolved shear stress nor the stress at the end of stage I altered with pressure. Surface barriers exert a large influence on the work-hardening mechanism of metals; at lower pressures surface egress of dislocations is facilitated as the rate of oxide growth on freshly exposed surfaces is reduced.

EFFECT OF VACUUM ENVIRONMENT ON THE MECHANICAL BEHAVIOR OF MATERIALS, by I. R. Kramer and S. E. Podlaseck. Summary rept. Oct. 1, 1961-Oct. 1, 1962 [24]p. incl. diagrs. table. (Rept. no. RM-125) (AF 49(638)946) AD 450484 Unclassified

Results of a study of the fatigue, tensile, and creep behavior of metals at low pressures are presented. In fatigue, an effect of frequency of cycling on the fatigue life of aluminum is described. For the tensile studies, aluminum single crystals are shown to exhibit lower strengths as environmental pressure is lowered. High purity polycrystalline aluminum is also shown to exhibit a decrease in the flow curve in a low-pressure environment. The tensile deformation curve of polycrystalline copper, however, did not change significantly with pressure from 760 to 10^{-8} torr. For commercial purity aluminum (1100), cleaning of the surface by ion bombardment resulted in a large decrease in the plastic flow curve and an increase in the ductility. (Contractor's abstract)

SOME ASPECTS OF UNIQUENESS FOR SOLUTIONS TO BOUNDARY PROBLEMS, by M. H. Martin. [1962] [21]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)570 and Guggenheim Memorial Foundation) Unclassified

Published in Proc. Edinburgh Math. Soc., v. 13: 25-35, 1962.

The following problem is considered: What can be said about the uniqueness of a function u, harmonic in a region S, if along the boundary C of S the external normal derivative u_n is a prescribed separable function $u_n = h(s) f(u)$ of u and the arc length s of C? It is assumed that S is a simply connected region bounded by a single analytic curve C, and that S lies in the interior of a region R within which u is regular analytic. The functions h (s), f (u) are real functions and are assumed regular analytic for all real values of their arguments.

ON A MIXED BOUNDARY PROBLEM FOR AN ELLIPTIC SYSTEM OF EQUATIONS, by J. S. Kim. 1961, 72p. incl. refs. (AFOSR-3986) (AF 49(638)590) AD 622602 Unclassified

G is a bounded domain of class C^∞ in E_n. τ is an n-2 dimensional manifold of class C^∞ on the boundary ∂G which divides ∂G into 2 components $\partial^{(1)}G$ and $\partial^{(2)}G$. In G (the closure of G), the systems of partial differential operators (A) and of boundary operators (B) are considered. An L_2 - estimate is given for the operator (A) together with the boundary operators (B) under the following asumptions: (1) A(x, D) is properly elliptic; (2) Each $B^{(i)}(x, D)$ complements A(x, D) on $\partial^{(i)}G$, i = 1, 2; and (3) $B^{(1)}(x, D)$, $B^{(2)}(x, D)$ are compatible with respect to A(x, D) on τ. Using this estimate and employing Hilbert space methods, the existence of a solution of the mixed problem (C) under some additional assumptions is proved. This result generalizes that of M. Schecter.

A FIELD THEORETICAL CALCULATION OF THE ONE-PION-EXCHANGE AND TWO-PION-EXCHANGE CONTRIBUTIONS TO THE PHASE SHIFTS WITH HIGHER ANGULAR MOMENTA FOR NUCLEON-NUCLEON SCATTERING, by I. Sato. Jan. 1962, 44p. incl. diagrs. tables, refs. (Technical rept. no. 238) (AFOSR-2117) (AF 49(638)24) AD 274818 Unclassified

Also published in Phys. Rev., v. 127: 1352-1364, Aug. 15, 1962.

The one-pion-exchange and two-pion-exchange parts of the S-matrix for nucleon-nucleon scattering are calculated field-theoretically. The rescattering of virtual pions by nucleons and the pion-pion interaction between virtual pions are taken into account. The S-matrix is then decomposed into the partial-wave amplitudes, and the phase shifts are calculated. Numerical evaluations are carried out for the 310-mev proton-proton scattering, and the results are compared with the phase shifts obtained by analyzing the experimental data. Without contribution of the pion-pion interaction, the results are far from agreement with experiment because of too strong attraction arising from the contributions of the two-pion-exchange part, but the contribution of the pion-pion resonance in the I = J = 1 state improves the results considerably by largely cancelling the attraction. Definite discrepancies remain between the theory and the experiments, and some unknown effects must play important roles in determining the nuclear force in the region of the internucleon distance around the Compton wave length of the pion. INTRODUCTORY LECTURES ON SCATTERING THEORY, by O. W. Greenberg. Jan. 1962. 75p. incl. diagrs.; (Technical rept. no. 245) (AFOSR-2409) (AF 49(638)-24) AD 275054 Unclassified

This report consists of notes on 12 lectures on non-relativistic scattering theory given to a class of second year graduate students at Maryland U. in the fall semester of the 1961-1962 academic year. The notes are organized into 2 sections. Section I, Wave packet treatment of scattering, discusses the following topics: requirements on initial (unscattered) wave packet, motion of free wave packet, scattering solutions of Schrödinger equation, scattering length and effective range theory, and resonant scattering. Section II, Formal theory of scattering, includes notes on: Møller wave operators and the S-matrix, scattering in the Dirac picture, adiabatic switching, the T-matrix, and cross sections, and additional topics.

RELATIVISTIC INVARIANCE AND THE SQUARE-ROOT KLEIN-GORDON EQUATION, by J. Sucher. [1962] [20]p. (Technical rept. no. 246) (AFOSR-2410) (AF 49(638)24) AD 275473 Unclassified

Also published in Jour. Math. Phys., v. 4: 17-23, Jan. 1963.

Although the usual operator invariance requirements and corresponding commutation conditions encountered in the study of the invariance of relativistic wave equations (and other equations of physics) are sufficient conditions for invariance, they are by no means necessary. More general conditions are given and illustrated with the square-root Klein-Gordon equation. A new proof is thereby given of the Lorentz invariance of this equation. The methods developed are extended to cover the presence of external fields and it is proved that the usual gauge invariant modification of the relativistic Hamiltonian of a spinless particle which takes into account the presence of an external electromagnetic field leads, in the quantum mechanical case, to an equation which does not admit the proper Lorentz group. This theorem and its generalization are discussed in connection with Dirac's statement that the square-root equation cannot be extended to include interaction without losing Lorentz invariance. RELATIVISTIC QUANTUM MECHANICS AND QUANTUM FIELD THEORY, VOLUME II, by J. Sucher. Mar. 1962, 300p. incl. diagrs. (Technical rept. no. 249) (AFOSR-2477) (AF 49(638)24) AD 289186 Unclassified

These notes contain part of the material covered in the lectures. The rest, for which no notes were taken, concerned itself mainly with the modified propagation functions and renormalization in quantum electrodynamics matters which are well covered in recent textbooks. The major aim was to keep the discussion as simple and informal as possible. To this end the Coulomb gauge was used and the rules for working with time-ordered diagrams were developed in great detail, in conjunction with the study of Compton and Møller scattering. These results were used to suggest the form of the covariant Feynman rules, and Feynman diagrams were then discussed in their own right from the point of view of the Feynman-Dyson-Wick analysis of the S-matrix. A fair amount of attention was paid to the connection between time-ordered and Feynman diagrams on the one hand and between time-ordered diagrams and non-relativistic quantum electrodynamics on the other.

HEISENBERG FIELDS WHICH VANISH ON DOMAINS OF MOMENTUM SPACE, by O. W. Greenberg. Apr. 1962 [25]p. incl. diagrs. refs. (Technical rept. no. 251) (AFOSR-2500) (AF 49(638)24) AD 275907 Unclassified

If a local Heisenberg field vanishes, or, where appropriate, has an infinite zero, on one of the momentum space domains, then the field is a generalized free field. Counter examples show that this conclusion cannot be drawn if the field vanishes on the momentum space domains. It follows that if 2 fields in the same Borchers class are equal on 1 of the domains, then the fields differ at most by a generalized free field in their Borchers class. (Contractor's abstract)

NORMALIZATION CONDITION FOR THE BETHE-SALPETER WAVE FUNCTION AND A FORMAL SOLUTION TO THE BETHE-SALPETER EQUATION, by I. Sato. June 1962, 37p. (Technical rept. no. 262) (AFOSR-2759) (AF 49(638)24) AD 289474
Unclassified

Also published in Jour. Math. Phys., v. 4: 24-35, Jan. 1963.

By the use of an inhomogeneous Bethe-Salpeter equation, a normalization condition for the Bethe-Salpeter wavefunction is obtained. This condition requires the normalization integral to be positive. A formal solution is obtained in the ladder approximation, and convergence of the normalization integral is proved by the use of this solution. This solution is also used to prove a dispersion relation for the vertex function of the compound particle and to give an approximate solution. The positiveness of the normalization integral is proved in the nonrelativistic limit. The bound state of nucleon and antinucleon is studied in the ladder-chain approximation and it is found that the normalization condition gives a finite wavefunction in spite of divergency of the normalization integral.

SCATTERING FOR THE K⁻-MESON FROM THE DEUTERON, by A. K. Bhatia. Aug. 1962, 94p. incl. diagrs. tables, refs. (Technical rept. no. 265) (AFOSR-3501) (AF 49(638)24) AD 414423
Unclassified

A simple model is constructed to study the scattering of the K⁻-meson from the deuteron. This model does not treat the nucleon as heavy and takes into account the multiple scattering, the binding energy corrections and the contribution from the off-energy shell scattering. The scattering problem is investigated by using the Watson multiple scattering expansion of the transition-operator t. Considering the multiple scattering up to double order only, the t-matrix is written as $t = tp + tn + tc + t_I$, where tp and tn correspond to the single scattering of the K⁻-meson from the proton and the neutron in the deuteron. tc corresponds to the bound state contribution and t_I corresponds to the continuum state contribution of the K⁻-meson from the deuteron. The interaction K⁻-P and the K⁻-N is taken as a point interaction and is of the form $tp = t_p^o \delta(r - f/2)$; $tn = t_n^o \delta)r + f/2)$ where r and f/2 are the relative co-ordinates of the K⁻-meson and the nucleon in the center of mass system of the K⁻-d. t_p^o and t_n^o are taken as constants and are determined by using Dalitz solutions I and II given by Ross and Humphrey. Several aspects of scattering theory are discussed including the normalization condition for the Bethe-Salpeter wavefunction and a solution to the Bethe-Salpeter equation, rotational invariance and the S-matrix in non-relativistic quantum mechanics, regularity of the T-matrix in the case of Dirac potential scattering, and completeness identity in field theory. Scattering theory is applied to several physical problems including a field theoretical calculation of the 1-pion exchange and 2-pion exchange contributions to the phase shifts with higher angular momenta for nucleon-nucleon scattering, scattering of the K⁻-meson from the deuteron, and a model of the pionic decays of the hyperons.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 299, Apr. 23, 1962.

A contribution to $D\bar{D}$ annihilation through the $N\bar{N}$ state into 2 pions is considered, starting from the case in which the deuteron mass x is small enough so that there are no anomalous thresholds. Analytic continuation in x up to the physical value $x = D^2$ is carried out on this function over paths in each halfplane: $x \pm iy$. The discontinuity function has a branch point with a left-hand cut which deforms the contour in the representation in

such a way that 2 different functions are obtained, corresponding to $D^2 \pm i\sigma$. The effect is due to the presence of the right-hand cut in the $N\bar{N}$ into 2-pion amplitude. The mass continuation of πD elastic scattering through the 2N state is also shown not to be single-valued with respect to x. Here, the effect is present even if the $4N^2$ cut of the discontinuity is left out; it is shown that the super-anomalous threshold is responsible for the double-valuedness. In this case, a criterion can be established for making the choice of branch: $D^2 \pm i\sigma$.

FLUCTUATIONS IN THE FLUX TRAPPED IN SUPERCONDUCTORS (Abstract), by J. Weber and R. A. Ferrell. [1962] [1]p. [AF 49(638)399] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 324, Apr. 23, 1962.

The current flowing in a superconductor which contains trapped flux undergoes fluctuations with the mean-squared value given by

$$\langle I^2 \rangle = \frac{2}{\pi} \int_{\omega_1}^{\omega_2} \left(\frac{R}{R^2 + \omega^2 L^2} \right) \left(\frac{\hbar\omega}{2} + \frac{\hbar\omega}{e^{kT} - 1} \right) d\omega.$$

ω_1 and ω_2 are the lower and upper cutoff frequencies of the measuring apparatus; R and L are the frequency-dependent resistance and inductance. The manner in which R vanishes in the limit of zero frequency dominates the character of the fluctuations.

FORBUSH DECREASES PRODUCED BY DIFFUSIVE DECELERATION MECHANISM IN INTERPLANETARY SPACE, by H. Laster, A. M. Lenchek, and S. F. Singer. [1962] [5]p. incl. diagrs. refs. (AF 49(638)530) Unclassified

Published in Jour. Geophys. Research, v. 67: 2639-2643, July 1962.

Transient decreases in the intensity of galactic cosmic radiation are known to be associated with the arrival at the earth of large clouds of magnetized solar plasma. The large scale of the phenomenon indicates that the clouds expand significantly while crossing the solar system. An interpretation is given based on the assumption that the plasma is magnetically turbulent. Cosmic rays enter the cloud, then execute a random-walk motion in space. While within the expanding cloud they must lose energy in an inverse Fermi mechanism and by betatron action in the weakening magnetic field. The energy spectrum within the cloud is depressed below the galactic spectrum. The spectrum is calculated in the isotropic approximation using age-diffusion theory, considering only the effects of spatial diffusion and energy loss. Convection is neglected. Several prominent features of observed decreases are thereby accounted for, i.e., the time profile, the magnitude, and the approximate rigidity dependence.

PITCH ANGLE DIFFUSION IN A MAGNETIC MIRROR GEOMETRY, by R. C. Wentworth. [1962] [7]p. incl. diagrs. table. [AF 49(638)530] Unclassified

Published in Phys. Fluids, v. 6: 431-437, Mar. 1963.

The diffusion in pitch angle produced by Coulomb scattering of charged particles in a magnetic mirror is derived by geometrical arguments neglecting energy loss. The resultant diffusion equation in particle pitch angle and time agrees with the more fundamental Fokker-Planck equation when energy loss is neglected. The diffusion coefficient may be defined as the inverse of a lifetime and for particles in the Van Allen radiation belt it is compared to the energy loss time neglecting pitch angle diffusion. It is shown that both energy loss and pitch angle diffusion must, in general, be considered simultaneously. However, the special problem of the early diffusion of mirror points of a monoenergetic group of electrons injected at very low pitch angle is discussed, and it is shown that significant changes in mirror altitude take place before energy loss is appreciable. COMMENTS ON A PAPER BY P. D. GRANNIS, 'ELECTROSTATIC EROSION MECHANISMS ON THE MOON', by E. H. Walker. [1962] [2]p. (AFOSR-3109) (AF AFOSR-61-57) Unclassified

Also published in Jour. Geophys. Research, v. 67: 2586-2587, June 1962.

The calculation of electrostatic hopping of dust grains by Grannis is based on his first equation, which gives the probability p(q) for a dust grain to assimilate a net charge q as a result of random variations in the total number of negative charges that fall on the grain in a time t. This equation is $p(q) = \exp[-(q-m)^2/2\sigma^2]/\sigma\sqrt{2\pi}$, where m is the mean value of q, and σ is the variance, which is related to the projected area of the grain A, the time t, and the flux of particles ϕ, by $\sigma^2 = At\phi$. In this paper it is shown that this equation is incorrect since it does not include the effect of the potential of the dust grain on the statistical process. The correct probability function can be derived from 2 equations which give the current

to a charged grain, to obtain the probability that the next particle to hit the dust grain will be an ion or an electron when the grain is charged.

INELASTIC ELECTRON SCATTERING BY THIN FILMS, by A. J. Glick. May 1962, 5p. (Technical rept. no. 254) (AFOSR-2819) (AF AFOSR-62-46) AD 440976 Unclassified

Also published in Electron Microscopy; Fifth Internat'l. Cong., Philadelphia, Pa. (Aug. 29-Sept. 5, 1962), New York, Academic Press, v. 1: AA8, 1962. (AFOSR-3384)

This paper consists of a review of the theory of electron energy loss and its relation to other properties of the scattering medium. The discussion applies particularly to electrons with energy between 10 and 100 kev and films several hundred to a thousand angstroms thick. For these conditions the effect of repeated scattering is easily identifiable and single scattering predominates. By considering the rate at which electrons in the beam lose energy $\hbar\omega$ and momentum $\hbar k$ the scattering cross section for single scattering can be expressed in terms of the frequency and wave number dependent dielectric constant, $\epsilon(k, \omega)$, of the material. A major advantage of representing the cross section in this manner is that many other quantities of interest also depend on the dielectric constant. Hence, a means is provided for relating a variety of apparently dissimilar properties of the material to its electron scattering properties.

SOME PROPERTIES OF DIELECTRIC CONSTANT AND PHONON FREQUENCY OF A SUPERCONDUCTOR, by T. Nishiyama. [1962] [23]p. incl. refs. (AFOSR-3489) (AF AFOSR-62-46) AD 438299 Unclassified

Also published in Nuovo Cimento, Series X, v. 28: 1146-1178, June 16, 1963.

The dielectric constant and the phonon frequency in a superconductor have been investigated by means of Green's functions for the electronic and the total charge density fluctuation. Making use of the linearization approximation the exact expressions for the electronic dielectric constant are obtained in both the high-frequency limit and the low-frequency limit. The proof of the sum rule formula given by Rickayzen has been confirmed in the small wave number limit. The relationship between the effective interaction between electrons and the dielectric constant has been examined by considering matrix elements of the density fluctuation between pair states. In the Appendix, for a simplified effective interaction truncated in the neighborhood of the Fermi surface, the explicit expressions of the dielectric constant and the phonon frequency are obtained. DIELECTRIC CONSTANT OF A SUPERCONDUCTOR, by R. E. Prange. Oct. 1962 [35]p. incl. diagrs. table, refs. (Technical rept. no. 266) (AFOSR-4074) (AF AFOSR-62-46) AD 437389 Unclassified

Also published in Phys. Rev., v. 129: 2495-2503, Mar. 15, 1963. (AFOSR-67-0167; AD 646326)

The longitudinal dielectric constant was calculated for the extended Bardeen-Cooper-Schrieffer model of a superconductor. An explicit formula is obtained which has been evaluated numerically. The competition between collective and single particle effects is pronounced, so that the dielectric function differs remarkably from the most elementary approximations to it. However, the dielectric function of the superconductor does not differ greatly from that in the normal metal in either the high frequency or static limit, regardless of the wavelength. This prevents the modifications due to superconductivity from being readily observed. In particular, the shift in the static polarizability should cause very small shifts in the phonon speed, so small that no effect on the lattice specific heat should be observed. TUNNELLING FROM A MANY-PARTICLE POINT OF VIEW, by R. E. Prange. Dec. 1962, 14p. incl. diagr. (Technical rept. no. 284) (AFOSR-4778) (AF AFOSR-62-46) AD 409443 Unclassified

Also published in Phys. Rev , v. 131: 1083-1086, Aug. 1, 1963.

The Hamiltonian for a system of interacting electrons in the presence of a barrier is transformed into one which can be separated into 3 parts. Two of the parts describe the electrons on the right and left sides of the barrier, while the third is a transition term which

allows tunneling through the barrier. It is shown that it is not reasonable to make the right and left hand Hamiltonians commute, but the effect of this failure is easily accounted for in perturbation theory. In addition, corrections to the transition operator arising from inter-electronic interaction are written down and discussed briefly. (Contractor's abstract)

CORRECTIONS TO THE DIELECTRIC CONSTANT OF A DEGENERATE ELECTRON GAS, by A. J. Glick. [1962] [12]p. incl. diagrs. table, refs. (AFOSR-64-0436) (AF AFOSR-62-46) AD 433086 Unclassified

Also published in Phys. Rev., v. 129: 1399-1410, Feb. 1, 1963.

The Lindhard approximation to the frequency- and wave-number dependent dielectric constant, $\epsilon(k, \omega)$, provides a good description of many properties of the degenerate electron gas. However, it is known that the short-range behavior of the gas is not adequately represented by this function and it is necessary to include certain additional terms. DuBois incorporated some exchange terms into $\epsilon(k, \omega)$ and was able to obtain the correction to the plasmon excitation frequency. Though his final results are resonable and have been corroborated using alternative approaches the "corrected" dielectric constant is found to violate certain a priori restrictions. In this paper a more accurate dielectric constant is derived. In order to obtain an acceptable function which does not violate the sum rule and positive definiteness restrictions on the imaginary part it is necessary to account for 3 types of corrections. These corrections originate in (1) the effective screening of the long-range interaction between particles; (2) the shift in single-particle energies of electrons and holes; and (3) the tendency of particles and holes to form bound states when any repulsive inter-particle interaction is present. With these corrections all spurious singularities in the dielectric constant disappear. Numerical calculations of $\epsilon(k, \omega)$ and of moments of the imaginary part of this function have been carried out for an intermediate electron density equal to the density of conduction electrons in aluminum. The resulting dielectric constant departs by as much as 50% from the Lindhard form for low frequencies, but has similar qualitative features. The moments can be used to determine the high-frequency behavior and other properties of the electron gas.

ABSENCE OF THE ISOTOPE EFFECT IN SUPERCONDUCTING TRANSITION ELEMENTS (Abstract), by D. S. Falk and R. A. Ferrell. [1962] [1]p. [AF AFOSR-62-46] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 324, Apr. 23, 1962.

