Self-diffusion in liquid ethane, under its own vapor pressure has been studied over most of the liquid range between the triple point and the critical point. The activation energy for self-diffusion increases markedly from approximately 0.5 kcal/mol at 100°K to 3.5 kcal/mol at 300°K. The Stokes-Einstein relation is not well satisfied with either a constant molecular radius or a radius proportional to the cube root of the molar volume. The results are well correlated by a free-volume expression in which the free volume, defined as an actual volume minus the volume of the hypothetical liquid at 0°K, replaces temperature as the independent variable. The value of the hypothetical 0°K liquid volume resulting in best fit of the experimental data is less than that determined by extrapolation of the liquid specific volume to 0 K or that based upon best fit of experimental liquid viscosity data, but it is between a value based on a hard-sphere radius determined from gas viscosity and one derived from the second virial coefficient. Proton spin-lattice relaxation measurements on the liquid ethane sample over a similar temperature range indicate that the relaxation is controlled by mutual diffusion of ethane and small amounts of dissolved oxygen, although the situation is somewhat complicated by temperature dependence of the distribution of oxygen between the 2 phases. ELECTROHYDRODYNAMIC AND MAGNETOHYDRODYNAMIC NONLINEAR SURFACE WAVES, by J. R. Melcher. [1962] 1v. incl. diagrs. (AFOSR-J125) (Sponsored jointly by Aeronautical Systems Division; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) AD 400081 Unclassified

Also published in Phys. Fluids, v. 5: 1037-1043, Sept. 1962.

A nonlinear formulation of electrohydrodynamic and magnetohydrodynamic surface interactions is developed which, in the absence of magnetic or electric fields, becomes the classical "long" gravity-wave theory. The results are valid for a shallow highly conducting fluid that interacts strongly with a rigid highly conducting plate in such a way as to either conserve an electric potential difference or a magnetic flux. The growth of surface discontinuities from compression and depression waves is discussed, with transition electrohydrodynamic waves originating from timelike data given to illustrate waves that are partly controlled by gravity and partly by the electric field. Waves initiated from spacelike data are also described, and the integral jump conditions derived. (Contractor's abstract)

TWO-QUANTUM TRANSITIONS IN THE MICROWAVE MAGNETIC RESONANCE SPECTRUM OF ATOMIC CHLORINE, by G. J. Wolga. [1962] [8]p. incl. diagrs. table, refs. (AFOSR-J978) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Also published in Phys. Rev., v. 127: 805-812, Aug. 1, 1962.

Two-quantum microwave magnetic resonance transitions corresponding to $\Delta M_J = \pm 2$ have been observed for both stable isotopes of atomic chlorine, Cl^{35} and Cl^{37}. The experimentally observed and theoretically predicted positions of the 2 quantum transitions agree within 13 parts per million, which was the precision of the experiment. The power dependence of the 2 quantum transitions has been measured and checked with a "variation of constants" treatment of the microwave-induced probability amplitudes, and agreement has been found. Variations in intensity between corresponding $\Delta M_J = \pm 1$ and $\Delta M_J = \pm 2$ resonances were observed and analyzed on the basis of time-dependent perturbation theory and the Schwinger-Karplus expression for the line shape of a collision-broadened resonance with saturation. Satisfactory agreement with theory is found for these intensity variations. The linewidths for the $\Delta M_J = \pm 2$ lines are approximately half of that for the $\Delta M_J = \pm 1$ lines; this is in agreement with the results of time-dependent perturbation theory. EFFECT OF ELECTROSTATIC INTERACTIONS ON THE NUCLEAR MAGNETIC RESONANCE DIPOLAR HYPERFINE STRUCTURE WITH STRONG CORRELATION-TIME NARROWING, by M. W. P. Strandberg. [1962] [6]p. (AFOSR-J979) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Also published in Phys. Rev., v. 127: 1162-1167, Aug. 15, 1962.

The effect of electric fields on the nuclear magnetic resonance dipolar hyperfine spectrum of a liquid with correlation-time narrowing is examined. A first-order molecular quadrupole effect and a second-order molecular electric dipole effect (Stark effect) of observable magnitude are predicted. The results are discussed with reference to the proton magnetic resonance in water. (Contractor's abstract)

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 472, Aug. 27, 1962. (Title varies)

Also published in Phys. Rev. Ltrs., v. 9: 243-245, Sept. 15, 1962.

The velocity of sound in liquid helium under its saturated vapor pressure has been measured at 1 mc/sec between 0.15 and 1.4°K with a resolution of approximately 1 part in 10^4 using a phase-comparison technique previously described. Near 0°K, the velocity is independent of temperature. With increasing temperature the velocity increases slightly, passing through a maximum in the vicinity of 0.65°K, and then falling almost linearly between this temperature and 0.9°K, with a slope of -1.6 m/sec-°K. At higher temperatures, the rate of decrease is more rapid. Between 0.15° and 1.4°K, the total decrease in the velocity is 1.9 ± 0.1 m/sec. The attenuation was also observed at this frequency. Its behavior is consistent with that reported in the preceding paper, its maximum occurring at 0.75°K.

THOMSON SCATTERING OF OPTICAL RADIATION FROM AN ELECTRON BEAM, by G. Flocco and E. Thompson. [1962] [3]p. incl. illus. diagr. table. (AFOSR-J983) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108; and National Science Foundation) Unclassified

Also published in Phys. Rev. Ltrs., v. 10: 89-91, Feb. 1, 1963.

Light from a ruby laser was focused to intersect a magnetically confined electron beam perpendicularly, and the scattered radiation was detected at an angle of 56° to the electron beam (90° to the laser beam). The intensity of the detected radiation was 10^{18} of the laser output. The number of photoelectrons produced in the detector due to Thomson scattering was close to the value predicted from the scattering cross-sections. Allowance was made for the effects of scattering of laser light other than by the electron beam and for the optical radiation generated by the electron beam and electron source.

INTERACTIONS BETWEEN SOUND WAVES, by L. W. Dean, III. [1962] [6]p. incl. diagrs. (AFOSR-J984) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Also published in Jour. Acoust. Soc. Amer., v. 34: 1039-1044, Aug. 1962.

Exact solutions for the interaction between 2 concentric cylindrical waves and between 2 concentric spherical waves are presented. The scattered-pressure amplitude in the far field is shown to be constant in the cylindrical case and to be proportional to r^{-1} ln r in the spherical case, where r is the distance to the source of primary waves. A near-field solution is derived for the scattered waves generated when 2 sharply defined, plane-wave beams of square cross section intersect at right angles. A comparison is made of the theory with recent experiments in which beams of circular cross section were used. It is concluded that if the scattered waves do exist, their amplitudes are at least 40 db below those that are predicted by this theory. When a hard object is placed in the region of intersection, scattered waves are observed. This effect can be explained by the fact that with the addition of the hard object (a cylinder) the primary waves have components of the same symmetry. These components are the waves scattered from the primary beams by the object. Evidence is presented to show that these components, having the same symmetry, interact strongly in the volume surrounding the object. (Contractor's abstract)

TANDEM USE OF GRATINGS AND ECHELLES TO INCREASE RESOLUTION, LUMINOSITY, AND COMPACTNESS OF SPECTROMETERS AND SPECTROGRAPHS, by G. W. Stroke and H. H. Stroke. [1962] [6]p. incl. illus. diagrs. refs. (AFOSR-J986) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) AD 403615 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 53: 333-338, Mar. 1963.

The principle of tandem (series) arrangements of spectroscopic elements—used with prisms in 1861 by Kirchhoff and Bunsen, later applied to Fabry-Perot étalons, and more recently to concave gratings in the soft x-ray domain—has been successfully extended to high-resolution gratings and echelles. For example, when 2 gratings are used in series near autocollimation, the resolving power is doubled as compared with a single element at the same angle. Moreover, for a given linear dispersion, the luminosity may be increased up to a factor of 4 (for perfect reflectivity and blaze), since the doubled angular dispersion within a constant aperture permits the reduction of focal length by a factor of 2. The advantages pointed out here also characterize multiple-pass arrangements, first described for prisms by Wadsworth in 1895 and again emphasized by Couderc, Jacquinot, and Walt... and for gratings by Hulthén, Rank, and others. These advantages indicate the possibility of extending multiple-pass arrangements to the use of echelles when the additional mirror reflection is acceptable. Design characteristics for tandem use of gratings in monochromators and for tandem use of high-order gratings (echelettes, echelles) in broad-range spectrograph arrangements, as well as experimental results, are presented. The single-echelette (echelle) spectrograph arrangement which is basic to the tandem extension is that first suggested by Shane and mounted, crossed with a prism, by Wood in 1947, and similarly mounted, crossed with a grating, by Harrison, Archer, and Camus in 1952. In the tandem arrangement only simple geometrical alignment, with no phase adjustment between the 2 gratings, is required, unlike the mounting for grating mosaics with several coplanar gratings. Presented at meeting of the Amer. Phys. Soc., Northwestern U., Evanston, Ill., June 19-21, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 413, June 19, 1962.

Also published in Jour. Opt. Soc. Amer., v. 53: 448-453, Apr. 1963.

The average electron concentration of a gas-discharge plasma can be inferred from the phase change suffered by an electromagnetic wave in its passage through the medium. With available microwave generators, the maximum electron density that can be measured is approximately 3×10^{14} cm^{-3}. On the other hand, interferometers that operate at optical wavelengths become insensitive at electron densities less than approximately 10^{16} cm^{-3}. An infrared interferometer is described here which operates at 0.03 cm wavelength and is able to detect densities above 5×10^{13} cm^{-3} in a plasma column 1-cm thick. In the design, incoherent radiation from a mercury arc lamp is split by a diffraction grating and the plasma placed in one of the diffracted beams. The beams are then recombined and fringe shifts measured by a Golay detector. (Contractor's abstract)

THERMAL NOISE IN LINEAR, LOSSY, ELECTROMAGNETIC MEDIA, by M. Vanwormhoudt and H. A. Haus. [1962] [6]p. incl. diagr. (AFOSR-J991) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Also published in Jour. Appl. Phys., v. 33: 2572-2577, Aug. 1962.

The thermal radiation of lossy media is described by a random current-source term that is introduced into Maxwell's equations. The media treated are linear, in general anisotropic, nonuniform, and such that the constituent relations are not local relations, but are described in terms of a Green's operator. For such media, in thermodynamic equilibrium, it is shown that simple relations exist between the correlation and spectral density matrices of the random current-source field and the Green's conductivity operator. These relations are analogous to Nyquist's theorem of lumped circuits. (Contractor's abstract)

CONTAINMENT OF PLASMAS BY HIGH-FREQUENCY ELECTRIC FIELDS, by M. Ericson, C. S. Ward, and others. [1962] [6]p. incl. illus. diagrs. refs. (AFOSR-J992) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108; Atomic Energy Commission, North Atlantic Treaty Organization, and the Phillippe Foundation) Unclassified

Also published in Jour. Appl. Phys., v. 33: 2429-2434, Aug. 1962.

A cylindrical plasma column was produced in hydrogen by a microwave electric field crossed with a static magnetic field. Under certain conditions of gas pressure, magnetic field, and strength of the microwave field, the plasma did not entirely fill the volume available to it but appeared as a narrow, perfectly stable, cylindrical column with a diameter as small as 1/4 of the diameter of the discharge tube. The experimentally observed properties of this "constricted" discharge are described. It is shown that they can be explained by treating the plasma as a compressible dielectric medium. CLOSE COLLISIONS IN A PLASMA, by D. E. Baldwin. [1962] [8]p. (AFOSR-J995) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) AD 410054 Unclassified

Also published in Phys. Fluids, v. 5: 1523-1530, Dec. 1962.

A 2-body distribution function in a plasma is developed for use in a kinetic equation for the 1-body distribution function. The kinetic equation is obtained for a uniform plasma for circumstances in which the time dependence of higher-order distribution functions can be assumed to occur within a functional dependence on the 1-particle distribution function. The resulting interaction term is new, in the sense that it contains no divergent integrals, and is considered accurate to first order in $(e^2/KT\lambda_D)$. The interaction term is composed of 2 parts. The first is a Boltzmann collision integral with a Debye-shielded interaction. The second term is due to the deviation of the shielding cloud from a Debye shield and is of the Fokker-Planck form, the coefficients of which are finite and well behaved. Because of its form, with a convergent collision integral and convergent Fokker-Planck coefficients, the solution may be considered a joining of the previous solutions to the problem. SKIN SENSITIVITY TO THERMAL STIMULI, by R. Melzack, G. Rose, and D. McGinty. [1962] [14]p. incl. illus. refs. (AFOSR-J997) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and National Institutes of Health) Unclassified

Also published in Exper. Neurol., v. 6: 300-314, Oct. 1962.

Distribution patterns of cutaneous thermal sensitivity in human subjects were studied by mapping large areas of skin with stimulators the tip temperatures and diameters of which were controlled. The maps show that skin sensitivity to cold and warm stimuli is distributed in the form of large sensory fields rather than isolated "spots" These sensory fields have a variety of sizes and shapes. Generally, they consist of highly sensitive areas, ranging in size from 6 cm^2 to spot-like peaks, surrounded by larger, less sensitive regions. Moreover, there are persistent fluctuations of thermal sensitivity in successive maps of the same area of skin. Fluctuation usually took 2 forms: marked changes primarily at the boundaries of the sensory fields; and "fragmentation" and "coalescence" of the fields themselves. It was also observed that small, warm stimuli produce frequent reports of pricking, stinging sensations at temperatures that evoke pleasant warmth when applied normally to large areas of skin. This observation suggests that the spatial properties of warm stimuli play an important role in determining the quality of cutaneous experience. (Contractor's abstract)

SOME PROPERTIES OF THE AFFERENT PATHWAY IN THE FROG CORNEAL REFLEX, by K. Kornacker. [1962] [16]p. incl. diagrs. refs. (AFOSR-J998) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108; Bell Telephone Labs., Inc., National Institutes of Health, and Teagle Foundation, Inc.) Unclassified

Also published in Exper. Neurol., v. 7: 224-239. Jan. 1963.

An electrophysiological method was used to examine the neurological basis of stimulus specificity in the frog corneal reflex. Anesthetized frogs possessing an intact corneal reflex were stimulated in a variety of ways and source density maps were constructed from the synaptic potentials recorded in the medulla oblongata at the level of the abducens nucleus. These maps, considered in relation to the effectiveness of the various stimuli for producing an eye retraction, suggest a set of characteristic physiological properties for the afferent nerve fibers which lie in the frog corneal reflex pathway. There appears to be a 100-μ separation in the medulla between the sites of termination of 2 groups of afferent myelinated nerve fibers. One group, consisting of the fastest conducting fibers, terminates medially, while the other group, consisting of fibers having a slower conduction velocity and a higher electrical threshold, terminates laterally. Two results further suggest that the frog corneal reflex may involve only those fibers which terminate in the lateral locus. First, the reflex motor cell response which follows an effective stimulation of the snout does not occur until 1 or 2 msec after the appearance of lateral activity, in spite of the much greater medial activity which occurs 2 msec before the lateral activity. Secondly, the activity following corneal stimulation is completely confined to the lateral locus. These results also suggest that the stimulus specificity of the frog corneal reflex rests simply on the relatively high density of small diameter fibers terminating peripherally in the cornea and centrally in the lateral locus. Finally, it is shown how ischemia could account for the abnormal eye reflexes which have been induced in amphibia by transplantation.

Also published in Jour. Geophys. Research, v. 67: 4259-4266, Oct. 1962.

The microwave resonance line at 22,235 mc/s (λ = 1.35 cm) arising from uncondensed H_2O in the terrestrial atmosphere is examined in detail as a means of providing easily obtained data on the physical structure of the atmosphere. It is shown that the line profile is drastically influenced by the vertical distribution of H_2O and that the anomalous abundance of uncondensed H_2O above 15 to 20 km should be easily detected and monitored by ground-based passive microwave observations. The method, capable of 24 hr/day operation, can be used to determine abundance changes on a time scale as short as several seconds, if necessary, and to reveal horizontal fine structure with a resolution of 150 m at an altitude of 30 km with a 10-ft parabolic receiving antenna. Other atmospheric constituents that have microwave resonance spectrums, for example O_3, are amenable to study by this procedure. (Contractor's abstract)

DESIGN PARAMETERS' INFLUENCE ON M.I.T. BAYARD-ALPERT GAUGE SENSITIVITY, by W. B. Nottingham. [1961] [5]p. incl. diagrs. tables. (AFOSR-J1385) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Also published in 1961 Trans. Eighth Nat'l. Vacuum Symposium combined with Second Internat'l. Cong. on Vacuum Science and Technology, Washington, D. C. (Oct. 16-19, 1961), ed. by L. E. Preuss. New York, Pergamon Press, v. 1: 494-498, 1962.

The Bayard-Alpert gages studied all had a screen grid between the electron emitting filament and the glass wall. Ion currents observed at the normal, small wire ion collector inside of the electron collector and also on the screen were studied as a function of the electron emission current as measured at the filament and the pressure of nitrogen. The parameters investigated were the distance between the electron emitting filament and the electron collector, and the design of the electron collector. Although the ion current observed at the normal collector showed a strong nonlinearity with increasing electron current at higher pressures, the total ion current was remarkably linear. Gage sensitivity K decreases by a factor of 2 as the filament-to-electron collector spacing is reduced from 3 mm to 1 mm. The closing of the electron collector with fine wires increases the sensitivity by a factor of 3.1 compared to the open-ended structure. At the high pressure of $p = (10^{-4}$ Torr), the gage constant decreases and the limit of pressure variation detection comes at Kp = 1.7 for a 100 v electron acceleration potential. Presented at Fourth Internat'l. Cong. on Acoustics, Copenhagen (Denmark), Aug. 21-28, 1962.

The present paper examines the problem of determining a set of quasi-discrete or ideal phonetic parameters when a set of continuous phonetic parameters is given. The input to the analyzer consists of a set of continuous phonetic parameters that describe certain continuous articulatory motions. In the present experiments, the input phonetic parameters are derived from measurements on cineradiographic films. The output of the analyzer consists of a set of ideal quasi-discrete phonetic parameters. The internal generative model simulates the above-mentioned articulatory processes, it accepts ideal phonetic parameters at its input, and operates on these to yield continuous phonetic parameters at its output. Comparison is made between the input and the internally-generated parameters, and new inputs to the internal model are tried until a best match is obtained in the comparator. Preliminary analysis and segmentation are carried out in order to obtain approximate first guesses for the ideal parameters. In the preliminary studies described here, 4 parameters $f_i(t)$, $i = 1-4$, were selected tentatively as input signals. Frame-by-frame measurements from the films were used to obtain input parameters for the final syllable of several utterances of the form $/ha\ C_1VC_2$, where the initial and final consonants C_1 and C_2 are identical. As a result of the preliminary analysis, tentative values for 20 parameters are obtained. These consist of the 3 time segmentation points (2 for each parameter) and the values of 12 ideal phonetic parameters.

AN ANALYSIS OF SPEECH SPECTRA IN TERMS OF A MODEL OF ARTICULATION, by J. M. Heinz. [1962] [4]p. incl. diagrs. refs. (AFOSR-J1549) (Sponsored jointly by Air Force Cambridge Research Lab. Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and National Science Foundation) Unclassified

Presented at Fourth Internat'l. Cong. on Acoustics, Copenhagen (Denmark), Aug. 21-28, 1962.

It is possible with the programs outlined here to compare an internally generated spectrum with an actual speech spectrum and to vary manually the input parameters until an optimum match is obtained. The results of the match are parameters which relate to the physical dimensions of the vocal tract and thus make it possible to study the dynamics of the articulatory system through analyses of the acoustic signal.

Presented at Fourth Internat'l. Cong. on Acoustics, Copenhagen (Denmark), Aug. 21-28, 1962.

Formant frequency values F_{10} and F_{20} are studied along with the curvature values. A postdental consonant, which is known to have a relatively stable place of articulation, is examined in different vowel contexts. Results show that consonantal context appears to have the greatest influence on the value of F_{20} for rounded vowels. In all cases, the effect is such that the extremal value of the second formant frequency is displaced from the ideal target value toward the frequency of the consonantal locus. In articulatory terms, this suggests that there is an effective inertia in the articulatory processes giving rise to undershoot in the system response during the production of syllabic nuclei. Such an interpretation has implications in the formulation of theories of speech perception and in the design of machines for speech recognition.

PLASMA DIFFUSION IN A MAGNETIC FIELD, by D. R. Whitehouse and H. B. Wollman. [1962] [9]p. incl. diagrs. refs. (AFOSR-64-0324) (Sponsored jointly by [Air Force Cambridge Research Labs.], Air Force Office of Scientific Research, Office of Naval Research, and [Signal Corps] under DA 36-039-sc-78108, and Atomic Energy Commission) Unclassified

Also published in Phys. Fluids, v. 6: 1470-1478, Oct. 1963.

The 2-dimensional diffusion of a partially ionized plasma in a magnetic field is studied using the macroscopic plasma equations. For a stable steady-state plasma with uniform electron temperature and ionization frequency, it is shown that the density distribution can exist only in the lowest mode by virtue of the internal constraint that the space charge potential is conservative. While the electron and ion diffusion currents in an insulating cavity are everywhere equal, similar to Schottky's ambipolar diffusion theory for 1 dimension, the plasma in a conducting cavity exhibits an increase in the net particle current to the walls and an unbalance of ion and

electron currents in the plasma. Thus an amperian current flows through the plasma and returns through the walls. With adjustable dc potentials applied to the walls of a split cavity, these currents may be continuously varied and even decreased below those given by the ambipolar condition. An experiment with a microwave cavity discharge demonstrates the existence of these unbalanced currents. (Contractor's abstract)

The chief concern of this paper is the modeling of the functional organization of the nervous system. Results are presented in very general form, without formal definitions, theorem, or proofs. One main field of interest is the construction of models of nervous circuit whose input-output functions remains constant under shifts of threshold, such as chemical and temperature changes. Another area of research shows how to design neurological nets with one rank of any number of components each with inputs from the same number of sources, and all of the first rank playing upon a single output component. Finally, the validity of Shannon's noisy coding theorem under certain assumptions for computing networks has been demonstrated, so that error-correcting codes may be used to combat failures and malfunctions of computing components.

THEORY OF THE ANALYSIS OF NONLINEAR SYSTEMS, by M. B. Brilliant. Mar. 3, 1958, 58p. incl. diagrs. refs. (Technical rept. no. 345) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

A theory of the analysis of nonlinear systems is developed. The central problem is the mathematical representation of the dependence of the value of the output of such systems on the present and past of the input. It is shown that these systems can be considered as generalized functions, and that many mathematical methods used for the representation of functions of a real variable, particularly tables of values, polynomials, and expansions in series of orthogonal functions, can be used in generalized form for nonlinear systems. The discussion is restricted to time-invariant systems with bounded inputs. A definition of a continuous system is given, and it is shown that any continuous system can be approximately represented, with the error as small as may be required, by the methods mentioned above. Roughly described, a continuous system is one that is relatively insensitive to small changes in the input, to rapid fluctuations (high frequencies) in the input, and to the remote past of the input. A system is called analytic if it can be exactly represented by a certain formula that is a power-series generalization of the convolution integral. This formula can represent not only continuous systems but also no-memory nonlinear systems. Methods are derived for calculating, in analytic form, the results of inversion, addition, multiplication, cascade combination, and simple feedback connection of analytic systems. The resulting series is proved to be convergent under certain conditions, and bounds are derived for the radius of convergence, the output, and the error incurred by using only the first few terms. Methods are suggested for the experimental determination of analytic representations for given systems. (Contractor's abstract)

CONSTRUCTION OF CONVOLUTION CODES BY SUB-OPTIMIZATION, by M. A. Epstein. Nov. 18, 1959, 20p. incl. diagrs. table, refs. (Technical rept. no. 341) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and Signal Corps under DA 36-039-sc-78108) Unclassified

A procedure for suboptimizing the choice of convolution codes is described. It is known that random convolution codes that have been passed through a binary symmetric channel, or a binary erasure channel, have a low probability of error and are easily decoded, but no practical procedure for finding the optimum convolution code for long code lengths is known. A convolution code is defined by its generator. It is proved that by sequentially choosing the generator digits, one can obtain a code whose probability of error decreases as fast as, or faster than, the usual upper bound for a random code. Little effort is required for suboptimizing the choice of the first few generator digits. This effort increases exponentially with the choice of successive generator digits. For a rate of transmission equal to 1/2, and the given procedure, a code of length 50 is the approximate limit, with the use of presently available digital computers. (Contractor's abstract)

DIFFRACTION OF A PLANE SOUND WAVE BY A SEMI-INFINITE THIN ELASTIC PLATE, by G. L. Lamb, Jr. [1959] [7]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Jour. Acoust. Soc. Amer., v. 31: 929-935. July 1959.

The diffraction of a plane small amplitude sound wave incident upon a semi-infinite thin elastic plate is investigated theoretically. The problem is formulated in terms of an integral equation relating the discontinuity in pressure across the diffracting plate to its flexural displacement and the usual fourth order thin plate differential equation governing the flexural motion of the plate when driven by the pressure discontinuity. This pair of coupled equations is then shown to be amenable to solution by the Wiener-Hopf method. A perturbation procedure, valid in the limit of increasing plate stiffness, is employed to obtain expressions for the sound fields radiated by and transmitted through the plate as well as for the diffracted sound field. It is necessary to state abstract conditions which define the theoretical entities of phonology and restrict their mode of operation so as to allow for simple and general descriptions of the relevant facts. These conditions are discussed at length and are in effect the theory of phonology that underlies the present work. The theory is further extended to include a possible measure of simplicity for phonological description. The body of the work consists of a detailed description of the phonological system of contemporary Russian and a report on the results of acoustical measurements performed on various linguistic entities. In a number of important respects in which it departs from procedures that enjoy almost universal acceptance among contemporary phonologists, the present description follows methods that are characteristic of the work of E. Sapir, in that the relation between the phonological representation and the phonetic facts is embodied in a set of rules which must be applied in a particular order, instead of being given by a list of allophones.

CLASSIFICATION DECISIONS IN PATTERN RECOGNITION, by G. S. Sebestyen. Apr. 25, 1960, 79p. incl. diagrs. table, refs. (Technical rept. no. 381) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) AD 260232 Unclassified

The basic element in the solution of pattern-recognition is the requirement for the ability to recognize membership in classes. This report considers the automatic establishment of decision criteria for measuring membership in classes that are known only from a finite set of samples. Each sample is represented by a point in a suitable chosen, finite-dimensional vector space in which a class corresponds to a domain that contains its samples. Boundaries of the domain in the vector space can be expressed analytically with the aid of transformations that cluster samples of a class and separate classes from one another. From these geometrical notions, a generalized discriminant analysis is developed which, as the sample size goes to infinity, leads to decision-making that is consistent with the results of statistical decision theory. A number of special cases of varying complexity are worked out. These differ from one another partly in the manner in which the operation of clustering samples of a class and the separation of classes is formulated as a mathematical problem, and partly in the complexity of transformations of the vector space which is permitted during the solution of the problem. The assumptions and constraints of the theory are stated, practical considerations and some throughts on machine learning are discussed, and an illustrative example is given for the automatically learned recognition of spoken words. MEASUREMENT OF FLUCTUATIONS IN RADIATION FROM A SOURCE IN THERMAL EQUILIBRIUM, by M. Harwit. June 1960 [106]p. incl. illus. diagrs. tables, refs. (Technical rept. no. 364) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

The principal aim of this study is to measure the Bose-Einstein classical or beat frequency fluctuation in a stream of photons from a source in thermodynamic equilibrium, and thus to verify the Einstein-Fowler equation of statistical thermodynamics: $\overline{(\Delta E)^2} = kT^2 \frac{\partial E}{\partial T}$. By quantum statistical means, the fluctuation in the stream of radiation incident on a detector from a source at temperature, T, is determined. Further, the amount of cross-correlation expected for the output current of 2 detectors illuminated by this source is derived. It is shown that the measured cross-correlation depends on the source temperature and can be used as a measure of source temperature. Hanbury Brown, and Twiss's theory of the intensity interferometer, based on an electromagnetic formulation is reproduced. Their results are then compared to the quantum statistical results in the region of common applicability; the 2 theories are found to concur. It is shown that the infrared spectral region is inherently optimum for speed in intensity interferometry, but that a microwave maser system may be competitive with the best available infrared detectors. Photon fluctuation experimental results

show that the measured correlation value agrees with the value predicted by the Einstein-Fowler equation, within experimental error. The average signal-to-noise ration is 3.9. (Contractor's abstract, modified)

MIGRATION AND EFFECTS OF COPPER IN P-TYPE BISMUTH TELLURIDE, by O. P. Manley. Sept. 1, 1960, 35p. incl. illus. diagrs. tables, refs. (Technical rept. no. 376) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

The effects of copper on p-type Bi_2Te_3 were studied by examining the changes in resistivity and thermoelectric power induced in samples placed in intimate contact with copper. The experimental results were used to estimate the over-all change in the electrical transport parameters between the limits of no copper present and full compensation. Because of analytical difficulties, it was not possible to determine such changes for intermediate degrees of doping. Furthermore, the data for the regions in which the host lattice was overcompensated indicated that a chemical change was taking place; therefore, any interpretation of the experimental results in terms of simple doping did not seem plausible. The interpretation of these measurements allowed the activation energy for diffusion of Cu in the direction parallel to the cleavage planes to be measured; the results were found to be in agreement with those reported by others. NEW METHODS IN METROLOGY. TRACING OF LARGE GRATING SYSTEMS WITH THE AID OF A MECHANICAL CARRIAGE CONTROLLED BY PHOTOELECTRIC INTERFEROMETRY, by G. W. Stroke. [1960] [33]p. incl. illus. diagrs. table, refs. (Sponsored jointly by Air Force Cambridge Research Center; Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108; Army Research Office (Durham) and National Science Foundation) Unclassified

Published in Optics in Metrology; Colloq. of the Internat'l. Commission of Optics, Cambridge, Mass. (May 6-9, 1958), ed. by P. Mollet, New York, Pergamon Press, 1960, p. 38-118.

A report is made on the successful use of interferometric control techniques originated by Harrison (1949). While the most spectacular application of interferometric photoelectric servo control involves the ruling on the MIT ruling engine, of a number of 10 in gratings of unmatched quality, an important result of the efforts which led to this achievement is found in new insight into the problems of properly translating the actual motions of a mechanical carriage into representative interferometric information. This new knowledge is applied to a measurement of the velocity of light in terms of 2 primary atomic standards, for length and frequency, and to the ruling of still larger diffraction gratings. SURFACE-DOMINATED JUNCTIONS, by J. F. Campbell, Jr. [1960] [5]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Report on the Twentieth Annual Conf. on Physical Electronics, Cambridge, Mass. (Mar. 24-26, 1960), Massachusetts Inst. of Tech., Cambridge, 1960, p. 116-120.

The voltage-current characteristics of diodes has been studied. For the diode tested, 63 v is the next point below breakdown at about 70v. From here, one progresses downward in voltage so that each current is approached from 2 directions in order to bracket the final current value. The present discussion is mainly concerned with the forward part of the characteristic. One may expect a surface layer to look electrically like a very lossy transmission line, with a series resistance per unit length formed by the resistance of the channel, with a leakage conductance per unit length formed by the conductance of the virtual p-n junction between the surface layer and the bulk, and with a capacitance formed by the space-charge layer of this junction. According to transmission line theory, the conductance of such a line is higher for ac than for dc. Therefore, one might expect to differentiate between channel and bulk effects by measuring the small-signal ac conductance of the diode for forward biases. This has been accomplished and the results are shown in graphic form. A simple theory has been devised for the expected dc behavior of a forward-biased channel. It must be stressed that the model and the conclusions are highly tentative, representing a partial analysis of the data from only one diode. However, the agreement with experiment is quite good and gives a consistent picture of the diode behavior.

ANISOTROPY OF THERMOELECTRIC POWER IN BISMUTH TELLURIDE, by J. H. Dennis. Jan. 15, 1961, 52p. incl. illus. diagrs. table, refs. (Technical rept. no. 377) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Bismuth telluride (Bi_2Te_3) has a hexagonal close-packed structure and highly anisotropic electrical and thermal conductivity. However, its thermoelectric-power tensor is only anisotropic under 2 rather special conditions. It

is shown theoretically, on the basis of the transport theory for the many-valleyed model of the band structure of Bi_2Te_3, that one way in which the thermoelectric power of this material can be made anisotropic is by causing 2 scattering mechanism (lattice and impurity) to operate simultaneously in the material. Iodine-doped n-type material accordingly exhibits an anisotropy of thermoelectric power which is believed to be caused by this mixed scattering, whereas undoped p-type Bi_2Te_3 is found to have isotropic thermoelectric power for any temperature up to room temperature. The theory also predicts that the thermoelectric power can be made anisotropic if there is simultaneous conduction by holes and electrons. Thus, above room temperature, when intrinsic conduction is setting in, the thermoelectric power of undoped p-type material indeed becomes anisotropic. Single crystals of Bi_2Te_3 were grown in a crystal and thermoelectric puller, in both crystallographic directions, over a wide range of temperature. The results of these measurements were in agreement with the predictions of the theory. (Contractor's abstract)

Presented at meeting of the Electrochem. Soc., Detroit, Mich., Oct. 1-5, 1961.

Published in Jour. Electrochem. Soc., v. 109: 884-889, Oct. 1962.

Air-depolarized partially submerged electrodes were studied to determine the location of the zones of reaction and the rate-controlling steps in their operation. Reaction was found to occur primarily on that part of the surface of the electrodes covered by the electrolyte meniscus. The rate-controlling step was the diffusion of oxygen through the liquid meniscus to the electrode surface. The mass transport of oxygen as a rate-controlling step was eliminated in a specially constructed wiped, rotating, partially submerged copper electrode. This electrode was used to measure the oxidation rate of copper at room temperature for various partial pressures of oxygen. Oxidation rates were found to be great enough to support far larger current densities than are generally attainable in normal oxygen-electrode operation. The oxidation of copper was found to follow the logarithmic equation $w = k_1 \text{Log}(k_2 t + 1)$, where k_1 was independent of oxygen partial pressure, and k_2 was proportional to the square root of the oxygen partial pressure. AD 278633 Unclassified

Systems whose form is fixed but which contain a number of variable parameters are considered. The system input v(t), is a sample function from a stationary ergodic random process: corresponding to v(t) there is another ergodic random process, d(t), which represents the desired output for the system. The problem of interest is how to find the setting of the variable parameters which causes the actual system out, q(t), to resemble most closely the desired output, d(t). An iterative method of solution is the approach considered here. That is, a sequence of parameter settings is generated by selecting an initial setting and then alternately observing the system performance and altering the parameter setting. A particular iterative adjustment procedure is considered and it is proven that, for certain forms of systems and under certain reasonable conditions on the random processes, the sequence of parameter settings generated by the adjustment procedure does converge to the optimum setting in the mean square sense. AUDITORY PATTERN-PROCESSING MODEL (Abstract), by S. Inomata. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Presented at Sixty-third meeting of the Amer. Acoust. Soc., New York, May 23-26, 1962.

Published in Jour. Acoust. Soc. Amer., v. 34: 739, May 1962.

An auditory pattern-processing model has been proposed in which an input auditory signal is roughly processed initially by a bank of low-pass filters. Each filter output is fed to a probabilistic coder whose output pulse probability is a function of the average energy of the positive portion of the input signal. The circuits have 3 different modes of conversion. A special feature of the model is that the place pattern analysis is done by a process similar to that of solving a Fredholm integral equation of the first kind, in which the kernel is related to the transmission characteristics of the low-pass filters. The spectrum reconstruction or spectral sharpening that can be achieved by this process is analogous in function to the sharpening observed in neurophysiological experiments. The time-pattern analysis, on the other hand, is carried out by periodicity-detecting methods. The relation of the model to psychoacoustical and neurophysiological data is discussed, and the implications of the model with regard to the specification of optimum speech-processing devices are considered. A programming method to implement the model on a digital computer is outlined.

BEAM-PLASMA DISCHARGE (Abstract), by W. Getty, B. Hartenbaum and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 169, Feb. 28, 1963.

The beam-plasma discharge is a low-pressure microwave discharge in which the microwave power is generated within the plasma by a collective interaction between a dense electron beam and the plasma. The interaction between the beam and plasma is such that intense microwave oscillations are produced either in the neighborhood of the electron-cyclotron frequency or

of ω_p of the plasma. The oscillations are associated with large oscillatory velocities of the plasma electrons. If these velocities are large enough, the electrons will further ionize the ambient gas, thus shifting ω_p and the oscillation frequency. In the experiments, it is observed that this ionization process occurs and that ω_p increases rapidly. Experiments are described in which a pulsed 10-kev, 1-A beam was injected along the axis of a magnetic mirror into a drift region containing gas (Ar, He, H_2) at 10^{-4}–10^{-3} mm Hg. Plasmas were produced with densities greater than 10^{12} cm^3, with electron "temperatures" in excess of 1000 ev, and ion temperatures of 5–10 ev.

In collisionless plasma acceleration and sheath problems, where the potential and one of the fluxes are known, the distribution in energy of flux of the other species can be computed as a solution of Abel's equation. This technique is illustrated, and self-consistent sample solutions are given for ion and electron beams crossing a potential drop, with a concomitant-trapped electron flux. (Contractor's abstract)

Presented at Fall meeting of the Amer. Physiol. Soc., Buffalo U, N. Y., Aug. 28-31, 1962.

Published in The Physiologist, v. 6: 235, Nov. 1963.

At the cortex (AI) of the awake cat, the evoked response to an acoustic click shows an early (8 - 12 msec) surface-positive deflection, a second (22 - 29 msec) surface-positive deflection, and a later (60 - 80 msec) surface-negative deflection. The three deflections show different properties in relation to variation in stimulus parameters and variation in organismic parameters. The late deflection is labile and is absent when the electrocorticogram and the electromyogram neck muscles) indicate that the cat is not awake. In contrast the early deflection (8 - 12 msec), while less sensitive to change in organismic variables, can be manipulated by stimulus variables, in particular background noise. Thus the early and the late components can be selectively eliminated from the complex evoked response.

Presented at Sixty-third meeting of the Acoust. Soc. Amer., New York, May 23-26, 1962.

Published in Jour. Acoust. Soc. Amer., v. 34: 745, May 1962.

Consider a pulsed sinusoid of 1 10 sec duration partially masked by white noise. It is well known that the level of signal must be varied linearly with the level of the noise to maintain some constant degree of masking. That is, the degree of masking is constant if the signal-to-noise ratio is constant. A similar relationship holds for a pulsed tone masked by a continuous sinusoid of the same frequency. Suppose, in separate experiments, the level of noise and level of the continuous sinusoid are adjusted so that each has equal masking effectiveness on a signal of some given level. If now the noise and sine-wave masker are combined, how much must the level of the signal be increased in order to achieve the same level of masking effectiveness as before? Rather than

3 db or some lesser number, the increase appears to be somewhere between 6 and 9 db. Other experiments related to this phenomena are discussed.

COMIT: A LANGUAGE FOR SYMBOL MANIPULATION, by C. Bosche. [1962] [7]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in Symbolic Languages in Data Processing, Proc. of the Symposium, Rome (Italy) (Mar. 26-31, 1962), New York, Gordon and Breach, 1962, p. 113-119.

COMIT is a general-purpose symbol manipulation programming language which provides facility for pattern searches and transformations on symbolic elements held in lists. It is possible to write recursions with several COMIT rules and to represent complex structures of information in COMIT. Since there are several different logical parts to COMIT storage, information may be coded in several ways and programs of quite different types written to solve the same problem. Information may be held in constituents, order of constituents, subscripts, the dispatcher, the implicit flow of control, shelf order, etc.

A DECISION STRUCTURE FOR TEACHING MACHINES, by R. D. Smallwood. July 1962. 1v. incl. diagrs. tables, refs. (Special technical rept. no. 7) Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) AD 287647 Unclassified

The purpose of this report is to present a possible decision structure that can be used by a teaching machine. Elements which constitute the structure within which the quantitative nature of the teaching machine operates are introduced. An evaluation of the performance of 2 estimation models on a set of actual responses by students to a teaching machine program is given. Finally, a description is presented of a preliminary teaching system that was constructed to illustrate how one could use the structure and tools in a specific device.

DEPOLARIZATION OF Hg^{202} ATOMS IN THE METASTABLE 6^3P_2 STATE (Abstract), by B. B. Aubrey and L. C. Bradley, III. [1962] [1]p. (In cooperation with Yale U., New Haven, Conn.) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]; Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 259, Apr. 23, 1962.

Hg atoms were excited to the metastable $6\,^3P_2$ state by unidirectional electrons in a planar diode containing natural Hg at a pressure of a few microns. The polarization in the $^3P_2$ state of Hg^{202} was determined by measuring the absorption of the vapor for polarized λ 5461 radiation from an Hg^{198} lamp in a scanning magnetic field. The mean times between quenching and depolarizing collisions, $T_0 = (5.5 \pm 2.0) \times 10^{-5}$ sec and $T_1 = (3.2 \pm 2.0) \times 10^{-5}$ sec, respectively, were determined for Hg^{202} metastables by letting argon into the diode and by measuring the quenching and depolarization of the Hg^{202} metastables as a function of the argon pressure. The value of T_1 yields a value of $(1.3 \pm 0.8) \times 10^{-14}$ cm^2 for the cross section for depolarization of the metastables by ground-state Hg atoms.

DIFFUSION OF A FINITE CYLINDRICAL PLASMA IN A MAGNETIC FIELD (Abstract), by S. D. Rothleder and D. J. Rose. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 149, Feb. 28, 1963.

Measurements were made, with Langmuir probes of the spatial distribution of plasma density, potential, electron temperature, and current density in a steady-state, magnetically confined, finite cylindrical plasma. The plasma, of density and percentage ionization greater than 10^{13} cc and 50%, respectively, was produced by a hollow-cathode discharge plasma source located on the axis of the cylinder. The measurements were made for magnetic fields in the range 300-1100 G, and for both insulating and conducting cylindrical end plates. Significant differences were found in the radial distributions of plasma properties for the 2 cases of insulating and conducting end plates, which were directly related to corresponding changes in the current-density distribution. The experimental results can be explained in terms of a steady-state, continuum plasma theory with classical collisional diffusion.

ELECTROHYDRODYNAMIC AMPLIFICATION (Abstract), by J. R. Melcher. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78106]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Northwestern U., Evanston, Ill., June 19-21, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 414, June 19, 1962.

The dynamics of conducting jets stressed by electric fields is considered theoretically and experimentally. At sufficiently high electric fields, jets of plane and circular cross section display a convective instability, if the jet velocity exceeds the effective phase velocity of a capillary surface wave. Interactions with external electrodes such as are used to introduce and extract electrical energy from the jet are considered. If a sinusoidal signal is introduced on the plane jet, it is amplified at the expense of the steady kinetic flow energy at a rate and over a frequency range that increase with the applied field intensity. If plane parallel electrodes interact strongly with the plane jet, this increase is directly proportional to the field. The circular jet behaves roughly in the same way, except that there may be a lower and an upper cutoff frequency that depend on the circular mode excited. A circular-jet experiment showed an upper cutoff frequency that agreed with the theory. The frequency range was 0-500 cps. The input capacitance is less than 10^{-12} F with a resistance limited by the insulation used.

FOURIER COEFFICIENTS OF POWER-LAW DEVICES, by P. Penfield, Jr. [1962] [16]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and Ford Foundation) Unclassified

Published in Jour. Franklin Inst., v. 273: 107-122, Feb. 1962.

A definite integral often used in evaluating Fourier coefficients of power-law devices under sinusoidal excitation is:

$\frac{1}{2\pi}\int_0^{2\pi}(1+\epsilon\cos\omega t)^{\alpha}\cos n\omega t\,d(\omega t)$ where α is an exponent characteristic of the device, and ϵ is an amplitude factor. In many practical cases, this integral can be evaluated in closed form, and when it cannot, there is a rapidly converging series representation. This representation can be used to derive differentiation formulas and recursion relations, and is also ideally suited for numerical calculations. This representation is discussed; differentiation and recursion relations are given; and several of the closed-form solutions are listed. (Contractor's abstract, modified)

FREQUENCY AND TEMPERATURE DEPENDENCE OF ULTRASONIC ATTENUATION IN LIQUID HELIUM BELOW 1°K (Abstract), by W. A. Jeffers, Jr. and

W. H. Whitney. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 472, Aug. 27, 1962.

The coefficient of absorption of sound in liquid helium has been measured at frequencies of 2.02, 3.91, 6.08, and 10.22 mc/sec at temperatures down to 0.2°K. Below 0.6°K, the attenuation varies approximately as $\omega^{1.5}T^3$. If the data are normalized to measurements of the absolute attenuation above 1°K, the attenuation below approximately 0.3°K appears to fall to zero more rapidly than T^3, in apparent agreement with the results of earlier experiments. However, if small corrections, consistent with the uncertainties in temperature measurement above 1°K, are made to the normalization constants, this change in temperature dependence can be made to disappear. It seems probable that the attenuation coefficient varies as $\omega^{1.5}T^3$ from 0.6°K down to the lowest temperatures reached. Above 0.6°K, the curves at the lower frequencies rise more rapidly than T^3 up to the peak of the absorption curve.

FUNCTIONAL ANALYSIS APPLIED TO NONLINEAR FEEDBACK SYSTEMS, by G. Zames. [1962] [13]p. incl. diagrs. refs. (In cooperation with Harvard U., Cambridge, Mass.) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and Office of Naval Research under Nonr-186616) Unclassified

Published in I. E. E. E. Trans. on Circuit Theory, v. CT-10: 392-404, Sept. 1963.

An operator theory is outlined for the general, nonlinear, feedback loop. Methods for bounding system responses and investigating stability are introduced. An iterative expansion of the feedback loop, valid for large nonlinearities and unstable systems, is derived. The theory is applied to the study of nonlinear distortion in a class of amplifiers; it is shown that feedback reduces distortion for band-limited inputs. A model of stable distortion is obtained and an iteration with optimized rate of convergence, is derived. (Contractor's abstract)

A FUNDAMENTAL COMPLEMENTARY PRINCIPLE FOR INDUCTIVE LOGIC, by M. C. Goodall. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Nature, v. 194: 998, June 9, 1962.

A is to be taken as an interrogation (or selective punctuation) of U, the response S of which is a string leading from A to a true sentence $\bar{S}$ in some L. A formalism may be set up in which $L(S, \bar{S})$ plays the part of a Lagrangian function. The formalism is analogous to the many-particle theory because $L(S, \bar{S})$ must always contain the results of indefinitely many other punctuations. The principal interest of this formalism is that it is appropriate to investigating the relation between an evolutionary system such as O and its environment U.

GENERATION OF A HOT, DENSE PLASMA BY A COLLECTIVE BEAM-PLASMA INTERACTION, by L. D. Smullin and W. D. Getty. [1962] [4]p. incl. illus. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Published in Phys. Rev. Ltrs., v. 9: 3-6, July 1, 1962.

A pulsed 10 kev 1A electron beam is projected into a drift region and confined by an axial magnetic field of 200-1000 gauss. The various quantities observed are the instantaneous currents to the wall, anode and collector; the response of a photomultiplier pointed at the path of the beam; the video output of a tuneable microwave receiver and x radiation. It is shown that the collector current reaches a peak and remains constant for the first 1.5 μ sec of a pulse and then breaks up, the missing current appearing as wall current. Sometime after this break strong oscillations are detected, from the frequency of which the electron density is computed.

INTERACTION OF A DIRECTED PLASMA WITH A MAGNETIC MIRROR (Abstract), by L. M. Lidsky and D. J. Rose. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 162, Feb. 28, 1963.

The interaction between a directed plasma and a "magnetic barrier" was investigated using a stationary plasma column and a moving magnetic field. This scheme has the advantage that the plasma properties are better known. The plasma (He or Ar), supplied by a modified hollow-cathode source, had density of up to $10^{13}/cm^3$ and was 75%-95% ionized. The magnetic field, generated by a pulsed, capacitively loaded helical line, had a translational velocity 1.5×10^7 cm/μ sec with peak field 4000 G. Titanate ceramic formed the dielectric element. A correction for the important but often overlooked effect of inductive coupling was derived. The experiments showed no evidence of ion reflection from the moving barrier. A large number of high-energy (> 200 ev) electrons was generated during passage of the pulse. These are attributed to nonadiabatic reversed-field heating of electrons trapped in a positive space-charge-potential region at the position of the field peak.

INTERFEROMETRIC METHOD OF VELOCITY OF LIGHT MEASUREMENT, by G. W. Stroke. [1962] [6]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and [Signal Corps] under [DA 36-039-sc-78108]) Unclassified

Published in Appl. Opt., v. 2: 481-486, May 1963.

An association of interferometric methods in the 3.2-cm microwave and visible-light optical domains is now being used for the measurement of the velocity of light in terms of primary atomic constants, an atomic clock for the frequency and a light source (Hg 198, Kr 86, optical maser) for the length. The microwave interferometry is carried out by hydraulically and continuously moving a piston in a perfect silver-plated, optically polished, fused-quartz, cylindrical resonant cavity. The optical and mechanical systems involve several novel features extending the interferometric servo-control method using photoelectric detection successfully applied to the ruling of high-resolution gratings. With precisions as good or better than those obtained in any previous measurement of c, an increase in accuracy by 1 to 3 orders of magnitude results from the use of primary standards for the frequency and length rather than the unreliable secondary standards used heretofore. This fact applies to other velocity-of-light measurements as well and should help in reducing the rather disturbing dispersion in the values of c, which heretofore considerably exceeded the precisions obtained in the measurements. Part I published in Advanced Energy Conversion, v. 3: 245-253, 1963.

Part II published in Advanced Energy Conversion, v. 2: 467-479, 1962. (AFOSR-J1119; AD 403611)

In Part I, experiments have been conducted to study ionization quantitatively for a low Cs concentration. Electrons were accelerated from heated surfaces E2 and E3 bombard E1. Ions produced at or near E1 were then accelerated toward the ion collector to serve as a measure of the ion production. Results of this experiment indicate that no appreciable ion current was produced in Cs vapor controlled by a $T_{Cs} = 350°K$, by electrons having an energy less than 3.89 volts. The square root of the ion-to-electron current ratio was a linear function of the surface electron energy in excess of the ionization potential. Although not accurately determined, the ionization coefficient is given by $P_i = P_1 (V-V_1)$ with $P_1 = 20\ cm^{-1}v^{-1}$ for the standard conditions of 3.54×10^{16} atoms/cm^3. In Part II, the energy distribution of electrons is studied. For refractory emitters, such as W, Ta, and Mo, operated in an energy-conversion diode, the ratio of the emitter temperature to the Cs temperature strongly influences the operating properties. If this ratio exceeds 3.2, an ion-rich sheath usually forms at the emitter surface; electrons are accelerated in the plasma space by this injection potential. An analysis shows that at the open-circuit condition, the energy distribution of the electrons at the plasma edge of the emitter sheath cannot be a true Maxwellian over the entire range in electron energy; instead, it is thought to be made up of 2 quasi-Maxwellians. The low energy electrons are trapped and may have a high average energy close to that of the injection potential. The untrapped electrons will have a. electron temperature equal to that of the emitter and their density will be that associated with an apparent or ficticious density many times that of the actual density. A theory has been developed to describe quantitatively the relations that must be satisfied for the description above to apply. It is concluded that if the emitter-to-Cs temperature ratio exceeds 3.6, volume ionization is not required for a stable sheath. In the range 3.2-3.6, surface ionization is usually insufficient, and it is necessary to have volume ionization to sustain the sheath. (Contractor's abstract, modified)

A KINETIC STUDY OF GLUTAMIC-ASPARTIC TRANSAMINASE, by G. G. Hammes and P. Fasella. [1962] [7]p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Institutes of Health)
Unclassified

Published in Jour. Amer. Chem. Soc., v. 84: 4644-4650, Dec. 20, 1962.

Kinetic studies of glutamic-aspartic transaminase have been made at high enzyme concentrations (10^{-5} M) using the temperature jump method. The observed relaxation times ranged from less than 50 μsec to about 20 msec. The minimal mechanism consistent with spectral and kinetic data is $E_L + As = X_1 = X_2 = E_M + Oa$ (1) $E_M + Kg = Y_2 = Y_1 = E_L + Gm$ (2). Here E_L is the aldehydic form of the enzyme, E_M is the aminic form, Gm, Kg, Oa and As are the substrates glutamate, ketoglutarate, oxalacetate and aspartate, respectively, and the X's and Y's are enzyme-substrate intermediates. Individual rate constants or lower bounds thereof were obtained for all of the steps: in addition approximate spectra were found for the intermediates which are consistent with their being Schiff bases. The binding constants for Schiff base formation are quite high—10^3 to $10^5\ M^{-1}$ depending on the specific substrate. The measured bimolecular rate constants for the interconversion of intermediates are between 10 and $10^2\ sec^{-1}$. These results are also in accord with stopped-flow and equilibrium dialysis experiments. (Contractor's abstract)

KINETIC THEORY OF PLASMA AND ELECTROMAGNETIC FIELD (Abstract), by T. H. Dupree. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v.8: 151, Feb. 28, 1963.

By generalizing a method due to Klimontovich, it has been possible to derive a closed set of equations for plasma and electromagnetic fields. These equations determine the particle distribution functions and ensemble-averaged fields as well as a complete set of correlation functions involving particle and field fluctuations. The equations are not limited to steady-state or uniform plasmas. It is shown that, in general, a correlation exists between all field components even though there is no direct interaction between fields. Solutions for all correlation functions have been obtained and are valid for small departures from the steady state. These correlation functions have been used to obtain formulas for electromagnetic energy density, incoherent scattering, and a generalized collision integral.

LISP 1.5 PROGRAMMER'S MANUAL, by J. McCarthy, P. W. Abrahams and others. Aug. 17, 1962, 99p. incl. diagrs. tables. (Sponsored jointly by Air Force Office

of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, National Institutes of Health, and National Science Foundation) AD 406138 Unclassified

The LISP language is designed primarily for symbolic data processing. It has been used for symbolic calculations in differential and integral calculus, electrical circuit theory, mathematical logic, game playing, and other fields of artificial intelligence. LISP is a formal mathematical language; it is therefore possible to give a concise yet complete description of it. Such is the purpose of the first section of the manual. Other sections describe ways of using LISP to advantage and explain extensions of the language which make it a convenient programming system.

THE LOGICAL BASIS OF LINGUISTIC THEORY, by N. Chomsky. [1962] [95]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and National Science Foundation) Unclassified

Published in Proc. Ninth Internat'l. Cong. of Linguists, Cambridge, Mass. (Aug. 27-31, 1962), ed. by H. G. Lunt. The Hague (Netherlands), Mouton and Co., 1964, p. 914-1008.

In this paper the term linguistic theory is restricted to systems of hypotheses concerning the general features of human language put forth in an attempt to account for a certain range of linguistic phenomena. Various levels of success may be attained by a grammatical description associated with a particular linguistic theory. The lowest level of success is achieved if the grammar presents the observed primary data correctly. A second and higher level of success is achieved when the grammar gives a correct account of the linguistic intuition of the native speaker, and specifies the observed data in terms of significant generalizations that express underlying regularities in the language. A third and still higher level of success is achieved when the associated linguistic theory provides a general basis for selecting a grammar that achieves the second level of success. In this case, we can say that the linguistic theory in question suggests an explanation for the linguistic intuition of the native speaker. Roughly stated these levels may be referred to as observational, descriptive, and explanatory adequacies. Several examples are given of how a higher level of adequacy might be achieved by linguistic theory in the domains of phonology and syntax. A concern with perception and acquisition of language has played a significant role in determining the course of development of linguistic theory. This report tries to show that the basic point of view regarding both perception and acquisition has been much too particularistic and concrete. It has failed totally to come to grips with the creative aspect of language use, that is the ability to form and understand previously unheard sentences.

LOSS IN INFORMATION TRANSMISSION THROUGH TWO-WAY CHANNELS, by F. Jelinek. [1962] [35]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in Inform. and Control, v. 6: 337-371, Dec. 1963.

A discrete 2-way channel related to the pioneering work of C. E. Shannon (see item no. 1493, Vol. IV) and further developed by R. M. Fano (see item no. 1427, Vol. IV) is considered. Certain restrictions are put on the probability. The terminals are connected to finite-memory stationary signal sources. These signal sources generate channel inputs depending on sequences of past outputs and inputs. Expressions for average information transmission rates in the left-to-right and right-to-left directions can be developed and their sum will be a simple information measure. When mutually independent messages are to be transmitted in opposite directions through the channel, it is desirable that they be encoded into sequences of strategy functions which, together with the received signals, constitute inputs to a transducer whose outputs are the channel input signals. The message source encoder-transducer combinations are stochastically equivalent to signal sources whose outputs are governed by appropriate probabilities. We can interpret the transducer-channel combination as a derived 2-way channel whose inputs are the strategy functions and whose outputs are the outputs of the underlying channel. Expressions for the information transmission rate through the 2 directions of the derived channel are developed and are compared to the expressions for the average information about outputs of the equivalent signal sources, transmitted through the underlying 2-way channel. The values of the former expressions are found to be less than or equal to the values of the latter, the difference constituting a 'coding information loss'. A condition on the transmission probabilities permits a class of lossless channels to be defined. Similarly, another class is defined having the property that, regardless of the strategy code used, the information transmitted through the derived channel will be strictly less than the information transmitted through the underlying channel. The consequences of the above results on the random selection of message codes are discussed. It is shown that one can obtain the number of variables to be optimized when best random codes for lossy channels are desired, by using the number of variables for lossless channels as an exponent to the product of the size of the input and output signal alphabets. For the lossy channel class a simplified encoding procedure must in practice be applied, but as can be demonstrated, it will not yield optimal codes. (Math. Rev. abstract)

THE MAGNETOHYDRODYNAMIC FLOW PAST A NONCONDUCTING FLAT PLATE IN THE PRESENCE OF A TRANSVERSE MAGNETIC FIELD, by D. M. Dix. Doctoral thesis, July 9, 1962, 128p. incl. diagrs. tables. refs. (Technical rept. no. 397) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108; Dept. of the Army, and National Science Foundation)
AD 278682 Unclassified

Also published in Jour. Fluid Mech., v. 15: 449-476, Mar. 1963.

The general character of the magnetohydrodynamic flow past a non-conducting flat plate in the presence of transverse magnetic fields is analyzed in some detail. The appropriate extension of the Rayleigh problem to the magnetohydrodynamic case is shown to yield solutions which correctly predict some features of the steady flow past a semi-infinite flat plate; in addition, it is shown that the knowlege of these significant features permits an easy evaluation of their magnitudes in other extensions of the Rayleigh problem. The flow past a semi-infinite flat plate is analyzed by 2 methods. First, by linearizing the governing equations and incorporating the assumption of a low ratio of viscous to magnetic diffusivity, the results for skin friction and the normal component of magnetic field at the plate are obtained, and are shown to be useful in interpreting the character of these low conductivity flows. Secondly, the complete set of governing equations is formulated as a finite difference problem and solved numerically on a digital computer. The results obtained, in addition to demonstrating feasibility of the numerical calculations, show that the disturbance produced by the plate is no longer confined to a thin viscous layer if the ratio of viscous to magnetic diffusivity is greater than 10^{-2}, but that an appreciable Alfvén type disturbance is excited. Current engineering practice for achieving a low bit error probability in a binary transmission system is to utilize pulses with a duration sufficient to insure the required receiver-signal selection. This practice is identical to obtaining a reliable pulse by repeating each information bit a fixed number of times. Although optimum for the transmission of a single information bit, such repetition is inefficient for the transmission of a sequence of bits. The selection of more efficient signals is called coding. The reception of coded signals is conveniently considered as 2 steps, detection and decoding, the first largely analog and the second largely digital. For each pulse input, the detector produces an output number quantized into Q levels. After obtaining the detector output for a block of symbols, the decoder makes the final decision as to the transmitted binary sequence. In this paper, consideration is given to the improvement in rate and signal-to-noise ratio offered by coding and decoding for 3 values of detector quantization. Q = 2 (binary detection) Q = 3 (ternary or null-zone detection), and Q = ∞ (continuous or unquantized detection). A qualitative insight is then provided into convolutional encoding and sequential decoding as one means, adaptable to any value of Q, for realizing these gains.

MICROWAVE EMISSION AND ABSORPTION AT CYCLOTRON HARMONICS OF A WARM PLASMA, by G. Bekefi, J. D. Coccoli and others. [1962] [4]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78106], and Atomic Energy Commission)
Unclassified

Published in Phys. Rev. Ltrs., v. 9: 6-9, July 1, 1962.

Measurements on microwave emission and absorption are presented where the plasma frequency is of the order of, or greater than, the microwave radian frequency. The measured magnitudes and spectra of the emitted and absorbed radiation were found to differ greatly from those predicted theoretically. The magnitudes of the emission and absorption lines of the electron cyclotron harmonics were several orders of magnitude greater than those calculated for a warm plasma with a Maxwellian distribution of electron velocities.

Also, the line shapes were not Lorentzian. These phenomena were observed in weakly and highly ionized plasmas of low and intermediate gas pressures.

Published in Phys. Rev., v. 129: 506-515, Jan. 5, 1963.

Microwave measurements of the radiation from a weakly ionized low-energy plasma immersed in a magnetic field show significant departures from the Kirchhoff-Planck law. The departures can be explained by taking account of the non-Maxwellian distribution of the radiating electrons. By comparing the measured and calculated radiation temperatures we estimate the distribution of electron velocities and their mean energy.

MINIMALLY REDUNDANT RELIABLE COMPUTING SYTEMS DESIGN (Abstract), by S. Winograd and J. D. Cowan. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108) Unclassified

Published in Redundancy Techniques for Computing Systems, Proc. of the Symposium, Washington, D. C. (Feb. 6-7, 1962), ed. by R. H. Wilcox and W. C. Mann. Washington, Spartan Books, 1962, p. 377.

It can be demonstrated that redundant computers that achieve arbitrarily low frequencies of error (apart from errors in the final outputs), may be constructed, so that they are not completely redundant, but process a finite fraction of information. This depends critically upon the error behavior of components as a function of complexity. If component errors increase with complexity, the above reliability may be obtained only by decreasing the fraction of information processed in the computer. However, it appears likely that for given hardware and codes, this fraction can be maximized. A further result of interest, is that such computers need not be precisely connected and in fact a certain bounded fraction of errors in connection may be tolerated.

MOHAWK PREFIX GENERATION, by P. M. Postal. [1962] [12]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and National Science Foundation) Unclassified

Published in Proc. Ninth Internat'l. Cong. of Linguists, Cambridge, Mass. (Aug. 27-31, 1962), ed. by H. G. Lunt. The Hague (Netherlands), Mouton and Co., 1964 p. 346-357.

Modern descriptive studies of Northern Iroquoian, like similar grammatical studies of other languages, have centered attention on what is called segmentive analyses of sentences and their parts. The aim of the present paper is to show that an adequate description of Mohawk sentences is incompatible with this kind of analysis, since a valid theory of Mohawk sentences requires a much more abstract conception of linguistic structure which includes constituents only indirectly related to phonetics and the notion of ormal relations between sentence structures. The primary interest is in the pronominal prefixes of Mohawk verbs.

A NEW CANONIC REALIZATION PROCEDURE, by H. B. Lee. [1962] [5]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in I. E. E. E. Trans. on Circuit Theory, v. CT-10: 81-85, Mar. 1963.

A dual pair of new canonic cycles are presented. Each cycle develops an initial LC impedance into a nonsymmetrical lattice, terminated in a simpler LC impedance. The remainder impedance always has the same zero and infinite frequency behavior as the initial impedance but involves 4 fewer coefficients. The most complicated mathematical operation which must be performed to

execute either cycle is the factorization o. a second-degree polynomial. Both cycles are easily extended to the RC and RL cases. (Contractor's abstract)

NUCLEAR ISOMER SHIFT IN THE OPTICAL SPECTRUM OF Hg^{195}: INTERPRETATION OF THE ODD-EVEN STAGGERING EFFECT IN ISOTOPE SHIFT, by W. J. Tomlinson, III, and H. H. Stroke. [1962] [3]p. incl. diagrs. table. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], and Atomic Energy Commission) Unclassified

Published in Phys. Rev. Ltrs., v. 8: 436-438, June 1, 1962.

For transitions involving electrons which penetrate the nucleus, the spectral lines are sensitive to the variations of the nuclear charge distribution arising from changes in neutron number. Data on the Hg isotope shifts of the 2537A line are collected and analysed. It is concluded that a possible basis for the odd-even staggering effect is that the odd neutron may go into a lower angular momentum orbit than the neutron pair and that in this orbit it is less effective in producing distortions.

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 300, Apr. 23, 1962.

An optical spectroscopic study has been made of Hg^{195} (9.5 hr), Hg^{195*} (40 hr) and Hg^{194} (~ 130d) using a 10-i.. grating in a 36-ft focal-length mirror monochromator. The isotopes were produced by $Au(p, xn)Hg^{198-x}$ reactions with 30-mev protons at the Harvard cyclotron. Spins of 13/2 and 1/2 for Hg^{195*} and Hg^{195}, respectively, are consistent with our data, whereas the previously suggested spin $I(Hg^{195}) = 3/2$ disagrees with our findings. With these values for the spins, the following moments were obtained from the measured hfs intervals: $u(Hg^{195}) = +0.53 \pm 0.05$ nm, $u(Hg^{195*}) = -1.05 \pm 0.05$ nm, $Q(Hg^{195*}) = (1.4 \pm 1.2) \times 10^{-24}$ cm^2. The signs of the quadrupole interaction constants are the same in Hg^{195*} and Hg^{201}. The isotope-shift measurements show an extension of the range of regularity in the shifts of the even-neutron isotopes to Hg^{194}, and provide further data for the study of odd-even staggering effects.

NUCLEAR ORIENTATION AND MAGNETIC MOMENT OF Hg^{197} (Abstract), by W. T. Walter. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 295, Apr. 23, 1962.

Optical pumping was used to orient both $I = \frac{1}{2}$ nuclei Hg^{197} and Hg^{199} in the ground state. An Hg^{202} lamp inside the air gap of a Bitter solenoid produced the circularly polarized pumping light. This variable-frequency light source is tuned by means of Zeeman shifting to pump either isotope. A single quartz cell was filled with stable isotope Hg^{199} and the 65-hr radio isotope Hg^{197}, and was placed in a homogeneous Helmholtz-field. Nuclear magnetic resonance in the oriented vapor of each isotope was optically detected in light scattered from the cell. Radio frequency 0.2-cps modulation and lock-in detection were employed. Resonances 25 cps wide were observed at 933 and 859 kc. The measured ratio was $u_{197}/u_{199} = 1.042479 (\pm 15)$. Comparison with the ratio of Stager's values of the interaction constants for the $^3P_1$ state, $A_{197}/A_{199} = 1.043284 (\pm 1)$, indicates a hyperfine-structure anomaly of 0.772 (± 14) parts in 1000. Using the Cagnac Hg^{199} result, $\nu_{197}/\nu_H = 0.185843^4 (\pm 30)$ and $u_{197} = 0.519014 (\pm 14)\mu_N$ without diamagnetic correction, is obtained.

ON THE LEARNING OF SPEECHLIKE VOCABULARIES, by A. S. House, K. N. Stevens and others. [1962] [11]p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and National Science Foundation) Unclassified

Published in Jour. Verbal Learning and Verbal Behavior, v. 1: 133-143, Sept. 1962.

A series of experiments dealing with the learning of ensembles of speechlike acoustic stimuli was performed. The stimulus ensembles differed with respect to the number of physical dimensions that were manipulated in generating the stimuli, and with respect to the extent to which the stimuli resembled speech. Results show that performance during learning is better when each stimulus is encoded into several physical dimensions than when the stimuli lie along a unidimensional continuum. Furthermore, as the stimuli become more like speech there is a deterioration of performance during learning, with the exception that performance is best when the stimuli are actually speech signals. Implications for theories of speech perception are discussed.

Published in Ann. New York Acad. Sci., v. 98: 788-805, Oct. 30, 1962.

A model for the eclosion rhythm of Drosophila is proposed as a step in the consideration of more refined schemes of this example of biological clocks. It is similar in principle to the coupled-oscillator model of Pittendrigh and Bruce, in that it includes a primary oscillating system that is influenced greatly by light, but only slightly by temperature. The latter is postulated to have its major effect on a phase-comparator, the output of which in turn times the observed biological phenomenon. Effects of single light signals, temperature steps, and of combined light and temperature entrainment are illustrated with electronic mock-up or simulation experiments, and these are compared with the corresponding experimental data for Drosophila.

THE PHYSICAL MEANING OF COMPACTNESS, by H. B. Lee. [1962] [7]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Published in I. E. E. E. Trans. on Circuit Theory, v. CT-10: 255-261, June 1963.

A lossless twoport N, whose impedances z_{11}, z_{12}, and z_{22} possess poles at the complex frequencies $s = \pm j\omega_p$, is considered. It is shown that the algebraic alternatives of compactness, or lack of compactness, for the z_{ij} at $s = \pm j\omega_p$ correspond directly to the physical alternatives of whether or not a pair of N's natural oscillations at the frequency $\omega = \omega_p$ are scaled replicas of one another throughout N. A secondary result of the paper is called the energy theorem. This theorem assumes that the natural oscillations of a lossless oneport have been excited by a unit impulse of current, and states that each impedance residue of the oneport is proportional to the energy stored in the corresponding one of these oscillations. Published in Psychology: A Study of a Science, Volume 4. Biologically Oriented Fields: Their Place in Psychology and in Biological Science, ed. by S. Koch, New York, McGraw-Hill, 1962, p. 334-379.

The important aspects of neural functioning seem to be represented by more or less complicated spatiotemporal patterns of neuroelectric activity and are not merely given by absolute values of electrical changes as a function of time. This concept of neuroelectric spatiotemporal patterning is designated by the abbreviation NSTP. The notion of a patterning of neural events that occur at one or more places in the nervous system and that typically have different temporal characteristics is by no means a novel one; similar ideas have been expressed by others. Nevertheless, this viewpoint is recapitulated in this paper since too many accounts of nervous-system functioning fail to deal with neural patterns. This emphasis upon the relational aspects of stimulus and of response variables is both conceptually and pragmatically useful, since it provides one with a strategic orientation in the task of ordering and relating the innumerable data that can be recorded from the nervous system. NSTP may prove to be an indispensable element in the formulation of neural correlates of behavioral events.

RECENT DEVELOPMENT IN OPTICAL CHARACTER RECOGNITION AT M.I.T., by L. G. Roberts. [1962] [4]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and National Institutes of Health) Unclassified

Published in Optical Character Recognition; Proc. of the Symposium, Washington, D. C. (Jan. 15-17, 1962), ed. by G. L. Fischer, Jr., D. K. Pollock and others. Washington, McGregor and Werner, 1962, p. 209-212.

Progress has been made in characterizing handwritten strokes and applying this to the handwriting recognition problem. It has been found that only 18 strokes are used to construct all of the English characters. These strokes can be generated and joined together by simple rules in a computer so as to write any word. By finding the ranges of the stroke parameters for an individual,

the computer can forge his handwriting. A set of simple tests has been developed on the strokes in a word which enables a computer to pick likely words from a dictionary. Presently these tests are to count the closed loops, the tails above and below the small letters, and the axis crossings at the center of the word. Plans for future work are presented.

The rate constants for the formation and dissociation of Ni(II) and Co(II) complexes with 1, 2, and 3 glycine, diglycine, or imidazole molecules have been determined by the temperature-jump technique. The approximate time scale of the reactions studied ranged from 0.1 to 500 msec. The rate constant of dissociation obtained by normalizing with respect to electrostatic and steric factors is characteristic of a given metal ion, and was generally 20 to 25 times greater for Co(II) than for Ni(II). The difference in the corresponding activation energies is predictable on the basis of crystal-field theories. Gylcine is bound to the metal via the negatively charged carboxyl group, hence the normalized rate constants increase in reactions involving the higher complexes, independently of the number of ligands bound if the bonding takes place via unchanged groups.

Published in Jour. Chem. Phys., v. 38: 287-290, Jan. 15, 1963.

Self-diffusion in liquid methane, under its own vapor pressure, has been studied between the triple point and the normal boiling point by means of the spin-echo technique. The activation energy for self-diffusion is approximately 0.67 kcal/mol. These results are compared with the constant-pressure tracer results of Naghizadeh and Rice (item no. 505, Vol. V), which show somewhat higher (~ 15%) self-diffusion coefficients and an activation energy of approximately 0.83 kcal/mol. The temperature dependence of self-diffusion in liquid methane appears to be comparable on the basis of a classical reduction to corresponding states, by means of critical constants, to that in liquid Ar, Kr, and Xe. Measurements of the proton spin-lattice relaxation time in our sample indicate that the relaxation is predominantly contr ed by the mutual diffusion of the hydrocarbon and t l amounts of dissolved oxygen. SOME PROBLEMS IN NONLINEAR THEORY, by M. Schetzen. July 6, 1962, 53p. incl. diagrs. refs. (Technical rept. no. 390) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108)
AD 278691 Unclassified

The first problem considered is the extension of the Wiener theory of nonlinear systems to include non-Gaussian inputs and error criteria other than the mean-square-error criterion. The second problem is the development of a procedure for the experimental determination of higher-order correlation functions without the use of delay lines. An application of this procedure is made to the synthesis N'th-order Gaussian processes. These processes have the property that their first N joint moments are those of a Gaussian process. The third problem is that of nonlinearly coupled oscillators. For this problem, a statistical model is proposed for a class of oscillators that are not phase-locked. Calculations based on this model demonstrate the effect of second-order nonlinearities upon the spectrum of the coupled oscillators. The fourth problem is that of locating noise sources in space by crosscorrelation techniques. For this problem, expressions are derived for the ambiguity in locating a target as a function of the time of observation when using this crosscorrelation technique with a given configuration of N antennas. Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 553, Nov. 23, 1962.

The frequency stability of 2 He-Ne masers under quiet acoustical and thermal conditions has been examined. A beat frequency was obtained between the 2 masers with short-term frequency width less than 100 cps corresponding to a frequency fluctuation smaller than 3×10^{-13} over a period of about 4 sec. This represents 2×10^{-11} cm change of length of our 60-cm masers. Under good conditions, the average frequency drift due to thermal fluctuations varied less than 50 cps during 1 sec. Similarly, the average frequency drift over periods as long as a few minutes was also small. This is considerably better than that reported previously, but greater than fundamental thermal fluctuations by about one order of magnitude; hence, further refinement can be expected. The frequency resettability was obtained repeatedly better than 1×10^{-9}. These results demonstrate the applicability of optical masers to detecting very small changes in length or position or to standards of length. These activities were carried out in an acoustically isolated vault at MIT Round Hill with particular geological location leading to a high degree of isolation from man-made microphonic disturbances.

Presented at Spring meeting of the Biometric Soc., Chapel Hill, N. C., Apr. 12-14, 1962.

Published in Biometrics, v. 18: 421, Sept. 1962.

In recent years, the application to biological problems of mathematical techniques of analysis has had a very rapid growth that has been greatly facilitated by the availability of automatic computers. An example is the use of autocorrelation and crosscorrelation analysis in the study of electroencephalograms. In the present report, another example is given; some results from a quantitative study of the nature of the control of eye movements in man. Simultaneous recordings onto magnetic tape were made of: (1) position of the eyes with respect to the head; (2) orientation of the head in space; and (3) position of an object for visual tracking. Analyses of the recordings were made by means of a special-purpose analog computer designed for correlation analysis. Comparison of the results for a normal subject with those for a patient who had a nonfunctioning labyrinth or vestibular apparatus indicates that the muscle and joint sense provide a considerable degree of stabilization of the eye movements when the head is moved actively or passively with respect to the neck. It is apparent, accordingly, that the vestibular apparatus does not have an essential part in the stabilization of eye movements when the head is moved with respect to the body, if the latter remains stationary.

Published in Engineering Aspects of Magnetohydrodynamics; Proc. of the Third Symposium, Rochester, N. Y. (Mar. 28-29, 1962), New York, Gordon and Breach, 1964, p. 362-379.

The parameters of a simplified equivalent circuit are derived and, in terms of these parameters, the conditions for self-excitation are given. An experiment is described which shows that the circuit parameters may be obtained approximately from measurements in the sinusoidal steady state on a stationary geometry, and that the values obtained allow a fairly accurate prediction of the actual generator behavior. This allows the circuit parameters to be related to the magnetic Reynolds number, R_m, of the gas flow and to the generator geometry, and allows the determination of a minimum R_m for self-excitation and of the efficiency of the generator.

THERMAL AND MATERIAL PROBLEMS IN A CONTROLLED FUSION BLANKET (Abstract), by W. G. Homeyer, A. J. Impink and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], MIT Computation Center and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 157, Feb. 28, 1963.

Nuclear heating in thermonuclear-blanket structures has been calculated by the neutronics code for the systems described in a previous paper. Relative heat deposition in the standard configuration was 19.8% in the vacuum wall, 22.5% in the wall coolant, 55% in the primary attenuator, 2.7% in the coil shield, and 0.003% in the coils. In vacuum walls of 1- and 3-cm Mo, 12.5% and 26%, respectively, were deposited. Other modifications had little effect. Total heating was 17.9 mev per D-T neutron. Tritium recovery at low concentration appears easy. It is unlikely that less than 110 cm of blanket can adequately shield superconducting coils while breeding tritium. Blanket thicknesses and other considerations dictate a large cylindrical system (2 m vacuum wall diam, 1000 mw thermal or more) with deposited heat flux in the order of 1.5 mw/m^2 on the vacuum wall. Thermal stress and heat transfer would be limiting at a few times this value; hence, an economic pulsed system would be much more difficult.

It is shown that circuits can be so designed that the input-output function is correct, although the threshold, strength of stimuli and even the connectivity may be in error so much that each individual formal neuron would make mistakes. Only nets designed to have n input lines that feed signals to n input neurons that, in turn, feed signal to a single output neuron are considered. The function computed by the net is represented by an input-output table. The fractional error, E, is defined as the ratio of dashes to the total number of places in an output column. If all inputs to a neuron are equally frequent, E is the fraction of times that a neuron might be in error, E_1 is the fractional error of the input neuron with the least number of dashes, and E_2 is the fractional error of the output neuron with the least number of dashes. The maximum values of E_1 and E_2 are computed for a net with error-free output. It is shown that $E_1 \approx 1 - \frac{1}{\sqrt{n}}$ and $E_2 \approx 1 - 2\sqrt{n}\,2^{-\sqrt{n}}$ where n is the number of neurons in rank 1.

TRITIUM REGENERATION IN A CONTROLLED FUSION BLANKET (Abstract), by A. J. Impink, W. G. Homeyer and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108], MIT Computation Center, and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 157, Feb. 28, 1963.

Calculations were made for the neutron-absorbing and

tritium-regenerating blanket for a steady-state D-T reactor. A 50-energy-group 5-spatial-region code was developed to treat neutron reactions in the entire range from 14 mev downward; integral transport S_n and diffusion-theory methods were used to approximate neutron transport in slab and cylindrical configurations. The blanket regions are, in order from the plasma: (1) vacuum wall (1, 2, or 3 cm Mo, or 1 cm Ni); (2) wall coolant (6.25 cm fused salt-Li_2BeF_4 of natural 20% or 50% Li^6; or $LiNO_2$); (3) primary attenuator (56 cm, 25% C, 75% fused salt as above, with or without added Be or BeO); (4) coil shield (30 cm Pb plus borated H_2O, 20 cm LiH, and 6 cm Pb); (5) superconducting coils (10 cm Mo nuclear equivalent). 2 cm Mo, natural Li_2BeF_4, no added Be, was standard; tritium production was 1.16/D–T neutron. Individual variations gave: 1.20 and 1.24 with 20% and 50% enriched Li^6; 1.35 with 5 cm Be; 1.20 with 9 cm BeO; 1.03 with Ni; 0.82 with $LiNO_2$. Tritium production of about 1.15 per D–T neutron will probably be necessary to offset losses.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 621, Dec. 27, 1962.

Precise measurements of the velocity of sound in liquid helium under the saturated vapor pressure, previously reported for 1 mc sec, have been extended to 4 and 12 mc sec. Within experimental error, the measured total change in velocity between 1.2 and 0.15 K, the lowest temperature reached, is the same at all 3 frequencies, but there is dispersion at intermediate temperatures. At each frequency, the velocity rises from its value at $T = 0$ very nearly as T^3, goes through a maximum, and then decreases rapidly at higher temperatures. At temperatures below that of the maximum, the results at a given frequenc can be quite well represented by the empirical equation $u = u_0 + (13.5 + 1.5f)T^3$ cm sec, where u_0 - 23827 cm sec and f is the frequency in mc sec. For f = 1.00, 3.91, and 11.90 mc sec, the maximum value of $(u - u_0)$ is 5, 7, and 11 cm sec and occurs at the temperature 0.67, 0.71, and 0.72 °K.

VALIDITY OF THE GINZBURG-LANDAU THEORY OF SUPERCONDUCTIVITY AT LOW TEMPERATURE (Abstract), by D. H. Douglass, Jr. and R. H. Blumberg. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [DA 36-039-sc-78108]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 4, Jan. 24, 1962.

The original Ginzburg-Landau (GL) theory consists of assumptions concerning the form of the magnetic field and the field-free parts of the free energy. The field-free portion, which is derived by expanding in a power series valid only near T_c, is, nevertheless, well behaved at low temperatures. The GL theory can be generalized to include any field-free function [the Gorter-Casimir (GC) free-energy expression is one] covering all T, whose expansion near T_c is the same as that of the original theory. The critical field of a thin film can be expressed in terms of this generalized function. The differences between various functions can be expressed in terms of a parameter α which can be measured experimentally at the lower temperatures. Theoretical values of α are + 0.25 and -0.75 for the GL and the GC functions, respectively. Experimental measurements on thin films of tin give a value of $\alpha = 0.14 \pm 0.10$, which seems to favor the original GL theory.

THE WAKE OF A CHARGED PARTICLE MOVING THROUGH A PLASMA WITH MAGNETIC FIELD, by S. K. Majumdar. Sept. 14, 1962, 36p. incl. diagrs. refs. (Technical rept. no. 401) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-78108, and National Science Foundation) Unclassified

Published in Proc. Phys. Soc. (London), v. 82: 669-638, Nov. 1, 1963.

The motion of a charged particle through a low-density electron plasma placed in an external constant magnetic field has been investigated by using transport equations. The motion of the particle in the direction of the applied magnetic field is considered in detail; the particles moving at right angles to the magnetic field are considered briefly. The charge density developed in the medium as a result of interaction of the medium with the moving particle through long-range Coulomb force is evaluated for the wavelength, λ, which is such that $R > \lambda > \lambda_D$, where R is the distance from the moving particle, and λ_D, the Debye wavelength. Three types of charge-density waves are associated with the moving test particle. One is a plasma electron wave that exists only for velocities of the test particle that are greater than the average thermal speed of the plasma electron; this wave also shows a Mach cone distribution. The second is an elliptically shaped extraordinary electromagnetic wave that exists for all velocities of the test particle, and is coupled to the plasma electron wave. The third is an almost spherical weak wave associated with the ordinary electromagnetic wave. This third wave is not coupled to the other 2 waves within the range of approximation considered here, and it goes over to an exponentially decreasing charge distribution in the limit of very small magnetic field. NEGATIVE L AND C IN SOLID-STATE MASERS, by R. L. Kyhl, R. A. McFarlane, and M. W. P. Strandberg. [1962] [16]p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under DA 36-039-sc-87376) Unclassified

Published in Proc. Inst. Radio Engineers, v. 50: 1608-1623, July 1962.

The analysis of solid-state cavity masers is extended to include the reactive component of the paramagnetic resonance. This reactance is inverted (in opposition to Foster's reactance theorem). A 2-cavity network makes use of this negative frequency dependence of reactance to obtain a broad-band flat-topped amplifier response. In verification of this theory a ruby maser has been built which has a 95-mc bandwidth at 14-db gain and operates at 9000 mc and 1.5°K. This performance is comparable to that of published, tapered magnetic field traveling-wave masers. General network limitations on cavity maser amplifiers are derived. Broad-banding techniques that have been published for parametric amplifiers are essentially equivalent. The tuning of the broad-band amplifier is critical. The same performance can be achieved in a unilateral transmission maser by using circularly polarized cavities, but the problem of circuit design and tuning with the increased number of parameters has thus far prevented successful operation. PHYSIOLOGICAL EFFECTS OF PAINFUL STIMULATION DURING HYPNOTIC ANALGESIA UNDER CONDITIONS DESIGNED TO MINIMIZE ANXIETY, by R. E. Shor. [1962] [20]p. incl. diagrs. tables, refs. (AFOSR-64-0829) (In cooperation with Harvard U. Medical School, Boston, Mass.) (Sponsored jointly by Air Force Office of Scientific Reserrch under AF 49(638)728, Human Ecology Fund, and National Institute of Mental Health) AD 438646 Unclassified

Also published in Internat'l. Jour. Clin. and Exper. Hypnosis, v. 10: 183-202, July 1962.

A statistically powerful experimental test of the physiological effects of painful stimulation during hypnotic analgesia was conducted under conditions designed to minimize anxiety. From the findings of no significant differences between the experimental conditions, the plausible interpretation was advanced that, inasmuch as the subjective experience of pain is eliminated during hypnotic analgesia, those physiological reactions do not occur which would otherwise ordinarily result from the stressful or threatening qualities of the painful stimulation tion. It was further advanced, however, that anything else which minimizes the incidental anxiety component of the total pain experience—such as ego-protective procedures in the waking state—can have an effect on physiological responses to painful stimulation similar to that of hypnotic analgesia. BIOELECTRIC CORRELATES OF HYPNOSIS: AN EXPERIMENTAL REEVALUATION, by D. N. O'Connell and M. T. Orne. [1962] [13]p. incl. diagrs. tables, refs. (AFOSR-64-0830) (In cooperation with Harvard U. Medical School, Boston, Mass.) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)728, Human Ecology Fund, National Institute of Mental Health) AD 438387 Unclassified

Also published in Jour. Psychiatric Research, v. 1: 201-213, Dec. 1962.

The purpose of this investigation was (1) to determine the magnitude and reliability of changes in potential during hypnosis and (2) if reliable changes were found, to determine whether they originate from the head, from the palms, or from both locations. It was found that previously reported bioelectric changes were found to be palmar in origin. No evidence was found to indicate the presence of cortical potential changes during hypnosis. Large and reliable changes in plamar potential level were observed during hypnosis. These changes were (1) an increase in level of palmar potential of the order of magnitude of 10-30 mv, the increase in level

shifting gradually and returning (usually) dramatically to previous levels at the termination of hypnosis, and (2) a marked smoothing of ongoing activity. These changes are most striking when only general suggestions of deepening hypnotic trance are made, specific suggestions tending to decrease the level of potential. These findings are tentatively interpreted as indicating that the hypnotic state is a state of increased central activation and focused attention. The level of arousal is not that found in sleep but rather that found during highly alert wakefulness.

AN ANALYSIS OF THE EFFECTS OF MOTION UPON AUDITORY FUNCTION DURING PROLONGED ATYPICAL STIMULATION, by S. J. Freedman and S. K. Secunda Apr. 1962 [54]p. incl. diagrs. tables, refs. (AFOSR-2078) (AF AFOSR-62-11) AD 436180 Unclassified

Presented at Eastern Psychological Assoc. meeting, Atlantic City, N. J., Apr. 1962.

The present experiment attempts to ascertain which components of gross bodily movement are responsible for the increased variability in dichotic time difference discrimination. Four 1-hr exposure conditions were employed during which the subjects heard continuous white noise loud enough to mask background sounds. The conditions were: (1) ambulatory, (2) recombent, (3) active head rotation, and (4) active whole body rotation. After exposure in the ambulatory condition, subjects showed significantly increased variability in the criterion task. Performance also deteriorated significantly with active head rotation and active whole body rotation. When bodily movements were restricted, however, there was essentially no increased variability. Thus, self-produced rotation while listening to dichotic noise is sufficient to disrupt a fundamental cue for auditory localization.

A STUDY OF VISUAL IMAGERY PRODUCED BY RHYTHMIC PHOTIC STIMULATION, by P. A. Marks. Apr. 1962, 5p. (AFOSR-2079) (AF AFOSR-62-11) AD 436181 Unclassified

Presented at Eastern Psychological Assoc. meeting, Atlantic City, N. J., Apr. 1962.

Photic stimulation provides a way of dependably producing imagery in a laboratory setting. This imagery resembles that which occurs in other situations. Both qualitatively and quantitatively, photic stimulation imagery varies greatly from subject to subject, and these individual variations seem related to definable personality and experiential factors. Such relationships provide leads for studying the factors at work in other types of imagery experience.

ADAPTATION AND TRAINING EFFECTS IN ERG: I. LONG-TERM ADAPTATION, by S. J. Freedman and L. Ronchi. [1962] [6]p. incl. diagrs. (AFOSR-3938) (In cooperation with Istituto Nazionale di Ottica, Florence (Italy)) [AF AFOSR-62-11] AD 449993 Unclassified

Also published in Atti Fondazione G. Ronchi, v. 17: 381-386, July-Aug. 1962.

An experiment is described in which ERG responses of 3 well-trained subjects were measured for 10 consecutive days. Plotting mean scotopic b-wave amplitudes from day to day demonstrated a systematic decline in response level for the early days of the experiments. Previous data from the same subjects lends support to these findings. It is suggested that such long-term adaptation may be typical of perceptual performance in general. (Contractor's abstract)

A THEORY OF LINEAR DYNAMIC BIREFRINGENCE, by R. S. Stein and S. Onogi. [1961] [21]p. incl. diagrs. refs. (AFOSR-1061) (AF AFOSR-61-28) Unclassified

The birefringence response of a Maxwell element to a sinusoidal strain is calculated assuming different strain-optical coefficients for the spring and dashpot elements. The composite response resulting from a distribution of such elements is calculated. This involves 2 distribution functions for the strain-optical coefficients of the 2 types of elements. Means for experimentally determining the spectra of these functions are discussed.

THE DYNAMIC BIREFRINGENCE OF HIGH POLYMERS, by R. S. Stein, S. Onogi, and D. A. Keedy. [1962] [21]p. incl. diagrs. refs. (AFOSR-2890) (AF AFOSR-61-28) AD 612354 Unclassified

Presented at Internat'l. Symposium on Macromolecular Chemistry, Montreal (Canada), July 27-Aug. 1, 1961.

Also published in Jour. Polymer Sci., v. 57: 801-821, Mar. 1962.

The simultaneous measurement of the birefringence and strain of a sample subjected to sinusoidal strain is proposed as a means for elucidating the molecular mechanism of the response of high polymers to mechanical deformation. A linear phenomenological theory is proposed in which strain-optical coefficient distribution functions are assigned to the elastic and viscous members of a distribution of Maxwell elements. An apparatus has been constructed to determine the dynamic

strain-optical coefficient at frequencies between 0 and 600 cps by means of mechanical excitation of vibration at low frequencies and electromagnetic at high frequencies. The dynamic birefringences of polyethylene was studied at room temperature over this frequency range.

DYNAMIC BIREFRINGENCE OF HIGH POLYMERS II, by R. S. Stein, S. Onogi and others. Apr. 30, 1962 [12]p. incl. diagrs. refs. (AFOSR-2925) (Sponsored jointly by Air Force Office of Scientific Research as progress rept. no. 4 under AF AFOSR-61-28, Office of Naval Research as technical rept. no. 44, and Petroleum Research Fund) AD 277402 Unclassified

Also published in Jour. Appl. Phys., v. 34: 80-89, Jan. 1963.

The time-dependence of birefringence was investigated in experiments involving relaxation at constant strain, extension at constant rate of strain, and periodically varying strain. The results of constant strain relaxation are calculated from the other 2 types of experiments using the linear phenomenological theory of birefringence relaxation. Strain-optical coefficient spectra are calculated for a number of low- and high-density polyethylenes and characteristics of the spectra are correlated with sample density. A simple molecular theory is presented. The time-dependence of birefringence is believed to principally arise from the finite relaxation time for crystal orientation. (Contractor's abstract)

PROBABILITY OF DETECTION AND SPEED OF RESPONSE IN SIMPLE MONITORING, by W. H. Teichner. [1962] [6]p. incl. diagrs. (AFOSR-2362) (AF AFOSR-62-202) Unclassified

Also published in Human Factors, v. 4: 181-186, Aug. 1962.

Two simple monitoring experiments were performed to study the dependence of probability of detection and of speed of response to detected signals on the initial probability of detection of the signal established psycho-physically and on duration of the task. The results indicated that: (1) detection during the task is directly related to the probability of signal detection before the task and inversely related to length of watch, and (2) the speed of response to these signals which are detected is directly dependent on the probability of detection before the watch but independent of factors which operate during the watch.

SOME PERSONALITY AND BEHAVIORAL FACTORS RELATED TO BIRTH ORDER, by E. E. Smith and J. D. Goodchilds. [1962] 12p. incl. tables. (AFOSR-2984) (AF 49(638)1000) AD 445113 Unclassified

Also published in Jour. Appl. Psychol., v. 47: 300-303, 1963.

A study was conducted using 165 firemen in large and small firehouses to test the hypothesis that first borns learn to interact more successfully because of their stronger dependency and affiliation needs. It was also predicted that this greater interactional skill would become more apparent the more complex the social situation. As predicted, first borns had less self-confidence. They also conformed more, were more efficient problem solvers in a group situation, and were more often the official leader of their work group, suggesting that study of the psychology of the early-born may lead to a fresh attack on the leadership problem. However, these group behaviors were only related to birth order in the larger and more complex groups.

MEMBRANE POTENTIALS IN GUINEA-PIG CEREBRAL CORTEX SLICES IN VITRO. THEIR DEPENDENCE ON SUBSTRATE AND OXYGEN. THE EFFECT OF CLUPEIN AND OF GANGLIO-SIDE PREPARATIONS, by H. H. Hillman. [1961] [5]p. incl. diagr. tables, refs. (AFOSR-2394) (AF 61(052)404) Unclassified

Also published in Jour. Neurochem., v. 8: 257-261, Dec. 1961.

Resting membrane potentials in guinea-pig cerebral cortex slices in vitro in Krebs-Ringer bicarbonate solution with 10 mM-pyruvate, lactate or oxaloacetate as sole substrate are at the same level as with glucose as substrate. They are lower in the absence of substrate, with 10 mM-L-glutamate as sole substrate, or during hypoxia. The membranes are depolarized by hypoxia in

the absence of substrate. The lowering of the resting potential induced by addition of 0.3 mg clupein/ml medium is counteracted by addition of 0.3 mg ganglioside preparation/ml medium.

Guinea pig cerebral cortex disintegrated in sucrose solutions was differentially centrifuged to yield 5 fractions. The activities of the fractions in catalyzing liberation of inorganic phosphate from adenosine triphosphate was measured in the presence of a number of added substances. With Mg, K, and Na ions, the unfractionated suspension liberated phosphate at about 2000 µmol/g cortex/hr; a nuclear fraction at 290, a mitochondrial fraction at 350, a mitochondrial plus microsomal fraction at 490, a microsomal fraction at 590, and a supernatant at 150 umol/hr with material derived from a gram of cortex. Liberation by the mitochondrial fraction was maximal at pH 9 and by the microsomal at 7.5. In media containing Mg and K ions, Na^+ accelerated the activity of the microsomal fraction to a much greater extent than it did that of the mitochondrial fraction. Depending on K^+ concentration and other factors, activation of the mitochondrial fraction was increased by 0-30% and the microsomal fraction by 30-170%. The adenosine triphosphatases were relatively insensitive to simple anions, but were inhibited by preparations of cerebral gangliosides and of the trypanocidal agent suramin.

GANGLIOSIDES, PHOSPHOLIPIDS, PROTEIN AND RIBONUCLEIC ACID IN SUBFRACTIONS OF CEREBRAL MICROSOMAL MATERIAL, by J. R. Wherrett and H. McIlwain. [1962] [6]p. incl. diagrs. tables, refs. [AF 61(052)404] Unclassified

Published in Biochem. Jour., v. 84: 232-237, Aug. 1962.

In differential centrifuging of cerebral microsomal fractions, gangliosides required lesser centrifugal forces for depositing a given proportion of material than did ribonucleic acid; protein and phospholipids were intermediate in their properties. On density-gradient centrifuging, ribonucleic acid was associated with denser material than the greater part of the gangliosides and phospholipids. On density-gradient electrophoresis, a zone of particles enriched in gangliosides moved more rapidly towards the anode than a zone enriched in ribonucleic acid; phospholipid and protein were associated equally with the 2 zones. Sodium deoxycholate and Lubrol caused greatest solubilization of gangliosides from microsomal material; sodium hydrogen carbonate solubilized most ribonucleic acid. These and other properties of the fractions suggest that gangliosides may be a characteristic component of the membrane structures observed by Hanzon and Toschi in cerebral microsomal fractions; these are likely to contain also proteins and phospholipids.

THE SODIUM AND OTHER IONS OF MAMMALIAN CEREBRAL TISSUES, MAINTAINED AND ELECTRICALLY STIMULATED IN VITRO, by H. S. Bachelard, W. J. Campbell, and H. McIlwain. [1962] [8]p. incl. diagrs. tables, refs. [AF 61(052)404] Unclassified

Published in Biochem. Jour., v. 84: 225-232, Aug. 1962.

Cerebral tissues incubated in oxygenated glucose-bicarbonate media rapidly gained sodium. Attempts were made to minimize these changes by alterations in the incubating medium. Rapid preparation of tissue by cutting it in situ yielded samples of lower sodium after incubation; during incubation, a net extrusion of sodium was observed in such samples, at rates of 180-240 µequiv/g of tissue/hr. Electrical stimulation increased the sodium content of the incubated tissue; after cessation of stimulation, the additional sodium was in part extruded. Tissue incubated in media low in sodium content was low in postasium content; when stimulated electrically, the respiratory rate of such tissues changed by -50 to +60% rather than by the +100% shown in media of normal sodium content. The intracellular to extracellular ratios of Na^+ and K^+ ions (based on chloride and inulin spaces) have been calculated for incubated tissues prepared by different techniques and compared with the ration (based on chloride space) in unincubated fresh tissue.

THE SODIUM-STIMULATED ADENOSINE-TRIPHOSPHATASE ACTIVITY AND OTHER PROPERTIES OF CEREBRAL MICROSOMAL FRACTIONS AND SUBFRACTIONS, by A. Schwartz, H. S. Bachelard, and H. McIlwain. [1962] [12]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)404] and National Heart Institute) Unclassified

Published in Biochem. Jour., v. 84: 626-637, Sept. 1962.

By differential centrifuging of sucrose dispersions of guinea-pig cerebral crotex, 75% of their sodium-stimulated adenosine-triphosphatase activity was obtained in a microsomal fraction; the tissue activity was computed as 1100-1500 umol of phosphate formed/g of fresh tissue hr. Assay conditions for the enzyme, and changes in its activity on keeping, are described. Differential

and density-gradient centrifuging indicated the enzyme system to be associated with the membrane structures rather than the ribonucleic acid granules of the microsomal fraction. Fractions richest in the adenosine triphosphatase possessed negligible succinic dehydrogenase but were enriched in acetylcholinesterase and in cholesterol. A portion of the adenosine-triphosphatase activity was no longer deposited at 6.2×10^6 g/min after treatment of microsomal fractions with deoxycholate, Lubrol W or digitonin; with digitonin, stimulation by sodium was retained to an appreciable degree by the enzyme of the supernatant. The adenosine-triphosphatase activity of untreated microsomal fractions was inhibited by 2,4, 6-trinitrobenzenesulphonate and suramin, in reaction mixtures with magnesium and potassium, or with magnesium, potassium, and sodium salts. Ouabain at 10^{-7} to 10^{-4} mol inhibited with magnesium, potassium, and sodium but not without sodium. Competition was noted between protamine, magnesium, and alkali metals for salt formation with adenosine triphosphate. The data are discussed in relation to the likely functioning of the enzyme system in active sodium and potassium transport.

Also published in Jour. Neurochem., v. 10: 325-339, May 1963.

Resting membrane potentials measured by micropipette electrodes in guinea pig cerebral cortex in vitro, were of a mean value between -36 and -40 mv. Application of electrical pulses for 1 min diminished the potentials observed 1 min after stimulation ceased. The time-course of recovery of potential was measured after 10 min stimulation: the potentials reached nearly zero and recovered at about -12.5 mv/min. The potentials before application of pulses were increased by 50 μM chlorpromazine and diminished by 0.3 mg/ml clupeine (protamine). Their change with pulses was diminished, or recovery accelerated, by 0.3 mM-phenobarbitone, by 50 μM-chlorpromazine, and by 20 μM-cocaine. These agents did not significantly affect the potassium or non-inulin sodium of tissues incubated in vitro. When however pulses were applied to such tissues, chlorpromazine inhibited the change in sodium and potassium; phenobarbitone permitted the changes but afforded more complete recovery of non-inulin sodium. Spike discharges were observed on 25 occasions on penetrating the isolated tissue with micro-electrodes. They commenced from potentials of -32 to -55 mv, were of +27 to +70 mv, were associated with positive and negative after-potentials and carried a notch on their rising phase. The nature and incidence of the discharges did not appear to be markedly affected by the substances named above, nor by a number of other experimental changes.

CHARACTERISTICS REQUIRED IN ELECTRICAL PULSES OF RECTANGULAR TIME-VOLTAGE RELATIONSHIPS FOR METABOLIC CHANGE AND ION MOVEMENTS IN MAMMALIAN CEREBRAL TISSUES, by H. McIlwain and P. Joanny. [1962] [11]p. incl. diagrs. tables, refs. (AFOSR-J834) (AF EOAR-62-4) AD 416522 Unclassified

Also published in Jour. Neurochem., v. 10: 313-323, May 1963.

The pulses caused loss of K, gain in Na and increase in respiration by isolated cerebral cortical tissue. These changes commenced at applied potentials 1-2 v and reached maxima at 7.5 v. Pulses of duration between 0.03 and 0.04 msec gave increasing effects. Response increased with increase in frequency between 2 and 30/sec but little greater effect usually ensued with higher frequencies. With submaximal pulses of 5 or 7.5 v, 0.4 msec and relatively low frequencies the initial changes in Na and K per pulse were approximately equivalent and between 5 and 6 mumol/g tissue/pulse. Similar pulses caused a sustained increase in respiration of 1.56 u mol O_2/g tissue/pulse. The increase in respiration was susceptible to inhibition by relatively low concentrations of chlorpromazine, and by phenobarbitone and 1,2,3,4-tetrahydro-5-aminoacridine. Response to sparse pulses was increased by protoveratrine A but response to pulse-types tested was unaffected by 4 other substances including trimethadione.

Experimental investigations of the scattering of sound by turbulence were successfully continued by developing and checking suitable methods for the measurement and registration of phase fluctuations. The main object of the phase measurements was to obtain frequency distributions of the phase fluctuations. This was made possible by the use of a phase-measuring circuit. In order to get a first survey of the behavior of the phase angle of sound scattered by turbulence, approximately 300 dual-beam oscillograms of received sound pulses were taken showing the phase variations on the upper trace and the amplitude variations on the lower trace simultaneously. In the case of laminar flow between sound transmitter and receiver, no measurable fluctuations was present in the phase or amplitude of the received sound.

THE ENZYMATIC DEGRADATION OF TERPENES, by W. Seubert, U. Remberger and others. Final technical rept. Dec. 14, 1962, 53p. incl. diagrs. tables, refs. (AFOSR-4905) (AF 61(052)251) AD 415464
Unclassified

The bacterial degradation of terpenes like citronellol and farnesol is initiated by the oxidation of the primary alcohol group to the carboxyl group. Subsequent degradation of the acid formed occurs at the level of CoA-activated intermediates. After fixation of CO_2 at the branched methylgroup the latter is eliminated as free acetic acid. The straight carbon chain formed is further degraded according to the principles of ß-oxidation to acetyl CoA. Pyruvate carboxylase employed in these studies has been purified 550 times from crude extracts

of Ps. citronellolis. The enzyme catalyzes the ATP and Mg^{++}-dependant carboxylation of pyruvate to oxalacetate. Biotin acts as the prosthetic group of the enzyme. By exchange studies with radioactive compounds, a CO_2-biotin-enzyme has been shown to participate in the carboxylation of pyruvate. In contrast to the mammalian pyruvate carboxylase, the enzyme isolated from bacteria catalyzes the above reaction in the absence of acetyl CoA. The implication of this observation regarding possible different carboxylation mechanisms in bacterial and mammalian systems is discussed.

EXPERIMENTAL STUDY OF THE STAGNATION TEMPERATURE IN A FREE MOLECULAR FLOW, by F. M. Devienne. [1956] [5]p. incl. diagrs. tables. (AFOSR-3512) (AF 61(052)124) Unclassified

Also published in Jour. Aeronaut. Sci., v. 24: 403-406, 412, June 1957.

The purpose of the experimental work described in this paper was the measurement of the temperature of a small thermally insulated flat plate in motion at high speed in a free molecular flow. The plate was oriented perpendicular to the direction of motion, and was fixed at the extremity of an arm which revolved at high speed in a vacuum chamber. The experimental results indicate that the temperature increase of the plate is a function of the speed of the plate, the pressure in the chamber and the surface condition of the plate. The results were compared with values calculated from the theory for free molecular flow, which gives the temperature increase of the plate as a function of the molecular speed ratio, the total emissivity and the thermal accommodation coefficients of the surface. In general, the experimental values for the temperature increase were less than those predicted by theory, when values for ϵ and α taken from tables of constants were used in the theoretical formulas. The theory, which assumes a Maxwellian distribution of molecular velocities, can be brought into accord with the experimental findings only if it is assumed that the accommodation coefficient is a function of pressure and speed. THE USE OF REVOLVING DISCS IN THE STUDY OF INTERACTION PHENOMENA BETWEEN MOLECULES AND A SURFACE, by F. M. Devienne and G. M. Forestier. Final rept. Sept. 1962 [50]p. incl. illus. diagrs. (AFOSR-3762) (AF 61(052)124) AD 289285 Unclassified

Results show that the dispersion of molecules reflected by a moving surface is very different from the dispersion when the same surface is at rest; the higher the speed the greater the difference. The re-emission distribution curve in a plane normal to the surface is a circle. But, when the surface is moving, the distribution curve has an elliptic form. The modulus of the vector corresponding to the number of molecules re-emitted in a given direction passes through a maximum for an angle to the horizontal which depends on the speed and on the nature of the gas. This dependence can be summed up by the variation versus σ which is the ratio of the speed of motion to the arithmetical mean speed of the molecules of the beam.

[OBSERVATIONS ON THERMODYNAMICS AND THE THEORY OF FINITE ELASTICITY] Observazioni sulla thermodinamica e sulla theria dell'elasticità finita, by B. D. Coleman. July 1961, 22p. (AFOSR-1324) (AF 49(638)541) Unclassified

A general theory of mechanically admissible stress-strain functions is first considered. Thermodynamical admissibility is defined in terms of an integral inequality for $\hat{S}$ (the stress tenso. S at a material point is given by a function $\hat{S}$ of the deformation gradient at that point). It is shown that a stress-strain function both mechanically and thermodynamically admissible from the present point of view must also be compatible with Green's theory of elasticity. A very simple form for the inequalities of $\hat{S}$ necessary and sufficient for thermodynamical admissibility in a perfect fluid is discussed. The concept of partial thermodynamical admissibility (weaker than thermodynamical admissibility) is also introduced to show that if $\hat{S}$ is partially thermodynamically admissible then $\hat{S}$ can be obtained from an energy function.

SUBSTANTIALLY STAGNANT MOTIONS, by B. D. Coleman. [1962] [8]p. (AFOSR-1962) (AF 49(638)541) AD 295972 Unclassified

Also published in Trans. Soc. Rheol., v. 6: 293-300, 1962.

An outline is given of part of the general theory of substantially stagnant motions. These are flows such that, if the present state is taken as a reference, a material point always sees behind itself essentially the same past deformation history. Included in the class of substantially stagnant motions are steady uniform expansion and the viscometric flows such as steady simple shearing flow, steady Poiseuille flow, and steady Couette flow. STEADY EXTENSION OF INCOMPRESSIBLE SIMPLE FLUIDS. by B. D. Coleman and W. Noll. [1962] [4]p. incl. refs. (AFOSR-2155) (In cooperation with Carnegie Inst. of Tech., Pittsburgh, Pa.) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)541 and National Science Foundation) AD 295937 Unclassified

Also published in Phys. Fluids, v. 5: 840-843, July 1962.

Steady extension is a flow possible in every incompressible simple fluid (Newtonian, non-Newtonian, or viscoelastic) without neglect of inertia. A special example of this flow is realized by considering a cylindrical fluid mass which is being continually elongated (or shortened) at a rate proportional to its length. The behavior of a general simple fluid in steady extension is determined by material functions other than the viscosity and normal-stress functions which govern viscometric flows. THE ADSORPTION OF FLEXIBLE MACROMOLECULES. PART II THE SHAPE OF THE ADSORBED MOLECULE. THE ADSORPTION ISOTHERM SURFACE TENSION, AND PRESSURE. by A. Silberberg. [1962] [24]p. incl. diagrs. tables. refs. (AFOSR-2347) (AF 49(638)541) AD 295939 Unclassified

Also published in Jour. Phys. Chem., v. 66: 1884-1907, 1962.

The known facts about the adsorption of macromolecules at surfaces are reviewed. A model is introduced in which the adsorbed polymer molecules are attached to the interface by stretches of segments in the surface alternating with loops pending away from it. These loops are considered to set up a thin surface adjoint bulk phase of rather high polymer concentration. The partition function for the entire system is written down, and equations determining the equilibrium values of all variables derived from it. In the process, a method of determining the entropy of mixing of polymer molecules with low molecular weight solvent is introduced and discussed. It is found that adsorption reaches a plateau value which maintains itself over a wide range in concentration. The plateau value is molecular weight dependent, adsorption increasing with increasing molecular weight, but at a decreasing rate, becoming independent of it, when it is very high. The temperature dependence of adsorption is small and segment adsorption energies can be quite low. Despite this the polymer molecules are practically flattened into the surface. Some half of the segments are directly in the surface and the adsorbed layer is very thin. The shape of the adsorbed polymer molecule is largely independent of molecular weight and concentration, but depends strongly on the factors restricting polymer accommodation to the surface. The low rate to equilibrium and the inability to "wash off" adsorbed polymer films is explained. The theoretical isotherm apparently fits a Langmuir plot, but not for the usual reasons. Surface tension decrement and surface pressure are shown to be nearly the same for very dilute polymer solutions. A surface equation of state is derived. Ideal behavior is predicted in the limit of low surface adsorption. (Contractor's abstract)

THE ADSORPTION OF FLEXIBLE MACROMOLECULES. PART I. THE ISOLATED MACROMOLECULE AT A PLANE INTERFACE, by A. Silberberg. [1962] [12]p. incl. diagrs. refs. (AFOSR-2365) (AF 49(638)541) AD 295938 Unclassified

Also published in Jour. Phys. Chem., v. 66: 1872-1883, 1962.

The adsorption of an isolated, flexible linear polymer molecule of high molecular weight is treated at an infinite plane surface. The question of a possible equilibrium configuration is examined when it is required that some at least of the segments of the polymer molecule are in contact with the surface, and it is assumed that for each segment so placed the internal energy of the system is reduced by an adsorption energy xkT. It is shown that the polymer molecule will split up into sequences of segments; alternate stretches of P_s segments all in the surface and loops of P_B segments all out of the surface, whose size is not a function of molecular weight. The length, P_B, of the loops will decrease and the fraction, p, of segments in the surface will increase as the absorption energy x increases. Several models are considered. For an all adsorbable polymer molecule on an all adsorbing surface, the loops P_B are small and p is large even at small values of x. Such polymer molecules stay close to the surface with practically all their segments, and behave essentially as 2 dimensional structures. In cases where not all surface sites are adsorbing, or not all polymer segments are adsorbable, or both, the size of loop is considerably increased and much higher adsorption energies are required. Restrictions limiting the re-entry of an adsorption loop into the surface, as well as any increase in specificity, have a similar effect. It is shown that structural principles affect polymer adsorption in sensitive fashion. It is one of the consequences of this model that the ends of the polymer molecule are on the surface. A discussion of previous theories, which predicted rather different results, is given.

GENERAL THEORY OF STATIONARY RANDOM SEQUENCES WITH APPLICATIONS TO THE TACTICITY OF POLYMERS, by B. D. Coleman and T. G. Fox. [1962] [15]p. (AFOSR-J1198) (AF 49(638)541)
AD 424249 Unclassified

Presented at 142nd meeting of the Amer. Chem. Soc., Atlantic City, N. J., Sept. 9-14, 1962.

Also published in Jour. Polymer Sci., Part A, v. 1: 3183-3197, Oct. 1963.

The assumption of statistical constancy implies that a particular sequence of isotactic (I) and syndiotactic (S) placements will occur independently of the position of the sequence along the chain. Further, one can assume an infinite chain length and neglect end effects. From these assumptions, a general theory covering Bernoullian, Markoffian, and non-Markoffian chain statistics is derived. From this theory, an equation is deduced for the number average length $u(I)$ of closed sequences of isotactic placements $u(I) =$ $[1 - p_1(S)]^{-1}[p_1(S) - p_2(S^2)]$ where $p_1(S)$ is the normal concern of S pairs. Nuclear magnetic resonance spectra may be used to test the validity of the equation even though the statistics may be non-Markoffian.

MULTISTATE MECHANISM FOR HOMOGENEOUS IONIC POLYMERIZATION. I. THE DIASTEREOSEQUENCE DISTRIBUTION, by B. D. Coleman and T. G. Fox. [1962] [11]p. incl. refs. (AF 49(638)541)
Unclassified

Presented in part at 142nd National meeting of the Amer. Chem. Soc., Atlantic City, N. J., Sept. 9-14, 1962.

Abstract published in Amer. Chem. Soc. Abstracts of Papers, 1962, p. 14-R. (Title varies)

Published in Jour. Chem. Phys., v. 38: 1065-1075, Mar. 1, 1963.

A mechanism is proposed to explain the "stereoblock" structures which occasionally result from homogeneous anionic polymerizations. The mechanism postualtes that a growing polymer chain has 2 reactive states in dynamic equilibrium, both capable of adding monomer, but each with its own stereospecificity. The resulting diastereosequence distribution is calculated and it turns out to be non-Markoffian. It is shown that the "two-state" polymerization mechanism yields predictions about the dependence of NMR spectra on polymerization conditions, and as such is capable of experimental test. The case of more than 2 states is also discussed.

A MULTISTATE MECHANISM FOR HOMOGENEOUS IONIC POLYMERIZATION. II. THE MOLECULAR WEIGHT DISTRIBUTION, by B. D. Coleman and T. G. Fox. [1962] [4]p. incl. refs. (AF 49(638)541)
Unclassified

Published in Jour. Amer. Chem. Soc., v. 85: 1241-1244, May 5, 1963.

To explain the "stereoblock" structures which occasionally result from homogeneous anionic polymerizations, an examination was made of (see item no. 1933, Vol. VI) the diastereosequence distribution resulting from a mechanism in which a reactive polymer chain end has 2 possible states, 1 and 2, in dynamic equilibrium, both capable of adding monomer, but each with its own stereospecificity. The molecular weight distribution resulting from such a mechanism when monofunctional initiators are used is considered. No side reactions are assumed such as irreversible termination or chain transfer; initiation is assumed to be instantaneous. As a result, under certain limiting conditions our molecular weight distribution reduces to the Poisson distribution obtained by Flory for the classical one-species polymerization. In general, however, the present mechanism yields a ratio, r, of the weight to number average degrees of polymerization which is larger than that obtained from the Poisson distribution. Whenever the rate constants for the reactions 1 ⇄ 2 are non-zero, the present distribution shares with the Poisson distribution the property that r approaches unity for long reaction times.

ON STRAIN ENERGY FUNCTIONS FOR ISOTROPIC ELASTIC MATERIALS, by L. E. Bragg and B. D. Coleman. [1962] [3]p. (AF 49(638)541)
Unclassified

Published in Jour. Math. Phys., v. 4: 424-426, Mar. 1963.

This article deals with isotropic elastic materials which possess a strain energy function. For such materials the strain energy of a material point is given, of course, by a symmetric function $\bar{\sigma}$ of the principal stretches ν_1, ν_2, ν_3 at tha point. It is known that a necessary condition to have an isotropic material compatible with the axioms for thermostatics proposed by Coleman and Noll is that the function $\bar{\sigma}$ be jointly and strictly convex in its 3 variables ν_1, ν_2, ν_3. It is shown that this condition is not sufficient for compatibility with the thermostatic axioms.

INFRARED SPECTROSCOPIC EVIDENCE FOR THE ROTATION OF THE WATER MOLECULE IN SOLID ARGON, by R. L. Redington and D. E. Milligan. [1962] [5]p. incl. diagrs. tables, refs. (AFOSR-2676) (AF 49-(638)542) Unclassified

Also published in Jour. Chem. Phys., v. 37: 2162-2166, Nov. 15, 1962.

High-resolution spectra of H_2O, HDO, and D_2O suspended in solid Ar have been observed in the range 4°—27°K. Evidence has been obtained for the rotation of these species in Ar matrices. The majority of the observed lines are found to be in very good agreement with low-J transitions of the gas spectra, allowing for a small matrix shift. Transitions arising from both spin modifications of H_2O and D_2O have been observed and the intensities observed suggest that a large degree of spin equilibration has taken place. A small contamination of O_2 may be responsible for this. A perturbation of one of the rotational levels of ν_2- H_2O is discussed. (Contractor's abstract)

EVALUATION OF LATTICE SUMS IN THE CALCULATION OF CRYSTAL SPECTRA, by R. M. Hexter. [1962] [10]p. incl. diagrs. tables, refs. (AFOSR-J1190) (AF 49(638)542) Unclassified

Also published in Jour. Chem. Phys., v. 37: 1347-1356, Sept. 15, 1962.

Transition dipole-transition dipole exciton interaction lattice sums are shown to be amenable to evaluation by the general procedure of Nijboer and de Wette. The practical evaluation of lattice sums in certain cubic and tetragonal crystals is then discussed, with emphasis upon the importance of the manner in which the spectrum of a molecular solid is obtained. The particle size of a polycrystalline sample is shown to strongly affect the value of the lattice sum. For single crystals, the orientation of the crystal and its transition moment directions with respect to the electric vector of the exciting field is of importance. Specific formulas relating crystal field splittings to dipole derivatives (in vibrational spectra) and to oscillator strengths (in electronic spectra) are given and tested with a variety of vibrational transitions of various cubic crystals as well as with the deformation mode of N_3^- in the tetragonal alkali azides. The oscillator strength of the $^1\Pi - {}^1\Sigma^+$ transition of CO is calculated to be 0.148. Splittings in the related transition in solid N_2 are also discussed. Results indicate that several conclusions in earlier calculations based upon dipole coupling models have been in error due to inadequate summation procedures. The results also indicate that exciton packets extend to the boundaries of the crystallites of which a polycrystalline sample is composed. Limitations to the general applicability of the summation procedures presented here are also discussed. (Contractor's abstract)

INFRARED STUDY OF THE REACTIONS OF CH_2 AND NH WITH C_2H_2 IN SOLID ARGON, by M. E. Jacox and D. E. Milligan. [1962] [5]p. incl. diagrs. tables, refs. (AFOSR-1191) (AF 49(638)542) Unclassified

Also published in Jour. Amer. Chem. Soc., v. 85: 278-282, Feb. 5, 1963.

As a part of a systematic study of the reactions of NH and CH_2 with simple unsaturated molecules in an inert matrix, infrared spectral observations have been made on the photolysis products of dilute solid solutions of $C_2H_4 + HN_3$, $C_2H_2 + CH_2N_2$, and $C_2H_2 + HN_3$ in argon at 4°K. The cyclic species ethylenimine is the product of the first reaction. However, radical attack on a triple bond does not appear to lead to a stable cyclic species. Allene is produced by the attack of CH_2 on C_2H_2. Evidence also suggests the production of ketenimine by the analogous reaction of NH with C_2H_2.

Possible mechanisms for these reactions are discussed. These mechanisms suggest that at least part of the CH_2 and NH may undergo matrix deactivation to the ground triplet state before reaction.

COMMENT ON "INFRARED ABSORPTION SPECTRA OF LiOH AND LiOD", by R. M. Hexter. [1962] [2]p. incl. refs. (AFOSR-J1192) (AF 49(638)542) Unclassified

Also published in Jour. Chem. Phys., v. 38: 1024-1025, Feb. 15, 1963.

Criticism is made of the suitability of the "factor group" approach to the interpretation of the detailed spectra previously reported by Buchanen et al (Jour. Chem. Phys., v. 36: 2665-2675, May 15, 1962). Certain aspects of the spectra are used to support a model of localized motion of the OH and OD ions (no coupling between the ions) in direct contrast to the correlated motion required by the factor group approach.

EXCITATION-MODULATION SPECTROSCOPY: A TECHNIQUE FOR OBTAINING VIBRATIONAL SPECTRA OF EXCITED ELECTRONIC STATES, by R. M. Hexter. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-J1194) (AF 49(638)542) Unclassified

Also published in Jour. Opt. Soc. Amer., v. 53: 703-709, June 1963.

A procedure is suggested for direct recording, in the infrared, of the vibrational spectra of excited electronic states of molecules. The procedure resembles the chemical modulation technique of Bair, Lund, and Cross as well as the pressure modulation technique of Gilfert and Williams. Infrared radiation is passed through a sample but is not chopped. Instead, ultraviolet radiation which also impinges upon the sample is chopped at the tuned frequency of the detector-amplifier system. Only those infrared transitions which take place within the vibrational manifold of the state populated due to the ultraviolet light are recorded. Using a simple adaptation of a commercial spectrometer, this makes possible the recording of the infrared spectra of the lowest triplet state of certain molecules. Preliminary results on naphthalene and acetone are reported and necessary improvements in the instrumentation are discussed. The limitations of the entire procedure are analyzed in terms of a simple model in which the excited molecule is supposed to have only one vibrational degree of freedom and the state manifold for that vibration has only 2 levels.

THE PROTON MAGNETIC RESONANCE SPECTRA OF OLEFINS. II. INTERNAL ROTATION IN ALKYLETHYLENES, by A. A. Bothner-By, C. Naar-Colin, and H. Günther. [1962] [4]p. incl. table, refs. (AFOSR-1955) (AF 49(638)980) Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 2748-2751, July 20, 1962.

Parameters obtained from the analysis of proton magnetic resonance spectra of several alkylethylenes are reported. From these values and others previously reported, it may be deduced that: (1) The spin-spin coupling constant between protons on adjacent triagonal and tetrahedral carbons depends on the rotational conformation, having a value near 11.5 cps when the protons are trans oriented and near 3.7 cps when they are

gauche oriented; (2) The long-range allylic coupling constants also depend on the rotational conformation, having the smallest absolute value when the allylic proton and the $=CH_2$ group are eclipsed; and (3) In the compounds $RCH_2CH=CH_2$ and $R_2CH-CH=CH_2$, the rotational conformers are about equally populated when $R = CH_3$, but as R is increased in size, the conformation with R and $=CH_2$ eclipsed becomes less favored. [MIXED REFRACTORY OXIDES], by K. S. Vorres. Final rept. Nov. 1962 [30]p. incl. diagrs. tables, refs. (AFOSR-4071) (AF AFOSR-61-104) AD 290693 Unclassified

The conditions for the appearance of the fluorite-type solid solution with ZrO_2 were investigated experimentally by studying sub-solidus equilibria in the binary systems composed of ZrO_2 and each of CuO, Cu_2O, SnO_2, Ag_2O, Tl_2O, CdO, and Ga_2O_3. No solid-solution formation was observed. The data were correlated with all other data on binary systems with ZrO_2 to determine conditions for the appearance of the fluorite phase. A plot of ionic radius versus electronegativity most effectively demonstrated that the conditions are: the added oxide must have a cation radius larger than that of tetravalent Zr to be stable down to room temperature, and the added oxide must be somewhat more electropositive than the Zr. This then produces a more nearly ionic lattice for which the fluorite structure would be expected. Furthermore, the added oxide must be di- or trivalent. Random cation placement occurs with divalent cations and ordering is obtained with the trivalent ones. The CaF_2-rare earth oxide systems in a laboratory atmosphere were studied, and ABO_4 type structures were correlated.

CORRELATING ABO_4 COMPOUND STRUCTURES, by K. S. Vorres. [1961] [10]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-104 and Institute of Gas Technology in Chicago) Unclassified

Abstract published in Eighteenth Internat'l. Cong. Pure and Appl. Chem., Montreal (Canada) (Aug. 1961), Abstracts of Scientific Papers, Toronto U. Press, 1961, p. 73. (Title varies)

Published in Jour. Chem. Education, v. 39: 566-568, Nov. 1962.

The structures of ABO_4 compounds depend on several factors. If A and B are the same, or if A can randomly replace B in the lattice, then one of the MO_2 structures is observed. The structure can usually be predicted on the basis of the cation: anion radius ratio. When A does not randomly replace B, then compound formation is observed. This has been studied systematically in terms of the valences of A and B. Thus these may be classified as IV-IV, III-V, II-VI, or I-VII compounds. The literature has been reviewed and a number of compounds have been prepared and studied to determine the criteria for random replacement or compound formation. These criteria are discussed in terms of similarity of valences, ionic size and non-metal contact distances, coordination number, electronegativity, and polarizability. Predictions are made for the structures of other compounds which have not yet been prepared or studied.

EXTENSION PROPERTIES OF BANACH SPACES, by A. Sobczyk. [1962] 11p. incl. refs. (AFOSR-3248) (AF 49(638)1055) AD 450830 Unclassified

Also published in Bull. Amer. Math. Soc., v. 68: 217-224, May 1962.

The equivalence of several properties concerning projections and extensions in Banach space which are seemingly different, is established. The main result is the equivalence of the extension property to the uniform extension property. This is a consequence of the following theorem: If a Banach space B has the property that there is a bounded projection of C onto B, for every Banach space C which is a superspace of B, then there exists a constant K = K(B), independent of C, such that for each superspace C, there is a projection onto B having bound less than or equal to K.

TOPOLOGICAL SPACES WITH LESS THAN HAUSDORFF SEPARATION, by A. Sobczyk. [1962] [36]p. incl. refs. (AFOSR-3249) (AF 49(638)1055) AD 428352 Unclassified

An attempt is made to provide a needed foundation for the study of projections in function-spaces on the basis of the following definition: A set **X** is a topological space in case there is a collection of subsets, called open sets, which satisfy the following conditions: (1) any union of open sets is open; (2) any finite intersection of open sets is open; and (3) x and φ are open. As usual, a subset A of X is closed if and only if its complement A' is open. It is proved that there is a resolution of topologies for X into complementary topologies, corresponding to complementary linear subspaces of real-valued continuous functions on X.

LINEAR VARIETIES OF PROJECTIONS, by A. Sobczyk. [1962] 17p. (AFOSR-3701) (AF 49(638)1055) Unclassified

A projection in a linear space E is a linear operator P such that $P^2 = P$. If $R \subset E$ is the range of P, since PPx = Px, the projection P is the identity on R. Let N denote the null-space of P. Then I - P is a projection with null-space R, and range N. Each $z \in E$ has a unique representation $z = x + y = Pz + (I - P)z$, $x \in R$, $y \in N$; R and N are called complementary subspaces and uniquely determine the projections P and (I - P). In case 2 projections P, Q in E have a common range, it follows that PQ = Q, QP = P; and in case they have a common null-space, that PQ = P, QP = Q. Conversely, if P and Q are any operators such that PQ = Q, QP = P, then from the first equation, P must be the identity on R (Q), $R(P) \supset R(Q)$, and from the second equation, Q must be the identity on R(P), $R(Q) \supset R(P)$, therefore R(P) = R(Q). Similarly, if P, Q are any linear operators such that PQ = P, QP = Q, it is shown that N(P) = N(Q).

PROJECTIONS AND ISOMETRIC SUBSPACES, by A. Sobczyk. [1962] 9p (AF 49(638)1055) Unclassified

It is proved that for any hyperplane M in a space $m(Z_p = R_p$ for any finite set $Z = 1, \ldots, p$, if there is a projection of bound 1 of R_p onto M, then necessarily M is isometric with R_{p-1}. The question is raised does a Banach space B exist which has exact projection constant s, such that for each C B, there is a projection of C onto B of bound less than s? And is there a space B which is universally unique-minimal, i.e., a space B which for every C which contains B, is unique-minimal? The discussion on these questions leads to the derivation of a form for the isometry of M onto R_m.

THE SIMPLE DIMENSION OF A TOPOLOGICAL SPACE, by A. Sobczyk. [1962] 12p. (AF 49(638)1055) Unclassified

Denote by C(S) the linear space of all continuous real functions on a topological space S. For any finite dimensional linear subspace N of C(S), if n is the dimension of N, there exist n linearly independent functions $u_1, \ldots, u_n$ of N which form a basis. It is shown that the mapping, φ, on S to Euclidean space E_n, defined by $\varphi(s) = (u_1(s), \ldots, u_n(s))$, is continuous.

AN EXAMPLE OF HYPERFRAGMENT DECAY IN THE π^+ MODE AND OTHER INTERACTIONS OF K^- MESONS AND HYPERONS IN EMULSION, by M. Blau, C. F. Carter, and A. Perlmutter. [1962] [12]p. incl. diagrs. tables, refs. (AFOSR-J539) (AF 49(638)97) Unclassified

Also published in Nuovo Cimento, Series X, v. 27: 774-785, Feb. 16, 1963.

A number of interactions of hyperons and K^- mesons with emulsion nuclei are described. In particular, an example of a hyperfragment decaying by the π^- mode and a possible ($\Sigma^+ p$) hyperfragment decay have been observed. Also described are captures of Σ^- hyperons with large energy release, an unusual Σ^- decay, a possible example of $\Sigma^+ \rightarrow n + \gamma$, and certain K^--multinucleon interaction A summary of all known $\Sigma^\pm$ inelastic interactions with nuclei is also included.

SOME LIE ADMISSIBLE ALGEBRAS, by P. J. Laufer and M. L. Tomber. [1961] [6]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)511 and National Science Foundation) Unclassified

Published in Canad. Jour. Math., v. 14: 287-292, 1962.

A study is presented of algebras which are related to Lie algebras in that they satisfy some of the identities of a Lie algebra and are also Lie admissible. An example of such a generalization is a flexible algebra satisfying $x(yz) + y(zx) + z(xy) = 0$ and $(xy)z + (yz)x + (zx)y = 0$. Such an algebra is both Lie admissible and Jordan admissible. The 2 major theorems are concerned with a more general class than that determined by the above identities. Let $\mathfrak{A}$ be a flexible, Lie admissible algebra over an arbitrary algebraically closed field Ω of characteristic 0. It is proved that if $\mathfrak{A}^{(-)}$ is a semi-simple Lie algebra, then $\mathfrak{A}$ is a direct sum of simple, flexible, Lie admissible algebras. Under the same hypotheses, if $\mathfrak{A}^{(-)}$ is a simple Lie algebra, then $\mathfrak{A}$ is a simple Lie algebra isomorphic to $\mathfrak{A}^{(-)}$.

THEORY OF ELECTRON CONDUCTION IN STRONG MAGNETIC FIELDS AT LOW TEMPERATURES, by K. Nakamura. Oct. 1962, 14p. (AFOSR-3906) (AF 49-(638)70) AD 287464 Unclassified

An approach for the study of electron conduction in strong magnetic fields is developed and the thermopowers of metals are calculated. The final results will be obtained in the near future. It is expected that in transverse conduction the dependence of thermopower upon magnetic field will be significantly changed by the presence of phonon drag. On the other hand, the effect of phonon drag in longitudinal conduction will be smaller, compared with that in transverse conduction.

ANTIFERROMAGNETIC RESONANCE AT HIGH MICROWAVE POWER (Abstract), by H. Van Till and J. A. Cowen. [1962] [1]p. [AF 49(638)613] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 449, Aug. 27, 1962.

Several new phenomena have been observed in the magnetic resonance in $CuCl_2 \cdot 2H_2O$ in the antiferromagnetic state at high microwave power. These include: (1) A shift in the antiferromagnetic-resonance position with increasing microwave magnetic field h_1 which terminates in a discrete "jump" of the resonance line to some other position. (2) A complex shift, with increasing h_1 in the fine-structure lines which appear on the larger line. Some lines appear to shift more rapidly than others and the line shapes change. (3) A change in position and amplitude of the proton magnetic resonance during the antiferromagnetic-resonance shift. (4) The transient appearance of a resonance at approximately $H/2$ when the antiferromagnetic resonance line has first undergone a discrete jump. The experiments were performed at 9.4 kmc, at temperatures near 1.2°K. The onset of the effect was observed at microwave powers of approximately 5 mW with cavity Q's of 3000. Although the theoretical interpretation has not been carried out, it appears that these phenomena are related to the critical field discussed in detail by Suhl for ferromagnetic resonance in ferrites.

EFFECT OF ISOTOPIC COMPOSITION ON SOLID STATE SPECTRA (Abstract), by D. J. Montgomery, W. B. Zimmerman, and R. H. Misho. [1962] [1]p. (AFOSR-3557) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)622 and Atomic Energy Commission) Unclassified

Presented at Internat'l. Symposium on Far Infrared Spectroscopy, Cincinnati, Ohio, Aug. 21-24, 1962.

A study was made of the infrared spectrum in the region of the dispersion wavelength, λ_0, for thin films of lithium fluoride ($\lambda_0 \sim 30\mu$) made with varying

proportions of Li^6 and Li^7, and for thin films of lithium hydride ($\lambda_0 \sim 20\mu$) made with varying proportions of Li^6 and Li^7, H^1 and H^2. The position of the principal absorption peak and its half-width were studied as a function of isotopic composition, film thickness, and temperature. Although some of the main features of the curves can be explained on the simple Born-Huang approach, the details show that a more powerful treatment is necessary. Some preliminary work is described on samples prepared by methods other than evaporation of films on various substrates.

AZIMUTHAL ASYMMETRY OF A POINT SOURCE IN A CYLINDRICAL LOW VELOCITY MEDIUM, by W. C. Meecham and J. DeNoyer. [1961] [6]p. incl. diagrs. (AF 49(638)911) Unclassified

Published in Bull. Seismol. Soc. Amer., v. 52: 139-144, Jan. 1962.

The geometry of the medium in the vicinity of an otherwise symmetrical source is shown to produce a frequency dependent variation of amplitude with azimuth. The model considered is a cylindrical low velocity and low density fluid medium that is contained in a full space of a higher velocity and density fluid material. A simple harmonic point source is located on the axis of the cylinder. Amplitudes in the higher velocity medium at large distances from the source are found to be functions of the velocity ratio and the density ratio of the 2 media, the radius of the cylinder, the wavelength, and the angle between the axis of the cylinder and a line connecting the point of observation with the source.

EFFECTS OF DECOUPLING ON SPECTRA OF SEISMIC WAVES, by D. E. Willis and J. T. Wilson. [1961] [9]p. incl. diagrs. table. (AF 49(638)911) Unclassified

Published in Bull. Seismol. Soc. Amer., v. 52: 123-131, Jan. 1962.

A series of controlled high explosive shots were conducted by the Atomic Energy Commission in a salt mine near Winnfield, La., to investigate seismic decoupling theories. Two recording stations were used by the University of Michigan at various distances between 1.1 and 14.7 km for a majority of these shots. Frequency analyses of the magnetic tape recordings were made and the results are presented showing the relationship of the frequency spectra as a function of charge size, distance from the source, and coupled vs decoupled shots. The smaller decoupled shots detonated in the large spherical cavities were observed to have somewhat higher predominate frequencies than the equivalent size coupled shots. A change in cavity size produced no significant difference in the shape of the spectra of the large decoupled shots.

OBSERVED ASYMMETRY OF AMPLITUDES FROM A HIGH EXPLOSIVE SOURCE, by J. DeNoyer, D. E. Willis, and J. T. Wilson. [1961] [5]p. incl. diagrs. table. (AF 49(638)911) Unclassified

Published in Bull. Seismol. Soc. Amer., v. 52: 133-137, Jan. 1962.

Frequency analysis of seismic magnetic tape records from a 500-ton high-explosive source shows a pronounced variation of amplitude with frequency for 2 different azimuths from the source. This amplitude variation is attributed, at least in part, to diffraction effects produced by the geologic structure in the vicinity of the source. The possibility of generating both SV and SH waves from P waves within this structure seems very probable.

SOME FEATURES OF STABILITY OF LAMINAR FLOWS AND OF TRANSITION TO TURBULENCE, by A. M. Kuethe. [1962] [12]p. incl. diagrs. table, refs. (AFOSR-3648) (AF 49(638)336 and AF 18(603)34) Unclassified

Also published in Miszellaneen der Angewandten Mechanik, by W. Tollmien. Berlin, Akademie-Verlag, 1962, p. 154-165.

Experiments are conducted on the character of small disturbances in Poiseuille flow in a tube and in a stable boundary layer on a sphere. Investigation is also undertaken on the transition process in the tube flow. Results are discussed and the following conclusions are reached: (1) the threshold disturbance for transition in fully developed Poiseuille flow in a tube decreases with increasing Reynolds number, (2) in fully developed Poiseuille flow in a tube and in a stable boundary layer, there exist many stable disturbance modes, (3) the details of the transition process are strongly dependent on the nature of the disturbance generated, (4) when the disturbance generator is placed in the laminar flow away from the wall, the maximum value of the high shearing stresses measured at the wall depends on the radial distance from the disturbance generator to the wall, and (5) the measurements provide some clues to the cause of the high rate of heat transfer and high recovery factor occurring in the transition region in high speed flow.

IGNITION TIME DELAY OF HYDROGEN-OXYGEN-DILUENT MIXTURES AT HIGH TEMPERATURES, by J. A. Nicholls, T. C. Adamson, Jr., and E. B Morrison. [1962] [5]p. incl. diagrs. table, refs. (AF 49(638)562) Unclassified

Published in AIAA Jour., v. 1: 2253-2257, Oct. 1963.

The motivation for this study arose from experiments on standing detonation waves wherein the flame front was visibly separated from the shock front. This physical separation corresponds to the ignition time delay. A theoretical analysis of the ignition time delay zone for hydrogen-oxygen-diluent mixtures is presented herein. A reaction scheme consisting of 9 reactions, which should be valid for temperatures above about 1100°K, is considered. Assuming the initial mol fractions of H_2 and O_2 to be of order unity and taking advantage of inequalities that should be valid to at least 2000°K, it is possible to integrate the differential equations representing the kinetics. Thus time dependent expressions for all radical and water vapor concentrations behind the shock wave are obtained. A characteristic time, based on the initial concentration of H_2 and the fastest reaction rate constant, is introduced. For times much greater than this characteristic time, the equations reduce to very simple forms. In order to arrive at an explicit analytical expression for the ignition time delay, a value for the mol fraction of H, characteristic of this delay time, is introduced. It is found that the delay time is dependent on the temperature, pressure, composition, and reaction rate constant for the rate controlling reaction. There is weak dependence on the reaction rate constants for the initiation reactions. A brief comparison between this theory and some experimental results on standing detonation wa[illegible]s presented and good agreement found. The theory is also in good agreement with available shock tube results.

ABUNDANCES OF ELEMENTS IN STARS AND NEBULAE (STUDIES OF HYDROGEN-DEFICIENT STARS: I), by L. H. Aller. June 1962, 41p. incl. diagrs. tables, refs. (Technical note no. 1) (AFOSR-2954) (AF 49(638)807) AD 282369 Unclassified

In order to interpret the spectrum of a star composed primarily of helium rather than of hydrogen, it is necessary to construct a model atmosphere which gives the variation of pressure temperature and density with depth. On the assumption that the atmosphere is in hydrostatic equilibrium and that flow of energy takes place by radiation rather than by convection currents, the calculation of an appropriate model is described. The essential boundary condition that the radiative flux is constant with depth can be applied only after temperature and pressure have been calculated for all different depths and the entire radiation field has been calculated. Hence an iterative process has to be applied. Procedures which work for the corresponding problem of a hydrogen atmosphere fail, and one must proceed by trial and error in order to obtain the final solution. (Contractor's abstract)

A SEARCH FOR Ba II STARS, by A. P. Cowley and C. R. Cowley. [1962] [3]p. incl. diagr. table. (AFOSR-3087) (AF 49(638)807) AD 450842 Unclassified

Also published in Publ. Astronom. Soc. Pacific, v. 74: 79-81, Feb. 1962.

In this preliminary survey of plates taken with the 10° objective prism of the 24-26 in. Curtis Schmidt of the University of Michigan, it was found that due to the crowding of metallic lines in the region of the λ-4554 Ba II resonance line, a higher dispersion than 110 A°/mm at Hγ was needed to be able to definitely class certain stars of the B II type as K giants. These stars differed most from normal K giants in the abnormal strength of Sr II 4077 and 4216. The stars previously classified as KO are thus assigned tentatively to a peculiar K-star category.

ABUNDANCES OF ELEMENTS IN STARS AND NEBULAE (SPECTRAL LINE STRENGTHS FROM ASTROPHYSICAL DATA), by L. H. Aller, July 1962, 29p. incl. diagrs tables. refs. (Technical note no. 3) (AFOSR-3432) (AF 49(638)807) AD 612193 Unclassified

An attempt is made to compile empirical log (gf λ's) for lines of metallic ions of FeII, FeIII, CrII, TiII, and MnII. Here f is the Landenburg f, or oscillator strength, g is the statistical weight of the lower level, and λ is the wavelength of the line. The curve of growth relates the equivalent width of a spectral line to the number of atoms capable of absorbing it and to the f-value of the transition involved. If the electron pressure and temperature in the stellar atmosphere are known, relative log gf λ's can be determined. Furthermore, if laboratory absolute gf's are available for a few of these lines, then relative gf λ's can all be converted to absolute gf λ's. The advantages and limitations of these astrophysical gf's are described, and it is emphasized that in order to secure adequate line strength data, one must (a) secure good line-intensity data (b) interpret these with the aid of a model atmosphere, taking into account effects of the stratification in the atmosphere. The gf λ-values herein tabulated may be useful in analyzing the spectra of incandescent gases in laboratory or experimental sources of unknown temperature and pressure. (Contractor s abstract)

ABUNDANCES OF ELEMENTS IN STARS AND NEBULAE (THE MANGANESE STAR 53 TAURI), by L. H. Aller and W. P. Bidelman. July 1962, 42p. incl. illus. diagrs. tables, refs. (Technical note no. 5) (AFOSR-3434) (AF 49(638)807) AD 612183 Unclassified

Presented at meeting of the Amer. Astronom. Soc., New Haven, Conn., Aug. 26-29, 1962.

Abstract published in Astronom. Jour., v. 67: 571, Nov. 1962. (Title varies)

The chemical composition of the Manganese star 53 Tauri was studied. Transition probabilities required for the problem are obtained from laboratory sources whenever possible, but some are obtained by the calibration of stellar data. The temperature of the star, deduced from ionization equilibrium, is near 11,000°K-a value in good agreement with that found from spectral energy scans by Jugaku and Sargent. The electron pressure in the atmosphere, deduced from the total intensities of hydrogen lines, appears to lie in the neighborhood of 500 dynes cm^{-2}. Several striking abundance anomalies are found; they cannot be explained by deviations from local thermodynamic equilibrium. Manganese seems to be the most abundant metal in the star, but gallium appears to show the greatest enhancement of abundance over the normal value. Strontium, yttrium, and zirconium are also enhanced in abundance, while manganese, and calcium seems to be depleted. (Contractor's abstract)

SINTERING OF ZINC OXIDE, by L. F. Norris and G. Parravano. [1962] [4]p. incl. diagrs. (AFOSR-1361) (AF 49(638)493) AD 438298 Unclassified

Also published in Jour. Amer. Ceram. Soc., v. 46: 449-452, Sept. 1963.

Sintering studies have been conducted with single crystal spheres of zinc oxide in air at total pressures of 10^{-3} to 1.0 atm over the range 1050° to 1250°C. Quantitative observations were made on the rate of growth of a neck between the spheres. No change in the distance between the geometrical centers of the spheres was observed. An analysis of the kinetic data shows that sintering was predominantly achieved by distillation through the surrounding gas phase. At 1150° the rate of welding was inversely influenced by the total pressure when the latter was changed from 0.003 to 0.75 atm. No conclusion could be reached on the effect of the oxygen partial pressure at constant total pressure. A brief summary of the various sintering mechanisms of zinc oxide from 700° to 1250°C is presented. (Contractor's abstract)

KINETICS OF SINTERING OF RUTILE SINGLE CRYSTAL SPHERES, by H. M. O'Bryan, Jr. and G. Parravano. July 1962, 33p. incl. illus. diagrs. tables, refs. (Rept. no. 02832-15-T) (AFOSR-2763) (AF 49(638)493) AD 282373 Unclassified

The sintering of single crystal rutile has been studied in air and in reducing atmosphere in the temperature range 900° to 1350°C using a sphere-to-sphere model. Rate data show that there are 2 sintering periods: a slow initial growth characterized by a rate exponent n = 7 and a more rapid subsequent period n = 2. The development of flat surfaces or facets on the particles is used to explain the 2 periods. A scaling exponent of 3 and an activation energy of 70 kcal/mol indicate that volume diffusion is the sintering mechanism. The initial rate exponent cannot be explained. Increase sinterability of reduced rutile is explained by the defect structure. Facet formation on rutile spheres is discussed. (Contractor's abstract)

THE STIRRED-FLOW REACTOR IN HETEROGENEOUS CATALYSIS, by G. Parravano. Final rept. Dec. 1962, 5p. (AFOSR-4410) (AF 49(638)506) AD 400053 Unclassified

This research was devoted to the study of those chemical reacting systems which are of interest for furthering

present understanding of the mechanism of heterogeneous catalysis. A thorough search of several catalytic reactions was undertaken. Isomerization of hydrocarbons, polymerization of vinyl monomers, oxidation of CO, decomposition of nitrous oxide, and electrochemical polymerization reactions were investigated to find the experimental conditions (nature of catalyst, concentration of reagents, temperature and contact time) most suitable for stirred-flow operation. The results suggest that the application of the stirred-flowed technique to heterogeneous catalysis has value for assuring uniformity of catalyst composition and polymer produced, and, in addition, has great value for use in complex reactions and for the comparison of results obtained on catalyst samples, which differ in a characteristic property of the solid state (electrical, magnetic effects).

FURTHER STUDIES OF Cr I EMISSION FROM THE SHOCK TUBE, by G. Charatis and T. D. Wilkerson. [1962] [2]p. incl. table, refs. [AF 49(638)439] Unclassified

Published in Phys. Fluids, v. 5: 1661-1662, Dec. 1962.

Previous results showing anomalous excitation temperatures of Cr I lines in reflected shocks are now attributed to an error in the gf values obtained by Hill and King. New work on relative intensities of Cr I and Cr II lines and line-reversal measurements are consistent with equilibrium in shocks at 6600° to 9600°K if the gf values are adjusted.

AN INFORMATIONAL APPROACH TO THINKING, by M. I. Posner. Apr. 1962, 177p. incl. diagrs. tables. refs. (Rept. no. 02814-9-T) (AFOSR-2635) (AF 49-(638)449) AD 276136 Unclassified

The general hypothesis of this thesis is that the amount of reduction of information from input to output is an important factor in the amount of thinking required by the task. This applies only to tasks which require the subject to process the input so that it is represented in a reduced form in the response. The hypothesis leads to the prediction that the greater the amount of information reduction involved in a task the greater the length of time to accomplish it, the more errors, the greater the variability over subjects, and the longer the learning time. The possibility of specifying the amount of thinking required by a psychological task is demonstrated. Within a given task configuration the information reduction measure provides accurate prediction of human performance. It provides a base line useful in the comparison of performance among different types of tasks and in the classification of tasks. (Contractor's abstract)

COMMUNICATIONS AND DECISION PROCESSES AS DETERMINANTS OF ORGANIZATIONAL EFFECTIVENESS. REPORT OF A FIELD EXPERIMENT, by S. E. Seashore and D. G. Bowers. Final rept. Mar. 1962, 141p. incl. diagrs. tables. (AFOSR-2553) (AF 49(638)-1032) AD 275894 Unclassified

A field experiment was conducted to increase in certain departments of an industrial firm: (1) group-oriented activity, (2) mutual interaction and influence within work groups, (3) supervisory supportiveness in relation to subordinates, and (4) amount of decision-making activity by subordinates. These changes were successfully introduced in 3 experimental departments in comparison with 2 control departments. The effects were to increase machine efficiency, and to increase employee satisfactions. Waste performance improved in both experimental and control departments. Absence rates rose overall, but less in the experimental than in the control departments. (Contractor's abstract)

SUPERVISORY METHODS AND GROUP PERFORMANCE NORMS, by M. Patchen. Mar. 1962 [29]p. incl. tables. (AFOSR-2554) (AF 49(638)1032) AD 281261 Unclassified

Also published in Admin. Sci. Quart., v. 7: 275-294, Dec. 1962.

Some of the determinants of group performance norms in an industrial firm are examined. Encouragement of efficiency by the foreman is shown to be effective only when the supervisor also attempts to obtain rewards for subordinates—and vice-versa. Close supervision is found, in seeming contradiction to previous studies, to facilitate high performance norms. Reward for efficiency and strong group cohesiveness have the best effects when supervision is close. The conditions under which close supervision can be effective and when it is ineffective are discussed. When the supervisor shows an interest in the work and is not indifferent, the subordinates are eager to please him. "Close supervision" is defined operationally as primarily frequent checking on subordinates' work, and not reducing their freedom to do the work in their own way.

SELF-ESTEEM AND THE DIFFUSION OF LEADERSHIP STYLE, by D. G. Bowers. Mar. 1962 [18]p. incl. refs. (AFOSR-2555) (AF 49(638)1032) AD 276702 Unclassified

Also published in Jour. Appl. Psychol., v. 47: 135-140, Apr. 1963.

This study suggests that conflicting evidence concerning leadership climate may be reconciled by postulating intervening cognitive processes. One such cognitive process, the self-esteem of the lower-level supervisor, is studied in the context of an organization in which no formal human relations training had taken place. A series of hypotheses relate supportiveness of the foreman's supervisor to the foreman's self-esteem, and its attendant consequences, and the latter to the foreman's behavior toward his subordinates. All hypotheses are confirmed and lend strong support of the proposition that evidence for leadership climate can be obtained ordinarily only by taking into account the motivational and cognitive structures which exist at the levels of organization being studied. DYNAMIC DECISION THEORY AND PROBABILISTIC INFORMATION PROCESSING, by W. Edwards. [1961] [39]p. incl. diagr. refs. (AFOSR-1402) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)769 and Operational Applications Lab.) Unclassified

Presented at Human Factors Soc. Conf., Columbus, Ohio, Sept. 13-15, 1961.

The development of a dynamic decision theory will be central to the impending rapid expansion of research on human decision processes. Out of a taxonomy of 6 kinds of decision problems, 5 require a dynamic theory in which the decision maker is assumed to make a sequence of decisions, basing decision n + 1 on what he learned from decision n and its consequences. Research in progress on information seeking, intuitive statistics, sequential prediction, and Bayesian information processing is reviewed to illustrate the kind of work needed. The relevance of mathematical developments in dynamic programming and Bayesian statistics to dynamic decision theory is examined. A man-computer system for probabilistic processing of fallible military information is discussed in some detail as an application of these ideas and as a setting and motivator for future research on human information processing and decision making. BAYESIAN STATISTICAL INFERENCE FOR PSYCHOLOGICAL RESEARCH, by W. Edwards, H. Lindman, and L. J. Savage. Jan. 1962 [50]p. incl. diagrs. tables, refs. (AFOSR-2009) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)769 and AF AFOSR-62-182, Office of Naval Research, and Operational Applications Lab.) Unclassified

Also published in Psychol. Rev., v. 70: 193-242, May 1963.

