FOREWORD

The guiding concept of this series has been to provide high quality bibliographic accessibility to a highly specialized body of literature — the scientific results of research supported by the U.S. Air Force in university, industrial and other laboratories worldwide. Among the objectives have been completeness, convenience and usefulness. Completeness has been sought by comprehensive literature searches performed by the Library of Congress staff. Convenience has been provided by the kinds of indexes included, making it possible to find citations by reference to contract numbers, for example, in addition to authors, subjects, and institutions. Usefulness has been having a separate information channel for Air Force research, packaged for ready reference.

This bibliographic series has met these objectives. When it began, its only alternative was not doing it at all. Since then the Defense Documentation Center system, in conjunction with the Clearinghouse for Federal Scientific and Technical Information, has broadened its services, has become largely automated, and is in a position to assume many of the functions of this series. Thus it is now possible to say that while the series is desirable, its function is no longer exclusive. Therefore, this volume, covering 1965, will be numerically the last in the series. Another volume, covering 1963-1964, will appear later. While the services of DDC and CFSTI may not be as immediately accessible as these volumes, it is believed that most of the users of this series will be able to meet their requirements using them. Limited literature searches are available from DDC, for example, at no charge to qualified requestors. The public will find that the Clearinghouse offers somewhat comparable services. Inquiries may be directed to DDC, Cameron Station, Alexandria, Va. 22314, and to CFSTI, U.S. Dept. of Commerce, Springfield, Va. 22151. Descriptions of their complete services are available on request.

I wish to extend to the Special Bibliographies Section of the Science and Technology Division of the Library of Congress the thanks of AFOSR and of users of AFOSR-supported research for a most competent undertaking. Harold Wooster deserves special credit for planning and guiding this series through its various volumes.

William J. Price

William J. Price
Executive Director
Air Force Office of Scientific Research

PREFACE

Penultimate Prolegomenon

It is with deep regret that I announce that 1965, the year reported in this volume, will be the last year of this series. One more volume will be issued early in 1970 to cover the period 1963-1964 and complete the set, but no later volumes are anticipated.

This series has set a standard of bibliographic excellence. Excellence, unfortunately, costs money and takes time. Not all that much money, and perhaps not all that much time but enough to make it impossible to continue to support this effort.

The principal loss to the military, library and scientific communit[illegible] will be the convenience of having all AFOSR publications during a given period brought together in on[illegible]onveniently indexed volume. The established abstracting and indexing services will continue to include open literature publications by AFOSR-sponsored scientists and engineers. And all AFOSR publications should be announced, now as in the past, in U. S. Government Research and Development Reports, published semi-monthly by the Clearinghouse for Federal and Scientific Information at a subscription price of $30.00 a year.

Scope

This is the eighth volume of a continuing bibliographic series, and includes within the limitations of the law of diminishing returns, abstracts of all technical reports, journal articles, books, symposium proceedings, and monographs produced and published by scientists supported in whole or in part by the Air Force Office of Scientific Research during the calendar year 1965. Previous publications in this series have been:

Vol. I (1950-1956), issued in 1961
Vol. II (1957-1958), issued in 1964
Vol. III (1959), issued in 1965
Vol. IV (1960), issued in 1966
Vol. V (1961), issued in 1967
Vol. VI (1962), issued in 1968

The Air Force Office of Scientific Research supports fundamental research in the six major scientific disciplines: physics, chemistry, engineering sciences (subsuming electronics, mechanics, and propulsion), life sciences (both biological and behavioral, but not medical), mathematics, and the information sciences. Thus the publications abstracted herein are multi-disciplinary, their common link being task support by AFOSR.

Sources Searched

References, reports, and clues to the existence of reports were found by searching the indexes and report collection of the Air Force Office of Scientific Research Technical Library, and the collection of the Defense Documentation Center. Detailed searches were made of each contract file in the several AFOSR Directorates. In addition, cover-to-cover searches were made of over 300 scientific journals issued mostly in the time period 1965-1968.

Form of Entry and Arrangement

Inherent in the organization of this book is the concept of the reports within a contract as an unanalyzed monographic series. Reports are posted chronologically and/or alphabetically under contracts, these in turn under departments or laboratories, and these under contractors. This does, in fact, provide a rough subject grouping with the detailed subject index leading into clusters of like reports.

The abstracts are indentified by item numbers and are listed under the numbers in the indexes. The form of entry is, in general, that being used for DDC catalog cards i.e., source of the document; title, personal author, if any; date; pagination; report number; contract number; and accession number.

The chief exception to DDC form of entry is that the primary entry is by the parent organization followed by the name of the specific laboratory or important subdivision.

Availability of Reports

The principal accession or control numbers, which indicate the locations of reports in collections are:

AD ASTIA Document or Accessioned Documents (available at DDC, Defense Documentation Center), Cameron Station, Alexandria, Virginia 22314

PB Publication Board for sale by the Clearinghouse for Federal Scientific and Technical Information (CFSTI), Sills Building, 5285 Port Royal Road, Springfield, Virginia 22151.

The fact that a report is abstracted in this book means that a copy of this report existed at the time the abstract was written; it should not be construed to imply that either AFOSR or the Library of Congress necessarily has a copy available for distribution. Those seeking reports should do so from the cited agencies, not from AFOSR.

Indices

A detailed subject index, arranged alphabetically, has been provided. In addition, there are a contract index, an AFOSR control number index, and a personal author index.

Acknowledgments

Many people shared in the production of this volume. The work has been fostered and nurtured by the previous Commanders and Executive Director of Air Force Office of Scientific Research, Brigadier Generals H. F. Gregory and B. G. Holzman; Colonels A. P. Gagge, Jack L. Deets, and Ivan Atkinson, Dr. Knox Millsaps and the present Executive Director, Dr. William Price. During the period of compilation of this volume (not the period of the literature covered) much of the responsibility for documentation within AFOSR was transferred to the Office of the Assistant Executive Director for Research Operations, Lt. Colonel Harry Jaffers. He, his administrative assistant for documentation, Miss Arlene D. Blose, and their intermittently faithful computer have been in large part responsible for providing the AFOSR input to this volume.

Library of Congress, protocol dictates the form and order of acknowledgment of contributions made by LC staff members to a bibliography. Formally, the credit lines read as follows:

"The bibliographic team worked under the guidance and leadership of Thomas C. Goodwin, Jr., Head of the Special Bibliographies Section, Science and Technology Division. The chief bibliographers have been, Doris C. Yates, Joyce F. Lindsay, Norman G. Lamb, Joycelyn A. Gunn, and Lorraine B. Trent. A special note of gratitude is due to the invaluable work in preparation of this manuscript, searching, and preliminary cataloging done by Mrs. Marion S. Carr, Mrs. Phyllis M. Martin, and Mrs. Lillie M. Frye. Recognition is also due to those who have aided in abstracting, subject indexing, and typing, especially Dr. Madeleine J. Wilkins, Jeanne D. Weber, Beatrice T. Treese, Virginia M. Sims, and May Faye Dunsmore."

Aarhus U. (Denmark).

ORTHOGONAL POLYNOMIALS IN 2 OR n VARIABLES, by T. Busk. Final rept. Jan. 1, 1960-May 31, 1965, 7p. incl. diagrs. (AFOSR-65-1568) (AF 61(052)322) Unclassified

In order to provide a tool for handling numerical, multivariate problems attempts have been made to construct a general interpolation formula in n variables for an arbitrary set of arguments. This means that the formulas should not be restricted to intersections of parallel lines, but can be spread in an arbitrary way in the plane or n-dimensional space. In order for a formula of this type to be considered satisfactory, it must fulfill the following requirements: (1) The formula must be symmetric in the arguments and (2) When the arguments are placed in accordance with a simple pattern, the formula ought to be simplified correspondingly, preferably to some known, well-established formula.

2

Advanced Kinetics, Inc., Costa Mesa, Calif.

STUDIES ON THE INTERACTION OF LIGHT AND PARTICLE BEAMS. Final rept. Aug. 1, 1964 - Feb. 28, 1965. Mar. 5, 1965 [23]p. incl. illus. diagrs. table, refs. (AFOSR-65-0492) (AF 49(638)1359) AD 614790 Unclassified

Theoretical and experimental studies were conducted on the interaction of coherent electromagnetic waves with matter in high magnetic fields. Verdet coefficients for 10 optical media at λ = 6328A were determined (Appl. Optics, v. 4: 253, 1965). The interaction of coherent electromagnetic waves with macroscopic particles was also studied.

3

Advanced Kinetics, Inc., Costa Mesa, Calif.

FARADAY EFFECT AT OPTICAL FREQUENCIES IN STRONG MAGNETIC FIELDS, by R. W. Waniek, N. George, and S. W. Lee. [1965] [7]p. incl. illus. diagr. table. (AFOSR-65-1140) (Bound with its AFOSR-65-0492; AD 614790) (AF 49(638)1359) AD 619134 Unclassified

Also published in Appl. Opt., v. 4: 253, Feb. 1965

Direct measurements of rotary power at 6328A are made for several optical materials subjected to transient fields up to 400 k-oersteds. The Verdet coefficients for these materials are extended into the very high-field region. The angle of rotation of the plane of polarization vs magnetic field is also plotted in a graph. These data have an estimated accuracy of ± 5%.

4

AeroChem Research Labs., Inc., Princeton, N. J.

ENHANCED CHEMICAL ENERGY TRANSPORT EFFECTS ON CONVECTIVE HEAT FLUXES IN THE HYDROGEN-OXYGEN SYSTEM, by D. E. Rosner. [1965] [3]p. incl. diagrs. refs. (AFOSR-65-2265) (AF 49(638)1138) AD 629247 Unclassified

Also published in Combust. and Flame, v. 9: 199-201, June 1965.

The effects of Lewis number greater than unity on convective heat flux in the hydrogen-oxygen system has been estimated. It is seen that the maximum value of the $Le_i > 1$ heat transfer enhancement increases at reduced pressures and always at near-stoichiometric conditions. In the pressure range of 10 to 100 atm, this enhancement increases with increasing wall temperature. These estimates reveal the extent to which current prediction techniques systematically under-estimate convective energy transfer rates in chemically reacting rocket motor systems due to this cause alone ($Le_i > 1$). In the hydrogen-oxygen system this effect is seen to be typically larger than 5% at chamber conditions. Larger values may be achieved in the vicinity of the rocket nozzle throat owing to the fact that pressure levels are lower there, yet viscous dissipation produces large H atom concentrations within the boundary layer.

5

AeroChem Research Labs., Inc., Princeton, N. J.

THE OXIDATION OF PYROLYTIC GRAPHITE AT TEMPERATURES OF 1400° – 1800°F AND AT AIR VELOCITIES OF 25 – 100 CM/SEC, by D. E. Rosner and H. D. Allendorf. [1965] [2]p. incl. diagr. (AFOSR-65-2489) (AF 49(638)1138 and AF 49(638)1195) AD 628276 Unclassified

Also published in Jour. Electrochem. Soc., v. 112: [653-654] June 1965.

Several questions relating to the high-temperature oxidation kinetics of pyrolytic graphite which were raised by M. Levy and P. Wong (Jour. Electrochem Soc., v. 111: 1088-1091, 1965) are discussed from the point of view of current investigations in the laboratory of Rosner and Allendorf. Topics include: Departures from Arrhenium behavior; kinetics of the attack of graphite by atomic oxygen; and diffusional effects for exothermic surface reactions.

TRANSPIRATION COOLING WITH CHEMICAL REACTIONS, by D. E. Rosner. [1965] [27]p. incl. diagrs. tables, refs. (AFOSR-65-2266) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)-1138 and General Motors Corporation) AD 625367 Unclassified

Also published in Pyrodynamics, v. 2: 221-247, 1965.

Protecting a surface by actually passing the coolant through it is known to be a highly efficient technique and may provide the only feasible method of preventing material failures in regions of extreme convective heat flux. While transpiration cooling has not in the past provided a practical solution to some problems (e.g., turbine rotor blades) owing largely to structural considerations, the approach holds promise for non-rotating systems (e.g., stators, ramjet components) in which the dominant heating mechanism is convective. In the present paper, transpiration coolant requirements are examined for gas/solid systems in which the thermal effects of chemical reactions must be taken into account. For example, a coolant may undergo phase change and chemical decomposition in passage through the wall itself. This would alter the effective heat absorption capability of the coolant and the mean molecular weight of the effluent gas. Further chemical reaction may occur when the coolant vapors (or decomposition products) mix with the hot gases in the external boundary layer. In general, both processes will (1) influence the amount of coolant required to maintain a prescribed surface temperature, and therefore (2) significantly alter the relative merits of possible coolants. As such, thermochemical effects are of great practical interest. Simple computational techniques and numerical examples are given herein, together with a discussion of several factors governing the rates of these chemical reactions. (Contractor's abstract)

DISCUSSION OF R. M. DAVIES' PAPER: HEAT TRANSFER MEASUREMENTS ON ELECTRICALLY BOOSTED FLAMES, by D. E. Rosner. [1965] [2]p. (AF 49(638)-1138)
Unclassified

Published in Tenth Symposium (Internat'l.) on Combustion, Cambridge (Gt. Brit.) (Aug. 17-21, 1964), Pittsburgh, Combustion Inst., 1965, p. 764-765.

It is possible to make a simple quantitative estimate of the effect of high H-atom mobility on the prediction of convective heat fluxes from electrically boosted flame gases. It is shown that Le = 1 predictions systematically underestimate the heat flux by a factor which can easily amount to 20% or more.

THEORY OF INTERFACIAL RATE PROCESSES IN FLOW SYSTEMS (Abstract), by D. E. Rosner. [1965] [2]p. (Bound with its AFOSR-65-2238) (AF 49(638)1138)
Unclassified

Chemical kinetic and energy transfer consequences of the interplay between convection diffusion and heterogeneous chemical reactions are under investigation. Recent quantitative studies of the effect of the interfacial mass velocity (the Stefan-Nusselt flow), normal to surfaces undergoing heterogeneous reaction, on the apparent kinetics of such reactions are described. A simple algebraic model has been developed which enables all pertinent non-dimensional reaction rate coefficients to be obtained over the entire range from reaction rate (chemical) control to diffusion control for one-step irreversible heterogeneous reactions of arbitrary kinetic order. Illustrative results are presented for the case of turbulent boundary layers on flat surfaces undergoing first order reaction. The Stefan-Nusselt flow results appeared to (1) destroy the time-honored notion that diffusional limitations ultimately cause all surface reactions to masquerade as first order reactions; (2) introduce a connection between the profile drag on reacting surfaces and the true kinetics of the reaction; and (3) leave unaltered the form of a potentially useful relation between the power required to maintain a reacting surface at a prescribed temperature and the true kinetics of the chemical reaction at that temperature. Applications of the theory to specific heterogeneous reactions (e.g., oxidation, chlorination, chemical vapor plating) are facilitated by the compilation of representative values of the mass transfer parameter B_{diff}. The errors committed by neglecting the Stefan-Nusselt flow are discussed for the high temperature oxidation of graphite and molybdenum in air. The results of the theory emphasize their generality as well as the physicochemical conditions under which simple computational procedures are likely to be acceptable

A synopsis is presented of the most significant results of a 3-yr research program carried out on the oxidation kinetics of refractory materials in dissociated gases. Microwave-discharge fast flow system techniques, coupled with electrical resistance heating and monitoring of the reacting specimens were used throughout. Experimental results are included for the attack of (1) polycrystalline molybdenum, tungsten, graphite, iridium and vitreous boron by atomic oxygen, (2) polycrystalline molybdenum and nickel by atomic chlorine, and (3) polycrystalline molybdenum by hydroxyl radicals. Reactant (O, Cl, and OH) partial pressures were of the order of 0.001 to 0.05 and surface temperatures were within the range 400 to 2600°K. A chronological list is provided of the 7 publications and 11 reports describing these results and the underlying methods in greater detail. (Contractor's abstract)

HIGH-TEMPERATURE OXIDATION OF CARBON BY ATOMIC OXYGEN, by D. E. Rosner and H. D. Allendorf. [1965] [4]p. incl. diagrs. refs. (AFOSR-65-0350) (AF 49(638)1195) AD 632227 Unclassified

Also published in Carbon, v. 3: 153-156, 1965.

The true kinetics of the attack of high temperature graphite by both atomic and diatomic oxygen have been studied using microwave discharge-fast flow system techniques. In the surface temperature range 1100°K—2000°K the oxidation probability for O-atom attack (1) exceeds that for O_2 by factors between 5 and as much as 80, (2) passes through a maximum in this temperature range, as does the O_2 attack probability on same surface, and (3) is independent of oxygen partial pressure (corresponding to a first order reaction), in contrast to the kinetic order of the O_2/carbon reaction. Several mechanistic implications of these results are briefly discussed. (Contractor's abstract)

KINETICS OF THE ATTACK OF MOLYBDENUM BY DISSOCIATED CHLORINE, by D. E. Rosner and D. L. Allendorf. [1965] [26]p. incl. diagrs. refs. (Rept. no. TP-117) (AFOSR-66-0357) (AF 49(638)1195) AD 624543
Unclassified

Also published in Jour. Phys. Chem., v. 69: 4290-4296, Dec. 1965.

The true kinetics of the attack of molybdenum surfaces by both atomic and diatomic chlorine have been studied using microwave discharge-fast flow system techniques coupled with electrical resistance heating and monitoring of the reacting specimens. Experimental results are reported herein over the surface temperature range from 400 to 1530°K, at reactant partial pressures of the order of 10^{-3} to 10^{-1} torr. In contrast to the behavior of nickel, dissociation markedly increases the chlorination probability of molybdenum over the entire temperature range investigated, the enhancement being of the order of 100-fold at about 1000°K. The high reaction probability for Cl_2(g) attack of high-temperature nickel, previously reported by McKinley and Shuler, has been verified. When exposed to dissociated chlorine, the ratio of the nickel chlorination rate to the Cl atom recombination rate decreases with decreasing surface temperature—on 420°K nickel filaments the recombination coefficient γ has been found to be $\frac{1}{2}$. The implications of these results with regard to dissociative adsorption on and evaporation from nickel and molybdenum surfaces are discussed in the light of available kinetic and thermochemical data for these and related heterogeneous reactions. (Contractor's abstract)

KINETIC AND AERODYNAMIC ASPECTS OF THE ATTACK OF REFRACTORY MATERIALS BY DISSOCIATED GASES (Abstract), by D. E. Rosner and H. D. Allendorf. [1965] [2]p. (Bound with its AFOSR-65-2238) (AF 49(638)1195)
Unclassified

The true kinetics of the attack of refractory materials by gaseous free radicals are being studied using microwave discharge-fast flow system techniques. Experimental results are reported for the attack of graphite by O-atoms (AeroChem TP-110, Mar. 22, 1965, CARBON - in press) and molybdenum by OH(g) and Cl(g) (AeroChem TP-117, July 7, 1965, Jour. Phys. Chem. - in press). In the surface temperature range 1100°—2000°K, the oxidation probability for O-atom attack of graphite is as follows: (1) exceeds that for O_2 by factors between 5 and as much as 80; (2) passes through a maximum in this temperature range, as does the O_2 attack probability on the same surface; and (3) is independent of oxygen partial pressure (corresponding to a first order reaction), in contrast to the O_2/carbon reaction. Several implications of these results are briefly discussed, with particular emphasis on the design of heat protection systems for lifting re-entry vehicles. Experimental results are reported on the attack of molybdenum by OH-radicals

formed from the reduction of $NO_2(g)$ by H-atoms. Molybdenum is also attacked by atomic chlorine at a rate which greatly exceeds the corresponding reaction rate with $Cl_2(g)$. Chlorination probabilities are presented over the surface temperature range 400° to 1300°K. In contrast to the behavior of nickel, dissociation markedly increases the chlorination probability of molybdenum over the entire temperature range investigated, the enhancement being of the order to 100-fold at about 1000°K. The implications of these results with regard to dissociative adsorption and evaporation are discussed in the light of available kinetic and thermochemical data for these and related heterogeneous reactions.

SURFACE RATE PROCESSES AND SENSITIVITY OF HIGH EXPLOSIVES, by R. F. Chaiken and F. J. Cheselske. [1965] [32]p. incl. diagrs. tables, refs. (AFOSR-65-1622) (Bound with its AFOSR-65-1801; AD 458854) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)851 and Office of Naval Research) AD 623860 Unclassified

Also published in Jour. Chem. Phys., v. 43: 3228-3236, Nov. 1, 1965.

The nature and rate of linear surface regression of TNT, RDX, tetryl and PETN are studied utilizing a hot plate pyrolysis technique over surface temperatures ranging as high as 500°C. The data, when compared to similar data for benzoic acid, suggest that the primary surface rate process appears to be an endothermic melt-flow having an apparent activation energy suggestive of heat transfer and viscous flow as a rate controlling step. These data, when used as a measure of surface heat dissipation, correlate very well with the measured values of impact sensitivity. Also, they offer an explanation for the fact that attempts to correlate impact and/or friction sensitivity with melting point alone could lead to misleading results when PETN and RDX are considered. (Contractor's abstract)

ON THE EXTINCTION OF OPPOSED-JET DIFFUSION FLAMES: A PHYSICAL CRITERION FOR EXTINCTION, by R. F. Chaiken. [1965] [29]p. incl. diagrs. tables. (AFOSR-65-1625) (Bound with its AFOSR-65-1801; AD 458854) (AF 49(638)851) AD 623859 Unclassified

A physical criterion for the extinction of opposed-jet diffusion flames is presented. This criterion, when used in conjunction with the Spalding theory of mixing in opposed-gas jets, enables the apparent flame strength to be related to (1) the effective maximum chemical reaction rate in the opposed-jet flame, and (2) the laminar flame speed of an equivalent pre-mixed diffusion flame. The derived relationships differ somewhat from similar relationships given by Spalding's earlier theoretical treatment of the phenomena in the thin-flame approximation, but do yield quantitatively similar results when compared with experimental data reported for opposed-jet diffusion flames involving oxidation of simple hydrocarbons and ammonia. INVESTIGATIONS OF THE MECHANISMS OF DECOMPOSITION, COMBUSTION, AND DETONATION OF SOLIDS, by F. J. Cheselske. Final rept. Mar. 1964-Feb. 1965. Mar. 15, 1965 [245]p. incl. illus. diagrs. tables, refs. (Rept. no. 0372-01F) (AFOSR-65-1801) (AF 49(638)851) AD 458854 Unclassified

This report summarizes the results of research on the mechanisms of decomposition, detonation and combustion of solids. Extensive kinetic studies are reported on (1) linear surface regression rates of solid high explosives, (2) sublimation of ammonium halides, (3) thermal decomposition of anhydrous perchloric acid, and (4) apparent flame strength measurements on NH_3 with O_2, Cl_2, NO and N_2O in the opposed-jet diffusion flame reactor. Preliminary phenomenological studies have been carried out on the decomposition of pure or nearly pure single crystals of ammonium perchlorate. Theoretical studies were made on reactions in opposed-jet diffusion flames. New models were developed to explain extinction phenomena in solid rocket motors and a low pressure deflagration limit. (Contractor's abstract)

Aerojet-General Corp., Azusa, Calif.

A MODEL FOR LOW PRESSURE EXTINCTION OF SOLID ROCKET MOTORS, by R. F. Chaiken. [1965] [8]p. incl. diagr. tables, refs. (AFOSR-65-2166) (Bound with its AFOSR-65-1801; AD 458854) (AF 49-(638)851) AD 629026 Unclassified

Also published in AIAA Jour., v. 3: 1144-1146, June 1965.

A new model is offered as an explanation of the observation that aluminized ammonium perchlorate composite propellants exhibit a low-pressure burning limit that is generally higher than the low-pressure stable deflagration limit as determined in a strand burner. The model resolves some of the difficulties which are apparent when attempting to identify criteria for low frequency combustion instability with low pressure extinction criteria. The model also enables a treatment of extinction in terms of the kinetics of the propellant flame reactions, yielding a new form of equation for relating L* (ratio of chamber volume to nozzle throat area) and extinction pressure, which is in satisfactory agreement with the available data.

IMPLICATIONS OF A STEADY-STATE SOLID

PROPELLANT COMBUSTION MODEL TO A LOW PRESSURE DEFLAGRATION LIMIT, by R. F. Chaiken. [1965] 11p. incl. refs. (Bound with its AFOSR-65-1801; AD 458854) (AF 49(638)851) Unclassified

Many experimental and theoretical studies on solid propellant combustion, have led to a concept of combustion in which the solid ingredients gasify under the thermal influence of a flame to form reactive species which then undergo gas-phase redox reactions to propagate that flame. The mass-flow and energy of each reaction in the burning process is of necessity coupled to each other by the conservation equations. Several mathematical models of varying complexity have been developed to describe the steady-state coupling process, but few theoretical studies have been made of extending these models to low pressure deflagration limits. A notable exception to this is the work of Johnson and Nachbar in describing the pressure deflagration limit (P_{DL}) of burning strands of ammonium perchlorate (AP) monopropellant. These authors attempted to ascribe the low P_{DL} of AP strand burning to radiation heat losses from the burning surface. A somewhat simpler approach to the P_{DL} problem can also be obtained from the two-temperature postulate and thermal-layer treatment of steady-state combustion. This treatment of composite propellant burning yields a generalized burning rate expression in terms of parameters which can be readily related to the chemical kinetic processes occurring during combustion. It is the purpose of this note to show that this treatment also leads directly to a minimum burning rate with implications towards a low pressure deflagration limit.

KINETICS OF THE DECOMPOSITION OF ANHYDROUS PERCHLORIC ACID, by D. J. Sibbett and I. Geller. [1965] [32]p. incl. diagrs. refs. (Bound with its AFOSR-65-1801; AD 458854) (AF 49(638)566 and AF 49(638)851) Unclassified

The kinetics of the decomposition of gaseous anhydrous acid in the heterogeneous range between 165 and 256°C is studied. The decomposition reaction appears to be a surface catalyzed, consecutive step process. The initial step appears to be $HClO_4 + HClO_4 \rightarrow H_2O \cdot Cl_2O_7$. The decomposition of the latter species appears consistent with the mechanism suggested by Figini, Colloccia, and Schumacher for Cl_2O_7. However, the presence of water is believed to inhibit the surface reaction by competing more strongly for the reactive sites than can $HClO_4$. As the concentration of adsorbed water increases the reaction $HClO_4 + H_2O \rightarrow H_2O \cdot HClO_4$ forms a relatively more stable species than the anhydrous acid. The decomposition of the monohydrate is believed to continue until all of the species, $HClO_4$ is exhausted. It appears possible that a relatively minor part of the decomposition proceeds by a gas phase reaction under the conditions of these experiments.

STUDY OF THE REACTION OF PENTABORANE WITH HYDRAZINE AND SUBSTITUTED HYDRAZINES, by H. V. Seklemian, R. W. Lawrence, and G. A. Cuter. Final rept. Mar. 1, 1962-Feb. 28, 1965. Apr. 1965 [41]p. incl. illus. diagrs. tables, refs. (Rept. no. 3015) (AFOSR-65-1058) (AF 49(638)1122) AD 619513 Unclassified

Pentaborane and hydrazine were allowed to react in an inert solvent under dilute conditions. The process includes an initial fast reaction followed by a slow reaction that evolves hydrogen and an insoluble solid product. The hydrogen evolution was found to be first-order process with a rate constant of $1.74 \pm 0.1 \times 10^{-4}$ sec^{-1} at 25°C. The rate-determining step was found to be dependent only on the hydrazine concentration. Traces of hydrazine are believed to catalyze the decomposition of a postualted soluble intermediate so that an ionic-type mechanism involving acid-base catalysis is proposed. The reaction in the gas phase yields the same reaction products; however, the reaction is considerably faster. The same process and mechanism holds true for monomethylhydrazine or unsym-dimethylhydrazine in place of normal hydrazine. The products of these reactions with hydrazine and monomethylhydrazine are insoluble in non-polar solvents. They thermally decompose, evolving hydrogen, and they are believed to be polymeric substances. Attempts to obtain a definitive structure for the insoluble products by nuclear-magnetic-resonance techniques and high-resolution infrared analysis were unsuccessful. (Contractor's abstract)

RESEARCH ON VOLTAGE GRADIENTS FROM ELECTRON-ACOUSTICAL WAVES, by C. B. Kretschmer. Final technical rept. Mar. 1965, 29p. incl. illus. diagrs. tables, refs. (Rept. no. AN-1398) (AFOSR-65-1044) (AF 49(638)1347) AD 620223 Unclassified

Experimental work was conducted on an energetic argon-fed hollow cathode arc. Microwave interferometer measurements at 1.20×10^{11} cps gave a plasma density of 1.8×10^{14} electrons/cm^3, and spectroscopic line intensity measurements yielded an electron temperature of 1.1 ev. The voltage gradient along the arc was less than 0.1 v/cm. Since a voltage gradient of 10 to 20 v/cm is required to produce current densities of the observed magnitude in a plasma with an electron temperature of 1.1 ev by ordinary conduction, it is believed that the arc current is carried by electrons which are trapped in electron plasma waves and accelerated to high velocity by the waves. Attempts to detect radiation emitted by the plasma at the electron plasma frequency gave inconclusive results. The arc column was found to radiate as much as 73% of the input power in the vacuum UV region between 400A and 1000A, with a large fraction concentrated between 430A and 540A. Many lines of singly through quadruply ionized argon were identified. Doubly ionized argon appeared to be the most abundant species.

UNSTABLE OSCILLATIONS IN ENERGETIC ARCS (Abstract), by C. P. Kretschmer [1965] [1]p. (Bound with its AFOSR-65-1266, AD 622527) (AF 49(638)1347) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

Experimental work was conducted on an energetic argon-fed hollow cathode arc. The arc was operated at currents of 100 to 200 amp with a total voltage drop of about 75 v, in a longitudinal magnetic field of 4400 gauss. The gas pressure in the region adjacent to the arc was less than 10^{-3} torr. The arc column had a diameter of 1.27 cm and a length of 60 cm. Microwave interferometer measurements at 1.20×10^{11} cps gave a plasma density of 1.8×10^{14} electrons/cm^3, and spectroscopic line intensity measurements yielded an electron temperature of 1.1 ev. Langmuir probes inserted into the arc column assumed floating potentials 0.5 to 2 v positive with respect to the anode. The dc difference in floating potential between probes separated by 22 cm indicated that the voltage gradient along the arc was less than 0.1 v/cm. The arc column was found to radiate as much as 73% of the input power in the vacuum ultraviolet region between 400A and 1000A, with a large fraction concentrated between 430A and 540A. Many lines of singly through quadruply ionized argon were identified. Doubly ionized argon appeared to be the most abundant species.

[NEW METHODS IN NONEQUILIBRIUM STATISTICAL MECHANICS] by G. Sandri. Final technical rept. Jan. 1-Dec. 31, 1964. Jan. 20, 1965 [5]p. (AFOSR-65-0204) (AF 49(638)1224) Unclassified

The aim of the research program is a complete theory of gases based on the first principles of nonequilibrium statistical mechanics. The main controllable properties of the relevant gases and plasmas are their transport coefficients, these coefficients are completely determined by the probability distribution for the velocity of the particles that constitute the medium. A new method of analysis of the velocity distribution is being developed which has proven successful in major areas where older approaches are inadequate. The limitations of previous theories have confined their applicability to unrealistic potentials and to unrealistic density and temperature regimes. Through the new methods, several of these limitations have been removed. The complete Coulomb interaction as well as short-range attraction can be treated systematically for the first time. The major problem of nonequilibrium 3-body contributions has received an important contribution by the recent solution of the hard-sphere 3-body problem. A list of publications is appended.

A NEW METHOD OF EXPANSION IN MATHEMATICAL PHYSICS. I, by G. Sandri. [1965] [27]p. incl. diagrs. (AFOSR-65-1742) (AF 49(638)1224) AD 625693 Unclassified

Also published in Nuovo Cimento, Series X, v. 36 67-93, Mar. 1, 1965.

The general method for uniformizing perturbation expansions introduced recently in The New Foundations of Nonequilibrium Statistical Mechanics, by G. Sandri, Rutgers Lectures 1961-1962 (method of extension) is further developed. The presentation given in this paper is self-contained and does not rely on explicit use of composition of mappings. The compatibility conditions that the method gives rise to are discussed and so is the basic induction theorem. A new very general uniformizing formula is derived. The Poincare-Lighthill procedure is deduced from this formula in a simpler fashion than in the previous paper. A general theory for the Fourier transforms of extended functions is developed. (Contractor's abstract)

HARD-SPHERE THREE-BODY PROBLEM. I (Abstract), by G. Sandri, R. Sullivan, and W. Thurston. [1965] [1]p. [AF 49(638)1224] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10, 236, Feb. 25, 1965.

In view of the importance of calculating in detail 3-body phase-space integrals for nonequilibrium problems, we have developed the rigorous solution for the hard-sphere model. Contrary to expectation (and to existing "proofs"), 4 successive binary collisions are possible among 3 identical spheres. We give now (1) the exact form of the 4-collision domain and (2) a rigorous proof of the impossibility of 5 collisions, in 3 or more dimensions.

VARIATIONAL TECHNIQUE FOR THE ELECTRICAL CONDUCTIVITY OF A PLASMA (Abstract), by F. Terkelsen and G. Sandri. [1965] [1]p. [AF 49(638)1224] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10, 232, Feb. 25, 1965.

The variational principle for the electrical conductivity of a plasma, recently used by Bernstein and Robinson, is established rigorously under very general conditions and applied to the complete kinetic equation obtained recently.

[INTERACTION PHENOMENA IN ROTATIONAL STREAMS] by C. D. Donaldson. Final rept. Oct. 29, 1965, 3p. incl. refs. (AFOSR-65-2206) (AF 49(638)-1437) AD 627453 Unclassified

Methods were derived for solving equations of motion for an inviscid, incompressible fluid with rotation. These solutions are valuable in understanding fluids undergoing strong interactions. Both analytical and numerical approaches were made. It is concluded that a numerical approach is quite likely to be successful.

33

Aeronautical Research Associates of Princeton, Inc., N. J.

ROTATIONAL SOLUTIONS OF THE EULER EQUATIONS, by D. A. Barnes and R. D. Sullivan. Sept. 1965 [30]p. incl. diagrs. refs. (ARAP rept. no. 79) (AFOSR-65-2656) (AF 49(638)1437) AD 627972 Unclassified

Steady-state rotational solutions of the Euler equations for an incompressible fluid are discussed, with emphasis on flows characterizing the impingement of a rotational jet upon a plane surface. These solutions are aimed at understanding actual rotational flows undergoing strong interactions, where, to a first approximation, viscous stresses may be ignored after the creation of vorticity. Of particular interest are 2 axially symmetric flows which have finite velocity profiles at large distances from the impingement plane. One of these has a parabolic profile and represents a flow inside a cylindrical cup of finite radius, the other has a Gaussian profile with

streamlines extending to infinity. Analytical expressions and computed values for velocities, velocity gradients, and pressures are given, and a comparison is made with experimental data. (Contractor's abstract)

THREE-DIMENSIONAL ROTATIONAL SOLUTIONS OF EULER'S EQUATIONS FOR AN INCOMPRESSIBLE FLUID (Abstract), by D. A. Barnes. [1965] [1]p. (AF 49(638)1437) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 537, Apr. 26, 1965.

A class of axially symmetric solutions of the inviscid hydrodynamic equations is discussed, with particular emphasis on flows that resemble the impingement of a rotational jet upon a flat plate. Depending upon the axial velocity gradient, the stream lines can adopt a 1- or many-celled pattern, similar to the behavior of viscous fluids between rotating cylinders. It is possible for these cells to exist in both the radial and axial directions. In some cases, the cell structure is replaced by an undulating flow.

CONSTRUCTIVE APPROACH IN THE METHOD OF EXTENSION, by G. Sandri and R. Sullivan. [1965] [2]p. incl. refs. (AFOSR-65-1746) (AF 49(638)1461) AD 625978 Unclassified

Also published in Nuovo Cimento, Series X, v. 37: 1799-1800, June 16, 1965.

A constructive procedure is presented to determine the fundamental variables required by a method of extension introduced earlier. The construction allows for the introduction of arbitrary scaling functions which are determined by the requirement that the expansion of the unknown function be uniformly valid. The theory is illustrated through the example of an exponential decay for which: $\frac{\partial f}{\partial t} = \epsilon f$, $f(0) = 1$. The extension $f(\tau_0, \tau_1)$ of $f(t)$ is introduced where τ_0 and τ_1 are functions of t. These functions are solved to yield $\tau_1(t) = \epsilon kt + \tau_1(0)$.

RESEARCH ON ENERGY ABSORBING STRUCTURES. PART III, by S. Uchiyama, D. H. Platus and others. Final rept. Feb. 1964-Feb. 1965, 95p. incl. illus. diagrs. table, refs. (AFOSR-65-0420) (AF 49(638)1144) AD 615653 Unclassified

Three studies related to expandable and energy-absorbing structures for aerospace application are presented. The first study is a very-large-deflection analysis of corrugated thin-shell structures employing the principle of minimum complementary energy in conjunction with a variational technique. A second area of study is an investigation of structural damping from hysteresis effects in metals associated with large inelastic deformations. Finally, a novel concept is introduced for a flexible metallic seal, and a theoretical and experimental study is described which demonstrates the feasibility of the concept as applied to a fuel expulsion tank.

VERY-LARGE-DEFLECTION BEHAVIOR OF CORRUGATED STRIPS, by D. L. Platus and S. Uchiyama. [1965] [4]p. incl. diagrs. table. (AF 49(638)1144) Unclassified

Published in AIAA Jour., v. 3: 1549-1552, Aug. 1965.

A technique is described for handling the very-large-deflection behavior of a corrugated strip in terms of the solution to a curved cantilever beam with an end load. A stepwise incremental solution is obtained for a modified Bernoulli-Euler equation, which permits both elastic and plastic deformation of beams of arbitrary shape. The technique involves incremental loads as well as incremental elements of the structure. For each incremental load application, the corresponding deformation of the curved cantilever beam is determined by accumulating rotations and deflections of short straight cantilever beams which approximate the structure. Each incremental cantilever beam is subjected to a linearly varying moment and in the plastic-range, linearly varying flexural rigidity. Results of the method are compared with a closed-form elastic solution and with experimental results. Few increments of load and length are required, so that the method is suitable for use with a desk calculator.

AS LONG AS YOU'RE UP GET ME A GRANT: THE PREPARATION OF UNSOLICITED RESEARCH PROPOSALS, by H. Wooster. Mar. 1, 1965, 18p. (AFOSR-65-0392) AD 614894 Unclassified

Presented at meeting of the Society of Technical Writers and Publishers, Delaware Valley Chapter, Drexel Inst., Philadelphia, Pa., Feb. 23, 1965.

The preparation of unsolicited research proposals is an art form peculiar to the R & D or Gilded Age. There are 4 stages in the search for research support: reconnaissance and target identification; contact; proposal writing and submission; and patient waiting. Target identification is a sort of technical intelligence. A list of source documents for determining the research interests of potential fund sources is given; the search should not end until the lowest level in an agency who can say "Yes" and make it stick is identified. Rules for bearding bureaucrats in their lairs during the contact, and ascertaining the oestrus cycle of the agency are followed, at long last, by suggestions for proposal preparation—title, abstract, detailed description of the work to be undertaken, and a cost estimate. Three of these are described as exercises in creative writing, the appendix gives specific recommendations for the preparation of cost estimates for grants and contracts.

REPORT ON A CONFERENCE ON THE EDUCATION OF SCIENCE INFORMATION PERSONNEL HELD JULY 27-28, 1964, IN CLEVELAND, OHIO, by R. Swanson. [1965] [2]p (AFOSR-65-0859) AD 618426 Unclassified

Also published in Amer. Doc., v. 16: 34-35, Jan. 1965.

This conference, sponsored by the Center for Documentation and Communication Research of the School of Library Science, Western Reserve U., was intended as a sequel to conferences on training held at the Georgia Inst. of Tech. in Oct. 1961 and Apr. 1962. Recent progress in the education of science information personnel was the main topic and included discussions of the training of librarians, inter-university efforts and cooperative efforts between universities and industry for program enrichment and on-the job training for students, and the need for more sponsorship of education programs in the information sciences The conference served as a forum for self appraisal as well as a medium for information exchange.

SOME OBSERVATIONS ON INSDOC SERVICES, by H. Wooster. [1965] [10]p. incl. tables. (AFOSR-65-1979) AD 623537 Unclassified

Also published in IASLIC Bull., v. 10: 1-10, Mar. 1965.

