For a random signal corrupted by additive statistically independent noise, it is common practice to use the SNR as a gain-invariant measure of the disturbance caused by noise. After filtering, however, the signal will be distorted and noisy; hence, the common definition of SNR is not directly applicable. An adequate definition is presented for a generalized SNR for noisy signals and the SNR of optimum mean-square filters is discussed. The SNR performance of filters may be a misleading measure of their merit.

TEMPERATURE AND FREQUENCY DEPENDENCE OF ULTRASONIC ABSORPTION IN LIQUID HELIUM BELOW 1°K, by W. A. Jeffers, Jr. and W. M. Whitney. [1965] [15]p. incl. diagrs. refs. (AFOSR-65-2404) (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, and National Science Foundation) AD 621831 Unclassified

Also published in Phys. Rev., v. 139: A1082-A1096, Aug. 16, 1965.

From measurements of the temperature dependence of the amplitude of ultrasonic pulses propagated over a fixed path in liquid helium, the attenuation coefficient has been determined at the 6 frequencies 1.00, 2.02, 3.91, 6.08, 10.2, and 17.7 mc/sec, at temperatures extending down to 0.2°K. Below 0.6°K, the observed variation of the absorption coefficient α (cm^{-1}) with frequency f (mc/sec) and temperature T (°K) can be represented by the empirical equation $\alpha = 0.11\, f^{3/2}T^3$. This behavior differs from that predicted by several existing theories that are based upon the 3-phonon or 4-phonon interaction between longitudinal acoustic quanta and thermal phonons. Over the temperature interval 0.6-0.8°K, the measured attenuation is somewhat greater than would be expected from an extrapolation of the results below 0.6°K into this temperature region. A comparison of the data with some calculations by Khalatnikov suggests that the additional absorption arises from thermal conduction in the normal fluid. An equation that is analogous to the classical Kirchhoff expression adequately accounts for this contribution to the total absorption, even at temperatures for which the lifetime of the thermal phonons exceeds the period of the sound wave. ORTHOGONAL DETECTION TO REDUCE COMMON CHANNEL INTERFERENCE, by T. H. Crystal. 1965 [2]p. incl. diagr. (AFOSR-65-2405) (Sponsored jointly by Air Force Electronic Systems Division; Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 621901 Unclassified

Also published in Proc. IEEE, v. 53: 742-743, July 1965.

It is shown that, since DSB is a linear modulation procedure which creates 2 shifted versions of the modulating signal spectrum, 2 DSB signals with overlapping spectra may be separated perfectly, rather than approximately, by a finite linear demodulation procedure. Because of the linearity of the modulation and demodulation process, there is no justification for comparison with nonlinear schemes nor for extending this procedure for more signals.

AN IONIZATION PROCESS IN A LOW-ENERGY CESIUM PLASMA, by H. L. Witting and E. P. Gyftopoulos. [1965] [10]p. incl. diagrs. table, refs. (AFOSR-65-2406) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), and National Science Foundation) AD 619854 Unclassified

Also published in Jour. Appl. Phys., v. 36: 1328-1337, Apr. 1965.

The mechanism of ion formation in cesium plasmas at relatively low electron temperatures (3500°K) and pressures of a few Torr are investigated. It is concluded that most of the ions are molecular and that they are formed by collisions between cesium atoms in the first excited state. The excited atoms are predominantly produced by inelastic electron collisions. The excitation cross section is computed by means of the impact parameter method. It has a maximum value of 100×10^{-16} cm^2 at 7 ev. The de-excitation cross section is computed and found to be approx. constant at $50 \times 10^{-16} cm^2$. Radiation trapping and diffusion of excited atoms are also studied. The ionization cross section is calculated by means of statistical thermodynamics from the measured recombination coefficient for the inverse of the ionizing process. It is found to be $1450 \times 10^{-16} cm^2$. The plasma is uniform throughout its volume except in the immediate vicinity of the bounding electrodes. The proposed mechanism results in performance characteristics for cesium thermionic converters, operating in the "ignited mode", which are in qualitative and quantitative agreement with experimental data.

ULTRASONIC ATTENUATION IN AMMONIUM CHLORIDE, by C. W. Garland and J. S. Jones. [1965] [6]p. incl. diagrs. table, refs. (AFOSR-65-2407) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)] and National Science Foundation) AD 619851 Unclassified

Also published in Jour. Chem. Phys., v. 42: 4194-4199, June 15, 1965.

The attenuation coefficient α of longitudinal ultrasonic waves propagating along the [100] direction in single-crystal ammonium chloride has been measured as a function of frequency from 5 to 55 mc/sec and as a function of temperature from 200° to 270°K. A sharp maximum is observed in α at the order-disorder critical temperature. The results are analyzed in terms of a relaxation model with a highly temperature-dependent relaxation time. GENERAL CRITERION FOR MIRROR INSTABILITY OF A PLASMA, by D. J. Rose. [1965] [5]p incl. diagrs. (AFOSR-65-2409) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), and National Science Foundation) AD 619942 Unclassified

Also published in Phys. Fluids, v. 8: 951-955, May 1965.

A plasma column in an axial magnetic induction B exhibits the well-recognized "mirror" instability if the pressure $p_\perp$ perpendicular to B becomes too high, as follows. A small azimuthally symmetric bulge in the field may trap additional plasma via the usual mirror effect. The increased diamagnetism further weakens the field in the bulge, thus trapping more plasma, and so forth. The criterion for stability against this mode for an azimuthally symmetric velocity distribution function $f(v, \theta)$ is given. The integral is a measure of changing $p_\perp$ if an incipient bulge forms in the plasma column; the K_0 term represents stabilizing effect of a finite wavelength perturbation. This criterion is more general than the two-temperature criteria obtained hitherto. (Contractor's abstract, modified)

SOME IMPLICATIONS OF THE STOCHASTIC BHEAVIOR OF PRIMARY AUDITORY NEURONS, by W. M. Siebert. [1965] [10]p. incl. illus. diagrs. refs. (AFOSR-65-2410) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 619855 Unclassified

Presented at meeting of Internat'l. Organization of Pure and Applied Biophysics, Paris (France), June 22-27, 1964.

Also published in Kybernetik, v. 2: 206-215, June 1965.

Since the only way in which auditory information can

reach the more central parts of the nervous system is via the VIIIth nerve, the effective 'neural noise' implied by stochastic 'coding' of auditory information must set some sort of limits on auditory discriminations. This paper shows that these limits can be calculated if an appropriate statistical model of the neural activity is accepted. Of course, no more than a bound on discrimination performance can be determined in this way, since there is no reason to suppose that the central processing in the nervous system is effectively ideal-- particularly in the artificial situations of auditory psychophysics. But if these bounds closely approximate performance (and there is some reason to believe they may, at least for the very simple auditory discriminations treated in this paper) then it seems reasonable to maintain that the observed stochastic 'coding' in a sense accounts for or explains these behavioral limits.

CESIUM ION-BEAM NEUTRALIZATION WITH ENERGETIC ELECTRONS, by G. C. Theodoridis and E. P. Gyftopoulos. [1965] [4]p. incl. diagrs. table, refs. (AFOSR-65-2411) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), and National Science Foundation) AD 621833 Unclassified

Also published in AIAA Jour., v. 3: 1414-1417, Aug. 1965.

The neutralization of the positive space charge of cesium ion beams of energies up to 2500 ev by means of energetic electrons (of the order of 100 ev) is investigated experimentally. It is found that neutralization occurs provided that electrons are supplied at the same rate as the ions. The results are independent of any other parameter of the electron beam. An attempt is made to justify the observed experimental results by means of a two-stream collective scattering interaction between the energetic electrons and the ion-beam plasma. The one-dimensional dispersion relation for this interaction indicates the existence of growing longitudinal oscillations under the conditions prevailing in the experiments. These oscillations may be the mechanism by which the electron drift energy is thermalized, thus leading to the observed neutralization. The results of this work suggest that neutralizing electrons can be introduced into the ion beam of an ion-propelled spaceship by means of an electron gun instead of being made available by placing a hot electron source in the vicinity of the ion beam. Through use of an electron gun, the electron current can be controlled continuously, and the electron emitter can be well protected.

EFFECTS OF ACOUSTIC STIMULI ON SPONTANEOUS SPIKE DISCHARGES IN AUDITORY NERVE FIBERS (Abstract), by N. Y.-S. Kiang and M. B. Sachs. [1965] [1]p. (AFOSR-65-2412) (In cooperation with Massachusetts Eye and Ear Infirmary, Boston) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, National Science Foundation, and Public Health Service) Unclassified

Presented at Fall Meeting of the Amer. Physiol. Soc., California U., Los Angeles, Aug. 23-27, 1965.

Also published in Physiologist, v. 8: 208, Aug. 1965.

Single auditory nerve fibers in anesthetized cats exhibit spike discharges even in the absence of controlled acoustic stimuli. These fibers respond to appropriate tonal stimuli by showing an increase in the rate of discharge. When spike discharges are driven by either tonal or noise stimuli, the addition of certain other tones results in a reduction in the rate of driven activity. These last tones, when presented alone, do not reduce the discharge rate to a level below that of spontaneous activity. Under certain conditions, a temporary reduction of discharge rate below spontaneous level can be demonstrated but these reductions cannot be maintained. It is suggested that the generation of evoked discharges may involve mechanisms that differ from those that generate spontaneous discharges.

EFFECTS OF EARLY EXPERIENCE ON BEHAVIOR: EXPERIMENTAL AND CONCEPTUAL CONSIDERATIONS, by R. Melzack. [1965] [29]p. incl. illus. diagrs. refs. (AFOSR-65-2413) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), and National Institutes of Health) AD 621081 Unclassified

Also published in Psychopathology of Perception; Proc. Fifty-third Annual Meeting of the Amer. Psychopathological Assoc., New York (Feb. 1963), ed. by P. H. Hoch and J. Zubin. New York, Grune and Stratton, Inc., 1965, 271-299.

Experiments on restriction of sensory experience in Scottish terrier and Beagles indicate that selection of particular neural patterns and information filter under the control of central nervous system process that correspond to prior experience at the early stages of synaptic transmission must be with the environment. Severe restriction of the early sensory experience of dogs produces striking abnormalities in their behavior at maturity such as extremely high level of behavioral arousal, failure to attend selectively to environmental stimuli, abnormal response to noxious stimulation, social submissiveness, and excessive licking behavior. One of the mechanisms proposed to account for these effects of restrictions describes a circle in which failure to filter out irrelevant information (on the basis of prior experience) leads to excessive arousal which, in turn,

interferes with mechanisms (perhaps innately determined) that would normally act in the selection of cues for adaptive response. The behavioral and physiological data obtained with the restricted beagles lend support to the conceptual approach based on current knowledge of information selection in the central nervous system. This conceptual approach has no difficulty in dealing with the obvious genetic contribution to behavior, and it is further substantiated by a comparison of the effects of restriction and brain lesions.

ROTATIONAL-BEAM POWER THEOREMS, by P. Penfield, Jr. 1965 [6]p. incl. refs. (AFOSR-65-2414) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)) AD 620714 Unclassified

Also published in IEEE Trans. Electron. Devices, v. ED-12: 258-263, May 1965.

General power theorems for rotational electron beams and some moving plasmas are derived by using 3 sets of variables: Clebsch variables, Lin's variables, and polarization variables. In each case, the most general power theorem, with unspecified linear operators, is given and for the polarization-variable case this is specialized to some cases of interest. Unfortunately, the physical interpretation of the variables used is not always clear, and the physically unmeasurable variables may not always behave as measurable ones would, so that the theorems are of limited usefulness. THE SPINOCERVICAL TRACT: DORSAL COLUMN LINKAGE, CONDUCTION VELOCITY, PRIMARY AFFERENT SPECTRUM, by A. Taub and P. O. Bishop. 1965 [21]p. incl. diagrs. refs. (AFOSR-65-2415) (Sponsored jointly by Air Force Aeronautical Systems Division; Air Force Office of Scientific Research under AF AFOSR-64-591; Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, National Science Foundation, and Teagle Foundation, Inc.) AD 621834 Unclassified

Also published in Exper. Neurol., v. 13: 1-21, Sept. 1965.

Microelectrode studies of single units in the spinocervical tract of the cat under barbiturate anesthesia demonstrate a monosynaptic linkage between the spinocervical tract and dorsal column cutaneous afferents at the segmental level of dorsal root entry. The spinocervical tract is substantially independent of the dorsal spinocerebellar tract, at least 75% of units studied terminating in the region of the ipsilateral lateral cervical nucleus. Mean over-all conduction velocity of units in the spinocervical tract is 58.0 m/sec, compared with mean over-all conduction velocity of cutaneous afferents in the dorsal columns providing input to these spinocervical tract units of 38.6 m/sec. The dorsal column input contains the $A\alpha$ cutaneous component, of which the small-fibered half is most effective in exciting spinocervical tract units. The $A\delta$ component is lacking. The spinocervical tract primary afferent input contains at least all of the A group to the $A\delta$ component. Thus slow-conducting cutaneous primary afferent fibers may project to fast-conducting long pathways. Some functional and clinical aspects of the spinocervical tract and its homologue are discussed. STIMULUS CODING IN THE AUDITORY NERVE AND COCHLEAR NUCLEUS, by N. Y.-S. Kiang. [1965] [16]p. incl. illus. diagrs. refs. (AFOSR-65-2416) (In cooperation with Massachusetts Eye and Ear Infirmary, Boston) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 617591 Unclassified

Also published in Acta Oto-Laryngol., v. 59: 186-200, [1965].

The average time pattern of response of any auditory nerve fiber to simple acoustic stimuli is predictable from its 'tuning curve' and rate of spontaneous discharge. In contrast, units in the cochlear nucleus may exhibit radically different response patterns to the same stimulus though their tuning curves and rates of spontaneous discharge are virtually identical. Messages carried by the auditory nerve are apparently recoded in the cochlear nucleus in a number of different ways. Consequently the nucleus should not be considered merely as a relay station.

EVIDENCE FOR A CONSIDERABLE NONLINEAR DIPOLE ABSORPTION IN GALLIUM ARSENIDE, by R. Geick. [1965] [5]p. incl. diagrs. refs. (AFOSR-65-2419) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36-039-AMC-03200(E)) AD 617998 Unclassified

Also published in Phys. Rev., v. 135: A1495-A1499, May 31, 1965.

A comparison is made of the infrared lattice absorption spectra of Ge and GaAs. For this purpose an approximate damping function is derived for GaAs. The comparison of the damping functions shows that both the nonlinear dipole moment and the anharmonicity should be important for the absorption of GaAs in the 2-phonon and 3-phonon summation bands. The matrix elements for these 2 mechanisms are found to have nearly the same order of magnitude. In the absorption coefficient and in the imaginary part of the dielectric constant, the anharmonicity in connection with the infrared-active lattice mode dominates at frequencies near the resonance frequency ω_o, while the nonlinear dipole moment dominates in the 3-phonon summation-band region where $(\omega^2/\omega_o^2 - 1) \gg 1$. ULTRASONIC ATTENUATION MEASUREMENTS IN POLY-L-GLUTAMIC ACID SOLUTIONS, by J. J. Burke, G. G. Hammes, and T. B. Lewis. [1965] [6]p. incl. diagrs. tables, refs. (AF AFOSR-65-2420) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), and National Institutes of Health) Unclassified

Also published in Jour. Chem. Phys., v. 42: 3520-3525, May 15, 1965.

Ultrasonic attenuation measurements of poly-L-glutamic acid in 0.2M NaCl(aqueous)-dioxane (2:1) have been carried out over a frequency range from 6 to 175 mc/sec using a pulse-echo method. Attenuation in excess of the pure solvent was found over the entire pH range investigated (5.4-9.0). A distribution of relaxation times is observed at all pH values. This distribution approaches a single relaxation time as the pH is raised. The amplitude parameter characterizing the attenuation and the average relaxation time does not vary markedly with pH. The amplitude parameter is approximately proportional to the polymer concentration in contrast to the average relaxation time which is not strongly dependent on the polymer concentration. The process primarily responsible for the observed chemical relaxation is probably the interaction between solvent and polymer. The minimal volume change associated with the observed process has been calculated and is approximated ± 3 cc/mol of monomer. Although the ultrasonic attenuation clearly depends on whether the polymer molecule is in the form of a helix or random coil, the transition from helix to coil is not primarily responsible for the observed excess absorption. By combining these results with other data, bounds for the average relaxation time characteristic of the helix-coil transition can be estimated as $5 \times 10^{-8} < \tau < 10^{-5}$ sec.

HELIUM AFTERGLOW AND THE DECAY OF THE ELECTRON ENERGY, by J. C. Ingraham and S. C. Brown. [1965] [8]p. incl. diagrs. table, refs. (AFOSR-65-2441) (Sponsored jointly by Air Force Electronic Systems Division; [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36-039-AMC-03200(E), and Atomic Energy Commission) AD 617999 Unclassified

Also published in Phys. Rev., v. 138: A1015-A1022, May 17, 1965.

The electron energy decay in the afterglow of a pulsed dc discharge in helium has been studied over a pressure range from 0.03 mm to 5 mm Hg. The energy decay is found to be influenced by cooling due to electron-atom elastic recoil and heating due either to electron-metastable superlastic collisions at low pressures or to the ionizing collision between 2 metastable atoms at high pressures. The analysis allows for the deviation of the electron velocity distribution from Maxwellian resulting from these heating effects. (Contractor's abstract)

TEMPERATURE DEPENDENCE OF THE ANTIFERROMAGNETIC ANISOTROPY IN MnF_2, by J. C. Burgiel and M. W. P. Strandberg. [1965] [5]p. incl. diagrs. refs. (AFOSR-65-2458) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)) AD 617997 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 877-881, 1965.

Existing data on the temperature dependence of the sublattice magnetization and of the antiferromagnetic resonance frequency of MnF_2, together with new antiferromagnetic resonance data, are used to determine the temperature dependence of the antiferromagnetic anisotropy energy E_A. For most temperatures from 0°K to the Néel temperature $E_A \propto M^{2.88 \pm 0.16}$, where M represents the sublattice magnetization. The experimental results are discussed in terms of the existing theoretical treatments of this problem, particularly the classical theory of Zener, and the spin-wave theory of Oguchi. Considerations indicate the existence of nearly complete correlation between neighboring spins at all temperatures right up to the Néel temperature. (Contractor's abstract)

DETERMINATION OF OPTIMUM NONLINEAR SYSTEMS FOR GENERALIZED ERROR CRITERIA BASED ON THE USE OF GATE FUNCTIONS, by M. Schetzen. 1965 [9]p. incl. diagrs. (AFOSR-65-2459) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 618340 Unclassified

Also published in IEEE Trans. Inform. Theory, v. IT-11: 117-125, Jan. 1965.

A generalization of the error criteria in the analysis of optimum nonlinear systems is presented. The experimental and analytical techniques presented are based upon the expansion of the nonlinear system in the orthogonal set of gate functions that were introduced into the study of nonlinear systems by Bose in 1956. It is shown that, for various error criteria, the coefficients in the expansion can be determined independently of each other. By making use of this result, methods are developed for the determination of nonlinear systems with and without memory, for which an arbitrary weighted function of the error or the probability of an arbitrary function of the error is a minimum. THE SUBJECTIVE EFFECTS OF TWO-DIMENSIONAL PICTORIAL NOISE, by T. S. Huang. 1965 [11]p. incl. illus. diagrs. tables, refs. (AFOSR-65-2461) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 618341 Unclassified

Also published in IEEE Trans. Inform. Theory, v. IT-11: 43-53, Jan. 1965.

A study has been made of the subjective effects of the class of independent additive rectangular low-pass Gaussian noises. Three original pictures, varying in the amount of detail, were used. The general shapes of the isopreference surfaces σ- k_1 - k_2 space where σ is the rms value, and k_1 and k_2 are the bandwidths of the noise in the horizontal and vertical directions, respectively, were found. If the objectionability of noise is a linear functional of the noise spectrum, then one may deduce that for the class of noises whose spectra are symmetrical with respect to both horizontal and vertical frequencies, the weighting function in the integral representing noise objectionability is similar in shape to these isopreference surfaces. Presented at 118th meeting of Amer. Astronom. Soc., Kentucky U., Lexington, Mar. 14-17, 1965

Also published in Astronom. Jour., v. 70: 330-331, June 1965.

During June and July, measurements of Venus were made with a five-channel microwave radiometer operating at 21.9, 23.5, 25.5, 29.5, and 32.4 Gc/sec. A single-channel radiometer at 21.1 Gc/sec was used separately. The five-channel radiometer was composed of separate Dicke-type radiometers which were connected simultaneously to the antenna feed by means of frequency-selecting filters. The antenna was a 28-ft paraboloid. The spectrum of Venus was determined by comparison with the moon. The antenna patterns measured at each frequency were used to relate the observations of the moon and Venus. The absorption in the terrestrial atmosphere was determined by solar extinction measurements and by measurements of ground-level humidity. The average observed brightness temperatures and relative rms uncertainties for 13 separate experiments were: 502 ± 82°K, 404 ± 28°K, 450 ± 23°K, 428 ± 20°K, 463 ± 32°K, and +30 ± 24°K, in order of increasing frequency. If data at each frequency are considered separately, the uncertainties are: ± 20%, ± 10%, ± 10%, ± 10%, ± 15%, and ± 10%, respectively. There is some evidence for fluctuations in the shape of the spectrum. The observations seem to be inconsistent with atmospheric models incorporating only nonresonant absorption mechanisms.

DYNAMICALLY INDEPENDENT EQUILIBRIUM EQUATIONS FOR RLC NETWORKS, by C. F. Price and A. Bers. 1965 [4]p. incl. diagrs. (AFOSR-65-2464) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)) AD 617994 Unclassified

Also published in IEEE Trans. Circuit Theory, v. CT-12: 82-85, Mar. 1965.

This paper presents a systematic derivation of a system of first-order dynamically independent equilibrium equations for an RLC network. The dynamically independent equations are obtained from a set of topologically independent equilibrium equations which are written in terms of a judiciously chosen set of independent, current and voltage, network variables. It is thus shown that superfluous variables, which are the result of dynamic constraints on the network, can be eliminated by inspection. Finally a method for writing the dynamically independent equilibrium equations by inspection of the network is presented. Therefore, it is shown that by the above techniques the set of dynamically independent equations can be obtained with little more labor than the more conventional equilibrium equations whose variables are only topologically independent. BOUNDS ON THE NATURAL FREQUENCIES OF LC STRUCTURES, by H. B. Lee. 1965 [2]p. (AFOSR-65-2465) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)) AD 617992 Unclassified

Also published in IEEE Trans. Circuit Theory, v. CT-12: 127-128, Mar. 1965.

The purpose of this communication is to prove the following theorem: The smallest (nonzero) natural frequency which one can realize from a set of positive capacitors $C_1, \cdots C_m$ and a set of positive inductors $L_1, \cdots L_n$, results when one does the following: (1) connects the capacitors in parallel to produce a capacitance $C_p = C_1 \cdots + C_m$; (2) connects the inductors in a series to produce an inductance $L_s = L_1 \cdots + L_n$; (3) connects C_p and L_s in parallel. Similarly, the largest (finite) natural frequency which one can realize results when one performs as follows: (1) connects the capacitors in a series to produce a capacitance $C_s = (C_1^{-1} \cdots + C_m^{-1})^{-1}$; (2) connects the inductors in parallel to produce an inductance $L_p = (L_1^{-1} \cdots + L_n^{-1})^{-1}$; (3) connects C_s and L_p in parallel. The theorem is useful, as it provides the following bounds on the natural frequencies of any transformerless LC structure: $1/\sqrt{L_p^0 C_s} \geq \omega_\nu \geq 1/\sqrt{L_s C_p^\infty}$. The proof rests upon the fact that every natural oscillation is self-exciting.

PROCESSING AND TRANSMITTING INFORMATION THROUGH THE CENTRAL NERVOUS SYSTEM, by J. L. Hall. [1965] [6]p. incl. diagrs. (AFOSR-65-2466) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 618993 Unclassified

Also published in IEEE Student Jour., v. 3: 29-34, May 1965.

Experiments were performed to explore the relationship between patterns of neural activity in the central nervous system and the binaural localization of sounds. Acoustic clicks were presented to the 2 ears of anesthetized cats that had been operated upon so as to expose the brain. A neural model was attained identifying the relative amounts of cell activity in the left and right accessory nuclei of the brain's superior olive with position of the virtual image, with the result that the image was perceived on the side where fewer cells respond. On comparison between predictions of the model with results from human psychophysics, the cells fired more when the stimulus to the contralateral ear (on the opposite side) comes first and when the clicks

are made more intense. There was good agreement between these results and those of psychophysical experiments on humans.

CONVECTION AND THE DIFFERENTIAL ROTATION OF THE SUN, by N. O. Weiss. [1965] [3]p. (AFOSR-65-2467) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)) AD 618261 Unclassified

Also published in The Observatory, v. 85: 37-39, Feb. 1965.

Criteria for estimating the superadiabatic temperature gradient required to produce a given convective energy flux in a rotating solar convective zone are discussed. It appears that, although the effect of rotation is negligible in the photosphere, it may double the superadiabatic gradient in the deep convective zone. Consequently, if convective heat transport is the same at the poles as at the equator of the Sun, the polar regions should be cooler by an amount of order 20°K.

SPIKE DISCHARGE PATTERNS OF SPONTANEOUS AND CONTINUOUSLY STIMULATED ACTIVITY IN THE COCHLEAR NUCLEUS OF ANESTHETIZED CATS, by R. R. Pfeiffer and N. Y.-S. Kiang. [1965] [16]p. incl. diagrs. tables, refs. (AFOSR-65-2468) (In cooperation with Massachusetts Eye and Ear Infirmary, Boston) (Sponsored jointly by Air Force Office of Scientific Research, Army Research (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, National Science Foundation, and Public Health Service) AD 618345 Unclassified

Also published in Biophys. Jour., v. 5: 301-316, May 1965.

Interspike interval histograms of spontaneous and stimulated activity were computed from spike discharges of single units in the cochlear nucleus. These histograms indicate that a number of different types of spontaneous discharge patterns exist in the nucleus. The type of spontaneous activity of a given unit is related to its activity in response to continuous tones. Correlations were found between the discharge patterns of units and their anatomical locations within the nucleus. (Contractor's abstract)

PROBABILITIES ASSOCIATED WITH SPIKE DISCHARGES IN AUDITORY NERVE FIBERS (Abstract), by P. R. Gray, N. Y.-S. Kiang, and J. W. Shipley [1965] [1]p. (AFOSR-65-2756) (In cooperation with Massachusetts Eye and Ear Infirmary, Boston) (Sponsored jointly by Air Force Office of Scientific Research Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, National Science Foundation, and Public Health Service) AD 622537 Unclassified

Presented at Fall Meeting of the Amer. Physiol. Soc., California U., Los Angeles, Aug. 23-27, 1965.

Also published in Physiologist, v. 8: 179, Aug. 1965.

The time patterns of spike discharges in auditory nerve fibers are influenced by both stimulus characteristics and refractory properties of the neurons. Conventional post stimulus-time (PST) histograms reflect the combined influence of these 2 factors, but these factors can be studied separately by appropriate processing of the data. Statistical analyses of spontaneous activity suggest that one may consider a neuron to be "recovered" when it has not discharged during the previous 20 msec. The effect of the stimulus on a fiber that has apparently recovered can be studied by estimating the conditional probability of a spike in a particular interval of time, given some minimum time since the last firing. Analysis of these "recovered probabilities" helps to explain certain otherwise puzzling features of the conventional PST histograms and leads to a more complete understanding of the relation between discharge probabilities of these fibers and the mechanical motion of cochlear structures.

CORRELATION FUNCTIONS IN NUCLEAR RELAXATION. I. ANALYSIS OF RANDOM MOTIONS FROM FIELD DEPENDENCE OF RELAXATION TIMES, by J. M. Deutch and J. S. Waugh. [1965] [5]p. incl. refs. (AFOSR-66-0089) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)) AD 624352 Unclassified

Also published in Jour. Chem. Phys., v. 43: 1914-1918, Sept. 15, 1965.

The contributions to T_1 in a fluid arising from spin-rotational interaction and chemical-shielding anisotropy are discussed in terms of their simultaneous use to analyze the detailed nature of random rotations without the need of a microscopic theory. This possibility often exists because of the involvement of different correlation functions of the lattice variables and the experimental distinguishability of the latter mechanism through its magnetic-field dependence. The method is illustrated by comparing the results to be expected for 3 different random processes: (1) rotational diffusion, (2) random walk among the m_j states of a rotational manifold of fixed J with no selection rules, and (3) the same with a rigorous $\Delta m_j = \pm 1$ selection rule. Possible favorable experimental cases are discussed. (Contractor's abstract)

LOW-FREQUENCY INSTABILITY OF PARTIALLY IONIZED PLASMA, by D. L. Morse. [1965] [8]p. incl. diagrs. table. (AFOSR-66-0090) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E) and National Science Foundation) AD 624357 Unclassified

Also published in Phys. Fluids, v. 8: 1339-1346, July 1965.

The stability of a partially ionized plasma in a magnetic field is investigated. The electron and ion flow equations and continuity equations are used to describe low-frequency, macroscopic variations of plasma density and space potential. The solutions to the linearized forms of these equations consist of a set of eigenfunctions of perturbed density, and a complex frequency eigenvalue corresponding to each perturbed density eigenfunction. It is found that rotating "flutelike" density perturbations may grow when a steady radial electric field is present, either parallel or antiparallel to the unperturbed density gradient. The growth rate is proportional to a "corrected" electric field, which includes the time-invariant gradients of both density and space potential. The stabilizing effects of diffusion, parallel and perpendicular to the magnetic field, are considered. (Contractor's abstract)

OPTIMUM PREFILTERING IN SAMPLED DATA SYSTEMS WITH READ-IN JITTER, by B. Liu and R. E. Kahn. [1965] [7]p. incl. diagrs. (AFOSR-66-0091) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office

of Naval Research] under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 625673 Unclassified

Presented at IEEE Internat'l. Convention, New York, Mar. 22-26, 1965.

Also published in IEEE Internat'l. Conv. Rec., pt. 7: 127-133, 1965.

This paper treats the problem of the simultaneous optimization of the presampling filter and the post-sampling filter in a sampling and reconstruction scheme where jitter is present at the sampler. The cases of both high frequency and extremely low frequency jitter are considered. The optimum filters with read-in jitter are determined and the minimum mean-squared errors are calculated. It is shown that in both cases the optimum prefilter limits the input spectrum to an angular frequency band of total width $2\pi\rho$ where ρ is the sampling rate.

IMPULSES ORIGINATING IN THE REGION OF DENDRITES, by P. D. Wall. [1965] [18]p. incl. illus. diagrs. refs. (AFOSR-66-0092) (Sponsored jointly by Air Force Aeronautical Systems Division; Air Force Office of Scientific Research under AF AFOSR-64-591, [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36-039-AMC-03200(E), Bell Telephone Laboratories, Inc., National Aeronautics and Space Administration, National Institutes of Health, National Science Foundation, and Teagle Foundation, Inc.) AD 624355 Unclassified

Also published in Jour. Physiol. (London), v. 180: 116-133, Sept. 1965.

The nature of impulses recorded in the region of dendrites in the most dorsal part of the dorsal horn is examined. Small extracellular action potentials can be recorded in the substantia gelatinosa. They are not produced by either terminals of afferent fibers or by the small cells of substantia gelatinosa. It is shown that there spikes have exactly the same qualitative properties as those evoked in the cell bodies of deeper cells. Continuous recordings can be made from the dendritic region to the cell body region of these cells. Spontaneous activity is only present in the cell body region but, when the receptive field of the cell is stimulated, impulses are initiated in the dendrites and are not conducted back into the dendrites from the cell body. It is tentatively concluded that the region from which impulses can be initiated extends up into the dendrites as the intensity of bombardment and firing of the cell increases. The presence of multiple trigger zones and travelling impulses in dendrites would mean that the cell has far greater potentialities for the analysis and abstraction of patterns in its afferents than in the case for a cell with a single trigger zone in the region of its axon hillock.

MICROWAVE SCATTERING DUE TO ACOUSTIC-ION-PLASMA-WAVE INSTABILITY, by V. Arunasalam and S. C. Brown. [1965] [9]p. incl. diagrs. table, refs. (AFOSR-66-0093) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36-039-AMC-03200(E), and Atomic Energy Commission) AD 624356 Unclassified

Also published in Phys. Rev., v. 140: A471-A479, Oct. 18, 1965.

An analysis is presented of an experimental study of microwave scattering from nonequilibrium plasmas in which the electrons had a large steady drift velocity with respect to the ions. According to theory, such plasmas must support "relatively undamped" acoustic-ion-plasma waves due to a 2-stream instability type of mechanism. Measurements of the frequency-power spectrum of the scattered signal show agreement with theory. In particular, as predicted, the measured scattering cross sections were large in comparison with the Thomson cross section. The effects of collisions predicted by theory did not show up in the experimental results. As expected from theoretical considerations of nonlinear effects (such as the nonlinear coupling between the plasma modes of different wave numbers), the relative drift velocity and the electron-ion temperature ratio tend toward a saturation value as the plasma current is increased. The experiment results indicate that the nonlinear effects are relatively weak.

BINAURAL INTERACTION IN THE ACCESSORY SUPERIOR-OLIVARY NUCLEUS OF THE CAT, by J. L. Hall. [1965] [10]p. incl. illus. diagrs. (AFOSR-66-0521) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)], National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) Unclassified

Also published in Jour. Acoust. Soc. Amer., v. 37: 814-823, May 1965.

Acoustic clicks were presented through earphones to the 2 ears of anesthetized cats, and the electrical response activity of single nerve cells in the accessory nucleus of the superior olive was studied. Stimulus parameters investigated included interaural time difference, interaural intensity difference, and average intensity. Attention was concentrated on cells that were excited by stimulation of the contralateral ear and inhibited by stimulation of the ispilateral ear. The experimental results are incorporated into van Bergeijs's model for binaural interaction, for which it is postulated that localization judgements are obtained on the basis of a comparison of the amounts of response activity in the two accessory nuclei. The model yields predictions that are in agreement with results from human psychophysics. The model predicts that the virtual image should be lateralized toward the side receiving prior or more intense stimulation. A time-intensity trading relationship that is in agreement with results from "centering" experiments is derived. The model predicts minimum detectable changes in interaural time difference of 5-10 usec and minimum detectable changes in interaural intensity difference of 0.1-0.5 db. (Contractor's abstract)

TEMPERATURE DEPENDENCE OF THE RAMAN SPECTRUM OF $BaTiO_3$, by C. H. Perry and D. B. Hall. [1965] [3]p. incl. diagrs. table, refs. (AFOSR-66-0523) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36-039-AMC-03200(E), and National Science Foundation) AD 626365 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 700-702, Oct. 25, 1965.

The Raman spectrum of single-crystal $BaTiO_3$ has been observed in the Stokes region over the temperature 4°-475°K and becomes more complex as the temperature is lowered from the paraelectric state to the ferroelectric state. A strongly temperature-dependent vibration (varying between 230/cm and 270/cm^{-1}) has been observed and interpreted as the longitudinal mode associated with the low-frequency transverse ferroelectric 'soft' mode. This transverse mode could not be observed, and it was presumably hidden under the relatively broad Rayleigh line. The results imply that the model which attributes the ferroelectric transition to an instability against an optical vibration may still be applicable, except that the variation of dielectric constant with temperature is not just associated with the low-frequency transverse mode but with the temperature-dependent longitudinal mode.

NONLINEAR NETWORK FOR THE MEASUREMENT OF THE RELATIVE ELECTRICAL CONDUCTIVITY BETWEEN HIGHLY CONDUCTING MATERIALS, by

B. T. Lubin, T. L. Földvári, and W. D. Jackson. [1965] [2]p. incl. diagrs. (Sponsored jointly by Aeronautical Systems Division; Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)) AD 626358 Unclassified

Also published in Rev. Scient. Instr., v. 36: 1663-1664, Nov. 1965.

This report describes a technique for determining the relative electrical conductivity between highly conductive substances also using an inductive coil method, but in conjunction with a nonlinear network that was previously used for inductive transducers. The method presented indicates a possibility to measure the electrical conductivity in situations where direct contact measurements are difficult or impossible to make, such as in the case of a 2-phase liquid metal flow.

FACILITATION AND INHIBITION IN THE VISUAL SYSTEM AFTER PHOTIC STIMULATION, by A. Cavaggioni and M. H. Goldstein, Jr. [1965] [24]p. incl. diagrs. refs. (AFOSR-66-0525) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 626366 Unclassified

Also published in Arch. Ital. Biol., v. 103: 397-420, Sept. 10, 1965.

A large enhancement of the characteristic waveform recorded from visual cortex in response to electric stimulation of the optic radiation is observed after photic stimulation. Only points 3, 4, and 5 of the shock-evoked response are enhanced. These results are in agreement with those reported by Schoolman and Evarts (Jour. Neurophysiol., v. 22: 112-119, 1959). A similar enhancement is demonstrated after the termination of a prolonged photic stimulation. The enhancement is greatly reduced by deep barbiturate anesthetization. On presentation of the shock stimuli to the optic chiasm, an inhibitory effect is shown at the lateral geniculate body which is coincident with the facilitation of the cortex. The experiments indicate that it is not likely that the enhancement following transients in photic stimulation is mediated by reticular pathways.

SOME DIELECTRIC AND ELECTRO-OPTIC PROPERTIES OF $BaTiO_3$ SINGLE CRYSTALS, by C. J. Johnson. [1965] [3]p. incl. diagrs. table. (AFOSR-66-0526) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, and National Science Foundation) AD 626361 Unclassified

Also published in Appl. Phys. Ltrs., v. 7: 221-223, Oct. 15, 1965.

A study was made of the Curie temperature, static dielectric constant, and electro-optic coefficient of barium titanate single crystals. The results indicate that the Curie temperature is not a fixed material property, but shows some dependence on the sample history and environment. The static dielectric values show that Curie-Weiss behavior does exist, and the constants C and T_0 were found to be $C = 1.5 \times 10^5 C°(\pm 0.1 \times 10^5 C°)$ and $T_0 = 115°C$ ($\pm 1°C$). The value obtained for the electro-optic coefficient was $g_{11} - g_{12} = 0.10$ (meters)^4/(coulombs)^2. (± 0.02).

OPTIMUM ANGLE MODULATION, by C. J. Boardman and H. L. Van Trees. 1965 [18]p. incl. diagrs. table, refs. (AFOSR-66-0529) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) Unclassified

Also published in IEEE Trans. Commun. Theory, v. COM-13: 452-469, Dec. 1965.

The problem of transmitting an analog message over a channel corrupted by additive Gaussian noise using angle modulation of a sinusoidal carrier is considered. The problem is formulated as a continuous estimation problem, where the desired output is a waveform that is the maximum a posteriori estimate of the transmitted message. The resulting structure is a nonrealizable, nonlinear system. Next, a demodulator structure that is realizable with delay is found, whose performance approximates the optimum system. Keeping the demodulator structure optimum, the transmitted signal is now optimized to obtain the best overall system. Two types of system constraints are considered. The demodulator is constrained to be above threshold, and the rms transmitted bandwidth is constrained. The modulator consists of a linear preemphasis network which causes the overall system to be optimum. Finally, the optimum system is compared to a phase modulation system using an optimum demodulator and properly chosen modulation index. For the class of message spectra, the difference is small. INFRARED MATERIALS: FAR INFRARED REFLECTANCE SPECTRA AND DIELECTRIC DISPERSION OF A VARIETY OF MATERIALS HAVING THE PEROVSKITE AND RELATED STRUCTURES, by C. H. Perry. [1965] [11]p. incl. refs. (AFOSR-66-0548) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36-039-AMC-03200(E), and National Science Foundation) AD 626357 Unclassified

Many compounds possessing the perovskite and related structures exhibit unusual properties, such as ferroelectricity and antiferromagnetism. Knowledge of the nature of the interatomic forces in the crystals prove extremely useful in explaining these phenomena. Of particular interest is the temperature-dependent low frequency mode which recent theories show is responsible for the ferroelectric and antiferroelectric behavior in certain perovskite titanates, zirconates and hafnates. The transmittance of a number of these materials were observed from 800-50/cm^{-1}. Reflectance measurements at room temperature were made of a wider range in the far infrared. Two cubic perovskite fluorides are included. The data were analyzed using the Kramers-Kronig relationship to obtain the dielectric dispersion of these materials. The resonances observed are related to presumed normal modes of vibration of the crystals and comparison is made between the various materials.

ABSOLUTE INSTABILITIES WITH DRIFTED HELICONS, by A Bers and A. L. McWhorter. [1965] [4]p. incl. diagrs. refs. (AFOSR-66-0549) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36-039-AMC-03200(E), and National Science Foundation) AD 626912 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 755-758, Nov. 8, 1965.

Analytic results are reported for an exact computer analysis of helicon-wave instabilities in a drifted electronhole plasma. The results, which are based on a recently developed technique for determining the nature of instabilities, show, for example, that in InSb with equal electron and hole concentration, an absolute instability should appear above a threshold magnetic field, at an arbitrarily small electric field. Furthermore, a physical picture of the instabilities is developed which shows that the electron negative-energy wave with both positive and negative group velocities becomes unstable in the presence of the resistive medium background provided by the holes.

HITTING AND MARTINGALE CHARACTERIZATIONS OF ONE-DIMENSIONAL DIFFUSIONS, by M. A. Arbib. [1965] [16]p. (AFOSR-66-0550) (Sponsored jointly by Aeronautical Systems Division; Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), and National Institutes of Health) AD 626260 Unclassified

Also published in Zeitschr. Wahrscheinlichkeitstheorie, v. 4: 232-247, Nov. 1965.

The main theorem of the paper is that, for a large class of one-dimensional diffusions (i. e. strong Markov processes with continuous sample paths): if x(t) is a continuous stochastic process possessing the hitting probabilities and mean exit times of the given diffusion, then x(t) is Markovian with the transition probabilities of the diffusion. For a diffusion x(t) with natural boundaries at $\pm \infty$, there is constructed a sequence $\pi_n(t, x)$ of functions with the property that the $\pi_n(t, x(t))$ are martingales, reducing in the case of the Brownian motion to the familiar martingale polynomials. It is finally shown that if a stochastic process x(t) is a martingale with continuous paths, with the additonal property that $\int_0^{x(t)} m(0, y]\, dy - t$ is a martingale, than x(t) is a diffusion with generator DmD^+ and natural boundaries at $\pm \infty$. This generalizes a martingale characterization given by Levy for the Brownian motion.

SYMPOSIUM: PHILOSOPHY AND LINGUISTICS. THE RELEVANCE OF LINGUSTICS TO PHILOSOPHY, by J. J. Katz. [1965] [14]p. (AFOSR-66-0551) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36-039-AMC-03200(E), and National Science Foundation) AD 626364 Unclassified

Also published in Jour. Philos., v. 62: 590-602, Oct. 1965.

The relevance of linguistics to philosophy is defended on the grounds that linguistic theory incorporates solutions to significant philosophical problems. The defense shows that a number of philosophical problems can be represented as questions about the nature of language, and that, so represented, they can be solved by conceptual constructions found in linguistic theory. The justification of these solutions is provided by the same evidence that warrants the introduction of such conceptual constructions into linguistic theory. The thesis is not that the linguist's description of locutions from natural languages reveals philosophical insights that somewhat escape philosophers. It is rather that conceptual constructions, initially devised to enable linguistic theroy to state uniformities in natural languages systematically, also fulfill the conditions on solutions to certain ph losophical problems. If this defense proves successful, linguistics is not incidentally pertinent to philosophy in the way that philosophy of science bears upon the clarification of methodology and theory construction in linguistics, but is directly relevant in the same way that philosophical theories themselves are.

AN ADDITIONAL REALIZATION CYCLE FOR LC IMPEDANCES, by H. B. Lee. 1965 [3]p. incl. diagrs. (AFOSR-66-0553) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36-039-AMC-03200(E)) Unclassified

Also published in IEEE Trans. Circuit Theory, v. CT-12: 435-437, Sept. 1965.

A realization cycle for a lossless driving point impedance is introduced which yields an unsymmetrical bridged tee terminated in a simpler impedance. The cycle is appropriate for lossless impedances of the form $Z(s) = A[s(s^2 + \alpha_1^2)\cdots(s^2 + \alpha_{n-1}^2)]/(s^2 + B_1^2)\cdots(s^2 + B_n^2)$ and has associated with it a remainder function $Z_r(s) = H[s(s^2 + \gamma_1^2)\cdots(s^2 + \gamma_{n-3}^2)]/(s^2 + \delta_1^2)\cdots(s^2 + \delta_{n-2}^2)$. The cycle is canonic, achieving a coefficient simplification of the driving point function via the synthesis of a four element two port. The validity of the procedure is shown. Several variations of the basic cycle are discussed, e.g. a lossless driving point admittance of the form of Z(s) above is also realized as an unsymmetric bridged tee (dual to that realized for Z) and a simpler admittance.

AN EXPERIMENTAL FACILITY FOR SEQUENTIAL DECODING, by C. W. Niessen. Sept. 13, 1965, 76p. incl. illus. diagrs. tables, refs. (Technical rept. no. 450; Lincoln Lab. technical rept. no. 396) (AFOSR-66-0978) (In cooperation with Massachusetts Inst. of Tech., Lincoln Lab., Cambridge) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 631240 Unclassified

This report describes the system design and implementation of a facility for the experimental study of sequential decoding that may be used at M.I.T. by graduate researchers in communications theory. Flexibility and ease of use are the primary requirements of this system. Thorough investigation of the characteristics of sequential decoding and likely problems to be studied led to a system based upon the Project MAC PDP-6 computer. A portable data-acquisition system, consisting of a digital tape recorder and analog-to-digital conversion equipment, is provided to make available to the computer the outputs of experimental demodulation equipment. The experimenter can decode the acquired data sequentially in accordance with an algorithm specified and easily written by him in a version of Fortran modified for this purpose. A display system is used for man-machine interaction. The system has been successfully implemented and tested, and experimental results are described.

CONCATENATED CODES, by G. D. Forney, Jr. Dec. 1, 1965, 107p. incl. diagrs. tables, refs. (Technical rept. no. 440) (AFOSR-66-1083) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) Unclassified

Concatenation is a method of building long codes out of shorter ones; it attempts to meet the problem of decoding complexity by breaking the required computation into manageable segments. Theoretical and computational results bearing on the efficiency and complexity of concatenated codes, are presented. The major theoretical results are the following: (1) Concatenation of an arbitrarily large number of codes can yield a probability of error that decreases exponentially with the over-all block length, while the decoding complexity increases only algebraically; and (2) Concatenation of a finite number of codes yields an error exponent that is inferior to that attainable with a single stage, but is nonzero at all rates below capacity. Computations support these theoretical results, and also give insight into the relationship between modulation and coding. This approach illuminates the special power and usefulness of the class of Reed-Solomon codes. An original presentation of their structure and properties is given, from which one derives the properties of all BCH codes; one determines their weight distribution, and considers in detail the implementation of their decoding algorithm, which is extended to correct both erasures and errors and is otherwise improved. This shows that on a particularly suitable channel, RS codes can achieve the performance specified by the coding theorem. Finally, a generalization of the use of erasures in minimum-distance decoding is presented, and the appropriate decoding techniques, which constitute an interesting hybrid between decoding and detection is discussed.

DENDRITIC FIELDS OF RETINAL GANGLION CELLS OF THE RAT, by J. E. Brown. [1965] [10]p. incl. illus. diagrs. tables, refs. (AFOSR-66-2301) (Sponsored jointly by Aeronautical Systems Division; Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), Bell Telephone Laboratories, Inc., National Aeronautics and Space Administration, National Institutes of Health, National Science Foundation, Teagle Foundation, Inc.) AD 630488 Unclassified

Also published in Jour. Neurophysiol., v. 28: 1091-1100, Nov. 1965.

Retinal ganglion cells of the rat were stained in vivo with methylene blue. Two classes of ganglion cells were found, based on the morphologies of the dendrites of the stained cells. The dendrites of one class of cells ("tight") penetrated deep into the inner plexiform layer and had a sense arborization. The dendritic arborization of the other class ("loose") was more sparse and was found in a more shallow region of the inner plexiform layer. No multilayered cells were observed. Speculatively, these two classes were identified with receptive field types previously found by electrophysiological techniques. Tentatively the tight cells might be those units with no demonstratable surround regions, and the loose cells those which have a center-surround type of organization.

RAT RETINAL GANGLION CELLS: RECEPTIVE FIELD ORGANIZATION AND MAINTAINED ACTIVITY, by J. E. Brown and J. A. Rojas. [1965] [18]p. incl. illus. diagrs. refs. (AFOSR-66-2302) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), Bell Telephone Laboratories, Inc., National Aeronautics and Space Administration, National Institutes of Health, National Science Foundation, and Teagle Foundation, Inc.) AD 630502 Unclassified

Also published in Jour. Neurophysiol., v. 28: 1073-1090, Nov. 1965.

The receptive field organization of single retinal ganglion cells of the rat was studied. A cell was stimulated by a variety of configurations of moving and stationary stimuli displayed on a screen 16 in. from the eye. The responses of the cell were recorded with a low-impedance metal microelectrode from the axon of the cell in the optic nerve or optic tract. Two types of units were found: units which had concentrically arranged receptive fields with a central region which responded either to an increase (on) or a decrease (off) of illumination and a surround region which antagonized

the responses of the central region, and units which had no demonstrable surround. In spite of extensive search no other types of receptive fields were found. The efficacy of the surround, when it was present, in antagonizing the center varied among the units. In addition, both on- and off-center units were either slow or fast in adapting to changes in illumination. The receptive field organization did not change very much with anesthetic doses of urethane and pentobarbital. The maintained activity of single retinal ganglion cells was studied in anesthetized and unanesthetized rats. In an unanesthetized rat the maintained activity of a single unit was more or less random. Under barbiturate anesthesia maintained activity characteristically showed a regular, repetitive bursting pattern: bursts of several spikes were recorded at rates between 12 and 16 times/sec. This repetitive, bursting activity was found to originate in the retina and was synchronized over a large part of the retina.

This paper deals with the theory and experimental verification of the probability distribution of photoelectron counts produced by a narrow-band Gaussian light source. By counting the rate of arrival of individual photoelectrons emitted from a photocathode when illuminated by a 6328A He-Ne laser operated just below the threshold level, theoretical equations for the statistics of this process have been verified experimentally. Using a counting time short compared with the inverse bandwidth of the light, the statistics followed closely the Bose-Einstein distribution to be expected for a source with a Gaussian amplitude distribution, but with a counting time longer than Δt, the statistics were of the form predicted by Glauber (Phys. Rev., v. 131: 2766, 1963).

PASSIVITY CONDITIONS, by P. Penfield, Jr. 1965, [3]p. (AFOSR-66-2304) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)) AD 630500 Unclassified

Also published in IEEE Trans. Circuit Theory, v. CT-12. 446-448, Sept. 1965.

A square, complex matrix S obeys the "passivity condition" if the matrix $(1 - S^{\dagger}S)$ is positive semidefinite. This condition is pertinent to circuit theory because the scattering matrix of a passive linear network, for any real frequency ω obeys this condition, as do many other matrices which can be derived from the scattering matrix. A set of necessary conditions for S to obey the passivity condition and one set of sufficient conditions are given. The chief virtue of these tests is that they are written entirely in terms of subdeterminants of the matrix S, and the matrix $(1 - S^{\dagger}S)$ need never by evaluated in order to apply the tests.

PCM PICTURE TRANSMISSION, by T. S. Huang. 1965 [7]p. incl. illus. diagrs. table, refs. (AFOSR-66-2309) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 630496 Unclassified

Also published in IEEE Spectrum, v. 2: 57-63, Dec. 1965.

This article briefly describes some of the research being carried on in PCM picture transmission. Research efforts on picture transmission by pulse code modulation falls into 2 categories: (1) Investigations on how the quality of the received picture depends on various system parameters, and (2) bandwidth compression techniques. Most of the studies have been done by digital computer simulation. The speed and memory capacity of present-day computers have limited the workers chiefly to considerations of monochrome still pictures

The absorption spectra of a number of alkali salts of platinum metal halide complexes have been investigated using a vacuum far-infrared spectrometer. Lattice vibrations and the stretching and bending frequencies of the metal-halogen bonds have been observed in the range 40-360 cm^{-1}. The compounds, which are of the type R_2XY_4 (square planar anion), were examined both at room temperature and at liquid nitrogen temperature. The assignment of the normal modes has been made and the force constants of the vibrational motions have been calculated using a valence force field model. (Contractor's abstract)

BASIC EQUATIONS AND CONSERVATION THEOREMS FOR THE ELECTROSTRICTION PHONON MASER, by H. A. Haus and P. Penfield, Jr. [1965] [5]p. incl. refs. (AFOSR-66-2317) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36 039-AMC-03200(E)]) AD 630497 Unclassified

Also published in Jour. Appl. Phys., v. 36: 3735-3739, Dec. 1965.

Brillouin scattering of light by phonons and the phonon maser are usually described in terms of an approximate set of linearized equations. The authors give a more exact set of equations for a lossless polarizable fluid, only relativistic effects are disregarded. When these equations are linearized and higher order terms in the ratio of sound speed to light speed are disregarded, they reduce to the customary set of equations. The more exact equations permit the derivation of the law of conservation of energy with a simple physical interpretation. From these equations, the Manley-Rowe relations and other conservation laws also follow relatively easily. (Contractor's abstract)

Also published in Cold Spring Harbor Symposia on Quantitative Biology, Cold Spring Harbor, N. Y. (June 4-11, 1965), ed. by L. Frisch. Cold Spring Harbor Laboratory of Quantitative Biology, v. 30: 217-225, 1965.

This paper complements the detailed account of the experiments in Journal of Physiology (v. 181: 525, Dec. 1965). Psychological questions associated with the phenomena of smell and quality of odors suggest that one function of smell is not to detect pure chemicals apart but to distinguish clearly between very similar mixtures. Physiological studies of olfactory receptors are discussed and electroosmogram responses are reported. The crude image of olfactory coding thus far constructed envisions receptors as having species of chemically sensitive traps which may have one or the other (or both) of 2 signaling actions on clasping a molecule. The actions of the molecular traps on a single receptor are not linearly combinatorial or else, if there is only one sort of trap for each receptor, then the action of odors on this trap is not simply combinational. The receptor sees pure odors and combinations of odors along a single dimension from most exalting to most depressing.

Also published in Jour. Physiol., v. 181: 525-529, Dec. 1965.

An account is given of research conducted to determine what relation there is between the slow change in the potential difference measured across the mucosa, and activity in the olfactory nerve. Fibers of the olfactory nerve often have a continuous, but noisy, activity. They are inhibited by some odours, excited by others, unaffected by yet others, and sometimes show a response in which noisy base-line activity becomes more rhythmic. For any pair of compounds that excite or inhibit one fiber in the same way, with very little search one can find a fiber that is affected differently by the two. This observation applies so far only to the limited variety of compounds used. The slow potentials recorded grossly from the mucous surface over the olfactory epithelium are compounded of at least two processes that oppose each other. One kind of process tends to return the potential to a certain level or drives it positive; another kind displaces the potential in the negative direction. These two processes can be distinguished not only by linear and nonlinear interactions between slow potentials but by a crude measurement of impedance that, at a low frequency, identifies the positive-driving process with a change in phase, and the negative-driving process with a change in magnitude. The positive-driving, or resting-level-seeking process, is tentatively identified with an inhibitory action of active sites in the receptors, and the other is identified with excitatory action of active sites.

Also published in Science, v. 150: 971-979, Nov. 19, 1965.

It is proposed that the presence or absence of pain is determined by the balance between the sensory and the central inputs to the gate control system. In addition to the sensory influences on the gate control system, there is a tonic input to the system from higher levels of the central nervous system which exerts an inhibitory effect on the sensory input. Thus, any lesion that impairs the normal downflow of impulses to the gate control system would open the gate. Central nervous system lesions associated with hyperalgesia and spontaneous pain could have this effect. On the other hand, any central nervous system condition that increases the flow of descending impulses would tend to close the gate. Increased central firing due to denervation supersensitivity might be one of these conditions. A peripheral nerve lesion, then, would have the direct effect of opening the gate, and the indirect effect, by increasing central firing and thereby increasing the tonic descending influences on the gate control system, of closing the gate. The balance between sensory facilitation and central inhibition of the input after peripheral-nerve lesion would account for the variability of pain even in cases of severe lesion.

BEAM-PLASMA DISCHARGE (Abstract), by R. Parker L. D. Smullin, and W. Getty. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 221, Feb. 25, 1965.

Recent experiments on a system with improved base pressure 10^{-8} Torr and with improved isolation of the electron gun from the plasma are described. Using 700-μsec pulses of about 10-15 kv and 10-20 A, virtually fully ionized plasmas of 10^{12}-10^{13} density are generated in an ambient hydrogen atmosphere of $1\text{-}3\times10^{-5}$ Torr By proper adjustment of the magnetic field, it is possible to eliminate gross instabilities during the pulse. The plasma electrons have a peculiar velocity distribution with an anomalously large high-energy component. When the beam is turned off, the low-energy electrons seem to disappear in 100 μsec, while the high-energy ones persist for 10-20 msec.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 226, Feb. 25, 1965.

A formula has been derived that gives the complete velocity distribution function of electrons f(v) in a plasma if the spectral intensity $I(\Omega, \omega)$ of Thomson-scattered light is known in angle Ω and frequency ω. f(v) may be relativistic, but quantum-mechanical and correlation effects are all neglected. An expression giving $I(\Omega, \omega)$ in terms of f(v) is derived and inverted, but the lack of simplicity in the resulting mathematical expressions necessitates a more pragmatic approach. The scattered intensity I is calculated for a number of cases where f(v) is presumed to have some symmetry. A rudimentary library of typical spectra is shown. Different f(v) can be distinguished with the least difficulty via the wings of the spectrum I.

EFFECT OF COMBINED d.c. AND rf MAGNETIC FIELDS UPON THE SKIN DEPTH OF GALLIUM (Abstract), by J. F. Cochran and C. A. Shiffman. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 110, Jan. 27, 1965.

The dependence upon static magnetic field of the skin depth of gallium single crystals was measured at 2 mc/sec and from 1° to 4°K, using a geometry in which the d.c. and rf fields are parallel. The skin depth displays marked oscillatory variations when the d.c. magnetic-field amplitude is less than, or comparable to, the rf-field amplitude. The authors have used rf magnetic fields up to 10 G and find that this effect does not depend upon specimen thickenss, but is a strong function of temperature in unstrained specimens. It is suggested that the experiment measures the average magnetoresistive effect due to the combined d.c. and rf fields acting on charge carriers that are moving predominantly parallel to the specimen surface in the skin layer.

ELECTRON-BEAM INTERACTIONS WITH IONS IN A HOT ELECTRON PLASMA (Abstract), by R. N. Wallace, S. Puri, and A. Bers. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 221-222, Feb. 25, 1965.

Low-frequency instabilities supported in an electron-beam/plasma system enclosed by a waveguide structure uniform in the direction of a large applied magnetic field are investigated. This investigation is part of a continuing study to determine conditions under which plasma ions may gain appreciable energy through direct interaction with the electron beam. Different types of instabilities are identified and their growth rates evaluated, using recently developed stability criteria. Finite-temperature transport theory shows that an absolute (nonconvective) instability occurs slightly below the ion-plasma frequency when the conditions $T_c > V_0$ and $\omega_{pb} > \omega_{pi}$ are well satisfied. When either T_c or ω_{pb} is smaller than the value required to maintain the absolute instability, a convective instability having a spatial growth rate that is sharply peaked in frequency is predicted. In addition, for $T_c < V_0$, a convective instability with slowly varying spatial growth rate is predicted for frequencies from ω_{oi} to above ω_{pi}. The physical nature of the absolute instability is interpreted by considering power flow in the waves, which are supported by the beam-plasma system.

INSTABILITIES IN PLASMAS WITH BEAM-TYPE DISTRIBUTIONS (Abstract), by A. Bers. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)]. and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 221, Feb. 25, 1965.

The stability of beam-type distributions, $f_0(p) = \delta(p_\perp - p_{0\perp})\delta(p_\parallel - p_{0\parallel})/2\pi p_{0\perp}$, using the linearized, relativistic, Vlasov and Maxwell equations is investigated. With the newly developed instability criteria, a complete analysis of the dispersion relation is carried out. In the zero-density limit, a "radiationlike" instability is found for transverse waves both along and across B_0; along B_0, it occurs for the right-polarized wave near ω_b, and across B_0 it occurs for the extraordinary wave near $n\omega_b$. As the density is increased, this

"radiationlike" instability is found to at first increase as $n_0^{\frac{1}{3}}$ and then rapidly decrease and disappear. The quasistatic waves ($k \| E$) across B_0 exhibit a similar instability. Stable "beam-type" distributions are found to have negative-energy wave characteristics. In the presence of another plasma (say, Maxwellian or also beam-type), these again become unstable.

INTERACTIONS OF A PLASMA WITH A BEAM INJECTED ACROSS THE MAGNETIC FIELD (Abstract), by R. R. Bartsch and A. Bers. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 214, Feb. 25, 1965.

It is shown that a beam (of ions or electrons) injected with velocity v_0 into a plasma across its confining magnetic field B_0 induces 3 distinct types of slow-wave instabilities: (1) positional instability of the beam for displacements across both B_0 and v_0; (2) growth of short-wavelength perturbations across both B_0 and v_0; (3) growth of short-wavelength perturbations along B_0. The first is a displacement instability—a diocotron instability enhanced by the plasma. The second is a cyclotron instability induced by the reactive medium properties of the plasma at the extraordinary wave resonances. The third is analogous to the Burt-Harris instability. The complete interaction is described by a dispersion relation that contains the boundary conditions for a thin beam across B_0 in a plasma. Applications of this theory to ion-beam systems (DCX, Calutron) and electron-beam systems (Astron) are discussed.

LIVING MODELS FOR LIVELY ARTIFACTS, by W. S. McCulloch. [1965] [11]p. [Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)] Unclassified

Published in Science in the Sixties; Tenth Anniversary AFOSR Scientific Seminar, Cloudcroft, N. M. (Jure 14-25, 1965), ed. by D. L. Arm. Albuquerque, New Mexico U. Office of Publications, 1965, p. 73-83.

The article presents a comparison of the central nervous system, the computer within man, with mechanical computers. The structure of the brain and spinal cord and the method by which they function and handle information is presented in some detail, and how they have inspired man to make devices to do similar things is considered. The history of logical machines and problems encountered in their engineering are reviewed. Nature has beaten man at miniaturizing by packing 10^{10} components in a single head so it can work "in parallel" and by having real neurons, not man's poor threshold devices, in truly anastomotic nets combatting noise. A theory is lacking for iterated decisional nets like the reticular core of the nervous system. Artificial neurons capable of composing properly anastomotic nets to compute correctly in the presence of almost every kind of noise are needed.

MEAN FREE PATH OF ELECTRONS AND MAGNETOMORPHIC EFFECTS IN SMALL SINGLE CRYSTALS OF GALLIUM, by M. Yaqub and J. F. Cochran. [1965] [19]p. incl. illus., diagrs. refs. (Sponsored jointly by Advanced Research Projects Agency, and Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)]) Unclassified

Published in Phys. Rev., v. 137: A1182-A1200, Feb. 15, 1965.

The variation of electrical resistivity of 99.9999%-pure gallium has been investigated as a function of size in oriented single crystals for current flow along the C axis. The crystals were in the form of wires of square cross section and their dimensions varied from 1 to 0.1 mm. Analysis of the data based on the free-electron model, assuming diffuse scattering at the boundaries, yields a value of 8.11×10^{-11} Ω-cm^2 for $(\rho_b l_b)$ C axis and indicates that at 0 K the mean free path of the charge carriers in the bulk metal is considerably in excess of 1 cm. Within the accuracy of the measurements the ideal bulk resistivity at low temperature varies as T^2, indicating that the electron-electron collisions may be contributing to the resistive processes. For low values of a longitudinal magnetic field, all the crystals showed a large decrease in resistance followed by an increase due to bulk magnetoresistance, both at 4.2° and 1.2° K. For the same 2 temperatures these crystals also displayed a rather large magnetoresistance in transverse magnetic fields. Magnetomorphic effects for transverse fields were evidenced by the fact that the field dependence of magnetoresistance was less than quadratic for all crystals until the cyclotron radius of the charge carriers acquired a value much smaller than the cross-sectional dimensions of the specimens. The resistance of all the crystals was found to be a complicated function of the measuring current. Calculations based on certain simplifying assumptions show that for thin wires in which boundary scattering is predominant, the resistance decreases monotonically as a function of the current and is due to the trapping of the charge carriers in the magnetic field generated by the

current. The details of the experimental curves can be reproduced reasonably well if the fall in resistance due to the trapped particles is superimposed on the magnetoresistance caused by the self field. (Contractor's abstract)

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 218, Feb. 25, 1965.

The technique is an adaptation of interferometric spectroscopy. The plasma is placed in one arm of a wide-bandwidth, far infrared Michelson interferometer and the path difference varied by a moving mirror. The instrument operates at wavelengths between approximately 0.2 and 1.0 mm, and the technique is applicable at densities between 10^{12} and 10^{17} electrons cm^{-3}. The frequency spectrum is the Fourier transform of the spatial-interference pattern and is evaluated by a digital computer. The effect of the plasma is measured by comparing 2 transforms, one with and one without the plasma present. The instrument has been tested with the positive column of a dc glow discharge in argon. Measurements were made of the real part of the dielectric coefficient at wave lengths between 0.22 and 0.72 mm, and they corresponded to an electron density of 9×10^{12} electrons cm^{-3}.

MICROWAVE MEASUREMENTS OF ELECTRON DIFFUSION IN A WEAKLY IONIZED FLOWING GAS (Abstract), by K. W. Gentle, G. A. Garosi and others. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)], and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1965.

Published in Bull. Amer. Phys. Soc , Series II, v. 10: 212, Feb. 25, 1965.

The effects of axial gas flow on the ambipolar diffusion of room-temperature electrons diffusing radially across a cylindrical plasma column are reported. The effective diffusion coefficient was inferred from time-resolved measurements of electron density in the late afterglow of a pulsed microwave discharge in helium and argon. The electron density was obtained from the loading of a cylindrical microwave cavity operated in the TE_{111} mode, at a frequency of 3000 mc/sec. The gas-flow velocity was varied between zero and 10,000 cm/sec and the static gas pressure between 2 and 20 Torr. Measurements show a pronounced increase in the diffusion coefficient at gas velocities for which the flow is turbulent. The results are compared with observed effects of gas flow on microwave breakdown.

PLASMA DISPERSION RELATIONS AND THE STABILITY CRITERIA (Abstract), by B. R. Kusse. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 222, Feb. 25, 1965.

Criteria developed by Briggs and Bers that predict the stability or instability of a plasma are outlined. To apply these stability criteria, the loci of the propagation constants k that satisfy the dispersion relation are investigated as the imaginary parts of critical frequencies are swept from large negative values to zero. From these loci in the complex k plane, the stability or instability of the plasma can be predicted. When kinetic theory is used to obtain the dispersion relations, they are in the form of singular integrals that result in nonanalytic functions in the complex ω and k planes. Care must be taken when these nonanalytic dispersion relations are used with the above stability criteria. In this paper, the kinetic-theory dispersion relation for longitudinal plane waves in an infinite plasma is discussed in connection with the stability criteria. The rules applying the stability criteria to kinetic-theory dispersion relations are presented. These techniques are then applied to investigate the instabilities of an infinite, one-dimensional plasma composed of hot contrastreaming electrons and cold, stationary ions.

PULSED ELECTRON CYCLOTRON RESONANCE DISCHARGE (Abstract), by T. J. Fessenden and L. D. Smullin. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)], and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 207, Feb. 25, 1965.

A hydrogen discharge has been produced by 1-μsec, 100-kw pulses of microwave power at 2.8 Gc/sec. The discharge in a cylindrical metal box was operated at pressures from 10^{-6} to 10^{-3} Torr. A steady magnetic-mirror field placed along the axis of the box served to confine the discharge and to resonate the electrons with the microwave field. The principal effect of the short pulses of microwave energy is to heat electrons, already present, to large temperatures. Between pulses the energetic electrons produce many low-energy electrons by ionization, thereby replacing the particles lost from the magnetic mirror by scattering. The energetic electrons produce x-rays of energies up to 500 kev. The "temperature" of the x-rays, as determined by a pulse-height analyzer, was approximately 25 kev.

REACTION OF ATOMIC HYDROGEN WITH PROPYLENE AT 77 °K AS STUDIED BY ELECTRON SPIN RESONANCE, by C. G. Hill, Jr., R. C. Reid, and M. W. P. Strandberg. [1965] [5]p. incl. diagr. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)], and National Science Foundation) Unclassified

Published in Jour. Chem. Phys., v. 42: 4170-4174, June 15, 1965.

Hydrogen-atom reaction rates with thin solid propylene films were studied at 77°K. Propylene was deposited on the walls of a quartz resonance cavity of an ESR spectrometer and hydrogen-atom concentrations were monitored during reaction. The hydrogen atoms were produced in a 2450 mc/sec microwave discharge external to the cavity and either diffused into or were pumped through the reaction zone. The products of the reaction were found to be propane and 2,3-dimethylbutane. The ratio of propane to 2,3-dimethylbutane in the products increased as the average hydrogen-atom concentration in the reactor increased. The product distribution and the variation of this distribution with hydrogen-atom concentration are explained by a given sequence of reactions. The rate constant k_1 was found to be 1.8×10^6 cc/mol/sec at 77°K assuming that the monitored hydrogen-atom concentration was equal to that in the reaction zone. (Contractor's abstract, modified)

REFLECTION OF GUIDED WAVES FROM A PLASMA COLUMN IN AN AXIAL MAGNETIC FIELD (Abstract), by B. L. Wright and G. Bekefi. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 211, Feb. 25, 1965.

Microwave-reflection measurements were made from a plasma-filled waveguide in a longitudinal magnetic field. The observations were carried out in the afterglow of a pulsed dc discharge in argon at pressures between 0.1 and 2 Torr. The reflected power and the average electron density were monitored simultaneously. During the decay of electron density, several maxima in reflected power were seen whose position varied with magnetic field. At a fixed frequency $\omega = 3000$ mc/sec, the locus of a given maximum satisfies $\omega^2 = \omega_c^2 + A\omega_p^2$, where ω_c and ω_p are the electron cyclotron and plasma frequencies, respectively. Over the range of densities investigated, ($0.05 < \omega_p^2/\omega^2 < 0.9$), values of the constant A for the different maxima were found to lie between -20 and +7. The observations are interpreted in terms of constructive interference of electromagnetic waves in a cold plasma, reflected at different regions along the plasma column.

Also published in Proc. Nat'l. Electronics Conf., v. 21: 759-763, Oct. 1965.

A discussion of the Wiener theory and the Wiener method of analysis and synthesis of a nonlinear system is presented. The theory is extended to encompass orthogonal functionals by means of differential equations. Several extensive developments from the theory are examined. These areas included measurement of the

Wiener kernels, extension of the theory to the analysis of nonlinear systems when the input is not a Gaussian process, and a generalization of the error criterion.

The temperature interval over which the transition from the superconducting to the normal state takes place in very pure lead has been measured. This transition width was determined from the temperature variation of the specific heat at the critical temperature and also from the variation of the magnetic-susceptibility. The specific heat data, which measure a bulk property of the specimen and the susceptibility data which measure a surface property of the specimen because the normal state skin depth at 20 cps is mm, both indicate a transition width of 3×10^{-4} K or less.

Presented at meeting of the Amer. Phys Soc., New York, Nov. 4-7, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 226, Feb. 25, 1965.

Thomson scattering at 45° of a ruby-laser beam from a hollow-cathode arc plasma has been obtained. Langmuir-probe dc measurements of the argon plasma produced indicate a plasma density of 5×10^{13}/cc with an electron temperature of 4 v. Because of the high electron density, the temperature measurements were limited to the high-energy tail of the electron distribution. By calibrating the scattering system, using Rayleigh scattering from a known density of nitrogen, absolute-intensity measurements of the Thomson-scattered signal were obtained that indicated an electron density of 5×10^{13}/cc, in good agreement with the probe measurements. The Thomson-scattered spectrum was scanned by rotating a narrow-band (3A) interference filter, which yielded an electron temperature of approximately 1 v. This disagreement with the probe data probably arises from the fact that, while the probe was limited to sampling the high energy tail, the Thomson scattering measured the main body of the electron distribution.

WEAK COLLISIONLESS SHOCK WAVES (Abstract), by J. M. Witting. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E)], Atomic Energy Commission, and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov 4-7, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 223, Feb. 25, 1965.

The shape of a class of finite-amplitude waves in a cold ($\beta \ll 1$) plasma is found. For angles of propagation that depart from perpendicular to the magnetic field by more than $(m_e / m_i)^{\frac{1}{2}}$, the electron inertia may be neglected, and is. Assuming some damping, weak shocks should have a laminar structure starting with essentially a solitary wave at the downstream edge and decaying to a

small-amplitude sine wave far upstream. Only a very small change in energy damped is required to change from a solitary wave to an almost sinusoidal wavetrain. Thus, electron Landau damping is sufficient for $\beta > m_e/m_i$ so that the wavetrain is almost sinusoidal all the way up to the shockfront. In terms of density and magnetic field (averaged over a period of the oscillation), the resulting shock thickness is of the order of the wavelength (~ion-gyro radius). The temperature rise varies over a large distance, approximately the length of the wavetrain.

HYPERFINE STRUCTURE OF Hg^{193} AND Hg^{193m} BY THE LEVEL-CROSSING METHOD, by O. Redi and H. H. Stroke. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under [DA 36-039-sc-78108) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 456, Apr. 26, 1965.

Level crossings were observed in the $(6s6p)\ ^3P_1$ state. The measured field values at the crossing points (NMR frequency of protons in water, kc/sec) were: Hg^{193} 25108.68 ± 0.30 (F, m_F, F', m_F') - (5/2, 5/2; 3/2, 1/2), Hg^{193m} 34381.24 ± 0.40 (15/2, 15/2; 13/2, 11/2), 32376.7 ± 2.0 (13/2, 11/2; 13/2, 7/2), 31234. ± 5. (13/2, 9/2; 13/2, 5/2). The first Hg^{193m} crossing agrees with Smith and the 2 new crossings permit precise calculation of B. The Hg^{193} crossing disagrees with the hfs (I = ½, A > 0) deduced from incomplete optical spectroscopic data. Ar(Hg^{193}) was found to be negative. From this and the expected isotope shift, the spin I = 3/2 is indicated. Thus Ar(Hg^{193}) = -6133. ± 15. mc/sec, μ = -0.620 ± 0.002 nm where the uncertainty in B is considered. The Hg^{193} results support recent optical spectroscopic findings of Davis and Kleiman.

ULTRASONIC PROPAGATION IN SOLID METHANE, by A. A. Thiele, W. M. Whitney, and C. E. Chase. [1965] [4]p. incl. diagrs. (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-sc-78108) Unclassified

Published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9(Pt. B): 1122-1125, 1965.

The results of Thomas, Alpert, and Torrey (Jour. Chem. Phys., v. 18: 1511, 1950) showing an anomalous peak at 20.4°K for the spin lattice relaxation time T_1 in solid CH_4, were analyzed over the temperature region above and below this peak by Tomita (Phys. Rev., v. 89: 429, 1953) who derived a relationship between T_1 and the average time τ_c spent by a molecule in one of its equivalent orientations in the lattice before it flips to another. Near T_λ, $\tau_c \sim 10^{-7}$ sec. corresponding to a frequency spectrum that extends over a range of several megacycles. This paper presents a preliminary account of the study of the velocity and attenuation of sound in solid methane, at frequencies of this order of magnitude, to obtain evidence of coupling between the rotational motions of the molecules and the vibrations of the lattice. It is shown that anomalies in both the velocity and absorption do in fact occur near the λ-point, and that the relaxation time characterizing the absorption is of the same order of magnitude as the molecular flipping time. However, the authors have not yet been successful in establishing a relationship between their results and those of the NMR investigations of Thomas et al.

PSYCHOLOGICAL FACTORS MAXIMIZING RESISTANCE TO STRESS: WITH SPECIAL REFERENCE TO HYPNOSIS, by M. T. Orne. [1965] [43]p. incl. refs. (AFOSR-65-1161) (AF 49(638)728) AD 621386 Unclassified

Also published in The Quest for Self-Control, ed. by S. Z. Klausner, New York, Free Press, 1965, p. 286-328.

Hypnosis and other psychological factors are considered which maximize an individual's resistance to stress. A survey of hypnosis is presented reviewing present knowledge on hypnotically induced anaesthesia, physical capacity under hypnosis, hypnotically induced amnesia, hypnotizability, and posthypnotic suggestion. It is pointed out that hypnosis has its major effect in providing an increase in motivation. A number of other psychological factors which contribute to an individual's ability to tolerate stress are also instrumental in increasing motivation, in much the same way as the hypnotic situation. The entire question of which factors contribute more to the individual's ability to tolerate stress requires empirical clarification.

VISUAL IMAGERY PRODUCED BY RHYTHMIC PHOTIC STIMULATION PERSONALITY CORRELATES AND

PHENOMENOLOGY, by S. J. Freedman and P. A. Marks. [1965] [18]p. incl. tables, refs. (AFOSR-65-0711) (In cooperation with Tufts U., Medford, Mass.) (AF AFOSR-62-11) AD 615698 Unclassified

Also published in Brit. Jour. Psychol., v. 56: 95-112, Feb. 1965.

This study is concerned with relationship between descriptions of visual imagery produced by rhythmic photic stimulation and a number of personality tests. Individuals who manifested the ability to suspend their generalized reality-orientation described more imagery; imagination and suggestability also seemed to be important. Subjects' expectations about what they would see influenced their reports, although comprehension of the experimental design, fatigue and motivation were not relevant. The correlated personality variables indicate a close relationship with other types of visual imagery; the phenomenology fits a synthesized description of sensory deprivation, mescaline, and hypnagogic imagery.

SOCIAL CONTROL IN THE PSYCHOLOGICAL EXPERIMENT: ANTISOCIAL BEHAVIOR AND HYPNOSIS, by M. T. Orne and F. J. Evans. [1965] [12]p. incl. tables, refs. (AFOSR-65-1363) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-88 and Human Ecology Fund) AD 622628 Unclassified

Also published in Jour. Personality and Social Psychol., v. 1: 189-200, Mar. 1965.

Rowland and Young found that hypnotized subjects (Ss) were willing to carry out such apparently antisocial actions as grasping a dangerous reptile, plunging their hands into concentrated acid, and throwing the acid at an assistant. However, only informal attempts were made to show that the Ss perceived the acts as dangerous, or to demonstrate that the requested behavior exceeded the broad limits of social control implicit in the context of a psychological experiment. The experiment conducted by Young was replicated exactly, and his results confirmed. However, nonhypnotizable Ss simulating hypnosis to a "blind" E, and even normal, waking control Ss, complied with the same requests. Ss invariably reported they were convinced the activities were safe because they were participating in research conducted by competent, responsible scientists. It is concluded that the tasks were perceived by Ss as being within the limits of legitimate requests made in an experimental context. The present study does not answer the question whether antisocial behavior can be elicited under hypnosis. However, it demonstrates the nature of control groups essential for a valid test of the antisocial hypothesis, and illustrates the broad range of behavior legitimized in an experimental context. THE STUDY OF DYNAMIC BIREFRINGENCE OF POLYMERIC SOLIDS, by R. S. Stein. Final rept. Nov. 1, 1963-Apr. 30, 1965. June 8, 1965, 1v. incl. illus. diagrs. tables, refs. (AFOSR-65-1335) (AF AFOSR-63-168) Unclassified

A new method for measuring dynamic birefringence has been developed and applied to the study of polymer deformation. This method consists of vibrating a sample at frequencies between 0.001 and 1000 cps, and strain amplitudes between 0.1 and 2%, and at temperatures between -80°C and +200°C. Stress, strain and birefringence are simultaneously observed. From these data quantities can be obtained for characterizing the deformation mechanism of the polymer. A thorough study of the dynamic, mechanical and optical properties of low and nigh density polyethylene, polypropylene, polybutene-1 and nylon-6 has been made. Use of these results combined with those obtained through related techniques presents a new picture of the deformation of crystalline polymers, involving the rapid deformation of the crystalline superstructure as the sample is deformed, followed by a slower viscoelastic reorientation of the constituent crystals. Six publications and three reports resulting from this research are included.

A HIGH SPEED STRETCHING APPARATUS FOR OPTICAL STUDIES ON POLYMER FILMS, by P. F. Erhardt, R. P. Fillmore and others. Apr. 25, 1965 [22]p. incl. illus. diagrs. refs. (ONR Technical rept. no. 81) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-168], Army Research Office (Durham), General Tire and Rubber Company, and Office of Naval Research) AD 619678 Unclassified

The report describes the design, calibration and operation of a pneumo-hydraulic high speed stretching apparatus in which a polymer film sample can be rapidly stretched from both ends. Provision is made for the concurrent measurement of stress and strain. The rise time of the piston velocity is approximately 4 msec and the linear range covers 85-90% of the piston travel. At the maximum operating pressure of 1500 psi, stretching rates in excess of 4000 in/min are obtainable. The apparatus is equipped to take low angle light scattering photographs during rapid extension of the sample and subsequent relaxation. A continuous wave gas laser is used as source and a high speed motion picture camera as the detector. With appropriate polarization of the light beam the system is readily adapted to investigate birefringence changes on stretching, using a photomultiplier as the intensity detector. Instructions for operating the high speed apparatus are appended.

ON THE ORIENTATION MECHANISM OF CRYSTALLINE POLYMERS, by R. S. Stein and K. Sasaguri. [1965] [36]p. incl. diagrs. (Bound with its AFOSR-65-1335) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-168], Atomic Energy Commission, Office of Naval Research, and Petroleum Research Fund) Unclassified

The effect of chain unfolding or crystal rotation within the spherulite is considered as an approach to account for the variation of orientation functions with elongation. A detailed accounting of the orientation of individual crystal axes is presented. The model successfully accounts for the variation of birefringence and crystal orientation functions with elongation which is found experimentally.

SOME OPTICAL AND MECHANICAL PROPERTIES OF POLYVINYL CHLORIDE, by A. Utsuo. Jan. 1965 [30]p. incl. diagrs. tables, refs. ([Office of Naval Research] Technical rept. no. 79) (Bound with its AFOSR-65-1335) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-168], Army Research Office (Durham), Office of Naval Research, and Petroleum Research Fund) AD 464060 Unclassified

The photoelastic properties of polyvinyl chloride (PVC) were subjected to preliminary investigation several years ago. Some of these measurements were repeated and extended during the past year. These measurements confirm previous observations and demonstrate the contribution of both distortional and orientational contributions to the birefringence. They also indicate the possibility of dichroism studies on partly decomposed PVC which will be described in a future report. Measurements of dynamic birefringence were also conducted indicating a negative strain-optical coefficient at room temperature consistent with a dominant distortional contribution.

A TECHNIQUE FOR THE STUDY OF SPHERULITE DEFORMATION: LIGHT SCATTERING MOVIES, by P. Erhardt and R. S. Stein. [1965] [3]p. incl. illus. diagr. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-168], Army Research Office (Durham), and Office of Naval Research) Unclassified

Published in Polymer Ltrs., Pt. B, v. 3: 553-555, July 1965.

In order to study spherulite deformation, it has been found practical to take a nearly continuous set of light scattering photographs from a single sample by using a continuous wave gas laser as the source, and a high speed motion picture camera as the detector. The polarized beam from a Spectra Physics Model 130 CW Laser was passed through a suitable cutoff filter to eliminate the blue fluorescent light, and then through a pin hole. The sample was placed in a rapid stretching device. A polaroid sheet analyzer was placed between the sample and the photographic film. With a camera and a Model 115 gas laser as source, good scattering patterns have been obtained at camera speeds as high as 5400 frames/sec. Using the Model 130 laser, there was change in Hv scattering patterns on stretching medium density polyethylene. The pattern becomes extended in a direction perpendicular to the stretching direction within a time comparable with that required to stretch the sample. The interpretation, as indicated previously, is that spherulite deformation occurs almost instantaneously as is indicated by the change in shape of the scattering pattern, whereas internal rearrangements responsible for intensity changes occur over a longer period of time.

A STUDY OF PREFERENTIAL SOLVATION UTILIZING NUCLEAR MAGNETIC RESONANCE, by L. S. Frankel, T. R. Stengle, and C. H. Langford. [1965] [2]p. incl. diagr. table. (AFOSR-66-0059) (AF AFOSR-65-212) AD 629846 Unclassified

Also published in Chem. Commun., No. 17: Sept. 8, 1965.

Two new methods are reported for the study of preferential solvation utilizing: (1) the effect of solvents on the n. m. r. chemical shift of the solute and, (2) the effect of a paramagnetic solute on the n m r transverse relaxation time of nuclei in the solvent molecules. The interactions in both cases are short range. The assumptions involved in this analysis receive strong support from results on acetylacetone comp'exes. The most "preferred" solvents in the list are $CHCl_3$ and methanol, the only ones capable of hydrogen bonding. Preliminary temperature-dependence data confirm the expectation that solvation is less preferential at higher temperature.

THE OUTER COORDINATION SPHERE. I. NUCLEAR MAGNETIC RESONANCE RELAXATION TIME EFFECTS PRODUCED BY PARAMAGNETIC IONS WITH NONLABILE INNER COORDINATION SPHERES, by T. R. Stengle and C. H. Langford. [1965] [6]p. incl. diagrs. refs. (AFOSR-66-0781) (AF AFOSR-63-212) AD 633545 Unclassified

Also published in Jour. Phys. Chem., v. 69: 3299-3304, Oct. 1965.

The effects of various paramagnetic Cr(III) complexes with well-defined nonlabile inner coordination spheres on the transverse relaxation times of F^{19} nmr signals

from F^- and PF_6^- have been determined in aqueous solution. The effects of the paramagnetic ions on nuclei in the second coordination sphere are seen to be substantial. The chemical evidence (concentration dependence, structure, etc.) suggests that a consistent interpretation of the effects may be given in terms of relative outer-sphere coordinating tendencies. The interpretation emphasizes the importance of the interaction between inner-sphere ligands and solvent molecules.

Distillation of acetonitrile from sodium hydride following a short reflux period removes all traces of acrylonitrile as well as acidic impurities and water. If the sodium hydride treatment (basic) is followed by a reflux and distillation over an acid such as phosphorus pentoxide, sulfuric acid, etc., solvent suitable for acid-base work is obtained. Final distillation of the product from calcium hydride ensures dryness of the solvent. Solvent purified by this method contained no polarographically detectable traces of either unsaturated nitriles, or bases.

SEXUAL DIFFERENTIATION OF THE BRAIN AND ITS EXPERIMENTAL CONTROL, by G. W. Harris and S. Levine. [1965] [25]p. incl. illus. diagr. tables, refs. (AFOSR-66-0787) (AF 61(052)454) AD 633284
Unclassified

Also published in Jour. Physiol. (London), v. 181: 379-400, Nov. 1965.

Studies were made on sexual behavior and on endocrine function in adult female rats treated with testosterone at 4 days of age, and in adult male rats treated with oestradiol at 4 days of age. For comparison with these animals other groups were studied—female rats injected with oestradiol at 4 days of age, and male rats injected with testosterone at 4 days of age, or with oestradiol at 14 days of age. Oil-injected controls were studied with each group of animals. Neonatal administration of testosterone to 4 day old female rats resulted in a complete loss of female type sexual behavior when adult. This was true even if the animals were ovariectomized when adult and given oestrogen-progesterone replacement therapy. However, if they were ovariectomized and given testosterone when adult, then a marked male type pattern of sexual behavior was observed. Neonatal treatment of female rats with oestrogen resulted in a slight disturbance of the normal female pattern of behavior. Neonatal administration of oestradiol to 4 day old male rats resulted in some loss of male sexual behavior, even after castration (when adult) and testosterone replacement therapy. Neonatal administration of testosterone to male rats did not affect their normal sexual behavior patterns when adult.

CONTINUOUS RECORDING OF CHANGES IN MEMBRANE POTENTIAL IN MAMMALIAN CEREBRAL TISSUES IN VITRO; RECOVERY AFTER DEPOLARIZATION BY ADDED SUBSTANCES, by I. M. Gibson and H. McIlwain. [1965] [23]p. incl. diagrs. tables, refs. (AFOSR-65-2639) (AF EOAR-63-1) AD 628358
Unclassified

Also published in Jour. Physiol. (London), v. 176: 261-283, Jan. 1965.

Apparatus is described for maintaining slices of mammalian cerebral cortex under good metabolic conditions while continuous recordings were made of membrane potential, with micropipette electrodes. The average stable resting potential observed was 59 ± 10 mV (s.d.). Potentials recorded in media 2.6 mM in calcium were more stable than those in media containing 0.75 mM calcium. Measured amounts of KCl in about 1 ul. of fluid were applied to the tissue surface. They diminished the resting potential, which subsequently recovered. The course of this change was compared with changes in potassium concentration near the cell calculated to result by diffusion. Addition to the tissue surface of sodium glutamate in small volumes of fluid also resulted in depolarization of cell elements, followed by recovery; a similar comparison was made of glutamate concentration and potential change. The sodium, potassium and chloride of the tissues were determined before and after incubation; in some cases incubation media contained inulin and this also was determined.

ENTRAINMENT OF CIRCADIAN RHYTHMS BY ZEITGEBERS, by J. Aschoff. Final rept. July 1[illegible], 1965 [1]p. (AFOSR-65-1564) (AF EOAR-64-68) AD 623809
Unclassified

A summary is presented of a study of the diurnal rhythmicity of perch-hopping in in finches kept in artificial light-dark cycles. It is found that with an increase of light-time, the activity-time of the bird increases. The phase angle difference, measured between midpoint of activity-time and midpoint of the light-cycle, follows the circadian rule, becoming more positive with an increase in light-time. The results are in agreement with 3 rules describing the activity cycles of wild birds in the field at different seasons.

Also published in Arch. Rational Mech. and Anal., v. 19: 266-298, July 26, 1965.

A calculation was made of the velocity of one-dimensional acceleration waves in materials with memory and it is shown how the dissipative effects of heat conduction and internal mechanical damping affect the amplitude of such waves. The basic constitutive assumption is that the stress is determined by the history of the strain and the history of a thermodynamic variable, such as the temperature or entropy density.

The classical theorems proved by Duhem and Hadamard for acceleration waves in elastic materials are extended to materials with memory. The principal result is a theorem to the effect that the "generalized stress relation" of Coleman implies that the acoustic tensor must be symmetric even in a material with memory. The theory of the acoustic tensor is developed in detail for homothermal and homentropic acceleration waves.

RELATIVE INTENSITIES OF TWO RYDBERG TRANSITIONS IN THE ELECTRON-IMPACT SPECTRUM OF WATER, by A. Skerbele, V. D. Meyer, and E. N. Lassettre. [1965] [4]p. incl. diagrs. tables, refs. (AFOSR-65-2175) (AF AFOSR-63-61) AD 627543 Unclassified

Also published in Jour Chem. Phys., v. 43: 817-820, Aug. 1, 1965.

The electron-impact spectrum of water has been determined using a higher-resolution electron spectrometer. The intensity distribution of 5 peaks in the spectrum which belong to 2 different Rydberg transitions has been investigated at zero scattering angle and electron kinetic energy of 200 v. Quantities proportional to the optical oscillator strengths for these excitations have been compared with absorption coefficients from ultraviolet spectra. The entire electron-impact spectrum in the region below the first ionization potential shows good agreement with ultraviolet absorption. (Contractor's abstract)

DETERMINATION OF MOLECULAR EXCITATION POTENTIALS BY ELECTRON IMPACT. AN ANOMALY IN THE N_2 SPECTRUM, by E. N. Lassettre, F. M. Glaser and others. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-65-2178) (Sponsored jointly by Air Force Cambridge Research Laboratories; and Air Force Office of Scientific Research under AF AFOSR-63-61) AD 627554 Unclassified

Also published in Jour. Chem. Phys., v. 42: 3429-3435, May 15, 1965.

An improved monochromator is described which provides an electron beam sufficiently homogeneous in energy so that peak widths range from 0.28 v at 400-v kinetic energy to 0.13 v at 150-v kinetic energy. Using this device excitation potentials have been determined for CO_2 and N_2. The highest peak in the spectrum of N_2 occurs at an excitation potential of 12.93 v while the most intense transition in the ultraviolet absorption spectrum, according to Huffman, Tanaka, and Larrabee, occurs at 12.74 v. This discrepancy exceeds the experimental error in the determination and indicates a failure of the Born approximation.

INTENSITY DISTRIBUTION IN THE ELECTRON-IMPACT SPECTRUM OF CARBON MONOXIDE AT HIGH-RESOLUTION AND SMALL SCATTERING ANGLES, by

V. D. Meyer, A. Skerbele, and E. N. Lassettre. [1965] [12]p. incl. diagrs. tables, refs. (AFOSR-65-2867) (AF AFOSR-63-61) AD 629613 Unclassified

An electron spectrometer, which provides velocity selection before scattering, is described; and the results of a study of relative intensities in the carbon monoxide spectrum are reported. The vibrational levels of the fourth positive band system have been resolved and relative intensities determined for the first nine. The relative intensities are compared with calculated Franck-Condon factors. The agreement is good at low vibrational quantum numbers but noticeable discrepancies are found for high-vibrational levels. The problem of calculating relative oscillator strengths from a fully resolved spectrum is considered and applied to data obtained in the present research. Relative oscillator strengths are compared with those obtained previously from unresolved spectra. If the Born approximation is valid, then the electron-impact and ultraviolet absorption spectra should be closely similar. This is actually observed for most of the spectrum but the transition at 12.79 v is an outstanding exception. The relative oscillator strength obtained from the electron-impact spectrum exceeds that from the ultraviolet absorption spectrum by almost a factor of 3. The reason for this anomaly is not known.

INTENSITY DISTRIBUTION IN THE N_2 $k(b\,^1\Pi_u)$ - $X\,^1\Sigma_g$ TRANSITION, by V. D. Meyer, A. Skerbele, and E. N. Lassettre. [1965] [3]p. incl. diagrs. table, refs. (AFOSR-66-1251) (AF AFOSR-63-61) AD 643471 Unclassified

Also published in Jour. Chem. Phys., v. 43: 3769-3771, Nov. 15, 1965.

The electron impact spectrum of N_2 has been studied in the excitation energy range 12.2 to 13.6 ev using electrons with initial energy of 200 v. Resolution is high enough so that vibrational structure is resolved. Although the electron impact spectrum should closely resemble the ultraviolet absorption spectrum (if the Born approximation holds) in both peak position and intensity the two actually differ in relative intensity by more than a factor of 20. The relative intensities obtained in electron impact are in much better agreement with theory than are the relative intensities obtained by other investigators in the absorption of ultraviolet radiation. This suggests that the ultraviolet spectrum is in error. Reasons for the discrepancy are discussed.

POWER SERIES REPRESENTATION OF GENERALIZED OSCILLATOR STRENGTHS, by E. N. Lassettre. [1965] [8]p. incl. diagrs. table, refs. (AFOSR-66-1261) (AF AFOSR-63-61) AD 641449 Unclassified

Also published in Jour. Chem. Phys., v. 43 4479-4486, Dec 15, 1965.

Expansion of generalized oscillator strengths in powers of the momentum change K (of the colliding electron) generally leads to series with finite radii of convergence. From a study of singularities of the function for complex values of k it is possible to transform the series into one which converges for all physically attainable values of K. The transformation depends on the ionization potential and the excitation energy, both of which can be determined experimentally. The transformed series should be useful in fitting experimental data and in the extrapolation of oscillator strengths It is especially useful, however, when applied to transitions for which a few terms of the series in inverse powers of K can be obtained. As an example the $1\,^1S - 2\,^1S$ transition in helium is treated. The mere determination of the degree of the first nonvanishing term in the inverse power series is enough to severely restrict the form of series and, in fact, to sum the first 6 terms These terms, which involve only one adjustable constant, fit the experimental data to within 3.5% and the deviation is mainly due to experimental error. (Contractor's abstract)

THE ELECTRON-IMPACT SPECTRUM OF MOLECULAR NITROGEN, by V. D. Meyer and E. N. Lassettre. [1965] [3]p. incl. diagrs. (AF AFOSR-63-61) Unclassified

Published in Fourth Internat'l. Conf on Physics of Electronic and Atomic Collisions: Abstracts of Papers, Laval U., Quebec (Canada) (Aug. 2-6, 1965), New York, Science Bookcrafters, Inc. [1965] p. 397-399.

The electron-impact spectrum of molecular nitrogen has been studied using an electron spectrometer which provides for electrostatic velocity selection before and after scattering of an electron beam by a gas. Previous results which demonstrated that the most intense

peak (12.93 v) in the electron-impact spectrum does not correspond to maximum absorption (12.74 v) in the ultraviolet have been confirmed. At kinetic energies as high as 400 v, peaks at 12.28 and 11.86 and several peaks on the low-energy side of the Lyman-Birge-Hopfield band system were found. In the ultraviolet region, absorption on the $C^3\Pi_u - X^1\Sigma_g^+$ transition (11.03 v) is observed. The intensity distribution within the Lyman-Birge-Hopfield band system was not independent of the kinetic energy of the exciting electrons.

ELECTRON-IMPACT STUDY OF THE VIBRATIONAL INTENSITIES IN THE $A^1\Pi - X^1\Sigma^+$ TRANSITION OF CO, by A. Skerbele, E. N. Lassettre, and V. D. Meyer. [1965] [2]p. incl. table. (AF AFOSR-63-61) Unclassified

Published in Fourth Internat'l. Conf. on Physics of Electronic and Atomic Collisions; Abstracts of Papers, Laval U., Quebec (Canada) (Aug. 2-6, 1965), New York, Science Bookcrafters, Inc. [1965] p. 400-401.

The $A^1\Pi - X^1\Sigma^+$ transition in CO has been studied at the electron kinetic energy of 200 v using a high-resolution electron spectrometer. Nine vibrational levels of this transition have been clearly resolved, and relative peak intensities have been determined for each level at small scattering angles ($\theta = 0$, 1, and 2). In excitation by the absorption of radiation, the intensity distribution among the vibrational levels of an electronic transition is determined by the Franck-Condon factor. The cross section for the excitation of a vibrational level is given by $\sigma_{v'} \propto \sigma_0 \left| \int_0 R_{v'} R_{v''}\, dr \right|^2 = \sigma_0 q_{v'v''}$ where σ_0 is the cross section for the electronic transition and $q_{v'v''}$ is the Franck-Condon factor. If the relative peak intensity determined from electron-impact spectra is related to the cross section for the transition, relative Franck-Condon factors can be calculated from the experimental data. As the data have been collected at a fixed scattering angle, a correction is introduced that allows comparison of relative intensities at the constant momentum change associated with the scattering process. The corrected and averaged data are then used to calculate Franck-Condon factors. The results are compared with the calculations of Nicholls (Jour. Quant. Spectra Radiative Transfer, v. 2: 433, 1962), agreement is good at low vibrational quantum numbers, but the deviation increases for v' greater than 5.

DIAMAGNETIC ANISOTROPY OF ELECTRON GROUPS, by A. A. Bothner-By and J. A. Pople. [1965] 24p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-199, and National Science Foundation) AD 649306 Unclassified

Also published in Ann. Rev. Phys. Chem., v. 16: 43-66, 1965.

A number of direct measurements of the anisotropy of diamagnetic susceptibility (x) were made some years ago by crystal and magnetic birefringence studies (Cotton-Mouton effect). Recently, new methods for measuring anisotropies of the shielding constant have become available. As the anisotropy of x of individual groups also plays an important part in predictive theories of the shielding constant, there is now considerable general interest in this area. In this review a survey is made of the existing literature on these aspects of anisotropy. Topics include: anisotropy of diamagnetic susceptibilities; anisotropies from crystal data; NMR methods for determining mean shielding; anisotropic shielding; predictive theories.

THE PROTON MAGNETIC RESONANCE SPECTRA OF OLEFINS. IV. 3-FLUOROPROPENES, by A. A. Bothner-By, S. Castellano, and H. Günther. [1965] [4]p. incl. diagr., table, refs. (AF AFOSR-63-199) Unclassified

Published in Jour. Amer. Chem. Soc., v. 87: 2439-2442, June 5, 1965.

The high-resolution proton and fluorine magnetic resonance spectra of allyl fluoride, allylidene fluoride, and 3, 3, 3-trifluoropropene-1 have been obtained at 35 and -50° and have been analyzed in terms of chemical shifts and coupling constants, using a least-squares method. The temperature-sensitive coupling constants in allyl fluoride and allylidene fluoride indicate that the thermodynamically more stable rotamer is in each case the symmetrical one. The coupling constants in 3, 3, 3-trifluoropropene are at most only slightly temperature dependent. Information on the relative signs of the various coupling constants is given by the spectral analysis.

ORGANOSULFUR DERIVATIVES OF THE METAL CARBONYLS. VI. MONOMERIC $CH_3SFe(CO)_2C_5H_5$ AND RELATED COMPOUNDS, by R. B. King and M. B. Bisnette. 1965 [4]p. incl. diagrs. table, refs. (AFOSR-65-1132) (AF AFOSR-64-580) AD 620476 Unclassified

Also published in Inorg. Chem., v. 4: 482-485, Apr 1965.

Brown monomeric $CH_3SFe(CO)_2C_5H_5$ has been obtained by the following 2 methods. (1) Treatment of a cold mixture of $NaFe(CO)_2C_5H_5$ and $(CH_3)_3CCl$ (i.e., $C_5H_5Fe(CO)_2H$ in situ) with dimethyl disulfide, (2) irradiation of $[C_5H_5Fe(CO)_2]_2$ with dimethyl disulfide at room temperature. Methyl iodide reacts readily with $CH_3SFe(CO)_2C_5H_5$ to give yellow crystalline ionic $[C_5H_5Fe(CO)_2S(CH_3)_2]I$. Ethanolic mercuric chloride reacts with $CH_3SFe(CO)_2C_5H_5$ to form the orange adduct $CH_3SFe(CO)_2C_5H_5 \cdot HgCl_2$. On pyrolysis at 70 $CH_3SFe(CO)_2C_5H_5$ readily loses carbon monoxide to form the previously reported dimeric $[CH_3SFeCOC_5H_5]_2$, for which an improved preparation from $[C_5H_5Fe(CO)_2]_2$ and dimethyl disulfide is also described. Treatment of di-t-butyl disulfide with $Fe_3(CO)_{12}$ of $[C_5H_5Fe(CO)_2]_2$ gives red $[(CH_3)_3CSFe(CO)_3]_2$ or brown $[(CH_3)_3CSFeCOC_5H_5]_2$, respectively. (Contractor's abstract)

REACTIONS OF ALKALI METAL DERIVATIVES OF METAL CARBONYLS. VI. SOME REACTIONS OF ANIONS PREPARED FROM INDENYLMOLYBDENUM TRICARBONYL DIMER AND AZULENEDIMOLYBDENUM HEXACARBONYL, by R. B. King and M. B. Bisnette. 1965 [7]p. incl. diagrs. tables, refs. (AFOSR-65-1134) (AF AFOSR-64-580) AD 622904 Unclassified

Also published in Inorg. Chem., v. 4: 475-481, Apr. 1965.

Indenylmolybdenum tricarbonyl dimer, $[C_9H_7Mo(CO)_3]_2$, is reduced by sodium amalgam in tetrahydrofuran to give a brown solution containing the $[C_9H_7Mo(CO_3]^-$ anion. This solution reacts with methyl iodide to form the expected yellow-orange tricarbonyl $CH_3Mo(CO)_3C_9H_7$. However, allyl chloride and chloromethyl methyl sulfide react with the $[C_9H_7Mo(CO)_3]^-$ anion in tetrahydrofuran solution at room temperature to form the yellow dicarbonyls σ-$C_3H_5Mo(CO)_2C_9H_7$ and σ-$CH_3SCH_2Mo(CO)_2C_9H_7$, respectively, in unusually facile decarbonylation reactions. Treatment of $[C_9H_7Mo(CO)_3]_2$ with iodine in dichloromethane solution gives a brown dicarbonyl iodide $C_9H_7Mo(CO)_2I$ rather than the expected tricarbonyl iodide. Azulenedimolybdenum hexacarbonyl, $C_{10}H_8Mo_2(CO)_6$, reacts with sodium amalgam in tetrahydrofuran to give a yellow-brown solution which gives yellow dimeric $[C_{10}H_8Mo(CO)_3CH_3]_2$ on treatment with methyl iodide. ORGANOSULFUR DERIVATIVES OF THE METAL CARBONYLS. VIII. NEW ASPECTS OF THE CHEMISTRY OF METHYLTHIO DERIVATIVES OF IRON CARBONYL, by R. B. King and M. B. Bisnette. 1965 [3]p. incl. diagrs. refs. (AFOSR-66-0321) (AF AFOSR-64-580) AD 629810 Unclassified

Also published in Inorg. Chem., v. 4: 1663-1665, Nov. 1965.

The methylthio iron carbonyl $(CH_3S\text{-}Fe(CO_3)_2(I)$ was synthesized with 60% yield by heating pentacarbonyl iron with dimethyl disulfide (II) in the presence of CO under pressure. In the absence of CO, the polymeric $(CH_3\text{-}S\text{-}Fe\ (CO)_3)n$ was the major reactant product. I reacts with excess II at atmospheric pressure to form an unindentified pyrophoric solid, with bicyclo [2. 2. 1] heptadiene-2, 5 to form $(CH_3\text{-}S)_2\text{-}Fe_7(CO)_4\text{-}C_7H_8$, with cyclooctatetraene to form small amounts of $C_8H_8\text{-}Fe(CO)_3$; and with bromine or iodine to form complex mixtures. The ultraviolet spectra of a number of $[RSFe(CO)_3]_2$ compounds are reported.

A PROPERTY OF ALGEBRAIC HOMOGENEITY FOR LINEAR FUNCTION-SPACES, by A. Sobczyk. [1965] 4p. (AF 49(638)1055) Unclassified

Published in Amer. Math. Monthly, v. 72: 28-31, Jan. 1965.

Let T be a nonvoid set, n a positive integer, and N(T) an n-dimensional linear space of real-valued functions on T. Then T contains n points $t_1, \ldots, t_n$ such that for every real sequence $(\alpha_1, \ldots, \alpha_n)$ there is a $\Phi \in N(T)$ such that $\Phi(t_j) = \alpha_j$. Comments about completely regular topologies on T are also made. (Math. Rev. abstract)

RANK-SETS AND RANK-SPACES IN LINEAR FUNCTION-SPACES, by A. Sobczyk. [1965] [4]p. (AF 49(638)1055) Unclassified

Published in Amer. Math. Monthly, v. 72: 31-34, Jan. 1965.

Let S be a set containing at least 2 points and D(S) a linear space of real-valued functions on S. For BCS, consider the following 2 properties: (1) the only function in D(S) vanishing on B is 0; (2) there is a minimal linear subspace K of D(S) such that for all $f \in D(S)$, there is a $g \in K$ such that $f(x) = g(x)$ for all $x \in B$. A typical theorem: Property (1) and property (2) with $K = D(S)$ are equivalent. A number of like results are also obtained. (Math. Rev. abstract)

BROWN'S METHOD OF EXTENDING FIXED POINT THEOREMS, by J. D. McKnight, Jr. [1965] [4]p. (AFOSR-65-1024) (AF 49(638)1215) AD 61843 Unclassified

Also published in Amer. Math. Monthly, v. 72 152-155, Feb. 1965.

Two theorems were previously presented by A. B. Brown to extend the Brouwer fixed point theorem. In this paper some of the essential ingredients of Brown's proofs are displayed by a sequence of simple propositions, and the technique used by Brown is illustrated by a larger class of concrete examples. For the latter, 2 theorems of the well-known type and 1 lemma of the classroom type are used. Finally a distinction is made between compact absolute retracts and absolute extensors for a class K of spaces.

CONVERGENCE OF COMPLEX LAGRANGE INTERPOLATION POLYNOMIALS ON THE LOCUS OF THE INTERPOLATION POINTS, by J. H. Curtiss. [1965] [18]p. incl. refs. (AFOSR-65-2355) (AF AFOSR-63-358) AD 629626 Unclassified

Also published in Duke Math Jour., v. 32 187-204, June 1965.

This paper studies certain convergence properties of $L_n(f,z)$ for z on C, where C is a simple closed curve in the complex z-plane f is a continuous function from C to the complex numbers, and $L_n(f,z)$ is the polynomial of degree at most n found by interpolation to f at the points S_n ($S_n = z_{n0}, z_{n1}, \ldots, z_{nn}$ denotes for each positive integer n a set of n + 1 distinct points on C). In particular, 2 theorems are proven. The basis of analysis for both theorems is a set of theorems of Riemann-Lebesgue type for certain "Taylor-Lagrange coefficients" which appear in the circle case. In the general case, the study involves the replacement of L_n after the mapping given by $z = \omega(\omega)$ by certain asymptotically equivalent but simpler functions which seem to be of some interest for themselves alone. The Faber polynomials play a significant role in the reduction of the problem.

A NON-TECHNICAL REPORT ON THE SECOND CORAL GABLES CONFERENCE ON SYMMETRY PRINCIPLES AT HIGH ENERGY, Jan. 20-22, 1965, by B. Kursunoğlu. [1965] [11]p. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-823, Atomic Energy Commission, National Aeronautics and Space Administration, and National Science Foundation) Unclassified

This nontechnical report on the second conference on symmetry principles at high energy first presents a brief background of the unitary symmetry concept up to the time of the first conference when an attempt was made to unite the unitary and Einsteinian symmetry theories of the features of particles. Before the second conference, the mathematical SU_3 was doubled into SU_6, but was not quite in accord with the requirements of the special theory of relativity. At the second conference, the new symmetry group U(12) was introduced. The author briefly discusses the contributions of the various speakers and presents the theoretical and experimental approaches in the research.

SYMMETRY PRINCIPLES AT HIGH ENERGY; SECOND CORAL GABLES CONFERENCE, Miami U., Coral

Gables, Fla. (Jan. 20-22, 1965), ed. by B. B Kursunoğlu, A. Perlmutter, and I. Sakmar. San Francisco, W. H. Freeman and Co., 1965, 438p. incl. diagrs. tables, refs. (AFOSR-65-1555) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-823], Atomic Energy Commission, National Aeronautics and Space Administration, and National Science Foundation) Unclassified

Nineteen papers from the conference are presented. A major part of the discussion concerns the extension and development of the proposal that SU(6) be accepted as a possible symmetry group of hadrons. Other symmetry groups such as SU(3), U(6), and U(12) are considered. Higher symmetry groups are discussed as well as strong interaction symmetries, multiparticle resonance decays, internal symmetries, the Lorentz group, non-compact groups, symmetries in the bootstrap program, high energy scattering, the Poincare group, field theory, weak interactions, and PC violation. Such problems are the extension of SU(6) symmetry to relativistic quantum theory are examined.

INJECTION AND TRAPPING OF PLASMA VORTEX STRUCTURES (Abstract), by D. R. Wells. [1965] [1]p. (Bound with AFOSR-65-1266; AD 622527) (AF AFOSR-65-844) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles Calif., Apr. 29-30, 1965.

Injection of high density plasma into a magnetic mirror has been accomplished by generating plasma vortex structures. The structures move from the peak field region under the mirror coils toward the center of the mirror and collide. Trapped magnetic fields in the structures produce a field reversal at the center of the mirror. Plasma is trapped inside the mirror for times of the order of msec. The ion temperature is of the order of 100 ev. Plasma volume is approximately 1000 cc. Confining field is 10 kgauss with a mirror ratio of 1.2. The vortex structures are generated by conical theta-pinch coils placed in the peak field regions of the mirror. Two separate experiments will be discussed. In the first of these, the guns were fired with argon at a static pressure of 200 microns filling the vacuum chamber. The plasmoids moved through a cold neutral background gas In the second series of experiments the background pressure was 3×10^{-6} torr and the cold gas was injected into the vacuum system by means of a pulse gas valve.

MAGNETOFLUIDDYNAMIC VORTICES CREATION AND INTERACTION, by R Benach [1965] 61p. (AFOSR-65-2088) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-844 and Atomic Energy Commission) AD 617783 Unclassified

Also published in Plasma Phys. Bull., v. 5. 1-61, June 1965.

An investigation is made of the creation and interaction of magnetofluiddynamic vortex structures. The case is considered of axially symmetric and colinear flow in a incompressible fluid, and the vorticity creation terms are explicitly secured. Both the 2-dimensional and 3-dimensional cases are considered and a physical interpretation is given for the interaction of a corotating and a contrarotating vortex ring of the same dimensions.

TRANSPORT PROPERTIES OF SOLIDS, by [F. J. Platt]. Final technical rept. Feb. 28, 1965, 4p. (AFOSR-65-1596) (AF 49(638)70) AD 623337 Unclassified

A review is presented of research on the transport properties of solids; specifically calculations on resistivity, thermoelectric power, and related properties of metals and dilute alloys; and also calculations on the properties of electrons in semiconductors. The residual resistivity of noble metal alloys and the resistivity of thin metallic wires are studied, as well as the effect of the distortion of the Fermi surface on the magnetic susceptibility of metals. Also considered are the thermoelectric power of pure metals at low temperatures and in strong magnetic fields, the transport properties of dilute alloys, and field emission from a metal in a strong magnetic field.

LOCALIZED LATTICE VIBRATION MODES DUE TO SUBSTITUTIONAL MASS DEFECTS IN SODIUM IODIDE, by S. S. Jaswal. [1965] [2]p. incl. diagrs. (AFOSR-65-0779) [AF AFOSR-62-37] AD 616058 Unclassified

Also published in Phys. Rev., v. 137· A302-A303, Jan. 4, 1965.

Frequencies for local modes due to mass defects in NaI are computed on the deformation-dipole model for the perfect lattice. In this crystal, local modes occur within the gap between the optical and acoustic branches of the frequency spectrum, as well as above the optical branches. Frequencies are computed for impurity ions of both signs, and of masses both greater and less than that of the host ions. (Contractor's abstract)

APPLICABILITY OF THE LORENTZ MODEL TO THE ABSORPTION OF INFRARED RADIATION BY LITHIUM

FLUORIDE (Abstract), by C. M. Randall, R. M. Fuller, and D. J. Montgomery. [1965] [1]p. (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under [AF AFOSR-62-37]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 129, Jan. 27, 1965.

Transmission spectra of thin films of lithium fluoride with controlled isotopic composition for the lithium were obtained for a number of temperatures between 50° and 300°K. These films were formed by evaporation in high vacuum on substrates of high-density polyethylene. With the aid of a CDC 3600 high-speed digital computer, the dispersion frequency ω_0, and reduced damping constant γ/ω_0, as well as the thickness of the film were obtained from the experimental curves by means of a least-squares-fitting procedure. The dependence of the resulting parameters are then compared with the predictions of simple theory. The agreement obtained indicates both the suitability of the least-squares-fitting procedure and that the Lorentz oscillator with constant damping is a suitable model for limited portions of the spectrum near the dispersion frequency, though, of course, more-realistic models indicate a frequency-dependent damping.

MAGNETIC TRANSITIONS IN $Ni[(NH_2)_2]_6Br_2$, by H. Forstat, N. D. Love, and J. McElearney. [1965] [5]p. incl. diagrs. tables. (AFOSR-65-1962) (AF AFOSR-63-430) AD 626502 Unclassified

Also published in Jour. Chem. Phys., v. 43. 1626-1630, Sept. 1, 1965.

Heat-capacity measurements have been made on single crystals of $Ni[(NH_2)_2CS]_6Br_2$ in the temperature range 1.3° - 17.4°K. Two λ-type anomalies were observed at 1.96° and 2.25°K and are associated with paramagnetic-antiferromagnetic transitions. The total entropy change associated with these transitions is 2.24 cal/mol deg and differs by approximately 2% from the expected value of R log (2S + 1), where S = 1 for the Ni^{++} ion. Approximately 78% of this total entropy change occurs above 2.25°K. A calculation based on the simple molecular field theory provided an estimate of the exchange integral as well as the temperature dependence of the sublattice magnetization. These are compared with the results from the magnetic susceptibility and nuclear magnetic resonance. (Contractor's abstract)

SPECIFIC HEAT OF $Fe_3(PO_4)_2 \cdot 8H_2O$, by H. Forstat, N. D. Love, and J. McElearney. [1965] [3]p. incl. diagrs. (AFOSR-65-2572) (AF AFOSR-63-430) AD 628742 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 32, Jan. 27, 1965.

Also published in Phys. Rev., v. 139: A1246-A1248, Aug. 16, 1965.

Specific-heat measurements have been made on a single crystal of $Fe_3(PO_4)_2 \cdot 8H_2O$ in the temperature range 1.8-25°K. Two λ-type anomalies were observed at 9.60° and 12.40°K and are associated with paramagnetic-antiferromagnetic transitions. The 6 iron ions per unit cell are not equivalent, giving rise to a two-step antiferromagnetic transition as observed in the 2 anomalies, and indicating a ratio of 2 for the entropy changes associated with the 2 sets of nonequivalent ions. The total entropy change associated with these transitions is 9.58 cal/mole deg, which differs by 1% from 3R ln(2S + 1), where S = 2 for Fe^{++}, with approximately 27% of this entropy gained above 12.40°K. By using the simple molecular-field theory, an estimate of the magnitude of the exchange integral was obtained as well as the temperature dependence of the sublattice magnetization. MAGNETIC AND CALORIC PROPERTIES OF K_3MoCl_6, by P. A. van Dalen, H. M. Gijsman and others. [1965] [4]p. incl. diagrs. (AFOSR-66-1632) [AF AFOSR-63-430] AD 641549 Unclassified

Also published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9(Pt. B): 888-891, 1965.

The susceptibility of powdered K_3MoCl_6 has been measured in the temperature range of 1° - 300 K. The salt was commercially obtained and had a purity of about 98%. Calorimetric experiments were made on a sample of the same origin. Above 15°K, the susceptibility follows a Curie-Weiss law $x = \frac{Ng^2S(S+1)\beta^2}{3k(T-\theta)}$ with S = 3/2, g = 1.87, and θ = -5°K, the magnetic moment of the Mo^{3+} ion being 3.61 Bohr magnetons. The experiments were made at 8 different temperatures between 15°K and room temperature. The g-value of the salt,

obtained from resonance experiments at room temperature, was found to be 1.92. The specific heat vs temperature curve gives some more information about the complicated behavior of the material in the temperature range of 4°-10°K.

MAGNETIC TRANSITION IN LUDLAMITE (Abstract), by N. D. Love, J. McElearney, and H. Forstat. [1965] [1]p. (AF AFOSR-63-430) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 473, Apr. 26, 1965.

Specific-heat measurements of ludlamite [$Fe_3(PO_4)_2 \cdot 4H_2O$] in the temperature region 2.7°-60°K indicated a magnetic transition at ~15.4°K. This suggests the possible existence of an antiferromagnetic state below 15.4°K, which agrees with the nuclear magnetic resonance work of Van Agt and Poulis. These specific-heat measurements appear to be quite similar to those for vivianite [$Fe_3(PO_4)_2 \cdot 8H_2O$], reported earlier. These results are discussed in connection with the NMR data.

PROTON RESONANCE IN ANTIFERROMAGNETIC $CoCl_2X[(NH_2)_2CS]_4$ (Abstract), by R. D. Spence, V. Nagarajan, and R. Au. [1965] [1]p. [AF AFOSR-63-430] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 75, Jan. 28, 1965.

Below the Néel temperature (0.91°K), $CoCl_2[(NH_2)_2CS]_4$ exhibits a complicated proton-resonance spectrum. Fifty-six different local fields ranging from 680 to 1750 G at 0.4°K have been observed both with and without an applied field. Eight other local fields are indicated by the applied-field data but have not yet been observed in zero field. The local fields occur in groups of eight with the the same magnitude but with different orientations determined by the magnetic point group of the crystal. In addition, there are certain relations between the magnitudes of the local fields that, appear to be dictated by the symmetry of the molecule rather than the magnetic point group. The crystal has a chemical space group $4_2/n$ and the sublattice magnetization lies along the fourfold axis. These faces, coupled with information concerning the magnetic point group obtained from the proton resonance experiment, lead to a set of permitted spin arrangements for the antiferromagnetic state.

DEFECT BEHAVIOR IN PLASTICALLY DEFORMED SEMICONDUCTORS, by L. A. Heldt. Final rept. Mar. 17, 1965, 4p. (AFOSR-65-0663) (AF AFOSR-62-290) AD 614842 Unclassified

This research is concerned with the behavior of defects during plastic deformation and the relation of this behavior to observed plastic properties. The experimental program is concerned with the semiconductor elements, for which rather direct means of investigation are applicable. The study involves carefully controlled determinations of the plastic properties of material deformed under constant stress. The effects of: (1) heavy doping, (2) specimen orientation and type of deformation, and (3) an impurity precipitated along the dislocation lines are measured. The results obtained are used to determine the relation of dislocation motion to the production of point defects, the effect of the density of dislocation intersections on dislocation motion, and the effects of an impurity precipitated along dislocation lines upon dislocation motion.

DIFFUSION OF ANTIMONY IN GERMANIUM DURING PLASTIC STRAINING, by C. D. Calhoun and L. A. Heldt. [1965] [2]p. incl. table, refs. (AFOSR-65-2560) (AF AFOSR-62-290) AD 627748 Unclassified

Also published in Acta Metall., v. 13: 932-933, Aug. 1965.

Research was conducted in order to determine the effect of plastic straining during the diffusion anneal upon diffusion in Ge. A p-n junction penetration method was used to determine the diffusivity of antimony in the p-type germanium used. Experimental runs were made over a range of temperatures and strain rates. For each specimen, penetration of the p-n junction was measured in the direction parallel to the bend axis. Junction depths were found to be uniform across the beveled surfaces of all specimens, even though the strain across this section varied from zero at the neutral axis to a maximum at the outer surfaces. The results reveal no measurable effect of plastic straining on the diffusion of Sb in Ge.

ANALYSIS OF VARIABLE-DENSITY SEISMOGRAMS BY MEANS OF OPTICAL DIFFRACTION, by P. L. Jackson. [1965] [19]p. incl. illus. diagrs. refs. (AFOSR-65-2908) (AF 49(638)1078) AD 614867 Unclassified

Presented at Thirty-third Internat'l. Meeting of the Society of Exploration Geophysicists, New Orleans, La., Oct. 23, 1963.

Also published in Geophysics, v. 30: 5-23, Feb. 1965.

Variable-density seismograms were originally developed in exploration work to aid in the visualization of strata formations. They can also be directly analyzed by means of optical diffraction. When a plane wave of spatially coherent monochromatic light passes through a variable-density seismogram, a diffraction pattern can be formed which defines the seismic frequencies. The seismogram is placed so that it affects the incident light in the same manner as a diffraction grating in a conventional spectroscopic apparatus. Resulting diffraction patterns reveal continuous energy-density spectra over a range of about nine octaves. The spectra are normally 2-dimensional. When variable-density profiles are used, the second dimension of the spectra is wavenumber, which is expressed as the diffraction caused by density variations across the data channels. The spectra can be made one-dimensional by inserting a cylindrical lens so that an image of the seismograms is formed in one direction in the same plane that Fraunhofer diffraction occurs in a perpendicular direction. By this means multichannel spectral analysis is performed. An additional lens is used to image the seismogram after the light has passed through the diffraction plane. The image can be filtered as to frequency, wavenumber, or propagation velocity, when obstructions are placed in the diffraction plane.

RESEARCH ON SPEECH COMMUNICATION. AUTOMATIC SPEECH RECOGNITION, by G. E. Peterson. Final rept. Jan. 15, 1964-Jan. 14, 1965. Feb. 1, 1965, 28p. (AFOSR-65-0512) (AF AFOSR-64-595) Unclassified

A set of logical procedures has been developed for converting the acoustical parameters of speech to a discrete code for automatic speech recognition. These procedures are now in a form which can be converted to a computer program. The major portion of these procedures is concerned with converting from acoustical parameters to sets of phone types, and these phone types may be further converted to phonemes by reference to an allophonic environmental statement for the various phonemes. A preliminary statement of the allowable phoneme sequences within a dialect has been constructed, based on the computer processing of a large dictionary. A second dictionary which is in a special coded form and which can be stored for rapid reference in a digital computer has been constructed to separate the phoneme sequences into words. Grammatical structures may also provide a valuable reference in the future in automatic speech recognition.

ITERATIVE COMPUTATION PROCEDURES FOR AN OPTIMUM CONTROL PROBLEM, by P. S. Fancher. [1965] [4]p. incl. diagr. (AFOSR-67-0830) (AF 49(638)-1318) AD 650452 Unclassified

Also published in IEEE Trans. Automatic Control, v AC-10: 346-348, July 1965.

The control problem treated here may be stated as follows: Given $\dot{x} = A(t)x + b(t)u(t)$ and an initial condition $x(0)$ and a control function $u(t)$ such that $|u(t)| \leq 1$ for $0 \leq t \leq T$ and such that the inner product $[x(T), x(T)]$ is a minimum. A theoretical basis for describing iterative procedures used for computing the solution to this problem is developed. A new computational procedure which does not require storing the control function from one iteration to the next is specified. The hybrid computer mechanization of this procedure is described and analog computer results illustrating the practicality of the method are presented. (Contractor's abstract)

A GENERAL THEORY OF MINIMUM-FUEL SPACE TRAJECTORIES, by L. W. Neustadt. [1965] [40]p. incl. refs. (AFOSR-67-0840) (AF 49(638)1318) AD 649990 Unclassified

Also published in SIAM Jour. Control, Ser. A, v. 3: 317-356, 1965.

This paper is concerned with the trajectories of vehicles moving in free space, i.e., of vehicles that are subject only to gravitational and propulsive forces. The following problem is fundamental in the control of such trajectories: given the vehicle position, velocity, and mass at a specified initial time, find a propulsion program that brings the vehicle to a prescribed terminal state (in a terminal time which may be free or fixed) with a minimum expenditure of fuel. Such a program will be called optimal. The problem described is clearly a variational one. In order to permit impulses, and yet have a precise mathematical formulation, it is necessary to place the problem in a somewhat unorthodox framework, and thereby arrive at a nonclassical variational problem. It is shown that thisframework is a reasonable one by proving both an existence theorem for solutions of the resultant variational problem and an approximation theorem which states that solutions of the unorthodox variational problem can be approximated by conventional thrust programs to any desired degree of accuracy. Necessary conditions that an optimum thrust program and associated trajectory must satisfy are derived.

[RELAXATION TIMES OF A DILUTE PLASMA], by R. S. B. Ong. Final rept. Jan. 1, 1964-Jan. 1, 1965. Jan. 26, 1965 [2]p. (AFOSR-65-206) (AF 49(638)1319) Unclassified

The ultimate objective of the research is to derive the macroscopic or hydrodynamic equations for a hot plasma of low density described by the Balescu-Lenard kinetic equation. An initial attempt has been made to study the relaxation phenomenon of such a plasma. The Balescu-Lenard equation is linearized with respect to the equilibrium Maxwell-Boltzmann distribution. It was observed that the Balescu-Lenard operator has the form of a differential operator in contrast to the classical Boltzmann integral operator, and the essentially one-dimensional analysis performed gives all indications that the approach to equilibrium requires an extremely long time. In the analysis of the linearized Balescu-Lenard equation, it is assumed that the dielectric constant is nonvanishing, and that the equation is similar to the Fokker-Planck equation. The case of the Fokker-Planck equation for a Lorentz gas is studied. The macroscopic conservation equations can also be derived directly from the B - B - G - K - Y hierarchy without making use of the kinetic equation. The results constitute a set of general conservation laws incorporating the 2 particle distribution function for a dilute, fully ionized plasma.

THE GENERAL CONSERVATION LAWS IN A DILUTE PLASMA, by R. S. B. Ong. [1965] 14p. (AFOSR-65-2478) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1319 and Michigan Phoenix Memorial Project) AD 628292 Unclassified

Also published in Nuovo Cimento Series X, v. 38: 1835-1848, Aug. 16, 1965.

The macroscopic conservation equations for a dilute, fully ionized plasma are derived directly from the B-B-G-K-Y hierarchy instead of from the kinetic equation involving only the single-particle distribution function. In this way it is possible to exhibit clearly the role which the two-particle correlation functions plays in the various macroscopic quantities. (Contractor's abstract)

FREE RADICAL PRODUCTION BY LASER PHOTOLYSIS (Abstract), by J. F. Verdieck. [1965] [1]p. [AF 49-(638)1319] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 86, Jan. 27, 1965.

The deep-blue compound 2-chloro-3-nitroso-2,3-dimethyl butane was photolyzed by ruby laser flash. Following the light absorption, the radical NOH is produced and dimerizes to form $H_2N_2O_2$. The second-order rate constant for the latter process was determined by following the time dependence of the absorption of NOH at 8000A. Initial concentration of NOH was estimated from the absorbance difference in the parent compound before and after several laser flashes. The value found for the rate constant is 3×10^3 liter $mole^{-1}$ sec^{-1}. Both normal-burst and Q-switched laser pulses were observed to produce the free radical, but only the former gave a large enough signal to measure with any precision. The normal pulse had a nominal energy of 1 J. The method is compared with conventional flash photolysis techniques. Advantages and further applications are discussed.

RELAXATION OF A HOT, STABLE SPATIALLY HOMOGENEOUS PLASMA (Abstract), by R. S. B. Ong. [1965] [1]p. [AF 49(638)1319] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 235, Feb. 25, 1965.

An initial study is made of the relaxation phenomenon in a hot, spatially homogeneous hydrogen plasma. The

Balescu-Guernsey-Lenard equation for the electrons is linearized with respect to the initial equilibrium Maxwell-Boltzmann distribution. The ions are assumed to form a neutralizing background having a Maxwell-Boltzmann at all times. Assuming an isotropic perturbation, the nondimensionalized kinetic equation is put into the form of a partial differential equation, first order in time and second order in the velocity. The Coulomb radius is used as a cutoff parameter and a stable plasma is assumed, i.e., with nonvanishing dielectric constant. The associated eigenvalue problem of the kinetic equation is of a singular Sturm-Liouville type in the velocity variable, which has an infinite domain. After transforming the eigenvalue equation into a 1-dimensional Schrödinger-type equation, the following properties may be shown (a) the linearized B-G-L operator is a self-adjoint differential operator, (b) zero is not an eigenvalue and all eigenvalues must be positive, indicating a decay of the perturbation, (c) the spectrum of eigenvalues is continuous, however, metastable states may possibly exist.

SATURATION EFFECTS IN STELLAR ATMOSPHERIC ABSORPTION LINES, by D. Mugglestone and B. F. O'Mara. [1965] [10]p. incl. diagrs. tables, refs. (AF 49(638)807) Unclassified

Published in Monthly Notices Roy. Astronom. Soc., v. 129: 41-50, 1965.

The influence of saturation effects upon atmospheric abundances derived from faint and medium-strong stellar absorption lines is considered. A physical interpretation is made of how saturation occurs and how the magnitude of the saturation is influenced by broadening mechanisms, atmospheric turbulence, elemental abundances etc. The influence of saturation on the determination of the abundances of solar atmospheric nitrogen and oxygen is considered, and strong disagreement is expressed with the results found by Neven for these 2 elements. Saturation effects are found which lead to abundances smaller (by a factor of the order of 10 for the medium-strong lines considered than those obtained by Neven (Contractor's abstract)

POLYMERIZATION OF VINYLCYCLOHEXANE WITH $TiCl_3$-$Al(C_2H_5)_3$ CATALYSTS, by W. H. McCarty and G. Parravano. [1965] [18]p. incl. diagrs. tables, refs. (AFOSR-67-2644) [AF 49(638)606] Unclassified

Also published in Jour. Polymer Sci. Pt. A, v. 3, 4029-4046, Dec. 1965.

The polymerization of vinylcyclohexane was followed dilatometrically in cyclohexane and n-heptane solvents with $TiCl_3$-$Al(C_2H_5)_3$ as catalyst. In n-heptane, constant rates were obtained, while in cyclohexane a slow change of the initial rate to a lower steady-state value was found. Polymerization rates were first order to 'TiCl$_3$' and 'monomer' for concentrations < 0.80 mol/l, and second order for monomer concentrations > 0.80 mol/l. The rate was highest at [$Al(C_2H_5)_3$] 0.005 mol/l (Al/Ti = 0.28). Polymer intrinsic viscosity increased with time, with increasing monomer concentration, and with decreasing temperature. It was independent of [$Al(C_2H_5)_3$]. A kinetic model which can account for these observations involves the alkylation of the $TiCl_3$ surface by reaction with $Al(C_2H_5)_3$ as the site-generating step. It is also suggested that monomer molecules partake in the site-generating step by reaction with the partially reduced $TiCl_3$ surface. This possibility demands a rate of polymerization dependent upon the monomer concentration to a power between 1 and 2. The lower the liquid phase monomer concentration the higher the exponent of the monomer concentration in the rate expression. The melting point of the polymer was 280 -285 C. The solubility of polyvinylcyclohexane was investigated for 15 paraffinic and aromatic hydrocarbons. Only 2 polymer fractions exhibited amorphous x-ray spectra, and both of these occurred at [$Al(C_2H_5)_3$] 0.005 mol/l.

The rate of polymerization of vinylcyclohexane is compared with that of propylene, pentene-1, and styrene on similar catalyst (Contractor's abstract)

PATTERN RECOGNITION AND INFORMATION PROCESSING, by W. P. Tanner, Jr. Final rept. Jan. 1965, 5p. (AFOSR-65-0242) (AF AFOSR-63-367) AD 611135 Unclassified

In the area of machine learning, work was initiated in applying techniques developed by Medyessy (1961) to unsupervised adaptive pattern recognition. Medgyessy's univariated techniques were extended to the multivariate normal case, and preliminary work was begun on devising techniques to handle approximations to such functions. The classification of information-processing systems was studied, with special attention given to the measurement of information processing capacity. An investigation was initiated for the study of current flow in the central nervous system, the first phase of which was concerned with the impedance of the dorsal columns of the spinal cord. The initial studies indicate that the voltage fell off more rapidly in depth and across the dorsal columns than it did longitudinally. Accordingly, the resistance to current flow was less in the longitudinal direction than it was in the transverse direction which meant that the dorsal columns were anisotropic. Another phase of this investigation measured the frequency dependence of the specific impedance of this same section of nervous tissue.

Given an associative system in which each element is assigned a cost and in which an equivalence relation obtains between elements, it is often of interest to ask the question: what is the least costly word equivalent to a given word? The case in which the equivalence relation is a 2-sided congruence relation is studied here, one example being the problem of optimizing a type of computer program. Such optimizing processes may be formalized as Markov normal algorithms. A general result concerning order relations on finite alphabets is established first. Then, the properties of a class of Markov normal algorithms are investigated. It is shown that each such algorithm must always terminate, and that every class of mutually equivalent algorithms contains a unique minimal algorithm which can be obtained by applying any algorithm of the class to itself. THE SPECIFIC IMPEDANCE OF THE DORSAL COLUMNS OF CAT AN ANISOTROPIC MEDIUM, by J. B. Ranck, Jr., and S. L. BeMent. [1965] [13]p. incl. diagrs., refs. (AFOSR-65-1166) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-367 and National Institutes of Health) AD 620527
Unclassified

Also published in Exper. Neurol., v. 11: 451-463, Apr. 1965.

Low frequency, nonstimulating current was passed from a small electrode on the surface of the dorsal columns in the cervical cord of cats. A glass microelectrode was used to record the voltage at distances of 0.5 to 2 mm from the current electrode. The voltage fell off more rapidly in depth and across the dorsal columns than it did longitudinally- the resistance was lower in the longitudinal direction. Accordingly, the dorsal columns are anisotropic An approximate equation is presented which describes the data fairly well and which is consistent with the anatomy. From this equation, the resistivity in the longitudinal direction was 138 to 212 ohm-cm and in the transverse direction, 1,211 ohm-cm. These values are shown to be consistent with the view that the anisotropy is primarily due to current flowing longitudinally in axons. The frequency dependence of the specific impedance was also measured. Some features of this frequency dependence have no clear explanation, but some of them are consistent with a nodal membrane having a time constant of roughly 50 μsec

GENERAL THEORY OF SIMPLE WAVES IN RELAXATION HYDRODYNAMICS, by N. Coburn. [1965] [29]p. incl. refs. (AFOSR-66-1507) (AF AFOSR-63-20)
AD 641441
Unclassified

Also published in Jour. Math. Anal. and Appl., v. 11: 102-130, July 1965.

Sufficient conditions are determined for existence of simple waves in one-dimensional, non-steady, non-magnetic, relaxation hydrodynamics and theory is applied to the flow of a dissociating gas. The theory of characteristic manifolds is discussed for 2 types of relaxation scalars: (1) K is not constant and is a function of class C^1 of the density, relaxation variable and entropy; and (2) K is not constant and is a function of class C^1 of the space and time variables. If a regularity condition is satisfied and if as K approaches the limiting speed c_∞, then the characteristic manifolds for the above 2 types of K satisfy the same partial equation as in the case where K is constant. For proper given data, the corresponding Cauchy problem is shown to possess a solution with 2 branches for any unitial manifold of class C^1 Finally, a special case of non-equilibrium hydrodynamics does exist which shows all the properties of discontinuity theory in equilibrium hydrodynamics.

A PROBLEM OF BING, by R. L. Wilder. [1965] [5]p. (AFOSR-65-2626) [AF AFOSR-63-373] AD 627975
Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 54: 683-687, Sept. 1965.

R. H. Bing established and used in his proof of the side approximation theorem (Ann. Math., v. 77: 145, 1963), a lemma to the effect that if $\{A_i: i = 1, 2, \ldots, m\}$ and $\{B_j: j = 1, 2, \ldots, t\}$ are finite collections of disjoint disks in E^3 and p and q are points separated by $\bigcup A_i \cup \bigcup B_j$, then there exist integers h and k, $1 \leq h \leq m$, $1 \leq k \leq t$, such that $A_h \cup B_k$ separates p and q. Bing raises the question whether this remains true if the A_i's and B_i's are contractible continua. This paper shows that the affirmative answer to this question is an immediate corollary to the following theorem. In S^n, $n \geq 2$, let $\{A_i: i = 1, 2, \ldots, m\}$ and $\{B_j: j = 1, 2, \ldots, t\}$ be finite disjoint, non-empty, $(n-r-2)$-acyclic closed sets, where r is a fixed integer such that $0 \leq r \leq n-2$. If a cycle Z_1 links $\bigcup A_i \cup \bigcup B_j$, then there exist integers h and k such that Z_r links $A_h \cup B_k$. Analogous theorems for non-closed sets and for infinite collections are proved. Examples are given to show the necessity of the hypotheses of the theorems. (Math. Rev. abstract)

THE POWER GROUP OF TWO PERMUTATION GROUPS, by F. Harary and E. Palmer. [1965] [3]p. (AFOSR-66-0194) (AF AFOSR-65-754) AD 631380 Unclassified

Also published in Proc. Nat'l. Acad Sci., v 54 680-682, Sept. 1965.

This investigation presents a natural group theoretic setting for deBruijn's generalization (Neder l. Akad Wetensch. Proc Ser. A, v. 62: 59-69, 1959) of Polya's classical enumeration theorem (Acta Math., v 68: 145-254, 1937). This is accomplished by applying Polya's method to the power group, B^A, obtained by a new operation on 2 given permutation groups A and B. If A and B act on disjoint sets X and Y, respectively, then B^A acts on Y^X, the set of all functions f from X into Y. The permutations in B^A are the collection of all ordered pairs, written $(\alpha;\beta)$, of permutations $\alpha \in A$, $\beta \in B$, whose action on any function $f \in Y^X$ is given by the equation $(\alpha;\beta)f(x) = \beta f(\alpha x)$, for all $x \in X$. Thus, 2 functions $f, g \in Y^X$ are equivalent with respect to the group B^A, provided there exist $\alpha \in A$ and $\beta \in B$ such that for all $x \in X$, $g(x) = \beta f(\alpha x)$. A method for determining the number of equivalence classes of such functions was first provided by deBruijn. An alternative method which only involves the cycle index of the power group is presented.

THE EFFECTS OF FAMILIARITY ON THE PERCEPTUAL RECOGNITION AND CATEGORIZATION OF VERBAL INFORMATION, by E. Smith. Dec 1965, 68p incl. diagrs. tables, refs. (Technical rept. no. 05823-9-T) (AFOSR-67-1806) (AF 49(638)1235) AD 656715 Unclassified

A comparison of the data for the tasks on "perceptual recognition" and "meaningful categorization" indicated that these functions reflected a memory process that follows recognition, rather than the recognition process itself. It was this memory process rather than recognition, which seemed to be sensitive to familiarity. In the latter task it appeared that familiarity affected both the retrieval and testing of the stored information about the meanings of the stimulus words.

EFFECTS OF S-R CODING ON THE RATE OF GAIN OF INFORMATION, by J. R. Peterson. Dec. 1965, 59p. incl. diagrs. tables, refs. (Technical rept. no. 05823-8-T) (AFOSR-67-1807) (AF 49(638)1235) AD 656711 Unclassified

It has been held that the function relating reaction time (RT) and the amount-of-information-transmitted-per-response (H_t) was a linear one. As a linear function, it could be expressed in the slope-intercept form: $RT = a + bH_t$ where a and b are the intercept and the slope constants. From the results of experimentation conducted, it appears likely that the magnitudes of the slope and intercept constants are dependent upon factors inherent in the experimental situation but that a and b are not affected in the same way. The purpose of the experiments reported here was to examine the probable validity of 3 hypotheses: (1) RT vs. H_t relationship is linear; (2) The intercept constant, a, is unaffected by variations in S-R coding rules; and (3) The slope constant, b, is highly dependent upon variations in S-R coding rules. The results of the present experiment are. (1) The RT vs H_t relationships were found to depart significantly from linearity for several of the S-R coding schemes studied, (2) The intercept constant, a, was found to be relatively insensitive to the S-R coding rules which were used; and (3) The slope constant, b, was found to be greatly affected by the S-R coding rules which were used.

EFFECT OF SIZE AND LOCATION OF INFORMATIONAL TRANSFORMS UPON SHORT-TERM RETENTION, by M. I. Posner and E. Rossman. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-67-1811) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1235 and Wisconsin U. Research Committee) AD 656536 Unclassified

Also published in Jour. Exper. Psychol., v. 70: 496-505, Nov. 1965.

This series of studies investigates the effect of informational transformations of various levels of difficulty, as indicated by the amount of information reduction required, upon material in short-term storage at the time of the transform. Experiment I shows that with number and similarity of interpolated items held constant, the greater the difficulty of a transform the more forgetting will result from it. Experiments II and III show that these effects cannot be attributed entirely to increases in the time an item remains in store. Rather, time in store and difficulty of transform both contribute to determining the amount of forgetting. Experiment IV shows that the loss of material in store is a decreasing function of its distance prior to the transform, but that the transformed material itself shows no decline in retention.

TRANSFER OF VERBAL PAIRED ASSOCIATES, by E. Martin. [1965] [17]p. incl. diagr. tables, refs. (AFOSR-67-1812) (AF 49(638)1235) AD 656979 Unclassified

Also published in Psychol. Rev., v. 72: 327-343, 1965.

From the current literature it is possible to identify 2 processes underlying the acquisition of verbal paired associates: response learning and association formation. It is also apparent from the literature that a complete treatment of association formation must take into account association directionality. Altogether, then, 3 "things" are seen to evolve during the acquisition of a paired-associate list: response availability, forward associations, and backward association. The thesis of the present research is that what is transferred from the 1st to the 2nd task in a paired-associate transfer situation is some combination of these 3 effects.

ON THE NATURE OF SHORT-TERM MEMORY ENCODING BY THE DEAF, by R. Conrad and M. L. Rush. [1965] [7]p. incl. tables. (AFOSR-67-1813) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1235 and National Institutes of Health) AD 656532 Unclassified

Also published in Jour. Speech and Hearing Disorders, v. 30: 336-343, Nov. 1965

A pilot attempt was made to examine the kind of imagery used by severely deaf children in short-term memory storage of visually presented consonant sequences. Subjects, both deaf and hearing controls, read briefly exposed 5-consonant sequences and, at the end of each exposure, wrote down what they could recall. Error matrices for the 2 groups were examined. Hearing subjects made a number of systematic recall errors which could be shown to be acoustically similar to the correct letters. The error of deaf subjects were not acoustically related to correct letters. The consistency of errors made by the deaf implies a consistent encoding procedure which is at present obscure.

RECENT PSYCHOLOGICAL RESEARCH RELEVANT TO THE HUMAN FACTORS ENGINEERING OF MAN-MACHINE SYSTEMS, by R. W. Pew. [1965] [5]p. incl. illus. refs. (AFOSR-67-1824) (Sponsored jointly by Advanced Research Projects Agency, Air Force Office of Scientific Research under AF 49(638)1235, and Air Force Systems Command) AD 656653 Unclassified

Presented at Nat'l. Electronics Conf., Chicago, Ill., Oct. 25-27, 1965.

Also published in Proc. Nat'l. Electronics Conf., v. 21: 678-682, Oct. 1965.