Bayesian statistics, a currently controversial viewpoint concerning statistical inference, is based on a definition of probability as a particular measure of the opinions of ideally consistent people. Statistical inference is modification of these opinions in the light of evidence, and Bayes' theorem specifies how such modifications should be made. The tools of Bayesian statistics include the theory of specific distributions and the principle of stable estimation, which specifies when actual prior opinions may be satisfactorily approximated by a uniform distribution. A common feature of many classical significance tests is that a sharp null hypothesis is compared with a diffuse alternative hypothesis. Often evidence which, for a Bayesian statistician, strikingly supports the null hypothesis leads to rejection of that hypothesis by standard classical procedures. The likelihood principle emphasized in Bayesian statistics implies, among other things, that the rules governing when data collection stops are irrelevant to data interpretation. It is entirely appropriate to collect data until a point has been proven or disproven, or until the data collector runs out of time, money, or patience. (Contractor's abstract)

STUDIES ON DRIVE AND INCENTIVE IN PERCEPTION. VII. SOME EFFECTS OF EXTRANEOUS SOUND AND MANIFEST ANXIETY ON DISCRIMINATION BEHAVIOR, by D. D. Dorfman, A. Platz, and R. B. Zajonc. Mar 1962, 20p. incl. diagrs. tables, refs. (Technical rept. no. 17) (AFOSR-2546) (AF 49(638)367) Unclassified

The present research was designed to test some implications of the hypothesis that the effective or perceived intensity of a stimulus is a function of drive (D) and physical stimulus intensity (S). Implications were derived for discrimination behavior using Spence's transposition model. Four stimulus-drive combinations consisting of either of 2 mild tactual stimuli paired with either of 2 sound intensities were presented to 48 S_S under conditions of successive discrimination-training. All S_S were consistently reinforced for emitting one response to a weak tactual stimulus and a second response to a stronger tactual stimulus. One group of S_S was reinforced only when the concomitant drive was low, and another group when the drive was high. Within each group, there were 4 subgroups, each with a different range of sound intensity. The results confirmed the following implications of the hypothesis: (1) Increase in drive from level of reinforcement reduced the percentage of correct responses to the weaker stimulus and increased it to the stronger; and (2) Decrease in drive from the level of reinforcement reduced the percentage of correct responses to the stronger stimulus and increased it to the weaker. Division of the subjects on the basis of Manifest-Anxiety scores revealed that these effects were larger for low- than for high-anxiety subjects. (Contractor's abstract)

STUDIES ON DRIVE AND INCENTIVE IN PERCEPTION. VIII. STIMULUS GENERALIZATION AS A FUNCTION OF DRIVE SHIFT, by D. V. Cross and R. B. Zajonc. Apr. 1962, 14p. incl. diagrs. tables. (Technical rept. no. 18) (AFOSR-2556) (AF 49(638)367) Unclassified

A number of recent experiments examined the hypothesis that the perceived stimulus intensity (S') is an increasing function of the physical stimulus intensity (S) and momentary drive (D) level. This hypothesis together with the assumption that response strength is not a function of $_SH_R$ but $_{S'}H_R$, led to implications concerning the effects of drive on stimulus generalization. It predicts, that when drive level is shifted from training to testing, the resulting change in the perceived stimulus intensity (S') will result in a lateral shift of the stimulus generalization gradient. Twelve male pigeons, deprived of food until their body weights were 80% of their free-feeding level, were utilized to test the implications of the drive-stimulus interaction hypothesis. Hunger served to manipulate drive level and circles of differing sizes were used for the stimulus dimension. The results demonstrated that a displacement of the gradients occurred as a consequence of drive shift. However, in contrast to previous studies, increase in drive level produced shifts of the generalization gradients toward stimuli of greater intensities, and decrease in drive toward stimuli of smaller intensities.

STUDIES IN SELECTION LEARNING. V. FACILITATION AND INHIBITION IN SELECTION LEARNING, by S. A. Karabenick. May 1962, 25p. incl. diagrs. tables. (Technical rept. no. 20) (AFOSR-2745) (AF 49(638)367) Unclassified

The purpose of this study is to investigate selection learning. In selection learning S is required to choose the items that he will learn from the total number of items with which he is presented. This choice is made on the basis of the presentation of a selection cue. The selection cue was varied in an attempt to investigate the 2 processes assumed to be active in selection learning: inhibition and facilitation. Selection learners were also compared with ordinary rote learners. Results for acquisition indicated that all conditions of learning were equal. After a 1 hr interpolated interval no difference was found between selection and ordinary rote learners. The result was at variance with previous studies in selection learning. The forgetting of incidental items was found to be significant in determining retention of intentional items in selection learning. Possible explanations were given for the effect of the selection cue on selection learning. Both facilitation and inhibition were concluded to be a function of the degree to which cue-producing orienting responses were evoked during acquisition in selection learning. This, however, was only a tentative speculation. (Contractor's abstract)

STUDIES ON DRIVE AND INCENTIVE IN PERCEPTION. IX. SOME EFFECTS OF CONDITIONED FEAR ON STIMULUS GENERALIZATION, by A. R. Platz. May 1962, 104p. (Technical rept. no. 19) (AFOSR-2834) (AF 49(638)367) AD 288189 Unclassified

The present study represents one of a series of tests of the hypothesis that drives affect the location of stimuli on intensity investigations. This modification of Hull-Spence behavior theory provides one approach for attacking the problems of perception within a theory which has already proved useful in studying learning phenomena and suggestive in the areas of personality research and social phenomena. It was argued that the drive-stimulus interaction hypothesis is consistent with the experimental data on perceptual effects of motivation, and provides a powerful tool both for integrating these data and for suggesting new tests of this interaction. Implications of the hypothesis were spelled out for accentuation effects, drive effects on recognition threshold, sensory interaction and discrimination learning.

AN AUTOMATIC SPEECH FORMANT TRACKING FILTER, by G. A. Hellwarth. May 1962, 123p. incl. illus. diagrs. refs. (Rept. no. 10) (AFOSR-2591) (AF 49(638)492) AD 282147 Unclassified

The various methods which have been employed for speech analysis are discussed with emphasis on transformations of the signal from the time domain to the time-frequency domain. Procedures are given for simplifying the results of the transformation in order to reduce the channel capacity required to describe the speech signal. Formant coding systems appear to yield great promise if accurate location of the speech formant frequencies can be obtained from the time-frequency transformation. As a solution to formant frequency measurement in real time, a continuously tuned, automatic tracking filter system is proposed which locates these spectral maxima of speech signals through an application of automatic frequency control techniques. The experimental circuitry is described, stability and performance characteristics are given for this feedback control system and several figures are shown to demonstrate the ability of the system to track speech formants. The problem of constructing a complete speech analysis system utilizing tracking filters is discussed. (Contractor's abstract, in part)

PARAMAGNETIC RESONANCE SPECTRUM OF VANADYL AMMONIUM SULFATE (Abstract), by R. Borcherts, G. Wepfer, and C. Kikuchi. [1962] [1]p. [AF 49(638)987] Unclassified

Presented at meeting of the Amer. Phys. Soc., Texas U., Austin, Feb. 23-24, 1962.

Published in Bull. Amer. Phys. Soc. Series II, v. 7: 118. Feb. 23, 1962.

This investigation of the oxidation states of vanadium is a continuation of the work done on vanadium in sapphire (item no. 1239, Vol. III). A sample of $(NH_4)_2Zn(SO_4)_2 \cdot 6H_2O$ containing approximately 0.1% VO^{++} has been grown by evaporation yielding single crystals of this Tutton Salt. The hyperfine separation at a frequency of 9.2865 ± 5 kmc was found to be 81.0 ± 0.5 gauss parallel to the tetragonal axis ($g_{||}$ = 1.993 ± 4) and 160.2 ± 0.5 gauss perpendicular to the tetragonal axis ($g_{\perp}$ = 1.971 ± 4). Powdered samples have 2 sets of 8 peaks. The more intense set has a separation of 78 ± 1 1 gauss (g = 1.99) whereas the weaker set has a separation of 200 ± 1 gauss (g = 1.95). This powdered spectrum is similar to that of vanadium pentoxide in glass (unpublished) and Oxovanadium (IV). Upon x-irradiation of a single crystal divalent vanadium is produced.

LARGE DEFLECTION PANEL FLUTTER, by E. F. E. Zeijdel. [1962] [128]p. incl. diagrs. tables, refs. (AFOSR-1952) (AF 49(638)389) AD 270855 Unclassified

A supersonic flutter analysis of an infinite span plate, which is separated into an array of rectangular panels, is presented. The region between Mach 1 and the $\sqrt{2}$ is of specific interest and linearized 3-dimensional aerodynamic theory is applied. The elastic behavior of the configuration is described by nonlinear plate theory to obtain a criterion of failure at large deflection. Specializing to those cases with relatively large aspect ratio and supports which are unrestrained in the chordwise direction, an estimation of maximum stress due to large deflection is given. Static membrane forces in the spanwise direction are also considered. Numerical results are derived and the effects of number of degrees of freedom, aspect ratio, structural damping, number of panels in the chordwise direction, static membrane forces in the spanwise direction, and large deflection examined. (Contractor's abstract)

OXYGEN AND HYDROGEN PEROXIDE ELECTROCHEMICAL BEHAVIOUR ON CHROMIUM, NICKEL, COBALT AND STAINLESS STEEL ELECTRODES, by G. Bianchi, F. Mazza, and T. Mussini. Feb. 1962 [39]p. incl. diagrs. refs. (Technical note no. 8) (AFOSR-2052) (AF 61(052)260) AD 278690 Unclassified

As far as a Ni electrode is concerned, in neutral solution the O_2 cathodic reduction is an indirect reduction through the redox couple Ni_3O_4/NiO, due to the fact that NiO can adsorb large quantities of O_2 with formation of Ni_3O_4. Again in the case of H_2O_2 solutions the cathodic process is ascribed to an indirect H_2O_2 reduction: H_2O_2 form Ni_3O_4 on Ni surface and thus H_2O_2 reduction occurs through the redox couple Ni_3O_4/NiO. During the H_2O_2 anodic oxidation Ni electrode is deemed to be coated with a Ni_3O_4 layer acting as electrode on which H_2O_2 oxidates at about +500 mv as it was previously observed for magnetite and other metals. The situation is analogous for alkaline solutions. Similar considerations are valid for a Co electrode. In the case of Cr it has been confirmed that no condition allows H_2O_2 formation by O_2 cathodic reduction (this result is verified again in the case of Ni and Co electrodes). It is very particular that O_2 and H_2O_2 cathodic reductions occur for Cr at a potential of about -200 mv independent of the fact that alkaline, neutral or acid solutions are concerned. As far as a stainless steel electrode is concerned, the conclusion can be drawn that stainless steel in neutral media behaves like Fe, from the point of view of O_2 and H_2O_2 reduction; like Cr in alkaline media. CATALYTIC DECOMPOSITION OF ACID HYDROGEN PEROXIDE SOLUTIONS ON PLATINUM, IRIDIUM, PALLADIUM AND GOLD SURFACES, by G. Bianchi, F. Mazza and T. Mussini. [1962] [17]p. incl. diagrs. tables, refs. (AFOSR-4236) (AF 61(052)260) AD 449072 Unclassified

Also published in Electrochim. Acta, v. 7: 457-473, July-Aug. 1962.

The catalytic decomposition of acid H_2O_2 solutions in presence of Pt, Ir, Pd, and Au has been studied. In H_2SO_4 solution, Pt, Ir, and Pd are catalytically active; Au is not active. In HCl solution, none of the above metals is active. The H_2O_2 decomposition is a first order reaction. The surface of the electrode becomes practically covered by a monomolecular layer of oxide during the catalytic H_2O_2 decomposition in acid solution, as shown by anodic and cathodic polarization curves, anodic decay curves and anodic and cathodic charging curves. The metal loses its catalytic activity when it cannot be covered by an adsorbed oxide layer, as when it forms complexes with the solution: for instance, Pt and Ir in HCl solutions or Au in H_2O_2 solutions. The

different rate of oxide formation by H_2O_2 and of the reaction between oxide and H_2O_2 to develop O_2 explains the differences of catalytic activity observed between Pt, Ir, and Pd. (Contractor's abstract)

INVESTIGATIONS OF THE EFFECT OF REPEATED HIGH G FORCES ON FROGS, by T. Gualtierotti, L. Gallitelli, and R. Margaria. [1959] [4]p. (AFOSR-3383) (AF 61(0520)23) AD 629110 Unclassified

Also published in Atti. Cong. Internaz. Med. Aeronaut. e Spaziale, v. 2: 527-529, Oct. 1959.

The recovery of the sense of balance after high G centrifugation in frogs does not seem to be achieved through a mechanism involving sight or muscle sense or touch. The possibility exists that the otolothic system is rebuilt; in this case however the otoliths may be so small as not to be affected by 2000 G centrifugation. Some still unknown mechanism for a gravitational orientation may exist in frogs.

FUNCTIONAL FUNDAMENTAL CHARACTERISTICS OF THE NERVOUS SYSTEM IN ATHLETES AND THE EFFECTS OF PERFORMANCE, by R. Margaria and T. Gualtierotti. [1959] [10]p. incl. diagrs. (AFOSR-3453) (AF 61(052)23) AD 629111 Unclassified

A statistical investigation was made in order to define the changes induced in the central nervous system by physical fatigue and to individuate the possible responsible mechanisms. Subjects performed exhaustive physical exercises after which total reflex time, spinal delay, endplate delay, and motor and sensory conduction speed were measured and compared to normal variability. The most consistent and significant effect of physical fatigue on the spinal cord was the shortening of the conduction time across the spinal centers. The physiological aspects and experimental error are discussed as possible causes of the increased variability observed in some of the data.

MARKOV PROCESSES ON AN ENTRANCE BOUNDARY, by F. [B.] Knight. [1961] [15]p. incl. refs. [AF 18-(603)30] Unclassified

Published in Illinois Jour. Math., v. 7: 322-336, June 1963.

It was proved that a simple Markov process can be reviewed as the prosection onto the original phase space of a strict Markov process on a ramified phase space. Here a new ramification is studied. Given a sample path $t \to x(t)$ of the original motion, the phase of the ramified path at time $t \geq 0$ can be described (a little informally) as the point on the Martin entrance boundary for $x(s)$; $s > t$ to which $x(s)$ tends as $s \downarrow t$; the ramified path is continuous from the right and strict Markov, and the ramified phases can be identified with families of limits of transition probabilities. This theory coincides with the previously proven theory if and only if

$\int_0^\infty e^{-t} P_a[x(t) \in B]dt$ tends to 0 uniformly in a as $B \downarrow 0$.

RANDOM WALKS AND A SOJOURN DENSITY PROCESS OF BROWNIAN MOTION, by F. B. Knight. [1962] [31]p. incl. refs. [AF 18(603)30] Unclassified

Published in Trans. Amer. Math. Soc., v. 109: 56-86, Oct. 1963.

Consider a standard 1-dimensional Brownian motion with sample paths $t \to x(t)$ and define the local time

$$t(t, a) = \lim_{b \downarrow a} \frac{\text{measure } (s: a \le x(s) < b,\ s \le t)}{2(b - a)}.$$

H. Trotter proved that t is continuous in the pair $(t, a) \in [0 + \infty] \times R^1$ and found a Hölder condition for it. The author's main result is that if $T = t^{-1}(t)$ is the inverse function of $t(t, 0)$, then $y(a) = T(T, a)$, considered as a stochastic process with parameter $a \ge 0$, is a diffusion with starting-point t, generator $4y\, d^2/dy^2$, and an absorbing barrier at $y = 0$. The proof is based on the author's approximation to the Brownian motion by random walks. More recently, D. B. Ray has found that, conditional on $x(T) = b$, $v(a) = t(T, a)$ is a still diffusion for T belonging to a wide class of stopping times including Knight's inverse local times $t^{-1}(t)$, passage times, and constant times. Using either Knight's or Ray's result, the exact Hölder condition for $t(t, a)$ as a function of a can be found.

FERROMAGNETIC RESONANCE OF SINGLE-DOMAIN PARTICLES, by E. P. Valstyn, J. P. Hanton, and A. H. Morrish. [1962] [10]p. incl. illus. diagrs. tables, refs. (AFOSR-2938) (AF 49(638)803) AD 296209 Unclassified

Also published in Phys. Rev., v. 128: 2078-2087, Dec. 1, 1962.

The ferromagnetic-resonance spectra of powders containing single-domain particles have been studied experimentally and theoretically. The theory is based on the Stoner-Wohlfarth model. The line shapes were calculated with the aid of a high-speed digital computer. Measurements were made on γ-Fe_2O_3 powders, both with and without an applied steady magnetic field. For zero applied steady field, the theoretical line shapes agree well with the experimental ones provided the particle shape distribution, the crystalline anisotropy, and the particle interactions are taken into account. With an applied field, the theoretical curves with only the shape distribution considered do not agree with the theoretical ones. It is found that the anisotropy constant K_1 and the relaxation time τ of γ-Fe_2O_3 are approximately 2.5×10^5 ergs/cm^3 and 2.0×10^{-10} sec, respectively. (Contractor's abstract)

EFFECT OF SURFACE ROUGHNESS ON MAGNETIC PROPERTIES OF FILMS, by R. J. Prosen, B. E. Gran and others. [1962] [2]p. incl. diagr. table. (AFOSR-J559) (AF 49(638)803) AD 408579 Unclassified

Presented at Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Also published in Jour. Appl. Phys., v. 34: 1147-1148, Apr. 1963.

The conditions of the surface have been found to have a profound influence on the magnetic properties of thin Permalloy films. Quantitative measurements of the surface area were determined by adsorption of a C^{14}-labeled surfactant. Static hysteresis curves, torque curves, and ferromagnetic resonance spectra have been measured and related to surface roughness. Biaxial anisotropy has been observed for films deposited on unidirectionally scratched substrates. The linewidth of the uniform precessional mode with the magnetic field applied parallel to the plane of the film is increased with increasing surface roughness. (Contractor's abstract)

FERROMAGNETIC-RESONANCE LINE SHAPE OF SINGLE-DOMAIN PARTICLES (Abstract), by A. H. Morrish, E. P. Valstyn, and J. P. Hanton. [1962] [1]p. [AF 49(638)803] Unclassified

Presented at meeting of the Amer. Phys. Soc., Seattle, Wash., Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 448, Aug. 27, 1962.

The ferromagnetic-resonance (FMR) spectra of powders containing single-domain particles have been studied experimentally and theoretically. Measurements from dc to 9 kmc in zero-applied steady magnetic field were made on powders of γ-Fe_2O_3. This experiment has the advantage that magnetization reversals do not occur. In contrast, reversals, which may be incoherent, do not take place in coercive force, remanence, and other measurements. The powders differed in their particle shape and size distribution. The FMR line shape was found to be rather broad and flat, and to depend on the particle-shape distribution. A calculation of the line shape was made with the aid of a fast digital computer. Approximate agreement between theory and experiment is obtained by taking into account only the particle-shape distribution as determined by an electron microscope. However, in order to achieve good agreement, it was necessary to consider the crystalline anisotropy and the particle interactions. The value of the crystalline anisotropy constant required to fit the data is in good accord with that deduced from FMR experiments at 9 and 24 kmc in an applied steady magnetic field.

THE ILSTOW AND FEYNMAN INTEGRALS, by R. H. Cameron. [1962] [75]p. (AFOSR-J443) [AF AFOSR-62-252] Unclassified

Also published in Jour. Anal. Math. (Jerusalem), v. 10: 287-362, 1962/1963.

Gel'fand and Jaglom pointed out that if $f = f(x)$ is a nice functional of the standard Brownian path $x(t)$: $t \leq 1$ starting at $x(0) = 0$, then the Wiener integral $\int f[\sigma x(t): t \leq 1]\, dx = \int f[x(\sigma^2 t): t \leq 1]dx$, defined at first for $\sigma > 0$, has an analytic continuation over the region $R(\sigma^2) > 0$, permitting the definition of the Feynman integral of f as $\lim_{\sigma^2 \to 1, R(\sigma^2) > 0} \int f[\sigma x]\, dx$ in some cases. Cameron took up this idea approximating the integrals by finite-dimensional integrals and connecting them by analytic continuation as above. This investigation is now continued by using the fact that $\int f[\sigma x]\, dx$ can be expressed as a Laplace transform with parameter σ^{-2}, and conditions are found for the existence of the Feynman integral of a tame function f; for example, it is found that if $f = g[\int_0^1 h(t)dx(t)]$ with $\int_0^1 h^2\, dt < \infty$ and $\int |dg| < \infty$, then f is Feynman-integrable and its integral is $(2\pi i)^{-1} \times \int g(u) \exp(iu^2/2)du$. An application to the Schrödinger equation is made. (Math. Rev. abstract, modified)

LIFETIME OF HELIUM METASTABLE ATOMS; MOBILITY AND AFTERGLOW STUDIES IN HELIUM, NEON, AND ARGON (Abstract), by H. J. Oskam, V. R. Mittelstadt and others. [1962] [1]p. [AF AFOSR-62-103] Unclassified

Presented at meeting of the Amer. Phys. Soc., Boulder, Colo., Oct. 10-12, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 636, Dec. 27, 1962.

Studies of helium metastable atoms by the absorption technique gave the following results: (a) The diffusion coefficients of the singlet and triplet metastable atoms are the same; the value agrees with that measured by Phelps as did the destruction frequency of the triplet state due to 3-body collisions with helium atoms, (b) When correcting the absorption signal for the emission signal at the same wavelength, no evidence was found for conversion of the singled state into the triplet state by superelastic collisions with electrons as postulated by Phelps, and (c) Preliminary measurements indicated a destruction frequency of the singlet state by collision-induced radiative transitions smaller than found by Phelps. The microwave-cavity method and the ion-transit-time method gave, with respect to ion mobilities, the following consistent data: (a) agreement for He^+, Ne^+, Ne_2^+, and Ar^+ ions with all previous measurements; (b) $\mu_0(He_2^+) = 16.2$ cm/sec per v/cm in contrast with all previous measurements; $\mu_0(Ar_2^+) = 1.85$ cm/sec per v/cm as measured for one of the 3 ions observed by Beaty in argon. The pressure dependence of the cataphoresis effect in helium is a consequence of the production of neon ions by collisions of He_2^+ with neon atoms.

HOLOMORPHIC FIBER BUNDLES OVER RIEMANN SURFACES, by H. Röhrl. [1962] [36]p. incl. refs. [AF 49(638)885] Unclassified

Presented at meeting of the Amer. Math. Soc., Milwaukee, Wis., Nov. 18, 1961.

Published in Bull. Amer. Math. Soc., v. 68: 125-160, May 1962.

This paper is a comprehensive and very useful survey of some recent developments in the study of holomorphic vector bundles over Riemann surfaces; many results are discussed, without proofs but with explicit references to the literature on this subject. The problem of classifying such bundles over compact Riemann surfaces is quite difficult, and satisfactory results are known only in the cases of surfaces of genus one or zero at present. This problem is discussed in detail. A similar problem arises in the classification of analytic families of vector bundles, a problem related quite closely to the modulus problem for Riemann surfaces. Various applications of properties of vector bundles are also discussed; included are Weierstrass and Mittag-Leffler theorems on Riemann surfaces, functional equations and factors of automorphy, and some questions on analytic systems of differential equations (the Riemann-Hilbert problem).

THERMAL DIFFUSION EFFECTS ON ENERGY TRANSFER IN A TURBULENT BOUNDARY LAYER WITH HELIUM INJECTION, by O. E. Tewfik, E. R. G. Eckert, and C. J. Shirtliffe. [1962] [20]p. incl. diagrs. table, refs. (AFOSR-2307) (AF 49(638)558) Unclassified

Also published in Proc. 1962 Heat Transfer and Fluid Mechanics Inst., Washington U., Seattle (June 13-15, 1962), ed. by F. E. Ehlers, J. J. Kauzlarich and others, Stanford U. Press, 1962, p. 42-61.

A circular cylinder with 2-in. diam and with a porous wall fabricated out of woven wire material was aligned with its axis parallel to an air stream with approximately 100 ft/sec velocity. Helium gas was injected into the turbulent boundary layer through the cylinder walls at a uniform rate in the range 1.55×10^{-4} to 1.08×10^{-3} of the free stream mass velocity. The local energy transfer along the cylinder was measured at various values of the wall temperature level where energy flows from the cylinder to the boundary layer and vice versa. Results showed that the wall temperature for zero energy transfer was larger than the free stream temperature by up to about 40°F, although viscous dissipation effects are negligible. This temperature excess increases with increasing injection rate and is independent of Reynolds number. An analysis in which the laminar sublayer is treated as Couette flow with helium injection and which includes thermal diffusion in this layer is formulated. Results show appreciable thermal diffusion effects on adiabatic wall temperature, increasing it over its value for zero injection by amounts of the same order of magnitude as found by measurements. Thermal diffusion, however, has negligible effects on the heat transfer coefficient. Its effects on the concentration and temperature distribution are discussed and shown to produce appreciable modifications in the latter. (Contractor's abstract)

THERMAL DIFFUSION IN LAMINAR BOUNDARY LAYERS OF BINARY MIXTURES OVER A SOLID, ADIABATIC FLAT PLATE, by A. A. Hayday, E. R. G. Eckert, and W. J. Minkowycz. May 1962, 42p. incl. diagrs. refs. (Technical rept. no. 48) (AFOSR-3497) (AF 49(638)556) AD 283369 Unclassified

An analytical study of the influence of thermal diffusion on steady laminar boundary-layer flow of binary gaseous mixtures past a semi-infinite flat plate is reported. The Soret-Dufour effects are evaluated for He-air and H-air mixtures taking into account the influence of free-

stream Mach number, free-stream concentration, and temperature. The results obtained belong to the well known class of similar solutions. In all cases, the plate is assumed to be in thermodynamic equilibrium and without mass absorption or release into the fluid. The results may therefore be interpreted as generalized solutions to the recovery problem. The effect of diffusion on the thermal recovery factor is found to be within 0.5 and 1% for He-air and H-air mixtures near sonic velocity. It increases to 13% for H-air mixtures at a Mach number 10.

TRANSPIRATION COOLING IN A MAGNETOHYDRODYNAMIC STAGNATION-POINT FLOW, by E. M. Sparrow, E. R. G. Eckert, and W. J. Minkowycz. [1962] [23]p. incl. diagrs. tables, refs. (AFOSR-3985) (AF 49(638)-558) Unclassified

Also published in Appl. Scient. Research, v. 11A: 125-147, 1962.

An analysis has been made to determine the reduction in stagnation point heat transfer when blowing and a magnetic field act simultaneously. It is found that in the presence of blowing, the magnetic field may be considerably more effective in reducing heat transfer than in the no-blowing case. The results show that the heat transfer reduction due to the simultaneous action of blowing and magnetic field is greater than that attained by multiplying together the separate reductions due to blowing alone and magnetic field alone. This favorable interaction diminishes as the Prandtl number diminishes and thus may be of lesser importance for highly ionized gases for which the Prandtl number is low. The analysis is carried through for both 2- and 3-dimensional stagnation points, and results are reported for Prandtl numbers of 0.01, 0.1, 0.7, 1, and 10. (Contractor's abstract)

DIFFUSION-THERMO EFFECTS ON HEAT TRANSFER FROM A CYLINDER IN CROSS FLOW, by O. E. Tewfik, E. R. G. Eckert, and L. S. Jurewicz. [1962] [7]p. incl. diagrs. table, refs. (AFOSR-64-0143) (AF 49-(638)558) AD 431009 Unclassified

Also published in AIAA Jour., v. 1: 1537-1543, July 1963.

Measurements are described of the distributions of the heat transfer coefficient and adiabatic wall temperature around a 3-in.-o.d. circular cylinder with a stainless steel woven-wire porous wall, and with its axis normal to a low-speed air stream. Helium was injected through the cylinder wall into the boundary layer at an approximately uniform rate per unit area of outside cylinder surface in the range of 5.45 to 25.8 lbm-hr-ft^2. The range of freestream velocity was 62.9 to 99.0 fps and of free-stream Reynolds number based on cylinder diameter 1.01×10^5 to 1.59×10^5. It was determined that, when the heat exchange between cylinder and air stream was zero, the wall temperature exceeded the freestream temperature by up to 86 F, depending upon location on cylinder circumference, helium injection rate, free-stream velocity, and properties. This phenomenon is due to the diffusion-thermo effect. The measured heat transfer coefficients at the forward stagnation point agreed fairly well with analyses that did not include the diffusion-thermo effect provided that the heat transfer coefficient was defined with the difference between the wall temperature and the adiabatic wall temperature. WIND TUNNEL INVESTIGATION OF A SPIKE-BLUFF BODY COMBINATION FOR A MONORAIL ROCKET SLED M = 2.0 TO M = 5.0, by R. Hermann, F. Moynihan, and D. Olson. Sept. 1962 [102]p. incl. illus. diagrs. tables. (Rept. no. RAL-RR-186) (AFOSR DRA-62-18) (AF 29(600)2839) AD 290609 Unclassified

Results of wind tunnel measurements of lift, drag, and pitching moment on a circular cross-section monorail sled using a flow separation spike including the influence of ground interference are presented and discussed. Variables investigated were the spike length, spike diameter and location on a series of sled nose shapes. Mach number range was from 2 to 5. The sled configuration having the largest drag (spike retracted) and the lowest drag (spike extended) was that with a flat face sled nose and with the spike mounted on the sled axis. The spike length for minimum drag, in general, became longer at higher speeds. Sled lift was essentially unaffected by variation of the spike length. Diameter of the spike had effect on the overall lift or drag. Unsteady flow phenomena (buzzing) were observed for some sled configurations at spike lengths on the order of 1 to 1.5 body diameters, but not at spike lengths for minimum drag. When buzzing occurred, it could be reduced or eliminated by rounding the sled nose shoulder. Mounting the spike below the sled axis diminished the drag reduction characteristics of the spike, increased the incidence of buzzing, but decreased the sled lift.

WIND TUNNEL INVESTIGATION OF AERODYNAMICS OF SLIPPER BEAMS AS MOUNTED ON A TYPICAL SUPERSONIC ROCKET SLED, by F. Moynihan and R. Hermann. Oct. 1962, 33p. incl. illus. diagrs. tables. (Rept. no. RAL-RR-190) (AFOSR DRA-62-19) (AF 29(609)2839) AD 294602 Unclassified

Results of wind tunnel measurements of lift and drag of slipper beams when mounted on a basic sled configuration are presented and discussed. The pressure distributions on the top and bottom of the sled body are also presented. Variables investigated were location of front slipper beam and front and rear slipper beam fairing shape. Mach number range was from 1.5 to 4. Simulated track cross section was that of the Air Force Missile Development Center at the Holloman Air Force Base, New Mexico. The results show that the slipper beam lift characteristics can predominate and by proper shape and location of the slipper beams, the overall sled lift can be effectively controlled. For example, the overall lift can be made negative over the whole Mach number range by using obviously negative lift fairings and by locating the front beam forward of the nose-body shoulder, and by placing the front beam at the shoulder the overall lift is approximately zero over the same speed range. AERODYNAMIC AND HEAT TRANSFER STUDIES WITH EVAPORATIVE FILM COOLING AT HYPERSONIC MACH NUMBERS, by R. Hermann and W. L. Melnik. Sept. 1962, 87p. incl. illus. diagrs. refs. (Research rept. no. 189) (AF 49(638)190) AD 404197 Unclassified

A theoretical model of evaporative film cooling was developed for blunt bodies indicating the effect of mass transfer on heat transfer for Prandtl and Lewis numbers unity. The velocity of the liquid film at the gas-liquid interface is assumed to be so small that the gaseous phase is unaffected. This assumption was verified by a numerical example from the analysis. With this approximation, the effect of mass transfer (evaporation from the liquid film) on heat transfer from the gas-phase boundary layer was obtained from the literature on transpiration cooling. The velocity profile through the liquid film was found to be identical to that of a Couette flow with pressure gradient. The evaporative film cooling experiments were conducted on hemisphere-cylinder, blunted cone, and flat-faced cylinder models at Mach number 6.8 in a high temperature hypersonic blowdown wind tunnel at the Rosemount Aeronautical Laboratories. POLAROGRAPHY OF MOLYBDENUM(VI) IN AQUEOUS SULFURIC ACID SOLUTIONS, by I. M. Kolthoff and I. Hodara. [1962] [13]p. incl. diagrs. tables, refs. (AFOSR-2596) (AF 49(638)519) AD 295890 Unclassified

Also published in Jour. Electroanal. Chem., v. 5: 369-381, 1962.

Polarograms of molybdenum(VI) were determined in solutions of varying molybdenum and sulfuric acid concentrations. Under suitable conditions, 2 clearly defined waves A and B are observed, wave A corresponding to the reduction of molybdenum(VI) to (V) and wave B of molybdenum(V) to (III). In 5 M sulfuric acid, wave A may be split into 2 waves, A_1 and A_2, the heights of which are diffusion controlled. These waves are attributed to the presence of different species of molybdenum(VI). In dilute sulfuric acid (0.1 M or less), wave B is split into 2 waves, B_1 and B_2, which are diffusion controlled and are attributed to the reduction of different species of molybdenum(V). The polarographic diffusion coefficient of molybdenum(VI) multiplied by the square root of the viscosity of the solution increases from $0.5 \cdot 10^{-5}$ in 0.1 M sulfuric acid to $0.6 \cdot 10^{-5}$ $cm^2 sec^{-1}$ in 5 M sulfuric acid. THE STABILITY CONSTANT OF THE $H_2SO_4 \cdot HSO_4^-$ ION AND ITS MOBILITY IN ACETONITRILE, by I. M. Kolthoff and M. K. Chantooni, Jr. [1962] [4]p. incl. tables. (AFOSR-3946) (AF 49(638)519) AD 405789 Unclassified

Also published in Jour. Phys. Chem., v. 66: 1675-1678, Sept. 1962.

From the electrical conductance at 25° of mixtures of tetraethylammonium bisulfate and sulfuric acid in acetonitrile (AN), a value of 65 for the mobility at infinite dilution of the conjugate ion, $H_2SO_4 \cdot HSO_4^-$, has been derived. From the solubility in AN of sodium bisulfate in the presence of various concentrations of sulfuric acid, the solubility product of sodium bisulfate and the stability constant of the conjugate ion have been calculated to be 3×10^{-7} and 1.0×10^3, respectively. Knowing the mobility of the conjugate ion, a value of 1.0×10^3 for the stability constant was calculated from conductance data in pure sulfuric acid solutions in AN. The value of 1.0×10^3 is in excellent agreement with the value 1.15×10^3 obtained from indicator equilibria in solutions of sulfuric acid.

POLAROGRAPHY AND AMPEROMETRY IN NON-AQUEOUS SOLVENTS, by I. M. Kolthoff. Final rept. Nov. 1, 1958-Oct. 31, 1962. Nov. 1, 1962, 4p. (AFOSR-4352) (AF 49(638)519) Unclassified

Research carried out under this contract is summarized. Extensive studies were made of acid-base equilibria in methyl isobutylketone and in non-waterlike solvents, with special emphasis on acetonitrile. A preliminary study of acid-base dissociation in the solvent dimethyl sulfoxide was made. A polarographic investigation was made of the molybdenum catalyzed reduction at the dropping mercury electrode of chlorate, perchlorate, and nitrate in aqueous medium. On the basis of this work, a method was developed to determine traces of molybdenum by measuring the catalytic chlorate reduction current. A list of publications resulting from this research is cited.

CALCULATED AND EXPERIMENTAL CONDUCTOMETRIC TITRATION CURVES OF INTERMEDIATELY STRONG ACIDS AND BASES IN ACETONITRILE, by I. M. Kolthoff and M. K. Chantooni, Jr. [1962] [5]p. incl. diagrs. tables. refs. (AFOSR-3439) (AF 49(638)519) AD 408603 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 85: 426-430, Feb. 20, 1963.

An equation has been derived for the calculation of conductometric titration curves of intermediately strong acids with aliphatic amines in acetonitrile as a solvent. The calculations require a knowledge of the dissociation constants $K_{BH^+AHA^-}$ of the conjugate salt, $K_{BH^+A^-}$ of the simple salt, of the conjugation constant K_{AHA^-}, and of ionic mobilities. Good agreement between calculated and observed conductances has been found in the titration of varying concentrations of sulfuric acid with n-butylamine and of 3,5-dinitrobenzoic acid with triethylamine. From the solubility of potassium 3,5-dinitrobenzoate in solutions of varying concentration of the parent acid, the conjugation constant K_{AHA^-} was found to be equal to 1.7×10^4 while the solubility product of the salt is 5.3×10^{-8} at 25°. A list of other determined constants is given. The maximum in the conductometric titration curves is found at 50% neutralization of the acid when K_{AHA^-} is very large and $K_{BH^+A^-}$ small.

ELECTRON SPIN RESONANCE STUDIES OF SOLID

DEFECTS, by J. E. Wertz. Final rept. Jan. 1, 1960-Dec. 31, 1961. Feb. 1962 [22]p. (AFOSR-2384) (AF 49-(638)683) Unclassified

The work reported here represents a 2-yr period (1960-61) in the study of properties of oxides begun in 1953. Most of the work deals with single crystals of magnesium oxide, but work was also done on powders of magnesium, calcium, strontium and barium oxides. Results on powdered MgO has made it encouraging to work on the other oxides. Additionally, results are reported on the isotropic (or nearly isotropic) defects in the sulfides and selenides of the alkaline earth metals (excluding those of beryllium). The defects include impurities in their usual valence states and in unusual ones as well, e.g., the monovalent ions of iron, cobalt, and nickel. In some cases, there is association of vacancies with other defects. Other defects included trapped electrons and trapped holes. Some of these centers were observed in neutron-irradiated samples, while others could be produced by 4.9 ev- or x-irradiation. Evidence was obtained for Jahn-Teller distortions with the ions Cu^{2+} and Ni^{1+} in MgO, the distortions being mobile above 4°K, but frozen-in at lower temperatures. The establishment of double-quantum electron spin resonance transitions for Ni^{2+} and Co^{1+} led to an estimate for the nuclear magnetic of Ni^{61}, which was heretofore unknown. OXYMERCURATION OF CIS AND TRANS-2-BUTENE, by M. M. Kreevoy, L. L. Schaleger, and J. C. Ware. [1962] [6]p. incl. diagr. table, refs. (AFOSR-862) (AF 49(638)711) AD 613312 Unclassified

Also published in Trans. Faraday Soc., v. 58: 2433-2438, Dec. 1962.

Equilibrium constants have been measured for the reaction of cis and trans-2-butene with aqueous mercuric chloride to give threo- and erythro-3-chloromercuri-2-butanol. These have been combined with the known free energies of formation of the olefins to show that the free energy of isomerization of the oxymercurials is zero. The deoxymercurations of the threo- and erythro-3-iodomercuri-2-butanols by non-halogen acids proceed at nearly identical rates. They give the starting olefins without cross-contamination. These facts are interpreted in terms of the preferred orientation of the various groups. (Contractor's abstract)

THE SOLVOLYSIS OF 2-IODOMERCURIETHYL ESTERS, by M. M. Kreevoy and G. B. Bolem. [1962] [4]p. incl. diagrs. tables, refs. (AFOSR-1717) [AF 49(638)711] AD 438549 Unclassified

Also published in Jour. Org. Chem., v. 27: 4539-4542, Dec. 1962.

A solvolytic deoxymercuration has been discovered—that of 2-iodomercuriethyl esters. Solvolysis rate constants for the benzoate in mixtures of water with 30% or more of dioxane, ethanol, or acetic acid are linearly related to the Grunwald-Winstein Y's. For the acetate, solvolysis rate constants are linearly related to the Grunwald-Winstein Y's in all mixtures of ethanol and dioxane with water, but no linear relation exists over any substantial range of acetic acid-water mixtures. With both compounds a separate slope (m) is obtained for each organic diluent. These results are interpreted in terms of the mechanism of the deoxymercuration reaction and the structure of the transition state. (Contractor's abstract)

INDUCTIVE AND RESONANCE EFFECTS ON DEOXYMERCURATION RATES, by L. L. Schaleger, M. A. Turner and others. [1962] [23]p. incl. diagr. tables, refs. (AFOSR-2732) (AF 49(638)711) AD 438552 Unclassified

Also published in Jour. Org. Chem., v. 27: 3421-3425, Oct. 1962.

Second-order rate constants, k_2, have been measured for deoxymercuration by nonhalogen acid of 14 oxymercurials, $RCH(OCH_3)CH_2HgI$, and 5 oxymercurials, $RCH(OH)CH_2HgI$. For the methyl ethers an excellent correlation (with $\rho^* = -2.77$) between $\log k_2$ and the Taft σ^*'s is obtained when $R = XCH_2$. Compounds in which R is an α,β-unsaturated group give substantial resonance effects. Compounds in which R has other than 2 α-hydrogen atoms seem to give rise to a Baker-Nathan effect with $n = 0.28$, but the effect is relatively small and the point for $R = H$ is an exception. The data for the alcohols is consistent with a similar pattern. These results preclude a transition state closely resembling the protonated starting state and are consistent with a transition state intermediate between protonated starting state, the olefin-mercuric monoiodide complex plus methanol, and the carbonium ion plus methanol. USE OF ELECTROSTATIC VARIATION PRINCIPLES IN MOLECULAR ENERGY CALCULATIONS. by D. M. Schrader and S. Prager. [1962] [5]p. incl. tables. (AFOSR-2802) (AF 49(638)720) AD 278445 Unclassified

Also published in Jour. Chem. Phys., v. 37: 1456-1460, Oct. 1, 1962.

The Thomson and Dirichlet principles of electrostatics have been applied to the evaluation of electron-interaction terms occurring in molecular-energy calculations. A suitable choice of certain trial electric fields and electrostatic potentials permits these terms to be approximated both from above and from below. These approximate calculations of electronic interaction terms may often be considerably easier to perform than the exact evaluations required when molecular energies are obtained in the usual way through the minimum-energy principle. At the same time, when the upper and lower bounds obtained by the present method are properly inserted into the total-energy expression, the validity of the minimum-energy principle is preserved, so that any parameters appearing in the trial wave function can still be evaluated by the usual energy minimization procedure. For illustration, the method has been applied to the calculation of the ground-state energy of molecular hydrogen. (Contractor's abstract)

DIFFUSION AND VISCOUS FLOW IN CONCENTRATED SUSPENSIONS. by S. Prager. June 1962. 18p. (Technical rept. no. 4) (AFOSR-2803) (AF 49(638)720) AD 278446 Unclassified

Also published in Physica, v. 29: 129-139, Feb. 1963.

The principle of minimum entropy production is applied to obtain bounds on the diffusion coefficient of a solute in a suspension of solid particles, as well as on the viscosity of the suspension. These bounds involve certain 2 and 3-point correlations characterizing the geometry of the liquid-solid interface, but are not in any way dependent upon the adoption of a simplified model to represent the system. In particular, it is not necessary to assume that the suspended particles are too far apart to interact with one another, and the theory is therefore valid even when the volume fraction of solid is high. COMPLEX REFRACTIVE INDEX OF AN IDEAL MONATOMIC GAS, by C. A. Mead. [1962] [6]p. (AFOSR-2196) (AF 49(638)940) AD 611743 Unclassified

Also published in Phys. Rev., v. 128: 1753-1758, Nov. 15, 1962.

The main results of some previous work of the author on this subject are rederived in a more rigorous fashion. In particular, no appeal is made to perturbation theory or to the author's "damping operator" formalism, and closer attention is paid to the question of proper averaging over configurations of absorbers. All effects due to translational motion of absorbers are neglected, but the dipolar "resonance" interactions are included. It is shown that the formal results of the previous work, which permit a detailed calculation of the absorption line shape, are valid under the following assumptions: (a) The average optical behavior of the gas is describable in terms of a refractive index, and (b) there is no correlation between the positions of different absorbers, i.e., the gas is ideal. However, it is also shown that the cutoff procedure for handling a divergent integral which appears in the theory must be modified. The modified cutoff procedure leads to a large increase in the theoretically predicted linewidth, in qualitative agreement with experiment. (Contractor's abstract)

THEORY OF ABSORPTION LINE SHAPES IN MONATOMIC GASES. I. GENERAL FORMULATION AND APPROXIMATE SOLUTIONS, by H. Takebe, G. P. Reck, and C. A. Mead. [1962] 37p. incl. diagrs. (AFOSR-4869) (AF 49(638)940) AD 414123 Unclassified

A formalism is developed for calculating the complex refractive index of a monatomic gas as a function of frequency in the region of an absorption. The treatment involves a direct study of the properties of the dressed photon state in the gas, and includes effects due to translational motion of the atoms as well as the dipolar resonance interactions between them. It is necessary to assume that the electromagnetic properties of the gas are describable in some detail by a linear frequency- and wave-number-dependent susceptibility. A set of coupled nonlinear integral equations are derived which together determine the susceptibility function and hence the observable refractive index. The static limit of large atomic mass is considered in some detail, and a first correction to it is also obtained. The results are compared with measurements by Tomiser on the linewidths of the sodium D-line at various temperatures and pressures. Qualitative agreement was obtained, while previous theoretical linewidths were too small by a factor of order 1000. (Contractor's abstract)

THEORY OF ABSORPTION LINE SHAPES IN MONATOMIC GASES. II. METHOD OF "QUASI-MOMENTS", by C. A. Mead. [1962] 28p. incl. diagrs. refs. (AFOSR-4870) (AF 49(638)940) AD 413810 Unclassified

The Kronig-Kramers theorem leads to a relation between the coefficients in an asymptotic expansion of the refractive index in the far wings of an absorption line and certain integral properties, called quasi-moments, of the absorption line. The quasi-moments, or Q-moments, are related to the ordinary moments when the latter exist, and can be qualitatively related to such commonly measured quantities as the half width. Since the asymptotic coefficients are relatively easy to evaluate this leads to a simple way of getting theoretical predictions for some properties of the line shape. The method is applied to the theory of a preceding paper, and results are obtained which are in qualitative agreement with experimental linewidths. It is also possible to take into account the correction to the strong linearity assumption made previously. The correction leads to a narrowing of the line ('non linear narrowing') which is in the right direction to remove the remaining discrepancy between theory and experiment.

STUDIES OF POINT DEFECTS IN MAGNESIUM OXIDE, by J. E. Wertz, G. Saville and others. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-64-0745) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-54 and Nadonal Science Foundation) AD 436513 Unclassified

Presented at Internat'l. Conf. on Crystal Lattice Defects, Kyoto (Japan), Sept. 7-12, 1962.

Also published in Jour. Phys. Soc. Japan, v. 18, Suppl. II: 305-311, M r. 1963.

This study is an attempt to correlate optical absorption bands in single magnesium oxide crystals with point defects known to exist from electron spin resonance observations. Optical measurements in the range 4000 to 50,000 cm^{-1} were made on crystals as received after heat treatments, after ultraviolet or x-irradiation, and after neutron irradiation with subsequent heat treatment or irradiation. The goal has been the assignment of optical bands as due to impurities in particular valence states, to trapped hole centers or trapped electron centers. Some progress has been made by comparison of optical and ESR spectra on the same crystals. The best point defect for which the correlation of behavior of the 2 types of spectra is the single hole trapped on an oxygen ion adjacent to a positive ion vacancy. The absorption band which is ascribed to this center occurs at 18,500 cm^{-1}, and is responsible for the fleeting violet color of MgO crystals upon irradiation. While neutron irradiation, gives rise to F-centers (electron trapped at negative ion vacancies) and to visible coloration, no assignment of optical bands with particular electron trapping centers has yet been made. SOLVENT EFFECTS ON CHARGE-TRANSFER COMPLEXES. I. THE S-TRINITROBENZENE-NAPHTHALENE COMPLEX IN CARBON TETRACHLORIDE, N-HEPTANE, N-HEXANE, CYCLO-HEXANE, CHLOROFORM, OR CARBON DISULFIDE, by C. C. Thompson, Jr. and P. A. D. de Maine. 1962, 28p. incl. diagr. tables, refs. (AFOSR-4832) (AF AFOSR-62-19) AD 416143 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 85: 3096-3101, Oct. 20, 1963.

Formation constants and absorptivities for the 1:1 s-trinitrobenzene-naphthalene complex in 6 inert solvents (CCl_4, n-hexane, cyclohexane, n-heptane, $CHCl_3$, or CS_2) were calculated with spectrophotometric data collected at 15 wavelengths between 3300 and 4000A at 20° and 45°C. Absorptivities for the complex at the absorption maxima (near 3600A) at 20°C vary from 1294 (± 22) for n-heptane to 1540 (± 13) for n-hexane. As the temperature is increased from 20° to 45°C, the absorptivities decrease by approximately 10% except in $CHCl_3$ systems where those between 3650 and 4000A are unchanged. The formation constant (K) is independent of wavelength at each temperature in all solvents except n-heptane where at 20°C, K, in mol/liter units, it is 9.58 (± 0.17) for wavelengths between 3300 and 3700A, and gradually increases to 14.61 (± 0.17) at 4000A. At 45°C, K in n-heptane is 6.12 (± 0.09) at wavelengths up to 3850A, and it increases to 8.27 (± 0.09) at 4000A. Average values for K at 20°C vary from 1.82 (± 0.08) in $CHCl_3$ to 9.58 (± 0.17) in n-heptane. However, the heat of complex formation appears to be independent of the inert solvent with a median value near - 3.0 kcal/mol except for cyclohexane where the value is - 4.16 (± 0.63) kcal. Recent developments in theories of complex formation are examined. Variation of K with wavelength and of absorptivities with temperature are attributed to simultaneous higher order reactions. ON AN EXTENSION OF THE CONCEPT CONDITIONAL EXPECTATION, by H. D. Brunk. [1962] [7]p. [AF 49-(638)754] Unclassified

Published in Proc. Amer. Math. Soc., v. 14: 298-304, Apr. 1963.

Let (Ω, S, μ) be a complete measure space, let the equivalence classes of S-measurable functions be called random variables, and let L_1 and L_2 be the classes of integrable and square integrable random variables. Let $\mathcal{L}$ be a sub-σ-lattice of S containing φ and Ω and call f $\mathcal{L}$-measurable if $[f > a] \in \mathcal{L}$ for every real a. Let $R(\mathcal{L})$ denote the class of $\mathcal{L}$-measurable random variables and let $L_i(\mathcal{L}) = L_i \cap R(\mathcal{L})$, i = 1, 2. Let $\mathcal{B}'$ denote the class of Borel sets of reals which exclude the origin. In this paper the author improves upon results of his in which μ is assumed finite and of Šidák in which $\mathcal{L}$ is a σ-field. Five theorems are stated and proved. Theorem 1 states (in part) that if $X \in L_2$ then there is a unique $Y \in L_2(\mathcal{L})$ (called the conditional expectation) such that $\int XZ\, d\mu = \int YZ\, d\mu$ for all $Z \in L_2(\mathcal{L})$ and $B \in Y^{-1}(\mathcal{B}')$, $\mu(B) < \infty \Rightarrow \int_B X\, d\mu = \int_B Y\, d\mu$, and that if also $X \in L_1$, then $Y \in L_1$, and this equality holds for all $B \in Y^{-1}(\mathcal{B}')$. Theorem 2 presents a similar result for $X \in L_1$, $Y \in L_1(\mathcal{L})$. Theorem 3 states that if $\mathcal{L}$ is also a sub-σ-field of S, then $E(\cdot\,|S)$ is the unique continuous extension to L_1 of projection in L_2 on $L_2(\mathcal{L})$. Let F be an arbitrary family of random variables and let $M \subset L_2$. Theorems 4 and 5 give necessary and sufficient conditions that there exist σ-lattices L_1 and $\mathcal{L}_2$ containing ω and Ω such that $R(\mathcal{L}_1) = F$ and $L_2(\mathcal{L}_2) = M$. (Math. SYMBOLIC SHORTHAND SYSTEM FOR PHYSIOLOGY AND MEDICINE, by N. Padmanabhan and G. Ember. [1962] [5]p. incl. diagrs. (AFOSR-J711) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-356 and Gustavus and Louise Pfeiffer Research Foundation) AD 415397 Unclassified

Also published in Methods Inform. Med., v. 1: 138-142, Oct. 1962.

The symbolic shorthand system (SSS) is applicable to any problem of documentation. Instead of a code designation composed of numbers and letters, the SSS uses mnemonic symbols and signs reminiscent of the subjects they denote. All possible subjects and relationships between them are first arranged in 1 dimension, typed separately on subject cards, and then arranged 1 after the other according to a fixed order of precedence. Synonymous designations are avoided because all symbols have only 1 fixed meaning. The possibility of combining symbols gives this system the vital flexibility that other methods lack and it can be expanded indefinitely by establishing new symbols and signs. BACKSCATTERING EFFECT ON GAMMA-RAY SPECTRA RECORDED BY SCINTILLATION SPECTROMETERS, by H. E. Bosch and M. C. Caracoche. [1962] [6]p. incl. diagrs. table. (AFOSR-64-556) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR 30-9 and Consejo Nacional de Investigaciones Científicas Y Técnicas) Unclassified

Also published in Nuclear Instr. and Methods, v. 22: 77-82, Mar. 1963.

Gamma radiation spectra emitted by standard nuclides are recorded by a scintillation spectrometer coupled to a multichannel pulse height analyzer. The variation in intensity of the backscattering peak is studied as a function of the source-to-crystal distance, for different energies, with and without a lead housing. The effect of the interposition of a collimator between source and crystal is also analyzed. Finally, the variation in peak intensity of the backscattering effect through addition of different thicknesses of aluminum and beryllium in the source backing is considered. The optimum geometry for recording electromagnetic radiation spectra is indicated. (Contractor's abstract)

BETA SPECTROSCOPY WITH SOLID STATE DETECTORS, by H. [E.] Bosch, F. Krmpotic and A. Plastino. [1962] [14]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR 61-39] Consejo Nacional de Investigaciones Científicas Y Técnicas, and Comision Nacional de Investigaciones Espaciales) Unclassified

Also published in Nuclear Instr. and Methods, v. 23: 79-92, May 1963.

The optimum conditions are described for registering beta spectra and detecting conversion electrons with solid state counters. The error in determining the beta spectra energies from standard sources is pointed out. A fast-slow coincidence circuit is set up for detecting conversion electrons in coincidence with electromagnetic radiations by means of a system with solid state counter and scintillation crystal. The results obtained in the case of Bi^{207}, Cs^{137}, Au^{198}, and Pb^{203} are given. (Contractor's abstract)

SOLUTION OF THE SUPERSONIC FLOW OF A NON-PERFECT GAS AROUND POINTED THREE-DIMENSIONAL BODIES BY THE LINEARIZED CHARACTERISTICS METHOD, by L. G. Napolitano. Final rept. Aug. 31, 1962, 38p. (AFOSR-4364) (AF 61(052)82) AD 294840 Unclassified

In the present report it is proved that the linearized characteristic method, devised by Ferri for perfect gas flows, can be extended to deal with fluids obeying the most general state equations. A pointed 3-dimensional body of arbitrary geometry differing from conical shape by a series of first order small terms has been considered explicitly. The thermodynamic characterization of the fluid has been expressed all in terms of appropriate thermodynamic derivatives of the fundamental relation (i. e. the first order homogeneous function giving the specific energy in terms of the entropy and of the specific volume) which has been left unspecified, and thus completely arbitrary, throughout. Shock matching boundary conditions and complete solution of the linearized equations between the shock and the body have been derived and discussed. The development has been carried down to workable relations. The present method starts finding its most useful applications from the moment in which real gas effects begin to appear and continues all the way up in the realm of dissociating, reacting and/or relaxing flows when equilibrium conditions can be assumed. (Contractor's abstract)

LINEARIZED STEADY MOTION OF PLURI-REACTING MIXTURES, by L. G. Napolitano. [1962] [2]p. (AFOSR-64-2236) (AF 61(052)327) AD 452414 Unclassified

Also published in AIAA Jour., v. 1: 230-231, Jan. 1963.

Presentation of a proof for 2 similar statements on the linearized steady motion of a mixture in which n reactions take place. The statements are: (1) when all pertinent relaxation times are much smaller than the macroscopic characteristic time, the linearized steady flow of a multireacting mixture is equivalent to that of an inert gas mixture with a volume viscosity depending on the equilibrium state of the mixture; and (2) when m relaxation times ($1 \leq m < n$) are much smaller than the macroscopic characteristic time, the linearized steady flow of an n reacting mixture is equivalent to that of a viscous mixture in which (n-m) reactions take place, the equivalent kinematic volume viscosity being the same as that for case (1).

THE IMITATION OF NATURAL AUTOMATA (THREE PORTRAITS OF A BRAIN), by V. Braitenberg. [1959] [6]p. (AFOSR-1294) (AF 61(052)96) AD 262252 Unclassified

Also published in Riv. Methodos, v. 11: 1-6, 1959.

Three different models of the brain are described. The first of these models of machines is the Darwinian machine or rigid brain. This is an ancestral machine made of sense organs, motor organs, a classifying organ, its mirror image, or declassifying organ, and a system of random connections. The second machine

is known as the coincidence detector and consists of 2 equal parts simply called left (L) and right (R , which are both connected to a central part, or organ of association. Two phases may be distinguished in the life of this machine. These are the infancy phase during which the machine just learns without working and the working phase during which one of the 2 parts (L or R) receives the input while the output emanates from the other. The third machine is known as the Freudian machine. The function of this brain is regulated by the following characteristics: (1) In each unit of time, the brain passes from one state to the other; (2) For each constellation of input in the sensory organs, there is a class of states of the brain compatible with that input, and another class of states that is incompatible; and (3) A constellation of activity in the motor organs corresponds to each state of the brain. Given a state S, the choice of the following state S' is regulated by the compatibility with the input already mentioned; the structure of the machine; the frequency of the transition S-S' in the past; and the advantage conferred by the transition S-S'.

NEURAL MECHANISM OF CEREBELLAR FUNCTION, by V. Braitenberg. Final rept. June 1962, 9p. (AFOSR-3033) (AF 61(052)96) AD 290196 Unclassified

The objective of this investigation is to show that the cerebellar cortex acts as a timing organ. The available clinical and electrophysiological data will be analyzed from this point of view and if possible, a theory will be formulated to integrate these observations. Mathematical formulations will be attempted to describe input-output relationships in the cerebellar cortex. The timing of the arrival of impulse volleys at different anatomical sites will be correlated with the distances travelled.

CALCULATION OF BAND STRUCTURE OF COMPLEX CRYSTALS BY THE FREE ELECTRON NETWORK MODEL, by G. Della Riccia. Mar. 1962 [13]p. incl. diagrs. (Technical note no. 5) (AFOSR-2532) (AF 61-(052)434) AD 289467 Unclassified

The mathematical formalism of the method for obtaining the complete band structure of a crystal and the band structure of complex crystals is presented. Application is made to the crystals of the diamond type (p = 1, 2 parameters) and to the complex crystals II-IV, such as Mg_2Sn (p = 2, 4 parameters). The physical assumptions which are at the base of this approximation method are also presented. In conclusion, the band structure in the FEN (free electron model in a lattice network) approximation is given by the variation against the wave vector $\vec{k}$, of the electron kinetic energy E on the branches of the network which are considered as lines of density current of the presence probability of electrons.

SELF COUPLED MESON FIELD: EQUATIONS FOR SINGLE PROPAGATORS, THEIR SOLUTION FOR A NUMERICAL MODEL, CONSIDERATIONS ON THE CONVERGENCE OF PERTURBATIVE EXPANSIONS, by E. R. Caianiello and A. Campolattaro. July 1962 [18]p. incl. refs. (Technical note no. 7) (AFOSR-3103) (AF 61(052)434) AD 281803 Unclassified

Also published in Nuovo Cimento, Series X, v. 26: 390-400, Oct. 16, 1962.

It is shown that all the independent equations, or conditions, that can be derived for a single propagation kernel from all the branching equations that connect it and its derivatives with respect to the parameters of the theory with kernels of arbitrarily high order reduce to a small and unique set. It is then shown that whereas the only information obtainable from the majoration of a regularized perturbative expansion of the kernels is that all majorants are divergent, a numerical model obtained by imposing that the free propagators in configuration space depend only upon the mass can be exactly solved if these equations are used. It is found that the general solution is a linear combination of hypergeometric functions of the coupling constant λ which is singular for $\lambda = 0$; there is, however, a unique choice of constants which yields a solution regular when $\lambda = 0$. This model is related to the asymptotic form of the correct theory if the latter is defined over an infinitesimal space-time volume. (Contractor's abstract)

NOVEL METHODS OF CALCULATION APPLIED TO SEMICONDUCTOR PHYSICS, by E. R. Caianiello. Final rept. Sept. 1962, 10p. (AFOSR-3769) (AF 61-(052)434) AD 289331 Unclassified

The purpose of this proposed research was to establish rigorous mathematical equations and methods for handling problems which occur whenever many particles have to be considered. This is the case both in many-body physics and in field theory; recent advancements have shown the advantage of treating both subjects by means of a unified technique, that which uses Green's functions, called propagation kernels. Although the problems of field theory and of many-body physics need different emphases on different parts of this formalism, it is an interesting characteristic of the formal theory of propagators. It consents to treat in a unified manner all such questions until the very point of computation. It offers furthermore the advantage that insight for further elaboration of ideas can thus come from different realms of physical intuition. (Contractor's abstract)

RENORMALIZATION GROUP AND COMPLETENESS OF FIELD THEORIES. NUCLEON-PION COUPLINGS, by E. R. Caianiello and M. Marinaro. Aug 1962 [32]p. (AFOSR-4579) (AF 61(052)434) AD 401374 Unclassified

Also published in Nuovo Cimento, Series X, v. 27 1185-1207, Mar. 1, 1963.

The problem of the mathematical consistency of a field theory defined by a given local Hamiltonian is studied in terms of the propagator (Green's function) formalism. It is necessary for the mathematical consistency of a theory that all the branching equations satisfied by its propagators be covariant under the transformations of its renormalization group (which can be explicitly written). This analysis (which differs in method, but not in principle, from the standard renormalization program) permits to find systematically and explicitly all the terms that need be added to the original Hamiltonian if this was not complete to start with, i.e. if covariance could not be secured for the set of branching equations obtained from it alone. Local non-renormalizable theories are mathematically meaningless, because they originate from only fragments of Hamiltonians which are meaningful only if taken as wholes; the missing terms (even if infinite in number) can be exactly reconstructed with the present method, which leads naturally to identify the concepts of mathematical consistency and of physical completeness. All meaningful relations among coupling constants, such as symmetry requirements, must remain invariant under the renormalization group, which plays a role as important in the search for completeness, as that of the gauge groupe in electrodynamical problems. For the sake of concreteness, and as a first example, this method is illustrated with reference to the study of the standard meson-nucleon couplings, scalar and pseudoscalar, neutral and charged; the well known σ^3 and σ^4 (scalar), σ^4 (pseudoscalar) terms are obtained (a precedent erroneous statement about the renormalizability of the neutral scalar coupling is corrected, so that now all results agree with the expected ones).

CALCULATION OF BAND STRUCTURE OF COMPLEX CRYSTALS BY THE ELECTRON NETWORK MODEL, by G. Della Riccia. July 1962 [4]p. incl. diagrs. (AFOSR-4597) (AF 61(052)434) Unclassified

The method of the electron in a network lattice permits calculation of the complete band structure of a complex crystal. one establishes explicitly a particular equation for each set of bands of the same type of symmetry. Besides the simplicity of the calculation, 2 advantages of such a method are the possibility of taking easily into account the influence of the atoms which are not merely the first neighbors, and the fact that the lattice potentials appear in the equations only as Dirac's functions. [EFFECT OF TELENCEPHALIC ABLATIONS ON THE AMPLITUDE OF EVOKED POTENTIALS IN THE CENTER MEDIAN BY SOMATIC STIMULATION] Effet d'ablations télencéphaliques sur l'amplitude des potentiels évoqués dans le centre médian par stimulation somatique, by M. Meulders, J. Massion and others. [1962] [10]p. incl. illus. refs. (AFOSR-J638) (AF 61-(052)475) AD 414072 Unclassified

Also published in Electroencephalog. and Clin. Neurophysiol., v. 15: 29-38, Feb. 1963.

Potentials evoked in the center median (CM) by somatic stimuli undergo a marked increase in amplitude when the animal passes from the waking state to chloralose-induced anesthesia. Systematic determinations in 16 cats showed that this increase in amplitude is between 80-100%. Wide telencephalic ablations were made under ether anesthesia. In these animals, the evoked response in the CM is maximal from the outset and is not modified by the administration of an anesthetic dose of chloralose. In the awake intact or thalamic animal, both external and receptive stimulation of the midbrain reticular formation, bring about a marked reduction, or even suppression of the responses in the CM. On the other hand, under chloralose anesthesia, only reticular stimulation is effective in producing a reduction in amplitude. The following points are discussed: (1) What are the telencephalic structures responsible for the control of amplitude in the CM? (2) Are there other structures (sub-telencephalic) which may play a similar role? (3) At what point and by what mechanism is this control exerted? (4) What is its physiological significance? (5) Do analogous phenomena exist in structures other than the CM?

STRESS DISTRIBUTION DUE TO A LOGARITHMIC SPIRAL DISLOCATION, by F. D. Ju. Jan. 31, 1962, 58p. incl. illus. diagrs. tables, refs. (Rept. no. ME-3) (AFOSR-904) (AF 49(638)993) AD 272134 Unclassified

The problem of the logarithmic spiral dislocation cut is solved. A new theory and postulations for determining the complex potential functions are presented. The logarithmic form of the multiple-valued term is adopted for its ease of manipulation. The condition on the complex potential functions are such that they are no longer required to vanish at the terminus of the cut; only the displacement is required to be finite there. In the specific problem of the logarithmic spiral dislocation cut, the stress pattern about the inner circumference, from the analytical solution, was observed to be symmetrical about a line which passes through the origin of the circular cutout and the terminus point of the dislocation cut. Since the geometry of the physical problem is anything but symmetrical, the symmetry of the stress pattern is unexpected. The maximum shearing stress is found to be finite at the terminus of the dislocation cut. This phenomenon again contradicts the concept of the wedge action in solids.

Also published in Life Sci., v. 10: 533-539, 1962.

The rate of CO_2 fixation was measured in cats in vivo after intravenous infusion of $NaHC^{14}O_3$ under steady state conditions. Tissue CO_2, aspartic and glutamic acids, glutamine, ketoglutarate and pyruvate were isolated from brain cortex and liver. With the specific activities of tissue CO_2 as a basis, a rapid CO_2 fixation into liver aspartic acid and a slower fixation into brain cortex aspartic acid was found. The closeness of the specific activities of ketoglutarate and glutamate indicated a rapid equilibrium between these compounds. Further supporting data for the compartmentation of glutamic acid metabolism in the brain were obtained.

CARBON DIOXIDE FIXATION IN THE BRAIN, by S. Berl, G. Takagaki and others. [1962] [4]p. incl. tables, refs. (AFOSR-J249) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)725, National Institutes of Health, Office of Naval Research, and Research Foundation for Mental Hygiene, Inc.) AD 400849 Unclassified

Also published in Jour. Biol. Chem., v. 237: 2570-2575, Aug. 1962.

Carbon dioxide fixation in brain was studied in cats to which $NaHC^{14}O_3$ with and without ammonia was administered by intracarotid infusion. Glutamic and aspartic acids, glutamine, flutathione, and γ-aminobutyric acid were isolated from blood, brain, and liver, and their specific activities were determined. The data indicate a significant incorporation of CO_2 into the amino acids of the cerebral cortex, presumably by way of the citric acid cycle. Without simultaneous ammonia infusion, the specific activity of aspartic acid is 3 times that of glutamine, whereas in the presence of ammonia the ratios of specific activity of both compounds are closer to unity or reversed. The data suggest that, in the presence of ammonia, the oxaloacetic acid is channeled into glutamine formation. γ-Aminobutyric acid isolated from the tissue, as well as that obtained after decarboxylation of glutamic acid or glutamine, has less than 5% of the counts of the precursor. These findings give additional support to the assumption that the operation of a CO_2 fixation mechanism in brain is similar to that in liver. Additional data on the compartmentation of glutamic acid and glutamine synthesis are presented. The significance of the findings for an interpretation of ammonia metabolism in brain is pointed out. Also published in Jour. Biol. Chem., v. 237: 2562-2569, Aug. 1962.

The metabolic pathways of $N^{15}H_3$ administered to cats by intracarotid infusion in experiments of short duration is reported. Glutamic and aspartic acids and their associated metabolites were isolated from brain, liver, and blood, and the isotope concentration in the various amino and amide groups was determined. The results support the conclusion that the metabolism of the dicarboxylic amino acid synthesized in the tissue and of its metabolic derivatives occur in cellular compartments. CARBON DIOXIDE FIXATION IN LOBSTER NERVE, by S.-C. Cheng and H. Waelsch. [1962] [2]p. incl. table, refs. [AF 49(638)725] Unclassified

Published in Science, v. 136: 782-783, June 1, 1962.

Aspartic, glutamic, malic, and citric (isocitric) acids were isolated by chromatographic methods from lobster nerves incubated with Ringer's solution containing C^{14}-bicarbonate. All the compounds were labeled; the bulk of the radioactivity appeared in the aspartic acid. The findings suggest the operation in lobster nerves of the citric acid cycle including CO_2 fixation. INFRARED SPECTRUM AND STRUCTURE OF GERMYL CYANIDE, by T. D. Goldfarb. [1962] [5]p. incl. diagrs. tables, refs. (AFOSR-2464) (AF AFOSR-61-11) AD 400073 Unclassified

Also published in Jour. Chem. Phys., v. 37: 642-646, Aug. 1, 1962.

The infrared spectra of GeH_3CN and GeD_3CN have been investigated in the 260-4000-cm^{-1} region with prism and grating spectrophotometers. The expected C_{3v} symmetry has been confirmed, and 7 of the 8 fundamental vibrational modes of each molecule have been assigned to observed bands of appropriate shape. The frequencies of the remaining skeletal bending fundamentals have been assumed to be one-half the frequency of their observed overtones. The rotational structures of 2 of the perpendicular bands of GeH_3CN have been resolved and Coriolis coefficients have been determined. The spectrum in the region of the CN stretching fundamental indicates that the molecule is the normal cyanide. No evidence was obtained for the presence of the isocyanide. This observation is compared with those obtained for the alkyl germyl cyano and silyl cyano compounds which have been interpreted as equilibrium mixtures of the normal and the isocyanides. A FUNDAMENTAL STUDY OF THE HYDRODYNAMIC

EQUATIONS FOR FREE-RADICAL FLAMES, by E. S. Campbell. Final rept. Jan. 1957 - Oct. 1962 [6]p. incl. refs. (AFOSR-4163) (AF 49(638)169) AD 288595 Unclassified

An investigation of the ozone oxygen flame is presented. This will be another link in the study of how flame properties, thickness, speed, heat release, specific enthalpy, mol-fraction and fractional mass-flow profiles, are affected by the kinetic scheme and will offer another test of the importance of assumptions introduced in more approximate flame theories. This system is particularly advantageous for 2 reasons: (1) it has possibly the simplest kinetics of any real flame; and (2) it has been studied experimentally over a wider range of the relative importance of the different elementary reactions by the simple expedient of varying the input (O_3/O_2).

A THEORETICAL STUDY OF SOME PROPERTIES OF LAMINAR STEADY STATE FLAMES AS A FUNCTION OF PROPERTIES OF THEIR CHEMICAL COMPONENTS, by E. S. Campbell, F. J. Heinen, and L. M. Schalt. [1962] [9]p. incl. diagr. tables, refs. (AFOSR-64-0145) (AF 49(638)169) AD 432553 Unclassified

Also published in Ninth Symposium (Internat'l.) on Combustion, Cornell U., Ithaca, N. Y. (Aug. 27-Sept. 1, 1962), New York, Academic Press, 1963, p. 72-80.

This paper combines results of 3 different types of studies in an attempt to begin developing a mathematical and physical understanding of (1) how certain flame properties depend upon the characteristics of the flame gases, and (2) the significance of some approximations which have been introduced into flame theories. The types of studies are: (a) the construction of the functional form of the general asymptotic solutions to the hydrodynamic equations for laminar steady state flames as a function of the distance; (b) construction of different methods of solving the equation systems; and (c) numerical studies of these equation for both hypothetical and real flames. Mechanisms for the most important numerical sources of the ideas presented are given. The essential aspects of a free radical for flame kinetics are assumed to be: (1) In the presence of a free radical, a chemical reaction can proceed with a comparatively low activation energy. (2) The formation of a free radical requires a comparatively high activation energy. (3) Radical recombination involves a comparatively low activation energy. Finally, certain problems encountered in numerical integrations and comparative usefulness of some procedures are considered. Specific attention is devoted to the sensitivity of the calculation to starting values. (Contractor's abstract, modified)

EXISTENCE OF A "WELL-DEFINED" ENERGY FOR AN IONIC CRYSTAL; JUSTIFICATION OF EWALD'S FORMULAE AND OF THEIR USE TO DEDUCE EQUATIONS FOR MULTIPOSE LATTICES, by E. S. Campbell. [1962] [12]p. incl. refs. (AFOSR-1880) (AF 49(638)969) Unclassified

Also published in Jour. Phys. Chem. Solids, v. 24: 197-208, Feb. 1963.

The Ewald calculation of the potential defined by an ionic lattice is shown to be justified under simple general conditions which are given for the existence of a "well-defined" specific energy for an ionic crystal. The significance of the Ewald calculation and of these conditions is clarified by a prior discussion of the connection between the specific energy for finite and infinite lattices. It is shown that the original argument given to justify the deduction of formulae for multipole lattices from Ewald's equations contains a logical error which led to misleading statements about the potential defined by a lattice of dipoles. Conditions for the validity of these formulae are given and proved. Advantages of these formulae are discussed.

AN EXTENSION OF ASCOLI'S THEOREM AND ITS APPLICATIONS TO THE THEORY OF OPTIMAL CONTROL, by S. S. L. Chang. Jan. 1962, 80p. incl. diagrs. (Technical rept. no. 400-51) (AFOSR-1973) (AF 49-(638)586) AD 275989 Unclassified

Presented at meeting of the Amer. Math. Soc., Jan. 24, 1964.

Also published in Trans. Amer. Math. Soc., v. 115: 445-470, Mar. 1965.

Ascoli's theorem deals with continuous functions and states that the space of bounded, equi-continuous functions is compact. The present paper extends it to the measurable functions. Both the space of bounded equi-measurable functions, and its product with the space of bounded equi-continuous functions are compact. The above theorem is applied to 2 problems in the theory of optimal control: (1) To give an existence proof of optimal control among allowed control functions which are measurable and enter the system equations in a non-linear manner; and (2) To derive a necessary condition for optimal control in bounded phase space. The condition is different and simpler than the one derived previously by Gamkrelidze.

CONTROL SYSTEMS, by S. S. L. Chang and J. Ragazzini. Final rept. Mar. 1962, 30p. (AFOSR-2855) (AF 49(638)586) AD 281761 Unclassified

As the theory of control systems develops, the trend is toward the understanding of increasingly sophisticated systems which do more than merely constrain 1 or more controlled variables to perform or react in a fixed prescribed manner. Various criteria of optimization must be sought to establish the design rationale of such control systems, and much of the work reported has been so directed. For instance, systems which perform in an optimum manner not just under 1 set of conditions and inputs or with 1 set of parameters fall in this class. These are systems with fixed controllers broadly "tuned" to cope with a variation of system parameters that may occur slowly in time in 1 system or in an ensemble or fixed systems to which they may be attached. For terminal control systems, investigations of optimum control using Pontryagin's maximum principle to establish control policy have been developed.

ON THE DIGITAL COMPUTER CLASSIFICATION OF GEOMETRIC LINE PATTERNS, by H. Freeman. [1962] [13]p. incl. diagrs. (AFOSR-3281) (AF AFOSR-62-152) Unclassified

Presented at Nat'l. Electronics Conf., Chicago, Ill., Oct. 8-10, 1962.

Also published in Proc. Nat'l. Electronics Conf., v. 18: 312-324, 1962.

This paper is concerned with techniques for the systematic classification of planar geometric line patterns of arbitrary configuration. The techniques are based on a method of quantitizing and encoding which facilitates classification in a digital computer. Emphasis is placed on three transformations from which a variety of pattern properties can be derived. The transformations involve, in turn, the directional components of the pattern, the pattern's degree of asymmetry about a specified set of axes, and the curvature components contained in the pattern's contours. ADAPTIVE INFORMATION PROCESSING, by S. S. L. Chang. [1962] [8]p. incl. diagrs. (AFOSR-3436) (AF AFOSR-62-321) Unclassified

Presented at Western Electronic Show and Convention, Los Angeles, Calif., Aug. 23-24, 1962.

Also published in WESCON Technical Papers, v. 6: (Part 4): Paper no. 16.1, p. 1-6.

This paper describes the underlying theory of a computer program for interpolation, integration, and differentiation of a function f(x) which is unknown except at sampling points. The program yields automatically the formula to be used so that the processed result is the most likely one among all possible ones. The expected error is also given. The program is based on statistical decision theory with the assumption that f(x) has a power spectrum which may or may not be known. In the special case that there is no error at sampling points and the power spectrum is bandlimited, the general formula for interpolation is reduced to a cardinal data hold, and the general expression for expected error is reduced to a statement of Shanon's sampling theorem.

JUSTIFICATION AND LIMITATION OF A TWO-PARAMETER, TWO-ADJUSTMENT, SELF-ADAPTIVE SYSTEM, by H. J. Perlis. [1962] [23]p. incl. diagrs. refs. [Rept. no. P63 120] (AFOSR-64-2317) (AF AFOSR-62-321) AD 452323 Unclassified

Presented at Winter general meeting of the Inst. Elec. & Electron. Engineers, New York, N. Y., Jan. 27-Feb. 1, 1963.

Also published in IEEE Trans. on Appl. and Indus., v. 82: 220-229, July 1963.

Control systems incorporating a plant with 2 varying parameters were analyzed. For the specific systems studied, it was shown that given the known nominal plant and system transmittance a passive system can be designed which will reduce the effects of plant variations to any desired level. Merely considering the fact that a known plant has wide variations in its parameters is not sufficient to justify an active adaptive system. When the effect of measurement noise in the system output is also considered, it is seen that self-adaption could be justified on the basis of both low sensitivity to plant variations and low relative measurement noise response. Since

the accuracy of identification is a function of measurement time, there appears to be a fundamental limitation in this class of self-adaption. The measurement time for a particular adjustment accuracy required that the plant parameters should not vary faster than a certain rate. This allows for a crude estimation to be made of how slow a slowly-varying plant must be.

[GAS DISCHARGE PHENOMENA], by B. Bederson. Final letter rept. Jan. 1, 1962, 2p. (AF 18(600)1701) Unclassified

The general aim of this project has been the development and application of microwave diagnostic methods to investigate fundamental atomic processes occurring in gaseous discharges. In particular an attempt was made to study the volume and surface recombination of atomic hydrogen in a discharge. To this end, a cavity spectrometer apparatus was developed. The results were not sufficiently reliable or reproducible to obtain recombination information. Modifications and redesign of the apparatus are in progress.

[ATOMIC HYDROGEN RECOMBINATION STUDIES], by B. Bederson. Final rept. Nov. 21, 1962, 3p. (AFOSR-404); (AF 49(638)943) AD 289275 Unclassified

The development of microwave diagnostic techniques for measuring the concentration of hydrogen atoms in a discharge and the application of these methods to the study of the rate constants associated with volume and surface recombination is investigated. A microwave cavity spectrometer has been built, especially designed to detect the 1420 Mc/sec transition in atomic hydrogen corresponding essentially to the zero field hyperfine separation of the ground state. It has been designed so that line shape measurements may be obtained in both the absorption and dispersion modes. One can then relate these measurements to the concentration of atomic hydrogen within a test volume positioned in the cavity, thereby providing a means of measuring recombination rate constants. THE DISCRIMINANT OF HILL'S EQUATION, by D. L. Jagerman. Nov. 1962, 43p. (Research rept. no. BR-39) (AFOSR-4606) (AF 49(638)229) AD 297220 Unclassified

Structure theorems for the discriminant, $\Delta(\omega^2)$, of Hill's differential equation are developed by means of interpolatory function theory (cardinal series representations). A method of solution of Hill's equation is developed yielding an asymptotic expansion of the discriminant for large $|\omega|$ with error term $0(|\omega|^{-9})$. Asymptotic expansions for the eigenvalues λ_n, λ'_n for large n are obtained with error terms $0(n^{-7})$. Relations between the occurrence of double zeros of the discriminant and the period of the coefficient function in Hill's differential equation are established. A discriminant-like function $D(\omega^2)$ is introduced and an interpolatory function-theoretic structure result is obtained. (Contractor's abstract)

[HYDROMAGNETIC TURBULENCE], by R. H. Kraichnan. Final rept. Mar. 1, 1958-Feb. 28, 1962. June 1962 [12]p. incl. refs. (AFOSR-2779) (AF 49(638)341) AD 289438 Unclassified

Research under this contract has been directed towards the theoretical study of fluids under conditions where their behavior must be described statistically. Two broad classes of problems are considered: (1) turbulence, a random macroscopic motion in which the fluid can be considered a continuous medium and (2) microscopic statistical mechanics, in which the fluid is treated as a system of very many interacting particles. These 2 subjects are unified by the fact that very similar mathematical methods may be used for both.

ON THE MALKUS THEORY OF TURBULENCE, by E. A. Spiegel. [1962] [28]p. incl. diagrs. refs. (AFOSR-J504) (AF 49(638)341) AD 406281 Unclassified

Also published in Colloq. Internationaux du Centre Nat'l. de la Recherche Scientifique; Mécanique de la Turbulence, Marseille (France) (Aug. 28-Sept. 2, 1961), Paris, CRNS, No. 108: 181-208, 1962.

The aim of the Malkus theory is to avoid explicit nonlinear calculations by appeal to an optimization principle which characterizes statistically steady turbulence. The principle of maximum dissipation is offered as the possibly correct one and is shown to be equivalent to maximum heat transport for thermal turbulence. The present discussion outlines Malkus' procedure for finding the state of maximum heat transport in a thermally convecting, turbulent fluid. The particular situation discussed is that of natural convection between 2 parallel, rigid, slippery, perfectly conducting plates. The fluctuating velocity and temperature fields are decomposed into the set of normal modes of the linearized equations. In terms of this representation the energetics of thermal turbulence is discussed qualitatively and the effects of nonlinearity are pointed out. With this discussion as background, Malkus' assumptions are introduced. These are: (1) The mean temperature gradient is nowhere positive; (2) A finite range of wavenumbers is effective in transporting heat; and (3) The highest vertical wavenumber contributing to the heat transport is marginally stable on the mean temperature profile. Physical

arguments are offered to justify each of these assumptions, but the best justification is in the presentation of results. The Malkus theory predicts the observed form of the temperature gradient just inside the boundary layer and the correct form of the heat transport law. The final impression is that the theory has much to recommend it and that it raises a number of interesting questions about turbulent flows.

MAGNETOHYDRODYNAMIC FLOW PAST A THIN AIRFOIL, by E. Cumberbatch, L. Sarason, and H. Weitzner. Mar. 15, 1962 [71]p. incl. diagrs. (AFOSR-2278) (AF 49(638)1006) AD 276239 Unclassified

Also published in AIAA Jour., v. 1: 679-690, Mar. 1963. (AFOSR-J537; AD 407873)

The steady flow of a perfectly conducting magnetohydrodynamic fluid past a thin non-conducting airfoil is studied in the model in which the fluid variables obey the Lundquist equations linearized about a constant unperturbed flow. Hyperliptic flows, in which hyperbolic and elliptic fields are superimposed, are considered. Results of Grad, McCune and Resler, and Sears and Resler are extended to the case of an arbitrarily inclined unperturbed field. The general solution contains 4 line singularities along the characteristics through the ends of the body, and has 2 arbitrary constants. By a generalized Kutta-Joukowski condition these constants are fixed so that 2 of the line singularities disappear. Specifically, it is required that the solution be locally square integrable. Behavior of the exponents of the singularities is investigated by numerical computation and, in limiting cases, analytically. The singular parts of some flows are investigated numerically. MAGNETOHYDRODYNAMIC MACH CONES, by E. Cumberbatch. [1962] [4]p. incl. diagrs. (AFOSR-J536) (AF 49(638)1006) AD 407868 Unclassified

Also published in Jour. Aerospace Sci., v. 29: 1476-1479, Dec. 1962.

Features of the surfaces of main disturbance created by a small object in steady motion through a conducting fluid are examined. These surfaces are found by drawing tangent cones from the object to the relevant wave-front diagrams. The outer wave cone (when present) is smooth, but the 2 inner cones have cross sections similar to the cusped figures of the inner wave-front diagram. It is conjectured that the disturbance may be concentrated along such line cusps. This has particular relevance in the application of known 2-dimensional results to 3-dimensional problems, say in the well-known techniques of aerodynamics. In MHD the omission of the large disturbance characteristics implicit in a 2-dimensional solution may invalidate its use in any practical 3-dimensional problem. (Contractor's abstract)

DISPERSION RELATIONS IN RAREFIED GAS DYNAMICS, by L. Sirovich. [1962, [11]p. incl. diagrs. tables, refs. (AFOSR-J538) (AF 49(638)1006) AD 414695 Unclassified

Also published in Phys. Fluids, v. 6: 10-20, Jan. 1963.

The 1-dimensional initial-value problem of a monatomic single component gas is considered. Using the linearized Boltzmann equation the dispersion relation is studied. In addition to the usual gas-dynamic sound waves, one finds an infinity of decaying propagating waves. The phenomenon exhibits itself as a sequence of epochs, the last state of which is hydrodynamic. With reference to the same problem, macroscopic equations such as Euler, Navier-Stokes, Burnett, moments

equations, etc., are considered. In addition, the recently considered kinetic models of Gross et al. are applied to the problem. These various formulations are critically analyzed and compared with each other and with the Boltzmann analysis. Lastly, several modifications are offered which remedy some of the shortcomings which appear in the approximate theories. (Contractor's abstract)

STEADY MAGNETOHYDRODYNAMIC FLOW PAST A NONCONDUCTING WEDGE, by C. K. Chu and Y. M. Lynn. [1962] [6]p. incl. diagrs. refs. (AFOSR-J1274) (AF 49(638)1006) AD 424348 Unclassified

Presented at Seventeenth annual meeting of the Amer. Rocket Soc., Los Angeles, Calif., Nov. 13-18, 1962.

Also published in AIAA Jour., v. 1: 1062-1067, May 1963.

The steady 2-dimensional magnetohydrodynamic flow of an infinitely conducting fluid past a nonconducting wedge with nonaligned flow and magnetic field is discussed. The flows considered are in the superfast or fully hyperbolic regime. The flows consist of several regions of uniformity connected by shocks and expansion waves. Because of the boundary condition on the magnetic field, the magnetic field must be the same in the regions above and below the wedge; thus the flows in these regions are coupled, unlike in the case of ordinary supersonic gas-dynamics. Only small wedge angles and weak waves (characteristics) are considered. The problem thus is linearized, and explicit solutions are obtained which are qualitatively similar to the nonlinear solutions. Some interesting and unexpected features arise, and they are discussed in detail. (Contractor's abstract)

A GENERALIZATION OF MIXING-LENGTH THEORY OF TURBULENT CONVECTION, by E. A. Spiegel. Dec. 1962, 10p. (AFOSR-J1601) (AF 49(638)1065) AD 427627 Unclassified

Also published in Astrophys. Jour., v. 138: 216-225, July 1, 1963.

The mixing-length theory as currently employed is valid only when the mixing length is sufficiently small. The present work attempts to remove this limitation by writing a heat-transfer integral for convecting fluid elements. There then follows an integrodifferential equation for the mean temperature in a convecting medium. It is indicated how this equation may be used to include the effects of penetration into convectively stable regions from adjacent stable regions.

DETERMINATION OF THE MAGNETIC MOMENT OF THE FIRST EXCITED STATE IN Sc^{44}, by I. Bergström and P. Thieberger. Apr. 15, 1962 [14]p. incl. diagrs. tables, refs. (Technical note no. 10) (AFOSR-2703) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)118 and Statens Rad för Atomforskning) AD 280977 Unclassified

Also published in Arkiv Fysik, v. 22: 307-315, 1962.

The g-factor of the 153 ns first excited state in Sc^{44} has been determined by studying the oscillations around the exponential decay curve which appear when the sample is placed in a magnetic field. With the assumption that paramagnetic effects can be neglected, a value for the g-factor of 0.35 ± 0.02 is obtained as an average of 3 different runs. From conventional angular correlation measurements an anisotropy of + 9.5 ± 2.5% is obtained. A_2 as calculated from the amplitude of the oscillations corresponds to an anisotropy of 6.5 ± 1%. This supports the assumption that the multipolarities involved are pure M1 and that the spin sequence is 1, 2 and 3 units, which corresponds to an anisotropy of 7.7%. The magnetic moment of the 153 ns state is then + 0.70 ± 0.04 nuclear magnetons. (Contractor's abstract)

INVESTIGATION OF NUCLEAR REACTIONS INDUCED BY HEAVY ION BOMBARDMENT AND OF EXCITED LEVELS IN HEAVY NUCLEI, by L. Bergström and B. Astrom. June 15, 1962 [18]p. incl. diagrs. refs. (AFOSR-2975) (AF 61(052)118) AD 278240 Unclassified

The following work is reported: (1) Angular correlations in (α, p)- and (α, α')- reactions at 14 mev. (2) Heavy ion induced reactions and properties of light astatine isotopes formed in those reactions. (3) Study of energy levels, transition probabilities, etc. in several isotopes mostly in the lead region, excited in radioactive decay. (4) Stopping of heavy ions in various materials, and (5) New instruments and methods - (a) automatic gain controlled amplifier, (b) use of CRT oscilloscopes in time- and pulse-height measurements, (c) time to pulse-height converter, and (d) surface barrier semiconductor detectors. (Contractor's abstract)

INVESTIGATIONS OF GAMMA RADIATION FROM NUCLEAR REACTIONS, by K. G. Malmfors. Final rept. Feb. 1, 1961 - Jan. 31, 1962, July 3, 1962, 3p. (AFOSR-3161) (AF EOAR-61-8) Unclassified

In these investigations, the proton beam from the cyclotron was directed to a target which was placed inside the spectrometer at the distance of 5 cm from a gold converter. The flight-times of the electron and the positron were converted into pulse-height and added together, thus making it possible to display a γ-spectrum on a 100-channel pulse-height-analyzer. A systematic study was carried out on the influence of the size, shape, and thickness of the converter in order to find the optimum conditions. The results indicate that the width of the converter should not be more than 2 or 3 mm so that the electrons and the positrons get free of the converter after the first revolution. An investigation was made of the possibility of placing the target material on the converter and to lead the cyclotron beam up to this new target position. An investigation of the possible use of the spectrometer as a Compton-spectrometer without depending on the cyclotron for the timing system was made.

MASS NUMBER ASSIGNMENTS AND γ-RAY SPECTRA OF SOME NEUTRON RICH Sn AND Sb ISOTOPES, by J. Ahler, G. H. Neumann and others. [1961] [14]p. incl. diagrs. tables, refs. [AF EOAR-62-86] Unclassified

Published in Arkiv Fysik, v. 21: 35-48, 1961.

Electromagnetic isotope separations have been performed on Sn and Sb, prepared from fissioned uranium. The different samples were studied for their half-lives and γ-spectra. New information was obtained concerning γ-rays. Data are given for Sn^{127}, Sn^{128}, Sb^{127}, Sb^{128} and Sb^{129}. The results obtained are mainly in agreement with previously known data.

THE ONSET OF DETONATION IN A DROPLET COMBUSTION FIELD, by F. B. Cramer. [1962] [5]p. incl. illus. diagrs. table. [AF 49(638)817] Unclassified

Published in Ninth Symposium (Internat'l.) on Combustion, Cornell U., Ithaca, N. Y. (Aug. 27-Sept. 1, 1962), New York, Academic Press, 1963, p. 482-487.

A sequence of events has been described which offers an explanation for the processes leading to the onset of detonation in a heterogeneous field of low volatility fuel droplets. While the gross pattern appears superficially similar to that occurring in premixed gases, the detailed mechanisms must be explained in terms of the physical behavior of the liquid component of the 2-phase system. The pressure ratios and shock velocity of both weak and strong shocks fall very close to the values which are calculated for oxygen. The highest concentration of fuel was 0.20 vol-%. The transport phenomena to produce fuel vapor at a rate sufficient to drive these detonation-like waves at the temperature differentials involved require specific surfaces which are orders of magnitude greater than the original spray presented. A type of mechanitical shattering must be available which will produce enough of a less than 10μ droplet mist to provide sufficient fuel vapor to continue to drive the detonation front. The effects of the predetonation, flame-driven flow field controls the time and magnitude of the onset of detonation through droplet shattering these flows impose. (Contractor's abstract, modified)

BOUNDARY LAYER TRANSITION: FREESTREAM TURBULENCE AND PRESSURE GRADIENT EFFECTS, by E. R. van Driest and C. B. Blumer. [1962] [4]p. incl. diagrs. table, refs. (AFOSR-J1036) (AF 49-(638)1178) Unclassified

Also published in AIAA Jour., v. 1: 1303-1306, June 1963.

A theory of boundary layer transition is presented which includes the effects of freestream turbulence and pressure gradient. The basic notion underlying the development concerns the remoteness of the boundary layer vorticity from the surface. The theory agrees well with experimental data. The laminar boundary layer solutions of Pohlhausen and Falkner-Skan are used to calculate the effect of pressure gradient on transition. Engineering formulas are presented, and one example is calculated showing the application of the theory to a body of revolution. The theory also can indicate the effects of Mach number and heat transfer.

RESEARCH ON X-RAY DETERMINATION OF PRECISION LATTICE PARAMETERS, by W. Parrish, M. Mack, and J. Taylor. Final rept. June 30, 1962, 57p. incl. illus. diagrs. tables, refs. (Technical rept. no. 156) (AFOSR-3082) (AF 49(638)620) Unclassified

The application of the centroid method to powder line profiles obtained with the x-ray diffractometer is shown to lead to lattice parameters which are independent of the diffraction angle. Thus it appears that the lattice parameter is free of systematic errors and that the centroid method has properly accounted for the aberrations which distort and shift the line profile. The instrumentation and methodology necessary for results of the highest precision are discussed. The effect of interferences from the $K\alpha_{3,4}$ satellites and Kβ lines is described. Three different methods that have been proposed for the determination of centroids have been investigated and applied to both spectral and powder line profiles, and the necessity for equivalence between the centroids of the spectral profile and the line profile is discussed. The line shapes and the centroids of observed and analytic spectral profiles are compared for both CuKα and FeKα radiations. Preliminary centroid results for the lattice parameter of tungsten (at 25°C and corrected for refraction) are: $\underline{a}_o$ = 3.16552 A with CuKα, and 3.16544 A with FeKα. Although peak angles are not amenable to correction for aberrations, various peak measurements have been made. The lattice parameter of tungsten (at 25°C and corrected for refraction) derived from peak angles corresponding to maximum $K\alpha_1$ intensity is: $\underline{a}_o$ = 3.16517 A with $CuK\alpha_1$, and 3.16521 A with $FeK\alpha_1$. A list of proposed publications, in which the topics treated in this report will be covered in greater detail, is included.

AN EXTERNAL CRACK PROBLEM - SYMMETRICAL CASE, by M. Lowengrub. Sept. 5, 1962, 18p. incl. diagrs. tables. (AFOSR-3671) (AF 49(638)1159) AD 283801 Unclassified

The problem of determining the stress field in the neighborhood of a crack given externally in an infinite elastic solid which is symmetrically deformed is discussed. The particular problem where the crack is deformed by applying an axially symmetric pressure which may be considered as varying along the length of the crack is discussed. This problem is then reduced to a mixed boundary value problem. It is assumed that the

equations of the classical (infinitesimal) theory of elasticity hold. The expressions for the stress and displacement components are discussed and the corresponding value problem is considered. The forms of the solution in certain special cases are derived and the components of stress and displacement for some of these special cases are tabulated. (Contractor's abstract)

A KINETIC STUDY OF THE EXCHANGE OF COPPER ION BETWEEN 1-(2-HYDROXY-1-NAPTHYLAZO)-2-NAPTHOL-4 SULFONIC ACID AND (ETHYLENEDINITRILO) TETRAACETIC ACID, by D. W. Rogers and C. N. Reilley. July 20, 1960 [20]p. incl. diagrs. tables. (Rept. no. UNC-Chem-CNR no. 6) (AFOSR-TN-60-822) (AF 49(638)333) Unclassified

The transfer of copper ion from its 1-(2 hydroxy-1-napthylazo)-2-napthol-4-sulfonic acid (Z) complex to EDTA (Y) is described by the equation Rate = $18[CuZ^-][H^+] + 32[CuZ^-][H_2Y^{-2}] + 100[CuZ^-][HY^{-3}] + 70[CuOHZ^{-2}][HY^{-3}]$ between pH 3 and 12. The rate equation of the back reaction is Rate = $1.7[CuHY][H_2Z^-] + 0.63[CuY^{-2}][H_2Z^-] + 56[CuY^{-2}][HZ^{-2}] + 1000[CuOHY^{-3}][HZ^{-2}]$. Each term in the rate equation represents a reaction path through different protonated or hydroxylated reactant forms. A mathematical technique is given for the separation of simultaneous reaction paths in complex systems. The law of Guldberg and Waage is followed to a fair approximation from which speculations are made on the structure of the activated complex. The rates of 6 similar reactions have been studied at one pH and are discussed in relation to the proposed mechanism. (Contractor's abstract)

RAPID CHELOMETRIC DETERMINATION OF CHROMATE AS Cr(III)-EDTA BY REDUCTION IN THE PRESENCE OF EDTA, by D. A. Aikens and C. N. Reilley. [1962] [3]p. incl. diagr. tables. (AFOSR-64-1399) (AF 49(638)333) AD 444449 Unclassified

Also published in Anal. Chem., v. 34: 1707-1709, Dec. 1962.

Reduction of Cr(VI) in the presence of a slight excess of EDTA leads to quantitative formation of Cr(III)-EDTA and provides a simple, rapid method for the chelometric determination of milligram amounts of chromate. The key to this method is chelation of labile intermediate Cr(V) and/or Cr(IV) oxidation states by EDTA, followed by further reduction to substitution inert Cr(III)-EDTA. The time required for a single determination is 5 to 6 min. The relative standard deviation is 1.4% with 0.5 mg. of Cr and 0.8% with 5.0 mg of Cr. The effects of pH, reducing agent, and buffer composition are discussed. Recovery of Cr is complete with 0.12M triethanolamine buffer, pH 6.1 to 6.9, and $NaHSO_3$ as the reducing agent. Excess EDTA is back-titrated at pH 2.5 to 3.5 with Th. (Contractor's abstract)

[GRAVITATION AND FIELD THEORY], by B. S. DeWitt. Final rept. Dec. 1, 1960-May 31, 1961. June 1, 1961, 6p. (AFOSR-1430) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)563 and Office of Naval Research) Unclassified

By studying the basic properties of the gravitational field and its relationship to quantum mechanics, it was hoped that equations predicting new and interesting experiments could be performed and that new effects, such as the concept of gravitational radiation, might be observed. The attack used was the method of canonical quantizing the gravitational field which has succeeded in other cases where there is a classical analog. The next phase will be to investigate the true observables and their relation to the constraints of the systems.

POINT DEFECTS AND DISLOCATIONS IN SILVER CHLORIDE, by M. N. Kabler, H. Layer and others. [1962] [12]p. incl. diagrs. refs. (AFOSR-2664) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)865, Army Research Office (Durham), and Atomic Energy Commission) AD 276839 Unclassified

Three experiments on imperfections in AgCl crystals are reviewed. Studies of the strain-aging in impure crystals as a function of time, temperature, and purity establish that the dislocations are pinned by divalent impurities which migrate with an activation energy of 0.46 ev. Observations of ionic conductivity during pulsed plasticity indicate that excess Ag interstitials are created with an efficiency of 10^{-7} fractional concentration per unit strain; these interstitials have a lifetime of 10^{8} jumps. Measurements of the annealing out of excess electrical conductivity of quenched crystals give the divacancy binding energy to be 0.42 ev and the migration energy to be 1.0 ev. The concentration of Schottky defects at high temperatures is estimated to be approximately 0.1%. (Contractor's abstract)

A NEW TECHNIQUE FOR RECORDING HEAVY PRIMARY COSMIC RADIATION AND NUCLEAR PROCESSES IN SILVER CHLORIDE SINGLE CRYSTALS, by C. B. Childs and L. M. Slifkin. [1962] [2]p. incl. illus. (AFOSR-3364) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)865 and Army Research Office (Durham)) Unclassified

Presented at Eighth Scintillation Counter Symposium, Washington, D. C., Mar. 1-3, 1962.

Also published in I. R. E. Trans. on Nuclear Sci., v. NS-9: 413-414, June 1962.

A new technique for recording heavy primary cosmic radiation and nuclear processes has been developed through decoration of dislocations formed by these processes in large AgCl single crystals. The crystals are prepared and exposed to cosmic radiation during high altitude balloon flights. The crystals are then treated according to the Haynes-Shockley photoelectric technique which results in Ag collecting at the dislocations thereby decorates the dislocations at room temperature within 2 hr. Since AgCl is transparent to visible light, the decorated dislocations are observable with an optical microscope at a magnification of about 150-200. A one-to-one correspondence has been established between tracks in the crystals and those in photographic emulsions accompanying the crystals during balloon flights. Examples of heavy primary cosmic radiation and nuclear processes in crystals are shown. (Contractor's abstract)

DISLOCATION-IMPURITY INTERACTIONS AND STRAIN

AGING IN AgCl, by M. N. Kabler, M. G. Miller, and L. M. Slifkin. [1962] [5]p. incl. diagrs. refs. (AFOSR-4472) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)865 and Army Research Office (Durham)) AD 291837 Unclassified

Also published in Jour. Appl. Phys., v. 34: 1953-1957, July 1963.

Strain aging in AgCl single crystals containing a few parts in 10^5 polyvalent metal impurity has been studied over the temperature range -12° to 51°C. At room temperature, the aging process requires of the order of half an hour to go to completion. The measured activation energy for the aging rate is 0.46 ± 0.06 ev. The maximum stress increment due to aging decreases with increasing temperature with an effective activation energy of 0.1 ev. On the basis of the kinetics of the process, it is demonstrated that the dislocation pinning giving rise to strain aging is due to the migration to the dislocations of the impurity ions themselves rather than the vacancies they introduce. Sharp upper yield points have been observed; they are discussed in terms of current concepts of dislocation multiplication and unpinning. (Contractor's abstract)

DETECTION OF NUCLEAR DISINTEGRATIONS PRODUCED BY 1.55-BEV PROTONS IN SILVER CHLORIDE SINGLE CRYSTALS, by C. B. Childs and L. [M.] Slifkin. [1962] [2]p. incl. diagrs. (AFOSR-J159) (AF 49(638)865) AD 400066 Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 354-355, Oct. 15, 1962.

A method was described by making the tracks of primary cosmic-ray particles visible in transparent crystals of AgCl. Application of the technique to the study of nuclear reactions produced by 1.55 bev protons from the Brookhaven cosmotron is now described. After exposure in the beam, each crystal is developed by subjecting it to a synchronous pulsed electric field and ultra-violet light. Photoelectrons swept into the interior of the crystal are trapped at the imperfections along the particle tracks. These electrons trap interstitial Ag ions, producing metallic Ag, thus rendering the tracks visible.

GIANT DISLOCATION LOOPS IN SILVER CHLORIDE CRYSTALS (Abstract), by A. Fukai and L. [M.] Slifkin. [1962] [1]p. [AF 49(638)865] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 210, Mar. 26, 1962.

Large, diamond-shaped dislocation loops, concentric about small included particles, in AgCl crystals were discovered by C. Childs (to be published). Further studies are presented here. The crystal was annealed at 445°-450°C for 44 hr in quartz powder, cooled to room temperature at 5°/hr, and the dislocations decorated by sweeping photoelectrons through the specimen. The large, 4-sided loops thus found have an average size of 120 μ on the side, and range from 14 to 310 μ. Three configurations have been observed: (1) multiple, diamond-shaped loops, coplanar and concentric, with an inclusion in the center; this corresponds to Childs' earlier findings; (2) isolated diamonds with no precipitates inside; (3) large (about 100 μ diam) polygonal helices. These loops are not found within a few hundred microns of the surface, and have been seen only in crystals of low-dislocation content (this crystal had fewer than 10^4 lines/cm^2). They presumably form during cooling by climb (as suggested by R. Thomson and J. Mitchell), thus explaining their absence near the surface and in material of high-dislocation content. The fractional-vacancy concentration required to account for the loops is only 10^{-9}.

SELF-DIFFUSION IN SILVER-GOLD SOLID SOLUTIONS (Abstract), by A. Gardner and L. [M.] Slifkin. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)865] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 234, Mar. 26, 1962.

Earlier data of W. Mallard and R. Bass on self-diffusion of silver tracer (Ag^*) and gold tracer (Au^*) in single crystals of silver-gold solutions have been extended and completed. The 114 diffusion coefficients thus obtained determine D_0 and Q (from the Arrhenius equation) for 9 compositions from pure Ag to pure Au. Some interesting results and deductions are: (1) correlation factors calculated from Lidiard's theory are of reasonable magnitude; (2) addition of the fast-diffuser Ag to the slow-diffuser Au reduces the D's for both tracers, in contrast to predictions of theories based on local kinetics; (3) for both tracers, D_0 decreases exponentially by a factor of 8 from pure Ag to pure Au; (4) this dependence of D_0 indicates that entropy of migration of a vacancy decreases by 2R from pure Ag to pure Au; (5) at a given composition, D_0 is larger for Au^* than Ag^* by about 40%; this can be accounted for semiquantitively; (6) the decreases in the Q's for both tracers with increasing Au content consist of comparable contributions from decreases in vacancy-migration energies and formation energies; and (7) at low temperatures, the measured D's are almost invariably higher than expected, even though the penetration plots are normal.

QUANTIZATION OF FIELDS WITH INFINITE-DIMENSIONAL GROUPS. III. GENERALIZED SCHWINGER-FEYNMAN THEORY, by B. S. DeWitt. May 1962 [65]p. incl. diagrs. refs. (Publication no. 13) (AFOSR-2572) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-72 and Office of Naval Research) AD 275778 Unclassified

Also published in Jour. Math. Phys., v. 3: 1073-1093, Nov.-Dec. 1962.

Nonlinear field theories having elementary vertex functions of arbitrarily high order are presented. Emphasis is given to purely formal aspects of the theory which may be expected to survive generalization to situations in which standard asymptotic conditions are inapplicable. Since the context in which the field nonlinearities are assumed to appear is that of a non-Abelian infinite dimensional invariance group, detailed attention is given to the question of a group invariant measure for the Feynman functional integral. It is shown that the physically important part of the measure is not determined by the group. The theory of the propagators and correlation functions are also given which characterize the system when invariant variables are introduced. The existence of a c-number action functional which contains a complete description of all quantum processes is proved. The second variational derivatives of this functional constitute the wave operator for the 1-particle propagators (including all radiative corrections) and its higher derivatives are the renormalized vertex functions. Finally, the implications for application to quantum gravidynamics are discussed. Because it leads to nonlocal covariant equations for a complex metric tensor the way is open to transmutations of topology at the quantum level. (Contractor's abstract, modified)

ON THE ROLE OF GRAVITATIONAL FIELDS IN SOME ELEMENTARY PARTICLE PROCESSES, by L. Halpern. [1962] [31]p. incl. diagrs. refs. (AFOSR-J330) (AF AFOSR-61-72) AD 408007 Unclassified

Also published in Nuovo Cimento, Series X, v. 25: 1239-1269, Sept. 16, 1962.

With the aid of a suitable perturbation formalism, the effect of an external gravitational field on elementary particle processes is investigated. Electromagnetic bremsstrahlung by charged scalar particle waves is treated and the dependence of the result on the inserted data and their empirical limits is analyzed. Application of the results to gravitational bremsstrahlung by particles of vanishing rest-mass is made. On the basis of these results, gravitational radiation from elementary particle processes is shown to be negligible. Some quantum electrodynamic processes of higher order, with closed loop diagrams are treated in curved space and the removal of their infinites by renormalization is discussed. Part of the matrix element for the process of photon trisection into 3 photons, has been evaluated and an upper limit for the cross-section of this process has been obtained in first order approximation in the external gravitational field. The magnitude of certain contributions from higher order terms has been estimated, but complete conclusions have not yet been obtained. A number of other processes, involving particles with spin and their radiative corrections are treated or discussed. Among the cross-sections of these processes, in first order perturbation only that for the trisection of photons becomes significant at the empirical energy limit: these theoretical results at present deny experimental possibilities. The role of terms of higher order is not yet known. Experimental possibilities for obtaining improved knowledge of the empirical upper limit of the energy losses produced on photons are suggested. General empirical aspects of the theoretical results are discussed. The Appendix contains an auxiliary theorem on a relation between the second derivatives of the metric tensor and the Riemann-Christoffel tensor at points, where geodesic co-ordinates are introduced.

RESOLVABLE INCOMPLETE BLOCK DESIGNS WITH

TWO REPLICATIONS, by R. C. Bose and K. R. Nair. [1962] [16]p. incl. tables. (AFOSR-J450) (AF 49(638)-213) AD 407899 Unclassified

Also published in Sankyā Indian Jour. Stat., v. 24, Series A: 9-24, Feb. 1962.

A class of resolvable incomplete block designs with 2 replications is given here. This includes the 2 known replicate designs, which are either the sample square or rectangular lattices and their extensions. The designs in this class are not necessarily PBIB designs but their duals are PBIB designs with 3 associate classes. Nevertheless the treatments in these designs have an association scheme with a maximum of 7 associate classes. A list of all the designs with $k \leq 10$ belonging to this class has been prepared and methods of construction of designs explained. The necessary formulae for analysis with recovery of interblock information are derived. (Contractor's abstract)

RESPONSE MODEL COEFFICIENTS AND THE INDIVIDUAL DEGREES OF FREEDOM OF A FACTORIAL DESIGN, by R. C. Bose and R. L. Carter. [1962] [12]p. (AFOSR-J474) (AF 49(638)213) AD 408214 Unclassified

Also published in Biometrics, v. 18: 160-171, June 1962.

A model is presented which gives the response corresponding to any point in the factor space (not necessarily a sample point) in terms of component-functions which, in turn, depend only on the experimental levels employed. Examples are included, showing how this response may be expressed as a linear combination of the conventional effects and interactions; this representation permits interpolation along the response surface, using these effects and interactions as coefficients. Finally, it is shown that, in the general multifactor case, the transformation between the conventional effects (normalized by constant multipliers) and the responses at the sample points is the Kronecker product of matrices whose elements are component-functions for the individual factors.

BALANCED BLOCK DESIGNS WITH TWO DIFFERENT NUMBERS OF REPLICATES, by L. C. A. Corsten. [1962] [21]p. (AFOSR-J624) (AF 49(638)213) AD 414099 Unclassified

Also published in Biometrics, v. 18: 499-519, Dec. 1962.

This paper attempts a systematic attack on the problem of construction of incomplete block designs having unequally replicated treatments, but otherwise balanced in the sense that the accuracy of the comparison between any pair of treatments depends only on the number of replicates of the treatments, and not on the choice of the particular pair of treatments from the set of all similarly replicated pairs. A further advantage of balance is the relatively simple form of analysis, but this aspect is of secondary importance, since general methods are available for the analysis of incomplete block designs. Only those designs are considered in which each treatment is replicated either r_1 or r_2 times, with $r_1 < r_2$; treatments will be called rare and frequent treatments. Then all comparisons between 2 rare treatments will be of equal accuracy, as will be all comparisons between 2 frequent treatments, and all comparisons between a rare and a frequent treatment. However, the 3 types of comparison will generally not be of equal accuracy.

THE EQUATION $a^M = b^N c^P$ IN A FREE GROUP, by R. C. Lyndon and M. P. Schutzenberger. [1962] [10]p. (AF 49(638)213) Unclassified

Published in Michigan Math. Jour., v. 9: 289-298, Dec. 1962.

The question of finding all solutions for the equation $a^M = b^N c^P$ in a free group is of interest only if none of the exponents is 0 or 1; it is assumed that M, N, $P \geq 2$. The equation possesses obvious solutions for which a, b, and c are all powers of a common element; it is shown here that these are all solutions. Some properties of the free monoid F of words representing elements in a free group are discussed. In section 3, the problem of finding all the solutions of the equations $a^M = b^N c^P$ in G is reduced to that of finding all solutions of each of 2 equations in F. It is shown in turn that each of these equations has only the obvious solutions. The greater part of the argument deals with the case that one of the exponents is 2 or 3. This suggests that arbitrary equations in powers of elements from a free group have only more or less obvious solutions when the exponents are sufficiently large. More generally, one may expect that in some sense more complicated equations have fewer solutions, with only rather special equations possessing genuinely nondegenerate solutions. Thus the equation $a^M = b^N c^P d^Q$, which possesses a wealth of nontrivial solutions when all 4 exponents are 2, appears to have only obvious solutions when all exponents are large.

FINITE COUNTING AUTOMATA, by M. P. Schutzenberger. [1962] [17]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)213 and Commonwealth Fund) Unclassified

Published in Inform. and Control, v. 5: 91-107, June 1962.

A family R_* of sets of words which is a generalization

of the family of regular sets is defined. The treatment is entirely algebraic and can be considered as an attempt towards a classification of the infinite monoids of finite-dimensional rational matrices which are the semidirect sum of finite monoids. If F is the set of input words, a finite counting automaton β of order q is the integral-valued function of F that is given by (1) a finite set of $(q_j + 1)$-tuples $(\alpha_j) = (F'_{j,1} F'_{j,2}, \ldots, F'_{j,q_j+1})$ of regular events $F'_{j,i}$ $(1 \leq j \leq M_j; q_1, \ldots, q_M \leq q)$, (2) a polynomial $\bar{\beta}$ with integral coefficients in the variates $\alpha_1, \ldots, \alpha_M$; for each $f \in F$, βf is defined as $\bar{\beta}(\alpha_1 f, \alpha_2 f, \ldots, \alpha_M f)$ where $\alpha_j f$ denotes the number of factorizations $f = f_1 f_2 \ldots f_{q_j+1}$ of f into $q_j + 1$ words such that $f_i \in F'_{j,i}$ $(1 \leq i \leq q_j + 1)$. The support of β is the set $\{f \in F: \beta f \neq 0\}$ and R_β is the family of supports of all such β. β is said to be linear if $\bar{\beta}$ is linear. Let $\overline{\deg}\ \beta = q'$ if q' is the least integer such that for all non-empty words f, $|\beta f|$ is bounded by a constant multiple of the q'th power of the length of f. The main result is that $\overline{\deg}\ \beta$ is the greatest lower bound of the numbers $r \geq 0$ such that $\lim \sup_{|f| \to \infty} |f|^{-r} |\beta f| = 0$; also that there is a linear finite counting automaton identically equal to β whose order is precisely $\overline{\deg}\ \beta$. It is proved that the family R_β is closed under union, intersection and product, but is not closed under the star operation as is the family of regular sets. (Math. Rev. abstract)

LORENTZ INVARIANT PROPAGATION OF EM WAVES IN A PLASMA WITH DENSITY GRADIENT, by G. Lanza, P. Rothwell, and R. Spurr. [1961] 20p. (AFOSR-1617) (AF 49(638)555) Unclassified

In order to obtain solutions which are Lorentz invariant, the relativistic Boltzmann equation of Clemmow and Wilson together with Maxwell's equations are applied to a plasma in a constant magnetic field, assuming a variable density in the z direction and hence, a variable collision frequency. The assumption is that $E = e^{i\omega t}$ gives 2 fourth order differential equations which are solved for the plasma and electromagnetic modes, respectively. The modified solutions of the usual dispersion relations resulting from the Lorentz form and the assumptions of variable density and collision frequency are examined for an effective density gradient an possible coupling between the different types of waves. Finally, the mode properties are examined in the inertial frame of an observer moving with relative velocity with respect to the plasma.

ON THE STEADY-STATE DYNAMICS OF SPIRAL GALAXIES, by H. D. Greyber. June 1, 1962, 40p. incl. diagrs. tables, refs. (Scientific rept. no. 3) (AFOSR-2958) (AF 49(638)555) AD 285856 Unclassified

In the theory discussed, ideas of plasma physics and magnetohydrodynamics are invoked for explaining the general circulation of gas through a spiral galaxy. In particular, a general dipole magnetic field in the region close to the center of the galaxy (whose axis roughly coincides with that for the galaxy) is assumed and the consequences studied. Thus for the charged gas and dust, gravitational and magnetic forces are assumed to play comparable roles. Before discussing the theory however, the evidence for the structure of spiral galaxies is reviewed, especially in the neighborhood of the galactic center.

RELATIVISTIC TREATMENT OF PLASMA, by G. Lanza and H. Yilmaz. Sept. 1, 1962 [8]p. (Scientific rept. no. 4) (AFOSR-2959) (AF 49(638)555) Unclassified

Presented at Internat'l. School of Physics "Enrico Fermi": Twenty-Fourth Course on Space Exploration and the Solar System, Varenna (Italy), June 4-16, 1962.

The equations of plasma physics are obtained from a few fundamental principles and in a relativistically covariant form. The general principles used are: (1) the relativistic invariance, (2) causality requirement, and (3) the positive definitiveness of energy. These are general statements which are valid for all phenomena, whether electromagnetic or not. In addition to these, the principles of charge conservation and of gauge invariance are employed to introduce electrodynamics. Other requirements, for example, the conservation of energy-momentum and angular momentum, etc. will not be considered as independent principles since these are the consequences of the homogeneity and isotropy of the Lorentz space.

SYNTHESIS AND CHARACTERIZATION OF SOME DIACIDOTETRAAMMINERHODIUM (III) COMPOUNDS, by S. A. Johnson and F. Basolo. [1962] [8]p. incl. diagr. tables, refs. (AFOSR-2253) (AF 49(638)315) AD 407714 Unclassified

Also published in Inorg. Chem., v. 1: 925-932, Nov. 1962.

The synthesis of salts of the complex cations $[RhA_mCl_2]^+$, where A = NH_3, en, m-bn, d, l-bn, tetrameen, tren, or trien are described. Similarly, preparations are given for salts of the type $[Rh(en)_2X_2]^+$, where X = Cl^-, Br^-, I^-, NO_2^-, or N_3^-, and for those of the type $[Rh(en)_2XCl]^{+n}$ where X = SCN^-, NO_2^-, or NH_3. In most cases it was possible to isolate both the cis and trans isomers. Proof of structure for the isomers of $[Rh(en)_2Cl_2]^+$ was obtained by resolution of the cis form. In all other cases structural assignmen. was based on measurements of absorption spectra. For the $[RhA_mCl_2]^+$ systems there was the supporting evidence that the rates of hydrolysis of the trans isomers are not base-catalyzed, whereas the cis isomers hydrolyze more rapidly in alkaline solution. THE HYDROGENOLYSIS OF DICYCLOPROPYLMETHANE ON NICKEL CATALYSTS, by J. Newham and R. L. Burwell, Jr. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-2219) (AF 49(638)935) Unclassified

Also published in Jour. Phys. Chem., v. 66: 1438-1444, Aug. 1962.

This paper deals with the hydrogenolysis of dicyclopropylmethane (A) on nickel-silica, reduced nickel oxide, and nickel wire at 55° in a flow reactor. Diffusional control was negligible. Results differ in 2 major ways from those on platinum (see item no. 2166, Vol. VI), a much increased yeild of 2-methylhexane (E) and the intrusion of demethanation. E amounts to about 70% of the final heptane product which indicates that cleavage of the first and of the second rings occurs preferentially in opposite locations and, therefore, with some difference in mechanism. The double ring opening reaction via a surface reaction intercepts the formation of desorbed isobutylcyclopropane (C) to a much greater extent than on platinum. The large yield of E results from predominant cleavage of a bond adjacent to the side chain during the opening of the second ring. The mechanism of ring opening is discussed with the tentative conclusion that the initial ring opens via formation of 1,3-diadsorbed 2-substituted cyclopropane either by direct reaction of physically adsorbed A or from 1-monoadsorbed 2-substituted cyclopropane. The adsorbed species formed in this reaction either desorb or further react to open the second ring before desorption. About 10% of the initial ring cleavage leads to demethanation by breaking 2 bonds in the cyclopropyl ring. The effect of temperature upon selectivities is much smaller than on platinum. (Contractor's abstract)

THE HYDROGENOLYSIS OF DICYCLOPROPYLMETHANE ON PLATINUM CATALYSTS, by J. Newham and R. L. Burwell, Jr. [1962] [8]p. incl. diagrs. tables, refs. (AFOSR-2220) (AF 49(638)935) Unclassified

Also published in Jour. Phys. Chem., v. 66. 1431-1438, Aug. 1962.

The hydrogenolysis of dicyclopropylmethane (A) has been studied in a flow reactor at 52°, $H_2/A = 16$, on coprecipitated platinum-alumina, 2 impregnated platinum-aluminas, platinum-pumice, and platinum-charcoal. Compound A hydrogenolyzes to butylcyclopropane (B) and isobutylcyclopropane (C). B further hydrogenolyzes to heptane (D) and 2-methylhexane (E); C to E and 2,4-dimethylpentane (F). The ratios B/C in the first reaction and D/E in the second are about 1/6 and E/F in the third is about 1/15, but there is some variation from catalyst to catalyst. Over half of the sequence A → B → D + E proceeds directly to D + E by a surface reaction which intercepts the formation of vapor phase B. The surface reaction is much less prominent in the sequence A → C → E + F. A very active impregnated platinum-alumina was investigated in 3 mesh sizes, 80-100, 40-60, and 20-40. The first behaved normally but the third gave much less C and a large initial ratio F/C. This behavior is diagnostic of large concentration gradients in the catalyst pores. The very active platinum-charcoal gave even more extreme behavior. The extreme cases of diffusional control do not agree very well with a model which assumes cylindrical pores. This matter and the effect of channelling upon selectivity are discussed. (Contractor's abstract)

SYMMETRY NUMBERS AND REACTION RATES, by E. W. Schlag. [1962] [3]p. incl. diagrs. (AFOSR-J877) (AF AFOSR-62-83) AD 415837 Unclassified

Also published in Jour. Chem. Phys., v. 38: 2480-2482, May 15, 1963.

It is shown that absolute rate theory, in its use of symmetry numbers in the rotational partition functions, does not provide an infallible method for considering the possibility of multiple reaction paths. The conditions under which this method must fail are considered; and hence, in absolute rate theory calculations, a correction factor must be included beyond that provided by the symmetry numbers. A general method is given for calculating the reaction path multiplicity; a direct count of all possibilities will, of course, always provide the correct answer. (Contractor's abstract)

THE INTERACTION OF NONIONIC DETERGENTS WITH

PROTEIN IN PAPER ELECTROPHORESIS. by R. M. Dowben, W. R. Koehler, and G. Barrieux. [1961] [6]p. incl. diagrs. table, refs. (AFOSR-24) (AF 49-(638)821) Unclassified

Also published in Clin. Chem., v. 7: 482-487, Oct. 1961.

Addition of polyoxyethylene nonionic detergents to the buffer in paper electrophoresis results in alteration of the rate of migration and shape of protein peaks. At low detergent concentrations, disruption of paper-protein binding leads to faster migration and sharper peaks. At high detergent concentrations, interaction of detergent with protein leads to slower migration and broader peaks. On glass-fiber paper, which binds protein less strongly than ordinary cellulose filter paper, only slowing of migration occurs upon addition of detergent to the buffer. Electrophoresis of polysaccharides using buffer-containing detergent results in a slight increase in migration.

FORMATION AND REVERSION OF GUINIER-PRESTON ZONES IN Al-5.3% Zn, by H. Herman, J. B. Cohen, and M. E. Fine. Apr. 1962 [36]p. incl. illus. diagrs. tables, refs. (AFOSR-J46) (AF 49(638)524) AD 297259 Unclassified

Also published in Acta Metall., v. 11: 43-56, Jan. 1963.

Formation, reversion, and reformation of GP zones in Al-5.3 at.% Zn were studied through measurement of electrical resistance, Young's modulus, critical resolved sheat stress, and small-angle scattering of x-rays. A definite zone radius of approximately 9 A is associated with the resistance maximum or plateau which is observed during aging. This zone is independent of aging temperature or whether the zones form on aging or reaging after reversion. After a long aging treatment, about 1/2 of the Zn atoms present are associated with zones; after reaging only about 1/4 are associated with zones. The intensity maximum in the small-angle x-ray scattering curve early in the aging process is apparently due to a shell depleted in Zn about each zone. There is no incubation time for aging or reaging. The kinetics of formation of zones on aging and reaging depend upon vacancy concentration and supersaturation, these vary with aging temperature, time, and previous treatment. In the absence of a large excess in vacancies (this is the situation during aging or late in the direct aging process), the relation of the composition of the solid solution about the zone to the spinodal composition is particularly important and the rate of zone formation decreases with an increase in aging temperature. In the initial stages, when there are large numbers of vacancies, the rate increases with an increase in aging temperature. (Contractor's abstract, modified)

CONCEPTUAL STRUCTURE AND GROUP PROCESSES IN AN INTERNATION SIMULATION. PART I. THE PERCEPTION OF SIMULATED NATIONS: A MULTIDIMENSIONAL ANALYSIS OF SOCIAL PERCEPTION AS AFFECTED BY SITUATIONAL STRESS AND CHARACTERISTIC LEVELS OF COMPLEXITY IN PERCEIVERS, by M. J. Driver. Apr. 1962 [356]p. incl. diagrs. tables, refs. (AFOSR-3439) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)742, Office of Naval Research, and National Institute of Mental Health) Unclassified

The purpose of the study was to uncover the general structure of the concept used to perceive social groups acting as simulated nations, to determine whether the complexity and content of this perceptual concept would shift under varying situational stresses and to discover whether differences in the complexity of this specific concept could be traced to a measure of generalized cognitive complexity. A model was presented in which complexity in a concept was defined in terms of 3 qualities: (1) amount of differentiation; (2) degree of representative integration; and (3) preponderance of internal dynamic properties of stimuli over more primitive external characteristics. The theory advanced was that complexity would relate to stress in a curvilinear fashion. Moderate stress should induce greater complexity in social perception than either too mild or too intense stress. In addition, it was expected that at most stress levels differences in complexity can be related to differences in the characteristic levels of cognitive complexity in perceivers. In general, the study found that by multidimensional scaling meaningful dimensions in the concept employed to perceive simulated nations could be discovered. It was also found that both content and structure in this social concept varied in provocative ways as a function of situational stress and characteristic levels of generalized complexity in perceivers. ELECTRON DENSITY AND COLLISION FREQUENCY OF ARC-HEATED ARGON PLASMA, by R. C. Warder, M. Brodwin, and A. B. Cambel. Jan. 1962, 63p. incl. illus. diagrs. tables, refs. (AFOSR-3045) (AF 49-(638)879) AD 276909 Unclassified

An investigation of the electrical properties of an argon plasma flow was conducted in an arc-heated plasma tunnel using microwave diagnostics. In particular, phase shift and attenuation measurements at 78 and 35.3 kmc were made to determine the electron density and electron collision frequency of the argon plasma. The electron densities as determined from the phase shift measurements at the 2 frequencies agree quite well and when compared with theoretical predictions indicate that the plasma flow is not in equilibrium. The attenuation measurements agree qualitatively; however, the experimentally derived electron collision frequencies do not agree with presently accepted theoretical predictions. Furthermore it has been shown that the infinite slab hypothesis which is assumed in many of the current microwave plasma studies was satisfied. The microwave interferometer method thus appears to be a reliable method for determining the electron density of plasma flows insofar as the infinite slab hypothesis is satisfied and the plasma electron density is below the cutoff value. THE EFFECT OF RADIATIVE LOSSES ON THE ATTENUATION OF ELECTROMAGNETICALLY DRIVEN SHOCK WAVES, by J. A. Thornton and A. B. Cambel. [1962] [13]p. incl. diagrs. refs. (AF 49(638)879) Unclassified

Published in Jour. Quant. Spectros. and Radiative Transfer, v. 2: 249-261, July/Sept. 1962.

The approximate, 1 dimensional blast wave theory of Harris is modified to take into consideration the effect of radiation losses from plasmas behind strong shock waves produced in electromagnetic shock tubes. The semi-empirical radiation theory of Kivel is used in evaluating the resulting modified shock expansion equation. The influence of various shock tube operating parameters such as energy input and ambient density on the shock wave velocity attenuation via radiation is examined. The predictions suggested by the proposed theory are confirmed by means of experimental data obtained in a conical discharge section electro-magnetic shock tube. It is seen that the most severe effect due to radiative losses occurs near the gaseous discharge. Radiation losses are found to be unimportant at distances downstream of the electrical discharge when the gas density is low. (Contractor's abstract)

THE SPECTROSCOPIC MEASUREMENT OF TEMPERATURE IN TRANSPARENT ARGON PLASMAS, by C. F. Knopp, C. F. Gottschlich, and A. B. Cambel. [1962] [3]p. incl. diagr. (AF 49(638)879) Unclassified

Published in Jour. Quant. Spectros. and Radiative Transfer, v. 2: 297-299, July/Sept. 1962.

In general, absorption spectroscopy is impractical in plasma diagnostics because the radiation intensities are quite high. Therefore, emission spectroscopy was used in this study. The technique described here is an adaptation of an astrophysical method developed originally by Fowler and Milne, and later treated analytically by Larenz for the case of transparent plasmas. The experimental utilization of the Fowler-Milne method is discussed and observations in connection with an argon arc jet are described. On the basis of these observations, it can be suggested that the method of Fowler-Milne may be used to advantage in determining the temperature of laboratory-type plasma arcs commonly used in studies of hypersonics and magneto-gasdynamic power generation.

THERMOPHYSICAL PROPERTIES OF PLASMAS, by R. C. Warder and A. B. Cambel. Final rept. Mar. 15, 1960-Mar. 14, 1962. July 1962, 6p. incl. refs. (AF 49-(638)879) AD 283512 Unclassified

Current research is concerned with determining: (1) the kinetic coefficients for the recombination of ions and electrons, and the effect of radiative transfer to high

Mach number shock waves; (2) the effect of electron-neutral particle collision on the transmission and reflection of microwaves incident on the plasmas, and the tensor electrical conductivity of the plasma; and (3) the velocity distribution and thermal conductivity of a conventional plasma jet, and the electrical conductivity, and viscosity of a plasma as a function of its thermodynamic state.

MICROWAVE DIAGNOSTICS OF ARC-HEATED PLASMA, by R. Warder, W. L. Nighan and others. [1962] [21]p. incl. diagrs. (AF 49(638)879 and AF AFOSR-62-307) Unclassified

Published in Symposium on Dynamics of Manned Lifting Planetary Entry, Philadelphia, Pa. (Oct. 1962), ed. by S. M. Scala, A. C. Harrison and M. Rogers. New York, Wiley and Sons, 1963, p. 185-205.

An investigation of the electrical properties of argon and nitrogen plasma flows have been conducted in arc-heated plasma tunnels using microwave diagnostics. In particular, phase shift and attenuation measurements at 78, 81.5, and 85.3 kmc have been made to determine the electron density and electron collision frequency of the plasma flows. The electron densities as determined from the phase shift measurements at the various frequencies agree quite well and, when compared with theoretical predictions, indicate that the plasma flow is not in equilibrium. The attenuation measurements agree qualitatively; however, the experimentally derived electron collision frequencies and hence, d-c conductivities do not agree with presently accepted theoretical predictions. Furthermore, it has been shown, the infinite slab hypothesis which is assumed in many of the current microwave plasma studies was satisfied. The microwave interferometer method thus appears to be a reliable method for determining the electron density of plasma flows.

ONE-DIMENSIONAL MAGNETOGASDYNAMIC FLOW WITH WALL FRICTION, by S.-S. Liu and A. B. Cambel. [1962] [5]p. incl. diagr. table, refs. [AF AFOSR-62-307] Unclassified

Published in Phys. Fluids, v. 6: 792-796, June 1963.

The case of 1-dimensional magnetogasdynamic flow under the influence of wall friction is investigated. In particular, the case of an infinitely conducting, compressible plasma is studied when the flow direction and the direction of the magnetic field are at right angled to one another. It is shown that all flow variables can be expressed as functions of the ratio of the local flow velocity to the Alfvén velocity. It is shown that the flow has a variety of regimes delineated by specific singularities and extremities. A typical magnetogasdynamic Fanno flow chart is presented and it is noted that the flow differs markedly from that encountered in classical gasdynamics. (Contractor's abstract)

INSTABILITY ANALYSIS OF CYLINDRICAL SHELLS UNDER HYDROSTATIC PRESSURE, by G Herrmann. [1962] [6]p. incl. tables, refs. (NASA technical note no. D-1510) (AFOSR-64-0135) (AF AFOSR-63-100) AD 436157 Unclassified

Also published in Proc. Nat'l. Aeronaut. and Space Admin. Conf. on Instability of Small Structures, Langley, Va., 1962, p. 239-244.

A general bending theory of circular cylindrical shells under the influence of initial stress is expressed to re-examine the theory and to compare the results with those of previous investigations. The outcome was the establishment of a simple but accurate expression for the buckling pressure applicable to a wide range of shell dimensions.

THE CONDUCTANCE AND DIELECTRIC CONSTANTS OF SILVER IODIDE, SILVER IODOMERCURATE AND CUPROUS IODOMERCURATE, by P. Splitstone and P. M. Harris. Aug. 1962, 54p. incl. diagrs. tables, (AF 49(638)397) AD 289557 Unclassified

The capacitances and loss factors of β-Cu_2HgI_4 and AgI (as briquets) have been measured in the frequency range 10^2 to 10^5 cps and at each of several temperatures below room temperature. Arguments are presented to show that all 3 of these substances are not simple dielectrics but are characterized by relaxation processes having 2 (or more) relaxation times. In all 3 substances the magnitude of the conductance increases with frequency (at constant temperature) as would be expected of a substance whose polarization is accompanied by dissipation. It is suggested that transport and polarization by ion displacement occurs by escape of ions from tetrahedral sites of the iodine lattice to octahedral sites of the iodine lattice to octahedral sites in which the polarizability is expected to be much higher and that this escape probability may be greatly enhanced by the presence of anion defects.

DESIGN OF AUTOMATED SINGLE CRYSTAL DIFFRACTOMETER FOR NEUTRON DIFFRACTION, by P. M. Harris. Aug. 1962, 17p. incl. diagrs. (Technical rept. no. 3) (AFOSR-4017) (AF 49(638)397) AD 285782 Unclassified

As neutron diffraction has been extended to investigations of the structures of more complex crystals, it has become necessary to collect measurements of a larger number of integrated reflections. The long counting times required have directed attention to the development of automated single crystal diffractometers. Because of the complexities and cost of the punched card or tape method of automation, it appeared worthwhile to survey more generally the possibilities available. This report describes 3 cases of practical importance; (1) normal beam method, (2) equi-inclination method, and (3) flat cone method. All 3 methods permit the mapping of a large number of reflections without reorientation of the crystal relative to the diffractometer axis. This is a great advantage as compared with the use of the crystal orienter since only 2 instead of 4 automated drives are required.

NONLINEAR VIBRATING SYSTEMS HAVING INFINITELY MANY LIMIT CYCLES, by K. Klotter and E. Kreyszig. Final rept. Apr. 1962, 18p. incl. diagrs. (AF 49(638) 990) Unclassified

The paper contains an analytical investigation of the limit cycles of the system given by $\ddot{q} - (\mathrm{Sgn}\,\dot{q})\left(\frac{aK^2}{2}\dot{q}^2\cos aq + \frac{c^2}{2}\right) f(q) = 0$ with $a > 0$, $f(q)$ is an odd polynomial with nonnegative coefficients, and the constants are denoted in a fashion convenient for the system investigated. It is shown that limit cycles exist and can be characterized in detail without integrating the equation.

A FOKKER-PLANCK EQUATION FOR SPIN RELAXATION, by A. Yoshimori and J. Korringa. [1962] 28p. incl. refs. (AFOSR-2586) [AF 49(638)264] Unclassified

Also published in Phys. Rev., v. 128: 1054-1060, Nov. 1, 1962.

A method is developed to describe the quantum mechanical motion of a few simple spin systems, with random time-dependent perturbations, in an exact manner, i. e. without reference to perturbation theory. It leads to a Fokker-Planck type diffusion equation. When applied to a spin influenced by a fluctuating local field (Abragam's model), this gives rise to a (microscopic) Bloch type equation for the spin operators. An application to a system of 2 identical spins (S = 1/2) with modulated dipole interaction produces a very complicated diffusion equation in 8 variables, which simplifies, however, in a case of restricted rotation. A model Hamiltonian for quadropole relaxation for S = 1 gives a relatively simple result, which reveals an interesting difference between the relaxation in finite and zero external fields. (Contractor's abstract)

THEORY OF RELAXATION OF A TWO-SPIN SYSTEM, by J. Korringa and A. Yoshimori. [1962] [35]p. (AFOSR-2587) [AF 49(638)264] Unclassified

Also published in Phys. Rev., v. 128: 1061-1069, Nov. 1, 1962.

The relaxation of a system of 2 inequivalent spins (S = 1/2, I = 1/2) with 2 non-commuting time dependent interactions, i. e. a randomly modulated dipole interaction, and a fluctuating local field acting on one of the spins (S), is discussed. The influence of the fluctuating field is treated exactly in terms of a Fokker-Planck equation, which is described in the previous paper (item no. 2186, Vol. VI). The dipole interaction is then treated with perturbation theory. This gives, in all detail, the time dependent transitions between the levels established in a constant external field. It is shown that rate equations are insufficient to describe the transitions, and that in weak fields a resonance phenomenon can occur. This resonance is studied in some detail with Green's function methods. (Contractor's abstract)

INDUCED COLLABORATION IN SOME NON-ZERO GAMES, by A. Scodel. 1962, 13p. (AFOSR-4206) (AF 49(638)317) AD 287838 Unclassified

Also published in Jour. Conflict Resolution, v. 6: 335-340, Dec. 1962.

Three kinds of 2-person non-zero-sum games were utilized in this study. Two of the games employed a matrix in which the competitive strategy did not dominate in a formal sense whereas the third involved a matrix of the dilemma variety in which the competitive strategy did dominate. In neither of the first 2 games was there any difference in the subjects' collaborative behavior for the 2 experimental conditions. Regardless of condition, however, subjects in these games manifested more collaboration than was true of games of identical matrices where pairs of subjects selected their own strategies. In the dilemma game, there was a pronounced difference between subjects under the 2 conditions - about half of the subjects exposed to the initially competitive stooge manifested collaboration in contrast to an almost complete absence of such behavior in those subjects who played with a collaborative stooge. The latter group played much like subjects playing the same game with other subjects. (Contractors abstract)

INTRA-ORGANIZATIONAL STRUCTURAL VARIATION: AN APPLICATION OF THE BUREAUCRATIC MODEL, by R. B. Hall. [1962] 22p. incl. refs. (AFOSR 2918) (AF 49(638)447) Unclassified

Ten organizations, 5 profit making and 5 governmental, were examined to determine whether or not variations in structure do occur between organizational segments engaged in divergent activities and whether such variations have any significant influence on the over-all organizational structure. The purpose was to set up scales for evaluating the degree of bureaucratization present in a given institution or segment thereof, and to determine the degree to which bureaucratic procedures might be incompatible with a given task. Six of the dimensions used as criteria were (1) a well defined hierarchy of authority, (2) a division of labor, (3) a system of rules covering rights and duties (4) a system of procedure, (5) impersonality, and (6) promotion and selection based on technical competance. It was found that tasks which require social or creative skills such as research, sales and design are not appropriately analyzed by the bureaucratic model. They are nonuniform or difficult to routinize and will be significantly less bureaucratic.

ADMINISTRATIVE PRACTICES IN UNIVERSITY DEPARTMENTS, by E. Haas and L. Collen. [1962] [17]p. incl. table, refs. (AFOSR-2985) (AF 49(638)447) AD 288167 Unclassified

Also published in Admin. Sci. Quart., v. 8: 44-60 June, 1963.

This paper attempts to explain variation in the formalization of administrative practices current in the teaching departments of a large midwestern university. Variation was noted in the degree of formalization in the following practices: hiring procedures, evaluation of performers, and handling of satisfactory faculty members. This variation was analyzed to determine its relationship to: department size, frequency of decision making, department prestige, supply-demand ratio, and humanistic orientation. Frequency of decision making emerged as the most significant of these. Humanistic orientation was found to be associated with the subject matter taught by the department. (Contractor's abstract)

LEARNING THEORY AND CLINICAL PSYCHOLOGY, by S. Liverant [1962] 35p. incl. refs. (AFOSR-2832) (AF 49(638)741) AD 612126 Unclassified

Also published in Prog. in Clin. Psychol., v. 5: 159-177, 1963.

Four conclusions about the reconciliation of learning theory and clinical psychology are offered. First, both behaviorists and clinical psychologists must overcome their traditional distrust of theory and come to a realization that the development of a constructural approach is to their mutual benefit and advancement. Second, the thrust of learning into clinical psychology has produced much questioning of clinical mythology, a procedure which is a necessary step in the progress of clinical psychology. Third, contact with clinical observation has in many instances forced the learning theorist to reexamine the narrowness of his formulations and has contributed to an awareness that imaginative conceptualization is prior to methodological ingenuity. Fourth, the strands of learning theory form a network of still tenuous strength, but one which offers a compelling approach to abnormal behavior and the clinician's interactions with the disturbed individual.

THE PREDICTION OF SOCIAL ACTION TAKING BEHAVIOR, by P. M. Gore and J. B. Rotter. [1962] [12]p. incl. table, refs. (AFOSR-2833) (AF 49(638)741) AD 612125 Unclassified

Presented at meeting of the Midwestern Psychological Association, 1962.

Also published in Jour. Personality, v. 31: 58-64, Mar. 1963. (Title varies)

Students in a Southern Negro college (N - 116) very much involved in the current social protest movement against segregation were used as subjects of a study of prediction of social action taking behavior. A forced choice test of a generalized attitude toward internal or external control of reinforcements, not specifically dealing with the issue studied, predicted the type and degree of commitment behavior manifested to effect social change. The social desirability motive and social class showed a weak trend, in the predicted direction, in the case of the former and a logically consistent one on an ad hoc basis in the case of the latter. These findings may serve as an impetus for much needed research in the important area of ongoing social action and social change.

ALIENATION AND LEARNING IN A HOSPITAL SETTING, by M. Seeman and J. W. Evans. [1962] [11]p. incl. tables, refs. (AFOSR-2860) [AF 49(638)741] AD 414295 Unclassified

Also published in Amer. Sociol. Rev., v. 27: 772-782, Dec. 1962.

This paper presents a controlled, and situationally specific, test of a common assertion regarding alienation in modern society. The hypothesis is tested that differences in alienation (i. e., in powerlessness) are associated with differential learning of behavior-relevant information. Comparing patients who differ in their degree of alienation, but who are matched for socioeconomic backgrounds and for health and hospital histories, it is shown that the more alienated patients score lower on an objective test of knowledge about tuberculosis. Furthermore, these differences in objective knowledge are reflected in both the staff's description of the patients, and in the patients' attitudes about the information process. In understanding the attitude data, it is shown that the social structure of the ward as well as individual alienation must be taken into account. The relevance of these findings for contemporary viewpoints concerning the significance of alienation is noted.

SOME FACTORS AFFECTING THE PERCEPTION OF EVENTS AS CHANCE DETERMINED, by S. Blackman. [1962] [6]p. incl. tables. (AFOSR-3703) [AF 49(638)741] Unclassified

Also published in Jour. Psychol., v. 54: 197-202, July 1962.

One hundred eighty students were exposed to series of red and green lights which appeared with equal frequency. The interest was on the effect of these variables on extinction of expectancies for success in predicting which light to expect. The conditions studied were, length of sequences of events, and whether the sequences were patterned. Ss were presented with varying series of red and green lights in training, then the red light stopped coming on. The major hypothesis states; Ss who received long sequences or patterned sequences of red and green lights will, when the red light stops coming on, have a lower expectancy for red than will Ss who receive short sequences or non-patterned sequences.

CONFORMITY UNDER VARYING CONDITIONS OF PERSONAL COMMITMENT, by D. P. Crowne and S. Liverant. [1962] [9]p. incl. tables, refs. (AFOSR-J1165) (AF 49(638)741) AD 423049 Unclassified

Also published in Jour. Abnorm. and Social Psychol., v. 66: 547-555, June 1963.

This study tested a central proposition, stemming from Rotter's social learning theory, that conformity is related to low expectations of success in socially evaluative situations and is consequently accompanied by defensive processes. Two variants of an Asch situation representing increasing degrees of personal commitment were compared to a control condition. Situational measures of confidence included betting and statements of expectancy. Additional personality indices included level of aspiration, need for approval, and internal vs external control of reinforcement. The Ss were 110 introductory psychology students. Results depict the conformer as one who has a low expectation of success in evaluative situations. His lesser confidence leads to avoidant behavior to resolve the ensuing conflict. Defensive processes of the conformer tend to become more marked as personal commitment increases.

IMPURITY DIFFUSION IN DIAMOND (Abstract), by W. J. Leivo and V. A. Fratzke. [1962] [1]p. [AF 18(603)40] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 436, Aug. 27, 1962.

The possibility of diffusing impurities into nonconducting diamonds under vacuum conditions in order to produce semiconducting diamonds was investigated. Diffusion experiments were carried out with Al, B, and Be at temperatures around 900°C which is below that at which the conversion rate of diamond to graphite becomes significant. Evidence of diffusion was determined by electrical-conductivity measurements, changes in optical absorption, and by comparison with natural semiconducting diamond. No detectable diffusion occurred in times up to 1 wk. The results are in accord with theoretical calculations of diffusion using a vacancy model for diffusion. The calculated activation energy is too high to give a measurable diffusion at 900°C in the time involved. The activation energy for diffusion of boron in diamond was computed; it is less than that for Al, and is essentially the same as for self-diffusion. The activation energy for self-diffusion using an extension of the method used by Dienes for diffusion in graphite was compared with that developed by Swalin for the diamond-type crystals.

VAPOR PRESSURES IN THE SYSTEM DI-N-BUTYL PHTHALATE DIETHYL ETHER AND A STUDY OF THE THERMOMETRIC METHOD FOR COMPARISON OF VAPOR PRESSURES, by T. E. Moore and R. J. Laran. [1962] 6p. incl. tables. (AFOSR-TN-60-579) (AF 18(600)478) Unclassified

The successful application of "wet-bulb" thermometry using thermistors as temperature-sensing elements in the determination of molecular weights of nonvolatile solutes in volatile solvents led to an investigation of the usefulness of the method for studying the thermodynamic properties of salts in ether. It was necessary to measure the vapor pressure of ether solutions of di-n-butyl phthalate over a wide range of concentrations to provide data for calibration of the thermometric apparatus. The measurements were made at 24 concentrations covering the range of ester mol-fractions from 0.006 to 0.175 at 25°. A static method employing a differential manometer and alternate freezing and thawing under evacuation was used. The solvent and solutions were stirred magnetically, and the temperature was controlled to ± 0.005°. Solutions were analyzed after mass measurement by evaporation to constant weight at 60-70°. A quadratic equation was fitted to the data by least squares procedure. $\Delta p = 0.43 = 33.64\ m - 2.478\ m^2$ The calibration data for solutions of di-n-butyl phthalate in ether show that ΔR varies linearly with Δp up to Δp equal to about 50 mm, with $\Delta R/\Delta p$ having a value of 4.38 ohms per mm. In order to evaluate the thermal efficiency of the method and compare this with the theoretical efficiency, the vapor pressure lowerings of ether corresponding to the measured temperatures of the solvent drop in the steady state were calculated from the known properties of ether. Values of the ratio of the calculated vapor pressure lowering to the vapor pressure lowering obtained from the calibration curve are shown.

ATOMIC COLLISIONS, by B. Roth. Final technical rept. Aug. 1962, 2p. (AFOSR-3533) (AF AFOSR-62-102) AD 285405 Unclassified

The problem of electron exchange in H^+ -H collisions was first investigated on a purely quantum mechanical basis. A calculation was made using the method of distorted waves. The 2 scattered waves, the one for non-capture and the other for capture (the electron being in the ground state in both cases), are coupled by the nucleus-electron interaction. Interference between these 2 waves gives rise to resonances. Calculation gives, for the energies of these resonances, values which agree exactly with 4 experimentally determined resonances in the range 0.5 to 50 kev. The resonances do not reach their maximum values (a probability of 1 or 0 for capture) as there is some damping. The interaction which gives rise to the resonance is a complex quantity.

THE DETERMINATION OF OPTICAL EXCITATION CROSS SECTIONS IN ATOMIC GASES, by R. M. St. John and C. C. Lin. Final rept. Jan. 3, 1962, 6p. incl. tables. (AFOSR-1992) (AF 49(638)41) Unclassified

A brief description of the work dealing with the determination of optical excitation cross-sections in atomic gases is given. Most early investigations dealt with the study of the 3^1p level of He and the effects of resonance radiation. Later studies dealt with excitation transfers of ^3D levels at high pressure. The theory of multiple transfer of excitation through high energy levels was developed to account for the shape of the excitation function. In 1961 a new system for processing excitation function data was constructed and developed, the basis of which is the display of the apparent cross section on an oscilloscope screen as a function of the electron energy. It is permanently recorded by a camera. Also the quantum mechanics theory of the multiple state transfer mechanism has been investigated in detail.

THEORY OF MULTIPLE STATE TRANSFER IN HELIUM AND OBSERVATION RELATIVE TO IT, (Abstract) by R. M. St. John, C. C. Lin, and R. G. Fowler. [1962] (AF 49(638)41) Unclassified

Published in Second Internat'l. Conf. on Physics of Electronic and Atomic Collisions; Abstracts of Papers, Colorado U., Boulder (June 12-15, 1961), New York, W. A. Benjamin, 1961, p. 123. (AFOSR 1327)

Excitation in helium is readily shifted from ^1P states to ^3D states at pressures as low as 10^{-2} mm. It is assumed in a new theory that low lying ^3D states receive population through radiative transitions from many higher ^3F states. An nth ^3F state is largely populated from the nth ^1P state through a collision of a ground state helium atom with an n^1p to n^3F is assumed to have either an n^2 or an n^4 variation. Refinements of the theory were made and the theory fitted to experimental observations of 3^3D density at a single pressure for each assumption. Recent observations on population densities of 4^3D and 5^3D are compared with the predictions of the above theory with its various assumptions. The theory yields cross sections for transfer of excitation from ^1P states to ^3F states (and the reverse process) which are near the gas kinetic value and hence are in relatively good agreement with the Wigner spin rule. Quantum-mechanical calculations of the cross sections have been made and the results compare favorably with experiments.