In a normal superconductor exhibiting the full isotope effect, the attractive electron-electron interaction results from the displacement of an ion as one electron of a pair approaches it. The resulting dipole moment then acts upon the second electron of the pair. It may happen on the other hand, that the electron shell of the ion is sufficiently polarizable that the influence of the first electron will be to redistribute the electrons in the shell, rather than to displace the center of the ion. In this case, superconductivity would be due to a type of Van der Waals force and no isotope effect would result. The transition elements contain shells of d electrons, and experimental optical data suggest that the polarizability may be sufficiently high that such a process dominates the usual phonon-induced superconductivity.

ANTIFERROMAGNETISM AS A POSSIBLE SOURCE OF SUPERCONDUCTIVITY (Abstract), by D. S. Falk. [1962] [1]p. [AF AFOSR-62-46] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 64, Jan. 24, 1962.

The absence of the isotope effect in ruthenium implies that other mechanisms, besides the electron-phonon interaction, may result in an effective electron-electron interaction which is attractive at the Fermi surface and which therefore produces the superconducting state. It is suggested that in an antiferromagnetic system, the interaction between adjacent ionic spins, compounded with the s-d exchange interaction, produces such an effective electron-electron interaction. A simple effective field calculation bears out this contention. The spin-wave calculation, complicated by the non-negligible contributions of the corrections to the spin wave approximation, will be discussed.

COOLING OF CONDUCTION ELECTRONS IN METALS AT VERY LOW TEMPERATURES (Abstract), by M. Fibich and R. A. Ferrell. [1962] [1]p. [AF AFOSR-62-46] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 219, Mar. 26, 1962.

At very low-excitation energies, a conduction electron in a metal loses energy to the other electrons at a rate proportional to the square of its excitation energy, whereas it loses energy to the lattice at a rate proportional to a higher power. For this reason, the conduction electrons at very low temperature may be expected to be in thermal equilibrium with the lattice. As the lattice is cooled down, the electron gas may remain at a higher temperature and only come into equilibrium after a finite time. The cooling rate can be calculated from the standard electron-phonon coupling, and its magnitude can be estimated for specific materials. Cases where the cooling rate may be observable and may have practical consequences are discussed.

CRITICAL MAGNETIC FIELDS OF SUPERCONDUCTING FILAMENTS (Abstract), by R. A. Ferrell and A. J. Glick. [1962] [1]p. [AF AFOSR-62-46] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York. Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 63, Jan. 24, 1962.

The critical magnetic fields of very thin superconducting films and filaments have been estimated by a computation of the susceptibility along the lines established by Schrieffer using the nonlocal electrodynamics in the Pippard limit. The calculation assumes diffuse electron scattering at the surface of the superconductor and is carried out in the limit of thickness $d \to 0$. The critical field in this limit is a numerical coefficient times the characteristic thickness dependence of $(\lambda L^2 \xi_0/d^3)^{\frac{1}{2}}$. The coefficient can be evaluated as a numerical integral over the Pippard kernel. Errors in the approach due to the zero thickness limit and to the dependence of the energy gap on magnetic field will be discussed.

LONGITUDINAL COLLECTIVE RESPONSE OF A SUPERCONDUCTOR (Abstract), by R. E. Prange. [1962] [1]p. [AF AFOSR-62-46] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 63, Jan. 24, 1962.

The response of a superconductor to a longitudinal disturbance depends on the frequency and wave number dependent dielectric constant. It might be expected that the absorptive part of the dielectric constant vanishes for all frequencies below the energy gap frequency, especially when the Coulomb repulsion is taken into account. It is shown that this is not the case, but that for long wavelength disturbances there exists an absorptive part at low frequency. This absorptive part does not necessarily correspond to an excited state of the superconductor, since excited states give rise to an absorptive part in the inverse dielectric constant. The response under consideration corresponds to a zero of the inverse dielectric constant. The known long wavelength properties, together with gauge invariance make necessary the existence of this response.

PROPAGATION OF GRAVITATIONAL FIELDS IN THE INDUCTION ZONE (Abstract), by D. Zipoy. [1962] [1]p. [AF AFOSR-62-46] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 320, Apr. 23, 1962.

When the dynamical gravitational fields in the near-induction zone around a vibrating bar are calculated, one finds that the retardation terms do not enter in first order in (r/λ) but only in higher-order terms. That is, if the motion of the bar is proportional to $\sin\omega t$, the fields near the bar are not proportional to $\sin\omega(t-r/c) \cong \sin\omega t-(r/\lambda)\cos\omega t$ but rather to $\sin\omega t + 0[(r/\lambda)^3] \propto \cos\omega t$ $(r \ll \lambda)$. This in effect implies that the near Coulomb-type gravitational fields are propagated with infinite velocity, a result well-known to astronomers but apparently to few others. The same effects appear in the fields around certain types of electromagnetic antennas.

ROLE OF VORTICES IN HIGH-FIELD SUPERCONDUCTIVITY (Abstract), by A. J. Glick and R. A. Ferrell. [1962] [1]p. [AF AFOSR-62-46] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 324, Apr. 23, 1962.

In order for the magnetic field to penetrate into the interior of a superconductor, it is necessary that there be nonvanishing paramagnetic term in the current density proportional to the mean momentum of paired electrons, which cancels the London diamagnetic term. Thus, the mean momentum forms a vector field which must have a certain amount of rotationality, proportional to the magnetic-flux density passing through the superconductor. But, this situation contradicts the basic irrotational-flow requirement of a superfluid. One means of reconciling the 2 requirements is to set up the usual intermediate state of alternate superconducting and normal regions, and to concentrate all of the irrotationality in the normal regions. A second possibility is that the entire metal could remain superconducting and the irrotationality could be concentrated into vortices analogous to those observed in liquid H^2.

SINGLE-NUCLEON DECAY OF THE GIANT DIPOLE STATE (Abstract), by M. Bauer and R. A. Ferrell. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-46] and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 347, Apr. 23, 1962.

Because of the high-excitation energies involved, in addition to the shell-model configurations responsible for the collective behavior of the giant-dipole resonance, the particle-hole interaction can admix configurations from the continuum in which a single nucleon contains all the excitation energy. The nucleon energy in the optical well does not correspond to the single-particle resonance in view of the interaction energy shift of the dipole state. The distortion of the single-particle wavefunction is then such that the continuum configuration represents a system in which 1 particle is not actually a member of the cluster formed by the others. Thus, the possibility of damping is introduced. On this basis, partial widths and branching ratios are calculated in the case of the 22.2-mev level in O^{16}

SURFACE RESISTANCE OF SUPERCONDUCTORS (Abstract), by L. Leplae and R. A. Ferrell. [1962] [1]p. [AF AFOSR-62-46] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 324, Apr. 23, 1962.

The effect of a finite electron mean-free path on the surface impedance of a superconductor has been studied with special attention to changes produced just above the gap frequency. The impurities have the effect of producing additional absorption at long wavelengths which otherwise would give rise only to lossless London-type response. Thus, the surface resistance, involving an integration over all wavelengths, is augmented, with the increased concentrated just above the gap. The strength of this additional surface resistance, integrated

over frequency, can be related by the Kramers-Kronig relations to the well-known increase in static penetration depth which results when the electron mean-free path is increased.

INTERACTION OF PHOTONS AND GRAVITONS, by J. Weber and G. Hinds. [1962] [8]p. (AFOSR-J873) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-143 and National Science Foundation) AD 418253 Unclassified

Also published in Phys. Rev., v. 128: 2414-2421, Dec. 1, 1962.

The Hamiltonian formulation of general relativity is employed to study the interaction of photons and gravitons in the first approximation. The redundant variables are eliminated by an appropriate choice of gauge and coordinate conditions. S-matrix elements are calculated for initial states in which one photon is present and final states in which a photon and a graviton are present. Self-energy effects appear in first order but contribute nothing. Energy and momentum can be strictly conserved only if the initial and final photons and the gravitons all propagate in the same direction. For this case the S-matrix elements vanish in consequence of the null character of the Maxwell field and the transition probability is also zero. Energy need not be exactly conserved if the process occurs at a rate which is sufficiently high. Under these conditions, corresponding to energies $\gg 10^{28}$ ev, a photon might decay into another photon and a graviton. The graviton has very low energy. This cannot explain the red shift as a "tired light" phenomenon. The creation of gravitons by Coulomb scattering of photons and by scattering in a magnetostatic field is shown to occur and the cross sections are calculated. (Contractor's abstract)

IMPULSIVE INJECTION OF ELECTRONS INTO THE EARTH'S INNER TRAPPING REGION FROM SOLAR COSMIC RAY EVENTS, by M. Liwshitz and A. M. Lenchek. [1962] [7]p. incl. table, refs. (AF AFOSR-62-284) Unclassified

Published in Jour. Geophys. Research, v. 68: 4091-4097, July 1, 1963.

The decay of albedo neutrons generated in the polar caps by solar high-energy-particle events provides an impulsive source of geomagnetically trapped electrons. The decay density due to slow albedo neutrons (which describe ballistic orbits above the atmosphere) can be calculated from simple kinematic considerations. At constant B the injection density exhibits a peak at intermediate L. At L = 2 and B = 0.22 gauss a typical large SHEP event deposits $\sim 3 \times 10^{-8}$ electron cm^{-3}. The flux from these electrons is $\sim 10^{3}$ electrons cm^{-2} sec^{-1} in the interval 0-780 kev. On account of the low efficiency for detecting these electrons, it appears that this process alone cannot account for the time variations seen in Explorer 7. (Contractor's abstract)

ASYMPTOTIC BEHAVIOR OF THE S MATRIX FOR HIGH ANGULAR MOMENTUM, by A. M. Jaffe and Y. S. Kim. [1962] [6]p. incl. refs. [AF AFOSR-62-361] Unclassified

Published in Phys. Rev., v. 129: 2818-2823, Mar. 15, 1963.

The behavior of the partial-wave transition matrix is discussed for large values of the angular momentum. For physical values of the angular momentum, it is shown that the N-channel T matrix vanishes in the high angular momentum limit. The validity of the optical model is discussed. In the Gelfand-Levitan formalism, it is shown that the 2 Jost functions coincide as the angular momentum goes to infinity along the real axis. For the Yukawa-type potentials, it is shown that the transition matrix reduces to its Born term as the real part of the complex angular momentum variable goes to infinity. (Contractor's abstract)

ROTATIONAL INVARIANCE AND THE S MATRIX IN NONRELATIVISTIC QUANTUM MECHANICS, by R. Fong and J. Sucher. [1962] [5]p. incl. diagrs. (AF AFOSR-62-361) Unclassified

Published in Phys. Rev., v. 129: 2824-2829, Mar. 15, 1963.

The connection between an observable invariance property of the scattering matrix and the interaction, V, generating the scattering, is studied for a particular case; rotational invariance in nonrelativistic potential scattering. It is shown that a determination that the scattering cross section depends only on the angle between the incident and outgoing beams by no means implies that V is

invariant under rotation. This is true even if coherent incident beams are used to probe the target. Some aspects of these results and their relevance for the construction of physical theories are briefly discussed. (Contractor's abstract)

RADIO EMISSION BY ELECTRONS IN THE FINE-STRUCTURE ELECTRIC FIELDS OF SHOCK WAVES, by D. A. Tidman. [1962] [9]p. incl. diagrs. refs. [AF 18(600)1315] Unclassified

Published in Phys. Fluids, v. 5: 1104-1112, Sept. 1962.

The structure of shock waves in fully ionized hydrogen in the absence of a magnetic field has been investigated by Greenberg and Trève using the Mott-Smith distribution for the protons and a local Maxwellian for the electrons. They find that large charge-separation effects occur inside the shock due to the electron-proton mass difference, thus giving rise to strong stationary electric-field oscillations in the shock transition. This behavior is typical of other theories of plasma shock structure. The radio noise emitted by electrons in the plasma accelerated in these electric fields is now calculated. In traversing the electric oscillations inside the shock, those electrons with a few times the thermal energy radiate like an assembly of oscillators at frequencies capable of propagating ahead of the shock. Although the particular shock-wave model of Greenberg and Trève

has been adopted for the purposes of the numerical discussion, the parameters of the radiation calculation are readily adjusted for possible changes in the shock-wave model which more detailed treatments of shock structure may bring. The application of this process to Type II solar radio bursts is discussed. Assuming that such shock waves are produced by a solar flare expanding into the corona, a sufficiently high intensity of radio emission is found to provide an alternate possible interpretation for this source of solar noise. BOUNDS ON THE TRUNCATION ERROR BY FINITE DIFFERENCES FOR THE GOURSAT PROBLEM, by A. K. Aziz and B. E. Hubbard. May 1962, 29p. incl. refs. (Technical note no. BN-289) (AFOSR-2727) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)228 and Naval Ordnance Lab.) AD 289185; AD 453995 Unclassified

Also published in Math. Comput., v. 18: 19-35, Jan. 1964.

A common method for obtaining an approximate solution to the various boundary value problems for partial differential equations is by finite differences. The fundamental problem concerning such finite difference approximations is to show that the truncation error tends to zero with diminishing mesh size. In general the main tool used in obtaining estimates for the solution of hyperbolic equations is the energy method. In this paper, explicit bounds are obtained in terms of the data of the problem for the linear and non-linear second order partial differential equation of hyperbolic type in 2 independent variables. The present approach is based not on the energy method but on the method of majorants which is embodied in the statement of the following theorem and its corollaries: $Lu = u_{xy} + au_x + bu_y + cu = f$ in R where R is the first quadrant of the (x, y) plane.

HARMONIC FUNCTIONS IN FOUR VARIABLES WITH ALGEBRAIC AND RATIONAL P_4 ASSOCIATES, by R. P. Gilbert. July 1962, 27p. incl. refs. (Technical note no. BN-294) (AFOSR-3490) (AF 49(638)228) AD 283840 Unclassified

Also published in Pacific Jour. Math., v. 13: 79-96, Spring 1963.

Integral representations for harmonic functions in 4 variables are investigated by means of an operator bearing close resemblence to 1 Whittaker-Bergman operator. The cases where the P_4 associate is algebraic is considered by means of the theory of double integrals on algebraic 3-folds. When the P_4-associate is rational one obtains particularly interesting representations by considering the connections with Weierstrass integrals of the first, second, and third kinds defined over a Riemann surface. In addition, a residue theorem is given for a class of harmonic vectors, $U = (u_1, u_2, u_3, u_4)$ satisfying the relations which are analogous to one vanishing of one curl and divergence is three-dimensions. POINTWISE BOUNDS IN THE FIRST BIHARMONIC BOUNDARY VALUE PROBLEM, by J. H. Bramble and L. E. Payne. [1962] [9]p. incl. refs. [AF 49(638)228] Unclassified

Published in Jour. Math. and Phys., v. 42: 278-286, Dec. 1963.

A priori bounds are derived for the solution of $\wedge\Delta u = F$ in R, $u = f$ on C, $\partial u/\partial n = g$ on C, where R is a bounded 2-dimensional region with a piecewise continuously differentiable boundary C. The authors state that their results extend easily to n dimensions. Let B be any biharmonic function in R whose gradient is square integrable on C. By applying several known inequalities for harmonic and biharmonic functions, a bound for $\int_R B^2\,dv$ in terms of B and its first derivatives on C is obtained. By combining this inequality with the meanvalue theorem for biharmonic functions the authors arrive at explicit pointwise bounds for the solution u of the original boundary-value problem, as well as for the first derivatives of u and Δu. These inequalities involve, in addition to the data and the distance from the boundary, an arbitrary smooth function φ in $R + C$. A good choice of φ, obtainable, for instance, by Ritz's method, will improve the estimates. The inequalities degenerate as the boundary is approached.

THE WAVE MOTIONS OF SMALL AMPLITUDE IN A FULLY IONIZED PLASMA. PART IV. WITH AN ARBITRARY APPLIED MAGNETIC FIELD, by D. G. Weir. Jan. 1962 [24]p. incl. diagrs. (Technical note no. BN-271) (AFOSR-2144) (AF 49(638)401) AD 271471 Unclassified

The dispersion relation of waves in a fully ionized plasma under a uniform magnetic field of arbitrary orientation has been derived from the 2 fluid theory which is a quartic equation for λ^2, λ being the complex wave number. Various cases have been examined. It has been shown that the roots for λ^2 are all real for an ideal plasma. In the low frequency range 3 of the roots for λ^2 are positive, corresponding to undamped waves, while one root is negative, leading to a damped exponential wave. One of the positive roots changes into a negative root at frequencies higher than the ion cyclotron frequency, calculated from the component of the magnetic field in the direction of the wave propagation. Another root changes sign when the frequency becomes higher than the electron cyclotron frequency calculated for the same component of the magnetic field. At very high frequencies all 4 roots are positive. The interaction between basic waves due to the external magnetic field at very high frequencies is negligible. (Contractor's abstract)

SOME CONSIDERATIONS ON RADIATION MAGNETOGASDYNAMICS, by S. I. Pai. Apr. 1962 [29]p. incl. diagrs. (Technical note no. BN-286) (AFOSR-2874) (AF 49(638)401) AD 276135 Unclassified

The fundamentals of radiant energy transfer and their effects on the gasdynamics are first discussed. The basic equations of radiation magnetogasdynamics are then derived. These equations are simplified under the assumption of local thermodynamic equilibrium. Two special cases have been worked out. One is the case of small mean free path of radiation and the other is the 2 dimensional steady flow in the presence of a straight opaque wall. In the latter case, further simplifications have been made by assuming boundary layer flow and gray gas approximation.

A NEW APPROACH TO TRANSPORT PROBLEMS IN FULLY IONIZED PLASMAS - II. by S. F. Edwards and J. J. Sanderson. June 1962 [15]p. (Technical note no. BN-293) (AFOSR-3018) (AF 49(638)401) AD 282194 Unclassified

Also published in Plasma Phys., Accelerators, Thermonuclear Research, v. 4: 409-413, 1962.

A general method is given for solving the equations governing the propagation of 1 and 2 particles through a fully ionized, near-equilibrium plasma. The coefficient

of electrical conductivity is determined variationally with the exclusion and inclusion of plasma oscillation effects. Without plasma oscillations the result agrees within about 3% with the values of Cowling and of Spitzer and Härm. The effect of plasma oscillations is small the correction being about 0.4%. THE CURVATURE OF SHOCK FRONTS IN SHOCK TUBES, by P. C. T. de Boer. July 1962 [151]p. incl. diagrs. refs. (Technical note no. BN-297) (AFOSR-3790) (AF 49(638)401) AD 286675 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 260, Apr. 23, 1962. (Title varies)

Also published in Phys. Fluids, v. 6: 962-971, July 1963.

Hartunian's theory for the curvature of a shock wave progressing into quiescent gas near a wall has been extended to the case of 2 parallel walls and to that of a circular tube. The axial extent of the curved shock in these cases amounts to 0.760 and 0.783, respectively, of Hartunian's single-wall result. The correction arising when the boundary layer has a finite effective length L has been calculated. Another correction involves the length a of a region of pressure adjustment immediately behind the foot of the shock. With suitable assumptions about the magnitudes of L and a, the results are in good agreement with Duff and Young's experimental data. The shock curvature measured by Lin and Fyfe is appreciably larger than found from the method described.

NEW TECHNIQUES FOR THE VACUUM-ULTRAVIOLET, by T. D. Wilkerson and R. Lincke. Dec. 1962 [9]p. incl. diagrs refs. (Technical note no. BN-307) (AFOSR-4408) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)401, National Aeronautics and Space Administration, and National Science Foundation) Unclassified

Simple and inexpensive methods have been developed for converting conventional photomultipliers into vacuum-uv-sensitive devices. The ranges of sensitivity are useful for many plasma experiments, both in space and in the laboratory. The bandwidths are sufficiently narrow as to improve the quality of both dispersive and non-dispersive radiation measurements.

SOME CONSIDERATIONS ON THE FUNDAMENTAL EQUATIONS OF ELECTRO-MAGNETO-GASDYNAMICS, by S. I. Pai. [1958] [14]p. incl. refs. (AF 49(638)401) Unclassified

Published in Calcutta Math. Soc., Golden Jubilee Commemoration Volume, Pt. 1: 235-248, 1958-1959.

The fundamental equations of the flow problems of electrically conducting fluids, particularly of ionized gases (plasma), are discussed first, then the magneto-gasdynamics approximations are derived. The general properties of fundamental equations of magnetogasdynamics are discussed. The most important parameters of magnetogasdynamics, the magnetic pressure number and the magnetic Reynolds number, are defined. Their influence on the flow field is considered. The magneto-gasdynamics approximations are then re-examined. The generalization of the analysis of magnetogasdynamics to electromagnetogasdynamics, radiation-magnetogasdynamics and magnetogasdynamics in a gravitational field are briefly treated. Finally, the 1-dimensional flow problems of magnetogasdynamics have been treated in some detail which include the characteristics of 1-dimensional unsteady flow and the steady flow through a nozzle.

INFLUENCE OF SHOCK-FRONT CURVATURE ON MEASUREMENTS USING THE SCHLIEREN-PHOTOTUBE TECHNIQUE (Abstract), by P. C. T. de Boer. [1962] [1]p. [AF 49(638)401] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Nov. 19-21, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 499, Aug. 28, 1963.

Some essential limitations are considered in the application of the schlieren-phototube technique to the study of relaxation phenomena behind shock waves. The resolving power is limited by Fresnel diffraction occurring in the edges of the light beam. Another limitation arises from the curvature of the shock wave. Expressions have been derived for the amplitude of the signal arising from the curved shock front as a function of the angle between light beam and shock tube. There is a marked dependence of amplitude on angle, and this was used experimentally for the alignment of the direction of the light beam. The instrumentation was calibrated by displacing the knife edge over a known distance and measuring the resulting signal. Measurements on shock fronts in argon and helium indicated that the axial extent of the curved shock at high initial pressures was approximately constant and that variations in shock tilt were negligible. There is evidence that the axial extent was determined mainly by irregularities in the shock-tube surface just before the test section.