This report surveys a body of psychological theory and illustrates a specific area in which the theory and associated empirical data are relevant to system design problems. Within the framework describing man as a single-channel information processor at least, there are other equally relevant bodies of data. For example, research on the functional characteristics of the memory subsystem, especially short-term memory are available to allow relatively precise specifications of tolerable memory load, given the nature of the material to be remembered. This literature would also suggest information format and coding for optimum recall or retrieval. Similarly, the accumulating body of data focused on engineering descriptions of man as a controller in feedback systems are available for those with problems in this area. This paper suggests that one should not retreat to the comfort of his armchair and its associated intuitive design techniques without first making a conscientious effort to talk to psychologists about his particular design problem and to seek out the applicable literature.

THE RANSCHBURG PHENOMENON: FAILURES OF IMMEDIATE RECALL CORRELATED WITH REPETITION OF ELEMENTS WITHIN A STIMULUS, by R. G. Crowder and A. W. Melton. [1965] [2]p. incl. diagr. (AFOSR-67-1829) (AF 49(638)1235) AD 656543 Unclassified

Also published in Psychonom. Sci., v. 2: 295-296, May 15, 1965.

Seven-consonant stimuli were recalled immediately. When the cosonant in position 2 was repeated in position 5, 6, or 7, an increase in errors occurred at the latter position, as compared with control stimuli involving no repetition. Confirmation of the Ranschburg Phenomenon does not occur, however, when the repeated-element position are 2 and 4. Nor was there an increased error rate for elements following a repeated element. These observations support the importance of intrastimulus interference in immediate memory, but leave uncertain the associative mechanism responsible for such interference. (Contractor's abstract)

S-R COMPATIBILITY AND INFORMATION REDUCTION, by P. M. Fitts and I. Biederman. [1965] [5]p. incl. diagrs. tables, refs. (AFOSR-67-1830) (AF 49-(638)1235) AD 656655 Unclassified

Also published in Jour. Exper. Psychol., v. 69: 408-412, Apr. 1965.

S-R compatibility effects were examined in 4 information-processing tasks (1-bit information conserving, 2-bit conserving, 2 to 1 bit filtering, and 2 to 1 bit condensing) in combination with 2 sets of responses (2 or 4 fingers of 1 hand only vs 1 or 2 fingers of both hands). Eight different groups of 10 Ss each were used, 1 under each condition, and tested for 2 sessions. One-bit conserving and 2 to 1 bit filtering were accomplished about equally well, under both response codes. The other 4 tasks involved significantly more time and errors. When a compatible (2-hand) response code was used, 2-bit information conserving was more efficient than 2 to 1 bit information condensing, notwithstanding the fact that the former involved twice as many alternative responses, these relation were reversed when a less compatible (1-hand) response code was used. These results indicate the importance of response coding in interpreting studies of different information-handling processes. (Contractor's abstract)

CONCEPT UTILIZATION, by E. Martin. [1965] [43]p. incl. diagr. table, refs. (AFOSR-67-1831) (AF 49-(638)1235) AD 656656 Unclassified

Also published in Handbook of Mathematical Psychology ed. by R. D. Luce, R. R. Bush and E. Galanter. New York, John Wiley and Sons, Inc., v. 3: 205-247, 1965.

Four speculations as to what subjects do in a concept-utilization task are considered. None of these speculations is testable by direct observation. In each case, however, the speculation is formulated with sufficient precision to allow the deduction of new statements which are testable by direct observation. The several theorists involved hypothesize variously that concept utilization can be viewed as paired-associative learning, as cue conditioning, as strategy selection, and as a combination of selection and conditioning. Making comparisons among the 4 models, one cannot help but detect a special emphasis on the utility of models which (1) make a firm contact with both the stimulus situation and response classes and (2) allow for the operation of more than one process at a time. Restle's strategy selection is poor in contact and is a single-process model, and consequently poor in verification. The 2 most successful models, Bourne and Restle's cue-conditioning model and Bower and Trabasso's selection-conditioning model, both make good contact and postulate multiple processes.

SEEKING INFORMATION TO REDUCE THE RISK OF DECISIONS, by W. Edwards and P. Slovic. [1965] [10]p. incl. diagrs. tables. (AFOSR-65-2203) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-192 and Dept. of the Army) AD 625542 Unclassified

Also published in Amer. Jour. Psychol., v. 78: 188-197, June 1965.

Undergraduate Ss (10 men) were asked to perform 528 information-seeking tasks of 2 types. In standard tasks, S paid for looks at the cells of a 16-cell matrix and was rewarded if he found the unique cell. In inverse tasks, S was fined for finding the unique cell and rewarded for each cell investigated which was not the unique one. The basic dependent variable, strategy-score, was the number of cells S looked at for tasks in which he did not find the unique cell. For tasks in which he did find it, elaborate rules were used to infer what he would have done had he not found it. The Ss performed remarkably well; about half the strategies used were optimal or approximately so, and serious divergences from the optimum were very rare. Performance was less good on standard than on inverse tasks, and slightly less so on tasks with more complex costs and pay-offs than on tasks with simpler costs and pay-offs. Half the Ss were too cautious and half were too incautious in tasks for which both were possible. Individual Ss usually were consistent in being cautious or incautious.

DIRECTIONAL AND WIDE-BAND VELOCITY FILTERING, by P. L. Jackson. [1965] [2]p. (AFOSR-65-2907) (AF 49(638)1078 and AF 49(638)1170) AD 618782 Unclassified

Also published in Geophysics, v. 30: 279-280, Apr. 1965.

It is pointed out that the condition of monochromatic illumination in obtaining a 2-dimensional Fourier transform by optical means may be relaxed for wide-band velocity filtering, and for the directional filtering of any 2-dimensional structure such as a contour map. Similar considerations hold for 2-dimensional Fourier transforms obtained by any means.

ATTENUATION OF P_n FROM OFFSHORE MAINE EXPLOSIONS, by G. E. Frantti. [1965] [7]p. incl. diagrs. (AFOSR-65-2310) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1170 and Air Force Technical Applications Center) AD 628275 Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 55: 417-423, Apr. 1965.

The attenuation of P_n based on seismic energy density in a 3-sec time window was examined as a function of frequency in the distance range $204.0 \leq \Delta \leq 346.4$ km for underwater explosions in the Gulf of Maine. The diffracted P wave contained energy in the approximate frequency interval 1.25 to 20 cps and attenuation over this portion of the spectrum exhibited an unusual frequency-dependence with little scatter in the data. Dissipation constants are estimated from these observations. Integration of the extrapolated energy spectrum suggests empirically that the seismic source efficiency is about 8%. DIFFRACTIVE PROCESSING OF GEOPHYSICAL DATA, by P. L. Jackson. [1965] [9]p. incl. illus. diagrs. refs. [AF 49(638)1170] AD 614759 Unclassified

Published in Appl. Opt. v. 4: 419-427, Apr. 1965.

Processing of geophysical data can be accomplished by optical diffraction. The data are in the form of transmissive recordings, environmental photographs, or drawings. Five analyses can be performed at or near the Fraunhofer diffraction plane with single diffraction, three analyses through spatial filtering with double diffraction, and one (correlation) with triple diffraction. Primary emphasis is on the processing of variable-

density seismograms, for which a special recorder has been constructed. Spatial filtering has also been applied to cloud cover pictures and contour maps.

Six pigeons reduced to 70% and 6 reduced to 90% of their body weight were trained to discriminate a 10-mm. circular spot from 4- and 16-mm. spots. Following training, Ss in the 1st group were raised to 90% and Ss in the 2nd dropped to 70% of their body weight. All birds were tested for generalization to spots 6, 8, 10, 12, and 14 mm. in diameter. Following brief discrimination retraining the birds were returned to their original body weights and again tested for generalization. The generalization gradients were found to shift toward larger stimuli when drive level was raised and toward smaller stimuli when it was lowered.

STUDY OF PHONON-OPTICAL INTERACTIONS, by F. A. Olson and V. R. Johnson. Final rept. Nov 1965, 41p. incl. illus. diagrs. refs. (AFOSR-65-2467) (AF 49(638)1330) AD 628020 Unclassified

Exploratory research is described concerning phonon-photon interactions in optical sources. These include a theoretical description of Bragg and Raman-Nath scattering caused by propagation of a plane acoustic wave through the path of a laser beam. This interaction is considered for intracavity operation with possibilities of modulation, frequency translation and output coupling. The conditions for synchronous mode operation are also described. Modulation of an injection laser is considered on a theoretical basis with suggestions as to what results are to be attained and how the concept may be tested. Because boundary conditions are indeterminate for the injection laser, it was felt that experimental research should first deal with the intracavity modulation and coupling in an optically pumped laser. Thus experimental work proceeded to test the interaction in a ruby laser. Several experimental difficulties were encountered. The prime problem being associated with strains set up by the thermal shock created when the laser was operated in a pulsed mode. During the latter part of this study, however, 850 Mc acoustic wave interaction was observed in the laser, its magnitude being slightly above the noise level. Suggestions are made as to how some of the experimental problems may be overcome and how significant output coupling and modulation may be best appreciated. (Contractor's abstract)

DETERMINATION OF MIXED VIRIAL COEFFICIENTS, by J. Brewer Final technical rept. Dec. 1965, 35p. incl. diagrs. tables, refs. (AFOSR-66-0411) (AF 49-(638)1190) AD 628889 Unclassified

An experimental apparatus has been constructed and developed and with it the interaction second virial coefficients have been measured from -125° to 50°C in 25°C increments for the following systems: N_2-Ar, Ar-H_2, Ar-He, Ne-Ar, N_2-H_2, N_2-He, Ne-H_2, H_2-He, Ne-H_2 and Ne-He. The excess and interaction second virial coefficients were determined usually within 0.1 cc/mole corresponding to an error in the ratio $\Delta P/P$ of 5×10^{-6}, by measuring the pressure change of mixing 2 pure gases at constant temperature and volume. This precision corresponds to about one part in 200,000 for conventional PVT experiments. The comparison between experimental values and those calculated by the Kihara potential was considered good at the higher temperatures and fair to poor at the lower temperatures where it was as much as 8 cc/mole. In the temperature range of -125° to 50°C, the excess quantity, E, was empirically correlated to the absolute temperature by the relation, $E = aT^b$ where the value of b was essentially the same for most of the binary mixtures.

Presented at Forty-ninth Symposium of the Italian Physical Society (S. I. F.), Bari (Italy), Nov. 1963.

Also published in Jour. Phys. and Chem. Solids, v. 26: 363-371, 1965.

A study is carried out on the polarization effects in KCl crystals of different purity in the range of temperatures between LNT and 250°C. It is shown that the effects of dielectric relaxation of dipolar nature are present together with nonlinear polarization phenomena. The presence of the latter has been studied by means of a careful testing of Ohm's law, of the superposition principle and by means of the method of ionic thermoconductivity (ITC). The ITC method allows a qualitative and quantitative discrimination of the different polarization processes. The results show that part of the current decay, observed when the static electrical field is applied to a KCl single crystal, is due to dipolar orientation, but part of it cannot be imputed to linear dielectric relaxation; an interpretation in terms of ionic space charge formation is shown to be more realistic. PHOTOSTIMULATED THERMOLUMINESCENCE IN POTASSIUM CHLORIDE SINGLE CRYSTALS, by B. Bosacchi, R. Fieschi, and P. Scaramelli. [1965] [6]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-27, and Consiglio Nazionale delle Richerche)
Unclassified

Published in Phys. Rev., v. 138: A1760-A1765, June 14, 1965.

Thermoluminescence photostimulated over the spectral range 230-1000 mμ is investigated in KCl single crystals in the temperature range 90-270°K. The glow peaks are stimulated by rigorously monochromatic

light of wavelength corresponding to the F, to the L, and to the tail of the K band. No V band stimulation is found; only electron traps are therefore involved in the process. Comparison of the stimulation spectra with the corresponding absorption and photoconductivity curves found by other authors shows that, besides the usual trapping through capture of photoelectrons from the conduction band, a second process takes place, namely tunneling from excited F centers; this happens for the glow band centered at ~215°K. The trap giving rise to the above band is assigned to F' centers, according to other works; further evidence is presented to support this identification. (Contractor's abstract)

ISOTOPE EFFECTS INDUCED BY LOCAL MODES IN THE U BAND, by G. Baldini, E. Mulazzi, and N. Terzi. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-66-1777) (In cooperation with Rochester U., N. Y.) (AF EOAR-65-5) AD 639842 Unclassified

Also published in Phys. Rev., v. 140: A2094-A2101, Dec. 13, 1965.

The experimental investigation in the temperature range from 4 to 400°K of the ultraviolet U band in KCl, KBr, and RbCl crystals containing H^- and D^- ions has revealed the following isotope effects: (a) The half-width of the U_H band is from 4 to 8% larger than that of the U_D band, and (b) The U_H band occurs at energies ~0.02 ev smaller than those of the U_D band. In order to describe these results, the method of moments, in the harmonic and Condon approximations, has been applied. From the symmetry of the defect it is shown that only the vibrational modes which transform according to the Γ 15$^-$ representation of the full cubic point group can be responsible for the isotope effects these modes are just those active in the infrared. It is found that during optical transitions, allowed in depole approximation, the Γ 15$^-$ modes suffer, via the electron-phonon interaction, only a frequency shift, and that only the local mode has to be taken into account in order to predict the observed isotope effects, since the contribution coming from the Γ 15$^-$ continuum is negligible. Finally, the local-mode frequency of the excited U center has been estimated. (Contractor's abstract)

DIELECTRIC RELAXATION IN POTASSIUM CHLORIDE IN THE RANGE OF TEMPERATURE L. N. T. -500°K (Abstract), by C. Bucci and R. Fieschi. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-65-7] and Consiglio Nazionale delle Ricerche) Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10, 348, Mar. 24, 1965.

The temperature-dependent polarization in KCl both pure and containing divalent metallic impurities has been investigated by means of the method of ionic thermoconductivity (ITC). The ITC has been recently introduced for studying the polarization in dielectrics: the depolarization current, at linearly increasing temperature, is characterized by bands each of them representing a different polarization process. In KCl, with a warming rate of nearly 0.1°K sec^{-1}, a band at 230 K has been recognized as the orientation of the dipolar complexes composed by metallic impurities and potassium vacancy and their dynamic parameters, in the case of Sr and Ca, have been measured. A broad band at temperatures higher than 450°K has been attributed to the release of space charge. Three bands in partial superposition, located between 350° and 420 K, have been investigated and the results are discussed and compared with the dc measurements of A. S. Nowick and P. H. Sutter and with the ac measurements at higher temperatures of P. V. Sastry and T. M. Srinivasan.

VIBRATIONS OF DYNAMICAL SYSTEMS WITH QUADRATIC NONLINEARITIES, by P. R. Sethna. [1965] [7]p. incl. diagrs. (AFOSR-65-2337) (AF AFOSR-62-275) AD 630334 Unclassified

Presented at ASME Applied Mechanics and Fluids Engineering Conf., Washington, D. C., June 7-9, 1965.

Also published in Jour. Appl. Mech., v. 32: 576-582, Sept. 1965.

General 2-degree-of-freedom dynamical systems with weak quadratic nonlinearities are studied. With the aid of an asymptotic method of analysis a classification of these systems is made and the more interesting subclasses are studied in detail. The study includes an examination of the stability of the solutions. Depending on the values of the system parameters, several different physical phenomena are shown to occur. Among these is the phenomenon of amplitude-modulated motions with modulation periods that are much larger than the periods of the excitation forces.

GALERKIN'S METHOD AND THE LOCAL POTENTIAL, by B. A. Finlayson and L. E. Scriven. [1965] 6p. (AFOSR-66-0286) (AF AFOSR-63-219) AD 628582 Unclassified

Also published in Non-Equilibrium Thermodynamics; Variational Techniques and Stability; Proc. of a Symposium, Chicago U., Ill. (May 17-19, 1965), ed. by R. J. Donnelly, R. Herman, and I. Prigogine. Chicago U. Press, 1966, p. 291-294. (AFOSR-66-1685)

The advantages of viewing the local potential method as an application of Galerkin's method are threefold: (1) Variational formalism is avoided by using Galerkin's method, a conceptually simple, straightforward approximating scheme; (2) convergence proofs and other useful mathematical information are sometimes available for Galerkin's method, and (3) inasmuch as Galerkin's method is actually only one member of a family of weighted-residual methods for direct approximation using trial functions with adjustable parameters, the way is plain to alternative direct methods for attacking a problem. From the standpoint of fluid mechanics and transport theory there is considerable need for careful and systematic comparisons of these more-or-less well-established schemes and for increased attention to them by mathematicians or numerical analysts.

TEMPERATURE DEPENDENCE OF CONDUCTIVITY EFFECTIVE MASS OF HOLES IN GERMANIUM, by K. S. Champlin, D. B. Armstrong and others. [1965] [3]p. incl. diagrs. refs. (AFOSR-65-2537) (AF AFOSR-64-606) AD 629847 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 547-549, Apr. 5, 1965.

An extension of the Benedict-Shockley microwave experiment is used to determine the conductivity effective mass of holes in germanium throughout the temperature range between 90° and 250°K. In this interval, the mass was observed to be significantly larger than the value 0.23 m_o calculated from cyclotron resonance data and to increase markedly with temperature. If this observation is correct, the enigmatic $T^{-2.33}$ temperature dependence of the conductivity of p-type germanium actually indicates a much less severe temperature dependence of relaxation time. The optical-mode scattering mechanism that has been proposed to explain this phenomenon would thus be neither justified nor necessary.

SINGULARITIES OF SOLUTIONS OF NONLINEAR

EQUATIONS, by J. Serrin. [1965] [21]p. incl. refs. (AFOSR-66-0247) (AF AFOSR-63-372) AD 630584 Unclassified

Also published in Proc. Symposia Appl. Math., v. 17: 68-88, 1965.

The behavior of solutions of non-linear second-order partial differential equations near isolated singularities is studied. The equation is assumed of the form (1) div $A(x, u_x) = 0$, where $A(x, u_x)$ is a given continuous real n-vector valued function of $x = (x_1, x_2, \ldots, x_n)$ and $u_x = (u_{x1}, u_{x2}, \ldots, u_{x_n})$ satisfying the following conditions for some $a \geq 1$, $b \geq 0$, $\alpha > 1$: (2) $|A(x,p)| \leq a|p|^{\alpha-1} + b^{\alpha-1}$, (3) $p \cdot A(x,p) \geq |p|^{\alpha} - b^{\alpha}$, (4) $(p-q) \cdot (A(x,p) - A(x,q)) > 0$, $p \neq q$ (monotonicity), (5) the Dirichlet problem is solvable for smoothly bounded domains and given continuous boundary data. Let $K = -(1/\omega_n) \oint A \cdot n \, ds$, where the integral is taken over any smooth non-intersecting closed surface in $0 < |x| < 1$ containing the origin in its interior, and n denotes the outer normal to this surface. Theorem 1: Let u(x) be a positive solution of equation (1) in the domain $0 < |x| < 1$. Then u tends to a (finite or infinite) limit u_0 as $x \to 0$. The origin is a removable singularity if and only if $K = 0$. If the singularity is not removable, then u_0 is infinite if $\alpha \leq n$ and finite if $\alpha > n$, moreover, in the neighborhood of the origin one has $u \approx r^{(\alpha-n)/(\alpha-1)}$ if $\alpha < n$, $u - u_0 \approx \pm r^{(\alpha-n)/(\alpha-1)}$ if $\alpha > n$. For $\alpha = n$, $u \approx \log 1/r$. (Here $f \approx g$ means the ratio is bounded away from 0 and ∞.) Theorem 2 deals with the case of solutions in a neighborhood of infinity. (Math. Rev. abstract)

ISOLATED SINGULARITIES OF SOLUTIONS OF QUASI-LINEAR EQUATIONS, by J. Serrin. [1965] [22]p. (AFOSR-66-0259) (AF AFOSR-63-372) AD 641521 Unclassified

Also published in Acta Math., v. 113: 219-240, 1965.

In a previous paper (Acta Math., v. 111: 247-302, 1964), the author studied the local behavior of the solutions of certain second-order, quasi-linear equations div $A(x, u, u_x) = B(x, u, u_x)$, the nature of removable singularities and, in the special case $B = 0$, the behavior of positive solutions near an isolated singularity. In the present paper, the condition $B \equiv 0$ above is proved to be superfluous, some of the other results are improved and a few errors are corrected. The new proofs are essentially refinements of the proofs given in the original paper. An interesting new remark is that if a solution $u \geq L$ has a nonremovable singularity at 0, then div $A(x, u, u_x) = B(x, u, u_x) = K\delta(0)$ in the sense of distributions. (Math. Rev. abstract)

REMOVABLE SINGULARITIES OF SOLUTIONS OF ELLIPTIC EQUATIONS. II, by J. Serrin. [1965] [7]p. incl. refs. (AFOSR-66-0265) [AF AFOSR-63-372] AD 641520 Unclassified

Also published in Arch. Rational Mech. and Anal., v. 20: 163-169, 1965.

The author proves 3 theorems to the effect that if u is a weak solution of the equation div $\mathfrak{A}(x, u, u_x) = \mathfrak{B}(x, u, u_x)$ on D−Q, where D is open and Q is compact with Hausdorff (n-1)-measure 0, then u can be defined on Q so that the extended function is a solution in all of D. It is assumed in all cases that $\mathfrak{A}$ is continuous, $|\mathfrak{A}(x, u, u_x)| \leq a$, and $|\mathfrak{B}(x, u, u_x)| \leq f(x)$ along the solution where $f \in L_n(D)$, and additional hypotheses are given as follows for each theorem. Theorem 3: The conclusion above holds in case $p \cdot \mathfrak{A}(x, u, p) \geq |p| - d|u| - g$, where d and $g \in L_{n+\epsilon}(D)$. Theorem 1: If $\mathfrak{A} = \mathfrak{A}(p)$ and $\mathfrak{B} = \mathfrak{B}(u)$, the solution u is continuous and $\mathfrak{A}$ and $\mathfrak{B}$ satisfy $(p-q) \cdot (\mathfrak{A}(p) - \mathfrak{A}(q)) > 0$ for $p \neq q$ and $(u-v) \cdot (\mathfrak{B}(v) \geq 0$, then u can be extended to be continuous on D (and to be a weak solution on D). Theorem 2: If $\mathfrak{A} = \mathfrak{A}(p)$, $\mathfrak{B} = \mathfrak{B}(u)$, $\mathfrak{A}$ and $\mathfrak{B}$ are of class C^2, $\mathfrak{B}_u \geq 0$, $\mathfrak{A}_{i,k}\xi_i\xi_k > 0$ if $|\xi| > 0$, and u is of class C^2 on D−Q, then u may be defined on Q so that u is of class C^2 on D. ON THE BEHAVIOR OF SOLUTIONS OF QUASI-LINEAR ELLIPTIC EQUATIONS, by H. Jenkins. [1965] [10]p. (AFOSR-66-0723) (AF AFOSR-63-372) AD 632747 Unclassified

Also published in Trans. Amer. Math. Soc., v. 119: 407-416, Sept. 1965.

Some earlier results of the author (Arch. Rational Mech. and Anal., v. 16: 402-410, 1964) and of R. Finn: (Jour. Analyse Math., v. 14: 139-160, 1965) are generalized to a class of quasi-linear equations in n-variables. This is accomplished by extending the method of constructing radially symmetric super-solutions which was developed previously for equations in 2-variables, to an analogous class in n-variables. It turns out, however, that the radially symmetric super-solutions so constructed, remain super-solutions when all but $j \geq 2$ of the variables are suppressed. The strongest results are then obtained by using the super-solutions arising by taking $j = 2$.

TRANSLATION-INVARIANT CONES OF FUNCTIONS ON SEMI-SIMPLE LIE GROUPS, by H. Furstenberg. [1965] [56]p. incl. refs. (AFOSR-65-2619) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-381] and Army Research Office (Durham)) AD 629600 Unclassified

Also published in Bull. Amer. Math. Soc., v. 71: 271-326, Mar. 1965.

Let G be a noncompact connected semisimple Lie group with a finite center, and let X be a homogeneous G-space. A non-zero positive real-valued continuous function s on G x X is called a multiplier on G x X if $s(g_1g_2, \xi) = s(g_1, g_2\xi)s(g_2, \xi)$. If H is a closed subgroup of G, and if s is a multiplier on G x X such that $s(h, \xi) = 1$ for all $h \in H$, $\xi \in X$, then s is called an H-multiplier. The set of all H-multipliers is denoted by $M_H(X)$. If $H = \{e\}$, then each multiplier is an H-multiplier. The set of all multipliers is denoted by M(X). If $s \in M_H(X)$, and $\xi \in X$, the function $g \to s(g, \xi)$ is called an H-multiplier function on G. The class of H-multiplier functions is denoted by $E_H(X)$ by E(X) if $H = \{e\}$). The author shows how, by making an appropriate choice for X and H, the functions in $E_H(X)$ may be made to play a role analogous to the role played by exponential functions on the real line in classical harmonic analysis. Many results in harmonic analysis may be viewed as results on decomposition of each function in a certain class in terms of extremals of that class, and classically these extremals often turn out to be exponentials. The author's main concern is with results of this nature in the above setting. (Math. Rev. abstract)

ERGODIC DECOMPOSITIONS INDUCED BY CERTAIN MARKOV OPERATORS, by B. Jamison. [1965] [13]p. incl. refs. (AFOSR-65-2625) [AF AFOSR-63-381] AD 628439 Unclassified

Also published in Trans. Amer. Math. Soc., v. 117: 451-468, May 1965.

Transition probability operators P (x, E) are considered on a compact metric space which satisfy a rather strong condition (uniform stability in mean). An ergodic decomposition is obtained. It is essentially a sharpening of a decomposition of Yosida's valid under less stringent conditions. The behavior is discussed of sample paths of the Markov processes themselves relative to the ergodic decomposition. Examples are given of transition probability operators which are uniformly stable in mean.

STRONG RATIO LIMIT PROPERTY FOR R-RECURRENT MARKOV CHAINS, by W. E. Pruitt. [1965] [5]p. (AFOSR-65-2638) [AF AFOSR-63-381] AD 627835
Unclassified

Also published in Proc. Amer. Math. Soc., v. 16: 196-200, Apr. 1965.

A Markov chain has the strong ratio limit property (SRLP) if there exist positive constants γ, π_i, τ_i $i = 0, 1, 2, \ldots$, such that $\lim_{n\to\infty} p_i^{(m+n)}/p_{kh}^{(n)} = \gamma^m \tau_i \pi_j/(\tau_k \pi_h)$, $m = 0, \pm 1, \pm 2, \ldots$. A markov chain is called R-recurrent or R-transient if $P_{ij}(z) = \Sigma_n p_i^{(n)} z^n$ diverges or converges for $z = R$. The author proves that if a Markov chain is R-recurrent and if for some integer $d > 0$, $\lim \sup_{n\to\infty} u_{(n+1)d}/u_{nd} = R^{-d}$, then the SRLP holds, where $u_n = p_{00}^{(n)}$ for $n \geq 1$ and $u_0 = 1$. The proof is analytic. A note added in proof indicates the result may be obtained probabilistically as a consequence of a theorem by Orey (Bull. Amer. Math. Soc., v. 67: 571-574, 1961). (Math. Rev. abstract)

A GENERAL ERGODIC THEOREM WITH WEIGHTED AVERAGES, by G. Baxter. [1965] [12]p. (AF AFOSR-63-381) Unclassified

Published in Jour. Math. and Mech., v. 14: 277-288, Mar. 1965.

A generalization of the ergodic theorem is given in the following form: Define a sequence $\{u_k: 0 \leq k < \infty\}$ recursively by $u_n = \omega_1 u_{n-1} + \omega_2 u_{n-2} + \ldots + \omega_n u_0$, $u_0 = 1$, where ω_k, $1 \leq k < \infty$, are given non-negative numbers such that $\sum_{k=1}^{\infty} \omega_k = 1$. Let T be a positive linear norm-contracting operator from L, (X, B, m) into itself. The result is that if f, $p \in L$, (X, B, m), $p \geq 0$, then $\lim_{n\to\infty} \sum_{k=0}^{n-1} u_k T^k f / \sum_{k=0}^{n-1} u_k T^k p$ exists almost everywhere on the set where $p > 0$. (Math. Rev. abstract)

TRANSMISSION PROBLEMS FOR HOLOMORPHIC FIBER BUNDLES, by H. Rohrl. [1965] [28]p. incl. diagrs. refs. (AFOSR-65-1414) [AF AFOSR-64-625] AD 622839 Unclassified

Also published in Proc. Conf. on Complex Analysis, Minneapolis, Minn. (Mar. 16-21, 1964), ed. by A. Aeppli, E. Calabi, and H. Rohrl. Berlin, Springer-Verlag, 1965, p. 215-242.

Transmission problems for holomorphic fiber bundles in high-dimensional complex spaces are considered. Topological preparations pertaining to the notion of boundary values on a hypersurface by approach from various sides are first carried out. Certain analytic preparations are made, which are mainly concerned with holomorphic bundles of complex Lie groups acting on holomorphic fiber bundles. The transmission problems are then stated. To each holomorphically correct transmission function, a holomorphic fiber bundle $\mathcal{B}_\tau$ is constructed such that the set of solutions of the transmission problem τ corresponds bijectively to the set of holomorphic sections in $\mathcal{B}_\tau$. Topologically correct transmission functions are discussed and related to homology theory. Holomorphically correct transmission functions are then considered.

The method of moving frames is applied to finite dimensional Banach spaces with smooth but unsymmetric unit spheres. The results obtained present a far reaching generalization of Euclidean methods. A complete theory of curvature is given. The theorems associated with the 4-vertex-theorem are reduced to a general theorem on differential equations with periodic orbit. Integral geometry is shown to depend on the group of the Hadwiger-Glur theorem only, not on the rotation group. The power of this approach is demonstrated in many detailed formulas. The theory of space curves and surfaces

is developed along similar lines. Here significant departures from the Euclidean case do appear. Surface area is defined as a function in Grassmann-space, not as a set function. The foundations of Finsler geometry are given.

GAUSSIAN PROCESSES AND GENERALIZED SCHROEDINGER EQUATIONS, by J. A. Beekman. [1965] [18]p. incl. refs. (AFOSR-66-1193) [AF AFOSR-65-331] AD 641071 Unclassified

Also published in Jour. Math. and Mech., v. 14: 789-806, Sept. 1965.

In "a family of integrals serving to connect the Wiener and Feynman integrals", Jour. Math. and Phys., v. 39: 126-140, 1960, and "the Ilstow and Feynman integrals", Jour. D'Analyse Math., v. 10: 287-361, 1962-1963, R. H. Cameron has defined several special integrals connected with the Wiener integral, and has studied the existence and properties of those integrals. Under certain hypotheses on the integrand, these integrals are connected with R. P. Feynman's function space integral in the one dimensional case. These "Feynman" integrals of certain classes of functionals serve as solutions to the Schroedinger equation. The present paper extends these ideas from the Wiener stochastic process to Gaussian Markov stochastic processes. Another problem considered is an existence theorem for a partial differential equation which plays the role for Gaussian Markov processes that the generalized heat flow equation does for the Wiener process.

ON THE NON-SOLVABILITY OF DIRICHLET'S PROBLEM FOR THE MINIMAL SURFACE EQUATION, by J. C. C. Nitsche. [1965] [10]p. incl. diagrs. refs. (AFOSR-66-0215) (AF AFOSR-65-883) AD 631378 Unclassified

Also published in Jour. Math. and Mech., v. 14: 779-788, Sept. 1965.

Let C be the boundary of a bounded plane domain D. The Dirichlet problem for the maximal surface equation consists in finding a solution of that equation in the domain D which takes on prescribed values on C. It was first proved by Radó that if D is convex, then a solution exists for any continuous boundary values on C. The present paper is devoted to a discussion of cases in which no solution exists. If C is a certain non-convex quadrilateral and if one assigns continuous boundary values to be zero on two sides and linear on the other two sides, then the Dirichlet problem has no solution in the domain D bounded by C. The paper also contains an extensive discussion of the previous literature on the subject starting with a paper of Bernstein, who first noted that there exist non-convex domains for which Dirichlet's problem is not in general solvable, and concluding with the recent paper of Finn (Jour. Analyse Math., v. 14: 139-160, 1965), in which it is shown that for every non-convex domain there exist continuous boundary values for which Dirichlet's problem is not solvable. (Math. Rev. abstract)

ON DIFFERENTIAL EQUATIONS OF MODE 2, by J. C. C. Nitsche. [1965] [7]p. incl. refs. (AFOSR-66-0263) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-883 and Office of Naval Research) AD 631621 Unclassified

Also published in Proc. Amer. Math. Soc., v. 16: 902-908, Oct. 1965.

The author considers quasi-linear elliptic equations of the form $L[z] = a(x, y, p, q)r + 2b(x, y, p, q)s + c(x, y, p, q)t = 0$, $ac - b^2 > 0$, $a > 0$. Putting $F_1 = ap^2 + 2bpq + cq^2$, $F_2 = (a + c)(p^2 + q^2)$, the mode of such an equation

is defined to be $\mu_2 - \mu_1$, where μ_1, μ_2 are, respectively, the orders of growth of F_1, F_2 as p, q tend to infinity. For equations of positive mode, and more generally, for equations satisfying the condition $\int^{\infty} (dw/wQ(w)) < \infty$,

$$\text{where } Q(w) = \min_{p^2+q^2=w^2} \left\{ \inf_{(x,y)} \left(\frac{F_2}{F_1} - 1 \right) \right\},$$

the author proves that solutions are bounded near isolated singularities; more precisely, they satisfy the following extended maximum principle. Let $z(x, y)$ be a solution in the punctured disc $0 < x^2 + y^2 < 1$ such that $m \leq \liminf z(x, y)$, $\limsup z(x, y) \leq M$.

$$x^2+y^2 \to 1 \qquad x^2+y^2 \to 1$$

Then $m < z(x, y) < M$ everywhere. The proof is accomplished by constructing a family of radially symmetric super solutions $\Phi(r;a)$ in the annulus $0 < a < r < 1$ such that $\Phi'(r;a) \to -\infty$ as $r \to a$, and $\Phi(r;a) \to 0$ as $a \to 0$. (Math. Rev. abstract)

LONGITUDINAL FLOW OVER A CIRCULAR CYLINDER WITH SURFACE MASS TRANSFER, by D. J. Wanous and E. M. Sparrow. 1965 [3]p. incl. diagrs. table. (AFOSR-65-0992) [AF AFOSR-64-17] AD 617624 Unclassified

Also published in AIAA Jour., v. 3: 147-149, Jan. 1965.

This note considers axisymmetric laminar boundary-layer flow longitudinal to a circular cylinder with continuously-distributed mass injection (blowing) or mass removal (suction) at the surface. Solutions are sought for 2 distributions of the surface mass transfer velocity: (1) $v_\omega \sim x^{-1/2}$, and (2) v_ω = constant. A graphical presentation of the local skin-friction results is given, from which it is seen that the skin-friction coefficient for the cylinder is always greater than that for a flat plate. The investigation also points out that the general effect of blowing is to decrease the skin friction, whereas suction increases the skin friction, though the effect of either is not as great for the cylinder as for the flat plate. From this it is concluded that surface mass transfer and transverse curvature oppose one another.

UNIFORM AIR INJECTION INTO A TURBULENT BOUNDARY LAYER FLOW OVER AN AXIAL CIRCULAR CYLINDER, by V. K. Jonsson and C. J. Scott. July 1965, 86p. incl. diagrs. tables. (Technical rept. no. 63) (AFOSR-65-2290) (AF AFOSR-65-17) AD 621888 Unclassified

An experimental study was made of the effects of uniform air injection into the turbulent boundary layer flowing on an axial circular cylinder with a nominal free stream velocity of 120 fps. The blowing rate parameter divided by the free stream flow rate varied from 0 to 21×10^{-5} while the Reynolds number based on free stream conditions varied from 4.0×10^5 to 10.6×10^5. The data for velocity profiles were inserted into the momentum equation and the distribution of turbulent shear stress and eddy viscosity was obtained. The correlation of eddy viscosity with both Reynolds number and injection rate was obtained by dividing by the product of the maximum shear stress velocity and boundary layer thickness. Furthermore, the results for the universal velocity profile correlate better when the maximum shear stress velocity is used rather than wall shear stress velocity. When some of the results are compared with previous experiments, the use of the maximum friction factor rather than wall friction factor in the blowing rate parameter produces better correlation between these various experiments. HOT-WIRE ANEMOMETER STUDY OF A TURBULENT BOUNDARY LAYER ON A POROUS AXIAL CIRCULAR CYLINDER WITH UNIFORM AIR INFECTION, by V. K. Jonsson and W. D. Batton. Sept. 1965, 93p. incl. illus. diagrs. tables, refs. (Technical rept. no. 65) (AFOSR-65-2724) (AF AFOSR-65-17) AD 628083 Unclassified

The report deals with a hot-wire anemometer study of a turbulent boundary layer on a porous axial cylinder with a free stream velocity of 120 fps. The variations through the boundary layer of the transverse and longitudinal fluctuating velocity components, the Reynolds stress, the turbulent friction coefficient, and the correlation coefficient were obtained at axial Reynolds numbers of 4×10^5, 6×10^5, and 9×10^5. Two cases of injection with air were studied in addition to the case of no injection. The value of the dimensionless injection rate was zero, 84×10^{-6}, and 20×10^{-5}. (Contractor's abstract)

EXPERIMENTS ON THE DIFFUSION THERMO EFFECT IN A BINARY BOUNDARY LAYER WITH INJECTION OF VARIOUS GASES, by E. M. Sparrow, C. J. Scott and others. [1965] [8]p. incl. diagrs. refs. (AFOSR-66-0331) [AF AFOSR-65-17] AD 631371 Unclassified

Presented at ASME Winter Annual Meeting, New York, N. Y., Nov. 29-Dec. 3, 1964.

Also published in Jour. Heat Transfer, v. 88: 321-328, Aug. 1965.

The free convection heat and mass transfer about a porous horizontal cylinder are investigated experimentally. Various gases, which are either preheated or precooled, are injected through the porous cylinder into an otherwise quiescent air environment. The gases include hydrogen, helium, carbon dioxide, and Freon-12; the first 2 of these have molecular weights less than that of air while the latter 2 have molecular weights greater than that of air. It is found that for the condition of no net heat transfer at the surface, the temperature of the surface differs from the temperature of the environment. The existence of the aforementioned adiabatic wall temperature is due to the diffusion thermo effect. When hydrogen or helium is the injected gas, the adiabatic wall temperature exceeds the ambient temperature by as much as 100°F. On the other hand, when carbon dioxide or Freon-12 is the injected gas, the deviation between adiabatic wall and ambient temperatures is both much smaller and of opposite sign relative to that noted previously. (Contractor's abstract, modified)

MASS-TRANSFER COOLING OF A FLAT PLATE WITH VARIOUS TRANSPIRING GASES, by E. M. Sparrow, W. J. Minkowycz, and E. R. G. Eckert. [1965] [2]p. incl. diagrs. [AF AFOSR-65-17] Unclassified

Published in AIAA Jour., v. 3: 1341-1343, July 1965.

Supplementary information is given for stagnation flows, consisting of mass-transfer cooling results for a flat plate. Consideration is given to laminar boundary-layer flow into which are injected various gases including hydrogen, helium, water vapor, argon, carbon dioxide and xenon. The molecular weights of the aforementioned transpiring gases range from 2.016 to 131.3. In all cases, the main-stream gas is air. The distribution of the surface mass transfer is such that similarity solutions of the boundary layer equations are possible, i.e., the injection velocity v_w varies as $x^{-1/2}$, where x is the distance from the leading edge.

OSCILLATIONS OF THE He II FILM, by F. I. Glick and J. H. Werntz, Jr. [1965] [5]p. incl. diagrs. table. (AF AFOSR-62-301) Unclassified

Published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9(Pt. A): 214-218, 1965.

An experiment is performed in which oscillations of the He II film have been studied. Basically, the apparatus consists of 2 concentric annular reservoirs separated by a stainless steel vacuum jacket. The outer reservoir is bounded by a thin-walled brass can; thus the liquid in it will have the temperature and stability of the temperature-regulated bath in which the apparatus is submerged. The stainless steel plug is lapped to the conical seat at the top of the inner reservoir where the 2 walls of the vacuum jacket are joined together and can be raised or lowered during an experiment; with the plug raised, isothermal experiments are performed, while with the plug seated, adiabatic experiments are performed. In the isothermal experiments, heat is transported between the reservoirs by distillation. It was found from the isothermal experiments, that for a fixed temperature the isothermal oscillation frequency varied as an inverse power of the barrier height. In the present film flow experiment, the relation predicted by Robinson (Phys. Rev., v. 82: 440, 1951) between the oscillation frequencies under adiabatic and isothermal conditions is verified within ±5%. However, the adiabatic damping predicted, using the observed heat conduction decay times, couldn't explain the observed adiabatic damping. The excess of the damping observed in an adiabatic experiment over that predicted was equal to the damping observed under isothermal conditions for the same barrier height, within the accuracy of the results. Values of the entropy defect of the superfluid were determined.

It is pointed out that the usual theories of pressure broadening disagree with direct experimental measurements of the widths of resonance-broadened alkali doublet lines, although the theories are at least qualitatively confirmed for the wings of resonance lines and for foreign-gas broadening. There are also 2 conflicting sets of experimental data (both in strong disagreement with theory). Some qualitative arguments are given for doubting the validity, near the center of a

resonance line, of the "2-body" approximation generally used in theoretical treatments, and some formal objections to the usual procedure are also presented. The basic equation relating the susceptibility to a resolvent operator matrix element is derived from a more fundamental point of view than usual; the result contains in principle all effects due to translational motion, to the quantized nature of the radiation field, and to "spatial dispersion." In the limit of large absorber mass it is proved rigorously that the 2-body approximation can never be valid near the center of a line, even for very low densities. By using different approximations for the wings and the line center, satisfactory agreement is obtained with experiments in both regions for the alkali doublet lines. Also it is possible for one to decide between the 2 conflicting experiments, favoring the square-root density dependence of the line-width observed by Lauriston and Welsh. (Contractor's abstract)

USE OF RETARDED GREEN'S FUNCTIONS IN EXCITON THEORY, by C. W. Deutsche and C. A. Mead. [1965] [11]p. incl. refs. (AF AFOSR-63-13) Unclassified

Published in Phys. Rev., v. 138· A63-A73, Apr. 5, 1965.

It is pointed out that the usual treatment of excitons in interaction with radiation with spatial dispersion does not obviously satisfy causality in all cases, and it is shown explicitly that certain paradoxes and ambiguities can appear even in simple cases. In particular, it is shown for a simple special case that an apparently reasonable choice of boundary condition leads to a reflection coefficient greater than unity, and also that in some cases one must make rather arbitrary and inconsistent requirements in order to get the right number of boundary conditions to determine a solution. The theory is reformulated in a way that is manifestly causal, with both field and polarization being generated by retarded Green's functions. Umklapp processes are also included. This formulation confirms the results of the usual treatment in the cases in which the latter are unambiguous and acceptable, but avoids the difficulties mentioned above. The model used is essentially classical and one dimensional, but nevertheless sufficiently general for the treatment of these problems.

THE EFFECT OF STRUCTURE ON ACID-INDUCED DEOXYMERCURATION RATES. VARIATION IN THE ALCOHOL COMPONENT, by M. M. Kreevoy and M. A. Turner. 1965 [3]p. incl. diagrs. tables, refs. (AFOSR 65-0686) (AF AFOSR-63-16) AD 616187 Unclassified

Also published in Jour. Org. Chem., v. 30. 373-375, 1965.

The aqueous acid induced deoxymercuration rates of 14 oxymercurials $ROCH_2CH_2HgI$, have been measured and combined with 2 rate constants obtained previously. The rates cover a range of a factor of over 20. No over-all correlation with the Taft σ^* is obtained, but a very limited correlation suggests a ρ^* of ~ -1.4. Steric factors and possibilities for internal hydrogen bonding also seem to influence the rates. (Contractor's abstract)

EFFECT OF MOLECULAR ACID-BASE DISSOCIATION OF SALTS ON CONDUCTOMETRIC TITRATION CURVES IN ACETONITRILE, by I. M. Kolthoff and M. K. Chantooni, Jr. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-65-0880) (AF AFOSR-63-28) AD 618442 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87· 1004-1011, Mar. 5, 1965.

Salts of weak acids and primary, secondary, and tertiary amines are subject to molecular acid-base dissociation in acetonitrile. When the acid has a large homoconjugation constant K_2 and the molecular formation constant K_f of the salt is less than infinity, the conductance of the salt may be much greater than that which corresponds to the calculated value from the ionic dissociation constant of the salt K_d, being $< K_2$ because of homoconjugation. With known values of K_f, K_d, and K_2, equations are derived which allow the calculation of conductometric titration curves of an acid with an amine under the previous conditions. Such curves exhibit a maximum in conductance. A relation is derived which allows the calculation of K_f from the location of the maximum and of K_d from the conductance at the maximum. A relation is also derived which allows the calculation of K_dK_f from the early portion of the titration curves

CALIBRATION OF THE GLASS ELECTRODE IN ACETONITRILE. SHAPE OF POTENTIOMETRIC TITRATION CURVES. DISSOCIATION CONSTANT OF PICRIC ACID by I. M. Kolthoff and M. K. Chantooni, Jr. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-66-0043) (AF AFOSR-63-28) AD 629614 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87 4428-4436, Oct. 1965.

An equation was derived for the calculation of pa_H in the neutralization with tetraalkylammonium hydroxide in acetonitrile of a weak acid with known dissociation constant K_{HA} and homoconjugation constant K_{HA2^-}. The

assumption was made that the tetraalkylammonium salts of the acid are completely dissociated. At 50% neutralization $pa_H = pK_{HA}$. When the product of initial acid concentration and K_{HA2^-} is greater than about 10, the buffer capacity has a pronounced minimum at 50% neutralization. Equations are derived to calculate K_{HA} and K_{HA2^-} from pa_H measured with the glass electrode in mixtures of an acid and its tetraalkylammonium salt. pK_{HA} and $pK_{2(HA)}$ of methanesulfonic acid (I) and 2,5-dichlorobenzenesulfonic acid (II) were determined by various methods and the following values were found. 10.0 and 3.8 for I and 6.2 and 2.65 for II, respectively. The glass electrode in AN was calibrated in mixtures of I and of II with their tetraethylammonium salts and in mixtures of o-nitroaniline and perchloric acid. pK_{HA} of picric acid was determined potentiometrically and a value of 11.0 ± 0.1 was found. SPIN STATES OF TRIVALENT CHROMIUM WITH TETRAGONAL SYMMETRY IN MgO, by P. V. Auzins and J. E. Wertz. [1965] [4]p. incl. diagrs. table. (AFOSR-66-0237) (AF AFOSR-63-200) AD 629658 Unclassified

Also published in Jour., Chem. Phys., v. 43 1229-1232, Aug. 15, 1965.

Spin transitions between nonadjacent energy levels of Cr^{3+} in tetragonal symmetry in MgO become allowed by the mixing of states which occurs when the applied magnetic field is not along the symmetry axis. The tetragonal electric field arises from association with a next-nearest-neighbor (nnn) cation vacancy. When the defect axis is perpendicular to the applied field, energy level and matrix element expressions for the -3/2 - 3/2 transition are closely related to those for the normally allowed transitions. Two other transitions between alternate levels (-3/2 - 1/2 and -1/2 - 3/2) become allowed for parallel microwave and static fields. The ESR lines corresponding to these transitions have been observed (Contractor's abstract)

TRAPPED HOLE CENTER CONTAINING FLUORINE IN MAGNESIUM OXIDE, by J. E. Wertz and P. V. Auzins. [1965] [3]p. incl. diagrs. (AFOSR-66-0239) (AF AFOSR-63-200) AD 629661 Unclassified

Also published in Phys. Rev., v. 139: A1645-A1647, Aug. 30, 1965

An intrinsic defect center readily induced in MgO by ionizing radiation is the positive hole localized on an oxygen atom adjacent to a positive ion vacancy (V_1 center). This has a tetragonal symmetry axis along [001] or equivalent directions. A similar ESR spectrum but with each line a hyperfine doublet was identified earlier as arising from the center $O^- -[=]-H^+O$ (V_{OH} center). This paper describes a similar ESR spectrum of a trapped hole center (V_F) with smaller (anisotropic) hyperfine splitting than V_{OH}. It is best observed in single crystals, but it may be induced in powdered MgO by fluorine doping and heating. It thus appears that fluorine is the nucleus responsible for hyperfine splitting. The contact and dipolar splitting constants are, respectively: a = 0.08 G, b = 0.33 G. The proposed model for the V_F center is $O^- -[=]- ^+$ (only deviations from normal site symmetry are shown). HYDROGEN-CONTAINING TRAPPED HOLE CENTER IN MAGNESIUM OXIDE, by P. W. Kirklin, P. Auzins, and J. E. Wertz. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-66-0240) [AF AFOSR-63-200] AD 629658 Unclassified

Also published in Jour., Phys. Chem. Solids, v. 26: 1067-1074, 1965.

Earlier ESR studies of X-irradiated MgO had shown the existence of centers having a positive hole trapped on an oxygen atom adjacent to a positive ion vacancy (V1-centers). Some MgO samples show a qualitatively similar ESR spectrum with each line a doublet. Electron-nuclear double resonance studies show unambiguously that the splitting arises from a hydrogen atom collinear with the positive hole and the vacancy. Infrared studies of unirradiated MgO had earlier shown a sharp band at 3296 cm^{-1}, which was observed to be shifted to 3323 cm^{-1} on irradiation. Decay of the 3323 cm^{-1} band occurs with corresponding growth of the 3296 cm^{-1} band and loss of the ESR signal. The 3296 cm^{-1} band is attributed to an OH^- ion with hydrogen adjacent to the vacancy. The shift occurs when a hole is trapped on an oxygen opposite the vacancy from the hydrogen atom of OH^-. The new center is referred to as the V_{OH} center. (Contractor's abstract)

THERMOLUMINESCENT FORMATION OF Cr^{2+} IN MAGNESIUM OXIDE, by J. E. Wertz and R. E. Coffman. [1965] [3]p. incl. diagrs. table, refs. (AFOSR-66-0241) [AF AFOSR-63-200] AD 629660 Unclassified

Also published in Jour. Appl. Phys., v. 36: 2959-2961, Sept. 1965.

In undoped crystals of MgO, x irradiation converts a large fraction of Cr^{3+} in octahedral symmetry to Cr^{2+}.

Heating such crystals until a blue thermoluminescence has been observed causes further reduction. Usually 95% or more of the Cr^{3+} is converted by the combined treatments. However, in Cr-doped MgO, one is able to reduce only a small fraction of the octahedral chromium to Cr^{2+}. The Cr^{2+} is reconverted to Cr^{3+} by heating. ESR measurements show that in the same temperature interval nearly all of the Fe^{1+} formed on x irradiation has disappeared. The source of electrons acquired by Cr^{3+} thus appears to be the Fe^{1+} ions. The thermoluminescence is ascribed to the Cr^{3+}-electron interaction, as suggested by Hansler and Segelken. Also published in Jour. Amer. Chem. Soc., v. 87 5019-5026, Nov. 20, 1965.

The complexing of $(CH_3)_2Sn^{+2}$(aq) by Cl^- and Br^- in aqueous solution has been studied by e.m.f., Raman, and proton n.m.r. measurements. By the use of the cells, glass electrode $|0.2\ M\ H^+,\ 2.8\ M\ Na^+,\ 3\ M\ ([ClO_4^-] + [X^-])|\ AgX|Ag$ (X = Cl and Br), the halide ion concentrations were determined in solutions containing $(CH_3)_2Sn^{+2}$. The following values for the stability constants of the chloro complexes were obtained at 25 by least-squares refinement: $\log \beta_1 = 0.380 \pm 0.001$ and $\log \beta_2 = -0.14 \pm 0.01$. Little of the 2:1 complex could have been present, and its existence is not definitely established. The interaction with Br^- was very weak, and $\log \beta_1 < -0.5$. The values of the ^{117}Sn and ^{119}Sn methyl proton spin-spin coupling constants and the integrated Raman intensities for tin-chloride bond stretching in solutions as a function of chloride ion concentration indicated that both inner- and outer-sphere complexes are formed. Only in concentrated chloride solutions are appreciable concentrations of the inner-sphere complex present. The Raman spectra show that inner-sphere complexing also occurs in concentrated bromide solutions. The dimethyltin(IV) ion is characterized by a high affinity for water molecules, and in many respects the solutions of $(CH_3)_2SnCl_2$ and $(CH_3)_2SnBr_2$ resemble those of oxonium chloride and bromide. The hypothetical free linear $(CH_3)_2Sn^{+2}$ can be regarded as an extremely "hard" acid which forms very stable complexes with bases of low polarizability and gives large crystal-field effects in lattices. ELECTRON SPIN RESONANCE STUDIES OF SELECTED SOLIDS, by T. M. Sanders, Jr. Final rept. [196- 37p. incl. diagrs. tables, refs. (AFOSR-65-085 (AF 49(638)811); AD 616788 Unclassified

The report describes research efforts in 2 major areas. First, electron spin resonance experiments on shallow donors in germanium are reported. The experiments consist in measurement of the Zeeman effect of the donors as a function of applied [110] compression. From the data a value may be derived for the valley-orbit (singlet-triplet) splitting ($4\Delta_c$) of the donor ground state. The results for P donors agree with determinations by other workers. The result for Sb in Ge is $4\Delta_c = (4.04 \pm 0.1) \times 10^{-4}$ ev. This result is not consistent with the value obtained from piezo-resistance measurements. The data also require that the singlet state lie below the triplet in Sb-donors, just as in P and As donors. An additional 4-line spin resonance spectrum in

Sb-doped Ge is ascribed to donors located near the surface of the samples, in regions of high local strain. The second major area discussed concerns polarized proton target studies. In order to increase the absolute proton polarization to a value sufficiently large for scattering experiments, the static magnetic field was increased over preliminary experiments and the temperature decreased. Near 4.7 kgauss and 1.3°K, the absolute proton polarization increased relative to the lower field value due to increases both in proton NMR frequency and in enhancement of proton polarizat by the "solid effect". Experimental apparatus was designed and constructed to extend the experiments to 12.5 kgauss and 0.5°K.

QUANTIZED VORTICES AND THE SUPERFLUID HELIUM ANALOG OF THE AC JOSEPHSON EFFECT, by W. Zimmermann, Jr. [1965] [4]p. incl. diagr. (AFOSR-65-2084) [AF AFOSR-65-793] AD 627505 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 976-979, June 14, 1965.

In a recent paper (Phys. Rev. Ltrs., v. 14. 540, 1965) Richards and Anderson reported the observation of an effect in superfluid helium which they interpreted in close analogy to the ac Josephson effect in superconductors. Their interpretation is based on an equation which was derived using the concept of a complex order parameter for the liquid. In this note, it is shown that this equation can also be derived from the conventional equations of 2-fluid hydrodynamics combined with the assumption of quantization of vorticity in the superfluid. It is believed that this approach is closely related to the order-parameter method and that the 2 points of view complement one another.

GYROSCOPIC DETEC "ION OF PERSISTENT FLOW OF SUPERFLUID LIQUID HELIUM, by J. B. Mehl and W. Zimmermann, Jr. [1955] [4]p. incl. diagrs. (AFOSR-65-2085) [AF AFOSR-65-793] AD 627506 Unclassified

Also published in Phys. Rev. Ltrs., v. 14. 815-818, May 17, 1965.

Long-lived persistent currents were observed in a superfluid flow of liquid helium. The currents were studied by means of gyroscopic effects associated with circuital flow, which permits repeated direct measurements of the angular momentum of the flow to be made without destruction of the flow. This gyroscopic technique has provided a particularly good means of establishing the existence of persistent flow and of studying its nature.

OBSERVATION OF STABLE SUPERFLUID CIRCULATION IN LIQUID-HELIUM II AT THE LEVEL OF ONE, TWO, AND THREE QUANTUM UNITS, by S. C. Whitmore and W. Zimmermann, Jr. [1965] [4]p. incl. diagrs. (AFOSR-65-2772) (AF AFOSR-65-793) AD 629827 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 389-392, Aug. 30, 1965.

Vinen's experiment (Proc. Roy. Soc. (London), v. 260A: 218, 1961) in which the circulation around a fine wire immersed in superfluid helium was measured by means of the influence that the circulation exerts on the transverse vibrations of the wire, is extended in order to present more evidence in support of the hypothesis of quantization of circulation. It is found that motion of the superfluid can persist for long periods of time with the assembly carrying the tube and wire stationary. Circulation around the wire tends to show markedly greater stability at the anticipated quantum levels than at other values. As the wire diameter was increased, the maximum value of stable circulation observed also increased. Several subsidiary observations which help support the conclusion that the effects of quantized circulation have been observed are reported.

SUPERFLUID LIQUID HELIUM GYROSCOPE, by J. B. Mehl and W. Zimmermann, Jr. [1965] [4]p. (AFOSR-65-1095) (AF AFOSR-62-316) AD 618080 Unclassified

Presented at meeting of Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Also published in Bull. Amer. Phys., Series II, v. 10: 30, Jan. 27, 1965.

Persistent circulating currents of superfluid helium have been observed by means of associated gyroscopic effects. The gyroscope consists of a 3 cm-diam glass sphere filled with powder, of particle size 10^{-3} cm, which forms fine channels through which the superfluid flows. The superfluid current is generated by steadily rotating the sphere about a vertical axis while cooling through the λ-point and then stopping the sphere's rotation at a lower temperature. The sphere is mounted so that it subsequently can be tipped through 90° about a horizontal axis and the vertical component of torque needed to carry out this tipping measured. By this means repeated measurements of the persisting angular momentum can be made, assuming the angular momentum to tip with the sphere. With an initial angular velocity of rotation of 0.28 radians sec^{-1}, measurements of a persisting angular momentum have been repeated up to 40 times during a period of 100 min showing no decay of the motion during that period to an accuracy of ±10%.

THE SELF-JUDGMENT METHOD OF CURVE FITTING, by P. A. D. de Maine. [1965] [9]p. incl. diagrs. tables, refs. (AF AFOSR-62-19) Unclassified

Published in Commun. Assoc. Comput. Mach., v. 8 518-526, Aug. 1965.

A computer-oriented method for processing and communicating numerical data is described. The instrument Reliability Factors (IRF), which exactly define the limits of reliability of each measured item of information, are used to compute the Maximum Permitted Error (MPE) associated with each value of each ordinate. The Self-Judgment Principle (SJP) is used to discard wrong information and to compute mean values of the parameters and their MPE's in terms of the IRF. Data compatibility tests with any number of different equations can be made quickly. Otherwise intractable problems are easily solved, and the design of many experiments is greatly simplified. The computational and mathematical techniques used to reduce bias in the SJP are discussed. Inadequacies in the statistical and graphical methods of curve fitting are noted. (Contractor's abstract)

THE SPECTRUM OF AN OPERATOR IN BANACH SPACE, by M. D. George. [1965] [3]p. (AFOSR-66-0258) [AF AFOSR-62-97] AD 631113 Unclassified

Also published in Proc. Amer. Math. Soc., v. 16: 980-982, Oct. 1965.

The author proves, for complex reflexive Banach spaces X for which the norm is Gâteaux differentiable at each nonnull vector, that a bounded linear operator T on X has its spectrum contained in the closure of W(T), where W(T) is the set of complex numbers taken on by f(x, Tx) over $x \in X$ having $\|x\| = 1$, and where f(x, Tx) is the unique complex α such that $\|x + \beta(Tx - \alpha x)\| \geq \|x\|$ for all complex β. Clearly f(x, Tx) = (Tx, x) if X is a Hilbert space, for which the result is well known; here in the Banach space case, the author is using James' definition of orthogonality. Earlier, Lumer (Trans. Amer. Math. Soc., v. 100: 29-43, 1961) proved the stated inclusion for only the approximate point spectrum, but for an arbitrary Banach space, by using semi-inner-products. More recently, in some similar not yet published joint work of Lumer and Williams, it seems that the full inclusion asserted here can be proved for a set closely related to W(T) without assuming X either reflexive or having the Gâteaux differentiability property. Also published in Ann. Math. Stat., v. 36: 559-564, Apr. 1965.

The following theorem is proved: Let $\xi_k : k = 0, \pm 1, \ldots$, be an independent sequence of real valued random variables with $E\xi_k = 0$ and moment generating functions $f_k(t) = Ee^{t\xi_k}$ such that (1) for every $\beta > 0$ there exists $T_\beta > 0$ such that $f_k(t)$ exists and $|1 - f_k(t)| < \beta|t|$ for $|t| < T_\beta$ uniformly in k. Let $a_{n,k} : k = 0, \pm 1, \ldots; n = 1, 2, \ldots$ be real numbers such that: (2) $\sum_{k=-\infty}^{\infty} |a_{n,k}| < A < \infty$ for $n = 1, 2, \ldots$ (3) $f(n) = \sup_k |a_{n,k}| \to 0$ as $n \to \infty$. Then $S_n = \lim_{a \to -\infty, b \to \infty} \sum_{k=a}^{b} a_{n,k} \xi_k$ is defined as an almost sure limit for all n, and for every $\epsilon > 0$ there exists a positive $\rho_\epsilon < 1$ (depending on A but not on the particular $a_{n,k}$'s) such that (4) $P[|S_n| > \epsilon] < 2\rho_\epsilon^{1/f(n)}$. The theorem is applied to establish exponential convergence rates for the strong law of large numbers for subsequences of linear processes of non-identically distributed random variables. The theorem is also applied to summability theory and convergence rates are provided for Toeplitz means of independent random variables.

CONVERGENCE RATES FOR THE LAW OF LARGE NUMBERS FOR LINEAR COMBINATIONS OF EXCHANGEABLE AND *-MIXING STOCHASTIC PROCESSES, by D. L. Hanson and L. H. Koopmans. [1965] [13]p. (AFOSR-66-2219) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-746] and Atomic Energy Commission) AD 643064 Unclassified

Also published in Ann. Math. Stat., v. 36: 1840-1852, Dec. 1965.

In the present paper upper bounds on $P[|S_n| \geq \epsilon]$ are investigated for 2 types of discrete parameter stochastic processes, ξ, closely related to independent sequences: exchangeable processes and *-mixing processes. Also, a basic theorem is established for exchangeable processes which enables conditions to be stated leading to upper bounds which end to zero with n at virtually any sub-exponential rate. These bounds are shown to be sharp in certain important special cases by exhibiting a mixture of normal random variables which actually attains them under the given conditions. Finally, the exponential bounds thus obtained for independent sequences is shown to carry over to *-mixing processes.

RESONANT HARMONIC GENERATION AND NON-LINEAR OPTICS, by [C. S. Naiman, J. Schwartz and others]. Scientific rept. Oct. 1, 1964-Mar. 31, 1965. [Apr. 1965] 27p. incl. diagrs. table, refs. (Rept. no. MC 63-96SR) (AFOSR-65-0727) (AF 49(638)1464) Unclassified

This report sketches the basic theory of optical second harmonic generation in sufficient generality to include materials with absorption at the fundamental, the second harmonic, or both. It is shown how such absorptions can result in enlarged values of the coefficient of second harmonic generation. The effects of the basic light propagation properties of the material as they contribute to the overall production of second harmonic radiation are further developed. In particular, a discussion is given of the relations between the elements of the second harmonic generation tensor, and the relations between these coefficients appropriate to the crystals of interest in this study.

RESONANT HARMONIC GENERATION AND NON-LINEAR OPTICS, by C. S. Naiman, J. Schwartz, and J. Ducuing. Final technical status rept. no. 2, Oct. 1, 1964-Sept. 30, 1965, 26p. incl. diagrs. table. (Rept. no. MC 63-96-R2) (AFOSR-66-0701) (AF 49(638)1464) AD 631676 Unclassified

Enhancement of the coefficient, x(2), of optical second harmonic generation by resonant absorption is discussed. In particular the conditions under which the resulting increase in x(2) overcomes any losses due to the linear absorptions so introduced are developed. Trivalent rare earth dopants in crystalline hosts of suitable symmetry, among other feasible materials, are examples of materials shown capable of efficient harmonic generation. Experimental techniques are developed for use of stimulated Raman effect methods for shifting the frequencies of available laser sources. The theory of harmonic generation in absorbing materials is discussed plus the variation in measurement techniques required in experimental studies of these materials. (Contractor's abstract)

[THE CALCULATION OF THE ABSOLUTE VELOCITY OF REACTIONS BETWEEN FLUORINE ATOMS AND OXIDES OF SULFUR MOLECULES AS RELATED TO FLUORINATED OXIDES OF SULFUR RADICALS] Die Bestimmung der Absolutgeschwindigkeit der Reaktionen zwischen F-Atomen und SO_3-Molekulen bzw. FSO_3-Radikalen, by J. E. Bolzan, J. E. Sicre, and H J Schumacher. [1965] [11]p. incl. tables. (AFOSR-66-0355) (AF AFOSR-65-800) AD 622804 Unclassified

Also published in Zeitschr. Phys. Chem., v. 46: 78-87, May 1965.

The simultaneously occurring reactions of F atoms with SO_3 and ($F_2S_2O_6 \rightarrow 2FSO_3$) were examined quantitatively at 70 - 110 C. The Fatoms do not react with $F_2S_2O_6$ molecules but only with FSO_3 radicals. The ratio of velocity constants of the reactions with SO_3 and FSO_3 is 3.0×10^{-2} and is temperature independent. Therefore, the activation energy of both reactions must be nearly identical and approximately zero. The following reaction scheme allows an explanation of all experimental results. $F_2 + h\nu_{(365\ m\mu)} \rightarrow 2F$. $F + SO_3 \rightarrow FSO_3$. $F + FSO_3 \rightarrow F_2SO_3$. $FSO_3 + FSO_3 \rightleftharpoons F_2S_2O_6$.

STABILITY CONDITIONS FOR A BOSON SYSTEM INTERACTING WITH A PARTLY REPULSIVE AND PARTLY ATTRACTIVE POTENTIAL, by A. Coniglio, M. Maturi and M. Marinaro. [1965] [12]p. (AFOSR-67-0597) (AF 61(052)826) AD 647629 Unclassified

Also published in Nuovo Cimento, Series X, v. 40 184-196, Nov. 11, 1965.

The properties of a dilute system of Bose particles with a short-range repulsive and a long-range attractive potential are studied. Some conditions on the scattering amplitude are found to assure the thermodynamic stability of the system. The method developed by Beliaev is used for calculating the ground-state energy and the elementary excitation spectrum of the system. The results are compared with those of Huang, Ezawa, and Iordanskii and are found to be in complete agreement.

NONANALYTICAL PROPERTIES OF PROPAGATORS. THE $g\varphi^4$ THEORY, by E. R. Caianiello, A Campolattaro, and M. Marinaro. [1965] [17]p. incl. refs. (AFOSR-67-1505) (AF 61(052)826) AD 654830 Unclassified

Also published in Nuovo Cimento, Series X, v. 38: 1777-1783, Aug. 16, 1965.

When perturbative expansion diverge, the search for solutions of the equations for propagators is a problem of real variable. It is shown, on the example of a neutral scalar field with $g\varphi^4$ self-coupling, that the coefficients of the divergent perturbative expansions can still be used in principle, heuristically, to obtain the wanted solutions. The proposed procedure, which is quite general, yields easily the known correct answer if applied to a solvable numerical model of this theory, giving solutions which are holomorphic in l/g and not uniquely determined by the knowledge of the perturbative coefficients. In the general case, the difference between any 2 such solutions would satisfy a bound state equation. A suitably regularized form of the theory is studied in some detail, its solutions, if any exist, belong, like those of the model, to

if any exist, belong, like those of the model, to Hadamard's "class 2" of nonanalytical functions.

Also published in Jour. Research Nat'l. Bur. Stand., v. 69A: 13-18, Jan.-Feb 1965.

The results of heat-capacity measurements are reported for beryllium aluminate in the temperature range 16 to 380°K. The sample to be tested was prepared by arc fusion of a stoichiometric mixture of high purity BeO and Al_2O_3 powder and determined to be 100% pure in the processing of the heat-capacity data. The uncertainty in the final values for heat capacity is estimated to be ± 0.1% between 80 and 380°K and increase at lower temperatures to ± 3% at 16°K. The thermodynamic data were calculated from these measurements on an IBM 7094 computer for the range 0 to 380°K.

New experimental work on the borohydrides of aluminum and beryllium is reported. The mean value found for the standard heat of formation of $Al(BH_4)_3$ (298°K) is +2 kcal/mol for the gas and -5 kcal/mol for the liquid, with an estimated possible error as great at 17 kcal/mol. The infrared spectra of MgF_2 (in a krypton matrix), $Al(BH_4)_3$, and $Be(BH_4)_2$ were measured, and a new band system was discovered for F_2^+. The bending fundamental of MgF_2 appears to be 242 cm^{-1}, and continuing spectroscopic work is expected to provide additional molecular constants for the other substances. High-temperature mass-spectrometric data on the $BeO-Al_2O_3$ system were treated thermodynamically, and lead to heats of atomization for O_2, Al_2O, and the new molecule AlOBe (as well as the heat of vaporization of liquid $BeO.Al_2O_3$) The values for O_2 and Al_2O agree well with previously available values. Recent precise measurements of the relative enthalpy of graphite over the range 1200-2600°K are summarized. Liquid $Al_2)_3$ was vaporized in vacuum and the condensates subjected to varying programs of annealing. The progress from amorphous to the stable alpha crystalline form was followed in detail by X-ray and electron diffraction. The report includes four appendices. The first is a formulation property index of the twelve preceding semiannual reports. The second comprises new tables of the standard thermodynamic properties of condensed phases of 17 substances, including 13 "mixed" oxides. The third appendix gives thermochemical values for additional compounds of several elements which have resulted from a current revision of NBS Circular 500. The fourth appendix includes the table of ionization potentials and electron affinities of light-element atoms and molecules presented in the last report but now considerably revised and augmented by recent information.

HEAT OF FORMATION OF ALUMINUM FLOURIDE BY DIRECT COMBINATION OF THE ELEMENTS, by E. S. Domalski and G. T. Armstrong. [1965] [11]p. incl. illus. diagrs. tables, refs. (AFOSR-66-0568) (ISSA-65-8) Unclassified

Also published in Jour. Research Nat'l. Bur. Stand., v. 69A: 137-147, Mar.-Apr. 1965.

The standard heat of formation of aluminum fluoride was calculated from the heats of combustion of Teflon and of aluminum-Teflon mixtures in fluorine. The heat measurements were made in a bomb calorimeter. C_2F_4(solid polymer) + $2F_2$(g) $2CF_4$(g) (1); Al(c) + $3/2F_2$(g) = AlF_3(c) (2). For reaction (1), ΔH_{298} was found equal to - 10,350.7 ± 0.4 Jg^{-1} (-247.43 ± 0.01 kcal $monomol^{-1}$), and for reaction

(2) $H^{\circ}_{298} - H^{\circ}_{f298}$ was calculated to be -1507.8 ± 1.2 kJ mol^{-1} (-360.37 ± 0.29 kcal mol^{-1}). The latter uncertainties are the computed standard deviations of the means. The calculated standard heat of formation of aluminum fluoride is estimated to be accurate to within ± 6.6 kJ mol^{-1} (1.6 kcal mol^{-1}). The measurements on Teflon were combined with existing data and the heat of formation of carbon tetrafluoride was calculated to be -221.8 kcal mol^{-1}. (Contractor's abstract)

FORCE FIELDS FOR THE BORON TRIHALIDES, by I. W. Levin and S. Abramowitz. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-66-2080) (Sponsored jointly by Advanced Research Projects Agency, [Air Force Office of Scientific Research under ISSA-65-8], and National Science Foundation) AD 643571 Unclassified

Also published in Jour. Chem. Phys. v. 43: 4213-4222, Dec. 15, 1965.

The method of Edgell and Moynihan for determining Coriolis ζ constants from the infrared band contours of degenerate vibration modes was verified for selected molecules and was then applied toward computing the ζ values of the E symmetry vibrations of the boron-trihalide molecules. Since it is not feasible to define unique potential functions for the BX3 species from only frequency data, general force fields were determined for the series by combining both the Coriolis ζ constants and the observed isotopic frequency data in a least-squares refinement scheme. The final force fields indicate that the sensitive stretch-bend interaction constant is a significantly large negative quantity that decreases as the series progresses from BF_3 to BI_3.

SPECTROPHOTOMETRIC DETERMINATION OF THE RATE OF DISSOCIATION OF TETRAFLUOROHYDRAZINE BEHIND A SHOCK WAVE, by L. M. Brown and

B. deB. Darwent. [1965] [8]p. incl. diagrs. refs. (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under [ISSA-65-8]) Unclassified

Published in Jour. Chem. Phys., v. 42· 2158-2165, Mar. 15, 1965.

The rate of dissociation of tetrafluorohydrazine in N_2 and Ar was determined at temperatures between 344° and 410°K and total pressures between 0.6 and 6.0 atm. The reaction was carried out by shock heating the gas mixtures in a shock tube. The progress of the reaction behind the incident shock wave was followed by a time-resolved spectrophotometric technique. The absorption coefficient of NF_2 at λ 2602 A was determined experimentally between 350° and 571°K and found to be 537 ± 10 liter/mol cm. The kinetics data indicated that the dissociation in 99% N_2 was quasiunimolecular throughout the experimental pressure range, attaining its first-order limit at a total pressure not far above 6 atm and its second-order region below 0.6 atm. The observed pressure for the region of transition from first- to second-order kinetics was reasonably consistent with the transition pressure obtained from classical theory on the basis of the estimated value (2×10^{15} sec^{-1}) of the pre-exponential factor for the limiting high-pressure first-order specific rate. At approximately 2 atm the observed specific rate for the nitrogen mixture was given by $k_2(N_2) = 10^{14.98 \pm 0.42} \exp[(-19.4 \pm 0.7$ kcal/mol)/RT] sec^{-1} between 344° and 407°K. The indicated uncertainties are the standard deviations of the associated values. (Contractor's abstract)

AFTERSHOCK SEQUENCE AND CRUSTAL STRUCTURE IN THE REGION OF GREECE, by A. G. Galanopoulos and B. C. Papazachos. Annual summary rept. no. 1, June 1, 1964-May 31, 1965, 5p. (AFOSR-65-2938) (AF 61(052)803) AD 627616 Unclassified

The object of this study was to determine the wave velocities of body waves, to attempt to calculate the average thickness of the crust and to have an estimation about the change of the thickness of the crust from place in the region considered. The first problem was to identify the most prominent phase and find their travel time curves. Different procedures were followed to determined the travel time curves for epicentral distance between 0 and 150 km and for epicentral distance between 200 and 1000 km. By using data from 250 earthquakes with epicenters near the station of Athens, the velocities of the direct P and S waves were found to be equal to 5.25 km/sec and 3.19 km sec, respectively. The determined mean focal depth of these earthquakes is 7 km. By using data from about 1000 earthquakes with epicenters in the region of Greece the most prominent phases for epicentral distances between 0 and 1000 km were identified. Their travel time curves were also determined.

SPACE AND TIME VARIATIONS OF STRAIN RELEASE IN THE AREA OF GREECE, by N. Delibasis and A. G. Galanopoulos. [1965] [12]p. incl. diagrs. (AFOSR-66-1226) (AF 61(052)803) AD 638527 Unclassified

Also published in Ann. Geol. Pays Helleniques, v. 18· 135-146, 1965.

Six cross-sections show the latitude and longitude variations of the total strain released by all earthquakes of magnitude >4 3/4 occurred in the area of Greece bounded by the parallels of 34 N and 42 N and the meridians of 19°E and 29°E during the period 1841-1959, and the cumulative magnitude corresponding to the total strain released in the eastern and western section, bounded by the 24°E meridian, over the 120- year interval 1841-1960 in dependence of time. There was verified the presence of an oscillation pattern with 2 migration cycles of the maximum of strain release between the 2 sections. The oscillation period was found to be 52 yr and the oscillation amplitude almost constant, i.e. about 8 to 9 1/4 cumulative earthquake magnitude.

THE SEISMIC ACTIVITY IN THE CYPRUS AREA, by A. G. Galanopoulos and N. D. Delibasis. [1965] [19]p. incl. diagrs. table, refs. (Rept. no. 4) (AFOSR-67-2762) (AF 61(052)803) Unclassified

Cyprus has 2 dominate topographic features, the Kyrenia range in the north and the Troodos Mountain in the south. There is evidence that the summit of Troodos, an igneous massif, has been elevated by more than 3,000 m since Cretaceous time while the rest of the island has risen only some 700 m, indicating isostatic adjustment to the underthrusting of the Eurasian hinterland by the African foreland. Cyprus and the adjacent sea areas are covered by one of the largest positive gravity anomalies found in the eastern Mediterranean. This large positive anomaly is superimposed on a regional negative anomaly. The earthquakes history of Cyprus shows only 15 severe earthquakes with damaging effect on the island. Two of these were accompanied by tsunamis strong enough to cause destruction on the southern coast. During the period 1911-1963 there are records of 18 earthquakes with epicenters within a distance of 100 km from the nearest coast of Cyprus. Six of these had a magnitude of 5.8 to 6.5 while the rest ranged between 4.75 and 5.75. The fact that all but one of the 18 occurred in or near the zone of underthrusting suggests that the

earthquake activity is closely related to the evolution and the deep-seated structure of this zone.

INHIBITION OF NONSPECIFIC SENSORY ACTIVITIES FOLLOWING STRIOPALLIDAL AND CAPSULAR STIMULATION, by G. Krauthamer and D Albe-Fessard. [1965] [25]p. incl. illus. diagrs. refs. (AFOSR-65-2852) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-13 and National Institute of Neurological Diseases and Blindness) AD 629092 Unclassified

Also published in Jour. Neurophysiol., v. 28: 100-124, Jan. 1965.

In cats under chloralose anesthesia, the nonspecific peripherally evoked responses of the anterior marginal and middle suprasylvian gyrus were inhibited following stimulation of the basal ganglia. The inhibition was bilateral and limited to the nonspecific sensory potentials evoked by peripheral stimuli. Primary somatic, visual, and auditory potentials were not inhibited. The inhibition was not associated with any cortical activity of striatal origin and the results of cortical ablation experiments indicate a subcortical locus of inhibition. The parameters of the inhibitory stimulation were studied. The effective stimulus usually consisted of a brief volley (25 msec), though single shocks were found to be effective for some electrode placements. Mapping of the basal ganglia showed the inhibitory points to be concentrated in the dorsolateral aspect of the head of the caudate nucleus, the dorsal globus pallidus, and the entopeduncular nucleus. Stimulation of the medial caudate nucleus, putamen, and claustrum was ineffective. Other inhibitory zones were located in the internal capsule; they were spatially distinct from other capsular regions which were either silent or excitatory. The possible significance of this distribution of inhibitory zones is discussed. The inhibition extended over 150-350 msec. Its onset was gradual, building up to a max 30-50 msec after striatal stimulation.

RESPONSES OF MONKEY THALAMUS TO SOMATIC STIMULI UNDER CHLORALOSE ANAESTHESIA, by D. Albe-Fessard and D. Bowsher. [1965] [15]p. incl. illus. refs. (AFOSR-65-2830) (AF EOAR-63-13) AD 628368 Unclassified

Also published in Electroencephalog. and Clin. Neurophysiol. Jour., v. 19: 1-15, July 1965.

The localization and characteristics of responses to somatic stimuli have been investigated by means of anatomo-electrophysiological methods in the thalamus and adjacent structures of Macaca cynomolgus under chloralose anaesthesia. Somatotopic responses were found in the nucleus ventralis posterior, exactly like those seen under barbiturates or in the waking animal by other workers. Short latency convergent responses, from all limbs, were evoked in the nucleus supragenicularis. Long latency convergent responses were observed in nuclei geniculatus medialis (pars magnocellularis), parafascicularis, commissuri posterioris, in the ventral parts of nucleus lateralis posterior, in parts of ventralis lateralis, and occasionally in nuclei reticularis thalami, centralis lateralis and the lateralmost part of nucleus dorsalis medialis. Preferential responses, in the sense of (a) greater amplitude of response to stimulation of one limb, or (b) absence of representation of one or two limbs were seen in the centrum medianum and in the ventral part of n. ventralis lateralis, overlying VPL. In general, long latency convergent and preferential response could only be evoked by brusque (not necessarily noxious) natural stimuli, and never by phasic hair movement or light touch, of the sorts that were found to evoke somatotopic responses in VP. The natural type of stimulus giving rise to responses in VL has not been determined. (Contractor's abstract)

HETEROSYNAPTIC FACILITATION IN NEURONES OF THE ABDOMINAL GANGLION OF APLYSIA DEPILANS, by E. R. Kandel and L Tauc. [1965] [27]p. incl. diagrs. table, refs. (AF EOAR-63-13) Unclassified

Published in Jour. Physiol., v. 181: 1-27, Nov. 1965.

A stimulus-pairing sequence based on classical behavioural conditioning was applied to the isolated abdominal ganglion of Aplysia depilans. Intracellular recordings from single cells were obtained, and the stimulus parameters to two different afferent nerves were controlled so that one produced a relatively small excitatory post-synaptic potential (the test stimulus) and the other, usually a brief train, produced a burst of spikes (the priming stimulus). The two stimuli were paired (once every 10 sec) for several minutes with the test preceding the priming by about 300 msec. In most of the cells examined, input pairing produced no facilitation of the test excitatory post-synaptic potential. However, in the right upper-quadrant giant cell of each ganglion and in fifteen out of ni. unidentified cells located near the medial borders of the giant cells, the test EPSP was augmented during pairing. The facilitation declined only slowly following the pairing procedure. In the unidentified cells, the test post synatic potential was augmented by about 100% during fifteen to thirty pairing trials and the facilitation declined within an average of 9 and a maximum of 20 min after the pairing procedures. The results demonstrated that in certain cells the amplitude of the post-synaptic potential produced by a weak stimulus to one pathway is capable of being facilitated for a prolonged period of time as a result of the repeated and concomitant pairing with a more effective stimulus to another pathway.

MECHANISM OF HETEROSYNAPTIC FACILITATION IN THE GIANT CELL OF THE ABDOMINAL GANGLION OF APLYSIA DEPILANS, by E. R. Kandel and L. Tauc. [1965] [20]p. incl. diagrs. refs. (AF EOAR-63-13) Unclassified

Published in Jour. Physiol., v. 181: 23-47, Nov. 1965.

An analysis of the cellular mechanisms of heterosynaptic facilitation in the right upper quadrant giant cell of the abdominal ganglion of Aplysia depilans was undertaken. Possible contributions by either the passive properties or the spike-generating activity of the post-junctional cell were excluded by the demonstration that (a) the priming stimulus did not produce a significant conductance change in the giant cell, and (b) a train of directly initiated spikes could not serve as a priming stimulus. Facilitation could be demonstrated despite a blockade, by curare, of post-synaptic inhibition, thereby eliminating the possibility of disinhibition. The response configurations to different test stimuli were compared before and during facilitation. In most cases, the test post-synatic potential retained their configuration during peak facilitation indicating an increase in the efficacy of the units initially making up the test pathway. A presynaptic facilitation hypothesis was tested by use of an elementary, presumably monosynaptic, PSP. Such an elementary PSP was facilitated by 100% and for periods up to 15 min after pairing with a priming stimulus. The data are therefore consistent with this hypothesis. The presynaptic facilitation hypothesis is, however, based on the additional assumption that (a) the test input is monosynaptic and (b) the test axon is afferent to the ganglion. Failure to meet either requirement would permit the priming stimulus to initiate repetitive activity in the test unit and thereby create a condition for post-tetanic facilitation. The criteria used and our experimental observations make it unlikely that repetitive firing of the test unit occurred, but this possibility cannot be fully excluded.

FIELD EMISSION STUDIES OF THE SURFACE CONSTANTS OF REFRACTORY METALS, by P. C. Bettler. Final rept. Aug. 20, 1965, 22p. incl. illus. diagrs. table, refs. (AFOSR-65-1688) (AF AFOSR-62-297) AD 620697 Unclassified

The activation energy for surface migration, the surface tension, and the diffusivity constant for surface motion were measured, using field emission techniques, for tungsten (BCC) and rhenium (HCP). The values for tungsten agree well with results reported by other investigators. Similar work on rhenium was not reported previously. Investigations are continuing on other metals with face centered cubic and hexagonal close packed crystal structure.

CATALOG OF NEVADA EARTHQUAKES, 1852-1960, by D. B. Slemmons, A. E. Jones, and J. I. Gimlett. [1965] [47]p. incl. diagrs. tables, refs. (AFOSR-65-2890) (AF AFOSR-62-285) AD 618430 Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 55: 519-565, Apr. 1965.

Nevada earthquakes for the period from about 1852 to 1961 are tabulated on IBM punch cards. During this period 1,173 events with Nevada epicenters were felt, 586 others with Richter magnitudes above 4.0 were recorded and were probably felt by some residents, and approximately 220 were reported in nonspecific terms (e.g. 'several aftershocks were felt'). High seismicity of this region is indicated by the fact that on an equal-area basis, during the period 1934-1960, Nevada has had the highest incidence of earthquakes per unit area of any of the conterminous Western States. The seismic activity shows a distinct tendency, statistically inadequate, for a 20-yr cycle of activity, with peaks at about 1852, 1872, 1894, 1916, 1932-33, and 1954. The general increase in number of events reported each year correlates well with the increase in Nevada population, but is probably modified by the development of: increasingly sophisticated methods of recording, spacing of seismographic stations, more intensive earthquake investigations of the United States Coast and Geodetic Survey, and changing population density and distribution. A method is developed for correlating between Richter magnitude, earthquake intensity, and size of felt area. This permits estimation of earthquake magnitude for shocks that pre-date instrumental methods of recording.

THE P_g-P_n METHOD OF DETERMINING DEPTH OF FOCUS WITH APPLICATIONS TO NEVADA EARTHQUAKES, by R. W. Greensfelder. [1965] [13]p. incl. diagrs. tables, refs. (AFOSR-65-2903) (AF AFOSR-64-646) AD 618425 Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 55: 391-403, Apr. 1965.

The P_g-P_n method is theoretically developed, including a complete error analysis, and then applied to some Nevada earthquakes. It is found that as expected, the method is very sensitive to the crustal model used, and the appearance of large errors in depths of focus calculated for some earthquakes leads to the conclusion of a major discontinuity in crustal thickness (ca. 10 km) north and east of Walker Lake, Nevada. This discontinuity may have its surface expression in the Walker Lane, a major right-lateral shear zone which has been defined on both physiographic and geologic grounds.

EFFECTIVE POTENTIAL FOR BOUND ELECTRONS IN A HYDROGEN PLASMA (Abstract), by P. C. Kepple, W. D. Deering, and O. Theimer. [1965] [1]p. [AF AFOSR-64-587] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 169, Feb. 25, 1965.

The effective potential V^* for bound electrons in a hydrogen plasma is calculated from two correlated quantities. (1) the radial charge distribution $\rho_f(r)$ of the charge cloud formed by the free electrons and ions in the neighborhood of a neutral hydrogen atom, (2) the radial distribution function $\rho_b(r)$ of the bound electron. $\rho_f(r)$ is found by solving a Poisson-Boltzmann equation with the hydrogen nucleus and $\rho_f(r)$ generates an average potential $V_f(r)$, which is added to the Coulomb potential of the nucleus to give $V^*(r)$, which is still a function of the unknown distribution $\rho_b(r)$. The latter is calculated by solving Schrödinger's equation with $V^*(r)$ by means of the WBK approximation. Self-consistent numerical results for $V^*(r)$ are presented that are quite different from the Debye-Huckel potential.

CAVITY EFFECT IN PRESSURE BAR, by F. D. Ju and K. B. Simmons. May 1965, 117p. incl. illus. diagrs. tables, refs. (Rept. no. ME-12) (AFOSR 65-1074) (AF AFOSR-64-250) AD 619820 Unclassified

The cross effects of a thin cavity in a pressure bar were investigated. The experimental research was divided into 2 stages: (1) research in materials, geometries, controlled measurements and loading methods and (2) experiments on the cavity bar to study the bar wave reflected and transmitted from the cavity section, the strain field approximate to the cavity region, the fracture mode, and the fracture strength. The model was made of epoxy and built from sections to allow for the control of certain geometrical variables. Both the nondestructive model and the fracture model designs were highly successful. The mode of fracture was invariably at the cavity section. No "scabbing" or "spalling" phenomena were detectable. The fracture tests indicated that the location of the cavity relative to the free end had little effect on the fracture strength. With increasing cavity size, the incident peak strain necessary to produce fracture decreased. However, if the strain levels were corrected for the reduced area at the cavity section, most of this variation was eliminated.

PRELIMINARY STUDY OF PURE SHEAR FRACTURE MODEL, by F. D. Ju and J. G. Baker. May 1965, 40p. incl. illus. diagrs. refs. (Technical rept. no. ME-13) (AFOSR-65-1195) (AF AFOSR-64-568) AD 619365 Unclassified

Under this investigation, a shear fracture model is designed to meet the following requirements. (1) an approximate pure shear state should exist in the critical section of the specimen throughout the deformation range up to fracture. (2) there should be no rotation in the specimen. (3) the shear should be limited to a narrow band along the line of shear fracture, and (4) the data should be reproducible for various specimen thicknesses. Only qualitative results are reported, but preliminary indications are that the specimen satisfactorily meets the above requirements.

PRODUCTION AND MEASUREMENT OF A DILATION LOADING FIELD, by F. D. Ju and R. A. Benham, Nov. 1965, 101p. incl. illus. diagrs. tables, refs. (Technical rept. no. ME-17) (AFOSR-65-2673) (AF AFOSR-65-568) AD 625790 Unclassified

A model of homogeneous, isotropic material was developed in which pure dilatation could be produced and measured. Essentially, the model is a cube of resin epoxy each face of which is pulled by equal tensile force. The equal tensile forces were produced with a hydraulic triaxial tensile testing machine developed for this project. The states of strain were then measured and recorded. An embedded 3-dimensional strain gage rosette was used. Dilatation states were produced to within instrumentation error at a hydraulic pressure of 10 psig and carried through to the maximum level of 60 psig which induced an internal strain of approximately 400 mμ in/in. The instrumentation error is estimated to have an accumulative maximum of ± 9%. There was also an evaluation of the perturbative effects due to the loading device. Included were alignment perturbation causing additional bending moment in the model and excessive friction in the load cylinder causing unequalization of the triaxial loads.

LUMINESCENCE FROM TRANSITION-METAL COMPLEXES. TRIS(2, 2'-BIPYRIDINE)- AND TRIS(1, 10-PHENANTHROLINE) RUTHENIUM (II), by G. A. Crosby, W. G. Perkins, and D. M. Klassen. [1965] [6]p. incl. diagrs. (AFOSR-65-2386) (AF AFOSR-63-269) AD 626517 Unclassified

Also published in Jour. Chem. Phys., v. 43, 1498-1503, Sept. 1, 1965.

Absorption and emission spectra and mean lifetimes (τ_m) of the luminescence of tris(2, 2'-bipyridine)- and tris (1, 10-phenanthroline) ruthenium (II) are reported. For the 2, 2'-bipyridine complex, two weak absorption bands occurring at 15 050 cm^{-1} are assigned respectively to the $^1A_1 \rightarrow {}^3T_1$ and $^1A_1 \rightarrow {}^1T_1$ transitions of d-d type and the intense luminescence with origin at 17 250 cm^{-1} (τ_m = 5.92 μsec) is assigned to $^1T_1 \rightarrow {}^1A_1$ fluorescence. For the 1, 10-phenanthroline complex no intra-d transitions were observed in absorption but the bright luminescence with origin at 17 700 cm^{-1} (τ_m = 9.93 μsec) was assigned to $^1T_1 \rightarrow {}^1A_1$ fluorescence in analogy with the first compound. The energy levels are analyzed on the basis of an octahedral model, and empirical value for the Racah B and C parameters for Ru(II) and the crystal field parameter are evaluated. Possible uses of the compounds for lasers application are suggested. (Contractor's abstract)

SYMMETRIC INTEGRATION RULES FOR HYPERCUBES. I. ERROR COEFFICIENTS, by J. N. Lyness. [1965] [17]p. incl. table. (AFOSR 65-2698) (AF AFOSR-62-400) AD 628522 Unclassified

Also published in Math. Comput., v. 19, 260-276, Apr. 1965.

A compact notation is introduced to describe and systematise symmetric integration rules and the Euler-Maclaurin expansion is used to describe their error terms. The application to cytolic rules is discussed especially in relation to the number of function evaluations required. This paper is devoted exclusively to theory, illustrated by well-known results. This theory leads to new powerful integration rules which will be published shortly.

SYMMETRIC INTEGRATION RULE FOR HYPERCUBES. II. RULE PROJECTION AND RULE EXTENSION, by J. N. Lyness. [1964] [14]p. incl. table. (AFOSR 65-2950)(AF AFOSR-62-400) AD 629529 Unclassified

Also published in Math. Comput. v. 19 394-407, July 1965.

The purpose of this paper is to introduce a theory of rule extension by which an s-dimensional rule of particular degree may be used to construct an r-dimensional rule of predetermined degree. This is a generalization of the process which leads to a product rule. The particular feature of this process is that it is a linear process, once a set of nonlinear equations have been solved to obtain the s-dimensional rule, the higher-dimensional rule may be obtained by the application of linear algebraic formulae. Previously unpublished integration rules are derived.

INTEGRATION RULES OF HYPERCUBIC SYMMETRY OVER A CERTAIN SPHERICALLY SYMMETRIC SPACE, by J. N. Lyness. [1965] [6]p. (AFOSR-65-2957) (AF AFOSR-62-400) AD 628521 Unclassified

Also published in Math. Comput., v. 19: 471-476, July 1965.

A theory of integration rules suitable for integration over a hypercube and having hypercubic symmetry has recently been published. In this paper it is found that, with minor modification, this theory may be directly applied to obtain integration rules of hypercubic symmetry suitable for integration over a complete n-dimensional space with a weight function. As in the case of integration over hypercubes, an n-dimensional rule of degree $2t + 1$ may be constructed requiring a number of function evaluations of order $2^n t^t/t$ only.

SHAPE RESONANCES IN SUPERCONDUCTING CYLINDERS, by C. J. Thompson. [1965] [8]p. incl. diagrs. table. (AFOSR-65-2975) (AF AFOSR-62-400) AD 627546 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 1053-1060, June 1965.

The energy gap equation for a superconducting circular cylinder at zero temperature is solved numerically for diameters in the range 10-17 A.U. As for the uniform membrane, the energy gap shows pronounced resonances when considered as a function of size. The resonances occur each time an eigenvalue for motion perpendicular to the cylinder axis passes through the Fermi surface. The peaks of the resonances ($\sim 30°K$) lie well above the bulk value for the energy gap ($\sim 7°K$), the troughs below this value ($\sim 10^{-2}°K$). The peaks are very sharp and for most values of the diameter, the energy gap is small ($< 10^{-2}°K$), and shows a tendency to remain small. (Contractor's abstract)

A THIRD POSITRON LIFETIME IN SOLID POLYMERS, by S. J. Tao and J. H. Green. [1965] [5]p. incl. diagr. tables, refs. (AFOSR-65-2826) (AF AFOSR-62-398) AD 629086 Unclassified

Also published in Proc. Phys. Soc. (London), v. 85: 463-467, 1965.

Positron lifetimes have been measured in Teflon (PTFE), polyethylene, nylon 6, polypropylene and paraffin wax. Using equipment of good resolution, $W_{1/2} = 0.7$ nsec, wide range, 30 nsec, and highly linear response, three components of the lifetimes are found in each case. These are about 0·3 nsec, 0·6-1·1 nsec and 1·7-4·1 nsec. Two components only have been reported so far. A connection is found between the observed intensities of the longer components and the degree of crystallinity of the polymers, and an explanation is offered. The intensities of the long components vary according to the previous heat treatment of the polymer, especially in Teflon, in a way which depends on the physical structure of the solid. The identification of the three components should permit a useful re-examination of positron lifetimes in 'molecular materials'.

New South Wales U. Dept. of Nuclear and Radiation Chemistry, Kensington (Australia).

POSITRONIUM AND IT'S CHEMISTRY, by J. H. Green. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-66-0278) (AF AFOSR-62-398) AD 630228 Unclassified

Also published in Proc., Roy. Australian Chem. Inst. Jan. 1965, p. 7-12.

A positron may form a stable bound state with an electron which has been given the rather inexact name "positronium" and the symbol Ps. Experimental researchers since the pioneering work of Deutsch (1951) have now made it clear that positronium has three features of obvious chemical interest. It is a very simple atom (allowing it to qualify without a nucleus) analogous to hydrogen, it can exist and react in the triplet state, and it is an elementary free radical. These features make its possible chemical interactions very interesting indeed in their own right, and also as a diagnostic for better-known fast reactions. So much so that the recent edition of the well-known text by Friedlander and Kennedy contains a chapter on nuclear processes as chemical probes and deals with positronium, muonium, Mossbauer effect and angular correlation of γ-rays as examples.

POSITRON LIFETIMES IN NEUTRON- AND GAMMA-IRRADIATED POLYMERS, by J. H. Green and S. J. Tao. [1965] [4]p. incl. tables. (AFOSR-66-0281) (AF AFOSR-62-398) AD 630227 Unclassified

Also published in Brit. Jour. Appl. Phys., v. 16: 981-984, July 1965.

Positron lifetimes in neutron- and gamma-irradiated solid polymers of the degrading and cross-linking type, polytetrafluoroethylene (PTFE) and polyethylene, were measured. Variations in lifetimes and intensities of the short and long components of the longer positronium lifetime are qualitative indicators of the degree of crystallinity and free radical production in the polymers. In polyethylene τ_2 decreases rapidly as cross-linking increases with small doses, especially of neutrons; I_3 decreases quite slowly as the solid becomes more amorphous. In PTFE, radical production following chain scission leads to a rapid decrease in I_3 due to conversion of positronium and an increase in the ratio $I_2/(I_2 + I_3)$ indicates increasing crystallinity.

DIELECTRIC CONSTANT OF HYDROGEN-BONDED LIQUIDS, by W. Dannhauser. Final scientific rept. Feb. 1, 1961- Aug. 31, 1965. Sept. 1, 1965, 8p. (AFOSR-65-1939) (AF AFOSR-63-271) AD 626156 Unclassified

The principal goal of the project was to measure the dielectric constant of representative classes of hydrogenbonded liquids and to assess the influence of molecular structure (size and shape of the 'side chain' group) on intermolecular hydrogen-bond formation. Thirty-five compounds, representative of several classes of simple hydrogenbonded liquids, were investigated. Measurements quantitatively confirmed the intuitive conclusion that the extent of intermolecular, linear chain hydrogenbond formation is governed largely by an entropy effect, and particularly the shape, of the molecule is the most important specific variable in the intermolecular association process. An added attraction of dielectric measurements is that they provide the possibility of obtaining information about the rate of dipolar reorientation from a study of dielectric relaxation.

DIELECTRIC CONSTANT OF HYDROGEN-BONDED LIQUIDS. IV. EQUILIBRIUM AND RELAXATION STUDIES OF HOMOLOGOUS NEOALCOHOLS, by W. Dannhauser, L. W. Bahe and others. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-65-2384) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-271 and National Science Foundation) AD 628410 Unclassified

Also published in Jour. Chem. Phys., v. 43: 257-266 July 1, 1965.

The dielectric constants of $H-(CH_2)_n-C(CH_3)_2-CH_2OH$ with n = 1, 2, 3, 4, 6, and 8 have been measured from about -70° to 100° C with test frequencies 0.05 to 2×10^5 kc sec. The equilibrium dielectric constant is analyzed in terms of associative, hydrogen-bond equilibria as deduced from the temperature variation of the Kirkwood correlation factor and ΔH and ΔS of hydrogen bonding are estimated. Dielectric relaxation has been defined over several decades of time. The principal dispersion locus is Debye-like irrespective of wide variations in the apparent degree of association and $\Delta H^{\ddagger}$ and $\Delta S^{\ddagger}$ for relaxation are similar for all species. The relation of dielectric relaxation to equilibrium liquid structure is discussed and evidence for rotational mobility in solid neopentanol and neohexanol is presented.

MULTIPOLE POLARIZABILITIES AND SHIELDING FACTORS FROM HARTREE-FOCK WAVE FUNCTIONS, by P. W. Langhoff and R. P. Hurst. [1965] [11]p. incl. tables, refs. (AFOSR-65-1965) (AF AFOSR-63-191) AD 626501 Unclassified

Also published in Phys. Rev., v. 139: A1415-A1425, Aug. 30, 1965.

Electric dipole, quadrupole, and octupole polarizabilities and shielding factors are calculated for a large number of 2- to 20-electron S-state atoms and ions. The calculations are carried out within the frame-work of an uncoupled Hartree-Fock approximation, subject to the proviso that the exchange part of Fock potential is expressable as a multiplicative function. All zeroth-order functions used are of the analytical Hartree-Fock type. The resulting numerical values are found to be strongly sensitive to the quality of the Hartree-Fock function used in the calculation, in agreement with Sternheimer's previous conclusion. This point proves to be of special importance in the case of the negative ions. In addition, it is shown that the variational method pioneered by Das and Bersohn, if carried out under proper orthogonality conditions, is equivalent to the present uncoupled Hartree-Fock approximation. Finally, it is noted that the variational method used in this work is less accurate than the Sternheimer numerical method; however, use of the variational method allows some simplification in the computational procedure.

A STUDY OF THE VALENCE ELECTRON APPROXIMATION APPLICATION TO LiH, by J. D. Stuart and R. P. Hurst. [1965] [6]p. incl. tables, refs. (AFOSR 65-2803) (In cooperation with Johns Hopkins U., Silver Spring, Md.) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-191) and Bureau of Naval Weapons) AD 628261 Unclassified

Also published in Molec. Phys., v. 9: 265-270, July 30, 1965.

Using the valence bond approach and a 6 term wave function valence electron calculations are made of the energy and dipole moment of lithium hydride. Comparisons are then made with previous 2 and with 4 electron results. It is found that reasonable agreement with 4-electron calculations of the dipole moment is obtained when the valence orbitals are made orthogonal to the orbitals of the neglected lithium inner shell 1s electrons and that an approximate variational theorem for the energy is then valid. On the other hand, when one fails to require the valence orbitals to be orthogonal to the inner shell an energy lower than the 'experimental' energy can be obtained and the computed dipole moment is in poor agreement with the computed four-electron moment and with the experimentally determined moment. Finally, as with 4-electron calculations, hybridization with the 2p coval covalent structure is necessary to give a reasonable dipole moment.

DIPOLE AND HYPERPOLARIZABILITIES OF SOME

Also published in Jour. Chem. Phys., v. 43: 257-266 July 1, 1965.

The dielectric constants of $H-(CH_2)_n-C(CH_3)_2-CH_2OH$ with n = 1, 2, 3, 4, 6, and 8 have been measured from about -70° to 100°C with test frequencies $0.05 < f < 2 \times 10^5$ kc/sec. The equilibrium dielectric constant is analyzed in terms of associative, hydrogen-bond equilibria as deduced from the temperature variation of the Kirkwood correlation factor and ΔH and ΔS of hydrogen bonding are estimated. Dielectric relaxation has been defined over several decades of time. The principal dispersion locus is Debye-like irrespective of wide variations in the apparent degree of association and $\Delta H^{\ddagger}$ and $\Delta S^{\ddagger}$ for relaxation are similar for all species. The relation of dielectric relaxation to equilibrium liquid structure is discussed and evidence for rotational mobility in solid neopentanol and neohexanol is presented.

DIATOMIC MOLECULES POSSESSING PERMANENT ELECTRIC MOMENTS (Abstract), by R. P. Hurst and J. M. O'Hare. [1965] [1]p. [AF AFOSR-63-191] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 381, Mar. 24, 1965.

The energy u, in an external electric field, of a diatomic molecule having a permanent electric moment is expressible by $\mu = \mu_0 - \mu_i F_i - 1/2\, \alpha_{ij} F_i F_j - 1/6\, \beta_{ijk} F_i F_j F_k \ldots$. Here, μ_0 is the energy of the molecule out of the field, μ_i is the permanent dipole moment, α_{ij} is the dipole polarizability tensor, and β_{ijK} is the hyperpolarizability tensor. In this work, results are presented for μ_i, α_{ij} and β_{ijK} for some diatomic molecules that have permanent electric moments. The zero-order wavefunctions used in these calculations are the extended basis Hartree-Fock functions recently obtained by Chicago U. Laboratory of Molecular Structure and Spectra.

KINETICS OF PROTEIN SYNTHESIS BY POLYRIBOSOMES, by I. Gerst and S. N. Levine. [1965] [21]p. incl. diagrs. (AFOSR-65-2153) (Sponsored jointly by Air Force Office of Scientific Research under AF-AFOSR-64-667 and Office of Naval Research) AD 629848 Unclassified

Also published in Jour. Theoret. Biol., v. 9: 16-36, 1965.

A detailed deterministic model for the kinetics of polyribosome mediated protein synthesis is developed on the assumption that the kinetics of the system depends linearly on the messenger RNA concentration While the concentration of such components as adaptor RNA and ribosomes are regarded as constant, the messenger RNA input is taken to be time dependent and the analysis is given for both step and ramp inputs. It is shown that the theory predicts a nonlinear build-up in protein concentration followed by a linear phase in agreement with some experimental results. The slope of the linear portion corresponds to the rate of messenger RNA production.

STABLE AND UNSTABLE SILYL AND GERMYL COMPOUNDS, by S. Sujishi and T. D. Goldfarb. Final rept. Oct. 1, 1960-Sept. 30, 1965 [6]p. incl. table, refs. (AFOSR-67-0754) (AF AFOSR-63-277) Unclassified

The infrared spectra of several silyl and germyl compounds have been studied. It has been established that in GeH_3CN the germanium is attached to the carbon atom. The boron trifluoride adducts of hydrogen cyanide, methyl cyanide, silyl cyanide and germyl cyanide are iso-structural. No evidence has been found for p-d π- bonding between the cyanide and silyl or germyl groups in these compounds. The infrared and ultraviolet spectra of $(CH_3)_{3-n}(SiH_3)_nN$ (n = 0, 1, 2, 3) indicate that p-d π-bonding between the nitrogen and silyl groups is important. The crystal structure of $(CH_3)_2(SiH_3)N$ has been determined by x-ray diffraction and a novel pentameric unit involving pentavalent silicon has been found. The skeletal bond angles in $(GeH_3)_2O$ and $(GeH_3)_2S$ indicate that the extent of p-dπ-bonding in these molecules is smaller than in $(SiH_3)_2O$. However, the reactions of digermylsulfide with selected Lewis acids suggests a small degree of π-bonding. These reactions are different from those of either dimethyl sulfide or disily sulfide, and several new germyl compounds have been detected. Evidence has been obtained for the formation of silyl-aluminum bonds by the reaction of disilane with lithium aluminum hydride. The rate of reaction depends greatly on the nature of the ether used as the solvent. Independent I. R., Raman and N.M.R. studies indicate that lithium aluminum hydride forms ion pairs in the solvents with low reactivity.

ON THE RELATIVE TIME OF ADAPTIVE PROCESSES, by S. S. L. Chang. [1965] [7]p. incl. diagrs. table, refs. (AFOSR-65 2145) (AF AFOSR-64-542) AD 629057 Unclassified

Also published in IEEE Trans. on Automatic Control, v. AC-10: 11-17, Jan. 1965.

Adaptive control systems can be classified according

to the response time of the adaptive loop T_a relative to that of the main servo loop T_m. The response time T_a cannot be smaller than the time needed for making the required measurement on which the adjustments are based. In a slow adaptive system, $T_a > T_m$, and the adjustments are made according to the estimated situation or performance. If $T_a \ll T_m$, usually a reference model is chosen and the system is forced to conform to the reference model. Sometimes the reference model is dimensionless so that the fastest response can be obtained. In both cases, $T_a \gg T_m$ and $T_a \ll T_m$, the system can be analyzed by introducing suitable approximations. The condition of stability for the adaptive loop is derived in general terms. If $T_a \approx T_m$, both analysis and synthesis become difficult. The concept of "dual control" is introduced, but not developed in the paper.

AN EXTENSION OF ASCOLI'S THEOREM AND ITS APPLICATIONS TO THE THEORY OF OPTIMAL CONTROL, by S. S. L. Chang. [1965] [26]p. incl. refs. (AFOSR-65-2333) (AF AFOSR-64-542) AD 627778 Unclassified

Also published in Trans. Amer. Math. Soc., v. 115: 445-470, Mar. 1965.

Ascoli's theorem deals with continuous functions and states that the space of bounded, equicontinuous functions is compact. The present paper extends it to the measurable functions. The space of bounded equimeasurable functions, is compact, and it contains the bounded equicontinuous functions as a subset. The above theorem is applied to 2 problems in the theory of optimal control: (1) To give an existence proof of optimal control among allowed control functions which are measurable and enter the system equations in a nonlinear manner; and (2) To derive a necessary condition for optimal control in bounded phase space. The condition is different and simpler than the one derived previously by Gamkrelidze. It is proved to be also sufficient for linear systems, and its applications to engineering problems are given in previous papers.

SOLUTION OF THE HYDRODYNAMIC EQUATIONS FOR LAMINAR TIME-INDEPENDENT FLAMES WITH ARBITRARILY LARGE DEVIATIONS FROM THE KINETIC STEADY STATE, by E. S. Campbell. [1965] [10]p. incl. diagrs. refs. (AFOSR-65-1473) (AF 49(638)169) AD622690 Unclassified

Also published in Combustion and Flame, v. 9: 43-52, Mar. 1965.

For the study of flame processes and their variation with fuel properties, a method is proposed suitable for large deviations from the kinetic steady state. A computer program which carries out the integration of the hydrodynamic equations subject to mathematical instability is presented in the minimum detail necessary for general use. The program has been successfully tested on the ozone-oxygen system. Further tests used as evidence for the validity of the system are given. Results are used to interpret a previous study of the hydrogen-bromine system.

COMPUTER CALCULATIONS FOR A PERFECT CRYSTAL OF MULTIPOLES, by E. S. Campbell. [1965] [14]p. incl. table. AF AFOSR-63-14 Unclassified

Published in Jour. Phys. and Chem. Solids, v. 26: 1395-1408, Sept. 1965.

A general method is proposed, which tests have shown to be convenient, for the study of how the following quantities vary with molecular orientation at the lattice sites: (1) the potential produced by a perfect crystal of multipoles; (2) the interaction energy with a second multipole; (3) the self-energy and self-potential of a primitive lattice. To make a study of the variation with molecular orientation feasible, it has been necessary to decompose the calculation into 3 stages: stage Ia is a function solely of crystal geometry; stage Ib, which involves the most calculation, can be greatly shortened by the use of any molecular symmetry; stage II, which is very short compared with stage I, is the only one which requires a quantitative knowledge of the multipole moments, and, therefore, of the charge distribution. The form of the proposed procedure—the result of a study of the ice lattice—has been shown to reduce markedly the computation required and to permit convenient error checks. Numerical constants required for calculations of orders < 5 are given. (Contractor's abstract)

COMPENSATION OF PLANT VARIATIONS IN OPTIMAL CONTROL SYSTEMS, by F. J. Alexandro, Jr. [1965] [6]p. incl. diagr. (AF AFOSR-62-321) Unclassified

Published in IEEE Trans. Automatic Control, v. AC-19: 275-280, July 1965.

Control of a linear plant, with bounded control input, may be implemented by constructing a control law generator which produces the optimal control as a function of the state variables. If the plant parameters differ from their nominal values, then maintaining optimal control by changing the control law generator is inconvenient since the control law is usually nonlinear. It is shown that in certain cases optimal control can be maintained without changing the control law generator. This is accomplished by using a linear transformation of state variables as the input to the control law generator. The variations of the plant are compensated for by changing the linear transformation. The conditions under which this possible are established in this paper. The advantage of this system is that a change in a linear function is easier to implement than a change in a nonlinear function. It is shown how this system can be incorporated into an adaptive system which compensates for plant variations. (Contractor's abstract)

THE EQUIVALENCE OF DIGITAL AND ANALOG SIGNAL PROCESSING, by K. Steiglitz. [1965] [12]p. Incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-321 and National Science Foundation) Unclassified

Published in Inform. and Control, 8: 455-467, Oct. 1965.

A specific isomorphism is constructed via the transform domains between the analog signal $L^2(-\infty, \infty)$ and the digital signal space l_2. It is then shown that the class of linear time-invariant realizable filters is invariant under this isomorphism, thus demonstrating that the theories of processing signals with such filters are identical in the digital and analog cases. This means that optimization problems involving linear time-invariant realizable filters and quadratic cost functions are equivalent in the discrete-time and the continuous-time cases, for both deterministic and random signals. Finally, applications to the approximation problem for digital filters are discussed. (Contractor's abstract)

A REGION CONCEPT AND ITS APPLICATION TO THRESHOLD LOGIC, by P. Kaszerman. [1965] [21]p. incl. diagr. refs. (AFOSR-65-2684) (AF AFOSR-63-24) AD 628827 Unclassified

Also published in Inform. and Control, v. 8: 531-551, Oct. 1965.

The concept of a "region of vertices" is introduced and precisely defined. Boundary, interior, and exterior vertices are defined. It is proved that a necessary and sufficient condition that a Boolean function be a threshold function is that the boundary TRUE vertices be separable from the boundary FALSE vertices. This leads to a simpler characterization of a threshold function than the original defining inequalities. The functions that are generated by a 2-threshold device network are examined for the properties in terms of regions of TRUE and FALSE vertices. By making use of these properties, synthesis procedures are developed. (Contractor's abstract)

COMPUTER STORAGE AND ANALYSIS OF CONTOUR MAP DATA, by S. P. Morse. Feb. 1965, 62p. incl. diagrs. table. (Technical rept. no. 400-106) (AFOSR-65-0592) (AF AFOSR-65-24) AD 617955 Unclassified

This report describes a method for storing and analyzing contour map data in a digital computer. The data is stored in the so-called contour-line-storage form. This form represents the contour lines in terms of sequences of octally encoded, short, straight-line segments. Algorithms can be developed to analyze the data directly in this form. In some cases, however, it may be advantageous first to convert the data into a form more suitable for the particular analysis. In this report, algorithms are described for locating the ground profile of a given path on a map, generating the gradient at a point on the map, and finding the volume between two elevations. As an illustration, some of the algorithms are applied to the problem of locating the ground track of an aircraft from the pilot's record of heading and altitude vs. time. This problem involves selecting certain ground tracks as "likely candidates," generating the ground profile for each of these tracks, comparing these ground profiles with the pilot's record of altitude vs. time, and then selecting the "candidate" that most closely agrees with the pilot's record.

A CRITERION FOR THE QUANTIZATION OF LINE-DRAWING DATA, by J. M. Glass. May 1965, 151p. incl. diagrs. tables, refs. (Technical rept. no. 400-112) (AFOSR-65-1495) (AF AFOSR-65-24) AD 621086 Unclassified

The digital transmission of line-drawing data requires that the data first be quantized. Since quantization tends to degrade the original data, it is desirable to employ as fine a quantization as possible. A criterion is developed for enabling one to determine the coarest possible quantization that will preserve the original data to within a specified tolerance. In the criterion developed, line drawings are thought of as thin elastic beams, which can be characterized by means of their strain-energy density functions. Quantization is seen to result in a spreading of these density functions, creating an uncertainty region in an energy space, the uncertainty decreasing with finer quantization. Of the possible continuous reconstructions that can be generated from the quantized data, there is one that is of particular interest - the minimum-energy curve. An appropriate quantization is determined by requiring that the total energies of the minimum-energy curve and the original curve be within a specified tolerance.

ANALYSIS OF A CONTOUR MAP ON A CLOSED SURFACE, by S. P. Morse. Sept. 1965, 29p. incl. diagrs. tables. (Technical rept. no. 400-123) (AFOSR-66-0693) (AF AFOSR-65-24) AD 631670 Unclassified

The various components of a contour map are defined, and a point of view is introduced that aids in developing insight into the properties of contour maps. Contour lines of intersection of a surface with reference surfaces. The contour lines can be classified into four classes: positive, negative, maximum, and minimum. If the surface is closed, such as the Earth's surface, positive and negative contour lines are always closed curves. Where the surface is perpendicular to the reference surfaces, a cliff is formed. A cliff line on a contour map is characterized by a merger of different contour lines. There is a graphical technique for determining where the various contour lines enter and leave a cliff line. A method exists for truncating the contour map so that it covers only a portion of a closed surface and still maintains the closed-curve property of contour lines. By defining an outer boundary, one is able to talk about the interior and exterior of those contour lines that are closed curves. Lines of slope are lines that are everywhere perpendicular to the contour lines. Slope contour lines are contour lines for the slope of the surface. The former is concerned with the direction of the gradient, the latter with its magnitude

ON AN EXTENDED CLASS OF ERROR-LOCATING CODES, by J. K. Wolf. [1965] [7]p. (AFOSR 65-2064) (AF AFOSR-65-499) AD 627687 Unclassified

Also published in Inform. and Control, v. 8: 163-169, Apr. 1965.

An explicit method of constructing error-location (EL) codes is presented for the case where errors occur in multiple sub-blocks. The procedure is applicable both when the erroneous sub-blocks occur randomly throughout the message and when they occur in bursts. The method allows for a wide range in redundancy and error-location capability. The method of construction is outlined for an EL code which locates errors occurring within 2 or fewer random sub-blocks. A general decoding procedure for the codes is presented.

UNEQUAL ERROR PROTECTION CODES, by B. J. Masnick and J. K. Wolf. [1965] [8]p. incl. tables, refs. (AFOSR-66-0109) (AF AFOSR-65-499) AD 641060 Unclassified

Also published in IEEE Mohawk Valley Commun. Symposium, Oct. 1965, p. 205-212.

The theoretical basis for the construction of a new class of linear codes which provides different levels of error protection for different digits of the code word is introduced. Examples of such codes are presented and some construction methods are devised and verified. Upper and lower bounds on the required redundancy for such codes are derived.

IDENTIFICATION OF THE STEADY STATE OPERATOR FOR DISCRETE SELF-OPTIMIZING SYSTEMS, by P. E. Sarachik. [1965] [3]p. incl. diagrs. (AFOSR-65-2075) (AF AFOSR-65-747) AD 277738 Unclassified

Also published in IEEE Trans. on Automatic Control, v. AC-10: 83-85, Jan. 1965.

It is shown that the self-optimization problem for unknown and in general nonlinear discrete time plants can be solved by an iterative procedure which alternates identification with optimization stages. It is further pointed out that when a plant is dynamic, care must be taken to insure that the plant is characterized by a unique fixed operator. For type-zero and type-one plants it is shown that by properly constructing a periodic input and allowing the plant to come to the periodic steady-state, the plant is correctly characterized by a steady-state operator. Finally, methods for performing the required identification are discussed.

FUNCTIONAL ANALYSIS IN AUTOMATIC CONTROL, by P. E. Sarachik. [1965] [12]p. incl refs. (AFOSR-65-2076) (AF AFOSR-65-747) AD 627683 Unclassified

Also published in IEEE Internat'l. Conv. Rec., 1965, p. 96-107.

Some recent applications of functional analysis to automatic control problems are described. A sufficient introduction to basic concepts is given to make the paper self-contained. Applications to the minimum norm and minimum time problems are discussed and it is shown that an analytical form of the optimal solution can be readily found by using certain functional analysis concepts. It is indicated how the iteration techniques for solution of operator or functional equations in a Banach space can be applied to generate a computational algorithm for obtaining the solution to an optimization problem. It is also which how the functional analysis approach can reveal what particular properties of an unknown system must be identified in order to solve an optimization problem.

CONTROLLABILITY AND OBSERVABILITY OF LINEAR DISCRETE-TIME SYSTEMS, by P. E. Sarachik and E. Kreindler. [1965] [14]p. incl. diagr. (AFOSR-65-2077) (Sponsored jointly by Aeronautical Systems Division; and Air Force Office of Scientific Research under AF AFOSR-65-747) AD 627717 Unclassified

Also published in Internat'l. Jour. Control, v. 1: 419-432, May 1965.

A system is considered to be completely controllable if any initial state can be transferred to any other state in finite time; it is completely observable if the state at any time can be determined from knowledge of the inputs and outputs over a finite time. In this paper a self-contained development is presented of the subject of controllability and observability of discrete-time systems. It is noted that the discrete-time case is directly analogous to the continuous-time case. In fact, most of the results for the discrete-time case can be obtained from the continuous-time case by replacing the continuous-time variable t with discrete points t_k on the t-axis and by replacing integrals with summations. However, some differences exist, and a direct and independent approach to controllability and observability is used here to avoid such differences and to consider the more general discrete-time systems.

CONVECTIVE INSTABILITY IN A COMPRESSIBLE ATMOSPHERE, by E. A. Spiegel. [1965] [23]p. incl. diagrs. tables, refs. (AFOSR 65-2827) AF AFOSR-62-386) AD 628525 Unclassified

Also published in Astrophys. Jour., v. 141: 1068-1090, Apr. 1, 1965.

The linear equations for time-independent convection in a plane-parallel layer of perfect gas are studied for the case of constant viscosity and conductivity. These equations determine the condition for the onset of steady convection. The equations are treated from 3 points of view. First a perturbation expansion in terms of layer thickness is carried out to first order. The zeroth-order terms give the Boussinesq equations studied by Lord Rayleigh. The first-order terms show that if the Rayleigh number is evaluated at the mid-height of the layer, its eigenvalues are stationary with respect to variations in layer thickness. The first-order eigenfunctions are numerically calculated for a particular polytropic index. Next, 2 variational statements are written and some sample numerical results are presented. It is found that variational techniques are not effective in the present problem. The WKB approach is then explored and extended to the determination of uniformly valid asymptotic solutions. These provide not only stability criteria (from which explicit numerical results are derived), but also produce analytic approximations for all the eigenmodes. This method appears to be generally useful for problems of this kind. (Contractor's abstract)

THE PULSATIONS OF MODELS OF DELTA CEPHEI STARS. II, by N. Baker and R. Kippenhahn. [1965] [22]p. incl. diagrs. table, refs. (AFOSR-66-1687) (AF AFOSR-62-386) AD 640197 Unclassified

Also published in Astrophys. Jour., v. 142: 868-889, Oct. 1, 1965.

The vibrational stability of detailed models of δ Cephei stars is studied by numerical integration of the linearized non-adiabatic pulsation equations. In contrast to a previous investigation, improvements in the method of integration allow the non-adiabatic calculations to be carried from the surface layers deep into the star. The periods are also determined from the models. It is found that both the period and the stability coefficient can be evaluated to high accuracy on the basis of the outer half (in mass) of the star. The effect of convection on the structure of the equilibrium models is included; the interaction of convection with the pulsations is neglected. Boundary conditions are discussed in detail in an appendix. A series of 15 models of 7 Mo lying along a portion of the evolutionary track calculated by Hofmeister, Kippenhahn, and Weigert has been investigated. The results confirm the existence of a region of linear instability, due largely to the destabilizing effect of second helium ionization, in a range of mean effective temperatures centered at about 5400°K. The instability is present for both the fundamental mode and the first overtone. In contrast to previous work, the hydrogen and first helium ionizations are found to contribute significantly to the destabilizing effect, especially for the overtones. The instability zone is wider in terms of effective temperature than is indicated by observations, and the temperatures of the most unstable models appear to be several hundred degrees lower than the observed temperatures of δ Cephei stars. The results are consistent with those of our previous work and of Cox. Possible consequences of the neglect of non-linear effects are discussed in a general way.

GENERALIZED EIGENVECTORS AND SEPARATION OF VARIABLES, by M. Machover. [1965] [20]p. incl. refs. (AFOSR-65-2735) (AF AFOSR-62-108) AD 629085
Unclassified

Also published in Trans. Amer. Math. Soc. v. 115: 505-524, Mar. 1965.

Consider the reduced wave equation $(\nabla^2 + k^2)u(x, y) = f(x, y)$ on a rectangle R, with suitable boundary conditions; k may be complex and the boundary conditions non-selfadjoint. The author treats this problem by separation of variables, and is thereby led to consider expansions in terms of generalized eigenvectors. { The latter term is used in the operator-theoretic sense, and not in the sense of generalized functions. } The main tool is an expansion theorem of G. Birkhoff. Some more general problems of separable type are considered briefly.

SOLUTION OF THE BOLTZMANN EQUATION IN AN UNBOUNDED DOMAIN, by H. Grad. [1965] [10]p. (AFOSR-65-1357) (AF AFOSR-62-266) AD 621471
Unclassified

Also published in Commun. Pure and Appl. Math., v. 18: 345-354, Feb.-May 1965.

Infinite full 3-dimensional space obviously generates no interference from boundary layers. For solutions of the linear Boltzmann equation in this domain, the technical point in obtaining a priori estimates is the vanishing of a certain boundary integral. For the rectangular box this is observed almost by inspection. In the unbounded domain it requires an additional estimate of a sufficiently rapid decay at infinity. In this report such an estimate is obtained.

ON BOLTZMANN'S H-THEOREM, by H. Grad. [1965] [19]p. (AFOSR-65-2334) (AF AFOSR-62-266) AD 629536
Unclassified

Presented at SIAM National Meeting, Washington, D. C., May 13-14, 1964.

Also published in Jour. Soc. Indus. and Appl. Math., v. 13: 259-277, Mar. 1965.

It is a classical result for solutions of the Boltzmann equation that Boltzmann's H-function, decreases monotonically with time, but ceases to decrease if the distribution function becomes locally Maxwellian. If, after a time, the system were to become precisely locally Maxwellian it would cease to be dissipative and the H-function (which then reduces to the negative thermodynamic entropy) would henceforth remain constant at a value higher than that appropriate to thermodynamic equilibrium. In order to demonstrate an approach to equilibrium, it is necessary to show not that the distribution approaches a Maxwellian, but that it does not approach a local Maxwellian too closely or too soon. In this paper we prove, for a general form of linear Boltzmann equation, that under appropriate boundary conditions all solutions approach equilibrium. The proof uses recent strong estimates of solutions of the linear Boltzmann equation.

STRUCTURE OF THE BOLTZMANN COLLISION OPERATOR, by L. Finkelstein. [1965] [6]p. incl. diagrs. (AFOSR-65-2335) (AF AFOSR-62-266) AD 629152
Unclassified

Also published in Phys. Fluids, v. 8: 431-436, Mar. 1965.

The full Boltzmann collision operator with an infinite collision cross section is investigated. It is shown that in the general case the operator is bilinear in F and $\partial F/\partial \xi$ and 3 different representations of it are given. The linearized collision operator is further explored and a new expression for the kernel in the form of a divergence is obtained. An approximation to the linearized operator is indicated, which may prove of value in numerical calculations. (Contractor's abstract)

STEADY STATE OSCILLATIONS IN A CAS, by H. Weitzner. [1965] [20]p. incl. diagrs. refs. (AFOSR-66-1200) (AF AFOSR-62-266) AD 640241
Unclassified

Also published in Rarefied Gas Dynamics; Proc Fourth Internat'l. Symposium, Toronto U. (Canada) (July 14-17, 1964) ed. by J. H. de Leeuw. New York Academic Press, v. 1: 1-20, 1965.

The linearized 1-dimensional Krook equation is solved for the case of a half-space of gas bounded by an oscillating wall. This situation corresponds to the commonly studied problem of the propagation of sound in a gas. The question of when a sound wave is observable is considered. Unless 2 conditions hold the sound wave will be lost in a larger, irregular disturbance. First, the observation must be taken many mean free paths from the wall. Second, the wave train is observable only for a limited length, and the number of wavelengths seen is of the order of the collision frequency over the oscillations frequency. THE TRANSISTIONAL DRAG ON A CYLINDER AT HYPERSONIC MACH NUMBERS, by M. H. Rose. [1965] [15]p. incl. diagrs. tables. (AFOSR-66-1201) (AF AFOSR-62-266) Unclassified

Also published in Rarefield Gas Dynamics; Proc. of the Fourth Internat'l. Symposium, Toronto U. (Canada) (July 14-17, 1964) ed. by J. H. de Leeuw, New York Academic Press, v. 1; 312-324, 1965.

The drag on a cylinder traversing a neutral, rarefied gas is computed in the hypersonic range. Although intermolecular collisions are assumed rare they are not entirely negligible and, therefore, will give rise to a small departure from free-flow conditions. The mathematical procedure is similar to that previously applied to the case of a sphere. Using the identical boundary conditions for both geometries, it is then possible to gain some insight into the effect of shape upon drag. Comparisons are also made with the theoretical results obtained for an infinite, two-dimensional strip. Finally, an attempt is made to relate the theoretical predictions for the cylinder with the presently available experimental results. (Contractor's abstract)

ATOMIC-HYDROGEN RECOMBINATION (Abstract), by A. Salop and A. Mandl. [1965] [1]p. [AF AFOSR-62-266] Unclassified

Presented at meeting of the Amer. Phys. Soc., Columbia U., New York, June 23-25, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 596-597, June 23, 1965.

Studies are being made of the recombination of atomic hydrogen in the after glow of an rf discharge by observing resonant absorption of radiation at the atomic-hydrogen hyperfine frequency (1420 mc/sec). Large-volume (1 liter), sealed bottles filled with reagent-grade hydrogen at pressures in the range of 0.8-2.5 mm Hg are placed directly within the cavity of a 1420 mc/sec magnetic-resonance spectrometer and subjected to a pulsed 7-mc/sec electrodeless discharge at a repetition rate of typically 1.5 sec. Sampling pulses of 1420-mc/sec radiation at the same repetition rate are passed into the cavity but are phased so as to occur at a time T after the appearance of the discharge pulses. The absorption line, characteristic of the afterglow at time T, is obtained and, under the assumption that hydrogen-hydrogen spin-exchange collisions are the primary cause of line broadening, the atomic concentration is determined from an analysis of the lineshape. By varying T over the effective afterglow time, the atomic recombination may be investigated. Measurements of the efficiency for the 1st-order recombination at glass and quartz surfaces are discussed.

TRANSPORT COEFFICIENTS FOR SYSTEMS WITH STEEP INTERMOLECULAR POTENTIALS, by R. G. Storer and H. L. Frisch. [1965] [2]p. (AF AFOSR-62-266) Unclassified

Published in Jour. Chem. Phys., v. 43: 4539-4540, Dec. 15, 1965.

A formal high-temperature perturbation expansion of the thermal transport coefficients of a fluid has recently been obtained, starting with the Kubo-Green correlation-function expressions and choosing the rigid-sphere fluid as the reference system. Further consideration is given to the expansion of the self-diffusion coefficient D in powers of n^{-1} where n is a measure of the steepness of the intermolecular potential. The result expressed is in a form which is suitable for calculation via molecular-dynamics data for rigid sphere generated on a computer.

THE CONCEPT OF MATHEMATICS HISTORICALLY SURVEYED, by M. Kline. [1965] [22]p. [AF AFOSR-64-537] Unclassified

Published in Science in the Sixties; Tenth Anniversary AFOSR Scientific Seminar, Cloudcroft, N. M. (June 14-25, 1965), ed. by D. L. Arm. Albuquerque, New Mexico U. Office of Publications, 1965, 10-31.

A broad account of the nature of mathematics and its relation to science is presented. The author's aim is to show that the 2 distinguishing characteristics of mathematics which in the past have been accepted as paramount-its rigorous methodology and its claim to truth-are invalid. After the classical Greeks contributed Euclidean geometry, insisting on the rigorous establishment of mathematics from self-evident truths, the Alexandrian Greeks created trigometry, thus giving arithmetic and algebra equal importance with geometry although they had no logical foundation. In the scientific period from the 1500's onward, the position of algebra and geometry were reversed; conclusions about geometry were to be established by algebraic reasoning. The nineteenth century creation of non-Euclidean geometry showed that the logic of Euclidean geometry was deficient and initiated the destruction of truth. However, mathematics preserved its power due to its achievements in science. By 1900, mathematicians restored the rigorous logical foundations of their subject, but paradoxes and the problem of consistency still exist. The present understanding of the nature of mathematics and its direct relation to science are discussed.

HALOGEN DERIVATIVES OF CO-ORDINATED GALLIUM HYDRIDE, by N. N. Greenwood and A. Storr. [1965] [8]p. incl. tables, refs. (AFOSR-65-1645) [AF EOAR-62-27] AD 624372 Unclassified

Also published in Jour. Chem. Soc. (London), v. 620: 3426-3433, May 1965.

The compounds, $Me_3NGaH_{3-n}X_n$ and $Me_3NGaD_{3-n}X_n$ have been prepared and their infrared spectra recorded in benzene solution in the range 200-4000 cm^{-1}. These spectra show several interesting features that are related to the substitution of hydrogen by halogen. The methyl-proton nuclear magnetic resonance spectea of these compounds in benzene solution have also been recorded. The monosubstituted halogenogallanes, Me_3NGaH_2X, are white, slightly volatile solids, which can be purified by vacuum sublimation. The disubstituted halogenogallanes, Me_3NGaHX_2, and the fully halogenated compounds, Me_3NGaX_3, are all involatile white solids. Displacement of trimethylamine from the adduct Me_3NGaH_2Cl by boron trifluoride results in the liberation of unco-ordinated GaH_2Cl which subsequently decomposes at low temperatures even in solution. An attempt to prepare the borohydride derivative, $Me_3NGaH_2(BH_4)$, leads to decomposition to gallium metal and hydrogen.

GALLIUM HYDRIDE ADDUCTS OF TRIMETHYLPHOSPHINE AND TRIPHENYLPHOSPHINE, by N. N. Greenwood, E. J. F. Ross, and A. Storr. [1965]. [6]p. incl. diagr. refs. (AFOSR-65-1276) (AF EOAR-64-79) AD 622771 Unclassified

Also published in Jour. Chem. Soc., v. 246: 1400-1406, Feb. 1965.

The new compounds Me_3PGaH_3 and Me_3PGaD_3 have been prepared and shown by their gas-phase infrared spectra to be monomeric. The P-Ga stretching frequency has been identified at 326 cm^{-1}. The absence of a 2: 1 adduct, $(Me_3P)_2GaH_3$, was shown by tensiometric titration at -21°C. Gas-phase displacement reactions indicate that trimethylamine and trimethylphosphine have similar donor strengths towards gallium hydride. The corresponding aluminum hydride adduct Me_3PAlH_3 could not be prepared directly, and tri- and trimethylphosphine does not displace trimethylamine from Me_3NAlH_3. The compound Ph_3PGaH_3 has been prepared but readily decomposes at room temperature. The equilibrium between trimethylamine, trimethylphosphine, and their adducts with gallium hydride in benzene solution has been investigated by nmr spectroscopy.

FLOWING GAS DISCHARGES IN POTASSIUM AND MERCURY, by C. A. Guderjahn. July 1, 1965, 31p. incl. diagrs. tables. (AFOSR-65-1914) (AF 49(638)1222) AD 628187 Unclassified

The resistivity of superheated potassium and mercury vapor was measured. Substantial heating of the gas by the discharge was avoided by flowing the gas through the discharge region. The resistivity of potassium gas at 7.8 torr pressure, 870°K and 1 amp/cm^2 current is 2.2 ohm-cm. The resistivity of mercury gas at 14 torr pressure, 870°K and 0.67 amp/cm^2 current is 10 ohm-cm. The resistance was primarily due to short range electron-neutral atom collisions. The cross section for this process as calculated from the resistivity is 1.5×10^{-14} cm^2 for potassium and 2.5×10^{-14} cm^2 for mercury. Radiation losses were neglected in this calculation. An experimental MGD device using potassium as the working fluid was constructed. Ionization was to be nonequilibrium and provided by magnetic induction. Self-sustained operation was not achieved due to internal shorting by potassium films on insulator surfaces.

LOW-PRESSURE HIGH-CURRENT DISCHARGES IN MOVING GASES (Abstract), by C. A. Guderjahn [1965] [1]p. (Bound with its AFOSR 65-1266; AD 622527) AF 49(638)1222 Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles Calif. Apr. 29-30, 1965.

The conductivity of discharges in superheated potassium and mercury vapor has been measured. The measurements were carried out in flowing gas at about 10 torr pressure. The electric field within the potassium vapor plasma column was measured to be 2.3 v/cm and was nearly independent of current between 0.5 and 7 amp. This sustaining field is associated with the energy required for ionization and could be exceeded by the $\vec{v} \times \vec{B}$ field in an MGD device operating at readily obtainable velocities and magnetic fields. The mercury vapor plasma column required about 3.5 v/cm at 1 amp current and was dependent upon the current to a greater extent than the potassium vapor.

STEADY-STATE ROCKET COMBUSTION OF GASEOUS HYDROGEN AND LIQUID OXYGEN. PART II. ANALYSIS FOR COAXIAL JET INJECTION, by L. P. Combs and M. D. Schuman. Mar. 1965, 134p. incl. illus. diagrs. tables, refs. (Research rept. no. 64-29) (AFOSR-65-1319) (AF 49(638)817) AD 623401 Unclassified

Simultaneous equations describing rocket propellant injection, atomization, mixing, vaporization, and combustion are formulated for a cylindrical liquid oxygen jet surrounded by an annular gaseous hydrogen stream. The formulation is based on division of the combustion chamber into a nonburning region near the injector and a combustion region further downstream. Processes in the nonburning region are required to satisfy certain combustibility criteria before combustion is possible. The propellants then pass through a plane flame front into the combustion region. A simplified treatment of turbulent mixing between unlike reacting gas streams, one of which contains a liquid oxygen spray, characterizes the combustion region model. Solutions of the system of equations, obtained with a digital computer program, are detailed, discussed, and compared favorably with experimental information from Part I.

RESPONSE OF A BURNING SOLID PROPELLANT TO PRESSURE WAVES OF FINITE AMPLITUDE, by A. L. Huebner and T. A. Coultas. June 1965, 72p. incl. diagrs. tables, refs. (Rept. no. R-6213) (AFOSR-65-1733) (AF 49(638)1208) AD 624944 Unclassified

Shock-tube techniques are utilized to determine the response of a burning solid propellant surface to pressure perturbations of small, but finite amplitudes. This method of obtaining propellant responses is described with emphasis upon the techniques developed to remove undesirable temperature gradients. Other experimental techniques utilized to obtain high-frequency response pressure measurements under reproducible pressure, flow, and temperature conditions are described. The propellants used in the study include those with a wide range of pressure exponents as well as absolute burning rate. A discussion of the treatment of the experimental data to obtain Fourier transforms and the propellant response as a function of frequency is presented, with particular emphasis upon the significance and reproducibility of the data. A comparison of these results is made with empirical instability data as well as theory.

ON THE HYPERSONIC FLOW OVER A DELTA WING WITH VERY SUPERSONIC LEADING EDGES, by N. D. Malmuth. Jan. 11,-Mar. 7, 1965. June 1, 1965, 23p. incl. diagrs, table, refs. (AFOSR-65-0757) (AF 49(638)1477) AD 618294 Unclassified

For the case of very supersonic leading edges, the inviscid hypersonic flow over the windward side of a symmetrical flat-plat delta wing at incidence is analyzed. The limit selected is that the incidence is of higher order than the aspect ratio as the incidence tends to zero at infinite Mach number. In this framework, the flow regions consist of a two-dimensional domain adjacent to the leading edges and a central conefield. The flow quantities in the central region represent small linear, rotational perturbations about the zero sweep flow. A Riemann-Poincare boundary value problem for the pressure perturbation is formulated. An additional condition involving the sidewash at the shock is found to be required to resolve the indeterminacy of the foregoing boundary value problem. Series solutions and numerical results are presented for the shock shape and the pressure. The behavior of the latter quantity is found to be similar to that given by the irrotational linear solution for the supersonic leading edge case. Finally, the relationship between the present application and others involving diffraction problems and corner flows is indicated. (Contractors' abstract)

A RELATION INVOLVING HANKEL TRANSFORMS WITH APPLICATIONS TO BOUNDARY VALUE PROBLEMS IN POTENTIAL THEORY, by I. N. Sneddon. [1965] [8]p. (AFOSR-66-2108) (AF 49(638)1159) AD 643563 Unclassified

Also published in Jour. Math. and Mech., v. 14: 33-40, Jan. 1965.

A classical problem of mathematical physics is that of determining the potential of the electrostatic field due to a circular disk whose potential is prescribed. One method of solving this problem is to determine the charge density on the disk and then to calculate the potential at a field point r by evaluating a surface integral over the surface of the disk. In the case in which the prescribed potential of the disk is a function only of the distance from the center of the disk, it has been shown that the charge density can be computed. This paper shows that this representation of the charge density is a special case of a general relation between Hankel transforms which are of interest in the discussion of axisymmetric boundary value problems of potential theory.

THE RELATION BETWEEN LOAD AND PENTRATION IN THE AXISYMMETRIC BOUSSINESQ PROBLEM FOR A PUNCH OF ARBITRARY PROFILE, by I. N. Sneddon. [1965] [11]p. incl. refs. (AFOSR-66-2112) (AF 49(638)1159) AD 643564 Unclassified

Also published in Internat'l. Jour. Eng. Sci., v. 3; 47-57, May 1965.

A solution of the axisymmetric Boussinesq problem is derived from which are deduced simple formulas for the depth of penetration of the tip of a punch of arbitrary profile and for the total load which must be applied to the punch to achieve this penetration. Simple expressions are also derived for the distribution of pressure under the punch x and for the shape of the deformed surface. The results are illustrated by the evaluation of the expressions for several simple punch shapes. (Contractor's abstract)

THE STRESS ON THE BOUNDARY OF AN ELASTIC HALF-PLANE IN WHICH BODY FORCES ARE ACTING, by I. N. Sneddon. [1965] [7]p. (AFOSR-66-2113) (AF 49(638)1159) AD 643566 Unclassified

Also published in Proc. Glasgow Math. Assoc., v. 7 (Pt. 1): 48-54, Jan. 1965.

In this paper the problem of determining the stress on the boundary y = 0 of the elastic half plane y 0 when there are prescribed body forces acting in the interior and the boundary is free from applied stress is considered. The Laplace transform is used to calculate the distribution of stress and the form of the displacement vector on the boundary. Also the basic formulas corresponding to an arbitrary distribution of body forces are derived. The forms of surface stress corresponding to 3 special cases are considered, namely, body forces acting in a direction normal to the boundary, point force, and body forces derivable from a potential function. Finally expressions are derived for the components of the surface displacement.

A NOTE ON THE PROBLEM OF THE PENNY-SHAPED CRACK, by I. N. Sneddon. [1965] [4]p. (AFOSR-66-2114) (AF 49(638)1159) AD 643565 Unclassified

Also published in Proc. Cambridge Philos. Soc., v. 61; 609-611, Apr. 1965.

This paper considers the problem of determining the distribution of stress in the neighborhood of a penny-shaped crack. Simple expressions are derived for the calculation of the stress intensity factor and the energy required to open up the crack in terms of a general (axisymmetric) pressure distribution. The solution is based on an elementary solution of a pair of dual integral equations.

THE USE OF TRANSFORM METHODS IN ELASTICITY, II, by I. N. Sneddon. June 7, 1965, 118p. incl. diagrs. tables, refs. (AFOSR-65-0875) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-444, Army Research Office (Durham), and Office of Naval Research) AD 466098 Unclassified

The application of the theory of integral transforms is considered for the solution of certain boundary value problems in the classical theory of elasticity. The first chapter is concerned with torsion problems - specifically, the torsional deformation of a half-space, a thick slab, and a semi-infinite cylinder. The physical situation for these problems is particularly simple in that in cylindrical coordinates the displacement vector has only 1 non-vanishing component and the stress vector has only 2. The second chapter is concerned with some dynamical problems. The generation of elastic waves in a body of infinite extent by prescribed body forces is first considered and then the problem of calculating the stress distribution in a half-space or a thick plate due to dynamic loading of the free surfaces.

A BOUSSINESQ PROBLEM FOR A FINITE CYLINDER, by D. B. Teague, May 1965, 79p. incl. diagrs. table, refs. (AFOSR-65-1328) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-444, Army Research Office (Durham), National Science Foundation and Office of Naval Research) AD 622525 Unclassified

A Boussinesq problem for a finite clamped cylinder is reduced to a Fredholm integral equation of the second kind with a symmetric kernel using the method of Sneddon-Srivastav. A simple approximate solution for the integral equation is obtained. This solution is accurate to within 3% provided the ratio of the radius of contact of the punch to the radius of the cylinder is less than one-half. Formulas are derived for the normal stress and displacement components, total force on the punch, and penetration of the tip of the punch as quadratures of the solution of the integral equation which are accurate to within 1% provided the ratio of length to radius of the cylinder is greater than unity. The accuracy of all final results is within 4% because of the accuracy of the solution of the integral equation. If the ratio of radius of contact of the punch to the radius of the cylinder is 0.1 or less, the results differ only slightly from the known solutions for the infinite half space.