The Indian National Scientific Documentation Center (INSDOC) is reviewed as a prototype of a national documentation center, viewed against plans for similar activities in the United States. Information was gathered during the author's visit to INSDOC in Feb. 1964. A description of INSDOC's use of Colon Classification in preparing a classified list of titles of overseas scientific journal articles is followed by the suggestion that their efforts might be better spent in distributing facsimile tables of contents; that preparation of more detailed abstract lists might better be delegated to the several Indian Scientific Institutes; that INSDOC strengthen its role as a national referral center and become a coordinator among the technical information activities of the various Institutes rather than try to do the job alone.

MANAGEMENT ASPECTS OF THE AFOSR MANAGEMENT CONTROL DATA SYSTEM "SOFTWARE", by D. R. Currier. Mar. 1, 1965 [41]p. incl. tables. (AFOSR-65-0272) AD 612080 Unclassified

The development of the AFOSR Management Control Data System input software is discussed. The vital relationship of this input software in the concept of the total system is stressed. The nature of MCDS input, the input/output data relationships, and the significance of the data transition points are defined. Ten Commandments of input data handling necessary to provide accurate, reliable, and timely output from the data store are presented. The application of behaviorism and communication theory to the handling of input software are described and related to the design of forms, methods, and procedures used by AFOSR to generate, record, process, and control the flow of input data to the data store of the MCDS.

DIRECTORATE OF CHEMICAL SCIENCES PROGRAM REVIEW, FISCAL YEAR 1965. ELEVENTH ANNUAL CHEMISTRY PROGRAM REVIEW, ed. by A. J. Matuszko and M. D. Sprinkel. Nov. 1965, 2[illegible]9p. incl. illus. diagrs. table. (AFOSR-65-1559) AD 627666 Unclassified

The purpose of the review is to provide a unified record of research in progress together with the achievements resulting from the AFOSR program of supported basic research in chemistry There are 3 main sections in

the review. For each project which was completed during fiscal year 1965, a concise factual summary (including administrative data as well as research accomplishments) is provided. Another section contains geographic and other program statistics, a list of all scientific reports received during the year, and a list of the active projects. A third section is devoted to research high-lights, items of special interest described in terms understandable by the nonspecialist.

MULTIVARIABLE SYSTEMS, by B. S. Morgan, Jr. [1965] [9]p. incl. diagr. refs. (AFOSR-65-1978) AD 626566 Unclassified

Also published in IEEE Internat'l. Conv. Rec., Pt. 6: 87-95, 1965.

The central theme of the paper is what to do with the coupling or interaction as it exists in multivariable systems. In a discussion of descriptions of multivariable systems, emphasis is placed on the influence that the design of multivariable systems has had on the theory of dynamical systems. Discussed briefly is the future influence of automata theory on multivariable systems. Reported in detail are design techniques for noninteracting systems and for improvement of performance by use of interaction. Under applications a discussion of design techniques used in practical multivariable systems is presented. (Contractor's abstract)

THE FUNDAMENTAL RESEARCH ACTIVITY IN A TECHNOLOGY-DEPENDENT ORGANIZATION, by H. M. Vollmer, L. W. Bass and others. [1965] [109]p. incl. refs. (AFOSR-65-2691) AD 628747 Unclassified

Presented at Tenth Inst. on Research Administration, Washington, D. C., Apr. 26-29, 1965, under the sponsorship of American U.

The fundamental research activities of an R and D organization are presented as important both for providing specific research results in areas of potential payoff for the organization and in providing a window between science and technology. The need and potential for the latter activity are inherent in the recognition that a very large portion of the scientific research on which a given technology depends is always done by other organizations. The discussion deals primarily with the opportunities and techniques for providing this window.

THE IMPORTANCE OF PROPERLY DESCRIBING THE OBJECTIVES OF THE AFOSR PROGRAM, by W. J. Price. Oct. 1965 [17]p. incl. diagrs. (AFOSR-66-0191) AD 628527 Unclassified

Presented at meeting of the OAR Scientific Advisory Group, Nov. 19, 1965.

The role of fundamental research in a mission-oriented agency is discussed with particular reference to the external contract and grant program of the Air Force Office of Scientific Research. A brief historical account of the evolution of this program points up the tendency to describe the contribution of Air Force research in terms of extreme positions — either in completely mission-orientated terms in which all research supported shows clearly its relationship and application to service needs, or completely science-oriented terms which describe the Air Force research roles as primarily a contribution to the large pool of scientific knowledge from which the Air Force and others draw. The point is made that the neglect of either position, and particularly of the ole that lies between the extremes, is very unfortunate inasmuch as it results in missing important justification for the research program, and important guidance for the management of the program. The AFOSR is described as a Research Institute — consisting of managers, researchers, and advisors — seeking to help insure the timely impact of science on the Air Force In carrying out this role it accomplishes research and also it provides communication between the scientific community and the Air Force. The research accomplished is described as phenomena-oriented research which is motivated by either helping a development group obtain the required understanding of phenomena key to technological barriers or by seeking to pioneer or colonize new fields of science holding out high promise for scientific discovery out of which innovations may arise which will bypass current technology barriers.

ESR OF X-IRRADIATED SILVER NITRATE, by W. C. Mosley and W. G. Moulton. [1965] [8]p. incl. diagrs tables, refs. (AFOSR-65-2591) (AF AFOSR-63-288) AD 629663 Unclassified

Also published in Jour. Chem. Phys., v. 43: 1207-1214, Aug. 15, 1965.

Four paramagnetic species have been detected by ESR in single crystals of $AgNO_3$ x irradiated at 77°K. The principal values and corresponding principal axes of the g tensors and hyperfine tensors have been determined. An 8-line spectrum, 4 doublets, is due to Ag^{++}. A 24-line spectrum, 4 sextets, has been assigned to a species believed to be $AgNO_3^-$. A spectrum of 4-triplets characteristic of stationary NO_2 molecules was observed in previously irradiated crystals and crystals doped with $AgNO_2$. A spectrum consisting of 2 weak singlets is due to an unidentified species. This is the only species stable at room temperature. Discussions of the orientations, configurations, mechanisms for production, and annealing characteristics of the several species are given. (Contractor's abstract)

VECTOR LYAPUNOV FUNCTIONS AND CONDITIONAL STABILITY, by V. Lakshmikantham. [1965] [10]p. (AFOSR-66-1209) (AF AFOSR-64-670) AD 641881 Unclassified

Also published in Jour. Math. Anal. and Appl., v. 10: 368-377, Apr. 1965.

Sufficient conditions for conditional stability and boundedness of solutions to non-linear differential equations are obtained in terms of vector Lyapunov functions. Ordinary differential equations, differential equations with unbounded operators in Banach spaces, functional differential equations, and parabolic differential equations are classes for which this theory is applicable.

WADEX WORD AND AUTHOR INDEX. PART I. DESCRIPTION. PART II. PROGRAM DOCUMENTATION, by E. A. Ripperger, H. Wooster and others. June 1965 [193]p. incl. diagrs. tables. (Rept. no. AMR 38) (AFOSR-65-2001) [AF AFOSR-64-33] AD 623162 Unclassified

The WADEX (Word Author inDEX) for Applied Mechanics Reviews, v. 16, 1963 is described. Titles are printed fully, including the author's name. Each title begins at the left side of the column and occupies as many lines as necessary. A designator is either a word in the title (except forbidden words) or an author's name. Designators are sequenced alphabetically and are given out of context at the left of the title. If there is more than one identical designator, titles are alphabetized according to the alphabetical position of the first author. If there are several identical designators with indentical authors, they are sequenced according to review number. The reference number indicates year, month, and review number in Applied Mechanics Reviews proper. It is printed in line with the designator on the right side of the column. WADEX is arranged in 2 columns with pagination at the bottom and a dictionary entry at the top of the page. The page is reduced about 50% from the compuscript. Certain combinations of words are artificially hyphenated to make listing of some papers more meaningful and useful. Whenever a designator is repeated in a given column, subsequent printing of the designator out of context is suppressed. However, the first instance of a designator out of context in any column is always printed. This is designed to improve readability The computer printout is a camera-ready copy with 6 5 average entry per paper including 1.5 for authors.

ANALYSIS OF AEROSPACE FUNDING AND EMPLOYMENT—FISCAL YEARS 1956 TO 1966, by R. D. George and E. M. Phelan. Sept. 1965 [42]p. incl. diagrs. tables, refs. (Rept. no. AR-65-5) (AF 49-(638)1259) AD 478017 Unclassified

U. S. Government aerospace funding for fiscal years 1956 to 1966 were analyzed to determine significant trends and their effects on employment in the aerospace industry. Analysis showed that aerospace expenditures followed an uninterrupted upward trend for almost a decade and then turned downward in fiscal 1964. Aerospace expenditures are now beginning to increase because of world conditions. This increase and the emphasis on R and D funding indicate the importance of maintaining teams of qualified scientists and engineers during periods of reduced funding. Assigning aerospace scientists and engineers to area of opportunity programs may be a way of keeping industry teams intact.

METHODOLOGICAL APPROACH TO PLANNING AND PROGRAMMING AIR FORCE OPERATIONAL REQUIREMENTS, RESEARCH, AND DEVELOPMENT (MAPORD), by H. E. Emlet, Jr. Oct. 1965 [96]p. incl. diagrs. tables. (Rept. no. AR-65-4) (AF 49(638)1259) AD 479811 Unclassified

The methodological approach to planning and programming Air Force operational requirements, research, and development (MAPORD) is a technique for identifying, according to the best available judgments, the elements and relations which are the basis for decisions in planning and programming Air Force operational requirements, research, and development. The technique employs a series of interlocking matrices which provide high visibility of the pattern of elements and relations; flexibility in modifying the pattern in response to changing events, changing emphases, and experimentation on the effects of altering judgments; and as rigorous a means as possible of relating judgments to each other and to a balanced program. The method is designed for application to electronic computers to afford high-speed updating, revision, interrogation, printout, and performance of all routine identifications of relations in the creation and maintenance of the MAPORD pattern. The method at its present stage of development incorporates a rigorous means for identifying certain broad categories of importance and is designed to accommodate techniques for further sorting of relative importance if and when such techniques can be defined.

HUMAN AND ANIMAL VIGILANCE, by H. J. Jerison. [1965] [3]p. incl. table. (AFOSR-66-1191) (AF AFOSR-64-150) AD 641703 Unclassified

Presented at Fifteenth Internat'l. Cong. of Applied Psychology, Ljubliana (Yugoslavia), Aug. 6, 1964.

Also published in Perceptual and Motor Skills, v. 21, 580-582, 1965.

Experiments with both men and monkeys, summarized in this report, indicate that vigilance decrements are associated with the ease or difficulty of observing. A given set of signals may be detected often or rarely by human observers, depending on how easy it is to watch the background of stimulus events within which signals can occur.

58

Antioch Coll. Behavior Research Lab., Yellow Springs, Ohio.

THE ELICITED OBSERVING RATE AND DECISION PROCESSES IN VIGILANCE, by H. J. Jerison, R. M. Pickett, and H. H. Stenson. [1965] [22]p. incl. diagrs. tables, refs. (AFOSR-66-1170) (Sponsored jointly by Aerospace Medical Research Laboratories; and Air Force Office of Scientific Research under AF AFOSR-65-150) AD 638785 Unclassified

Also published in Human Factors, v. 7 107-128, 1965.

Observers detected many more of a fixed number of signals when these were among stimuli presented at 5 per min than when these were among stimuli presented at 30 to 60 per min. The effect, which is associated with either the signal probability or the non-signal stimulus density, is analyzed with conventional measures and with measures from the theory of signal detectability (TSD). The TSD measures were used to define several possible modes of observing, and the model of vigilance based on decisions about observing could then be related to decision processes in detection performance as considered in TSD. If a single measure of the probability of alert observing is required, the best one is the percentage of detections of the readily detectable signal of the vigilance task. However, the TSD analysis suggested various different "mixes" of modes of observing for the sub-groups in this experiment, and these mixes could be specified with the help of heuristic models relating performance measures to the probability of observing.

VARIATIONS IN SHORT-PERIOD RECORDS FROM CANADIAN SEISMOGRAPH STATIONS, by M. Ichikawa and P. W. Basham. [1965] [33]p. incl. diagrs. tables, refs. (AFOSR-66-0429) (AF AFOSR-62-453) AD 625677 Unclassified

Also published in Canad. Jour. Earth Sci., v. 2: 510-542, 1965.

A study of the relative recording ability of some of the Canadian seismograph stations has indicated a pattern of P-wave amplitude anomalies varying from station to station and, at any one station, showing a significant regional variation which does not seem to be entirely produced by source mechanism effects. Rather local crustal effects appear important, and spectral studies indicate that significant effects can be produced in low velocity upper crustal layers. The initial investigation of early P-wave trains and theoretical models suggests that these crustal effects can best be examined by the use of apparent incident angles, and that spectral amplitude decrements change significantly from station to station, although this is unexplained. It appears that the different recording ability of stations can be explained by a combination of shallow crustal effects operating on the signal amplitude and the local noise properties. (Contractor's abstract)

EVIDENCE FOR IONIC CONDUCTION IN CERIUM OXIDE (Abstract), by E. L. Holverson and C. J. Kevane. [1965] [1]p. [AF AFOSR-64-609] Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 172, Feb. 25, 1965.

Electrical conduction in ceramic cerium oxide was studied in the temperature range from 300° to 800°C and over a range of oxygen partial pressures from 1 to 10^{-4} atm. The impurity concentrations in the material studied were determined spectrographically and by controlled addition of impurities. The study consisted of applying a constant direct voltage across cerium oxide samples doped with varying amounts of calcium oxide, and observing the current transients as well as the potential distribution as a function of the oxygen pressure and the temperature. Ohm's law was found to be applicable for the potential difference between the potential probes. The potential distribution was found

to be inconsistent with the concept of a decomposition potential. Polarization effects were found to be prominent: anomalous potential distributions, large polarization voltages, and decays in current immediately after application of a voltage were found. It was concluded that the results were consistent with the space-charge polarization theory of Jaffé. The passage of direct current through a calcium-doped cerium oxide sample was accompanied not only by sample discoloration but also by the evolution of oxygen, as was confirmed by mass spectrographic analysis. This positive identification of oxygen as the evolved gas confirms the previous interpretation that conduction in calcium-doped cerium oxide is partially ionic in nature.

DOCUMENT ASSOCIATION AND CLASSIFICATION BASED ON L-LANGUAGES, by J. Sanders. [1965] [5]p. (AFOSR-65-1589) (AF AFOSR-62-289) AD 623495 Unclassified

Also published in Jour. Assoc. Comput. Machinery, v. 12: 249-253, Apr. 1965.

Measures of document connectedness and association are defined whose nature arises from the internal structure of the documents themselves rather than via the judgment of an external observor. The intent is to develop the theoretical structure in such a way that the processing of documents into the various classifications can be done entirely by machine. The theory is founded on a set of formal languages, the L-languages. A formal presentation of the theory is made and examples of 5 documents are given and discussed. The implications of the theory for automated document retrieval are discussed in conjunction with various extensions of the formal theory. (Contractor's abstract)

A HYBRID ANALOG-DIGITAL PSEUDO RANDOM NOISE GENERATOR, by R. L. T. Hampton. Jan. 1964, 45p. incl. diagrs. table, refs. (AFOSR-64-0393) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-89 and National Aeronautics and Space Administration) AD 434556 Unclassified

Also published in 1964 Spring Joint Computer Conf.; AFIPS Conf. Proc., Washington, D. C. (Apr. 1964), Baltimore, Spartan Books, Inc., v. 25: 287-301, 1964.

Also published in Simulation, v. 4. 179-187, Mar. 1965.

The design of a hybrid analog-digital pseudo-random noise generator intended to replace conventional random-noise generators in analog and hybrid computer simulating is described. It is capable of producing 4 essentially uncorrelated binary outputs from a single 25-stage shift-register. The length of the pseudo-random output sequence is 33, 554, 431 bits which is equivalent to several thousand computer runs.

A HYBRID ANALOG-DIGITAL PARAMETER OPTIMIZER FOR ASTRAC II, by B. A. Mitchell, Jr. Jan. 16, 1964, 37p. incl. illus. diagrs. table, refs. (ACL memo. no. 90) (AFOSR-84-0397) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-89 and National Aeronautics and Space Administration) AD 434559 Unclassified

Also published in 1964 Spring Joint Computer Conf., AFIPS Conf. Proc., Washington, D. C. (Apr. 1964), Baltimore, Spartan Books, Inc., v. 25. 271-285, 1964.

Also published in Simulation, v. 4. 399-411, June 1965.

A new automatic multi-parameter optimizer for iterative differential analyzers employs sequential random parameter perturbation. The nominal parameter point changes whenever the random perturbations improve the system performance measure. Binary counters operate simple digital-to-analog converters to implement parameter storage, multiplication, and step-size changes. All-digital logic yields different types of random perturbations, viz. simple random walk, random walk with reflecting or absorbing barriers, and various types of correlation over successive perturbations.

EXPERIMENTS USING PSEUDO-RANDOM NOISE, by R. L. [T.] Hampton. [1965] [9]p. incl. diagrs. tables. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-89 and National Aeronautics and Space Administration) Unclassified

Published in Simulation, v. 4: 246-254, Apr. 1965.

The results of experiments performed with pseudo-random noise sequences are described. It is shown that Gaussian noise can be easily produced from such sequences. It is also demonstrated that the sequences themselves have a binomial probability distribution The

correlation technique investigated, using pseudo-random noise, makes possible a continuous recording of a system's impulse response without the use of sophisticated hardware. The impulse response obtained from the cross-correlation experiment can be approached from either the positive or negative direction, i.e., τ can be made not only a time delay, but also a time advance. This enables one to observe the trailing end of a waveform before viewing its leading end. It also permits a quick experimental verification of the correlation property that $R_{xy}(\tau) = R_{xy}(-\tau)$. Examples for a first- and second-order system are given. (Contractor's abstract)

ASTRAC II PLUG-IN DIODE FUNCTION GENERATOR, by R. H. Whigham. [Feb. 1965] 1p. incl. diagr. (ACL memo no. 101) (AFOSR-65-0585) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-89 and National Aeronautics and Space Administration) AD 615439 Unclassified

The ASTRAC II plug-in diode function generator consists of a plug-in module which covers the patching area of 2 operational amplifiers on a standard analog-computer patchbay. The circuit utilizes both of the covered amplifiers to provide both positive and negative slopes. Six breakpoints are fixed at ± 1, ± 3, and ± 5.5 v. Slopes and a d-c adjustment are set by means of eight 10-turn wire-wound potentiometers. The input diodes reduce the input loading. Shunt diodes and low impedance levels improve the frequency response. The maximum current requirement is 18 ma with all slopes maximum, some positive and some negative. The error for a given frequency depends on the particular function generated. In general, however, the error is less than 0.5% of half scale for input frequencies less than 5 kc with slopes less than 2. The temperature drift is approximately 2 mv/°C.

A FAST 10V DIODE QUARTER SQUARE MULTIPLIER, by R. H. Whigham. [1965] [7]p. incl. illus. diagrs. tables. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-89 and National Aeronautics and Space Administration) Unclassified

Published in Simulation, v. 5: 114-120, Aug. 1965.

This report describes the design and performance of a fast wideband quarter-square diode multiplier designed to work the ± 10-v low-impedance computing circuits of a high-speed iterative differential analyzer (ASTRAC II), or in other hybrid analog-digital computer systems. To reduce cost, the new multiplier employs absolute-value squaring circuits and does not require committed computer amplifiers. Improved combination shunt-series switching circuits and low resistance values ensure wide bandwidth (± 0.5% of half-scale dynamic error at 10 kc, < 1 degree phase shift below 70 kc). Temperature-compensating diodes in the bias networks reduce thermal drift below 0.7 mv/°C, so that the multiplier static accuracy of ± 0.20% of half-scale is maintained from 15 to 40°C. A number of useful design hints are listed. (Contractor's abstract)

HYBRID-COMPUTER TECHNIQUES FOR MEASURING STATISTICS FROM QUANTIZED DATA, by G. A. Korn. [1965] [10]p. incl. diagrs. table, refs. (Bound with its AFOSR-65-2313; AD 631635) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-89] and National Aeronautics and Space Administration) Unclassified

Published in Simulation, v. 4: 229-239, Apr. 1965.

Digital data processing necessarily involves quantization (roundoff) of input data. The statistical theory of amplitude quantization indicates that the effects of quantization on statistics are often negligible or can be approximately predicted and corrected, even with surprisingly coarse quantization. This tutorial paper reviews contributions to the theory made in England, the Netherlands, and Russia, as well as B. Widrow's original work in this country. Applications to remarkably inexpensive hybrid analog-digital averaging computers and correlators are also discussed. The theory can pay very handsome practical dividends; in many applications, 2- to 4-bit analog-to-digital converters and data-transmission channels can yield averages, mean squares, and correlation functions with 10- to 20-bit accuracy, and one-bit (polarity-coincidence) correlators are often practical. EFFECT OF PRESSURE ON THE DIFFUSION RATE IN

METALS. by R. H. Dickerson, R. F. Bonanno, and C. T. Tomizuka. [1965] [7]p. incl. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)790 and Atomic Energy Commission) Unclassified

Published in Physics of Solids at High Pressures, Proc. First Internat'l. Conf., Tucson, Arizona (Apr. 20-23, 1965), ed. by C. T. Tomizuka and R. M. Emrick. New York, Academic Press, 1965, p. 329-335. (AFOSR-66-0131)

The molar activation volume ΔV in a diffusion process is defined as $(\delta \Delta G/\delta p)_T$, where ΔG is the molar Gibbs free energy for the self-diffusion process, p is pressure and T temperature. Using a gas pressure system up to 9 k bar at temperatures of about 1000°C, the effect of pressure on the self-diffusion rate in Au was determined, and ΔV evaluated from the results. ΔV amounts to about 70% of the molar volume; this estimate agrees with that obtained by summing the volume of a mol of vacancies at rest and the volume increase caused by a mol of vacancies moving to the activated state. The effect of pressure on the diffusion rates of In and Sb in Ag, and the self-diffusion rate of Ag itself are also determined. The difference between the ΔV's corresponding to self-diffusion and the diffusion of In and Sb respectively are compared with those calculated from the Lazarus-Le Claire and the Corless-March theories; the agreement with the latter theory is close.

EFFECT OF HYDROSTATIC PRESSURE ON THE CURIE POINTS OF SEVERAL FERRITES, by C. L. Foiles and C. T. Tomizuka. [1965] [5]p. incl. diagrs. tables, refs. (AFOSR-65-1745) (AF AFOSR-63-105) AD 641494 Unclassified

Also published in Jour. Appl. Phys., v. 36: 3839-3843, Dec. 1965.

The effect of hydrostatic pressure on the Curie temperature T_c was measured for 4 members of a Ni-Zn ferrite series (30%, 50%, 80%, and 100% NiO) and for 2 members of a gadolinium-iron-garnet series ($Gd_3AlFe_4O_{12}$ and $Gd_{1.5}Y_{1.5}Al_{0.5}Fe_{4.5}O_{12}$). A transformer technique was used for the measurements with the maximum pressure available being 8 kbar. The Curie temperature showed a linear increase with pressure and the slopes ranged from 0.58 ± 0.05 to 1.16 ± 0.07°C/kbar. The approximate Curie points varied from 153°C ($Gd_3AlFe_4O_{12}$) to 616°C (100% NiO ferrite). The samples with T_c less than 400°C were measured in a liquid-pressure system and the others were measured in a gas-pressure system. (Contractor's abstract)

EFFECT OF HYDROSTATIC PRESSURE ON THE NÉEL TEMPERATURE IN CHROMIUM, by T. Mitsui and C. T. Tomizuka. [1965] [2]p. incl. diagrs. refs. (AF AFOSR-63-105) Unclassified

Published in Phys. Rev., v. 137: A564-A565, Jan. 18, 1965.

The electrical resistivity of high-purity chromium polycrystal was measured as a function of temperature in the range of hydrostatic pressure from atmospheric pressure to 8 kbar. The Néel temperature, which manifests itself as the resistivity minimum, was observed to decrease linearly with pressure at a rate of 5.1 ± 0.2°K/kbar. The relative resistivity anomaly in the neighborhood of the Néel temperature was found to be pressure-insensitive. Attempts have been made to interpret the results in terms of the spin-density-wave theory. (Contractor's abstract)

EFFECT OF HYDROSTATIC PRESSURE ON THE NÉEL TEMPERATURE AND ELECTRICAL RESISTIVITY ANOMALY IN CHROMIUM METAL, by T. Mitsui. [1965] [9]p. incl. diagrs. refs. (AF AFOSR-63-105) Unclassified

Published in Physics of Solids at High Pressures, Proc. First Internat'l. Conf., Tucson, Arizona (Apr. 20-23, 1965), ed. by C. T. Tomizuka and R. M. Emrick. New York, Academic Press, 1965, p. 213-221. (AFOSR-66-0131)

The electrical resistivity of high-purity polycrystalline chromium was measured as a function of temperature in the range of hydrostatic pressures from atmospheric pressure to 8 kbar. The Neel temperature, which manifests itself as a resistivity minimum, was observed to decrease linearly with pressure at a rate of -5.1 ± 0.2°C/kbar. This value is in agreement with the one estimated by the thermodynamical relation of the second order phase transition. The electrical resistivity anomaly, which is associated with magnetic energy gaps introduced by the periodicity of antiferromagnetic spin arrangement, was found to be pressure insensitive. RADIATIVE LIFETIMES AND EXCITATION MECHANISMS IN HELIUM, by W. R. Pendleton, Jr and R. H. Hughes. [1965] [5]p. incl. diagrs. table, refs. (AFOSR-65-2776) [AF AFOSR-62-159] AD 629540 Unclassified

Also published in Phys. Rev., v. 138 A683-A687, May 3, 1965.

The radiative decay rates of the $n^1S(n = 4,5)$, 3^1P, $n^1D(n = 3,4,5)$, $n^3S(n = 4,5)$, $n^3P(n = 3,4,5)$ and $n^3D(n = 3,4)$ states of helium have been measured using pulsed, variable-energy electron-impact excitation and a sampling method of detection. The results agree well with previously published measurements. Experimental evidence is presented for the mechanisms involved in the collisional-transfer reactions where atoms in ^1P states excite ^3D levels: nF levels ($n > 5$) are populated by collisional transfer from n^1P levels and in turn cascade to the ^3D levels. Possible laser action in the $3^1P - 3^1S$ and $5F - 3^3D$ transitions is suggested.

COMBUSTION GAS EMITTED RADIATION AND CHEMILUMINESCENCE PHENOMENA (Abstract), by J. S. Gordon. [1965] [1]p. (Bound with its AFOSR-65-2238, AD 627978) (AF 49(638)1400) Unclassified

Spectral radiance-measurement discrete emission bands in combustion gases are being used to study and characterize chemiluminescence. A chemical kinetics interpretation of results is desired. A low pressure premix gas burner is being assembled for use with simple fuel oxidizer combinations (CHg O_2). Later experiments will use CHg NO, C_2H_2 N_2O and other systems (containing halogen, boron, etc.). This apparatus replaces the previous unsuccessful configuration in which the torch plume impinged on a nozzle section so as to exhaust selected portions of the flame gas (fast reaction zone) into a vacuum chamber Previous observation of strong chemiluminescence with O_2 isobutylene using this configuration could not be reproduced. The combustion gas will be optically scanned over the wavelength region of interest (2000 to 6000A) using a McPherson Model 235 grating monochromator and photomultiplier recorder system as functions of location within the flame. The objectives are to determine radiative lifetimes of selected species (CH, NO, OH, HCO, C_2 etc.) based on monochromator scan results, and departures from thermal equipartitions between rovibronic energy levels of selected species (interdepartures from the thermochemical equilibrium as defined by thermodynamic calculations as function of fuel oxidizer stoichiometry and location within the premix flame brush)

THE KINETICS OF THE HYDROGEN-FLUORINE REACTION. II. THE OXYGEN-INHIBITED REACTION, by J. B. Levy and B. K. W. Copeland. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-65-0692) (AF 49-(638)1131) AD 615181 Unclassified

Also published in Jour. Phys. Chem., v. 69 408-416, Feb. 1965.

The kinetics of the thermal, gaseous hydrogen-fluorine reaction have been investigated by a colorimetric technique. The reaction has been found to be inhibited by oxygen and the inhibited reaction was studied mainly at 132°, but also from 122 to 162 The experiments have been performed at a total pressure of about 645 mm, with oxygen varying from about 80 to 500 mm. Nitrogen and helium have been used to maintain the total pressure at the desired value. Hydrogen and fluorine pressures have been in the general range of 20-80 mm It has been found that the rate decreases with added oxygen but reaches a limiting value unaffected by further oxygen addition. The limiting rate obeys the expression $-d(F_2)/dt = k(F_2)(H_2)^{1/2}$ fairly well, but the curves of the integrated forms are linear only for about the first 50% of reaction, dropping off thereafter The Arrhenius plot for the rates from 132 to 162 C is linear, yielding

activation energy of 16.7 kcal/mol. The results are discussed in terms of a chain reaction involving the propagation steps, $H + F_2 \rightarrow HF + F$, $F + O_2 + M \rightarrow FOO + M$, and $FOO + H_2 \rightarrow HF + O_2 + H$. Evidence is presented for an activation energy of 5-7 kcal/mol for the reaction $F + H_2 \rightarrow HF + H$ and for a heat of formation for the FOO species of +3.5 kcal/mol. (Contractor's abstract)

THE KINETICS OF THE TETRAFLUOROHYDRAZIN FLUORINE REACTION, by J. B. Levy and B. K. W. Copeland. [1965] [5]p. incl. diagrs. tables, refs. (AF 49(638)1131) Unclassified

Published in Jour. Phys. Chem., v. 69, 3700-3704, Nov. 1965.

The reaction between fluorine and tetrafluorohydrazine has been investigated from 35 to 86°. Nitrogen trifluoride has been shown to be the only product. The kinetics have been measured by a colorimetric technique and have been shown to be homogeneous. It has been found that the kinetic data obey the expression $-d(F_2)/dt = k(F_2)(N_2F_4)^{\frac{1}{2}}$ and $k = 1.0 \times 10^{11.0 \pm 0.2} \exp(-200,400 \pm 400/RT)\ M^{-\frac{1}{2}}\ sec^{-1}$. It is proposed that $k = K^{\frac{1}{2}}k_2$ where K is the equilibrium constant for the dissociation of tetrafluorohydrazine and k_2 is the rate constant for the reaction $NF_2 + F_2 \rightarrow NF_3 + F$. A NOVEL CHEMICAL SYSTEM FOR GENERATION OF ELECTRON RICH GASES, by R. Friedman and A. Macek. [1965] [26]p. incl. diagrs. tables, refs. (Also bound with its AFOSR-64-1291) (AF 49(638)651) Unclassified

Published in Tenth Symposium (Internat'l.) on Combustion, Cambridge (Gt. Brit.) (Aug. 17-21, 1964), Pittsburgh, Combustion Inst., 1965, p. 731-741.

A unique, self-oxidized combustion system, consisting initially of a solid mixture, is described which burns to yield an all-gas plasma containing over 10^{15} (measured) or 10^{16} (calculated) electrons cm^3 at atmospheric pressure. The ingredients are tetracyanoethylene, hexanitroethane, and cesium azide, formulated to be stoichometric to CO, N_2, and Cs. The mixture is compacted to 1.6 gm/cm^3 by pressing at 20,000 psi. The strand burning rate at 1 atm is 1.3 mm/sec and the pressure exponent is about 0.6. The flame temperature, calculated as 3660 K, was measured as 3520 K by the spectral-line-intensity method and 3000 -3100 K by the line-reversal method. In view of the radial nonuniformity of the plasma, the former value is considered more likely to be correct. Electron densities were determined both from measurements of individual spectral-line shapes (Stark-broadening) and by the Inglis-Teller series limit method. The two methods agreed with one another. Strands of 1.27-cm diam gave 3 or 4 times higher electron concentrations than strands of 0.79-cm diam; however, electron concentrations, while extremely high, were still below calculated values, even after the lowering of flame temperature below theoretical (because of heat loss) was considered. It is suggested that adequate time was available for cesium ionization, under the experimental conditions, but time was not adequate for complete oxidation of CN and CN^- to CO and N_2, so electrons were largely attacked as CN^- rather than free. Hence, longer residence times allowing a closer approach toward equilibrium should give even higher yields.

RESEARCH ON THE DEFLAGRATION OF HIGH-ENERGY SOLID OXIDIZERS, by J. B. Levy, R. Friedman and others. Quarterly technical summary rept. no. 10, Sept. 1-Nov. 30, 1964. Jan. 19, 1965, 13p. incl. illus. diagrs. tables. (AFOSR-65-1278) (AF 49(638)1169) AD 465871 Unclassified

Further measurements of the rate of deflagration of pressed strands of hydrazine diperchlorate at elevated pressures have been made. The data are erratic. The effect of copper chromite catalyst on the deflagration of hydrazine diperchlorate at atmospheric pressure has been examined at a higher catalyst content. Flame temperatures have been calculated for 1, 10, and 100 atm pressure and are fairly constant at 1600°K. Attempts at measurement of the flame temperature by means of fine Pt-Pt, 10% Rh thermocouples have been unsuccessful—apparently because of catalysis by the metals of condensed phase reactions. Exploratory experiments have been performed with ammonium perchlorate, hydrazine perchlorate and hydrazine diperchlorate on the deflagration of spheres of these oxidizers at atmospheric pressure in fuel gas streams (Contractor's abstract)

Atlantic Research Corp. Kinetics and Combustion Group, Alexandria, Va.

RESEARCH ON THE DEFLAGRATION OF HIGH-ENERGY SOLID OXIDIZERS, by J. B. Levy, G. von Elbe and others. Quarterly technical summary rept. no. 11, Dec. 1, 1946-Feb. 28, 1965. May 19, 1965 [18]p. incl. diagrs. tables. (AFOSR-65-1280) (AF 49(638)1169) AD 617272 Unclassified

Further experiments are performed in which the flame temperature above deflagrating hydrazine diperchlorate has been measured with fine thermocouples. Results are obtained with ceramic-coated Pt-Pt, 10% Rh thermocouples and with uncoated chromel-alumel thermocouples. A flame temperature of about 1350 K is indicated for an ambient pressure of about 20 atm. This is substantially below the theoretical flame temperature of about 1600 K. The thermal decomposition of hydrazine diperchlorate

has been investigated from 211-291 °C. Ammonium perchlorate has been found in the surface of a strand of hydrazine diperchlorate which had been ignited at an elevated pressure, allowed to deflagrate partially and extinguished by sudden pressure release. Deflagration rate measurements from 6-130 atm are reported for pressed hydrazine diperchlorate. (Contractor's abstract, modified)

RESEARCH ON THE DEFLAGRATION OF HIGH-ENERGY SOLID OXIDIZERS, by J. B. Levy, G. von Elbe and others. Quarterly technical summary rept. no. 12, Mar. 1-May 31, 1965, 1965. Aug. 11, 1965, 10p. incl. diagrs. tables. (AFOSR-65-1615) (AF 49-(638)1169) AD 472633 Unclassified

The measurements of the flame temperature of deflagrating hydrazine diperchlorate using fine chromel-alumel thermocouples have been completed at 28 atm. A value of 1385 ± 35 °K was obtained. Experiments at 55 atm tentatively put the flame temperature at above 1500 °K at this pressure. Both temperatures are below the theoretical value of 1600 °K and indicate that thermodynamic equilibrium is not attained in the flame, although it may be at higher pressures. The temperature profile through the combustion wave was obtained for deflagration at 28 atm. The thickness of the preheat zone was measured as 550 ± 80 μ, and the thermal diffusivity was determined to be 0.0015 ± .0005 cm^2/sec, for HDP of 2.1 g/cc density. Further measurements of the deflagration rate were made as a function of pressure. (Contractor's abstract, modified)

RESEARCH ON THE DEFLAGRATION OF HIGH-ENERGY SOLID OXIDIZERS, by J. B. Levy, G von Elbe,and others. Quarterly technical summary rept no. 13, June 1-Aug 31, 1965. Oct. 11, 1965, 10p. incl. diagrs. table. (AFOSR-65-2291) (AF 49(638)1169) AD 624533 Unclassified

The flame temperature of hydrazine diperchlorate was measured using fine chromel-alumel thermocouples. At 28 atm, the measured temperature was found to be ~ 200 °C below the calculated product gas temperature. The observed temperature increases with pressure, and at approximately 100 atm the theoretical value is attained The temperature profile through the preheat zone of the combustion wave was carefully measured at 18 atm. This was found to agree well with that predicted by theory if some variation of thermal diffusivity with temperature is assumed. The thermal profile at low pressure was found not to exhibit the character of that of a normal deflagration wave. This finding has shed considerable light on the nature of the process. Finally, quenching experiments were performed and these are discussed. (Contractor's abstract)

RESEARCH ON THE DEFLAGRATION OF HIGH-ENERGY SOLID OXIDIZERS, by J. B. Levy, G. von Elbe and others. Final technical rept. June 1, 1962-Nov. 30, 1965, 55p. incl. diagrs. tables, refs. (AFOSR-66-0157) (AF 49(638)1169) AD 628035 Unclassified

The results of research on the deflagration of the solid-propellant oxidizers, hydrazine perchlorate (HP) and hydrazine diperchlorate (HDP), are reported and discussed. Each compound was found to be unique physically and chemically, in both its low-temperature thermal decomposition and its high-temperature deflagration behavior HP and HDP are white solids of crystal densities 1.939 and 2.21 g/cc, and melting points of 141 and 191 °C, respectively. The following aspects of the combustion process were studied: The deflagration rate as a function of pressure and the effects of catalysts; the flame temperature and the temperature profile through the combustion wave; quenching, thermal decomposition, and chemical behavior. In addition, vaporization rates of HP were measured.

[DEFECT MODE IN A FACE CENTERED CUBIC LATTICE] Schwingungszustand eines Fremdatoms im kubisch flaechenzentrierten Gitter, by E. Balcar. [1965] [8]p. (AFOSR-66-1610) (AF 61(052)638) AD 638514 Unclassified

Also published in Acta Phys. Austriaca, v. 20: 325-331, 1965.

The substitution of an atom in a crystal by an atom which is lighter than the surrounding host atoms, gives rise to a localized defect mode of the lattice. To calculate the frequency of this mode a model of the crystal was assumed with general forces between nearest atoms and central forces between next nearest atoms. This model gives the dynamical matrix of the system which contains the symmetry of the face centered cubic crystal. A theoretical formula was developed to calculate the defect mode frequency by using the dynamical matrix. The resulting formula was applied to the calculation of the frequency of an isotope defect in a face centered cubic lattice (Ni in Pd) and compared with experimental results.

CURRENT SHEET TILT IN A RADIAL MAGNETIC SHOCK TUBE, by R. B. Johansson. Sept. 1964 [20]p. incl. illus. diagrs. table. (Research rept. no. 189) (AF 49(638)659) AD 608147 Unclassified

Also published in Phys. Fluids, v 8· 866-871, May 1965.

This paper describes an experiment carried out in a radial (inverse pinch) shock tube with argon of 50-400 μ pressure and hydrogen of 100 μ pressure. The current sheet was found to be tilted so that the cathode side lagged the anode side. At the anode the shock has a tilt in the same direction as the current sheet. At the cathode the shock is normal. These phenomena can be correlated by physical models which assume that the current is predominantly carried by the ions. (Contractor's abstract)

THE DIOCOTRON INSTABILITY IN A CYLINDRICAL GEOMETRY, by R. H. Levy. Dec. 1964 [21]p. incl. diagrs. table, refs. (Research rept. no. 202) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)659 and National Aeronautics and Space Administration) AD 609638 Unclassified

Also published in Phys. Fluids, v. 8 1288-1295, July 1965.