MEASUREMENT OF THE RELAXATION TIMES FOR THE OPTICAL EXCITED STATES OF ATOMS, by R. G. Fowler. Interim final rept. May 31, 1962, 5p. (AF 49(638)639) (AFOSR-4043) Unclassified

This research on transition probabilities emphasizes absolute magnitudes and the factors which govern them. A low pressure gas is excited to an equilibrium condition, then the excitation source is removed abruptly and the relaxation in the luminosity of a single spectral line is observed photoelectrically. The information is displayed on an oscilloscope and photographed for analysis. The rather small amount of light available is a matter of some concern so a second standby absolute experiment was begun. In either experiment complete success will depend on an understanding of the migration of radiation through a gas. Experiments have thus

been undertaken on the escape of mercury resonance radiation from a uniformly excited vessel to determine temperature dependence, effect of foreign gas, and effect of apparatus dimensions. A time calibration technique has been developed for kilomegacycle oscilloscopes. A complete working apparatus system has been set up for direct time constant measurement. It has been demonstrated that the time constant for migration of resonance radiation varies inversely as the square root of the temperature. Equipment is available for measurements of resonance radiation transfer time, lithium lifetimes and molecular dissociation.

COLLISIONAL EXCITATION TRANSFER TO THE $4\,^1D$ STATE IN HELIUM BY MULTIPLE STATE MECHANISM, by C. C. Lin and R. M. St. John. [1962] [5]p. incl. diagrs. tables, refs. (AFOSR-J67) (AF AFOSR-62-67) AD 400375 Unclassified

Also published in Phys Rev. v. 128: 1749-1753 Nov. 1962.

The electron-excitation function of the $4\,^1D$ state of helium was measured at various pressures by means of an automatic processing system. The peak of the curve shifts gradually from 50 ev to 100 ev as the pressure is increased due to the collision transfer from the ^1P state. The transfer can be explained by the multiple state mechanism. Based on this theory the calculated population of the $4\,^1D$ state at $7.4 \times 1/10^{-2}$ mm pressure agrees quite well with experiments. The observed amount of transfer from $n\,^1P$ states to $4\,^1D$ and to $4\,^3D$ are of the same order of magnitude as predicted by the theory. The results of this work provide strong support for the multiple state transfer process. (Contractor's abstract)

SYSTEM FOR PROCESSING AND RECORDING EXCITATION FUNCTION DATA, by R. M. St. John, C. C. Lin and others. [1962] [6]p. incl. diagrs. refs. (AFOSR-J126) (AF AFOSR-62-67) AD 400190 Unclassified

Also published in Rev. Scient. Instr., v. 33: 1089-1094, Oct. 1962.

A system which automatically processes optical excitation data is described. This system is capable of producing data faster and of better quality than the old method. The apparent cross section for excitation by electron impact of a particular state is proportional to the light intensity of a radiative transition from this level divided by the product of the electron beam current times pressure. The light intensity is measured from the output current of a photomultiplier tube. When the pressure in the collision chamber is maintained constant, the apparent cross section is proportional to the ratio of photomultiplier current to electron beam current. This ratio is continuously computed by an analog divider while the electron accelerating voltage power supply is slowly swept through its range by a motor and gear reduction system so as to give a visual display of the excitation function on an oscilloscope. Permanent records of the function are made by photographing the trace. Absolute values of the excitation function can be obtained by calibration against a standard lamp. In order to suppress noise and light signals not originating in the collision chamber, the light beam from the collision chamber is square wave modulated; this then is converted into a sinusoidal wave by means of a tuned amplifier. This in turn is rectified by a phase-sensitive detector which produces a dc voltage proportional to the signal light intensity. Circuits of the phase-sensitive detector and modulation unit are presented. (Contractor's abstract)

CROSS SECTIONS FOR INELASTIC COLLISIONS UNDER NEAR RESONANCE CONDITION-2S-2P TRANSITIONS IN He BY ELECTRON IMPACT (Abstract), by N. F. Lane and C. C. Lin. [1962] [1]p. [AF AFOSR-62-67] Unclassified

Presented at meeting of the Amer. Phys. Soc., Boulder, Colo., Oct. 10-12, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 642, Dec. 27, 1962.

A method for the calculation of cross sections of inelastic electron- atom collisions for the case of near-resonance is presented. By means of the standard partial-wave method, the Schrödinger equation can be reduced approximately to a series of pairwise-coupled differential equations which contain the matrix elements of the interaction potential of the 2 colliding system (of distance R apart) between the initial (i) and final (f) state such as $U_{ii}(R)$, $U_{ff}(R)$, and $U_{if}(R)$. In this method, the functions U_{ii} and U_{ff} are approximated by the form of $B(>^{-1} - R_0^{-1})$ with a cutoff distance R_0, while U_{if} is replaced by AR^{-2} for $R > R_c$ and a constant for $R < R_0$.

The partial cross sections for $l > 8$ calculated by this procedure agree quite well with those obtained from Seaton's schematic model. For smaller values of l, a considerable difference in the partial cross sections is found. The total cross sections for the $2\,^1S - 2\,^1P$, $2\,^3S - 2\,^3P$ transitions in He calculated by this improved inexact-resonance method are appreciably smaller than the corresponding values obtained by Born's approximation and by Seaton's close-coupling formula.

PRESSURE DEPENDENCE OF EXCITATION FUNCTIONS OF THE 4^1D, 4^3S, AND 3^3P STATES IN HELIUM (Abstract), by R. M. St. John and C. C. Lin. [1962] [1]p. [AF AFOSR-62-67] Unclassified

Presented at meeting of the Amer. Phys. Soc., Boulder, Colo., Oct. 10-12, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 642, Dec. 27, 1962.

The excitation function of the 4^1D state of helium has been measured at various pressures. The peak of the curve shifts gradually from 50 to 100 ev as the pressure is increased. This can be explained by the collisional transfer of excitation from the ^1P states through the multiple-state mechanism. Based on this theory, the calculated population of the 4^1D state agrees quite well with experiments. The effect of direct transfer from 4^1P is found to be much weaker than that of the multiple-state process. The excitation functions of the 3^3P and 4^3S states at pressures about 0.1 mm show a secondary peak at 50 ev similar in shape to the excitation function of the 4^1D state at low pressure. Preliminary analysis indicates that this secondary peak can be explained by assuming a transfer from the high level ^1D to ^3D states in addition to the stronger multiple-state transfer $n^1P \rightarrow nF$. The spin-orbit interaction produces a small amount of singlet-triplet mixing which leads to substantial cross sections for $n^1D \rightarrow n^3D$ transfer because of the extremely close resonance.

STUDY OF RESONANCE RADIATIVE TRANSFER (Abstract), by H. Mochizuki. [1962] [1]p. [AF AFOSR-62-67] Unclassified

Presented at meeting of the Amer. Phys. Soc., Boulder, Colo., Oct. 10-12, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 643, Dec. 27, 1962.

Experimental investigations have been made of mercury 2537A radiation transfer through a slab of mercury gas at various densities, by using a sinusoidally modulated (~10 kcps) radio-frequency-excited (50 mcps) source of 2537A radiation. Transmitted radiation has been found to gain in phase relative to the source wave, while that which is scattered at 90° loses phase. A different density dependence is observed for the 2 modes of observations.

A SYSTEM FOR PROCESSING AND RECORDING EXCITATION FUNCTION DATA (Abstract), by R. M. St. John. [1962] [1]p. [AF AFOSR-62-67] Unclassified

Presented at meeting of the Amer. Phys. Soc., Texas U., Austin, Feb. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 115, Feb. 23, 1962.

A system has been developed which automatically processes and records data obtained in optical excitation experiments. In experiments of excitation by electron impact in a constant density gas, cross sections are proportional to the ratio of the light yield from the collision chamber to the electron current passing through the chamber. The light beam from the chamber is chopped 150 times/sec. The square wave response of the photomultiplier is amplified with a tuned amplifier; the tuned output is detected by a phase sensitive detector which produces a dc voltage proportional to the light intensity. This dc voltage is divided by a voltage proportional to the electron beam current, by means of an analog computer, giving a voltage proportional to the cross section for excitation. The energy of the exciting electrons is slowly swept through a range of 500 v. The computer output and electron accelerating voltage are fed to an oscilloscope in order to display the excitation function. A camera attached to the oscilloscope records the trace.

DISSOCIATION OF MOLECULAR HYDROGEN IN ELECTRIC DISCHARGES (Abstract), by S. B. J. Corrigan. [1962] [1]p. [AF AFOSR-62-378] Unclassified

Presented at meeting of the Amer. Phys. Soc., Boulder, Colo., Oct. 10-12, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 637, Dec. 27, 1962.

This paper presents improved experimental values of the electron-impact dissociation coefficient for molecular hydrogen in the range of reduced electric fields $x/P = 12\text{-}100$ v cm^{-1} (mm Hg)$^{-1}$. The measurements were made both in low-current rf discharges and in uniform positive columns. The dissociation coefficients obtained in these 2 ways are in good mutual agreement, and, as regards order of magnitude, are consistent with earlier published data. Reasons are given for assuming that the electron-energy distribution in this gas is closely Maxwellian, and this assumption is used to derive dissociation cross sections consistent

with the observed discharge-rate coefficients. Some more-tentative experimental data for dissociation rates in molecular oxygen are also presented.

THE REACTION OF HYDROGEN ATOMS WITH LIQUID OZONE, by J. A. Wojtowicz, F. Martinez, and J. A. Zaslowsky. [1962] [4]p. incl. diagrs. tables. (AFOSR-J1471) (AF 29(600)1667) AD 427637 Unclassified

Also published in Jour. Phys. Chem., v. 67: 849-852, Apr. 1963.

The reaction of atomic hydrogen with liquid ozone at - 196° gives a product which upon warming evolves molecular oxygen and leaves a residue of aqueous hydrogen peroxide. It is shown that under certain reproducible conditions the ratio of evolved oxygen to residual hydrogen peroxide is unity. The absence of hydrogen peroxide as a primary reaction product (under these conditions) was confirmed by infrared examination.

X-RAY STUDIES ON THE PRODUCT OF THE REACTION OF ATOMIC HYDROGEN AND LIQUID OZONE, by F. Martinez, J. A. Wojtowicz, and J. A. Zaslowsky. [1962] [3]p. incl. diagr. table. (AFOSR-J1473) (AF 49(638)1137) AD 426554 Unclassified

Also published in Jour. Phys. Chem. v. 67: 714-716, Mar. 1963.

This paper describes the results obtained by x-ray examination of the hydrogen atom-liquid ozone product in an attempt to identify the postulated product. The intent of these experiments was to determine if a superoxidic species could be detected in the frozen matrix of the hydrogen atom-ozone reaction product and to ascertain whether hydrogen peroxide is present. Although no proof for the presence of a new peroxide was obtained, the absence of hydrogen peroxide suggests that a higher unstable peroxide is the progenitor of the hydrogen peroxide which is detected on warming.

POLAROGRAPHIC REDUCTION OF SOME ALKYL- AND POLYMETHYLANTHRACENES, by L. H. Klemm, A. J. Kohlik, and K. B. Desai. [1962] [6]p. incl. diagrs. tables, refs. (AFOSR-2606)(AF 49(638)473) AD 612345 Unclassified

Also published in Jour. Org. Chem., v. 28: 625-630, Mar. 1963.

Polarography was conducted on anthracene, 10 monoalkylanthracenes, and 9 di- and polymethylanthracenes in 0.1 M tetra-n-butylammonium iodide in 75% dioxane-water. Using anthracene as a standard of comparison the change in the half-wave reduction potential, $-\Delta E_{1/2}$, for the single wave obtained for each of the other compounds is positive, consistent with a decrease in ease of electroreduction due to alkyl substitution. For isomeric monoalkyl derivatives, $-\Delta E_{1/2}$ is found to vary with the position of substitution in the manner 2- >1- >9-. Plots of $-\Delta E_{1/2}$ vs σ^*, the polar substituent constant, for the 2- and for the 1- plus 9-series are linear. There is no indication of a steric effect due to the bulkiness of the alkyl group. For those compounds containing more than one methyl substituent (investigated for 8- and/or meso-substituents only) a strict additivity relationship in $-\Delta E_{1/2}$ exists, except for the single change of 9-methylanthracene → 9, 10-dimethylanthracene, for which an enhancement potential must be included in order to retain additivity. Comparison of data indicates that $-E_{1/2}$ bears no simple relationship either to the frequency of the p-band (or other band) in the ultraviolet absorption spectrum or to the methyl affinity of the compound. In general, however, $-E_{1/2}$ bears an inverse relationship to the predicted value for the ionization potential. Syntheses of many of the compounds used are presented and discussed. COPLANARITY EFFECTS ON THE SPECTRAL, GAS CHROMATOGRAPHIC, POLAROGRAPHIC, AND DIELS-ALDER CHARACTERISTICS OF 1-ALKYL-1-(2-NAPHTHYL)ETHENES, by L. H. Klemm, W. C. Solomon, and A. J. Kohlik. [1962] [10]p. incl. diagrs. tables, refs. (AFOSR-4081) (AF 49(638)473) AD 296207 Unclassified

Also published in Jour. Org. Chem., v. 27: 2777-2786, Aug. 1962.

Syntheses of a series of 1-alkyl-1-(2-naphthyl)-ethenes (where the alkyl group R = Me, Et, n-Pr, i-Pr, and t-Bu) from alkyl 2-naphthyl ketones by Grignard and Wittig methods are described. Comparison of ultraviolet absorption spectra of the alkenes shows a shift to higher frequency of the major absorption maximum of the order t-Bu > > i-Pr >n-Pr = Et = Me > H (taken as standard). From general appearances of the spectra and examination of molecular models, it is presumed that the average inherent angles of twist in these molecules follow the order t-Bu >> i-Pr >n-Pr = Et >Me > H (virtually coplanar). Polarographic reduction of the alkenes gives 2 waves at potentials of E1/2' (first wave, reduction of alkenyl double bond) and E1/2' (second wave, reduction of naphthalene nucleus)

EXISTENCE OF CONTINUOUS LATTICE HOMOMORPHISMS, by L. W. Anderson, [1962] [3]p. (AF 49(638)889) Unclassified

Published in Jour. London Math. Soc., v. 37: 60-62 1962.

A topological lattice is a Hausdorff space L and a pair of continuous lattice operations $\wedge$, $\vee : L \times L \to L$. Denote by I the unit interval, and by Hom (L, I) the continuous lattice homomorphisms of L into I. The breadth of L, denoted Br(L), is the smallest integer such that if $A \subset L$ is finite, then there is $B \subset A$ such that $B \leq n$ and AB. Theorem: If L is a compact connected distributive topological lattice with Br(L) finite, then Hom(L, I) distinguishes points. It is known that a compact, connected, finite-dimensional, distributive topological lattice has finite breadth. It follows that if L is locally compact, connected and distributive, then Hom(L, I) distinguishes points. The question remains: If a continuous curve is a distributive lattice of breadth n, can it be embedded topologically and algebraically in an n-cell. (Math. Rev. abstract)

FIXED POINT THEOREMS FOR PSEUDO MONOTONE MAPPINGS, by L. E. Ward, Jr. [1962] [4]p. (AF 49(638)889) Unclassified

Published in Proc. Amer. Math. Soc., v. 13: 13-16, Feb. 1962.

A continuous function $f: X \to Y$ is called pseudo-monotone if, whenever A and B are closed, connected subsets of X and Y, respectively, and $B \subset f(A)$, then f maps some component of $A \cap f^{-1}(B)$ onto B. (In general, not every monotone map is pseudo-monotone.) Extending an argument of J. L. Kelley, the author proves the following theorem: If X is a continuum and $f: X \to X$ is pseudo-monotone, then X contains a non-empty subcontinuum Y which is minimal with respect to being invariant under f. In particular, if each non-degenerate subcontinuum of X has a cut point, and if f is monotone, then f has a fixed point. A generalization is also given. (Math. Rev. abstract)

SYMMETRIC EXTERIOR DIFFERENTIATION AND FLAT FORMS, by V. L. Shapiro. [1960] [8]p. (AFOSR-3230) (AF 49(638)988) Unclassified

Also published in Canad. Jour. Math., v. 14: 79-86, 1962.

Let ω be a continuous differential r-form defined in a bounded domain R of Euclidean n-space, E^n, where $n \geq 1$ and $0 \leq r \leq n - 1$. ω is called a flat form in R, if there exists a constant N such that

$|\int \partial\sigma\omega| \leq N\,|\sigma|$ for every $(r+1)$-simplex σ contained in R, where $|\sigma|$ designates the $(r+1)$-volume of σ. For n = 1 and ω a zero form, flatness is the same thing as the usual Lip 1 condition. A necessary and sufficient condition that a continuous real-valued function of one variable f(x) satisfy a Lip 1 condition over an interval (a, b) is that its upper and lower symmetric derivatives be bounded in (a, b). This paper proves the analogue of this result for r-forms; in particular, the following theorem: Let ω be a continuous differential r-form defined in a bounded domain R of E^n. A necessary and sufficient condition that ω be flat in R is that its upper and lower symmetric exterior derivatives be bounded in R.

THE UNIQUENESS OF FUNCTIONS HARMONIC IN THE INTERIOR OF THE UNIT DISK, by V. L. Shapiro. [1962] [14]p. (AFOSR-J1267) (AF AFOSR-62-82) AD 424232 Unclassified

Presented at meeting of the Amer. Math., Soc., Vancouver (Canada) Aug. 30, 1962.

Also published in Proc. London Math. Soc., v. 13: 639-652, Oct. 1963.

Let $f(r, \theta)$ be harmonic in the unit disk $0 \leq r < 1$, and let $\|f(r, \theta)\| = \max_\theta |f(r, \theta)|$. Let $f^*(\theta) = \lim \sup_{r \to 1} f(r, \theta)$, and let $f_*(\theta)$ be the lim inf. The author proves the following main theorem. Suppose $\|f(r, \theta)\| = o[(1-r)^{-2}]$. Let E be a countable subset of $[0, 2\pi)$ such that $f^*(\theta)$ and $f_*(\theta)$ are finite on $[0, 2\pi) - E$ and of class L^1 on $[0, 2\pi)$. Suppose further that $(1-r) f(r, \theta) \to 0$ for each θ in E. Then $f^*(\phi) = f_*(\theta)$ a. e. and $f(r, \theta) = \pi^{-1} \int_0^{2\pi} P(r, \theta-\phi) f^*(\phi)\, d\phi$, where P is the Poisson kernel. There is a very elegant corollary: If $\|f(r, \theta)\| = o[(1-r)^{-2}]$ and $f(r, \theta) \to 0$ for every θ, then $f(r, \theta) \equiv 0$. Simple examples show this latter result to be best possible in three different ways: "o" cannot be weakened to "O", "every θ" cannot be replaced by "every θ but one", and the L^∞ norm cannot be replaced by any L^p norm $\|f(r, \theta)\|_p$, $p < \infty$. However, the main theorem (and hence the corollary) still holds if the estimate for $\|f(r, \theta)\|$ is generalized to $\|f(r, \theta)\|_p = o[(1-r)^{-2 + 1/p}]$. (Math. Rev. abstract)

OPTICAL AND ESR SPECTRA OF IRRADIATED CaO CRYSTALS, by J. C. Kemp and V. I. Neeley. [1962] [2]p. incl. diagrs. (AFOSR-J542) (AF AFOSR 62-180) AD 408016 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 24: 332-333, Feb. 1963.

The optical spectrum of a single crystal of CaO before and after irradiation with 10^{19} nvt fast neutrons is compared with that of MgO. It is concluded that the optical data and the ESR results are consistent with the fact that the 1.90 ev band in CaO is due to positive-ion vacancies at 300.77° and 4.2°K., except for a T_1 increase at 4.2°K. Spin density of samples that received 10^{19} nvt was 3×10^{18}/cc in CaO and 1×10^{18}/cc in MgO. The strongest visible peak (1.90 ev) in CaO was down 65% at 350°C; the ESR signal, only 8%.

CRYSTAL STRUCTURES OF OXALYL BROMIDE AND OXALYL CHLORIDE, by P. Groth and O. Hassel. [1962] [7]p. incl. diagrs. tables. (AF 61(052)71) Unclassified

Published in Acta Chem. Scand., v. 16: 2311-2317, 1962.

Details are presented of crystal structure determinations of oxalyl bromide and oxalyl chloride. The crystals are not isomorphous and their structures quite different. In the oxalyl bromide structure weak charge transfer bonds connect every molecule with its 4 nearest neighbors, the O...Br separation (3.27A) being only slightly shorter than the expected van der Waals separation. The C-Br...C angle is found equal to 169°. In the oxalyl chloride structure, charge transfer bonds between oxygen and chlorine are not indicated.

INCREASE IN SEX DRIVE BY SEPTAL, TEMPORAL CORTICAL AND HABENULAR LESIONS IN RATS, by E. W. Rasmussen, B. R. Kaada and others, [1962] [17]p. incl. diagrs. tables, refs. (AFOSR-2740) [AF 61(514)1127] Unclassified

The effects of various neocortical and rhinencephalic lesions on the sex drive have been studied in 139 male and female rats. The animals were tested pre- and postoperatively in a modified obstruction box in which the number of crossings of an electrified grid to a sex incentive in 30 min period was regarded as an index of the strength of the sex drive. An increase in the number of crossings was produced in 28 rats of which 25 suffered bilateral lesions in the septal region, the temporal-insular cortex, and the stria medullaris and habenula. No change was produced by epiphysectomy. The increase was not due to a lowered sensitivity to the electrified grid, nor to loss of fear of crossing the grid, as evidenced by passive avoidance tests performed in the same animals and by the time taken to perform a certain number of crossings with no current on the grid. In the animals showing an increased number of crossings to a sex incentive postoperatively, there was a decrease in wheel-running, indicating that the increase in the number of crossings cannot be due to an increase in the general motor activity of the animal. It is suggested that the septum, stria medullaris, habenula and the temporal-insular cortex normally suppress the arousal mechanism in mating behavior and counterbalance the arousal effect exerted by the genital region of the sensorimotor cortex, the olfactory system and amygdala. IMPAIRED ACQUISITION OF PASSIVE AVOIDANCE BEHAVIOR BY SUBCALLOSAL, SEPTAL, HYPOTHALAMIC, AND INSULAR LESIONS IN RATS, by B. R. Kaada, E. W. Rasmussen, and O. Kveim. [1961] [10]p. incl. illus. diagr. table, refs. (AFOSR-2742) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(514)1127 and Norwegian Research Council for Science and the Humanities) AD 624011 Unclassified

Also published in Jour. Compar. and Physiol. Psychol., v. 55: 661-670, 1962.

The present results are based on the study of 191 brain lesioned rats and 24 normal control animals. The various lesions involve: a variety of cortical areas, the septal nuclei, hippocampus, fornix, corpus callosum, thalamic, preoptic, and anterior hypothalamic regions. A behavioral test measured the water-deprived animals' ability to passively avoid shock by not drinking from an electrified water source. The main conclusions are: (1) Passive avoidance behavior is deficient following bilateral lesions of subcallosalseptal-preoptic area, the anterior hypothalamus, and thalamus. (2) Bilateral neocortical lesions depress passive avoidance behavior when insular cortex is involved in the damage. (3) The behavioral effect of the lesions is interpreted as representing the animals' inability to inhibit the relevant approach response. The implicated areas have already been shown by stimulation to have somatomotor inhibitory functions. (4) Alternate explanations of the findings are considered and tentatively rejected.

DECREASE IN SEX DRIVE BY ABLATION OF THE SENSORIMOTOR CORTEX, AMYGDALA AND OLFACTORY BULBS IN RATS, by B. R. Kaada, E. W. Rasmussen and others. [1962] [22]p. incl. tables, refs. (AFOSR-2801) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(514)1127 and Norwegian Research Council for Science and the Humanities). Unclassified

Lesions were made in various cortical areas and 'rhinencephalic' structures of 139 male and female rats at the age of about 6 months. The animals were tested preoperatively in a modified obstruction box in which the number of crossings of an electrified grid to a sex incentive during a given period (30 min.) is used as an indication of the strength of the heterosexual drive. Retesting was performed 5 to 28 weeks after the operation. A group of 96 rats served as controls. The extent of the lesions was determined histologically. A marked decrease in the crossings produced by bilateral removal of (1) the upper part of the sensorimotor cortex, apparently corresponding to the genital representation, (2) the amygdala, and (3) the olfactory bulb, was not due to a decrease in the general motor activity nor increased sensitivity to the grid. The above could be counteracted by bilateral removal of the septum, habenula, or temporal-insular cortex. The estrous cycle and the copulatory behavior of the animals were retained. It is suggested that the removal of (1), (2), and (3) above interferes with the arousal mechanism in mating behavior.

THE LACK OF EFFECT OF LSD 25 ON AMYGDALOID AND CORTICAL ATTENTION RESPONSES, by H. Ursin. [1962] [14]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 61 (514)1127 and Norwegian Research Council for Science and Humanities) Unclassified

Also published in Psychopharmocologia, v. 3: 317-330, 1962.

The present report deals mainly with the effects of LSD 25 on the threshold for the attention response elicited by stimulation of the cerebral cortex, the amygdaloid nuclear complex and the brain stem reticular formation. In addition, a few observations were made following stimulation of intralaminar thalamic nuclei, caudate nucleus and septal area. The threshold of the attention responses was tested before and after intravenous or intraperitoneal injection of LSD 25. The threshold was found to be unaltered by the drug for all central nervous system structures studied. Since there was no effect of LSD 25 on the telencephalically induced attention response while chlorpromazine has a clear blocking effect under the same experimental circumstances, it seems no longer correct to consider these 2 psychotropic drugs as having any simple opposite effect on nervous system function. The results are believed to have some bearing upon the possibility that the main effect of LSD 25 is due to interference with sensory inflow to the central nervous system.

Also published in Biochem Jour., v. 85: 243-250, Oct. 1962.

Cell-free extracts of MeOH-grown Pseudomonas AM 1 were examined for the presence of enzymes catalyzing the carboxylation of pyruvate or phosphoenolpyruvate (I) to C_4-dicarboxylic acids. The only enzyme found in appreciable activity was a I carboxylase, similar to that found in plant tissues. The enzyme has been purified 28-fold by protamine sulfate treatment, $(NH_4)_2SO_4$ precipitation, and diethylaminoethyl cellulose column chromatography. The purified I carboxylase catalyzes the formation of oxalacetate and inorganic phosphate from I and HCO_3^-. The reaction is Mg^{++} dependent, with a pH optimum of 8.5. It is competitively inhibited by phosphate and noncompetitively by NH_4^+. K_m values of 0.33 mM and 0.196 mM, respectively were found for I and $MgCl_2$ at pH 8.5 and 22°. The properties of the enzyme were compared with those of similar enzymes obtained from other sources.

Also published in Biochem. Jour., v. 86: 462-468, March 1963.

Tetrahymena pyriformis, strain E, cells grown in proteose-peptone media contained malate synthase in high activity but they were low in isocitric lyase. The formation of malic synthase was repressed by glucose; this repression was partially relieved by acetate. The formation of isocitric lyase was stimulated by acetate in the presence or in the absence of glucose. Cells grown in chemistry defined media containing acetate contained both isocitric lyase and malic synthase in high activity; cells grown in such media containing glucose were virtually devoid of both enzymes. These findings show that isocitric lyase and malic synthase, though operationally linked in the glyoxylate cycle, are not coordinately repressible. Tetrahymena capable of converting fats into glycogen contained both enzymes in higher activity than those incapable of glyconeogenesis. In the former type of organism, the enzymes were found only in 1 of the 2 mitochondrial fractions obtained after disruption of the cells; in the latter type, the enzymes were not localized in any single cellular component. These results suggest that the conversion of fat into glycogen by Tetrahymena necessitates both the presence of high activities of glyoxylate-cycle enzymes and their incorporation into an organized intracellular structure.

MICROBIAL GROWTH ON C_1 COMPOUNDS. 5. ENZYME ACTIVITIES IN EXTRACTS OF PSEUDOMONAS AM 1, by P. J. Large and J. R. Quayle. [1962] [11]p. incl. diagrs. tables, refs. (AFOSR-J955) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)180, Public Health Service and Rockefeller Foundation) AD 416577 Unclassified

Also published in Biochem. Jour., v. 87: 386-396, May 1963.

The following enzymes were found in extracts of MeOH-, formate-, and succinate-grown Pseudomonas AM1 and their activities measured: tetrahydrofolate

formylase, methylene-tetrahydrofolate dehydrogenase, serine hydroxymethyltransferase, glycerate dehydrogenase, glyoxylate reductase, malate synthase, citrate synthase, isocitrate dehydrogenase, and malate dehydrogenase. No glyoxylate carboligase, isocitrate lyase, or malate dehydrogenase (decarboxylating) could be detected in the organism grown on any of the substrates. Transamination of serine with α-oxoglutarate and pyruvate was observed in extracts of Pseudomonas AM1. Cell-free extracts of Pseudomonas AM1, fortified with suitable cofactors, catalyze the conversion of formate to glycine and give serine and glycerate as major products. In the presence of adenosine triphosphate the extracts catalyze the phosphorylation of glycerate to phosphoglycerate. (Contractor's abstract)

CARBON ASSIMILATION BY PSEUDOMONAS OXALATICUS (OX 1). 6. REACTIONS OF OXALYL-COENZYME A, by J. R. Quayle. [1962] [6]p. incl. diagrs. table, refs. (AFOSR-J956) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)180, Public Health Service, and Rockefeller Foundation) AD 416606 Unclassified

Also published in Biochem. Jour., v. 87: 368-373, May 1963.

It is shown that oxalyl-CoA maybe readily synthesized and some of its chemical properties are described. Its reversible enzymic reduction to glyoxylate and CoA has been demonstrated. This reaction has been suggested as a key reaction in the microbial synthesis of cell constituents from oxalate. Use of the measured equilibrium constant gives a value of + 2·54 kcal for $\Delta G'$ at pH 7·0 of reaction (2), proceeding from left to right. This compares with the value -0·9 kcal calculated from thermodynamic data. However, some of the values used in the latter calculation, e.g. the heat of combustion of oxalic acid and the free energy of hydrolysis of oxalyl-CoA, are of doubtful accuracy. The value of + 2·54 kcal for the free energy of reduction of oxalyl-CoA may be compared with the value of + 4·2 kcal for the analogous reaction (3) catalysed by the aldehyde dehydrogenase from Clostridium kluyveri $CH_3 \cdot CO \cdot S \cdot CoA + NADH + H^+ \rightleftharpoons CH_3 \cdot CHO + NAD^+ + CoA \cdot SH$.

EXPERIMENTS ON VISUALLY CONTROLLED ORIENTATION IN THE DESERT LOCUST, SCHISTOCERCA GREGARIA (FORSKAL), by G. K. Wallace. [1962] [9]p. incl. diagrs. tables, refs. (In cooperation with Reading U. Oxford (Gt. Brit.)) (AF 61(052)114 and AF 61(052) 420)) Unclassified

Published in Animal Behav., v. 10: 361-369, July-Oct. 1962.

This paper raises the problem of the mechanisms underlying visually controlled orientation in the Desert Locust. The experiments are concerned with 3 aspects of this problem: (1) inhibition of information from, or response to, irrelevant stimuli, (2) the processes of orientation to one of several possible stimuli; and (3) the maintenance of direction once locomotion is initiated. Lack of response to irrelevant stimuli appears to be due to a mutual exclusion of responses at the motor level. There is no evidence of centrifugal sensory inhibition. The behavior observed while the insect becomes orientated to 1 of 2 stimuli is described and an explanation given in terms of varying thresholds for the release of jumping and turning responses. A tracking experiment is described which shows that direction of locomotion is not maintained under certain circumstances. The experimental results are embodied in a tentative description of the processes underlying orientation.

THE SODIUM CONTENT OF THE SMOOTH MUSCLE OF THE GUINEA PIG TAENIA COLI, by P. J. Goodford. [1962] [12]p. incl. diagrs. tables, refs. (AFOSR-J302) (AF 61(052)476) AD 408044 Unclassified

Also published in Jour. Physiol., v. 163: 411-422, Oct. 1962.

The sodium, potassium and lithium contents of the smooth muscle of the guinea-pig taenia coli have been determined after immersion in sodium-free solutions prepared with lithium chloride, chlorine chloride or tris-hydroxymethylaminomethane hydrochloride. More sodium was lost rapidly from the muscle than could be accounted for by the material in the extracellular space. But 1.5 mmol/kg wet wt at 35°C and 50 mmol/kg wet wt at 4°C remained firmly in the tissue during

immersions in sodium-free solution lasting 1 hr. The observations indicated that the muscle sodium was not simply distributed between the intracellular and extracellular spaces. The results are discussed with reference to the known ability of smooth muscle to generate action potentials in sodium-free solutions. (Contractor's abstract)

SODIUM AND POTASSIUM CONTENT OF THE SMOOTH MUSCLE OF THE GUINEA-PIG TAENIA COLI AT DIFFERENT TEMPERATURES AND TENSIONS, by M. Freeman-Narrod and P. J. Goodford. [1962] [13]p. incl. illus. diagrs. refs. (AFOSR-J302) (AF 61(052)476) AD 408046 Unclassified

Also published in Jour. Physiol., v. 163: 399-410, Oct. 1962.

The total sodium and potassium content of the guinea-pig taenia coli, and the rate of uptake of radioactive sodium and potassium ions, have been measured in vitro at 35°, 20° and 4°C and at a range of tensions. The average cell diameter was also measured at each tension. The total potassium content was reduced, and the total sodium increased at lower temperatures. The rate of uptake of tracer ions was depressed by cooling. At 4°C both sodium and potassium were partly inexchangeable. At 20°C the sodium was partly inexchangeable. At 35°C all the sodium exchanged very rapidly, which may indicate that this exhcange is an "active" process. Tension changes did not affect the total sodium or potassium content. The rate of uptake of tracer potassium was increased at higher tensions, and the rate of sodium loss was reduced when no tension was applied to the muscle. These effects might be due to the increased ratio of cell surface area to cell volume, and for potassium they were quantitatively explained in this way. (Contractors abstract)

LACK OF ACTIVATION OF PHOSPHORYLASE BY ADRENALINE DURING ITS PHYSIOLOGICAL EFFECT ON INTESTINAL SMOOTH MUSCLE, by E. Bueding, E. Bulbring and others. [1962] [3]p. incl. refs. (AFOSR-J304) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)476, American Heart Association, Office of Naval Research, and Public Health Service) AD 408045 Unclassified

Also published in Nature, v. 196: 944-946, Dec. 8, 1962.

Adrenaline causes no activation of phosphorylase in the intact tissue at the time when it produces relaxation of intestinal smooth muscle by causing cessation of spike activity and hyperpolarization. Phosphorylase activity may be increased afterwards by subjecting the tissue to certain manipulations, and this activation is greater after previous treatment with adrenaline. No activation is demonstrable with an improved technique. Since the changes in the electrophysiological and mechanical state of taenia coli produced by adrenaline require metabolic energy, it appears that biochemical mechanisms other than activation of phosphorylase or of phosphofructokinase must be associated with these [illegible] (Contractor's abstract)

INFLUENCE OF SODIUM AND CALCIUM ON SPONTANEOUS SPIKE GENERATION IN SMOOTH MUSCLE (Abstract), by E. Bülbring, H. Kuriyama, and B. Twarog. [1962] [2]p. (AFOSR-J310) (AF 61(052)476) AD 408052 Unclassified

Presented at meeting of the Physiol. Soc., London (Gt. Brit.), Jan. 13, 1962.

Also published in Jour. Physiol., v. 161: 48P-49P Apr.-May 1962.

Experiments were performed on intestinal smooth muscle of the guinea-pig taenia coli using the sucrose gap method and intracellular electrical recording. If the calcium is removed from the bathing solution, the excitation, commonly observed in other excitable tissues, may be absent or short lasting and soon the spontaneous spike discharge ceases. Conversely, if the external calcium concentration is raised to 7.5 mM, a period of increased electrical activity usually precedes the membrane stabilization. Spontaneous spike discharge continues when sodium is substituted by lithium, and also with tris-(hydroxymethyl)amino methane) for periods up to 1 hr. The amplitude of the spontaneously discharged action potentials is not reduced by reducing the external sodium concentration and replacing it with Tris. However, the local potentials (slow waves) are abolished in the absence of sodium and are greatly increased in excess sodium. If calcium is removed from a sodium-free Tris solution electrical activity stops in a few minutes, and starts again when calcium is restored. The time during which spontaneous spike discharge continues in sodium-free solution becomes shorter when the external calcium is reduced below half the normal concentration; e.g. in 1.3 mM Ca^{2+} it stops after 28 min, in 0.6 mM after 15 min, in 0.3 mM after 8 min. The amplitude of the spontaneously discharged action potential in sodium-free solution appears to be a function of the external calcium concentration. In the presence of excess calcium, the spikes are followed by a positive after-potential which, on passing off, continues as a potential initiating the next spike, thus producing a pace-maker type of action potential. The observations suggest that calcium may be essential for spike discharge in this smooth muscle.

THE IMPORTANCE OF CALCIUM FOR MEMBRANE POLARIZATION AND SPONTANEOUS ACTIVITY OF INTESTINAL SMOOTH MUSCLE CELLS (GUINEA-PIG TAENIA COLI) (Abstract), by E. Bülbring and H. Kuriyama. [1962] [1]p. [AF EOAR-62-5] Unclassified

Published in Proc. Internat'l. Union of Physiological Sciences: Twenty-second Internat'l. Cong. Leyden (Netherlands) Sept. 10-17, 1962), Amsterdam, Excerpta Medica Foundation, v. 2: Abstract no. 866, 1962.

In excess calcium (7.5 mM) the maximum slope of the relation between membrane potential and external potassium concentration (K_0) is steeper (43 mV/tenfold K_0) than normal (38 mV/tenfold K_0) and for low K_0 more linear, indicating a dimminished Na-permeability in excess Ca. Removal of glucose depolarizes the membrane and accelerates spontaneous activity. Excess calcium initially prevents this, but not after prolonged glucose depletion, suggesting energy requirement for calcium function at the membrane. Spontaneous activity normally consists of local potentials and spikes. Excess calcium reduces the local potentials, especially when they are large and prolonged in excess Na; excess Ca then accelerates repolarization and spikes are followed by a positive after potential. Membrane activity continues in complete absence of Na (replaced with Tris), but stops rapidly in Na-free and Ca-free solution. Restoration of the normal Ca concentration restores activity. In the absence of Na, in normal solution, in low K_0 (0.3-3 mM), as well as in excess K_0(18 mM), i.e. regardless whether the membrane potential is high or low, the amplitude of the action potential decreases with a decrease of Ca_0 from 1.25 mM to 0.25 mM, and increases in the presence of 7.5 mM Ca_0. This result suggests that the presence of calcium is essential.

THE DECAY OF K-MESIC ATOMS, by J. R. Rook. [1962] [27]p. incl. diagrs. tables, refs. (AFOSR-J364) (AF 61(052)455) AD 408599 Unclassified

Also published in Nuclear Phys., v. 39: 479-505, Dec. 1962.

The information concerning the form of the nuclear density distribution in the extreme surface region that would be obtained from measurements of the K-mesic x-ray yields is discussed. Certain extreme shapes would be distinguished from the conventional Saxon-Woods form, but there is not as much sensitivity to the form of the density distribution as might be expected. Reasons are given for this lack of sensitivity. The significance of the relatively large number of multinucleon events observed in nuclear emulsion is discussed. The discrepancy between the deuterium and emulsion data is first established and then the probability for the 2 step process is calculated. It is concluded that this process does not explain the frequency of multinucleon events observed in nuclear emulsion and it appears that there is some support for the hypothesis of strong correlations in the nuclear surface. STUDY OF BIOCHEMISTRY OF BIOGENIC AMINES, by H. Blaschko. Final rept. July 1, 1959-June 30, 1962. July 10, 1962. 2p. (AFOSR-3032) (AF 61(052)235) AD 290198 Unclassified

This work led to the formulation of rules governing the substrate specificity of the amino acid decarboxylase that is responsible for the formation of the catechol amines in the body. It was shown that the presence of the hydrogen atom in position alpha is not essential for decarboxylation. The main outcome is the discovery of the strong awakening action of L-metatyrosine in the reserpinized animal, which is of practical interest, as the meta-hydroxy compound has much better keeping qualities than dopa and other catechol derivatives.

OBSERVATIONS ON THE ENZYMIC OXIDATION OF ω-AMINO ACIDS, by H. Blaschko, S. M. Kirpekar, and S. D. Phipps. [1962] [3]p. incl. table. (AFOSR-4275) (AF 61(052)235) Unclassified

Also published in Arch. Internat'l. Pharmacodyn., v. 139: 120-122, 1962.

The ω-amino acids have become of interest since some members of the homologous series, $H_2N(CH_2)_nCOOH$, act on certain excitable structures. Experiments using the available commercial samples of 3 members of the series, ω-amino enanthic acid (or ω-amino-n-heptanoic acid), ω-amino caprylic acid (or ω-amino-n-octanoic acid) and ω-amino-n-hendecanoic acid, were carried out in an atmosphere of O_2 at 37.5°C. It is concluded that all 3 oxidases agree in that the presence of a second amino group in the close vicinity of the first interferes with the attachment of the latter for the enzyme. This interference becomes less when the second group is further removed; hence the long-chain diamines react with the enzymes and are oxidized. These observations show that the amino group is not unique in exerting a disturbing effect. The carboxyl group obviously does the same, here again the disturbing influence depends on the intramolecular distance. In the plasma oxidases, it appears that in the goat enzyme this effect wanes with shorter distances than in the

pig enzyme, but more experiments would be required to establish this difference with certainty.

THE AMINE OXIDASES OF MAMMALIAN BLOOD PLASMA, by H. Blaschko. [1962] [50]p. incl. diagrs. tables, refs. [AF 61(052)235] Unclassified

Published in Advances in Compar. Physiol. and Biochem., v. 1: 67-116, 1962.

Variation in the substrate specificity of an enzyme from species to species is a phenomenon frequently encountered. Differences of this kind are believed to be due to variations in the enzyme protein, probably in the amino acid composition; they may also manifest themselves in immunological differences that occur when specimens of an enzyme are prepared from different species. The differences found among the amine oxidases of mammalian blood plasma from different species are therefore by no means unique. What is unusual and interesting is that here are variations in the substrate specificity pattern of a more fundamental type. The significance of these variations and their bearing on the question of the relationship between mammalian species are discussed in this review.

BIOLOGICAL INACTIVATION BY AMINE OXIDASES AND TIME COURSES OF DRUG ACTION, by H. Blaschko. [1962] [6]p. incl. refs. (AFOSR-J174) Sponsored jointly by Agricultural Research Council, Air Force Office of Scientific Research under AF EOAR-62-80, and Public Health Service) AD 400428 Unclassified

Also published in Proc. First Internat'l. Pharmacological Meeting, Stockholm (Sweden) (Aug. 22-25, 1962), Oxford, Pergamon Press, v. 6: 289-293, 1962.

New work shows clearly that the current classification of amine oxidases is obsolete. The histaminase of pig kidney is a diamine oxidase, as first shown by the work of Zeller and strongly supported by subsequent observations; the histaminase of pig plasma is a monoamine oxidase. Both of these enzymes, are inhibited by cyanide and by carbonyl reagents (semicarbazide, hydroxylamine and aminoguanidine). The pig plasma oxidase shares many substrates with the intracellular monoamine oxidase, and yet, the latter is not inhibited by cyanide nor by carbonyl reagents. There is also the pea seedling oxidase, an enzyme sensitive to both cyanide and carbonyl reagents, which will act on diamines as readily as on monoamines. Thus, inhibition by carbonyl reagents is common to all these enzymes, with the single exception of the well-known intracellular monoamine oxidase. The action of these reagents is probably on a carbonyl group in the 2 amino hydrogens of the substrate, $R\text{-}CH_2\text{-}NH_2$, to form a Schiff's base, $\rangle C = N.CH_2.R$ as an intermediate. This is supported by the observation that the plasma oxidases are unable to act on N-methylated amines, in sharp contrast to the intracellular aminoxidase, which oxidizes the N-methylated amines (e.g. adrenaline or metanephrine) as readily as the corresponding primary amines. On the other hand the intracellular histaminase resembles the plasma oxidases in the inability to act on N-methylated amines. These observations suggest that the primary enzyme-substrate complex formed by the intracellular amine oxidase is fundamentally different; it probably involves an immediate reaction with at least one of the hydrogen atoms attached to the α-carbon atom.

POTENTIATION OF THE RESPONSE TO HISTAMINE BY PICOLYLAMINES, by H. Blaschko and S. Kurzepa. [1962] [8]p. incl. diagrs. (AFOSR-J176) (AF EOAR-62-80) AD 400429 Unclassified

Also published in British Jour. Pharmacol. and Chemother., v. 19: 544-551, Dec. 1962.

The response of the isolated ileum of the guinea pig to histamine is potentiated in the presence of 2-, 3-, or 4-picolylamine. These compounds have been found to inhibit the histaminase and (or) diamine oxidase of pig kidney. The 3 corresponding picolylmethylamines did not potentiate the response of the ileum to histamine; they were without significant affinity for the pig kidney oxidase. It is suggested that the potentiating action of the 3 primary amines is due to their inhibitory action on histaminase. The responses of the ileum to acetylcholine and 5- hydroxytryptamine were not potentiated. (Contractor's abstract)

SELF CONSISTENT COMPUTATION OF AN R.F. CONFINED PLASMA CONFIGURATION, by H. Motz. [1962] 17p. incl. diagrs. tables. (Technical note no. 10) (AFOSR-2694) (AF 61(514)1183) AD 289196 Unclassified

Also published in Proc. Fifth Internat'l. Conf. on Ionization Phenomena in Gases, Munich (Germany) (Aug. 28-Sept. 1, 1961), Amsterdam, North-Holland Publishing Co., v. 2: 1484-1494, 1962. (Title varies)

The confinement of a plasma by an electromagnetic field oscillating at a frequency above the plasma frequency in a resonator was studied. The resonator,

a cylindrical cavity, supported an E_{011} mode of oscillation and the dimensions were chosen specially to lead to a field configuration such that, in the absence of plasma, it had a field minimum surrounded everywhere by higher field values. A self-consistent calculation was carried out in order to find a stable plasma configuration confined by the field. The perturbation of the cavity resonance by the plasma was determined. The calculation was done numerically by means of a high-speed electronic computer.

FREQUENCY DOUBLING WITH FERRITES, by C. S. Gaskell. [1962] [15]p. incl. diagrs. (Technical note no. 12) (AFOSR-2695) (AF 61(514)1183) AD 289197 Unclassified

Previous measurements on millimeter wave harmonic generation in ferrites have shown that powers of about 20 w can be produced at 2 mm wavelength (with unspecified conversion losses). As conversion losses as low as 3.5 db have been reported at lower frequencies, the method appears attractive for doubling from 35 gc/s band; this being the highest frequency band at which high power reliable tubes are generally available. Measurements have been made on a variety of ferrites, the best results for frequency doubling being obtained with Ferroxcube D5 in a disk geometry. Peak output powers up to 600 at 70 gs/s have been measured with conversion losses of 14 db. Maximum output power power was obtained when the output waveguide was polarized parallel to the input guide, rather than perpendicular. Preliminary measurements on higher harmonics indicate that the third is at least 60 db down on the fundamental. Possible explanations for the discrepancies between these measurements and the simple theory are presented, together with suggestions for improved techniques, and further applications of ferrite doubling. GENERATION AND USE OF PULSED MAGNETIC FIELDS, by C. S. Gaskell. 1962, [36]p. incl. illus. diagrs. tables, refs. (Technical note No. 11) (AFOSR 2931) (AF 61(514)1183) AD 277626 Unclassified

Methods of generating high magnetic fields are surveyed, and the design and construction of a pulsed field set are described. Capacitors are used to store the energy, and are discharged through a triggered spark gap into a special wire-wound solenoid. By this method, fields up to 280 kilogauss have been produced. A method of plotting magnetization curves in high fields is described, and results are given for gadolinium. Sources of error and possible improvements in the experimental technique are discussed. MILLIMETER WAVE HARMONIC GENERATION IN FERRITES, by C. S. Gaskell. [1961] [3]p. incl. diagrs. [AF 61(514)1183] Unclassified

Published in Proc. Inst. Radio Engineers, v. 50: 326, Mar. 1962.

An output (harmonic) waveguide was polarized perpendicular and parallel to the input guide. The low outputs obtained with perpendicular polarization are believed to be due to the large mis-match of the sample. Much better matching was obtained with parallel polarization. The reduction in efficiency at high input powers with the latter was caused by sample heating. The conversion losses for average power are some 3 db greater than for peak power, since the output pulse was only 80 nsec wide, compared with 170 nsec for the input pulse. This could have been caused by a frequency change during the magnetron pulse, or by spin wave excitation. With an input of 15 kw in the parallel geometry and with the Ferroxcube D5 sample, the third harmonic output was some 60 db below the input. Under certain conditions the magnetron was known to have given third harmonic outputs of this magnitude; this result is therefore not conclusive, but represents an upper limit. No higher harmonics were within the detection sensitivity of the apparatus (about -80 db).

DIELECTRIC PROPERTIES OF TITANIA CERAMICS AT MICROWAVE FREQUENCIES, by J. M. Free, M. E. B. Moffat, and G. B. Walker. [1962] [3]p. incl. diagrs. (AFOSR-J880) (Sponsored jointly by the Admiralty, Air Force Office of Scientific Research under AF EOAR-62-62, Defense Board of Canada,

Department of Scientific and Industrial Research, and Paul Fund of the Royal Society) AD 416019 Unclassified

Also published in Brit. Jour. Appl. Phys., v. 14: 289-291, May 1963.

The determination of the relative permittivity k and the loss tangent tan δ of the ceramics titania ($k \simeq 95$, $\tan \delta \simeq 0.0004$) and magnesium titanate ($k \simeq 14.3$, $\tan \delta \simeq 0.0001$) by H_{01} mode and 'ghost' mode cavity techniques is outlined. Results are presented for the frequency range 3 to 35 Gc/s at room temperature. It is noted that k varies by 5% in both materials, and that tan δ rises significantly but remains at a relatively low value as the frequency is raised from 3 to 35 Gc/s. Experiments are described in which 1.8 cm wavelength cavities loaded with single glazed titania disks have been successfully operated at electric field strengths up to 10mv m^{-1} with 20 kev axial electron beams. The use of these materials in slow-wave structures is briefly discussed. (Contractor's abstract)

PRODUCTION OF A HIGHLY BUNCHED ELECTRON-BEAM FOR A SUBMILLIMETER WAVE UNDULATOR, by A. J. Lichtenberg, M. E. B. Moffat, and H. Motz. [1962] [4]p. incl. diagrs. [AF EOAR-62-62] Unclassified

Published in Microwave: Proc. Fourth Internat'l. Conf. on Microwaves Tubes, Scheveningen (Netherlands) (Sept. 3-7, 1962), Eindhoven, Centrex Publishing Co. 1963, 375-378.

In order to generate sub-millimeter waves in a magnetic undulator more efficiently than has been possible before, an electron linac has been proposed which will provide a 2-mev beam of tightly bunched electrons for injection into the undulator. It was shown by Walsh and Motz that an undulator output of the order of watts can be achieved in practice in a wavelength region for which the beam bunching is adequate. It is hoped that the accelerator under construction will provide such a power at half a millimeter. The bunching action packs the electrons into a certain fraction of the length of the period of the wave on which they are riding. It is clear that the shortest accelerator wavelength possible should be chosen for close bunching. From practical consideration of availability of power sources, size of structure, machining tolerances and beam diameter, 1.8823 cm was chosen as the working wavelength of the linac. The design of an accelerator for optimum bunching has been considered in a theoretical investigation using as the principal tool the theorem of adiabatic invariance of the integral $\oint p' \, dz' =$ constant extended over a period of the motion. The variables p' and z' are the longitudinal momentum and distance coordinates measured relative to those of the phase-stable particle S of velocity v_s riding at a position with phase ϕ_s of a wave of peak axial electric field ϵ traveling with velocity v_s.

DYNAMICAL THEORY OF THE REFLECTION OF X-RAYS BY NON-PERFECT CRYSTALS, by D. Taupin. Final technical rept. Mar. 31, 1962, 49p. incl. diagrs. refs. (AFOSR-2963, pt. 1) (AF 61-(052)310) AD 289109 Unclassified

A generalization of Zachariasen's dynamical theory is derived for the case of distorted or non-perfect crystals and non-plane waves; this treatment does not separate the wavefields in the crystal medium and leads to a partial differential equation system which can only be numerically solved. A detailed application to bent and uniformly distorted crystals is given, which is a generalization of our former dynamical theory. A rough calculation of dislocation cross sections for the Bragg Case is then reported. Some figures are given, which indicate the range of utility of the x-ray method for the determination of the perfection of silicon crystals. Experimental measurements of reflecting powers of imperfect silicon crystals have been made. The agreement with calculated values is rather satisfactory. (Contractor's abstract)

CRYSTALLINE TEXTURE OF $BaTiO_3$ CRYSTALS, by C. Bousquet, M. Lambert and others. Final technical rept. Mar. 31, 1962, 29p. incl. illus. diagrs. (AFOSR-2963, pt. 2) (AF 61(052)310) AD 278109 Unclassified

This report on the measurement of parameters and disorientations in a multidomain $BaTiO_3$ crystal draws a correlation between the square pattern texture and a quasi-cubic phase. The barium titanate may exist at room temperature under a crystalline form clearly different from the normal tetragonal form; it is very slightly tetragonal, and the observed axial ratio varies with the sample. Many details of the deformation of the crystallites in this texture have been accurately determined. Nevertheless many questions are left unanswered: for instance the arrangements of the domains in the square pattern texture and the mechanism of formation of this texture. The results show that it is necessary to specify the structure and the texture of a sample for a fundamental study of its ferroelectric properties. It is very likely that these properties are dependent on the variation of the axial ratio of the crystal, which varies with the sample.

RAREFIED GAS DYNAMICS: PROCEEDINGS OF THE THIRD INTERNATIONAL SYMPOSIUM, Paris (France) (June 1962), ed. by J. A. Laurman. New York, Academic Press, 1963, 2v. incl. illus. diagrs. tables, refs. (AFOSR-5312) (Sponsored jointly by Air Force Office of Scientific Research under MIPR-62-7, Délégation Générale a la Recherche Scientifique et Technique, International Union of Theoretical and Applied Mechanics, National Aeronautics and Space Administration, and Office of Naval Research) Unclassified

Various aspects of rarefied gas dynamics are considered including fundamental kinetic theory, molecular beams and surface interactions, ionized flows, transition flow, theory and experiment, and experimental methods. Included in the first section are a number of papers discussing the validity of the Boltzmann equation as applied in rarefied gas dynamics (including the ionized case) and various techniques for solving it. Other papers in this section consider more specific problems such as shock wave structure. In addition to a number of papers dealing with standard molecular beam techniques, Section II also presents newer methods including the nozzle-source method for producing beams. Section III is concerned with the application of free molecule flow theory to ionized gas flows. Various attempts, theoretical and experimental, to bridge the gap in knowledge between continuum and free-molecule flows are covered in Sections IV and V. The last section contains a few papers involving experimental methods related to testing with both ionized and unionized gases in low density wind tunnels. Also included are a selected number of questions and answers that followed in the discussion period after each presentation.

INVARIANCE IN QUANTUM MECHANICS AND GROUP EXTENSIONS, by L. Michel. Oct. 15, 1962 [87]p. incl. diagrs. (AFOSR-4366) (AF 61(052)474) AD 294842 Unclassified

There is a review of certain topics connected with symmetry groups in quantum theory which are not very well known to most physicists A concise review of basic group-theoretic notions and connected physical considerations leads up to the central topic of the article, which is the problem of group extensions. This problem is the following: Given 2 groups A and B, find all groups E such that A is an invariant subgroup of E and B is the quotient E/A. In particular, the group E is called a central extension of B by A if A is abelian and A is a subgroup of the center of E. The characterization of central extensions of the connected Poincaré group by an arbitrary abelian group is given. Then the corresponding extensions for the extended Poincaré group are presented. It is shown that it is possible to generalize the results to extensions by a non-abelian group. Finally, questions of physical interpretation are discussed. (Math. Rev. abstract)

ON THE RELATIVISTIC DEGENERATE ELECTRON GAS, by B. Jancovici. Mar. 1962, 37p. incl. diagrs. (Technical note no. 4) (AFOSR-2701) (AF EOAR-62-10) AD 275844 Unclassified

Also published in Nuovo Cimento, Series X, v. 25: 428-455, July 16, 1962.

The properties of an electron gas are studied, at zero temperature and at a density high enough for the Fermi energy to be relativistic (such densities and relatively low temperatures occur in the interior of white dwarfs). The problem is studied in the dielectric formulation of the quasi-boson approximation: the electron-hole pairs, which appear because of the Coulomb interactions or the interactions with the transverse photon field, are treated like bosons, and the other processes than the creation and the annihilation of such pairs are neglected; the positrons are included among the possible holes. Model Hamiltonians are written down and diagonalized, which describe the system within this approximation. Longitudinal and transverse dielectric constants are computed, which depend on the wave-number and the frequency, and which describe the response of the system to external excitations; the necessary charge renormalization very naturally appears. The propagation of longitudinal and transverse waves is studied and the dispersion law is computed. Finally, the ground state energy is computed up to the term of order $e^4 \log e^2$. DEUTERON ELECTROMAGNETIC FORM FACTORS, by M. Gourdin. Nov. 1962, 22p. incl. diagrs. refs. (Technical note no. 7) (AFOSR-4362) (AF EOAR-63-47) AD 294841 Unclassified

Also published in Nuovo Cimento, Series X, v. 28: 533-546, May 1, 1963.

Using the impulse approximation with a nonrelativistic

wave-function for the deuteron an expression is derived for the deuteron electromagnetic current in terms of the nucleon electromagnetic scalar form factors. This is then re-interpreted in terms of charge, quadrupole and magnetic form factors of the deuteron and gives a particularly simple expression for the electron scattering differential cross-section. The approximations involved are then discussed. For instance, the expression for the magnetic moment gives a 3.9%-D state compared with experimental estimates of 6-7% from photodisintegration. It is concluded that a correct analysis of electron-deuteron scattering is difficult for momentum transfers above about 400 mev. (Contractor's abstract)

RADIATIVE CORRECTIONS TO HIGH-ENERGY SCATTERING PROCESSES, by N. Meister and D. R. Yennie. [1962] [20]p. incl. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-63-47] and Atomic Energy Commission) Unclassified

Published in Phys. Rev., v. 130: 1210-1229, May 1, 1963.

A unified treatment of radiative corrections to a class of scattering experiments is presented. The experiments considered are those in which either (but not both) the scattered or recoil particle is detected. The recoil kinematics are properly treated and the calculation is simplified by retaining only terms of logarithmic order. The general results are applied to specific practical examples in which radiative corrections are likely to be important. Except possibly for the case of Compton scattering with nearly maximum or nearly minimum momentum transfer, the errors are estimated to be less than 2% of the cross section.

EFFICIENCY OF THE VARLEY MECHANISM FOR VACANCY PRODUCTION IN ALKALI HALIDES, by G. Chiarotti and G. F. Nardelli. Apr. 25, 1962 [17]p. incl. diagrs. tables, refs. (Technical note no. 2) (AFOSR-2717) (AF 61(052)423) Unclassified

Also published in Radiation Damage in Solids; Proc. of Symposium on Radiation Damage in Solids and Reactor Materials, Venice (Italy) (May 7-11, 1962), Vienna, International Atomic Energy Agency, v. 3: 135-146, 1963.

The efficiency for the ejection of an ionized halogen from a regular lattice position into an interstitial position is investigated in the 2 cases of double ionization in inner and outer shells. The various contributions to the potential energy (Madelung, repulsive and polarization energies) have been evaluated for a number of points in the <111> direction with the aid of an electronic computer. The polarization energy has been estimated to zero-order approximation, and the repulsive interaction has been limited to the third neighbors. Inspection of the potential energy curves shows that, in the case of a halogen doubly ionized into inner shells, the ejection is highly improbable. On the contrary, the ejection mechanism might be operative when the halogen is doubly ionized into its outer shell, provided the time for the delocalization of the 2 holes is larger than 3×10^{-15} sec. EFFECT OF CHARGE SEPARATION ON SHOCK-WAVE STRUCTURE (Abstract), by R. D. Mathieu and H. Li. [1962] [1]p. [AF 49(638)647] Unclassified

Presented at meeting of the Amer. Phys. Soc., Northwestern U., Evanston, Ill., June 19-21, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 414, June 19, 1962.

The structure of a shock wave in a fully ionized hydrogen plasma is investigated using a 2-component fluid model consisting of electrons and singly charged ions. A set of macroscopic equations is written for each component. These equations are coupled through the momentum and energy-exchange terms between the components. The effects of viscosity and thermal conductivity are neglected. The ratio of mean free path to Debye length appears as a parameter. Results are obtained for Mach numbers of 1.1 and 1.2 The phenomenon of charge separation gives rise to an induced electric field within the plasma. At these Mach numbers and typical plasma conditions, the electric field is on the order of 12,000 v/cm. The fluid properties of the ions and electrons oscillate about and damp out to the equilibrium Rankine-Hugoniot values after the shock. As the mean free path between particles decreases, the oscillations damp out more rapidly and at the same time the oscillations become less frequent.

METABOLISM OF SULFATE BY THE CHROMATOPHORE OF RHODOSPIRILLUM, by M. L. Ibanez and E. S. Lindstrom. [1962] [5]p. incl. tables, refs. (AFOSR-4305) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-42 and National Science Foundation) Unclassified

Also published in Jour. Bacteriol., v. 84: 451-455, Sept. 1962.

The chromatophore of Rhodospirillum rubrum was shown to possess enzymes for the activation and reduction of inorganic sulfate. The chromatophore was able to synthesize 3'-phosphoadenosin 5'-phosphosulfate (PAPS), using either exogenous adenosine triphosphate (ATP) or ATP synthesized via photophosphorylation. Light was required for the reduction of sulfate to a volatile form, presumably sulfite. Light enhanced the incorporation of sulfate-sulfur into cystine, cysteine, and cysteic acid of the chromatophore. This incorporation was probably the result of exchange reactions of reduced sulfur, not the result of net synthesis. The 100:1 ratio of the activation to reduction of sulfate and the inhibition of the reduction by exogenous ATP suggested that PAPS might not be the substrate for chromatophoral sulfate reduction. AN EFFECT OF CALCIUM ON THE MOTILITY OF RHODOSPIRILLUM RUBRUM (Abstract), by L. A. Feldman and E. S. Lindstrom. [1962] [1]p. (AF AFOSR-61-42) Unclassified

Presented at meeting of the Amer. Soc. Microbiol., Kansas City, Mo., May 6-10, 1962.

Published in Bacteriol. Proc., p. 60, 1962.

Calcium was shown to be necessary for the functioning of the flagellae of R. rubrum. Cells grown in a low Ca^{2+} had flagellae that were indistinguishable morphologically and serologically from flagellae from cells grown with ample Ca^{2+}. Growth was necessary to regenerate motility in cells transferred from a medium deficient in Ca^{2+} to a medium sufficient in Ca^{2+}. Apparently, Ca^{2+} functions in some internal structional or energy relationships to permit motility. (Contractor's abstract)

REVERSIBILITY OF RADICAL-OLEFIN REACTIONS, by P. S. Skell. Final rept. Oct. 29, 1962, 5p. (AFOSR-3910) (AF 49(638)457) AD 601708 Unclassified

It was the major object of the program to learn the conditions necessary for radical decomposition with special emphasis on depropagation in polymer forming systems, depropagation being measured by cis-trans isomerization of isotopically labeled monomers. This objective was achieved for styrene and vinyl chloride. Concomitant with these studies, many areas dealing with reversibility of simpler radical-olefin additions and rearrangements were examined with considerable profit.

ROLE OF GROUND STATE IN SINGLET-TRIPLET TRANSITION PROBABILITIES, by L. Goodman and V. G. Krishna. [1962] [2]p. incl. table. (AFOSR-64-0253) (AF AFOSR-62-39) AD 432745 Unclassified

Also published in Jour. Chem. Phys., v. 37: 2721-2722, Dec. 1, 1962.

The spin-orbit perturbations in azines are presented in tabular form. The transition moments of $S_0 \leftrightarrow T_1$ stolen from the singlet-singlet transitions, triplet-triplet transitions, and the dipole moments are given. The contributions to the singlet-triplet transition probability from the singlet-singlet transition, $S_0 \leftrightarrow S_k$, where S_k is the principal perturbing singlet state, are also presented. Results show that neglecting the perturbation of the ground state, as practiced uniformly before, has little justification. The leading contribution to $S_0 \leftrightarrow T_1$ in the diazines comes through the mixing of the singlet ground states. Wherever the possibility for $N \leftrightarrow V$ triplet-triplet transition exists, the mixing of the excited triplets with the ground state should not be neglected.

CHARGE TRANSFER INTERACTION BETWEEN IODINE AND AZINES: IONIZATION POTENTIALS OF AZINES, by V. G. Krishna and M. Chowdhury. [1962] [3]p. incl. diagrs. tables, refs. (AFOSR-64-0290) (AF AFOSR-62-39) AD 434510 Unclassified

Also published in Jour. Phys. Chem., v. 67: 1067-1069, May 1963.

This note is concerned with the complexes formed between iodine and monocyclic azines: pyridine, pyrimidine, pyrazine, and s-triazine. The aspects considered are: the perturbation of the visible band of iodine and the ultraviolet and infrared spectra of donor, the equilibrium constants of the molecular complexes formed, and the energy and extinction coefficient of the charged transfer (CT) bands. An important aspect of this investigation is its relation to the ionization potentials of azines. It is shown that azines are n-donors toward iodine. The trend of the charge transfer maxima indicates that the experimentally observed ionization potentials of the azines correspond to π-electron ionization.

PROPERTIES OF HARMONIC FUNCTIONS OF THREE REAL VARIABLES GIVEN BY BERGMAN-WHITTAKER OPERATORS, by J. Mitchell. [1962] [12]p. (AFOSR-3384) (AF 49(638)826) AD 416531 Unclassified

Presented at meeting of the Amer. Math. Soc., Cincinnati, Ohio, Jan. 1962.

Also published in Canad. Jour. Math., v. 15: 157-168, 1963.

Let C be a closed rectifiable curve not passing through the origin, which bounds a domain in the complex ζ-plane. Let $X = (x, y, z)$ be a point in euclidean 3-space F^3, and set $v(X, \zeta) = Z\zeta^2 + x\zeta + Z^*$, where $Z = 1/2$ $(iy = z)$, $Z^* = 1/2\ (iy - z)$. If $g(v, \zeta)$ is a function of the 2 complex variables v, ζ the Bergman-Whittaker operator defined by $H(X) = B(g) = \frac{1}{2\pi i} \int_C g(v, \zeta)\ \frac{d\zeta}{\zeta}$ generates harmonic functions H(X). This connection between functions of 2 complex variables and harmonic functions of 3 variables has been used extensively in the investigation of various functional properties of harmonic functions in E^3. In the present paper, consideration is given to the case in which the function $g(v, \zeta)$ is of the form $f(v, \zeta)p(v)$, where p is a meromorphic function of v with an infinity of poles and $\zeta^{-1} f(v, \zeta)$ is an entire function in both variables. The transform $H(X) = B(g)$ is studied in detail and a numb. of results, concerning the character of the singularities and some growth properties of H(X) are obtained. (Math. Rev. abstract)

PROPERTIES OF COMPLETE ORTHONORMAL SYSTEMS ON MATRIX SPACES, by S. H. Tung. Sept. 1962, 67p. (AFOSR-3286) (AF 49(638)826) AD 621239 Unclassified

Properties of complete orthonormal systems (CONS) on the domain D in the 2 x 2 and n x n cases were studied. Complete orthonormal systems on B and D in the 2 x 2 and n x n cases were given by Mitchell. These systems provided the basic tool for this study. Some inequalities for trigonometric polynomials in one complex variable to analogous polynomials on the domain D were extended. An upper bound for derivatives of polynomials on D in the n x n case was derived. A summability theorem for a Fourier Bessel series was proved. Uniform boundedness of the difference kernel of Fourier-Bessel series and Fourier cosine series was established by means of asymptotic formulas for Bessel functions. With this, the equiconvergence theorem of the simple Fourier-Bessel and Fourier cosine series of Lebesgue integrable functions at every point was obtained. This led to a theorem for Cesáro equisummability of Fourier Bessel series of a real function on B and its corresponding Fourier trignometric series. The Poisson kernel for the domain D and the Dirichlet problem in D were used in proving Harnack's theorems. Other possible problems in the various chapters are discussed.

DETERMINATION OF LOSS FACTORS OF MATERIALS IN POWDER AND GRANULAR FORM (Abstract), by M. M. Simon. [1962] [1]p. (AFOSR-65-1606) (AF AFOSR-63-43) Unclassified

Presented at Sixty-fourth meeting of the Acoust. Soc. Amer., Seattle, Wash., Nov. 7-10, 1962.

Also published in Jour. Acoust. Soc. Amer., v. 34: 2004, Dec. 1962.

This study concerns the determination of loss factors of materials in powder and granular forms by means of decay-time and bandwidth measurements. Two types of liquid-filled tubes are used for the experiment. One is a heavy walled stainless-steel cylinder driven by a steel membrane, the other is a glass U tube driven by a loudspeaker above the liquid column. The loss factors are determined for the liquid filled tubes. The material to be studied is then placed at a velocity node within the liquid, and the loss factor of the combination is determined. From these determinations, the loss factor of the additional material, as well as its bulk modulus of elasticity, can be calculated. (Contractor's abstract)

ATOMIC SURFACE STRUCTURE OF FIELD-EVAPORATED ALLOY CRYSTALS (Abstract), by E. W. Müller. [1962] [1]p. [AF 49(638)504] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 27, Jan. 24, 1962.

Although low-temperature field evaporation of pure metal crystals as used for tip specimens in the field ion microscope develops most perfect surfaces with thousands of high-index crystal facets, field evaporation of some alloys results in a more-or-less amorphous surface. This is due to the statistical distribution of the kind of nearest neighbors at each surface site. The degree of randomness is different for various alloys. In 50% W-Mo with the predominant 011, 112, and 001 planes typical for the bcc lattice, planes with indices such as 122, 123, and 334 may still appear, while in 50% Re-Mo, the field-evaporated surface is completely amorphous. Field electron emission from this surface shows almost no details, indicating that work function differences of various crystallographic orientations are not a volume effect. Ordered alloys such as 650°C annealed 50% Pt-Co develop highly perfect crystalline surfaces in which the 2 kinds of atoms can be distinguished in some parts of the field ion image. Disordering at 1000°C produces some randomness, although there is evidence of a persistent short-range order over areas of 30-50 A diam.

OCCURRENCE OF H_3^+ IN THE FIELD IONIZATION OF HYDROGEN, by T. C. Clements and E. W. Müller. [1962] [4]p. incl. illus. diagrs. (AFOSR-J271) (AF AFOSR-62-96) AD 400883 Unclassified

Also published in Jour. Chem. Phys., v. 37: 2684-2687, Dec. 1, 1962.

Mass spectroscopical analysis of the ions produced at a point emitter with dynamic supply of hydrogen at room temperature or in modified field ion microscopes at 78° and 20°K showed the abundant occurrence of H_3^+ besides H^+ and H_2^+ observed earlier by Inghram and Gomer. The triatomic molecule ion is formed only in the narrow range of field strength near best image conditions. The mechanism of H_3^+ formation under the extreme field conditions is uncertain. Field ion-microscopic observations shows H_3^+ only over single protruding surface atoms, which might act as sites for deactivation of an intermediate state, or simply provide a region of locally enhanced field to allow quick field ionization of short-lives H_3. RESEARCH IN MODERN CRYSTALLOGRAPHY, by R. Pepinsky. Final rept. Apr. 1, 1958-Feb. 28, 1962. Mar. 1962 [129]p. (AFOSR-3885) (AF 49(638)416) AD 285510 Unclassified

This research is directed at the assembly of all known

information on the physical, chemical and structural properties of solids, with the aim of facilitating discovery of known materials and development of new materials for military and other technological applications. Collation and correlation of this information will permit establishment of criteria by which known or new materials can be selected or prepared for examination for specific properties, and will maximize the predictability of behavior. It should be invaluable for purposes of identification. It should permit revelation of purely scientific relationships which are now obscured by the very mass of data. The amount of information to be handled is staggering, and about doubles each decade. A new approach to the preparation of a new type of encyclopedia is required. The deisgn of a suitable procedure was the first step in the present program and it has been accomplished. In the system adopted, all data are transferred to IBM punched cards, in a form suitable for efficient input to an IBM 704 machine after transfer to magnetic tape, and coded in such a manner that all useful computations can be carried out on simple instructions to the machine. Programs have been developed for processing the data, computing, correlating, preparing rapid-retrieval cards and tapes, and sorting out and automatically printing whatever information is desired and available. Rather than printing out everything that is known or knowable about solids, the information is left implicity in the storage to be made available on request.

AUTOMATIC INSTRUMENTATION, by R. Pepinsky. 1962, 29p. [AF 49(638)1044] Unclassified

Presented at Symposium on Recent Advances in Experimental and Theoretical Methods of Crystal Structure Research, Munich (Germany), July 28-31, 1962.

This report covers some of the automatic instruments used in experimental and theoretical methods of crystal structure research. The following applications are included: optical; mechanical; thermal; electrical and dielectric; crystal growth; shaping; x-ray fluorescence analysis; and x-ray and neutron diffraction. Computers are not included except for references to certain analogue devices which are directly coupled to automatic machines, and which have the advantage of permiting rapid introduction or adjustability of parameters and their immediate effects on the computations. It is estimated that in some instruments there is a savings of at least a factor of 4 in overall time and a gain of 5 in accuracy; the saving in tedium is extreme.

ANTIFERROELECTRICITY IN $CsH_3(SeO_3)_2$ (Abstract), by Y. Makita and R. Pepinsky. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-367] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 177, Mar. 26, 1962.

Dielectric, pyroelectric, thermal, optical, and x-ray measurements are reported for paraelectric $CsH_3(SeO_3)_2$ above T_c = 145°K, and for the antiferroelectric phase below. The dielectric constant and temperature curves for these 2 phases are similar to those near the upper transition in $NaH_3(SeO_3)_2$. Various pyroelectric tests indicate essentially no spontaneous polarization. Correspondingly, no ferroelectric hysteresis appears; D vs E curves are linear, except for upward curvature in a narrow temperature range just below T_c when a strong field is applied perpendicular to (100). ϵ_1 (100) shows a peak at T_c which shifts to lower temperature on application of a biasing dc field. ΔT_c = 4.3°C for 32 kv/cm. ΔS = 0.81 cal/mol-deg. Assuming 2 equivalent sublattices below T_c and using Kittel's theory, P_s for a sublattice is ≈ 4.5 μcoul/cm^2. The upper phase has symmetry P2/m; the lower has a superstructure, and the symmetry is now under examination, as are the structures of both phases.

CRYSTAL STRUCTURE OF FERROELECTRIC (GLYCINE)$_2$.MnCl$_2$.2H$_2$) (Abstract), by M. Lee, Y. Okaya, and R. Pepinsky. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-367] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 177, Mar. 26, 1962.

(Glycine)$_2$.MnCl$_2$.2H$_2$O, a room-temperature ferroelectric, has symmetry P2$_1$, with a = 9.96, b = 8.53, c = 6.86, β = 107°, Z = 2; the ferroelectric axis is along b. The structure was determined by full 3-dimensional methods and refined by least squares to R = 0.155. The absolute configuration was established from bounded P$_s$(u) projections, from which the structure was also discernable. Each Mn is coordinated octahedrally to 2 Cl's (trans), 2 H$_2$O's and 2 O's (1 from each glycine); the correct chemical name is thus syn-dichloro-bis-glycino-biaquo-manganese(II). The glycines are zwitter ions. H bonds from H$_2$O's to carboxyl O's result in infinite spirals of molecules parallel to b, and sheets parallel to (001); the sheets are interconnected by N-H···O and N-H···Cl bonds, accounting for the observed (001) cleavage. One H of each water is apparently not involved in H bonding. To account for the ferroelectricity, further anomalous, x-ray analyses are required.

FERROELECTRIC POLARIZATION MECHANISM IN (NH$_4$)$_2$ (Abstract), by B. Singh and R. Pepinsky. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-367] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v 7: 177, Mar. 26, 1962.

Three-dimensional x-ray analyses of paraelectric and ferroelectric (NH$_4$)$_2$SO$_4$ and neutron analysis (at the Brookhaven reactor) at room temperature have clarified the polarization mechanism and other features of these structures. The paraelectric phase is comprised of a statistical mixture of 2 mirrored structures, producing a pseudomirror at z = 1/4; the true symmetry is thus Pna2$_1$ rather than Pnam. The 2 ammonium groups, NH$_4$(I) and NH$_4$(II), are unrelated crystallographically. NH$_4$(I) is very loosely bound to neighboring sulfates; all N-H···O distances are greater than 3 A and hindered rotation of NH$_4$(I) about c persists in both phases. NH$_4$(II) is more tightly bound but disordered about z = 1/4 above T$_c$, and is ordered below; this results in considerable tilt about c below T$_c$. There are 5 short N-O separations below T$_c$; H's in 4 of these separations are shown to be directly involved in the polarization. This dissimilar behavior of the 2 ammoniums may account for the double peak in specific heat.

FERROELECTRICITY IN TRIS-SARCOSINE CALCIUM CHLORIDE (Abstract), by R. Pepinsky and Y. Makita. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-367] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 241, Mar. 26, 1962.

(Sarcosine)$_3$ CaCl$_2$ shows symmetry Pnma at 20°C. with a = 9.153, b = 17.48, c = 10.28 A, ρ_{obs} = 1.533 g/cc, Z = 4. Optically, the crystal is positive, with the acute bisectrix along a and the optic plane perpendicular to c. Twinning is common on {011} and similar to that in paraelectric (NH$_4$)$_2$SO$_4$, but is not temperature- or pressure-sensitive. Large crystals are easily grown from aqueous solution. A sharp dielectric peak appears along b[ϵ_b(max) ≈ 80] at 127°K, and ferroelectricity appears below this temperature, with saturated hysteresis loops. P$_s$ at 125°K ≈ 0.1, at 78°K ≈ 0.27 μ-cb/cm^2; E$_c$ at 125°K ≈ 0.6, at 78°K ≈ 3 kv/cm. ϵ_b follows a Curie-Weiss law above T$_c$[$\epsilon_b = C/(T - T_0)$]; T$_c$ - T$_0$ ≈ 0.5°, C = 72°K. The transition appears to be of second order, with ΔS = 0.38 cal/mol-deg. Assuming the second-order transition, ξ in the Gibbs free-energy equation is 3.6 x 10^{-6}(esu/cm^2)$^{-2}$. The ferroelectric phase has symmetry C$_{2v}$. Structure analysis of both phases are in progress.

FIELD-REVERSIBLE OPTICAL ROTATION IN FERROELECTRIC LiH$_3$(SeO$_3$)$_2$ (Abstract), by H. Futama and R. Pepinsky. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-367], Medical Sciences Research Foundation, National Institutes of Health, and Phillips Laboratories) Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 177, Mar. 26, 1962.

The room-temperature ferroelectric $LiH_3(SeO_3)_2$ crystallizes in space group Pn from an optically-inactive aqueous solution. Optical activity is possible in non-enantiomorphic point groups m and mm^2, and distinguishable from birefringence if the optic axial plane is perpendicular to reflection plane (s). In $LiH_3(SeO_3)_2$, the ferroelectric axis is perpendicular to (001); the crystal is optically negative for no light, the acute bisectrix is along [010], and $2V = 68 \pm 2°$. One-millimeter-thick plates are cut perpendicular to the optic axes, and electroded to permit ferroelectric polarization. A plate is oriented in a Rudolph spectropolarimeter with the optic beam (divergence < 4') along the optic axis. In accordance with Pepinsky's prediction, a saturating electric field causes optic rotation. At 5890 A, the rotation is ~ 4°; at 4000 A, it is tripled. Reversal of the electric field reverses the rotation. Measurements of dispersion, temperature dependence, switching times, and domain structure are presented.

PHASE TRANSITIONS IN $NaH_3(SeO_3)_2$ (Abstract), by Y. Makita, K. Vedam, and R. Pepinsky. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-367] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Chem. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 241, Mar. 26, 1962.

$NaH_3(SeO_3)_2$ is ferroelectric below 194°K. Details of electrical, mechanical, optical, and thermal properties are reported here. Three phases are observed: (1) paraelectric above 194°K, space group $P2_1/n$; (2) ferroelectric between 194° and 94°K, triclinic, space group C1, spontaneous polarization close to [132] or [132] direction, twinning on (201) and (010) effected by shearing stresses; (3) ferroelectric below 94°K, probable symmetry Cs, polarization along [102]. For the transition at 194°K, $\Delta S = 0.97$ cal/mol-deg. Field-induced transitions are observable near the temperature extremes of phase (2); the temperature for the (1)-to-(2) transition is raised, and that of the (2)-to-(3) transition is lowered, by the field, indicating first-order transitions. Thermodynamic relations, and evidence for ferri-electric character, are discussed.

REVERSAL OF OPTICAL ROTATORY POWER BY FIELD IN FERROELECTRIC CRYSTALS (Abstract), by R. Pepinsky. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-367], National Institutes of Health, and Phillips Laboratories) Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 177, Mar. 26, 1962.

A ferroelectric crystal may have optically inactive pseudosymmetry (PS), whereas the true symmetry (S) permits optical rotation within individual domains. Examples above 250°K, with pseudo- (PS) and true (S) point-group symmetries indicated as (PS, S), are triglycine sulfate, etc (2/m, m); Ca_2Sr(propionate) (422, 4); $LiN_2H_5SO_4$ (mmm, mm2); NH_4HSO_4 $RbHSO_4$ (2/m, m); $LiH_3(SeO_3)_2$ (2/m, m); colemanite (2/m, 2); $NaNO_2$ (mmm, mm2). In m or mm2, ease of observability of the rotation depends on the orientation of the optic axes (as well as the magnitude of the rotation/mm within a single domain). The effect is readily seen along the optic axes in polarized $LiH_3(SeO_3)_2$, and polarization reversal alters the rotation sense. Unbiased crystals, comprised of equal volumes of oppositely-oriented 180° domains, show no rotation. In ferroelectric crystals with optically active pseudo-symmetries (e.g., Rochelle salt), polarization may cause incremental rotations. This phenomenon, when present, permits modulation of optical transmission and new methods for domain observation and switching. More important, anomalous x-ray diffraction analyses permit direct observation of interatomic bonds responsible for optical activity and correlation of the sense of rotation with absolute configuration.

SEARCHING LEGAL LITERATURE ELECTRONICALLY: RESULTS OF A TEST PROGRAM, by J. S. Melton and R. C. Bensing. Reviewed by J. O'Connor. [1960] [19]p. (AFOSR-3376) (AF AFOSR-62-257) Unclassified

Presented at meeting of the Amer. Bar Assoc., Miami, Fla., Aug. 1959.

Also published in Minnesota Law Review, v. 45: 229-248, Dec. 1960.

A pilot system for machine searching of legal records has been developed using variations of a basic approach which was developed for the retrieval of scientific information. Subject indexing of a passage is done by someone "learned in the law." He writes down what he regards as the "significant words" and assigns them "role indicators," and punctuates this set of symbols.

Machine-aided searching, rather than searching aided only by printed indexes, has 2 advantages. First, in printed indexes, a term can be put under more than one heading only by repeating the term or by cross-referencing. Thus potentially useful information often is omitted. However, rapid machine searching makes feasible examination of every record in the file. Second, if the searching machine is fairly powerful, it can perform a number of searches simultaneously. This makes feasible the formulation of a number of questions of varying form for the same initial search request.

THE PROPERTIES OF SINGLE CRYSTAL GERMANIUM SURFACES. Final technical rept. [1962] 18p. incl. diagrs. refs. (AFOSR-J1131) (AF AFOSR-62-155) AD 420996 Unclassified

This study of ortho to para hydrogen conversion on germanium prepared under ultra-high vacuum conditions at very low temperatures was undertaken to obtain information on its surface magnetic properties, and, if possible, to use the conversion rate for determining the cleanness of the surface. The data available on germanium and silicon may be grouped into heat and non-heat treated surfaces. It is not known whether some rearrangements occur on surfaces created by crushing or cleaving. Thus, caution should be used in evaluating data obtained on differently treated surfaces. Typical examples of pressure vs resistance change graphs for n-hydrogen exposed to germanium for 2 hr at 13° and 77°K are shown It is concluded that germanium surface does not exhibit a strong paramagnetic susceptibility. However, with the present data, it is not possible to rule out a weak susceptibility.

MODEL FOR THE (100) SURFACES OF SILICON AND GERMANIUM, by M. Green. [1962] [2]p. incl. diagrs. table. [AF AFOSR-62-155] Unclassified

Published in Jour. Chem. Phys., v. 37: 458-459, July 15, 1962.

Low-energy electron diffraction studies of germanium and silicon suggest that the atoms of the (100) surface are displaced from their idealized positions in directions perpendicular to rows in the (110) azimuth, with adjacent rows displaced in opposite directions; the extent of the displacement is uncertain. No displacement has been observed on the (100) diamond surface. It is suggested that a covalent bond of normal length forms between those atoms which are displaced towards one another in the (100) surfaces of silicon and germanium, each surface atom having one unbound electron occupying a 3 sp^3 orbital. Energy calculations are given to support the suggestion in the cases of germanium, silicon, and diamond. In the case of diamond, the formation of surface bonding does not appear to be energetically favorable.

REMOTE POINTS IN βR, by N. J. Fine and L. Gillman. [1961] [9]p. (AFOSR-3830) (AF 18(603)65) Unclassified

Also published in Proc. Amer. Math. Soc., v. 13: 29-36, Feb. 1962.

It has been known for some time that there is a point in βR (where R is the real line) that is not in the closure of any R-closed discrete subset of R. The main result of the paper is that, assuming the continuum hypothesis there is a point p in βR that is not in the closure of any discrete subset of R; equivalently, there is a maximal family of zero sets on R with the finite intersection property no member of which is nowhere dense. It is not determined whether the continuum hypothesis is necessary. The result is obtained from a more general theorem, which asserts that for a certain class of spaces, a point satisfying an even stranger condition exists if and only if the space is not pseudocompact. A result on pseudocompactness of sub spaces of βS when S is realcompact is also given and some examples are discussed. (Math. Rev. abstract)

VARIATIONS ON EQUICONTINUITY, by J. P. Clay. [1962] [9]p. incl. refs. (AF 49(638)569) Unclassified

Presented at meeting of the Amer. Math. Soc., Feb. 1962.

Published in Duke Math. Jour., v. 30: 423-431, Sept. 1963.

The transformation group (X, T) is said to be almost equicontinuous provided that if $x \in X$ and if α is an index of X, then there exists an index β of X and a syndetic subset of A of T such that $t \in A$ implies $x\beta t \subset x t\alpha$; and (X, T) is said to be weakly almost equicontinuous provided that if $x \in X$ and if α is an index of X, then there exists an index β of X and a compact subset K of T such that if $y \in x\beta$, then there exists a subset A of T such that $T = AK$ and such that $t \in A$ implies $yt \in xt\alpha$. Among others the following theorems are proved: (1) (X, T) is locally almost periodic if and only if (X, T) is pointwise almost periodic and almost equicontinuous; (2) Almost equicontinuous and weakly almost equicontinuous are productive; (3) (X, T) is weakly almost equicontinuous if and only if $P = Q$; and (4) The unique existence of a universal admissible minimal transformation group where admissible is any one of 10 properties. THE STRUCTURE OF DIMOLYBDENUM CARBIDE BY NEUTRON DIFFRACTION TECHNIQUE, by E. Parthe and V. Sadagopan. [1962] [10]p. incl. diagrs. table. (AFOSR-2386) (In cooperation with Massachusetts Inst. of Tech., Cambridge) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1027 and National Science Foundation) AD 611197 Unclassified

Also published in Acta Cryst., v. 16: 202-205, Mar. 10, 1963.

It is generally believed the Mo_2C has either the hexagonal C6 cadmium iodide anti-type structure or the related hexagonal L'3 structure. A neutron diffraction study showed that this is not the case. Mo_2C is only pseudohexagonal and crystallizes with an orthorhombic unit cell with $a = 4.72_4$, $b = 6.00_4$, and $c = 5.19_9$ A. The atomic arrangement of Mo_2C presents a new structure type. Space group is D_{2h}^{14}-Pbcn. Eight molybdenum atoms are in 8(d) with $x = 1/4$, $y = 1/8$, $z = 1/12$ and 4 carbon atoms are in 4(c) with $y = 3/8$. The carbon atoms in Mo_2C arrange themselves in such a way that each molybdenum atom has 3 nearly planar carbon neighbors. (Contractor's abstract)

CRYSTAL CHEMISTRY OF METALLIC COMPOUNDS, by E. Parthe. Technical status rept. Jan. 1, 1962-Sept. 30, 1962 [23]p. incl. diagrs. tables. (Rept. no. 3) (AFOSR-2645) (AF 49(638)1027) AD 284060 Unclassified

The structure of NbAs has been solved and has been found to present a new structure type, which is a transposition structure variation of the WC structure type.

NbAs is tetragonal with a = 3.452A and c = 11.67_9A. Space group is C_{4V}^{11} - 14_1 md with 4Nb in 4a with z = 0 and 4As in 4a with z = 5/12. The same structure type has been found to apply to TaAs with a = 3.437A and c = 11.65_8A and "β-NbP" with a = 3.334A and c = 11.37_8A. The previously reported structure proposal for α and β -NbP was proven to be wrong. In the case of a gradual P deficiency, a gradual structural change of the NbAs structure type was observed, which corresponds to a gradual irregular transposition, presenting a structure halfway between NbAs and WC. The new structure type and its variation fit well with the other known monophosphide or arsenide structure types.

ON THE POSSIBILITY OF FORMING PSEUDOSILICIDES, by H. Boller and E. Parthe. Technical status rept. Jan. 1, 1962-Sept. 30, 1962 [12]p. incl. diagrs. tables. (Rept. no. 5) (AFOSR-2647) (AF 49(638)1027) AD 284058 Unclassified

Also published in Acta Cryst., v. 16: 830-833, Aug. 1963.

The concept of 'pseudosilicon' is very successful for the prediction of occurrence and structure of certain groups of nonmetallic compounds. Experiments to extend this concept to metallic compounds show that the concept has to be modified. Two factors have been found to be of importance for determining if a 'pseudosilicide' will occur. One is the composition of the compound and the second is a geometrical factor which depends on the crystal structure type. It is known that compounds of the 'pseudosilicon' type, and also nonmetallic 'pseudosilicon' oxide, have extremely narrow homogeneity ranges, but transition metal 'pseudosilicides' exhibit wide ranges which may spread far from the ideal composition of the 'pseudosilicide'. Alloys close to the composition of the 'pseudosilicide' show a chemical stabilization like increased oxidation resistance and also a volume contraction. Two new true 'pseudosilicides' have been synthesized: $Hf_5(In_{0.5}Sb_{0.5})_3$ with $D8_8$ structure: a = 8.46A, c = 5.79A and c/a = 0.684; and $Mo(Al, P)_2$ with C40 structure: a = 4.76A, c = 6.64A and c/a = 1.40. Results are further reported on the following ternary sections: Nb_3Al-Nb_3Sb, Nb_3Ga-Nb_3Sb, Nb_3In-Nb_3Sb, (Zr_5Al_3)-Zr_5Sb_3, Zr_5Ga_3-Zr_5Sb_3, (Zr_5In_3)-Zr_5Sb_3 and Ti_5Ga_3-(Ti_5Sb_3). THE TRANSPOSITION STRUCTURE OF NbAs AND OF SIMILAR MONOPHOSPHIDES AND ARSENIDES OF NIOBIUM AND TANTALUM, by H. Boller and E. Parthe. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-J1599) (AF 49(638)1027) AD 427625 Unclassified

Also published in Acta Cryst., v. 16: 1095-1101, Nov. 1963.

NbAs crystallizes in a new structure type, which is a transposition structure variation of the WC structure type. NbAs is tetragonal with a = 3.45$_2$A and c = 11.67 11.67$_9$A. The space group is $I4_1md$ (C_{4v}^{11} with 4Nb in 4a with z = 0 and 4As in 4a with z = 5/12. Other isotypic compounds are TaAs with a = 3.43$_7$A and c = 11.65$_6$A and 'β-NbP' with a = 3.33$_4$A and c = 11.37$_8$A. The previously proposed structure for α and β-NbP is proved to wrong. Stoichiometric NbP or 'β-NbP' crystallizes in the NbAs structure, but P-deficient NbP_{1-x} has a partly disordered NbAs structure. The transposition is not as regular as in stoichiometric NbP. The degree of disorder depends nearly linearly on phosphorus deficiency. The new structure type is compared with other known monophosphide structure types. The concept of a structural transposition and its cancellation offers a new viewpoint for an explanation of the occurrence of more than 1 crystal structure for the same compound. SYSTEM FOR ENERGY CONTROL AND ABSOLUTE CALIBRATION OF A 23 MEV BETATRON, by K. N. Geller. [1962] [8]p. incl. diagrs. (AFOSR-J631) (AF 49(638)454) AD 414208 Unclassified

Also published in Nuclear Instr. and Methods, v. 17: 161-168, Oct. 1962.

The theoretical and technical features of a system used to determine and control the operating energy of a 23 mev betatron are described. By observing the variation in orbit radius as a function of magnet excitation, the shape of the calibration curve to maximum operating energy is predictable. Although an absolute calibration of the predicted energy scale is possible, the present calibration is empirical and based on only the 16.22 mev resonance in the $O^{16}(\gamma,n)O^{15}$ reaction. Photoneutron threshold energies based on the present energy scale are in good agreement with accepted values. (Contractor's abstract)

[RESEARCH ON SCATTERING AND POLARIZATION OF ELECTRONS UNDER THE G FACTORS OF THE F FREE ELECTRON], by A. K. Mann. Final rept. Jan. 1, 19[illegible] Sept. 30, 1961. July 1962, 62p. incl. diagrs. refs. (AFOSR-3147) (AF 49(638)537) AD 613546 Unclassified

The possibility of obtaining spin-exchange orientation of a number of third and fifth column elements, with $^2P_{I/2}$ and $^4P_{3/2}$ ground states respectively, was investigated without success during this period. Failure with the fifth column elements may be due to strong chemical affinity with the Rb vapor, which either greatly broadens the resonances or completely dominates the spin-exchange process. This explanation is not entirely satisfactory however, due to the established ability to obtain spin-exchange orientation of atomic nitrogen. Failure with the third column elements may be due to excessive broadening of the resonance lines due to interactions of the $P_{1/2}$ ground-state atoms. Success was achieved with spin-exchange orientation of Ag atoms in a sealed vessel, duplicating recent results of other investigators. The possibility of observing Au and Cu orientation through use of the hyperfine resonance was investigated, with a search being made for the hf resonance in oriented Ag vapor. Success was not achieved, due to the very poor phase stability of the resonance, making effective use of the lock-in detector system impossible. A new rf powered Rb resonance lamp of the type developed by Varian Associated was constructed and tested. The lamp appeared to be of about the same resonance intensity as that previously used, but was free from troublesome plasma oscillations.

SEARCH FOR SPIN-EXCHANGE ORIENTATION OF 3RD AND 5TH COLUMN ELEMENTS IN THE PRESENCE OF OPTICALLY ALIGNED Rb VAPOR (Abstract), by R. L. de Zafra. [1962] [1]p. (AF 49(638)537) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 15, Jan. 24, 1962.

A search has been made for orientation produced in the third column elements B, Al, Ga, and In, and in the fifth column element Sb by electron exchange with optically pumped Rb vapor, in a sealed glass system. The technique used was that first employed by Dehmelt in which the Rb vapor acts as both polarizer and analyzer for the "foreign" vapor. Low-field Zeeman transitions were searched for in the ground state of the third column ($^2P_{1/2}$) and fifth column ($^4S_{1/2}$) elements over a fairly wide range of vapor densities. A lock-in detection system allowed signals as low as 10^{-3} (Rb Zeeman transition signal) to be easily detected. No resonance signals were observed for any of the elements tested, although the Zeeman signal from spin-exchange oriented Ag (ground-state $^2S_{1/2}$) could readily be observed, with a signal strength on the order of 1/10 the Rb^{85} signal strength, consistent with the results of Hayne and Robinson. Spurious resonance signals were also observed at a frequency corresponding to $g_F = 1$ when searching for resonance in certain samples of Al, and were probably due to atomic hydrogen freed during heating of the sample. Possible reasons for negative results with the third and fifth column elements are discussed.

TOWARDS A THEORY OF RECURSIVE PROCESSORS, by P. Z. Ingerman. [1961] 14p. (AFOSR-1472) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)951 and National Science Foundation) Unclassified

This paper presents some definitions towards a theory of recursive processors and some theorems which have been proved concerning recursive processors. The criterion used in the definitions is that, although rigorous, they must also not contradict the intuition of persons who have been designing processors for years on (at least partially) an intuitive basis. Given the definitions, several theorems may be proved which give an insight into the intuitive portion of the techniques at present used for the construction of processors.

AN AXIOMATIC APPROACH TO PREFIX LANGUAGES, by S. Gorn. [1962] [24]p. incl. table. (AFOSR-2097) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)951 and National Science Foundation) AD 289182 Unclassified

Also published in Symbolic Languages in Data Processing; Proc. of the Symposium, Rome (Italy) (Mar. 26-31, 1962), New York, Gordon and Breach, 1962, p. 1-21.

A set of axioms is presented which characterizes those linear sequential languages over a "stratified alphabet" called "complete prefix language". Such concepts as "local uniformity", "uniformity", "contractibility", "expandibility", and "homogeneity" are definable properties of such "generalized prefix languages". The definitions are mathematically formal but are purely extensional and non-constructive. This is in contrast with the "mechanically intensional" but constructive definitions by which the mechanical languages under discussion are presented in the computer and information sciences. The advantage in having such a mathematical theory of prefix languages available is that it would lead to a general "structural theory" of appropriate "sublanguages". Parts of such a structure theory could be used to discover how to "extend" languages by some appropriate standard "adjunction" processors. Control systems for the processing of mechanical languages which include such automatic extension processors will provide primitive models of "growing mechanical languages" and the growth and subsidence of corresponding "information retrieval problems". PROCESSORS FOR INFINITE CODES OF THE SHANNON-FANO TYPE, by S. Gorn. [1962] [25]p. incl. diagrs. (AFOSR-2595) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)951 and National Science Foundation) AD 289475 Unclassified

Also published in Proc. Symposium on Mathematical Theory of Automata, New York (Apr. 24-26, 1962), ed. by J. Fox, M. Crowell, and R. Meyerson. Brooklyn, Polytechnic Press, 1963, p. 223-240.

Standard processors, reported elsewhere, are given which do the following: (1) Given a finite rooted tree, presented in one of the author's tree-naming languages, the first processor in a single scan generates "tree-addresses," for each node, from given-ordered alphabets in a generalized Dewey-decimal code. (2) A similar processor generates the addresses of the end points only, yielding a generalization of the Shannon-Fano code. (3) Such an end-point code, when sorted in order of appearance in prefix language, is lexicographically arranged; with ordering determined by a "depth language" it sorts by length first, and then lexicographically. The third processor uses either of these orderings to "deconcatenate" code in a single scan; the second ordering is more efficient. It is possible to generalize such codes and processors further to include end-point codes for infinite trees. The codes and processors are effective for those infinite trees which are "periodic." Any " "rooted" finite graph may be "broken open" into such an infinite periodic tree. The end-point codes generated by such graphs form the extents of mechanical languages which result from Chomsky phrase structure grammars of type 3. An example is given of an infinite end-point code which cannot be so generated (it is probably a phrase-structure language of type 1).

AMBIGUITY-PREVENTING NORMAL FORMS FOR SYNTAX SPECIFICATION, by R. M. Cotton. June 1962 [25]p. (AFOSR-3429) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)951 and National Science Foundation) AD 285579 Unclassified

The question whether a formal computing language contains syntactic ambiguities has both theoretical and practical interest, as experience with ALGOL 60 has shown. It has been demonstrated that there is no decision procedure for determining whether an arbitrary language specified in Backus Normal Form contains such ambiguities. This paper investigates restrictive conditions on BNF rule sets sufficient to prevent ambiguities from occurring. In this way normal forms within BNF are defined which can be termed ambiguity-preventing. Some of these normal forms are sufficiently expressive to permit the specification of some or all of ALGOL. It is

shown that there are efficient algorithms for the syntactic recognition of languages specified by means of these normal forms. An algorithm is given in an appendix for the systematic discovery of all recognition trees of a string in an arbitrary (ambiguous) BNS specified language. Also, a proof of the unsolvability theorem referred to above is given. (Contractor's abstract)

DETECTION OF GENERATIVE AMBIGUITIES IN CONTEXT-FREE MECHANICAL LANGUAGE, by S. Gorn. [1962] [21]p. incl. diagrs. (AFOSR-3481) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)95' and National Science Foundation) Unclassified

Abstract published in Information Processing; Proc. of the Internat'l. Fed. for Information Processing Cong., Munich (Germany) (Aug. 27-Sept. 1, 1962), Amsterdam, North-Holland Publishing Co., 1963, p. 515-516.

Also published in Jour. Assoc. Comput. Mach., v. 10: 196-208, Apr. 1963.

The author relates his work to the Chomsky-Schützenberger representation of context-free languages using a graph and the 2 operations of disjunction and concatenation instead of a set of equalities and 2 operations noted sum and product. The problem of determining whether an arbitrary c.-f. grammar is ambiguous or not is known to be recursively unsolvable. The author detects ambiguities for finite subsets of c.-f. languages; to do this, he gives a sequence of algorithms to apply to a c.-f. grammar: elimination of certain superfluous rules; derivations of sentences are generated level by level, the levels being related to the steps of production of sentences in the Chomsky-Schützenberger scheme; comparisons of the derivations up to a level n are done, providing the list of ambiguous sentences. THE COMPUTER AND INFORMATION SCIENCES: A NEW BASIC DISCIPLINE, by S. Gorn. [1962] [9]p. (AFOSR-3482) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)951, National Science Foundation, and Rome Air Development Center) Unclassified

The information processing area is developing into a new basic discipline which will be as fundamental in future university curricula as those now presented in the departments specializing in mathematics and in the natural language of the country to which the university belongs. A central topic in this discipline is the study of the synthesis and analysis of mechanical languages and their processors, where the word processor is interpreted broadly to refer to mechanisms, to programs for a mechanism, and to systems and organizations composed of mechanisms, programs, and algorithmized people. Special attention must be given to the study of these languages and their processors as growing organisms whose growth may be mechanically controlled. Like the tangent disciplines of psychology and linguistics, and unlike the tangent discipline of mathematics, it must be concerned with pragmatic phenomena in addition to semantic and syntactic questions. A TRANSLATION TECHNIQUE FOR LANGUAGES WHOSE SYNTAX IS EXPRESSIBLE IN EXTENDED BACKUS NORMAL FORM, by P. Z. Ingerman. [1962] [42]p. incl. tables, refs. (AFOSR-J237) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)951 and National Science Foundation) AD 407528 Unclassified

Also published in Symbolic Languages in Data Processing; Proc. of the Symposium, Rome (Italy), (Mar. 26-31, 1962), New York, Gordon and Breach, 1962, p. 23-64.

The well-formedness of R(L), the set of rules which are the grammar of some language L with names N(L), basic symbols B(L), and expressions E(L) is considered. A restriction on R(L) is stated: for every element of N(L) there is at least one string of elements of B(L) which can be generated by a processor designed to generate words in a language given a name and a grammar. A rule-chain is defined as a sequence of rules, all elements of R(L), such that the metaresult of the k'th rule is one of the metacomponents (or the sole metacomponent) of the $(k+1)^{st}$ rule. Finally, the set of heads of a language is defined as the subset of N(L) which appear as metaresults but not as metacomponents. Without loss of generality (since additional rules can be introduced), only single-headed languages are considered.

MECHANICAL PRAGMATICS: A TIME-MOTION STUDY OF A MINIATURE MECHANICAL LINGUISTIC SYSTEM, by S. Gorn. [1962] [14]p. incl. diagrs. refs. (AFOSR-J245) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)951, National Science Foundation and Rome Air Development Center) AD 407529 Unclassified

Also published in Commun. Assoc. Comput. Mach., v 5: 576-589, Dec. 1962.

This report begins with a miniature object language and its syntax, and proceeds to put both through a series of modifications. Each modification will either change the intent in the syntax language alone, or will keep the total intent fixed but will permit an exchange between the

object and syntax languages, thereby modifying both. In short, the pirpose here is to present with a small example a picture of the dynamic relationship between object languages, their syntax languages and their interpreters; this dynamic relationship, intended to be a mechanical one, is one of mutual growth and exchange.

HYPOTHALAMIC CORTICOTROPIN AND LUTEINIZING HORMONE RELEASING FACTORS, by S. M. McCann. [1962] [6]p. incl. diagrs. refs. (AFOSR-2001) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)685 and National Institutes of Health) AD 277645 Unclassified

Also published in Advances in Neuroendocrinol.; Proc. of the Symposium, Miami, Fla. (Dec. 6-8, 1961), Urbana, Illinois U. Press, 1963, p. 328-333.

Several points with regard to the existence of corticotropin releasing factors distinct from vasopressin are emphasized. Some of the recently obtained evidence pointing to the existence of luteinizing hormone releasing factors in extracts of the stalk-median eminence region are outlined. It is concluded that a specific luteinizing hormone (LH) releasing factor exists in stalk-median eminence extract tissue which is effective in stimulating LH secretion by the hypophysis, except when the secretion rate of LH is already maximal, as appeared to be the case in the ovariectomized rat.

RECENT STUDIES ON THE REGULATION OF HYPOPHYSIAL LUTEINIZING HORMONE SECRETION, by S. M. McCann. [1962] [15]p. incl. diagrs. table, refs. (AFOSR-2633) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)685 and Public Health Service) AD 408074 Unclassified

Also published in Amer. Jour. Med., v. 34: 379-393, Mar. 1963.

The recent development of a highly sensitive assay for luteinizing hormone (LH), the ovarian ascorbic acid depletion method, has made possible a systematic study of the factors influencing the secretion of this trophin in the rat. Elimination of negative feedback from ovarian steroids by gonadectomy resulted in elevated levels of LH in the pars distalis and plasma. Injection of ovarian steroids in such animals produced a decrease in the plasma titer of LH. Estrogen was effective in small amounts, progesterone in physiologic doses only after priming of the animal with estrogen. Lactation, perhaps acting through the suckling stimulus itself, also acted to inhibit LH secretion. LH secretion appears to be regulated by the hypothalamus since certain lesions in this structure markedly reduced both the secretion and storage of the trophin by the pituitary gland. Conversely, hypothalamic stimulation evoked the secretion of LH. The hypothalamus appears to exert its control over LH secretion by means of a humoral substance, designated luteinizing hormone-releasing factor (LH-RF) which is released into the hypophysial portal vessels and triggers the discharge of LH by an action on the hypophysis itself. The nature of this substance is unknown, but it may be a polypeptide related to the known neurohypophysial hormones.

REGULATION OF LUTEINIZING HORMONE (LH) SECRETION BY A HYPOTHALAMIC LH-RELEASING FACTOR, by S. M. McCann, D. Ramirez, and R. Adams. [1962] [8]p. incl. diagrs. table, refs. (AFOSR-2634) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)685 and Public Health Service) Unclassified

Also published in Hormonal Steroids; Biochemistry, Pharmacology, and Therapeutics; Proc. of the First Internat'l. Cong., Milan (Italy) 1962, ed. by L. Martini and A. Pecile. New York, Academic Press, v. 1: 251-258, 1964.

The ovarian ascorbic acid depletion method has been used to study the factors regulating the secretion of LH; this secretion is subject to negative feedback control by the ovarian steroids estrogen and progesterone. It is also inhibited by laciation, possibly acting via the suckling stimulus. Hypothalamic lesions interfere with the secretion and storage of LH; conversely, LH secretion is induced by hypothalamic piqure. Crude extracts of the stalk-median eminence region evoke LH secretion in a variety of test situations. This activity is not due to LH or to contamination with a variety of known pharmacologically active agents. It is trypsin labile, a fact suggesting that the active substance may be a polypeptide. The most sensitive test system so far described for this LH-RF is the ovariectomized estrogen-progesterone blocked rat. Since conditions which markedly alter ACTH secretion have little or no influence on LH secretion, it is postulated that the LH-RF is not identical with CRF.

NEUROHUMORAL CONTROL OF THE PITUITARY, by S. M. McCann. Final rept. Aug. 1, 1959-July 31, 1962. Nov. 21, 1962 [7]p. (AFOSR-4341) (AF 49(638)685) AD 293154 Unclassified

Investigations have been carried out to more clearly define the hypothalamic control over the anterior pituitary with particular emphasis on ACTH and gonadotrophins. In the case of ACTH, very little residual ACTH secretion occurs in rats with hypophyses engrafted to the kidney capsule. Attempts to significantly alter the content of stored CRF by altering the titer of circulating corticoids were unsuccessful. In the case of the gonadotropins, it is shown that hypothalamic lesions lead to elevated secretion of LTH and markedly reduced secretion of LH. Hypothalamic stimulation augments LH secretion and

evidence is presented indicating that LH release may be triggered by a hypothalamic LH-releasing factor. Since the conditions governing secretion of LH and ACTH have been demonstrated to be different, it is postulated that the LH-RF is different from CRF. Additional studies have dealt with the factors governing the secretion and storage of LH.

COMPARISON OF THE REGULATION OF LUTEINIZING HORMONE (LH) SECRETION IN IMMATURE AND ADULT RATS, by D. V. Ramirez and S. M. McCann. [1962] [12]p. incl. diagrs. tables, refs. (AFOSR-J646) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-133 and National Institutes of Health) AD 414519 Unclassified

Also published in Endocrinol., v. 72: 452-464, Mar. 1963.

A careful study of some factors influencing LH secretion and storage has been made in immature and adult rats of both sexes. The ovarian ascorbic acid assay for LH has been utilized throughout. The LH content of the anterior lobe was 19.8 μg/gland in immature females and 23.3 μg/gland in adults. In immature males the content (7.0 μg/gland) was lower than that in immature females and rose markedly to a value of 32.9 μg/gland in adults, a value which was greater than that found in adult females. No detectable LH was found in plasma from rats with intact gonads except in the case of adult males, in which minimal levels were detectable. Two to 3 weeks following gonadectomy, pituitary LH content had risen significantly in both adult females and immature males, whereas it remained unchanged in immature females and adult males. By contrast with the variable response to gonadectomy seen in the hypophysis, plasma LH activity increased significantly in all gonadectomized groups. When expressed on a weight basis, equivalent LH-releasing activity was found in stalk median eminence extracts from immature and adult males on iv injection into immature females which had been pretreated with gonadotrophins. Extracts prepared from immature and adult rats of both sexes elevated the plasma LH activity in ovariectomized, estrogen-progesterone blocked rats. From the above results it appeared that all LH-releasing machinery of adults was present in immature animals. Daily sc injections of estradiol benzoate in immature and adult oophorectomized females lowered plasma LH below that found in controls, but immature animals were 2-3 times more sensitive to this effect of estrogen than adults. Estrogen also reduced hypophysial LH content, which indicates that it blocks synthesis as well as secretion of LH. (Contractor's abstract, modified)

ON THE PSEUDO-RIGIDITY OF STEIN MANIFOLDS, by A. Andreotti and E. Vesentini. [1962] [11]p. (AFOSR-J531) (AF EOAR-62-35) AD 407855 Unclassified

Also published in Ann. Scuola Norm. Super. Pisa, Series 3, v. 16: 213-223, 1962.

The present paper is devoted to proving that any family of Stein manifolds whose parameter space is an open set in some numerical space C^m gives a class of pseudo-trivial local deformations. For Stein manifolds of

dimension 1, i.e. for non-compact connected Riemann surfaces, this result was proved, using the potential theory, by M. S. Narasimhan. The proof is a straightforward application of the theory of deformations developed by K. Kodaira and D. C. Spencer modulo some minor changes to adapt it to the case of deformations of non-compact spaces. The theorem given here is a particular case of an analogous theorem concerning 1-convex spaces, but the proof of it is technically more involved.

A NOTE ON STEIN SPACES AND THEIR NORMALISATIONS, by R. Narasimhan. [1962] [7]p. (AFOSR-J960) (AF EOAR-62-35) AD 415974 Unclassified

Also published in Ann. Scuola Norm. Super. Pisa, Series 3, v. 16: 327-333, 1962.

It is well known that every open Riemann surface is a Stein manifold. But no proof has so far appeared of the corresponding statement for complex space of dimension one (with arbitrary non-normal singularities), that every (reduced) complex space of dimension one, which has no compact irreducible components, is a Stein space. The object of the present paper is to give a proof of the following theorem on complex spaces, of which the statement made above is a particular case in view of the fact that every normal complex space of dimension one is nonsingular: A (reduced) complex space X is a Stein space if and only if its normalization X^* is a Stein space.

ACTIVITY OF SINGLE UNITS IN THE PRIMARY OPTIC CORTEX IN THE UNANESTHETIZED RABBIT DURING VISUAL ACOUSTIC, OLFACTORY AND PAINFUL STIMULATION, by T. Lömo and A. Mollica. [1962] [35]p. incl. illus. diagrs. refs. (AFOSR-2827) (AF 61-(053)107) AD 632118 Unclassified

Also published in Arch. Ital. Biol., v. 100: 90-120, Jan. 1962.

The effects of natural stimuli on the discharge of single units of the primary optic cortex have been studied in rabbits with intact nervous systems, and without anesthesia or curare. Of the units recorded in this area, 73% did not alter their discharge during intermittent luminous stimulation. Nine per cent gave variable responses, while 18% were definitely influenced. Not only the units influenced by the specific stimuli, but also the uninfluenced ones, could be clearly modified by the application of nonspecific stimuli of acoustic or painful type. These stimuli are effective even if applied on their own in the dark and can often sensitize to light-flashed units which cannot normaliy be influenced in this way. The effects of the nonspecific stimuli are not linked to the orienting reflex. Olfactory stimuli, by contrast, have little effect even when they produce intense behavioral effects. The introduction of barbiturates in sub-anesthetic doses produces an increase in unitary activity, during which the effects of the nonspecific stimuli can still be seen; later, the discharges disappear or become deeply depressed. After the application of strychnine to the primary optic cortex, in doses such as to produce isolated convulsive waves in the electrocorticogram, one can still record unitary discharges which are uninfluenced by light-flashes. The unitary responses produced by luminous stimuli at low frequency can be recorded over long periods and remain unchanged for several hours. Only when the animal is restless and shows intense spontaneous motor activity, do the unitary discharges appear temporarily inhibited. The somatic and negative mechanisms which might give rise to the observed effects have been examined. The hypothesis is put forward that those elements of the optic cortex which are refractory to specific stimuli possess, in whole or in part, special associative functions.

ROLE OF THE PUPIL IN CHANGES IN EVOKED RESPONSES ALONG THE VISUAL PATHWAYS, by J. Affanni, M. Mancia, and F. L. Marchiafava. [1962] [10]p. incl. illus. refs. (AFOSR-2882) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)107 and Rockefeller Foundation) AD 405505 Unclassified

Also published in Arch. Ital. Biol., v. 100: 287-296, June 5, 1962.

This work is concerned with the role played by the pupils in changes in evoked potentials recorded in the optic tract, lateral geniculate body and visual cortex of cerveau isolé cats, following repetitive photic stimulation and electrical activation of the mesencephalic reticular system. In cerveau isolé cats, an extreme myosis produced either spontaneously, or by repetitive photic stimulation, was always associated with a reduction and disappearance of potentials evoked along the visual pathways. Stimulation of the mesencephalic reticular formation produced a reappearance and a potentiation of the visual responses of optic tract, lateral geniculate body, and visual cortex. This effect was associated with a

dilatation of the pupils. Permanent dilatation of the pupils followed by application of darkened contact lenses which simulated fissurated pupil prevented the reduction of the visual potentials elicited by prolonged, repetitive photic stimulation. Under these conditions the midbrain reticular stimulation did not influence the responses recorded from the optic tract and the lateral geniculate body. Responses of the visual cortex were instead often depressed. These results suggest that variation of pupils size plays a major role in the phenomena referred to as visual habituation and dishabituation.

ENHANCEMENT OF EEG SYNCHRONY IN THE ACUTE CERVEAU ISOLÉ, by E. Bizzi and W. A. Spencer [1962] [14]p. incl. illus. tables, refs. (AFOSR-2805) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)107 and Rockefeller Foundation) AD 632117 Unclassified

Also published in Arch. Ital. Biol., v. 100: 234-247, Mar. 1962.

The effects of reversible functional visual deafferentation produced by retinal ischemia and irreversible olfactory deafferentation have been studied in acute post-collicular cerveau isolé preparations which showed interspindle lulls characterized by low voltage fast activity. Visual deafferentation was found to produce a generalized increase in cortical synchrony, but olfactory deafferentation failed to produce anything more than temporary changes in EEG pattern. The increase in EEG synchrony produced by retinal ischemia characteristically appeared after 1 - 3 min, was fully reversible, and was not evident as a replacement of low voltage fast activity during interspindle lulls by slow waves. The effects of retinal ischemia can be assigned to the withdrawal of tonic retinal impulses for the following reasons: (a) the effects were not accompanied by any alterations in EKG or blood pressure; (b) the effects were duplicated by optic nerve ligation; and (c) ocular compression following optic nerve ligation failed to produce any further change. Pentothal, when administered intravenously following either single or combined visual and olfactory deafferentation, always produced a further increase in EEG synchrony. These data suggest that the acute post-collicular cerveau isolé possesses tonically active desynchronizing structures which are reflexly driven by visual impulses. Possible mechanisms underlying this activity are discussed, and their relationship to the activating potentialities of the chronic cerveau isolé are suggested.

PALPEBRAL ASYMMETRY IN THE DARK ADAPTED OWL (ATHENE NOCTUA) FOLLOWING UNILATERAL IRREVERSIBLE VISUAL DEAFFERENTATION, by G. Berlucchi and P. Strata. [1962] [11]p. incl. illus. refs. (AFOSR-4178) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)107 and Rockefeller Foundation) AD 637120 Unclassified

Also published in Arch. Ital. Biol., v. 100: 248-258, Mar. 1962.

Unilateral visual deafferentation was obtained in the owl by photocoagulating the optic papilla or by destroying the retina with ischemia. The unilateral retinal inactivation is followed by palpebral asymmetry, which becomes evident when the bird falls asleep or during arousal produced by light sensory stimulations. The asymmetrical behavior of the eyelids consists of the earlier closure and the delayed opening of the blinded eye respectively at the onset and at the end of the sleep. These phenomena are attributed to hypotonia of the levator palpebrae superioris and depressor palpebrae inferioris muscles in the blinded eye. This hypotonia is due to the lack of a tonic discharge, normally arising from the retina. Since the palpebral asymmetry is present also in complete darkness, it is concluded that the retinal dark-discharge drives reflex the palpebral motoneurons involved in the opening of the eye.

A METHOD FOR THE QUANTIFICATION OF TONIC ACTIVITY IN THE NERVOUS SYSTEM, by A. Arduini and L. R. Pinneo. [1962] [10]p. incl. diagrs. (AFOSR-4242) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)107 and Rockefeller Foundation) Unclassified

Also published in Arch. Ital. Biol., v. 100: 415-424, Oct. 1962.

A method has been described for quantitative analysis of tonic activity in the nervous system. The parameter of measurement in the average power of the system, which is proportional to the mean square ($V\text{-rms}^2$) voltage of the signal minus the mean square of the noise; the average power is also proportional to the number of impulses of the system. Limitations of the system are: (a) measurement is possible only in a system that

involves discrete pulses, such as fiber tracts, and (b) it does not account for differences in fiber size or wave form which might disproportionately affect the total potential. Mathematical formulations basic to the assumption of a linear transformation from number of pulses to the rings or ms voltage were given and an alternate technique for measuring average voltage described.

PROPERTIES OF THE RETINA IN RESPONSE TO STEADY ILLUMINATION , by A. Arduini and L. R. Pinneo. [1962] [24]p. incl. illus. diagrs. refs. (AFOSR-4243) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)107 and Rockefeller Foundation) Unclassified

Also published in Arch. Ital. Biol., v. 100: 425-448, Oct. 1962.

In 85% of nembutal-anesthetized cats tested, tonic activity in the retina as measured by gross electrodes in the optic chiasm, decreased with increases in the level of steady illumination. The change in activity is related to the intensity of illumination by an inverse power function. In 15% of nembutal-anesthetized cats tested, the tonic activity in the retina is enhanced when the level of steady illumination is raised. The change in activity in these animals is always related to the dark discharge just prior to stimulation. In these experiments when the signal-to-noise (S/N) ratio was below 1.45, there was an increase with light; in the same animals, if, the S/N ratio of the dark discharge was above 1.45, there was a decrease with light. These results were also found in unanesthetized pre-trigeminal preparations and in pre-collicular decerebrate preparations. In the pre-trigeminal cats with S/N ratios below the reversal threshold, it was found that this level could be increased by repeated light stimulation, reversible deafferentation by retinal ischemia due to increased intraocular pressure, or by injections of small doses of nembutal. As in the nembutal preparations, when the S/N ratio was again greater than the reversal (2.50 in the pre-trigeminal preparation), the effect of light was to reduce the level of tonic activity. Semi-microelectrode controls confirmed the results obtained with gross electrodes. This substantiates the hypothesis that the tonic acitivity of the retina as measured in this study was directly related to the number of elements firing. The conclusion is reached that tonic retinal activity is functionally related to several aspects of the visual process. Possible mechanisms of control of tonic activity in the retina are discussed.

DIFFERENCES IN CORTICAL ACTIVITY DURING DESYNCHRONIZED SLEEP AND AROUSAL, by A. Arduini. [1962] [3]p. incl. refs. (AFOSR-J195) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)107 and Rockefeller Foundation) AD 400182 Unclassified

Also published in Proc. Internat'l. Union of Physiological Sciences; Twenty-second Internat'l. Cong., Leyden (Netherlands) (Sept. 10-17, 1962), Amsterdam, Excerpta Medica Foundation, v. 1 (Pt. 1): 464-466, 1962.

Preliminary investigations lead to the surprising conclusion that, at least as far as 'spontaneous' pyramidal activity is concerned, the stage of deep sleep characterized by fast EEG patterns and by muscular relaxation cannot be easily distinguished from the aroused state in which the EEG is also represented by fast low voltage waves and by a strong tonus of the cervical muscles. In both instances the pyramidal tract fibers appear to be considerably more active than in the light sleep state. These findings do not necessarily imply that the mechanisms of EEG desynchronization are the same for deep sleep and arousal. It is clear, moreover, that the distribution of the activity among the different phyramidal fibers is likely to be greatly different during arousal and during fast sleep. It is surprising, nevertheless, that the overall activity of the main efferent channel arising from the cerebral cortex is so high during a condition characterized, behaviorally, by deep sleep.

[PYRAMIDAL ACTIVITY IN THE CAT DURING WAKEFULNESS AND PHYSIOLOGICAL SLEEP] Attivita' piramidale nel gatto durante la veglia ed il sonno fisiologico, by A. Arduini, G. Berlucchi, and P. Strata. [1962] [3]p. (AFOSR-J1326) (AF 61(052)107) AD 427980; AD 632617 Unclassified

Also published in Boll. Soc. Ital. Biol. Sper., v. 38: 1607-1609, 1962.

The recent descriptions of a stage of sleep in which the EEG resembles that of the waking animal has posed some problems on the behavior of cortical neurons during sleep. These experiments were made with electrodes implanted in the pyramidal tract at the level mesencephalic or bulbar, and concurrent measurements of the EEG and electromyogram of the neck muscles. It was concluded that in the phase of sleep with rapid EEG, similar to that in waking, the pyramidal neurons, at least those of the reticular, showed a frequency of firing that did not exceed that of the waking state. A discussion of the significance of these findings will be published elsewhere.

SOMATOPIC ORGANIZATION OF THE POSTURAL RESPONSES TO STIMULATION AND DESTRUCTION OF THE CAUDAL PART OF THE FASTIGIAL NUCLEUS, by O. Pompeiano. [1962] [13]p. incl. illus. diagrs. refs. [AF 61(052)107] Unclassified

Published in Arch. Ital. Biol., v. 100: 259-271, Mar. 1962.

The influence of localized destruction of the caudal part of the fastigial nucleus on cat's decerebrate rigidity was studied. Lesions of the rostral part of the caudal third of the fastigial nucleus yielded a striking decrease of extensor rigidity in the contralateral forelimb, while the

hindlimbs did not show any postural asymmetry. On the other hand, when the lesion involved only the extreme caudal pole of the fastigial nucleus, the ensuing atonia was limited to the contralateral hindlimb, while the forelimbs did not show any postural asymmetry. If the same nuclear regions were stimulated with threshold stimuli, responses localized to the forelimb or to the hindlimb, but opposite in sign, were obtained. The somatotopic organization of the postural responses to localized stimulation or destruction of the caudal part of the fastigial nucleus is in agreement with anatomical data on the termination within the contralateral Deiters nucleus of the efferent fibers arising from these fastigial regions. The conclusion is drawn that the tonic facilitatory influence exerted by the caudal part of the fastigial nucleus on the extensor mechanisms of the contralateral side of the body is mediated via the Deiters nucleus.

STRUCTURAL FACTORS IN THE FORMATION OF CLATHRATE HYDRATES, by G. A. Jeffrey. [1962] [12]p. incl. diagrs. tables, refs. (AFOSR-2152) (AF 49(638)456) AD 424399 Unclassified

Also published in Dechema-Monographen, v. 47: 849-860, 1962.

The clathrate hydrates form a well-defined class of crystalline compounds in which hydrogen-bonded water molecules form a 'host' structure enclosing hydrophobic or partially hydrophobic molecules or ions as "guests" in a cage type of molecular complex. In common with most molecular complexes they have potential or actual use as intermediates in separation and purification processes. At present, 2 chemically distinct series of compounds of this general class are known. These are the gas hydrates and the alkylated quaternary ammonium salt hydrates with some related peralkylated analogues. These compounds have a common structural feature in the $H_{40}O_{20}$ pentagonal dodecahedron, which is the basic unit of coordination of their water structure. The relationship between these structures and the factors which appear to control their formation is discussed.

POLYHEDRAL CLATHRATE HYDRATES. III. STRUCTURE OF THE TETRA N-BUTYL AMMONIUM BENZOATE HYDRATE, by M. Bonamico, G. A. Jeffrey, and R. K. McMullan. [1962] [13]p. incl. illus. diagrs. tables. [AF 49(638)456] Unclassified

Published in Jour. Chem. Phys., v. 37: 2219-2231, Nov. 15, 1962.

The compound $(n\text{-}C_4H_9)_4N \cdot C_6H_5COO \cdot 39\ 1/2H_2O$ forms tetragonal crystals with 4 molecules in the unit cell. The water structure is a hydrogen-bonded clathrate framework, in the cavities of which are located the tetra alkyl ammonium cations. The oxygen atoms of the benzoate anions are hydrogen-bonded to the water framework and form part of the polyhedral structure. This structure contains 10 pentagonal dodecahedra, 16 tetrakaidecahedra, and 4 pentakaidecahedra per unit cell. The 20 larger polyhedra are occupied by the 16 alkyl and 4 benzyl groups with a statistical disorder over 2 sets of equivalent cation and anion positions. There is evidence of additional hydrogen-bonded water inside some of the dodecahedra which are distorted due to the presence of the ions. The clathrate framework is iso-structural with that of other salts in this series, which have a very similar tetragonal lattice but differ in containing 5 tetra n-butyl ammonium salt molecules per unit cell.

POLYHEDRAL CLATHRATE HYDRATES. IV. THE STRUCTURE OF THE TRI N-BUTYL SULFONIUM FLUORIDE HYDRATE, by G. A. Jeffrey and R. M. McMullan. [1962] [9]p. incl. illus. diagrs. tables, refs. [AF 49(638)456] Unclassified

Published in Jour. Chem. Phys., v. 37: 2231-2239, Nov. 15, 1962.

The preparation and crystal structure of $(n\text{-}C_4H_9)_3S^+F^- \cdot 2OH_2O$ is reported. This hydrate is isostructural with the chlorine gas hydrate, $6Cl_2 \cdot 46H_2O$, having a pseudo body-centered arrangement of $H_{40}O_{20}$ pentagonal dodecahedra in a cubic unit cell of approximately 12A edge. The cations occupy large voids formed by the tetrakaicahedra in the structure and are statistically disordered. The water structure is distorted as compared with the idealized polyhedral framework and there is evidence that the pentagonal dodecahedra may be occupied by a water molecule or a fluoride ion. THE PHOTOINITIATED ARYLATION OF TRIVALENT PHOSPHORUS COMPOUNDS, by J. B. Plumb and C. E. Griffin. [1962] [2]p. (AFOSR-J440) (AF AFOSR-62-48) AD 408601 Unclassified

Also published in Jour. Org. Chem., v. 27: 4711-4712, Dec. 1962.

As part of an effort to develop new procedures for the formation of the aryl-phosphorus bond, the photolysis of aromatic iodo compounds in the presence of triphenylphosphine and several trialkyl phosphites was examined. It was found that the processes constituted convenient

and apparently general one-step syntheses of the corresponding triphenyl(aryl)phosphonium iodides and dialkyl arylphosphonates. In the triphenyl-phosphine reaction, all indications point to a non-chain reaction. Without careful choice of conditions, the alkyl iodide undergoes an Arbuzov reaction with the trialkyl phosphite to form dialkyl alkylphosphonate at the expense of the phenylphosphonate. When the above reaction was conducted at 50°, only 3.9% of the phenylation product was obtained; the remainder of the phosphite was converted quantitatively to dimethyl methylphosphonate. In accord with its mechanism, the Arbuzov process was expected to be less important with the higher trialkyl phosphites.

MAGNETIC CHARACTERISTICS OF LAVES PHASES CONTAINING LANTHANIDE METALS COMBINED WITH NICKEL, by E. A. Skrabek and W. E. Wallace. [1962] [2]p. incl. diagr. table, refs. (AFOSR-64-1513) (AF AFOSR-63-187) AD 446361 Unclassified

Presented at Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Also published in Jour. Appl. Phys., v. 34: 1356-1357, Apr. 1963.

Studies have been made of the series of compounds represented by the formula ANi_2, where A is Y, Ce, Pr, Nd, Sm, Gd, Tb, Dy, Ho, Er, Tm, and Lu. These compounds are all isostructural, possessing the $MgCu_2$ structure. Nine of the compounds exhibit magnetic ordering at temperatures ranging from 8°K to 90°K. The Y, Ce, and Lu remain paramagnetic down to liquid helium temperatures. YNi_2 and $LuNi_2$ exhibit Pauli paramagnetism from 4° to 300°K suggesting that Ni has a filled 3d shell and is not carrying a moment in these phases. $CeNi_2$ also exhibits Pauli paramagnetism, which implies that Ce has been ionized to the quadripositive state. The measured saturation moment extrapolated to 0°K is in good agreement with the value expected if Ni is nonmagnetic and the lanthanide component carries the moment of the free tripositive ion in the case of $GdNi_2$, but is in poor agreement for the 8 other compounds which order magnetically. For all except $SmNi_2$ the observed moment is less than that of the free ion, the discrepancy ranging from 78% for $PrNi_2$ to 28% for $HoNi_2$. The low moment is attributed to the quenching effect of the crystal field, but the possibility cannot be excluded that these are not simple ferromagnets. The moment for $SmNi_2$ is 6.3 μ_B, as compared with 0.71 μ_B for the ground state free tripositive ion (L-S coupling). The origin of the high moment for this compound is not understood. Its magnitude can be rationalized in terms of a change to L - S coupling.

LINE STRENGTHS AND WIDTHS IN HYDROGEN IODIDE, by G. Ameer and W. Benesch. [1962] [4]p. incl. diagrs. table, refs. [AF 18(600)986] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Abstract published in Bull. Amer. Phys. Soc. Series II, v. 7: 271, Apr. 23, 1962 (Title varies)

Published in Jour. Chem. Phys., v. 37: 2699-2702, Dec. 1, 1962.

Measurements on 13 lines in the hydrogen iodide fundamental vibration-rotation have yielded a set of line strengths of considerable accuracy. From these strengths a total band intensity of 0.37 cm^{-2} atm^{-1} at 300°K has been computed, as well as a value for the vibration-rotation interaction parameter θ which is found to be -5. Both of these figures indicate that the effective charge of this molecule is remarkably small, which fact is reflected in a great dominance of the R branch over the P branch. Using the line strengths as input data, linewidths have been computed from equivalent width measurements. Finally, the linewidths have been converted to optical collision cross sections. The J dependence of the linewidths and the collision cross sections is not typified by the other hydrogen halides. The usual resonance peak is absent and a lower limiting value seems to be reached by $|m| = 3$. Furthermore, the collision cross sections for the lines of higher J are much larger than might be inferred from the other hydrogen halides. (Contractor's abstract)

ANALYSIS OF COLD WAR OUTCOMES WHICH THE MAJOR POWERS ARE SEEN AS DESIRING MOST AND LEAST, by S. E. Shively. Jan. 1962, 58p. incl. tables. (AFOSR-1851) (AF 49(638)1116) AD 270730 Unclassified

A study has been conducted to investigate the final outcomes of the Cold War which are desired (and not desired) by the Soviet Union, the United States, Communist China and the respondent's own country. A sample of legislators and students from France, Germany, India, Japan, Spain, Brazil, and Finland were asked questions about these most and least desired outcomes. The major findings are: (1) The respondents demonstrate that they believe there is a high positive correlation regarding the outcomes of the Cold War which are most desired between their own country and the United States; (2) Similarly, the respondents believe there is a high positive correlation between their own country and the United States on the outcomes which are least desired; (3) High positive correlation also exists in respect to the outcomes most and least desired between the Soviet Union and Communist China; (4) Negative correlations exist in reference to most and least desired outcomes between the respondent's own country and the Soviet Union, the respondent's own country and Communist China, the United States and the Soviet Union, and the United States and Communist China; (5) The respondent's own country is viewed as being the most desirous of world-wide disarmament; (6) The United States is seen as most desiring a reconciliation between itself and the Soviet Union; (7) Both the Soviet Union and Communist China are believed to most desire the acceptance of Communism by non-Communist nations; (8) The respondent's believe their own country

least desires World War III; (9) The United States is seen as least desiring an internal economic depression; (10) The Soviet Union is believed to least desire an economic crisis in the Soviet Union; and (11) Communist China is seen as least desiring an alliance between the United States and the Soviet Union against Communist China. EXPLORATIONS IN PERSONAL AND NATIONAL EFFICACY, by D. M. Walton. Jan. 1962, 37p. incl. tables. (AFOSR-1852) (AF 49(638)1116) AD 270731 Unclassified

Legislators and students from Brazil, Finland, France, Germany, India, Japan, and Spain were interviewed about their perception of their own efficacy, the efficacy of their own nation and that of an additional list of nations and groups of nations. A fairly consistent agreement is found in degree of influence that respondents attribute to themselves, and in the degree of influence that is attributed to the various nations, or groups of nations. The legislators generally see themselves as being more influential than the students see themselves. The United States and the Soviet Union are consistently ranked as being influential while the Latin American Nations are consistently ranked low.

ANTICIPATED CHANGES OF NON-COMMUNIST NATIONS TOWARD COMMUNISM, by D. M. Walton. Jan. 1962, 38p. incl. tables. (AFOSR-1914) (AF 49(638)-1116) AD 271902 Unclassified

This report deals with propensities on the part of nations to become communistic in the future either voluntarily or by force. The respondents, students and legislators from Brazil, Finland, France, Germany, India, Japan and Spain, were interviewed about general likelihood and desirability of such changes in the United States and their own country. The respondents were then provided with a list of non-Communist nations and asked to state which one of the countries listed might change in either of the 2 ways mentioned. A great degree of agreement is found for all subject groups on all of these likely transitions. Voluntary change is seen as being more likely than a change brought about by force. One group of nations consistently seen as likely to change to communism either voluntarily or by force includes Cuba, the Republic of Congo (ex-Belgium), Indonesia, Italy, Ghana, Guinea, United Arab Republic and Iraq. Another group which is seen as being unlikely to change includes Canada, Norway, Great Britain, Israel, Belgium, West Germany, Dahomey and Gabon.

PERCEIVED ECONOMIC AND MILITARY STRENGTH OF NATIONS, by S. E. Shively. Feb. 1962 [53]p. incl. tables. (AFOSR-1915) (AF 49(638)1116) AD 272036 Unclassified

The distribution of economic and military power in the world at the present time and the predicted power distribution 5 yr hence were investigated. Samples of legislators and students from 7 countries were interviewed. The major findings are that the United States is pictured as being the strongest nation in the world at the present time in respect to economic strength, and it is expected to also remain strongest 5 yr from now; the Soviet Union is believed to be the second strongest nation at the present time with respect to economic strength and it is expected to also be the second strongest during the next 5 yr; however, the United States is pictured as relatively decreasing in its economic lead during the next 5 yr. The students place the Soviet Union as the strongest military power, both at the present time and 5 yr hence, and the United States as the second strongest. Legislators, on the other hand, tend to believe that the United States is the strongest military power both at the present time and in 5 yr, the Soviet Union being the second strongest.

ANTICIPATED CHANGES IN COMMUNIST NATIONS, by S. E. Shively and M. Gannon. Mar. 1962 [30]p. incl. tables. (AFOSR-2317) (AF 49(638)1116) Unclassified

To investigate possible changes of certain Communist nations away from Communism, the opinions of 616 parliamentarians and 700 students from France, Germany, India, Japan, Spain Brazil and Finland were studied. The major findings may be expressed in the following statements: (1) It is felt that Poland, East Germany, Hungary and Czechoslovakia — in that order — are more likely to change away from Communism than are Bulgaria, North Viet-Nam, North Korea, Albania and Rumania. (2) It is believed that change in Czechoslovakia, although more likely than in 5 of the above nations, is not as likely to occur as in Poland, East Germany and Hungary; (3) The expectancy of political re-alignments away from Communism taking place in the next 5 yr in currently Communistic countries is generally higher than comparable expectations that non-Communistic nations will turn toward Communism; (4) In general, it is believed that if a movement away from Communism occurs, it is more likely to take the form of anti-Communist revolutions than of the acceptance of national Communism or the institution of a democratic government; (5) The rank order correlations between the 9 Communist countries changing through anti-Communistic revolutions, development of national Communism and the institution of a democratic form of government are quite high; this points to considerable agreement concerning some type of change away from Communism in some of the nations under study; (6) The Indian respondents consistently fail to recognize the likelihood that Communist nations are liable to change away from Communism; further, they do not foresee changes in non-Communist countries toward Communism; and (7) In general, students anticipate greater changes than do the legislators. MAGNITUDE OF EXCHANGE INTERACTIONS IN GADOLINIUM, by D. A. Goodings. [1962] [20]p. incl. diagr. table, refs. (AFOSR-2537) (AF 49(638)323) Unclassified

Also published in Phys. Rev., v. 127: 1532-1536, Sept 1, 1962.

The effective nearest-neighbor exchange interaction J in gadolinium can be deduced from experiment in 2 ways. From a high temperature expansion of the susceptibility and the measured value of the Curie temperature T_c one obtains J = 2.9°K, while from the low temperature magnetization curve and simple spin-wave theory one finds J = 1.8°K. In order to clarify the reason for this discrepancy, the low temperature spin-wave problem has been analyzed in detail. Contributions to the magnetization from 2 different spin-wave modes were evaluated up to order $T^{7/2}$ and important corrections arising from zone boundary effects were included. The detailed analysis yields a slightly improved low temperature value, J = 2.1°K. It is also demonstrated that the magnetization follows a $T^{3/2}$ law very closely from low temperatures up to about 0.8 T_c because of a complicated cancellation of the higher order effects. Finally it is shown qualitatively that the remaining difference between the high and low temperature J values can probably be explained by the effect of interactions beyond nearest neighbors and it is suggested that these are on average more antiferromagnetic than ferromagnetic.

The crystal structure of 2, 5-dichloroaniline, $C_6H_3Cl_2NH_2$ has been determined by the combined application of nuclear quadrupole resonance and x-ray diffraction. The molecule is planar, except for the nitrogen which deviates slightly, by 0.06A. The benzene ring is slightly deformed from the regular hexagon and the observed bond lengths agree well with the result of a simple molecular orbital calculation. There is no hydrogen bonding in the structure. The shortest intermolecular Cl...Cl distance, 3.37A, is shorter than the usually quoted van der Waals distance of 3.6A.

A NUCLEAR QUADRUPOLE RESONANCE AND X-RAY STUDY OF THE CRYSTAL STRUCTURE OF PENTACHLOROPHENOL, by T. Sakurai. [1962] 38p. incl. diagrs. tables, refs. (AFOSR-2541) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)323 and National Science Foundation) AD 276140 Unclassified

Also published in Acta Cryst., v. 15: 1164-1173, 1962

The crystal structure of the pentachlorophenol, C_6Cl_5OH, was solved by the combined application of nuclear quadrupole resonance and x-ray diffraction. The molecules are linked by chains of hydrogen-bonds with a configuration similar to that in tetrachlorohydroquinone $C_6Cl_4(OH)_2$. The nuclear quadrupole resonance of one of the ortho chlorine atoms is specially affected by the intermolecular interaction. This interaction is attributed to the proton on the OH group of the adjacent molecule, and the existence of O-H$\begin{matrix}\cdot\cdot O \\ \cdot\cdot Cl\end{matrix}$ bifurcated hydrogen bonds with bond lengths O-H..O = 2.97A and O-H..Cl = 3.28A is inferred. During the phase determination, a pseudo solution was obtained, which was unusually close to the true solution. The relation between these 2 solutions is discussed.

APPLICATIONS OF NUCLEAR QUADRUPOLE RESONANCE, by G. A. Jeffrey and T. Sakurai. [1962] [67]p. incl. diagrs. tables, refs. (AFOSR-2542) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)323] and National Science Foundation) AD 276141 Unclassified

Also published in Prog. Solid State Chem., v. 1: 380-416, 1964.

Radio-frequency nuclear resonance has provided the chemist with 2 powerful techniques for investigating chemical problems. In both nuclear magnetic resonance and nuclear quadrupole resonance, the structure and behavior of molecules can be explored using the nucleus effectively as a test probe. In contrast to nmr, nqr depends primarily upon interaction between the nuclear quadrupole moment and the electric field gradients attributable to the charge distribution in the solid. Therefore many problems concerned with the electronic structure in crystalline solids can be explored by this method. Information pertaining to the nuclear quadrupole interaction of atoms in gases can be obtained by other methods, such as microwave spectroscopy, but not by nqr. The method pertains specifically to the solid state, and may be expected to develop into an increasingly effective means of investigation in that area. In principle, it is applicable to all atoms with nuclear spin greater than or equal to unity. In practice, the nuclear quadrupole moment and natural abundancy and the chemical bonds associated with it must have an appreciable measure of p-orbital character in order to obtain a suitably large field gradient.

MAGNETIC FIELD DEPENDENCE OF THERMODYNAMIC PROPERTIES OF ANTIFERROMAGNETS; ADIABATIC MAGNETIZATION, by R. J. Joenk, Jr. [1962] [48]p. incl. diagrs. tables, refs. (AFOSR-2752) (Also bound with its AFOSR-3362; AD 283065) [AF 49(638)323] Unclassified

Also published in Phys. Rev., v. 128: 1634-1645, Nov. 15, 1962. (AFOSR-J1570; AD 426562)

The thermodynamic properties of cubic or uniaxial antiferromagnets are examined using spin wave theory. The specific heat, magnetization and parallel susceptibility are shown to be exponentially increasing functions of applied field for values of H_0 less than the critical spin-flopping field. Since this field dependence suggests than an antiferromagnet can be cooled by the adiabatic application of a magnetic field, the theory of adiabatic magnetization is investigated. Field-dependent nuclear spin effects are evaluated on an effective field model by perturbation theory and are included in the analysis. It is found that when spin wave effects are dominant, cooling should be observed; at lower temperatures, when nuclear effects are non-negligible, either cooling or heating may be observed, depending on the initial temperature and final value of the magnetic field. The dependence of the cooling on the physical parameters of the antiferromagnet is discussed and detailed calculations are made for MnF_2.

STUDIES OF POLARON MOTION. PART III. THE HALL MOBILITY OF THE SMALL POLARON. by L. Friedman and T. Holstein. [1962] 102p. incl. diagrs. (AFOSR-3042) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)323 and Westinghouse Electric Corp) Unclassified

Also published in Ann. Phys., v. 21: 494-549, Mar. 1963. (AFOSR-J1571; AD 427639)

The one-dimensional molecular crystal model of polaron motion is developed to consider the existence of a Hall effect. The treatment is confined to the case for which the electronic overlap term of the total Hamiltonian is a small perturbation. In zeroth order - i.e., in the absence of this term - the electron is localized at a given site. The vibrational state of the system is specified by a set of quantum numbers, Nk, giving the degree of excitation of each vibrational mode. The existence of a nonvanishing electronic bandwidth then gives rise to transitions to neighboring sites. Of principal interest in the present paper is the high temperature regime where polaron motion is predominantly between neighboring sites. Although the lowest order jump rate is adequate in considering the polaron drift mobility, higher order processes, involving the occupation of (at least) 3 sites, must be taken into account in treating the Hall effect.

TEMPERATURE DEPENDENCE OF THE ZEEMAN EFFECT IN THE NUCLEAR QUADRUPOLE RESONANCE IN CHLORANIL, by C. B. Richardson. [1962] [6]p. incl. diagrs. tables, refs. (AFOSR-J1568) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)323] and National Science Foundation) AD 427659 Unclassified

Also published in Jour. Chem. Phys., v. 38: 510-515, Jan. 15, 1963.

The nuclear quadrupole resonance of Cl^{35} and its Zeeman effect have been observed in chloranil between 78° and 373°K. Effects of thermal expansion appear negligible hence the Bayer theory is used with the measured temperature dependence of the pure quadrupole frequencies and the field-gradient asymmetries to yield room-temperature rigid-body libration amplitudes of $\langle \theta_x^2 \rangle = 18 \times 10^{-3}$ rad^2, $\langle \theta_y^2 \rangle = \langle \theta_z^2 \rangle = 0$, where x is along the molecular normal. A broad phase transition centered near 100°K is examined. The results suggest that the potential well $V(\theta_x)$ has a double minimum and that the transition occurs when the molecules have sufficient torsional energy to override the barrier.

COVALENT BOND ASYMMETRIES FROM ZEEMAN-SPLIT NQR, by V. Rehn. Sept. 1962 [11]p. incl. diagrs. tables, refs. (AFOSR-J1564) (AF 49(638)323) AD 427658 Unclassified

Also published in Jour. Chem. Phys., v. 38: 749-759, Feb. 1, 1963.

An experimental technique is developed for the measurement of asymmetry parameters in electric quadrupole coupling of nuclei with spin I = 3/2 in covalent bonds in organic single crystals. The theoretical details of Zeeman-split nuclear quadrupole resonance spectra, upon which the technique is based, are examined and found to yield a particularly simple approximate expression for the asymmetry parameter of the electric field gradient tensor, which has been previously shown to be proportional to the double-bond character of the covalent bond. The technique is applicable to atoms bound to a single neighbor in the organic molecule. The limitations of the approximations involved in obtaining the simple formula are examined in detail, and it is found that an order-of-magnitude smaller probable error may be obtained than has been possible with previous geometrical techniques. Correction formulas are presented which may yield still another order-of-magnitude better precision if desired.

Experimental results on the Cl^{35} resonances in para-dichlorobenzene, para-chloroaniline, and 1245 tetrachlorobenzene demonstrate the method, along with verifying the second- and third-order perturbation theoretic results which derive the maximum magnetic field-about 2400 Oe— in which the simple formulas may be used. Other experimental measurements of the asymmetry parameters of C·Cl bonds are tabulated.

ADIABATIC MAGNETIZATION OF ANTIFERROMAGNETS, by R. J. Joenk, [Jr.] [1962] [2]p. incl. table. (AFOSR-J1566) (AF 49(638)323) AD 427657 Unclassified

Presented at Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Also published in Jour. Appl. Phys., v. 34: 1097-1098, Apr. 1963.

Spin-wave theory was used to determine the magnetic field dependence of the thermodynamic properties of cubic or uniaxial antiferromagnets at temperatures well below the Néel point. These properties were found to be exponentially increasing functions of applied field for values of H_0 less than the critical spin-flopping field. This field dependence suggests that if spin wave effects are dominant an antiferromagnet can be cooled by adiabatic magnetization in contradistinction to the paramagnetic case of cooling by demagnetization. Both lattice and nuclear effects can alter the situation in a real material and were included in this investigation. The dependence of adiabatic magnetization cooling on the physical quantities characterizing the antiferromagnet is discussed and theoretical temperature changes for several uniaxial antiferromagnets are given. SECOND ANISOTROPY CONSTANT IN CUBIC FERROMAGNETIC CRYSTALS, by R. J. Joenk, Jr. 1962 [43]p. incl. diagrs. table, refs. (AFOSR-J1567) (Also bound with its AFOSR-3362; AD 283065) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)223 and National Science Foundation) AD 427652 Unclassified

Also published in Phys. Rev., v. 130: 932-938, May 1, 1963.

The second anisotropy constant, K_2, is evaluated at 0°K for cubic, ferromagnetic crystals using 2-particle dipole- and quadrupole-like interactions as perturbations on a molecular field Hamiltonian. In second- and third-order perturbation, the energy denominators are modified to take into account the effect on the molecular field of the exchange interaction of consecutively reversed spins. The expression for $K_2(0)$ is used in conjunction with that for $K_1(0)$ to calculate the values of the pseudodipolar and pseudoquadrupolar coupling constants for iron, cobalt, and nickel. For bcc Fe, $D/J = 0.0793$ and $Q/J = 0.00157$, where $JS = 2.87 \times 10^{-14}$ erg; for fcc

Co, D/J = 0.113 and Q/J = 0.000865, where JS = 2.0 x 10^{-14} erg; and for fcc Ni, D/J = -0.0768 and Q = 0, where JS = 2.5 x 10^{-14} erg, although the application of the model to nickel is not entirely satisfactory. These values are used to predict the size of the third anisotropy constant and the paramagnetic resonance linewidth.

ELECTRICAL RESISTIVITY OF FERROMAGNETS AT LOW TEMPERATURES, by D. A. Goodings. [1962] [2]p. incl. diagr. table. (AFOSR-J1568) (AF 49(638)-323) AD 427656 Unclassified

Presented at Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Also published in Jour. Appl. Phys., v. 34: 1370-1371, Apr. 1963.

The contribution to the electrical resistivity of ferromagnetic metals which is associated with the magnetic behavior has been studied theoretically at low temperatures. As in previous theoretical work this resistivity is assumed to be due to scattering of conduction electrons by spin waves through the s-d interaction. An expression valid for a general lattice is presented which is shown to account for the form of the temperature dependence for Fe, Co, Ni, and Gd. However, estimates of the magnitude of the resistivity arising from this interaction indicate that it may be from 1 to 2 orders of magnitude too small to account for the experimental results. EFFECT OF SURFACE PINNING ON THE MAGNETIZATION OF THIN FILMS, by J. A. Davis and F. Keffer. [1962] [2]p. incl. diagr. (AFOSR-J1569) (AF 49(638)-323) AD 427651 Unclassified

Presented at Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Also published in Jour. Appl. Phys., v. 34: 1135-1136, Apr. 1963.