SURVEY OF ARTICLES ON THE APPLICATIONS OF

INTEGRAL TRANSFORMS IN THE THEORY OF ELASTICITY, by Y. S. Uflyand, trans. by W J. A. Whyte, ec. by I. N. Sneddon. Oct. 1, 1965, 402p. incl. diagrs. tables, refs. (AFOSR 65-1556) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR 64-444, Army Research Office [Durham] and Office of Naval Research) AD 475151 Unclassified

A systematic presentation is attempted of methods using integral transforms for solving boundary layer problems in the theory of elasticity. The report contains five parts. Part I: Methods of solution of 2-dimensional problems are developed by applying Fourier transforms to equations stated in cartesian and bipolar coordinates. Part II: The Mellin transform is applied to the basic plane problems for the wedge and to problems of the bending of wedge-shaped plates under various boundary conditions. Part III: Solutions of some classes of 3-dimensional boundary problems of elastic equilibrium are obtained by means of the Hankel transform. Part IV: The Mehler-Fock transform is used for 3-dimensional problems, including mixed problems for the half-space with a circular line dividing the boundary conditions. Part V: The Kontorovich-Lebedev transform is used for such 3-dimensional problems as the second basic problem for the wedge, the equilibrium of an infinite body weakened by a plane cut, and the basic mixed problem for a half-space with a rectilinear line dividing the boundary conditions.

CONTACT PROBLEMS IN THE LINEAR THEORY OF VISCOELASTICITY, by G. A. C. Graham. Sept. 10, 1965, 41p. incl. diagrs. refs. (AFOSR-65-1906) (AF AFOSR-64-444) AD 626055 Unclassified

Some well known elastic half space solutions are generalized to encompass arbitrary linear viscoelastic behavior. The viscoelastic material is assumed to be homogeneous and isotropic, and thermal effects are not included. The main part of the survey is devoted to the quasi-static theory whose distinguishing feature is the neglecting of the inertia terms in the equations of motion. Expressions are found for the displacement stress field acting at any point of a viscoelastic half space whose boundary is subjected to an arbitrary time dependent distribution of normal pressure. The solution to the general axisymmetric elastic contact problem given by Sneddon is extended to viscoelasticity theory. Generalizations of the axisymmetric elastic contact problem with friction and Hertz's theory of the contact of smooth elastic bodies are also given. Problems of rolling contact are considered, and some viscoelastic half space problems are solved on the assumption that inertia terms may not be neglected.

THE SOLUTION OF BOUNDARY-VALUE PROBLEMS IN ORDINARY DIFFERENTIAL EQUATIONS EMPLOYING ITERATIVE DIFFERENTIAL ANALYZER EQUIPMENT, by R. E. Showalter. [1965] [7]p. incl. illus diagrs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-444, Army Research Office (Durham), and Office of Naval Research) Unclassified

Published in Simulation, v. 5. 374-380, Dec. 1965.

The application of the iterative differential analyzer to the solution of 2-point boundary-value problems in linear differential equations which possess unique solutions is discussed. Such a boundary-value problem may be solved by varying initial conditions manually until the boundary conditions are satisfied. When it is desired to solve the problem very rapidly, the solution of the boundary-value problem may be only one step of an iteration procedure, therefore, it is logical to let the computer itself duplicate this trial-and-error process, since the frequency responses and repetitive operation speeds presently available make it possible for the analog computer to complete many iterations in the same amount of time an operator can normally complete one cycle by a trial-and-error procedure manually. The task set forth here is to (1) describe a method of iteration that is realizable on the analog computer, (2) verify that the process does yield the desired solution, and (3) determine those factors which control the speed of covergence. To carry out (2) it must be demonstrated that the iteration process does converge and that it converges to the solution of the given problem.

THEORY OF NONEQUILIBRIUM THERMODYNAMICS WITH APPLICATION TO THE TRANSPORT PROCESSES IN A SOLID, by M. R. El-Saden. [1965] [5]p. incl. refs. (AFOSR-65-2086) (AF AFOSR-65-80E) AD 627735 Unclassified

Presented at ASME-AIChE Heat Transfer Conf. and Exhibit, Los Angeles, Calif., Aug. 8-11, 1965.

Also published in Jour. Heat Transfer, v. 88: 57-63, Feb. 1965.

The theory of nonequilibrium thermodynamics for inherently irreversible coupled processes is presented and the concept of heat is incorporated appropriately. The theory is applied to the problem of a solid carrying electric and heat currents in the presence of an external magnetic field. The principle of increase of entropy is employed to determine the reversibility or irreversibility of the macroscopic effects involved and to determine the limits on the material's properties. The dynamic equations show that, in the one-dimensional thermoelectric case, the heat current is not coupled to the electrical phenomenon. In 2- and 3-dimensional cases, the heat current is coupled to the electrical phenomenon only through the influence of the external magnetic field. Areas of disagreement with the literature are pointed out and discussed.

CHRONOPOTENTIOMETRIC STUDY OF PHENYLMERCURIC ION ADSORPTION ON A MERCURY ELECTRODE, by R. F. Broman and R. W. Murray. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-65-2364) (AF AFOSR-64-584) AD 629808 Unclassified

Also published in Anal. Chem., v. 37: 1408-1414, Oct. 1965.

Both phenylmercuric ion and the product of its one-electron reduction are strongly adsorbed on a mercury electrode surface. The adsorbed reactant gives rise to polarographic, potential-sweep chronoamperometric, and chronopotentiometric prewaves during which the adsorbed reactant is coulometrically electrolyzed before the diffusing solution reactant is reduced. Adsorption and desorption rates of both reactant and product are slow. A spike on the chronopotentiometric prewave has been interpreted as arising from a relatively slow reorientation process within the adsorbed layer leading to a transient reaction over-potential. POLAROGRAPHIC DROP-TIME MEASUREMENT USING AN ALTERNATING CURRENT TECHNIQUE, by J. W. Hayes, D. E. Leyden, and C. N. Reilley. [1965] [2]p. incl. illus diagrs. refs. (AFOSR-65-2764) (AF AFOSR-64-584) AD 627826 Unclassified

Also published in Anal. Chem., v. 37: 1444-1445, Oct. 1965.

The report describes a simple way to trigger an electronic counter to measure the drop time of a dropping mercury electrode using conventional operational-amplifier techniques. The signal from the current amplifier in a conventional operational-amplifier ac polarograph is filtered to remove the dc polarographic current, rectified, and applied to the counter input. The current is of sufficient magnitude over the whole potential range of the dropping mercury electrode even in the absence of depolarizer, to provide sufficient voltage for positive triggering of the counter. Because the counter receives a pulse each time the drop falls, the drop time of every other drop is registered.

OPERATIONAL-AMPLIFIER, ALTERNATING-CURRENT POLAROGRAPH WITH ADMITTANCE RECORDING, by J. W. Hayes and C. N. Reilley. [1965] [4]p. incl. illus. diagrs. table. refs. (AFOSR-65-2765) (AF AFOSR-64-584) AD 627838 Unclassified

Presented at 149th meeting of the Amer. Chem. Soc., Detroit, Mich., Apr. 1965.

Also published in Anal. Chem., v. 37: 1322-1325, Oct. 1965.

An alternating current polarograph, which permits automatic recording of the in-phase and quadrature components of the faradaic admittance, has been designed and constructed. Operational amplifiers are the basis of the instrumentation, but tuned amplifiers have been purposefully avoided. Phase selection is accomplished by multiplication of current and voltage signals by an electronic multiplier. Compensation for the effect of series resistance is made by subtraction of the iR drop from the voltage signal before multiplication using the predetermined value of the series resistance at drop fall. Noise levels have been reduced to a negligible level by the use of solid-state amplifiers in the low-signal level parts of the instrument. Stability is excellent, and results are within the expected limits of dummy-cell components. (Contractor's abstract)

THIN LAYER POTENTIAL SCAN COULOMETRY. DETERMINATION OF METAL IONS AND OF HALIDE IONS USING A MERCURY-COATED PLATINUM ELECTRODE, by D. M. Oglesby, L. B. Anderson and others. [1965] [5]p. incl. diagrs. tables. refs. (AFOSR-65-2766) (Sponsored jointly by Advanced Research Projects Agency, and Air Force Office of Scientific Research under AF AFOSR-64-584) AD 627836 Unclassified

Presented at 149th meeting of the Amer. Chem. Soc., Detroit, Mich., Apr. 1965.

Also published in Anal. Chem., v. 37: 1317-1321, Oct. 1965.

A linear ramp potential excitation was applied to a thin layer electrolysis cell containing a solution of several electroactive substances. The integral of the current response constitutes a coulometric titration of the electroactive species present. The technique, potential scan coulometry, was evaluated by electrolysis of solutions of copper, lead, cadmium, and zinc ions in a 1M KNO_3 medium and precipitation of I^-, Br^-, and Cl^- ions with mercurous ion electrogenerated from a mercury-coated platinum electrode. The technique appears to be particularly suited to rapid analysis of mixtures and of very small amounts of electroactive substance.

CURVED SPACE AND GRAVITATION. II, by R. W. Brehme. [1965] [9]p. incl. diagrs. (AF AFOSR-64-153) Unclassified

Published in Amer. Jour. Phys., v. 33: 713-721, Sept. 1965.

The Euclidean and Einstein geodesics are defined for a 2-dimensional space-time surface. Both are shown to approach the same classical law of gravitational acceleration, and to preserve the equivalence principle. However, only the Einstein geodesic allows a local time to be defined in such a way that the local velocity of light is constant. The conical surface is discussed and the connection is made between it and the frame of the uniformly accelerated relativistic rocket. Coordinate transformations are discussed to the extent that it is established that the shape of the 2-dimensional surface embedded in a Euclidean 3-space depends on the choice of coordinate frame. PHOTON BOUND STATES AND GRAVITONS, by G. Papini. [1965] [11]p. incl. refs. (AF AFOSR-64-153) Unclassified

Published in Nuovo Cimento, Series X, v. 39: 716-726, Sept. 16, 1965.

The possibility that a nonlinear photon-photon interaction gives rise to gravitons is investigated. At first photons are treated as neutral vector particles of small finite mass; then as zero-mass particles in the frame of usual gauge-invariant quantum electrodynamics. The corresponding Bethe-Salpeter equations are solved in the chain approximation. Bound states exist which have the required symmetry properties, and correspond to particles with spin two or zero. Of these, only one has zero mass and its phenomenological coupling to photons is, in the approximation considered, entirely dynamical. (Contractor's abstract)

DISLOCATIONS AND NUCLEAR PARTICLE TRACKS IN SILVER CHLORIDE CRYSTALS, by C. B. Childs and L. M. Slifkin. [1965] [10]p. incl. illus. refs. (AFOSR-65-2112) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under AF AFOSR-64-450) AD 629058 Unclassified

Also published in Brit. Jour. Appl. Phys., v. 16: 771-777, 1965.

Defects such as dislocations and the tracks left by energetic charged particles may be made visible inside large crystals of silver chloride by a photoelectric technique, the net result of which is the deposition of metallic silver along the imperfections. The main advantage of this procedure in the study of dislocations is that large regions of the crystal may be observed in the cold-worked state. For the study of cosmic rays and nuclear events, a convenient and distortion-free detector is offered which may be of use in specialized applications.

INTERNAL FRICTION OF SILVER CHLORIDE SINGLE CRYSTALS AT HIGH TEMPERATURE (Abstract), by A. Fukai and L. Slifkin. [1965] [1]p (Sponsored jointly by Advanced Research Projects Agency, and Air Force Office of Scientific Research under [AF AFOSR-64-450]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 308, Mar. 24, 1965.

Using the composite oscillator method at 35 kc/sec, the internal friction of silver chloride single crystals has been studied at temperatures up to 380°C. It has been shown that (a) the strain-independent decrement increases monotonically with increasing temperature, with an activation energy of 0.5 ev; (b) the strain-dependent decrement at constant strain amplitude exhibits a broad peak in the temperature range corresponding to the dislocation isoelectric point. This may be understood in terms of the electric charge on the dislocations. Such a charge is compensated by a space charge that produces a potential well. At the isoelectric point, the dislocation is uncharged and can oscillate with larger amplitudes, giving a larger decrement. The temperature dependence of breakaway stress gives approximately 0.23 ev as the effective binding energy of pinning points to dislocations, which agrees with that calculated from the extra concentration of impurity ions on dislocations. Preliminary measurements of the temperature dependence of Young's modulus show a significant nonlinear decrease at high temperatures.

VACANCY-FORMATION ENERGY AND CHARGED DISLOCATIONS IN SILVER CHLORIDE (Abstract), by W. McGowan and L. Slifkin. [1965] [1]p. (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under [AF AFOSR-64-450]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 308, Mar. 24, 1965.

Using an indentation technique, the sign of the electric charge carried by dislocations in silver chloride has been determined. An isoelectric temperature is observed in the purer specimens and ranges from 18° to 85°C for a divalent impurity content of 0.3-23ppm. Dislocations are negatively charged below the isoelectric temperature and are positive above it. The voltage pulse observed upon indentation is smooth at lower temperatures but develops structure at temperatures near the isoelectric point, even changing sign several times in the vicinity of the isoelectric point. The room-temperature charge density along the dislocation line is estimated to vary from 2×10^{-5} esu cm in heavily doped material to 6×10^{-6} esu cm in pure material. From the variation of isoelectric temperature with impurity content, the energy of formation of the silver vacancy is estimated to be 0.6 ev. Using the data of Ebert and Teltows on the formation energy of the Frenkel defect, one obtains the formation energy of the silver interstitial to be 0.9 or 1.1 ev, depending on whether or not the association analysis of Ebert and Teltow is used.

ELASTIC CONSTANTS OF NaF, NaCl, AND NaBr AT 4.2°K (Abstract), by J. T. Lewis, A. Lehoczky, and C. V. Briscoe. [1965] [1]p. (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under [AF AFOSR-64-645]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 44, Jan. 27, 1965.

The elastic constants of NaF, NaCl, and NaBr have been measured at 4.2°, 80°, and 300°K, using an ultrasonic pulse technique. The elastic constants at 4.2°K in units of 10^{11} dyn/cm^2 are C_{11} = 10.85, C_{12} 2.290, and C_{44} = 2.899 for NaF; C_{11} = 5.733, C_{12} = 1.123, and C_{44} = 1.331 for NaCl; C_{11} = 4.800, C_{12} = 0.9796, and C_{44} = 1.070 for NaBr. The experimental error in C_{11} and C_{44} is approximately 1%. In C_{12}, the experimental error is approximately 4%.

These elastic constants are compared with the experimental work of other investigations, the majority of

which have been conducted at temperatures higher than 4.3°K. Comparison is also made with the theoretical calculations of several workers. The method of de Launay Launay has been used to calculate the Debye characteristic temperature at 0°K, θ_0^{el}. At 0°K, θ_0^{el} = 491°5°K for NaF, 321.2°K for NaCl, and 224.6°K for NaBr. The experimental error in θ_0^{el} is less than 1%. These values are compared with θ_0^{c}, obtainable from experimental specific heats and theoretical computations.

ASYMPTOTICALLY OPTIMAL TESTS FOR MULTINOMIAL DISTRIBUTORS, by W. Hoeffding. [1965] [33]p. (AFOSR-67-0681) (AF AFOSR-65-760) AD 648674 Unclassified

Also published in Ann. Math. Stat., v. 36: 369-401, Apr. 1965.

Tests of simple and composite hypotheses for multinomial distributions are considered. It is assumed that the size α_n of a test tends to 0 as the sample size N increases. The main concern of this paper is to substantiate the following proposition: If a given test of size α_n is "sufficiently different" from a likelihood ratio test then there is a likelihood ratio test of size $\leq \alpha_n$ which is considerably more powerful than the given test at "most" points in the set of alternatives when N is large enough, provided that $\alpha_n \to 0$ at a suitable rate. In particular, it is shown that chi-square tests of simple and of some composite hypotheses are inferior, in the sense described, to the corresponding likelihood ratio tests. Certain Bayes tests are shown to share the above-mentioned property of a likelihood ratio test.

EXTRACTION OF Fe(III) AND In(III) FROM AQUEOUS HCl BY TRI-n-OCTYLAMINE IN NITROBENZENE, by A. D. Nelson, J. L. Fasching, and R. L. McDonald. [1965] [9]p. incl. diagrs. table, refs. (AFOSR-65-0680) (AF AFOSR-63-65) AD 615073 Unclassified

Also published in Jour. Inorg. and Nuclear Chem., v. 27: 439-447, 1965.

A study has been made of the distribution of Fe(III) and In (III) between aqueous HCl and solutions of tri-n-octylamine (TOA) in nitrobenzene at trace metal concentrations and under metal loading conditions. The equilibrium between tri-n-octylamine and HCl was also investigated. The equilibrium constant for the reaction TOA + $(HCl)_2$ - TOACHl was found to be 5.6 x 10^6 over the amine salt concentration range 1.7 x 10^{-3}-9.5 x 10^{-2}M; TOACHl appears to be an essentially undissociated ion pair in nitrobenzene. The metal extraction data have been interpreted in terms of the extraction of the tetrachloro metal anions. The possibility of the addition of one or more amine hydrochlorides to the extracted metal species must also be considered; these "extra hydrochlorides' are not bound directly to the metal but, rather, are the result of electrostatic interactions. The results give not only an interesting example of the effect of organic phase ionization on the distribution ratio but also emphasize the hazards of drawing conclusions concerning the metal species extracted from equilibrium extraction data.

SYMMETRY NUMBERS AND REACTION RATES. II. THE COMPUTATION OF THE REACTION-PATH DEGENERACY FOR BIMOLECULAR REACTIONS, by E. W. Schlag and G. L. Haller. [1965] [4]p. (AFOSR-65-0878) [AF AFOSR-62-83] AD 617829 Unclassified

Also published in Jour. Chem. Phys., v. 42: 584-587, Jan. 15, 1965.

The reaction path degeneracy n is a needed parameter in the computation of a rate constant based on absolute rate theory since it is only partially provided by the symmetry numbers. The previous group theoretical method for deriving n is examined for the case of bimolecular reactions. Furthermore, this method is compared to a direct count of the number of reaction possibilities, and it is seen, by comparison, that there are some difficulties in the application of the direct count method. Some direct count rules are derived which should avoid these difficulties. The computation of equilibrium constants and rate constants for reactions involving optically active species is discussed. Presented at 148th meeting of the Amer. Chem. Soc., Chicago, Ill., Sept. 1964.

Also published in Jour. Chem. Phys., v. 42: 3009-3018, May 1, 1965.

The relaxation of a gas of polyatomic molecules, excited to a particular energy is analyzed in terms of a random walk through all relevant energy states to yield the various stable products. The quantum yield is taken as the probability of forming a given one of these products. This relation problem is solved by means of an asymptotic, natural expansion in terms of the events in the process which are physically the most significant. The first term in this many-shot expansion is the strong collision result. For nearly strong collision processes and nonequilibrium systems this many-shot expansion yields a rapidly converging series for an arbitrary ordered set of transition probabilities and hence constitutes a computationally useful solution to the Pauli master equation for such a nonequilibrium system. The relaxation problem is analyzed in terms of some assumed sets of collisional transition probabilities, including a model that assumes statistical equilibration of vibrational energy in every collision complex. It is shown in an application to an actual laboratory system that such a highly efficient model predicts many-shot behavior only slightly stronger than some recently observed experimental results.

sented at 149th Nat'l. meeting of the Amer. Chem., Soc., Detroit, Mich., Apr. 1965.

Also published in Jour. Chem. Phys., v. 43: 898-902, Aug. 1, 1965.

The relaxation problem in a nonequilibrium multilevel system weakly coupled to a heat bath can be expressed in terms of a Pauli master equation. It has previously been shown that this relaxation problem can be solved in terms of a many-shot expansion, the leading term being the strong-collision result and further terms being due to weak collisions. It is shown that this many-shot expansion can be derived from a generalized matrix form of the master equation, as well as by the phenomenological approach used previously. A matrix form for a generalized nearest-neighbor model is analyzed and developed in terms of a series which considers the asymptotic contributions of upward transitions in terms of successively less-probable Markov chains. The input for these computations is a complete set of transition probabilities, for which these methods predict the appropriate laboratory observable. Under certain experimental conditions the laboratory observable is particularly sensitive to the weak-collision terms, and it is in this region that one should be able to obtain information about the effect of collisions on the distribution of internal energy. The photolysis of cyclobutanone was investigated. Some work on the mechanism confirmed that it was a simple photolytic decomposition. One of the directly formed products is cyclopropane. Since the light quantum excites cyclobutanone with about 112 kcal/mol, the initially formed cyclopropane will similarly be highly excited. In fact the energy of the cyclopropane can be varied continuously since the wavelength irradiating the cyclobutanone can be varied continuously. Such systems are needed as test cases in the theory of reaction rates. A new way of analyzing rate equations was proposed, for molecular systems that undergo reactions from many quantum levels. Some work in the vacuum ultraviolet region was also done. A high intensity light source in this region, operated by microwaves at high power was developed. With this source and a monochromator, thresholds for ionization of inorganic molecules were measured. Investigations relevant to the theory of absolute reaction rates were also performed.

BUCKLING OF A LONG CYLINDRICAL, SHELL

CONTAINING AN ELASTIC CORE, by G. Herrmann and M. J. Forrestal. [1965] [6]p. incl. diagrs. refs. (AFOSR-65-2483) (AF AFOSR-64-100) AD 628702 Unclassified

Presented at AIAA Sixth Structures and Materials Conf., Palm Springs, Calif., Apr. 5-7, 1965.

Also published in AIAA Jour., v. 3: 1710-1715, Sept. 1965.

A long, thin, circular cylindrical shell containing an elastic core, bonded to the inner surface of the shell, is subjected to a uniform external hydrostatic pressure. Stability of equilibrium of the shell is investigated by considering possible neighboring equilibrium states. The loading exerted by the elastic core on the shell in the deformed state is found by solving an associated boundary value problem of the linearized theory of elasticity in the presence of initial stresses. An expression for the buckling pressure of the shell is derived, and results are presented for a wide range of shell and medium parameters. (Contractor's abstract)

CLOSED FORM EXPRESSION FOR THE MIE SERIES FOR LARGE, LOW DENSITY, DIELECTRIC SPHERES, by M. A. Plonus and N. Inada. [1965] [2]p. incl. diagr., (AFOSR-65-2340) (AF 49(638)1377) AD 627561 Unclassified

Also published in Proc. IEEE, v. 53: 662-663, June 1965

The Mie series for large dielectric spheres converges very slowly. However, when the relative dielectric constant ϵ of the sphere is close to unity and Δ is small, the Mie series for the backscattering cross section σ can be summed and a closed form expression for σ given. Such calculations are carried out for the backscattering cross section of a low density dielectric sphere with the restriction that $\epsilon - 1 = \Delta \ll 1$. The expression obtained is $\sigma = \pi a^2 \left(\frac{\epsilon - 1}{2}\right)^2 \left| \frac{2ka \cos 2ka - \sin 2ka}{2ka} \right|^2$.

DISTANCE MATRIX OF A GRAPH AND ITS REALIZABILITY, by S. L. Hakimi and S. S. Yau. [1965] [13]p. incl. diagrs., (AFOSR-65-1007) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-98 and Army Research Office (Durham)) AD 614559 Unclassified

Also published in Quart. Appl. Math. v. 22: 305-317, Jan. 1965.

The distances in a linear graph are described by a distance matrix D. The realizability of a given D by a linear graph is discussed and conditions under which the realization of D is unique are established. The optimum realization of D, i.e., the realization of D with "minimum total length", is investigated. A procedure is given by wich a tree realization of D can be found, if such a realization exists. Finally, it is shown that a tree realization, if it exists, is unique and is the optimum realization of D.

OPTIMUM DISTRIBUTION OF SWITCHING CENTERS IN A COMMUNICATION NETWORK AND SOME RELATED GRAPH THEORETIC PROBLEMS, by S. L. Hakimi. [1965] [15]p. incl. diagrs. table. (AFOSR-66-0209) (AF AFOSR-63-98) AD 641266 Unclassified

Also published in Operations Research, v. 13: 462-475, May-June 1965.

The concept of a median in a weighted graph is generalized to a multimedian. Then, it is shown that the optimum distribution of p switching centers in a communication network is at a p-medium of the corresponding weighted graph. The following related problem in highway networks is also considered: what is a minimum number of policemen that can be distributed in a highway network so that no one is farther away from a policeman than a given distance D. This problem is attacked by generating all vertex-coverings (externally stable sets) of a graph by means of a Boolean function defined over the vertices of a graph. Then this idea is extended to Boolean functions that generate all matchings, all factors, and all possible subgraphs of G with given degrees.

AUTONOMOUS CLOCKS IN SEQUENTIAL MACHINES, by S. S. Yau. [1965] [6]p. incl. diagrs. (AFOSR-65-2349) (AF AFOSR-65-98) AD 629851 Unclassified

Also published in IEEE Trans. Electron. Comput., v. EC-14: 467-472, June 1965.

A necessary and sufficient condition for the existence of an autonomous clock in a sequential machine M is found to be the existence of a nontrivial input-independent partition on the set of internal states of M, no matter whether M is completely specified or

incompletely specified. Two different techniques are given for generating the smallest input-independent partition π^1, from which all other input-independent partitions can be obtained. One is suitable for a sequential machine whose state behavior is specified in the form of a flow table, while the other is convenient for a sequential machine whose state behavior is specified in the form of a connection matrix. Both techniques are efficient, and give all possible assignments to the redundant conditions of an incompletely specified sequential machine to reach the same nontrival input-independent partition, and hence the same autonomous clock. COMPACTIFICATION OF HOMOGENFOUS SPACES, I, by R. Hermann. [1965] [24]p. incl. refs. [AF AFOSR-64-512] Unclassified

Published in Jour. Math. and Mech., v. 14: 655-678, July 1965.

The beginning sections of this paper are devoted to proving the following fact which is, according to the author, a main theorem of the paper. A compact manifold of negative Euler characteristics can have no Lie group transitively on it. More precisely, the author proves that if G H is a compact homogeneous space with non-zero Euler characteristic, acted on effectively by a connected Lie group G, then G is a semi-simple group with trivial center and a maximal compact subgroup K of G acts transitively on G H; in particular, the Euler characteristic of G H is positive and, as a homogeneous space of the compact group K, G H is an object whose structure is well known. Moreover, it is shown that a subgroup conjugate to H contains the part AN of the Iwasawa decomposition G = KAN of G, where A is an abelian group and N is a nilpotent group. (Math. Rev. abstract)

LOW TEMPERATURE CREEP DEFORMATION OF CRYSTALS PARTICULARLY PHENOMENA AT LIQUID HELIUM TEMPERATURES, by J. Weertman. Final rept. Mar. 1, 1960 - Mar. 1, 1965. June 1, 1965, 9p. (AFOSR-65-1484) (AF 49(638)1041) AD 620337
Unclassified

Creep behavior of cadmium and mercury were investigated in the liquid helium temperature range with emphasis on the possible mechanisms of creep. Creep was found to be temperature dependent at all temperatures of investigation down to 1.75°K, and impurities in the metals had no noticeable effects. Activation energies were determined in the range 1.75-30°K and activation volume measurements were carried out. Creep behavior in the liquid temperature range was found to differ little from the usual low temperature creep at higher temperatures. At liquid helium temperatures, however, creep did not follow low temperature theories, but correction could be made by Alefeld's new rate equation for processes at low temperatures. Quantum tunneling effects on creep were found to be unimportant at temperatures above 0.04°K.

OPTICAL-ABSORPTION COEFFICIENTS OF VANADIUM PENTOXIDE SINGLE CRYSTALS, by N. Kenny, C. R. Kannewurf, and D. H. Whitmore. [1965] [1]p. [AF AFOSR-64-635] Unclassified

Presented at meeting of the Amer. Phys. Soc., Columbia U., New York, June 23-25, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 609, June 23, 1965.

The optical-absorption coefficients of orthorhombic V_2O_5 single crystals were evaluated, using incident polarized light over the wavelength range 0.47-1.8μ, and in unpolarized light from 1.5 to 7.5 μ. The intrinsic absorption edges were found to have an exponential dependence on photon energy. Fundamental absorption was observed at incident photon energies of 2.15, 2.22, and 2.17 ev for E a, E b and E c, respectively. Some evidence for a direct forbidden transition mechanism with bandgaps of 2.36 and 2.34 ev was observed for E a and E c, respectively. A double absorption peak was observed for the polarization E a; the major peak occurs at 1.00 μ and the minor peak at 0.83 μ. Since this peak is completely missing in the absorption spectra when E b and E c, the mechanism associated with the absorption peak for E a must itself be optically anisotropic. This double peak is associated with nonstoichiometric defects that act as donors.

MICROWAVE DIAGNOSTICS OF ARC-HEATED NITROGEN AND AIR PLASMAS, by H. M. Waller. Aug. 1965, 43p. incl. illus. diagrs. refs. (Rept. no. B-2-65) (AFOSR-66-0363) (AF AFOSR-63-329) AD 628918 Unclassified

Electrical properties of arc-heated nitrogen and simulated air plasma flows were studied using microwave diagnostic techniques. The plasmas were produced by running nitrogen through a commercial plasma jet with a supersonic nozzle attached downstream. Oxygen is mixed with the nitrogen plasma just upstream of the throat of the supersonic nozzle in order to produce the simulated air plasma. Electron densities and collision frequencies were determined from measurements of the phase shift and attenuation of E-band microwaves transmitted through the plasma. The microwave frequencies used were 76.9 and 82.4 kMc and for both air and nitrogen plasmas the following properties were determined: electron density, attenuation constant, and collision frequency. These properties are presented as functions of h_{gas}, a measure of the electrical power input to the plasma, which ranged up to 36 kw. The experimental results are compared with available theoretical predictions and qualitative agreement is found.

THERMOPHYSICAL PROPERTIES OF PLASMAS (Abstract), by D. P. Aeschliman, D. A. Freiwald and others. [1965] [2]p. (Bound with AFOSR 65-1266; AD 622527) (AF AFOSR-63-329) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

A study to determine the thermophysical properties of argon; air and nitrogen plasmas is being pursued along 2 lines, namely, (1) the experimental measurement of magnetoplasmas, and (2) the analytical prediction of plasma flows, using a system to obtain simultaneous photographs in perpendicular directions of seed particles in the laminar-flow arc, from which the velocity profile and the velocity gradient may be found. Also under construction is a pressure-drop measuring system. If the velocity and pressure gradients are known, the viscosity can be determined. Preliminary investigations of plasmoid-shock wave interactions are underway comparing results obtained through head-on and transverse interactions between a shock wave generated in an EM shock tube and a plasmoid in argon, air and nitrogen. Doppler shift and microwave interferometer systems are being developed to investigate an apparent precursor effect ahead of the plasmoid. A spectrographic analysis of the plasmoids and the interactions is also being considered.

DELTA MODULATION IN FEEDBACK CONTROL SYSTEMS, by G. J. Murphy and G. Shuraym. [1965] [4]p. incl. diagrs. (AFOSR-65-2348) (AF AFOSR-63-270) AD 629664 Unclassified

Presented at Nat'l. Electronics Conf., Chicago, Ill Oct. 25-27, 1965.

Also published in Proc. Nat'l. Electronics Conf., v. 21: 609-612, 1965.

The purpose of this paper is to demonstrate that techniques that have previously been used for the analysis and the design of feedback control systems can be employed successfully also in the analysis and the design of delta-modulation data-transmission systems. It was shown that a delta-modulation data-transmission system is equivalent to a single-loop sampled-data relay control system in the absence of disturbances. The model of such a system is shown. In addition, it was stated that systems of this kind can not, in general, be made stable in the sense of Liapunov merely by appropriate choice of G(s) and H (s), and that, for such a system to be asymptotically stable in the sense of Lagrange, in the absence of an input signal, it is necessary and sufficient that all of the poles of sG (s)H (s) have negative real parts.

CONFORMATIONAL ANALYSIS IN MOBILE CYCLOHEXANE SYSTEMS, by E. L. Eliel. [1965] [14]p. incl. diagrs. table, refs. (AFOSR-65-2389) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-772], Army Research Office (Durham), National Science Foundation, and Petroleum Research Fund) AD 628454 Unclassified

Also published in Angew. Chem., v. 4 761-774, 1965.

By 'conformational analysis' is meant the analysis of the physical and chemical properties of a compound in terms of its preferred 'conformation', i.e. rotational arrangements about single bonds. This particular review deals with cyclohexanoid compounds capable of existing in 2 or more stable conformations.

REACTIONS OF 1, 4-DICHLORO-1-BUTENES WITH MAGNESIUM, A NEW CYCLOBUTENE SYNTHESIS, by M. S. Newman and G. Kaugars. [1965] [4]p. incl. diagrs. tables, refs. (AFOSR-66-0319) (AF AFOSR-64-569) AD 629838 Unclassified

Also published in Jour. Org. Chem., v. 30: 3295-3233, Oct. 1965.

The reactions of trans-1, 4-dichloro-1-phenyl-1-butene (I) and cis-1, 4-dichloro-1, 2-diphenyl-1-butene (II) with magnesium in ether afford 1-phenylcyclobutene (III) and 1, 2-diphenylcyclobutene (VIII) in 5-46 and 90% yields, respectively. A study of the reaction products from I indicates that the reaction of I to form the vinyl Grignard reagent is more rapid than that to form primary Grignard reagent. Evidence that vinyl Grignard reagents do not maintain stereochemical identity is presented.

THE SOLVENT EFFECT IN THE REACTION OF BENZALDES-OXYBENZOIN WITH PHOSPHORUS PENTACHLORIDE, by M. S. Newman and G. Kaugars. [1965] [4]p. incl. diagrs. refs. (AFOSR-66-0320) (AF AFOSR-64-569) AD 629837 Unclassified

Also published in Jour. Org. Chem. v. 30: 3105-3108, Sept. 1965.

Reaction of benzaldesoxybenzoin (I) with phosphorus pentachloride in methylene chloride led to a mixture of products from which 1-chloro-2, 3-diphenylindene (V) was obtained in 30% yield. In a similar reaction in carbon tetrachloride a different mixture of products was obtained from which 3, 3-dichloro-1, 3-triphenylpropene (VII) was isolated in 47% yield. These results are discussed in the light of the fact that phosphorus pentachloride is monomeric in methylene chloride and dimeric in carbon tetrachloride.

PHOTOCHEMICAL TRANSFORMATIONS OF A β, γ-EPOXY KETONE, by A. Padwa. [1965] [3]p. incl. diagrs. refs. (AFOSR-66-0296) (AF AFOSR-65-820) AD 629833 Unclassified

Also published in Jour. Chem. Soc., v. 87: 4205-4207, Sept. 10, 1965.

The light-induced β-γ epoxy ketone rearrangement of trans-1, 4-diphenyl-3, 4-epoxy-butan-I-one to dibenzoylethane has been studied. In addition to dibenzoylethane, 1-hydroxy-1, 2-diphenyl-3, 4-epoxy cyclobutane was formed. The formation of the epoxy cyclobutanol may be considered to be analogous to the formation of cyclobutanols from the irradiation of aliphatic ketones containing γ-hydrogens. The isolation of both compounds adds strong support for Yang's stepwise mechanism.

PHOTOLYTIC DESULPHURIZATION OF DIBENZOYLSTILBENE EPISULPHIDE, by A. Padwa and D. Crumrine. [1965] [2]p. incl. diagrs. refs. (AFOSR-66-0297) (AF AFOSR-65-820) AD 629834 Unclassified

Also published in Chem. Commun., No. 21: 506-507, Nov. 10, 1965.

A description is given of the photo-extrusion of sulphur from dibenzoylstilbene episulphide (I) by ultraviolet light filtered through Pyrex glass. Irradiation of (I) afforded a mixture of cis-and trans-dibenzoylstilbene (II and III) in high yield. The photodesulphurization is markedly stereospecific. Consideration of the isomeric distribution of the olefin obtained in a number of photolyses and the irradiation time demonstrated at least 90% stereo-selective removal of sulphur from (I) to give (III). The loss of sulphur from the episulphide upon photolysis is most simply explained by assuming a cleavage of the C(α)-S bond of the 3-membered ring followed by loss of atomic sulphur.

THE PHOTOCHEMICAL DECOMPOSITION OF α-DIAZOACETOPHENONE IN HYDROXYLIC SOLVENTS, by A. Padwa and R. Layton. [1965] [4]p. incl. table. (AFOSR-66-0298) (AF AFOSR-65-820) AD 629835 Unclassified

Also published in Tetrahedron Ltrs., v. 26: 2167-2170, 1965.

The photolysis of α-diazoacetophenone in hydroxylic solvents gave esters of phenylacetic acid and acetophenone. It was possible to generate the triplet keto carbene by selectively activating Michler's ketone in the presence of α-diaxoacetophenone by using a uranium glass filter. The sensitized photochemical decomposition in iso-propyl alcohol produced a species showing little tendency to undergo the Wolff rearrangement. These results suggest that the singlet keto carbene is the precursor of the rearranged ketone.

FORMATION OF DETONATION WAVES IN FLOWING COMBUSTIBLE GASEOUS MIXTURES, by L. E. Bollinger, G. C. Smith and others. Final rept. Dec. 1, 1962- Jan. 31, 1965. Apr. 22, 1965, 7p. (Rept. no. 1574) (AFOSR-65-1051) (AF AFOSR-63-203) AD 618200 Unclassified

Detonation induction distances were measured in hydrogen-oxygen and methane-oxygen mixtures flowing at various velocities through a 9 stainless steel tube, 9 mm inside diam. The linear flow velocities of the gas mixture ranged from 0-100 m/sec in hydrogen-oxygen mixtures. Some experiments were conducted at 5 atm initial pressure. Experiments with methane-oxygen mixtures were carried out at 1 atm only; the initial velocities of these mixtures ranged from 0-30 m/sec. It was found that the formation of detonation waves in flowing combustible gaseous mixtures is dependent upon the initial pressure and the intensity of turbulence present in the gases. As the initial pressure is raised, the effect of turbulence becomes less pronounced. Higher turbulence levels cause an effective decrease in the quenching diam as indicated in these experiments. Higher flow rates for a methane-oxygen mixture (50% fuel) insure positive ignition and positive measurement of flame propagation rates.

RESEARCH ON ROTATING R-F FIELD PLASMA (Abstract), by M. L. Pool [1965] [1]p. (Bound with AFOSR-65-1266; AD 622527 (AF AFOSR-65-202) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

Hydrogen and deuterium gases in a magnetic bottle 30 in. long have been excited by revolving magnetic and rotating electric fields produced by a 2-phase 6-kw oscillator operated at the ion cyclotron frequency of 4.2 mc/sec. The 2-phase system put a rotation quasi-current through the center of the plasma region. When the system is operated at the cyclotron frequency, the ions walk toward the center of the plasma. A 30-joule ruby laser beam was pulsed through the central region in order to produce Thomson scattering. Interference filters were used instead of a monochrometer. At 14 μ an electron density of 10^{13} cm^{-3} was measured in the central plasma region by the laser technique. A cooled solid state silicon detector in conjunction with a 200-channel pulse height analyzer was used to estimate the energy of the electrons emerging from the ends of the magnetic bottle. The shielding of the potential by the exciting quasi-current producing coils has offered considerable difficulties. It is proposed that this problem can best be solved by using a system of ferrite type magnets.

THOMSON SCATTERING OF LASER LIGHT FROM A PLASMA (Abstract), D. R. Sigman, J. F. Holt, and M. L. Pool. [1965] [1]p. [AF AFOSR-65-202] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 226, Feb. 25, 1965.

Electron densities in a 4-mc/sec ion-cyclotron resonance heated plasma contained in a magnetic-mirror system have been determined by measuring the 90° Thomson scattering from a 20-J pulsed ruby-laser beam. The measurements were localized to a 1-cm^3 volume at the geometrical center of the plasma bottle. Densities as low as 10^{13} cm^{-3} could be measured. These measurements were made possible by the use of low-noise electronics. In addition, stray scattered laser light entering the light-detection system from the walls and windows of the plasma bottle was minimized. Calibration of the system was made by measuring the Rayleigh scattering from air at several pressures. The Rayleigh scattering was linear with

pressure; and, for equal gas pressures, the ratio of the Rayleigh scattering for air to that of hydrogen satisfied the index of refraction relationship. The Thomson scattering from the hydrogen plasma was found to be linear with the power input into the 4-mic sec oscillator. The maximum power used was 6 kw.

TWO-PHASE RADIOFREQUENCY HEATING OF A PLASMA CONFINED IN A MAGNETIC-MIRROR SYSTEM (Abstract), by E. E. Hagenlocker, J. F Holt and others. [1965] [1]p. [AF AFOSR-65-202] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 207, Feb. 25, 1965.

A radiofrequency coil configuration that induced a rotating electric field and revolving magnetic field was constructed for this experiment. This coil configuration was used in conjunction with a magnetic-mirror system capable of confining 30-kev deuterons. In this properly phased revolving magnetic field and rotating electric field, an ion in phase with the rotating electric field would drift, in theory, toward the axis about which the electric field was rotating. The proper phasing of the 2-phase system made a considerable difference in the properties of the plasma generated. The observed electron densities at a deuteron gas pressure of 1 and 14 μ indicated ion cyclotron resonance. For a deuterium gas pressure of 14 μ the electron density and light emitted increased as the axial magnetic field was decreased because of increased heating of the free electrons.

THE AMERICAN NEGRO. A PROBLEM IN EXPECTANCIES, by H. M. Lefcourt and G. W. Ladwig. [1965] [4]p. incl. tables, refs. (AF 49(638)317) Unclassified

Published in Jour. Personality and Social Psychol., v. 1: 377-380, Apr. 1965.

This study dealt with differences between Negro and white inmates in their expectancies that events are internally or externally controlled. Sixty white and 60 Negro inmates from correctional institutions were compared on 3 scales pertinent to the internal-external control dimensions, and on 3 performance variables from Rotter's Level of Aspiration Board task. On all measures Negroes revealed greater expectancy of control being external The results have implications for interpreting the frequently observed differences between white and Negro intelligence test performance and achievement striving (Contractors' abstract)

THE EFFECT OF REFERENCE GROUP UPON NEGROES TASK PERSISTENCE IN A BIRACIAL COMPETITIVE GAME, by H. M. Lefcourt and G. W. Ladwig. [1965] [4]p. incl. tables, refs. (AF 49(638) 317) Unclassified

Published in Jour. Personality and Social Psychol., v. 1: 668-671, June 1965.

This study concerns Negro Ss' avoidance tendencies in competitive achievement tasks. It was predicted that Negro Ss would not show avoidance behavior if they had higher expectancies of being able to gain reinforcements for their efforts. Three groups of Negro reformatory inmates played a competitive game with white stooges who won continuously. One group, designated the high-expectancy group, was comprised of jazz musicians who had been led to believe that the game was related to personal skills of musicians. This group persisted significantly longer than either of 2 control groups. The latter demonstrated the more typical failure-avoidance characteristic of Negroes in previous research. RISK TAKING IN NEGRO AND WHITE ADULTS, by H. M. Lefcourt [1965] [6]p. incl. tables, refs. (AF 49(638)317) Unclassified

Published in Jour. Personality and Social Psychol., v. 2: 765-770, Nov. 1965.

Thirty Negro and 30 white adult males performed in a risk-taking experiment. Contrary to previous findings in skill-demanding tasks, Negroes demonstrated more behavior reflecting an internal control orientation than whites in the gambling situation under study. Negroes chose less low probability bets, made less shifts of bets, and generally took less risks than whites. The perception of Negroes that success in conventional tasks is controlled by forces other than their own efforts is apparently reversed in games of chance. The inference follows that environmental changes in the opportunity structure will contribute toward more of an internal control orientation among Negroes. (Contractors' abstract)

INTERNAL VERSUS EXTERNAL CONTROL OF

REINFORCEMENT AND DECISION TIME, by J. B. Rotter and R. C. Mulry. [1965] [7]p. incl. table, refs. (AFOSR-66-1151) (AF 49(638)741) AD 640784 Unclassified

Also published in Jour. Personality and Social Psychol., v. 2: 598-604, Oct. 1965.

Previous research has shown generality of individual differences in an expectancy that reinforcement is contingent on one's own behavior (internal control) an expectancy that reinforcement is determined by luck, chance, fate or powerful others (external control). The hypothesis was investigated that "internals' and 'externals' differ in the value placed on the same reward, depending upon whether it is perceived as contingent upon chance or skill. To test this, decision time was measured in a difficult matching test, and described to 1/2 the Ss as skill, and to 1/2 as chance determined. Results show significant interaction between internal-external control and chance v skill instructions. As hypothesized, internals take longer with skill instructions, externals with chance instructions. The study extends the construct validity of the internal-external control variable and has implications for personality, cultural differences, and decision theory.

PRIMER FOR PRODUCTIVITY, by H. B. Pepinsky, K. E. Weick, and J. W. Riner. [Final rept.] Mar. 1965, 66p. incl. diagrs. tables, refs. (In cooperation with Purdue U., Lafayette, Ind.) (AFOSR-65-0491) (AF AFOSR-62-339) AD 617956 Unclassified

A systematic and empirical case is made for the observing and interpreting, by a spectator, of the productivity of persons who hold membership in utilitarian organizations within American society. First, a metatheory of work in organizational environments, introducing key concepts for the spectator and differentiating between spectator and participant definitions of the work situation, is offered. This is followed by a definition of productivity, which again meaningfully differentiates between the causally textured definitions of spectators and participants and between such participant definitions as those of superordinate and subordinate persons. Testable propositions concerning work and its accomplishment are advanced. Second, a formal spectator's definition of organization, utilizing key concepts and definitions from the foregoing discussion, is presented. Third, an empirical case, which illustrates how key ideas can be applied to the study of organizations, is given. And finally, the authors pose a number of issues about organizational behavior, suggested by a comparison of their ideas with those of other investigators.

LIFETIME STUDIES OF THE RADIATIVE DISSOCIATION OF EXCITED H_2, by R. G. Fowler and T. M. Holzberlein. [1965] [2]p. incl. diagr. (AFOSR-65-2879) (AF 49(638)1404) AD 628348 Unclassified

Also published in Jour. Chem. Phys., v. 42: 3723-3724, May 15, 1965.

The lifetime, τ in nsec, of the continuum radiation accompanying the transition $a^3\Sigma_g^+ - b^3\Sigma_u^+$, in molecular H was found to be independent of wavelength, 3000-6500A, but affected by pressure, p, in the range 0.02-20 mm, approx. according to the equation $\tau = (36 + 9.3p)/(1 + 0.83p)$. This time refers to the shortest or first decay process. A binary collision process, with a cross section of 1.8×10^{-15} cm^2 is implied by this p dependence. The saturation at high p may be spurious. The molecules (presumably at 1200°K) were excited by monoenergetic electrons (100 ev). Also observed was a much longer duration decay, not pressure sensitive, with a lifetime of 450 ± 100 nsec. The relative initial intensities of the 2 processes shifted from 4(slow): 1 (fast) at low p to 1:1 at high p. Absolute intensities of both processes increased with p.

DISSOCIATION OF MOLECULAR HYDROGEN BY ELECTRON IMPACT, by S. J. B. Corrigan. [1965] [6]p. incl. diagrs. refs. (AFOSR-66-1446)(AF 49(638) 1404) AD 640785 Unclassified

Also published in Jour. Chem. Phys., v. 43: 4381-4386, Dec. 15, 1965.

The dissociation of molecular hydrogen by electron impact was studied by observing the rate of pressure decrease in a closed system when the dissociation fragments were trapped on molybdenum trioxide. An onset potential of 8.8 (± 0.2) ev was obtained, indicating that a large part of the dissociation must proceed through direct excitation of the repulsive $b\,^3\Sigma_u^+$ state of the molecule. From the onset potential to 95 ev, the upper energy limit of the observations, the dissociation rate increased rapidly at first, then more slowly above 14 ev passing through a flat maximum at 40 ev and then slowly decreasing up to the highest energy investigated. Reasons are given for supposing that the observed cleanup of hydrogen at high electron energies contains an effect due to dissociative neutralization of molecular ions. With this assumption the cross section for excitation of the molecule to triplet states is derived by subtracting the molecular ionization cross section from the observed total dissociation cross section. In this way a cross section is obtained for dissociation into neutral atoms which has a maximum of 9×10^{-17} cm^2

at an energy of 16.5 ev, followed by a rapid decrease with increasing electron energy. (Contractor's abstract)

MEASUREMENT OF THE DISSOCIATION CROSS SECTION OF MOLECULAR HYDROGEN BY ELECTRON IMPACT (Abstract), by S. J. B. Corrigan. [1965] [1]p. [AF 49(638)1404] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 158, Feb. 25, 1965.

Dissociation of molecular hydrogen by slow electrons was studied by observing the rate of pressure decrease in a closed system when the dissociation fragments were trapped on molybdenum trioxide. An onset potential of 8.7 (± 0.2) ev was obtained, indicating that a large part of the dissociation must proceed through excitation of the molecule directly to the $b^3\Sigma_u^+$ state.

With increasing electron energy, the observed cross section increased rapidly and approximately linearly at first, then less rapidly above 14 ev, passing through a flat maximum at 40 ev followed by a slow decrease up to the limit of our observations at 100 ev. It is argued that the cleanup of gas observed with 100-ev electrons can be attributed almost entirely to the action of H_2^+ ions. With this assumption, the known ionization cross section of molecular hydrogen enables the contribution from ions to be evaluated at lower electron energies. Subtracting this from the total observed cross section, a cross section is obtained or dissociation into neutral atoms that has a sharp max of

8×10^{-17} cm^2 (± 20%) at about 17 ev, falling rapidly with increasing energy until it becomes essentially zero at 50 ev

OPERATING MODE OF AN INVERTED ELECTRODE SYSTEM FOR ATOMIC-LIFETIME MEASUREMENTS (Abstract), by T. M. Holzberlein. [1965] [1]p. [AF 49(638)1404] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 169-170, Feb. 25, 1965.

Specially designed excitation tubes are needed for a new method recently applied to atomic-lifetime measurements and the design and operation has been the subject of recent further study. Using an external cathode in cylindrical symmetry, one finds that space-charge exclusions of radially convergent impact electrons is almost complete until plasma conditions are developed. The plasma neutralization of the electronic space charge apparently is progressive in a radial-inward sense, having a very sharp boundary between the excited and the unexcited regions of the gas. The time required for this boundary to reach the central zone is indicated by the buildup of light radiation from this zone. Propagation time is strongly pressure- and electron-energy-dependent. A network producing nearly flat-topped pulses having a variable width from 100 nsec to 20 μsec while preserving 7-nsec rise and fall times was built; 200-v pulses are delivered at an output impedance of 10-20 Ω. This circuit and its construction are discussed, together with the behavior of the device as shown by lifetime observations on the fast-decaying 5016-A line of He.

EXPERIMENTAL STUDY OF RESONANCE RADIATION TRANSFER, by H. Mochizuki and R. G. Fowler. [1965] [5]p. incl. illus. diagrs. (AFOSR-65-1096) (AF AFOSR-62-378) AD 612530 Unclassified

Also published in Phys. Rev., v. 137: A17-A21, Jan. 4, 1965.

Experimental investigations have been made of the transfer of mercury 2537-A radiation through a slab of natural mercury gas of various densities and dimensions, using a sinusoidally modulated ($\omega = 2\pi f$, f = 5 to 50 kc sec) radiofrequency-excited (50-mc sec) source of 2537-A radiation. Transmitted radiation has been found to gain in phase relative to the source wave, while that which is scattered at 90° loses phase. From the radiation scattered at 90°, decay time constants of the imprisoned photons have been calculated by using the relation between the time constant T and the phase shift ϕ, $\phi = \tan^{-1}\omega T$. The relation $T \propto C^2 (K^2 + C^2)$, where K is a constant, has been found for the dependence on the breadth C of the resonance tube as well as the well known dependence in $T \propto \ln n$ on the molecular density n. On the other hand, the transmitted radiation obeys a relation $T_c \propto (nA)^{1/2}$ between the time constant T_c corresponding to the advanced phase shift, the thickness A of the resonance tube, and n. The dependences on other factors have also been examined. (Contractor's abstract)

COLLISIONAL TRANSFER OF EXCITATION ENERGY IN HELIUM, by R. M. St. John and T.-W. Nee. [1965] [7]p. incl. diagrs. table (AFOSR-65-2824) (AF AFOSR-63-252) AD 628229 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 55, 426-432, Apr. 1965.

Recent absolute measurements of many helium excitation functions at low pressure and of the singlet and triplet D functions at several pressures have allowed an extension and upgrading of the multiple-state-transfer process. Atoms excited to an n^1P level are converted to a mixed singlet-triplet F state by an atomic collision. Low-lying singlet and triplet D levels are fed by the many F states thus populated. Apparent excitation functions were computed by machine for the 3^3D, 4^3D, and 4^1D states and compared with the experimental excitation functions. The computed curves best match the experimental curves when it is assumed that (a) the transfer cross section for the nth set of ^1P-F states is proportional to n^1 or n^2, and (b) the $^1F_3$ and $^3F_3$ components of the mixed state are active in the transfer-cascade processes, while the $^3F_{2,4}$ states are inactive. The energy is primarily transferred through n^1P-nF sets of states with n < 15. (Contractor's abstract)

ELECTRON EXCITATION CROSS SECTION OF THE $3^2S \rightarrow 3^2P$ TRANSITION OF SODIUM, by L. L. Barnes, N. F. Lane, and C. C. Lin. [1965] [4]p. incl. diagrs. tables. (AFOSR-65-2882) (AF AFOSR-63-252) AD 628406 Unclassified

Also published in Phys. Rev., v. 137: A388-A391, Jan. 18, 1965.

The cross section of the $3^2S \rightarrow 3^2P$ transition of sodium produced by electron impact has been calculated by performing a numerical integration of the set of 3-channel differential equations. By means of this numerical procedure, it is no longer necessary to replace the nondiagonal matrix elements of the interaction potential by their asymptotic forms and to neglect the diagonal part of the interaction-potential matrix, as was done in the previous calculations. The cross sections calculated by this numerical scheme are smaller than those of the previous work, and the difference can be ascribed to the use of the true interaction potentials rather than their asymptotic forms. An outline of the general formulation of the numerical method for an n-channel case is given. (Contractor's abstract)

THEORY OF THE EXCITATION OF THE 4686-A LINE OF He^+ BY ELECTRON IMPACT, by E. T. P. Lee and C. C. Lin. [1965] [4]p. (AFOSR-65-2954) (AF AFOSR-63-252) AD 628407 Unclassified

Also published in Phys. Rev., v. 138: A301-A304, Apr. 19, 1965.

The cross sections for the production of He^+ ion in the 4S state by single-electron collisions with neutral helium atoms in the ground state have been calculated by the Born approximation at various incident-electron energies from 200 to 450 ev. These cross sections range from 8.2×10^{-21} to 6.6×10^{-21} cm^2. By using the ionization-excitation cross sections of the 4P and 4D states calculated by Dalgarno and McDowell and by extending their calculations to 4F, the cross sections of the excitation of the $n = 4 \rightarrow n = 3$ transitions of He^+(4686 A) have been computed. It was found that the transition 4S - 3P contributes about 90% of the total radiation of the various members of the $n = 4 \rightarrow n = 3$ group. The theoretical cross sections of the 4686-A radiation agree with the experimental values to within 15%. It is concluded that the observed 4686-A radiation can be ascribed mainly to direct ionization-excitation to the n = 4 states of He^+ by single-electron impact, and no evidence is found for any indirect excitation mechanism which is responsible for a significant portion of the population of the 4S state of He^+. EXCITATION AND IONIZATION-EXCITATION OF ARGON ATOMS BY ELECTRON IMPACT (Abstract), by R. J. Anderson and C. C. Lin. [1965] [1]p. [AF AFOSR-63-252] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 382-383, Mar. 24, 1965.

Electron-excitation functions for several argon lines in the range of 4060-6000 A have been measured for electron incident energies from 0 to 100 ev. These lines correspond to the various members of the $(3P)^5(5P) \rightarrow (3P)^5(4S)$, $(3P)^5(5d) \rightarrow (3P)^5(4P)$, and $(3P)^5(6d) \rightarrow (3P)^5(4P)$ transitions. The peak values of the excitation functions of these lines occur at about 25 ev and the max excitation cross sections range from 1×10^{-18} to 2×10^{-19} cm^2. Also observed are the excitation functions of the group of transitions $(3p)^4(4p) \rightarrow (3p)^4(4s)$ of the Ar^+ ions in the region of 4580-5290 A, which resulted from ionization-excitation of the argon atoms by electron impact. These lines are generally less intense than the ones observed for neutral argon and the max cross sections of the Ar^+ transitions are in the range of 4×10^{-19} to 2×10^{-20} cm^2.

SIMULTANEOUS EXCITATION AND IONIZATION OF HELIUM BY ELECTRON IMPACT (Abstract),

by E. T. P. Lee and C. C. Lin. [1965] [1]p. [AF AFOSR-65-252] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 182, Feb. 25, 1965.

The cross sections for the production of He^+ ion in the 4^2S state by single-electron collisions with ground state helium atoms have been calculated by the Born approximation. For the wavefunction of the ionized electrons, the hydrogenic continuum functions given by Sommerfeld were used. At an incident electron energy of 405 ev, the calculated cross section is 7.2×10^{-21} cm^2. This process is responsible for the major part of the intensity of the 4686-A radiation ($n = 4 \rightarrow n = 3$ of He^+) observed in the helium-discharge experiment. Using the ionization-excitation cross sections of the 4^2P and 4^2D states calculated by Dalgarno and McDowell, the theoretical cross section of the 4686-A line of He^+ is obtained as 3.4×10^{-21} cm^2 at 405 ev, which agrees well with the experimental value of 3.0×10^{-21} cm^2.

THEORY OF EXCITATION OF THE 4686-A RADIATION OF He^+ BY ELECTRON IMPACT (Abstract), by E. T. P. Lee and C. C. Lin. [1965] [1]p. [AF AFOSR-65-252] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 170, Feb. 25, 1965.

The cross sections for the production of He^+ in the 4S state by electron collisions with He atoms have been calculated at various incident-electron energies from 200 to 450 ev. These values range from 8.1×10^{-21} to 6.6×10^{-2} cm^2 with the peak at 230 ev. Unlike the case of the 4P, 4D, and 4F states of He, the excitation cross sections for 4S do not depend very sensitively on the choice of the effective nuclear charge of the continuum wavefunction. The cross sections of the excitation of the $n = 4 \rightarrow 3$ transitions of He^+ (4686 A) were obtained from the ionization-excitation cross sections of the 4S, 4P, 4D, and 4F states of He^+. The theoretical cross sections of the 4686 A radiation agree with the experimental values to within 15%. It is concluded that the observed 4686-A radiation can be ascribed mainly to the direct ionization-excitation to the $n = 4$ states of He^+ and no evidence is found for any indirect extraction mechanism that is responsible for a significant portion of the population of the 4S state of He^+.

TOTAL ELECTRON-IMPACT EXCITATION CROSS SECTION OF HELIUM (Abstract), by R. M. St. John, T. W. Nee, and R. W. Kassik. [1965] [1]p. [AF AFOSR-65-252] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 170, Feb. 25, 1965.

The absolute total excitation function of helium due to electron impact has been obtained. Data on 18 levels were used in order to perform extrapolations from measured cross sections within families for obtaining the cross sections for $n = 2$ and for high values of n. The measured and extrapolated cross sections were added at specific electron energies in order to produce to total-excitation function. The function shows a broad maximum of about 1900×10^{-20} cm^2 extending from 30 to 100 ev. About 58% of the function is due to $n = 2$ levels, 32% due to the 18 measured levels, and 10% due to the high n levels. Excitation to F, G, ..., states is included in the cascade component of measured ^1D and ^3D levels.

TRANSFER OF EXCITATION OF ENERGY IN HELIUM BY ATOMIC COLLISIONS (Abstract), by T.-W. Nee and R. M. St. John. [1965] [1]p. [AF AFOSR-65-252] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 182, Feb. 25, 1965.

The multiple-state transfer process of helium has been clarified and extended through the comparison of its predictions with recent absolute measurements of helium-excitation functions at several pressures. Atoms excited to an n^1P level are converted to a mixed singlet-triplet F state by an atomic collision. Low-lying singlet and triplet levels are fed by the many F states thusly populated. Apparent excitation functions were computed by machine for the $3\,^3D$, $4\,^3D$, 3^1D, and 4^1D states and compared with experimental curves of the 3^3D, 4^3D, and 4^1D states at four pressures. The calculations were based on a variety of assumptions relating to the variation of the transfer cross section with the principal quantum number n and to the mixed F state model. The computed functions best match the experimental curves when it is assumed that: (a) the transfer cross section for the nth set of ^1P - F states is proportional to the first power of n, and (b) the $^1F_3$ and $^3F_3$ components of the mixed state are

active in the transfer-cascade processes, while the $^3F_{2,4}$ states are inactive. The energy is primarily transferred through n^1P - nF sets of states with n ~15.

STUDY OF SUPEROXIDIZERS, by D. A. Csejka. Final rept. Dec. 1, 1961- Jan. 31, 1965. Mar. 12, 1965, 32p. incl. diagrs. tables, refs. (AFOSR-65-1050) (AF 49(638)1137) AD 617964 Unclassified

The reactions of hydrogen atoms with gaseous ozone and with oxygen were studied to determine if hydrogen superoxide, H_2O_4, could be obtained in higher yields. Attempts to concentrate H_2O_4 by separating it from its ice matrix were made. Hydrogen superoxide was examined by X-ray, nuclear magnetic resonance and IR methods at low temperature in order to determine its structural characteristics. The heat of decomposition and formation of H_2O_4 were determined at -196°C. The reactions of H_2O_4 with ammonia, chlorine and ethylene were studied. Di-t-butyl tetroxide was prepared so that the O_4 species could be examined by IR spectroscopic techniques. The reactions of ozone with hexafluoroethane, ammonia, bromine trifluoride and chlorine trifluoride were studied. Tetrafluorohydrazine was treated with ozone, oxygen atoms, oxygen and potassium superoxide in an effort to prepare new oxides such as NF_2ONF_2, NF_2OONF_2 and NF_2OOH. The preparation of chlorine tetroxide was investigated. Reactions of nitrogen trifluoride with ethane, ammonia and diborane at elevated temperatures were examined.

FIBER OPTICS AND THE LASER, by N. S. Kapany [1965] [23]p. incl. illus. diagrs. refs. (AFOSR-65-1977) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1200, National Institutes of Health and Office of Naval Research) AD 627456 Unclassified

Also published in Ann. New York Acad. Sci., v. 122 615-637, May 28, 1965.

Fiber optics provides an optical element capable of conducting light and images in various parts of the spectrum along flexible axes with high photometric efficiency and large acceptance angles. Not only can fibers be used as passive carriers of light and images, but also as active guides in the form of scintillating fibers, lasing fibers, cathodoluminescent fibers, and the like. The advent of lasers has provided light sources in discrete parts of the visible and infrared spectra. These sources are highly monochromatic and directional and are capable of delivering instantaneous power per cycle far in excess of that of the sun. The present work examines the following aspects of these new techniques: (1) the various applications made possible by the combination of the fields of lasers and fiber optics, (2) the use of lasers in medicine for the coagulation of tissues accessible to direct observation and of tissues inside the human body inaccessible to direct observation, using laser-fiber optics endoscopes, and (3) the possibility of using the fiber optics hypodermic probe, capable of uv excitation as well as laser coagulation in deep regions under the skin. More recent work done on lasing fibers, made possible with the availability of neodymium - doped glasses, is described along with the output characteristics and potential applications.

THE EFFECT OF STRUCTURE ON THE RATE OF DISPROPORTIONATION OF AROMATIC SULFINIC ACIDS, by J. L. Kice, D. C. Hampton and A. Fitzgerald. [1965] [4]p. incl. diagr. tables, refs. (AFOSR-65-0861) (AF AFOSR-63-106) AD 619613 Unclassified

Also published in Jour. Org. Chem., v. 30: 852-855, Mar. 1965.

The rates of disproportionation of a series of aromatic sulfinic acids have been determined in acetic acid, containing small amounts of water and sulfuric acid. All of the disproportionations exhibit kinetics which are second order in sulfinic acid and show essentially the same dependence on water and sulfuric acid concentration previously found for p-toluenesulfinic acid. For para-substituted benzenesulfinic acids one finds that electron-withdrawing para substituents retard the disproportionation while electron-releasing ones accelerate it. This is exactly the opposite of the effect of the same substituents on the rate of decomposition of the corresponding sulfinyl sulfones I, the reaction believed to be the rate-determining step in the disproportionation. This means that the observed effect of para substituents on disproportionation is entirely the result of their influence on the prior equilibrium between sulfinic acid and sulfinyl sulfone. Evidence is also presented which indicates that the equilibrium between sulfinic acid and sulfinyl sulfone is not really too unfavorable thermodynamically to the sulfinyl sulfone, and that in favorable cases the equilibrium concentration of the sulfinyl sulfone may be as much as a few per cent of the stoichiometric concentration of the sulfinic acid. SYNTHESIS OF OPTICALLY ACTIVE PHENYL BENZENETHIOLSULFINATE BY ASYMMETRIC OXIDATION OF PHENYL DISULFIDE, by J. L. Kice and G. B. Large. [1965] [5]p. incl. refs. (AFOSR-65-2045) (AF AFOSR-65-106) AD 627774 Unclassified

Also published in Tetrahedron Ltrs., No. 40: 3537-3541, 1965.

A simple, convenient method is presented for the preparation of an optically active aromatic thiolsulfinate having a sufficient degree of optical activity for subsequent polarimetric rate measurements. The disulfide used was phenyl disulfide, oxidized by a solution of d-percamphoric acid. The resulting product was pure phenyl benzenethiolsulfinate, mp 67-68 C with infrared and ultra violet absorption spectra identical with a known sample. The yield was approximately 60%. Measurement of the specific rotation showed that the sample of the thiolsulfinate was definitely optically active. This represents the first example of an optically active thiolsulfinate in which the sulfinyl group is the sole source of asymmetry in the molecule.

PERTURBATION THEORY EXPANSIONS THROUGH 21ST ORDER OF THE NON-RELATIVISTIC ENERGIES OF THE TWO-ELECTRON SYSTEMS $(2p)\ ^{23}P$ AND $(1s)^{21}S$, by J Midtal. [1965] 13p. incl. tables. (Institute rept. no. 26) (AFOSR-65-1662) (AF EOAR-64-32) AD 624378 Unclassified

A 10th-order perturbation wave function is presented for the $(2p)^{23}P$ state and the $(1s)^{21}S$ state of a 2-electron system. Estimates of the correct perturbation energy coefficients through 21st order are evaluated giving the total non-relativistic energies with ten significant figures. Two important convergence properties concerning the perturbation energy coefficients furnished by the Hylleraas-Scherr-Knight variational perturbation method are considered. The numerical values of the energy coefficients obtained by using trial wave functions up to order 203 are presented, and it is found that perturbational convergence is somewhat better for the $(1s)^{21}S$ state than for the $(2p)^{23}P$ state, whereas the variational convergence is best for the $(2p)^{23}P$ state. The total non-relativistic energies computed from the sets of coefficients are given for the first 10 members of the isoelectronic sequences.

EXACT QUANTUM DYNAMICAL SOLUTIONS FOR OSCILLATOR-LIKE SYSTEMS, by M. Kolsrud. [1965] [23]p. (Institute rept. no. 28) (AFOSR-65-2754) (AF EOAR-64-32) AD 628414 Unclassified

There are very few cases in which the exact solutions of the quantum-mechanical equations of motion are known. For a certain class, however, it is possible to obtain explicit solutions, or rather to express the quantummechanical solutions in terms of the classical ones. This class consists of systems whose Hamiltonians are polynomials of the second degree in canonically conjugate dynamical variables (i.e. 'oscillator-like'). As these systems play a rather important role in quantum theory, it seems worth while to present an exact treatment of their dynamics. In order to study the variation with time of the state-or of the dynamical variables-of a system, it is convenient to introduce the unitary "timeevolution" operator T. An explicit expression for the operator T is found.

AN EIGENVALUE PROBLEM IN QUANTUM MECHANICS, by M. Kolsrud. [1965] 10p. (Institute rept. no. 34) (AFOSR-66-1013) (AF EOAR-64-32) AD 638055 Unclassified

Stationary perturbation theory in quantum mechanics often makes the following assumption: A hermitian operator is expanded in a power series in terms of a small expansion parameter. Then each of the discrete eigenvalues will also be given by a power series, in terms of the same parameter. Consideration is now given to a special eigenvalue problem where this not the case. However, a slightly different expansion shows that to the assumed power series expansion of the eigenvalue there must be added logarithmic terms. The result therefore constitutes an example in a theory which treats the problem of the analyticity of the eigenvalues as functions of one or more parameters.

SEARCH FOR AN EXCITED STATE OF THE $_{\Lambda}Be^{9}$ HYPERNUCLEUS, by A. G. Frodesen, F. Lunde, and O. Skjeggestad. [1965] [4]p. incl. diagrs. (AFOSR 65-1354) (AF EOAR-63-100) AD 621353 Unclassified

Also published in Phys. Norvegica, v. 1: 277-280, 1965.

Among 43 uniquely identified $_{\Lambda}He^{5}$ and 29 $_{\Lambda}He^{4,5}$ hypernuclei produced in association with stable prongs of range 500 μ in K^{-} capture stars in nuclear emulsions, a search has been made to detect possible $_{\Lambda}He^{5}$ originating from an excited state of $_{\Lambda}Be^{9*} \rightarrow {}_{\Lambda}He^{5} + He^{4}$. For each of the capture stars the effective mass of the $_{\Lambda}He$ and each of the stable prongs have been calculated on the assumption that the stable prongs are α-particles. The experimental effective mass distribution has been compared with background estimates from Monte Carlo calculations. The data are consistent with no $_{\Lambda}He^{5}$ events coming from $_{\Lambda}Be^{9*}$.

A FORTRAN PROGRAMME FOR THE ANALYSIS OF HYPERFRAGMENTS AND FOR OTHER EMULSION STUDIES, by A. G. Frodesen, K. S. Kolbig and M. M. Nicolic. Feb. 3, 1965, 86p. incl. diagrs tables, refs. (Rept. no. CERN 65-6) (AFOSR-65-1735) (AF EOAR-63-100) AD 625014 Unclassified

A FORTRAN computer programme is described which is primarily designed as an aid for the identification of hyperfragments from a kinematic analysis of the production and decay vertices, but which may also be applied to other emulsion studies. The programme considers the kinematics for: (1) capture at rest of a negative meson or negative baryon in light emulsion nuclei, leading to the formation of a number of charged secondaries, and at the most one neutral particle; (2) decay at rest of a hyperfragment into charged particles and at the most one neutral particle, and (3) decay in flight of a hyperfragment into charged particles. The subroutines of the programme are described, and range-energy tables (tables of isotopes and particles with binding energies of hypernuclei) and a list of FORTRAN variables are given.

A SYSTEMATIC STUDY OF HYPERNUCLEI FROM Σ^- CAPTURES IN NUCLEAR EMULSIONS, by A. G. Frodesen, T. Roe and O. Skjeggestad. [1965] [7]p. incl. diagr. tables, refs. (AFOSR-65-1841) (AF EOAR-63-100) Unclassified

Also published in Nuclear Phys., v. 68: 575-581, 1965.

A total of 35 hypernuclei produced by stopping Σ^- hyperons in nuclear emulsions was studied with main emphasis on the identification problem. A kinematical analysis of the hypernucleus production and decay stars was combined with mass and charge determination of individual prongs. Out of 25 non-mesic hypernuclei, 8 could be uniquely identified and 4 assigned a unique charge. All 10 mesic decay could be uniquely identified. The emission rate of measurable hypernuclei from Σ^- capture is found to be $(3.7 \pm 0.9)\%$. For hypernuclei of charge $Z \geq 2$ the overall non-mesic decay ratio is 4.2 ± 1.9.

HIGH ENERGY PHYSICS WITH EMPHASIS ON STRANGE PARTICLES, by [O. Skjeggestad and S. O. Sörensen]. Final scientific rept. Aug. 31, 1965, 31p. incl. diagrs. tables, refs. (AFOSR-65-1912) (AF EOAR-63-100) AD 626056 Unclassified

Two approaches are used in a search among nonmesic hypernuclei for evidence of multi-nucleon stimulated Λ decay: (1) an attempt is made to detect fast deuterons or tritons among the decay products of hypernuclei by mass measurements on fast prongs. It is indicated that stimulated decay processes of the types $\Lambda + d \rightarrow n + d$ and $\Lambda + t \rightarrow n + t$ may occur; (2) a search is made for special 2-body decay modes which are expected if the multi-nucleon stimulation picture is correct. Two examples of the decay mode $_{\Lambda}He^5 \rightarrow n + He^4$ and one of the mode $_{\Lambda}He^4 \rightarrow n + He^3$ are found. The non-mesic to π^- - mesic decay ratios for hypernuclei are determined. A short description is presented of the CERN program REAP-THRESH for geometrical reconstruction of events in bubble chambers.

BIOCHEMISTRY OF BIOGENIC AMINES, by H. K. F. Blaschko. Final rept. Mar. 1, 1965 [4]p. incl. refs. (AFOSR-65-0668) AF EOAR-64-12) AD 615503 Unclassified

The meta-hydroxy analog of tyrosine was shown to have the effect of awakening tranquilized animals. Many sources were established for an enzyme that will oxidize hydroxyindole derivatives. Distribution of amine oxidases in mammalian blood plasma was studied; the enzyme is related to spermine oxidase. Benzylamine oxidase from pig plasma was crystallized. Work was resumed on detaching the enzyme lysolecithin from the insoluble mitochondrial detritus. Chromaffin granules of the adrenal medulla. Posterior pituitary hormones and neurophysin: Hormones were dissociated from protein by using columns of sphadex G-25 and 0. in formic acid. Granules rich in hormones were obtained by differential centrifugation, the granules containing a protein resembling the Van Dyke protein. Sulfur containing amino acids: Optically pure L-homocystine was obtained from L-methionine.

[HYDROXYINDOLE OXIDASE IN THE CRYSTALLINE STYLE OF PINNA NOBILIS] Attivita idrossindolossidasica nello stilleto cristallino di Pinna Nobilis, by H. Blaschko. [1965] [9]p. incl. diagr. (AFOSR-65-1549) (AF EOAR-64-12) AD 623375 Unclassified

Also published in Riv. Biol., v. 58: 27-36, Jan.-Mar. 1965.

Experiments were conducted on the hydroxyindole oxidase activity of an enzyme present in crystalline Pinna nobilis. It is shown that a homogenate of the crystalline style oxidizes psilocine with the formation of a blue pigment. This activity was also observed in the gill plates of Mytilus edulis and is described as an expression of the phenol oxidase activity in these tissues. This finding is discussed in relation to earlier observations on the presence of a phenoloxidase in mollusks.

THE AMINE OXIDASE OF PIG PLASMA IN COPPER DEFICIENCY, by H. Blaschko and F. Buffoni and others. [1965] [2]p. incl. table. (AFOSR-65-2856) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR 64-12 and National Institutes of Health) AD 629259 Unclassified

Also published in Biochem. Jour. v. 96: 4C-5C, 1965.

The amine-oxidase ('benzylamine-oxidase' or histaminase) activity of the blood serum of copper-deficient pigs was studied. Observations on the biochemical basis of the cardiovascular changes in copper-deficient pigs were made and the amine oxidase of pig plasma was crystallized and shown to be a copper-containing protein. Samples from animals maintained on a diet deficient in copper were examined for their amine-oxidase activity. The freezedried material was tested manometrically, with 10mm -benzylamine as substrate. The samples included material collected not only from deficient animals but also from animals that had received copper after a first sample had been collected while they were copper-deficient. The results show that in the deficient animals enzymic activity was either absent or extremely low. Under copper therapy the enzymic activity made its appearance. These observations are of interest in relation to the role of copper in enzymic processes. Although in the experiments the mechanism of action of copper was not studied it is believed that the pig plasma enzyme belongs to a group of oxidases in which copper is an essential constituent of the catalytic system. From what is known of the chemistry of related enzymes, the bovine spermine oxidase, the pea-seedling amine oxidase and the diamine oxidase of pig kidney, it is clear that the whole group of amine oxidases sensitive to cyanide and to carbonyl reagents represents a new type of copper-containing protein with catalytic activity.

ACID NUCLEASES OF THE BOVINE ADRENAL MEDULLA, by A. D. Smith and H. Winkler. [1965] [1]p. (AFOSR-66-0849) (AF EOAR-64-12) AD 639529 Unclassified

Also published in Nature, v. 207: 634, Aug. 7, 1965.

The observations show that the RNase described by Philippu and Schumann is present in the soluble protein fraction and also that an acid DNase is present in the same lysate. The material used in this study was obtained from the bovine adrenal medullary "large granule" fraction by ultracentrifugation over a sucrose density gradient. Although a possible contamination of the chromaffin granules by either mitochondria or microsomes can be excluded as a source of the enzymatic activities studied, the possibility remains that the two enzymes are lysosomal in origin. Two alternative interpretations offer themselves: either the presence of the two acid hydrolases is an expression of a close relationship between chromaffin granules and lysosomes, or the two enzymes are located not in the chromaffin granules but in lysosomes which might be present in the particulate fraction isolated from the chromaffin tissue.

PYRIDOXAL PHOSPHATE AS A CONSTITUENT OF THE HISTAMINASE (BENZYLAMINE OXIDASE) OF PIG PLASMA, by H. Blaschko, and F. Buffoni. [1965] 16p. incl. diagrs. tables, refs. (AFOSR-66-1143) (AF EOAR-64-12) AD 639530 Unclassified

Also published in Proc. Roy. Soc. (London), v. 163B: 45-60, Aug. 1965.

The histaminase ('benzylamine oxidase') of pig plasma has recently been crystallized and a description is given of some of the physical and chemical properties of the pure preparation of the oxidase. The fluorescence of the enzyme is typical of a protein containing tryptophan. The phosphorus content is about four atoms per molecule. On enzymic hydrolysis a product has been obtained that has the fluorescence properties of a pyridoxal protein. This product gave rise on acid hydrolysis to material capable of activating the L-typrosine apodescarboxylase of Streptococcus faecalis R in the presence of adenosine triphosphate, indicating that pyridoxal was set free in the hydrolysis. Acid hydrolysis of a solution of the crystalline enzyme and subsequent treatment with urea yielded diffusible material with the spectroscopic and fluorescence properties of pyridoxal. Using the bacterial apodecarboxylase, traces of pyridoxal phosphate and larger amounts of free pyridoxal were shown to be present. It was calculated that about 3 or 4 moles of pridoxal were present per mole of enzyme. Together with the phosphate estimations, these phosphate per mole. Observations on rate maintained on a diet deficient in vitamin B_6 are in agreement with these conclusions. (Contractors' abstract)

WAVES IN ANISOTROPIC MEDIA, by H. Motz. Final rept. Mar. 10, 1965 [20]p. incl. diagrs. (AFOSR-66-0907) (AF EOAR-63-33) Unclassified

Theoretical studies have been directed towards

understanding how factors sometimes discounted in simple models, such as temperature and collision effects, affect the propagation of waves in an anisotropic medium. The theoretical and computational work on dielectric loaded structures has yielded a method of calculating field and frequency of the lowest TM mode, from which the dispersion curve is easily obtained. Theoretical work on waves on electron beams has been confirmed by an experiment on a two beam vacuum tube. Microwave emission from a solid state plasma device has been observed. The effect of a standing microwave field pattern on the electron temperature in a plasma has been investigated and found to accord with the theory. Laser induced electron and ion emission has been observed from metal points and plane surfaces. The time delay between the laser pulse and onset of emission has been measured as less than 3.10^{-8} sec. Stimulated emission has been observed in the ruby optical pumping experiment at 3 cm and 8 mm wavelengths.

BRAIN STEM STIMULATION AND ETHOLOGICAL STUDIES ON BIRDS, by N. Tinbergen, D. M. Vowles, and J. D. Delius. Final rept. Jan. 1, 1964-Jan. 31, 1965, 8p. (AFOSR-65-0666) (AF EOAR-64-2) AD 615476 Unclassified

The work was specifically intended to elucidate further the physiological mechanisms of some particular types of behavior in birds using in combination brain stimulation and observation techniques. Studies were made of the interactions between internal and external stimulation and of the interactions occurring during simultaneous stimulation of two different areas of the brain, which yield either similar or differing types of behavior. The experimental animals chosen for this work were hering gulls, whose behavior is simpler, i.e., stereotyped, than that of the classically studied mammals.

THE EFFECT OF HUNGER ON THIRST-MOTIVATED BEHAVIOR IN THE BARBARY DOVE, by D. J. McFarland. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-66-0841) (AF EOAR-64-2) AD 639523 Unclassified

Also published in Animal Behav., v. 13: 286-292, Apr.-Jun. 1965.

A number of workers have reported that dogs and other animals, including man, eat less than normal when thirsty and drink less when hungary. It has been suggested that inhibition of eating by thirst produces a food deficit which is capable of motivating behavior learned for food reward. McFarland found that the extent to which Barbary doves would work for food when thirsty was commensurate with their secondary hunger, as measured by recovery in food intake after water deprivation. The experiments reported in this paper were designed to investigate the corresponding effect of hunger on thirst motivated behavior.

HUNGER, THIRST AND DISPLACEMENT PECKING IN THE BARBARY DOVE, by D. J. McFarland. [1965] [8]p. incl. diagr. tables, refs. (AFOSR-66-0842) [AF EOAR-64-2] AD 637631 Unclassified

Also published in Animal Behav., v. 13: 293-300, Apr.-July 1965.

The demonstration that displacement activities can be influenced by direct relevant stimulation has led to a rejection of the view that they must necessarily be "allochthonous". Although the latter view is implicit

in the original definitions of displacement activity many recent authors have suggested that the term should continue to be used in a purely descriptive sense. Accordingly, in this paper, the term "displacement activity" is applied to activities which belong to motivational and functional systems other than that predominantly activated at the time of observation. The first step in explaining the occurrence of a displacement activity must be to determine to which system the activity belongs. This is the main object of this paper, in which a typical displacement activity is examined in relation to the motivational complex characteristic of the situation in which it occurs.

CONTROL THEORY APPLIED TO THE CONTROL OF DRINKING IN THE BARBARY DOVE, by D J. McFarland. [1965] [15]p. incl. diagrs. refs. (AFOSR-66-1108) [AF EOAR-65-14] AD 637630 Unclassified

Also published in Animal Behav., v. 13 476-492, Oct. 1965.

A preliminary hypothesis about the system controlling drinking in the Barbary dove is derived from experimental data of a behavioral rather than a physiological kind. This hypothesis is put on a quantitative basis by using a method that is described in detail in the appendix. The model which results from this process is capable of predicting the course of water intake during recovery from water deprivation, but is unable to account for the observed bodyweight changes. By analyzing the model according to the rules outlined in the appendix, a more complex model is arrived at, which accounts for both water intake and bodyweight changes during recovery from water deprivation. This complex model also accounts for the course of food intake during water deprivation, and the extent to which water intake falls during food deprivation. The model shows a close parallel to the known physiological facts and successfully predicts the daily evaporative water loss in the Barbary dove, and the extent to which Barbary doves can tolerate water rationing without loss of bodyweight.

NOTES ON A PARTIAL SURVEY OF CYBERNETICS IN EUROPE AND U. S. S. R., by M. A. Arbib. Final rept. May 19, 1965. 152p. incl. diagrs. refs. (AFOSR-65-1412) (AF 49(638)1446) AD 623127 Unclassified

Brief summaries are given of research activities at a number of centers and laboratories in Western and Eastern Europe. The summaries are primarily the transcribed notes of the autnor made during a recent trip. The research reported is that primarily classified as cybernetics in the Western sense, i.e., categorized as automata theory, neural modeling, artificial intelligence, and pattern recognition. Soviet work excels in areas such as control theory and information theory where strong mathematics is paramount. Research lags where it requires large-scale computers for non-numerical work. The report includes an introductory section which traces the historical progress of the role of cybernetics (in the Soviet sense, i.e., broadly as the science of control including problems of mathematical economics and operations research) in the Soviet society. Several appendices are included: (a) a listing associating particular scientists and groups with particular subject fields; (b) an annotated listing of some of the major journals which publish papers in cybernetics; (c) a list of references to reviews of aspects of Soviet science and education germane to the topics of the report, and (d) a random selection of Russian papers supplementary to (c). The report contains city, name, and subject indices.

A COMMON FRAMEWORK FOR AUTOMATA THEORY AND CONTROL THEORY, by M. A. Arbib. [1965] [17]p. (AF 49(638)1446) Unclassified

Published in SIAM Jour. Control, Ser. A, v. 3, 206-222. 1965. (AFOSR-66-0013; AD 641628)

This is an expository paper sketching some of the ideas common to automata theory and control theory. The first section on states and semigroups, indicates how discrete automata and continuous systems can be subsumed under a common definition. The unifying concept is that of the input semigroup and the semigroup of the system — or automation. Unfortunately, this central idea is not explored in any depth here. The remainder of the paper is devoted, for the most part, to linear systems and their generalization, additive systems Linear systems arise in a natural way in control theory and have, accordingly, been studied

intensively. The paper does not indicate whether additive systems have a corresponding role in automata theory. Controllability and observability are discussed for linear systems. (Math. Rev. abstract)

REACTIONS OF CARBON VAPOR. I. REACTIONS OF TRIATOMIC CARBON WITH OLEFINS, by P. S. Skell, L. D. Wescott, Jr. and others. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-65-2144) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-503, Army Research Office (Durham), Esso Research and Engineering Corporation, and National Science Foundation) AD 629063 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 2829-2835, July 5, 1965.

A major component of carbon vapor is C_3. The chemical properties of this substance were studied at -196° in additions to olefins, the products being bisethanoallenes. Relative rates show C_3 to be a nonselective dicarbene for oelfin additions and yet it does not show insertion properties. In a paraffin hydrocarbon matrix at -196°, C_3 is stable. This variety of C_3 adds stereospecifically to cis- and trans-2-butenes, confirming the conclusion from spectroscopic analysis of the Swings bands that the ground state is singlet. Nonstereospecificity is observed with simultaneous deposition at -196° of C_3 and the 2-butenes, indicative of a hitherto unobserved triplet state C_3, limits of 10^{-1} to 10^{-5} sec were placed on the half-life for decay of this triplet state to a singlet state.

THE REACTIONS OF CARBON ATOMS WITH CHLORINATED HYDROCARBONS, by P. S. Skell and R. F. Harris [1965] 1p. incl. diagr. (AFOSR-66-1040) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-503], and Army Research Office (Durham)) AD 632216 Unclassified

Also published in Jour. Amer. Chem. Soc., v 87: 5807, Dec. 1965.

Reactions of carbon atoms with chlorinated hydrocarbons are described. The reaction with carbon tetrachloride yields 2 products, tetrachloroethylene and octochloropropane. Carbon atoms reacts with chloroform in a similar manner, yielding trichloroethylene and 1, 1, 2, 2, 3, 3-hexachloropropane, t-butyl chloride produces 1-chloro-2, 2-dimethylcyclopropane as the major product.

THE REACTIONS OF CARBON ATOMS WITH SATURATED HYDROCARBONS, by R. R. Engel and P. S. Skell. [1965] 1p. incl. diagrs. (AFOSR-66-1041) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-503] and Army Research Office (Durham)) AD 632217 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 4663, Oct. 1965.

The reactions of carbon atoms with saturated hydrocarbons are reported. The products formed with 2-metnylpropane were 1, 1-dimethylcyclopropane and 2-methylbutane. The reaction of carbon atoms with cyclopropane gave, as the major product, methylenecyclopropane in 65% yield. Using the time-delay technique as previously described, it was determined that all products were resulting from the ^1S state of carbon.

CHEMICAL PROPERTIES OF LABILE SPECIES, by P. S. Skell. Final rept. 1961-1965, 5p. incl. refs. (AFOSR-67-0044) (AF AFOSR-62-52 and AF AFOSR-64-503) AD 645534 Unclassified

The major effort was expended in the study of vaporized carbon. The chemistry of C_1 and 3 states of C_3 in 2 states have been studied extensively, and reactions with olefins, alkanes and some alkyl halides have been examined in considerable detail. The success in studying carbon vapor has indicated the feasibility of extending the studies to other high temperature atomic and molecular species. The primary objective of the program was the study, at room temperature or below, of the chemical properties of species stable at high temperatures. The most interesting class of substances which falls in this category are the atomic species, which for the main part have not been studied as reactive species.

THE FORM OF D ORBITALS IN CARBON-SULFUR BONDS, by L. Goodman and R. W. Taft. [1965] 3p. incl. diagrs. table. (AFOSR-66-0584) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-742 and National Science Foundation) AD 632763 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 4385-4387, Oct. 5, 1965.

It has been found that the effect of twisting OCH_3 group and SCH_3 group from the ring coplanarity produces fluorine nuclear magnetic resonance shielding effects which are dramatic in their qualitative differences. This F shielding result clearly requires that there is population of the S 3d orbitals in the twisted conformation and hence establishes that the d orbitals are not severely angularly deformed.

EXPERIMENTAL TECHNIQUES FOR THE DIRECT OBSERVATION OF FATIGUE-INDUCED DEFORMATION FAULTING IN THIN-FOIL STAINLESS STEEL, by L. E. Murr and P. J. Smith. [1965] [7]p. incl. illus. diagrs. refs. (AFOSR-65-1155) (AF AFOSR-63-165) AD 618357 Unclassified

Also published in Trans. Metall. Soc. AIME, v. 233: 755-761, Apr. 1965.

A study is made by transmission electron microscopy of thin foils of 304 stainless steel fatigues external to the electron microscope in reversed bending, and of thin foils fatigued directly within the microscope in alternating tension. The build-up of stacking faults in the thin foil during fatigue was correlated with the dislocation structures found in thin films prepared from fatigued bulk specimens. The performance of the special devices designed for fatigue of thin foils so outlined and the importance of alternative methods of preparation of more uniform fatigue specimens by vapor deposition are emphasized. SOME OBSERVATIONS OF DISLOCATION MOTION IN THIN METAL FOILS RESULTING FROM HIGH INTENSITY ELECTRON IRRADIATION IN AN ELECTRON MICROSCOPE, by L. E. Murr. [1965] 12p. incl. illus, diagrs, tables, refs. (AFOSR-66-2648) (AF AFOSR-64-669) AD 643186 Unclassified

Also published in Proc. Penn. Acad. Sci., v 39: 202-213, 1965

Dislocation motion in thin foils of stainless steel and inconel (76% Ni, 16% Cr) was observed by transmission electron microscopy. Stresses required to move and nucleate dislocations were measured directly from electron micrographs with the aid of selected area electron diffraction patterns of the dislocated areas. A theoretical treatment is presented to account for the stresses induced in thin foils by the action of the electron beam, and it is concluded that thermal stresses of sufficient magnitude to move dislocations could exist. MECHANISM OF THE PRECIPITATION OF THE SPINEL FROM MgO-Al_2O_3 SOLID SOLUTIONS, by V. S. Stubican and R. Roy. [1965] [5]p. incl. diagrs. [AFOSR-65-2024) (AF 49(638)957) AD 627716
Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 1293-1297, Aug. 1965.

The point defects present in the MgO-Al_2O_3 crystalline solutions were investigated by using precise cell dimensions and density measurements. The precipitation of the spinel from crystalline solutions was studied by quantitative x-ray diffraction. It was found that the precipitation is a diffusion controlled process, and the equation for the fraction precipitated, $y = 1-\exp[-(t/\tau)^n]$, fits the experimental results for y= 0.05 - 0.95. The exponent n was found to be very close to 3 2, suggesting that under the experimental conditions the growing particles are approximately spheroidal. Electron prove investigations showed that the preferred sites for the nucleation and the precipitation of spinel were the grain boundaries and intergranular voids. (Contractor's abstract, modified)

FLUX METHODS FOR THE ANALYSIS OF TRANSPORT PROBLEMS IN SEMICONDUCTORS IN THE PRESENCE OF ELECTRIC FIELDS, by J. P. McKelvey and J. C. Balogh. [1965] [7]p. incl. diagrs. (AFOSR-65-1182) [AF AFOSR-63-73] AD 621427
Unclassified

Also published in Phys. Rev., v. 137: A1555-A1561, Mar. 1, 1965.

A calculational technique based upon the detailed study of flux interactions between various parts of a diffusion-recombination system is extended to include cases where electric fields may be acting upon the particles of the system. The analysis is worked out in detail for systems obeying Boltzmann statistics in

which the field satisfies the condition $\mu E_0 < c$, where $\bar{c}$ is the mean thermal velocity. Analytic solutions for the reflection and transmission coefficients of a sheet of material of arbitrary thickness for incident carriers are worked out for constant electric fields; approximate or numerical methods are applicable for nonconstant fields. The effect of the details of scattering and recombination processes upon the solutions is considered. A simple example is worked out to exhibit areas of agreement between this method and the more conventional calculational techniques and to demonstrate certain advantages in generally and conceptual simplicity associated with the flux method. FLUX METHODS FOR TRANSPORT PROBLEMS IN SOLIDS WITH NONCONSTANT ELECTRIC FIELDS. USING A WKB APPROXIMATION (Abstract), by E. F. Pulver and J. P. McKelvey. [1965] [1]p. [AF AFOSR-63-73] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Ser. II, v. 10, 504, Apr. 26, 1965.

Recently developed methods for the solution of 1-dimensional steady-state transport problems in solids (particularly semiconductors) have been extended to cases where nonconstant electric fields act upon the charged carriers of the system by the use of a WKB method of approximation. A system of coupled flux conservation equations for the diffusion-recombination system is solved, and by the use of the WKB approximation expressions for the reflection and transmission coefficient of a layer of material of arbitrary thickness, which involve integrals of the field are derived. The expressions that are obtained for the zero-recombination case are exact. Criteria for the validity of the WKB method are discussed, and it is shown that the method is applicable when the drift velocity is much less than the mean thermal velocity and when the field gradient is smaller than a specified amount. The latter condition can be expressed in the form $d(q^{-1})/dx < 1$, where $q = (2k_0w_0 + w_0^2 + h^2E^2)^{1/2}$; here k_0, w_0 represent the scattering and recombination probabilities, respectively, per particle per unit distance and $n = kT/2e$.

EXSOLUTION OF β-Ga_2O_3 CRYSTALLINE SOLUTIONS IN THE SYSTEM $MgAl_2O_4$—Ga_2O_3, by G. Katz and R. Roy. [1965] 3p. incl. diagrs. tables, refs. (AFOSR-66-0232) (AF AFOSR-63-208) AD 629699 Unclassified

Presented at the Sixty-sixth annual meeting of the Amer. Ceramic Soc., Chicago, Ill., Apr. 21, 1964.

Also published in Jour. Amer. Ceram. Soc., v. 48: 450-452, 1965

The subsolidus phase equilibrium diagram for the pseudobinary join $MgAl_2O_4$—Ga_2O_3 was determined. The shape of the exsolution boundary was obtained by heat-treating samples pre-equilibrated at 1600 C. Crystalline solubility of Ga_2O_3 in $MgAl_2O_4$ decreased from 73 mol-% at 1600° to 55 mol-% at 1200°C. The crystalline solution was formed by the replacement of Mg^{2+} ions by Ga^{3+} ions to produce a cation defect spinel. The phase precipitated was the monoclinic β-Ga_2O_3 (θ-Al_2O_3 structure). Changes in the ratios of relative X-ray diffraction intensities indicated that the crystalline solutions also disorder with temperature. (Contractor's abstract)

THE USE OF A NEW POTENTIAL BARRIER MODEL IN THE FOWLER-NORDHEIM THEORY OF FIELD EMISSION, by P. H. Cutler and D. Nagy. [1965] [24]p. incl. diagrs. tables, refs. (AFOSR-65-0782) (AF AFOSR-63-213) AD 616202 Unclassified

Also published in Surface Sci., v. 3: 71-94, Jan 1965.

For fields $> 5 \times 10^7$ v/cm, the observed field emitted current density deviates from the Fowler-Nordheim theory. One possible reason for this is the inaccuracy of the classical image-force barrier at small distances from the surface. This report examined the effect of a modified surface potential barrier on the emitted current and energy distributions in the field emission region. The new potential represents

quantum modifications to the classical image-force and is based on quantum-mechanical calculations of the electronic potential in the surface region of a metal. The result for the current density is obtained in analytic form, and energy distributions of the field emitted electrons are calculated for the normal and total energy cases.

FIELD-EVAPORATION END FORM OF TANTALUM, by S. Nakamura and E. W. Müller. [1965] [5]p. incl. illus. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-96 and Office of Naval Research) Unclassified

Published in Jour Appl. Phys., v. 36: 2535-2539, Aug. 1965.

A field-evaporation end form depends in a complicated way upon many factors. The end form of a pure and nearly perfect metal crystal as obtained under various conditions must be established experimentally to permit proper interpretation of field-ion micrographs of general specimens of that metal. The end form of tantalum, distinctly different from other bcc metals such as tungsten, molybdenum, and iron, is shown in its dependence on temperature, hydrogen promotion, and field-stress-induced slip. Low-coordination atom sites stabilized by polarization occur in specific crystallographic regions.

DESCRIPTION OF CATALOGING AND INDEXING SYSTEM FOR THE ACM REPOSITORY, by M. Rubinoff and J. F. White, Jr. Jan. 25, 1965, [63]p. incl. diagrs. tables, refs. (AFOSR-65-0424) (AF 49(638) 1421) AD 612277 Unclassified

The repository library of the Association for Computing Machinery (ACM) was first proposed in 1961, and subsequently the Moore School of Electrical Engineering was designated as the site. The Moore School established an advisory board on information retrieval, a research team to provide council in relating the repository to current developments. The Moore School research team concentrated on preparation of an organizational and procedural plan for a mechanized information center with 2 principles: (1) a library must make its information as easily accessible to a customer as any store, and (2) information service should be provided at a competitive price. The system aims to store bibliographic elements, 4 echelons of index terms for enhancing user convenience, and a number of document attributes for expediting user search. The system has a "multiport" entry plan whereby search may be based on any of the many aspects of the contents of the packaging of documents. The concept of the multiport entry is an outgrowth of the Moore School multilist system (AD 270573) and has been incorporated into the indexing system via "added info" groups. The scheme also permits stochastic search through the system, i.e., attaining the most applicable word from an initial approximation and a search through related categories, sections and classes.

ESTABLISHMENT OF THE ACM REPOSITORY AND PRINCIPLES OF THE IR SYSTEM APPLIED TO ITS OPERATION, by M. Rubinoff and J. F. White, Jr. [1965] [8]p. (AFOSR-66-0011) [AF 49(638)1421] AD 632185 Unclassified

Also published in Commun. Assoc. Comput. Mach., v. 8: 595-601, Oct. 1965.

The history of the establishment of the ACM Repository at the Moore School, Pennsylvania U., is reviewed briefly. The organizational and fundamental principles: (1) that information be made easily accessible to the customer, preferably on a self-serve basis, and (2) that the value of the services exceed user costs The system is designed for remote teletype writer on-line access to an information file in a 1301 disk storage which is auxiliary to the IBM 7040/1401 system at the university computer center. Significant features of the planned system include: (a) direct access via the console, (b) system storage of a complete description of itself in addition to document catalog and indexing data to enable users to design their own search strategies, (c) use of an unrestricted search vocabulary, (d) access through one or more of a large number of entry ports to enable adaptive man-machine interfacing with the indexing structure, and (e) stochastic type searching through related categories, sections, and classes of data. Thesauri and microthesauri are embedded in the system and kept dynamic and open-ended. The index terms have been generated primarily with regard to the document file

rather than with regard to a philosophical partitioning of knowledge, and with a view to interests of potential users and the nature of future accessions The collection primarily deals with computing machinery and programming languages.

INDEPENDENCE OF LUTEINIZING HORMONE AND ADRENOCORTICOTROPHIN SECRETION IN THE RAT, by V. D. Ramirez, D. Moore, and S. M. McCann. [1965] [4]p. incl. diagrs. tables, refs. (AFOSR-65-1509) (Sponsored jointly by AFOSR under AF AFOSR-62-133, and National Institute of Health) AD 622921 Unclassified

Also published in Proc. Soc. Exper. Biol. and Med., v. 118: 169-173, 1965.

Experiments were performed on adult, virgin female rats to determine if alterations in the titers of circulating adrenal and ovarian steroids would (1) produce alterations in the secretion of both luteinizing hormone (LH) and adrenocorticotrophin (ACTH), or (2) modify only the secretion of the trophin specific for the particular target gland. Results showed that alteration of the target gland steroids produced specific effects on LH in the case of ovarian steroids, and ACTH in the case of cortical steroids. Estrogen can stimulate ACTH secretion and inhibit LH secretion simultaneously.

Also published in Proc. Internat'l. Union of Physiological Sciences; Twenty-third Internat'l. Cong., Tokyo (Japan) (Sept. 1-9, 1965), Amsterdam, Excerpta Medica Foundation, v. 1: 292-299, 1965.

Crude acidic hypothalamic extracts from rat, beef, or sheep are active in releasing LH (ovarian ascorbic acid assay) and FSH (mouse uterine weight augmentation or rat ovarian weight augmentation assays). These extracts are also capable of inhibiting the nursing-induced decline in pituitary prolactin stores. The LH-RF can elevate plasma LH in a variety of situations, both the FSH-RF and LH-RF are active in ovariectomized rats in which the release of FSH and LH have been inhibited either by administration of both estrogen and progesterone, or by hypothalamic lesions which eliminate neural control of gonadotrophin secretion. This latter observation suggests that these two factors act directly on the pituitary to discharge gonadotrophins. Cerebral cortical extracts are incapable of affecting gonadotrophin secretion and the LH-RF has been shown to be localized in the SME region. The FSH-RF, LH-RF and PIF are relatively heat stable on comparison with the neat lability of LH.

DISSOCIATION ENERGY OF BORON MONOFLUORIDE FROM MASS-SPECTROMETRIC STUDIES, by D. L. Hildenbrand and E. Murad. [1965] [4]p. incl. tables, refs. (AF 49(638)1397) Unclassified

Published in Jour. Chem. Phys., v. 43: 1400-1405, Aug. 15. 1965

Gaseous equilibria involving BF, BF_3, Ca, CaF and CaF_2 were studied by mass spectrometry in the range 1583° to 1734 K. The vapor species were produced in a graphite Knudsen cell containing a mixture of elemental boron and calcium fluoride, and they were identified from their characteristic mass spectra and ionization-efficiency curves. From ion-intensity measurements made at ionizing energies a few volts above thresnold, the equilibrium constants and heats of several reactions involving BF(g) were evaluated. These results yield the standard heat of formation -27.5±3 kcal/mol for BF(g) and the dissociation energy, $D_0°$, of 7.85 ± 0.15 ev. The thermochemical dissociation energy of BF is significantly larger than a spectroscopic value obtained from linear extrapolation of the ground-state vibrational levels, but it agrees well with a value taken from a short extrapolation of the vibrational levels in the excited $^1\pi$ state. ELECTROCORTICAL CORRELATES OF AVOIDANCE CONDITIONING IN THE MONKEY AND THEIR MODIFICATIONS WITH ATROPINE AND AMPHETAMINE, by G. F. Ricci and L. Zamparo. [1965] [17]p. incl. diagrs refs. (AFOSR-65-1545) (AF EOAR-62-102) AD 623378 Unclassified

Abstract published in Biochem. Pharmacol., v. 12, (Suppl.): 268-269, 1963.

Also published in Pharmacology of Conditioning, Learning and Retention; Proc. Second Internat'l. Pharmacol. Meeting, Prague (Czechoslovakia) (Aug. 20-23, 1963), ed. by M. Ya. Mikhil'son, V. G. Lonzo, and Z. Votava. New York, Pergamon Press, 1965, p. 269-285.

Avoidance conditioning experiments were conducted on the monkey. Results are presented which show that the facilitatory mechanisms accompanying the onset of the conditioned and differential trials in the visual cortex are unaffected in spite of the behavioral effects caused by atropine and amphetamine. In contrast, the modifications of the cortical responses which accompany the performance of the correct responses both in the visual and sensory motor areas are disrupted by atropine and reactivated by amphetamine.

CARLEMAN ESTIMATES FOR THE LAPLACE-BELTRAMI EQUATION ON COMPLEX MANIFOLDS, by A. Andreotti and E. Vesentini. [1965] [50]p. incl. refs. (AFOSR-65-2646) (AF EOAR-63-29) AD 627990 Unclassified

Also published in Publ. Math., No. 25: 81-130, 1965.

The finiteness theorems of Andreotti and Grauert (Bull. Soc. Math. France, v. 90: 193-259, 1962) for cohomology with coefficients on a locally free sheaf on a complex manifold are given a differential-geometric treatment. This treatment sacrifices the generality of analytic spaces, but bypasses the difficult approximation theorem of Andreotti and Grauert, using instead L2-estimates with weights on compactly supported cohomology represented by forms. The techniques used are an expansion of those of an earlier paper by the authors (Ann. Scuola Norm. Sup. Pisa, v. 15: 283-309, 1961), together with clever use of the Carleman-type inequality. The authors first obtain the vanishing of the appropriate cohomology on a q-complete manifold and proceed via the abstract finiteness theorem of L. Schwartz (C. R. Acad. Sci. Paris, v. 236: 2472-2473, 1953) to the q-pseudoconvex manifolds. The authors give a lucid exposition of all the techniques used; in particular, there is a full discussion of the relevant topological spaces, called Fréchet-Schwartz spaces. Besides the finiteness theorems, there is also a general extension theorem for forms with coefficients in a vector bundle defined near the boundary of a complex manifold. (Math. Rev. abstract)

[A GENERALIZATION OF THE THEOREM OF RIESZ-THORIN] Una generalizzazione del teorema di Riesz-Thorin, by S. Campanato and M. K. V. Murthy. [1965] [14]p. incl. refs. (AFOSR-68-0061) (AF EOAR-63-29) AD 663660 Unclassified

Also published in Ann. Scoula Norm. Super. Pisa, v. 19: 87-100, 1965.

The authors prove a large number of interpolation theorems generalizing the following theorem (of Riesz-Thorin): If T is a linear operator which simultaneously maps $L^{p_j}(\Omega)$ into $L^{q_j}(\Omega)$ with respective bounds K_j, $j = 1, 2$, then for each t on [0, 1], T maps $L^{p}(\Omega)$ into $L^{q}(\Omega)$ with bound $K_1^{1-t}K_2^{t}$ if p and q are given by $p^{-1} = (1-t)p_1^{-1} + tp_2^{-1}$, $q^{-1} = (1-t)q_1^{-1} + tq_2^{-1}$. Their first theorem is a very similar theorem concerned with maps T from $L^{p_j}(\Omega)$ to spaces $L_k^{(q_j, \lambda_j)}(\Omega)$; $u \in L_k^{(p, \lambda)}(\Omega)$ (with $p \geq 1$, $\lambda \geq 0$) if and only if $r^{-\lambda/p} \inf \| u - P \|_{p, \Omega(x,r)} \leq L < \infty$ for all $x \in \Omega$, and $0 < r \leq d$, d being the diameter of Ω and $\Omega(x, r)$ being $\{y : y \in \Omega, |x-y| < r\}$, the inf being with respect to all polynomials of degree $\leq k$. One of their most interesting results concerns an operator which simultaneously maps $L^{p1}(\Omega)$ into $L^{q1}(\Omega)$ and $L^{p2}(\Omega)$ into $C^{h2, \alpha 2}(\Omega)$, i.e., functions of class C^{h2} with α_2-Holder-continuous derivatives; the theorem is too long to state here. The theorems require that the measure of $\Omega(x, r)$ be $\geq cr^n$, $c > 0$, for each $x \in \Omega$ and $r < d$; the last theorem also requires the convexity of Ω.

THE FUNCTIONAL SIGNIFICANCE OF SLEEP WITH PARTICULAR REGARD TO THE BRAIN MECHANISMS UNDERLYING CONSCIOUSNESS, by G. Moruzzi. [1965] 66p. incl. illus. diagrs. refs. (AFOSR-66-2590) (Sponsored jointly by Air Force Office of Scientific Research under AF 61(052)830) and National Institute of Health) AD 643706 Unclassified

Also published in Semaine d'Etude sur Cerveau et Experience Consciente Rome, v. 30 515-577, 1965.

The main results obtained may be summarized as follows. (1) behavioral sleep is not necessarily associated with synchronization of the activity of brain neurons. There are episodes of desynchronized sleep, associated with rapid eye movements, twitching of the limbs and atonia of the antigravity muscles. These episodes have been observed in several mammals, including man, where they seem to be associated with dreams. They are related with the appearance of spikelike potential oscillations in the nucleus reticularis pontis caudalis and in the lateral geniculate body; (2) several lines of evidence suggest the existence, within the medulla and the lower pons, of EEG synchronizing structures, antagonistically oriented with regard to the activating reticular system and probably related with the onset of sleep.

This study attempted to relate electrical activity within the reticular formation to the behavior of particular kinds of reticular neurones. Reticulospinal neurones almost invariably received excitatory connections from the cerebral cortex. The cortical areas involved included the sensorimotor regions, the temporal cortex and the occipital cortex. It was established that at least part of the cortico-reticular pathway from the sensorimotor regions is monosynoptic. Since nearly half of reticulospinal neurons received afferent connections from peripheral an indication of the complexicity of the synoptic organization was generalized. Further work is being done on the patterns of connectivity of the reticular formulation.

ON THE ORIGIN OF THE DARK DISCHARGE OF RETINAL GANGLION CELLS, by G. W. Hughes and L. Maffei. [1965] 15p. incl. diagrs. refs. (AFOSR-65-2962) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-9, and Rockefeller Foundation) AD 628354
Unclassified

Also published in Arch. Ital. Biol., v 103: 45-59 1965.

In petrigeminal or decerebrate cats microelectrode spike recording from the retina was performed. The pulses were counted in one sec every 2 sec after having exposed the eye from 2 to 5 min to a very strong light (4000 Lux). The firing rate of the ganglion cells became stationary in 2 to 3 min after the light cutoff, while the threshold went on decreasing for a long time (up to 1 hr) The shapes of the transients of the ganglion cell firing rate as a function of time for 'on' and 'off' cells are presented. Because no relationship was observed during dark adaptation between the threshold changes and the ganglion cell firing rate, the conclusion was drawn that the dark discharge is not due to the activity of the receptors, but may rather be regarded as the expression of the autochthonous activity of the deafferented neural part of the retina. Other considerations lead to the hypothesis that the bipolar cells do not contribute to the activity of the ganglion cells in darkness

RETINAL GANGLION CELL ACTIVITY IN CATS DURING DARK ADAPTATION, by G W Hughes and L Maffei [1965] [3]p incl. diagr. (AFOSR-65-2963) (Sponsored jointly by Air Force Office of Scientific Research under AF-EOAR-63-9, and Rockfeller Foundation) AD 628352 Unclassified

Also published in Nature, v. 205: 601-602, Feb. 6, 1965

The time-course of thresnold changes tested by means of short pulses of light and the time-course of the spontaneous firing rate of the same ganglion cell are completely different. From this observation it is concluded that: (1) any process of dark adaptation, either limited to the receptors or involving the neural elements of the retina, does not influence the ganglion cell dark discharge, at least after the transient period, (2) the dark discharge is likely to represent the spontaneous activity of deafferented retinal neurones; and (3) since there is good evidence that the visual thresnold during the process of dark adaptation is determined neurally rather than at the receptor level, it is likely that the dark deafferentation occurs between the bipolar and the ganglion cell. [BEHAVIORAL AND ELECTROPHYSIOLOGICAL STUDY OF SLEEP IN THE PIGEON] Studio Comportamentale Electrofisiologico del Sonno nel Piccione, by V. Tradardi [1965] [2]p. (AFOSR-66-1122) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-9, and Rockefeller Foundation) AD 638062

Also published in Boll. Soc. Ital. Biol., v 40: 769-770, 1965.

The existence of 2 phases of sleep has been demonstrated behaviorally and electrophysiologically in the pigeon. A study was carried out on 15 adult pigeons of both sexes with implanted electrodes to record the EEG, ocular movements, and posterior neck muscle EMG. The study was done at night in complete darkness. Electrical activity was recorded on a Grass polygraph, and visual and photographic records were made in infra-red light. The first phase was characterized by a low-frequency (2-6cps), high-amplitude (75-300 mv) EEG, diminished nuchal muscle EMG, and practically silent EOG (electrooculogram). In this phase, the animals were immobile with closed eyelids. The second phase consisted of frequent single episodes lasting no longer than 10-12 sec and characterized by high-frequency (12-16cps), low amplitude (less than 50 mv) EEG, a further decrease in posterior neck muscle EMG (without complete atony), and a series of 3-8 positive or negative monophasic EOG oscillations lasting 0.1-0.2 sec and corresponding to the animal's ocular movements. During this phase the pigeon's head and neck drooped, and then suddenly the animal regained his initial position, apparently without waking up The 2 phases of sleep were similar to those observed in the cat, but the deep sleep episodes were shorter and not accompanied by complete nuchal atony The author concludes that it is probably the strong labyrinthine stimulus caused by the pigeon's head falling that interrupts the deep phase of sleep after so short a period of time

COMPARATIVE NEUROPHYSIOLOGY IN VISION, by G. Moruzzi. Final technical rept. Sept. 15, 1964-Sept. 14, 1965. Sept. 15, 1965, 10p. incl. refs. (AFOSR-65-2011) (AF EOAR-64-37) AD 627634 Unclassified

The work of this project has been concerned with investigations of the photic control of the flashing of fireflies, presynaptic inhibition in the lateral geniculate body of the cat, and the influence of sleep and wakefulness on the response of lateral geniculate neurons to sinewave photic stimulation and to flashes of light. Experiments on the firefly indicated that the effect of steady photic stimulation of the eyes on the spontaneous flashing varies inversely with the stimulus intensity. Direct electrical stimulation of the lantern with single pulses elicited a flash with constant latency. Photic stimulation with single pulses elicited a reflex flash. From investigations of the cat's lateral geniculate body, it was concluded that a presynaptic inhibitory control is exerted by the mesencephalic reticular formation and by several cortical areas on the transmission at the level of the lateral geniculate body (LGB). Control experiments on retinal units showed no difference in the response of sinewave photic stimulation during sleep and wakefulness. It was found that LGB unit responsiveness is always greater during wakefulness. The hypothesis of an inhibitory mechanism through interneurons at geniculate level is discussed as a possible explanation of decreased responsiveness found during synchronized sleep.

[PRESYNAPTIC INHIBITION IN THE LATERAL GENICULATE NUCLEUS] Inibizione presinaptica nel nucleo genicolato laterale, by A. Angel, F. Magni, and others. [1965] 2p. incl. refs. (AFOSR-65-1121) (AS EOAR-64-37) AD 638061 Unclassified

Also published in Atti. Accad. Naz. Lincei, Rend. Classe Sci. Fis. Mat. e Nat., Series 8, v. 38: 559-560, Apr. 1965.

Experimental evidence is presented for the existence of inhibitory control of the retinal afferents to the lateral geniculate nucleus by the reticular substance and the visual cortex. Work was done on the unanesthetized midpontine-pretrigeminal cat, a micropipette in the lateral geniculate nucleus was used to stimulate optic fibers ending there, and antidromic responses were recorded in the chiasm and optic nerve following enucleation. Stimulating the mesencephalic reticular formation or visual cortex increased the amplitude of the antidromic response, indicating a depolarization of the optic fiber terminals in the geniculate nucleus. It was concluded that this depolarizing effect is responsible for the lateral geniculate presynaptic inhibition and compare the effect to that demonstrated in the spinal medulla and cuneate nucleus following cortical stimulation.

Pisa U. Inst. of Physiology (Italy).

UNIT RESPONSES OF THE LATERAL GENICULATE BODY TO LIGHT FLASHES DURING WAKEFULNESS AND SYNCHRONIZED SLEEP, by L. Maffei and G. Rizzolatti. [1965] 3p. incl. diagr. (AFOSR-66-2003) (AF EOAR-64-37) AD 643493 Unclassified

Also published in Experimentia, v. 21: 599-601, 1965.

The existence of a reticular control upon the responsiveness of cells in the lateral geniculate body (LGB) is well established. The enhancement during reticular or natural arousal of the geniculate responses evoked by electric shocks to the chiasm or optic nerve shows that the influence is facilitatory in nature. It is surprising, however, that the responses evoked by light flashes actually decrease during, or soon after mesencephalic reticular stimulation. The hypothesis of an occlusion at the level of the geniculate, between reticular and retinal inputs, cannot easily account for this discrepancy. This work is an attempt to reexamine the problem by a study of the evoked responses of single LBG units.

EXCITABILITY OF INTRA-GENICULATE OPTIC TRACT FIBRES AFTER RETICULAR STIMULATION IN THE MIDPONTINE PRETRIGEMINAL CAT, by A. Angel, F. Magni, and P. Strata. [1965] 24p. incl. diagrs. refs. (AFOSR-66-2064) (AF EOAR-64-37) AD 643102 Unclassified

Also published in Arch. Ital. Biol., v. 13: 668-693, 1965. 1965.

In the unanaesthetized mid-pontine pretrigeminal cat, stimulation of the mesencephalic reticular formation produced an enhancement in the excitability of the optic fibers entering the lateral geniculate body. The effect started 20 msec after the beginning of the stimulus, reached a maximum after 50-60 msec and lasted for 200 msec or more. The sites in the midbrain producing the effect were found in the area of the mesencephalic reticular formation. No effect was seen after stimulation of the superior colliculus, cerebral peduncles or medical meniscus. After stimulation of the mesencephalic reticular formation it was possible to record monophasically a slow wave from the optic nerve. Evidence is presented that the slow wave recorded from the optic nerve is not due to an envelop of centrifugally conducted spikes. Spikes can be recorded from the optic nerve or chiasm in animals with a sub-normal body temperature after stimulation of the mesencephalic reticular formation and they were interpreted as being analogous to the dorsal reflex. All these lines of evidence suggest that the depolarization of the terminals of optic fibres within the LGB was produced by an active presynaptic inhibitory process.

ELECTRORETINOGRAPHIC RESPONSES FROM THE EYES OF THE WOLF-SPIDER LYCOSA TARENTULA (ROSSI), by F. Magni and P. Strata. [1965] [11]p. incl. diagrs. refs. (AFOSR-66-2065) (AF EOAR-64-37) AD 643100 Unclassified

Also published in Arch. Ital. Biol., v. 103: 694-704, 1965.

In the Lycosid spider, Lycosa tarentula (Rossi), the ERG was studied in the principal and secondary eyes. Short flashes of light, up to 100 msec, evoked in the ERG of all eyes a monophasic negative wave. Longer stimuli evoked in the ERG of the principal eye a fast negative wave followed by a negative steady potential; at the end of the stimulus, the potential returned to zero or may show a positive overshoot. In the secondary eye there are, in addition, 2 slow components, the first positive, the second negative. These components can be experimentally eliminated and under these conditions the ERG resembled that of the principal eye. The ERG of the principal eye is interpreted as due, at least in part, to a generator potential arising from the receptor cells. The slow components of the secondary eye are likely to arise in other ocular structures, but it is not possible to explain their nature on the basis of the present researches. The hypothesis is made that they may be due to the activity of the neural network connecting the photoreceptor cells in the secondary eye.

INFLUENCE OF SLEEP AND WAKEFULNESS ON THE RESPONSE OF LATERAL GENICULATE UNITS TO SINEWAVE PHOTIC STIMULATION, by L. Maffei, G. Moruzzi and G. Rizzolatti. [1965] [13]p. incl. diagrs. refs. (AFOSR-66-2066) (AF EOAR-64-37) AD 643880 Unclassified

Also published in Arch. Ital. Biol., v. 103: 596-608, 1965.

A summary of the research performed provided these results. Units of the lateral geniculate body (LGB) were recorded in the unanaesthetized, midpontine pretrigeminal cat. A sinewave oscillation of light intensity, at different frequencies (from 0.1 to 1 cps), was used for visual stimulation. During behavioral and EEG wakefulness the firing of LGB units was modulated by the sinewave light in an almost linear fashion. The oscillation of the firing rate appeared to be perfect replica of the sinewave. The "on" cells were in phase with the stimulus, the "off" cells were 180 out of phase; and the "on-off" cells presented a stimulus response phase relationship between 0 and 180 . During synchronized sleep, every relation between sinewave stimulus and response disappeared. Control experiments, as well as several considerations, suggest that the hypnic "escape" of LGB units from the modulating influence of sinewave light may be due to the withdrawal of extraretinal volleys, possibly mediated by reticulo-geniculate pathways.

EFFECT OF SYNCHRONIZED SLEEP ON THE RESPONSE OF LATERAL GENICULATE UNITS TO FLASHES OF LIGHT, by L. Maffei and G. Rizzolatti. [1965] 15p. incl. diagrs. refs. (AFOSR-66-2067) (AF EOAR-64-37) AD 643101 Unclassified

Also published in Arch. Ital. Biol., v. 103: 609-622, 1965.

Units of the dorsal part of the lateral geniculate body (LGB) were recorded in the midpontine pretrigeminal cat. Flashes of light of 100-300 msec in duration were applied every 10 sec, after eliminations of the causes of error due to pupillary changes and eye movements. The LGB unit responsiveness to light flashes was calculated as signal to noise ratio (where the signal is the response correlated with the stimulus, and noise is the spontaneous activity before the stimulus). The LGB unit responsiveness resulted always greater during behavioral and EEG alertness, independently from the changes of the background firing. When the light pulse was decreased by means of neutral filters, a stimulus still evoking a clear-cut response during wakefulness, became uneffective during synchronized sleep. It was necessary to increase the intensity of the stimulus more than 10 times to have again a response. Control experiments have shown that this difference between sleep and wakefulness is not retinal in origin. The hypothesis of an inhibitory mechanism acting through interneurons on LGB units is discussed as a possible explanation of the striking decrease of responsiveness found during synchronized sleep

PHOTOLYSIS OF TRIARYLPHOSPHINES. by M. I. Kaufman and C. E. Griffin. [1965] [4]p. (AFOSR 65-1129) (AF AFOSR-62-48) AD 619327
Unclassified

Also published in Tetrahedron Ltrs. No. 12: 769-772, 1965.

The photolysis of several triarylphosphines is studied in solutions of benzene, naphthalene and benzene-ethanol. Irradiation of triphenylphosphine in benzene for 1 hr gave diphenylphosphine and biphenylphosphine as major products. Longer irradiation periods did not appreciably increase the extent of decomposition. Analogous results were obtained with naphthalene as solvent; though in the presence of alcohols a different course of reaction occurred. In this case diphenylphosphine and ethyldiphenylphosphine were the major products.

PHOTOLYSIS OF BENZYLTRIPHENYLPHOSPHONIUM AND TETRAPHENYLPHOSPHONIUM CHLORIDES. by C. E. Griffin and M. L. Kaufman. [1965] [3]p. (AFOSR-65-1130) (AF AFOSR-62-48) AD 619758
Unclassified

Also published in Tetrahedron Ltrs., No. 12: 773-775, 1965.

The photolysis of benzyltriphenylphosphonium (I) and tetraphenylphosphonium (II) is studied in solutions of benzene-ethanol. Irradiation of I led to complete consumption in 3-1/2 hr. None of the several products identified, incorporated chlorine. The products were consistent with a photochemical degradation of the phosphonium cation by a given sequence. This sequence accurately predicted the products of the irradiation of II. The findings confirm the reversible nature of phosphoranyl radical formation in these systems and strongly suggest the occurrence of one-electron transfer processes involving reduction of phosphonium cations.

FREE RADICAL ATTACK ON TRIVALENT PHOSPHORUS DERIVATIVES. by C. E. Griffin. Final scientific rept. Oct. 1, 1961-Sept. 30, 1965. 15p. incl. refs. (AFOSR-65-2009) (AF AFOSR-62-48 and AF AFOSR-64-470) AD 627269 Unclassified

Summaries are presented of research concerned primarily with 3 areas of organophosphorus chemistry. (1) the photoinduced arylation of trivalent phosphorus compounds, (2) the photolysis of tri- and tetra-valent phosphorus compounds, and (3) studies of the physical properties (uv and nmr spectra) of these structures. This investigation has provided significant new knowledge regarding the free radical chemistry of organophosphorus compounds, particularly with regard to the reversibility of formation and chemistry of phosphoranyl radicals. Additionally, this research and that conducted simultaneously by Horner (Tetrahedron Ltrs. 763 1965) represent the first demonstrations of photochemical reactivity of organophosphorus compounds.

STUDIES OF INTERMETALLIC COMPOUNDS CONTAINING LANTHANIDES, by W. E. Wallace. Final rept. Dec. 1, 1962-Nov. 30, 1964. Jan. 1, 1965 [51]p. incl. diagrs. tables, refs. (AFOSR-65-0016) (AFOSR-63-187) AD 455668 Unclassified

The magnetic properties of 6 series of intermediate phases of intermetallic compounds, represented by the formulas ANi_2, ACo_2, ANi, ACu, AAg, and $A'Fe_2$, are discussed. The samples studied were prepared for research by extreme heat being applied in order to rid them of extraneous phases. Careful measurements were made on the samples in the paramagnetic region rather than the ferromagnetic phases. The symbol A designates one of the lanthanide metals. Special care was given to ANi and ACo_2. It was found that because there is non magnetism in the ANi_2 compounds, the moment per formula unit is that of the A Component; in the ferromagnetic phase these moments are lower than the free ion moments and the decrease is taken to be a crystal field effect. In the ACo_2 compounds, the measured moments suggested that the A and Co moments were antiferromagnetically coupled for the heavy lantnanides and ferromagnetically coupled for the light lanthanides.

MAGNETIC CHARACTERISTICS OF LANTHANIDE-COPPER COMPOUNDS, by R. E. Walline and W. E. Wallace. [1965] [19]p. incl. diagrs. tables, refs. (Also bound with its AFOSR-65-0016; AD 455668) (AF AFOSR-63-187) Unclassified

Published in Jour. Chem. Phys., v. 42: 604-607, Jan. 15, 1965.

Magnetic characteristics and structures of 11 intermetallic compounds represented by the formula LnCu are reported. The compounds with Ln = Ce, Pr, Nd and Sm occur in the FeB structure, those with Ln = Y, Gd, Tb, Dy, Ho, Er and Tm have the CsCl structure. YCu is a Pauli paramagnet. The magnetic characteristics of PrCu and NdCu are anomalous and attempts to deduce the nature of the cooperative magnetic phases in these materials, if any, at low temperatures are unsuccessful. Results for the other compounds

suggest that they are antiferromagnetic at low temperatures. TbCu and HoCu exhibit 2 magnetic transitions; the nigh temperature transition is interpreted as the Neel point and the one at the lower temperature as an order-order transition in the antiferromagnetic state. In the paramagnetic region effective moments in good agreement with the free tripositive ion values are observed in all cases except for GdCu and ErCu A variable moment is observed for ErCu whereas for GdCu a moment of 8.46 μ_B is obtained.

DEOXYGENATION REACTIONS OF AMINE OXIDES AND SULFOXIDES, by T. Cohen. [Final rept.] [1965] [52]p. incl. diagrs. refs. (AFOSR-65-1729) (AF 49(638) 788 and AF AFOSR-63-344) AD 625414 Unclassified

Research was conducted to determine the scope and nature of reactions of pyridine N-oxide with electrophiles. Reactions of dimethylsulfoxide with epoxides were also investigated. A new synthesis of α-hydroxyaldehydes and ketones was discovered, involving the oxidation of epoxides by dimethylsulfoxide which acts as a solvent. This new preparative procedure appears to require different reaction conditions for each epoxide used. The discovery of the oxidation of carboxylic acids by pyridine N-oxides to form aldehydes and ketones led to a new mechanistic concept involving activation of carboxylic acids toward nucleophilic attack at the α-position. Side products of this novel 4-electron decarboxylative oxidation, when phenyl-acetic acid is used, are diphenylmaleic anhydride, mandelic acid acetate and phenylglyoxylic acid. Evidence has been adduced that the currently accepted radical-pair mechanism for the reaction of acetic anhydride with 2- and 4-picoline oxide is probably incorrect and that the reaction occurs rather by an ion pair mechanism. Other observations made in the course of the work are discussed.

THE REACTIONS OF 2-AND 4-PICOLINE N-OXIDE WITH PHENYLACETIC ANHYDRIDE, by T. Cohen and J. H. Fager. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-66-0318) (AF AFOSR-63-344) AD 625035 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 5701-5710, Dec. 1965.

The reactions of 2- and 4-picoline N-oxide with phenylacetic anhydride yield the oxidation-reduction products, benzaldehyde, carbon dioxide, picolines, and small quantities of diphenylmaleic annydride, in addition to rearrangement products. The latter consist predominantly of 2-pyridinemethanol phenylacetate and 2-phenylethylpyridine, in a ratio of about 1.5:1 in the case of 2-picoline N-oxide, and of 4-pyridinemethanol phenylacetate and 4-phenyletnylpyridine, in a ratio of about 0.06:1 in the case of 4-picoline N-oxide. The product composition is unchanged when the reactions are performed in the presence of the radical trap m-dinitrobenzene. The rearrangement but not the oxidation products are thought to arise via anhydrobase intermediates. The ester products in this case (and in the corresponding acetic annydride reaction with 2-picoline N-oxide) are thought to be formed by nonradical paths while the phenyletnylpyridines are probably formed by geminate recombination of benzyl and picolyl radicals or ions which are produced by fragmentation of the anhydrobases. [ATROPINE DETOXICATION DURING HYPOTHERMIA BY THE ISOLATED PERFUSED RAT LIVER], by S. C. Kalser. Final technical rept. Mar. 3, 1965 [6]p. (AFOSR-65-0459) (AF AFOSR-64-87) AD 614068 Unclassified

Experiments have been performed on the isolated perfused rat liver in an attempt to obtain a perfusing medium which would be devoid of plasma protein. It was considered that if such a medium could be perfected, it would overcome any hindrance to drug uptake by the liver which might occur due to plasma binding of the drug. Results of this experimentation are outlined. Several exploratory type experiments were performed on the isolated liver in which blood flow through the liver was maintained constant by the readjustment of vascular resistance of the arterialized portal vein. In preparation for a contemplated Air Force Grant request in which the correlation of the toxicity of atropine with its metabolism in acute hypothermia and in cold acclimatization will be studied, work was attempted on a surgical technique which would allow a chronically prepared rat to be intravenously injected and have bile collected without the use of anesthesia.

DRUG METABOLISM ATROPINE IN HYPOTHERMIA. I. BILIARY EXCRETION OF C^{14}-ATROPINE METABOLITES IN THE INTACT AND NEPHRECTOMIZED RAT, by S. C. Kalser, E. J. Kelvington and others. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-65-0961) (AF AFOSR-64-87) AD 619618 Unclassified

Also published in Jour. Pharmacol and Exper. Ther., v. 147: 252-259, 1965.

Bile was collected from pentobarbitalized rats, both intact and nephrectomized, at various time intervals after the intravenous injection of C^{14}-atropine, and at body temperatures of 37°, 25°, and 17° C. Urine was collected and analyzed at the end of the 4-hr experiment. As much as 70% of the atropine is excreted by the biliary system within 4 hr in the 37°C, nephrectomized preparation; 50% appears in the biliary system of the intact animal in this time interval. It is found that the liver is able to metabolize increased amounts of the drug in the absence of kidney function. Deep hypothermia appears to more markedly impair renal excretion of atropine and/or metabolites than it does hepatic excretion.

DRUG METABOLISM IN HYPOTHERMIA. II. C^{14} ATROPINE UPTAKE, METABOLISM AND EXCRETION BY THE ISOLATED PERFUSED RAT LIVER, by S. C. Kalser, E. J. Kelvington and others. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-65-0962) (AF AFOSR-64-87) AD 619617 Unclassified

Also published in Jour. Pharmacol. and Exper. Ther., v. 147: 260-269, 1965.

The uptake, metabolism and excretion of C^{14}-atropine by the isolated perfused rat liver were studied at 37 and at 2 hypothermic temperatures, 25 and 17 C.

The uptake of C^{14}-atropine by the liver was decreased from a half-time of 6 min to a half-time of 20 min as the temperature was decreased from 37°C to 17°C. All of the C excreted into the bile appeared as atropine metabolites which were more polar than the parent compound. None appeared as unchanged atropine or as the hydrolysis product, tropic acid. These results are compared with those obtained from the nephrectomized bile-fistula rats at the same temperatures.

INTERPRETATION OF THE SOFT X-RAY EMISSION SPECTRUM OF LITHIUM METAL, by D. C. Goodings. [1965] [11]p. incl. diagrs. refs. (AFOSR-65-2204) (AF AFOSR-63-196) AD 625546 Unclassified

Also published in Proc. Phys. Soc. (London), v. 86: 75-85, 1965.

The shape of the soft x-ray emission spectrum of lithium has been calculated in the Hartree-Fock approximation taking into account the fact that an atom about to emit a K x-ray is a point defect in the otherwise periodic potential of the lattice. The perturbation from the 1s hole was treated in the 'localized approximation' of the Koster-Slater theory, its effect being expressed by a single parameter. Starting from Ham's calculated density-of-states function and gradually increasing the strength of the perturbation one observes the formation of a resonance state (virtual bound state) and then a real bound state. For reasonable values of the perturbation parameter the results show a peak about 1 ev below the Fermi energy, a feature which resembles the measurements of Crisp and Williams and others. The calculations also provide a plausible explanation of the measurements of Catterall and Trotter on the satellite K emission spectrum of lithium. (Contractor's abstract)

MEASUREMENT BY NMR OF THE DIFFUSION RATE OF HF IN ICE, by M. Kopp, D. E. Barnaal, and I. J. Lowe. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-66-0234) (AF AFOSR-63-196) AD 629656 Unclassified

Also published in Jour. Chem. Phys., v. 43: 2965-2971, Nov. 1, 1965.

An experiment is described by which the diffusion of fluorine in monocrystalline ice cylinders is followed quasicontinuously, using the proton magnetic resonance spin-lattice relaxation time T_1 to measure the HF concentration along the sample. The diffusion coefficient D_F was evaluated for various temperatures between -30° and -4°C. The results show more scatter than the experimental error can account for. A least-squares fit of the data yields D_F (-10°C) = 0.8x10-6 cm^2/sec for the diffusivity and E = 0.58 ev = 13.4 kcal/mol for the activation energy, with root-mean-

square deviations of 0.5×10^{-6} cm^2/sec and 0.08 ev, respectively. The highest concentration of diffused HF which can be absorbed by monocrystalline ice is about 4×10^{-5} HF/H_2O. A possible explanation is offered for the large value and dispersion of the diffusivity. (Contractor's abstract)

HIGH-FREQUENCY CYCLOTRON RESONANCE IN METALS (Abstract), by H. Scher and T. Holstein. [1965] [1]p. [AF AFOSR-63-196) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.
Published in Bull. Amer. Phys. Soc., Series II, v. 10: 111, Jan. 27, 1965.

The authors calculated the surface impedance of an isotropic electron-phonon gas in the presence of a large static magnetic field and high-frequency electromagnetic wave ($\omega \sim 10^{12} - 10^{13}$ cps). The genesis of the calculation is a recently derived quantal transport equation, modified to include the effects of the external magnetic field. Resultant expressions for the frequency- and wave-vector-dependent bulk conductivity $\sigma(\omega, q)$, are inserted into the standard expression for surface impedance in the extreme anomalous limit. Justification for this procedure is attained by an alternate semiclassical treatment of the transport equation with account taken of diffuse boundary scattering. Results for the surface impedance include (a) a frequency-dependent line shift, which is most pronounced for $\omega \sim \omega_D$ (ω_D - Debye frequency), and (b) changes in the shape of the lines associated with frequency-dependent collision processes.

SPIN-DISORDER THERMAL RESISTIVITY OF THE FERROMAGNETIC TRANSITION METALS, by L. Colquitt, Jr. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-65-2093) (AF AFOSR-63-196) AD 627380 Unclassified

Also published in Phys. Rev., v. 139: A1857-A1865, Sept. 13, 1965.

Data of White and Woods (Philos. Trans. Roy. Soc. (London), v. A251: 273, 1965) for the thermal resistivity W of the transition metals show that W for Fe, Co, and Ni displays an anomalous persistent temperature dependence in the region just below and through the Debye temperature. Since W for the nonferromagnetic transition metals is approximately constant in this region, it is reasonable to attribute the additional temperature dependence to the well-known spin-disorder scattering of conduction electrons. It is shown, however, that a model which treats the magnetic d electrons as localized and neglects s-d transitions cannot account for the anomalous behavior of W, while a model which treats magnon-induced s-d interband transitions presents a plausible explanation.

Pittsburgh U. Dept. of Physics, Pa.

ELECTRICAL AND THERMAL RESISTIVITIES OF THE NONMAGNETIC TRANSITION METALS WITH A TWO-BAND MODEL, by L. Colquitt, Jr. [1965] [5]p. incl. diagrs. tables. (AFOSR-65-2101) (AF AFOSR-63-196) AD 629655 Unclassified

Also published in Jour. Appl. Phys., v. 36: 2454-2458, Aug. 1965.

A 2-band spherical model is used to represent the conduction electrons of the nonmagnetic transition metals with an incomplete d shell. It is shown by comparison with experimental results that phonon-induced interband s-d transitions are the major contributor to the electrical and thermal resistivities p and W at all but the lowest temperatures. Consequently, the momentum gap between the s and d bands is an important parameter of the theory and may be used to classify the behavior of p and W. At the lowest temperatures it is found that the experimental data for p of all the transition metals studied may be consistently interpreted if it is assumed that electron-electron scattering processes are important.

VARIATIONAL APPROACHES TO THE ANTIFERROMAGNETIC LINEAR CHAIN, by H. Falk and T. W. Ruijgrok. [1965] [6]p. incl. diagrs. refs. (AFOSR-66-0230) (AF AFOSR-63-196) AD 629657 Unclassified

Also published in Phys. Rev., v. 139: A1203-A1208, Aug. 16, 1965.

Within the framework of a somewhat general free-energy variational calculation the autnors find that a solution with an energy gap and spontaneous long-range order is favored. However, if on the basis of recent results one disallows the gap, then Bulaevskii's solution, without spontaneous long-range order, is obtained. From Bulaevskii's coupled integral equations and the condition for maximum entropy with respect to variation of the external field h at fixed temperature , the authors obtain a pseudophase boundary in the h, plane. The analysis indicates that asymptotically along the boundary, $(2-h)/$ → positive constant as → 0, and $h/\theta_0 -)^{1/2}$ → positive constant as → $_0$, where (h = 0, = $_0$) is the intersection of the boundary with the axis. Qualitatively similar behavior is displayed by the exactly soluble X-Y model for which the pseudophase boundary is also given here. The boundary curves are compared with one obtained for a finite chain by Bonner and Fisher. (Contractor's abstract)

EFFECT OF SURFACE PINNING ON THE MAGNETIZATION OF THIN FILMS, by J. A. Davis. [1965] [6]p. incl. diagrs. refs. (AFOSR-66-0233) (AF AFOSR-63-196) AD 629654 Unclassified

Also published in Jour. Appl. Phys., v. 36: 3520-3525, Nov. 1965.

The effect of surface pinning, as manifested by a surface anisotropy field, on the magnetization of thin films is examined in detail for a simple cubic lattice of atoms having spin 1/2 coupled by pure exchange. The magnetization-versus-temperature curve is found to lie above that obtained in the absence of pinning. For very weak pinning (surface anisotropy field much less than surface exchange field), the magnetization is sensitive to film thickness falling off more rapidly than for bulk, in qualitative agreement with some experiments. For intermediate pinning, the magnetization is essentially independent of film thickness, following the bulk behavior, in qualitative agreement with other experiments. For very strong pinning (surface anisotropy field on the order of or greater than surface exchange field), the magnetization falls off slower than for bulk, again with a thickness dependence. As a consequence, one may interpret experimental results in terms of the degree of surface spin pinning. Physically it is not yet clear why the degree of pinning should behave in the required fashion. (Contractor's abstract)

EXPERIMENTAL RESEARCH ON THE EFFECT OF PRESSURE GRADIENT AND FREE STREAM TURBULENCE ON THE BOUNDARY LAYER OF A FLAT ROUGH PLATE, by E. Mattioli. Nov. 1965, [28]p. incl. diagrs. (Technical note no. 33) (AFOSR-66-0339) (AF EOAR-63-98) AD 630799 Unclassified

Presented at the National Cong. of AIDA (19th) Naples, Oct. 25-28, 1965.

A determination was made of displacement thickness and momentum loss thickness in the boundary layer of a rough flat plate at low velocities, at various conditions of wall roughness, pressure gradient and free stream turbulence. The opportunity is discussed to assume y = zero at the 'top plane' of the rough surface, taking as additional parameter the flow velocity at the wall. New results are indicated about the slowing down of the stream near the wall, about the turbulence mainly initial effect, about the presence of a boundary layer above the boundary layer, as a consequence of the combined action of pressure gradient and free stream turbulence. (Contractor's abstract, modified)

HIGHLY SIMPLIFIED CALCULATION OF THE INCOMPRESSIBLE LAMINAR BOUNDARY LAYER, by G. Jarre. Dec. 1965, [16]p. incl. diagrs. tables. (Technical note no. 35) (AFOSR-66-2742) (AF EOAR-63-98) AD 644129 Unclassified

A highly simplified calculation of the incompressible laminar boundary layer under any variable pressure gradient, is outlined and satisfactorily applied to accelerated and retarded flows. The method allows the direct derivation of the shear stress at the wall from the outer velocity law. The method is very promising in the field of the aeronautical slender bodies. THE EFFECT OF VARIABLE TRANSPORT PROPERTIES ON A DISSOCIATED BOUNDARY LAYER WITH SURFACE REACTION, by G. S. Janowitz and P. A. Libby. [1965] [12]p. incl. diagrs. tables, refs. (AFOSR-65-0553) (AF 49(638)217) Unclassified

Also published in Internat'l. Jour. Heat and Mass Transfer, v. 8, 7-18. 1965.

A study is carried out on the alteration in surface heat transfer and in the profiles of the flow variables associated with several descriptions of the transport properties of a dissociating gas. A boundary layer of the similar type is considered, a reasonably accurate description of the viscosity, conductivity and diffusivity of a mixture of atoms and molecules is employed along with several approximate descriptions which have been employed in the past. Numerical examples corresponding to high altitude hypersonic flight are considered and indicate that alterations of heat transfer of up to 60% and of the profiles of possible significance can occur depending on the description of the transport properties employed. LONG CYLINDRICAL SHELL UNDER CONCENTRATED LOADS APPLIED TO A CENTRAL REINFORCING RING, by A. Allentuch, K. Brady, and J. Kempner. Apr. 1965, [78]p. incl. diagrs. tables, refs. (PIBAL rept. no. 680) (AFOSR-65-0984) (AF 49(638)1360) AD 618306 Unclassified

The stresses and displacements were determined in an infinite circular cylindrical shell reinforced at its midlength by a single frame. Acting at the ends of a diameter of the ring were 2 self-equilibrating radial forces and moments. Stress distributions and displacements in the shell are presented along 3 generators. They indicated high stresses in the neighborhood of the ring. For the values of the parameters considered, these stresses become negligible at a distance from the ring of approximately 0.15 times the radius of the shell so that the length of shell which acts with the ring is 0.30 times the radius of the shell Stress and displacement distributions in the circumferential direction are also presented for the shell and the ring. CREEP ANALYSIS OF CIRCULAR PLATES BY ENERGY METHODS, by J. Bentson, S. A. Patel, and B. Venkatraman. Mar. 1965, [20]p. incl. diagrs. (PIBAL rept. no. 698) (AFOSR-65-0985) (AF 49(638) 1360) AD 618310 Unclassified

The paper investigates the creep bending of circular plates using energy theorems of elasticity. Firstly, the theorem of minimum potential energy is used to derive, in terms of rectangular coordinates, the governing differential equations and the natural boundary condition for laterally loaded thin plates. Next, these equations are transformed into polar coordinates for application to rotationally symmetric circular plate problems. For such plates, the theorem of minimum total complementary potential is then used to derive the governing moment equation and the corresponding boundary conditions. This is followed by a brief discussion of Reissner's variational theorem as applied to circular plates problems. The use of each of these 3 theorems is then illustrated by obtaining solutions to the problem of a simply supported circular plate. Finally, these solutions are graphically compared with exact solutions obtained previously. (Contractor's abstract)

AN ITERATIVE SOLUTION FOR ROTATIONALLY SYMMETRIC NONLINEAR MEMBRANE PROBLEMS. by M. A. Goldberg. July 1965, [41]p. incl. diagrs. refs. (PIBAL rept. no. 906) (AFOSR-65-1504) (AF 49(638)1360) AD 620738 Unclassified

An improved iterative technique for the large deflection analysis of rotationally symmetric membranes is presented. This procedure takes advantage of the complementary aspects of 2 previously suggested relaxed iteration procedures. The resulting method utilizes the Keller-Reiss type functional for each iterate. In analogy to a technique previously suggested the relaxation parameter is then evaluated from an auxiliary equation. The iterative procedure is employed to obtain an approximate solution for an internally pressurized shallow spherical membrane, which is held at the boundary. Numerical results obtained herein are in agreement with previous solutions to this problem

RESEARCH STUDIES CONDUCTED UNDER CONTRACT NO. AF 49(638)1391 AT THE POLYTECHNIC INSTITUTE OF BROOKLYN AEROSPACE INSTITUTE, by R. J. Cresci and M. H. Bloom. Final rept. Oct. 1965. 10p. incl. refs. (Rept. no. PIBAL 898) (AFOSR-66-0572) (AF 49(628)1391) AD 630557 Unclassified

The report presents a brief review of a series of studies performed in connection with the flow over slender configurations at high Mach numbers and low Reynolds numbers. Two particular problem areas were emphasized in this research, these are the near wake of axisymmetric bodies and viscous-inviscid interactions that occur along the intersection of planar surfaces aligned with the stream. The results of both theoretical and experimental studies related thereto are presented

SIMILAR SOLUTIONS FOR THE HYPERSONIC LAMINAR BOUNDARY LAYER NEAR A PLANE OF SYMMETRY. by M. Trella and P. A. Libby. Feb. 1964. 50p. incl. diagrs. tables, refs. (PIBAL rept. no. 825) (AFOSR-64-0566) (AF AFOSR-62-409) AD 438832 Unclassified

The laminar hypersonic boundary layer near a plane of symmetry is treated from the similarity point of view. Cases of favorable and adverse pressure gradients in the plane of symmetry and of inflow to and outflow from that plane are considered. The similarity parameters are related to physical observables so that the results may be applied at least in terms of local similarity, to determine the boundary layer characteristics in practical problems. It is found that crossflow has significant effects on the boundary layer in the plane of symmetry when the pressure gradient is adverse (Contractor's abstract)

A REVIEW OF RESEARCH PERFORMED AT THE POLYTECHNIC INSTITUTE OF BROOKLYN, AEROSPACE INSTITUTE UNDER GRANT AF AFOSR-62-409, by M. H. Bloom and R. J. Cresci. [Final rept.] Sept. 1, 1963-Sept. 30, 1965, Oct. 1965. 12p. (PIBAL rept. no. 897) (AFOSR-65-2230) (AF AFOSR-62-409) AD 628472 Unclassified

Research is summarized on a theoretical analysis of continuum flow fields about hypersonic vehicles. Study of the asymptotic inviscid flow field about slender bodies is emphasized. Since indications are that for slender bodies transition in the boundary layer occurs at high altitudes, the turbulent regime is given special attention. A consistent asymptotic solution is obtained for flows of perfect gases at infinite Mach number, and qualitative features of flows at large discussed. It is found that only in the 2 limiting cases of low and infinite external Mach number

is boundary-layer similarity possible. Problems relating to chemical reactions in the boundary layer are also investigated. For the analysis, an approximate technique is used based on linearization about the Blasius solution.