The diocotron (or slipping stream) instability of low density ($\omega_p \ll \omega_c$) electron beams in crossed fields is considered for a cylindrical geometry. For a simple density distribution, the normal modes of the electron beam correspond to a continuum of eigenvalues, plus 2 discrete eigenvalues. Work due to Case and Dikii appears to show that the continuous spectrum is not important in stability studies of this type. The condition for stability considering the discrete modes only is derived, under suitable geometrical and electrical conditions, it is shown that these modes can be stable. The analogy between the electromagnetic problem considered here and the problem of the stability of an ideal rotating fluid is discussed. It is shown that stability conditions derived for the latter problem depend on the possibility of axial perturbations, what this implies for the electron beam problem is briefly discussed. THE ELECTRON PLASMA EXPERIMENT THEORY AND APPLICATIONS, by R. H. Levy and G. S. Janes. June 1965 [18]p. incl. diagrs. refs. (Rept. no. AMP-160) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)659 and National Aeronautics and Space Administration) AD 473350 Unclassified

The basic concepts involved in the production and control of pure electron and electron rich plasmas are reviewed, with particular reference to the different geometries in which equilibrium may be achieved. An inductive method of establishing arbitrary equilibrium profiles is described. Recent theoretical work on the stability of some particularly simple equilibria is then discussed. Instabilities considered are the so-called diocotron (or slipping stream) instability, this instability (whose importance in magnetron work is well understood) is related to the Kelvin-Helmholtz instability in fluid mechanics and a new mode involving spontaneous coherent radiation into space as a result of bunching. This effect can be described as the flexible antenna instability. Both these instabilities are considered for low density electron beams. Two experiments are discussed. The object of the first is to produce a stable electron plasma in a simple geometry. The second is designed to test the practicability of the inductive charging scheme. A brief review of selected applications of the electron plasma is also given, these include space radiation shielding and certain high voltage laboratory devices. (Contractor's abstract)

OBSERVATIONS OF ANOMALOUS DIFFUSION IN EM-REGION PLASMA-ACCELERATION EXPERIMENTS (Abstract), by R. S. Lowder and G. S. Janes [1965] [1]p. [AF 49(638)659] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Published in Bull Amer. Phys Soc , Series II, v. 10: 195, Feb. 25, 1965.

Anomalous electron diffusion has previously been reported in an annular geometry EM-region plasma accelerator, employing an axial electric field. In this device, the mean free path and ion gyro radius are large as compared to apparatus dimensions, while the Debye length and electron gyro radius are relatively small. The axial diffusion has been accounted for by observations of azimuthal density variations and measurements of phase-correlated azimuthal electric fields resulting from polarization along the density gradients. A broad, somewhat striated spoke rotating at 1 5 the E/B velocity in the E x B direction is observed. This nonuniformity may be due to an inherent nonuniform ionization of the neutral influx at the anode rather than to instabilities in the plasma itself. The spoke velocity also approximates the critical velocity commonly observed for ionization waves. Time fluctuations in density and in electric and magnetic fields can be correlated assuming adiabatic electron motions.

PLASMA PROPULSION RESEARCH (Abstract), by G S. Janes. [1965] [2]p. (Bound with its AFOSR-65-1266, AD 622527) (AF 49(638)659) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

I. Collisionless Electron Heating Accompanying Anomalous Electron Diffusion in EM Region DC Accelerators. Electron diffusion can be accounted for by a

collisionless adiabatic transport process; however, neutral atoms leaving the anode are ionized by electron impact and the energy for this must be provided by some nonadiabatic electron heating process which must include both a source of energy and a means of conveying it to the electrons. The collisional ion-electron thermal relaxation process is very slow. However, ion acoustical waves have been observed, and the evidence suggests that this low frequency ion wave energy is transported to higher frequencies where it is absorbed by electrons at the electron cyclotron frequency. II. Single Component Plasma Research. The term "single component" is used to describe plasma conditions wherein the number density of electrons exceeds the number density of ions and neutrals to such an extent that the plasma motion is controlled by magnetic and collective electrostatic forces rather than by magnetic and collective inertial (or pressure) forces (i.e., $\epsilon_0 E^2/2 > nKT$ or ρv^2). DC experiments in cylindrical geometries indicate the possibility of producing these conditions inductively by injecting electrons tangentially into cylindrical (or torus) shaped systems with rising axial magnetic fields. If verified, this inductive pumping technique should result in the generation of large radial electrostatic fields.

SINGLE-COMPONENT PLASMAS. I (Abstract), by R. H. Levy, G. S. Janes, and P. J. Gierasch. [1965] [1]p. [AF 49(638)659] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 238, Feb. 25, 1965.

It is possible to arrange, in special geometries, for a cloud of electrons not neutralized by the presence of ions to be confined in equilibrium under opposing magnetic and electric forces. The neutralizing positive charge is fixed on a single electrode external to the plasma. If the thermal pressure of the electron gas is less than the electrostatic pressure, the Debye length $(kT/4\pi n_e e^2)^{\frac{1}{2}}$ will be smaller than the over-all size of the cloud. Since collective effects are then possible, the cloud has some plasma properties even though it contains only a single component. The electric-field pressure is, in turn, smaller than the magnetic pressure by a factor that is roughly analogous to the β of a neutral plasma. An important feature of the single-component plasma is that the electric field, and hence also the E/B drift velocity, has strong spatial variations. The question of stability is considered for some simplified cases. An important distinction from neutral plasmas is that coherent radiation from the plasma will probably govern the over-all stability of any particular configuration.

SINGLE-COMPONENT PLASMAS. II (Abstract), by G. S. Janes and R. H. Levy. [1965] [1]p. [AF 49(638)-659] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 238, Feb. 25, 1965

Single-component plasma conditions can be produced in magnetron or PIG-type apparatus operating under high-vacuum space-charge-limited conditions. The results of such experiments suggest that electron densities in excess of $10^{10}/cm^3$, containment times in excess of 10^{-5} sec, and values of $\omega\tau$ in excess of 10^4 have been obtained. These considerations suggest that it may also be possible to create single-component plasma conditions without the use of an initial dc high-voltage power supply by trapping electrons on magnetic-field lines and changing the total magnetic flux in the system, provided that the local electron-diffusion velocities do not exceed the magnetic compression rate. This inductive-pumping technique appears to have useful applications to radiation shielding in space and to plasma generation.

EXPERIMENTAL AND THEORETICAL STUDY OF MAGNETOHYDRODYNAMIC IONIZING FRONTS, by R. M. Patrick and E. R. Pugh. [1965] [9]p. incl. illus. diagrs. refs. (AF 49(638)1129) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 195, Feb. 25, 1965.

Published in Phys. Fluids, v. 8: 636-655, Apr. 1965.

An experimental and theoretical description of ionization fronts propagating into hydrogen with a bias magnetic field in the plane of the front is presented. The experimental evidence showed that the absolute light intensity behind the front corresponds to a fully ionized plasma. The density ratio was obtained by measuring the magnitude of the current in the front, the front speed, and using the equation of mass and momentum. The front speeds are small compared to the Alfven velocity and are characterized by a critical velocity U_c, where U_c is the velocity a molecule must have so the kinetic energy equals the energy necessary to ionize it. A theory for the ionization front was developed which neglects the plasma pressure and abandons the condition $E = V \times B$ both ahead and behind the front. The theory predicts the front velocity and the rather unusual variation of the density ratio across the fronts with the front speed. (Contractor's abstract)

PROPERTIES OF COLLISIONLESS PLASMAS (Abstract), by R. M. Patrick. [1965] [1]p. (Bound with its AFOSR-65-1266; AD 622527) (AF 49(638)1129) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

An experimental and theoretical description of ionization fronts propagating into hydrogen with a bias magnetic field in the plane of the front was carried out. Measurements of the absolute light intensity behind the front showed that the plasma was fully ionized. The front speeds were small compared to the Alfven speed ahead of the front, and were characterized by a critical velocity U_c, where U_c is the velocity a molecule must have so its kinetic energy equals the energy necessary to ionize it. A semi-empirical theory was developed for these fronts and predicted the front speed and the rather unusual variation of the density ratio across the fronts with front speed. Calculations based on work by Salpeter of the spectrum of Thomson scattering of a laser beam from typical laboratory plasmas were completed. Thomson scattering of a ruby laser beam by plasma electrons produced by strong magnetohydrodynamic shock waves in a MAST was observed. The intensity of the scattered radiation was equal to or greater than the radiation emitted by the shock heated hydrogen, and sufficient for time resolution of 10^{-8} seconds. The scattering results gave the velocity distributions of electrons and corroborated the previous measurements of shock speed, shock thickness, and plasma density.

THOMSON-SCATTERING OBSERVATIONS FROM MHD SHOCK-HEATED PLASMAS (Abstract), by R. M. Patrick and E. T. Gerry. [1965] [1]p. [AF 49(638)-1129] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10-226, Feb. 25, 1965.

Thomson scattering of a ruby-laser beam by plasma electrons produced by strong MHD shock waves in a MAST has been observed. The laser beam was aligned parallel to the axis of the MAST; the 90° scattering was observed perpendicular to the direction of the shock propagation. The power of the "Q"-switched laser beam was between 3 and 30 mw, with pulse durations between 2×10^{-6} and 10^{-7} sec. The magnitude of the scattered radiation was equal to or greater than the radiation emitted by the shock-heated hydrogen and sufficient for time resolution of 10^{-8} sec. The scattering results gave the velocity distribution of the electrons, and corroborated the previous measurements of shock speed, shock thickness, and plasma density. The initial conditions ahead of the MHD shocks were hydrogen pressure between 40 and 100 μ Hg, B filed 3800 G; the conditions behind: plasma density $4\text{-}10 \times 10^{15}$ ions/cm^3, B filed 8000 G. Oscillograms showing both plasma radiation and Thomson scattering are shown. The measured velocity distribution for the plasma electrons is discussed.

LABORATORY SIMULATION OF SOLAR WIND PHENOMENA, by R. M. Patrick and E. R. Pugh. Oct. 1965, 28p. incl. illus. diagrs. tables, refs. (Research rept. no. 234) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1483 and National Aeronautics and Space Administration) AD 622725 Unclassified

The IMP Satellite magnetic field measurements in the vicinity of the earth's magnetopause have shown that there is a standing shock between the earth's magnetic field and the solar wind, and a flow between the shock and the magnetosphere which is like a continuum flow. A theory which describes the boundary between this flow and the magnetosphere has been developed which shows that the diffusion of the magnetic field lines associated with the solar wind into the earth's magnetosphere can be much larger than previously expected. This has generated an interest in this Laboratory to build a facility which produces a steady flow of high conductivity, collision-free plasma with a characteristic flow dimension large compared to the ion gyro radii. A description of this facility and the design criteria will be given. The results of the calculation of the plasma flow in the field annihilation region between the solar wind and the magnetopause will be briefly reviewed, and the most recent experimental results obtained in the plasma wind tunnel facility will be given.

ON A NEW TYPE OF ACCELERATOR FOR HEAVY IONS, by G. S. Janes, R. H. Levy and others. [1965] [101]p. incl illus. diagrs. refs. (Rept no. RR-235) (AF 49(638)1553) AD 475149 Unclassified

A new device (called HIPAC - Heavy Ion Plasma Accelerator) which may be capable of accelerating ions of any atomic number to energies sufficient to overcome the nuclear Coulomb barrier is described. A closed potential well is created by filling a toroidal vacuum chamber with electrons; the electrons are contained by a magnetic field whose intensity is so low that its effect on the ions can be neglected. Ions are both accelerated and trapped in the well, the trapping effect allows sufficient time for the ions to become highly stripped by electron impact. The very large ion energies that can be achieved in this way would allow a wide variety of nuclear

reactions to be studied, including inverse fission. The present primitive state of development of the HIPAC is described, and the future prospects assessed.

OSCILLATORY MAGNETIC PROPERTIES OF NEARLY FREE ELECTRONS, by M. L. Glasser. [1965] [2]p. incl. refs. (AFOSR-65-1372) (AF AFOSR-63-260) AD 621407 Unclassified

Also published in Phys. Ltrs., v. 15: 17-18, Mar. 1, 1965.

Theory interpreting oscillatory magnetic properties of metals is considered. It is suggested that a proper way to investigate the problem would be to calculate the oscillatory part of the free energy of a gas of Bloch electrons in a magnetic field, but this is a mathematically intractable problem. This investigation presents a simple model formulated on the basis of some approximations which permit a relatively straight forward analytic solution. The principal assumption is that the metal to be described is amenable to the weak pseudopotential approximation. The oscillatory free energy can be evaluated analytically if the potential is constant normal to and periodic along the uniform magnetic field.

ION-PAIRING BETWEEN LITHIUM AND THE RESIDUAL ACCEPTORS IN GaSb, by R. D. Baxter, R. T. Bate, and F. J. Reid. [1965] [8]p. incl. diagrs. refs. (AFOSR-65-1186) (AF AFOSR-64-525) AD 620689 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 41-48, 1965.

The electrical properties of p-type GaSb containing lithium have been measured over the temperature range 20-400°K. It was found that introduction of lithium by diffusion at temperatures below 500° C results in reduced hole concentrations and increased Hall mobilities. In addition, the residual acceptor level at approx. 0.03 ev characteristic of pure material, apparently disappears and is replaced by a shallow acceptor level. This behavior is taken as evidence for the formation of ion pairs between lithium donors and doubly charged residual acceptors. Introduction of lithium by diffusion at 600° C and subsequent heat treatment at lower temperature results in the formation of a large density of holes ($>1 \times 10^{18}$ cm^{-3}) associated with a shallow level, suggesting the presence of substitutional lithium.

CONDUCTION ELECTRON SCATTERING BY IONIZED DONORS IN InSb AT 80°K, by R. T. Bate, R. D. Baxter and others. [1965] [10]p. incl. diagrs. refs. (AFOSR-65-2105) (AF AFOSR-64-525) AD 628437 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 1205-1214, Aug. 1965.

Electron mobility data obtained from Hall effect and resistivity measurements at 80°K on samples of InSb containing 1×10^{15} to 3×10^{17} ionized donors per cc are reported and analyzed. The dominant scattering mechanism is that by ionized impurities, and theoretical results are corrected for electron-electron collisions and band nonparabolicity. The Kane model for the conduction band is employed, neglecting perturbations from bands other than the conduction and valence bands. The non-parabolic band shape is found to have a strong influence on the mobility at higher carrier concentrations. Approximate calculations are also made of the contribution of polar scattering as modified by the electron-electron collisions. Combination of the 2 mechanisms accounts fairly well for the observations measured as a function of impurity concentration.

SOLUBILITY AND ELECTRICAL BEHAVIOR OF Li IN N-TYPE GaSb (Abstract), by R. D. Baxter and F. J. Reid [1965] [1]p. [AF AFOSR-64-525]
Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, June 23-24, 1965.

Published in Bull. Amer. Phys. Soc. Series II, v. 10 599, June 1965.

When diffused into n-type GaSb containing Te donors, lithium enters the lattice both interstitially and substitutionally, the dominant species being determined by the diffusion temperature. Diffusion of Li at 400°C results in increased electron concentrations and in Hall mobilities, which at 77°K are more than 50% higher than for samples with comparable electron concentrations but without added lithium. Diffusion at temperatures above 500 C, however, produces p-type GaSb characterized by a shallow acceptor level. The 400°C results are discussed in terms of a lithium-donor/residual-acceptor interaction, which was postulated to describe results of previous investigations into effects of lithium on electrical properties of p-type GaSb. Results of the higher-temperature diffusions are identical to those obtained on p-type GaSb and similar to those described by Fuller for Li in GaAs, in which the shallow acceptors are identified as Li^+Li^- self-pairs. Spectrographic determinations of total lithium solubility as functions of temperature and initial carrier concentration are presented and compared with electrical data.

ON THE POTENTIAL OF IONIZED IMPURITIES IN SOLIDS (Abstract), by I. Adawi. [1965] [1]p. [AF AFOSR-64-640]
Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 302, Mar. 24, 1965.

A self-consistent approach is used to discuss the potential of ionized impurities in solids in which the conduction electrons are treated as a free electron gas of arbitrary degeneracy. A perturbation series is written down explicitly to all orders in the potential Φ. The linear term in Φ— which gives the same results obtained by Takimoto, Langer, and Vosko and by March and Murray—can be obtained from the dielectric treatment of Lindhard, and hence one can include the polarization of the core electrons. The screening charge density in metals and the Friedel oscillations are discussed. For a slowly varying potential, the perturbation series can be summed and one obtains the Thomas-Fermi equation. Corrections to the linearized Thomas-Fermi equation are discussed. These terms improve only the asymptotic behavior of the potential and lead to difficulties if extended to the origin. However, the first correction to the mobility is quite small in general, as can be established in the Born approximation.

The purpose of this program is to amplify the scarce existing information concerning those physical properties of gases which determine their thermal radiation, especially at high temperatures and pressures. The experimental approach consists in determining directly, by means of emission radiometry and spectroradiometry, the magnitude and spectral distribution of the thermal radiation. These measurements will be conducted on gases which appear as or at least are contained in the combustion products of actual combustors, e.g. rocket combustion chambers, and will extend over ranges of temperature, pressure and radiating path lengths as close as possible to the ranges encountered in practice in such combustors. This information will enable the designer to predict, with greatly improved accuracy, the radiant heat flux from the combustion gases to the walls of the combustor.

This report analyzes the deterministic approaches which have been applied to the description of neural net configurations and their training algorithms which employ a single layer of trainable gain elements and partition the input space by hyperplanes. The nets are described by n-dimensional geometric vector methods. A general algorithm is developed based on gradient or steepest-descent methods for optimizing a system given a quadratic index of performance. Reductions of this algorithm to the two basic classes of (a) error correcting and (b) forced learning algorithms as special cases are considered. Effects are discussed of component imperfections such as saturation, nonlinear adaption rates, hysteresis, and component failure. Examination of advantages and disadvantages of the various algorithms indicate that the error correcting algorithm and its modified forms have the following areas of superiority: (1) capability in separating separable classes, (2) ability to form least-mean-square error for non-separable classes, (3) minimum magnitude gain vector, and (4) relative insensitivity to component imperfections. The forced learning algorithms respond to the relative frequency of the input classes. Where this sensitivity is important, the forced learning algorithm may be superior.

THE APPLICATION OF ERROR CORRECTING LEARNING MACHINES TO LINEAR DYNAMIC SYSTEMS, by J. G. Goerner, L. A. Gerhardt, and F. D. Powell. [1965] [6]p. incl. diagrs. (AFOSR-66-0012) (AF 49(638)-1449) AD 632184 Unclassified

Presented at Nat'l. Electronics Conf., Chicago, Ill., Oct. 25-27, 1965.

Also published in Proc. Nat'l. Electronics Conf., v. 21, 541-546, 1965.

It is shown that a learning machine with orderly structure and deterministic training can model an unknown linear plant and/or find the plant's inverse to the extent physically realizable with least-mean-squared-error performance. Use of these properties to solve problems involving complex least-mean-square performance indices is demonstrated and a general algorithm for deterministic search for LMSE performance is described. MECHANICS OF INCREMENTAL DEFORMATIONS, by M. A. Biot. New York, Wiley and Sons. 1965, 504p. incl. diagrs. refs. (AFOSR-65-0551) (AF 49(638)1329) Unclassified

A new approach to non-linear elasticity and viscoelasticity is presented which is characterized by the use of cartesian concepts and elementary mathematical methods and by the explicit introduction of a local rotation field in the 3-dimensional equations. The theory provides general and rigorous equations governing the dynamics and stability of solids and fluids under initial stress. It does not require that the medium be elastic or isotropic, and it is applicable to anisotropic, plastic, and viscoelastic media.

MICROWAVE SPECTROSCOPIC STUDIES OF MOLECULES, by J. Sheridan. Jan. 31, 1965, 11p. incl. tables. (Scientific rept. no. 3) (AFOSR-65-1687) (AF EOAR-62-1) AD 625407 Unclassified

Detailed spectroscopic studies are summarized for acetyl acetylene and trifluoroethylene. For the first of these, assignments and barrier-heights were found for 3 isotopic forms and very consistent results derived. For trifluoroethylene, an exhaustive study of vibrationally excited molecules was made, leading to identification of spectra for carbon-13 species in natural concentration. When these were combined with data for the deuterated species, all possible microwave structural information for the molecule was derived. Dipole moment studies of these substances are also reported with preliminary work on other molecules. Computational procedures in spectral analysis were developed.

PREPARATION OF THIAZYL FLUORIDES, by B. Cohen, T. R. Hooper and others. [1965] [2]p. (AFOSR-65-2184) [AF EOAR-63-96] AD 627198 Unclassified

Also published in Nature, v. 207 748-749, Aug. 14, 1965.

Observations were made of the action of several liquid and gaseous fluorides on sulphur nitride, and also the reaction of sulphur tetrafluoride with ammonia. The fluorides examined were: selenium tetrafluoride, iodine pentafluoride, sulphur tetrafluoride, antimony pentafluoride, and vanadium pentafluoride. The temperatures at which the reactions occur and the products formed (particularly thiazyl fluoride) are given. It is noted that sulphur tetrafluoride reacts with ammonia at -95°C to yield sulphur tetranitride and at 25°C to yield thiazyl fluoride.

Published in Jour. Neurophysiol., v 28 1185-1194, Nov. 1965.

In a series of 6 cats, transcortical electrodes were chronically implanted in auditory cortex. The effects of sectioning the brachium of the inferior colliculus upon cortical potentials elicited by acoustic stimuli were studied in unanesthetized animals and in animals anesthetized with barbiturates. Complete transection of the brachium of the inferior colliculus abolished evoked potentials in auditory cortex under both of these conditions.

SMALL-PARAMETER EXPANSIONS OF LINEAR BOLTZMANN COLLISION OPERATORS, by H. Akama and A. Siegel. [1965] [27]p. incl. diagrs. refs. (AFOSR-66-1587) (AF AFOSR-62-177) AD 640227 Unclassified

Also published in Physica, v. 31 1493-1519, 1965.

An important problem in the study of irreversible processes is the approximation of the linear Boltzmann operator by the Fokker-Planck operator or, when this is insufficient, by still further terms. The first attempt at a solution of this problem was the Kramers-Moyal expansion. Van Kampen and Siegel have reformulated this expansion with the aim of systematizing terms according to order of magnitude. Very few studies have been made of this problem in the multidimensional case, particularly collision processes. The present paper derives a new and greatly simplified formula for the coefficients of the Kramers-Moyal series in collision processes. This is applied to Siegel's order-of-magnitude rearrangement ("CD expansion"), which is found to have the required property at least in the case of power-law molecular interactions. Finally, a new stochastic model, related to the theory of collision processes is presented for the sake of its mathematical interest and simplicity. (Contractor's abstract)

COVARIANT MERGING OF SPIN AND UNITARY SPIN, by P. Roman and J. J. Aghassi. [1965] [3]p. incl. table, refs. (AFOSR-65-0824) (AF AFOSR-63-385) AD 616207 Unclassified

Also published in Phys. Ltrs., v. 14: 68-70, Jan. 1, 1965.

Previous progress toward the unification of internal and external symmetries is considered, and it is pointed out that the lack of covariance is the main difficulty in the scheme. A possible covariant generalization is proposed which is based on the observation that the inhomogeneous Lorentz group, including reflections, I_4, can be be considered as the limit of a deSitter group whose group space is embedded in a flat 5-dimensional space-time, becoming the 4-surface of a sphere with $R \to \infty$. The Lie ring of this O_5 group can be constructed by considering its fundamental 4-component spinor representation, the generators of which are composed of 2 independent sets of 2 x 2 Pauli matrices

A NOTE ON FIELD THEORIES WITHOUT MASS RENORMALIZATION, by W. S. Hellman and P. Roman. [1965] [3]p. (AFOSR-65-1813) (AF AFOSR-63-385) AD 625559 Unclassified

Also published in Nuovo Cimento, Series X, v. 37: 779-781, May 16, 1965.

It has been formerly conjectured by Olesen that a field theory in which no mass renormalization is necessary yields an S-matrix equal to unity. In this paper a counter-example is presented to the field theory constructed to illustrate the above conjecture. The model considered is that of a neutral pseudoscalar boson gradiently coupled to the Dirac field. It is found that the theory is not constrained to be equivalent to a free-field theory. The results indicate that a spinless pseudoscalar boson with zero bare mass must be excluded from the domain of Olesen's theorem. One of the conditions of the field theory can, however, be restated to take in account the example.

MASS FORMULA IN THE COVARIANT SPIN-UNITARY SPIN SCHEME, by P. Roman and J. J. Aghassi. [1965] [4]p. incl. tables. (AFOSR-65-1814) (AF AFOSR-63-385) AD 625561 Unclassified

Also published in Nuovo Cimento, Series X, v. 36: 1062-1065, Apr. 1, 1965.

A mass formula is developed to give insight into the covariant spin-unitary spin scheme. The full symmetry group $SV_{12} \otimes U_1^B$, where U_1^B is the baryon gauge group, is decomposed to relinquish $m^2 = (A_1 + B_1 s_2) + (A_2 + B_2 s_2) \mathcal{A}_2 + (A_3 + B_3 s_2)[T(T+1) - Y^2/4] + (A_4 + B_4 s_2)BY$. This formula is applied for the baryon supermultiplet 364 and the meson supermultiplet 143 to obtain the baryon and boson masses.

D F RATIOS AND BARYON MAGNETIC MOMENTS IN THE SV_{12} SCHEME, by P Roman and J. J Aghassi. [1965] [4]p incl table (AFOSR-65-1869) (AF AFOSR-63-385) AD 626513 Unclassified

Also published in Nuovo Cimento, Series X, v 38 1092-1095, July 16, 1965

Some dynamical predictions are calculated for the baryon meson vertices in the SV_{12} symmetry scheme Breaking down SV_{12} into $SU_3 \times O_5$ and noting that the algebra of O_5 is locally isomorphic with that of SP_4, the

equation for the (8, 4) baryon current is formulated. Solving this equation, the D/F ratio for the $\bar{B}NM$ vertex is determined to be 4:2. The baryon magnetic moments are calculated and, invoking the usual SU_3 identifications, are presented in arbitrary units. The results are compared to SU_6 theory, and though there is considerable agreement, a value of -1.62 is obtained for $\mu(p)/\mu(n)$ which disagrees with both the SU_6 prediction and the even smaller experimental values. Thus it is concluded that though the scheme yields an excellent classification of states and an accurate mass formula, it probably is not accurate for grasping intricate features of dynamics at high energy.

ELECTROMAGNETIC MASS CORRECTIONS IN THE COVARIANT SV_{12} SCHEME, by P. Roman and J. J. Aghassi. [1965] [4]p. incl. tables. (AFOSR-65-1870) (AF AFOSR-63-385) AD 626512 Unclassified

Also published in Nuovo Cimento, Series X, v. 37: 354-357, May 1, 1965.

Electromagnetic effects are considered in the SV_{12} symmetry scheme, a covariant merging of space-time and SU_3 symmetries within a framework which uses the deSitter group for a background. The electromagnetic mass-splitting operator is taken, to transform as the charge operator Q and it is convenient to evaluate this by using the U-spin formalism. The complete mass formula is obtained and its constants determined for the 143 and 364 baryon supermultiplets. Electromagnetic sum rules are discussed. The principal result is that electromagnetic mass splittings can be related in different spin submultiplets.

MACH'S PRINCIPLE, BARYON CONSERVATION AND BARYON MASS, by P. Roman. [1965] [17]p. incl. refs. (AFOSR-65-1871) (AF AFOSR-63-385) AD 626780 Unclassified

Also published in Nuovo Cimento, Series X, v. 37: 396-412, May 16, 1965.

Mach's principle is viewed as being incorporated into relativity by means of Dicke's scalar field theory. The assumption is made, however, that the scalar field interacts only with baryonic matter. It follows that the baryon current obeys an equation of continuity. By adopting the steady-state model of the universe, the baryon mass becomes determined by the scalar field. Thus, both baryon conservation and the origin of the baryon mass can be regarded as a consequence of Mach's principle. In order to ensure the unrestricted validity of the equivalence principle, one must allow for a pressure in the matter fields. Various cosmological consequences are discussed. COVARIANT UNIFICATION OF SPACE-TIME AND SU_3 SYMMETRY (Abstract), by P. Roman and J. J. Aghassi. [1965] [1]p. [AF AFOSR-63-385] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 430, Apr. 26, 1965.

Three quarks spanning the fundamental spinor representation of the deSitter group are taken to define the noncompact SV_{12} group. Mesons and baryons are constructed as 2- and 3-fold products. Reducing these according to $L_5 \times SU_3$, one obtains for mesons the 0^- and 1^- octets and the 0^- and 1^- singlet; for baryons, one gets the $1/2^+$ octet, $3/2^+$ decuplet, $1/2^+$ singlet, and the $3/2^-$ octet. A mass formula, including also electromagnetic effects is derived. It gives interesting intermultiplet relations and good numerical fits. Further dynamical consequences of the scheme are discussed.

SYMBOLIC CALCULUS OF THE WIENER PROCESS AND WIENER-HERMITE FUNCTIONALS, by T. Imamura, W. C. Meecham, and A. Siegel. [1965] [12]p. incl. refs. (AFOSR-65-2121) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-557] and Office of Naval Research) AD 622659 Unclassified

Also published in Jour. Math. Phys., v. 6: 695-706, May 1965.

A new definition is given for the 'ideal random function' (derivative of the Wiener function), which separates out infinite factors by fullest exploitation of the possibilities of the Dirac delta function. By allowing all integrals to be written formally as sums, this facilitates the definition and manipulation of the Wiener-Hermite functionals, especially for vector random processes of

multiple argument. Expansion of a random function in Wiener-Hermite functionals is discussed. An expression is derived for the expectation value of the product of any number of Wiener-Hermite functionals; this is all that is needed in principle to obtain full statistical information from the Wiener-Hermite functional expansion of a random function. The method is illustrated by the calculation of the first correction to the flatness factor (measure of Gaussianity) of a nearly-Gaussian random function. (Contractor's abstract)

WIENER-HERMITE EXPANSION IN MODEL TURBULENCE IN THE LATE DECAY STAGE, by A. Siegel, T. Imamura, and W. C. Meecham. [1965] [15]p. incl. tables, refs. (AFOSR-65-2122) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-557] and Office of Naval Research) AD 622660 Unclassified

Also published in Jour. Math. Phys., v. 6: 707-721, May 1965.

The Wiener-Hermite functional expansion, which is the expansion of a random function about a Gaussian function, is substituted into the Burgers 1-dimensional model equation of turbulence. The result is a hierarchy of equations which (along with initial conditions) determine the kernel functions which play the role of expansion coefficients in the series. Initial conditions are postulated, based on physical reasoning, criteria of simplicity, and the assumption that the series is to represent the late decay stage (in which the Gaussian correction is small and also decreasing with time). These are shown to justify an iterative solution to the equations. The first correction to the Gaussian approximation is calculated. This is then tested by evaluating the correction to the flatness factor, which for an exactly Gaussian function has the value 3, but which has been found by experiment (in real 3-dimensional fluids, of course) to have a value which deviates from the Gaussian value increasingly rapidly with the order of the derivative. This effect is utilized as a test of the inherent ability of the Wiener-Hermite expansion to bring to realization the physical properties implicit in the Navier-Stokes or Burgers equations. The various contributions to the flatness-factor deviation, when computed, do show a potential capability of providing a theoretical basis for the effect. (Contractor's abstract)

PARAMETER OF DISCONTINUITY AND DIFFERENTIAL-OPERATOR EXPANSION OF THE LINEAR BOLTZMANN OR MASTER OPERATOR, by A. Siegel and H. Akama. [1965] [19]p. incl. diagrs. refs. (AFOSR-66-0385) (AF AFOSR-64-557) AD 629805 Unclassified

Also published in Phys. Fluids, v. 8: 1218-1236, July 1965.

The ratio of the average microscopic agitation interval to the macroscopic relaxation time is proposed as the expansion parameter of linear Boltzmann or master operators. This parameter is interpretable physically both as a measure of the discontinuity of the random process, and as an inverse measure of the size of the fluctuating system. In the limit when the expansion parameter is zero, the process becomes continuous and is described by the Fokker-Planck equation. When the parameter is nonvanishing, the expansion of the master operator in terms of it is, in three representative cases, a 'CD expansion' in products of creation and destruction operators for Hermite functions; the dominant term is usually the Fokker-Planck operator. These results are considered in relation to van Kampen's hypothesis for small-parameter expansions of the same operators. It is found that the CD expansion fits the available model processes exactly, and that these processes do not satisfy van Kampen's hypothesis. As a new application, the explicit CD series is given for the density fluctuation model. Special cases of the model include the density fluctuations studied by van Kampen and the Ehrenfest urn model. PROPAGATOR EXPANSIONS OF THE LINEAR BOLTZMANN OR MASTER OPERATOR (Abstract), by I. Kohlberg and A. Siegel. [1965] [1]p. [AF AFOSR-64-557] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 530, Apr. 26, 1965.

The linear Boltzmann or Master operator can usually be expanded as the sum of the Fokker-Planck operator—CD/Λ and the series $(\lambda/\Lambda)^s \sum_{l=1}^{s} b_{sl} C^{s-l+1} D^l$, where λ/Λ is the ratio of the microscopic fluctuation time to the macroscopic relaxation time and C and D are creation and destruction operators on the distributed variable y. Introducing $\Lambda = (t/\lambda)$ = number of collisions and $T = (t/\Lambda)$ = dimensionless relaxation time leads to the following propagator expansion of the linear Boltzmann operator: $P(y, T, N) = \exp(-x^2/2)/\{2\pi[1-\exp(-2T)]\}^{1/2} + \Sigma (1/N)^m P_m(x)$ where $x = [y - y_0 \exp(-T)]/[1-\exp(-2T)]^{1/2}$. It has been proved that every $P_m(x)$ can be written in closed form, expressed as a finite sum of hermite functions of x. The expression for P(y, T, N) then embodies a theorem of central-limit type but for nonindependent increments, because we observe that the Gaussian Uhlenbeck-Ornstein function is achieved as the number of collisions becomes infinite. The result is a generalization of the additive-process Edgeworth series to this nonadditive case.

CREATINE KINASE: EVIDENCE FOR A DIMERIC STRUCTURE, by D. M. Dawson, H. M. Eppenberger, and N. O. Kaplan. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-66-1128) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-732, American Cancer Society, and National Institutes of Health) AD 641142 Unclassified

Also published in Biochem. and Biophys. Research Commun., v. 21: 346-353, Nov. 22, 1965.

The findings presented here indicate that creatine kinase is an enzyme whose structure is that of a dimer, as suggested by Eppenberger et al (1964) and Thomson et al (1964). The muscle enzyme may be composed of two identical subunits (M-M), the brain enzyme of two identical but different subunits (B-B), and the hybrid molecule of two subunits, one of either kind (M-B). The hybrid enzyme, whether it occurs naturally or is formed in vitro, is intermediate in kinetic qualities and in electrophoretic mobility between the two parental or unmixed forms. Hence, the nature of the multiple forms of creatine kinase resembles that found with the lactic dehydrogenases in that a hybrid enzyme occurs in vivo.

PHOTOINITIATION OF UNIMOLECULAR REACTIONS. THE PHOTOLYSIS OF 2,3-DIAZABICYCLO [2.2.1] HEPT-2-ENE, by T. F. Thomas and C. Steel. [1965] [4]p. incl. diagrs. tables, refs. (AFOSR-66-0592) (AF AFOSR-64-583) AD 632738 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87. 5290-5293, Dec. 5, 1965.

The gas-phase photolysis of [2,3-diazabicyclo [2.2.1] hept-2-ene (I) with 337 mμ light has been investigated in the pressure range 10-1000μ. The variation in the yields of hydrocarbon products, bicyclo [2.1.0] pentane (II), cyclopentene (III), and 1,3-cyclopentadiene (IV), with pressure is consistent with the initial formation of "hot" II which can either be deactivated or isomerized to "hot" III. The latter can either undergo unimolecular decomposition to yield IV or be deactivated. Changing the wave length of irradiation from 313 to 334 mμ changed the relative yields of the products in a manner consistent with this "hot" molecule mechanism. (Contractor's abstract)

SPATIALLY INHOMOGENEOUS STATES OF MANY-BODY SYSTEMS, by M. Eger and E. P. Gross. [1965] [1]p. (AF AFOSR-63-176) Unclassified

Published in Jour. Math. Phys., v. 6: 891-901, June 1965.

To treat many-body systems in the presence of a static potential or problems of highly collective spatially inhomogeneous motions such as vortex lines, wavefunctions of a type $\Psi = \prod_{i}^{N} g(X_i)\Phi(X_1, \cdots, X_N)$ have been

proposed. Here Φ is the exact ground state of the homogeneous system and g(x) is a 1-particle state introduced to describe the effect of the spatial inhomogeneity. However, to determine g(x) by the variation principle, one needs to know the spatial correlation functions of all orders for the homogeneous many-body system. It is shown that the method of point transformations allows one to work with qualitatively similar but different states. The description of the system in the presence of a static impurity or of a state representing a vortex line in liquid helium requires a knowledge of only the average kinetic energy and x-ray scattering factor for homogeneous liquid helium. Both of these are available from experiments. The treatment of a recoiling impurity atom, strictly speaking, requires a knowledge of the current correlation tensor for the ground state of the homogeneous many-body system. This term vanishes in the Hartree limit of the theory for bosons. (Contractor's abstract)

SPONTANEOUS SYMMETRY BREAKDOWN AND THE μ-e-γ INTERACTION, by R. Arnowitt and S. Deser. [1965] [12]p. incl. refs. (AFOSR-65-1787) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-368] and National Science Foundation) AD 625563 Unclassified

Also published in Phys. Rev., v. 138: B712-B723, May 10, 1965.

Spontaneous breakdowns of symmetries are examined for the electromagnetic interactions of the muon-electron system. Upon arranging the 2 fields into an isotopic doublet the Lagrangian is seen to possess SU(2) symmetry. Three possibilities are available: (a) no spontaneous breakdown of the SU(2) symmetry is allowed and the muon-electron system remains a degenerate doublet; (b) a partial breakdown occurs in which a mass splitting develops but the heavier muon remains stable, (c) a complete breakdown occurs in which the muon decays into an electron plus a photon. Using the high-energy scheme of Baker, Johnson, and Willey, approximate solutions for the one-fermion Green's function and vertex function are examined. The solutions obtained permit case (b) to occur but not case (c), provided improper Lorentz invariance is imposed. It is shown, at least for the one-fermion Green's function, that no solutions breaking P, C, or T invariance can arise.

MINIMUM SIZE OF DENSE SOURCE DISTRIBUTIONS IN GENERAL RELATIVITY, by R. Arnowitt, S. Deser, and C. W. Misner. [1965] [20]p. incl. diagrs. (AFOSR-66-0437) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-368 and National Science Foundation) AD 630322 Unclassified

Also published in Ann. Phys., v. 33. 88-107, June 1965.

The properties of very dense sources of the gravitational field are examined. The sources are spherically symmetric initially static distributions of neutral or charged dust, treated as dynamical systems with no phenomenological pressure term. The exterior Schwarzschild solution is analyzed from this point of view as generated by a realistic 'bare' matter stress-tensor with appropriate initial Cauchy data. A coordinate frame is introduced in which the radial coordinate coincides with the invariant distance, and the initial value equations are solved in this frame. The systems considered become, in the limit, models for neutral and charged particles, and so provide solutions for the problems of interaction between 'point' particles and the gravitational field. It is shown that, at the instant of time symmetry, there is a minimum invariant extension for a particle, below which no solution of the field equations exists; this fact emerges especially clearly in the invariant radial frame used. The clothed (or exterior) mass and invariant properties of the interacting systems as a function of the bare mass charge, and extension are given. The results are in agreement with those obtained previously in another frame, in terms of whose radial coordinate the particle had vanishing extension in the limit. (Contractor's abstract)

SOME PROPERTIES OF THE QUANTUM LINEARIZED EINSTEIN FIELD, by S. Deser, J. Trubatch, and S. Trubatch. [1965] [7]p. (AFOSR-66-0431) (AF AFOSR-65-368) AD 630210 Unclassified

Also published in Nuovo Cimento, Series X, v. 39: 1159-1165, Oct. 16, 1965.

Some aspects of the quantized linear approximation to Einstein theory are examined, in view of their relevance to the full theory's quantization. In contrast to the otherwise similar Maxwell field case, it is seen that the Lorentz-invariance requirements on the time-translation and Lorentz-rotation generators P^0, J^{0i} are not expressible in terms of simple local commutation relations for the energy density with itself. This is in

agreement with the expectation that such local relations apply only to fields of spin one or lower. It is also shown that the physical requirement $-P_\mu P_\mu \cdot 0$ is fulfilled in the linearized theory.

CRITIQUE OF A NEW THEORY OF GRAVITATION, by S. Deser and F. A. E. Pirani. [1965] [13]p. incl. refs. (AFOSR-66-0448) (In cooperation with Northeastern U.) (AF AFOSR-65-368) AD 630311 Unclassified

Also published in Proc. Roy. Soc. (London), v. 288A· 133-145, Oct. 1965.