The pinning of surface spins introduces an effective gap into the spin-wave spectrum of thin films, causing the magnetization vs temperature curve to lie well above that obtained from use of periodic boundary conditions. The results of detailed calculations are presented for the case of partial surface pinning in a simple cubic lattice, spin 1/2. For films of greater than 6 atomic layers, and for a surface anisotropy field greater than one-tenth the surface exchange field, the magnetization is essentially indistinguishable from the Bloch $T^{3/2}$ curve below $T/T_c \sim 0.2$. This may account for recent measurements by Neugebauer on nickel and by Hoffman on iron. (Contractor's abstract)

A NUCLEAR QUADRUPOLE RESONANCE INVESTIGATION OF THE STRUCTURE OF HEXACHLOROBENZENE, by C. B. Richardson. [1962] [1]p. incl. tables. (AFOSR-65-0178) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-196 and National Science Foundation) AD 611496 Unclassified

Also published in Acta Cryst., v. 16: 1063, Oct. 1963.

Nuclear quadrupole resonance measurements were made at -78°C of the asymmetry in the electric field gradient tensors of hexachlorobenzene single crystals. The resultant value of 0.151 ± 0.016 at each Cl nucleus supports the double bond hypothesis of asymmetry. A temperature dependence of the NQR signal between -78° and 0°C is attributed to an increase in the amplitude of the libration of each molecule about its hexad axis with increasing temperature.

AN EXPERIMENTAL INVESTIGATION OF BOUNDARY LAYER WITH ADVERSE PRESSURE GRADIENT, by E. Mattioli. Dec. 1962 [24]p. incl. illus. diagrs. (Technical note no. 22) (AFOSR-4551) (AF 61(052)511) AD 404142 Unclassified

A working section was made suitable for researches on boundary layer with an adverse pressure gradient. The ceiling of the working section is formed with adjustable shutters. The 2 assembling details of the wind tunnel and of 2 additional apparatus (a probe holder gear and a micromanometer for reading directly the wind speed) are described. Preliminary researches were made in order to control the validity, at low speed, of a formula giving the resistance coefficient of the gauze screens. Experimental results to obtain a constant pressure gradient on a plate and the measurements of the intermittence factor in a cross section of the flow are reported. These measurements show the existence of an intermittence region between the turbulent boundary layer and the free-stream, undetected by the Pitot tube. The physical construction of said region and the meaning of the intermittence factor are discussed. (Contractor's abstract)

THE SURFACE RE-EMISSION LAW IN FREE MOLECULE FLOW, by S. Nocilla. [1962] [20]p. incl. diagrs. table. (AFOSR-J1043) (AF 61(052)511) Unclassified

Also published in Rarefied Gas Dynamics; Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press, Suppl. 2, v. 1: 327-346, 1963. (AFOSR-5310)

The main object of this research is a study of validity of the re-emission model already introduced by the author in the light of more recent experimental results on molecular beams. According to this model, the re-emitted molecules behave as a gas in Maxwellian equilibrium, subject to thermal agitation and moreover to a translation motion. The space distribution law is established for the molecules re-emitted from an elementary rectangular surface and from an infinite strip of elementary width. The theoretical results obtained are then compared with Hurlbut's experimental results obtained with nitrogen molecular beams inpinging on lithium fluoride crystals. The comparison enables an estimate to be made of the values of the 2 fundamental parameters (S_r and θ_r) referred to the re-emitted gas. The theoretical formulae also allow one to specify in what manner a free-molecule flow may be interpreted as a superposition of an infinite number of pencils of elementary molecular beams. PHASE TRANSITIONS IN SODIUM TUNGSTEN BRONZES, by A. S. Ribnick, B. Post, and E. Banks. [1932] [8]p. incl. diagrs. refs. (AFOSR-64-0774) (AF 18(600)1193) AD 436519 Unclassified

Also published in Advances in Chem., Ser. No. 39: 246-253, 1963.

The reported structures of tungsten bronzes include cubic, pseudocubic, tetragonal, orthorhombic, and monoclinic distortions of the perovskite-type structure; well-characterized tetragonal and hexagonal structures, as found in the series K_xWO_3; and some unit cells which are reported for isolated phases. This work surveys some of the phases found for various alkali tungsten bronzes. In the sodium bronzes there is a progression of distorted perovskites from $x = 0$ to $x \simeq 0.15$, in the same order as the thermal transitions of WO_3 (monoclinic → orthorhombic → tetragonal). High-temperature x-ray diffractometry shows these phases to go through the same thermal transitions as WO_3, except that 2-phase regions intervene. Between $x = 0.15$ and 0.28, 2 tetragonal phases coexist, the second having a range of homogeneity from $x = 0.28$ to 0.38. This is followed by a cubic (or pseudocubic) range from $x = 0.43$ to 0.95. SOME MASS TRANSFER EFFECTS ON THE WALL JET, by H. Fox and M. H. Steiger. Aug. 1962, 20p. incl. diagrs. table, refs. (PIBAL rept. no. 757) (AFOSR-3056) (AF 49(638)217) AD 284698 Unclassified

Also published in Jour. Fluid Mech., v. 15: 597-609, Apr. 1963.

The wall jet with suction or injection is investigated; an analysis under conditions corresponding to similar flows is shown to reduce to an eigenvalue problem. Asymptotic solutions valid far from the surface are used to initiate the integration and circumvent the usual iteration associated with the 2-point boundary value problem. Typical solutions for various rates of suction and injection are obtained. It is found that the skin friction decreases with increasing rate of suction. Representative thermal solutions are obtained for Prandtl and Lewis numbers equal to 1, under the special condition that the surface temperature is equal to the ambient temperature or that the enthalpy varies monotonically from the surface value to the ambient value. SOME PERTURBATION SOLUTIONS IN LAMINAR BOUNDARY LAYER THEORY. PART I. THE MOMENTUM EQUATION, by P. A Libby and H. Fox. Aug. 1962, 69p. incl. diagrs. tables, refs. (AFOSR-3711, pt. 1) (AF 49(638)217) AD 284097 Unclassified

Also published in Jour. Fluid Mech., v. 17: 433-449, Nov. 1963.

Velocity fields are considered which are associated with a variety of flows and which may be described by perturbation of the Blasius solution. These are flows which, for example, because of localized mass transfer involve the initial value problem of boundary layer theory, flows with variable ratio of viscosity-density product, and flows with mass transfer. The perturbation solutions are presented in accord with the usual linearization procedures so that further applications for the determination of first-order effects can be readily made. The results of such applications in several cases are compared to more accurate solutions.

A NEW APPROACH TO THE NUMERICAL INTEGRATION OF DIFFERENTIAL EQUATIONS, by J. R. M. Radok. [1959] 7p. (AFOSR-3742) (AF 49(638)302) Unclassified

Presented at the Annual meeting of the Gesellschaft für Angewandte Mathematik und Mechanik, Hannover (West Germany) Mar. 23-28, 1959.

Steady states normally associated with elliptical equations are idealizations and it is more natural to study them as limiting states of transient processes described by parabolic or hyperbolic equations. One is immediately led to the employment of computers as experimental tools for the testing of mathematical models for the simulation of physical processes. In principle, the above is extremely simple and plausible, but its execution requires a great deal of preliminary work, one line of which is the main subject of this paper. In the search for more efficient methods for the solution of difference differential equations, a full utilization of the asymptotic character of the sought solutions was tried. With this object in mind, an investigation of the use of exponential functions for the purpose of extrapolation from initial or previously predicted data has been undertaken with promising results.

REVIEW OF ELECTROMAGNETIC DRAG EFFECTS ON SPACE VEHICLES, by K. P. Chopra. [1961] [16]p. incl. refs. [PIBAL rept. no. 643] (AFOSR-447) (AF 49(638)445) Unclassified

Presented at Amer. Astronaut. Soc. Symposium on Interactions of Space Vehicles with an Ionized Atmosphere, Washington. D. C., Mar. 17, 1961.

Various electromagnetic effects contributing to the drag of a space vehicle moving in an ionized atmosphere pervaded by a magnetic field are reviewed. These effects are classified into 2 broad categories based on whether the electromagnetic phenomena are induced inside the space vehicle or in the surrounding atmosphere. The effects falling in the second category may be analyzed from points of view of the atmosphere being treated as a continuum. Such areas, where improvements can be made to gain useful information of interactions of a space vehicle in an ionized atmosphere pervaded by a magnetic field, are indicated. Of special interest is a suggested model of an ionized cloud around the space vehicle.

ON THREE-DIMENSIONAL SWIRLING WAKES, by M. H. Steiger. Feb. 1962, 10p. (PIBAL rept. no. 739) (AFOSR-2216) (AF 49(638)445) Unclassified

The velocity fields of 3-dimensional viscous wakes with small swirl and streamwise pressure gradients are examined with the use of the boundary layer approximations, Oseen's linearization of the convective terms, and the asumption of constant fluid properties. Transform methods yield mathematically exact solutions with general types of initial conditions. The theory, while applicable to many practical problems (such as describing the phenomena in a tip vortex), is not applied here and its application is left for future investigation. ON THE ACCURACY OF APPROXIMATE THRUST STEERING SCHEDULES IN OPTIMAL CORRECTIONAL MANEUVERS, by S. E. Meckowitz. Feb. 1962 [37]p. incl. diagrs. tables. (PIBAL rept. no. 741) (AFOSR-2284) (AF 49(638)445) AD 274749 Unclassified

A frequent variational problem is one for which the fuel expenditure is to be minimized. In practice, approximate thrust steering schedules that vary bilinearly or linearly with time are introduced to reduce the multidimensional trials involved in attaining a numerical solution. The degree of approximation is established which is induced when these approximate programs are used for the correctional maneuver characterized by a small parameter which is related to the percentage change in orbital characteristics. For the maneuver the thrust magnitude is assumed to be constant and can be of the same order as the central force. It is proved that if there is an acceptable error in the minimum value of the burning time then the bilinear program is applicable regardless of imposed end constraints. However, for a special class of correctional maneuvers, defined by the property that boundary conditions are weakly dependent upon the circumferential displacement, one can utilize the simpler linear program with the same degree of accuracy. Numerical verification of this theory is given by considering examples and comparing the results of burning time and terminal values of the dependent variables with exact solutions. LAMINAR, TRANSITIONAL, AND TURBULENT HEAT TRANSFER TO A CONE-CYLINDER-FLARE BODY AT MACH 8.0, by V. Zakkay and C. J. Callahan. Feb. 1962 [56]p. incl. diagrs. tables, refs. (PIBAL rept. no. 737) (AFOSR-2359) (AF 49(638)445) AD 274122 Unclassified

Also published in Jour. Aerospace Sci., v. 29: 1403-1413, 1420, Dec. 1962.

An experimental investigation of the laminar, transitional, and turbulent heat transfer rates over a conical cylindrical flared body is presented. Regions of favorable, zero, and adverse pressure gradient on the body are investigated. The experimental results are compared with theory. The model was tested at a free stream Mach number of 8 and a Reynolds number of 1.6×10^5 to 0.3×10^5 per in. based on free stream conditions. Various stagnation-to-wall temperature ratios were obtained by cooling the model prior to the test with liquid nitrogen. The stagnation-to-wall temperature ratios ranged from 10 to 3.3. Theoretical predictions gave good results for the heat transfer rates in the laminar region, and fair prediction in the transitional and turbulent regimes extending over the shoulder and forward portion of the cylindrical body. Over the aft portion of the cylinder and over the flare, the predictions are only qualitatively correct and underestimate the heating rate by a factor as high as 2. Conversely, the flat plate reference enthalpy method is found more closely to predict the heat rates over the aft portion of the body, but increasingly to overestimate the heating rates over the forward portion of the cylinder. A modified equation for the heat transfer coefficient in the transitional and fully turbulent region based on the FPRE (flat plate reference enthalpy) method is then presented. This method gives good agreement with the experimental results. The following is concluded from the results: Cooling the wall delayed transition By expanding the flow rapidly between the cone and the cylinder, the transition Reynolds number is reached very rapidly. By making a smooth transition between the cylinder and the flare, no separation

occurred at the cylindrical flare junction. The transitional and turbulent heat transfer in the presence of an adverse pressure gradient may be predicted with sufficient accuracy by the FPRE method. (Contractor's abstract)

A STUDY OF AERODYNAMIC EFFECTS OF ISOTHERMAL AND TEMPERATURE GRADIENT ATMOSPHERES ON RE-ENTRY TRAJECTORIES, by L. Rute Mar. 1962, 23p. incl. illus. diagrs. refs. (PIBAL rept. no. 738) (AFOSR-2411) (AF 49(638)445) AD 281765 Unclassified

The behavior of skip and impact trajectories of space vehicles entering an atmosphere in which temperature varies with altitude is studied. The atmosphere is divided into layers, each of which is characterized by an appropriate temperature gradient. Numerical results for heat transfer rates, relative decelerations and altitude as functions of flight time, and an altitude-range history for STD Day (ARDC Model Atmosphere, 1959) Hot and Cold Day, are presented for selected re-entry conditions. These results are compared with those obtained in an isothermal (exponential) atmosphere for the same re-entry conditions. The difference in peak heat transfer rates and maximum relative decelerations in the 2 atmospheric models is not significant for properly selected scale heights. However, the effect of temperature variation upon minimum elevation for the skip trajectory and upon range to point of impact for impact trajectories is noticeable. (Contractor's abstract)

THERMAL AND CHEMICAL EFFECTS IN WAKES, by M. H. Bloom. [1962] [14]p. incl. diagrs. refs. (PIBAL rept. no. 732) (AFOSR-2419) (AF 49(638)445) AD 611191 Unclassified

Presented at AGARD meeting on High Temperature Aspects of Hypersonic Flow, Brussels (Belgium), Apr. 3-6, 1962.

The far-wake, the regions in which diffusive phenomena become important and boundary-layer phenomena can be approximated, is discussed quantitatively. The thermal and chemical effects bearing on observable phenomena are discussed, along with the fluid mechanical factors that these effects depend upon. Topics include: scaling, similitude, and orders of magnitude; temperature distributions and electron densities in far-wakes calculated with coupled diffusion and detailed rate chemistry of multicomponent air; effects of differing values of the Lewis and Prandtl number; 3-dimensional effects; stream-wise pressure gradient effects; and unsteady effects.

COMPRESSIBLE VISCOUS FLOW IN A TWO-DIMENSIONAL ADIABATIC CHANNEL, by J. Soong and M. H. Bloom. May 1962, 38p. incl. diagrs. tables, refs. (PIBAL rept. no. 749) (AFOSR-2968) (AF 49(638)445) AD 278128 Unclassified

The analysis of compressible viscous flow in a 2-dimensional adiabatic channel is made by means of a boundary layer approximation. In particular, 2-dimensional laminar flow within parallel adiabatic walls is treated. Some solutions were obtained which are in agreement with the results of more conventional 1-dimensional flow analysis as far as pressure gradient and choking length are concerned. However, in the well-behaved cases profile changes involving popping and reverse flow are observed. This can be explained on the basis of nonuniformity in density and momentum over the cross section. Another set of cases which exhibit more unusual behavior are obtained. They are largely associated with positive pressure gradients in subsonic flow and negative pressure gradients in supersonic flow. It is observed that, due to non-uniform velocity, the flow may be partially supersonic and partially subsonic over a section. Mathematically, the initial pressure gradient can be prescribed in this analysis. Therefore, the unusual pressure gradient cited can be obtained in principle. The physical significance of the unusual solutions is discussed.

THREE-DIMENSIONAL EFFECTS IN VISCOUS WAKES, by M. H. Steiger and M. H. Bloom. June 1962, 32p. incl. diagrs. table. (PIBAL rept. no. 711) (AFOSR-2969) (AF 49(638)445) AD 278129 Unclassified

Presented at IAS Natl. Summer meeting, Los Angeles, Calif., June 19-22, 1962.

Also published in AIAA Jour., v. 1, 776-782, Apr. 1963.

Three-dimensionality in wake-like or jet-like free mixing is investigated. The first section of the report deals with the general mathematical model, in which the boundary layer approximations are used and with methods of solution. Laminar and turbulent flow, compressibility, unsteadiness and streamwise pressure gradients are admitted initially. The flux forms of the equations are given. Algebraic integrals of the energy equations and the diffusion (frozen-flow) equations are obtained. A simplification of the convective terms, roughly corresponding to the Oseen approximation, is used in the asymptotic downstream region. This results in linearization in the case of constant-fluid-properties, and permits the derivation of convenient solutions. Corresponding first-approximation solutions are obtained for the compressible case. Finally, second-approximation improvements are derived. The second section contains explicit solutions for specific configurations, in

particular for flows whose initial isovels are of ellipdc shape. These flows may be wake-like or jet-like. Compressibility is admitted; however, the flows must have uniform pressure and be steady. The final section deals with interpretation and evaluation of the results. (Contractor's abstract)

ON THE DISTRIBUTION OF ENTROPY WITHIN THE STRUCTURE OF A NORMAL SHOCK WAVE, by M. Morduchow and P. A. Libby. Aug. 1962, 70p. incl. diagrs. refs. (PIBAL rept. no. 759) (AFOSR-3198) (AF 49(638)445 and AF 49(838)717) AD 284699 Unclassified

Presented at Symposium on Chemical Engineering in Space Technology, New Orleans, La., Mar. 10-13, 1963.

A unified mathematical account is given of the available knowledge, together with additional new results of the entropy distribution through a normal shock wave. The most notable feature of this distribution is the fact that as long as heat conductivity is present the entropy will first increase within the shock until it reaches a maximum value at a certain point inside of the shock, and then diminishes to its final value behind the shock. A physical discussion of the results is given in addition to a review of the phenomena not usually included in the analysis of shock wave structure. A systematic review of classical shock wave structure according to the Navier-Stokes equations is included here together with a discussion of the physical validity of these equations. The structure of, and the entropy distribution within weak shock waves in general, and shock waves of arbitrary strength with Prandtl numbers of 0, 3/4 and infinity are analyzed in detail, together with qualitative results for shock waves in general.

ON TAKE OFF FROM CIRCULAR ORBIT BY SMALL THRUST, by L. Ting and S. Brofman. Aug. 1962, 28p. incl. diagrs. (PIBAL rept. no. 758) (AFOSR-3900) (AF 49(638)445) AD 284799 Unclassified

Analytic solutions for the trajectories of taking off from a circular orbit by low thrust at a finite angle to the radial vector are presented. The solution is uniformly valid for the entire time interval measured from the initial instant of take-off, $t = 0$, to $t = O(1/\epsilon)$ subjected to the upper limit set by the assumption of small thrust, where ϵ is the ratio of thrust to the central force at $t = 0$. The zero order solution, which is in error to the order ϵ, is a function of the "slow" time variable $\tau = \epsilon t$ and reduces to Tsien's solution for circumferential thrust. Due to the long time interval, $t = 0$ to $O(1/\epsilon)$, the standard techniques for the next order solution break down. The present solution is obtained by splitting it into 2 parts; one is a non-oscillatory function of τ and the other is an oscillatory function of t with varying periods. With this scheme it is possible to simplify the equations by estimating the order of magnitude of the terms for the entire interval. For the first order solution the non-oscillatory part is uniquely determined from an integral equation while the oscillatory term cannot be uniquely determined. This indeterminacy is removed by the requirement of the vanishing of the secular terms in the second order solution when the same scheme of splitting the solution is applied. The same technique can be repeated to obtain higher order solutions. Comparison with several results from numerical integration of the complete equation shows how the addition of the first order solution increases the accuracy of the analytic solution.

LINEARIZED DIFFUSION IN A RELAXING CONVECTING GAS WITH PRANDTL AND LEWIS NUMBER EFFECTS, by P. M. Sforza. Sept. 1962, 22p. incl. diagrs. (PIBAL rept. no. 725) (AFOSR-3979) (AF 49(638)445) AD 287463 Unclassified

The linearized model of an ideal gas with diffusion processes and rate reaction is applied to 1-dimensional unsteady motion generated by initial nonuniformities of state and velocity. The time-dependent system resembles that of steady, 2-dimensional, free mixing of jet or wake type. The temporal and spatial character of the profiles of flow variables is studied analytically for the conditions of state and velocity nonuniformities with various combinations of Lewis and Prandtl numbers. This model corresponds to a 2-dimensional viscous free mixing flow of an ideal dissociating gas with state variations of temperature and concentration.

ON CALCULATION OF THE LAMINAR SEPARATION POINT, AND RESULTS FOR CERTAIN FLOWS, by M. Morduchow and S. P. Reyle. [1962] [2]p. incl. tables, refs. (AF 49(638)445) Unclassified

Published in Jour. Aerospace Sci., v. 29: 996-997, Aug. 1962.

In view of the difficulty of calculating the laminar separation point exactly, and of the slight discrepancies even among exact solutions, it appears particularly worthwhile to have available an approximate, simple, reliable method of locating the separation point in a given adverse pressure gradient. The purpose of this note is to show the application of the method given by Morduchow and Clarke to several types of flows. The method is shown to be quite simple and accurate for various flows.

A CREEP LAW TO ACCOUNT FOR MATERIAL COMPRESSIBILITY, by F. A. Cozzarelli, B. Venkatraman and S. A. Patel. July 1962, 6p. (PIBAL rept. no. 656) (AFOSR-3005) (AF AFOSR-62-200) AD 282331 Unclassified

Based on the linear stress-strain relations of classical elasticity and the analogy between creep and nonlinear elasticity, a creep law governing the behavior of compressible materials is formulated. The strain and complementary energy functions associated with the analogous elastic law are developed. Finally the nonlinear elastic law is used in deriving the moment-curvature relations governing the lateral bending of thin plates.

BIOT'S VARIATIONAL PRINCIPLE IN HEAT CONDUCTION, by T. J. Lardner. [1962] [11]p. incl. diagrs. tables, refs. (AFOSR-J437) (AF AFOSR-62-200) Unclassified

Also published in AIAA Jour., v. 1: 196-206, Jan. 1963.

Biot's variational principle is applied to a number of different 1-dimensional heat conduction problems. These problems show the applicability of the variational principle to problems involving prescribed heat flux boundary conditions and to those with temperature-dependent material properties. A method is introduced for including boundary conditions when these are expressed as prescribed heat fluxes. The idea behind this is overall energy balance within the body, which is a constraint condition to be satisfied by the time histories of the generalized coordinates. The variational principle is then applied to the well-known problem of constant surface heat flux in order to present the technique and provide a basis for the remaining sections. The equivalence of the result obtained in applying the variational principle for a prescribed surface temperature history to that obtained for a prescribed heat flux is also pointed out. Radiation cooling due to fourth power radiation from semi-infinite solids and finite slabs together with radiation according to Newton's law of cooling is then treated. Finally, the introduction of temperature-dependent material properties is discussed and the determination of the temperature distribution in a semi-infinite solid with variable properties is investigated. NOVEL TECHNIQUE FOR CHARACTERIZATION OF ADSORPTION RATES ON HETEROGENEOUS SURFACES, by L. M. Naphtali and L. M. Polinski. [1962] [7]p. incl. diagrs. (AFOSR-J605) (AF 49(638)337) AD 414005 Unclassified

Also published in Jour. Phys. Chem., v. 67: 369-375, Feb. 1963.

A novel technique is proposed for obtaining and interpreting data on adsorption rates to a catalyst surface. The method is illustrated by actual data from a hydrogen-on-nickel system. The amount of adsorbed gas on a catalyst which is part of an isothermal system varies with time when the pressure changes. The variation depends on the adsorption kinetics and the heterogeneity of the surface. For a sinusoidally varying pressure, the dependence of the adsorption amplitude and phase lag on the frequency is one way of characterizing adsorption kinetics. The "frequency response" to an induced sinusoidal pressure variation of the moles of gas adsorbed on a uniform surface having first-order kinetics can be computed theoretically. A heterogeneous surface is assumed to be an assembly or series of "different uniform-surfaces" randomly interspersed. An assembly of such surfaces, characterized by different rate constants, has an out-of-phase component of the adsorption which resembles a spectrogram, separating the effect of different types of surface sites irrespective of the fact that adsorptions are occurring simultaneously on unlike sites. As an illustration of the technique, hydrogen adsorption was studied on a supported nickel catalyst. The effect of oxygen addition to the catalyst on the adsorption kinetics of hydrogen was studied. It was found that an increase in oxygen content reduced the amount of fast adsorption and increased the slow adsorption. It was possible to characterize and separate the rates of adsorption of both the fast and the slow types. (Contractor's abstract)

INTERDEPENDENCE OF EXCITED STATES OF DICHROIC MOLECULES, by G. Oster and G. K. Oster. [1962] [10]p. incl. diagrs. refs. (AF 49(638)293) Unclassified

Published in Luminescence of Organic and Inorganic Materials; Internat'l. Conf., New York U., N. Y. [1961] ed by H. P. Kallmann and G. M. Spruch. New York, Wiley & Sons, 1962, p. 186-195.

Triphenylmethane dyes which lack trigonal symmetry of their substituent groups are colored green in solution. Apparently the 2 absorption bands at each end of the visible spectrum are associated with the 2 dichroic axes. Although the free dye is photochemically inactive, the dyes when bound to high polymers in solution are capable of being photoreduced. Furthermore, the bound dye is fluorescent while the free dye is not, due to competing internal conversion processes which are suppressed on binding. Excitation with near ultraviolet light gives a green fluorescence (positively polarized) while excitation with red light gives a deep red fluorescence (negatively polarized). Hence it appears that the 2 absorption bands are independent electronic systems. Excitation with blue light, on the other hand, gives green fluorescence plus a little red fluorescence. Flash spectroscopy of bound dye was carried out using extremely high intensity filtered light. Excitation with red light caused a reversible decrease of the long wavelength absorption band while excitation with blue light resulted in a reversible decrease in both peaks. The production of metastable species is not appreciably influenced by the presence of oxygen. Furthermore no self-quenching of these species is observed. It is concluded that the excited molecule imbedded in the polymer is protected from external quenching influences. (Contractor's abstract)

PEROXIDE DECOMPOSITION AND CAGE EFFECT, by W. Braun, L. Rajbenbach, and F. R. Eirich. [1962] [5]p. incl. tables. (AF 49(638)331) Unclassified

Published in Jour. Phys. Chem., v. 66: 1591-1595, Sept. 1962.

After assuming that the lifetime of the acetoxy radical is of the same order as the "lifetime" of a "germinate diffusive combination" reaction (cage) and assuming that ethane results from the germinate combination of methyl radicals, it is possible to relate the amount of ethane formed to microscopic diffusion parameters and the lifetime of the acetoxy radical, while assuming "free" diffusion of the radical pairs. The calculation

lead to results consistent with these assumptions. The rate constant for the decarboxylation of the acetoxy radical was calculated to be $k = 1.6 \times 10^9$ sec^{-1}, at 60°, and the activation energy, 6.8 kcal/mol. In order to evaluate the possibility of the reaction scheme involving the germinate combination of a methyl radical with an acetoxy radical to explain the "cage" methyl acetate experimentally observed, a calculation was carried out assuming this mechanism. The ratio of cage methyl acetate to cage ethane was thus calculated and it agreed remarkably well with the experimentally observed rate. (Contractor's abstract)

PHOTOCHEMICAL STUDIES IN FLASH PHOTOLYSIS. II. PHOTOLYSIS OF ACETONE WITH FILTERED LIGHT, by N. Slagg and R. A. Marcus. [1960] [5]p. incl. diagrs. tables, refs. (AFOSR-240) (AF 49(638)-772) Unclassified

Also published in Jour. Chem. Phys., v. 34: 1013-1017, Mar. 1961.

Flash photolysis was studied in the absence of wavelengths below 200 mμ. Effects of acetone pressure, light intensity, added biacetyl, temperature, and wavelength were investigated. The results are consistent with primary acts postulated previously on the basis of low-intensity studies, but with the absence of complicating first-order secondary reactions at these high radical concentrations. Deactivation of excited molecules explains the pressure effect on the C_2H_6/CO ratio, for wall effects are absent under flash conditions. A hot radical mechanism is suggested by the data for methane formation. The effect of wavelength on C_2H_6/CO ratio in regions centered near 260, 280, and 295 mμ is rather striking, and the results are compared with trends in low-intensity studies in the same pressure region. PHOTOCHEMICAL STUDIES IN FLASH PHOTOLYSIS. IV. INTENSITY AND WAVELENGTH EFFECTS, by A. Shilman and R. A. Marcus. [1962] [7]p. incl. diagr. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)772 and Alfred P. Sloan Foundation) Unclassified

Also published in Bull. Soc. Chim. Belg., v. 71: 653-659, Nov.-Dec. 1962.

Wavelength and intensity effects which have been observed in the flash photolysis of acetone are reviewed. Marked nonmonotonic wavelength effects occurred in the different regions investigated (260, 280, and 300 mμ) and serve to emphasize the problem of interpreting any data obtained with unfiltered light. The data at 300 mμ were compared with those obtained with continuous light sources 10^6 fold less intense. A considerable difference occurred in the C_2H_6/CO ratio. To investigate this intensity effect, flash photolysis was made over a wide range of reduced intensities, as low as 10^4 fold less than the maximum one, and the transition intensity region for a change in C_2H_6/CO ratio and CO quantum yield was located. This phenomenon illustrates the more general fact that the apparent primary processes observed at typical flash intensities need not be the same as the primary processes found at low intensities. PHOTOLYSIS OF DIBORANE AT 1849 A, by W. C. Kreye and R. A. Marcus. [1961] [9]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)772] and Office of Naval Research) Unclassified

Published in Jour. Chem. Phys., v. 37: 419-427, July 15, 1962.

The photolysis of diborane at 1849 A has been studied. The products have been found to be H_2, B_4H_{10}, B_5H_{11}, and, at low pressures, a —BH— polymer. Reaction orders at 4°C have been obtained from linear plots of reaction products vs time for a range of diborane pressures from 0.08 to 80 cm, and at 2 light intensities. Linear relations between products and time existed only at very low conversions (~1%) which required the development of a low-temperature separation method for manipulating and analyzing the traces of B_4H_{10} and B_5H_{11}. Because of the reactivity of these compounds, a detailed conditioning procedure was employed for the glass system. A mechanism consistent with the kinetic data and sugged by the kinetic results of thermal and photosensitized decomposition of diborane is postulated: the B_5H_{11} is assumed to be formed from a dissociation of B_2H_6 into BH_3's, the latter arising from an excited molecule. The B_4H_{10} and polymer are assumed to be formed from a dissociation of B_2H_6 into B_2H_5 and H, followed by radical recombination. There is a significant difference between the kinetics of thermal and photochemical B_5H_{11} formation, a result which may be due to the considerable energy excess of the 1849 quantum over that needed for dissociation (~125-kcal excess). The primary quantum yield of the step forming B_2H_5 and H is about 10 times higher than that of the one forming BH_3's. A rather rough estimate suggests that the former is of the order of magnitude of unity. (Contractor's abstract)

COMBUSTION INSTABILITY: NON-LINEAR ANALYSIS OF WAVE PROPAGATION IN A LIQUID PROPELLANT

ROCKET MOTOR, by S. Z. Burstein and V. D. Agosta. Mar. 1962, 134p. incl. diagrs. refs. (Rept. no. PRL-62-15) (AFOSR-2614) (AF 49(638)165) AD 282970 Unclassified

A simplified model for the combustion of a bipropellant spray, with droplet break up, in the steady and nonsteady state, in a liquid propellant rocket motor, is presented. Only the longitudinal modes of nonlinear high frequency combustion instability are considered, and the method of obtaining a priori prediction of the stability or shocking limits of these pressure waves in a given rocket configuration is shown. In addition, a new technique for obtaining the composition of a complex chemical system in equilibrium is used. The longitudinal modes of nonlinear high frequency combustion instability in liquid propellant rocket motors are studied theoretically by maintaining the nonlinearity of the differential equations.

COMBUSTION INSTABILITY; SHOCK WAVE PROPAGATION IN A LIQUID PROPELLANT ROCKET MOTOR, by W. Chinitz and V. D. Agosta. June 1962. 94p. incl. diagrs. tables, refs. (Rept no. PRL-62-13) (AFOSR-3498) (AF 49(638)165) AD 282969 Unclassified

A model is presented for longitudinal shock wave propagation in liquid propellant rocket engines. The equations are written for the gas subsystem with appropriate terms included in the conservation equations to account for the evaporation and subsequent combustion of liquid fuel drops. Drag terms are included to account for the friction which may exist between the gas and liquid fuel drops when the velocities of each subsystem are not equal. The possibility of droplet shattering due to the action of large aerodynamic forces is also included in the analysis. Finally, the effect of gaseous dissociation is included employing the assumption that chemical equilibrium exists in the gas at the stations of interest. This analysis indicates that mass and heat addition and drag effects will substantially affect the gas dynamic state downstream of a shock wave. Qualitatively, the addition of mass appears to be the predominating effect. The analysis is employed to examine the effects of shock waves on a system in which liquid drops are suspended in an oxidizing atmosphere. The analysis is also utilized to examine shock wave propagation in a liquid propellant rocket engine.

NONLINEAR FLEXURAL VIBRATIONS OF SANDWICH PLATES, by Y.-Y. Yu. Feb. 1962. 19p. incl. refs. (Technical note no. 12) (AFOSR-1310) (AF 49(638)453) AD 289871 Unclassified

Also published in Jour. Acoust. Soc. Amer., v. 34: 1176-1183, Sept. 1962.

A set of nonlinear equations describing the vibrations of sandwich plates is derived. These equations are then applied to a plate vibrating in plane strain and to a rectangular plate, with the boundary edges assumed to be hinged in both cases. It is shown that the nonlinear frequencies increase with the amplitude of vibration and that transverse shear deformations play an important role. However, the effect produced by these deformations decreases with increasing amplitudes of vibration. (Contractor's abstract, modified)

APPLICATION OF VIBRATIONAL EQUATION OF MOTION TO THE NONLINEAR VIBRATION ANALYSIS OF HOMOGENEOUS AND LAYERED PLATES AND SHELLS, by Y.-Y. Yu. [1962] [8]p. incl. refs. (AFOSR-2256) (AF 49(638)453) AD 289868 Unclassified

Presented at Winter annual meeting of the Amer. Soc. Mech. Eng., New York, Nov. 25-30, 1962.

Also published in Jour. Appl. Mech., v. 30: 79-86, Mar. 1963.

An integrated procedure is presented for applying the variational equation of motion to the approximate analysis of nonlinear vibrations of homogeneous and layered plates and shells involving large deflections. The procedure consists of a sequence of variational approximations. The first of these involves an approximation in the thickness direction and yields a system of equations of motion and boundary conditions for the plate or shell. Subsequent variational approximations with respect to the remaining space coordinates and time, wherever needed, lead to a solution to the nonlinear vibration problem. The procedure is illustrated by a study of the nonlinear free vibrations of homogeneous and sandwich cylindrical shells, and it appears to be applicable to still many other nomogeneous and composite elastic systems. NONLINEAR VIBRATION ANALYSIS OF PLATES AND SHELLS (Abstract), by Y.-Y. Yu. [1962] [2]p. (AFOSR-64-2472) (AF 49(638)453) AD 453960 Unclassified

Also published in Nonlinear Problems; Proc. of a Symposium, Wisconsin U., Madison (Apr. 30-May 2, 1962) ed. by R. E. Langer. Madison, Wisconsin U. Press, 1963, p. 284-285

An approximate method is presented for the analysis of nonlinear vibrations of plates and shells involving large deflections. The proposed method consists of a sequence of variational approximations based upon the variational equation of motion. The first of these involves an approximation in the thickness direction and yields an approximate system of differential equations of motion and appropriate boundary conditions for the plate or shell. When some or all of these differential equations and/or boundary conditions cannot be solved and satisfied exactly, subsequent variational approximations with respect to the remaining space coordinates and time may be further carried out. The derivation of the plate and shell equations and the steps taken in the solution therefore constitute a continuous process. The method is applicable in layered composite plates and shells as well as those of the homogeneous type. For illustration of the method, the nonlinear free vibrations of sandwich plates and cylindrical shells are studied. The vibration study included the effect of transverse shear deformation, the importance of which has been established previously on linear vibrations of sandwich structures. For nonlinear vibrations on such structures, the importance of the transverse shear effect on the frequency is found to decrease with increasing vibration amplitude. It is also shown that both the transverse shear and nonlinear effects are of less importance to cylindrical shells than to plates. (Contractor's abstract, modified)

THE DERIVATION OF NETWORK FUNCTIONS FROM PHASE FUNCTIONS, by S. Deutsch. Mar. 6, 1962 [22]p. incl. diagrs. refs. (Research rept. no. PIBMRI-1006-62) (AFOSR-2406) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under AF 18(600)-1505) AD 277511 Unclassified

Equations are developed for deriving a network function F(s) given its phase function T(θ). Several numerical examples are given. In each case, the recurrence of the given T(θ) function in F(jθ) is a means of checking the accuracy of the derived F(s) function. The real part of log F(jθ) yields the log magnitude response, log M(θ). The examples indicate that the mathematical operations of findings F(s) are relatively simple. The equations are also employed to evaluate certain definite logarithmic integrals.

BILINEAR PATTERN CLASSIFIERS, by J. F. Kampmeier. Mar. 12, 1962, 26p. incl. diagrs. table, refs. (Research rept. no. PIBMRI-996-62) (AFOSR-2417) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF 18(600)1505) AD 277417 Unclassified

An analysis of the requirements for a portion of a general pattern recognition system, and the design of a classifier which meets those requirements are presented. The problem of pattern recognition is divided into 2 parts, measurement and classification. Classification alone is considered in this report. It is shown that the function of a classifier can be reduced to the realization of an arbitrary, n-variable switching function. A further requirement upon the classifier is that it must be capable of learning through experience. Several methods of designing a classifier with learning ability are found either to be unreasonably complex or to not have sufficient flexibility in realizing switching functions. A new type of net work is introduced which meets the requirements for a practical classifier. The classifier netowrk becomes capable of learning if feedback is added. Application of Laplace transform theory shows that correct recognition of patterns occur after several presentations of all patterns to be classified. (Contractor's abstract)

CARRIER MULTIPLICATION IN Ge AT X-BAND, by S. J. Freedman. Feb. 27, 1962 [28]p. incl. illus. diagrs. refs. (Research rept. no. PIBMRI-995-62) (AFOSR-2652) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF 18(600)1505) AD 288994 Unclassified

Experiments have been performed to observe breakdown in Sb-doped Ge at 4.2°K under strong rf illumination at 9.3 kmc/sec. An interpretation of the results in terms of a phenomenological rate equation shows that the relaxation times for carrier multiplication are too long to allow efficient harmonic generation. The switching times measured for breakdown are used to explain previous results of Seeger on a proposed low temperature limiter. Preliminary measurements of the third harmonic field induced at 78°K seem to confirm the field depence of a recent theory of Paranjape. (Contractor's abstract)

THE THEORY AND DESIGN OF F M. RECEIVERS, by D. Hess. May 11, 1962, 84p. incl. diagrs. (Research

rept. no. PIBMRI-1026-62) (AFOSR-2654) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF 18(600)1505) AD 282110
Unclassified

The spectrum of an FM wave modulated by gaussian noise is studied. As the rms frequency deviation of the wave becomes greater than the maximum frequency component of the modulating signal, the power spectrum of the FM wave becomes gaussian in form independent of the power spectrum of the modulating signal. The response of linear band-pass networks to an FM signal is studied. The response of the linear network is written as the sum of a quasi static response and an error term. The quasi static response is a modified version of the steady state response. The modification permits a very tight bound to be put on the error term and hence leads to very tight bandwidth specifications on FM filters. Several new and several existing FM demodulators are studied to establish design criteria for the demodulators. Finally the ability of a phase-lock loop to demodulate an FM signal is studied. Relationships are derived which specify the minimum closed loop bandwidth needed to demodulate a given FM signal with a specified amount of output distortion. The design of a phase-lock demodulator is considered with and without the use of a limiter. It is shown that an increase in closed loop bandwidth takes the place of limiting. CONSTANT EFFICIENCY 2N-PORT NETWORKS, by H. Kurss. May 7, 1962 [4]p. (Rept. no. 1027) (AFOSR-2751) (AF 18(600)1505) Unclassified

The efficiency of a 2N-port network is the fraction of the input power which is delivered to the load. It is shown that a 2N-port whose input is zero for all lossless loads will have a constant efficiency for arbitrary active or passive loads. The general constant efficiency 2N-port is represented as the cascade connection of a lossless 2N-port with either a ratio repeater or a power reverser or both. These component networks have constant efficiencies which, are, respectively, +1, an arbitrary positive number, -1. For reciprocal networks the ratio repeater is absent while for passive networks the power reverser is absent.

THE OPTIMAL CONTROL OF CHEMICAL PROCESSES, by C. B. Brosilow. July 3, 1962 [114]p. incl. diagrs. refs. (Research rept. no. PIBMRI-1023-62) (AFOSR-2398) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office, and Office of Naval Research under AF 18(600)1505) AD 286160
Unclassified

Attention is focused on obtaining a near optimal controller, for chemical processes, which is simple to design and inexpensive to implement. Pontryagin's technique is used to show that for a quadratic objective function, and a process which is described by a set of ordinary differential equations, linear in the controllable variables, the optimal control is on-off control, when the controllable variables are assumed to be bounded. A technique of parameter optimization is developed and used to obtain the equations which specify the switching times. These equations are restricted to processes which can be approximated by stable, linear, stationary differential equations. For the special case of one switch it is shown that the control law can be transformed into a switching criterion which is linear in the process outputs. Employing this criterion continuously results in a feedback controller which requires only a relay and a summing device for implementation. Analog computer studies on the control of both underdamped and overdamped systems with the 'one switch into the future' optimal controller show that this controller gives a virtually dead beat type of response even for severe disturbances. CRITICALLY-DAMPED COMPENSATION FOR BROADBAND AMPLIFIERS, by S. Deutsch. July 23, 1962 [25]p. incl. diagrs. tables, refs. (Research rept. no. PIBMRI-1051-62) (AFOSR-4503) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF 18(600)1505) AD 293853 Unclassified

Also published in I. E. E. E. Trans. on Circuit Theory, v. CT-10: 141-145, Mar. 1963.

Lossless critically-damped 2-terminal and 3-terminal ladders are considered as a means of compensating for parasitic shunt capacitance in broadband amplifiers. Equations are presented that simplify the design of these ladders. The capacitance and inductance values are tabulated for ladders that contain up to 7 reactive elements. The analysis is extended to the limiting cases of an infinite number of elements. The element values and transient responses of these optimum ladders are derived. Using a figure of merit that is based on the slope of the step response at its half-amplitude point, the infinite 2-terminal ladder is 59% better than an uncompensated circuit while the 3-terminal ladder is 117% better. FREQUENCY OF MODULATION NOISE, by J. T. Frankle. Aug. 31, 1962, 63p. incl. diagrs. tables, refs. (Research rept. no. PIBMRI-1041-62) (AFOSR-4504) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office, and Office of Naval Research under AF 18(600)1505) AD 608942 Unclassified

The noise characteristics of a commercial FM receiver were determined experimentally and compared with the theoretical results of Middleton and Stumpers. The theoretical solutions are derived on the basis of both gaussian and rectangular receiver IF characteristics. The experimental results follow the rectangular solution for low carrier to noise ratio and the gaussian solution for high carrier to noise ratio. This is explained by the characteristics of the receiver and FM noise theory. A novel technique, employing an envelope detector, is used to measure carrier to noise ratio prior to the FM detector. The thesis also includes information helpful in consolidating the FM noise theory in the literature.

DC EFFECTS UNDER MICROWAVE EXCITATION OF THIN FERRITE FILMS, by W. Heinz. Oct. 3, 1962, 58p. incl. diagrs. (Research rept. no. PIBMRI-1086-62) (AFOSR-4603) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office, and Office of Naval Research under AF 18(600)1505) AD 298304 Unclassified

The dc voltage, developed along the plane of a thin film of ferromagnetic or ferrimagnetic material under microwave excitation, has been observed in ferrite. The voltage is generated along the direction of the microwave magnetic field, which is perpendicular to the static field (also in the film plane). An expression is derived for the voltage developed across a film located in a standing wave pattern near a point of maximum magnetic field. It is a modification of a formula developed by Juretschke for metals, to include ferrites. Two magnetite (Fe_3O_4) films were investigated at X-band. In order to build up the fields sufficiently for the signal to be detected, the films were mounted in a cavity. The cavity was critically coupled at ferromagnetic resonance and the incident peak power was varied between one and three kilowatts. The linear relation between voltage and incident power, and the reversal of voltage with dc magnetic field reversal were confirmed experimentally. The experimental curve shape of the voltage vs static magnetic field was intermediate between a dispersion type and an absorption-type. The voltage developed in ferrites is considerably lower than that in ferromagnetic conductors because the effect depends on the microwave current density in the film. Thus, we have a sensitive means for the detection of ferromagnetic resonance in thin films of good conductors, but this application is not practical for ferrite films. In the case of the latter, the phenomenon may shed light on the conductivity, Hall effect, and magnetoresistance at microwave frequencies.

MICROWAVE PROPERTIES OF THIN FERRITE FILMS, by L. M. Silber. Feb. 27, 1962 [8]p. (Research rept. no. PIBMRI-997-62) (AF 18(600)1505) Unclassified

The magnetic properties of thin ferrite films have been investigated both by conventional microwave methods, and by observation of the dc Hall effect voltage which is associated with ferromagnetic resonance. These measurements allow determination of the saturation magnetization, resonance linewidth or relaxation time, gyromagnetic ratio, extraordinary Hall coefficient, and magneotresistance anisotropy. While the Hall effect measurement can be made on films too thin to measure by conventional microwave techniques, the Hall voltage is proportional to the microwave current density, and thus is largest in films of high conductivity. It has been possible thus far to study ferromagnetic resonance by the dc signal only in magnetite, while films of magnetite and nickel, magnesium, manganese, copper ferrites, mixed ferrites, and ferrialuminates have been studied by conventional microwave methods. The measurements reveal that the best films have magnetization, gyromagnetic ratios, and linewidths which are quite comparable to those of the corresponding bulk ferrites. Films which are not prepared properly show deviations from bulk properties such as reduction of saturation magnetization and greatly increased linewidth. Possible explanations, such as strain and exchange anisotropy, will be discussed. Apart from their use in conventional microwave devices, the films also give promise of allowing the determination of ferromagnetic exchange constants through observation of spin wave resonance.

NARROW-BAND TV USES PSEUDO-RANDOM SCAN, by S. Deutsch. [1962] [3]p. incl. illus. diagrs. [AF 18-(600)1505] Unclassified

Published in Electronics, v. 35: 49-51, Apr. 1962.

An ingenious very narrow bandwidth (10 kc/s only) television system is proposed, relying on the statistical rarity of fast motion and the fact that the eye, while sensitive to flicker, is more tolerant to gradual fade. The proposed system has a resolution of ~45,000 picture elements which is of the same order as that of an indifferently adjusted inexpensive receiver. The principle consists of a random dot scan, so that despite the very long frame period of 2.667 sec every region of the screen is covered by the scanning dot several times during that period. The scanning process proceeds in 3 steps: (1) A coarse vertical scan at 768 c/s is moved horizontally at 24 c/s to give 32 lines/field; (2) This 768 c/s rate is derived from the master generator at 18,432 c/s, which waveform is superimposed to give a stepped dot pattern, the beam remaining stationary for ~0.25 μsec; (3) Finally, square waves are added to this dot pattern to produce the small-area pseudo-random sampling, the entire dot array being slightly shifted every 1/24 sec, the process repeating after the full local scan of the small area containing 64 picture elements has been completed. Hence the frame period of 64/24 = 2.667 sec. All 3 scan processes are produced with 6 square waves only, all derived by division from the 18,432 c/s source. They are explained by means of block diagrams and waveform diagrams including those of synchronizing and shaping circuits. A brief description of the transmitter and receiver is given.

APPLICATION OF PONTRYAGIN'S MAXIMUM PRINCIPLE: LINEAR CONTROL SYSTEMS, by G. L. Collina and P. Dorato. June 1962, 33p. incl. diagrs. refs. (Research rept. no. PIBMRI-1015-62) (AFOSR-2655) (AF 18(603)105) AD 287333 Unclassified

The problem of linear, continuous-time, deterministic optimal, control systems is discussed. In particular it is shown, via Pontryagin's maximum principle, that linear optimal control systems always result from the combination of (1) a linear plant; (2) integral quadratic performance criterion; and (3) no constraints on the plant input. The controller synthesis is outlined in the general time-varying case and various illustrative examples are included. A comparison of the maximum principle approach with dynamic programming and the classical calculus of variations, is also included. Both

driven and undriven control systems are considered. For the case where the time-interval of optimality is infinite, the stability of the optimal system is investigated. It is shown that stability is assured whenever the integral of the performance criterion is positive definite. (Contractor's abstract)

THE ANALYSIS AND SYNTHESIS OF RC SYNCHRONOUS NETWORKS, by B. M. Tobin. June 5, 1962 [174]p. incl. diagrs. tables, refs. (Research rept. no. PIBMRI-1016-62) (AFOSR-2770) (AF 18(603)105) AD 290782 Unclassified

A major problem in the field of ac control systems is the synthesis of suitable electrical compensating networks which operate on the envelopes of modulated signals. Classical time-variant compensating networks suffer from a number of disadvantages. RC synchronous networks in which the basic reactive elements are synchronously-switched capacitances whose current polarities reverse periodically at twice the carrier frequency overcome these drawbacks. Although successful single capacitance synchronous networks have been constructed an exact theory upon which a logical synthesis procedure can be based has been lacking. A unified theory of analysis and synthesis of RC synchronous networks is presented. The theory leading to a rigorous procedure for synthesizing an RC synchronous network which realizes a prescribed envelope voltage transfer function is developed.

PLANT-ADAPTIVE OPTIMAL SYSTEMS, by P. Dorato. Mar. 9, 1962 [4]p. incl. diagrs. (PIBMRI-1005-62) (AF 18(603)105) Unclassified

The purpose of this note is to indicate how the relationship between controller and plant parameters may be obtained. It is interesting to note that often in the synthesis of optimal control systems one obtains part of the solution to the adaptive problem. Consider, for example, a plant with dynamics, in state space, of the form $\dot{x} = f(x, u, w)$, where x represents the plant output, u the control input, and w a constant plant-parameter vector. The value of the parameters in the controller depend, of course, on the plant-parameter vector w. If a relationship between the parameters of the controller and w can be established, then a adaptive path may be included in the optimal system to maintain optimality.

ON THE DESIGN OF LINEAR PROCESS ADAPTIVE CONTROL SYSTEMS, by H. N. Yagoda. Aug. 31, 1962, 102p. incl. diagrs. tables, refs. (Research rept. no. PIBMRI-1075-62) (AFOSR-4510) [AF AFOSR-62-280] AD 295074 Unclassified

The problem is presented of controlling a stable, slowly time varying, linear process. A solution is proposed that is simple, practical and applicable to any finite order process. Use is made of a continuously adjusted tandem compensator; a comparison of the weighted histories of the input and output signals is used to control this adjustment. System design is based upon the use of a variable transfer function characterization for both the compensator and the process. In effect, a compensator is designed that attempts to cancel the variable poles of the process with variable zeros, the variable zeros of the process with variable poles and the variable process gain with its reciprocal. The design technique developed is applied to several problems. The processes involved range from a variable gain amplifier through a plant that contains a variable gain and 2 pair of variable complex poles. The processes are grouped in accordance with the number of variable parameters in the process characterizing function.

THE RESPONSE OF AN AUTOMATIC PHASE CONTROL SYSTEM TO FM SIGNALS AND NOISE, by D. L. Schilling. June 1962, 136p. incl. diagrs. tables. (Research rept. no. PIBMRI-1040-62) (AFOSR-4502) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office, and Office of Naval Research under AF AFOSR-62-295) Unclassified

Also published in Proc. IEEE, v. 51: 1306-1316, Oct. 1963.

An automatic phase control system is analyzed to determine its response to frequency modulated signals and narrowband Gaussian noise. Emphasis is placed on the system's response to frequency ramp modulated signals. In contradistinction to previous analyses, the assumptions of a linearized system and of a S/N ratio greater than unity were not made. The response of the system to an FM signal is obtained using a perturbation technique and perturbing about the solution to the nonlinear pendulum problem. A piecewise-linear solution is also presented and used to extend the class of solutions obtainable when using the perturbation technique. The piecewise-linear technique does not result in as good an approximation, but it can be used when the system is critically-damped, or over-damped.

ON THE MINIMAL SET OF COMPATIBLES FOR CLOSURE, by W. C. W. Mow. Oct. 1962, 36p. incl. tables. (Research rept. no. PIBMRI-1084-62) (AFOSR-4505) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office, and Office of Naval Research under AF AFOSR-62-295) AD 295633 Unclassified

Given an incompletely specified sequential switching function in the form of flow table, Paull and Unger had provided a systematic procedure for reducing the function into a set of maximum compatibles. A technique is presented here for selecting a minimal closed set of compatibles without the process of enumeration. The rules have been applied to numerous examples including those presented by Paull and Unger.

SYMMETRIES OF UNIFORM WAVEGUIDE CONTAINING ANISOTROPIC MATERIALS, by Y. Knoishi. Aug. 20, 1962 [26]p. incl. diagrs. table. (Research rept. no. PIBMRI-1052-62) (AFOSR-4506) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office, and Office of Naval Research under AF AFOSR-62-295) AD 293852 Unclassified

Waveguides, which have symmetry, have simpler electrical characteristics and equivalent circuits and the symmetry sometimes serves as better matching characteristics than general waveguides when the waveguide includes anisotropic material. The anisotropic conditions under which waveguides can keep the symmetries are discussed. As a practical example, it is also shown what kind of dc magnetic field may be applied to Ferrite materials so that the symmetry of the waveguide is preserved. (Contractor's abstract)

MEASUREMENT OF NEURON ACTIVITY BY PARAMAGNETIC RESONANCE, by M. A. Kelly. Nov. 9, 1962, 18p. incl. diagrs. (Research rept. no. PIBMRI-1071-62) (AFOSR-4508) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office, and Office of Naval Research under AF AFOSR-62-295) AD 291441 Unclassified

This report proposes a theory for measuring neuron activity at any desired location in a living animal by a technique that requires no physical contact between the subject and the detector. The theory postulates that free radicals are produced in the formation of neuron action potentials, and that the concentration of these free radicals can be measured by magnetic resonance techniques. A device to test these postulates has been built, but does not yet possess the sensitivity needed to give the theory a meaningful test. The design and construction of this device is described. FILTERS WITH POLES HAVING EQUAL VERTICAL SPACING, by R. I. Disman and S. Deutsch. Sept. 24, 1962 [22]p. incl. diagrs. table. (Research rept. no. PIBMRI-1077-62) (AFOSR-4509) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office, and Office of Naval Research under AF AFOSR-62-295) AD 291550 Unclassified

In the Butterworth criterion for maximally flat low-pass amplitude response the poles are spaced by equal angles on a unit circle in the left hand s-plane. This configuration does indeed give a good cut-off in filters but at the expense of the transient response. The poor transient response is due to the poles which approach the j-axis; their specific contributions are described mathematically. The above problem was considered when a filter was needed to give a band-limited output to an input of sampling pulses. It was decided to place the poles on the unit circle, with equal vertical spacing, so as to try to compromise between good cut-off and acceptable transient response. From the pole distribution the following calculations were performed: amplitude response, time delay, impulses response, and step response. A synthesis was also performed to determine the corresponding circuit configuration. The above calculations were performed for 2, 3, 4, and 5 reactive element circuits. A Butterworth filter of 5 reactive elements is compared to a corresponding filter with equal vertically-spaced poles with respect to amplitude response, time delay, and transient response. PROBABILITY DISTRIBUTION AT THE OUTPUT OF A LOGARITHMIC RECEIVER, by S. Geldston. Oct. 4, 1962, 102p. incl. diagrs. refs. (Research rept. no. PIBMRI-1087-62) (AFOSR-4719) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-62-295) AD 298294 Unclassified

A statistical study of the behavior of the logarithmic receiver in an environment of bandlimited white noise and signal plus noise is presented. The output probability densities, the means, variances, and higher moments are calculated for various input noise and signal levels. A significant feature of the logarithmic receiver is that the magnitude of the output variance about its mean value is independent of the magnitude of the input noise level, provided that the dynamic range is not exceeded. Thus, the combination of logarithmic receiver and high pass filter can be used as a technique for obtaining a constant false alarm rate for systems operating in a noisy environment. The degradation of sensitivity for the logarithmic receiver is proportional to the logarithm of the number of pulses integrated. The sum and difference output distribution from the twin channel logarithmic configuration to an input of bandlimited white noise is calculated. The importance of the twin channel configuration is stressed because of its application to tracking radars that use the monopulse technique and to height finders that use the multibeam technique. A comparison is made of the output power spectral density between the logarithmic receiver and the linear receiver, both having an input of bandlimited white noise. The procedure consists of calculating the autocorrelation function at the output of the logarithmic receiver. By means of the Fourier transform of the autocorrelation function, the power spectral density is thus determined. When comparison is made with a linear receiver, a considerable amount of spectral power at the output of a logarithmic receiver is found to be centered about even harmonics of the IF frequency.

OPTIMIZATION OF MULTIVARIABLE SAMPLED DATA CONTROL SYSTEMS, by J. Lieutaud. Sept. 1962, 50p. (Research rept. no. PIBMRI-1078-62) (AFOSR-4720) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office, and Office of Naval Research under AF AFOSR-62-295) AD 297251 Unclassified

This study is concerned with the optimization of multivariable sampled-data control systems. A squared error performance criterion is chosen and the effects of controllability and observability are studied. In particular it is shown that the optimization can always be carried out on a system all of whose coordinates are both controllable and observable. In each case several illustrative samples are included. (Contractor's abstract)

COHERENT DETECTION ON PULSED RADARS, by A. Kerdock. June 1962, 33p. incl. diagrs. (Research rept. no. PIBMRI-1103-62) (AF AFOSR-62-295) AD 295076 Unclassified

Coherent detection on a pulsed radar is discussed from a statistical decision theory viewpoint. The Neyman Pearson test is applied to 2 cases; first, where it is desired to detect targets moving with one particular radial velocity, and second, where it is desired to detect targets at all velocities equally well. In the first case it is shown that, in a sense an ideal integrator is achieved; i.e., the results are exactly the same as if all the power reflected from the target were received in one pulse, rather than many. A mechanization for the second case is given. The statistics for a suboptimum integrator which approximates the Neyman Pearson test in a simpler form are derived. The performance of this integrator is compared with that for the ideal noncoherent integrator. (Contractor's abstract)

PROCEEDINGS OF THE SYMPOSIUM ON MATHEMATICAL THEORY OF AUTOMATA, New York, Apr. 24-26, 1962, ed. by J. Fox, M. Crowell, and R. Meyerson. Brooklyn, Polytechnic Press, 1963, 640p. incl. diagrs. tables, refs. (Microwave Research Inst. Symposia Series, v. 12) (In cooperation with Inst. of Radio Engineers and American Inst. of Electrical Engineers) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [AF AFOSR-62-295]) Unclassified

The book contains a detailed presentation of 32 lectures delivered at the above symposium, organized by the Brooklyn Polytechnic Institute with the support of a number of military-scientific organizations and the IEEE. Apart from 3 general lectures, given by distinguished guests in the opening session, the distribution of the lectures by subject is as follows: computability—5 lectures; classes of automata and construction of proofs—6 lectures; algebraic theory of automata—8 lectures; theory of nets and switching—6 lectures; theory of search and adaptive processes—3 lectures. The collection ends with a brief account of a panel discussion on the connection of the theory of calculating machines with the concept of computability. The main conclusions are that a knowledge of the theory of computability saves programmers from such blind alleys as, for example, the attempt to construct a universal debugger; the Turing

machine continues to be the basic model for workable calculating machines; such generalizations of calculating processes as the introduction of chance, the unification of man and machine in a single system, and likewise the use of infinitely much information as initial data, do not extend the classical notion of computability. (Math. Rev. abstract in part)

TRANSMISSION OF F. M. SIGNALS THROUGH LINEAR FILTERS, by D. [T.] Hess. [1962] [8]p. incl. diagr. [AF AFOSR-62-295] Unclassified

Published in Proc. Nat'l. Electronics Conf., v. 18: 469-476, Oct. 1962.

The response of a linear filter to an FM signal is derived. The response is expressed as a closed form function of the instantaneous frequency of the input wave plus an error term on which a tight bound is kept. The bound is appreciably tighter than other existing bounds. With the linear filter response as a basis, an inequality is derived which relates the bandwidth of a linear filter to the amount of phase distortion appearing in the output FM signal. With this inequality, an example is computed which shows that the bandwidth required to transmit a commercial FM signal with less than 1% phase distortion is 225 kc—the experimentally determined bandwidth required to transmit a commercial FM signal.

MICRORADIOGRAPHY, by B. L. Henke. [1960] [7]p. incl. illus. diagrs. [AF 49(638)394] Unclassified

Published in Encyclopedia of Science and Technology, McGraw-Hill, 1960, p. 366-370.

In microradiography, it is convenient to be able to generate a wide range of essentially monochromatic beams by exciting secondary fluorescent radiation from a variety of elements with a single high intensity source of primary rays, such as the Machlett AEG-50 tungsten target tube. The technique of contact microradiography consists of (1) preparation of a sample in the form of a small piece generally unmounted with a thickness of .1mm or less for metals and other dense materials considerably greater if necessary for biological specimens; (2) placement of the sample in close contact with a fine-grained photographic film in a simple camera or light tight envelope; (3) exposure to a suitable x-ray beam; (4) enlargement of the developed image, which appears as a black spot. Thus the photographic image itself takes the place of the usual specimen for microscopic observation. Graininess may begin to interfere at magnifications of 300, although satisfactory results are often obtained up to 800. A number of special microradiographic techniques applicable to life science and industrial testing which have been developed are described.

PROJECTION MICROSCOPY AND MICROANALYSES, by O. S. Peen. [1961] [11]p. incl. illus. diagrs. [AF 49(638)394] Unclassified

Presented at Tenth annual Conf. on Application of X-Ray Analysis, Denver, Colo., Aug. 7-9, 1961.

Published in Advances in X-Ray Anal., v. 5: 324-334, 1962.

Results of recent experiments on microanalyses with an x-ray projection microscope will be reviewed. As the use of monochromatic radiation is imperative, spectral analyses of the point source were carried out. A simple stationary divergent-beam-type transmission spectrograph was used. The shape and size were miniaturized to fit in the specimen holder of the Norelco projection unit. Emission spectra from clean targets and the fluorescent radiation emerging from a 10- to 50-μ-diam spot of contaminated targets and of 2-layer targets are shown. The spectra were recorded photographically. In addition, a proportional counter, in combination with the R. C. L. 128-channel pulse-height analyzer, was used for measuring the ratio of "white" to line radiation. (Contractor's abstract)

PRODUCTION, DETECTION, AND APPLICATION OF ULTRASOFT X-RAYS, by B. L. Henke. [1962] [16]p. incl. illus. diagrs. refs. [AF 49(638)394] Unclassified

Published in X-ray Optics and X-ray Microanalysis; Third Internat'l. Symposium, Stanford U., Calif. (Aug. 1962), ed. by H. H. Pattee, V. E. Cosslett, and A. Engström. New York, Academic Press, 1963, p. 157-172.

The ultrasoft x-radiations are often very efficient for use in microanalysis because of 2 important and unique characteristics. First, these are ideal radiations with which to place energy into microscopic systems because the effective interaction thicknesses are typically in the micron range and smaller. Second, the interaction is relatively simple. Photoelectric absorption is the dominant primary interaction. The reduction of the resulting low-energy photoionized atomic states is dominantly by the ejection of Auger electrons. The characteristic, re-emitted energy either as Auger electrons or as fluorescent x-ray photons results in spectra which are simpler in both structure and number of lines as compared to that from conventional x-ray or optical spectra. As an example of the use of 500-v, monochromatic x radiation in contact-microradiographic analysis, the mass of single human red blood cells has been measured, with a precision of 2 or 3%. It has been demonstrated that it is possible to detect, with high electron counting rates, the presence of small percentages of all elements within the first 100A or less of the sample surfaces. In addition ultrasoft x-ray physics has become of importance in the study of radiations emanating from the sun as measured from rockets and satellites. Such applications of ultrasoft x-ray physics have in common the need for efficient sources and detectors. With the hope that such information will be of some value to workers in this relatively new field, a brief description is given of the x-ray generation and detection methods which have been employed in this laboratory for many of the applications as described.

RECENT WORK IN THE 10- TO 100-A X-RAY REGION (Abstract), by B. L. Henke. [1962] [1]p. (AF 49(638)-394) Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 238, Mar. 26, 1962

An efficient high-intensity source of ultrasoft x-radiations has been developed. Relative photon-counting efficiencies for GM and proportional counters and for various photocathode surfaces mounted upon electron multiplier tubes have been investigated. A sensitive method of spectroscopic measurement has been developed based upon an energy analysis of the photo- and Auger-electron spectra excited by the ultrasoft x-ray beam. An inverse-square electrostatic spectrometer has been specially designed for this work in the 10- to 1000-ev region.

SODIUM AND MAGNESIUM FLUORESCENCE ANALYSIS-PART I: METHOD, by B. L. Henke. [1962] [16]p. incl. illus. diagrs. tables. (AFOSR-3889) (AF AFOSR-62-415) Unclassified

Presented at Eleventh annual Conf. on Application of X-Ray Analysis, Denver, Colo., Aug. 8-10, 1962.

Also published in Advances in X-Ray Anal., v. 6: 361-376, 1963.

As is well known, the fluorescent yield decreases very rapidly with the atomic number with the result, for example, that sensitive sodium and magnesium analysis is extremely difficult if not impossible with conventional

x-ray spectrographs. It is demonstrated, however, that analysis for sodium and magnesium can be accomplished with sensitivity comparable to that conventionally obtained for elements such as aluminum, silicon, and phosphorous, providing that the conditions for excitation and measurement of the associated soft x-radiations are optimized. A high-intensity demountable tube using an aluminum anode has been developed which can be used interchangeably with the conventional spectrographic x-ray source. This provides a large amount of incident radiation, aluminum foil filtered, optimally close in wavelength to that of the line radiation being excited. A gypsum analyzing crystal is used along with greatly reduced beam collimation. The standard flow proportional counter and pulse height discrimination is employed. An appropriate filter, such as aluminum foil, is used as a window for the counter to provide further discrimination and enhanced signal-to-background ratio. (Contractor's abstract)

POLARIZATION OF THE ELECTRET, by B. Gross and R. J. De Moraes. [1962] [4]p. incl. diagrs. tables, refs. (AFOSR-3464) (AF AFOSR-60-6) Unclassified

Also published in Jour. Chem. Phys., v. 37: 710-713, Aug. 15, 1962.

The internal charge distribution of the carnauba wax electret has been determined by a sectioning method. After polarization and cooling samples are cut into sections of different thickness. These are reheated and the ensuing discharge currents are measured. The total released charge, as determined by numerical integration of the corresponding current-time curve, gives the polarization of each section. A macroscopic space charge polarization would give charge values which, with decreasing thickness of sections, go to zero; a uniform volume polarization would give values which are independent of thickness. Measurements gave constant values and therefore prove the existence of a uniform volume polarization of the electret. (Contractor's abstract)

[ELECTRETS], by B. Gross. Final rept. [1962] [8]p. incl. tables. (AFOSR-3465) (AF AFOSR-60-6) Unclassified

The main objective of this research was the investigation of the nature of the heterocharge of the electret and the determination of the space charge distribution of the system. The preparation of samples has been perfected and several series of systematic measurements have been undertaken. The results confirmed beyond doubt that the electret possesses a uniform volume polarization. In addition to space charge measurements by the dissectioning method, irradiation effects have been explored, in the expectation that they might shed light on the nature of the polarization of the electret.

THE FORMATION AND DISCHARGE OF CARNAUBA WAX ELECTRETS IN NUCLEAR RADIATION FIELDS, by P. V. Murphy. [1962] [2]p. incl. diagrs. (AFOSR-3467) (AF AFOSR-61-140) AD 428415 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 24: 329-330, Feb. 1963.

It is reported that a 4 Mrad dose of Co^{60} γ-rays reduced the heterocharge of a thermoelectret by a factor of 8 and the density of unpaired electrons by a factor of 18. Radio-electrets were formed by the simultaneous action of an electric field and β-rays from Sr^{90}. The isothermal decay currents for radio-electrets and thermoelectrets varied with time according to $i = kt^{-n}$. The residual volume polarizations were determined and compared. That of the radioelectret was proportional to the total radiation dose.

AN EXPERIMENTAL STUDY OF THE DECAY OF TURBULENT ENERGY IN SEVERAL GASES AND AT HIGH AND LOW DENSITY, by W. H. Webb. Jan. 1962, 71p. incl. diagrs. tables, refs. (Rept. no. 59) (AFOSR-2302) (AF 49(638)465) AD 276521 Unclassified

A hot-wire anemometer study of the decay of turbulent energy downstream of a grid in atmospheric pressure air, argon and helium and at several ambient pressure levels in air was carried out. A variable density low speed blow-down tunnel was employed which was operated over the range 0.2 to 8 atm pressure. It was found in the decay measurements that above a grid Reynolds number, RM, of about 2,000 and at atmospheric pressure and above, an identical initial period decay law occurred independent of the gas employed or the ambient pressure level. There was no evidence indicating the invalidity of the continuum view of turbulence for this range. For RM below 1,000 or at low ambient pressure, however, a decrease in the normal turbulence intensity was found, the magnitude of which appeared to depend on the pressure level and the gas employed. (Contractor's abstract)

HOT-WIRE HEAT LOSS AND FLUCTUATION SENSITIVITY FOR INCOMPRESSIBLE FLOW, by W. H. Webb. Jan 1962, 61p. incl. diagrs. tables, refs. (Rept. no. 596) (AFOSR-2303) (AF 49(638)465) AD 276520 Unclassified

An experimental study of the forced convection, heat loss from long thin cylinders placed normal to an incompressible flow was carried out. Tests were made in 3 different gases (air, argon, helium) at atmospheric pressure and in air over a pressure range of 0.2 to 8 atm. Particular attention was given to determining the effect of cylinder temperature on the heat loss. It was found that the constants employed in the usual empirical representation of this heat loss vary with cylinder temperature in a way dependent on Knudsen number, results in helium giving a marked indication of this. A velocity fluctuation sensitivity equation was derived which includes the effects of this temperature variation. (Contractor's abstract)

THE CONTINUUM THEORY OF SPHERICAL ELECTROSTATIC PROBES, by C. H. Su and S. H. Lam Apr. 1962, 46p. incl. diagrs. (Rept. no. 605) (AFOSR-3067) (AF 49(638)465) AD 283914 Unclassified

A continuum theory for negatively charged spherical electrostatic probes in a slightly ionized plasma is developed. The density of the plasma is taken to be sufficiently high such that both ions and electrons suffer numerous collisions before being collected by the probe. The probe surface is assumed to be absorbing. The ion and electron temperatures may have different values but are uniform in space. By confining attention to highly negative probe potentials, the Boltzmann distribution for electron number density is shown to be the correct approximation. Under the assumption that the probe radius, rp, is large compared with the electronic Debye distance, h_e, and that the probe potential is sufficiently negative, the structures of the potential, electron, and ion density distributions are discussed. Under such circumstances the boundary condition for ion density at the probe is unimportant. Analytical behavior of the solutions are given and a simple closed-form ion-current-voltage characteristic is obtained. Two kinds of current-voltage characteristics are constructed. One of them is specially appropriate for the determination of the ionization density. Finally, the disturbance in the plasma is found to be confined mainly to a layer adjacent to the probe. It is shown that the thickness of the layer is not or order or Debye length, whenever $P_p >> h_e$. (Contractor's abstract)

POINT HEAT SOURCES AND THE TEMPERATURE-VORTICITY ANALOGY IN COMPRESSIBLE BOUNDARY LAYERS, by W. J. McCroskey. May 1962 [56]p. incl. illus. diagrs. tables, refs. (Rept. no. 613) (AFOSR-3068) (AF 49(638)465) AD 284000 Unclassified

Under certain generally accepted assumptions, the analogy between temperature and vorticity for viscous, 2-dimensional, constant property flows can be extended to compressible boundary layer flows. Within the scope of the assumptions, temperature and shearing stress are linearly related, and this relation is formally valid for both laminar and turbulent flows. This paper describes a simple problem for which the temperature-shearing stress analogy is valid. The problem concerns the flow over a semi-infinite insulated flat plate with a point heat source of strength located at the leading edge. Detailed theoreticaly velocity and temperature profiles are presented for the laminar case. They are nonsimilar, and depend on the parameter. Further, the velocity and temperature profiles resemble those of a compressible boundary layer on an insulated flat plate with no heat source. An experimental program was conducted to verify the theoretical predictions.

TURBULENT DECAY IN AIR, ARGON AND HELIUM, by W. H. Webb. Preliminary rept. Aug. 1961 [21]p. incl. illus. diagrs. (AFOSR-3977) (AF 49(638)465) Unclassified

It is generally accepted that turbulence is a continuum phenomenon and that under ordinary circumstances, the Navier-Stokes differential equations provide an adequate mathematical framework for the description of a turbulent field. Occasionally, however, objections are raised, based on the observation that the violent fluctuations inherent in turbulence render higher order velocity derivatives nonexistent. Appreciable molecular effects would not be expected unless some special mechanism connecting the molecular and microscopic scales is operative. One such mechanism has been proposed which predicates the local growth of molecular "clusters" as a simple mechanical result of the collisions of finite-sized molecules. It was believed that by measuring the decay of turbulence in gases of different molecular structure a crucial test of the existence of observable effects of a particular molecular mechanism would be given. The present preliminary report gives the results obtained on the decay of grid turbulence produced in 3 gases; air, argon and helium.

HEAT TRANSFER IN A RAREFIED GAS BETWEEN PARALLEL PLATES AT LARGE TEMPERATURE RATIOS, by D. R. Willis. [1962] [40]p. incl. diagrs. refs. (AFOSR-3978) (AF 49(638)465) AD 606414 Unclassified

Also published in Rarefied Gas Dynamics; Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press, Suppl. 2, v. 1: 209-225, 1963. (AFOSR-5310)

Using a relaxation type model to describe the intermolecular collisions the problem is reduced to the solution of 2 coupled nonlinear integral equations for the density and temperature of the gas. An analytic solution of these equations is obtained for the limiting case of very high plate temperature ratio. Numerical results are obtained for several temperature ratios, the lowest being 4 to 1, and for a state of rarefaction varying from free molecular to the transition regime. The numerical results are compared with results of a moment method, using 4 moments, and a first iterate method. The results of this moment method are found to be insufficiently sensitive to variations in the plate temperature ratio. The numerical results for a temperature ratio of 4 to 1 correlate reasonably well with results of a linearized 8 moment method through use of a modified rarefaction parameter. BOUNDARY LAYER FLOW WITH SUSPENDED PARTICLES, by H. H. Chiu. Aug. 1962 [32]p. incl. diagrs. tables. (Rept. no. 620) (AFOSR-4540) (AF 49(638)465) AD 424280; AD 604821 Unclassified

The laminar boundary layer flow with particles injected upstream of the leading edge of a plate is investigated. The boundary layer equations for the gas, and the equations governing the rate of momentum and heat transfer between the gas and the particles were solved simultaneously. A series solution is constructed in terms of a system of universal functions from which the solution for the arbitrary velocity and temperature ratio of the gas and the particles at the leading edge may be calculated. A closed form solution is obtained for the particle motion. It is found, within the validity of the approximation, that the wall shear force may be larger or smaller than that of the flow of clean gas, depending on the relative magnitude of the velocity of the particles and the gas at the leading edge; and that the wall heat transfer depends primarily on the relative magnitude of the temperature of the particles and the gas at the leading edge, and upon the wall temperature.

EXPERIMENTAL INVESTIGATION OF BOUNDARY LAYER TRANSITION ON A FLAT PLATE WITH A POINT HEAT SOURCE AT THE LEADING EDGE, by W. J. McCroskey. Aug. 1962 [26]p. incl. illus. diagrs. refs. (Rept. no. 627) (AFOSR-4541) (AF 49(638)465) AD 604822 Unclassified

The addition of heat to the boundary layer of an insulated flat plate by means of a point heat source at the leading edge has been found to delay the transition of laminar flow to turbulence. This paper describes an experimental investigation of the variation of transition Reynolds number on a roughened flat plate model with a heat source of strength, Q, spanning the leading edge. The present problem is compared with the problem of an aerodynamically heated boundary layer on an insulated flat plate. Transition Reynolds number was found to increase with increasing S over a range equivalent to a Mach number variation of $0 < M_\infty < 0.6$. (Contractor's abstract)

LEADING EDGE OF A SHOCK-INDUCED BOUNDARY LAYER, by M. Sichel. [1962] [13]p. incl. diagrs. refs. (AFOSR-J368) (AF 49(638)465) AD 408590 Unclassified

Also published in Phys. Fluids, v. 5: 1168-1180, Oct. 1962.

The boundary layer which is formed as a shock wave propagates down a shock tube causes both shock attenuation and shock curvature. Hartunian studied the curvature effect; however, as he points out, because of the singularities at the leading edge of the boundary layer his solution is not valid where the shock wave touches the tube wall. A detailed study is now made of the flow near the leading edge of this shock-induced boundary layer for a weak shock wave. The leading flow can be divided into a shear layer near the wall, and into a free stream or shock region. By expanding Navier-Stokes equations in the small parameter M_1^*-1 and stretching the coordinates, simplified equations for the shear layer and shock region are obtained. The shear layer and shock region flows interact and it is found that the shock region must be a zone of non-Hugoniot flow where the shock structure is 2-dimensional. An approximate solution of the shock shape is obtained by replacing the shock region by an oblique shock which is approximately matched to the shear layer. (Contractor's abstract)

STRUCTURE OF WEAK NON-HUGONIOT SHOCKS, by M. Sichel. [1962] [10]p. incl. diagrs. refs. (AFOSR-J1049) (AF 49(638)465) AD 418301 Unclassified

Also published in Phys. Fluids, v. 6: 653-662, May 1963.

As the curvature of shock waves increases, the shock structure becomes 2 dimensional, and the usual Hugoniot jump conditions no longer hold. An equation has been derived for the structure of such a 2-dimensional non-Hugoniot shock in the case of weak shocks with Mach numbers close to one. It appears that the non-Hugoniot region behaves as an acoustic wave driven by higher-order viscous effects. The properties of the viscous-transonic or V-T equation have been investigated. The V-T equation appears to be a combination of Burgers' equation for weak normal shock structure and the transonic equation. It is shown that the structure of oblique shocks is a similarity solution of the V-T equation. Proper formulation of boundary conditions is considered and a uniqueness proof is given for a particular restricted boundary value problem.

ASYMPTOTIC THEORY OF SPHERICAL ELECTROSTATIC PROBES IN A SLIGHTLY IONIZED, COLLISION-DOMINATED GAS, by L. M. Cohen. [1962] [8]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)465 and Atomic Energy Commission) Unclassified

Published in Phys. Fluids, v. 6: 1492-1499, Oct. 1963.

The problem of an electrostatic probe in a dense, slightly ionized gas is treated by techniques of asymptotic analysis. In particular, the asymptotic limits $\rho_p = r_p/\lambda_d \to \infty$ and $\epsilon = T_+/T_- \to 0$ are treated in considerable detail. (r_p, λ_d, T_-, T_+ are probe radius, Debye length, electron, and ion temperature, respectively). Sample integral curves for electrostatic potential, ion and electron density are given. Probe characteristic curves for 3 values of ϵ (finite and small) and ρ_p (large) are also given. It is noted that these characteristics do not saturate for large probe potential because the influence of the probe is felt to very great distances from the probe; the shielding due to the space-charge sheath is incomplete. A GRAPHITE HEATED NITROGEN WIND TUNNEL FOR CONTINUOUS OPERATION AT MACH NUMBERS UP TO 20, by R. P. Shreeve and S. M. Bogdonoff. [1962] [25]p. incl. illus. diagrs. table. (AF 49(638)465) Unclassified

Published in Advances in Hypervelocity Techniques; Proc. of the Second Symposium, Denver, Colo. (Mar. 20-21, 1962), ed. by A. M. Krill. New York, Plenum Press [1962] p. 1-25.

Various forms of heaters have been used to preheat the test gas and thus prevent condensation from occurring in the nozzles of wind tunnels at Mach numbers greater than 5. By using heaters, conventional wind tunnel techniques have been used at Mach numbers up to about 12 in air. For higher Mach numbers, there exists a serious problem of obtaining nonoxidizing heater materials to obtain stagnation temperatures exceeding 2,800°R while operating at high stagnation pressures. The oxidation problem was avoided by using nitorgen as the test gas (since it is diatomic and very similar to air) with graphite as the heater material. A simple graphite resistance heating element has been developed which has been used regularly to supply steady gas total temperatures in excess of 5,000°R at total pressures up to about 1,000 psi. With these stagnation conditions, condensation would be avoided in an expansion of the gas in the nozzle to a test section Mach number of greater than 20. The system has been designed for continuous operation and is currently limited only by the capacity of the auxiliary equipment.

EVALUATION OF SWIRL ATOMIZER SPRAY CHARACTERISTICS BY A LIGHT SCATTERING TECHNIQUE, by N. Cohen and M. Webb. Feb. 8, 1962 [70]p. incl. illus. diagrs. (Aeronautical Engineering Lab. rept. no. 597) (AFOSR-2525) (AF 49(638)938) AD 274968 Unclassified

The Sauter mean diameter of the droplets produced by a swirl-type atomizer was measured over a wide range of injector pressure drop, ambient gas density, and ambient gas viscosity. The measurements were employing the optical (light scattering) technique developed at Princeton by Dobbins (item no. PRL 04:003, Vol. II). Repeatability of results was established within the experimental error, which was found to be reasonable despite the numerous but small systematic errors associated with the measurements. It was established that the light scattering technique could be conveniently applied to droplet measurements.

RESEARCH ON SOLID PROPELLANT COMBUSTION INSTABILITY, by R. H. W. Waesche and J. Wenograd. Final progress rept. May 1, 1961-Apr. 30, 1962. Aug. 3, 1962 [10]p. incl. diagrs. (Aeronautical Engineering rept. no. 564) (AFOSR-3277) (AF 49(638)-1073) AD 284238 Unclassified

The complex interaction of an oscillating pressure field with the flame of a burning solid propellant was studied. An understanding of this interaction is a basic necessity in the elucidation of the fundamental physicochemical processes governing the acoustic instability of solid propellant rocket motors. An oscillator-driver capable of subjecting a burning solid propellant surface to suitable pressure oscillations was developed. Theoretical consideration of the connection between the burning rate response function of a solid propellant and the acoustic admittance of the surface lead to the conclusion that at low frequency the product gas is emitted isothermally rather than isentropically. This necessitates a change is the relationship between the burning rate response function and the acoustic admittance.

TURBULENCE EFFECTS IN CHEMICAL REACTION KINETICS MEASUREMENTS, by I. Glassman and I. J. Eberstein. [1962] [3]p. incl. diagrs. refs. (AFOSR-J1012) (AF AFOSR-62-90) AD 417862 Unclassified

Presented at Seventeenth annual meeting of the Amer. Rocket Soc., Los Angeles, Calif., Nov. 13-18, 1962.

Also published in AIAA Jour., v. 1: 1424-1426, June 1963.

Possible sources of error that may arise in chemical kinetic measurements due to turbulent fluctuations are examined. The interest in the problem stems from the use of a flow reactor for the measurement of chemical reaction rates, on the assumption that steady-state kinetics prevail in the reactor. The ways in which turbulence may effect the reaction rate are defined, and variation of the rate with respect to temperature is established.

RED GIANTS OF POPULATION II. II, by M. Schwarzschild and R. Härm. [1962] [8]p. incl. diagrs. tables. (AFOSR-J300) (AF 49(638)298) AD 408038 Unclassified

Also published in Astrophys. Jour., v. 136: 158-165, July 1962.

In continuation of the work described in Paper I of this series (item no. 2508, Vol. VI) a sequence of 70 core models has been constructed for a red giant of population II, covering the helium flash. This phenomenon occurs when helium-burning starts in the contracting core. Because of the high degeneracy in the core, the new energy source causes heating, not an expansion. The rise of the temperature accelerates the helium-burning, and thus a thermal runaway occurs, which terminates only when the core becomes non-degenerate. Subsequent helium-burning causes rapid expansion and cooling. At the peak of the helium flash the temperature reaches over 300 million degrees. The rate of energy liberation at this peak corresponds to about 10^{12} solar luminosities. Practically none of this energy penetrates the thermal blanket of the nondegenerate outer layers of the helium core. The evolution at the peak is so fast that the time interval between successive numerical models had to be reduced to as low as 2 sec.

RED GIANTS OF POPULATION II. I, by M. Schwarzschild and H. Selberg. [1962] [8]p. incl. diagrs. tables. (AFOSR-J301) (AF 49(638)298) AD 408039 Unclassified

Also published in Astrophys. Jour., v. 136. 150-157, July 1962.

The present model sequence, which stops just at the onset of helium-burning, is being published (even though it is 3 yr old and shows satisfactory agreement with that published already by Haselgrove and Hoyle) in part to give more detailed numerical data than these authors have given, and in part to form a basis for a more recent investigation (Schwarzschild and Harm 1961), in which the helium flash was followed through in detail and which is to be described more thoroughly in the second paper of this series. The aim of the present work is solely the investigation of the physical development of the inner portions of population II red giants. Accordingly, the structure of the outer convective envelope was approximated by simple formulae of low accuracy. This has the consequence that the radii of the models derived, as well as their positions in the Hertzsprung-Russell diagram, cannot be very precise. (Contractor's abstract)

FORMATION AND DISSOLUTION OF PLATINUM OXIDE FILM: MECHANISM AND KINETICS, by S. W. Feldberg, C. G. Enke, and C. E. Bricker. [1962] [9]p. incl. diagrs. tables, refs. (AFOSR-J896) (AF 49(638)467) Unclassified

Presented at meeting of the Electrochem. Soc., Los Angeles, Calif., May 6-10, 1962.

Also published in Jour. Electrochem. Soc., v. 110: 826-834, July 1963.

Oxide film formation on a smooth platinum electrode in perchloric acid solution has been studied as a function of potential, current, time, and electrode history, using constant current and controlled potential techniques. Anodic film formation proceeds through 2 single electron steps: a slow step followed by a fast (reversible) one. During film reduction, the fast step occurs first, followed by the slow step. In the case of constant current reduction, the slow step does not occur, and the film is exactly half-reduced. Complete reduction requires several hours at a controlled potential. Three electrode states are thus clearly defined: oxidized, half-reduced (active), and completely reduced or clean. A single kinetic equation quantitatively relates the current, potential, and time parameters, predicts the initial rate of open-circuit potential decay following film formation, and strongly suggests that the oxide is a chemisorbed film.

ELECTROCHEMISTRY OF FILMS, by C. G. Enke. Final rept. Oct. 7, 1960-Oct. 31, 1962. 8p. incl. diagrs. (AFOSR-4876) (AF 19(638)973) AD 416507 Unclassified

The work on the silver-silver chloride system using the stabilized dc operational amplifiers started by applying a current step to a silver electrode and observing the potential change as a function of time. The formation of a silver chloride film was found to be a fast and reversible reaction. Several interesting phenomena were observed. A peak in the potential, when applying an anodic current to a clean electrode, was noted; this is thought to be caused by the nucleation of silver chloride islands on the electrode. Secondly, a very large capacitance was observed; this could be caused by either a much larger electrode area than calculated or to specific adsorption of reactant, or both. Finally it was observed that the film passivates when an anodic current is run for a long period of time. The electrode under a microscope was found to consist of a layer of porous silver. This would give a large surface area and partly explain the large capacitances observed. The data taken on the completed apparatus indicated a value for the double layer capacitance on a silver

electrode of approximately 60 ma/cm^2. A preliminary set of runs to determine the kinetics of the silver chloride reaction gave straight line plots according to theory, but the slopes of the lines were not the same for the various values of the currents used.

ENTIRE FUNCTIONS IN SEVERAL VARIABLES WITH CONSTANT ABSOLUTE VALUES ON A CIRCULAR UNIQUENESS SET, by S. Bochner. [1961] [5]p. (AFOSR-J324) (AF 49(638)578) Unclassified

Also published in Proc. Amer. Math. Soc., v. 13: 117-120, Feb. 1962.

The author generalizes a result of R. Benjanic and W. Stoll in proving that if for an entire function we have $|f(\zeta)| = 1$ on a set S then f(z) is a homogeneous polynomial. The general point set S has the following properties: (1) S is circular, that is, if $(\zeta_1, \ldots, \zeta_n) \in S$, then also $(\zeta_1 t, \ldots, \zeta_n t) \in S$ for any $|t| = 1$; (2) S is connected; (3) S is a uniqueness set for entire functions, in the sense that if f(z) is 0 on S it is $\equiv 0$. The author obtains the precise function of f and applies his results to definite functions in the matrix space.

THE ROLE OF MATHEMATICS IN THE RISE OF MECHANICS, by S. Bochner. [1962] [18]p. (AFOSR-J326) (AF 49(638)578) Unclassified

Also published in Amer. Scientist, v. 50: 294-311, June 1962.

Some observations are made on the mathematical nature of mechanics. The Greeks had a systematic mathematical astronomy but outside of this they seemingly did not arrive at a theoretical mechanics or theoretical physics that was equal in status to their mathematics. Their mechanics was only an assortment of achievements. Modern mechanics came into being soon after the Renaissance. The seventeenth century in mechanics extended from Stevin to Newton and culminated in Newton's Principia. The eighteenth century extended from Newton and Leibniz to Lagrange and culminated in his Mecanique analytique, the nineteenth century in mechanics extended from Lagrange and Laplace up to the stirrings of quantum theory in 1900. In the twentieth century, the leading new theories of mechanics became more than before, direct and full representatives of the new physical theories of which they are a part and can hardly be isolated from them for separate analyses. To characterize them: the seventeenth century was an age of revelation, the eighteenth century was an age of patristic organization, and the nineteenth century was an age of canonical legislation.

PSYCHOPHYSICS OF TIME-VARIANT STIMULI: THE ABSOLUTE THRESHOLD FOR ACCELERATED MOTION, by R. D. L. Filion. [1962] [45]p. incl. diagrs. tables, refs. (AFOSR-2521) (AF 49(638)381) Unclassified

The utility of basic threshold determinations for accelerated motion was noted, especially within the context of a servo-system model of behavior which emphasized the sensitivity of organisms to time-variant stimuli. Thresholds were obtained using both accelerated and constant-velocity motion displayed on an oscilloscope. It was found that the absolute threshold for acceleration, and the difference threshold for velocities resulting from accelerated velocity, were unusually high. Graphic analysis showed that neither a fixed value of acceleration, for a fixed velocity increment, nor a constant Weber fraction $\frac{(\Delta V)}{V}$ could account for the threshold values obtained under all conditions of display size and initial velocity. Suggestions and comments were made concerning modifications of experimental design for future research.

SITES OF INTERFERENCE IN A MULTI-UNIT IDENTIFICATION TASK, by R. M. Gagne and J. M. Fleming. [1962] [11]p. incl. diagrs. tables. (AF AFOSR-62-197) Unclassified

Published in Psychol. Repts., v. 11: 765-775, Dec. 1962.

A study was undertaken to determine the amount and location (site) of interference when new units are added to a previously learned identification task. The tasks used involved nonsense figures projected by slides as stimuli, and responses made to spring-return toggle switches on a sloping panel. Interference was measured as overt errors, and also in terms of time of response. A total of 5 groups of high-school boys, 10 in each group, participated in the experiment. An original set of 3 groups each learned a 4-unit identification task, followed by the learning of an augmented task composed of the original 4 units plus 2, plus 4, and plus 6, respectively. Two additional groups learned tasks as follows: 2 units, plus 4 units; 6 units, plus 4 units. The object was to measure how much interference occurred, in the second task, among the "old" units as compared with the "new" ones. The results were as follows: (1) Interference, as revealed by time scores, increased more rapidly within the "new" units than within the "old", as more were added to the original 4-unit task. (2) Interference among "new" units of the augmented task was in all cases significantly less than among the same number of units in original learning, but increased at approximately the same rate with number of units, (3) As measured by overt errors, interference of the "intra-task" variety was moderate within the "old" units of the second task, highest within the "new" units. In contrast, importations between old and new units occurred with low frequency in both directions, and (4) The occurrence of interference was compared for 2 total tasks of 6 and 10 units, learned in the sequences 2 plus 4 and 4 plus 2; and 4 plus 6 and 6 plus 4. When the larger task was learned first, the amount of interference in the second (augmented) task was quite low. However, when the total interference was compared, no significant differences between the 2 different sequences were found. The results are discussed in terms of their general significance for the operation of interference in identification learning and for the efficiency of various learning sequences.

RHEOLOGY OF POLYTETRAFLUOROETHYLENE, by A. V. Tobolsky, D. Katz, and M. Takahashi. [1961] [7]p. incl. diagrs. tables. [AF 49(638)974] Unclassified

Published in Jour. Polymer. Sci., Part A, v. 1: 483-489, Jan. 1963.

The rheology of polytetrafluoroethylene above its melting point was studied by the technique of stress relaxation. The temperature shift for the maximum relaxation time at various temperatures fits the WLF equation, if the value of T_g is taken to be 110°C. Degradation of the polymer becomes appreciable above 380°C. Master stress relaxation curves were constructed from the data between 336° and 380°C. The continuous distribution of relaxation times was obtained, and also the discrete distribution of relaxation times by procedure X. The contribution of the maximum relaxation time to the total flow viscosity indicates that the molecular weight distribution of the sample used was narrow.

GRAVITATIONAL FIELD ENERGY AND g_{00}, by C. W. Misner. [1962] [12]p. incl. refs. (AFOSR-4529) (AF 49(638)304) Unclassified

Also published in Phys. Rev., v. 130: 1590-1594, May 15, 1963.

It is shown that one of the family of "generalized energy density" definitions being investigated by Komar, one for which the generalized energy density is made positive definite by use of minimal surfaces, leads to a total "generalized energy". This "generalized energy" is: (a) undefinable for closed universes, (b) not conserved for some asymptotically flat spaces, and (c) not the correct total energy for the Oppenheimer-Snyder collapsing star metric where the metric in a neighborhood of infinity is identically the Schwarzschild metric.

WAVES NEWTONIAN FIELDS, AND COORDINATE F FUNCTIONS, by C. W. Misner. July 1962, 22p. incl. refs. (AFOSR-4530) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)304 and National Science Foundation) Unclassified

Presented at Conf. on Relativistic Theories of Gravitation, Warsaw (Poland), July 1962.

Three topics are discussed concerning fields in the neighborhood of infinity in asymptotically flat spaces: (1) the wave-front theorem which shows that the flux of energy decreases faster than $1/r^3$ on any t = constant surface of an asymptotically rectangular coordinate system in an asymptotically flat space; (2) the identification of total energy-momentum P^μ and the coordinate invariant P^μ/r asymptotic behavior of specific "Newtonian" components of the metric; (3) the definition of "gauge scalar" wave amplitudes which describe gravitation radiation escaping to infinity (or short waves in any weak field region). In addition there is brief mention of quantum theory and some indications that spacelike surfaces might exist in a quantized geometry.

COMPLEX ANGULAR MOMENTA IN POTENTIAL SCATTERING, by M. Froissart. [1962] [6]p. (AFOSR-5115) (AF 49(638)304) Unclassified

Also published in Jour. Math. Phys., v. 3: 922-927, Sept.-Oct. 1962.

The S matrix associated with a central potential is shown to be meromorphic in the energy and angular momentum variables under very broad conditions. The domain of meromorphy contains the product of a domain in the energy variable by a domain in the angular variable. The former (latter) domain has a very simple connection with the domain of meromorphy of the Laplace (Mellin) transform of the potential with respect to the radius. (Contractor's abstract)

THREE-DIMENSIONAL GEOMETRY AS CARRIER OF INFORMATION ABOUT TIME, by R. F. Baierlein, D. H. Sharp, and J. A. Wheeler. [1962] [2]p. (AFOSR-J786) (AF 49(638)304) AD 407730 Unclassified

Also published in Phys. Rev., v. 126: 1864-1865, June 1, 1962.

A geometry of curved empty space which evolves in time in accordance with Einstein's field equations may be termed a "geometrodynamical history." Such a history can be specified by giving on a 3-dimensional space-like hypersurface ("initial surface") (1) the geometry intrinsic to this surface and (2) the extrinsic curvature of this surface. However, the intrinsic and extrinsic curvatures of the surface cannot be specified independently, but have to satisfy the initial value equations of Foures and Lichnerowicz (analogous to div E = O and div B = O in electromagnetism). An alternate way of specifying a history is outlined in which the intrinsic geometry is given freely on each of 2 hypersurfaces, and nothing is specified as to the extrinsic curvature of either. In the special case in which the 2 so-specified 3-geometries are nearly alike--a procedure is outlined in order to find the following from Einstein's equations: (1) the invariant space-time interval between an arbitrary point on one surface and a nearby point on the other surface (and thus the 4-geometry interior to the thin sandwich); (2) the extrinsic curvature of the sandwich; hence (via the rest of Einstein's equations) (3) the entire enveloping 4-geometry or geometrodynamical history); and finally (4) the time-like separation of the original surfaces and their location in spacetime. In this sense two 3-geometries carry latent information about time. (Contractor's abstract)

THE PROBLEM OF MEASUREMENT, by E. P. Wigner. [1962] [10]p. incl. diagr. refs. (AFOSR-J788) (AF 49-(638)304) AD 413381 Unclassified

Also published in Amer. Jour. Phys., v. 31: 6-15, Jan. 1963.

The standard theory of measurements in quantum mechanics is reviewed with special emphasis on the conceptual and epistemological implications. It is concluded that the standard theory remains the only one which is compatible with present quantum mechanics. Hence, if one wants to avoid the conclusion that quantum mechanics only gives probability connections between

subsequent observations, the quantum-mechanical equations would have to be modified. Particular attention is paid to the case that the measuring apparatus is macroscopic and its state vector not accurately known before the measurement. (Contractor's abstract)

THE UNIVERSE IN THE LIGHT OF GENERAL RELATIVITY, by J. A. Wheeler. [1962] [37]p. (AFOSR-J789) (AF 49(638)304) AD 411442 Unclassified

Also published in Monist, v. 47: 40-76, Fall 1962.

It is noted that in various symposia on relativity there are 2 trends: (1) Interest has fallen in inventing new theories of gravitation, spacetime, and the expanding universe; and (2) Increasing numbers of investigators share the conviction that Einstein's 1915-1916 analysis of the curvature of space by energy is a unique theory of unrivalled scope and reasonableness, against which no objection of principle or observation has even been sustained, and out of which one should now try to read the deeper meaning and consequences. It is concluded that general relativity plus the quantum principle, where necessary supplies a rationale for cosmology. The study of the dynamical evolution of a geometrodynamical model universe has already provided some guidance in understanding the properties of the real universe. However, there are many fascinating and still unsolved questions of principle connected with the development of such a curved empty space. Further straight-forward analysis of the consequences of general relativity and the quantum principle appears to be the route most likely to lead to a clearing up of these issues and to new insight into the past and future of the universe.

THE SCIENTIST: HIS INCREASED RESPONSIBILITIES, by M. W. Wigner and E. P. Wigner. [1962] [7]p. (AFOSR-J790) (AF 49(638)304) AD 411286 Unclassified

Published in Hungarian Quart., v. 3: 1-7, Apr.-July 1962.

The new tasks confronting physical scientists can be grouped rather loosely into 3 categories, none of which can be completely separated from the others nor from the scientist's traditional occupations of teaching and research. They comprise first, technical work for the economy and defense of the country; secondly, service in governmental positions or committees, furnishing information and advice of a scientific nature concerning new projects problems in international tensions, and finally, participation and leadership in efforts to lessen international tensions, a responsibility arising from the unique position of the scientist in world affairs.

PIONIC NUCLEI, by R. F. Peierls and S. B. Treiman. [1962] [3]p. (AFOSR-J792) (AF 49(638)304) AD 413691 Unclassified

Also published in Phys. Rev. Ltrs., v. 8: 339-341, Apr. 1962.

Explanations of the near equality of the η^0 and ζ masses are presented. The η^0 and ζ are interpreted as loosely-bound nuclei made up of 4π, with quantum numbers that forbid $2\text{-}\pi$ and $3\text{-}\pi$ decays in the absence of electromagnetic interactions. For the η^0, this is consistent with the 0^{-+} quantum number assignment. The quantum numbers 0^{++} (I = 1) are assigned to the ζ, and implications are discussed.

REGGE POLES IN HIGH-ENERGY ELECTRON SCATTERING, by R. Blankenbecler, L. F. Cook, Jr., and M. L. Goldberger. [1962] [13]p. incl. diagrs. refs. (AFOSR-J811) (AF 49(638)304) AD 413504 Unclassified

Also published in Phys. Rev., v. 128: 2440-2454, Dec. 1, 1962.

The possibility that the photon is described by a Regge trajectory is considered, and the effect of this assumption on the analysis of electron-pion, electron-nucleon, and electron-helium scattering is examined in some detail. Partial-wave projections for the various amplitudes are made in the annihilation channel, and a multiparticle unitarity condition is formally imposed by use of the N/D matrix formulation. Since the photon does not have a fixed spin of one, the spin matrix structure is considerably more complicated than in the conventional theory. The amplitudes are written in terms of the Regge poles corresponding to the photon, ρ-ω meson, etc., and the resulting cross sections are given in the interesting high-energy limit. The essential change due to the Regge behavior of the photon is an over-all nonintegral power of the energy occurring in the cross section. The effect of this factor can be experimentally tested and this possibility is discussed.

ELEMENTARY PARTICLES OF CONVENTIONAL FIELD THEORY AS REGGE POLES, by M. Gell-Mann and M. L. Goldberger. [1962] [3]p. incl. refs. (AFOSR-J818) (AF 49(638)304) AD 413697 Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 275-277, Sept. 15, 1962.

Conventional field theory is examined in low order perturbation theory. To all the fourth order of PS-PS pion-nucleon theory, it is shown that all the angular momentum poles vary with energy except for the nucleon pole. However, the Regge nature of the nucleon is implied from the study of the radiative corrections to it by a virtual neutral vector meson. The paths of the trajectories so calculated show many of the characteristics expected from the Regge formalism. This indicates that the Regge pole boundary conditions might be contained in conventional field theory as well as in the dispersion relation approach.

HIGH-ENERGY GAMMA RAYS AND LOW-ENERGY PROTONS AND DEUTERONS FROM C^{12} + p FOR E_p = 14-20 MEV, by E. K. Warburton and H. O. Funsten. [1962] [10]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)920], Atomic Energy Commission, and Higgins Scientific Trust Fund) Unclassified

Published in Phys. Rev., v. 128: 1810-1819, Nov. 15, 1962.

The 90° yield of gamma rays from proton bombardment of C^{12} was studied for proton energies between 14 and 20 mev. Gamma rays are observed corresponding to the ground-state decay of the C^{12} 4.43-, 12.7-, and 15.1-mev levels and from the $C^{12}(p,\gamma 0)N^{13}$ reaction. Three resonances are observed in the yield of the 15.1-mev gamma ray. These resonances correspond to N^{13} levels at 18.1, 18.65, and 19.8 mev. The N^{13} 18.1-mev level has a width of 330 ± 100 kev in the center-of-mass system. The other 2 levels have widths less than 200 kev. The yields of the 4.43- and 12.7-mev gamma rays reveal little or no structure. The excitation function of the $C^{12}(p,\gamma 0)N^{13}$ reaction also shows little structure. Angular distributions and absolute integrated cross sections for the $C^{12}(p,p')C^{12}$ reaction are given for the C^{12} 12.7-mev level with E_p = 17.5, 19.5, and 20 mev and for the C^{12} 15.1-mev level with E_p = 19.5 mev. The latter is approximately symmetrical about 90° which suggests possible contribution from the compound nucleus reaction mechanism. Comparison of the cross sections for $C^{12}(p,p'\gamma)C^{12}$ and $C^{12}(p,p')C^{12}$ gives $\Gamma_\gamma/\Gamma = 0.027 \pm 0.007$ for the C^{12} 12.7-mev state and 1.15 ± 0.3 for the C^{12} 15.1-mev state. The yield of the $C^{12}(p,d)C^{11}$ reaction was measured by the stacked foil technique from threshold (E_p = 17.85 mev) to 19.8 mev. There is no evidence for structure. Angular distributions are given for the $C^{12}(p,d)C^{11}$ reaction for E_p = 19.3, 19.5, and 20.0 mev. The results are compared to previous work on the $B^{11}(d,n)C^{12}$ reaction and it is concluded that the contribution of the compound nucleus reaction mechanism to either reaction is most likely small for the bombarding energies in question. STUDY OF SPORADIC E AND OTHER FORMS OF IONIZATION, by [B. Dueno]. Interim final rept. [1962] [8]p. incl. table. (AFOSR-3278) (AF 49(638)172) Unclassified

A Granger Model 902 Step Frequency Ionospheric Sounder was used to record data, every 5 min on 35 mm film, which was compared to data on the total component of the earth's magnetic field obtained by means of a Varian Rubidium Vapor Magnetometer. Preliminary results seem to indicate that there exists a relationship between sizable magnetic disturbances and Sporadic E. First, the solar magnetic variation on quiet days of the geomagnetic components in the middle latitudes are augmented during the summer season, and second, Sporadic E as observed by backscatter from Puerto Rico has been found to be most prevalent in the due south direction thus suggesting some sort of geomagnetic control. One clue that Sporadic E may not be independent of magnetic activity was furnished by the radio fade out which occurred on Apr. 27, 1962 due to a solar flare. This caused a depression of the magnetic field of approximately 4 γ.

THE INFRARED SPECTRA OF PRASEODYMIUM OXIDE

AND PRASEODYMIUM CARBONATE, by A. F. Clifford and P. A. Faeth. [1962] [12]p. incl. diagrs. table, refs. (AF 18(603)45) Unclassified

Published in Rare Earth Research; Proc. of the Second Conf., Glenwood Springs, Colo. (Sept. 24-27, 1961), ed. by J. F. Nachman and C. E. Lundin. Gordon and Breach, New York, 1962. p. 35-46.

Several samples of PrO_x have been prepared which have x values $1.50 < x < 1.83$; by decomposing $PrO_{1.83}$ in vacuo any x value could be prepared. The preparations were analyzed for infrared-absorption acitvity in the region 2-16 μ. An absorption band at about 15 microns appeared for all samples if the specimens were permitted access to the atmosphere. No band appeared in this region if the samples were analyzed immediately after their preparation. Infrared analysis of samples of praseodymium carbonate and praseodymium hydroxide showed absorption activity in the same regions where activity was noted for air-exposed praseodymium oxide samples. It is concluded that the absorption band at 15 μ for the air-exposed oxides is due to hydration-carbonation effects. The band is probably indicative of a metal-oxygen bond as proposed by Meloche for oxide systems; the band might also be due to a chemisorbed species (CO_2 or H_2O). A sample of praseodymium carbonate was decomposed in vacuo and the spectrum of the resultant compound was observed. A differential thermal analysis (DTA) of the carbonate in air showed that the dehydration probably is complete below 300°; the carbonate loses CO_2 at 470° and 630°C and is subsequently converted to the oxide Pr_6O_{11} near 400°C.

APPLICATION OF COORDINATION KINETICS TO THE SEPARATION OF METAL IONS: COORDINATION KINETIC CHROMATOGRAPHY, by D. W. Margerum. Final rept. Mar. 1962, 10p. incl. refs. (AFOSR-2721) (AF 49(638)60) Unclassified

Investigations of the kinetics of coordination complexes have yielded the discovery of the first coordination chain reaction. These chain reactions offer the possibility of metal complexes serving as ligand selectors and chemical amplifiers. Such reactions may be of great importance in ascertaining the role of trace metals in metalloenzymatic systems. The coordination chain reactions also may be utilized in ultratrace analysis of ligands of metal ions because of the extreme sensitivity of the reaction rate to the concentration of these stable chain propagations. Multidentate complexes with steric hindrance are found which are not attacked by other metal ions or other multidentate complexes. These complexes appear to be among those most suitable for kinetic separations and the initially proposed application still looks promising as a general technique; however, in the course of this study other applications of the coordination chain reactions to both analyses and to an examination of the role of metals in enzymatic systems appears to be of even greater importance.

COORDINATION KINETICS BY ION EXCHANGE, by D. W. Margerum and B. A. Zabin. [1962] [5]p. incl. diagrs. refs. (AFOSR-J7) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)60 and Monsanto Chemical Co.) AD 400087 Unclassified

Also published in Jour. Phys. Chem., v. 66: 2214-2218, Nov. 1962

Cation-exchange resin is used as a metal ion buffer to give very low but constant concentrations of metal ions in order to control the rate of fast coordination reactions in the solution phase. The rate of formation of nickel(II)-EDTA is used to test 2 variations of the system. Particle diffusion rates limit the magnitude of the coordination rate constants which can be measured. The fraction of resin in the hydrogen ion form compared to sodium ion form has an unexpectedly large effect on the diffusion of nickel ion under conditions of low nickel loading where the coupled resin diffusion process should depend largely on the self-diffusion constant of nickel ion.

COORDINATION CHAIN REACTIONS. EXCHANGE BETWEEN ETHYLENEDIAMINETETRACETATOCUPRATE(II) AND TRIETHYLENETETRAMINENICKEL(II), by D. C. Olson and D. W. Margerum. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-J693) (AF 49(638)60) AD 415063 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 85: 297-303, Feb. 5, 1963.

A chain reaction mechanism is proposed for the exchange

of triethylenetetramine and ethylenediaminetetraacetate between their nickel(II) and copper(II) complex. This exchange proceeds at a much faster rate than the aqueous dissociation rate of these complexes. The chain reaction is initiated by a trace of either of these multidentate ligands. In the chain-propagation steps, one multidentate ligand displaces another from the metal complex and vice versa. Very sensitive control of the reaction rate is possible because the chain propagators are stable ligands whose concentration can be adjusted. Metal ions terminate the chain and the reaction can be used for trace metal determination.

Purdue U. Dept. of Chemistry, Lafayette, Ind.

MULTIDENTATE LIGAND KINETICS. III. THE FORMATION AND DISSOCIATION OF TRIETHYLENETETRAMINENICKEL(II) AND TETRAETHYLENEPENTAMINENICKEL(II) AND THEIR EXCHANGE WITH RADIONICKEL ION, by D. W. Margerum, D. B. Rorabacher, and J. F. G. Clarke, Jr. Oct. 1962 [11]p. incl. diagrs. tables, refs. (AFOSR-64-1405) (AF 49(638)60) AD 444458 Unclassified

Also published in Inorg. Chem., v. 2: 667-677, Aug. 1963.

The kinetics of the formation and dissociation reactions of triethylenetetraminenickel(II) and of tetraethylenepentaminenickel(II) as well as their exchange reactions with radionickel ion have been studied at 25°, μ = 0.1 pH 4.5 to 7.5, using spectrophotometric, titrigraphic, and radiochemical methods. It is proposed that these 4- and 5-dentate ligands react with nickel by the stepwise formation of coordinate bonds, where the rate-determining step is the formation of the first Ni-N bond and the subsequent bonding is rapid. Similarly, the dissociation mechanism proposed involves the preequilibration of intermediately bonded species leading to the rate step of breaking the last Ni-N bond. On this basis, it is possible to estimate the equilibrium constants for each of the reaction intermediates. The differences in the reaction-rate constants of the straight-chain polyamines (having from 2 to 6 nitrogens), as well as their protonated species, can be attributed entirely to statistical and electrostatic effects. This model should be applicable to complexes containing other metal ions and other unbranched multidentate ligands. (Contractor's abstract)

SOLVATION AS A FACTOR IN THE ALKYLATION OF AMBIDENT ANIONS: THE IMPORTANCE OF THE HYDROGEN BONDING CAPACITY OF THE SOLVENT, by N. Kornblum, P. J. Berrigan, and W. J. Le Noble. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-1831) (AF 49(638)324) AD 416521 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 85: 1141-1147, Apr. 20, 1963.

When solutions of the salts of phenol or p-alkylphenols in a wide variety of solvents are alkylated with allyl or benzyl halides, the ether (oxygen alkylation) is the sole product. However, when these reactions are conducted in water, phenol or fluorinated alcohols, substantial amounts of o- and p-alkylated products result. Neither carbon nor oxygen alkylation is a carbonium ion process but, rather, these are second-order nucleophilic displacements. An explanation for the fact that water, phenol and fluorinated alcohols foster carbon alkylation, which invokes their strong hydrogen bonding capabilities, is proposed.

SOLVATION AS A FACTOR IN THE ALKYLATION OF AMBIDENT ANIONS: THE IMPORTANCE OF THE DIELECTRIC FACTOR, by N. Kornblum, R. Seltzer, and P. Haberfield. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-J845) (AF 49(638)324) Unclassified

Also published in Jour. Amer. Chem. Soc., v. 85: 1148-1154, Apr. 20, 1963.

Solutions of sodium 8-naphthoxide in a variety of solvents have been alkylated with benzyl bromide, methyl iodide and n-propyl bromide. The results of these studies provide a clear demonstration of the ability of the solvent to decide the course of an ambident anion reaction. A discussion of solvent effects on the course of ambident anion processes is presented which distinguishes between protic and aprotic solvents and which emphasizes the utility of this distinction. As a consequence, it is now possible to correlate the dielectric constant of an aprotic solvent with its influence on the alkylation process. Finally, the interdependence of solvent and cation effects is explicitly recognized and employed so that insights concerning the ability of solvents to determine the course of ambident anion reactions are obtained.

A CONVENIENT SYNTHESIS OF AROMATIC AND ALIPHATIC SODIUM SULFINATES, by W. E. Truce and F. E. Roberts, Jr. [1962] [2]p. incl. refs. (AFOSR-J374) (AF 49(638)531) AD 408602 Unclassified

Also published in Jour. Org. Chem., v. 28: 593-594, Feb. 1963.

A method of converting thiols to the corresponding Na sulfinates in good yield was reported. The thiols were prepared from acrylonitrile. The β-aryl- or alkylthiopropionitriles were oxidized to the sulfones in good yield. β-p-tolylsulfonylpropionitrile (4g) suspended in 50 ml of alcohol was treated with 10 ml of alcohol, 0.44g Na, and 1.45g 1-propanethiol. The mixture was refluxed 5 hr, evaporated, and the solid suspended in Et_2O and filtered off to give 3.1g of Na 1-propanethiolate. Acidification gave the free sulfinic acid, mp 81-83°. The ethereal residue contained β-propylthiopropionitrile. Similarly, β-propylsulfonyl-propionitrile gave 58% benzyl Pr sulfone, mp 87-89°. Thus reaction of Et β-p-tolylsulfonylacrylate with Na thiophenoxide gave a mixture of the Et cis- and trans-β-phenylthioacrylate.

CRYSTALLINE LITHIOMETHYLTRIMETHYLSILANE AND SOME OF ITS PROPERTIES, by J. W. Connolly and G. Urry [1962] [2]p. (AF 49(638)927) Unclassified

Published in Inorg. Chem., v. 2: 645-646, June 1963.

The reaction of Li and chloromethyltrimethylsilane in 2-methylpentane gives $LiCH_2SiMe_3$ (I) in about 60% yield. Pure crystalline I is obtained by sublimation at 100°/10^{-5} mm, mp 112°. The liquid is stable to 130°, above that if decomposes slowly into tetramethylsilane (II) and a nonvolatile stable pyrophoric white solid. I reacts with MeOH to give equimolar quantities of pure II. Molecular weight of 92 was found by isopiestic method. I in benzene solution exhibits nuclear magnetic resonance of 2 proton resonances in a ratio of 4.5 to 1 with an internal shift of -2.16 ppm from Me to CH_2 protons. I reacts readily with chloromethyltrimethylsilane to form mainly 2,2,5,5-tetramethyl-2,5-disilahexane (III) and II with some 2,2,4,4-tetramethyl-2,4-disilahexane and less volatile products. I, treated with $CoCl_2$ yields II and III as the only products.

IMPULSE APPROXIMATION CALCULATION OF HIGH-ENERGY DEUTERON-DEUTERON ELASTIC SCATTERING, by A. Tubis and B. Chern. [1962] [5]p. incl. diagrs. refs. (AFOSR-J1252) [AF AFOSR-62-132] AD 424318 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 358, Apr. 23, 1962.

Also published in Phys. Rev., v. 128: 1352-1356, Nov. 1, 1962.

The high-energy deuteron-deuteron elastic scattering cross section and vector polarization was calculated on the basis of the impulse approximation with the neglect of off-energy-shell effects in the nucleon-nucleon scattering matrix and effects of multiple scattering. The results are in terms of the free nucleon-nucleon scattering amplitudes and an appropriate Fourier transform of the deuteron wave function. For simplicity, the D-state component of the deuteron was neglected throughout this calculation. Numerical results are given for 312 and 620 mev. At the 2 energies considered, the results for the cross section are comparable to those for nucleon-deuteron scattering. The validity of the approximations used and possible improvements of the calculation are discussed. (Contractor's abstract)

ISOTOPIC SPIN IN $K \to 3\pi$, by G. Barton, C. Kacser, and S. P. Rosen. [1962] [4]p. (AFOSR-J1611) [AF AFOSR-62-132] AD 427620 Unclassified

Also published in Phys. Rev., v. 130: 783-786, Apr. 15, 1963.

Because recent data on $K_2^0 \to \pi^+\pi^-\pi^0$ are at variance with the $\Delta T = 1/2$ rule while the data on $K^+ \to 3\pi$ are not, the charge space kinematics of $K \to 3\pi$ are re-examined. Matrix elements are assumed to be at most linearly dependent on the usual variables S_i, and it follows that only 4 of the 7 possible 3π states can contribute to the decay. Of these states, 2 have $T = 1$, the third has $T = 2$ and the fourth $T = 3$. The possible values of ΔT are 1/2, 3/2, 5/2, 7/2, and accordingly, the most general interaction Hamiltonian is written as the sum of 4 parts $H_{n/2}$, each corresponding to $\Delta T = n/2$ ($n = 1, 3, 5, 7$). It is then possible to express the matrix elements, rates and spectra of all the modes of $K \to 3\pi$ in terms of the reduced matrix elements of $H_{n/2}$ between the four 3π states and the K meson. The analysis reveals that, provided the branching ratio of $K_2^0 \to 3\pi^0$ to $K_2^0 \to \pi^+\pi^-\pi^0$ is 3/2, the present data are consistent with an interaction Hamiltonian containing only $\Delta T = 1/2$ and 3/2, and a 3π final state of isotopic spin one.

STABILITY CRITERIA FOR LONGITUDINAL PRESSURE OSCILLATIONS IN A ROCKET MOTOR, by S. N. B. Murthy, J. R. Osborn, and S. K. Srinath. [1962] [48]p. incl. diagrs. (AF AFOSR-62-360) Unclassified

By treating the rocket motor as a constant diameter duct with a finite width of combustion zone located between 2 uniform regions and with finite wave transmission coefficients at the nozzle and the injector ends, stability criteria are established for longitudinal pressure oscillations. It is shown that while the energy release rate per unit width of the combustion zone is critical in determining whether the motor will be stable, the location of the combustion zone in the motor, the overall length of the motor and the total amount of energy released influence the performance of the motor in a complex fashion. PLASMA ACCELERATION BY A 2 4 KMC GRADIENT ELECTRIC FIELD, by H. W. Hendel, D. D'Agostini and others. Sept. 12, 1962 [26]p. incl. diagrs. table. (Rept. no. [illegible]-1609) (AFOSR-4152) (AF 49(638)658) AD 285667 Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J. Nov. 28-Dec. 1, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 8: 175-176, Feb. 28, 1963.

Plasma velocities up to 2×10^6 cm/sec for Hg ions were measured for applied rf fields less than 200 v/cm at 140 and 330 mc and found to be in agreement with a theory developed on the basis of energy considerations. In recent work the applied frequency was raised to 2.4 kmc. Greater resolution of the velocity measurement was achieved by pulsing the accelerating rf field. The rf pulse time delay can be adjusted relative to the initiation of the plasma pulse to select a plasma volume element of critical density and thus accelerate to optimum velocity. The ion velocity was found to depend approximately linearly on the field strength. The plasma density in the 2.4 kmc experiments was higher than that of the previous experiments by a factor of about 100. The highest bulk ion velocity measured at 700 v/cm was 8×10^5 cm/sec. The new data, obtained at applied frequencies one order of magnitude higher than those previously employed and taken over a wider field strength range, are in good agreement with the theory when the functional dependence of the collision frequency upon plasma density and rf field strength is considered. In the range of the present experiments, the increase in collision frequency with increasing applied frequency reduces the gain in thrust expected from the use of a more dense plasma at a higher applied frequency. INSTABILITY OF A VORTEX SHEET IN NON-EQUILIBRIUM FLOWS, by K. C. Wang. [19 2] [6]p. incl. diagrs. refs. (AF 18(600)1591) Unclassified

Published in Phys. Fluids, v. 5: 1368-1373, Nov. 1962.

The stability of a plane vortex sheet between 2 uniform streams is examined with respect to small disturbances when the 2 media are relaxing diatomic gases (such as oxygen or nitrogen). For the equilibrium and frozen cases, the eigenvalue equation is identical in form with that of the conventional case, and the stability is decreased due to the relaxation. For the nonequilibrium case, the eigenvalue equation is complex and depends on the wavenumber of the disturbances; the vortex sheet is shown to be always unstable. (Contractor's abstract)

LINEARIZED DISSOCIATING GAS FLOW PAST SLENDER BODIES, by T. Y. Li and K. C. Wang. Jan. 1962 [35]p. incl. refs. (Rept. no. TR-AE-6201) (AFOSR-2048) (AF 49(638)977) AD 274318 Unclassified

An inviscid, compressible, linearized dissociating gas flow over slender bodies of general cross section is considered. Essentially it is an extension of the conventional slender body theory including the dissociation effects. Both supersonic and subsonic cases are examined. To the present approximation the lateral forces and moments are found the same as those for the conventional case, but there exist additional nonequilibrium terms in the drag expression. If the body is pointed at both ends, the nonequilibrium term is formally the same for both the supersonic and the subsonic cases except that the sign in the respective cases is just the opposite. Physical aspects of the nonequilibrium drag problem are briefly considered. These considerations show that in the subsonic case the nonequilibrium term represents a drag and in the supersonic case it is a thrust. The supersonic drag of slender bodies of revolution at small angle of attack has been calculated, including dissociation effects. (Contractor's abstract)

SUPERSONIC DRAG OF SLENDER BODIES IN A SIMPLE DIATOMIC DISSOCIATING GAS, by Z. S. Chang. Jan. 1962, 25p. incl. diagrs. tables, refs. (Rept. no. TR-AE-6205) (AFOSR-2163) (AF 49(638)977) AD 274359 Unclassified

Quantitative results of linear slender-body theory are treated. The drag of 2 cases is considered; a circular cone and a parabolic spindle. The extra drag due to nonequilibrium effects turns out to be appreciable in 1 case. For the case of the circular cone, the extra drag is positive, while for the case of the parabolic spindle, the extra drag is negative indicating that the nonequilibrium effects decrease the total drag.

STEADY SUBSONIC DRAG IN NONEQUILIBRIUM FLOW OF A DISSOCIATING GAS, by T. Y. Li and K. Kusukawa. [1962] [17]p. incl. diagrs. refs. (AFOSR-3527) (AF 49(638)977) Unclassified

Also published in Proc. 1962 Heat Transfer and Fluid Mechanics Inst., Washington U. Seattle (June 13-15, 1962), ed. by F. E. Ehlers, J. J. Kauzlarich and others. Stanford U. Press, 1962, p. 109-125.

Adopting the Lagrange approach, the dynamic behavior of a thermodynamic system consisting of a moving material element along a streamline, subjected to the effects of dissociation and recombination, is examined. A linear equation governing the variations of pressure and specific volume along a streamline has been obtained. This equation can be treated generally and its solution is applied to the calculation of the drag on an arbitrary body in steady adiabatic dissociating gas flow. The results show that: (1) Chemical relaxation effects cause a phase difference to exist between the variations of pressure and specific volume. As a consequence of this phase difference the body will experience a positive nonequilibrium drag in subsonic dissociating gas flow. This nonequilibrium drag is shown to be of the second order in perturbation quantities; and (2) The effect of irreversible entropy increase along the streamline is to contribute to the above mentioned nonequilibrium subsonic drag a correction term which is of the third order in perturbation quantities. MERCURIC HALIDES AS MOLTEN ELECTROLYTES: PHYSICAL PROPERTIES, VIBRATIONAL SPECTRA, CONSTITUTION, AND ELECTRICAL CONDUCTANCE, by G. J. Janz and J. D. E. McIntyre. [1962] [8]p. incl. illus. diagrs. tables, refs. (AFOSR-3804) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)978 and National Science Foundation) Unclassified

Also published in Jour. Electrochem. Soc., v. 109: 842-849, Sept. 1962.

Densities, viscosities, electrical conductances, and Raman spectra for $HgCl_2$, $HgBr_2$, and HgI_2, are reported from the melting points to the boiling points. In contrast to ionic fused salts, the energies of activation for electrical conductance are greater than those for viscous flow. Evidence for autocomplex formation is discussed. A model for these molten electrolytes is advanced in which the primary constituents are simple molecules together with the complex ionic species HgX^+ and HgX_3^-. The entropy of fusion shown to arise, in large part, from an increase of rotational freedom rather than positional randomization, and the cohesive intermolecular forces are of the dispersion and multipole type rather than coulombic as in highly ionic melts. The mechanisms of transport processes for the solid and liquid states of these salts are discussed in the light of concepts current for molten electrolytes. (Contractor's abstract)

STRUCTURE AND PHYSICAL PROPERTIES OF MOLTEN SALTS, by G. J. Janz. Final rept. Dec. 1, 1960-Nov. 30, 1962, 6p. (AFOSR-4564) (AF 49(638)978) Unclassified

The properties and structures of molten nitrates and mercuric halides have been characterized; the former are examples of highly ionic systems and the latter are predominantly molecular molten salts. Studies of molten salt-mixtures using the preceding both as solutes and solvents are in progress. An interesting result is that a molecular salt such as $HgCl_2$ can be readily 'dissolved' in fused salt solvents, and, depending on the solute-solvent interactions thus induced, the $HgCl_2$ may suffer a complete loss of the triatomic linear molecular species (characteristic of the pure salt in its molten state) or, again, may dissolve molecularly. Other studies with such mixtures, and investigations of the Group II halides, in progress, are surveyed in this report.

A MODIFIED INCREMENTAL STRAIN LAW FOR WORK-HARDENING MATERIALS, by W. H. Warner and G. H. Handelman. [1956] [15]p. (AFOSR-4980) (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(600)1586] and Wright Air Development Center) AD 416425 Unclassified

Also published in Quart. Jour. Mech. and Appl. Math., v. 9: 279-293, Sept. 1956.

A generalization of the incremental strain law given by Hodge, Prager, and Drucker is developed. The new law affords the possibility of several different types of loading regions in contrast to the single loading or unloading region of the older theories. The stress-strain relations can be explicitly inverted and minimum principles for the stress rates and strain rates proved in the manner of Greenberg. An absolute minimum principle corresponding to the differential equations of structural stability is developed. A particular evaluation of the coefficients indicates that the new law may have broader applications than the previous theory. (Contractor's abstract)

The small vibrations of a vertical pendulum consisting of a bob suspended from a wire are studied. The wire is assumed to be clamped at its upper end. This pendulum has an infinite number of vibration frequencies. These frequencies are determined when the stiffness of the wire is small. The frequencies are found to reduce to those of a flexible pendulum when the stiffness is zero, and these frequencies are evaluated. The expansion of the frequencies is also determined for arbitrary stiffness of the wire when its mass is small compared to that of the bob. Numerical results based upon the present analysis are given. (Contractor's abstract)

ANALYSIS OF THE DYNAMICS OF ELASTIC SYSTEMS. Final rept. Nov. 1, 1960-Oct. 31, 1962, 4p. (AFOSR-4555) (AF 49(638)962) AD 401179 Unclassified

The application of asymptotic methods to problems of elastic vibration and wave motion and the analysis of stochastic effects in the behavior of elastic structures was investigated. Two problems in elastic vibrations have been solved. One is concerned with the vibrations of a pendulum in which the elastic properties of the support rod are taken into account. The method of solution was based on an asymptotic expansion in terms of the small stiffness of the rod. Similarly, the transverse vibrations of a circular plate under tension were studied. The elastic stability of bars in which the cross-sectional dimensions are not small when compared with the length was analyzed. In the area of random effects, an analysis of the bending of columns by axial loads of random eccentricity was completed. The transverse vibrations of a taut string with randomly varying mass distribution were investigated. A somewhat similar problem concerning the longitudinal vibrations of an elastic bar whose cross-sectional area varies in a random manner was solved.

VIBRATIONS OF A RECTANGULAR PLATE WITH DISTRIBUTED ADDED MASS, by H. Cohen and G. [H]. Handelman. [1956] [11]p. incl. diagrs. (AFOSR-4675) [AF 49(638)962] AD 407865 Unclassified

Also published in Jour. Franklin Inst., v. 261: 319-329, Mar. 1956.

The problem studied is that of determining the lowest frequency of vibration of a rectangular plate, simply supported on 2 edges and free on the other two, and carrying a rigid mass of finite width running completely across the plate. Appropriate minimum principles are developed and approximate frequencies computed. The frequency may be either less or greater than that of the unloaded plate depending on the ratio of the physical parameters.

SPECTROSCOPIC STUDIES OF IMPLODING PLASMA RINGS IN DETONABLE GAS MIXTURES, by K. M. Foreman and M. E. Levy. July 30, 1962, [29]p. incl. illus. diagrs. (Rept. no. PPL-TR-62-16(865) (AFOSR-3973) (AF 49(638)552) AD 288098 Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 8: 167, Feb. 28, 1962. (Title varies)

Spectroscopic observations were made of the flow field behind a cylindrical hypersonic wave front resulting from an imploding electrical discharge into an initially low pressure quiescent gas. Sub-μsec resolved spectra were obtained by use of a quartz prism monochromator-photo-multiplier detector system with photographic recording of an oscilloscope displayed output signal. Electrically produced plasma rings were established in detonable as well as non-reactive gases. Strong indications were observed that exothermic reactions, as evidenced by H_2O emission, proceed in H_2 + 1, 2 O_2 reactant mixtures within less than 1 μ sec under certain initial low pressure conditions. A reaction threshold at 1 mm Hg A pressure was found for the particular reaction vessel used. Time-integrated spectrometer photos support the conclusions reached with the transient spectra analysis equipment.

DEVELOPMENT OF SPACE- CHARGE DOMINATED DISCHARGES BETWEEN ELECTRODES, by P. M. Mostov and L. Aronowitz. Sept. 4, 1962 [23]p. incl. diagrs. table. (Rept. no. PPL-TR-62-23; RAC 1022A) (AFOSR-5045) (AF 49(638)552) AD 415449 Unclassified

Previous solutions for the transient development of the Townsend-type gaseous discharge between parallel electrodes have been limited to the uniform electric field low-current regime. The present study traces the growth into the highly non-linear space-charge dominated high-current regimes indigenous to many modern applications. The discharge is treated by a modified 3 fluid macroscopic formulation, with provisions for ionization and charge mobility in the gas proper, and the release of electrons at the cathode by incident positive ions. Gauss' law is used to account for space charge as it develops, rather than for an a posteriori correction. The important effect of field-distortion on Townsend's first coefficient and on electron and ion drift velocities is included. A versatile digital computer program applied to a low-pressure discharge has yielded a detailed examination of regimes usually grossly classified by the terms "formative time lag" and "breakdown." Very strong spatial and temporal variations of the electronic and ionic components of charge density, current and conductivity are found. (Contractor's abstract in part)

GROWTH OF NONLINEAR TRANSIENT TOWNSEND DISCHARGES INCLUDING ELECTRODE AND SPACE-CHARGE EFFECTS (Abstract), by P. M. Mostov and L. Aronowitz. [1962] [1]p. [AF 49(638)552] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 460, Aug. 27, 1962.

Previous solutions for the growth of current and charge density in the transient Townsend discharge between parallel electrodes have been limited to linear low-current cases. The present study probes into the nonlinear high space-charge high-current regimes indigenous to many modern applications. A versatile digital program that includes the important effect of space-charge field distortion on Townsend's first coefficient and on the electron and ion drift velocities has been developed and used to provide a detailed examination of regimes usually grossly classified by "formative time lag" and "breakdown." Five distinct regimes of current growth and the mechanisms dominant in each, are identified and discussed. Transient characteristics of electrode and electrodeless discharges are compared. The program is sufficiently flexible to accept arbitrary voltage shapes, including the step voltages to which most previous analyses are restricted. Assumptions and regimes limitations are discussed. Spatial and temporal variations of the electronic and ionic components of charge

density, current, and conductivity for 4 voltages for argon at 10 mm, 1-cm gap, are given.

PREREQUISITE FOR SHEATH SYMMETRY IN PULSED PLASMA ACCELERATORS (Abstract), by L. Arnowitz. [1962] [1]p. [AF 49(638)552] Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 177, Feb. 28, 1963.

Pulsed-plasma accelerators typically operate by connecting a capacitor bank charged to voltage V across axially symmetric electrodes between which is un-ionized low-pressure gas. The resulting discharge forms a more or less thin high-current "sheath" with maximum current density $j \geq 10^7$ A/m^2. For small values of V, the sheath may form asymmetrically or discontinuously on the electrode surfaces. An explanation for the loss of symmetry is suggested by the observation that the processes responsible for current growth during initial breakdown cannot account for the large sheath-current densities. It has been observed that an abrupt transition in the discharge mechanism may occur when the initial current exceeds a certain value for a sufficiently long interval. Since the sheath tends to form in the areas where the transitions first occur, it will be symmetric only when the value of dj/dt before the transition is large enough to confine the current to a thin symmetric region. It is shown that sheath symmetry in a linear pinch requires $dj/dt \sim 10^{12}$ A/m^2-sec, and that such large values are possible for sufficiently high V.

THE CONDITIONAL DISTRIBUTION OF SETS OF TESTS ON A SYSTEM SIMULATED FROM TESTS ON ITS COMPONENTS, by W. S. Connor. [1962] [3]p. (AFOSR-3238) [AF AFOSR-62-309] AD 611932 Unclassified

Also published in Ann. Math. Stat., v. 34: 1585-1587, Dec. 1963.

A description is given of a system which is made up of components in such a way that failure of any component causes the failure of the system, and the system cannot fail unless some component fails. There are n_i trails for component i, i = 1, ... , k, of which n_{i1} are successes and the rest are failure. Let $n^* = \min_i n_i$, $n_1^* = \min_i n_{i1}$. A trial for the system is simulated by drawing at random a result for each component. If all component results are successes, the system trial is a success. If not, the system trial is a failure. The process is continued, without replacement of component results, until n^* system trials have been generated. The principal purpose of this note is to derive the conditional distribution of S, the number of successful system trials, $0 \leq S \leq n_1^*$, given $n_{11}, \ldots, n_{k1}$. It is also shown that the conditional expectation of S, E(S), is the product of the estimated component reliabilities.

COMPLETE STABILITY OF A NONLINEAR CONTROL SYSTEM, by J. P. LaSalle. [1962] [4]p. (AFOSR-2228) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)382 and Dept. of the Army) AD 451547 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 48: 600-603, Apr. 1962.

This paper eliminates a restriction and simplifies the derivation of the complete stability of a nonlinear control system given in a previous paper (see LaSalle and Lefschetz, Stability by Lyapunov's Detect Method, with Applications, Academic Press, New York, 1961). More precisely, the control system is given by $\dot{x} = Ax - bf(\sigma)$, $\sigma = c'x - rf(\sigma)$. Introduce the Lyapunov function $V = x'(Bx + \int_0^\sigma f(s)ds$. It is shown that if f in continuous, and $\sigma f(\sigma) > 0$ for $\sigma \neq 0$, if B is positive and if $\dot{V}$ is negative definite, then the zero state $(x = 0, \sigma = 0)$ is completely stable (i. e., asymptotically stable in the large). STABILITY AND LIMIT SETS, by T. Ura. Feb. 1962 [28]p. incl. diagrs. (Technical rept. no. 62-4) (AFOSR-2281) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)382 and Army Ballistic Missile Agency) Unclassified

In his book, The methods of A. Liapunov and their application, Moscow, 1957, Zubov states: A necessary and sufficient condition for the stability of a closed invariant set M is that no path from outside M possess an α-limit point in M. Here it is assumed that the dynamical system is defined on a complete separable metric space X, and that M possesses a relatively compact neighborhood U; by stability is meant that of Liapunov in the positive sense. It is known that Zubov's condition is merely necessary and not sufficient. On the other hand, it is known that in the case of a planar dynamical system, this condition is sufficient if M consists of a single isolated singular point. The object of this paper is to give some concrete counter-examples for Zubov's proposition and to obtain more general sufficient conditions, not merely for a singular point in the plane, but also for any compact invariant set in a general space.

SOME MATHEMATICAL CONSIDERATIONS ON NONLINEAR AUTOMATIC CONTROLS, by S. Lefschetz. [1960] 52p. incl. refs. (Technical rept. no. 62-10) (AFOSR-2501) (In cooperation with National U. of Mexico) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)382 and Army Ballistic Missle Agency) AD 608403 Unclassified

Also published in Contrib. Differential Equations, v. 1: 1-28, 1963.

The system of differential equations is $\dot{y} = Ay + \varphi(\sigma)b$, $\sigma = c' y - p\varphi(\sigma)$, where A is an n x n matrix, y, c and b are n-vectors, σ, p and $\varphi(\sigma)$ are scalars. The "admissible" scalar functions φ are continuous and $\sigma\varphi(\sigma) > 0$ for $\sigma \neq 0$. The problem is to find conditions under which the origin ($x = 0$, $\sigma = 0$) is asymptotically stable in the large for all admissible $\varphi(\sigma)$. This is called absolute stability. Assume that all the characteristic roots of A have negative real parts and let C be any positive definite n x n matrix. There is then a unique matrix B satisfying $A' B + BA = -C$ (the prime denotes transpose). Define $d = Bb + 1/2\, c$. It is then shown that the inequality $\rho > d'C^{-1} d$ is a sufficient condition for absolute stability. The significance of this condition is examined in detail when A is diagonal, and the relation to Aizerman's problem is mentioned. How the general method can be used to investigate more complex control systems is illustrated, special cases $n = 1$, 2 are studied, and one critical case is investigated.

CONTROL OF RANDOMLY VARYING LINEAR DYNAMICAL SYSTEMS, by R. E. Kalman. [1962] [12]p. incl. refs. (AFOSR-3600) (AF 49(638)382) Unclassified

Also published in Proc. Symposia in Appl. Math., v. 13: 287-298, 1962.

Control of linear dynamical systems described in discrete time, whose equations of motion are independent random functions, is described. In particular, the stability of discrete time regulators whose equations of motion change in time in an independent random fashion is considered. Defining a suitable index of performance for the system, the author derives the control law of the system. Using this optimum control law it is shown that there exists a lower limit, $|L_i| > 1/\rho_{max}$, which the characteristic roots of the equations of motion, taken in the mean square sense, must satisfy for any control. If ρ_{max} is greater than or equal to unity, it is not possible to stabilize the system by any kind of control.

This result should be contrasted with that for deterministic systems, which can be stabilized to any degree desired, provided only that the control variables are not a priori bounded. (Math. Rev. abstract)

THE CRITICAL CASE IN DIFFERENTIAL EQUATIONS, by S. Lefschetz. [1961] [14]p. (AFOSR-5194) [AF 49(638)382] Unclassified

Also published in Bol. Soc. Mat. Mexicana, v. 6: 5-18, 1961.

The following system is studied: (1) $\dot{y} = Y(y, z)$, $\dot{z} = Az + Z(y, z)$, where y is a p-vector, z a q-vector, A is a constant matrix, all of whose eigenvalues have negative real part, and Y, Z are power series convergent near y = 0, z = 0, which begin with terms of at least second degree and are such that y = 0, z = 0 is an isolated zero for them. Such a system may be considered as a canonical form for an n-vector equation $\dot{x} = Kx + X(x)$, where K has p eigenvalues equal to zero with simple elementary divisors and X is a power series with no constant and linear terms. By constructing a finite number of transformations which are regular near y = 0, z = 0, (1) is reduced to the system

(2) $\dot{y} = G(y, z) + \gamma 0(z) + \Sigma 1^{N-1} \nu k (Y, z)$, $\dot{z} = Az + Z^{*}(Y, z)$, with the following properties.

G(y, 0) is a power series whose terms g(y) of lowest degree N > 1 are such that (I) if y = 0 is asymptotically stable for $\dot{y}$ g(y) (which is the case if and only if N is odd), then y = 0, z = 0 is asymptotically stable for (2) and (1); (II) if N is even and if there is a p-vector ν for which $\gamma \cdot g(y)$ is positive definite, then y = 0, z = 0 is unstable for (2) and (1). The proofs of (I), (II) are based on considerations of appropriate Lyapunov functions. The cases p = 1, 2, 3 are examined separately. Two appendices on Lyapunov's stability theorems and on a special case of a theorem of Zubov make the paper self-contained. (Math. Rev. abstract)

ON THE STABILITY OF TIME-VARYING LINEAR SYSTEMS, by R. E. Kalman. [1962] [3]p. incl. table. (AFOSR-J260) (Sponsored jointly by Aeronautical Systems Division, AFOSR under AF 49 (638)382, and Army Ballistic Missile Agency) AD 400889 Unclassified

Also published in IRE. Trans. on Circuit Theory, v. CT-9: 420-422, 1962.

In 1946 James and Weiss introduced the following concept of stability: Definition 1: A (linear, constant-coefficient) system is stable if and only if every bounded input produces a bounded output. This definition has become very popular because it seems to make sense also for more general types of systems. Let $w(t, \tau)$ be the impulse response of a linear system, i. e., the effect at time t of a unit impulse applied at time τ. In 1951 Zadeh showed that the preceding definition can be related to the impulse response by: Theorem 1: A linear (constant or time-varying) system is stable in the sense of Definition 1 if and only if

$$\int_{-\infty}^{\tau} | w(\tau, \tau) | d\tau < \infty \text{ for all } \tau.$$

The present note presents 3 counterexamples to show that Definition 1 is not wholly satisfactory, and that it is not possible to determine the stability of a time-varying linear system from its impulse response, without supplementary assumptions concerning the system itself.

A CLASS OF FUNCTIONAL-DIFFERENTIAL EQUATIONS, by J. K. Hale. [1962] [13]p. (AFOSR-J1217) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)382 and Army Ballistic Missile Agency) AD 423626 Unclassified

Also published in Contrib. Differential Equations, v. 1: 411-423, 1963.

The behavior of the solutions of a particular class of functional-differential equations is discussed as the independent variable approaches infinity. This class of equations arises as a natural generalization of the class of ordinary differential equations considered in an earlier paper, Behavior of Solutions Near Integral Manifolds, which in turn, has many interesting applications to the behavior of solutions of ordinary differential equations near integral manifolds. This analysis generalizes most of the results of the earlier paper to functional-differential equations. A Lyapunov functional is used.

FUNCTIONAL-DIFFERENTIAL EQUATIONS WITH PARAMETERS, by J. X. Hale. [1962] [10]p. (AFOSR-J1218) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)382, Army Ballistic Missile Agency, and Office of Naval Research) AD 424711 Unclassified

Also published in Contrib. Differential Equations, v. 1: 401-410, 1963.

Previous results of the author (see item no. 2518, Vol. V) are extended to a more general type of equations. Results are summarized which are obtainable for a simple ordinary differential system (1) dy/dt = A(x)y

where t is a scalar, x is an m-vector, y is an n-vector, and A(x) is an n x n matrix whose elements are continuously differentiable with respect to x for x in some set U. For a given $t_0 \geq 0$ and a given x in U, it is supposed that there exist functions $\beta(x)$, K(x) continuous in x for x in U. $\beta(x)$ [not necessarily of constant sign] possessing a continuous first derivative respect to x such that the solution $y(t, t_0, x, y_0)$, $y(t_0, t_0, x, y_0) = y_0$ of (1) satisfies the relation (2)

$$\| y(t, t_0, x, y_0) \| \leq K(x) e^{-\beta(x)(t - t_0)} \| y_0 \|, \quad t \geq t_0.$$

The basic lemma states the existence of a function V(t, x, y) (similar to a Lyapunov function) associated with the class of functions (2) satisfying (1). It is shown that V(t, x, y) is a Lipschitzian in x, y and the Lipschitz constants are given in terms of $\beta(x)$, K(x) and the derivative of the matrix A(x) with respect to x.

SYMMETRY ADAPTED FUNCTIONS BELONGING TO THE CRYSTALLOGRAPHIC GROUPS, by H. V. McIntosh. [1958] [24]p. incl. diagrs. refs. (AFOSR-J1513) (AF 49(638)382) AD 429254 Unclassified

Presented at Symposium on Molecular Structure and Spectroscopy, Ohio State U., Columbus, 1958.

Also published in Jour. Molec. Spectros., v. 10: 51-74, Jan. 1963.

Various authors have discussed methods of obtaining the irreducible representations of groups containing nontrivial normal subgroups, in terms of the representations of the normal subgroup and its factor group. These results have applied to special cases, such as to normal subgroups of prime index or to the case in which a subgroup exists isomorphic to the factor group and having one element in each coset of the normal subgroup. These results have been extended to a general theory, which not only includes all the results of the papers cited, but also enables one to obtain very easily the characters and representations of certain classes of groups heretofore obtainable only by special methods. Examples of such groups are crystallographic double groups which have been discussed by Bethe, Elliott, and Opechowski as well as those crystallographic lattice groups for which there is no subgroup isomorphic to the corresponding point group. The basis of this theory is a canonical form for the representations of a semidirect product of 2 groups; a generalization of the representation theory of direct products which is developed in the present paper. ON THE ASYMPTOTIC BEHAVIOR OF SOLUTIONS OF A CLASS OF DIFFERENTIAL EQUATIONS, by J. K. Hale and N. Onuchic. [1962] [15]p. incl. diagr. (AFOSR-64-0356) (AF 49(638)382) AD 434502 Unclassified

Also published in Contrib. Differential Equations, v. 2: 61-75, 1963.

Consider the equation $w' = Aw + f(t, w)$ where w, f are n-vectors, A is an n x n matrix and f(t, w) is a continuous function of t, w for all $t \geq 0$ and w in some set U. Many papers have discussed the asymptotic relationships between the solutions of the above equation and the solutions of $w' = Aw$. However, in most of these papers, it is assumed that the function f(t, w) is either "small" for large values of t and all $w \in U$ or "small" compared with the matrix A. In this paper, consideration is given to some asymptotic relationships between the solutions of these 2 equations for cases when the function f(t, w) is not necessarily small for all w in some sets but becomes small along solutions of the equation.

STRUCTURAL STABILITY ON TWO-DIMENSIONAL MANIFOLDS, by M. M. Peixoto. [1961] [20]p. incl. diagrs. refs. [AF 49(638)382] Unclassified

Published in Topology, v. 1: 101-120, 1962

Let M^2 be a 2-dimensional compact differentiable manifold, and B the space of all vector fields on M^2.

A vector field X on M^2 is said to be structurally stable if given $\epsilon > 0$ there is a neighborhood Δ of X in B such that whenever $Y \in \Delta$ there is an ϵ-homeomorphism of M^2 onto itself transforming trajectories of X onto trajectories of Y. In order that the vector field X be structurally stable on M^2 it is necessary and sufficient that the following conditions be satisfied: (1) there is only a finite number of singularities, all generic; (2) the α and w-limit sets of every trajectory can only be singularities or closed orbits; (3) no trajectory connects saddle points; and (4) there is only a finite number of closed orbits, all simple.

GLOBAL GROSS SECTIONS OF COMPACT DYNAMICAL SYSTEMS, by S. Schwartzman. [1962] [6]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)382], Army Ballistic Missile Agency, and Office of Naval Research) Unclassified

Published in Proc. Nat'l. Acad. Sci., v. 48: 786-791, May 1962.

Let (X, R, φ) be a transformation group with compact connected, locally connected, locally simply connected phase space X, and phase group the reals. A closed subset K of X is said to be transverse to the flow provided there exists $\epsilon > 0$ such that φ restricted to K x $(-\epsilon, \epsilon)$ is a homomorphism onto an open set. Two theorems are discussed. Theorem 1: The following conditions on a closed subset K of X are equivalent. (1) K is transverse to the flow and every orbit intersets K. (2) The natural map φ makes K x R into a regular covering of X with an infinite cyclic group of covering transformations. (3) The natural map is a local homeomorphism onto all of X. (4) There exists a function f (x) of absolute value one defined on X whose angular variable is strictly increasing along each orbit such that K is the set of points where f(x) is called a cross-section if it satisfies any of the conditions 1 through 4. Theorem 2: If K_1 and K_2 are 2 connected cross-sections of a given flow in X, the universal covering spaces of K_1 and K_2 are homeomorphic. The map f in (4) defines a one-dimensional cohomology class in X. It is shown that if K_1 and K_2 are 2 cross-sections having the same associated cohomology class, then they are naturally homeomorphic. (Math. Rev. abstract, modified)

LYAPUNOV FUNCTIONS FOR THE PROBLEM OF LUR'E IN AUTOMATIC CONTROL, by R. E. Kalman. [1962] [5]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638) 382 and National Aeronautics and Space Agency) Unclassified

Published in Proc. Nat'l. Acad. Sci., v. 49: 201-205, Feb. 1963.

This paper is concerned with the global asymptotic stability of the class of closed loop control systems governed by the equations (1) $dx/dt = Fx - g\varphi(\sigma)$, $d\xi/dt = \sigma(\sigma)$, $\sigma = h'x + \rho\xi$, where σ, ξ, ρ are real scalars, x, g, h are real n-vectors, and F is a real, stable n x n matrix. $\varphi(\sigma)$ is a real-valued continuous function which belongs to the class A_k: $\varphi(0) = \sigma$, $0 < \sigma\varphi(\sigma) < \sigma^2 K$. Lur'e posed the problem of finding conditions on ρ, g, h and F which are necessary and sufficient for the existence of a Lyapunov function V of a special class (quadratic in x and σ plus the integral of $\varphi(\sigma)$ which insures global asymptotic ability of (1) for any φ in the class A_∞. Later Popov was able to show that if F is stable and $\rho > 0$, then global asymptotic stability of (1) is assured if $\mathrm{Re}(2\alpha\rho + i\omega\beta)[h'(i\omega I - F)^{-1}g + \rho/i\omega] \geq 0$, for all real ω, holds for $2\alpha\rho = 1$ and some $\beta \geq 0$ (P). Popov was unable to resolve the question of existence of a Lyapunov function which assures global asymptotic stability whenever (P) holds. Using the theory of controllability of linear dynamical systems, the question is completely settled and at the same time the problem posed by Lur'e is solved. (Math. Rev. abstract)

THE STATISTICAL MECHANICS OF MICELLES, by R. H. Aranow. [1962] [7]p. incl. refs. (AFOSR-J714) (AF 49(638)735) AD 415057 Unclassified

Also published in Jour. Phys. Chem., v. 67: 556-562, Mar. 1963.

A theory of micelle statistics is developed using the extended theory of dilute solutions, the dielectric continuum model of the solvent, and the statistical mechanical treatment of physical clusters at constant pressure. A connection is made between the mass action approach and the 2-phase approach currently in use for examining micelle behavior. Both ionic and nonionic micelles are treated. A discussion is given for non-ionic micelles of the meaning of averages, fluctuations in size, ideality, and variation of c. m. c. with temperature. A more general theory of micelle statistics is formulated by the elimination of the continuum model of the solvent and the extended theory of dilute solutions. Reich's model for non-ionic micelles is used to illustrate the theory. (Contractor's abstract)

EFFECT OF DIFFUSION ON INTERFACIAL TAYLOR INSTABILITY, by R. H. Aranow and L. Witten. [1962] [8]p. incl. tables, refs. (AFOSR-J894) (AF 49(638)735) Unclassified

Also published in Phys. Fluids, v. 6: 535-542, Apr. 1963.