LAMINAR BOUNDARY LAYER WITH UNIFORM INJECTION, by P. A. Libby and K. Chen. [1968] [7]p. incl. diagrs. refs. (AFOSR-64-1395) (AF AFOSR-63-1) AD 606074 Unclassified

Also published in Phys. Fluids, v. 8: 568-574, Apr. 1965.

The nonsimilar velocity distribution in a two-dimensional laminar boundary layer with uniform external stream and with either uniform suction or injection is obtained by a series expansion in terms of a mass transfer parameter. The results are compared with more accurate analysis and shown to be in good agreement for a range of values of this parameter. The solution for the velocity distribution is then employed for the calculation of the distributions of energy and element mass fraction when there are imposed requirements for energy and mass balance at the exposed surface of a porous plate with uniform injection. As one example of several possible applications of these solutions, there is computed the flow associated with the injection of hydrogen into an air stream according to the flame sheet model. A MOMENT METHOD FOR COMPRESSIBLE LAMINAR BOUNDARY LAYERS AND SOME APPLICATIONS, by P. A. Libby and H. Fox. [1965] [17]p. incl. diagrs. refs. (AFOSR-64-1786) (AF AFOSR-63-1) AD 612081 Unclassified

An integral method based on moment techniques and especially useful for compressible laminar flows is presented. The describing partial differential equations are first transformed to the Levy-Lees variables and then converted to integral conditions with u^m as a weighing factor. A technique for handling the variation in transport properties which explicitly arises for $m>0$ is described. The resultant equations are applied for $m=0, 1$, with the commonly employed fourth and fifth degree polynomial profiles for velocity and stagnation enthalpy. The distinct classification of similar and nonsimilar flows within the same analytic framework is emphasized. The analysis is applied to a variety of flows for which more accurate results are available and is found to yield satisfactory results in most cases. Therefore, the present method is considered to improve somewhat the conventional integral method ($m=0$) without excessive labor. (Contractor's abstract)

THE VISCOUS INCOMPRESSIBLE FLOW INSIDE A CONE, by R. C. Ackerberg. [1965] [35]p. incl. diagrs. refs. (AFOSR-65-0577) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-1, National Science Foundation and Office of Naval Research) AD 614492 Unclassified

Also published in Jour. Fluid Mech., v. 21: 47-81, 1965.

The steady, axisymmetric, converging motion of a viscous incompressible fluid inside an infinite right circular cone is considered. It is shown that the exact solution of the Navier-Stokes equation for the stream function ψ is of the form $\psi(r, \theta) = AF(r\nu A, \theta)$, where (r, θ) are spherical polar co-ordinates chosen so $r=0$ is the apex and $\theta = 0$ is the axis of the cone, $2\pi A$ is the volumetric flow rate, and ν the kinematic viscosity of the fluid. Asymptotic expansions of the stream function are found for large and small $r\nu/A$. For large $r\nu A$, Stokes's method for slow motions is generalized to obtain a complete asymptotic expansion. Except for cones of special angles, all terms in this expansion may theoretically be found. For small $r\nu/A$ a solution is constructed in 2 parts, namely, an inner expansion which starts from boundary-layer type equations as well as the no-slip condition at the wall, and an outer expansion in unstretched variables $r\nu A$ and $\cos\theta$ which satisfies the boundary conditions at the axis of the cone. The condition that the inner solution merge with the outer solution with an exponentially small error requires an outer solution near the

apex which is not potential sink flow, as might perhaps have been expected from the solution for 2-dimensional flow in a wedge. The simplest outer flow satisfying the requirement is a vortex motion. Complete inner and outer expansions are developed and it is shown that they contain only six undetermined constants which must be determined by joining this solution numerically to the Stokes solution upstream. The inclusion of logarithmic terms in these expansions has not been found necessary. (Contractor's abstract)

LINEARIZED ANALYSIS OF DIFFUSING, RELAXING GAS FLOW, by P. M. Sforza and M. H. Bloom. [1965] [8]p. incl. diagrs. (AFOSR-65-1232) (AF AFOSR-63-1) AD 622746 Unclassified

Also published in Phys. Fluids, v. 8: 36-43, Jan. 1965.

A linearized model of an ideal diatomic gas with diffusion processes and rate reaction is applied to 1-dimensional unsteady motion generated by initial nonuniformities of state and velocity. The time-dependent system resembles that of steady free-mixing of jet or wake type, with 2 space coordinates. The temporal and spatial character of the profiles of flow variables is studied analytically under 2 sets of conditions. First considered is the case of unit Lewis number and for this case the investigation is subdivided as follows: (1) Zero mass motion with state nonuniformities for planar, cylindrical, and spherical configurations; and (2) nonzero mass motion with state nonuniformities for the planar and cylindrical configurations. Secondly, the case of arbitrary, but constant, Lewis number is considered. In this instance, the investigation is limited to nonzero mass motion with state nonuniformities in the planar geometry. In all cases the Prandtl number is assumed to be an arbitrary constant. Analytic solutions are obtained for all cases and various parametric effects discussed. (Contractor's abstract)

ON THE SOLUTION OF INITIAL-VALUED BOUNDARY LAYER FLOWS, by M. H. Steiger and P. Sepri. May 1965, 22p. incl. diagrs. refs. (PIBAL rept. no. 872) (AFOSR-65-1415) (AF AFOSR-63-1) AD 619098 Unclassified

This report is concerned with the exact solution of the boundary layer equations, particularly when the initial conditions are not of a simple form. A comparatively new procedure is applied to the forementioned problem, and the preliminary results of the investigation are reported. The theory is restricted to flows which are described by 2 coordinates. By replacing the normal partial derivatives by finite differences, the boundary layer equations are reduced to an initial value system of coupled first order ordinary differential equations. Since these equations are classified as stiff, their solution requires special consideration. As an illustration, the velocity field of 2-dimensional wake is obtained by full finite difference schemes. An improved theory is suggested and possible future studies are discussed. INCOMPRESSIBLE FLOW ALONG A CORNER. PART I. BOUNDARY LAYER SOLUTIONS AND FORMULATION OF CORNER LAYER PROBLEM, by S. G. Rubin. May 1965, 29p. incl. diagrs. refs. (PIBAL rept. no. 876) (AFOSR-65-1420) (AF AFOSR-63-1) AD 621987 Unclass

The incompressible viscous flow along a right-angle corner is considered. The effect of the 3-dimensional geometry on the second-order boundary layer flow away from the corner is determined and an interesting secondary flow is deduced. It is observed that this cross-flow prescribes the necessary asymptotic boundary conditions for the equations governing the flow inside the corner layer. A systematic matching scheme is specified and the corner flow problem is reformulated in terms of the corner layer - boundary layer matching conditions. (Contractor's abstract)

AN EXPERIMENTAL STUDY OF THE TURBULENT MIXING OF A SUBSONIC AND A SUPERSONIC JET IN A CLOSED DUCT, by H. S. Bluston. May 1965, 48p. incl. diagrs. tables, refs. (PIBAL rept. no. 868) (AFOSR-65-1794) (AF AFOSR-63-1) AD 624551 Unclassified

An experimental study is presented of the turbulent mixing of 2 coaxial air jets at subsonic-supersonic speeds in a closed duct. By using a suitable total pressure it is possible to correctly expand the ducted outer jet to ambient conditions. Negligible pressure gradients are found in a considerable region of the duct and all static and stagnation pressure measurements are made in the regime. The axial velocity decay is thus determined and compared with some results of Zakkay. On the basis of the pressure measurements the flow field is divided into 3 mixing regions. In each of these regions the normalized velocity and total pressure profiles are correlated with values of the axial and radial coordinates. Jet boundaries are measured and an eddy viscosity function calculated. Detailed recommendations are made for improvements of this type of experiment.

STUDIES IN THREE-DIMENSIONAL FREE-MIXING: I. FINITE DIFFERENCE SOLUTIONS. II. EXPERIMENTAL RESULTS, by M. H. Steiger, W. Hinzand and others. [1965] [64]p. incl. diagrs. tables, refs. (AFOSR-66-0118) (AF AFOSR-63-1) Unclassified

Presented at AIAA Second Aerospace Sciences Meeting, New York, Jan. 25-27, 1965.

This paper presents numerical and experimental studies of 3-dimensional viscous free-mixing, i.e., non-axisymmetric flows which require 3 space coordinates for their description. Both wakes (flows in moving ambients regardless of whether the profiles have velocity excesses or defects) and jets (flows in motionless surroundings) are treated. Flows of this type decay to axisymmetric form, however, their analysis is difficult due to non-similarity, nonlinearity (particularly in jets) and absence of rigorous compressibility transformations. The numerical investigations employ finite difference methods to derive solutions. First exact and difference solutions are presented for the incompressible wake equation. This provides a comparison between the explicit and implicit schemes and a measure of their accuracy. Next compressibility effects on wakes are studied. Finally, experimental results for cold jets are presented, and compared to difference solutions and approximate momentum integral solutions.

DAMPING PARAMETERS OF LAYERED PLATED AND SHELLS, by Y-Y. Yu and N. Ren. [1965] [29]p. incl. diagrs. tables, refs. (AFOSR-64-2087) (AF 49(638)1290) AD 610140 Unclassified

Also published in Acoustical Fatigue in Aerospace Structure, Proc. of the Second Internat'l. Conf., Dayton, Ohio (Apr. 29-May 1, 1964), ed. by W. J. Trapp and D. M. Forney, Jr. Syracuse Univ. Press, 1965, p. 555-584.

The concept of the damping parameter is clearly applicable to all types of layered plates and shells and to all types of vibrations. Thus, expressions for the damping parameters are now available for extensional vibrations of sandwich plates and axially symmetrical vibrations of sandwich cylindrical shells as well as for flexural vibrations of sandwich plates. A comprehensive review of these is given in this paper. In addition, the damping parameters for the 2-layered plate are discussed. They are important because the 2-layered plate represents a basic situation in which damping of the vibration of a plate by an added viscoelastic layer was first adopted in practice. In all cases considered, expressions are given for the frequencies together with the damping parameters.

ON LINEAR EQUATIONS OF ANISTROPIC ELASTIC PLATES, by Y-Y Yu. [1965] [4]p. (AFOSR-65-0556) (AF 49(638)1290) AD 613863 Unclassified

Also published in Quart. Appl. Math., v. 22: 357-360, Jan. 1965.

The generalized Hamilton principle and the associated variational equation of motion for linear and anisotropic elastic plates are deduced from their counterpart in general elasticity theory given in a previous paper (Jour. Acoust. Soc. Amer., v. 36: 111, 1964), through expansion of the displacement and strain in infinite power series in the manner of Cauchy and Mindlin and by carrying out the integration in the thickness direction of the plate. The Euler equations of the variational principle then yield the complete system of plate equations of all orders as were obtained by Mindlin by a different procedure. Some zero-order and first-order equations for an isotropic plate have been derived before from the generalized variational equation of motion.

APPLICATION OF VARIATIONAL EQUATION OF MOTION TO THE NONLINEAR ANALYSIS OF DYNAMIC BUCKLING, by Y-Y Yu. June 1965, [25]p. incl. diagrs. table, refs. (Scientific rept. no. 4) (AFOSR-65-1421) (AF 49(638)1290) AD 627961 Unclassified

An integrated procedure has been proposed for applying the variational equation of motion to the analysis of nonlinear vibrations of solids. In this paper, the procedure is extended to the analysis of nonlinear dynamic buckling. Example is given for a simply supported sandwich or homogeneous plate in plane-strain motion, one edge of which is fixed and the

other subjected to a longitudinally oscillating displacement. Response curves for the parametrically excited, lateral vibration corresponding to the first instability region are presented. Results show that the transverse shear effect cannot be neglected for the sandwich plate, as in the case of ordinary, nonlinear lateral vibration of the plate. The transverse shear effect is negligible for the homogeneous plate (timoshenko beam), at least for the first instability region. (Contractor's abstract)

2378

Polytechnic Inst. of Brooklyn. Dept. of Mechanical Engineering, N. Y.

ON THE AXISYMMETRICAL VIBRATIONS OF CONICAL SHELLS, by Y. Kagawa. June 1965, [19]p. incl. diagrs. tables. (Scientific rept. no. 6) (AFOSR-65-1422) (AF 49(638)1290) AD 627963 Unclassified

It is shown that the fundamental frequencies of the axisymmetrical vibrations of conical shells can be predicted quite accurately by the extensional theory as long as the thickness of the shell is small compared with its length and the apex angle is not too wide. This is confirmed by comparing the results of the extensional theory with those of experiment and with those of the more exact theory including bending effect.

VIBRATIONS OF TWO-LAYERED PLATES, by S. Ren and Y-Y. Yu. June 1965, 28p. incl. diagrs. tables, refs. (Scientific rept. no. 5) (AFOSR-65-1423) (AF 49(638)1290) AD 627962 Unclassified

Four approximate theories of 2-layered plates nave been presented. Among these the 2 uncoupled classical theories of flexure and extension are the simplest. For the infinite plate the flexural theory gives the flexural branch and the extensional theory the equivoluminal and extensional branches of the frequency spectrum. The 3 branches all start from the origin and are in an ascending order as just stated. The classical theory that includes the effect of coupling between flexure and extension produces the same 3 branches of the frequency spectrum, in fact with little improvement over the uncoupled theories up to, say, 20,000 cps. The important thing to note, however, is that flexure and extension are in general coupled. Therefore, either type of excitation will induce both types of motion simultaneously, which can only be accounted for by the coupled theory.

ON THE FORM OF VARIATIONALLY DERIVED SHELL EQUATIONS, by Y-Y. Yu. [1965] [4]p. incl. refs. (AFOSR-66-0571) (AS 49(638)1290) AD 631389 Unclassified

Also published in Jour. Appl. Mech., v. 32: 223-238, Trans. ASME, v. 86: Ser. E., June 1965.

The report gives a variational derivation of shell equations. A variational formulation of the 3-dimensional elasticity theory is discussed. This formulation is used to derive shell equations which do not make use of the conflicting assumptions of zero transverse normal stress and strain. Several observations concerning the significance of shell theories are concluded.

POSITION AND THERMAL PARAMETERS OF OXYGEN ATOMS IN CALCITE, by H. Chessin, W. C. Hamilton and B. Post. [1965] [5]p. incl. diagrs. tables. (AFOSR-65-1989) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)827 and Atomic Energy Commission) AD 626868 Unclassified

Also published in Acta Cryst., v. 18: 689-693, Apr. 1965.

The position and thermal parameters of the oxygen atoms in calcium carbonate (calcite) at room temperature, 215° and 130°K, were determined. Reflections to which only oxygen atoms contribute were measured by counter methods. Parameters were refined by least-squares methods. The C-O bond length is 1.283 ± 0.002 at room temperature and does not change significantly between room temperature and 130°K. (Contractor's abstract)

SURFACE THERMAL DIFFUSE SCATTERING FROM TUNGSTEN, by J. Aldag and R. M. Stern. [1965] [4]p. incl. illus. diagrs. refs. (AFOSR-65-1992) (AF 49(638)1369) AD 626876 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 68-69, Jan. 28, 1965.

Also published in Phys. Rev. Ltrs., v. 14: 857-860, May 24, 1965.

An anisotropic diffuse background was observed, superimposed on the expected low-energy electron diffraction pattern from the clean (110) surface of a tungsten single crystal. The observations were made using a Varian system with 230- to 700-ev electrons over a temperature range of 300° to 1600°K. No such structured background appears in X-ray diffraction patterns from tungsten. It was concluded that the observations were of thermal diffuse scattering from anisotropic surface modes and that this phenomena should be of value in investigating dispersion relationships for surface phonons.

ADSORPTION OF OXYGEN ON (110) TUNGSTEN SURFACE (Abstract), by R. M. Stern and I. Cantarell. [1965] [1]p. [AF 49(638)1369) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 69, Jan. 28, 1965.

A clean tungsten (110) surface is observed in post-accelerated low-energy electron diffraction during the adsorption of oxygen. Pressure changes following flash desorption are monitored with a residual-gas analyzer. The results are strongly dependent on the ubiquitous presence of CO. The flashoff pressure rise contains no oxygen, but is composed of CO and H_2. After flashoff, the equilibrium O_2 pressure decreases, indicating adsorption of oxygen on the tungsten surface. Linear adsorption, $dN/dT = S_0(1-\theta)$ is observed; S_0 is the absolute sticking probability (S_0=0.5 ± 0.1) and θ the coverage. Oxygen adsorption is accompanied by the appearance of additional diffraction features, interpreted as revealing island growth. The appearance of the additional diffraction features can be completely inhibited by the presence of CO, which must compete with oxygen for adsorption sites. CO is desorbed at 1000°C; the oxygen associated diffraction features are altered at 1700°C and removed, accompanied by no oxygen pressure rise, at 1890°C. Removal of the adsorbed CO is followed by the immediate appearance of any latent oxygen-diffraction features, if any, or after suitable oxygen adsorption otherwise.

EVOLUTION OF THE CATHODE SHEATH IN A GLOW DISCHARGE (Abstract), by H. Veron and N. Wainfan. [1965] [1]p. [AF 49(638)1369] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 476, Apr. 26, 1965.

Time resolved spectroscopic measurements and electrostatic-probe measurements were used to investigate the evolution of the cathode sheath of a pulsed hydrogen glow discharge in the annular gap between the cathode and the Pyrex walls of a discharge tube. The cathode sheath started to propagate into the annular gap at the time that the electric field at the cathode face reached its maximum value. It is proposed that the initial positive space-charge sheath distributed over the cathode face produces a fringing field at its perimeter and that the axial component of this fringing field provides the primary driving mechanism for the propagation of the sheath into the annular gap. For annular gap sizes of the order of several-ion mean-free path lengths, the velocity of propagation of the sheath is approximately $1/2(2\ ev/m_+)_{1/2}$. The propagation velocity is discussed as a function of pressure, applied voltage, and annular-gap size.

NETWORK THEORY OF SEMICONDUCTOR HALL-PLATE CIRCUITS, by J. M. Garg and H. J. Carlin. [1965] [15]p. incl. diagrs. tables, refs. (AFOSR-65-2271) (AF 18(603)105) AD 625740 Unclassified

Also published in IEEE Trans. on Circuit Theory, v. CT-12: 59-73, Mar. 1965.

The paper deals with purely electrical realization of of the network element, the Gyrator, at low frequencies. It discusses the utilization of Hall effect in semiconductors and the properties of nonreciprocal devices based on this effect. The systematic study of the Hall plate, the best that can be expected from it and the conditions under which the best performance can be expected are established; and some new theoretical and practical schemes are suggested which permit better understanding of device performance and yield better devices. The Hall devices are nonreciprocal, passive, and stable but dissipative. They permit the extension of frequency range from dc to several magacycles over which the nonreciprocal devices can be used. In this sense they are complementary to the microwave Faraday-effect devices such as isolators and circulators and will permit greater flexibility and choice of elements for complex circuit designs, if the loss can be tolerated. This paper presents basic limitations, from an insertion loss standpoint, on the performance of Hall-plate circuits imbedded in resistance or reactance networks. (Contractor's abstract)

This paper is concerned with a method of evaluating small average sample size (1.0 to 1.2) sequential detection of Ricean distributed signals. A solution is presented for this method of testing and the results compared to Wald's approximation. In addition, this testing method is compared with fixed sample size and null-zone detection. The results of this report show that sequential detection has a significant improvement over fixed sample testing and may be approximated by the null-zone detector for small average sample sizes. Some remarks are included on truncating the sequential detector after the second sample

STOCHASTIC TIME-OPTIMAL CONTROL, by P. N. Robinson. June 1965, [58]p. incl. diagrs. tables, refs. (Research rept. no. PIBMRI-1268-65) (AFOSR-65-1718) (AF 49(638)1402)
Unclassified

The problem under study is the stochastic time-optimal control problem. Basically the object is to determine a control input which causes the output of a stochastic system to reach some region R of the origin in such a way that the expected value of the time required to reach R is minimized. The system is assumed to satisfy a stochastic differential equation. This problem has already been considered by a few authors, however in most cases serious errors were made in their analysis and problem statement. In this study a careful problem statement is made, appropriate optimization equations derived, and an iterative method of solution technique (approximation in policy space) is applied to solve certain specific problems. ELECTRIC FIELD PATTERNS IN A FERRITE LOADED WAVEGUIDE, by P. de Santis. [1965] 43p. incl. diagrs. (Rept. no. PIBMRI-1281-65) (AFOSR-65-1719) (AF 49(638)1402) AD 624077
Unclassified

A rectangular waveguide loaded with a transversely magnetized ferrite slab is analyzed. The diagram, longitudinal propagation constant vs distance of the ferrite slab from the side wall, is studied to get some information on the electric field patterns in the cross-section of the guide. A numerical case of interest is studied with parameters having values between those used by Barzilai and Gerosa and those by Lax and Button. It is concluded that the desired waveguide requirements and the necessity of only one propagating mode in the same direction can be met with the help of a design based on the present analysis. APPLICATION OF GAME THEORY TO THE SENSITIVITY DESIGN OF SYSTEMS WITH OPTIMAL CONTROLLER STRUCTURES, by P. Dorato and A. Kestenbaum. [1965] [11]p. incl. diagrs. (AFOSR-65-2102) (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham) and Office of Naval Research] under AF 49(638)1402 and [Army Research Office (Durham)] under DA-31-124-AROD-316) AD 628296
Unclassified

The theory of games is applied to the sensitivity design of systems with unknown plant parameters. It is assumed that a controller structure is known and furthermore this controller is optimal when the controller parameters are equal to the plant parameters. The performance index then becomes a function of plant and controller parameters. This function is treated as a pay-off function with the antagonists represented by the controller and plant parameters. (Contractor's abstract)

The problem of propagation of plane electromagnetic waves polarized in the plane of incidence in a plane-stratified isotropic plasma (regarded as a dielectric) is dealt with by reducing it to the solution of an ordinary differential equation which is singular at the level of plasma resonance. The absorption of power in the resonant layer is calculated approximately in 2 cases involving a linear profile. In the first, the relative dielectric constant varies linearly in a thin transition layer between 2 homogeneous regions. In the second, the dielectric constant is linearly varying over a large interval. (Contractor's abstract)

PROGRESS REPORT TO THE JOINT SERVICES TECHNICAL ADVISORY COMMITTEE, by E. Weberand W. K. Kahn. Progress rept. no. 28, Apr. 1, 1965-Sept 30, 1965. [1965] [224]p. incl. diagrs. tables, refs. (AFOSR-66-1059) (AF 49(638) 1402) Unclassified

This report is the twenty-eighth in a series of progress reports, now issued semi-annually, which summarizes the research programs at the Microwave Research Institute of the Polytechnic Institute of Brooklyn from April 1, 1965 to September 30, 1965. The programs involve academic research activity of faculty and students, and cover a broad spectrum ranging from basic theoretical physics, mathematics, and engineering, to experimental investigations involving basic measurement development of devices, and materials. Each activity reports in summary fashion specific results obtained during the period in question: the sponsoring agency for the activity is individually acknowledged. Contributions are compiled under five headings: Electromagnetics, Plasma Electrophysics and Electronics; Solid State and Materials Research; Networks and Waveguide Techniques; and Systems, Communications and Control.

FORMATION OF THE CATHODE-FALL REGION IN A PULSED GLOW DISCHARGE, by M. Nanemow, N. Wainfan, and A. L. Ward. [1965] [5]p. incl. illus. diagrs. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham) and Office of Naval Research] under AF 49-(638)1402) Unclasified

Published in Phys. Rev., v. 137: A56-A60, Jan. 4, 1965.

Results are presented of an experimental and theoretical study of the formation of the cathode-fall region of a pulsed glow discharge in hydrogen at large overvoltages. The calculations are based upon a Townsend avalanche model that takes explicit account of space charge. Both the experimental data and theoretical results give a minimum delay of about 35 nsec for the start of the formation of the cathode-fall region of the discharge. Profiles of the electric field as a function of time at the face of the cathode are given and calculated profiles of the number density of free electrons are compared with experimentally measured intensity profiles. In both cases there is good agreement between theory and experiment. Since the model used accounts for the observed features of the high-current pulsed discharge, there is no apparent need to invoke any other mechanism to account for the propagating luminous fronts and the short formative times of the cathode-fall region. MATHEMATICAL MODELS FOR DRIFT FAILURE ANALYSIS, by M. L. Snooman. [1965] 11p. incl. diagrs. tables, refs. (AFOSR-65-0623) (AF AFOSR-62-280) AD 614847 Unclassified

Also published in Proc. Eleventh National Symposium on Reliability and Quality Control, Miami Beach, Fla., Jan. 12-14, 1965.

Several mathematical techniques which are available for the analysis of drift failures are discussed. The conventional techniques of drift failure analysis are 'stacking-up-to-the-tolerance', worst case analysis and expansion of the performance function in a Taylor series which is truncated after the linear terms. These techniques are simple to apply but are rather inaccurate in many cases. The very general approach involving the change of random variables theorem is discussed; however, the resulting integral expressions are only amenable to solution and interpretation in special cases. The specific moment relationships are computed for Gaussian and rectangular distribution models. A discussion of how one can estimate parameter moments from manufacturer's specifications is included. The probabilistic expressions including the quadratic terms are derived. The partial

derivative coefficients in the Taylor series are related to sensitivity functions used in system theory. A probabilistic interpretation is given to stacking up the tolerance, and worst case analysis.

ANALYSIS AND SYNTHESIS OF NON-UNIFORM TRANSMISSION LINES INCORPORATING LOSS, by H. A. Stadmore [1965] [11]p. (AFOSR-65-2336) (AF 49(638)1373) and AF AFOSR-62-280) AD 629172 Unclassified

Also published in IEEE Internat'l. Conv. Rec., Part 7: 7-17, 1965.

A method of analysis and synthesis of a lossy, passive, reciprocal non-uniform transmission line is presented. Solutions to the assumed telegrapher's equations are cast in terms of a volterra integral equation to make use of the inherent convergence properties when iterative methods are applied. Utilizing complex normalization it is possible to formulate a scattering matrix referenced to arbitrary generator and load impedances. The first order approximation to the input scattering coefficient, is derived and specialized to the case of parallel loss. A synthesis procedure for this is outlined. Higher order approximations to the coefficient in the general loss case are indicated for the analysis problem. (Contractor's abstract)

THE INTERCHANGE OF SOURCE AND DETECTOR IN LOW-POWER MICROWAVE NETWORK MEASUREMENTS, by H. M. Altschuler. [1965] [7]p. incl. diagrs. (AFOSR-65-2400) (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under AF AFOSR-62-295) AD 625768 Unclassified

Also published in IEEE Trans. Microwave Theory and Techniques, v. MTT-13: 84-90, Jan. 1965.

The technique for interchanging generator and detector in the impedance measurement of microwave 1-ports is a useful, known procedure often applied when low powers are indicated. The necessary and sufficient conditions for the validity of such measurements are examined critically and direct extensions of this technique to measurements of reciprocal 2-ports are given. A completely separate analysis is necessary when such an interchange is made in the case of an interference bridge which is to be used for the determination of the scattering parameters of arbitrary (active or passive, and reciprocal or nonreciprocal) 2-ports. This analysis, presented in detail, results in a new low-power-level version of a method of measuring arbitrary 2-ports as outlined in an earlier paper. The measurement technique and the subsequent data analysis of the 2 versions are found to be identical, except that the 2 scattering parameters S_{12} and S appear in interchanged positions. (Contractor's abstract)

MINIMUM-SCATTERING ANTENNAS, by W. K. Kahn and H. Kurss. Apr. 7, 1964 [12]p. incl. diagrs. (Rept. no. PIBMRI-1215-64; memo no. 96) (AFOSR-65-1726) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-453, Army Research Office (Durham), Office of Naval Research, and National Science Foundation) AD 624080 Unclassified

Also published in IEEE Trans. Antennas and Propagation, v. AP-13: 671-675, Sept. 1965.

Antennas with identical patterns differ to the extent in which they modify an incident wave, i.e., in the amount they scatter. An antenna is completely described by an (infinite dimensional) scattering matrix. The concept of a minimum scattering antenna introduced by Dicke is generalized to include antennas with a finite number of accessible waveguide ports and with non-reciprocal components. A canonical minimum scattering antenna is defined as one which becomes 'invisible' when the accessible waveguide terminals are open circuited. Such an antenna is shown to be unique once the independent radiation patterns have been specified. Neither an impedance nor an admittance matrix for such an antenna exists. The physical significance of the minimum scattering antenna concept is examined from several points of view. Appropriate generalizations of Dicke's results are derived for multiport and non-reciprocal antennas. The 'scattered power', is introduced as a convenient measure of scattering. It is demonstrated, for a large class of antennas, that the scattered power is quite generally greater than the absorbed power, equality being attained for minimum scattering antennas of this class. This result further justifies the minimum-scattering terminology. Arrays of canonical antennas are discussed briefly.

NONLINEAR EFFECTS IN THE TWO-STREAM INSTABILITY, by J. P. Freidberg. [1965] [8]p. incl. diagrs. refs. (AFOSR-65-2451) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-453 and Rome Air Development Center) AD 628729 Unclassified

Also published in Phys. Fluids, v. 8: 1031-1038, June 1965.

The problem of the nonlinear interaction of 2 cold interpenetrating electron and ion streams is treated. By seeking traveling-wave-type solutions to the nonlinear twofluid system of equations, an amplitude dependent dispersion relation is obtained. An examination of the solution and the dispersion relation indicates that there is a range of values for k, where the 2-stream stability levels off before the onset of overtaking.

A NOTE ON THE UNIFIED THEORY OF NONLINEAR OSCILLATIONS OF A COLD PLASMA, by J. P. Freidberg and R. Sasiela. [1965] [3]p. incl. diagrs. (AFOSR-66-2360) (Sponsored jointly by Air Force Systems Command and Joint Service Technical Advisory Comm. under AF AFOSR-63-453) AD 642815 Unclassified

Also published in Jour. Math. Anal. Appl., v. 12: 488-490, Dec. 1965

It is shown that Dolph's time-dependent solutions to the cold plasma equations are based on an assumption which is not completely general. For the case of a plasma consisting of 2 mobile species, a more general form of Poisson's equation is required to account for an inhomogeneous initial distribution of ions.

OXYGEN DETERMINATIONS IN SILICATES AND TOTAL MAJOR ELEMENTAL ANALYSIS OF ROCKS BY SOFT X-RAY SPECTROMETRY, by A. K. Baird and B. L. Henke. [1965] [3]p. incl. diagrs. tables, refs. (AFOSR-65-2150) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-689 and National Science Foundation) AD 629074 Unclassified

Also published in Anal. Chem., v. 37: 727-729, May 1965.

New developments in forming thin film x-ray tube and detector windows and building large d-spacing analyzing crystals have resulted in 30- to 50-fold increases in the counting rates for oxygen Kα in silicates using a vacuum-path x-ray spectrometer. A test of the precision of oxygen determinations over the range 44 to 54% shows that it is now possible to achieve better than 1% relative standard deviation in routine rock analyses. This improved precision allows the detection of significant biases in calibration which seem to be caused by an inadequate knowledge

of the concentrations of the other elements present and by the lack of adequate standards. (Contractor's abstract)

THEORIES OF THERMAL TRANSPIRATION AND MOLECULAR EFFUSION, by Y. Wu. Feb. 1965, 23p. incl. diagrs. refs. (Rept. no. 718) (AFOSR-65-0645) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1271 and National Science Foundation) AD 616285 Unclassified

Revised theories of thermal transpiration and molecular effusion are presented in a rigorous treatment. It is a modified version of the classical laws of Reynolds and Graham. A set of invariants and a new geometrical property, isotropicity, have been found in a system with non-uniform temperature distribution on the boundary in the Knudsen regime. The reciprocal transmission probability theorem has been proved to be valid in this stationary state system according to the invariant of number flux throughout the region. The application of thermal transpiration to rarefied gas kinetics has been found in many problems, i.e., heat conduction between 2 parallel plates and co-axial cylinders, thermal creep effect, and temperature jump effect.

Presented at AIAA Second Aerospace Sciences Meeting, Jan. 25-27, 1965, New York.

Published in AIAA Jour., v. 3: 1850-1855, Oct. 1965.

In a flowing low-density plasma, the presence of a solid body introduces electrostatic as well as gasdynamics disturbances. A general theory was presented recently for these electrogasdynamic problems with the assumptions that the ion thermal speed is negligible compared to the flow speed and that the characteristic length of the problem is much greater than the Debye length. The present paper considers the flow of a collisionless plasma over a right circular cone within the framework of this theory. By confining attention to the case when the flow speed is greater than the ion wave speed (the supersonic case), the conical self-similar solutions for a large range of flow velocities and cone angles are constructed. The ion saturation current density to the cone surface and the potential at the edge of the sheath are computed. The limiting behavior of the solution near various singular points in the governing equation is analyzed and discussed.

ON THE HYDRODYNAMIC STABILITY OF PARALLEL DUSTY GAS FLOWS, by J. T. C. Liu. [1965] [7]p. incl. diagrs. (AF 49(638)1271) Unclassified

Published in Phys. Fluids, v. 8: 1939-1945, Nov. 1965.

The physical implications of the stability of parallel flows of a dusty gas are studied. The over-all (gas-plus particle) disturbance kinetic energy balance is contributed by dissipation due to the usual gas viscosity and augmented by the work done due to particle-gas interaction and energy conversion from the mean flow to the disturbances by both the gas and particle Reynolds shear stresses. The viscous sublayer structure, where viscosity is known to be destabilizing, is obtained. The Reynolds shear stresses of both phases are derived from considering the relaxative nature of the disturbance vorticity diffusion process.

A UNIFORMLY VALID ASYMPTOTIC THEORY OF

RAREFIED GAS FLOWS UNDER NEARLY FREE MOLECULAR CONDITIONS, II, by Y-P. Pao. [1965] [15]p. incl. refs. (AF 49(638)1271) Unclassified

Also published in Rarefied Gas Dynamics; Proc. Fourth Internat'l. Symposium, Toronto U. (Canada) (July 14-17, 1964), ed. by J. H. de Leeuw. New York, Academic Press, v. 1; 296-311, 1965.

For a rarefied gas flow of infinite extent over a submerged body, at very large Knudsen number, the free molecular solution is not a uniformly valid approximation throughout the flow field. This nonuniform validity will necessarily invalidate the collisional corrections obtained (even in the vicinity of the submerged body) by any iteration procedure based on the free molecular solution as the order of correction becomes higher. In the present study, a uniformly valid asymptotic theory is developed, based on the BGKW model equation, for the simple nearly free molecular flow problem of a 2-dimensional cylinder rotating in an infinite gas otherwise at rest. The asymptotic solutions given by this theory will be uniformly valid approximate solutions. (Contractor's abstract)

THE GAS-PHASE DECOMPOSITION OF HYDRAZINE AND ITS METHYL DERIVATIVES, by I. Glassman and I. K. Eberstein. [1965] [10]p. incl. illus. diagrs. refs. (AFOSR-66-1098) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-90 and National Science Foundation) Unclassified

Also published in Tenth Symposium (Internat'l.) on Combustion, Cambridge (Gt. Brit.) (Aug. 17-21, 1964), Pittsburgh, Combustion Inst., 1965, p. 365-374.

The decomposition of hydrazine, hydrazine-water mixtures, UDMH, and monomethyl-hydrazine was studied in the Princeton adiabatic flow reactor. The over-all reaction order of all 3 monopropellants was very close to unity. A study of hydrazine-water mixtures showed their rates to be slower than those of the anhydrous material by approximately a factor of 10 and independent of the amount of water added. Slightly wet hydrazine behaved kinetically like the hydrazine water mixtures. Thus it seems that water inhibits the gaseous decomposition of hydrazine by very effectively suppressing some reaction step. A comparison of reaction rates of the 3 monopropellants shows that, in the temperature regime of this study, UDMH decomposition is the fastest, hydrazine decomposition is the slowest, and the monoethylhydrazine-decomposition rate is intermediate. UNIFIED THEORY FOR THE LANGMUIR PROBE IN A COLLISIONLESS PLASMA, by S. H. Lam. [1965] [15]p. incl. diagrs. table. (AF AFOSR-63-112) Unclassified

Published in Phys. Fluids, v. 8. 73-87, Jan. 1965.

An asymptotic analysis is presented of the Langmuir-probe problem in a quiescent, collisionless plasma in the limit of large body dimension of Debye length ratio. The structures of the electric potential distribution about spheres and cylinders are analyzed and discussed in detail. It is shown that when the probe potential is smaller than a certain well defined value, there exists no sheath adjacent to the solid surface. At large body potentials, for which a sheath is present, the electric potential distribution is given in terms of several universal functions. Master current-voltage characteristic diagrams are given which exhibit clearly the effects of all the pertinent parameters in the problem. An explicit trapped-ion criterion is presented. The general problem with an arbitrary body dimension to Debye length ratio is qualitatively discussed.

IGNITION OF AN EVAPORATING FUEL IN A HOT, STAGNANT GAS CONTAINING AN OXIDIZER, by C. E. Hermance, R. Shinnar, and M. Summerfield.. [1965] [9]p. incl. diagrs. refs. (ASOSR-66-1789) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1267 and National Aeronautics and Space Administration) AD 639878 Unclassifid

Presented at AIAA Solid Propellant Rocket Conf., Palo Alto, Calif., Jan. 29-31, 1964.

Also published in AIAA Jour., v. 3: 1584-1582, Sept. 1965.

Experimental evidence indicates that the ignition of a solid propellant by conventional agents occurs in the gaseous reaction zone adjacent to the propellant surface and that, in such heterogeneous systems, the gas composition, pressure, and temperature strongly influence the ignition delay. This paper, in contrast to extensive past study of ignition in homogeneous mixtures, describes some of the key theoretical properties of ignition in heterogeneous systems through similarity theory and numerical analysis of the mathematical model. Certain common simplifying assumptions and ignition criteria, valid for homogeneous systems, were found to be invalid in heterogeneous systems. In heterogeneous systems with igniter gas temperatures near E/R, the particular choice of ignition criterion affects the formula connecting the ignition delay and the chemical or

physical parameters of the gas phase. Furthermore, a log-log plot of ignition delay vs concentration of gaseous oxidizer exhibits a slope that varies over a wide range of negative values; this slope is not a simple multiple of the controlling reaction order. These theoretical results require verification by critically designed experiments.

THE HOMOGENEOUS GAS PHASE KINETICS OF REACTIONS IN THE HYDRAZINE-NITROGEN TETROXIDE PROPELLANT SYSTEM, by R. F. Sawyer. 1965, [315]p. incl. illus. diagrs. tables, refs. (Tech. rept. no. 761) (AFOSR-66-0855) (AF 49(638)1266) AD 634277 Unclassified

The reaction of hydrazine and nitrogen tetroxide is affected strongly by reactant decompositions. Hydrazine can decompose to hydrogen, ammonia, and nitrogen. Nitrogen tetroxide can decompose to nitrogen dioxide, nitric oxide, oxygen, and nitrogen. The gas phase homogeneous reactions of hydrazine, hydrogen, ammonia, and hydrogen/ammonia mixtures with nitrogen dioxide, oxygen, nitric oxide, and oxygen/nitric oxide mixtures were studied in an adiabatic flow reactor at temperatures of from 800° to 1300 K. Heats of reaction, reaction orders, and reaction rates were determined for 11 reactions involving combinations of the above reactants. Arrhenius rate constants were calculated and overall activation energies determined from the measured reaction rates. The reaction of hydrogen and oxygen is about 2 times more rapid than the reaction of hydrogen and nitrogen dioxide. The hydrogen/nitrogen dioxide reaction reaction produces nitric oxide which inhibits the further oxidation of hydrogen. Ammonia reacts about 10 times more rapidly with nitrogen dioxide than with oxygen. Hydrazine and nitrogen dioxide react with a 2 step behavior; the rapid reduction of nitrogen dioxide to nitric oxide is followed by a slower reduction of the nitric oxide. The first step occurs without hydrazine decomposition. The second step requires the decomposition of hydrazine. The reaction of hydrazine and oxygen occurs with simultaneous decomposition and oxidation.

HIGH TEMPERATURE CHEMICAL KINETICS (Abstract), by I. Glassman. [1965] [3]p. incl. table. (Bound with its AFOSR-65-2238) [AF 49(638-1268] Unclassified

The abstract is presented in 2 sections as the thesis work of R. F. Sawyer and J. W. Rich, respectively. The first section discusses the gas phase reactions of hydrazine, $N_2O_4 \rightleftharpoons 2NO_2$, and their decomposition products. A whole matrix of reactions is suggested by the decomposition products of hydrazine and NO_2 which is the favored equilibrium product of N_2O_4 at the temperature of concern. Reaction orders and rates have been measured in an adiabatic flow reactor 12 reactions; no observable reaction was found for the 4 remaining combinations. The hydrazine/NO_2 combination exhibited the unique behavior of a 2-step reaction. The reduction of NO_2 to NO occurs about 20 times more rapidly than the subsequent reduction of NO. In combination with previous studies of hydrazine decomposition, evidence was obtained that the first step of the hydrazine/NO_2 reaction occurs without the decomposition of hydrazine while other hydrazine reactions either require hydrazine decomposition or involve simultaneous decomposition and oxidation. The second section discusses the dissociation of diatomic molecular systems; a vibrational "ladder-climbing" model of molecular dissociation, which assumes that the probability of vibrational excitation upon molecular collision could be described by near-adiabatic distorted wave treatment was investigated. Transition matrix elements for the Morse oscillator were used and an exponentially repulsive intermolecular potential was adopted. It was assumed that the range of the repulsive potential could be approximately related to the range of the Morse intramolecular potential. This approximation yielded a collisional selection rule in which only single vibrational quantum transitions were allowed, yet the effect of anharmonicity was retained in the matrix elements. The cascaded kinetic equations for molecular dissociation in the presence of an inert diluent were formulated and solved. In the normal dissociation temperature range, a quasi-steady state was quickly attained. An analytical expression for the quasi-steady state dissociation rate was obtained and compared with shock tube experimental results.

EXPERIMENTS ON ANNEALED ALUMINUM, by M. J. Kenig. [1965] [175]p. incl. illus. diagrs. tables, refs. (Rept. no. 737) (AFOSR-65-0983) (AF 49(638)1306) AD 618088 Unclassified

This investigation is a study of the quasi-static stress-strain relation for the case of biaxial stress in annealed commercially pure aluminum, and its implications with respect to the speed of propagation of disturbances caused by incremental stresses. Tubes of 1100 aluminum are subjected to combined tension and torsion loads applied by means of a very slow loading technique. It is concluded that annealed 1100 aluminum is a mechanically unstable material and that current theory of plasticity cannot possibly apply to mechanically unstable materials. Shock wave theory, as developed in this dissertation, can be generally applied to mechanically unstable materials prestressed into the plastic region to predict the speed of propagation of the leading edge of disturbances caused by incremental stress.

THERMOELASTICITY WHEN THE MATERIAL COUPLING PARAMETER EQUALS UNITY, by O. W. Dillon, Jr. [1965] [5]p. incl. diagrs. (AFOSR-65-2480) (AF 49(638)1306) AD 628258 Unclassified

Also published in Jour. Appl. Mech., pp. 378-382, June 1965.

Presented at Applied Mechanics/Fluids Conf., Washington, D. C., June 7-9, 1965.

Analytical solutions of 3 problems in coupled thermoelasticity are presented for the case when the material coupling parameter equals unity. The problems considered are: (a) Danilovskaya's problem of a step function in temperature at the surface; (b) a step function in surface strain; and (c) constant velocity impact. Solutions are presented for the case of thin bars (one-dimensional stress) and are obtained by the La Place-transform technique. There is great simplification in the equations when the material coupling parameter equals unity which permits the straightforward inversion of the transformed solutions from the corresponding uncoupled solutions. COMBUSTION PROCESSES IN LIQUID PROPELLANT ROCKET MOTORS, by I. Glassman. Final rept. Sept. 1, 1962-Aug. 31, 1963. Dec. 22, 1965. [8]p. incl. refs. (AFOSR-65-2933) (AF AFOSR-63-111) AD 627712 Unclassified

Princeton University has been engaged in a long range program on combustion processes in liquid propellant rocket motors. Aspects of this program are still continuing. During the period of September 1, 1962 to August 1963, the work was supported by Air Force Office of Scientific Research Grant 111-63. The detailed technical accomplishments have been published in the open literature as listed in the section on publications. The report reviews the history, results, and publications of the research program up to August 31.

SOLID PROPELLANT COMBUSTION INSTABILITY: OSCILLATORY BURNING OF SOLID ROCKET PROPELLANTS (U), by R. H. W. Warsche and M. Summerfield. June 1, 1963-Sept. 30, 1964. Aug. 1965, [308]p. incl. diagrs. illus. tables, refs. (AMS rept. no. 751) (AFOSR-66-0937) (Sponsored jointly by Advanced Research Projects Agency and Air Force Office of Scientific Research under AF AFOSR-63-448) Unclassified

This research was concerned with the problem of combustion instability in solid propellant rocket motors and, in particular, the nature of the dynamic coupling between the oscillating pressure and the combustion process at the propellant surface. A T-tube rocket motor was used to generate a high amplitude pressure oscillation, in the range from 75 to 1600 cycles/second and 250 to 1150 psi mean pressure. Various test specimens of ammonium perchlorate composite propellants were exposed to this oscillating pressure field in a combustion chamber connected to the T-motor. Through windows in the chamber, observations of flame gas temperature were made by measuring the luminous radiation with a photocell receiver, and spatial gas temperature variations (entropy waves) were investigated by high speed photography. It was found that, for all the different propellants, in the entire range of frequency and pressure noted above, the flame temperature responded isentropically to the oscillating pressure, and no entropy waves were seen in the combustion gas stream. This is completely contrary to theoretical expectations and it obviously means that the physical nature of the pressure-flame interaction is not well understood. Because of the importance of this interaction, further experiments with a different approach are proposed.

THERMAL INSTABILITY IN NON-DEGENERATE STARS, by M. Schwarzschild and R. Harm. [1965] [13]p. incl. diagrs. table. (AFOSR-66-0381) (AF 49(638)1555) AD 630098 Unclassified

Also published in Astrophys. Jour., v. 142: 855-867, Oct. 1, 1965.

In the numerical investigation of the evolution of a star of 1 solar mass through the phases in which it contains a helium-burning shell as well as a hydrogen-burning shell, an unexpected type of thermal instability has been encountered. This instability is somewhat reminiscent of the helium flash even though degeneracy plays no role in the models considered. The existence of the instability has been made reasonably certain both by a physical analysis and by a direct mathematical derivation. The new instability appears to have the character of a thermal runaway in a non-degenerate shell containing a highly temperature-sensitive nuclear-energy source. Such a shell will be unstable only if it is sufficiently thin not to affect the over-all hydrostatic structure of the star noticeably. Under this condition the pressure within the shell cannot greatly increase during the thermal runaway, and hence cooling by an adiabatic expansion cannot stabilize the shell. Some speculations are presented regarding whether this instability could have substantial consequences for a star's evolution. (Contractor's abstract)

[NUMERICAL RESEARCH ON STELLAR EVALUATION], by R. Harm and M. Schwarzschild. Final rept. Feb. 12, 1965, 2p. (AFOSR-65-0575) (AF AFOSR-63-152) Unclassified

The question whether the helium flash causes mixing of hydrogen into the helium core is examined by computing detailed model sequences for 3 stars different in mass and composition. These sequences, derived by the Henyey method, cover the entire helium-flash phases. The numerical results indicate that the convective core, though greatly extended during the later cooling phases after the helium flash, misses reaching the hydrogen-rich layers, but only by a very narrow margin. In view of the narrowness of this margin and because of the fact that a number of physical complications have not yet been taken into account in these computations, the question still cannot be answered regarding mixing caused by the helium flash. The main result of the entire investigation is that for the type of star considered the helium flash is a very sudden but nevertheless apparently harmless transition from the hydrogen burning phase the subsequent phase in which both helium and hydrogen burn simultaneously.

BIOLOGICAL CLOCKS, by C. S. Pittendrigh. (1965) [16]p. incl. diagr. [AF AFOSR-63-340) Unclassified

Published in Science in the Sixties; Tenth Anniversary AFOSR Scientific Seminar, Cloudcroft, N. M. (June 14-25, 1965), ed. by D. L. Arm. Albuquerque, New Mexico U. Office of Publications, 1965, 96-111.

The nature of biological periodicity has been of interest to scientists as early as 1729 when De Mairan noted that periodic movements of certain plants persisted even in a periodic environment. Some of the more recent discoveries and experimental results concerned with circadian oscillations are presented. The behavior of certain organisms to a fixed stimulus is markedly different at different circadian phases. The precision and temperature compensation of the rhythmicity are among its most striking features. The rhythmicity is, moreover, innate to the organism. A significant result has been the demonstration that De Mairan's rhythms do not depend on the greater complexity of multicellular organization. Many attempts to manipulate circadian rhythmicity chemically have been singularly unsuccessful. The only unequivocal demonstrations of manipulation of the clock concern either the phase period or a steady-state rhythm. It is noted that light cycles are universally effective in entraining circadian oscillations and oscillations and observations have shown that the light is transduced by the eye. Time-compensated sun orientation has been discovered in a remarkedly diverse array of metozoa; this does not account however, for the initial evolution of circadian oscillations - it has exploited already existing rhythmicity. The primary functional significance of the oscillations and the importance of new experimental work in this field are discussed.

SOLVENT EFFECTS ON THE INFRARED FREQUENCY OF INORGANIC CARBONYL AND NITROSYL BANDS, by W. D. Horrocks, and R. H. Mann. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-65-0689) (AF AFOSR-63-242) AD 615669 Unclassified

Also published in Spectrochim. Acta, v. 21: 399-408, 1965.

The infrared spectra of a number of transition metal carbonyl and nitrosyl compounds have been recorded in a series of solvents. The behavior of the various bands is discussed in terms of the relative frequency shift plots of Bellamy and co-workers. The magnitude of the frequency shifts is correlated with the relative electron density around the metal atom in a series of compounds in which the ligands are varied. Solvent effects on N—O and C—O vibrators appear to be fairly similar in character with the N—O band shift greater in magnitude. This is discussed in terms of dative metal-ligand π-bonding in these complexes. It is found that in molecules with more than one C—O band, the frequency shifts of these bands correlate fairly well among themselves but do not correlate with those of complexes having only one C—O band. The bridging carbonyl band in $Co_2(CO)_2$ has a solvent shift benavior very similar to organic ketones. In certain solvents, however, there is evidence for the formation of the $Co(CO)_4^-$ anion. INTRINSIC ANALYTIC CONTINUATION AND ENVELOPES OF HOLOMORPHY, by S. Bochner. [1965] [4]p. [AF 49(638)578] Unclassified

Published in Proc. Nat'l. Acad. Sci., v. 53: 904-907, May 1965.

A system $\mathcal{F} = \{S;f^\alpha\}$ is introduced in which S is called a base space; it is a connected real-analytic manifold of a fixed dimension n; and $\{f^\alpha\}$ is a family of analytical functions on S and α is an enumerative index which transverses an arbitrary but fixed index set A. By means of "Zorn's lemma" it was concluded that any such system has at least one continuation which is maximal in partial ordering. A second conclusion drawn was a one-one holomorphic map of the domain D into another domain of C^n, also maps the corresponding envelopes of holomorphy, even if the latter are many-sheeted. This conclusion rests on the proposition that if a domain D of C^n, the function becomes

a natural completion when S = D and f^{∞} consisted of all one-component holomorphic functions, scalars or densities.

VISUAL VELOCITY DISCRIMINATION: EFFECTS OF "BLANKING" THE STIMULUS, by F. J. Mandriota. [1965] [2]p. incl. diagr. (AFOSR-65-1306) (AF 49(638)381) AD 621190 Unclassified

Also published in Psychon. Sci., v. 2: 159-160, 1965.

Weber ratios were obtained for visual velocity discrimination under 2 stimulus conditions which differed only with regard to the presence of visible continuous motion. Discrimination of velocity under normal conditions was compared with discrimination under blanked conditions. In the latter, the subjects saw only the initial and final positions of a target separated in time by intervals comparable to the duration of the motions seen under the former condition. Difference thresholds for blanked motion are approximately double those for continuous motion over a wide range of velocities. (Contractor's abstract)

ABSOLUTE AND DIFFERENTIAL CUING OF SUCCESSIVE REVERSALS, by M. Goldstein and B. G. Galef, Jr. [1965] [8]p. incl. diagrs. tables. (AFOSR-65-2660) (AF AFOSR-62-197) AD 629146 Unclassified

Also published in Perceptual and Motor Skills, v. 21: 159-166, 1965.

Successive reversals for a single pair of stimulus alternatives were signalled by means of a 'differential' cuing method for 1 of 2 'absolute' curing methods, under differential cuing, there were 2 extra stimuli that corresponded to reversal and nonreversal, respectively. Under absolute cuing, there was only 1 extra stimulus, but its cuing absence served as 1 signal and its presence served as another. Both possible ways of pairing presence vs absence with reversal vs nonreversal were studied. There were 30 human Ss divided equally among the 3 methods. Differential cuing was the most difficult method. Absolute cuing was least difficult when presence of the extra stimulus was coupled with reversal and absence of the extra stimulus with nonreversal. LEARNING SET WITH INTRA-PROBLEM STIMULUS VARIATION, by M. Goldstein and R. J. Weber. [1965] [7]p. incl. diagrs tables. (AFOSR-66-1164) (AF AFOSR-65-965) AD 640940 Unclassified

Also published in Perceptual and Motor Skills, v. 21: 799-805, 1965.

Thirty-six discrimination problems of a new type were presented to teenage human Ss. Each problem contained four trials, and each trial involved a choice between a constant and varied stimulus. The constant stimulus appeared on all trials within a problem. The varied stimulus was different on every trial. There were 6-experimental groups, representing orthogonal combination of a 3-treatment reinforcement variable and a 2-treatment response vs non-response variable. The reinforcement variable involved the following treatments, listed in ascending order of difficulty: constant stimulus correct on all problems, varied stimulus correct on all problems, constant and varied

stimuli correct alternately over problems. The response vs nonresponse variable was applied only to Trial 1, and its effects were evaluated on later trials, which showed that the nonresponse treatment was more difficult.

IMPLICATIONS OF SU(6) SYMMETRY FOR TOTAL CROSS SECTIONS, by K. Johnson and S. B. Treiman. [1965] [3]p. incl. refs. (AFOSR-65-0838) (AF 49(638) 1333) AD 616047 Unclassified

Also published in Phys. Rev. Ltrs., v. 14. 189-191, Feb. 8, 1965.

It is of value to apply SU(6) notions to questions involving scattering reactions among particles, which entails coming to grips with the meaning of SU(6) in a relativistic context. The forward elastic scattering of pseudoscalar mesons on baryons is considered. The implication is explored of assigning to the full meson fields the definite SU(6) transformation properties of the meson states themselves. Because of the mass difference between K and π mesons, attention is restricted to the high energy region.

SELF-CONSISTENT, NONDEGENERATE MULTIPLETS, by L. F. Cook and J. E. Paton. [1965] [14]p. incl. diagrs. (AFOSR-65-1061) (AF 49(638) 1333) AD 619626 Unclassified

Also published in Phys. Rev., v. 137: B1267-B1280, Mar. 8, 1965.

The restrictions of self-consistency are investigated for 2 sets of interacting particles, vector and scalar or pseudoscalar, with unequal masses. Self-consistency is studied within a field-theoretic framework and within a bootstrap framework. It is assumed that solutions exist when the particles of a given set have equal masses and the coupling constants are proportional to the structure constants of SU_3. The unequal-mass case is studied by perturbing the equal-mass solutions and retaining only first-order terms in the mass and coupling-constant shifts. It is found that fully self-consistent solutions do not exist in either case, but it is seen how such solutions can come about in the field-theoretic case. In the bootstrap analysis it is very difficult to understand how self-consistent solutions develop unless hidden identities are satisfied. (Contractor's abstract)

BOUNDS FOR A CLASS OF BETHE-SALPETER AMPLITUDES, by G. Tiktopoulos and S. S. Treiman. [1965] [6]p. incl. diagrs. (AFOSR-65-1063) [AF 49(638)1333] AD 620639 Unclassified

Also published in Phys. Rev., v. 137: B1597-B1602, Mar. 22, 1965.

For a certain wide class of kernels involving trilinear coupling of scalar particles, the absorptive part of the Bethe-Salpeter amplitude for forward scattering is bounded from above and below. The bounds are expressed in the form $B_1 \alpha 1 < A(S) < B_2 S \alpha 2$, where S is the scattering energy and B_1 and B_2 are positive constants. Expressions for the exponents of α_1, and α_2 are given as functions of the coupling constant g. For the straight-ladder model, α_1 and α_2 coincide for all values of g, the common expression agreeing with an exact result of Nakanishi. For the more complicated models, α_1 and α_2 do not in general coincide. However, in the strong coupling limit $g \to \infty$, it is found that $\alpha_2/\alpha_1 \to 1$; moreover, the common asymptotic behavior $\alpha_1, \alpha_2 \to g \to \infty g/4\pi M$ is the same for all the models, including the straight-ladder model. The fluctuations in counting rate of a particle detector are studied. These may be used to study the coherence properties of the beam. For the case of electromagnetic radiation they may be used to study spectral line shapes. The Fluctuations in intensity of scattered particles provide a means of studying fluctuation phenomena in the target. (Contractor's abstract)

ENERGY OF INFINITELY LONG, CYLINDRICALLY SYMMETRIC SYSTEMS IN GENERAL RELATIVITY, by K. S. Thorne. [1965] [16]p. incl. illus. diagr. refs. (AFOSR-66-0813) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638) 1333] and National Science Foundation) AD 639986 Unclassified

Also published in Phys. Rev., v. 138: B251-B266, Apr. 12, 1965.

A definition of energy is proposed for systems invariant under rotations about, and translations along, a symmetry axis. This energy (which is called "cylindrical energy" or "C" energy) takes the form of

a covariant vector P^i, which obeys the conservation law P^i, $i = 0$. C energy is localizable and locally measurable: The component of P^i along the world line of an observer is the C-energy density he measures. Near the symmetry axis of a static system, where strong gravitational fields are absent, C-energy density reduces to proper mass density $T_0{}^0$. C energy is propagated by Einstein-Rosen gravitational waves and by cylindrical electromagnetic waves. In vacuo and in the presence of electromagnetic fields the C energy on a space-like hyper-surface is minimized when the system is static; and the differences between the "potential" part and the "kinetic" part is a Lagrangian for the Einstein-Maxwell field equations. C energy can be a powerful tool in the analysis of finite as well as infinite cylindrically symmetric systems. Here it is used to elucidate the nature of Einstein-Rosen gravitational radiation, and to suggest and support the conjecture of flux resistance to gravitational collapse: In any configuration of electromagnetic fields collapsing toward a singularity, each electric and magnetic-field line is either entirely ejected from the collapsing region or entirely swallowed by it as collapse proceeds; there can be no flux threading a collapsed region. INELASTIC N/D PROBLEMS AND CASTILLEJO-DALITZ-DYSON CUTS, by J. B. Hartle and C. E. Jones. [1965] [3]p. incl. diagrs. (AFOSR-66-0827) (AF 49(638)1333) AD 639985 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 801-803, May 10, 1965.

Calculations indicate that the Frye-Warnock equations and the Froissart and Ball-Frazer methods all give the same result as many-channel N/D. It is also established that the Frye-Warnock equations are correct at high angular-momentum variable (l), from there the research went to include solutions to lower values of l. Cuts are introduced in the D function. These cuts emerge gradually from the inelastic cuts as l is decreased. These Castillejo-Dalitz-Dyson (CDD) cuts are an inelastic phenomenon. This report illustrates the origin of such cuts.

HIGH-ENERGY LARGE-ANGLE SCATTERING BY SINGULAR POTENTIALS, by G. Tiktopoulos. [1965] [9]p. incl. diagrs. refs. [AF 49(638)1333] Unclassified

Published in Phys. Rev., v. 138: B1550-B1558, June 21, 1965.

An attempt, based on potential scattering, to understand the recent experimental results on high-energy large-angle proton-proton scattering is presented. Potentials of the form $g\, e^{-i\Delta r}\, r^{-n}$, representing strong absorption ($\tau > \Lambda \geq 0$; $n \geq 2$) at short distances r ($g > 0$ may depend on the energy), are studied in order to obtain the asymptotic form of the associated scattering amplitude at high energies and fixed (nonforward) angle. This form is found to display the rapid (experimental) decrease of the (elastic) differential cross section with increasing scattering angle which is typical of the p-p experiments. HYDROSTATICS AND STABILITY OF STARS IN GENERAL RELATIVITY, FROM AN ENERGY POINT OF VIEW (Abstract), by K. S. Thorne and J. A. Wheeler. [1965] [1]p. [AF 49(638)1333] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Energy concepts are applied to the study of the structure and stability of spherically symmetric equilibrium configurations of perfect fluid. It is shown that, a amongst all momentarily static configurations of perfect fluid containing a fixed number of baryons, those configurations that extremize the mass as observed from outside are the configurations of hydrostatic equilibrium. Moreover, if an equilibrium configuration is radially perturbed, the (second-order) change in the mass can be divided into a kinetic part K plus a potential part P, whose difference is a Lagrangian for the equation governing radial motion. The equilibrium configuration is stable if and only if P is positive definite. The relation between this stability criterion and that of Chrandrasekhar is exhibited.

INELASTIC RESONANCES AND CASTILLEJO-DALITZ-DYSON SINGULARITIES, by J. B. Hartle and C. E. Jones. [1965] [5]p. incl. refs. [AF 49(638) 1333] Unclassified

Published in Phys. Rev., v. 140: B90-B94, Oct. 11, 1965.

By considering many coupled 2-body-channel scattering amplitudes that possess a unique continuation in the angular-momentum variable l, we show: (1) that several methods of obtaining the single-channel N/D solution for the elastic amplitude with an inelasticity factor agree with the corresponding many-channel matrix N/D solution at high l; (2) that in order to preserve agreement when continuing to low angular momentum one must generally introduce Castillejo-Dalitz-Dyson (CDD) cuts or poles into the single-channel D function, (3) that the integral equations for N/D may be continued in l, automatically yielding the CDD cuts mentioned above. Finally, we introduce a distinction between elastic and inelastic resonance poles based on continuation in l and show that the latter will not appear in calculations that fail to include the requisite CDD singularities. SOME PHYSICAL CONSIDERATIONS OF THE HYDRODYNAMIC STABILITY OF PARALLEL TWO-PHASE FLOW (Abstract), by J. T. C. Liu. [1965] [1]p. [AF 49(638)1333] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Ser. II, v. 10: 537, Apr. 26, 1965.

The change in over-all (fluid + particle) disturbance kinetic energy is due to the balance between energy conversion from the mean flow to the disturbance by fluid and particle Reynolds shear stresses (τ, τ_p, respectively) and fluid viscous dissipation augmented by the net work done due to particle-fluid interaction. Near the wall, where fluid viscosity destabilizes, augmented phase shift of fluid velocity components decreases τ_r but is eventually offset by their relative magnitude increase, τ_p conspires with τ towards that of a single heavier gas and (disturbance frequency) x (particle relaxation time) is the rate controlling parameter. The information is derived from relaxation of fluid disturbance vorticity diffusion process from "frozen" with diffusivity of a pure gas $\nu = \mu/\rho$ when the vorticity layer is too thin to contain sufficient particles for interaction towards "equilibrium" with diffusivity $\tilde{\nu} = \mu/(\rho+\rho_p)$ of a heavier gas, in which simple perturbation of a pure gas cannot properly describe regardless how small ρ_p/ρ is.

ULTRATRACE DETERMINATION OF METALS USING COORDINATION CHAIN REACTIONS, by D. W. Maugerum and R. K. Steinnaus. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-65-0882) (AF AFOSR-63-134) AD 617584 Unclassified

Also published in Anal. Chem., v. 37: 222-228, Feb. 1965.

A chemical kinetic method is proposed for the detection and determination of ultratrace quantities of metal ions. A coordination chain reaction system involving the exchange of triethylenetetramine-nickel (II) and (ethylenedinitrilo) tetraacetatocuprate (II) is used. This exchange proceeds by a chain mechanism where the chain centers are the free ligands, EDTA and trien. The rate of the exchange reaction is followed by its color change and is responsive to 10^{-9}M concentration changes of EDTA. The theoretical limits for metal determinations suggest that analysis down to the 10^{-9}M level with ±5% accuracy should be possible. Experimental results are given down to 10^{-9}M. As little as 10^{-10} mole of sample can be analyzed with the theoretical limit around 10^{-11} mole. Any metal ion which complexes EDTA can be determined. (Contractor's abstract)

THE ACTION OF ACIDS ON NITRONIC ESTERS AND NITROPARAFFIN SALTS. CONCERNING THE MECHANISMS OF THE NEF AND THE HYDROXAMIC ACID FORMING REACTIONS OF NITROPARAFFINS, by N. Kornblum and R. A. Brown. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-1260) (AF AFOSR-65-122) AD 621470 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 1742-1747, Apr. 20, 1965.

Nitronic esters are rapidly decomposed by acids. The course which the reaction follows is strongly dependent on the acid concentration. Thus, the ethyl nitronic ester of p-nitrophenylnitromethane gives p-nitrobenzaldehyde in 80% yield on treatment with 4 N H_2SO_4 while, in contrast, 31 N H_2SO_4 converts it into p-nitrobenzhydroxamic acid in 98% yield. The reaction of nitroparaffin salts with H_2SO_4 also exhibits this dependence on acid concentration. The mechanisms of these new nitronic ester reactions, and of the Nef and the hydroxamic acid forming reactions of nitroparaffins, are discussed in the light of these facts. (Contractor's abstract)

The structure of a learning control system combines digital memory and logic circuitry with an adaptive system. Data obtained through adaptation is stored (remembered) and later utilized to improve the system performance. The general learning system operation is outlined in this paper and a simple experimental system which illustrates the improved performance is discussed. The example system is a second order plant in which the damping ratio and undamped natural frequency are considered to be affected by the environment in a piecewise constant manner. The system was simulated on a GEDA analog computer and the memory and logic functions were supplied by an IBM 1620 through IBM 1711 and 1712 analog to digital and digital to analog equipment

A HEURISTIC APPROACH TO REINFORCEMENT LEARNING CONTROL SYSTEM, by M. D. Waltz and K. S. Fu. [1965] [9]p. incl. diagrs. refs. (AFOSR-66-1509) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-35[illegible], Collins Radio Fellowship, and National Science Foundation) AD 640188 Unclassified

Also published in IEEE Trans. Automatic Control, v. AC-10: 390-398, Oct. 1965.

This paper describes a learning control system using a reinforcement technique. The controller is capable of controlling a plant that may be nonlinear and nonstationary. The only a priori information required by the controller is the order of the plant. The approach is to design a controller which partitions the control measurement space into sets called control situations and then learns the best control choice for each control situation. The control measurements are those indicating the state of the plant and environment. The learning is accomplished by reinforcement of the probability of choosing a particular control choice for a given control situation. The system was stimulated on an IBM 1710-GEDA hydrid computer facility. Experimental results obtained from the simulation are presented. (Contractor's abstract)

UNITARY SYMMETRY AND WEAK INTERACTIONS. III. NONLEPTONIC HYPERON DECAY, by S. P. Rosen. [1965] [7]p. incl. tables, refs. (AFOSR-66-0067) (Sponsored jointly by Air Force [Office of Scientific Research] under [AF AFOSR-64-274] and National Science Foundation) AD 630213 Unclassified

Also published in Phys. Rev., v. 137: B431-B437, Jan. 25, 1965.

It is shown that B. W. Lee's relation for nonleptonic hyperon decay can be derived from T-L invariance and $\Delta T = 1/2$, and that the vanishing of $\sigma(\Sigma^+ \rightarrow n\pi^+)$ requires the additional assumption or R invariance. The vanishing of $\sigma(\Sigma^- \rightarrow n\pi^-)$ cannot be derived from these symmetries, and since there are no others applicable to weak interactions in SU(3), it must result from weak-interaction dynamics. A comparison is made between this theory and those of Cabibbo and Coleman, Glashow and Lee. Mathematical aspects of T-L invariance are discussed in an appendix. (Contractor's abstract)

OPTIMAL VARIATIONAL METHOD FOR PAIR CORRELATIONS IN MANY-FERMION SYSTEMS, by J. C. Porter. [1965] [16]p. incl. refs. (AFOSR-66-0069) [AF AFOSR-64-274] AD 630375 Unclassified

Also published in Phys. Rev., v. 140: A732-A747, Nov. 1,, 1965.

By means of a suitably chosen variational principle, Euler equations are derived which generalize the Hartree-Fock equations in such a way as to include two-particle correlations. For a system of N fermions these equations involve N single-particle functions and 1/2N(N-1) pair correlation functions. The Euler equations are optimal in the sense that a more accurate estimation of the total energy would require the introduction of three-particle correlation functions and the retention of terms nonlinear in the two-particle functions. Although intended primarily for use in the calculation of atomic and molecular electronic structure, the Euler equations are here used to determine the Coulomb correlation energy in the case of the high-density electron gas. The result obtained is shown to have the same leading logarithmic divergence with density as that found previously by Gell-Mann and Brueckner. (Contractor's abstract)

HIGH-ENERGY LIMIT OF PION-NUCLEON TOTAL CROSS SECTION, by M. Sugawara and A. Tubis. [1965] [4]p. incl. diagr. refs. (AFOSR-66-0070) (Sponsored jointly by Air Force [Office of Scientific Research] under [AF AFOSR-64-274] and National Science Foundation) AD 630441 Unclassified

Also published in Phys. Rev., v. 138: B242-B245, Apr. 12, 1965.

A simple estimate of the high-energy limit of the pion-nucleon total cross section is given in terms of the mass and the width of the 33 resonance and the S-wave pion-nucleon scattering lengths. The underlying assumptions are that the forward elastic (charge-nonexchange) scattering amplitude satisfies the usual (once-subtracted) dispersion relation, and that the scattering becomes dominantly absorptive in the high-energy region. This estimate gives 23 mb as the limit of the total cross section which is in close agreement with what one obtains from a simple extrapolation of the available high-energy cross-sections. The present analysis strongly suggests that a simple correlation exists between a pronounced low-energy resonance and the high-energy limit of the scattering amplitude. (Contractor's abstract)

ORIGINS OF THE LEE TRIANGLE, by S. P. Rosen. [1965] [4]p. incl. refs. (AFOSR-66-0071) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-274] and National Science Foun Foundation) AD 630443 Unclassified

Also published in Phys. Rev., v. 140: B326-B329, Oct. 25, 1965.

The Lee triangle, $\sqrt{3}\langle\Sigma^+|p\pi^0\rangle - \langle\Lambda|p\pi^-\rangle = 2\langle\Xi^-|\Lambda\pi^-\rangle$, is shown to be a consequence of any Hamiltonian which transforms as a member of an SU(3) octet, and which satisfies one simple constraint. If the Hamiltonian is constructed in the form $\Sigma g_n[(\bar{B}XB)_{(n)}X\pi]_{(8)}$, where $n = 8_D, 8_F, 10, 10^*, 27$, the required constraint is $g_{10} = g_{10^*}$. Thus the baryon-antibaryon decuplets must appear with equal weights, but the octets and (27)plet are placed under no restrictions. This result is used to explain why some dynamical models and symmetry arguments predict the Lee triangle, while others do not. Within the framework of SU(6), it also correlates the orbital angular momentum in $\Sigma^+ \rightarrow n_{\gamma}^+$ with the Lee triangle.

PHASE TRANSITIONS IN SYSTEMS OF INTERACTING

FERMIONS, by S. Gartenhaus and G. Stranahan. [1965] [11]p. incl. diagrs. refs. (AFOSR-66-0072) [AF AFOSR-64-274) AD 630377 Unclassified

Also published in Phys. Rev., v. 138: A1346-A1356, May 31, 1965.

Girardeau has shown that a particular class of variational approximations for the free energy of a Fermi-Dirac system may be expressed in terms of the exact free energy of a certain soluble 'model Hamiltonian.' This exact formula for the partition function associated with the model system involves the solution of a certain nonlinear integral equation, and in the present work it is shown in detail that there is a correspondence between phase transitions in the system and the existence of multiple solutions of this equation. The connection between the existence of phase transitions and the properties of the interaction is studied, and it is shown that these phase transitions may occur for a very wide class of interactions. It is established that there is an upper bound to the temperature, above which no phase transitions will occur at any density. The extension of these results to a classical and a Bose-Einstein system is indicated, and the lattice-gas model previously studied by Mermin is re-examined in the light of the present results. TRANSIT ACCELERATION OF CHARGED PARTICLES IN AN INHOMOGENEOUS ELECTROMAGNETIC FIELD, by C. S. Shen. [1965] [14]p. incl. diagrs. tables, refs. (AFOSR-66-0076) (AF AFOSR-64-274) AD 630376 Unclassified

Also published in Astrophys. Jour., v. 141: 1091-1104, Apr. 1965.

This paper discusses the transit accelerations of charged particles when they pass through a time varying inhomogeneous magnet field. Detailed calculations are carried out for cases when the varying field is small compared to the homogeneous field. The first order effect of the varying field causes diffusion of particles in the phase space. The net energy gain is proportional to the square of the field intensity. When the characteristic frequency of the field is small compared to the cyclotron frequency of the particle, the energy gain of the particle is proportional to the energy of the particle itself. For fast varying fields, the dependence becomes implicit. Unlike the Fermi mechanism, the transit acceleration depends very little on the displacement velocity of the fields. It accelerates electrons more effectively than it does ions. The efficiency of this mechanism is discussed in the last section. The magnetosphere is chosen as the background because of the availability of relatively reliable data obtained from there. It is found that a 10-kev electron may increase its energy to 100 kev within a few hours through the enhanced random-walk process. (Contractor's abstract)

NONLEPTONIC HYPERON DECAY AND THE RELATIVISTIC GENERALIZATION OF SU(6), by

S. P. Rosen. [1965] [4]p. incl. tables, refs. (AFOSR-66-0077) (AF AFOSR-64-274) AD 630381
Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 758-761, May 1965.

It is natural to assume that when an interaction is not invariant under a particular symmetry, that its transformation properties will be as simple as possible. For nonleptonic hyperon decay, this approach is empirically justified in the isospin and unitary-symmetry schemes, but it does not appear valid in SU(6). This report examined the flaws and plausibility of showing the compatibility of the $\Delta T = 1/2$ rule and octet dominance with the experiment, and the assignment of the interaction to a 35-plet.

Published in Phys Rev., v. 140 B1144-B1150, Nov. 22, 1965.

Two-body and 3-body weak radiative decays of hyperons are studied in context of the SU(3) scheme. The various sum rules that follow from T-L symmetries as well as those due to R invariance are derived. A pole model is set up for the 2-body decays of both radiative and pionic type and is used to predict the amplitudes and decay rates for the photonic modes. In particular, the rate for $\Sigma^+ \rightarrow p + \gamma$ calculated in this model agrees with the recent experimental value. (Contractor's abstract)

CONTINUOUS MEASUREMENT OF SOLID PROPELLANT BURNING RATES, by J. R. Osborn, R. J. Burick, and P. Y. Ho. Annual rept. Feb. 1965, 53p. incl. diagrs. tables, refs. (Rept. no. 1-65-2) (AFOSR-65-1623) (AF AFOSR-64-207) AD 616098
Unclassified

The basic operating principles of an experimental system for the direct and continuous measurement of solid propellant burning rates are presented. A continuous burning rate measurement technique, termed the Servomechanism technique is employed for obtaining erosive burning rate data for types BDI and BUU double-base propellants. Burning rate measurements are made with different gas flow velocities parallel to the burning propellant surface; the gas velocities approach the acoustic speed. A feasibility study indicates that a technique employing ultrasonic pulses can be developed for obtaining direct measurements of the burning rate of a solid propellant. The technique is based on measuring the time for an ultrasonic pulse to travel through a propellant sample. Another feasibility study finds microwave techniques not readily adaptable to such burning rate measuremer s.

HIGH FREQUENCY COMBUSTION PRESSURE OSCILLATIONS IN MOTORS BURNING GASEOUS PROPELLANTS, by M. J. Zucrow J. R. Osborn and J. M. Bonnell. Aug. 1965, [75]p. incl. diagrs. tables, refs. (Rept. no. TM-65-5) (AFOSR-66-0900) (AF AFOSR-62-360)and AF AFOSR-65-753)
AD 478023 Unclassified

A series of experiments was conducted for determining the factors that promote combustion pressure oscillations in rocket motors burning either premixed or unmixed gaseous propellants. The influences of the following parameters were investigated: combustion chamber geometry, the chemical differences in the propellants, and several injection variables. Auxiliary investigations were conducted for determining the effects of baffles located in the combustion chambers, and the applicability of linear theories for predicting the occurrence of combustion pressure oscillations in gaseous propellant motors. All of the experiments were conducted with rocket motors of cylindrical geometry; two different chamber diameters of 7 in. and 14 in. were utilized with different chamber lengths ranging from 2 in. to 18 in. The fuels were methane, ethylene, and hydrogen, and in all cases the oxidizer was air. For the premixed gas systems, both concentrated and distributed types of injection systems, as well as injectors mounted at different locations in the motor, were employed. For unmixed gases, concentrated type injection systems were utilized but two different modes of injection ("impinging jets" and "showerhead") having different injection velocities and orientations of the fuel and oxidizer streams were studied. STABILITY CRITERIA FOR LONGITUDINAL PRESSURE OSCILLLATIONS IN A ROCKET MOTOR, by S. N. B. Murthy and J. R. Osborn. [1965] [7]p. incl. illus. (AFOSR-65-2078) [AF AFOSR-65-753]
AD 627495 Unclassified

Also published in Jour. Acoust. Soc. Amer., v. 37, 872-878, May 1965.

The problem called 'high-frequency combustion instability in rocket motors' has been considered to be one in which the acoustics of the combustion chamber, nozzle, and flame front are significant for determining whether or not a motor will experience pressure oscillations of an acoustic type. To date, no theory has been developed for demonstrating the effects of the location and width of the flame front in the combustion chamber upon the occurrence of pressure oscillations of the longitudinal mode. In the paper, the rocket motor is treated as a constant-diameter duct with a finite width of combustion zone located between two uniform regions. It also is considered to have finite wave-transmission coefficients at the nozzle and the injector ends. For these conditions, stability criteria are established for the longitudinal mode of pressure oscillations. It is shown that, while the energy release rate per unit width of the combustion zone is significant in determining whether the motor will be stable, the location of the combustion zone in the motor, the over-all length of the motor, and the total amount of energy released also influence the stability of the motor in the longitudinal mode. ELECTRON CYCLOTRON RESONANCE PLASMA ACCELERATOR, by H. Hendel and T. Faith. Final technical rept. Jan. 31, 1965, 27p. incl. diagrs. refs. (AFOSR-65-0430) (AF 49(638)1342) AD 612175 Unclassified

Results are presented ofr a continuously operating electron cyclotron resonance plasma accelerator at a frequency of 2.45 kmc and absorbed power levels of up to 0.5 kw. Langmuir probe measurements indicate that a space charge field set up by energetic electrons (electron temperature approximately 15 ev) accelerates plasma ions to energies of from 35 to 150 ev, as measured by a retarding-field ion-energy analyzer. Langmuir probe plasma potential measurements were made adjacent to the analyzer and the effects of ion acceleration in the plasma beam-analyzer sheath were subtracted from the ion energy measurements. The final ion energy shows a linear relationship to the electron temperature in agreement with the theory. Strong electron confinement along magnetic field lines was observed in the discharge region. At low power approx. 30% of the absorbed microwave power is converted into kinetic energy of the ions. At a power of 0.5 kw, due apparently to strong excitation in the magnetic bottle region, electrons from this region are connected by the magnetic field lines to the waveguide walls and losses for bottle configurations of the magnetic field were found to be high (efficiency of 4%). Constant-magnetic-field experiments indicate that efficiencies with magnetic bottle field should be at least as high as 30% if the accelerator is designed to exclude all field-line connections between wall and plasma. The specific impulse, efficiency, and thrust attainable from a thruster based on electron cyclotron resonance are in the useful range for space propulsion applications, especially in orbit corrective missions. The absence of sensitive accelerating or electron emitting electrodes promises long lifetime for such a thruster.

ELECTRON CYCLOTRON PLASMA THRUSTOR FOR ORBIT CORRECTIVE MISSIONS, by H. W. Hendel and T. J. Faith, Jr. [1965] 6p. incl. diagrs. table. (AED no. C-2352) (AFOSR-66-1094) (AF 49(638) 1342) AD 639979 Unclassified

Presented at Twenty-sixth Meeting of the Propulsion and Energetics Panel, AGARD, Pisa (Italy), Sept. 6-10, 1965.

This report contains measurements of ion kinetic energy, electron temperature and plasma-potential gradient. These measurements are in good agreement with theoretical predictions based on an ion accelerating mechanism employing a space-charge potential gradient set up by the energetic electrons produced in an electron cyclotron discharge. Electron temperatures (up to 25 ev), ion energies (35 to 150 ev), and propulsive efficiencies greater than 30% have been measured at 50 w. The fuel utilization is better than 50%. Due to the absence of cathodes or ion accelerating structures, life-times expected for the thrustor are of the order of years. Such devices have been run in the laboratory for over 1500 hrs without visible deterioration. On the basis of this measured performance, the electron cyclotron accelerator described compares favorably with other station-keeping systems for those long duration missions where thrustor life is of particular importance.

Presented at Fourth Symposium on Advanced Propulsion Concepts, Palo Alto, Calif., Apr. 26, 1965.

Also published in RCA Rev., v. 26: 200-216, June 1965.

Results are presented for a continuously operating electron cyclotron resonance plasma accelerator at a frequency of 2.45 kmc with absorbed power levels up to 0.5 kw. Langmuir-probe measurements indicate that a space-charge field set up by energetic electrons (electron temperatures from 5 to 25 ev) accelerates plasma ions to energies of from 35 to 150 ev, as measured by a retarding-field ion-energy analyzer. The final ion energy shows a linear relationship to the electron temperature, in agreement with the theory. Strong electron confinement along magnetic field lines is observed in the discharge region. At powers up to 10 w, approx. 30% of the absorbed microwave power is converted into kinetic

energy of the ions when a magnetic bottle is formed at the rear of the accelerator. When a similar bottle is used with a power of 0.5 kw, the efficiency falls to 4%. It is believed that this reduction is due to strong excitation in the magnetic bottle region, where electrons are connected by the magnetic field lines to the waveguide walls. The fact that low-and high-power efficiencies have been found comparable for other magnetic field shapes indicates that an accelerator designed to exclude field-line connections between wall and plasma should yield efficiencies of at least 30% at the higher power levels. The specific impulse, efficiency, and thrust attainable from a thruster based on electron cyclotron resonance are in the useful range for space-propulsion applications, especially in orbit-corrective missions. The absence of sensitive accelerating or electron-emitting electrodes promises long lifetime for such a thruster.

THE SIGN OF THE TRIGONAL FIELD SPLITTING OF B-SITE IONS IN SPINEL, by S. B. Berger. [1965] [2]p. incl. tables. (AF 49(638)1223) Unclassified

Presented at Tenth Conf. on Magnetism and Magnetic Materials, Minneapolis, Minn., Nov. 16-19, 1964.

Also published in Jour. Appl. Phys., v. 36: 1048-1049, Mar. 1965.

A direct determination of the sign of the trigonal field splitting parameter of the Cr^{3+} ion on the B site of natural ruby spinel ($\approx MgAl_2O_4$ with Cr^{3+}) which is 85 to 90% normal is reported. Electron spin resonance experiments were performed at 9.5 to 9.7 and 23.08 Gc/sec and the spin Hamiltonian parameters were determined: $g_\parallel = 1.985 \pm 0.001$, $g_\perp = 1.983 \pm 0.003$, and $2D = +1.83 \pm 0.004$ cm^{-1} (+55 Gc/sec). The g values and absolute value of 2D are in close agreement with those obtained earlier. The present value of 2D was obtained from the M = 1/2 to 3/2 transition and the sign determined by the relative intensity change with temperature of the M = 1/2 to 3/2 and M = -3/2 to -1/2 transitions (hign magnetic field quantum numbers used). The positive sign obtained directly in this work contradicts the previous indirect determination which yielded a negative sign. (Contractor's abstract)

LASER PUMPING TECHNIQUES STUDY, by P. A. Silberg. Final rept. Oct. 1, 1964-Sept. 30, 1965. Oct. 30, 1965 [65]p. incl. illus. diagrs. table, refs. (AFOSR-65-?212) (AF 49(638)1420) AD 632848 Unclassified

In the course of the study of laser pumping techniques. Raytheon developed a reliable calorimeter technique to measure the transfer efficiency of the theta pinch in converting capacitively stored electrical energy to electromagnetic energy. It is shown, with the use of circuit measurements, that the efficient theta-pinch circuit decay consists of a 2-stage circuit decay and that the inefficient theta pinch consists of a 3-stage decay. Using the circuit decay data, a modified transfer efficiency measurement for a 2-stage plasma circuit was developed that is approximately as accurate as the calorimeter technique, but very much faster and easier to make. These measurements have have been used to evaluate the transfer efficiency of the theta-pinch in Argon at pressures of 2 and 5 Torr with different tube sizes and with different coupling impedances. Measurements have shown a transfer efficiency as high as 59% with present measurements. Spectral measurements show that the preionization techniques increase the continuum radiation with the small diameter tubes and are ineffective with the largest diameter tubes used. REACTION RATE STUDIES OF GASEOUS UNIMOLECULAR ISOMERIZATIONS, by F. D. Tabbutt. Final rept. Mar. 1965, 4p. incl table. (AFOSR-65-0581) (AF AFOSR-63-119) Unclassified

Kinetic studies of gaseous unimolecular isomerization were conducted at very high pressures (1 to 280 atm). Thus with very short intervals between collisions the active intermediates could be engaged in a collision that might lead to different products, giving some indication of the nature of the intermediates. The studies were conducted with cyclopropane and cyclobutane. At least 19 products of comparable magnitude were obtained in addition to the major product propylene.

BASIC ATOM CHEMISTRY-SURFACE CATALYZED EXCITATION, by P. Harteck. Final rept. Sept. 1962-Aug. 1964. June 1965, 6p. incl. refs. (AF AFOSR-65-1273) (AF AFOSR-63-174) AD 622583 Unclassified

An investigation was made concerning the production of excited molecules on the surface of a catalyst by recombination of atoms. It was found that catalysts such as nickel and cobalt are effective in producing excited molecules from oxygen and/or nitrogen atoms. Conditioned glass or quartz surfaces also frequently and unexpectedly catalyze the formation of excited molecules. Catalyzed excitation of this type was observed when oxygen atoms were present in the gas phase at a total pressure ranging from a few μ to 1 mm. The excited oxygen molecules, $O_2A^3\Sigma_u^+$ were found to emit the characteristic spectra expected, $O_2A^3\Sigma_u^+ \rightarrow O_2X^3\Sigma_g^- + h\nu$; and in addition to react with various other molecules. Additional catalysis reactions and atom studies made in connection with this work as reported in the literature.

THE CHEMILUMINESCENT REACTION OF OXYGEN ATOMS WITH SULFUR MONOXIDE AT LOW PRESSURES, by T. R. Rolfes, R. R. Reeves, Jr., and P. Harteck. [1965] [5]p. incl. diagrs. tables. (AF AFOSR-63-174) Unclassified

Published in Jour. Phys. Chem., v. 69: 849-8[illegible], Mar. 1965.

The reaction of oxygen atoms with sulfur monoxide results in a visible blue emission, extending into the ultraviolet. The reaction was studied in the low pressure region up to a total pressure of 20 μ where the emission was found to be due to the simple 2 body reaction, $SO + O \rightarrow SO_2 + h\nu$, analogous to the 2 body reaction of nitric oxide and oxygen atoms. The rate coefficient for this reaction was estimated as 7×10^{-16} cm^3/molecule sec. The SO was produced by reaction with O atoms via $COS + O \rightarrow CO + SO$. This reaction could also be used under certain conditions to titrate the oxygen atoms to obtain a quantitative measure of the oxygen atom concentration.

VISCOSITY MEASUREMENTS OF IONIC MELTS AT TEMPERATURES TO 1100°C, by R. D. Reeves and G. J. Janz. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-65-2200) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-181 and Office of Naval Research) AD 625536 Unclassified

Also published in Rev. Scient. Instr., v. 36: 1124-1129, Aug. 1965

An extension of the theory of the oscillating crucible gives an equation in $\eta^{\frac{1}{2}}$ which is particularly useful as an absolute method for viscosity calculation. While more complex in theory, the oscillating crucible possesses useful advantages for high temperatures, namely, the features of a small flat temperature zone, and of a completely sealed sample container. Use of a closely fitting liner in the crucible offers a further advantage in that an exchange of the melt container is possible without any changes in the experimental assembly. Results are reported for a number of "reference" liquids at 25°C and at 440°C (KNO_3), and for $CaCl_2$(785-970°C) and $BaCl_2$ (985-1040°C). An error analysis shows that the precision is extremely sensitive to the decrement δ_m; this appears as the largest error source. An error of viscosity of ±4% is calculated.

OPTIMAL TRAJECTORY, GUIDANCE, AND CONJUGATE POINTS, by I. Lee. [1965] [9]p. incl. refs. (In cooperation with General Electric Research Laboratory, Schenectady, N. Y.) (AF AFOSR-63-279)

Published in Inform. and Control, v. 8: 589-606, Dec. 1965.

Two interesting and important properties of the conjugate points are discussed and illustrated by means of examples. These properties are shown to have significant implications for trajectory and guidance optimization problems. The conjugate point nearest to the initial time determines the maximum duration of an optimal control for a linear process with a quadratic cost functional and for a certain nonlinear process. If there is a conjugate point to the terminal time, then it is not possible to construct the linear, optimal guidance system in a neighborhood of the nominal trajectory. (Contractor's abstract)

In this paper the autnor derives the spectral representation of a function f $L^2[0, a]$ associated with the system $r^2u'' + ru' + (k^2r^2 - \nu)u = 0 (0 < r < a)$, $\alpha u(a) + \beta u'(a) = 0$, where $\alpha f(x)$ is defined by any one of the three following equations: (1) $f(x) = f(x)$, (2) $\alpha f(x) = f'(x)$, or (3) $\alpha f(x) = f'(x) + Zf(x)$ where f and Z are given constants. This gives rise to a type of Hankel transform. This result is then applied to find representations of the solutions of the following problems. (1) $\Delta u + k^2u = 0 (0 < r < a, 0 < \theta < 2\pi)$, with boundary conditions $u(a, \theta) = 0 (0 \leq \theta \leq \gamma)$, $u(r, a) = 0 (0 < r < a)$ and $u(r, 0) = f(r) (0 < r < a)$; (2) $\Delta u + k^2u = F(r, \theta) (0 < r < a, 0 < \theta < 2\pi)$, with boundary conditions $\alpha u(a, \theta) = 0 (0 < \theta < 2\pi)$. The enzymic synthesis of phosphatidic acid, tri-, di- and monoglyceride from L-a-glycerol-phosphate-1, 3-C^{14} is described. On a specific activity basis a fraction from spinach leaves sedimenting at 104,000 x g had the greatest activity. Requirements for ATP, coenzyme A, fatty acid, and a divalent cation were demonstrated, thus suggesting synthesis of phosphatidic acid by the Kennedy-Kornberg pathway. Replacement of glycerol-phosphate with glycerol resulted in a pronounced decrease of incorporation. Activity could be restored by addition of glycerol kinase thus indicating absence of glycerol kinase in these particles. Kinetic studies on the products indicated that phosphatidic acid was the precursor for glycerides. In addition to these products an unknown labeled phosphatide is observed.

PLASTOCYANIN PHOTO-OXIDATION BY DETERGENT-TREATED CHLOROPLASTS, by B. Kok and H. J. R. Ruraiński. [1965] [3]p. incl. diagrs. (AFOSR-65-1517) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)947], National Aeronautics and Space Administration, and National Institute of Health) AD 619224
Unclassified

Also published in Biochem. et Biophys. Acta, v. 94: 588-590, 1965.

The time course was measured of the photo-oxidation of 2 concentrations of plastocyanin, 70% of which was in the reduced state at the beginning of the experiment. Despite a 4.5-fold concentration difference, the initial rate of photo-oxidation is equal in both cases. However, the time required for the conversion to be half completed is ≈ 5-fold longer in the case of high substrate concentration. These kinetics closely resemble those reported for cytochrome F and indicate that the rate is proportional to the ratio (plastocyanin) reduced/(plastocyanin) total. Data were also obtained by recording the time courses of plastocyanin photooxidation for 2 light intensities. The saturation rate as well as quantum yield of the process are proportional to the fraction of the substrate in the reduced form. The most reasonable explanation remains that in photosynthesis, plastocyanin and cytochrome F function 'in parallel', both donating to photosystem I electrons generated in the second, O_2-evolving, photo-act.

FATTY ACID SYNTHESIS BY EXTRACTS OF EUGLENA, by G. M. Cheniae and P. C. Kerr. [1965] [6]p. incl. tables, refs. (AFOSR-65-1518) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)947 and National Institute of Health) AD 619135
Unclassified

Also published in Plant Physiol., v. 40: 452-457, May 1965.

Stearic acid, a major product of fatty acid synthesis by extracts of Euglena, was degraded and shown to be synthesized de novo. Oxidation of products with peracids did not alter subsequent chromatographic behavior thus indicating lack of unsaturation in the products. Avidin did not inhibit incorporation of ^{14}C-acetyl-CoA nor did it alter distribution of products. The fatty acids synthesized were found to occur both in the free and esterified form in approximately equal amounts and with no significant differences in the spectrum of products. The requirement for adenosine triphosphate could not be replaced by adenosine mono- diphosphate but could be partially replaced by other nucleoside triphosphates. The results are discussed on the basis that the phosphoenolate of acetyl-CoA acts as a carbanion for condensations in a variant reaction of the classical malonyl-CoA-acetyl-CoA condensation.

The photochemical activities of cell free preparations of Bishop's Scenedesmus mutant no. 8, of the wild type strain and of spinach chloroplasts was compared. The data were largely consistent with the assumption that the mutant lacks photosystem I of photosynthesis. Whereas high potential oxidants such as ferricyanide and benzoquinone sustained oxygen evolution with good yield, lower potential oxidants were reduced with a poor quantum efficiency. A comparative study of a number of oxidants having different normal potentials was made. A distinct transition from high to low quantum yield occurred at a potential value of E' ≈ + 0.18 volt. It was assumed that this potential is equal or close to the normal potential of the primary photoreductant generated inphotoact II of photosynthesis.

BASIC RESEARCH IN PHOTOSYNTHESIS, by B. Kok. Final rept. Oct. 1, 1960-Dec. 31, 1965 [8]p. incl. refs. (AFOSR-66-0602) (AF 49(638)947) AD 630524 Unclassified

The supported research covered a number of aspects of photosynthesis and related processes. Instrumentation and methodology were developed in the areas of mass spectrometry, sensitive spectroscopy, polarography (O_2 exchange), and further techniques to irradiate photosynthetic materials with high-intensity monochromatic light. The question whether respiration proceeds at the same rate in light as in darkness was studied with different organisms and light of different colors and intensity. It was shown that, depending on the wavelength of illumination, O_2 uptake could be either decreased or enhanced during photosynthesis. Analysis of the 2 photosystems of photosynthesis were also made with isolated spinach chloroplasts. Action spectra have been determined for various chloroplast reaction systems. A long wave chlorophyll component in the chloroplast, which occurs in the low concentration of 1 per 400 total chlorophylls was detected and investigated with the aid of sensitive spectroscopy.

THE REDUCING POWER GENERATED IN PHOTOACT I OF PHOTOSYNTHESIS, by B. Kok, H. J. Rurainski, and O. V. H. Owens. [1965] 10p. incl. diagrs. refs. (AFOSR-66-0838) (AF 49(638)947) AD 639869 Unclassified

Also published in Biochim. et Biophys. Acta, v. 190: 347-356, 1965.

The photoreduction of biologen dyes having E_0' values between -0.32 and -0.74 V was studied with isolated chloroplasts. Compared to ferricyanide, all compounds mediated photosynthetic oxygen evolution and photophosphorylation with equal rate and efficiency. The concentration required for maximum stimulation increased with decreasing normal potential. Under anaerobic conditions, an accumulation of the reduced viologens could be observed directly. Despite the interference of a back reaction with photosynthetically evolved O_2, compounds with $E_0' > -0.55$ could be reduced completely, lower-potential agents partially. It is concluded that the normal potential of the strong reductant, generated in the long-wave photoact of photosynthesis is as low or lower than -0.7V.

ONE-ELECTRON CRYSTAL POTENTIAL AND OPW BAND ENERGY CALCULATIONS FOR KCl (Abstract), by D. Kahn and F. W. Quelle, Jr. [1965] [1]p. [AF 49(638)1017] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 347, Mar. 24, 1965.

A series of programs for the calculation of electron-energy bands of group IV semiconductors written by one of us (FWQ) has been extended to include different types of atoms in the unit cell. The starting potential for this self-consistent calculation scheme includes the perturbation of the free-ion electronic potential by the neighboring ions in the crystal. A comparison of the potential with a potential obtained from a Hartree-Fock-Slater free-ion calculation and a comparison of some preliminary results for the energy gap in KCl are discussed.

PHOTODIFFUSION PHENOMENA IN ADDITIVELY COLORED ALKALI HALIDE CRYSTALS (Abstract), by J. N. Maycock and D. Kahn [1965] [1]p. [AF 49(638)1017] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 348, Mar. 24, 1965.

Photodiffusion studies in illuminated, additively colored alkali halide crystals have demonstrated photodiffusion voltages of several hundred microvolts in a number of alkali halide crystals. Observation of the photodiffusion current with chopped light show a dependence on the chopping frequency that may be correlated with the electron mobility in the crystal. Variation of the initial current density with illumination is shown for several crystals.

The formulation of a theoretical model for photodiffusion in crystals with current blocking contacts is also discussed.

SOME APPLICATIONS OF STOCHASTIC DIFFERENTIAL EQUATIONS TO OPTICAL NONLINEAR FILTERING, by W. M. Wonham. [1965] [23]p. incl. refs. (AFOSR-65-2330) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638) 1206 and National Aeronautics and Space Administration) AD 629271 Unclassified

Also published in SIAM Jour. Control, Ser. A, v. 2: 347-369, 1965.

In control theory it is required to estimate the dynamical state of a physical system on the basis of data perturbed by noise. Solution of the estimation problem is usually immediate if one knows the probability distribution of the system state at each instant of time, conditional on the data available up to that instant. It is thus of interest to ask how this posterior probability distribution evolves with time, and if possible to specify the dynamical structure of a filter (i.e., analog device), which generates the posterior distribution when its input is the time function actually observed. In this paper, filters of this type are defined by means of stochastic differential equations for the posterior distribution in which the observed time function appears as a forcing term. When the function to be estimated is a Markov step process and the noise is white Gaussian, the optimal nonlinear filter equations are discussed in detail. For one example, performance of the optimal nonlinear filter is evaluated numerically and is found to be somewhat better than that of the simpler Wiener filter. The paper concludes with heuristic generalization to a continuous state, and some tentative remarks on the form of the solution.

NEAR OPTIMAL CONTROL IN THE PRESENCE OF SMALL STOCHASTIC PERTURBATIONS, by H. J. Kushner. [1965] [6]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1206 and National Aeronautics and Space Administration) Unclassified

Presented at the Joint Automatic Control Conf., Stanford, Calif., June 24-26, 1964.

Published in Jour. of Basic Eng., v. 87: 103-108, Mar. 1965.

One considers the stochastic system $\dot{x}(t) = f(x(t), u(t)) + \xi(t)$ where $\xi(t)$ is a noise term, with loss criterion $E\int_0^T g(x,u)dt$. A method of computing a correction to the optimal deterministic control, when the effects of $\xi(t)$ are small, is presented. The method is based on some recent works in the stochastic calculus of variations which prove the applicability of a form of the Lagrange multiplier rule and the Hamiltonian formulation to stochastic extremum problems. The method is quite general and is capable of expansion to a greater degree of control correction as the noise effects increase. (Contractor's abstract)

NONLINEAR FILTERING THEORY, by R. S. Bucy. [1965] [1]p (AF 49(638)1206) Unclassified

Published in IEEE Trans. on Automatic Control, v. AC-10: 198-199, Apr. 1965.

A partial differential equation governing the temporal evolution of the conditional density is obtained which seems more rigorous and simpler, with more insight into the structure of the answer than that formally obtained by H. J. Kushner. Linearizing the optimum nonlinear problem leads to quite a different and probably more useful approximate solution. First an abstract representation for the conditional density in terms of a functional of the stochastic integral of various functions with respect to the observed random process is obtained, then using Ito's random calculus a random partial differential equation for the conditional density is obtained. There is a marked departure from the usual procedure of first linearizing and then applying the linear theory.

STABILITY AND POSITIVE SUPERMARTINGALES, by R. S. Bucy. [1965] [5]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1206 and National Aeronautics and Space Administration. Unclassified

Published in Jour. Differential Equations, v. 1: 151-155, Apr. 1965.

The problem considered is the stability of solutions of nonlinear difference equations containing random elements. Guided by the Liapunov theory for deterministic systems, the concepts of a random equilibrium point and stability of a random solution in probability, as well as an almost everywhere or almost sure asymptotic stability, are introduced. These concepts seem the natural counterparts for random systems of the Liapunov theory, with positive supermartingales corresponding to Liapunov functions. The results obtained are roughly as follows. A sufficient condition for stability in probability is the existence of a positive definite continuous function which is a supermartingale along solutions, and for asymptotic stability almost everywhere the existence of a decreasing positive supermartingale."

SEMIRIGOROUS LCAO-MO-SCF METHODS FOR THREE-DIMENSIONAL MOLECULAR CALCULATIONS INCLUDING ELECTRON REPULSION, by J. J. Kaufman. [1965] [5]p. incl. refs. (AFOSR-66-0315) (Sponsored jointly by Advanced Research Projects Agency and Air Force Office of Scientific Research under AF 49(638)1220) AD 629397 Unclassified

Presented at Internat'l Symposium on Atomic and Molecular Quantum Theory, Sanibel Island, Fla., Jan. 18-23, 1965.

Also published in Jour. Chem. Phys., v. 43: S152-S156, Nov. 15, 1965.

A semirigorous LCAO-MO-SCF method including electron repulsion, for 3-dimensional closed-shell molecular calculations has been derived. The method starts with the complete many-electron Hamiltonian (in which interelectronic interactions are included explicitly) and the self-consistent molecular orbital equations of Roothaan, then makes a series of systematic approximations for the integrals involved. There are several different levels of approximation which evolve depending on how restrictive one makes the conditions for neglecting a'(1)a''(1), where a' and a'' are 2 orbitals on atom A; and a'(1)b''(1), where a is an orbital on atom A and b is an orbital on atom B, $A \neq B$, and for neglecting $(a'c'''|G|b''d''')$, where atom D, and A, B, C, D are, in general, different atoms. The approximations for the core operators are defined and the core Hamiltonian matrix elements are presented in detail for several of the levels of approximation. The complete expressions for $F_{a'a'}$, $F_{a'a''}$, and $F_{ab''}$ for closed-shell systems in the 2 simplest of the approximative schemes are included. The salient details of the more complicated schemes (corresponding to lesser and lesser neglect of the interaction of charge distributions) are indicated. These semirigorous LCAO-MO-SCF schemes hold promise for less-than-rigorous yet better-than-empirical calculations for the whole gamut of 3 dimensional molecules from simple inorganics through complicated organics. An analogous treatment with the same approximations for the neglect of certain integrals can also be applied to an open-shell LCAO-MO-SCF procedure. (Contractor's abstract)

MOLECULAR ORBITALS OF DIBORANE IN TERMS OF A GAUSSIAN BASIS, by L. Burnelle and J. J. Kaufman. [1965] [6]p. incl. diagr. tables, refs. (AFOSR-66-0360) (AF 49(638)1220) AD 632224 Unclassified

Also published in Jour. Chem. Phys., v. 43: 3540-3545, Nov. 15, 1965.

The molecular orbitals of diborane have been calculated by the nonempirical SCF-LCAO method, taking all electrons of the molecule into account and calculating exactly all the integrals. The basis functions were Gaussians centered on the various atoms of the molecule. Two sets of Gaussians have been used, the largest one containing 54 functions, distributed as follows: $9s + 3p$ on each boron, and 3s on each hydrogen. The ordering of the molecular orbitals on the energy scale agrees with that found by Newton, Boer, Palke, and Lipscomb who have used an almost optimized minimal STO basis. The calculated total molecular energy, -52.753 a.u., is 0.468 a.u. higher than the experimental value. A value of 12.9 ev is obtained for the ionization potential, which is to be compared with experimental results ranging from 11.9 to 12.1 ev. An electron-population analysis indicates the presence of very small gross atomic charges ($q_B = -0.088e$, $q_{H(bridge)} = 0.002e$; $q_{H(terminal)} = 0.045e$). The overlap populations are as follows: $n(B, B) = 0.064$; $n(B, H_{terms}) = 0.880$, $n(B, H_{bridge}) = 0.345$. These suggest a structure involving practically no bond between the borons, the bonding in the central part of the system being mainly concentrated in 3 center banana bonds. (Contractor's abstract)

LCAO-MO CALCULATIONS ON BORON COMPOUNDS. I. LCAO-MO-SCF CALCULATIONS ON BORAZINES, by O. Chalvet, R. Daudel, and J. J. Kaufman. [1965] [6]p. incl. tables. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1220, Office of Naval Research, and Ordnance Materials Research Office) Unclassified

Published in Jour. Amer. Chem. Soc., v. 87, 399-405, Feb. 5, 1965.

Molecular orbital calculations for borazines using an LCAO technique have been performed in the framework

of the following 3 different approximations: (1) Huckel, (2) Pariser-Parr (without iteration), and (3) Pople (iterated to self-consistency) utilizing the Pariser-Parr approximations for the integrals. Several different theoretical models for choice of input parameters have been utilized. Modified values for boron electron-repulsion integrals, which take into account electron correlation effects, have been calculated for each different choice of theoretical model. Comparison of the calculated LCAO-MO-SCF results for molecular energy levels against known experimental data and examination of the magnitude of the terms of the final SCF Hamiltonian matrix to be diagonalized indicated a reasonable choice for a calculational model. The latest material on nonlinear control theory is presented as it has developed from the direct stability method of Liapunov. The first chapter deals exclusively with dimensions one and two and can be considered elementary. The next 5 chapters present theory from what may be considered the pre-Popov period and leans heavily upon vectors and matrices. The next chapter deals with Popov's contribution, which envolves Fourier transforms and advanced analysis. The last chapter considers a theorem similar to but weaker than Kalman's completion of Popov's second theorem. For the reader, the text presupposes little more than a basic knowledge of standard vector-matrix technique and the existence properties of ordinary differential equations.

Such a system is defined by an "attainability function" $F(x_0, t_0, t)$, which intuitively yields the set of points attainable at time t when starting from x_0 at time t_0 under a suitable control. This set-valued function is subject to natural axioms regarding its semigroup property with respect to t_0, t, continuity in t (in the Hausdorff metric), upper semicontinuity with respect to the initial conditions, etc. It is shown that F may be extended "backward" (t preceding t_0), and various natural extensions of concepts pertaining to dynamical systems, such as invariant sets and stability, are defined. A trajectory of the system is, in a natural sense, a continuous selection of $F(x_0, t_0, t)$ as a function of t. Trajectories play an important role with respect to "weak" invariance of sets and "weak" stability. The latter notion is introduced in this paper: a set is weakly stable if, for x_0 sufficiently near to the set, there exists a trajectory starting at x_0 and remaining suitably near the set. Necessary and sufficient conditions for both strong and weak stability, simple or uniform, are formulated in terms of Ljapunov-like functions.

THE CONDITION OF REGULAR DEGENERATION FOR SINGULARLY PERTURBED LINEAR DIFFERENTIAL-DIFFERENCE EQUATIONS, by K. L. Cooke. [1965] [56]p. incl refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1242. National Aeronautics and Space Administration, and Office of Naval Research)
Unclassified

Published in Jour. Differential Equations, v. 1: 39-94, Jan. 1965.

A necessary and sufficient condition for regular degeneration of a singularly perturbed linear differential equation with constant coefficients

$$\sum_{k=1}^{n} c_k \varepsilon^k u^{(k+m)}(t) + \sum_{j=0}^{m} a_j u^{(j)}(t) = 0$$

is that all the roots of an auxiliary polynomial $\theta_R(z) = a_m + \sum_{k=1}^{n} c_k z^k$ have negative real parts. By

regular degeneration one means, roughly speaking, that as $\epsilon \to 0^+$ the solution of the perturbed equation approaches the solution of the unperturbed equation $\sum_{j=0}^{m} a_j u^{(j)}(t)=0$ on any finite interval, and the exponential order as $t \to +\infty$ of the former approaches the exponential order of the later. The author gives an example illustrating that for singularly perturbed linear differential-difference equations with constant coefficients, of the form

$$\sum_{k=1}^{n} \epsilon^k [c_k(\epsilon)u^{(k+m)}(t) + d_k(\epsilon)u^{(k+m)}(t-1)]$$

$$+ \sum_{j=0}^{m} [a_j(\epsilon)u^{(j)}(t) + b_j(\epsilon)u^{(j)}(t-1)] = f(t, \epsilon),$$

where $a_j(\epsilon) \to a_j$, $b_j(\epsilon) \to b_j c_k(\epsilon) \to c_k$, $d_k(\epsilon) \to d_k$, $f(t, \epsilon) \to f(t, 0) = f(t)$ as $\epsilon \to 0^+$, the same condition does not ensure the preservation of exponential order. The author then goes on to prove that such a condition does, in fact, ensure convergence over finite intervals, and formulates a much stronger criterion for regular degeneration for his differential-difference equation. This criterion reduces to the simpler one for the case of ordinary differential equations, and also to the conditions formulated by A. Halanay.

HEREDITARY DEPENDENCE IN THE THEORY OF DIFFERENTIAL EQUATIONS-PART I, by G. S. Jones. Jan. 1965, 42p. incl. refs. (In cooperation with Maryland U., College Park) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1242, National Aeronautics and Space Administration and Office of Naval Research) AD 610842 Unclassified

A general class of differential equations with hereditary dependence is introduced which includes most equations of hereditary type encountered in applications with the notable exception of equations of neutral type. Furthermore, the class introduced allows the development of a strong and tractable qualitative theory closely resembling that of ordinary differential equations. Much of the linear analysis and the stability theory as developed by J. K Hale for a more restricted class of hereditary equations carries over directly. However, only results associated with existence and uniqueness of solutions and dependence on initial data and parameters are considered herein

NUMERICAL ANALOGS TO THE SCHWARZ ALTERNATING PROCEDURE, by K Miller [1965] [13]p incl. diagrs. (AFOSR-66-0048) (AF AFOSR-62-233) AD 630897 Unclassified

Also published in Numerische Math. v. 7: 91-103, 1965.

The classical alternating procedure of H. A. Schwarz is a suitable method for solving the Dirichlet problem in the union of 2 overlapping domains $R=R_1 \cup R_2$, provided that the Dirichlet problem in a domain R of the domain R_1 and R_2. The author attempts a numerical method for the Dirichlet problem in a domain R of the above type, discretizing the independent variables, he gives an alternating iteration process. Under 4 formal hypotheses, he proves the convergence and stability of his method, and further, gives the rate of convergence for several examples, e.g., for 2 overlapping rectangles, or an overlapping disc and rectangle. In all examples, the 4 formal hypotheses are certainly satisfied. Although the author treats only Laplace's equations in the plane for simplicity, the method is equally effective for uniformly elliptic equations with an arbitrary finite number of variables. (Math. Rev. Abstract)

SOME PROBLEMS IN NUMERICAL ANALYTIC CONTINUATION, by J R. Cannon and K. Miller (1965) [12]p. (AFOSR-66-0055) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-233 and Atomic Energy Commission) AD 631132 Unclassified

Also published in SIAM Jour. Numer. Anal., Ser B, v. 2. 87-98, 1965.

The paper is concerned with methods of approximate numerical analytic continuation of a bounded analytic function on a disc D. Three problems are considered. In the first case, f(z) is approximated at a finite number of points in D. In the second, f and its derivatives of orders $\leq q$ are approximated at a single point z_0 in D. In the third case, f and its derivatives of order $\leq q$ are given at a finite set of points z_j in D. Error estimates are given and an approximating polynomial is determined by a linear programming problem. (Math. Rev. abstract)

THREE-DIMENSIONAL WINGS OF MINIMUM TOTAL DRAG IN NEWTONIAN FLOW, by D. G. Hull and A. Miele. [1965] [7]p. (AFOSR-65-2087) (AF AFOSR-65-828) AD 627668 Unclassified

Also published in Jour. Astronaut. Sci., v. 12: 39-45, 1965.

The problem of minimizing the drag of a slender, 3-dimensional wing in hypersonic flow is considered under the following assumptions: the wing has 2 planes of symmetry; the wing is slender in both the chordwise direction and the spanwise direction; the span is prescribed; the thickness along the leading edge is zero; the angle of attack and the sideslip angle are zero; the pressure distribution is Newtonian, and the skin-friction coefficient is constant. The indirect methods of the calculus of variations in two independent variables are employed, and the minimum drag problem is solved for various conditions. If the volume is free while the trailing edge thickness distribution is given, the optimum surface is obtained by joining corresponding points of the leading edge and the training edge with straight lines, on the other hand, if the volume is given while the trailing edge thickness distribution is free, the optimum surface is obtained by joining corresponding points with a curve such that the complements of the locally normalized coordinates satisfy at 3/2-power law. The above results are valid regardless of the conditions imposed on the planform shape and the planform area. For all of the cases considered, analytical expressions are obtained for the aerodynamic drag and the drag coefficient.

THREE-DIMENSIONAL CONFIGURATIONS OF MINIMUM TOTAL DRAG IN NEWTONIAN FLOW, by D. G. Hull. [1965] [5]p. incl. diagrs. refs. (AFOSR-66-0050) (AF AFOSR-65-828) AD 641238 Unclassified

Also published in Jour. Astronaut. Sci., v. 12: 83-87, 1965.

Variational problems associated with 3 dimensional configurations (wings, bodies, and wing-body combinations) are considered, and the minimum drag problem is solved under the assumption that the base area and the wetted area are given while the length and the volume are free. The following hypotheses are employed: The configuration has 2 planes of symmetry; the angle of attack and the sideslip angle are zero; the pressure distribution is that pertaining to Newtonian flow; and the friction coefficient is constant. It is shown that the optimum configuration is governed by a first order, nonlinear, partial differential equation, and its general solution is presented in parametric form. Furthermore, the aerodynamic drag depends on the base area and the wetted area but is independent of the base shape; therefore, the optimum configuration is not unique. As a particular case, homothetic configurations are considered, (that is, configurations whose transversal contours are geometrically similar to the contour of the base), and the associated optimum geometries are determined.

EXTREMAL PROBLEMS IN AERODYNAMICS, by A. Miele. [1965] [13]p. incl. refs. (AFOSR-66-0196) (AF AFOSR-65-828) AD 468758 Unclassified

Presented at Symposium on the Mathematical Theory of Optimal Control, Michigan U., Ann Arbor, Oct. 5-7, 1964.

Also published in SIAM Jour. Control, Ser. A., v. 3: 129-141, 1965.

The advent of jet and rocket engines as aircraft propulsion systems and the parallel increase in flight velocities and altitudes have made it necessary to extend the optimization of aerodynamic shapes to a wider range of mach and Reynolds numbers, thereby including the hypersonic and free-molecular flow regimes. Since the distributions of pressure and skin-friction coefficients depend on the flow regime, a single optimum body does not exist; rather, a

succession of optimum configurations exists, that is one for each flow regime and each set of free-stream conditions. In addition, the optimum geometry depends on the quantity being extremized (aerodynamic drag, lift-to-drag ratio, surface integrated heat transfer rate, sonic boom of an aircraft, thrust of a nozzle, as well as the constraints employed in the optimization process, whether geometric quantities (length, thickness, volume, wetted area, planform area, frontal area) or aerodynamic quantities (lift, bending, moment, pitching moment, position of the center or pressure). The physical models of interest in the theory of optimum aerodynamic shapes are reviewed. The corresponding mathematical models are illustrated for problems involving one independent variable and for problems involving two independent variables. Finally, new trends in the theory of optimum aerodynamic shapes as well as certain problems of interest in the immediate future are outlined.

DETECTABILITY OF LUNAR X-RAYS, R. C. Haynes and R. D. Juday [1965] [6]p. incl. diagr. table, refs. (AFOSR-66-0796) (AF AFOSR-65-858) AD 641543 Unclassified

Also published in Planetary and Space Sci., v. 13: 1249-1254, 1965.

Several theories that imply the generation of x-rays by the moon were examined. The x-ray fluxes to be expected at the top of the earth's atmosphere were estimated and compared. For example, it was found that an x-ray flux is to be expected when the moon is full and K_p high, as a consequence of the configuration of the auroral electrons in space deduced from the long tail model of the magnetosphere. The x-ray photons are caused by energetic electrons in the tail that bombard the lunar surface. Alternatively, Gold has suggested that lunar x-rays are produced by the bombardment by solar-wind electrons; this results in a lunar phase dependence that is different from the long tail model. The background is discussed and it is concluded that the lunar x-ray flux may be detectable. Experiments of this kind may provide useful tools for investigating the models. (Contractor's abstract)

RADIOACTIVITY IN SUPERNOVA REMNANTS, by D. D. Clayton and W. L. Craddock. [1965] [12]p. incl. diagrs. tables, refs. (AFOSR-65-1824) (AF AFOSR-65-855) AD 625688 Unclassified

Also published in Astrophys. Jour., v. 142: 189-200, July 1, 1965.

The theory is considered that the nearly exponential decrease after the first 100 days of the light-curves of Type I supernovae is due to nuclear energy released by the spontaneous fission of Cf^{254}. Uncertainty of the correctness of the Cf-hypothesis qualifies any interpretation of (1) supernovae light-curves, (2) the location and mechanism of heavy-element nucleosynthesis by rapid neutron captures, and (3) the present-day energy balance in supernova remnants. It is demonstrated that, if the Cf-hypothesis is correct, the Crab Nebula presently has a radioactive energy input of 1.2×10^{36} ergs sec, of which amount 92% is in the form of kinetic energy of heavy ions. That much energy would be significantly related to observed properties of the nebula. An experimental test of the Cf-hypothesis may be made by searching for gamma-ray lines associated with transbismuth radioactivity. The anticipated line spectrum is complex. The strongest line flux is 9.7×10^{-5} cm^{-2} sec^{-1} from the Crab for the 390-kev line of Cf^{249}. Good angular and energy resolution will be required to resolve the lines from the sky background.

PHOTON-INDUCED BETA DECAY IN STELLAR INTERIORS, by P. B. Snaw, D. D. Clayton, and F. C. Micnel. [1965] [8]p. incl. diagrs. refs. (AFOSR-66-0432) (AF AFOSR-65-855) AD 630449 Unclassified

Also published in Phys. Rev., v. 140. B1433-B1441, Dec. 6, 1965.

Because of the astrophysical importance of beta-decay lifetimes in stellar interiors, calculation was made of the rate of photon-induced beta decay ("photobeta" decay). In the photobeta process the photon can be considered to decay virtually into an electron-positron pair, with the positron being absorbed by the nucleus. The photobeta process is in competition with normal beta decay (if energetically possible), excited-state beta decay, and free-positron capture. An infrared divergence problem for exothermic photobeta decay is discussed, although the exothermic photobeta is is too small to enhance most spontaneous beta decays. Applications are discussed in the driven decay of stable nuclei. As an example, the photobeta lifetime of a nucleus stable by 200 kev drops from 3×10^{10} yr at 3×10^8 K, to 10^5 yr at 1.2×10^9 K for a nuclear transition matrix element characterized by log ft 6 The competition between the photobeta process and excited-state beta decay is discussed. THE PHOTOCHEMISTRY OF METHYL ISOPROPYL KETONE, by A. Zahra and W. A. Noyes, Jr. (1965] [6]p. incl. diagrs tables, refs. (AFOSR-65-0884) (AF AFOSR-63-206) AD 618346 Unclassified

Also published in Jour. Phys. Chem., v. 69 943-948, Mar., 1965.

The photochemistry of methyl isopropyl ketone

(3-methyl-2-butanone), is contrasted with that of 2-pentanone since the former, as distinguished from the latter, may not undergo a Norrish Type II reaction. The main reactions are those expected from photochemical dissociation into radicals but there occurs almost certainly some direct dissociation into acetaldehyde and propylene by a process designated by Norris as Type III. By the addition of oxygen and of biacetyl it is shown that a triplet state as well as a singlet state must be considered in any detailed mechanism of the photochemistry of this ketone. Some suggestions are made as to the role each one plays. Analyses were performed for carbon monoxide, methane, ethane, propylene, and propane. The propylene always exceeds the propane so that these 2 gases are not formed solely by disproportionation of isopropyl radicals.

THE FLUORESCENCE OF BENZENE AND BENZENE-d_6, by J. A. Poole. (1965) [5]p. incl. tables, refs. (AFOSR-65-1256) (AF AFOSR-63-206) AD 621469 Unclassified

Also published in Jour. Phys. Chem., v. 69: 1343-1347, Apr. 1965.

A study was made of the quantum yields of fluorescence of benzene and benzene-d_6 in the pressure range 5-15 mm and at the temperatures 30, 60, and 90°C. The exciting lines were monochromatically chosen to correspond to the transition $^1B_{2u} \leftarrow {}^1A_{1g}$. The yields for benzene-d_6 exceeded those for benzene in all cases. The Stern-Volmer plots showed a small but finite slope, and the addition of 80 mm of cyclohexane resulted in a decrease in fluorescence yield except in the case of benzene at 30 C where no such decrease was observed. The high values for the emission yields of biacetyl, sensitized by the benzenes, at 30 C substantiates the hypothesis that the primary process involving $^1B_{2u}$ removal is intersystem crossing to the $^3B_{1u}$ state. The energy required for this process is about twice the difference in zero point energies for benzene and benzene-d_6. Thus, intersystem crossing seems to depend upon vibrational energy content. The fluorescence yields decreased with increasing temperature and decreasing wave length of the exciting line. The nonradiative process involving intersystem crossing appears to be faster for the light benzene.

ON THE BESSEL-FUBINI AND FAY SOLUTIONS FOR PLANE, FINITE-AMPLITUDE WAVES, by D. T. Blackstock. [1965] [4]p. incl. diagrs. (AFOSR-65-2481) (AF 49(638)1320) AD 627957 Unclassified

Presented at Fifth Cong. Internat'l. Acoustic, Liege (Belgium), Sept. 7-14, 1965.

The problem of a plane, originally sinusoidal sound wave of finite amplitude is considered here. Two excellent approximate solutions are regarded as classics. The Bessel-Fubini (1) solution holds prior to shock formation, i.e., in the region $\sigma < 1$, whereas, Fay's (2) analysis pertained to the region where the shocks have already become fully formed and are slowly decaying. In other words (1) holds near the source and (2) rather far from the source. There is a gap, called the transition region, not covered by either. This paper presents a more general solution containing both as limiting cases and covers the transition.

STABILITY OF MAGNETOHYDRODYNAMIC SHOCKS (Abstract), by M. Lessen and N. Deshpande [1965] [1]p. (Bound with AFOSR-65-1266; AD 622527) (AF 49(638)1540) Unclassified

Presented at Eighth AFOSR Contractor's meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

The stability of plane magnetohydrodynamic shocks in perfectly conducting plasma is investigated in a coordinate system that moves with the shock. The plane of the shock coincides with the y-z plane and the flow is in the x direction with an applied magnetic field in the z direction. The flow is disturbed about the steady state, and the space and time dependence of the disturbance is assumed to be of the form $\exp[i(\alpha_1 x + \alpha_2 y - \beta t]$. Three-dimensional perturbations are considered. The dispersion relation has two branches, one corresponding to the fast waves and the other to the swept wave. Gardner and Kruskal investigated the stability of such shocks, but they did not consider the swept wave. They concluded that the shocks are stable. A solution, corresponding to the fast wave and the swept wave for the downstream region of the shock is obtained. There is no perturbation ahead of the shock. The matching of the solution at the shock gives the allowable disturbance frequencies. It is observed that there exists a growth rate. Shocks

in "cold plasmas" as well as in "hot plasmas" are considered. It is found that the cold plasma shocks are unstable for all Alfven Mach numbers; hot plasma shocks are unstable for large gasdynamic Mach numbers and small Alfven Mach numbers, but are stable for small gasdynamic Mach numbers and large Alfven Mach numbers. These Mach numbers are referred to the downstream region of the shock.

CROSS-EXAMINING PROPOSITIONAL CALCULUS AND SET OPERATIONS, by J. F. Randolph. [1965] [11]p. incl. diagrs. refs. (AFOSR-65-0863) (AF AFOSR-64-481) AD 617475 Unclassified

Also published in Amer. Math. Monthly, v. 72: 117-127, Feb. 1965.

The purpose of this paper is to give an operational method for obtaining the truth value column of a compound proposition without writing any other column of the truth table. This is accomplished by using a combination of crosses and dots in such a manner as to greatly simplify operational steps. As well as making computation shorter and easier, the notation reveals pertinent facts about a proposition much as the graph of an equation displays properties of the equation.

PLASMA DENSITY AHEAD OF PRESSURE DRIVEN SHOCK WAVES, by L. B. Holmes. May 1965, 181p. incl. diagrs. tables, refs. (Technical note no. 1) (AFOSR-65-0974) (AF AFOSR-65-478) AD 622569 Unclassified

The electrical precursor has been investigated in the present experiment using external potential probes in conjunction with a solenoidal magnetic field, and using internal collecting probes which sample electron and ion densities next to the probe. Potential probe experiments in conjunction with a solenoidal magnetic field show that the electrostatic precursor signal is due in part to radial diffusion of electrons to the wall of the shock tube. A theory is presented for the diffusion fusion of the electrons and ions to the grid of the probe and for the motion of the charged particles inside the probe. This theory relates the collected currents to the plasma density in the shock tube. The sensitivity of the collecting probe is such that densities from 10^9 cm^{-3} to 10^{13} cm^{-3} can be measured. The evidence of the existence of a neutral plasma and the high velocity of propagation of the precursor strongly suggests that the gas ahead of the shock wave is photoionized. It is established that multiple step photoionization produces the plasma.

THE ENERGY DEPENDENCE OF THE ABUNDANCE OF LITHIUM, BERYLLIUM, AND BORON IN THE PRIMARY COSMIC RADIATION: OBSERVATIONS AT FORT CHURCHILL, by G. D. Badhwar, S. N. Devanathan, and M F. Kaplon. [1965] [13]p incl. diagrs. tables, refs. (AFOSP-65-1779) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-439 and National Aeronautics and Space Administration) AD 608770 Unclassified

Also published in Jour. Geophys. Research, v. 70 1005-1017, Mar. 1, 1965.

The relative abundances of lithium, beryllium, boron, and the S-group nuclei have been determined at 2 different energies by means of a pure nuclear emulsion

stack flown from Fort Churchill, Canada (- 70.5), on Aug. 4, 1962, under a total of 4.7 g/cm^2 of residual atm. The ratio of the L to S nuclei, T_{LS}, at the top of the atm between 200 and 70 mev/n and > 700 mev/n was determined to be 0.41 ± 0.08 and 0.19 ± 0.03, respectively. The results of both the absolute flux values of L- and S-group nuclei, as well as their ratios, are in accord with other investigations. Combined with the evidence from the measurements of T_{He_3He} in the same stack, results indicate that low energy cosmic ray nuclei have traversed about twice as much hydrogen as high energy particles. The results rule out an accelerating mechanism of the Fermi type but can be explained by a source-trapping mechanism.

THEORY OF OPTICAL ABSORPTION BY VIBRATION OF DEFECTS IN DIAMOND, by R. J. Elliott and P. G. Dawber. [1965] [6]p. incl. diagrs. refs. (AFOSR-65-1967) (AF AFOSR-64-611) AD 626495 Unclassified

Also published in Lattice Dynamics; Proc. Internat'l. Conf., Copenhagen (Denmark) (Aug. 5-9, 1963), New York, Pergamon Press, 1965, p. 479-484.

The optical absorption due to the creation of single phonons is calculated for the perturbed vibrations around a defect of a type thought to occur in type I diamonds. A simple model is taken for the defect consisting of a single layer of nitrogen atoms in a (100) plane, sharing their extra electron with a neighboring layer of carbon atoms. Using as a parameter the weakening of the force constant between these layers, reasonable agreement is achieved with the strongest observed peaks. Some other aspects of the spectrum indicate, however, that the model is not completely adequate.

DETAILED BALANCE IN OPTICAL TRANSITIONS IN MOLECULES AND SOLIDS, by W. B. Fowler and D. L. Dexter. [1965] [5]p. incl. diagr. refs. (AFOSR-65-2092) [AFOSR-64-611] AD 627483 Unclassified

Also published in Jour. Chem. Phys., v. 43: 1768-1772, Sept. 1, 1965.

Recent theoretical and experimental work has shown that the simplest form of the Einstein equation relating induced absorption and spontaneous emission probabilities (characterized by τ and τ^{-1} is not generally valid for impurities or color centers in solids, liquids, or molecules. Separate computations of these probabilities in systems exhibiting sizeable Stokes's shifts resolve some of the problems, they also disclose the difficulties involved in obtaining any connection between τ and τ. Here is considered how the transition probabilities between a pair of electronic-vibrational states are related. Observable quantities, i.e., integral absorption cross section and the radiative decay time, involve sums and averages over the vibrational states, and no definite theoretical information relates these quantities. However, there is a simple connection between induced and spontaneous emission probabilities. New experiments which could yield information about the rate of lattice relaxation are suggested from this point of view. (Contractor's abstract)

COHERENCE PROPERTIES OF OPTICAL FIELDS, by L. Mandel and E. Wolf. [1965] [57]p. incl diagrs. refs. (AFOSR-65-2057) (Sponsored jointly by Air Force Cambridge Research Laboratories, Air Force Office of Scientific Research under AF AFOSR-65-237, and Army Research Office (Durham)) AD 627733 Unclassified

Also published in Rev. Modern Phys., v. 37: 231-287, Apr. 1965.

A review is presented of coherence properties of electromagnetic fields and their measurements, with special emphasis on the optical region of the spectrum. Analyses based on both classical and quantum theories are described. The measure of second-order coherence is introduced and some important effects studied. The general statistical description of an optical field is discussed in both the classical and quantum theories, and the generalized phase-space distribution function is found to lead to a formal similarity between the two. The most important higher-order effects are considered, including the Hanburg Brown-Twiss effect. Various transient interference and beat effects produced by independent light beams are also discussed.

LIGHT FLUCTUATIONS AS A NEW SPECTROSCOPIC TOOL, by E. Wolf. [1965] 14p. incl. diagrs. refs. (AFOSR-66-0394) (AF AFOSR-65-237) AD 629929 Unclassified

Presented at Conf. on Photographic and Spectroscopic Optics, Tokyo and Kyoto, Sept. 7-8, 1964.

Also published in Japan Jour. Appl. Phys., Suppl. 1, v. 4: 1-14, 1965.

In the first part of this lecture, basic concepts relating to the theory of light fluctuations are presented and some features which distinguish the fluctuation properties of thermal and laser light are mentioned. A survey is then made of various new techniques proposed by many authors, for obtaining information about spectra from fluctuation and correlation measurements. In particular, intensity correlation interferometry, photon coincidence methods and pulse counting techniques are reviewed. Current researches

relating to the determination of the phase of the second order complex degree of coherence — the knowledge of which is of importance for an unambiguous determination of asymmetric spectral profiles from some of these experiments—is also discussed. Theoretical methods for obtaining this phase information utilize the analytic properties of coherence functions. Proposed experimental methods make use of the technique of the coherent background and of three point correlation measurements. Finally the notion of spectral correlation function is introduced and it is shown how it is related to higher order coherence functions. The possibility of obtaining some information about spectral correlation from multiple photon coincidence experiments is also mentioned.

COSMIC γ RADIATION (Abstract), by G. H. Share. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-237] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 14, Jan. 27, 1965.

Previous balloon borne experiments with a Cerenkov-scintillation telescope indicated an isotropic extrapolated flux of $(5.5\pm0.7)\times10^{-3}\gamma/cm^2 \cdot sr \cdot sec$ produced by γ-rays converting in lead. More-sophisticated models of this detector were flown in 1963 and 1964, making use of simple pulse-height analysis and a cylindrical side-shower guard counter. The 1963 flights from Texas confirm the above flux in the unguarded channel. A lower limit to the isotropic extrapolated γ-ray flux is set at $6\times10^{-4}\gamma$ cm·sr·sec. The 1964 flight was launched from a higher geomagnetic latitude such that the extrapolated charge-particle flux increased by a factor of 2.5 over the 1963 value. Preliminary analysis of the initial ascent indicates that the extrapolated unguarded γ-ray flux is the same as in 1963 ($\phi_{63}=6.5\pm0.6$ counts/min, $\phi_{64}=7.1\pm1.6$ counts/min). A guarded channel that detects both pair-produced electrons in two of the telescope counters yields an extrapolated flux of $(8\pm2)\times10^{-4}\gamma/cm^2 \cdot sr \cdot sec$.

A NEW PHASE-SPACE DISTRIBUTION FUNCTION IN THE STATISTICAL THEORY OF THE ELECTROMAGNETIC FIELD, by Y. Kano. [1965] [3]p. incl. refs. [AF AFOSR-65-237] Unclassified

Published in Jour. Math. Phys., v. 6: 1913-1915, Dec. 1965.

In a previous paper a certain new probability distribution function q(z) relating to blackbody radiation was introduced. In the present paper the properties of this function for a general radiation field are studied. Unlike the phase-space distribution function of Sudarshan (1963), this function is nonnegative and is an ordinary function. A series expansion for q(z) is given, and it is shown that the series is absolutely convergent for all eigenvalues z of the destruction operator. It is also shown that the density matrix in the Fock representation can be uniquely determined from this probability distribution function, and vice versa. The relation between q(z) and the Sudarshan's phase-space distribution function is discussed. (Contractor's abstract)

NEW CHARACTERISTIC OF HIGH-ENERGY INTERACTIONS (Abstract), by M. L. Shen and M. F. Kaplon. [1965] [1]p. [AF AFOSR-65-439] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 14, Jan. 27, 1965.

By applying a new method for determining the primary energy of cosmic-ray jets to the analysis of the interactions of the nucleonic particles emerging as fragmentation products of heavy nuclei with energies of the order of 1000 bev/nucleon, it has been observed that the γ_0 (the Lorentz factor of the c m system) values of the fragments belonging to the same break-up process show special ratios among themselves. This can be explained in terms of a new characteristic of high-energy interactions: namely, the coherent interaction of the incoming particle with the nuclear cluster inside the emulsion nuclei. Thus, the impulse approximation does not appear to be valid in this high-energy region and the momentum transfer will take place between the entire incoming particle and the entire target particle. This new phenomena probably is due to the increase in the interaction range in very high-energy nucleon-nucleon collisions and may reflect certain consequences of the multiperipheral model of multiple production.

TRAPPED EXCITONS IN DILUTE RARE-GAS ALLOYS, by G. Baldini. [1965] [6]p. incl. diagrs. table, refs. (AFOSR-65-1112) [AF AFOSR-63-236] AD 612546 Unclassified

Also published in Phys. Rev., v. 137. A508-A513, Jan. 18, 1965.

The ultraviolet absorption spectra of Ar, Kr, and Xe diluted in Ne, Ar, and Kr, have been measured at 6±2°K. The several peaks observed are ascribed to perturbed atomic resonances and transitions to Rydberg states of the impurities. An empirical relation suggests that the modes of vibration of the impurities in the host-lattices are partly responsible for the half-widths of the peaks.

Also published in Phys. Rev., v. 140: A906-A910, Nov. 1, 1965.

The line shape of the 1s-2p transitions of substitutional H and D atoms in solid argon has been analyzed on the basis of a "four-mode model." The impurity is treated as interacting (semiclassically) with a linearly coupled "breathing mode" and with three localized quadratically coupled modes. A full quantum-mechanical treatment of the latter is essential. The experimentally observed isotope shift of the peak is fitted and part of the isotopic width change accounted for by this model. Local-mode infrared absorptions at 0.033 and 0.023 ev are predicted for Ar:H and Ar:D, respectively. It is shown that the relatively high concentration of H (or D) impurities used (2%) simultaneously accounts for the additional width change and the low-energy tail of the spectrum. Excitation energies for the 1s-2p transitions of H atoms trapped at octahedral or tetrahedral interstitial sites are computed using a tight-binding model which was previosuly used to predict the excitation energy for the substitutional site. Within computational accuracy the transitions are found to take place at the same energy as that for substitutional atoms. Although it seems unlikely that interstitials are present in Baldini's work (here analyzed), experiments to verify their absence are suggested. Experimental measurement of the concentration dependence of the linewidths and the intensity of the low-energy tail will provide useful checks of the model. (Contractor's abstract)

ISOTOPE EFFECTS IN THE U BAND (Abstract), by G. Baldini. [1965] [1]p. [AF AFOSR-65-236]
Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 77, Jan. 27, 1965.

The study of the U band in KCl, KBr, and RbCl crystals containing H^- and D^- ions has revealed interesting isotope effects. At liquid-helium temperature, the half-widths of the U_H band and from 3%-16% larger than those of the U_D band in the three crystals investigated. At all temperatures, from 4° to 400°K the peak positions of the U_H band occur at energies ~ 0.02 ev smaller than those of the U_D band. The different half-widths, observed at low temperatures, are attributed to the local vibrational mode introduced by the two isotopes and the peak shift is accounted for in terms of different zero-point energies for the U_H and U_D center. It has been observed also that the U band is not single by a few components, with a spacing of approximately 0.1 ev, appear in both the U_H and U_D band. It is suggested that lattice vibrations can change the cubic symmetry of center enough to remove the degeneracy of the p-like excited state of the center and produce the observed structure.

RESEARCH ON MAGNETO-GASDYNAMICS, by D. C. Pack. Final scientific rept. Feb. 15, 1965, 4p. (AFOSR-65-1069) (AF EOAR-64-6) AD 618296
Unclassified

An analysis was made of the rectilinear, adiabatic but non-isentropic, unsteady flow of a perfectly conducting ideal gas moving in the presence of a transverse magnetic field. Detailed properties of certain generalized simple waves were obtained. The upstream influence effects in the flow of a perfectly conducting fluid over an insulating wall were found on the basis of linearized theory. The question of the physical realization of the solutions found by Cabannes for flow of perfectly conducting gas past a wedge in a magnetic field aligned with the stream was examined by a combination of analytical and neuristic arguments. Magneto-gasdynamic deflagrations under the Chapman-Jouguet condition were studied and work has been initiated on similarity solutions for cylindrical megneto-gasdynamic detonations and flames.

UPSTREAM INFLUENCE EFFECTS IN THE FLOW OF A CONDUCTING FLUID OVER AN INSULATING WALL, by G. W. Swan. [1965] [13]p. incl. diagrs. (AFOSR-65-1362) (AF EOAR-64-6) AD 621284
Unclassified

Also published in Quart. Jour. Mech. and Appl. Math., v. 28(Pt. 2): 243-255, May 1965.

In magnetogasdynamics, the 2-dimensional steady supersonic flow of a perfect gas past a straight-edged wall is complicated in situations where disturbances not only propagate upstream in the gas but propagate in all directions in the solid wall. An analysis is presented of an infinitely conducting, non-viscous perfect gas moving over a stationary non-conducting wall of infinite extent with a uniform magnetic field orientated at right angles to the flow. The special case is considered where the flow everywhere is uniform and the disturbances are created only at the boundary between the gas and the nonconducting solid. The analysis is then extended to a flow with the magnetic field orientated at an arbitrary angle to the stream.

ANISENTROPIC ONE-DIMENSIONAL UNSTEADY MATNETOGASDYNAMIC FLOW, by J. B. Helliwell. [1965] [18]p. incl. refs. (AFOSR-66-0049) (AF EOAR-64-6) AD 639527 Unclassified

Also published in Jour. Math. and Mech., v. 14: 523-540, July 1965.

The investigation relates to the rectilinear adiabatic but non-isentropic flow of a perfectly conducting ideal gas with constant polytropic index moving in the presence of a transverse magnetic field. The influences of viscosity, heat conduction and radiation are all supposed negligible. As an example of such a flow one may consider the situation arising when an expansion wave overtakes and interacts with a shock wave thereby causing it to decay. The exact equations of nonisentropic magnetogasdynamic flow are discussed and alternative forms of the characteristic equations derived. It is shown that by the use of Naylor's modified stream function the general problem may again be reduced to the solution of a single quasi-linear partial differential equation which, as a generalization of the case of ordinary gasdynamics, possesses special integrals only for suitable distributions of both the entropy and magnetic field strength. Solutions analogous to Martin and Ludford's degenerate 'simple wave' forms are also discussed.

MAGNETOGASDYNAMIC DEFLAGRATION UNDER THE THE CHAPMAN-JOUGUET CONDITION, by A. R. Gordon and J. B. Helliwell. [1965] [8]p. incl. diagrs. (AFOSR-66-0213) (AF EOAR-64-6) AD 639526 Unclassified

Also published in Jour Fluid Mech., v. 23: 779-786, 1965.

An investigation is made into the propagation of a one-dimensional combustion wave, which consists of a flame front and a precursor shock wave which pass down a tube closed at one ene, in the presence of a transverse magnetic field in the undisturbed gas at rest. The snock wave is assumed to be of sufficient strength to ionize completely the initially non-electrically-conducting gas and the conditions at the flame front are taken to satisfy the Chapman-Jouguet condition. Details of the solution are compared with the corresponding results for ordinary gasdynamic defiguration.

THE STABILITY OF ATTACHED SHOCK WAVES IN MAGNETOGASDYNAMIC FLOW PAST A WEDGE, by D. C. Pack and G. W. Swan. [1965] [7]p. incl. diagrs. (AFOSR-66-0658) (AF EOAR-65-58) AD 639859 Unclassified

Also published in Jour. Inst. Matn. and its Appl., v. 1: 317-322, Dec. 1965.

The question of the physical significance of the new phenomena indicated by Cabannes' work on magnetogasdynamic flow past a wedge is considered from the point of view of the stability of the shock waves. Analytical and heuristic reasons are given suggesting that downstream-facing shocks are stable if the upstream flow is supersonic and unstable if it is subsonic, while upstream facing shocks are always to be considered unstable.

TECHNIQUES FOR CALORIMETRIC TITRATIONS IN THE SEMI-MICRO RANGE. PART I. APPARATUS. A SENSITIVE, AUTOMATICALLY RECORDING QUASI-ISOTHERMAL CALORIMETER, by S. Johansson. [1965] [21]p. incl. diagrs. tables, refs. (AFOSR-65-1649) (AF EOAR-63-8) AD 624325 Unclassified

Also published in Arkiv Kemi, v. 24: 189-209, 1965.