Hoyle and Narlikar have developed a new theory of gravitation, for which they claim that it is a direct inter-particle action theory, that it 'is equivalent to that of Einstein in the description of macroscopic phenomena, and hence the situation is the same so far as the classical tests of general relativity are concerned', that the sign of the gravitational constant is correctly determined, and that it has other advantages over Einstein's theory such as implying the absence of solutions representing an empty universe. In the present paper, it is shown that these claims are largely unsubstantiated. (Contractor's abstract)

DIFFUSION IN METALS AT ULTRA-HIGH PRESSURES, by D. L. Decker and H. B. Vanfleet. Final rept Mar. 1, 1965, 56p. incl. illus. diagrs. tables, refs. (AFOSR-65-0580) (AF AFOSR-63-201) AD 614839 Unclassified

Silver wires 3 mm in diam have been quenched from temperatures between 500 and 1000 C to room temperatures for pressures up to 30 kbar. Upon quenching, an increase in room temperature resistance was measured, but 90% of this increase was permanent and remained even after high temperature anneals. The diffusion of silver into lead has been investigated using radioactive tracer techniques in a temperature range within 200 C of the melting point of lead for 6 pressures between zero and 40 kbar. The activation energy was found to increase from 15.2 to 21 9 ± .3 kcal mol as the pressure increased from atmospheric to 39.2 kbar. The activation volume for pressures below 11.9 kbar ranged from .54 ± .06 to .48 ± .05 atomic volumes as the temperature decreased from 769 to 556 K. Above 11.9 kbar the activation volume was nearly constant at 38 ± .03 atomic volumes over the same temperature interval. As a result of the large decrease in the activation volume that occurs between zero and 11.9 kbar it is suggested that the diffusion process for silver into lead changes from a composite of interstitial plus vacancy to an interstitial mechanism. Therefore the measured activation volume of .38 ± .03 atomic volumes as measured for pressure above 11.9 kbar is ΔV_m the activation volume of motion which characterizes the interstitial mechanism. MELTING AND HIGH-TEMPERATURE ELECTRICAL RESISTANCE OF GOLD UNDER PRESSURE, by D. L. Decker and H. B. Vanfleet. [1965] [5]p. incl. diagrs. table, refs. (AFOSR-65-1373) (AF AFOSR-63-201) AD 622632 Unclassified

Also published in Phys. Rev., v. 138: A129-A133, Apr. 5, 1965.

The electrical resistance of gold was measured over the temperature range 30 C to the melting point and over a pressure range 0-70 kbar. At constant pressure, a sudden twofold increase in resistance sharply indicated the melting point and was used to determine the solid-liquid phase line to 70 kbar. The experimental melting curve has an initial slope, 5.91 C/kbar, in very good agreement with Clapeyron's equation, and has a form satisfying a Simon's equation with a coefficient c 2.2 ± 0.1. The electrical resistance data show a

decrease in the temperature coefficient of resistivity at higher pressures, while the resistance at the melting point appears to be a constant independent of pressure. (Contractor's abstract)

EQUATION OF STATE OF NaCl AND ITS USE AS A PRESSURE GAUGE IN HIGH-PRESSURE RESEARCH, by D. L. Decker. [1965] [5]p. incl. diagrs. tables, refs. (AFOSR-65-1374) [AF AFOSR-63-201] AD 621257 Unclassified

Also published in Jour. Appl. Phys., v. 36: 157-161, Jan. 1965.

The pressure as a function of lattice parameter and temperature has been calculated for NaCl over a pressure range of 0 to 500 kbar for temperatures between 0 and 1500°C. The calculation used the Mie-Gruneisen equation of state with Born-Mayer type repulsion terms between first and second nearest neighbors. The Gruneisen constant was expanded about its value at room temperature and atmospheric pressure; the first coefficient in the expansion being evaluated by forcing the calculated thermal expansion at atmospheric pressure to fit the experimental results of Enck. The 2 empirical parameters in the repulsion terms were evaluated using the experimental lattice parameter and isothermal compressibility at atmospheric pressure. The calculated pressure vs volume agrees with Bridgman's room-temperature measurements in NaCl below 100 kbar to within 3% and with high-pressure high-temperature shock data to better than 2%. It is proposed to use the numerical results to calibrate the pressure in high-pressure high-temperature apparatus. (Contractor's abstract)

EFFECT OF PRESSURE ON THE INTERMETALLIC DIFFUSION OF SILVER IN LEAD, by H. R. Curtin, D. L. Decker, and H. B. Vanfleet. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-65-2588) (AF AFOSR-63-201) AD 627751 Unclassified

Also published in Phys. Rev., v. 139: A1552-A1557, Aug. 30, 1965.

The diffusion of silver-110 into lead has been investigated using radioactive-tracer techniques in a temperature range within 200°C of the melting point of lead for 6 pressures between 0 and 40 kbar. The activation energy was found to increase from 15.2 to 21.9 + 0.3 kcal/mol as the pressure increased from atmospheric to 39.2 kbar. The activation volume for pressures below 11.9 kbar ranged from 0.54 ± 0.06 to 0.48 ± 0.05 atomic volumes as the temperature decreased from 769 to 556°K. Above 11.9 kbar the activation volume was nearly constant at 0.38 ± 0.03 atomic volumes over the same temperature interval. As a result of the large decrease in the activation volume that occurs between 0 and 11.9 kbar it is suggested that the diffusion process for silver into lead changes from a composite of interstitial plus vacancy to an interstitial mechanism. Therefore the activation volume of 0.38 ± 0.03 atomic volumes as measured for pressures above 11.9 kbar represents the activation volume of motion ΔV_m characterizing the interstitial mechanism. Within the accuracy of the experimental data for lnD vs T_m/T the results suggest that $\Delta H(P)/T_m(P)$ is independent of pressure to 40 kbar.

THE YIELD OF SINGLET OXYGEN IN THE REACTION OF CHLORINE WITH HYDROGEN PEROXIDE, by R. J. Browne and E. A. Ogryzlo. [1965] [2]p. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-158, and Defence Research Board of Canada) AD 632910 Unclassified

Also published in Canad. Jour. Chem., v. 43: 2915-2916, Oct. 1965.

In these gas phase studies it was shown that the visible emission at 6 340 A arises from a simultaneous electronic transition in 2 colliding O_2 ($^1\Delta_g$) molecules and that the emission intensity in this band is proportional to the square of the O_2 ($^1\Delta_g$) concentration. Using an f/4.5 Hilger-Watts glass-prism spectrometer with a slit of 500 μ combined with an RCA 7102 photomultiplier the following results were obtained when O_2 ($^1\Delta_g$) was measured in the products of an electrical discharge: $[O_2 (^1\Delta_g)] = 1.5 \times 10^{-5}$ mol/1; R = 36; k = 2.4×10^3 1/mol.] When the emission from the chlorine-hydrogen peroxide reaction was observed with the same optical system, the maximum ratio R measured was 1.8×10^3. The concentration of O_2 ($^1\Delta_g$) is 7.5×10^{-4} mol/1. Assuming that the bubble temperature is 300°K this corresponds to a partial pressure of 14 mm Hg. Since

the total oxygen pressure in the bubbles is about 750 mm Hg, this corresponds to a minimum yield of 2% O_2 ($^1\Delta_g$) in the reaction. There are a number of reasons for believing that the yield of O_2 ($^1\Delta_g$) is actually greater than this.

SOME INEQUALITIES FOR SYMMETRIC MEANS, by P. S. Bullen. [1965] [8]p. (AFOSR-65-2606) [AF AFOSR-62-261] AD 629135 Unclassified

Also published in Pacific Jour. Math., v. 15 47-54, Mar. 1965.

Let $(a) = (a_1, \cdots, a_m)$, $(w) = (w_1, \cdots, w_m)$ be m-tuples of positive numbers, $E_0 = 1$, $E_r = E_r(a)$ the rth elementary symmetric function of (a), $P_r = \binom{m}{r}^{-1} E_r$, A_m [respectively, G_m] the arithmetic [geometric] mean of (a) with weights (w), $W_m = w_1 + \cdots + w_m$, $(wa) = (w_1a_1, \cdots, w_ma_m)$, $F_r(a) = E_r(wa)\, E_r(w)$, $m = n + q$. Let $(\bar{a}) = (a_1 \cdots, a_n)$, $(\tilde{a}) = (a_{n+1} \cdots, a_m)$, $\bar{E}_r = E_r(\bar{a})$ and $\tilde{E}_r$, etc., be analogously defined. Results of the author and M. Marcus (Proc. Amer. Math. Soc., v. 12, 285-290, 1961) and others are generalized as follows. Theorem 2: Let $1 \le r \le k \le m$, $u = \max(r-n, 0)$, $v = \min(r, q)$, $w = \max(k-n, 0)$, $x = \min(k, q)$, $v \le w$. Then (1) if $r-u \le k-x$, $\dfrac{P_r^{k/r}}{P_k} \ge \dfrac{\bar{P}_{r-u}^{(k-x)/(r-u)} P_v^{w/v}}{\bar{P}_{k-x} \tilde{P}_w}$ with equality if and only if $r = k$ or $a_1 = \cdots = a_m$, or $r = 1$, $k = m$ and $\bar{P}_1 = \tilde{P}_1$}, (2) $P_r^{k/r}/P_k \ge P_v^{w/v}/\tilde{P}_w$ with equality if and only if $r = k$ or $a_1 = \cdots = a_m$, or $r = 1$, $k = m$ and $a_1 = \cdots = a_n = \tilde{P}_1$}. Theorem 7: $W_m(A_m - G_m) \ge \bar{W}_n(\bar{A}_n - \bar{G}_n) + \tilde{W}_q(\tilde{A}_q - \tilde{G}_q)$ with equality if and only if $\bar{G}_n = \tilde{G}_q$}; $(A_m/G_m)^{W_m} \ge (\bar{A}_n/\bar{G}_n)^{\bar{W}_n} (\tilde{A}_q/\tilde{G}_q)^{\tilde{W}_q}$ with equality if and only if $\bar{A}_n = \tilde{A}_q$}. Theorem 8. If (a), (w) are similarly ordered, (1) $s < t$ implies $F_s^t \ge F_t^s$ with equality if and only if $a_1 = \cdots = a_m$, or $s = 0$}, (2) an analogue of Theorem 2 holds with P replaced by F. The following analogue of inequalities for $\bar{A}_n - \bar{G}_n$ is obtained and a generalization of Hölder's inequality derived: Let $\bar{W}_n = 1$, $R_n = \bar{A}_n/\bar{G}_n$, $w = \min(\bar{w})$, $W = \max(\bar{w})$, $L_n = \prod_{i,j=1}^{n} (\frac{1}{2}a_i^{1/2}a_j^{-1/2} + \frac{1}{2}a_i^{-1/2}a_j^{1/2})$, $\Lambda_n = \prod_{i,j=1}^{n} (\frac{1}{2}a_i^{1/2}a_j^{-1/2} + \frac{1}{2}a_i^{-1/2}a_j^{1/2})^{w_iw_j}$. Then $L_n^{w(n-1)} \le R_n \le L_n^{W}$, $\Lambda_n^{1/(1-w)} \le R_n \le \Lambda_n^{1/w}$ with equalities if and only if $a_1 = \cdots = a_n$. (Math. Rev. abstract, modified)

A GENERAL PERRON INTEGRAL, by P. S. Bullen. [1965] [14]p. incl. refs. (AFOSR-65-2607) [AF AFOSR-62-261] AD 629134 Unclassified

Also published in Canad. Jour. Math., v. 17: 17-30, 1965.

Integrals are considered from the point of view of inverting differential operators. For this purpose it is necessary to introduce integrals more general than the Lebesque integral. For the second section of the article a generalized second order derivative is introduced and it is used to obtain conditions for a function to be hyperharmonic. Later in the article the general Perron integral that inverts the derivative in question is defined. In the final section examples are given of the above theory.

COMPARISON THEOREMS FOR ELLIPTIC DIFFERENTIAL EQUATIONS, by C. [W.] Clark and C. A. Swanson. [1965] [5]p. (AFOSR-66-0210) (AF AFOSR-63-379) AD 641529 Unclassified

Also published in Proc. Amer. Math. Soc., v. 16: 886-890, Oct. 1965.

In recent years the classical Sturm-Picone comparison theorem for a pair of second order ordinary differential equations has been generalized in 2 directions. First, Hartman and Wintner have extended the theorem to

self-adjoint elliptic equations in n dimensions. On the other hand, Leighton has shown in the case n = 1 that the usual pointwise inequalities for the coefficients can be replaced by a more general inequality. The purpose of this note is to extend Leighton's result to self-adjoint elliptic equations. The Hartman-Wintner result is a corollary of the main theorem. An example is given to show that the result is actually stronger. An interesting feature is the simplicity of the proof as compared to that of Hartman and Wintner or the recent proof of Kreith.

THE GENERAL PROBLEM OF THE MOTION OF COUPLED RIGID BODIES ABOUT A FIXED POINT, by E. Leimanis. VOL. 7. SPRINGER TRACTS IN NATURAL PHILOSOPHY, ed. by C. Truesdell, L. Collatz and others. Berlin, Springer-Verlag, 1965, 337p. incl. diagrs. tables, refs. (AFOSR-66-0261) (AF AFOSR-64-483) Unclassified

This attempt to account for the present state of the field and its growth during the last two hundred years of the theory of motion of several coupled rigid bodies about a fixed point is concerned first with particular cases of integrability of the equations of motion and with their geometrical interpretation. Next the motion of a symmetric as well as an asymmetric self-excited rigid body is considered because of its importance in various devices with internal reaction commonly used today to influence rotational motions; for example, devices for the steering of space vehicles. Finally consideration is given to the motion of an externally excited rigid body, especially a rigid body subject to periodic torque vectors which are of interest in astronomy and atomic physics. In the former the main concern is the perturbation of the Earth's rotation about its axis under the influence of forces arising from the planetary system. In atomic physics electrons and nuclei in high frequency magnetic fields represent atomic gyroscopes subject to periodic torques. Later chapters survey the problems, the separation of the general motion of mutually attracting rigid bodies into translations of their mass centers and rotations about the latter, rotation of an artificial satellite about its mass center and the motion of a rigid body about a fixed point in a central Newtonian force field.

DUAL DYNAMICAL SYSTEMS AND THEIR REPRESENTATION BY SYSTEM FUNCTIONS, by L. Weiss. [1965] [11]p. (AFOSR-65-2127) (AF AFOSR-64-693) AD 628704 Unclassified

Presented at Second Allerton Conf. on Circuit and System Theory, Illinois U., Urbana, Sept, 1964.

Also published in Internat'l. Jour. Control, v. 1: 475-485, May 1965.

The system function concept is an extension of the usual application of the transform method to linear systems. In this paper it is shown that there are 2 system functions which can be naturally associated with a given system and that each one can be interpreted in 2 ways. These alternate interpretations are used to show that the same system function provides a means for calculating the time-domain output of a given system and the transform-domain output of the dual system (defined as the adjoint of the given system with reversal of the time scale ordering). SOME PROBLEMS AND SOME RECENT RESULTS IN STOCHASTIC CONTROL, by H. J. Kushner. [1965] [9]p. incl. refs. (AFOSR-65-2128) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-693 and National Aeronautics and Space Administration) AD 628700 Unclassified

Also published in IEEE Internat'l. Convention Record, v. 16. 108-116, 1965.

This paper is divided into 2 major sections. The first section is of the nature of both a review of work in stochastic optimal control in the past 2 yr, and a brief discussion of a few of the important remaining problems. There are some remarks on noise sources and their mathematical description, a discussion of the partial differential equation obtained by the application of dynamic programming to a class of continuous time models and a list of references to a few other problems and approaches. The second section is more specific and discusses the application of some recent results of the author (in the theory of stochastic stability) to the design of controllers for linear and non-linear stochastic systems. The latter material giving techniques for obtaining optimal controls to a number of stochastic problems, rounds out the first part, and is of interest since,

via some perhaps small (if any) changes in problem statements a number of solutions can be obtained. In fact there are stochastic analogies to almost all of the suggested applications of Liapunov theory to the choice of feedback controls in deterministic systems. (Contractor's abstract)

ON THE STABILITY OF SYSTEMS DEFINED OVER A FINITE TIME INTERVAL, by L. Weiss and E. F. Infante. [1965] [5]p. (AFOSR-65-2129) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-693 and National Aeronautics and Space Administration) AD 628699 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 54: 44-48, July 1965.

Consider the system of n first-order real differential equations represented in vector form by $dx/dt = f(x,t)$ defined over a finite interval of time. The function f is assumed to be smooth enough in x and t (over T) to assure existence and uniqueness of solutions over T as well as the continuous dependence of the solutions on initial conditions at t_0. It is not required that $f(0,t) = 0$ The purpose of this note is to present some results toward the establishment of a comprehensive qualitative theory of stability for such systems.

ON SYSTEM FUNCTIONS WITH THE PROPERTY OF SEPARABILITY, by L. Weiss. [1965] [10]p. incl. diagrs. refs. (AFOSR-65-2130) (AF AFOSR-64-693) AD 628696 Unclassified

Presented at Second Allerton Conf. on Circuit and System Theory, Illinois U., Urbana, Sept. 1964.

Also published in Internat'l. Jour. Control, v. 1, 487-496, May 1965.

This paper considers linear differential (time-varying) systems which may be described by either of 2 system functions based on a specified integral transform. In particular, those systems are discussed for which at least one of the aforementioned system functions is separable in its 2 arguments. Physical interpretations of separable system functions are given and 2 theorems are proved which yield sufficient conditions for the presence of this property. It is also proved that the so-called 'bi-frequency' function of Zadeh must be separable for linear differential systems. Finally, the problem of approximately representing a given system by a separable system function based on the Laplace transform is discussed. (Contractor's abstract)

ON THE CONSTRUCTION OF STOCHASTIC LIAPUNOV FUNCTIONS, by H. J. Kushner. [1965] [2]p. incl. refs. (AFOSR-66-0387) (AF AFOSR-64-693) AD 641078 Unclassified

Also published in IEEE Trans. Automatic Control, v. 10: 477-478, Oct. 1965.

The object of this correspondence is to present the stochastic analog of the deterministic method of partial integration for computing Liapunov functions and to give some examples. In the deterministic method, a suitable negative definite or semidefinite function $\dot{V}(x) = dV(x)/dt$ is chosen. There is an attempt to compute V(x) via a sequence of partial integrations, and use of the system equations. Finally, the computed V(x) is checked for positive definiteness in a suitable region. The method is interesting since $\dot{V}(x)$ is easier to choose than V(x). Concepts of stochastic stability are discussed only indirectly The system under investigation is represented by the stochastic vector differential equation $dx = f(x)dt + \sigma(x)dz$. f and σ are a vector and matrix respectively with components f_i, σ_{ij}, each of which satisfies a local Lipshitz condition.

The author proves several sufficient conditions for stability and instability of autonomous functional differential equations of the form (1) $\dot{x}(t) = f(x_t)$, $t \geq 0$, where $f(\Phi)$ is a function on C_H, the open ball $\{\Phi: \|\Phi\| < H\}$ in the space $C[-r, 0]$, and applies these to several interesting examples. The theorems depend on concepts of invariant set and Liapunov functional, and in part represent generalizations of similar theorems for ordinary differential equations given by LaSalle (Proc. Nat'l. Acad. Sci., v. 46: 363-365, 1960). With a suitable definition of "derivative" $\dot{V}_{(1)}(\Phi)$ for a functional V, the first theorem has the following form. Theorem 1: Let V be a continuous scalar function on C_H. Let U_1 designate the region where $V(\Phi) < 1$ and suppose there exists a nonnegative constant K such that $|\Phi(0)| \leq K$, $V(\Phi) \geq 0$, and $\dot{V}_{(1)}(\Phi) \leq 0$ for all Φ in U_1. If R is the set of all points in U_1 where $\dot{V}_{(1)}(\Phi) = 0$ and M is the largest invariant set in R, then every solution of (1) with initial values in U_1 approaches M as $t \to \infty$. A large part of the paper is devoted to a detailed stability analysis of 8 examples, with the aid of suitable Liapunov functionals and the theorems of the paper. In the first example, extensions of results of Levin and Nohel (Jour. Math. Anal. Appl., v. 8: 31-44, 1964) are obtained. Among the other examples are a system of equations used by Volterra (Lecons sur la théorie mathématique de la lutte pour la vie, Gauthier-Villars, Paris, 1931) as a model for the interaction of 2 species and a Rayleigh equation with retardation. In the last section of the paper, it is indicated how the stability theorems may be extended to the case of infinite lag. (Math. Rev., abstract)

Published in Proc. Nat'l. Acad. Sci., v. 53: 501-503, Mar. 1965.

Consider the differential equation (') $dx/dt = Ax - \Phi(\sigma)b$, $\sigma = c'x$, where t is a real variable, x, b and c are real n-vectors, c' is the transpose of c, A is a real n-by-n matrix and $\Phi(\sigma)$ is a real continuous scalar function of σ such that $\sigma\Phi(\sigma) > 0$ for $\sigma \neq 0$ and such that through each point $x^0 \in E^n$ there passes a unique trajectory of ('). Define $P(z) = (\alpha + \beta z)c'(Iz - A)^{-1}b$, a function of the complex variable z, with $\alpha \geq 0$, $\beta \geq 0$, $\alpha + \beta > 0$ and I, the identity n-by-n matrix. A criterion for the asymptotic stability of (') in terms of P(z), well known as "Popov's criterion", is satisfied if (') has a Liapunov function of the form $V = x'Bx + \beta \int_0^\sigma \Phi(\tau)d\tau$, B a symmetric matrix. Yakubovich and Kalman tried to change into "if and only if" the "if" in the preceding statement, but they succeeded only under additional assumptions. This note is to announce that the converse holds true without the above restrictions. Further results are also announced. (Math. Rev. abstract)

ON THE STABILITY OF STOCHASTIC DYNAMICAL SYSTEMS, by H. J. Kushner. [1965] [5]p. (AF AFOSR-64-693)
Unclassified

Published in Proc. Nat'l. Acad. Sci., v. 53: 9-12, Jan. 1965.

Theorems pertaining to the stability of the stochastic discrete-time system $x_{n+1} = f(x_n, y_n)$, $f(0, y) = 0$, where y_n is a Markov process, are given using Liapunov functions. The various definitions of stability are too long for complete reproduction here. The following is a sample: "The origin is stable with probability one if and only if for any $\rho > 0$, $\epsilon > 0$, there is a $\delta(\rho, \epsilon) > 0$ such that if $x_0 \leq \delta(\rho, \epsilon)$, $P[\sup_n x_n \geq \epsilon] \leq \rho$." By requiring the stochastic Liapunov function $V(x_n, y_n)$ to have the supermartingale property in a neighborhood, some useful estimates as well as stability theorems are derived. (Math. Rev. abstract)

THE STABILITY OF NONLINEAR DYNAMICAL SYSTEMS, by J. P. La Salle. [1965] [10]p. incl. refs. [AF AFOSR-64-693]
Unclassified

Published in Science in the Sixties; Tenth Anniversary AFOSR Scientific Seminar, Cloudcroft, N. Mex. (June 1965), ed. by D. L. Arm. Albuquerque, Mexico U. Office of Publications, 1965, p. 124-133. (AFOSR-68-2384; AD 678056)

After an introduction dealing with the history of linear stability analysis and its use in the design of control devices, Liapunov's nonlinear analysis of stability and the theory of optimal control is discussed. The Liapunov method is the only general method available today for analyzing stability and taking into account the nonlinearities of the system, the best that has been accomplished is the solution of a fairly large number of specialized problems. It is not yet known how to use

computers as an aid in applying Liapunov's method. The significant stability problems require methods that are nonnumerical and the nonnumerical use of computers is not yet highly developed. The Liapunov theory of stability for autonomous systems has been unified and extended and appears to be fairly complete. Further developments of theory for nonautonomous systems seem possible. For the study of the stability of nonautonomous linear systems, new methods have been found but there are no new ideas in sight other than those generated by Liapunov's method for carrying out nonlinear stability analyses. The study of more "practical' types of stability is promising. Two relatively new areas of mathematical research are the theory of functional differential equations and the theory of stochastic differential equations. Developments in these areas could have a profound effect on the theory of control systems and the theory of systems in general.

ULTRASTRUCTURE AND PHARMACOLOGICAL STUDIES OF NERVE ENDINGS IN THE PINEAL ORGAN, by A. Pellegrino de Iraldi, L. M. Zieher, and E. de Robertis. [1965] [34]p. incl. illus. diagrs. tables, refs. (AFOSR-65-2836) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-314 and Consejo Nacional de Investigaciones Cientificas y Technicas) AD 628435 Unclassified

Also published in Prog. Brain Research, v. 10: 389-422, 1965.

The work was initiated to investigate the origin of the nerve fibers innervating the pineal gland and particularly the nature of the granular vesicles present in these nerve endings. For this purpose 2 principal approaches were used: Some rats were submitted to the bilateral extirpation of the superior cervical ganglia, and others were submitted to the action of drugs that may alter the metabolism of catechol and indolamines. In both cases the glands were fixed and studied under the electron microscope, and the changes occurring in the nerve fibers and endings were specially recorded. Preliminary determinations of 5-HT content were also carried out in normal and denervated glands and in some of the rats treated with some of the agents that may change in this indolamine. FUNCTIONAL IMPLICATIONS OF STRUCTURAL FINDINGS IN RETINAL GLIAL CELLS, by A. Lasansky. [1965] [25]p. incl. illus. diagr. refs. (AFOSR-65-1941) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-656 and Consejo Nacional de Investigaciones Cientificas y Tecnicas) Unclassified

Also published in Prog. Brain Research, v. 15: 48-72, 1965.

When the outer surface of the retina is placed in a solution containing ferrocyanide and after ferric ions are added, it is possible to detect with the optic microscope within the retina Prussian blue deposits. When retinae are examined with the electron microscope it is found that the terminal bars attaching 2 membranes of glial cells (Muller cells) are similar to those known, but the terminal bars relating the membranes of visual and Muller cells present only a zonula adherens. It is concluded that the intercellular spaces between visual and Muller cells are freely open and it seems rather difficult that Muller cells may control the flow of water, ions and metabolites through the neural retina.

Also published in Nature, v. 205: 1216-1218, Mar. 20, 1965.

5-HT was iontophoretically injected on the somatic membrane of central neurons of the snail Cryptomphallus aspersa. Only a limited number of cells called CILDA are sensitive to 5-HT and show a peculiar inhibitory input called Inhibition of Long Duration. 5-HT microinjections depolarize and excite CILDA neurons. Repeated microinjections cause intense desensitization of 5-HT receptors, an interval of 40 sec being necessary to obtain the same effect in 2 successive injections. 5-HT receptors may be blocked by LSD 25, BOL 148, morphine, chorpromazine and atropine. All these drugs block 5-HT receptors reversibly. Dibenamine, tryptamine and cyproheptadine block the receptor irreversibly. SKF trans-385 and ipronaizaid also block the receptors. 5-HT reduces the membrane conductance of CILDA neurons. This effect was not observed in other types of neurons. Recent findings show that BOL 148 blocks excitatory postsynaptic potential in CILDA neurons. From the present results it may be discussed that 5-HT may be the natural excitatory transmitter to CILDA neurons in mollusea.

Gerschenfeld. [1965] [2]p. (AFOSR-65-1947) (AF AFOSR-64-656) Unclassified

Also published in Proc. Scient. Meeting Biologists, Rosario (Chile), Apr. 12-14, 1965, p. 149-150.

Some central cells (CILDA neurons) present in the nervous system of Cryptomphalus aspersa have an inhibitory input called "inhibition of long duration" and respond to the iontophoretic injection of 5-HT. It is known that changes in the calcium concentration of the environment modify the response of the 5-HT receptors. In multicellular preparations it is difficult to understand this relationship but combining intracellular recording with iontophoretic microinjections it is possible to analyze this problem at a cellular level. When CILDA neurons are bathed with a Ca-free saline solution, there is an increase of 8% in the membrane conductance. In this ionic condition 5-HT response is transiently blocked. The same concentration of Na EDTA but added to a Ca-free saline solution blocks completely and reversibly the response to the 5-HT injection. The effects of Na EDTA on membrane conductance are unspecific and similar effects have been observed in cholinergic receptors of snail neurons.

STUDIES ON THE FUNCTION OF THE PIGMENT EPITHELIUM IN RELATION TO IONIC MOVEMENT BETWEEN RETINA AND CHORIOID (Abstract), by A. Lasansky and F. Fisch. [1965] [1]p. (AFOSR-65-1949) (AF AFOSR-64-656) Unclassified

Presented at Symposium on the Structure of the Eye, Weisbaden (Germany), 1965.

Electrophysiological and pharmacological findings in mammalian retina suggested the possibility that the pigment epithelium might be the main source of the resting potential across the eye and the principal diffusion barrier between retina and choriodal vessels. In order to investigate these points the ionic movements across the isolated toad pigment epithelium and chorioid were studied in a flux chamber. A steady potential of about 20-30 mv, epithelial side positive and a short circuit current of approx 40 μ amp cm^{-2} can be recorded for many hours under these conditions. Determinations of unidirectional radioisotope fluxes in the absence of an electrochemical gradient evidenced a net transfer of chloride (.92 μ eq cm^{-2} hr^{-1}) from epithelial to choriodal surface which accounts for a major part of the short circuit current (1.44 μ eq cm^{-2} hr^{-1}). The discrepancy between short circuit current and net chloride transfer is not explained by the measurements of cation fluxes, since no net transfer of sodium or potassium was found in the short-circuited condition. These findings support the view that the pigment epithelium has an important role in influencing the ionic environment within the neural retina.

IONIC MECHANISM ASSOCIATED WITH NON-CHOLINERGIC SYNAPTIC INHIBITION IN MOLLUSCAN NEURONS, by H. M. Gerschenfeld and D. J. Chiarandini. [1965] [14]p. incl. illus. tables, refs. (AFOSR-66-1124) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-656 and Consejo Nacional de Investigaciones Cientificas y Tecnicas, Argentina) AD 641885 Unclassified

Also published in Jour. Neurophysiol., v. 28: 710-723, July 1965.

The ionic basis of the non-cholinergic inhibitory postsynaptic potential (IPSP) in D neurons with inhibition (D Inhi) neurons of the snail Cryptomphalus aspersa was analyzed by intracellular recording. It has been found that the increase in the intracellular concentration of Cl^- does not modify either the IPSP or its equilibrium potential. When the external concentration of K was zero, an increase in both the IPST's amplitude and equilibrium potential value was observed. It is concluded that the non-cholinergic IPST's are due to an increase of the subsynaptic membrane permeability that allows a selective efflux of K^+ down its electrochemical gradient. THE QUEST FOR SELF-CONTROL: CLASSICAL PHILOSOPHIES AND SCIENTIFIC RESEARCH, ed. by S. Z. Klausner. New York, Free Press, 1965, 400p. incl. tables, refs. (AFOSR-65-0719) (AF 49(638)992) AD 621135 Unclassified

Revised drafts are given of papers presented at a Conference on Self-Control under Stressful Conditions, held in Washington, D. C., on Sept. 10-12, 1962. Titles of the papers are as follows. Part One on Self-Control in the perceptive of history: Collocation of concepts of self-control, Self-images and systems of spiritual direction in the history of European civilization. Self-control: the Greek paradigm. Part Two on Self-Control in a sociological perspective. Popular psychology: a content analysis of contemporary inspirational nonreligious books. Social identity and self-control, the routinization of love: Structure and process in primary relations. Part Three on Self-Control in psychological perspective: Psychodynamic aspects of stress tolerance. Some psychological determinants of stress behavior. Experimental analysis of stress and individual self-control in animal behavior. Part Four on Self-control in psychiatric perspective: Psychological factors maximizing resistance to stress, with special reference to hypnosis. Behavioral approach to the problem of self-control, Stress and the concept of selfrealization. Part Five on Scientific hermeneutics.

NECESSARY, PERMISSIBLE, AND OBLIGATORY DISCOURSE WITH CAPTOR PERSONNEL, by A. D. Biderman. May 4, 1965, 10p. (AFOSR-65-0750) (AF 49(638)992) AD 467873 Unclassified

This report discusses circumstances under which discourse other than name, rank and serial number between prisoners of war and captor personnel may be necessary, permissible, or obligatory. Several examples are given in which this has been proven true because of requirements of international law, the maintenance of health, life and welfare of prisoners of war in an organized camp, for exploiting potential "friendlies" or defectors, for self-defense against false accusation, and in various special circumstances of cold or hot war. It is concluded that the "name, rank, service number, date of birth, only" rule relates to an abstract conception of interrogation that is only sometimes congruent with actual confrontations with captor personnel that are experienced by prisoners of war. The considerations advanced here are independent of the issue of duress and "loss of self-control," except that there are dangers of confusing rational and moral action with rationalization of weakness.

SOME NOTES ON THE PRODUCTION OF PSYCHIATRIC AND PSYCHOLOGICAL KNOWLEDGE, by S. Z. Klausner. [1965] [10]p. incl. tables. (AFOSR-66-1154) (AF 49(638)992) AD 639868 Unclassified

Also published in Jour. Consulting Psychol., v. 29: 405-415, 1965.

The polemic about the relative competencies of psychiatrists and psychologists has, by and large, concerned their clinical roles. Members of these 2 professions differ in types of knowledge they produce in their research roles for application in clinical situations. A list of 1,226 concepts was selected from the literature reporting studies of behavior under stress. An analysis of these research concepts shows that psychiatrists use concepts of personality almost exclusively when studying stressful situations, whereas psychologists are more flexible in combining concepts of personality with those of society and culture. Differences among members of these professions in modes of research conceptualization and in problem selection tend to be more closely related to such factors as the institutional setting in which they work, their religious affiliation, and their self-perception as "tender" or "tough" minded, than they are to differences in professional training.

FEAR AND ENTHUSIASM IN SPORT PARACHUTING, by S. Z. Klausner. May 1965 [33]p. incl. diagrs. tables. (AFOSR-65-1329) (AF 49(638)992) AD 619389 Unclassified

Also published in Motivations in Sports, ed. by R. Slovenko and J. A. Knight, Springfield, Charles C. Thomas, 1965, p. 670-694.

A study is presented on the relation between the experience of fear and the experience of enthusiasm. Fear is assessed by a self-report of fear and by an inference from a projective test about predispositions to fear. Replies to a mail questionnaire by 825 sport parachutists affiliated with 103 parachute clubs constitute the data of this study. Only the jump experience, an analysis of the stories told about one picture in the draw-a-person test, and a few social characteristics are reported.

CHINESE "THOUGHT REFORM" AS A SOURCE OF PERSPECTIVES TOWARD WESTERN CORRECTIONAL PRACTICE, by A. D. Biderman. May 20, 1965, 7p. incl. refs. (AFOSR-65-1205) (AF 49(638)1344) AD 623172 Unclassified

Presented at First Internat'l. Cong. of Social Psychiatry, London (Gt. Brit.), Aug. 17-22, 1964.

Studies of Chinese Communist 'brainwashing' practices proceeded with little reference to Western literature on phenology and correction. When serious comparative consideration of Western and Chinese reform efforts did take place, however, the normative outlook from which Westerners had viewed Chinese 'thought reform' gave uniquely valuable perspectives on Western practices. Several illustrations are given of how the examination of deplored reform practices can provide valuable, chastening insights regarding the meaning and effectiveness of reform efforts that one values positively. The sympathetic regard of Western observers for those they considered victims of the Chinese practices contrasts with difficulties practitioners have in identifying with the subjects of their own correctional procedures. The explicity positive valuation which was placed on the efforts of subjects to resist 'brainwashing' contrasts with the tendency of practitioners to regard resistance as obduracy. The literature on 'brainwashing' emphasizes the malleability of attitudes and behavior as contrasted with the emphasis on the intractability of inmates or patients typical of Western correctional literature. Despite great difference in theories applied by practitioners, similar emotional reactions are experienced by their subjects. (Contractor's abstract)

THE SOCIAL SCIENCES IN INTERNATIONAL AND MILITARY POLICY; AN ANALYTIC BIBLIOGRAPHY, by E. T. Crawford. Oct. 1965 [91]p. incl. refs. (AFOSR-65-1899) (AF 49(638)1344) AD 623841 Unclassified

The bibliography presents selective materials pertaining to the role of social science research in international and military policy and operations since the beginning of World War II. The bibliography lists 150 references to books, articles and reports, all of which are part of the open literature. The references are annotated. The report also contains an introduction which discusses the purpose of the bibliography, its scope, the sources from which the works cited are drawn and some limitations of the available literature. The bibliography is divided into 5 parts. Part I lists general works discussing the role of social science research in public policy. Part II lists work which show the trends in the relationship of government and the social science community in the area of international and military affairs since the beginning of World War II. Parts III and IV list literature which suggests some analytic categories to be used in studying social science research and international and military policy. Part V, finally, contains writings which give a theoretical perspective on the roles of applied social science. (Contractor's abstract)

WORSHIP AND THE DANGEROUS LIFE: A STUDY OF CHURCH ATTENDANCE AMONG SPORT PARACHUTES, by S. Z. Klausner. Dec. 1965, 48p. incl. diagrs. tables, refs. (AFOSR-66-0124) (AF 49(638)1510) AD 630793 Unclassified

The data for this study were drawn from 825 questionnaires returned by members of American sport parachuting clubs. Among Protestant parachutists, the emotionally volatile are more frequent church attenders than the relatively calm. Among Catholics the reverse is true; the calmer types go to church while the more volatile tend to stay away. Skydivers who avoid thinking about their fear of jumping are, especially among Protestants, more frequent church attenders than those skydivers who express their fear. Catholics who express the feeling of free fall in sensory and esthetic terms are more frequent church attenders than the Catholics who confront this experience in a simple, descriptive, matter-of-fact way. Protestants who grasp the free fall experience in a matter-of-fact way were more frequent worshippers in their churches than those Protestants for whom free fall is an esthetic or sensory experience. Protestants who felt that harm befalling a skydiver was due to fate-that is, predestined or determined, rather than a result of the jumper's irresponsible behavior, are more frequent church attenders. Catholics for whom skydiver injury is due to his own responsibility are more likely than fatalistic Catholics to be frequent attenders at Mass. (Contractor's abstract)

REPORT ON INSECT VISION, by D. M. Vowels. Final rept. June 1965 [87]p. incl. diagrs. tables, refs. (AFOSR-65-1226) (AF AFOSR-63-458) AD 621280
Unclassified

The properties of a model describing optomotor responses in the housefly are listed. Some of these theoretical properties may be found empirically by histological and electrophysiological techniques. The parameters required are the interommatidial angle, the diameter of the receptive field of an ommatidium or retinula cell, and the relationship between the generator potential and light intensity. The interommatidial angle was measured histologically. This is variable over the whole eye, the most uniform region lying between 20 and 60° in the horizontal plane (anterior = 0°) and 30° above and 10° below horizontal in the vertical. The mean interommatidial angle in the horizontal plane is 3.9° and 2.5° in the vertical. The role of screening pigment is examined. This is most dense in the upper part of the eye. During dark adaptation the pigment migrates, moving inwards away from the lenses and contracting outwards towards the pseudocone from deeper parts of the retina. This is discussed in relation to the optical system of the ommatia, and it is suggested that the pigment migration will lead to a widening of the receptive field.

ANTENNA RADIATION IN A MOVING DISPERSION MEDIUM, by K. S. H. Lee and C. H. Papas. Feb. 1965 [21]p. incl. diagrs. (Technical rept. no. 34) (AFOSR-65-0653) (AF 49(638)1266) AD 614275
Unclassified

Also published in IEEE Trans. Antennas and Propagation, v. AP-13: 799-804, Sept. 1965.

The general problem of calculating the radiation field of an antenna immersed in a moving dispersive medium is formulated as an algebraic equation in wave-vector frequency space for the potential 4-vector in the rest frame of the antenna, and is solved in terms of a Green's function having the form of a one-dimensional integral. The special case where the moving medium is a homogeneous ionized gas and the antenna is an oscillating dipole is studied in detail. It is found that the far-zone field is not transverse and the Poynting vector is not purely radial.

RADIATION RESISTANCE OF AN OSCILLATING DIPOLE IN A MOVING MEDIUM, by P. Daly, K. S. H. Lee, and C. H. Papas. [1965] [5]p. (AFOSR-66-0545) [AF 49-(638)1266] AD 644573 Unclassified

Also published in IEEE Trans. Antennas and Propagation, v. AP-13: 583-587, July 1965.

The radiation resistance of an oscillating electric dipole immersed in a moving medium is calculated by Brillouin's "EMF method." Two cases are studied in detail: (1) the moving medium is simple, and (2) the moving medium is an ionized gas (plasma). It is found that in case 1, the motion of the medium tends to increase the radiation resistance, whereas in case 2, the motion of the medium tends to decrease the radiation resistance. A comparison is made between Frank's well-known theory of the radiation from an oscillating dipole moving through a material medium and the results obtained in this paper. (Contractor's abstract)

Published in IEEE Trans. Antennas and Propagation, v. AP-13: 960-966, Nov. 1965.