NEW DETECTOR FOR THE VACUUM ULTRAVIOLET, by R. Lincke and T. D. Wilkerson. [1962] [3]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)401] and National Science Foundation) Unclassified

Published in Rev. Scient. Instr., v. 33: 911-913, Sept. 1962.

A new method is described for detecting vacuum uv radiation. This radiation is converted to visible light in 2 steps, the first being creation of photoelectrons at a high voltage cathode, the second consisting of stopping these electrons in a scintillator at ground potential. The visible scintillations are detected with a standard photomultiplier. The system has been compared with a sodium salicylate detector, using a vacuum uv monochromator and a steady light source. Spectral lines between 500 and 1300A have readily been recorded. Compared to other systems the new detector offers a number of advantages which are discussed. Preliminary results for pulsed light sources indicate that the method is also useful for studying phenomena whose time scales are of the order of 1 μ sec.

NEW VACUUM-ULTRAVIOLET DETECTOR (Abstract), by R. Lincke and T. D. Wilkerson. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)401] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 259, Apr. 23, 1962.

The detector converts vacuum-uv radiation into visible light which is recorded by conventional methods. Vacuum uv falls on a gold cathode held 15 kv below ground potential. Resulting photoelectrons accelerate into a grounded plastic scintillator covered with a thin aluminum coating. Visible-light output passes through a window into a high-grain photomultiplier outside the vacuum vessel. Spectral lines from 500 to 1300A have readily been recorded by this method. Longer wavelengths are not observable because of the quantum-yield cutoff of gold and the opacity of the scintillator coating. Scattered-light response is, therefore, negligible compared to sodium-salicylate detectors. Comparison spectra are presented. The new method avoids surface-contamination effects of open vacuum photomultipliers and current limitations of magnetic, resistance-strip multipliers. Sensitivity is comparable to other methods for wavelengths shorter than 1200A. Applications appear likely for space experiments, as well as for laboratory studies of steady or transient discharges.

VIBRATIONAL RELAXATION IN CARBON DIOXIDE. II, by W. J. Witteman. [1962] [7]p. incl. diagrs. tables. [AF 49(638)401] Unclassified

Published in Jour. Chem. Phys., v. 37: 655-661, Aug. 1, 1962.

The vibrational energy rate of approach to thermal equilibrium of suddenly heated CO_2 gas has been studied by using a shock tube and the integrated schlieren method for density measurements. The experimental results agree fairly well with the predicted direct excitation of bending mode and indirect excitation of valence mode in the temperature range 440°-816°K. The measured relaxation times for the direct excitation process range from 3.75 μ sec at 440°K to 0.64 μ sec at 816°K. The effects of impurities through leakage in the tube can be considered negligible. The average temperatures of the measured bending energies are slightly higher than the corresponding temperatures of the valence energies, which indicates that the time constant of the indirect excitation process is at least one order of magnitude smaller. WAVE MOTION IN A FULLY IONIZED PLASMA UNDER A UNIFORM MAGNETIC FIELD OF ARBITRARY ORIENTATION (Abstract), by S. I. Pai and D. G. Weir. [1962] [1]p. [AF 49(638)401] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 13, Jan. 24, 1962.

The dispersion relation of waves has been derived from 2-fluid theory which is a quartic equation for λ^2, λ being the complex wave number. Various cases have been examined. It has been shown that the roots for λ^2 are all real for an ideal plasma. In the low-frequency range 3 of the roots for λ^2 are positive, corresponding to undamped waves, while 1 root is negative, leading to a damped experimental wave. One of the positive roots changes into a negative root at frequencies higher than the ion-cyclotron frequency, calculated from the component of magnetic field in the direction of the wave propagation; another root changes sign when the frequency becomes higher than the electron-cyclotron frequency calculated for the same component of the magnetic field. At very high frequencies all 4 roots are positive. The interaction between basic waves due to external magnetic field at very high frequencies is negligible.

PROGRESSIVE DEFORMATION OF A CURVED VORTEX FILAMENT BY ITS OWN INDUCTION, by F. R. Hama. [1962] [7]p. incl. diagrs. (AFOSR-3678) (AF 49(638)-645) Unclassified

Published in Phys. Fluids, v. 5: 1156-1162, Oct. 1962.

Progressive 3-dimensional deformation of an initially parabolic, plane curved vortex due to its own induction is numerically obtained in this paper by the use of the localized-induction concept instead of through the full Biot-Savart law. It is shown that after the region near the vertex rises up from the plane of the initial orientation, a helical deformation takes place on the legs of the parabola. The helix, which rotates in the direction opposite to the circulatory rotation around the vortex filament, is found to travel away toward the far ends of the parabola as the vertex keeps rising up, while increasing the amplitude and extent of the helical deformation. Similar computations also carried out with a hyperbolic initial shape resulted in essentially the same conclusions as the parabola but with much better numerical stability, as well as with an exponential initial configuration, which grew into somewhat more complicated patterns, yet maintained the essential feature of the helical deformation.

SOME OBSERVATIONS OF TRANSITION FLOW IN AXIALLY SYMMETRIC BOUNDARY LAYERS, by F. R. Hama. [1962] [14]p. incl. illus. (AFOSR-3692) (AF 49(638)645) Unclassified

Direct surveillance of the vortex pattern caused by a ring-shaped trip is made on 1-in. and 1/2-in. circular cylinders and on a 30° cone in a water tank. Over the cylinders, the boundary-layer thickness is approximately up to the radius of the cylinders. Ring-shaped vortices are shed and deformed into vortex loops in much the same manner as on a flat plate. On the cone, the ring-shaped vortices are stretched and then inevitably deformed into vortex loops, showing that a mere stretching is not a sufficient mechanism for the creation of a turbulence spot. A mechanism of the final breakdown from the vortex loop is tentatively proposed. (Contractor's abstract)

AN EXPERIMENTAL STUDY OF THE THREE DIMENSIONALITY OF THE FLOW AROUND A CIRCULAR CYLINDER, by G. E. Mattingly. June 1962, 67p. incl. illus. diagrs. refs. (Technical note no. BN-295) (AFOSR-3873) (AF 49(638)645) AD 285632 Unclassified

The flow around a circular cylinder of a finite length, with its symmetrical axis oriented normal to the direction of motion, is investigated by means of dye techniques in a water tank. The flow around the cylinder including the end effect is described during the period of accelerated motion preceding a constant velocity as well as during the flow at constant velocity. The Reynolds number is varied in the range $10^{4-} < Re < 10^{5+}$ for 3 cylinders which are 6-, 4-, and 1-in. diam and 30-in. long. The flow around the cylinders is found to be strongly 3-dimensional, and a plausible explanation of the origin of the 3-dimensionality is put forward. (Contractor's abstract)

PROGRESSIVE DEFORMATION OF A PERTURBED LINE VORTEX FILAMENT, by F. R. Hama. [1962] [9]p. incl. diagrs. refs. (AFOSR-J1046) (AF 49(638)645) AD 418298 Unclassified

Also published in Phys. Fluids, v. 6: 526-534, Apr. 1963.

When a straight 2-dimensional vortex filament, which is laid on the x axis, is perturbed by a 3-dimensional distortion, it deforms progressively by its own induction. The progressive deformation is numerically obtained in this paper for a localized distortion $y = a \exp(-x^2)$ and for a periodic distortion $y = 2a \cos[\frac{1}{2}(\pi x)]$, a being the amplitude relative to the lateral extent of the distortion. When a is small, the Gaussian distortion causes a helical deformation which first moves in and then moves away toward far ends along the vortex filament, whereas the central portion where the disturbance was originally located, subsides and straightens. The plane of the sinusoidal distortion simply rotates in the direction opposite to that of the translation of fluid in the undisturbed vortex. The retrograde rotation is the same as that formulated by Kelvin. For these cases of small amplitude, a linearized theory is also put forward. When a^2 is large compared with unity, on the contrary, a nonlinear effect comes in, causing higher-order deformations to take place in both cases near the tip of the distorted pattern. This substantiates in part the author's experimental observation of the progressive deformation of a vortex loop in the final stage of boundary-layer transition. A possible mechanism of 3-dimensional amplification of initially small perturbation in a shear flow is also discussed. (Contractor's abstract)

INVESTIGATION OF AXIAL FLOW COMPRESSOR BY ELECTRIC SPARK TECHNIQUE, by Y. Kageyama. 1961, 55p. incl. illus. diagrs. tables, refs. (AFOSR-4165) (AF AFOSR-61-3) Unclassified

The electric spark technique was applied to an investigation of the air flow in an axial flow compressor. The results confirmed that this technique is available for the investigation of blade performance. Specifically, this experiment involved measurements of the boundary layers on the compressor blade, 3-dimensional flow pattern and instantaneous wake patterns behind rotor blades at design point operation. In addition, stall investigations were conducted under variable conditions. It was confirmed that the 3-dimensional effect increased, if solidity increased, and the direction of 3-dimensional flow on the rotor blade was from hub to tip. The spark technique permitted a more precise investigation of the flow on the blades of axial flow compressor, which should lead to greater efficiency, particularly at high speed operation.

EFFECTS OF GLUCOSE AND OXYGEN DEPRIVATION ON FUNCTION OF ISOLATED MAMMALIAN RETINA, by A. Ames, III and B. S. Gurian. [1962] [18]p. incl. diagrs. refs. (AFOSR-64-0174) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)-98 and National Institute of Mental Health) AD 432739 Unclassified

Also published in Jour. Neurophysiol., v. 26: 617-634, July 1963.

Light-evoked compound action potentials were recorded from the optic nerve of isolated rabbit retina, maintained at 30°. The evoked potentials disappeared after 4 min of anoxia, but when O_2 was resupplied recovery was rapid and complete even after 60 min deprivations. Without glucose, response amplitude fell to 40% in 4 min and to 0% in 60 min, about 66% of the initial amplitude was recoverable after 60 min deprivations. Recovery after simultaneous deprivation of O_2 and glucose was markedly delayed but finally as complete as after deprivation of glucose alone. Elevating the temperature 7° reduced by threefold the duration of the combined deprivation that could be reversibly sustained. Effects of reducing O_2 and glucose to intermediate levels and of adding other nutrients were also examined.

POSSIBLE PHYSIOLOGICAL BASES FOR ANIMAL NAVIGATION WITH SPECIAL REFERENCE TO INERTIAL GUIDANCE NAVIGATION SYSTEMS (Abstract), by J. S. Barlow. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)-98], Office of Naval Research, and Signal Corps) Unclassified

Published in Internat'l. Biophys. Cong., Stockholm (Sweden) (July 31, 1961-Aug. 4, 1961), Abstracts of Contributed Papers, 1961, p. 138.

The phenomenon of animal navigation has thus far escaped a complete explanation in physiological terms. That return of animals from a distant point might be accomplished by means of a memory of every twist and turn of the outgoing path has long been entertained. Experiments in the past to test this hypothesis have however appeared to yield negative results, although upon closer inspection these experiments are perhaps not absolutely conclusive. Over short distances observations obtained by Beritoff indicate that for man, cats, and dogs, the vestibular apparatus is of great importance for spatial orientation and navigation. These considerations are discussed in relation to known physiology of the vestibular apparatus, biological clocks, and reports on experimental observations on navigation by animals and by man (particularly with deficites of the vestibular apparatus). Suggestions are advanced for further investigations in which predictions that are possible can be subjected to experimental test.

(Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)98, Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and National Institutes of Health) Unclassified

Published in Neural Physiopathology: Some Relationships of Normal to Altered Nervous System Activity, ed. by R. G. Grenell, New York, Harper and Row, 1962, p. 258-265.

Normal and abnormal oscillatory phenomena are studied by means of an automatic averaging technique which emphasizes only those potential swings that are phase-locked to the stimulus and averages out the background activity that is only randomly related to the incidence of the stimulus. Normal subjects were stimulated photically and the results are presented in the form of autocorrelations of the electroencephalogram. There is evidence for some neuronal activity persisting

as an alpha rhythm not paced by the flash. In another set of experiments performed on normal subjects the photically induced oscillations are found to have a different frequency from the alpha oscillations. The slight difference in frequency of the 2 autocorrelations may be due to the increased alertness of the subject while being flashed. A disruption can be found in disease states that affect this system. For example, the autocorrelogram of a patient who had a cerebrovascular accident in the right hemisphere did not detect any abnormality in the resting EEG, but the use of a flash revealed a normal primary response but an absent evoked oscillation. Finally, the response to auditory stimuli on abnormal nervous activity was illustrated by a clinical case in which the patient suffered attacks which were in some ways psychomotor in type, but which were characterized by her hearing jazz music. Such a case suggests that the neuronal mechanism responsible for further processing of the message after its initial arrival at the receiving cortex was disordered to the extent of losing its oscillatory response to a stimulus and of producing abnormal sensations of sound in the absence of input from the peripheral auditory mechanisms.

SUBSONIC FLUTTER OF PANELS ON CONTINUOUS ELASTIC FOUNDATIONS—EXPERIMENT AND THEORY, by J. Dugundji, E. Dowell, and B. Perkin. Apr. 1962 [79]p. incl. illus. diagrs. (ASRL-TR-74-4) (AFOSR-3057) (AF 49(638)219) AD 278235 Unclassified

The subsonic aeroelastic stability of a 2-dimensional panel resting on a continuous elastic foundation was investigated both experimentally and theoretically. Experimentally, tests were conducted on a 104-in. x 24-in. x 0.0018-in. rectangular aluminum panel in a low-speed wind tunnel. Definite flutter of a travelling wave type was observed. Films and oscillograph records were taken. Theoretically, a finite panel, 2 mode, standing-wave analysis was shown to give essentially the same behavior as the infinite panel, travelling-wave analysis of Miles for this panel on an elastic foundation. Although a mild, divergence-type instability exists for these panels, the dominant instability was shown to be of a travelling wave, flutter type. The role of additional internal damping was investigated and found to have an interesting destabilizing effect between the divergence and flutter speeds. Comparison of experiment and theory showed good agreement in the prediction of the flutter speed and wave-length, but rather poor agreement in the wave speed and frequency at flutter. This discrepancy was attributed to various limitations in the test set-up as well as to the general difficulty of predicting the wave speed and frequency as accurately as the flutter speed. The present investigation should be of interest in problems of hydroelasticity, axially symmetric cylinders, and inflatable structures at low speeds, as well as to the general problem of panels lying on springy elastic material.

A series of ductile, 2 phase W-Ni-Fe composites, sintered in the presence of a liquid phase, were tested in tension. Identical room temperature stress-strain curves were obtained for specimens containing from 80 to 92 wt-% W (58 to 75 vol-% W particles). The composites exhibited a maximum elongation of 29% at room temperature, and 10.7% at 77°K. The W particles in the composite elongated by the same amount at these temperatures. Single phase alloy specimens matching the composition of the composite matrix showed about one half the flow stress of the composites. The test results demonstrated that the mechanical properties of W-Ni-Fe composites are determined by the W particles alone and are independent of matrix volume fraction or mean free path over the composition range studied. PLASTIC DEFORMATION OF THIN BRAZED JOINTS IN SHEAR, by C. W. Shaw, L. A. Shepard, and J. Wulff. Nov. 1962, 45p. incl. illus. diagrs. tables, refs. (ASRL-TR-94-3) (AFOSR-4987) (AF 49(638)775) AD 297526 Unclassified

Also published in Trans. Amer. Soc. Metals, v. 57: 94-119, Mar. 1964.

The plastic behavior of the more ductile phase of a 2 phase material was simulated in shear tests on thin silver joints brazed in tubular steel specimens. Both the yield strength and the work hardening rate of the silver were increased by the presence of the rigid interfaces. At 10% strain, the flow stress of the thin joints was 1.5 as great as fine grained polycrystalline silver. Deformations of the silver near the steel interfaces was severely limited across the joint. These effects were postulated to arise from the constraint of slip by the nonyielding interfaces. (Contractor's abstract)

SNAPPING PHENOMENA OF ELASTO-PLASTIC CURVED BEAMS UNDER STATIC AND DYNAMIC LOADINGS, by P. T. Hsu and M. M. Chen. Jan. 1962, 55p. incl. diagrs. (ASRL-TR-100-2) (AFOSR-2460) (AF 49(638)985) AD 275779 Unclassified

The snap-buckling problems for an elasto-plastic curved beam under laterally applied static and dynamic loads are investigated. By neglecting the transverse shear and strain-rate effects, the governing equations for various phases of motion are formulated for a simplified model. Elasto-perfectly-plastic materials are considered. Numerical results of the analytic solutions are given in the form of load-deflection relations and phase trajectories for several typical cases. AN EXPERIMENTAL INVESTIGATION OF A TWO-LAYER INVISCID SHOCK CAP DUE TO BLUNT-BODY NOSE INJECTION, by J. R. Baron and E. Alzner. [1962] [10]p. incl illus. diagrs. table. (AFOSR-J391) (AF 49(638)245) AD 408546 Unclassified

Also published in Jour. Fluid Mech., v. 15: 442-448, Mar. 1963.

Blunt-body solutions for supersonic flow usually concern closed body surfaces. A report is made on an experimental investigation of a 2-layer shock cap and the existence of a predictable contact surface separating the layers is indicated. The inner layer was generated by injecting air through a contoured axisymmetric channel on a blunt body so as to simulate a hemispherical contact surface in a Mach number 4.8 flow. Results show the existence of the contact surface and the influence of a range of mass-injection rates upon the displacement of the bow shock and contact surface from the body. AN INTEGRAL METHOD FOR CALCULATING HEAT AND MASS TRANSFER IN LAMINAR BOUNDARY LAYERS, by F. E. C. Culick. [1962] [11]p. incl. diagrs. refs. (AFOSR-J822) (AF 49(638)245) AD 413946 Unclassified

Also published in AIAA Jour., v. 1: 783-793, Apr. 1963.

An integral method to treat simultaneous heat and mass transfer in a binary-mixture laminar boundary layer when the pressure is uniform is presented. The principal results are 2 pairs to dual integral relations arising from solutions to the integral concentration and energy equations. One pair connects the surface mass transfer rate and surface concentration of injected gas; the other relates surface temperature and heat transfer rate in the presence of mass transfer. Only the cases of helium and air injection into an undissociated air stream are discussed in detail, but the method can be applied to problems involving other gases. The approximate results agree quite well with some numerical solutions and with recent experimental results for which no numerical solutions are available. (Contractor's abstract)

[A STUDY OF THE MECHANICS FOR OPTIMIZATION OF CELESTIAL TRAJECTORIES] Summary rept. Nov. 27, 1962, 3p. (AFOSR-4239) (AF 49(638)363) AD 292729 Unclassified

An attempt was made to define optimum techniques for epoch correction and optimum performance, and to establish boundaries between areas in which different techniques were superior. The simple approach is to change the period of the interceptor vehicle by applying a tangential impulse. In general, the change should be made by a non-tangential impulse, which yields a saving in time and propellant. A brief examination of the effective cross-sectional area of planets was made. The variational calculus and its operational descendants are employed to analyze the problems of trajectory optimization. The orbital escape problem and the soft landing problem are considered. It was found that for landing on the moon, a constant-thrust-angle trajectory is probably the best operational system. A further development in the optimization theory is presented which includes the stochastic nature of a trajectory in the optimization process itself. The procedure is outlined and applied to the case of soft landing on the moon.

INTERSECTION THEORY ON QUOTIENTS OF ALGEBRAIC VARIETIES, by R. E. Briney. [1962] [22]p. incl. refs. (AF 18(603)90) Unclassified

Published in Amer. Jour. Math., v. 84: 217-238, Apr. 1962.

Several studies have been made regarding the problem "given 2 cycles Z, Z' carried by an ambient algebraic variety X, a well-defined multiplicity $(C; Z \cdot Z')_X$ can be assigned to each component C of their intersection which is simple on X". However, no general definition has been given for multiplicities of intersection at components which are singular on the ambient variety. A particular case of this problem is considered in the present note. Let a finite group g act as a group of biregular transformations on a nonsingular variety X, and assume that the quotient space $Y = X/g$ is a variety. If elements of g other than the identity have fixed points on X, the variety Y will in general have singularities. An intersection multiplicity $(C; Z \cdot Z')_Y$ for any component C of the proper dimension, $\dim Z + \dim Z' - \dim Y$: when C is simple on Y is defined. A global intersection theory is established, not only on quotients of nonsingular varieties but on those which result from nonsingular varieties after a finite number of repetitions of the process of forming quotients. The precise result is stated as follows: Let Q be the category of all normal varieties Y having a nonsingular normalization in some field K obtainable from $k(Y)$ by a finite sequence of (finite) Galois extensions. Then Q is an intersection category, with an intersection multiplicity which agrees on nonsingular varieties with the usual one.

TRIGONOMETRIC POLYNOMIALS AND DIFFERENCE METHODS OF MAXIMUM ACCURACY, by G. Strang. [1962] [8]p. (AFOSR-3695) (AF 49(638)42) Unclassified

Also published in Jour. Math. and Phys., v. 41: 147-154, June 1962.

The fundamental problem in the theory of partial difference approximations to hyperbolic equations is the question of convergence to the true solution through the use of an increasingly fine mesh. This question is examined for those explicit methods of greatest interest, the most accurate ones. The most exact methods prove to be stable under quite resonable restrictions on the mesh ratio. Bernstein's inequality for the derivative of a trigonometric polynomial is applied in the latter half of the paper to establish the connection between 2 standard necessary conditions for convergence. For systems of equations, the reasoning is reversed to obtain a sort of Bernstein theorem for the spectral radius when the polynomial's coefficients are matrices.