A theory is developed concerning the onset of interfacial instabilities at the liquid-liquid interface between 2 solvents when they are mutually immiscible and when a third species, the solute, is diffusing across the interface. The analysis made involves solving the linearized hydrodynamic equations of motion for an idealized model with appropriate boundary conditions at the interface. The interface becomes unstable and turbulence at the interface develops under certain conditions which depend upon the densities of the solutions, the strength of the frictional forces between solute and solvents, concentration gradients, and the direction and rate of diffusion of the solute. The effects of surface tension and viscosity are considered. Some experimental results pertaining to the instability are cited. (Contractor's abstract)

THE LIGHT INDUCED ELECTRON PARAMAGNETIC RESONANCE SIGNAL OF PHOTOCATALYST P700, by H. Beinert, B. Kok, and G. Hoch. [1962] [4]p. (AFOSR-2293) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)947, Atomic Energy Commission, and National Institute of Health) Unclassified

Also published in Biochem. and Biophys. Research Commun., v. 7: 209-212, 1962.

One unit or mol of the photocatalyst P700 (I) pigment complex occurs for each 300-400 mol of chlorophyll (II) in all aerobic photosynthetic organisms. In whole cells or chloroplasts, I undergoes photochemical bleaching sensitized by surrounding II, which brings the pigment into the oxidized state and an associated moiety into the reduced state. A second photochemical conversion mediated by dark reactions regenerates I in a reduced state. Data are given on chemical and physical agents which produce oxidation and reduction of I. In experiments on red algae (strain TX 27) the I (which is a single electron-transferring agent) gave a weak Mn^{++} and a stronger Fe^{+++} signal, as well as a free-radical signal under some experimental conditions. Similar signals were obtained from scenedesmus.

LIGHT CONVERSION IN PHOTOSYNTHESIS, by B. Kok. [1962] [22]p. incl. diagrs. table. refs. (AFOSR-2632) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)947, National Institutes of Health, and School of Aero-space Medicine) AD 415243 Unclassified

Also published in 6570th Biologistics for Space Systems Symposium, Aerospace Medical Research Lab., Wright-Patterson AFB, Ohio, Oct. 1962, p. 83-104.

This article is devoted to the basic phenomena behind the photosynthetic conversion of light into chemical energy. The main question considered is the manner in which the plant grasps and uses the tiny amount of energy found in photons of some 680mμ wave lengths. Since this article is a summary of present facts and speculations about phtosynthesis the following topics are discussed: energy carriers, ATP and $TPNH_2$; fluorescence, which is one of the ways a chlorophyll molecule can dispose of an absorbed photon by re-emitting a photon of red (680mμ) light (this is useful in proving light absorption by pigments); evidence for 2 photoreactions in photosynthesis as discovered by Emerson, who suggested that 2 pigments must be excited to perform efficient photosynthesis and thus indicated involvement of 2 light reactions, one synthesized by light absorption in chlorophyll a and one by another pigament (for example, chlorophyll b); and finally the question for the future, the distribution of light between the 2 photo steps and how optimal distribution is achieved, securing overall efficiency in the plant.

SENSITIZATION OF CHLOROPLAST REACTIONS. I. SENSITIZATION OF REDUCTION AND OXIDATION OF CYTOCHROME C BY CHLOROPLASTS, by B. Kok, G. Hoch, and B. Cooper. [1962] [2]p. incl. diagrs. refs. (AFOSR-3006) (AF 49(638)947) AD 412440 Unclassified

Also published in Plant Physiol., v. 36: 274-279, May 1963.

Normal photoreduction of cytochrome c by chloroplasts is changed to photooxidation by treatment with detergent, by aging, or by mild heating. During the transition from one action to the other, the long wave limit of photoreduction shifts to shorter wavelengths and either a net reduction or net oxidation can be observed - dependent on wavelength. The effectiveness spectrum of the photoreduction process shows a drop at wavelengths beyond 690 mμ. In contrast, the quantum yield of photooxidation rises at long wavelengths.

ON THE PIGMENT ABSORBING AT 750 mμ OCCURRING IN SOME BLUE-GREEN ALGAE, by E. B. Gassner. [1962] [3]p. incl. diagr. (AFOSR-3484) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)947 and National Institutes of Health) Unclassified

Also published in Plant. Physiol., v. 37: 637-639, Sept. 1962.

A study was made of the pigment responsible for the

the absorption maximum at 750 mμ found in 2 strains of blue-green algae. In Synechococcus cedrorum (Sauvg.) the 750 mμ absorption band was relatively high, amounting to approx 1/20 the height of the chlorophyll peak. Procedures of extraction and partial purification have been developed. The long wavelength absorption maximum at 750 mμ in vivo shifts to about 730 mμ after the pigment is extracted into organic solvents. The complete spectrum of the purified pigment is complex and resembles that of bacterial pheophytin. Effects of light, pH, solvent and oxidation-reduction reagents on both the 750 mμ and 730 mμ forms of the pigment were examined. No indications for a possible biological activity were obtained.

ELECTRON TRANSPORT IN CHLOROPLAST REACTIONS, by B. Kok, B. Cooper, and L. Yang. [1962] [24]p. incl. diagrs. tables, refs. (AFOSR-J957) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)947 and National Institutes of Health) AD 415839 Unclassified

Also published in Microalgae and Photosynthetic Bacteria, 1963, p. 373-396.

A study was made of the absorption changes induced by repetitive flashing light in chloroplast suspensions. The stepwise reduction of various substrates by the flashes was accompanied by a cyclic change of absorption (turnover) of "P700" and "P520". The indication was that only part of the pigment systems contributed to the absorption changes. An association with the "first" (long wave sensitized) photoact was indicated for both pigments. No absorption change was clearly correlated with the "second" photoact. A dissimilar response of P700 and P 520 was observed, in several cases, most notably in the presence of phenazine methosulfate. Pigment turnover in the absence of (net) substrate reduction, observed in several instances was considered to indicate a cyclic electron transport: Turnover induced by several substrates failed to stop after depletion of the oxidant and turnover induced by dichlorophenolindophenol (DCPIP) after addition of 3-(3, 4-dichlorophenyl)-1,1-dimethylurea (DCMU). The poison did not inhibit the reduction of the dye by the flashes but caused a complete re-oxidation during the dark periods. This accessibility of reduced indophenol to photo-oxidized P 700 underlies its restoring effect upon DCMU inhibited triphosphopyridine nucleotide (TPN) reduction and the associated pigment turnover.

The data appeared to indicate a mechanism of photosynthesis in which the photo-oxidant of the first photoact—P 700^{+} or an immediate conversion product—is subjected to the second photoact. Consequently the photoreductant of the first photoact was assigned a low enough potential to concurrently dirve adenosine triphosphate (ATP) formation and TPN reduction. (Contractor's abstract)

INTERIOR FIELD AND POTENTIAL IN SPACE CHARGE LIMITED PHOTOCONDUCTIVITY, by [D. Kahn and D. E. Grabenstein]. [1962] [8]p. incl. illus. diagrs. table. [AF 49(638)1017] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 173, Mar. 26, 1962.

Measuremenis of the interior potential of an illuminated KBr crystal containing F centers under an applied dc potential have been made using a metallic probe connected to an electrometer. The results agree with the predictions of the theory for a crystal with 2 current-blocking electrodes. The contact potential between the crystals and the electrode can be determined by varying the applied dc potential. The interior potential is constant over most of the crystal. This agrees with measurements of the interior field of the crystal with a low-frequency (0.01-40 cps) ac voltage applied to the illuminated crystal. The field is determined by observing the current pulse caused by an additional, short light flash on the crystal. The initial height of the pulse is proportional to the field averaged over the illuminated portion of the crystal. At low frequencies, the pulse height during dc illumination is much lower than when the crystal is not illuminated, indicating a flattening of the interior field.

RECOMBINATION IN SPACE-CHARGE LIMITED PHOTOCONDUCTIVITY (Abstract), by D. E. Grabenstein and D. Kahn. [1962] [1]p. [AF 49(638)1017] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 172, Mar. 26, 1962.

The variation with illumination of the ac photoconductivity in illuminated KBr crystals with current-blocking electrodes has been studied. The variation of the low-frequency limit of photocapacitance and the high-frequency limit of the photoconductance with illumination for some specimens agrees with that expected on the assumption of bimolecular recombination. This is in agreement with the results of Onuki. Subsequent illumination of the crystals produced a gradual decrease in the variation with intensity, until little or no change could be observed by decreasing the illumination by a factor of 30. This latter behavior has been observed by Macdonald. The decrease in variation is ascribed to the bleaching of the crystals at the electrodes.

APPEARANCE AND IONIZATION POTENTIALS OF SELECTED FRAGMENTS FROM ISOTOPICALLY LABELED PENTABORANES, by J. J. Kaufman, W. S. Koski and others. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-J1482) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1220 and Office of Naval Research) AD 427538 Unclassified

Presented in part at Inorg. Chem. Div. of the 140th Nat'l. meeting of the Amer. Chem. Soc., Chicago, Ill., Sept. 1961.

Also published in Jour. Amer. Chem. Soc., v. 85: 136.-1375, May 20, 1963.

This paper presents appearance potentials of isotopically labeled pentaboranes, $B^{11}_{5}H_{9}$ and $B^{11}_{5}D_{9}$, and some of their fragment ions as determined by mass spectrometric electron impact measurements. A set of apparently self-consistent ionization potentials for the pentaboranes and various fragments was calculated from these appearance potentials using what little

thermochemical bond energy data are available combined with the authors' interpretation of the processes taking place on ionization and fragmentation. $A(B_5H_9) > A(B_5D_9)$ is compared to $A(B_2H_6) < A(B_2D_6)$ and possible reasons for the reversal of ionization potential differences are discussed. Using an IBM 7090 computer program, isotopic fragmentation patterns for normal and deuteriated pentaboranes were calculated from the mass spectra of these compounds at 70 ev. (Contractor's abstract)

THE EFFECT OF SUBSTITUTION OF THE IONIZATION POTENTIALS OF FREE RADICALS AND MOLECULES. II. THEORETICAL INTERPRETATION OF DELTA K VALUES FOR ALKYL RADICALS AND AMINES, by J. J. Kaufman. [1962] [5]p. incl. refs. (AFOSR-J1484) (AF 49(638)1220) AD 427535 Unclassified

Presented at Eighteenth Internat'l. Cong. of Pure and Applied Chemistry Symposium on Structure and Reactivity of Small Molecular Species, Montreal (Canada), Aug. 1961.

Also published in Jour. Amer. Chem. Soc., v. 85: 1576-1580, June 5, 1963.

The constancy of δ_K values [which measure the change in ionization potential between a substituted molecule (or radical) and the parent compound] for alkyl radicals and amines is discussed in terms of the energies and possible wave functions for these species and their corresponding positive ions. For an alkyl radical it is possible to separate the σ- and π-electrons, and, to a first approximation, deal with the wave function, Hamiltonian and orbital of only the π-electron. It is shown to be possible to describe the wave functions and Hamiltonians for the substituted and unsubstituted amines and their positive ions in a manner which emphasizes their close similarity to the alkyl radicals by making a formal separation into σ- and "π-like" electrons. The wave functions of the π- and "π-like" electrons are described and the effects of various perturbations on the Hamiltonians are shown. A comprehensive treatment of a pure inductive effect of a substituent group is given and the extension to substituent groups capable of mesomeric effects is indicated.

THE DETERMINATION OF A COEFFICIENT IN A PARABOLIC DIFFERENTIAL EQUATION. PART II. NUMERICAL APPROXIMATION, by J. Douglas, Jr. and B. F. Jones, Jr. [1962] [8]p. (AFOSR-J446) (AF 49(638)632) AD 407115 Unclassified

This sequel to (item no. 2624 Vol. VI) is concerned with an effective means of computing the solution a(t). The authors show (using a modified iteration procedure), that given $\epsilon > 0$ and a fixed mesh width $k > 0$, it is possible to compute a polygonal function $\phi_k(t)$ on $[0, T_0]$, $T_0 < T$, with vertices at the points $k, 2k, \ldots, Nk = T_0$, which is bounded from above and below by appropriate functions of t, and which satisfies the inequality $|\phi_k(t) - L\phi_k(t)| < \epsilon$ for $t = k, 2k, \ldots, Nk$. Then, using the properties of L obtained in the previous article, they show that for small k, $\phi_k(t)$ is actually a good approximation to a(t) for all t in $[0, T_0]$. (Math. Rev. abstract)

THE DETERMINATION OF A COEFFICIENT IN A PARABOLIC DIFFERENTIAL EQUATION. PART I. EXISTENCE AND UNIQUENESS, by B. F. Jones, Jr. [1962] [12]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)632] and National Science Foundation) Unclassified

Published in Jour. Math. and Mech. v. 11: 907-918, Nov. 1962.

The following problem, corresponding to a heat conduction on a semi-infinite rod, with variable and unknown thermal conductivity is considered: to find u(x, t) and a positive a(t) satisfying

$$\begin{aligned} &\frac{\partial u}{\partial t} = a(t)\frac{\partial^2 u}{\partial x^2}, && 0 < x < \infty,\ 0 < t < T, \\ &u(x, 0) = 0, && 0 \le x < \infty, \\ &u(0, t) = f(t), && 0 \le t < T, \\ &-a(t)\frac{\partial u}{\partial x}(0, t) = g(t), && 0 < t < T. \end{aligned} \tag{1}$$

Here f(t) and g(t) are given, with $g > 0$, $f(0) = 0$, and $f'(t) > 0$ for $t > 0$. After the change of variables $\eta = \int_0^t a(\tau)\,d\tau$ is made, the coefficient a(t) disappears from the first of these equations. Thus, with the appropriate assumptions on the growth of $u(x, t)$ as $|x| \to \infty$, the first three equations in (1) have a unique solution u, expressible by means of the Poisson-Weierstrass kernel; this solution is seen to satisfy the fourth equation in (1) if and only if a(t) satisfies the nonlinear integral equation

$$a(t) = \frac{\pi^{1/2}\, g(t)}{\int_0^t f'(\tau)\left[\int_\tau^t a(y)\,dy\right]^{-1/2} d\tau}.$$

Define the mapping $a \to La$ by $La(t) = a(t)$, then, under the assumption that $H(t) = L1(t)$ approaches a positive limit as $t \to 0+$ (which implies that $f'(t) \to \infty$ as $t \to 0+$) the author shows that L has a unique fixed point. This is done by showing that L maps the set of continuous functions h(t) satisfying

$$\inf_{0 < \tau < t} H^2(\tau) \le h(t) \le \sup_{0 < \tau < t} H^2(t)$$

into an equicontinuous subset of itself; then, using the monotonicity of L, the solution a may be constructed. (Math. Rev. abstract)

THE TRIPLET STATE OF BENZENE, by H. Ishikawa W. A. Noyes, Jr. [1962] [1]p. incl. refs. (AFOSR-2364) (AF 49(638)679) Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 1502, 1962.

The first excited triplet state of benzene has been identified through emission from a glassy matrix and possibly through weak absorption from the ground state. Some reactions of the triplet state of benzene are briefly discussed. The fate of the triplet state molecules is at present unknown, several possibilities are presented: (1) they cross over to the ground state with ultimate loss of vibration energy by collision; (2) they are discharged on the walls; and (3) they undergo reaction to an intermediate which reverts ultimately to normal benzene.

PHOTOSENSITIZATION BY BENZENE VAPOR: BIACETYL. THE TRIPLET STATE OF BENZENE, by H. Ishikawa and W. A. Noyes, Jr. [1962] 36p. incl. diagrs. tables, refs. (AFOSR-2427) (AF 49(638)679) AD 432681 Unclassified

Also published in Jour. Chem. Phys., v. 37: 583-591, Aug. 1, 1962.

Biacetyl strongly quenches the fluorescence of benzene vapor. There is a resulting dissociation of biacetyl which occurs presumably because the second excited singlet state of biacetyl is produced by energy transfer from the benzene. Emission by biacetyl also occurs, but the ratio of phosphorescence to fluorescence is very large and may be infinity. The triplet state of biacetyl seems to be produced preferentially by energy transfer from a triplet state of benzene. Emission efficiencies are such that nearly every singlet-state molecule of benzene which does not fluoresce must undergo an intersystem crossover to the triplet state. Since this crossover predominates over fluorescent emission, the life of the singlet state of benzene is presumably determined mainly by the crossover. The effective cross section for self-quenching of the singlet state of benzene is about 0.036×10^{-16} cm^2, while the effective cross section for quenching by biacetyl is about 2.5×10^{-16} cm^2. Since the life of the triplet state of benzene in the gas phase is not known, cross sections for reactions of this state may not be calculated (Contractor's abstract)

THE TRANSFER OF ELECTRONIC ENERGY FROM BENZENE TO BIACETYL, by H. Ishikawa. 1962. [38]p. incl. diagrs. tables, refs. (AFOSR-2437) (AF 49(638)679) Unclassified

The purpose of this work is to study the mechanism of transfer of energy, particularly electronic energy, between polyatomic molecules. Benzene is used as an energy donor and biacetyl as an energy acceptor in this work. A study of energy transfer from benzene vapor to biacetyl vapor after the former has absorbed radiation at 2537A has revealed 2 phenomena of photosensitization: (1) the sensitized decomposition of biacetyl (however, not conclusively); and (2) the sensitized emission of biacetyl. The sensitized decomposition of biacetyl may be explained as a result of energy transfer from singlet excited benzene to biacetyl exciting the latter to the second upper singlet state. The data of the emission of biacetyl sensitized by benzene may best be treated by assuming the presence of triplet state benzene in high concentration which will be formed from singlet excited state benzene by intersystem crossing. As a mechanism of sensitized biacetyl emission, energy transfer from triplet benzene to biacetyl is proposed. (Contractor's abstract, modified)

ENERGY DISSIPATION FROM EXCITED ACETALDEHYDE MOLECULES, by C. S. Parmenter and W. A. Noyes, Jr. [1962] [6]p. incl. diagrs. tables, refs. (AFOSR-J320) (AF 49(638)679) AD 408023 Unclassified

Also published in Jour. Amer. Chem. Soc., v, 85: 416-421, Feb. 20, 1963.

Energy dissipation in acetaldehyde vapor following absorption at various wave lengths from 2537 to 3340A has been studied. At the longer wave lengths dissociation and intersystem crossover to the ground state from a triplet state account for most of the dissipation. At shorter wave lengths dissociation becomes of increasing importance. This dissociation probably occurs from high vibration levels of the singlet state but the possibility of rapid transition through a triplet state cannot be excluded. As shown previously by other authors, the mode of dissociation changes with wave length. (Contractor's abstract)

THE PHOTOCHEMISTRY OF MIXTURES OF 2-PENTANONE AND 2-HEXANONE WITH BIACETYL, by J. L. Michael and W. A. Noyes, Jr. [1962] [6]p. incl. diagrs. tables, refs. (AFOSR-J667) (AF 49(638)679) AD 415469 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 85: 1027-1032, Apr. 20, 1963.

Energy transfer to biacetyl molecules occurs from 2-pentanone and from 2-hexanone molecules excited at 3130 A. Evidence is found in sensitized biacetyl emission. The emission caused by pentanone is about 20 times as intense as that caused by hexanone. Biacetyl markedly reduces the non-free radical dissociation of 2-pentanone into ethylene and acetone at 3130 A, but the yield of carbon monoxide increases although it is always low. The effect of biacetyl on the hexanone at 3130 A is negligible. Energy transfer to biacetyl and dissociation into ethylene and acetone both seem to come from the same state for the pentanone. There is a weak sensitized emission caused by 2-pentanone at 2537 A and a marked increase in carbon monoxide yield. For hexanone the effects are small, although there is some increase of carbon monoxide yield The evidence indicates that the direct photochemical dissociation of 2-pentanone into ethylene and acetone occurs from an excited singlet state.

Evidence herein presented is not sufficiently definite to permit conclusions about 2-hexanone. (Contractor's abstract)

THE PHOTOCHEMISTRY OF METHYLAMINE, by J. V. Michael and W. A. Noyes, Jr. [1962] [6]p. incl. tables, refs. (AFOSR-J668) (AF 49(638)679) AD 415395 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 85: 1228-1233, May 5, 1963.

Hydrogen, methane, nitrogen, ethane, ammonia, ethylenimine, dimethylamine, azomethane and a polymer have been identified as products in the photochemical decomposition of methylamine. Quantum yields of most of these products have been determined under a variety of experimental conditions at room temperature. By use of CH_3ND_2 and of CD_3NH_2 as well as by use of scavengers it has been shown that the main primary process is the elimination of a hydrogen atom. This is followed by abstraction from the substrate to form hydrogen gas. Other steps in the mechanism are suggested and evidence for some of them presented. (Contractor's abstract)

GROWTH OF FLUCTUATIONS IN A UNIFORMLY CONTRACTING OR EXPANDING CLOUD, by M. P. Savedoff and S. Vila. [1962] [6]p. incl. table. (AFOSR-J131) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)52 and Alfred P. Sloan Foundation) AD 400193 Unclassified

Also published in Astrophys. Jour., v. 136: 609-614, Sept. 1962.

Since no gas sphere in hydrostatic equilibrium is unstable to radially symmetric perturbations, provided that $\Gamma > 4/3$ and that the density increases with depth, the stability of a model without hydrostatic equilibrium is investigated. This model has been discussed by Ebert and Bonnor and is characterized by a uniform density, pressure, and expansion or contraction. Since in the absence of pressure gradients each element is in free fall, one erroneously expects that Jean's criterion determines stability. For the zero energy case (corresponding to parabolic motion), the system is unstable for all $\Gamma < 5/3$ independent of the Jeans criterion. For expansion, the Jeans criterion separates unstable from stable motion when $\Gamma = 4/3$ while all larger values of Γ the motion is unstable; independent again of the Jeans criterion. Exact solutions are given for non-zero energy (elliptical and hyperbolic motion) for special values of Γ, and asymptotic solutions valid for several ranges of Γ are given. The existence of unstable solutions suggests, but does not prove, the possibility of fragmentation into stable protostars or protogalaxies.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 311, Apr. 23, 1962.

Also published in Nuovo Cimento, Series X, v. 26: 740-747, Nov. 16, 1962.

An attempt was made to determine the abundance of low-energy tritons and deuterons in a nuclear emulsion stack exposed at a geomagnetic latitude, $\lambda = 61°N$ on Aug. 3, 1958 under 3.8 g/cm^2 of matter. Some of the implication of the results are discussed. However, due to the uncertainty of the correction for secondary production within the atmosphere, the results are consistent with the absence of these elements in primary cosmic radiation.

COHERENCE FUNCTIONS OF BLACKBODY RADIATION (Abstract), by E. Wolf and Y. Kano. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)602] and United Aircraft Corp.) Unclassified

Presented at meeting of the Opt. Soc. Amer., Washington, D. C., Spring, 1962.

Published in Jour. Opt. Soc. Amer., v. 52: 596, May 1962.

R. C. Bourret discussed certain correlation functions of blackbody radiation. These functions are a measure of the correlation between the electric-field vectors at 2 points in space, at 2 instants of time. In the present paper, an extension of Bourret's analysis is described, concerned with determination of the complex degree of coherence of blackbody radiation. This quantity is essentially the complex analytic signal associated with one of the real correlation functions considered by Bourret. The behavior of the analytic continuation of the temporal, complex degree of coherence $\gamma_{11}(\tau)$ into the lower half of the complex τ-plane is examined. It is shown that this analytic continuation has no zeros anywhere in this half-plane, and also that $\gamma_{11}(\tau)$ has no zeros on the real τ-axis. This result in turn implies that the phase function of the temporal, complex degree of coherence of blackbody radiation is a "minimal phase function." This conclusion lends support to the theory relating to the possibility of complete determination of energy distribution in certain asymmetric spectra from measurements of visibility of interference fringes alone.

COMPARISON OF THREE THEORIES OF ELECTROMAGNETIC DIFFRACTION (Abstract), by B. Karczewski and E. Wolf. [1962] [1]p. [AF 49(638)602] Unclassified

Presented at meeting of the Opt. Soc. Amer., Washington, D. C., Spring 1962.

Published in Jour. Opt. Soc. Amer., v. 52: 600, May 1962.

In recent papers one of the authors studied on the basis of the theories of Kottler, Severin, and Vasseur, the distribution of the energy density in the far field of an electromagnetic wave diffracted from an aperture. In the present paper, this investigation is carried further by comparing the predictions relating to the state of polarization of the far field. Polarized as well as unpolarized incident fields are considered. The coherency matrices of the far field, appropriate to the theories of Kottler, Severin, and Vasseur are derived and with their help the state of polarization is analyzed. It is found that for all but small angles of diffraction the 3 theories predict substantially different behavior. Thus, a comparison of the results of the present investigation with the corresponding polarization measurements would afford a relatively simple test as to the validity of the theories under conditions that are commonly encountered in optics. Such a comparison might also help to resolve a long-standing controversy as to the correctness of Kottler's definition of a black screen.

IS A COMPLETE DETERMINATION OF THE ENERGY DISTRIBUTION IN SPECTRAL LINES POSSIBLE FROM MEASUREMENTS OF THE VISIBILITY OF INTERFERENCE FRINGES? (Abstract), by E. Wolf. [1962] [1]p. [AF 49(638)602] Unclassified

Presented at meeting of the Opt. Soc. Amer., Washington, D. C., Spring 1962.

Published in Jour. Opt. Soc. Amer., v. 52: 596, May 1962.

A well-known method due to Michelson provides information about the energy spectrum of a light source from measurements of the visibility of interference fringes. It is generally believed, and has in fact been first explicitly asserted so by Rayleigh, that unless the spectrum is symmetric the complete spectral profile cannot be determined from visibility measurements alone. The apparent reason for this is that the visibility is proportional to the modulus of the Fourier transform of the energy spectrum and hence does not yield separately the cosine and the sine transforms. Thus, a Fourier inversion does not appear to be possible except when, on account of symmetry of the spectrum, the sine transform may be assumed to be zero. It is shown that the above argument is inconclusive because it fails to take into account the analytic properties of the Fourier transform of the energy spectrum. These properties, which are playing an increasingly important role in current researches on coherence properties of light are shown to impose a lower bound on the phase function of the Fourier transform. A theory is put forward, according to which the actual phase function of the Fourier transform of many asymmetric profiles is either this "minimal phase function" or differs from it by an insignificant amount. Such profiles could be completely determined from the knowledge of the visibility curve alone. A possible departure from the minimal phase solution raises some interesting, unsolved problems. The theory has a close bearing on the recently proposed square-law detection techniques and coincidence counting methods for the analysis of very narrow spectra, such as those encountered in the output from an optical maser.

MEASURES OF BANDWIDTH AND COHERENCE TIME IN OPTICS (Abstract), by L. Mandel and E. Wolf. [1962] [1]p. [AF 49(638)602] Unclassified

Presented at annual meeting of the Opt. Soc. Amer., Rochester, N. Y., [1962]

Published in Jour. Opt. Soc. Amer., v. 52: 1322, Nov. 1962.

Several different definitions of the coherence time $\Delta\tau$ can be found in the literature. It is generally assumed that in cases of practical interest, the different definitions give values of the same order of magnitude. The same remark applies also to definitions of the effective bandwidth $\Delta\nu$. It is generally assumed that these 2 quantities are related by the order of magnitude formula $\Delta\tau \sim 1/\Delta\nu$. It is shown from detailed examination of one particular case of practical interest that the bandwidths as defined by 2 of the previously proposed formulas are quite different orders of magnitude, although the correspondingly defined coherence times differ only by a factor of the order of unity. This example shows that the reciprocity relation $\Delta\tau \sim 1/\Delta\nu$ must be treated with caution, especially in the case of multiple peaked distributions, such as found in the spectrum of optical-maser beams.

Also published in Nuovo Cimento, Series X, v. 27: 700-717, Feb. 1, 1963.

The effect of ionization loss on a primary cosmic ray spectrum of the form $N_{A,Z}(\epsilon) = K(A, Z)\,\gamma/\epsilon^{\gamma+1}$ is calculated for H^1, Be^9, C^{12}, F^{19}, Al^{27}, Ca^{40} and Fe^{56} as representative of the charge spectrum of primary cosmic rays. The calculation is carried out for passage through 2, 4, 6, and 10 g/cm^2 of hydrogen and also for a model in which the amount of material traversed is inversely proportional to the momentum. The observable effects obtained, i.e. the shift of the maximum towards higher velocity with increasing Z and the relative enrichment of the lighter nuclei/energy interval at low energies are compared with the experimental data obtainable. Some discussion of the implications for aspects of the origin of cosmic rays is given.

ON THE ENERGY DEPENDENCE OF FRAGMENTATION OF COSMIC RAY NUCLEI IN INTERSTELLAR SPACE, by H. H. Aly and M. V. K. Appa Rao. Nov. 2, 1962 [18]p. incl. diagrs. refs. (Rept. no. NYO 10249) (AFOSR-4421) (AF AFOSR-62-32)
Unclassified

Also published in Nuovo Cimento, Series X, v. 28: 457-465, May 1, 1963. (AFOSR-40513; AD 434420)

The energy-dependence of fragmentation probabilities for cosmic ray nuclei in interstellar hydrogen is investigated, using the data that exist from experiments in which protons of various energy bombard different nuclei. The probability of a medium nucleus (C, N, O, F) going into a light nucleus (Li, Be, B) in an interaction of a medium nucleus in hydrogen (P_{ML}) seems to be energy-independent up to energies of the order of 6 gev/nucleon, whereas the probability of a heavy nucleus (Z >10) going into a light nucleus (P_{HL}) seems to be strongly energy-dependent. The above results imply that the interstellar matter traversed by cosmic ray nuclei as deduced from the abundance of light nuclei is dependent on the energies under consideration. The maximum possible difference between the values deduced at low energy (< 500 mev/nucleon) and the value deduced at high energy (> 1.5 gev/nucleon) is about 2 g/cm^2, if the experimentally measured ratio (Li, Be, B)/(C, N, O, F) is the same at the 2 energy ranges, the value at lower energies being higher. SCREENING CORRECTION TO THE SLATER EXCHANGE POTENTIAL, by J. E. Robinson, F. Bassani and others. [1962] [3]p. incl. diagrs, refs. (AFOSR-4075) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-145 and Atomic Energy Commission) Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 215-217, Sept. 1, 1962.

Modifying the original Slater calculation to include the influence of electron correlation on pair interaction (but still within the approximation of a uniform electron gas) has the effect of decreasing sharply the Slater exchange potential in the regions of low electronic density, where it was known to be too high. The Coulomb interaction is in effect replaced by a screened interaction, the simplest form of the screening factor resulting from the linearized Thomas-Fermi dielectric function. The quantitative effect of the correlation factor is demonstrated by a calculation of the exchange potential for Cl^- in a chloride. It may be very important in various types of band structure calculations.

RELATION BETWEEN ABSORPTION AND EMISSION PROBABILITIES IN LUMINESCENT CENTERS IN IONIC SOLIDS, by W. B. Fowler and D. L. Dexter, [1962] [12]p. incl. diagr. refs. (AFOSR-J158) [AF AFOSR-62-145] AD 400091 Unclassified

Also published in Phys. Rev., v. 128: 2154-2165, Dec. 1, 1962.

The Einstein relationship between spontaneous emission probability for radiative transitions is not generally valid for impurity centers in condensed media. An alternative approach to the problem is available by which estimates of the possible discrepancies can be made. Several mechanisms are discussed, particularly the Jahn-Teller effect, which depend on the existence of the phonon field and the lattice relaxation following absorption of a photon. In some simple cases, such as the F center in KCl and LiF, the decay time predicted from the integrated absorption cross section may differ by an order of magnitude from that observed. In other simple and cubic systems, where the atomic symmetries are appropriate, the discrepancy may be even larger. In noncubic crystals similar discrepancies may be expected. THE FINE STRUCTURE OF ABSORPTION IN NaCl: Ag, by R. S. Knox. [1962] [7]p. incl. diagrs. table, refs. (AFOSR-J604) (AF AFOSR-62-145) AD 414204 Unclassified

Presented at Internat'l. Conf. on Crystal Lattice Defects, Kyoto (Japan) Sept. 7-12, 1962.

Also published in Jour. Phys. Soc. Japan, v. 18, Suppl. II: 268-274, Mar. 1963.

It is known that a low concentration of Ag^+ introduces weak lines into the absorption spectrum of NaCl near the fundamental edge. The small observed oscillator strengths of these lines lend considerable plausibility to their assignment to perturbed $4d^{10} \rightarrow 4d^9 5_s$ transitions in the silver ions as originally proposed by Seitz, but certain theoretical calculations seem to indicate, on the basis of energy level predictions, that perturbed $4d^9 5_p$ states are directly involved as final states. In this note, the relative strengths and positions of the observed lines are shown to be consistent with the original $4d^9 5_s$ assignment, on the basis of a semi-empirical crystal-field study and an analysis of their temperature dependence. WANNIER EXCITONS IN SIMPLE VAN DER WAALS CRYSTALS, by R. S. Knox. [1962] [6]p. incl. refs. (AFOSR-J1559) (AF AFOSR-62-145) AD 427640 Unclassified

Presented at 10th Annual meeting of the Radiation Research Soc., Colorado Springs, May 20-23, 1962.

Also published in Radiation Research, v. 20: 77-82, Sept. 1963.

It is proposed that the Wannier model can be usefully applied to exciton states in the solid rare gases, and it has been shown that all but the lowest ($n = 1$) states in solid argon appear to be good Wannier states. For the lowest state, the model is inapplicable in detail but at least provides an alternative to the Frenkel model which, because of the large spatial extent of excited rare-gas orbitals, also appears to be inadequate. The lowest exciton state is not to be regarded as totally unexplained; rather it is only the fine details of the internal charge distribution of this state which remain to be elucidated. Physically, this state may be regarded as a hole in the p^6 shell of the atom, to which is bound an electron in some totally symmetric state resembling a highly perturbed 4s electron orbital or a complicated linear combination of Ar^- 4s orbitals on nearby neighbors. It is remarkable that in all rare gases the energy of the lowest state so closely matches the corresponding atomic excitation energy (in solid argon, where the difference is greatest, there is a blue shift of only 0.5ev.). The Wannier model can be used in more complicated molecular crystals, and this paper illustrates its properties and limitations.

OPTICAL ABSORPTION BY A PAIR OF IONS, by D. L. Dexter [1962] [2]p. (AFOSR-J560) (AF AFOSR 62-145) AD 427584 Unclassified

Presented at 10th Annual meeting of the Radiation Research Soc., Colorado Springs, May 20-23, 1962.

Also published in Radiation Research, v. 20: 118-119, Sept. 1963.

Varsanyi and Dieke have demonstrated unequivocably the absorption of a single photon by a pair of rare-earth ions in a crystal, acting in cooperation. Neither ion by itself could possibly absorb the photon, since no single-ion state exists at the photon energies involved. Absorption of light occurs discretely at sums of energy-level separation in the 2 ions is detected experimentally by the excitation spectrum of 1 of the emission lines. The basic reason this phenomenon is so unusual is related to the fact that the interaction of radiation with matter consists of a sum of 1-electron operator, $\vec{A}_i \cdot \vec{\Delta}_i$, where $\vec{A}$ is the vector potential. From this point of view, only 1 electron at a time could possibly be excited, hence only 1 ion. In this paper a procedure for computing the probability of this effect is outlined, and some of the implications of the associated phenomena are discussed.

VALENCE BAND STRUCTURE OF SILVER CHLORIDE, by R. S. Knox, F. Bassani, and W. B. Fowler, Jr. [1962] [4]p. incl. diagrs. (AFOSR-J1576) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-145] and Atomic Energy Commission) AD 427589 Unclassified

Also published in Photog. Sensitivity, v. 3: 11-14, Sept. 1962.

Preliminary calculations of the band structure of AgCl were made by using a combination of the tight binding and orthogonalized plane wave (OPW) methods. The results confirm Seitz's speculation on the nature of AgCl (Rev. Mod. Phys., v. 23: 328, 1951) and provide a specific prediction of the wave vector (111) of the phonons which may be expected to participate in the production of the indirect spectrum of AgCl. Assuming that the conduction band of AgCl is simple, the computation shows that the difference between the indirect and the direct band gap (at Γ) is 1.86 ev.

IS A COMPLETE DETERMINATION OF THE ENERGY SPECTRUM OF LIGHT POSSIBLE FROM MEASUREMENTS OF THE DEGREE OF COHERENCE? by E. Wolf. [1962] [8]p. incl. refs. (AFOSR 2128) (AF AFOSR-62-246) AD 414162 Unclassified

Also published in Proc. Phys. Soc., (London) v. 80: 1269-1272, 1962.

It is shown that the analytic properties of the temporal complex degree of coherence $\gamma(\tau)$ impose a relationship between modulus of (τ complex) and arg ($\gamma(\tau)$ on the real time axis. This relationship involves, in general, the location of the zeros of the degree of coherence in the lower half of the complex (τ) plane. It is suggested that the analytic continuation of the temporal degree of coherence of many spectral distributions has no zeros at all in this half plane. The spectral profiles of such distributions could be uniquely determined from measurements of modulus of $\gamma(\tau)$ alone. This possibility is of interest in connection with Michelson's well-known method of visibility curves. It is also of interest in connection with the recently proposed correlation and coincidence techniques (employing square-law detection) for determining narrow spectral profiles, such as those found in the output from an optical maser.

THE MEASURES OF BANDWIDTH AND COHERENCE TIME IN OPTICS, by L. Mandel and E. Wolf. [1962] [4]p. incl. diagrs. refs. [Technical note no. 3] (AFOSR-J119) (AF AFOSR-62-246) AD 400078 Unclassified

Also published in Proc. Phys. Soc. (London). v. 80: 894-897, 1962.

Several different definitions of the coherence time $\Delta\tau$ can be found in the literature and it is generally assumed that, in cases of practical interest, the different definitions give values of the same order of magnitude. The same remark applies also to definitions of the effective bandwidth $\Delta\nu$. Moreover it is generally supposed that these 2 quantities are related by the order of magnitude formula $\Delta\tau \sim 1/\Delta\nu$. It is shown from a detailed examination of one particular case of practical interest that the bandwidths as defined by 2 of the previously proposed formulae are of quite different orders of magnitude, although the correspondingly defined coherence times differ only by a factor of order unity. Similarly it may happen that the 2 values of $\Delta\tau$ differ greatly, whereas the corresponding values of $\Delta\nu$ are nearly equal. This discussion shows that the reciprocity relation $\Delta\tau \sim 1/\Delta\nu$ must be treated with caution, especially in the case of multiple-peaked distributions, such as arise in optical masers. TEMPORAL COHERENCE OF BLACKBODY RADIATION, by Y. Kano and E. Wolf. [1962] [4]p. incl. diagr. (AFOSR-J508) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-246 and United Aircraft Corp.) AD 616223 Unclassified

Also published in Proc. Phys. Soc. (London), v. 80: 1273-1276, 1962.

The temporal complex coherence function of blackbody radiation is calculated and is found to be expressible in terms of the generalized Riemann ζ-function. Curves are given which show the variation of the absolute value and of the argument of the temporal complex degree of coherence $\gamma(\tau)$ as functions of increasing time delay τ. It is shown that the analytic continuation of $\gamma(\tau)$ has no zeros in the lower half of the complex τ plane. This result supports the theory proposed in the paper by Wolf (item no. 2655) about the possibility of determining certain energy spectra from measurements of the absolute value of the degree of coherence.

COHERENCE-TIME AND EFFECTIVE BANDWIDTH OF BLACKBODY RADIATION, by C. L. Mehta. [1962] [8]p. incl. table, refs. (AFOSR-J589) (AF AFOSR-62-246) AD 413772 Unclassified

Also published in Nuovo Cimento, Series X, v. 28: 401-408, Apr. 16, 1963.

The coherence-time and the effective bandwidth of blackbody radiation are calculated on the basis of definitions proposed for these quantities by Wolf and Mandel. The 2 sets of definitions are found to give results of the same order of magnitude. The coherence-time at room temperature (~ 300°K) is found to be about $2 \cdot 10^{-14}$ S, corresponding to a coherence-length in vacuum of $6 \cdot 10^{-4}$ cm. A table of corresponding values for various temperatures is given. (Contractor's abstract)

BOUNDARY WAVE IN ELECTROMAGNETIC THEORY OF DIFFRACTION, by B. Karczewski. [1962] [2]p. incl. diagr. (AFOSR-J879) (AF AFOSR-62-246) AD 416009 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 53: 878-879, July 1963.

The Luneberg-Severin-Vasseur (LSV) theory which solves a diffraction problem of electromagnetic (vector) wave on an aperture in an infinite plane and perfectly conducting screen, as a one-side boundary-value problem (condition $E_{tan\ g} = 0$ is fulfilled on $z = \pm 0$) is considered. Unperturbed field is assumed on the aperture. The LSV theory described a diffracted electromagnetic field behind the screen in terms of double integrals, extended over the aperture. The purpose of the present note is to transform these double integrals into single integrals taken along the boundary of the aperture plus some terms corresponding to the geometrical wave. In doing this, it becomes possible to establish the existence, in the framework of the LSV theory, of a boundary electromagnetic wave for the case of an arbitrary wave incident on an aperture.

POLARIZATION PROPERTIES OF THE ELECTROMAGNETIC FIELD DIFFRACTED FROM AN APERTURE, by B. Karczewski and E. Wolf. [1962] [3]p. [AF AFOSR-62-246] Unclassified

Published in Electromagnetic Theory and Antennas; Proc. Symposium, Copenhagen (Denmark) June 25-30, 1962), ed. by E. C. Jordan. Oxford, Pergamon Press, pt. 2: 797-799, 1963.

Predictions regarding the state of polarization of the field are deduced. The main concern is the case when the incident field is a quasi-monochromatic unpolarized plane wave. It is shown that there are marked differences as between the approximate theories of Hottier, Severin and Vasseur, in their predictions of the state of polarization of the far field, even at moderate angles of diffraction. The mathematical approach is based on Wolf's coherency matrix.

CRITIQUE OF THE PEKAR THEORY OF THE F-CENTER, by W. B. Fowler and D. L. Dexter. Apr. 1962 [18]p. incl. diagrs. tables, refs. (AFOSR-4461) [AF 49(638)433] AD 295912 Unclassified

Also published in Phys. Stat. Sol., v. 2: 821-828, 1962.

A discussion is presented of the Pekar treatment of optical absorption and emission by the F-center in alkali halides, in which the crystal is treated as a polarizable dielectric continuum. In some important respects this is the most successful theory yet developed; nevertheless it is shown to lead to very poor predictions of other observable quantities and more important, to contain striking internal inconsistencies. These are pointed out and discussed. The theory is interpreted in a way which shows how, as it has been applied, it is essentially invariant with respect to the internal inconsistency as well as to a demonstrably false assumption on which it is based. A GENERAL LINEARIZATION METHOD FOR AUTOMATIC LENS CORRECTION, by G. H. Spencer. [1962] 18p. incl. refs. (Bound with its AFOSR-4624; AD 296404 as Appendix B)[AF 49(638)668] Unclassified

The use of programmed computing machinery for automatic lens correction requires a definite prescription according to which a lens system may be adjudged: (a) acceptable or not acceptable, or (b) improved or not improved over a previous configuration. Judgment of the first kind may be made on the basis of whether or not a given set of equations are satisfied; judgments of the second kind, on the basis of whether or not the value of a "merit function" has been reduced. A typical lens design problem will involve both absolute requirements, to which a judgment of the first kind is appropriate, and relative requirements calling for a judgment of the second kind. This paper describes a linearization method designed to accomodate requirements of both types. Several previously described linearization procedures are shown to be included within the framework of the present method. (Contractor's abstract)

A FORMAL THEORY OF INDUCTIVE INFERENCE. PART I, by R. J. Solomonoff. [1962] [22]p. (AFOSR-64-0946) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-377 and Public Health Service) AD 440057 Unclassified

Presented at Conf. on Cerebral Systems and Computers, California Inst. of Tech., Pasadena, Feb. 8-11, 1960.

Also published in Inform. and Control, v. 7: 1-22, Mar. 1964.

Four ostensibly different theoretical models of induction are presented, in which the problem dealt with is the extrapolation of a very long sequence of symbols—presumably containing all of the information to be used in the induction. One of these models is equivalent to a Bayes formulation, in which a priori probabilities are assigned to sequences of symbols on the basis of the lengths of inputs to a universal Turing machine that are required to produce the sequence of interest as output. Few rigorous results are presented. Informal investigations are made of the properties of these models. There are discussions of their consistency and meaninfulness, of their degree of independence of exact nature of the Turing machine used, and of the accuracy of their predictions in comparison to those of other induction methods.

Rockford Research Inst., Inc., Cambridge, Mass.

A FORMAL THEORY OF INDUCTIVE INFERENCE. PART II. by R. J. Solomonoff. [1962] [31]p. (AFOSR-64-1388) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-377 and Public Health Service) AD 444470 Unclassified

Also published in Inform. and Control, v. 7: 224-254, June 1964.

Induction systems introduced in item no. 2668, Vol. VI are applied to 3 specific types of problems and the reasonableness of the results obtained is discussed. The first section deals with the Bernoulii sequence. The predictions obtained are identical to those given by Laplace's rule of succession. The next section deals with the extrapolation of a sequence in which there are certain kinds of intersymbol constraints. Codes for such sequences are devised and some properties of the coding method are discussed. The use of phrase structure grammars for induction is described in the third section. The last section considers the use of the induction theory for decision making.

GAS-IONIZING SHOCK AND COMBUSTION WAVES IN MAGNETOGASDYNAMICS, by J. B. Helliwell. [1962] [15]p. incl. diagrs. (AFOSR-3513) [AF EOAR-61-49] Unclassified

Also published in Jour. Fluid Mech., v. 14: 405-419, Nov. 1962.

Some general properties of 1-dimensional deflagration waves in a non-conducting inviscid gas at rest are discussed when ionization of the gas takes place across a shock wave which precedes the flame front, and electromagnetic fields are present. The direction of wave propagation, the electric field and magnetic field are taken as a mutually orthogonal triad of vectors.

The jump relationships across the gas-ionizing shock wave and magnetogasdynamic combustion wave are investigated and the 2 Hugoniot curves analyzed in detail in the pressure-specific volume plane. The possible types of wave are indicated for arbitrary magnitudes of the unstream electromagnetic field. It is shown that weak gas-ionizing shock waves cannot exist. For suitably chosen electromagnetic field strengths the density ratio across the shock wave may be greater than the ordinary gasdynamic limit and, in such cases, the pressure and density ratios are related in an inverse manner, in contrast to the behavior for ordinary gasdynamic or magnetogasdynamic shock waves. The magnetogasdynamic combustion wave has similar properties to that in ordinary gasdynamics (Contractor's abstract)

MAGNETOGASDYNAMIC DEFLAGRATION AND DETONATION WAVES WITH IONIZATION, by J. B. Helliwell. [1962] [19]p. incl. diagrs. (AFOSR-3927) (AF EOAR-63-22) AD 416527 Unclassified

Also published in Jour. Fluid Mech. v. 16: 243-261, June 1963.

The propagation of a one-dimensional combustion wave into a non-ionized gas at rest in the presence of an electromagnetic field is considered when ionization of the gas occurs across either the combustion wave or a preceding shock wave. The electric and magnetic fields in the undisturbed gas ahead of the waves are mutually perpendicular and orthogonal to the direction of wave propagation. It is shown that steady detonation occurs at a point which is analogous to the Chapman-Jouguet point of ordinary gas-dynamic combustion theory. Numerical calculations are made of the state of the gas between and behind the waves in 3 particular models, in both of which the upstream electric field is zero. The models are then equivalent to magnetogasdynamic phenomena in a perfectly conducting gas. First, the case of steady detonation is studied. Secondly, steady deflagration in a tube, closed at one end, is discussed. (Contractor's abstract)

HYDROLYSIS EQUILIBRIA OF CATIONS AND ANIONS, by L. G. Sillén. Final technical rept. Oct. 1, 1958-Sept. 20, 1962. Oct. 6, 1952, 21p. incl. refs. (AFOSR-3766) (AF 61(052)162) AD 289352 Unclassified

This report on hydrolysis equilibria of cations and anions summarizes 26 technical notes that have been published as articles in scientific journals, and in addition 25 future papers that have been practically completed. Crystal structure analyses on oxo- and hydroxo-compounds of Cr, Fe, Al, In, Ge, Te, Zr, Th, V, Co, Ni, Zn, Ga, Sn and Pb were achieved. The existence of discrete groups $Al_2(OH)_2(H_2O)_8^{4+}$ and $Al_{13}O_4(OH)_{24}(H_{20})_6^{7+}$ was proved and their structures determined. For compounds of Ge, Sn and Pb, illustrations for the solution equilibria were found. The treatment of data in complicated systems was greatly aided by a generalized least-squares program for high-speed computers. For thermochemical studies, an automatic recording calorimeter for enthalpy titrations was constructed, and a special general least-squares program worked out. Results are given for the $Br^- - Hg^{2+}$ system but data on many more systems are available. (Contractor's abstract)

STUDIES ON THE HYDROLYSIS OF METAL IONS. 40. A LIQUID DISTRIBUTION STUDY OF THE HYDROLYSIS OF Cd^{2+}, by D. Dyrssen and P. Lumme. [1962] [9]p. incl. diagrs. refs. (AFOSR-3751) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)162 and Finnish State Commission for Natural Sciences) AD 414031 Unclassified

Also published in Acta Chem. Scand., v. 16: 1785-1793, 1962

The distribution of cadmium at 25°C between the liquid amine LA-1 in benzene and 3 M Na(ClO4, OH) has been measured, as a function of $[OH^-]$, with radioactive cadmium. The distribution data could be explained by Dyrssen and Silien's 2-parameter approximation for the stepwise formation of $Cd(OH)_4^{2-}$ from Cd^{2+}. High-speed refinement of the parameters obtained by curve-fitting gave the following values with the σ-deviations:

$$a = 1/4 \log \beta_4 = 3.012 \pm .043$$

$$b = 1.2 \log K_n K_{n+1}^{-1} = 0.429 \pm 0.047$$

$$\log \nu_2 \beta_2 (20\%\ LA\text{-}1) = 16.345 \pm 0.082$$

The value for the formation constant of $Cd(OH)^+$, $\log K_1 = 4.30 \pm 0.18$, agrees very well with the value in 3 M $LiClO_4$ determined by Biedermann and Ciavatta. Some experiments were also carried out with radioactive $Cd(OH)_2$ in a solubility column, but the solubility is lower than that predicted from the values of a and b and Schindler's value of the solubility product of $Cd(OH)_2$ in 3 M $NaClO_4$.

THE CRYSTAL STRUCTURE OF $Na_4Ge_9O_{20}$, by N. Ingri and G. Lundgren. [1962] [17]p. incl. diagrs. tables, refs. (AFOSR-64-1049) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)162 and Swedish Natural Science Research Council) AD 441490 Unclassified

Also published in Acta Chem. Scand., v. 17: 617-633, 1962.

Crystals of $Na_4Ge_9O_{20}$ are tetragonal, space group $I4_1$ a, with the dimensions a = 14.98 ± 0.01 A, c = 7.384 ± 0.005 A. The unit cell contains 4 formula units. Using 3-dimensional Patterson and Fourier methods the germanium, oxygen and sodium positions have been determined. These positions have been refined using the method of least squares. The refined atomic coordinates are collected in tabular form.

$Na_4Ge_9O_{20}$ is built up of GeO_4 tetrahedra and GeO_6 octahedra coupled together forming a 3-dimensional network. The Ge-O distances have been determined with a standard deviation of ± 0.015 A. The most important distances and angles in the structure are tabulated. The mean Ge-O distance for octahedral coordination is 1.90_7 A (in the structure varying from 1.82_2 A to 1.99_8 A) and for tetrahedral coordination 1.74_0 A (in the structure varying from 1.71_5 to 1.76_4 A).

The formation constant of $GeO_2(OH)_2^{2-}$ at 25°C in a 3 M NaCl medium has been determined using a hydrogen electrode. The following reactions and constants were obtained:

$$GeO(OH)_3^- + OH^- \rightleftharpoons GeO_2(OH)_2^{2-} \quad \log K_2 = 1.64 \pm 0.03$$

$$GeO(OH)_3^- \rightleftharpoons GeO_2(OH)_2^{2-} + H^+ \quad \log {}^*K_2 = -12.43 \pm 0.03 \quad (\log K_w = -14.07)$$

In the range studied there were no indications of the formation of polyanions. (Contractor's abstract)

THE ION ACTIVITY FUNCTION—AN APPROACH TO THE STUDY OF ELECTROLYTE BEHAVIOR IN CONCENTRATED SOLUTIONS. I. THE SYSTEMS LiCl-H_2O AND LiBR-H_2O, by E. Hogfeldt and L. Leifer. [1962] [7]p. incl. diagrs. table. (AFOSR-65-1249) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)162, Atomic Energy Commission, and Swedish Atomic Energy Research Council) AD 619756 Unclassified

Also published in Acta Chem. Scand., v. 17: 338-344, 1963.

An approach to behavior in concentrated electrolytes is presented. Utilizing the fact that a unique ion activity function was obtained for H_3O^+ in several strong acids, ion activity and ion activity coefficient functions for the ions in the systems LiCl-H_2O and LiBr-H_2O over a wide

composition range have been calculated. The results indicate that free Li^+ carries about three water molecules even in the most concentrated solutions and Cl^- and Br^- are unhydrated in the region 12m to saturation. The decrease in $\pi_0^{-1} y_{Cl^-}$ and $\pi_0^{-1} y_{Br^-}$ (seen in the highest concentrations of the salt solutions) has been interpreted as due to ion-pair formation. It is assumed that the ion activity coefficient function of Cl^- and Br^- would be constant in the high salt concentration if no ion-pairing occurred and based on deviations approximate values for the degree of dissociation, α, of the ion pair can be calculated.

EQUILIBRIUM STUDIES OF POLYANIONS. 10. ON THE FIRST EQUILIBRIUM STEPS IN THE ACIDIFICATION OF $B(OH)_4^-$, AN APPLICATION OF THE SELF-MEDIUM METHOD, by N. Ingri. [1962] [8]p. incl. diagrs. tables. ([Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)162] and Swedish Natural Science Research Council) Unclassified

Published in Acta Chem. Scand., v. 17: 573-580, 1963.

In the present work the "self-medium" method has been used to study the reactions, $qB(OH)_4^- + pH_2O \rightleftharpoons H_p(B(OH)_4)_q^{-q+p} + pOH^-$. The acidification was followed to $Z = 0.05$ for $B = 3.0, 2.5, 2.4, 1.2$ and 0.6 M. Z is the average number of H^+ bound to $B(OH)_4^-$ assuming no hydrolysis and B the total borate concentration. In the range over which it was studied, Z is mainly determined by p. The data indicated for $B = 2.5$ M, main species with $p = 2$ ($B_3O_3(OH)_4^-$ or $B_4O_5(OH)_4^{2-}$ or $B_5O_6(OH)_6^{3-}$ etc) and for $B \leq 1.2$ M, additional species with $p = 1$ ($B(OH)_3$ or $B_2O(OH)_5^-$ or $B_3O_3(OH)_5^{2-}$ etc). The data have been explained on the basis of the formation of the complexes $B(OH)_3$, $B_4O_5(OH)_4^{2-}$ and $B_3O_3(OH)_5^{2-}$ and the following equilibrium constants have been deduced: $\log K_1 = -5.31 \pm 0.02$, $\log K_{24} = -7.34 \pm 0.11$ and $\log K_{13} = -4.64 \pm 0.19$. The constants have been refined using the least squares program LETAGROP and the errors given are 3σ (σ is the standard deviation). (Contractor's abstract)

EQUILIBRIUM STUDIES OF POLYANIONS. 11. POLYBORATES IN 3.0 M Na(Br), 3.0 M Li(Br) AND 3.0 M K(Br), A COMPARISON WITH DATA OBTAINED IN 3.0 M $Na(ClO_4)$, by N. Ingri. [1962] [9]p. incl. diagr. table. ([Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)162] and Swedish Natural Science Research Council) Unclassified

Published in Acta Chem. Scand., v. 17: 581-589, 1963.

Using a hydrogen electrode, the borate equilibria have been studied at 25°C in the three media, 3.0 M Na(Br), 3.0 M Li(Br), and 3.0 M K(Br). The total boron concentration, B, has been varied, usually between 0.01 and 0.400 M. These data as well as the data we obtained earlier for 3.0 M $Na(ClO_4)$ medium could be explained by the species, $B(OH)_3$, $B(OH)_4^-$, $B_4O_5(OH)_4^{2-}$ and small amounts of $B_5O_6(OH)_4^-$. However, for 3.0 M $Na(ClO_4)$, 3.0 M Na(Br) and 3.0 M Li(Br), the data are slightly better explained by assuming that $B_3O_3(OH)_5^{2-}$ is also formed. There is no evidence for formation of $B_3O_3(OH)_5^{2-}$ in 3.0 M K(Br). Equilibrium constants and standard deviations have been calculated for these combinations using the computer program LETAGROP; the results of the calculations are tabulated. (Contractor's abstract)

EQUILIBRIUM STUDIES OF POLYANIONS. 12. POLYGERMANATES IN Na(Cl) MEDIUM, by N. Ingri. [1962] [20]p. incl. diagrs. tables, refs. ([Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)162] and Swedish Natural Science Research Council) Unclassified

Published in Acta Chem. Scand., v. 17: 597-616, 1963.

The pH equilibria of germanic acid and germanate ion have been studied in 0.5 m (molality) Na(Cl) medium at 25°C by electrometric titration using a glass or a hydrogen electrode. The total germanium concentration, B, had values generally between 0.0005 and 0.040 m. When the total germanium concentration B is $\leq$ 0.005 m, essentially only the mononuclear species germanic acid $Ge(OH)_4$ and the ions $GeO(OH)_3^-$ and $GeO_2(OH)_2^{2-}$ seem to be present; the data for $B > 0.005$ m give evidence also for a polynuclear species containing

eight germanium atoms and with a charge minus three. The following reactions and constants were obtained:

$Ge(OH)_4 + OH^- = GeO(OH)_3^-$ $\log \beta_1 = 4.67_8 \pm 0.006$

$Ge(OH)_4 + 2OH^- = GeO_2(OH)_2^{2-}$ $\log \beta_2 = 6.14 \pm 0.13$

$8Ge(OH)_4 + 3OH^- = (Ge(OH)_4)_8(OH)_3^{3-}$ $\log \beta_{38} = 29.14 \pm 0.05$ $H_2O \rightleftharpoons H^+ + OH^-$ $\log K_w = -13.70 \pm 0.03$

The constants have been refined using the least squares program LETAGROP and the error given is 3σ (σ is the standard deviation). (Contractor's abstract)

STUDIES ON THE HYDROLYSIS OF METAL IONS PART 41. THE HYDROLYSIS OF THE CADMIUM ION, Cd^{2+}, by G. Biedermann and L. Ciavatta. [1962] [19]p. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)162 and Swedish National Science Research Council) Unclassified

Published in Acta Chem. Scand., v. 16: 2221-2239, 1962.

The hydrolysis equilibria of the Cd(II) ion have been studied at 25°C by measuring the hydrogen ion concentration of a series of cadmium perchlorate solutions using a glass or a quinhydrone half-cell. The $[Cd(II)]_{tot}$ has ranged from 0.1 to 1.45 M. For each $[Cd(II)]_{tot}$ the $[H^+]$ was increased from a value corresponding to a solution saturated with $Cd(OH)_2$, until hydrolysis became negligible. All solutions studied were made to contain 3 M ClO_4^- by adding $LiClO_4$. The emf data, which show that only a small part of the Cd^{2+} ions can be transformed to hydrolysis products without precipitation, may be explained by assuming the equilibria

$Cd^{2+} + H_2O = CdOH^+ + H^+$ $\log *_{1,1} = -10.2 \pm 0.1$ (1)

$2\,Cd^{2+} + H_2O = Cd_2OH^{3+} + H^+$ $\log \beta_{1,2} = 9.10 \pm 0.05$ (2)

$4\,Cd^{2+} + 4H_2O = Cd_2(OH)_4^{4+} + 4H^+$ $\log \beta_{4,4} = -31.8 \pm 0.1$ (3) It may be deduced on the basis of the equilibrium constants (1), (2) and (3) that for $[Cd(II)]_{tot} > 0.1$ M the principal product of hydrolysis is the species Cd_2OH^{3+}.

FATIGUE STUDIES OF METAL CRYSTALS, by A. Shrier, P. Wallace and others. [1962] [11]p. incl. illus. diagrs. tables, refs. (AFOSR-J885) (AF 49(638)17) AD 293471 Unclassified

Also published in Acta Metall., v. 11: 779-789, July 1961.

Single crystals of silver and zinc were fatigued in alternating bending at constant strain amplitude of 0.12% and 0.2% for silver and 0.01% for zinc. They were studied by a combination of several x-ray techniques (double-crystal diffractometer, divergent beam, x-ray reflection microscopy), electron transmission microscopy and hardness measurements. The experimental results indicate that the fatigue process may be divided into 3 stages. The initial stage can be identified with cyclic work-hardening and is attributed to a general increase in dislocation density. The second stage represents a period of dynamical recovery. It consists in the removal of dislocations from distorted lattice domains and leads to a decrease of coarse lattice misalignments. At this stage cross-slip seems to play a fundamental role, as a process by which dislocations can escape from their locked positions. When cross-slip was obstructed by a high-angle boundary in silver or a twin boundary in zinc a premature fatigue failure occurred at the obstruction. The third stage is characterized by an extensive fragmentation of the structure. Due to the interaction of basal and pyramidal slip in zinc the structure resulting from this process shows considerable differences compared to that of silver. It appears that the high-stress fatigue process (below yield stress) is in principle not different from the low-stress fatigue mechanism except for a higher rate. It is believed that fatigue failure may perhaps result from the obstructions to cross-slip by internal barriers consisting of lattice domains of high dislocation density, the latter being formed by dynamical recovery. CHANGES IN NUCLEAR SPIN RELAXATION BY IRRADIATION OF ELECTRON RESONANCES (Abstract), by G. E. Schacher and H. C. Torrey. [1962] [1]p. [AF 49(638)755] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 85, Jan. 24, 1962.

Proton spin relaxation time T_{1N} in several solid insulators in which proton and electron spins are coupled by dipolar interaction has been measured. In such materials, positive and negative enhancements of proton polarization are produced by saturating double flip transitions. It has been found that T_{1N} is less than normal when double flips are induced by applied rf and that T_{1N} is greater than normal, sometimes by two orders of magnitude, when the central

electron resonance is strongly excited. The first effect is understandable from the normal rate equations. The second can be explained by a decoupling of electrons and proton spins due to the stirring of the electron spins by the applied rf.

NUCLEAR MAGNETIC RESONANCE OF Xe^{129} (Abstract), by E. R. Hunt and H. Y. Carr. [1962] [1]p. [AF 49(638)755] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 293, Apr. 23, 1962.

The Xe^{129} relaxation time in gaseous and liquid xenon has been measured using new samples whose impurity content is lower than that used by Streever and Carr (item no. 2443, Vol. IV). In contrast to the previous results, the relaxation rate is proportional to the density of the gas: $1/T_1 = 5.7 \times 10^{-6} \rho$ (ρ in amagats). A similar result has been observed independently by Staub and co-workers. In the liquid in equilibrium with its vapor, $T_1 = 1000$ sec; no temperature dependence was found within the experimental error of 15% for the new samples in the range 0° to -74°C. In both the liquid and gas, the shift in the resonant field is proportional to the density and the field: $\Delta H = 4.3 \times 10^{-7} \rho H_0$. Diffusion measurements indicate that $D = 6 \pm 1 \times 10^{-4}$ cm^2/sec at 235 amagats in the gas and $1.6 \pm 0.3 \times 10^{-4}$ cm^2/sec in the liquid at -74°C.

COOPERATIVE STORAGE WAREHOUSES, by H. J. Harrar. Doctoral thesis, May 1962, 203p. incl. tables, refs. (AFOSR-2615) (AF 49(638)849) AD 278712 Unclassified

Summary published in Coll. and Research Libraries, v. 25: 37-43, Jan. 1964.

Cooperative storage warehouses have been suggested as a possible means by which large libraries may, with minimal expenditures, retain and even acquire infrequently used but potentially valuable research material. Three types of this facility exist in the United States today. The first, exemplified by the New England Deposit Library, is a central storage warehouse owned and operated by several participating libraries. Each member merely rents space in a jointly-owned building, determines how its space is to be used, and maintains its own collections. The second type, illustrated by the Hampshire Inter-Library Center, is a consolidated warehouse owned and supported by a group of cooperating libraries. Each member contributes its little-used serials to the warehouse, which completely integrates the resulting collection. Contributed funds and income from the disposition of duplicates provide for a limited acquisitions program of rarely-consulted serials and expensive sets. The third type, illustrated by the Midwest Inter-Library Center, is distinguished from the preceding 2 types by the scope of its operations and holdings. Materials deposited by members are absorbed into the collections when deposit limitations permit, and duplicates are discarded. Unlike the others, this type has a professional staff which operates library programs approved by the membership and which carries on an acquisitions program designed to supplement members collections as well as to strengthen library resources in the region. The present study determines the effectiveness of each of these types of warehouses and recommends optimum measures for storage of little-used materials.

THE FUNCTION OF A MODERN SPECIAL LIBRARY, by R. R. Shaw. [1962] [8]p. (AFOSR-3828) (AF AFOSR-62-9) AD 416512 Unclassified

Also published in Research Management, v. 5: 485-492, Nov. 1962.

The special library differs from the general library in that it can design the scope of its collections and services to support defined objectives of the group it serves, and by concentrating on the needs and problems of that group, it can provide service of much greater depth and quality than can be provided by the general library. The intellectual requirements require that any and all material in the universe, treated in the special library, be focussed on the problems and needs

of the community which the library serves. This may mean preparation of new abstracts from the special point of view of the company, it may mean translation and other conversion of materials to meet local needs. It might be best done by running a messenger service to another library. It might require computer time. If the intelligence has to be evaluated by people with subject competence, provision should be made for use of substantive staff. All of this should be done without wasting the time of the bench scientist on bibliographical operations which can be performed better, faster, and cheaper by trained bibliographers. The special library should be operated as a dynamic service rather than as a storage warehouse.

EFFECTS OF ANXIETY LEVEL AND MILD SITUATIONAL STRESS ON VARIOUS PSYCHOLOGICAL FUNCTIONS; THE INTERRELATIONSHIPS AMONG THESE FUNCTIONS ANXIETY LEVEL AND OTHER PERSONALITY VARIABLES; A MULTIVARIABLE AND FACTORIAL STUDY, by O. Spreen. Final rept. Aug. 1962, 158p. incl. tables, refs. (AFOSR-4283) (AF 61(052)-483) AD 292785 Unclassified

Fifty-eight variables selected from various psychological functions were studied. Two hundred ninety two German males were selected as representing the highest and lowest 30% on the anxiety scale (matched for intelligence). High and low anxiety groups were randomly assigned to conditions of mild situational stress and nonstress. For each variable, an individual statistical analysis was performed. Results were as follows: (1) Variables under investigation were not significantly influenced by stress and nonstress conditions of testing, (2) Fifteen out of 36 hypotheses about questionnaire data were confirmed, (3) Four significant specific factors, 7 significant "ability" factors, and 5 other significant factors were extracted. Results of the individual and factor analysis were discussed with respect to relevant literature concerning the general topics of study. Additional results concerning the variables under investigation were briefly discussed. (Contractor's abstract, modified)

AN ESERINE-LIKE ACTION OF CHLORAL HYDRATE, by D. A. Brown. [1962] [9]p. incl. illus. (AFOSR-4194) (AF 61(052)25) AD 631886; AD 406820 Unclassified

Also published in Brit. Jour. Pharmacol. and Chemother., v. 19: 111-119, Aug. 1962.

The intra-arterial injection of chloral hydrate potentiated the transmission of nerve impulses through the cat superior cervical ganglion, antagonized the ganglion-blocking action of hexamethonium, and greatly enhanced the ganglion-stimulant action of acetylcholine. Effects on the ganglion-stimulant actions of carbachol, nicotine, tetramethylammonium and potassium chloride were slight or absent. Chloral hydrate itself usually had no direct stimulant action. The neuromuscular-blocking action of tubocurarine on the isolated rat diaphragm preparation was completely and rapidly reversed by chloral hydrate. This reversal was prevented by previous treatment of the muscle with neostigmine. Chloral hydrate potentiated the actions of acetylcholine and nicotine on the isolated rabbit duodenum, and, in concentrations exceeding 1 mg. ml, produced a spasm which was abolished by hyoscine but not by mepyramine. It was concluded that these eserine-like effects were manifestations of an anticholinesterase action of chloral hydrate. Neither chloralose nor trichlorethanol showed evidence of this property. INELASTIC COLLISIONS OF PROTONS AND HYDROGEN ATOMS WITH EXCITED HYDROGEN ATOMS (Abstract), by J. F. Carew, S. N. Milford. [1962] [1]p. [AF AFOSR-61-10] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 79, Jan. 24, 1962.

Born cross sections for collision of a proton with an excited hydrogen atom may be derived approximately from the Born cross sections for collision of an electron with an excited hydrogen atom. A comparison of the exact and approximate Born cross sections for the collisions $p + H(nl) \rightarrow p + H(n'l')$: $1s \rightarrow 2s$, $1s \rightarrow 2p$, $3s \rightarrow 4p$, shows that they agree down to energies near the Born maximum. Born proton cross sections are being calculated for many transitions in the range $n, n' = 1$ to 10. For the collisions $H(1s) + H(n,l) \rightarrow H(n',l') + H(n'',l'')$, the electron Born differential cross sections can be used to give the atom Born differential cross sections. A number of cases in the range $n, n', n'' = 1$ to 10 is being calculated.

THEORETICAL STUDIES CONNECTED WITH THE SOLID STATE RASER, by W. A. Barker, M. Lal Narchal and others. Final technical rept. Mar 15, 1959-Mar. 15, 1962. Apr. 14, 1962 [63]p. incl. diagrs. tables, refs. (AFOSR-2558) (AF 49(638)612) AD 277218 Unclassified

This theoretical analysis demonstrates that low noise radio frequency amplifiers may be designed and constructed. These devices, called RASERS, are radio frequency masers. Inversion of the nuclear spin population distribution may be achieved by saturating an allowed or forbidden electron spin transition with

microwave power of the appropriate frequency. The redistribution of nuclear spin population takes place as a result of a number of factors among which are: (1) the relative magnitude of the nuclear Zeeman interaction and the hyperfine interaction, (2) the algebraic sign of the nuclear gyromagnetic ratio or the hyperfine coupling contrast, (3) the orientation and frequency of the "pumping" field or fields, and (4) the nature and relative magnitude of the relaxation mechanisms. Eight cases of negative enhancement are tabulated on the nuclear polarization chart. Other possibilities are discussed in this analysis in more complex cases.

THE GAIN BANDWIDTH PRODUCT OF THE RASER, by F. X. Haas. [1962] [9]p. incl. diagr. table. (Bound with its AFOSR-2558; AD 277218) [AF 49(638)612] Unclassified

In order that a comparison of the gain and bandwidth of a raser can be made with the corresponding quantities of a maser and other amplifiers, the gain and bandwidth of the raser will be determined in terms of the Q's (quality factors) of the system modes. The values of the Q's determine whether or not stable power gain is possible. The bandwidth, $B = 2\Delta f$, of the raser is defined as the frequency width between points at which the magnitude of the reflection coefficient squared is reduced to half of its value at resonance. Thus the gain bandwidth product in the high gain limit for a solid state raser depends not only on the resonant frequency and the magnetic quality factor, but also on the resonant line width of the raser material. The best gain bandwidth product is obtained when both the bandwidth of the resonance line and the bandwidth of the coupling circuit are large.

GAIN-BANDWIDTH OF A RASER (Abstract), by F. X. Haas and W. A. Barker. [1962] [1]p. [AF 49(638)612] Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-25, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 553-554, Nov. 23, 1962.

Radio-frequency quantum-mechanical devices may be constructed using the interaction between nuclear and electron spins. The gain-bandwidth product of the raser has been calculated by analyzing an appropriate equivalent circuit. The analysis follows Strandberg's treatment of paramagnetic amplifiers. The result $G^{1/2}B = 2/[(1/B_m) + (|Q_{m0}|/f_0)]$ is valid in the high-gain limit for rasers and masers. In rasers, the signal frequency f_0 is due to nuclear magnetic resonance. The resulting natural linewidth B_m is often so narrow that $G^{1/2}B \gtrsim 2B_m$. In masers, $G^{1/2}B \cong (2f_0)|Q_{m0}|$. We estimate $G^{1/2}B$ to lie between 10 and 10^3 cps in Be^9, Si^{29}, and Ge^{73}. The magnetic-quality factor Q_{m0}, and B_m depend on the concentration of paramagnetic electrons.

NEGATIVE ENHANCEMENT OF THE NUCLEAR MAGNETIC RESONANCE FOR I = 1/2 BY DYNAMIC NUCLEAR POLARIZATION (Abstract), by W. A. Barker and M. Lal Narchal. [1962] [1]p. [AF 49(638)612] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 293, Apr. 23, 1962.

It has been suggested that an inverted nuclear population distribution can be used to construct a low-noise quantum-mechanical amplifier operating in the range from 20 kc to 1000 mc. In an electron nuclear-coupled spin system for I = 1/2, it is quite easy to see the conditions for which the enhancement of the NMR is negative. A total of 24 cases of dynamic nuclear polarization have been investigated. Eight of these are favorable for raser action, of which 6 are a consequence of the Overhauser effect and 2 a consequence of the Jeffries-Abragam effect.

2704

OVERHAUSER AND JEFFRIES-ABRAGAM EFFECT IN A FOUR-LEVEL SYSTEM, by M. Lal Narchal and W. A. Barker. [1962] [6]p. incl. diagr. tables. [AF 49(638)-612] Unclassified

Published in Appl. Opt., v. 2: 787-792, Aug. 1963.

The method of partial distributions is used to compute the normalized population distribution in an electron-nuclear coupled spin system in which I = S = 1/2. The expressions obtained are more general than those reported previously in that they include the effects of competitive relaxation and competitive radiative induced transition probabilities. It is clear that positive and negative enhancement may be obtained either by the Overhauser or the Jeffries-Abragam effect irrespective of the relative magnitudes of the nuclear Zeeman and hyperfine interaction energies. A small enhancement is not necessarily due to incomplete saturation, but may well be the result of compensating emission and absorption.

POPULATION-DISTRIBUTION PROBLEM IN MANY-LEVEL ELECTRON-NUCLEUS-COUPLED SPIN SYSTEMS (Abstract), by M. Lal Narchal and W. A. Barker. [1962] [1]p. [AF 49(638)612] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 293, Apr. 23, 1962.

The method of partial distributions has been applied to calculate explicit population-distribution expressions for an electron-nucleus-coupled spin system (S = 1/2) when microwave pumps which saturate the allowed or first-order forbidden transitions are applied. The expressions show the possibility of obtaining positive or negative enhancement of the NMR signal for any nucleus of nonzero spin. Explicit enhancement expressions have been evaluated exhibiting features not evident in the I = 1/2 system.

RASER NOISE, by M. Lal Narchal. [1962] [5]p. incl. diagr. (Bound with its AFOSR-2558; AD 277218) [AF 49(638)612] Unclassified

There are two main contributions to the RASER noise - intrinsic RASER noise and noise due to the associated circuitry. The intrinsic RASER noise is due to the spontaneous transitions from a higher energy state to a lower energy state. The radiation so emitted has the same frequency as the input signal but has no definite phase relationship with it. The noise to signal ratio due to the spontaneous emission is of the order of the ratio of the Einstein's spontaneous and induced emission coefficients $\frac{8\pi h\nu^3}{C^3}$. Since the frequency of the RASER $\lesssim$ 100 mc, this ratio $\sim 10^{-27}$. The noise due to associated circuitry can be described by applying the Nyquist-Johnson theorem to an equivalent circuit representing the RASER amplifier.

GAMMA RAY ASTRONOMY, by I. Escobar, R. Schulczewski and others. [1962] [46]p. incl. illus. diagrs. refs. (AFOSR-4082) (AF 49(638)290) Unclassified

Presented at Fourth Interamerican Symposium on the Peaceful Application of Nuclear Energy, (Mexico), Apr. 9-13, 1962.

An analysis is made of the characteristics of cosmic radiation of high energy gamma type and its production in this and other galaxies by assuming certain parameters based on recently obtained results. A study is made of the number of particles of this kind that can indicate on a detector the possible forms of separating showers generated from gamma rays from those much more frequently produced by protons. A description of the equipment used is given. Some of the preliminary results obtained are presented.

STUDY OF TIME VARIATIONS AND SOLAR MODULATIONS, by I. Escobar. Final technical rept. Oct. 1962, 1v. incl. illus. diagrs. tables, refs. (AFOSR-5215) (AF AFOSR-60-13) AD 415367; AD 419521 Unclassified

Mechanism by which the sun controls the intensity of cosmic radiation sampled at the earth are the subject of this investigation. The work performed at this institute was divided into 2 parts. First, the continuous recording of various components of the cosmic ray intensity with a variety of instruments. Second, the analysis and interpretation of the results, generally devoted to the study of Forbush decreases. Data for this analysis was obtained from the instruments at Chacaltaya and supplemented with results from several other institutions. (Contractor's abstract)

DAY TO DAY MODULATION OF GALACTIC COSMIC RAYS BY SOLAR WIND, by H. S. Ahluwalia. [1962] [21]p. incl. diagrs. (AFOSR-64-0033) (AF AFOSR-62-395) Unclassified

Also published in Proc. Fifth Interamer. Seminar on Cosmic Rays, La Paz (Bolivia) (July 17-27, 1962), v. 1: paper no 9, Sept. 1962.

Hydrodynamic expansion of solar corona (solar wind) provides an effective mechanism for day to day modulation of galactic cosmic rays. On quiet days cosmic rays tend to be entrapped in the co-rotating solar spiral interplanetary magnetic field created by quiet day solar wind and their guiding centers move past the earth with a velocit, of several hundred km/sec. The associated relativistic effects produce quiet day solar diurnal variation of cosmic rays, the amplitude and the time of maximum of which are related to the solar wind velocity in a simple manner. The explosive heating of the corona following a solar flare results in a "blast wave". On enveloping the earth this blast wave gives rise to cosmic ray storm and storm time diurnal variation. Further it is suggested that "approaching" and "receding" blast wave gives rise to anisotropic increases in cosmic ray intensity which are sometimes observed during the pre-onset and recovery phrases of cosmic ray storms. (Contractor's abstract)

ON SHORT-LIVED ANISOTROPIC COSMIC RAY INCREASE OF JULY 18, 1959 (Abstract), by H. S. Ahluwalia. [1962] [1]p. (AFOSR-64-0034) (AF AFOSR-62-395) Unclassified

Also published in Proc. Fifth Interamer. Seminar on Cosmic Rays, La Paz (Bolivia) (July 17-27, 1962), v. 2: paper no. 26, Sept. 1962.

Only July 18, 1959, a short-lived highly anisotropic cosmic ray increase was observed by some of the IGY network of recording stations during recovery from the third of the series of 3 closely spaced cosmic ray storms. Characteristic features and the solar and terrestrial relationships of this increase are studied. Different mechanisms proposed thus far for this increase are critically examined. Arguments are presented to the effect that this could not be a solar flare type increase. It is suggested that this increase was probably produced by galactic cosmic rays which were reflected from 'receding' Parker type blast waves formed during the explosive heating of a solar corona following the west limb 3^+ solar flare of July 16. ESTIMATION OF PORE RADIUS AT BOTH SURFACES OF ISOLATED TOAD SKIN, by G. Whittembury. [1962] [1]p. (AFOSR-1743) (AF AFOSR-61-85) Unclassified

Presented at Sixth annual meeting of the Biophys. Soc., Washington, D C., Feb. 14-16, 1962.

Published in 1962 meeting of the Biophys. Soc. Abstracts, paper no. TD 7.

This method allows the observance of swelling and shrinking of cells of isolated toad skin, when the solutions bathing either the outside or inside of the skin are changed. Thus the concentration of probing molecules of graded size, isosmic to the cells, across each face of the isolated toad skin can be determined. These concentrations have been used for the estimation of pore radius at the outer and inner face of the skin, following the approach of Goldstein and Solomon for the red cells. Pore radius of 5.0 A at the outer surface, and 6.8 A at the inner surface are obtained. Anti-diuretic hormone has an effect only when added to the inner surface; it widens the 5.0 A pores to about 6.8 A. A model membrane, formed by narrow and wide pores in series in which the main resistance to diffusion is at the wider pores, may explain some of the apparent inconsistencies previously observed. ACTION ON ANTIDIURETIC HORMONE ON THE EQUIVALENT PORE RADIUS AT BOTH SURFACES OF THE EPITHELIUM OF THE ISOLATED TOAD SKIN, by G. Whittembury. [1962] [14]p. incl. diagrs. tables, refs. (AFOSR-J608) (AF AFOSR-61-85) AD 414002 Unclassified

Also published in Jour. General Physiol., v. 46: 117-130, Sept. 1962.

A previously described method allows the observation of swelling and shrinking of the epithelial cells of the isolated toad skin, when the solution bathing either the outer or the inner side of the skin is modified. The equivalent pore radius at the outer and inner face of the skin epithelium can be estimated from the concentrations used; 4.5Å and 7A for the inner and outer surface pore radius, respectively, have been obtained. Antidiuretic hormone had an effect only when added to the inner side. This effect was only at the outer surface and is interpreted as widening of the 4.5A pores to about 6.5A. A model membrane, formed by narrow and wide pores in series, may explain some of the apparent inconsistencies observed. (Contractor's abstract, modified)

[FORMATION AND ROLE OF RADICALS IN FLAVOPROTEIN CATALYSES]. Final rept. 1962 [4]p. (AFOSR-4325) (AF EOAR-61-2) Unclassified

The work dealing with cytochrome oxidase on a bioluminescent system and on compounds in mixtures of oxidized and reduced flavin mononucleotide is summarized. The degree to which the cytochrome oxidase

reactions can be represented as due to partial reactions with oxygen of cytochromes a_3 and a has been extensively studied with the aid of a computer. The establishment of the life-time of reduced flavin mononucleotide in the presence of molecular oxygen was preliminary to the study of bioluminescence. Analysis of the factors involved in the luminescent reaction is still underway.

THE NATURE OF COMPOUNDS PRESENT IN MIXTURES OF OXIDIZED AND REDUCED FLAVIN MONONUCLEOTIDES, by Q. H. Gibson, V. Massey, and N. M. Atherton. [1962] [15]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-61-2], Medical Research Council, and Public Health Service) Unclassified

Published in Biochem. Jour., v. 85: 369-382, Nov. 1962.

The composition of the equilibrium mixtures obtained by mixing known amounts of flavine mononucleotide (FMN) and reduced FMN ($FMNH_2$) have been studied by spectrophotometry, fluorimetry, and electron-spin-resonance spectrometry. The major component of the mixtures containing more than 2mM total flavine is a species absorbing at 900 mμ which is regarded as a charge transfer complex (CT) between $FMNH_2$ and FMN. Comparison of the spectrophotometric and electron-spin-resonance data show a close correlation between the extinction at 570 mμ and the concentration of the free radical. When the radical concentration is plotted against total percentage of $FMNH_2$ at constant flavine concentration, a strongly asymmetric curve is obtained with a max at about 70% reduction. Evidence is presented that this asymmetry is due to the presence of another radical species, a complex between the semiquinone and $FMNH_2$. The formation of the complex between the semiquinone and the $FMNH_2$ is inhibited in the presence of solutes such as caffeine and urea, and in various organic solvents (formamide, dimethyl sulfoxide, propylene glycol, and MeOH). In aqueous solution (0.12M phosphate, pH 6.3) the data are consistent with the following equilibria: $2FMN \xleftrightarrow{K_F = 10mM} (FMN)_2$; $2FMNH_2 \xleftrightarrow{K_{FH_2} = mM} (FMNH_2)_2$; $FMNH_2 + FMN \xleftrightarrow{K_{CT} = 0.445mM} CT$; $CT \xleftrightarrow{K_x = 10^6/M}$ $2FMNH, FMNH + FMNH_2 \xleftrightarrow{K_{FMNH_2FMNH} = 5.6mM}$ ($FMNH_2FMNH$). The effect of changing the solvent on the relation between the extinction at 570 mμ and that at 900 mμ suggests that the charge transfer complex (900 mμ band) is a precursor of the free semiquinone.

REACTIONS OF CYTOCHROME OXIDASE WITH OXYGEN AND CARBON MONOXIDE, by Q. H. Gibson and C. Greenwood. [1962] [14]p. incl. diagrs. tables, refs. [AF EOAR-61-2] Unclassified

Published in Biochem. Jour., v. 86: 541-554, Mar. 1963.

The reaction of the Yonetani preparation of cytochrome oxidase with carbon monoxide is accurately second-order with a rate constant $8 \times 10^4 M^{-1}$ sec^{-1} at 20° and activation energy of 6.4 kcal. The dissociation velocity constant of carbon monoxide is 0.023 sec^{-1} at 20° and pH 7.4. In the Yonetani preparation, 1/3 of the total iron reacts with carbon monoxide to form the carbon monoxide compound as determined both by spectrophotometry and by gasometric methods. The reaction of oxygen with reduced cytochrome oxidase is rapid and the course of the reaction is complex. At low oxygen concentrations the approximate second-order rate constant is 6×10^7 M^{-1} sec^{-1} for the Yonetani preparation and 3×10^7 M^{-1} sec^{-1} for the Greenwood (1963) preparation. When the reaction between reduced cytochrome oxidase and oxygen is followed at different wavelengths, the course of the reaction changes. At low oxygen concentrations (less than 5 μM) the reaction proceeds faster when followed at 605 mμ than when followed at 445 mμ. At concentrations of oxygen above 10 μM, the observed changes at 605 mμ are slower than those at 445 mμ. The apparent second-order rate constant at 445 mμ and at low oxygen concentrations increases as the reaction proceeds; at high oxygen concentrations it decreases. These changes are attributed to consecutive reactions between oxygen and reduced cytochrome a_3, and between reduced cytochrome a_3 and oxidized cytochrome a. Satisfactory agreement between observation and calculation has been obtained by assuming that reduced cytochrome a_3 can react with oxygen with a velocity constant of 1.5×10^8 M^{-1} sec^{-1} and that the reaction between reduced cytochrome a and cytochrome a_3 is first-order with a rate constant of 1.5×10^3 sec^{-1}. The spectrophotometric changes at different wavelengths may be produced by using the extinction coefficients given by Yonetani.

The basal diencephalon of locally anesthetized cats, immobilized with gallamine, has been explored with stereotaxically oriented electrodes while the superficial radial nerve was stimulated with single pulses Potential distribution when leading with concentric bipolar needle electrodes, has been compared with the distribution of evoked responses when the inner core (180 micra in diameter) of the needle electrode was used as exploring element against an indifferent electrode on the scalp (so called monopolar recording). The diencephalic area which appears to be activated by somatic impulses when the monopolar arrangement is used is much larger than the area wherefrom responses are recorded with the bipolar concentric lead. The possibility that unipolar leads may also record activity spread from some distance is discussed. (Contractor's abstract)

CENTRAL NERVOUS MECHANISMS IN CIRCULATION REGULATION, by C. Bartorelli and A. Zanchetti. May 31, 1962, 13p. incl. refs. (AF 61(052)253) AD 632506 Unclassified

The diencephalic mechanisms for rage were found to be under the inhibitory control of sino-aortic pressoceptors, and to be excited by chemoceptive firing. Inhibitory as well as excitatory effects can be induced also from the reticular formation. Lesion experiments indicate that rate activity is supported by the activating reticular system. Mapping diencephalic responses to somatic stimuli has been to define some limited foci of activation. A tonic inhibitory role on arterial pressure exerted by afferents from heart and lungs is described. (Contractor's abstract)

FUNCTIONAL RELATIONSHIP BETWEEN MIDBRAIN RETICULAR FORMATION AND LATERAL HYPOTHALAMUS (Abstract), by P. Rodomin, A. Malliani, and A. Zanchetti. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)253 and Rockefeller Foundation) Unclassified

Published in Proc. Internat'l. Union of Physiological Sciences; Twenty-second Internat'l. Cong., Leyden (Netherlands) (Sept. 10-17, 1962), Amsterdam, Excerpta Medica Foundation, v. 2: Abstract no. 1131, 1962.

Experiments have been performed in locally anesthetized cats to compare the afferent projections from the

somatic system (single pulses to one radial nerve) to both midbrain reticular formation and lateral hypothalamus. Preamplifier filters were set so that both slow waves and unit responses could be recorded by means of tungsten microelectrodes. The following data suggest that somatic impulses may affect the 2 structures parallely, although partially independent activation can also occur. (1) No fixed relationship between the latencies of the potentials evoked in the 2 regions has been observed, the hypothalamic often trailing, but sometimes leading the reticular response. (2) Simultaneous waxing and waning of both types of response shows that their peak amplitudes are positively correlated. (3) The ratio of hypothalamic to reticular potentials is increased when measured on responses to a second stimulus of a pair (240 msec delay), or after small doses of Thiopental thus indicating that the hypothalamus is relatively less depressed.

INHIBITION OF DIENCEPHALIC SHAM RAGE BEHAVIOR BY LOWER BRAIN STEM STIMULATION (Abstract), by G. Carli, A. Malliani, and A. Zanchetti. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)253 and Consiglio Nazionale delle Recherche) Unclassified

Published in Proc. Internat'l. Union of Physiological Sciences; Twenty-second Internat'l. Cong., Leyden (Netherlands) (Sept. 10-17, 1962), Amsterdam, Excerpta Foundation. v. 2: Abstract no. 1134, 1962.

The effects of electrical stimulation of medulla and pons through stereotactically directed electrodes have been studied in 70 actute decorticate cats. Either excitation or inhibition of sham rage behavior, as well as postural reactions, could be elicited from the lower brain stem. Attention is directed toward the inhibitory responses only. The following results have been obtained. (1) Threshold stimulation (1-2 volts, 25-100 c/sec, 1 msec) of several tegmental points could block the spontaneously recurring or reflexly evoked outbursts of rage, while being without any effect when timed during an interval of quiet of the preparation. Both somatic and automatic (pupillary, respiratory, and circulatory) components of rage behavior were simultaneously inhibited. (2) The inhibitory response was independent of co-stimulation of cerebellofugal fibers coursing through the brain stem, as it could be obtained also in cats which had undergone total cerebellectomy 14-21 days before. (3) Inhibition of sham rage could be elicited only from the medial portions of the reticular formation, but inhibitory and excitatory points were quite intermingled. (Contractor's abstract)

MIDBRAIN COURSE OF DESCENDING PATHWAYS MEDIATING SHAM RAGE BEHAVIOR, by G. Carli, A. Malliani, and A. Zanchetti. [1962] [14]p. incl. illus. refs. (Sponsored jointly by [Air Force Office of Scientific Research] under AF 61(052)253 and Consiglio Nazionale delle Recherche) Unclassified

Published in Exper. Neurol., v. 7: 210-223, Jan. 1963.

The midbrain course of descending pathways mediating sham rage behavior has been investigated in thalamic cats. Electrical stimulation of the lateral hypothalamus has been tested for rage outbursts before and following various lesions in the midbrain. The following lesions were found not to impair transmission of the descending hypothalamic influences: transection of the rostral third of the central periaqueductal gray and adjacent tegmentum, with interruption of the hypothalamic component of Schütz's dorsal longitudinal fasciculus; midline lesions, including the medial component of the medial forebrain bundle to the ventral tegmental area of Tsai and to the caudal periaqueductal gray; and lateral tegmental lesions involving the lateral component of the medial forebrain bundle to the lateral midbrain tegmentum. Large lesions involving most, though not all, of the tegmentum at the midcollicular level impaired, but did not abolish, rage responses to lateral hypothalamic stimulation. It is concluded that descending connections from the lateral hypothalamus, responsible for the peripheral manifestations of rage, are diffuse through the midbrain, including both the lateral and the medial components of the medial forebrain bundle, and possibly the dorsal longitudinal fasciculus as well.

Also published in Microwave Jour., v. 5: 80-86, May 1962.

This paper discusses an investigation of the use of free space transmission between a pair of appropriately spaced and designed radiators as a possible replacement for waveguide transmission within a millimeter wavelength system. In developing a free space transmission system, it is necessary to design and develop devices which will perform the same functions in free space as those performed by conventional waveguide components and instruments. Among the needed devices are duplexers, directional couplers, attenuators, wave meters, hybrid junctions, reflectometers and a means of transmission around corners.

[COLLECTION OF LOW SPEED ELECTRONS BY METALLIC SURFACES], by [W. R. Ferris]. Final rept. [1962] 8p. (AFOSR-3532) (AF 49(638)175) AD 288282 Unclassified

The collection of very low velocity electrons by metallic surfaces is a complex phenomenon and merits further study. Contamination is always present and may be a powerful factor in the behavior of a particular surface. The electrons rejected by a surface influence the characteristics of electron devices in many ways, among them being the macroscopic phenomenon known as "black out" as well as second order effects such as gain variation in dc amplifiers, frequency drift in oscillators, and noise in high gain amplifiers. REACTION OF VANADIUM (IV) CHLORIDE WITH SOME ALIPHATIC AMINES, by M. W. Duckworth and G. W. A. Fowles. [1962] [7]p. (AF 61(052)318)
Unclassified

Published in Jour. Less-Common Metals, v. 4: 338-344, 1962.

The reactions at room temperature of VCl_4 with an excess of several primary and secondary aliphatic amines are studied. Each primary amine (NH_2R, R = Me, Et, Pr and Bu) gives an aminobasic VCl_4, $VCl_2(NHR)_2 \cdot NH_2R$, which is insoluble in the usual organic solvents. The thermal decomposition of these compounds shows that amine is steadily lost when heated in vacuo up to 100°, although there is apparently no composition of particular stability. Nevertheless, at ~ 60°, these substances change color from green to purple, indicating a change in the environment of the V atom. Two V-Cl bonds are aminolyzed by the secondary amines (NHR_2, R = Me, Et, Pr). Structures for the compounds are proposed on the basis of spectroscopic studies. (Contractor's abstract)

The di-t-butyl peroxide-induced decarbonylation of 2-formylbornane in the liquid phase at 138° gives mainly bornane and traces of bornene and tricyclene as the sole C_{10}-hydrocarbon products. The hypothetical rearrangement product 2,3,3-trimethylnorbornane (isocamphane) is not observed and cannot be present to an extent greater than about 0.1% of the total volatile hydrocarbon formed. The chain length for carbon monoxide production in the decarbonylation varies with the ratio of peroxide to aldehyde used and ranges from about 0.4 to 4.8 as the ratio changes from about unity to about 0.1. At high initial ratios, the yields of disproportionation products (bornene and tricyclene) increase at the expense of bornane, suggesting an increased importance of radical-radical reactions relative to hydrogen abstraction. REACTIONS OF THE 2-BORNYL RADICAL. II. A FREE RADICAL WAGNER-MEERWEIN REARRANGEMENT, by J. A. Berson, C. J. Olsen, and J. S. Walia. [1962] [12]p. incl. diagrs. tables, refs. (AFOSR-2314) (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)1544, Alfred P. Sloan Foundation, Office of Ordnance Research and Richfield Oil Corp.)
Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 3337-3348, Sept. 5, 1962.

The thermal decomposition of 2-azobornane in the solvents diphenyl ether and n-hexadecane at temperatures above 250° gives a mixture of hydrocarbons, among which is 2,3,3-trimethylnorbornane (isocamphane), resulting from formal Wagner-Meerwein rearrangement. The latter hydrocarbon arises by a cleavage-recyclization mechanism, an interpretation supported by the formation of isocamphane as well as bornane, 1-p-menthene, tricyclene and bornene in the decomposition of either 2-azocamphane or 1-azo-cis-2(2,2,3-trimethyl-3-cyclopentenyl)-ethane. Further support for classical rather than mesomeric product-forming intermediates is provided from the normal rates of decomposition of the azo compounds, from the dependence of the product distribution on the source of radicals, and from the stereochemistry of the hydrogen-abstraction by the 2,3,3-trimethyl-2-norbornyl radical, which gives both isomers of isocamphane. Presented at 139th meeting of the Nat'l. Amer. Chem. Soc.; Symposium on Structure of Micellar Solutions. Mar. 1961.

Also published in Jour. Colloid Sci., v. 16: 462-473, Oct. 1961.

Precise measurements of conductivity of solutions of pure sodium decyl and dodecyl sulfates and their mixtures in the region of the critical micelle concentration (cmc) are reported and the cmc values of the mixed systems are evaluated. An empirical interpretation of these results is proposed which leads to a self-consistent assignment of composition to the mixed micelles. This interpretation is based on an extrapolation - the conductivity vs concentration plot, to obtain the concentration of monomers in a mixed solution in the same way in which the cmc is obtained in a pure system. This extrapolated concentration is assumed to be the cmc of the mixed monomers, again in analogy with the

pure system. This concentration therefore determines the composition of the equilibrium monomers. The composition of the mixed micelles is then calculated by difference. (Contractor's abstract)

THERMODYNAMIC ASPECTS OF MIXED MICELLES-APPLICATION TO AN EMPIRICALLY ESTABLISHED EQUILIBRIUM, by K. J. Mysels and R. J. Otter [1961] [7]p. incl. diagrs. refs. (AFOSR-1949A) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)309 and Office of Naval Research) Unclassified

Presented at 139th meeting of the Nat'l. Amer. Chem. Soc.; Symposium on Structure of Micellar Solutions, Mar. 1961.

Also published in Jour. Colloid Sci., v. 16: 474-480, Oct. 1961.

Relationships between the overall composition, in terms of mole fraction of 2 micelle-forming components, in a solution of these 2 components and the critical micelle concentration on the one hand and the composition of the mixed micelles on the other, are reviewed and activity coefficients introduced to account for the behavior of real systems. It is shown that the behavior of the critical micelle concentration is not a sufficient criterion for the ideality of the system, that the contribution to nonideality of the 2 components can be resolved, and that the ideality of the monomeric solution may be tested if the composition of mixed micelles is known. These considerations are applied to the results obtained in (see item no. 2736, Vol. VI) for the sodium decyl and dodecyl sulfates and indicate definite deviations from ideality for the whole system as well as for the monomeric solution. These deviations are, however, not very large and affect the mixed critical micelle concentration insignificantly. (Contractor's abstract)

AN APPROACH TO GAS MEMBRANE OSMOMETRY, by K. J. Mysels and E. Gonick. [1961] [3]p. (AFOSR-1951) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)309, National Science Foundation and Research Corp.) Unclassified

Also published in Jour. Phys. Chem., v. 65: 1631-1633, Sept. 1961.

Osmometry is, in principle, the most sensitive method of measuring colligative properties. Truly semipermeable membranes are scarce. The membrane formed by an inert gas held in nonwetted capillaries between the solvent and the solution is discussed. The gas-phase gap is permeable to H_2O vapor but completely impervious to any nonvolatile solvent. Membranes are prepared by siliconizing a commercial membrane filter of high porosity, pores ≤ 1 μ. In these membranes, thermal contact between the 2 surfaces is relatively good. Membranes thus prepared are compared with those prepared by the porous-disk method; heat transport between the 2 surfaces is quite slow in these membranes. The driving force for the transport of solvent in membranes prepared by either method is the difference in vapor pressure between the 2 surfaces. The experimental rate is considerably higher than the theoretical one. The osmometer used is a modification of the application described by Scatchard, et. al. Experiments are conducted mainly with 3×10^{-4}M KCl on the solution side. Steady values are difficult to obtain; probable causes for this are discussed. It is not always possible to calculate the rate of transport, even when steady values are obtained. (Math. Rev. abstract)

FLOW IN THIN LIQUID FILMS, by J. Lyklema, P. C. Scholten, and K. J. Mysels. [1962] [24]p. incl. diagrs. table, refs. (AFOSR-5174) (AF 49(638)369) AD 416373 Unclassified

Also published in Jour. Phys. Chem., v. 69: 116-123, Jan. 1965.

An improved experimental method for studying vertical soap films slowly pulled out of a solution is described and the interpretation of the optical thickness measurements is discussed. The behavior of molecule films presents complications which are described. Rigid films on the other hand give results for films thicker than 800-1100 A, which agree very closely with Frankel's law relating film thickness to the velocity of pull-out. Since Frankel's law is derived on the assumption that the viscosity is constant up to the monolayer, this agreement proves the absence of any thick rigidified water layers (or of slip) in the neighborhood of the surface. INORGANIC SULFUR REAGENTS. I. THE THIONYL HALIDES, by C. M. Buess, N. Kharasch, and R. B. Langford. [1961] [15]p. incl. diagrs. table, refs. (AFOSR-266) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)718 and Stauffer Chemical Co.) Unclassified

While it is clear that many compounds of the inorganic sulfur reagents have now become of the greatest theoretical and practical interest, yet there has been a lack of correlative and review papers which would serve to focus attention on them. It seemed desirable to prepare a series of brief articles, each of which would give a thorough entry to the literature on a selected group of these substances. The present paper concerns the thionyl halides, SOX_2. The known examples of this group of compounds are shown, together with the other known compounds of sulfur and halogen, and of sulfur, oxygen and halogen.

ELECTROMAGNETIC RADIATION FROM AN ELECTRIC DIPOLE IN A COLD ANISOTROPIC PLASMA, by H. H. Kuehl. [1962] [9]p. incl. diagrs. (AFOSR-J126) (AF 49(638)522) AD 400447 Unclassified

Also published in Phys. Fluids, v. 5: 1095-1103, Sept. 1962.

The general solution to the problem of monochromatic radiation from an electric dipole in a magnetically biased, cold tenuous plasma is presented. It is found that, generally, several waves exist in the radiation zone, traveling in different directions with different indices of refraction. For certain ranges of the plasma, gyro, and operating frequencies, the field becomes very large in certain directions compared with that in other directions, producing highly directive radiation characteristics. In general, the expression for the field is quite complicated although several special cases are treated which yield simple solutions. For high operating frequency it is found that the radiation pattern is identical to the isotropic case although a Faraday rotation takes place. Solutions are given for low and very low frequencies which place in evidence the guiding nature of the magnetostatic field. For the case of a large magnetostatic field it is shown that only 2 waves exist and that the time-average power flow is purely radial. (Contractor's abstract)

NOTE ON VISCOUS AND DIFFUSION STRESSES IN A MULTI-COMPONENT GAS MIXTURE, by J. C. Williams, III. [1961] 5p. (AFOSR-1230) (AF 49(638)-831) Unclassified

From a physical point of view, it does not seem logical to divide the stress tensor into viscous and diffusion parts since at the microscopic level the same velocities which are involved in the transport of momentum, and hence give rise to viscosity, are involved in diffusion. In fact, one might argue that viscous stresses arise from the diffusion of momentum. This view would be consistent with the fact, pointed out by von Kármán, that the viscosity coefficient for the mixture is defined in such a way that the momentum transfer by means of diffusion is included into the viscous stress components.

KINETIC EQUATIONS FOR PLASMAS, by T. Koga. [1962] [7]p. incl. diagrs. refs. (AFOSR-2006) (AF 49-(638)831) Unclassified

Also published in Phys. Fluids, v 5: 705-711, June 1962.

The effect of the inner-core field which is induced by a charged particle within the Landau distance and has been neglected in current kinetic theories of plasmas, is investigated from the transport-theory viewpoint. In the equation for a 1-particle distribution function, the effect of the outer-core field between the Landau distance and the Debye distance is represented by the friction and diffusion terms of the Fokker-Planck type, while the effect of the inner-core field is represented by the collision term of the Boltzmann type. The magnitudes of these terms are compared with each other. It is shown that the collision term may be larger than the friction and diffusion terms under certain conditions. When the effect of the outer-core field is larger than that of the inner-core field, the assumption of weak interaction is shown not to be valid. The possible nonlinear and non-Markovian behavior of a particle is considered only implicitly. The radiation phenomena are neglected. (Contractor's abstract)

PRESSURE LAG THROUGH ORIFICES AND SHORT TUBES FOR SMALL PRESSURE RATIOS AND FLOW CONDITIONS FROM FREE MOLECULE TO CONTINUUM by J. G. Everton and F. O. Smetana. Jan. 1962, 36p. incl. illus. diagrs. (USCEC rept. no. 83-211) (AFOSR-2360) (AF 49(638)831) AD 274626 Unclassified

Experiments were conducted to determine the time required for the pressure in a 1-l volume to rise to 33% of final value when filled through a short tube. Tube length to diameter ratios of 0.5 to 8.0 were tested. Initial pressure in the volume ranged from about 25μ to about 25 mm. The pressure at the upstream end of the fill tube was maintained at 1.25 times the initial pressure in the volume for all runs. A rapidly acting pneumatic valve was opened to connect the 2 chambers. It was found that the fill time could be predicted quite satisfactorily at both pressure extremes by variants of conventional theory. At intermediate pressure, however, no satisfactory theoretical prediction was found. (Contractor's abstract)

THE CRITERION OF RAREFACTION OF PLASMAS, by T. Koga. Mar. 1962 [9]p. incl. diagr. (USCEC rept. no. 83-212) (AFOSR-2361) (AF 49(638)831) AD 274627 Unclassified

According to the analysis of kinetic equations of particles in plasmas given in a previous report (see item no. 2664, Vol. V) rarefaction of a plasma is defined. The criterion of rarefaction is divided into 2 parts: 1 is the condition of the discrete binary interactions of particles which permits us to define a free path; the other is the comparison between the mean free path and a representative dimension of the field (the Knudsen number). The first condition is determined by the number density of particles and the temperature (the average energy of random motions of particles). In the regime of rarefaction, the basic kinetic equations are of the Boltzmann type. (Contractor's abstract)

A STUDY OF COMPRESSIBLE AND INCOMPRESSIBLE VISCOUS FLOW IN SLENDER CHANNELS, by J. C. Williams, III. June 1962 [81]p. incl. diagrs. refs. (USCEC rept. no. 83-213) (AFOSR-2361) (AF 49(638)-831) AD 277587 Unclassified

An analytical study is made of viscous compressible and incompressible flow in slender channels. By performing an order of magnitude analysis, similar to that employed in deriving the Prandtl boundary layer equations, a set of approximate equations of motion, valid for the entire compressible or incompressible viscous flow field in slender channels, was obtained. These approximate equations of motion are identical with the Prandtl boundary layer equations. It is found that accurate similar solutions in the incompressible 2-dimensional problems are possible for flows in convergent or divergent channels with plane walls. For incompressible axisymmetric flow, similar solutions are possible for flow in channels where the wall shape varies exponentially with the distance along the channel. In the case of 2-dimensional compressible flow with adiabatic walls, similar solutions are possible for a variety of wall shapes and pressure gradients. A detailed study of compressible flows

in convergent-divergent channels is made to determine the effects of viscosity on the location of the sonic line, on the pressure ratio at the geometric throat and on the discharge coefficient for such channels. (Contractor's abstract)

SELF-SIMILAR AND PSEUDOSIMILAR SOLUTIONS OF BLAST WAVES IN ELECTROGASDYNAMICS, by K. Oshima. Aug. 1962, 3?p. incl. diagrs. tables, refs. (USCEC rept. no. 83-215) (AFOSR-3672) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)831 and Office of Naval Research)
AD 284914 Unclassified

Also published in Jour. Phys. Soc. Japan, v. 19: 1057-1063, June 1964.

Using the electrogasdynamical equations and the Poisson equation, a characteristic length Re, which is proportional to the Debye length divided by a ionization rate of a gas, is defined. The length plays an important role in the electrogasdynamical blast wave. Since the classical gasdynamical blast wave with a constant energy contained in it has a characteristic length, (Ro), which is defined by the constant energy, the essential parameters of the electrogasdynamical blast wave with a constant energy in it are Ro and Re, or the square of its ratio, Ao. A self-similar solution of the electrogasdynamical blast wave is found. Its shock front propagates exponentially with time and its energy also increases exponentially with time. Several numerical calculations with various values of the parameter, Re, have been carried out. This solution contains a classical gasdynamical blast wave as a limiting case of Re approaches infinity. (Contractor's abstract)

ON THE CURRENT COLLECTED BY A CHARGED CIRCULAR CYLINDER IMMERSED IN A TWO-DIMENSIONAL RAREFIED PLASMA STREAM, by F. O. Smetana. [1962] [27]p. incl. diagrs. table. (AFOSR-3684) (Sponsored jointly by Aeronautical Systems Division, Air Force Office of Scientific Research under AF 49(638)831 and Rome Air Development Center)
Unclassified

Also published in Rarefied Gas Dynamics; Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press, Suppl. 2, v. 2: 65-91, 1963 (AFOSR-5310)

Assuming that the concentration of ions and electrons near a small, charged cylinder in a plasma stream does not alter the symmetry of the force field appreciably, one can determine the trajectory of any particle in the stream when under the influence of this field, provided the motion is collisionless. By summing over all particle velocities in the undisturbed stream (one may take a Maxwell-Boltzmann distribution), it is possible to find the number of orbits which intersect the cylinder. This depends among other things upon the radial extent of the field. When the field extends more than 10 cylinder radii, the flux varies but slightly with changes in field extent. The same is true when the field extent is very small. For intermediate field extent considerable error can result if the value is not known reasonably well. An approximate Poisson equation is developed and solved and this appears to yield errors in the flux no larger than 10%. The results of the numerical integrations for the cylinder current are presented graphically. (Contractor's abstract)

EXPERIMENTAL STUDY OF HYPERSONIC RAREFIED FLOW NEAR THE LEADING EDGE OF A THIN FLAT PLATE, by R. L. Chuan and S. A. Walter. [1962] [15]p. incl. illus. diagrs. tables. (AFOSR-3688) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)831 and Office of Naval Research) Unclassified

Also published in Rarefied Gas Dynamics; Proc. Third Internat'l. Symposium, Paris (France) June 1962), New York, Academic Press, Suppl. 2, v. 2: 328-342, 1963. (AFOSR-5310)

Measurements of surface pressure and pitot pressure distributions in the neighborhood of the leading edge of a thin flat plate are made under 2 sets of flow conditions: $M_\infty \sim 6$, λ_∞ 0.01 cm and $M_\infty \sim 8$, $\lambda_\infty \sim 0.4$ cm. The surface pressure behavior appears to follow continuum hypersonic viscous interaction prediction, with a monotonic increase of pressure with increasing value of the hypersonic interaction parameter, $\chi = \frac{\sqrt{C_\infty M_\infty^3}}{\sqrt{Re_\infty}}$, even to values of χ beyond the validity of theory, although the slope of p vs χ is much lower than predicted. There is no leveling of the pressure to a constant value, as predicted both by the continuum theory of Oguchi and the kinetic theory of Charwat, even at distances of the order of one mean free path from the leading edge. Pitot pressure profiles reveal a straight transition boundary between free stream and disturbed flow, (not necessarily a shock), beginning at the leading edge and inclined at an angle that is the same for $M_\infty \sim 6$, and $M_\infty \sim 8$. Velocity slip at the wall, amounting to as high as 60% of free stream velocity, is measured. Local skin friction coefficient calculated from measured pitot pressures agrees fairly well with continuum theory. (Contractor's abstract)

THE BOLTZMANN EQUATION FOR ELECTRONS IN A PLASMA, by T. Koga, J. G. Everton, and P. C. Wilber. [1962] [7]p. incl. table. (AFOSR-3689) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)831 and Office of Naval Research) Unclassified

A model of plasmas is proposed in this letter. Since electromagnetic fields are induced by charged particles, interactions between the charged particles are fairly complicated so that, the usual concept of collision is not valid. In a sense of approximation, the collision may be separated from group interaction under the condition that $3kT/2 > e^2 n^{1/3}$. Here, 3kT/2 is the average energy of motion of a particle, e the electronic charge, and n the number density of charged particles. In this note, it is propsed that several plausible assumptions by which the solution to these equations may be approached: (1) The probability of mutual collisions between electrons is negligibly small compared with the probability of collisions between electrons and heavy particles; and (2) The mass of a heavy particle is much larger than the mass of an electron. There are 3 types of collisions between an electron and a heavy particle that are considered: (a) simple collision, (b) ionization collision, and (3) recombination collision.

RESEARCH ON RAREFIED GASDYNAMICS AND PLASMADYNAMICS, by R. L. Chuan. Sept. 1962, 118p. incl. illus. diagrs. tables, refs. (USCEC rept. no. 83-101) (AFOSR-4641) (AF 49(638)831) AD 406432 Unclassified

Research activites in the field of rarefied gasdynamics during the period Sept. 1960 to Aug. 1962 are reported in summary. Most of these constitute continuation of work reported previously, particularly in the experimental studies of rarefied gasdynamics and the attendant development of equipment experimental tools. New activities have been mainly in the general area of plasmadynamics which is distinguished from magnetohydrodynamics in that the gas in question is only partially ionized and the electrical conductivity is far from approaching infinity. This represents a direction towards treating realistic problems, some of which are of engineering interest, such as the re-entry radio communication problem. (Contractor's abstract)

OPERATIONAL CHARACTERISTICS OF A CRYOPUMP USED IN A LOW-DENSITY WIND TUNNEL, by J. G. Everton. [1962] [5]p. incl. illus. diagrs. tables. [AF 49(638)831] Unclassified

Published in 1962 Trans. Ninth Nat'l. Vacuum Symposium, Los Angeles, Calif. (Oct. 31-Nov. 2, 1962), ed. by G. H. Bancroft. New York, Macmillan Co., 1962, p. 227-231.

While the original cryopump fell short of expected performance, the experience gained from it led to a relatively simple modification which has recently been accomplished and which has multiplied the operational capability several fold. This paper discusses: (1) the design and operation of the original cryopump, (2) the modification of the pump, and (3) operational characteristics subsequent to the modification.

FREE-MOLECULE FLOW FIELD OVER A FLAT PLATE (Abstract), by H. T. Yang. [1962] [1]p. [AF AFOSR-63-55] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Nov. 19-21, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 497, Aug. 28, 1963.

The flow field over a finite flat plate shorter than the free-stream mean free path is studied in detail. The discontinuous 2-stream molecular-distribution function and the line-of-sight principle are employed. In the particular case of no free-stream motion, any circular arc subtending the plate as its chord is a constant-density line. This result is independent of the form of the distribution function and may be verified experimentally by density visualization over a thin film heated or cooled in a low-density chamber. Assuming 2-stream Maxwellian distribution, density, velocities, stresses, temperature, and heat fluxes for the entire flow field are obtained. They are expressed, with free-stream speed ratio (Mach number) and plate to free-stream speed ratio as parameters, in the form of infinite series. These flow quantities reduce to conventional free-molecule results on the plate and approach correct free-stream values away from the plate. Numerical examples are worked out on Honeywell-800 and IBM-7090 digital computers.

HYPERSONIC WAKE MEASUREMENTS BEHIND A SPHERE AT VERY LOW REYNOLDS NUMBERS (Abstract), by R. L. Chuan. [1962] [1]p. [AF AFOSR-63-55] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Nov. 19-21, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 497, Aug. 28, 1963.

Pitot pressure profiles taken in the wake of a small sphere (0.583 in. diam) show the strong influence of viscous interaction (such as is evident in hypersonic flow around the leading edge of a body), which obliterates the classical near-wake structure of expansion and recompression. The experiments are performed under 2 sets of conditions: (1) moderate density, with Mach number 5.5, Reynolds number (based on sphere diam) 585, and (2) low density, with Mach number 8.5, Reynolds number 105. In the former case, the recompression shock in the near-wake is barely discernible. In the latter case, for which the Knudsen number based on the sphere diameter is 0.35, there is no distinct shock structure around and behind the sphere. Measurements within a few diameters of the sphere suggest that the analytical model of a void swept by the sphere and being refilled after the passage of the sphere is probably fairly good. The pitot pressure on the center line is nearly zero just behind the sphere; and rises to 42% of the free-stream value at 16.5 diameters downstream, decreasing very slowly thereafter. This contrasts with the high-density case (measured by McCarthy) where the pitot pressure on the center line rises to 24% of free-stream value. The growth of the half-width wake appears to be expressed by $Y_w/D = D/2 + (\chi/D)^{0.5}$, where D is the diameter of sphere χ is measured from the center of the sphere.

PRELIMINARY MEASUREMENTS OF THE FLOW CHARACTERISTICS THROUGH A CONVERGENT-DIVERGENT NOZZLE IN THE TRANSITION REGIME (Abstract), by F. O. Smetana. [1962] [1]p. [AF AFOSR-63-55] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Nov. 19-21, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 500, Aug. 28, 1963.

In an effort to understand the low-density gas-flow phenomena in a convergent-divergent nozzle in order to determine whether lower operating limits of such nozzles do in fact exist, measurements were made of the variation of the discharge coefficient with Reynolds number and over-all pressure ratio. A limited amount of data on the variation of the ratio of the throat pressure to the upstream-reservoir pressure with upstream-reservoir pressure for maximum mass flow was also obtained. The results of these measurements indicated that, while the characteristics at the continuum end were well-understood and those at the free molecule end could be explained at least qualitatively, the characteristics in the transition regime remain difficult to interpret quantitatively.

MACHINE COMPUTATION OF EARTHQUAKE HYPOCENTERS, by E. Herrin, J. Taggart, and C. F. Brown, Jr. [1962] [28]p. incl. tables, refs. (AFOSR-4380) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-137 and National Science Foundation) AD 295947 Unclassified

Also published in Jour. Grad. Research Center, v. 30: 79-106, July 1962.

Machine computation of hypocenters using the method of least squares not only provides a relatively inexpensive means for studying earthquakes in time and space, but also provides large quantities of station residuals all computed according to the same procedure and thus well suited to statistical analysis. Studies of individual station corrections and regional differences in travel times require such data. Provision was made for the use of up to 200 station arrival-times in the computation. Constants for the various stations, together with the travel-time tables, are stored either on punched paper tape or magnetic tape, and may be selected by the operator as desired. All of the solutions given in this paper were obtained using the Jeffreys-Bullen travel times. The computer program is similar to that described by Bolt. Notable differences exist, however, in the weighting of the residuals, the means by which the equations of condition are set up, and in the calculation of focal depths. A brief outline of the computer program is given. (Contractor's abstract)

USE OF FOCAL DEPTH DETERMINATIONS IN DISTINGUISHING UNDERGROUND BLASTS FROM EARTHQUAKES, by E. Herrin and J. Taggart. Final rept. Dec. 1962 [52]p. incl. diagrs. tables. (AFOSR-4942) (AF AFOSR-61-137) AD 402752 Unclassified

The first step in the determination of depth of focus is to compute accurately the epicenter of the event in question. A study of the accuracy of various techniques for locating epicenters has revealed that regional variations in Pn velocities must be considered when travel paths of less than 2000 km are to be used in the computation. Because stations at near distances from the epicenter are most useful in determining focal depths, careful studies of regional velocities are necessary to this research project, along with the development of new computer techniques allowing for regional variations in seismic travel times. The results of this type of research along with other projects are included in the report. Two technical papers referred to in the report are included in an appendix while several others, either published or in press, are summarized here.

REGIONAL VARIATIONS IN Pn VELOCITY AND THEIR EFFECT ON THE LOCATION OF EPICENTERS, by E. Herrin and J. Taggart. [1962] [10]p. incl. diagrs. tables, refs. (AF AFOSR-61-137) Unclassified

Published in Bull. Seismol. Soc. Amer., v. 52: 1037-1046, Dec. 1962.

Evidence from recent earthquakes and explosions is presented showing substantial regional variations in the velocity of Pn in the U. S. These variations have a significant effect on the location of epicenters by the least-squares-method. A contour map of Pn velocity in the United States is included. A new method for computer location of epicenters is described, and is shown to decrease the error of location for events in the western United States by as much as an order of magnitude. STUDY OF SOFT RECOVERY FROM TWO-STAGE

VEHICLES, by G. G. Schurr. Jan. 1962, 78p. incl. illus. tables, refs. (AFOSR/IDRA-62-2) (AFOSR-2333) (AF 29(600)2925) AD 272857 Unclassified

Possible recovery methods for vertically reentering payloads released from 2-stage boosers are investigated and discussed. Reentry trajectories including deceleration and heating rates were calculated for a series of reentry velocities and ballistic parameters. The influence of drag variation during reentry on peak deceleration and heating rates is investigated. A recovery method using a variable area drag brake (flexibrake), a parachute system and aerial snatch by helicopter was selected as the most suitable system for recovery of a payload released from a booster consisting of an XM-33 rocket as first stage and an ABLX 244 rocket as second stage. The flexibrake will limit the max deceleration to 15 G and the max deceleration onset rates to 300 G/sec. Attitude stabilization of the payload during the entire flight is maintained by a hydrogen peroxide attitude control system. Preliminary weights and volumes for the payload and recovery vehicle were estimated. (Contractor's abstract)

THE LOGIC OF AN APPROACH TO THE ANALYSIS OF COMPLEX SYSTEMS, by K. H. Schaeffer. Apr. 1962, 42p. incl. refs. (AFOSR-2136) (AF 49(638)-1020) AD 275534 Unclassified

In an attempt to evolve a general method for systems analysis, a possible approach to the analysis of complex man-machine systems is discussed. This approach assumes that systems can be divided into elements and their direct relations, where the elements include the components and the processes of the system, as well as the factors external to the system which determine it. The elements and direct relations are used to construct a representative network of the system. The system is then analyzed by means of one or more mathematical models. These models are evaluated against the network for their completeness in representing the system. Elements and direct relations which were not modeled or were only inadequately modeled are then described by less formal means. In the final step, the mathematical models and the additional descriptions are judgmentally integrated by the analyst. (Contractor's abstract, modified)

A PRELIMINARY INVESTIGATION AND ANALYSIS OF THE ROLE OF SCIENTISTS IN RESEARCH ORGANIZATIONS, by H. M. Vollmer. Feb. 1962, 173p. incl. illus. diagrs. tables, refs. (Technical rept. Phase 1) (AFOSR-2545) (AF 49(638)1028) AD 275937 Unclassified

A review of past studies provided the basis for a conceptual representation of elements commonly included in the role of a scientist in a research organizaztion. Analysis of survey data indicated differences and similarities in specific role expectations of research scientists in an industrial research laboratory versus other types of employees in a variety of organizations. Comparison of findings from this survey with findings from 2 other studies suggests that situational variations in the context of employment may have considerable effect upon scientists' expectations regarding relations with supervision, career advancement opportunities, and salary considerations. The importance that scientists attach to intellectual challenge in their work and to professional status among colleagues appears to be more constant, regardless of variations in organizational environment. VISUAL INFORMATION PROCESSING IN INSECTS, by J. C. Bliss. Summary rept. Oct. 14, 1961-Oct. 14, 1962. Nov. 1962, 42p. incl. illus. diagrs. tables, refs. (Technical rept. no. 1) (AF 49(638)1112) AD 414386 Unclassified

This report describes mathematical analysis, behavior experiments, and neurophysiological experiments aimed at determining the mechanisms of visual perception in insects. The behavioral experiments with the beetle Limus indicate that spatial processing involving

autocorrelation is being performed among the ommatidia of the eye. This processing was studied by means of an optomotor reaction involving a turning tendency with movement in the visual field. Visual processing in the beetle Lixus was also studied by means of microelectrode recording of electrical nervous activity. The electroretinogram (ERG) was measured for various visual stimuli and Bode diagrams were determined for small changes in light intensity. Nonlinear effects were also noted for large channels in light intensity. Spike potentials were obtained from a single cell which fired with a change in light intensity. Spike potentials were also obtained from the ventral nerve cord, anterior thoracic region, and motor nerve stump of the first joint of the right front leg. A functional model is proposed to explain the behavioral and neurophysiological results. (Contractor's abstract)

CONCEPTS OF SHOCK WAVE PROPAGATION, by G. E. Duvall. [1962] [25]p. incl. diagrs. refs. (AF 49(638)-1086) Unclassified

Published in Bull. Seismol. Soc. Amer., v. 52: 869-893, Oct. 1962.

Those aspects of shock wave propagation which differ qualitatively from linear wave propagation are discussed and illustrated. These include amplitude attenuation, energy dissipation and their interrelations, spectral intensity distribution and its variation with distance, and the relations of wave structure to thermodynamic, shear, and time-dependent material properties. Pertinent formulae are derived and calculations are given for a rigid-locking solid. These illustrate the concentration of energy at low frequencies as the wave progresses and provide upper limits for the rates of attenuation peak shock pressure in plane and spherical geometries.

Let C_0 be the space of all complex-valued continuous functions on the plane which vanish at infinity, and let D be the subcollection of functions with compact support. Let A be a finite set of differential operators $\Sigma a_{mn} \partial^{m+n}/\partial x^m \partial y^n$ with constant coefficients. Let $C_0(A)$ be the completion of D under the set of semi-norms $\|f\|_\infty$, $\|Bf\|_\infty$, $B \in A$, with each indicated norm as the sup norm. Each $C_0(A)$ is invariant under translation. Certain subspaces $C_0(A)$ are also invariant under all rotations of the plane; namely, $C_0^N = \{f \in C_0 | f$ has derivatives of all orders less than or equal to N in $C_0\}$, and $C_0^\infty = \cap_N C_0^N$. If A is a proper subset of $\{\partial^{m+n}/\partial z^n \partial \bar{z}^m;\ m + n = N\}$, then $C_0(A)$ is invariant under rotations and is distinct from any of the above mentioned invariant spaces. Moreover, distinct subsets A give distinct $C_0(A)$. Furthermore, each rotation-invariant subcollection distinct from the C_0^N and C_0^∞ is given by an N and an A as above. If the sup norm is replaced throughout by the L_p norm, $1 < p < \infty$, there are no analogues of the $C_0(A)$ in the prior paragraph. Analogous results are also stated for algebras of functions on Riemann surfaces in relation to conformal equivalences between such surfaces. No proofs are given for any of the results that are stated. (Math. Rev. abstract)

ANALYTIC MEASURES ON COMPACT GROUPS, by K. de Leeuw and I. Glicksberg. [1962] [5]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)294] and National Science Foundation) Unclassified

Published in Bull. Amer. Math. Soc., v. 69: 46-50, Jan. 1963. (Title varies)

An extension to compact abelian groups of the theorems of F. and M. Riesz is obtained, concerning analytic measures on the circle group. Let G be a compact abelian group, and let Γ be its dual group. Let γ be a non-trivial homomorphism of Γ into the reals R, and let φ be the continuous dual homomorphism of R into G. Several notions are defined relative to φ. A regular Borel measure μ is called quasi-invariant under φ if the collection of Borel sets E with $|\mu|(E) = 0$ is invariant under translation by elements of $\varphi(R)$. A measure μ (or function f) on G is called φ-analytic if $\hat{\mu}(\gamma) = 0$ ($\hat{f}(\gamma) = 0$) for all γ such that $\xi(\gamma) < 0$. Call a subset E of G null [thick] in the direction of φ if for each $x \in E$ $\{t \in R | x + \varphi(t) \in E\}$ has zero [positive] Lebesgue measure. Call a measure μ on G non-vanishing in the direction of φ if $|\mu|(E) > 0$ for each Borel subset E of G that is thick in the direction of φ and for which $|\mu|(E + \varphi(R)) > 0$. Finally, call μ on G absolutely continuous in the direction of φ if $\mu(E) = 0$ for all Borel sets E which are null in the direction of φ. The principal result, which is used to obtain the other results, is that if μ is a φ-analytic measure on G, then μ is quasi-invariant under φ. The extension of the first of the F. and M. Riesz theorems is that if μ is a φ-analytic measure on G, then μ is absolutely continuous in the direction of φ. The following result is an extension of a result of Rudin for the circle group: If E is a closed subset of G, then E is null in the direction of φ if and only if to each continuous function h on E there is a continuous φ-analytic function f on G which is an extension of h. The extension of the second theorem of F. and M. Riesz states that if μ is a φ-analytic measure on G, then μ is non-vanishing in the direction of φ. It is also shown that $\varphi(R)$ is dense in G and μ is a φ-analytic measure on G that either vanishes on an open subset of G or is absolutely continuous and vanishes on a Borel set of positive Haar measure, then μ is the zero measure. Modifications are indicated to show that the principal theorems are also valid for G locally compact. (Math. Rev. abstract)

SOME CURRENT DEVELOPMENTS IN MODELS OF LEARNING FOR A CONTINUUM OF RESPONSES, by P. Suppes. [1962] [9]p. incl. diagrs. refs. (AFOSR-64-1035) (AF 49(638)1037) AD 440960 Unclassified

Presented at AIEE Joint Automatic Control Conf., New York, June 27-29, 1962.

Also published in I. E. E. E. Trans. on Appl. and Indus. v. 83: 297-305, Sept. 1964.

Within experimental psychology, models of learning for a continuum of responses have not as yet been developed to as high a degree as models which are restricted to a finite number of responses. For a continuum of responses, the assumption of conditioning to exactly 1 response is psychologically unrealistic and mathematically awkward. The assumption was previously introduced that the conditioning of each stimulus is smeared over a certain interval of responses, and the conditioning of any stimulus is represented by a smearing distribution. At present, it seems that a better argument can be made in terms of ideas of response generalization. However, it should be emphasized that the derivation of the

smearing distribution from more primitive or fundamental psychological ideas has not yet been completed in detail in any satisfactory form. The axioms of this theory are formulated verbally but with some attempt to convey a sense of formal precision. It is not difficult to convert them into a mathematically exact form, they fall naturally into 3 groups First, the conditioning axioms are stated, then the sampling axioms, and finally the response axioms.

SOME DIFFERENTIAL EQUATIONS OF THE MATHIEU TYPE, AND RELATED INTEGRAL EQUATIONS, by G. E. Latta [1962] [8]p. (AFOSR-J1266) (AF 49(638)-1045) AD 424343 Unclassified

Also published in Jour. Math. Phys., v. 42: 139-146, June 1963.

This paper presents some eigenvalue problems for equations of the Mathieu type and shows that the solutions satisfy corresponding integral equations, similar to Whittaker's integral equation for the Mathieu functions. It also deals with a similar eigenvalue problem for a system of 2 first order equations, the solutions of which solve the problem of the diffraction of a plane wave by a slit. An equivalent pair of integral equations for the solutions is constructed, and the solution of the eigenvalue problem is discussed at some length.

ON THE MARTIN BOUNDARY FOR MARKOV CHAINS, by K. L. Chung. [1962] [6]p. (AFOSR-3832) (AF AFOSR-62-243) Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 48: 963-968, June 1962.

A continuous parameter Markov chain $\{x(t), t \geq 0\}$ with stationary transition probability $p_{ij}(\cdot)$ is considered. It is supposed that $-\infty < p_{ii}'(0)$, $\Sigma_j p_{ij}'(0) = 0$ and that the states are transient. If a is the time to the first infinite discontinuity, let $y(t) = x(a-t)$, defined when $a \geq 1$. The y(t) process is a Markov chain, and its absolute and (stationary) transition probabilities are evaluated explicitly. A Martin-type boundary is defined by the convention that the sequence of states (integers) $\{j_k, k \geq 1\}$ converges to a boundary point if $j_k \to \infty$ and if (*) $\lim_{k\to\infty} P\{y(a) = i | y(t) = j_k\}$ exists for all i. (The indicated conditonal probability does not depend on t). A second boundary definition is also suggested, in which y(a) in (*) is replaced by y(s). The conditional probability is then a function of $t - s$ (> 0), and the limit is to exist for all $t - s$, i. (Math Rev. abstract, modified)

ON THE DISTRIBUTION OF A "CLOSENESS" CRITERION, by T. Cacoullos. May 9, 1962, 17p. (Technical rept. no. 75) (AFOSR-2718) (Sponsored jointly by Air Force [Office of Scientific Research], Office of Naval Research and [Signal Corps] under Nonr-22552) Unclassified

The classification approach is realistic in many taxonomic problems, where the possibilities are limited to two. However, when the external evidence is slight or in case the populations are clearly distinct but still overlapping, like the example of a modern language and 2 relatively older ones where the actual question is which older language is nearer to the modern language, then the question of which is the nearer is quite pertinent and realistic. The problem in the topothetical approach is the choice of an "appropriate" measure of distance between 2 populations. For the case of multivariate normal populations with the same covariance matrix, the Mahalanobis generalized distance seems a natural measure of the divergence between them. In a more general distance function the statistic d is introduced in the form of a non-central bilinear form in normal variates; then, it is reduced to a difference of independent non-central quadratic forms in normal variates. The method of mixtures developed by Robbins and Pitman is employed to yield the distribution function of d as a mixture of distribution functions of differences of independent chi-square variables.

AVERAGE RENEWAL LOSS RATES, by M. V. Johns, Jr. and R. G. Miller, Jr. May 18, 1962, 11p. incl. refs. (Technical rept. no. 76) (AFOSR-2719) (Sponsored jointly by Air Force [Office of Scientific Research], Office of Naval Research and [Signal Corps] under Nonr-22552) Unclassified

The appropriate index of merit for decision procedure is the "average" profit (or loss) per unit time (or per item) for a large number of cycles. The notion of "average" profit rate can be mathematically defined in 4 distinct and apparently equally plausible ways, and it is the purpose of this note to show that the various definitions are not necessarily equivalent and to determine the conditions under which they are equivalent.

A COMPARISON OF QUEUE DISCIPLINES WHEN SERVICE ORIENTATION TIMES OCCUR, by D. P. Gaver, Jr. July 5, 1962 [30]p. incl. diagr. tables,

refs. (Technical rept. no. 79) (AFOSR-3157) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22552) Unclassified

Situations in which customers belonging to 2 (or more) different classes vie for service at a single facility can be identified in various fields of application. For example, a machine tool may be used to produce any one of a variety of parts, a computer will be used for a number of different kinds of basic computations, a repairman or operator may be responsible for a number of machines, etc. When such versatility is required of the server, it is not surprising to find that the latter sometimes requires a time, in addition to the usual time, in order to accomplish each individual task. This time is the orientation time required whenever the server must turn attention from members of one class of customers to those of another. Queue disciplines are presented.

ACCOMMODATION OF SECOND-CLASS TRAFFIC, by D. P. Gaver, Jr. Feb. 26, 1962, 28p. (Technical rept. no. 74) (AFOSR-3181) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22552) Unclassified

Various situations seem to give rise to traffic problems of the following sort: a service facility exists for a certain primary function, but not always busy performing it thus gaps exist between periods of primary function performance. The gaps are thus available for some secondary tasks, the performance of which must not disturb the facility's primary activity; the traffic composed of such tasks may be called second-class. Thus opportunities exist for performance of low-priority tasks in what would otherwise be idle periods. The quality of the resulting service to the tasks is investigated.

STATIONARITY EQUATIONS IN CONTINUOUS TIME MARKOV CHAINS, by R. G. Miller, Jr. [July 27, 1962] [18]p. incl. refs. [Technical rept. no. 80] (AFOSR-4212) (Sponsored jointly by [Air Force Office of Scientific Research], Office of Naval Research, and [Signal Corps] under Nonr-22552) AD 282910 Unclassified

Also published in Trans. Amer. Math. Soc., v. 109: 35-43, Oct. 1963.

The author considers an irreducible Markov chain with a countable infinity of states in continuous time; honesty of the (standard) matrices P(t) is not insisted on, but it is assumed that all states are stable and that the Q-matrix is conservative. The positive solutions to the equations (*) $yQ = 0$ is investigated. It is noted that the following false theorem is often assumed: "The existence of a convergent positive solution to (*) is a necessary and sufficient condition for positive recurrence, and when one exists, it is unique up to a constant multiplier and coincides with $y_i = \lim p_{ii}(t)$ $(t \to \infty)$". However, the false statement is true if it be assumed that the process is uniquely determined by its Q-matrix (i.e., if the "minimal" process is "honest"). There is then, in addition, an analogue to Derman's theorem about recurrent chains: Recurrence implies that (*) has a positive solution which is unique up to a multiplying constant (the author determines this unique solution in terms of "taboo" probabilities). The paper concludes with remarks about the imbedded Markov chain, and examples illustrating the pathology of the transient case. (Math. Rev. abstract, modified)

A CONVERGENT ASYMPTOTIC EXPANSION FOR MILL'S RATIO AND THE NORMAL PROBABILITY INTEGRAL IN TERMS OF RATIONAL FUNCTIONS, by H. Ruben. June 8, 1962, 20p. incl. refs. (Technical rept. no. 78) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22552) AD 277106 Unclassified

Also published in Math. Ann., v. 151: 355-364, June 1963.

Let Mill's ratio be defined by $R(x) = [1-\Phi(x)]/\phi(x)$, where $\phi(x)$ and $\Phi(x)$ are the standardized normal density and distribution function. Using results in asymptotics due to J. Franklin and B. Friedman, the author obtains a series expansion $R(x) = \Sigma_{k=0}^{\infty} g_k(x)$, both asymptotic and convergent for $x > 0$, where $g_k(x)$ are rational functions given by expressions too lengthy to be reproduced here. A recursive method is presented for computing the $g_k(x)$, and upper bounds are obtained for the truncation errors $R(x) - \Sigma_{k=0}^{n-1} g_k(x)$. (Math. Rev. abstract)

ESTIMATING MISSILE RELIABILITY, by S. Blumenthal and J. Denton. Oct. 26, 1962, 17p. (Technical rept. no. 81) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22552) AD 291603 Unclassified

The probability that a missile will destroy its assigned target is studied based on estimations of missile reliability. It is desirable that each target upon which missiles are expended should have enough missiles allocated to it so that its survival probability is very small. However, we wish to avoid assigning more missiles than necessary to a given target. Nevertheless, a given

amount of over-assignment is to be preferred to the same amount of under-assignment, i. e., in terms of a non-negative loss function, the loss is zero when the target does not survive and positive otherwise. (Contractor's abstract)

ON A PSEUDO-SOLUTION TO A SCHEDULING PROBLEM, by S. Zacks. Dec. 14, 1962, 15p. incl. table. (Technical rept. no. 84) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22552) AD 294126 Unclassified

The scheduling problem considered is relatively simple. All the operations were considered as equally important, and it was assumed that each of the operations could be performed at any time uninterruptedly. In reality, most of the scheduling problems are more complicated. Some operations often require priority over other operations in the sense that they are more profitable or a higher utility weight is attached to them. In these cases, the scheduling problem might be more complicated, since there are more restrictions in the case of priorities, and more freedom of choice in the case of discontinuous operations. Yet, no way of finding a general optimal solution, which is short of complete enumeration, was established. Pseudo-solutions, based on an extra assumption concerning the dependence structure among the earliest starting points of operations, were derived by the method of dynamic programming. SEQUENTIAL TESTS FOR THE MEAN OF A NORMAL DISTRIBUTION II (Large t), by J. Breakwell and H. Chernoff. Nov. 27, 1962, 17p. (Technical rept. no. 83) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22552) AD 294125 Unclassified

Also published in Ann. Math. Stat., v. 35: 162-173, Mar. 1963.

Asymptotic expansions are derived for the behavior of the optimal sequential test of whether the unknown drift μ of a Wiener-Levy process is positive or negative for the case where the process was observed for a long time. The test is optimal in the sense that it is the Bayes test for the problem where there is an a priori normal distribution of μ, the regret for coming to the wrong conclusion is proportional to μ, and the cost of observation is constant per unit time. The Bayes procedure is then compared with the best sequential likelihood ratio test. (Contractor's abstract)

Stanford U. Applied Mathematics and Statistics Lab., Calif.

TWO-PERSON MARKOV GAMES, by G. Elfving. June 1, 1962, 40p. incl. diagrs. table. (Technical rept. no. 77) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22552) AD 277105 Unclassified

The present analysis deals with sequential 2 person non-zero-sum games in which the players' decisions are based on a fixed number of preceding moves. The decision rules are (in general) independent of time and may include randomization. A notion of social equilibrium is discussed. It applies generally to games where the players are technically in the same position, and a distribution (D) of strategies is required over a population, such that any strategy that appears in D is good against the mixed strategy defined by selecting a strategy in D at random. BUCKLING OF A THIN CIRCULAR CYLINDRICAL SHELL HEATED ALONG AN AXIAL STRIP, by N. J. Hoff, C.-C. Chao and W. A. Madsen. Sept. 1962, 16p. incl. diagrs. (SUDAER no. 142) (AF AFOSR-62-146) AD 400282 Unclassified

Presented at West Coast Conf. of the Appl. Mech. Div. of the Amer. Soc. Mech. Engineers, Monterey, Calif., Aug. 26-28, 1963.

Also published in Jour. Appl. Mech., v. 31: 253-258, June 1964.

The elastic stability of a thin-walled circular cylindrical shell is investigated by means of the small-deflection theory when the shell is subjected to such nonuniform heating as causes a uniform axial compressive stress to arise in a band of width 2b while the rest of the shell is free of stress. The critical value of the compressive axial stress is found to be equal to the critical stress of the same circular cylindrical shell when subjected to

uniform axial compression provided the band is not extremely narrow. In the latter case, the critical stress of the band is higher than that of the uniformly compressed shell. (Contractor's abstract)

A THEORY OF ASYMMETRIC HYPERSONIC BLUNT-BODY FLOWS, by R. J. Swigart. Jan. 1962, 53p. incl. diagrs. table, refs. (SUDAER no. 120) (AFOSR-2232) (AF 49(638)965) AD 274612 Unclassified

Also published in AIAA Jour., v. 1: 1034-1042, May 1963.

The problem of supersonic and hypersonic flow past blunt bodies at small angles of attack is considered. Two-dimensional asymmetric as well as 3-dimensional flow is analyzed. The method of analysis is an inverse one, that is, the shock-wave shape and free stream conditions are known, and the corresponding body shape and flow field are determined. Solutions at zero angle of attack are obtained as a special case of the general problem. Results at zero angle are obtained for shock waves that are portions of circles, parabolas, spheres, and paraboloids of revolution at a free stream Mach number of infinity and ratio of specific heats of 1.4. Results are obtained for parabolic and paraboloidal shock waves at small angle of attack and infinite free stream Mach number. A symmetrical shock wave at angle of attack is produced by a body that is asymmetric to the shock axis of symmetry. However, a conic section may be fitted to the converged body shape out to the sonic point. This is done for the third-truncation body that produces a parabolic shock at angle of attack of 10°. The body is closely approximated by a prolate ellipse at angle of attack of 14.2°. (Contractor's abstract)

A REVIEW AND EXTENSION OF SECOND-ORDER HYPERSONIC BOUNDARY-LAYER THEORY, by M. Van Dyke. [1962] [16]p. incl. diagrs. refs. (AFOSR-3881) (AF 49(638)965) Unclassified

Also published in Rarefied Gas Dynamics; Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press, Suppl. 2, v. 2: 212-227, 1963. (AFOSR-5310)

A critical examination is made of second-order boundary-layer theory as applied to heat transfer at the stagnation point of a sphere in supersonic flow. A constant-density model is constructed, which sheds light on such matters as the displacement effect and the Newtonian approximation. An examination of a number of existing theories shows several to be defective in their treatment of the related effects of external vorticity and displacement. Theoretical calculations are compared with 2 sets of experimental data, showing mediocre agreement for 1 and serious discrepancies for the other. (Contractor's abstract)

HIGHER APPROXIMATIONS IN BOUNDARY-LAYER THEORY. PART 2. APPLICATION TO LEADING EDGES, by M. Van Dyke. [1962] [15]p. incl. refs. (AFOSR-J1028) (AF 49(638)965) AD 418295 Unclassified

Also published in Jour. Fluid Mech., v. 14: 481-495, Dec. 1962.

A systematic procedure was developed in part 1 (item no. 2801) for improving upon Prandtl's boundary-layer theory. The second approximation was studied in detail for steady laminar flow of a constant-property fluid past an analytic semi-infinite plane or axisymmetric body free of separation. Five additive second-order effects were identified. Here that analysis is illustrated by application to specific problems. It is natural to consider first the Falkner-Skan family of self-similar flows, which require numerical integration of only ordinary differential equations. The 3 most useful cases are chosen, corresponding to the plane and axisymmetric stagnation point and the flat plate (the first-order solutions being associated with the names of Hiemenz, Homann, and Blasius). Each of these can be taken as the basis of a Blasius series to extend the solution downstream over a body of general shape. That point of view, which is in fact essential in the second approximations for unsymmetric plane flow, is the one adopted here. (Contractor's abstract)

HIGHER APPROXIMATIONS IN BOUNDARY-LAYER THEORY. PART 1. GENERAL ANALYSIS, by M. Van Dyke. [1962] [17]p. incl. diagr. refs. [AF 49(638)965] Unclassified

Published in Jour. Fluid Mech., v. 14: 161-177, Oct. 1962.

Prandtl's boundary-layer theory is embedded as the first step in a systematic scheme of successive approximations for finding an asymptotic solution for viscous flow at large Reynolds number. The technique of inner and outer expansions is used to treat this singular-perturbation problem. Only analytic semi-infinite bodies free of separation are considered. The second approximation is analyzed in detail for steady laminar flow past plane or axisymmetric solid bodies. Attention is restricted to low speeds and small temperature changes, so that the velocity field is that for an incompressible fluid, the temperature field being calculated subsequently. The additive effects are distinguished of longitudinal curvature, transverse curvature, external vorticity, external stagnation enthalpy gradient, and displacement speed. The effect of changing co-ordinates is examined, and the behavior of the boundary-layer solution far downstream discussed. Application to specific problems will be made in subsequent papers.

HEAT OF ISOMERIZATION OF PEROXYNITRITE TO NITRITE AND KINETICS OF ISOMERIZATION OF PEROXYNITROUS ACID TO NITRIC, by J. D. Ray. [1960] [7]p. incl. diagrs. (Bound with its AFOSR-3473; AD 603735) (AF 49(638)286) Unclassified

Presented at Southeastern Regional meeting of the Amer. Chem. Soc., Birmingham, Ala. (Nov. 3-5, 1960).

The reaction between hydrogen peroxide and nitrous acid at 0° results in high yields of the rapidly formed intermediate peroxynitrous acid which isomerizes to nitric acid at a slower rate. By stopping the reaction with the addition of base at various times and measuring the total heat evolved in a calorimeter, the rate constant for isomerization of the peroxynitrite ion to the nitrite ion was deduced to be 38.3 ± 2 kcal/mol in dilute aqueous solutions at 1°. (Contractor's abstract)

ON THE MORPHOLOGY OF THE CRYSTALLINE STATE IN POLYMERS, by P. J. Flory. [1962] [11]p. incl. diagrs. refs. [AF AFOSR-62-131] Unclassified

Published in Jour. Amer. Chem. Soc., v. 84: 2857-2867, Aug. 5, 1962.

Geometrical and spatial requirements for the accommodation of polymer chains in random conformations set an upper limit of $v_2 A_c/2A_a$ on the fraction of those chains emerging from the face of a lamellar crystallite of large lateral dimensions which may traverse the interfacial zone and vanish into the surrounding disordered region without returning to the crystallite; v_2 is the volume fraction of polymer in the surrounding phase; and A_a and A_c are the cross sections occupied by the polymer chain in its amorphous and crystalline conformations, respectively. A considerable fraction of the chains emanating from the crystal face may escape the environs of the crystal without returning. Those which return need not adopt the folded pattern currently assumed. Helical conformations, increase the crystalline chain cross section and thus alleviate the crowding of chains otherwise attending their disorientation. In copolymers, the infrequency of occurrence of long runs of the crystallizing unit generally precludes multiple participation of the same molecule in a given crystallite. It is suggested that the morphology which developes during crystallization is determined by kinetic factors which preclude achievement of this optimum result. The elementary process in crystallite growth is considered to consist in the deposition of a chain unit rather than of an entire sequence of units. Mobility of chains in the outermost layer of the growing crystal face is viewed as an important factor. (Contractor's abstract, modified)

PHASE EQUILIBRIA AND ELECTRICAL PROPERTIES OF A TERNARY INTERMEDIATE PHASE IN THE SILVER-ANTIMONY-TELLURIUM SYSTEM, by R. A. Burmeister and D. A. Stevenson. Dec. 1962, 47p. incl. diagrs. tables, refs (Technical rept. no. 1; rept. no. DMS-62-11) (AF 49(638)1123) AD 297451 Unclassified

A determination of phase equilibria in the region of the Ag-Sb-Te system corresponding to $AgSbTe_2$ has shown that material of this composition will normally exhibit a 2 phase microstructure. The phase which has previously been identified as $AgSbTe_2$ is shown to be an incongruently melting intermediate phase formed by a peritectic type reaction. The region of stability of this phase near the melting point extends from approximately 58 to 60 mol-% Sb_2Te_3 on the Ag_2Te - Sb_2Te_3 section. Hall coefficient and electrical resistivity measurements indicate the single phase material is degenerate with predominantly hole conduction. (Contractor's abstract, modified)

NEURAMINIC ACID AND CENTRAL NERVOUS SYSTEM FUNCTION (NEURAMINIC ACID IN THE BRAIN AND TISSUES OF VARIOUS ANIMALS), by N. Eldredge, W. Cutting, and G. Read. [Final rept.] [1962] [20]p. incl. diagrs. tables, refs. (AFOSR-2897) (AF 49(638)-714) AD 294997 Unclassified

A comparative study of the sialic acid concentration of the brains and tissues of various animals was made in order to determine whether differences were present which could be correlated with the phylogenetic level of the nervous system. Sialic acid, probably in the form of N-acetylneuraminic acid (NANA) was present in chordate brains in both the ganglioside, G, and lipid-free residue, R. For G the range was 300-600 mg% of the total lipids and for R, 350-600 mg% of the total lipid-free residue. There were no differences which could be correlated with the phylogenetic level of the nervous system. In animals with diffuse nervous systems whole tissues were analyzed and compared to whole mouse tissue. In whole mouse, sea urchins, and clams the R and G fractions were similar and contained both NANA and N-glycoylneuraminic acid, NGNA. In snails the R fraction contained NANA, NGNA and an unidentified spot with the color characteristics of shikimic and quinic acids. The G fraction contained no NANA. Chitons and sea anenomes were similar; the G fraction contained both NANA and NGNA while NANA was missing in the R fraction. All the whole tissues except the sea urchin contained unidentified spots in addition to the NANA and NGNA. (Contractor's abstract)

EVIDENCE FOR EXCHANGE-COUPLED LINEAR CHAINS IN $Cu(NH_3)_4SO_4 \cdot H_2O$, by R. B. Griffiths. [1962] [8]p. incl. diagrs. refs. (AFOSR-2775) (AF 18-(603)131) AD 283774 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 440, Aug. 27, 1962.

Published values of specific heat and magnetic susceptibility for $Cu(NH_3)_4SO_4 \cdot H_2O$ show broad maxima at a temperature (~3°K) roughly 10 times the Néel temperature. It is shown that the behavior of these quantities above the Néel temperature may be explained qualitatively, and also quantitatively at temperatures near the maxima, in terms of an isotropic antiferromagnetic exchange interaction between neighboring spins in linear chains of copper ions. The exchange energy $|J|/k$ is estimated to be 3.15 ± 0.2°K.

THEORY OF EXCHANGE RELAXATION OF HYPERFINE STRUCTURE IN ELECTRON SPIN RESONANCE, by J. D. Currin. Jan. 1962 [31]p. incl. diagrs. refs. (Technical note no. 53) (AFOSR-2204) (AF 49(638)388) AD 276243 Unclassified

Also published in Phys. Rev., v. 126: 1995-2001, June 15, 1962.