Exact formulas for the electric and magnetic fields at any arbitrary point within a cavity region completely enclosed by a conducting spherical shell of arbitrary size are derived under the assumption that the exciting electromagnetic field is a linearly polarized monochromatic, plane wave falling on the external surface of the shell. It is shown that the polarization of the electromagnetic field at the center of the cavity is the same as the polarization of the incident wave. From a knowledge of this steady-state solution, the time history of the electromagnetic field at the center of the cavity is calculated for the case where the incident wave is a Gaussian pulse. Numerical information on the effectiveness of the aluminum and copper shields under steady-state and transient conditions is provided for several pulse durations, shield sizes and wall thicknesses. PERTURBATION THEORY OF MICROWAVE INTERACTION WITH GYROELECTRIC PLASMAS, by E. R. Nagelberg. [1965] [7]p. incl. diagrs. refs. [AF 49-(638)1266] Unclassified

Published in Jour. Math. Phys., v. 6: 44-50, Jan. 1965.

As a means of determining the effects of a uniform but arbitrarily directed magnetic field on cylindrical and spherical wave propagation in a cold, homogeneous plasma, the magnetic field is regarded as a small perturbation. Assuming an expansion for the electric and magnetic fields in powers of the parameter $i\omega_g/\omega$,

where ω_g is the static gyrofrequency of the electron, the linear terms are solved. This solution is carried out under the assumption that the fields are known for the limit of vanishing static magnetic field. The first-order theory is then applied to cylindrical and spherical systems. When the approximate solution for the axially magnetized column is compared with the exact result, agreement is obtained provided that the static magnetic field is weak, as expected. THE DEMONSTRATION AND MANIPULATION OF A CIRCADIAN RHYTHM IN A SINGLE NEURON, by F. Strumwasser. [1965] [21]p. incl. illus. diagrs. refs. (AFOSR-65-2751) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1447 and Army Medical Research and Development Command) AD 628727 Unclassified

Also published in Circadian Clocks, ed. by J. Aschoff. Amsterdam, North-Holland Publishing Co., 1965, p. 442-462.

It is demonstrated that a circadian and fortnight lunar rhythm exist in one of the nerve cells of an isolated ganglion from the sea hare, Aplysia californica. The circadian rhythm can be conditioned by exposure of the intact organism to controlled cycles of light followed by darkness. Furthermore, it can be phase shifted by temperature pulses applied to the isolated ganglion and by the intracellular injection of such agents as actinomycin D which are known to block messenger RNA synthesis and hence protein synthesis.

NERVOUS FUNCTION AT THE CELLULAR LEVEL, by F. Strumwasser. [1965] [26]p. incl. table, refs. (Sponsored jointly by [Air Force Office of Scientific Research under AF 49(638)1447] and Army Medical Research and Development Command) Unclassified

Published in Ann. Rev. Physiol., v. 27: 451-476, 1965.

Certain aspects of nervous function at the cellular level, with emphasis on the current themes available from a survey of the literature through Sept. 1964 are reviewed. The topics covered are: the mechanisms of synaptic transmission, comparative aspects of chemically and electrically excitable membranes, investigations on glia in the nervous system, and the nature of intercellular and intracellular events related to developmmental and long-term processes in nervous systems.

AN EXPERIMENTAL STUDY OF THE HYDROMAGNETIC WAVEGUIDE, by R. H. Hertel. Jan. 1965, 123p. incl. illus. diagrs. refs. (Technical rept. no. 3) (AFOSR-65-0726) (AF 49(638)1462) AD 615630 Unclassified

The hydromagnetic waveguide consists of a cylindrical metal tube filled with a longitudinally magnetized plasma. Among the classes of waves which propagate in this system are the compressional hydromagnetic modes, characterized by a waveguide cutoff at low frequencies and by a resonance at the electron cyclotron frequency. This paper presents the results of observations of the propagation of such waves in a decaying hydrogen plasma at frequencies from 0.8 to 3.4 times the ion cyclotron frequency. The phase shift and attenuation of the waves are interpreted in terms of the ion density and the temperature by applying a theory based on a three-fluid description of the plasma. Spectroscopic measurements of the H_β line profile and absolute intensity are used to check the density and temperature inferred from the wave measurements. The results of this study indicate that a simple approximate relationship between the phase factor and density obtained by neglecting dissipation gives densities which agree well with the spectroscopic measurements. A journal publication, Experimental Study of Compressional Hydromagnetic Waves, by D. G. Swanson, R. W. Gould, and R. H. Hertel (Phys. Fluids, v. 7: 269-277, Feb. 1964) is appended to this report.

A sample enclosure compatible with the Norelco goniometer permits x-ray diffraction measurements on liquids confined under their own vapor pressure or an inert gas. Diffraction is in reflection-type geometry using a free liquid surface. The prototype, made of plastic, has been operated between 0 and 50°C on samples of liquid gallium, liquid mercury, and mercury-gallium mixtures. (Contractor's abstract)

X-RAY DIFFRACTION STUDIES OF STABLE AND SUPERCOOLED LIQUID GALLIUM, by S. E. Rodriguez and C. J. Pings. [1965] [3]p. incl. diagrs. table, refs. (AFOSR-65-1366) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1273 and Office of Naval Research) AD 618429 Unclassified

Also published in Jour. Chem. Phys., v. 42: 2435-2437, Apr. 1, 1965.

X-ray diffraction studies of stable and supercooled liquid gallium (mp 29.8C) between 0 and 50°C show no important dependence of internal structure on temperature. Atomic radial-distribution functions were determined for 0, 10, 20, 29.5, 30, and 40 and 50°C, from diffraction data to S = 11/A-1. Diffraction measurements were made in reflection geometry with silver Kα radiation, scintillation counter, and pulse-height analyzer. The density distribution indicates 11 near neighbors. A Ga-Ga complex is also indicated.

ABSORPTION OF SOUND IN CRITICAL MIXTURES, by C. J. Pings and A. V. Anantaraman. [1965] [2]p. incl. diagr. (AFOSR-65-1636) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)-1273 and Office of Naval Research) Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 781-782, May 10, 1965.

The Fixman theory for sound absorption in fluids in the vicinity of gas-liquid and liquid-liquid critical points is investigated experimentally. Results are obtained for the nitrobenzene-iso-octane system which include measurements over the full composition range for frequencies between 4.5 and 16.5 mc/sec and for temperatures of 30.5, 34.8, and 44.8°C. The experimental data lend substantial credence to the functional dependence of sound absorption upon temperature and frequency as predicted by Fixman.

Also published in Jour. Appl. Phys., v. 36: 1692-1698, May 1965.

Expressions are derived for x-ray absorption factors for a liquid or amorphous sample confined within a cylindrical sample cell. Sufficient geometrical parameters are included in the formulation to cover many experimental cases of practical interest. Various integrals involved are formulated in numerical calculus formulas adaptable to digital computer procedures. The statistical error caused by subtracting the cell background from the scattering of a cell and sample can be reduced substantially by limiting the volume of the cell material irradiated. The absorption factors calculated apply to uniform beams only; the approximation of absorption factors for nonuniform beams is discussed. (Contractor's abstract)

SATURATED LIQUID DENSITY OF CARBON TETRAFLUORIDE FROM 90° TO 150°K, by C. M. Knobler and C. J. Pings. [1965] [2]p. incl diagr. table. (AFOSR-65-1638) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1273 and Office of Naval Research) AD 623996 Unclassified

Also published in Jour. Chem. and Eng. Data, v. 10: 129-130, Apr. 1965.

Because of a discrepancy in available data, measurements were made of the saturated liquid density of carbon tetrafluoride at 16 temperatures between 90° and 150°K. The experimental density values determined are compared with those calculated from the equation $d(g/cm^3) = 2.254 - 3.64 \times 10^{-3}T - 5.40 \times 10^{-6}T^2$ and with those from other investigations. The value reported for the coefficient of thermal expansion in the temperature range 94° to 107°K is in good agreement with Croll and Scott's value of $2.59 \pm 0.04 \times 10^{-3}$/°K. The standard deviation of the measured points from the smooth curve in the range 94° to 150° is 7.1×10^{-4} g/cm^3.

IMPROVED APPROXIMATION FOR INCOHERENT X-RAY SCATTERING, by S. E. Rodriguez and C. J. Pings. [1965] [2]p. incl. table. (AFOSR-65-1639) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1273 and Office of Naval Research) AD 617876 Unclassified

Also published in Acta Cryst., v. 18: 979-980, May 1965.

In the approximation for incoherent x-ray scattering presented, the entire decrease in atomic factor f is assigned to outer orbitals. The equation then becomes $I_{inc} = Z - f$. This approximation has special attraction for cases where exchange terms are important. Oxygen and germanium are used as examples and the values determined are compared to values obtained by quantum-mechanical means and James' equation $I_{inc} = Z - f^2/Z$. The new approximation appears superior for both elements.

REFRACTIVE INDEX AND LORENTZ-LORENZ FUNCTION FOR SATURATED ARGON, METHANE, AND CARBON TETRAFLUORIDE, by C. P. Abbiss, C. M. Knobler and others. [1965] [4]p. incl. diagrs. tables, refs. (AFOSR-65-2369) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)-1273 and Office of Naval Research) AD 629252 Unclassified

Also published in Jour. Chem. Phys., v. 42: 4145-4148, June 15, 1965.

By means of the principle of minimum deviation, the refractive index was determined for argon, methane, and carbon tetrafluoride as saturated liquids from the triple point to the critical point. For argon, some measurements were also made on the saturated gas. For argon and methane, known values of the densities were used to compute the Lorentz-Lorenz function over the entire range of the saturation curve. For carbon tetrafluoride these computations were made only up to 0.7 of the critical temperature due to the lack of density data at higher values. The Lorentz-Lorenz function varies little with density and temperature for the three liquid phases. The argon measurements indicate definite increases in the Lorentz-Lorenz function on isothermal condensation. (Contractor's abstract)

THERMODYNAMICS OF CHEMICAL COUPLING, by C. J. Pings and E. B. Nebeker. [1965] [6]p. incl. diagr. refs. (AFOSR-66-0302) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)1273 and Research Corporation) AD 629249 Unclassified

Also published in I and EC Fundamentals, v. 4: 376-381, Nov. 1965.

The applicability of irreversible thermodynamics to coupled chemical reactions is discussed. Coupling is distinguished from the common phenomenon of interference, and a sufficient condition for the existence of nontrivial chemical coupling is given. The phenomenological coupling coefficients are identified for a particular example of a reacting system near equilibrium. Linear transformations which destroy the Onsager relations, or which eliminate the coupling of chemical reactions, are shown to be not generally applicable; any such given transformation can be used only for a particular initial state of the system. Also, the physical significance of the stoichiometry of such transformed reactions is questionable. (Contractor's abstract)

MECHANISMS OF PHOTOCHEMICAL REACTIONS IN SOLUTION. XXXII. ASYMMETRIC INDUCTION DURING ENERGY TRANSFER, by G. S. Hammond and R. S. Cole. [1965] [2]p. incl. diagr. refs. (Contribution no. 3246) (AFOSR-66-0883) (AF 49(638)1479) AD 635425 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 3256-3257, July 20, 1965.

The generalized energy transfer reaction considered is $D^* + A \rightarrow D + A^*$. There is considerable evidence that transfer of triplet excitation requires molecular contact between donor and acceptor. Under such circumstances stereochemical factors may be of importance in determining the efficiency of transfer, and one might anticipate that an optically active donor would show selection between the d and l isomers of a racemic substrate. Studies are reported that verify these expectations.

THEORY OF LAMINAR NEAR WAKE OF BLUNT BODIES IN HYPERSONIC FLOW, by B. L. Reeves and L. Lees. [1965] [14]p. incl. diagrs. refs. (Publ. no. 617) (AF 49(638)1298) AD 626810 Unclassified

Presented at Second AIAA Aerospace Sciences meeting, New York, Jan. 25-27, 1965.

Also published in AIAA Jour., v. 3: 2061-2074, Nov. 1965.

The problem of laminar flow in the near wake of blunt bodies is discussed. A theoretical model is employed which emphasizes 2 essential regions. In the first region, fluid is entrained by the shear layer from an irrotational external stream, and, simultaneously, fluid is scavenged by the shear layer from the recirculating viscous flow at the base. In the second region, which always commences upstream of the rear stagnation point, the turning of the flow in the inner viscous wake produces a strong viscous-inviscid interaction and generates a series of compression waves that eventually coalesce into a neck or wake shock. By means of this model, the near-wake solution is determined by a set of joining conditions for the 2 regions and also by a singular point in the neck which is shown to be analogous to the critical point of the Crocco-Lees theory. The viscous interaction solution is obtained by means of a moment-integral method and follows the previous work by the authors on separated and reattaching laminar flows. Results of the present theory are in good agreement with the near-wake experiments of Dewey for adiabatic flow over a circular cylinder. (Contractor's abstract)

THE ELECTRICAL CONDUCTIVITY OF SEEDED GASES, by T.-F. Zien. [Final rept.] pt. 2 [1965] [24]p. incl. diagrs. refs. (AFOSR-65-2018) [AF 49(638)1348] AD 627900 Unclassified

A crude but simple method of evaluating the electrical conductivity of seeded-plasma, applicable to both equilibrium and non-equilibrium cases is presented. A simplified method, that of the mean-free-path, is used in which the force acting on an electron due to the externally applied electric field is considered the only force that causes collision between the electron and the neutral atom or molecule. This method does not consider the effect of the ions; however, in the ordinary practice of seeding, the seeding fraction is usually less than 1% and the temperature rarely exceeds 3000°K. Under these circumstances the effect of ions is believed to be negligible. Satisfactory results are obtained in the temperature range of practical interest, but serious error may occur when applying this method to higher temperature regions where the ionization becomes so significant that Coulomb interaction is important.

SOME EXPERIMENTAL OBSERVATIONS ON THE NONLINEAR VIBRATION OF CYLINDRICAL SHELLS, by M. D. Olson. [1965] [3]p. incl. diagrs. [AF 49(638)-1364] Unclassified

Published in AIAA Jour., v. 3: 1775-1777, Sept. 1965.

In preparing for flutter experiments, vibration tests were performed on several cylindrical shells. Qualitatively, when any mode of the shell was forced into resonance and the pickup was positioned at a longitudinal nodal line, the Lissajous figure for the vibration was a horizontal figure 8 of relatively small height. It was also observed, that as any mode was driven to increasing amplitudes by increasing the driver voltage, at some critical amplitude the vibration would become unstable. Although no quantitative data were obtained, it was observed that this critical amplitude depended on the circumferential wave number n. It is suspected that this is evidence of the occurrence of the companion mode instability observed in the ring vibrations. The experimental results presented support the thesis that the nonlinear vibrations of thin cylindrical shells in mode shapes with long axial wavelengths exhibit many of the phenomena previously observed for thin cylindrical rings. In particular, for amplitudes of the order of the shell thickness, the vibrations exhibit a slight nonlinearity of the "softening" type.

SUPERSONIC FLUTTER OF CIRCULAR CYLINDRICAL SHELLS SUBJECTED TO INTERNAL PRESSURE AND AXIAL COMPRESSION, by M. D. Olson. Apr. 1965, 98p. incl. illus. diagrs. tables, refs. (Aeroelasticity and Structural Dynamics rept. no. SM 65-7) (AFOSR-65-0599) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1364 and National Aeronautics and Space Administration) AD 619729 Unclassified

Results of recent experiments on the flutter of circular cylindrical shells in the Mach number range 2.5-3.5 are presented. Three shells with radius-to-thickness ratios of 2000 were subjected to radial external pressure loadings and to combinations of axial compressive loading and internal pressurization while in the presence of an external axially-directed supersonic flow. Small amounts of internal pressurization were very stabilizing with respect to flutter, but moderate amounts reduced stability to the unpressurized level. However, high internal pressures completely stabilized the shells. The axial compressive loading was slightly destabilizing for moderate amounts of internal pressurization. There was no apparent danger of destruction of models even for the most violent flutter conditions which occurred just prior to buckling under radial external pressure loading and just after buckling under axial compressive loading. Buckled portions of a shell did not flutter. It appears that the large local curvatures encountered in the buckling of a cylindrical shell have a marked stabilizing effect on the shell locally. However, it also appears that the localized buckling usually encountered in practice significantly reduces the stability of any unbuckled regions of the shell.

ERROR ESTIMATES FOR LUKE'S APPROXIMATION FORMULAS FOR BESSEL AND HANKEL FUNCTIONS, by H. Krumhaar. [1965] [11]p. incl. refs. (AFOSR-66-2627) [AF 49(638)1364] AD 639772 Unclassified

Also published in Zeitschr. Angew Math. und Mech., v. 45: 245-255, 1965.

Error estimates are presented for approximation formulas for Bessel functions $J_n(z)$ and for the Hankel functions $H_0^{(1)}(z)$ and $H_1^{(2)}(z)$. These approximation formulas are obtained by means of the trapezoidal rule according to Luke. The error estimates are valid in the case of Bessel functions for arbitrary real or complex argument z, they hold in the case of the Hankel functions for arguments z with a positive imaginary part. Use is made of Luke's results, some of them are repeated in order to make this paper self-contained. In order to derive the error estimates for the Hankel functions some inequalities are engaged for the Gamma function with certain complex arguments and for Bessel functions of certain complex orders. STABILITY OF SPINNING SPACE STATIONS DUE TO CREW MOTION, by W. T. Thomson and Y. C. Fung. [1965] [6]p. incl. diagrs. (AFOSR-65-2472) [AF AFOSR-63-352] AD 621861 Unclassified

Also published in AIAA Jour., v. 3: 1082-1087, June 1965.

The stability of a spinning space station due to periodic motions of the crew is considered. It is shown by a few examples that instability may occur if the period of an astronaut's motion bears certain ratios to the half-period of the spin of the satellite. For example, if he moves back and forth along a radius of a circular, planar satellite, instability will occur when the period of his motion is approximately an integral multiple of the half-period of the satellite spin. A similar conclusion holds if the astronauts move with constant speed or oscillate periodically in circumferential direction. The heavier the moving masses are, relative to the satellite, or the larger their amplitude of motion, the wider will be the regions of instability. General equations are given which are useful for analyzing other modes of crew motion or for other problems such as passive damping of a spinning satellite. (Contractor's abstract)

RECOMBINATION RATES AND NON-EQUILIBRIUM ELECTRICAL CONDUCTIVITY IN A SEEDED PLASMA (Abstract), by E. E. Zukoski. [1965] [1]p. (Bound with its AFOSR-65-1286; AD 622527) (AF 49(638)1285) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

Experimentally determined values of electrical conductivity and electron temperature have been measured in a non-equilibrium seeded plasma. These results are in good agreement over a wide range of parameters with values calculated from a two-temperature model of the plasma. There is no doubt that the two-temperature model is valid over a wide range of gas temperatures, seed concentrations, and current densities for the argon-potassium and helium-potassium plasmas. However, the model does not give an accurate description of the plasma when the current density is below about 0.4 amp/cm^2; in this range the omission of the influence of atom-atom excitation and the influence of non-equilibrium excited state populations may explain the discrepancy between experiment and theory. In addition, the electron-electron-ion collisional recombination rate for potassium has been measured in the argon-potassium system. The range of electron temperatures investigated was between 1900°K and 3000°K with electron densities between 3×10^{13} and $4 \times 10^{14}/cm^3$. The measured values show a scatter of 60% about theoretical values calculated from present recombination rate theory employing the Gryzinski classical collision cross sections.

ABSOLUTE INTENSITY MEASUREMENTS FOR THE 2.7 μ BAND OF WATER VAPOR IN A SHOCK TUBE, by R. W. Patch. [1965] [30]p. incl. illus, diagrs. tables, refs. (AFOSR-65-2488) (AF AFOSR-63-71) AD 629612 Unclassified

Also published in Jour. Quant. Spectros. and Radiative Transfer, v. 5: 137-164, 1965.

The apparent spectral absorption coefficients of the H_2O infrared bands in the vicinity of 2.7 μ were measured in a shock tube behind reflected shock waves in an Ar-H_2O mixture. By interrupting an infrared beam at a 60 kc rate and projecting this beam across the shock tube to a monochromator, it was possible to measure simultaneously both emission and absorption of H_2O at 1000°K. The spectral absorption coefficients obtained from emission measurements averaged 9.8% higher than absorption measurements, probably due to experimental errors (smaller than usually encountered in shock tube measurements). At 1933°K experimental difficulties precluded simultaneous measurement of infrared emission and absorption, so measurements were restricted to emission. The apparent absorption coefficients were integrated to give the integrated absorption coefficients for the collection of bands near 2.7 μ. Integrated absorption coefficients were 49.8 cm^2 atm^{-1}, 54.7 cm^2 atm^{-1} and 31.6 cm^2 atm^{-1} for absorption at 1000°K, emission at 1000°K, and emission at 1933°K, respectively. The 2 values at 1000°K were in good agreement with those of Goldstein, who made no measurements above this temperature. (Contractor's abstract)

A SEARCH FOR INTERSTELLAR ICE ABSORPTION IN THE INFRARED SPECTRUM OF MU CEPHEI, by R. E. Danielson, N. J. Woolf, and J. E. Gaustad. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-65-1080) (In cooperation with Mount Wilson Observatory, Pasade a, Calif.) (AF 49(638)1323) AD 619133 Unclassified

Also published in Astrophys. Jour., v. 141: 116-125, Jan. 1, 1965.

The infrared spectra of μ Cephei and α Orionis obtained in the second flight of Stratoscope II are compared in an attempt to detect an absorption band at 3.1 μ due to interstellar ice particles. The absence of the band suggests that no more than 1/4 of the interstellar reddening is due to ice. The water-vapor bands in the spectra of these 2 supergiants are surprisingly strong, and no satisfactory explanation for this phenomenon is known. (Contractor's abstract)

OBSERVATIONS OF PROPER-MOTION STARS. II, by O. J. Eggen and J. L. Greenstein. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-66-1252) (i cooperation with Mount Wilson Observatory, Pasadena, Calif.) (AF 49(638)1323) AD 638864 Unclassified

Also published in Astrophys. Jour., v. 142: 925-933, Oct. 1, 1965.

In the course of an observational program on white dwarfs, results of which have been reported earlier in Astrophys. Jour., v. 141: 83, 1965, colors and spectra of many non-white dwarfs were obtained. A few wide binaries are found to be optical pairs only and the data for these pairs are given. New physical pairs containing white dwarfs were established, and new single white dwarfs were discovered spectroscopically and are listed. This paper lists 12 newly observed white dwarfs of spectral types DA and DF and gives further observations on 2 stars from our earlier work. The RR Lyr variable, AP Ser, is also a visual binary. Photometric ovservations of the faint, physical companion give δ (U-B) = $+0.12^m$ and lead to a luminosity of $M_v = +1.6^m$ at median light of the variable. Stars found not to be white dwarfs during the earlier survey of proper-motion stars are listed. Lowell survey colors were also studied statistically and found to be moderately reliable. Proper-motion stars of color class -1 and most of those of color class 0 are almost certainly white dwarfs. Also, some interesting subdwarf M stars were found, with weak TiO and strong MgH bands.

THE EARLY A STARS. I. ROTATION AND METALLICISM, by P. S. Conti. [1965] [12]p. incl. illus. diagr. table, refs. (AFOSR-66-1255) (In cooperation with Mount Wilson Observatory, Pasadena, Calif.) (AF 49-(638)1323) AD 639013 Unclassified

Also published in Astrophys. Jour., v. 142: 1594-1603, Nov. 15, 1965.

The problem of classifying main-sequence stars near type A0 is reviewed. Attention is drawn to a similar difficulty with regard to Am (metallic-line) stars previously found only as early as A5. Recent detail analysis, using model atmospheres of 2 early A stars, Sirius and 68 τ, have shown abundance anomalies similar to those in Am stars. Since these stars had been classified as normal, it is suggested that other Am stars of early type can be found by improved methods, one of which is discussed here. The line strength of the strong line of ionized scandium at λ 4246 relative to the line of ionized strontium at λ 4215, indicates the presence of an Am star. In normal stars these two lines have the same strength, but in Am stars as well as in Sirius and 68 τ the scandium line is considerably weaker. This criterion, which is useful for detection of Am stars over a wide range of effective temperature, is clearly discernible only for sharp-line stars and in spectra of relatively high dispersion. A diagram of rotation as a function of B-V color for the brightest stars in the sky indicates many sharp-line stars near type A0, which have formerly been classified as normal. High-dispersion spectra of most of them show that about one-half have anomalous Sc/Sr line strength. It is probable that they are the heretofore hidden analogues of the later-type Am stars and that the metallic-line phenomena extend into the early A stars. (Contractor's abstract)

THE COMPOSITION OF MAIN-SEQUENCE STARS OF TYPES A-K IN THE HYADES CLUSTER, by P. S. Conti, G. Wallerstein, and R. F. Wing. [1965] [25]p. incl. diagrs. tables, refs. (AFOSR-66-1256) (In cooperation with Mount Wilson Observatory, Pasadena, Calif.) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1323 and National Science Foundation) AD 639991 Unclassified

Also published in Astrophys. Jour., v. 142: 999-1023, Oct. 1, 1965.

The investigation is designed to test the common assumption that all main-sequence stars in a cluster have the same chemical composition. The chemical composition of main-sequence Hyades stars with B-V colors between 0.0 and +0.9 (spectral types A0V and K2V) were derived. HD 28344 (type G IV) was chosen as the standard star because it has previously been compared to the sun. The compositions of the other stars are identical to that of HD 28344 with the following exceptions. (1) 68 τ displays the abundance anomalies of a

metallic-line star, and (2) there are wide fluctuations in the lithium content of the Hyades stars. To derive a similar composition for the hottest star (HD 73666 of Praesepe) it is necessary to assume that Praesepe is reddened by at least 0.03 mag in B-V. For the coolest stars it appears to be necessary to modify the models by including the contribution of line blanketing to the opacity. Departures from local thermodynamic equilibrium indicated by the low excitation temperatures found for the A stars, apparently have no effect upon the derived abundances. Why HD 73666 and 68 ? lie above the turnoff point of the color-magnitude diagrams of thier clusters is not explained. (Contractor's abstract)

ROTATIONAL MODES IN SPHERICAL-MIRROR RESONATORS, by W. A. Specht, Jr. June 1964, 46p. incl. diagrs. refs. (Scientific rept. no. 2) (AFOSR-64-1311) (AF 49(638)1322) AD 604690 Unclassified

Also published in Jour. Appl. Phys., v. 36: 1306-1313, Apr. 1965. (Title varies)

This work is the examination of a cavity mode approach to the mode structure of a laser. Solutions of the vector wave equation for electromagnetic fields in and between perfectly conducting oblate spheroidal cavities are examined for the case of wavelengths much less than cavity dimensions. These solutions are the field modes in Fabry-Perot type resonators with equal-radius concave spherical mirrors, or with concave-convex spherical mirrors, when the parameters of the oblate spheroids are chosen so that the radii of curvature and spacing on the axis of rotation match those of the resonator mirrors. Expressions for the transverse and longitudinal mode structures are derived. The eigenvalue equations are written, and are solved for the case of the two lowest-order modes.

NONLINEAR EFFECTS IN TRAVELING WAVE LASER AMPLIFIERS, by D. H. Close. May 1965, 214p. (Scientific rept. no. 5) (AFOSR-65-0999) (AF 49(638)1322) AD 621320 Unclassified

Using semiclassical radiation theory, a formalism similar to that used by Lamb in his "Theory of an Optical Maser" is developed for studying the amplification of vector traveling waves in a laser-type medium. The effect of the medium on the waves is given in terms of space (or time) dependent field amplitudes and phases and a nonlinear index of refraction. With particular emphasis on typical gaseous media, the effects of Doppler broadening are treated in detail for arbitrary ratios of natural to Doppler line widths. Lowest order nonlinear effects (due to a polarization cubic in the field amplitudes) are studied extensively, and the frequency dependence of several of these processes is presented in graphical form. The characteristics of these nonlinear processes peculiar to Doppler broadened lines are discussed, and the processes are interpreted in terms of saturation and coherent modulation of the population inversion density.

SPONTANEOUS RADIATING ATOM IN CAVITY FIELDS, by C. J. Buczek. Apr. 1965, 148p. incl. diagrs. refs. (Scientific rept. no. 4) (AFOSR-65-1000) (AF 49(638)-1322) AD 621319 Unclassified

The characteristics of spontaneous emission from an atom which interacts with a coherent light wave are determined. The competition between coherent photons and spontaneous photons is treated in detail for a system consisting of a stationary atom, an open cavity and spatial fields. It is found that the interaction with the coherent field modifies the spectral distribution of spontaneous radiation from the atom. For spontaneous transitions involving an atomic state which interacts with the coherent field, the spectral distributions can no longer be described by Lorentzian functions. The new distributions exhibit a broadening and splitting for strong interactions between the atom and the coherent field. It is shown that the qualitative features of these new distributions can be predicted from the energy-level diagram of the atom-cavity system. The net probability of the system gaining a coherent or cavity photon is calculated by integrating over the emitted spontaneous frequencies. The equivalence of this approach to the method of computing probabilities by integrating over time is demonstrated by using Parseval's theorem.

A PROCEDURE FOR SOURCE STUDIES FROM SPECTRUMS OF LONG-PERIOD SEISMIC BODY WAVES, by A. Ben-Menahem, S. W. Smith, and T.-L. Teng. [1965] [33]p. incl. diagrs. tables, refs. (AFOSR-65-2913) (AF 49(638)1337) AD 617039 Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 55: 203-235, Apr. 1965.

The well-known first motion method of Nakano and Byerly is extended, generalized and combined with recent new ideas in body wave theory in order to set up a routine procedure for extracting source parameters from spectral analysis of isolated P and S pulses recorded at a net of standardized stations around a nonshallow source. The method consists of compensating the observed spectrums for instrumental and propagational effects. A combined study of the resulting radiation patterns, initial phases, and the initial amplitudes will render information regarding the spatial and temporal nature of deep and intermediate earthquake sources as seen through the spectral window of 10-100 sec. The shorter periods can be used for source studies only if an accurate station correction is available. (Contractor's abstract)

SURFACE WAVE RADIATION PATTERN AND SOURCE MECHANISM OF THE SEPTEMBER 1, 1962, IRAN EARTHQUAKE, by F. T. Wu and A. Ben-Menahem. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-65-2915) (AF 49(638)1337) AD 621761 Unclassified

Also published in Jour. Geophys. Research, v. 70: 3943-3949, Aug. 1965.

Surface waves recorded at stations surrounding the Iran earthquake of Sept. 1, 1962, were Fourier-analyzed; the amplitudes were corrected for instrumental response, geometric spreading, and absorption and are presented as a function of azimuth and frequency. The patterns thus derived are compared with theoretical radiation patterns for different source types, orientation of motion vectors, and other parameters. It is found that the source of the Iran earthquake can be represented as a double couple equivalent to a sinistral reverse shear fault with strike N 80° W, dip 78° to the southwest,

slip angle 63° and a depth of 11 km. This solution agrees well with the conclusion obtained from a first motion study. It is remarkable that solutions obtained over such a wide frequency range conform to each other. (Contractor's abstract)

ATTENUATION OF SEISMIC ENERGY IN THE UPPER MANTLE, by D. L. Anderson, A. Ben-Menahem, and C. B. Archambeau. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-65-2916) (AF 49(638)1337) AD 616476 Unclassified

Also published in Jour. Geophys. Research, v. 70: 1441-1448, Mar. 15, 1965

The amplitude attenuation and phase dispersion for Love and Rayleigh waves in the period range 50 to 300 sec is determined from 2 earthquakes by digital techniques. A distribution of Q, or anelasticity, is determined for the upper mantle which satisfies the amplitude decay data for Love and Rayleigh waves and which is consistent with available body wave data. An argument is made for a longitudinal wave Q of about 2.4 to 2.6 times the Q for shear waves. This implies that very small losses are involved in pure compression compared to the losses in shear. This is an argument against the importance of certain mechanisms, such as thermoelastic losses, in the mantle. The Q for shear waves in the upper 400 km of the mantle seems to vary from about 50 to about 150. The Q for mantle Rayleigh waves is greater than the Q for mantle Love waves, both theoretically and experimentally. However, it is predicted that QR becomes less than QL at some period shorter than 50 sec, the crossover period being diagnostic of the thickness of the 'Q crust' or lithosphere. SEISMIC DIGITAL DATA ACQUISITION SYSTEMS, by S. W. Smith. [1965] [6]p. incl. diagrs. (AFOSR-65-2918) (AF 49(638)1337) AD 618780 Unclassified

Presented at Symposium on Theory and Computers, Moscow and Leningrad (USSR), May 15-21, 1964.

Also published in Rev. Geophys., v. 3. 151-156, Feb. 1965.

Two digital seismograph systems in current operation are described. Together they provide high quality data for experimental studies of earth tides, free oscillations, surface waves, and teleseismic body waves. A broad-band system sampling 3 components 10 times per sec covers the frequency range between 0.003 and 3.0 cps, and a long-period system sampling each of 10 channels every 15 sec covers the range between 0.0 and 0.01 cps. The broad-band system can be used to simulate any desired standard seismograph and provides greater dynamic range and more flexibility than most existing seismographs. The long-period system is currently being used for a free oscillation experiment in which strain and pendulum seismographs record together. (Contractor's abstract)

DETERMINATION OF SOURCE PARAMETERS BY AMPLITUDE EQUALIZATION OF SEISMIC SURFACE WAVES. 2. RELEASE OF TECTONIC STRAIN BY UNDERGROUND NUCLEAR EXPLOSIONS AND MECHANISMS OF EARTHQUAKES, by M. N. Toksöz, D. G. Harkrider, and A. Ben-Menahem. [1965] [16]p. incl. diagrs. tables, refs. (AFOSR-65-2921) (AF 49(638)-1337) AD 613864 Unclassified

Also published in Jour. Geophys. Research, v. 70: 907-922, Feb. 15, 1965.

The radiation patterns of Love and Rayleigh waves from 3-nuclear explosions are studied to determine the nature of the asymmetry of radiation and the mechanism of Love wave generation. From a comparative study of different explosions it is reasoned that the Love waves are generated at the source of the explosion The source function, represented as the superimposition of an isotropic dilatational component due to the explosion and a multipolar component due to the release of tectonic strain energy, is consistent with the observed radiation patterns and the amplitude spectrums The amount of seismic energy due to the strain release is computed. In some cases it is found that this energy may be due to the relaxation of the pre-stressed medium by the explosion-formed cavity. It has been concluded that the explosion must have triggered some other strain release mechanism, such as an earthquake. The amplitude equalization method is applied to surface waves from an earthquake to determine the source parameters.

UPPER MANTLE STRUCTURE OF WESTERN NORTH AMERICA FROM APPARENT VELOCITIES OF P WAVES, by M Niazi and D. L. Anderson. May 1965, 33p. incl. diagrs. tables, refs (Contribution no. 1346) (AFOSR-66-0117) (AF 49(638)1337) AD 616298 Unclassified

Also published in Jour. Geophys. Research, v. 70. 4633-4640, Sept. 15, 1965.

Variation of the compressional velocity with depth in the C-region of the upper mantle in Western North America is studied. Apparent velocities of first arrivals across the Tonto Forest Array in Arizona were determined for about 70 shallow focus earthquakes. The epicenters range from 10° to 30° in distance and are mostly south of the array The method gives the slope of the travel time curve directly, the parameter required for a velocity-depth determination. For this distance range it is found that although the slope of the P travel time curve decreases substantially with distance, i.e.,

increasing apparent velocity, the variation is not uniform. Two relatively abrupt changes are observed at distances of about 17° and 24°. These are most readily interpreted as two second order discontinuities in the region of the mantle above 1000 km. Assuming an average crustal structure as derived from seismic refraction measurements and taking the uppermost 200 km of the mantle given by Gutenberg or Jeffreys, various possibilities are explored for the form of variation of the P wave velocity with depth. The discontinuities in the rate of change of velocity with depth which cause the observed breaks in the apparent velocity curve are found to be at depths of about 320 and 640 km. Although no absolute times are required in the method the travel times for the various derived models are computed and compared with standard tables. (Contractor's abstract)

CRUSTAL STRUCTURE IN EAST ANTARCTICA FROM SURFACE WAVE DISPERSION, by G. Dewart and M. N. Toksöz. [1965] [13]p. incl. diagrs. tables, refs. (AFOSR-66-0426) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1337 and National Science Foundation) AD 628463 Unclassified

Also published in Geophys. Jour. Roy Astronom. Soc., v. 10: 127-139, 1965.

The structure of the Earth's crust and the upper mantle in East Antarctica are investigated using the dispersion properties of both the Love and the Rayleigh waves. The group velocities of surface waves between 15 and 70 sec periods are measured over several paths crossing Antarctica from Sandwich Arc and Drake Passage to stations of Wilkes and Mirny. Theoretical dispersion curves are computed for various crust and upper mantle models. The structure that fits the Rayleigh and Love wave data equally well is characterized by a 42 km thick crust and low (7.85 km sec) sub Moho velocities. The average thickness of the ice layer over East Antarctica, between Princess Martha Coast and Wilkes Station, is determined to be about 3 km. The general problem of non-uniqueness in group velocity inversion is also discussed. (Contractor's abstract)

THE Sa PHASE FROM THE HINDU KUSH EARTHQUAKE OF JULY 6, 1962, by J. N. Brune. [1965] [15]p. incl. diagrs. table, refs. (AFOSR-66-2401) (Sponsored jointly by Air Force Cambridge Research Laboratories, Air Force Office of Scientific Research under AF 49-(638)1337 and U. S. Coast and Geodetic Survey) AD 638278 Unclassified

Also published in Pure and Appl. Geophys., v. 62. 81-95, 1965.

The Hindu Kush earthquake of July 6, 1962 produced an Sa phase (vertical component or Rayleigh type) which was clearly recorded at stations in North America in the distance range 90° to 110°. The propagation of this phase is studied in detail, both by the usual method of measuring velocity of first arrival and also by determining group velocities from the derivative of the phase of the Fourier transform (in the period range 20 to 80 seconds). The energy in the Sa phase propagates in a manner intermediate between that of a single ray and that of a single isolated mode. The expected interference effects which vary as a function of distance are observed and complicate a straight-forward measurement of group velocities. The results are most reliable if only the group velocities corresponding to parts of the spectra with relatively high amplitudes are used. The results show a regional variation in the velocity of the Rayleigh type Sa for continental areas, being higher under shield areas than under areas of more recent tectonic activity. The results are compared with theoretical calculations for the Gutenberg, Jeffreys-Bullen and Canadian Shield models of the Earth and the results indicate regional variations in shear velocity in the upper mantle extending to depths of several hundred km under continents. (Contractor's abstract)

MECHANISM OF DEEP EARTHQUAKES FROM SPECTRUMS OF ISOLATED BODY-WAVE SIGNALS. 1. THE BANDA SEA EARTHQUAKE OF MARCH 21, 1964, by T.-L. Teng and A. Ben-Menahem. [1965] [14]p. incl. diagrs. table, refs. (AFOSR-66-0465) (AF 49-(638)1337) AD 626242 Unclassified

Also published in Jour. Geophys. Research, v. 70: 5157-5170, Oct. 15, 1965.

Spectrums of teleseismic body waves have been obtained for the period range 20-100 sec from the records of a group of USCGS standardized seismograph stations around the source of a deep-focus earthquake in the Banda Sea. Corrections were applied for all the factors which took part in shaping the waveform of the signal during the course of propagation, and the spectrums were extrapolated to the vicinity of the source

according to the equalization procedure described in a previous paper. Radiation patterns drawn from the corrected P wave spectrums over the above period range show that the spatial factor of the source function is independent of frequency up to 0.1 cps. Through a comparison of the empirical radiation patterns with those calculated from an assumed double-couple point source, it was possible to determine the source parameters. These are in good agreement with the solution furnished by first motions. Similar results from S waves confirm the double-couple assumption. All the corrected spectrums confirm the theory that the gross structure of the source time function is of the form $(1 - e^{-t/\tau})H(t)$, with $0 < \tau \leq 10$ sec. From the equalized amplitudes, a quantity L_0ds (source displacement times the area of a virtual fault plane), is found to be 0.125 km^3. Further, by the concept of equivalent source theory, a virtual moment of a volume source can be deduced which leads in a simple way to the total energy of the source. (Contractor's abstract)

OBSERVED ATTENUATION AND Q VALUES OF SEISMIC SURFACE WAVES IN THE UPPER MANTLE, by A. Ben-Menahem. [1965] [11]p. incl. diagrs. tables. refs. (AFOSR-66-0467) (AF 49(638)1337) AD 625959 Unclassified

Also published in Jour. Geophys. Research, v. 70: 4641-4651, Sept. 15, 1965.