ON THE THIRD ENGEL CONDITION, by J. L. Alperin. [1962] 7p. (AFOSR-4108) (AF 49(638)42) Unclassified

In a recent paper, Heineken made a detailed study of groups satisfying the third Engel condition in which he proved that any such group G was locally nilpotent and moreover, if G had no elements of order 2 or 5, then G was in fact nilpotent of class at most 4. Previously, Higgins studied Lie rings satisfying the third Engel condition and showed that any such Lie ring L, of characteristic prime to 2 and 5, was nilpotent of class at most 6. This paper attempts to remove the restrictions indicated by both authors on elements of order 5 and on characteristic prime to 5. However, in order to do this, larger bounds are obtained for the class of nilpotence in both these results. Specifically, the following theorems are proved: (1) Any group satisfying the third Engel condition and which contains no elements of order 2 is nilpotent of class at most 7; and (2) Any Lie ring satisfying the third Engel condition and which is of characteristic prime to 2 is nilpotent of class at most 7.

ON THE OSCILLATIONS AND THE STABILITY OF ROTATING GASEOUS MASSES, by S. Chandrasekhar and N. R. Lebovitz. [1961] [13]p. incl. table, refs. (AFOSR-J727) (In cooperation with Chicago U., Ill.) (AF 49(638)42) Unclassified

Also published in Astrophys. Jour., v. 135: 248-260, Jan. 1962.

The oscillations and the stability of a rotating gaseous mass are considered on the basis of an appropriate tensor form of the virial theorem. On the assumption that the Lagrangian displacement ξ can be expressed in the form $\xi_j = X_{jr}\gamma_r e^{\lambda t}$ (X_{jr} constants), a characteristic equation for λ (of order 18) is derived from the 9 integral relations provided by the virial theorem. An examination of the roots of this characteristic equation enables the enumeration of the properties of all the natural modes of oscillation belonging essentially to harmonics not higher than the second. It is shown that there are 3 principal groups among these modes: a group of 3 modes, each of which exhibits a doublet character; a group of 2 modes, 1 of which becomes neutral at a point where the condition for the occurrence of a point of bifurcation is satisfied and both of which become overstable at a higher angular velocity; and a group which represents the coupling of 2 modes, 1 of which is purely radial and the other of which is purely non-radial in the absence of rotation. In addition to these modes, there are 2 "trivial" modes, 1 of which is neutral and the other of which has a characteristic frequency equal to the angular velocity. (Contractor's abstract)

ON THE DISTRIBUTION OF MATTER WITHIN HIGHLY FLATTENED GALAXIES, by A. Toomre. [1962] [8]p. incl. diagrs. tables. (AFOSR-65-0077) (AF 49(638)42) AD 455618 Unclassified

Also published in Astrophys. Jour., v. 138: 385-392, Aug. 15, 1963.

A new mathematical method for deducing, from an arbitrary law of rotation, the equilibrium distribution of mass within a highly flattened, axisymmetric, self-gravitating system, such as a spiral galaxy is presented. An exact and an approximate single integral are developed, each of which gives the required surface mass density explicitly in terms of the rotation function. In

addition, certain conveniently expressible mass distributions are shown to correspond accurately to some fairly realistic functions describing the rotation velocity. The properties of some of these mathematically exact galaxy models are also discussed and intercompared.

ON SUPERPOTENTIALS IN THE THEORY OF NEWTONIAN GRAVITATION. II. TENSORS OF HIGHER RANK, by S. Chandrasekhar and N. R. Lebovitz. [1962] [5]p. (AFOSR-65-0079) (In cooperation with Chicago U., Ill.) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)42 and Office of Naval Research) AD 455628 Unclassified

Also published in Astrophys. Jour., v. 136: 1032-1036, Nov. 1962.

In addition to the tensors considered in the earlier paper (item no. 1532, Vol. V) the following tensors are defined and studied:

$$\mathfrak{D}_{ij}(x) = G\int_V \rho(x')\frac{x'_i x'_j}{|x-x'|}\,dx',$$

$$\mathfrak{D}_{ij;k}(x) = G\int_V \rho(x')\frac{(x_i-x'_i)(x_j-x'_j)x'_k}{|x-x'|^3}\,dx', \text{ and}$$

$$\mathfrak{D}_{ijkl}(x) =$$

$$G\int_V \rho(x')\frac{(x_i-x'_i)(x_j-x'_j)(x_k-x'_k)(x_l-x'_l)}{|x-x'|^5}\,dx'.$$

These tensors are useful in problems (such as the stability of the Jacobi ellipsoids) in which it is necessary to examine the effects of perturbations belonging to the third harmonic. (Contractor's abstract)

ON THE OSCILLATIONS AND THE STABILITY OF ROTATING GASEOUS MASSES. II. THE HOMOGENEOUS, COMPRESSIBLE MODEL, by S. Chandrasekhar and N. R. Lebovitz. [1962] [13]p. incl. diagrs. tables. (AFOSR-65-0082) (In cooperation with Chicago U., Ill.) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)42 and Office of Naval Research) AD 455620 Unclassified

Also published in Astrophys. Jour., v. 136: 1069-1081, Nov. 1962.

The pulsation frequencies of rotating, gaseous masses of uniform density, i.e., of the Maclaurin spheroids, are found as functions of the angular momentum M and the ratio of the specific heats γ. Numerical calculations for the pulsation frequencies and normal modes are given for $\gamma = 1.3, \frac{4}{3}, 1.4, 1.5, 1.6$, and $\frac{5}{3}$. It is found that the value of γ, at which dynamical instability sets in, is reduced from $\gamma = \frac{4}{3}$ by rotation. It is also found that when $\gamma = 1.6$, the normal modes of oscillation obtained in the limit $M \to 0$ are both very far from being radial. (Contractor's abstract)

1658

ON THE OSCILLATIONS AND THE STABILITY OF ROTATING GASEOUS MASSES. III. THE DISTORTED POLYTROPES, by S. Chandrasekhar and N. R. Lebovitz. [1962] [23]p. incl. tables, refs. (AFOSR-65-0083) (In cooperation with Chicago U., Ill.) (Sponsored jointly

by Air Force Office of Scientific Research under AF 49-(638)42 and Office of Naval Research) AD 455621 Unclassified

Also published in Astrophys. Jour., v. 136: 1032-1104, Nov. 1962.

The theory of the oscillations of rotating gaseous masses, developed in an earlier paper of this series, is applied to determine the effect of a small rotation (Ω) on the fundamental modes of oscillation of a polytrope. The basis for this application is provided by the theory of rotationally distorted polytropes; this theory is reviewed and amplified further to include a discussion of the superpotential. The various tensors expressed in terms of the characteristic frequencies of oscillation, are evaluated for distorted polytropes, appropriately, to the first order in Ω^2. The final results on the effect of rotation on the characteristic frequencies are presented in the form of tables. (Contractor's abstract)

PULSATIONS OF MACLAURIN SPHEROIDS (Abstract), by S. Chandrasekhar and N. R. Lebovitz. [1962] [1]p. (In cooperation with Chicago U., Ill.) [AF 49(638)42] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 321, Apr. 23, 1962.

In the theory of the adiabatic pulsations of spherical gaseous masses, the formula $\sigma^2 = (\beta\gamma - H)\, W/I$, giving approximately the frequency σ of radial pulsations, is well known. This formula becomes exact in the limit when the density distribution in the unperturbed configuration is uniform. The problem of generalizing this formula to the case of rotating, and hence nonspherical, configurations can be approached from several directions. The approach followed here consists in calculating exactly the pulsation frequencies of rotating masses of uniform density, i.e., of Maclaurin spheroids, as functions of angular momentum and the ratio of specific heats. The principal results are: (1) Rotation has a stabilizing effect; (2) there are 2 pulsation modes of very different character; and (3) the pulsation modes for $\gamma = 1.6$ (approximately) differ strongly from those for which $\gamma \neq 1.6$. The last result modifies and clarifies a previous interpretation of double periods in certain variable stars.

SIMILARITY SOLUTIONS FOR THE FLOW INTO A CAVITY, by C. Hunter. [1962] [17]p. incl. diagrs. tables. (AFOSR-64-2554) (AF 49(638)708)
AD 453969 Unclassified

Also published in Jour. Fluid Mech., v. 15: 289-305, Feb. 1963.

An investigation is made into the possible types of similarity solutions that can describe the symmetric flow of a fluid into an empty spherical cavity. The flow is homentropic, and the fluid obeys a perfect gas law $p = K\rho^{\gamma}$. Values of γ in the range $7 \geq \gamma > 1$ are discussed. In this range, it is found that similarity solutions in which the flow accelerates into the cavity exit for $\gamma > \frac{3}{2}$. For these solutions, the radius R of the cavity decreases as the nth power of time measured from the instant at which the cavity disappears. This power n increases monotonically as γ decreases, and attains the value 1 for $\gamma = \frac{3}{2}$. Similarity solutions in which the cavity collapses with constant velocity are given by the value n = 1, and such solutions are possible for all values of γ in the range considered. INVESTIGATIONS IN GLOBAL ANALYSIS, by I. E. Segal. Final rept. Sept. 16, 1960-June 30, 1962. July 30, 1962, 6p. (AFOSR-3530) (AF 49(638)945)
AD 285302 Unclassified

The research done under this contract has been directed toward the advance of precise understanding of the elusive but fundamental concept of a local quantized field. The main result is the attainment of the key element for the equation $\Box\sigma = F(\sigma)$, under the assumptions that F (a function of a real variable) is smooth, does not grow too rapidly at infinity, and either gives rise to a positive energy or is Lipschitzian. Under these assumptions, a state of the quantized field at one time may be propagated in a clear-cut and rigorous manner to a state at any other time, which is empirically most essential, and determines in practice an arbitrarily close approximation to the S-operator. The quantum field itself has less direct physical significance, and is more complicated mathematically. It can be represented by linear differential operators on the manifold of classical solutions of the given partial differential equation, or in the Lipschitzian case, by derivations of a certain C^*-algebra. In addition, considerable research has been undertaken in analyzing various relevant topics in function space, the mathematical theory of free fields, and the theory of non-linear hyperbolic partial differential equation.

THEORETICAL INVESTIGATIONS OF A SUPERSONIC LAMINAR BOUNDARY LAYER WITH FOREIGN-GAS INJECTION, by S. I. Freedman, J. R. Radbill, and J. Kaye. [1962] [11]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)1493 and Office of Naval Research)
Unclassified

Published in AIAA Jour., v. 1: 148-158, Jan. 1963.

The phenomena arising from the uniform injection of helium, air, argon, and iodine into the laminar boundary layer of a supersonic stream of air in a tube were investigated theoretically. The partial differential equations describing the energy, mass, and momentum transfers through the boundary layer were obtained, and a series solution was found for the case of uniform injection through the tube wall. The results of the analysis are in the form of axial distributions of wall temperature and recovery factor and of radial distribution of concentration, velocity, static, and stagnation temperatures. The gas mixture was assumed to be a perfect gas. Properties of the mixture were calculated in accordance with the Gibbs-Dalton rule and the mixing rules based on the kinetic theory of dilute gases. Transport properties for pure air were taken from the N. B. S. tabulations. Transport properties for the other gases were calculated by kinetic-theory methods, employing a Lennard-Jones 6-12 model for the interaction potential. The theoretical predictions for the recovery factor along the tube with air or argon injection agree with experimental data to within 1%. The theoretical predictions for helium injection indicate an 8% rise in the recovery factor along the tube, while experiments have shown only a 1% rise. These differences between theory and experiment are attributed to inaccuracies in the approximations to the transport properties of the binary mixtures. (Contractor's abstract)

THE THERMODYNAMIC PROPERTIES OF THE PRODUCTS OF H_2-O_2 COMBUSTION AT ELEVATED TEMPERATURES, by W. C. Moffatt, F. D. Skinner, and R. J. Zaworski. [1962] [9]p. incl. diagrs. (AFOSR-3740) (AF 49(638)375) Unclassified

A program has been developed for the 704 computer which yields the compostion and thermodynamic properties of the products of combustion of stoichiometric H_2-O_2 mixtures. The calculations were based on the existence of 6 species in the products: H_2O, H_2, O_2, H, O, and OH, covering temperature and pressure ranges of 1600° to 6000°K and .01 to 1000 atm, respectively. The standard Newton-Raphson iteration procedure was employed to determine the composition, and corrected iterations were performed until the maximum error in any composition was less than 0.1%. The thermodynamic properties were then calculated directly. To facilitate presentation of the data in the form of a Mollier Chart, temperature and pressure were selected as the independent variables. Also, interpolation of this data was carried out to determine the properties for incremental values of density and Z (the ratio of the molecular weights of undissociated and disocciated products) at each temperature. In all cases, the computed values of enthalpy and entropy were found in dimensionless form, permitting the use of any appropriate set of units. The present computation was based on a stoichiometric mixture of H_2 and O_2, but provision was made so that properties and compositions corresponding to other proportions might be readily found. AN ANALYTICAL AND EXPERIMENTAL INVESTIGATION OF LAMINAR AND TURBULENT AIR FLOW IN A TUBE WITH AN ENTRANCE MACH NUMBER OF FIVE. by G. A. Brown. May 1960 [254]p. incl. illus. diagrs. tables, refs. (Technical rept. no. 7359-13) (AFOSR-3492) (AF 49(638)442) AD 621242 Unclassified

An investigation was made of the adiabatic flow of air in the entrance region of a tube with an inlet Mach number of about 5. Measurements were made of the static pressure and adiabatic wall temperature along the test section for values of the inlet core diam Reynolds number between 85,000 and 170,000. A special micromanometer was designed to measure static pressure at the low pressures of about 0.03 psia. Small combination probes were developed to measure the profiles in the boundary layers on the tube walls. The measured static pressures, wall temperatures, recovery factors, local friction coefficients, boundary layer profiles, etc. were in excellent agreement with available theoretical predictions for the laminar boundary layer. The results for the turbulent boundary layer location of transition were in good agreement with available data. The experimental data support the following conclusions: (1) When a tube is supplied with a gas directly from a nozzle, a laminar boundary layer will develop on the tube walls with an isentropic core of fluid near the centerline; (2) If the turbulence level and surface roughness are kept low, transition to a turbulent boundary layer will not occur until Reynolds values core length greater than 10^6 are exceeded; (3) When the turbulent boundary layer is formed, the boundary layer fills the tube in a very short distance and the isentropic core disappears; and (4) When a supersonic laminar boundary layer is present which has a fairly thick subsonic portion, the flow in the tube can be affected by variations in the pressure at the tube exit. A solution has been developed for predicting the pressure distribution in the entrance region of a tube when a compressible laminar boundary layer is present and the flow occurs under adiabatic conditions. The predictions from this solution are within ±5% of the predictions from 2 exact solutions which are available and agree well with existing experimental data. (Contractor's abstract, modified)

AN ANALYTICAL AND EXPERIMENTAL INVESTIGATION OF THE ANNULAR INJECTION OF HELIUM INTO A SUPERSONIC AIR CORE, by C. A. Kemper. May 1962 [187]p. incl. illus. diagrs. tables. (AFOSR-3493) (AF 49(638)442) AD 621243 Unclassified

The experimental portion of the investigation included the development of miniaturized boundary-layer instrumentation capable of measuring velocity, temperature, and concentration profiles of the flow. Profiles were obtained at 8- and 16-diam downstream of the tube entrance, wall temperature measurements were obtained at each L/D, and wall static pressures at every 2L/D. Both the wall distributions and the profiles indicate that the flow was laminar and that the main air flow was not physically disturbed by injection except at the highest rates of injection. The wall concentration of He was unity at the tube entrance and decreased to less than 10% by mass at an L/D of 8. The maximum reduction in wall temperature recovery factor was about 6% for the highest rate of He injection. An analysis was developed for the case of annular injection parallel to the main flow of gas at the entrance of a tube. It is assumed that the flow is divided into 3 regions. The first region is an inner boundary layer adjacent to the tube wall which begins growing at the tube entrance and in which the governing equations are solved by simultaneous numerical integrations. The second region is an intermediate boundary layer, corresponding to the injection slot at the tube entrance, in which the equations are solved by an integral method. The third region is a core of the main stream in which it is assumed that the flow is entropic and 1-dimensional. The analytical solutions for the case where air is injected at the main flow conditions agree quite well with experimental data for zero injection and with previous analytical solutions for flow of air in a tube. THE VARIANCE ON PALMGREN-MINER DAMAGE DUE TO RANDOM VARIATION, by S. H. Crandall, W. D. Mark, and G. R. Khabbaz. Jan. 1962 [22]p. incl. diagrs. table. (AFOSR-1999) (AF 49(638)564) AD 271151 Unclassified

Also published in Proc. Fourth U.S. Nat'l. Cong. Appl. Mech., California U., Berkeley (June 18-21, 1962), New York, Amer. Soc. Mech. Engineers, v. 1: 119-126, 1962.

A random stress-history which is proportional to the stationary response of a single-degree-of-freedom vibratory system to wide-band Gaussian excitation is assigned a damage based on the Palmgren-Miner hypothesis and an idealized S-N law. The damage accumulated in time T is a random variable because of the randomness in the number of cycles and the randomness in the amplitudes of the cycles. The mean and variance of the damage are obtained by 2 procedures: one which accounts for both sources of randomness and one which neglects the randomness in the number of cycles contained in the interval. The 2 procedures give the same asymptotic result when the bandwidth shrinks to zero. (Contractor's abstract)

ON RANDOM VIBRATION OF SYSTEMS WITH NONLINEAR DAMPING, by G. R. Khabbaz. July 1962 [121]p. incl. diagrs. tables, refs. (AFOSR-3165) (AF 49(638)564) Unclassified

The energy dissipated from a system in motion depends on many factors such as temperature, stress amplitude and type of material. The simplest model is one in which the damping force is linearly proportional to velocity and independent of the oscillation frequency. The response of a single degree-of-freedom model to a stationary white gaussian input was studied. In the model, the restoring force is linearly proportional to the relative motion of mass and support, but in addition to the viscous damping force, there is also a nonlinear damping force. The differential equation of relative motion of such a model is given by:

$\ddot{u} + 2\xi(\dot{u} + \eta \dot{u}^m) + u = F(T)$; the term $\dot{u}^m$ is the nonlinear damping term. If $\eta = 0$, the above equation becomes the differential equation relative motion for the linear system. Various responses of the system, represented by this equation to a stationary white gaussian input have been analyzed. In general, the effect of the nonlinear damping term on the responses of the sytem can be divided into 3 categories: (1) responses unaffected by the small nonlinear damping term such as the expected number of zero crossings; (2) responses slightly affected by the addition of a small nonlinear damping term to the linear system such as the probability distribution densities of displacement velocity and amplitude of motion; and (3) responses affected significantly due to the addition of a small nonlinear damping term such as the average number of crossings, a high level of response per unit time, and the average accumulation of fatigue damage. THE ENVELOPE OF RANDOM VIBRATION OF A LIGHTLY-DAMPED NONLINEAR OSCILLATOR, by S. H. Crandall. Oct. 1962 [23]p. incl. diagrs. (Rept. no. 201) (AFOSR-4078) (AF 49(638) 564) AD 288025 Unclassified

Presented at Second Conf. on Nonlinear Vibrations, Warsaw (Poland), Sept. 18-21, 1962.

There are several ways in which the envelope of the stationary random response of a lightly-damped oscillator can be characterized. Two characteristics which lead to the same first-order probability distribution for systems with conservative nonlinear restoring forces are described. In such systems, the envelope distributions are in general different from the distributions of peak amplitudes. The Duffing system is used to illustrate these general results. For the special case of a Gaussian oscillator, an envelope characterization has been given by Rice. It is shown that in this case the above envelope characterization has the same first-order distribution as that given by Rice, but that the second-order probability distributions are, in general, different. EXPERIMENTS WITH A TRANSIENT DC CROSSED-FIELD ACCELERATOR AT HIGH POWER LEVELS, by W. T. Hogan. [1962] [27]p. incl. illus. diagrs. table. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)643 and Office of Naval Reserach) Unclassified

Published in Engineering Aspects of Magnetohydrodynamics, Proc. of the Third Symposium, Rochester N. Y. (Mar. 28-29, 1962), New York, Gordon and Breach, 1964, p. 479-505.

Results show that the eddy currents flowing in the gas as the gas leaves the magnetic field region do not appreciably decelerate the flow, even when the magnetic Reynolds number is greater than unity. For these experiments, the total gas dynamical pressure was larger than the magnetic pressure. The measured open circuit voltages were a few per cent lower than the calculated values for a circular channel indicating that no detrimental internal short circuits exist. By apportioning the total current between the test gas and the cooler gases that follow, and using a model that consists of a slug with a constant value of mass acted upon by the Lorentz force associated with the current passing through the test gas, the

momentum and energy can be balanced. On the basis of the above model, the momentum efficiency was about 70% and 50% for the long and short accelerators, respectively. The percentage of electrical energy charged as a loss to the boundary layers decreases with increasing power. The estimate of this loss indicated that it was 25% at a power of 1.0 megawatts and reduced to about 10% at 5 megawatts. The measured increase in electrical conductivity of the accelerated gases is approximately accounted for by ohmic heating.

STATISTICAL THERMODYNAMICS, by L. Tisza. Final rept. Sept. 30, 1962, 5p. (AFOSR-4233) (AF 49(638)95) AD 292906 Unclassified

The classical thermodynamic theory is extended by constructing 2 theories of irreversibility of strongly coupled systems. These theories, macroscopic thermodynamics of equilibrium (MTE) and statistical thermodynamics of equilibrium (STE), are Gibbsian in the sense that they overlap to a considerable degree with the thermodynamics and the statistical mechanics of Gibbs. However, they have a more rigorous local organization, they are more complete, and have a wider range of agreement with experiment.