The electron spin exchange interaction between colliding molecules is examined as a possible relaxation mechanism for the hyperfine structure of free-radical molecules in solution. An expression is derived which, under suitable conditions, relates the frequency dependent susceptibility to a single parameter q, which can be interpreted as the frequency of spin exchanges. For large values of q the absorption narrows to a single line of width σ^2/q, where σ is the mean square width of the unperturbed spectrum. For small values of q the widths of the individual hyperfine lines are found to depend upon their relative intensities. These results are compared with some recent experiments. TRIDENT PRODUCTION CROSS SECTION AND

QUANTUM ELECTRODYNAMICS AT SMALL DISTANCES, by M.-C. Chen. [1962] [3]p. incl. diagrs. tables. (Technical note no. 55) (AFOSR-2434) (AF 49-(638)388) Unclassified

Also published in Phys. Rev., v. 127: 1844-1846, Sept. 1, 1962.

The cross section has been calculated for the coincidence experiment of electron-positron pair production from electron-proton collisions as a test of quantum electrodynamics at small distances. The electrons and positrons are considered highly relativistic and the protons are considered as Coulomb field sources; otherwise the calculations are exact to the fourth order of the matrix element. Distances probed are about 0.5°F. (Contractor's abstract)

THE 27-FOLD WAY AND OTHER WAYS: SYMMETRIES OF MESON-BARYON RESONANCES, by S. L. Glashow and J. J. Sakurai. Mar. 1962, 33p. incl. refs. (Technical note no. 57) (AFOSR-2435) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)388 and Atomic Energy Commission) AD 274991 Unclassified

Also published in Nuovo Cimento, Series X, v. 25: 337-354, July 16, 1962.

Meson-baryon resonances are discussed within the framework of unitary symmetry based upon the Gell-Mann-Ne'eman bary n octet the (eightfold way). It is argued that the low-lying $J=3/2^+$ isobars ($N^*_{3/2}$, Y^*_0, Y^*_1, Y^*_2, etc.) realize a 27-dimensional representation of SU(3). Purely group-theoretic considerations directly following from unitary symmetry are compared with dynamical considerations suggested by the coupling constant combinations required by unitary symmetry and R-symmetry. Higher resonances are briefly discussed. (Contractor's abstract)

THE $K^+ \rightarrow \pi^+ + e^+ + e^-$ DECAY, by M. Baker and S. L. Glashow. June 1962, 12p. incl. diagr. (Technical note no. 58) (AFOSR-2563) (AF 49(638)388) AD 277636 Unclassified

Also published in Nuovo Cimento, Series X, v. 25: 857-863, Aug. 16, 1962.

The decay mode of the charged K meson into a charged pion and an electron-positron pair is calculated. It has previously been estimated to occur once in ten million events. An occurrence of one in one hundred thousand events is estimated here. The calculation is only an estimate, for the branching ratio depends upon the (experimentally unknown) pion and kaon form factors, and upon the relative role played by vector and axial-vector weak interaction. BOSON-LIKE BEHAVIOR OF PAIRS OF FERMIONS I, by A. Katz. June 1962, 37p. incl. diagrs. (Technical note no. 56) (AFOSR-2564) (AF 49(638)388) AD 277638 Unclassified

Also published in Nuclear Phys., v. 42: 394-414, Apr. 1963.

A class of diagrams corresponding to the binary collision approximation is chosen out of the perturbation expansion of the thermodynamic potential in diagrams drawn on a cylinder. A subclass of these diagrams corresponding to the formation of non-overlapping pairs yielded the expected result that these pairs behave as free bosons. Exchange effects between pairs are then included as insertions in the former diagrams. This yields an approximation valid up to much higher densities. The pairs now behave as interacting bosons. They still condense at low temperature. The assembly of condensed pairs at zero temperature can maintain a chemical equilibrium with a Fermi sea of unpaired particles. In this way a system of arbitrary density can be approximated which exhibits a smeared Fermi surface and superfluid characteristics. In the translationally invariant case a "simple pairing" of the Bardeen-Cooper-Schrieffer type prevails. However this is a result rather than an assumption. All results are gauge invariant. UNITARITY AND HIGH ENERGY INELASTIC SCATTERING, by M. Baker and R. Blankenbecler. June 1962, 23p. incl. diagrs. table. (Technical note no. 60) (AFOSR-2640) (AF 49(638)388) AD 277639 Unclassified

Also published in Phys. Rev., v. 128: 415-420, Oct. 1, 1962.

The effect of approximately enforcing the unitarity requirement on peripheral collision-type approximations is discussed. A matrix formulation of the Fourier-Bessel representation of the scattering amplitude is utilized which automatically satisfies unitarity at high energies. Results indicate that quantitative agreement of the peripheral collision approximation with experiment can be accidental since the corrections due to unitarity take the same form and magnitude as the phenomenological form factors depending only on the momentum transfer which are introduced to account for off-mass-shell effects. Three models are discussed, and one of them has the behavior characteristics of a Regge trajectory. (Contractor's abstract)

QUANTIZATION OF A SELF-COUPLED BOSON FIELD, by L. I. Schiff. June 1962 [7]p. (Technical note no. 65) (AFOSR-2941) (AF 49(638)388) AD 278436 Unclassified

Also published in Proc. 1962 Internat'l. Conf. on High-Energy Physics at CERN, Geneva (Switzerland) (July 4-11, 1962), Geneva, Cern, Scientific Information Service, 1962, p. 690-692.

A new method is proposed for the quantization self-coupled boson fields. The field is analyzed in terms of Hermitian amplitudes of an expansion in plane waves, and the wave function of the system is expressed in terms of these amplitudes. The field Hamiltonian then becomes a differential operator. The variational method is applied, using a trial function that consists of products of arbitrary functions of the mode amplitudes that refer to equal and opposite momenta. Explicit expressions for the vacuum, 1-particle, and 2-particle states are obtained, and the rest mass and coupling constant are renormalized. There is only S wave scattering in this approximation, and there can be an S wave bound state of 2 particles if the renormalized coupling constant is sufficiently large and negative. SPONTANEOUS BREAKDOWN OF ELEMENTARY PARTICLE SYMMETRIES, by M. Baker and S. L. Glashow. June 1962 [44]p. incl. diagrs. refs. (Technical note no. 63) (AFOSR-2943) (AF 49(638)388) AD 278434 Unclassified

Also published in Phys. Rev., v. 128: 2462-2471, Dec. 1, 1962.

Non-perturbative solutions of quantum field theory are sought. A model is considered which possesses the higher symmetry SU(3). It is found that without the introduction into the Lagrangian of any symmetry-breaking terms, solutions exist which have only the lower symmetries of isotopic spin and hyperchange. It is also shown that the usual electrodynamic interaction of the muons and the electrons allows the possibility of generating a mass splitting between them. Finally a Lagrangian is considered in which the bare coupling constants are set equal to zero, and self-generated renormalized coupling constants are found. (Contractor's abstract)

DIVERGENCE CONDITIONS AND THE GRAVITATIONAL FIELD EQUATIONS, by H. R. Pagels. June 1962, 15p. (Technical note no. 62) (AFOSR-2944) (AF 49(638)388) AD 278433 Unclassified

Also published in Jour. Math. Phys., v. 4: 731-734, June 1963.

It is shown that in addition to the 4 divergence laws $T^{\alpha\beta}|_\beta = 0$, stress tensors satisfying the Einstein field equation must also satisfy the 6 additional divergence conditions $(T^{\gamma\alpha}|_\beta - T^{\gamma\beta}|_\alpha)|_\gamma = 0$. Conversely under quite general assumptions these 10 conditions on $T_{\alpha\beta}$ dictate the metric-matter connection proposed by Einstein. In the spirit of Rainich theory the entire content of the gravitational field equations is expressed in terms of conditions on the stress tensor.

EXCITATION OF INDIVIDUAL PARTICLE STATES OF NUCLEI BY INELASTIC ELECTRON SCATTERING, by R. S. Willey. June 1962 [66]p. incl. diagrs. refs. (Technical note no. 66) (AFOSR-3066) (AF 49(638)388) AD 282615 Unclassified

Also published in Nuclear Phys., v. 40: 529-565, Feb. 1963. (AFOSR-J394; AD 407369)

Formulas are given for the computation of cross sections for excitation of shell model states in light nuclei by inelastically scattered electrons. The contributions from the transverse electric and magnetic interactions are calculated in detail. The determination of radiative lifetimes by extrapolation of electron scattering data is discussed and found to be model-dependent. Particular calculations are carried out for Li^7 and O^{18}. The Li^7 calculation provides an example in which the contributions from the transverse interactions are of the same order of magnitude as the contribution from the Coulomb interaction, even at small momentum transfer. In the case of O^{18}, electron scattering experiments may distinguish collective excited states from individual-particle states. (Contractor's abstract)

ELECTROMAGNETIC RADIATIVE CORRECTIONS AND THE ELEMENTARY NATURE OF THE PHOTON, by M. Lévy. [1962] [4]p. incl. diagr. [Rept. no. T527; rept. no. ITP-70] (AFOSR-3955) (AF 49(638)388) AD 408941 Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 235-238, Sept. 1, 1962.

The connection which was found between radiative effects and Regge poles puts the calculation of electromagnetic radiative corrections in a new perspective. For example, it is the knowledge of the fine structure of the positronium spectrum which leads one to believe that there probably are spin-dependent terms which should be summed in an exponential factor in the electron-proton scattering cross-section. Also, the main part of the radiative corrections in a given process at high energy can probably be estimated directly from the known energy spectrum of the intermediate states allowed in the crossed channel. Finally, the question of the origin of the Regge poles is discussed again. In the theory of strong interactions, where one does not have a consistent field theory to start with, the question of whether Regge poles are "fundamental" or whether they can be derived by calculations based on a specific Lagrangian is rather a matter of taste (or, as has been said, a "philosophical" question). In quantum electrodynamics, the situation is different, because there exists a field theory enabling us to make predictions which can be tested experimentally. (Contractor's abstract)

EVALUATION OF THE VAN HOVE CORRELATION FUNCTIONS FOR CERTAIN PHYSICAL SYSTEMS, by R. B. De Bar. [1962] 23p. incl. refs. (AFOSR-4319) (AF 49(638)388) Unclassified

Also published in Phys. Rev., v. 130: 827-832, Apr. 15, 1963.

The space and time Fourier transforms of the Van Hove correlation function are evaluated for the cases of coherent scattering from simple crystals, and in a

"quantum hydrodynamics" approximation, from liquid He II. A compact approximate expression for the 1-phonon part of the crystal correlation function transform is given, and the contribution of the 2-phonon term is considered. A new method of obtaining quantum-mechanical corrections to the classical expression for the Van Hove self-correlation function is discussed, and the result is shown to be of greater potential accuracy than those previously given in the literature. As a test, the prescription is applied to the Langevin equation result for the classical correlation function, and the product is found to differ significantly from recent results, but to be in agreement with an older expression obtained by Vineyard.

HIGH-FREQUENCY REGION OF THE SPECTRUM OF ELECTRON AND POSITRON BREMSSTRAHLUNG, by R. J. Jabbur and R. H. Pratt. [1962] [7]p. incl. diagrs. table, refs. (Technical note no. 69) (AFOSR-J232) (AF 49(638)388) AD 400852 Unclassified

Also published in Phys. Rev., v. 129: 184-190, Jan. 1, 1963.

The cross section for a bremsstrahlung process in which almost all the energy of an incident high-energy electron is transferred to the photon is calculated analytically, using techniques previously developed for atomic photoeffect. Only terms of relative orders a^4, a^2q^2, and q^4 are neglected, where $a = Ze^2$ and q is the momentum of the outgoing low-energy electron (with $\hbar = c = m_e = 1$). Similar results are obtained for positron bremsstrahlung and pair production; previous work on the photoeffect is extended. The accuracy of these predictions is discussed, and they are compared with experiments.

LEVEL SPECTRA OF A = 6 NUCLEI FROM THE FREE NUCLEON-NUCLEON INTERACTION, by J. F. Dawson and J. D. Walecka. [1962] [32]p. incl. diagrs. refs. (AFOSR-J627) (AF 49(638)388) AD 414098 Unclassified

Also published in Ann. Phys., v. 22: 133-164, Apr. 1963.

The calculational procedure recently discussed by Dawson, Talmi, and Walecka for calculating level spectra of double-magic-plus-two-nucleon nuclei from the free nucleon-nucleon interaction is applied to the A = 6 system. A Bethe-Goldstone equation is written for the 2 external nucleons and by working within an harmonic oscillator framework, the equation can be transformed

to relative coordinates and solved. The free nonsingular nucleon-nucleon interaction (independent of the form used) is found to give a good fit to all the known levels, and the more sophisticated Brueckner-Gammel-Thaler and Hamada potentials are found to give essentially the same results, after careful examination of the effect of the strong tensor coupling in the T = 0 states. This, in a sense, justifies previous calculations of spectra of light nuclei with nonsingular interactions. Somewhat too much absolute binding energy is found, presumably because of the use of harmonic oscillator single-particle potentials. Quite good agreement is found for the magnetic moment of Li^6 and the f_τ value for the ground state β decay $He^3 - Li^6$ (both within <6%) and also for the quadrupole moment of Li^6, using the more complicated potentials. Stanford U. Dept. of Physics, Calif.

APPLICATION OF THE VARIATION METHOD TO FIELD QUANTIZATION, by L. I. Schiff. [1962] [7]p. incl. refs. (AFOSR-J634) (AF 49(638)388) AD-14004 Unclassified

Also published in Phys. Rev., v. 130: 458-464, Apr. 1, 1963.

Application of the variation method to simple field theory is presented. A representation is found in which the state functions are emphasized. Variational trial forms are chosen for these, and optimized by making the expectation value of the field Hamiltonian stationary. Only the simplest case of a neutral, spin-zero, boson field with a fourth-power self-coupling term is considered here, but it is hoped that with further elaboration this may in the future lead to a description of the multipion resonances. The variation method has the advantage of avoiding any limitation on the strength of the self-coupling. Explicit results are obtained for the vacuum, single-particle, and 2-particle (scattering and bound) states, and comparison is made with the determinantal method. Finally, a criterion for the variational stability of the vacuum state is obtained.

CALCULATION OF THE PHOTOEFFECT (Abstract), by R. H. Pratt, R. D. Levee and others. [1962] [1]p. [AF 49(638)388] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 492, Aug. 27, 1962.

A numerical program has been developed for the calculation of atomic photoelectric differential and total cross sections, including all polarization correlations. The program is designed to calculate relativistic electron wavefunctions in a screened Coulomb potential. Forty terms are included in the partial-wave expansion for the wavefunction of the outgoing electron. A detailed analysis is made of the sources of error in the calculation, and it is believed that the results obtained are accurate within 1%. Results have thus far been obtained for K-shell photoeffect, neglecting electron screening, covering the energy range from 200 kev to 2 mev, for elements from Z = 26 to Z = 92. These results may be compared with previous theoretical predictions, based mainly on various analytic approximations and extrapolations from them. Comparisons are also made with recent experimental results for the process.

CALCULATION OF THE TIP OF THE BREMSSTRAHLUNG SPECTRUM (Abstract), by R. J. Jabbur and R. H. Pratt. [1962] [1]p. [AF 49(638)388] Unclassified

Presented at meeting of the Amer. Phys. Soc., Stanford U., Calif., Dec. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 609, Dec. 27, 1962.

A numerical program has been developed to calculate the total cross section for high-energy electron bremsstrahlung, in the Coulomb field of a nucleus of charge Z, in the tip limit, i.e., when almost all the energy of the incident electron is transferred to the photon. The formalism needed for this purpose was developed in analytical work which calculated the cross section as the first 4 terms of a power series in Z. At high energies, the use of a modified plane wave to describe the incoming electron becomes exact, and the cross section becomes a series of cross sections for the possible angular-momentum states of the outgoing low-energy electron. The purpose of the present numerical calculation is to settle 2 questions that analytical work has not answered: (1) How well is a given partial-wave cross section represented by the first few terms of a series in Z? (2) How many partial waves make a significant contribution to the total cross section?

COULOMB GREEN'S FUNCTIONS AND THE FURRY APPROXIMATION (Abstract), by L. Hostler. [1962] [1]p. [AF 49(638)388] Unclassified

Presented at meeting of the Amer. Phys. Soc., Stanford U. Calif., Dec. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 609, Dec. 27, 1962.

The Coulomb Green's function for the nonrelativistic Schrödinger equation has been obtained in closed form using an integral representation for a product of 2 Whittaker functions with different arguments. The Neumann series for $J_\nu(kz)$ is required in evaluating the sum on states. Similarly, the relativistic Coulomb Green's functions, Klein-Gordon and Dirac, have been obtained in closed form in the "Furry approximation" $(Z^2e^4/\hbar^2c^2)/l^2<<1$. The Klein-Gordon Green's function in this approximation is also the exact Green's function for the Klein-Gordon equation without the potential squared term. An alternate and very simple derivation of the approximate Dirac Green's function is given using perturbation theory (along the lines of Meixner). A parallel treatment of the Coulomb wavefunctions with (modified) plane-wave behavior at infinity can be given in which the only sum formula needed is the Neumann series (above).

EFFECTS OF INTERMEDIATE VECTOR BOSONS IN RADIATIVE DECAYS (Abstract), by E. S. Ginsberg and R. H. Pratt. [1962] [1]p. [AF 49(638)388] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 502, Aug. 27, 1962.

The effects of an intermediate vector boson in the radiative decay modes $\pi(K) \to \mu(e) + \nu + \gamma$ and $\mu \to e + \nu + \bar{\nu} + \gamma$ are systematically investigated. Possible anomalous magnetic-moment and quadrupole-moment terms are included. This work extends the results of Berman, Ghani, and Salmeron on $K \to e + \nu + \gamma$, and the results of Eckstein and Pratt on $\mu \to e + \nu + \bar{\nu} + \gamma$. The cross section for the emission of a photon at a large angle with respect to the muon in $K \to \mu + \nu + \gamma$ can be nearly doubled if an intermediate boson, with mass $M_b \sim m_K$, exists. Radiative corrections to the $\mu(e)$ polarization from $\pi(K)$ decay have also been calculated. The lepton polarization is no longer complete, due to the possible emission of soft photons, but the correction is small.

LATTICE-SPACE QUANTIZATION OF A NONLINEAR FIELD THEORY (Abstract), by L. I. Schiff. [1962] [1]p. [AF 49(638)388] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 299, Apr. 23, 1962.

In an earlier paper (see item no. STA. 03: 002, Vol. I.) the gradient (kinetic energy) term in the field Hamiltonian was treated as a perturbation on a solution which takes the nonlinearity into account exactly. In the present paper, gradient and nonlinear terms are treated on an equal basis by means of a variational method in which oscillator trial functions are used. The ground state (vacuum) energy is obtained explicitly, and goes over continuously into that for the neutral scalar-spin zero field when the coefficient of the nonlinear term vanishes. For very small lattice constant l, the vacuum energy per unit volume is proportional to l^{-4} in both the linear and nonlinear cases. The energies of the first-excited (single particle) states are being calculated.

SPECULATIONS CONCERNING THE $\Delta S = \Delta Q$ REACTIONS AND THE INTERMEDIATE BOSON STRUCTURES

IN WEAK INTERACTIONS, by T. D. Lee. [1962] [3]p. (AFOSR-J704) (AF AFOSR-62-452) AD 413640
Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 319-321, Oct. 1, 1962.

The purpose of this note is to show that a single set of 6 bosons (consisting of 2 positive, 2 neutral, and 2 negative particles) is sufficient to produce the following patterns of the usual weak interactions: (1) Existence of $\Delta S = -\Delta Q$ reactions in the decay of strange particles; (2) Absence of $|\Delta S| > 1$ reactions; (3) Validity of $|\Delta \vec{I}| = 1/2$ rule for all nonleptonic decays of strange particles; and (4) Absence of neutral lepton currents. Results indicate that $W_1^{\pm}$ (where W = intermediate bosons) decays predominantly into leptons and pions. The $W_2^{\pm}$ has a much longer lifetime, and it decays predominantly into K particles.

COMPUTATION OF THE COMPRESSIBLE LAMINAR BOUNDARY-LAYER FLOW INCLUDING DISPLACEMENT-THICKNESS INTERACTION USING FINITE-DIFFERENCE METHODS, by I. Flügge-Lotz and F. G. Blottner. Jan. 1962 [135]p. incl. diagrs. refs. (Technical rept. no. 131) (AFOSR-2206) (AF 49(638)550) AD 273983 Unclassified

The equations for the laminar compressible boundary layer are presented along with the necessary boundary conditions. The equations are nondimensionalized, which results in using quantities of the same order of magnitude better suited for computations. The boundary-layer equations are also modified using the Howarth-Dorodnitsyn transformation, which results in equations advantageous for numerical computation when the flow is hypersonic. Since the boundary conditions require that the enthalpy and velocity be known at the outer edge of the boundary layer, the necessary formulas are presented to calculate the exterior flow, provided the pressure distribution is known. Finally, the characteristic values of the boundary layer (shearing stress, heat transfer, and displacement thickness) are defined. (Contractor's abstract)

Magnetic multipole transitions in Be^9, B^{10}, C^{12}, N^{14}, O^{16}, and Si^{28} were studied by measuring the energy spectra resulting from the scattering of 41.5-mev primary electrons through an angle of 180°. At this angle of scattering, electric multipole transitions were greatly suppressed, and in addition, the background radiation tail accompanying the elastic peak was minimized. Inelastic electron scattering cross sections were obtained by comparing the inelastic peaks to the electron-photon elastic scattering peak and radiation widths were deduced by using virtual photon theory. Inelastic scattering peaks corresponding to excitation energies of 2.4 and 14.7 mev were measured for Be^9; 7.9, 11.8 and 14.0 mev for B^{10}; 2.1, 4.4, 4.9, 7.3, 9.1, 10.4, and 12.9 mev for B^{11}; 15.1 mev for C^{12}; 9.2 and 10.5 mev for N^{14}; and 11.6 mev for Si^{28}. No excitations were observed for O^{16} below 15 mev, and no excitations were observed in Ca^{40} below the giant resonance for 160° electron scattering. (Contractor's abstract)

Positron and electron beams from the Stanford Mark III linear accelerator have been used to investigate the importance of 2-photon exchanges in electron scattering from the proton. The scattering cross sections for positrons and electrons have been compared at 200 and 300 mev for q^2 (the square of the 4-momentum transfer) from 0.3 to 5.2 F^{-2}. The results show no evidence of anomalous 2-photon effects and verify the correctness of the first Born approximation form factor analysis to within a few percent or better for this range of q^2. The variation of the cross sections with q^2 has also been measured with high accuracy. The specific ionizations of 300-mev positrons and electrons in hydrogen at one atmosphere have been compared in the course of the experiment, and found to be equal to within ± 0.3%. The (γ,p) reaction in O, F, Ne, and C has been studied with electrons of energies up to 36 mev. Survey studies were made of the Al, Ar, and B (γ,p) energy spectra. It has been theoretically predicted and received partial experimental verification that there is a 1 to 1 correspondence between electron- and photon-induced reactions, and that one can assume, when analyzing electron-production yields, that the electron has associated with it a virtual-photon spectrum, similar to the real-photon bremsstrahlung spectrum. The electron production yields were analyzed with the use of the E1 virtual-photon spectrum to obtain σ(γ,p). The proton yields and corresponding cross section of C, F, and Ne contain more than 2 peaks or resonances. Ne has a series of well-resolved, evenly spaced peaks whose envelope has the usual giant-resonance shape. The peaks occur at laboratory proton energies of 3.20, 3.70, 4.58, 5.80, 6.65, 7.75, 8.65, 9.40, and 11.40 mev. The final-state properties of the Ne protons from 4 to 10 mev and the O protons from 9.2 to 12.4 mev were determined to within 20% by excitation experiments. Angular distribution measurements over a considerable region of the giant resonances are presented for O, F, Ne, and C. (Contractor's abstract)

DEUTERON MAGNETIC DIPOLE DISINTEGRATION BY 180° ELECTRON SCATTERING, by G. A. Peterson and W. C. Barber. [1962] [9]p. (Rept. no. HEPL-260) (AFOSR-J502) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116) Unclassified

Also published in Phys. Rev., v. 128: 812-820, Oct. 15, 1962.

The magnetic dipole disintegration of the deuteron has been measured for excitation energies up to 16 mev in the presence of relatively small electric multipole contributions by using a method of inelastic electron scattering at 180°. Electrons of initial energy 41.5 mev were magnetically deflected before and after scattering so that those scattered at 180° entered a magnetic spectrometer set at 160° with respect to the incident beam. The experimental cross sections measured relative to elastic scattering from the proton are higher than predicted by the electrodisintegration theory of Jankus. The discrepancy may be an indication of mesonic exchange currents which are not included in the Jankus theory. (Contractor's abstract)

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 45, Jan. 24, 1962.

Also published in Phys. Rev. Ltrs., v. 8: 381-385, May 1, 1962. (Title varies)

Recent data has been obtained on the neutron form factors from new investigations of the electrodisintegration of the deuteron. An analysis based on the Durand-Goldberg approximation to the peak cross section gives F_{1n} values smaller than those found previously using the modified-Jankus theory but in agreement with these results within the earlier experimental errors. F_{2n} values are in close agreement with those found previously. New values of the parameters in recently proposed models of the nucleons will be given. The effect of deuteron final-state interactions on the determinations of the form factors will be discussed.

ANGULAR DISTRIBUTIONS AND BOUND-NUCLEON FORM FACTORS BY ELECTRON-PROTON COINCIDENCE DETECTION IN INELASTIC ELECTRON-DEUTERON SCATTERING (Abstract), by D. Aitken and R. Hofstadter. [1962] [1]p. [Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 489, Aug. 27, 1962.

An experiment is now under way at Stanford to study the angular distribution of outgoing protons from inelastic electron-deuteron scattering by means of electron-proton coincidence detection. It is felt that a systematic investigation of this sort will detect any change in the free-particle form factors resulting from nucleon-nucleon binding, including exchange effects, and will, in addition, provide limits on the magnitude of final-state interaction effects. Counter absolute efficiencies and coincidence radiative corrections are determined by normalizing e⁻-p coincidence cross sections from H_2 with the proton values. The over-all correction is ~16%. Considerable machine time has been spent on one point--incident electron energy of 500 mev, and electron scattering angle of 75°. The coincidence cross section $d^3\sigma/d\Omega_e d\Omega_p dE'_e$ has been determined with a probable error of less than 10%, and compared with a calculation by Durand using a Hulthen wavefunction for the deuteron and assuming free-proton form factors. Experiment shows a value ~20% smaller than predicted. Relativistic corrections, D-state contributions, and cross sections with other potential models are being calculated for comparison.

Presented at meeting of the Amer. Phys. Soc., Stanford U., Calif., Dec. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 620, Dec. 27, 1962.

Pions have been observed in the momentum range 300-500 mev/c that are produced in a liquid-deuterium target by the electron beam of the Stanford Mark III linear accelerator. The detector is used at the exit of the 72-in. magnetic spectrometer and employs a 3 x 3-in. NaI(Tl) crystal gated by a plastic scintillator. The pulse heights due to the ionizing π^- mesons and the electromagnetic shower of the accompanying electrons are displayed on a multichannel pulse-height analyzer. The pions give a sharp peak superimposed on the broad, electron shower spectrum. As the momentum is increased, the position of the pion peak is virtually unchanged while the shower spectrum shifts to higher pulse heights so that greater separation is achieved at the higher momenta. The π^- detection is checked by observing π^+ mesons without a background of electrons. The pure-electron spectrum can be determined by eliminating pions from the analyzing magnet by choice of kinematics. The method promises to be very useful for finding the π^-/π^+ ratio in deuterium for electroproduced pions and for many other processes.

ELECTRIC AND MAGNETIC FORM FACTORS OF THE He^3 NUCLEUS (Abstract), by H. Collard and R. Hofstadter. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116)
Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 489, Aug. 27, 1962.

Differential cross sections for elastic scattering of electrons from gaseous He^3 have been measured for incident electron energies between 100 and 700 mev at electron angles from 40° to 135°. Absolute cross sections were obtained by normalization with proton cross sections at every measured point. The He^3 cross sections were equated to a Rosenbluth-type formula, using the charge and measured magnetic moment of the He^3 nucleus. In this way, the He^3 form factors $F_1(q^2)$ and $F_2(q^2)$ were determined in the range $q^2 = 1 - 5\ F^{-2}$. The values of F_1 were fitted approximately by means of a Gaussian charge-density distribution with rms radius 1.86 ± 0.19 F. F_2 can be fitted approximately with a magnetic-moment density distribution corresponding to a Gaussian of rms radius 1.68 ± 0.17 F. Corresponding results are also found with other models, such as the hollow exponential, with radii of 2.07 and 1.90 F for the electric and magnetic distribution, respectively. Thus, in He^3, the magnetic distribution is smaller in geometric size than the charge distribution.

ELECTRON-DEUTERON SCATTERING AT HIGH-MOMENTUM TRANSFER (Abstract), by E. F. Erickson and H. W. Kendall. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [N6onr-25116])
Unclassified

Presented at meeting of the Amer. Phys. Soc., Stanford U., Calif., Dec. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 620, Dec. 27, 1962.

Elastic electron-deuteron scattering cross sections have been measured for 4-momentum transfer q in the range 2.4-4.1 F^{-1} by detecting the recoil deuterons. Results are presented and compared with previous experimental work at lower values of q, and with the predictions of the Jankus theory using various deuteron models and the experimental values of the nucleon form factors. The "quadrupole" distribution is observed to dominate the scattering at the higher-momentum transfers.

ELECTRON-PROTON COINCIDENCES IN INELASTIC ELECTRON-DEUTERON SCATTERING, by M. Croissiaux. June 1962 [52]p. incl. diagrs. refs. (Rept. no. HEPL-264) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116) AD 414692 Unclassified

Also published in Phys. Rev., v. 127: 613-616, July 15, 1962.

Electron-proton coincidences in inelastic electron-deuteron scattering were detected under the following conditions: incident beam energy 500 mev; electron scattered at 75° and 359 mev; proton detected at 40°23' (the q direction for the e-p elastic scattering). The coincidence cross-section with a D_2 target was found to be $(4.2 \pm 0.8) \times 10^{-32}$ cm^2/sr^2 mev. The experimental result agreed, within the statistical errors, with the value calculated from a theory of Durand. One may conclude that proton form factors in a bound state and the free state do not differ significantly.

HIGH-ENERGY ELECTRON-PROTON SCATTERING AT 180° (Abstract), by P. A. M. Gram and E. B. Dally. [1962] [1]p. [Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 489, Aug. 27, 1962.

Absolute cross sections for elastic electron-proton scattering at 180° have been measured in the momentum transfer squared (q^2), range 5.64 to 20.2 F^{-2} by detecting recoil protons at 0° with a magnetic spectrometer and counter telescope. At each of 5 fixed values of q^2, cross sections were also measured for protons recoiling at 10° and 15°, with the incident electron energy programmed to maintain q^2 constant. The Rosenbluth corss-section formula which describes the process can, at constant q^2, be represented by a straight line: $d\sigma\ d\Omega$ vs $\cot^2\theta/2$ where θ is the scattered electron angle. Combining sets of 3 cross sections at constant q^2, a least-squares fit of a line to the data data was made. The intercept, which is the point at 180°, determines $(F_1 + kF_2)^2$, the purely magnetic contribution to the scattering process. Knowledge of both slope and intercept enables one to solve for F_1 F_2 separately and to determine the statistical error to be associated with them. Details of the experiment and analysis are presented along with the results, which are in general agreement with those described by Bumiller, Croissiaux, Dally, and Hofstadter. HIGH-ENERGY ELECTRON SCATTERING FROM C^{12} AND O^{16} (Abstract), by H. Crannell. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research,, Atomic Energy Commission, and Office of Naval Research under [N6onr-25116]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Stanford U., Calif. Dec. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 620, Dec. 27, 1962.

An experiment is in progress to measure the differential cross section for elastic and inelastic scattering of electrons from C^{12} and O^{16} with incident electron energies of 600 and 800 mev. Momentum transfers of greater than 3.2 F^{-1} have been studied. Absolute elastic-scattering cross sections are obtained by normalization with proton cross sections. The use of a 10-channel counter system, with a resolution of 0.37%, allows the 4.4- and 9.6-mev levels in C^{12} and the 6.6-mev levels in O^{16} to be resolved. Cross sections for these levels are measured, subject to the usual errors involved in radiative unfolding. A phase-shift analysis of the data is planned.

INELASTIC ELECTRON SCATTERING, by W. C. Barber. 1962, 42p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116) Unclassified

Published in Ann. Rev. Nucl. Sci., v. 12: 1-42, 1962.

This review is concerned with the exploration of nuclear energy states by means of inelastic electron scattering. This entire review is limited to cases where scattering of electrons (negative or positive) produces the nuclear excitation. The subject is limited still further by excluding those inelastic processes where mesons are produced. The excitation energies at 100 mev or less are considered. The theory of inelastic electron scattering is discussed in chapter II. Included are the cross sections for scattering with nuclear excitation as calculated by different approximate theories. In part B, the competing background-producing process of bremsstrahlung during elastic scattering is considered. The close relationship between the inelastic electron scattering cross section and the photon absorption cross section is discussed in part C. In chapter II A, the apparatus used in inelastic electron scattering is described. Part B discusses very briefly the apparatus for electrodisintegration

experiments, and part C considers the possibility of coincidence experiments in which the scattered electron and a nuclear particle are detected simultaneously. Chapter IV describes the experimental results and how they are combined with the theories to derive properties of nuclear excited states.

INELASTIC ELECTRON SCATTERING FROM DEUTERIUM (Abstract), by M. R. Yearian, R. Hofstadter, and E. B. Hughes. [1962] [1]p. [Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 489, Aug. 27, 1962.

A new series of high-accuracy investigations has been started to determine the form factors of the neutron by the inelastic scattering of high-energy electrons from deuterium. Several new techniques are used to improve the accuracy of the data. Thin liquid-hydrogen and deuterium targets are used in place of more-conventional long targets. The thin targets reduce the radiation corrections and also the backgrounds from photoinduced reactions, such as pion production. We are also using a 10-channel ladder of scintillation counters backed up by a large Cerenkov counter as our detector. This detector permits collecting data at 10 different scattered electron energies simultaneously, thus improving the resolution as well as reducing the time necessary to collect data. Finally, we collect a very large amount of data at each energy and angle, taking hydrogen and deuterium points with high accuracy. The over-all accuracy of the points is better than 3%. Preliminary data are presented for q^2 values of 5.0 and 10.0 F^{-2}. The analysis is made using both the peak method and the area method. Values of the neutron form factors are presented.

LOW-MASS ANOMALY IN PHOTOPRODUCTION OF PION PAIRS, by B. Richter. [1962] [4]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116) Unclassified

Published in Phys. Rev. Ltrs., v. 9: 217-220, Sept. 1, 1962.

An anomaly in the production of pion pairs in the reaction $p + d \rightarrow He^3 + 2\pi$ has been previously observed. It occurs in the isotopic spin state T = 0 of the 2 pions and is interpreted as being caused by a final-state interaction of the 2 pions. The experiment described in this paper was an attempt to observe the anomaly in the reaction $\gamma + p \rightarrow p +$ ABC, where ABC refers to the anomaly, without any restriction on possible decay modes of the ABC if it is a particle. Brief details of the apparatus used and the corrections applied to measured quantities are provided. Kinematics were arranged so that the ABC was produced at c. m. angle of about 90°. The properties of the ABC as measured by the experiment are mass = 322 ± 8 mev, width ≤ 20 mev (full width at half maximum) and $(d\sigma/d\Omega)_{c.m\,90^\circ} = (0.75 \pm 0.20) \times 10^{-30}$ cm^2/sr.

MAGNETIC FORM-FACTORS BY 180° ELECTRON SCATTERING, by G. A. Peterson. [1962] [2]p. incl. diagr. (HEPL-277) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission and Office of Naval Research under [N6onr-25116]) Unclassified

Published in Phys. Rev. Ltrs., v. 2: 162-163, Sept. 1, 1962.

Measurements of magnetic scattering of 180° are possible without finding the usual angular distribution of scattering electrons but in order to accomplish such measurements special techniques are described and the results are provided for elastic scattering from equivalent Li^6 and Li^7 targets. It is pointed out that data taken over a larger range of momentum transfers than available in the experiment described could provide additional information about ground state wave functions that can be obtained by conventional electron scattering experiments.

NEW ABSOLUTE CROSS SECTIONS FOR ELECTRON SCATTERING BY THE PROTON (Abstract), by T. [J.] Janssens, R. Hofstadter and others. [1962] [1]p. [Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under N6onr-25116] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 488, Aug. 27, 1962.

Absolute electron cross sections were measured using a flat, thin-walled hydrogen target. Lucite and liquid Cerenkov counters were employed to check detector efficiency and cross sections with the 2 detectors agreed to 2%. The cross sections at $q^2 = 10$ F^{-2} were analyzed by the slope-intercept method to give preliminary values for the Dirac and Pauli form factors of $F_1 = 0.478 \pm 0.020$ and $F_2 = 0.353 \pm 0.015$. Both the measured cross sections and the form factors are in excellent agreement

with values previously obtained using polyethylene targets and a carbon-subtraction method. The thin stainless-steel target windows have the advantage of small background and the disadvantage of bulging under pressure. Radiative corrections evaluated by the Tsai method were applied. With background only a few percent of the peak, we were able to make measurements farther out on the tail and so required smaller corrections than previously. The target thickness was measured optically through a hole in the heat shield and, at the temperature and pressure used, showed an 18% increase. Further analysis and elimination of error is in progress.

NEW DETERMINATIONS OF PROTON FORM FACTORS (Abstract), by T. J. Janssens, R. Hofstadter and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [N6onr-25116])
Unclassified

Presented at meeting of the Amer. Phys. Soc., Stanford U., Calif., Dec. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 620, Dec. 27, 1962.

New absolute electron-proton cross sections have been measured at values of the momentum transfer squared (q^2) up to 32 F^{-2}. The data at large angles and energies provide new information on a possible flattening of the cross sections previously reported (see item no. 2762, Vol. V). Indications are that the flattening is less than previously thought by about 1 standard deviation and is on the borderline of experimental error. The new cross sections have been combined to yield new values of proton form factors for large q^2 up to 30 F^{-2}. The extended form factors are compared to the Clementel-Villi double-resonance theoretical model.

An attempt to determine the neutron charge form factor G_{Ep} by measuring precise values of the ratio of elastic electron-deuteron scattering to the elastic electron-proton scattering, was made in the range of momentum transfer $0.3 \leq q^2 \leq 2.2 F^{-2}$. The experimental procedure employed a beam of electrons from the Stanford linear accelerator which pass through an Al cup containing either liquid hydrogen or deuterium into an efficient Faraday cup. Scattered electrons were detected in a Cerenkov counter after passing through a magnetic spectrometer. The results obtained were $G_{En} = 0.00 + 0.01$ for $0.3 \leq q^2 < 2.2 F^{-2}$, and at $q^2 = 1.6 F^{-2}$, G_{Ep} was deduced to be 0.850 ± 0.010. The ratio of the rms magnetic and electric radii is unity to within 4%. Many corrections were employed and agreement was obtained with a value of G_{Ep} from a previous accurate determination.

STUDY OF NUCLEAR MAGNETIC TRANSITIONS BY INELASTIC ELECTRON SCATTERING, by W. C. Barber, J. Goldemberg and others. [1962] [21]p. incl. diagrs. tables, refs. (Rept. no. HEPL-276) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [N6onr-25116])
Unclassified

Also published in Nuclear Phys., v. 41: 461-481, Mar. 1963.

The energy spectrum of inelastically scattered electrons at 180° was measured for 41.5 mev electrons from the Stanford Mark II Linear Accelerator for the following elements: $_1D^2$, $_3Li^6$, $_3Li^7$, $_7N^{14}$, $_8O^{16}$, $_9F^{19}$, $_{10}Ne^{20}$, $_{11}Na^{23}$, $_{12}Mg$, $_{13}Al^{27}$, $_{15}P^{31}$, $_{16}S^{32}$, $_{18}Ar^{40}$, $_{19}K^{39}$, $_{20}Ca^{40}$ and $_{83}Bi^{209}$. Some of the elements investigated show clear evidence of excitation of nuclear levels. It is shown that these excitations are most likely due to magnetic dipole transitions. The experiment was performed under conditions in which the "long wave approximation" is approximately valid, so radiation widths were derived for the excited states. A comparison is made with the single particle model predictions. A systematic behavior of some M1 transitions in light nuclei suggested recently by Kurath is supported by the data.

The radiation tail was investigated in some detail and the large-angle bremsstrahlung formula of McCormick, Keiffer and Parzen was found to agree with the data for gas targets. (Contractor's abstract)

Also published in Phys. Rev., v. 129: 2802-2807, Mar. 15, 1963.

Coherent photoproduction of π^0 mesons from deuterium has been used to measure the deuteron form factor. Measurements of the production cross section were carried out for photon energies from 470 to 514 mev by detecting momentum-analyzed recoil deuterons. These measurements were analyzed in terms of the impulse approximation calculation of Hadjioannou. The deuteron form factor has been determined in the range of momentum transfers from 1.74 to 2.74 F^{-1}. The results are consistent with the predictions of a repulsive core potential; however, there is some ambiguity in the interpretation due to the uncertainty in the magnitude of the multiple scattering corrections to the impulse approximation. Measurements of the cross section were also made as a function of photon energy for 2 constant momentum transfers, 1.76 and 1.96 F^{-1}. The range of energies covered was 300 to 500 mev. The results indicate that there is a large reduction of the cross section with respect to the impulse approximation prediction near the (3,3) resonance. This is in qualitative agreement with calculated corrections arising from multiple scattering of the meson in the deuteron. The measurements show that this deviation decreases as the photon energy increases in the region above resonance. (Contractor's abstract)

ANNIHILATION IN FLIGHT OF 200 AND 800 MEV POSITRONS, by A. Browman and J. Pine. [1962] [6]p. incl. diagr. table, refs. (Rept. no. HEPL-266) (AFOSR-J543) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under Nonr-22567) AD 408015
Unclassified

Also published in Nuovo Cimento, Series X, v. 27: 850-855, Feb. 16, 1963.

The total cross-sections for annihilation in flight of 200 and 800 mev positrons have been measured. The ratio of the 2 cross-sections has been determined to an accuracy of 2.5% and is in accord with theory, while their absolute values are about (5 ± 2.5)% low. From the measured ratio, there is no evidence for a deviation from theory which depends on the momentum transfer. The possible discrepancy in absolute value may arise from systematic corrections to the experiment. (Contractor's abstract)

INELASTIC ELECTRON SCATTERING STUDIES: Cu^{63}, In^{115}, Ta^{181}, Pb^{208}, AND Bi^{209}, by H. W. Kendall and J. Oeser. [1962] [14]p. incl. diagrs. table, refs. (Rept. no. HEPL-282) (AFOSR-J647) (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under Nonr-22567) Unclassified

Also published in Phys. Rev., v. 130: 245-258, Apr. 1, 1963.

Measurements were made of the cross sections for scattering of electrons of primary energies from 183 mev to 600 mev from Cu^{63}, In^{115}, Ta^{181}, Pb^{208}, and Bi^{209}, using high-resolution detectors. A number of E2, E3, E4, and two E5 transitions were induced with nuclear excitations up to 7 mev. The levels excited have enhanced gamma-decay rates to the nuclear ground states. In the odd-A nuclei most of the observed transitions were to clusters of near-similar states. The results are compared in detail to studies of (p, p'), (d, d'), (a, a'), and (n, n') reactions in the same nuclei. Great similarities between these and the (e, e') are established. It is shown how the combined results can be used to determine the disposition and intensities of the levels within the clusters and how these are related to the discrete-energy core excitations in neighboring even-even nuclei. Data taken at high momentum transfer show that inelastic electron scattering continues to be dominated by excitation of collective states in disagreement with predictions based on present understanding of the process. Excitations seen in both Bi^{209} and Pb^{208} at about 5.8 mev are identified as leading to collective states in these nuclei. They are probably E5 transitions although E4 assignments cannot be excluded. The collective states are not seen in Ta^{181} and Au^{197} in (e, e').

ELASTIC SCATTERING OF HIGH-ENERGY POSITRONS FROM HYDROGEN COBALT, AND BISMUTH (Abstract), by D. Yount and J. Pine. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [Nonr-22567]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 46, Jan. 24, 1962.

A beam of about 4×10^8 positrons per second has been obtained with energy 300 mev (or lower) and energy spread ± 1%. Elastic scattering of positrons relative to electrons has been measured for hydrogen at 200 mev, 30°; 300 mev, 30°, 45°, and 130°. Scattering at 300 mev has also been measured for cobalt at four angles between 10° and 40° and for bismuth at 6 angles between 5° and 45°. The data are characterized by the ratio R, defined as $[(d\sigma/d\omega)_- - [(d\sigma/d\omega_+]/(d\sigma/d\omega)_- + (d\sigma/d\omega)_+]$, where the - and + subscripts refer to electron and positron cross sections. In first Born approximation R = 0. However, interference between 2-photon and 1-photon Feynman diagrams changes sign for electron scattering relative to positron scattering. Hence, R yields information about 2 photon exchanges, and depends on the static charge distribution of the nucleus as well as on dynamical effects such as nucleon polarizability. The experimental results will be presented and discussed.

EXCITATION OF ISOMERIC STATES IN Rh^{103} AND In^{115} BY ELECTRONS (Abstract), by T. H. Crawford, J. Goldemberg, and W. C. Barber. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [Nonr-22567]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Stanford U., Calif., Dec. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 604, Dec. 27, 1962.

Yield curves for the production of the 54-min isomeric state of Rh^{103} and the 4.5-h state of In^{115} were measured both for electrons and bremsstrahlung of energies between 5 and 40 mev. The electrons were produced by the Mark II Stanford linear accelerator, and the irradiations were made with the usual "stacked-foil" method. The ratio of electron/photon yield is sensitive to the multipole character of the absorption process. The results show that the absorption mechanism in the reactions $Rh^{103}(\gamma, \gamma')Rh^{103*}$ and $In^{115}(\gamma, \gamma')In^{115*}$ is dominantly electric quadrupole up to about 10 mev and changes to dipole for energies greater than that. This behavior of the cross section explains the 2 resonances found previously in the cross sections for the above reactions. The reactions $Rh^{103}(\gamma, 2p)Tc^{101}$ and $Rh^{103}(\gamma, 2n)Rh^{101}$ were also measured during the course of the experiment.

PHOTOPRODUCTION OF π MESONS FROM HYDROGEN AND DEUTERIUM (Abstract), by M. Bazin and J. Pine. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under [Nonr-22567]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 48, Jan. 24, 1962.

Differential cross sections for π^+ photoproduction from hydrogen have been measured for photon energies from 165 to 200 mev. The mesons are identified by momentum and range, as determined by a magnetic spectrometer and counter telescope. At 180-mev photon energy, the angular distribution from 30 to 150° in the center-of-mass system has been measured. Data at higher photon energies does not include the forward angles, while at lower energies the backward angles are inaccessible. The final accuracy is expected to be ≤ 5% relative uncertainties and about 5% absolute uncertainty. The π^-/π^+ ratio from deuterium has also been measured for a similar range of angles and photon energies. In this case, the mesons are identified by momentum and dE/dx, to avoid possible bias from the asymmetrical behavior of stopped pions. The final uncertainties of the measured ratios are expected to be ≤ 5%. The results will be presented and discussed.

NONLINEAR THEORY OF PLASMA OSCILLATIONS, by P. A. Sturrock. Jan. 1962 [25]p. incl. refs. (ML rept. no. 874) (AFOSR-1996) (AF 49(638)415) AD 404797 Unclassified

The nonlinear properties of electrostatic waves in a uniform, zero-temperature plasma free from magnetic field are investigated by 2 independent perturbation procedures. The first of these is the derivative-expansion technique, applied to the Lagrangian variable formalism. The second is a canonical-transformation procedure based on a Hamiltonian description. Both procedures lead to the same formula for the dominant (four-wave) interaction process. If the spectrum is 1-dimensional, the wave interaction vanishes. In general, the effect of wave interactions may be divided into 'coherent' and 'incoherent' contributions. The former leads to a frequency displacement which may be characterized by a dispersion relation. This is evaluated for a test wave in a thermally excited plasma and found to be of the standard form. FERRIMAGNETIC RELAXATION MEASUREMENTS AND MICROWAVE CIRCUIT PROPERTIES OF FERRITE ELLIPSOIDS, by L. K. Anderson. Feb. 1962 [170]p. incl. illus. diagrs. tables, refs. (ML rept. no. 880) (AFOSR-2121) (AF 49(638)415) AD 612628 Unclassified

The object of this paper is to describe the results of an experimental investigation of relaxation processes in microwave ferrites. A new experimental procedure has been developed in which the contribution of the uniform precessional mode to the relaxation may be separated from that of the other spin modes by controlling the interaction between the ferrite sample and its microenvironment. In contrast to previous theories, the results are valid even when the interaction is large, provided that the sample is not too close to a waveguide wall. This "wall effect," which takes the form of a shift, broadening and distortion of the resonance line, is discussed in some detail.

PLASMA SHEATH FORMATION BY RF FIELDS, by H. S. Butler and G. S. Kino. July 1962, 31p. incl. illus. diagrs. (ML rept. no. 917) (AFOSR-2998) (AF 49(638)415) AD 283839 Unclassified

Also published in Phys. Fluids, v. 6: 1346-1355, Sept. 1963.

It has been observed experimentally that the application of a radio-frequency voltage (10 kc/sec-50 mc/sec) to any one of several electrode configurations around the outside of a plasma discharge tube results in a constriction of the luminous portion of the plasma away from the inner walls of the glass tube. This investigation has established that the phenomenon is basically a radio-frequency rectification effect, leading to the formation of thick ion sheath. The interaction is described mathematically in terms of a differential equation which has an approximate solution that fits qualitatively all the observed characteristics of the phenomenon. The differential equation, in its most general form, has also been solved numerically and the solution is shown to quantitatively fit experimental observations for both radio-frequency sine and square wave signals. An application of this phenomenon as a possible external diagnostic probe technique is proposed. (Contractor's abstract)

FOLDOVER IN DIODE-LOADED RESONANT CIRCUITS, by R. E. Tokheim. Aug. 1962, 31p. incl. diagrs. (AFOSR-4829) (AF 49(638)415) AD 407128 Unclassified

Experimental investigation of foldover was made in a medium frequency series resonant circuit using 2 back-to-back Varicap diodes. Foldover of this nature is a phenomenon of some importance in several practical devices, including bistable switching circuits, the parametron, the parametric limiter, the parametric amplifier and the harmonic generator. The purpose of this study was to determine how well such foldover could be predicted from theory for the series circuit. Theoretical results were based upon precise measurements of the individual circuit components. Very good agreement of theory with experiment was obtained, assuming only the fundamental frequency term in the harmonic balance method of solving the nonlinear differential equation. TEMPERATURE DEPENDENCE OF THE WIDTH OF THE R LINE OF CHROMIUM IN MgO (Abstract), by G. F. Imbusch, G. B. West and others. [1962] [1]p. [AF 49(638)415] Unclassified

Presented at meeting of the Amer. Phys. Soc., Stanford U., Calif., Dec. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 613, Dec. 27, 1962.

The width of the cubic-site R line (6981 A) of a chromium-doped MgO crystal has been measured at different temperatures from 4.2°K to room temperature. The spectrometer used was an Ebert grating spectrograph built by the Jarrell-Ash Company. The linewidth increases with temperature in a manner similar to that found for the R line of chromium in ruby. The increase with temperature is a little greater in the case of MgO than for aluminum oxide whose lattice is harder. Since the chromium ion in MgO is in a site of cubic symmetry, the theories of thermal line broadening should be more easily applied to the fluorescence line of chromium-doped MgO than the ruby fluorescence. The shift in the position of the center of the R line with temperature has also been measured in the same temperature range. The line is found to move to the red by about 9 A from 77° to 273°K.

EVEN AND ODD INSTABILITIES IN COUPLED FERRITE SPHEROIDS, by B. A. Auld and C. H. Holmes. Oct. 1962. [3]p. incl. illus. diagr. (ML rept. no. 968) (AF AFOSR-62-343) Unclassified

Presented at the Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Published in Jour. Appl Phys., v. 34: 1277-1279, Apr. 1963.

A theoretical analysis supported by experimental evidence shows that coupling between 2 ferrimagnetic ellipsoids can lead to a type of instability analogous to the second-order, Suhl spin-wave instability in a single sample. Two ferrite samples coupled through their dipolar fields constitute a pair of coupled non-linear resonators. If the samples are identical, the uniform precession of the system is describable in terms of an even mode in which the transverse components of magnetization in the 2 samples are parallel, and an odd mode in which the transverse components are antiparallel. The frequency separation of these modes is determined by the strength of the coupling. At sufficiently low power levels the even and odd modes are independent, and the response of the system to a driving field exhibits the usual double-peaked shape characteristic of coupled linear resonators. At high power levels, however, nonlinear terms, arising primarily from shape anisotropy, produce significant mode interaction. If, for example, the even mode is excited to a large amplitude at ω_p by applying identical driving fields to the 2 samples, there results a torque at $2\omega_p$ that can lead to exponential growth of the odd mode. Conversely, excitation of the odd mode to a large amplitude can lead to parametric excitation of the even mode. The theoretical analysis predicts the conditions under which growth is attained. Experiments conducted on narrow linewidth disks of single-crystal YIG are in substantial agreement with the theory. The instability is observed as saturation of the directly driven mode and as radiation from the unstable mode. (Contractor's abstract)

SOLUTION OF THE FULL PLASMA-SHEATH EQUATION (Abstract), by S. A. Self and G. S. Kino. [1962] [1]p. [AF AFOSR-62-343] Unclassified

Presented at meeting of the Amer. Phys. Soc., Boulder, Colo., Oct. 10-12, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 631, Dec. 27, 1962.

In the theory of the plasma of an arc, Tonks and Langmuir and later workers assume exact space-charge neutrality. Thus, they ignore the derivative term in the full-plasma-sheath equation and solve the resulting plasma-integral equation, obtaining solutions applicable to the body of

the plasma, but which become progressively inaccurate as the boundary is approached. A solution for the sheath region ignoring ion generation is then matched at some point near the limit of the plasma solution. This procedure gives rise to some uncertainties, since the selection of the matching point, i.e., the plasma-sheath boundary, is rather arbitrary. To overcome these uncertainties, the full plasma–sheath equation has been solved numerically for the plane symmetric discharge with long ion mean free path. Solutions are presented for various values of the discharge parameters. These solutions apply throughout the plasma and sheath regions and, thus, avoid the arbitrary choice of a plasma-sheath boundary.

VARIATIONAL TECHNIQUE FOR DETERMINING DISPERSION RELATIONS IN PLASMA SYSTEMS, by E. M. Barsten. [1962] [6]p. incl. diagrs. (ML rept. no. 981) (AF AFOSR-62-343) Unclassified

Published in Phys. Fluids, v. 6: 828-833, June 1963.

Sturrock's variational principle seems particularly well suited to the study of small-amplitude disturbances of plasma systems and is formulated in a sufficiently general manner so as to be applicable to relativistic as well as nonrelativistic multistream problems. The use of this variational principle is shown to be effective (in conjunction with the trial-function method) in approximating dispersion relations. To this end the variational procedure is applied to 2 simple plasma problems which admit of exact solution. It is found that a first-order error in the trial functions leads to only a second-order error in the dispersion relation–a behavior typical of variational procedures and which renders them so useful. BLACK-BODY DISTRIBUTION LAW IN SEMI-CLASSICAL RADIATION THEORY, by J. H. Eberly. Apr. 1962, 81p. incl. diagrs. (ML rept. no. 940) (AFOSR-3427) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22548) AD 282148 Unclassified

A formalism is developed, employing an improved semi-classical theory of electrodynamics, with which it is possible to treat interacting systems of radiation and large or small numbers of atoms. The theory differs from the ordinary semi-classical theory as it is most commonly employed in 2 ways: (1) The neoclassical theory takes consistent account of the effect of the atoms on the electromagnetic fields, as well as the effect of the fields on the atoms. (2) The neoclassical theory avoids the use of perturbation theory in the usual sense, and does not introduce the concept of transition probability. The neoclassical theory is based on the attempt to integrate Schrodinger's equation directly.

GENERATION OF SUB-MILLIMETER RADIATION BY A BUNCHED BEAM OF RELATIVISTIC ELECTRONS, by P. A. Szente. July 1962, 126p. incl. diagrs. refs. (ML rept. no. 935) (AFOSR-3428) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22548) AD 282146 Unclassified

The interaction of a bunched beam of relativistic electrons with several different microwave circuits was analyzed, with a view toward the generation of electromagnetic radiation in the sub-millimeter wavelength region. Because of relativistic effects, it was possible to use structures which had dimensions large compared to the desired wavelength. A relativistic electron beam was obtained from a traveling-wave linear accelerator which operated at a frequency of 9288 mc/sec. The interaction properties predicted by theory were compared with the experimental results obtained from resonant cavities, from a dielectric-loaded slow-wave structure, and from 2 other special structures: a magnetic undulator and a sinuous waveguide. In the case of the magnetic undulator, approximately 150 mw were generated at 5.4 mm, and 35 mw at 1 mm. The shortest wavelength observed was 0.4 mm at a power level of 40 μw.

THE MICROWAVE CHARACTERISTICS AND APPLICATIONS OF FERROELECTRIC CERAMICS, by M. DiDomenico, Jr. Oct. 1962, 151p. incl. illus. diagrs. table, refs. (ML rept. no. 960) (AFOSR-5013) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22548) AD 292131 Unclassified

The purpose of this investigation was to study both theoretically and experimentally the uses of ferroelectric ceramics in microwave device applications. At microwave frequencies, ferroelectric ceramics behave as nonlinear dielectrics and exhibit small signal as well as large signal scaler nonlinear characteristics in both the dielectric constant and the rf dielectric conductivity. The preliminary part of this study gives a comprehensive review of the experimentally measured characteristics of the ferroelectric titanates, and in particular of the ceramic 73% BaTiO3 -27% SrTiO3. An X-band electrically tunable ferroelectric phase shifter was constructed. Phase shifter was controlled by applying a dc electric field to the ferroelectric. The measured characteristics of this device showed that phase shifts of 40° - 50° are attainable over a 400 mc band centered about 9.3 kmc with insertion losses ranging from 2 - 6 db. The general incremental behavior of such small signal devices as phase shifters, attenuators, and tunable cavities is also discussed. The non-linear behavior of the 73% BaTiO3 - 27% SrTiO3 ceramic was further used to construct a harmonic generator operating from 3 to 9 kmc. In order to assess the characteristics of ferroelectric traveling-wave harmonic generators, an example is worked out for an S-band TE sub-10 mode at the fundamental frequency of 3 kmc.

COUPLED MODE THEORY OF ACOUSTIC WAVE AMPLIFIERS, by C. F. Quate. Feb. 1962, 35p. incl. diagrs. (ML rept. no. 889) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22548) AD 292329 Unclassified

It has recently been demonstrated that acoustic waves can be amplified in CdS when the free carriers in the photoconductor drift through the crystal with a velocity somewhat faster than sound. The acoustic waves generate an electric field which couples to the carriers in piezoelectric materials. The coupled mode theory of interactions of this type is discussed. The propagation characteristics of the waves in the elastic media and the waves on the drifting carriers are changed when the normal modes in the 2 systems are weakly coupled with the piezoelectric field. With this coupling, and with the case where the diffusion current is less than the current of the bunched carriers, we find 1 forward wave growing exponentially and a second wave attenuating exponentially with distance. The boundary conditions are studied and show that the amplified wave is strongly excited by the elastic wave at the input. The analysis presented should be valid in the range of frequencies where the mean free path of the carriers is short compared to the acoustic wavelength. (Contractor's abstract)

EFFECTS OF ELECTRON BEAM CONFINEMENT ON KLYSTRON EFFICIENCY, by C. G. Nelson. Apr. 1962, 97p. incl. diagrs. tables, refs. (ML rept. no. 910) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22548) AD 276503 Unclassified

The effects of magnetic field configuration on klystron efficiency were measured, especially the effects of introducing magnetic flux at the cathode, leading to so-called confined flow in the electron beam. The experiments were performed using a 2-cavity klystron of special design, incorporating a movable output cavity and a scanning iris. The scanning iris permitted measurements of dc and rf current distribution in the beam; longitudinal movement of the cavity made these measurements possible at various axial positions and allowed the determination of optimum cavity spacing. Detailed studies were made on 4 beams requiring magnetic focusing fields of up to twice the Brillouin field. Detailed current distributions in these beams were used in determining various parameters useful in analyzing klystron performance, such as plasma wavelength, beam coupling coefficients, and beam loading conductance. FLUORESCENCE SPECTRA OF CHROMIUM IONS IN α AND β GALLIUM OXIDE (Abstract), by G. F. Imbush, A. L. Schawlow, and J. P. Remeika. [1962] [1]p. (In cooperation with Bell Telephone Labs., Inc.) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-22548]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 445-446, Aug. 27, 1962.

Fluorescence of Cr^{3+} ions has been observed at low ion concentrations in both α and β crystalline forms of gallium oxide. In both cases, the R_1 line (^2E, $\bar{E}$–$^4A_2$) and the R_2 line (^2E, $2\bar{A}$–$^4A_2$) were observed with a Hilger wavelength spectrometer modified to have a dispersion of 2.3 A/mm. The spectrum of Ga_2O_3:Cr^{3+} which has been reported previously is that of the β form which was prepared by crystallization from a flux. It has fluorescence lines R_1 at 6885 A and R_2 at 6950 A (at 77°K). αGa_2O_3 has a simple crystal structure (isostructural with αAl_2O_3); the Cr^{3+} fluorescence lines are at 6859 and 6943 A. The sample was prepared by heating the monohydrate in air. The spectrum is quite similar to that of pink ruby, while the larger ^2E splitting of the β form is probably caused by tetragonal and rhombic components of the crystal field.

MONOCHROMATIC RUBY OPTICAL MASER (Abstract), by L. F. Mollenauer, G. F. Imbusch and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-22548]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 445, Aug. 27, 1962.

An ideal optical maser would generate light that is truly monochromatic. Preferably the wavelength should be determined by some atomic resonance, rather than by structural dimensions. However, most optical masers use highly reflecting end plates and so have strong, closely spaced, axial-mode resonances. Typically maser oscillation occurs simultaneously in several axial modes, so that the output contains several frequencies. Ordinarily, the atomic linewidth is broad enough to include a number of axial modes, and the exact output wavelengths are determined by the cavity resonances. However, ruby at 77°K has very strong,

narrow fluorescence lines ($\Delta\nu \sim 0.2$ cm^{-1}), and so the maser can be operated with one end unsilvered. The, the output wavelength is determined by the spectral line. By using a sapphire-clad rod immersed in liquid nitrogen, a single sharp line has been obtained. Its width was determined using the tilted-plate interferometer to be less than 0.0025 cm^{-1} near the threshold.

MULTIPLE BEAM INTERFEROMETRY WITH LARGE PLATE SEPARATIONS (Abstract), by H. W. Moos, G. F. Imbusch and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-22548]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 445, Aug. 27, 1962.

The use of multiple-beam interferometry for detailed studies of surface contours has been confined to reflectors almost in contact. With truly monochromatic, parallel optical-maser light sources, it is now possible to extend it to large plate separations. The experimental arrangement is equivalent to a Fabry-Perot interferometer with 1 plate tilted a few wavelengths from parallelism. Monochromatic light entering perpendicular to the plates is transmitted at those places where the plate spacing is $n\lambda/2$. The interference fringes can be photographed either with or without focusing. If the plates are flat and the medium homogeneous, they are straight lines; otherwise the fringes are curves, but still very sharp if the reflectivity is high. If several wavelengths are present, fringes appear between the orders. Thus, the tilted-plate interferometer can be used for high-resolution spectroscopy of collimated sources, even if the plates are not very flat. It can also exhibit sensitively variations in refractive index of the medium between the plates.

NORMAL MODE THEORY FOR ELECTRON-BEAM PLASMA AMPLIFICATION, by M. Chodorow, J. C. Eidson, and G. S. Kino. [1962] [5]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-22548]) Unclassified

Also published in Microwave: Proc. Fourth Internat'l. Cong. on Microwave Tubes, Scheveningen (Netherlands) (Sept. 3-7, 1962), Eindhoven, Centrex Publishing Co., 1963, p. 333-337.

It is the purpose of this paper to show that a variational technique, based on a trial function with the same radial variation of the field over the beam plasma system as the cold of the plasma, is quite adequate to obtain good agreement with field theory solutions as determined by Allen et al. The variational method also makes it possible to obtain a far better physical insight into the type of coupling that occurs in the beam plasma system. Using the quasi-static approximation, a variational expression for the propagation constants in terms of the potential function has been obtained for a beam plasma system with finite geometry and magnetic field. Using the unperturbed static modes of the plasma as trial functions, dispersion diagrams were obtained which agree reasonably well with the more exact numerical solutions. This method gives more insight into the nature of the interaction.

PARAMETRIC [REFREGERATION] DISCUSSION AND EXPERIMENTAL VERIFICATION OF THE REMOVAL OF SLOW-WAVE NOISE, by P. A. Sturrock, G. C. van Hoven, and A. Karp. [1962] [5]p. incl. illus. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-22548]) Unclassified

Published in Microwaves: Proc. Fourth Internat'l. Cong. on Microwave Tubes, Scheveningen (Netherlands) (Sept. 3-7, 1962), Eindhoven, Centrex Publishing Co., 1963, p. 231-235.

As a first attempt at the realization of a parametrically refrigerated amplifier, the noise removal coupler has been investigated experimentally. Parametric coupling to circuit waves was directly demonstrated and indirectly shown. The exchange of energy between these waves and the slow space-charge wave was indirectly shown. Parametric refrigeration is fundamentally different from all other noise removal processes. Consequently, its use in conjunction with these other methods should allow a substantial reduction in presently available microwave noise figures.

PUMPING POWER CONSIDERATIONS IN AN OPTICAL MASER, by O. Svelto. Apr. 1962, 29p. incl. diagrs. (ML rept. no. 902) (Sponsored jointly by Air Force [Office of Scientific Research], Office of Naval Research, and Signal Corps under Nonr-22548) Unclassified

Published in Appl. Opt., v. 1: 745-751, Nov. 1962.

Also published in Appl. Opt. Suppl. on Opt. Masers, v. 1: 107-113, 1962.

The theoretical efficiency of various pumping power systems that have been adopted in optical masers is studied. A thermodynamical method is used to calculate the power transferred from the flashtube to the maser material. In this way a general expression is obtained which allows one to calculate the total power and the power per unit area of the flashtube needed, for a given power absorption by the active rod. When the rod is

surrounded by a sheath with an index of refraction equal to or greater than that of the rod, the power per unit area of the flashtube is lowered at best by the factor n, where n is the index of refraction of the rod. The total power required from the flashtube is not affected by the sheath. The most efficient case occurs when the pumping power is allowed to enter the active rod from all directions. In this case the necessary power per unit area of the flashtube is reduced by a factor n^2 with respect to the case of a simple rod. (Contractor's abstract)

SPIN-WAVE RESONANCE IN THIN FILMS AT OBLIQUE ANGLES, by T. D. Rossing. [1962] [2]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-22548]) Unclassified

Presented at the Eighth Symposium on Magnetism and Magnetic Materials, Pittsburgh, Pa., Nov. 12-15, 1962.

Published in Jour. Appl. Phys., v. 34: 1133-1134, Apr. 1963.

Spin-wave spectra in thin Permalloy films have been observed as the angle between the applied field and the film is varied from 0 to 90°. The applied field corresponding to the main resonance peak falls very close to its calculated value for all angles. At some critical angle the spin-wave spectrum collapses to a single peak. The observed critical angle is very near the angle at which the resonance frequency becomes independent of small changes in the magnetization, which supports a dynamic-pinning model. The separation between the main peak and the subsidiary peaks reaches a maximum at an angle slightly less than the critical angle and drops sharply as the critical angle is approached. At no angle does the wavelength of the spin waves appear to be a submultiple of the film thickness as would be expected if the surface spins were completely pinned. As the angle between the applied field and the film increases from 0, the linewidth increases and reaches a maximum near 80°. Beyond this angle the linewidth decreases rapidly, and in many films the linewidth at 90° is less that at 0. Simple theory explains the increase in linewidth with angle, locates the angle of maximum linewidth, but fails to predict the narrowness at 90°. (Contractor's abstract)

THEORETICAL CONSIDERATIONS ON MILLIMETER WAVE GENERATION BY OPTICAL MIXING, by J. R. Fontana and R. H. Pantell. [1962] [5]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under [Nonr-22548]) Unclassified

Published in Proc. Inst. Radio Engineers, v. 50: 1796-1800, Aug. 1962.

The generation of radiation by mixing optical maser signals is one possible method for closing the gap between microwaves and infrared. The conversio efficiency attainable with different types of nonlinear media is considered. It is shown that lossless nonlinear media, such as dielectrics, have very low conversion efficiency properties, regardless of the way they are used. Nonlinear resistive media, on the other hand, have efficiencies up to 25%, independently of the frequency conversion ratio. Consequently, in order to generate wavelengths in the millimeter range by mixing optical maser outputs, the materials used should involve nonlinear dissipative processes. (Contractor's abstract)

STANFORD MICROWAVE SPECTROHELIOGRAMS FOR 1960 JULY, by G. Swarup. Mar. 1962, 37p. incl. illus. diagrs. table. (Scientific rept. no. 12; Stanford Radio Astronomy Inst. publ. no. 12) (AFOSR-1604) (AF 18(603)53) AD 275790 Unclassified

Maps are presented of the sun which show the disc distribution of solar radio emission at 9.1-cm wavelength by means of radioisophotes, or lines of constant brightness temperature. The contour interval, which varies from map to map, is usually about 80,000 K, and is determined after the map is drawn by reference to the measured flux density of the whole sun. A circle shows the photosphere. With the microwave spectroheliograph, the sun is scanned along approximately 15 parallel lines from west to east, and from the resulting records the maps are carefully prepared by hand. A positional accuracy of better than ± 1/2 min of arc in the location of bright features is maintained.

FUTURE LARGE RADIO TELESCOPES, by R. N. Bracewell, G. Swarup, and C. L. Seeger. [1962] [5]p. incl. illus. diagrs. refs. (AFOSR-3051) (AF 18(603)53) Unclassified

Also published in Nature, v. 193: 412-416, Feb. 1962.

As the cost and size of steerable paraboloidal reflectors for radio-telescopes has become prohibitive, some alternative methods for constructing narrow beam instruments are examined. Aerials that can grow would enable observational and constructional work to proceed side by side with less time wastage and some examples are given. A brief review, with reference to the literature, of several narrow beam instruments is made. It is pointed out that the cost of data-handling equipment and computers might equal the cost of the aerials in future large multiple-beam instruments.

A MODEL FOR THE SOURCES OF THE SLOWLY VARYING COMPONENT OF MICROWAVE SOLAR RADIATION, by T. Kakinuma and G. Swarup. [1962] [20]p. incl. diagrs. tables, refs. (AFOSR-J61) (AF 18-(603)53) AD 400438 Unclassified

Also published in Astrophys. Jour., v. 136: 975-994, Nov. 1962.

A comparison of the observations of the slowly varying component of the solar radio emission made with high-resolution interferometers operating at wavelengths of 3.2, 7.5, 9.1, and 10.7 cm shows that the flux densities of many strong sources are higher at the longer wavelengths than at 3 cm. The same conclusion is derived from eclipse and statistical investigations, which indicate further that the spectrum of the flux density has a peak around 6 cm. The decrease in flux density with frequency cannot be explained simply by assuming a greater optical thickness for the extraordinary wave near 10 cm in the million-degree corona, as given by the magneto-ionic theory, since the observed degree of polarization at 7.5 or 9.1 cm is much lower than that at 3.2 cm. It is suggested that radiation at the gyro-frequency and its harmonics emitted by the thermal electrons in the dense region over a sunspot group should be taken into account to explain the spectrum of the slowly varying component. This mechanism of resonance absorption requires the average strength of the magnetic field over the sunspot group to be about 600 gauss at a height of 2×10^4 km above the photosphere and 250 gauss at a height of 4×10^4 km. In order to explain the observed values of brightness temperature of $1\text{-}4 \times 10^6$°K near 10 cm by the magneto-ionic theory, it is necessary to assume values of electron density of up to 20 or 40 times the normal. However, these high values of densities are not required by the gyro-theory, and values of five to ten times the normal are sufficient for explaining simultaneously the observations of brightness temperature flux density, and polarization. This theory also explains the small size of the source in the range 3-10 cm. The radio emission is considered to originate thermally, which requires that the value of the electron temperature in the region of the inner solar corona above a large sunspot group is about $2\text{-}4 \times 10^6$°K. RADIO ASTRONOMY TECHNIQUES, by R. N. Bracewell. [1962] [88]p. incl. illus. diagrs. tables, refs. (AFOSR-J294) (AF 18(603)53) AD 406486 Unclassified

Also published in Handbuch der Phys., v. 54: 42-129, 1962.

The first 2 parts of this chapter, concerned respectively with receivers and aerials, represent a selection from a vast field of radio technology. Parts II and III have been written for the physicist, etc., who would benefit from a collected exposition of the parts of radio technique relevant to his work. Part IV lays the groundwork for studying those parts of radio astronomy technique which have not been borrowed from existing practice but have been developed recently by radio scientists engaged in astronomical observation. It introduces the quantities brightness, brightness temperature, and flux density in terms of which observations are expressed, and sets up the aerial smoothing equation, an integral equation which relates them to available power, the quantity which is actually measurable with a receiver and aerial. Part V describes the simple 2-element interferometer, the radio analog of Michelson's stellar interferometer, and interprets its function as a determination of the complex visibility of a temporal interference fringe system. Part VI of this chapter goes into details of the measurement of radiation fields from celestial sources by means of both pencil beam aerials and interferometers. All the components of the often complex apparatus which is immersed in the field, the concepts necessary for considering its interaction with the field, and the procedures for absolute calibration, are discussed in the preceding parts, and the observing procedures clarified.

BROADBAND TUNNEL-DIODE AMPLIFIERS, by B. R. Henoch and Y. Kvaerna. Interim rept. Sept. 1961 - Aug. 1962, 85p. incl. diagrs. (Technical rept. no. 213-2; rept. no. SEL-62-099) (Sponsored jointly by Air Force; and Air Force Office of Scientific Research under AF 18(603)53) AD 299284 Unclassified

A tunnel-diode amplifier can be broadbanded by incorporating the diode in a filter structure where the reactive elements of the diode are part of the filter. This is described as matching the amplifier impedance to a constant-gain circle in the impedance plane. Design

principles are given for amplifiers of this type, and the frequency response is calculated for a few circuits. The results show bandwidths much larger than can be handled by the presently available circulators needed for separating the input and output parts. Reflections from the circulator can easily give rise to oscillation, especially outside the band of interest, because an amplifier with only reactive tuning is active for all frequencies up to the diode cut-off frequency. A solution to this problem is to introduce resistive elements in the amplifier circuit so as to have negligible effect in the band of interest, but to load down the tunnel diode so as to make the whole circuit passive outside this band. The theory of such selective loaded amplifiers is discussed, and several practical realizable circuits are described. (Contractor's abstract)

HIGH-RESOLUTION STUDIES OF TEN SOLAR ACTIVE REGIONS AT WAVELENGTHS OF 3-21 CM, by G. Swarup, T. Kakinuma and others. [1962] [17]p. incl. diagrs. tables, refs. (AFOSR-J872) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)1059 and National Science Foundation) AD 416018 Unclassified

Also published in Astrophys. Jour., v. 137: 1251-1267, May 15, 1963.

Ten strong sources of the slowly varying component (S-component) of solar radio emission have been studied using high-resolution interferometers operating at wavelengths of 3.2, 7.5, 9.1, 10.7, and 21.1 cm. All the 10 radio sources were associated with sunspot groups having areas greater than about 500 millionths of the solar hemisphere. The observations were obtained with interferometers which are located at Nagoya, Ottawa, Stanford, and Sydney and which provide fan- and pencil-shaped beams having widths of about 1-3 min of arc. This international cooperation has made it possible to study the wavelength dependent of the S-component. It appears that a strong source of the slowly varying component has a higher value of flux density near 10 cm than at 3 cm or 21 cm. The size has a value of about 2-3 min of arc at wavelengths of 3 and 10 cm and about 3-4 min of arc at 21 cm. The calculated values of heights show a large scatter but are of the order of 10000-20000 km at wavelengths of 3 and 10 cm, and about 40000-90000 km at 21 cm. As other eclipse and interferometric observations have shown, the radio emission is circularly polarized, with the degree of polarization being > 30% at 3 cm, ~ 10% at 10 cm, and < 2% at 21 cm. At 10.7 cm, the brightness temperatures of the 10 sources range from 1.6 to 3.8 x 10^6°K when it is assumed that the north-south widths of the sources are equal to the observed east-west widths. The brightness temperatures show good correlation with both sunspot areas and magnetic fields. The above results about the flux-density spectrum and degree of polarization are not consistent with simple magnetoionic theory in which only the effect of electron-ion collisional absorption is considered.

THE MAGNETOSPHERE DURING MAGNETIC STORMS: A WHISTLER ANALYSIS, by D. L. Carpenter. June 1962, 72p. incl. diagrs. tables, refs. (Technical rept. no. 12; rept. no. SEL-62-059) (AFOSR-2653) (Sponsored jointly by Air Force Office of Scientific Research under AF 18(603)126 and National Science Foundation) AD 281837 Unclassified

The electron density of the outer ionosphere, or magnetosphere of the earth was studied, using whistlers. The analysis leads to new results, results which have not been predicted by theory or by the relatively small amount of relevant information from satellites. It is shown that (1) ionization density levels in the magnetosphere are substantially depressed during magnetic storms; and (2) the degree of depression may increase rapidly with distance from the earth, thus producing large gradients in ionization density. PERIODIC NOISE ASSOCIATED WITH WHISTLER ECHO TRAINS, OBSERVED AT SPACE STATIONS IN OPPOSITE HEMISPHERES (Abstract), by R. A. Helliwell, J. Katsufrakis and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 18-(603)126 and National Science Foundation) Unclassified

Presented at URSI-IRE Joint Spring meeting Washington, D. C., Apr. 30-May 3, 1962.

Published in I. R. E. Trans. on Antennas and Propagation, v. AP-10: 492, July 1962.

Whistler recordings from northern and southern hemisphere stations has revealed a remarkable association between whistlers and periodic VLF ionospheric noise (VLF emissions). The phenomenon is illustrated with recordings obtained on October 1, 1961, at 1250 UT during the course of a severe magnetic storm. The spectra from all stations in the same hemisphere are identical, but show the expected "conjugate" anti-phase relationship in opposite hemispheres. The events were not restricted to geomagnetically conjugate pairs of stations but were identified over a large geographical area extended in longitude from Byrd Station to Wellington and in latitude from Stanford to Byrd. The essence of the phenomenon is the development of discrete emissions which appear to grow out of the echoes of a strong whistler. With each successive whistler echo and its associated emission, the parent whistler becomes weaker and finally disappears (after 30 hops). The discrete emission on the other hand is observed to undergo a small but distinct change in form with each echo, so that after many echoes the emission often bears little resemblance to the original form. It is suggested that although the observed noise may be generated by traveling wave amplification, these records indicate that a strong electromagnetic wave traveling in the whistler mode may provide the bunching necessary for coherent, discrete emission from a stream of particles. Thus discrete bunches of charged particles would not be required to produced discrete emissions.

NONLINEAR OPTICAL EFFECTS: AN OPTICAL POWER LIMITER, by A. E. Siegman. July 1962, 17p. incl. diagrs. refs. (Technical rept. no. 172-1; SEL-62-085) (AFOSR-2638) (AF 49(638)660) AD 287601 Unclassified

Also published in Appl. Opt., v. 1: 739-744, Nov. 1962.

Parametric subharmonic oscillators and amplifiers at optical frequencies have recently been proposed, using optical maser pump sources together with the nonlinear optical properties of certain crystals. The simplest such structure would comprise a Fabry-Perot resonator filled with nonlinear crystal, the ends being transparent at the fundamental or pump frequency ω and reflecting at the subharmonic frequency $\omega/2$. This paper demonstrates that such a structure will also function as an ideal optical power limiter at the fundamental. Power transmission through the structure at ω will limit sharply and flatly at the threshold level at which subharmonic oscillations commence; a large power-dependent reflection will also occur on the input end above threshold. The use of such a limiter for eliminating spiking in optical masers, and for other purposes, is suggested. (Contractor's abstract)

INTERACTION BETWEEN A DIELECTRIC (OR COLD PLASMA) AND A CAVITY, by K. I. Thomassen. [1962] [8]p. incl. illus. diagrs. (Technical rept. no. 251-2; rept. no. SEL-62-092) (AFOSR-4080) (AF 49(638)660) AD 288014 Unclassified

Also published in Jour. Appl. Phys., v. 34: 1622-1629, June 1963. (Title varies)

This paper treats the interaction between a cylindrical plasma column (or dielectric material) and a resonant cavity from which it protrudes. From the results, one may determine the dielectric constant and loss, or in the case of a plasma, the plasma frequency and collision frequency, given measured values of the resonant frequency shift and change in the cavity Q. This theory differs from earlier theory on cylindrical cavities in that it treats a cavity of more general shape, although restricted to TM modes, and takes into account the subtle boundary effects at the openings through which the plasma is admitted. These effects may be calculated by estimating the field variation over the part of the cylindrical plasma surface that lies inside the cavity. (Contractor's abstract)

OBSERVATIONS OF COLLECTIVE PHENOMENA IN PLASMAS, by K. I. Thomassen. Oct. 1962, 49p. incl. diagrs. table. (Technical rept. no. 251-3; rept. no. SEL-62-143) (AFOSR-4154) (AF 49(638)660) AD 292797 Unclassified

The objective of this research was to find experimental evidence of an anomalous resistance in plasmas. Anomalous resistance results when collective action by electrons causes randomization of the growing oscillations in the 2-stream instability. This sequence of events leading to dissipation of energy was predicted several years ago by Buneman. It is believed that this objective was achieved (i.e., that anomalous resistance is evidenced by observations to be reported here), on a high density plasma subjected to r-f fields by a cavity resonant at a frequency well below the plasma frequency. With sufficient r-f power and density, the 2-stream instability should be excited to turbulence level during each half-cycle, causing irreversible power loss. Calculations enumerating the necessary conditions for observing the phenomena were made, showing that the resistance can easily be seen above the intrinsic cavity loss using very moderate amounts of power. INVESTIGATION OF RUBY-OPTICAL-MASER CHARACTERISTICS USING MICROWAVE PHOTOTUBES, by B. J. McMurtry. July 1962, 139p. incl. illus. diagr. tables, refs. (Technical rept. no. 177-3; rept. no. SEL-62-097) (AFOSR-J1312) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)660 and Dept. of Army) AD 289510; AD 424371 Unclassified

Also published in Appl. Opt., v. 2: 767-786, Aug. 1963.

In this analysis, the successful demonstration of a novel experiment testing this proposal is described. This experiment led to the verification of the microwave-phototube proposal, and also provided a powerful tool for studying the spectral output of the ruby laser. The second topic is the application of this method of photoelectric mixing to the study of the ruby laser. Experiments are described which permit conclusions concerning (1) the behavior of the laser's spectral output as a function of pump power and temperature; (2) the validity of applying homogeneous interferometer mode analyses to the case of ruby; and (3) the effects of fluorescence line shape and stimulated emission in determining oscillation frequencies. In addition, they provide extremely high resolution measurements of the oscillation linewidth. (Contractor's abstract)

WHISTLER EVIDENCE OF A "KNEE" IN THE MAGNETOSPHERIC IONIZATION DENSITY PROFILE, by D. L. Carpenter. [1962] [8]p. incl. illus. diagrs. refs. (AFOSR-64-0316) (AF 49(638)1060) AD 433075 Unclassified

Also published in Jour. Geophys. Research, v. 68: 1675-1682, Mar. 15, 1963.

Study of a new whistler phenomenon shows that the magnetospheric ionization profile often exhibits a 'knee', that is, a region at several earth radii in which the ionization density drops rapidly from a relatively normal level to a substantially depressed one. The new whistler phenomenon (called, for convenience, the 'knee whistler') is compared with ordinary whistlers and is illustrated by a number of examples recorded at middle- and high-latitude stations. It is suggested that the knee exists at all times in the magnetosphere, and that its position varies, moving inward with increasing magnetic activity. There are indications that conditions of whistler-mode propagation may be unusually favorable on the low-latitude side of the knee and that the region on the high-latitude side may be favorable for the production of triggered ionospheric noise. It is pointed out that knee whistlers account for a substantial number of the observations of deep density depressions during magnetic storms. Several questions of interpretation are raised, and the direction of future investigations is indicated. (Contractor's abstract)

EVIDENCE OF ANOMALOUS RESISTANCE IN PLASMAS, by K. I. Thomassen. [1962] [2]p. (AF AFOSR-62-286) Unclassified

Published in Phys. Rev. Ltrs., v. 10: 80-81, Feb. 1, 1963.

The afterglow phase of a pulsed reflex type discharge was examined for evidence of instability arising from electron drifts through a positive ion background. Plasma resistance was inferred from the ratio of incident to reflected power in a 200 mc/s reentrant cavity through which the plasma penetrated. Measurements

in hydrogen at ion densities greater than 10^{12} showed an anomalous increase in resistance with power input, whereas similar measurements in argon were consistent with only very small resistance changes. The results are consistent with instability predictions.

EXPERIMENTAL OBSERVATIONS OF ANOMALOUS RESISTANCE (Abstract), by K. I. Thomassen. [1962] [1]p. [AF AFOSR-62-286] Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 168-169, Feb. 28, 1963.

Anomalous resistance, due to instabilities rather than collisions, was predicted by Buneman. This resistance is believed to have been observed in a plasma subjected to an electric field at a frequency intermediate between the collision frequency (5 mc) and the plasma frequency (> 30 kmc). The (H) plasma, created in a pulsed reflex discharge, penetrated the gap of a 140-mc re-entrant cavity such that the fundamental mode would cause interstreaming of electrons and ions along the dc magnetic field aligning the column. (The skin depth was approximately 1/3 the column radius.) Given sufficient rf power and density, the 2-stream instability should be excited to turbulence level during each half-cycle, causing irreversible power loss. At low power and density, the plasma should be mainly reactive, except for small losses to individual processes such as collisions. By observing the incident and reflected power into the cavity, we did find resistive loading that increases with power but that does not vary with power at lower plasma densities.

COMMUNICATION THROUGH RANDOM MULTIPATH MEDIA, by D. P. Harris. Apr. 1962 [94]p. incl. diagrs. refs. (Technical rept. no. 1002-2; rept. no. SEL-62-031) (AFOSR-3907) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524, and Lockheed Missiles and Space Co.) AD 291447 Unclassified

The performance capabilities of some specific techniques for communicating through noisy, randomly time-varying multipath channels are considered. Analysis is undertaken in sufficient depth to give guidance in the selection of design parameters of various types of systems. The results permit some comparisons to be made of the performance potentials of different communication techniques. Bounds on the communication rate possible with an adaptive matched-filter receiving technique are obtained as functions of the channel-sounding effort, the signal characteristics, and the channel characteristics. These bounds are found to be relatively insensitive to the degree of effort expended in measuring the channel transfer function. The performance characteristics of a class of radiometric signal-detection techniques that require no channel-sounding provisions are analyzed. Detailed design equations and graphs for determining and optimizing performance of such techniques are presented. The results appear to be very attractive when relatively large channel bandwidths are available. An investigation of the performance of some elementary narrowband multipath communication techniques indicates that they may offer competitive performance potentials under some conditions. For many types of multipath channels, the advantages of seeking generally optimum communication techniques are somewhat limited. (Contractor's abstract)

AN INVARIANT INPUT FOR A PATTERN RECOGNITION MACHINE, by G. H. Ball. Apr. 1962, 132p. incl. diagrs. tables, refs. (Technical rept. no. 2003-4; rept. no. SEL-62-051) (AFOSR-4161) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 288807 Unclassified

Information extracted from a visual pattern by the receptor is required to be invariant with respect to the rotation and the translation (and at times, scale changes) of the pattern. Numerical parameters are obtained from the pattern that correspond to the shape of the pattern. Integral geometry is employed to obtain these invariant parameters. Probabilities of misclassification are found as a function of the number of pattern measurements that are used to estimate a parameter. The numerical values of some parameters are obtained for the set of patterns consisting of circles, squares, rectangles ellipses, and right isosceles triangles. Decision theory is used to obtain the structure of the test having minimum probability of error (under certain constraints). Majority voting is discussed as a means of combining the results of many tests on a pattern, and 2 electronic devices, which may be useful in the actual implementation of the procedure given, are exhibited.

NONLINEAR DISTORTION IN FREQUENCY-DEPENDENT TWO-PORT SYSTEMS WITH APPLICATION TO COMMON-EMITTER TRANSISTOR AMPLIFIERS, by L. N. Ma. Oct. 1962, 66p. incl. diagrs. (Technical rept. no. 1611-1; rept. no. SEL-62-093) (AFOSR-5036) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 293836 Unclassified

For a class of frequency-dependent 2-port systems, departure from linear behavior can be obtained by representing the terminal current at each port by a Taylor series of 4 variables, viz, 2 terminal voltages and their first time derivatives. From this representation, a linear model for the solution of harmonic distortions in a 2-port system can be constructed to consist of a set of harmonic current generators at each terminal in addition to the linear small-signal model. Such a model using harmonic current generators is valid for 2-port systems which depart only slightly from linear behavior, and is suitable for use with general linear termination. Using this model, the solution for harmonic distortion is reduced to the solution of a sequence of linear equations. As an application of the analysis, the nonlinear distortion of alloy junction transistor amplifiers at low current levels is determined. The nonlinearities due to the law of the junction and the space-charge layer widening effect are considered. The nonlinearities of the low-frequency common-emitter short-circuit current gain β_0 and the β cut-off frequency ω_β are also included. The results indicate that the model is valid over an extended range of frequencies and bias conditions. (Contractor's abstract)

A STUDY OF MATCHING CONDITIONS IN A TWO-LOOP FREQUENCY MULTIPLIER USING A CAPACITANCE DIODE, by A. Guissard. Dec. 1962, 68p. incl. illus. diagrs. tables, refs. (Technical rept. no. 2256-1; rept. no. SEL-62-154) (AFOSR-64-0626) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) Unclassified

This report is concerned with the problem of finding the matching conditions in a 2-loop frequency multiplier, using a nonlinear capacitance diode. Several authors give theoretical expressions of the efficiency, assuming in most cases that the filters in each loop are tuned, but they do not seem to consider the question of impedance matching in such circuits. This first part of the work is devoted to a theoretical approach to the problem, showing that impedance matching has a meaning for a 2-loop frequency multiplier containing a nonlinear reactance in the common branch. An effort to find out what conditions have to be fulfilled in order to get matching is also included. The analysis is then restricted to the case where the nonlinear reactance is a nonlinear capacitance diode whose characteristic function can be expanded in a Taylor series. The circuit equations for a multiplication of order n are established and the matching conditions are found and discussed. The influence of the dc bias voltage of the diode is also pointed out. APPROXIMATE SOLUTION IN A FINITE TIME INTERVAL FOR ORDINARY NONLINEAR DIFFERENTIAL EQUATIONS, by R. E. Lindsay. July 1962, 88p. incl. diagrs. refs. (Technical rept. no. 2055-1; rept. no. SEL-62-089) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 441212 Unclassified

The object of this investigation is to obtain approximate solutions over finite time intervals to ordinary, nonlinear, differential equations. A new method of approximation is introduced which, for a given differential equation and associated initial conditions, yields an approximate solution which is close to the exact solution everywhere in the prescribed time interval. Because of the nature of the approximate solution, an estimate of the solution error can be obtained from the original differential equation. This approximation technique is compared with some well-known method of approximation. Examples are considered in which the approximation method developed in this research gives superior numerical results. Further, problem areas are indicated (multiple-degree-of-freedom systems, time-variable systems) which are not suitable for treatment by some of the well-known methods but capable of analysis by the technique to be presented in this study. BANDWIDTH AND SPECTRA OF PHASE- AND

FREQUENCY-MODULATED WAVES, by N. Abramson. Oct. 1962, 21p. (Technical rept. no. 2005-3; rept. no. SEL-62-138) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 441214
Unclassified

The spectrum of a cosine angle-modulated by a Gaussian random process (GRP) of (almost) arbitrary spectrum is investigated. Such a GRP provides a convenient model for voice signals, TV signals, and other types of complex communication signals. A simple closed form expression for the bandwidth of the modulated signal in terms of the bandwidth of the modulating signal is found. A general expansion for the shape of the spectrum of the modulated cosine is derived. In addition to reducing, in certain limiting situations, to known results, this expansion provides a practical means of obtaining the spectrum in intermediate cases. Examples are presented showing the spectrum of a cosine modulated by both a lowpass GRP with rectangular spectrum, and a bandpass GRP of Gaussian spectrum. (Contractor's abstract)

COMMUNICATION IN RANDOM OR UNKNOWN CHANNELS, by C. E. Rushforth. July 1962, 62p. incl. diagrs. refs. (Technical rept. no. 2004-6; rept. no. SEL-62-086) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 283083
Unclassified

The problem of communicating in the presence of random or unknown multiplicative disturbances is dealt with. The main contributions are in the areas of signal selection and the design and evaluation of the associated receiver. It is shown that the optimum signals for a known channel can be the worst possible signals for the unknown or random channel. Physical reasoning leads us to choose the signals (s' s') and (s', -s'), the first is associated with channel measurement, the second with the transmission of information. The optimum receiver for this set of signals when the channel output is white noise is shown to cross-correlate the perturbed reference with the perturbed message. Evaluation of the error probability for the transmitted-reference system for various situations indicates that, for a fixed signal-to noise ratio, the error probability increases as the time-bandwidth product increases. COMMUNICATION PROCESSES IN RANDOM MULTIPATH CHANNELS, by C. E. Rushforth. Apr. 1962 [37]p. incl. diagrs. refs. (Technical rept. no. 2004-5; rept. no. SEL-62-063) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 276688
Unclassified

Some of the problems associated with communications through channels whose exact nature is not known, a priori are considered. Two criteria for evaluating system performance are discussed: the probability of error and the divergence between statistical hypotheses. For a particular case of random multipath channel communication, an expression is obtained for the probability of error as a monotonically decreasing function of the divergence. This expression is shown to be identical to an expression obtained for the case of receiving known signals in the presence of additive noise. The adaptive behavior of a receiver is considered with memory making a sequence of observations. It is shown for a particular case that the optimum receiver evolves from one using estimates of the channel output to the classical matched filter or correlation detector using a known channel output. COUPLING OF MODES BETWEEN A SLOW-WAVE PLASMA MODE AND A HELIX, by S. F. Paik. [1962] [6]p. incl. diagrs. table. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research and [Signal Corps] under [Nonr-22524])
Unclassified

Published in Jour. Appl. Phys., v. 33: 2468-2473, Aug. 1962.

Propagation of waves in a transmission system consisting of a plasma column and a coaxial helix is investigated. The propagating characteristics of the structure are analyzed by a straightforward field analysis. It is demonstrated that the field solution can be reduced to a simple circuit equation describing 2 coupled tuned circuits. This analytical result shows that the propagation of waves in the plasma-helix structure can be described by a purely capacitive coupling of modes between the space-charge modes of plasma column and the helix mode. The result of this study is compared with earlier work by Bulgakov et al. The limitation of the perturbation techniques is discussed and the condition for the validity of the small perturbation assumption is given. The experimental method of separating and measuring the 2 coupled modes of propagation by means of mode-selecting techniques is described. (Contractor's abstract)

A FOUNDATION FOR THE ANALYSIS OF ANALOG-ORIENTED COMBINED COMPUTER SYSTEMS, by D. J. Nelson. Apr. 1962, 171p. incl. diagrs. tables, refs. (Technical rept. no. 1002-1; rept. no. SEL-62-069) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 278507 Unclassified

The theory of errors in analog-type systems is treated, both conceptually and mathematically. The error concepts presented have their roots in matrix theory.

In general, discussion is broken into 2 parts: true error and sensitivity to perturbations. The errors considered are those concerning the solution as a function of time and those concerning the location of the characteristic roots of the piecewise linear system. To properly evolve the concepts, linear systems are considered first with perturbations in parameters and initial conditions. The concepts thus developed are expanded to include nonlinear systems. One chapter is devoted to the mechanics and analysis of deterministic errors in digital differential analyzers (DDA's). The result of this analysis is to resolve the error theory of DDA's to a point equivalent to that of standard analog systems. (Contractor's abstract)

LEARNING TO RECOGNIZE PATTERNS IN A RANDOM ENVIRONMENT, by N. Abramson and D. Braverman. May 1962 [16]p. incl. diagrs. refs. (Technical rept. no. 2003-5; rept. no. SEL-62-071) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 402104 Unclassified

Also published in I. R. E. Trans. on Information Theory, v. IT-8: S8-63, Jan. 1962.

The optimal use of a sequence of prior observations in order to recognize patterns is treated. The class of pattern recognition problems is completely general in that the results may be applied to patterns of a visual, aural or electromagnetic origin. The use of prior observations for pattern recognition may be described as a process of learning the statistical characteristics of the patterns involved. The matnematical description of the learning process is analyzed in order to obtain optimum (i. e., minimum probability of error) solutions to various types of pattern recognition problems. These solutions to the mathematical problem are then interpreted in terms of the systems implementation they imply. The optimum systems are shown to consist of banks of generalized correlators. Under assumption of independent measurements, the optimum systems reduce to a class of systems which function by reinforcing desired responses. (Contractor's abstract)

LINEAR ESTIMATION OF SAMPLED STOCHASTIC PROCESSES WITH RANDOM PARAMETERS, by H. E. Rauch. Apr. 1962, 89p. incl. diagrs. tables, refs. (Technical rept. no. 2108-1; rept. no. SEL-62-058) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 441527 Unclassified

The general solution is derived for the problem of the optimum linear estimation of a sampled stochastic process, when the transition and output matrices of the model of the process are random parameters that are independent from 1 sample point to the next with known mean and covariance. The resulting estimate is optimum in the sense that it minimizes the trace of the covariance matrix of the error (a generalized mean-squared-error criterion). All of these results are derived from the sampled version of the Wiener-Hopf equation, and they apply without modification to stationary and nonstationary statistics and to growing-memory and infinite-memory filters. MEASUREMENTS OF AROUND-THE-WORLD HIGH-FREQUENCY PROPAGATION, by R. B. Fenwick. Jan. 1962, 33p. incl. illus. diagrs. refs. (Technical rept. no. 1004-1; rept. no. SEL-62-011) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) Unclassified

During the period April through October 1961, systematic studies of round-the-world (RTW) signals, with transmitter and receiver at the same location, were made at Stanford, California, using 50-kw, 1-msec pulse transmissions in the 12- to 28-mc range. Information obtained includes average monthly curves of RTW maximum frequency vs time of day, time delay and pulse dispersion as a function of radio frequency, variation of optimum propagation azimuth with time of day, and the degree of degradation of RTW propagation by geomagnetic storms. Predicted curves of average monthly RTW maximum propagating frequency vs time of day were obtained with the aid of National Bureau of Standards world maps, and compared with the measurements. These curves adequately predict certain features of RTW propagation, but provide too low an estimate of the maximum frequency that can propagate at any given time, if ionospheric tilts are neglected. The dominant propagating mode is concluded to be a combination of earth-ionosphere-earth hops on parts of the path, and F2-layer - to - F2-layer hops, made possible by layer tilts, on the remainder of the path. STUDY OF LINEAR FEEDBACK SYSTEMS WITH PERIODIC PARAMETERS THROUGH AN EXTENSION OF THE FLOQUET THEORY, by L. Lee. Dec. 1962, 88p. incl. refs. (Technical rept. no. 2551-1; rept. no. SEL-62-117) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 441208 Unclassified

The basic properties of multi-variable linear feedback systems with periodically varying parameters are investigated. This class of systems is described by linear differential equations with periodic coefficients in the state space. The classical Floquet theory on linear differential equations with continuous, periodic coefficients has been extended to treat linear differential equations with piece-wise continuous, periodic coefficients. The extended Floquet theory is applied to the stability analysis of modulated feedback control systems with continuous and piece-wise continuous carriers. It is shown that analysis and synthesis of many classes of linear feedback systems may be formulated from a unified point of view by using Volterra integral equations of the second kind.

THE THEORETICAL HEIGHTS AND DURATIONS OF ECHOES FROM LARGE METEORS, by L. A. Manning.

[1962] [23]p. incl. diagrs. refs. (Technical rept. no. 1150-1; rept. no. SEL-62-137) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 441211 Unclassified

Also published in Jour. Research Nat'l. Bur. Stand., v. 68: 1067-1078, Oct. 1964.

Mathematical theory of the durations of radio echoes from overdense trails is developed. Included is the dependence of the height distribution of ionization on meteor magnitude, velocity, zenith angle, the form of the attachment law, the height dependence of diffusion coefficient, and an adjustable relation between luminous and ionizing efficiency. It is shown that well defined attachment-free and attachment-controlled duration regions exist with different line-density and wavelength dependences. The transition zone is broad, and its location depends strongly on meteor velocity. Normalized duration and line-density parameters are defined in terms of which a single computer-calculated duration vs density relation good for all parameter values is plotted. Bridging formulas approximating the duration relation are derived from asymptotic expressions, and the relation between echoing height and duration or line density is presented. Equations are given relating the exponent of the wavelength to echo duration. (Contractor's abstract)

A TWO-DIMENSIONAL STUDY OF HIGH-SPEED, HIGH-CURRENT SWITCHING TRANSISTORS, by E. R. Lewis. Feb. 1962 [110]p. incl. diagrs. tables, refs. (Technical rept. no. 1754-1; rept. no. SEL-62-020) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Signal Corps under Nonr-22524) AD 274270 Unclassified

A study was made of high-speed, high-current switching transistors, which are used in computing systems. It was known that the operation of transistors at very high current levels is greatly affected by emission crowding. The base current causes a voltage drop along the junction and tends to crowd emission toward the edges of the emitter nearest the external base contact. This effect is included in a fairly complete 2-dimensional dc model of a double-diffused, germanium mesa switching transistor. Having been accredited experimentally, the model was applied to some problems in relating device performance to device geometry. Two interesting results accrue. First, the results show no optimum value of base width - the base should just be as narrow as possible. The second result was a normalized curve from which an optimum value of emitter stripe width may be obtained. Finally, a 2-dimensional switching phenomenon is described. It is shown that emission crowding can be considerably enhanced during the turn-on process. Also described is a multitetrode transistor analogue in which enhanced crowding can be actually observed. THE EFFECTS OF ELECTRIC FIELDS ON THE FLOW OF LIQUID HELIUM, by W. J. Neidhardt and J. Fajans. May 1962, 135p. incl. diagrs. tables, refs. (Research rept. no. SIT-P65(5/62) (AFOSR-2588) (AF 49(638)-352) AD 608395 Unclassified

An investigation was made of the effect of electric fields on the flow of liquid helium in a narrow channel superleak whose exit was maintained at a pressure far below the vapor pressure of the liquid. Liquid helium evaporation in the channel and the resulting liquid-gas interface caused an electric pressure gradient. It was found that electric fields of magnitude 3×10^6 v/cm did not destroy the superfluidity exhibited in the channel. The effect of the applied electric field was to increase flow above and below λ point. Below the λ point, both the normal and the superfluid flows were increased by the applied field. At very high applied field the flow attained a limiting value which was a function of temperature. (Contractor's abstract, in part)

ELECTROHYDRODYNAMICS OF SUPERFLUID HELIUM IN NARROW CHANNELS, by W. J. Neidhardt and J. Fajans. [1962] [33]p. incl. diagrs. refs. (AFOSR-2755) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)352] and National Aeronautics and Space Administration) AD 405798 Unclassified

Also published in Phys. Rev., v. 128: 495-502, Oct. 15, 1962.

The flow of superfluid helium from a liquid reservoir to a vacuum through a 10^{-5} cm channel, which was enhanced tenfold by an electric field of 3×10^6 v/cm when a phase boundary occurred within the channel, was unaffected when the boundary moved past the channel and field. Superfluid flow at subcritical velocity given by $\Gamma - \Gamma_0 = f(T)V^2$, when increased to critical flow under the influence of electrostrictive pressures was given by $\Gamma = [\rho_n/\rho][\eta(T_\lambda)/\eta(T)]K_n + [\rho_s/\rho]K_s$, with Γ and Γ_0 the flow with and without applied electric field, V the applied voltage, T the temperature, ρ_n and ρ_s the normal and superfluid densities, ρ the total density, η the viscosity, and K_n and K_s flows obtained from normalization of data. A coincidence was noted between a maximum at 2.06°K in the relative flow and an already reported maximum at 2.10°K in thermal boundary conduction. Any shift in the λ point induced by a macroscopic field of 1.5×10^6 v/cm was less than 0.02°K, but displacements as great as 0.5°K were induced by use of very fine channels.

[THEORETICAL RESEARCH IN THE STATISTICAL MECHANICS OF PHYSICS PROCESSES]. Final rept. June 1, 1958-May 31, 1962, 5p. (Rept. no. SIT-P69(7/62)) (AFOSR-2957) (AF 49(638)352) AD 285877 Unclassified

This research was concerned with experimental aspects of low temperature physics, i.e., focusing of phonons in superfluid helium and electrohydrodynamics of superfluid flow in narrow channels. It was proposed that the characteristic phonon emission spectrum of various crystals be measured and that the relative influence of the 2 helium isotopes on the "black body" phonon spectrum be determined. A cryostat for producing temperatures to 0.4°K and apparatus for focusing and detection of phonons was constructed.

HALL CURRENTS AND VORTICES IN THE COAXIAL PLASMA ACCELERATOR, by W. H Bostick. [1962] [6]p. incl. diagrs. (AFOSR-64-0280) (Sponsored jointly by [Air Force Cambridge Research Center] Air Force Office of Scientific Research under AF AFOSR-62-225, and [Atomic Energy Commission]) AD 431080 Unclassified

Also published in Phys. Fluids, v. 6: 1598-1603, Nov. 1963.

The fact that the current sheet in a coaxial plasma accelerator is planar with the center conductor negative, and bullet-shaped when the center conductor is positive can be at least partially explained by a combination of Hall currents and plasma vortices, both of which should be expected to occur in such an accelerator. This explanation asserts that the peculiar asymmetrical behavior of this accelerator is a consequence of the fundamental property of ordinary-matter plasma: that electrons are light and positive ions are heavy. The sign of the asymmetry would be changed if antimatter plasma were employed. It is doubtful whether a planar current sheet could be achieved with a positronium plasma. (Contractor's abstract)

PLASMA VORTICES (Abstract), by W. H. Bostick. [1962] [1]p. (Sponsored jointly by Air Force Cambridge Research Labs., Air Force Office of Scientific Research under [AF AFOSR-62-225] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 176-177, Feb. 28, 1963.

Plasma vortices are observed to be produced by shear in velocity across a magnetic field. Electric-field measurements in a turbulent plasma in a magnetic field indicate that the turbulence is made up of many vortices. Double-probe measurements of ion density show that the plasma density is high within the vortex, and low outside the vortex. An analysis of the plasma coaxial accelerator shows that vortices are expected to be produced in the accelerated plasma and that Hall currents account for the planar-current sheet when the center conductor is negative. An analysis of the θ pinch indicates that Hall currents in conjunction with shear in acceleration should produce a right-handed vortex ring at one end of the coil and a left-handed one at the other. For example, the right handedness is to be expected in all 3 forms: $\nu_\theta \sim \nu_{poloidal}$, $B_\theta \sim B_{poloidal}$, $\nu_\theta \sim \nu_{translational}$. The plasma remaining within the coil is expected to have an angular momentum opposite the ν_θ of the rings emanating from the ends of the coil.

ANNIHILATION OF 1.3 GEV ANTIPROTONS IN COMPLEX NUCLEI, by B. E. Ronne, P. J. Carlson, and O. Danielsson. [1962] [25]p. incl. diagrs. tables, refs. (AFOSR-3128) (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-62-15] and Swedish Atomic Research Council) Unclassified

Also published in Arkiv Fysik, v. 22: 193-217, 1962.

An investigation of 537 interaction stars in nuclear emulsions, of which 215^{+65}_{-35} are due to 2 gev/c antiprotons and the rest to negative pions, is reported. The antiproton mean free path of annihilation is found to be 26 ± 5 cm. Experimental results concerning antiproton stars are obtained from measurements on the available sample of stars by subtracting the known pion contribution from the measured quantities. The average number of charged pions outside the nucleus for antiproton stars is $2.64^{+0.25}_{-0.32}$ and the average total energy per pion 430 ± 50 mev. The mean number of emitted protons is 7.55 ± 0.70 and the mean energy per star that these carry away is 415 ± 50 mev. The average pion multiplicity in the annihilation process is found to be $5.0^{+0.5}_{-0.6}$.

In carrying out the calculation of this value, detailed study of secondary interactions of primary pions in the nucleus where the annihilation occurred was necessary. It was found that 30% of the primary pions leave the nucleus without interaction, 28% are absorbed, 30% leave the nucleus after one or more elastic and/or charge-exchange scatterings, and 12% give rise to production of new pions through inelastic scattering. No antisigma hyperons were definitely established in spite of a careful search for such particles. (Contractor's abstract)

INTERACTION OF 2 GEV NEGATIVE π-MESONS WITH EMULSION NUCLEI, by B. E. Ronne and O. Danielsson, [1962] [17]p. incl. diagrs. tables, refs. (AFOSR-3129) (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-62-15] and Swedish Atomic Research Council) AD 613754 Unclassified

Also published in Arkiv Fysik, v. 22: 175-191, 1962.

An investigation of 281 interactions of 2 gev/c negative pions with emulsion nuclei is reported. The fraction of stars with charged secondary pions is $75 \pm 3\%$ and the mean number per star of emitted charged pions is 1.21 ± 0.08. Only 2 K-mesons have been observed, which confirms other results that the production cross section of strange particles is low. Results have been compared with the predictions from a cascade calculation by Metropolis et al which starts from the known elementary pion-nucleon and nucleon-nucleon cross sections. The agreement between their calculated data and the experimental results of this study is good as far as the multiplicity, energy spectrum and angular distribution of emitted pions and also the energy spectrum of knock-on protons are concerned. A COMPARISON OF THE METHOD OF RATIO ESTIMATION AND THE METHOD OF MAGNITUDE ESTIMATION, by M. Mashhour. Jan. 30, 1962, 14p. incl. diagrs. tables, refs. (Technical scientific note no. 8) (AFOSR-2744) (AF 61(052)300) AD 281220 Unclassified

The main features of both methods are briefly reviewed. A modified method of ratio estimation in which the subject is left free to report his impressions in terms of arbitrary pairs of numbers is discussed. The results of a series of experiments on velocity perception with ratio and magnitude estimation are compared, and some of the advantages and disadvantages of both methods are enumerated. It is indicated that the method of magnitude estimation is a special case of the method of ratio estimation, although they can, under special experimental conditions, be equivalent. (Contractor's abstract).

A SUBJECTIVE SCALE AND THE THRESHOLD OF VELOCITY, by M. Mashhour. Jan. 30, 1962, 10p. incl. diagrs. tables. (Technical scientific note no. 9) (AFOSR-2830) (AF 61(052)300) AD 281249 Unclassified

By the method of ratio production, a subjective scale of velocity is established. The psychophysical relation of velocity can be described by a power function which is slightly positively accelerated. Under the same experimental conditions but with a different group of subjects the absolute limen of velocity is determined as 1.57 min of visual angle per sec. It is argued on the basis of the experimental findings that the "threshold" constant found, usually by curve-fitting procedures, is either a sign of a shift in the function or a result of the sampling fluctuation of the observed line around the true regression line. MEROMORPHIC FUNCTIONS WITH VALUES THAT ARE BOTH DEFICIENT AND ASYMPTOTIC, by A. Edrei. [1962] [11]p. (AFOSR-J327) (AF 49(638)571) Unclassified

Also published in Studies in Mathematical Analysis and Related Topics, ed. by G. Szegö, C. Loewner and others. Stanford, Calif., Stanford U. Press, 1962, p. 93-103.

Let f(z) be a meromorphic function in the z-plane. The paper is concerned with the conjecture of Nevanlinna that every deficient value of f(z) is also an asymptotic value. The author investigates conditions under which the conjecture may hold. To that end, new concepts like B-regular path, opening of a curvilinear sector and lens are used. The conditions turn out in terms of restrictions on the localization of zeros and poles of f(z) on suitable B-regular paths. Then it is shown that all deficient values of f(z), other than 0 and ∞, are necessarily asymptotic values. (Math. Rev. abstract, modified)

THEORY OF APPROXIMATION, by G. G. Lorentz. Final rept. June 1, 1961-May 31, 1962. June 20, 1962 [3]p. (AFOSR-2896) (AF 49(638)-810) AD 289421 Unclassified

The work completed under this contract considers several aspects of approximation theory. The possibility of uniform approximation of all continuous positive functions f(x) on a compact set A by polynomials with positive coefficients in several given functions $g_1, g_2, \ldots$ is considered. The finer question of the degree of approximation has been solved for the simplest case when A = [0, 1] and there are 2 functions, $g_1 = x$, $g_2 = 1-x$.

Roughly speaking, the error of approximation is the square root of the error obtained by unrestricted polynomials. It has also been shown that the entropy of the set of functions satisfying a Lipschitz condition of order and in addition of uniformly bounded variation, class $\mathrm{Lip}\alpha \cap V$, is $\frac{1}{\epsilon} \log \frac{1}{\epsilon}$. The entropies of sets of functions in the Hausdorff metric are also discussed and it is shown that Kolmogorov's estimates for the classes $\mathrm{Lip}\alpha$ hold not only in the uniform, but also in the L^1-metric. The determination of the widths of the sets $\mathrm{Lip}\alpha \cap V$ are still under consideration. Also under study is the problem of showing that for such classes as $\mathrm{Lip}\alpha$, etc., well approximated by arbitrary linear means can be only a small portion, in the sense of entropy.

ENTROPIES OF SETS OF FUNCTIONS OF BOUNDED VARIATION, by G. F. Clements. [1962] [11]p. (AFOSR-J1027) (AF 49(638)619) AD 419710 Unclassified

Also published in Canad. Jour. Math., v. 15: 422-432, 1963.

The author, using the results of K-7 is concerned with further calculations of H_ϵ and C_ϵ where the A are sets of functions of f(x) with the additional restriction of bounded variation. Denote $f(\epsilon) < g(\epsilon)$ for $f(\epsilon) = O(g(\epsilon))$ and $f(\epsilon) \approx g(\epsilon)$ if both $f(\epsilon) < g(\epsilon)$ and $g(\epsilon) < f(\epsilon)$. The following is proved: (1) Let V_σ be a set of uniformly bounded functions on [0, 1], satisfying a Lipschitz condition of order σ $(0 < \sigma < 1)$ and with total variation not exceeding some constant $B > 0$; then for $A = V_\sigma$, $H_\epsilon \approx C_\epsilon \approx (1/\epsilon) \log (1/\epsilon)$. (2) Let X_n be a cube in the Euclidean n-space with the usual metric ρ and let X_n^* be the set of all non-void closed subsets of X_n with the Hausdorff metric σ derived from ρ; then $H_\epsilon \approx C_\epsilon \approx (1/\epsilon)^n$ for this X_n^*. The calculation of H_ϵ and C_ϵ for the sets ${}_cX_n^*$, ${}_LX_n^*$ and M_L consisting of certain continuous parametric curves C contained in X_n, where $M_L \subset {}_LX_n^*$ and the curves $C \in {}_LX_n^*$ are of length not exceeding L is also investigated. Finally, H_ϵ and C_ϵ are estimated to be $\approx (1/\epsilon) \log (1/\epsilon)$ for the set Q_B of functions f defined on [0, 1] for which f(x+), f(x-) exist and $|f(x)| \leq B$, and in which the metric $\sigma(f, g)$ is defined by Hausdorff metric σ (G_f, G_g) between the generalized graphs G_f (of f) and G_g (of g). DIRECT TEST FOR THE STRONG EQUIVALENCE PRINCIPLE, by T. A. Morgan and A. Peres. [1962] [2]p. (AFOSR-3871) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)461 and National Science Foundation) Unclassified

Also published in Phys. Rev. Ltrs., v. 9: 79-80, July 15, 1962.

Following unpublished work of Dicke, the authors distinguish (a) the weak equivalence principle: in a freely falling, nonrotating laboratory, all free particles move with constant velocities, (b) the strong equivalence principle: all the laws of physics are the same in that laboratory, independent of its position in space and time, inhomogeneities of the gravitational field being neglected. They accept the view that experiments of the Eötvös type support only (a), and that (b) is justified only by indirect arguments. As a direct test of (b) they propose an Eötvös experiment with oriented nuclei.

ASYMPTOTIC PROPERTIES OF GRAVITATING SYSTEMS (Abstract), by P. G. Bergmann, L. Robinson, and E. Schücking. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)-461], National Science Foundation and Wright Air Development Division) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 32, Jan. 24, 1962.

If the gravitational field of a physical system tends to zero at large spatial distances, the metric is usually said to be "asymptotically flat". A more detailed analysis leads to these results: (a) In the absence of gravitational radiation the affine connection is asymptotically integrable, i.e., one can speak of "the same vector" at spatial infinity in different directions, but it is impossible to cover the far away regions of space-time with a properly meshing Cartesian coordinate grid. (b) In the presence of gravitational radiation the affine connection is not asymptotically integrable; even at spatial infinity an attempt to transfer, e.g., the direction of the time axis from 1 orientation in space to another by parallel transport will lead to a result that depends on the chosen route.

PERTURBATION THEORY FOR THE INTERACTING BOSE SYSTEM (Abstract), by A. Miller. [1962] [1]p. [AF 49(638)461] Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 530, Nov. 23, 1962.

The Hamiltonian for a Bose system of density n is written $H_0 + H'$, where H_0 provides a field for particle motion without change of momentum, and H' scatters particles from plane-wave states. For sufficiently repulsive forces, the energy spectrum of H_0 contains a gap of magnitude nV_0, where V_k is the Fourier transform of the 2-particle interaction. This gap removes the 3rd-order divergence in the Rayleigh-Schrödinger perturbation series. Expressions for the ground-state energy are obtained in terms of V_k for the 2nd through 4th order. The 2nd-order result reproduces the energy shift found by various authors. For nonzero temperature, the partition function and chemical potential are expanded in a power series in V_k, using H_0 as the Hamiltonian. Similar expansions for the expectation value of the energy and the density-correlation function yield expressions for the specific heat and the excitation spectrum, to 1st order in V_k.

IMPURITY STATES ASSOCIATED WITH SUBSIDIARY ENERGY-BAND MINIMA, by H. Kaplan. Dec. 1962, 17p. incl. diagr (AFOSR-64-1244) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)642 and National Aeronautics and Space Administration) AD 402925 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 24: 1593-1599, Dec. 1963.

Two results have been established concerning the existence of localized electronic states associated with a point impurity in a substance having a spherical energy band, $E(k) = \epsilon_0 + \epsilon_1 \times \cos k + \epsilon_2 \cos 2K)$, where $k = k$ with a subsidiary minimum at $k = 0$. The 1st result is a generalization of Slater and Koster's result, that in 1 dimension an energy band with a subsidiary minimum has no localized states associated with this minimum if the impurity potential is of the delta-function type; i.e., it has only 1 matrix element between Wannier functions, a diagonal 1 referring to 1 site. This result also holds for a spherical band in 3 dimensions. The 2nd result is that, for the Coulomb-impurity potential screened by the static dielectric constant, and the above spherical band, there are hydrogen-like localized states built out of states near the subsidiary minimum, even when all powers of k in E(k) are taken into account in the equation for the envelope function. The deviation of the impurity potential from slow variation causes a long lifetime for decay of the localized state into conduction states of the same energy. For a typical shallow impurity state, the lifetime is approximately equal to 10^{-8} to 10^{-9} sec. (Contractor's abstract)

LATTICE VIBRATIONS OF ZINCBLENDE STRUCTURE CRYSTALS, by H. Kaplan and J. J. Sullivan. [1962] [10]p. incl. diagrs. tables, refs. [AF 49(638)642] Unclassified

Published in Phys. Rev., v. 130: 120-129, Apr. 1, 1963.

In this article expressions are presented based on the shell model of lattice dynamics, for all important long-wavelength properties of the lattice vibration spectrum of a zincblende structure crystal, and for the vibration frequencies having wave vectors at the Brillouin zone boundary in the [100] direction. General first and second neighbor short-range force constants are used. The formulas are presented in the distortion dipole form of Mashkevich and Tolpygo, which uses 1 constant, α to describe the electronic polarizability of each atom, rather than the 2 redundant constants Y and k, the shell charge and polarization spring, respectively, used in the shell model. Some of the force constants in the expressions are evaluated for GaAs, InSb, AlSb, and ZnS with the aid of available experimental data. The authors were unable to fit all of the data for any substance with only first neighbor force constants. When small, realistic values of second neighbor constants were used, a multitude of fits resulted. The absence of a criterion determining the "best" fit results in a spread of possible ionic charge values of about 1 electronic charge for the 3-5 compounds, and an inability to decide whether ZnS is very ionic or rather covalent. Results point up the necessity of calculations of atomic force constants from fundamental quantum mechanics.

FORMULATION OF THE SCATTERING FUNCTIONS IN TERMS OF THE UNITARY REPRESENTATIONS OF THE INHOMOGENEOUS LORENTZ GROUP, by A. O. Barut. [1962] [3]p. (AFOSR-2073) (In cooperation with California U., Lawrence Radiation Lab., Berkeley) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)801 and Atomic Energy Commission) Unclassified

Also published in Phys. Rev., v. 127: 321-323, July 1, 1962.

A group-theoretical basis of the axiomatic S-matrix theory is presented. The unitarity condition is taken as the scalar product of the scattering functions which then are shown to transform according to the unitary representations of the inhomogeneous Lorentz group. The general transformation property of the invariant scattering functions is given which allows one, in principle, to write down these functions for arbitrary processes. (Contractor's abstract)

VIRTUAL PARTICLES, by A. O. Barut. [1962] [3]p. incl. diagrs. (AFOSR-2074) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)801 and Atomic Energy Commission) Unclassified

Also published in Phys. Rev., v. 126: 1873-1875, June 1, 1962.

Particles or resonances which do not correspond to the usual Breit-Wigner type poles in the partial wave amplitudes are defined. They are described in terms of the trajectory of the poles of the S matrix in the complex angular-momentum plane as a function of energy, when this trajectory does not quite reach a physical value of J. Range and scattering parameters are used to determine the trajectories near the threshold, which in turn are related to high-energy cross sections for processes in which these particles are exchanged in the cross channels. The trajectories for the 2 definitely known examples, namely the I = 0, π-π, S-wave virtual state, and the single n-p S-wave virtual state, as well as the triplet n-p trajectory, are determined. ACTION PRINCIPLE FOR HIGHER ORDER LAGRANGIANS WITH AN INDEFINITE METRIC, by A. O. Barut and G. H. Mullen. Jan. 1962 [30]p. incl. refs. (AFOSR-2318) (AF 49(638)801) Unclassified

Also published in Ann. Phys., v. 20: 203-218, Nov. 1962.

A consistent action principle with an indefinite metric and a Lagrangian of any finite order requires that the Lagrangian be invariant under an operation called metric conjugation. This in turn implies that (1) an observable must commute with the metric operator, (2) the S-matrix must be unitary, and (3) transitions between states of opposite metric parity are forbidden. For higher order Lagrangians the energy is still the 00-component of the energy-momentum tensor $T^{\mu\nu}$. It was necessary to split the derivatives of the field variables into normal and tangential components so that canonical conjugate variables could be defined. (Contractor's abstract)

QUANTIZATION OF TWO-COMPONENT HIGHER ORDER SPINOR EQUATIONS, by A. O. Barut and G. H. Mullen. Jan. 1962 [36]p. incl. Diagr. refs. (AFOSR-2319) (AF 49(638)801) Unclassified

Also published in Ann. Phys., v. 20: 184-202, Nov. 1962.

A 2-component fermion field is quantized using a Lagrangian formalism containing higher order derivatives of the field variables and an indefinite metric in Hilbert space. A consistent quantization necessitates beside a massive spin one-half field, obeying the Feynmann-Gell-Mann equation, the introduction of a massless spin one-half field, obeying the neutrino equation. Gauge invariant electromagnetic and vector interactions are introduced in a manner which depends on the transformation properties of the field variables. The physical restrictions placed on the S-matrix by the use of an indefinite metric eliminates the massless field from the composite field for electrodynamics and pseudo-vector mesons interactions and implies parity invariance but not for 4-field weak interactions. The results obtained for quantum electrodynamics are equivalent to the usual 4-component theory. (Contractor's abstract)

K-N SCATTERING IN THE MANDELSTAM REPRESENTATION. I. ANALYTICITY OF THE AMPLITUDE AND THE EFFECT OF BARYON POLE ON $K^- + p \to \Sigma + \pi$ REACTION, by S. Iwao. [1962] [22]p. incl. diagr. tabs, refs. (AFOSR-4404) (AF 49(638)801) AD 295948 Unclassified

Also published in Nuovo Cimento, Series X, v. 25: 973-994, Sept. 1, 1962.

Analytic properties of the partial wave amplitude for the $K^- + p \to \Sigma + \pi$ reaction are investigated in the total energy space by making use of the Mandelstam representation. The unitarity condition requires the study of the pion-hyperon as well as the kaon-nucleon scattering The latter interaction will not be important for the long-range part of the interaction, so we neglected the effect of it in this paper. The long-range part of the interaction due to the single-baryon exchange can explain the observed low-energy pion-hyperon resonances. The low-frequency of the Σ-hyperon in the I = 1, p 3/2 resonance is interpreted by an accidental cancellation of the long-range potential, and hence the universality of the strong pion-baryon interaction still holds for the ΣΣπ interaction. The I = 0 and I = 2, p 3/2 resonances can be interpreted by the attractive long-range interaction in the pion-hyperon scattering. (Contractor's abstract)

PARAMAGNETIC RELAXATION IN SMALL PARTICLES, by A. Honig. [1962] [4]p. incl. diagr. (AFOSR-64-0414) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)966] and National Science Foundation) AD 435663 Unclassified

Also published in Paramagnetic Resonance; Proc. of the First Internat'l. Conf., Jerusalem (Israel) (July 16-20, 1962), New York, Academic Press, v. 2: 439-442, 1963.

It is known that the lowest phonon mode frequency which can exist in a crystal is given by $\nu = v_s/2L$, where L is the largest dimension of the crystal and v_s is the speed of sound in the crystal. At sufficiently low temperatures, single phonon processes dominate the relaxation, since the temperature dependence of Raman processes is at least T^7 while that of single phonon processes is approx T. For single phonon spin flip processes, it is clear that if $L < h\nu_s/2g\mu_B H$, the relaxation cannot occur. In the case of n-type silicon, taking v_s as approx 10^6 cm/sec yields a cut-off to the single phonon spin-lattice relaxation at 300 gauss for 5 μ particles. Such particles have been prepared and results on silicon are discussed. Donors in silicon are a particularly favorable paramagnetic system since it has already been established that at 1°K, single phonon processes dominate and because the relaxation times are long enough to permit use of field cycling techniques for measuring relaxation at the low magnetic fields. Information can be obtained on phonon coupling of the particles through various media with this type of experiment. (Contractor's abstract)

MAKING SMALL IRON SPHERES BY MELTING IRON POWDER, by R. Stover and J. W. Trischka. [1962] [1]p. (AFOSR-3404) (AF AFOSR-60-23) AD [illegible] Unclassified

Also published in Rev. Scient. Instr., v. 33: 694, June 1962.

The spheres were made by placing a mixture of 100 mesh Fe powder and powdered Al_2O_3 (ignited powder) in a hole bored in a graphite rod. An induction furnace, through which H_2 gas flowed, was used to obtain the required temperature. Not all, but most spheres were free from surface imperfections, which could be detected with a microscope if they were 0.2% of the diam. Microscope measurement of sphere diam showed no variations within the accuracy of the measurements, about 1%. The above method is, of course, useful only if a small number of spheres of a certain approx size are needed. The spheres which were made had diam mostly in the range from 0.0025 to 0.0045 in.

CLASSICAL RADIATION RECOIL, by A. Peres. [1962] [5]p. incl. refs. (AFOSR-J162) (AF AFOSR-62-36) AD 400066 Unclassified

Also published in Phys. Rev., v. 128: 2471-2475, Dec. 1, 1962.

The conditions under which a material system may recoil while emitting electromagnetic or gravitational radiation are investigated. The lowest order secular effects in the electromagnetic case arise from an interference of the electric dipole radiation with the electric quadrupole or magnetic dipole radiations. In the gravitational case, the lowest order terms involve the

interference of the mass quadrupole radiation with the mass octopole or the flow quadrupole radiations. The investigation of the gravitational radiation recoil is carried out in complete analogy with the more elementary electromagnetic case, so that this paper should be accessible to physicists having no previous knowledge of general relativity theory.

GRAVITATIONAL NEWS, by T. A. Morgan and A. Peres. [1962] [3]p. incl. refs. (AFOSR-J625) (AF AFOSR-62-36) AD 414142 Unclassified

Also published in Nuovo Cimento, Series X, v. 27: 1266-1268, Mar. 1, 1962.

The "news function" of a material system emitting gravitational waves is shown to depend, at large distance from the source, essentially on the second (retarded) time derivatives of the mass quadrupole, $Q^{ab} = \int T^{00} (X^a X^b - 1/3\ \delta^{ab} X^c X_c)\ d^3X$ (T^{00} = gravitational energy), and the total rate of loss of mass by gravitational radiation is given by $m = -1/5\ \ddot{Q}^{ab}\ddot{Q}_{ab}$. Observation of gravitational radiation would therefore provide information about the mass quadrupole components.

SPURIOUS NATURE OF ULTRAVIOLET DIVERGENCES, by A. Peres. [1962] [12]p. incl. refs. (AFOSR-J744) (AF AFOSR-62-36) AD 413368 Unclassified

Also published in Nuovo Cimento, Series X, v. 28: 78-89, Apr. 1, 1963.

It is possible to remove ultraviolet divergences from Feynmann diagrams by first differentiating them with respect to their external momenta, then integrating with respect to the internal momenta, and finally integrating back with respect to the external momenta. The last (indefinite) integrals involve arbitrary integration constants, which have to be fixed by further prescriptions, e.g. by requiring that there should be neither mass nor charge renormalization. The whole procedure is consistent with the requirements of covariance, unitarity, and causality, so that the ultraviolet divergences should be considered as entirely spurious. The results obtained by the present method are identical to those of renormalized quantum field theory, whenever renormalization is possible, but are reached here with less computational labor. The present method displays very clearly the arbitrariness involved at each stage of the perturbation procedure, which is quite parallel to the semi-phenomenological approach of dispersion theory. DECAY PROPERTIES OF NEGATIVE KAONS (Abstract), by S. Lichtman, W. Becker and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)588], Atomic Energy Commission, National Science Foundation, and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 296, Apr. 23, 1962.

Using the helium bubble chamber as detector, a study was made of the decay properties of negative kaons, obtained from a Berkeley beam of momentum 335 mev/c. Employing selection criteria which insured long-decay secondaries without bias, the effective sample contained 422 events. These were identified by means of a kinematic-fit procedure. Correction for bias, misidentification, and contamination were small, amounting to less than 2% of the sample. The correct percent branching fractions are $K_{\mu 2}^-$ (57.0 ± 3.5), $K_{\pi 2}^-$ (25.5 ± 3.5), $K_{3\pi}^0$ and π^0 + lepton (11.8 ± 2.0), K_τ^- (5.7 ± 0.5), where the errors represent systematic as well as statistical uncertainties. These results are in good agreement with the emulsion K^- decay experiments, which are also analyzed by kinematic fitting. On the other hand, the above results for $K_{\mu 2}$, $K_{\pi 2}$ are in 2 standard deviation disagreement with those measured by means of direct observation of π^0 γ-rays (in Xe) recently reported by Roe et al. The lifetime of the K^- is now being measured: a ± 6% result is reported.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 348, Apr. 23, 1962.

A 3-standard-deviation result indicative of a positive helicity for the A-decay proton was reported in Phys. Rev. Ltrs., v. 7: 264-268, Sept. 15, 1961 (see item no. 1242, Vol. V). This study has been continued so as to double the data effectively. These data were obtained in an exposure of the helium bubble chamber to a Berkeley low-energy K^- beam. The A-decay proton polarization was directly measured by means of subsequent proton-helium scattering. Until the time of writing, selection criteria yielded a sample of 169 events with average transverse proton polarization of 80% and an observed average analyzing polarization of ~ 40%. A maximum likelihood analysis gives α_A = -0.67 (+0.36, -0.29) for the A-decay asymmetry parameter. This confirms our previous determination and is in agreement with other recent results. More-extensive results are reported.

DATA-PROCESSING REQUIREMENTS OF VELA UNIFORM, TASKS I, III, IV, by C. G. Fain and B. A. Francis. Final rept. May 15, 1962. 40p. incl. diagrs. table. (Rept. no. TO-B 62-28) (AFOSR-2592) (Sponsored jointly by Advanced Research Projects Agency and Air Force Office of Scientific Research under AF 49(638)-1108) AD 284633 Unclassified

This is the final report of a 6-month study of the data-handling and data-processing problems associated with Tasks I, III, and IV of VELA UNIFORM, a program for the design of a world-wide detection system for underground explosions. An earlier report on Task I, the World-Wide Standard Seismological Network, is summarized and specifications are given for a microfilm storage and reproduction system for seismograms. The 4 basic functions of Task III, Systems Development, and Task IV, Nuclear and Chemical Research Explosions, are defined, and the implementation of these functions and the various agencies responsible are discussed. Details are given on the type and form of data being recorded under Tasks III and IV, the daily volume of data expected in fiscal years 1963 and 1964, the data processing to be performed at various locations, and the flow of data to the Data Analysis and Technique Development Center (DATDC). It is recommended that only essential data be kept permanently at the DATDC so that magnetic tapes may be erased and re-used to save storage space and money. The responsibilities of the DATDC and the functions and data-processing facilities required by it are described. A coordination function is suggested to increase the crossflow of information among VELA UNIFORM contractors. The computer programs and programming aids required at the DATDC, together with the digital and analog computer systems selected, are discussed. Maximum use of the FORTRAN programming system is recommended, and an expansion in scope of the present computer program collection and distribution activity at the DATDC is proposed. TIME DEVELOPMENT OF THE BEAM FROM THE RUBY LASER (Abstract), by R. L. Martin. [1961] [1]p. (AFOSR-66) [AF 49(638)673] Unclassified

Presented at Spring meeting of the Opt. Soc. Amer., Pittsburgh, Pa., Mar. 2-4, 1961.

Also published in Jour. Opt. Soc. Amer., v. 51: 477, Apr. 1961.

High-speed streak moving pictures of the beam from the ruby laser are discussed. The pictures were taken with a film speed of about 300 ft sec and a variety of focusing conditions. The relaxation oscillations during the excitation pulse are clearly visible as well as variations in the laser characteristics as a function of time. An analysis of these characteristics are given.

OPTICAL PUMPING OF CESIUM VAPOR (Abstract), by S. Jacobs, P. Rabinowitz, and G. Gould. [1961] [1]p. (AFOSR-68) [AF 49(638)672] Unclassified

Presented at Spring meeting of the Opt. Soc. Amer., Pittsburgh, Pa., Mar. 2-4, 1961.

Also published in Jour. Opt. Soc. Amer., v. 51: 477, Apr. 1961.

The 8^2P states of cesium gas were excited by absorption of 3888-A radiation emitted from a helium discharge lamp. The populations of various states were computed from measured flourescent intensities and compared with the populations expected from the measured lamp intensity. The coherent gain coefficient due to induced emission at 3 μ and 7 μ was found to be sufficient to establish oscillation in a Fabry-Perot-type cavity.

FLUORESCENCE OF THE Cr^{+++} PAIR SPECTRUM IN SYNTHETIC RUBY (Abstract), by R. T. Daly. [1961] [1]p. (AFOSR-69) [AF 49(638)673] Unclassified

Presented at Spring meeting of the Opt. Soc. Amer., Pittsburgh, Pa., Mar. 2-4, 1961.

Also published in Jour. Opt. Soc. Amer., v. 51: 473, Apr. 1961.

The excitation spectrum of the strong ruby satellite lines at 7008 A and 7040 A have been explored at 77° and 2°K. The low-lying and excited levels of these lines appear to arise from 2 nonequivalent cation pairs in the corundum lattice. A recent determination of these levels

is presented. Results of experiments to produce stimulated emission in a 3-level optical maser using these levels are given.

RESEARCH ON PROPERTIES OF LASER DEVICES. by R. Daly, G. Grosof and others. Jan. 19, 1962. 170p. incl. illus. diagrs. tables. (Rept. no. TRG-134-TR-6) (AFOSR-2043) (AF 49(638)673) AD 608954 Unclassified

LASER amplification corresponding to a gain of 6% per meter was measured at 3μ in cesium vapo. optically pumped with light from a helium discharge lamp. Amplification and oscillation at 1 u were measured in a helium-neon system based on collisions of the second kind. The amplification parameters, when optimized resulted in a fain of 9% per meter. Krypton-xenon and zinc vapor are other media utilizing collisions of the second kind which were investigated. Crystals of calcium tungstate containing either Dy(3+) or Nd(3+) were grown. LASER oscillation was observed from 2 crystals of $CaWO_4$:Nd. Direct amplification of the output of a ruby oscillator in a second ruby rod was demonstrated. Three methods of achieving single pulse output from ruby oscillators are described. A pulse of 2,000,000 watts peak power was achieved by one method. A broadband emission was discovered in normally pink ruby (.04% Cr by weight). It accounts for 30% of the total emission, making the quantum efficiency unity. A theoretical analysis of the properties for cube corner interferometers has been experimentally verified. (Contractor's abstract)

RESEARCH ON PROPERTIES OF LASER DEVICES, VOLUME I, ed. by M. C. Newstein and S. A. Rothberg. July 2, 1962 [181]p. incl. illus. diagrs. tables, refs. (Rept. no. TRG-134-TR-7) (AFOSR-2778, v. 1) (AF 49(638)673) AD 278053 Unclassified

Three major analytical tasks were performed. These consisted of the analysis of the modes of a resonator with a pin-hole suppressor, of amplifier performance, and of pulse oscillator performance. A cesium gas LASER, optically pumped by a helium discharge has been made to oscillate at a wavelength of 7.18μ. High gain He-Ne discharge LASERs were constructed and used in the investigation of tunable LASERs and the study of oscillators terminated by prism reflectors. Preliminary experimental verification was obtained for a theory of the normal pulse output from the ruby LASER. A spinning prism Q-switch was used to induce very high peak power pulses from rods of ruby (greater than 10 megawatts) and Nd doped glass (greater than 1 megawatts). The results appear to be within 50% of optimum as predicted by the theory developed under analytical tasks. (Contractor's abstract)

OPTICAL RANGE FINDER APPLICATION OF THE LASER (Abstract), by L. Goldmuntz. [1961] [1]p. [AF 49(638)673] Unclassified

Published in Proc. Nat'l. Electronics Conf., v. 17, 156, Oct. 1961.

The extraordinary spectral purity and narrow beam width of coherent optical radiation leads to some immediate applications, even with the presently available imperfect realizations of LASER. A range finder which utilizes ruby radiation has been demonstrated by TRG. It displays an accuracy of ± 25 ft to ranges of 15,000 ft. The limitation to the performance of the range finder is LASER back-scatter from atmospheric particles and scattering of ambient light. The system operates on the basis of an automic quasi correlation technique in the receiver. Ranges approximately out to the limits of visibility can be obtained at present. Ranges beyond the limits of visibility within the earth's atmosphere can be obtained by short pulse LASER devices operating in conjunction with optical heterodyne techniques in the optical receiver. This system can be developed by extrapolations from present state of the art techniques.

CONFOCAL AND NON-CONFOCAL RESONATORS AT LASER WAVELENGTHS, by G. Grosof and G. Gould. June 12, 1962 [38]p. incl. diagrs. tables. (Technical note no. 45) (Bound with its AFOSR-2778, v. 2; AD 420330) [AF 49(638)673] Unclassified

Since confocal and nonconfocal resonators have the advantages over conventional Fabry-Perot resonators (reduction of diffraction losses reduction of tolerances on optical quality and alignment, choice of using prism retro-reflectors and a greater diffraction loss discrimination), these cavities are especially attractive for the design of gaseous lasers. This experiment, confined to the lowest-loss resonant mode resonant mode called by Boyd-Gordon the TEM_{00q} mode, gives the analytic expressions for 4 types of cavities: confocal sphere-sphere confocal sphere-flat, nonconfocal sphere-sphere and nonconfocal sphere-flat. It is considered important that the diffraction loss for a confocal cavity is usually less than that for a similar Fabry-Perot cavity. A procedure for estimating the maximum tilt angle of confocal and nonconfocal cavities is described. The extremes in dimensions are estimated.

ENHANCEMENT IN MERCURY-KRYPTON AND XENON-KRYPTON GASEOUS DISCHARGES, by G. Grosof and R. Targ. [1962] [12]p. incl. diagrs. refs. (Bound with its AFOSR-2778, v. 2; AD 420330) [AF 49(638)673] Unclassified

Also published in Appl. Opt., v. 2. 299-302 Mar. 1963

This research, directed toward obtaining population inversion in various gas discharges suitable for use in LASERs, reports on 2 related experiments in which krypton atoms in the $1s_5$ metastable level selectively excite either mercury or xenon energy levels by collisions of the second kind. With krypton added to mercury a coherent gain of 1% in a path 1.6 m. long for light of wavelength 1.7987 μ was achieved. Because of the difficulty of controlling the mercury vapor pressure it may be assumed that the conditions described do not necessarily give the largest attainable gain coefficient. The experiments were performed with natural mercury, a mixture of isotopes, which exhibits a complex spectra. It is advisable to use the readily available mercury-198 isotope. With krypton added to xenon, selective excitation resulted in line enhancement by a factor of 5 over pure xenon.

RESEARCH ON PROPERTIES OF LASER DEVICES, by M. Newstein and S. Rothberg. Quarterly technical summary rept. no. 2, Sept.-Nov. 1962, 1v. incl. diagrs. tables. (Rept. no. TRG-134-QTR-2) (AF 49(638)673) AD 292165 Unclassified

Variation of power output from a gaseous LASER when the frequency is scanned over the Doppler lineshape is reported. A theory of perturbed cavities was applied to the case of small curvature. An analysis was made of the fluctuations in the output of a quantum detector of arbitrary quantum efficiency preceded by a LASER amplifier. Work continued on the development of optically pumped cesium gas LASERs designed to operate in the mw range at 3μ and 7μ. The study of the possibility of utilizing photo-dissociated TlBr as a gaseous LASER medium was pursued. Crystalline and glassy media for rare earth ions were studied. Oscillation was achieved in a LASER cavity consisting of crossed roof prisms. Measurements of flashlamp absolute spectral brightness available stored energy in ruby rod, and output pulse radiant energy were made in order to determine the division of the over-all efficiency of pulse ruby oscillators.

RUBY OUTPUT, by B. Hammond and R. Martin. Progress rept. no. 1, May 28, 1962 [14]p. incl. diagrs. table. (Technical note no. 52) (Bound with its AFOSR-2778, v. 2; AD 420330) [AF 49(638)673] Unclassified

This experiment to verify some of the aspects of the output energy vs the input of the ruby laser uses different excitation conditions but constant laser cavity parameters. It is indicated that the output energy E_o should be a linear function of the normalized input energy, $E_i - E_{th}$, with a slope independent of excitation geometry while the slope of the curve $E_o - E_{in}$, should reflect the efficiency of excitation. Results are summarized in graphs. Although considerable variation in the values of the slope C were observed they appear to fall into 2 groups with a substantial gap. This implies different oscillating volumes in the 2 cases. Other evidence for different oscillating volumes comes from measurements of the temperature rise in the ruby. Also photographs of the emitting area of the ruby with focused excitation have

shown peculiar patterns. Two reasons for repeating the experiment with a new multilayer were the large range of the threshold in the V2902 cavity and the fact that the output reflector was partially damaged in an early experiment. The reflectivity of a similar multilayer on a sapphire plate is being measured to try to clear up the observation that the output slope of 0.72 joules/cm^3 is higher than expected for the assumed values of reflectivity and scattering loss.

BUCKLING OF CONICAL SHELLS UNDER EXTERNAL PRESSURE TORSION AND AXIAL COMPRESSION, by J. Singer, A. Eckstein, and M. Baruch. [Final rept.] Sept. 1962 [66]p. incl. illus. diagrs. tables. (TAE rept. no. 19) (AFOSR-4361) (AF 61(052)339) AD 295047 Unclassified

A method for the analysis of the instability of thin conical shells under external pressure is extended to buckling under torsion and combined torsion and external or internal pressure as well as axisymmetric temperature distributions. The method is based on solution of modified Donnell type stability equations, in the presence of slightly relaxed boundary conditions for the u and v displacements. Two formulations of the solution for torsion and combined loadings are given and compared. For conical shells of small and medium taper ratio, the interaction curves may be approximated by the semi-empirical curve of Grate, Batdorf and Baab (The Effect of Internal Pressure on the Buckling Stress of Thin Walled Circular Cylinders Under Torsion, NACA AAR No. 14E27, May 1944) for cylindrical shells, but for large taper ratio different curves are obtained. Tests of 33 steel, Alclad, and Al alloy conical shells of varying geometries are described. The buckling and post-buckling behavior and the effect of initial out-of-roundness are discussed. The results of another experimental program on the instability of thin truncated conical shells in torsion and under the combined loading of external pressure and torsion are given, and compared with theory. (Contractor's abstract)

INDUCED MAGNETIC ANISOTROPY IN THIN FERROMAGNETIC FILMS INVESTIGATED AT LOW TEMPERATURES, by A. A. Hirsch and N. Friedman. [1962] 8p. incl. illus. diagr. (AFOSR-4591) (AF 61(052)481) AD 401375 Unclassified

Also published in Physica, v. 29: 543-547, May 1963.

A new method of investigation of induced magnetic anisotropy in thin films is given, which is based on the study of the magnetoresistance effect when 2 crossed magnetic fields are applied. The experiments were carried out from liquid air down to liquid helium temperatures on thin evaporated films of pure Ni or pure Fe placed in a rotated cryostat. It was shown that when the films are deposited in an external magnetic field in a vacuum of 10^{-6} mm of Hg, the easy axis of magnetization is induced in the direction of the external field. The experimental data were compared with a theoretical model suggested for the magnetization of films under the influence of 2 crossed magnetic fields. This model was elaborated by means of the approximation of coherent rotation of electron spins in a single domain particle, whose anisotropy was made up of a unidirectional, a uniaxial and a cubic magnetocrystalline component. It was found that films deposited in an external magnetic field show a symmetry around the easy magnetization axis like a spheroidal particle around a polar axis. At very low temperatures the induced anisotropy is more distinct because of vanishing thermal stresses. A process of formation of elongated grains or of chains of small particles seems to be responsible for the induced easy magnetization axis. (Contractor's abstract)

Technion - Israel Inst. of Tech. Dept. of Physics, Haifa.

MAGNETIC UNIAXIAL ANISOTROPY IN FILMS AT LIQUID HYDROGEN TEMPERATURES FROM ELECTRIC RESISTIVITY MEASUREMENTS IN CROSSED MAGNETIC FIELDS, by A. A. Hirsch and N. Friedman. [1962] [1]p. (AFOSR-J31) (AF 61(052)481) AD 297275 Unclassified

Also published in Bull. Research Council Israel, v. 10F: 3, Apr. 1962.

Using the crossed magnetic field technique in the study of magnetoresistance effect in thin ferromagnetic wires, this work has been extended to very thin films at liquid hydrogen temperatures. Taking into consideration the dependence of the electric resistivity on the orientation of domain magnetization, conclusions have been drawn about the magnetization process and the magnetic uniaxial anisotropy of the films. These conclusions are based on a theoretical model for the magnetization process in crossed magnetic fields of an elongated particle having a large magnetocrystalline energy.

STATISTICAL MODEL APPLIED TO THE REGION OF THE ν_3 FUNDAMENTAL OF CO_2 AT 1200°K, by U. P. Oppenheim and Y. Ben-Aryeh. [1962] [7]p. incl. diagrs. refs. (AFOSR-4772) (AF EOAR-62-120) Unclassified

Under certain conditions the spectral emission (or absorption) of bands of molecules in the gaseous state may be described with the help of the "statistical" model. A new method is developed in order to correlate the observed emissivity of a statistical band with the experimental parameters of the gas (pressure, optical

path, etc.). Use is made of curves of growth for every frequency in the band, and the method is applied to the region of the 4.3-μ bands of CO_2 at a temperature of 1200°K. Experimental results for CO_2 are described, which were obtained by heating the gas in cells of different length in an electrical furnace. Good quantitative agreement is found with experimental results of other workers. It is shown that the statistical model predicts the emissivity correctly over wide ranges of pressure and optical path. (Contractor's abstract)

AN APPROXIMATE METHOD FOR CALCULATING THE COMPRESSIBLE LAMINAR BOUNDARY LAYER WITH CONTINUOUSLY DISTRIBUTED SUCTION, by W. Pechau. July 2, 1962, 73p. incl. diagrs. refs. (Rept. no. 62/-12a) (AFOSR-3715) (AF EOAR-61-45) AD 285303 Unclassified

An approximate method for calculating the compressible laminar boundary layer with suction was developed. The method is applicable to arbitrary distributions of potential velocity and suction velocity on adiabatic walls at a Prandtl number of unity. With zero pressure gradient, it also holds in the case of heat transfer at constant wall temperature. A comparison with known exact solutions is made, and extensive and systematic computations of the laminar compressible boundary layer with suction on aerfoil sections are performed. In the subsonic range the profile NACA 0010 and in the supersonic range a symmetric biconvex profile with a thickness ratio of 10% is taken at various Mach numbers and angles of incidence. A special study is made on the influence of the location and extent of the suction area on the position of the point of separation. It is shown that a given suction quantity is most efficient in delaying separation when located on the aft part of the profile.