Attenuation coefficients and Q values of Love and Rayleigh waves in the period range 50-330 sec have been derived from the amplitude spectrums of these waves. Data were obtained from surface wave signals of 12 earthquakes recorded at Pasadena and some other USCGS standardized stations on a variety of seismographs. The resulting absorption parameters, as determined from all seismic events, show a mean scatter of about 10%. Nevertheless, data from each event indicate a systematic higher attenuation (lower Q) for Love waves than for Rayleigh waves. The attenuation coefficients for both waves tend to increase almost linearly with frequency, and the corresponding Q functions are slowly varying in the period range 50-150 sec, with mean values QL = 105 and QR = 145. In contradistinction to the phase velocities, there is not evidence yet for a persistent difference in attenuation of mantle surface waves under oceans and continents.

THERMODYNAMICS OF A SOLAR COMPOSITION GASEOUS MIXTURE, by M. S. Vardya. [1965] [9]p. incl. tables, refs. (AFOSR-65-2199) (AF AFOSR-63-171) AD 625535 Unclassified

Also published in Monthly Notices Roy. Astronom. Soc., v. 129: 205-213, Oct., 1965.

Computation of several thermodynamic quantities were carried out for a gaseous mixture of solar photospheric chemical composition containing hydrogen in 5 states (H_2^+, H_2, H, H^- and H^+)-helium and 16 other elements in multiple ionization states and with radiation effects included. The discrepancy on various thermodynamic quantities of the neglect of H_2^+ and H^-, of metals and of radiation pressure were estimated. (Contractor's abstract)

STUDIES IN STELLAR EVOLUTION. I. THE INFLUENCE OF INITIAL CNO ABUNDANCES IN A STAR OF MASS 2.3, by P. Bodenheimer, J. E. Forbes and others. [1965] [21]p. incl. diagrs. tables, refs. (AFOSR-65-2818) [AF AFOSR-63-171] AD 627966 Unclassified

Also published in Astrophys. Jour., v. 141: 1019-1042, Apr. 1965.

A series of evolutionary sequences have been calculated for a configuration of mass 2.3 magnitude. They cover late pre-main-sequence and main-sequence evolution and differ in their initial chemical compositions. Sequence I begins with concentrations of C, N, and O similar to observed atmospheric values published for stars predominantly of Population I. The C/N and O/N ratios are considerably in excess of their equilibrium values, and there is found to be a pre-main-sequence adjustment period of carbon burning causing an additional pre-main-sequence dip in luminosity on the Hertzsprung-Russell diagram. Sequence IV shows that the dip becomes less marked if the total heavy-element concentration is reduced. Sequence II begins with nearly equilibrium abundances of C^{12} and N^{14} and the carbon dip is not seen. Sequence III illustrates the effect of increasing the O/N ratio and confirms that O^{16} is

only very gradually converted to CN isotopes. The physical approaches and approximations used in these calculations are described in a series of appendices. They are intended to supplement the basic discussion of the numerical technique. They treat the equation of state, opacity, chemical composition changes due to hydrogen burning, chemical homogenization of convective regions and the obtaining of a starting configuration for an evolutionary sequence. [ATMOSPHERIC MODELS OF THE CENTRAL STARS OF PLANETARY NEBULAE] Atomosphären von Zentralsternen planetarischer Nebel I*, by K.-H. Böhm and W. Deinzer. [1965] [19]p. incl. diagrs. tables, refs. (AFOSR-66-0371) (AF AFOSR-63-171)
AD 641291 Unclassified

Also published in Zeitschr. Astrophys., v. 61: 1-19, 1965.

The calculation of atmospheric models for the central stars of planetary nebulae is discussed. The determination of the effective temperature T_{eff} and the surface gravity g for these stars is based on O' Dell's (1963) recent data. A Fortran program was developed for the purpose of solving simultaneously the equations of hydrostatic and of nongrey radiative equilibrium. The program includes the calculation of the monochromatic absorption coefficients due to H, HeI, HeII, CIII, CIV, NIII, NIV, NV, OIII, OIV, OV, NeII, NeIII, NeIV, NeV. Radiation pressure was taken into account. The equations of nongrey radiative equilibrium are solved by Lucy's (1964) iteration method; this is especially convenient if electron scattering becomes important.

STUDIES IN STELLAR EVOLUTION. II. LITHIUM DEPLETION DURING THE PRE-MAIN-SEQUENCE CONTRACTION, by P. Bodenheimer. [1965] [11]p. incl. diagrs. tables, refs. (AFOSR-66-0383) (AF AFOSR-63-171) AD 629682 Unclassified

Also published in Astrophys. Jour., v. 142: 451-461, Aug. 15, 1965.

Pre-main-sequence theoretical evolutionary tracks have been calculated for configurations of 6 different masses between 500 and 1200 solar masses in order to determine the extent to which lithium is destroyed in the convective envelopes as a function of mass. The evolutionary sequences are started with an initial amount of lithium based on observed abundances. At each time step in the calculation, reaction rates are calculated in detail, and the resulting chemical compositions are homogenized over the convective envelope. The evolutionary tracks are carried over to the main sequence in order to provide a basis for comparison with recent observations of lithium abundances in main-sequence stars in the Hyades cluster and in the solar neighborhood. The theoretical depletion as a function of position on the main sequence agrees well with the general trend of the observations, for calculations based both on the solar mass-luminosity relation and on the mass-luminosity relation that has been observed for the Hyades. STUDIES IN STELLAR EVOLUTION. III. THE CALCULATION OF MODEL ENVELOPES, by L. Henyey, M. S. Vardya, and P. Bodenheimer. [1965] 14 p. incl. diagrs. refs. (AFOSR-66-1271) (AF AFOSR-63-171)
AD 641297 Unclassified

Also published in Astrophys. Jour., v. 142: 841-854, Oct. 1, 1965.

The formal theory underlying existing techniques for representing the superadiabatic layers in convective envelopes was re-examined. Particular emphasis was placed on the discussion of points of uncertainty and possible controversy. The analysis was carried out in a form which permits the formulation of certain constants, the arbitrariness of whose values represents the inherent uncertainty in the theory. Parallel calculations based on different values of these constants lead to a quantitative evaluation of their effect upon evolutionary tracks in the Hertzsprung-Russell diagram. Marked effects result from uncertainties in the ratio of mixing length to scale height and possibly from inadequate knowledge concerning opacities at low temperatures. (Contractor's abstract)

THE TIME EVOLUTION OF AN H II REGION, by W. G. Mathews. [1965] [21]p. incl. diagrs. tables, refs. (AFOSR-66-1582) (AF AFOSR-63-171) AD 641298 Unclassified

Also published in Astrophys. Jour., v. 142: 1120-1140, Oct. 1, 1965.

The dimensions of Strömgren spheres when stellar black-body radiation is first saturated by recombinations are compared to the dimensions of Strömgren spheres in pressure equilibrium. The time scales for the formation of these spheres are compared with the turn-on time for the stellar ultraviolet luminosities and the lifetimes of various stars on the main sequence. The mean absorption coefficient for ionizing hydrogen and the mean photon energy are evaluated as functions of optical depth at the Lyman limit. The equations of hydrodynamics with radiative transfer and cooling by [OII] radiation are differenced. A detailed numerical solution is made for a 30 $\mathfrak{M}_\odot$ star that moves onto the main sequence with the effective temperature and ultraviolet photon luminosity determined from accurate pre-main-sequence evolution tracks of Bodenheimer. On the main sequence $T_* = 41958^\circ K$ and $\mathfrak{Q} = 8.75 \times 10^{48}$

ultraviolet photons/sec. The star is assumed to form in an infinite medium of neutral hydrogen at rest at 100°K. The complete run of gas velocity, density, temperature, pressure, degree of ionization, photon flux, and optical depths are given at time t = 0.919 x 10^4, 3.07 x 10^4 and 6.16 x 10^4 years. It is found that a sharp maximum in the gas temperature follows the ionization front. The cooling by [OII] radiation immediately behind the front and the gradual rise in the equilibrium temperature observed outward from the star keep the velocity of most of the ionized gas in the HII region < 0.1 km/sec. At t = 6.16 x 10^4 years a strong shock is moving ahead of the ionization front into the neutral gas. Allowances for cooling in the neutral gas and magnetic fields are not made. PRESSURE BROADENING AND OPACITY IN THE M_2V STAR HD_{95735}, by M. S. Vardya and K.-H. Böhm. [1965] 6p. incl. diagrs. table, refs. (AFOSR-66-1592) (AF AFOSR-63-171) AD 641295 Unclassified

Also published in Monthly Notices Roy. Astronom. Soc., v. 131: 89-94, Oct.-Dec. 1965.

The possibility that unknown sources of opacity may exist in the M2V spectral class star, HD95735, has been investigated. The factor by which the known sources of opacity should be multiplied to obtain the opacity obtaining in the star is estimated by comparing the total pressure obtained from model atmosphere and that from pressure broadened wings of λ4227 line of CaI. This factor is close to unity if the effective temperature of the star is about 3400°K, and it increases for lower effective temperatures. The effect of metal abundance has also been considered.

INFRARED SPECTRUM AND VIBRATIONAL ASSIGNMENT FOR CHLORINE MONOXIDE, Cl_2O, by M. M. Rochkind and G. C. Pimentel. [1965] [8]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)944 and National Science Foundation) Unclassified

Published in Jour. Chem. Phys., v. 42: 1361-1368, Feb. 15, 1965.

Infrared studies of chlorine monoxide (O^{16} and O^{18}) in the region 200-4000 cm^{-1} for both gas and condensed phases are presented. The spectra require reassignment of the stretching fundamentals and reveal the previously unknown bending fundamental. The new assignment (solid phase. ν_1 = 630.7, ν_2 = 296.4, ν_3 = 670.8 cm^{-1}) results in a new value for the Cl-O bond stretching force constant, K_r = 2.75 mdyn/A, which is strikingly lower than values previously cited. The bond in chlorine monoxide is proposed as the prototype Cl-O single bond. The low stretching-force constant indicates little ionic character in the Cl-O bond, in disagreement with conclusions based on nuclear quadrupole coupling data. (Contractor's abstract)

MATRIX PHOTOLYSIS PRODUCTS OF DIAZOMETHANE: METHYLENEIMINE AND HYDROGEN CYANIDE, by C. B. Moore, G. C. Pimentel, and T. D. Goldfarb. [1965] [8]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)944, and Petroleum Research Fund) Unclassified

Published in Jour. Chem. Phys., v. 43: 63-70, July 1, 1965.

Photolysis of diazomethane dimers in solid nitrogen produces methyleneimine, H_2CNH, and HCN, as shown by infrared spectral study. The HCN frequencies show that it forms a strong hydrogen bond to the imine. Deuterium and ^{15}N isotopic substitutions aid in the vibrational assignment of H_2CNH. Normal coordinate analysis indicates that this prototype C=N stretching force constant is (9.3 ± 0.5) x 10^5 dyn/cm despite difficulties in obtaining a satisfactory fit to all of the observed frequencies.

GAS-LASER FREQUENCY SELECTION BY MOLECULAR ABSORPTION, by C. B. Moore. [1965] [2]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-332] and National Science Foundation) Unclassified

Published in Appl. Opt., v. 4: 252-253, Feb. 1965.

The frequency of a Ne-He laser operating at the 2947.90 cm^{-1} (3.3923-μ) $3s_2 \rightarrow 3p_4$ transition was changed to the nearby frequency of the 2948.79 cm^{-1} (3.3912-μ) $3s_2 \rightarrow 3p_2$ transition by placing CH_4 in the optical resonator and achieving a power level 40% above normal. The use of gas-phase molecular absorption within the laser cavity can discriminate efficiently between 2 frequencies separated by little more than the Doppler line width of the molecular transition. This discrimination is done without introducing into the optical resonator any extra optics or losses at the frequency of the desired transition, as presented in an example.

INFRARED DETECTION OF DIIMIDE, N_2H_2, AND IMIDOGEN, NH, BY THE MATRIX ISOLATION METHOD, by K. Rosengren and G. C. Pimentel. [1965] [10]p. incl. diagrs. tables, refs. (AF AFOSR-63-332) Unclassified

Published in Jour. Chem. Phys., v. 43: 507-516, July 15, 1965.

Hydrazoic acid labeled with deuterium and ^{15}N was photolyzed in solid nitrogen at 20°K. The ^{15}N multiplet splitting positively identifies absorptions of photolysis products as those of trans-N_2H_2 (at 1286 cm^{-1}), trans-HNND (at 1181 and 1058 cm^{-1}), trans-N_2D_2 (at 946 cm^{-1}), and cis-N_2H_2 (at 3074 and 1279 cm^{-1}). The spectrum of trans-N_2H_2 is in agreement with a planar symmetric structure and the vibrational frequencies are quite close to corresponding vibrations of ethylene. Imidogen, NH, was also observed in both solid argon and in solid nitrogen as another photolysis product. The ^{15}N splitting in the ammonia absorption shows that the ammonia dimer in solid nitrogen has a cyclic structure.

INFRARED SPECTRA OF SOLID α AND β-OXYGEN, by B. R. Cairns and G. C. Pimentel. [1965] [7]p. incl. diagrs. tables, refs. (AF AFOSR-63-332) Unclassified

Published in Jour. Chem. Phys., v. 43: 3432-3438, Nov. 15, 1965.

The spectrum of solid α-oxygen deposited at 15° or 20°K consists of a sharp absorption centered at 1549 cm^{-1} (half-width ~ 4 cm^{-1}) and a more intense, broad absorption (half-width ~ 45 cm^{-1}) with well-defined peaks at 1591 and 1617 cm^{-1}. Warming through the $\alpha \rightarrow \beta$ phase transition (at 24° K) causes the broad band to become more diffuse. Recooling restores the low-temperature spectrum and shows that the $\alpha \rightarrow \beta$ transition is rapid and reversible. Slow deposition at 4° K gives an imperfect solid in which the sharp feature is very much intensified. The broad band is due to combinations involving translational lattice modes; the sharp feature is apparently the O_2 fundamental appearing because of lattice imperfections. The β-oxygen spectrum

indicates intermolecular force constants of 0.024 and 0.013 mdyn/A and the α-oxygen spectrum is consistent with a site symmetry of C_{2h} in a space group of C_{2h}^1. None of the spectra, including those of isotopic mixtures, suggests the presence of O_4 molecules.

INFRARED SPECTRUM AND VIBRATIONAL POTENTIAL FUNCTION OF AMIDE ION, by J. W. Nibler and G. C. Pimentel. [1965] [6]p. incl. diagrs. tables. [AF AFOSR-63-332] Unclassified

Published in Spectrochim. Acta, v. 21: 877-882, May 1965.

The infrared spectra of solid $NaNH_2$, NaNHD, $NaND_2$ in Nujol mulls are given. The NH_2^- fundamental frequencies are: ν_1, 3212.5; ν_2, 1539.5; ν_3, 3263.0 cm^{-1}. These and the isotopic data, coupled with an estimated N—H bond length of 1.03 ± 0.02A (giving a bond angle of 104.6°), yield the valence bond force constants: K_r = 5.72 x 10^5 dyn/cm, K_α = 0.76 x 10 ergs/rad^2, K_{rr} = -0.11 x 10^5 dyn/cm, $K_{r\alpha}$ = -0.31 x 10^3 dyn/rad. The K_α value is quite close to that of water, K_r is about 20 - 25% lower than that of water, and the interaction force constants have the same signs as those of water and similar magnitudes. Comparison to the spectra of H_2O, HOD and D_2O in copper chloride dihydrate suggests the effect of the crystalline environment. (Contractor's abstract)

ACIDITY OF HYDROCARBONS. XVI. EQUILIBRIUM ACIDITIES OF HYDROCARBON ACIDS IN CYCLOHEXYLAMINE, by A. Streitwieser, Jr., , J. I. Brauman and others. [1965] [3]p. incl. diagr., tables, refs. (AFOSR 65-0683) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-554] and Petroleum Research Fund) AD 615134 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 384-386, Jan. 20, 1965.

Equilibrium constants were determined in cyclohexylamine for reactions $A^- M^+ + BH \rightleftharpoons AH + B^- M^+$ in which AH and BH are hydrocarbons whose corresponding carbanions show usable spectral differences and M is lithium or cesium. The solutions were made up on a vacuum line with careful exclusion of air and moisture using known amounts of hydrocarbons and solvent and amounts of lithium cyclohexylamide or cesium cyclohexylamide such that measurable amounts of all 4 components were present. The organocesium compounds studied obeyed Beer's law over a concentration range of at least 10-fold. The lithium salts of all compounds more acidic than p-biphenyldiphenylmethane also obeyed Beer's law, but Beer's law correlations could not be obtained for solutions of p-biphenylydiphenylmethane, triphenylamide-cyclohexylamine. It is clear from the differences between the cesium and lithium salts of these hydrocarbons that the acidity of cyclohexylamine relative to hydrocarbons depends on the metal used. The procedure establishes relative equilibrium acidities; however, it is convenient to record the results as absolute pK values. One of the important aspects of the present results is their confirmation of McEwen's approximate assignments.

PERFECT CLOSURES OF RINGS AND SCHEMES, by M. J. Greenberg. [1965] [5]p. (AFOSR-65-2604) (AF AFOSR-63-121) AD 628703 Unclassified

Also published in Proc. Amer. Math. Soc., v. 16: 313-317, Apr. 1965.

A (commutative) ring A of characteristic $p > 0$ is said to be perfect if the endomorphism F given by $F(a) = a^p$ is bijective. It is shown that every ring A has a perfect closure, that is, there is a perfect ring A^*, and a homomorphism $\Phi: A \to A^*$, such that for any perfect ring B, and any homomorphism $\varphi: A \to B$, there is a unique $\varphi^*: A^* \to B$ with $\varphi = \varphi^*\Phi$. The author lists various elementary properties of the operation of perfect closure, and applies them to preschemes. A prescheme $(X, \mathcal{O}_X)$ is called perfect if the pth power endomorphism F of $\mathcal{O}_X$ is bijective. Every prescheme X has a perfect closure, which is a perfect prescheme X^* with a morphism $\Phi: X^* \to X$ satisfying a universal property similar to the one above. (Math. Rev. abstract)

AN APPROACH TO THE ENUMERATION PROBLEM FOR NON-STABLE VECTOR BUNDLES, by I. James and E. Thomas. [1965] [21]p. incl. refs. (AFOSR-66-0008) (AF AFOSR-63-336) AD 630898 Unclassified

Also published in Jour. Math. and Mech., v. 14: 485-506, May 1965.

Let [X, Y] denote homotopy classes of maps of X into Y. Let $p: E \to B$ be the fibre space induced from the path space over C by a map $f: B \to C$. Nomura's mapping sequence ends with $\cdots [A, \Omega C] \to [A, E] \xrightarrow{p^*} [A, B] \to [A, C]$, where the last three are only sets but the group $[A, \Omega C]$ acts on $[A, E]$ as a transformation group and exactness at this point means $p_*\eta = p_*\eta'$ if and only if there is $\gamma \in [A, \Omega C]$ such that $\eta' = \gamma \cdot \eta$. It is known that the set $p_*^{-1}\xi$ may depend on the element ξ. The authors give a construction for analyzing this dependence in certain important cases. Specifically, they construct a homomorphism $\Delta([f], \xi)$. $[A, \Omega B] \to [A, \Omega C]$ if B is an H-space and C a topological group, and prove Theorem 1.2. Let A be a pathwise-connected space, let B be an H-space, and let C be a topological group. If $\xi \in [A, B]$ is an element such that $f_*\xi$ is trivial, then $p_*^{-1}\xi$ is equivalent, as a set, to the cokernel of $\Delta([f], \xi)$: $[A, \Omega B] \to [A, \Omega C]$. They work out the reflection of this operation in the cohomology of B and C so as to apply it when $C = K(G, q)$ and hence $[A, \Omega C] = H^{q-1}(A, G)$ while $[f] \in H^q(B, G)$.

The main applications are to $B = B_O$ (although as pointed out by W. Sutherland, they apply equally well to $B = B_H$). Theorem 1.6. Let n be odd and $n \geq 3$. Let ξ be a stable real vector bundle over a complex A, where $\dim A = n + 1$. If $\dim A = n$, suppose that $n \equiv 3 \bmod 4$ and that $\xi^* w_{n+1} = 0$. Then the number of classes of n-plane bundles over A which are stably equivalent to ξ is equal to the order of the cokernel of $\Delta(w_{n+1}, \xi)$: $[A, \Omega B] \to H^n(A; Z_2)$. The computations are carried out in one illustrative example, that of n-plane bundles over real projective n-space, P^n. Corollary 1.10. Either let n and k be even or let n be odd, $n \neq 1, 3, 7$. Then the number of classes of n-plane bundles over P^n which are stably equivalent to k_η is equal to 1 or 2 according as $\binom{k-1}{n-1}$ is odd or even. (Math. Rev., abstract)

ON CROSS SECTIONS TO FIBER SPACES, by E. Thomas. [1965] [2]p. (AFOSR-66-0032) [AF AFOSR-63-336] AD 631126 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 54: 40-41, July 1965.

Let M be a compact, connected, differentiable manifold. The author defines span (M) to be the maximal number of linearly independent tangent vector fields on M. He announces a number of results, of which some examples are given here. Theorem: Let M be orientable and $\dim M \equiv 3 \bmod 4$; then span (M) $\geq$ 2. For $\dim M = 3$ this is a classical result of Stiefel. Theorem: If M is a spin-manifold and $\dim M \equiv 7 \bmod 8$, then span (M) $\geq$ 3. For complex manifolds M the author defines, in an analogous way, the span of M in terms of complex linearly independent continuous vector fields. He obtains, for example, the following sufficient condition for span (M) $\geq$ 2: The complex dimension n of M is divisible by 4, the Chern classes $c_1(M)$, $c_2(M)$, $c_{n-1}(M)$, $c_n(M)$ vanish, and the Chern class $c_{n-2}(M)$ vanishes mod 2. A further theorem applies to the existence of stable almost-complex structures on 8-dimensional manifolds, giving new information in a case studied earlier by Massey (Bull. Amer. Math. Soc., v. 67: 559-564, 1961). The new method of proof for the author's interesting theorems on cross-sections relies on Postnikov invariants and higher-order cohomology operations. It will be described in a forthcoming paper. (Math. Rev. abstract)

STEENROD SQUARES AND H-SPACES. II, by E. Thomas. [1965] [23]p. incl. refs. (AFOSR-66-0035) [AF AFOSR-63-336] AD 631127 Unclassified

Also published in Ann. Math., v. 81: 473-495, May 1965.

The author studies how the Steenrod squares act in an H-space by reducing it in certain important cases to a purely algebraic problem. The main algebraic result is: Let A be a finitely generated truncated polynomial algebra over the mod 2 Steenrod algebra. Let D be the ideal of decomposable elements. Let n and t be positive integers such that $\binom{n-1-t}{t} \equiv 1 \bmod 2$. Then $A_n = S^t_\zeta A_{n-t} \bmod D$ and $S^t_q A_n \equiv 0 \bmod D$. Here truncated polynomial algebra means a polynomial algebra A' modulo any ideal contained in $(A')^3$. Using the projective plane of an H-space as in Part I the following sort of result is obtained. Let X be an H-space whose algebra $H^*(X)$ is generated by a finite number of odd-dimensional primitive classes, all of which have distinct degrees. Let $u_{2j-1} \in H^{2j-1}(X)$ $(j > 0)$ denote the primitive class of degree $2j - 1$, if such exists, otherwise, set $u_{2j-1} = 0$. Then $S^{2i}_q u_{2j+1} = \binom{2j+1}{2i} u_{2(i+j)+1}$ for all $i, j \geq 0$. Moreover, if $H^*(X)$ is an exterior algebra on odd-dimensional generators, then the above formula describes completely the action of the Steenrod squares in $H^*(X)$. Stronger results, obtained by assuming associativity of the H-space X, use the classifying space B_X. (Math. Rev. abstract)

NONLINEAR EVOLUTION EQUATIONS IN BANACH SPACES, by T. Kato [1965] [18]p. incl. refs. (AFOSR-66-0255) (AF AFOSR-64-553) AD 631158 Unclassified

Also published in Proc. Symposia Appl. Math., v. 17: 50-67, 1965.

The author discusses some results for the problem $u' + A(t)u = f(t, u)$, $u(0) = 0$, where u(t) takes values in a Banach space X (assumed separable, although this is not always necessary) and A(t) is a family of (usually unbounded) operators in X. First, some standard theorems (Picard, Cauchy-Peano) for the case $A(t) \equiv 0$, f(t, u) continuous in (t, u), are cited, and then a recent result of Browder for this case (Ann. Math., v. 80: 485-523, 1964) is indicated, where existence and uniqueness in a Hilbert space X follow from the continuity of $f(\cdot, \cdot)$ and the hypothesis $\mathrm{Re}(f(t, u) - f(t, v), u - v) \leq M\|u - v\|^2$, with f supposed also to map bounded sets into bounded sets. Next, some of the main results are given (due to the author, Yosida, Tanabe, Krasnosel'skiĭ, Krein, Sobolevskiĭ) concerning the explicit construction of an evolution operator U(t, s). The application of these results to the equation $u(t) = U(t, 0)u_0 + \int_0^t U(t, s)f(s, u(s))ds$ is then indicated under various hypotheses on A and f. The following theorem is proved which generalizes a result of Browder. Let X be Hilbert and f demi-continuous from $I \times X$ to X (I is an interval $[0, T]$), mapping bounded sets into bounded sets, and satisfying the monotonicity type hypothesis above. Let $-A(t)$ be the infinitesimal generator of a contraction semigroup with $(A(t) + I)^{-1}$ strongly continuously differentiable, and suppose that

an evolution operator U(t, s) exists having standard properties (without specifying further explicit hypotheses on the A(t) which would insure this). Then the integral equation above has a unique continuous solution for any $v \in X$, and $v \to u$ is continuous from $X \to C(I, X)$. Some theorems for cases when F is "regular" relative to A (A(t) = A here for convenience) are then given, and the question of global solutions is briefly discussed. Examples are given throughout the paper. (Math. Rev. abstract)

ON THE CAPACITY OF COMPOSITE CONDUCTORS, by M. H. Protter and H. F. Weinberger. [1965] [9]p. incl. diagrs. (AFOSR-66-1206) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-553] and National Science Foundation) AD 641739 Unclassified

Also published in Jour. Math. and Phys., v. 64: 375-383, Dec. 1965.

Let S_0 be a closed connected 2-dimensional surface in E^3, and let S_1 and S_2 be 2 other closed surfaces lying entirely in the interior of S_0. S_1 and S_2 need not be connected and may intersect, but neither is to be entirely contained in the other. The authors concern themselves with finding inequalities relating the capacities C, C_1, C_2 of the condensers R, R_1, R_2 bounded by the surfaces S_0 and $S_1 \cup S_2$, S_0 and S_1, S_0 and S_2. Main theorem Let u, u_1 and u_2 be the harmonic measures of R, R_1 and R_2 with respect to $S_1 \cup S_2$, S_1 and S_2 (the authors use the term capacitary potential for harmonic measure). Also, let m_1, m_2 be any constants such that $m_1 \le \min u_1$ on S_2, $m_2 \le u_2$ on S_1. Then

$$C \le C_1 + C_2 - \frac{m_2(1-m_1)C_1 + m_1(1-m_2)C_2}{1-m_1m_2}.$$

The theorem is proved by applying the maximum principle to $v = u - ((1-m_2)u_1 + (1-m_1)u_2)/(1-m_1m_2)$ and using the fact that one can evaluate the capacity of a condenser (bounded by B_1 and B_2) by integrating the normal derivative of the harmonic measure relative to B_1 over any simple closed surface containing B_2. Similar methods are used to obtain a corresponding inequality in the other direction. These inequalities are then applied in a number of examples, and comparisons made in some cases where the exact value of C is known. (Math. Rev. abstract)

LOWER BOUNDS FOR SOLUTIONS OF DIFFERENTIAL INEQUALITIES IN HILBERT SPACE, by H. Ogawa. [1965] [3]p. (AFOSR-66-1397) (AF AFOSR-64-553) AD 641736 Unclassified

Also published in Proc. Amer. Math. Soc., v. 16: 1241-1243, Dec. 1965.

Let A be an operator in a Hilbert space and let u(t) be in the domain of A for each $t \in (0, \infty)$. Assuming u is strongly differentiable, Au strongly continuous and du/dt strongly piecewise continuous, all with respect to t, define $Lu = \frac{du}{dt} - Au$. In the case where A is symmetric, i.e., (Au, v) = (u, Av), Cohen and Lees obtained lower bounds for solutions of differential inequalities of the form $|Lu(t)| \ge \phi(t)|u(t)|$. Assuming that A is selfadjoint, Agmon and Nirenberg found a simpler proof of this result, as well as some extensions, by means of convexity theorems. The purpose of this paper is to present still simpler proofs, assuming only that A is symmetric, of the theorem of Cohen and Lees for p =2 and of the extensions of Agmon and Nirenberg.

ON ACCRETIVE BOUNDARY PROBLEMS OF THE SECOND ORDER, by F. Wolf. [1965] [4]p. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-553, and Miller Inst. for Basic Research in Science) Unclassified

Published in Proc. Nat'l. Acad. Sci., v. 53: 5-8, Jan. 1965.

Let B_0, C_0 be formally hermitian, second-order partial differential operators defined in a domain G of E^n. Let B be the Friedrichs extension in $L^2(G)$ of the restriction of B_0 to C_0^∞ (the set of infinitely differentiable functions with compact supports). If B_0 is uniformly elliptic on any compact subdomain of G, it is shown, under suitable regularity assumptions on the coefficients of B_0 and C_0, that there exists a unique extension C of C_0 so that the operator B + iC has the left-hand half-plane in its resolvent set. It is not required that C_0 be dominated by B_0. For $|(Cu, u)| \le M|(Bu, u)|$ and D(C) D(B), the result was previously known and easily obtained by means of the Lax-Milgram lemma.

NETS OF THRESHOLD ELEMENTS, by K. Krohn and J. Rhodes. [1965] [10]p. incl. refs. (AFOSR-66-1222) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-848 and Office of Naval Research) AD 641541 Unclassified

Also published in Inform. and Control, v. 8: 579-588, Dec. 1965.

Several theoretical results are obtained concerning properties of the transition function given by a finite net of threshold elements. In particular, an exact characterization of these transition functions is given solely in terms of the Boolean Ring. Specializing this result necessary and sufficient conditions are found that a Boolean function is realizable by a single threshold element. Also axioms for the transition functions of McCulloch-Pitts Nets, etc. are furnished.

NUCLEAR SPIN OF 45d IRON-59 (Abstract), by B. M. Dodsworth and H. A. Shugart. [1965] [1]p. (AFOSR-65-1563) [AF AFOSR-62-346] AD 640223 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Also published in Bull. Amer. Phys. Soc., Series II, v. 10: 445, Apr. 26, 1965.

The nuclear spin of 45d iron-59 was measured as 3/2 by the atomic beam, magnetic resonance method. This result is the same as that deduced previously from β decay theory and is consistent with a shell model neutron assignment $(f_{3/2})^3 (f_{5/2})^2$. The radioactivity was produced by the (n, γ) reaction on natural iron metal. A tantalum oven containing a zirconium oxide liner was heated by electron bombardment to produce the beam of iron atoms. After traversing the beam machine, the activity was collected on either freshly deposited copper or sulfur surfaces and was counted in flow proportional β counters. Because of the integral value of the electronic angular momentum in iron, only multiple quantum transitions are observable in the normal flop-in apparatus. Nineteen resonances were observed in the F = 11/2 and 9/2 levels of the $^5D_4$ electronic state at magnetic fields up to approx 27 gauss. Although structure appears on the resonance lines due to beam instability and possible resolution of multiple quantum transitions, the resonances indicate a nuclear spin of 3/2.

HYPERFINE STRUCTURE AND NUCLEAR MOMENTS OF PROMETHIUM-148 AND ERBIUM-165, by D. Ali, I. Maleh, and R. Marrus. [1965] [5]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-346] and Atomic Energy Commission) Unclassified

Published in Phys. Rev., v. 138: B1356-B1360, June 21 1965.

The hyperfine structure of the $^6H_{7/2}$ level in 5.3-day Pm^{148} and the $^3H_6$ level in 10-h Er^{165} have been measured by atomic-beam magnetic resonance. The spins of these isotopes have been verified to be $I(Pm^{148}) = 1$ and $I(Er^{165}) = 5/2$. The electronic g factor for the $^6H_{7/2}$ level in Pm^{148} is found to be $g_J = -0.8278(1)$. The hyperfine constants and inferred nuclear moments are given for Pm^{148} and for Er^{165}. The nuclear moments of Pm^{148} were calculated from the hyperfine constants and assumptions made concerning the electronic fields at the nucleus; these assumptions include a 2% correction for the breakdown of Russell-Saunders coupling, but do not include corrections for the Sternheimer effect. The stated errors include a 5% uncertainty for $\langle 1/r^3 \rangle$. The Fermi-Segrè formula and the direct measurement of the magnetic moment of Er^{167} were used to calculate the dipole moment of Er^{165}. The quadrupole moment of Er^{165} has not been corrected for the Sternheimer effect. The measurements indicate that Pm^{148} may be described by the shell model, but that Er^{165} is deformed and must be interpreted by the collective model. (Contractor's abstract, modified)

VORTICES IN AN IMPERFECT BOSE GAS. I. THE CONDENSATE, by A. L. Fetter. [1965] [9]p. incl. diagrs. refs. (AFOSR-65-1342) (AF AFOSR-63-130) AD 622626 Unclassified

Also published in Phys. Rev., v. 138: A429-A437, Apr. 1965.

A theoretical study of rectilinear vortices in an imperfect Bose gas shows a close correspondence with classical hydrodynamics. The energy and momentum of a vortex pair in an unbounded fluid were calculated. The similarity between a vortex pair and a vortex ring leads to an estimate of the critical velocity v_c of liquid He II in a tube of radius R that includes the effect of the walls $v_c = C\hbar/2mR$, where C is a constant of order unity. A variational treatment of a system of many identical vortices in a container shows that the energy is lowest for a uniform distribution and that the number of vortices per unit area ν agrees with Feynman's result $\nu = 2m\omega/h$. In the classical limit ($h \to 0$), the angular momentum and energy approach the values for solid-body rotation. (Contractor's abstract)

VORTICES IN AN IMPERFECT BOSE GAS. II SINGLE-PARTICLE EXCITATIONS, by A. L. Fetter [1965] [8]p. incl diagrs. tables, refs. (AFOSR-65-1343) (AF AFOSR-63-130) AD 622848 Unclassified

Also published in Phys. Rev., v. 138 A709-A716, May 3, 1965.

The single particle excitations of an imperfect Bose gas with a vortex in the condensate are studied using the Bogoliubov approximation. The problem is reduced to an eigenvalue equation, whose solution yields both

the single-particle energies and the eigenfunction expansion of the single-particle Green's function. The spectrum of the eigenvalues contains a discrete portion (bound states) and a continuous portion (scattering states). The lowest eigenvalue corresponding to angular momentum $l = 0$ and $l = \pm 1$ is determined variationally. In the long-wavelength limit, the eigenvalue for $l = \pm 1$ agrees with the frequency of normal modes calculated by Kelvin and Pitaevskii. The density of noncondensed particles is expressed in terms of the single-particle Green's function and is shown to be finite at the center of the vortex. (Contractor's abstract)

LOW-TEMPERATURE BEHAVIOR OF THE HEISENBERG FERROMAGNET, by M. Wortis. [1965] [20]p. incl refs. (AFOSR-65-2189) (AF AFOSR-63-130) AD 625930 Unclassified

Also published in Phys. Rev., v. 138: A1126-A1145, May 17, 1965.

The mechanics of spin deviations is formulated in a simple manner, which maintains the true spin kinematics and does not involve the introduction of any artificial interactions. A virial expansion for the thermodynamics based on this mechanics, clearly distinguishes kinematical and dynamical effects. At low temperatures, low-density kinematical effects are easily proved exponentially small. The second virial coefficient is computed unambiguously. Dyson's low-temperature free energy is straightforwardly rederived, and an upper bound is estimated on the validity of the associated low-density boson picture. (Contractor's abstract)

RELATIVISTIC CORRECTIONS TO THE FINE STRUCTURE OF HELIUM, by K. Y. Kim. [1965] [7]p. incl. refs. diagrs (AFOSR-66-0380) (AF AFOSR-63-130) AD 630297 Unclassified

Also published in Phys. Rev., v. 140: A1498-A1504, Nov 29, 1965

Relativistic corrections to the fine structure of the hydrogen atom have been calculated by many authors, but the experimental confirmation of the theory, or alternatively the determination of the numerical value of the fine-structure constant α, is limited to an accuracy of 1 10^5 because of the short lifetime of $2\,^2P$ states of hydrogen. However, in view of the fact that $2\,^3P$ states of helium have a longer lifetime, it is expected that the (fine-structure) intervals of the $2\,^3P$ states of helium can be measured to an accuracy of $1/10^6$ or better. With this expectation, an attempt was made to evaluate semirelativistically the theoretical formula for the helium fine structure to the order $\alpha^4 Ry$. (Contractor's abstract)

EVIDENCE THAT THE DEUTERON IS NOT AN ELEMENTARY PARTICLE, by S. Weinberg. [1965] [7]p. incl. refs. (AFOSR-65-0816) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-232 and Atomic Energy Commission) AD 616214 Unclassified

Also published in Phys. Rev., v. 137: B672-B678, Feb. 8, 1965.

If the deuteron were an elementary particle then the triplet n-p effective range would be approximately -ZR/(I-Z), where R = 4.31F is the usual deuteron radius and Z is the probability of finding the deuteron in a bare elementary-particle state. This formula is model-independent, but has an error of the order of the range m_π^{-1}=1.41F of the n-p force, so it becomes exact only in the limit of small deuteron binding energy, i.e., $R >> m_\pi^{-1}$. The experimental value of the effective range is not of order R and negative, but rather of order m_π^{-1} and positive, so Z is small or zero and the deuteron is mostly or wholly composite. PHOTONS AND GRAVITONS IN PERTURBATION THEORY: DERIVATION OF MAXWELL'S AND EINSTEIN'S EQUATIONS, by S. Weinberg. [1965] [15]p. incl. refs. (AFOSR-65-1823) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-232 and Atomic Energy Commission) AD 625562 Unclassified

Also published in Phys. Rev., v. 138: B988-B1002, May 24, 1965.

The S matrix for photon and graviton processes is studied in perturbation theory, under the restriction that the only creation and annihilation operators for massless particles of spin j allowed in the interaction are those for the physical states with helicity ± j. In order to obtain long-range forces, it is necessary to introduce noncovariant potentials in the interaction, and the Lorentz invariance of the S matrix requires that these potentials be coupled to conserved tensor currents, and also that there appear in the interaction direct current-current couplings, like the Coulomb interaction. The potentials for j = 1 and j = 2 must inevitably satisfy Maxwell's and Einstein's equations in the Heisenberg representation. It is shown to be impossible to construct a Lorentz-invariant S matrix for magnetic monopoles and charges in perturbation theory.

PHASE OF THE CP-INVARIANCE VIOLATION IN τ^0 DECAY, by S. L. Glashow and S. Weinberg. [1965] [2]p. (AFOSR-65-1868) (AF AFOSR-63-232) AD 626779 Unclassified

Also published in Phys. Rev. Ltrs., v. 14 835-836, May 17, 1965

A previous experiment (Phys. Rev. Ltrs., v. 14: 475, 1965) indicates possible strong CP-invariance violation in the decay mode $K_1^0 \to \pi^+ + \pi^- + \pi^0$. The measured ratio of the K_1^0 and K_2^0 decay amplitudes, $Re(a_1 a_2) = +0.25 \pm 0.65$, $Im(a_1/a_2) = +1.00 \pm 0.65$, suggests that this ratio may have absolute magnitude of order unity and phase near 90°, though the statistics are hardly conclusive. It is pointed out that if $a_1 a_2$ is actually not much less than one in magnitude, then CPT symmetry and the $\Delta T \leq 3/2$ rule require its phase to be very close to ± 90°. This constraint was not imposed in the analysis made in the previous experiment, so the fact that this analysis did give a mostly imaginary ratio lends additional credence to the existence of a strong $K_1^0 \to 3\pi$ mode. If this mode does exist, then a refined measurement of the phase of $a_1 a_2$ can provide a sensitive test of CPT and/or $\Delta T \leq 3/2$.