Dynamic analysis of a rigid-plastic curved beam with axial constraints under impulsive loading is presented. The governing equations for the dynamic equilibrium of the moving hinges for various phases of motion have been formulated. The nonlinear differential equations are then solved by a numerical integration process for a curved beam consisting of 2 straight elements for different initial rises and initial velocities. The results are compared with the case of a rigid-plastic straight beam treated by Symonds and Mentel.

APPLICATION OF THE MONTE CARLO METHOD TO HEAT TRANSFER IN A RAREFIED GAS, by J. K. Haviland and M. L. Lavin. [1962] [7]p. incl. diagrs. table. [AF 49(638)207] Unclassified

Published in Phys. Fluids, v. 5: 1399-1405, Nov. 1962.

A Monte Carlo method was developed and applied to the heat transfer between 2 parallel walls in a rarefied gas using the IBM 709 computer. Three solutions were obtained, all at a temperature ratio between the walls of 4:1. One was for hard-sphere molecules at a Knudsen number of 2.0, and 2 were for Maxwellian molecules at Knudsen numbers of 0.53 and 1.64. These results appear to be of sufficient accuracy to differentiate between some of the approximate analytical methods available at present. It is believed that solutions could be obtained to any degree of accuracy, given sufficient time on a high-speed computer.

DETERMINATION OF SHOCK-WAVE THICKNESSES BY THE MONTE CARLO METHOD, by J. K. Haviland. [1962] [23]p. incl. diagrs. table, refs. (AFOSR-J1041) (Sponsored jointly by Air Force Cambridge Research Center, and Air Force Office of Scientific Research under AF AFOSR-62-84) Unclassified

Also published in Rarefied Gas Dynamics; Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York Academic Press, Suppl. 2, v. 1: 274-296, 1963.(AFOSR-5310)

A Monte Carlo method has been developed for the solution of rarefied gas problems, and has been applied here to the determination of the shock structure in a gas consisting of hard sphere molecules at Mach numbers of 1.5, 2.0, and 3.0. At the 2 lower Mach numbers, the resulting shock widths are in good agreement with the 2-fluid solution by Ziering, but at a Mach number of 3.0, the shock width is closer to the bimodal solution by Mott-Smith. It is concluded that the Monte Carlo method is capable of providing solutions to any desired accuracy, provided that sufficient time is available on a high-speed computer. The method is not restricted to hard sphere molecules, and can be applied to any molecular model with a spherically symmetric force field. (Contractor's abstract)

ON PERTURBED BOUNDARY LAYER FLOWS, by J. D. McClure. June 1962 [181] . incl. diagrs. tables, refs. (Rept. no. 62-2) (AFOSR-3494) (AF AFOSR-62-187) AD 283677 Unclassified

The concepts necessary for understanding the character of perturbed boundary layer flows are developed. Attention is primarily directed toward the role of the boundary layer in flows over perturbed surfaces. The theory for the laminar boundary layer with free-stream Mach number ranging from 0 to 2 is first considered. This part of the investigation is largely of an introductory nature,

although several new points are made. The latter concern waves which travel with supersonic phase velocity relative to the free stream as well as the development and comparison of alternate analytical techniques associated with the inviscid solutions of the equations of motion. Some implications and limitations of the theory are discussed. The effects of the boundary layer are further illustrated by the examination of the stability of traveling wave disturbances in the fluid and an adjoining flexible surface. Significant boundary layer effects are found to derive from 1 of 3 or more-or-less distinct causes: (1) the boundary layer thickness is comparable to the scale of the disturbance; (2) the disturbances are similar in nature to those arising in boundary layer instability and can cause resonance phenomena in the fluid; and (3) the disturbances exhibit transonic behavior. The associated difficulties regarding the nature of the mean flow are largely removed by a detailed examination of the turbulent boundary layer over a rigid wavy wall and by correlation of the measured and predicted effects of the boundary layer on the surface pressure. These effects are found to be quite significant for certain geometries. (Contractor's abstract, modified)

THE MULTIPLE-CROSSED-BEAM METHOD FOR MEASURING ELECTRON-IONIZATION CROSS SECTIONS, by C. K. Crawford and C. E. Woodward. Nov. 1962, 36p. incl. illus. diagrs. table. (Technical rept. no. 175) (AFOSR-4984) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-184110, and Air Force Systems Command) Unclassified

A new method for measuring the absolute values of electron-ionization cross sections is proposed. The technique involves intersecting 2 electron beams with a single atomic beam composed of the material to be studied. Pulsing the first electron beam results in an atomic-beam modulation which may be detected by the second electron beam. Ionization cross sections may be determined if the resulting ion currents are measured and the intersection geometries known. The absolute material-flow rate may also be determined. If a mass spectrometer is provided, the technique may be used on atomic beams composed of several constituents. The absolute cross-section values and the flow rates may be calculated separately for each constituent. The pre-ionization mass and the source temperature can also be calculated. The theory for the method has been developed, and suitable experimental apparatus has been built. The technique has been demonstrated using Mg. In its present form, the signal-to-noise ratio is poor, about 2:1, but suggestions are made which would improve it by more than 2 orders of magnitude. More work is required before useful cross-section data can be obtained (Contractor's abstract)

COLOR CENTERS IN MIXED CRYSTALS OF ALKALI HALIDES, by A. Smakula, N. C. Maynard, and A. Repucci. [1962] [7]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-184110]) Unclassified

Published in Phys. Rev., v. 130: 113-119, Apr. 1, 1963.

Single crystals of KCl, RbCl, KBr and mixed crystals of KCl-RbCl, KCl-KBr, and RbCl-KBr of various compositions have been colored by 3-mev electrons with doses 10^4 to 10^6 rads at 20°, -80°, and -190°C. The influence of radiation dose, coloration temperature, and composition of mixed crystals on spectral position, half-width, and intensity of the V_1, K, F, F′, and M bands has been studied. At room temperature, K, F, and M bands were produced, and at highest coloration N bands; only F and K bands appear at -80°C. At -190°C coloration the V_1, K, F, and F′ bands appeared. In mixed crystals, the spectral position of all absorption bands deviates from the Mollwo relation (vd^n = const). The deviation in V_1, K, F, and M is toward lower, and in F′ toward higher energy. The half-width of all bands in mixed crystals is greater than in pure components except that of V_1 in the KCl-RbCl system, where it is smaller. The intensity of coloration in KCl-RbCl decreases with composition and reaches a minimum at molar ratio 1:1. In KCl-KBr and RbCl-KBr the intensity curves exhibit a relative maximum and a relative minimum. The behavior of the observed color-center bands is correlated to crystal structure and to the configuration of color centers.

DIFFRACTION OF ULTRASOUND IN ELASTICALLY ANISOTROPIC NaCl AND IN SOME OTHER MATERIALS, by E. P. Papadakis. [1962] [5]p. incl. illus. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-184110]) Unclassified

Published in Jour. Acoust. Soc. Amer., v. 35: 490-494, Apr. 1963.

Ultrasonic diffraction in NaCl and KCl single crystals, as well as in steel, has been studied by the pulse-echo method from 8-45 mc sec with 1/2 in. disk transducers. The diffraction is of the Fresnel type, so that the curves of loss due to diffraction can be plotted with a normalized abscissa $S = z(a^2/\lambda)$, where z is the path length in the specimen, a the transducer radius, and λ the ultrasonic wavelength. In general, the loss curve is not monotonic in S. The shape of the curve is dependent upon the specimen material, the crystallographic direction of ultrasonic propagation, and the transducer plating configuration.

The position of the last local maximum in the loss curve is a function of the anisotropy of the specimen. In particular, its position in steel (isotropic case) agrees with the theoretical position for isotropic materials. (Contractor's abstract)

The Neel model of diffusion aftereffect has been used to analyze the motion of 90° and 180° domain walls when the aftereffect mechanism is present. Instability occurs in the response of the 180° wall to step and ramps of applied magnetic fields. For a step of field, the response of the wall is delayed from the time of application of the field by a time which decreases with increasing step height. For a ramp of field in a finite sample, instability occurs when a minimum ramp slope is exceeded. These instabilities furnish a basis for the explanation of the recently reported phenomenon of "dynamic squareness" of the hysteresic loop. (Contractor's abstract)

DYNAMIC SQUARENESS IN POLYCRYSTALLINE GARNETS, by B. W. Lovell and D. J. Epstein. Nov. 1962 [2]p. incl. illus. diagrs. (Technical rept. no. 173) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and [Signal Corps] under Nonr-184110) Unclassified

Presented at Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Published in Jour. Appl. Phys., v. 34: 1115-1116, Apr. 1963.

Certain samples of polycrystalline yttrium iron garnet and lutetium iron garnet have previously been found to acquire a square 60-cps hysteresis loop when cooled to 78 °K in a magnetic field. It is found that these are not normal square-loop materials, for at sufficiently slow excitation (ca 0.5 cps for yttrium iron garnet, one cycle per hour for lutetium iron garnet) they revert to normal, but strongly frequency-dependent loops. At 78 °K, for proper amplitude step excitation, the response of these cores is a delayed pulse. For lutetium iron garnet this delay can be several hundred u sec in duration. The behavior of these materials can be qualitatively explained by domain wall instability produced by a diffusion aftereffect mechanism. (Contractor's abstract)

Published in Jour. Appl. Phys., v. 34: 1119-1120, Apr. 1963.

The response of 90° and 180° (001)-plane domain walls acted upon by a damping pressure due to diffusion aftereffect, is investigated for steps and ramps of applied field. The resultant motion, using the Néel energy-level scheme for diffusants, is shown to be dynamically stable in the case of the 90° wall, in the sense that the incremental damping coefficient is never negative. Dynamic instability is shown to be possible for the 180° wall, and appears in the step response as a delay between the time of application of the field and the time of an observable response. The ramp response is unstable in a finite sample only when a minimum ramp slope has been exceeded. The ramp response is used to discuss the motion of the 180° wall under triangular-wave drive, and results similar to certain experimental observations are obtained. (Contractor's abstract)

THE FORCE ON A MOVING DISLOCATION, by A. N. Stroh. Mar. 1962, 17p. incl. diagrs. (Technical rept. no. 169) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-184110) AD 274488 Unclassified

Also published in Phys. Rev., v. 126. 55-61, Oct. 1, 1962.

A Lagrangian formulation is used to discuss the nature of the force on a moving dislocation. Whether or not a Lorentz force appears depends on the definition of force adopted, but it is shown that this force can give rise to no physical effects; a definition which does not introduce it is therefore recommended. The force is given by the usual static expression ($F = \sigma b$) and is independent of the motion of the dislocation. (Contractor's abstract)

LONGITUDINAL PUMPING OF MAGNETOELASTIC WAVES IN FERRIMAGNETIC ELLIPSOIDS, by F. R. Morgenthaler. [1962] [2]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research,

Office of Naval Research, and Signal Corps under Nonr-184110) Unclassified

Presented at Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Published in Jour. Appl. Phys., v. 34: 1289-1290, Apr. 1963.

The instability threshold of parametrically excited magnetoelastic waves is derived, as a function of the dc magnetic field strength, for that region of field where the phonon and magnon spectra intersect. The case considered involves the longitudinal pumping (with an rf magnetic field of constant frequency 2ω), of a small ferrimagnetic single crystal having cubic symmetry. The crystal is ellipsoidal in shape and is magnetized along a [100] direction. The unstable magnetoelastic waves are a mixture of transverse phonons (polarized in the longitudinal direction) and magnons (spin waves) which propagate at (or very near) right angles to the dc field. If the 2 branches of the magnetoelastic wave spectrum are split by a frequency large compared to the phonon relaxation frequency, an approximate, and greatly simplified expression may be deduced from the general solution. It is found that the line shape of the phonon contribution to the threshold is asymmetric, and that the peak of the curve occurs for a smaller value of dc field than is generally believed. This shift in field is $\sim b^2 (2\Delta H_k)Q$ (where b is the magnetoelastic energy coefficient, $2\Delta H_k$ is the appropriate spin-wave linewidth, and Q is the appropriate phonon Q) and must be taken into account for an accurate determination of the exchange constant (particularly at the lower microwave frequencies). The peak of the phonon contribution to the threshold curve is independent of this shift and also of b; it is $\sim \lambda \omega^2 Q^{-1}$, where ω is the frequency of the magnetoelastic wave and λ is the exchange constant. The width of the peak at half-height is essentially independent of Q (except at very low frequencies) and is $\sim |b| M^2 \omega \lambda^{\frac{1}{2}}$, where M is the value of the saturation magnetization.

UNSTABLE GROWTH OF PHONONS AT HIGH MICROWAVE POWER LEVELS IN MAGNETICALLY ORDERED SINGLE CRYSTALS, by F. R. Morgenthaler. [1962] [2]p. incl. table. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-184110) Unclassified

Presented at Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Also published in Jour. Appl. Phys., v. 34: 1287-1288, Apr. 1963.

Conditions are given under which transverse and longitudinal microwave phonon standing waves present in a ferrimagnetic single crystal can be parametrically excited by the uniform precession of the magnetization. The instability thresholds for both first- and second-order processes are derived for crystals having cubic symmetry and are found to depend on higher-order magnetoelastic energy terms. The phonons need not be degenerate with any portion of the spin-wave band; in which case, the usual magnetoelastic coupling is absent. Competition from spin-wave processes is considered, and the conditions necessary for phonon domination are presented. The possibility of either maximizing or forbidding a particular phonon process is also discussed. (Contractor's abstract)

STUDY OF EXTENSIVE AIR SHOWERS AT 5200 M ALTITUDE WITH SPECIAL RESPECT TO γ-RAY SHOWERS. Final rept. Oct. 1962, 1v. incl. illus. diagrs. tables, refs. (AFOSR-4780) (In cooperation with San Andres U., La Paz (Bolivia) and Tokyo U. (Japan)) (AF 49(638)922) AD 415424 Unclassified

The equipment, its construction and its installation on Mt. Chacaltaya are described. The main results of the study of extensive air showers at 5200 m altitude are discussed with respect to: (1) the search for showers generated by primary cosmic gamma rays of energy greater than 10^{14} ev; (2) the search for evidence of Z primaries; and (3) the character study of ultra high energy nuclear interactions. A study of the experimental arrangement and classification of showers and the results (recognition of separate groups of showers, distribution of arrival directions and conclusion) is presented.

RESULTS ON GAMMA RAY ASTRONOMY FROM EXPLORER XI, by W. L. Kraushaar and G. Clark. [1962] [10]p. incl. diagrs. table. (AFOSR-64-0032) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)922, Atomic Energy Commission, National Aeronautics and Space Administration and Office of Naval Research) Unclassified

Also published in Proc. Fifth Interamer. Seminar on Cosmic Rays, La Paz (Bolivia) (July 17-27, 1962), v. 1: paper no. 16, Sept. 1962.

Explorer XI carried a gamma ray detector to make astronomical observations with high energy (> 50 mev) primary cosmic gamma rays. The results of this experiment are presented. The synchrotron tests showed that the instrument responded to x-rays with an aperture cone of about 17° half angle. The albedo effect observed during the tumble phase indicated that the telescope was selectively sensitive to x-rays in orbit. If the results obtained during the tumble phase are confirmed by subsequent measurements, a serious problem of explaining how the x-ray energy intensity can so greatly exceed the nonthermal radio energy intensity is indicated.

Construction of the Bolivian Air Shower Joint Experiment (BASJE) has been completed. The equipment consists of electron density detectors, scintillators, and an energy flow meter composed of lead glass Cerenkov detectors. A summary of the results of the first 6 months of operation is given. The results are concerned with the search for showers generated by primary cosmic gamma rays of energy greater than 10^{14} ev, the search for evidence of high Z primaries, and the study of the character of ultra high energy nuclear interactions.

PRIMARY GAMMA RAY OBSERVATIONS BY EXTENSIVE AIR SHOWERS, by G. Clark, I. Escobar and others. [1962] [16]p. incl. diagrs. (AFOSR-64-0037) (Also bound with its AFOSR-4780; AD 415424) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)922, Bolivian Government, and Japanese Ministry of Education) Unclassified

Also published in Proc. Fifth Interamer. Seminar on Cosmic Rays, La Paz (Bolivia) (July 17-27, 1962), v. 2. paper no. 43, Sept. 1962.

The preliminary analysis of data taken for the purpose of searching for showers generated by primary gamma rays is described. The criterion used in looking for such events is that showers produced by primary gamma rays must not contain appreciable numbers of mu-mesons and nucleus-active particles. Also included is a description of the equipment used.

METHODS FOR OBSERVING EXTREMELY LARGE EXTENSIVE AIR SHOWERS, by K. Suga. [1962] [5]p. incl. diagr. (AFOSR-64-0038) (AF 49(638)922) Unclassified

Also published in Proc. Fifth Interamer Seminar on Cosmic Rays, La Paz (Bolivia) (July 17-27, 1962), v. 2: paper no. 49, Sept. 1962.

Air showers greater than 10^{19} particles have been observed and the size spectrum in this range shows no sign of an approaching cut-off. The highest energy of primary cosmic-ray particles which have been observed so far is of the order of 10^{19} ev. The plastic scintillators utilized enclose an area of $5km^2$. It would require waiting for them several decades to observe showers of over 10^{20} ev with such an array. Essentially different methods must be used to observe these large events. Methods based on the detection of scintillation light produced in the air by shower particles and based

on the reception of echo radio signals from the ionizated air column produced by the shower particles are discussed.

YIELD AND ANGULAR DISTRIBUTION OF CERENKOV RADIATION FROM EXTENSIVE AIR SHOWERS, by H. Kasha and Y. Oren. [1962] [9]p. incl. diagrs. table. (AFOSR-64-0400) (AF 49(638)922) Unclassified

Also published in Proc. Fifth Interamer. Seminar on Cosmic Rays, La Paz (Bolivia) (July 17-27, 1962), v. 2: paper no. 45, Sept. 1962.

The relative yield of Cerenkov radiation from extensive air showers (EAS) and its angular distribution were measured as a function of the shower size in the range 4×10^4 to 2×10^6 particles. It was found that the larger showers are not as efficient in producing Cerenkov light signals as the smaller ones. The effect can be understood in light of the results on the angular distribution of Cerenkov radiation near the shower axis which showed more peaked forwards in larger showers. This result also leads to the conclusion that the angular distribution of electrons with energy > 21 mev near the axis of EAS is dependent on the shower size. (Contractor's abstract)

SEARCH FOR EXTENSIVE AIR SHOWERS INITIATED BY HIGH-ENERGY COSMIC γ-RAYS (Abstract), by G. W. Clark, I. Escobar and others. [1962] [1]p. (In cooperation with San Andres U., La Paz (Bolivia)) [AF 49(638)922] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 311, Apr. 23, 1962.

The Bolivian Air Shower Joint Experiment (BASJE) began operation in January with 45 detectors and a 60-in. multiplate cloud chamber at an altitude of 5200 m. The detailed structure of extensive air showers are being studied with the hope of detecting showers generated by high-energy primary cosmic γ-rays. Fast-timing and electron-density measurements give accurate determinations of the arrival directions, sizes, and core locations of showers at a rate of 300/hr for showers with more than 3×10^4 particles. Fifteen $4m^2$ scintillation detectoes shielded by 160 g/cm^2 of galena (PbS) measure the penetrating component, and 7 lead-glass Cerenkov detectors under the same shield measure the energy flow. A search for showers that have little or no penetrating component is being made with the idea that they may be produced by cosmic γ-rays. Results from the early period of operation are presented.

ASYMPTOTIC CONES OF ACCEPTANCE AND THEIR USE IN THE STUDY OF THE DAILY VARIATION OF COSMIC RADIATION, by U. R. Rao, K. G. McCracken, and D. Venkatesan. [1962] [25]p. incl. diagrs. tables, refs. (In cooperation with Iowa State U., Iowa City) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Jour. Geophys. Research, v. 68: 345-369, Jan. 15, 1963.

The dependence of the counting rate of a cosmic ray detector on the asymptotic directions of approach of the primary cosmic radiation is discussed. By means of a simulation of the geomagnetic field that uses spherical harmonics up to the sixth degree, and an arbitrary anisotropy in the primary cosmic radiation, a method for calculating the time variations in the counting rate of a cosmic ray detector is developed. Resolving the arbitrary anisotropy as a Fourier series in longitude, the amplitude and phases of the diurnal (24-hourly) and semi-diurnal (12-hourly) components of the daily variation are calculated for a number of stations. No simple relationship is observed between the phases and the latitudes and longitudes, geographic or geomagnetic. Moreover, the theoretical calculations point out that a difference of more than 5 hr between the diurnal phases at 2 different places could arise purely from the known geomagnetic configuration. A study of the time-averaged diurnal component of the daily variation experimentally observed by 22 neutron monitors during the International Geophysical Year (1957-1958) reveals good agreement with the theoretical calculations and leads to the following conclusions: (1) The results are consistent with anisotropy that is independent of rigidity in the range 1-200 bv, the exponent of the power law which fits the data being 0.0 ± 0.05; (2) The anisotropy varies as the cosine of the asymptotic latitude and has a maximum in the direction 85° to the east of the earth-sun line; and (3) The maximum amplitude of the average anisotropy is 4×10^{-3} times the average cosmic ray flux.

ASYMPTOTIC FIELD OPERATORS IN QUANTUM FIELD THEORY, by S. S. Schweber and E. C. G. Sudarshan. [1962] [32]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098], and National Science Foundation) Unclassified

Published in Ann. Phys., v. 19: 351-382, Sept. 1962.