STUDIES ON THE CHANGE OF THE CONCENTRATIONS OF INTERMEDIATES DURING PHOTOSYNTHESIS OF CHLORELLA AND ISOLATED CHLOROPLASTS, by O. Kandler. Final rept. May 1, 1962 [23]p. incl. diagrs. tables, refs. (AFOSR-3406) (AF 61(052)244) AD 283132 Unclassified

The enzymatic determination of the photosynthetic glycollic acid (PGA) concentration in Chlorella did not show a correlation between the rate of photosynthesis and the increase of PGA after darkening. The PGA increase is not prevented by the omission of CO_2, but does not occur under N_2. Hence it is assumed that the change in the PGA concentration depends mainly on the change in the rate of glycolysis by photosynthesis. Presumably glycolysis is controlled by photosynthesis through the competition between light phosphorylation and triose phosphate oxidation for inorganic phosphate. The effects of high KCN concentrations on the distributions of C^{14} and on the concentrations of the intermediates in Chlorella were investigated. A drastic difference between the behavior of the labeled PGA and that of the total amount was revealed by enzymatic analysis. It is assumed, that the very small photosynthesis pool in the chloroplasts exchanges only very slowly with the cytoplasmic pool. In isolated chloroplasts, the pH optimum for CO_2 fixation was determined. In whole chloroplasts it was near 7.3 and near 8.2 in broken chloroplasts. Different amounts of inactive PGA were added to broken chloroplasts to measure the distribution of C^{14} after 15 and 30 min photosynthesis in $C^{14}O_2$. The data did not suggest the occurrence of a favored reduction of the PGA formed newly by CO_2 assimilation, as in Chlorella. (Contractor's abstract)

[STUDIES ON THE CHANGES IN POOL SIZES OF VARIOUS INTERMEDIATES DURING PHOTOSYNTHESIS UNDER THE INFLUENCE OF DIFFERENT EXTERNAL FACTORS AND INHIBITORS] Suddeutsche versuchts- und forschungsanstalt fur milchwirtschaft weihenstephan, by O. Kandler. Annual summary rept. May 1, 1961, 31p. incl. tables. (AF 61(052)244) AD 632273 Unclassified

The change in concentration of the photosynthetic intermediates in Chlorella were determined with the help of the optical test during the transition from dark to light and vice versa. In addition, the effects of anaerobiosis and CO_2 deprivation were studied. Preliminary calculations showed that the rate of formation of pteroylglutamic acid after turning off the light equals about the rate of CO_2 fixation in the light. The influence of monodoacetic acid, arsenate and dinonyl phthalate photosynthesis of Chlorella was studied in 2 ways. It is assumed that, in Chlorella cells, the path of carbon in photosynthesis proceeds via a pteroylglutamic acid by-pass, where as in broken chloroplasts a reversal of glycolysis, similar to dark fixation takes place. Preliminary experiments in the preparation of whole and broken chloroplasts are described. (Contractor's abstract, modified)

NUMERICAL TREATMENT OF THE INITIAL VALUE PROBLEM FOR SYSTEMS OF QUASILINEAR PARTIAL DIFFERENTIAL EQUATIONS OF FIRST ORDER, by R. Albrecht and W. Urich. [1962] [9]p. (AFOSR-4058) (AF EOAR-62-94) AD 450315 Unclassified

Also published in Numerische Math., v. 4: 253-261, 1962.

A description is given for the practical implementation of a method for the approximate solution of the initial value problem for a system of m quasilinear partial differential equations of first order in m dependent and n + 1 independent variables. Only real functions and real variables are considered. The importance of such systems stems from the fact that a properly posed, noncharacteristic initial value problem for an arbitrary system of partial differential equations can be reduced to a problem of the above mentioned type. The method is generalized to the case of quasilinear systems and an error estimate is given.

ELASTIC THERMAL STRESSES IN DELTA WINGS. PART II, by H. Parkus. Dec. 15, 1962 [37]p. incl. diagrs. tables. (AFOSR-4584) (AF 61(052)214) Unclassified

The study of thermal stresses in delta wings is continued. Equations of first approximation for the skew-symmetric temperature part are derived and solved. A numerical example is given. Then the equations of second (and final) approximation are obtained and solved for both the symmetric and the skew-symmetric part. The numerical example is continued into the second approximation.

CONDUCT THEORETICAL AND EXPERIMENTAL INVESTIGATIONS ON THE AERODYNAMICS OF THE MIXING OF COOLING AIR WITH COMBUSTION PRODUCTS IN A COMBUSTION CHAMBER-INVESTIGATION OF THE DIFFERENCE BETWEEN THE ISOLATED AND UNISOLATED COMBUSTION CHAMBER, by W. Rogner. Final technical rept. Nov. 1, 1961-Jan. 31, 1962. Feb. 28, 1962 [24]p. incl. illus. diagrs. tables. (AFOSR-2667) (AF 61(052)569) AD 275845 Unclassified

Theoretical and experimental investigations were made of the aerodynamics of the mixing of cooling air with combustion products in a combustion chamber. The difference between the isolated and unisolated combustion chamber was determined. The turbulence combustion chamber attained very high degrees of efficiency both in an insulated and noninsulated state and the temperature distribution at the exhaust-end of the combustion chamber was uniform in both cases, particularly so when slight tertiary air quantities were injected against the main flow.

SPECTRAL REFLECTIVITY AS A FUNCTION OF TEMPERATURE OF β-BRASS TYPE ALLOYS, by L. Muldawer. [1962] [9]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)73] and Atomic Energy Commission) Unclassified

Published in Phys. Rev., v. 127: 1551-1559, Sept. 1, 1962.

A number of β-brass alloys undergo reversible color changes as a function of temperature. Normally, yellow β-brass becomes copper-red at about 250°C, the color change taking place gradually. β-AgZn is pink at room temperature and silver gray at 300°C. Similar changes have been observed in β-AgCd, β-AuZn, and β-AuCd. Color changes consistent with the above observations have been noted on cooling to liquid nitrogen temperatures. Although disordering takes place in some of these alloys, it is not thought that these color change phenomena are primarily due to disordering or to surface films. Quantitative measurements of reflectivity as a function of wavelength at several temperatures have been made on β-CuZn, β-AgZn, β-AuZn, β-AgCd, β-AuCd, and α-brass. The reflectivity edge for β-brass shifts from 5000A at 27° to 5300A at 275°C, equivalent to a shift of about -5.6×10^{-4} ev C. Edge shifts of this magnitude were not observed with α-brass, Cu, Au, Au_3Zn, CuAu, and Cu_3Au. A number of possible explanations of the optical results are discussed: it is believed that these results are primarily due to plasma effects strongly influenced by interband transitions. [NUCLEAR MAGNETIC RESONANCE STUDY OF LIQUIDS AND MIXTURES] by M. Eisner. Interim final rept. Apr. 12, 1962, 2p. (AFOSR-2473) (AF 49(638)-934) Unclassified

NMR relaxation studies provide a method for studying the microscopic dynamics of liquids and liquid mixtures. Some success has been achieved in constructing dynamical models which elucidate a variety of experimental observations. The present program was designed to concentrate on the measurement of diffusion coefficients in liquid and to relate these to the intermolecular relaxation processes. The work during this past year was principally concerned with constructing the equipment necessary for measuring diffusion coefficients through nmr spin-echo techniques. The apparatus has now been constructed and tested. Calibration of the equipment against known diffusion coefficients has indicated that the equipment is working satisfactorily. In the theoretical work, it was found that the principal part of the relaxation process could still be characterized by a single relaxation parameter, which is determined largely by pair-interactions. This indicates that the relaxation of complex assemblies can be adequately created by considering the sum of the pair interaction alone. In addition, the small residual part of the relaxation which is characterized by different relaxation parameters seems to be observable.

INORGANIC COORDINATION COMPOUNDS: KINETICS AND MECHANISM OF SOME THERMAL REARRANGEMENTS, by W. M. Wendlandt. Final rept. Apr. 4, 1962, 3p. (AFOSR 2492) (AF 49(638)787) AD 454052 Unclassified

The kinetics of the thermal deaquation and rearrangement of the complexes of the type $[Co(NH_3)_5(H_2O)]X_3$, where X was Cl, Br, I and NO_3 was completed, and found to obey a first order rate law. DTA (differential thermal analysis) data showed that the reaction proceeded according to a one step process except in the case of the chloride complex, where an apparent two step process was noted. All of the deaquation peaks occurred in the 100° to 125° C temperature range. Dissociation pressure measurements on the above systems showed that it was irreversible and hence the heat of deaquation, ΔH, could not be determined. However, this value was measured for the chloride and bromide complexes by the method of quantitative DTA. Substituting other trivalent metal cations such as Rh(III) and Ir(III) for Co(III), an attempt was made to study the similar deaquation reactions. These complexes were difficult to prepare in a high state of purity so that the results were questionable. The stoichiometry and possible reaction mechanism for the thermal dissociation of some hexamine type complexes, $[Co(NH_3)_6]X_3$, where X = Cl, Br, NO_3 and SO_4, were determined. Further work is being carried out on a series of pentammine and tetramminecobalt complexes.

THERMAL DECOMPOSITION OF METAL COMPLEXES. V. SOME HALOPENTAMMINECOBALT (III) HALIDE COMPLEXES, by W. W. Wendlandt and J. P. Smith. [1962] [8]p. incl. diagrs. tables, refs. (AFOSR-J1201) (AF 49(638)787) AD 423519 Unclassified

Also published in Jour. Inorg. and Nuclear Chem., v. 25: 843-850, July 1963.

The thermal dissociation of 9 halopentamminecobalt (III) complexes was studied by the techniques of thermogravimetry (in vacuo), differential thermal analysis (in helium) and gas evolution analysis (in helium). The stoichiometry of the dissociation reactions was determined by analysis of the residues and reaction products. Activation energies for the dissociation of several of the complexes were also obtained. The complexes dissociated by 2 different mechanisms: (a) those in which the Co(III) was reduced by iodide ion; and (b) those in which the Co(III) was reduced by ammonia. In the latter case, ammonium halide and nitrogen were also obtained in the reaction products. (Contractor's abstract)

THERMAL DECOMPOSITION OF METAL COMPLEXES. III. STOICHEIOMETRY OF THE THERMAL DISSOCIATION OF SOME HEXAMMINECOBALT (III) COMPLEXES. by W. W. Wendlandt. [1962] [7]p. incl. diagrs. table, refs. (AFOSR-J1202) (AF 49(638)787) AD 423118 Unclassified

Also published in Jour. Inorg. and Nuclear Chem., v. 25: 545-551, May 1963.

The stoichiometry and probable decomposition sequence for the thermal dissociation of $[Co(NH_3)_6]X_3$, where X is Cl, Br, NO_3, and $[Co(NH_3)_6]_2(SO_4)_3 \cdot 2.5H_2O$, are presented. Differential thermal analysis and gas evolution curves are presented for each of the complexes. The data shows that the reduction of Co(III) → Co(III) is due to ammonia, forming NH_4X(X = Cl, Br or SO_4) and

nitrogen. No free halogen could be detected. Due to the presence of both oxidizing and reducing groups, $[Co(NH_3)_6](NO_3)_3$ decomposed in a different manner than the other 3 compounds. (Contractor's abstract)

ION RADICALS. THE REACTION OF THIOAROMATIC COMPOUNDS WITH ACIDS. II. DIPHENYL DISULFIDE, THIANTHRENE AND THIANTHRENE OXIDES. by H. J. Shine and L. Piette. [1962] [9]p. incl. diagrs. tables, refs. (AFOSR-J236) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-48 and Robert A. Welch Foundation) AD 400875 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 4798-4806, Dec. 20, 1962.

It has not been found possible to recover diphenyl disulfide (I) from solution in 100% sulfuric acid. When 100% sulfuric acid is poured through a bed of I and immediately received onto ice the I is recoverable. In this case the acid solution is pale green rather than purple. Solutions of thianthrene (III), its monoxide V and cis-dioxide VI in 96%, 97%, 100% and fuming sulfuric acid have been investigated. Ultraviolet, visible, near infrared and e. s. r. spectra have been recorded. Products have been isolated quantitatively. Some observations on III in trifluoroacetic acid are made and the work of Fava, Sogo and Calvin is discussed. Solutions of III in 96-97% sulfuric acid are paramagnetic. It is proposed that the species present is the positive ion-radical of diphenylene disulfide. The transformation of V to this species in 96-97% acid is shown in the visible and ultraviolet region and the absorption spectra changes are related to the growth of the spin signal in e. s. r. spectroscopy. The products isolated from III in 96-97% acid are III and V. From III in 100% acid and fuming sulfuric acid the product is mostly V. From solutions of V in 96% acid that have been kept some time the major product is III. It is tentatively proposed that an additional product from these solutions, not yet identified, results from some V behaving as an acceptor during the conversion of V to the ion-radical. Proposals are made to account for the one-electron oxidation of III to the ion-radical. The ion-radical has been detected also in solutions of III in benzene and chloroform to which aluminum chloride was added. (Contractor's abstract)

ION RADICALS. II. THE ESR SPECTRA OF 2,7-DIMETHYL- AND 2,7-DICHLOROTHIANTHRENE IN CONCENTRATED SULFURIC ACID, by H. J. Shine, C. F. Dais, and R. J. Small [1962] [2]p. incl. diagr. (AFOSR-J285) (AF AFOSR-61-48 and AF AFOSR-63-23) Unclassified

Also published in Jour. Chem. Phys., v. 38: 539-570, Jan. 15, 1963.

The dimethylthianthrene gives rise to a 9-line spectrum. From a consideration of the relative intensities of the lines, it is concluded that electron delocalization occurs in the dimethyl compound similar to that observed in methyl semiquinone ion radicals. 2,7-Dichlorothianthrene produces a 3-line spectrum. This is attributed to coupling of the free electron with the 2 equivalent protons in 3,8-positions.

THE THERMAL DECOMPOSITION OF METAL COMPLEXES. IV. SOME AMINE COMPLEXES OF COPPER(II) SULPHATE, by W. W. Wendlandt. [1962] [10]p. incl. diagrs. table, refs. (AFOSR-J1203) (AF AFOSR-63-23) AD 423042 Unclassified

Also published in Jour. Inorg. and Nuclear Chem., v. 25: 833-842, July 1963.

The thermal dissociation of the mono-, bis-, and tris-(ethylenediamine)-, the bis(1,2-propanediamine)-, and the bis(1,3-propanediamine)-complexes of copper (II) sulphate was studied by thermogravimetry, differential thermal analysis, gas evolution, and high temperature reflectance spectroscopy. The TGA curve obtained for $[Cu(en)_3]SO_4$ corresponded to that expected for the deamination of 1 of the ethylenediamines. The decomposition curves of the bis(amine)-complexes corresponded to a 1 step deamination process, giving $CuSO_4$ which immediately dissociated into CuO and SO_3. The E_a for the deaquation of $[Cu(en)(H_2O)_2]SO_4$ was 29 kcal mol^{-1} as determined by a DTA method. Reflectance curves are given for all of the complexes at ambient temperature as well as $[Cu(en)(H_2O)_2]SO_4$ at elevated temperatures.

AUTOMATIC DIGITAL RECORDING THERMOBALANCE, by W. W. Wendlandt. [1962] [3]p. incl. diagrs. (AFOSR-J1204) (AF AFOSR-63-23) AD 423043 Unclassified

Also published in Anal. Chem., v. 34: 1726-1728, Dec. 1962.

An automatic recording thermobalance is described which records the voltage variations that are proportional to the weight change of a sample, as it is heated, in an analog (X-Y recorder) as well as digital (digital recorder) form. The system consists of a conventional recording thermobalance in which the voltage outputs from the balance accessory and the furnace thermocouple, after amplification, are converted to a series of pulses. These pulses are counted on an electronic counter and then printed on a digital recorder. Provision is made for printing the furnace temperature voltage, then 5 sec later the sample weight voltage, at intervals of 1 min. The instrument is useful in providing input data for digital computer calculations of thermogravimetric and kinetic quantities of interest. (Contractor's abstract)

ACETYLENE-ETHYLENE OXIDE FLAMES, by R. F. Stubbeman and R. C. Anderson. Feb. 1962 [16]p. incl. diagrs. tables. (Technical note no. 8) (AFOSR-2344) (AF 18(603)142) Unclassified

Ignition and flame propagation limits, flame velocities, and reaction products for flames in acetylene-ethylene oxide mixtures burning in an inert atmosphere have been investigated. Flame temperatures have been calculated. Results bear out the indications noted in earlier tests that ethylene oxide is notably effective in enhancing decomposition of the hydrocarbon. The system does not show promise for practical applications because actual flame speeds and temperatures are rather low. As a flame system, it is of interest because of the pronounced effects apparently of pre-flame reactions, the fact that there are no ignition limits at higher pressures and temperatures, and certain anomalies in composition effects. (Contractor's abstract)

PREPARATION OF DEUTERATED BUTANES, by M. J. Ijam and L. F. Hatch. Aug. 1962, 14p. incl. diagrs. tables. (Technical note no. 9) (AFOSR-4274) (AF 18-(603)142) Unclassified

The synthesis of terminally-deuterated butanes was investigated. The initial reaction was one of equilibration between deuterium oxide and butandione (diacetyl, $CH_3COCOCH_3$) to obtain deuterated butandione. The extent of deuteration up to 34 equilibrations was determined. Two methods for the reduction of butandione to butane were investigated. The reduction of the dione to the glycol, conversion of the glycol to the dibromide and its reduction to the hydrocarbon was not satisfactory. A 2-step process in which the reaction of the dione with hydrazine in triethylene glycol medium was followed by sodium methoxide reduction of the hydrazone was satisfactory. A quantity of deuterated butane was prepared by this process. Deuterated butane of the type $CH_3CD_2CD_2CH_3$ was prepared by the reaction between butandione and deuterated hydrazine ($ND_2ND_2 \cdot D_2O$) followed by sodium methoxide reduction of the hydrazone. The product was not pure $CH_3CD_2CD_2CH_3$.

COMPARATIVE STUDIES OF PYROLYSIS OF ACETYLENE, VINYLACETYLENE, AND DIACETYLENE. by K. C. Hou and R. C. Anderson. [1962] [3]p. incl. diagr. tables, refs. (AFOSR-J1461) (Sponsored jointly by Air Force Office of Scientific Research under AF 18-(603)142 and Petroleum Research Fund) AD 426551 Unclassified

Also published in Jour. Phys. Chem., v. 67: 1579-1581, Aug. 1963.

Since vinylacetylene and diacetylene are both straight-chain unsaturated compounds which might be significant intermediates in the pyrolysis of acetylene, a comparative study of the thermal reactions of these 3 compounds was made. Reaction patterns were determined in a flow system, using temperatures in the range of 500-800°, and mixtures of 25 mol % hydrocarbon in helium. Products were analyzed chromatographically. A reactor was also designed to discharge directly into a mass spectrometer, so that tests might be made for free radicals

and the product gases also analyzed in the mass spectrometer. Good results were obtained in detecting methyl radicals formed in reaction of di-t-butyl peroxide and lead tetramethyl, but no evidence was found for any free radical fragments from the acetylenic compounds at temperatures up to 700 . Diacetylene was barely detectable in the low temperature reaction of acetylene, and no evidence was found to indicate it is a likely intermediate in the acetylene reactions under such conditions. Vinylacetylene is readily detected and shows appropriate reactivity, but little tendency to decompose to acetylene. It seems likely that it, like benzene, is a reactive side product rather than a key intermediate. (Contractor's abstract)

CROSS SECTIONS FOR THE DE-EXCITATION OF HELIUM METASTABLE ATOMS BY COLLISIONS WITH ATOMS, by E. E. Benton, E. E. Ferguson and others. [1962] [4]p. incl. diagrs. table. (AFOSR-4384) [AF AFOSR-62-270] AD 295638 Unclassified

Also published in Phys. Rev., v. 113: 206-209, Oct. 1, 1962.

The lifetimes of metastable helium atoms He (2^3S) and He (2^1S) were measured by a time-resolved optical absorption technique in the afterglow of a pulsed helium discharge at 10-mm pressure with small concentrations of various impurity gases added. The following de-excitation cross sections in units of 10^{-16} cm^2 were determined for He(2^3S): Ne—0.28, Ar—6.6, Kr—10.3, Xe—13.9, N_2—6.4, and H_2—6.0. The uncertainties are estimated to be ±20% for the rare gases and ±50% for the molecular gases. He(2^1S) cross sections were measured to be Ne—4.1, Ar—55, Kr—64, and Xe—103, all times 10^{-16} cm^2. The neon cross section is believed reliable to ±20% but the remaining singlet cross sections may be too high by as much as a factor 2 or 3. The cross sections refer to de-excitation by ionizing collisions except in the case of neon where neon excitation occurs. Competing destruction processes render the singlet cross-section analysis somewhat uncertain except in the case of neon. (Contractor's abstract)

CALCULATION OF CROSS SECTIONS FOR ZERO ACTIVATION ENERGY PROCESSES BY SIMPLE COLLISION MODELS WITH EMPHASIS ON THE PENNING EFFECT, by E. E. Ferguson. [1962] [3]p. incl. table, refs. (AFOSR-4385) [AF AFOSR-62-270] AD 295936 Unclassified

Also published in Phys. Rev., v. 128: 210-212, Oct. 1, 1962.

Recent cross sections obtained for the destruction of He(2^3S) metastable atoms by ionization of Ar, Kr, Xe, H_2, and N_2 are analyzed by a simple collision picture. It is found that the ratio of the experimental to momentum transfer cross sections is the same order as the efficiency of ejection of electrons from metal surfaces by He(2^3S) atoms, namely 0.2-0.3. The momentum transfer cross sections agree with the experimental values better than some of the published experimental values agree among themselves and in addition there is a great paucity of data in this area so that an order-of-magnitude estimate is often useful. In addition, it is shown that calculated momentum transfer cross sections for the reactions, $He(2^3S) + He(2^3S) \rightarrow He^+ + He(1^1S) + e^-$, $He_2^+ + Ne \rightarrow Ne^+ + 2He$, $He(1^1S) + He(n^1P) \rightarrow He(1^1S) + He(nf)$, $He(2^1S) + Ar \rightarrow He(1^1S) + Ar^+ + e^-$, agree very well with literature values of cross sections for the processes. It appears that for a broad class of atomic reactions requiring zero activation energy, a momentum transfer collision has a high probability of reaction. Momentum transfer cross sections are dominated by the long-range attractive forces and can easily be calculated, thereby providing a useful estimate of the actual reaction cross section. BINDING ENERGY OF He_2^+ (Abstract), by P. N. Reagan, J. C. Browne, and F. A. Matsen. [1962] [1]p. (Sponsored jointly by Advanced Research Projects Agency, [Air Force Office of Scientific Research under AF AFOSR-62-270], and Robert A. Welch Foundation of Houston, Tex.) Unclassified

Presented at meeting of the Amer. Phys. Soc., Texas U., Austin, Feb. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 174, Feb. 23, 1962.

Binding energies of 2.1 and 3.1 ev for He_2^+ have been reported from scattering measurements and spectroscopic experiments, respectively. In an attempt to resolve the

discrepancy the energy of He_2^+ has been calculated as a function of R using the following configurations $1s1s\,1s'$, $1s\,2s1s'$, $1s1s\,2p_0$, $2p_0{}^2 1s$, $1s\,2p_0\,1s$, $1s\,2p_0\,2p_0$, $2p_{\pm1}{}^2 1s$, $3d_0{}^2 1s$, $3d_{\pm1}{}^2 1s$, $3d_{\pm2}{}^2 1s$, $1s\,3d_0 3d_0$ with restricted orbital exponent optimization. The results favor the lower value. Several of the low-lying excited states of He_2^+ have also been investigated.

CATAPHORESIS IN He-Ne MIXTURES (Abstract), by A. L. Schmeltekopf, E. E. Ferguson, and W. W. Robertson. [1962] [1]p. (Sponsored jointly by Advanced Research Projects Agency and [Air Force Office of Scientific Research under AF AFOSR-62-270]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Texas U., Austin, Feb. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 115, Feb. 23, 1962.

Cataphoresis in He-Ne mixtures has been studied spectroscopically and the measurements checked by mass spectroscopic means. The effect of pressure has been investigated from 6-70 mm Hg. Wall temperature was varied from 70-500 C and current from 10-500 ma in a quartz tube of 0.500 in. diam. The results are compared with the theoretical predictions of Druyvesteyn. The effectiveness of cataphoretic separation of Ne from He has been found to increase with both pressure and current density over these extended ranges. Increased temperature markedly decreases the effectiveness of cataphoresis. The measurements were generally made in the positive column with large He to Ne ratios. In order to check for a possible 'retrograde' cataphoresis, some measurements were made with He as a minor constituent in Ne. Spectroscopic observations at the cathode appeared to indicate an enhanced He concentration there (retrograde cataphoresis). However, mass spectroscopic analysis showed that the cataphoresis, while slight, was still normal. The extreme excitation conditions at the cathode render spectral intensity interpretations difficult if not indeed misleading there

CONSIDERATIONS ON HELIUM EMISSION λ10830A IN AURORAE, by E. E. Ferguson. [1962] [2]p. AF AFOSR-62-270] Unclassified

Published in Planetary and Space Sci., v. 9: 280-287, May 1962.

From available measurements of Penning-type collisions from a He atom in a metastable 2^3S state (AR 6.6, Kr 10.3, Xe 13.9, N 6.4, and H 6.0 x 10^{16} sq cm) the cross section for O is estimated equal to that of N and for O to that of Kr. From these data the lifetime estimate Shefov seems to be at least 2 orders of magnitude too large. For He (2^3S) + O → He (1^1S) + O^+ + er ≈ 10 sec at 300 km and ≈ 1 sec at 200 km altitude. Thus, Shefov's assumption of λ 10,830A being due to resonant light scattering of solar photons does not account for the observed intensity of this line in auroras.

CROSS SECTIONS FOR THE DE-EXCITATION OF HELIUM METASTABLES BY IMPURITIES (Abstract), by E. E. Benton and W. W. Robertson. [1962] [1]p. (Sponsored jointly by Advanced Research Projects Agency and [Air Force Office of Scientific Research under AF AFOSR-62-270]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Texas U., Austin, Feb. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 114, Feb. 23, 1962.

A study was made of the effects of small amounts of impurities on the destruction frequencies of the 2^1S and 2^3S metastable states of helium. The optical absorption technique developed by Phelps and Pack was used for measuring destruction frequency. The resulting de-excitation cross sections of 2^3S helium metastables due to the following impurities are: 6.6×10^{-16} cm^2 (± 20%) for argon; 1.03×10^{-15} cm^2 (± 20%) for krypton; 1.4×10^{-15} cm^2 (± 20%) for xenon; 2.8×10^{-17} cm^2 (± 20%) for neon; 6×10^{-16} cm^2 (± 40%) for nitrogen; and 6×10^{-16} cm^2 (± 40%) for hydrogen. The cross section for de-excitation of 2^1S helium metastables by neon was calculated to be 4.1×10^{-16} cm^2 (± 25%). The destruction frequencies of the 2^1S state are not readily interpreted in terms of cross sections since their loss by superelastic collision with electrons is a significant process with the conditions prevailing in the discharge. The electron concentration may very well be increased by the presence of the impurity in the very early afterglow.

EFFECT OF HELIUM ON THE LOW-LYING STATES OF ATOMIC HYDROGEN (Abstract), by J. C. Browne and F. A. Matsen. [1962] [1]p. (Sponsored jointly by Advanced Research Projects Agency, [Air Force Office of Scientific Research under AF AFOSR-62-270], and Robert A. Welch Foundation of Houston, Tex.) Unclassified

Presented at meeting of the Amer. Phys. Soc., Texas U., Austin, Feb. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 114, Feb. 23, 1962.

The energies of the low-lying states of the HeH system have been calculated as a function of distance from

R = 6 to 20 au. The following configurations were employed: $[(1s1s')_{He}X_H]$, where X_H = 1s, 2s, $2p_0$, $2p_+$, 3s, $3p_0$, $3p_+$, $3d_0$, $3d_+$. The approximate eigenfunctions were analyzed into "natural orbitals" which showed that the hydrogen orbitals become nonhydrogenic at quite large distances. Maxima were found in the 2s and 3s potential curves. The results are compared to those obtained from disperston theory.

ELECTRON CROSS SECTION FOR HELIUM (Abstract), by H. A. Williamson and F. A. Matsen. [1962] [1]p. (Sponsored jointly by Advanced Research Projects Agency, [Air Force Office of Scientific Research under AF AFOSR-62-270], and Robert A. Welch Foundation of Houston, Tex.) Unclassified

Presented at meeting of the Amer. Phys. Soc., Texas U., Austin, Feb. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 114, Feb. 23, 1962.

Using the Exchange Distorted Boron-Oppenheimer approximation and the method of partial cross sections, the elastic scattering cross-section for slow electrons was calculated by normal helium (1^1S) and the inelastic scattering cross-section for the $1^1S - 2^3S$ transition. An open-shell wave function was used to represent the atom in the 1^1S state, and a wavefunction of the type given by Morse, Young, and Haurwitz was used for the the 2^3S state. The integro-differential equations were solved by Hulthen's variational method, using 2 distorted trial functions of the form suggested by Huang. As a consequence of the use of the open-shell configuration, both trial functions contained 3 variational parameters, one of which specified the phase shift of the distorted wave. The results compare favorably with experimental values and are slightly superior to the earlier calculations of Moiseiwitsch and of Massey and Moiseiwitsch

HELIUM AFTERGLOW STUDIES BY SPIN RESONANCE TECHNIQUES (Abstract), by F. C. Fehsenfeld and E. E. Ferguson. [1962] [1]p. (Sponsored jointly by Advanced Research Projects Agency and [Air Force Office of Scientific Research under AF AFOSR-62-270]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Texas U., Austin, Feb. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7. 115, Feb. 23, 1962.

An x band electron spin resonance spectrometer has been used to analyze the afterglow of an electrodeless discharge in helium. In the experiment, the products of the discharge were flowed from the excitation region through the detection cavity of the spectrometer. A cyclotron resonance signal and an additional signal as yet unidentified have been obtained. At low pressure in a TE_{102} rectangular cavity the 2 signals were coincident and occurred near g = 2.00. However, with increasing pressure the latter signal was shifted and became resolvable. Both signals were broadened with pressure. The use of a TE_{012} cylindrical cavity resulted in a large relative enhancement of the cyclotron resonance signal. The variation of intensity and half-width of both signals with pressure and distance from the primary discharge will be reported. The observations are correlated with the processes known to occur in helium afterglows.

METASTABLE HELIUM ATOM CONCENTRATIONS IN THE EARTH'S ATMOSPHERE, by E. E. Ferguson and H. Schlüter. [1962] [10]p. incl. diagrs. tables, refs. [AF AFOSR-62-270] Unclassified

Published in Planetary and Space Sci., v. 9: 701-710. Oct. 1962.

Calculations of He(2^3S) metastable concentrations in the earth's atmosphere by a previously suggested process involving photoexcitation by solar UV 584 and 537A is shown to yield only ~ 5×10^5 metastables cm^2 (column) under typical twilight conditions. This is far too small to account for recent Russian twilight glow observations of resonant scattered λ 10,830A. Radiative recombination is shown to be probably more importan but still probably insufficient to account for observations. Direct excitation by photoelectrons seems to be the most likely operative metastable production mechanism. The processes of metastable destruction are considered in some detail. Cross-sections for triplet metastable destruction by O_2 and N_2 molecules are 14 and 7 x 10^{-16} cm^2, respectively, and it is estimated that the O atom cross-section is around 5×10^{-16} cm^2. FINITE GROUP ALGEBRAS AND QUANTUM MECHANICS, by F. A. Matsen. Oct. 1, 1962 [181]p. incl. tables, refs. (AFOSR-5522, (AF AFOSR-62-273) AD 631243 Unclassified

The purpose of this report is to present a unified algebraic theory of certain symmetry problems in quantum mechanics. In particular, it is concerned with a system whose Hamiltonian commutes with a finite group of operators. The Hamiltonian also commutes with all linear combinations of the group operators. The set of all linear combinations of the group operators constitute a group (Frobenius) algebra.

THE REPRESSION-SENSITIZATION SCALE: II. CONCURRENT AND CONSTRUCT VALIDITY, by D. Byrne. [1960] [15]p. (AFOSR-146) (AF 49(638)460) AD 611192 Unclassified

A series of studies were undertaken in order to begin the establishment of construct validity for the Repression-Sensitization Scale. It was found that the R-S Scale is negatively correlated with Ullman's Facilitation-Inhibition Scale; positively correlated with Worchel's Self Activity Inventory; negatively correlated with the California F Scale, positively related to the expression of sexual responses on the TAT for male Ss only and unrelated to the expression of aggression and emotionality for either sex; positively correlated with deviant response bias on an Adjective Check List; and unrelated to measures of intellectual ability. Thus, with minor exceptions the findings confirmed the general hypothesis that the R-S Scale is a measure of defensive behavior. (Contractor's abstract)

SELF-ENHANCEMENT AND INTERPERSONAL ATTRACTION, by P. Worchel. [1961] 18p. incl. tables, refs. (AFOSR-1464) (AF 49(638)460) Unclassified

The present series of studies on interpersonal attraction is based on the extension of the fundamental assumption of self theory, namely, that the basic drive of the individual is to maintain and enhance his self-concept, his status or self-esteem. It is contended that (a) self-enhancement produces a "readiness" to like, (b) liking is directed towards those objects or activities instrumental in producing self-enhancement, and (c) by a process of emotional conditioning, liking spreads to those objects and activities associated with the aroused emotional state. The same general relationships are predicted to hold for self depreciation and disliking. It is the purpose of the present paper to test the first and last hypotheses, namely, that self-enhancement produces liking, and that such liking spreads to associated objects.

APPROACH AND AVOIDANCE AFFILIATION MOTIVES, by D. Byrne, R. D. McDonald, and J. Mikama. [1962] 17p. incl. diagr. tables, refs. (AFOSR-J369) AF AFOSR-63-261] AD 408583 Unclassified

Also published in Jour. Personality, v. 31: 21-37, Mar. 1963.

An interpersonal affect scoring system for thematic apperception material was proposed as a possible technique for measuring approach and avoidance affiliation motives. It was shown to be sufficiently reliable for use in research. In testing a 2-factor theory of affiliation need, it was found that high "n" affiliation individuals produce stories predominating in approach motivation, medium "n" affiliation individuals produce stories with a mixture of approach and avoidance motivation, and low "n" affiliation individuals produce stories predominating in avoidance motivation. A further investigation indicated that scores on Murray's affiliation questionnaire are positively related to thematic apperception measures of "n" affiliation and the interpersonal affect index of approach motivation.

GANGLIONIC TRANSMISSION DURING THE NEOSTIGMINE PRESSOR RESPONSE (Abstract), by J. G. Hilton. [1962] [1]p. (AFOSR-J212) (AF AFOSR-62-241) AD 400436 Unclassified

Also published in Proc. Internat'l. Union of Physiological Sciences: Twenty-second Interrat'l. Cong., Leyden (Netherlands) (Sept. 10-17, 1962), Amsterdam, Excerpta Medica Foundation, v. 2: Abstract no. 176, 1962.

It has been postulated that the pressor response elicited by neostigmine after blockade of the ganglia is due to a ganglion stimulating action of the preserved acetylcholine. To test this postulate the effects of neostigmine and atropine on ganglionic transmissio have been studied in the anesthetized dog. This study was carried out by isolating and stimulating preganglionic sympathetic nerves in the vagal trunk and recording post-superior cervical ganglionic transmission. Blood pressure change was monitored by recording femoral arterial pressures. Recordings were made upon completion of all surgical procedures prior to the administration of drugs, after the administration of a ganglionic blocking agent, after the administration of neostigmine, and after the administration of atropine. Results showed that (1) the ganglionic blocking agent caused a fall in blood pressure and a blockade of ganglionic transmission; (2) the neostigmine produced a rise in blood pressure and a blockade of ganglionic transmission; (3) the neostigmine produced a rise in blood pressure without return of ganglionic transmission and after atropine the blood pressure fell without effect upon ganglionic transmission. These results seem to invalidate the postulate that the neostigmine pressor response is due to a ganglionic action and place the site of action at some postganglionic site.

STUDY OF A TRACER METHOD FOR SOLID PROPELLANTS. SPECTROSCOPIC DETECTION OF TRACER ELEMENTS IN SOLID PROPELLANT ROCKET EXHAUSTS, by W. Stard and B. Hornstein. Summary rept. May 24, 1960-May 23, 1961. Feb. 1962. 52p. incl. illus. diagrs. tables. (AFOSR DRA-62-6) (AFOSR-2712) (AF 29 600)2432) AD 275805 Unclassified

The feasibility of a spectroscopic method for detection of tracer elements in the exhaust flames of solid

propellant rocket engines was investigated. This technique has the possibility of being used to determine burning rates and characteristics of solid propellant grains in operating motors. This is done by relating time of appearance of specific emitted radiation in the exhaust flame with the original position of corresponding tracer salts previously incorporated within the grain. Spectrograph modification and protective measures were required for field monitoring of tracer emission in rocket exhausts of engines operating in an outdoor test installation. Suitable tracers were incorporated into solid propellant grains of 2 compositions-one aluminized to obtain high flame temperatures and background continuum radiation, the other without aluminum to provide lower temperatures and no background. Feasibility of the method was demonstrated with the detection of tracer emission from the aluminized propellant against the background radiation.

INDUCTIVE METHODS IN SEMATIC ANALYSIS; A STUDY OF INDUCTIVE METHOD IN SYNTAX, by P. L. Garvin. Jan. 22, 1962 [28]p. (Technical note no. 1) (AFOSR-1976) (AF 49(638)1128) Unclassified

This paper constitutes an attempt to render explicit the procedure followed intuitively in the conduct of the syntactic analysis of a littleknown language. It is assumed that the detailed explication of the analyst's intuitive research decisions will ultimately give a precise and reliable understanding of the process of analysis, thus leading to the formulation of an inductive research methodology for syntax. The emphasis in this approach is thus on the development of a method rather than of a form of statement. The contention is that the application of a controlled procedure will yield reliable results.

DEGREES OF COMPUTER PARTICIPATION IN LINGUISTIC RESEARCH, by P. L. Garvin. Apr. 19, 1962, 8p. (Technical note no. 2) (AFOSR-2480) (AF 49(638)1128) AD 280044 Unclassified

Presented at the Burg Wartenstein Symposium No. Eighteen of the Wenner-Gren Foundation for Anthropological Research: The Use of Computers in Anthropology, Burg Wartenstein, Austria, June 20-30, 1961.

Also published in Language, v. 38: 385-389, Oct.-Dec. 1962. (Title varies)

The criteria for rating of these computer applications is the extent to which the computer program exercises linguistic judgment. In language data collection, the computer program is not provided with any linguistic information. It is only capable of differentiating the physical shape of input units and uses the differentiation to perform a sort. In linguistic information processing and machine sentence generation, the program contains information about a particular language which permits it to differentiate certain co-occurrence properties of a language known to it and to use this differentiation for a variety of purposes. In automatic linguistic analysis, the program contains information drawn from general linguistic assumptions and methods. This information enables the program to detect co-occurrence properties of a language unknown to it. The judgment of a computer program thus consists in the increasing diversity of conditions which it is capable of taking into account in making its string of yes/no decisions.

LINGUISTICS, DATA PROCESSING, AND MATHEMATICS, by P. L. Garvin and W. Karush. July 9, 1962, 24p. (Technical note no. 4) (AFOSR-2866) (AF 49(638)1128) AD 277949 Unclassified

Also published in Natural Language and the Computer, ed. by P. L. Garvin. New York, McGraw-Hill, 1963, p. 357-359.

The 2 disciplines most closely concerned with language data processing are linguistics and mathematics (including mathematical logic). It is the purpose of this paper to explore how these 2 disciplines relate to each other and to language data processing. Much emphasis has been given to the significance of mathematics for the modeling and processing of natural language and a great deal of effort has been devoted to attempts at expressing linguistic relations in mathematical terms. It is clear that the attraction of higher mathematics for linguists is increasing. Often, some ambitious approaches are mathematically contrived and turn out to be linguistically sterile. Does this mean that mathematical theory is useless in natural language research, or does it mean that the mathematics has not been applied properly or that the needed mathematics has not yet been developed? These are the questions which this paper raises. This is done by comparing the 2 disciplines in the following respects: (1) the explicit methods of reasoning; (2) the [illegible]ge, as shown by the criteria used to evaluate the contributions; and (3) the mode of investigation of particular

research problems. The place of mathematics in an empirical field of science is discussed with particular reference to natural language research.

CESIUM ION BEAM NEUTRALIZATION IN VEHICULAR SIMULATION, by J. M. Sellen, Jr. and R. F. Kemp. [1961] 63p. incl. illus. diagrs. refs. (AFOSR-937) (AF 49(638)886) Unclassified

Presented at Nat'l. IAS-ARS Joint Meeting, Los Angeles, Calif., June 13-16, 1961.

A series of experiments are described which relate to the charge neutralization of a broad cesium ion beam under circumstances which simulate the conditions of space. This has been accomplished by the use of pulsed beams and by the control of the boundary conditions in such a manner as to reduce to an extremely low level the electric fields between these boundaries and the ejected plasma. In the ion engine, the period of ion turn-around has been reduced to values below the present limits of measurement (~ 1μ sec); the ejected plasma possessed a high degree of overall neutrality. The experiments also demonstrated that for fixed ion source perveance the neutralization is independent of the acceleration voltage. In considering the relationship of these experiments to the theoretical treatments of charge neutralization, 4 factors are emphasized: (1) The neutralizer configuration is of importance in the behavior of the beam; (2) There are pronounced differences between the transient behavior of the plasma and after the plasma has encountered the boundaries; (3) The energies of the electrons in the plasma in flight are of the order of volts, and the thermal energies which the electrons possess from the hot cathode are of secondary importance; and (4) Non-conservative processes, by which at least some of the electrons acquire an additional energy, are present during both the flight period and the steady state period of the plasma. These considerations point out the area toward which the experimental observations and theoretical treatments should mutually converge.

MECHANICS OF PLASMA FORMATION IN COLLISIONLESS PLASMA BEAMS (Abstract), by W. Bernstein and J. M. Sellen, Jr. [1962] [1]p. [AF 49(638)886] Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 163, Feb. 28, 1963.

The plasma potential, electron-velocity distribution, and ion density have been studied as functions of position in synthetic-plasma beams for various electron-injection conditions, and for both the pulsed, in-flight, period and the steady-state period after the plasma-front arrival at the collector. Significant differences between these periods occur when electron-injection energy is substantially larger than the energy from thermionic emission. During the in-flight period, electron-velocity distributions are non-Maxwellian in the region near the injection, and, at greater distances, attain a lower temperature, Maxwellian character. Beam divergence is determined by the high-kinetic-energy electrons present in the injection region. In steady state, electron-velocity distributions appear Maxwellian with a uniform temperature throughout the beam; this temperature is intermediate between the extremes in the in-flight situation and results in a reduced ion divergence. Ion-electron coupling is indicated in both in-flight and steady-state situations. Rapid noncollisional thermalization of electrons is indicated in the steady state. Evidence for the presence of oscillations in the plasma beam is presented.

I. SYNTHESIS OF COLLISIONLESS PLASMA BEAMS (Abstract), by J. M. Sellen, Jr. and W. Bernstein. [1962] [1]p. [AF 49(638)886] Unclassified

Presented at meeting of the Amer. Phys. Soc., Atlantic City, N. J., Nov. 28-Dec. 1, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 8: 162, Feb. 28, 1963.

Techniques have been developed for the synthesis of high directed velocity Ce-ion plasma beams. The plasma densities are such that Debye lengths are small compared to the beam dimensions, yet collison-mean-free paths are much larger than the beam dimensions. The ions are generated by contact ionization of Ce upon a hot planar W surface 2.5 cm in diam and are accelerated electrostatically by a planar W grid. The acceleration distance is variable, but is generally of the order of 1 mm. Electrons are introduced into the ion stream through fully or partially immersed W-wire neutralizers. Ion densities in the plasma range from 10^{9}-10^{10} ions/cm^{3}

and ion velocities from 2×10^6–5×10^6 cm/sec depending upon acceleration voltages. A minimum divergence angle of ~3° results from electrostatic lens effects in the acceleration; additional divergence depends upon the injection energies of the electrons. Diagnostic techniques for these plasmas are presented. Interaction of the plasma beam with solenoidal and with transverse magnetic fields is being studied. Application of these studies to exospheric phenomena is discussed.

INVESTIGATIONS OF AERODYNAMICALLY GENERATED SOUND, by H. S. Ribner. Final rept. Jan. 1962. 6p. (UTIA rept. no. 81) (AFOSR-2148) (AF 49(638)249) AD 288991 Unclassified

Aerodynamically generated sound is studied. Thirteen investigations were completed dealing with (1) Aeolian tones; the sound emitted by a rod in an airstream, and the associated forces; (2) boundary layer noise-rigid wall: the direct sound generated by the turbulent boundary layer of a spinning thick-walled cylinder; (3) boundary layer noise - flexible wall: the sound generated by panel vibration excited by turbulent duct flow (simulation of boundary layer flow); and (4) aerodynamic noise theory, particularly jet noise. ELECTRON EXCITATION FOR THE PROBING OF LOW DENSITY GAS FLOWS, by E. P. Muntz, E. O. Gadamer, and D. J. Marsden. [1962] [27]p. incl. diagrs. tables. (AFOSR-3694) (AF 49(638)548) Unclassified

This paper describes the status of electron excitation as a probe for low density gas flows. The beam is most reliably used when pressures range between 0.1 μ Hg and 300 μ Hg. The primary usefulness of the probe is its ability to measure at a point in a flow the static parameters of temperature and density.

RESEARCH IN MAGNETOGASDYNAMICS, by J. H. de Leeuw. Final technical rept. Mar. 28, 1962. 11p. (AFOSR-2431) (AF 49(638)823) AD 283026 Unclassified

The basic objective was the study of the flow of ionized gases with the particular purpose of considering the influence of electric and magnetic fields. A design study was made for a plasma tunnel in which the ionized gas flow is produced by passing the working gases, argon or nitrogen, through an electric arc. It was concluded that a tunnel with a cryogenic pumping system would be the most economical one for providing a capability of expanding the flow to static pressures of the order of a few μ Hg. A first project involved the study of langmuir probes for the determination of electron temperature and charged particle concentration in a low density plasma flow. Experiments performed at 2 levels of charged-particle concentration showed that the electron temperature appeared to be lower than the ion temperature. The other projects have been started involving the use of a large capacity energy storage system for the production of strong magnetic fields. This storage system is believed to be of a novel nature since it employs electrolytic capacitors without requiring a special crow bar arrangement to protect them from the reverse voltage pulse associated with the usually underdamped circuits. A description of the projects using this capacitor bank is included. The first concerns the influence of a

magnetic field on the properties of the boundary layer in an electrically conductive gas. The second is a study of the interaction of shock-ionized argon with a magnetic field.

THE USE OF LANGMUIR PROBES IN LOW DENSITY PLASMA FLOWS, by J. B. French, A. A. Sonin, and J. H. de Leeuw. [1962] [24]p. incl. diagrs. tables, refs. [AF 49(638)823] Unclassified

Published in Rarefied Gas Dynamics: Proc. Third Internat'l. Symposium, Paris (France) (June 1962), New York, Academic Press, Suppl. 2, v. 2: 471-494, 1963. (AFOSR-5310)

An experimental study of Langmuir probes which are small in relation to neutral particle mean free paths is presented. The probes were studied in a moderately supersonic plasma stream at high and low ion concentrations. Probe theory is reviewed and extended, and by comparison with experiment it is indicated that these small probes can be used for the determination of plasma properties when care is exercised in ascertaining the conditions to which the probe is subjected. In particular, the charged particle mean free paths in terms of the probe size and the ratio of electron-to-ion temperature are of importance. The probes were used in the study of the stagnation region in front of a blunt body. (Contractor's abstract)

ATTITUDE STABILITY OF ARTICULATED GRAVITY-ORIENTED SATELLITES. PART I. GENERAL THEORY, AND MOTION IN ORBITAL PLANE, by B. Etkin. Nov. 1962 [48]p. incl. diagrs. tables. (UTIA rept. no. 89) (AF AFOSR-62-40) AD 299840 Unclassified

A theoretical framework is presented for analyzing the rotational and relative motions of compound satellite systems. It consists essentially of expressions derived for the forces and moments acting on the constituent bodies, and of their utilization in Lagrange's equation to find the equations governing the motion of the system. The method is applied to a specific system intended for passive attitude stabilization, and numerical examples are calculated. The design is found to provide damping to 1/2 amplitude in as little as 1/3 of an orbit, and to have small response to orbit ellipticity.

AN EXPERIMENTAL INVESTIGATION OF THE SOUND GENERATED BY THIN STEEL PANELS EXCITED BY TURBULENT FLOW (BOUNDARY LAYER NOISE), by G. R. Ludwig. Nov. 1962, 1v. incl. illus. diagrs. tables, refs. (UTIA rept. no. 87) (AFOSR-4740) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)249 and AF AFOSR-62-267 and Defence Research Board of Canada) Unclassified

The sound power radiated by a series of 11- x 11-in. steel panels excited by fully developed turbulent channel flow has been studied. Four thicknesses of panel were used: 0.0015, 0.002, 0.004, and 0.008 in. Two long acoustically quieted air ducts of 8- x 12- and 1- x 12-in. inside cross sections were used to provide the turbulent flow. The maximum flow speed at the duct center line was about 180 fps. The acoustic efficiency, defined as radiated acoustic power divided by boundary-layer friction power, has been calculated for the various panels. These efficiencies are compared to those of a jet and of a turbulent boundary layer on a rigid wall. For low subsonic Mach numbers and thin panels, the efficiencies attained were greater than that of a turbulent boundary layer on a rigid wall by at least a factor of 10 and greater than that of a jet by a factor of more than 100. Extrapolation of the test data to include high subsonic Mach numbers and thicker panels suggests that the flexible panel mechanism for generating sound may prove relatively more efficient than the other 2 mechanisms over a fairly wide range of these parameters.

[RESEARCH ON THE VOLUME[T]RIC REGULATION OF THE ALDOSTERONE SECR[ETION] Recherches sur la régulation volumetrique de la sécrétion de l'aldostérone, by A. Baisset, L. Douste-Blazy and others. [1962] [6]p. incl. diagrs. (AFOSR-J181) (AF 61(052)-411) AD 400052 Unclassified

Also published in Ann. Endocrinol., v. 23: 419-424, 1962.

The effects of auricular distention on the secretion of aldosterone in the normal dog before and after vagotomy, decerebration, hypophysectomy, and hypothalamic lesions were studied. It was noticed in the anesthetized dog that distention of the right auricle diminishes the aldosterone secretion by at least 50%. This effect is suppressed by vagotomy or posterior hypothalamic lesions, but it is maintained after hypophysectomy or anterior hypothalamic lesions. Distention of the left auricle did not influenced aldosterone secretion.

MATHEMATICAL STUDY ON KINETIC THEORY OF GASES APPLIED TO LOW DENSITY HIGH SPEED FLOW, by J. J. Smolderen. Final rept. Jan. 31, 1962, 5p. (AFOSR-2490) (AF 61(052)486) AD 289458 Unclassified

The solution of a simplified form of the unsteady shock problem, using a more schematic discontinuous distribution function as suggested by Lees in his treatment of the Rayleigh problem, has been obtained. Also, a general discussion of the mathematical type of the partial differential systems obtained for various choices of moment equations has been made. The study of the singularity obtained earlier has been started for the case of the 1-dimensional model. The various approximations methods available for the treatment of the Boltzmann equation are compared, particularly those based on the moment equations. Finally, the study of steady state boundary condition problems for the linearized model equation was initiated. The equation is found to be of singular parabolic type according to the terminology of Gevrey.

A ONE DIMENSIONAL MATHEMATICAL MODEL FOR THE BOLTZMANN EQUATION, by J. J. Smolderen. Oct. 1962, 56p. incl. diagr. refs. (Technical note no. 10) (AFOSR-4368) (AF 61(052)486) Unclassified

A 1-dimensional model for the Boltzmann equation of kinetic theory of gases is proposed, in order to study the validity of the usual approximation method and the behavior of the solutions near the free molecule limit. The interaction term is very similar to the Fokker Planck term. The conservation of mass, momentum and energy results from the particular form assumed for the interaction term and the only equilibrium solutions are shown to be of Maxwell-type. Hydrodynamic equations similar to the Navier-Stokes-Fourier equations are derived in the usual way under the asuumption of small gradients. Shock waves are shown to exist in supersonic flows. The distribution function is obtained in the case of a spatially uniform condition and the existence of an infinite number of a relaxation modes and corresponding relaxation times is shown. The linearized versions of the model equation are established with particular emphasis on the simplest problesm of heat conduction and wave propagation and the usefulness of Fourier transformation with respect to the velocity component is indicated. Finally, the behavior of the solutions near the free molecule limit is briefly investigated for steady state conditions. Existence of a singular behavior for slow molecules, analogous to boundary layer phenomenon, is indicated and the equation is shown to reduce to a singular parabolic equation

studied by Gevrey, in the region of interest. The leading terms in the deviation from free molecule data are found to be of the order of the cube root of an interaction parameter, playing a role analogous to the Knudsen number.

LAMINAR SEPARATION IN SUPERSONIC FLOW, by J. J. Ginoux. Final rept. Dec. 1, 1961-Sept. 30, 1962 [45]p. incl. illus. diagrs. tables. (AFOSR-4238) (AF EOAR-62-52) AD 292901 Unclassified

A preliminary experimental investigation has been made of the effect of 3-dimensional flow perturbations on the heat-transfer rate in the reattachment region of a laminar flow behind a 2-dimensional backward-facing step. It was found that the mean value of the heat-transfer rate was increased by as much as 70% by the presence of strong flow perturbations, while the recovery factor increased approximately from the laminar value ($\sqrt{P}^2$) to the turbulent one ($\sqrt{P}^2$). A novel technique of heat-transfer measurements was used, by which heat was uniformly dissipated on the surface of the model. A theory has been developed for the case of a supersonic flow over a flat plate, which gives an exact solution of the boundary layer equations when heat is uniformly dissipated on the surface. It was shown in particular that the ratio of the heat transfer coefficient for an isothermal wall to the heat-transfer coefficient for uniform heat-flux is a constant independent of Mach number and Reynolds number. Numerical integration showed that it is equal to 0.72; independently of the Prandtl number in the range 0.5 to 1.0. (Contractor's abstract)

ON THE NONSTATIONARY NAVIER-STOKES SYSTEM, by T. Kato and H. Fujita. [1962] [18]p. (AFOSR-4372) (AF EOAR-62-7) AD 295874 Unclassified

Also published in Rend. Sem. Matem. Univ. Padova, v. 32: 243-260, 1962.

A number of works have been published on the initial value problem for the nonstationary Navier-Stokes equations. As yet the existence of a global solution (in time) has not been proved for the 3-dimensional flow for sufficiently general initial conditions; but it now appears that the existence and uniqueness of a genuine solution which is local in time have been established. An attempt is made to deduce an existence and uniqueness theorem by means of Hilbert space theory. The ultimate objective is proof of the theorem in its classical form. As a preliminary step to this goal, a somewhat weaker form is proved as an existence and uniqueness theorem on the initial value problem of the Navier-Stokes equation regarded as a nonlinear operator equation in an appropriate Hilbert space.

[THEOREM OF LOCAL CHARACTER FOR THE NAVIER-STOKES SYSTEM AND STABILITY OF STATIONARY SOLUTIONS] Teoremi de tipo locale per il sistema de Navier-Stokes e stabilita delle soluzioni stazionarie, by G. Prodi. [1962] [24]p. incl. refs. (AFOSR-4373) (AF EOAR-62-7) Unclassified

Also published in Rend. Sem. Matem. Univ. Padova, v. 32: 374-397, 1962.

This work is a study of the Navier-Stokes system

$$\frac{\partial u}{\partial t} = (u \cdot \text{grad})u - \Delta u = - \text{grad } p + f$$
$$\text{div } u = 0 \quad (u = (u_1, u_2, u_3))$$

in a 3-dimensional bounded open set. Existence and uniqueness theorems, of local character with respect to t, are given for the mixed problem. The approach to the problem is similar to Sobolewski's; but some improvements are supplied by a more direct method. With a view to applications to other problems, there is an estimate of the interval where the existence of the solution is assured. The problem of stability of stationary solutions is considered, more exactly it is proved that, if the variation operator associated to a stationary solution u^* has the whole spectrum with positive real part, the solution u^* is asymptotically stable. This statement is implicitly assumed in all the papers but there was no evidence that it has been proved.

PYROLYSIS OF ALLYLIC ACETATES. II, by F. L. Greenwood. [1962] [4]p. incl. refs. (AFOSR-2120) (AF 49(638)292) Unclassified

Also published in Jour. Org. Chem., v. 27: 2308-2311, July 1962.

2-Acetoxy-trans-3-hexene and 4-acetoxy-trans-2-hexene have been pyrolyzed under conditions that gave partial pyrolysis. Both esters gave rise to a mixture of 1,3- and 2,4-hexadiene, the 2-acetoxy compound giving somewhat more of the 1, 3-diene and the 4-acetoxy compound giving more of the 2,4-diene. The 1,3-diene was predominantly the trans isomer, and about half of the 2,4-diene was the trans, trans isomer. The unpyrolyzed ester recovered in each case was the same mixture of 2-acetoxy and 4-acetoxy compounds. Clearly, the esters underwent isomerization during the pyrolysis, and in this isomerization the trans-alkene configuration was essentially retained. (Contractor's abstract)

INNOVATION IN TASK ORIENTED COMMUNICATION, by T. B. Roby. Final rept. Aug. 1962 [15]p. (AFOSR-J1372) (AF AFOSR-62-372) AD 428333 Unclassified

The objective of this project was to examine the processes whereby people develop a new language to deal with a distinctively new environment or task. The impetus for this research came from the observation that whenever a new technological development is introduced, the people most closely connected with it—for example, technicians and operators—very rapidly develop a convenient, concise jargon which permits them to express themselves and to cope with whatever the coordinative requirements of the task may be. Typically, of course, this language innovation is based upon a transfer of existing language elements. The present study them is prepared to set up such conditions deliberately and in a controlled way, and to study the determinants of the new language construction as well as to study the form that the language itself takes. The results of this study indicated better performance for the 2-way conversation condition. It also indicated differences in stimulus materials: the polygon for which the variations were more pronounced were easier to identify than those in which fine details had to be differentiated. (Contractor's abstract)

ON THE GREEN'S FUNCTION OF POTENTIAL SCATTERING, by M. Verde. Final rept. Sept. 29, 1962 [37]p. (AFOSR-4055) (AF 61(052)230) AD 290687 Unclassified

Also published in Nuovo Cimento, v. 24: 547-566, May 1963.

The Green's function in some potential scattering problems of spherical symmetry is written as an integral of the product of the Green's function Ga corresponding to the angular variables and Gr corresponding to the radial variables. The integration is carried along a suitable line C in the plane of complex angular momentum. If C surrounds the spectrum of Ga, the usual partial waves expansion is obtained if C surrounds the spectrum of Gr, a different expansion results which is the most suitable for describing collisions involving small wave lengths.

DYNAMICAL EQUATIONS AND ANGULAR MOMENTUM, by V. De Alfaro, T. Regge, and C. Rossetti. [1962] [34]p. incl. diagr. table, refs. (AF 61(052)230) Unclassified

Published in Nuovo Cimento, Series X, v. 26: 1029-1062, Dec. 1, 1962.

In this paper the potential scattering is described in terms of Jost functions $F(\lambda, s)$ of the variables λ (angular momentum) and s (energy). In particular the connection between analytic properties of $F(\lambda, s)$ and double dispersion relation plus unitarity for the transition amplitude is discussed. It is found that all these properties can be condensed into an integral representation for $F(\lambda, s)$ and a nonlinear identity. This identity contains rougly the same amount of information of Khuri's dispersion relations for the scattering amplitude in the energy at fixed transmitted momentum. From this identity and the integral representation it is possible to construct $F(\lambda, s)$ in much the same way as Blankenbecler et al. are constructing the double spectral function for the transition amplitude in the variables s, t. The advantage of working on the mass shell, is paid

for by the nonlinearity of these equations. It should be pointed out that in this method there are no subtraction troubles and that it is possible to determine the location of bound states and resonances.

THE MAXIMUM ANALYTICITY PRINCIPLE IN THE ANGULAR MOMENTUM, by E. Predazzi and T. Regge. [1962] [16]p. [AF 61(052)230] Unclassified

Published in Nuovo Cimento, v. 24: 518-535, May 1962.

Chew has proposed to extend this maximum analyticity principle to angular momentum. So far analyticity of the scattering amplitude in the angular momentum has been proved for potential scattering only when Re ( ) > - . According to Chew it ought to be possible to extend this analyticity in the whole plane, apart from those singularities which have a clear physical interpretation in terms of dynamical resonances or bound states. In this paper it is shown that a potential with a strongly repulsive core may be the way out of the dilemma in the sense that the resulting amplitude is then even in (+) and the desired analytical continuation is then trivial.

PHASE SHIFTS AND MODEL POTENTIALS, by M. Verde. [1960] [11]p. (AF 61(052)230) Unclassified

Published in Beitrage zur Entwicklung der Physik, ed. by H. Frauenfelder, O. Huber, and P. Stahelin. Basel. Birkhauser Verlag, 1960, p. 231-241. (Helv. Phys. Acta, Suppl. 5)

Here is a brief discussion of the problem of fundamental interest in nuclear physics, concerning the correspondence of a set of measured phase shifts as a function of the energy in an elastic scattering, to a possible potential which may serve as a model to describe a nuclear collision. It is quantitatively demonstrated that the asymptotic behavior of the potential at large distances is very sensitive to the position and the nature of singularities of the scattering matrix S(E), as function of the energy E^2. On the other hand, any knowledge of the potential at small distances, if deduced from s-eigenwaves, only, is insensitive to the analytical properties of S(E) at low energies. Since a large number of partial waves are involved in high energy collision data, it is necessary to generalize in order to establish a correspondence between a model potential and the analytical behavior of the total scattering amplitude as function of the scattering angle at a fixed energy. The necessary mathematical tool consists in relating the model potential U(x) to some appropriate kernels $K_e(x, x')$ and $K_i(x, x')$

$$K_e(x, x) = \int_x^\infty U(x')dx', \quad K_i(x, x) = \int_0^x U(x')dx'$$

K_e and K_i are respectively called the kernels of Marchenko and of Gel'fand and Levitan. In the final section it is indicated how the Gel'fand and Levitan equation and the corresponding equation for the outgoing waves can be derived.

ALPHA-FLUOROALKYL THIOETHERS, by C. T. Mason. Final rept. Mar. 1962, 43p. incl. tables. (AFOSR-2398) (AF 49(638)283) AD 419526 Unclassified

Fundamental research on halogenated thioethers (sulfides) is reported. The primary idea of the research is to investigate the properties of new fluoromethyl thioethers and to compare their properties with those of the chlorine analogues. A series of so far unreported fluoromethyl n-alkyl sulfides was prepared from the corresponding chloromethyl alkyl sulfides. Their chemical properties are discussed. (Contractor's abstract)

DECAY OF Sm^{156} (Abstract), by R Gunnink. [1962] [1]p. [AF 49(638)815] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 353, Apr. 23, 1962.

Also published in Phys. Rev., v. 131: 301-304, July 1, 1963.

The radiations following the decay of 9.4 ± 0.2 hr Sm^{156} have been studied using techniques of scintillation spectrometry and 4π-β counting. The isotope was produced by fissioning natural uranium in a high neutron flux and, except for Sm^{153}, was separated from other fission products by radiochemical techniques. The following γ-rays were observed in the decay of Sm^{156}: 38 kev, x-rays (~ 20%), 87 kev (40%), 165 kev (18%), 203 kev (29%), and 255 kev (5%). The 87-kev γ transition was found to be in coincidence with both the 165- and 203-kev γ transitions. Its K-shell conversion coefficient is 0.35 ± 0.02. Angular-correlation studies indicated the 87-203 kev γ anisotropy to be about -0.27 and the 87-165 kev γ anisotropy to be < 0.1. Fermi plots of the β spectra coincident with the 165- and 203-kev γ rays produced identical end points of 430 ± 10 kev. Another β group, 45% in abundance, had an end point of 715 ± 15 kev, and presumably goes to the ground state of Eu^{156}. Interpretation of the data and alternative decay schemes is discussed.

A SYSTEM FOR AUTOMATIC DENSITOMETRY FOR THE MEASURING AND CALCULATION OF RADIATION DOSE DISTRIBUTIONS, by B. G. Karlsson and B. Larsson. Feb. 20, 1962, 12p. incl. diagrs. tables. (Technical note no. 3) (AFOSR-2669) (AF 61(052)183) AD 276062 Unclassified

The usefulness of the method of experimental radiosurgery of the brain depends on a careful planning of the operative procedure, the shape of the lesion being related to the distribution of isodose curves in the tissue. A system for automatic densitometric measurements was developed which permits automatic evaluation of dose distributions in volumes of various size by means of photographic emulsions or in-phantom chemical dosimeters. The apparatus is also convenient for the semi automatic calculation of dose distributions in multiple field procedure. (Contractor's abstract)

HISTOLOGY OF THE SURGICAL RADIOLESION IN THE HUMAN BRAIN AS PRODUCED BY HIGH ENERGY, by W. Mair, B. Rexed, and P. Sourander. [1962] [6]p. incl. illus. (Technical note no. 4) (AFOSR-3480) (AF 61(052)183) AD 284931 Unclassified

Presented at Symposium on High Energy Protons, Harrogate, Yorkshire, (Gt. Brit.) Aug. 1962.

Changes in the mid brain of a man following irradiation were studied on one side of the spinothalamic tract region by high energy protons to relieve pain. The man was 59 and suffered from intractable pain due to cancer of the lung with spread to the axilla and the supraclavicular region. The irradiated region was sharply demarcated being ovoid in shape with a crenated border. Destruction of myelin sheaths, axons, astrocytes and oligodendroglia occurred in the irradiated region and some tiny perivascular haemorrhages were present. Nuclear debris and collections of macrophages were found at the edge of the necrosis. Little proliferation of astrocytes was seen 9 weeks after irradiation. The changes were exactly similar to those seen in goats 7 and 4 weeks after irradiation with the same dose. Tiny, discrete, rounded, zones of necrosis were seen in man just rostral to the confluent necrosis. They are presumably the result of interesecting beams as they pass to the center of irradiation.

BORIDES OF RUTHENIUM, OSMIUM AND IRIDIUM, by B. Aronsson, E. Stenberg, and J. Aselius. (Technical note no. 32) May 21, 1962, [6]p. incl. tables. (AFOSR-2785) (AF 61(052)40) AD 281221 Unclassified

Also published in Nature v. 195: 377-378, July 28, 1962.

The work by Buddery and Welsh (Nature, v. 167: 362. 1951) on the composition of the intermediate phases in the binary system of boron with the platinum metals is extended by the study of crystal structure using powder photographs of arc-melted alloys. The results of Kempter and Fries, (Jour. Chem Phys. v. 34: 1994, 1961) that there are phases with the W_2B_5-type structure in the Ru-B and Os-B systems and that the boron content of these phases is smaller than 71.4 at-% (Me_2B_5) were confirmed. More thorough investigation should make it possible to determine if $RuB_{1.1}$ and $OsB_{1.2}$ are cubic or hexagonal and the crystal structure of $RuB_{2.1}$ and $OsB_{2.2}$.

X-RAY STUDIES OF MOLYBDENUM AND TUNGSTEN PHOSPHIDES, by S. Rundqvist and T. Lundström. [1962] [10]p. incl. diagrs. tables, refs. (Technical note no. 33) (AFOSR-2993) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)40 and Swedish State Council of Technical Research) AD 278177 Unclassified

Also published in Acta Chem. Scand., v. 17: 37-46, 1963.

The Mo-P and W-P systems have been studied by x-ray powder methods. In addition to the previously reported phases Mo_3P, MoP MoP_2, WP, and WP_2, the occurrence of a phase with the approximate composition $MoP_{0.75}$ has been established. The unit cell dimensions for Mo_3P, MoP, and WP have been redetermined. Some data supporting the hypothesis of an ordered distribution of phosphorus atoms in MoP (WC-type structure) are given. The structures of the isostructural MoP_2 and WP_2 have been determined, and the MoP_2 structure has been refined from x-ray powder data. The orthorhombic unit cell dimensions (in A) are for MoP_2: a = 3.145; b = 11.184; c = 4.984; and for WP_2: a = 3.166, b = 11.161; c = 4.973. The space-group is $Cmc2_1$ with 4 metal atoms and 8 phosphorus atoms in 3 sets of fourfold positions. The structure is related to the $ZrSi_2$ (C 49) type. (Contractor's abstract)

THE CRYSTAL STRUCTURES OF Rh_2Si AND Rh_5Si_3 WITH SOME NOTES ON THE Rh-Si SYSTEM, by I. Engstrom. [1962] [10]p. incl. diagrs. tables, refs. (AF 61(052)40) Unclassified

Published in Acta Chem. Scand., v. 17: 775-784, 1963.

The crystal structures of Rh_2Si and Rh_5Si_3 have been refined from single crystal data. For Rh_2Si (C23 type), the unit cell dimensions are a = 5.40_8 A, b = 3.93_0 A, and C = 7.38_3 A, and the atomic parameters are Rh_I in 4(c): x = 0.8393, z = 0.0694; Rh_{II} in 4(c): x = 0.9726, z = 0.6991; Si in 4(c): x = 0.2819, z = 0.1052. For Rh_5Si_3 (Rh_5Ge_3- type), the unit cell dimensions are a = 5.31_7 A, b = 10.13_1 A and c = 3.89_5 A, and the atomic parameters are Rh_I in 2(c); Rh_{II} in 4(g): x = 0.1542, y = 0.2158; Rh_{III} in 4(h): x = 0.3297, y = 0.3936; Si_I in 2(a); Si_{II} in 4(h): x = 0.3917, y = 0.1505. A hexagonal phase with the composition $Rh_{\sim 1.5}Si$ and the unit cell dimensions a = 11.85_1 A, c = 3.62_3 A is reported. (Contractor's abstract)

RESEARCH ON INTERPOLATION PROBLEMS, by L. Carleson. [Final rept.] June 1, 1962, [42]p. (AFOSR-2972) AF 61(052)238) AD 278144 Unclassified

In a paper by Carleson (1958), a new method to study interpolations by bonded analytic functions was introduced. The results of this paper have been shown to hold in arbitrary domains of finite connectivity. Corresponding results have been obtained for other H^p-classes and for the class of uniformly continuous functions. Finally, the method has been used to prove the corona conjecture on the maximal ideal space of H^∞.

INTERPOLATIONS BY BOUNDED ANALYTIC FUNCTIONS AND THE CORONA PROBLEM, by L. Carleson. [1962] [13]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052) 238] and National Science Foundation) Unclassified

Published in Ann. Math., v. 76: 547-559, Nov. 1962.

This paper contains a number of results related to the theory of interpolation in H^p spaces, where $p > 1$. Letting $G(z)$ be an element of H^p with norm $\| G \|_p$ and letting $\mu(z)$ be a positive measure on $|z| < 1$, the author first considers the problem of determinating a condition on μ necessary and sufficient for the existence of a constant C such that $\int |G(z)|^p_p \, d\mu(z) \leq C \cdot \| G \|^p_p$ for all G in H^p. He is able not only to determine such a condition (which says that the ratio of the measures of certain annular wedges to their angles be bounded) but to apply it to the construction of regions in which a given Blaschke product is neither too large or too small. The author is then able to solve certain interpolation problems in the Banach algebra B of boun bounded analytic functions in the open unit disc. If $\{b_\nu\}$ and $\{c_\nu\}$ are 2 sequences with no common terms such that the corresponding Blaschke products $B(z)$ and $C(z)$ converge, it is shown that the condition $|B(z)| + |C(z)| \geq \delta > 0$ is necessary and sufficient for the existence of f in B such that $f(b_\nu) = 0$, $f(c_\nu) = 1$ $(\nu = 1, 2, \ldots)$. Finally the author solves an interpolation problem of D. J. Newman's to be equivalent to the corona conjecture. Thus the Corona problem is solved. The Corona conjecture is as follows. Given $f_1, \ldots, f_n$ in B, a necessary and sufficient condition for the ideal generated by them to be B is that there

exist $\delta > 0$ such that $|f_1(z)| + \ldots + |f_n(z)| > \delta(|z| < 1)$. (Math. Rev. abstract)

A MAGNETIC SPECTROMETER FOR NEUTRON CAPTURE EXPERIMENTS, by G. Backstrom, A. Backlin and others. [1962] [15]p. incl. illus. diagrs. (AFOSR-4416) (AF EOAR-62-72) AD 295941 Unclassified

Also published in Nuclear Instr. and Methods, v. 16: 199-213, July 1962.

A 50 cm radius double focussing spectrometer is described, which is used for measuring internal conversion spectra following neutron capture. A collimated neutron beam interacts with a target inside the spectrometer. A target area of 20 cm^2 may be used at a line half-width of 0.1% due to a special arrangement involving electrostatic acceleration. The magnetic field is regulated to a few parts in 10^5, and data are taken automatically. Preliminary results are shown. The instrument may also be used for gamma-ray experiments, with either Compton electrons or photo-electrons. (Contractor's abstract)

SINGLE AND DOUBLE INTERNAL BREMSSTRAHLUNG, by J. E. Thun, W. D. Hamilton and others. Sept. 13, 1963. [13]p. incl. diagrs. refs. (AFOSR-4419) (AF EOAR-62-72) AD 295943 Unclassified

Also published in Arkiv Fysik, v. 22: 565-577, 1962.

A theoretical calculation on internal bremsstrahlung is presented which gives the same result as that obtained from the theory of Knipp and Uhlenbeck. The IB cross section is measured for P^{32} by recording coincidences between β-particles of a certain energy selected by a magnetic spectrometer and IB photons above 300 kev. The angle between the β-particles and photons was 90°. The experimental result agrees well with theory. In connection with another experiment on double (2-quantum) internal bremsstrahlung (DIB), a theoretical calculation on this process is presented. The experiment in which triple coincidences between the β-particle and the related 2 photons are recorded puts an upper limit to the DIB from P^{32}. An upper limit to the rate of emission of nuclear γ-rays in this decay is also obtained from the experimental data. Finally, improvements of the experimental facilities are discussed which will further reduce the upper limit on DIB. (Contractor's abstract)

DOUBLE INTERNAL CONVERSION, by G. Bäckström, J. Lindskog, and J. O. Lindström. [1962] [2]p. incl. diagrs. [AF EOAR-62-72] Unclassified

Also published in Phys. Ltrs. v. 3: 23-24, Nov. 15, 1962.

The purpose of this paper is to report on the direct observation of this double conversion process for the 192 keV isomeric transition in In^{144}. Strong evidence for assuming that the effect observed is due to a nuclear 2 quantum process has been found. It is concluded that the electron coincidences observed are due to transitions via virtual nuclear states with a rate of 3×10^{-4} two step transitions (involving a K and an L electron) per direct transition.

EXPERIMENTAL STUDIES OF THE ELECTROMAGNETIC TRANSITIONS FROM THE FIRST EXCITED STATES IN Hf^{177}, Lu^{175}, and Lu^{177} by J. Lindskog, T. Sundström, and P. Sparrman. [1962] [14]p. incl. diagrs. tables, refs. (AFOSR-J141) (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-62-123] and Swedish Atomic Research Council) AD 400381 Unclassified

Also published in Arkiv Fysik, v. 23: 341-353, 1962.

The lifetimes of the first excited states of Hf^{177}, Lu^{175}, and Lu^{177} were measured by the delayed coincidence technique. The results of the measurements are given. In Lu^{177} the energies of the transitions from first and second excited states to the ground state were remeasured and the $L_I + L_{II}/L_{III}$ ratio for the 122 kev transition was determined. The properties of the 3 transitions treated are discussed in terms of the unified model. The possibility that the conversion coefficient for the 113 kev transition in Hf^{177} is affected by nuclear structure effects is considered. (Contractor's abstract)

SEARCH FOR TWO-QUANTUM DECAY OF In^{114m}, by Z. Grabowski, S. Gustafsson, and G. Bäckström. [1962] [6]p. incl. diagrs. refs. (AFOSR-J316) (AF EOAR-62-123) AD 408027 Unclassified

Also published in Nuclear Phys., v. 38: 646-653, Nov. 1962.

The 192 kev isomeric state in In^{114} decays with a half-life of 50 d. Measurements of the K/L ratio with a double focusing spectrometer confirmed that the transition to the ground state is of E4 character. The level might alternatively decay by 2-quantum emission, which should be particularly probable in this case, since it may proceed by enhanced E2 transitions. Considering that the 192 kev E4 transition is strongly retarded, the In^{114m} case seems to be especially suitable for detection of 2-quantum decay. This mode of decay was experimentally investigated by coincidence measurements between gamma rays of 96 kev and other gamma-rays, didplayed on a multi-channel analyzer. The result shows that the relative probability for 2-quantum decay is less than 3×10^{-5}, a value which is orders of magnitude lower than theoretical estimates. Analogous experiments with conversion electrons might prove valuable.

AUGER SPECTRA IN THE INTERMEDIATE COUPLING REGION, by O. Hornfeldt, A. Fahlman, and C. Nordling. [1962] [9]p. incl. diagrs. tables, refs. [AF EOAR 62-123] Unclassified

Published in Arkiv Fysik, v. 23: 155-163, 1963.

K-LL Auger spectra of the elements from strontium (Z = 38) to silver (Z = 47) have been studied with a high-resolution β-spectrometer. The 9-line spectrum predicted in the intermediate coupling theory has been established in strontium, zirconium, and molybdenum. Energies and relative intensities have been measured. From the observed separations of the lines in the strontium, zirconium, and molybdenum spectra a set of constant is obtained for the calculation of K-LL Auger energies in the intermediate coupling region. These constants differ considerably from those given by Asaad and Burhop, which indicates that for a given set of constants, the corresponding expressions for the calculation of Auger energies are valid only over a restricted Z region. GAMMA-GAMMA ANGULAR CORRELATION AND INTENSITY MEASUREMENTS ON LOW ENERGY GAMMA RAYS IN THE DECAY OF Ce^{144}, by W. Zuk and S. Gustafsson. [1962] [9]p. incl. diagrs. table, refs. [AF EOAR-62-123] Unclassified

Published in Arkiv Fysik, v. 24: 69-77, 1963.

The decay of Ce^{144} has been investigated using a γ-scintillation spectrometer and an automatic γ-γ directional correlation apparatus. The relative intensities of the following γ-rays of Pr^{144}, 134 and 80 kev, and the 36 kev x-ray have been measured giving the following result 100; 33.4 ± 1.0; 107.0 ± 2.0. The result for the 80 kev γ-ray is in agreement with Hickok et al, and in disagreement with Geiger et al. A measurement has been made of the γ-γ angular correlation of the 54-80 kev cascade in Pr^{144}. This measurement confirms the 1⁻ spin assignment of Geiger et al for the 134 kev level. In Nd^{144}, the angular correlation of the 1.49-0.69 mev cascade has been measured. The result is in very good agreement with the previous measurement by Steffen. (Contractor's abstract)

THE GYROMAGNETIC RATIO OF THE FIRST ROTATIONAL STATE IN Hf^{178}, by E. Karlsson, E. Matthias, and S. Ogaza. [1962] [10]p. incl. diagrs. tables, refs. [AF EOAR-62-123] Unclassified

Published in Arkiv Fysik, v. 22: 257-266, 1962

The g-factor of the 93 kev state in Hf^{178} has been measured by observation of the shift of the angular correlation in external magnetic fields of 45,760 and 25,200 gauss. The result was g = + 0.29 ± 0.02. A time-dependent electric quadrupole perturbation was found in the source used by means of an attenuation measurement. The corresponding integral factors G_2 = 0.74 ± 0.09 and G_4 = 0.818 ± 0.046 were used for corrections to the $w\tau$-value. The life-time of the 93 kev state was found to be τ = 2.16 ± 0.04 ns. The result is in agreement with the theoretical predictions of Nilsson and Prior. (Contractor's abstract)

AN INSTRUMENT FOR THE STUDY OF MOMENTS OF EXCITED NUCLEAR STATES BY ANGULAR CORRELATION METHODS. PART A: PRINCIPLES OF MEASUREMENTS WITH A 4-DETECTOR SYSTEM AND APPLIED EXTERNAL FIELDS. CONSTRUCTION OF A NEW 60,000 GAUSS ELECTROMAGNET BASED ON THESE PRINCIPLES, by B. E. Karlsson [1962] 25p. incl. illus. diagrs. tables, refs. [AF EOAR-62-123] Unclassified

Published in Arkiv Fysik, v. 22: 1-25, 1962.

Methods for measuring small perturbations in γ-ray angular correlations with good accuracy are presented.

The sensitivity of the measurements is increased by using a multi-detector system. It is shown that the inherent symmetry properties of a 4-detector system can be utilized for reduction of systemic errors. A 60,000 gauss electromagnet was constructed especially for this application and possibilities of applying magnetic fields both parallel and perpendicular to the detected radiations add to the flexibility of the arrangement. In connection with each particular application, possible experiments are outlined. In part B of this paper, the electronic system is presented as well as a summary of results obtained.

AN INSTRUMENT FOR THE STUDY OF MOMENTS OF EXCITED NUCLEAR STATES BY ANGULAR CORRELATION METHODS. PART B: ELECTRONIC EQUIPMENT. TEST METHODS AND PERFORMANCE OF THE SYSTEM, by B. E. Karlsson, E. Matthias, and C-A. Lerjefors. [1962] [13]p. incl. diagrs. tables, refs. [AF EOAR-62-123] Unclassified

Published in Arkiv Fysik, v. 22: 27-39, 1962.

In item no. 3129 accurate methods for measuring small perturbations in γ-ray angular correlations were presented. Here, some features of a detecting system especially made for this purpose will be discussed. Four detectors are used, and information from these is collected in several coincidence circuits simultaneously. The operation of the detectors in the vicinity of strong magnetic fields is also of great interest. A summary is given of results obtained.

ON THE TRANSITIONS FROM THE EXCITED LEVELS OF Re^{187}, by K. S. Han, S. C. Pancholi, and Y. Grunditz. [1962] [9]p. incl. diagrs. tables, refs. [AF EOAR 62-123] Unclassified

Published in Arkiv Fysik, v. 23: 505-513, 1963.

The internal conversion spectrum from the excited levels of Re^{187} has been studied by means of a high resolution double focusing magnetic β-ray spectrometer. A total of 34 internal conversion lines and 6 Auger lines were found. The energies of the 14 observed γ transitions are in excellent agreement with those of previous work. Multipolarity assignments for the γ-transitions have been made on the basis of internal conversion coefficient radios. (Contractor's abstract)

PHOTO ELECTRON MEASUREMENTS OF L LEVELS IN THE ELEMENTS STRONTIUM (Z = 38) TO PALLADIUM (Z = 46), by A. Fahlman, O. Hornfeldt, and C. Nordling. [1962] [6]p. incl. diagrs. tables, refs. [AF EOAR-62-123] Unclassified

Published in Arkiv Fysik, v. 23: 75-80, 1963.

The photo electron method has been applied for precision measurements of the L_I, L_{II} and L_{III} binding energies in the elements strontium (Z = 38) to palladium (Z = 46). For technetium (Z = 43), no experimental determinations of the electron binding energies have previously been reported. Good agreement is found with theoretical predictions for spin and screening doublet splittings, whereas a comparison with x-ray data shows discrepancies that are significant. (Contractor's abstract)

THE PHOTO ELECTRON METHOD OF DETERMINING h/e, by S. Hagström, O. Hörnfeldt and others. [1962] [9]p. incl. diagrs. refs. [AF EOAR-62-123] Unclassified

Published in Arkiv Fysik, v. 23: 145-153, 1963.

A new method has been applied for the determination of the fundamental constant combination h/e. Photo electrons from the same shell in a converter material are expelled by the characteristic x-radiation ($K\alpha_1$) from 2 different elements. The electron lines are brought to a common focus in a high precision iron-free β-spectrometer by accelerating or retarding the photo electrons. Equating the total applied voltage times the electronic charge, Ve, to the energy difference between the two x-ray lines, $h(\nu_1 - \nu_2)$, gives h/e. Some preliminary measurements are reported together with a study of possible systematic errors. The measurements give for the quantum energy conversion constant ($E\lambda_s$), ($E\lambda_s$) (12372.9 ± 1.5)kv · X.U. from which (4.1356 ± 0.0006) x 10^{-15} J/A is obtained for the ratio h/e.

THE Z-DEPENDENCE OF ENERGIES AND RELATIVE INTENSITIES IN THE K-LL AUGER SPECTRUM, by O. Hörnfeldt. [1962] [11]p. incl. diagrs. tables, refs. [AF EOAR-62-123] Unclassified

Published in Arkiv Fysik, v. 23: 235-245, 1963.

The formulae deduced by Asaad and Burhop for calculating K-LL Auger energies have been adjusted to experimental data by introducing a new expression to approximate the electrostatic interaction energy between the 2 vacancies in the final state of the atom. Using the modified formulae, the K-LL Auger energies have been calculated for 81 elements, the Z-values ranging from Z = 20 to Z = 100. In most cases, the agreement with observed energies is better than 0 05% or within the errors of the measurements. Using published experimental data, the intensities of the lines in the K-LL spectrum relative to that of the K-L_1L_1 ($^1S_0$) transition have with one exception (the K-L_1L_2 transitions) been demonstrated to be linearly dependent on Z or Z^{-2}. This empirically obtained Z-dependence is different from the theoretical predictions by Asaad and Burhop, and by Callan. (Contractor's abstract)

IGNITION AND COMBUSTION OF SOLID PROPELLANTS, by R. C. Mitchell and J. A. Keller. Oct. 1, 1961 to Sept. 30, 1962, 35p. incl. diagrs. tables, refs. (AFOSR-5316) (AF AFOSR-62-99)
Unclassified

The response of several selected composite propellants subjected to surface heat fluxes was experimentally studied. The surface propellant samples were subjected to thermal-radiation heat fluxes from 1 to 13.5 cal/sec sq cm and convective heat fluxes from 30 to 100 cal/sec sq cm. Parallel theoretical studies, which were guided by the experimental results, have given a satisfactory explanation of the general character of the ignition process. The scope of this research work has been broadened to include several phases of the combustion of solid propellants.

COMBUSTION IRREGULARITIES IN SOLID PROPELLANTS, by R. L. Coates. Fifth quarterly progress rept. Apr. 1-June 30, 1962. Aug. 6, 1962 [111]p. incl. diagrs. tables, refs. (AF AFOSR-62-451) AD 284930 Unclassified

The results of all firings to date are presented in graphical form, together with some analysis of energy losses. Tables of firing data are included, and the analysis to relate viscoelastic properties to the propellant response behavior is extended. Further efforts to measure viscoelastic properties are also described. The estimation of the acoustic admittance of the burning surface and of the gas phase attenuation constant from growth and decay constants is discussed. The specific acoustic admittance ratio of the surface, referred to as the gas phase, is estimated to be of the order 0.01 to 0.03, decreasing in magnitude in the frequency range 1 to 6 kc. IONIZATION IN THE SHOCK INITIATION OF DETONATION, by A. Bauer, M. A. Cook, and R. T. Keyes. Sept. 15, 1962 [30]p. incl. illus. diagrs. tables, refs. (AFOSR-4053) (AF 18(603)100) AD 289569
Unclassified

Conduction-time (or distance) curves measured by both the "parallel" and "perpendicular probe" methods in receptors of the "card gap", "shock pass, heat filter plate" and plate impact methods of sensitivity are correlated and compared with the pressure-time (or distance) curves obtained by the aquarium method. Results indicate that detonation is initiated by a shock-wave only upon establishment of (dilute) plasma conditions in the shock front. The ionization wave that establishes this coincidence is initiated at the inert barrier or SPHF plate after a time τ following transmission of the shock into the receptor. After formation, requiring a finite time, the ionization wave builds up in intensity at the SPHF plate, flashes forward into the receptor charge and apparently triggers detonation (at the instant of arrival of a critical level of ionization) at the shock front. Therefore, the pressure in the shock front, while an important factor in the shock initiation of detonation, may not be the only, or even the most important one; strong ionization may also be an essential factor. Shock initiation of detonation appears to require the development of a strongly ionized reaction shock. (Contractor's abstract)

CHEMICAL REACTION RATES AND THE SHOCK INITIATION OF DETONATION IN LIQUID EXPLOSIVES, by A. Bauer, M. A. Cook, and R. T. Keyes. Sept. 3, 1962 [21]p. incl. illus. diagrs. tables, refs. (AFOSR-4054) (AF 18(603)100) AD 287915
Unclassified

Detonation velocity-charge diameter curves were obtained for the liquid explosives, nitromethane, dithekite-13, D-8, 97.2/2.8 NM-ethylene diamine, 80/20 NM-tetryl, and 80/20 NM-TNT. A point initiation model for liquid explosives, according to which the chemical reaction was assumed to start at small centers and proceed radically outward, was developed and applied with the detonation head model to determine chemical reaction times for NM and D-13. The shape of the velocity-diameter curves and the manner in which they were fit by the calculations indicated that indeed detonation reactions in liquid explosives expand outward from small centers of initiation. Preliminary measurements of the pressure associated with the super velocity of "flash-across" phenomenon observed in the shock

initiation of liquid explosives are also presented. The measurements were made to determine if this phenomenon which propagates from the barrier-receptor interface to the initial shock front during the card gap tests at velocities that exceed the normal detonation velocity, is governed by hydrodynamic laws of wave propagation. (Contractor's Abstract)

THE INTERACTION OF LIGHT WITH MATTER STUDIES BY THE EFFECT OF DIFFRACTION ON POLARIZATION, by F. S. Harris, Jr. Final rept. Jan. 27, 1962. 2p. (AFOSR-2122) (AF 49(638)799) Unclassified

Studies were made of Fresnel diffraction by a slit for small angles; also there were made studies of diffraction at wide angles with measurements of intensity in polarization. Detailed calculations with a computer have been made of diffraction by a half plane with regard to Sommerfield theory. The incident plane of polarization, the material of the edge and the wave length of the light were found to have a marked effect on the diffraction pattern. Edges of optical quality and the difficulty of measuring with extreme sensitivity proved to be limiting factors. A photometer was developed for measuring very small light intensities as a function of the diffraction.

DIFFRACTION OF POLARIZED LIGHT AT WIDE ANGLES IN THE SHADOW OF A HALF-PLANE (Abstract), by F. S. Harris, Jr., M. S. Tavenner, and G. R. Orme. [1961] [2]p. [AF 49(638)799] Unclassified

Presented at Spring meeting of the Opt. Soc. Amer., Pittsburgh, Pa., Mar. 2-4, 1961.

Published in Jour. Opt. Soc. Amer., v. 51: 477-478, Apr. 1961.

Wide-angle diffraction patterns in the shadow of a half-plane were measured over a range of 10^8 in relative intensity. Patterns studied included light unpolarized, polarized parallel to edge, and perpendicular to diffracting edge. Light of wavelength 5461 A was measured 19 cm from the edge by means of a scanning dry-ice cooled 1P21 photomultiplier photometer whose output was traced on a strip-chart recorder. This system was adapted from one previously used for long-light-path studies. With a 90° normal-incident light on the half-plane, the diffracted light was measured from 9° to 56° diffracting angle. At 56°, intensities of 2.52×10^{-8} for parallel-polarized and 4.29×10^{-8} for perpendicular-polarized light were measured. These experimental results are in general less than Sommerfeld theory curves. The ratio of perpendicular to parallel intensities increased to a value of about 2 at a diffracting angle of 40°, decreasing for larger angles. This was much less than Sommerfeld's theoretical values. Unpolarized light intensity values were along the Sommerfeld parallel-polarization curve.

PRESSURE DEPENDENCE OF INTERNAL FRICTION OF ALUMINUM (Abstract), by J. L. Seely, G. S. Baker, and P. Gibbs. [1962] [1]p. [AF 49(638)353] Unclassified

Presented at meeting of the Amer. Phys. Soc., Baltimore, Md., Mar. 26-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 225, Mar. 26, 1962.

Internal-friction measurements were made as a function of hydrostatic pressures up to 3 kbar by use of a piezoelectric torsional oscillator inside the pressure vessel, as well as with a Marx composite oscillator both before and after pressure treatment. Specimens were prepared by coldworking 99.99% aluminum polycrystals to a 50% reduction in width, followed by an anneal at 300°C. Measurements outside the pressure vessel showed that the strain-amplitude dependence was irreversibly increased by amounts up to 1500% of the initial values as a result of the application of 3 kbar for 15 min at 25°C. The original amplitude dependence was restored by annealing 15 min at 300°C. A subsequent compression again increased the amplitude dependence, but to a lesser extent. After several such annealing-compression cycles there was no irreversible effect within 4% of background. Additional cold-work followed by annealing again produced the effect. The effect increased with increasing pressure. An increase in amplitude dependence of up to 600% also occurred in samples which had not been previously coldworked. The internal friction at constant strain amplitude increased faster than linearly with increasing pressure and decreased linearly with decreasing pressure. Successive pressure cycles gave the same effect but with decreasing magnitude.

RESEARCH IN NONLINEAR SONIC PHENOMENA, by W. L. Nyborg. Final rept. Oct. 15, 1960-Oct. 14, 1962, 5p. (AFOSR-5202) (AF 49(638)968) AD 416602 Unclassified

A laboratory was developed for carrying out experiments with very intense sound in the high frequency range, from 200 kc to 10 mc, consisting of a 10 kilowatt transmitter. Controlled bubble production and activity in sound fields was studied. Work on vibrating gas-liquid interfaces and associated events showed that a spatially periodic eddying configuration is set up near the surface standing wave as predicted by Lanquet-Higgens. The magnitude is far more than expected which suggested the liquid air interface presents some sort of "skin" on which the oscillating liquid exerts tangential stress. Work was conducted concerning the design and testing of composit "Mason-horn" type transduces of brass, steel and stainless steel suitable for experiment where prescribed localilized vibration is applied. The unit operated at about 85 kc. Exploratory work showed that when a unit is used as an electrode during electrolysis, considerable variation in the process is observed when vibration is applied.

ON A POSSIBLE $\Xi\pi$ RESONANCE, by A. P. Balachandran and H. Pietschmann. June 30, 1962, 4p. (Scientific note no. 15) (AFOSR-3100) (AF 61(052)265) AD 289427 Unclassified

Also published in Physics Ltrs. v. 2: 126-127, Sept. 1, 1962.

The possibility of a $T = 1/2$, $D_{3/2}$ resonance in the Ξ - π system is pointed out by a consideration of the octet model for strong interactions. For this purpose, the resonances Y_1^*, N^{**} and Y_0^{**} are classified into the same octet, assuming tentatively that Y_1^* is a $D_{3/2}$ resonance. A Ξ-π resonance appears to have the perdicted quantum numbers reported at the 1962 CERN conference. Following the method of Gell-Mann, the authors predict $T = 1/2$ in the Ξ - π system with a mass about 1460 mev. Experiments in which it can show up are discussed.

QUANTUM THEORY OF TRANSPORT COEFFICIENTS. I, by K. Baumann and J. Ranninger. [1962] [14]p. incl. diagrs. [AF 61(052)265] Unclassified

Published in Ann. Phys., v. 20: 157-170, Nov. 1962.

The techniques of modern quantum field theory are applied to the electron-hole field interacting with the field of phonons in a crystal. The interaction is described by the Fröhlich Hamiltonian. In the evaluation of the electrical conductivity, an infinite number of Feynman diagrams has to be taken into account. The first 3 of these diagrams are worked out explicitly, and are found to be the beginning of a geometrical series, which yields a conductivity $\sim T^{-4}$ for $T/\theta << k\theta/E_F$, $\sim T^{-5}$ for $k\theta/E_F << T\ \theta << 1$. For $T/\theta >> 1$ the well-known T^{-1} law is reproduced. (Contractor's abstract)

ELASTIC PROTON-PROTON SCATTERING AT HIGH ENERGIES, by G. Czapek, G. Kellner, and G. Otter. Apr 2, 1962 [23]p. incl. diagrs. table, refs. (Scientific note no. 3) (AFOSR-2691) (AF 61(052)433) Unclassified

Elastic p-p scattering at 23.5 gev kinetic energy has been studied in nuclear emulsions. The emulsions were exposed normally to their plane to the external proton beam of the CERN PS. 133 proton-free-proton elastic scatterings have been found. The contribution of quasielastic events and other background is about 4%. The elastic cross section gives $\sigma_1 = (8.3 \pm \frac{1.2}{0.7})$ mb. The behavior of the differential cross section shows that the real part of the scattering amplitude must be assumed to be small. The elastic scattering at high energies has been calculated with the simple model of a completely absorbing target nucleon. The following assumptions have been made: (1) there is a well defined surface of the nucleon with radius R and (2) a large number of reaction channels is open for the incoming particle. Numerical evaluation of the result shows close agreement with the experimental data for R = 1.10 fermi. (Contractor's abstract)

DETERMINATION OF THE SLOPE OF THE POMERANCHUK-TRAJECTORY FROM HIGH ENERGY ELASTIC SCATTERING, by G. Czapek, G. Kellner and H. Pietschmann. May 14, 1962, [9]p. incl. diagrs. tables, refs. (Scientific note no. 4) (AFOSR-2977) (AF 61(052)433) AD 283659 Unclassified

New light has been shed on the theory of elementary particles by the hypothesis, that the concept of singularities in the complex angular momentum variable (Regge-poles) also applies to a relativistic quantized theory. In particular, the assumption is made that particles (including resonances) which differ only by their mass and spin values lie on the same trajectory in the Chew-Frautschi diagram. On the other hand, high energy elastic scattering is correlated to the slope of the Pomeranchuk trajectory. It is mentioned that a high energy behavior of this type is also a consequence of a model in the strip approximation to the Mandelstam representation. Furthermore, this model provides successive approximations to the form factor of the diffraction scattering amplitude. As a consequence of the Regge-type behavior, the differential elastic cross-section at high energies should decrease exponentially from the optical point

$$\frac{d\sigma}{d\Omega} \sim e^{-2t\, t_0(s)}$$

This is verified by plotted results and is used to establish the slope of the Pomeranchuck-trajectory expanding it into a power series. The elastic scattering of 16 GEV π-mesons and GEV protons on protons has been studied with bubble chamber and emulsion techniques. The hypothesis of Regge-poles though not on very good footing from a theoretical point of view seems to be very appealing when compared with the experiment.

AN ELECTROMAGNETIC SUSPENSION SYSTEM FOR THE MEASUREMENT OF AERODYNAMIC CHARACTERISTICS, by H. M. Parker, J. E. May, and G. S. Nurre. Mar. 1962. [40]p. incl. illus. diagrs. refs. (Rept. no. AST-4433-106-62U) (AFOSR-2294) (AF 49(638)1022) AD 273655 Unclassified

The design concepts are presented for a free electromagnetic suspension system functioning as force balance yielding simultaneous and independent measurements of force in 3 mutually perpendicular directions. The system is adapted to function as a wind tunnel balance which requires no physical attachment to the model under study. The concepts have been reduced to practice in a first-generation balance which is to be applied to the study of low-density sphere drags as a first demonstration of the unique capabilities of this balance system. The first model also is intended to serve as a test device to provide design information for a second-generation balance for the study of dynamic stability. The apparatus is described in detail and calibration procedures and future applications are discussed. (Contractor's abstract)

SYMMETRIC VIBRATION OF THE ELASTIC SOLID CYLINDER, by D. S. Moseley. Mar. 22, 1962 - Dec. 14, 1962. [31]p. (Technical rept. no. TN 1734-01-1) (AFOSR-4650) (AF 49(638)1148) AD 407408 Unclassified

The exact formulation of displacements and resonant frequencies of an elastic solid cylinder was attempted. Progress was made, but the principal objective was not reached. This report traces the course of work through the early demonstration of invalidity of a formulation that was postulated prior to the contract, and through several assaults upon the problem. Novel solutions of the wave equation for radially symmetric displacements were discovered. A section is devoted to the recommended direction of future work.

THE INCORPORATION OF [2-^{14}C] MEVALONIC ACID AND $^{14}CO_2$ INTO THE PHYTYL SIDE CHAIN OF CHLOROPHYLL IN MAIZE SEEDLINGS, by E. I. Mercer and T. W. Goodwin. [1962] [1]p. (AFOSR-4343) (AF 61-(052)355) AD 404876 Unclassified

Presented at 419th meeting of the Biochem. Soc., Inst. of Rural Science, Penglais, Aberystwyth (Wales). Sept. 13-14, 1962.

Also published in Biochem. Jour., v. 85: 13P, Nov. 1962.

The relative incorporation of mevalonic-2-C^{14} acid and $C^{14}O_2$ into the phytyl side chain of chlorophyll was studied in corn seedlings during illumination. The mevalonic-2-C^{14}-treated corn yielded 5.2 mg of sterol with a specific activity of 84,530 counts min mg (total counts 440,330) and phytol containing a total of 400 counts min. The $C^{14}O_2$-treated corn yielded 5.7 mg of sterol with a specific activity of 15,860 counts min mg (total counts 90,400 min) and phytol containing a total of 114,000 counts min (specific activity 160,500 counts min mg.

STUDIES IN CAROTENOGENESIS. 29. ATTEMPTS TO DETECT LYCOPERSENE IN HIGHER PLANTS, by E. I. Mercer, B. H. Davies, and T. W. Goodwin. [1962] [9]p. incl. diagrs tables, refs. (AFOSR-J840) (AF 61-(052)355) AD 416554 Unclassified

Also published in Biochem. Jour., v. 87: 317-325, May 1963.

A method for the detection and identification of lycopersene has been developed. The sensitivity limit is 0.05 ug. Analysis of the unsaponifiable components of excised, etiolated maize seedlings exposed to [2-C^{14}]mevalonate under conditions of light and darkness, and to $C^{14}O_2$, has failed to reveal the presence of lycopersene. [C^{14}]Carbon dioxide is incorporated into both squalene and phytoene by maize seedlings, but [2-C^{14}]mevalonate is incorporated only into squalene. [2-C^{14}]Mevalonate is incorporated into both squalene and phytoene by carrot-root slices; no lycopersene could be detected. Tare (Vicia sativa) lipid was also examined for the presence of lycopersene, but none was detected. Lycopersene is probably not a precursor of carotenoids.

COUMARIN AND RELATED COMPOUNDS IN ANTHOXANTHUM AND MELILOTUS SPECIES, AND THE FORMATION OF DICOUMAROL, by W. M. Ashton and E. G. Davies. [1962] [2]p. [AF 61(052)355] Unclassified

Presented at 419th meeting of the Biochem. Soc., Inst. of Rural Science, Penglais, Aberystwyth (Wales), Sept. 13-14, 1962

Published in Biochem. Jour., v. 85: 22P, Nov. 1962.

Both Anthoxanthum odoratium (sweet vernal grass) and Melilotus alba (sweet clover) contain melilotic, o-coumaric and p-coumaric acids, and esculin the former contains ferulic acid, the latter, 7-hydroxycoumarin. With spoilage of anthoxanthum hay, coumarin disappeared in 18 days, the amount of related compounds increased and reached a steady maximum in 4 weeks. Dicoumarol (I) was detected chromatographically in the spoiled hay. Additions of penicillium jensenl to anthoxanthum or sweet-clover hay increased the I formed, and the amount of available formaldehyde appeared to limit I production. o-Coumaric acid and not coumarin is considered to be the percursor of 4-hydroxycoumarin and hence I.

PRELIMINARY OBSERVATIONS ON TERPENOIDS IN PLANT TISSUE CULTURES, by T. W. Goodwin and B. L. Williams. [1962] [1]p. [AF 61(052)355] Unclassified

Presented at 419th meeting of the Biochem. Soc., Inst. of Rural Science, Penglais, Aberystwyth (Wales), Sept. 13-14, 1962.

Published in Biochem. Jour., v. 85: 12P, Nov. 1962.

Cultures of cambial tissue of Paul's Scarlet Rose grown at room temperature for 14 days in White's medium containing 10% coconut milk and 6 mg/l of 2,4-dichlorophenoxyacetic acid, yielded 200 g l of cells. The cells were extracted with acetone. No chlorophyll was detected in the extracts. After saponification of the extracts, the unsaponifiable matter was 15 mg g dry wt, 1/3 of which was digitonin-precipitable sterols (phytosterols). No ergosterol was found. The hydrocarbon fraction of the sterol-free unsaponifiable matter contained squalene but no colorless C_{40} polyenes. Three xanthophylls were detected; auroxanthin was the main component, 4 ug g dry wt

THE EFFECT OF STRUCTURAL CHANGES ON THE PYROLYSIS OF ESTERS OF ORGANIC AND INORGANIC ACIDS, by G. G. Smith. Final rept. Jan. 1962. 5p. (AFOSR-2218) (AF 49(638)616) Unclassified

The effect of polar and steric influences on the thermal stability of organic and inorganic esters has been studied. With organic esters, the polar effect on the thermal stability has been studied by determining the reaction rates at several temperatures of over 70 esters. An understanding about the influence of polar groups on reactivity in a solvent free system has been gained. Evidence substantiating the formation of a charged intermediate in ester pyrolysis has been obtained.

SUBSTITUENT EFFECTS IN PYROLYSIS. V. A $\rho - \sigma^+$ CORRELATION IN THE PYROLYSIS OF 1-ARYLETHYL ACETATES, by R. Taylor, G. G. Smith, and W. H. Wetzel. [1962] [8]p. incl. diagrs. tables, refs. (AFOSR-J280) (AF 49(638)616) AD 415329 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 4817-4824, Dec. 20, 1962.

A kinetic study of the gas-phase thermal decomposition of a number of 1- and 2-arylethyl acetates has been made between 297.8° and 409.2°. Each ester was pyrolyzed at 4 different temperatures and over a temperature range of not less than 50° in a static system at reactant pressures of 6 to 200 mm; the energies and entropies of activation range, respectively, from 41.7 kcal mol and +0.34 to -2.66 e.u. for the 1-arylethyl acetates, and from 44.8 to 45.9 kcal mol and -3.24 to -3.67 e.u. for the 2-arylethyl acetates. A plot of log k_{rel} for the effects of the substituents in the 1-aryl series at 600°K against σ^+-constants (Brown and Okamoto) gives an excellent correlation ($\sigma = -0.66$) thus proving that the elimination of acetic acid proceeds via a mechanism in which some charge separation occurs, as has recently been suggested. The importance of the breaking of the carbon-hydrogen and single carbon-oxygen bonds in the reaction mechanism has been further evaluated. (Contractor's abstract)

A METHOD FOR ASSESSING ELECTROPHILIC SUBSTITUENT EFFECTS IN THE GAS-PHASE AND THE CORRELATION WITH REACTIVITY IN THE CONDENSED-PHASE, by R. Taylor and G. G. Smith. [1962] [11]p. incl. diagrs. tables, refs. (AFOSR-J913) (AF 49(638)616) Unclassified

Also published in Tetrahedron, v. 19: 937-947, June 1963.

Substituent effects in the gas-phase pyrolysis of 1-arylethyl acetates (a reaction which proceeds via a transition state of carbonium ion character) are compared with those obtained in condensed-phase electrophilic aromatic substitutions and related reactions, and are found to closely parallel them. The p-methyl and p-t-butyl substituents activate in the inductive order, disproving the contention that the Baker-Nathan effect is primarily a function of the resonance requirement of a particular reaction. It is shown that the variable reactivity of the para-position in biphenyl in electrophilic and related reactions is unlikely to be attributable to an energy barrier restricting the attainment of a coplanar form, and that the electrophilic reactivity of the 2-position in fluorene cannot be satisfactorily represented by a single substituent constant. Sigma values in reactions proceeding via electron deficient centers are revealed as being partially dependent upon the extent of solvation though this effect is relatively minor. The pyrolysis reaction promises to be of fundamental value for examining the effects of substituents known to be strongly susceptible to solvent effects in condensed-phase reactions. Steric effects in the reaction are discussed. (Contractor's abstract)

EFFECTS OF GLASS CONTAMINATION AND ELECTRODE CURVATURE ON ELECTRICAL BREAKDOWN IN VACUUM, by E. E. Donaldson and M. Rabinowitz. [1962] [4]p. incl. illus. diagrs. (AFOSR-J557) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-86 and Atomic Energy Commission) AD 408600 Unclassified

Also published in Jour. Appl. Phys., v. 34: 319-322, Feb. 1963.

It has recently been found that particles of contamination reside on surfaces inside vacuum systems as a result of thermal decomposition of glass. These particles contain at least Na, K, and B as well as traces of Al and Si. They may well have been important in many clean surface experiments. This investigation has shown that these particles have a strong influence in reducing the breakdown voltage in vacuum. Breakdown voltages for Al, Cu, and stainless steel electrodes with radii of curvature of 21.7, 25.4, 50.8, and 101.6 mm were determined under clean and contaminated conditions at 10^{-5} Torr. It was found that under clean conditions the

electrodes of smaller radii of curvature have higher breakdown voltages than the more nearly plane electrodes. (Contractor's abstract)

CHEMICAL SPUTTERING OF TUNGSTEN AT ELEVATED TEMPERATURES, by H. F. Winters, D. R. Denison and others. [1962] [7]p. incl. illus. diagrs. refs. (AFOSR-J1073) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-86 and Atomic Energy Commission) Unclassified

Also published in Jour. Appl. Phys., v. 34: 1810-1816, June 1963.

Positive ions emitted from heated tungsten filaments operating in various gas environments and in residual gases remaining at 10^{-11} Torr have been investigated. The ions appear both as a continuous current and in the form of ion bursts. The pressure and temperature dependence of the ion current is given; the properties of the bursts are investigated; and a model for the mechanism of burst production is proposed. It is shown that the ion current can be used as a sensitive indicator of surface reactions.

SHORT-TERM RETENTION AS A FUNCTION OF CONTEXTUAL CONSTRAINT, by K. E. Lloyd and W. A. Johnston. [1962] [8]p. incl. tables, refs. (AFOSR-J750) (AF 49(638)805) AD 413636 Unclassified

Also published in Jour. Exper. Psychol., v. 65: 460-467, May 1963.

Contextual constraint has improved recall in the classic memory span task. Here this variable was manipulated in a sequential memory task in which S continually received information, and, at unpredictable moments, was requested to recall some of it. In experiment I, 24 undergraduates continuously stored an average of 3 or 7 items and recalled them 2 at a time. This required many recall points which interrupted the contextual passages. The effect of varying contextual constraint was significant ($p < .01$), but small. In experiment II, interruptions were gradually reduced by requesting more and more items per recall point. Recall improved ($p < .01$) as constraint increased and as interruptions decreased; these variables interacted. Interruptions severely curtailed the benefits of context. (Contractor's abstract)

IMAGE-SHARING ENDOMORPHISMS AND LINEAR EQUATIONS, by F. Halmo. [1962] [15]p. (AF 49(638)-218 and AF AFOSR-62-413) Unclassified

Published in Topics in Abelian Groups; Proc. of the Symposium, New Mexico State U., University Park (June 4-8, 1962), ed. by J. M. Irwin and E. A. Walker. Scott, Foresman and Co., Chicago [1963] p. 337-347.

This paper deals with systems of linear equations over abelian groups, where the coefficients are endomorphisms. The main result of the paper is the following interesting generalization of Cramer's rule. Let G be a 2-divisible abelian group ($2G = G$) and S a commutative ring of endomorphisms of G. Let (s_{ij}) be an n-by-n matrix of elements of S such that $\det(s_{ij})$ is an automorphism of G. Then the system of n equations in n unknowns $x_1 s_{11} + \ldots + x_n s_{1n} = b_1$ $(i = 1, \ldots, n)$, with $b_i \in G$, has a unique solution in G. (Math. Rev. abstract)

LAGUERRE TRANSFORMS, by I. I. Hirschman, Jr. [1962] [14]p. (AF 49(638)846) Unclassified

Published in Duke Math. Jour., v. 30: 495-510, Sept. 1963.

Let L_n be the n^{th} Laguerre polynomial. Consideration is given to the transformation of sequences defined by $F(n) = \sum_{m=0}^{\infty} G(n, m)\, f(m)$, where the "kernel" $G(n, m)$ has the form $G(n, m) = \int_0^{\infty} (E(x))^{-1} L_n(x) L_m(x) e^{-x} dx$, where E(x) is a member of a special class of positive functions previously studied. Exploiting the recursion formula for the polynomials L_n, an inversion formula for the transformation $f \to F$, which is analogous to the Post-Widder inversion formula for the Laplace transform, is constructed. Necessary and sufficient conditions that F(n) have the form $\sum_{m=0}^{\infty} G(n, m)\, f(m)$ with $f(m) \geq 0$ are also established. (Math. Rev. abstract)

ELECTRON TRANSFER BETWEEN TRIS-p-NITROPHENYLMETHYL RADICAL AND TRIS-p-NITROPHENYLMETHIDE ION STUDIED BY ELECTRON SPIN RESONANCE TECHNIQUES, by M. T. Jones and S. I. Weissman. [1962] [6]p. incl. diagrs. tables, refs. (AFOSR-2575) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)464] and Office of Naval Research) AD 295929 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 4269-4274, Nov. 1962.

The rate constants and the activation energies for the electron transfer between tris-p-nitrophenylmethyl radical and tris-p-nitrophenylmethide ion for all combinations of the sodium or potassium salts in 1, 2-dimethoxyethane, tetrahydrofuran, pyridine, and acetonitrile have been measured by electron spin resonance (esr) methods. The rates lie in the range 10^7 to 10^9 liter mol^{-1} sec^{-1}. The activation energies lie in the range 0.3 to 2.3 kcal mol^{-1}. The analysis of the rate constants and the activation energies is straightforward except for the case of the sodium tris-p-nitrophenylmethide in THF, where the dependence of rate on total methide concentration is not linear. In a particular solvent, the sodium salt yields a slower rate than the potassium salt except in acetonitrile. (Contractor's abstract)

THE STATISTICAL THEORY OF CONDENSATION, by C.-T. Chen-Tsai. Apr. 1962, 46p. incl. diagrs. refs. (Technical rept. no. 3) (AFOSR-2662) (AF 49(638)834) AD 278248 Unclassified

The statistical theory of the condensation of water is treated. Efforts are made to clarify the significant role the interaction potential between particles plays on the condensation phenomenon, and to attain plausibility in mathematical arguments. In Chapter II, Mayer's theory of imperfect gases is recapitulated, and some reasonable assumptions on the pressure vs specific volume curves in the region of validity of the theory are made. In Chapter III, general properties of the pressure vs specific volume curves are discussed. By using the grand canonical ensemble method the characteristic phenomenon of condensation is mathematically derived in Chapter IV. Chapter V presents an exact mathematical treatment of the Einstein condensation to illustrate the proper limiting process of the series expressions for thermodynamic functions for infinite systems.

ENERGY SPECTRUM OF ELEMENTARY EXCITATIONS IN HELIUM II, by H. W. Jackson and E. Feenberg. [1962] [8]p. incl. diagrs. table, refs. [Technical rept. no. 2] (AFOSR-4414) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)834 and National Science Foundation) AD 295850 Unclassified

Also published in Rev. Modern Phys., v. 34: 686-693, Oct. 1962.

A recalculation of the spectrum is made using the second-order Brillouin-Wigner energy formula, and the results are compared with those of earlier calculations and experimental data. The calculations are made using, firstly, the Kirkwood superposition approximation for the 3-particle distribution function p (1, 2, 3) and, secondly using a new approximation called the "convolution approximation". A criterion is given for the accuracy of the use of any approximation for p (1, 2, 3), and this is applied to both approximations used. A discussion of the stability of these elementary excitations is given.

THEORY OF THE FERMION LIQUID, by F. Y. Wu and E. Feenberg. [1962] [13]p. incl. diagr. table refs. (AFOSR-348) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)834] and National Science Foundation) AD 400189 Unclassified

Also published in Phys. Rev., v. 128: 943-955, Oct. 15, 1962.

The ground-state wave function generated by a system of interacting bosons is used as the correlation factor in a trial function describing the interacting fermion system. Expectation values are computed by the technique of the generalized normalization integral. The resulting cluster integrals are evaluated by introducing simple approximate forms for the n-particle distribution functions defined by the boson wave function. To illustrate the method, it is applied to establish a connection between known results for fermion and boson forms of a hard-sphere system at low density. As a second illustration experimental information on liquid He^4 is used to work out properties of a hypothetical fermion-type system of mass 4. Results are given for the energy, effective mass, and magnetic behavior. The application to He^3 waits on the evaluation of the radial distribution function and liquid structure factor for the corresponding artifical boson system of mass 3. (Contractor's abstract)

ANGULAR DISTRIBUTIONS OF α PARTICLES FROM F^{19}(d, α)O^{17} (Abstract), by J. M. Fowler, J. B. Reynolds and others. [1962] [1]p. [AF 49(638)843] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 287-288, Apr. 23, 1962.

The angular distributions of α particles produced in the bombardment of thin (1/8-mil Teflon) F^{19} targets with 10-mev deuterons have been measured at 7½° intervals from 7½° to 142½° (and occasionally greater) laboratory angles. α particles leaving O^{17} in its ground- and first-excited states were detected with solid-state detectors. Absolute, as well as relative, cross sections were measured. All 4 angular distributions exhibit the oscillations characteristic of direct reactions. The ground-state angular distribution rises sharply in the forward direction and peaks at approximately 12° cm with 3 smaller peaks at greater angles. The first-excited state (0.871 mev) angular-distribution peaks at 23° cm shows 2 smaller peaks and rises to a peak at 155° cm as pronounced as the forward one. The second-excited-state (3.058 mev) angular distribution has a prominent forward peak at 20° cm, smaller peaks at intermediate angles, and is rising again at 147° cm. The third-excited state (3.846 mev) angular distribution is similar. Attempts to fit these data with various direct reaction theories are discussed

DIFFERENTIAL CROSS SECTIONS OF THE Be^9(d, α)Li^7 AND Al^{27}(d, α)Mg^{25} REACTIONS (Abstract). by J. J. Wesolowski, J. M. Fowler and others. [1962] [1]p. [AF 49(638)843] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 269, Apr. 23, 1962.

The reactions Be^9(d, α)Li^7 and Al^{27}(d, α)Mg^{25} have been investigated at the cyclotron with 10-mev deuterons. The differential cross sections between laboratory angles 7½° to 165° were measured for the ground-state and first excited-state α particles from the beryllium and for the ground-state and several excited-state α's from the aluminum reaction. Absolute differential cross sections were measured for both reactions. The α particles were detected with solid-state counters. A thin aluminum foil (approximately 0.18 mg/cm²) was used in the aluminum reaction, and a self-supporting evaporated film of beryllium was used in the beryllium reaction. The angular distribution for the ground-state α's from Al^{27}(d, α)Mg^{25} shows, in addition to a forward peak, a weak maximum in the backward direction. The backward peaking of the α's from Be^9(d, α)Li^7 is particularly pronounced both for the ground state and first-excited state.

DIFFERENTIAL CROSS SECTIONS OF THE N^{14}(d, α)C^{12}, P^{31}(d, α)Si^{29}, AND V^{51}(d, α)Ti^{49} (Abstract), by R. J. Wilson, J. M. Fowler and others. [1962] [1]p. [AF 49-(638)843] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 286, Apr. 23, 1962.

The angular distribution of the α particles from the reactions N^{14}(d, α)C^{12}, P^{31}(d, α)Si^{29}, and V^{51}(d, α)Ti^{49} were obtained at a deuteron energy of 10 mev using solid-state detectors. Very thin N^{14} targets were prepared by evaporating Melamine ($N_6H_6C_3$) in vacuum onto a thin film (10 μg/cm² or less) of polyvinyl chloride acetate. Thin P^{31} targets were prepared by placing water slurries of very fine mesh, amorphous red phosphorous onto ¼-mil films of Mylar and allowing the water to evaporate. The V^{51} targets were prepared by evaporating vanadium onto extremely thin carbon films. Angular distributions were also obtained for α particles leaving C^{12} in the first-excited state (4.43 mev) and Si^{29} in the first-excited state (1.28 mev). The absolute cross sections for all 3 reactions were measured.

PROTON POLARIZATION IN B^{10}(d, p)B^{11} AND Si^{28}(d, p)Si^{29} WITH 10-MEV DEUTERONS (Abstract), by R. W. Bercaw and F. B. Shull. [1962] [1]p. [AF 49(638)843] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 269, Apr. 23, 1962.

The polarization of the reactions P(θ) was studied using $C^{12}(p,p)C^{12}$ at 50° (laboratory) as an analyzer. The right-left asymmetry of the carbon-scattered protons were measured by 2-counter telescopes. For the boron ground-state reaction, P is positive (Basel convention) up to 100° where it changes sign; its maximum value is +0.23 ± 0.06 at 37.5°. Agreement is good with data at 8.9 and 7.8 mev, but differs in sign at 11.4 mev. Reactions to the 2.14-mev and to the unresolved 4.46- and 5.03-mev excited states of B^{11} were studied over narrower ranges of angle; for the former, P was found negative near 60°, consistent with the assumption that spin-flip occurs; for the latter, P was positive throughout the stripping peak, indicating neutron capture with $j = \ell + \frac{1}{2}$. For the silicon ground-state reaction, where $\ell = 0$, P was found to be nonzero in the measured range (7° to 80°); it is roughly similar to data at 15 mev.

EFFECTS OF ION ASSOCIATION ON RATES OF OXIDATION-REDUCTION TRANSFER REACTIONS IN THE NAPTHALENE-NAPTHALENIDE SYSTEMS, by P. J. Zandstra and S. I. Weissman. [1962] [3]p. incl. diagrs. table. (AFOSR-J145) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-365, National Science Foundation, Office of Naval Research, and Petroleum Research Fund)
AD 296214 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 4408-4410, Dec. 5, 1962.

The rates of the rapid reactions: (1) $C_{10}H_8^- + C_{10}H_8 = C_{10}H_8 + C_{10}H_8^-$; (2) $C_{10}H_8^-Na^+ + C_{10}H_8 = C_{10}H_8 + Na^+C_{10}H_8^-$ have been measured in tetrahydrofuran, tetrahydropyran and 2-methyltetrahydrofuran. The processes follow a second order kinetic law. The rates and their variation with temperature depend on solvent. Reaction rate of (1) is generally more rapid than (2), but in tetrahydrofuran the rate of (2) increases with decreasing temperature below 300°K and is greater than the rate of (1) below 280°K. PROTON MAGNETIC RESONANCE STUDIES IN SODIUM-AMMONIA SOLUTIONS, by T. R. Hughes, Jr. [1962] [8]p. incl. diagrs. table, refs. (AFOSR-J341) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-365, Alfred P. Sloan Foundation, National Institutes of Health, and Office of Naval Research) AD 408060 Unclassified

Also published in Jour. Chem. Phys., v. 38: 202-209, Jan. 1, 1963.

High-resolution techniques have been applied to the measurements of the proton magnetic resonance shifts in sodium-ammonia solutions. Concentrations ranging from $R = 1.6 \times 10^{-4}$ to 1.7×10^{-1} were studied, and the temperature was varied from below -70° to above +25°C. The miscibility gap was noted in the relatively concentrated solutions. In dilute solutions, a triplet, arising from the spin-spin interaction of the nitrogen nucleus on the proton nuclei within an ammonia molecule, was sometimes observed. In order to interpret the data taken on samples having a mol rate $R \leq 1.15 \times 10^{-2}$, a modified form of the Knight shift expression applicable to this system is derived:

$$\left(\frac{\Delta H}{H_0}\right)_I = -\frac{8\pi}{3L_0} D(I) \chi_{e,\ theo},$$

where $\chi_{e,\ theo} = L_0 \mu_e^2/kT$. Using this relation, the data taken at -33.2°C are found to offer strong support for the existence of some kind of monomers down to $R \leq 3.41 \times 10^{-4}$. The value deduced for the total negative spin density of the electron on the monomer protons is -8.1×10^{23} cm^{-3} using the equilibrium constants of Becker, Lindquist, and Alder. Application of this same formalism to published Knight shift data yields corresponding values for the total electron density associated with the monomer of 9.0×10^{24} cm^{-3} on the nitrogen nuclei and of approximately 3.3×10^{22} cm^{-3} on the sodium-ion core. The possibility that the electron relaxation occurs on the monomer rather than on the ammonia molecules bordering a singly occupied cavity is also discussed.

THE CLEAVAGE OF ARYL ETHERS BY ALKALI METALS IN ALIPHATIC ETHER SOLVENTS. DETECTION BY ELECTRON SPIN RESONANCE, by D. H. Eargle, Jr. [1962] [3]p. incl. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-365] and Office of Naval Research)
Unclassified

Presented at 141st National meeting of the Amer. Chem. Soc., Washington, D. C., Mar. 1962.

Published in Jour. Org. Chem., v. 28: 1703-1705, June 1963.

The cleavage of several types of aromatic ethers was investigated in a variety of inert aliphatic ether solvents by using the alkali metals Li, Na, K, Rb, and Cs. The reaction was first detected in a study of spin exchange in the singly and doubly charged anions of biphenylyl ether. As a typical example, the cleavage by Na and subsequent work-up of 9-naphthyl ether (I) was described. I (1 g) was placed in an outgassed tube which was then mirrored with 0.2 g Na (by distillation 3 times through constrictions in a side tube), 4 cc dimethoxyethane distilled into the tube, the whole degassed, the tube sealed, the mixture shaken 2 or 3 times to contact the

metal mirror, then shaken 1 hr longer. The contents were neutralized with dilute H_2SO_4, 20 ml Et_2O added, and the whole extracted with $NaHCO_3$, then with NaOH. The acidified $NaHCO_3$ extract yielded only a thin film having the odor of aliphatic acids. The acidified NaOH extract yielded 0.30 g β-naphthol, mp 122°. The neutral fraction was fractionally sublimed to give 0.20 g naphthalene and 0.13 g β-dinaphthyl, mp 181-183.5°, and a small amount of a high melting material not identified. Product yields and reactivity were greatest with the larger aryl groups: 60% p-phenylphenol from biphenylyl ether to about 8% PhOH from Ph_2O. The alkali metals were reactive in the order expected: Li < Na < K < Rb < Cs. Product analysis and the electron spin resonance indicated that the reaction proceeded through a heterolytic cleavage of the aryl C-O bond of the dinegative ion.

PRIMARY COSMIC-RAY ALPHA PARTICLES - III, by M. W. Friedlander and C. T. Spring. [1962] [9]p. incl. diagr. table, refs. (AFOSR-J382) (AF AFOSR-62-404) AD 406451 Unclassified

Also published in Nuovo Cimento, Series X, v. 26: 1292-1300, Dec. 16, 1962.

Nuclear photographic emulsions were exposed to the cosmic radiation on a high altitude balloon flight at 49° N geomagnetic latitude on Aug. 3, 1958. The total flux of primary α-particles, having kinetic energies greater than 400 mev/nucleon, was found to be (87 ± 8) particles/m^2 ster s. Simultaneously, another set of emulsions was exposed at 61° N geomagnetic latitude. A comparison of the data obtained from the 2 flights leads to an estimate of the geomagnetic cut-off for 49° N as (500 ± 50) mev/nucleon kinetic energy. (Contractor's abstract)

COULOMB ENERGY OF He^3 AND CHARGE DISTRIBUTION OF NUCLEON, by H. Ohmura and T. Ohmura. [1962] [5]p. incl. tables. (Technical rept. no. 1) (AFOSR-J37) [AF AFOSR-62-412] AD 297042 Unclassified

Also published in Phys. Rev., v. 128: 729-733, Oct. 15, 1962.

The effect of finite nucleon size on the Coulomb energy of He^3 has been investigated. The experimental value of the difference between the binding energies of H^3 and He^3 is 0.764 mev, while the calculated Coulomb energy is approx equal to or greater than 1.0 mev if the nuclear force has no repulsive core. If the finite size of nucleon is taken into consideration, the Coulomb energy of H^3 is reduced by about 15-20%. The effect of finite charge distribution is determined mainly by the mean square radius. If there is a hard core (with radius D), the calculated Coulomb energy (assuming point nucleons) is already smaller, with the values 0.8—0.9 mev for D = 0.2×10^{13} cm, ~0.7 mev for D = 0.6×10^{13} cm. The reduction of Coulomb energy due to the finite size is about 8% and 3%, respectively, for 2 different models. The Coulomb potential between extended unpolarized nucleons is given in closed form for exponential and Yukawa charge distributions. (Contractor's abstract)

THEORY OF THE INTERACTION OF LOCALIZED ELECTRONIC EXCITATIONS, by W. T. Simpson. [1962] [14]p. (AF 49(638)677) Unclassified

Presented at Tenth annual meeting of the Radiation Research Soc., Colorado Springs, Colo., May 20-23, 1962.

Also published in Radiation Research, v. 20: 87-100, Sept. 1963.

The matrix element connecting electronic excitation on a molecule at r in interaction with electronic excitation on a molecule at the origin is calculated by using quantum electrodynamics and perturbation theory to the first nonvanishing order. For transition moments, m_z, parallel to the z-axis, the matrix element is found to be

$$m_z^2 \left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}\right) \frac{e^{-ik_0 r}}{r}$$

This result agrees with one found previously by using a semiclassical argument; also, the result goes over into the well-known coulombic interaction matrix element (dipole approximation) when $k_0 \rightarrow 0$.

Washington U. [Dept. of Chemistry] Seattle.

POLARIZABILITY CHANGE IN LIQUIDS DUE TO MANY-BODY INTERACTIONS, by R. Yaris and B. Kirtman. [1962] [5]p. incl. table, refs. (AFOSR-2602) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)723 and Office of Naval Research) Unclassified

Also published in Jour Chem. Phys., v. 37: 1775-1779, Oct. 15, 1962.

Approximate quantum-mechanical expressions for the change in polarizability due to many-body interactio... in spherically symmetric liquids, or dense gases, are derived by a variational form of perturbation theory. These expressions are evaluated using Linder's continuum model for the liquid and Slater-type wavefunctions. It is shown that the change in polarizability is approximately $[3g\alpha^2/8(ea_0)^2]$, where α is the unperturbed polarizability and g is a parameter which depends on the dielectric constant and molar volume of the liquid. The predicted increase in polarizability varies from 0.042% for He to 3.54% for Xe. (Contractor's abstract)

EFFECT OF CENTRIFUGAL DISTORTION ON THE SHAPE OF THE HYDROGEN SULFIDE FUNDAMENTAL INFRARED BANDS, by M. T. Emerson and D. F. Eggers, Jr. [1962] [9]p. incl. diagrs. tables, refs. (AFOSR-2158) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)797 and National Science Foundation) AD 446158 Unclassified

Also published in Jour. Chem. Phys , v. 37: 251-259, July 15, 1962.

The fundamental infrared vibration bands of hydrogen sulfide exhibit an interesting intensity anomaly characterized by P branches which are much weaker than the corresponding R branches. This work shows that this anomaly is caused by centrifugal distortion of the nonrigid molecule. A formalism based on a semi-classical approach is used to calculate the vibration—rotational line positions and their intensities. The computed theoretical spectra are in good agreement with the experimental spectra. This formalism also gives a method of determining the relative sign of $(\partial\mu/\partial Q)$ with respect to μ_0. The values of $(\partial\mu/\partial Q)$ needed in the calculations were obtained from the experimental integrated band intensities and were found to be $(\partial\mu/\partial Q_1) = -4.4$ esu $g^{-\frac{1}{2}}$ and $(\partial\mu/\partial Q_2) = +8.7$ esu $g^{-\frac{1}{2}}$. THE MAN-COMPUTER RELATIONSHIP, by D. L. Johnson and A. L. Kobler. [1962] [22]p. (Bound with its AFOSR-3865; AD 287791; AD 291144) (AF 49(638)-1070) Unclassified

Published in Science, v. 138: 873-879, Nov. 23, 1962.

The levels of human knowledge of the environment and the universe are increasing, and it is obviously necessary that man's ability to cope with this knowledge should increase for his very survival. The processes of automation have provided a functional agent for this purpose. Successful mechanized solution of routine problems has directed attention toward the capacity of the computer to arrive at apparent or real solutions of routine-learning and special problems. The computer is being called on to act for man in areas where man cannot define his own ability to perform and where he feels uneasy about his own ability to perform and where he would like a neat, well-structured solution and feels that in adopting the machine's partial solution he is closer to the "right" than is in using his own. An aura of respectability surrounds a computer output, and this, together with the time-balance factor, makes unqualified acceptance tempting. The need for caution, then, already exists and will be much greater in the future. It has little to do with the limited ability of the computer per se, much to do with the ability of man to realistically determine when and how he must use the tremendous ability which he has developed in automation.

ACOUSTIC EXCITATION OF NUCLEAR SPIN TRANSITIONS IN NaCl (Abstract), by H. P. Mahon, Jr. and E. A. Uehling. [1962] [1]p. [AF 49(638)92] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 38, Jan. 24, 1962.

The probability of nuclear spin transitions in NaCl induced in single phonon interactions of the spin and lattice vibrations is studied by a method which differs considerably from 2 others reported previously. Measurements of spatial distribution of acoustic excitation energy and total rate of decay of this energy are made. Losses due to mode conversion, poor geometry, and transmission across boundaries are negligible under conditions of the experiment. The remaining loss due to intrinsic attenuation is measured. A new method is given for measuring energy distribution at the surface which shows that a single fundamental vibrational mode is excited. Results include sound attenuation measurements at 15 mc/sec in NaCl and the nuclear spin transition probability. An unexplained variation in attenuation (0.15 to 0.003 cm^{-1}) is measured among samples of equally good optical quality. The spin transition probability is given in terms of an enhancement factor γ_1. $\gamma_1 = 17$ is obtained for Na in NaCl. This is considerably larger than $\gamma_1 = 4$ reported previously using another method. Other comparisons that may be made are with a static $\gamma_0 = 10$ found in molecular beam measurements and a second order process enhancement $\gamma_2 = 60$ obtained from relaxation measurements.

CHANGE OF THE VELOCITY OF SOUND IN METALS IN A MAGNETIC FIELD (Abstract), by A. G. Beattie, H. B. Silsbee, and E. A. Uehling. [1962] [1]p. [AF 49(638)92] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-25 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 478-479, Aug. 27, 1962.

Recent measurements in this laboratory confirm a result reported previously, that, in a metal at room temperature, the velocity of a longitudinal sound wave propagated in a direction perpendicular to an applied magnetic field may increase by as much as 1 part in 10^5 in fields of the order of 10 kG. The previous measurements were on Sn and Al, while the present measurements are on Al and Mg. However, the methods of measurement are quite different. The first depends upon

the measurement of a phase difference, while the second uses the change in the mechanical reactance of a rod in which a standing-wave pattern is established. All 4 results are in fairly good agreement with a previously derived phenomenological theory which states that the shift is expected to increase with an H^2 dependence. It is hoped that the techniques of measurement will be refined sufficiently to detect the deviations from this macroscopic theory which are expected to appear at liquid-helium temperatures.

EFFECTS OF SURFACE CONDITIONS ON THE LINE SHAPE OF FERROMAGNETIC RESONANCE IN METALS (Abstract), by R. L. Cooper, H. B. Silsbee, and E. A. Uehling. [1962] [1]p. [AF 49(638)92] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 448, Aug. 27, 1962.

The width and shape of the ferromagnetic-resonance line in Ni and certain of its alloys have been studied in the 2 cases of static magnetic field parallel or perpendicular to the surface of the sample. Electropolishing or other changes in surface condition can produce large changes in the perpendicular case without corresponding changes in line shape in the parallel case. Annealing has moderate effects which are similar for both cases, except when surface condition is affected by the anneal. Attempts to interpret these observations in terms of current theories of line shape are discussed.

ELECTRON-SPIN-RESONANCE STUDY OF PHASE TRANSITION IN $BaTiO_3$ (Abstract), by W. R. Elliott and J. L. Bjorkstam. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)92] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 449, Aug. 27, 1962.

The Fe^{3+} esr at x-band in $BaTiO_3$ has been used as a vehicle to study the possibility of electric tuning of stimulated-emission devices when a ferroelectric host lattice is employed. There is an abrupt change in the spectrum at both the cubic-tetragonal (120°C) and tetragonal-orthorhombic (0°C) phase transitions. Since these transitions can be induced by applying an electric field to the sample, one should be able to alter appreciably the Fe^{3+} spectrum in this way. Previous attempts to do so have not been successful. Operating at temperatures just above the cubic-tetragonal phase transition in crystals with appropriate impurity concentrations and properly prepared electrodes, the tetragonal field splittings of the Fe^{3+} spectrum with an applied electric field have been induced. Details of these results together with similar studies at the tetragonal-orthorhombic transition are presented.

PROTON RELAXATION AT HIGH TEMPERATURES IN KH_2PO_4-TYPE FERROELECTRIC CRYSTALS (Abstract), by E. A. Uehling, E. D. Jones, and H. B. Silsbee. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)92] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 483, Aug. 27, 1962.

The spin-lattice relaxation time T_1 of spin ½ nuclei in KH_2PO_4 and its isomorphs has been studied in a number of different cases. In all but 1 sample, the experimental data are consistent with expectations based on spin diffusion in the limiting case of slow diffusion. The exception is a particular sample of KH_2AsO_4, presumably of low impurity concentration, in which the proton relaxation times are of the order of 3-5 times longer than in any other sample. It exhibits strong frequency and temperature dependences which are formally consistent with predictions based on spin-diffusion theory in the fast-diffusion limit. This interpretation must be regarded, however, as untenable for reasons which are discussed. The behavior at high frequencies and high temperature suggests a transition from the unknown new mechanism to the competing spin-diffusion mechanism. Additional crystals of sufficiently low impurity concentrations to be useful in these studies are not yet available.

SEARCH FOR THE As^{75} NUCLEAR-MAGNETIC AND QUADRUPOLE RESONANCE IN KH_2AsO_4 (Abstract), by E. D. Jones, H. B. Silsbee, and E. A. Uehling. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)92] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington U., Seattle, Aug. 27-29, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 483, Aug. 27, 1962.

A tentative interpretation of the anomalous behavior of the proton relaxation time T_1 as a function of frequency in the temperature region around the ferroelectric Curie

temperature of KH_2AsO_4 invokes a fast relaxation of the arsenic and an interaction between the arsenic and proton spin systems. Consequently, an extensive search has been made for the As^{75} NMR and NQR. A search for the NMR $\frac{1}{2} \rightarrow \frac{1}{2}$ transition covered the temperature range of 4.2° to 300°K. A search based on a possible quadrupolar splitting was made at 4.2°K (20-90 mc/sec) and at 77°K (5-190 mc/sec). Comparison with previously known quadrupole-resonance signals indicates that the sensitivity of the apparatus is good. All attempts to detect the As^{75} resonance in KH_2AsO_4 have so far failed. Successful observation of the As^{75} NQR in $Na_2HASO_4 \cdot 7H_2O$ has, however, been made. Estimates from sensitivity considerations give an arsenic T_1 not much greater than 10^{-6} sec in KH_2AsO_4.

IMMERSIONS OF COMPACT METRIC SPACES INTO EUCLIDEAN SPACES, by S.-T. Hu. [1962] [10]p. (AFOSR-3746) (AF 49(638)179) Unclassified

Also published in Illinois Jour. Math., v. 7: 415-424, Sept. 1963.

By an application of the Smith classes to the tubular neighborhood of the diagonal of the topological square X^2 of a finitely triangulable space X, W.-T. Wu introduced his immersion classes $\Psi^n(X)$ for every n = 1, 2, ... and proved that a necessary condition for X to be immersible into the n-dimensional Euclidean space R^n is $\Psi^n(X) = 0$. By means of this condition, he proved that the n-dimensional skeleton of the unit (m + 2)-simplex cannot be immersed in R^m if $n \leq m \leq 2n - 1$. His method is purely combinatorial, and hence it cannot be extended to general spaces. In a paper on isotopy invariants the enveloping space $E_m(X)$ of any given topological space X for each integer $m > 1$ is defined. If X is finitely triangulable, then $E_m(X)$ has the same homotopy type as the boundary of a tubular neighborhood of the diagonal in the topological power X^m. The objective of the present paper is to apply the Smith theory to $E_m(X)$. This leads to the immersion classes $\Psi_m^n(X)$ defined for every topological space X. If X is a metric space, we consider a subspace $E_m(X, \delta)$ of $E_m(X)$ for every real number $\delta > 0$ and prove that the inclusion $E_m(E, \delta) \subset E_m(X)$ is a homotopy equivalence. This enables us to localize the situation and to establish the main theorem that a necessary condition for a compact metric space X to be immersible into R^n is $\Psi_2^n(X) = 0$. (Math. Rev. abstract)

CONFORMAL TRANSFORMATION GROUP OF A COMPACT HOMOGENEOUS RIEMANNIAN MANIFOLD, by S. I. Goldberg and S. Kobayashi. [1962] [4]p. (AFOSR-3254) (AF 49(638)967) Unclassified

Also published in Bull. Amer. Math., v. 68: 378-381, July 1962.

Let M be a Riemannian manifold, $C_0(M)$ the largest connected group of conformal transformations of M, and $I_0(M)$ the largest connected group of isometries of M. The following theorems are announced: (1) Let M be a compact Riemannian manifold. If $C_0(M) \neq I_0(M)$, then there is no harmonic form of degree p, $0 < p < \dim M$, whose length is a non-zero constant, and (2) Let M be a compact homogeneous Riemannian manifold. If $C_0(M) \neq I_0(M)$, then M is a rational homology sphere.

MAGNETOACOUSTIC MEASUREMENTS IN THE NOBLE METALS AT 350 MC/SEC, by H. V. Bohm and V. J. Easterling. [1962] [37]p. incl. diagrs. tables, refs. (AFOSR-2760) (AF 49(638)832) AD 295928 Unclassified

Also published in Phys. Rev., v. 128: 1021-1029, Nov. 1, 1962.

Further magnetoacoustic measurements on the noble metals are presented for frequencies up to 350 mc/sec. Plots of the ultrasonic pulse height, h, vs the reciprocal of the magnetic field strength, 1/H, show 20 or more max and min for several orientations in each metal. Fermi surface dimensions are calculated from the periods in 1/H of the magnetoacoustic oscillations using the interpretation that the periodicity arises from those portions of the Fermi surface which are extremal in the q x H direction of momentum space; Fermi surface cross sections viewed along the [100], [110], [111], and [112] directions are shown in detail. The results are compared with Fermi surface dimensions given by: (1) other magnetoacoustic effect data, (2) de Haas-van Alphen and anomalous skin-effect data, and (3) recent band theory calculations. Some simple calculations of electron mean free paths and collision relaxation times are given. (Contractor's abstract)

342 MC/SEC MAGNETOACOUSTIC MEASUREMENTS IN ALUMINUM, by G. N. Kamm and H. V. Bohm. [1962] [13]p. incl. diagrs. (AF 49(638)832) Unclassified

Published in Proc. Eighth Internat'l. Conf. on Low Temperature Phys., London (Gt. Brit.) (Sept. 16-22, 1962), Washington, Butterworths, 1963, p. 199-201.

Magnetoacoustic oscillations of the ultrasonic attenuation in high-purity single-crystal aluminum samples using 342 mc longitudinal sound waves have been used to make a high resolution study of the surface topology of the Fermi surface. The data verifies the general features of the second-zone Fermi surface proposed by W. A. Harrison, but the dimensions appear to be a few percent larger. The oscillation periods which are observed can be related to central or to off-center orbits on the Fermi surface. An interpretation of the long period oscillations which are observed with magnetic field H in the (100) and (110) planes in comparison with the theoretical model of the third zone Fermi surface is offered.

ULTRASONIC ATTENUATION IN SUPERCONDUCTING VANADIUM AND ZINC, by H. V. Bohm and N. H. Horwitz. [1962] [8]p. incl. diagrs. table. (AF 49(638)-832) Unclassified

Also published in Proc. Eighth Internat'l. Conf. on Low Temperature Phys., London (Gt. Brit.) (Sept. 16-22, 1962), Washington, Butterworths, 1963, p. 191-192.

Measurements have been made of the ultrasonic attenuation in single crystal samples of vanadium with longitudinal waves at a frequency 343 mc. The samples had a resistivity ratio of about 130. The fit to adjusted BCS theory values is, in general, quite satisfactory. However, there exists an anisotropy in the values obtained for the energy gap as measured along the 3 major crystallographic directions. Values of 3.4 ± 0.2, 3.1 ± 0.2 and 3.2 ± 0.2 kT_c units were obtained for [110], [100], and [111] directions respectively. Single crystal samples of zinc of 99.9999% purity were examined using longitudinal waves at a frequency of 233 mc. A special cryostat was designed to cool the sample to about 0.4 T_c. Energy gap measurements have been obtained for the [1010] and [1210] crystallographic directions. (Contractor's abstract, modified)

NMR STUDY OF THE PHOTOLYSIS KINETICS IN SIMPLE AMINO ACIDS. I. SARCOSINE HYDROCHLORIDE AND ITS ESTER, by M. Sheinblatt. [1962] [4]p. incl. diagrs. refs. (AF 61(052)03) Unclassified

Published in Jour. Chem. Phys., v. 36: 3103-3106, June 15, 1962.

The mean lifetimes τ of the amino group of acidic aqueous solutions of sarcosine-HCl and sarcosine Me ester-HCl were measured at 21° by nuclear magnetic resonance techniques. $1/\tau$ was first order in respect to both sarcosine and its ester concentration. $1/\tau$ depended strongly on $1/a_{H^+}$ in very acidic solutions and became almost independent in diluted acid solution. An interpretation is given in terms of an exchange of protons between the amino acid or its ester with a water molecule which was H-bonded to the amino-group.

1^1S, 2^1S, AND 2^3S STATES OF H^- AND OF HE, by C. L. Pekeris. [1962] [7]p. incl. tables, refs. (AFOSR-3169) (AF 61(052)510) Unclassified

Also published in Phys. Rev., v. 126: 1470-1476, May 15, 1962.

The ionization energy J, including mass-polarization and relativistic corrections but not Lamb shift correction, was evaluated for the 1^1S state of the negative-hydrogen ion using determinants up to order n = 444. We get $J(444) = 6083.0943\ cm^{-1}$, and, by extrapolation, $J(\infty) = 6083.0958\ cm^{-1}$. A search for bound states 2^1S and 2^3S of H^- led to negative results. In the case of helium, an upper bound to the non-relativistic energy eigenvalue ν for the 1^1S state was evaluated at n = 1078 to be $\nu_+ = 198317.866\ cm^{-1}$, as against the previously determined lower bound of $\nu_-(1078) = 198317.374\ cm^{-1}$. For the 2^3S state, this gap is already completely closed at n = 715, with $\nu_+(715) = 38453.1299\ cm^{-1}$ and $\nu_-(715) = 38453.1292\ cm^{-1}$. At n = 1078, $J = 38454.827375\ cm^{-1}$, and the electron charge density at the nucleus D(0) comes out 33.18414092, in agreement with previously extrapolated values. This substantiates a disagreement of the order of one part in 10^5 between theory and experiment in the hyperfine structure of the 2^3S state of He^3 which was established by White, Chow, Drake, and Hughes. With Suh and Zaidi's value for the Lamb shift of $-0.109 \pm 0.009\ cm^{-1}$, the ionization energy of the 2^3S state comes out $38454.718 \pm 0.009\ cm^{-1}$, as against Herzberg's experimental value of $38454.73 \pm 0.05\ cm^{-1}$. For the 2^1S state, we get $J(615) = 32033.316\ cm^{-1}$, which with a Lamb shift of $-0.104 \pm 0.014\ cm^{-1}$ evaluated by Suh and Zaidi, leads to an ionization energy of $32033.214 \pm 0.014\ cm^{-1}$. The experimental value is, according to Herzberg, equal to $32033.26 \pm 0.03\ cm^{-1}$ or at worst, $\pm 0.05\ cm^{-1}$. A summary is given of the verification to date of the Lamb shift in 2-electron atoms. (Contractor's abstract)

EXCITED S STATES OF HELIUM, by C. L. Pekeris. [1962] [3]p. incl. tables. [AF 61(052)510] Unclassified

Published in Phys. Rev., v. 127: 509-511, July 15, 1962.

As part of a program aiming to determine all the observed term values of 2 electron atoms on the basis of the Schrodinger wave equation, evaluation has been made of the 1s ns levels of helium up to n = 9, in both the singlet and the triplet states. The previous method, using perimetric coordinates, was extended to allow for the asymmetry between the 1s and the excited electrons. The mass polarization and relativistic corrections were also determined. The difference between the ionization energies J(220), obtained by solving a determinant of order 220, and the experimental values, ranges from $3.6\ cm^{-1}$ for $3\ ^1S$ to $5.8\ cm^{-1}$ for $9\ ^1S$, and from $0.5\ cm^{-1}$ for $3\ ^3S$ to $5.7\ cm^{-1}$ for $9\ ^3S$. The extrapolated values indicate that with a faster computer than WEIZAC it should be feasible to determine all of the 31 observed 1s ns levels ($n \leq 17$) of helium to within the experimental accuracy.

LIGHT-DEPENDENT ADENOSINE TRIPHOSPHATASE IN CHLOROPLASTS, by M. Avron. [1961] [7]p. incl. diagrs. tables, refs. (AFOSR-2895) (AF 61(052)390) Unclassified

Also published in Jour. Biol. Chem., v. 237: 2011-2017, June 1962.

Isolated Swiss chard chloroplasts or chloroplast fragments were shown to possess a light-dependent adenosine triphosphatase (ATPase) activity. The reaction was dependent upon the presence of phenazine methosulphate. It had a pH optimum of approx 8.0, a temperature optimum of 15-20°, and required light intensities of approx 200,000 lux for maximal activity. The reaction was competitively inhibited, strongly by adenosine diphosphate and poorly by adenosine 5'-phosphate. It was also inhibited by magnesium, ammonium, fluoride, arsenate, and ethylenediaminetetraacetate. Calcium markedly stimulated the reaction. In its presence, rates of up to 35 umol of ATP hydrolyzed per mg of chlorophyll per hr were obtained. The possibility that the reaction may reflect a partial reversal of the photophosphorylating path, and its relation to other ATPase reactions, are discussed

THE MECHANISM OF PHOTOPHOSPHORYLATION IN CHLOROPLASTS, by M. Avron. Final rept. Apr. 30, 1962, 6p. (AFOSR-2950) (AF 61(052)390) AD 283586 Unclassified

The investigation performed concentrated around 4 aspects: (1) Ultraviolet irradiation of chloroplasts. The inhibitory effects of ultraviolet irradiation on photophosphorylation and the Hill reaction was investigated. The mechanism of the inactivation was related to the chloroplastic components which were found to be destroyed by the treatment; (2) Photophosphorylation as a tool for the synthesis of specifically labeled nucleotides; (3) Light activated adenosine triphosphatase; and (4) Reversible uncoupling of photophosphorylation. Treating chloroplasts with ethylenediaminetetraacetate was found to bring about complete uncoupling of the photophosphorylating system. Partial recoupling could be affected by incubation of a 3 component system consisting of: (a) the treated chloroplasts, (b) the components released by the treatment (containing a small amount of protein), and (c) metal ion.

PHOTOPHOSPHORYLATION AS A TOOL FOR THE SYNTHESIS OF SPECIFICALLY LABELED NUCLEOTIDES, by M. Avron. [1961] [9]l. incl. diagrs. tables, refs. (AFOSR-J178) (AF 61(052)390) AD 400458 Unclassified

Also published in Anal. Biochem., v. 2: 535-543, Dec. 1961.

A method is described for the direct synthesis of terminally labeled ATP^{32} with chloroplasts isolated from swiss-chard leaves. By simple variations, both the central and terminal phosphates were equally labeled, or the central phosphate was exclusively labeled. Coupling the reaction with other enzymes is suggested as a mode for the synthesis of many P^{32}-labeled compounds. P^{32}-labeled GTP, ITP, and UTP were also synthesized by the same reaction. All the above compounds may also be synthesized labeled with O^{18} in their phosphate oxygens. The advantages and disadvantages of the method, as compared with others, are discussed.

THE EFFECT OF ULTRAVIOLET LIGHT OF PHOTOPHOSPHORYLATION AND THE HILL REACTION, by N. Shavit and M. Avron. [1962] [9]p. incl. diagrs. tables, refs. (AFOSR-J947) (AF EOAR-62-59) AD 415927 Unclassified

Also published in Biochem. et Biophys. Acta, v. 66: 187-195, Mar. 1963.