An isothermal-jacket calorimeter suitable for the measurement of small heat effects is described. The apparatus is normally used for incremental calorimetric titrations in solution chemistry. The temperature measuring system consists of a conventional Wheatstone bridge with a thermistor assembly in one of the arms. The unbalance voltage is amplified and fed into a recorder which describes the temperature-time curve. The performance of the calorimeter is nearly isothermal but also nearly adiabatic for the heat effects normally encountered. The resulting temperature rise of the system is less than 0.0$\frac{1}{2}$ degrees. The normal temperature sensitivity is about $\pm 2.10^{-5}$ degrees corresponding to ± 0.02 J., which is

close to the practical limit set by the temperature inhomogeneity due to incomplete stirring in the reaction mixture. The precision as judged from the spread of data in a titration is 0.5% or better.

STUDY ON THE HYDROLYSIS OF METAL IONS. PART 56. SOLVENT EXTRACTION STUDY OF THE HYDROLYSIS OF ZINC (II) IN 3 M $NaClO_4$ AT LOW CONCENTRATIONS by T. Sekine. [1965] [13]p. incl. tables, refs. (AFOSR-67-1307) (AF EOAR-63-8) AD 653484 Unclassified

Also published in Acta Chem. Scand., v. 19: 1526-1538, 1965.

The mononuclear hydrolysis of Zn(II) in 3 M $NaClO_4$ has been studied by a distribution method. The mono nuclear species, $Zn(OH)_2$, was extracted into a benzene phase containing 5% (by volume) of the long-chain liquid amine Amberlite LA-1. The net distribution ratio of Zn(II) could be explained by the relation $D = [Zn(II)]_{org, total}/[Zn(II)]_{aq, total} = [Zn(OH)_2L_2]_{org}/([Zn^{2+}] + [Zn(OH)_2] + [Zn(OH)_3] + [Zn(OH)_4^{2-}])$ where L denotes the amine. The hydrolysis constants and the distribution constant of the $Zn(OH)_2$ species between the organic and the aqueous phases were calculated by a generalized least squares method, using the LETAGROP VRID computer program.

A CALORIMETRIC AND POTENTIOMETRIC STUDY OF THE SYSTEMS Cl^--Hg^{2+} AND Br^--Hg^{2+} AT 25°C IN 3M $NaClO_4$ MEDIUM, by R. Arnek. [1965] [20]p. incl. diagrs. tables, refs. (AFOSR-67-1312) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-8, Swedisn Natural Science Research Council and Swedish Technical Research Council) AD 653429 Unclassified

Also published in Arkiv for Kemi, v. 24: 531-550, 1965.

The calorimeter for enthalpy titration constructed by Schlyter (1959) has been modified: the temperature measureing device now consists of a thermistor. Resistance is measured using an amplifier as a null instrument. This method is thought to be more convenient than the "deflection method" used by Schlyter. By means of enthalpy titration the enthalpy changes ΔH in (kcal/mol) for the stepwise formation of Cl^--Hg^{2+} and Br^--Hg^{2+} complexes have been measured. From the enthalpy titrations it was also possible to obtain values for some of the equilibrium constants. A determination of all the equilibrium constants was performed independently by emf methods.

THE INTERACTION OF CHARGE CARRIERS WITH THE CRYSTAL LATTICE, by G. M. Rothberg. Final rept. [1965] 4p. (AFOSR-65-1562) (AF 49(638) 1018) AD 621218 Unclassified

This report presents a survey of research conducted on (1) electron-phonon interactions through the use of thermoelectric power; (2) determination of the thermal conductivity of one gas relative to another; and (3) measurement of the effect of pressure on tunneling in superconducting films to see if films and electrical contacts could be made to stand up under high pressures and low temperatures. The thermoelectric power (TEP) of germanium was measured from 100 K to 300 K and at pressures from vacuum to 2000 atm. It is shown theoretically that energy change in the lattice-electron system should contribute to the TEP, and it has also been found that the fractional change in the TEP of n-type germanium produced by 2000 atm pressure is a few tenths of a percent; the change of p-type is less.

THERMOELECTRIC POWER OF GERMANIUM. EFFECT OF TEMPERATURE-DEPENDENT ENERGY LEVELS, by P. J. Freud and G. M. Rothberg. [1965] [8]p. incl. illus. diagrs. table, refs. [AF 49(638 1018] Unclassified

Published in Phys. Rev., v. 140: A1007-A1014, Nov. 1, 1965.

A statistical-mechanical treatment of the thermoelectric power of semiconductors is given which includes the interaction energy of the electron-lattice coupling. This interaction modifies the thermodynamic functions of the system and contributes to the electron-diffusion part of the thermoelectric power. The usual expression for the diffusion part of the thermoelectric power is modified by the inclusion of 2 constant terms b and d, the respective extra entropies per electron and hole. New measurements have been made of the thermoelectric power of high-purity n- and p-type germanium from 90°K to 250°K. The essential feature of these measurements is that the potential leads were in regions of well determined temperature and negligible temperature gradient. Although it is difficult to separate the phonon-drag and electron-diffusion parts, it is estimated that $b=40\pm15\mu V/°K$, $d=40\pm15\mu V/°K$. The sum (b+d) should equal the derivative of the energy gap with respect to temperature at constant volume, but our result is more than a factor of four smaller than the value obtained by others from the temperature dependence of the energy gap. It is believed that this discrepancy is due to a remaining deficiency in the theory of ther thermoelectric power. (Contractor's abstract)

CRITICAL ANALYSIS OF THE THERMODYNAMIC DATA FOR Pt AND A PREDICTION OF $\Theta_{DW}(T)$, by J. L. Feldman and G. K. Horton. [1965] [3]p. incl. diagrs. refs. (AFOSR-65-0796) [AF AFOSR-62-167] AD 616213 Unclassified

Also published in Phys. Rev., v. 137: A1106-A1108, Feb. 15, 1965.

The purpose of this paper is a critical examination of the available measurements of the specific heat, thermal expansion, and compressibility of platinum to see whether reliable predictions can be made for the Debye-Waller factor. A calorimetric equivalent Debye temperature curve is constructed, and in using its values to predict those of $\Theta_{DW}(T)$, the Debye characteristic temperature of the Debye-Waller factor, a Barron plot is constructed as well. The latter value vs temperature curve is plotted by using a Padé approximant to link the high-and low-temperature expansion. The results are compared with an experiment in a preceding paper by Harris, Benczer-Koller, and Rotaberg (Phys. Rev., v. 137: A1101, 1965)

CALCULATION OF O_0^c DIFFERENCES FOR THE FACE-CENTRED CUBIC AND CLOSE-PACKED HEXAGONAL LATTICES IN THE IDEAL INERT GAS SOLIDS, by C. Feldman. [1965] [7]p. incl. tables, refs. (AFOSR-66--666) (AF AFOSR-62-167) AD 640185 Unclassified

Also published in Proc. Phys. Soc. (London), v. 86: 865-871, 1965.

O_0^c(cpn) and the ratio K $100[\Theta_0^c(cph) - \Theta_0^c(fcc)]$ / Θ_0^c(fcc) for the ideal inert gas solids was calculated, using the quasi-harmonic approximation and an (m-6) Lennard-Jones all-neighbor force model; K was found to be about $2\frac{7}{7}$. The neglect of explicit anharmonic contributions to K is discussed. A table of the relevant all-neignbor sums is given. It was found that the use of the ideal axial ratio $\gamma_I = \sqrt{(8/3)}$ to characterize the close-packed hexagonal lattice limits the accuracy to which K can be calculated to about one decimal place, and Θ_0^c(cpn) to about 2 decimal places. ANHARMONIC TREATMENT OF SPECIFIC HEAT (Abstract), by J. L. Feldman, G. K. Horton, and J. B. Lurie. [1965] [1]p. [AF AFOSR-62-167] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 434, Apr. 26, 1965.

This paper develops an approximate method of calculating anharmonic corrections to the calorimetric properties of solids from known values of the corresponding harmonic quantities. It is assumed that anharmonic effects may be represented by simple temperature- and frequency-dependent shifts, first used by Barron and Overton, in the frequencies appearing in the free energy or the entropy. Numerical results for S^{ah} and $C_v^a - C_v^h$, based on published harmonic calculations, are given for several substances. It is found that $S^a - S^h$ begins to depart from a linear T dependence at $T/\Theta 0.3$. A discussion of how the results may be used as a refinement of Tosi and Fumi's method for analyzing experimental calorimetric data is given. Using this approach, it is demonstrated that the oscillations in $C_v^a - C_v^h$ found in calculations recently reported by Overton for a special model of copper do not occur. Finally, criteria for the existence of oscillations in $C_v^a - C_v^h$ are obtained by studying simplified spectra.

EFFECT OF CRYSTAL ANISOTROPY ON THE THERMAL CONDUCTIVITY OF COPPER ALLOYS, by C. Feldman. [1965] [2]p. (AFOSR-65-2548) (AF AFOSR-65-726) AD 629069 Unclassified

Also published in Phys. Rev., v. 139, A211-A212, July 5, 1965.

The lattice thermal conductivity of copper alloys has been studied, taking account of the anistropy of the crystal by using a modified Debye distribution having angular dependence. This is equivalent to replacing the elastic velocities (V_i) that occur in the usual Debye distribution by $V_i(\theta, \phi)$ and multiplying by $d\Omega/4\pi$. Lindenfeld and Pennebaker assumed an isotropic crystal and so used the usual Debye distribution in their calculation of the conductivity. Using the expressions for K_T and K_L (the contributions to the conductivity from the transverse and longitudinal modes) employed by Lindenfeld and Pennebaker and the elastic velocities found from elastic-constant data, the angular integration for the anisotropic average of the total conductivity was performed by using the Houston's average over the principal crystalline directions. For $T/\rho_0 \cdot 10^6$ (ρ_0 is the residual resistivity), the curves of the (conductivity)/$T_{\rho 0}$ against T/ρ_0 are nearly linear, and in this region the largest departure between theory and experiment occurs. These calculations give a slope which is approximately 5% lower than the Lindenfeld-Pennebaker theoretical result, while their result gave a slope which was about 650% higher than the experimental one. This indicates that the departure of the calculated conductivity from their experimental results cannot, at least for copper be accounted for by anisotropy. (Contractor's abstract)

THE S WAVE PROJECT FOR FOCAL MECHANISM STUDIES EARTHQUAKES OF 1963, by W. Stauder and G. A. Bollinger. July 31, 1965, 91p. incl. diagrs. tables. (AFOSR-65-2319) (AF AFOSR-62-458) AD 472354 Unclassified

This is the second report of the S wave project, a routine program instituted for the determination of the focal mechanism of the larger earthquakes of each year using methods developed for the use of S waves in focal mechanism studies. In addition to the methods of data analysis described in detail in the previous report for earthquakes of 1962, in studying the earthquakes of 1963 use has also been made of a computer program. The program uses an error surface to search for the position of the axes of a double couple which gives the least standard deviation of the S wave polarization data. Seventy-two earthquakes of magnitude more than 6 1 4 occurred during 1963. Of these thirty-five earthquakes, so located as to afford a distribution of seismographic stations favorable for the use of S wave data, were selected for examination. Satisfactory focal mechanism solutions are here presented for twenty-six of these shocks. Tentative solutions are given for six, and no solution is advanced for the remaining three. A CASE OF TRANSIENT ANISOTROPY DURING THE RECOVERY PHASE OF A FORBUSH DECREASE, by H. S. Ahluwalia. 1965 [ ]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-319 and National Aeronautics and Space Administration) Unclassified

Presented at Ninth Internat'l. Conf. on Cosmic Rays, London (Gt. Brit.), Sept. 6-17, 1965.

Published in Scientific Contributions of Space Physics Group, La Paz (Bolivia), Laboratório de Física Cósmica de Chacaltaya, 1965, p. 32-59.

On July 18, 1959 a short-lived highly anisotropic cosmic ray increase was observed by some of the I.G.Y. network of recording stations during recovery from the third of the series of three closely spaced Forbush decreases. Characteristic features and the solar and terrestrial relationships of this increase are studied. Mechanisms proposed thus far for this increase are critically examined. Arguments are presented to the effect that this could not be a solar flare-type increase. It is suggested that this increase was probably produced by galactic cosmic rays which got reflected from receding blast wave and co-rotating shock wave formed during the explosive heating of solar corona following the west limb 3+ solar flare of July 16, 1959. The corresponding features of associated heliophysical, geophysical and cosmic ray phenomena were studied and thereby derived the velocity of the blast wave to be 1700 Km/s and its total thickness to be about 0.14 A. U. Also there is belief that this blast wave had considerable fine structure built into it. There is some evidence that this blast wave probably started to dissolve into background solar wind at a distance of about 1.5 A.U. from sun. (Contractor's abstract)

Presented at Sixth Internat'l. Space Science Symposium, Mar del Plata (Argentina), May 11-19, 1965.

Published in Scientific Contributions of Space Physics Group, La Paz (Bolivia), Laboratório de Física Cosmica de Chacaltaya, 1965, p. 10-31.

A study is presented of the characteristic effects of the deformed magnetic field on the trajectories and asymptotic directions of arrival of medium energy cosmic rays at three representative stations: Chacaltaya, Deep River and London. For this purpose use has been made of the spherical harmonic description of the deformed magnetic field given by Mead (1964) and this has been superposed on Stormer Dipole and Finch and Leaton higher degree simulation field configurations. It is found that asymptotic directions of arrival for deformed fields are considerably different from those for undisturbed fields at lower rigidities and the mean deviation at each station is larger for night than for day hemisphere. There is also evidence of a strong modulation of penumbral bands by the deformed field. There is an indication that small semi-diurnal component, at equatorial stations, results from the deformation of the terrestrial field. The resulting

component is however, an order of magnitude smaller than that observed on many occasions at low latitude stations. (Contractor's abstract)

SOLAR DAILY VARIATION RECORDED AT LOW LATITUDE STATION BY EAST AND WEST POINTING TELESCOPES DURING A PERIOD OF MAXIMUM AND MINIMUM IN SOLAR ACTIVITY, by H. S. Ahluwalia, V. I. Escobar and others. 1965 [11]p. incl. diagr. table. (AF AFOSR-64-319) Unclassified

Presented at Ninth Internat'l. Conf. on Cosmic Rays, London (Gt. Brit.) Sept. 6-17, 1965.

Published in Scientific Contributions of Space Physics Group, La Paz (Bolivia), Laboratorio de Física Cósmica de Chacaltaya, 1965, p. 1-9.

This report examines the characteristics of solar daily variation recorded by east and west pointing directional telescopes at Mt. Chacaltaya during the years of maximum (1958) and minimum (1964) in solar activity in the last solar cycle. It is found that the amplitude of the diurnal component, both in the east as well as in west directions, is reduced in 1964 compared to its value in 1958. The time of maximum of the diurnal component in the two directions has, however, the same value in the two years within errors of observations. The results of diurnal component are compared with those obtained with neutron monitors, at other equatorial mountain level stations of Huancayo and Mt. Norikura for the same period as well as with the parameters defining the diurnal component of solar daily variation is of 22 yr rather than of 11 yr. (Contractor's abstract)

THE E_p = 2.66 MEV RESONANCE IN $O^{16}(p,p)O^{16}$, by V. Gomes, R. A. Douglas and others. [1965] [9]p. incl. diagrs. table. (AFOSR-65-2695) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-310 and National Science Foundation) AD 628698 Unclassified

Also published in Nuclear Phys., v. 68, 417-425, June 1965.

The absolute differential cross section has been measured over the E_p = 2.66 mev resonance [$E_x(F^{17})$ = 3.10 mev] in $O^{16}(p,p)O^{16}$ at the following angles in the center-of-mass system: 54.5°, 70.5°, 90.0°, 107.0°, 125.5° 140.5° and 151.3°. Also angular distributions (15 angles from $\theta_{c.m.}$ = 30.5° to 155.6°) were measured at the following energies, 1.473, 1.931, 2.481, 2.660, 2.668 and 2.978 mev. A partial wave analysis of the results was performed. The first analysis used only cross section data as the input to the computer programme. The results fail to predict the observed off resonance polarizations. A second analysis using both cross section and polarization data for the input gives a satisfactory fit to all experimental data. The parameters which give the best fit to the data are Γ = 20 ± 1 kev (lab), E_r = 2.663 ± 0.007 mev, J^π = 1/2-. (Contractor's abstract)

ABSOLUTE CROSS SECTION MEASUREMENTS FOR THE REACTIONS $Ne^{20}(d,n)Na^{21}$ g.s. and $Ne^{20}(d,n)Na^{21}$ (0.34 MEV), by E. F. Pessoa, R. L. Dangle and others. [1965] [15]p. incl. diagrs. refs. (AFOSR-66-0445) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-310] and National Science Foundation) AD 630520 Unclassified

Also published in Nuclear Phys., v. 68, 337-351, June 1965.

Absolute cross sections for the reactions $Ne^{20}(d,n)Na^{21}$ g.s. and $Ne^{20}(d,n)Na^{21}$ (0.34 mev) have been measured in the range of incident particle energies from 1.3 to 2.3 mev. A phenomenological analysis has been applied to the total cross section for the $Ne^{20}(d,n)Na^{21}$(0.34 mev) reaction to separate the direct interaction contribution from the resonant state formation. The direct interaction contribution turns out to be very small indicating that the predominant reaction mechanism is a resonant type process.

SPECIFIC CHANGES IN WATER INTAKE AND ADIPSIA FOR WATER AND SODIUM CHLORIDE AFTER HYPOTHALAMIC LESIONS, by J. Antunes Rodrigues and M. R. Covián. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-66-0988) (AF AFOSR-63-311) AD 635442 Unclassified

Also published in Acta Physiol. Latinoamer., v. 15, 251-259, 1965.

The effect of bilateral hypothalamic lesions on water and 2% NaCl intake was studied in 29 adult male rats using the self-selection method. Electrolytic bilateral lesions placed in the median hypothalamus reaching the anterior part of the posterior hypothalamus, laterally to the ventral medial nuclei, ventral to the fornix and partially destroying them resulted in a specific decrease in water intake. When lesions involved the median hypothalamus destroying its medial and lateral parts including the ventro-medial and lateral parts including the ventro-medial and dorsomedial nuclei and the fornix, the rats developed diabetes insipidus, sodium chloride ingestion was not increased. Lesions in the lateral hypothalamus in the frontal plane of the

ventro-medial nuclei and lateral to the fornix resulted in adipsia for both fluids and aphagia. Taking into account previous findings, the role of the hypothalamus in the regulation of hydro-mineral metabolism is discussed. (Contractor's abstract)

ELECTROPHYSIOLOGICAL STUDY OF KANAMYCIN AND AMINOSIDINE OTOTOXICITY IN THE UNANESTHETIZED GUINEA PIG, by R. F. Marseillan. [1965] [8]p. incl. illus. diagrs. refs. (AFOSR-66-0990) (AF AFOSR-63-311) AD 634556 Unclassified

Also published in Acta Physiol. Latinoamer., v. 15: 300-307, 1965.

The chronic auditory ototoxicity of 2 oligosaccharide antibiotics was studied in guinea pigs with round window implanted electrodes. In the awake guinea pig auditory muscle activity is low and its effect on middle ear sound transmission negligible over 1 kc. Thus, the microphonic potentials have a very good stability making muscle section or recording under anesthesia unnecessary. Complete suppression of microphonic potentials was obtained after 15-21 days of kanamycin sulfate given in 400 mg/kg day. With 200 mg/kg day the maximum depression of the potentials was reached with a similar total quantity of drug, but a small response remained. The progression of the ototoxicity produced by aminosidine sulfate was more rapid and the general toxicity higher. The changes in the VIII nerve action potentials induced by the drugs were more irregular than those of the microphonics. (Contractor's abstract)

[PHYSIOPATHOGENESIS OF PAIN] Fisiopatogenese da Dor, by M. R. Covian. [1965] [22]p. incl. illus. diagrs. refs. (AFOSR-66-0995) [AF AFOSR-63-311] AD 635441 Unclassified

Also published in Arquivos Neuro-Psiquiatria, v. 23: 143-164, Sept. 1965.

The study of the physiology of pain includes the study of the receptors, the stimuli, the pathways, the structures of the central nervous system, the perception of pain and the motor and automic reaction. The receptors and the pathways of pain, as well as their specificity, are analyzed. The transmission of the quick and slow pain through different nervous paths until the cerebral cortex is discussed. The influence of attention on the degree of the perception of pain is commented. Based on experimental researches, the reticulo-cortico-reticular circuit is considered as indispensable for the perception of pain. Regarding the pathology of pain, the congenital analgesia is analyzed, the author accepting the hypothesis that in some synapses the pattern of impulses which give rise to the sensation of pain is changed. Emphasis is given to the role played by the frontal lobe as part of a potentiating mechanism which conditions the general distress of the patient. Referred pain is explained by the theory of "convergence-projection" of visceral fibers and cutaneous fibers for pain on the same neuron in some point of the sensory path. The relief or ceasing of pain brought about by hypophysectomy in cases of breast cancer gives rise to discussions on the role played by the hormones on the perception of pain. WIT, CREATIVITY, AND SARCASM, by E. E. Smith and H. L. White. [1965] [4]p. incl. refs. (AFOSR-65-1583) (AF 49(638)1216) AD 623294 Unclassified

Also published in Jour. Appl. Psychol., v. 49: 131-134, Apr. 1965.

A study was conducted using 156 airmen to test the hypotheses that wit and creativity are positively correlated; that defensiveness and creativity are negatively correlated, and that wits are effective leaders. The effects of sarcastic versus nonsarcastic wit were explored. The first 2 hypotheses were supported. Wits were not found to be effective leaders but were associated with less defensiveness and more effective group problem-solving. Most of the positive relationships with wit were found, more specifically, to be associated with sarcastic wit. (Contractor's abstract)

MICROBIAL GROWTH ON C_1 COMPOUNDS. SYNTHESIS OF CELL CONSTITUENTS BY METHANE- AND METHANOL-GROWN PSEUDOMONAS METHANICA, by P. A. Johnson and J. R. Quayle. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-65-2973) (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-64-8], Public Health Service, and Rockefeller Foundation) AD 628391 Unclassified

Also published in Biochem. Jour., v. 95: 859-867, June 1965.

A study has been made of the incorporation of carbon from [^{14}C]methane, [^{14}C]methanol and [^{14}C]bicarbonate by cultures of Pseudomonas methanica growing on methane, and [^{14}C]methanol by cultures of the same organism growing on methanol. Over 90% of the radioactivity fixed from [^{14}C]methane or [^{14}C]methanol at the earliest times of sampling appeared in phosphorylated compounds. Glucose phosphate and fructose phosphate together constituted the largest part of the radioactive phosphates (70-90%). The first stable products of [^{14}C]bicarbonate fixation were malate and aspartate. The percentage of the total radioactivity fixed that was contained in each of the radioactive compounds has been plotted against time. The slopes of the curves obtained

show that hexose phosphates are primary stable products of [^{14}C]methane and [^{14}C]methanol incorporation and that aspartate and malate are primary stable products of [^{14}C]bicarbonate incorporation. No carboxydismutase activity has been found in cell-free extracts of the organism. This fact, together with the other findings, shows that an autotrophic metabolism involving the ribulose diphosphate cycle of carbon dioxide fixation cannot be operating. (Contractor's abstract)

INCORPORATION OF C_1 UNITS INTO ALLULOSE PHOSPHATE BY METHANE-GROWN PSEUDOMONAS METHANICA, by M. B. Kemp and J. R. Quayle. [1965] [3]p. incl. diagrs. table. (AFOSR-66-1882) (AF EOAR-64-8) AD 643915 Unclassified

Also published in Biochim. et Biophys. Acta, v. 107: 174-176, 1965.

Studies of the incorporation of [^{14}C]methane and [^{14}C] methanol into Pseudomonas methanica growing on methane, or [^{14}C]methanol into the same organism growing on methanol, have shown that over 90% of the radioactivity fixed at the earliest times of sampling appears in phosphorylated compounds. Glucose phosphate and fructose phosphate together constitute the largest part of the radioactive phosphates (70-90%); phosphoglycerate is a relatively minor component (2 - 17%). These results suggest that a direct incorporation of C_1 units into hexose phosphate occurs in P. methanica during growth on methane or methanol. This communication presents evidence that cell-free extracts of methane-grown P. methanica can catalyze the condensation of formaldehyde with ribose 5-phosphate to form allulose (psicose) phosphate.

INTENTIONAL COMBUSTION OSCILLATIONS IN PROPULSION SYSTEMS, by D. Harris and J. Swithenbank. Final rept. Jan. 25, 1965 [21]p. incl. illus., diagrs. (Rept., no. H. I. C.-54) (AFOSR-65-1804) (AF EOAR-63-101) AD 625499 Unclassified

A review is presented of a study on the possible uses of combustion oscillations in a rocket combustion chamber. One such use is the extraction of magnetohydrodynamic electrical power. When the amplitude of oscillation is 50% or better, the mean conductivity is in theory increased by one and a half times. To test this analysis, experimental apparatus was constructed comprising a gaseous rocket motor where the air is introduced tangentially and the fuel is introduced either tangentially or longitudinally. Combustion oscillations have been produced during tangential entries of fuel but no experimental results have been obtained.

METHODS OF ELECTROMAGNETIC INDUCTION APPLIED TO THE MEASUREMENT OF SUPERSONIC VELOCITIES IN SHOCK TUNNELS, by R. J. Parsons and M. A. Patrick. Feb. 1965 [9]p. incl. illus. diagrs. (Rept. no. H. I. C.-56) (AFOSR-65-1327) (AF EOAR-65-23) AD 622665 Unclassified

A technique based on electromagnetic induction is proposed to measure the velocity of the flow in a hypersonic shock tunnel. The expanded flow in the tunnel test section has a sufficiently high conductivity level to allow the generation of an MHD voltage in the presence of a magnetic field, which can then be used to indicate the flow velocity. To overcome charge effects on the electrodes, the magnetohydrodynamic voltage from such a device should be of the order of 100 v. For a true open circuit reading and input impedence of the external circuit should be very high. (Contractor's abstract, modified)

AN INVESTIGATION OF SUPERSONIC COMBUSTION AND HETEROGENEOUS TURBULENT JET MIXING RELATED TO THE DESIGN/OPERATION OF SCRAMJETS, by I. T. Osgerby. Doctoral thesis Oct. 1965, [220]p. incl. illus. diagrs. tables, refs. (AFOSR-66-1855) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-65-23 and Ministry of Aviation) AD 638695 Unclassified

Chemical kinetic calculations of the combustion time in a constant area scramjet combustion (M_o 7) indicate reaction times 10^{-5} secs, and show that the combustion process is usually controlled by diffusion. The mixing process in concentric fuel/air jets is investigated by means of integral forms of the equations of motion and slow mixing requires about 50 diam. Initial contraction of the slow inner jet is predicted by the theory, and verified by experiment. The simulation of scramjet combustion conditions by a shock tunnel is considered feasible.

REALLY HIGH SPEED PROPULSION BY SCRAMJETS, by E. T. Curran and J. Swithenbank. Oct. 1965. [32]p. incl. illus. refs. (Rept. no. H. I. C.-67) (AFOSR-66-1861) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-65-23 and Ministry of Aviation) AD 638520 Unclassified

The high overall efficiency of the scramjet engine is potentially maintained over the speed range from Mach 5 to 20. At higher speeds, Hydrogen fuel is essential

and a fixed geometry appears feasible. Optimization of the intake diffusion can be carried out most easily in terms of the intake process efficiency and velocity ratio. The optimum amount of diffusion is reduced when realistic nozzle losses are included. The development of a hypersonic flight test vehicle is recommended.

SOME ELECTRON SPIN RESONANCE OBSERVATIONS OF GADOLINIUM S STATE IONS IN METALS, by A M. Harris J. Popplewell, and R. S. Tebble. [1965] [10]p. incl. diagrs tables, refs. (AFOSR-65-1381) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-62-54 and Ministry of Aviation) AD 621348 Unclassified

Also published in Proc. Phys. Soc. (London), v. 85: 513-522, 1965.

Measurements of the paramagnetic g factors are made, using electron spin resonance at 8 mm wavelength, in solid solutions of gadolinium in yttrium, palladium and lutetium at temperatures between 60°K and 400°K. The measurements show that the g factor for the trivalent gadolinium ion in the metallic lattice varies significantly from the free ion value and is concentration dependent. For alloys containing more than 30% Gd in the Gd-Y alloy system, 80% Gd in the Gd-Lu alloy system, and for all concentrations in the Gd-Pd alloy system, the g factors are less than the free ion value. Lower concentrations of Gd in the Gd-Y and Gd-Lu alloy systems have g factors greater than the free ion value of 1.99. A qualitative attempt is made to explain this variation, using a model proposed by Kondo in which 2 interactions are considered. (Contractor's abstract)

Also published in Arch. Ital. Biol., v. 103: 90-118, 1965.

Recording with 1-5 μ tungsten microelectrodes from different portions of the diencephalon was performed with the aim of correlating unit and wave responses to afferent stimuli, in order to validate the local origin of sensory evoked potentials in these parts of the brain. In unanesthetized immobilized cats evoked responses to single radial stimuli, to clicks and to light flashes could be recorded in all diencephalic regions explored. Rather long latencies were observed for purely negative potentials in the anterior and preoptic hypothalamus, and in the midline and intralaminar thalamus, while shorter latencies, sometimes less than 10 msec, were found for a short positive deflection with which most of posterior and lateral hypothalamic responses were initiated From the results obtained no conclusive evidence either pro or con the local origin of evoked waves in the anterior and preoptic hypothalamus could be obtained by micro electrode recordings, because of difficulties in isolating single unit discharges in these regions. (Contractor's abstract)

DISTRIBUTION OF ELECTRICAL RESPONSES TO SOMATIC STIMULI IN THE DIENCEPHALON OF THE

CAT, WITH SPECIAL REFERENCE TO THE HYPOTHALAMUS, by P. Rudomin, A. Malliani and others. [1965] [30]p. incl. illus. diagrs. refs. (AFOSR-65-1790) (Sponsored jointly by Aeronautical Systems Division, Air Force Office of Scientific Research under AF 61(052) 253, and Consiglio Nazionale delle Ricerche) AD 626245
Unclassified

Also published in Arch. Ital. Biol., v. 103: 60-89, 1965.

The basal diencephalon of intact immobilized cats under local anesthesia was systematically explored with stereotactically oriented electrodes, and the distribution of potentials evoked by single stimuli to somatic nerves was examined by alternatively employing a monopolar and bipolar leading arrangement. With the monopolar type of recording, almost the whole hypothalamus appeared responsive to somatic stimuli, and potentials picked up from adjacent structures were rather similar in shape, polarity and amplitude. Recordings with close coaxial bipolar electrodes gave a quite different, much more selective picture, some portions of the ventral diencephalon (lateral hypothalamus, subthalamus, etc.) being highly responsive to somatic stimuli, while other regions (preoptic and anterior hypothalamus, medial portions of the tuberal hypothalamus) did not show any consistent response. It is suggested that somatically evoked potentials in rostral parts of the hypothalamus, where responses are only detected monopolarly without evidence of local potential gradients in bipolar leads, are likely to represent activity originating at some distance and conveyed to the exploring electrode by electric spread. An alternative explanation is also discussed. (Contractor's abstract)

CONTRIBUTION OF LOCAL ACTIVITY AND ELECTRIC SPREAD TO SOMATICALLY EVOKED POTENTIALS IN DIFFERENT AREAS OF THE HYPOTHALAMUS, by A. Malliani, P. Rudomin, and A. Zanchetti. [1965] [17]p. incl. illus. diagrs. refs. (AFOSR-65-2241) (Sponsored jointly by Aeronautical Systems Division, Air Force Office of Scientific Research under AF 61(052) 253, and Consiglio Nazionale delle Ricerche) AD 629280
Unclassified

Also published in Arch. Ital. Biol., v. 103: 119-135, 1965.

The contribution of local activity and electric spread to somatically evoked potentials in different areas of the hypothalamus has been assessed by observing whether potentials monopolarly and bipolarly recorded therefrom were influenced by local lesions around the tip of the electrode, according to what could be expected for either local or remote activity in line with the volume conductor theory. Whenever the recording probe, either a macro- or a micro-electrode was in lateral and posterior regions of the hypothalamus and in the subthalamus, local lesions changed all monopolarly recorded responses into purely positive deflections, irrespective of the fact that, before the lesion, the evoked potentials were purely negative or positive-negative in configuration. The responses led bipolarly between the tips of a coaxial probe were completely abolished whenever the lesion involved both leads to the probe. When the recording electrode, either a macro- or a microelectrode, was in the anterior hypothalamus and in the preoptic region, even a large local lesion could never change polarity, shape or amplitude of the evoked potential. Careful control experiments showed that local electrolysis did not change recording conditions.

PRESSOCEPTIVE AND CHEMOCEPTIVE AORTIC REFLEXES IN DECORTICATE AND IN DECEREBRATE CATS, by G. Baccelli, M. Guazzi and others. [1965] [7]p. incl. diagrs. refs. (AFOSR-65-2242) (Sponsored jointly by Aeronautical Systems Division, Air Force Office of Scientific Research under AF 61(052)253, and Consiglio Nazionale delle Ricerche) AD 624832
Unclassified

Also published in Amer. Jour. Physiol., v. 208: 708-714, Apr. 1965.

Graded electrical stimulation of 3 different components of the aortic nerve has been performed in decorticate cats, and later repeated after intercollicular decerebration. Threshold stimuli, involving only the largest fibers probably originating from pressoceptors, slightly decrease blood pressure and respiration both in quiet decorticate and in decerebrate cats. However, in decorticate animals during spontaneous fits of sham rage, inhibition of all somatic and visceral components of rage behavior is observed. When aortic nerve stimuli also involve intermediate-threshold fibers presumably of chemoceptive origin, excitation of rage behavior accompanied by strong hypertension and hyperventilation is seen in decorticate preparations, while after decerebration reflex hyperpnea is accompanied by hypotension or by no consistent pressor change. Stronger stimuli activating smaller fibers of probable pressoceptive origin still have conspicuous excitatory effects in decorticate animals, as shown by appearance of rage activity and pressor reactions, whereas after decerebration prominent hypotension with hyperpnea is observed. The predominance of excitatory cardiovascular responses to aortic nerve stimuli in decorticate animals, and of inhibitory reactions after decerebration is discussed. (Contractor's abstract)

LOCAL TISSUE LESIONS AS A MEANS OF ASSESSING THE LOCAL OR REMOTE ORIGIN OF EVOKED POTENTIALS WITHIN THE BRAIN, by A. Malliani and A. Zanchetti. [1965] [3]p. incl. diagrs. (Sponsored jointly by Aeronautical Systems Division, Air Force Office of Scientific Research under AF 61(052)253, and Consiglio Nazionale delle Ricerche) Unclassified

Published in Nature, v. 206: 627-629, May 8, 1965.

Recent investigations have been carried out on the distribution of somatically evoked potentials throughout the non-specific sensory system in the core of the brain using bipolar and monopolar probes. The absence of local potential gradients, as detected by bipolar leads, strongly suggests that in some regions the monopolar electrodes were not picking up locally evoked activity. This paper has attempted to devise a more crucial technique for supporting this conclusion. This method consists of observing the eventual changes in amplitude and shape of monopolarly and bipolarly recorded potentials after local lesions have been formed round the tip of the recording electrode. This experimental approach is based on the commonly accepted volume conductor theory. The data so far amassed indicate that caution should be applied before a committal is made to mere monopolar recording with relatively low-impedance electrodes, especially from those numerous regions deep in the brain.

A STUDY OF PONTINE LESIONS SUPPRESSING DEEP SLEEP IN THE CAT, by G. Carli and A. Zanchetti. [1965] [38]p. incl. illus. diagrs. tables, refs. (AFOSR-66-0846) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-64-41 and Consiglio Nazionale delle Ricerche) AD 639813 Unclassified

Also published in Arch. Ital. Biol., v. 103: 751-788, 1965.

Experiments were performed on cats carrying implanted recording electrodes in the skull and neck, whose sleeping behavior was long studied both before and after lesions in the caudal midbrain and in the pons. Complete destruction of various structures in the caudal midbrain and in the pons did not prevent deep sleep from repeatedly occurring. Among these structures, which are clearly not essential for induction of deep sleep, one should recall several nuclei participating in the ascending limb of the midbrain-limbic circuit, several raphe nuclei, nucleus reticularis tegmenti pontis, the locus coeruleus as well as the associated nucleus subcoeruleus. None of these structures has also been found to play an essential role in mediating any of the ascending or descending phenomena of deep sleep. In none of the cats with loss of deep sleep was nucleus reticularis pontis caudalis markedly injured. Loss of deep sleep for at least four consecutive days, and often for longer periods, was constantly associated with lesions in nucleus reticularis pontis oralis. However, only when the largest extent of the brain stem lesion involved the mediolateral portions of the middle and perhaps the posterior pontis oralis has been devided, was deep sleep long suppressed in all its various manifestations. Lesions limited to either the medial or the lateral portions of nucleus reticularis pontis oralis at any rostrocaudal level, or even severely involving the anterior third but affecting to a lesser degree the middle one, were always compatible with maintenance of deep sleep. (Contractor's abstract).

BRAIN STEM-LIMBIC CONNECTIONS, AND THE ELECTROGRAPHIC ASPECTS OF DEEP SLEEP IN THE CAT, by G. Carli, V. Armengol, and A. Zanchetti. [1965] [26]p. incl. illus. diagrs. refs. (AFOSR-66-0847) (Sponsored jointly by Aeronautical Systems Division, Air Force Office of Scientific Research under AF EOAR-64-41, and Consiglio Nazionale delle Ricerche) AD 634487 Unclassified

Also published in Arch. Ital. Biol., v. 103: 725-750, 1965.

Lesions which interrupt the ascending limb of the midbrainlimbic circuit in the cat at different levels, or which even destroy it completely, do not prevent electroencephalographic desynchronization at the beginning of periods of deep sleep, nor do they affect the maintenance

of desynchronization throughout the deep sleep episodes. Likewise, none of the lesions to ascending limbic pathways abolishes or impairs the appearance of a hippocampal theta rhythm at the beginning of each deep sleep episode, and its regular maintenance throughout its duration. Lesions involving the course or termination of various descending components of the limbic-midbrain circuit do not prevent or modify any of the classical signs of deep sleep, including the appearance of spiky waves in the pontine tegmentum shortly before and throughout each deep sleep period. It is concluded that neither the ascending nor the descending component of the limbic-midbrain circuit exert any essential role in deep sleep behavior. (Contractor's abstract)

BLOOD PRESSURE AND HEART RATE DURING NATURAL SLEEP OF THE CAT AND THEIR REGULATION BY CAROTID SINUS AND AORTIC REFLEXES, by M. Guazzi and A. Zanchetti. [1965] [29]p. incl. illus. diagrs. tables, refs. (AFOSR-66-0868) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-64-41 and Consiglio Nazionale delle Ricerche) AD 632814 Unclassified

Also published in Arch. Ital. Biol., v. 103: 789-817, 1965.

Blood pressure and heart rate changes during the wakefulness-sleep cycle were studied in 24 unanesthetized free-moving cats, carring an implanted cannula in a femoral artery as well as electrodes for electroencephalographic, electromyographic and eye movement recording. In 14 animals sino-aortic deafferentiation was performed. Quantitative evaluation of all data was carried out by analysis of variance. Both in intact and in deafferented animals, light sleep was accompanied by a slight but definite decrease in systolic and diastolic pressures, and in heart rate. While both arterial pressure and heart rate showed a consistent trend to increase toward the end of light sleep and at the very beginning of deep sleep, a large fall in arterial pressure and heart rate were always observed during deep sleep. Blood pressure and heart rate were also more variable during deep than during light sleep. Systolic and diastolic pressures, as well as heart rate, were significantly higher in deafferented than in intact animals both during quiet wakefulness and throughout light sleep. However, such surprisingly large falls in pressure were recorded during the course of deep sleep episodes that arterial pressure finally attained much lower absolute values in deafferented than in intact animals. In several incidents of the lowest values of blood pressure, episodes of transient cerebral ischemia (electroencephalographic flattening and seizures) occurred.

ROLE OF PRESSOCEPTIVE AND CHEMOCEPTIVE REFLEXES IN THE REGULATION OF CIRCULATION DURING SLEEP (Abstract), by M. Guazzi, G. Baccelli, and A. Zanchetti. [1965] [1]p. (AFOSR-66-1114) (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-65-6] and Consiglio Nazionale delle Ricerche) AD 639843 Unclassified

Also published in Abstracts of Papers presented at Twenty-third Internat'l. Cong. Physiological Sciences, Tokyo (Japan), Sept. 1-9, 1965.

In order to study the role of sino-aortic reflexes in circulatory control during such a usual daily phenomenon as sleep, we have compared the effects of deep sleep on arterial pressure in cats with intact sino-aortic reflexes and in cats with sino-aortic deafferentation. In all animals blood pressure was continuously recorded through a polyethylene cannula in a femoral artery, while EEG, neck EMG and eye movements were simultaneously monitored to assess depth of sleep. Selective destruction of either carotid body chemoceptors or carotid sinus pressoceptive afferents has provided a means of assessing the respective role of each type of afferent input in regulating circulation during deep sleep. The symposium on plasma effects in solids was the first of its kind. It was an attempt to bring together 2 rather distinct groups of people: plasma and solid-state physicists; their common interest being the study of the gas of free charged carriers in solids. One hundred and fifty physicists from about 20 countries attended the conference. Twenty five papers were presented and appreciable time was allotted to the following discussions. wave propagation in solid state plasmas, wave interactions, quantum effects, hot plasmas, and instabilities.

Approximately 110 scientists were present at the 3 day symposium on Radiation damage in semiconductors. The reviews, discussions and contributions presented at the meetings are classified under the following headings: primary structure of defects, defect-impurity interactions, mobility and annealing, theory of point defects, semiconducting compounds, and thresholds and cross sections. The present volume gives a measure of the progress made since the last prior meeting on the subject of radiation effects in semiconductors. (1959).

The symposium on radiative recombination in semiconductors brought together about 250 specialized physicists from some 20 countries. The proceedings give an up-to-date account of the physical processes which are fundamental in semiconductor lasers. The subjects treated include intrinsic radiative recombination, impurity and exciton effects, junction lasers, new excitation processes, in particular those involving an electron beam, and new materials which enlarge the field of semiconductor lasers toward the visible spectrum.

PLASMA-DENSITY MEASUREMENTS USING A DEUTERON BEAM, (Abstract), by R. L. Hickok, F. C. Jobes, and J. F. Marshall. [1965] [1]p. [AF 49(638)1500] Unclassified

Published in Amer. Phys. Soc., Series II, v. 10: 508, Apr. 26, 1965.

A 1.8 mev deuteron beam has been used to investigate the deuterium density distribution in a high-current deuterium-arc plasma. The beam lies in a plane perpendicular to the arc axis and is swept through the arc at 60 cps. Protons from the $D(d,p)H^3$ reactions, detected by solid-state counters, are used to sample the sweep voltage and thereby determine the beam path at the time of reaction. It is necessary to calculate the proton paths in the nonuniform confining magnetic field of the arc to determine the counting efficiency as a function of position along the deuteron beam. The proton counting rate can then be related to the average deuterium density along the beam path. If the arc is assumed to have cylindrical symmetry, then the data can be inverted to a radial density profile. Density profiles obtained this way are compared with the profiles of spectral lines emitted by the arc.

PLASMA DENSITY MEASUREMENTS USING A DEUTERON BEAM (Abstract), by R. L. Hickok, F. C. Jobes, and J. F. Marshall [1965] [1]p.

(Bound with AFOSR 65-1266; AD 622527) (AF 49(638) 1500) Unclassified

Presented at Eighth AFOSR Contractor's meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

The deuterium density distribution in a magnetically confined vacuum arc plasma has been investigated by using a 1.8 mev deuteron beam. The arc is a gas fed dc electrical discharge running between electrodes and confined by an axial magnetic field of approx 4000 gauss. In normal operation, the gas feed is of the order of 3 atm-cc/sec and the dc power dissipation is 30 kw. This produces a plasma with an estimated electron temperature of 40 ev, an estimated ion temperature of 5 ev, and an ion density of the order of 10^{14} per cc. The 1.8 mev deuteron beam lies in a plane perpendicular to the arc axis and is swept through the arc at 60 cps. Protons from the $D(\alpha, p)H^3$ reaction, detected by a surface barrier semiconductor counter, are correlated with beam position by using the detector pulses to sample the sweep voltage. The sweep voltage is then used to select the address in a multichannel pulse height analyzer. Since the amplitude of the sweep voltage is a measure of the deuteron beam position, the pulse height analyzer presents a display of the number of protons detected versus beam position. After adjustment for the relative time spent in each beam path, the number of counts in each channel is a measure of the deuterium density integrated over the beam path that corresponds to that channel. The data are then inverted to yield a radial density profile of the form $\rho = f(r) + g(r) \cos \theta$, using detector efficiencies computed as functions of position along the beam paths. The computed efficiencies must take into account the particle trajectories in the nonuniform magnetic field. Density profiles obtained this way are quite similar to the profiles of spectral lines emitted by both ions and neutral atoms in a He doped arc.

A STUDY OF DOUBLE LAYER REPULSION AND VAN DER WAALS ATTRACTION IN SOAP FILMS, by J. Lyklema and K. J. Mysels. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-65-1633) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49 (638)309] and National Science Foundation) AD 624280 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 2539-2546, June 20, 1965.

Measurements of equilibrium thicknesses of soap films over a range of ionic strengths are presented for mobile and rigid films of sodium lauryl sulfate in the presence of lithium chloride. The forces determining this thickness are discussed in terms of existing theories of van der Waals attractions and of electric double layer repulsion. Some of the problems involved in the experimental testing of these theories are brought out. While there is good qualitative agreement between theory and experiment, definite quantitative discrepancies appear also. It is suggested that some of these could stem from limitations of the double layer theory.

NITROGEN ANALOGS OF SESQUIFULVALENCE. I. SYNTHESIS AND PROPERTIES, by J. A. Berson, E. M. Evleth, Jr. and Z. Hamlet. [1965] 15p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)828, Army Research Office (Durham) and Camille and Henry Drefus Foundation) Unclassified

Published in Jour. Amer. Chem. Soc., v. 87: 2887-2900, July 5, 1965.

The syntheses of a series of pyridine anhydro bases isoelectronic with sesquifulvalence are described. These substances are protonated on carbon rather than on nitrogen. The corresponding conjugate acids are strong enough to be titratable, the pK_a values being in the range 8.5 to 12. The acidity of a C-H function attached to C-2 or C-4 of a pyridinium nucleus is enhanced by a factor of 10^6 to 10^7 by incorporation of the C-H group in a cyclopentadienyl ring. NITROGEN ANALOGS OF SESQUIFULVALENE. II. THEORETICAL CORRELATION OF GROUND-STATE PROPERTIES, by J. A. Berson, E. M. Evleth, Jr., and S. L. Manatt. [1965] 8p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)828, [Army Research Office (Durham)] and Camille and Henry Dreyfus Foundation) Unclassified

Published in Jour. Amer. Chem. Soc., v. 87: 2901-2908, July 5, 1965.

The dipole moments of a series of nitrogen anhydro bases and pyridones can be calculated by a modified Huckel technique. The agreement with experimental values is quite good. Despite pronounced bond alternation, the confugated systems of the anhydro bases have substantial charge separation as evidenced by experimental dipole moments, a result that is not predicted by considerations of n.m.r. chemical shifts. The relative acidities of the conjugate acids of these substances are not properly predicted by Hückel theory, probably because of the undue emphasis the calculation places on formal conjugation. The large spread in acidities in the series cyclopentadiene, indene, and fluorene is drastically compressed by attachment of a pyridinium nucleus. Much of the effect of annelation of the five-membered ring on the acidities of the anhydro bases of the 2-series seems to be attributable to intramolecular overcrowding in the annelated derivatives, which produces noncoplanarity of the conjugated system. NITROGEN ANALOGS OF SESQUIFULVALENE. III. THEORETICAL CORRELATION OF EXCITED-STATE PROPERTIES, by E. M. Evleth, Jr., J. A. Berson, and S. L. Manatt. [1965] 6p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)828, [Army Research Office (Durham)]and Camille and Henry Dreyfus Foundation) Unclassified

Published in Jour. Amer. Chem. Soc., v. 87: 2908-2913, July 5, 1965.

The experimental energies and intensities of the electronic absorption bands of a series of nitrogen analogs of sesquifulvalene are compared with the results of three kinds of theoretical treatment. Although the Huckel theory and its variant, the π-method, are satisfactory in correlating much of the data, they fail to account for the major observed difference in behavior between the members of the 2- and 4-series, namely, the occurrence of strong, long wave length bands in the 2-series but of only one in the 4-series. Treatment of the data by first order perturbation theory, using the series of anions phenylcyclopentadienide, phenylindenide, and phenylfluorenide, gives better results. The transition energies are correlated with the values calculated from perturbation theory with a correlation coefficient of 0.953 the value of the resonance integral β, obtained from the slope of the correlation, is -47.6 kcal. mol. KRAMERS-KRONIG DISPERSION ANALYSIS OF INFRARED REFLECTANCE BANDS, by G. Andermann, A. Caron, and D. A. Dows. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-65-2398) (AF 49(638)1308) AD 625772 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 55: 1210-1216, Oct. 1965.

A procedure is presented for the use of the Kramers-Kronig dispersion relations in treatment of normal-incidence infrared reflection spectra to yield optical constants of crystals. The crux of the practical problem, treatment of unobserved wing regions in the integrations, is discussed in detail. Definitive methods of picking optimum upper and lower limits for integration over actual data and for fitting artificial wings are discussed. The method is tested on a reflection spectrum generated by a model involving several damped harmonic oscillators. It is shown how a region involving a single band (but flanked by "unobserved" bands) can be treated, and how accurately the method reproduces the theoretically known optical indices. It appears feasible to obtain the indices of absorption and of refraction to ± 0.005 and ± 0.002, respectively, given accurate data on reflectance. Integrated band intensities are reproduced to within a few percent. (Contractor's abstract)

CATHODOLUMINESCENCE AT p-n JUNCTIONS IN GaAs, by D. B. Wittry and D. F. Kyser. [1965] [3]p. incl. illus. diagr. (AFOSR-65-1898) (AF AFOSR-63-76) AD 625875 Unclassified

Also published in Jour. Appl. Phys., v. 36: 1387-1389, Apr. 1965.

A decrease in the cathodoluminescence produced in GaAs by a scanning electron probe has been observed when the probe is close to a p-n junction. The decreased intensity is shown to result from the drift of excess carriers across the junction. Measurements of the short-circuit current of the diode confirm this interpretation and provide a means of estimating minority carrier diffusion lengths.

ON THE THEORY OF CONTINUOUS ARRAY PROCESSING, by D. G. Childers and I. S. Reed. [1965] [7]p. incl. refs. (AFOSR-66-1060) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-188 and Air Force Systems Command) AD 638503 Unclassified

Also published in IEEE Trans. Aerospace and Navigational Electron., v. ANE-12: 103-109, June 1965.

The theory of continuous and discrete array signal processing is considered for tracking and navigational radar (sonar) systems. The purpose of the active array (and the associated filtering) is to detect an echo of a transmitted pulse reflected from a target in the presence of correlated reverberation or clutter and uncorrelated noise, both of which may vary from antenna-array element to antenna-array element, i.e., both of which are space-time varying functions. The array configuration and signal processor can also be used to determine the target location and direction. For the continuous array the receiving 'elements' are distributed continuously in the spatial medium, and the linear processor has a frequency response that is a function of the spatial variables. The discrete array is one where each individual point-receiving element in the spatial medium has a linear signal processor. (Contractor's abstract, modified)

SPACE-TIME CROSS-CORRELATION FUNCTIONS FOR ANTENNA ARRAY ELEMENTS IN A NOISE FIELD, by D. G. Childers and I. S. Reed. [1965] [9]p. incl. diagrs. refs. (AFOSR-67-0464) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-188

and Air Force Systems Command) AD 648269 Unclassified

Also published in IEEE Trans. Inform. Theory, v. IT-11: 182-190, Apr. 1965.

The importance of designing a radar (or communications) receiver to operate effectively in the presence of spatial noise creates the necessity for determining the space-time cross-correlation functions between antenna array elements. A representation of a general, polarized, nonisotropic noise process is used to determine the cross-spectral densities and cross-correlation functions between arbitrarily oriented dipole antenna array elements in the presence of a noise field only. Several examples have been worked out for isotropic noise to show the variation of the cross-correlated noise function vs the spatial separation of the dipoles. One important result is that the noise cross correlation is shown to be a function of the receiver element spatial orientation when the elements are dipoles. For certain spatial orientations between dipoles it is possible to reduce the noise cross correlation between these antenna array elements to zero. (Contractor's abstract)

PAIRING ENERGY OF LITHIUM AND BORON IN SILICON, by W. G. Spitzer and M. Waldner. [1965] [3]p. incl. diagr. (AFOSR-65-0915) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office Durham, and Office of Naval Research under AF AFOSR-64-496]) AD 618355 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 223-224, Feb. 15, 1965.

Recent studies have shown that isolated substitutional boron impurities in silicon give rise to an infrared active, local mode of vibration. Several samples of B-doped Si compensated with Li were measured as a function of temperature between room temperature and approx 200°C. At 25°C the weak B^{10} absorption band near 644 cm^{-1} is seen with 3 other bands, 681, 584, and 522 cm^{-1}. It is further observed that the 644-cm^{-1} band increases in strength with increasing temperature; the other bands show a related decrease. These results are interpreted as additional evidence for Li-B ion pairing.

REALIZATION OF IRRATIONAL IMPEDANCES BY INFINITE LENGTH CASCADED NETWORKS, by R. M. Gagliardi and A. Beihaghi. [1965] [3]p. (AFOSR-65-2103) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-496) AD 627965 Unclassified

Also published in IEEE Trans. Circuit Theory, v. CT-12: 290-292, June 1965.

An attempt is made to develop some sufficiency conditions and formal design procedures for a class of irrational impedance functions of the form $Z(s) = (+) \sqrt{P(s)}$, where P(s) is rational meromorphic and the (+) indicates the root having a positive real part. The problem is restricted to networks that are 1-dimensional semi-infinite and can therefore be viewed as an infinite length of cascaded substructures. The necessary conditions are first considered for the impedance function in the equation above to be realizable as a passive network. It is concluded that Z(s) will be a PR irrational function if P(s) is real and positive for s real and positive. The sufficiency of these conditions for realization of Z(s) as a semi-infinite passive one-port is more difficult to determine.

THEORY OF PHONON-ASSISTED TUNNELING IN SEMICONDUCTORS, by L. Kleinman. [1965] [12]p. incl. diagrs. tables, refs. (AFOSR-65-2734) (Sponsored jointly by Advanced Research Projects Agency and AIR Force[Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-496) AD 626445 Unclassified

The phonon-assisted tunneling current is calculated for a model p-n junction (as opposed to the homogeneous-electric-field model) due to 2 mechanisms. A first-order mechanism in which an electron on, say the p side scatters to a state on the n side with the emission of a phonon yields results similar to those calculated by other workers for the homogeneous-electric-field model and is about three orders of magnitude too small to account for the experimentally observed current. A second-order process in which an electron on the p side tunnels to an intermediate state in a higher band on the n side via the interband term in the Hamiltonian and then scatters with the emission of a phonon to a final state on the n side yields a current equal in magnitude to the experimentally observed current. This mechanism also succeeds, where the first one fails, in accounting for the magnitude of an differences between the experimentally measured pressure coefficients $^{\pi}LA^{+}$, $^{\pi}LA^{-}$, $^{\pi}TA^{+}$, $^{\pi}TA^{-}$, where $^{\pi} = J^{-1}dJ\ dP$, the superscripts identify the direction of current flow, and the subscripts, the branch of the phonon involved in the tunneling process (LA = longitudinal acoustic, TA = transverse acoustic).

TRANSVERSE MAGNETIC WAVE PROPAGATION IN SINUSOIDALLY STRATIFIED DIELECTRIC MEDIA, by C. Yeh, K. F. Casey, and Z. A. Kaprielian. [1965] [6]p. incl. diagrs. (AFOSR-66-0538) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-64-496]) AD 641734 Unclassified

Also published in IEEE Trans. Microwave Theory and Techniques, v. MTT-13: 297-302, May 1965.

The problem of the propagation of TM waves in a sinusoidally stratified dielectric medium is considered. The propagation characteristics are determined from the stability diagram of the resultant Hill's equation. Numerical results show that the stability diagrams for Hill's equation and those for Mathein's equation are quite different. Consequently, the dispersion properties of TM waves and TE waves in this stratified medium are also different. Detailed dispersion characteristics of TM waves in an infinite stratified medium and in waveguides filled longitudinally with this stratified material are obtained.

INTERACTION OF MICROWAVES WITH AN INHOMOGENEOUS AND ANISOTROPIC PLASMA COLUMN, by C. Yeh and W. V. T. Rusch. [1965] [5]p. incl. diagrs. (AFOSR-66-0539) (Sponsored jointly by Air Force Cambridge Research Lab; and [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-64-496]) AD 641726 Unclassified

Also published in Jour. Appl. Phys., v. 36: 2302-2306, July 1965.

The problem of the interaction of microwaves with a radially inhomogeneous plasma column confined by an impressed axial static magnetic field is treated analytically. Extensive numerical results for the back-scattering cross sections are presented for various interesting ranges of the parameters involved. It is found that the often-used homogeneous model for interpretation of experimental data can sometimes lead to ambiguous results. This ambiguity arises because of the interdependence of the average plasma frequency, the gyrofrequency, and the inhomogeneity of the plasma density distribution. Further measurements are suggested to distinguish these effects.

EXACT SOLUTION TO A LENS PROBLEM, by C. Yeh. [1965] [8]p. incl. diagr. refs. (AFOSR-66-0540) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-496) AD 641729 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 55, 860-867, July 1965.

An exact solution is obtained for the diffraction of plane electromagnetic waves by an elliptic cylindrical lens surrounding an infinitely long parallel slit in a perfectly conducting plane. Results are expressed in terms of Mathieu functions. Approximate expressions for the expansion coefficients for the diffracted waves, the scattered intensity at infinity, and the transmission coefficients are also obtained in the long-wavelength (Rayleigh scattering) limit. Possible numerical investigations are discussed. (Contractor's abstract)

REFLECTION AND TRANSMISSION OF ELECTROMAGNETIC WAVES BY A MOVING DIELECTRIC MEDIUM, by C. Yeh. [1965] [5]p. incl. diagrs. (AFOSR-66-0541) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-64-496] and Naval Ordnance Test Station) AD 641733 Unclassified

Also published in Jour. Appl. Phys., v. 36: 3513-3517, Nov. 1965.

The reflection and transmission of electromagnetic waves by a moving dielectric medium are investigated theoretically, and the reflection and transmission coefficients are determined. Two cases of the movement are considered: (a) The dielectric medium moves parallel to the interface. (b) The dielectric medium moves perpendicular to the interface. Various interesting features concerning the variation of the reflection and transmission coefficients, angles of reflection and transmission, and the frequencies of the reflected and transmitted wave, as a function of the velocity of the moving medium, are discussed.

RESEARCH IN OPTICAL COHERENCE, by R. S. Macmillan, G. O. Young and others. Final rept. Dec. 1965, 15p. incl. diagrs. (USCEE rept. no. 168) (AFOSR-66-0917) (AF AFOSR-65-188) AD 634013 Unclassified

This report summarizes the research in optical coherence and related subjects performed during the past calendar year. It consists of a brief summary of the research performed during 1965 and a list of papers which have been submitted for publication or which are in the process of being prepared for publication. At present, one paper has been published, two papers have been submitted for publication, and two papers are in the process of being prepared for publication. In addition to the papers, there was a presentation at the 1965 Fall URSI-IEEE Meeting. The topics discussed include coherence studies, functional transformations optical polarization modulation, a test for ergodicity for a certain class of random processes, and lens system optimization.

THE IONICITY OF GaAs, by F. A. Kröger. [1965] [1]p. (AFOSR-65-2062) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-65-496) AD 627719 Unclassified

Also published in Phys. Ltrs., v. 15: 218, Apr. 1, 1965.

From recent (200) x-ray reflection intensity measurements of GaAs, it may be deduced that Ga has a positive charge and As a corresponding negative charge of (0.51 ± 0.13) unit charges. This polarity is not surprising in view of the difference in electro-negativity of Ga and As. The observed value for the static charge is close to the dynamic charge determined to be about 0.46 q from infrared reflection and dielectric and refractivity measurements. However, it is cautioned that this correspondence may be fortuitous.

INFRARED REFRACTIVE INDEX AND ABSORPTION OF InAs AND CdTe, by O. G. Lorimor and W. G. Spitzer. [1965] [4]p. incl. diagrs. tables, refs. (AFOSR-65-2063) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-65-496) AD 627720 Unclassified

Also published in Jour. Appl. Phys., v. 36: 1841-1844, June 1965.

Transmission interference fringes from 2690 to 320 cm^{-1} for InAs and from 1330 to 320 cm^{-1} for CdTe are analyzed with classical dispersion theory to obtain the room-temperature dielectric constants. For InAs the dielectric constant ϵ_∞ between the band edge and the reststrahl, and the static dielectric constant ϵ_0 are: $\epsilon_\infty = 11.8 \pm 0.1$, $\epsilon_0 = 14.55 \pm 0.3$; and for CdTe: $\epsilon_\infty = 7.05 \pm 0.05$ ϵ_0 10.60 ± 0.15. These values agree favorably with previously reported values. The absorption of InAs is measured from 2500 cm^{-1}, near the fundamental absorption edge, to 260 cm^{-1}. Eight absorption peaks are observed between 444 and 269 cm^{-1} which are attributed to multiphonon combinations with the following characteristic phonon frequencies: TO_1 = 222 cm^{-1}, TO_2 214 cm^{-1}, LO = 196 cm^{-1}, and LA = 143 cm^{-1}. The transmission of CdTe is observed from 10,000 to 220 cm^{-1}. From 10,000 to 450 cm^{-1} the transmission is essentially constant at ~60%. Below 400 cm^{-1} only two previously reported transmission minima are observed.

INFRARED COMBINATION MODE ABSORPTION IN LITHIUM-BORON-DOPED SILICON, by M. Waldner, M. A. Hiller, and W. G. Spitzer. [1965] [5]p. incl. diagrs. tables, refs. (AFOSR-66-0080) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham) and Office of Naval Research] under AF AFOSR-65-496) AD 641047 Unclassified

Also published in Phys. Rev. v. 140 A172-A176, Oct. 4, 1965.

Infrared absorption bands due to double-quantum transitions of local lattice-mode vibrations is boron-lithium-doped silicon have been observed. The transistions are found near twice the frequency of all local modes and at the sum frequency of the two strongest local-mode vibrations, which are those associated with boron-lithium pairs. The relative strengths of the pair modes, the displacement of the modes from the mode due to isolated substitutional boron, and the relative strengths of the overtone absorption bands are consistent with the assumption of a predominantly Coulomb interaction between the boron and lithium ions. Five additional absorption bands, with frequency depending upon boron isotope, are found at frequencies not corresponding to sums of local-mode frequencies. Four of these bands occur at sum frequencies of the two strongest local-mode frequencies. Four of these bands occur at sum frequencies of the two strongest local-mode frequencies and of silicon critical-point phonon frequencies. The dependence of the frequency of all absorption peaks on lithium and boron isotopes is used to assist in the assignment of the absorption bands.

THE EFFECT OF DOUBLY IONIZABLE VACANCY ACCEPTORS ON THE CONDUCTIVITY OF DONOR DOPED SEMICONDUCTING COMPOUNDS WITH SPECIAL REFERENCE TO CdTe AND ZnTe, by F. A. Kroger. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-66-0527) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham) and Office of Naval Research under AF AFOSR-65-496) AD 641045 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 1717-1726, Dec. 1965.

A discussion is given for the effect of doubly ionizable vacancy acceptors on the semiconducting properties of donor doped compound semiconductors. The state during preparation as well as that reached after rapid cooling is discussed. The considerations are applied to CdTe and ZnTe. It is shown that a model proposed for CdTe by de Nobel is consistent with the experimental data available at present. ZnTe is seen to have a strong preference for p-type conduction, but on the basis of the model accepted so far conversion to low resistivity n-type material should be possible at large doping concentrations. High resistivity material, as observed, requires extension of the model. Different conclusions reached by Mandel et al. are traced back to the assignment of an erroneous value to an essential entropy term. (Contractor's abstract)

CERENKOV RADIATION IN INHOMOGENEOUS PERIODIC MEDIA, by K. F. Casey, C. Yeh, and Z. A. Kaprielian [1965] [8]p. incl. diagrs. refs. (AFOSR-66-0537) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-65-496) AD 641046 Unclassified

Also published in Phys. Rev., v. 140: B768-B775, Nov. 8, 1965.

The formal exact solution to the problem of the radiation of a charge particle traveling with a constant velocity in a periodically inhomogeneous medium is obtained. As a specific example, the case with a sinusoidally varying dielectric profile is treated in detail. Results of the computation are summarized in 2 graphs from which information concerning threshold velocity for a particular mode, the emission angles for various radiating modes, and the cutoff frequency for a certain mode can be found. Unlike the case of Cerenkov radiation in a homogeneous medium, there exist radiating modes in this inhomogeneous-dielectric case even when the velocity of the charged particle is below the threshold Cerenkov velocity. A formal expression for the radiation spectrum is also given. Approximate expressions for the radiated fields and for the radiation spectrum are obtained when the variation of the permittivity is small. Results are discussed and interpreted. THE ROLE OF THE IONIZATION OF DEFECTS IN CAUSING SYSTEMATIC DIFFERENCES IN THE SEMICONDUCTOR PROPERTIES OF UNDOPED COMPOUNDS, by F. A. Kroger. [1965] [9]p. incl. diagr. tables, refs. (AFOSR-66-1067) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-65-496) AD 641049 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26, 1707-1715, Dec. 1965.

Undoped compounds often show either n- or p-type conduction, a variation of the activity of the lattice constituents causing a variation in the concentration of donor or acceptors, but not a change of the conductivity

type. Only in a few cases can a transition from n- to p-type be achieved. It is shown that the degree of ionization of the imperfections acting as donors or acceptors is an important factor in deciding the type of atomic imperfection that is predominately formed. The insight gained is used to explain some observed trends in the semiconductor properties of the II-VI and IV-VI compounds.

OPTIMAL CONTROL PROBLEMS AS EXTERNAL PROBLEMS IN A BANACH SPACE, by L. W Neustadt [1965] [10]p. (AFOSR-67-0377) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham) and Office of Naval Research] under AF AFOSR-65-496) AD 647456 Unclassified

Also published in Proc. Symposium on System Theory, New York (Apr. 20-22, 1965), ed by J. Fox, M. Crowell, and R. Krieger. Brooklyn, Polytechnic Press, 1965, p. 215-224.

This paper presents the formulation of an extremely general variational problem in a Banach space setting. This formulation includes, a special cases, the conventional optimal control problems both with an without restricted phase coordinates. Using the concept of quasiconvexity, it is possible to derive necessary conditions for extremality in terms of the separability of two convex sets in a Banach space The Pontryagin maximum principle, together with its extension to the problem with restricted phase corrdinates, is derived from the general necessary conditions presented herein. HIGH-SPEED LOW-DENSITY WAKE AS A STUDY IN TRANSITIONAL GASDYNAMICS (Abstract), by R. L. Chuan. [1965] [1]p. [AF AFOSR-63-55] Unclassified

Presented at meeting of the Amer. Phys. Soc., Calif. Inst. of Tech., Pasadena, Nov. 23-25, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 273, Feb. 25, 1965.

In the immediate neighborhood of a rapidly moving body whose dimension is small as compared to the free-stream mean-free path, molecule-body collisions dominate (and the local flow field is free molecular); but far enough away from the body, molecule-molecule collisions dominate. Thus, in the wake configuration, one finds the development of a flow field from free molecular to continuum uncomplicated by the presence of walls. The low-density "wake" really represents a "region of influence" of a scatterer placed in an unbounded high-speed low-density gas stream. Experimental description of such a complete gasdynamic spectrum has been obtained in the forms of flow field photographs and impact-pressure profiles with spheres and cylinders at Knudsen numbers from 0.02 to 30 and Mach numbers from 6 to 8. It is found, in the case of the cylinder, that at a distance of about 2 free-stream mean free paths downstream, the flow field exhibits free molecular behavior; and that from a distance of about 10 mean free paths on, the wake departs appreciably from a free molecular description.

QUASI-STELLAR SOURCES AND GRAVITATIONAL COLLAPSE; PROCEEDINGS OF THE FIRST TEXAS SYMPOSIUM ON RELATIVISTIC ASTROPHYSICS, Dallas, Tex., Dec. 16-18, 1963, ed. by I. Robinson,

A. Schild, and E. L. Schucking. Chicago U. Press, 1965, 475p. incl. illus. diagrs. tables, refs. (AFOSR-65-1494) (In cooperation with Texas U., Dallas and Yeshiva U., New York) (Sponsored jointly by Aeronautical Research Laboratory; Air Force Office of Scientific Research under AF AFOSR-64-539, National Aeronautics and Space Administration, National Science Foundation, and Office of Naval Research) Unclassified

Papers presented at the first Texas Symposium on Relativistic Astrophysics and related papers are reported. Theories of the quasi-stellars that were first identified in 1963 and theories on the strong radio sources that led to their discovery are discussed. The theory of gravitational collapse is given special consideration. Though the gravitational field is the weakest field in nature, it is the only one that can theoretically account for the enormous energy output of the quasi-stellars. It was established at the conference that the quasi-stellars are superstars, emitting enormous amounts of energy and located far beyond what had been thought to be the edge of space; still their interior structure and physical mechanism of energy production are not understood.

ALL HOMOGENEOUS SOLUTIONS OF EINSTEIN'S FIELD EQUATIONS WITH INCOHERENT MATTER AND ELECTROMAGNETIC RADIATION, by I. Ozsvath. [1965] [4]p. (AFOSR-66-0379) (AF AFOSR-64-709) AD 630236 Unclassified

Also published in Jour. Math. Phys., v. 6: 1265-1268, Aug. 1965.

The theorem is proven that the Einstein field equations with dust and electromagnetic null field have only two homogeneous solutions. Discussions of these two solutions appear in another paper.

2632

Southwest Center for Advanced Studies, Dallas, Tex

NEW HOMOGENEOUS SOLUTIONS OF EINSTEIN'S FIELD EQUATIONS WITH INCOHERENT MATTER OBTAINED BY A SPINOR TECHNIQUE, by I. Ozsvath. [1965] [21]p. (AFOSR-66-0061) (AF AFOSR-65-903) AD 630310 Unclassified

Also published in Jour. Math. Phys., v. 6: 590-610, Apr. 1965.

Einstein's field equations with incoherent matter are solved for the case of homogeneous spacetime, i.e., for metrics allowing a 4 parametric simply transitive group of motions. Two families of new solutions are obtained by use of a spinor technique. As a special result a proof emerges for Godel's theorem, which states that there exist only 2 homogeneous solutions of Einstein's field equations with incoherent matter and rigid rotation, namely the Godel cosmos and the Einstein static universe.

HOMOGENEOUS SOLUTIONS OF THE EINSTEIN-MAXWELL EQUATIONS, by I. Ozsvath, [1965] [11]p. (AFOSR 66-0471) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-903 and National Aeronautics and Space Administration) AD 630384 Unclassified

Also published in Jour. Math. Phys. v. 6: 1255-1265, Aug. 1965.

In this paper the solutions of the Einstein-Maxwell equations are investigated under the assumption that

the metric of the space-time and the electromagnetic field are invariant under the transformations of a four-parametric, simply transitive group. The results can be summarized as follows: In the case of null electromagnetic fields there are two different possibilities; if the cosmological constant = 0, all the solutions are Robinson waves; if the cosmological constant does not = 0, there exists only one solution. There exist no other solutions for null electromagnetic fields. In the case of non-null electromagnetic fields two solutions are found. One metric is known having been first given by Robinson; A new solution is given. The question as to whether there are solutions different from these remains open.

NONDESTRUCTIVE EVALUATION OF METAL FATIGUE, by F. N. Kusenberger, B. E. Leonard and others. Final rept. Mar. 1965, 85p. incl. illus. diagrs. tables, refs. (AFOSR-65-0981) (AF 49(638)1352) AD 619685 Unclassified

Work under this program has included studies of the usefulness of ultrasonic and magnetic techniques as nondestructive observational methods for determining the extent of fatigue development in both ferromagnetic and nonferromagnetic metals. Investigations were conducted on rod-type specimens cycled in direct tension. The magnetic techniques were carried out on steel specimens and the ultrasonic techniques on both steel and aluminum. Methods were investigated for generating and focusing Rayleigh waves, and transducer design and fabrication were examined. X-ray diffraction measurements, using a 0.004 in. diam collimator, were also made in the vicinity of the tip of a small fatigue crack.

TRANSIENT HEAT CONDUCTION AT HIGH THERMAL FLUX, by U. S. Lindholm, E. J. Baker, and R. C. Kirkpatrick. [1965] [4]p. incl. illus. diagrs. (AFOSR-65-1158) (AF 49(638)1119) AD 618002 Unclassified

Presented at Winter annual meeting of the Amer. Soc. Mech. Engineers, Philadelphia, Pa., Nov. 17-22, 1963.

Also published in Jour. Heat Transfer, v. 87: 49-52, Feb 1965.

Transient heat conduction in a copper rod was studied using an arc-imaging furnace to supply pure radiant thermal energy at flux levels up to 1000 cal/cm^2-sec. No significant effects were observed attributable to the rate of heating up to and through melting at the surface. Transient temperature profiles agree well with theory and melting was initiated at its equilibrium temperature. The dynamics of the vaporization process are more uncertain. (Contractor's abstract)

WAVE PROPAGATION IN AN ELASTIC NONHOMOGENEOUS BAR OF FINITE LENGTH, by U. S. Lindholm and K. D. Doshi. [1965] [8]p. incl. diagrs. (AFOSR-65-1159) (AF 49(638)1119) AD 618980 Unclassified

Presented at Winter annual meeting of the Amer. Soc., Mech. Engineers, New York, Nov. 29-Dec. 3, 1964.

Also published in Jour. Appl. Mech. v. 32: 135-142, Mar. 1965.

The case of an elastic disturbance propagating in a nonhomogeneous bar of finite length is solved by using the principle of virtual work. The nonhomogeneity is prescribed as a continuously varying modulus of elasticity with position in the bar. The density is assumed constant. Numerical results are presented for a finite-length pressure pulse in a free-free bar

giving a comparison between the homogeneous and non-homogeneous solutions. (Contractor's abstract)

TRANSIENT STRESSES IN SOLIDS INDUCED BY RADIANT SURFACE HEATING, by U. S. Lindholm. [1965] [3]p. incl. diagrs. (AFOSR-65-1740) (AF 49(638)1119) AD 625990 Unclassified

Also published in AIAA Jour., v. 3: 1203-1205, June 1965.

If the surface of a solid is exposed to a very high rate of radiant heating, transient stresses may be induced either by thermoelastic coupling at low surface temperatures or by rapid vaporization at high surface temperatures. Some preliminary considerations of this phenomena are discussed. An experiment is described for detecting transient stresses in a rod-type lead specimen resulting from a high thermal flux at one end. The specimen is heated in an arc-imaging facility. The transient pressures measured appear in qualitative agreement with predictions based on rapid vaporization from the surface. More quantitative agreement will require accurate knowledge of the surface emissivity, surface temperature, and internal energy distribution in the solid or melt.

ASYMPTOTIC SOLUTIONS OF THE BHATNAGAR-GROSS-KROOK EQUATION, by L.-K. Chi. [1965] [2]p. (AF 49(638)1228) AD 625965 Unclassified

Also published in Phys. Fluids, v. 8: 991-992, May 1965.

The relationship between the Boltzmann equation and the boundary-layer equations is investigated. It is shown that the boundary-layer equations can be derived directly from the Bhatnagar-Gross-Krook model of the Boltzmann equation by coupling the Chapman-Enskog procedure with the boundary analysis. For illustration, the 2-dimensional monatomic gas flow past a semi-infinite flat plate is considered. The boundary-layer equations and the Navier-Stokes equations are found to be different asymptotic forms of the Bhatnagar-Gross-Krook equation in different limiting processes.

KINETIC THEORY OF THE LEADING EDGE, by S. Ziering, L.-K. Chi, and R. Fante. [1965] [12]p. incl. diagrs. refs. (AF 49(638)1228) Unclassified

Also published in Rarefied Gas Dynamics, Proc. Fourth Internat'l. Symposium, Toronto U. (Canada) (July 14-17, 1964), ed. by J. H. de Leeuw. New York Academic Press, v. 1: 394-415, 1965.

The interaction of a finite plate with a streaming gas is considered by using the Bhatnagar, Gross, and Krook equation of statistical mechanics. In order to describe the near free molecule domain accurately, the distribution function is separated into various domains. The collisionless forms of the distribution functions are constructed and briefly discussed. When collisions are retained, integral solutions are constructed for the various parts of the distribution function. These have to be solved either by numerical methods or by approximation schemes. Various limiting cases are treated and discussed. Specific numerical results for a linearized iterative treatment in the near free molecule domain are presented. (Contractor's abstract)

SOME NOTES ON THE USE AND DATA PROCESSING ASPECTS OF ASSOCIATION FACTORS IN IS&R SYSTEMS, by E. G. Fossum and G. Kaskey. Mar. 30, 1965, 28p. incl. tables, refs. (Technical status rept. no. 5) (AFOSR-65-1702) (AF 49(638)1194) AD 624241 Unclassified

A number of methods have been proposed to utilize the statistical properties of pair-occurrences of index terms used to describe documents in a library. The common objective is to increase the number of terms in an original search request by the addition of others "highly associated" with them. For the study being conducted by UNIVAC a large sample of DDC (formerly ASTIA) documents were used for testing and evaluating some of the several measures of association which have been proposed, and for determining the implications of their use upon the configurations of a data processing system used in an information storage and retrieval application. The formulation of the exact purpose and nature of such tests requires incorporating the use of association factors into the total specifications of an operating IS&R system. A number of the problems connected with attempts to accomplish this are discussed.

SIMULATION OF THERMONUCLEAR PLASMA BY THERMALLY IONIZED PLASMAS (Abstract), by W. D. McBee. [1965] [1]p. (Bound with AFOSR 65-1266; AD 622527) (AF 49(638)1541) Unclassified

Presented at Eighth AFOSR Contractor's meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

A parallel can be drawn between hot, dense, thermonuclear plasmas and cold, thin, thermally generated plasmas in terms of certain dimensionless parameters

which relate to configurational stability. Experiments are being planned to use this parallel in a study of proposed thermonuclear plasma stabilizing field configurations and microinstabilities, using a thermally generated alkali plasma laboratory facility. The advantage of this approach lies in the ease with which parameter values and field configurations can be changed in the relatively low magnetic field, small size, low temperature simulant plasma. The thermally generated plasma system which will be the facility used in this study has been in operation for some time.

WORK ACTIVITIES AND ATTITUDES OF SCIENTISTS AND RESEARCH MANAGERS: DATA FROM A NATIONAL SURVEY, by H. M. Vollmer. May 1965, 218p. incl. tables. (AFOSR-65-0781) (AF 49(638)1028) AD 620376 Unclassified

This report constitutes a basic data source on the organizational relations, activities, and attitudes of scientists and research managers in a variety of contexts throughout the United States. The data were obtained from a national survey of scientists and research managers in 4 disciplines-biology, chemistry, mathematics, and physics--using random samples of members of professional associations, and are broken down by 5 major variables: professional affiliation, type of employer, geographic region, educational level, and age. This is a descriptive report and largely consists of a tubular presentation of data accompanied by brief textual summaries of outstanding findings. As presented, the data are susceptible to further analysis and interpretation according to specific interests of the reader.

LIQUID-PHASE OXIDATIONS OF CYCLIC ALKENES, by D. E. Van Sickle, F. R. Mayo, and R. M. Arluck. [1965] [9]p. incl. tables, refs. (AFOSR-66-0686) (AF 49(638)1102) AD 632255 Unclassified

Presented at meeting of the Org Chem. Div. of the Amer. Chem. Soc., Sept. 10, 1963.

Abstract published in 145th meeting of the Amer Chem. Soc. Abstracts of Papers, 1963, p. 26O.

Also published in Jour. Amer. Chem. Soc., v. 87: 4824-4832, Nov. 5, 1965.

This work was undertaken to relate the initial products of liquid-phase oxidations of unsaturated hydrocarbons under mild conditions (and thus their mechanisms of oxidation) to the structures of the hydrocarbons. Results with cyclopentene, cyclohexene, cycloheptene, cyclooctene, cyclododecene, methylenecyclohexane, and vinylcyclohexane at 50-70 are discussed in terms of the addition and hydrogen-abstraction mechanisms. Indicated rates of addition of alkylperoxy radicals to the corresponding cyclic alkenes are similar. Indicated rates of abstraction (per hydrogen atom) differ by a factor of 22 and depend partly on the degree of reorganization required to give a planar allyl radical. While the other alkenes give mostly allylic hydroperoxides, 70% of the cyloctene reacts by the addition mechanism, producing epoxide, suberic aldehyde, and polymer. These results are compared with the work of others. The "dimeric" peroxides from cyclopentene and cyclohexene are shown to be 2-(3-cycloalkenylperoxy)cycloalkanyl hydroperoxides. THE LIQUID-PHASE OXIDATION OF CYCLOPENTENE, by D. E. Van Sickle, F. R. Mayo, and R. M. Arluck. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-66-0698) (AF 49(638)1102) AD 632256 Unclassified

Presented at meeting of the Org. Chem. Div. of the Amer. Chem. Soc., Chicago, Ill., Sept. 4, 1964.

Abstract published in 148th meeting of the Amer. Chem. Soc. Abstracts of Papers, 1964, p. 92s.

Also published in Jour. Amer. Chem. Soc., v. 87: 4832-4837, Nov. 5, 1965.

The axo-initiated oxidation of cyclopentene was studied at 50° in the presence and absence of benzene as solvent. In the absence of benzene, the oxidation is autocatalytic. The rate of initiation by hydroperoxide corresponds closely to its second-order rate of decomposition. The hydroperoxide is more stable in benzene solution and no autocatalysis of the oxidation of cyclopentene is observed in benzene at 50°. A retarder is formed during the autoxidation of cyclopentene. An intermediate steady rate of oxidation therefore may only represent a transition from initial autocatalysis to later autoretardation.

SHOCK INITIATION OF LOW-DENSITY PRESSINGS OF AMMONIUM PERCHLORATE, by M. W. Evans, B. O. Reese and others. Oct. 1965, 26p. incl. illus. diagrs. tables, refs. (AFOSR-65-2261) (AF 49(638) 1124) AD 624537 Unclassified

Presented at Fourth Symposium on Detonation, Naval Ordnance Lab., White Oak, Silver Spring, Md., Oct. 1965.

Initiation and detonation behavior of 13 μ ammonium perchlorate was studied at loading density 1.00 g cm^3. Steady detonation velocities were determined experimentally at three diameters and extrapolated to 3.75 $\pm$ 0.15 mm μsec at infinite diameter. Calculations with the BKW equation of state give 4 25 mm μsec-- as good agreement as could be expected for a low-energy

chlorine-containing explosive. By introducing 24-kbar flat-topped plane shocks into pellets of various lengths, it was determined that steady full-strength detonation was reached after about 15 mm travel. The growth of pressure in the accelerating wave was followed approximately be means of free-surface measurements on thin Plexiglas at the top surfaces of the pellets, and these measurements indicated the pressure to be 55 ± 10 kbar in the full-strength wave. Reducing the air pressure in the pressings to 5 microns left the build-up to detonation unaffected. The position of the shock Hugoniot for the pressings relative to the Hugoniot of the solid crystal is discussed in terms of heat production during collapse and possible reaction processes. (Contractor's abstract)

AN ANALYSIS OF THE SHOCK INITIATION OF GRANULAR EXPLOSIVES BY THE GAS COMPRESSION-CONDUCTION MECHANISM, by C. M. Ablow, Y. D. S. Rajapakse, and M. W. Evans. Oct. 1, 1965 [30]p. incl. diagrs. tables, refs. (Rept. no. WSCI 65-30) (AFOSR-65-2308) (AF 49(638)1124) AD 628033 Unclassified

The role of the gas compression-conduction mechanism in shock initiation of granular materials was studied by analyzing the dependence of grain surface temperature on the magnitude of the shock and the relative sizes of grain and surrounding volume of interstitial gas. It is shown that at one atmosphere initial ambient pressure the mechanism can be a contributing factor to initiation if particle size distribution or particle irregularity leads to the existence of small particles surrounded by large, gas-filled spaces; the required sizes are possible for real materials. At low pressures (approximately 10μ hg) on the other hand, it is unlikely that the mechanism is a contributing factor. Since in practice these granular masses can be shock-initiated independent of initial ambient pressure, the conclusion is that at least one primary initiation mechanism other than gas compression-conduction plays a role. (Contractor's abstract, modified)

SHOCK WAVE COMPRESSION OF 'PLEXIGLAS' IN THE 2.5 TO 20 KILOBAR REGION, by D. N. Schmidt and M. W. Evans. [1965] [4]p. incl. illus. diagrs. table. (AFOSR-65-2492) (AF 49(638)1124) AD 628715 Unclassified

Also published in Nature, v. 206: 1348-1349, June 26, 1965.

The dynamic compressibility of 'plexiglas' in the range from 2.5 to 20 kbar was studied using the wedge and optimal lever technique described by Fowles. Cast 'plexiglas', determined by photoelastic examination to be freer of structure and residual strain than extruded or moulded material, was used. The results imply the existence of a maximum shear stress of 1.5 times the observed stress difference, that is 1.5 x 3 kbar = 4.5 kbar. The reduction of critical shear stress to 1.5 x 2 kbar = 3 kbar at the higher shock amplitude may be due to the associated temperature increase, which is estimated to be 60°C. The absence of a precursor wave is reflected in the pressure-volume curve as a positive monotonic second derivative. This implies that yielding occurs over a range of stresses and cannot be assigned a definite value.

RESEARCH ON UNSTABLE COMBUSTION IN SOLID PROPELLANT ROCKETS, by L. A. Dickinson, E. L. Capener, and R. J. Kier. Annual rept. Jan. 1, 1964-Dec. 31, 1964. Jan. 13, 1965 [58]p. incl. illus. diagrs. tables, refs. (AFOSR-65-1418) (AF 49(638)1367) AD 612178 Unclassified

Initiation of axial combustion instability in an experimental combustor 40 in. long by 50 in. inside diam containing a radial burning grain is studied utilizing a wide variety of composite propellants. Where instability occurs a correlation is found between the threshold pressure at which instability is first observed and propellant ballistic parameters notably the linear burning rate. Fast burning propellants containing either a catalyst or potassium perchlorate, do not sustain axial mode combustion instability. Transverse instability is observed for most non-aluminized propellants in pressure regimes where they are stable to axial combustion instability. A granular diffusion flame model is shown as a promising explanation of combustion stability criteria. (Contractor's abstract)

ON HYPERBOLIC MIXED PROBLEMS, by L. Sarason. [1965] [25]p. (AFOSR-65-1397) (AF 49(638)1345) AD 622651 Unclassified

Also published in Arch. Rational Mech. and Anal., v. 18: 310-334, 1965.

The mixed problem for first order strictly hyperbolic systems with principal parts having constant coefficients is considered. An explicit representation is given for the solution of the mixed problem with inhomogeneous righthand side, initial, and boundary data when the lower-order term is absent. In the case that the boundary condition is dissipative and there are just two space-like variables, an estimate is given which is similar to Agmon's, but extends it in that there is no restriction on the characteristic roots of the operator beyond those imposed by strict hyperbolicity and in that the boundary value of the solution is also estimated. The estimate permits the addition to the differential operator of a lower order term with variable coefficients.

THE SPAN AND PRINCIPAL FUNCTIONS IN RIEMANNIAN SPACES, by L. Sario, M. Schiffer, and M. Glasner. [1965] [20]p. (Sponsored jointly by Air Force Office Office of Scientific Research under AF 49(638)1345 and National Science Foundation) (In cooperation with California U., Los Angeles) AD 624114 Unclassified

Also published in Jour. D'Anal. Math., v. 15: 115-134, 1965.

The first step in building up a theory of harmonic functions of finite norm in a Riemannian space is to characterize the spaces in which such functions exist. Let HD be the class of harmonic functions with finite norm D, and denote by O_{HD} the class of Riemannian spaces that do not carry nonconstant functions in HD. We shall associate with every Riemannian space R a number S such that $R \in O_{HD}$ if and only if $S = 0$. The number S shall be called the span of R. This result together with other properties of the span was a consequence of a general extremum theorem in the theory of principal functions, which was developed for Riemannian spaces. The approach employed was a generalization of a method previously used for the Laplacian and for elliptic operators in Euclidean space. At the crucial step of establishing convergence, earlier proofs do not, however, generalize. This difficulty was overcome by the fact that the main existence theorems for principal functions can also be used in continuity and convergence arguments.

THE DECOMPOSITION OF CERTAIN GROUP REPRESENTATIONS, by K. de Leeuw and I. Glicksberg. [1965] 57p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-381] and National Science Foundation) Unclassified

Also published in Jour. D'Anal. Math., v. 15: 135-192, 1965.

Let G^d be the discrete version of a locally compact group G. If U is a unitary representation of G^d on a Hilbert space H, which is also weakly measurable on G, von Neumann and Segal have shown that $H = H_c \oplus H_0$, where H_c, H_0 are invariant orthogonal subspaces consisting, respectively, of all χ in H with $g \to U_g \chi$ continuous on G, and those χ in H for which $g \to (U_g \chi, \chi)$ is a null (L^1) function on G. Correspondingly, if p is any positive definite function on G^d, locally measurable as a function on G, then $p = p_c + p_0$ where p_c is positive definite and continuous, while p_0 is positive on G^d and a null function on G. This paper was devoted to some extensions of this result to a much broader context, in which local compactness and measurability need not play a fundamental role.

HYPERSONIC FLOW OVER AN OSCILLATING WEDGE, by S. C. McIntosh, Jr. [1965] [8]p. incl. diagrs. refs. (AFOSR-65-1744) [AF 49(638)1274] AD 625974 Unclassified

Presented at Amer. Inst. Aeronaut. Astronaut. Fifth Annual Structures and Materials Conf., Palm Springs, Calif. Apr. 1-3, 1964.

Also published in AIAA Jour., v. 3: 433-440, Mar. 1965.

The equations of hypersonic small-disturbance theory are perturbed for small oscillations of a thin, semi-infinite, flexible wedge. A solution for arbitrary smooth mode shapes is found in terms of infinite series. It is shown that the results from more approximate methods, such as piston theory and others that attempt to account for a strong bow shock, can be reproduced by successively neglecting terms in the complete solution. It appears that the most significant contribution of the complete solution is to change the phase shift of the unsteady pressure. It is shown that the complete solution is the only one that will produce an adequate representation in the double limit of very large Mach number and adiabatic exponent near unity. A METHOD OF SERIES TRUNCATION APPLIED TO SOME PROBLEMS IN FLUID MECHANICS, by M. Van Dyke. Oct. 1965, 20p. incl. diagrs. refs. (SUDAER rept. no. 247) (AFOSR-65-2014) (AF 49(638)1274) AD 627655 Unclassified

Presented at Seventh Symposium on Advanced Problems and Methods in Fluid Dynamics, Jurata (Poland), Sept. 1965.

During the last few years a method of series truncation has been applied to some of the problems in fluid mechanics. In this paper significant features of this method are discussed. Illustrative examples are drawn partly from published work and a number of new results, some still in the process of completion, are included. Topics covered are: (1) thin layer: the blunt-body problem; (2) changes of variable: an accurate blunt-body solution; (3) thick layer: viscous flow past circle and parabola.

A COMPARISON OF THREE PERTURBATION METHODS FOR EARTH-MOON-SPACESHIP PROBLEM, by A. H. Nayfeh. [1965] [6]p. incl. diagrs. refs. (AF 49(638) 1274) Unclassified

Published in AIAA Jour., v. 3: 1682-1687, Sept. 1965.

The limiting case of the restricted 3 body problem, in which the mass of one of the finite bodies is much smaller than the mass of the other, is of the singular perturbation type. The first-order perturbation solution has a logarithmic singularity at the position of the smaller body, and higher approximations are increasingly more singular. Three methods of treating singular perturbation problems are compared as applied to this problem. Uniformly valid first-order solutions are obtained for the problem of a two-fixed force-center by using the generalized method. It is shown that the generalized method gives better approximations than the method of inner and outer expansions and thus can be used for wider ranges of the small parameter. Furthermore, the Poincare-Lighthill-Kuo (PLK) method is shown to give incorrect results for the trajectory. (Contractor's abstract)

THE BUCKLING BEHAVIOR OF UNIFORMLY HEATED THIN CIRCULAR CYLINDRICAL SHELLS, by B. Ross, N. J. Hoff, and W. H. Horton. Apr. 1965 [58]p. incl. illus. diagrs. tables, refs. (SUDAER rept. no. 225)

(AFOSR-65-0982) (AF 49(638)1276) AD 618092
Unclassified

The results of buckling tests on uniformly heated, clamped, thin circular cylindrical shells are presented and discussed. Particular attention is paid to both the actual buckling process and the ensuing postbuckling behavior. Load versus end shortening curves are included and it is remarked that, in the thermal buckling problem, such curves are nonlinear. The possibility of snap-through buckling, which occurs at a value of end shortening greater than that corresponding to the maximum supported load, is experimentally verified. A comparison of the present experimental results with available theory is made. It is observed that the experimental values of the buckling temperature can be substantially greater than the temperatures calculated by linear theory from the experimental buckling loads. (Contractor's abstract)

Stanford U. Dept. of Aeronautics and Astronautics, Calif.

BUCKLING OF CIRCULAR CYLINDRICAL SHELLS UNDER EXTERNAL PRESSURE, by T.-C. Soong. Apr. 1965, 34p. incl. diagrs. tables, refs. (SUDAER rept. no. 228) (AFOSR-65-0986) (AF 49(638)1276) AD 619684 Unclassified

A set of uncoupled differential equations of equilibrium based on Sanders' assumptions has been developed which includes the effects of the prestresses. Both the Sanders-type equations and Donnell's equations are solved for the buckling pressure of shells under lateral and hydrostatic pressure. It is found that restriction of the axial displacement has considerable influence upon the buckling pressure. Moreover, the more rigorous Sanders-type equations yield lower buckling pressures than Donnell's equations (Contractor's abstract)

ELASTIC PLASTIC ANALYSIS OF THE COLLAPSE OF UNIFORMLY COMPRESSED CIRCULAR CYLINDRICAL SHELLS, by T.-C. Soong and N. J. Hoff. Apr. 1965, 50p. incl. illus. diagrs. tables, refs. (SUDAER rept. no. 231) (AFOSR-65-1587) (AF 49(638)1276) AD 625276 Unclassified

A new geometric form is proposed as a large-displacement buckling pattern of a circular cylindrical shell of finite length simply supported at the ends and subjected to axial compressive load. Exact expressions are derived for displacements and membrane strains. They show that the new pattern is almost entirely free of membrane strain. During buckling plastic yield hinges are assumed to develop which form ridges separating the mostly flat buckled surfaces. The buckling load and the postbuckling load are calculated from the energy balance and from a compatibility condition of the displacements of test specimen and elastic testing machine. (Contractor's abstract)

THE SNAP-THROUGH AND POSTBUCKLING EQUILIBRIUM BEHAVIOR OF CIRCULAR CYLINDRICAL SHELLS UNDER AXIAL LOAD, by W. A. Madsen and N. J. Hoff. Apr. 1965, 68p. incl. diagrs. tables, refs. (SUDAER rept. no. 227) (AFOSR-65-1588) (AF 49(638)1276) AD 625275 Unclassified

The present analysis was begun with an investigation of the effect that a more accurate displacement assumption, in conjunction with the exact strain-displacement relations, has on the postbuckling equilibrium behavior. It was hoped that the limiting behavior of wall thickness and wave number parameter would be altered, and that the stress coefficient would not tend to zero. Particular attention was given to an exact representation of membrane strains because it was known that in the limit as the radius-to-thickness ratio of the shell approaches infinity, the displacements approach the inextensional polyhedral surface. While all the strains in the middle surface of this limiting polyhedral shell are zero, the Donnell strain-displacement relations yield strains amounting to 0.1% if the number of waves around the circumference is 10. The results obtained did not differ significantly from the Donnell strain-displacement relations. (Contractor's abstract)

AN ANALOG STUDY OF THE THERMAL BUCKLING BEHAVIOR OF THIN CYLINDRICAL SHELLS, by B. Ross. Apr. 1965 [29]p. incl. diagrs. (SUDAER rept. no. 226) (AFOSR-65-1875) (AF 49(638)1276) AD 629580 Unclassified

A simple beam-column model is utilized to study the thermal buckling behavior of similar shells. Closed-form solutions of the governing differential equation are presented for the cases of simply-supported ends and clamped ends. Numerical calculations are performed and the data obtained used to construct equilibrium curves relating the axial load to the axial end shortening and to the midlength lateral deflection. The theoretical curves obtained for the clamped beam-column are in good qualitative agreement with the experimental curves recorded in an equipment problem of a previous investigation. THE MECHANISM OF DISCHARGE PATTERN FORMATION IN CRAYFISH INTERNEURONS, by K. Takeda and D. Kennedy. [1965] [19]p. incl. diagrs. refs. (AFOSR-66-1131) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-147 and Public Health Service) AD 640183 Unclassified

Also published in Jour. Gen. Physiol., v. 48: 435-453, Jan. 1965.

Excitatory and inhibitory processes which result in the generation of output impulses were analyzed in single crayfish interneurons by using intracellular recording and membrane polarizing technique. Individual spikes which are initiated orthodromically in axon branches summate temporally and spatially to generate a main axon spike; temporally dispersed branch spikes often pace repetitive discharge of the main axon. Hyperpolarizing IPSP's sometimes suppress anonal discharge to most of these inputs, but in other cases may interact selectively with some of them. The IPSP's reverse their polarity at a hyperpolarized level of membrane potential; they sometimes exhibit 2 discrete time courses indicating 2 different input source. Outward direct current at the main axon near branches causes repetitive discharges which may last, with optimal current intensities, for 1 to 15 sec. The relation of discharge frequency to current intensity is linear for an early spike interval, but above 100 to 200 impulses/sec it begins to show saturation. In one unit the current-frequency curve exhibited two linear portions, suggesting the presence of 2 spike-generating sites in the axon. Current threshold measurements, using test stimuli of different durations, showed that both accommodation and "early" or "residual" refractoriness contribute to the determination of discharge rate at different frequencies. FUNCTIONAL ROLE OF MUSCLE RECEPTOR ORGANS IN CRAYFISH, by H. L. Fields and D. Kennedy. [1965] [6]p. incl. illus. diagrs. refs. (AFOSR-66-1132) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-334, Epilepsy Foundation, and Public Health Service) AD 641487 Unclassified

Also published in Nature, v. 206: 1232-1237, June 19, 1965.

The abdominal stretch receptors of decapod crustaceans have been extensively analyzed as to mechanisms of transduction and of excitatory and inhibitory control. Despite the thoroughness with which this organ has been examined as a receptor, little is known of its reflex function or of its central connections. Two types of experiments have been performed to elucidate the function of this proprioceptor in the reflex control of abdominal muscles in the crayfish. The first approach was to determine the innervation pattern of the extensor musculature. Glass microelectrodes were used to record junctional events in muscle fibers while the nerve trunk to the extensors was electrically stimulated with brief pulses of graded intensity. A more directly functional approach involved analysis of the central effects of stretch receptor output with all neural connections intact. In these experiments, receptor discharge was monitored with a fine platinum wire hooked under the dorsal nerve. Motoneurone discharge was simultaneously followed by monitoring junctional potentials in other extensor muscle fibers with an intracellular microelectrode.

The flexor musculature of the crayfish abdomen is divided into 2 systems: a set of tonic superficial muscles, and a complex series of massive flexor muscles that produce powerful twitches but never exhibit tonic contractions. The muscle types are histologically differentiated, and also separately inervated: the main flexors receive 10 large motor axons, and the slow superficial muscles six smaller ones. Impulses in the inhibitor axon, even at the optimal interval, reduce the amplitude of excitatory post-functional potentials by only a small amount: their effect in shortening duration is more notable. It is postulated that the peripheral inhibitor functions to cut short excitatory depolarizations and hence to terminate lingering tension that might oppose subsequent reflex actions. The flexor musculature of the crayfish abdomen is divided into 2 systems: a set of tonic superficial muscles, and a complex series of massive flexor muscles that produce powerful twitches but never exhibit tonic contractions. The muscle types are histologically differentiated, and also separately innervated: the main flexors receive ten large motor axons, and the slow superficial muscles six small ones. Fibres of the main flexor muscles studied are almost all triply innervated; each receives endings from (a) the "motor giant axon, (b) one of several specific nongiant motor axons, and (c) a common inhibitor. Excitatory junctional potentials due to motor giant and non-giant anons are similar and large; each may trigger secondary, active "spikes", thus often producing post-junctional responses of 100 m V. or more. Activity in the central giant fibres drives both motor axons. The response to both when the motor giant system is fully rested, is slightly larger than that to either alone; when activated by stimulation of the central giant fibre the junctional potentials are evoked asynchronously due to differences in central reflex time, and double spiking in the muscle fibres sometimes results. INDUCTIVE EFFECTS ON THE POSITION OF A RING-CHAIN EQUILIBRIUM, by R. H. Eastman and K. Tamaribuchi. [1965] [3]p. incl. diagrs. table. (AFOSR-65-1635) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1272 and National Science Foundation) AD 624006 Unclassified

Also published in Jour. Org. Chem., v. 30: 1671-1673, May 1965.

A Hammett study is made of the succinic acid-succinic anhydride equilibrium in order to quantitatively evaluate the relative importance of bulk versus electronic influences in ring-chain equilibria. In the compounds studied, only an inductive effect is possible. Results show that the effect of the substituents cannot be purely electronically inductive and that electron-injecting groups favor the anhydride form. The data suggest focusing attention on effects of electron donation on the stability of the anhydride form, assuming that the substituent has little effect on that of the diacid.

OPTICAL RESOLUTION OF D, L AMINO ACIDS BY GAS CHROMATOGRAPHY AND MASS SPECTROMETRY, by B. Halpern, J. W. Westley and others. [1965] [5]p. incl. diagrs. table, refs. (AFOSR-65-2031) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-886, National Aeronautics and Space Administration, and National Institutes of Health) AD 629825 Unclassified

Also published in Biochem. and Biophys. Research Commun., v. 20: 710-714, 1965.

Experiments were conducted on DL-amino acids with the L-form labeled with two ^{2}H atoms. They were coupled with trifluoroacetylthiazolidine-4-carboxylic acid chloride into which, in position 2, ^{2}H can be introduced by radioactive formaldehyde. The solution was injected into the gas chromatograph and the emerging components collected for introduction into the mass spectrometer. By monitoring the ratios of fraction a (a : a + 2) at m/e 184:186, and the ratio of (b : b + 1) at the base peak M-156, the identity of the optically active amino acids could be determined. By improving

the method with a direct coupling of the mass spectrometer to the gas chromatograph, it was expected to increase the sensitivity to the nanogram range.

THE ROLE OF DIPOLE INTERACTIONS IN DETERMINING POLYPEPTIDE CONFIGURATIONS, by D. A. Brant and P. J. Flory. [1965] [2]p. incl. diagr. refs. (AFOSR 65-0876) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1341 and National Institutes of Health) AD 619126
Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 663-664, Feb. 1965.

A characteristic measure of the unperturbed dimensions of the random polypeptide chain is given by $\langle r^2 \rangle_0 / n l^2$, the ratio of the actual mean square end-to-end distance, $\langle r^2 \rangle_0$, to the mean square end-to-end distance for the randomflight chain of virtual bonds, $n_p l_p^2$. Experiments were conducted to determine $\langle r^2 \rangle_0$ for 3 polypeptides: poly-β-benzyl-L-asparate in m-cresol at 100°, poly-L-glutamic acid in aqueous 0.3 M sodium phosphate at pH 7.95 and 37°, and poly-L-lysine hydrobromide in aqueous 1.0 M sodium bromide at pH 4.54 and 37°. A characteristic ratio of 9 ± 1 was found for all 3 polymers. Previously published results for poly-γ-benzyl-L-glutamate yield a value in the same range. The experimental result is much larger than the value of 1.93 calculated assuming free rotation about the single bonds adjoining the α-carbons. Thus, the same value of $\langle r^2 \rangle_0 / n_p l_p^2$ holds within experimental error for the systems studied, marked differences in solvents and in amino acid side chains notwithstanding. Investigation of the influence of dipolar interactions on peptide configurations is also reported.

THE CONFIGURATION OF VINYL POLYMERS. EXPERIMENTAL RESULTS, by J. E. Mark and P. J. Flory. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-65-1215) (AF 49(638)1341) AD 621305
Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 1423-1429, Apr. 5, 1965.

The characteristic ratio $\langle r^2 \rangle_0 / nl^2$ for isotactic poly(n-pentene-1) deduced from intrinsic viscosities of fractions in 2-pentanol at the θ-point of 62.4° is 9.2 ± 0.5. This result, though larger than the characteristic ratios for polyethylene, polyisobutylene, and poly(dimenthysiloxane), is less than would be expected on the basis of steric interactions within the isotactic chain structure. The temperature coefficients determined for several isotactic and atactic vinyl polymers from stress-temperature measurements on crosslinked networks in the amorphous state, are found to be positive but small. The temperature coefficient for isotactic poly(n-pentene-1) from the temperature dependence of its intrinsic viscosity in n-hexadecane is in satisfactory agreement with the stress-temperature value. The significance of these results is discussed in relation to those for other vinyl polymers and also with reference to predictions from analysis of the chain structure and the interactions of its substituents. STATISTICAL THERMODYNAMICS OF LIQUID MIXTURES, by P. J. Flory. [1965] [6]p. incl. refs. (AFOSR-65-1449) (AF 49(C38)1341) AD 621398
Unclassified

Also published in Jour. Amer. Chem., Soc., v. 87: 1833-1838, May 5, 1965.

Liquid mixtures of nonpolar molecules are treated on the basis of a simple partition function affording an approximate, but satisfactory, representation of liquid state properties. Parameters characterizing the pure components, i.e., the density, thermal expansion coefficient, and thermal pressure coefficient, are thus brought to bear on the analysis of properties of mixtures. Theoretical expressions for the equations of state contributions to the free energy, enthalpy, entropy, chemical potential, and excess volume are derived. The theoretical entropy of mixing in excess of the combinatorial or ideal entropy depends on the reduced volumes of the 2 components and of the mixtures: it does not vanish, in general, when the excess volume is reduced to zero, contrary to a tenet of regular solution theory. The treatment is applicable to mixtures of molecules differing in size.

THE THERMODYNAMIC PROPERTIES OF MIXTURES OF SMALL, NONPOLAR MOLECULES, by A. Abe and P. J. Flory. [1965] [9]p. incl. tables, refs. (AFOSR-65-1450) (AF 49(638)1341) AD 622625 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 1838-1846, May 5, 1965.

The excess enthalpies, volumes, and entropies of 23 equimolar binary liquid mixtures for which necessary data are available in the literature are interpreted according to the relationships presented in P. J. Flory, Jour. Amer. Chem. Soc., v. 87: 1833, 1965. Most of the mixtures comprise pairs of small globular molecules from the group c-C_6H_{12}, C_6H_6, $C(CH_3)_4$, CCl_4, $SiCl_4$, $TiCl_4$, and $SnCl_4$ or from the condensed gases CH_4, Ar, O_2, and N_2. Also included are mixtures of C_6H_6 and of c-C_6H_{12} with n-hexane and n-heptane, the benzene-diphenyl system, and 2 hydrocarbon-fluorocarbon mixtures. Previously unaccounted equation of state terms, which depend on properties of the pure components, make important contributions to each of the excess quantities. Through use of pair interaction parameters chosen to achieve agreement with the observed excess enthalpies, excess volumes are calculated which agree in nearly all cases with those observed within limits set by experimental errors. Although excess entropies calculated on the same basis tend to be somewhat lower than those observed, the agreement is favorable for most systems.

THERMODYNAMIC PROPERTIES OF SOLUTIONS OF HELICAL POLYPEPTIDES, by P. J. Flory and W. J. Leonard, Jr. [1965] [7]p. incl. diagrs. table, refs. (AFOSR-65-1641) (AF 49(638)1341 AD 624274 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 2102-2108, May 20, 1965.

Partial pressures of mixtures of pyridine and of 1, 2-dichloroethane with poly-γ-benzyl-L-glutamate have been determined at 25° for volume fractions of solvent from ω_1 = 0 to ca 0.4. Similar experiments have been carried out on mixtures of chloroform with poly-β-benzyl-L-asparate. In all cases the solvent activities increase gradually and smoothly with solvent concentrations; they are insensitive to the molecular weight of the polymer. The Henry's law slope at $\varphi_1 = 0$ is very much less than would be required by ideal solution theory, which should apply to a system of impenetrable rod-like particles at high concentration. The observed behavior is readily explicable in terms of solvent mixing with side chains of α-helical solute particles. The solvent activities are devoid of evidence of phase transitions. The occurrence of conformational changes with dilution is rendered extremely unlikely by the results presented. The side chains of the undiluted polypeptide evidently are disordered.

SECOND AND FOURTH MOMENTS OF CHAIN MOLECULES, by P. J. Flory and R. L. Jernigan. [1965] [11]p. incl. diagr. refs. (AFOSR-65-1642) (AF 49(638) 1341) AD 624273 Unclassified

Also published in Jour. Chem. Phys., v. 42: 3509-3519, May 15, 1965.

Exact methods are developed for calculating second and fourth moments $\langle M^2 \rangle$ and $\langle M^4 \rangle$ of chain molecules, where $M = \sum_{i=1}^{n} m_i$ and m_i is a vector associated with Bond i but not necessarily colinear with it. The rotational isomeric-state approximation is adopted to represent the effects of hindrance potentials affecting bond rotations. No other approximations are invoked in deriving the statistical-mechanical averages denoted by $\langle\ \rangle$. Account is taken of neighbor correlations, and the treatment is applicable alike to finite and infinite chains. Illustrative calculations of $\langle r^2 \rangle / nl^2$ and of $\langle r^4 \rangle / n^2 l^4$, where r is the end-to-end length of the chain, l the bond length, and n the number of bonds, are presented for normal alkane homologs H-$(CH_2)_n$-H, throughout the range of n from $1 < n < \infty$. The methods are applicable also to chains having any variety of bonds in linear succession.

THE CONFIGURATION OF RANDOM POLYPEPTIDE CHAINS. I. EXPERIMENTAL RESULTS, by D. A. Brant and P. J. Flory. [1965] [4]p. incl. diagrs. tables, refs. (AFOSR-65-2376) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1341 and National Institutes of Health) AD 629282 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 2788-2791, July 5, 1965.

A dimensionless characteristic ratio $(r^2)_o / n_p l_p^2$ of the measured mean square unperturbed end-to-end distance $(r^2)_o$ to the number n_p of planar, trans peptide units multiplied by the square of the length l_p between successive α-carbons has been evaluated for 4 polypeptides. Measurements reported on poly-β-benzyl-L-asparate in m-cresol at 100°, on poly-L-glutamic acid in aqueous 0.3 M sodium phosphate at pH 7.85 and 37°, and on poly-L-lysine in aqueous 1.0 M sodium bromide at pH 4.54 and 37° yielded values of the characteristic ratio of 9.6, 8.8, and 8.6, respectively. From the data of Doty, Bradbury, and Holtzer for

poly-γ-benzyl-L-glutamate in dichloroacetic acid at 25, (J. Am. Chem. Soc. 78:947, (1956), a value of 6.8 was calculated. No dependence of the unperturbed dimensions upon the solvents or amino acid side chains represented is discernible within the estimated experimental uncertainty of ≈ 10%. (Contractor's abstract)

THE CONFIGURATION OF RANDOM POLYPEPTIDE CHAINS. II. THEORY, by D. A. Brant and P. J. Flory. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-65-2397) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1341 and National Institutes of Health) AD 628283 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 2791-3000, July 5, 1965.

The experimentally measured dimensions of polypeptide chains in the unperturbed, random coil form were successfully correlated with the chain structure using the rotational isomeric state model and statistical mechanical methods applicable to linear systems of interacting subunits. The poly-peptide chain with all its amide groups in the transformation may be treated as a sequence of virtual bonds of fixed length connecting successive α-carbons; the mutual orientation of a pair of adjoining virtual bonds is determined by the angles of rotation about the single bonds at the intervening α-carbon atom. Contributions to the configuration energy from bond rotation (torsional) potentials and interactions between nonbonded atoms and groups have been assessed and subsequently evaluated using approximate analytical expressions. From the chain geometry and the character of these interactions, it is shown that the mutual orientation of a given pair of adjoining virtual bonds is sensibly independent of the orientations of all other virtual bonds in the chain. Electrostatic interactions between amide groups, heretofore ignored, markedly affect the configuration. Satisfactory agreement between theoretical calculations and experimental results is achieved only by taking account of these dipolar interactions, in addition to the relevant torsional and van der Waals energies. The dependence of the polypeptide unperturbed dimensions on chain length was also investigated. (Contractor's abstract)

DIPOLE MOMENTS IN RELATION TO CONFIGURATION OF n-ALKANE CHAINS BEARING α, ω-DIPOLAR SUBSTITUENTS by W. J. Leonard, Jr., R. L. Jernigan, and P. J. Flory. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-65-2768) (AF 49(638)1341) AD 627956 Unclassified

Presented at meeting of the Phys. Chem. Div. of the Amer. Chem. Soc., Detroit, Mich., Apr. 5, 1965.

Also published in Jour. Chem. Phys., v. 43: 2256-2261, Oct. 1, 1965.

The dipole moments of α, ω-dibromo-n-alkanes Br-$(CH_2)_{n-1}$-Br have been treated by exact methods applicable to a linear sequence of bonds each constrained to choice among several discrete rotational states, due account being taken of neighbor dependence in assignment of statistical weights to the various configurations. Computations have been carried out on the basis of threefold potentials with one trans and two gauche states (±120°) for each bond. Successive gauche states of opposite sign are excluded by steric overlaps. An energy of 500 mol^{-1} has been assigned to gauche relative to trans, in keeping with spectroscopic evidence for n-alkanes and the scheme successfully applied to the mean-square dimensions of polymethylene chains. Nonbonded interactions in which a Br atom is involved have been assigned statistical weights consistent with van der Waals radii and with evidence from Raman and infrared studies on n-alkyl bromides. The mean-square dipole moments averaged over all configurations are appreciably affected by the dipole-dipole interaction energy for n - 1 ≤ 6, but not for longer chains. Calculated values are in good accord with experimental results for n - 1=3 to 10, inclusive. The applicability of the rotational-isomeric state-approximation to chains of comparatively short length is thus demonstrated. (Contractor's abstract)

STEREOREGULARITY AND UNPERTURBED DIMENSIONS OF ISOTACTIC POLY-α-OLEFINS, by P. J. Flory, J. E. Mark, and A. Abe. [1965] [4]p. incl. diagrs. (AFOSR-66-0316) (AF 49(638)1341) AD 629281 Unclassified

Also published in Polymer Ltrs., v. 3: 973-976, 1965.

The occurrence of some of the units of the chain in non-isotactic structural arrangements offers the only plausible explanation for the striking discordance between theory and experiments on allegedly stereoregular vinyl polymers having the hydrocarbon substituents R = CH_3, C_2H_5, n-C_3H_7, and C_6H_5. The atypical structures probably are syndiotactic units; A further possibility is occurrence of an occasional head-to-head pair of units. Typical isotactic vinyl polymers appear to possess a small fraction of atactic units, and these are regarded as responsible for depressing the dimensions of the random coil. The facts that various isotactic polymers including polypropylene, poly-n-butene-1, and poly-n-pentene-1 are highly crystalline and spherulitic, and that they exhibit fairly sharp melting points, show unequivocally that their crystalline domains greatly exceed the average length (ca. 10-15 monomer units) of an isotactic sequence. The syndiotactic units, and/or other stereo-irregular units, must therefore be incorporated in crystallites.

THE DETECTION OF KNOWN SIGNALS IN COLORED GAUSSIAN NOISE, by T. Kailath. [1965] [6]p. incl.

refs. (AFOSR-65-2356) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1517, Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-22583) AD 629369 Unclassified

Presented at Nat'l. Electronics Conf., Chicago, Ill. Oct. 25-27, 1965.

Also published in Proc. Nat'l. Electronics Conf., v. 21: 650-655, 1965.

The use of the Karhunen-Loeve method provides an elegant solution for the problems of the detection of known signals in colored Gaussian noise. Nevertheless it introduces certain complications because the expansion is an infinite-series expansion: questions of convergence and interchange of order of integration. The resolution of these problems is difficult and has led (when the K-L expansion is used) to the introduction of subsidiary conditions whose physical meaning is often unclear. A method of reducing the detection problem to a finite-dimensional form is presented where many of the difficulties with the infinite-series K-L expansion do not arise. The resulting simplicity provides more physical insights into the earlier results. It has also suggested some new results.

AN OPERATING SYSTEM FOR THE LINC COMPUTER, by R. K. Moore. Nov. 1, 1965, 157p. (Technical rept. no. IRL-1038) (AFOSR-66-0325) (Sponsored jointly by Air Force Office of Scientific Research under AF 49 (638)1599, National Aeronautics and Space Administration and National Institutes of Health) AD 628780 Unclassified

This report describes an extensive software system for the LINC computer. The system includes a symbolic program assembler, an Algol-58 compiler (which runs on an IBM 7090), a data-filing system, and various displaying and typing programs, including a general text editor. Utilization of all system features is described, with the aid of many examples, and annotated program listings of the system are included. The system is of interest both as an example of LINC utilization and as a study in the programming of small computers with aid of large computers.

BIOLOGICAL APPLICATIONS OF MASS SPECTROMETRY, by J. Lederberg. Final rept. Mar. 1-June 30, 1965. Aug. 1, 1965 [13]p. incl. diagrs. table, refs. (Technical rept. no. IRL 1030) (AFOSR-65-1632) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-886, National Aeronautics and Space Administration, and National Institutes of Health) AD 624074 Unclassified

A review is presented of an investigation on the applications of the mass spectrometer to biological research. The mass spectra of the amino acids is examined as well as the spontaneous cyclization of oligopeptides, the optical activity of amino acids, logarithmic recording of the mass spectral data, computer methods and other techniques of analysis, and the heavy particle bombardment of biochemical materials. Included is an article on the optical resolution of D, L amino acids by gas chromatography and mass spectrometry. The use of mass spectrometry is shown for the radio detection of D and L input reagents, as well as to identify the optically active species.

DISLOCATION REACTIONS IN SILICON WEB-DENDRITE CRYSTALS, by S. O'Hara and G. H. Schwuttke. [1965] [5]p. incl. illus. diagr. refs. (AFOSR-66-0235) (In cooperation with Westinghouse Electric Corp., Pittsburgh, Pa. under AF 49(638) 1029) (AF AFOSR-65-731) AD 629840 Unclassified

Also published in Jour. Appl. Phys., v. 36: 2475-2479, Aug. 1965.

The origin and reactions of dislocations in silicon web-dendrite crystals are discussed. In particular, x-ray topographs are compared with etching results. Dislocations having [2$\bar{1}$1] axes or < 110 > type axes have been characterized. In the former case, normal edge and 20° dislocations are seen; however, an apparently new dislocation with a [2$\bar{1}$1] axis and [101] type or [110] type of Burgers vector has also been observed. Dislocations having a [$\bar{1}$10] axis and [110] Burgers vector have been identified and associated with the Cottrell-Lomer reaction. The presence of multiple twin planes parallel to the growth direction of the web, accompanied by regions of very high dislocation density near the dendrites, increases the probability of certain dislocation reactions.

DISLOCATIONS IN SILICON WEB AS SEEN IN LARGE-AREA X-RAY TOPOGRAPHS (Abstract), by G. H. Schwuttke and S. O'Hara. [1965] [1]p. [AF AFOSR-65-731] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Nov. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 310, Mar. 24, 1965.

The crystal perfection of silicon web is discussed. Dislocation sources, dislocations, and dislocation reactions in such crystals are described. Dislocations with [211] axis are shown to have 90° or 30° Burgers vectors; dislocations with [110] axis and [101] Burgers

vector are associated with the Lomer-Cottrell reaction. Also, a new dislocation with [211] axis and Burgers-vector direction in [101] or [110] is identified. Finally, the unique role played by multiple twin planes present along the length of the web in increasing certain dislocation reactions is pointed out.

DIRECT ENERGY CONVERSION SYSTEMS. PART I. ELECTRICAL CONDUCTIVITY OF PARTIALLY IONIZED GASES, by S. Schweitzer and M. Mitchner. Quarterly technical rept. Mar. 1-May 31, 1965, Sept. 30, 1965, 52p. incl. diagrs. tables, refs. (Rept. no. SU-IPR-18) (AFOSR-66-0225) (AF 49(638)1123) AD 628528 Unclassified

A simplification of the Chapman-Enskog method for the calculation of the electrical conductivity of a multicomponent partially ionized gas in a magnetic field is presented. The calculation requires the inversion of a matrix which is of the order of the approximation, and is independent of the number of species. The third approximation to the electrical conductivity is examined for an electron-ion-neutral plasma and the results are compared with those obtained from the mixture rules of Lin, Resler, and Kantrowitz, and of Frost. It is shown that within the uncertainties in the experimental electron-neutral cross-section values, Frost's formula offers a satisfactory method of calculation for most engineering applications. DIRECT ENERGY CONVERSION SYSTEMS. PART II. ELECTROCATALYTIC ACTIVITY OF HYDRAZINE IN FUEL CELL APPLICATIONS, by P. D. Stonehart. Quarterly technical rept. Sept. 30, 1965 [63]p. incl. illus. diagrs. tables, refs. (AFOSR-66-0226) (AF 49(638)1123) AD 626529 Unclassified

The electrode reactions of hydrazine in acid and basic solutions on smooth and platinised platinum have been examined. From analysis of the rest potentials and concentration relationships a rapid one electron exchange with a stable surface species has been postulated. The mechanism of oxidation occurs via a sequential system whereby hydrazinium radicals are the products of the initial oxidation. The electrode reactions of carbon monoxide in acid solutions on smooth platinum electrodes have also been examined. The carbon monoxide is strongly bound to the metal surface and probably exists as a compound. Suppression of the reversible hydrogen reaction was observed in the presence of CO. Removal of the carbon monoxide film was performed as soon as oxide formation occurred indicating that the carbon monoxide is essentially electro-inactive and that the reaction is purely chemical with the metal oxide to form carbon dioxide. Electrochemical regeneration of the metal oxide forms the regenerative cycle. $MO + CO \rightarrow M + CO_2$ $M + H_2O \rightarrow MO + 2H^+ + 2e^-$. The oxidation of methanol in acid does not proceed via carbon monoxide as an intermediate. (Contractor's abstract)

USE OF HYDROGEN BUBBLES FOR QUANTITATIVE DETERMINATION OF TIME DEPENDENT VELOCITY FIELDS IN LOW SPEED WATER FLOWS, by F. A. Schraub, S. J. Kline and others. Feb. 1964, 55p. (Rept. no. MD-10) (AFOSR-64-1278) (AF 49(638)1278) AD 602 795 Unclassified

Presented at Winter Annual Meeting of the Amer. Soc. of Mechanical Engineers, Nov. 29-Dec. 3, 1964, New York.

Also published in Jour., Basic Engineering, v. 87: 429-444, June 1965.

Improved flow visualization methods based on the hydrogen bubble technique are described. Use of "combined-streak markers" allows quantitative measurement of the instantaneous velocity field in a plane as a function of time in low speed water flows. Adaptation to a great variety of situations using different probe techniques is possible. Disturbance to the flow is very small. Adequate accuracy is obtainable. The method offers the advantage of simultaneous visual images of the flow structure and quantitative measurement of velocity over a finite region. It also allows some types of measurements not previously possible. Limitations of the method include its restriction to low speed water flows and the observation of fluctuations only at low frequencies. Practical difficulties occur due to probe frangibility and problems of uniform bubble production. Part I describes the underlying concepts, summarizes the history of the method and describes operating experience to data at Educational Services, Inc., and Stanford U. Part II is a detailed analysis of the uncertainties in velocity measurements using combined-time-streak markers formed by hydrogen bubbles. (Contractor's abstract)

A STUDY OF THE STRUCTURE OF THE TURBULENT BOUNDARY LAYER WITH AND WITHOUT LONGITUDINAL PRESSURE GRADIENTS, by F. A. Schraub and S. J. Kline. Mar. 1965, 157p. incl. illus. diagrs. tables, refs. (Rept. no. MD-12) (AFOSR-67-0605) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1278 and National Science Foundation) AD 646989 Unclassified

The existence of 3 regions of the turbulent boundary layer, each correlating with a distinct part of the nondimensional mean velocity profile, was confirmed; these are (a) wake or intermittent region (b) fully turbulent region (c) wall layer region. Details of the flow structure of these regions were further verified using a new hot-wire anemometer and an improved combined-time-streak marker hydrogen-bubble technique. Instananeous spanwise velocity profiles over a large extent of the flow at many fixed y-positions across the layer were obtained. The study of the flow structure was extended to include both positive and negative pressure gradient flows, including a relaminarization flow. The hot-wire anemometer provided a means of obtaining detailed mean velocity profiles well within the sublayer region. The hydrogen-bubble combined-time streak marker visualization technique was shown to be a useful tool for quantitative measurement of time-dependent velocity fields. A UNIFIED METHOD FOR PREDICTING THE PERFORMANCE OF SUBSONIC DIFFUSERS OF SEVERAL GEOMETRIES, by A. B. Cocanower, S. J. Kline, and J. P. Johnston. May 1965, 94p. incl. diagrs. tables, refs. (Rept. no. PD-10) (AFOSR-66-2702) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1278 and General Electric Company) AD 642497 Unclassified

A unified performance prediction method has been developed for Class A diffusers. The prediction method uses the momentum equation, continuity equation, and two empirical correlation equations. In addition to the prediction method, two parameters have been developed to characterize inlet conditions and separation respectively: B_1 is defined as the ratio of the inlet boundary layer blockage area to the total inlet area; B_1 0.05 indicates those flows which can be divided into an effective core flow plus turbulent boundary layers, B^* is a correlation of first appreciable stall in a diffuser; it provides a means to terminate analytical calculations. The predicted results include: (1) performance charts; (2) predicted effects of Reynolds number, Mach number, wall counter, corners, and diffuser geometry on pressure recovery for Class A diffusers.

AN ANALYTICAL AND EXPERIMENTAL STUDY OF THE PLANE, INCOMPRESSIBLE, TURBULENT FREE SHEAR LAYER WITH ARBITRARY VELOCITY RATIO AND PRESSURE GRADIENT, by C. M. Szbin. Oct. 1963, 113p. (Rept. no. MD-9) (AFOSR-5443) (AF AFOSR-63-136) AD 430120 Unclassified

Presented at Winter Annual Meeting of the Amer. Soc. of Mech. Engineers, Nov. 29-Dec. 3, 1964, New York

Also published in Jour. Basic Eng., v. 87: 421-428, June 1965.

A first order approximation is derived in similarity coordinates for the velocity variation across a mixing zone between two streams of different velocities in an arbitrary pressure gradient. The velocity profiles obtained are functions of a single parameter, the ratio of the velocity of the slow stream to that of the fast stream. The first order velocity profiles are compared to those obtained from the complete solution to the zero pressure gradient case by Gortler and good agreement is found when the velocity ratio is greater than 0.5. The form of the eddy diffusivity appropriate to the first order theory is determined from analysis and experimental data. This form leads to an explicit transformation for the similarity coordinate requiring only a single empirical constant for all cases. This similarity coordinate is shown to reduce to Gortler's variable in the constant pressure case. Expressions for the shear and the mixing layer width for the general case are presented, and shown to check the data from several cases. A hot wire anemometer which was specially designed and constructed for taking the experimental data in a water channel is described. (Contractor's abstract)

UNCOUPLED-PHASE METHOD IN THE MULTI-CHANNEL N/D FORMALISM, by P. Nath and G. L. Shaw. [1965] [6]p. incl. tables, refs. (AFOSR-65-0845) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1389 and National Science Foundation) AD 617040 Unclassified

Also published in Phys. Rev., v. 137: B711-B716, Feb. 8, 1965.

The uncoupled-phase method is a nonperturbative formalism relating the scattering amplitudes describing n strongly coupled 2-body channels to the uncoupled amplitudes describing n-1 channels alone. The uncoupled scattering amplitudes are defined to be those that would exist if the couplings to the nth channel were switched off while the interactions among the n-1 channels remain unchanged. The uncoupled-phase method, previously based on the potential model, is extended to the relativistic problem by considering a set of n coupled N/D partial-wave dispersion relations. For the situation in which the left-hand cut is approximated by the forms g (s + m) where g is an n x n matrix of constants and s is square of the total energy in the center-of-mass system, the uncoupled-phase method is exact. The quantitative validity of the uncoupled-phase method for more complicated left-hand singularities is tested by performing a 2-channel computer experiment. A full numerical solution of the coupled integral equations for the N functions is obtained by the matrix-inversion technique

THRESHOLD AND ASYMPTOTIC BEHAVIOR OF THE N/D EQUATIONS, by M. Bander and G. L. Shaw. [1965] [19]p. incl. diagrs. refs. (AFOSR-65-0846) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1389, Atomic Energy Commission, and National Science Foundation) AD 617042 Unclassified

Also published in Ann. Phys., v. 31. 506-524, Feb. 1965.

Two important problems involved in obtaining solutions of partial wave dispersion relations by the N/D method are having (1) the correct threshold behavior, and (2) an acceptable high energy behavior. Various physical and numerical approximations have been made to insure this. The sensitivity of the solutions of the N/D equations to these approximations are numerically investigated. For this purpose, J = 1 π-π scattering is considered, employing elastic unitarity and assuming that the left hand cut is dominated by the exchange of the resonance. Two significant features are: (a) The values of the cutoffs needed to produce a resonance are quite sensitive to the input strength of the left hand cut, e.g., a change of the input width of the by a factor of 2 changed the value for a straight cutoff to produce a resonance at a given energy by a factor of 10 Due to the results of (a) the danger in employing a single cut-off in the calculations of SU_3 multiplets is emphasized. (b) If a pole is introduced on the left hand cut in order to insure the threshold behavior (1), then the ranges in values for the cutoffs to insure (2) for which any resonance occurs are extremely narrow. A solution in which the phase shift does not become large is insensitive to the position of this pole. (Contractor's abstract)

EFFECT OF CLOSED INELASTIC CHANNELS ON THE WIDTH OF RESONANCES, by J. R. Fulco, G. L. Shaw, and D. Y. Wong. [1965] [8]p. incl. diagrs. refs. (AFOSR-65-0847) (AF 49(638)1389) AD 617038 Unclassified

Also published in Phys. Rev., v. 137: B1242-B1249, Mar. 8, 1965.

It is proposed that including nearby inelastic channels would greatly reduce the discrepancy between predicted and observed widths of resonances This statement is examined in a quantitative manner. Three separate examples of -wave resonances, (760 mev), K* (885), and N* (1238), are considered for a 3-channel π-π, $\pi\omega$, KK system, a 2-channel πK, ηK system, and a 2-channel πN, KΣ system, respectively. It is found that, all the calculated widths are 2 to 5 times larger than the observed values, indicating that the lowest mass channels coupled via the longest range forces do not constitute a realistic model.

LEPTON SCATTERING AMPLITUDES IN TWO MODEL FIELD THEORIES, by G. W. Erickson and H. M. Fried. [1965] [10]p. incl. refs. (AFOSR-65-1347) (AF 49(638) 1389) AD 622618 Unclassified

Also published in Jour. Math. phys., v. 6: 414-423, Mar. 1965

Two lepton-lepton scattering amplitudes are considered within the context of a no-recoil Bloch-Nordsieck model, with emphasis on the singularities in that configuration-space variable conjugate to momentum transfer. For the interaction $\mathcal{L}_I = g\bar{\psi}A\psi$, renormalizable in 4 dimensions, and in the approximation of including only the exchange of all possible bosons between a pair of leptons, a light cone singularity no worse than that of the one-boson-exchange graph is found. Similar statements may be made for the same interaction, nonrenormalizable in 6 dimensions, provided certain continuations in the center-of-mass energy variable are employed; otherwise, an essential singularity appears. A remark illustrating the formation of bound states is made for the renormalizable interaction. No argument is given to establish the relevance of these models to the actual field-theoretic situations. (Contractor's abstract)

P-AND D-STATE CONTRIBUTIONS TO THE CHARGE FORM FACTORS OF H^3 AND He^3, by B. F. Gibson and L. I. Schiff. [1965] [7]p. incl refs. (AFOSR-65-1348) (AF 49(638)1389) AD 622619 Unclassified

Also published in Phys. Rev., v 138: B26-B32, Apr. 12, 1965.

The method of Sachs is used to obtain explicit expressions for the P- and D-state components of the ground-state wave functions of H^3 and He^3, under the assumption that they have $T = 1/2$ and $J^P = 1/2^+$. The effect of a reasonable admixture of these components on the electric charge form factors of the two nuclei is calculated, and it is found that the striking difference between the observed charge form factors cannot be accounted for in this way. It seems most likely that a combination of S'-state and T = 3/2-state admixture might provide an explanation of this effect without leading to disagreement with other experimental observations. (Contractor's abstract)

NONEQUIVALENCE OF THE ONE-CHANNEL N/D EQUATIONS WITH INELASTIC UNITARITY AND THE MULTICHANNEL ND^{-1} EQUATIONS, by M. Bander, P. W. Coulter, and G. L. Shaw. [1965] [3]p. (AFOSR-65-1755) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1389) and Atomic Energy Commission) AD 626299 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 270-272, Feb. 22, 1965.

An example is presented demonstrating the nonequivalence of the one-channel N/D equations with inelastic unitarity and the multichannel ND^{-1} equations. A partial-wave elastic-scattering amplitude A = N/D determined by the Frye-Warnock equations is shown in general not equal to the amplitude A_{11} determined by the multichannel ND^{-1} formalism for a set of coupled two-body channels with potentials B_{ij}. It is found that a sufficient condition for the two calculations to agree is that the diagonal forces in the channels not explicitly considered should not be strong enough to produce bound states in the absence of coupling to channel 1. It is speculated that this condition holds in general

Stanford U Dept. of Physics, Calif.

CLASSICAL EXAMPLES OF SPACE INVERSION AND TIME REVERSAL, by L. I. Schiff. [1965] [5]p. incl. diagrs. (AFOSR-65-1758) (AF 49(638)1389)
AD 626297 Unclassified

Also published in Physics, v. 1: 209-213, 1965.

The motions of 4 different classical systems under space inversion (P) and time reversal (T) are discussed. It is imagined that each system is photographed with a motion picture camera, and that the film is developed and positively printed. The film may then be inverted front for back and run through the projector in normal time sequence (P), or run through the projector in the correct orientation but backward in time (T). If the projected image represents a possible motion of the system, it is said to be P or T invariant, as the case may be. Classical models of a moving charge, a precessing magnetic dipole, a moving magnetic monopole, and a precessing electric dipole, are considered. The first 2 systems are separately P and T invariant, and the last 2 are neither P nor T invariant. A brief comment is made on charge conjugation (C) invariance and the classical validity of CPT invariance. (Contractor's abstract, modified)

STRUCTURE OF THE PROTON AND THE HYPERFINE SHIFT IN HYDROGEN, by C. K. Iddings. [1965] [13]p. incl. diagrs. tables, refs. (AFOSR-65-1775) (AF 49(638) 1389) AD 625937 Unclassified

Also published in Phys. Rev., v. 138: B446-B458, Apr. 26, 1965.

The proton-size correction to the hyperfine structure in the ground state of atomic hydrogen is re-examined. It is shown by means of dispersion relations that this correction can be expressed as an integral over experimentally measurable cross sections for electron-proton scattering. This clarifies the physical nature of the correction, puts it on a rigorous basis and lends support to previous analyses. In the absence of experimental data, some theoretical estimates for the correction are given. They agree with previous estimates, and therefore the present experimental value for the hyperfine splitting cannot be explained. Some possible implications of this disagreement are discussed and some experiments are suggested which would clarify the situation. (Contractor's abstract)

ROTATION AND GRAVITATIONAL COLLAPSE, by R. V. Wagoner. [1965] [6]p. (AFOSR-65-1831) AF 49(638)1389) AD 625933 Unclassified

Also published in Phys. Rev., v. 138: B1583-B1588, June 21, 1965.

A new method of solution of the Einstein field equations is used to investigate the gravitational collapse of a rotating massive body. The equations are studied on a timelike hyperplane of reflection symmetry within an axially symmetric distribution of perfect fluid. An explicit family of solution is obtained for the evolution in time of the metric at a fixed radius in a comoving coordinate system. These solutions contain as limiting cases, valid throughout the hyperplane, the nonrotating collapse of a uniform-density sphere and the Newtonian equation of motion for a class of finite rotating bodies. The general solution reveals that rotation is unable to halt gravitational collapse at a given comoving radius if the ratio of interior rest mass to angular momentum per unit mass is sufficiently large. In that case the contribution of the rotational kinetic energy to the effective gravitational mass becomes more important than the opposing effect of centrifugal force. This leads to a dynamical singularity, in which the proper-time derivatives of both radial and circumferential distances become negatively infinite, while the distances themselves remain finite. GIANT MAGNETIC QUADRUPOLE OSCILLATIONS IN NUCLEI, by T. DeForest, Jr., J. D. Walecka and others. [1965] [4]p. incl. diagrs. table, refs. (AFOSR-65-1832) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1389 and Office of Naval Research) AD 463453 Unclassified

Also published in Phys. Ltrs., v. 16. 311-314, June 1, 1965.

Calculations are carried out for the $J^- 2^-$, T 1 states in O^{16} and C^{12}, using the particle, hole approximation and the random phase approximation. Two elements of spin dependence are included-- that of the free force and the spin-orbit splitting of the configurations. In the calculations, a giant magnetic quadrupole state occurs at 20.76 mev in C^{12} and 21.34 mev in O^{16}. High resolution experiments on the giant dipole region in C^{12} and O^{16} at 180° are reported. The cross section for inelastic scattering at 180° from carbon of 65 mev primary electrons is plotted as a function of the excitation energy. A strong energy peak occurs at the 19.2 mev level in C^{12}. Similar results have been reported at the 20.2 mev level in O^{16}. These rapidly rising peaks in C^{12} and O^{16} suggest that they are the giant magnetic quadrupole oscillations.

ELASTIC MAGNETIC ELECTRON SCATTERING, by R. H. Pratt, J. D. Walecka, and T. A. Griffy. [1965] [8]p. incl. table, refs. (AFOSR-65-1833) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1389 and Office of Naval Research) AD 625925 Unclassified

Also published in Nuclear Phys., v. 64: 677-684, 1965.

The 180° elastic scattering of electrons from nuclei is discussed in Born approximation. In the derivation of the differential cross section given, only the static magnetic moment is seen in the backward direction as the momentum transfer $q \to 0$. The derivation has the advantage that it holds for an extended target with arbitrary charge and current distribution and with any spin. It also demonstrates how the experimental results can deviate from this limit. The ml form factor for F^{19} is calculated as experimental results for this nucleus have not been in agreement with the theory using the static magnetic moment. The analysis brings the theoretical cross section into agreement with experiment. (Contractor's abstract, modified)

DOUBLE-CHARGE-EXCHANGE SCATTERING OF

PIONS FROM NUCLEI, by R. G. Parsons, J. S. Trefil, S. D. Drell. [1965] [4]p. incl. tables, refs. (AFOSR-65-1834) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1389, and Atomic Energy Commission) AD 625921 Unclassified

Also published in Phys. Rev., v. 138: B847-B850, May 24, 1965

Pions offer a unique possibility as probes of nuclear structure since they can exchange two units of electrical charge unaccompanied by other quantum numbers. The double-charge-exchange cross section is calculated for the reaction $\pi^- + He^3 \rightarrow \pi^+ + 3n$ in the impulse approximation using the Chew-Low model for the pion-nucleon interaction. Only the dominant 3-3 channel is retained. For incident pions in the energy region of several hundred mev, values of the differential cross section of $d^2\sigma / d\Omega dE \approx 1.10$ μb mev are obtained for forward angles. Triple-scattering terms are also calculated and found to introduce corrections of 10^{-7} in $d^2\sigma / d\Omega dE$. Similar results are obtained when the work is extended to the reaction $\pi^+ + O^{18} \rightarrow \pi^- + Ne^{18}$ using shell-model wave functions.

STRUCTURE OF He^3 AND H^3 FROM HIGH-ENERGY ELECTRON SCATTERING, by T. A. Griffy and R. J. Oakes. [1965] [4]p. incl. diagrs. refs. (AFOSR-65-1835) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1389 and Office of Naval Research) AD 625939 Unclassified

Presented at meeting of the Amer. Phys. Soc., Gatlinburg, Tenn., Oct. 15-17, 1964.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10, 624, June 23, 1965

Also published in Rev. Modern Phys., v. 37: 402-405, July 1965.

The structure of the 3-nucleon systems He^3 and H^3 is investigated by analysis of their electron-proton coincidence cross sections. The cross section is computed using 2 approximations: (1) The nonrelativistic approximation in which the 3-body nucleus is described by a wave function, and (2) the nucleon-pole approximation. In the former case, calculations using the Irving-Gunn wave function are found to best agree with recent experimental results. In the latter case the shape of the cross section is given by the nucleon propagator and is also found in agreement with experimental data. The relation between the 2 approximations is presented

SINGLE-CHANNEL CALCULATION OF THE ρ RESONANCE WITH INELASTIC UNITARITY, by P. W. Coulter and G. L. Shaw [1965] [6]p. incl. diagrs. refs. (AFOSR-65-1836) (AF 49(638)1389) AD 625936 Unclassified

Also published in Phys. Rev., v. 138: B1273-B1278 June 7, 1965.

The width and shape of the ρ resonance are computed from a single-channel N/D formalism with inelastic unitarity. The input force is assumed to be furnished primarily by the exchange of the σ in the crossed channels. The input mass, 760 mev, and width, ~100 mev, are taken from experiment. The inelastic factor η is assumed to be determined by the $\pi\pi \rightarrow \pi\omega$ reaction at low energy and fitted to various arbitrary forms at higher energies. A cutoff is adjusted to produce the ρ resonance at the observed energy. The smallest output width obtained is 250 mev, as compared with 600 mev for the pure-elastic-scattering ($\eta = 1$) calculation. A more nearly symmetric shape for the resonance is obtained when inelastic effects are considered. (Contractor's abstract)

MULTICHANNEL EFFECTIVE-RANGE THEORY FROM THE N/D FORMALISM, by P. Nath and G. L. Shaw. [1965] [5]p. incl. diagrs. refs. (AFOSR-65-1837) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1389 and Atomic Energy Commission) AD 625932 Unclassified

Also published in Phys. Rev., v. 138: B701-B706, May 10, 1965.

An effective-range theory for systems of many coupled 2-body channels is given using the N/D formalism. The effective-range expansion is carried out in the amplitudes M_{ij}, where M is essentially the matrix T^{-1} with the right-hand cut removed. Quite in analogy with the single-channel effective-range theory, the diagonal elements M_{ij} are given by an expression quadratic in k_i, the relative momentum in channel i. The effective ranges R_{ii} are given by certain principal-value integrals which depend on the position of the left-hand singularities in the corresponding channels and can be taken to be energy-independent to the same extent as in the one-channel theory. The nondiagonal elements M_{ij}, in general, have a weak energy dependence and can approximately be treated as constants. A 2-channel computer experiment is performed to test these proposals in detail. Three different situations for the left-hand cut are considered: (1) a set of monopoles, (2) a set of dipoles, and (3) the left-hand cut produced by the exchange of scalar particles in the crossed t reactions. For a larger number of situations considered, the simple features proposed for the multichannel effective range theory are found to exist.

VALIDITY OF THE PHASE-SHIFT REPRESENTATIONS,

by Y. Fujii. [1965] [4]p. incl. diagrs. refs. (AFOSR-65-1838) (AF 49(638)1389) AD 625940 Unclassified

Also published in Phys. Rev., v. 139: B472-B475, July 26, 1965.

A previous discussion on the validity of the phase-shift representation is further developed. An example treated in a previous work based on a separable-potential model is given in an improved method to show that such a representation fails in more general cases than those considered recently by Bander, Coulter, and Shaw, based on a simplified N/D model. It is also shown that $\delta_I(S)$, the imaginary part of the elastic phase shift, is a boundary value of a function which connects the elastic S-matrix element in the physical sheet to that in other Riemann sheets. Consequently, $\delta_I(S)$ should be so chosen as to satisfy certain mathematical conditions as well as to fit experiments. The simplest example of such a function is given. (Contractor's abstract)

MESON DECAYS AS POSSIBLE TESTS FOR A STRONG C VIOLATION, by Y. Fujii and G. Marx. [1965] [3]p. (AFOSR-65-1839) (AF 49(638)1389) AD 625927 Unclassified

Also published in Phys. Ltrs., v. 17: 75-77, June 15, 1965.