It is the purpose of this paper to generalize in a systematic fashion the notion of asymptotic fields to encompass situations in which bound states occur. In Section I, the definition of in- and out-fields in nonrelativistic quantum mechanics is reviewed. In Section II, asymptotic operators are introduced within the nonrelativistic framework and their properties are investigated. Section III generalizes these definitions to encompass relativistic field theories. The last section summarizes the work of this paper and indicates certain new avenues opened by the present definitions.

$Bi^{209}(d, p)Bi^{210}$ REACTION AT LOW BOMBARDING ENERGIES AND WITH HIGH RESOLUTION, by J. R. Erskine, W. W. Buechner, and H. A. Enge. [1962] [9]p. incl. diagrs tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Phys. Rev., v. 128: 720-728, Oct. 15, 1962.

The $Bi^{209}(d, p)Bi^{210}$ reaction has been studied with a multiple-gap magnetic spectrograph and an 8-mev electrostatic accelerator. Forty energy levels were

observed up to an excitation energy of 3.2 mev. The ground-state Q value was measured to be 2.369 ± 0.010 mev. The angular distribution of each group was peaked at an observation angle of 180° because of the large Coulomb barrier and relatively low bombarding energy, and the width of the backward peak depends weakly on the ℓ value of the captured neutron. There is good agreement concerning the shape of the angular distribution between the experimental data and calculations using distorted-wave, deuteron-stripping theory. The ground-state group belongs to a cluster of 9 groups, one of which is probably 2 unresolved groups. These 9 groups probably correspond to levels in the Bi^{210} ground-state configuration ($h_{9/2}g_{9/2}$). The intensities of these groups appear to be proportional to the statistical factor (2J + 1). (Contractor's abstract)

CHARACTERIZATION OF Ru^{107}, Ru^{108}, Rh^{107}, AND Rh^{108}, by W. R. Pierson, H. C. Griffin, and C. D. Coryell. [1962] [15]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research and Atomic Energy Commission under [AT(30-1)2098])
Unclassified

Published in Phys. Rev., v. 127: 1708-1722, Sept. 1, 1962.

The mass number of Rh^{107} (21.7 ± 0.4 min) has been confirmed by alpha bombardment of Ru^{104} at selected energies, by fast-neutron bombardment of Pd^{108}, and by chemical identification; and the mass number of Rh^{108} (16.8 ± 0.5 sec) has been established by the nature of its γ radiations. The mass numbers of the two precursors Ru^{107} (4.2 ± 0.3 min) and Ru^{108} (4.5 ± 0.2 min) have thereby also been established. The main radiations associated with these species are as follows: (energies in kev): Ru^{107} β groups of 2100 ± 300 and 3150 ± 300, γ rays of 195 (14%, coincident with the 2100 β), 370 (~ 6%, coincident with the 195 γ), 480 (weak, seen only in coincidence with the 195 γ), 860 (7%, coincident with the 195 γ), 930 (4%), 1030 (4%), and 1290 (4%); Ru^{108} β groups 1150 ± 100 and 1320 ± 100, a γ of 165 ± 3 (28%, coincident with the 1150 β); Rh^{107} β groups 840 ± 40, 940 ± 70, 1140 ± 50, and 1200 ± 50 kev, γ rays of 115 (0.5%), 235 (~ 3%, seen only in coincidence with the 390 γ), 307 (73%, coincident with the 1200 β), 365 (~ 2%, coincident with the 307 γ), 390 (11%, coincident with the 1140 and 840 β groups), 470 (1%), 570 (2%, coincident with the 940 β), and 675 (3%, coincident with the 840 β), and γ coincidence-sum lines at 680 (~ 3%), 880 (very weak), and 1140 (≤ 0.5%); Rh^{108} β of 4500 ± 600 kev, γ rays of 430 (43%), 510 (10%, partly coincident with the 430 γ), 620 (22%, coincident with the 430 γ), 1520 (5%), and 2000 (≤ 3%). No 940 γ from the Pd^{108} 940 level could be detected (< 3%), and less than one-third of the 510 γ rays follow β transitions to the 940 level. All γ rays above 115 in the 4 species are in fast coincidence with β rays. There are other γ rays associated with these species, especially for Ru^{107} and/or Rh^{108} above 1500. No evidence was found for isomers of Pd^{107}, Rh^{107}, PD^{108}, or Rh^{108} from decay of 21.7-min Rh^{107} or 16.8-sec Rh^{108}. No Rh^{107} or Rh^{108} isomers could be isolated. However a γ ray of 21 kev, presumed to be K x rays of rhodium, appears in the short-lived ruthenium spectrum, with an intensity 5 to 8% relative to Ru^{107}. The following decay paths are proposed: decay of Ru^{107} (Q^β = 3200) proceeding to Rh^{107} excited levels of 1290 (4%), 1030 (11%), 930 (4%), 675 or 1530 (< 5%), 565 (~ 6%), and 195 (0 to 5%), and to ground state (74%), with the reservation that it is likely that some of these levels should be referred to the supposed isomeric level rather than to the ground level; decay of Rh^{107} (Q^β = 1510) proceeding to Pd^{107} levels of 1140 (~ 0.2%), 675 (may be more than one level, 7%), 570 (2%), 470 (1%), 390 (8%), and 307 (71%), and to ground state (0 to 17%); decay of Ru^{108} (presumably 0+, Q^β = 1320) proceeding to Rh^{108} levels of 165 (0+ or 1+, 28%) and ground state (1+, 72%); decay of Rh^{108} (1+, Q^β = 4500) proceeding to Pd^{108} levels of 2000 or higher (≤ 3%), 1520 or higher (> 5%), 1050 (0+, 22%), 940 (2+, 0 to 5%), and 430 (2+, ~17%), and to ground state (0+, 51%). Interpretations of these schemes are presented. (Contractor's abstract)

COMMENTS ON CHEW'S BOOTSTRAP RELATIONSHIP, by F. E. Low. [1962] [3]p. [Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy, Commission, and Office of Naval Research under AT(30-1)2098]
Unclassified

Published in Phys. Rev. Ltrs., v. 9: 277-279, Sept. 15, 1962.

G. F. Chew has previously shown the existence of a certain reciprocity between the nucleon and the (3,3) resonance. Chew's equations for the reduced width and P-wave amplitudes are extended to show that the validity

of the reciprocity is wider than he has claimed. The reciprocity is independent of the energies and coupling constants of the states, and is more a property of the form of the equations than of the particular solution found in nature. Therefore, the existence of an alternative interpretation of Chew's results is presented. Chew's theory is compared to a Lagrangian model, and their similarities and differences are discussed.

A DATA HANDLING SYSTEM FOR A SCINTILLATION COUNTER HODOSCOPE (Abstract), by P. Gorenstein and L. S. Osborne. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 9, Jan. 24, 1962.

A system is in operation at the M.I.T. Synchrotron Lab. for recording and storing data from an 80 element scintillation counter hodoscope. The use of such a multichannel detection system at a pulsed accelerator involves the problem of sorting and storing the information from many events which may occur during the short spill-out of the beam. The system to be described consists of a fast, 1-μ sec, reliable "buffer storage" of 8-eighteen-bit words which accumulate during the 800 μ sec burst of the synchrotron and a tape punch which prints out at a maximum speed of 100 lines/sec during the 0.15-sec off time of the accelerator. Provision is made for some limited data analysis as a criterion for accepting events. During an on time of 6 months, the laboratory had a transistor failure rate of about 6 out of 600. An important feature of this system is its utilization of commercially available engineered components, thus taking advantage of the great advances in reliability and speed that have been made in digital computer technology in recent years.

DECAY OF Tl^{199} AND Au^{199}, by R. W. Bauer, L. Grodzins, and H. H. Wilson. [1964] [6]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Phys. Rev., v. 128: 694-699, Oct. 15, 1962.

The decays of Tl^{199} to Hg^{199} and Au^{198} to Hg^{199} have been examined using γ-ray coincidence spectrometry and angular correlation techniques. The level order as well as level spins of Hg^{199} deduced from this study support the recent work of Jung and Svedberg. The branching ratios of the electron capture transitions from Tl^{199} to 6 levels in Hg^{199} have also been determined. Particular emphasis was placed on obtaining the empirical parameters of importance to the measurement of the magnetic moment of the 158-kev first excited state in Hg^{199} as well as to the interpretation of the state as one member of a doublet resulting from coupling the $1/2^-$ ground state with the 2^+ core excitation. This interpretation, due to de-Shalit, implies the interrelations of some of the magnetic moments and lifetimes of the states involved. This study supports such an interpretation. DIRECT AND COMPOUND NUCLEUS EFFECTS IN NUCLEAR PHOTODISINTEGRATION, by C. Shakin. [1962] [14]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Ann. Phys., v. 22: 54-67, Apr. 1963.

A modified form of H. Feshbach's unified theory of nuclear reactions is used to construct the correct final state for the calculations of photodisintegration. The reaction theory used satisfies the requirements of the Pauli Principle. A correlation is made between resonance phenomena and shell model states whose energies are determined to lie in the continuum of the complete nuclear Hamiltonian. The calculated cross-sections include, in addition to the usual Breit-Wigner expression, another contribution which may be termed direct. It is important to note that the direct contribution to the cross section exhibits resonant behavior simultaneously with the Breit-Wigner expression. (Contractor's abstract)

ENERGY LEVELS OF P^{29} FROM THE SCATTERING OF PROTONS BY Si^{28} (Abstract), by E. Kashy, M. W. Brenner, and A. M. Hoogenboom. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 73, Jan. 24, 1962.

Energy levels of P^{29} have been observed as resonances in the differential elastic- and inelastic-scattering cross section for protons incident upon natural silicon (92.2% Si^{28}). Twenty-two resonances were observed in the

bombarding energy range from 4.8 to 7.0 mev, corresponding to levels in P^{29} from 7.4 to 9.5-mev excitation. By compering the differential elastic-scattering cross section at center-of-mass angles of 92.1, 54.7, and 125.3 deg with theoretical single-level dispersion theory calculations for the same angles, values of the orbital angular momentum of the incident protons were determined for most of the resonances. The analysis of the data and possible shell-model configurations of some of the levels will be discussed.

ENERGY LEVELS OF Rh^{104} FROM THE Rh^{103} (d, p) Rh^{104} REACTION (Abstract), by A. G. Da Silva and W. W. Buechner. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 83, Jan. 24, 1962.

The energy levels of Rh^{104} have been investigated by analyzing the reaction protons resulting from the bombardment of Rh^{103} with 7.0-mev deuterons using high-resolution, broad-range magnetic spectrographs. Proton groups corresponding to 33 levels below 1.5-mev excitation energy in Rh^{104} were observed. A Q value of 4.735 mev was obtained for the highest energy proton group. There is some evidence that this group corresponds not to the ground state of Rh^{104} but to an excited level at 0.051 mev. Angular distributions of protons to 5 of the low-lying levels were obtained. Theoretical angular distributions have been calculated, using the distorted-wave Born approximation method for states expected in this region. These do not closely resemble the angular distributions obtained experimentally. The angular distributions will be shown and possible level assignments will be discussed.

ENERGY SPECTRA AND ANGULAR DISTRIBUTIONS OF PHOTOFISSION NEUTRONS (Abstract), by J. L. Matthews, W. Bertozzi and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, National Science Foundation, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 303-304, Apr. 23, 1962.

The energy spectra of neutrons emitted in photofission of even-mass nuclei are expected to depend on the angle at which the neutrons are detected relative to the photon beam, owing to the anisotropy of the fission fragments near threshold. Calculations of the spectra have been undertaken on the assumption that neutrons are emitted after fission and isotropically in the frame of reference of the moving fragments. The angular distribution of the fragments relative to the beam is of the form $(a + b \sin^2\Theta)$. Measurements of the spectra from U^{238} and Th^{232} at 79° and 159° relative to the beam direction are compared with these calculations.

THE HIGH ENERGY BEHAVIOR OF SCATTERING AMPLITUDES IN PERTURBATION THEORY. I, by P. G. Federbush and M. T. Grisaru. [1962] [11]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Ann. Phys., v. 22: 263-273, May 1963.

A procedure is described for extracting the dominant behavior at high energies of individual Feynman diagrams. This procedure is illustrated by the calculation of several examples, and is applied to the summation of several classes of diagrams in the high energy limit. Although all the examples dealt with concern spinless bosons, and nonderivative coupling, the inclusion of spin and more complicated couplings does not alter the basic method. HIGH ENERGY BEHAVIOR OF SCATTERING AMPLITUDES IN PERTURBATION THEORY. II, by P. G. Federbush and M. T. Grisaru. [1962] [10]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Ann. Phys., v. 22: 299-308, May 1963.

The methods of previous papers are applied to problems involving particles with spin, and diagrams that require renormalization. Effects of the insertion of self-energy and vertex corrections are illustrated by examples. The class of diagrams describing electron-electron scattering by massive photon exchange, in the absence of photon-photon interactions and with neglect of exchange, is considered. It is argued that individually these diagrams are dominated at high energy by s ln s. Some general rules emerge from the calculations, but rigorous proofs are lacking. (Contractor's abstract)

A HIGH INTENSITY NANOSECOND PULSED VAN DE GRAAFF ACCELERATOR, by L. E. Beghian and M. K. Salomaa. [1962] [7]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Nuclear Instr. and Methods, v. 17: 181-187, Oct. 1962.

A description is given of a Van de Graaff generator modified for nanosec pulsing in the terminal. The beam is chopped by sweeping past a limiting aperture with an RF oscillator. A discussion is given for the choice of design parameters. Pulse widths as low as 2×10^{-9} sec have been obtained. Typical operating conditions are 3×10^{-9} sec pulse width, $1/40$ duty cycle, peak currents 0.8-1 mA, with an average current of 17 μA. Measured gamma ray and neutron time spectra are shown. MAGNETIC MOMENTS OF THE FIRST EXCITED 2+ STATES IN Sm^{152}, Gd^{154}, AND Gd^{156}, by R. W. Bauer and M. Deutsch. [1962] [10]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Phys. Rev., v. 128: 751-760, Oct. 15, 1962.

The gyromagnetic ratios g of the 122-kev state of Sm^{152}, of the 123-kev state of Gd^{154}, and of the 89-kev state of Gd^{156} have been measured to be 0.35 ± 0.03, and 0.367 ± 0.03, and 0.32 ± 0.03, respectively, by the precession of the angular correlation of γ-ray cascades proceeding through these states in an external magnetic field. The perturbations of the angular correlations for sources both in aqueous solution and in molten anhydrous chlorides have been studied. The attenuation in a transverse magnetic field was used to determine the hyperfine structure constant of the 89-kev state of Gd^{156} in the $^8S_{7/2}$ ground state of Gd^{3+} in aqueous solution as $a = 17 \pm 3$ mc/sec. The perturbations in molten Gd sources were found to be much weaker than in solution and to be unaffected by magnetic fields. (Contractor's abstract)

MESONS AND THE STRUCTURE OF NUCLEONS. PART IV. THE NUCLEON-NUCLEON POTENTIAL, by G. Costa and B. T. Field. [1962] [18]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Ann. Phys., v. 18: 47-64, Apr. 1962.

The atomic model, in which physical nucleons are described as compound systems of a nucleon core plus a single pion, has been used as the basis for a computation of the low-energy interaction between 2 physical nucleons. Advantage is taken of previous work for the specification of the interaction between the pion and the nucleon core in the different possible states of total angular momentum and isotropic spin. An initial simplification, where one of the atoms is replaced by an effective scattering center, is only moderately successful in reproducing the gross features of the observed nucleon-nucleon interaction. The full computation (approached in the spirit of the Heitler-London

approximation to the H-H interaction) improves on the qualitative fit, but it is impossible to reproduce simultaneously the asymptotic behavior of both the central and tensor terms in the nucleon-nucleon potential using a reasonable set of pion-core interactions. A significant result is the derivation, using the simplified model, of a nucleon-nucleon spin-orbit interaction whose range is shorter than that of the other terms in the potential. The computation provides a strong indication that the spin-orbit interaction may arise from the same features of the pion-nucleon interaction as give rise to the resonant pion-nucleon scattering in the state of T = J = 3/2. METHOD TO MEASURE THE LIFETIME OF THE Σ^0 HYPERON, by K. Huang. [1962] [15]p. incl. diagrs. table. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Phys. Rev., v. 123: 2793-2807, Dec. 15, 1961.

A method, suggested by Wattenberg to measure the lifetime of the Σ^0 hyperon, is analyzed theoretically. The suggested method consists of measuring the distribution of angles between the Dalitz pairs emitted in the process $\Sigma^0 \rightarrow \Lambda^0 + e^+ + e^-$, in which the Σ^0 was previously produced in a nucleus. The distribution function contains a part that depends both on the charge Z of the nucleus and on the lifetime of Σ^0. This part comes from the interference between the Z-dependent part of the matrix element with the Z-independent part. This interference owes its existence to 2 facts: that the target nucleon is in a bound state, and that the Σ^0 has a finite mass width. The effects of nuclear structure can be eliminated from the problem. A family of curves for the distribution functions corresponding to various values of the lifetime is obtained through the use of Born approximation for the Coulomb wave functions of the Dalitz pair. If the lifetime is in the neighborhood of 5×10^{-20} sec, then measurements with an accuracy of 10% would determine the lifetime to within a factor of 10. (Contractor's abstract)

MÖSSBAUER EFFECT IN HIGH MAGNETIC FIELDS (Abstract), by N. Blum and L. Grodzins. [1962] [1]p. [Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 39, Jan. 24, 1962.

The nuclear hyperfine spectrum of the 14.4 kev gamma ray from Fe^{57m} has been investigated as a function of external magnetic field for several different environmental materials. Experimental results are presented for soft iron, stainless steel, and copper environments in transverse and longitudinal fields up to 80 kgauss. Preliminary analysis indicates that the resultant internal field at the radioactive nucleus may be given by a linear relation of the form $H_{nuc} = H_{int} + H_{ext}(1 + c)$, where c depends only upon the environmental material and is negative.

MULTIPLE-GAP MAGNETIC SPECTROGRAPH FOR CHARGED-PARTICLE STUDIES, by H. A. Enge and W. W. Buechner. [1962] [3]p. incl. diagrs. tables. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Rev. Scient. Instr., v. 34: 155-162, Feb. 1963.

A spectrograph has been designed that simultaneously records broad-range, charged-particle spectra at 24 different reaction angles, 7.5° apart, from 0 to 172.5°. At each angle, the spectrograph records a spectrum with a total energy range of about 2.3:1 and with a resolving power exceeding $R = E/\Delta E = 1000$, where ΔE is the full width at half-maximum of a peak. The recorders are seventy-two 2 x 10 in. nuclear-track plates, which are developed and scanned under a microscope after the exposures. When half-millimeter strips across the nuclear-track plates are scanned, the information contained on the nuclear-track plates after 1 exposure corresponds to about 36,000 data points. A typical exposure time with about a 0.5-μA beam is of the order of 2 to 3h.

THE NEUTRON STRENGTH FUNCTION AND THE SHELL MODEL, by B. Block and H. Feshbach. [1962] [24]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Ann. Phys., v. 23: 47-70, July 1963.

The projection operator-equivalent potential method is employed for the study of neutron widths and strength function. Assuming that the residual potential, V_R, consists of a sum of 2 particle potentials it can be shown with the aid of another plausible assumption that the width can be written as a product of 2 factors. One

of these is the square of the matrix element of V_R between the open channel wave function and a shell model 2 particle one-hole state. The second factor, giving the probability that the compound nucleus wave function contains the 2 particle-one hole state, decreases as the difference between the energy of the compound nucleus and the energy of the 2 particle-one hole state increases. The results are generalized to include the case where the energies of several 2 particle-one hole states fall close to each other. It is found that the giant resonance for the widths will now have a substructure which should be observable. The strength function is found to depend upon the average of the transition probabilities to the 2 particle-one hole states, the number of these states, and Δ. The number is sharply limited by the requirements that angular momentum and parity be conserved in the transition and that energy be conserved to within an error equal to Δ. If the residual potential is expanded in multipoles, keeping terms up to and including the quadripole, it is found that for the most part in the region $40 \leq A \leq 64$ the only possible transitions involve the monopole; between A = 68 and 85, both dipole and quadripole terms are effective as well, while between 85 and 130 only the quadripole term can induce transitions. This behavior enables one to obtain a fit to the data by means of 3 parameters: the average matrix elements squared for the monopole, dipole, and quadripole parts of the residual potential. NUCLEAR EXCITATION FUNCTIONS AND THICK-TARGET YIELDS F^{19}, Na^{23}, As^{75} (d, t), AND Na^{23}, As^{75} (d, p), by L. H. Bowen and J. W. Irvine, Jr. [1962] [6]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission and [Office of Naval Research] under [AT(30-1)2098]; General Electric Co., and National Science Foundation) Unclassified

Published in Phys. Rev., v. 127: 1698-1703, Sept. 1, 1962.

Excitation functions and thick-target yields have been determined for the (d, p) and (d, t) reactions which occur when sodium fluoride and arsenic targets are bombarded with deuterons of $\leq$ 15 mev. The yields of F^{18}, Na^{24}, and Na^{22} from sodium fluoride, and As^{76} and As^{74} from arsenic targets were measured with a calibrated scintillation counter after appropriate chemical treatment. The range-energy relationship for deuterons in sodium fluoride was determined experimentally from 15.2 mev to 5.3 mev. Absolute cross sections were determined at 15.2 mev for the following reactions: $Na^{23}(d,p)Na^{24}$ (125.7 ± 2.5 mb), $Na^{23}(d,t)Na^{22}$ (12.2 ± 2.0 mb), $F^{19}(d,t)F^{18}$ (29.0 ± 2.2 mb), $As^{75}(d,p)As^{76}$ (140.3 ± 6.6 mb), and $As^{75}(d,t)As^{74}$ (16.5 ± 1.2 mb). The results are shown to be in qualitative agreement with available information on the relative contributions of compound nucleus formation and direct interaction. (Contractor's abstract)

NUCLEAR EXCITATION FUNCTIONS AND THICK-TARGET YIELDS: Zn + d AND $Ar^{40}(d,\alpha)$, by D. C. Williams and J. W. Irvine, Jr. [1962] [7]p. incl. diagrs. refs. (Sponsored jointly by [Air Force Office of Scientific Research] Atomic Energy Commission, and [Office of Naval Research] under [AT(30-1)2098]) Unclassified

Published in Phys. Rev., v. 130: 265-271, Apr. 1, 1963.