IS CHARGE-CONJUGATION INVARIANCE BADLY BROKEN?, by S. L. Glashow and C. M. Sommerfield. [1965] [3]p. incl. table, refs. (AFOSR-65-1951) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-232 and Office of Naval Research) AD 626894 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 78-80, July 12, 1965.

Several simple C-nonconserving interactions are considered, any one of which could provide a mechanism for the decay $K_2^0 \to 2\pi$. Present experimental data relating to C-nonconserving mesonic decay rates with phase-space estimates are compared. There is considerable suppression for C-nonconserving $\omega\pi\eta$ and $\phi\pi\eta$ coupling constants but no meaningful limit on the strength of the C-nonconserving $\rho\eta\pi$ coupling constant is obtained. It is shown that even if this coupling is strong, it would not produce a significant charge asymmetry in η decay.

CYCLOTRON RESONANCE IN ALUMINUM, by F. W. Spong and A. F. Kip. [1965] [17]p. incl. illus. diagrs. table, refs. (AF AFOSR-63-290) Unclassified

Published in Phys. Rev., v. 137: A431-A447, Jan. 18, 1965.

A systematic study of Azbel'-Kaner cyclotron resonance in aluminum at 35 Gc/sec has clarified and extended previous work. Results on the orientation dependence and relative values of the cyclotron mass for different electron orbits correspond closely with expectations based on Harrison's free-electron model. However, the observed mass values are consistently 55-60% higher than those predicted by the free-electron model. Since the nearly-free-electron model agrees with ab initio band-structure calculations which exist for aluminum and which are thought to be reliable within the independent-particle model, the bulk of this discrepancy is presumed to be attributable to the many-body effects of correlation and electron-phonon interactions. The anomalous cyclotron resonance spectrum attributed in previous work to a cyclotron mass of 3.10m (m is the free electron mass) is elucidated in terms of current sheets which reproduce the skin currents deep within the metal. These sheets are produced by the spatially periodic magnetic focusing of limiting-point electrons on the Fermi surface. This mechanism leads to a cyclotron mass for these electrons of 1.55m, just one half the value given on the Azbel'-Kaner model. Quantum oscillations in the surface impedance analogous to the de Haas-van Alphen oscillations in the susceptibility are observed at ~1.5° K. Observed periods agree with the de Haas-van Alphen periods measured by Gunnersen. (Contractor's abstract)

CYCLOTRON RESONANCE IN SILVER, by D. G. Howard. [1965] [11]p. incl. diagrs. refs. (AF AFOSR-63-290) Unclassified

Published in Phys. Rev., v. 140: A1705-A1715, Nov. 29, 1965.

Azbel'-Kaner-type cyclotron resonance has been used to examine the Fermi surface of silver. The types of resonances observed from a (110)-surface sample are very like those reported for copper. Resonances originating from orbits about the zone contact regions have been observed over a limited range of angles. Relatively strong signals have been obtained from orbits near the limiting points when the field lies nearly parallel to the [001] direction of the (110) surface. The 2 orbits reported in copper whose centers lie neither at the center nor the edge of the zone have been observed, and in addition a third orbit of this type has been identified and measured over a large range of angles. Data taken on a (100)-surface specimen (not available in the copper studies) have shown resonances due to both hole and electron orbits; these resonances are consistent with the previous knowledge of the geometry of the Fermi surface. The effect on cyclotron resonance signals of a magnetic field inclined with respect to the specimen surface has been investigated. Apparent shifts in the measured cyclotron mass as large as 50% per degree of field misalignment have been obtained. The similarity of a number of the signals to the peak-reversal phenomena observed in potassium and aluminum is discussed. Certain of the signals in fields inclined at large angles to the surface have yielded a measure of the neck size in excellent agreement with de Haas-van Alphen measurements. (Contractor's abstract)

THE SURFACE IMPEDANCE OF METALS IN A WEAK MAGNETIC FIELD, by J. F. Koch and A. F. Kip. [1965] [5]p. incl. diagrs. (Sponsored jointly by Advanced Research Projects Agency and Air Force Office of Scientific Research under [AF AFOSR-63-290]) Unclassified

Published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed.by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9(Pt. B): 818-822, 1965.

The absorption derivative signals in single crystals of tin, indium, and aluminum are studied. The crystals were cut with several different symmetry planes from single-crystal boules, and subsequently electropolished The experiments were done at frequencies between 30 and 70 Gcps and at liquid-helium temperatures. The results and observations are summarized: (1) A typical signal consists of a number of distinct derivative maxima and minima at magnetic fields below 100 Oe, (2) The effect shows a striking dependence on the sample surface

in which it is observed; (3) Polarization of the RF current affects the amplitude, but not the position of the derivative maxima; (4) If the experimental frequency is increased, the peak positions shift to higher fields as $\omega^{3/2}_{RF}$; (5) The low-field effect can readily be observed with the magnetic field tipped at arbitrarily large angles with respect to the sample surface; (6) The preparation of a highly polished surface is essential to the observation of the effect; and (7) The effect is independent of temperatures between 4.2°K and the superconducting transition temperature. It is suggested that the observed signals are due to the interaction of conduction electrons, traversing the skin region on a segment of cyclotron orbit, with the RF electric field; electron trajectory through the region of the skin depth is discussed.

OBSERVATIONS OF LONG-PERIOD PULSATIONS OF ELECTRON PRECIPITATION IN CONJUGATE REGIONS OF THE AURORAL ZONES, by R. R. Brown, J. R. Barcus and others. [1965] [4]p. incl. diagrs. (AFOSR-65-1877) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-331, National Science Foundation, and Office of Naval Research) AD 626096 Unclassified

Also published in Jour. Geophys. Research, v. 70: 1246-1249, Mar. 1, 1965.

Observations are summarized for a long-period pulsation event in ionospheric absorption of cosmic radio noise at Kotzebue, Alaska and at the Australian National Antarctic Research Expeditions' Station at Macquarie Island. Although there is a great degree of simultaneity and similarity, additional features of pulsating electron precipitation are shown from x-ray and riometer observations. These observations outside the immediate vicinity of the conjugate regions indicate spatial structure on a scale of a few hundred km.

EVIDENCE SUGGESTING DUMPING OF SEMITRAPPED ELECTRONS ON THE NIGHT SIDE OF THE EARTH, by J. R. Barcus. [1965] [3]p. incl. diagrs. (AFOSR-65-1878) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-331, and Office of Naval Research) AD 626097 Unclassified

Also published in Jour. Geophys. Research, v. 70 1237-1239, Mar. 1, 1965.

A precipitation event intense enough to make a near maximum demand on the outer zone was observed by means of bremsstrahlung x-rays, with a balloon-borne scintillation detector. The balloon was launched from Barrow, Alaska, in March 1963 during the recovery phase of a magnetic storm. X-ray activity above 100 kev was barely detectable, except for an extremely intense burst (~ 350 times normal) occurring at approximately 1030 UT. The origin of this striking spectral variation is considered. It is pointed out that local acceleration, other than untrapping mechanisms, need not necessarily coincide with the region of precipitation. It is possible that daytime events, extensive in space and time, are the result of energization processes occurring in the sunlit magnetosphere; the transient and localized bursts occurring near midnight are the result of partial dumping of the semitrapped enhancement in the outer zone.

BALLOON OBSERVATIONS ON THE RELATIONSHIP OF ENERGETIC ELECTRONS TO VISUAL AURORA AND AURORAL ABSORPTION, by J. R. Barcus. [1965] [13]p incl. illus. diagrs. refs. (AFOSR-65-1879) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-331 and 62-422, National Science Foundation, and Office of Naval Research) AD 626502 Unclassified

Also published in Jour. Geophys. Research, v. 70 2135-2147, May 1, 1965.

Simultaneous bremsstrahlung x-ray and photometric measurements show a rather loose correlation, in the sense of a detailed space-time association, between the appearance of x-rays at balloon altitudes and visual aurora at large L values. The observations suggest that essentially different, though not infrequently coupled, mechanisms are responsible for the low and high energy portions of the precipitated electron spectrum. Detailed examination of an ionospheric absorption event associated with auroral breakup indicates that the event is largely accounted for by the same flux of low energy electrons responsible for the simultaneous luminosity enhancement. OBSERVATIONS ON THE SPATIAL STRUCTURE OF PULSATING ELECTRON PRECIPITATION ACCOMPANYING LOW FREQUENCY HYDROMAGNETIC DISTURBANCES IN THE AURORAL ZONE, by J. R. Barcus and T. J. Rosenberg. [1965] [10]p. incl. diagrs (AFOSR-65-1880) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-331, National Science Foundation, and Office of Naval Research) AD 626503 Unclassified

Also published in Jour. Geophys. Research, v 70 1707-1716, Apr. 1, 1965.

Low-frequency hydromagnetic disturbances which are generated in a sunlit part of the distant magnetosphere and propagate as transverse waves to auroral latitudes are accompanied by pulsating electron precipitation and ionospheric absorption of cosmic radio noise with a similar temporal behavior The region over which this pulsating activity occurs is belt-like, ~ 1000 km long and ~ 100-400 km across. Sometimes the instantaneous pattern of precipitation exhibits spatial structure over

these dimensions, but at least on one occasion the pulsations were in phase over a large region near the noon meridian. A unique acceleration process does not appear to be required, as the bremsstrahlung x-ray spectrums obtained for the pulsations are not essentially different from those observed during activity preceding or following these events. The statically trapped radiation is eliminated as a possible source, and some mechanisms involving local energization are briefly discussed. (Contractor's abstract)

BALLOON OBSERVATIONS OF AURORAL ZONE X RAYS IN CONJUGATE REGIONS. 2. MICROBURSTS AND PULSATIONS, by R. R. Brown, J. R. Barcus, and N. R. Parsons. [1965] [14]p. incl. diagrs. table. (AFOSR-65-1882) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-331, National Science Foundation, and Office of Naval Research) AD 626099 Unclassified

Also published in Jour. Geophys. Research, v. 70: 2599-2612, June 1, 1965.

Simultaneous balloon observations of x-ray pulsations in the 5-10 sec range made from Fairbanks, Alaska, and Macquarie Island, Australia, showed no detailed correlation in time or amplitude. Observations in the northern hemisphere, with 2 balloon instruments separated by about 150 km in the east-west direction, showed no obvious correlation, but when the separation was reduced to about 100 km in the north-south direction, x-ray pulsations showed in-phase variations. Observations with 2 balloon instruments separated by 150 km in the east-west direction showed time coincidences for about 1/3 of the microbursts; the other 2/3 were observed on one balloon or the other. From the small scale size of microburst electron precipitation it is suggested that magnetospheric plasma instabilities are responsible for the electron bombardment of the auroral zone atmosphere. Similar considerations are suggested for pulsating electron precipitation. (Contractor's abstract)

OBSERVATIONS ON THE ASSOCIATION OF AURORAL LUMINOSITY WITH AURORAL X-RAYS AND COSMIC NOISE ABSORPTION, by T. J. Rosenberg. [1965] [9]p. incl. diagrs. table. (AFOSR-65-2798) (AF AFOSR-63-331) AD 627541 Unclassified

Also published in Jour. Atmos. and Terrest. Phys., v. 27: 751-759, June 1965.

Simultaneous observations of auroral luminosity and bremsstrahlung x-rays from the same balloon payload are reported here. Comparison of the balloon measurements with riometer records has shown the same variety of associations that appear in other studies of auroral phenomena. Because the photometer and scintillation counter geometries are fixed relative to each other and view equivalent regions of the sky at the production layer, it has been possible to investigate behavioral differences in the low and high energy portions of the precipitated electron spectrum with more certainty than when comparing balloon and ground-based observations. Certain aspects of the present observations suggest that temporal variations in these two energy ranges are rather independent, on occasion. These observations support the suggestion that two mechanisms having characteristically different energy spectra control the acceleration and/or precipitation of energetic electrons.

Correlations of auroral luminosity with x-rays then depend upon the degree of coupling between the mechanisms. (Contractor's abstract)

COMMENTS ON RELATIVISTIC SUPERMULTIPLET THEORIES, by S. Weinberg. [1965] [5]p. incl. refs. (AFOSR-65-1815) (AF AFOSR-64-232) AD 625573 Unclassified

Also published in Phys. Rev., v. 139: B597-B601, Aug. 9, 1965.

It is proved that it is impossible to extend the SU(6) symmetry to a well-behaved group of unitary operators on the physical Hilbert space since no such group can have irreducible representations containing all spin states of the particles involved. It is shown that the recently proposed U(12) symmetry evades the theorem by acting on the generalized M function rather than on the physical Hilbert space. A brief explanation is provided for the use of the M function. Some evasions of the theorem other than the U(12) symmetry are also discussed.

THREE-BODY N/D EQUATIONS. I. INTEGRAL ANGULAR MOMENTA, by S. Mandelstam. [1965] [22]p. incl. diagrs. (AFOSR-66-0016) (AF AFOSR-64-232) AD 630309 Unclassified

Also published in Phys. Rev., v. 140: B375-B396, Oct. 25, 1965.

Equations are derived for calculating 3-body partial wave amplitudes once all singularities other than the unitarity discontinuity are known. The equations can easily be reduced to Fredholm equations. They have a similar structure to the 2-body equations, but are more complicated owing to the presence of disconnected diagrams. The D function is related to the form factor in the usual way, and it has the expected zeros and cuts on the unphysical sheet. A subsidiary problem which is treated is the determination of a function with kinematical branch points when the discontinuities across the dynamical cuts on all sheets are known. Also, a brief discussion is given of the many-channel analog of the Omnes equation. This discussion may be useful to those who do not wish to study the mathematical theory in detail. INFRARED PHOTONS AND GRAVITONS, by S. Weinberg. [1965] [9]p. (AFOSR-66-0021) (AF AFOSR-64-232) AD 640277 Unclassified

Also published in Phys. Rev., v. 140: B516-B524, Oct. 25, 1965.

It is shown that the infrared divergences arising in the quantum theory of gravitation can be removed by the familiar methods used in quantum electrodynamics. An additional divergence appears when infrared photons or gravitons are emitted from noninfrared external lines of zero mass, but it is proved that for infrared gravitons this divergence cancels in the sum of all such diagrams. (The cancellation does not occur in massless electrodynamics.) The formula derived for graviton bremsstrahlung is then used to estimate the gravitational radiation emitted during thermal collisions in the sun, and this found to be a stronger source of gravitational radiation (though still very weak) than classical sources such as planetary motion. The conjecture of Dalitz that divergences in the Coulomb-scattering Born series may be summed to an innocuous phase factor is verified, and it is shown how this result may be extended to processes involving arbitrary numbers of relativistic or nonrelativistic particles with arbitrary spin. UNSTABLE-PARTICLE SCATTERING AND THE STRIP APPROXIMATION, by I. T. Drummond. [1965] [18]p. incl. diagrs. refs. (AFOSR-66-0025) [AF AFOSR-64-232] AD 630237 Unclassified

Also published in Phys. Rev., v. 140: B482-B499, Oct. 25, 1965.

The problem of formulating a bootstrap calculation when one of the scattering particles is unstable, is examined. The unstable-particle scattering amplitude is defined as an S-matrix pole residue, the analytic structure of which may be determined from the usual Landau rules. Although the instability of the external particle complicates the structure it does not do so too severely. Therefore, it can be postulated that, in analogy with the stable case, the unstable-particle amplitude exhibits Regge asymptotic behavior. A strip approximation to the amplitude which is a crossing-symmetric superposition of Regge pole terms can then be constructed. This approximation exhibits, in some respects, satisfactory analytic structure. In particular it takes quite well into account certain anomalous threshold effects. It satisfies a quasi-Mandelstam representation which is used to explore the analytic structure of the corresponding partial-wave amplitudes and their continuation to arbitrary angular momentum. Certain simple discontinuity formulas are used to obtain dynamical equations for the partial-wave amplitudes and a complete bootstrap scheme is formally constructed. VORTICES IN AN IMPERFECT BOSE GAS. III. SCATTERING OF SINGLE-PARTICLE EXCITATIONS, by A. L. Fetter. [1965] [9]p. incl. refs. (AFOSR-66-0373) (AF AFOSR-65-130) AD 630279 Unclassified

Also published in Phys. Rev., v. 140: A452-A460, Oct. 18, 1965.

The scattering of single-particle excitations by a vortex in the condensate of an imperfect Bose gas is studied using the Bogoliubov approximation. The S matrix is calculated as in conventional scattering theory, and the phase shifts are determined with the Schwinger variational principle. The differential cross section in the long-wavelength limit is found to be $d\sigma/d\varkappa = 1/2\pi (\hbar/mc^2)k \cot^2(1/2\varkappa)$, where m is the mass of one atom and c is the speed of sound. This cross section agrees precisely with that found previously for scattering of sound by a classical vortex with circulation h/m. (Contractor's abstract)

SPHERICAL IMPURITY IN AN INFINITE SUPERCONDUCTOR, by A. L. Fetter. [1965] [16]p. incl. diagrs. refs. (AFOSR-66-1546) (AF AFOSR-65-130) AD 641036 Unclassified

Also published in Phys. Rev., v. 140: A1921-A1936, Dec. 13, 1965.

The modifications in a superconducting medium due to a single, spherically symmetric, nonmagnetic impurity are examined using the BCS theory of superconductivity. The energy spectrum of quasiparticles has both a discrete portion (bound states) and a continuous portion (scattering states). In the scattering region ($E > \Delta$), a given energy corresponds to two distinct momentum states, one above and one below the Fermi level. The calculation of the S matrix for the impurity scattering is thus a problem of two coupled channels. The electron density $n(\gamma)$ and the order parameter $\Delta(\gamma)$ far from the impurity are evaluated asymptotically in terms of the eigenphase shifts and mixing parameter of the two channels. Two soluble models for the impurity are considered. With a hard-sphere, long-range spatial oscillations are found in $\Delta(\gamma)$ as well as in $n(\gamma)$. With a delta-shell potential, a resonant enhancement occurs in the scattering of quasiparticles with momentum near the Fermi momentum. Both the spatial oscillations and the resonant enhancement are expected to appear for more general impurity potentials. (Contractor's abstract)

THE INSTABILITY OF CENTRIFUGAL-ELECTROSTATIC-FOCUSED FLOW, by R. Lundgren. Sept. 23, 1965, 102p. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-117 and Electronics Technology Division) AD 474598 Unclassified

The stability of thin centrifugal- electrostatic-focused (CEF) streams is investigated. It is found that these streams can be unstable for axially asymmetric perturbations, but that perturbation growth stops or is severely damped after the beam attains some specific thickness. Linear analysis of the thin stream model shows that it is usually unstable for two-dimensional perturbations, with exponential time growth dependent on the azimuthal wave number. Moving the coaxial focusing walls closer to the stream first causes the growth rate at small n to decrease, then vanish, and finally to reappear accompanying a stream-image charge instability. The physical mechanism of growth is examined in detail and compared to its dual, the magnetically focused model of Kyhl-Webster-Pierce. The large-amplitude growth region is examined by numerical integration using a two-dimensional charged-rod model. The accuracy of the numerical method is checked against the results of a single-rod small-amplitude analysis. Starting points for the non-linear calculations are small density perturbations for n = 5, and 15 = 30. Growth of the stream thickness is exponential for approximately one or two stream revolutions, then quickly limits, going to a much slower or zero growth rate.

AN OPTIMAL REGULATOR PROBLEM, by A. Chang. [1965] [14]p. incl. refs. (AFOSR-65-0908) (AF AFOSR-63-139 and AF AFOSR-63-292) AD 618347 Unclassified

Also published in Siam Jour. Control, Ser. A, v. 2: 220-233, 1965.

An optimal regulator problem is considered for systems whose behavior may be described by the linear differential equation $\dot{x}(t) = Ax(t) + Bu(t)$, where A and B are matrices of real constants. Given this system, an initial state x_0, and the conditions (a) the pair (A, B) is controllable, i.e., rank $[B, AB, \ldots, A^{n-1}B] = n$; (b) the pair (A, Q) is observable, i.e., rank $[Q, AQ, \ldots, A^{n-1}Q] = n$; (c) the autonomous system $\dot{x} = Ax$ is Ljapunov stable, let $T \subset U$ be the set of all admissable controls which transfer x_0 to the origin. The problem is to find a $u \in T$ such that $J(u, x_0) = \inf_{\nu \in T} J(\nu, x_0)$. It is shown that there exists a unique optimal control for any choice of the initial state and that Pontryagin's maximum principle gives necessary and sufficient conditions for a control to be optimal. The problem of optimal feedback control is considered, and it is shown that an optimal feedback control is a linear function of the state in a neighborhood of the origin. The final result is that the optimal feedback control is a continuous function of the state which, in principle, makes this computation feasible.

QUASISTATIC ANALYSIS OF WAVES IN A PLASMA-FILLED WAVEGUIDE, by J. E. Scharer and A. W. Trivelpiece. [1965] [2]p. incl. diagrs. (AFOSR-65-0909) (Sponsored jointly by Air Force Cambridge Research Lab; [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-63-139]) AD 617238 Unclassified

Also published in Jour. Appl. Phys., v. 36: 318-319, Jan. 1965.

Using the quasistatic approximation in bounded magnetized plasmas, the dispersion equation obtained predicts phase velocities greater than the velocity of light for a certain region of the ω-β plane. This is considered to invalidate the quasistatic analysis. In this note the region is investigated for an idealized plasma-filled guide with propagation and magnetic field oriented axially along the guide, and the conditions for validity of the dispersion relation for this region are determined. The magnetic and electric fields and power flow are obtained, and the validity for the quasistatic analysis for the backward-wave mode and forward-wave mode is studied.

THE DETECTION OF WEAK MAGNETIC FIELDS USING DIPOLE RESONANCE IN THIN-PERMALLOY FILMS, by C. E. Frank. Jan. 18, 1965, 91p. incl. illus. diagrs. tables, refs. (Rept. no. 65-4) (AFOSR-65-1141) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-63-139) AD 468085 Unclassified

Anisotropic magnetic thin films can be formed by vacuum evaporation and deposition of ferromagnetic materials in a dc magnetic field parallel to the substrate. Such films, especially those of nickel-iron of "permalloy" composition, have been extensively studied in the past, primarily with respect to properties which are useful in digital computer applications. Recently, interest in these devices has developed for detecting very weak magnetic fields, using low-frequency-switching methods as described by West, Odom, Rice, and Penn. The work reported here makes use of a new ultra-high-frequency magnetic-spin-resonance method devised by the author. Among the new results obtained are analytical and experimental verifications of the high sensitivity attainable. Although the actual sensitivities measured in ordinary laboratory surroundings were limited to approximately 10 gauss by the ambient magnetic noise level, it is demonstrated that the system is capable of much greater sensitivity if used in quieter locations.

THE ANALYSIS AND SYNTHESIS OF PROBABILITY TRANSFORMERS, by D. L. Moorehead. Jan. 28, 1965, 64p. incl. diagrs. refs. (Rept. no. 65-6) (AFOSR-65-1223) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-63-139, and National Science Foundation) AD 463597 Unclassified

The purpose of this report is to investigate the effect of finite state machines on an input random process, and to propose a method whereby a machine can be designed that transforms the probability measure of a process into a specified measure. Of particular interest is what a finite automaton does to certain important properties that random processes can have. It is shown that all finite state machines can preserve the stationarity of input processes via specifying an appropriate initial probability distribution over the states of the machine. Necessary and sufficient conditions are obtained on the structure of a finite state machine such that the process consisting of the sequence of states will be ergodic. This is achieved by extension of a theorem in information theory on similar conditions for finite state channels. A topic given considerable attention is the synthesis of a finite state machine whose output will be a random process with a specified finite order probability distribution, given a particular input process and its associated measure. It can be shown that this problem cannot be solved exactly, but that an arbitrarily close approximation can be achieved subject to an error criterion defined in the report. A class of processes, the measure of which can be realized exactly, is also given. Necessary and sufficient conditions are given on a machine such that the output process be a finite Markov chain.

ANODE STRUCTURES FOR COLD-CATHODE HIGH-POWER MAGNETRONS, by Y. Ikeda and C. Susskind. [1965] [7]p. incl. diagrs. table. (AFOSR-65-2194) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-63-139) AD 625583 Unclassified

Also published in Radio and Electron. Engineer, v. 29: 93-99, Feb. 1965.

The characteristics of anode structure suitable for cold-cathode high-power magnetrons have been investigated analytically and experimentally, with special emphasis on increasing the interaction and maximizing the area of coherent interaction with the electron beam at a given frequency. The structures analyzed were designed for large mode separation, high interaction impedance, and easy coupling to the output circuit. They may be applicable to travelling-wave amplifiers; some circuit characteristics of the structures are therefore also included. (Contractor's abstract)

OPTIMAL CONTROL OF APERIODIC DISCRETE-TIME SYSTEMS, by B. W. Jordan and E. Polak. [1965] 15p. incl. diagrs. (AFOSR-66-0044) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-63-139, and National Aeronautics and Space Administration) AD 641493 Unclassified

Also published in Siam Jour. Control, Ser. A, v. 2: 332-346, 1965.

Much of previous work on the optimal control of discrete-time processes was concerned with sampled-data systems in which the sampling instants are fixed and equi-spaced and in which the optimization is carried out over the amplitudes of the piecewise constant controls. Necessary conditions for optimal control of a class of fixed duration, discrete-time processes with aperiodically modulated inputs, which are suggested by engineering considerations were established. The plants of the systems under consideration were described by nonlinear differential equations and the inputs are piecewise constant, suitably restricted in amplitude, and required to have K or fewer discontinuities whose position is not restricted. (K is a fixed, positive integer.) Using techniques analogous to the ones used in establishing the Pontryagin maximum principle, it is shown that for an admissible control to be optimal, it is necessary that a Hamiltonian-like functional be either locally maximum or stationary with respect to the admissible controls, and that a set of transversality conditions be satisfied. Computational and engineering aspects of this problem are dealt with in a separate paper to be published soon.

STATISTICAL THEORY OF ELECTRON TRANSPORT IN CROSSED FIELDS: CHARACTERISTICS OF THE SMOOTH-BORE MAGNETRON, by K. Mouthaan. Aug. 6, 1965, 102p. incl. diagrs. refs. (Rept. no. 65-29) (AFOSR-66-0368) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-63-139 and Army Electronics Laboratories) AD 626296 Unclassified

Electron transport across the magnetic field in crossed electric and magnetic fields is described on the basis of random fluctuations in the fields. The theory is formulated in terms of the slipping-stream instability, so that a definite mechanism behind the fluctuations in the fields is established. The transport equation appropriate to the analysis is shown to be the diffusion equation; a definite expression for the diffusion tensor is obtained. The components of the diffusion tensor transverse to the magnetic field are found to be proportional to the square of the electric field, and inversely proportional to the cube of the magnetic field, the exponential-growth rate of the slipping-stream instability determines the magnitude of the diffusion coefficients. Application of the theory is made to find the cut-off characteristics of the smooth-bore magnetron. Explicit expressions for the space-charge distribution, the electric-field distribution, the anode current, and the circulating current are obtained. The results are compared with available experimental results. The agreement between theoretical and experimental values is good, particularly for the anode current. The new theory thus appears to provide, for the first time, a correct theoretical explanation of the cut-off characteristics of the smooth-bore magnetron. (Contractor's abstract)

AN ALGEBRAIC CHARACTERIZATION OF CONTROLLABILITY, by A. Chang. [1965] [2]p. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-63-139) Unclassified

Published in IEEE Trans. Automatic Control, v. AC-10: 112-113, Jan. 1965.

A theorem is proved for complete controllability for linear differential systems. Systems are considered whose state at time t is described by an n-dimensional vector x(t) that satisfies the differential equation $\dot{x}(t) = A(t)x(t) + B(t)u(t)$, where the control, u(t), is assumed to be an r-dimensional vector, and A(t) and B(t) are n x n and n x r matrices, respectively.

A NEW MODEL FOR SIMPLE NEURAL NETS AND ITS APPLICATION IN THE DESIGN OF A NEURAL OSCILLATOR, by T. Pavlidis. [1965] [15]p. incl. diagrs. refs. (AF AFOSR-63-292) Unclassified

Published in Bull. Math. Biophys., v. 27: 215-229, June 1965.

The results of a previous theoretical study of a class of systems are applied for the design of neural nets which try to simulate biological behavior. Besides the models for single aperiodic and periodic neurons, a neural oscillator is developed which consists of 2 cross-excited neurons. Its response is similar to the firing pattern of certain biological neural oscillators, like the flying system of the locust. Also, by proper change of its parameters, it can be made highly irregular, providing a deterministic model for the spontaneous neural activity. (Contractor's abstract)

FUZZY SETS, by L. A. Zadeh. Nov. 16, 1964 [16]p. incl. diagrs. (Rept. no. 64-44) (AFOSR-64-2507) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139, and National Science Foundation) AD 608981 Unclassified

Also published in Inform. and Control, v. 8. 338-353, June 1965

A fuzzy set is a class of objects with a continuum of grades of membership. Such a set is characterized by a membership (characteristic) function which assigns to each object a grade of membership ranging between zero and one. The notions of inclusion, union, intersection, complement, convexity, etc., are extended to such sets, and various properties of these notions

in the context of fuzzy sets are established. In particular, a separation theorem for convex fuzzy sets is proved without requiring that the fuzzy sets be disjoint. (Contractor's abstract)

ON THE RELATION BETWEEN ORDINARY AND STOCHASTIC DIFFERENTIAL EQUATIONS, by E. Wong and M. Zakai. Aug. 11, 1964, 29p. (Rept. no. 64-26) (AFOSR-65-0265) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139 and National Science Foundation) AD 609826 Unclassified

Also published in Internat'l. Jour. Eng. Sci., v. 3: 213-229, June 1965.

The following problem is considered in this paper: Let x_t be a solution to the stochastic differential equation: $dx_t = m[x_t, t]\,dt + \sigma[x_t, t]\,dy_t$ where y_t is the Brownian motion process. Let $x_t^{(n)}$ be the solution to the ordinary differential equation which is obtained from the stochastic differential equation by replacing y_t with $y_t^{(n)}$ where $y_t^{(n)}$ is a continuous piecewise linear approximation to the Brownian motion and $y_t^{(n)}$ converges to y_t as $n \to \infty$. If x_t is the solution to the stochastic differential equation (in the sense of Ito) does the sequence of the solutions $x_t^{(n)}$ converge to x_t? It is shown that the answer is in general negative. It is however, shown that $x_t^{(n)}$ converges in the mean to the solution of another stochastic differential equation which is: $dx_t = m[x_t, t]\,dt + 1/2\sigma[x_t, t]\,(\partial\sigma[x_t, t]/\partial x_t)\,dt + \sigma[x_t, t]\,dy_t$. SOLUTION OF CIRCULAR LOOP ANTENNAS AND SCATTERING FROM CONDUCTING LOOPS BY NUMERICAL METHODS, by A. Baghdasarian and D. J. Angelakos. Jan. 8, 1965, 23p. incl. diagrs. (Rept. no. 65-1) (AFOSR-65-0549) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139) AD 457192 Unclassified

The integral equation of the current distribution along a circular loop antenna is solved by numerical methods. It is shown that the integral equation can be converted into a set of linear simultaneous equations, solutions of which give the current distribution. First, the loop antenna driven by a voltage source is considered and solutions to loops of various sizes are obtained. Secondly, current distributions are obtained for the loop as a scatterer illuminated by a plane wave. Finally, from the knowledge of the current on the illuminated loops, backscattering patterns are obtained for rotating loops. Measurements are also performed for the latter case and the results compared with calculations. (Contractor's abstract)

PROPAGATION AND INSTABILITIES OF WAVES IN BOUNDED FINITE TEMPERATURE PLASMAS, by A. J. Lichtenberg and J. S. Jayson. [1965] [7]p. incl. diagrs. refs. (AFOSR-65-0912) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-64-139 and National Science Foundation) AD 617232 Unclassified

Also published in Jour. Appl. Phys., v. 36: 449-455, Feb. 1965.

The quasistatic analysis is used to examine propagation and instabilities of waves in a plasma in which the transverse bounds and the temperature are important. A dispersion equation is derived by use of a dielectric tensor, which is correct within the quasistatic assumption and the assumption of longitudinal velocity, only. The dispersion curves have a smooth transition from the zero temperature case at long wavelengths to the unbounded finite temperature case at short wavelengths. The stop-bands which appear in the zero temperature analysis become propagating regions in the more general case. Landau-type damping is calculated; the cyclotron wave is strongly damped. The effect of the boundaries and the magnetic field on a double-humped velocity distribution is examined. The transverse boundaries are stabilizing with respect to space-charge waves, but the cyclotron interactions are strengthened. The temperature always exerts a stabilizing influence which is particularly marked for the interaction between the cyclotron waves. Curves of the limiting regions of stability, with respect to various parameters, are given, illustrating these effects. By the use of an example it is demonstrated that a moderate temperature can suppress the cyclotron instability. The result is in agreement with the experimental observation that a plasma, predicted to be unstable with respect to the cyclotron-wave interaction, was actually stable. (Contractor's abstract)

ON CONVERGENCE OF THE SOLUTIONS OF DIFFERENTIAL EQUATIONS INVOLVING BROWNIAN MOTION, by E. Wong and M. Zakai. Jan. 19, 1965, 17p. (Rept. no. 65-5) (AFOSR-65-0913) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139) AD 463598 Unclassified

Let $y(t, \omega)$ be a Brownian motion process ($E\{[y(t) - y(s)]^2\} = |t - s|$), and let $\{y_n(t, \omega)\}$ be a sequence of "well-behaved" approximations to $y(t, \omega)$. Consider the sequence of solutions $\{x_n(t)\}$ of the differential equation

$dx_n(t) = m[x_n(t), t]\,dt + \sigma[x_n(t), t]\,dy_n(t)$, $a \le t \le b$. In this paper it is shown that for polygonal approximations $\{y_n(t)\}$ and under quite general conditions on m and σ l.i.m. $x_n(t) = x(t)$, where x(t) is the solution of a stochastic differential equation $\sigma'(x,t) = \sigma(x,t)\,\sigma_x$

$dx(t) = m[x(t), t]\,dt + 1/2\,\sigma'[x(t), t]\,\sigma[x(t), t]\,dt + \sigma[x(t), t]\,dy(t)$, $a \le t \le b$.

MULTIPARAMETER SENSITIVITY ANALYSIS FOR LINEAR SYSTEMS, by R. N. Biswas and E. S. Kuh. Mar. 9, 1965, 25p. incl. diagrs. (Rept. no. 65-8) (AFOSR-65-1326) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139, and National Science Foundation) Unclassified

A new method of sensitivity analysis for linear multiparameter systems is presented. The method depends on the existence of a simple matrix flow graph model. The matrix sensitivity $S = (\delta x)^{-1} X W^{-1} \delta W$ as introduced by Cruz and Perkins is reviewed first. The relations between the conventional multiparameter scalar sensitivity and the elements of the sensitivity matrix are then obtained. These formulas are simple to compute and give insight to the design of multiloop systems. Higher order multiparameter sensitivities are also derived. Examples are given in terms of general RLC networks and multiloop feedback systems. Preliminary results indicate that the method is also useful in the synthesis of general transfer functions, and may prove to be important in the design of integrated electronic circuits. STUDY OF WIDE-BAND PARAMETRIC AMPLIFIERS AND CONVERTERS, by M. Fukada. Apr. 30, 1965, 101p. incl. diagrs. tables, refs. (Rept. no. 65-10) (AFOSR-65-1459) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139) AD 465194 Unclassified

A rather complete broadbanding theory is presented for varactor parametric amplifiers and inverting-type converters, including single-varactor, multiple-varactor and traveling-wave parametric amplifiers. In all these cases, theoretical limitations on gain-bandwidth and the method of synthesizing optimum amplifiers are obtained. In the theory of single-varactor amplifiers, an extension of Kuh and Fukada's work on lossless shunt-varactor amplifiers has been made. It is shown that any dissipative-varactor amplifier can be treated in a manner similar to the lossless-varactor case if the reflection-coefficient of its associated matching network is defined properly. Examination of series-varactor amplifiers shows that their gain-bandwidth limitation is the same as in shunt-varactor amplifiers. A practical transmission-line network design is also developed and demonstrated by an experimental microwave degenerate amplifier. The theory of multiple varactor amplifiers and converters includes nonreciprocal equalization, reciprocal equalization and traveling-wave parametric amplifiers.

MICROWAVE LOSS IN A REFLEX PLASMA DISCHARGE, by P. Govindan, A. J. Lichtenberg, and J. R. Woodyard. May 3, 1965, 50p. incl. illus. diagrs. tables, refs. (Rept. no. 65-11) (AFOSR-65-1460) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139) AD 464949 Unclassified

Also published in Jour. Appl. Phys., v. 38: 382-389 Jan. 1967. (AFOSR-68-0091)

The Q of a partially ionized plasma with fluctuating density, created by a reflex discharge, is determined by measuring the decay of microwave energy in a cavity coaxial to the plasma column. The measurements indicate that for $\omega_p/\omega < 1$ the losses are predominately due to electron-neutral collisions, but that virtual collisions with the ends of the interaction region may also be significant. For $\omega_p/\omega > 1$ electron-ion collisions appear to be a significant source of loss for hot cathode discharges but not for cold cathode discharges. Anomalous diffusion does not play a significant role in the microwave losses. The absolute magnitude of the experimentally determined collision time is considerably lower than that calculated from the theory. This discrepancy can be at least partly explained, with some additional assumptions, for hot-cathode operation. For cold-cathode operation there remain some unexplained inconsistencies within the experimental results. (Contractor's abstract)

OPTICAL LEVEL POPULATION INVERSIONS IN A SODIUM-MERCURY MIXTURE DISCHARGE, by L. H. Lin. June 4, 1965, 48p. incl. diagrs. tables, refs. (Rept. no. 65-15) (AFOSR-65-2219) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-64-139) AD 469266 Unclassified

Population densities of excited sodium levels in a glow discharge of a mixture of sodium and mercury vapors were obtained by spectral line intensity measurements. Comparison with the case of pure sodium vapor discharge was made. It was found, in the mixture discharge, that the population densities of sodium levels, which have energies close to the energies of mercury 6^3P_1 and 6^3P_0 levels, are highly populated by the process of resonance excitation transfer to the extent that many population inversions result between these levels and some lower off-resonance levels. The excitation transfer between the mercury metastable level 6^3P_0 and the sodium level $7^2S_{1/2}$ is most significant: the corresponding cross section is estimated to be 4.7×10^{-15} cm^2. Optically allowed transitions between the population inverted levels are all in the infrared region, the shortest wavelength being approximately 3.37 μ ($7^2S_{1/2} - 5^2P_{1,2,3/2}$). The negative absorption coefficients for some important transitions are also calculated.

COCHLEAR SENSORY-FIELD EFFECTS BASED ON INTER-UNIT COUPLING, by G. G. Furman. July 6, 1965, 118p. incl. diagrs. tables, refs. (Rept. no. 65-19) (AFOSR-65-2220) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139) AD 470556 Unclassified

The characteristics of a variety of possible inhibitory-connection schemes among elements lying within the cochlea were investigated. The characteristics were obtained analytically and were supplemented by and checked against data obtained from digital simulation. It was found that, under certain conditions, all of these connective schemes can lead to a sharpening of the frequency sensitivity of any single neuron. An anatomy-oriented inhibition scheme, called shunting inhibition, was developed. Apart from its possible application in the cochlea, shunting inhibition leads to theoretically intersecting operations in sensory information processing, operations not possible with the classical subtractive type of inhibition.

LIMITING STABLE CURRENTS IN BOUNDED ELECTRON AND ION STREAMS, by W. B. Bridges, J. I. Frey, and C. K. Birdsall. [1965] 9p. incl. tables, refs. (AFOSR-66-0042) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139) AD 641709 Unclassified

Also published in IEEE Trans. Electron Devices, v. ED-12 264-272, May 1965.

The classical static analysis of the infinite planar diode has been extended to include the effects of finite transverse beam size. Simple expressions have been found for the increase in maximum stable current density over that of an infinite stream for finite cylindrical and strip streams flowing between plates of infinite diodes. The results are also given in terms of stream perveance. The effect of a nonuniform distribution of current across the stream is shown to be relatively small. Experimental values of maximum stable current agree with those obtained from the analysis. A further extension of the static analysis has been made to include the effects of additional conducting plane boundaries parallel to the stream motion. For length-to-width ratios $L/D < 0.25$ the tube is adequately described by the results for the infinite planar diode and for $L/D > 4$, the infinitely-long drift tube theory suffices. At intermediate values of L/D, the maximum amount of current that can be stably passed through the tube is greater than that predicted by either asymptotic theory. (Contractor's abstract)

MONOCHROMATIC ILLUMINATION OF CADMIUM-SULFIDE OSCILLATOR, by R. M. White. [1965] [2]p. incl. diagr. table. (AFOSR-66-0043) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139) AD 641711 Unclassified

Also published in Proc IEEE, v. 53: 745-746, July 1965.