Meson decays with simple transition matrix elements are investigated as possible tests for strong C violation. Three decays are considered: (1) the transition $\cdot \eta$ (2) the transition $\ldots \nu$, and (3) the transition $\varphi \rightarrow \gamma$. For (1) the observation of a decay $^0 \rightarrow \cdot^0 \gamma\gamma$ would prove the existence of a C violation. If the matrix element for (2) would not vanish, it would result in a decay mode $\omega \rightarrow (\cdot^+ \cdot^-)_{I=1}, \gamma$ in which the 2π system would be in a p state and characterized by I = 1. This would mean a C violation, though difficulties occur because of the low Q value of (2). The observation of the analogous case (3) would establish a C violation. It is noted that it would be worthwhile to search after the $\cdot \pi\pi\gamma$ decay as it seems to be favorable for the measurement of the ratio of the C violating and C conserving matrix elements.

DEUTERON ELECTROMAGNETIC FORM FACTORS - II, by M. Gourdin. [1965] [9]p. incl. refs. (AFOSR-65-1867) (AF 49(638)1389) AD 626811 Unclassified

Also published in Nuovo Cimento, Series X, v. 35: 1105-1113, Feb. 16, 1965.

Using the impulse approximation for the deuteron in the Breit system corrections are presented to a previous calculation of the deuteron electromagnetic form factors, taking into account the momentum of the spectator nucleon. For the magnetic moment, the well-known nonrelativistic formula $\mu_d = (\mu_p + \mu_n)(1 - 3/2 P_D) + 3/4 p_D$, has been obtained. The most important corrections seem to be: (1) meson exchange current effects; (2) relativistic corrections to the neutron-proton deuteron vertex; and (3) off-mass-shell-dependence of the nucleon form factors.

RELATIVISTIC EFFECTS IN THE FORM FACTORS OF He^3 AND H^3, by G. B. West. [1965] [7]p. incl. diagrs. refs. (AFOSR-65-1971) (AF 49(638)1389) AD 626330 Unclassified

Also published in Phys. Rev., v. 139: B1246-B1252, Sept. 2, 1965.

Relativistic corrections to Schiff's nonrelativistic analysis of the 3-body nuclei form factors are estimated. High-energy electron scattering from these nuclei is re-examined using an impulse approximation in which the intermediate nucleon states are taken to propagate and interact as free particles. It is concluded that the corrections to the form factors are small (5%) for $- q^2$ 8 F^{-2}. However, it is shown that they assume great importance if the experiments are used to investigate the neutron charge form factor. Various effects arising from the use of the impulse approximation are discussed. These include considerations of current conservation, of the static limit ($q^2 \cdot 0$), and of the extraction of nuclear form factors from the impulse-approximation nuclear current. MUON CAPTURE AND INELASTIC ELECTRON SCATTERING IN C^{12} AND O^{16}, by T. DeForest, Jr. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-65-1972) (AF 49(638)1389) AD 626331 Unclassified

Also published in Phys. Rev., v. 139: B1217-B1226, Sept. 6, 1965.

The dipole contribution to the muon-capture matrix elements, M_V, M_A, and M_P, is calculated using wave functions computed in the particle-hole theory. It is found that $(M_V^2)_D \quad (M_A^2)_D = (M_P^2)_D$ to within 13%. The assumption that the dipole part of the nuclear matrix element may be expressed as the unretarded dipole matrix element multiplied by the elastic form factor is found to hold to about 1%. Calculations of inelastic electron scattering from the 2-, T 1 states in these nuclei predict large cross sections for some of the states at about 100 mev c momentum transfer These giant-magnetic-quadrupole states are identified with observed levels found in recent 180° electron-scattering experiments (Contractor's abstract)

P- AND D-STATE CONTRIBUTIONS TO THE MAGNETIC MOMENT FORM-FACTORS OF H^3 AND He^3, by B. F. Gibson. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-65-1973) (AF 49(638)1389) AD 626332 Unclassified

Also published in Phys. Rev., v. 139: B1153-B1159, Sept. 6, 1965.

The effects of reasonable admixtures of P- and D-state ($J^P = 1^+$, $T = 1/2$) components to the ground-state wave function of H^3 and He^3 on their magnetic moment form factors are calculated. It is found that these form factors cannot be accounted for in this way. Inclusion of the S' state and a typical $T = 3/2$ state still leaves the magnetic form factors unexplained, although such an admixture is shown to account for the difference between the observed charge form factors. The empirical isoscalar and isovector exchange magnetic moment form factors that are needed to fit the experimental data are calculated. (Contractor's abstract)

MESON STATES IN A NONLINEAR SPINOR MODEL OF ELEMENTARY-PARTICLE THEORY WITH SPONTANEOUS SYMMETRY BREAKDOWN, by N. Byrne, C. Iddings, and E. Shrauner. [1965] [12]p. incl. diagrs. refs. (AFOSR-65-1974) (AF 49(638)1389) AD 626814 Unclassified

Also published in Phys. Rev., v. 139: B933-B944, Aug. 23, 1965.

A self-coupled spinor model of elementary particles having $SU_2 \times SU_2$ symmetry is considered. It is demonstrated that for the case of complete spontaneous breakdown of the isospin symmetry the bubble approximation gives a method for treating the meson states that is compatible with symmetries of the model in that it gives the Goldstone bosons and Goldberger-Treiman relations exactly. It is also shown that by a continuation in the parameter characterizing the isospin breakdown a transformation can be made from a solution having isospin degeneracy to solutions in which the isospin, as well as the chiral symmetry is spontaneously broken. Calculational techniques for this approximation are explicitly given. (Contractor's abstract, modified)

THE $\eta \to \pi^+ \pi^- \pi^0$ DECAY WITH C-VIOLATION, by M. Nauenberg. [1965] [3]p. (AFOSR-65-1975) (AF 49(638)1389) AD 626812 Unclassified

Also published in Phys. Lett., v. 17: 329-331, July 15, 1965.

Calculations are presented for the effect of C violation on the η decay spectrum. It is assumed that in addition to a $I = 1$ $\eta \to 3\pi$ transition due to virtual electromagnetic interactions, there exists a $I = 0$ transition induced by the interaction H which violates C. The resultant $\pi^+ \pi^-$ asymmetry has very characteristic features due to the fact that the final $I = 0$, 3π state is antisymmetric under the exchange of any pair of pion momentum. Some details of a model for $\eta \to 3\pi$ decay are discussed. The possibility that the C-violating interaction H violates isospin, and in particular that it allows an η decay to the $I = 2$, 3π state is considered.

BREAKDOWN OF UNITARY OCTET SYMMETRY IN A NONLINEAR SPINOR MODEL OF ELEMENTARY-PARTICLE THEORY, by N. Byrne, C. Iddings, and E. Shrauner. [1965] [15]p. incl. diagrs. tables, refs. (AFOSR-65-1976) (AF 49(638)1389) AD 626813 Unclassified

Also published in Phys. Rev., v. 139: B918-B932, Aug. 23, 1965.

The spontaneous breakdown of unitary octet symmetry in a nonlinear spinor model of elementary-particle theory is considered. This model is an adaptation to unitary octet symmetry of a previous model, and it contains $SU_3 \times SU_3$ symmetry in the same way that the previous model contained $SU_2 \times SU_2$ symmetry (Phys. Rev., v. 122: 345, 1961 and v. 124: 246, 1961). An exact formula is derived for the physical baryon mass that reduces to the usual superconductor-type formula in the lowest order approximation. Nonperturbative solutions that leave the physical Λ and Σ masses degenerate are obtained. The presence is confirmed in the nonperturbative solutions of massless pseudoscalar and scalar mesons transforming as components of F-type octets as predicted by the Goldstone theorem. Massless pseudoscalar and scalar mesons are found that transform as components of unitary spin decimets. Only the F octets are Goldstone mesons associated with the spontaneous breakdown of octet symmetry in this model, whereas the massless decimets are associated with the invariance of a restricted part of the Langrangian under a larger group and their masslessness is not a consequence of symmetry breakdown in these solutions. HYPERFINE STRUCTURE AND WEAK INTERACTIONS, by J. B. Adams. [1965] [2]p. incl. table. (AFOSR-65-2096) (AF 49(638)1389) AD 627633 Unclassified

Also published in Phys. Rev., v. 139: B1050-B1051, Aug. 23, 1965.

The contribution of possible 4-fermion V-A weak interactions to the hyperfine splitting is considered for the hydrogen-like bound systems (e^-, p^+), (μ^-, p^+), (e^-, μ^+), and (e^-, e^+). Numerical values are presented for the change in hyperfine splitting due to the weak interactions, ΔE_W, and the ratio of this splitting to the fundamental electromagnetic splitting, E_{EM}. Because there exists an uncertainty in the theoretical prediction of E_{EM} for the (e^-, p^+) system and because the finite lifetimes of the (e^-, μ^+) and (e^+, e^-) systems impose a minimum limit on the line breadth of the hyperfine transition, these systems do not prove practical to test theories of weak interactions. However, for the mesonic atom (μ^-, p^+) the size of the effect, 19 parts per million, might be experimentally measurable. (Contractor's abstract, modified)

ABSORPTIVE CORRECTIONS AND FORM FACTORS IN THE PERIPHERAL MODEL, by M. Bander and G. L. Shaw. [1965] [7]p. incl. diagrs. refs. (AFOSR-65-2097) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1389, and Atomic Energy Commission) AD 629020 Unclassified

Also published in Phys. Rev., v. 139: B956-B962, Aug. 23, 1965.

Absorptive corrections applied to the peripheral model have provided a relatively successful interpretation of a variety of high-energy production processes. There exist, however, a number of difficulties associated with these calculations. This paper considers the reaction $\pi N \to N$, which is dominated by π exchange, in order to study the following three ambiguities: (1) the actual dependence of the absorptive corrections on the initial- and final-state elastic-scattering phase shifts, (2) the role of a form factor, and (3) the numerical values of the final-state elastic-scattering phase shifts. The comparison of the calculation made with the experimental data, in particular the density matrix of the leads to the following results. The $J = 1^+/2$ partial waves must be totally suppressed by the absorptive corrections and the form factor must play a very minor role in order to fit the observed deviation of the ρ's density matrix from that predicted by the exchange of a π in the peripheral model. Any form factor associated with π exchange is expected to have a weak t dependence, since there exists no resonance with the approximate quantum numbers (to couple to the π) with energy < 1.3 bev. It is plausible that form factors, while unimportant for π exchange, may play a significant role in vector exchange. (Contractor's abstract)

PROPERTIES OF A MASSIVE NEUTRAL GAUGE PARTICLE, by Y. Fujii. [1965] [7]p. incl. diagrs. table, refs. (AFOSR-65-2786) (AF 49(638)1389) AD 629283 Unclassified

Also published in Phys. Rev., v. 138: B423-B429, Apr. 26, 1965.

The properties of a massive neutral vector particle were investigated which is assumed to be gauge particle associated with the baryon number and to bear strong interactions. The strong resemblance to quantum electrodynamics serves as a guide. Results are as follows: (1) A simple relation between the mass and wave-function renormalizations is obtained. (2) The theory of mixing between two vector particles cannot be applied in its simplest form if one or both of them are gauge particles. (3) There are some restrictions on the form of the interaction with mesons, which can be tested experimentally. The analysis of the production of two vector particles from a pion incident on a nucleon is proposed as an example. (Contractor's abstract)

RADIATIVE LEPTON PRODUCTION BY A NEUTRINO BEAM, by J. B. Adams. [1965] [10]p. incl. diagrs. table, refs. (AFOSR-66-0433) (In cooperation with Brandeis U., AF AFOSR-63-368) (AF 49(638)1389) AD 630355 Unclassified

Also published in Phys. Rev., v 140· B1131-B1140, Nov. 22, 1965.

The reaction $\nu + n \rightarrow \mu + p + \nu$ is considered. To an extensive perturbation-theory type model for the nonradiative reaction ($\nu + n \rightarrow \mu + p$) are added electromagnetic interactions of the particles involved. Total and differential cross sections are computed for several neutrino energies in the BeV range. Results when normalized to the nonradiative cross sections are found to be insensitive to parameters in the model except the nucleon anomalous moments. For high-energy neutrinos, the effect of the anomalous moments is manifest as a striking peak in the photon spectrum when displayed as $d\sigma$ d lnk versus lnk. This offers the possibility of testing for the excitation of higher nucleon resonances in the reaction. (Contractor's abstract)

ON THE ELECTROMAGNETIC STRUCTURE OF THE YUKAWA MESON, by L. I. Schiff [1965] [6]p. (AFOSR-66-0435) (AF 49(638)1389) AD 630398 Unclassified

Also published in Prog. Theoret. Phys., Suppl., Extra Number 400-405, 1965.

A discussion is presented of a recent proposal of hofstadter for the measurement of the electromagnetic form factor of the Yukawa meson, by comparing the elastic scattering of positive and negative pions on an isoscalar nucleus. A formalism is developed which permits coulomb effects to be calculated to first order without the use of coulomb wave functions. In particular, it is shown that the coulomb born amplitude is not enough in itself, but that there are additional first order coulomb effects that arise from distortion of the pion wave function by the nuclear interaction. COUPLING CONSTANTS IN MUON CAPTURE, by L. L. Foldy and J. D. Walecka. [1965] [12]p. incl. diagrs. table, refs. (AFOSR-66-0452) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638) 1389, and Atomic Energy Commission) AD 630087 Unclassified

Also published in Phys. Rev., v 140 B1339-B1350, Dec. 6, 1965

The measured capture rate of muons in C^{12} leading to the ground state of B^{12}, in combination with other data, is employed as a basis for a determination of the weak-interaction coupling constants associated with muon capture. The study of this transition has the advantages: (1) that the rate depends only weakly on the vector, induced pseudoscalar, and (possible) tensor coupling constants, but not at all on a possible scalar coupling constant; (2) that empirical information from inelastic electron scattering on C^{12} leading to the excitation of the 15.1-mev level, the M 1 lifetime of this level, and the ft 1/2 value for the β decay of B^{12} allows one to determine the required nuclear matrix elements of major importance (as well as some of minor importance) in practically a model-independent way. The capture rate can thus be expressed in terms of the axial vector coupling constant and the weak-magnetism coupling constants. Assuming the validity of the conserved-vector-current hypothesis (CVC), and $5 \; C_p \cdot 28$, one then finds that $F_A{}^\mu F_A{}^\beta = 1.04_{-0.10}^{+0.07}$. On the other hand, if one assumes $F_A{}^\mu = F_A{}^\beta$, one obtains for the isotopic vector magnetic moment of the nucleon (at the appropriate momentum transfer) $\mu(\nu^2) = 5.7_{-1.6}^{+1.1}$ nuclear magnetons, which is consistent with the CVC prediction of 4.60 nm and can be considered as evidence for weak magnetism in muon capture. SPONTANEOUS SYMMETRY BREAKDOWN IN A NON-LINEAR BOSON FIELD: A MODEL FOR C VIOLATION, by G. Marx. [11]p. [1965] incl. diagrs. refs. (AFOSR-66-0475) (AF 49(638)1389) Unclassified

Also published in Phys. Rev., v. 140: B1068-B1078, Nov. 22, 1965.

A boson field with quartic self-coupling is discussed in the BCS approximation. For certain values of the coupling constant the transition from simple products to normal ordered products by a Bogolyubov transformation implies a spontaneous breakdown of the original symmetries in the Lagrangian. In a real scalar field a discrete symmetry can be broken; in more complex fields mass splitting also occurs. If the boson is characterized by the assignment 0^{+-}, the nonvanishing vacuum expectation value of its field operator may result in tadpole diagrams, which offer an explanation of the C-violating transitions. The experimental consequences of different coupling schemes between the 0^{+-} meson and other particles are discussed in detail. The role of the $\varrho\pi\eta$ and $\varrho\pi X$ matrix elements is emphasized in explaining different C-violating transitions in SU(2)- and SU(3)-symmetric ways, respectively.

ELECTRON SCATTERING FROM THE MAGNETIC DIPOLE AND OCTOPOLE MOMENTS OF BERYLLIUM-9 AND BORON-11, by R. E. Rand, R. Frosch, and M. R. Yearian. [1965] [4]p. incl. diagrs. refs. [Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission and Office of Naval Research under [Nonr-22567]) Unclassified

Published in Phys. Rev. Ltrs., v. 14: 234-237, Feb. 15, 1965.

Measurements were taken of the magnetic form factors of Be^9 and B^{11} by electron scattering at an angle of 180°. A method for studying the properties of the octopole moment in light nuclei was proposed. It was concluded that agreement between the experimental points and the theoretical curves would indicate that the single-particle model could be made to fit the data by multiplying the dipole and octopole moments by the same factor.

INELASTIC ELECTRON SPECTRA FROM THE ELECTRODISINTEGRATION OF DEUTERIUM (Abstract), by M. R. Yearian, E. B. Hughes and others. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under [Nonr-22567]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 95, Jan. 27, 1965.

The momentum spectrum of inelastic electrons from the electrodisintegration of the deuteron has been measured for values of the 4-momentum transfer, $q^2 = 1.5$, 2.5, 4.6, and 7.5 F^{-2}. The spectra were obtained for 3 different scattering angles for each value of q^2, with the exception of 7.5 F^{-2} where only one spectrum at $\theta = 120°$ was obtained. A comparison has been made between the observed cross sections and that predicted from a simplified form of the Durand theory, which neglects the D-state component of the deuteron wavefunction and the final-state n-p interaction. Discrepancies between the theory and experiment are observed for momenta close to the elastic peak and near the peak in the inelastic peak, the agreement is surprisingly good. For the lowest values of q^2, a peak appears in the inelastic spectrum corresponding to a strong $^1S_0$ n-p final-state interaction. Neutron form factors were obtained from the area under the inelastic peak and compared with those obtained using quasielastic-peak method.

NEUTRON FORM FACTORS FROM INELASTIC ELECTRON-DEUTERON SCATTERING (Abstract), by E. B. Hughes, T. A. Griffy and others. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under [Nonr-22567]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 95-96, Jan. 27, 1965.

Values of the neutron form factors G_{mn} and G_{en} have been obtained from electron-deuteron scattering for values of the 4-momentum transfer $q^2 = 1.0$ to 30.0 F^{-2}. The square of the neutron's charge form factor $(G_{en})^2$ was found to be zero for $q^2 > 6F^{-2}$, with an error of approximately 5% due to uncertainties in the theoretical expression for the electrodisintegration cross section. For values of $q^2 < 6F^2$, negative values were obtained for $(G_{en})^2$, suggesting a theoretical uncertainty greater than 5%. The results for the neutron form factors were combined with the recent determination of the proton form factors by Janssens to obtain the isotopic vector and scalar form factors. The isotopic form factors are analyzed in terms of the known vector mesons, ω, ϕ, and ρ. An adequate fit to the form factors is obtained if one uses an effective ρ mass of 567 mev. An attempt has also been made to obtain a fit to the form factors by including an additional isovector meson of variable mass and requiring that the ρ mass be near its experimental value of 750 mev.

EXPERIMENTS AT LIQUID HELIUM TEMPERATURES ON MACROSCOPIC QUANTUM EFFECTS AND GENERAL RELATIVITY, by W. M. Fairbank. Final rept. Aug. 7, 1965, 3p. (AFOSR-65-1600) (AF AFOSR-62-119) AD 623790 Unclassified

A review is presented of research in the following three areas: (1) preliminary research on the design of a low temperature gyro experiment to check the general theory of relativity by an experiment proposed by L. I. Schiff, (2) quantized flux in superconductors which is found to be in integral units of hc 2e instead of hc e; and (3) the scattering of light from He II to see quantized vortices. During this investigation, a superconducting circuit was developed capable in principle of measuring 10^{-11} gauss, and the idea of a truly zero magnetic field region was conceived, made possible by the fact of flux quantization in superconductors.

SPIN AND GRAVITATION, by H. Pagels. [1965] [24]p. incl. refs. (AFOSR-65-0814) (AF AFOSR-62-452) AD 616217 Unclassified

Also published in Ann. Phys., v. 31: 64-87, Jan. 1965.

The presence of a gravitational or electromagnetic field can be regarded as altering the symmetries of flat spacetime in such a way that the group of translations for states with charge and spin is no longer abelian. Furthermore, just as invariance under gauge transformations implies current conservation, invariance under general coordinate and general similarity transformations implies that the stress-energy tensor must satisfy $T^{\alpha\beta}{}_{,\beta} = 0$ and $(T^{\alpha\gamma} x^{\beta} - T^{\alpha\beta} x^{\gamma})_{,\alpha} = 0$, ten conditions which lead to the Einstein equations. It is also possible to construct the gravitational analogue of the electromagnetic current, $J_{\alpha} = (K/2)\sigma_{\lambda\zeta} T_{\alpha}{}^{\lambda\zeta}$, which depends on the way in which the distribution of matter changes, and is divergence-free because of the Einstein equations. In this way the dynamical content of symmetry principles is emphasized, and it is shown that Einstein's equations essentially follow from covariance alone. (Contractor's abstract)

MEASUREMENT OF THE LONDON MOMENT, by M. Bol and W. M. Fairbank. [1965] [4]p. incl. diagrs. [AF AFOSR-63-348] Unclassified

Published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9(Pt. A): 471-474, 1965.

It is shown that a solid rotating mercury cylinder reversibly obeys London's equations when cooled through the superconducting transition. Thus, when a mercury cylinder is cooled through the transition while rotating with angular velocity w, the electrons in the surface layer spontaneously l ; behind, producing a d.c. axial magnetic field within the superconducting of 10^{-7} wg. This same field is produced if the sample is cooled into the superconducting state without rotation and is subsequently set into rotation with an angular velocity w.

QUANTIZED FLUX IN SUPERCONDUCTING CYLINDERS, by A. L. Kwiram and B. S. Deaver, Jr. [1965] [4]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-348] and Office of Naval Research) Unclassified

Published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9(Pt. A): 451-454, 1965.

The flux change occurring in small hollow superconducting cylinders cyclically cooled through the transition temperature in an applied axial magnetic field at frequencies up to 80 kcps was observed. A periodic variation as a function of applied field was found at all frequencies tried, indicating that the quantized flux is established in these cylinders at least at fast as 10^{-5} sec. The period has been measured and corresponds to a flux change of hc 2e through the cylinder. Measurements were made on tin, indium, lead, and vanadium cylinders about 1 cm long and about 40 μ 00. Various wall thicknesses from 500 A up to 15,000 A were used.

SPONTANEOUS AND SUGGESTED POSTHYPNOTIC AMNESIA, by E. R. Hilgard and L. M. Cooper. [1965] [13]p. incl. diagrs. tables. (AFOSR-66-2207) (AF 49(638)1436) AD 643591 Unclassified

Also published in Internat'l. Jour. Clin. and Exper. Hypnosis, v. 13: 261-273, 1965.

This investigation was carried out to obtain comparable figures on the prevalence of spontaneous and suggested posthypnotic amnesia. Ninety-one introductory psychology students were randomly assigned to 1 of 2 groups, and were required to serve as Ss for two consecutive days. The standard induction of the Stanford Hypnotic Susceptibility Scale, Form A was used on the first day, and that of Form B on the second. Suggestibility items were then presented and served to apprise susceptibility and to test for amnesia. For 1 group, spontaneous amnesia was tested on the first day, and suggested amnesia on the second day. This order was reversed for the second group. Using as evidence of amnesia that 4 or fewer of the 10 possible items were recalled, 6 (7%) showed spontaneous amnesia on one of the 2 days, while a significantly large number 32 (35%), showed suggested amnesia. When the groups were subdivided on the basis of susceptibility scores, it was found that there is a marked advantage for suggested amnesia over spontaneous amnesia for highly susceptible hypnotic Ss, while this difference essentially disappears for low Ss. It was further found that (a) suggested amnesia is significantly greater than spontaneous amnesia whether or not one follows the other, (b) there is a small effect of the suggested posthypnotic amnesia for all levels of susceptibility, but this becomes pronounced with susceptibility scores of 6 and above, (c) the highly susceptible hypnotic Ss show no more spontaneous posthypnotic amnesia than do others. While there may be a small amount of spontaneous amnesia, this amount, if any, is small compared with suggested amnesia. (Contractor's abstract)

THE FRONTIERS OF PSYCHOLOGY, by E. R. Hilgard. [1965] [15]p. incl. refs. [AF 49(638)1436] Unclassified

Published in Science in the Sixties; Tenth Anniversary AFOSR Scientific Seminar, Cloudcroft, N. M. (June 14-25, 1965), ed. by D. L. Arm, Albuquerque, New Mexico U. Office of Publications, 1965, p. 58-72.

In this discussion of psychology as both a basic and an applied science, the vitality of the field and its current breadth is presented. At the same time, it is shown that the difference between basic and applied science is not so great when both are good science, and that in fact, they mutually interact. Psychology as a basic science is described through a consideration of current work in 3 large fields: biological, general experimental, and social psychology. Psychology as a technology is described by a discussion of personality tests, programmed learning, psychotherapy, and persuasive techniques. It is pointed out that without basic research, the applications would often be ineffective and uncritical, and without the technological applications, important areas of investigation might have their basic problems overlooked.

ON A CHARACTERIZATION OF THE THREE LIMITING TYPES OF THE EXTREME, by J. Sethuraman. Feb. '1965, 12p. (Technical rept. no. 104) (AFOSR-65-0637) (Sponsored jointly by Air Force Office of Scientific, Army Research Office (Durham), and Office of Naval Research) AD 610845 Unclassified

If X and Y are independent random variables then they are said to be completely confounding if the distributions of Z, Z conditional on Z = X, Z conditional on Z = Y are the same. If X, Y, and Z completely confound one another where Y and Z have the same distribution as $a_1X + b_1$ and $a_2X + b_2$ which are basically different linear functions, then the distribution of X is one of the three limiting types of the extreme (minimum) observation from independent samples from the same population.

ALGEBRAIC STRUCTURE OF LINEAR DYNAMICAL SYSTEMS. I. THE MODULE OF Σ, by R. E. Kalman. [1965] [6]p. (AFOSR-67-1469) (AF 49(638)1440) AD 654828 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 54: 1503-1508, Dec. 1965.

The main result of this first note is the theorem that a linear, constant, discrete-time dynamical system Σ is a (finitely generated) module over the polynomial ring K[z] with coefficients in an arbitrary field K. In other words, Σ may be viewed as the realization of a certain algebraic structure (a module), just as classical mechanics may be interpreted as the realization of a certain analytic structure (a differential equation). This result is applied to the proof of the existence of transfer functions, derivation of recursion relations, and controllability criteria associated with Σ algebraic ideas and methods are stressed.

TWO-DIMENSTIONAL HYPERSONIC STAGNATION FLOW AT LOW REYNOLDS NUMBERS, by T. K. Fannelop and I. Flugge-Lotz. [1965] [15]p. incl. diagrs. tables, refs. (AFOSR-65-2332) (AF AFOSR-62-242) AD 629666 Unclassified

Also published in Zeitschr. Flugwissensch., v. 13: 282-296, 1965.

An accurate boundary-layer analysis for hypersonic high altitude flight requires consideration of second-order (low Reynolds-number) effects. In the case of viscous flow over a cylinder with finite nose radius the second-order effects are found to be those arising from wall curvature, from velocity slip and temperature jump at the wall and from displacement-thickness interaction. A complete theory which accounts for all these effects has been given by M. D. Van Dyke. Local solutions to Van Dyke's equations for the stagnation region can be obtained by an expansion in powers of s (the arclength from the stagnation point) without use of auxiliary transformations. These local solutions become independent of the free stream conditions when the exact Sutherland viscosity law is approximated by a power law. A large number of solutions for various wall-to-stagnation-temperature ratios and power-law exponents are tabulated. These solutions are sufficiently accurate (5 to 6 decimal places in most cases) to be used as initial values for step-by-step numerical procedures for solving the first-and second-order boundary layer equations. Perfect-gas relationships are used in the analysis and the solutions are strictly applicable only when the stagnation temperature is not too high. When the wall is cold the heat-transfer rate at the stagnation point is found to be reduced due to the second-order effects. The calculated reductions are, however, much smaller than the measured reductions reported by Tewfik and Giedt, but they agree with Lenard's theoretical results. (Contractor's abstract)

PHOTOPRODUCTION OF NEUTRAL MESONS FROM HYDROGEN NEAR THRESHOLD, (Abstract) by F. Bulos and B. Richter, [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [Nonr-22567], Atomic Energy Commission, and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys., Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 446, Apr. 26, 1965.

Absolute and differential cross sections have been measured for the photoproduction of neutral pions from hydrogen at 3 different laboratory γ-ray energies: 185, 170, and 160 Mev. The recoil proton was momentum-analyzed and identified by 2 counters in coincidence. The coefficients A, B, C for the c.m. angular distribution ($d\sigma/d\Omega$), $A + B\cos\theta + \cos^2\theta$ were determined. Using the dispersion relation calculation of Chew, Goldberger, Low, and Nambu the coefficients A, B, C were expressed in terms of S and P waveshifts in the isotopic spin states 2 3, 1 2. Taking the better known phase shifts from scattering experiments the phase shifts δ_{11}, δ_{13} were calculated. It was found that δ_{11} is negative at the above energies and goes positive at γ-ray energy of 325 mev corresponding to pion energy in scattering experiments of 180 mev. Absolute and differential cross sections and values of phase shifts that best fit the experiment are presented

Published in Phys. Rev., v. 139 B1079-B1085, Aug. 23, 1965.

The importance of 2-photon exchange in elastic electron-proton scattering was investigated by measuring the ratio of positron-proton to electron-proton scattering. Four-momentum transfers as large as 0.756 $(bev/c)^2$ (19.5 F^{-2}) were used. The data indicate that 2-photon effects are (4.0 ± 1.5)% larger than those predicted by the radiative corrections at the highest momentum transfers attained in these experiments. The 2-photon corrections predicted using a static charge distribution fit the data well at lower momentum transfer and forward angles, but appear to be small at higher momentum transfer and backward angles. A CORRELATED URN-SCHEME FOR A CONTINUUM OF RESPONSES, by B. C. Arnold. July 20, 1965, 84p. incl. table, refs. (Technical rept. no. 75) (AFOSR-65-1594) (AF 49(638)1253) AD 623171 Unclassified

A new model to cover the case of simple learning with a continuum of responses is presented and analyzed. Called a correlated urn-scheme, it is an adaption of the continuous analog of the classical urn-scheme for learning. The behavior of the model under non-contingent reinforcement is investigated and tests of the applicability of the model are derived. Sufficient conditions, relating to reinforcement schedules, for ergodic behavior in the case of contingent reinforcement are developed using a theorem due to Ionescu-Tulcea. The relation of the correlated urn-scheme to existing models is discussed, with much attention to the much used linear model, and possible generalizations of the urn-scheme are suggested.

THE GENERALIZATION FUNCTION IN THE PROBABILITY LEARNING EXPERIMENT, by M. V. Levine, June 3, 1965, 109p. incl. diagrs. table, (Technical rept. no. 73) (AFOSR-65-1595) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49 (638)1253], National Institutes of Health and National Science Foundation) AD 622587 Unclassified

This report formulates and studies some methods for obtaining generalization functions from learning data. First it considers mathematical questions and concludes that the generalization function defined with respect to a slight modification of a familiar learning model is essentially determined by the behavior of the individual subject in one experiment. Next it is shown that generalization functions obtained by application of the methods can be used to predict certain empirical functions with great accuracy. Finally, it studies the empirical generalization functions and attempts to describe and account for the relationship between the function and distribution of reinforcements (Contractor's abstract, modified)

LANGUAGE IDENTIFICATION IN THE LIMIT, by E. M. Gold. [Dec. 1965] 33p. incl. refs. (Rand RM-4136-PR) (AFOSR-66-0419) [AF AFOSR-65-856]
AD 631779 Unclassified

Language learnability is investigated. That is, given a specified class of possible languages and given a method of presenting information about the unknown language, which is to be chosen from the class, the question is asked, "Is the information sufficient to distinguish the unknown language?" Many definitions of distinguishability are possible, but only one is considered here. In this preliminary investigation, a language is taken to be only a set of strings on some finite alphabet which is specified a-priori. Several variations of each of two basic methods of information presentation are investigated: A text for a language generates strings of the language in any order such that every one occurs at least once. An informant for a language can tell the learner whether or not a string is in the language and does so at each time. It is found that the class of context sensitive languages is learnable from an informant, but not even the class of regular languages is learnable from a text. (Contractor's abstract, modified)

GALACTIC FLARES AND QUASI-STELLAR RADIO SOURCES, by P. A. Sturrock. [1965] [4]p. incl. refs. (AFOSR-65-1079) [AF 49(638)1321] AD 619755 Unclassified

Also published in Nature, v. 205: 861-864, Feb. 27, 1965.

A theory of galactic explosions is proposed on the basis that the requirements for such a theory are the same as for a theory of solar flares. The pre-flare state on a galactic scale comprises a large mass of gas which is prevented from collapsing by the pressure of a trapped magnetic field; such a configuration is called a galaxoid. Both gravitational and magnetic energies will be released if the magnetic field and the gas can be de-coupled. Evidence in support of the theory is discussed.

RADIATION AT THE PLASMA FREQUENCY AND ITS HARMONIC FROM A TURBULENT PLASMA, by P. A. Sturrock, R. H. Ball, and D. E. Baldwin. [1965] [8]p. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1321 and National Aeronautics and Space Administration) Unclassified

Published in Phys. Fluids, v. 8: 1509-1516, Aug. 1965.

Any mechanism which couples electrostatic waves (plasma oscillations) and electromagnetic waves in a plasma will lead to radiation from plasma oscillations. The most important consequence of nonlinearity of the equations is that 2 electrostatic waves are coupled to one electromagnetic wave; this process is therefore responsible for radiation at the second harmonic ($2\omega_p$). Low-frequency or static inhomogeneities of the plasma couple one electrostatic wave to one electromagnetic wave, and therefore, produce radiation at (or near) the plasma frequency. Two types of inhomogeneity are considered: "isotropic" inhomogeneities, which are fluctuations in the plasma density, and "anisotropic inhomogeneities," which comprise an inhomogeneous distribution of currents and magnetic fields These radiation mechanisms are analyzed by means of a set of fluid equations for the electron component, which should provide an adequate description for plasma oscillations with wavenumbers small compared with the Debye wavenumber. The radiation field is evaluated by a Green function method, ignoring re-absorption, which one expects to be a very weak process. For each radiation mechanism, a formula is obtained for the volume emissivity of a turbulent plasma representing the plasma oscillations and the inhomogeneities each by a correlation function and an energy spectrum. Useful approximate forms of these formulas are given. (Contractor's abstract)

HARMONIC GENERATION AND PARAMETRIC OSCILLATIONS IN A PLASMA, by J. H. Krenz and G. S. Kino. [1965] [9]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham) and Office of Naval Research under Nonr-225-48) Unclassified

Published in Jour. Appl. Phys , v. 36: 2387-2395, Aug. 1965.

Nonlinear rf effects in plasmas are discussed. It is shown that the strong type of harmonic generation mechanism is due to the equation of motion for the plasma electrons being nonlinear, as is the relationship between current and velocity. A theory of plasma harmonic generators and parametric oscillators is given. Input reaction is taken into account and it is shown that a resonance at the output frequency tends to lead to high efficiency. Such a resonance is the electrostatic resonance of a plasma sphere. Experiments carried out with a small spherical rf discharge are described. A 25% conversion efficiency to the second harmonic of an S-band signal has been obtained. Measurements have been made up to the seventh harmonic. For maximum efficiency a plasma resonance at the harmonic of interest is required. By tuning the system to be resonant at half the input frequency, parametric oscillations were obtained at this frequency, thus proving that the nonlinearity must be of a reactive type. It is believed this is the first time that parametric oscillations have been observed in a plasma.

INTERACTION OF LIGHT AND MICROWAVE SOUND, by C. F. Quate, C. D. W. Wilkinson, and D. K. Winslow. [1965] [21]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Aeronautical Systems Division; Air Force Office of Scientific Research under AF 49(638)1429, and Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-22548) Unclassified

Published in Proc. IEEE, v. 53: 1604-1623, Oct. 1965.

The interaction of sound waves at microwave frequencies and electromagnetic waves at optical frequencies is denoted by the term Brillouin scattering. In the past, this type of scattering has been used for measuring elastic constants of materials. Interest in this subject has been renewed with the availability of coherent light from a laser and there are now a variety of problems where this interaction can be utilized. It can be used to modify an optical beam by either deflecting it in space or translating it in frequency. It can be used to monitor the spatial distribution of acoustic energy. Brillouin scattering from thermal sound waves can be used to determine the velocity of sound and attenuation in media where it is difficult to use more conventional means. With stimulated Brillouin scattering, an intense light beam can generate coherent sound of great intensity. The authors discuss each of these cases and calculate the interaction in terms of classical parametric amplifiers and parametric oscillators are exhibited. Recent experimental results are summarized and serve to confirm the simple picture wherein the 2 wave systems are coupled together by the photoelastic and electrostrictive constants of the medium. PHONON DRAG AND PHONON INTERACTIONS IN N-InSb, by S. M. Puri. [1965] [15]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham) and Office of Naval Research under [Nonr-22548]) Unclassified

Published in Phys. Rev., v. 139: A995-A1009, Aug. 2, 1965.

The experimental results of phonon-drag thermoelectric power of n-InSb are analyzed to obtain information about electron-phonon and phonon-phonon interactions. We find that for temperatures greater than 6°K, the piezoelectric mode of electron scattering is negligible as compared to the deformation potential type of scattering. A value of 8.25 ev is found for the deformation-potential constant. The relaxation time of long-wavelength acoustical phonons is given by $\tau_q(T) = 4.4 \times 10^3 / qT^3$ for temperatures $\tau < 40°K$. The data also indicate that inelasticity of electron-phonon collisions broadening of the electron energy levels are the dominant "cutoff" mechanisms involved in the quantum theory of magnetoresistance; the first dominates in relatively low fields, while the latter takes over for fields greater than 60 kgauss. Presented at Fourteenth Gen. Assembly URSI, Tokyo (Japan) Sept. 1963.

Also published in Prog. Radio Sci. 1960-1963, v. 3: 76-91, 1965.

A whistler method of deducing the equatorial profile of electron density is described. Results of several investigations are compared, and it is found that there is excellent agreement on the shape of the profile. Its average behavior in the range 2 R_E to 5 R_E geocentric distance is estimated to fall between about $N \propto R^{-3}$ and $N \propto R^{-4}$. Several roughly comparable estimates of numerical values are found to be within a factor of about 2. It is found that the results from whistlers are generally consistent with 5000-km values of electron density obtained by incoherent scatter measurements at the geomagnetic equator. Whistler evidence of a knee in the equatorial profile is presented which is consistent with measurements made by the Lunik I and Lunik II probes. Some of the recently obtained results on temporal variations in magnetospheric density are also discussed.

EFFECTIVE TRANSPORT COEFFICIENTS AT LOW AND HIGH COLLISION FREQUENCIES (Abstract), by O. Buneman. [1965] [1]p. [AF 49(638)1524]
Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 232, Feb. 25, 1965.

It has been found possible to employ gasdynamical concepts and terminology for the description of a plasma even at low and vanishing collision frequencies. The plasma must be near thermal equilibrium and nearly uniform. It must be treated as a gas mixture (neutrals, ions, electrons), each component having its "effective" coefficients of specific heat, viscosity, thermal conduction, and Van der Waals force. The components are brought into interaction by momentum and energy-exchange terms, the macroscopic Coulomb interaction being included here as a link between ions and electrons. The four transport coefficients are functions of the wavenumber and frequency of the deviations from thermodynamic equilibrium. The exact functional dependence is determined by the choice of a model for the collision term, such as B-G-K or Fokker-Planck. Formulas valid at all values of collision frequency are obtained from these models, and, in the limits of high and zero collision frequencies, one finds the correct dispersion laws for sound waves, ion waves, and (Landau-damped) plasma oscillations.

EXPERIMENTAL SEPARATION OF COLLECTIVE AND INDIVIDUAL PHENOMENA IN PLASMAS-ANOMALOUS RESISTANCE, by K. I. Thomassen. [1965] [4]p. incl. diagrs. refs. (AF AFOSR-62-286)
Unclassified

Published in Jour. Appl. Phys., v. 36, 62-65, Jan. 1965.

An experimental method for separating collective effects from collision dominated phenomena in plasmas consists of probing the plasma at a frequency between the collision and plasma frequencies that govern the rates of the individual and collective processes. This method is applied to the measurement of anomalous resistance by utilizing a re-entrant cavity to expose a quiescent plasma to the strong electric fields at this intermediate frequency, thus provoking anomalous resistance. The resistive loading of the cavity is then observed as a function of power level or field strength, giving evidence of an anomalous resistance above power levels which initiate the two-stream instability.

PROPERTIES OF GALLIUM ARSENIDE DIODES BETWEEN 4.2° AND 300°K, by D. J. Dumin and G. L. Pearson. [1965] [9]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Army Research Office (Durham) under Nonr-22524)
Unclassified

Published in Jour. Appl. Phys., v. 36: 3418-3426, Nov. 1965.

The current-voltage characteristics of zinc-diffused gallium arsenide diodes have been measured between 4.2° and 300°K, with carrier concentrations in the n-type region varying from 6×10^{15} to 9×10^{18} cm^{-3}. In the forward direction it is shown that the current is

due to tunneling at low temperatures and high carrier concentrations whereas it arises from thermal processes involving recombination in the space-charge region at higher temperatures and low carrier concentrations. The temperature at which the current changes from predominantly tunneling to predominantly thermal in origin has been determined as a function of the n-type carrier concentration. In the reverse direction the current in these diodes appears to be dominated by tunneling at all temperatures and doping densities tested.

MULTIPHASE PERIODIC VERY-LOW-FREQUENCY EMISSIONS, by N. Brice. [1965] [9]p. incl. illus. diagrs. refs. (AFOSR-65-0907) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-370 and National Science Foundation) AD 617240 Unclassified

Also published in Jour. Research Nat'l. Bur. Stand., v. 69D: 257-265, Feb. 1965.

When periodic very-low-frequency (VLF) emissions of more than 1 set are observed concurrently (multiphase emissions) the observation of 3 sets symmetrically spaced is surprisingly frequent. Evidence is presented which suggests that 2 sets represent a transient situation, and that the strength of 1 emission may depend on the strength of, and the elapsed time since the preceding emission. The data are interpreted as evidence of a relaxation phenomenon in the generation of discrete VLF emissions, and a qualitative explanation of the stability of symmetrical 3-phase emissions is given. EFFECT OF GAUSSIAN BEAM SPREAD ON PHASE VELOCITY MATCHING IN CW OPTICAL SECOND-HARMONIC GENERATION, by G. E. Francois and A. E. Siegman. [1965] [6]p. incl. diagrs. (AFOSR-65-1957) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-323 and Aeronautical Systems Division) AD 626518 Unclassified

Also published in Phys. Rev., v. 139: A4-A9, July 5, 1965.

This paper reports the results of an experimental and theoretical study of the angular variation of optical second-harmonic generation in ammonium dihydrogen phosphate using a Gaussian single-transverse-mode cw gas-laser beam. The observed angular dependence of the second-harmonic output near the phase matching angle is significantly different from the $|(\sin c)^{\epsilon}|^2$ angular dependence predicted by plane-wave theory. The difference can be quantitatively explained by an extended analysis which takes into account the Gaussian amplitude distribution and spherical wavefront of the cw laser beam. The theory predicts small but significant corrections to the results of measurements of the nonlinear coefficients of materials. These corrections can also account, at least approximately, for the effects of small crystal defects and imperfectly Gaussian beam patterns. (Contractor's abstract)

AN INTERPRETATION OF TRANSVERSE WHISTLERS, by I. Kimura, R. L. Smith, and N. M. Brice. [1965] [6]p. incl. diagrs. refs. (AFOSR-66-0546) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-783, National Aeronautics and Space Administration, and National Science Foundation) AD 641215 Unclassified

Also published in Jour. Geophys. Research, v. 70: 5961-5966, Dec. 1, 1965.

An explanation is offered for the transverse whistler. This type of whistler was first observed in the Alouette 1 Satellite VLF recordings. It appeared in the frequency range of 1-8 kc/s and was observed late at night (2100 - 0100 local time) from moderate to low latitudes (44° - 30° dipole latitudes). One peculiar characteristic of this whistler is that the variation of time delay with frequency, observed at 1000-km altitude, is given by the sum of the Eckersley law time delay, characteristic of normal whistlers, and an additive correction term.

AN ANISOTROPIC ELECTRON VELOCITY DISTRIBUTION FOR THE CYCLOTRON ABSORPTION OF WHISTLER AND VLF EMISSIONS, by H. Guthart. [1965] [13]p. incl. diagr. refs. (AFOSR-66-1074) (AF AFOSR-65-783) AD 641213 Unclassified

Also published in Jour. Research Nat'l. Bur. Stand., v. 69D: 1403-1415, Nov. 1965.

In 1962, Scarf proposed cyclotron absorption as the physical mechanism explaining the high-frequency cutoff of nose whistlers. Using the Scarf proposal, two anisotropic electron velocity distributions for the magnetosphere are assumed and the complex refractive index is evaluated for each. The transverse (with respect to the ambient earth's field) velocity distribution in each case is assumed Maxwellian. The first longitudinal distribution of velocities considered is Maxwellian to several mean square velocities and then is proportional to v^{-1}. The cyclotron damping term is then evaluated; however, upon investigation, the rate of change of whistler damping with frequency is found to be insufficiently rapid to agree with the observed whistler cutoff. The second velocity distribution considered is a double-humped Maxwellian, i.e., a thermal electron distribution, and a resonant electron stream. This distribution allows for cyclotron absorption and, at the same time, is consistent with the whistler dispersion and attenuation. Arising from the analysis of the double-humped Maxwellian distribution is a transverse instability developed by Bell and Buneman which leads to VLF emissions. The relative importance of cyclotron damping vis-a-vis VLF emissions is examined and a qualitative explanation of some whistler-induced emissions is suggested. (Contractor's abstract)

NOSE WHISTLER DISPERSION AS A MEASURE OF MAGNETOSPHERE ELECTRON TEMPERATURE, by H. Guthart. [1965] [3]p. incl. illus. diagrs. table, refs.

(AFOSR-66-1075) (AF AFOSR-65-783) AD 641214
Unclassified

Also published in Jour. Research Nat'l. Bur. Stand., v. 69D: 1417-1424, Nov., 1965.

The fractional deviation of nose whistler group delay from the zero - temperature model has been calculated assuming a Maxwellian magnetosphere and a gyrofrequency electron density distribution; i.e., the electron density varies as the inverse cube with distance from the earth's center. The thermal correction to the zero-temperature group refractive index has been inserted into the nose-whistler group delay integral to determine the modified group delay. Significant deviations from the zero-temperature group delay for frequencies above the nose frequency have been calculated. Since deviations from the zero-temperature dispersion of a few percent are readily discernible, nose whistler data should provide at least an estimate of the upper bound on magnetosphere temperature. Twenty-three whistlers have been analyzed and an upper bound on magnetosphere temperature of $2(10^4)$°K has been determined. (Contractor's abstract)

OPTIMAL ADAPTIVE ESTIMATION OF SAMPLED STOCHASTIC PROCESSES, by D. T. Magill. Dec. 1963, 67p. incl. diagrs. refs. (Technical rept. no. 6302-3) (AFOSR-64-1333) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-225(24)
AD 436021 Unclassified

Also published in IEEE Trans. Automatic Control, v. AC-10, 434-439, Oct. 1965.

An adaptive approach is presented to the problem of estimating a sampled, scalar-valued, stochastic process described by an initially unknown parameter vector. Knowledge of this quantity completely specifies the statistics of the process, and consequently the optimal estimator must learn the value of the parameter vector. In order that construction of the optimal estimator be feasible it is necessary to consider only those processes whose parameter vector comes from a finite set of a priori known values. Fortunately, many practical problems may be represented or adequately approximated by such a model. The optimal estimator is found to be composed of a set of elemental estimators and corresponding set of weighting coefficients, one pair for each possible value of the parameter vector. This structure is derived using properties of the conditional mean operator. For gaussmarkov processes the elemental estimators are linear, dynamic systems, and evaluation of the weighting coefficients involves relatively simple, nonlinear calculations. The resulting system is optimum in the sense that it minimizes the expected value of a positive-definite, quadratic form in terms of the error (a generalized mean-square-error criterion) (Contractor's abstract)

QUANTUM EFFICIENCY AND RADIATIVE LIFETIME IN p-TYPE GALLIUM ARSENIDE, by J. Vilms and W. E. Spicer. [1965] [7]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under Nonr-22524)
Unclassified

Published in Jour. Appl. Phys., v. 36: 2815-2821, Sept. 1965.

A new method for the study of radiative recombination in uniformly doped semiconductors has been developed and applied to p-type gallium arsenide. The bulk quantum efficiency is obtained by measurement of photoluminescence as a function of the penetration length of the exciting radiation. Using an estimated electron mobility, the total recombination lifetime of electrons (minority carriers) is found from this photoluminescence measurement and also independently by the measurement of surface photovoltage. The radiative lifetime is determined from the bulk quantum efficiency and the total electron lifetime. The model on which the measurements are based accounts for the principal effects affecting the intensity of photoluminescence, i.e., bulk quantum efficiency, surface recombination, and refraction and reflection of luminescence at the sample surface. The model is consistent with the experimental data for the p-type gallium arsenide samples studied. The bulk quantum-efficiency values obtained here are 8% at 300°K and 28% at 80°K for 2 higher-efficiency samples and 6 times lower for a third sample. The radiative lifetime of electrons is found to be approximately 2×10^{-8} sec at 300°K, and 3×10^{-10} sec at 80°K. The total lifetime of electrons (minority carriers) is found to be approximately 1.5×10^{-9} sec at 300°K and 10^{-10} sec at 80°K for the 2 higher-efficiency samples, and 10^{-10} sec at both temperatures for the third sample. SURFACE STATES AND BARRIER HEIGHT OF METAL-SEMICONDUCTOR SYSTEMS, by A. M. Cowley and S. M. Sze. [1965] [9]p. incl. diagrs. tables, refs. ([Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Army Research Office (Durham)] under Nonr-22524)
Unclassified

Published in Jour. Appl. Phys., v. 36: 3212-3220, Oct. 1965.

The barrier height for n-type semiconductor-metal contacts is found to be a linear combination of the metal work function φ_m and a quantity φ_0 which is defined as the energy below which the surface states must be filled for charge neutrality at the semiconductor

surface. The energy φ_0 is measured from the edge of the valence band. For constant surface state density the theoretical expression obtained is $\varphi_{B_n} = \gamma(\varphi_m - \chi) + (1 - \gamma)(E_g - \varphi_0) - \Delta\varphi_n$, where χ and E_g are electron affinity and the band gap of the semiconductor, respectively, $\Delta\varphi_n$ is the image force barrier lowering, and γ is a weighting factor which depends mainly on the surface state density and the thickness of the interfacial layer. The parameter γ is found to range from 0.07 for GaAs to almost unity for the CdS data, indicating weak and strong dependence of the surface barrier height on the metal work function. The value of φ_0 is roughly a third of the respective band gap energies for Si, GaP, and GaAs, and the surface state density for these semiconductors is found to be in the range 10^{13} - 10^{14} states/cm^2/ev, for the experiments cited.

SURFACE STATES AND BARRIER HEIGHT IN METAL-SEMICONDUCTOR SURFACE BARRIER DIODES, by A. M. Cowley. May 1965, 187p. (Technical rept. no. 0414-1; rept. no. SU-SEL-65-051) (Sponsored jointly by Air Force Office of Scientific Research, Office of Naval Research, and Army Research Office (Durham), under Nonr-22583) AD 467489 Unclassified

Metal-semiconductor surface barrier diodes were investigated from the standpoint of the mechanism for the formation of the potential barrier at the metal-semiconductor interface and the measurement of the barrier height. The dependence of the barrier height of metal-semiconductor systems upon the metal work function was derived with the following assumptions: (1) The contact between the metal and the semiconductor has an interfacial layer of the order of atomic dimensions; it was further assumed that this layer is transparent to electrons with energy greater than the potential barrier, but can withstand potential across it. (2) The surface state density (per unit area per electron volt) at the interface is a property only of the semiconductor surface and is independent of the metal. Several models for describing the bias behavior of the MOS structure with surface states are also discussed. For thin interfacial layers, the model which specifies that the surface states charge is independent of bias seems to best describe the variation of the depletion capacitance with voltage for GaP and Si diodes.

APPLICATIONS OF OHM'S LAW FOR MULTICOMPONENT PLASMAS (Abstract), by S. T. Demetriades. [1965] [2]p. (Bound with AFOSR-65-1266; AD 622527) AF 49(638)1445 Unclassified

Presented at Eighth AFOSR Contractor's meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

A generalized Ohm's law for non-isothermal multicomponent plasmas with temperature and pressure gradients is derived from a system of differential equations describing the transport of momentum for each species α of a multicomponent plasma in electric and magnetic fields. This system of differential equations is derived from the Boltzmann equation by defining the drift velocity of species α with respect to the velocity of the plasma as a whole. An advantage of this formulation is that it removes some of the restrictive assumptions of Polovin and Tserkasova while it retains their generalized multicomponent results. This generalized Ohm's law is used to determine the scaler conductivity, Hall and ion-slip coefficients and the pressure and temperature gradient coefficients for any 3 or 4 component plasmas. It is shown that the electron temperature gradient must be used in computing the effect of temperature gradients. These results can be extended to an n-component plasma. On the basis of this investigation it is shown how particle concentrations computed for equilibrium mixtures can be corrected and used in the computation of the Ohm' law for non-equilibrium (2-temperature) mixtures.

OHM'S LAW IN MULTICOMPONENT NON-ISOTHERMAL PLASMAS WITH TEMPERATURE AND PRESSURE GRADIENTS, by S. T. Demetriades and G. S. Argyropoulos. Final rept. Sept. 1965 [183]p. incl. tables, refs. (Research rept. no. STD-65-12) (AFOSR-66-0004) (AF 49(638)1445) AD 628029 Unclassified

A closed set of transport equations with collision terms that have been evaluated by the 13-moment approximation is used, under well-defined assumptions, to derive a generalized Ohm's law in multicomponent

non-isothermal plasmas as a function of the electric and magnetic fields and the temperature and pressure gradients. The nine coefficients defining this dependence are expressed in matrix form in terms of component properties for any number N of components in the plasma, each component having its own temperature. The matrix expressions are evaluated in detail for N = 4, 5; this allows the investigation of effects that cannot be studied with the available three-fluid expressions. It is shown that in any plasma in which this theory applies, the only temperature gradient that needs to be considered in Ohm's law is that of the electrons and that all the plasma properties, except those that describe or include interactions between heavy species, must be determined at the electron temperature.

MECHANISM AND DYNAMICS OF COAXIAL PLASMA ACCELERATION, by W. H. Bostick. Final technical rept. July 1965, 7p. (Rept. no. SIT-P161) (AFOSR-65-1532) (AF AFOSR-64-465) AD 619527 Unclassified

The character of the current sheet which separates a plasma from a magnetic field is explored. One interesting configuration of this current sheet is that formed by the flow of plasma over the dipole magnetic field produced by a loop coil inserted in the vacuum system. Magnetic field probes and electric field probes have already shown that this current sheet exhibits turbulence in the form of plasma vortices. The study of this turbulence, in order to understand its onset and its scale is now an objective. The correlation of this plasma behavior with that of the solar wind on the geomagnetic field is also an objective. The character of turbulence in the current sheet of the plasma coaxial acceleration is studied. The mechanism of plasma propulsion in the small 2 wire and coaxial button guns is investigated. Also published in Phys. Fluids, v. 8: 1397-1399, July 1965.

Plasma flow over a 3-dimensional dipole is examined to determine the existence and character of turbulent electric fields. Image converter photographs exhibit general boundary shapes which are in accord with theoretical shapes. Magnetic probe measurements show that the magnetic field is highly turbulent in the magnetic boundary and that the character of the turbulence is asymmetric. Electric-field probe and ion density measurements also show that the plasma is turbulent in the boundary of the magnetic cavity and that the plasma penetrates the cavity in a turbulent state. The character of the signals suggests that the turbulence is in the form of plasma eddies or vortices. (Contractor's abstract, modified)

LONG RANGE NAVIGATION IN ANIMALS, by C. G. Edelstam. Final scientific rept. June 10, 1965 [50]p. incl. diagrs. tables, refs (AFOSR-65-1566) (Sponsored jointly by Air Force Office of Scientific

Research under AF EOAR-63-6, King's Fund for Swedish Culture, and Swedish Fisheries Research Board) AD 623338 Unclassified

The physical and sensory basis of navigation in fish, turtles, birds, and bats has been examined theoretically and by experiment. The stars are found to be superior for several reasons to the sun as potential cues in visual navigation. The advantage of non-visual over visual navigation increases rapidly with increasing size of the sense organs, which may help to explain certain differences in homing behavior between small and large animals. Methods are suggested to differentiate between navigation systems based on measurements of (a) the altitude of the stars, (b) the altitude of the sun, (c) the position of celestial radio sources, (d) the inertial forces experienced during the outward journey prior to homing, (e) the intensity of gravity, (f) the intensity and direction of the Coriolis force, and (g) the intensity and direction of the geomagnetic field. Some results of such tests and of other experiments are reported. (Contractor's abstract)

EFFECTS OF ELECTROLYTIC TELENCEPHALIC LESIONS IN THE PIGEON (COLUMBA LIVIA). A PRELIMINARY STUDY, by E. Fabricius and L. Steen. Final scientific rept., Appendix II, Oct. 29, 1965, 7p. incl. tables. (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-25 and Swedish Natural Science Research Council) Unclassified

The technique of making telencephalic lesions in pigeons by local irradiation with high energy protons has 2 serious difficulties: The obtainable material is limited and the localization of the lesions involves problems. To meet this situation, preliminary experiments were performed with electrolytic lesions. The main purpose was to see if satisfactory localizations are possible, if the lesions obtain favorable shape, size and limitation and if the method allows the production of a large material. If these conditions are fulfilled the material itself can also be used for the discussion of lesion effects. In this preliminary material attempts were made to locate the lesions in such a way that information regarding possible relations between telencephalic structures and fear responses could be obtained, i.e. by aiming at the archstriata and their nervous connections.

OBSERVATIONS ON THE ONTOGENY OF BUILDING BEHAVIOR IN THE BEAVER (CASTOR FIBER), by L. Wilsson. Final scientific rept., Appendix IV, Oct 29, 1965, 3p. (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-25 and Swedish Natural Science Research Council) Unclassified

The ontogeny of building behavior was studied in young beavers brought up under almost natural conditions, within a wild group of beavers in an enclosure, in a young beaver brought up by a tame female in a terrarium and in young beavers taken captive at ages ranging from less than 10 days to more than 2 months. Motor patterns were observed in connection with treefelling, transport of all sorts of material, digging and building. The motor patterns and the ability to react to a releasing and directing stimulus situation seem to be inborn to such a degree that good results are obtainable at first confrontation without it being necessary to learn by trial and error.

ONTOGENY OF SOCIAL BEHAVIOR IN THE PIGEON (COLUMBA LIVIA), by L. Fall. Final scientific rept., Appendix III, Oct. 29, 1965, 9p. incl. diagr. table, refs (Sponsored jointly by Air Force Office of

Scientific Research under AF EOAR-63-25 and Swedish Natural Science Research Council) Unclassified

This study mainly deals with the imprinting processes in the common pigeon (Columba livia). A short survey of the general development of behavior in young pigeons is given. With the hypothesis that the onset of fear responses is an inhibiting factor for the imprinting these processes are studied in more detail. The squabs are so far taken from the nests in 2 groups of age: 5 days (before the onset of fear responses), and 15 days (the fear responses are well established). Hitherto the tests (a choice situation between the imprinting object - man - and a pigeon) that are done when the animals are sexually mature, are too few to tell anything about the truth in the above hypothesis and the critical period of imprinting in the pigeon. GAPLESS SURFACE EXCITATIONS IN LIQUID HELIUM, by D. F. Brewer, A. J. Symond, and A. L. Thomson. [1965] [4]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research under AF-EOAR-64-13 and Science Research Council) Unclassified

Published in Phys. Rev. Ltrs. v. 15: 182-184, Aug. 2, 1965.

It has long been known that boundary effects can influence appreciably the behavior of superfluid helium. In the unsaturated helium film, in which one dimension is restricted to less than 100 A, Frederikse (1949) found that the superfluid transition temperature is depressed below that of the bulk liquid, and the maximum in the specific-heat anomaly also occurs at lower temperatures, and becomes smeared. The measurements appeared to show that for a given film thickness the onset temperature for superflow was well below that of the specific-heat maximum by as much as 0.4°K, although in the bulk liquid the 2 temperatures coincide. A later experiment by Brewer et al (1960) showed that in very fine channels of diameter approximately 70 A the 2 temperatures were the same (~2.05 K) to within ± 0.05°K. The authors have examined this problem experimentally in some detail, and conclude that the above results are in essentially correct, and are consistent with the presence of excitations associated with a free liquid surface, and possessing a temperature-dependent energy gap which becomes zero at a temperature lower than that where the ordered phase disappears.

SURFACE EFFECTS IN ^{3}He AT LOW TEMPERATURES, by D. F. Brewer, A. J. Symonds, and A. L. Thomson [1965] [3]p. incl. diagrs. [AF EOAR-64-13] Unclassified

Published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept 4, 1964), ed by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9(Pt. A): 371-372, 1965.

Preliminary experiments to determine the influence of assembly size on the properties of liquid ^{3}He have been conducted. Specific heat measurements of ^{3}He adsorbed

on vycor porous glass in the range of 0.4° to 2.5°K are reported. Comparing the specific heat of the saturated liquid and of the liquid under pressure, in the range below 1.3°K, the bulk liquid values at any pressure are higher. The full vycor specific heat cannot therefore be explained as a sum of compressed liquid values alone; it is necessary to assume either the presence of an appreciable amount of solid with very small specific heat or of size effects (or both). Measurements on monolayer and 2-layer coverage show large specific heat anolomies.

TRIANGULAR FACTORS OF MODIFIED MATRICES, by J. M. Bennett. [1965] [5]p. incl. diagr. (AFOSR-65-2351) (AF AFOSR-62-402) AD 629530 Unclassified

Also published in Numerische Math., v. 7: 217-221, 1965.

This paper is concerned with obtaining the inverse of a matrix of the form $B = A + XCY^T$, where A is n x n, C m x m, and X and Y are n x m matrices. It is assumed that A^{-1} is known. Rather than obtain B^{-1} directly, the author wishes to obtain the factorization B = l du from the (assumed known) factorization A = LDU. Here L and l are lower triangular, D and d are diagonal, and U and u are upper triangular. To factor a general matrix A by the Crout method into LD and U requires about n^3 3 operations. The author's algorithm factors B in about $2mn^2$ operations. He omits additions in making these operation counts (an unrealistic procedure for the latest computers). The author assumes that, where matrixes are factored, rows and columns are arranged so that zero pivots do not occur. He does not say how this is to be accomplished in practice. Furthermore, he does not mention the question of numerical instability when small pivots occur. A numerical example is given.

The cosmic-ray differential density spectrum in the range 3 to 10 000 p/m^2 has been obtained, using Wilson cloud chambers, at sea level and at 2285 m a.s.l. In neither case can the whole spectrum be fitted by a single power law. Using a three-parameter fit the sea-level spectrum is best approximated by two power laws of exponents -2.491 ± 0.036 and -3.42 ± 0.32, respectively, joining at 560 ± 180 particles per square metre. At 2285 m a.s.l. the three best parameters are -2.431 ± 0.015, $-4.8^{+1.3}_{0.8}$ and 6000^{+1000}_{800} particles per square metre. The change with altitude supports the hypothesis that the change in exponent is due to a steepening of the primary cosmic-ray energy spectrum. (Contractor's abstract)

MEASURING THE STARS. THE STELLAR INTERFEROMETER AT NARRABRI OBSERVATORY, by R. H. Brown. [1965] [6]p. incl. illus. diagrs. (AFOSR-65-1115) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-302] and British Department of Scientific and Industrial Research) AD 620963 Unclassified

Also published in Scient. Australian, v. 2: 14-19, Feb. 1965.

The stellar intensity interferometer at Narrabri Observatory is described and its advantages compared to former interferometers. The intensity interferometer is capable of measuring the angular sizes of stars much smaller, hotter, and further away than those measured by other systems. It's advantages are that there is no need for high mechanical precision either in constructing it or guiding it on a star, it does not seem significantly affected by atmospheric scintillation; and measurements are objective and independent of the observer's skill. Development, installation, and initial testing are discussed, and a short theoretical explanation is presented.

ELASTIC AND ELECTROMAGNETIC PROTON INTERACTIONS AT 3 TEV, by C. B. A. McCusker, L. S. Peak, and R. L. S. Woolcott. [1965] [6]p. incl. diagr. table. (AFOSR-65-1812) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-305 and Nuclear Research Foundation) AD 626487 Unclassified

Also published in Australian Jour. Phys., v. 18: 277-282, June 1965.

Results of a line scan of protons of average energy 3 tev in nuclear emulsion are presented. No elastic scatters are detected in the scanned length of 594 cm. The probability of detecting an elastic scatter in emulsion is calculated, and it is found that the proton-proton elastic cross section at 3 tev is ~ 5 mbn. Five examples of proton direct pair production are found in the above path length. It is shown that this result is consistent with the predictions of quantum electrodynamics. (Contractor's abstract)

RESPONSE OF PLASTIC SCINTILLATORS TO COSMIC RAY AIR SHOWERS, by A. D. Bray, D. F. Crawford and others [1965] [5]p. incl. illus. diagrs. tables. (AFOSR-65-1954) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-305 and Nuclear Research Foundation) AD 626826 Unclassified

Also published in Rev. Scient. Instr., v. 36: 587-591, May 1965.

The response of plastic scintillators to the flux of particles occurring in cosmic ray air showers was measured at various distances from the center of showers of various sizes. The number of scintillator particles S obtained by dividing the observed pulse height by the mode of the pulse-height distribution due to single fast muons was compared with the number of incident ionizing particles G seen by Wilson cloud chambers and Geiger counters. The ratio S/G is always greater than unity. It increases with increasing number of charged particles m^2, being 1.1 for 100 scintillator particles/m^2 and 4.0 for 10,000 scintillator particles/m^2. It varies with radial distance from the shower center and with shower size, being 1.2 on average at 30 m from the center of showers of $\sim 10^5$ particles and greater than 4 near the center of large showers. The increase in S/G is partly due to cascading of the electromagnetic component within the plastic scintillator but mostly to nuclear interactions produced in the scintillator by strongly interacting particles. THE STRONGLY INTERACTING PARTICLES IN AIR SHOWER CORES, by M. M. Winn, R. H. Wand and others. [1965] [32]p. incl. diagrs tables refs. (AFOSR-65-1955) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-305 and Nuclear Research Foundation) AD 626506 Unclassified

Also published in Nuovo Cimento, Series X, v. 36: 701-732, Apr. 1, 1965.

An experiment using the Sydney extensive air shower array with its 64 large plastic scintillators is described for studying the strongly interacting particles in air shower cores. It is shown that there is no unique structure function for the strongly interacting particles which will fit all showers. Rather, showers can be classed as single-core or multi-core; the former appearing due to proton primaries, the latter to primaries of $A \geq 2$. With the apparatus it has proved possible to study individual nuclear interactions in the showers. In contrast with much emulsion work, the surviving baryon can often be easily identified and its momentum determined. Results concerning the elasticity in individual nucleon-air nucleus collisions are also reported. (Contractor's abstract, modified)

NEAR-INFRARED SPECTRUM OF LIQUID WATER FROM 30 TO 374°, by E. Fishman and P. Saumagne. [1965] [1]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638) 3 and French Atomic Energy Commission) AD 629388 Unclassified

Also published in Jour. Phys. Chem., v. 69: 3671, Oct. 1965.

Much attention has been given to the structure of liquid water and questions have been raised regarding the fraction of monomeric water present in the liquid. From the spectra shown it has been concluded that: (1) There is a very strong effect of temperature since the single band becomes 2 bands and the frequencies shift. (2) The structure changes; no totally free water molecules are present since no band is observed at 3750 cm^{-1}. (3) If the higher frequency band appearing at 200° is assumed to result from nonhydrogen-bonded species, then these results are consistent with the theory of Marchi and Eyring giving the fraction of monomeric molecules as a function of temperature. (4) These 2 peaks can also reasonably be explained as ν_3 and ν_1, since their frequency difference is the same as found for ν_3 and ν_1 in the vapor phase and in dilute solutions of water in inert organic solvents. As the environment of the liquid water becomes more and more like that in the vapor, there is apparently a continuous change in relative intensity both in pure water and in organic solvents.

INTERACTION OF PLASMAS WITH HIGH INTENSITY R-F FIELDS (Abstract), by H. Gruenberg [1965] [2]p. (Bound with its AFOSR 65-1266, AD 622527) (AF 49(638)1374) Unclassified

Presented at Eighth AFOSR Contractor's meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

Work was continued on the resonant frequency spectrum of a plasma-filled cavity in the microwave region with a static magnetic field present. Numerical programs were set up to compute the resonance frequency shifts, changes in Q, and changes in the r-f field configuration. This was done for a number of cavity modes as a function of cyclotron frequency, plasma frequency and collision frequency. The results agree very well with those obtained from variational and perturbational computations. In the measurement of electron temperature and density by means of Langmuir probes results appear reasonable in the absence of a static magnetic field. Preliminary experiments have been carried out with a plasma-filled cavity excited by a few watts of X-band power (about 8,600 mc) and small probing fields in the 12,000 to 18,000 mc range. It was possible to measure the shifts in resonance frequency for seven cavity modes due to the presence of the plasma. Since the resonance frequencies of these modes are far from the cyclotron frequency, it is possible to use perturbation methods to compute these resonances provided the electron density distribution is given. Conversely, by expanding the density distribution in a triple Fourier series, it is possible to compute the Fourier coefficients in terms of the resonance frequency shifts of a sufficient number of modes.

SUMS OF DEFICIENCIES OF MEROMORPHIC FUNCTIONS, by A. Edrei. [1965] [29]p. incl. refs. (AFOSR-65-2158) (AF 49(638)571) AD 629029 Unclassified

Also published in Jour. D'Anal Math., v. 14: 79-107, 1965.

Let f(z) be meromorphic in the plane and of lower order μ, where $0 \quad \mu \quad \infty$. Let $\tau_1, \tau_2, \tau_3, \ldots$ be the deficient values of f(z) arranged so that $\delta(\tau_\nu, f)$ is a non-increasing sequence of ν. Denote by $\nu(f)$ the total number of deficient values and write $\quad (f) \quad \sum \delta(\tau_\nu, f)$. The author's key result (Theorem 2) is that if q is an integer such that (1) $q \geq 2\mu$, $\delta(\tau_\nu, f) \leq 1 - \cos(\pi \mu q)$, then $f(re^{i\theta})$ is close to τ_ν on a set of having measure at least $2 \quad q + 0(1)$, and this holds for a sequence of r which tends to infinity and is independent of ν. From this result a number of interesting consequences follow. The first is Theorem 1: $\delta(f) \leq 1 - \cos \quad \mu$ if $\mu < .64$ and $\nu(f) \leq 2$. The result is sharp if $\mu = 1 \quad 2$ and shows that in this case (f) can reach its maximal value 1 only if $\nu(f) \quad 1$, i.e., for instance, if f(z) is entire. The author conjectures that for $1 \quad 2 < \mu \quad 1$, $\delta(f) \leq 2 - \sin \quad \mu \quad 2$, with equality only if $\nu(f) \quad 2$. It would follow from this in particular that $\delta(f) \quad 2$ if $\mu \quad 1$. The proof of Theorem 2 is not too easy, one main problem being to define a suitable sequence of r. This is done by means of constructing a rather elaborate sequence of Polya peaks for the function T(r, f). By an ingenious device the general case is reduced fairly simply to the case q = 1. (Math. Rev. Abstract, modified)

ENTIRE AND MEROMORPHIC FUNCTIONS WITH ASYMPTOTICALLY PRESCRIBED CHARACTERISTIC, by A. Edrei and W. H. J. Fuchs. [1965] [13]p. (AFOSR-65-2159) (AF 49(638)571) AD 629028 Unclassified

Also published in Canad. Jour. Math., v. 17: 383-395, 1965.

The authors establish the following powerful analogue of a theorem of Valiron, for the characteristic of Nevanlinna T(r, f). Given a function $\Lambda(r) = \text{const} + \int_\alpha^r t^{-1}\Psi(t)dt$, where $\alpha > 0$ and $\Psi(t)$ is non-negative, non-decreasing and unbounded; if for some positive K and sufficiently large r, (*) $\Lambda(r) \quad r^K$, then there exists an entire function f(z), of finite order, such that (**) $T(r, f) \sim \Lambda(r)$ $(r \to \infty)$. If the condition (*) is omitted, then (**) still holds provided r tends to infinity avoiding an exceptional set E of finite measure. If, however, $\Lambda(r)$ satisfies the relation $\Lambda(r + 1) \leq \Lambda(r))^{\eta} \exp(\Lambda^{\eta}(r))$ for some η in $0 \quad \eta \quad 1 \quad 2$, then (**) holds without reference to an exceptional set. Furthermore, the authors prove that if $E(r, \eta)$ denotes the portion of the exceptional set E in (r, ∞), then meas $E(r, \eta) = 0(1/\Lambda(r))$. It is also observed that the entire functions constructed to solve the above problem satisfy the following interesting inequality: (***) $T(r, f) \geq \log M(r, f) \geq T(r, f) + KT^{2\eta}(r, f) \log^{(1 - 2\eta)} r$ $(r \notin E)$. The relation (***) has some far reaching consequences; besides it helps one deduce the theorem of Valiron, together with additional information. (Math. Rev. abstract)

BOLTZMANN EQUATION APPROACH TO PHOTOCONDUCTIVITY IN SEMICONDUCTORS WITH OPTICAL PHONONS, by H. J. Stocker. Doctoral thesis June

1965 [142]p. incl. diagrs. refs. (AFOSR-65-2311) (AF AFOSR-63-420) AD 620886 Unclassified

The Boltzmann equation for the distribution function of conduction electrons is an electric field, including generation of electrons due to photon absorption, recombination, elastic scattering, and optical phonon emission, is constructed and solved with the aid of some simple assumptions about the energy dependences of the various transition rates. The photoconductive current, as a function of photon energy, shows oscillations with minima at multiples of the optical phonon energy, in agreement with recent observations in the low temperature photoconductivity of several semiconductors. The oscillations are the result of the strong interaction of electrons with longitudinal optical phonons. An energy variation of either lifetime or elastic scattering is not necessary for the existence of these oscillations, although their exact shape depends on it. The calculated field dependence of the shape of the oscillatory photoconductivity agrees qualitatively with experiments in InSb. (Contractor's abstract)

NUCLEAR SPIN RELAXATION IN p-TYPE InSb AT LIQUID-HELIUM TEMPERATURES, by J. Hofland and A. Honig. [1965] [5]p. incl. diagrs. (AFOSR-65-1904) [AF AFOSR-63-425] AD 625578 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 700-704, Apr. 26, 1965.

The spin-lattice relaxation rate 1 T_1 of In^{115} nuclei in the semiconductor InSb was studied and explained for samples ranging in net acceptor impurity concentration from 10^{14} cm^3 to $10^{17}/cm^3$. The temperature dependence of the relaxation rate between 1.0 and 4.2°K was determined as well as the magnetic field dependence between 300 Oe and 10 kOe. Three distinct relaxation mechanisms were found, which are operative singly in each of 3 different concentration regions. It is hypothesized that the relaxation in the low-concentration region arises from the Bloembergen mechanism. The intermediate-concentration mechanism has special properties but is related to the low concentration relaxation mechanism. A theory for the expression of relaxation governed by fast centers and nuclear spin diffusion is discussed which is applicable to both concentration regions. Brief consideration is also given to the high concentration sample.

Part 1 of this paper describes abstract cybernetic models for the data processing activities of organisms. In the model, an organism is regarded as reducible to minimal components that are active control systems. Part 2 of the paper discusses relevant features of several experiments in the field of man-machine interaction and provides data in support of model hypotheses. The model postulates a system composed of a pair of distinct and goal-directed individual organisms Z_α and Z_β which exist in an environment E. For purpose of data processing and problem solving aspects of Z_α and Z_β, E is a semantic environment. In metalanguage, organism Z is described as the realization of a code for a stable, goal-directed and active control system C. The Z's learn concepts about problem solving. Admissible C's are therefore restricted to a class of hierarchically organized adaptive control systems C = (C^0, C^1...) where the terms 0, 1,... denote levels of organization. System structures are considered in which Z_α and Z_β cooperatively communicate to achieve a common goal.

SOME ESTIMATES OF THE COEFFICIENTS IN THE CHEBYSHEV SERIES EXPANSION OF A FUNCTION, by D. Elliott and G. Szekeres. [1965] [8]p. incl. table. (AFOSR-65-1010) (AF AFOSR-63-300) AD 618827 Unclassified

Also published in Math. Comput., v. 19: 25-32, Jan. 1965.

The function f(x) is expanded in a convergent series of Chebyshev polynomials $T_n(x)$ as $f(x) = \sum_{n=0}^{\infty} a_n T_n(x)$. This paper considers two problems. The first concerns finding an asymptotic estimate for large n of the coefficients a_n when f(z) (z = x + iy) is an integral function. The second involves the Chebyshev expansion of f(x) given its Laplace transform $\bar{f}(p)$. The Laplace transform $\bar{f}(p)$ is used either for an asymptotic evaluation of a_n or, if $\bar{f}(p)$ is sufficiently simple, to determine a_n explicitly. Examples are given of Chebyshev expansions with coefficients a_n which have been obtained in this manner.

Suppose it is required to calculate the coefficients a_r in the Chebyshev series $\sum a_n T_n(x)$ of a function f(x) in the range $-1 \leq x \leq 1$. It is well known that a convenient general method is to find the Lagrangian interpolation polynomial which coincides with f(x) at certain points. These are usually chosen to be the zeros of a Chebyshev polynomial of high degree, or alternatively the extrema of such a polynomial. The author compares the accuracies of these 2 procedures, and concludes that the latter is often to be preferred. (Math. Rev. abstract)

COLLISION LASERS, by G. Gould. [1965] [9]p. incl. illus. diagrs. tables, refs. (AFOSR-65-2808) [AF 49-(638)673] AD 629159 Unclassified

Also published in Appl. Opt., Suppl. 2 Chem. Lasers, p. 59-67, 1965.

Reliance on spontaneous emission to relax the lower level limits the efficiency and the power output from gas discharge lasers. The level spacing required for an untrapped radiative cascade places the laser levels well up in the energy level structure. The consequence is low quantum efficiency, a small fraction of electrons with the necessary energy for excitation, and parasitic loss through excitation of lower levels. A judicious combination of inelastic electron-atom and atom-atom collisions for excitation and relaxation can maintain a population inversion in appropriate atoms. This is possible because transfer rates between levels due to atom-atom collisions are small if the energy defect substantially exceeds the average kinetic energy. Thus collisions with other atoms can selectively relax the lower level to other nearby levels without reducing the upper level population. In favorable cases laser power of order 1 W/cm^3 is expected with an efficiency greater than 10%. Temperatures above 1000° are needed to produce a monatomic gas of most elements with suitably spaced low-lying levels. Two such elements are manganese and lanthanum. Mn can be contained in alumina tubing at 1350°; La in tantalum tubing at 1800°. Diffusion to cold windows is prevented by a noble buffer base. Apparatus for testing each of these systems has been constructed. Xenon test oscillations have been observed in the apparatus at the working temperature. Measurements of fluorescence in the prospective laser transitions are being carried out.

PHOTODISSOCIATION OF THALLIUM BROMIDE AND CESIUM BROMIDE, by W. T. Walter and S. M. Jarrett. [1965] [4]p. incl. diagrs. table, refs. (AFOSR-65-2809) [AF 49(638)673] AD 629160 Unclassified

Also published in Appl. Opt., Suppl. 2 Chem. Lasers, p. 201-204, 1965.

Photodissociation of TlBr and CsBr by the 1850A mercury resonance line could lead to laser transitions at 5350A and 2.93 μ in Tl and Cs, respectively. The transition probabilities of Cs are such that radiative decay will maintain a population inversion between the $7\,^2P_{3/2}$ and $7\,^2S_{1/2}$ levels. Calculations indicate that

a gain of 4% per m is expected at a temperature of 890°C for photodissociation into the 7 $^2P_{3/2, 1/2}$Cs levels. In Tl, however, the 6 $^2P_{3/2}$ level is metastable. A suitable quenching gas must be found before oscillation is possible at 5350A from photodissociation into the $7\,^2S_{1/2}$ level. Nitrogen and CO_2 were tried thus far without success. (Contractor's abstract)

INFRARED LASER OSCILLATION IN HBr AND HI GAS DISCHARGES, by S. M. Jarrett, J. Nunez, and G. Gould. [1965] [3]p incl. diagr. table. (AFOSR-66-1684) (AF 49(638)1535) AD 638967 Unclassified

Also published in Appl. Phys. Ltrs., v. 7: 294-296, Dec. 1, 1965

CW infrared laser oscillation has been observed in gas discharges produced in the hydrogen halides HBr and HI. Oscillation was observed at 6 wavelengths in the region between 2.2μ and 3.5μ, 3 each in HBr and HI. The oscillations have been identified with 4d-5p and 5d-6p transitions in atomic BR and I.

PULSED LASER TRANSITIONS IN MANGANESE VAPOR, by M. Pilch, W. T. Walter and others. [1965] [2]p. incl. diagr. table. (AFOSR-66-1686) (AF 49(638)1535) AD 638389 Unclassified

Also published in Appl. Phys. Ltrs., v. 7: 309-310, Dec. 1, 1965.

A gas discharge tube containing the atomic vapor of neutral manganese has produced laser action on 5 green lines and 6 infrared lines. The gain coefficient of the strongest transition at 5341A was 37dB/m. The observed pulse width of 20 nsec implies a peak power output of 300W. This new pulsed manganese laser is similar to the pulsed laser at 7229A recently reported in the atomic vapor of neutral lead. Transient population inversions are produced by preferential electron excitation of those atomic energy levels which are both close to and optically connected with the ground level. These inversions are inherently transient because of the metastability of the lower laser level.

LOGICAL DESIGN OF TERNARY SWITCHING CIRCUITS, by M. Yoeli and G. Rosenfeld. 1965 [11]p. incl. diagrs. tables, refs. (AFOSR-65-1361) (AF EOAR-63-65) AD 621260 Unclassified

Also published in IEEE Trans. Electron. Comput., v. EC-14: 19-29, Feb. 1965.

A logical design theory for ternary voltage switching circuits is developed. The theory is based on familiar binary switching circuit elements and simplification methods. The theory thus leads to simple electronic realization. The basic system of ternary switching elements is made function realizable by means of either diode gates or a single triode. Various simplification methods for combinational circuits are described, i.e., a map method and two algebraic methods. The first algebraic method is an adaptation of the Quine method for determining the prime implicants of a given binary function, and the second is a modification of the Scheinman binary method. TERNARY-TRANSMISSION CONTACT NETWORKS, by M. Yoeli. 1965 [4]p. incl. diagrs. table, refs. (AFOSR-66-1219) (AF EOAR-63-65) AD 639509 Unclassified

Also published in IEEE Trans. Circuit Theory, v. CT-12: 414-417, Sept. 1965.

This communication discusses multiterminal 2-

positional contact networks which include resistors and (ideal) rectifiers. Ternary transmission values are considered, namely 0 (open circuit), 1/2 (partial short circuit), and 1 (short circuit). It introduces a special binary-ternary switching algebra and demonstrates its suitability to the analysis of such ternary-transmission contact networks. This algebra is to be distinguished from the ternary algebras used e.g., in connection with ternary voltage switching circuits or for the study of static hazards of binary switching circuits.

BUCKLING OF CIRCULAR CONICAL SHELLS UNDER COMBINED TORSION AND EXTERNAL OR INTERNAL PRESSURE, by J. Singer and M. Baruch. [1965] [24]p. incl. diagrs. tables, refs. (AFOSR-65-1234) (AF EOAR-62-61) AD 622654 Unclassified

Also published in Topics in Applied Mechanics, ed. by D. Abir, F. Ollendorff, and M. Reiner. Amsterdam, Elsevier Publishing Co., 1965, p. 65-88.

A method developed previously for the analysis of the instability of thin conical shells under external pressure is now extended to buckling under torsion and combined torsion and external or internal pressure as well as axisymmetric temperature distributions. The method is based on solution modified Donnell type stability equations, in the presence of slightly relaxed boundary conditions for the u and v displacements. Two formulations of the solution for torsion and combined loadings are given and compared. Typical examples are calculated and compared with results obtained by Seide and tests, and interaction curves for combined torsion and external and internal pressure loading are given and compared with experimental curves. For conical shells of small and medium taper ratio, the interaction curves may be approximated by the semi-empirical curve of Crate, Batdorf and Baab for cylindrical shells, but for larger taper ratio different curves are obtained. GENERAL INSTABILITY OF STIFFENED CIRCULAR CONICAL SHELLS UNDER HYDROSTATIC PRESSURE, by M. Baruch and J. Singer. [1965] [18]p. incl. diagrs. tables, refs. (AFOSR-65-2251) (AF EOAR-62-61) AD 419706 Unclassified

Also published in Aeronaut. Quart., v. 16: 187-204, May 1965.

Donnell type equilibrium and stability equations are derived for stiffened thin conical shells. The stiffeners are considered closely spaced and are therefore assumed to be "distributed" over the whole surface of the shell. In the proposed theory the stiffeners and their spacing may vary in any prescribed manner but here only equal and equally spaced stiffeners are dealt with. The force- and moment-strain relations of the combined stiffener-sheet cross section are determined by the assumption of identical normal strains at the contact surface of stiffener and sheet. The stability equations are solved for general instability under hydrostatic pressure by the method of virtual displacements. The solution used earlier for unstiffened conical shells, which satisfies some of the boundary conditions of simple supports only approximately, is again applied here. The effect of this incomplete compliance with boundary conditions is shown to be negligible by consideration of "boundary work". The solution proposed for stiffened conical shells involves the concepts of "correcting coefficients" and minimisation of corresponding "error loads". Typical examples are analyzed and the effect of eccentricity of stiffeners is investigated. Simplified approximate formulae for the critical pressure of frame-stiffened conical shells are also proposed. (Contractor's abstract)

BUCKLING OF UNSTIFFENED CONICAL SHELLS UNDER COMBINED TORSION AND AXIAL COMPRESSION OR TENSION, by A. Berkovits and J. Singer. [1965] [10]p. incl. illus. diagrs. tables, refs. (AFOSR-65-1235) (AF EOAR-63-58) AD 621342 Unclassified

Presented at Seventh Israel Annual Conf. on Aviation and Astronautics, Feb. 1965.

Also published in Israel Jour. Technol., v. 3: 15-24, 1965.

A method developed previously is extended to the analysis of the instability of isotropic conical shells under combined torsion and axial compression or tension. The method is based on solution of modified Donnell type stability equations, in the presence of slightly relaxed boundary conditions for the u and v displacements. Typical examples are calculated, and theoretical interaction curves for combined loading are presented and compared with the interaction curve for cylindrical shells. An experimental program was conducted in order to determine the shape of the interaction curves for combined torsion and axial compression of isotropic conical shells. Results of combined loading tests on unstiffened aluminum alloy shells are presented. The results indicate a parabolic interaction function between torsional and compression buckling strength, similar to the empirical interaction function generally obtained for cylinders. This was to be expected in view of the similarity of the theoretical interaction curves for cones and cylinders. (Contractor's abstract)

GENERAL INSTABILITY OF CONICAL SHELLS WITH NONUNIFORMLY SPACED STIFFENERS UNDER HYDROSTATIC PRESSURE, by M. Baruch, J. Singer, and O. Harari. [1965] [10]p. incl. diagrs. table, refs. (AFOSR-65-1236) (AF EOAR-63-58) AD 617151 Unclassified

Presented at Seventh Israel Annual Conf. on Aviation and Astronautics, Feb. 1965.

Also published in Israel Jour. Technol., v. 3: 62-71, 1965.

A method of analysis of the general instability of stiffened conical shells, developed earlier for uniform and equally spaced stiffeners, is extended to shells with non-uniformly spaced stiffeners. For hydrostatic pressure loading, rings are the most efficient stiffeners. On account of the cone geometry, equally spaced rings divide a conical shell into "sub-shells" of unequal local buckling strength. Hence unequal spacings, which result in "sub-shells" of equal local buckling strength, are the logical approach to an optimum structure. A rule for such spacings is derived and discussed. The general instability analysis is then given for conical shells with rings spaced according to rules of this type. Numerical calculations are presented and discussed, and an approximate design formula is proposed. (Contractor's abstract)

BUCKLING OF CIRCULAR CONICAL SHELLS UNDER UNIFORM AXIAL COMPRESSION, by J. Singer. 1965 [3]p. incl. table. (AFOSR-65-2168) (AF EOAR-63-58) AD 629040 Unclassified

Also published in AIAA Jour., v. 3: 985-987, May 1965.

A new modified third stability equation in the buckling of circular conical shells under uniform axial compression is determined, under the assumption that for the buckling analysis, the prebuckling stress is represented satisfactorily by the membrane stresses. A total of N linear equations is obtained for an N-term solution, and the lowest eigenvalue η of the determinant of the coefficients of C_n yields the buckling load. However, in the case of buckling load. However, in the case of buckling under external pressure, $n = 1$ is always the basic mode, here the value of n of the basic mode is determined by the geometry of the shell and is usually larger than unity. The critical loads are calculated for 2 typical shells (one short and one long) by 1-, 2-, 3-, 4-, 5-, and 7-term solutions, and are compared with the approximate axisymmetric solution of the equation representing the buckling load. The convergence is much slower for a shell of large taper ration. The asymmetrical buckling loads are found to be very slightly below the axisymmetric ones in the examples.

EFFECT OF ECCENTRICITY OF STIFFENERS ON THE GENERAL INSTABILITY OF STIFFENED CYLINDRICAL SHELLS UNDER TORSION, by M. Baruch, J. Singer, and T. Weller. Aug. 1965, 35p. incl. diagrs. tables, refs. (Scientific rept. no. 3; TAE rept. no. 43) (AFOSR-65-2753) (AF EOAR-63-58) AD 628174 Unclassified

A method of analysis of eccentrically stiffened cylindrical shells, developed earlier, is applied to buckling under torsion. In the calculations about 350 shells covering a wide range of shell and stiffener geometries have been considered. It is found that for long cylinders rings are the important stiffeners, and internal rings stiffen more than external rings. For short cylinders the effect is inverted, external rings yielding higher critical loads than internal rings. Stringers have little effect in long cylinders, but in short cylinders they stiffen the shell against buckling in torsion as much as rings. Outside stringers always stiffen the shell more than inside stringers. (Contractor's abstract)

ON THE BUCKLING OF UNSTIFFENED ORTHOTROPIC AND STIFFENED CONICAL SHELLS, by J. Singer. [1965] 22p. incl. illus. diagrs. tables, refs. (AFOSR-66-0327) (AF EOAR-63-58) AD 631100 Unclassified

Presented at Seventh International Aeronautical Congress, Paris (France), June 14-16, 1965.

A linear theory developed earlier for the analysis of the instability of isotropic conical shells under external pressure is described briefly. Recent experiments with electroformed specimens are shown to be even in better agreement with theory than previous tests. Extensions of the method to other loading cases are discussed with their experimental confirmation. Results of a similar method of analysis for clamped conical shells under external pressure are presented. Boundary conditions are discussed in the light of recent conclusions as to their effect on the buckling of cylindrical shells. The extension of the method of analysis for buckling of orthotropic shells under external pressure, torsion and axial compression is then considered, and recent experimental results are described. For stiffened shells, the more accurate approach of 'distributed stiffeners', which permits consideration of the effect of eccentricity of stiffeners, is reviewed. Results for conical shells with uniformly and non-uniformly spaced stiffeners under external pressure are discussed and related to optimization studies. Recent experiments on stiffened conical shells under external pressure and

some preliminary tests under axial compression and torsion are then described. The behavior of conical shells under combined loading is then considered and interaction curves are presented for isotropic and orthotropic conical shells. (Contractor's abstract)

FURTHER REMARKS ON THE EFFECT OF ECCENTRICITY OF STIFFENERS ON THE GENERAL INSTABILITY OF STIFFENED CYLINDRICAL SHELLS, by J. Singer, M. Baruch, and O. Harari. Aug. 1965 [27]p. incl. diagrs. tables, refs. (Scientific rept. no. 2; TAE rept. no. 42) (AFOSR-66-0569) (AF EOAR-63-53) AD 630543 Unclassified

The analysis of the general instability of stiffened cylindrical shells under hydrostatic pressure, carried out earlier, is continued in order to study the inversion of the eccentricity effect. Typical shells (250) of varying geometries are considered. The results show that for lateral pressure loading the inversion of the eccentricity effect is practically independent of the geometry of the ring but depends very strongly on the shell geometry parameter Z, whereas for hydrostatic pressure the inversion is also influenced by the bending stiffness of the rings. A range of inversion is also influenced by the bending stiffness of the rings. A range of inversion is found for both loadings. A detailed physical explanation of the cause of the eccentricity effect and its inversion is proposed.

ON THE STABILITY OF ECCENTRICALLY STIFFENED CYLINDRICAL SHELLS UNDER AXIAL COMPRESSION, by J. Singer, M. Baruch, and O. Harari. Dec. 1965 [45]p. incl. diagrs. tables, refs. (Scientific rept. no. 4; TAE rept. no. 44) (AFOSR-66-0613) (AF EOAR-63-58) AD 630392 Unclassified

The eccentricity effect of stiffeners is studied for stiffened cylindrical shells under axial compression. Classical simple supports and clamped ends are considered. A detailed physical explanation of the causes of the eccentricity effect and its behavior is proposed and verified by computations for 350 typical shells. As for buckling under hydrostatic pressure and torsion studied earlier, the behavior of the eccentricity effect in the case of axial compression also depends very strongly on the geometry of the shell, represented by the Batdorf parameter, while the geometry of the stiffeners only influence its magnitude. Inversion of eccentricity effect occurs at very low Z, but for practical dimensions outside stringers always stiffen the shell more than inside ones. The eccentricity effect has a pronounced maximum at practical values of Z, and the behavior of the eccentricity effect is very similar for clamped and simply supported shells. Rings, which are much less effective stiffeners than stringers under axial compression, are also considered. Results are compared with those of other investigators. (Contractor's abstract)

THE PRECESSING SYSTEM OF REFERENCE, by Z. Karni. [1965] [5]p. (AFOSR-66-0244) (AF EOAR-64-71) AD 631091 Unclassified

Also published in Israel Jour. Technol., v. 3. 147-151, 1965.

This paper discusses the integration of the vector equation of motion for the particle and for the rigid body by introducing the so-called "precessing system of reference". The examples of the spinning top and of the Foucault pendulum are used to illustrate some features of the solution of differential vector equations by vector methods. The vector solution is altogether more compact, it leans on directions in space which possess a physical meaning (any may form an oblique system of reference), and above all, in some cases there is no need to solve the equation at all since the solution is explicitly readable from the differential vector equation itself. The introduction of the precessing system of reference is a means by which the second-order differential vector equations of motion can be reduced to first order equations.

SCHUMANN-RUNGE BANDS OF O_2 IN SOLID PHASES: SPECTROSCOPIC MEASUREMENT OF INTERMOLECULAR POTENTIALS, by O. Schnepp and K. Dressler. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-65-2547) (Sponsored jointly by Air Force Office of Scientific Research under [AF 61(052)428] and Dept. of Army) AD 628720 Unclassified

Also published in Jour. Chem. Phys., v. 42: 2482-2489, Apr. 1, 1965.

The absorption spectra of oxygen in solid solution in nitrogen and argon have been investigated in the spectral region of the Schumann-Runge bands. Eleven discrete bands have been measured in each case. The vibrational structure is very similar to that of the free molecule for low vibrational quantum numbers of the excited electronic state but the spacings deviate considerably from those of the gas for higher quantum numbers, inasmuch as their convergence is slower. Potential curves have been constructed from the data for the oxygen molecule perturbed by the solid solvent cage. The deviations of these curves from those of the free molecule have been analyzed in terms of oxygen-argon and oxygen-nitrogen pair repulsive potentials.

THE ABSORPTION SPECTRA OF SOLID CO AND N_2, by M. Brith and O. Schnepp. [1965] [17]p incl. illus. diagrs. tables, refs. (AFOSR-66-1559) (AF 61(052)-428) AD 638513 Unclassified

Also published in Molec. Phys., v. 9. 473-489, Apr. 1965.

The absorption spectra of CO and N_2 solids were investigated in the wavelength region 1600-1150A at temperatures ranging from 10°K to 30°K. For CO two electronic transitions were observed: $A^1\Pi - X^1\Sigma^+$, 13 vibrational bands measured between 1570A and 1250A; $d^3\Delta - X^1\Sigma^+$, 7 vibrational bands measured between 1300A and 1225A. The spectra are simply related to the molecular transitions and can be interpreted on the basis of existing theory of the excited states of molecular crystals of cubic symmetry. Davydov splitting has been clearly resolved for a number of bands of the A - X transition, and the experimental splitting energy can be quantitatively accounted for if the f-number of this transition is 0·16. The observed relative intensities of the components are in agreement with theoretical prediction. For N_2 also 2 electronic transitions have been observed. $a^1\Pi_g - X^1\Sigma_g^+$, 8 vibrational bands measured between 1460A and 1250A; $w^1\Delta_u - X^1\Sigma_g^+$, 11 bands measured between 1400A and 1170A. Here again Davydov splitting was observed but the theoretical interpretation of the splitting energy and the relative intensities of the components is complicated by the fact that the corresponding molecular transitions are dipole forbidden. The assignment of the latter transition is confirmed. (Contractor's abstract)

NUCLEAR RESONANCE IN SHEETS AND POWDERS OF COBALT, by M. Kuznietz and A. A. Hirsch. [1965] [11]p. incl. diagrs refs. (AFOSR-66-0279) (AF EOAR-63-71) AD 629255 Unclassified

Also published in Nuclear Magnetic Resonance and Relaxation in Solids. Proc. of the Thirteenth Colloque Ampere, Leuven U (Sept. 1-5, 1964), ed. by L Van Gerven. Amsterdam, North-Holland Publishing Co., 1965, p. 122-132.

An interpretation is suggested for the NMR of Co^{59} in sheets and powders of metallic cobalt, under the assumption that 2 different effects might influence the magnitude of the NMR signal: the enhancement of the applied rf field by displacements of the Bloch walls, and the penetration of the rf field only till the "skin-depth". The measurements were carried out by a modified Hartley oscillator, in which the sweep and the modulation of the frequency are both electric. The magnitude of the signal was found to be proportional of the mass of the cobalt powder taken for its calibration. The NMR signal, in annealed sheets of cobalt of different thickness which are much higher than the "skin-depth", is proportional to the square root of the product of the electrical resistivity and the magnetocrystalline anisotropy constant. A linear relation is found between the NMR signal and the area of annealed sheets and evaporated thick films, showing that the NMR in bulk material is a surface phenomenon. The NMR signals were investigated from liquid nitrogen temperature up to 367°K. The signal in powder decreased with the increase of the temperature, while in annealed sheet it increased in accordance with the suggested interpretation. A slight cold-rolling of annealed sheet (which reduces the thickness by less than 3%) decreases the signal practically to zero, while by removal of the external surface of the sheet (chemically) the signal appears again, which shows that the cold-rolling affects mainly the layer in which are located the nuclei responsible for the NMR. DEPENDENCE OF COERCIVITY ON DRIVING FIELD IN MULTILAYER FILMS OF NICKEL, by A. A. Hirsch. 1965 [4]p. incl. illus. diagrs. (AFOSR-67-0350) (AF EOAR-63-71) AD 646950 Unclassified

Presented at INTERMAG Conf., Washington, D C., 1965.

Also published in IEEE Trans. Magnetics, v. MAG-1, 254-257, Dec. 1965.

The variation in the coercivity of magnetization loops of multilayer films of nickel was investigated as function of the rate of rise r in the applied magnetic field. The films were prepared by deposition of nickel and copper alternately in a vacuum of 2×10^{-6} mm of Hg on to substrates made of thin aluminum foils. The thickness of the nickel layers L varied in the different films from 8 to 1000A. The loops were cycled with sinusoidal or triangular waveform driving fields, with a variety of amplitudes from 1 kOe to 4 kOe, with frequencies from 0.0° to 2 cps. The measurements were performed from room down to liquid hydrogen temperatures. It was found that the coercive force could be expressed by $H_c = H_o + Q(\ln r - \ln r_o)/T^A$ for values of r changing from 1 to 5 Oe ms, where H_o, A and r_o varied slightly with temperature T. QUANTITATIVE HIGH TEMPERATURE INFRARED SPECTROSCOPY, by U. P. Oppenheim. Final rept. Apr. 30, 1965, 4p. (AFOSR-65-1490) (AF EOAR-63-111) AD 623193 Unclassified

Spectral emissivity studies were made of three water vapor bands at 1.9, 2.7 and 6.3-μ. Atmospheric interference was successfully eliminated by building a hermetically sealed optical system, from which absorbing gases could be eliminated. Spectral studies with a resolution of 0.5 cm^{-1} were carried out for H_2O vapor at 1200°K in the 1.9 and 2.7-μ bands. By the use of spectral band models the band parameters and the integrated intensity of these 2 bands were determined at 1200°K. The method of "curves of growth" was also applied to atmospheric absorption by CO, N_2O and H_2O at room temperature. Total emissivity calculations were made on H_2O at 1200°K, based on the contributions of spectral band emissivities in the 1.9, 2.7 and 6.3-μ regions. The integrated intensity of the 6.3-μ band was established by measuring the intensity of a single rotational line in this band. (Contractor's abstract)

AN INTERMEDIATE STATE BETWEEN He I AND He II, by M. Revzen, A. Ron, and I. Rudnick. [1965] [3]p. incl. diagr. refs. (AFOSR-66-2130) (AF EOAR-65-25) Unclassified

Also published in Phys. Rev. Ltrs., v. 15. 384-386, Aug. 1965.

One possible interpretation of the results of a recent experiment is that there is a discontinuity in the magnitude of the velocity of sound at the λ transition of He^4 at vapor pressure. This note is concerned with the consequences of this eventuality. It is stated that this indicates the existence of an intermediate state between He I and He II at pressures higher than the vapor pressure. The proposed phase diagram is depicted qualitatively. It is calculated that the slopes of the 2 lines differ by 1% at vapor pressure. If this difference persists to higher pressures, then one can estimate that the width of the intermediate state is less than $\frac{1}{4}\mu$ K for pressures below 10 atm. Measurements above the vapor-pressure line have defined the λ line closer than 1 μ°K. On the other hand, accuracies of 1 μ°K are possible.

EMISSIVITY OF WATER VAPOR AT 1200 K IN THE 1.9- AND 2.7-μ REGIONS, by A. Goldman and U. P. Oppenheim. [1965] [7]p. incl. diagrs. tables, refs (AFOSR-66-0346) [AF EOAR-65-84] AD 632445 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 55: 794-800, July 1965.

The emissivities of the 2 bands of water vapor at 1.9 and 2.7μ were determined at elevated temperatures. Use was made of quartz absorption cells of various lengths, which were heated in an electrical furnace to a temperature of 1200°K. By applying the 'statistical' spectral-band model at every frequency in low-resolution spectra (8 cm^{-1}), it was possible to obtain the band parameters $2\pi\gamma^0/d$ and thus to correlate the observed spectral absorptance with the optical path length and the pressure of the gas. From absorptance measurements in the 'linear region' the absolute intensity of the bands was derived. The total emissivity was calculated as a function of path length and pressure, and good agreement was obtained with direct observations of total emissivity at 1200°K. (Contractor's abstract)

SPECTRAL EMISSIVITY OF WATER VAPOR AT 1200°K, by U. P. Oppenheim and A. Goldman. [1965] [4]p. incl. tables, refs. (AFOSR-66-0347) [AF EOAR-65-84] AD 631098 Unclassified

Also published in Tenth Symposium (Internat'l.) on Combustion, Cambridge (Gt. Brit.) (Aug. 17-21, 1964), Pittsburgh, Combustion Inst., 1965, p. 185-188, 1965.

Results are presented of quantitative spectroscopic studies on pure water vapor in the 1.9- and 2.7-μ regions. Use was made of quartz absorption cells of various lengths, which were heated in an electrical furnace to a temperature of 1200°K. By applying the 'statistical' spectral band model at every frequency in each band, it was possible to correlate the observed spectral emissivities with the optical path length and the pressure of the gas. From emissivity measurements in the "linear region" of the 2.7-μ band it was possible to measure the absolute intensity of this band, which was found to be 198 cm^{-2} atm^{-1} at 300°K. INVESTIGATIONS ON THE NONELASTIC BEHAVIOR OF THE UPPER MANTLE, by S. Mueller and K. Fuchs. Quarterly narrative progress rept. no. 1, May 1-July 31, 1965. Aug. 15, 1965, 14p. incl. tables, refs. (AFOSR 65-2939) (AF 61(052)861) AD 628068 Unclassified

The distorting effect of the earth's crust on the spectrum

of seismic signals which are transmitted from the source through the mantle to the receiving station is discussed. In an attempt to correct for the influence of the "receiver-crust" a crustal model for the region of the Grafenberg Observatory (GGGR) near Nürnberg, Germany, has been derived. Its main features are a positive velocity gradient at the top of the crystalline basement, a low-velocity channel at a depth of about 10 km, and the possible existance of a high-velocity layer just above the MOHOROVICIC discontinuity. The presence of this layer could be detected from the spectra of body waves. (Contractor's abstract)

PHOTOASSIMILATION OF GLUCOSE BY CHLORELLA IN MONOCHROMATIC LIGHT AND THE INHIBITION BY DCMU AND ANTIMYCIN A, by O. Kandler. Final rept. May 1, 1965, 24p. incl. diagrs. tables, refs. (AFOSR-65-2722) (AF EOAR-64-53) AD 620057 Unclassified

It was investigated whether monochromatic light beyond 700 μ can bring about light dependent glucose uptake in the absence of O_2 and CO_2. The effects of DCMU and antimycin A on photoassimilation of glucose were studied. Glucose assimilation proceeds at a high rate even beyond 700 mu. It is inhibited only about 30% by DCMU at a concentration where photosynthesis is completely inhibited. Antimycin A inhibits to 70% where photosynthesis is hardly effected. These results are strong evidence for the existence of cyclic photophosphorylation in vivo. (Contractor's abstract)

ASYMPTOTIC EXPANSIONS FOR THE ERROR OF DISCRETIZATION ALGORITHMS FOR NON-LINEAR FUNCTIONAL EQUATIONS, by H. J. Stetter. [1965] [14]p. incl. table, refs. (AFOSR-65-1026) (AF EOAR-63-77) AD 619757 Unclassified

Also published in Numerische Math., v. 7, 18-31, 1965.

This note considers the converging solution of a finite algorithm and the asymptotic expansions of its discretization error. Under suitable conditions, the existence of such expansions is proven for a general class of discretization algorithms for nonlinear functional equations in Banach-spaces. Several important functional equations and their discretizations are then considered: initial and boundary value problems for both ordinary and partial differential equations, integral equations, and integrodifferential equations. Finally an example is considered of a nonlinear boundary value problem of the third kind.

STABILIZING PREDICTORS FOR WEAKLY UNSTABLE CORRECTORS, by H. J. Stetter. [1965] [6]p. incl. tables. (AFOSR-65-1027) (AF EOAR-63-77) AD 619636 Unclassified

Also published in Math. Comput., v. 19 84-89, Jan. 1965.

The weak unstability occurring within algorithms used for computation of certain integral equations destroys the validity of the computation. This note demonstrates how to eliminate the cause of the weak unstability: the combination of a judiciously chosen predictor with the weakly unstable corrector constitutes a strongly stable algorithm if the corrector is not iterated.

A STUDY OF STRONG AND WEAK STABILITY IN DISCRETIZATION ALGORITHMS, by H. J. Stetter. [1965] [16]p. incl. table, refs. (AFOSR-66-0389) (AF EOAR-63-77) AD 639502 Unclassified

Also published in SIAM Jour. Numer. Anal., Ser. B., v. 2, 265-280, 1965.

The author presents slightly unusual definitions of strong stability and weak instability of discrete ordinate methods for solving ordinary differential equations. He then shows that a multistep method satisfies his condition of strong stability if and only if the usual associated polynomial has a simple zero at $z = 1$ and all other zeros inside but not on the unit circle. A method would then be called weakly unstable if it is stable in the usual sense, but does not satisfy this more stringent condition. Possible extensions of the ideas to partial differential equations and to boundary value problems are also mentioned.

PLASMA JET CHEMISTRY (Abstract), by C S Stokes and A V. Grosse [1965] [2]p. (Bound with its AFOSR-65-2238) (AF AFOSR-65-775) Unclassified

The reduction of tantalum pentoxide (Ta_2O_5) to metallic tantalum has been accomplished by the use of a helium plasma jet where the oxide was carried into the jet with hydrogen. The reaction $Ta_2O_5 + 5H_2 \rightarrow 2Ta + 5H_2O$ produced yields as high as 43% tantalum. The formation of tantalum carbide was studied using 2 different approaches (1) tantalum pentoxide and methane, and (2) commercial tantalum metal powder and methane. The reactions of the above 2 methods are (1) $Ta_2O_5 + 2\ CH_4 \rightarrow Ta_2C + 5H_2O + 1\ C$ and $Ta_2O_5 + 2\ CH_4 \rightarrow 2TaC + 5H_2O + C$. (2) $2Ta + CH_4 \rightarrow Ta_2C + 2H_2$ and $Ta + CH_4 \rightarrow TaC + H_2$. The first reaction produced yields of 24% TaC and 17% Ta_2C depending on the conditions, together with some metallic tantalum. The second reaction produced 72% TaC and 27% Ta_2C as maximum under several different operating conditions. The above investigations show a gas-solid reaction producing a solid as the product. It is of interest to show a gas-solid reaction producing only a gas. For an example of this type of reaction, the synthesis of H_2S from the elements was picked. The reaction $H_2 + S \rightarrow H_2S$ was carried out in a helium-hydrogen plasma jet and yielded up to 37% H_2S based on the sulfur input. The production of H_2S has been shown to be dependent on the enthalpy of the jet.

SPIN-ROTATION CONTRIBUTION TO THE FLUORINE RELAXATION IN $C_6H_5CF_3$ (Abstract), by R. H. Faulk and M. Eisner. [1965] [1]p. [AF AFOSR-63-173] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 158, Feb. 25, 1965.

The relaxation time of the fluorine nuclei in benzotrifluoride has been measured and is found to be an only slightly varying function of temperature, ranging from 3.2 sec at -20°C to 2.4 sec at +50°C. The contributions to the relaxation time from the dipole-dipole and spin-rotation interactions have been separately calculated, and the effective spin-rotation coupling constant is calculated to be 25 ± 2 kc/sec. This coupling constant has been used to calculate the paramagnetic contribution to the chemical shift of the fluorine in $C_7H_5F_3$ relative to F_2, and yields the value, 453 ppm, which is within 10% of the observed value of 493.3 ppm for the chemical shift. Part of the difference in these quantities may be attributed to the diamagnetic contributions to the shielding constants of the fluorine nuclei in $C_7H_5F_3$ and F_2.

TRANSLATIONAL CONTRIBUTIONS TO NMR RELAXATION IN BENZENE (Abstract), by R Smith and M. Eisner. [1965] [1]p. [AF AFOSR-63-173] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman. Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 157, Feb. 25, 1965.

Temperature and concentration dependence of diffusion and proton relaxation have been measured in mixtures of C_6H_6-C_6D_6. The linear dependence of $1/T_1$ on concentration observed is used to effect a model-independent separation of rotational and translational contributions to relaxation. The temperature dependence of the translational contribution differs from that of diffusion, leading to an anomalous temperature dependence. Contrary to the suggestions that this anomalous dependence is

associated with spin-rotation interactions, it is found that the deviations from the prediction in dipole-dipole relaxation are in the translational component.

DOUBLE-MINIMUM POTENTIAL FUNCTIONS IN EXCITED ELECTRONIC STATES OF SO_2 AND NO_2 (Abstract), by J. B. Coon and F. A. Cesani. [1965] [1]p. [AF AFOSR-63-326] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys Soc., Series II, v. 10· 157, Feb. 25, 1965.

Additional examples of double-minimum potential functions in the excited states of bent triatomic molecules are found. This extends previous work. A new vibrational analysis of the 3700-A system of SO_2 has been made. Calculated intensities of all bands involving only the symmetrical modes of vibration agree well with the observed intensities. However, 4 nontemperature-sensitive bands that cannot be accounted for by the symmetrical modes are interpreted as involving a double-minimum potential in the Q_3' coordinate. These bands are given the assignments (011^+), (021^+), (101^+), and (111^+). The last two are strong bands whose relative intensities and observed interval (1^+-0^+) of 1201 cm^{-1} are used to calculate a double-minimum potential function. The barrier height is roughly 1500 cm^{-1}. The weak bands (011^+) and (021^+) lead to a barrier height significantly lower. Similar calculations are made for the 2491-A system of NO_2. For this molecule, $(1^+-0^+) = 713$ cm^{-1} and the barrier height is approximately 800 cm^{-1}.

ELECTRON PARAMAGNETIC RESONANCE OF Cr^{2+} IN 4- AND 8-COORDINATED CRYSTALS (Abstract), by M. Dewit, A. R. Reinberg and others. [1965] [1]p. [AF 49(638)1250] Unclassified

Presented at meeting of the Amer. Phys Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10· 329-330, Mar. 24, 1965.

Electron paramagnetic resonance attributed to distorted isolated substitutional Cr^{2+} has been observed in 4-coordinated CdS and ZnSe, and 8-coordinated CaF_2 and CdF_2. In 4-coordination, the distortions occur along ⟨100⟩ axes, in 8-coordination along ⟨110⟩ axes. The centers are characterized by given parameters, where A is the zero-field splitting. Superhyperfine structure is observed in CdS with ~9 Cd nuclei, in the fluorides with 8 F nuclei, and in ZnSe with 4 Se nuclei. Applying stress to CdS at 1.3 K causes the centers to redistribute among the equivalent directions, strongly suggesting a distortion and not defect association.

ELECTRON PARAMAGNETIC RESONANCE OF FLUORINE IN SINGLE-CRYSTAL BERYLLIUM OXIDE (Abstract), by A. R. Reinberg and T. L Estle [1965] [1]p [AF 49(638)1250] Unclassified

Presented at meeting of the Amer Phys Soc., New York, Jan. 27-28, 1965.

Published in Bull. Amer Phys Soc , Series II, v. 10 57, Jan. 28, 1965.

EPR spectra for irradiated fluorine-doped BeO powders above 77 °K have recently been reported. Similar spectra

in single crystals from 1.3° to 300°K have been observed. As for the powders, a large fluorine hyperfine interaction (775 G for H C) and a superhyperfine structure (shfs) due to nearest-neighbor beryllium ions are observed. At the lowest temperature and for H C, the shfs consists of 7 equally spaced lines, suggesting interaction with two beryllium nuclei (I = 3/2). Above about 30°K, it changes to a 10-line pattern with the same over-all splitting. The low-temperature spectrum is interpreted in terms of a deep donor made up of 3s and 3p functions centered on the substitutional fluorine and 2s and 2p functions centered on 2 of the nearest-neighbor basal beryllium ions. The high-temperature spectrum results when the electron hops among the 3 equivalent directions that lie in the basal plane. Line shapes predicted on the basis of the hopping model are consistent with observations in the intermediate-temperature region.

PARAMAGNETIC RESONANCE SPECTRA OF Fe-Cu ASSOCIATES IN ZnS (Abstract), by W. C. Holton, M. Dewit and others. [1965] [1]p. [AF 49(638)1250] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 330, Mar. 24, 1965.

An EPR spectrum arising from a spin 5/2 in orthorhombic symmetry has been studied in single crystals of of cubic ZnS containing Fe and Cu. The hyperfine structure of Fe^{57}, Cu^{63}, and Cu^{65} and the angular dependence of the spectrum with respect to crystal orientation in the magnetic field lead to the model of a neutral defect in which the charged impurities Fe^{3+} and Cu^{+} are associated at 2 nearest zinc sites. The $3d^5$ configuration of Fe^{3+} in orthorhombic symmetry leads to 3 Kramer's doublets. The transitions within the lowest 2 doublets have been observed and the results at 1.3°K and 9.2 Gc sec are $g_x = 9.66$, $g_y = 1.265$, $g_z \simeq 0.3$ for the lowest doublet and $g_x = 4.06$, $g_y = 4.53$, $g_z = 4.36$ for the middle doublet. The axes are $x \simeq [331]$, $y = [110]$, $z \simeq [116]$ with the x axis rotated 3.6° away from [331] toward [111]. The main features of the spectrum can be explained with a spin Hamiltonian $= g\beta H \cdot S + E(S_x^2 - S_y^2) + DS_z^2$ with $S = 5/2$, E comparable to the microwave quantum, and $D \gg E$. The middle doublet has also been observed at 77°K in single crystals and powders and corresponds to the $g = 4.29$ lines of Fe^{3+} previously observed in glasses and biological materials. Similar centers have been observed in single crystals of ZnSe and ZnTe. This association of Fe and Cu in ZnS furnishes a possible explanation of the "killer" action of Fe on the ZnS:Cu luminescence.

SUPERHYPERFINE STRUCTURE OF IRON-GROUP IMPURITIES IN II-VI COMPOUNDS (Abstract), by T. L. Estle and W. C. Holton. [1965] [1]p. [AF 49(638)-1250] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 57, Jan. 28, 1965.

Superhyperfine structure (shfs) of EPR spectra has been reported for several iron-group impurities in II-VI compounds. All reported observations have been explained as an interaction of the substitutional impurity with the nearest zinc or cadmium nuclei. No observations attributed to the still-nearer negative ions have been reported. The failure to observe O^{17} or S^{33} shfs may result from the low relative abundance of these isotopes. In cadmium compounds, the intense Cd^{111} and Cd^{113} shfs would make observation of the negative-ion shfs difficult. However, if ZnSe and ZnTe the Se^{77} and Te^{125} shfs should be easily observed if they are resolved. We have observed shfs in ZnSe:Cr^{+}, ZnSe:Mn^{2+}, ZnSe:Fe^{3+}, ZnFe:Cr^{+}, and ZnTe:Fe^{+} arising from Se^{77} or Te^{125}. The Cr^{+} shfs, originally attributed to Zn^{67}, and the Fe^{+} and Mn^{2+} shfs result from the two closest shells of negative ions. Only the nearest shell shfs has been observed for Fe^{3+}. No resolved Zn^{67} shfs has yet been observed in ZnSe or ZnTe. Quantitative results are reported.

BASIC RESEARCH IN CRUSTAL STUDIES, by S. J. Laster, M. M. Backus and others. Final rept. Sept. 1, 1963-Nov. 30, 1965. Dec. 31, 1965, 1v. incl. illus. diagrs. tables, refs. (AFOSR-[illegible]0577) (AF 49(638)-1244) AD 628385 Unclassified

The work falls into 4 tasks: (1) single-layer models; (2) multilayer models; (3) models with layer thickness variation; and (4) experimental studies using field data. The single-layer studies included theoretical investigation of normal and leaking modes, studies of the practical aspects of frequency-wavenumber analysis and investigation of mode separation by multichannel filte ing. Theoretical and analog model investigations for 2 layers over a half-space showed the difficulty in directly observing an intermediate velocity layer using frequencies of 0.5 cps or less. Analog model investigations of a model having a dipping M-discontinuity showed a wide range of phase velocities for ray events, as predicted. Experimental studies of field data showed the usefulness of velocity filtering as an interpretive aid. Correlation statistics for small events showed that only about 50% of the energy arriving between the first arrival and surface waves is predictable. For events at small distance

(Δ ~ 30 km), Rayleigh-mode dispersion curves were measured. These suggested low near-surface velocities extending to a depth of 1/2-km. It was found that receiving arrays in line with the shot are necessary for adequate dispersion measurements.

NUMERICAL EXPERIMENTS IN THE ESTIMATION OF FREQUENCY WAVENUMBER SPECTRA OF SEISMIC EVENTS USING LINEAR ARRAYS, by A. F. Linville and S. J. Laster. [1965] 36p. incl. illus. diagrs. tables. (AFOSR-67-1201) (Bound with its AFOSR-66-0577; AD 628385) (AF 49(638)1244)
AD 652973 Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 56. 1337-1355, Dec. 1966.

Studies in the measurement of frequency-wavenumber spectra of transient events have been conducted using theoretical and analog model data recorded along a 21-element, inline array. Straight-forward numerical transformation, assuming space stationarity, gives good definition of the dominant (Rayleigh) mode, but little information concerning higher modes. The presence of spatial nonstationarity due primarily to cross correlation between modes complicates the fine structure of the spectral estimate. Averaging over redundant space lags is necessary to remove this. Additional difficulties arise from side lobes due to use of the finite length array. The amplitude of the side lobes can be reduced by using a space lay window. In the present case this gives indications of the higher modes, but these indications are so ill-defined as to be useless for determining dispersion. The effects of amplitude deviations between channels are also studied. (Contractor's abstract)

NEAR-SURFACE DISPERSION STUDIES AT TONTO FOREST SEISMOLOGICAL OBSERVATORY, by A. F. Linville and S. J. Laster. [1965] 66p. incl. illus. diagrs. tables. (AFOSR-67-2090) (Bound with its AFOSR-66-0577; AD 628385) (AF 49(638)1244)
AD 658274 Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 57. 311-340, June 1967.

Four local seismic events digitally recorded on a crossed-linear array have been analyzed to evaluate the representation of wave propagation in inhomogeneous earth models in terms of "local" dispersion. The analysis techniques studies are based primarily on the correlation properties of the signals at various receivers. Frequency-wavenumber spectra are computed for the events by various methods, and a comparison of the results indicates that the best method is a combination using averaged correlations computed from prewhitened data. The utility of computing dispersion curves from an estimation of the "transfer function" has been evaluated. The studies show the necessity of recording data directly "inline" in areas of rough topography between source and array if "local" dispersion is to be measured. Multichannel prediction studies indicate that the signals are highly nonstationary in space.

ANALOG MODEL STUDIES OF WAVE PROPAGATION IN A CRUST WITH A DIPPING INTERFACE, by S. J. Laster and A. F. Linville. [1965] 36p. incl. illus. diagrs. tables (Bound with its AFOSR-66-0577, AD 628385) (AF 49(638)1244) Unclassified

Analogue model studies of a single layer with dipping interface upon a half-space show that the most striking prediction of ray theory is the production of a multiplicity of phase velocities for compressional refracted events, as opposed to the single phase velocity found in parallel layered models. An attempt is made to determine the true refractor velocity and dip from measured velocities associated with particular ray paths. For low frequencies the chief prediction of mode theory is a dependence of the dispersion curves on horizontal distance, as a result of their dependence on layer thickness. An attempt is made to measure the leaking mode dispersion curves for comparison with theory.

APPLICATION OF MULTICHANNEL FILTERING FOR THE SEPARATION OF DISPERSIVE MODES OF PROPAGATION, by S. J. Laster and A. F. Linville. [1965] [70]p. incl. illus. diagrs. (Bound with its AFOSR-66-0577, AD 628385) (AF 49(638)1244) Unclassified

Presented at Forty-sixth Annual Meeting of the Amer. Geophysical Union, Washington, D. C.

This paper discusses the results of multichannel mode separation studies using both theoretical and analog model seismograms. Unlike conventional velocity filtering, the mode separation technique makes use of the fact that for dispersive modes the phase velocity is frequency dependent. Other information, such as modal amplitude and the relation between horizontal and vertical components of motion, can be included in the filter design. In the present study 2 processors are considered. One, having 9 channels, makes use of only the frequency-velocity relationships, while a second (6 channels) also uses two component information. A description of the filter design and the results obtained from applying these filters to the data are given (Contractor's abstract)

MULTICHANNEL PROCESSING APPLIED TO THE ANALYSIS OF REFRACTION SEISMOGRAMS RECORDED AT TONTO FOREST SEISMOLOGICAL OBSERVATORY, by T. W. Harley, R. B. Hofmann, and S. J. Laster. [1965] 58p. incl. illus. diagrs. tables. (Bound with its AFOSR-66-0577, AD 628385) (AF 49(638)1244) Unclassified

A group of experimental crustal seismograms from the Tonto Forest Seismological Observatory have been selected which show a large number of coherent, pulse-like events. These include both recordings of nuclear devices detonated in Nevada and shots recorded during the 1964 USGS calibrations program. The nuclear records have been subjected to wideband velocity filtering and the results clearly illustrate the P_n and P_g arrivals, with little indication of P^*_n. The similarity in velocity between P_n and the P_n multiples suggests that dip of the discontinuity under Tonto Forest is very small or absent. The USGS shots indicate a significant difference between the crust to the north of the array as compared to the crust south of the array. P_g is observed on all records, but P_n is observed only from shots in the north, while a lower velocity event, perhaps P^*_n, is seen from shots in the south. Well-developed surface waves are also more common from shots in the north, presumably due to greater thickness of sedimentary cover. The seismometer to seismometer predictability of a shot from the Bylas shotpoint and of a quarry blast from near the Clarkdale shotpoint are investigated. Significant pulse-shape changes across the array are observed in the raw data, and it is found that only about 50 % of the energy is predictable from one seismometer to the next. THEORETICAL INVESTIGATION OF MODAL SEISMOGRAMS FOR A LAYER OVER A HALF-SPACE, by S. J. Laster, J. G. Foreman, and A. F. Linville [1965] [26]p. incl. illus. diagrs. table. (AF 49(638)-1244) Unclassified

Presented at Thirteenth Annual Internat'l. Meeting of the Society of Exploration Geophysicists, Los Angeles, Calif., Nov. 19, 1964.

Published in Geophysics, v. 30 571-596, Aug. 1965.

The use of normal modes to represent the propagation of elastic waves at large horizontal offset is well known. By addition of the relevant leaky modes, the mode theory is shown to be useful for representation of the seismograms at shorter range. A theoretical model consisting of a 2-cm brass layer over a steel half-space is considered. Dispersion curves and excitation functions are computed for the first 4 normal modes and the first 3 PL modes. Attenuation as a function of frequency also is computed for the PL modes. A suite of seismograms is computed for the distance range 50-70 cm, showing each mode individually and their sum (the total seismogram). It is found that, for the distances used, the individual modes do not approximate transients with a definite "arrival" time. Only their sum is required to exhibit this physical behavior. In addition, at short distances, the dispersion of a single mode is not visually obvious although the dispersion curve may be recovered by use of Fourier transform methods. Determination of the dispersion curves from the total seismogram is more difficult and requires some separation of the modes, as they overlap in frequency and velocity. This work shows the preponderance of the leaky modes in the early part of the seismogram and indicates their importance in the later part of the seismogram for short horizontal offset. THE THERMAL DECOMPOSITION OF METAL ETHYLENEDIAMINE OXALATE COMPLEXES, by J. M Haschke and W. W. Wendlandt. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-65-1217) (AF AFOSR-63-23) AD 622847 Unclassified

Also published in Anal. Chim. Acta, v. 32: 386-393, 1965.

The thermal dehydration and deamination of some ethylenediamine complexes of Zn, Cd, Cu, Ni, and Co oxalate were studied by thermogravimetry, differential thermal analysis, differential scanning calorimetry, high temperature reflectance spectroscopy, and gas evolution. The tris(ethylenediamine) complexes deaminated to mono(ethylenediamine) compounds which then decomposed directly to the metal oxide. The kinetics and heats of dehydration and deamination of several of the complexes were determined.

THE SOLID STATE REACTION BETWEEN TRIS(ETHYLENEDIAMINE)CHROMIUM(III) COMPLEXES AND ALKALI METAL HALIDES AND THIOCYANATES, by W. W. Wendlandt and C. H. Stembridge. [1965] [7]p. incl. diagrs. tables. (AFOSR-65-1218) [AF AFOSR-63-23] AD 622840 Unclassified

Also published in Jour. Inorg. and Nuclear Chem., v. 27: 575-581, 1965

Various tris(ethylenediamine) complexes, $[Cr(en)_3]X_3$ ($X = Cl^-$, Br^-, I^-, and SCN^-), were heated with large excesses of ammonium and alkali metal halides and thiocyanates. The tris → bis deamination reaction was followed by high temperature reflectance spectroscopy and by dynamic reflectance spectroscopy from ambient to 225 C. The reaction product, in most cases, was cis-$[Cr(en)_2Y_2]X$, where Y and X are the same or different anions, depending upon the matrix material employed. In an ammonium salt matrix the ease of

anion coordination was: $F^- > SCN^- > Cl^- > Br^-$, in an alkali metal salt matrix, the order was: $SCN^- > F^- > Cl^- > Br^-$. These orders hold regardless of whether the coordinated anion is initially ionically bound in the complex or the matrix salt anion. The thermal matrix method appears to be a potentially useful technique for the preparation of bis(ethylenediamine)chromium(III) complexes.

ION RADICALS. VI. PHENOXATHIIN AND PHENOXATHIIN 5-OXIDE IN SULFURIC ACID, by H. J. Shine and R. J. Small. 1965 [5]p. incl. diagrs. tables, refs. (AFOSR-65-2391) (AF AFOSR-63-23) AD 725592 Unclassified

Also published in Jour. Org. Chem., v. 30: 2140-2144, July 1965.

The reactions of phenoxathiin (I) and phenoxathiin 5-oxide (III) in acidic solutions have been studied by ultraviolet, visible, and e.s.r. spectroscopy. It has been shown that in 82, 96, and 100% sulfuric acid III is converted to the phenoxathiin cation radical (II). The conversion of III to II has been followed by changes in the absorption and e.s.r. spectra. A second cation radical (V) is also formed in the 96% sulfuric acid solutions—that of 3-hydroxyphenoxathiin. It is proposed that in acidic solution III is in equilibrium with protonated III(IV) and the phenoxathiin dication (VI); that the formation of the cation radical II occurs by loss of hydroxyl from IV, and that the hydroxyl is stored either as hydrogen peroxide or a peroxysulfuric acid; and that the reactions which eventually lead to V include, first, a hydroxylation of the aromatic ring by attack of water on either of the cations, IV or VI. A hydroxyphenoxathiin 5-oxide (VII) has been isolated from solutions of III in 96% sulfuric acid. The reactions of VII in 96% sulfuric acid have been investigated briefly. The e.s.r. spectrum of a solution of VII in 96% sulfuric acid is attributed to V. (Contractor's abstract)

ION RADICALS. V PHENOTHIAZINE, PHENOTHIAZINE 5-OXIDE, AND PHENOTHIAZONE-3 IN ACID SOLUTIONS, by H. J. Shine and E. E. Mach. 1965 [10]p. incl. diagrs. tables, refs. (AFOSR-65-2392) (AF AFOSR-63-23) AD 625593 Unclassified

Also published in Jour. Org. Chem., v. 30 2130-2139, July 1965.

The reactions of phenothiazine (I), phenothiazine 5-oxide (II), and phenothiazone-3 (III) in acidic solutions have been studied by ultraviolet, visible, and e.s.r. spectroscopy. Solutions of II in 96% sulfuric acid are stable, it is proposed that they contain the protonated phenazothionium ion (VI). Similarly, solutions of III in 96% sulfuric acid are stable, and it is proposed that they contain the protonated hydroxyphenazothionium ion (XIII). Solutions of I in 96% sulfuric acid contain the phenothiazine cation radical (IV) which, in time, is further oxidized to VI. It is shown that III in 59% sulfuric acid is converted to the hydroxyphenothiazine cation radical (XI). It is also shown that in 4 aqueous sulfuric acid II is converted not only to the cation radical IV but also to XI. Mechanisms are proposed for these reactions. It is proposed that in aqueous sulfuric acid II is in equilibrium with protonated II(VIII) and with the phenazothionium ion (V) arising from dehydration of VII. (Contractor's abstract, modified)

ION RADICALS. VII. THE REACTIONS OF THIANTHRENE OXIDE IN HYDROCHLORIC ACID, by H. J. Shine and C. F. Dais. 1965 [4]p. incl. diagrs. refs. (AFOSR-65-2393) (AF AFOSR-63-23) AD 625590 Unclassified

Also published in Jour. Org. Chem., v. 30 2145-2148, July 1965.

The reaction of thianthrene monoxide with concentrated hydrochloric acid gave thianthrene and 2-chlorothianthrene. The thianthrene cation radical was also formed. Chlorine was detected above the surface of the reaction solution. The same reaction in the presence of phenol gave p-chlorophenol, thianthrene, and the monohydrate of p-hydroxyphenylthianthrenylium chloride, no 2-chlorothianthrene was formed. Attempts to chlorinate thianthrene suspended in hydrochloric acid with chlorine and hypochlorous acid failed. The products were thianthrene oxides. The reductive chlorination is therefore regarded as not arising from reduction to thianthrene followed by electrophilic chlorination. Instead, nucleophilic substitution by chloride ion on the hydroxysulfonium cation is proposed. The formation of chlorine in the reductive chlorination is regarded as

coincident with, but not responsible for the formation of 2-chlorothianthrene. A nucleophilic substitution is also applied to interpreting the chlorination of thianthrene in dry chloroform. (Contractor's abstract)

ON THE SUBDIFFERENTIABILITY OF CONVEX FUNCTIONS, by A. Brondsted and R. T. Rockafellar. [1965] [7]p. (AFOSR-66-0666) [AF AFOSR-63-467] AD 632888 Unclassified

Also published in Proc. Amer. Math. Soc., v. 16: 605-611, Aug. 1965.

Let E be a locally convex vector space and $f: E \to (-\infty, \infty]$ a convex function, $f \not\equiv \infty$. The function f is said to be subdifferentiable at x in E if there exists a continuous linear functional x^* on E such that $f(y) \geq f(x) + (y-x, x^*)$ for all y in E. (Equivalently, there exists a nonvertical supporting hyperplane at the point (x, f(x)) to the convex supergraph $\{(y, r): r \geq f(y)\}$ of f in E x R.) The set of all such x is denoted by dom ∂f, while $\{x: f(x) < \infty\}$ is denoted by dom f. By modifying a lemma due to Bishop and Phelps (Proc. Symp. Pure Math., v. 7, 27-35, 1961), the authors prove (Theorem 2) that if f is lower semi-continuous and E is a Banach space, then dom ∂f is dense in dom f and f is equal to the supremum of the continuous affine functions on E whose graphs support the supergraph of f. Stronger results of a similar nature are obtained for the convex function f^* dual to f, and some examples are given. These and related results improve theorems of J. J. Moreau (Faculté des Sciences de Montpellier, Séminaires de Mathématiques, Université de Montpellier, Montpellier, 1963). (Math. Rev. abstract)

HELLY'S THEOREM AND MINIMA OF CONVEX FUNCTIONS, by R. T. Rockafellar. [1965] [17]p. incl. refs. (AFOSR-66-0669) (AF AFOSR-63-467) AD 632889 Unclassified

Also published in Duke Math. Jour., v. 32: 381-398, Sept. 1965.

This paper proves an existence theorem (which is, in effect, an extension of the classical theorem of Helly, according to which an infinite collection of compact convex sets in R^n has a nonempty intersection if every $n + 1$ of the sets have a point in common) for solutions to a very general class of constrained and unconstrained minimization problems involving convex functions on R^n. This theorem is not limited to collections of convex functions on a bounded convex set, and hence can be used both in the compact case and in the theory of convex programming, where compactness is usually too severe a restriction. The principle device used is to replace

compactness by "asymptotic regularity conditions' which restrict benavior alorg certain infinite ravs which might be present. Besides applying the existence theorem to ordinary convex nrograms, results are derived from it in the theory of inequalities and Lagrange multipliers complementary to those in Proc. Amer. Math. Soc., v. 8: 617-622, 1957. A new general version of von Neumann's minimax theorem, not requiring compactness, is also deduced.

THERMOELECTRIC AND ELECTRICAL MEASUREMENTS IN THE La-Te SYSTEM, by T. H. Ramsey, H. Steinfink, and E. J. Weiss. [1965] [6]p. incl. diagrs. table, refs. (AFOSR-65-1384) [AF AFOSR-62-237] AD 621261 Unclassified

Also published in Jour. Appl. Phys., v. 36: 548-553, Feb. 1965.

An evaluation of the electrical conductivity and Seebeck coefficient of the compounds in the La-Te system has indicated values of ρ from 0.1 Ω-cm to 20 x 10^3 Ω-cm. The bonding, based on earlier crystal-chemical studies and supported by this evaluation, indicates a variation from almost pure metallic in LaTe to metallic with a substantial ionic component in La_2Te_3. An evaluation of the Seebeck coefficient has further differentiated between the purely metallic and semiconducting nature of the various compounds. The evaluation was conducted on polycrystalline pressed-powders or sintered materials, and the energy-gap measurements are believed to be a measure of surface phenomena activation processes rather than an indication of true intrinsic character.

OXIDATION OF AROMATIC COMPOUNDS BY ELECTRON TRANSFER, by M. J. S. Dewar. Final rept. Oct. 1, 1961-Dec 31, 1965, 12p. incl. diagrs. tables. (AFOSR-66-0714) (AF AFOSR-64-528) AD 632268 Unclassified

The work carried out under this project has been concerned with a general survey of reactions involving the oxidation of aromatic compounds by electron transfer, the oxidizing agents being derivatives of metals in high valence states. An extensive qualitative survey suggested that many aromatic compounds undergo oxidation by such reagents, by mechanisms in which the key step is indeed an electron transfer. A number of these reactions lead to products different from those given by other oxidizing agents and it seems likely that procedures of this kind may prove to be of value in synthesis. Several of these reactions have been studied in detail, their kinetics seem to indicate very clearly that the first step is indeed the production of an ion-radical by abstraction of an electron from the aromatic substrate. Apart from possible practical applications, reactions of this kind may help to throw light on the nature of the electron transfer process. As a byproduct of this work, a number of metal coordination polymers which serve as electron transfer agents and possible semiconductors were prepared and found to show semiconduction properties. THE PHOTOCHEMISTRY OF KETENE. THE METHYLENE RADICAL, by S.-y. Ho, I. Unger, and W. A. Noyes, Jr. Mar. 20, 1965, 5p. (AFOSR-67-0637) (AF AFOSR-65-778) AD 648665 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 2297-2298, May 20, 1965.

Recent evidence indicates that both singlet and triplet methylenes are produced when ketene is irradiated at 3200A. This behavior is intermediate between that of 2700A and 3700A. The primary photochemical process shifts from the production of singlet methylene at the shorter wave lengths to the production of singlet and triplet methylenes at longer wave lengths.

SOME EFFECTS OF THE MARTIAN ATMOSPHERE ON ELECTROMAGNETIC RADIATION FROM MARINER IV, by H. D. Cubley and A. H. LaGrone. [1965] [2]p. incl. diagrs. table. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office, and Office of Naval Research] under AF AFOSR-65-765) Unclassified

Published in IEEE Trans. Antennas and Propagation, v. AP-13: 983-986, Nov. 1965.

The 2300-mc/s channel provides a means of directly investigating the atmosphere of Mars. This method requires that the trajectory of the spacecraft be such that the spacecraft pass through or very near the occultation zone of Mars. The assumed trajectory of the Mariner IV spacecraft is, in fact, such a trajectory. The path of this trajectory is to be a gradual curve that passes within 8750 km of Mars at closest approach. This trajectory then continues past Mars and enters the occultation zone approx 20,000 km behind the planet. The radio signal from the spacecraft will experience diffraction effects due to the planet and any atmosphere that may exist. The Martian ionoshphere was considered and found to have negligible effects. Reflections of the 2300-mc/s signal from the Martian surface and effects due to polarization were also neglected. Based on these assumptions and the two proposed atmospheres of Mars, the field strength observed on Earth due to the occultation of Mariner IV by Mars was solved analytically. Results of this computation are shown for both the upper and lower extremes of the Martian atmosphere and for the case of an airless Mars. It should be noted that the Martian atmosphere bends the rays in such a manner that the edge of the planet appears to be displaced. This causes the familiar Fresnel diffraction pattern to be shifted a significant distance below the geometrical edge of the planet, the amount of shift being a function of the index of refraction profile of the assumed atmosphere. The second effect is a divergence effect that reduces the strength of the signal. These effects can be used to help deduce the composition of the atmosphere of Mars or of other planets as probes similar to Mariner IV are sent to explore outer space.

A NEW METHOD FOR THE PREPARATION OF SUCCESSIVE REPLICAS FOR USE IN ELECTRON MICROSCOPY, by M. A. Wilkov. [Jan. 1965] 15p. (AFOSR-65-1071) (AF AFOSR-64-560) AD 616340 Unclassified

A new method is described for making negative carbon platinum replicas of a selected area. Location of the area to be replicated is accomplished with a micrometer mechanical stage on an optical microscope. A collodion matrix is then formed on a replica grid and the entire assembly is dry stripped with tape. This process does not disturb the specimen surface, even after many replications, which enables the method to be used in the study of the changes in surface structure during mechanical deformation. Several examples of the process are given by the micrographs of the surface damage of aluminum single crystals and 4340 steel specimens subjected to a fatigue stress.

MECHANISM OF FATIGUE IN METALLIC CRYSTALS, by M. A. Wilkov and R. Shield. [Jan. 1965] [39]p. (AF AFOSR-64-560) AD 616341 Unclassified

The origin and progressive growth of cracks on the surface of (112) and (123) oriented single crystals of aluminum subjected to cyclic deformation at 77°K and 300°K were observed with a JEM 150 electron microscope. A negative carbon platinum replication technique was used which allowed a successive examination of the surface changes in a selected area on the surface of a specimen at given intervals of load application. Changes in crystallographic orientation or temperature did not appear to have any effect on the basic mode of crack formation, only the density and rate of crack growth. A tentative explanation of the mechanism of fatigue is proposed based on this work and other previous investigations.

SOME EXCITED STATES OF THE HELIUM MOLECULE. I. THE LOWEST $^1\Sigma_{u+}$ AND $^3\Sigma_g{}^+$ STATES AND THE FIRST EXCITED $^1\Sigma_g{}^+$ STATES, by J. C. Browne. [1965] [4]p. incl. diagrs. tables, refs. (AFOSR-65-2802) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-215 and National Aeronautics and Space Administration) AD 644862 Unclassified

Also published in Jour. Chem. Phys., v. 42: 2826-2829, Apr. 15, 1965.

Some theoretical potential curves for the $^1\Sigma_u{}^+$ (2s, ^{1}So), $^1\Sigma_g{}^+$ (2s, ^{1}So), $^1\Sigma_g{}^+$ (2po, ^{1}So), $^3\Sigma_g{}^+$ (2s, $^3S_1$), and $^3\Sigma_g{}^+$ (2po, $^3S_1$) states of the helium molecule are reported. It has been found that by using a two-term wavefunction with a mixed basis of Slater-type orbitals and elliptic orbitals, the $^1\Sigma_u{}^+$ potential curve has a maximum of about 0.174 ev at R = 5.0ao and a minimum at R = 2.07ao with a rationalized binding energy, E_B = E (calc. R_e) - E (calc., R = ∞) of E_B = 1.9 ev. In agreement with the recent suggestions of R. S. Mulliken, the lowest bound state of the helium molecule of symmetry $^3\Sigma_g{}^+$ and the first bound excited state of symmetry $^1\Sigma_g{}^+$ arise from the interactions He(^{1}So, $1s^2$) + He(^{3}So, 1s2s), $^3\Sigma_g{}^+$ (2s, $^3S_1$), and He(^{1}So, $1s^2$) + He(^{1}So, 1s2s), $^1\Sigma_g{}^+$ (2s, ^{1}So), respectively. The $^1\Sigma_g{}^+$ (2s, ^{1}So) and $^3\Sigma_g{}^+$ (2s, $^3S_1$) states were also found

to have maxima in their computed potential curves. The computed maxima are: $^1\Sigma_g^+$ - 0.7 ev, R = 4.5ao. $^3\Sigma_g^+$ - 0.8 ev, R = 3.75ao.

SOME EXCITED STATES OF He_2^{++}: MIXED BASIS-SET CALCULATIONS, by J. C. Browne. [1965] [4]p. incl. diagrs. tables, refs. (AFOSR-66-2797) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-215 and National Aeronautics and Space Administration) AD 644861 Unclassified

Also published in Jour. Chem. Phys., v. 42 1428-1431, Feb. 15, 1965.

Quantum-mechanical calculations have been made which yield approximate potential curves for the lowest $^1\Sigma_u^+$, $^3\Sigma_u^+$, and $^3\Sigma_g^+$ states and the first excited $^1\Sigma_g^+$ state of He_2^{++}. The $^3\Sigma_g^+$ and $^3\Sigma_u^+$ states exhibit no minima in their computed potential curves, but the $^1\Sigma_u^+$ and $(^1\Sigma_g^+)^*$ states are bound. Rigorous lower bounds of 0.29 and 0.24 ev are found for D_e of $^1\Sigma_u^+$ and $(^1\Sigma_g^+)^*$, respectively. The probable errors in these D_e are less than 0.1 ev.