Radiochemical techniques have been used to determine partial or complete excitation functions to 15 mev for the reactions $Ar^{40}(d,\alpha)Cl^{38}$, $Zn^{66}(d,\alpha)Cu^{64}$, $Zn^{64}(d,\alpha n)Cu^{61}$, $Zn^{67}(d,\alpha n)Cu^{64}$, $Zn^{64}(d,2p)Cu^{64}$, and $Zn^{67}(d,2p)Cu^{67}$. The results have been compared with the predictions of the statistical model of nuclear reaction. Most features of the (d,α) and $(d,\alpha n)$ excitation functions measured are consistent with the predictions of the model. The $Zn^{67}(d,\alpha n)Cu^{67}$ reaction appears to take place essentially by a direct process, while the $Zn^{64}(d,2p)Cu^{64}$ reaction, which has a much higher cross section, agrees with the model. Support is found for a rather large value of the nuclear radius parameter, $r_0 = 1.7F$. Excitation functions are presented for the reactions $Zn^{64}(d,p)Zn^{65}$ + $Zn^{64}(d,n)Ga^{65}(\beta^+)Zn^{65}$, $Zn^{66}(d,n)Ga^{67}$, and $Zn^{66}(d,2n)Ga^{66}$. Thick-target yields from deuteron bombardment of metallic zinc are given for Cu^{61}, Cu^{64}, Cu^{67}, Zn^{65}, Ga^{66}, and Ga^{67}.

NUCLEAR EXCITATION FUNCTIONS: Ar^{40}, Zn^{68} (d, He^3), by D. C. Williams and J. W. Irvine, Jr. [1962] [6]p. incl. diagrs. table, refs. (Sponsored jointly by [Air Force Office of Scientific Research] Atomic Energy Commission, and [Office of Naval Research] under [AT(30-1)2098]) Unclassified

Published in Phys. Rev., v. 130: 259-264, Apr. 1, 1963.

The (d, He^3) reaction has been studied by radiochemical techniques. Absolute excitation functions have been determined to 15 mev for the reactions Ar^{40}(d, He^3)Cl^{39} and Zn^{68}(d, He^3)Cu^{67}. The Ar^{40}(d, He^3)Cl^{39} cross section is 0.37 ± 0.07 mb at 14.8 mev and the Zn^{68}(d, He^3)Cu^{67} cross section is 0.54 ± 0.08 mb at 15.4 mev. These cross sections are shown to be more than an order of magnitude greater than predicted by the statistical model of nuclear reactions. The energy dependence of the cross section appears to be governed by the Coulomb barrier felt by the outgoing He^3 particle, at least when the He^3 energy is less than the classical barrier height. The shape of the observed excitation functions may be reproduced moderately accurately by a very simple proton pickup model.

ON MODEL CALCULATIONS OF NEUTRON WIDTHS AND STRENGTH FUNCTIONS, by C. Shakin. [1962] [33]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Ann. Phys., v. 22: 373-405, June 1963.

A procedure for calculating the neutron strength function as advanced by B. Block and H. Feshbach is considered. Methods are developed which relate the calculation of the strength function to the usual concepts of the shell model and nuclear optical model. Specific consideration is given to the isotopes of lead and tin and the agreement with experiment is good. Further, it is also shown that the neutron widths calculated for very simple excitations can be quite small for heavy nuclei due to cancellations which appear in a certain overlap integral. This result implies that the observation of a resonance of very small width does not necessarily imply the formation of a compound state of great complexity. The simple excitations considered are a reasonable approximation to the virtual states of a compound nucleus such as Pb^{209}, and in this case, the calculated widths agree in order of magnitude with the widths found experimentally. Pb^{208}(d, p)Pb^{209} REACTION AT A BOMBARDING ENERGY OF 7.5 MEV (Abstract), by J. R. Erskine and W. W. Buechner. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 360, Apr. 23, 1962.

The Pb^{208}(d, p)Pb^{209} reaction has been studied at a bombarding energy of 7.5 mev with a multiple-gap magnetic spectrograph. The ground-state Q value was measured to be 1.705 ± 0.915 mev. Five excited states were observed at excitation energies of 0.774, 1.563, 2.015, 2.483, and 2.527 mev. The observed angular distributions all peak at 180° observation angle. The shapes of these angular distributions agree reasonably well with calculations made using distorted-wave stripping theory. These calculations, however, considerably underestimate the absolute cross section, presumably because of the neglect of deuteron polarization. The differential cross sections measured at 172.5° are, starting with the ground state: 0.33, 0.02, 2.84, 2.59, 0.43, and 2.52 mb sr. A comparison is presented between the data from the Pb^{208}(d, p)Pb^{209} reaction and similar data from the Bi^{209}(d, p)Bi^{210} reaction with regard to the number of levels, their positions, and yields. This comparison suggests that the observed Pb^{209} states are the following single-particle neutron states, starting with the ground state: $g_{9/2}$, $i_{11/2}$, $d_{5/2}$, $s_{1/2}$, $g_{7/2}$, and $d_{3/2}$.

PHOTOGRAPHS OF CERENKOV LIGHT FROM E. A. S. AND THEIR INTERPRETATION, by D. A. Hill, J. Overbeck and others. [1962] [13]p. incl. illus. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Proc. Fifth Interamer. Seminar on Cosmic Rays La Paz (Bolivia) (July 17-27, 1962), v. 2: paper no. 46, Sept. 1962.

Large mirrors with photomultipliers in coincidence are capable of detecting showers of about 10^{12} ev. Their angular resolution is limited by distortion of the incident light from the true direction, and this limitation will be comparable in magnitude at all altitudes. Intensifier systems are capable of angular resolution approaching 0.1°, and can be used to cover a large field of view, but their energy threshold is limited by the necessity for integrating background light over a time sufficient to switch on the system. Larger mirrors would reduce the energy threshold only slowly, since the ratio background pulse is independent of mirror area. The energy threshold is expected to be inversely proportioned to the diam of the mirror, since the fluctuations in background which limit photography are proportional roughly to the mirror area $^{0.5}$

POLARIZATION OF NEUTRONS FROM THE PHOTODISINTEGRATION OF DEUTERIUM, by W. Bertozzi, P. T. Demos and others. [1962] [3]p. incl. diagr. table. Sponsored jointly by [Air Force Office of Scientific Research] Atomic Energy Commission, and [Office of Naval Research] under AT(30-1)2098) Unclassified

Published in Phys. Rev. Ltrs., v. 10: 106-108, Feb. 1, 1963.

Existing treatments of the photodisintegration of the deuteron neglect mesonic effects and the experiment described in this paper was carried out to examine these mesonic effects. It is pointed out that at 90° to the photon beam, the polarization of the nucleons is due largely to the E1 and M1 interference and to a good approximation this determines the ratio of these E1 and M1 amplitudes. Details of the experimental apparatus and technique are provided and results given for 3 ranges of γ-ray energy from 12-15 mev, 15-20 mev and 20-30 mev. The results do not offer any evidence of a large correction due to mesonic effects within the uncertainty of the experiment. Computer calculations at present in progress will subsequently reduce still further the experimental uncertainty.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 359-360, Apr. 23, 1962.

The Mössbauer effect is being used to measure the ratio of the quadrupole moments of the first 2+ levels in the even-even tungsten isotopes. The source, in an environment with cubic symmetry, is doppler shifted at 4°K with respect to an absorber yielding a measurable quadrupole splitting. A search for a tungsten compound exhibiting a completely resolved hyperfine spectrum has so far been unsuccessful, though several compounds have sufficiently large electric field asymmetries for the quadrupole interaction to be measured to 5%. Preliminary results for the separation of the $m = 2$ and $m = 0$ lines for the 100 kev state of W^{182} in WS_2, $CaWO_4$, WO_3, and WC are -0.55, -0.4, -0.4, and +0.35 cm sec. respectively. A positive number means that the $|m| = 2$ line has higher energy. These results can, of course, be used with Coulomb excitation measurements of the transition quadrupole moment for the 100-kev transition to estimate an electric field gradient at the nucleus of about 5×10^{17} volts cm^2. Preliminary results on the 2+,

111-kev state in W^{184} indicate that its quadrupole moment differs from that of the 2+, 100-kev state in W^{182} by less than 25%, in agreement with Coulomb-excitation data.

RADIATION GAUGE ELECTRODYNAMICS. I. THE TWO-POINT FUNCTION, by C. R. Hagen. [1962] [8]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Phys. Rev., v. 130: 813-820, Apr. 15, 1963.

The Lehmann representations of the spin zero and spin one-half Green's functions are studied with particular emphasis upon infrared effects. By means of a Bloch-Nordsieck type model the infrared parts of these functions are calculated and the analytic properties of the solution examined. A double integral representation of the 2-point function is proposed and a possible application suggested.

RADIATION-GAUGE ELECTRODYNAMICS. II. THE ASYMPTOTIC CONDITION, by C. R. Hagen. [1962] [12]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Nuovo Cimento, Series X, v. 28: 970-981, June 1, 1963.

The use of the asymptotic condition in electrodynamics is criticized and an alternative approach suggested which utilizes specific properties of the radiation-gauge Green's functions. This technique is based upon the introduction of a nonlocal field operator which has the property of asymptotically creating physical electrons without the usual emission of soft quanta. It is shown by means of an example how a cross-section may be calculated without either the appearance of spurious infrared divergences or the improper imposition of an asymptotic condition. RADIATION OF LOW ENERGY QUANTA IN NUCLEAR REACTIONS by H. Feshbach, D. R. Yennie and others. [1962] [22]p. incl. diagr. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Nuclear Phys., v. 37: 150-171, Aug. 1962.

The production of radiation concomitant with the elastic scattering of nucleons by nuclei is considered. It is shown that the first term of a series expansion of the differential radiation cross-section in the energy of the radiated quantum may be expressed in terms of the elastic scattering amplitudes at the incident and final energies. This result is valid even when there are resonances in the scattering whose widths are a small fraction of the energy loss. The interference between these 2 amplitudes permits the determination of the shape elastic amplitude, and therefore the cross section for compound elastic scattering as well as the correlation distance W defined as the energy separation over which there is a substantial correlation in the fluctuations in the elastic scattering amplitude; its inverse measures the time delay in the reaction. When a resonance has a width of the order of the energy loss, the interference can be employed to evaluate the change of phase of the elastic scattering amplitude across the resonance and may therefore serve as an indicator of whether or not a fluctuation in the elastic cross-section is a resonance. These results when applied to reactions lead to a method for the measurement of the relative amount of direct and compound nuclear processes and to a direct test of the random phase approximation of the statistical hypothesis in nuclear reactions. A derivation of the principal result valid for relativistic particles is also given. (Contractor's abstract)

A SEARCH FOR A FREQUENCY SHIFT OF 14.4 kev PHOTONS ON TRAVERSING RADIATION FIELDS, by R. Weiss and L. Grodzins. [1962] [4]p. incl. diagrs. table. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Phys. Ltrs., v. 1: 342-344, July 15, 1962.

Two experiments designed to test two hypothetical photon-photon mechanisms which were proposed to account for the frequency (red) shift of galactic light: a shift which is generally attributed to the Doppler effect from an expanding universe are reported. Both experiments gave negative results and evidence against these hypotheses. The experiments were done using the Mössbauer effect with 14.4 kev photons which were made to pass through a one-metre long X band cylindrical cavity, and tube kept at a temperature of 1300°K, each of which simulated the black body radiation field of outer space.

A SEARCH FOR A ω^o MESON IN THE MASS RANGE OF 300-500 MEV (Abstract), by D. Luckey, D. Garelick and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)-2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 40, Jan. 24, 1962.

The existence of a heavy neutral meson is suggested by electron scattering experiments and has been sought by many experimenters. We have searched for a ω^o meson assuming that they are coherently produced from complex nuclei with a cross section proportional to A^2 in the forward direction (as are π^o's), the decay mode is $\gamma + \pi^o$, and the spin is 1. Single and double π^o photoproduction are suppressed by conservation of angular momentum. The experiment consisted of 3 total-absorption gamma-ray counters located to optimize the detection efficiency of ω^o's of mass 300-500 mev. Targets of carbon and titanium were used in the bremsstrahlung beam of the Cornell Synchrotron. The pulse heights and arrival times of events were recorded on film. Analysis sets a maximum limit of 5×10^{-33} cm^2/sr for the production from hydrogen with the above assumptions. Various backgrounds will be discussed.

SINGLE-PARTICLE LEVELS OF Ca^{49} (Abstract), by E. Kashy, A. Sperduto and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 315, Apr. 23, 1962.

The energy levels of Ca^{49} from 0- to 5-mev excitation energy have been investigated through the reaction $Ca^{48}(d,p)Ca^{49}$ using 7.0-mev deuterons. The target consisted of $CaCO_3$ enriched to 84.3% Ca^{48} and evaporated onto a thin gold foil. The angular distributions and energy spectrum of the reaction protons were measured using the MIT single- and multiple-gap spectrographs, with the angular-distribution data obtained from 7.5 to 172.5 deg in 7.5-deg intervals. A preliminary analysis of the proton groups, corresponding to levels at 0- and 2.026-mev excitation in Ca^{49}, indicates that these levels correspond to the $2p_{3/2}$ and $2p_{1/2}$ single-particle levels, in agreement with previous work. The analysis of the data and shell-model configuration of the remaining observed levels are discussed.

STRIPPING ANALYSIS OF THE (d, p) ANGULAR DISTRIBUTIONS FROM THE $Cl^{35}(d,p)Cl^{36}$ AND THE $Cl^{37}(d,p)Cl^{38}$ REACTIONS. by A. M. Hoogenboom, E. Kashy, and W. W. Buechner. [1962] [10]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Phys. Rev., v. 128: 305-314, Oct. 1, 1962.

The analysis of the angular distribution of the protons from the $Cl^{35,37}(d,p)Cl^{36,38}$ reactions revealed 46 levels in Cl^{36} and 4 levels in Cl^{38}, previously unreported and the l_n values and absolute differential cross sections for 30 groups to levels in Cl^{36} and for 7 groups to levels in Cl^{38}. The discussion, which is given in terms of the shell model, resulted in the following spin assignments: The 0.789-mev state in Cl^{36} has $J^\pi = 1^+$, and the 1.163-mev state has probably $J^\pi = 1^+$. The spins of the levels at 0.671, 0.761, and 1.309 mev in Cl^{38} are 5^-, 3^-, and 4^-, respectively. The observed values of the single-particle reduced width θ_0^2 for the different subshells agree quite well with the values given by Macfarlane and French for other nuclei. (Contractor's abstract)

STRIPPING ANALYSIS OF THE $Fe^{56}(d,p)Fe^{57}$ REACTION (Abstract), by F. Alba, A. Sperduto and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)-2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 315, Apr. 23, 1962

The MIT-ONR Van de Graaff accelerator and the multiple-gap broad-range spectrograph were used to study angular distributions of protons emitted from a thin target of Fe^{56}. Incident deuterons with energy of 7.5 mev were used, and the spectrum of protons observed corresponds to a range in excitation energy in Fe^{57} from the ground-state transition to about 6.5 mev. Data were obtained at 7.5-deg intervals from 7.5 to 172 deg. Preliminary analysis of 11 proton groups up to 1.73-mev excitation show typical forward-stripping patterns for 8 of the levels. The orbital angular momenta of the captured neutron l_n assigned are as follows:

Ex	0	0.014	0.137	0.367	1.256	1.359	1.630	1.728
l_n	1	1	3	1	1	1	1	1

The groups corresponding to levels in Fe^{57} at 0.708, 1.010, and 1.199 mev show no pronounced peaking. Results for levels above 1.73 mev are presented.

STUDY OF THE K^+ DECAY, by A. M. Boyarski, E. C. Loh and others. [1962] [5]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098) Unclassified

Published in Phys. Rev., v. 128: 2398-2402, Dec. 1, 1962.

Some properties of the various decay modes of K^+ mesons have been studied with hodoscope scintillation counters. One hundred twenty two $K_{\mu 3}$ events were identified in the high-energy end of the muon energy spectrum from 115 ± 3 mev to 134 mev which yielded $(0.42 \pm 0.10)\%$ as the relative branching ratio. The result, together with the K_{e3} branching ratio and the low-energy end of the $K_{\mu 3}$ muon energy spectrum, is found to satisfy a constant form factor V-A interaction. The muon longitudinal polarization for the $K_{\mu 3}$ events was found to be $-0.8^{-0.2}_{-0.8}$ which is 2 standard deviations from the calculated value -0.81 using the constant form factors which best fit the spectrum. A lifetime analysis of the decay modes gave $\tau(K_{\mu 3}) = (1.06 \pm 0.16) \times 10^{-8}$ sec, $\tau(K_{\mu 2}) = (1.197 \pm 0.032) \times 10^{-8}$ sec, and $\tau(K_{e2}) = (1.259 \pm 0.017) \times 10^{-8}$ sec which are consistent with a single total lifetime, as expected. The total lifetime was found to be $\tau(K^+) = (1.231 \pm 0.011) \times 10^{-8}$ sec in agreement with previous values. The relative $K_{\mu 2}$ K_{e2} branching ratio was measured as 2.98 ± 0.25. A search for the occurrence of an intermediate-mass lepton in the decay $K \to \chi + \nu$ established 3×10^{-4} as the upper limit for the branching ratio with $m_e < m_\chi < 75$ mev. A UNIFIED THEORY OF NUCLEAR REACTIONS. II, by H. Feshbach. [1962] [27]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Ann. Phys., v. 19: 287-313, Aug. 1962.

The effective Hamiltonian method for nuclear reactions described in an earlier paper (A Unified Theory of Nuclear Reactions. I.) is generalized to include all possible reaction types, as well as the effects arising from the identity of particles. The principal device employed is the projection operator which selects the open channel components of the wave function. It is found that the formal structure of part I providing a unified description for direct and compound nuclear reactions including the coupled equation description for direct reactions remains valid in this wider context. A Kapur-Peierls expansion may also be obtained. The concept of channel radii is not needed nor is any decomposition of the wave function for the system into angular momentum eigenstates required, so that the expressions for transition amplitudes and widths are invariant with respect to the angular momentum coupling scheme. Since the open channels can only be defined in an asymptotic sense, the corresponding projection operators are not unique. As a consequence, the projection operator method has a flexibility which in the first place is consonant with the wide range of phenomena which can occur in nuclear reactions and in the second place can effectively exploit an intuitive understanding of the phenomena. Examples of projection operators are obtained including one which leads to the Wigner-Eisenbud formalism, another which is appropriate for the stripping reaction, and, finally, one which takes the Pauli exclusion principle into account. Note that explicit representations of the projection operators are not required for the development of general formal results but are necessary if, eventually, quantitative calculations are made. VIOLATION OF ISOTOPIC SPIN CONSERVATION IN THE DECAY OF EXCITED MESONIC STATES, by B. T. Feld. [1962] [3]p. incl. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [AT(30-1)2098]) Unclassified

Published in Phys. Rev. Ltrs., v. 7: 181-184, Feb. 15, 1962.

The decay into 4 pions of a pseudoscalar, isoscalar meson (0^{-+}) was alleged to be forbidden by parity conservation. Reference is made to the classic papers on the α-particle model of O^{16}. It was previously revealed that some 0^{-} configurations of 4 spin-zero bosons do exist, although the large values required for the internal vibrational and rotational quantum numbers would inhibit very strongly the decay of a 0^{-+} meson into 4 pions.

CURRENT CARRYING CAPACITY OF SUPERCONDUCTING Nb-Zr SOLENOIDS, by D. B. Montgomery. July 1962, 17p. incl. diagrs. tables, refs. (AFOSR-3015) (AF 19(604)7344) AD 282158 Unclassified

Also published in Appl. Phys. Ltrs., v. 1: 41-43, Oct. 1, 1962.

A mechanism of induced persistent currents is offered to explain the low current carrying capacity of Nb-Zr solenoids. The persistent currents are induced as the magnet is energized and are of sufficient magnitude to saturate the superconducting filaments. The magnitude of the induced currents can be estimated from a measurement of the residual field in the solenoid. The current carrying capacity of Nb-Zr solenoids is shown to be a particular function of field, inside diameter, and geometry. The most important conclusion drawn is that to generate fields in large bore magnets will require more wire than would be predicted from considerations neglecting the induced currents. SEMICLASSICAL DISPERSION THEORY OF INTERBAND MAGNETO-OPTICAL EFFECTS, by J. Kolodziejczak, B. Lax, and Y. Nishina. [1962] [6]p. incl. refs. (AFOSR-J153) [AF 19(604)7344] Unclassified

Also published in Phys. Rev., v. 128: 2655-2660, Dec. 15, 1962.