Photophosphorylation and Hill-reaction activity of swiss-chard chloroplasts or chloroplast fragments were decreased by irradiation with short-wavelength ultraviolet light. Photophosphorylation was more resistant to irradiation than the Hill reaction. The presence of ascorbate during irradiation prevented the decrease in Hill reaction and photophosphorylative activity. Protection was more pronounced for the Hill reaction than for photophosphorylative activity. Compounds containing SH-groups could not replace ascorbate; it is suggested that ascorbate protects mostly by reducing the effective ultraviolet intensity, and in addition by exerting a specific effect on the chloroplasts themselves. By ultraviolet irradiation, it was possible to obtain chloroplast preparations which had lost the ability to perform the Hill reaction, but still possessed high photophosphorylative activity. Such preparations may be useful in further research. The endogeneous plastoquinone of chloroplasts was shown to be destroyed by irradiation. The activity of irradiated chloroplasts was stimulated by the addition of plastoquinone. However, a similar stimulation was obtained on addition of plastoquinone to non-irradiated chloroplasts.

PREPARATION AND CHARACTERIZATION OF POLYTYROSYL TRYPSIN, by A. N. Glazer, A. Bar-Eli, and E. Katchalski. [1962] [7]p. incl. diagrs. tables, refs. (AFOSR-4192) (AF 61(052)391) Unclassified

Also published in Jour. Biol. Chem., v. 237: 1832-1838, June 1962.

Polytyrosyl derivatives containing 20 to 28 additional residues of tyrosine per mol of trypsin were prepared by using trypsin as the initiator for the polymerization of N-carboxy-L-tyrosine anhydride in aqueous solution. Approximately half of the ϵ-amino groups of trypsin were acylated by the N-carboxyanhydride. The average chain length of the tyrosine side chains was approximately 2.5. The polytyrosyl trypsin preparations appeared to be rather homogeneous in the ultracentrifuge. In contrast to trypsin, the polytyrosyl derivative was sparingly soluble between pH 5 and 9. The polytyrosyl trypsin was considerably more resistant to autolysis than the unmodified enzyme. No significant differences were observed in the behavior of polytyrosyl trypsin and trypsin toward denaturing agents such as urea and toward soybean trypsin inhibitor. The polytyrosyl derivatives possessed enzymatic activity toward benzoyl-L-arginine ethyl ester equivalent to that of trypsin. The specific activity of polytyrosyl trypsin toward a variety of ester, protein, and synthetic polypeptide substrates has been determined and compared with that of trypsin. Water insoluble trypsin was prepared from polytyrosyl trypsin, and its activity on low and high molecular weight substrates was tested.

INACTIVATION OF ESCHERICHIA COLI BACTERIOPHAGE T2 BY POLY-L-LYSINE. II. PROPERTIES OF THE IRREVERSIBLY INACTIVATED PHAGE, by C. Shalitin and E. Katchalski. [1962] [9]p. incl. diagrs. tables, refs. (AFOSR-J951) (Sponsored jointly by Air Force Office of Scientific Research under AF C1(052)391 and National Institutes of Health) AD 416187 Unclassified

Also published in Arch. Biochem. and Biophys., v. 99: 508-516, Dec. 1962.

Coliphage T2 irreversibly inactivated by poly-L-lysine was obtained by prolonged incubation of phage with the basic polypeptide at 37°C, followed by tryptic digestion. T2 particles thus treated, though appearing morphologically intact, have lost their ability to form plaques. Using isotopically labeled (P^{32} or S^{35}) phage, it was demonstrated that T2 inactivated irreversibly by polylysine adsorbs normally to Escherichia coli B, and injects its DNA into the host cells. The adsorption of the irreversibly inactivated phage on E coli B was not accompanied by death of the host cell. In the infected cells, induced biosynthesis of β-galactosidase could be effected. Marker rescue experiments in which $T4r^+$ (wild type), irreversibly inactivated by polylysine, was crossed with intact T4rII, and irreversibly inactivated $T2hr_{22}$ was crossed with intact $T2h^+r^+$ (wild type), revealed that the genome of of the inactivated phage contributes no markers in mixed infections. The same conclusion was drawn from genetic recombination experiments using irreversibly inactivated $T2hr_{22}$ and intact $T2h^+r^+$ (wild type).

INACTIVATION OF ESCHERICHIA COLI BACTERIOPHAGE T2 BY POLY-L-LYSINE. I. NATURE OF THE INACTIVATION PROCESS, by C. Shalitin, D. Danon, and E. Katchalski. [1962] [14]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)391 and National Institutes of Health) Unclassified

Published in Arch. Biochem. and Biophys., v. 99: 494-507, Dec. 1962.

Interaction of coliphage T2 with poly-L-lysine was investigated. T2 suspended in saline loses its plaque-forming ability in the presence of polylysine. Inactivation is fast, about 80-90% of phage being inactivated within 1 min, and practically independent of temperature within the range 0-37°C. Study of the effect of pH and ionic strength on the extent of phage inactivation revealed that the interaction between phage and basic polypeptide is largely determined by the electrostatic attraction between the negatively charged virus and the positively charged polypeptide. Partial reversion of the inhibitory effect of poly-L-lysine on the growth of T2 could be carried out by incubation with trypsin or with polyaspartic acid. Populations of coliphage T2 which lost their plaque-forming ability by treatment with polylysine, were thus assumed to consist of 2 fractions: (a) reversibly inactivated phages, i.e., phages whose ability to form plaques is restored by tryptic digestion; and (b) irreversibly inactivated phages, i.e., phages whose ability to form plaques cannot be restored by tryptic digestion. Increase in temperature and time of incubation of T2 with polylysine caused a corresponding increase in the fraction of irreversibly inactivated phage. Electron microscopic examination has shown that inactivation of T2 by polylysine is accompanied by aggregation. Incubation of the phage aggregates with trypsin or with polyaspartic acid resulted in complete resuspension of the agglutinated particles.

EFFECT OF A PERIODIC POTENTIAL ON A DEGENERATE FERMI GAS, by S. Moszkowski and L. Wilets. Jan. 18, 1962, 23p. (Technical note no. 14) (AFOSR-2390) (AF 61(052)337) AD 273697 Unclassified

The effect of a periodic potential on the particle and energy density of a degenerate Fermi gas is considered. It is found that for a weak and long wavelength potential the inhomogeneity correction (deviation from the Thomas Fermi statistical model) to the kinetic energy density is only 1/9 as large as the Weizsacker estimate. The potential energy density due to Majorana exchange 2-body interactions of short range is also given to a high accuracy by the statistical model; the corrections are only 1/9 as large as for a short range Wigner (ordinary) interaction. For the analogous 2-dimensional Fermi gas, the inhomogeneity corrections vanish at least to high order unless the periodic potential contains short wavelength components. Relevance to the problem of the nuclear surface is discussed.

UNITARY SYMMETRY OF STRONG INTERACTIONS, by C. A. Levinson, H. J. Lipkin, and S. Meshkov. Feb. 15, 1962 [15]p. incl. diagrs. tables. (Technical note no. 15) (AFOSR-2527) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)337 and National Science Foundation) AD 280021 Unclassified

Also published in Phys. Ltrs., v. 1: 44-49, Apr. 15, 1962.

The purpose of this note is to point out various experimental implications of the Octet model and the Sakata model classification schemes for elementary particles. In particular, reaction amplitudes and some of the recently observed resonances are discussed. The methods employed are similar to those used previously, which were concerned with the consequences of the Sakata model. The Octet model as well as the Sakata

model assigns the mesons to a (1, 1) representation of the group SU_3. However the Octet model differs from the Sakata model in the baryon assignments. The Sakata model assigns the n, p and Λ to the (1, 0) symmetry and makes no explicit statements about the remaining baryons. The Octet model assigns the 8 baryons n, p, Λ, Σ^-, Σ^0, Σ^+, Ξ^- and Ξ^0 to thr (1, 1) symmetry.

NUCLEAR MANY-BODY PROBLEM WITH NON-UNIFORM DENSITY. I. THEORY, by D. S. Koltun and L. Wilets. [1962] [9]p. incl. refs. [AF 61(052)337] Unclassified

Published in Phys. Rev., v. 129: 880-888, Jan. 15, 1963.

The many-body problem for nuclear matter is considered under the constraint that the density of the system vary periodically in space; this is equivalent to the problem of an external periodic potential. The method of Martin, Schwinger, and Puff is employed to derive, through second order in the amplitude of the density ripple, a set of tractable equations for the energy of the system. No new approximations are needed beyond those already assumed for the uniform density case. The model exhibits some interesting complications of the finite nuclear problem, and yet possesses sufficient simplicity for solubility. In the long-wavelength limit, an expression obtains for the explicit dependence of the energy on the density gradient: this relationship is useful in a study of the nuclear surface problem. Numerical calculations are planned.

THE PHOTOCHEMICAL SYNTHESIS OF 1,5-DIKETONES AND THEIR CYCLIZATION: A NEW ANNULATION PROCESS, by P. de Mayo, H. Takeshita, and A. B. M. A. Sattar. [1962] [1]p. incl. diagr. (AFOSR-2164) (AF AFOSR-61-6) Unclassified

Also published in Proc. Chem. Soc. (London): 119, Mar. 1962.

Irradiation 45 hr with an 80-w lamp of a 12% solution of $AcCH_2Ac$ in cyclohexene gave the diketone (78% yield), and this was cyclized by base in 95% yield to a 5:3 mixture (analyzed by gas-liquid chromatography). Similar results were obtained by using cyclopentene, 1-methylcyclohexene, or 1-octene in place of cyclohexene. When isopropenyl acetate was irradiated in the presence of I, and the resulting diketone cyclized with base, AcOH was eliminated with the formation of m-5-xylenol. A mechanism is proposed for both the reactions.

THE PHOTODIMERS OF α-PYRIDONES, by W. A. Ayer, R. Hayatsu and others. [1961] [6]p. incl. diagrs. table. (AFOSR-2198) (AF AFOSR-61-6) Unclassified

Also published in Tetrahedron Ltrs. No. 18: 648-653, Nov. 1961.

Lack of high intensity bands at λ 253, 255 mμ (log ε 3.69, 3.73) in the spectrum of α-pyridone dimer (I), its N-Me derivative and other dimers, but present in structures containing the system C: C. N. CO, and lack of a band in the infrared compatible with that expected of a vinyl lactam, excluded the structure proposed and also the 1, 2, 1, 4- Diels-Alder type adduct, but strongly suggested formation by 1, 4-addition of the components themselves. Irradiation of 4-methyl-N- methylpyridone gave a dimer (II), m p 260° (decomposition), doublet 8.15 τ, 1:2 vinyl-methine protons showing the position of the C-Me group on a double bond terminal as a result of 1, 4- addition. Irradiation of 6-methyl-N-methylpyridone gave a dimer (III), m p 210-212° (decomposition), single band at 8.37 τ, 2:1 vinyl-methine protons, indicating the quaternary nature of the Me group. Structures for the dimers were discussed from the standpoint of dipole measurements and nuclear magnetic resonance spectra.

THE PHOTO-OXIDATION OF PYRROLE: A SIMPLE SYNTHESIS OF MALEMIDE, by P. de Mayo and S. T. Reid. [1962] [1]p. incl. refs. (AFOSR-3909) (AF AFOSR-61-6) Unclassified

Also published in Chem. and Indus., No. 35: 1576-1577, Sept. 1, 1962.

Photooxidations of pyrroles have, with 2 exceptions, produced tars. Wasserman and Liberles reported interesting products from oxidation of tetrapyrrole, and Bernheim and Morgan obtained from oxidation of pyrrole (I) a crystalline compound which analyzed approx like succinimide, though not it, and gave NH_3 and succinic acid upon alkaline hydrolysis. A 0.1% aqueous solution of I, containing 2.5 mg-% cosin, shaken and irradiated with a 100-w lamp rapidly took up 1 mol of O. Evaporation of the solvent at room temperature, extraction of the residue with Me_2CO, and crystallization from the same gave the hydroxyketopyrolidine II (R = H), m.p. 102-2.5° (32%). Infrared bands at 1650 and 1590 cm^{-1} supported structure II. Similar oxidation of N-methylpyrrole gave II (R = Me), m.p. 84-5° (48%). Contratry to the report of Bernheim and Morgan, this oxidation proceeded to the same extent and at about the same rate as that of I.

PHOTOCHEMICAL SYNTHESES, 5. SULPHENES AND PHOTOCHEMICAL INTERMEDIATES, by J. P. King, P. de Mayo and others. [1962] [8]p. incl. diagrs. table, refs. (AFOSR-J242) (AF AFOSR-61-6) AD 400847 Unclassified

Also published in Canad. Jour. Chem., v. 41: 100-107, Jan. 1963.

The present status of sulphenes ($R'R''C:SO_2$) as stable entities or chemical intermediates is discussed. The early report by Locher and Fierz (Helv. Chim. Acta, v. 10: 642, 1927) of the preparation of a stable crystalline sulphene has been investigated; it is concluded that their claim is unfounded. The irradiation of unsaturated sultones in the presence of methanol is shown to give sulphonic esters: the corresponding thermal reaction of sultones is known to lead to sulphonic acid derivatives. It is proposed that the irradiation of unsaturated sultones yields sulphenes, which then react with the medium. (Contractor's abstract)

THE EFFECT OF DISCHARGE CONDITIONS ON THE INTENSITY OF THE NITROGEN SECOND POSITIVE SYSTEM (Abstract), by D. C. Tyte. [1962] [1]p. (AFOSR-5065) (AF AFOSR-62-236) Unclassified

Presented at meeting of the Canadian Association of Physicists, Laval U., Quebec City (Canada), June 6-9 [1962].

The relative intensities of the nitrogen second positive system have been measured in a discharge through nitrogen under a wide range of current densities and in a discharge through a wide range of helium-nitrogen mixtures.

Results indicate a small systematic variation with conditions of the intensity ratio of bands from a common upper state. It is suggested that this is an indication that the molecule may be slightly distorted by the fields existing in the discharge plasma.

Presented at First internat'l. Conf. on Vacuum Ultra-Violet Radiation Physics, Los Angeles, Calif., Apr. 16-19, 1962.

Also published in Jour. Quant. Spectros. and Radiative Transfer, v. 2: 433-449, Oct./Dec. 1962.

The great need for laboratory work on astrophysical problems is discussed and illustrated by the current research program in this field at the University of Western Ontario. As an example of the experimental work in progress, a critical review is given of intensity measurements on 20 band systems. The dependence upon transition parameters of the degree of variation of the electronic transition moments for these systems is discussed. The variation with internuclear separation of the electronic perturbation integral in excitation and ionization transitions is also discussed. As an example of the theoretical work in progress, arrays of Franck-Condon factors calculated to high vibrational quantum numbers for the following 11 vacuum ultraviolet band systems and 9 excitation transitions are presented: (1) N_2: Lyman-Birge-Hopfield, Vegard-Kaplan, Birge-Hopfield; (2) N_2^+: Janin d'Incan, Second Negative; (3) O_2: Schumann-Runge; (4) CO: Fourth Positive, Cameron, Hopfield-Birge a, Hopfield-Birge b; (5) CO^+: First Negative; (6) $N_2(X^1\Sigma_g^+) - N_2(a^1\Pi_g$,

$A^3\Sigma_g$, $B^3\Pi_g$, $C^3\Pi_u$); and (7) $N_2(X^1\Sigma_g^+) - N_2^+$ ($X^2\Sigma_g^+$, $A^2\Pi_u$, $B^2\Sigma_u$, $?^2\Pi_g$, $C^2\Sigma$). Finally a study of the geometry in the v'-v'' plane of loci of the local maxima of Franck-Condon factors is reviewed. This has immediate application to identification of molecular spectra.

FURTHER COMMENTS ON ACCIDENTAL COINCIDENCES IN FAST-SLOW COINCIDENCE SYSTEMS, by E. B. Shera. [1961] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 18(603)61] and National Science Foundation) Unclassified

Published in Nucl. Instr. and Methods, v. 12: 198, June 1961.

The assumption of independence in regard to a 2-fold fast-slow coincidence circuit leads to the omission of a term due to the finite resolving time of the fast coincidence circuit: $N^{12} = 2t_f N_1 N_2$, where $2t_f$ is the resolving time of the fast coincidence circuit and N_1, N_2 are the counting rates from the amplitude selectors. This term represents a major contribution to the actual random rate in most experiments. When estimating the magnitudes of the remaining accidental terms, the effect of dead times in the detectors and in the electronic circuitry before the slow coincidence circuit should not be neglected. These terms represent processes in which 2 successive events occur in the same detector within the resolving time of the slow coincidence circuit. If the detector or circuitry is inoperative for an interval following an event, the accidental counting rate from such processes will be correspondingly reduced. Indeed, if the dead time of the detectors is longer than the resolving time of the slow coincidence circuit, these processes contribute nothing to the random rate.

MEAN LIVES OF POSITRONS IN AQUEOUS SOLUTIONS, by J. E. Jackson and J. D. McGervey. [1962] [12]p. incl. diagrs. table. (AFOSR-3541) (AF 49(638)760) AD 286919 Unclassified

Also published in Jour. Chem. Phys., v. 38: 300-303, Jan. 15, 1963.

By measurement of the time distribution of positron annihilations in aqueous solutions, reaction rates for oxidation of positronium by the ions MnO_4^-, IO_3^-, and Hg^{++} have been determined. In strong oxidizing solutions the mean life of the positrons reaches a lower limit of 4.3×10^{-10} sec; the short lifetime τ_1 in water was measured and found to agree with this value. A $Pb(ClO_4)_2 \cdot 3H_2O$ solution reduced the intensity I_2 with no significant change in the long life τ_2, an effect previously observed in nitrate solutions. This may mean that in these 2 cases oxidation can occur before Ps is thermalized but not afterwards. The decay distributions from a mixture of Hg^{++} and MnO_4^- ions in solution and the Hg^{++} ion in separate solutions with Cl^- and ClO_4^- indicated an association taking place between the negative and positive ions. POSITRON ANNIHILATION REACTIONS IN CONDENSED MATERIALS, by J. D. McGervey. Final rept. July 1, 1960-June 30, 1962 [7]p. incl. diagrs. (AFOSR-3542) (AF 49(638)760) AD 286667 Unclassified

Measurements were made of the time distribution of positron annihilations in aluminum, tin, copper, titanium, and zinc. All of these metals measured to date have shown a long lived component. This component, which is still unexplained, contains from 5 to 10% of the total counts, with a mean life of about 4×10^{-10} sec in all the metals measured. The presence of the long lived component is deduced from an extremely small number of counts. Nevertheless these counts are significantly above the background level; the counting rate in the peak was about 5000 times the background. Short mean lives in these metals were determined by subtracting the counts in the extrapolated long lived component and measuring the slope of the remaining distribution. Data are being obtained on the angular distribution of annihilation radiation from alloys. The angular correlation method gives a direct experimental determination of the Fermi energy of the conduction electrons. The major difficulty with the method is that in many alloys of interest a large number of positrons annihilate with core electrons rather than conduction electrons, and it is necessary to subtract this component in order to obtain the curve for conduction electron annihilation. CONTACT POTENTIAL OF CADMIUM SULFIDE, by J. C. Erskine and S. Machlup. [1962] 12p. incl. diagrs. [AF 49(638)760] Unclassified

Presented at meeting of the Amer. Phys. Soc., Toledo, Ohio, May 4-5, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 586, Nov. 23, 1962.

The Kelvin method has been used to measure the contact potential between a c-cut CdS crystal (both +c and -c faces) and a reference (platinum or gold) electrode. The Brattain-Bardeen cycle of ambient gases gave poor reproducibility; and $N_2 - H_2S - N_2 - SO_2$ cycle became reliable after 2 or 3 cycles, giving a difference of surface potentials of about 50 mv (the matte -c surface more electropositive than the shiny +c). After 4 or 5 cycles, the contact potential (relative to Pt) of both surfaces varied between 0.4 and 0.5 v. The potentials approached each other after repeated cycling (producing visible

deposits of sulfur on the -c face). These results are in qualitative agreement with predictions based on piezoelectric, x-ray diffraction, and solution potential data for II-VI compounds having wurtzite structure.

OXIDATION OF POSITRONIUM (Abstract), by J. E. Jackson and J. D. McGervey. [1962] [1]p. [AF 49(638)-760] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 337, Apr. 23, 1962.

The oxidation of Ps has been observed in the oxidizing solutions $KMnO_4$, KIO_3, and $HgCl_2$. The variation of the long mean life with concentration shows that the oxidation probability per unit time is proportional to the concentration of the oxidizing ions (MnO_4^-, IO_3^-, and Hg^{2+}). The short mean life in water was measured and found to be $(0.41 \pm 0.03) \times 10^{-9}$ sec. equal to the "long" mean life in highly concentrated solutions, as expected. The oxidation rate for various ions, negative as well as positive, depends on their chemical-oxidation potentials. It was found that in solutions of $Pb(ClO_4)_2 \cdot 3H_2O$ the intensity of the long-lived component decreased with no measurable change in the long lifetime itself. A similar result was obtained for $NaNO_3$ solutions by Green and Bell. The oxidation potential of Pb^{2+} is close to that of NO_3^-, and is smaller than that of the other oxidizing ions; thus, it may be that in these solutions positronium can be oxidized before it is thermalized, but not afterwards.

THEORY OF DOCUMENTATION AND SEARCHING STRATEGY. Final technical documentary rept. [1962] 41p. incl. refs. (AFOSR 2710) (AF 49(638)357) AD 278551 Unclassified

A report is made of work directed toward the development of a general theory of documentation which will enable mathematical analyses of the basic principles underlying techniques of information retrieval. Two basic lines have been followed in these studies. The first is that of investigating existing information systems, analyzing and comparing them in such a way as to provide data upon which hypotheses may be tested. This may be referred to as the "practical" approach. The second is that of mathematical and logical investigation of documentation in the abstract, developing the models and the hypotheses which are to be used in working toward a general documentation theory; this is referred to as the "theoretical" approach. The practical approach has been followed in the study of devices, procedures, and operations used in information retrieval. The theoretical approach has been applied to studies in systems and operations analyses. Citations with abstracts are given for 30 publications resulting from these studies.

INFORMATION RETRIEVAL ON THE GE-225 COMPUTER, by J. Belzer. [1962] [9]p. incl. diagrs. [AF 49(638)357] Unclassified

Published in Information Retrieval in Action; Proc. of a Conf., Western Reserve U., Cleveland, Ohio (Apr. 16-18, 1962), Cleveland, Western Reserve U. Press, 1963, p. 31-39.

In an automatic retrieval system there are two important parameters: the efficiency of the system, and the effectiveness of the system. The efficiency of the system depends on the computer technique in performing the searches rapidly. This is accomplished by scoring the terms in the documents which are required in the questions and thus by-passing the need for comparisons of each term in the question with each of the terms in the documents. Also, for reasons of efficiency the sytem yields document numbers only, as answers to questions. The effectiveness is accomplished by great depth in document analysis and indexing its content by concept rather than words. This approach requires a sequential type system rather than the aspect type.

"NEED-TO-KNOW", by A. J. Goldwyn. [1962] [4]p. incl. illus. (AF 49(638)357) Unclassified

Published in Library Jour., v. 87: 1351-1354, Apr. 1, 1962.

The operator of an information system must establish and maintain a control over the use of this file. "Need

to Know" is used here to designate a formal test designed to protect this control. From the user's point of view, such a test, if arbitrarily set, may be unfair if it denies to him the right of access to a needful product. Some tests are implicit in the nature of any system: these include a corporate or governmental right to restrict access to certain information. Beyond this, however, the operator can ask that the question be answerable, that it be based on a real need, and that it be expressed in appropriately formulated terms.

PERTINENCY OF SEARCH RESULTS TO COMPUTER OUTPUT, by J. L. Melton. [1962] [9]p. [AF 49(638)-357] Unclassified

Published in Information Retrieval in Action; Proc. of a Conf., Western Reserve U., Cleveland, Ohio (Apr. 16-18, 1962), Cleveland, Western Reserve U. Press, 1963, p. 161-169.

The determination of pertinence of search result in relation to computer output is extremely difficult. Even though the computer output may be completely relevant to a question, the component information elements are not likely to be equally useful. Some of the problems to be considered are the environment of the question, the background and needs of the questioner, and the order of presentation of the information elements.

SIMILARITY AND STABILITY OF TEXTUAL INTERESTS, by R. A. Fairthorne. [1962] [15]p. [AF 49(638)357] Unclassified

Published in Information Retrieval in Action; Proc. of a Conf., Western Reserve U., Cleveland, Ohio (Apr. 16-18, 1962), Cleveland, Western Reserve U. Press, 1963, p. 183-197.

Useful grouping of texts depends on the stability of interests of the users. Since the task of the documentalist is to supply a particular person with a particular text, theory must begin to work in terms of particular people and places, with the result that the methods and materials of documentation are inherently imprecise and incomplete The first task of mathematics in this situation is not to use more powerful methods to refine results, but to represent what are deemed to be the essential formal documentary characteristics. In this application, constructivist mathematics will probably prove most useful.

SPINAL CORD AND ACTH RELEASE IN ADRENALECTOMIZED RATS FOLLOWING ELECTRICAL STIMULATION, by E. S. Redgate and N. D. Lipscomb. [1961] [4]p. incl. tables, refs. (AFOSR-1647) (AF 49(638)443) Unclassified

Also published in Endocrinology, v. 70: 263-266, Feb. 1962.

Rapid ACTH release following stimulation of an extremity has been proposed to occur by mediation through vascular and neural paths. The vascular paths presumably involve release of substances into the blood at the site of stimulation which subsequently release ACTH from the pituitary. Blood ACTH levels in adrenalectomized rats were measured by the adrenal ascorbic acid method in hypophysectomized rats. The contribution of the vascular path to the mediation of ACTH release was estimated by assaying aortic blood for ACTH content after electrical stimulation of the hindlegs of 3-hr and 48-hr cord-sectioned rats. No response to the flow of electric current through the hindlegs was observed. It was concluded that no contribution to ACTH release was rendered by the vascular path. In contrast, electrical stimulation of the intact neural paths in the forelegs of cord-sectioned rats resulted in ACTH release equivalent to that observed in intact cord rats. This indicated that absence of ACTH release in response to hindleg stimulation was not the result of depression of ACTH release in the cord-sectioned adrenalectomized rat preparations.

SPINAL CORD AND ACTH RELEASE IN ADRENAX RATS, by E. S. Redgate. Oct. 1961 [10]p. incl. tables. (AFOSR-1651) (AF 49(638)443) Unclassified

The task of delineating the pathways by which ACTH release is mediated is hindered by the tremendous variety of stimul which induce ACTH release. Investigators have proposed mediation by neural pathways and by chemical factors. To assess the relative ACTH releasing effectiveness of neural and vascular paths, the thoracic cord-sectioned rat was chosen. The

effectiveness of the vascular path from periphery to pituitary was tested by measuring ACTH release attendant upon hindpaw stimulation, while the neural path effectiveness could be estimated in cord-sectioned rats by stimulation of the normally innervated forepaws. Previously the data supported the conclusion that spinal paths are essential while there was no support for a blood-borne chemical mediator originating at the site of stimulation. ACTH depression was considered in detail and lead accidently to the observation that fasted rats respond with elevated blood levels of ACTH which are significantly above those of the fed rats.

MEDIATION OF ACTH RELEASE BY STRUCTURES IN ISOLATED CAT BRAIN. by E. S. Redgate. Oct. 1961 [6]p. incl. tables. (AFOSR-1652) (AF 49(638)443) Unclassified

The available data suggests that posterior hypothalamic and midbrain neurons increase ACTH output while hippocampal, anterior hypothalamus, and cortex inhibit ACTH output. The present experiments are concerned with testing the affect of these neural structures on ACTH output from the isolated brain cat preparation which is elicited by electrical stimulation. The choice of this preparation was dictated by 2 primary considerations: neurophysiological procedures such as stimulation and ablation can be carried out in the absence of interference of secondary effects mediated by neural paths to periphery; and the procedures can be carried out in the absence of anesthesia. The carotid sinuses were denervated, nodose and superior cervical ganglia extirpated. Recording electrodes were placed on the lateral gyrus and the middle ectosylvian gyrus. A stimulating electrode was placed at various sites in the midbrain and pons. The spinal cord was sectioned at the C-1 level and ether anesthesia discontinued Positive pressure respiration was instituted with 5% CO_2, 95% O_2. Since blood from the anterior cavernous sinuses as well as many other structures in the head drain through the posterior facial vein, this blood was collected for ACTH assay. Tegmental stimulation at sites capable of evoking typical arousal responses is associated [illegible]reased ACTH output. Stimulation at other site[illegible]ebral peduncles is associated with neither a[illegible]CTH release.

VASOPRESSIN BIOSYNTHESIS, II. INCORPORATION OF [^{35}S]CYSTEINE INTO VASOPRESSIN AND PROTEIN ASSOCIATED WITH CELL FRACTIONS, by H. Sachs. [1962] [13]p. incl. diagrs. tables, refs. (AFOSR-J835) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)764 and National Institutes of Health) AD 416517 Unclassified

Also published in Jour. Neurochem., v. 10: 299-311, May 1963.

Following the direct infusion of highly labeled [S^{35}]cysteine into the third ventricle of the brain of the dog, it was possible to isolate minute quantities (0.06 to 2.0 μg) of [S^{35}]vasopressin associated with a number of cellular structures. The isotopic purity of each labeled vasopressin fraction was confirmed by extensive ion exchange chromatography and degradative procedures. After the continuous infusion of [S^{35}]cysteine for 3-6 hr, vasopressin associated with the neurosecretory particles always had the lowest specific activity. Vasopressin molecules with high specific activities were associated with 2 particulate fractions; namely, the crude hypothalamic nuclear fraction (600 g, 15 min) and a large-granule fraction (10,500 g, 15 min). Further fractionation of the large-granule and microsome fraction with deoxycholate indicated that vasopressin with the highest specific activity was associated with the membranous (deoxycholate soluble) components rather than with the ribosome rich fraction. In contrast to the incorporation of [S^{35}]cysteine into vasopressin, the proteins with the highest specific activity were found in the fraction containing the neurosecretory particles. When [H^3]leucine was infused into the third ventricle instead of [S^{35}]cysteine, the proteins associated with the microsomal fraction had the highest specific activity.

STUDIES ON THE INTRACELLULAR DISTRIBUTION OF VASOPRESSIN, by H. Sachs. [1962] [9]p. incl. diagrs. tables, refs. (AFOSR-J836) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)764 and National Institutes of Health) AD 416518 Unclassified

Also published in Jour. Neurochem., v. 10: 289-297, May 1963.

Homogenates of dog hypothalamo-median eminence (HME) were centrifuged to remove nuclei and cell debris. The 70,000 g pellet from this supernatant contained 40-50% of the vasopressin activity and was rich in neurosecretory particles (NSP). The NSP fraction from HME contained only 20% of the vasopressin content of neural lobe NSP fraction. Vasopressin in NSP could be concentrated 5-fold by centrifugation in a sucrose gradient. Subcellular distribution of protein, nucleic acid, cytochrome oxidase and β-glucuronidase were also studied but no correlation could be made with vasopressin distribution.

ACTH IN DOG BLOOD (Abstract), by N. Ohsawa and E. S. Redgate. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-3, and Public Health Service) Unclassified

Presented at Fall meeting of the Amer. Physiol. Soc., Buffalo U., N. Y., Aug. 28-31, 1962.

Published in The Physiologist, v. 5: 191, Aug. 1962.

Dog plasma, incubated 12 to 16 hr at 370°C, contained no detectable quantity of ACTH. U.S.P. Reference Standard was added, the plasma dissolved in 5% acetic acid and heated to 70°C for 30 min. The solution was applied to an XE-64 resin column. ACTH was eluted with 50% acetic acid and the eluant lyophilized. The dry powder was dissolved in acid-saline (0.01 N HCl in 0.9% NaCl) and assayed in hypophysectomized rats by the adrenal ascorbic acid depletion method. When compared with Reference Standard dissolved in acid-saline, recovery was 145% (mean of five experiments). Dog plasma was processed as described above and ACTH added to the lyophilized eluant. Potency was 180% as compared to ACTH in acid-saline. ACTH added to unprocessed dog plasma or to bovine serum albumin (Fraction V) was more potent than ACTH in acid-saline (160 and 180%, respectively). When corrected for "potentiation", recovery by the XE-64 method is about 80%. By this method, blood ACTH levels in dogs under deep pentobarbital anesthesia have been shown to range between less than 1.5 to 7.5 milliunits for 100 ml whole blood. The elevation in the level of ACTH in blood from the carotid artery, induced by hemorrhage, was unexpectedly as great as that in blood from the jugular vein.

THREE DIMENSIONAL ORBITS WITH FIXED LOW THRUST, by G. Shapiro. May 11, 1962, 10p. (AFOSR-2610) (AF 49(638)1002) AD 276684 Unclassified

The orbit of a satellite with an additional fixed low thrust in a fixed direction is extended to 3 dimensions. The orbital eccentricity and inclination oscillate between bounds independent of the low thrust level. Escape does not occur and the major axis remains constant. The applicability of the analysis to the behavior of the orbit of a satellite for solar observation is shown. (Contractor's abstract)

ANALYTIC SOLUTION OF A MICROTHRUST PROBLEM, by G. Shapiro and E. W. Paul. [1962] [19]p. (AFOSR-4336) (AF 49(638)1002) AD 293204 Unclassified

Presented at Seventeenth annual Meeting and Space Flight Exposition of the Amer. Rocket Soc., Los Angeles, Calif., Nov. 13-18, 1962.

Examples of the inaccuracy of numerical integration (Cowell's method) of satellite orbits for many cycles are given. A mathematical model applicable to the perturbation of an orbiting solar observatory by radiation pressure or to testing an electrical propulsion system is used to illustrate one analytical procedure, the Krylov-Bogoliuboff method, which results in a closed form solution to first order. In the 2-dimensional case, the major axis remains constant while the orbit approaches a straight line so that eccentricity tends to 1. In the 3-dimensional case, the major axis again remains unchanged but the eccentricity, inclination and argument of perigee oscillate between limits which are independent of the magnitude of the acceleration due to the radiation pressure. STUDY OF THE GROWTH MECHANISM AND TWIN HABITS OF $Ba_2TiP_2O_9$, by D. E. Harrison and W. A. Tiller. [1962] [7]p. incl. illus. diagrs. table, refs. (AFOSR-2127) (AF 49(638)1029) Unclassified

Also published in Jour. Appl. Phys., v. 33: 2451-2457, Aug. 1962.

Crystals of $Ba_2TiP_2O_9$ were grown from the melt by the Bridgman technique. Two types of twinning occur, namely: growth twins and mechanical twins. The growth twins form with the (100) plane as the twin plane and mechanical twins form with the (001) plane as the twin plane. In twinned crystals, growth proceeds most rapidly in the [010] direction. Rapid growth in this direction is believed to result from efficient nucleation at the re-entrant corners formed by the {310} faces of the twin components. The mechanical twins form according to pseudo-merohedral symmetry by reflection across the (001) twin plane. The angle of obliquity is 4° and the twinning shear is 0.140. (Contractor's abstract)

DISCUSSION OF THE J. R. LOW, JR. PAPER ON THE DEFORMATION AND FRACTURE OF IRON, by R. W. Armstrong. [1962] 8p. incl. illus. diagrs. (Scientific paper no. 62-925-116-P2) (AFOSR-2353) (AF 49(638)1029) AD 611199 Unclassified

The purpose of this discussion is to direct further attention to the severe matrix (and twin) plastic accommodation experimentally observed in the vicinity of mechanical twins in bcc metals, e.g., α iron. This plastic accommodation is intimately associated with the twinning shear displacement, the twin size, and the twin shape. The reason for this distortion being prominent in the bcc metals will be illustrated. An appreciation for the nature of this accommodating flow might allow a better understanding of the relationships between slip, twinning, and fracture in α iron. (Contractor's abstract)

[Westinghouse Electric Corp. Westinghouse Research Labs., Pittsburgh, Pa.]

SOME REMARKS ON GRAIN BOUNDARY MIGRATION, by G. F. Bolling. Apr. 10, 1962 [4]p. (AFOSR-2649) (AF 49(638)1029) Unclassified

Studies of grain boundary migration in zone-refined metals have all shown that the rate of migration is greatly reduced by small added solute concentrations. However, it is apparent that a difference exists between boundary migration during normal grain growth and single boundaries migrating in a bicrystal to consume a substructure. To effect the same reduction in velocity in the 2 cases, more solute is required for grain growth than for the single boundary experiments. The rate of grain boundary migration is dependent on solute concentration and must therefore also depend on the solute distribution. In the single boundary experiments, a low-angle substructure, within single crystals obtained by growth from the melt, was used to provide the driving force to move a grain boundary; in grain growth, no substructure of this magnitude was present. Other observations support the hypothesis that a magnified solute concentration impedes the single boundary migration. It is clear, even without a detailed theory, that the apparent activation energies and exact solute dependence must be different as long as the nonuniform solute distribution produced by the substructure is important. Recrystallization experiments should also be susceptible to the same kind of local segregation at subboundaries or dislocation cell walls.

DEFORMATION TWINNING IN B.C.C. METALS, by R. W. Armstrong. Mar. 13, 1962 [8]p. incl. diagrs. (Scientific paper no. 62-925-116-P2) (AFOSR-2345) (AF 49(638)1029) AD 280561 Unclassified

Also published in Iron and its Dilute Solid Solutions; Proc. of a Conf., Detroit, Mich. (Oct. 23, 1961), ed. by C. W. Spencer and F. E. Werner. New York, Interscience Publishers, 1963, p. 263-267.

The distortion in body centered cubic (bcc) metals, e.g., α-iron, is shown to be progressively effected by twinning displacement, twin size and shape. A concentration of stress may be necessary to produce a twin nucleus which in some circumstances (i.e., low temperatures) appear to spread catastrophically. Caution should be

used in comparing mechanical twinning in bulk material and thin foils because size effects seem to exist.

A MATHEMATICAL ANALYSIS OF SOLUTE REDISTRIBUTION DURING EVAPORATION WITH A CARRIER GAS, by W. A. Tiller. July 23, 1962 [12]p. incl. diagrs. (Scientific paper no. 62-944-116-P1) (AFOSR-3886) (AF 49(638)1029) AD 288893 Unclassified

Control of solute flux entering a carrier gas stream required a knowledge of the solute distribution in the liquid during the evaporation and the gas-phase boundary layer characteristics at the surface of the liquid. A mathematical analysis is presented of the solute redistribution in a 1-dimensional liquid system as a function of position and time during evaporation at a constant rate. Evaporation kinetics are assumed to be sufficiently rapid for equilibrium to prevail at the surface of the liquid and the evaporation flux is assumed to be transport controlled. It is further assumed that the flow of carrier gas is sufficient to produce a solute boundary layer of thickness 2L at the surface. The solute concentration outside this boundary layer is that of the in-coming carrier gas. Cases of purely diffusional transport in the liquid (no mixing) and of primarily convective transport in the liquid (partial mixing) are considered.

A DEVICE FOR ACCURATE REPOSITIONING OF AN X-RAY DIFFRACTION GONIOMETER, by G. F. Bolling. Oct. 8, 1962 [3]p. incl. diagr. (Scientific paper no. 62-944-116-P3) (AFOSR-4000) (AF 49(638)1029) AD 290685 Unclassified

Also published in Rev. Scient. Instr., v. 34: 706-707, June 1963.

A description is presented of a device which provides an inexpensive and time-saving method for repositioning a goniometer. This device has an accuracy superior to that available on commercial x-ray diffraction equipment. No increase in the absolute angular position is obtained, but the device is quite useful in experiments which require accurate comparative data.

MIGRATION OF A LIQUID ZONE THROUGH A SOLID: PART I, by W. A. Tiller. Dec. 18, 1962 [25]p. incl diagrs. tables, refs. (Scientific paper no. 62-944-116-P6) (AFOSR-4645) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under AF 49(638)1029) AD 406472 Unclassified

Also published in Jour. Appl. Phys., v. 34: 2757-2762, Sept. 1963.

The migration of slab, cylindrical and spherical zones through a block of solid under the influence of a temperature gradient has been analyzed theoretically. The migration rate is found to be directly proportional to the temperature gradient in the system and to depend upon orientation – dependent atomic kinetics of the melting and freezing processes. The magnitude of the atomic kinetic effect depends upon the size of the molten zone. Stable zone migration occurs only in certain crystallographic orientations. The theory is discussed in terms of the limited experimental results available.

MIGRATION OF A LIQUID ZONE THROUGH A SOLID: PART II, by W. A. Tiller. Dec. 18, 1962 [18]p. incl. diagrs. (Scientific paper no. 62-944-116-P7) (AFOSR-4646) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under AF 49(638)1029) AD 432747 Unclassified

Also published in Jour. Appl. Phys., v. 34: 2763-2767, Sept. 1963.

The migration of slab, cylindrical and spherical zones through a block of solid under the influence of an electric field gradient has been analyzed theoretically. It was determined that the zone could migrate either up or down the field gradient, E^*, depending upon the magnitude and sign of (1) the effective ionic mobility of the solvent atoms, U, (2) the Peltier coefficient at the solid-melt interface, and (3) the imposed temperature gradient, G^*.

MEASUREMENTS OF STACKING-FAULT PROBABILITIES IN BULK SPECIMENS, by H. M. Otte, D. O. Welch, and G. F. Bolling. Nov. 29, 1962 [7]p. incl. tables. (Scientific paper no. 62-944-116-P4) (AFOSR-4658) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1029 and Office of Naval Research) AD 406475 Unclassified

Also published in Philos. Mag., v. 8: 345-348, Feb. 1963.

The presence of residual elastic strains in deformed bulk specimens can contribute to the shifts of x-ray reflections. This is important in elastically anisotropic face-centered cubic metals and can contribute to calculations of stacking-fault probabilities. An example of such an effect in measurements on zone-refined lead at 4.2° K is examined. (Contractor's abstract)

EFFECT OF GRAIN BOUNDARIES ON SOLUTE PARTITIONING DURING PROGRESSIVE SOLIDIFICATION, by W. A. Tiller. [1962] [2]p. incl. diagr. (AFOSR-J598) (AF 49(638)1029) AD 414373 Unclassified

Also published in Jour. Appl. Phys., v. 33: 3106-3107, Oct. 1962.

It can be shown that significant grain boundary segregation occurs during progressive solidification only when constitutional supercooling is present in the liquid ahead of the freezing interface. An extension of the analysis of cell boundary grooves shows that steep-walled grooves are stable only when a certain degree of constitutional supercooling in the liquid is exceeded. A SEARCH FOR HOST SENSITIZED LUMINESCENCE OF RARE EARTH IONS IN $Sr_2ZrP_2O_9$, by N. T. Melamed and D. E. Harrison. Dec. 28, 1962 [13]p. incl. diagr. (AFOSR-4647) (AF 49(638)1177) AD 406473 Unclassified

The compound $Sr_2ZrP_2O_9$ belongs to a family of host luminescent materials whose properties appeared to be favorable for the production of host-sensitized luminescence. However, measurements which were performed on this compound activated by rare earths indicated that little or no sensitization was taking place. An estimate of the expected sensitized luminescence yields indicates that the failure to obtain sensitization can be accounted for by the low oscillator strengths of the rare earth ions. It suggests that rare earth ions are in general not well suited as activators in host sensitized systems except at comparatively high concentrations.

METABOLIC CONTROL OF β-GLUCOSIDASE SYNTHESIS IN YEAST, by A. M. MacQuillan and H. O. Halvorson. [1962] [8]p. incl. diagrs. tables, refs. (AFOSR-4228) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)314, and National Science Foundation) Unclassified

Also published in Jour. Bacteriol., v. 84: 23-30, July 1962.

The hybrid Saccharomyces fragilis x S. dobzhanskii produced a constitutive β-glucosidase when grown in succinate synthetic medium. Upon addition of β-glucosides, thio-β-glucosides, or low concentrations of glucose, a further induction of enzyme synthesis was observed. Studies with other sugars revealed some specificity in response to hexose induction. Phenyl-thio-β-D-glucoside did not affect constitutive synthesis nor induction by glucosides, thio-glucosides, or glucose. Repression of β-glucosidase synthesis is brought about by high concentrations of glucose and other carbon compounds. Preinduction does not confer resistance to catabolic repression of enzyme synthesis; this leads to the conclusion that 2 sites of control for β-glucosidase synthesis are present in yeast. Multiplicity of control is further suggested from: (1) the properties of the inducing system; (2) semiconstitutive nature of enzyme synthesis; (3) the repression of constitutive synthesis by glucose; (4) the elevated derepressed rates of enzyme synthesis after glucose inhibition, and (5) the selection of a family of low constitutive mutants with variable inducibility. (Contractor's abstract)

ELECTRON TRANSPORT IN SPORE GERMINATION, by H. O. Halvorson. [1962] [1]p. (AFOSR-4231) (AF 49-(638)314) Unclassified

Presented at Sixteenth annual meeting of the Soc. of General Physiologists, Marine Biological Lab., Woods Hole Mass., Sept. 5-7, 1961.

Also published in Jour. Gen. Physiol., v. 45: 601A, Jan. 1962.

The bacterial endospore represents the most extreme case of dormancy known in biology. Bacterial spores differ from their homologous vegetative cells both in chemical composition and in enzyme composition. In particular, spores contain a dormant, soluble flavoprotein system for terminal respiration whereas vegetative cells utilize a particulate, cytochrome-containing system. During activation and germination, spores release calcium dipicolinic acid and activate their electron transport system. Activated spores are germinated in response to L-alanine. The initial site on the spore for bending L-alanine was identified as an L-alanine dehydrogenase. The enzyme has been purified and characterized, and it requires DPN. The soluble DPNH oxidase has been partially purified and its interaction with dipicolinic acid examined. The findings can be understood if dipicolinic acid acts as an electron acceptor. In order to explain the role of dipicolinic acid stimulation of DPNH oxidase a 2-step mechanism was proposed. Assuming that dipicolinic acid can act as an electron acceptor, it provides an explanation for the burst in respiratory activity during sporulation, the rise in respiration following activation and germination of spores, the control of L-alanine-induced germination, and the germination of spores under anerobic conditions. The changes in the electron transport system during sporulation and germination provide a model system for a study of cellular differentiation.

THE FUNCTION AND CONTROL OF INTRACELLULAR PROTEIN TURNOVER IN MICROORGANISMS, by H. O. Halvorson. [1962] [9]p. incl. diagrs. tables. refs. (AFOSR-4232) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)314, National Institutes of Health, and National Science Foundation) AD 407568 Unclassified

Also published in Amino Acid Pools, Symposium on Free Amino Acids, Duarte, Calif. (May 1961), New York, Elsevier, 1962, p. 646-654.

Microorganisms contain metabolic pools of nucleotides and amino acids which are on the main line of synthesis of macromolecules. These endogenous metabolic pools are derived either from exogenously provided components or synthesized in vivo from NH_3 and glucose

The recent demonstrations in bacteria, yeast and mammalian cells that under certain conditions nucleic acids and proteins are labile and are degraded to their constituent precursors provides yet another mechanism for internally replenishing these metabolic pools. Under conditions permitting protein and nucleic acid synthesis, a dynamic turnover exists due to the simultaneous breakdown and reutilization of the degradation products for synthesis. Two of the central questions raised by the demonstration of protein and nucleic acid turnover are, What are the control mechanisms governing its function and does this turnover have any significance to the physiology of the cell?

COMPARISON OF THE α-GLUCOSIDASES OF SACCHAROMYCES PRODUCED IN RESPONSE TO FIVE NON-ALLELIC MALTOSE GENES, by H. O. Halvorson, S. Winderman, and J. Gorman. [1962] [12]p. incl. diagrs. tables, refs. (AFOSR-J645) (AF AFOSR-62-205) AD 413633 Unclassified

Also published in Biochim. et Biophys. Acta, v. 67: 42-53, Jan. 1963.

A comparison has been undertaken of the α-glucosidases produced in Saccharomyces in response to 5 non-allelic maltose genes. The partially purified enzymes were found to be indistinguishable in regard to heat activation, electrophoretic mobility, chromatography from CM-cellulose or DEAE-cellulose columns, neutralization with specific antiserum, or substrate specificity. In each of the genotypes only a single species of α-glucosidase was observed.

HALOGENATION WITH COPPER(II). I. SATURATED KETONES AND PHENOL, by E. M. Kosower, W. J. Cole and others. [1962] [4]p. incl. refs. (AFOSR-64-1401A) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)252 and National Science Foundation) AD 444447 Unclassified

Presented in part at Org. Chem. Div. of the Amer. Chem. Soc., New York, Sept. 11-16, 1960.

Abstract published in 138th National meeting of the Amer. Chem. Soc., Abstracts of Papers, 1960, 7-P.

Also published in Jour. Org. Chem., v. 28: 630-633, Mar. 1963.

A procedure for halogenation of enolizable compounds using copper(II) chloride or bromide in dimethylformamide is described. Methyl ethyl ketone yields 55-70% 3-chlorobutanone, methyl cyclopropyl ketone yields both chloromethyl and dichloromethyl cyclopropyl ketones, propiophenone gives an excellent yield of α-chloropropiophenone, and phenol leads to o- and p-chlorophenols, in a ratio (1:6) substantially different from that of other chlorination methods, along with some 2,4-dichlorophenol. A convenient test for relative reactivities of enols and enolizable compounds is also included. (Contractor's abstract)

HALOGENATION WITH COPPER(II). II. UNSATURATED KETONES, by E. M. Kosower and G.-S. Wu. [1962] [3]p. incl. diagr. tables, refs. (AFOSR-64-1401B) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)282 and National Science Foundation) AD 444447 Unclassified

Presented in part at Org. Chem. Div. of the Amer. Chem. Soc., New York, Sept. 11-16, 1960.

Abstract published in 138th National meeting of the Amer. Chem. Soc., Abstracts of Papers, 1960, 7-P.

Also published in Jour. Org. Chem., v. 28: 633-638, Mar. 1963.

The halogenation procedure described in item no. 3300 was applied to a number of unsaturated ketones. 2-Cyclohexenone and 3-methyl-2-cyclohexenone gave phenol and m-cresol, respectively. Isophorone yielded 3-chloromethyl-5,5-dimethyl-2-cyclohexenone and 6-chloro-3,5,5-trimethyl-2-cyclohexenone in about equal quantities along with a lesser quantity of some phenols. Mesityl oxide and isomesityl oxide form mixtures (in different proportions) of almost every possible monochlorinated product. Methyl vinyl ketone leads to 3-chloro-3-buten-2-one. The mechanisms for the halogenation reactions are discussed. (Contractor's abstract)

ORGANOSILYL AZIDES, by R. West and J. S. Thayer. [1962] [2]p. (AFOSR-2363) (AF 49(638)285) Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 1763-1764, May 1962.

The first organosilyl azides, R_3SiN_3 (R = Ph, Me) were synthesized by refluxing the corresponding chloride with NaN_3 and anhydrous $AlCl_3$ in tetrahydrofuran. Ph_3SiN_3 (I), m.p. 81°, was a white crystalline solid, insoluble in H_2O, but soluble in most organic solvents. $PhMe_2SiN_3$ (II) was a colorless liquid, b.p. 70°, while Me_3SiN_3 (III), prepared in 90% purity, was a volatile, easily hydrolyzable liquid. I was stable to hydrolysis in water or in aqueous base, but acetone-water mixtures or addition of H^+ led to immediate liberation of azide ion. II and III hydrolyzed readily under all conditions, though more slowly than the corresponding chlorides. I was thermally quite stable, being only 50% decomposed after 10 hr at 220° in hexadecane. All three azides underwent ready photolysis with probable formation of azene intermediates. I and III formed isolable products when heated with Ph_3P. The unexpected stability of I was probably due to strong dative π-bonding between the Si and the N to produce a linear Si-N-N-N configuration, in contrast to the bent structure of organosilyl azides.

THE MONOADDITION OF PHENYLSILANE TO CYCLIC POLYOLEFINS, by R. E. Bailey, L. S. Tutas, and R. West. [1962] [2]p. (AFOSR-64-0218) (AF 49(638)285) AD 432507 Unclassified

Also published in Jour. Org. Chem., v. 28: 1417-1418, May 1963.

The addition of phenylsilane to 1,5,9-cyclododecatriene using benzoyl peroxide and chloroplatinic acid as catalysts failed to give any of the desired tricyclic silicon analog of perhydro-9b-borphenalene (I), as has been previously reported. Chloroplatinic acid catalysis led only to polymeric material, but with benzoyl peroxide a 16% yield of 9-phenylsilyl-1,5-cyclododecadiene (II) was obtained. The monoaddition product is completely unreactive toward further addition, being recovered unchanged after 7 days of heating with benzoyl peroxide catalyst. Similar results were obtained in the addition of phenylsilane to 1,5-cyclo-octadiene, which led only to the monoadduct, 5-phenylsilylcyclooctene. The reluctance of silicon to add to form the perhydrosilaphenalene ring may result in part from the large radius of the silicon atom, which would prevent the molecule from assuming a strainless configuration. However, unsuccessful attempts to cyclize 5-pentenyl-dichlorosilane by intramolecular Si-H addition suggest that the mechanism of silane addition may require a geometry which makes the formation of a six-membered ring unfavorable. With either chloroplatinic acid or benzoyl peroxide, 5-pentenyldichlorosilane gave none of the desired 1,1-dichlorosilacyclohexane, even though the latter compound can assume a strainless chair like configuration.

A CONVEXITY CONDITION IN BANACH SPACES AND THE STRONG LAW OF LARGE NUMBERS, by A. Beck. [1961] [6]p. (In cooperation with Cornell U., Ithaca, N. Y.) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)868 and Office of Naval Research) Unclassified

In a recent paper the author showed the theorem: Let χ be a Banach space and $\{X_i\}$, be a sequence of independent random χ-variables with $E(X_i) = 0$ all $i > 0$. Under appropriate conditions on χ and on $\{X_i\}$, we can then assert that $(1/n)\sum_{i=1}^{n} X_i$ converges to 0 in the strong topology of χ almost surely, under the hypotheses that χ is uniformly convex and that the variances of X_i are uniformly bounded ($\mathrm{Var}(X_i)=E(X_i^2)$). Using the same methods to show a necessary and sufficient condition on the Banach space the author obtains this particular strong law of large numbers. A Banach space χ is said to have property (A) if, for every sequence $\{X_i\}$ of independent random χ-variables with $E(X_i)=0$, all i, and $\mathrm{Var}(X_i) < M$, all i, we have $\frac{1}{n}\sum_{i=1}^{n} X_i \to 0$ strongly almost surely.

A Banach space χ is said to have property(B) if there exists an integer $k > 0$ and $\epsilon > 0$ such that any choice $a_1, a_2, \ldots, a_k$ of elements from χ with $a_i \neq 1$ gives us $\pm a_1 \pm a_2 \pm \ldots \pm a_k < k(1 - \epsilon)$ for some combination of the - and - signs.

THE MEANING OF SOME POPULAR VARIABLES, by E. F. Borgatta. [1962] [9]p. incl. tables, refs. (AFOSR-2387) (AF AFOSR-62-16) AD 450006 Unclassified

Also published in Jour. Social Psychol., v. 63: 309-317, 1964.

The structure of variables based on how persons assess each other is described. Within this structure, consideration is given to some popular concepts that occur in the research literature. Attention is given to the fact that if an attribute of a person is described as a tendency to behave in a given way, some direct basis of assessment is implied. Paper-and-pencil tests measure the tendency to respond to the test in a given way. It is an unwarranted inferential jump to assume such tests are measures of tendencies to behave in given ways in interpersonal relations. Exploration of paper-and-pencil tests with direct measures of interpersonal behavior should occur with knowledge of the systematic structure of the latter. (Contractor's abstract)

ON THE EXISTENCE OF A THIRD INTEGRAL OF MOTION, by G. Contopoulos. [1962] [14]p. incl. diagrs. refs. (AFOSR-J427) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-380 and Office of Naval Research) AD 407246 Unclassified

Also published in Astronom. Jour., v. 68: 1-14, Feb. 1963.

The aim of this paper is to unify the work done until now from different points of view on a third integral of motion besides the energy and the angular momentum integrals, and to present a number of applications and generalizations. In the Introduction, different methods for finding integrals of motion are discussed. The third integral is explicitly calculated by means of von Zeipel's method. In the next section different definitions of integrable systems are given and a distinction between useful and nonuseful integrals is made. Poincare's nonexistence theorem is mentioned and its many exceptions are pointed out. Then a distinction of separable and nonseparable systems is made. It is seen that by introducing contact transformations many dynamical systems become separable. This explains the fact that in the case of 2 degrees of freedom the orbits are in general distorted Lissajous figures. The problem of the convergence of the third integral is the subject of the next section. Siegel gave a proof that in general the formal third integral does not converge. However, one can approximate any Hamiltonian, that is given as a polynomial or a series, by another Hamiltonian that possess converging integrals, coinciding with the given Hamiltonian up to the terms of any degree. Numerical results provide ample evidence that the third integral exists in quite general potential fields, as in Schmidt's model of the Galaxy, in slightly elliptical clusters or galaxies, in the field of the oblate earth, in resonance cases where the unperturbed frequences have a rational ratio, and in potential fields that do not have a plane of symmetry. In the case of non-axially symmetric systems two new integrals are introduced. However, no integral corresponds to the angular momentum. In an asymmetric galaxy initially circular orbits after some time pass near the center of the galaxy. The third integral can be applied to the boundaries of the orbits and their hodographs, to the study of periodic orbits, to the dispersion of a group of stars, to the three-axial velocity ellipsoid, to the construction of models of the Galaxy, etc. Finally a practical method for searching for new integrals is indicated.

A LOCALLY CONVEX ALGEBRA OF ANALYTIC FUNCTIONS, by L. Brickman. [1962] [7]p. (AF 49(638)224) Unclassified

Published in Jour. Math. and Mech., v 11: 473-479, May 1962.

Let $D_R = \{ z \mid |z| < R \}$, $0 < R \leq 1$, and let A_R be the set of functions f holomorphic in D_R such that $f(0) = 0$. This set is given the topology of uniform convergence on compact subsets of D_R. In order to treat multiplication and inversion problems of Möbius, a commutative, associative multiplication in A_R is set forth by

$$\{f g\}(z) = \sum_{p=1}^{\infty} z^p \sum_{m n = p} a_m b_n = \sum_{n=1}^{\infty} a_m g(z^m) = \sum_{n=1}^{\infty} b_n f(z^n),$$

where $f(z) = \sum_{m=1}^{\infty} a_m z^m$, $g(z) = \sum_{n=1}^{\infty} b_n z^n$, $f, g \in A_R$. With this definition of multiplication A_R becomes a locally multiplicative convex topological algebra with identity e defined by $e(z) = z$.

If f is defined as above, then f is a regular (invertible) element of the algebra if and only if $a_1 \neq 0$. This gives a simple proof of a theorem. If f, $g \in A_R$ and $g'(0) \neq 0$ then there is a unique sequence $\{c_n\}$ such that $f(z) = \sum_{n=1}^{\infty} a_n g(z^n)$, $|z| < R$. The exponential function exp f maps A_R onto the multiplicative group of invertible elements. If exp f = exp g, then f - g = 2 n π i, i.e. for some integer n and vice versa. (Math. Rev. abstract)

ON NONNEGATIVE POLYNOMIALS, by L. Brickman and L. Steinberg. [1962] [4]p. (AF 49(638)224) Unclassified

Published in Amer. Math. Monthly, v. 69: 218-221, Mar. 1962.

The question of polynomials nonnegative in an interval, finite or half infinite, is discussed. All polynomials mentioned are understood to have real coefficients. A previous result is given as follows: (1) Let the polynomial f(x) be nonnegative for nonnegative x. Then there exist polynomials p(x), q(x), s(x) such that $f(x) = p^2(x) + q^2(x) + [r^2(x) + s^2(x)]x$. In the present note (1) is improved upon to obtain: (2) Let the polynomial f(x) be nonnegative for nonnegative x. Then there exist polynomials p(x) and q(x) such that $f(x) = p^2(x) + q^2(x)x$. (3) Let the polynomial f(x) be nonnegative in the finite interval [a, b]. Then f(x) can be written $f(x) = p^2(x)(x - a) + q^2(x)(b - x)$ if the degree of f(x) is odd, and $f(x) = p^2(x) + q^2(x)(x - a)(b - x)$ if the degree of f(x) is even. p(x) and q(x) can be chosen so that the degree of each term does not exceed the degree of f(x). Proof is given of (2) and (3).

A COORDINATIZATION THEOREM FOR JORDAN ALGEBRAS. by N. Jacobson. [1962] [7]p. (AFOSR-J620) (AF AFOSR 61-29) AD 415106 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 48: 1154-1160, July 1962.

If A is an associative algebra and contains n^2 elements e_{ij}, i, j=1, ..., n, satisfying the usual identities for matrix units. then it is easily proved that A is isomorphic to the algebra B_n of all n x n matrices over an associative algebra B. This paper gives a proof of the analogous (much harder) theorem for Jordan algebras, namely, a characterization of those Jordan algebras which are isomorphic to the Jordan algebra $H(D_n\gamma)$ of n x n matrices over the alternative involutorial algebra D which are hermitian relative to the involution $x \to \gamma^{-1}\bar{x}'\gamma$ in D_n, where $\gamma = \mathrm{diag}(\gamma_1, \ldots, \gamma_n)$, with γ_i self-adjoint invertible elements in the nucleus of D. It is assumed that $n \geq 3$. The case that γ is the identity matrix was handled by the author. The present proof is much simpler and relies on 2 concepts which are of independent interest: regularity (or invertibility) of an element in a Jordan algebra, and isotopic multiplication (an analogue for Jordan algebras to change of multiplication in an associative algebra from xy to xcy, where c is some fixed element of the algebra). MACDONALD'S THEOREM ON JORDAN ALGEBRAS, by N. Jacobson. [1962] [10]p. (AFOSR-J621) (AF AFOSR-61-29) AD 415470 Unclassified

Also published in Arch. Math., v. 13: 241-250, 1962.

MacDonald's theorem states that any identity for special Jordan algebras which does not involve more than 3 variables and is linear in one of them, holds for all Jordan algebras. In this paper a new proof of this result is given which is less technical than the original one. Let $J^{(r)}$ and $J_o^{(r)}$ be the free Jordan algebra and the free special Jordan algebra in r generators (over a ground-field which remains fixed). There is a canonical homomorphism $\upsilon: J^{(r)} \to J_o^{(r)}$, mapping genrators onto generators. $J^{(2)}$ and $J_o^{(2)}$ may be identified with subalgebras $J^{(3)}$ and $J_o^{(3)}$, respectively. Let $E[E_o]$ be the associative algebra of linear transformations of $J^{(3)}[J_o^{(3)}]$ generated by multiplications with elements of $J^{(2)}[J_o^{(2)}]$. υ induces a homomorphism of E onto E_o and MacDonald's theorem is equivalent to the assertion that this is an isomorphism. This is the form in which the author proves the theorem. He introduces a free associative algebra F with a countable number of generators and defines an epimorphism $\sigma: F \to E$, which, combined with υ, gives an epimorphism: $\sigma: E \to E_o$. He then proves that the kernels of σ and σ_o coincide with an explicitly given ideal R in F. This is, of course, the crux of the proof. The main steps are: (a) straightening the elements of F modulo R and (b) counting the elements of F/R in a suitable manner. (Math. Rev. abstract)

[A NOTE ON THE MULTIPLICATIVE GROUP OF SOLIDS] Eine Bemerkung über die multiplikative Gruppe eines Körpers, by P. M. Cohn. [1962] [5]p. [AF AFOSR-61-29] Unclassified

Published in Arch. Math., v. 13: 344-348, 1962.

In this paper, the author proves that if the torsion subgroup of an Abelian group G is embedded into the multiplicative group F^X of a field F, then there exists a field extension E of F such that G is a subgroup of E^X and moreover, E^X/F^X is torsion-free. He then derives as a weaker solution to a problem of L. Fuch; an Abelian group G can be embedded into the multiplicative group of a field if and only if the torsion subgroup of G is locally cyclic. In another corollary, the author proves that there exists a field where the multiplicative group does not split relative to its torsion subgroup. (Math. Rev. abstract)

RINGS WITH A WEAK ALGOTITHM, by P. M. Cohn. [1962] [25]p. incl. refs. [AF AFOSR-61-29] Unclassified

Published in Trans. Amer. Math. Soc., v. 109: 332-356, Nov. 1963.

Generalizing the Euclidean algorithm, a weak algorithm is defined for rings. It is shown that a ring satisfying the weak algorithm is a weak Bézout ring, i.e., an integral domain in which any 2 principal right ideals with a non-zero intersection have a sum and intersection which are again principal. Such a ring is necessarily a unique factorization domain. It is demonstrated that free associative algebras (over a field) satisfy the weak algorithm, and more generally that the free product of (any number of) skew fields over a given skew field satisfies a form of the weak algorithm and is a weak Bézout ring. THEORY OF PRESSURE SHIFTS OF HCl LINES CAUSED BY NOBLE GASES, by H. Margenau and H. C. Jacobson. [1962] [23]p. incl. diagrs. tables, refs. (AFOSR-64-0260) (AF 18(603)15) AD 432523 Unclassified

Presented in part at Conf. Molecular Line Shapes, Rehovoth, Israel, Aug. 1961.

Also published in Jour. Quant. Spectrosc. Radiat. Transfer v. 3: 35-58, Jan-Mar. 1963.

Recent experimental work has shown that the shift of lines in the 1-0 and 2-0 bands of HCl, when absorbed under perturbation by rare gases, is strongly dependent on the rotational quantum number. To explain this effect, the forces between a rotating and vibrating dipole and a spherically symmetric atom were calculated retaining the influence of space quantization. It is also indicated why space quantization of the dipole with respect to the interaction line matters in this problem. Asymptotic dispersion forces do not account for the results observed, nor should this be expected. But when repulsive forces are included, many experimental features, especially the J-dependence of the shifts, receive at once a qualitative explanation. In part V, 2 models, one very crude and the other more realistic, are employed in an attempt to account for the numerical shifts. The work necessarily involves the use of unknown kinetic theory parameters. Fitting the data leads to their determination; not incontrovertibly to be sure, but in a manner that leaves little doubt as to the basic adequacy of the explanation offered.

PRESSURE-INDUCED SHIFTS OF HCl LINES (Abstract), by H. C. Jacobson. [1962] [1]p. [AF 18(603)15] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 271, Apr. 23, 1962.

The following abstract (Pressure Shifts of Molecular Lines) suggests in qualitative terms an explanation of the J-dependent frequency shifts observed in the HCl rotation-vibration spectrum perturbed by rare gases. Extensive observations by Jaffe et al. and by Rank et al. offer opportunities for applying various intermolecular-force models to illuminate the problem of the shifts. Therefore, the author calculated the mean-frequency shift with the use of the statistical theory of pressure broadening in terms of Lennard-Jones potentials, allowing the parameters in this potential to reflect the influence of space quantization. Guided by knowledge of the kinetic-theory radii involved, it is shown that a simple choice of these parameters reproduces the general tendencies of the experimental data, although numerical discrepancies with respect to P-branch lines remain.

PRESSURE SHIFTS OF MOLECULAR LINES (Abstract), by H. Margenau. [1962] [1]p. [AF 18(603)15] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 271, Apr. 23, 1962.

The shifts of HCl lines perturbed by rare gases, as measured by Jaffe et al. and by Rank et al., show a strong dependence on the rotational quantum number J. This cannot be explained as the result of long-range Van der Waals forces. It is shown that the effects encountered are, in part at least, measures of the dependence of short-range interactions upon the magnetic-quantum number M. Discussion includes an appraisal of methods for calculating shifts, a determination of impact radii at which adiabaticity for individual M states exists and a qualitative picture of interaction curves which lead to the experimental findings. The curves incorporate the fact that radiator and perturber have smallest distances of approach when M = J. This prevents the perturbation from vanishing when an average over M is performed and results in J-dependent shifts.

WIDTHS OF PRESSURE-BROADENED HCl VIBRATION-ROTATION LINES (Abstract), by R. M. Herman. [1962] [1]p. [AF 18(603)15] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 271, Apr. 23, 1962.

Observations of the HCl vibration-rotation lines broadened by foreign gases reveal that the widths, as well as the shifts, show marked variations with J. It is clear that the Anderson theory of line broadening yields theoretical widths which are much smaller than those observed. An alternate theory has been developed in which one uses the "adiabatic representation" to carry out the calculation of line-shape parameters starting from the quantum-mechanical Fourier-integral formula. The advantage of working in this representation is that the deformations of the electronic-state functions are treated accurately. Such accuracy is necessary if one is to account correctly for the effects of dispersion forces in line broadening. A strong dependence of the intermolecular force on the orientation of the HCl molecular axis arises because the center of charge of the polarizable electrons in HCl does not coincide with the center of rotation. This angular dependence is very important and results in large, J-dependent widths. Substantial agreement between predicted and observed linewidths has been obtained for certain foreign gases.

DENSITY MEASUREMENTS IN SOLID HE^4, by J. N. Kidder. [10]p. incl. diagr. table. (AFOSR-2864) (AF 49(638)690) AD 612 79 Unclassified

Also published in Proc. Eighth Internat'l. Conf. Low Temperature Phys., London (Gt. Brit.) (Sept. 16-22, 1962), Washington, D. C., Butterworths, 1963, p. 419-420.

The measurements were made on solid He^4 in the region of the γ(body-centered cubic) phase discovered by Vignos and Fairbank. Points were taken at constant temperature for 6 temperatures between 1.45°K and 1.73°K. The results for pressures near the melting and transition curves are shown. The lower density γ phase is clearly seen as the first step in the curve. The measured volume changes for melting and for the solid transition are listed. The volume changes for melting agree with those of Grilly and Mills to within 2-3%, while the solid transition volume changes are slightly higher than theirs but in agreement within the experimental error. Their data indicated a minimum in the solid transition volume change near the center of the gamma phase. No such effect is seen here.

CRITICAL VELOCITIES AND BOUNDARY INTERACTIONS IN THE ISOTHERMAL FLOW OF SUPERFLUID HELIUM, by J. N. Kidder and W. M. Fairbanks. [1962] [36]p. incl. diagrs. table, refs. (AFOSR-2865) (In cooperation with Duke U., Durham, N. C.) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-87, and Army Research Office (Durham)) AD 612440
Unclassified

Also published in Phys. Rev., v. 127: 987-994, Aug. 15, 1962.

The pressure gradient as a function of the superfluid velocity in a 1.1-mm-diam capillary was measured at 4 temperatures between 1.23 and 1.57 K. In the flow tube the normal fluid was held at rest by ultrafine porosity filters, while the superfluid flowed isothermally. Superconducting microwave cavities were used as level indicators, making it possible to detect pressure gradients as small as 0.0003 dyn/cc. A critical superfluid velocity, below which no pressure gradient could be detected, was observed directly. The critical velocity decreased linearly with temperature, being 1.25 mm/sec at 1.26K, and 0.85 mm/sec at 1.57K. For a superfluid velocity greater than the critical velocity, the variation of the pressure gradient with velocity was described. It is believed that this represents an interaction between vorticity in the superfluid and the wall of the flow tube. (Contractor's abstract, modified)

[DENSITY MEASUREMENTS AND SOLID HE^3] by J. N. Kidder. Final rept. Dec. 14, 1962. 15p. incl. diagrs. refs. (AFOSR-4749) (AF AFOSR-62-87) AD 408479
Unclassified

This report describes the density measurements as a function of temperature and pressure (PVT relation) made on solid He^4. The isothermal compressibility and the volume changes at the phase transitions have been accurately measured in the region of the body-centered-cubic solid phase. An estimate is made of the isobaric thermal expansion coefficient. The data suggest that thermodynamic relations predicting a negative thermal expansion coefficient in the solid might be altered by the fact that the compressibility of the solid at the melting curve is greater than at higher pressures. Calculations were made on the data of several experiments studying the flow of superfluid helium. There is ample evidence that a dissipative interaction can exist between the superfluid and the boundaries of the flow system when the superfluid velocity is greater than a certain critical value.

SYMMETRY PROPERTIES OF WAVE FUNCTIONS IN MAGNETIC CRYSTALS, by J. O. Dimmock and R. G. Wheeler, Jan. 11, 1962. [64]p. incl. diagrs. tables, refs. (AFOSR-2056) (AF 49(638)503) AD 271644
Unclassified

Also published in Phys. Rev., v. 127: 391-404, July 15, 1962.

The symmetry properties of wave functions in magnetic crystals are discussed in terms of the irreducible representations of magnetic space groups. The specific effects of the magnetic ordering on the crystal eigenstates are of 3 types: (1) There is a lifting of some eigenfunction degeneracies because the crystal symmetry is reduced in the magnetic state; (2) New Brillouin zone surfaces are introduced if there is a reduction in translational symmetry; (3) The symmetry of the energy band in K-space may be reduced. The rutile structure is considered as a specific example and the space groups of MnF_2 and MnO_2 in their magnetic and nonmagnetic states are obtained. (Contractor's abstract)

AD 285426 Unclassified

The exciton spectra and their magneto optical effects was investigated in selected insulators, most successfully, cadmium sulfide and cadmium selenide. Theoretical work was carried out on the representation theory of finite groups, in particular, the consideration of the group properties of magnetic crystals. Magneto optical studies of the exciton absorption in other selected semiconductors such as ZnS, HgS and MgTe will be continued. MgTe holds special promise. Due to the hexagonal symmetry and the very large spin orbit splitting of the Te ion it is hoped that one may be able to detect in the exciton evidence for toroidal energy surfaces in band structure. Crystal growth facilities have been constructed which will aid in procurement of suitable samples. A superconducting high field magnet should allow an extension of the field parameter to nearly 60 kilogauss.

IONIC CONDUCTIVITY AND TIME-DEPENDENT POLARIZATION IN NaCl CRYSTALS, by P. H. Sutter and A. S. Nowick. [1962] [13]p. incl. illus. diagrs. refs. [AF 49(638)503] Unclassified

Published in Jour. Appl. Phys., v. 34: 734-746, Apr. 1963.

When a constant electric field is applied to a dielectric, the current density per unit field decreases with time from an "initial conductivity" to a "final (or steady-state) conductivity." A study is made of this time-dependent polarization effect for "pure" NaCl crystals in the range from 50° to 200°C. The validity of Ohm's law and the superposition principle is demonstrated for these crystals; this establishes the linearity of the formal equation which relates polarization, electric field, and their time derivatives. Also studied are the effect of prolonged current flow, the effect of deliberate introduction of an air gap between the crystal and one of its electrodes, and the effects of impurities, deformation, x-ray irradiation, and annealing. It is concluded that the results are not consistent with the well-known space-charge polarization theory of Joffe, according to which the buildup of space charge occurs because of blocking of the current carriers at one or both electrodes. Rather, it is necessary to regard the time-dependent polarization as a dielectric relaxation phenomenon. According to this viewpoint, the final conductivity, and not the initial value, represents the true ionic conductivity. Possible relaxation mechanisms are discussed in terms of defect clusters and charged jogs on dislocations. (Contractor's abstract)

THEORETICAL VALUES FOR MAGNETIC MOMENTS OF Mu-MESONIC ATOMS, by K. W. Ford, V. W. Hughes, and J. G. Wills. [1962] [8]p. incl. tables, refs. (AFOSR-3252) (AF 49(638)545) AD 400863 Unclassified

Also published in Phys. Rev., v. 129: 194-201, Jan. 1, 1963.

The magnetic moment of a negative muon bound in the field of a nucleus is slightly less than the moment of a free muon. The binding corrections to the moment have been calculated accurately for a number of nuclei, using realistic nuclear charge distributions. Polarization of the nucleus and of the atomic electrons by the muon also give rise to significant corrections to the muon moment. Precise determinations of the magnetic moment of heavy mu-mesonic atoms afford a way to test for possible structure of the muon which might be exhibited through the polarization of the muon in the strong electric field of the nucleus. The theoretical and experimental g values are in reasonable good agreement in view of the uncertainties about chemical and solid state magnetic shielding effects.

COLLISIONS OF MUONIUM IN GASES; MUONIUM CHEMISTRY (Abstract), by J. Bailey, W. Cleland and others. [1962] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)545], Atomic Energy Commission and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr 23-26, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 234, Apr. 23, 1962.

Earlier indications of the importance of collisions of muonium in gases to the study of muonium have been confirmed unambiguously in the author's recent measurement of the hyperfine structure of muonium. A microwave-induced transition between 2 hyperfine levels in a strong magnetic field is observed when positive muons are stopped in pure argon; the line intensity is reduced to half when an admixture of about 4 parts in 10^5 of air is added; the line appears with 2 parts in 10^4 of air. Since the probability that a muon forms muonium is not believed to depend on the presence of impurities, the decrease in the muonium-resonance signal is attributed either to chemical reactions of muonium or to changes in muonium polarization in collisions. It is difficult to decide the relative importance of these 2 possibilities, since very little is known about the cross sections for the corresponding processes for hydrogen. It may be possible to observe the microwave spectrum of a molecule such as OM (analog of OH) if it is formed under our conditions. The pressure shift of the hfs of muonium in high-pressure argon gas is discussed.

SUSCEPTIBILITY OF A LOCALIZED MAGNETIC STATE IN A METAL (Abstract), by J. A. White. [1962] [1]p. [AF 49(638)545] Unclassified

Presented at meeting of the Amer. Phys. Soc., Cleveland, Ohio, Nov. 23-24, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 557, Nov. 23, 1962.

The susceptibility of an orbitally nondegenerate spin 1/2 atomic impurity state in a metal is calculated on Anderson's model. The totality of many electron atom-metal eigenstates is divided into 2 classes according as the projection of the local moment along the direction of the applied field is positive or negative. The partition function is calculated by summing separately over the 2 classes, within each of which the major contribution comes from states for which the projection has approximately the most probable value $\langle \mu_{\pm} \rangle = \pm \langle \mu \rangle$ for that class. The resulting susceptibility when expressed in terms of $\langle \mu \rangle$ is the sum of a Curielike term and a local contribution to the Pauli spin paramagnetism: $\chi_{loc} = \langle \mu \rangle^2 / kT + \partial \langle \mu \rangle / \partial H$. The magnitude of $\langle \mu \rangle$ depends on the admixture of free-atom and pure-metal states, the density of free-electron states at the Fermi level, the repulsion between localized electrons of opposite spin, and temperature; it is always smaller than for an isolated atom and normally decreases gradually with rising temperature.

THE KINETICS OF THE THERMAL ISOMERIZATION OF [2.1.0] BICYCLOPENTANE, by M. L. Halberstadt and J. P. Chesick. [1962] [4]p. incl. diagrs. tables, refs. (AFOSR-2156) (AF 49(638)722) AD611452 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 2688-2691, July 20, 1962.

The thermal isomerization of [2.1.0] bicyclopentane is a homogeneous unimolecular reaction and has been studied in the range 287.9 to 310.1° and pressures of 66.7 to 0.04 mm. The high-pressure rate constant at 291.2° can be expressed in the Arrhenius form $k_\infty = 10^{14.58} \exp[-(46.6 \pm 1.0)\text{kcal}/RT]\ \text{sec}^{-1}$. The number of effective oscillators in the Kassel integral is estimated as 18 ± 2. Added nitrogen increases the rate in the lower pressure region with a pressure efficiency relative to the reactant molecule of 0.10 ± 0.02. Energy considerations appear to preclude a cyclic strainfree diradical as a transition state. (Contractor's abstract)

KINETICS UNIMOLECULAR AND HALOGEN ATOM REACTIONS, by J. P. Chesick. Final rept. Sept. 6, 1962. 2p. (AFOSR-3485) (AF 49(638)722) Unclassified

This report contains a bibliography of completed studies of various unimolecular reactions in which the activation energy barrier was of interest in consideration of the detailed molecular decomposition processes. For molecules of sufficiently small size, the low pressure behavior of the unimolecular reaction rate constant has yielded information on the relative lifetimes of the energized molecules as a function of molecular size and structure. Incompleted work included: (1) preliminary experiments with methylenecyclopropane which indicated that this molecule did not undergo a simple unimolecular reaction; (2) work on the thermal decomposition of ethylcyclopropane indicating a longer lifetime for the excited species in this unimolecular reaction than was found for methylcyclopropane; and (3) the thermal isomerization of dimethylbicyclobutane which gave tentative Arrhenius parameters of $8.2 \times 10^{13}\ \text{sec}^{-1}$ and 40.4 kcal/mol.

THE KINETICS OF THE THERMAL CIS-TRANS ISOMERIZATION OF 2-METHYL [2.1.0] BICYCLOPENTANE, by J. P. Chesick. [1962] [4]p. incl. diagrs. refs. (Contribution no. 1688) (AFOSR-3890) (AF 49(638)722) AD 611449 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 3250-3253, Sept. 5, 1962.

The kinetics of the reversible cis-trans isomerization reaction of 2-methyl [2.1.0] bicyclopentane were studied between 203.3 and 231.7°C and at reactant pressures between 0.08 and 1.7 mm. If the lower boiling isomer is tentatively identified as trans, then K = k-trans/cis = 0.58 at 220° for the trans-cis reaction. The transition state is concluded to be one of incomplete rupture of the bridgehead-bridgehead bond corresponding to considerable residual bicyclic strain energy. The first order rate constants decreased less than 10% on lowering the reactant pressure to 0.1 mm. (Contractor's abstract modified)

THE THERMAL ISOMERIZATION OF TROPILIDENE, by F. N. Klump and J. P. Chesick. [1962] [3]p. incl. diagr. refs. (AF 49(638)722) Unclassified

Published in Jour. Amer. Chem. Soc., v. 85: 130-132, Jan. 20, 1963.

The thermal isomerization of tropilidene to toluene has been observed in the gas phase in the temperature range 363-408°, and in the pressure range 0.9-19.7 mm. The first-order rate constant was found to be independent of the surface to volume ratio, and unchanged both by nitric oxide addition and by a 20-fold increase in pressure through nitrogen addition.

The rate constant for the reaction is given by $k = 3.5 \times 10^{13} \exp[(-51.1 \pm 0.8)\ \text{kcal/RT}]\ \text{sec}^{-1}$. The activation energy precludes a simple carbon-carbon bond rupture as the initial step, and a species at least formally similar to norcaradiene is suggested as the reactive intermediate.

THE ABSORPTION SPECTRUM OF GASEOUS BENZYNE, by R. S. Berry, G. N. Spokes, and M. Stiles. [1962] [8]p. incl. diagrs. refs. (AFOSR-2399) (In cooperation with Michigan U., Ann Arbor) (AF AFOSR-61-25) AD 430657 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 84: 3570-3577, Sept. 20, 1962.

Flash photolysis has been carried out on thin solid films of 2 substances known to give benzyne under other conditions. Transient and final product ultraviolet gas phase spectra have been recorded and at least 1-reaction has been observed, with butadiene. On the basis of the observed final products, the reactions and the appearance of a transient continuous spectrum, it is concluded that gaseous benzyne is produced and that it probably is responsible for the transient absorption spectrum. (Contractor's abstract)

ABSORPTION SPECTRA OF GASEOUS HALIDE IONS AND HALOGEN ELECTRON AFFINITIES: CHLORINE, BROMINE, AND IODINE, by R. S. Berry, C. W. Reimann, and G. N. Spokes. [1962] [13]p. incl. illus. diagrs. tables, refs. (AFOSR-J1495) (AF AFOSR-61-25) AD 427550 Unclassified

Also published in Jour. Chem. Phys., v. 37: 2278-2290, Nov. 15, 1962.

Absorption spectra have been taken of partially dissociated vapors of chloride, bromide, and iodide salts of rubidium and cesium. The salts have been heated by shock waves. Continuous absorption spectra characterized by sharp thresholds are attributed to the ions Cl^-, Br^-, and I^-. The low-energy thresholds for the 3 ions fall at approximately 3424, 3685, and 4040A, respectively. From the threshold wavelengths and appropriate small environmental corrections, the electron affinities of chlorine, bromine, and iodine are determined to be 3.628±0.005, and 3.078±0.005 ev, respectively.

ABSORPTION SPECTRUM OF GASEOUS F- AND ELECTRON AFFINITIES OF THE HALOGEN ATOMS, by R. S. Berry and C. W. Reimann. [1962] [4]p. incl. illus. diagr. table, refs. (AFOSR-65-1253) (AF AFOSR-63-183) AD 621462 Unclassified

Also published in Jour. Chem. Phys., v. 38: 1540-1543, Apr. 1 1963.

The absorption spectrum of gaseous fluoride ion has been observed in shock-heated vapors of CsF, RbF, and KF. The spectrum is a continuum with 2 sharp thresholds at 3595 and 3542A, similar to those of the other halide ions. The electron affinity determined from the low-energy threshold is 3.448 ± 0.005 ev. The cross-section for photodetachment at 3565A is about $2.5 \pm 2 \times 10^{-18}$ cm^2 and at 3525, about $3.3 \pm 2 \times 10^{-18}$ cm^2. The electron affinities of chlorine,

bromine and iodine are revised, respectively, to 3.613, 3.363, and 3.063 ev, all with uncertainties of 0.003 ev.

STATISTICAL THERMODYNAMICS OF NONUNIFORM FLUIDS, by J. L. Lebowitz and J. K. Percus. [1962] [8]p. incl. refs. (AFOSR-4112) (In cooperation with New York U.) (AF 49(638)753) AD 292937 Unclassified

Presented at meeting of the Amer. Phys. Soc., Northwestern U., Evanston, Ill., June 19-21, 1962.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 7: 415, June 19, 1962. (Title varies)

Also published in Jour. Math. Phys., v. 4: 116-123, Jan. 1963.

A general formalism has been developed for obtaining the low-order distribution functions $n_q(r_1, \cdots, r_q)$ and the thermodynamic parameters of nonuniform equilibrium systems where the nonuniformity is caused by a potential U(r). The method consists of transforming from an initial (uniform) density n_0 to the final desired density n(r) via a functional Taylor expansion. When n_0 is chosen to be the density in the neighborhood of the r's one obtains n_q as an expansion in the gradients of the density. The expansion parameter is essentially the ratio of the microscopic correlation length to the scale of the inhomogeneities. Analysis is most conveniently done in the grand ensemble formalism where the corresponding thermodynamic potential serves as the generating functional [with U(r) as the variable] for the n_q. The transition from U(r) to n(r) as the relevant variable is accomplished via the direct correlation function which enters very naturally, relating the change in U at r_2 due to a change in n at r_1. It is thus essentially the matrix inverse of the 2-particle Ursell function. The recent results of Stillinger and Buff on the thermodynamic potentials for nonuniform systems follow as a special case of analysis without any recourse to the virial expansion. Thus, they hold also in the liquid region. In a succeeding paper, analysis is applied to obtain the asymptotic behavior of the radial distribution function in a uniform system.

DISSOCIATION ROLE OF A DIATOMIC MOLECULE IN AN INERT GAS (Abstract), by T. A. Bak and J. L. Lebowitz. [1962] [1]p. (In cooperation with New York U.) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)753] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 42, Jan. 24, 1962.

The dissociation rate of a dilute solution of diatomic molecules in an inert gas which is suddenly raised to a high temperature was investigated. A classical impulsive collision model is used for the interaction between the diatomic molecules and the solvent gas which is treated as a temperature bath at a temperature T. Explicit calculations have been carried out for a 1 dimensional harmonic model (including also transitional degrees of freedom assumed to be in equilibrium with the reservoir), in which the diatomic molecule is assumed to dissociate as soon as its vibrational energy exceeds the dissociation energy E. An apparently general result was obtained (independent of the form of the vibrational potential) for the dissociation rate

$$K(E) \text{ in the region } E \gg kT;\ K(E) \approx kT\,[\tau(E)]^{-1} f(E),$$

where f(E) dE is the probability of the molecule having vibrational energy in the range dE when it is in equilibrium at temperature T, and $\tau(E)$ is the time between collisions for molecules with vibrational energy E. This may be related to the maximum amplitude of vibration and is much larger and in better agreement with experiment than the K obtained from a weak interaction model.

DYNAMICAL STUDY OF BROWNIAN MOTION (Abstract), by J. L. Lebowitz and E. L. Rubin. [1962] [1]p. [AF 49(638)753] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 24-27, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 82, Jan. 24, 1962.

A study was made on the motion of Brownian particles in a fluid, (through the time evolution of their distribution function), from a dynamical point of view; i.e., without a priori introduction of purely stochastic elements. The method consists of rewriting the Liouville equation for the joint distribution μ, of fluid and Brownian particle (which may itself be composite) as a pair of coupled non-linear equations for the distribution function of the Brownian particle f, and the conditional distribution of the fluid (μ/f). These equations are then solved by an iteration procedure which is essentially an expansion in the ratio of the "effective" velocities of Brownian and fluid particles. A Fokker-Planck type equation for the Brownian particles was obtained. The next order yields a simple correction for spatially nonuniform distributions of Brownian particles. The evaluation of the higher order terms lead to some serious difficulties which will be discussed. The relationship between this procedure and the Kirkwood theory of liquids is also being investigated.

RADIAL DISTRIBUTION FUNCTIONS IN CRYSTALS AND FLUIDS (Abstract), by J. L. Lebowitz, J. K. Percus, and I. J. Zucker. [1962] [1]p. (In cooperation with New York U.) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)753] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Northwestern U., Evanston, Ill., June 19-21, 1962.

Published in Bull. Amer. Phys. Soc., Series II, v. 7: 415, June 19, 1962.

A study is being made of the qualitative nature of the 2-particle distribution function $n_2(r_1, r_2)$ with particular reference to its long-range behavior in crystals and fluids. In a box with periodic boundary conditions, $n_2(r_1, r_2) = n_2(r_1, r_2)$ and in the limit of the system becoming infinite is equal to $n^2 g(r)$. The low-k behavior of $\sigma(k)$, the Laplace transform of g(r) is studied. This yields the moments of (g-1) and may thus give information about the existence of long-range order. $\sigma(k)$ is related to $\langle \rho k \rho - k \rangle$, where ρk is the Fourier transform of the density. In the crystalline state, pk may be expressed in terms of the normal coordinates and $\sigma(k)$ evaluated for some harmonic crystals. For a 1-dimensional system with nearest neighbor forces, $\sigma(k)$ is given directly in terms of the thermodynamic parameters of the system; $\sigma(k) = [n \exp(\mu(p + k) - \mu(p)) - n]^{-1}$, where μ, the chemical potential and p, the pressure, are measured in units of temperature. The absence of phase transitions here implies the existence of all the moments of (g-1) and the absence of long range order.

ASYMPTOTIC BEHAVIOR OF THE RADIAL DISTRIBUTION FUNCTION, by J. L. Lebowitz and J. K. Percus. [1962] [7]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-64] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York U. N. Y., Jan. 23-26, 1963.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 8: 32, Jan. 23, 1963.

Also published in Jour. Math. Phys., v. 4: 248-254, Feb. 1963.

The pair distribution function in a uniform classical fluid is equivalent to the 1-body density when 1 particle is fixed. An implicit relation for this nonuniform density is found by a functional expansion of the difference of chemical potential and external potential about its value for a system of uniform density. A linearization of this expansion, followed by retention of, at most, second derivatives of the inhomogenity, reproduces the Ornstein-Zernicke relations for the asymptotic pair correlation. Linearization alone calls for the sum of internal potential and direct correlation function to vanish asymptotically. This relation is developed for the case of weak long-range forces, resulting in the Debye-Huckel expression for an electron gas, and reproducing the asymptotic correlations of the Kac-Uhlenbeck-Hemmer 1-dimensional model. The relation is also shown to follow from the virial expansion for the direct correlation function.

DISSOCIATION OF DIATOMIC MOLECULES, by T. A. Bak and J. L. Lebowitz. [1962] [9]p. incl. refs. [AF AFOSR-62-64] Unclassified

Published in Faraday Soc. Discussions, v. 33: 189-197, 1962.

A diatomic molecule is considered as 2 hard spheres connected by a spring. It is imbedded in a gas of hard-sphere atoms, which is assumed to be in thermal equilibrium at all times. Only a 1-dimensional model is considered, and the possibility of multiple collisions during an encounter is neglected. The molecule is assumed to dissociate immediately whenever its vibrational energy exceeds E. The density in the phase space of the diatomic molecule is described by the Liouville equation for the isolated molecule with an added collision integral for collisions with the gas atoms. Since the gas is assumed in equilibrium this integral equation is linear. The rate constant for dissociations is found directly from the integral equation and (for small mass of the gas atoms) after its reduction to a Fokker-Planck equation.

WANTED: A REACTIVE TYPEWRITER, by C. N. Mooers. Final rept. Oct. 1962, 25p. incl. refs. (Rept. no. ZTB-142) (AFOSR-2711) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)376, Gmelin Institute, National Institutes of Health and Rome Air Development Center) AD 400349 Unclassified

Some critical remarks are directed at many current and fashionable topics in information retrieval. The information crisis is attributed to the challenge of new machines, not to an unexpected surge in literature. The concentration on retrieval selector machines is discounted as misplaced emphasis. Programs in which information retrieval is an activity for independent effort at each documentation center are described as dated and leading to unnecessary duplication of costly effort. Thesaurus building is analyzed as a neo-uniterm aberration undertaken in the mistaken belief that thesaurus word lists can discover meanings in texts. Compound descriptors and their algebra are mentioned. The very important future use of remote computers by means of typewriters in the library with wire connection to the computer is described. Such wire-connected typewriters are called "reactive typewriters." The impediments to getting reactive typewriters are enumerated. Appropriate wire-connecting typewriters having both upper and lower case characters are only available at exorbitant cost at present, i.e., about $10,000 for each typewriter terminal. Arguments are given to show that the cost should be in the order of $500 to $1000 for the sa small library users. Omissions of necessary hardware in contemporary computing machines are listed. Programming languages for the reactive typewriter are discussed, and the features of the TRAC language are mentioned. Some of the broader capabilities and consequences of the reactive typewriter are sketched. A plea is made for cooperation by potential users to insist that the manufacturers make available reactive typewriter equipment at reasonable prices. (Contractor's abstract)

Brain (Cat) - Pulse waves
1423
Brain (Cat) - Red nucleus
1535
Brain (Cat) - Sleep
602
Brain (Cat) - Stimulation
911, 912, 1007, 1008, 1532, 1538,
2086, 2233, 2365, 2723, 2724
Brain (Cat) - Telencephalic ablations
2086
Brain (Cat) - Tracer studies
2096
Brain (Dolphin) - Neurophysiology
706
Brain (Dolphin) - Stimulation
707
Brain (Man) - Radiation effects
3104
Brain (Man) - Stimulation
1538
Brain (Monkey) - Cortical responses
714, 2670
Brain (Monkey) - Degeneration
1375-1377
Brain (Monkey) - Stimulation
493
Brain (Rabbit) - Auditory responses
1533
Brain (Rabbit) - Cortical responses
1532
Brain (Rabbit) - Stimulation
915
Brain (Rat) - Inhibition
2235
Brain (Rat) - Lesion effects
2238
Brain activity (Monkey) - Vibration effects
433
Brain activity (Rabbit) - Hypercapnia
496
Brain activity (Rat) - Hormone effect
497, 498
Brain functions - Conference
431
Brass crystals - Resistivity
605
Brazed joints - Plastic deformation
1638
Bremsstrahlung - Beta particle reactions
3119
Bremsstrahlung - Cross sections
2843
Bremsstrahlung - Spectrographic analysis
2835
Bromine isotopes (Radioactive) - Decay
900
Bromine isotopes (Stable) - Relaxation time
66
Bronzes - Phase studies
2406
Brownian motion - Mathematical analysis
2051
Brownian motion - Stochastic processes
146
Buckling - Mathematical analysis
126, 3015-3017
Buckling - Pressure effects
704
Buckling - Theory
126
Butenes - Oxymercuration
2046
Butenes - Shock tube studies
800
Butyl lithium - Heat of formation
1425, 1426
Butyl phthalate solutions - Vapor pressure
2201

Cadmium - Deformation
705
Cadmium - Level crossing
636, 653
Cadmium - Zeeman resonance
637
Cadmium alloys - Fracture
705
Cadmium ions - Hydrolysis
2682, 2689
Cadmium isotopes (Radioactive) - Dipole moments
641
Cadmium isotopes (Radioactive) - Hyperfine structure
635, 639, 654

Subject Index

Cadmium isotopes (Radioactive) - Level crossing
638
Cadmium isotopes (Radioactive) - Lifetimes
661
Cadmium isotopes (Radioactive) - Nuclear moments
639, 664, 665
Cadmium isotopes (Stable) - Lifetime
646
Cadmium isotopes (Stable) - Zeeman levels
644
Cadmium sulfide crystals - Contact potential
3261
Caffeine - Biosynthesis
749
Calcite - Impurities
350
Calcium aluminate - Crystal structure
5
Calcium compounds - Chemical reactions
7
Calcium compounds - Crystal structure
9, 1141
Calcium compounds - Paramagnetic resonance spectra
1140, 1141, 2228
Calcium compounds - Zeeman splitting
1771, 1772
Calcium isotopes (Radioactive) - Dipole moment
619
Calcium isotopes (Radioactive) - Lifetimes
655
Calcium isotopes (Radioactive) - Nuclear reactions
1742
Calcium isotopes (Stable) - Decay schemes
861
Calcium-alumina mixtures - Chemical reactions
7
Calcium-barium-silicon-oxides - Crystallographic analysis
4
Capacitors - Magnetic field effects
2260
Carbodiimides - Molecular structure
2808
Carbon - Electron scattering
2861
Carbon - Metallic properties
445
Carbon - Spectra
2851
Carbon compounds - Microbial growth
2239-2242
Carbon dioxide - Biosynthesis
2094, 2095
Carbon dioxide - Emissivity
3020
Carbon dioxide - Vibrational relaxation
1620
Carbon isotopes (Stable) - Half-life
862
Carbon isotopes (Stable) - Proton reactions
2538
Carbon monoxide - Band spectra
3253
Carbon monoxide - Chemical reactions
1016
Carbon monoxide-cytochrome oxidase - Chemical reactions
2716
Carbonyl radical - Spectra
672
Cardiovascular system - Blood pressure
2725
Carotenoids - Biochemical analysis
3159, 3160
Casimidine - Molecular structure
1089
Casimiroedine - Molecular structure
1091
Catalysis - Flavoproteins
2714, 2715
Catalytic reactions - Chromatographic analysis
1349
Catalytic reactions - Mechanisms
1987
Catecholamines - Chemical reactions
1038
Catecholamines - Pharmacological analysis
1039
Catecholamines - Separation
1040
Catecholamines - Synthesis
2252
Cavity resonance - Perturbation theory
2257
Cavity resonators - Design
2109
Celestial mechanics - Particle trajectories
230
Celestial mechanics - Perturbation theory
230
Cells (Biology) - Physiology
1393
Cells (Biology) - Vasopressin content
3273, 3274
Cellular Regulatory Mechanisms - Symposium
1480
Central nervous system - Blood circulation
2720
Central nervous system - Color stimulation
713, 714
Central nervous system - Fatigue effects
2014
Central nervous system - Hypertension
2721
Ceramic materials - Dielectric properties
2262
Ceramic materials - Ductility
399
Ceramic materials - Electrical properties
77-79
Ceramic materials - Microstructural properties
402
Cerebral cortex - Conditioned reflex
2357
Cerebral cortex - Drug effects
2237
Cerebral cortex - Neuromuscular transmission
2069
Cerebral cortex (Cat) - Acoustical responses
1831
Cerebral cortex (Cat) - Electrical activity
911
Cerebral dominance - Analysis
138

Cerebral hemispheres - Functions
139
Cerebral potentials - Light responses
1538
Cerebral tissues - Bioassay
1913, 1914
Cerebral tissues - Drug effects
1917
Cerebral tissues - Enzyme activity
1912, 1915
Cerebral tissue - Membrane potential
1911
Cerebral tissues - Stimulation
1914, 1917, 1918
Cerenkov detectors - Applications
1692
Cerenkov radiation - Spectral distribution
2431
Cerenkov radiation - Theory
1695
Cerium dioxide - Electrical conductance
78, 79
Cerium isotopes (Radioactive) - Decay processes
3127
Cesium - Recombination reactions
42
Cesium - Surface interactions
1850
Cesium discharges - Microwave interferometry
1206
Cesium ions - Charge neutralization
3070
Cesium isotopes (Radioactive) - Beta spectra
2065
Cesium-nitrate-aluminum system - Combustion products
91
Cesium plasma - Spectra
90
Cesium vapor - Absorption
632
Cesium vapor - Alkali metal attack studies
992, 998
Cesium vapor - Atomic energy levels
2999
Cesium vapor - Chemical reactions
992
Cesium vapor - Optical absorption
649
Cesium vapor - Optical properties
2998
Cesium vapor - Photon excitation
664
Cesium vapor lamps - Design
1212
Cetacea - Learning
707
Cetacea - Vocal behavior
706, 708
Chain reactions - Applications
2544
Charge neutralization - Theory
3070, 3071
Charged particles - Coulomb scattering
1557
Charged particles - Decay schemes
2530
Charged particles - Motion
929
Charged particles - Nuclear scattering
2093
Charged particles - Production
1178
Chelate compounds - Bibliography
2135
Chemical bonds - Mathematical analysis
1288
Chemical bonds - Nuclear spins
2395
Chemical engineering - Control systems
2451
Chemical reactions
see also specific types of reactions, e.g., Oxidation-reduction reactions
Chemical reactions - Addition
615, 617, 2551
Chemical reactions - Alkylation
2553
Chemical reactions - Catalysis
1987
Chemical reactions - Chlorination
616
Chemical reactions - Decarboxylation
2435
Chemical reactions - Decomposition
238, 2010, 3042
Chemical reactions - Deoxymercuration
2048
Chemical reactions - Dissociation
1878, 2548
Chemical reactions - Equilibrium studies
2686-2688
Chemical reactions - Exchange reactions
283-285, 604, 835, 2547, 2548
Chemical reactions - Hydrogenation
162-166
Chemical reactions - Hydrogenolysis
2165, 2166
Chemical reactions - Ion exchange
2545
Chemical reactions - Ionization
1850
Chemical reactions - Kinetics
276, 960, 1483, 1796, 1851, 1878, 25[illegible]
Chemical reactions - Mechanisms
1483, 1501, 1941, 2551
Chemical reactions - Nitration
275
Chemical reactions - Oxidation
769, 805, 1509, 1510, 1822, 2008
Chemical reactions - Oxymercuration
2046
Chemical reactions - Ozonation
3093
Chemical reactions -pH effects
1483
Chemical reactions - Photolysis
276, 277, 279, 549, 1496, 1499-1501, 1503, 1937, 1939, 2436-2438
Chemical reactions - Photoreduction
2615
Chemical reactions - Photosynthesis
2608, 2609

Subject Index

Chemical reactions - Polymerization
1934, 1935
Chemical reactions - Pressure effects
442
Chemical reactions - Pyrolysis
799, 3043, 3092
Chemical reactions - Radiolysis
443
Chemical reactions - Recombination reactions
1283
Chemical reactions - Reduction
2007-2009
Chemical reactions - Replacement reactions
895
Chemical reactions - Solvolysis
61[illegible] 2047
Chemical reactions - Substitution
274, 896, 2102, 2546
Chemical reactions - Sulfination
1429
Chemical reactions - Synthesis
1796, 1878, 2552, 2554, 2732-2735, 3041
Chemical reactions - Temperature factors
7
Chemical reactions - Thermal decomposition
3033, 3034, 3037, 3039
Chemical reactions - Thermal arrangement
3032
Chemical reactions - Ultrasonic waves
1483
Chemical techniques - Polishing
507
Chemoreceptors - Sensitivity
1491-1493
Chlorella - Photosynthesis
3022
Chlorine - Spectra
776
Chlorine isotopes - Nuclear energy levels
1745
Chlorine isotopes (Stable) - Magnetic resonance spectra
1783
Chlorine isotopes (Stable) - Nuclear quadrupole resonance
2394
Chloroacetyl-d, l-alanine - Spectra
823
Chlorophylls - Carotenoids
47
Chlorophylls - Spectra
48
Chloroplasts - Metabolism
3228
Chloroplasts - Photosynthetic reactions
2609, 2614, 3023, 3024, 3229-3231
Chromates - Chemical analysis
2137
Chromium - Electron distribution
481
Chromium - Emission studies
1988
Chromium - Spectra
2885, 2894
Chromium - X-ray diffraction analysis
481
Chromium compounds - Magnetic field effects
1758, 1759
Chromium compounds - Resonance
1762, 1765
Chromium compounds - Zeeman splitting
1758
Chromium oxychloride - Crystal structure
2681
Circuit theory - Filters
369
Circuits - Harmonic oscillation
355
Circular plates - Thermal stresses
959
Classical fluids - Theory
2277
Classical mechanics - Perturbation theory
110
Classification - Computers
2105
Classification - Machines

Nuclear reactions - Elastic scattering
869-871, 1711, 1738
Nuclear reactions - Excitation curves
862, 864, 869, 870, 872-876, 879, 880, 885, 1726-1728
Nuclear reactions - Gamma radiation
885, 2126
Nuclear reactions - Mathematical analysis
483, 1727, 1728, 1748, 2994
Nuclear reactions - Nucleons
1720
Nuclear reactions - Parity
1749, 2851, 2956
Nuclear reactions - Photofission
1710, 1713, 1733
Nuclear reactions - Pion scattering
3147
Nuclear reactions - Proton scattering
884, 1734, 2995
Nuclear reactions - Quantum mechanics
2825, 2826, 2836
Nuclear reactions - Reaction thresholds
866, 892
Nuclear reactions - Resonant transfer
860, 863
Nuclear reactions - Scattering
872-877, 880, 883, 1712
Nuclear reactions - Spectrographic analysis
870, 871, 873, 876, 877, 883, 898, 1704
Nuclear reactions - Stripping analysis
1745, 1746
Nuclear resonance - Electromagnetic properties
2185
Nuclear resonance - Mathematical analysis
3149
Nuclear resonance - Quantum mechanics
2824
Nuclear resonance - Selection rules
1297
Nuclear resonance - Theory
3148
Nuclear scattering - Angular distributions
872-876, 883, 902, 1712
Nuclear scattering - Cross sections
872, 880, 1461, 1711
Nuclear scattering - Excitation
2849
Nuclear scattering - Ionization chambers
887
Nuclear scattering - Mathematical analysis
1451, 1452, 1472, 1473, 1544, 1552, 2534, 2984
Nuclear scattering - Models
1296
Nuclear scattering - Pole approximation
2821
Nuclear scattering - Proton-antiproton interaction
2276
Nuclear scattering - Recoil kinematics
2284
Nuclear scattering - Quantum mechanics
2985
Nuclear scattering - Theory
1452, 1478, 1544, 1545, 1550-1552, 2276
Nuclear shell models - Inelastic scattering
2983
Nuclear shell models - Resonance
3148, 3149
Nuclear spins - Analysis
2532
Nuclear spins - Energy
2210
Nuclear spins - Magnetic fields
2273, 2389, 2401
Nuclear spins - Mathematical analysis
1058, 2186, 2704, 2705
Nuclear spins - Mesons
2561
Nuclear spins - Radioactive isotopes
327
Nuclear spins - Relaxation time
2186, 2187
Nuclear spins - Resonance
308, 3173, 3176
Nuclear spins - Tertiary butyl formate
2804
Nuclear spins - Theory
2273
Nuclear structure - Analysis
2558
Nucleation - Theory
503, 504
Nuclei - Charge density
2828
Nuclei - Charge distribution
1494
Nuclei - Electromagnetic mass
1188
Nuclei - Energy levels
2960
Nuclei - Excitation
2829, 2837
Nuclei - Fragmentation
3178
Nuclei - Inelastic scattering
901
Nuclei - Interactions
1495
Nuclei - Internal fields
1146
Nuclei - Magnetic moments
3124, 3128
Nuclei - Spectrographic analysis
901, 1188
Nuclei acids - Biosynthesis
936
Nuclei acids - Secretion
1432
Nucleons - Annihilation reactions
2952, 3237
Nucleons - Atomic models
1720, 2854
Nucleons - Charge distribution
3193
Nucleons - Interactions
484, 1473, 1478, 2954

Nucleons - Nuclear spectroscopy
2838
Nucleons - Regge analysis
2537
Nucleons - Resonance
1302, 1707
Nucleons - Scattering
1296, 1451, 1472, 1473, 1478, 1544, 1738, 2984
Nucleotides - Synthesis
3230
Numerical methods - Difference and functional equations
1598

Ocean - Currents
1662
Ocean floor - Pressure
427
Ocean waves - Spectra
426
Olefins - Isomerism
1947
Olefins - Spectra
1946
Operations research - Computers
134, 135
Operations research - Group dynamics
1990
Operations research - Scheduling
2792
Operations research - Stability
358
Operations research - Systems analysis
1435
Operations research - Statistical distribution
2787, 2788
Operators (Mathematics) - Extension properties
1130-1132
Operators (Mathematics) - Harmonic functions
155, 1630
Operators (Personnel) - Data processing systems
1268
Optic cortex - Stimulation
2363
Optic nerve - Color stimulation
713
Optic nerve (Monkey) - Stimulation
712
Optic nerve (Rabbit) - Photic stimulation
1632
Optical absorption - Mechanism
649
Optical absorption - Rare earths
2653
Optical diffraction - Analysis
3141
Optical echoes - Detection
1870
Optical equipment - Design
107, 207, 678
Optical equipment - Excitation functions
2210, 2214
Optical filters - Properties
695
Optical masers - Applications
681, 1873, 2895
Optical masers - Molecular beams
349
Optical masers - Phototube analysis
2918
Optical masers - Radiation generation
2901
Optical properties - Analysis
207, 208
Optical pumping - Instrumentation
1212
Optical systems - Power transmission
2915
Optics - Coherence
2635, 2638, 2656, 2657
Optics - Lenses
1068
Optics - Light absorption
2649, 2663
Optics - Theory
2662
Optimal control - Functional analysis
690, 691
Optimal design - Theory
547
Orbital flight paths - Corrections
439
Orbital flight paths - Mathematical analysis
439, 2424, 3276-3278
Orbital flight paths - Optimal transfer
63
Orbital flight paths - Thrust
3276, 3277
Organic compounds - Alkylation
2549, 2550
Organic compounds - Chemical properties
3103
Organic compounds - Electronic structure
2231
Organic compounds - Ozonation
3093
Organic compounds - Photochemistry
850, 2636
Organic compounds - Polarographic analysis
2219
Organic compounds - Resonance absorption
829
Organic compounds - Spectra
550
Organic compounds - Stereochemistry
2551
Organic compounds - Synthesis
550, 2181, 2377
Organic crystals - Irradiation
834
Organic iodine compounds - Chemical reactions
2377
Organic ions - Formation
3035
Organic nitrogen compounds - Reaction kinetics
3174
Organosilyl azides - Synthesis
3302
Orthogonal polynomials - Properties
2294
Oscillation modes - Mathematical analysis
1652, 1658

Oscillator strength - Calculation
780
Oscillators - Analysis
2455
Oscillators - Load resistance
361
Oscillators - Mathematical models
1990
Oscillators - Performance
361, 2997, 2998, 3001-3003, 3007
Oscillators - Quantum mechanics
533
Oscilloscopes - Applications
2123, 2208
Osmium borides - Crystal structure
3106
Oxalic acid dihydrate - Phase studies
1520
Oxalyl-coenzyme A - Chemical properties
2543
Oxalyl halides - Crystal structure
2232
Oxidases - Mammalian blood
2254
Oxidation - Analysis
2008
Oxidation - Kinetics
769, 805, 1509, 1510, 1822
Oxidation-reduction reactions - Kinetics
66, 3189, 2715
Oxides - Chemical reactions
5
Oxygen - Atmospheric absorption
656, 688, 689
Oxygen - Band spectrum
3256
Oxygen - Chemical reactions
276, 1165
Oxygen - Cluster models
2203
Oxygen - Electron scattering
2861
Oxygen - Parity nonconservation
1823
Oxygen - Recombination reactions
24-27, 720, 2265
Oxygen - Spectrum
656, 689, 2851
Oxygen isotopes (Radioactive) - Decay
2961, 2962, 2964
Oxygen isotopes (Radioactive) - Half-life
882
Oxygen isotopes (Radioactive) - Nuclear moments
665
Oxygen isotopes (Stable) - Reaction matrix theory
457
Oxygen uptake - Physiological effects
2612
Oxymercuration - Kinetics
2046
Oxymercurials - Deoxymercuration
2048
Oxytocin response - Inhibition
538, 539
Ozonation - Mechanism
3093
Ozonides - Synthesis
1172
Pain - Physiological effect
1900
Pair correlation functions - Measurement
1110
Palladium - Nuclear energy levels
3132
Palladium - Spectra
87
Palladium alloys - Diffusion
591
Panels - Differential equations
221
Panels - Flutter
219, 220, 223, 1635, 2005, 2006
Panels - Sound emission
3085
Panels - Stresses
221
Panels - Supersonic flow
220, 1635
Panels - Vibration
222
Paraazoxyanisole - Dielectric constant
1525
Paradoxal sleep - Mechanism
915
Paramagnetic amplifiers - Analysis
2898
Paramagnetic crystals - Spin resonance
1060, 1061
Paramagnetic ions - Relaxation time
1050
Paramagnetic relaxation - Phonons
2987
Paramagnetic resonance - Analysis
2814, 2815
Paramagnetic resonance - Antiferromagnetism
624, 2717
Paramagnetic resonance - Electrons
420
Paramagnetic resonance - Shifts
1052
Paramagnetic resonance - Spin interaction
1059, 1898
Paramagnetic resonance - Theory
2814, 2815
Paramagnetic resonance spectra - Radiation effects
1143
Paramagnetic resonance spectra - Symmetry
1140
Paramagnetic resonance spectra - Temperature effects
1051, 1142, 1143
Parity - Theory
1823, 2983
Particle accelerators - Vortices
2949, 2950
Particle beams - Scientific research
1190
Particle detectors - Spectra
2539
Particle injection - Gases
2496
Particle interactions - Cross sections
161
Particle interactions - Mathematical analysis
2764, 2976

Particle interactions - Scientific research
3152
Particle interactions - Theoretical analysis
303
Particle motion - Mathematical analysis
151, 929, 1606
Particle physics - Mathematical analysis
2074
Particle trajectories - Corrections
2830
Particle trajectories - Electromagnetism
2534
Particle trajectories - Mathematical analysis
1046, 2752, 2968, 3155
Particle trajectories - Quantum mechanics
1046
Particles

Polymer solutions - Optical properties
610, 611, 614
Polymer solutions - Stress relaxation
613
Polymer solutions - Thermodynamic properties
585, 586
Polymer solutions - Viscoelastic properties
612
Polymerization - Mechanism
1934, 1935
Polymers - Crystal structure
2209
Polymers - Molecular structure
1931, 1933
Polymers - Optical properties
1906, 1907
Polymers - Surface tension
1931
Polymers - Ultrasonic attenuation
2295
Polynomials - Algebraic equations
357
Polynomials - Approximation
1104
Polynomials - Functions
814
Polystyrene solutions - Physical properties
766-768
Polytetrafluoroethylene - Properties
2522
Polytyrosyl trypsin - Preparation
3232
Population (Mathematics) - Sample size
609
Positronium - Oxidation
3259, 3262

Subject Index

Positrons - Annihilation reactions
2874, 3259, 3260
Positrons - Bremsstrahlung
2835
Positrons - Elastic scattering
2850, 2876
Potassium - Chemical reactions
1016
Potassium bromide crystals - Color centers
1249
Potassium bromide crystals - Photoconductivity
2616, 2617
Potassium chlorate crystals - Spectra
1394
Potassium chloride crystals - Absorption bands
468
Potassium chloride crystals - Purification
1250
Potassium chloride crystals - Transference number
2768
Potassium compounds - Nuclear magnetic resonance
3215
Potassium compounds - Properties
755
Potassium compounds - Proton resonance
3209
Potassium compounds - Spin relaxation
3214
Potassium crystals - Elastic constants
1347
Potassium isotopes (Radioactive) - Reaction thresholds
866
Potential energy - Calculation
466
Potential scattering - Amplitude modulation
328
Potential scattering - Angular momentum
2525, 3097, 3099
Potential scattering - Green's function
3096
Potential scattering - Holomorphy domain
3098
Potential scattering - Jost functions
3097
Potential scattering - Mathematical analysis
304, 333, 2525
Potential scattering - Models
3100
Potential scattering - Theory
333
Potential theory - Dirichlet algebra
2781
Potential theory - Harmonic functions
2293
Powder metallurgy - Iron spheres
2988
Powders - Resonance studies
2044
Powders - Spectra
2017, 2019
Praseodymium - Energy levels
1392
Praseodymium carbonate - Spectra
2543
Praseodymium oxide - Hysteresis
2542
Pressor amines - Physiological effects
1418
Pressure - Measurement
1195, 2756
Pressure distribution - Supersonic flow
2965
Pressure field - Measurement
381
Pressure gauge - Design
196
Pressure lag - Determination
2748
Pressure oscillations - Stability
2562
Primary radiation - Detection
1689, 1692, 1693
Primary radiation - Direction of approach
1717
Primary radiation - Energy
1694
Probability - Applications
1433, 2020
Probability - Elementary theory
2062
Probability - Limit theorems
3
Probability - Markov processes
1135, 2015, 2023, 2027, 2784, 2789, 2795
Probability - Random walks
2016
Probability - Stable processes
1139
Probability - Stochastic processes
532
Probability - Supermartingales
2625
Probes (Electromagnetic) - Computer analysis
3083, 3084
Production amplitudes - Integral equations
458, 459
Production processes - Anomolies
2533
Professional personnel - Technological changes
1026
Programming languages - Machine translation
387
Programming manuals - Computer languages
1853
Project Luna See - Analysis
1873
Propellants
see specific types of propellants, e.g., Liquid propellants; Solid propellants
Propionitrile - Molecular structure
666
Proportional counters (Gas flow) - Design
2726
Proprioception - Response timing
1267
Protein synthesis Glucose repression
3295
Protein synthesis - Metabolic control
3294
Proteins - Biosynthesis
3297, 3298
Proteins - Detergent effects
2169

Proteins - Optical properties
3206
Proteolytic enzymes - Preparation
3232
Proton energies - Determination
858
Proton reactions - Spectrographic analysis
1704, 1734
Proton resonance - Measurement
3190
Proton-deuteron reactions - Carbon
2538
Protons - Angular distributions
559, 1745, 1746, 2855, 3044
Protons - Annihilation
1459, 2953, 2955
Protons - Atmospheric scale height
1579
Protons - Decay
2995
Protons - Elastic scattering
2860, 3153, 3154
Protons - Energy
559
Protons - Form factors
2867, 2869
Protons - Inelastic scattering
2698, 2699
Protons - Nuclear interactions
1453
Protons - Nuclear scattering
1461, 1711, 1712
Protons - Particle trajectories
2968
Protons - Polarization
3183, 3188
Protons - Scattering
1725, 2850, 2866
Protons - Spectrographic analysis
559
Pseudomonas - Growth
2239, 2240, 2242, 2243
Pseudosilicides - Synthesis
2337
Psychoacoustics - Theory
136
Psychological research - Statistical analysis
199, 1994
Psychology - Learning theory
2194
Psychology (Industry) - Scientific personnel
2773
Psychology (Industry) - Sociological factors
2192
Psychometrics - Test methods
1909, 2957-2959
Public opinion - Foreign policy
2380, 2381
Pulsation frequencies - Rotation effects
1660
Pulse communication systems - Theory
1054
Pulse transmission - Electromagnetic properties
211
Pulse transmitters - Whistler dispersion
2910
Pumping systems - Theory
2899
Purines - Photosensitivity
749
Pyridines - Polarographic analysis
2136
Pyridones - Photochemical synthesis
3241
Pyridylsydnones - Phototropy
897
Pyrites - Surface studies
1521
Pyrolysis - Kinetics
799
Pyrolysis - Mechanism
3092, 3164, 3165
Pyrroles - Photooxidation
3242

Quantum electronics - Optical masers
342
Quantum field theory - Algebraic analysis
1108
Quantum field theory - Completeness
1553
Quantum field theory - Equations of motion
155
Quantum field theory - Gravitational effects
159
Quantum field theory - Mathematical analysis
152, 1111, 1115-1118, 1450, 2074, 2075, 2147, 2148, 2824
Quantum field theory - Nuclear spins
108, 1117
Quantum field theory - Topology
2077
Quantum mechanics - Algebraic theory
3060
Quantum mechanics - Atomic orbitals
3045, 3050
Quantum mechanics - Elastic scattering
1738
Quantum mechanics - Electromagnetic fields
343
Quantum mechanics - Elementary particles
3150
Quantum mechanics - Feynman integral
1729
Quantum mechanics - Field operators
1702
Quantum mechanics - Field theory
1450, 1546, 1548, 1664, 2147, 2148, 2646, 2981, 2982
Quantum mechanics - Frequency fluctuation
1816
Quantum mechanics - Masers
1114
Quantum mechanics - Mathematical analysis
595, 598, 1546-1548, 1550, 1582, 1664, 2953, 2960, 2981, 2982, 2985, 2992, 3246, 3252, 3253
Quantum mechanics - Measure theory
2527
Quantum mechanics - Molecular energy
2049
Quantum mechanics - Nuclear physics
2960-2962

Subject Index

Quantum mechanics - Nuclear reactions
483
Quantum mechanics - Particle interaction
2269
Quantum mechanics - Perturbation theory
2073, 2826, 3161
Quantum mechanics - Radiation processes
2533
Quantum mechanics - Scattering
1284, 1545, 2951
Quantum mechanics - S-matrix
1582
Quantum mechanics - Statistical analysis
927, 1816, 2952
Quantum mechanics - Superconductors
2647
Quantum mechanics - Symmetry groups
2274
Quantum mechanics - Theory
1547, 1703
Quantum mechanics - Wave functions
1282, 1550, 2229
Quantum transition - Theory
822
Quartz - Phase studies
1022

Radar equipment - Design
694, 697, 743
Radar pulses - Theory
2473
Radar receivers - Signal-to-noise ratio
2471
Radar signals - Accuracy
1185
Radiation - Antennas
355
Radiation - Energy
240
Radiation - Polarization
651
Radiation - Sources
2904, 2909
Radiation - Theory
2889
Radiation counters - Design
2123, 3103
Radiation damage - Scientific research
2486
Radiation recoil - Mathematical analysis
2990
Radio astronomy - Antennas
2906
Radio astronomy - Instrumentation
688, 742
Radio astronomy - Solar emission
2902
Radio astronomy - Theory
2905
Radio communications systems - Performance
2922
Radio emission - Flux density
1861
Radio noise - Calculation
1588
Radio noise - Frequency modulation
2453
Radio receivers - Design
2448
Radio signals - Electrical stimulation
2713
Radio signals - Mathematical analysis
2943
Radio telescopes - Design
2903
Radio transmission - Interference
683
Radio wave amplifiers - Rasers
2700, 2701
Radio waves - Conductivity
2755
Radio waves - Propagation
2937
Radio waves - Solar systems
743
Radioactive decay - Measurement
2124, 2271, 2819
Radioactive decay - Parity
1549

Radioactive decay - Spectrographic analysis
2961, 2962
Radioactive isotopes - Decay
1709
Radiofrequency energy - Transfer
2213
Radioisotopes
see also specific types of radioisotopes, e.g., gold isotopes (Radioactive)
Radioisotopes - Applications
1245
Radiotelescopes - Operational properties
688
Rare earth compounds - Spectra
594
Rare earth elements - Energy levels
1391
Rare earth elements - Hyperfine structure
1387
Rare earth elements - Luminescence
3293
Rare earth elements - Magnetic properties
1385, 2260
Rare earth elements - Spectra
1384-1386, 1389
Rare earth oxides - Electrical properties
77
Rare earth oxides - Hysteresis
2542
Rare gases
see also specific gases, e.g., Argon
Rare gases - Atomic structure
2652
Rare gases - Ionization
3048
Rare gases - Lattice parameters
1944
Rarefied gas - Dynamics
585
Rarefied gas dynamics - Symposium
2268
Rasers - Theory
2700, 2701, 2706

Reaction (Physiology) - Background light effects
712
Reaction (Physiology) - Hormone effects
836, 837
Reaction (Psychology) - Cortical lesions
494
Reaction (Psychology) - Signal detection
1908
Reaction (Psychophysiology) - LSD effects
815
Reaction (Psychophysiology) - Perceptual effects
816
Reaction kinetics - Equilibrium factors
835
Reaction kinetics - Measurement
1469, 1470
Reaction kinetics - Statistical analysis
24, 26
Reaction kinetics - Theory
798
Reaction kinetics - Turbulence effects
2505
Reaction mechanisms - Analysis
1348
Reading machines - Computers
2924
Real variables - Functions
708
Reasoning (Psychology) - Computers
2772
Recombination - Spectrographic analysis
386
Recombination coefficients - Calculation
41, 1257
Recombination reactions - Catalytic effects
719, 721, 722
Recombination reactions - Kinetics
23, 24, 26, 42, 725
Recombination reactions - Measurement
25, 27
Recombination reactions - Mechanism
1257
Recombination reactions - Test equipment
2108, 2109
Recombination reactions - Theory
41
Recombination reactions - Thermodynamic properties
720, 1496, 3030
Recording systems - Thermobalances
3038
Recovery - Test methods
58
Recovery (Space vehicles) - Feasibility studies
2769
Recursive processor - Theory
2344
Red nucleus - Stimulation
1535
Reduction reactions - Analysis
2098, 2136, 2137
Reduction reactions - Mechanism
2007, 2009
Redundant components - Control systems
2941
Re-entry aerodynamics - Mathematical analysis
58, 2418, 2769
Re-entry trajectories - Theory
2671, 3078
Re-entry vehicles - Aerodynamic heating
13, 16, 19, 20
Re-entry vehicles - Recovery
58, 2769
Re-entry Vehicles - Symposium
1001
Refining (Metallurgy) - Zone melting
3289, 3290
Reflection - Temperature effects
962
Reflectivity - Wavelength effects
3029
Refractive index - Monatomic gases
2052, 2054
Refractory materials - Analysis
1948
Relativistic cosmology - Models
944, 945
Relativity theory - Mathematical analysis
302, 304, 305, 329, 2974, 2975
Relativity theory - Test methods
2823, 2833
Relativity theory - Topology
2531
Relaxation oscillation - Magnetic fields
372
Relaxation time - Density effects
2692
Relaxation time - mathematical analysis
66, 2186, 2187
Relaxation time - Measurement
66, 678, 753, 1060, 1061, 1879, 2208, 2691
Relaxation time - Temperature dependence
622, 1050
Religious groups - Social interaction
734
Renal function - Saline effects
942
Replacement reactions - Mechanism
895
Repression-sensitization scale - Defense behavior
3061
Reproduction (Birds) - Physiology
488, 489, 490
Research organizations - Employee relations
2773
Resins - Spectra
852
Resistance - Shock waves
788
Resistance (Electrical) - Properties
1485
Resistivity - Quenching effects
605
Resolution - Measurement
1181
Resonance - Analysis
1762
Resonance - Magnetic fields
312, 313, 1465
Resonance - Microwave susceptibility
415
Resonance - Shell models
1710

Subject Index

Resonance - Symmetry
2818
Resonance - Theory
312, 1302, 1707
Resonant absorbers - Dispersion theory
1144
Resonant cavities - Dielectric interactions
2916
Resonant frequency - Measurement
1856
Resonators - Applications
3006
Retina - Stimulation
2369
Retina (Pigeon) - Anatomy
599
Retina (Pigeon) - Functional organization
601
Retina (Rabbit) - Physiology
1632
Retina (Toad) - Ferrocyanide uptake
188
Retonation - Theory
376
Reversible reactions - Spectrographic analysis
2057
Reversible reactions - Thermodynamics
2058
Rhenium compounds - Synthesis
162-166
Rhenium isotopes (Radioactive) - Nuclear energy levels
3131
Rheumatic diseases - Drug effects
1158
Rhodium compounds - Crystal structure
3108
Rhodium compounds - Synthesis
2162
Rhodium isotopes (Radioactive) - Decay schemes
1705
Rhodium isotopes (Radioactive) - Energy levels
1712
Rhodium isotopes (Stable) - Isomeric states
2877
Ribonucleic acids - Composition
1035
Ribonucleic acids - Conference
431
Rocket combustion - Mechanism
22
Rocket fuels - Effectiveness
63
Rocket motors - Pressure oscillations
2562
Rocket propelled sleds - Dynamic properties
60
Rocket propelled sleds - Test methods
54
Rocket propelled sleds - Wind tunnel tests
2035, 2036
Rocket trajectories - Mathematical analysis
2423
Rockets - Fuel consumption
61
Rods - Elasticity
2577, 2578, 2580, 2582
Roll - Optical analysis
54
Rotation - Mathematical analysis
1967
Rotator constants - Energy moments
1966
Rubber - Compressive properties
127
Rubidium atoms - Relaxation time
678, 679
Rubidium compounds - Electro magnetic properties
755
Rubidium compounds - Neutron diffraction analysis
1173
Rubidium compounds - Optical masers
349
Ruby - Applications
2997, 2998
Ruby - Energy
3010
Ruby - Nuclear magnetic resonance
618, 1052, 1898
Ruby - Optical properties
631, 3000
Ruby - Relaxation times
1060
Ruthenium - Spectra
87
Ruthenium borides - Crystal structure
3106
Ruthenium isotopes (Radioactive) - Decay schemes
1705
Rutile crystals - Sintering
1986

Salt solutions - Molecular properties
2572
Salts - Fluorescence
949
Samarium isotopes (Radioactive) - Decay
3102
Samarium isotopes (Stable) - Magnetic moments
1719
Sampled-data feedback systems - Analysis
339
Sandwich panels - Compression tests
2021
Sandwich plates - Vibrations
2441-2444
Sapphire - Dielectric properties
67
Satellite vehicles - Orbital flight paths
3276, 3277
Satellites (Artificial) - Attitude control systems
364, 3082
Saturn (Planet) - Radiation
651
Scandium compounds - Crystal structure
2339
Scandium isotopes (Radioactive) - Decay schemes
861
Scandium isotopes (Radioactive) - Energy levels
2124
Scandium isotopes (Radioactive) - Nuclear magnetic resonance
327

Scattering
see also as a subdivision, e.g., Electrons - Scattering
Scattering - Cross sections
484, 961
Scattering - Distortion effects
455
Scattering - Integral equations
485, 486, 766
Scattering - Mathematical analysis

Silicon compounds - Crystal structure
2334, 2338, 3108
Silicon compounds - Electron impact studies
1122, 1123

Silicon compounds - Preparation
3205
Silicon compounds - Spectra
1350
Silicon crystals - Electron spin relaxation
2987
Silicon isotopes (Stable) - Half-life
862
Silicon isotopes (Stable) - Proton bombardment
1725
Silicon surfaces - X-ray diffraction analysis
2327
Silver - Auger energies
3126
Silver - Chemical polishing
507
Silver - Fermi surfaces
3220
Silver - Lattice defects
84
Silver - Oxidation
86
Silver - Plastic deformation
1638
Silver alloys - Diffusion
591
Silver alloys - Semiconductors
2810
Silver bromide crystals - Cyclotron resonance
1262
Silver bromide crystals - Electrical properties
1253, 1254
Silver bromide crystals - Magnetoresistance
1285
Silver chloride - Valence bands
2654
Silver chloride crystals - Aging
2143
Silver chloride crystals - Cosmic ray tracking
2141, 2142, 2144
Silver chloride crystals - Dislocations
2140 2145
Silver chloride crystals - Electrical properties
1254
Silver chloride crystals - Nuclear processes
2141, 2142
Silver compounds - Dielectric properties
2182
Silver crystals - Deformation
509, 1240
Silver crystals - Etching
508
Silver halides - Electronic properties
1251
Single crystals - Electron bombardment
770
Single crystals - Electron spin resonance
2228
Single crystals - Grain boundaries
183
Single crystals - Impurities
771
Single crystals - Magnetic properties
511-513, 1761
Single crystals - Neutron diffraction analysis
2183
Single crystals - Optical properties
2331
Single crystals - Resonance
1765, 2044
Single crystals - Spin transitions
624, 625
Single crystals - Stresses
479
Single crystals - X-ray diffraction analysis
5, 6, 8, 1413
Sintering - Kinetics
1985, 1986
Skin - Pore radius
2711, 2712
Skin - Thermal sensitivity
1797
Sleep - Body fluid variation
1422
Sleep - Electroencephalographic analysis
437, 2366, 2370, 2371
Sleep (Cat) - Electrical properties
1009
Sleep (Cat) - Electroencephalographic analysis
1007, 1008, 1010, 1011, 1013
Sleep (Cat) - Mechanism
1504-1506
Sleep (Dog) - Electroencephalographic analysis
1013, 1014
Sleep (Man) - Eye movements
1507
Sleep (Rabbit) - Electroencephalographic analysis
1012, 1014
Slender bodies - Drag
2567
Slip band formation - Temperature
400
S-matrix - Asymptotic behavior
1581
S-matrix - Holomorphy domain
3098
S-matrix elements - Reduction
1460
S-matrix theory - Crossing symmetry
626
S-matrix theory - Time duration
322, 2540
Soaps - Colloidal films
2739, 2740
Social perception - Analysis
2171
Sociologists - Research methods
199
Sociology - Correlation techniques
3307
Sociology - Motivation
3063
Sociology - Religious groups
734, 3306
Sociology - Theory
3309
Sociometrics - Emotion
3305-3308, 3310
Sociometrics - Learning theory
2196
Sociometrics - Perception
3309

Subject Index

Sodium - Fluorescence analysis
2483
Sodium chloride - Chemical reactions
86
Sodium chloride - Hyperfine structure
2650
Sodium chloride - Nuclear spin
3210
Sodium chloride crystals Electron diffraction analysis
770
Sodium compounds - Complex ions
2038
Sodium compounds - Crystal structure
2683
Sodium compounds - Electrical properties
756
Sodium decyl sulfates - Conductivity
2736
Sodium decyl sulfates - Thermodynamic equilibrium
2737
Sodium hyponitrite - Synthesis
2307
Sodium ions - Mobility
810
Sodium solutions - Magnetic resonance
3190
Sodium sulfinates - Synthesis
2552
Solar corona - Dynamics
2709
Solar flares - Analysis
1306, 2710
Solar flares - Space flights
745
Solar flares - Statistical analysis
75, 1307
Solar radiation - Cosmic rays
316, 2708
Solar radiation - Frequency
688
Solar radiation -Mathematical models
2879
Solar radiation - Sources
2904, 2909
Solar radiation - Spectra
572
Solar radiation - Terrestrial magnetism
2879
Solar spectrum - Analysis
2902
Solenoids - Superconductivity
1750
Solid explosives - Detonation
3139
Solid propellants - Applications
383
Solid propellants - Combustion
3135, 3136
Solid rocket propellants - Combustion
92, 2504, 2775, 2776
Solid rocket propellants - Electron density
91
Solid rocket propellants - Tracer detection
3065
Solid state electronics - Tunneling phenomena
355
Solid state physics - Conductivity
2199
Solid state physics - Crystallization
3286
Solid state physics - Magnetic resonance
3177
Solid state physics - Pressure
83
Solid state physics - Rasers
2780
Solid state physics - Semiconductors
2977
Solid state physics - Theory
1627
Solids - Atomic spectra
2646
Solids - Chemical impurities
1233
Solids - Crystal structure
2392
Solids - Damping
184
Solids - Deformation
663, 1685, 3044, 2280
Solids - Dislocations
1233
Solids - Elasticity
3158
Solids - Electrical properties
2662
Solids - Electron properties
2231, 2392
Solids - Magnetic properties
416, 2188, 2392, 2393
Solids - Nucleation
3286
Solids - Optical properties
203, 2049, 2649, 2662, 2663
Solids - Resonance
2044
Solids - Surface properties
50
Solids - Thermodynamic properties
30, 104, 939, 2649, 2663
Solids - X-ray diffraction analysis
203, 2280
Solutions - Freezing
3283
Solutions - Magnetic properties
2393
Solutions - Micelle concentration
2736
Solutions - Spectrographic analysis
759
Solvents - Dielectric constants
2550
Solvolysis - Kinetics
2047
Somatic impulses - Potentials
2722
Sound - Detection
139
Sound diffraction - Analysis
1681, 1813
Sound dispersion - Electric field effects
1320

Sound emission - Turbulent boundary layer
3085
Sound localization - Measurement
140
Sound patterns - Russian
1814
Sound propagation - Atmospheric models
258
Sound scattering - Turbulence effect
1922, 1923
Sound transmission - Dolphin
706-708
Sound transmission - Magnetic fields
1768, 3211, 3218
Sound transmission - Mathematical analysis
1786, 1821
Sound velocity - Temperature factors
1785, 1890
Space charges - Electric field
2584
Space charges - Fluid flow
344
Space charges - Velocity
345
Space environment - Simulation
56, 57
Space flight - Flight paths
439
Space flight - Hazards
75, 745
Space flight - Telemetry
432
Space flight - Vibration
433
Space vehicles - Magnetic fields
2414
Space vehicles - Orbital flight paths
2424
Space vehicles - Particle interactions
964
Space vehicles - Propulsion
1178, 1179
Space vehicles - Re-entry
3078
Space vehicles - Soft landing
1647
Spaceships - Control systems
448, 451
Spark cameras - Design
3081
Spectrographic analysis - Impact flash
3251
Spectrographs - Design
878, 1722
Spectrometers - Design
658, 802, 939, 1153, 1515, 1720, 2108, 2126, 2402, 2612, 3116
Spectroscopy - Applications
132, 661-665, 762, 763, 1023, 1394, 1397, 1943, 2613
Spectroscopy - Bibliography
817
Spectroscopy - Electron transitions
773
Spectroscopy - Fourier transforms
1394
Spectroscopy - Theory
273, 850
Spectrum analyzers - Synthesis
703
Speech - Analysis
1805-1807
Speech - Conference
2093
Speech parameters - Computer analysis
629, 1804
Speech perception - Theory
136, 1869
Speech transmission - Coding
2092
Spheres - Thermal radiation
2673
Spheres (Iron) - Preparation
2988
Spherical cavities - Fourier transforms
251
Spheroids - Fluid dynamic properties
554, 555, 557
Spikes - Aerodynamic configurations
2035
Spin density - Determination
672, 675, 677
Spin exchange interaction - Determination
1051
Spin relaxation time - Temperature factors
3214
Spin transitions - Magnetic field effects
625
Spin waves - Nuclear interactions
462, 469
Spinal cord - Adrenocorticotropin effects
3270, 3271
Spinning - Theory
840
Spin-spin splitting - Theory
1776
Spin-wave instability - Theory
298
Spin-wave spectra - Angle variation effect
2900
Splitting constants - Time dependence
668
Stability - Mathematical analysis
2588, 2589, 2592, 2596
Stability - Test methods
357
Stability mechanisms - Mach number effect
229
Stabilization systems - Differential equations
358
Staging - Mathematical analysis
61
Stagnation pressures - Measurements
105
Stars - Astrophysical properties
739, 1861, 1980
Stars - Classification
1979
Stars - Composition
246, 248, 250, 253, 256, 1977, 1978
Stars - Distribution
300

Subject Index

Stars - Energy
251, 1983
Stars - Helium flash
2507, 2508
Stars - Hyperfine structure

Stars - Spectra
1984
Stars - Spectrographic analysis
244-246, 248-252, 256
Stars - Temperature
245, 252, 1656, 1982
Statistical distribution - Population
2785, 2795
Statistical distribution - Probability
2587, 2787, 2796, 3180
Statistical mechanics - Solutions
33, 1112, 2605
Statistical processes - Applications
1825
Statistical tests - Optimal design theory
2793
Statistical tests - Probability
2794
Statistics - Applications
1994
Statistics - Binomials
517, 524
Statistics - Design of experiments
702
Statistics - Distributions of statistical functions
515, 516, 518, 519, 521, 523, 1042, 1043, 2061, 2168
Statistics - Estimation theory
55, 353
Statistics - Inequalities
608
Statistics - Order statistics
520, 522
Statistics - Quality control
525, 527
Statistics - Sampling
523
Steady extension - Mathematical analysis
1930
Steel - Fracture
1177
Steel - Martensite
1226
Steel - Sound diffraction
1681
Steroids - Nomenclature
2083
Stishovite - Optical properties
113
Stochastic processes - Linear systems
2936
Storage - Effectiveness
2694
Storage systems - Design
1708
Strain - Aelotropic medium
717
Strain - Elastic coefficients
128
Strain aging - Kinetics
2143
Strategic materials - Reliability
2791
Stress - Deformation
128, 2091
Stress - Fatigue
3075
Stress - Fourier analysis
716
Stress - Mathematical analysis
1670, 2133
Stress - Pressure effects
704
Stress - Spiral dislocations
2092
Stress - Theory
1369, 2573, 3011
Stress (Psychology) - Anxiety
2696
Stress relaxation - Molecular weight distributions
613
Strings - Vibration
2577
Stripping reactions - Analysis
1745, 1746, 3044
Strong couplings - Symmetry
461
Strong interactions - Cross sections
161
Strong interactions - Mathematical models
334
Strontium - Auger energies
3126
Strontium - Nuclear energy levels
3132
Strontium isotopes (Radioactive) - Lifetime
655
Structural shells - Bending theory
2180
Structural shells - Damping
218
Structural shells - Elasticity
2580, 2796
Structural shells - Flutter
217, 219
Structural shells - Stability
2180
Structural shells - Temperature effects
2412
Structural shells - Vibrations
222, 2442-2444
Subadditive functions - Integral norms
709
Subject indexing - Legal records
2325

Sublimation rate - Determination
29
Submillimeter waves - Production
2259, 2264
Submillimeter waves - Scientific research
1270
Subsonic flow - Boundary layer
385
Substituted benzene radicals - Spectra
671
Substitution reactions - Kinetics
2102, 2546
Substitution reactions - Mechanisms
3166
Sugar tolerance (Cat) - Measurement

2768
Transformations - Theory
547
Transformations (Quantum mechanics)-Position operators
108
Transition amplitudes - Analyticity
332
Transition elements - Crystal structure
2336
Transition probabilities - Relaxation times
752
Transistor amplifiers - Nonlinear systems
2925
Transonic flow
see also Hypersonic flow
Transonic flow - Mathematical analysis
389
Transport properties - Concentration effects
2685
Transport properties - Green's functions
3151
Transport properties - Quantum field theory
3150
Trapped particles - Geomagnetic shells
573
Trapped particles - Magnetic field effects
741
Triethylaluminum - Heat of formation
1425
Trimethyl silyl azide - Physical properties
2556
Trimethylaluminum - Heat of formation
1425
Tungsten - Thermionic emission
3168, 3169
Tungsten compounds - Electrical properties
754-756
Tungsten compounds - Phase studies
2406
Tungsten isotopes (Stable) - Quadrupole moments
1735
Tungsten phosphides - Crystal structure
3107
Tungstic oxide - Solid state physics
756
Tunneling - Strain effect
590
Turbulence - Mathematical analysis
2112
Turbulence - Surface properties
1366
Turbulence - Theory
2112
Turbulent boundary layer - Chemical reactions
15
Turbulent boundary layer - Differential equations
803

Turbulent boundary layer - Energy transfer
2028
Turbulent boundary layer - Gases
917
Turbulent boundary layer - Phase transitions
2123
Turbulent boundary layer - Surface properties
18, 2031
Turbulent boundary layer - Temperature effects
804
Turbulent flow - Boundary layer
1668
Turbulent flow - Decay
2489, 2494
Turbulent flow - Laminar boundary layer
1676
Turbulent flow - Measurement
1359, 1360
Turbulent flow - Reaction kinetics
2506
Turbulent flow - Sound scattering
1922, 1923
Turbulent flow - Temperature effects
1360, 1362
Turbulent flow - Wave characteristics
1678
Turbulent flow reactors - Heat transfer
2506
Twinning (Crystallography) - Analysis
3231, 3282, 3284
Two-way channels - Information transmission
1855

Ultrasonic attenuation - Frequency effects
1841
Ultrasonic attenuation - Instrumentation
3219, 3220
Ultrasonic attenuation - Measurement
3218, 3221-3223
Ultrasonics - Equipment
694
Ultraviolet radiation - Detection
1618, 1619
Ultraviolet radiation - Field theory
2992
Ultraviolet spectroscopy - Scientific research
1154
Uranium isotopes (Radioactive) - Fission
879
Urinary system - Altitude effects
433
Urinary system - Diseases
434
Uterus (Rat) - Hormone effect
536, 539

Vacuum apparatus - Contamination
3167
Vacuum apparatus - Design
1752
Vacuum Science and Technology - Symposium
74
Vacuum systems - Charge transfer
1209
Vacuum systems - Electrical breakdown
1211, 3167
Van Allen belt - Analysis
741
Vanadium - Deuteron bombardment
3187
Vanadium compounds - Chemical reactions
2732
Vanadium compounds - Crystal structure
114
Vanadium compounds - Hyperfine structure
757, 758, 2004
Vanadium compounds - Magnetic resonance
753
Vanadium compounds - Optical properties
114
Vanadium compounds - Solid state physics
754
Vanadium compounds - Spectra
2004
Vanadium compounds - X-ray diffraction analysis
114
Vanadium crystals - Ultrasonic attenuation
3222
Vanadium isotopes (Stable) - Nuclear energy levels
2852
Vanadium pentoxide - Hyperfine structure
757, 758
Vanadyl compounds - Spectra
674, 676
Vapor pressure - Measurement
196
Varactor diodes - Mathematical models
2884
Varactor diodes - Test methods
2883
Vasopressin - Biological assay
3273, 3274
Velocity perception - Magnitude estimation
2957
Verbal Learning and Verbal Behavior - Symposium
271, 272
Vibrational constants - Determination
1020
Vibrational spectra - Recording
1943
Vibrations - Differential equations
222, 2441, 2442, 2444
Vibrations - Mathematical analysis
1967, 2574, 2577, 2579, 2581, 3158
Vibrations - Pressure effects
62
Video processors - Operation
1197
Vinyl compounds - Chemical reactions
2554
Vinylacetylene - Pyrolysis
3043
Viscoelasticity - Temperature factors
612
Viscometers - Applications
412
Viscosity
see also as a subdivision, e.g., Fluid flow - Viscosity
Viscosity - Temperature dependence
768

Viscous flow - Entropy
2050
Viscous flow - Mathematical analysis
2759, 2801
Vision - Birds
2367
Vision - Brain mechanisms
2366
Vision - Color perception
545
Vision - Eye movements
1345
Vision - Restriction
1773
Vision - Test methods
1330-1341, 1343, 1345, 1904
Vision (Cat) - Conditioned reflex
2364
Vision (Insect) - Optic nerve
2774
Vision (Octopus) - Form discrimination
1464, 1465
Visual adaptation - Photochemistry
546
Visual cortex (Cat) - Stimulation
1537
Visual cortex (Monkey) - Stimulation
712
Visual field (Monkey) - Striate cortex removal
492
Visual perception - Adaptation
1904
Visual perception - Color vision
1342, 1344
Visual perception - Conditioned reflex
501, 2357
Visual perception - Fluctuation
1330
Visual perception - Measurement
1773
Visual perception - Sensitivity
1331, 1333-1335, 1340
Visual perception - Spatial cues
2520
Visual perception - Stimulation
501, 502
Visual perception (Man) - Illusion effects
495
Visual responses - Adaption
1337
Visual responses - Analysis
1332, 1333, 1339
Visual responses - Pre-receptor elements
1305
Visual responses - Stimulation
429
Visual thresholds - Analysis
1336, 1341
Visual thresholds - Measurements
1331
Visual thresholds - Sharpness
1338, 1343
Vocal behavior - Dolphin
706, 708
Vocal tract - Speech parameters
1806
Voigt effect - Theory
1770
Voltage - Magnetic field effects
2454
Volume expansion coefficients - Determination
1944
Vortices - Boundary layer
1159
Vortices - Deformation
1622, 1626
Vortices - Stability
2564, 2566

Wakefulness - Body fluid variation
1422
Wakefulness - Electroencephalographic analysis
2370, 2371
Wakefulness (Man) - Eye movements
1507
Wakes - Hypersonic flow
2419
Wakes - Mathematical analysis
2415
Wall motion - Damping
1682, 1684
Warehouses - Storage
2694
Water - Freezing
3283
Water - Spectra
1938
Water vapor - Chemical reactions
2510
Wave functions - Computer analysis
596
Wave functions - Determination
597
Wave functions - Distortion
455
Wave functions - Mathematical analysis
160, 2204
Wave functions - Optical analysis
2210, 2214
Wave functions - Statistical analysis
1282
Wave propagation - Theory
212
Wave spectra - Computer analysis
1196
Wave transmission - Diffraction theory
2731
Wave transmission - Pressure variations
425
Wave transmission - Scattering
211
Wave transmission - Stress
1488
Waveguide couplers - Design
1280
Waveguides - Design
2729, 2730
Waveguides - Electrical properties
2468
Waveguides - Filters
2447

Waveguides - Mathematical analysis
1774
Waveguides - Polarization
2261
Waveguides - Radiation
1084
Waves - Acoustic response
1449
Waves - Interaction
2965
Weak couplings - Symmetry
461
Weak interactions - Cross sections
161
Weather forecasting - Numerical analysis
715
Weightlessness - Theory
56
Whistlers - Theory
2914, 2919
Wind tunnel tests - Applications
1641
Wind tunnels - Cryopumps
2760
Wind tunnels - Instrumentation
3157
Wing-body interference - Analysis
34-36
Wings - Fluid flow
35, 227
Wings - Hypersonic flow
226
Wings - Thermal stresses
3027

Xanthine - Derivatives
749
Xenon - Adsorption
3201
Xenon - Lattice parameters
1945
Xenon - Polarization
3200
Xenon - Ultraviolet absorption
2648
Xenon isotopes (Stable) - Relaxation time
2692
X-ray diffraction analysis - Applications
9, 142-144
X-ray diffraction analysis - Instrumentation
3288
X-ray diffraction analysis - Test equipment
203
X-ray diffraction cameras - Design
1413
X-ray intensity - Electron flux
320
X-ray microscopes - Applications
2480
X-ray microscopes - Design
2479
X-ray showers - Frequency
316
X-ray spectroscopy - Calibration
774
X-ray spectroscopy - Microanalysis
2476
X-rays - Applications
2477
X-rays - Detection
2481
X-rays - Production
2482
X-rays - Scientific research
1255
X-rays - Spectrographic analysis
2482

Yaw - Optical analysis
54
Yeasts - Genetics
3299
Yeasts - Protein synthesis
3294, 3295, 3298
Ytterbium - Paramagnetic resonance spectra
1143
Yttrium compounds - Crystal structure
2339
Yttrium isotopes (Radioactive) - Nuclear magnetic resonance
327
Yttrium isotopes (Radioactive) - Nuclear spin
308

Zeeman effect - Level crossing
635, 636, 644, 654
Zeeman effect - Measurement
1826
Zeeman effect - Temperature factors
637, 2394
Zeeman effect - Theory
2395
Zinc - Emission probabilities
3005
Zinc - Ionization
1152
Zinc alloys - Diffusion rates
1236
Zinc alloys - Stress
479, 907
Zinc compounds - Crystal structure
2978
Zinc compounds - Dehydration
6
Zinc compounds - Fluorescence
949
Zinc crystals - Magnetic properties
512, 513
Zinc crystals - Ultrasonic attenuation
3222
Zinc ferrites - Cryogenics
1997
Zinc ferrites - Thermodynamic properties
1995, 1996
Zinc isotopes - Nuclear reactions
898
Zinc isotopes (Radioactive) - Dipole moments
640, 642
Zinc isotopes (Radioactive)-Hyperfine structure
665

Subject Index

Zinc isotopes (Radioactive) - Lifetimes
661
Zinc isotopes (Radioactive) - Nuclear magnetic moments
664
Zinc isotopes (Stable) - Level crossing
648
Zinc oxide - Sintering
1985
Zirconium - Oxidation
1510, 1511
Zone formation - Kinetics
2170
Zone melting - Electric fields
3290
Zone melting - Temperature factors
3289