QUANTUM MECHANICAL POTENTIAL ENERGY CURVES FOR THE $^1\pi_u$ AND $^3\pi_u$ STATES OF THE He_2 AND THE $^1\pi_g$ AND $^3\pi_g$ STATES OF H_2, by J. C. Browne. [1965] [3]p. incl diagrs. tables, refs. (AFOSR-66-2801) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-215 and National Aeronautics and Space Administration) AD 646122 Unclassified

Also published in Phys. Rev., v. 138 A9-A11, Apr. 5, 1965.

There are reported here calculated potential curves for the $^1\pi_u$ and $^3\pi_u$ states of He_2 and for the $^1\pi_g$ and $^3\pi_g$ states of H_2. In each case the potential curve shows a pronounced maximum before descending into a bound state. These maxima are shown to result from interactions of potential curves originating from a normal atom and a second quantum excited atom with curves which originate in a normal atom plus a third quantum excited atom. The computed maxima are $^1\pi_u(He_2)$ 0.5 ev, R 3.5A_0, $^3\pi_u(He_2)$ - 0.6 ev, R 3.0A_0, $^1\pi_g(H_2)$ 0.43 ev, R 4.0A_0, $^3\pi_g(H_2)$ 0.57 ev, R 4.0A_0. These maxima were predicted earlier by Mulliken on semitheoretical grounds. The wave function used for each calculation was a three term function of the generalized valence-bond type. All used Slater-type orbitals for a basis set.

A REMARKABLE PROPERTY OF PLANE WAVES IN GENERAL RELATIVITY, by R. Penrose. [1965] [6]p. incl. diagrs. refs. (AFOSR-65-1015) (AF AFOSR-63-454) AD 618617 Unclassified

Also published in Rev. Modern Phys., v. 37: 215-220, Jan. 1965.

The complete general-relativistic plane wave space-times are examined in relation to the focusing effect they exert on null cones. The following remarkable property is then obtained. No spacelike hypersurface exists in the space-time which is adequate for the global specification of Cauchy data. As a consequence, it is not possible to imbed a plane wave globally in any hyperbolic normal pseudo-Euclidean space. (Contractor's abstract)

ZERO REST-MASS FIELDS INCLUDING GRAVITATION: ASYMPTOTIC BEHAVIOR, by R. Penrose. [1965] [45]p. incl. diagrs. refs. (AFOSR-65-1016) (Sponsored jointly by Aeronautical Research Laboratory, and Air Force Office of Scientific Research under AF AFOSR-63-454) AD 619637 Unclassified

Also published in Proc. Roy. Soc. (London), v. 284A. 159-203, Feb. 23, 1965.

A zero rest-mass field of arbitrary spin s determines, at each event in space-time, a set of 2s principal null directions which are related to the radiative behavior of the field. These directions exhibit the characteristic peeling-off of Sachs. Part I of this paper is concerned with an independent derivation of this property for fields of any spin in special relativity by means of an inductive spinor argument which depends ultimately on the appropriate asymptotic behavior of a simple Hertz-type complex scalar potential. Part II describes a general technique for discussing asymptotic properties of fields in curved space-times, which is applicable to all asymptotically de Sitter space times. The technique affords a covariant approach to the definition of radiation fields in general relativity. Further applications of the technique are also indicated

10 EXACT GRAVITIONALLY-CONSERVED QUANTITIES, by E. T. Newman and R. Penrose. [1965] [3]p. incl. refs. (In cooperation with Pittsburgh U. and Birkbeck College, London) (AF AFOSR-63-454) AD 641682 Unclassified

Published in Phys. Rev. Ltrs., v 15: 231-233, Aug. 9, 1965.

The paper is concerned with a discussion of 10 exact gravitationally conserved quantities. In ordinary electromagnetic theory, total charge remains exactly constant for any system surrounded by source-free space. This is a direct consequence of Maxwell's equations for the free-space region, whereas dipole and higher moments can be carried away by electromagnetic radiation. In gravitational theory, analogs of this conserved charge would at first sight appear to be mass, momentum, and angular momentum, as they are indeed exactly conserved in the linearized Einstein theory for regions surrounded by empty space. However, in the full nonlinear theory mass and momentum can be changed by gravitational radiation. It has therefore been commonly believed that there are no exactly conserved gravitational quantities in general relativity. But it is found out quite unexpectedly, that there is a set of 10 geometrical quantities, defined for asymptotically flat space-times, which have a quadrupole structure and whose values cannot be altered in any way by gravitational radiation.

THE PHYSICS OF METASTABLE SYSTEMS, by W. W. Robertson. Final rept. Feb. 1, 1964-Jan 31, 1965, 10p. (AFOSR-65-1052) (AF AFOSR-64-273) AD 619100 Unclassified

The work of this project has been concerned with the mechanisms whereby long-lived metastable states of the rare gases are formed and decay. Work completed included a method of titration for He^+, He_2^+, $He(2^3S)$ whereby the concentrations were proportional to the intensity of selectively excited spectra of admixed gases in a burner arrangement where the fuel consisted of the excited species in a helium stream. Absorption and emission spectra in a pulsed discharge with time resolved techniques enabled the $He(2^1S)$, $He(2^3S)$, He^-, He_2^+ and He_2^* concentrations to be monitored. Abstracts of papers that have been published in journals and references to the journal articles are given.

ATOMIC AND MOLECULAR EMISSION IN THE NEGATIVE GLOW OF A HELIUM DISCHARGE, by W. B. Hurt and W. W. Robertson. Aug. 1964 [5]p. incl. diagrs (AFOSR-65-1429) (AF AFOSR-64-273) AD 622627 Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Also published in Jour. Chem. Phys., v. 42 556-560, Jan. 15, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10 192, Feb. 25, 1965.

The spatial distribution of helium atomic and molecular radiation has been investigated in the negative glow of a dc discharge. The atomic radiation peaks sharply at the cathode edge of the negative glow, the molecular radiation less sharply at a greater distance from the cathode. Microwave quenching indicates that most of the atomic and all of the molecular radiation results from electron-ion recombination processes. The decrease in atomic radiation reflects the decrease in atomic ion concentration which is controlled primarily by diffusion away from the cathode and by three-body conversion to molecular ions. The molecular ions are lost by diffusion and by collisional-radiative recombination to the neutral molecule, with collisional processes predominating. The negative glow can be characterized as a plasma steady in time but with a 1-dimensional spatial decay away from the cathode. (Contractor's abstract)

TEMPERATURE DEPENDENCE OF THE RATE OF CONVERSION OF He^+ INTO He_2^+, by F. E. Niles and W. W. Robertson. [1965] [4]p. incl. diagrs refs. (AFOSR-65-2506) (AF AFOSR-64-273) AD 628447 Unclassified

Also published in Jour. Chem. Phys., v. 42 3277-3280, May 1, 1965.

Measurement of the decay of atomic and molecular emissions in the early helium afterglow for temperatures from 77° to 449°K and pressures from 3.76 to 9.93 Torr, together with the known value for the ambipolar diffusion of He^+, have shown that the temperature dependence of the conversion frequency for the reaction $He^+ + 2He \rightarrow He_2^+ + He$ goes as T^{-1}. When the conversion frequency is expressed as βp^2, the quantity βT^3 is independent of temperature and pressure with an average value of 2.97×10^9 K^3 $sec^{-1} \cdot Torr^{-2}$. When the conversion frequency is expressed as $k_R[He]^2$, the quantity $k_R T$ is independent of temperature and pressure with an average value of 3.19×10^{-29} $K \cdot cm^6$ $atoms^{-2}$ sec^{-1}. Theoretical considerations confirm that the temperature dependence of the conversion frequency goes as T^{-1}. (Contractor's abstract)

COLLISIONAL RADIATIVE RECOMBINATION OF He_2^+ INTO DISSOCIATIVE STATES, by W. W. Robertson. [1965] [7]p. incl. diagrs. (AFOSR-65-2507) (AF AFOSR 64-273) AD 628448 Unclassified

Also published in Jour. Chem. Phys., v 42 2064-2070, Mar. 15, 1965.

Spectroscopic investigation of a flowing helium afterglow revealed the presence of strong 10 830-A atomic helium emission corresponding to the $2^3P \rightarrow 2^3S$ transition, which could be quenched by the application of a weak microwave field to the afterglow. An examination of the axial variation and pressure dependence of the

concentration of 2^3P atoms established that it resulted primarily from the ion-electron recombination of He_2^+, rather than He^+, at the higher pressures examined. An extension of the theory of collisional-radiative recombination of molecular ions to include dissociating states is postulated to explain these observations. (Contractor's abstract)

DISSOCIATION OBSERVED IN A HELIUM AFTERGLOW (Abstract), by C. B. Collins, Jr. and W. W. Robertson. [1965] [1]p. [AF AFOSR-64-273] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 186, Feb. 25, 1965.

Spectroscopic observations conducted on a flowing helium afterglow at an electron density of the order of 2×10^{12} cm^3 and a temperature of 1800 K revealed the emission of the 10 830-A ($2^3P - 2^3S$) helium line at a higher intensity than could be expected as the result of cascading from the higher levels populated by the collisional-radiative recombination of He^+. The emission was found to be quenched upon application of a weak microwave field to the afterglow. An examination of the pressure dependence of the 10 830-A intensity and ion concentrations established that the anomalously high 2^3P population was the result of the ion-electron recombination of He_2^+. The axial variation of the intensity revealed a dependence that was first order on He_2^+ concentration and first order on electron density. Mechanisms are discussed.

Texas U. [Dept. of Physics] Austin.

MEASUREMENT OF THE TEMPERATURE DEPENDENCE OF THE RATE OF CONVERSION OF He^+ INTO He_2^+ IN THE HELIUM AFTERGLOW (Abstract), by F. E. Niles, C. B. Collins, Jr., and W. W. Robertson. [1965] [1]p. [AF AFOSR-64-273] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 186, Feb. 25, 1965.

Previous work yielded the rate of conversion at room temperature of He^+ into He_2^+ by the reaction $He^+ + 2He \rightarrow He_2^+ + He$ from the observed decay of the atomic and molecular emission in the early helium afterglow and the known rate of diffusion of He^+. Similar measurements have been carried out over the temperature range 77 –443 K. These measurements show that the temperature dependence of the rate of conversion β^2 goes as T^{-1} and, consequently, that the temperature dependence of β goes as T^{-3}. These results seem to be consistent with the theoretical predictions of the temperature dependence of termolecular reactions.

OBSERVATIONS ON THE VISIBLE AND NEAR-INFRARED ARGON CONTINUUM (Abstract), by J. F. Prince and W. W. Robertson. [1965] [1]p. [AF AFOSR-64-273] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965

Published in Bull. Amer. Phys. Soc., Series II, v. 10 170-171, Feb. 25, 1965.

Spectroscopic observations have been made on the visible and nearinfrared (3500-8000 A) argon continuum. For these studies, the continuum was examined in the positive column of a dc, high-purity argon discharge. The continuum intensity has been measured as a function of wavelength at constant currents for pressures of about 5-50 Torr and at constant pressures for currents of 2.5-10 mA. Ratios of relative line intensity to continuum intensity as a function of pressure and discharge current is also reported. The heavily structured argon continuum, which was observed in the present experiments, is compared to the results of previous workers with allowance made for the many differences in experimental conditions. The present results are examined under the current theory that the primary sources for the visible and infrared argon continuum are free-free and free-bound transitions in the argon plasma.

SPECTROSCOPIC INVESTIGATION OF THE HELIUM-NEON MOLECULE, by W. R. Henderson, F. A. Matsen, and W. W. Robertson. [1965] [6]p. incl. diagrs. refs. (AF AFOSR-64-273) Unclassified

Presented at meeting of the Amer Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10 186, Feb. 25, 1965.

Published in Jour. Chem Phys., v. 43 1290-1295, Aug. 15, 1965.

When a discharge is excited in a helium-neon mixture a band spectrum appears that is absent in the spectra of the separate gases. This spectrum has been attributed to the HeNe molecule. Although investigated here under fairly high resolution, the spectrum was not completely analyzed However, substitution of ^3He for ^4He resulted in isotopic shifts in agreement with those calculated for the rotational structure of a diatomic HeNe molecule. Investigation of the spatial distribution of intensity of the atomic and molecular radiation in the

cathode region of a dc discharge in a helium-neon mixture and of its behavior under a superimposed microwave field yielded an indication of the origin of the molecular spectrum. The molecular ion $HeNe^+$ is evidently formed by the reaction $He^+ + Ne + X \cdot HeNe^+ + X$ and then recombines partially into bound states. The molecular radiation observed is thus attributed to transitions between weakly bound states of the neutral molecule HeNe populated from above by electron-ion recombination. ROTATING FLUID MASSES IN GENERAL RELATIVITY, by R. H. Boyer. [1965] [4]p. (AFOSR-66-1412) (AF AFOSR-64-454) AD 641681 Unclassified

Also published in Proc. Cambridge Philos. Soc., v. 61: 527-530, 1965.

Some properties of the gravitational field of an isolated, axially symmetric, uniformly rotating mass of perfect fluid in a steady state according to the general theory of relativity are derived. Several exact models describing rotating fluids are known in Newtonian mechanics, the Maclaurin and Jacobi ellipsoids being perhaps the most interesting. In general relativity, no such exact solution is known in its entirety, although Kerr has exhibited a certain vacuum solution possessing features that one might expect of a space-time exterior to some rotating body. Having Kerr's solution in mind, the question of whether a perfect fluid interior can be matched to any given exterior field is considered. The main results exhibit the class of all possible fluid boundaries, given the exterior field, and some relations between the pressure, density, 4-velocity, and interior metric tensor.

GRAVITATIONAL COLLAPSE IN A RELATIVISTIC POLYTROPIC GAS (Abstract), by R. W. Lindquist. [1965] [1]p. (Sponsored jointly by Aerospace Research Laboratories, Air Force Office of Scientific Research under [AF AFOSR-64-454, and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 48, Jan. 27, 1965.

An exact solution of the relativistic equations for spherically symmetric collapse for a perfect fluid that satisfies a polytropic equation of state with $\gamma > 2$, is presented. The solution obtained describes a fluid of infinite extent in which the density falls off as r^{-}, it is thus not directly applicable to a collapsing star with a finite boundary. Nevertheless, the dynamical features of the collapse are qualitatively similar to those observed in numerical solutions for more realistic models if a certain dimensionless ratio GM_0/c^2R_0 (M_0 and R_0 being two parameters of the solution with dimensions of mass and distance, respectively) is greater than unity, each spherical element of fluid collapses to a minimum radius and then expands, while if $GM_0/c^2R_0 \cdot 1$ the solution contracts indefinitely, much like the $p = 0$ case of Oppenheimer-Snyder. Behavior of light rays and the nature of the Schwarzschild surface for this solution are discussed.

SOME USES OF HYPERBOLIC VELOCITY SPACE, by L. H Boyer. [1965] [7]p. incl. diagrs. refs. (Sponsored jointly by Aeronautical Research Laboratories, and Air Force Office of Scientific Research under AF AFOSR-64-454) Unclassified

Published in Amer. Jour. Phys., v. 33: 910-916, Nov. 1965.

This paper deals with the definition and properties of the velocity space of special or general relativity. The metric naturally induced by the enveloping space-time is that of a space of constant negative curvature which is referred to here as a 3-dimensional Lobachevsky space. The purpose is to show how this notion can simplify or reinterpret ideas of relativistic kinematics. Supplementing the more familiar applications, 3 others are given here which make essential use of the curvature, namely to the derivations of aberration, Thomas precession, and the forms of relativistic collision invariants. ATTRACTION AS A LINEAR FUNCTION OF PROPORTION OF POSITIVE REINFORCEMENTS, by D. Byrne and D. Nelson. [1965] [5]p. incl. diagrs. tables, refs. (AF AFOSR-63-261) Unclassified

Published in Jour. Personality and Social Psychol., v. 1, 659-663, June 1965.

In various investigations of the effects of the similarity of a stranger's attitude on attraction toward him, the proportion of similar attitudes has not been distinguished from the number of similar attitudes. In a 4 x 3 factorial design, 4 levels of proportion and 3 levels of number were employed. Each of 168 Ss was asked to read an attitude scale purportedly filled out by an anonymous stranger and to evaluate him on a number of variables including attraction toward him. As hypothesized, analysis of variance indicated that attraction was significantly ($p < .001$) affected only by proportion. Utilizing these and other data for a total of 790 Ss, the functional relationship between proportion of similar attitudes and attraction was found to be a linear one. The conceptualization of attitude similarity as constituting positive reinforcement was strengthened by the finding of a linear relationship in McDonald's data between proportion of high creativity ratings given to 192 Ss and their attraction toward the rater. MAGNITUDE OF POSITIVE AND NEGATIVE REINFORCEMENTS AS A DETERMINANT OF ATTRACTION, by D. Byrne and R. Rhamey. [1965] [6]p. incl. diagr. tables, refs. (AF AFOSR-64-261) Unclassified

Published in Jour. Personality and Social Psychol., v. 2, 884-889, Dec. 1965

It was hypothesized that positive and negative reinforcements concerning personal attributes are of greater magnitude and hence exert a greater effect on attraction than reinforcements involving attitude and similarity-dissimilarity with respect to impersonal topics. In a 4 x 3 factorial design, 4 levels of attitude similarity (1.00, .67, .33, and .00) and 3 types of evaluation conditions (positive, negative, and control) were employed. Each of 180 Ss was asked to read an attitude scale purportedly filled out by an anoymous stranger and to evaluate him on a number of variables, including attraction. In the positive and negative conditions, Ss also received information concerning the stranger's evaluation of them. Analysis of variance indicated that attraction was significantly influenced by both independent variables ($p < .01$). The effect of the personal evaluation items was found to be greater than that of the impersonal items ($p < .001$). It was suggested that the equation for the law of attraction should include a weighting factor to designate the effect of reinforcement magnitude. (Contractor's abstract)

AN ADAPTIVE PATTERN CLASSIFICATION SYSTEM, by J. D. Patterson and B. F. Womack. Aug. 16, 1965, 87p. incl. diagrs. table, refs. (Technical rept. no. 9) (AFOSR-66-0514) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-65-766; and Texas Instruments, Inc.) AD 489328 Unclassified

Also published in IEEE Trans. Systems Sci. Cybernetics, v. SSC-2, 62-67, Aug., 1965.

Adaptive pattern classification is the assignment of patterns to classes based on typical patterns or training samples which are used by the system to determine the decision procedure. An adaptive pattern classification system is described that does not require a prior knowledge of the probability density of the pattern vectors for each class, as do the classical statistical techniques. Any decision rule that consists of a discriminant function that is a linear combination of arbitrary scalar functions of the pattern vector may be chosen on the basis of a priori knowledge about the classes, engineering judgement, and economic considerations. The system

optimizes itself by adjustment of the decision parameters according to a weighted mean-square-error performance criterion, using a multivariable search technique. (Contractor's abstract, modified)

A STUDY OF NONLINEAR NEGATIVE CAPACITANCE, by C. L. Wright, Jr. and C. O. Harbourt. Aug. 16, 1965, 110p. incl. refs. (Technical rept. no. 5) (AFOSR-66-0516) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-65-766) AD 489325 Unclassified

An analytical study is made of the behavior of a certain class of RLC networks which contain a theoretical nonlinear negative capacitance along with various possible combinations of constant parasitic elements that are certain to be present in any physical realization of this type of capacitance. The theoretical capacitor is defined in terms of its charge-voltage relationship. This study is directed toward an evaluation of the usefulness of a nonlinear negative capacitance in a network to accomplish either amplification or oscillation or switching. In order for a network to be useful as an amplifier, its small-signal model must be stable. Therefore, for this part of the study the nonlinear capacitor is represented by a linear, negative capacitance. Singular point-analysis discloses that any of the defined networks may have 2 stable equilibrium points. This is the basic criterion for a bistable device, so the conclusion is that nonlinear capacitance, like nonlinear resistance, can be used effectively to construct a switching circuit. It is proven by phase plane methods that none of the second order systems can support a sustained oscillation. A nonlinear negative capacitance has been realized by means of a transistor negative impedance converter circuit. (Contractor's abstract, modified)

TRAINING-ADJUSTED DECISION SYSTEMS FOR PROCESS CONTROL, by C. L. Kettler and B. F. Womack. Aug. 16, 1965, 122p. incl. refs. (Technical rept. no. 11) (AFOSR-66-0518) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-65-766) AD 489330 Unclassified

Methods for the control of discrete product manufacturing processes are developed. Emphasis is placed on the end requirement for economical physical implementation of an adaptive controller with analog circuits. The proposed process controller is capable of making pass/reject decisions (classifications) at each of the manufacturing stations comprising the process for each discrete unit of manufacture. The process controller is capable of estimating control parameters at future manufacturing stations, or at final test. The minimum average risk classification operator is explored where the required conditional probability densities are multivariate symmetric. A search procedure is developed for determining the quadratic classification operator, which does not require exact prior knowledge of the (possibly different) functional forms of the conditional probability densities. The individual search algorithms are shown to converge for finite training sets. The derived value will converge in probability with increasing size of the sample set to the required value, which is shown to be median-unbiased. Implementation of the translation, rotation, and dilation algorithms with analog circuits is considered as an approach to realizing the slave classification operator. THE USE OF ELECTROMAGNETIC RADIATION IN THE STUDY OF PLANETARY ATMOSPHERES AND SURFACES, by H. D. Cubley and A. H. LaGrone. Aug. 15, 1965, 100p. incl. refs. (Technical rept. no. 7) (AFOSR-66-0519) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-65-766) AD 489327 Unclassified

Various techniques employing electromagnetic radiation are presently being used in the study of planetary atmospheres and surfaces. These techniques generally make use of either thermal radiation from the planet itself or solar radiation that is reflected and scattered from the surface and atmosphere of the planet. Such measurements are made from earth-based observation points. Radio astronomy uses radio techniques to measure such quantities as the surface temperature of the planet and the polarization of any nonthermal radiation from the planet. Radar astronomy uses both pulsed and continuous wave radar. These radars can be used to study the surface roughness of a planet, its rotation rate, and the density of its ionosphere. Infrared astronomy is used in the study of the emission and absorption bands in a planetary atmosphere. Visual astronomy enables the observation of surface features such as clouds and haze. Close-up observations are possible when a spaceprobe such as Mariner 4 is occulted by a planet and its atmosphere. (Contractor's abstract, modified)

THE CATHODE RAY STORAGE TUBE IN ADAPTIVE DECISION SYSTEMS, by J. H. Seamon and B. F. Womack Aug. 10, 1965, 107p. incl. refs. (Technical rept. no. 10) (AFOSR-66-0531) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-65-766) AD 489329 Unclassified

The Cathode Ray Storage Tube (Scan-Converter Tube) is investigated for storage of an array of adaptive weights for an Adaptive Decision System. The advantages and limitations of the Tube are investigated. The significant advantage of the Tube is the low cost per weight. This low cost is due to the large number of weights available, and to electron beam scanning which eliminates the need for connectors to individual weights. The most serious limitation of the Tube is the lack of a greater dynamic range. The realization of an Adaptive Decision System using the Tube is proposed. The logical structure is that of a 2-layer machine with the first layer adaptive. Both layers use threshold logic. The interconnections of the layers are such that the System consists of parallel committees, and can be trained by the Committee Training Procedure. The fixed increment training rule is used. The logic used is (1,0), which offers advantages in adapting the weights in the Tube. A Modified Training Procedure is proposed to reduce the complexity and cost of the System.

THEORY AND MEASUREMENT OF DIELECTRIC PROPERTIES OF ALKALI HALIDE CRYSTALS AT CRYOGENIC TEMPERATURES, by D. Grisson and W. H. Hartwig. Aug. 16, 1965, 90p. incl. refs. (Technical rept. no. 6) (AFOSR-66-0532) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-65-766) AD 483326 Unclassified

The Born expression, $E \sim r + \beta/r^n$, for the energy of interaction between 2 ions is used to derive a new expression for the ionic polarizability of the alkali halides. The new expression for the ionic polarizability, based upon dielectric constant measurements, gives values of the repulsive exponent n, in the Born energy relation, which agree well with values obtained from compressibility studies. The dielectric losses in a perfect crystal are examined in detail. It is assumed that there are 3 mechanisms which may contribute to the losses in a perfect crystal: radiation damping, quantum absorption, and collision broadening. Calculations show the losses due to radiation and quantum effects to be too small to measure. A new theory of collision broadening, as applied to dielectric losses, is offered. The thermal energy of the crystal lattice produces an rms ion displacement from the equilibrium position. Experimental dielectric loss measurements in the VHF-UHF range show the actual losses to be much larger than those calculated for perfect crystals. The observed losses in NaCl and KCl are shown to be of the same nature as Debye relaxation, which are associated with crystal defects. For NaCl, a loss peak near 300 mc/sec has an activation energy of .0011 ev and has a fractional defect density of approximately 5×10^{-10}. (Contractor's abstract, modified)

KERR CELL PHOTOGRAPHY OF A DYNAMICAL DEUTERIUM PLASMA PRODUCED IN A 30 KILOJOULE THETA PINCH, by H. N. Roberts, R. F. Gribble, and A. A. Dougal. Jan. 15, 1965, 60p. incl. refs. (Technical rept. no. 3) (AFOSR-66-0534) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-65-766) AD 800738 Unclassified

A 0.1 μs Kerr cell shutter was employed in a photographic investigation of the space and time history of the luminous ring characteristic of the plasma current sheath in a high temperature, pure, dense, deuterium plasma formed in the "theta pinch" geometry. Only one photograph could be taken per discharge. Repeatability is found to be a reasonable assumption. Generation of the plasma is accomplished in a 4 stage process. A method is proposed for obtaining rough estimations of relative electron densities from a photographically recorded light intensities. The effect that different bias field intensities have on the beginning of the initial inward sweep of the luminosity is correlated with simple theory providing an indication that the current sheath and luminous ring are coincident during the initial inward sweep. Snowplow model energy calculations performed with the slope of the initial inward sweep from position vs time plots indicate ion energies from 40 to 100 ev agreeing with 10% to computer calculations based on the theoretical considerations employed by the Hain-Roberts code. The noted dependence of the initial minimum radial position on reverse bias field is "trapped" by the current sheath. A comparison of theoretical and experimental position vs time plots indicates that the leading edge of the observed luminosity is essentially the position of maximum particle density during the initial inward sweep. MICROWAVE EMISSION FROM BULK n-TYPE INDIUM ARSENIDE, by D. K. Ferry and A. A. Dougal. [1965] [2]p. incl. diagrs. (AFOSR-66-1061) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-65-766) AD 643321 Unclassified

Also published in Appl. Phys. Ltrs., v. 7: 318-319, Dec. 15, 1965.

The observation of microwave emission from n-type indium arsenide in the presence of applied electric and magnetic fields at liquid nitrogen temperatures is reported. Radiation is observed when the electric field (E) exceeds a threshold value which is dependent on the magnetic field (B). The threshold E is observed to be 135 v/cm at 8.5 kg; the emission is observed for B as low as 5 kg.

CONTINUOUS MICROWAVE EMISSION FROM INDIUM ANTIMONIDE, by D. K. Ferry, R. W. Young, and A. A. Dougal. [1965] [1]p. incl. diagrs. (AFOSR-67-0818) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-65-766) AD 650027 Unclassified

Also published in Jour. Appl. Phys., v. 36: 3684-3685, Nov. 1965.

Observation is made of the continuous microwave emission from InSb with dc electric and magnetic fields applied. This continuous operation was obtained at 77°K with the magnetic field oriented perpendicular to the electric field. The threshold electric and magnetic fields were observed to be 6 v/cm and 3000 G, respectively. Several attempts were made to obtain continuous emission with the magnetic field oriented parallel to the electric field. However, the increased current in this mode again led to thermal problems and no emission was observed. The threshold in electric field for continuous emission is similar to that for pulsed emission. This occurrence of continuous emission must be considered in proposed theories of the effect. The low electric field required is insufficient to cause impact ionization, and rules out avalanche breakdown and pinch effects as the basis. This, coupled with the continuous emission observation, points toward a more fundamental process as the basis of the microwave emission.

A 16-FOOT DIAMETER MILLIMETER WAVELENGTH ANTENNA SYSTEM, ITS CHARACTERISTICS AND ITS APPLICATIONS, by C. W. Tolbert, A. W. Straiton, and L. C. Krause. Aug. 1964, 8p. incl. illus. diagrs. table. (AFOSR-66-1052) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-66-766], National Aeronautics and Space Administration, and National Science Foundation) AD 643214 Unclassified

Also published in IEEE Trans. Antennas and Propagation, v. AP-13: 225-229, Mar. 1965.

This paper describes the characteristics of the 16-ft diam millimeter wavelength antenna system at the Electrical Engineering Research Laboratory, University of Texas, Austin. Aperture efficiencies of the antenna at the frequencies of 35, 70 and 94 Gc are 59%, 55% and 52%, respectively, corresponding to gain and beamwidths of 62.5 dB and 0.118° at 35 Gc/s, of 68.5 dB and of 70.9 dB and 0.048° at 94 Gc/s. First sidelobes and other sidelobes over the 35- to 94-Gc/s frequency interval are -18 dB and -25, respectively. The 70-Gc/s radiation temperatures of Jupiter and the earth's moon have been measured. The brightness temperature of Jupiter was found to be 112 ± 22°K and the maximum brightness temperature contour of the moon was 270°K. Relatively higher emission temperatures were observed from the maria and the craters of Copernicus and Tycho than from surrounding lunar areas.

INVESTIGATION OF TAU A AND SGR A MILLIMETER WAVELENGTH RADIATION, by C. W. Tolbert and A. W. Straiton. [1965] [4]p. incl. illus. diagr. tables, refs. (AFOSR-66-1053) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [AF AFOSR-66-766]) AD 643213 Unclassified

Also published in Astron. Jour., v. 70: 177-180, Mar. 1965.

The techniques of investigating the position and flux density of 35 and 70 Gc Tau A radiation and 35 and 94 Gc Sgr A radiation are described. Tau A (35 Gc) and Sgr A (35 Gc) flux densities were 420 ± 60 x 10^{-26} cps^{-1} and 290 ± 100 x 10^{-26} W m^{-2} cps^{-1}, respectively. The flux density of Tau A (70 Gc) interpreted from an antenna temperature signal to noise ratio of approximately 2 to 1 was 790 ± 50 x 10^{-26} W m^{-2} cps^{-1}. Observations at 94 Gc of Sgr A, having a calculated antenna temperature standard deviation of 0.2°C, revealed no source of radiation at the central position of Sgr A (35 Gc). The 35 Gc position of Tau A and Sgr A coincided, within the limits of the measuring accuracy ± 3^s R.A. and ± 1' Dec., with lower frequency source positions. (Contractor's abstract)

FIELD EQUATIONS IN CYLINDRICAL COORDINATES FOR GYROELECTRIC MEDIA WITH SOURCES, by R. K. Likushi. [1965] [2]p. (AFOSR-66-1054) [AF AFOSR-66-766] AD 643215 Unclassified

Also published in IEEE Trans. Microwave Theory and Techniques, v. MTT-13. 881-882, Nov. 1965.

Transverse field equations are developed for gyroelectric media with sources. These equations are developed from first principles for materials characterized by a tensorial relative permittivity of the form

$$\bar{\bar{K}} = \begin{bmatrix} K_{11} & jK_{12} & 0 \\ -jK_{12} & K_{11} & 0 \\ 0 & 0 & K_{33} \end{bmatrix}$$

By making a transformation from a gyroelectric medium to a gyromagnetic medium the equations reduce to those obtained by Rosenbaum and Coleman, "Cerenkov Radiation in Anisotropic Ferrites", IEEE Trans. Microwave Theory and Tech., v. MTT-11: 302-311, Oct. 1963.

MAGNETOTELLURIC MICROPULSATIONS AT WIDELY SEPARATED STATIONS, by A. S. Orange and F. X. Bostick. [1965] [7]p. incl. diagrs. table. (AFOSR-66-1069) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [AF AFOSR-66-766]) AD 642952 Unclassified

Also published in Jour. Geophys. Research, v. 70: 1407-1413, Mar. 15, 1965.

Magnetotelluric micropulsations were recorded simultaneously at Texas, Puerto Rico, and Trinidad, West Indies, during October 1962. Analysis of several data samples yielded information concerning the power spectrums of micropulsation activity and the coherency of signals recorded at the 3 locations. No frequency variation with latitude or longitude was observed. No significant diurnal frequency variation was noted, although a wide change in peak frequency was seen from day to day. The coherency analysis indicated that the signals at the 3 locations were consistently very similar and at times were nearly identical. (Contractor's abstract)

IMPULSE RESPONSE OF THE MAGNETOSPHERIC COLUMN, by C. F. Prince, Jr., F. X. Bostick, and H. W. Smith. [1965] [8]p. incl. diagrs. (AFOSR-66-1071) (Sponsored jointly by Air Force Office of Scientific

Research, Army Research Office (Durham), and Office of Naval Research under [AF AFOSR-66-766])
AD 643216 Unclassified

Also published in Jour. Geophys Research, v. 70, 4901-4908, Oct. 1, 1965

The transmission characteristics of a plane stratified model of the earth's magnetospheric to plane hydromagnetic waves incident at the uppermost layer interface have been computed. The computations, performed as a function of the angular frequency of the wave, are used to obtain the ratio of the amplitude of the tangential magnetic fields in the specified incident waves to the magnetic field amplitudes computed at the layer interface representing the earth's surface. This steady-state transfer function is then Fourier-transformed to obtain simulated time records of the magnetic field at the earth's surface excited by impulsive inputs at the top of the magnetospheric column. Models representing both daytime and nighttime atmospheres during conditions of sunspot minimum are considered. The simulated time records are compared with experimental recording of the geomagnetic field obtained by other investigators. (Contractor's abstract)

SYNTHESIS OF A LINEAR TIME-VARIABLE PARAMETER CONTROL SYSTEM, by B. F. Womack. [1965] [19]p. incl. illus. diagrs. table. (AFOSR-66-1073) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-66-766] and Southern Fellowship Foundation) AD 643016 Unclassified

Presented at Southwest Inst. of Electrical and Electronic Engineers Conference, Apr. 22-24, 1964.

Also published in Internat'l. Jour. Control, v. 1, 55-73, Jan. 1965.

The modified adjoint system has been utilized by other researchers in the analysis of time-varying parameter (TVP) systems whose input signal is a stationary random variable corrupted with noise (Laning and Battin 1956). The modified adjoint system will be developed in this paper as a synthesis tool for final-value systems. The system error is to be a minimum at time t T. The technique is applicable to systems which can be represented by ordinary linear differential equations with deterministic functions as coefficients. The modified adjoint system is advantageous since it yields the optimum system, in a mean-square sense, and provides a set of integral equations which makes compensation an easier task than is possible with the original system (Womack 1963). An experimental system and a random signal generator were constructed to test the synthesis procedure. The performance of the experimental system incorporating conventional compensation is compared with the performance of the system including a compensator designed by using the modified adjoint system. Results indicate the latter system to be superior in a mean-square sense. (Contractor's abstract)

BREAKDOWN MINIMA DUE TO ELECTRON-IMPACT IONIZATION IN SUPER-HIGH PRESSURE GASES IRRADIATED BY A FOCUSED GIANT-PULSE LASER, by D. H. Gill and A. A. Dougal. [1965] [3]p. incl. diagrs. (AFOSR-67-0762) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-66-766] and National Science Foundation) AD 649602 Unclassified

Also published in Phys. Rev. Ltrs., v. 15, 845-847, Nov. 29, 1965.

Minima in the curves of threshold electric field vs pressure for ionization of superhigh-pressure helium, argon, and nitrogen using a focused giant-pulse ruby laser are reported. These minima are characteristic of electron impact ionization. Definitive experimental data are presented which are indicative of electron impact ionization where the heating of electrons occurs through energy transfer from the light wave to the electrons undergoing collisions with neutrals. The presence, pressure, and sharpness of these minima are predicted by a simple electron-impact ionization theory, and these predictions agree with the experimental data presented here.

THE EFFECTS OF GANGLIONIC BLOCKADE UPON THE PRESSOR RESPONSE ELICITED BY ELEVATION OF THE CEREBRAL SPINAL FLUID PRESSURE (Abstract), by J. G. Hilton and M. Steinberg. [1965] [1]p. (AFOSR-66-1468) (AF AFOSR-63-391) AD 641527 Unclassified

Also published in Proc. Internat'l. Union of Physiological Sciences, Twenty-third Internat'l. Cong., Tokyo (Japan) (Sept. 1-9, 1965), Amsterdam, Excerpta Medica Foundation, v. 1 478, 1965.

The sensitivity of the ganglia to stimulation by the cholinergic agents neostigmine and pilocarpine after blocking drugs has led to a study of the effects of ganglionic blocking drugs upon a variety of vasomotor reflexes. This report concerns the effects of the reflex vasopressor response elicited by elevation of the cerebral spinal fluid pressure. Dogs were anesthetized with sodium pentobarbital and the arterial pressure was recorded from the brachial and femoral arteries, the venous pressure was recorded from the femoral vein. Alterations in vasomotor tone were measured using a modification of the major vessel occlusion technique of Bartelstone. Cerebral spinal fluid pressure was

elevated via a needle placed directly into the cisterna magna. Vasomotor tone and blood pressure were measured in the absence and presence of an elevated cerebral spinal fluid pressure during the control period and after the intravenous injection of 1 mg/kg of the ganglionic blocking drug chlorisondamine chloride. The results of this study showed that chlorisondamine chloride did not completely block either the alteration in vasomotor tone or the alteration in blood pressure produced by elevation of cerebral spinal fluid pressure. This alteration was blocked by the production of total spinal anesthesia or by the administration of small doses of atropine or similar parasympatholytic agents.

CAROTID SINUS OCCLUSION RESPONSE IN THE PRESENCE OF CHLORISONDAMINE AND ATROPINE (Abstract), by M. Steinberg and J. G. Hilton. [1965] [1]p. (AFOSR-66-1470) (AF AFOSR-65-391) AD 641064 Unclassified

Also published in Texas Rept. Biol. Med., v. 23: 667, 1965.

Classical ganglionic blocking agents such as chlorisondamine (1 mg/kg) fail to block completely the pressor response of carotid sinus occlusion in dogs. The pressor response is obliterated by the injection of 1 mg/kg of atropine after the chlorisondamine (Ecolid) has been given. Systemic blood pressure is lowered when chlorisondamine is injected and further reduced after the administration of the atropine. Piperocaine hydrochloride, 1.5% (20 cc introthecally) given after the 2 above mentioned agents significantly lowered the post blockade blood pressure. A major vessel occlusion was performed caudal to the renal arteries (Hilton modification of Bartelstone, Circ. Res., v. 8: 1059, 1960). Blood pressure was monitored from the femoral artery, brachial artery and femoral vein, using a Statham Transducer and a Grass Polygraph. Results indicate that there is a component of the ganglia which is "muscarinic" in response, which agrees with recent publications. This report is a part of a study of vasopressor reflexes under the influence of autonomic agents.

RESEARCH STUDY OF LIGHT EMISSION CAUSED BY PRESSURE FLUCTUATIONS IN ROCKET ENGINES, by B. Hornstein. Final rept. Jan. 1-Dec. 31, 1964, May 1965, 66p. incl. illus. diagrs. tables, refs. (Rept. no. RMD 5516-F) (AFOSR-65-1208) (AF 49-(638)1279) AD 622524 Unclassified

Simultaneous high frequency measurements of light emission and pressure were made in an oscillating premixed methane-air rocket engine in order to gain knowledge concerning important pressure-combustion interactions. With transverse oscillations, no corresponding emission fluctuations were observed, but longitudinal pressure oscillations were always found to be accompanied by emission fluctuations of the same frequency. Visible spectra were photographically recorded and showed similarity to previous laboratory spectra of flames as a function of pressure. These spectra and the high frequency photomultiplier data are interpreted to show that the CH and OH emission fluctuations are indicative of pressure response in the early chain-branching phase of reaction.

AFOSR COMBINED CONTRACTORS MEETING ON COMBUSTION DYNAMICS RESEARCH: ABSTRACTS [Patrick Air Force Base, Fla.] (June 1-4, 1965) [1965] 71p. (AFOSR-65-0590) [AF 49(638)1505] AD 623186 Unclassified

Abstracts are presented of papers presented at the meeting in various fields of combustion dynamics, including supersonic combustion, steady-state rocket combustion, jet mixing, liquid rockets, plasmas, light emission and thermal radiation, shock initiation, liquid rocket injectors, and resonant combustion. Special emphasis is placed on combustion instability and solid propellants.

COMPUTER PROCESSING AND CULTURAL DATA: PROBLEMS OF METHOD, by P. L. Garvin. [1965] [20]p. incl. diagrs. refs. (AFOSR-65-2263) (AF 49-(638)1128) AD 625069 Unclassified

Also published in The Use of Computers in Anthropology, ed. by D. Hymes. London, The Hague, Mouton and Co., 1965, p. 120-139.

The paper considers some crucial aspects of problems connected with the processing of cultural data on computing equipment. Questions arise which are more closely related to the characteristics of computer applications than to the nature of the problems that are to be studied. One set of questions concerns the use of the computer as a tool for information processing, and more particularly, with the input and output problems that it raises. (1) what type of information is required to make the use of the equipment possible, i.e., what is needed to make a problem computable? (2) what type of information can be expected as the result of computer use? Limited experience exists on the use of computers for the study of culture, and these questions can at present only be considered in the abstract and in the most general terms. A variety of possibilities are examined and relevant questions are posed for future research.

LINGUISTIC AND ENGINEERING ASPECTS OF AUTOMATIC SPEECH RECOGNITION, by P. L. Garvin and S. Bertram. [1965] [3]p. (AFOSR-66-0416) (AF 49(638)1128) AD 632108 Unclassified

Also published in Phonetica, v. 13: 37-39, 1965.

This brief note comments on 3 problem areas associated with automatic speech recognition: (1) distortions occurring in the acoustic environment under ordinary circumstances; (2) dependence of recognition on context; and (3) selection of a form of analysis that yields parameters most nearly invariant to characteristics independent of message recognition.

SOME COMMENTS ON ALGORITHM AND GRAMMAR IN THE AUTOMATIC PARSING OF NATURAL LANGUAGES, by P. L. Garvin. [1965] 7p. (AFOSR-65-1386) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1516 and Rome Air Development Center) AD 621159 Unclassified

Presented at Internat'l. Conf. on Computational Linguistics, May 19-21, 1965, New York.

The repeated assertion regarding the efficiency of a simple parsing algorithm combinable with a variety of different grammars written in the form of appropriate tables of rules is examined. The question is raised of the increasing complexity of the tables when more than the most elementary natural-language conditions are included, as well as the question of the ordering of the rules within such nonelementary tables. It is concluded that the structuring of the parsing program as an executive routine with appropriate subroutines is a satisfactory separation of grammar and algorithm.

GENERATION AND DIAGNOSIS OF SYNTHESIZED PLASMA STREAMS, by J. M. Sellen, Jr., W. Bernstein, and R. F. Kemp. [1965] [7]p. incl. diagrs. refs. (AFOSR-65-1807) (AF 49(638)886) AD 625992 Unclassified

Also published in Rev. Scient. Instr., v. 36: 316-322, Mar. 1965.

A contact-ionization source is described which generates a cesium ion stream characterized by a high degree of order in the ion motion. Electrons are added to form a quiescent, collisionless plasma stream. Diagnostic instruments are described for demonstrating the properties of the plasma streams. Ion densities range from 5×10^7 to 1×10^{11} ions/cm^3 in the source region, at accelerating voltages from 100 v to a few thousand volts, depending on the experimental application. Conical expansion of the beam reduces the densities in downstream regions. Electron temperatures in the beams range downward from the ~ 2500 °K emissive wire temperature. Means are described for increasing electron temperatures to several times this value, with resultant increase in beam divergence. (Contractor's abstract)

PROPERTIES OF ACCELERATED PLASMAS (Abstract), by C. L. Dailey. [1965] [1]p. (Bound with AFOSR-65-1266; AD 622527) (AF 49(638)1210) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

An inductive pulsed plasma accelerator has been operated with sufficient pre-ionization to produce a diamagnetic discharge on the first half-cycle. The accelerator circuit is well coupled to the plasma for a few tenths of a μ-second while the plasma current builds up in a thin layer close to the accelerator coil. It then propagates at a nearly constant velocity producing complete ionization and accelerating the plasma to a velocity comparable to the current layer velocity. The propagating current layer possesses an initial sharp front in which occur the maximum values of the axial electric field, the plasma current density and the slope of the radial magnetic field. This front is followed by a layer of ion current in the region of the shoulder of the magnetic field disturbance. Upon passage of the current layer, the ions execute a half-cycle gyration and are ejected axially from the region of influence of the accelerator coil. The ion current corresponds to the azimuthal component of this velocity; the time required for this acceleration determines the scale of the current layer.

RESEARCH ON INTERACTION OF PLASMA STREAMS WITH MAGNETIC FIELDS (Abstract), by J. M. Sellen, Jr., W. Bernstein, and R. F. Kemp. [1965] [1]p. (Bound with AFOSR-65-1266; AD 622527) (AF 49(638)-1538) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

The interaction of a collisionless Cs^+ plasma stream with a transverse dipole-like magnetic field has been examined. It was noted that the plasma was unstable whenever the plasma stream penetrated or traversed a magnetic field in excess of some critical value. This instability was manifested by both high frequency

(10-100 mc) and low frequency (100 kc) oscillations. More recent studies have related to the low frequency oscillations. At least two modes of this oscillation have been observed. A second area of study is the generation of dense, slowly moving plasma streams. These plasmas are to be utilized in the examination of streaming instabilities between this directed ion flow and a thermal plasma. A third area of study is the oscillation in the virtual source region of dense, unneutralized ion streams. This unipolar flow region duplicates that portion of the Chapman-Ferraro interaction in which the ion stream is reflected. While the Chapman-Ferraro description of this reflection is of a steady-state, non-time-varying potential structure, the actual behavior is oscillatory with a characteristic period of the order of the total ion time-of-flight in the sheath region.

OPERATING BOUNDARIES FOR STEADY HYPERSONIC FLIGHT ON A MINOR CIRCLE, by A. M. Drummond. [1965] 8p. incl. diagrs. refs. (AFOSR-65-2345) (AF AFOSR-64-222) AD 629043 Unclassified

Also published in Canad. Aeronaut. and Space Jour., v. 11: 1-8, Jan. 1965.

An analysis is presented of steady flight at constant altitude on minor-circle paths about a spherical, non-rotating earth. Calculations determining the altitude-speed domain available for flight are made and the limitations imposed on the domain by lift, thrust and temperature bounds are shown. The principal conclusion is that minor-circle flight is possible at speeds up to and slightly beyond circular speed at an average altitude of 160,000 ft. The performance is mainly thrust limited, though increased allowable skin temperatures would result in an increase in performance. The highest possible value of the quantity C_L S/W is desirable to achieve a high operating altitude. (Contractor's abstract)

SPIN DECAY OF A CLASS OF SATELLITES CAUSED BY SOLAR RADIATION, by B. Etkin and P. C. Hughes. July 1965 [51]p. incl. illus. diagrs. table. (UTIAS rept. no. 107) (AFOSR-66-0725) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-222 and Defence Research Telecommunications Establishment) AD 631934 Unclassified

A study is presented of the interaction with the solar radiation field of a spinning satellite having long flexible rods. The dynamics of thermal bending of the rods is analyzed, including the effect of vehicle rotation, and the shape, amplitude and phase are calculated. The radiation pressure on the periodically bent rods produces a net average despin torque that depends critically on the phase lag of the thermal bending. The theory is compared with flight data from the Alouette I and S48 satellites, and the agreement indicates that the mechanism studied is the primary cause of despin of these vehicles.

SPIN DECAY OF A FLEXIBLE SATELLITE BY STRUCTURAL DISSIPATION OF ENERGY, by B. Etkin. Mar. 1965, 34p. (UTIAS rept. no. 105) (AF AFOSR-64-222) AD 475737 Unclassified

This report analyzes the coupling of the rigid-body and elastic modes of motion of a spinning satellite under 2 conditions of motion: (1) wobbling, in which the direction of the spin vector is appreciably different from that of a principal axis of inertia and (2) quasi-steady spin, in which the spin vector nearly coincides with the principal axis of maximum inertia. In the former case, elastic modes are excited into periodic motion, with consequent energy dissipation, even in the absence of an external force field. In the latter case, the elastic mode excitation is caused by, and requires the presence of, the external gravity-gradient field. Order-of-magnitude estimates of the rate of energy dissipation and spin decay are presented for both cases for the Alouette 1 satellite. It is concluded that the mechanism studied is not the principal one causing the spin decay of Alouette 1 satellite.

REFRACTION OF SOUND BY JET FLOW OR JET TEMPERATURE, by J. Atvars, L. K. Schubert and others. May 1965 [28]p. incl. illus. diagrs. refs. (UTIAS technical note no. 109) (AFOSR-66-0332) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-223, National Aeronautics and Space Administration, and National Research Council of Canada) AD 623867 Unclassified

The heart-shaped pattern of subsonic-jet noise normally peaks somewhere between 15° and 45° from the axis, depending on conditions, falling off sharply as the axis is approached. Conflicting explanations of this directivity pattern appear in the literature. The present investigation suggests that the deep cleft in the pattern can be attributed mainly to refraction of the sound out of the jet by the velocity and temperature fields. The evidence lies in measurements made of the sound field of a harmonic 'point' source placed within a 3/4" diam air jet. The source is the orifice of a tube about 1/16" i. d. driven through a conical coupling of a horn-type loudspeaker driver; this radiates sound essentially omnidirectionally up to about 15,000 cps. The experiment established the formation of an axial intensity minimum, which appears to be mainly due to refraction. The depth of the refraction valley increases with jet velocity, jet temperature, and sound frequency; a depth corresponding to an intensity reduction of the order of 35 db is attained at M - 0.9 for 3000 cps.

FREE-MOLECULE FLOW THROUGH AXI-SYMMETRIC TUBES, by S. J. Townsend. Mar. 1965 [114]p. incl. diagrs. table, refs. (UTIAS rept. no. 106) (AFOSR-65-0749) (AF AFOSR-64-276) AD 616615 Unclassified

The properties of the flow field of a gas passing through an internally reflecting, axi-symmetric tube are calculated. The major assumptions are: (1) that the mean free path of molecules in the external gas is large compared with the tube dimensions, (2) that molecules incident on the internal surface undergo complete energy accommodation, (3) that there is no accumulation or ablation at the wall, and (4) that the boundary distribution functions for the gases are Maxwellian. Expressions for convection of mass, axial momentum and kinetic energy through the tube are derived. Radical distributions of these flow quantities across the inlet and exit planes are treated. Integrations over the inlet and exit planes give the total quantities convected through the tube. It is shown that the properties can be calculated directly in terms of tube geometry and wall temperatures Results also show that it is possible to develop a net thrust on an internal flow system under free-molecule flow conditions.

FREE-MOLECULE FLOW THROUGH CONICAL TUBES, by S. J. Townsend, G. N. Patterson, and S. R. M. Sinclair. [1965] [12]p. incl. diagrs. (AF AFOSR-64-276) Unclassified

Also published in Rarefied Gas Dynamics; Proc. Fourth Internat'l. Symposium, Toronto U. (Canada) (July 14-17, 1964), ed. by J. H. de Leeuw. New York Academic Press, v. 1: 641-652, 1965.

The transport of mass, axial momentum, and energy

through axially symmetric tubes in free-molecule flow is considered. The dependence upon wall temperature of the axial momentum and energy flows in the exit plane is outlined. The resultant transport equations are presented along with representative numerical solutions. Extensions of these flow distributions to the case of arbitrary speed ratio can be carried out. The problem of an optimum free molecule "scoop" for orbital vehicles is also considered. Optimum wall angles for convergent cones can be found, resulting in maximum mass flow passed by the scoop.

THE DETERMINATION OF SPATIALLY NON-UNIFORM ELECTRON DENSITY DISTRIBUTION, by K. A. Graf. Apr. 1965 [120]p. incl. illus. diagrs. tables, refs. (UTIAS rept. no. 106) (AFOSR-65-0935) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-366 and Defence Research Board of Canada) AD 616614
Unclassified

Electron densities have been measured in the subsonic portion of a free-expansion argon jet by microwave and Langmuir probe methods. The electron density in the jet had a Gaussian radial distribution; along the axis of the jet the density fell off approximately exponentially. Microwave measurements were made by traversing the microwave beam across the jet. This allowed the spatial variation of electron density to be determined. The data were analyzed with a ray-tracing technique. Langmuir probe measurements were made with cylindrical and flaw probes under essentially collison free conditions and over a range of probe radius to Debye length rations of about 10 to 50. Both electron and ion collection were measured and analyzed. Two methods are considered for interpreting the electron part of the characteristic, the deviation-from-linearity method and the 2-tangent-intercept method. The latter method is found to give values 2 or 3 times higher than the former method. This difficulty is overcome by analyzing the data with the aid of theoretical particle-collection curves calculated by Laframboise. In these calculations, the ratio of ion and electron temperatures, and the ratio of probe radius to Debye length are taken into account. Using this procedure, the probe data agree very well with the microwave data. (Contractor's abstract)

AERODYNAMICALLY GENERATED SOUND, by H. S. Ribner. Final rept. Dec. 1965 [15]p. incl. diagrs. (AFOSR-65-2714) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-672, National Aeronautics and Space Administration, and National Research Council of Canada) AD 627897
Unclassified

This research relates turbulence to the noise-generating features of the UTIAS 4-in. low-speed jet more directly than in prior work, with a minimum of simplifying assumptions. The design and calibration techniques of the aerofoil probe anemometer have been refined further and some illustrative applications have been explored. The research on refraction of pure tones injected into a jet via hypodermic tube has thrown further light on jet noise directionality. In measurements with extremely cold nitrogen jets (-180°C), the sound was found to be refracted inward to produce a large enhancement along the jet axis. Similar behavior, with quantitative agreement, has been found with filtered jet noise. The convection of a vortex through a plane shock gives rise to a weak S-shapes distortion of the shock together with a cylindrical sound wave. The theory for the sound wave (UTIAS rept. no. 61, 1959) has been extended to predict the shape of the shock distortion to within upper and lower bounds. Good qualitative agreement with the experimental shape is found.

A TURBULENCE PROBE UTILIZING AERODYNAMIC LIFT, by T. E. Siddon. June 1965 [32]p. incl. illus. diagrs. refs. (UTIAS technical note no. 88) (AFOSR-66-0615) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-672 and National Research Council of Canada) AD 627572
Unclassified

The concept of a new-type of anemometer for measuring the cross-stream or "v"-component of turbulent velocity is presented. Basic theory concerning the response characteristics of the so-called "aerofoil probe" is discussed. Steps in the development of a satisfactory prototype of the "aerofoil probe" are outlined. Various problems concerning resonant frequencies, accelerometric effects, low-frequency response fall-off, and the effect of finite aerofoil size were encountered, and these are described in detail. A method of dynamic calibration employing a square-wave turbulence simulator is outlined. Various experimental data accumulated from measurements in a low-speed turbulent air jet are presented. These include velocity measurements, frequency spectra, autocorrelations, and 2 point space-time correlations. Comparisons with hot-wire data are made wherever possible. Conclusions are drawn as to feasibility of using the aerofoil probe in preference to hot-wire techniques for turbulence measurements. Limitations of both techniques are compared.

INSTRUMENTATION AND CALIBRATION OF UTIAS 11-in. x 15-in. HYPERSONIC SHOCK TUNNEL, by Y. Y. Chan, R. F. Mason, and N. M. Reddy. June 1965 [92]p. incl. illus. diagrs. table, refs. (UTIAS technical note no. 91) (AFOSR-66-0002) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-365, Defence Research Board of Canada, and National Research Council) AD 631933 Unclassified

An outline of the problems encountered in the calibration of the UTIAS 11 in. x 15 in. Hypersonic Shock Tunnel and some of the solutions are presented. An impulsively heated tungsten-wire technique was successfully developed to obtain detonation-free, smooth, and very repeatable combustion by burning stoichiometric mixtures of oxygen and hydrogen, diluted with helium. It was found that tailored shock Mach numbers as high as $M_s = 9.5$ were achieved. A test section flow calibration was done by measuring wall static pressures, pitot pressures and stagnation point heat-transfer rates. Qualitative pressure-time histories of static and pitot pressures obtained from theoretical considerations were used to interpret the experimental data as well as the nozzle starting time and testing times. Schlieren pictures of the flows over a flat plate and a right circular cylinder are also presented. Methods of predicting the test-section flow quantities in the different flow regimes are indicated. Nozzle starting processes are explained by utilizing available theories. The reservoir and test section conditions were usually P_o - 30 atmospheres to 90 atmospheres; T_o - 3000° to 4500°K; $Z_o = 1.00$ to 1.35; p_∞ - 0.003 to 0.02 psi, p_t - 0.1 to 0.8 psi, $M_\infty = 8.0$ to 13.8, Re/ft = 1.5×10^4 to 3.82×10^3 (based on flow field behind the shock). NEAR FREE MOLECULE BEHAVIOR OF GASES WITH FINITE INFINITE COLLISION CROSS SECTION, by J. J. Smolderen. [1965] [18]p. incl. table. (AF EOAR-63-38) Unclassified

Published in Rarefied Gas Dynamics; Proc. Fourth Internat'l. Symposium, Toronto U. (Canada) (July 14-17, 1964), ed. by J. H. de Leeuw, New York, Academic Press, v. 1: 277-295, 1965.

The paper deals with the behavior, at large Knudsen numbers, of solutions of the Boltzmann equation in the realistic case of molecular interactions with infinite range. So far, most of the applications of the Boltzmann equation to the treatment of transitional or near free molecule flow problems have been based on simple molecular models with finite range of interaction, such as the rigid sphere model, or the BGK model, which can be treated as a finite range interaction. The present paper deals essentially with 1-dimensional problems such as Couette flow and heat conduction between parallel plates, and power law type interactions are considered, although the results could be extended to arbitrary laws, at the cost of considerable mathematical complications. The full Boltzmann equation is replaced by a reduced linear integro-differential equation exhibiting the same singular behavior, caused essentially, by the divergence of the collision integral if the distribution function becomes discontinuous. It is then shown that the gas-kinetic boundary value problem for this linear integro-differential equation may be reduced to the solution of an integral equation of a rather complicated and singular type. The essential practical result from these mathematical developments is the nature of the Knudsen number dependence of the dominant term of the near free molecule corrections, which turns out to be $K^{-(s-1)/(s+1)}$, s being the exponent in the interaction force law. Numerical treatment is briefly outlined for the case of hyperthermal Couette flow, assuming a rather rough estimate for the solution of the integral equation. (Contractor's abstract)

[ULTRASONIC INTERACTION BETWEEN SPECIES] by K. D. Roeder. Summary rept. June 1, 1964-Aug. 31, 1965, 4p. (AFOSR-65-2223) (AF AFOSR-64-671) AD 625034 Unclassified

Certain families of moths have ears capable of detecting the ultrasonic pulses emitted by the sonar system of insect-hunting bats. Among other maneuvers, these moths turn and fly directly away from a source of faint ultrasonic pulses. This report covers 2 phases of an attempt to analyze the physiological mechanisms of this system. Working with microelectrodes, interneurons have been found that are driven by the acoustic receptors, and whose properties suggest that they are directly concerned in the evasive behavior. The acoustic sensitivity of the receptors has been found to be 0.02-0.03 dyne/cm^2 between 20 and 50 kHz. The range of the tympanic organ for the cries of hunting bats has been found to be 32 to 40 meters. Work is in progress on the significance of the ultrasonic clicks emitted by certain moths when molested or exposed to an artificial source of ultrasonic pulses.

TEMPERATURE DEPENDENCE OF CHLORINE NQR FREQUENCIES AND PI BONDING, by T. E. Haas and E. P. Marram. [1965] [5]p. incl. diagrs. table, refs. (Contribution no. 333) (AFOSR-66-1740) (AF AFOSR-65-859) AD 641544 Unclassified

Also published in Jour. Chem. Phys., v. 43: 3985-3989, Dec. 1, 1965.

A theory is presented for the anomalous temperature dependence of Cl^{35} NQR frequencies observed for certain transition-metal-chloride compounds. The basic feature of the theory is a break down of π bonding due to bending vibrations, and a consequent increase in the electron population in chlorine 2p π orbitals, causing in turn an increase in the observed NQR frequency. An approximate separation of lattice-motion effects and intramolecular effect is made for the series of compounds K_2MCl_6; M = W, Re, Os, Ir, Pt, and it is shown that the predicted magnitude and behavior of the intramolecular effects agree well with the observed values. EFFECTS ON HAND-EYE COORDINATION OF TWO DIFFERENT ARM MOTIONS DURING COMPENSATION FOR DISPLACED VISION, by S. J. Freedman, S. B. Hall, and J. H. Rekosh. [1965] [3]p. incl. table. (AFOSR-65-1365) (AF 49(638)12??) AD 621187 Unclassified

Also published in Perceptual and Motor Skills, v. 20: 1054-1056, 1965.

Comparisons were made between the compensations produced by sagittal arm motion, a swift extension of the arm from its resting position in the lap to an approximately straight ahead position, and by transverse arm motion, the fully extended arm starting from a position at 45° to the body midline at shoulder height and moving parallel to the surface of the table until approximately straight ahead. Eight right-handed male college students were tested with both types of arm motion, 4 wearing base right prisms and 4 wearing base left. Effects of exposure with sagittal motion generalize more to transverse than vice versa. The differences may be related to the greater precision of body midline judgments with sagittal motion.

EXPERIMENTAL DEAFFERENTATION IN MAN, by S. J. Freedman. [1965] [10]p. incl. refs. (AFOSR-65-2678) (AF 49(638)1282) AD 628717 Unclassified

Also published in Proc. Symposium; Bel-Air II-Desafferentation Experimentale et Clinique, Geneva (Switzerland) (1965), Geneva, Georg and Cie, 1965, p. 79-88.

In this discussion on human sensory deprivation, selected aspects of experimental work with adults are considered. Comments are made on hallucinatory phenomena and perceptual findings. The study of sensory deprivation may be approached by searching for a solution to a problem, for relevant variables, and for explanatory principles.

REMARKS ON THE RELATION BETWEEN PERCEPTION AND MOTION, by S. J. Freedman. [1965] [9]p. incl. diagr. refs. (AFOSR-65-2679) (AF 49(638)1282) AD 629300 Unclassified

Also published in Proc. Symposium ; Bel-Air II-Desafferentation Experimentale et Clinique, Geneva (Switzerland) (1965), Geneva, Georg and Cie, 1965, p. 298-306.

Experiments (auditory-motor and visual-motor) over the last 10 yr in several different laboratories have implicated the necessity of self-produced movements for either the compensatory adaptation or the deterioration of perceptual-motor performance to occur. Whether the change in the nature of motor-sensory relationships is systematic or asystematic, whether it is time-independent or time-varied, there has been no significant alteration of perception and perceptual-motor performance, unless the observer is permitted free movement. The experiments imply that the stability of spatial perception and spatially-oriented behavior depends upon continued contact with the customary sense-stimulating environment. The processes which are described appear also to play a critical role in the development of effective perceptual-motor coordination, and may be related conceptually to Piaget's concepts of assimilation, accommodation and alimentation in the development of the sensory-motor schemata which he considers requisite to intelligence.

NUCLEAR-SPIN LATTICE RELAXATION IN PURE AND PARAMAGNETICALLY DOPED CaF_2 FROM 4.2° TO 195°K (Abstract), by R. A. Laing and J. Cass. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-592] and National Aeronautics and Space Administration) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chattanooga, Tenn., Nov. 5-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 258, Feb. 25, 1965.

In an effort to understand the interaction between the nuclear-spin system and the lattice via dilute concentrations of paramagnetic impurity in ionic crystals, the nuclear spin-lattice relaxation time has been measured as a function of magnetic field, temperature, and orientation for three different samples of CaF_2. One of the "pure" samples contained trace amounts of rare-earth ions. The other "pure" sample contained trace amounts of transition ions, and the third sample had been doped with 1 part in 10^5 of Mn^{2+}. The results showed that the nuclear spin-lattice relaxation process was diffusion-limited above 77°K for the two "pure" samples, although the relaxation process of the Mn^{2+}-doped sample was rapid diffusion up to temperatures of at least 90°K. The sample containing trace amounts of transition-metal ions was studied at 4.2°K and the relaxation process was found to be in the rapid-diffusion limit. In all samples, in the liquid-nitrogen temperature range, it appeared that both the direct and Raman processes were competing in the relaxation of the paramagnetic ions. The results indicate that the concentration and type of paramagnetic impurity affect not only the magnitude of the nuclear spin-lattice relaxation time but also the nature of the relaxation process. Additional measurements in the liquid-helium temperature region are being made and are reported on in the paper.

ON THE RACAH ALGEBRA FOR THE GROUP R_4, by G. Ponzano. [1965] 3p. incl. diagr. (AFOSR-65-1849) (AF EOAR-64-39) AD 625698 Unclassified

Also published in Nuovo Cimento, Series X, v. 35: 1231-1233, Feb. 16, 1965.

The 6j-symbol for the group R_4 is explicitly calculated and the properties of the Racah algebra of compact simply reducible groups are verified. Owing to the isomorphism $R_4 \sim R_3 \times R_3$, it is expected that R_4 invariants can be expressed in terms of the corresponding ones for R_3. From the R_4 Wigner coefficient, the 3nj-symbols for R_4 are given by the product of two R_3 3nj-symbols of the same type with different arguments. The result is illustrated with graphical representations.

SINGULAR POTENTIALS WITH SHORT RANGE, by H. Cornille and E. Predazzi. [1965] 34p. incl. diagrs. table, refs. (AFOSR-66-1717) (AF EOAR-64-39) AD 638060 Unclassified

Also published in Nuovo Cimento, Series X, v. 35: 879-912, Feb. 1, 1965.

Previous works have shown the properties and the possibility of useful approximate methods for the Jost functions, and the radial wave functions in the case of Yukawa generalized potentials, less or equally singular than the centrifugal term. Some of these results are extended to a larger class of short-range potentials which, near the origin, can be represented as a finite superposition of inverse powers of the radial variable; namely, the most singular term is repulsive with a.. arbitrary inverse-power behavior. For simplicity, the degrees of the other terms are obtained from one of the leading terms by the decreasing of unities. The key (as for the inverse power-square case) is to find a singular factor removing the singular part near the origin of the outgoing (ingoing) waves, and keeping unaltered the symptotic character of the outgoing (ingoing) waves. After this, the analysis follows, as closely as possible, the usual development. By investigating the asymptotic behavior of the Laplace transform, the existence of the Jost function is proved. The definition of the Jost function as a series, whose p-th term comes from the contribution of the iteration of order p of the inverse Laplace transform is divergent. A method is presented for evaluating the Jost function by means of convergent sequences, which allow the calculation of approximations which are always convergent without any arbitrary cut-off or hard-core procedures. All the above formalism is given for the $\ell = 0$ case. (Contractor's abstract)

A NEW APPROACH TO SCATTERING BY SINGULAR POTENTIALS, by S. Fubini and R. Stroffolini. [1965] 5p. (AFOSR-66-2716) [AF EOAR-64-39] AD 644091 Unclassified

Also published in Nuovo Cimento, Series X, v. 37: 1812-1816, June 16, 1965.

The problem of giving an unambiguous mathematical meaning to the solutions of nonrenormalizable field theories has been the object of several investigations. One possible line of attack is to consider simple models given by singular nonrelativistic or relativistic potential scattering equations as a guide to obtain new ideas and techniques to be generalized to the field-theoretical case. A discussion is given of a new point of view in the study of singular potentials, which allows a systematic treatment of a large class of potentials. The approach proposed is essentially based on the study of the polydromy of the wave function $\psi(r)$ in the r variable. The important point is that both singular and regular potentials exhibit very simple and general features in this framework.

SINGULAR LOGARITHMIC POTENTIALS IN COORDINATE SPACE, by H. Cornille and E. Predazzi. [1965] [11]p. (AF EOAR-64-39) Unclassified

Published in Jour. Math. Phys., v. 6: 1730-1740, Nov. 1965.

In previous works study was made of the problem of the determination of the Jost function for singular repulsive potentials behaving near the origin like inverse powers. The key was to define "new Jost solutions" which, still being asymptotically ingoing (or outgoing) waves, tend to constant (Jost functions) near the origin. It was shown from the perturbation expansion in coordinate space of these "new Jost solutions" that construction of the Jost functions can be made by connecting the radial coordinate r and the order of the perturbation expansion p. More precisely, if introduction is made of an r(p) dependence, the Jost function is the limit of convergent sequences provided r(p) goes to zero less rapidly than a given limiting dependence $r_L(p)$. In this paper, working in coordinate space, the same method is extended for two other families of singular potentials: (1) consideration is given to the case in which the most singular part of the potentials behaves like $G^2(\log r^{-1})^{\beta} r^{-2n}$, ($n \geq 1$, β arbitrary) near the origin; (2) study is made of exponentially singular repulsive potentials of finite range. It is found that the most singular is supposed to be the potential, the higher becomes the available limiting dependence. (Contractor's abstract)

VARIATIONAL APPROACH TO PERTURBATION THEORY. I. APPLICATION TO THE CALCULATION OF ATOMIC POLARIZABILITIES, by H. J. Kolker and H. H. Michels. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-66-0065) (AF 49(638)1133) AD 632226 Unclassified

Also published in Jour. Chem. Phys., v. 43: 1027-1035, Aug. 1, 1965.

A variational approach to perturbation theory is derived which establishes the relationship between variational and conventional approaches that utilize expansions in terms of atomic or molecular eigenfunctions. This approach is based upon the observation that the variational approach to perturbation theory is formally equivalent to a variational method for constructing a special set of excited-state wavefunctions. A mathematical demonstration of this equivalence has been formulated. With the use of this new approach to perturbation theory, both the static and dynamic polarizabilities of the two-electron helium isoelectronic series, H^-, He, and Li^+ and a four-electron system represented by the beryllium atom have been calculated. Multiconfiguration open-shell wavefunctions were employed. These flexible wavefunctions permit a quantitative analysis of the near-degenerate s-p orbital mixing in the ground state of the beryllium atom. The inclusion of this orbital degeneracy effect results in a substantial reduction in the calculated polarizability. (Contractor's abstract)

EFFECTS OF INERT GAS OVERPRESSURE ON ARC CHARACTERISTICS, by R. H. Bullis, W. J. Wiegand, and D. W. Bell. [1965] [12]p. incl. diagrs. refs. (AFOSR 65-2500) (Also bound with its AFOSR 65-1241; AD 621276) (AF 49(638)1221) AD 628024

Presented at Twenty Fifth Annual Conf. of Physical Electronics, Mass. Inst. of Tech., Mar. 24-26, 1965.

To determine the effect of the presence of an inert gas on the properties of the nonequilibrium cesium plasma which exists in the interelectrode space of an arc-mode thermionic converter, detailed electrostatic probe measurements have been made of electron temperature, electron number density, and the plasma potential over a wide range of inert gas pressures. By employing electrostatic probe techniques to measure the properties of the nonequilibrium cesium plasma, direct assessment has been made of the effects of an overpressure of inert gas on the plasma properties without having to include extraneous effects such as changes in the work functions of the emitter and collector produced by the interaction of the inert gas with these surfaces. In addition, spectroscopic measurements have been made to determine the behavior of the atomic and molecular excited state populations with changes in inert gas pressure, converter output and maximum electron density in the neutralization plasma. The range of inert gas pressure over which volume ionization processes can be sustained in the nonequilibrium neutralization plasma in the converted with argon used as the inert gas has been determined from these measurements.

CHARACTERISTICS OF THE NEUTRALIZATION PLASMA IN THE ARC-MODE THERMIONIC CONVERTER, by R. H. Bullis and W. J. Wiegand. [1965] 12p. incl. diagrs. (Bound with its AFOSR 65-1241; AD 621276) (AF 49(638)1221) Unclassified

Further detailed measurements of the properties of the nonequilibrium plasma existing in the interelectrode space of arc-mode converters have been made with coaxial electrostatic Langmuir probes. Previous probe measurements have detected the existence of a small retarding sheath in the immediate vicinity of the emitter as well as a variation in the plasma potential which is accelerating for electrons and which extends over distances from the emitter surface corresponding to 20 to 30% of the interelectrode spacing. Detailed studies have been made to determine the behavior of the potential distribution for variations in emitter temperature,

cesium pressure, converter spacing, and output. From these studies the position of the minimum point in the potential well, which is accelerating for electrons, has been found to be strongly affected by changes in emitter temperature and cesium pressure. The over-all potential drop in the electron accelerating region near the emitter appears to be independent of the energy required to excite a cesium atom from the ground state to the $6P_{1/2}$, $6P_{3/2}$ first excited states. The average fields found to exist in this region range from 300 to 1500 v/m. The small retarding sheath near the emitter surface has been found to be strongly influenced by the production rate of ions at the emitter surface. A strong correlation has been observed between several of the parameters of the plasma and the output characteristics of the arc-mode converter. The observed variations in electron number density and electron energy distribution with position in the interelectrode space determined from probe measurements correlate well with spectroscopically determined electron densities and electron temperatures. STUDIES OF NON-EQUILIBRIUM IONIZATION (Abstract), by R. H. Bullis and W. J. Wiegand [1965] [2]p. (Bound with AFOSR 65-1266; AD 622527) (AF 49(638)1221) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

Investigations of the effects of cathode-anode spacing and of the presence of a relatively high inert gas background pressure on the properties of the non-equilibrium cesium plasma generated in the arc-mode thermionic plasma diode have been made using coaxial electrostatic probe and spectroscopic techniques. From detailed coaxial electrostatic probe studies of the nonequilibrium cesium arc, it has been established that an accelerating region for electrons exists in the plasma immediately adjacent to the cathode surface. Correlations of potential drop and position of the minimum point of the potential well, which extends from the cathode surface several thousand Debye lengths into the plasma, have been made with variations in emitter temperature, cesium pressure, and cathode-anode spacing. Studies have been conducted to determine the effects of the presence of an inert gas background pressure on the properties of the non-equilibrium arc. Spectroscopic observations of the arc characteristics indicated that the population of cesium molecules in excited states was drastically reduced with increasing argon background pressure. These results will be correlated with electron number densities determined by probe techniques and the mechanisms postulated for the production of the enhancement in the degree of ionization observed in the non-equilibrium arc.

AN ASYMPTOTIC SOLUTION FOR OPTIMUM POWER-LIMITED ORBIT TRANSFER, by T. N. Edelbaum, Oct. 1965, 10 p. (AFOSR 65-2002) (AF 49(638)1239) AD 623170 Unclassified

A complete first-order asymptotic solution was obtained for optimum power-limited transfer between coplanar elliptic orbits of arbitrary size, eccentricity, and orientation. The solution was obtained by the averaging method of Bogoliubov and Mitropolsky and corresponds to what is called 'the improved first approximation' including both secular and short-period terms. The problem for which the solution is presented corresponds to miminum-fuel transfer in fixed time of a low-thrust rocket operating at constant power and variable thrust. The average acceleration of the rocket is assumed small in relation to the acceleration of gravity. Analytic expressions were derived for the orbit elements, the payoff, and the optimum control.

OPTIMUM POWER-LIMITED ORBIT TRANSFER IN STRONG GRAVITY FIELDS, by T. N. Edelbaum. [1965] [5]p. incl. diagrs. refs. (AFOSR 65-2328) (AF 49(638)1239) AD 629302 Unclassified

Presented at AIAA/JON Astrodynamics Guidance and Control Conf., Aug. 24-26, 1964, Los Angeles, Calif.

Also published in AIAA Jour., v. 3: 921-925, May 1965.

Analytic solutions are obtained for optimum transfer between arbitrary coplanar or coaxial ellipses in strong central gravitational fields. Fuel consumption is minimized for fixed transfer times with powerlimited propulsion. The first-order secular solution obtained is valid only if many revolutions are made about the primary body during the transfer. The necessary conditions of Euler, Weierstrass, and Jacobi are satisfied so that the solutions actually furnish a local minimum. Multiple solutions are obtained for large changes in inclination or argument of perigee. The analysis shows which of these solutions furnishes an absolute minimum. It is found that all extremals violate the Jacobi condition and cease to be minimizing solutions if they are followed far enough. (Contractor's abstract)

DATA PROCESSING TECHNIQUES FOR THE DETECTION AND INTERPRETATION OF TELESEISMIC SIGNALS, by C. B. Archambeau, J. C. Bradford and others. [1965] [6]p. incl. diagrs. table. (Sponsored jointly by Advanced Research Projects Agency; Air Force Office of Scientific Research under AF 49(638)-1117, and Air Force Technical Applications Center) Unclassified

Published in Proc. IEEE, v. 53: 1860-1865, Dec. 1965.

This paper is a collection of six papers describing recent developments in automated detection and identification of teleseismic earthquakes and explosions in a seismic noise background. The first paper evaluates the assumption that the outputs of seismometer arrays can be added since the signals will reinforce while the noise is cancelled. The second paper describes a method utilizing orthogonal expansions of the Kautz type in an effort to determine spectral and temporal differences between both types of signals and noise. The third pacer describes a thermal equilibrium analogy to estimate the noise energies in each mode to account for the observed depth and frequency behavior. The use of multiple and partial coherence functions for resolving noise backgrounds into their propagation components is described in the fourth paper. Compressional, shear, and surface wave components of signals can be separated from seismic noise backgrounds by recognizing their differing polarization properties, as shown in the fifth paper. The source mechanisms can theoretically be identified from their radiation patterns provided instrument and travel path distortions are removed. A final paper describes this theory and how these various methods of detecting and isolating the signals can be integrated into an automated signal analysis system. (Contractor's abstract, modified)

STUDY ON THE RELAXATION OF DISLOCATIONS IN F F. C. C. METALS, by M. Mongy. [1965] [4]p. (AFOSR-65-1176) (AF EOAR-63-53) AD 622393 Unclassified

Also published in Acta Univ. Upsalien., v. 54: 3-6, 1965.

The effect of orientation of single crystals on the shape and position of the internal friction peak was investigated. Single crystals of 4 face centered cubic metals, aluminum, copper, silver, and gold were measured in the [100], [110], and [111] directions. Minimum values were obtained in the [111] direction for aluminum, copper, and gold. and in the [100] direction for silver. A high degree of anisotropy in the values of the activation energy and the relaxation frequency was observed in all the metals. The values of the activation energy and relaxation frequency in polycrystalline samples represent a mean value of those measured in the 3 principal directions of the single crystals.

INVESTIGATION OF THE BORDONI PEAK IN GOLD AND OTHER F. C. C. METALS, by M. Mongy. [1965] [10]p. incl. diagrs. tables. (AFOSR-65-1385) (AF EOAR-65-53) AD 621313 Unclassified

Also published in Arkiv Fysik, v. 29: 343-352, Mar. 1965.

The Bordoni peak has been investigated in the 3 principal directions [111], [100] and [110] of a single crystal of gold at the frequencies 5, 10, 20 and 45 mc/s. The results confirm the previous measurements on single crystals of aluminum, copper and silver. The activation energy and the relaxation frequency differ much from one orientation to the other and the minimum values are obtained when the ultrasonic waves are applied in the [111] direction The comparison of the Bordoni peak with Zener's single relaxation theory shows that the peak in the [111] direction is due to a single relaxation process while a spectrum of relaxations is responsible for the peak in the other 2 directions. The activation energy and the relaxation frequency obtained in the [111] direction are found to be very near to those characterizing the single relaxation peak in copper and silver. The values of $(c_t H/f_0 b^4 \mu)$ calculated using these activation energies and relaxation frequencies, show that the ratio is invariant in the 3 metals. This is in agreement with Seeger's model and shows that the theory can only be applied when the peak is due to a single relaxation process. (Contractor's abstract)

STUDY OF THE BORDONI PEAK IN A SILVER SINGLE CRYSTAL, by M. Mongy, K. Salama and O Beckman. [1965] [8]p. incl. diagrs. tables. (AFOSR-65-1894) (AF EOAR-63-53) AD 626094 Unclassified

Also published in Nuovo Cimento, Series, X, v. 36: 10-17, Mar. 1965.

The Bordoni peak was investigated in the [100], [111] and [110] orientations of a silver single crystal. The measurements were made at frequencies 10, 20 and 50 mHz in the temperature range 80° to 300°K. The activation energies and the relaxation frequencies are found to be different from one orientation to the other; the minimum values are obtained when the ultrasonic waves are applied parallel to the [100] direction. The comparison of the peak with Zener's single relaxation theory shows that the peak in the [100] direction is due to a single relaxation process. In the other 2 directions, the results favor a spectrum of different relaxation frequencies with a constant activation energy. The values of the activation energy and the relaxation frequency characterizing the single relaxation process are compared with those previously obtained in copper. The results of both metals are discussed in view of Seeger's theory. (Contractor's abstract)

DOPING PROPERTIES OF Sb_2Te_3 INDICATING A TWO VALENCE BAND MODEL, by B. Rönnlund, O. Beckman, and H. Levy. [1965] [6]p. incl. diagrs. (AF EOAR-63-53) Unclassified

Published in Jour. Phys. and Chem. Solids, v. 26: 1281-1286, Aug. 1965.

Seebeck coefficient and electrical conductivity has been measured on Sb_2Te_3 doped with Pb, I, $CuBr_2$, Sn, etc. The material is always strongly p-type with $S \simeq 80\ \mu V/°K$ and σ varying between $2 \cdot 10^5$ and $5 \cdot 10^5 (\Omega m)^{-1}$. The S vs σ curve indicates 2 valence bands with parameters $\mu_0(m^*/m)^{3/2} = 0{\cdot}0057\ m^2/Vs$ and $0{\cdot}034\ m^2/Vs$ separated by 0·23 eV. The doping behavior is discussed in terms of the crystal bonding. (Contractor's abstract)

PYROLYSIS STUDIES. XIII. KINETICS OF THE VAPOR PHASE PYROLYSIS OF ARYLETHYL METHYL CARBONATES. A LINEAR FREE-ENERGY RELATIONSHIP FOR ORTHO SUBSTITUENTS, by G. G. Smith and B. L. Yates. [1965] [5]p. incl. diagrs. tables, refs. (AFOSR-65-0678) (AF AFOSR-62-268) AD 616470 Unclassified

Also published in Jour. Org. Chem., v. 30: 434-438, Feb. 1965.

The absolute reaction rate constants in the pyrolysis of a series of ortho-, meta-, and para-substituted 1-arylethyl methyl carbonates and some ortho-substituted 1-arylethyl acetates have been determined. The mechanism of the pyrolysis of the carbonates is discussed. Even in the pyrolysis of the ortho-substituted esters, proximity effects are at a minimum for it is found that a linear free-energy relationship is obeyed between the pyrolysis of the ortho-substituted acetates and carbonates. Important differences are found between this relationship and the linear free-energy relationship obeyed by the meta- and para-substituted isomers. (Contractor's abstract)

PYROLYSIS STUDIES. XIV. THE PYROLYSIS OF t-BUTYL BENZOATES, by G. G. Smith and B. L. Yates. [1965] [3]p. incl. tables. (AFOSR-65-0879) (AF AFOSR-62-268) AD 617231 Unclassified

Also published in Canad. Jour. Chem., v. 43: 702-704, 1965.

It was thought that a study of the thermal elimination of benzoic acids from t-butyl benzoate esters would be suitable for the determination of σ^0 values. Four consecutive runs were made for 4 different esters, the reactor having a completely deactivated surface before the measuring of each ester. From the results obtained, it is clear that the thermal decomposition of t-butyl benzoates is not a simple intramolecular homogeneous reaction but rather the reaction is subject to occurring also on the walls which activate the reactor and cause an increasing amount of heterogeneous reaction, it is apparent that pyrolysis of t-butyl benzoate is not suitable for studying linear free energy relationships.

PYROLYSIS STUDIES. XV. THERMAL RETROGRADE ALDOL CONDENSATION OF β-HYDROXY KETONES, by G. G. Smith and B. L. Yates. [1965] [1]p. incl. diagrs. table. (AFOSR-65-1647) (AF AFOSR-62-268) AD 624374 Unclassified

Also published in Jour. Org. Chem., v. 30: 2067, 1965.

The vapor phase kinetics are investigated of a retrograde aldol condensation of 4-hydroxyl-4-methyl-2-pentanone which thermally decomposes to acetone. Based on the kinetics obtained and the products formed, it is proposed that β-hydroxy ketones thermally decompose in the vapor state through a 6-membered cyclic transition state mechanism similar to those formerly proposed for the pyrolysis of esters, β-hydroxyl olefins, and β, γ-unsaturated acids. The investigation indicates that although the acidity of the hydrogen, which is thought to be involved in the transition state, is not particularly important, the greater basicity of the C = O bond in the β-hydroxy ketones over that of C = C bond is significant.

PYROLYSIS STUDIES, PART XVI. A MECHANISTIC STUDY OF THE PYROLYSIS OF β-HYDROXY-OLEFINS, by G. G. Smith and B. L. Yates. [1965] [4]p. incl. tables, refs. (AFOSR-66-0567) (AF AFOSR-62-268) AD 632591 Unclassified

Also published in Jour. Chem. Soc., v. 1331: 7242-7246, Dec. 1965.

The pyrolysis of β-hydroxy-olefins to olefins and carbonyl compounds has been shown to be a first-order homogeneous unimolecular reaction. Alkyl groups at the 1-position of but-3-en-1-ol have much less effect on the rate of pyrolysis than when they are in a structurally similar position of ethyl formate. This implies that there is less heterolytic splitting of the C-CHOH bond in β-hydroxy-olefins in the transition state than C-O splitting in ester pyrolysis. A 3-phenyl substituent in but-3-en-1-ol increases the rate of pyrolysis more than similar substitution in ethyl formate. Apparently there is greater use of the π-electrons in the transition-state pyrolysis of β-hydroxyolefins than in ester pyrolysis. Tertiary alcohols decompose more radily than secondary and primary alcohols. A comparison of the entropies of activation indicates that tertiary alcohols are in a more favorable conformation for thermal decomposition than the primary alcohols. (Contractor's abstract)

IGNITION AND COMBUSTION OF SOLID PROPELLANTS, by J. Cheng, L. S. Bouck and others. Oct. 1,

1964-Sept. 30, 1965. 83p. incl. illus. diagrs. tables, refs. (AFOSR-66-1672) (AF AFOSR 65-40) AD 637496 Unclassified

This report discusses the progress and accomplishments of several projects during the grant period. Theoretical analyses have been made of the ignition process employing a model which considers surface regression and a simplified 2-dimensional model, which treats the nonhomogeneous nature of the composite propellant. Experimental studies of ignition were made by use of a shock tube and of electrically heated wires. A technique was perfected for the study of the thermal effects of propellant constituent reactions in the time scale of interest in ignition. A rarefaction tube was employed to extinguish samples of burning propellants, and extinguishment requirements of several propellants were determined.

INTRAMOLECULAR HYDROGEN BONDING IN cis-CYCLOPROPANEPOLYCARBOXYLIC ACIDS, by J. L. Haslam, E. M. Eyring and others. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-65-0720) (AF AFOSR-64-476) AD 615670 Unclassified

Presented at 146th National Meeting of the American Chemical Society, Denver, Colo., Jan. 22, 1964.

Also published in Jour. Amer. Chem. Soc., v. 87: 1-6, Jan. 5, 1965.

Acid dissociation constants and specific rates of reaction between a base and an intramolecularly hydrogen-bonded proton in monoanions of dicarboxylic acids have be have been determined at 10 and 25° in 0.1 M ionic strength aqueous solution for the following acids: cis-3,3-dimethylcyclopropane-1,2-dicarboxylic acid, cis-3,3-diphenylcyclopropane-1,2-dicarboxylic acid, and spiro[cyclopropane-1,9'-fluorene]-cis-2,3-dicarboxylic acid. The kinetic data obtained with the temperature-jump relaxation method permit an assignment of relative strengths of intramolecular hydrogen bonds in agreement with K_{a1}/K_{a2} data. Rough values of E_a, ΔH^*, and ΔS^* are calculated, and their significance is considered. Kinetic data are also reported for N,N-dimethyl-o-aminobenzoic acid at 25° and cis-cyclopropane-1,2,3-tricarboxylic acid at 10 and 25°.

Presented at 149th National Meeting of the Amer. Chem. Soc. Detroit, Michigan, April 1965.

Also published in Jour. Amer. Chem. Soc., v. 87: 4247-4251, Oct. 5, 1965.

The rate constant for the rapid abstraction by hydroxide ion of a proton from the monoanion of 3 alkyl-substituted succinic acids varies inversely as the ratio of the acid dissociation constants Ka_1/Ka_2. These data confirm the generality of this result found previously for a series of 2,2-disubstituted malonic acids and for three cis-3,3-disubstituted cyclopropane-1,2-dicarboxylic acids. Acid dissociation constants and rate constants for the proton abstraction were also determined in D_2O for the 3 cyclopropane acids as well as for the 3 succinic acids. These isotopic data as well as acid dissociation constants for the monomethyl esters of these acids are consistent with the interpretation that the breaking of an intramolecular hydrogen bond in the monoanion is rate determining although these data cannot conclusively establish the presence of such an intramolecular hydrogen bond. LASER TEMPERATURE-JUMP STUDIES OF FAST REACTIONS, by E. M. Eyring. Final technical rept. Oct. 1, 1963-Sept. 30, 1965. 5p. incl. refs. (AFOSR-65-2941) (AF AFOSR-64-476) AD 628027 Unclassified

A ruby laser was assembled from commercial components for use as a single-pulse, source of heat in temperature-jump relaxation kinetic studies of very rapid reactions in aqueous and nonaqueous solutions. Preliminary results were obtained with an aqueous uranyl ion monomerdimer equilibrium to which copper nitrate was added. A neodymium doped glass laser rod radiating at 1.06μ was not found satisfactory for the same purpose. A concurrent investigation of a fast protolytic reaction in water and D_2O by the conventional Joule heating temperature-jump method yielded solvent D_2O kinetic isotope effect data with ramifications for enzyme kinetics.

ORIGIN OF DETONATION-GENERATED IONIZATION WAVES, by M. A. Cook and D. A. Newell. Sept. 15, 1965. 34p. incl. diagrs. tables, refs. (AFOSR-65-1918) (AF AFOSR 65-56) AD 629231 Unclassified

The high electron density which exists in the external ionization wave that propagates away from the free surface of a detonating explosive was investigated by electrostatic probes and an impurity-doping method. Two impurities, potassium nitrate and cesium nitrate, were added to RDX in different molar concentrations. The conduction in the ionization wave was measured by the electrostatic probe technique. The increased maximum

conduction at the front of the ionization wave and the increased thickness of the wave for doped RDX as compared with conduction measurements obtained with pure RDX were discussed in terms of 2 current models for the origin of the ionization wave - the shock wave model and the detonation generated plasma model.

INFLUENCE OF ELECTRICAL FIELDS ON SHOCK OF DETONATION TRANSITION, by M. A. Cook and T. Z. Gwyther. Sept. 28, 1968, [12]p. incl. illus. diagrs. tables. (AFOSR-65-2653) (AF AFOSR-65-56). AD 629239 Unclassified

The prediction that one should be able to influence detonations in condensed explosives as well as gaseous ones by means of axial electric fields is studied by means of the deflagration to detonation transition (DDT) in a modified card gap (or SPHF plate) test by observing the influence of an applied field on the distance S_2 into the receptor where the DDT occurs. This distance S_2 for Composition B was shown to be appreciably influenced by an applied electric field. The magnitude of the effect in 2 in. diameter cast Composition B (donor and receptor) and nearly a 5 cm lucite SPHF plate was about 0.15mm/KV/cm, a positive to negative potential increasing the distance S_2 and a negative to positive one decreasing S_2 (unless the DDT occurs too close to an electrode). INTERNAL FRICTION UNDER HYDROSTATIC PRESSURE, by M. H. Miles, K. L. DeVries, and P. Gibbs. [1965] [3]p. incl. diagrs. refs. [AF 49(638)853] Unclassified

Published in Jour. Appl. Phys., v. 36: 852-854, Mar. 1965.

Internal friction measurements of zone-refined Al were obtained up to pressures of 5 kbar. The log of the background damping was found to increase linearly with pressure, with slopes of about 1.5×10^{-4} kbar^{-1} and 47.7×10^{-4} kbar^{-1} for CS_2 and kerosene pressure media, respectively. A reversible, intrinsic, pressure dependence of the amplitude-dependent part of the decrement Δ was found for Al of the approximate form $\partial(\ln\Delta)/\partial p = M + N\,\epsilon_0$, where $M = -4.5 \times 10^{-3}$ kbar^{-1}, $N = -4.2 \times 10^{-8}$ kbar^{-1}, and ϵ_0 is the strain amplitude. Theoretical expressions for the value of the "misfit parameter" ϵ' and its pressure derivative are derived from the Granato-Lücke theory in terms of M, N, and elastic constant data. It is suggested that the Granato-Lücke theory does not apply to zone-refined Al at these strain amplitudes. (Contractor's abstract)

SYMPATHETIC ACTIVITY AND THE SYSTEMIC CIRCULATION IN THE SPINAL CAT, by A. F. de Molina and E. R. Perl. [1965] [21]p. incl. diagrs. refs. (AFOSR-66-1459) (AF AFOSR 65-748) AD 641173 Unclassified

Also published in Jour. Physiol., v. 181: 82-102, 1965.

A description is given of a series of experiments in the spinal cat whose purpose was to relate reflex and background discharge of sympathetic preganglionic neurones to the systemic circulation. Reflex discharges evoked by single afferent volleys in spinal nerves usually appeared in only certain post-ganglionic branches of the stellate and upper lumbar ganglia. A number of types of stimuli which reflexly excite preganglionic neurones evoked transient increases in the systemic arterial pressure, and/or altered flow in the femoral, inferior mesenteric and brachial arteries. Afferent fibers associated with reflex variations in arterial flow conducted between 10 and 25 m/sec, the same range of velocities as those evoking preganglionic reflexes. It was concluded that in the spinal cat: the distribution of preganglionic impulses is specific in terms of effector organs and demonstrates independent control of some portions of the sympathetic outflow; cycling of the systemic arterial pressure with its relation to sympathetic activity indicates some form of vasomotor control at the spinal level.

FLOW MODES IN ELECTRIC SHOCK TUBES, by J. P. Barach and R. E. Vermillion. [1965] [9]p. incl. diagrs. refs. (AFOSR-66-1259) (AF AFOSR-64-287) AD 641715 Unclassified

Also published in Phys. Fluids, v. 8: 1976-1984, Nov. 1965.

Three modes of plasma flow in a low pressure electric shock tube have been studied. A diffusion type flow occurs below 10 μ initial pressure. Flow with a separated shock front ahead of the usual single luminous front is found to occur for high initial pressures, large distances downstream or lower Mach numbers. The separated shock front is found to occur when it is stable against Taylor interchange with the driver, brought on by flow deceleration. Calculations based on a simple blastwave model give agreement with the experimental data. (Contractor's abstract, modified)

PARAMETRICALLY EXCITED SURFACE WAVES, by R. P. Brand and W. L. Nyborg. [1965] [7]p. incl. diagrs. table, refs. (AFOSR-65-1104) (AF AFOSR-63-62) AD 620532 Unclassified

Also published in Jour. Acoust. Soc. Amer., v. 37: 509-515, Mar. 1965.

Experimental results are given on waves established at the upper surface of liquid in a rectangular plexiglas vessel executing uniform vertical oscillation, with frequencies primarily in the range 50-500 cps. Observed wave frequencies and wavelengths are in reasonable agreement with Benjamin-Ursell theory, but observed values of the critical onset amplitude ξ_c are much greater than expected. Considerable, though insufficient, improvement results from modifying the theory so that acoustic boundary layers at the container walls are taken into account. Using this modified theory, the ratio of observed to predicted ξ_c is as much a 14 at low frequency, but decreases to about 2 at the upper frequency limit. It is suggested that the discrepancy may arise, at least in part, from time-dependent solid-liquid surface energy, the time-dependence resulting from oscillation of the miniscus at vessel walls. HIGH AMPLITUDE SOUND AS A PHYSICAL AGENT, by W. L. Nyborg. [1965] 7p. incl. diagr. table, refs. (AFOSR-65-2182) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-62 and National Institutes of Health) AD 627184 Unclassified

Presented at the meeting of the Fifth Internat'l. Cong. of Acoustics, Liege (Belgium), Sept. 7-14, 1965.

Also published in Proc. of the Fifth Internat'l. Cong. of Acoustics, Liege (Belgium), 1965, Belgium, v. Ia; KII Section, 1965.

In fluids, especially in liquids, an important second-order quantity in explaining sonically generated changes is a time-independent velocity field, the acoustic streaming. Using available theory, calculations are presented which, although not precise, are indicative of possibilities for more exact analysis of sonic effects. Only the moderately high amplitudes (10^3 - 10^5 cps) are considered due to the limited range of application of second-order analysis. Violent activity, i.e., transient cavitation, is excluded, but effects of stable cavitation, i.e., vibration of bubbles at sub-collapse levels, are included. It appears that bubble-associated acoustic streaming yields velocity gradients of sufficient magnitude to fragment droplets and macromolecules, provided their characteristics lie in certain ranges.

EFFECT OF LOCALIZED SOUND ON AN ELECTRODE REACTION (Abstract), by W. E. Rowe. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-62] and National Institutes of Health) Unclassified

Presented at Sixty-ninth meeting of Acoust. Soc. of Amer., June 2-5, 1965, Washington, D. C.

Published in Jour. Acoust. Soc. Amer., v. 37: 1214, June 1965.

Ultrasound in the absence of cavitation was applied in a special manner to a process in which the sonic effect on a surface monolayer could be studied. The process selected involved cyclic anodic and cathodic polarization of a platinum electrode in acid electrolyte. It was shown that in such a cycle adsorbed monolayers of

oxygen and hydrogen are deposited and removed, as revealed by characteristic changes in recordings of the electrode potential E as a function of time t. In the present study, the test electrode used was a platinum sphere approx 0.5 mm in diam mounted on the tip of an 85-kc/sec Mason horn. Sound applied during selected parts of the cycle caused pronounced changes in recorded E vs t plots. The observed changes probably result from mass transport of dissolved gas and from stress on adsorbed layers, both transport and stress being associated with acoustic streaming.

MOSSBAUER STUDIES OF CHEMICAL BONDING, by J. F. Duncan and R. M. Golding. [1965] [21]p. incl. diagrs. tables, refs. (AFOSR-65-1651) (AF AFOSR-63-27) AD 624363 Unclassified

Also published in Quart. Rev., v. 19: 36-56, 1965.

Mossbauer spectroscopy, the study of gamma-ray absorption or emission between the nuclear ground and excited states, is discussed relative to its pertinence to chemical analysis. The fundamental and theoretical aspects are first discussed, especially as they pertain to internal magnetic fields, electric-field gradients, isomeric or chemical shift, and temperature-dependence. Such practical aspects as experimental apparatus, the number of suitable isotopes, the prevention of loss in resonant gamma-ray energy, and the experimental features of the Mossbauer spectra are also considered. Chemical applications of Mossbauer spectroscopy are reviewed and several examples of its use in chemical works are presented.

APPLICATIONS OF THE MOSSBAUER EFFECT IN CHEMISTRY, by J. F. Duncan. Final rept. [1965] [5]p. (AFOSR-65-2530) (AF AFOSR-63-27) AD 627923 Unclassified

The quadrupole splitting for all iron compounds has been predicted and the magnetic susceptibility of Fe^{2+} and Fe^{III} complexes calculated, when the iron atom is in a crystal field of octahedral symmetry and tetragonal symmetry. The results have enabled the investigator to relate the electric field gradient at the iron nucleus and the magnetic moment of high spin ferrous and low spin ferric compounds. This work is related to the Mossbauer programme. Using quantum mechanics, predictions were made of the intensities and splitting of Mossbauer absorption lines. In particular, the asymmetry of the quadrupole split Mossbauer spectrum of polycrystalline triphenylchlorostannane observed by Goldanskii, the so-called 'Goldanskii effect', has been explained.

INVESTIGATION OF LOW MULTIPLICITY JETS FROM INACTIONS OF 24.5 GeV/c PROTONS WITH HYDROGEN, by K. J. G. Tölg-Hanke. Scientific note no. 8, March 1965, [18]p. incl. diagrs. (AFOSR-65-0998) (AF 61(052)433) Unclassified

The aim of this investigation is to collect data for comparison of pp and π^-p interactions, to search for resonances and, if any to see if they decay in a cascade. Low multiplicity jets namely 4-prongs were used because previous work dealing with comparison to π^-p-4-prong jets at 16 GeV/c has been done. The behavior of P-P^4 prong jets indicated that the initial particles tend to maintain their CM momentum and the pions created from a cylindrical cloud along the axis.

INVESTIGATION OF THE COULOMB-NUCLEAR INTERFERENCE IN ELASTIC K^-p SCATTERING AT LOW ENERGIES, by K. Schlosser, B. Buschbeck-Czapp, and others. Scientific note no. 29, Apr. 1965, [17]p. incl. diagrs. tables. (AFOSR-65-0990) (AF 61(052)644) Unclassified

Twenty-thousand photos have been scanned for elastic K^-p scattering in the momentum region 100-360 mev/c; 536 1-prong and 1923 2-prong events were analyzed. The phase angle and the absolute value of the nuclear part of the elastic scattering amplitude was determined. This result was found without the application of zero-range theory. (Contractor's abstract, modified)

ON CLASSICAL SYSTEMS WITH INTERNAL SYMMETRY GROUPS, by R. Sexl. Scientific note no. 28,

Mar. 22, 1965 [16]p. incl. refs. (AFOSR-65-0992) (AF 61(052)644 Unclassified

The invariance groups of the hydrogen atom and the harmonic oscillator are compared. They are known to be O_4 and U(3) respectively. The coordinates and momenta transform nonlinearly in the case of the hydrogen atoms. Therefore the finite symmetry transformations generated by Lenz's Vector cannot be given in closed analytic form. A geometrical interpretation of these transformations is however easily possible. It is shown, furthermore, that closed orbits in classical physics always correspond to a degeneracy with respect to angular momentum in quantum mechanics.

SYMMETRY GROUP CONTAINING LORENTZ INVARIANCE AND UNITARY SPIN, by T. Fulton and J. Wess. [1965] [4]p. (AFOSR-66-0875) (AF 61(052)-644) AD 638953 Unclassified

Also published in Phys. Ltrs., v. 14: 57-60, Jan. 1, 1965.

A previously proposed group, $\mathcal{G}_6$, embodying both ordinary spin and SU(3) to account for the symmetries of the strongly interacting particles is discussed. The group $\mathcal{G}_6$ is some extension of the inhomogeneous Lorentz group, L, by means of the unitary spin group, and its little group is [SU(6)]q, where q is the momentum. In view of the remarkable success in applying [SU(6)]q to the elementary particle spectrum, the difficult question of the Lorentz invariance of $\mathcal{G}_6$ becomes a crucial one. An approach to the problem of Lorentz invariance is proposed. Rather than studying $\mathcal{G}_6$, a simple formal generalization of L to a group $\mathcal{G}$, different from $\mathcal{G}_6$, which has L as a subgroup and [SU(6)]q as a little group, is considered. The generators of L commute with those of SU(3). It is also shown that the pseudoscalar octet and vector nonet mesons can be put into a manifestly L covariant representation which reduces to the 35 dimensional representation previously proposed for these particles.

HIGH ENERGY PARTICLE RESONANCES, CROSS SECTION AND SYMMETRIES, by W. E. Thirring. Mar. 11, 1965, 4p. Sept. 1, 1964-Feb. 28, 1965. (Technical status rept. no. 5) (AF 61(052)644) Unclassified

The line of approach was a relativistic extension of SU(6), a combination of internal and space-time symmetries. A group L which is the semidirect product of SL(6, c) and 36 translations was investigated. Relations between the Boson masses and the form factors of Baryons were derived and found to be in agreement with experimental numbers. Some results are given of elastic scattering of low energy K^- and charge exchange scattering at low K^- momenta.

[INVESTIGATION ON THE DYNAMICS OF LIQUIDS BY MEANS OF NEUTRON AND GAMMA SCATTERING] Zur Untersuchung der Dynamik von Flüssigkeiten mittels Neutronen-und Gamma-Streuung, by P. Wein Weinzierl and E. Ujlaki. [1965] 7p. incl. diagr. refs. (AFOSR-66-1682) (AF 61(052)645) AD 638529 Unclassified

Also published in Acta Phys. Austriaca, v. 21: 218-224, 1965.

The present situation of our knowledge on the dynamics of liquids, especially polar liquids like H_2O, is shortly summarized. A method is described by which information on liquid dynamics is obtained from Rayleigh scattering of recoilless emitted γ-radiation by the liquid sample. The condition of large source width, ΔE 10^{-5}ev, and high Mossbauer-factor seems best fulfilled by the 46 kev transition in W^{183}. A bent crystal diffraction spectrometer with 60 cm radius is required

to select the 46 kev line from the complex spectrum. The design of the entire equipment comprising this diffraction spectrometer and a velocity drive for speeds up to 10m/sec for the source is described.

THE OXIDATION OF ARSENIC (III) AND ANTIMONY (III), by J. G. Mason. Final rept. Feb. 1, 1963-Feb. 1, 1965. [17]p. incl. diagrs. (AFOSR-65-0662) (AF AFOSR-63-210) AD 614476 Unclassified

The kinetics of the Cr(VI)-As(III) reaction have been measured in perchloric acid solutions, acetic acid solutions, acetic acid-acetate buffers, NH_4NO_3, and $H_2PO_4^-$ - $HPO_4^{=}$ buffers. The reaction shows catalysis by H^+, and HOAc. The general form of the rate laws is Perchloric acid:

$$\frac{-d[Cr(VI)]}{dt} = (k_o + k_1[H^+] + k_2[H^+]^2)\frac{A[As(III)][Cr(VI)]}{1 + B[As(III)]}.$$

Acetic Acid and Acetate Buffers: $\frac{-d[Cr(VI)]}{dt} =$

$$(k_o + k_{HOAc}[HOAc])\ \frac{A[As(III)][Cr(VI)]}{1 + B[As(III)]};\ H_2PO_4^- - HPO_4^{=}$$

Buffers; $\frac{-d[Cr(VI)]}{dt} = \frac{k[As(III)][H_2PO_4^-][Cr(VI)]}{1 + B'[H_2PO_4^-]}$. In phosphate buffers, a Cr(VI) · $H_2PO_4^-$ complex is indicated as an oxidizing agent. In the other systems, the following mechanism is consistent with the experimental facts: As(III) + $HCrO_4^- \rightleftarrows$ As(III) · $HCrO_4^-$ pre-equilibrium; As(III) · $HCrO_4^- \xrightarrow{k}$ products.

LAMINAR SEPARATION IN SUPERSONIC AND HYPERSONIC FLOWS, by J. J. Ginoux. Final rept. Oct. 1965. [27]p. incl. illus. diagrs. tables, refs. (AFOSR 65-2715) (AF EOAR 65-11) AD 628182 Unclassified

High speed 2-dimensional reattaching flows are characterized by the development of regularly spaced vortices in the boundary layer, whose effect is to produce heat transfer rates at reattachment which are, locally over the span, considerably higher in laminar and transitional flows than in the turbulent case. These results are expected to occur both at supersonic and hypersonic speeds, as these vortices were observed over a range of Mach nos of 1.5 to 7.0. A basic difference in the recovery of total energy at reattachment was observed between laminar and transitional flows over ramps. In the latter case, the recovery temperature was maximum at reattachment and decreased to the laminar theoretical value in a region downstream of reattachment, where the flow was turbulent. The aerodynamic heating of sweptback wings can be predicted by a simple method derived from flat plate theory and by superimposing flow components parallel and perpendicular to the leading edge. Streamwise vortices do not seem to affect the average heat transfer coefficient.

PYROLYSES OF ETHYL CYANIDE, T-BUTYL CYANIDE, CUMYL CYANIDE, AND ACETAMIDE, AND BOND STRENGTHS IN CYANIDES, by M. Hunt, J. A. Kerr, and A. F. Trotman-Dickenson. [1965] [6]p. incl. tables, refs. (AFOSR-65-2497) (AF EOAR-63-23) AD 627833 Unclassified

Also published in Jour. Chem. Soc., (London), No. 933: p. 5074-5080, Sept. 1965.

Pyrolyses of several cyanides and acetamide have been carried out by the aniline-carrier technique. Ethyl cyanide decomposes by 3 reactions yielding ultimately hydrogen, methane, and ethylene as gaseous products; the decomposition to give a methyl radical is a first-order homogeneous reaction with (686-765°K): log k (sec^{-1}) = 14.1 - (72,700/2.3RT). The analogous reaction for t-butyl cyanide has (602-652°K): log k (sec^{-1}) = 15.2 - (70,200/2.3RT). The rate-determining step for the production of methane in the pyrolysis of cumyl cyanide is of the first-order and homogeneous with (520-624°K): log k sec^{-1}) = 12.5 - (50,100/2.3RT). The methane probably arises from bond rupture in the nitrile yielding a methyl radical, but it is possibly produced by direct molecular elimination. Acetamide decomposes mainly by the molecular elimination of ammonia for which the rate constant is (563-747°) log k (sec^{-1}) = 14.7 - (73,400 2.3RT).

MATRIX ELEMENTS FOR VIBRATION-ROTATION TRANSITIONS IN THE HBr OVERTONE AND HOT BANDS, by H. J. Barkov, A. L. Shabott, and B. Sesh Rao. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-65-2262) (AF 49(638)1127) AD 625988 Unclassified

Also published in Jour. Chem. Phys., v. 42: 4124-4131, June 15, 1965.

The strengths of the vibration-rotation lines of the first overtone, hot-band, and fundamental band of HBr have been measured by a curve of growth method, applying a correction for 2 overlapping lines devised by Sakai. The squares of the electric-dipole matrix elements $|\mathfrak{m}_0^2(m)|^2$ and $|\mathfrak{m}_1^2(m)|^2$ for the lines have been calculated, and have been fitted, respectively, to a cubic and quadratic polynomial in m, using the method of least squares. The experimental results for all 3 bands are compared with the theory of Herman and Wallis. The fact that the experimental $|\mathfrak{m}_0^2(0)|^2$ is less than that calculated from a linear dipole-moment function clearly requires a positive value of M_2, the second derivative of the dipole-moment function. The squares of the matrix elements $|\mathfrak{m}_0^2(0)|^2$ are used to calculate M_1 and M_2, the dipole-moment coefficients, for Morse and anharmonic oscillators. Of all the possible sets of M_1 and M_2 obtained in each case, the one giving results in better agreement with $|\mathfrak{m}_1^2(0)|^2$ is chosen. The chosen values of the dipole-moment coefficients are $M_1 = +4.56 \times 10^{-11}$ esu and $M_2 = +0.69 \times 10^{-3}$ esu cm^{-1} for the Morse oscillator and $M_1 = +4.63 \times 10^{-11}$ esu and $M_2 = 0.70 \times 10^{-3}$ esu cm^{-1} for the anharmonic oscillator. Since the sign of M_2 is positive, the Morse oscillator results are preferred. (Contractor's abstract)

APPLICABILITY OF INFRARED EMISSION AND ABSORPTION SPECTRA TO DETERMINATION OF HOT GAS TEMPERATURE PROFILES, by R. H. Tourin and B. Krakow. [1965] [6]p. incl. diagrs. refs. (AFOSR-65-1436) [AF 49(638)1132] AD 622691 Unclassified

Also published in Appl. Opt., v. 4: 237-242, Feb. 1965.

Changes in IR emission and absorption spectra of hot gases brought about by controlled variations of gas temperature profile were measured. Spectral emission-absorption temperatures were determined from the spectral data as a function of wavelength. These temperatures proved independent of wavelength for an isothermal profile, despite a large variation of absorption with wavelength. For nonisothermal profiles, the emission-absorption temperature varied with wavelength in a characteristic manner for each profile. These results established more firmly the validity of the IR emission-absorption technique of gas temperature measurement, and confirmed a previous hypothesis that the wavelength dependence of spectrally determined temperature, observed for most flames, is a temperature profile effect. The spectral emittance equation for a gas was formulated in terms of observable quantities for isothermal and nonisothermal cases, taking the spectrometer slit function into account. MACHINE LEARNING FOR GENERAL PROBLEM SOLVING, by D. L. Johnson. 1964-1965. 83p. incl. diagrs. tables, refs. (AFOSR-66-0835) (AF AFOSR-65-939) AD 632576 Unclassified

Three efforts are reported that explore different approaches to machine learning and problem solving. The first extends methods previously applied to trigonometric identities to problems of finding proofs of Boolean algebra identities. The problem of storing, choosing, and applying transformations was a major difficulty. A special coding system was developed that allows a single transformation to be stored that accounted for all possible combinations of variables. The program enables problems to be solved after "learning" that could not have been solved initially. Preliminary phases of an effort are described that investigates concept formation modeled in one sense after the work of Piaget. The second extends an adaptive tree pruning system exemplified in playing chess. The present system has a higher playing-to-learning time ratio resulting from the removal of "statistical learning". A record of decisions during search is stored without perturbing learning parameters and is subsequently processed to form two new lists, each containing learning parameters and thresholds that caused parts of the tree that could and could not be pruned. Constraints imposed on the system for pruning adjustment are discussed. The third effort, an attempt to apply some of the learning methods to Slagle's symbolic integration (SAINT) program, was discontinued, both because of hardware and software limitations and because complexity of the integration process might obscure the basic learning problem that is being studied.

TRIPLET STATE ESR OF METAL CHELATE COMPOUNDS, by I. M. Brown, S. I. Weissman, and I. C. Snyder. [1965] [7]p. incl. diagrs. table, refs. (AFOSR-65-1341) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-365] Atomic Energy Commission and National Science Foundation) AD 622911 Unclassified

Also published in Jour. Chem. Phys., v. 42: 1105-1111, Feb. 1, 1965.

The electron spin resonance spectra of a series of metal chelate compounds are reported. The metals are alkaline earths; the ligands are bidentate and tridentate derivatives of 2, 2'-bipyridine and 1, 10-phenanthroline and related compounds. The ESR spectra are interpreted as due to randomly oriented molecular triplets. Most spectra can be computer-simulated with a spin-Hamiltonian corresponding to a magnetic dipole-dipole interaction of the unpaired electrons of $D \approx 0.01\ cm^{-1}$ and $E = 0$. The vanishing value of E is interpreted to mean that the complexes have S_4 symmetry with the ligands on opposite sides of the cation and having mutually perpendicular planes. The spectra of some potassium chelate dimers are also reported. These characteristically appear to have nonvanishing E values.

MATRIX ELEMENTS OF A FERMION SYSTEM IN A REPRESENTATION OF CORRELATED BASIS FUNCTIONS, by E. Feenberg and C.-W. Woo. [1965] [15]p. incl. diagr. tables, refs. (AFOSR-65-0811) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-412 and National Science Foundation) AD 616219 Unclassified

Also published in Phys. Rev., v. 137: A391-A405, Jan. 18, 1965

The ground state and low excited states of liquid He^3 (and other fermion systems) can be constructed from a set of basis functions $\Psi(|n) = \psi_0^B \Phi(|n)$ in which ψ_0^B is the ground-state boson-type solution of the Schrödinger equation and the model functions $\Phi(|n)$ are Slater determinants suitable for describing states of the noninteracting Fermion system. Diagonal and

nondiagonal matrix elements of the identity and the Hamiltonian operator are evaluated by a cluster-expansion technique. An orthonormal basis system is constructed from $\Psi(|n)$ and used to express the Hamiltonian operator in quasiparticle form: a large diagonal component containing constant, linear, quadratic, and cubic terms in free-quasiparticle occupation-number operators and a nondiagonal component representing the residual interactions involved in collisions of 2 and 3 free quasiparticles. GROUND STATE AND LOW EXCITED STATES OF A BOSON LIQUID WITH APPLICATIONS TO THE CHARGED BOSON SYSTEM, by D. K. Lee and E. Feenberg. [1965] [12]p. incl. diagrs. tables, refs. (AFOSR-65-0812) (AF AFOSR-62-412) AD 617236
Unclassified

Also published in Phys. Rev., v. 137: A731-A742, Feb. 1, 1965.

The maximum deviation of the radial distribution function from its asymptotic value is used as an expansion parameter in calculating the properties of a degenerate boson system. The uniform limit holds at low densities under appropriate constraints on the Fourier transforms of the interaction potential and also at high densities for the charged-boson system. In the uniform limit a procedure based on (1) a Jastrow-type trial function, (2) the Wu-Feenberg functional for the kinetic energy, (3) the Kirkwood superposition approximation, or the more accurate Abe form for the 3-particle distribution function, yields the Bogoliubov formulas for the ground-state energy and the excitation energies of a degenerate or nearly degenerate boson system. Numerical results are also computed at intermediate and moderately low densities ($0.01 \lesssim r_s \lesssim 100$). (Contractor's abstract, modified)

DYNAMIC NUCLEAR ENHANCEMENT IN METALLIC SODIUM, by J. F. Reichert and J. Townsend. [1965] [7]p. incl. diagrs. refs. (AFOSR-65-0813) [AF AFOSR-62-412] AD 616268 Unclassified

Also published in Phys. Rev., v. 137: A476-A482, Jan. 18, 1965.

A double-resonance spectrometer was constructed capable of making accurate measurements of all the dynamical variables expressed in the master equation governing the time evolution of the dynamic nuclear enhancement of a single sodium sample. This system could measure the rate of rise of the nuclear polarization after the onset of saturation, the rate of decay of the polarization after the saturation was removed, and the nuclear T_1 by the standard 180°-90° pulse method. It was found that each of these processes had the same time constant $T_1 = 13.2 \pm 0.2$ msec within experimental error, in agreement with theory. The steady-state enhancement as a function of electron saturation gave a value of the leakage coefficient f to be 0.88 ± 0.05 at 29°C. The values of T_1 and f enable one to calculate T_{1e}, i.e., the spin-lattice relaxation time due to the conduction-electron-nuclear contact interaction, to be 14.9 ± 0.8 msec. These data demonstrate that the electron-nuclear contact interaction is the dominant mode of nuclear relaxation for sodium at room temperature. (Contractor's abstract)

Trial functions g(r) may be used as radial distribution functions to study the ground-state properties of a uniform extended quantum fluid. A result obtained by Wigner and Seitz in the study of the charged electrons gas imposes an integral inequality on any assumed g(r). The relation is $\int_0^\infty [1 - g(r)]r\,dr / [\int_0^\infty [1 - g(r)]r^2\,dr]^{2/3} \geq 1.792/3^{1/3} = 1.243$. This inequality places an effective constraint on the location, magnitudes, and width of the nearest-neighbor peak. (Contractor's abstract)

Strong dynamical correlations implied by realistic 2-nucleon potentials have substantial effect on energy moments of the photonuclear cross section calculated by means of the dipole sum rules. A model is devised in which it is found that the bremsstrahlung weighted cross section, which is sensitive to the long-range behavior of the 2-body correlation factor f, may be significantly decreased, and the integrated cross section and the first moment of the cross section, which are sensitive to the 2-nucleon potential and to the

short-range behavior of f, are strongly enhanced relative to values of these moments based on a Fermi gas model and monotonic central potentials. The numerical results are not inconsistent with the most relevant experimental data.

PRIMARY COSMIC-RAY ALPHA-PARTICLES. IV - ENERGY SPECTRUM AT41°N GEOMAGNETIC LATTITUDE, by D. E. Guss. [1965] [15]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-382], Army Research Office (Durham) and National Science Foundation) Unclassified

Published in Nuovo Cimento, Series X, v. 39: 27-41, Sept. 1, 1965.

From the analysis of an emulsion stack exposed to the primary cosmic radiation over Texas on Feb. 8, 1959, the α-particle integral energy spectrum was found to be well represented by a simple power law of the total energy $N(W) = CW^{-\gamma}$ in the kinetic energy range (2.5 - 7.5) gev/nucleon. The value of exponent was found to be $\gamma = 1.56 \pm 0.18$, which is not appreciably different, but perhaps somewhat lower than a value $\gamma \simeq 1.65$ found at solar minimum in the kinetic energy range (1.8 ÷ 3) gev/nucleon. A slightly smaller exponent at solar maximum is consistent with a solar modulating mechanism which preferentially removes low-energy particles from the primary cosmic-ray spectrum. These emulsions were exposed at a time near solar maximum, and the result is not consistent with a value $\gamma = 1.0$ in this energy range at solar maximum, as has been suggested. By using glass-backed plates and a low-temperature isothermal processing technique, the emulsion noise was reduced to a level where measurements could be extended to α-particle kinetic energies of 7.5 gev/nucleon. Agreement of the point on the integral spectrum at a kinetic energy of 7 gev/nucleon with flux values found at Guam during a period of similar cosmic-ray intensity shows that there is no significant noise contribution in these emulsions which varies with cell size in the same way as the Coulomb scattering signal.

MEASUREMENT OF THE MÖSSBAUER RECOILLESS FRACTION IN β-Sn FOR 1.3 TO 370°K, by C. Hohenemser. [1965] [12]p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-383] and National Science Foundation) Unclassified

Published in Phys. Rev., v. 139: A185-A196, Jul. 5, 1965.

Doppler-shift measurements of Mössbauer recoiless fractions f in β-Sn show discrepancies of the order of 20 to 30% and sometimes bear quoted errors of ± 10%. Such discrepancies can be caused by using incorrect values of α, the internal conversion coefficient; τ_m, the mean life of the excited state; Γ_A and Γ_S, the absorber and source linewidths; and B, the nonresonant background present in the detector at the energy of the Mössbauer γ rays. In the present work, the use of a black resonant absorber and the technique χ-γ delayed coincidences combine to eliminate dependence on these parameters in first approximation. In particular, the results $f = 0.455 \pm 0.010$ at 77.3°K and $f = 0.72 \pm 0.01$ at 4.2°K are obtained. The errors are systematic, and are due largely to uncertainties in evaluating the residual resonant transmission of the black absorber, the total magnitude of which is about 5% for $T _ 100$°K. For the experimental temperature range of $1.3 _ T _ 370$°K, f values are obtained at over 300 points for two different source samples. The results are as much as 20% higher than some previously reported values, and also do not agree well with the theoretical calculations of DeWames, Wolfram, and Lehaman for $T _ 150$°K. On the other hand, when the data are expressed in terms of a Debye temperature Θ derived at each temperature from the Debye formula for f, the Θ values show remarkably little variation with temperature, and fall on a smooth curve. The results at low temperature help to clarify the data of Wiedemann, Kienle, and Pobell in the superconducting region and immediately above. (Contractor's abstract)

NEW MÖSSBAUER f VALUES IN β-Sn (Abstract), by C. Hohenemser and W. F. Walters. [1965] [2]p. Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-383] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 64-65, Jan. 28, 1965.

Doppler-shift measurements of Mössbauer f values show discrepancies of the order of 20%-30%, and sometimes bear quoted errors of ±10%. Such discrepancies can be caused by using incorrect values of α, the internal conversion coefficient; Γ^1/Γ, the emission-absorption width over the natural width; and B, the nonresonant background. In a previous "relative" experiment for 1.3 to 373°K, a black resonant absorber was clamped in front of the source. The counting rate depended only weakly (through the resonant transmission correction) on α and Γ^1/Γ. However, f values were obtainable only if f was known for a single temperature (for normalization) or, equivalently, if B was known. In a new experiment, the black absorber is retained, but B dependence is avoided by identifying the 23.8-kev γ-rays by their electronically measured life-time. Prompt coincidences from Te x-rays are removed by critical absorption. The result: $f = 0.46 \pm 0.01$ at 77°K. This converts the relative data to f values. It yields $f = 0.74 \pm 0.02$ at 4°K.

ON ARYLBORON FREE RADICALS, by S. I. Weissman and H. van Willigen. [1965] [2]p. incl. diagr. (AFOSR-65-2079) (Sponsored jointly by [Air Force Office of Scientific Research under AF AFOSR-65-771] and National Science Foundation) AD 627494 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 2285-2286, May 20, 1965.

Experiments are conducted on trimesitylboron, which are in disagreement with those of Leffler, Doland, and Tanigaki (Jour. Amer. Chem. Soc., v. 87: 928, 1965). Leffler, et al, concluded that dimesityboron fluoride over Na-K alloy gives the radical Mes_2B, that addition of pyridine to this radical gives a second radical Mes_2B-Pyr, and that the trimesitylboron negative ion, Mes_3B, decomposes to Mes_2B after prolonged reduction. It is concluded from the present investigation that it is the dimesitylboron fluoride or its radical which decomposes and forms the trimesitylboron negative ion. Formation of Mes_2-Pyr is highly improbable. (Contractor's abstract)

VAN DER WAALS FORCES IN CONDENSED SYSTEMS, by G. D. Halsey, Jr. Final rept. [1965] [5]p. (AFOSR-65-0014) (AF 49(638)723) Unclassified

A brief summary of scientific accomplishments under this contract is presented. Most of the work pertained to the study of the relatively high-temperature interaction of gases with solids. A second general topic treated was that of solid solutions of the simplest molecules available. After observing that rapid equilibrium with an adsorbed solid solution was obtained, an attempt was made to study these systems in the absence of the adsorbent, but many difficulties were encountered. Studies of the sulfur trioxide system were an accidental by-product of an attempt to study a simple molecular interaction of chains of SO_3 molecules in the monomer SO_3. The actual situation was much more complicated than anticipated, and the result of the work was the first lengthy contribution to the physical chemistry of this very important compound since the 1920's. Work on the botanical polymer from locust bean gum represents an attempt to apply the methods of adsorption study to a much more complex system, and it presents many problems of interest in biochemistry as well as in pure physical chemistry. Dilute solutions of hydrogen in simple liquids was studied in 2 contrasted situations: the physical interaction that leads to solution as H_2 in liquid argon, and the chemical solution in liquid sodium. A bibliography of publications is included.

PERTURBATION OF SINGLET-TRIPLET TRANSITIONS ENERGIES, by R. E. Kellogg and W. T. Simpson. [1965] [5]p. incl. diagr. table, refs. [AF AFOSR-63-64]
Unclassified

Published in Jour. Amer. Chem. Soc., v. 87: 4231-4234, Oct. 5, 1965.

The first singlet-triplet transition energies for various substituted butadienes have been measured. A red shift found consistently going with 1- or 1, 4-substitution but not consistently with 2- or 2, 3-substitution is taken as evidence of hyperconjugation. A major conflicting possibility for explaining spectral shifts is internal dispersion forces. The dispersion force effect here is minimized because the transition studied has almost zero transition moment. A valence bond theory of perturbation of π-electron systems is developed and used to explain the results. A formula for free valence of residual affinity can be adapted from another, complementary, expression which automatically appears in the theory. It is judged more approximate to emphasize the complementary expression, which is called fixed valence. The fixed valence for a site is the sum of the Dirac-Penney bond orders of all bonds in the unperturbed molecule involving that site. The perturbation energy for radical attack is found to be inversely proportional to the fixed valence. (Contractor's abstract)

A STUDY OF BONDING IN IRON COMPOUNDS USING THE MÖSSBAUER EFFECT, by N. E. Erickson. Final rept. June 3, 1965, 186p. incl. diagrs. tables, refs. (AFOSR-65-1225) (AF AFOSR-63-253, AF AFOSR-64-594, and AF 49(638)1004)
Unclassified

A series of studies are described in which the relationship between certain features of Mössbauer spectra and the bonding characteristics of iron in various types of compounds were investigated. A study of Mössbauer spectra of a number of low-spin and high-spin ferrous and ferric mixed cyanide-di-imine complexes is reported. It was found that when the differences in chemical isomeric shifts between similar ferrous-ferric compounds are plotted versus the average shift of the pair, the resulting curve is linear and valid for both high-and low-spin compounds. A linear relationship was found to exist between average chemical isomeric shift and redox potentials of these pairs. This work reports the first Mössbauer study of iron in a negative oxidation state and the first Mössbauer studies of cis-trans isomerism in iron compounds, where the isomerism arises from the relative positions of 2 groups around a single metal atom.

AN EXAMPLE OF Sni CLEAVAGE OF A SULFIDE, by W. M. Schubert and Y. Motoyama. [1965] [2]p. incl. diagr. table, refs. (AFOSR-66-0306) (AF AFOSR-64-590) AD 629806
Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 5507-5508, Dec. 5, 1965.

It has been established that unimolecular carbon-sulfur heterolysis is the rate-controlling step in the conversion of alkyl α-dimethylaminobenzyl sulfides to N, N-dimethyl-benzalimmium ion in aqueous acidic media. This appears to be the first authentic instance of an alkyl-sulfur bond of a sulfide. In pure water, the alkyl α-dimethylaminobenzyl sulfides are hydrolyzed to benzaldehyde practically instantly. In dilute aqueous acidic media, in which the substrate is present largely as the nitrogen conjugate acid, SH^+, the reaction rate is slow enough to measure. The over-all reaction proceeds quantitatively in two stages: the sulfide to $PhCH = NME_2$ and then to PhCHO. The report concerns the kinetics of the first stage. First-order rate constants for the stage were obtained by an ultraviolet spectrophotometric method.

EFFECTS OF TURBULENCE IN He II THERMAL COUNTERFLOW, by J. T. Tough, W. D. McCormick, and J. G. Dash. [1965] [5]p. incl. diagrs. refs. (AFOSR-66-0401) (AF AFOSR-62-298) AD 629533
Unclassified

Also published in Phys. Rev., v. 140: A1524-A1528, Nov. 29, 1965.

Measurement of the damping of small-amplitude transverse vibrations of a fine wire was used to investigate thermal counterflow of He II in wide channels of rectangular cross section. Below a critical heat current, the damping is independent of the current, and is dictated by laminar viscous flow of normal fluid. At higher heat currents, the damping increases above the subcritical value, and the excess damping has been studied as a function of parameters of the apparatus and liquid. The dependence of the magnitude of the critical heat current on temperature and channel width is described by a critical Reynolds number $R_c = \rho V_{nc} d/\eta \cong 1200$, where V_{nc} is the normal fluid velocity corresponding to the critical heat current, d is the channel width, η is the normal fluid viscosity, and ρ is the total density. R_c is independent of wire diameter and vibration frequency. The excess damping was found to fit a single empirical expression over a wide range of experimental parameters. An outstanding characteristic of the supercritical damping force is its dependence on the Reynolds number $(R - R_c)^{1/2}$. (Contractor's abstract)

FERROMAGNETISM OF DILUTE SOLUTIONS OF COBALT IN PALLADIUM, by R. D. Dunlap, J. G. Dash and others. [1965] [5]p. incl. diagrs. table. (AFOSR-66-1608) (AF AFOSR-64-594) AD 643424 Unclassified

Also published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9(Pt. B): 1007-1011, 1965.

Previously reported measurements of ferromagnetic transitions in solid solutions of the cobalt-palladium system cover the concentration range from 100 to 0.1% Co. The most dilute sample was reported to have a Curie temperature of 7°K and the extrapolation of the T_c vs concentration curve seemed to indicate that a transition would occur for arbitrarily small concentrations of cobalt. The present work is an extension of these results in an attempt to determine whether there is a critical concentration below which ferromagnetism does not exist at T = 0.

INTERNAL FIELD OF FE^{57} IN NI IN THE REGION OF THE CURIE POINT, by D. G. Howard, B. D. Dunlap, and J. G. Dash. [1965] 5p. incl. diagrs. refs. (AF AFOSR-64-594) Unclassified

Published in Phys. Rev. Ltrs., v. 15: 628-632, Oct. 11, 1965.

The variation of magnetization with temperature of a ferromagnetic material near the Curie point T may be calculated to be $M = \text{const} \times (1 - T/T_c)^{\beta}$, where β depends upon the model used. Beta is ≈ 0.31 for a 3-dimensional Ising model and 1/2 for the molecular field approximation. Mössbauer spectra were obtained with a multichannel spectrometer and these were resolved into 6-line patterns up to 0.98 T_c. Above this temperature the normal intensity ratios appear to be preserved, though they are no longer resolved. Beta was found to be 0.33 ± 0.03 in the region $0.84 < T/T_c < 0.99$ and followed the 1/2 power law closely at higher temperatures.

LANDAU LEVEL OSCILLATIONS IN THE MAGNETO-ACOUSTIC ABSORPTION IN ZINC, by H. V. Bohm and L. Mackinnon. [1965] [4]p. incl. diagrs. (AF AFOSR-62-379) Unclassified

Published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards, and others. New York, Plenum Press, v. LT9(Pt. B): 786-789, 1965.

Most of the work so far described has been confined to the orientations $H \perp q$ and $H \parallel q$, where H is the magnetic field and q the propagation direction of longitudinal megacycle ultrasonic waves. This paper describes some experimental results obtained for other relative orientations of H and q. The ultrasonic

apparatus used was that described by Kamm and Bohm (Rev. Scient. Instr., v. 33: 957, 1962) operating at frequencies between 230 and 350 mcps in the temperature range 4.2° to 1.4°K. Experimental results indicate that the magnetoacoustic technique is capable of providing information on certain fermi surface cross-sectional areas as well as on caliper dimensions.

INVESTIGATIONS OF THE ELECTRONIC STRUCTURES OF METALS USING ULTRASONIC TECHNIQUES, by N. Tepley. [1965] [18]p. incl. diagrs. refs. (AFOSR-66-0079) (AF AFOSR-64-695) AD 629858 Unclassified

Also published in Proc. IEEE, v. 53: 1586-1603, Oct. 1965.

The paper reviews ultrasonic research on the electronic properties of metals performed since the first observations, about 10 yr ago, that at low temperatures electrons are responsible for the primary contribution to the ultrasonic attenuation. After a description of the Fermi surface and other aspects of the physics of electrons in metals, there is a sketch of the origins of geometric resonances, acoustic cyclotron resonances, and quantum oscillations, as well as other less familiar magnetoacoustic effects in the ultrasonic attenuation in pure metals. The types of information that each of these effects can give about the Fermi surface are cited. There is a discussion of ultrasonic attenuation experiments in superconductors, and of the kinds of information that these experiments can provide. In each area, the present status of research is indicated. The paper concludes with a brief description of the experimental techniques involved in this branch of research. Included are some relatively new techniques for performing simultaneous experiments at several ultrasonic frequencies and for performing ultrasonic attenuation experiments in metals at 9 Gc s. FINE STRUCTURE OF THE 2^3P and 3^3P STATES OF HELIUM, by B. Schiff, C. L. Pekeris, and H. Lifson. [1965] [4]p. incl. tables, refs. (AF EOAR-65-69) Unclassified

Published in Phys. Rev., v. 137: A1672-A1675, Mar. 15, 1965.

Nonrelativisitic eigenvalues accurate to one part in 10^9 to 10^{10} have been obtained for the 2^3P and 3^3P states of helium by improving the method previously developed for calculating 2-electron atom P-state wave functions, and by including up to 560 terms in the expansion. The corresponding values for the fine-structure splitting of the 2 levels are accurate to between 10^{-5} and 10^{-6} cm^{-1}, and the small discrepancy with experiment is presumed to be due to the neglect of quantum-electrodynamic correction terms of relative order α^2 in the calculation. The results for the 2^3P state are in good agreement with those obtained recently by C. Schwartz. (Contractor's abstract)

THE NUMERICAL INTEGRATION OF THE EQUATIONS OF MOTION OF A VISCOUS FLUID, by J. Gillis and A. Brandt. Final rept., pt. 1, Aug. 25, 1965 [3]p. [AFOSR-65-2213, pt. 1] (AF EOAR-63-73) AD 628179 Unclassified

A brief review is given of work on the development of methods for solving the equations of motion of magneto-hydrodynamics, taking account of viscous effects. The case of an electrically conductive fluid in an external transverse magnetic field is investigated. When the external field is zero, the equations reduce to those of Navier-Stokes. Several checks to the accuracy of the solutions are considered.

THE EFFECTS OF STRUCTURAL DEGRADATION ON THE COUPLED PHOTOCHEMICAL ACTIVITIES OF ISOLATED CHLOROPLASTS, by J. Gressel and M. Avron. [1965] [11]p. incl. diagrs. tables, refs. (AFOSR-65-1298) (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-64-19] and Charles F. Kettering Foundation) AD 620594 Unclassified

Also published in Biochim. et Biophys. Acta, v. 94: 31-41, Jan. 1965.

Isolated washed chloroplasts were degraded by sonication or lipolytic enzymes and the inhibition of photophosphorylation coupled to photoreduction was measured. Sonication, pancreatic lipase and phospholipase inhibited photophosphorylation with ferricyanide. This differential inhibition of phosphorylation could not be accounted for by any type of ATPase activity. Wheat germ lipases, which best hydrolyse lipids with short fatty acid chains, did not affect the photoreactions. Some poorer-grade preparations were contaminated with an ATPase which could account for some uncoupling. The data support the hypothesis that, as with mitochondria, a more complex phospholipoprotein structure is necessary for coupled reactions than for electron transport alone.

USE OF POLY-α-AMINO ACIDS IN BIOLOGICAL STUDIES, by E. Katchalski. [1965] [36]p. incl. illus. diagrs. tables, refs. (AFOSR-66-0288) [AF EOAR-63-59] AD 639505 Unclassified

Also published in Harvey Lectures, Series 59: 243-278, 1965.

Polyamino acids have been useful in the elucidation of the mode of action of known proteolytic enzymes, as well as in the search for new proteolytic enzymes. The work performed using synthetic polypeptide antigens has contributed much to knowledge of the factors determining antigenicity of proteins. The close resemblance between the antibacterial and antiviral properties of basic polyamino acids and some natural peptides indicates that both the synthetic model compounds and the natural materials may act biologically by a similar mechanism. Basic polyamino acids may prove to be useful in the clarification of the role of the basic

proamines and histones in regulating chromosome activity. In view of the achievements attained with simple high molecular weight model compounds, it might be anticipated that when the organic chemists have a large number of synthetic high molecular weight polypeptides of a predetermined amino acid sequence, these macromolecules will be of even greater use than the polyamino acids in unraveling the secrets of protein molecules and in establishing the correlation between their structure and function.

PREPARATION AND CHARACTERIZATION OF POLY-DL-ALANYL RABBIT γ-GLOBULIN, by S. Fuchs and M. Sela. [1965] [10]p. incl. illus. diagrs. tables, refs. (AFOSR-66-1140) (Sponsored jointly by Air Force Office of Scientific Research under [AF EOAR-64-22] and National Institutes of Health) AD 639528 Unclassified

Also published in Jour. Biol. Chem., v. 240. 3558-3567, Sept. 1965.

Poly-Dl-alanyl rabbit γ-globulin was prepared from γ-globulin and N-carboxy-DL-alanine anhydride, and purified by chromatograph on columns of Sephadex G-50. Over 75% of the ε-amino groups reacted with the monomer, yielding derivatives in which around 700 alanine residues are attached, on the average, per globulin molecule. Polyalanyl globulin preparations were cleaved with mercaptoethanol in the absence of urea, and could be fragmented with papain to yield alanylated chains and fragments. These were separated and analyzed for their alanine content. The extent of attachment of alanine residues per ε amino group of chain A or B was essentially the same. Alanylated globulins, chains, and fragments were characterized physico-chemically and compared with their unalanylated analogues. Solubility is increased upon poly-DL-alanylation; polyalanyl globulin is not precipitated by 37% saturated aqueous ammonium sulfate; and the alanylated A Chain is completely soluble at all pH values, unlike the A chain obtained upon partial reduction of unmodified γ-globulin. Alanylated antibody molecules kept their capacity to bind the antigen, but lost their ability to precipitate the antigen. Thus polyalanylation of rabbit immune γ-globulin increased its solubility significantly without drastically affecting its antigenic or antibody properties.

COMPETITION OF ANTIGENIC DETERMINANTS, by I. Schechter. [1965] [3]p. incl. tables. (AFOSR-66-1881) (AF EOAR-64-22) AD 63233[illegible] Unclassified

Also published in Biochim. et Biophys. Acta, v. 104: 303-305, 1965.

Interference in the immune response between peptide determinants is reported. Polypeptidyl proteins were used as immunogens, and antibody to the polypeptidyl moiety was measured by using for precipitation a polypeptidyl protein in which the protein moiety was incapable of reacting with any antibody formed. Thus, in the system employed the competing determinants are chemically defined and molecular parameters of the immunogens may be varied by changing either the peptides or the protein carrier.

IMMUNOGENICITY AND ROLE OF SIZE: RESPONSE OF GUINEA PIG TO OLIGOTYROSINE AND TYROSINE DERIVATIVES, by F. Borek, Y. Stupp, and M. Sela. [1965] [2]p. incl. diagr. table, ref. (AF EOAR-64-22) AD 632324 Unclassified

Also published in Science, v. 150: 1177-1178, Nov. 26, 1965.

Guinea pigs injected with 100 micrograms of p-azobenzenearsonate derivatives of hexal-L-tyrosine, tri-L-tyrosine, or N-acetyl-L-tyrosine amide, in complete Freund's adjuvant, developed, after 10 to 19 days, delayed-type hypersensitivity to these substances. This was shown by skin reactions, followed by the formation of circulating antibodies that were detectable by passive cutaneous anaphylaxis. Experiments with p-azobenzenearsonate-hexa-L-tyrosine labeled with iodine-131 showed that this substance was bound in vitro to proteins of normal guinea pig serum. Binding was similar with the nonantigenic hexa-L-tyrosine and its p-azobenzoate derivate. (Contractor's abstract)

RELATION BETWEEN OPTICAL CONFIGURATION AND IMMUNOGENICITY OF SYNTHETIC POLYPEPTIDES, by F. Borek, Y. Stupp and others. [1965] [6]p. incl. tables, refs. (AF EOAR-64-22) AD 632325 Unclassified

Also published in Biochem. Jour., v. 96: 577-582, Sept. 1965.

Three random linear copolymers composed of 2 or 3 of the amino acids D-tyrosine, D-glutamic acid, D-alanine and D-lysine, and a branched multichain copolymer with a poly-D-lysine backbone and polymeric side chains of D-tyrosine and D-glutamic acid, were found to be non-antigenic in rabbits, by precipitin and passive cutaneous anaphylaxis, and in guinea pigs, by delayed hypersensitivity tests. The corresponding 4 copolymers of L-amino acids were shown to be antigenic by all the 3 criteria. No immunological cross-reactions were observed between the polypeptides composed of

D-amino acids and the corresponding L-amino acid copolymers. Similarly, an azobenzenearsonic acid conjugate of poly-D-tyrosine was shown to be non-antigenic in guinea pigs, in contrast with an analogous conjugate of poly-L-tyrosine. Animals sensitized with the conjugate of poly-L-tyrosine did not exhibit delayed skin reactions when cross-tested with the D-conjugate. A linear polymer composed of D-tyrosine, L-glutamic acid and L-alanine was found to be immunogenic and to cross-react with the corresponding polymer composed exclusively of D-amino acids.

EQUILIBRIUM MECHANOCHEMISTRY OF COLLAGEN FIBRES, by J. Yonath, A. Oplatka, and A. Katchalsky. [1965] [7]p. incl. diagrs. (AFOSR-66-2593) [AF 61(052) 919] AD 645042 Unclassified

Also published in Structure and Function of Connective Tissue; Proc. of an Advanced Study Institute, St. Andrews (Scotland) (June 15-25, 1964), London, Butterworths, 1965, p. 381-387.

Collagen fibers contract by interaction with numerous ionic reagents, such as KCNS or LiBr, and relax upon removal of the contracting agent. The contraction is due to a process of chemical melting in which chemical energy may be converted into mechanical work under isothermal conditions. In order to correlate the investment of chemical energy with the mechanical work obtainable in such mechanochemical conversions, the force-length relations for collagen fibers interacting with KCNS was studied.

MECHANOCHEMISTRY, by A. Katchalsky. [1965] [5]p. incl. illus. diagrs. (AFOSR-66-1475) [AF EOAR-62-58] AD 637917 Unclassified

Also published in Rehovoth, 1965, 8-12.

The variety of energy transformations used in modern industry does not include the conversion of chemical energy into mechanical energy - a type common in nature and the sole energy conversion utilized by living creatures. At the end of the 1940's, it was discovered that chemical energy can be converted into mechanical energy by the use of synthetic polymers, the first proof that man-made appliances were able to achieve mechano-chemical conversions thought to be characteristic of living organisms alone. The theory behind mechano-chemical transformations is explained. Experimenting with collagen as the mechanochemical material and providing a salt solutions as fuel, a model engine was successfully built which converts mechanochemical contraction into continuous rotary motion; the concentration of the solution supplying chemical energy becomes diluted, thus preserving the Law of Conservation of Energy. These models help in understanding natural systems but they don't provide an alternative to the study of the systems themselves.