From the classical equation of motion a conductivity tensor is derived for a bound electron in a dc external magnetic field. Then the conductivity for a circularly polarized wave is obtained, which is expanded in terms of the magnetic field. With the appropriate form of the oscillator strength for the interband transitions, the conductivity components are evaluated for the zeroth, first, and second power of the magnetic field over the 2 energy bands for the direct and the indirect transitions. The results are used to obtain expressions for the interband Faraday rotation and the Voigt phase shift in the limits of $\omega < \omega_g$ and $\omega > \omega_g$, where ω is optical frequency and ω_g the frequency corresponding to the energy gap. In the latter case oscillatory behavior is described by the expression near the frequency of singularities with a loss term in the form of relaxation time τ. (Contractor's abstract)

ZEEMAN EFFECT OF THE R LINES IN Cr_2O_3, by C. V. Stager. [1962] [2]p. incl. diagr. (AFOSR-J540) (AF 19-(604)7344) AD 408013 Unclassified

Presented at Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Also published in Jour. Appl. Phys., v. 34: 1232-1233, Apr. 1963.

The Zeeman effect of the R lines at 4.2°K in fields up to 88 kOe was investigated. The magnetic field has been applied both parallel and perpendicular to the C_3 axis. When the external field is applied along the C_3 axis, all of the lines split into 2 components. No splitting is observed in the perpendicular orientation. As the Kramer's degeneracy has already been lifted by the exchange field, the splitting is attributed to the removal of a sublattice degeneracy. It is well known that the spin system of Cr_2O_3 will flip when a critical field of about 59 kOe is applied along the C_3 axis at 4.2°K. The spin-flop phenomenon has been seen in the optical spectra. From the splitting above the critical field there is tentative evidence of an anisotropic exchange interaction. (Contractor's abstract)

MAGNETOELECTRIC EFFECTS IN Cr_2O_3 AND $(Cr_2O_3)_{0.8}\cdot(Al_2O_3)_{0.2}$, by S. Foner and M. Hanabusa. [1962] [2]p. incl. diagrs. refs. (AFOSR-J541) (AF 19(604)7344) AD 415316 Unclassified

Presented at Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Also published in Jour. Appl. Phys., v. 34: 1246-1247, Apr. 1963.

Magnetic field induced magnetoelectric (ME) effects in Cr_2O_3 and $(Cr_2O_3)_{0.8}\cdot(Al_2O_3)_{0.2}$ have been examined with an ac method as a function of temperature and magnetic field. The ME effect parallel to the c axis reverses in sign at low temperatures for both materials, and is linear in H for all temperatures up to the spin-flop field H_C after which the ME effect approaches zero. The temperature dependence of the extrema of (dE dH) vs H leads to a measure of H_C vs T which agrees with earlier antiferromagnetic resonance and magnetic moment data in similar materials. Complete reversibility of the ME effect is observed when the magnetic field exceeds H_C and then returns to lower values, thus demonstrating a stable memory of the domain distribution introduced during magnetic annealing. Brief remarks are made on the angular dependence of the ME effect, and indications of nondiagonal contributions in the vicinity of H_C are mentioned. (Contractor's abstract)

STABILIZATION AND CONTROL OF DC MAGNETIC FIELDS WITH SUPERCONDUCTING SOLENOIDS, by S. Foner. [1962] [3]p. incl. diagrs. (AFOSR-J594) (AF 19(604)7344) AD 414067 Unclassified

Also published in Rev. Scient. Instr., v. 34: 293-295, Mar. 1963.

The new high current superconductors can be used as diamagnetic shields in order to stabilize and control dc magnetic fields. Although solid cylinders or solenoids are practical, this note will discuss some useful characteristics of solenoid structures. With a nominal amount of superconducting material, structures can be devised which eliminate field changes over a given volume of a dc magnetic field and which simultaneoulsy permit precise control and variation of the magnetic field over the same volume. Some brief experimental results with such structures are presented.

MAGNETOREFLECTION IN BISMUTH, by R. N. Brown, J. G. Mavroides, and B. Lax. [1962] [7]p. incl. diagrs. table, refs. (AFOSR-J596) (AF 19(604)7344) AD 414010 Unclassified

Also published in Phys. Rev., v. 129: 2055-2061, Mar. 1, 1963.

Direct interband transitions have been observed in the infrared magnetoreflection of single-crystal bismuth at low temperatures. They are manifested by oscillations which are almost periodic in 1/H. Analysis in terms of a 2-band model yields the energy gap, $\epsilon_g = 0.015 \pm 0.002$ ev, and also the cyclotron masses at the bottom of the conduction band for 2 orientations of the magnetic field with respect to the crystallographic axes. Within the resolution of the instrument, the g factors of the conduction and valence bands are equal. (Contractor's abstract)

CRITICAL FIELD, ANTIFERROMAGNETIC RESONANCE IN Cr_2O_3 (Abstract), by S. Foner. [1962] [1]p. [AF 19-(604)7344] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 200-201, Mar. 26, 1962.

Earlier high-field, antiferromagnetic-resonance (AFMR) experiments at 35 and 70 kmc/sec have been extended in the critical-field region. Both high-magnetic fields and high frequencies are essential for such measurements. In addition to the zero-frequency, "spin flop" resonance and critical-field resonance (CFR) at 35 kmc/sec, the CFR has been examined in the narrow angular region with the applied field nearly parallel to the principal axis of Cr_2O_3 as a function of frequency, angle, field, and temperature. The results at 70, 95, and 116 kmc/sec are in good agreement with the earlier experiments and with computer calculations obtained with the molecular-field approximation for the CFR resonance and for the usual AFMR. The CFR and the usual AFMR are restricted to angles of less than 4 and 41 degrees, respectively, for the highest frequency, and to correspondingly smaller angles for lower frequencies. Some methods of observation and limitations of the small-angle resonance are also discussed.

FORCED-CONVECTION SURFACE-BOILING HEAT TRANSFER AND BURNOUT IN TUBES OF SMALL DIAMETER, by A. E. Bergles and W. M. Roshenow. May 25, 1962 [144]p. incl. illus. diagrs. tables, refs. (Technical rept. no. 8757-21) (AF 19(604)7344) Unclassified

A heat-transfer apparatus was designed and constructed for the study of forced-convection boiling in small channels. In the region of low wall superheat, the heat flux can be predicted by available correlations for forced convection. Data indicate, however, that these correlations do not properly account for the radial variation of properties for water at high temperature difference. An analysis for the prediction of the inception of first significant boiling was developed. Experimental results are in good agreement with analytical predictions. The analysis provides information necessary for the prediction of the complete forced-convection surface-boiling curve. Data for a small-diameter tube indicate that the bubbles formed at incipient boiling can trip the laminar or transition boundary layer to a fully-developed turbulent boundary layer. The region of vigorous boiling coincides approximately with the extrapolation of the pool-boiling curve in one set of experiments. In other experiments, pool-boiling data were strongly influenced by fluid and surface conditions, as well as by bubble-induced convection in the pool. It is concluded that fully-developed forced-convection boiling can be related to pool boiling by either direct extrapolation or superposition of forced convection. Burnout flux increases with decreasing tube diameter. Flow oscillations caused by system compressibility can greatly reduce the burnout heat flux in the subcooled region. This instability is particularly difficult to avoid with tubes of very small diameter. (Contractor's abstract, modified)

HIGH-FIELD ANTIFERROMAGNETIC RESONANCE IN Cr_2O_3, S. Foner. [1962] [15]p. incl. illus. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 19(604)7344], Office of Naval Research, and Signal Corps) Unclassified

Published in Phys. Rev., v. 130: 183-197, Apr. 1, 1963.

Antiferromagnetic resonance (AFMR) experiments in single-crystal Cr_2O_3 are summarized with specific emphasis on the high-field resonance mode. Most of the experiments involve pulsed magnetic fields and millimeter wavelength radiation. A brief description of the experimental techniques is included. The experimental results include AFMR as a function of temperature (from 4.2°K to the Neel temperature), frequency (36 to 135 kmc/sec), magnetic field, and angle between the magnetic field and the c axis. Results of the spin-flop resonance mode are also presented as a function of temperature, field, frequency, and angle. Magnetic measurements at the spin-flop and low-field static susceptibility measurement both parallel and perpendicular to the c axis are also given as a function of temperature. Normalized plots of the AFMR based on the molecular field approximation are presented as a function of angle and field and compared with experiment. The AFMR experiments agreed with the molecular field results when the static susceptibility data were included in the calculations. The characteristic quantity $(2 H_E H_A)^{\frac{1}{2}}$, where H_E is the exchange field and H_A is the anisotropy field, is 60 ± 3 kgauss from 4.2 to 235°K. The unusual temperature independence of $(2 H_E H_A)^{\frac{1}{2}}$ is partly accounted for by the crystalline field contribution to H_A which is only 700 gauss at 4.2°K. Assuming only dipolar and crystalline field contributions to H_A the crystalline field portion at low temperatures is 1000 gauss. This corresponds to an axial D contribution which is 1 9 that of Cr^{3+} in Al_2O_3 and of the opposite sign. More recent

optical and related data which confirm this result are discussed and some possible mechanisms of the unusual temperature dependence are indicated. A nonzero value of the parallel static susceptibility at low fields is also observed and briefly discussed. (Contractor's abstract)

OSCILLATORY INTERBAND VOIGT AND FARADAY EFFECTS IN GERMANIUM (Abstract), by Y. Nishina, J. K. Furdyna, Z. Ziejczak, and B. Lax. [1962] [1]p. [AF 19(604)-7
Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 535, Nov. 23-24, 1962.

The interband Voigt effect in germanium was measured for photon energies from 0.790-0.845 ev at room temperature in a 4-μ-thick sample in magnetic fields up to 59 kgauss. The rotation of a linearly polarized wave was measured by the technique previously described. From this, a plot of the Voigt phase shift vs photon energy was derived. The results showed the oscillatory behavior due to the direct transitions between the various lowest Landau levels observed in magnetoabsorption. Anisotropy of phase shift as well as energy was observed with magnetic fields along different crystal directions. With a phenomenological relaxation time, the line shapes of the interband Faraday rotation and Voigt effect were calculated from the semiclassical dispersion theory developed recently. The experimental results for the line shapes were in good qualitative agreement with those of the theory.

Preliminary results are reported of observations of oscillatory changes in sound velocity in bismuth at 4°K as magnetic field is varied. These are presumed to arise from a quantum mechanism similar to the de Haas-van Alphen effect. Pulsed ultrasonic longitudinal waves of 20 and 33 mc/s were used, and a maximum $\Delta v/v$ of about 10^{-4} has been observed.

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 189, Mar. 26, 1962.

Persistent currents have been established in hollow cylinders of sintered niobium-tin by dc and pulsed magnetic fields at 4.2°K. Slowly varying fields produced a maximum persistent field of nearly 25 koe (corresponding to a current density of over 10^5 amp. cm^{-2}), while pulsed fields gave about 15 koe. In both cases, for increasing and decreasing fields, the internal axial field changed in steps. As H_{ext} was slowly increased, H_{int} remained constant until the samples momentarily become normal, permitting H_{ext} and H_{int} to equalize. H_{int} again remained constant if H_{ext} was reduced to zero. However, in pulsed fields (~ 10 msec rise, ~ 80 msec tail), H_{ext} and H_{int} usually did not equalize after a step. In cylinders 2.75 cm long x 1.6 cm o.d. x 0.7 cm i.d., the first step occurred for 10 koe < H_{ext} < 25 koe depending on on dH_{ext}/dt, the higher limit corresponding to lower rates. Further increase of H_{ext} gave rise to similar jumps of H_{int}. For unknown reasons, cylinders with thicker walls and/or larger outer diameters usually gave lower persistent fields.

THEORY OF INTERBAND FARADAY AND VOIGT EFFECTS IN SEMICONDUCTORS (Abstract) by B. Lax, Y. Nishina, and J. Kolodziejczak. [1962] [1]p. [AF 19-(604)7344] Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 535, Nov. 23, 1962.

A quantum formulation of the conductivity tensor has been utilized to calculate the interband Faraday rotation and Voigt effect in a semiconductor with simple parabolic bands. Expansion as a function of a magnetic field for the circularly polarized components yields results for the Faraday rotation identical to the classical calculation and differ from those of Boswarwa, Howard, and Lidiard. An expression for the Voigt effect is also derived for photon energies both below and above that of the energy gap. The principal terms of interest for the oscillatory region of the Faraday and Voigt effects are of the same form for the quantum and classical theories and those given earlier. The theory can be used to explain the line shapes of the direct and indirect transitions.

ZEEMAN SPECTRUM OF EUROPIUM-ACTIVATED CALCIUM FLUORIDE (Abstract), by W. A. Runciman and C. V. Stager. [1962] [1]p. [AF 19(604)7344] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 196, Mar. 26, 1962.

The Zeeman splitting of the fluorescence line at 24206 cm^{-1} has been observed in crystals of $CaF_2(Eu^{2+})$ at 4.2°K in a field of 31 kgauss. The splitting of the same line is observed in absorption and, owing to depopulation of the higher levels of the ground state, only 6 lines are observed. At 20 kgauss 3 lines are observed and the whole pattern is believed to contain 10 major lines with a spacing appropriate to a Lande g factor of 2. The 6 central components show evidence of fine structure. A powdered sample shows the Zeeman pattern in fluorescence, indicating that the europium ions are cubic sites. Line intensities in the polarization spectra depend on the orientation of the crystal relative to the magnetic field. An energy-level diagram is proposed to account for the observed spectra. The ground state is known to be the $^8S_{7/2}$ state of the f^7 configuration, and it is suggested that the upper state belongs to the f^6d configuration. A large strain splitting of this line supports this assignment of the upper state.

ZEEMAN SPECTRUM OF SAMARIUM-ACTIVATED CALCIUM FLUORIDE (Abstract), by W. A. Runciman and C. V. Stager. [1962] [1]p. [AF 19(604)7344] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 85, Jan. 24, 1962.

The Zeeman splitting of the fluorescence line at 14111 cm^{-1} has been observed in crystals of CaF_2 (Sm^{++}) at 4.2°K in a field of 70 kgauss. The g value is about 1.3, considerably lower than the Russell-Saunders value of 1.5 for a $^7F_1$ level. The reduction is believed to be due to crystal field interactions. Polarization spectra obtained at 54 kgauss indicate that this transition, which is the one occurring in the optical maser, is electric dipole in nature. Hence the transition is believed to be $f^5d - f^6$ rather than $f^6 - f^6$. The absorption line at 14483 cm^{-1} shows no splitting, and one possible explanation of this is that the upper frequency difference of 116 cm^{-1} is vibrational in origin.

POWER AND ENERGY RELATIONS IN BIDIRECTIONAL WAVEGUIDES, by P. Chorney. [1962] [16]p. incl. diagrs. table. refs. (AFOSR-3391) (Sponsored jointly by Air Force Office of Scientific Research, Office of

Naval Research, and Signal Corps under DA 36-039-sc-78108, and National Science Foundation) Unclassified

Also published in Electromagnetics and Fluid Dynamics of Gaseous Plasma, Proc. of the Symposium, New York (Apr. 4-6, 1961), Brooklyn, Polytechnic Press, v. 11: 195-210, 1962.

Some new general theorems on the propagation properties of a certain broad class of lossless, passive, uniform waveguides are developed. This broad class is referred to as bidirectional. Two important cases of bidirectional waveguides are: (1) those containing isotropic materials and (2) those containing gyrotropic materials with the gyrotropic axis along the waveguide axis. A feature of the materials considered is that they are, in general, dispersive. The theorems interrelate group velocity, phase velocity, power, energy, and pseudoenergy. The term pseudoenergy is used to distinguish the true energy from the energy-like terms which appear in the complex form of Poynting's theorem; for the case of dispersive media, true energy does not appear as such in the complex form of Poynting's theorem. As an illustration, these theorems are applied to the plasma-filled waveguide. Some general properties of the dispersion character are revealed. (Contractor's abstract)

ADAPTIVE DECISION PROCESSES, by J. L. Rosenfeld. Sept. 27, 1962, 82p. incl. diagrs. table, refs. (Technical rept. no. 403) (AFOSR-3974) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

General adaptive processes are described. In these processes, a measure of performance is increased as the experimenter gathers more information; the actions taken by the experimenter determine both the profit and the type of information gathered. In particular, the adaptive decision process is a 2-person, zero-sum, m x n game with some unknown payoffs. this game is played repeatedly. The true values of the unknown payoffs are learned only during those plays of the game at which the unknown payoffs are received. The players are given a priori probability distributions for the values of the unknown payoffs. A measure of performance is defined for the players of adaptive decision processes. An optimum strategy for one player is derived for the case in which the opponent uses one mixed strategy, known to the player, repeatedly. Optimum minimax strategies for both players are derived for the case in which the players are given the same information about the unknown payoffs. An optimum strategy, from a restricted class of strategies, is derived for one player when he is playing against nature, which is assumed to be an opponent whose strategy is unknown but is unfavorable to the player. THE EFFECT OF CLOSE COLLISIONS ON THE TWO-BODY DISTRIBUTION FUNCTION IN A PLASMA, by D. E. Baldwin. Dec. 31, 1962, 57p. incl. refs. (Technical rept. no. 402) (AFOSR-5014) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039 sc-78108, and National Science Foundation)
AD 296211 Unclassified

The development of a 2-body distribution function in a plasma for use in a kinetic equation for the 1-body distribution function is investigated. The kinetic equation is obtained for a uniform plasma for those circumstances in which the time dependence of higher-order distribution functions can be assumed to occur within a functional dependence on the 1-particle distribution function. The conditions of validity for this functional-dependence assumption are discussed. The resulting interaction term is new in the sense that it contains no divergent integrals requiring cutoffs, and it may be considered accurate to first order in $(e^2/kT\lambda_D)$. The interaction term is composed of 2 parts. The first is a Boltzmann collision integral with a Debye-shielded interaction. The second term is due to the deviation of the shielding cloud from a Debye shield and is the Fokker-Planck form, the coefficients of which are finite and well-behaved. Because of its form, with a convergent integral and convergent Fokker-Planck coefficients, the solution may be considered as a joining of the previous solutions to this problem. A COMMUNICATION ANALYSIS OF HIGH-FREQUENCY IONOSPHERIC SCATTERING, by G. Einarsson. Nov. 15, 1962, 76p. incl. illus. diagrs. refs. (Technical rept. no. 400) (AFOSR-5031) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) AD 416605 Unclassified

A communication scheme for random multipath channels is investigated. During predetermined intervals the transmitter sends a sounding signal that the receiver uses to predict the behavior of the channel during the intermediate time when communication is performed. It is assumed that the channel varies slowly, and that the additive noise in the receiver is low. The possibility of representing a multipath channel as a time-variant filter is investigated. A sampling theorem for linear bandpass filters is derived, and the results that can be expected when it is used to represent a single fluctuating path with Doppler shift are discussed. The prediction operation is essentially linear extrapolation; a formula for the mean-square error is derived and compared with optimum linear prediction in a few cases. Calculations on actual data from ionospheric scattering communication show that the method is feasible and give good correspondence with the theoretical results. Under the assumption that the receiver makes decisions on each received waveform separately, and that there is no overlap between successive waveforms, the optimum receiver is derived. It consists mainly of a set of matched filters, one for each of the possible waveforms. The predicted value of the channel parameters is used in weighting the output from the matched filters to obtain likelihood ratios. This formulation provides means for dealing with random multipath channels in a way suitable for mathematical analysis. (Contractor's abstract, modified)

PERTURBATION OF A PLASMA BY A PROBE, by J. F. Waymouth. Dec. 26, 1962 [44]p. incl. diagrs. tables, refs. (Technical rept. no. 406) (AFOSR-5033) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) AD 296210 Unclassified

The perturbation of the plasma by a probe is analyzed as a problem in ambipolar diffusion, subject to the assumptions that the mean-free path of plasma particles is: (1) comparable to or smaller than probe dimensions, and (2) much greater than the thickness of any sheaths that may be present. Sheaths must therefore be assumed to be thin in comparison with probe dimensions. Analyses are carried through for spherical probes and for plane probes oriented normal to a magnetic field. The results can be expressed in terms of a parameter Q which is approximately equal at zero sheath potential to the sum of the ratios of probe size to electron mean-free path and probe size to ion mean-free path. Since Q also depends on sheath potential, the current-voltage characteristics are distorted. Methods for determining zero sheath potential, and calculating the properties of the undisturbed plasma from the probe curves are given. (Contractor's abstract, modified)

PRECISE CRITICAL-FIELD MEASUREMENTS OF SUPERCONDUCTING Sn FILMS IN THE LONDON LIMIT. by D. H. Douglass, Jr. and R. H. Blumberg. [1962] [6]p. incl. diagrs. tables, refs. (AFOSR-J173) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) AD 400080 Unclassified

Also published in Phys. Rev., v. 127: 2038-2043, Sept. 15, 1962.

Precise measurements of the critical field of superconducting tin films were made as a function of temperature and thickness. Particular attention was paid to measurements near the transition temperature where the London limit holds. It was found that near the transition temperature the critical field could be expressed in the form $H_c = (\Delta t)^{1/2}\gamma(1 + \epsilon\Delta t)$, where γ and ϵ are independent of temperature. In terms of the Ginzburg-Landau theory modified to include the lower temperatures, the constant γ determines the penetration depth and the constant ϵ is different for different modifications of the field-independent free energy. Penetration depths determined in this way were found to be a function of thickness. Assuming that the coherence length ξ in the film is determined by the thickness and using the expression for the thickness dependence of the penetration depth given by Tinkham, one can obtain a bulk coherence length ξ_0 of approximately 2100A, as well as a bulk penetration depth of 510A, from the data. Two particular modifications of the Ginzburg-Landau theory are considered. The first, which is the original theory, predicts a value of $\epsilon = 0.31$. The second, which is the Gorter-Casimir modification proposed by Bardeen, predicts a value of $\epsilon = 0.19$. Experimentally, ϵ was determined to have an average value of 0.14 ± 0.10.