MECHANOCHEMISTRY OF COUPLED CONTRACTILE AND CHEMICAL RATE PROCESSES, by A. Katchalsky. Final rept. Jan. 1, 1964-Dec. 31, 1965. [74]p. incl. illus. diagrs. tables, refs. (AFOSR-66-1181) (AF EOAR-64-25) AD 635032 Unclassified

After briefly presenting concepts involved in mechano-chemical conversions, some work done on the equilibrium and kinetic behavior of the contractile fibers is summarized. The strong influence of LiBr on collagen fibers is based on complex formation which is accompanied by a relatively sharp transition from a rigid, triple helical structure, to an amorphous randomly kinked structure; while the crystalline well organized region presents a Hooke'an behavior, well known from the study of rigid materials, the amorphous region exhibits some novel features not described before. An equation is derived which permits the prediction of the kinetics of contraction in the amorphous range. There is a clear indication of a phase transition in the equilibrium f-l-c curves, but it is never sharp and at higher forces becomes so smeared out that it is doubtful whether the thermodynamic criteria of first order transition may be applied to collagen fibers. To investigate the point more closely, 2 series of measurements are applied to the region under consideration. The operation of mechanochemical engines is analyzed, and it is pointed out that the cyclic operation of the engine is self-regulatory and may serve as a simple

model for biological cybernetic systems. Five articles and 3 abstracts of articles concerning work done under this contract are included.

CHANGES IN THE INFRARED ABSORPTION SPECTRUM OF COLLAGEN DUE TO THE INTERACTION WITH LITHIUM BROMIDE, by M. Sherebrin. [1965] 4p. incl. tables. (Bound with its AFOSR-66-1181; AD635032) [AF EOAR-64-25] Unclassified

Collagen contracts when placed in concentrated solutions of LiBr. The molecular mechanism of this contraction is of primary interest especially in terms of the interaction of LiBr with the collagen molecule. The investigation was conducted to determine whether there are changes in absorption frequencies of collagen in the infrared with varying concentrations of LiBr and with the mechanical changes in length. The absorption line at 1250 cm^{-1} was observed to increase to 1270 cm^{-1} when the film was treated with increasing concentrations to 8.95 M LiBr. No changes in absorption lines were observed when the length of the film was stretched from 2.5 to 4.0 cm.

THE RELATION BETWEEN FORCE AND RATE OF CONTRACTION IN COLLAGEN IN THE PRESENCE OF CONTRACTING SALT, by J. Yonath. [1965] [26]p. incl. diagrs. tables. (Bound with its AFOSR-66-1181; AD 635032) [AF EOAR-64-25] Unclassified

Previous reports have described the kinetics of contraction and relaxation of collagen fibers following transfer of the fibers from one chemical environment to another. This type of contraction-relaxation process may be denoted as "chemical contraction (or relaxation)" or as "chemical melting (or crystallization). Melting or crystallization of a fiber in a contracting medium may be brought about by changing the length or the stretching force. Such changes can be either abrupt, e.g. by suddenly diminishing a high stretching force which had been applied on the fiber in a concentrated salt solution so as to prevent melting; or continuous, e.g. by continuously contracting a highly stretched fiber in salt solution. Such contractions (and relaxations) may be denoted as "mechanical contraction (or relaxation)" or as "mechanical melting (or crystallization)". Experiments carried out in order to study the kinetics of mechanical melting are described.

THF VIBRATING REED TECHNIQUE, by S. Reich. [1965] [10]p. incl. diagrs. (Bound with its AFOSR-66-1181; AD 635032) [AF EOAR-64-25] Unclassified

A vibrating reed instrument was built in order to study the dynamical properties of collagen fibers in the low frequency range as functions of both LiBr content and of temperature. The driving element is a magnetic phonograph recording head. A small aluminum clamp which holds the end of a collagen reed is mounted in the recording head in place of the stylus. The flexural vibration of the reed is excited by imparting a sinusoidal motion to the reed clamp. The recording head with the sample is mounted in a transparent container in which temperature and humidity are controlled. The experimental procedure

consists of observing the tip of the reed with a low power microscope and recording the resonance frequency and the band width.

RANGE OF FERROMAGNETIC EXCHANGE INTERACTION IN NONMAGNETIC FILMS ON IRON SUBSTRATES, by W. L. Trousdale and R. A. Lindgren. [1965] [3]p. incl. diagrs. (AFOSR-65-1370) (AF AFOSR-64-636) AD 622905 Unclassified

Presented at Tenth Conf. on Magnetism and Magnetic Materials, Minneapolis, Minn., Nov. 16-19, 1965.

Also published in Jour. Appl. Phys., v. 36: 968-970, Mar. 1965.

A experiment was performed to measure the penetration of conduction electron spin polarization into nonmagnetic metallic films deposited on an iron substrate. The technique was to evaporate the metal in question on the iron and then to probe the effective exchange field, produced by the electron spin polarization, as a function of the distance from the substrate by evaporating an intermediate partial layer of Co^{57}. The hyperfine field of the Fe^{57} was measured by the Mossbauer method and the exchange was calculated from the hyperfine field under the assumption that the hyperfine field is related to the exchange field through the Brillouin function of the local spin. Measurements were carried out at 300, 78, 4.20, and 1.22°K. Samples using palladium on an iron substrate were investigated with the Fe^{57} placed from 20 to 120 lattice spacings away from the substrate with the following results: (1) The size of the exchange field varies from 0 to approx. 150°K in the thinnest sample and from 0 to 25°K in the thickest. (2) For samples of given thickness, an empirical probability distribution function for the exchange field was found which gave a good fit to the hyperfine spectra at all temperatures. (3) The probability function is maximum at zero exchange field, decays initially quite rapidly, and then tails off slowly. A few measurements were made with copper and silver as the intermediate metal. The indication is that the effective exchange field in copper is greater than in silver but considerably less than in palladium. (Contractor's abstract)

SOME THEORETICAL ASPECTS OF THE IMPROVEMENT OF DOCUMENT SCREENING BY ASSOCIATIVE TRANSFORMATIONS, by E. C. Bryant, D. T. Searls, and R. H. Shumway. Nov. 30, 1965, 50p. incl. diagr. tables, refs. (AFOSR-66-0171) (AF 49(638)1484) AD 628191 Unclassified

With respect to document storage and retrieval, associative techniques can be considered that improve the file or improve the search query. In this study, techniques that improve the files are considered. The file may be one in which terms are selected by indexers or by machines. The index is considered a matrix of zeros and ones; no weighting of index terms is implied. Two kinds of zero-one files were investigated. The first is a file constructed from an orderly subject matter (organic chemistry; electronics), with a well defined term list and a rigid set of rules for term selection. A "correct" indexing can be defined, and formulas were devised to show anticipated gain by associative techniques. The second is a file in which assignment of terms is made after subjective judgment concerning applicability of the term to the document. Terms are less well defined, and partial synonymity is an acute indexing problem. It was postulated, therefore, that selection by a high proportion of indexers is a measure of term applicability to the given document. No attempt was made to "solve" this problem. Instead, a particular associative scheme was selected that was shown to provide gain. A well structured file (a Patent Office file on analog, digital converters) was used. The associative technique provided gain even after noise was introduced by randomization.

PARTIAL DISLOCATIONS, PHASE TRANSFORMATIONS AND NON-STOICHIOMETRY IN METAL OXIDES, by B. G. Hyde. [1965] [2]p. incl. diagrs. refs. (AFOSR-65-2089) [AF AFOSR-65-853] Unclassified

Also published in Internat'l. Conf. on Electron Diffraction and Crystal Defects, Melbourne (Australia) (Aug. 16-21, 1965), New York, Pergamon Press, 1965.

The relationships between the structure-types α-UO_3, fluorite, and rare earth sesquioxide type-A are examined: a plausible dislocation mechanism for phase transformations (accompanied by composition changes) between these types is proposed. A cursory examination of the effect of "radius-ratio" in determining whether non-stoichiometry in metal oxides will be accommodated by (1) shear, or (2) anion vacancies is made.

THE PHOTOCHEMICAL PRODUCTION OF STRAINED RINGS, by P. de Mayo. Final rept. May 3, 1965, 6p. incl. diagrs. (AFOSR-65-0970) (AF AFOSR-63-99) AD 617927 Unclassified

In this study, the photochemical synthesis of strained rings was investigated. It was found that intermolecular cycloaddition could be induced photochemically. While simple unsaturated ketones appeared unreactive the hydrogen bonded "cyclic' ketone acetyl acetone could be induced to participate. Further, this diketone had the advantage that any hydrogen abstraction would give a diradical which would be immediately converted, by spin inversion, into the starting material. Two other unrelated photochemical studies are also reported. (1) the photosensitized oxidation of pyrrole, providing the structure of the product maleimide and the mechanism of oxidation; and (2) the dimerisation of α-pyridones and sultones as a means of building up cyclic systems.

ON THE RELATIONSHIP BETWEEN r CENTROID AND BAND FREQUENCY, by R. W. Nicholls. [1965] [4]p. (AFOSR-65-1092) (Sponsored jointly by Air Force Cambridge Research Center, Air Force Office of Scientific Research under AF AFOSR-62-236, and National Aeronautics and Space Administration) AD 618285 Unclassified

Also published in Proc. Phys. Soc. (London), v. 85: 159-162, Jan. 1965.

The monotonic relationship between r centroid and band frequency has been investigated in detail, and the circumstances which cause r centroids to increase or decrease with increasing frequency as $r'_e <$ or $> r'_e$ are discussed.

Except in cases where change in molecular properties with internuclear separation is of specific interest, band frequency (or wavelength) may thus often be more conveniently used as an alternative to the r centroid as an independent variable in the discussion of the change of such molecular properties as transition probabilities from band to band in a system. ROTATIONAL EXCITATION IN ALKALI-ION COLLISIONS, by R. P. Lowe and H. I. S. Ferguson. [1965] [2]p. incl. table. (Sponsored jointly by Air Force Cambridge Research Center; Air Force Office of Scientific Research under AF AFOSR-62-236, National Aeronautics and Space Administration, and National Research Council of Canada) Unclassified

Published in Fourth Internat'l. Conf. on Physics of Electronics and Atomic Collisions: Abstracts of Papers, Laval U., Quebec (Canada) (Aug. 2-6, 1965), New York, Science Bookcrafters, Inc. [1965] p. 285-286.

This paper reports an extension of previous studies to include excitation by Li^+, Na^+, K^+, Rb^+, and Cs^+ ions at energies up to 10 kev. Spectra of the R-branch of the (0, 0) first negative band at 3914 A taken with a photoelectric Ebert monochromator at a spectral slit width of 0.65 A were used to deduce the population distribution. The beam current of alkali ions ranged from 50 to 200 μamp and the collision chamber pressure was 20 μ Hg. For Li^+ excitation, the rotational temperature increases rapidly with decreasing ion energy. The temperatures for Na^+ excitation are comparable with those for Li^+ ions at 4 kev. The heavier ions K^+, Rb^+, and Cs^+ produce temperatures which only slightly exceed that of the accelerator. No significant redistribution of rotational energy by gas-kinetic collisions after excitation is possible. An investigation of the

variation of intensity with pressure and beam current suggest that the excitation takes place in primary collisions for Li^+ and Na^+, but that a secondary process, probably involving secondary electrons, dominates for the heavier ions.

ELECTRON ENERGY MEASUREMENTS OF THE RACETRACK MICROTRON BEAM, by V. Sells, H. Froelich, and E. Brannen. Jan. 1965, 57p. incl. illus. diagrs. table, refs. (Technical rept. no. RMG-T-2) (AFOSR-65-1627) (AF AFOSR-63-297) AD 624038 Unclassified

The momentum spread in the beam of a racetrack microtron is measured using a high resolution beta ray spectrometer. The design of the semicircular double focusing magnetic spectrometer is described. A method of continuous magnetic field measurement in the spectrometer is discussed. The object and image positions relative to the entrance and exit planes of the spectrometer are calculated. The momentum spread in the electron beam of the accelerator as taken directly from the spectrometer is 0.41% at the half width position; 0.62% at half current; 1.28% at 90% current and 1.86% at 100% current. These values maybe corrected for the natural line width of the spectrometer whose theoretical base spread is 0.16%. With these corrections the upper limit of the energy spread in the 6.0 mev beam is 22 kev at half width; 34 kev at half integrated current; 73 kev at 90% current and 110 kev at 100% current level.

TEMPERATURE MEASUREMENTS ON LASER-PRODUCED FLAMES (Abstract), by J. E. Mentall and R. W. Nicholls. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-522] and National Aeronautics and Space Administration) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 492, Apr. 26, 1965.

The interaction of a focused laser beam with a powdered solid produces highly luminous gas. Following qualitative spectroscopic observations on a number of powered solids, quantitative intensity measurements have been made on some of the molecular-band systems (C_2 Swan, CN violet, and AlO blue-green) that arise from laser excitation of carbon and aluminum in air. These measurements indicate the existence of Boltzmen distributions of relative populations of vibrational and notational energy levels to which vibrational and rotational temperatures are assigned.

ENERGY SPECTRUM OF THE ELECTRON BEAM IN A RACETRACK MICROTRON, by V. Sells, H. Froelich, and E. Brannen. [1965] [3]p. incl. diagrs. refs. (AFOSR-66-2200) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-297 and National Research Council of Canada) Unclassified

Also published in Jour. Appl. Phys., v. 36: 3264-3266, Oct. 1965.

The energy spectrum of the beam of a 4-sector racetrace microtron has been measured here, using a high-resolution double focusing β-ray spectrometer. For an energy gain per orbit of 750 kev, it was found that 50% of the integrated current in the eighth orbit (6 mev) was contained in an energy interval of 34 kev and 90% of the beam current in a 73-kev interval. This narrow energy spread (±0.3%) is of particular interest in the generation of submillimeter radiation and in the use of the microtron as an injector for high-energy synchrotrons.

THE U.W.O. RACE-TRACK MICROTRON, by E. Brannen, H. Froelich, and V. Sells. [1965] [4]p. incl. diagr. (AFOSR-66-2850) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-297, National Research Council of Canada, and Ontario Research Foundation) AD 644574 Unclassified

Also published in Canad. Jour. Phys., v. 43: 1555-1558, Aug. 1965.

The use of a race-track design for the magnetic guide field of a microtron has a number of advantages in comparison with a conventional microtron with a homogeneous field. The energy gain per orbit can be chosen freely and can, in fact, be made variable. In addition, beam focusing by the magnetic field can be provided the size of the magnet gap can be reduced, and electron injection can be facilitated. The electron beam has a remarkably narrow energy spread (50% of the electrons in a 34-kev interval) and theoretically has unusual longitudinal bunching characteristics (50% of the 8-orbit electrons in a bunch 0.5 mm long). Race-track designs that maintain stability of the betatron oscillations by splitting the magnetic fields into 4 sectors were proposed independently by Roberts (1958) and Moroz (1957). The race-track microtron built at the University of Western Ontario (the U. W. O. microtron) (Froelich and Brannen 1963; Froelich 1962) follows these proposals. The magnetic guide field consists of 4 sectors with uniform fields. In order to achieve stability of betatron oscillations, the stray fields in the 2 short regions between sectors were reduced by using magnetic shields. The magnet gap within the sectors has a width of only 7.2 mm. The energy gain per orbit and thus the final energy can be varied continuously, and synchronism can be obtained by adjusting the width of the central region between the sectors. The electron injection system consists of a Pierce-type electron gun having a lanthanum hexaboride cathode and small deflecting pole pieces. The gun current is 400 ma, the pulsed gun voltage 25 kv, and the pulse length 1 μsec.

ON THE LOGIC OF INFORMATION RETRIEVAL, by W. Goffman. [1965] [4]p. (AFOSR-65-2690) (AF AFOSR-64-402) AD 629801 Unclassified

Also published in Inform. Storage and Retrieval, v. 2: 217-220, 1965.

An information retrieval process may in general be characterized in terms of 2 sets Q and S with a relation R. Q represents queries, S a file of documents, and the relation R, called relevance, is a property which assigns to any q in Q a certain subset A of S called the answer to q. The classical 2-valued propositional calculus has generally been accepted as the underlying logic of an information retrieval process. However, the Boolean model has been shown inadequate for describing an information retrieval process, and it follows that the 2-valued propositional logic is also inadequate. The logical system which seems most appropriate is the probability logic suggested by Reichenbach. A theorem is proved that an infinitely valued logic cannot be represented by a finite valued system having single valued truth tables. In terms of information retrieval, this theorem implies that no finite valued logic is adequate for representing an information retrieval process.

AN EPIDEMIC PROCESS IN AN OPEN POPULATION, by W. Goffman. [1965] [2]p. (AF AFOSR-64-403) Unclassified

Published in Nature, v. 205: 831-832, Feb. 20, 1965.

An epidemic process can be characterized as a time-dependent process of transition by the members of a population (N), where the state transitions are caused by exposure to some influence called infectious material. The members of the population can belong to one of three basic states at any given time: Infective (I), Susceptible (S), Removal (R). The epidemic process and states are explained by the author. Mathematical treatments of epidemic processes, both deterministic and stochastic, which have appeared have usually dealt with processes involving closed populations, i.e., N remains a constant throughout the development of the process. The author deterministically represents an epidemic process in which N is not open; new supplies of susceptibles and infectives are introduced into the population as the process proceeds on its course of development. Letting μ = the rate at which new susceptibles are introduced into N, ν = the rate at which new infectives are introduced, and γ = the rate of removal of both susceptibles and infectives, the system of equations indicates that $S + I = \frac{\mu + \nu}{\gamma}$ for all values of t. Hence the process (E) will reach a maximum in finite time if, and only if, the sum of susceptibles and infectives is constant.

A STUDY OF SUPERCONDUCTIVITY IN LEAD-BISMUTH ALLOYS USING ELECTRON TUNNELING TECHNIQUES, by J. G. Adler and S. C. Ng. [1965] [12]p. incl. diagrs. table, refs. (AFOSR-65-1187) (In cooperation with Dalhousie U. Halifax, Nova Scotia) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-565] and National Research Council of Canada) AD 619612 Unclassified

Also published in Canad. Jour. Phys., v. 43: 594-604, Apr. 1965.

Some of the properties of superconducting lead-bismuth alloy films have been investigated using electron tunneling techniques. The superconducting energy gaps and transition temperatures as well as the effective tunneling density of electron states near the end point of the phonon spectrum have been measured for various compositions of this alloy system. It was found that pure bismuth films as well as bismuth films containing small amounts of lead are not superconducting above 1°K. The results also indicate that for alloys with bismuch concentrations between about 35% and 75%, superconductivity is due partially to a proximity effect. (Contractor's abstract)

MAGNETIC AND RESISTIVE BEHAVIOR OF SUPERCONDUCTING LEAD-INDIUM ALLOYS (Abstract), by D. E. Farrell, J. G. Adler, and B. S. Chandrasekhar. [1965] [1]p. [AF AFOSR-64-565] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 347, Mar. 24, 1965.

Magnetization and resistive transition measurements have been made on well-annealed alloys of lead with 10-50 at-% indium, as a function of temperature. The magnetization was measured using a Foner magnetometer with phase-sensitive detection. Excellent agreement exists for the values of H_{c2} obtained by the two methods. The magnetization curves show unusual behavior close to H_{c2} in certain ranges of frequency ω and amplitude A of vibration of the sample. The observed curves can be described by an expression of the form $M(H) = M_0(H) + M_1(H, \omega, A) \exp(i\omega t)$, where M_0 corresponds to the usual Abrikosov behavior and M_1 increases with field above H_{c1} but then goes abruptly to zero at H_{c2} in a highly reversible manner even though M_1 itself displays some irreversibility. This disappearance of M_1 provides a much clearer indication of H_{c2} than has been the case hitherto in magnetization measurements. The dependence of this anomaly on the frequency and amplitude of the specimen vibration and particularly on the temperature strongly suggests that it arises from the motion of pinned flux lines.

[VASOPRESSIN BIOSYNTHESIS, by H. Sachs.] Final scientific rept. Feb. 1963-Oct. 1964 [1965] 3p. (AFOSR-65-0282) (AF AFOSR-63-408) AD 611185 Unclassified

The objectives of the research were to study in vivo and in vitro a number of processes concerned with the biosynthesis, storage, and release of vasopressin. Previous experimental data suggested the possibility that the biosynthesis of vasopressin occurs in a bound, biologically inactive form and that the release of hormone takes place during the formation and maturation of the neurosecretory particles. Data have now been obtained which are consistent with such a 'precursor model' for vasopressin biosynthesis. The in vitro systems, capable of carrying out the biosynthesis and release of vasopressin, offer a considerable number of possibilities for studies concerned with the neurosecretory process.

RELEASE OF VASOPRESSIN FROM ISOLATED GUINEA PIG POSTERIOR PITUITARIES, by E. W. Haller, H. Sachs and others. [1965] [5]p. incl. diagrs. table, refs. (AFOSR-65-2853) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-408, National Heart Institute, and National Institute of Health) AD 629599 Unclassified

Also published in Amer. Jour. Physiol., v. 209: 79-83, July 1, 1965.

Isolated guinea pig posterior pituitaries, incubated in a modified Krebs-Ringer solution at 37°C, released vasopressin at a relatively constant basal rate. Electrical stimulation at a voltage gradient of 3-9 v cm (200 msec pulses of 60 cycles sec ac every 2 sec) resulted in an elevation of vasopressin output. Stimulation at lower field strengths was not effective and maximal vasopressin release was produced by stimulation at any voltage gradient between 3 and 9 v cm. Vasopressin secretion was augmented at rest and during electrical stimulation by the presence of 2 mM Ba(++) in the incubation medium (increase of Ca (++) by 2 mM had no effect). Tetracaine (0.5 mM) blocked the response to electrical stimulation. Chemical, biological, and enzymic tests indicated that the pressor material secreted by the tissue was identical with arginine vasopressin. The experimental findings support the hypothesis that conduction of action potentials along the hypothalamo-neurohypophysical tract releases vasopressin from the posterior pituitary. (Contractor's abstract)

NATURAL LANGUAGE SYNTAX ORIENTED TRANSLATORS, by P. Z. Ingerman. Final rept. [1965] [14]p. (AFOSR-65-1940) (AF 49(638)1452) Unclassified

The final report is divided into 2 major sections. The first reports the results of research performed under the contract, while the second is a discussion resulting from the monitoring of standardization activities dealing with programming languages. The major project has been the specification of a syntax-oriented translator of sufficient generality so that it can be used to translate from most of the higher-level programming languages currently in use to an assembly-type intermediate language. Subsidiary to this has been the development of an assembly-type language which can serve not only as the target for the syntax-oriented translator, but can also be used in its own right both as an assembly language and as one possible solution to the reprogramming problem.

A UNIVERSAL ASSEMBLY MAPPING LANGUAGE, by M. L. Graham and P. Z. Ingerman. [1965] [13]p. incl. diagrs. (AFOSR-65-2685) (AF 49(638)1452) AD 629371 Unclassified

Also published in Proc. Twentieth Nat'l. Conf. of the Association for Computing Machinery, Aug. 24-26, 1965, p. 409-421.

The meta-language presented is entirely devoid of machine-oriented mnemonic codes. The user must use the metalanguage to define the meanings of the set of machine-oriented mnemonic codes which he wishes to use. The assembly language itself does not exist. A source program in the assembly language which the user specifies is presented to the meta-language processor together with the description of this language in terms of the metalanguage. The processor then interprets the source code in terms of the description it has been given and generates output in the form specified by the user in his meta-language description.

Westinghouse Electric Corp. Defense and Space Center, Baltimore, Md.

AN ASSEMBLY LANGUAGE FOR REPROGRAMMING, by M. L. Graham and P. Z. Ingerman. [1965] [5]p. (AF 49(638)1452) Unclassified

Presented at Assoc. for Computing Machinery Reprogramming Conf., Princeton, N. J., June 1965.

Published in Commun. Assoc. Comput. Mach., v. 8: 769-774, Dec. 1965.

Assembly languages generally provide a one-for-one translation from a symbolic to a numeric version of a program, that is, from assembly language to machine-language. The meta-language presented here can be used to specify the mapping of any language which conforms to a canonical list form into an arbitrary stream of bits. This bit stream may be treated as a machine language program, a character stream, or whatever else the user might desire. Thus, this meta-language can be used to map from one assembly language into another or from the assembly language for one machine into the machine language of another.

GROWTH OF LARGE SINGLE CRYSTALS OF HEXAGONAL SELENIUM FROM THE MELT AT HIGH PRESSURES, by D. E. Harrison and W. A. Tiller. [1965] [4]p. incl. illus. diagr. (AFOSR-65-2033) (AF 49(638)1029) AD 627582 Unclassified

Also published in Jour. Appl. Phys., v. 36: 1680-1683, May 1965.

The preparation of single crystals of hexagonal selenium at ordinary pressures is hampered by the very slow rate at which crystals can be grown from the melt under these conditions. In this paper a technique is presented for preparing single crystals under pressure. As the equilibrium freezing temperature is increased by the application of pressure, crystals can be grown at rates several orders of magnitude faster than under ordinary pressures. At 5 kbar pressure, single crystals were grown up to 1 cm in diam by 10 cm long. X-ray and optical studies established that the principal cleavage surfaces were along the {1010} and {1012} planes. A STABILITY FUNCTION FOR EXPLICIT EVALUATION OF THE MULLINS-SEKERKA INTERFACE STABILITY CRITERION, by R. F. Sekerta. [1965] [5]p. incl. diagrs. (AFOSR-65-2036) (AF 49(638)1029) AD 627583 Unclassified

Also published in Jour. Appl. Phys., v. 36: 264-268, Jan. 1965.

In a previous paper by Mullins and Sekerka (Jour. Appl. Phys., v. 35: 444, 1964), a stability criterion was introduced for a planar solid-liquid interface during the unidirectional solidification of a dilute binary alloy at constant velocity. However, evaluation of the criterion proved difficult. In this paper, a stability function S for its evaluation is introduced and tabulated. The criterion is then written in terms of S and compared with the constitutional supercooling criterion for interface stability. From these results, experimental data can be analyzed and a conclusive test of the stability theory can be made.

MEASUREMENT OF BRINE DROPLET MIGRATION IN ICE, by J. D. Harrison. [1965] [5]p. incl. diagrs. (AFOSR-66-1662) (AF 49(638)1029) AD 639872 Unclassified

Also published in Jour. Appl. Phys., v. 36: 3811-3815, Dec. 1965.

Migration of NaCl, KF, and KI droplets through ice was measured in the temperature interval from -6° to 0°C in the presence of a 15°C/cm thermal gradient. Normally the droplets increased in velocity and size as they approached the ice-water interface. A 30-μ-diam droplet migrating at 0.3 μ/sec at -5°C would be 65μ in diam and migrating at 1.2 μ/sec at -1/2°C. Special phenomena observed were droplet elongation, diagonal migration, and constant-velocity migrations.

CZOCHRALSKI GROWTH OF LOW-DISLOCATION-DENSITY ZINC TUNGSTATE CRYSTALS, by S. O'Hara and G. M. McManus. [1965] [6]p. incl. illus. diagr. refs. (AF 49(638)1029) Unclassified

Published in Jour. Appl. Phys., v. 36: 1741-1746, May 1965.

Zinc tungstate crystals were grown by the Czochralski method and the effect of growth parameters on crystal perfection was studied. Of the (010) and (100) slip planes, Berg-Barrett photographs showed that the (100) slip plane appeared to be the most active during crystal growth. Observations made on crystals grown in a steep temperature gradient showed that strain due to thermal gradients was responsible for the high dislocation densities in these crystals. Studies on seeding showed that if no widening occurred, then the perfection of the region of the crystal after seeding was much higher than the seed; the changes in temperature employed to widen the crystal gave rise to very high dislocation densities. X-ray examination verified the observations made by chemical etching. Crystals grown under nearly isothermal temperature conditions provided material with dislocation densities between 0 and 500/cm^2. These crystals propagated with facets at the solid-liquid interface which gave rise to impurity distributions similar to those observed in semiconductor crystals. The conditions for growing low-dislocation-density Czochralski of zinc tungstate are similar to those for growing low-dislocation-density semiconductor crystals. (Contractor's abstract)

GROWTH MORPHOLOGY OF HEXAGONAL SELENIUM AT HIGH PRESSURES, by D. E. Harrison. [1965] [5]p. incl. illus. (AF 49(638)1029) Unclassified

Published in Jour. Appl. Phys., v. 36: 3150-3154, Oct. 1965.

Hexagonal selenium can be grown from the melt either in the form of spherulites or as single crystals. At normal pressures, the transition from spherulitic to single-crystal growth habit is not usually shown to be the result of the very slow growth rate of single crystals. At higher pressures, the single-crystal growth rate is enhanced sufficiently to permit observation of this transition. Examination of melt-grown crystals by Weissenberg x-ray techniques disclosed a disorder normal to the "c" axis direction. The absence of the disorder in vapor-grown needles produced at 5 kbar indicates that the disorder is built in during growth from the melt.

HEAT CAPACITY OF ORDERED AND DISORDERED COPPER-PLATINUM BELOW 4.2°K, by J. Rayne and B. Roessler. [1965] [4]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1029 and National Science Foundation) Unclassified

An earlier investigation (J. Rayne, Phys. Rev., v. 108: 649, 1957) of the low-temperature heat capacity of Cu_3Au showed no difference in the electronic specific heat coefficient between the ordered and disordered conditions. But due to the unusual nature of the order-disorder transformation in copper-platinum, the present investigation was conducted. Results show that there is a large decrease in the value of the specific heat coefficient for the ordered alloy compared to that of the disordered alloy. An increase in the Debye temperature on ordering is observed which is consistent with that observed in Cu_3Au. The decrease in the value of the specific heat coefficient which is observed in ordered copper-platinum may be due to magnetic ordering, either ferromagnetic or antiferromagnetic; it may also be due to the Brillouin zone-Fermi surface interaction.

ROLLING BALL VISCOMETER FOR USE AT TEMPERATURES TO 400°C UNDER PRESSURES TO 5 KILOBAR, by D. E. Harrison and R. B. Gosser. [1965] [4]p. incl. diagrs. tables. (AF 49(638)1029) Unclassified

Published in Rev. Scient. Instr., v. 36: 1840-1843, Dec. 1965.

In an earlier publication, one of the authors (Jour. Chem. Phys., v. 41: 844, 1965) gave data on the pressure dependence of the viscosity of liquid selenium up to 350°C and at 4 kbar. This paper describes the rolling ball viscometer in detail and gives data on the pressure dependence of the viscosity of glycerol at 75°C up to 5 kbar pressure. The rolling ball technique of measuring viscosity was adapted for use at temperatures up to 400°C under pressures up to 5 kbar. At 75°C, $\log_{10}$ viscosity of glycerol was found to increase linearly with pressure up to 5 kbar.

[THERMAL CONDUCTIVITY AND THERMOELECTRIC POWER OF SOLIDS AT LOW TEMPERATURES, by P. G. Klemens.] Final rept. June 1, 1962-May 31, 1965, 8p. (AFOSR-65-1485) (AF 49(638)1165) AD 620270 Unclassified

Thermal conductivity and thermoelectric power of solids were investigated at low temperature. Photon-assisted scattering of electrons by the impurity atoms was first studied and the electrical resistivity of a number of gold alloys was measured from 2 to 401°K. Experiments demonstrated the reality of resistance due the phonon-assisted inelastic impurity scattering and verified the theoretical magnitude and temperature dependence of the effect. Alloys having localized lattice modes were considered and a precise determination of the temperature dependence of the electrical resistivity of gold is given. Electrical and thermal conductivities and thermoelectric power were studied in the semi-metals of tin-telluride and platinum-antimonide. The role of resonance scattering of phonons in the thermal conductivity of glasses is discussed.

ELECTRICAL RESISTIVITY OF SOME GOLD ALLOYS: A SEARCH FOR EFFECTS DUE TO LOCAL MODES, by D. H. Damon and P. G. Klemens. [1965] [5]p. incl. diagrs. tables, refs. (AFOSR-65-1993) (AF 49(638)1165) AD 628863 Unclassified

Also published in Phys. Rev., v. 138: A1390-A1394, May 31, 1965.

If phonon-assisted electron scattering by impurities contributes appreciably to the electrical resistivity of alloys, localized modes about light impurities should lead to a resistance which increases faster than linearly at temperatures around $\theta_0/2$, where θ_0 is the characteristic temperature of the local mode. The electrical resistivity of gold alloys containing 1.8 at-% Zn, 2.4 at-% Al and 2.6 at-% Cu was measured between 80° and 500°K. In these cases local modes are expected. Measurements were also made of alloys with 1.0 and 1.6 at-% Pt, where local modes should be absent. Substantial deviations from Matthiessen's rule were found, but not the temperature variation expected from local modes. It is suggested that this effect is obscured by deviations from Matthiessen's rule arising from the zone structure of gold. An unexplained discrepancy was found in the resistance of the 1.6% Pt alloy. The resistivity of pure gold between 80° and 480°K is tabulated in 20° steps.

SPIN-LATTICE RELAXATION OF ATOMIC HYDROGEN IN CaF_2 INVOLVING LOCAL MODES, by P. G. Klemens. [1965] [2]p. (AFOSR-65-1994) (AF 49(638)1165) AD 626860 Unclassified

Also published in Phys. Rev., v. 138: A1217-A1218, May 17, 1965.

The spin-lattice relaxation of atomic hydrogen and deuterium in CaF_2 measured previously (Phys. Rev., v. 138: A1208, 1965) shows an exponential dependence, which is ascribed to a Raman process involving local modes. The magnitude of the pre-exponential factor can be compared to the ordinary Raman process for these centers, which was also observed. This ratio is compared with the predictions of the author's theory of spin-lattice relaxation involving local modes. It appears that the theory overestimates the effect of

local modes on spin-lattice relaxation by a factor of order 5. This may arise from a comparable error in the theoretical estimate of the decay rate of a local mode by anharmonic processes, which enters the expression for the spin-lattice relaxation rate. Other possible sources of error are also discussed.

EFFECT OF THERMAL AND PHONON PROCESSES ON ULTRASONIC ATTENUATION, by P. G. Klemens. [1965] [34]p. incl. refs. (AFOSR-66-1556) (AF 49(638)1165) AD 638698 Unclassified

Also published in Physical Acoustics, ed. by W. P. Mason, New York, Academic Press, v. IIIB: 201-234, 1965.

Ultrasonic and hypersonic waves in a solid are, in principle, the same in nature as the lattice waves which describe the thermal vibrations of the solid. Apart from a difference in frequency the main difference is one of how the properties of these waves are studied. The former are available as coherent beams, the latter are only a background of noise. The attenuation of the ultrasonic beam can be studied directly, but the attenuation or scattering of a lattice wave must be induced from observed conduction properties.

DIFFUSION OF ELECTRONS ON THE FERMI SURFACE II. LONGITUDINAL MAGNETORESISTANCE OF Ib METALS, by P. G. Klemens and J. L. Jackson. [1965] [7]p. (AFOSR-66-1602) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1165, Nederlandse Organisatie voor Zuiver Wetenschappelijk, Stichting voor Fundamenteel Onderzoek der Materie, and Westinghouse Academic Leave Program) AD 638699 Unclassified

Also published in Physica, v. 31: 1421-1427, 1965.

Following Pippard's method, the longitudinal high-field magnetoresistance is discussed in terms of belts on the Fermi sphere on which the deviation of the electron distribution from equilibrium must vanish. For the ideal resistance case the electron diffusion equation is solved with appropriate boundary conditions for a number of directions and neck radii, and the magnetoresistance is insensitive to the neck radius. The profound effect of dislocations on the magnetoresistance is pointed out.

INELASTIC IMPURITY SCATTERING OF ELECTRONS IN GOLD ALLOYS AT LOW TEMPERATURES, by D. H. Damon and P. G. Klemens. [1965] [5]p. incl. diagrs. table. (AFOSR-66-1651) (AF 49(638)1165) AD 639875 Unclassified

Also published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LTS(Pt. B): 996-1000, 1965.

The electrical resistivity of some binary gold alloys with copper and platinum was measured from 1.5° to 40°K, in order to study deviations from Matthiessen's rule and to investigate a possible contribution of phonon-assisted impurity scattering to the resistance. This process was originally suggested by Koshino, who ascribed it to the perturbing effect of the displacement of the impurity potential by a lattice wave. This was critizied by Taylor who showed that the displacement perturbation could be transformed away, leaving only a small residual effect on the resistivity. However, there is a further effect arising from the strain on the impurity site due to a lattice wave, which should also lead to phonon-assisted scattering, and to an additional resistance of the form $\rho_i = A \quad \epsilon^2 = \beta(T)$. where ρ_0 is the residual resistivity, A a numerical constant, and $<\epsilon^2>$ the mean square thermal strain, so that $\beta(T) \alpha T^4$ at low temperatures.

ANHARMONIC ATTENUATION OF LONGITUDINAL HYPERSONIC WAVES (Abstract), by P. G. Klemens. [1965] [1]p. [AF 49(638)1165] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 393, Mar. 24, 1965.

Momentum-conservation requirements forbid a direct 3-phonon interaction between a longitudinal ultrasonic wave and thermal phonons. Nevertheless, the low-temperature anharmonic attenuation of longitudinal waves is observed to be comparable to that of transverse waves. A mechanism is proposed whereby the longitudinal wave interacts with modes of comparably low frequency and over-populates these modes, thereby speeding up the interaction. This leads to an absorption that depends on intensity and pulse repitition rate and approaches that of transverse waves in the high-intensity limit. The results of the theory are compared with experiments on quartz by J. de Klerk and D. I. Bolef.

MIGRATION OF A LIQUID ZONE THROUGH A SOLID. PART III, by W. A. Tiller. [1965] [3]p. incl. diagrs. (AFOSR-65-1998) (AF 49(638)1177) AD 627557 Unclassified

Also published in Jour. Appl. Phys., v. 36: 261-263, Jan. 1965.

A theoretical analysis of the migration of a liquid zone through a solid is extended to include nonconservative systems where atoms are exchanged between the liquid zone and the environment. It applies to both evaporation and condensation of either the solute or the solvent species. When the vapor exchange is such as to increase or decrease the liquid temperature of the zone, the zone migration velocity increases or decreases, respectively, in a linear manner with zone size. For certain conditions it is possible to produce a zone of constitutionally supercooled liquid ahead of the freezing interface. The migration rates of gallium alloy zones through GaAs are quantitatively consistent with this treatment.

ANOMALOUS TRANSMISSION OF X-RAYS IN Fe-3% Si CRYSTALS AND THE OBSERVATION OF FERROMAGNETIC DOMAINS (Abstract), by B. Roessler, J. J. Kramer, and M. Kuriyama. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)1177] and Advanced Research Projects Agency) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 471-472, Apr. 26, 1965.

Large sheet crystals of an iron-3% silicon alloy were grown by the surface-energy-induced recrystallization technique. These crystals, with a {100} surface, were found to anomalously transmit x-rays, revealing both dislocations and ferromagnetic domains along <100> directions. The domain structure could be made to disappear in the presence of a magnetic field and to reappear when the field was removed. The surface domain pattern, as revealed by colloidal magnetite powder patterns, was considerably different from that observed by the x-ray technique.

DISLOCATION ARRANGEMENTS IN ZINC TUNGSTATE, by S. O'Hara, G. M. McManus, and B. Roessler. [1965] [6]p. incl. illus. diagr. refs. (AF 49(638)1177) Unclassified

Published in Jour. Appl. Phys., v. 36: 2898-2903, Sept. 1965.

Dislocation in low dislocation density ($\sim 10^2 cm^{-2}$) single crystals of $ZnWO_4$ have been analyzed by the application of standard etching techniques and by Borrmann and Berg-Barrett x-ray diffraction techniques. The majority of dislocations lying on the (010) slip planes were found to have [100] Burgers vectors, while the remainer had [001] vectors. Dislocations lying on the (100) plane had predominantly [001] Burgers vectors; dislocations with [010] Burgers vectors were present, but uncommon. In Borrmann photographs, dislocations, close to the exit surface of the crystal gave images of increased rather than decreased intensity. The effect of the oxygen atom positions on the intensities of the anomalously transmitted x-ray beams was shown to be significant in $ZnWO_4$. Also, impurity segregation, which was revealed in both transmission optical and x-ray photographs, indicates that facetting occurred on a convex growth interface.

EPITAXY IN THIN FILMS OF EuS, by C. W. Chen and S. Zeitman. [1965] [2]p. incl. table, refs. (AF 49(638)1245) Unclassified

Published in Jour. Appl. Phys., v. 36: 669-670, Feb. 1965.

It is stated that for measurement of the magnetic and electrical properties of europium sulfide, large single crystals are necessary. The chemical and physical properties of the sulfide, however, make it a difficult task to grow crystals directly from the melt. This note reports the excellent properties of EuS for epitaxial growth. Experimental results show that single-crystalline films were grown epitaxially upon the (100) cleavage surface of single-crystal substrates of NaCl, NaBr, and MgO and upon the (111) cleavage surface of CaF_2. An important characteristic of the epitaxial growth of EuS is stated to be one-to-one correspondence in the growth mode. It was also found that (110) films of EuS can be grown upon artifically prepared (110) surfaces of CaF_2 crystals.

GROWTH AND CHARACTERIZATION OF SINGLE CRYSTALS OF RARE EARTH COMPOUNDS. [1965] [9]p. incl. diagr. (Technical rept. no. 7) (AF 49(638) 1245) AD 614435 Unclassified

The spin disorder effect on scattering of the conduction electrons was examined together with the increases in the residual resistivity of Gd observed in various intra-rare earth alloys. It was found that the extrapolated values of the spin-disorder resistivity reported in the literature were much too small to account for the inelastic scattering with spin flip. This large discrepancy between the calculated and extrapolated value of spin-disorder resistivity has heretofore been overlooked. It may imply the existence of short-range order of spins in the paramagnetic state at temperatures considerably higher than the Curie point. Resistance measurements were conducted on a polycrystalline sample of Si-doped $CrBr_3$. The electrical data revealed that the compound became a semiconductor only in the paramagnetic state. Below the Curie temperature it remained an insulator. The excess electrons donated by the Si atoms in $CrBr_3$ thus behave markedly differently from those donated by La in EuS. Experimental work was continued on the growth of crystals of La-doped EuS. An investigation was begun on Ba-doped NdS. Further progress was made in the study of the magnetic structures of the solid solutions of CrTe and CrSb.

GROWTH AND CHARACTERIZATION OF SINGLE CRYSTALS OF RARE EARTH COMPOUNDS. [1965] 8p (Technical rept. no. 9) (49(638)1245) AD 622796 Unclassified

The electrical resistivities of the intra-rare-earth alloys of dysprosium have been determined at 4.2, 77°, and 296°K for a continued study of the impurity scattering of the conduction electrons. The resistivity data reveal that substitution of La, Ce, Pr, Nd, and Sm in Dy leads to considerable increases in the residual resistivity of Dy at low temperatures, but the increases, disappear at 296°K. The impurity-induced resistivities are predominantly due to the exchange scattering of the electrons via the Ruderman-Kittel type exchange interaction between the 4f and conduction electrons. The exchange scattering is shown to depend only on the difference between the atomic spins of the solvent and solute ions, with the spin-orbit coupling playing an insignificant role. Neutron diffraction studies of the CrTe-CrSb solid solutions have revealed the formation of a canted spin structure in the pseudo-binary system with cosine of the cant angle varying as a linear function of the composition.

SURFACE CONTRIBUTION TO THE SPECIFIC HEAT OF CRYSTALS AT LOW TEMPERATURES, by A. A. Maradudin and M. Ashkin. [1965] [4]p. (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under AF 49(638)1245) Unclassified

Published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio, (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9(Pt. B) 1126-1129, 1965.

A lattice dynamical calculation of the low-temperature specific heat of a crystal possessing free surfaces is presented. A pair of adjacent free surfaces is created in a nearest and next-nearest neighbor central force model of a simple cubic crystal by setting all atomic interactions which link to 2 planes equal to zero. The negatives of these interactions are treated as a perturbation on the Hamiltonian of the uncut crystal. The change in the specific heat of the crystal resulting from the introduction of the pair of free surfaces is expressed as a contour integral over the Green's function of the perturbed crystal. In the limit of low temperatures, only the long wavelength components of the Fourier transform of the Green's function are required, and these can be evaluated analytically if the relation on the atomic force constants which corresponds to elastic isotropy is imposed. The result for the surface contribution to the specific heat C_s has the form $C_s = bST^2$, where S is the surface area, T is the absolute temperature, and b is a numerical constant. The value for b obtained in the present calculation differs somewhat from the value obtained earlier by Dupuis, Mazo, and Onsager, who studied a semi-infinite isotropic elastic continuum.

HIGH-INTENSITY LIGHT SOURCES FOR THE EXCITATION OF RESONANCE FLUORESCENCE IN POTASSIUM AND RUBIDIUM (Abstract), by R. J. Atkinson, G. D. Chapman, and L. Krause. [1965] [1]p. (AFOSR-65-0408) [AF AFOSR-63-361] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Also published in Bull. Amer. Phys. Soc., Series II, v. 10: 49, Jan. 27, 1965.

A description is given of 2 RF light sources that produce intense potassium and rubidium resonance radiation. Their properties have been systematically investigated in relation to their operating parameters. A comparison is made with 2 commercially available lamps (Osram and Varian) with respect to integrated intensity, peak intensity, half-width, and degree of self-reversal of the resonance lines. It is found that the RF sources, developed in this laboratory, emit resonance lines of significantly higher peak intensities, smaller half-widths, and smaller self-reversal than those produced by the other lamps. Typical half-widths of the potassium and rubidium D lines, produced by the lamps, are 0.15 and 0.37 cm^{-1}, respectively, compared with the corresponding half-widths of 0.34 and 1.5 cm^{-1}, respectively, emitted by the Osram lamps.

TRANSFER OF EXCITATION IN COLLISIONS BETWEEN CAESIUM ATOMS (Abstract), by M. Czajkowski and L. Krause. [1965] [1]p. (AFOSR-65-0409) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-361] and National Research Council of Canada) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Also published in Bull. Amer. Phys. Soc. Series II, v. 10: 49, Jan. 27, 1965.

The cross sections for the transfer of excitation between $6^2P_{1/2}$ and $6^2P_{3/2}$ resonance states in cesium, induced by inelastic collisions with cesium atoms in the ground state, have been determined using the method of sensitized fluorescence. The experiments were carried out at cesium-vapor pressures in the range of 10^{-6} - 10^{-4} Torr, where multiple scattering of resonance radiation is no longer effective. The fluorescence was excited with 1 component of the resonance doublet at a time, and the 2 components present in the fluorescent spectrum were separated by means of interference filters, detected with an ITTFW118 photomultiplier and recorded using photon-counting techniques. The total cross sections for the processes $^2P_{1/2} \rightarrow {}^2P_{3/2}$ and $^2P_{1/2} \rightarrow {}^2P_{3/2}$ are 6.5×10^{-14} and 2.0×10^{-13} cm^2, respectively, compared with the values of 6×10^{-16} and 1.3×10^{-15} cm^2 obtained by Seiwert, who corrected experimental results obtained at higher vapor pressures, using a modified Holstein theory of radiation diffusion. The reported results are consistent with those previously obtained for similar processes in potassium and rubidium.

EXCITATION TRANSFER BETWEEN THE $^2P_{1/2}$ AND $^2P_{3/2}$ RESONANCE LEVELS IN ALKALI ATOMS INDUCED BY INELASTIC OLLISIONS, by G. D. Chapman, M. Czajkowski and others. [1965] [5]p. incl. diagrs. table, refs. (AFOSR-65-2060) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-361 and National Research Council of Canada) AD 627629 Unclassified

Also published in Fourth Internat'l. Conf. on Physics of Electronic and Atomic Collisions: Abstracts of Papers, Laval U., Quebec (Canada) (Aug. 2-6, 1965), New York, Science Bookcrafters, Inc. [1965] p. 55-59.

Experiments are reported in which a determination is made of the total cross sections for collisions of the second kind leading to transfer of excitation between $^2P_{1/2}$ and $^2P_{3/2}$ resonance levels in potassium, rubidium, and cesium. These transitions give rise to sensitized fluorescence which may be observed when alkali vapor at low pressure, either pure or in the presence of an inert gas, is irradiated with one component of the resonance doublet. Sensitized fluorescence also results if inert gas atoms take part in the collisions instead of the alkali atoms in the ground state. The arrangement of apparatus used in these experiments is shown. Results are plotted and tabulated.

Collisions of the second kind leading to the transfer of excitation between $6^2P_{1/2}$ and $6^2P_{3/2}$ states in cesium have been investigated by studying sensitized fluorescence in cesium vapor at pressures in the range 2×10^{-6} to 7×10^{-5}mm Hg, which were not accessible previously to such experiments and at which trapping of resonance radiation is virtually absent. The use of an improved fluorescence tube and of high-resolution interference filters in conjunction with a liquid-air-cooled photomultiplier tube permitted accurate measurements of extremely low fluorescent light intensities. The total cross sections for the processes $6\,^2P_{1/2} \rightarrow 6^2F_{3/2}$ and $6\,^2P_{1/2} \rightarrow 6\,^2P_{3/2}$ equal 0.64×10^{-15} cm^2 and 3.1×10^{-15} cm^2 respectively and are in a ratio of 0.20, which agrees well with the value predicted by the principle of detailed balancing. SENSITIZED FLUORESCENCE IN VAPORS OF ALKALI METALS IV. ENERGY TRANSFER IN RUBIDIUM-RUBIDIUM COLLISIONS, by A. G. A. Rae and L. Krause. [1965] [15]p. incl. diagrs. tables, refs. (AFOSR-65-2861) (AF AFOSR-65-361) AD 628744 Unclassified

Also published in Canad. Jour. Phys., v. 43: 1574-1588, Sept. 1965.

Sensitized fluorescence in rubidium vapor has been investigated in order to determine total cross sections for collisions of the second kind between rubidium atoms, leading to the transfer of excitation between the $5^2P_{1/2}$ and $5^2P_{3/2}$ resonance levels. The experiments were carried out at vapor pressures below 0.00001 mm Hg, where there is virtually no imprisonment of resonance radiation. The exceedingly low fluorescent intensities were registered in an automatically programmed sequence of measurements, using photon counting techniques. (Contractor's abstract modified)

A description is given of radio frequency light sources which produce potassium and rubidium resonance radiation of high intensity. The properties of the spectral lamps have been systematically investigated in relation to their operating parameters. The rf lamps emit resonance lines of much higher peak intensities, smaller halfwidths and smaller degrees of self-reversal than do commercially available lamps. Typical half widths of the resonance lines of potassium and rubidium produced by the rf sources were found to be 0.15/cm and 0.37 cm^{1}, respectively, compared with the corresponding widths of 0.34/cm and 1.5 cm^{-1} respectively, emitted by Osram spectral lamps operated at low currents. SURFACE STUDIES BY SLOW ELECTRON DIFFRACTION, by M. B. Webb. Final rept. [1965] 45p. incl. diagrs. table, refs. (AFOSR-65-2726) (AF AFOSR-63-51) AD 628026 Unclassified

The low energy electron diffraction from the surface of silver and its temperature dependence have been measured. From measurement of the Debye-Waller factor, it has been determined that the mean square thermal displacement normal to the surface of the surface atoms is 2.0 ± 0.2 times that for the bulk atoms and that this excess amplitude falls to the bulk value approximately as e^{-n} where n indexes the atomic plane. These results agree with the model calculations. However, these experiments indicate the excess thermal amplitude is nearly isotropic in disagreement with simple arguments and model calculations. This discrepancy may be due to non-ideal experimental surfaces. The diffuse scattering in the vicinity of the diffraction maximum has been identified as the thermal diffuse scattering. The expected thermal diffuse scattering for low energy electrons is calculated for a simple model. Experiments show the angular dependence, temperature dependence, dependence on the diffraction vector and the integrated intensity are those expected. The temperature measurements lead to independent determinations of the penetration of the electrons into the crystal. The penetration may be described by a linear absorption coefficient which is approximately proportional to the electron energy to the minus one-half power for energies between 50 and 300 e.v. The measurement of the diffuse scattering leads to the possibility of measuring the angular dependence of the atomic structure factor.

TEMPERATURE DEPENDENCE OF THE LOW-ENERGY ELECTRON DIFFRACTION FROM SILVER (Abstract), by E. R. Jones, J. T. McKinney, and M. B. Webb [1965] [1]p. [AF AFOSR-63-51]
Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 324, Mar. 24, 1965.

The low-energy electron diffraction from (111) surfaces of silver has been studied. The apparatus uses both visual and Faraday cage detection. The diffraction maxima generally broaden from the instrumental limit of 1/2° to a few degrees colatitude going from 300° to 600°K. The broadening is not observed for (0h) reflections from the best crystals. The intensity decreases exponentially. Since the shape is changing, it is not straightforward to extract Debye-Waller factors, but to summarize the data, apparent Debye temperatures from 130° to 158°K are observed. Under the peaks, there are $1/\theta$ wings, which we suggest are the surface thermal diffuse scattering. They become relatively more intense with increasing temperature, as expected within experimental accuracy. For diffraction from a 2-dimensional array, at any point in reciprocal space there will be contributions to the scattering from all those phonons with wave vectors reaching the reciprocal lattice rod. This gives, for a Debye spectrum at high temperatures, a $1/\theta$ dependence instead of the usual $1/\theta^2$.

MECHANISMS OF TRANSGRANULAR STRESS CORROSION CRACKING OF SOLID SOLUTION ALLOYS, by N. Ohtani and R. A. Dodd. [1965] [12]p. incl. illus. diagrs. table, refs. (AFOSR-65-1903) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-221 and American Chemical Society) AD 625554 Unclassified

Also published in Corrosion, v. 21: 161-172, May 1965.

Effects of structure and electrochemical properties on transgranular stress corrosion susceptibility of various copper and silver alloys and austenitic stainless steels are examined. Results suggest that the alloys be classified in 3 groups according to their postulated mode of failure: (1) Those of the (base solvent) (noble solute) type, e.g., Cu(Au), Cu(Pt), Cu(Pd), single crystals which are generally very susceptible to stress corrosion cracking, due to solute diffusion to dislocations and the accompanying local galvanic corrosion; (2) Those of the (base solvent) (base solute) type, e.g., Cu(Zn), which are not very susceptible to stress corrosion cracking when in single crystal form and in the particular environments studied; transgranular

cracking in polycrystals is believed to be mechanical in nature; and (3) Austenitic stainless steels, transgranular stress corrosion susceptibility of which may be due to nucleation of σ phase at stacking faults, or to formation of passive surface films, or to a combination of both effects, thus; unlike (1) and (2) above, the stress corrosion behavior of these alloys may depend on stacking fault energy. MECHANISM OF STRESS CORROSION CRACKING IN FACE-CENTERED-CUBIC METALS, by R. A. Dodd. Final technical rept. [1965] 4p. (AFOSR-65-2702) (AF AFOSR-83-221) AD 628085 Unclassified

The work was designed firstly to examine the possibility of the existence of a universal mechanism of transgranular stress corrosion cracking, originally postulated by Robertson and Tetelman, and later, when such a mechanism was substantially disproved, to examine possible cracking mechanisms in various alloy systems of interest. The experimental techniques employed included the determination of times to complete fracture under stress corrosion conditions, potentiostatic studies of polarization phenomena, etc., and electron microscope investigations of dislocation configurations and estimates of the related stacking fault energies.

LEWIS ACID ADDUCTS OF GROUP IV-A AZIDES, by J. S. Thayer and R. West. [1965] [2]p. incl. diagr. tables, refs. (AFOSR-65-0533) [AF AFOSR-62-244] AD 613920 Unclassified

Also published in Inorg. Chem., v. 4: 114-115, Jan. 1965.

The previous isolation of complexes having the formula $(C_6H_5)_3MN_3 \cdot P(C_6H_5)_3$ [3-5] and the lability of $(CH_3)_3SiN_3$ in the presence of $AlCl_3$ suggested that group IV-A azides might act as Lewis bases. It was found that the Lewis acids $SnCl_4$, BBr_3 and Sb_{15} form stable 1:1 adducts with azides of Si, Ge, and Sn. All of the complexes isolated, except for $CH_3(C_6H_5)_2SiN_3 \cdot BBr_3$ were white solids that decomposed without melting. They dissolve without appreciable dissociation in dichloromethane, chloroform, carbon tetrachloride, and benzene; contact with water, alcohols, or acetone causes immediate decomposition. Azide band positions in the complexes differ markedly from those of the free azides. In addition, all silyl azide complexes show a strong band at about 980/cm^{-1} not present in other complexes.

THE RADICAL ANION OF DODECAMETHYLCYCLOHEXASILANE, by G. R. Husk and R. West. [1965] 2p. incl. table, and refs. (Air Force Office of Scientific Research under [AF AFOSR-62-244] and Atomic Energy Commission) Unclassified

Published in Jour. Amer. Chem. Soc., v. 87: 3993-3994, Sept. 5, 1965.

The discovery of radical anions of saturated systems led into the investigation of the possibilities of radical-anion formation from alkylpolysilanes. In these experiments the low-lying d orbitals played an important role in accepting electrons. The reduction of dodecamethylcyclohexasilane gave a paramagnetic species. It is suggested from the e.s.r. spectrum that the unpaired electron was delocalized over all six silicon atoms.

THE MOLECULAR STRUCTURE OF A TRICYCLIC COMPLEX, $[SFe(CO)_3]_2$, by C. H. Wei and L. F. Dahl. [1965] 11p. incl. diagrs. tables, refs. (AFOSR-65-0681) (AF AFOSR-64-516) AD 615676 Unclassified

Also published in Inorg. Chem., v. 4: 1-11, Jan. 1965.

A 3-dimensional single-crystal x-ray determination of $[SFe(CO)_3]_2$ has revealed the first known example of a transition metal μ-dithio complex with a disulfide group symmetrically bonded to 2 iron tricarbonyl fragments. The structure thereby respresents a new type of transition metal carbonyl complex in which 2 fonding metals and 2 nonmetal bridging groups are fused along the bridged atoms to give a heterotricyclic system containing 4 three-membered rings. The compound contains 2 dimeric molecules in a triclinic unit cell. An analysis of the structure and bonding of $[SFe(CO)_3]_2$ is given and a comparison of its molecular configuration with that of $[C_2H_5SFe(CO)_3]_2$ is made. (Contractor's abstract)

A NEW TYPE OF CYCLIC TRANSITION METAL COMPLEX, $[Ni(SC_2H_5)_2]_6$, by P. Woodward, L. F. Dahl and others. [1965] [3]p. incl. diagr. (AFOSR-67-0724) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-518 and Sloan Foundation) AD 649136 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 5251-5253, Nov. 20. 1965.

This paper reports the structure and sterochemistry of a nickel mercaptide hexamer which has been definitely established by a single-crystal x-ray analysis as the first representative of a new type of transition metal cluster. The crystals are monoclinic with twelve $Ni(SC_2H_5)_2$ species in a unit cell of dimensions a = 12.32, b = 16.10, c = 11.76A., β = 101°00, and of space group symmetry $P2_1/n$. Solid bis(ethylthio)nickel(II) consists of cyclic hexamers. The six nickel(II) atoms form a regular planar hexagon by linkage with twelve symmetrically bridging mercaptan groups. Pairs of sulfur atoms are uniformly situated above and below the plane of the nickel ring, but equidistant from each pair of adjacent nickel atoms so as to give each similarly coordinated nickel (II) an approximately square-planar environment of four sulfur atoms. The hexanuclear nickel complex can be considered to arise from the intersection of these planes of sulfur atoms at the nonbonded S-S edges with a dihedral angle of 120°. Within experimental error the nickel and four surrounding sulfur atoms are coplanar; the presumably nonbonded Ni-Ni distances around the hexagon are all equivalent and the Ni-S bond distances likewise. The Ni-S-Ni and S-Ni-S angles in the fragment are all about 83°.

THREE-DIMENSIONAL CRYSTAL STRUCTURE OF BENZENECHROMIUM TRICARBONYL WITH FURTHER COMMENTS ON THE DIBENZENECHROMIUM STRUCTURE, by M. F. Bailey and L. F. Dahl. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-67-0725) (AF AFOSR-64-518) AD 649138 Unclassified

Also published in Inorg. Chem., v. 4: 1314-1319, Sept. 1965.

As part of a systematic investigation of possible threefold distortion of arene rings on π-bonding to chromium, a 3-dimensional single crystal x-ray analysis of benzenechromium tricarbonyl, $C_6H_6Cr(CO)_3$, has been carried out. Crystals of benzenechromium tricarbonyl contain 2 molecules in a monoclinic unit cell of symmetry $P2_1/m$ and dimensions a = 6.17 ± 0.02 A, b = 11.07 ± 0.04 A, c = 6.57 ± 0.02 A., and β = 101.5 ± 0.1°. A final anisotropic least-squares refinement with the hydrogen atoms included in the structure factor calculations has resulted in discrepancy factors of R_1 = 4.2% and R_2 = 4.1% for 518 observed reflections. Benzenechromium tricarbonyl possesses essentially C_{3v} molecular symmetry in agreement with the approximate molecular structure obtained from previous two-dimensional x-ray work. The π-bonded benzene ring, however, shows no significant distortion from the sixfold (D_{6h}) symmetry of free benzene, which is indicative of a completely delocalized benzene-chromium interaction. A comparison of the molecular parameters of benzenechromium tricarbonyl, hexamethylbenzenechromium tricarbonyl, and dibenzenechromium is made, and the crystallographic isomorphism of $C_6H_6Cr(CO)_3$ and $C_4H_4SCr(CO)_3$ is discussed. (Contractor's abstract)

STRUCTURE OF THIOPHENECHROMIUM TRICARBONYL, $C_4H_4SCr(CO)_3$, by M. F. Bailey and L. F. Dahl. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-67-0726) (AF AFOSR-64-518) AD 649141 Unclassified

Also published in Inorg. Chem., v. 4: 1306-1314, Sept. 1965.

A three-dimensional x-ray analysis of $C_4H_4SCr(CO)_3$ has revealed a 3-fold orientation disorder of the thiophene ring. The crystals contain 2 molecules in a unit cell of symmetry $P2_1/m$ and dimensions a = 6.06 ± 0.02 A, b = 10.79 ± 0.03 A, c = 6.65 ± 0.02 A, and β = 102.2 ± 0.1°. Fourier syntheses and an isotropic rigid-body least-squares refinement based on a disordered model, in which the thiophene rings are randomly distributed in one of 3 orientations, have yielded an unweighted discrepancy factor of 13.2% for 653 observed reflections. The molecular configuration with the thiophene sulfur atom always trans to one of the

3 carbonyl groups is invarient to the crystalline disorder. However, the disordered structure has made impossible a detailed comparison of the molecular parameters of the metal-complexed thiophene with those of "free" thiophene. A comparison of the crystal structures of $C_4H_4SCr(CO)_3$ and $C_6H_6Cr(CO)_3$ is given.

Wisconsin U. Dept. of Chemistry, Madison.

CRYSTAL STRUCTURE OF A 1: 1 MIXTURE OF TWO IRON CARBONYL SULFUR COMPLEXES, $S_2Fe_3(CO)_9$ AND $S_2Fe_2(CO)_6$, by C. H. Wei and L. F. Dahl. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-67-0727) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-518 and Atomic Energy Commission) AD 649142 Unclassified

Also published in Inorg. Chem., v. 4: 493-499, Apr. 1965.

The structure of $[S_2Fe_3(CO)_9]$ $[S_2Fe_2(CO_6]$ (previously formulated incorrectly as $S_2Fe_3(CO)_9$) has been determined by x-ray diffraction. Three-dimensional isotropic least-squares refinement of all atoms yielded a final unweighted reliability index of $R_1 = 8.9\%$. The crystals contain four formula species in an orthorhombic unit cell of dimensions a = 13.23 ± 0.01 A., b = 11.08 ± 0.01 A., c = 17.95 ± 0.01 A. and of symmetry Pnma. The structure consists of an ordered array of 2 different molecular species of formulas $S_2Fe_3(CO)_9$ and $S_2Fe_2(CO)_6$, both which possess crystallographic C_8-m symmetry. The molecular configuration of the $S_2Fe_2(CO)_6$ molecule is in close agreement with that of triclinic $S_2Fe_2(CO)_6$, prepared by the Hieber-Gruber reaction. The $S_2Fe_3(CO)_9$ molecule is found to be a conformer of the isomorphous Hieber-Gruber compounds $X_2Fe_3(CO)_9$ (X = S, Se).

Wisconsin U. Dept. of Chemistry, Madison.

THE STRUCTURE OF HEXAMETHYLBENZENECHROMIUM TRICARBONYL WITH COMMENTS ON THE DIBENZENECHROMIUM STRUCTURE, by M. F. Bailey and L. F. Dahl. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-67-0741) (AF AFOSR-64-519) AD 648890 Unclassified

Also published in Inorg. Chem., v. 4: 1298-1306, Sept. 1965.

The controversy concerning the molecular symmetry of dibenzenechromium has a three-dimensional x-ray investigation of the molecular configuration of hexamethylbenzenechromium tricarbonyl, $(H_3C)_6C_6Cr(CO)_3$, which has produced results pertinent to the nature of arene complexes. Hexamethylbenzenechromium tricarbonyl crystallizes with 8 molecules in an orthorhombic unit cell of symmetry Pbca and dimensions a = 13.67 ± 0.03 A, b = 13.53 ± 0.03 A, and c = 15.27 ± 0.03 A. The structural determination including rigid-body analysis and anisotropic least-squares refinement has resulted in final discrepancy factors $R_1 = 10.5\%$ and $R_2 = 10.0\%$ for 1447 observed reflections. In each molecule the carbonyl groups occupy 3 trigonal coordination sites of the chromium atom; the hexamethylbenzene ring lies on the opposite side of the chromium atom, parallel both to the plane of the 3 oxygen atoms. The $Cr(CO)_3$ fragment is oriented such that (for a valence bond model with localized octahedral-type chromium orbitals) 3 assumed chromium orbitals (which can be delocalized in an MO formulation) point toward the midpoints of the alternate C-C bonds of the hexamethylbenzene ring. The methyl carbon atoms of the hexamethylbenzene ring are essentially coplanar with the benzene carbon atoms. The trigonal field of the $Cr(CO)_3$ moiety produces no evidence of a threefold distortion of the ring. Instead, a twofold deformation of both the benzene carbon and methyl carbon atoms is indicated which is attributable to asymmetric crystal forces and to a possible absence of the sixfold symmetry of the carbon skeletal structure in "free" hexamethylbenzene due to intramolecular steric interactions of the methyl groups. DIFFICULTY FACTORS AND THE USE OF r PHI by E. F. Borgatta. [1965] [17]p. diagrs. tables. (AFOSR-66-0287) (AF AFOSR-62-16) AD 640202 Unclassified

Also published in Jour. Gen. Psychol., v. 73: 321-337, 1965.

In the utilization of factor analysis, one guideline that appears to occur often refers to the type of correlation coefficient (r_{phi}) utilized in the analysis. In particular, since the difficulties of items defined as dichotomous place restrictions on the magnitudes of correlations in computing r_{phi}, it has been assumed that utilization of such coefficients leads to spurious factors. Experience by the author with matrices that have involved dichotomies have not supported Fruchter's notion that "The phi coefficient (fourfold point correlation) should not be used unless some correction is made to avoid spurious factors due to differences in splits of the dichotomized variables." A direct empirical test is reported in which a principal-components solution, with all factors retained in the varimax rotation, was used. Extraction was stopped when the eigen-values became zero. The communality estimate is the square of the multiple-regression

coefficient. The paper demonstrates (in a complex factorial situation) the stability of factorial structures with changing difficulties of items and the fact that no difficulty factors can be found to develop. In one sector, however, it can be shown that differences in meaning and grouping of variables can arise by altering the cutting points of the variables utilized in these two factorial areas.

Also published in Pacific Jour. Math., v. 15: 1187-1219, 1965.

The homomorphisms φ of the group algebra $L^1(F)$ into the algebra M(G) of measures, where F and G are locally compact groups, has been completely determined when both groups are abelian by P. J. Cohen, and when G is compact and the homomorphism is norm decreasing and order-preserving by Glicksberg. In this paper the structure of norm decreasing homomorphisms φ is determined for arbitrary locally compact F and G. As an application the special structure of all norm decreasing homomorphisms mapping $L^1(F)$ onto $L^1(G)$. The analysis is effected by finding all multiplicative subgroups of the unit ball of measures on a locally compact group, for as we show, each extends to a norm decreasing homomorphism φ: M(F) → M(G), and is determined by the image under φ of the group of point masses on G, a multiplicative subgroup of the unit ball in M(G).

BOUNDARY PROPERTIES OF FUNCTIONS OF SEVERAL COMPLEX VARIABLES, by W. Rudin and E. L. Stout. [1965] [15]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-407 and National Science Foundation) Unclassified

Published in Jour. Math. and Mech., v. 14: 991-1005, Nov. 1965.

For every set S, let S^n be the n-fold cartesian product. Let U be the open unit disk in the complex plane C and let $T = \overline{U} - U$ be the unit circle. If Ω is open in C^n and $E \subset \overline{\Omega} - \Omega$, let $H(\Omega, E)$ be the algebra of continuous functions on $\Omega \cup E$ which are holomorphic on Ω. Define $A(U^n) = H(U^n, T^n)|T^n$. Of course, the restriction map $\rho: H(U^n, T^n) \to A(U^n)$ is bijective. Let m_p be the p-dimensional measure in T^n. The following theorem is proved. Let $a_1, \cdots, a_n$ be integers and let Ω be an open connected subset of C^n. Let the compact subset E of $\overline{\Omega} - \Omega$ be a D-set for the polynomials on C^n. Suppose that $(z_1, \cdots, z_n) \in E$ implies $(\lambda^{a_1} z_1, \cdots, \lambda^{a_n} z_n) \in \Omega$ if $\lambda \in U$ and $(\lambda^{a_1} z_1, \cdots, \lambda^{a_n} z_n) \in E$ if $\lambda \in T$. Take $f \in H(\Omega, E)$ such that $|f|$ is constant on the set $\{(\lambda^{a_1} z_1, \cdots, \lambda^{a_n} z_n) | \lambda \in T\}$ for every $(z_1, \cdots, z_n) \in E$; then f is rational. Polynomials M P, Q exist such that P and Q are coprime, $Q(z) \neq 0$ if $z \in \Omega$, $Q \cdot f = P$ on $\Omega \cup E$, and $M\overline{Q}|E = P|E$. If in addition $E \subset T^n$, then this theorem can be improved to: A monomial M and polynomials

Q, Q^* exist such that $\overline{Q^*(z_1, \cdots, z_n)} = Q(\bar{z}_1, \cdots, \bar{z}_n)$ and such that $Q \cdot f = R$ is a polynomial with $R(z_1, \cdots, z_n) = M(z_1, \cdots, z_n) \cdot Q^*\left(\frac{1}{z_1}, \ldots, \frac{1}{z_n}\right)$.

QUENCHING OF Na RADIATION BY He, by J. H. Stamper. [1965] [2]p. incl. diagr. (AFOSR-65-1950) (AF AFOSR-64-249) AD 629072 Unclassified

Also published in Jour. Chem. Phys., v. 43: 759-760, July 15, 1965.

According to Demtröder (Z. Physik, v. 166: 42, 1962) the effective cross section for the quenching of Na D resonance lines by He gas at a temperature of 200°C is 0.34×10^{-16} cm^2. This result contradicts those of previous researchers who found no such effect. An attempt is made to explain Demtröder's findings theoretically. The implications of this experiment are viewed with some skepticism and it is concluded that quenching the Na D lines was not accomplished to the extent reported.

ATOMIC INTERACTIONS OF MUONIUM, by R. M. Mobley, J. M. Bailey and others. [1965] [4]p. incl. diagrs. [AF AFOSR-64-249] Unclassified

Published in Fourth Internat'l. Conf. on Physics of Electronic and Atomic Collisions: Abstracts of Papers, Laval U., Quebec (Canada) (Aug. 2-6, 1965), New York, Science Bookcrafters, Inc. [1965] p. 194-197.

Powerful tools for the study of muonium are provided by the parity nonconservation in the weak interactions responsible for the decays of the pi meson and the muon. Thus from the decay of π^+ mesons, polarized positive muons with their spins oppositely directed to their momenta are produced; and in the decay of the positive muon into positrons and neutrinos, the positrons are emitted preferentially in the direction of the muon spin. With the availability of polarized muons and of a means for detecting the muon spin direction, magnetic-resonance-type experiments involving the muon and muonium can be performed. It has been learned that there is a shift in the muonium-hyperfine-structure interval due to collisions with other atoms. The direct interactions of muonium with various molecules can be studied by either detecting the reduction in the muonium resonance signal for the hfs transition in an external magnetic field caused by admixture of the molecules as impurities to the argon gas, or by measurement of the polarization of the muons as a function of time and of impurity concentration by use of a precision digital time analyzer following the scintillation counters for the positrons.

COLLECTIVE OSCILLATIONS IN A DENSE ELECTRON GAS CONTAINING A FIXED POINT CHARGE, by E. ... Sziklas. [1965] [13]p. incl. diagrs. refs. [AF AFOSR-64-249] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 116, Jan. 30, 1965.

Published in Phys. Rev., v. 138: A1070-A1082, May 17, 1965.

The collective excitations of a dense electron gas containing a fixed point charge with neutralizing positive background are investigated. A dielectric formulation, evaluated in a self-consistent-field approximation, yields a single-particle Schrödinger equation describing the collective modes. This equation has solutions belonging to the continuous spectrum (free plasmons) and to the discrete spectrum (bound plasmons). A cross section is derived for scattering of free plasmons by the point charge. The bound plasmon, representing a density wave trapped at the impurity site, has no counterpart in the uniform gas; it exists only for negative impurity charge and has an excitation frequency lying in the range $\omega_p/\sqrt{2} \leq \omega < \omega_p$, where ω_p is the plasma frequency. The bound plasmon appears to be a reasonably well-defined excitation with a lifetime $\sim 10^{-15}$ sec in metals. A simple hydrodynamic model provides further physical insight. The experimental detection of bound and free plasmons in metals and the relationship between surface plasmons, experimentally observed in many metals, and the predicted bound plasmon are discussed.

DETERMINATION OF THE RATIO $g_j(Rb^{85,87})/g_j(H)$ BY SPIN-EXCHANGE OPTICAL PUMPING (Abstract), by G. S. Hayne, E. S. Ensberg, and H. G. Robinson. [1965] [1]p. [AF AFOSR-64-249] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 28, Jan. 27, 1965.

The $\Delta F = 0$, $\Delta m_F = \pm 1$ transitions between ground-state Zeeman sublevels in optically pumped $Rb^{85,87}$ have been observed at about 7 and 14 G by monitoring the transmitted light. The dc magnetic field was stabilized by an optically pumped magnetometer, and lineshapes (width ~ 100 cps) were displayed by sweeping the center frequency of the frequency-modulated rf magnetic field. Corresponding Zeeman transitions in atomic hydrogen, which was admitted from a discharge through an aperture into the continuously evacuated

dotriacontane-coated Rb absorption cell, were detected through hydrogen-rubidium spin-exchange collisions. With the Breit-Rabi formula, the experimental frequencies led to the result $g_J(Rb^{85,87})/g_J(H) = 1 + (23.5 \pm 1.) \times 10^{-6}$. The theoretical value for this ratio is $1 + 3 \times 10^{-5}$. This result may be compared with Driscoll's measurement of g_J (Rb)/g_p, which combined with a value of $g_J(H)/g_p$ yields $g_J(Rb)/g_J(H) = 1 + (25 \pm 1) \times 10^{-6}$. Efforts to avoid possible systematic errors are discussed.

HYPERFINE STRUCTURE OF THE J = 1, v = 0 STATE IN $Rb^{87}F^{19}$ AND $Rb^{85}F^{19}$ (Abstract), by P. A. Banczyk and V. W. Hughes. [1965] [1]p. [AF AFOSR-64-249] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 101, Jan. 27, 1965.

Radiofrequency transitions between hfs levels of the J = 1, v = 0 state in $Rb^{87}F^{19}$ have been observed in near-zero electric field and zero magnetic field with a molecular-beam electric-resonance apparatus described earlier. The resolved transitions exhibit the natural linewidth of 1.4 kc/sec. Analysis of the spectra was done in accordance with a procedure previously described, except that the constant c_3 of the nuclear spin-spin tensor interaction is measured from the spectra. The results for the $Rb^{87}F^{19}$ hfs constants are $(eq_1Q_1) = -(34.0313 \pm 0.0010)$ mc/sec; $c_1 = +(1.595 \pm 0.050)$ kc/sec; $c_2 = +(10.51 \pm 0.08)$ kc/sec; $c_3 = +(3.16 \pm 0.18)$ kc/sec; $c_4 = +(0.66 \pm 0.10)$ kc/sec. Further analysis of similar $Rb^{85}F^{19}$ data allows a measurement of c_3 and a slightly better determination of measurements previously reported. The final results for the $Rb^{85}F^{19}$ hfs constants are $(eq_1Q_1) = -(70.3405 \pm 0.0004)$ mc/sec; $c_1 = +(0.525 \pm 0.010)$ kc/sec; $c_2 = +(10.53 \pm 0.07)$ kc/sec; $c_3 = +(0.93 \pm 0.05)$ kc/sec; $c_4 = +(0.23 \pm 0.06)$ kc/sec. The ratio of the electrical-quadrupole interaction constants is $(eq_1Q_1)^{85}/(eq_1Q_1)^{87} = +(2.06694 \pm 0.00006)$.

MODE COMPETITION AND FREQUENCY SPLITTING IN MAGNETIC-FIELD-TUNED OPTICAL MASERS, by R. L. Fork and M. Sargent, III. [1965] [2]p. incl. refs. [AF AFOSR-64-249] Unclassified

Published in Phys. Rev., v. 139: A617-A618, Aug. 2, 1965.

Equations are given describing the beat-frequency variation and mode competition in a gaseous optical maser operated in a magnetic field parallel to the maser axis. The equations include only lowest order nonlinear terms. Important terms in the amplitude- and frequency-determining equations are shown to arise from an induced atomic precession. These terms have a character similar to those describing the effects of selective depletion of the velocity distribution or "hole burning." It is shown that the induced atomic precession causes parametric conversion of an optical field of one circular polarization into one of the other polarization with a frequency shift equal to the rate of precession. This process tends to make the competition between modes of different polarizations important. An additional feature, not found in the scalar theory, is that, for sufficiently large magnetic fields, competition can be important between modes separated in frequency by several Doppler-broadened linewidths. MUONIUM CHEMISTRY (Abstract), by J. M. Bailey, W. E. Cleland and others. [1965] [1]p. (In cooperation with Columbia U., New York) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-249] and Office of Naval Research) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 80, Jan. 27, 1965.

Experiments have been carried out to investigate the interactions of muonium atoms (μ^+e^-) with several molecules including NO, O_2, NO_2, C_2H_4, H_2, and N_2. Polarized muonium is formed by stopping polarized positive muons from the Nevis synchrocyclotron in high-pressure argon gas in a longitudinal magnetic field. Quenching of the ground-state hyperfine resonance signal in muonium has been observed as a function of concentration of NO, O_2, NO_2, and C_2H_4; no quenching was observed due to H_2 or N_2. In addition, the time dependence of the muon depolarization has been measured, using a digital time analyzer. Depolarization rates have been measured at several concentrations of each of the impurity molecules. The data on NO are consistent with depolarization due to electron-exchange collisions. Molecular formation is believed to take place in the muonium $-C_2H_4$ system. Cross sections are presented.

NEW METHODS FOR MEASURING HYDROGENIC FINE

STRUCTURE (Abstract), by M. Leventhal, W. E. Lamb, Jr. and others. [1965] [1]p. [AF AFOSR-64-249] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 458, Apr. 26, 1965.

New experimental arrangements are being investigated for the purpose of studying fine-structure resonances in excited states of simple atoms. In one form of the apparatus, metastable n = 2, $^2S_{\frac{1}{2}}$ hydrogen atoms are created by electron bombardment of molecular hydrogen at a pressure of about 1 μ. The metastables move a short distance from the electron gun into a microwave quench region. The Lyman-α radiation emitted when the metastables undergo resonant transitions to the short-lived ^2P term is collected by a light pipe that points at the quench region. An ultraviolet photodetector receives the radiation, and the photosignal is amplified and fed to a lock-in detector. The gun and quench region are situated in a variable magnetic field, which enables resonances to be scanned. All allowed transitions between the n = 2, $^2S_{\frac{1}{2}}$, and $^2P_{\frac{1}{2}}$ levels have been observed. A preliminary low precision measurement of the $^2S_{\frac{1}{2}}$ to $^2P_{\frac{1}{2}}$ separation has been made and is compatible with previous atomic-beam results.

OBSERVATION OF SHARP RESONANCES AT LEVEL CROSSINGS IN HYDROGEN (Abstract), by K. R. Lea, W. E. Lamb, Jr. and others. [1965] [1]p. [AF AFOSR-64-249] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 458, Apr. 26, 1965.

Employing the apparatus previously described, the 2 resonance transitions αe and αf in hydrogen have been observed at magnetic fields near 575 and 1190 G, respectively. In these regions, the β state is degenerate with the e and f levels, respectively. A small electric field in the appropriate direction couples the degenerate levels. The coupling is demonstrated by the appearance of narrow resonance lines, superimposed on the much broader resonances αe, αf. The sharp resonances occur when the radio frequency matches the $\alpha\beta$ separation. Previous observations of these sharp resonances have been restricted to the vicinity of the βe crossing only.

THE ONE DIMENSIONAL SOLUBLE PARTICLE TRANSFER PROBLEM AND THE MODIFIED ENERGY MATRIX METHOD, by Y. Nishida. [1965] [9]p. incl. tables. (AFOSR-65-2688) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-394 and Atomic Energy Commission) AD 627773 Unclassified

Also published in Ann. Phys., v. 34: 415-423, Oct. 1965.

The comparison of the modified energy matrix treatment of the particle transfer problem with the exact solution available in a special one dimensional case which has been made by Breit is analyzed and carried out by an alternative procedure with the same conclusion. The analysis includes the consideration of effects of the continuum of the energy spectrum of each of the 2 δ-function potentials and of the effects of these parts of the spectra on the transition probability. These effects are found small in the case considered. The exact solutions are put into a form especially suitable for the comparisons made. The modified energy matrix method is made use of to estimate the effect of the finiteness of the range of force and to analyze the location in space of contributions to the transfer amplitude. A SOLUBLE SEMICLASSICAL PARTICLE TRANSFER PROBLEM, by G. Breit. [1965] [23]p. incl. diagrs. (AFOSR-65-2689) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-394, Army Research Office (Durham), and Atomic Energy Commission) AD 624638 Unclassified

Also published in Ann. Phys., v. 34: 377-399, Oct. 1965.

The one dimensional semiclassical transfer problem presented by 2 δ-function potentials approaching each other with uniform velocities before a certain time and receding from each other again with uniform velocities in the infinite future admits of an exact solution. A systematic iterative construction is described and the properties of the solution are compared with those of solutions obtained by 2 approximate methods. The first of these is the 'energy matrix' approximation used by Breit and Ebel in calculations on the $N^{14}(N^{14}, N^{13})N^{15}$ reaction. The second is similar to it in that only 2 out of an infinity of expansion functions are used in the expansion of the time dependent wave function. Instead of employing linear combinations of adiabatic wave functions, however, the second method of approximation employs expansion functions which are eigenfunctions for each of the 2 potentials in its own Galilean frame. The exact solution gives transition probabilities in reasonable agreement with the approximations within limits explicable by the character of the approximations.

INFLUENCE OF MULTIPLE VIRTUAL TRANSITIONS

ON THE REORIENTATION EFFECT IN COULOMB EXCITATION, by J. F. Masso and D. L. Lin. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-66-0446) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-394], Army Research Office (Durham), and Atomic Energy Commission) AD 628650
Unclassified

Also published in Phys. Rev., v. 140: B1182-B1190, Dec. 8, 1965.

Calculations of the reorientation effect in Coulomb excitation of the first 2^+ state of even-even nuclei are extended by employing the semiclassical approximation to take into account second- and third-order virtual E2 transitions to higher excited states. Deviations from first-order perturbation theory in the excitation probability are investigated numerically as a function of the bombarding energy and the scattering angle for heavy-ion projectiles. Results are presented for rotational and vibrational nuclei as a guide in the selection of conditions suitable for the determination of the static quadrupole moment of the lowest 2^+ state. Conditions for the practical convergence of the perturbation expansion are discussed.

CROSS SECTION AND POLARIZATION IN THE PHOTODISINTEGRATION OF THE DEUTERON (Abstract), by R. G. Brandt, W. Zickendraht and others. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-394], Army Research Office (Durham), and Atomic Energy Commission)
Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 448, Apr. 26, 1965.

Employing the theoretical development given elsewhere, calculations are performed including electromagnetic multipoles up to E4 and M4 in the nonretarded approximation employing the Yale potential. Cross sections and polarizations for unpolarized γ-rays and deuterons are compared with values using an earlier potential, with experimental data, and with other calculations. It is shown that multipoles of higher order than E2 and M1 produce a nonnegligible change in the cross section above a γ-ray energy of about 40 mev. This can be of the order of 30%-50% at certain angles above an energy of 100 mev. A method is developed whereby photodisintegration calculations are performed making use more directly of phenomenological phase parameters. Differences between these results and those obtained employing the Yale potential are small.

HIGH-PRECISION MEASUREMENT OF THE 2^3P_1-2^3P_2 FINE STRUCTURE OF He^4 (Abstract), by R. D. Swift, F. M. J. Pichanick, and V. W. Hughes. [1965] [1]p. (Sponsored jointly by Advanced Research Projects Agency and Air Force Office of Scientific Research under [AF AFOSR-64-394]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 455, Apr. 26, 1965.

A report of the results of a series of high-precision measurements on the fine structure of helium using the microwave-optical atomic-beam technique is made. The standard deviation of 34 runs on the ($J = 1$, $M_J = 0 \longleftrightarrow J = 2$, $M_J = 0$) transition was 2.7 kc/sec or about 1 ppm of the fine-structure interval. Several corrections had to be applied to the experimental data prior to the evaluation of the fine structure. The most important correction was an allowance for the variation of optical matrix elements as a function of magnetic field. This effect could be estimated both theoretically and experimentally, the 2 results differing by some 15%. The discrepancy corresponds to about 3 ppm in the corrected fine structure. In view of this uncertainty and other possible systematic effects, we are currently quoting 2291.170 ± 0.018 mc/sec for the 2^3P_1 to 2^3P_2 fine-structure interval. This experimental value is more accurately known than the theoretical value, but calculations of higher-order theoretical corrections are in progress.

INTERACTION OF NUCLEI WITH ELECTROMAGNETIC MULTIPOLES (Abstract), by G. Breit and M. L. Rustgi. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-394], Army Research Office (Durham), and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10. 447, Apr. 26, 1965.

Employing the classification of Franz and Stech as presented in Blatt and Weisskopf, the interaction of nuclei with electromagnetic multipoles is written in such a way that different terms involve physical uncertainties of different types. In the nonretarded approximation, the electric field due to the electric multipoles is expressible as the gradient of a potential and therefore the corresponding interaction energy can be written in a somewhat definitive way. The interaction with the magnetic moment in the nonretarded approximation is treated in the same fashion. An expression for the interaction energy without neglecting the retardation effects is also derived and the way in which equivalent operators in such a treatment may be introduced is pointed out. The elimination of the coordinates of the center of mass and underlying assumptions are discussed.

SIMPLIFIED DERIVATION OF THE AMPLITUDES FOR THE PHOTODISINTEGRATION OF THE DEUTERON WITH ARBITRARY NUMBER OF ELECTROMAGNETIC MULTIPOLES (Abstract), by R. Botzian, M. L. Rustgi and A. J. Torruella. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-394] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 448, Apr. 26, 1965.

Employing the interaction Hamiltonian in the operator form as derived by Breit and Rustgi, a simplified derivation of the amplitudes for the photodisintegration of the deuteron is reported and the same expressions as given earlier are obtained. In this derivation, use is made of the Wigner-Eckart theorem, and the commutation relations between the spin matrices but the Racah coefficients are not employed. As in the earlier papers, the nonretarded approximation has been used, the final-state interaction of the outgoing neutron and proton is included and the effect of the magnetic moments on the electric multipoles is not considered.

PHONON-COUPLED PAIR SPECTRA OF K_2ReCl_6 IN SINGLE CRYSTALS OF K_2PtCl_6, by P. B. Dorain and R. G. Wheeler. [1965] [3]p. incl. diagrs. table. (AFOSR-66-1633) [AF AFOSR-65-873] AD 641223 Unclassified

Also published in Phys. Rev. Ltrs., v. 15· 968-970, Dec. 20, 1965.

The optical spectra of dilute single crystals of K_2PtCl_6 containing Re^{+4} show absorption peaks which may be assigned to ion pairs of Re^{+4} in addition to lines arising from the single ion. The spectrum reported in this note arises from the free-ion transition from $^4A_{2g}(\Gamma_8)$ to $^2T_{2g}(\Gamma_7)$ and the associated pair transitions. The results show that (1) the coupling of rhenium pairs in K_2PtCl_6 crystals in the ground state is antiferromagnetic, and (2) the excited-state coupling parameters are strongly dependent upon the associated vibrational states but are predominantly antiferromagnetic.

ANTIFERROMAGNETIC RESONANCE IN K_2ReCl_6, K_2ReBr_6, AND K_2IrCl_6 (Abstract), by R. G. Wheeler and P. B. Dorain. [1965] [1]p. [AF AFOSR-62-186] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 329, Mar. 24, 1965.

Using interferometric far-infrared spectroscopic techniques, the zero magnetic-field antiferromagnetic resonance of the fcc crystals K_2ReCl_6, K_2ReBr_6, and K_2IrCl_6 has been observed at 1.5 K. In K_2ReBr_6, 2 lines at 35.0 and 33.0 cm^{-1}, each of width less than 0.5 cm^{-1} are observed. In K_2ReCl_6, a single line of approximate width of 3 cm^{-1} is observed at 43.75 cm^{-1}. A single line at 11.5 cm^{-1} is observed in K_2IrCl_6. The last observation appears to confirm type 3A ordering suggested by Ter Haar and Lines. Since there is evidence that little or no lattice distortion occurs in the cubic rhenium compounds, the doublet-line structure suggests a significant next-nearest-neighbor anisotropy if the ordering is type 3A. The diamagnetic crystal K_2PtCl_6 was used to locate vibronic and lattice modes.

OPTICAL SPECTRA OF DILUTE AND CONCENTRATED SINGLE CRYSTALS OF K_2ReCl_6 AT 4.2 K (Abstract), by P. B. Dorain and R. G. Wheeler. [1965] [1]p. [AF AFOSR-62-186] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 329, Mar. 24, 1965

The optical spectra of single crystals of dilute and concentrated K_2ReCl_6 and K_2ReBr_6 exhibit sharp lines at T = 4.2 K for the transitions from the $^4A_2$ to the ^2E, $^2T_1$, and $^2T_2$ states arising from the t_{2g}^3 configuration. The diluted crystal of K_2ReCl_6 in K_2PtCl_6 shows a particularly simple vibronic structure of 124, 166, and 320 cm^{-1} for all electronic transitions and may be associated with the ν_6, ν_5 and ν_2 modes of the complex The small splitting (2 cm^{-1}) of the $^2T_2\Gamma_8$ state arises from the very small distortion caused by poor packing The pure crystals show similar vibronic lines The $^2T_2\Gamma_8$ state shows no splitting and therefore the crystals are good cubic lattices. Zeeman effects also show that the ground state of the concentrated crystal is a singlet. From the observed splitting of the $^2T_2\Gamma_7$ state in the concentrated crystal the local antiferromagnetic field is found to be 30 kG. Several other lines in the concentrated crystal are discussed.

MEASUREMENT OF EXCITED STATE RELAXATION RATES, by W. R. Bennett, Jr., P. J. Kindlmann, and G. N. Mercer. [1965] [24]p. incl. illus. diagrs. tables, refs. (AFOSR-65-1122) [AF AFOSR-64-626] AD 620469 Unclassified

Also published in Appl. Opt., Suppl. 2, Chem. Lasers, p 34-57, 1965

A detailed review is given of methods for the measurement of radiative decay rates and total inelastic destructive cross sections of short-lived excited states. The paper is divided into 6 main sections, dealing with methods of approximate calculation and interpretation of radiative and collision processes, previous methods of measurement, a review of delayed multichannel coincidence techniques, properties of the vernier chronotron; methods of statistical analysis, and a summary and analysis of data pertinent to laser transitions in helium, neon, and singly ionized argon. The main emphasis is given to experimental techniques for the measurement of excited state lifetimes in the 4-nsec to 1000-nsec range and the analysis of data taken in the noble gases with this system.

A QUANTUM MECHANICAL EVALUATION OF LINE BREADTHS INVOLVED IN TUNED-LASER ABSORPTION AND STIMULATED EMISSION SPECTROSCOPY, by W. R. Bennett, Jr. [1965] [3]p. (AFOSR-65-2874) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-626] and Army Research Office (Durham)) AD 614383 Unclassified

Also published in Appl. Opt., Suppl. 2, Chem. Lasers, p. 78-80, 1965.

An analysis is given of collision- and power-broadening effects in tuned-laser absorption spectroscopy using time-dependent perturbation theory. The results are compared with the earlier analysis based on the Lorentz theory of collision broadening given by Gerritsen and Heller. Finally, the analysis is extended to include similar broadening effects on the net gain coefficient when both stimulated emission and absorption are involved. (Contractor's abstract)

EXCITATION AND INVERSION MECHANISMS IN GAS LASERS, by W. R. Bennett, Jr. [1965] [17]p. incl. illus. diagrs. refs. (AFOSR-65-2965) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-626] and Army Research Office (Durham)) AD 627690 Unclassified

Also published in Ann. New York Acad. Sci., v. 122: 579-595, May 28, 1965.

Recent developments up to 1965 in the field of gas lasers are reviewed. Two excitation mechanisms, optical pumping by stimulated emission and electron impact, have made considerable progress. For most cw gas lasers, which are 4-level systems, a buildup of the metastable level with increasing excitation produces a saturation bottleneck that severely limits the power output of the system. It is possible that this problem may be overcome by a 3-level gas laser system. Pulsed and continuous laser oscillation in singly ionized states of the noble gases are considered.

INVERSION MECHANISMS IN GAS LASERS, by W. R. Bennett, Jr. [1965] [31]p. incl. diagrs. tables, refs. (AFOSR-65-2065) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-626] and Army Research Office (Durham)) AD 627489 Unclassified

Also published in Appl. Opt., Suppl. 2, Chem. Lasers, p. 3-33, 1965.

A review is presented of recent developments in the gas laser field which is intended to supplement a previous, more detailed paper on the same subject (Appl. Opt., Suppl. 1: 24, 1962). In addition, a number of new results are described. The present work has 6 main sections dealing with: a summary of general laser conditions, inversion saturation mechanisms in 4-level systems, possible 2- and 3-level collision lasers, stimulated emission pumping, transient inversions, and ion lasers. Emphasis is placed on atomic systems, and a summary of currently known gas laser transitions is included as an appendix.

DECOMPOSITION OF BENZENEDIAZONIUM-3-CARBOXYLATE: TRANSIENT 1,3-DEHYDROBENZENE, by R. S. Berry, J. Clardy, and M. E. Schafer. [1965] [7]p. incl. diagrs. (AFOSR-65-1251) [AF AFOSR-63-183] AD 622852 Unclassified

Also published in Tetrahedron Ltrs., No. 15: 1011-1017, Apr. 1965.

The mass spectrum and the optical spectrum were studied as functions of time for the process and products of flash-initiated decomposition of benzenediazonium-3-carboxylate. The products of decomposition include a transient parent C_6H_4 species of mass 76. The fragmentation pattern and its time dependence show that the mass 76 species is different from either of those obtained from the ortho or para isomers of the precursor. Comparison of the fragmentation pattern with model compounds suggests that 1,3-dehydrobenzene probably

in a singlet state, is the most likely assignment of the species. Two structural representations are proposed.

THRESHOLD SHAPES AND RESONANCES IN THE PHOTODETACHMENT CROSS SECTIONS OF CHLORIDE, BROMIDE, AND IODIDE, by R. S. Berry, C. W. David, and J. C. Mackie. [1965] [6]p. incl. diagrs. refs. (AFOSR-65-1254) (AF AFOSR-63-183) AD 622855 Unclassified

Also published in Jour. Chem. Phys., v. 42: 1541-1546, Mar. 1, 1965.

The photodetachment curves of Cl^-, Br^-, and I^- have been examined in their threshold regions by absorption spectroscopy of shock-heated alkali halide vapors. The chloride curve appears smooth and normal in terms of threshold laws, but the bromide and iodide curves show maxima about 500 cm^{-1} above the thresholds, with widths of about 200 cm^{-1} at half-height. The threshold positions are not affected by changes in conditions. The anomalously large absorption or resonances seem to be due to the halide ions, but to be influenced to some degree by the alkali atoms or ions. Three explanations, none entirely satisfactory, are put forth for the maxima; these are: (1) near-resonant transfer of energy from $X + e^-$ to M, giving $X^- + M^*$; (2) metastable autodetaching states of the halides; and (3) mixing of vacant alkali ion orbitals with continua of the halides. The third is considered most plausible.

CARBALKOXYNITRENES. THE PHOTOLYTIC DECOMPOSITION OF GASEOUS ALKYL AZIDOFORMATES, by D. W. Cornell, R. S. Berry, and W. Lwowski. [1965] [4]p. incl. diagr., tables, refs. (AFOSR-65-2202) [AF AFOSR-63-183] AD 625537 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87 3626-3629, Aug. 20, 1965.

The photolytic decomposition of gaseous ethyl and methyl azidoformates has been studied with regard to carbalkoxynitrene formation and other modes of decomposition. Chemical trapping and product analysis show that the nitrenes are produced when light is used whose energy is above about 95 kcal /mol , but below 130 kcal. Transient spectra show absorption by NCO. From the appearance time of NCO and the dependence of the NCO spectrum on partial pressure of a chemical trapping agent, limits on the nitrene lifetime are set at about 3×10^{-7} and 10^{-5} sec. At higher photolysis energies transient N_3 is also observed, and the product pattern indicates that a transient but unobserved CO_2N_3 may be present.

THE DIMERIZATION OF GASEOUS BENZYNE, by M. E. Schafer and R. S. Berry. [1965] [5]p. incl. illus. diagrs. table, refs. (AFOSR-66-0058) (AF AFOSR-63-183) AD 629681 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 4497-4501, Oct. 20, 1965.

Benzyne is the primary organic product of the photoinitiated decomposition of benzenediazonium 2-carboxylate. Its presence and its ultraviolet absorption spectrum are established by the coincident results of time-resolved optical and mass spectra. The integrated intensity of the ultraviolet absorption spectrum, and the intensity of mass peak 76, both measured as functions of time, lead to a rate constant for the dimerization of benzyne to biphenylene. The second-order constant has a value greater than or equal to 7×10^8 l /mol sec, and corresponds to a minimum reaction probability, per collision of 7×10^{-3}.

EFFECT OF PRESSURE ON CONDUCTANCE. I. TETRAISOAMYLAMMONIUM PICRATE IN DIETHYL ETHER AND IN BENZENE, by J. F. Skinner and R. M. Fuoss. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-65-2382) (AF AFOSR-63-244) AD 626519 Unclassified

Also published in Jour. Phys. Chem., v. 69 1437-1443, May 1965.

The conductance of tetraisoamylammonium picrate (TIAPi) has been measured in diethyl ether at five

concentrations from 3×10^{-6} to 3×10^{-4} M at 30 to 5000 kg/cm^2 and in benzene at four concentrations from 3×10^{-4} to 3×10^{-3} M at 25 to 750 kg/cm^2. The change in conductance with increasing pressure in both solvents has been explained in terms of decreased ionic mobility owing to increased solvent viscosity and shifts in the ion pair and triple ion association equilibria as a result of increased dielectric constant of the solvent. In the highly compressible ether, at concentrations below the conductance minimum, the conductance increased by about one order of magnitude while in benzene, at concentrations above the minimum, a small decrease in conductance appeared as predicted. A value of Λ_0 = 190 for TIAPi in ether and values of the center-to-center contact distances for ion pairs (4.9 A) and triple ions (15 A) were obtained from the data. The corresponding Walden product for TIAPi in diethyl ether is 0.39, in good agreement with values of 0.42 in water, 0.47 in nitrobenzene, and 0.43 in ethylene dichloride. (Contractor's abstract)

TRIAL AND ERROR PREDICATES AND THE SOLUTION TO A PROBLEM OF MOSTOWSKI, by H. Putnam. [1965] [9]p. (AFOSR-66-0418) (AF AFOSR-65-345) AD 632770 Unclassified

Also published in Jour. Symbolic Logic, v. 30. 49-57, Mar. 1965.

Sets for which there are decision procedures are considered under modification of the notion of a decision procedure by (1) allowing the procedure to "change its mind" any finite number of times, and (2) giving up the requirement that it be possible to tell (effectively) if the computation has terminated. Two theorems are proved concerning the necessary and sufficient conditions (in terms of the Kleene-Mostowski hierarchy of arithmetic predicates) that P be a trial and error predicate, and that there exist a k such that P is a k-trial predicate. A second group of results is concerned with the metatheory of quantification theory (without identity). It is shown that the formula wanted by Mostowski with no model in which (1) the universe of discourse is the natural numbers and (2) the predicate letters are all interpreted as recursively enumerable (r.e.) predicates or truth functions of r.e. predicates, does not exist. Every consistent formula of quantification theory does have a model in Σ_1^*, the smallest class containing the r.e. predicates and closed under truth functions.

ANALYTIC NATURAL DEDUCTION, by R. M. Smullyan. [1965] [17]p. incl. diagrs. (AF AFOSR-63-433) Unclassified

Presented at Internat'l. Cong. of Mathematicians, Stockholm (Sweden), Aug 15-22, 1962.

Published in Jour. Symbolic Logic, v. 30: 123-139, June 1965.

Some natural deduction systems for quantification theory whose only quantificational rules involve elimination of quantifiers are considered. By imposing certain restrictions on the rules, a system is obtained which is termed Analytic Natural Deduction; it has the property that the only formulas used in the proof of a given formula X are either subformulas of X, or negations of subformulas of X. By imposing further restrictions, a canonical procedure is obtained which is bound to terminate if the formula being tested is valid. The procedure can be thought of as a partial linearization of the method of semantical tableaux. The completeness theorem for semantical tableaux rests essentially on Konig's lemma on infinite graphs. The completeness theorem for natural deduction uses as a counterpart of Konig's lemma, a lemma on infinite "nest structures", as theory are defined in the article. These structures can be looked at as the underlying combinatorial basis of a wide variety of natural deduction systems.

SCALED PARTICLE THEORY OF FLUID MIXTURES, by J. L. Lebowitz, E. Helfand, and E. Praestgaard. [1965] [6]p. incl. diagrs. refs. (AFOSR-65-2782) (AF AFOSR-64-508) AD 629819 Unclassified

Also published in Jour. Chem. Phys., v. 43: 774-779, Aug. 1, 1965.

An extension of a previous one-component theory of hard-sphere systems (in 3, 2, and 1 dimensions) and the surface tension of real systems is made to mixtures. The theory is based on consideration of an approximate expression for the work of adding an additional hard sphere to a mixture. Comparison between theory and molecular-dynamics calculations of the various contributions to the virial pressure (related to contact distribution functions) of such hard-sphere mixtures is excellent. Comparison of the theory with experimental surface tensions of mixtures of simple liquids is satisfactory. (Contractor's abstract)

MICROSCOPIC THEORY OF BROWNIAN MOTION IN AN OSCILLATING FIELD; CONNECTION WITH MACROSCOPIC THEORY, by J. L. Lebowitz and P. Résibois. [1965] [11]p. incl. refs. (AFOSR-65-2865) (AF AFOSR-64-508) AD 628252 Unclassified

Also published in Phys. Rev., v. 139: A1101-A1111, Aug. 16, 1965.

Recently, Lebowitz and Rubin, and Resibois and Davis, showed that the Fokker-Planck equation for the distribution function of a Brownian particle (B particle) of mass M, in a fluid of particles of mass m, may be derived directly from the Liouville equation for the joint

distribution of fluid and B particle. It is the lowest order term in a $(m/M)^2$ expansion of the effect of the fluid on the distribution of the B particle. These authors studied in particular the steady-state distribution function of B particles acted on by a small constant external field E, which results from a balance between the effects of the driving force and those of the fluid. These studies are now extended to the case where the B particle is acted on by a time-dependent field. Complete agreement is had between the microscopic theory and that obtained from stochastic considerations. The relation between the different formalisms used by Lebowitz and Rubin and by Resibois and Davis are also clarified.

SEPARATION OF THE INTERACTION POTENTIAL INTO TWO PARTS IN TREATING MANY-BODY SYSTEMS. I. GENERAL THEORY AND APPLICATIONS TO SIMPLE FLUIDS WITH SHORT-RANGE AND LONG-RANGE FORCES, by J. L. Lebowitz, G. Stell, and S. Baer. [1965] [17]p. incl. illus. diagrs. refs. (AFOSR-66-0397) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-508, Atomic Energy Commission, and National Science Foundation)
AD 629816 Unclassified

Also published in Jour. Math. Phys., v. 6: 1282-1298, Aug. 1965.

Systematic methods are developed for investigating the correlation functions and thermodynamic properties of a classical system of particles interacting via a pair potential $v(r) = q(r) + w(r)$. The method is then applied to the case in which $w(r)$ is a "Kac potential" $w(r, \gamma) = \gamma^{\nu}\varphi(\gamma r)$ (ν the dimensionality of the space) whose range γ^{-1} is very long compared to the range of $q(r)$. The work is related closely to the work of Kac, Uhlenbeck, and Hemmer. The main new feature of the new method is the separation of the correlations, e.g., the two-particle Ursell function $\mathfrak{Y}(r)$, into a short-range part $\mathfrak{Z}^S(r, \gamma)$ and a long-range part $\mathfrak{Z}^L(y, \gamma)$, $y = \gamma^r$; r the distance between the particles. The 2 parts of $\mathfrak{Z}$ are defined in terms of representation by graphs with density (or fugacity) vertices and K- and Φ-bonds, $K(r) = e^{-\beta i} - 1$, $\Phi = -\beta w$. A resummation of these graphs then yields a simple graphical representation for the long-range part of the correlation functions in terms of graphs with Φ-bonds and "hypervertices" made up of the short-range part of the correlations. This representation is then used in this paper to make separate expansions of $\mathfrak{Z}^S(r, \gamma)$ and $\mathfrak{Z}^L(y, \gamma)$ and through them of the thermodynamic parameters in powers of γ. Explicit calculations of the Helmholtz free energy is carried out to a higher order in γ than done previously by Hemmer and it is shown how to carry out the calculation, in principle, to any order. The general method is further applied (in separate articles) to lattice gases, plasmas, and to the special problem of critical phenomena. (Contractor's abstract)

INEQUALITIES FOR THE GROUND STATE OF LIQUID ^{4}He (Abstract), by O. Penrose. [1965] [1]p. (In cooperation with [London U. Imperial Coll. of Science and Tech. (Gt. Brit.)]) [AF AFOSR-64-508]
Unclassified

Published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9(Pt. A): 91, 1965.

Simple upper bounds can be calculated both for the energy and for the fraction of condensed particles, for a system of interacting Bose particles with hard cores.

For example, if liquid He^4 is treated as a system of hard spheres at a density of 0.28 times the close-packing density, the inequality shows that at most 72% of the particles can have zero momentum. The upper bound on the energy is similar to that given by Dyson (Phys. Rev., v. 106: 20, 1957), but is not restricted to hard-sphere interactions.

BOOTSTRAP GRAVITATIONAL GEONS, by A. Komar. [1965] [5]p. (AFOSR-65-1068) (AF AFOSR-64-509)
AD 620494 Unclassified

Also published in Phys. Rev., v. 137: B462-B466, Jan. 25, 1965.

It is shown that there exist solutions of the vacuum Einstein field equations with the property that exterior to the Schwarzschild radius, R = 2m, the solution appears to be that of a static spherically symmetric particle of mass m, whereas interior to the Schwarzschild radius the topology remains Euclidean and the solutions have the property of a bundle of gravitational radiation so intense that the mutual gravitational attraction of the various parts of the bundle prevent the radiation from spreading beyond the Schwarzschild radius. It is not known whether there exist solutions of this type which remain nonsingular for all times; however, no singularity can ever by observed exterior to the Schwarzschild radius. The Cauchy data for one such solution are explicitly exhibited.

PHYSICS AND GEOMETRY, by P. G. Bergmann. [1965] [4]p. (AFOSR-66-1334) (AF AFOSR-64-509) AD 641630 Unclassified

Also published in Logic, Methodology and Philosophy of Science. Proc. 1964 Internat'l. Cong., Hebrew U., Jerusalem (Israel) (Aug. 26-Sept. 2, 1964), ed. by Y. Bar-Hillel. Amsterdam, North-Holland Publishing Co., 1965, p. 343-346.

The lecture is primarily concerned with general relativity, and with the relationship between physics and geometry suggested by that theory. The general theory of relativity is Einstein's theory of gravitation, right now the only theory of gravitation that, after Newton's, has achieved a measure of universal recognition. Initially, general relativity physics was claimed to have been geometrized; if space-time is represented as a differentiable manifold which the attributes of a (pseudo) Riemannian geometry, then it has been suggested that general relativity represents the "physicalization of geometry". Granting the transition from linear manifolds to more general structures as implied by general relativity, then one principal result is that the identification of world points (the localization of events in space-time) by their coordinate values loses a great deal of its former substance. In general relativity there are no inertial frames, and there are no other simple means by which a world point can be identified. The only clear-cut identifications that are still possible in general relativity are those of whole fields, in extended 4-dimensional domains, not of world points. It is suggested that the interpretation of geometric and of physical statements in general relativity differs fundamentally from that of statements in earlier theories based on rigid rectilinear frames of reference, and there is a need for the construction of a new vocabulary, a subset of the conventional vocabulary.

FOUNDATIONS OF SPECIAL RELATIVITY AND THE SHAPE OF THE BIG DIPPER, by A. Komar. [1965] [4]p. [AF AFOSR-64-509] Unclassified

Published in Amer. Jour. Phys., v. 33: 1024-1027, Dec. 1965.

The foundations of the special theory of relativity are examined in a new form which is more in keeping with the space-time symmetry of the resulting theory, and which employs those concepts which are most directly related to actual observation. The transformation group to which one is immediately led is the conformal mappings of the 2-sphere, which, as is well known, is isomorphic to the homogeneous improper orthochronous Lorentz group. In order to obtain extensions to the Poincare group and/or the Einstein group of general relativity, additional assumptions are required. (Contractor's

ON A SPECIAL CLASS OF TYPE-I GRAVITATIONAL FIELDS, by M. Trümper. [1965] [6]p. (AF AFOSR-64-509) Unclassified

Published in Jour. Math. Phys., v. 6: 584-589, Apr. 1965.

This paper contains an investigation of the algebraic structure and the analytic properties of a class of normal hyperbolic Riemannian 4-spaces restricted by the following condition: There exists a timelike unit vector u^a such that the Riemann tensor satisfies ${}^*R_{abcd}u^b u^d = 0$. This condition is shown to be equivalent to the statement that the conform tensor is Petrov type I with real eigenvalues, u^a being a principal vector and an eigenvector of the Ricci tensor. The eigen null directions (Debever vectors) of the conform tensor lie in a timelike hyperplane. The complete set of Bianchi identities is examined. It yields an expression for the covariant eigentime derivative of ϵ_{ab} and an algebraic relation linking the rotation and shear of u^a to the curvature tensor of the Riemannian space. The general results are applied to special Einstein spaces ($R_{ab} = 0$). A simplified proof of the theorem that in the case of non-degeneracy such spaces are static, the curves of the congruence being paths of an isometric motion was given. (Contractor's abstract)

EXACT SOLUTION OF A MANY-FERMION SYSTEM AND ITS ASSOCIATED BOSON-FIELD, by D. C. Mattis and E. H. Lieb. [1965] [9]p. (AFOSR-66-0395) [AF AFOSR-64-713] AD 630221 Unclassified

Also published in Jour. Math. Phys., v. 6: 304-312, Feb. 1965.

Luttinger's exactly soluble model of a 1-dimensional many-fermion system is discussed. It is shown that he did not solve his model properly because of the paradoxical fact that the density operator commutators $[\rho(p), \rho(-p')]$, which always vanish for any finite number of particles, no longer vanish in the field-theoretic limit of a filled Dirac sea. In fact the operators $\rho(p)$ define a boson field which is ipso facto associated with the Fermi-Dirac field. This observation is then used to solve the model, and obtain the exact (and now non-trivial) spectrum, free energy, and dielectric constant. This is also extended to more realistic interactions in

an Appendix. We calculate the Fermi surface parameter n_k, and find: $\partial n_k / \partial k|_{kF} = \infty$ (i.e., there exists a sharp Fermi surface) only in the case of a sufficiently weak interaction. (Contractor's abstract)

SUPPRESSION AT HIGH TEMPERATURE OF EFFECTS DUE TO STATISTICS IN THE SECOND VIRIAL COEFFICIENT OF A REAL GAS, by S. Y. Larsen, J. E. Kilpatrick and others. [1965] [2]p. (AFOSR-66-0396) (AF AFOSR-64-713) AD 629871 Unclassified

Also published in Phys. Rev., v. 140: A129-A130, Oct. 4, 1965.

It is shown that the repulsive core present in realistic 2-body potentials and in hard spheres leads to the rapid suppression of the effects of statistics in the second virial coefficient, except at very low temperatures. For hard spheres, an upper bound is obtained which goes down exponentially with temperature when the latter becomes large.

ON TRANSFINITE RECURSION, by R. M. Smullyan. [1965] [11]p. (AFOSR-67-1524) (AF AFOSR-65-433) Unclassified

Presented at Internat'l. Cong. of Science and Methodology, Jerusalem (Israel), 1964.

Also published in Trans. New York Acad. Sci., v. 28: 175-185, Dec. 1965.

The purpose of the article is to prove a certain principle common to several important constructions in set theory. The unifying principle, the double superinduction principle introduced, reduces to a common denominator proofs of Zorn's lemma and Zermelo's well ordering theorem, some results on ordinal numbers, and the proof of the tranfinite recursion theorem. One well known proof of Zorn's lemma uses a lemma known as Bourbaki's fixed point theorem. The Double Superinduction Principle, so to speak, abstracts the heart of the proof of Bourbaki's lemma, and once this principle is established in its own right, the proof of Bourbaki's lemma becomes particularly lucid. Some have felt that Bourbaki's lemma comes about as close as possible to Zorn's lemma without actually using the axiom of choice. One theorem is given which, likewise, comes just about as close as possible to the well ordering theorem without using the axiom of choice. This also yields another equivalent of the axiom of choice.

QUANTIZED GRAVITATIONAL THEORY AND INTERNAL SYMMETRIES, by A. Komar. [1965] [3]p. (AFOSR-65-1874) (AF AFOSR-65-816) AD 626100 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 76-78, July 12, 1965.

The construction of a general relativistic quantum theory of gravitation is discussed. Considering that the Einstein group is a function group and simple, it is suggested that there exists no unique procedure for constructing such a theory. A truncated classical theory is considered which is obtained by considering only those families of solutions of the Einstein field equations which satisfy boundary conditions at infinity suitable for a discussion of gravitational radiation. From this theory one can recover a preferred group of spacetime transformations, the generalized Bondi-Metzner (GBM) group, similar to the Poincaré group though infinite. The GBM group has 2 Abelian normal subgroups, called T and ST, where T is a 4-dimensional group associated with the translations. It is proposed that the infinite group I = GBM/T is a possible candidate for the internal symmetry group.

SOME COMMENTS ON THE ONE-DIMENSIONAL MANY-BODY PROBLEM, by E. H. Lieb. [1965] [24]p. (AFOSR-66-1574) (AF AFOSR-66-508) AD 637834 Unclassified

Presented at Fourth Eastern Theoretical Physics Conf., Stony Brook, N. Y., Nov. 26-27, 1965.

In the first half, the implication and significance of one dimensional models for many-body physics is discussed. In the second part, a brief historical survey is given of existing models and results obtained to date.

Iron - Solvent extraction
2160
Iron alloys - Mossbauer effect
1108

Iron compounds - Bonding
3087
Iron compounds - Chemical reactions
1906
Iron compounds - Complex compounds
3188
Iron compounds - Magnetic properties
1658
Iron compounds - Metal carbonyls
1910
Iron compounds - Mossbauer effects
3042
Iron compounds - Synthesis
1912
Iron crystals - Resistance (Electrical)
680
Iron fluorides - Covalency
1720
Iron group impurities - Paramagnetic resonance studies
2888
Iron oxides - Antiferromagnetism
1681, 1683
Iron phosphates - Specific heat
1925
Iron-silicon crystals - X-ray transmission
3164
Irreversible processes - Liquids
651
Irreversible processes - Operators (Mathematics)
118
Irreversible processes - Quantum theory
652, 699
Irreversible processes - Thermodynamics
197
Isomeric transitions - Europium
1106
Isomerization - Mechanism
1131
Isomerization - Polycyclic compounds
1134
Isomers - Stability
688
Isopropyl radicals - Production
2514
Isotopes
see also specific isotopes, e.g., Germanium Isotopes (Radioactive)
Isotopes (Radioactive)
see also Radioactive isotopes
see also specific isotopes, e.g., Germanium Isotopes (Radioactive)
Isotopic exchange reactions - Kinetics
838
Iterative methods - Analysis
3173

Japanese language - Analysis

Jet mixing - Compressible flow
1566
Jet mixing - Ramjets
2573
Jet mixing flow - Proton interaction
3043
Jet mixing flow - Separation
383
Jet mixing flow - Turbulence
2369
Jets - Axisymmetric flow
2364
Jets - Molecular velocity
971
Jets - Supersonic flow
2306
Jets - Two-dimensional flow
2365
Junction diodes - Voltage
338
Jupiter (Planet) - Extraterrestrial radio waves
813
Jupiter (Planet) - Radio astronomy
800, 811

Ketenes - Photochemical reactions
2915
Ketones
see also specific compounds, e.g., Acetone
Ketones - Alkylation
1613, 1617
Ketones - Carboxylic acids
2327
Ketones - Chemical reactions
1614, 1615, 2193
Ketones - Photochemical reactions
2164, 2194, 2514, 3127
Ketones - Pyrolysis
3024
Kidney - Diagnosis
456, 457
Kidney - Lymph
454
Kidney - Potassium uptake
1289, 1290
Kinetic theory - Boltzmann equation
2114
Kinetic theory - Distribution functions
2347, 2350
Kinetic theory - Rice-Allnatt equations
639, 651
Kinetic theory - Shock waves
759, 760
Kinetic theory - Statistical mechanics
931, 2643
Krypton - Absorption spectra
636
Krypton - Molecular energy levels
630, 647
Krypton - Vapor pressure
3083

Knudsen number - Rarefaction parameter
385

Laminar boundary layer - Fluid flow
2351, 2358, 2362
Laminar boundary layer - Mass transfer
2009
Laminar boundary layer - Reviews
673
Laminar boundary layer - Transport properties
2005
Laminar boundary layer - Velocity distribution
2360
Laminar flow - Blunt bodies
201
Laminar flow - Jet mixing
1566
Laminar flow - Separation
2361
Laminar flow - Thermal diffusion
1580
Langmuir probes - Applications
1866
Langmuir probes - Plasma physics
1748, 2411, 2980, 3008
Language - Analysis
1384, 1754, 2966
Language - Causative forms
1753

483, 1070, 1072, 1096
Polyoxyethylene - Molecular structure
2678
Polysomes - Messenger RNA
3184

Polystyrenes - Electron transitions
624
Polystyrenes - Excimer formation
641
Polytropic processes - Mathematical analysis
2934
Polyvinyl chloride - Properties
1876
Polyvinylnaphthalenes - Electron transitions
624
Porphyrins - Photochemistry
912
Positronium - Chemistry
2076
Positronium - Field theory
2434
Positrons - Annihilation reactions
2075-2079
Positrons - Scattering
2760
Potassium - Elasticity
1317
Potassium - Electrical resistance
2128, 2129
Potassium - Fluorescence
3174, 3179
Potassium - Solar radiation
1100
Potassium - Ultrasonic properties
1318
Potassium bromide - Photoconductivity
1199-1201
Potassium chloride - Scattering
706
Potassium chloride crystals - Potential theory
2489
Potassium compounds - Color centers
1193, 1198
Potassium compounds - Properties
1926, 1975, 1976, 1978, 2156
Potassium compounds - Pyrolysis
2903, 2904
Potassium compounds - Thermodynamics
845
Potassium halides - Spectra
1191, 2540, 3170
Potassium ions - Neuromuscular transmission
1464
Potential constants - Algorithms
2021
Potential functions - Excited states
2883
Potential scattering - Mathematical analysis
405, 1650, 1651, 2437, 3003, 3004
Potential scattering - Theory
1274, 2994
Potential theory - Conductivity
264
Potential theory - Electron bombardment
1393
Potential theory - Field emission
2285
Potential theory - Mathematical analysis
110, 150, 552, 1560, 1982, 3209
Potential theory - Molecules
706
Potential theory - Nuclear models
521
Powder alloys - Ductility
1596
Powdered solids - Laser excitation
3133
Power series - Electron transitions
1897
Power series - Wave functions
1238
Power spectra - Television noise
1747
Praseodymium - Atomic energy levels
1334, 1667
Precession - Equations of motion
2861
Precipitation - Solid solutions
2279
Pressure gauges - Applications
145, 2252
Pressure gauges - Design
194
Pressure oscillations - Light emission
2962
Pressure vessels - Cascade structures
2276
Pressure vessels - Design
3220
Pressure waves - Generation
375, 376
Pressurized water reactors - Nuclear power
2276
Primary cosmic rays - Proton flux
2527
Prisoners of war - Interrogation
173
Probability - Decision theory
677
Probability - Reliability (Electronics)
2395
Probability - Theory
1622, 1992, 1993
Probability distribution functions - Electromagnetic fields
2535
Productivity - Technological transfer
1121
Programmed instruction - Applications
1020, 1171, 1179
Programming (Computers) - Indexes
52
Programming (Computers) - Time sharing
543
Programming languages - Compilers
870
Programming languages - Design
542, 545, 3144
Projective geometry - Theory
1068
Promethium - Hyperfine structure
369
Promethium compounds - Oxides
3126
Propaganda - Communist China
1591
Propagation - Oscillations
1730

Propagation - Plasma medium
2606
Propagators - Mathematical analysis
2042
Propellants
see specific types of propellants, e.g., Liquid rocket propellants; Solid propellants
Propellants - Properties
1003, 2296, 2410, 2412
Propulsion - Ramjet
2574
Propylene - Reaction kinetics
1861
Propynes - Lithium derivatives
3187
Protein synthesis - Messenger RNA
3184
Protein synthesis - Ribosomes
2086
Proteins - Amino acid composition
949
Proteins - Antigen-antibody reactions
3111
Proteins - Dipole moments
2677, 2683
Proteins - Electropnoresis
933
Proteins - Synthesis
670, 898, 1319
Proteins - Thermodynamics
2682
Proton beams - Plasma physics
891
Proton scattering - Potential theory
2437
Protons - Annihilation reactions
1414, 1423
Protons - Chemical reactions
466
Protons - Coupling constants
1903
Protons - Elastic scattering
900, 1649, 2818
Protons - Energy spectrum
1470
Protons - Hyperfine structure
2710
Protons - Inelastic scattering
1492, 1652, 1653
Protons - Nuclear reactions
687, 1337, 1338, 1422
Protons - Scattering
608, 2760
Psychology - Game behavior
505, 506
Psychology - Scientific research
174, 1758, 2747
Psychometrics - Factor analysis
3194
Psychometrics - Memory
3067
Psychometrics - Parachute jumping
175
Psychometrics - Personality
507
Psychometrics - Probability
844
Psychometrics - Word association
981
Psychophysiology - Electrical current
2812
Psychophysiology - Optical images
1871
Psychoses - Sleep
920
Psychotropic agents - Behavior
443
Pulsation frequencies - Estimation
1035
Pulse code modulation - Picture transmission
1642
Pulse rate - Sleep
2587
Pumping (Optical) - Gas lasers
3226
Punch - Penetration
2136
Purines - Free radicals
877
Pynolytic graphite - Oxidation
5
Pyrenes - Chemical reactions
255
Pyridines - Luminescence
2069
Pyridines - Pyrolysis
2898
Pyridines - Synthesis
1351, 2597
Pyrimidines - Free radicals
877
Pyrimidines - Magnetic resonance spectra
200
Pyrolysis - Reaction kinetics
1188, 3022-3025

Quantification theory - Natural deduction
3235
Quantitative Biology - Symposium
685
Quantum chemistry Boron compounds
2495, 2498
Quantum chemistry - Mathematical analysis
2496
Quantum field theory - Mathematical analysis
1508
Quantum mechanics - Absorption spectroscopy
3225
Quantum mechanics - Communication systems
848, 849
Quantum mechanics - Counting methods
303
Quantum mechanics - Cryogenics
2741
Quantum mechanics - Crystal lattices
413
Quantum mechanics - Decay schemes
1526
Quantum mechanics - Electrical conductance
2607
Quantum mechanics - Elementary particles
522, 697, 865, 1521

Subject Index

Quantum mechanics - Field theory
272, 278, 864, 866, 1523, 1528, 1538
Quantum mechanics - Gases
3246
Quantum mechanics - Gravity
3248
Quantum mechanics - Harmonic oscillators
918
Quantum mechanics - Irreversible processes
652
Quantum mechanics - Magnetic fields
1692
Quantum mechanics - Mathematical analysis
273, 527, 534, 691, 696, 1417, 1419, 1514, 1522, 2234, 2235, 2237, 2786, 2995
Quantum mechanics - Model theory
1532
Quantum mechanics - Momentum
1080, 2996
Quantum mechanics - N-body problem
2436
Quantum mechanics - Nuclear physics
512
Quantum mechanics - Nuclear reactions
3209
Quantum mechanics - Optical fields
2532
Quantum mechanics - Pair production
689, 695
Quantum mechanics - Particle interactions
1088
Quantum mechanics - Perturbation theory
1506
Quantum mechanics - Photoelectrons
1839
Quantum mechanics - Plasma oscillations
1665
Quantum mechanics - Statistical analysis
1061
Quantum mechanics - Vortices
270
Quantum mechanics - Wave functions
2993

Rabbits - Gamma globulin
3110
Raccoons - Nerve fibers
1333
Radar antennas - Design
804
Radar echoes - Correlation techniques
1790
Radar echoes - Dielectrics
2169
Radar scanning - Astronomy
801, 809, 812
Radar signals - Echoes
2602
Radar targets - Identification
960
Radiant heating - Stress
2641
Radiation - Boundary layer
1584
Radiation - Combustion gases
80
Radiation - Field theory
2831
Radiation belts - Kinetics
960
Radiation damage - Desoxyribonucleic acids
875
Radiation damage - Semiconductors
2590
Radiation damage - Thymidines
876
Radiation measurement systems - Lifetimes
2078, 2079
Radiation spectra - Mathematical analysis
2624
Radio astronomy - Antennas
957
Radio astronomy - Millimeter waves
2952
Radio astronomy - Moon
799
Radio astronomy - Nebulae
2954
Radio astronomy - Planets
796, 800, 806, 807, 809, 811, 1794, 1834
Radio astronomy - Plasma medium
803
Radio astronomy - Scintillation
808
Radio astronomy - Solar corona
798
Radio communication systems - USSR
1586-1588
Radio equipment - Operation
957
Radio noise - Demodulation
1772
Radio receivers - Operation
860, 1035
Radio signals - Detection
2386
Radio telescopes - Puerto Rico
804
Radio waves - Interferometers
2700
Radio waves - Properties
803, 1180, 2776
Radioactive decay - Threshold energy
906
Radioactive fallout - Polar regions
292
Radioactive isotopes - Chemical reactions
468
Radioactive isotopes - Nuclear properties
268, 269
Radiofrequency - Breakdown
485
Radioisotopes
see specific types of radioisotopes, e.g., Gold isotopes (Radioactive)
Radiometers - Applications
437, 1794
Raman spectra - Temperature dependence
1818
Raman spectroscopy - Crystal lattices
300
Ramjets - Aerodynamics
951

Ramjets - Performance
2573, 2574
Random noise - Angle modulation
1822
Rare earth compounds - Crystal growth

Tellurides - Conductivity
425, 2622
Tellurium alloys - Impurities
3020
Tellurium alloys - Phase studies
2908, 2911, 2913
Tellurium alloys - Properties
2618, 2910
Temperature (Neel) - Pressure effects
74, 75
Tensile properties - Dilation
2068
Tensor analysis - Deformation
2859
Tensor analysis - Invariance
2860
Tensor analysis - Matrix algebra
501
Tensor analysis - Quantum mechanics
296
Tensor analysis - Relativity theory
2830
Terbium compounds - Oxides
3126
Terrain - Mapping
2102, 2103
Terrestrial magnetism - Turbulence
2801
Tetrafluorohydrazine - Chemical reactions
82, 2051
Tetrahydrofuran - Infrared spectrum
1321
Tetramethylethyleneferrocene - Crystal structure
464
Tetryl - Surface properties
15
Thalamus - Nervous system
2578
Thalamus - Pituitary hormones
587
Thalamus - Stimulation
2056, 2291
Thallium compounds - Photolysis
2840
Thallium halides - Nuclear magnetic resonance
625, 626
Theorems - Calculus of variations
2212
Theorems - Operators (Mathematics)
2062
Therapy - Hypnosis
2292
Thermal accelerators - Properties
1003, 1004
Thermal carbon atoms - Reaction products
471
Thermal conductivity - Boundary value problems
1982
Thermal conductivity - Crystal lattices
2549
Thermal conductivity - Determination
956, 2373
Thermal conductivity - Magnetic fields
1692
Thermal difusion - Theory
1353
Thermal diffusion - Transport properties
1580, 1585
Thermal expansion - Determination
1494
Thermal neutrons - Scattering
823
Thermal properties - Cryogenics
776-779
Thermal properties - Magnetohydrodynamics
562
Thermal radiation - Magnetic field effects
736
Thermal radiation - Superfluidity
406
Thermal radiation - Supersonic flow
1582, 1583
Thermal resistivity - Electron spin
2336
Thermal stress - Measurement
1455
Thermal stress - Pressure effects
2641
Thermionic converters - Plasma properties
1770, 3006-3008
Thermionic emission - Lasers
109
Thermodynamic equilibrium - Inhibition
1497, 1498
Thermodynamic properties - Stress effects
2876, 2877
Thermodynamics - Boundary layer
2008
Thermodynamics - Chemical coupling
197
Thermodynamics - Combustion products
2295, 2296
Thermodynamics - Crystal lattice defects
2615
Thermodynamics - Gas flow
2406
Thermodynamics - Infrared spectroscopy
3063, 3064
Thermodynamics - Irreversible processes
2144
Thermodynamics - Mathematical analysis
1701
Thermodynamics - Potential effects
661
Thermodynamics - Reviews
489
Thermodynamics - Theorems
2115
Thermoelectric power - Statistical mechanics
2550
Thermoelectricity - Energy conversion
2693
Thermonuclear reactions - Control
1570, 1763

Subject Index

Thermonuclear reactions - Heat transfer
1759
Thermonuclear reactions - Spectra
1760-1762
Thiazyl fluorides - Synthesis
116
Thickness - Measurement
379
Thin films
see also Films
Thin films - Annealing
825
Thin films - Boundary value problems
622
Thin films - Growth
3167
Thin films - Magnetic fields
309, 2340
Thin films - Superconductivity
1519
Thin films - Transport properties
907, 908, 1257
Thiocyanates - Chemical reactions
2897
Thiocyanic acids - Microwave spectra
862
Thiols - Microwave spectra
883
Thiophenes - Complex compounds
3191
Thiosulphates - Stereochemistry
2231
Thiourea - Complex compounds
1927
Thirst (Birds) - Motivation
2254
Thorium isotopes (Radioactive) - Fission neutrons
1662
Three-dimensional flow - Equations
1566
Threshold logic - Application
980
Threshold logic - Network synthesis
2097
Thrust - Constraints
1004
Thrust - Optimization
1023
Thryratrons - Light pulses
78
Thymidines - Free radicals
876
Thyroid gland - Hyperglycemia
1373
Thyroid hormone - Secretion
1380, 1381
Time systems - Theory
1024, 2110
Tin - Deuteron bombardment
903
Tin - Mossbauer effect
3078
Tin - Surface impedance
285
Tin alloys - Superconductivity
422
Tin crystals - Whiskers
383
Tin hydrides - Electron spin resonance
881
Tin isotopes (Stable) - Proton scattering
1649
Tissues (Biology) - Amines
1361-1363, 1471, 1472
Tissues (Biology) - Calcium ions
459
Tissues (Biology) - Osmosis
3021
Titanates - Crystal structure
1641
Titanates - Infrared spectra
1825
Titanium alloys - Electrical resistance
423
Titanium alloys - Paramagnetism
1705
Titanium alloys - Superconductivity
416
Titanium alloys - Ultrasonic waves
1733
Titanium isotopes (Stable) - Nuclear energy levels
1646, 1652, 1653
Topological algebraic structures - Groups
601
Topological spaces - Function spaces
1913, 1914
Topology - Differential geometry
136
Topology - Electrical networks
1144, 1148, 1177, 1795
Topology - Fixed point theorems
1915
Topology - Functional analysis
1070, 1190, 1263, 1264, 1947
Topology - Fuessner's method
1170
Topology - Graphic analysis
160
Topology - Measure theory
547
Topology - Surfaces
1259
Topology - Tchebychoff approximation
480
Toroids - Experiments
1005
Torsion - Disks
1606
Toxicity (Guinea pig) - Electrophysiology
2566
Tracer studies - Photolysis
1356
Tracking - Performance (Human)
1346-1349
Trajectories - Analysis
2370
Trajectories - Optimization
1935, 3010, 3011
Transducers - Diaphragms
194
Transducers - Groove guides
2393

Transfer matrix - Flow growth
369
Transfer of training - Analysis
981
Transfer orbits - Technique
1021
Transfer trajectories - Optimization
2372
Transformations (Mathematics) - Groups
3046
Transformations (Mathematics) - Hyperon decay
2447
Transformations (Mathematics) - Operators
2999
Transformations (Mathematics) - Topology
1177
Transformers - Electrical networks
2780, 2781, 2785, 2787, 2790
Transformers - Information theory
2778
Transistor amplifiers - Analog computers
788
Transistors - Circuits
334
Transistors - Distortion
1225
Transition elements - Band theory of solids
426
Transition elements - Magnetic properties
2822
Transition metals - Complex hydrides
197?
Transition metals - Superconductivity
431
Transition metals - Thermal resistivity
2337, 2338
Transition temperature - Physical factors
427, 428
Transition temperature - Scattering
411
Transmission lines - Nonplanar surfaces
1064
Transmission lines - Synthesis
1028, 2396
Transonic flow
see also Hypersonic flow
Transonic flow - Mathematical analysis
1637
Transpiration cooling - Chemical reactions
6
Transport coefficients - Wave numbers
2773
Transport properties - Couette flow
752
Transport properties - Gas flow
1572
Transport properties - Gases
977
Transport properties - Mathematical analysis
142, 1203, 1574
Transport properties - Measurement
2281, 2282
Transport properties - Perturbation theory
2120
Transport properties - Pressure effects
1293
Transport properties - Statistical analysis
1981
Transport properties - Thermodynamics
2114
Transport theory - Statistical mechanics
9
Traveling wave tubes - Converters
322
Traveling wave tubes - Quantum mechanics
329
Trees (Mathematics) - Electrical networks
1144, 1148, 1170, 1177
Trematodes - Life cycle
1119
Triatomic molecules - Potential functions
2883
Trifluoroethylene - Microwave spectroscopy
115
Trigger circuits - Design
1375
Trimesitylboron - Free radicals
3080
Trinitrotoluene - Surface properties
15
Tritiated compounds - Gas chromatography
1356, 1357
Tritium - Electron scattering
2754
Tritium - Thermonuclear reactions
1759-1761
Tuned circuits - Capacitance
2942
Tungstates - Superconductivity
424
Tungsten - Electrodes
1809
Tungsten - Mossbauer effect
1202, 3053
Tungsten - Properties
969, 2059, 2382, 2383
Tungsten alloys - Mechanical properties
1597
Tungsten alloys - Superconductivity
419
Tungsten compounds - Solid state physics
816
Tungsten compounds - Synthesis
1911
Tungsten crystals - Surface properties
967
Tungsten isotopes (Stable) - Magnetic moments
1657
Tunnel diodes - Amplifiers
361
Tunneling (Electronics) - Green's function
1519
Tunneling (Electronics) - Perturbation theory
616
Tunneling (Electronics) - Phonons
617, 2608
Tunneling (Electronics) - Semiconductors
615, 620, 1218
Tunneling (Electronics) - Superconductivity
3139
Turbulence - Analysis
128, 1189

Subject Index

Turbulence - Boundary layer
2348
Turbulence - Measurement
2982
Turbulence - Plasma medium
1158, 1170, 2765
Turbulence - Pressure gradient
2344
Turbulence - Thermal properties
1580, 3089
Turbulent boundary layer - Air injection
2006, 2007
Turbulent boundary layer - Flow fields
2697
Turbulent boundary layer - Shear stresses
2699
Turing machines - Computational analysis
1841
Two-dimensional flow - Stagnation point
2750
Tyrosine - Antigen-antibody reactions
3112

Ultrasonic absorption - Temperature effects
1768
Ultrasonic propagation - Measurement
1734
Ultrasonic radiation - Absorption
3019
Ultrasonic radiation - Earth models
769
Ultrasonic radiation - Electronic structure
3100
Ultrasonic radiation - Magnetic fields
1708
Ultrasonic radiation - Nondestructive testing
2038
Ultrasonic radiation - Quantum oscillations
1693, 3101
Ultrasonic tests - Applications
2157
Ultrasonic waves - Magnetic fields
1733
Ultrasonics - Attenuation
021, 1079, 1771, 1783, 3158
Ultrasonics - Geology
2629
Ultrasonics - Physiological research
2986
Ultraviolet radiation - Photochemistry
2164
Ultraviolet spectra - Isotope effects
2540
Underground explosions - Seismic waves
389
Underground explosions - Tectonic strain
228
Underground explosions - Wave amplitude
222
Underwater equipment - Transducers
432
Upper atmosphere - Auroral electrons
2511
Upper atmosphere - Field theory
2455
Upper atmosphere - Gases
1940
Uranium - Resonance cross sections
757
Uranium - Superconductivity
427
Urban sociology - Analysis
1115
Urinary system - Obstruction
440, 457
Urinary system - Oxygen tension
456
Urine - Amines
1303
Urine - Excretion
939, 940, 942
USSR - Mass media
1586, 1588

Vacuum apparatus - Electron beams
101
Vacuum apparatus - High temperature research
686
Vacuum systems - Aluminum
1511
Vacuum systems - Electrical breakdown
3066
Vacuum systems - Metals
1512
Valence - Wave functions
2084
Van der Waal's forces - Condensed systems
3082
Vanadium - Emission spectra
832
Vanadium - Properties
1055, 1190, 1575
Vanadium alloys - Superconductivity
416
Vanadium pentoxide crystals - Optical absorption
2183
Vaporization - Thermodynamics
1398
Vapors - Chemistry
2270
Vapors - Electrical conductance
1743
Varactor diodes - Cutoff frequency
1750
Variational calculus - Differential equations
152
Variational calculus - Stochastic processes
154
Vasoactive agents - Lymph
454
Vasoactive agents - Thalamus
587
Vasopressin - Biosynthesis
3141
Vasopressin - Secretion
3142
Vector analysis - Stability
49
Venturi tubes - Superfluid flow
1698, 1732

Venus - Radio astronomy
807, 1794, 3196
Very low frequency - Atmospherics
2776
Vibration - Digital simulation
922
Vibration - Dynamics
1632, 1979
Vibration - Mathematical analysis
1631, 1634, 2375, 2379
Vibration - Potential theory
822
Vibration - Pressure effects
1600
Vibration - Stability
205
Vibration - Stress effect
1629, 1630, 2165
Vibration - Theory
862
Vibrational constants - Determination
990, 2131
Vibronic spectrum - Thermal effects
1575
Video signals - Radio noise
1793
Vinyl compounds - Stereochemistry
2678, 2679
Vinylazulenes - Synthesis
1344
Vinylcyclohexane - Polymerization
1941
Viscoelasticity - Theory
2142
Viscometers - Rolling ball technique
3154
Viscosity
see also as a subdivision, e.g., Fluid flow - Viscosity
Viscosity - Measurement
2184, 2474-2476
Viscosity - Pressure dependence
3154
Viscous flow - Mathematical analysis
381
Vision - Adaptation
1316, 2311, 2312
Vision - Physiology
2258, 2259, 2314, 2988
Vision - Stimulation
1871
Vision (Cat) - Electroencephalography
666
Vision (Cat) - Test methods
1090-1092
Vision (Insects) - Mathematical models
180
Vision (Octopus) - Brain lesions
1450
Vision (Octopus) - Electroretinography
1440
Visual cortex (Cat) - Photic stimulation
1820
Visual cortex (Monkey) - Stimulation
1089
Visual perception - Performance (Human)
1957
Visual perception - Psychometrics
2425, 2426
Visual perception - Stimulation
1883, 2424
Visual perception - Test methods
57, 58
Visual threshold (Cat) - Defects
1089
Visual thresholds - Analysis
2424
Vocabulary - Algebraic topology
438
Volumetric analysis - Calorimeters
2540
Volumetric analysis - Electrolysis
2148
Vortices - Bose gas
270, 271
Vortices - Magnetohydrodynamics
1327, 1920
Vortices - Mathematical analysis
301
Vortices - Quantum mechanics
663, 664, 1663, 2024

WADEX - Analysis
52
Wakes - Axisymmetric flow
384, 2357, 2364
Wakes - Free-mixing
2371
Wakes - Hypersonic flow
2628
Wakes - Slender bodies
381
Wakes - Two-dimensional flow
2365
Water - Decomposition
912
Water - Electron scattering
1240, 1890
Water - Excretion
941
Water - Ingestion
2565
Water - Parenteral infusion
939, 940, 942
Water - Spectra
210, 1642, 1889, 2821, 2869, 2870, 2882
Water - Vaporization
1137
Water vapor - Emissivity
2867
Water vapor - Lasers
1226
Wave dispersion - Theory
2701, 2792
Wave equations - Boundary value problem
3055
Wave functions - Determination
959, 1125
Wave functions - Eigenfunction expansion
2479
Wave functions - Equations of motions
2305

Subject Index

Wave functions - Hydrodynamics
1081
Wave functions - Inelastic scattering
2715
Wave functions - Mathematical analysis
697, 956, 1083
Wave functions - Polarization
2083
Wave functions - Relativity theory
1237
Wave mechanics - Amplifiers
329
Wave transmission - Dielectrics
2612
Wave transmission - Resonance
2218
Wave transmission - Vector analysis
181
Waveguides - Electric fields
2388
Waveguides - Magnetohydrodynamics
187
Waveguides - Mathematical analysis
308
Waveguides - Propagation
324, 2606
Wavelengths - Fluorescence analysis
2405
Waves - Anisotropic medium
2250
Weapon systems - Game theory
56
Weather forecasting - Statistical analysis
1322, 1324
Wedges - Hypersonic flow
795, 2058
Wedges - Magnetohydrodynamics
2545
Wedges - Supersonic flow
1582
Whiskers (Crystals) - Elasticity
683
Whiskers (Crystals) - Electrical resistance
682, 684
Whistlers - Atmospheric sounding
2772
Whistlers - Electromagnetic interference
2791-2793
Wind - Ocean currents
1627
Wind tunnels - Applications
380, 2341
Wings - Drag
2508, 2509
Word association - Theory
981

Xenon - Chemistry
638
Xenon - Crystal parameters
2551
Xenon - Excitation
647, 727
Xenon - Heat transfer
1633, 1636
Xenon - Plasma propulsion
973, 974
Xenon - Spectra
628, 826
Xenon fluorides - Molecular structure
634
X-ray absorption - Mathematical analysis
191
X-ray diffraction analysis - Graphics
282
X-ray diffraction analysis - Incoherent scattering
193
X-ray diffraction analysis - Instrumentation
188, 189
X-ray emissions - Electron interactions
1517
X-ray spectra - Measurement
826, 828, 829, 831
X-ray spectra - Scintillation counters
1647
X-ray spectroscopy - Crystals
1044
X-ray spectroscopy - Instrumentation
2403
X-rays - Lunar generation
2511
X-rays - Reflection
830, 1230, 1738
X-rays - Scattering
732, 1239

Yagi antennas - Wave transmission
1058, 1059
Yeast - Protein synthesis
3184
Ytterbium - Atomic energy levels
1335
Ytterbium - Paramagnetic resonance
1103

Zeeman effect - Level crossings
715
Zinc - Hydrolysis
2547
Zinc - Properties
566, 775, 3094, 3099
Zinc alloys - Fermi surfaces
567
Zinc alloys - Thermodynamics
2618
Zinc compounds - Paramagnetic resonance
817, 2884, 2887
Zinc crystals - Grain boundaries
2181
Zinc crystals - Whiskers
682
Zinc telluride - Conductivity
2622
Zinc tungstate crystals - Growth
3151, 3165
Zirconates - Spectra
1800, 1825
Zirconium - Deuteron bombardment
903

Zirconium - Oxidation
1488-1491
Zirconium alloys - Ultrasonic properties
1708
Zirconium compounds - Density
2284
Zone melting - Applications
1198, 3163