The period, waveform, and amplitude of current oscillations in a uniformly illuminated cadmium-sulfide oscillator have been found to depend strongly upon the wavelength and intensity of the light used. The observations described here show that a given feature of the oscillation (e.g., a particular waveshape) is not associated solely with a single wavelength, but rather that the wave-length at which the feature occurs depends upon the light intensity. The observations strongly suggest that the wavelength and intensity of illumination are not primary parameters, but rather, by their effects upon resistivity of the CdS they affect the oscillations.

SYNTHESIS AND REALIZATION OF COUNTING BISTABLE CIRCUITS, by D. A. Hodges Aug 31, 1965, 87p. incl. illus diagrs. tables, refs. (Rept no. 65-33) (AFOSR-66-0366) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research

Office (Durham), and Office of Naval Research] under AF AFOSR-64-139, and Electronics Technology Division) AD 627797 Unclassified

Synthesis procedures are extended for counting bistable circuits from given dc bistable configurations and 2 silicon-integrated bistable circuits are described. Active devices are presented by a controlled-conductance model which is first derived from a consideration of the principles underlying charge-control device operation. The model is also applicable to non-change-control active devices. These results make evident the straight-forward application of the synthesis procedures utilizing enhancement or depletion mode active devices. A linearized active region analysis is carried out for a basic bistable configuration. Either symmetrical or nonsymmetrical triggering techniques are allowed. Conditions are determined for regenerative switching and practical triggering techniques are predicted for the basic junction-type field-effect transistor (FET) circuit and a bipolar junction transistor (BJT)-FET circuit. With minor changes, the conclusions are valid for the cross-coupled and emitter-coupled circuits. A dc bistable circuit and a counting bistable circuit were designed and fabricated in silicon integrated form. Each experimental monolithic circuit incorporates as the active devices one BJT and one FET. Predicted and measured results for dc circuit characteristics and switching times are in reasonable agreement. (Contractor's abstract)

LASER ARRAYS, by J. C. Gibson. July 23, 1965 [44]p. incl. diagrs. tables, refs. (Rept. no. 65-21) (AFOSR-66-0402) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139) AD 476149 Unclassified

This paper deals with the application of various types of array techniques. The laser is assumed to have a Gaussian field distribution at its aperture, and its far field pattern is developed from this aperture pattern. The linear broadside array factor is applied to both the Gaussian element pattern and to an element consisting of a circular aperture uniformly illuminated with a plane wave. The Dolph-Tchebyscheff and binomial amplitude distribution array factors are applied to the Gaussian element pattern to reduce sidelobe levels with equal element spacing. Ishimaru's technique of unequal element spacing is applied to the Gaussian element pattern to reduce sidelobes, and then to suppress the secondary beam. The half-power beamwidths are calculated and compared, and the circular array is investigated for application to the Gaussian element pattern. Results concerning relative sidelobe levels and grating lobe levels are tabulated and compared. Conclusions are made concerning the feasibility of applying array theory to lasers with element spacings of hundreds of wavelengths. (Contractor's abstract)

SYNTHESIS OF INTEGRATED SELECTIVE AMPLIFIERS FOR SPECIFIED RESPONSE AND DESENSITIVITY, by A. A. Gaash. June 17, 1965, 105p. incl. diagrs. tables, refs. (Rept. no. ERL-65-31) (AFOSR-66-1065) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-64-139) AD 628677 Unclassified

The fundamental objective of the report is the realization of highly selective, bandpass network functions in the medium of semiconductor integrated circuitry. Realization of such circuit performance has to take into consideration the special properties of integrated, monolithic microcircuitry. In view of the unavoidable dependence of integrated passive and active components on environmental conditions and on manufacturing tolerances, syntheiss procedures via sensitivity functions are explored. Attention is focused on closed sensitivity formulations in order to reveal extra degrees of freedom available for desensitization. To that end, various sensitivity functions in single-loop and multi-loop feedback structures are investigated. The effect of the variation of integrated passive components is then assessed. The corresponding sensitivity contributions are shown to be independent of the circuit configuration and are expressed in form of sensitivity invariants. Based on the sensitivity formulation, sensitivity criteria are incorporated into the synthesis procedures, permitting simultaneous realization of specified response and sensitivity. The procedures make use of multi-loop feedback structures, wherein redundant transmission loops are introduced together with the correlated nature of the time-dependent and time-independent changes of integrated components.

SEMICONDUCTOR INTEGRATED OSCILLATORS, by G. D. Hachtel. Aug. 31, 1965 [191]p. incl. illus. diagrs. tables, refs. (Rept. no. 65-32) (AFOSR-66-1066) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-64-139) AD 629578 Unclassified

The realization of oscillation in monolithic semiconductor integrated circuits was considered. A procedure was developed for the synthesis of integrable, near-harmonic, oscillators from known, integrable, bistable circuits. By the insertion of resistors, capacitors, and batteries, the procedure converts the integrable bistable circuits into 'inductor-less' oscillators. Experimental integrated realizations of oscillators synthesized were fabricated.

DIRECT MEASUREMENT OF THE DEPLETION LAYER WIDTH VARIATION VS APPLIED BIAS FOR A P-N JUNCTION, by N. C. MacDonald and T. E. Everhart. [1965] [3]p. incl. diagrs. illus. (AFOSR-66-0344) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139 and Electronic Technology Division) Unclassified

Also published in Appl. Phys. Ltrs., v. 7: 267-269, Nov., 1965.

Using the scanning electron microscope, the width of the depletion region of a reverse-biased silicon N^+-P junction was measured as a function of the applied voltage. It was observed that as the reverse bias across the junction is increased, dynamical broadening of the depletion layer occurs in both the voltage-contrast and the electron-beam-induced current modes of operation. The specimens were angle lapped to expose the junction profile. Measurement of the depletion layer width w as a function of the reverse bias V_R followed the familiar $w \propto (V_R)^{1/2}$ relationship for an abrupt junction.

NECESSARY CONDITIONS FOR THE REALIZABILITY OF n-PORT RESISTIVE NETWORKS WITH MORE THAN (n+1) NODES, by I. T. Frisch and K. R. Swaminathan. [1965] [8]p. incl. diagrs. (AFOSR-67-0487) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-64-139) AD 647457 Unclassified

Also published in IEEE Trans. Circuit Theory, v. CT-12: 520-527, Dec. 1965.

A new set of necessary conditions are presented for an nth-order square symmetric matrix Y with real entries to be the n-port admittance matrix of a network containing positive resistors and (n ≥ 2) nodes. The so-called "supremacy" conditions represent a symmetric set of inequalities among products of pairs of elements in a matrix S obtained in a simple manner as linear combination of entries in Y. The conditions are derived by augmenting the given matrix Y with an additional port to form a connected port structure, transforming the port structure until it is linear, applying the "uniform tapering conditions" and then eliminating the augmenting port. Extensions are given to the case of n+p nodes with 2 < p n. (Contractor's abstract)

ELECTRON-STREAM DIODE INSTABILITIES WITH ELASTIC COLLISIONS, by J. Frey and C. K. Birdsall [1965] [3]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under AF AFOSR-64-139) Unclassified

Published in Jour. Appl. Phys., v. 36: 2962-2964, Sept. 1965.

Instabilities can be induced in parallel-plane (diode) configurations when a very high current is passed through the diode, even if this current is neutralized by ions This work extends Pierce's original calculation of the critical current for instability to find the growth rate for a wide input-current range, and then goes on to include collisions of the injected stream with background neutrals and allow for mobile neutralizing particles. Collisions damp the instability, increasing the value of input current at which onset of instability will occur, if the collision frequency ν is such that $\omega_p^2 L, \nu u_0 \quad 4\pi$,

approximately, then there is no time growth. Allowing the background ions to be mobile also eliminates this type of instability. The results without collisions compare favorably with some experiments involving essentially collisionless diodes; those with collisions included do not agree with some experiments involving collision-dominated triode lasers. ON THE STABILITY OF FEEDBACK CONTROL SYSTEMS WITH PERTURBATION GAIN, by C. T. Chen. [1965] 10p. incl. diagrs. (Bound with its Rept. no. 65-14, AD 468178) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-64-139) Unclassified

This paper considers a special class of single-loop feedback systems both in the continuous and in the sampled-data cases. It is shown that if the gain deviation from the linearity of the memoryless nonlinear element, $\tilde{\sigma}(\sigma,t)$, is smaller than $\lambda(t)\sigma$, then $\lambda(\cdot) \in L^1(0,\infty)$ implies that the system output is bounded for any bounded input. As $t \to \infty$, the system output tends to that of the linearized ($\tilde{\sigma}(\sigma,t) = 0$) system as $t \to \infty$. Similar results hold for the sampled-data case. SYNCHROTRON RADIATION FROM A SELF-CONSISTENT PLASMA (Abstract), by A. J. Lichtenberg and D. Tuma. [1965] [1]p. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [AF AFOSR-64-139] and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10, 238, Feb. 25, 1965.

The Fokker-Planck equation with radiation added as a friction term is solved numerically to obtain the time-dependent distribution of the high-energy tail of a plasma with an initial Maxwellian distribution. The synchrotron radiation spectrum is then obtained for a transparent plasma with an analytic density distribution that approximates that found by the numerical integration. It is found for a plasma with density $n_e = 10^{11}/cm^3$, temperature $T_e = 75$ kev, in a magnetic field of 50 k Gauss, parameters appropriate to an experimental magnetic-mirror configuration, that the radiation term dominates. Within a few msec, although the temperature has not changed appreciably, the number of high-energy electrons has altered significantly. This decrease is sufficient to lower the radiation in the higher cyclotron harmonics by an amount that should be observable. For example, after 5 msec, the radiation in the 8th harmonic has been decreased by 40%.

A GENERAL FORMULATION OF THE TOTAL SQUARE INTEGRALS FOR CONTINUOUS SYSTEMS, by E. I. Jury and A. G. Dewey. [1965] [2]p. (AFOSR-65-2432) (AF AFOSR-64-292) AD 627761 Unclassified

Also published in IEEE Trans. Automatic Control, v. AC-10: 119-120, Jan. 1965.

The problem of evaluating the total square integral arises in the analysis and design of feedback control systems, both for deterministic and for stochastic inputs. The first approach to this problem was made by James, et. al. using the solution of a recurrence formula. Integrals up to the seventh order were tabulated. A few years later, Newton et al presented a method based on the solution of a matrix equation dependent on whether n, the order of the system, was even or odd. The earlier table was extended up to the tenth order. Kalman and Bertram recently mentioned an approach from the point of view of Liapunov functions However, this leads to the solution of a system of algebraic equations and the method has no computational advantage over that of Newton. The points discussed in this correspondence are (1) The formulation of a general expression for any order n as the ratio of two determinants. This could easily be programmed on a digital computer. (2) It is shown that the denominator determinant is precisely equal to Δ_n, the nth Hurwitz determinant. This equivalence guarantees the existence of the total square integral for a stable system. (3) Finally a scheme is shown whereby the amount of computation is minimized. For design problems where there are algebraic coefficients, an expression is given involving the expansion of only (n-2) determinants of order (n-3). In this expression no cancellation of terms occurs.

ANALYSIS OF A NEW CLASS OF PULSE-FREQUENCY MODULATED FEEDBACK SYSTEMS, by T. Pavlidis and E. I. Jury. [1965] [9]p. incl. illus. diagrs. refs. (AFOSR-65-2433) (AF AFOSR-64-292) AD 627762 Unclassified

Also published in IEEE Trans. Automatic Control, v. AC-10: 35-43, Jan. 1965.

A new class of pulse-frequency modulated systems is presented. These systems, referred to here as Σ-PFM, have many advantages over previously used schemes such as integral PFM. Most significant advantages are improved stability and simpler physical implementation of the modulator. The major part of the paper is concerned with the study of sustained oscillations using a specially developed quasi-describing function. One important feature of these kinds of PFM systems is that they often present a limit annulus and not a limit cycle, a feature which is common in most nonlinear discrete feedback systems. A few examples with experimental verification are presented and the limitations of the method are discussed. (Contractor's abstract)

ANALYSIS AND SYNTHESIS OF STABLE LINEAR SEQUENTIAL CIRCUITS, by A. Gill. [1965] [9]p. incl. diagr. (AFOSR-65-0630) (AF AFOSR-64-639) AD 614164 Unclassified

Also published in Jour. Assoc. Comput. Mach., v. 12: 141-149, Jan. 1965.

Linear sequential circuits (LSC's) are finding an increasing number of uses in error-correction, computer control, random number generation and other digital applications. The purpose of this paper is to develop analysis and synthesis techniques for the class of autonomous "stable" LSC's which is of special interest in error-correction schemes. Properties of such LSC's are described in terms of their state graphs, and a method is presented for constructing the state graph from the characteristic matrix of a given LSC. Necessary and sufficient conditions are formulated for a given graph to correspond to a realizable stable circuit, and a procedure is given for finding this circuit's characteristic matrix and synthesizing it by means of shift registers. THE MINIMIZATION OF LINEAR SEQUENTIAL CIRCUITS, by A. Gill. [1965] 3p. (AFOSR-66-0023) (AF AFOSR-64-639) AD 632732 Unclassified

Also published in IEEE Trans. Circuit Theory, v. CT-12: 292-294, June 1965.

It is shown how the characterizing matrices of the linear form of a given linear sequential circuit can be computed directly from the characterizing matrices of the given circuit. An immediate corollary of the shown procedure and of Moore's result concerning the uniqueness of the minimal form is the following. If a sequential machine can be realized by means of a linear circuit, then its minimal form can also be thus realized. It can be noted that no use was made of the fact that GF (p) is a finite field. In fact, the minimization algorithm remains valid for linear time-discrete systems associated with (finite or infinite) fields, and in particular for linear time-discrete systems ('sampled data' systems) where the underlying field is that of real numbers.

ON THE BOUND TO THE MEMORY OF A SEQUENTIAL MACHINE, by A. Gill. [1965] 3p. incl. diagrs. (AFOSR-66-0028) (AF AFOSR-64-639) AD 641808 Unclassified

Also published in IEEE Trans. Electron. Comput., v. EC-14: 464-466, June 1965.

A sequential machine consists of a finite input alphabet X, a finite output alphabet Y, a finite state set S, a next-state function δ, and an output function λ, defined (for all integers t) by

$$\left.\begin{aligned} s_{t+1} &= \delta(s_t, x_t) \\ y_t &= \lambda(s_t, x_t) \end{aligned}\right\} x_t \in X,\ y_t \in Y,$$

$s_t \in S$. A machine has memory μ if μ is the least integer such that $y_t = f(x_t, x_{t-1}, \ldots, x_{t-\mu}, y_{t-1}, \ldots, y_{t-\mu})$. If a a minimal n-state machine has a finite memory μ, then $\mu < n(n-1) = N$. In this note it was proven that $N = n(n-1)\ 2$ is the best possible upper bound for μ.

H-GUIDE LOG-PERIODIC SLOT ANTENNA, by G. N. Vornoff. Dec. 6, 1965, 126p. incl. illus. diagrs. tables, refs. (Rept. no. 65-34) (AFOSR-66-0367) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-65-139) AD 627417 Unclassified

A theoretical and experimental investigation of an end-fire (as contrasted to a conventional back-fire design) flush-mounted log-periodic slot antenna is described. The antenna consists of 2 periodic slot arrays cut in one of the metal walls of a tapered H-guide. The antenna receives excitation at the large end of the structure and radiates toward the small end, yet retaining pattern integrity over large bandwidth This is made possible by judiciously employing the surface wave properties of a broadband TE_{01} mode propagated in a tapered H-guide.

It has been shown theoretically that the energy can be transported from the large end of the structure to a desired active region located near the small end, without appreciably exciting the preceding portions of the antenna. The results of the near field measurements, antenna VSWR, and radiation patterns are presented. The antenna radiates essentially constant patterns over a 3:1 bandwidth with half-power beamwidths of approximately 20° in the E- and H-planes. The results of this study indicate that the antenna can generate a narrow beam and is potentially capable of transmitting high power. (Contractor's abstract)

PLASMA RESEARCH. Quarterly progress rept. no. 2, Apr. 1-June 30, 1965, 63p. incl. diagrs. tables, refs. (AFOSR-66-0403) (Sponsored jointly by Air Force Avionics Laboratory, [Air Force Office of Scientific

Research, Army Research (Durham), and Office of Naval Research] under AF AFOSR-65-139, Atomic Energy Commission, and National Science Foundation) AD 625424 Unclassified

This research in plasmas is part of an integrated program of research and teaching in the problems of creation, containment, heating, stability, radiation, and measurement of the physical and electromagnetic properties of high- and low-temperature plasmas. The basic high-temperature plasma research facility consists of a 250,000-joule capacitor energy-storage system and related electronic control and safety equipment. This bank operates two basic experiments each of which requires pulse magnetic magnetic fields in excess of 50,000 gauss.

PROPAGATION AND INSTABILITIES IN BOUNDED AND FINITE TEMPERATURE PLASMAS, by J. S. Jayson. Sept. 22, 1965, 115p. incl. diagrs. tables, refs. (Rept. no. 65-24) (AFOSR-66-0617) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-65-139; Air Force Office of Scientific Research under AF 33(615)1078; and National Science Foundation) AD 630128 Unclassified

The quasi-static analysis is used to examine propagation and instabilities in plasmas in which both the transverse bounds and the temperature are important. Initially only longitudinal thermal velocity is assumed and two stream instabilities are studied. With the introduction of transverse temperature, instabilities resulting from temperature anisotropy are also studied. The full set of Maxwell's equations is utilized for an investigation of the effects of dispersion on the synchrotron radiation spectrum. The investigation of hot plasmas with finite boundaries was undertaken initially to explain the differences between phenomena found in experimental observations and those predicted by the cold plasma theory. Longitudinal temperature is added to the model and it is found that strong cyclotron wave damping and the absence of the cyclotron-cyclotron interaction in a two stream configuration are predicted by the theory. Introducing transverse temperature into the model, using the Boltzmann equation, instabilities arising from temperature anisotropy are investigated and it is found that, for a bi-Maxwellian distribution, for low values of k_z the plasma is stable. The investigation of finite plasmas with transverse temperature is pursued by consideration of a configuration in which a boundary layer region is included and the particle density decreases to zero through this region.

PLASMA RESEARCH. Quarterly progress rept. no. 3, by C. K. Birdsall, A. J. Lichtenberg, and A. W. Trivelpiece. July 1-Sept. 30, 1965, 37p. incl. illus. diagrs. (AFOSR-66-2365) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under AF AFOSR-65-139, Atomic Energy Commision, Electronics Technology Division, and National Science Foundation) AD 641083 Unclassified

Progress is reported on experimental and theoretical research in problems of creation, containment, heating, stability, radiation, and measurement of the physical and electromagnetic properties of high and low temperature plasmas. The hot-electron experiment operated without difficulty during most of the report period. Most of the effort was concerned with obtaining adequate data to determine the absolute intensity of the synchrotron radiation emitted by the hot-electron plasma. The electron and loss energy analyzer was completed, and the electron end-loss plasma camera used in conjunction with an image converter was used to improve the estimates of the size and location of the plasma. The inconclusive results of the laser-scattering experiments have led to a study of the scattering of laser photons by a hot-electron plasma. A turbulent heating experiment was performed in order to study ion heating by an electron current modulated at the ion-cyclotron frequency. Calibration of the ion energy analyzer is proceeding. A description of the turbulent heating experiment is presented. The experimental apparatus for plasma instability experiments is being prepared. An analysis of flute modes in a mirror machine plasma with diffused boundary was completed. Related research includes the testing of a computer model for nonlinear investigation

of plasma interchange instability, investigation of the damping and instabilities of cyclotron waves in a plasma, and the study of nonlinear interaction of an electron with an electromagnetic wave. (Contractor's abstract)

EXPERIMENTAL STUDY OF WAVE PHENOMENA ASSOCIATED WITH THE ONSET OF GASEOUS DETONATION, by P. A. Urtiew. Feb. 1965 [114]p. incl. illus. diagrs. tables, refs. (Rept. no. AS-65-1) (AFOSR-65-1277) (AF AFOSR-64-129) AD 621214 Unclassified

A study is made of wave processes that occur at the instant of transition from the deflagrative to the detonative mode of propagation of the combustion wave in an explosive gas mixture. Experimental observations are made by means of Schlieren photography with pressure transducer measurements using stoichiometric hydrogen-oxygen mixtures. Theoretical interpretation of experimental results reveals that the transition is promoted by the action of a spherical detonation wave generated by a point explosion ahead of the main combustion zone. The theory of self-similar motion is applied to analyze the flow field induced by the initial transverse wave. On the basis of experimental observations a specific model is proposed for the geometric pattern of the oscillating wave system in the burned medium. The frequency of vibrations obtained from the analysis of this model is shown to be in satisfactory agreement with the eigenvalue of the linear wave equation.

PRESSURE WAVE GENERATION IN A FISSIONING GAS. II. EFFECTS OF DISSOCIATION AND MULTIPHASE COMPOSITION, by H. P. Smith, Jr., R. D. Evans and others. [1965] [4]p. incl. diagrs. table. (AFOSR-66-0064) (AF AFOSR-64-129) AD 632323 Unclassified

Also published in Phys. Fluids, v. 8· 1421-1425, Aug. 1965.

The analysis of pressure pulses which are generated in a fissioning gas by neutron irradiation is extended to the case of a dissociating medium including a condensed phase. After a satisfactory check of the process induced in boron trifluoride that was treated previously,

the analysis is applied to borazine for which the former method would be quite inadequate since now the effects of dissociation, involving the formation of free liquid boron, become predominant in controlling the thermodynamic behavior of the substance. (Contractor's abstract)

DYNAMICS OF THE GENERATION OF PRESSURE WAVES BY ACCELERATING FLAMES, by P. A. Urtiew, A. J. Laderman, and A. K. Oppenheim. [1965] [6]p. incl. illus. diagrs. (AFOSR-66-0349) (AF AFOSR-64-129) AD 631159 Unclassified

Also published in Tenth Symposium (Internat'l.) on Combustion, Cambridge (Gt. Brit.) (Aug. 17-21, 1964), Pittsburgh, Combustion Inst., 1965, p. 797-804, 1965.

The theory of initial flame acceleration in an explosive gas contained in a constant cross-section tube, developed previously for a hemispherically shaped flame, was extended to include flames of spheroidal shapes. An expression for the flame world-line was developed, which depends only on a single parameter that accounts for the effects of the thermodynamic properties of the mixture and the geometry of the flamefront. Its value is determined graphically on the basis of experimental data. This leads to an unambiguous technique for the evaluation of the relative flame-propagation speed and for the calculation of the pressure wave generated by the flame. (Contractor's abstract)

California U. Inst. of Engineering Research, Berkeley.

STUDY OF THE DEVELOPMENT AND STABILIZATION OF DETONATIONS, by A. K. Oppenheim. Final rept. Oct. 1964-Oct. 1965, 7p. incl. refs. (AFOSR-66-0777) (AF AFOSR-65-129) AD 632575 Unclassified

The most significant progress made during last year's research work is associated with the successful development of novel experimental techniques which yielded a more penetrating insight into the detonation phenomena than that possible by any other means. This includes: (1) stroboscopic laser schlieren system permitting the attainment of extremely sharp (less than 10^{-8} sec) light pulses with an ultra-high (up to 10^6/sec) repetition rate for high speed schlieren photography; (2) ultra-high frequency response bar-type pressure transducers, permitting the measurement of a pressure pulse at a point of not more than 1 mm in diameter with a submicrosecond rise time; (3) soot-film technique for recording traces of detonation waves which, in our investigations, are particularly useful in pinpointing the location of their onset, and in the study of their structure. The most interesting progress made in analytical investigations is concerned with the study of the generation of pressure waves in fissioning gases.

AN EXPERIMENTAL STUDY OF THE ROTATIONAL DISTRIBUTION FUNCTION OF NITROGEN IN A SHOCK WAVE, by F. Robben and L. Talbot. May 1965, 1v. (Rept. no. AS-65-6) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-538 and Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245) AD 466306 Unclassified

The electron beam fluorescence technique has been used to measure the rotational energy distribution through shock waves in nitrogen. At Mach 1.7, the deviation from thermodynamic equilibrium was found to be small, and the rotational temperature profile followed the density profile. Comparison with theoretical calculations yielded the rotational relaxation collision number $Z_r = 5$, in reasonable agreement with other determinations. At high Mach numbers, the measured rotational distribution function within the shock wave could not be represented by a single temperature, but was found to be representable approximately by the merging of 2 rotational distribution functions corresponding to temperatures upstream and downstream of the shock wave. The profile of the average local 'temperature' defined by the ratio of the total measured rotational energy to the gas density, was found to precede the density profile through the shock wave by an amount which increased with Mach number.

California U. Inst. of Engineering Research, Berkeley.

MEASUREMENT OF SHOCK WAVE THICKNESS BY THE ELECTRON BEAM FLUORESCENCE METHOD, by F. Robben and L. Talbot. May 1965, 33p. (Rept. no. AS-65-4) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-538 and Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245) AD 466304 Unclassified

Shock wave thicknesses and density ratios have been measured in helium, argon and nitrogen by means of the electron beam fluorescence method, over the range $1.5 < M < 17.4$, in a low density wind tunnel. The shock thickness in argon and helium agreed well with Mott-Smith theory at the higher Mach numbers, and were between Navier-Stokes and Mott-Smith theory at the lowest Mach number. In nitrogen, the measured shock thicknesses were considerably greater than the predictions of Navier-Stokes theory. Measured density ratios across the shock wave were in good agreement with theory, in the lower density flows. Poorer agreement was found at higher flow densities, leading to estimates of upper bounds for the range of linear variation of fluorescence intensity with gas density. Measured density ratios for shocks produced in divergent free-jet flows were found to be in better agreement with theory after a viscous curvature correction was applied.

California U. Inst. of Engineering Research, Berkeley.

SOME MEASUREMENTS OF ROTATIONAL TEMPERATURES IN A LOW DENSITY WIND TUNNEL USING ELECTRON BEAM FLUORESCENCE, by F. Robben and L. Talbot. May 1965, 1v. (Rept. no. AS-65-5) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-538 and Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245) AD 466305 Unclassified

The fluorescence of a 30 kv electron beam has been used as a probe to measure the rotational distribution function of flowing nitrogen in a low density wind tunnel. The fluorescence consists predominantly of the so-called first negative system of nitrogen. Measurements of the intensities of the rotational structure of the (o-o) vibrational band have been used to calculate, through a theoretical model, the original rotational distribution function of N_2 before excitation. A series of measurements was performed in the undisturbed flows of a subsonic nozzle, a Mach 4 nozzle, and free jet expansions from sonic orifices at Mach numbers ranging up to 19. The rotational temperature measurements are shown to be about 3% high at 280°K, with a progressively increasing error at lower temperatures. These measurements also indicated no measurable lag in rotational temperature in the free jet expansion.

EFFECT OF BASE BLEEDING ON THE NEAR WAKE FOR VERY LOW REYNOLDS NUMBERS, by S. A. Berger and H. Viviand. [1965] [3]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245) Unclassified

Published in AIAA Jour., v. 3: 2154-2156, Nov. 1965.

Results are presented of the effect of base bleeding on the near-wake structure calculated according to a formulation involving the solution of incompressible Stokes approximate equations. The study is concerned with the problem of determining the structure of the incompressible base and near-wake flow for values of 0 large enough for this flow to be entirely viscous, the case being of interest for slender bodies at sufficiently low Reynolds numbers. A numerical example, is presented and discussed.

382

California U. [Inst. of Engineering Research] Berkeley.

HEAT TRANSFER AND SHEAR BETWEEN COAXIAL CYLINDERS FOR LARGE KNUDSEN NUMBERS, by D. R. Willis. [1965] [3]p. (Sponsored jointly by [Air Force Office of Scientific Research] and Office of Naval Research under Nonr-22245) Unclassified

Published in Phys. Fluids, v. 8: 1908-1910, Oct. 1965.

The heat transfer between coaxial cylinders for large Knudsen number is obtained using the method of Knudsen iteration. The BGK model equation, together with an extension which allows the Prandtl number to be set arbitrarily is used. Results are compared with those obtained by moment methods. It is found that the criterion proposed by Hurlbut for validity of the free molecular results is reasonable. Results are also presented for the rotating cylinder problem in a high Knudsen number flow.

383

California U. [Inst. of Engineering Research] Berkeley.

HYDRODYNAMICAL THEORY OF DIFFUSIVE SEPARATION OF MIXTURES IN A FREE JET, by F. S. Sherman. [1965] [7]p. incl. diagr. tables, refs. (Sponsored jointly by [Air Force Office of Scientific Research] and Office of Naval Research under Nonr-22245) Unclassified

Published in Phys. Fluids, v. 8: 773-779, May 1965.

The static molar concentration and fractional molar flow rates of the components of a binary mixture are computed to order $(Re)^{-1}$ on the centerline of an axially symmetric free jet, under conditions of nearly inviscid flow. These computed results confirm the conclusions of Reiss and Fenn regarding the mechanism underlying measured separation effects in jets at relatively high Reynolds number. Some qualitative comments about probe-induced separation are given.

384

California U. [Inst. of Engineering Research] Berkeley.

INCOMPRESSIBLE LAMINAR AXISYMMETRIC NEAR WAKE BEHIND A VERY SLENDER CYLINDER IN AXIAL FLOW, by H. Viviand and S. A. Berger. [1965] [7]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research and Office of Naval Research under Nonr-22245) Unclassified

Published in AIAA Jour., v. 3: 1806-1812, Oct. 1965.

A solution to the near wake problem behind a very slender cylinder in axisymmetric incompressible laminar flow is obtained in the form of an asymptotic expansion, by the technique of inner and outer expansions. The influence of the recirculating flow is neglected. Although the solution thus found applies only up to a very limited distance downstream of the base, it exhibits important differences with the corresponding 2-dimensional problem of the wake behind a flat plate; these differences are characteristic of the axisymmetry of the flow.

THE DILATION CONTRIBUTION TO THE HEAT CAPACITY OF COPPER AND α-BRASS AT ELEVATED TEMPERATURES, by Y. A. Chang and R. Hultgren. [1965] [4]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)83] and Atomic Energy Commission)
Unclassified

Published in Jour. Phys. Chem., v. 69 4162-4165, Dec 1965.

For pure copper and an α-brass containing 9.7 atom % Zn, the compressibilities were measured from 77 to 800 K, and the heat contents of the brass, from 298 to 800 K. From these and other data found in the literature, the dilation term $C_p - C_v$ of the heat capacity was calculated. The Nernst-Lindemann approximate formula was found to express accurately the dependence of the dilation term on temperature for these two substances. However, data found in the literature for 8 other substances indicate the Nernst-Lindemann approximation more usually gives too rapid an increase of the dilation term with temperature.

A STUDY OF THE AFTERSHOCKS AND FOCAL MECHANISM OF THE SALINAS-WATSONVILLE EARTHQUAKES OF AUGUST 31 AND SEPTEMBER 14, 1963, by A. Udias. [1965] [22]p. incl. diagrs. tables, refs. (AFOSR-65-2253) (AF 49(638)904) AD 614335
Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 55: 85-106, Feb. 1965.

The earthquake sequences connected with the earthquakes of Aug. 31 and Sept. 14, 1963 in the Salinas-Watsonville region of California are studied with reference to the background seismic activity. A very favorable distribution of permanent and mobile stations in this area permits the analysis to include earthquakes of small magnitudes. The mechanism of the larger aftershocks of both sequences is found to be similar to the mechanism of the main shock of Sept. 14, 1963. The orientation of the principal axes of stress derived from the focal mechanism of the Sept. 14 earthquake, is related to the strike of the San Andreas fault. (Contractor's abstract)

California U. Seismographic Station, Berkeley.

CRUSTAL STRUCTURE IN CENTRAL CALIFORNIA IN RELATION TO THE SIERRA NEVADA, by T. Mikumo. [1965] [19]p. incl. diagrs. tables, refs. (AFOSR-65-2906) (AF 49(638)904) AD 614352 Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 55: 65-83, Feb. 1965.

Crustal structure in central California (between the latitudes of 36° and 41°N) including the Sierra Nevada was studied by travel times of P_n waves from Nevada explosions and earthquakes, dispersion of surface waves, and correlation between computed and observed gravity anomalies. Simple 2-dimensional models are presented for the structure, parameters of which are determined by least-squares from P_n observations. Theoretical gravity distributions expected from the crustal models are computed by a 2-dimensional technique and compared with Bouguer anomalies. In the preferred model, the overall crustal depths to the Moho-discontinuity beneath the Pacific coast region, the Central Valley and the Sierra Nevada are found to be about 22, 26 and 43 km, respectively, indicating a steep crustal thickening under the high mountain region. The dispersion of group velocities of Rayleigh and Love waves passing across the region was investigated from Nevada and Utah earthquakes, Love waves from the Utah earthquake give evidence in support of the derived structure (Contractor's abstract)

GRADIENTS OF TRAVEL-TIME CURVES FROM DEEP-FOCUS EARTHQUAKES, by B. A. Bolt. [1965] [16]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)904 and National Science Foundation) AD 618781 Unclassified

Presented at Symposium on Theory and Computers, Leningrad and Moscow (USSR), May 15-21, 1964.

Also published in Rev. Geophys., v. 3: 83-98, Feb. 1965.

Inferences that can be drawn about the structure of the upper mantle from observations of surface-reflected longitudinal body phases are discussed. In particular, some aspects of previous observational, statistical, and theoretical work on the phase pP are reviewed. Recently, mathematical work has thrown more light on the properties of the cusps of the surface-reflected longitudinal phases. Seismological experiments are discussed that are designed to determine the actual behavior of the wave pulses near the cusps. Some preliminary attention has been given to this problem using a seismic array with linear dimension about 10 times greater than the observed wavelength. Computer analysis of the pulses observed at the array elements leads to estimates of the gradients of the travel-time curves Weighting must be arranged to take into account the measured lateral refraction and crustal delays at each element. Analysis of the deep-focus earthquake of Apr. 2, 1963, is presented as an example.

MAGNETIC-TAPE DATA-ACQUISITION SYSTEM, by P. W. Rodgers, W. C. Marion and others. [1965] [26]p incl. diagrs. (Bound with its Final rept., AD 458052) [AF 49(638)904] Unclassified

The Berkeley magnetic-tape data-acquisition system was put into operation on June 17, 1964 and has been recording the output of a 2-component seismometer system satisfactorily since that time. The system consists of the seismometers, amplifiers, and 2 tape transports, one for recording and one for playback. Seismic signals are generated by 3 Lehner and Griffith Press-Ewing long-period seismometers with 30 sec free period. Their outputs are filtered, amplified with transistorized amplifiers and applied to the tape system input. The magnetic tape system is designed to provide for simultaneous recording of 14 channels of data with a bandwidth of 0 to 10 cps. In its present preliminary form the primary use of the tape-recorded data is the detailed examination of recorded earthquakes from seismograms.

THE NOVEMBER 1964 EARTHQUAKE SEQUENCE NEAR CORRALITOS, CALIFORNIA, by T. V. McEvilly. [1965] [14]p. incl. diagrs. (Bound with its Final rept., AD 458052) [AF 49(638)904] Unclassified

Data accumulated from the 1964 earthquake sequence at Corralitos indicated 3 major phenomena: (1) an extremely localized region of energy release—in this case a volume on the order of a 1 or 2 km radius sphere at a depth of 5 to 10 km; (2) a mechanism continually supplying energy to the local region in such a uniform way that the first motion radiation pattern is constant. (3) a process of interaction or adjustment whereby a large shock in the sequence but outside the small source volume (in this case probably on the major fault in the area) can occur with apparently different force orientation and perturb the mechanism of the concurrent small shocks in the localized source toward this different orientation.

SOME INEQUALITIES FOR THE FUNDAMENTAL FREQUENCY OF A NONHOMOGENEOUS MEMBRANE, by D. O. Banks. [1965] [4]p. (AFOSR-66-0022) (AF AFOSR-64-82) AD 641707 Unclassified

Also published in Jour. Soc. Indus. and Appl. Math., v. 13: 635-638, Sept. 1965.

This paper gives a method of finding explicit lower bounds for the lowest eigenvalue of a nonhomogeneous membrane with a fixed boundary. The method for obtaining these bounds is an adaptation of the method due to Payne and Weinberger for finding explicit lower bounds for the lowest eigenvalue of a homogeneous membrane in terms of the fundamental eigenvalues of homogeneous strings.

RESPONSE OF A BURNING FUEL PLATE TO SOUND VIBRATIONS, by F. A. Williams. [1965] [13]p. incl. diagrs. table, refs. (AF AFOSR-65-927)
Unclassified

Presented at AIAA Second Aerospace Sciences Meeting, New York, Jan. 25-27, 1965.

Published in AIAA Jour., v 3: 2112-2124, Nov 1965.

Combustion instability is considered from the viewpoint of the time dependent response of a flat-plate boundary layer with mass transfer to standing or traveling acoustic vibrations in the gas. The acoustic admittance is defined in terms of the response of the boundary layer at [illegible] and is employed to obtain necessary conditions for wave amplification. Results for the gasification rate at the wall, the wall shear stress, and the acoustic admittance are obtained as expansions in the parameter ωx/U (ω oscillation frequency, x distance from the upstream edge of the plate, and U velocity of gas relative to the plate. It is shown that the zero-order (quasi-steady) response rarely leads to amplification of a standing wave. Effects of pressure oscillations alone seldom produce wave amplification. The velocity oscillations lead to the greatest acoustical energy emission and absorption, and the presence of a flame in the boundary layer greatly enhances the influence of velocity oscillations. Results to first and second orders in the parameter ωx/U are presented. The opposite limiting case, in which ωx/U is large compared with unity, is also considered. (Contractor's abstract)

RESONANCE STABILIZATION OF A-FERROCENYL CARBONIUM IONS, by J. C. Ware and T. G. Traylor, [1965] [8]p. incl. diagrs. table, refs. (AFOSR-65-1669) (AF AFOSR-64-514) AD 624364 Unclassified

Also published in Tetrahedron Ltrs., no. 18, 1295-1302, 1965.

Results of resonance stabilization experiments on the ferrocenyl group indicated that the ferrocenyl group is best considered as a somewhat complexed cyclopentadienide anion and its ability to supply electrons by resonance is severely decreased by this complexing. Nevertheless, the remaining resonance effect on solvolysis rates is approx. 6 kcal/mol larger than that of a phenyl group.

WEIGHT FACTORS FOR THE TWO-DIMENSIONAL ISING MODEL, by G. Baxter. [1965] [7]p. incl. diagrs. (AFOSR-65-2636) (AF AFOSR-65-722) AD 629844
Unclassified

Also published in Jour Math. Phys., v. 6: 1015-1021, July 1965.

A group of local weights is constructed for the square, honeycomb, and triangular lattices which counts for any closed path in the lattice 1/2 π times the change in the argument of the tangent vector (mod 2) and the number of enclosed units of area (mod 2). These weights are used to evaluate the partition function of the 2-dimensional Ising model with nearest-neighbor interaction and with a particular, imaginary external magnetic field For the square lattice, the method gives a result announced by Lee and Yang (Contractor's abstract)

SELF-CONSISTENT TREATMENT OF KONDO'S EFFECT IN DILUTE ALLOYS, by Y. Nagaoka. [1965] [9]p incl diagrs (AFOSR-65-2534) (AF AFOSR-64-610) AD 628434 Unclassified

Also published in Phys. Rev., v. 138 A1112-A1120, May 17, 1965

Investigation is made of how conduction electrons in dilute alloys are affected by the exchange interaction with localized spins of impurities. It is shown that, if the interaction is antiferromagnetic, the perturbational treatment breaks down below a critical temperature, and that near the Fermi surface there appears a quasibound state between the conduction-electron spin and the localized spin. Because of the appearance of this quasibound state, the resistivity increases with decreasing temperature, but has a finite value at T = 0. There is no logarithmic term in the resistivity at low temperatures, in contrast to Kondo's theory of the resistance minimum. There also appears an anomaly in the specific heat at low temperatures.

DISPERSION THEORY OF THE KONDO EFFECT, by H. Suhl. [1965] [9]p. incl. diagr. refs. (AFOSR-65-2540) (AF AFOSR-64-610) AD 627627 Unclassified

Also published in Phys. Rev., v. 138: A515-A523, Apr. 1965.

According to recent work by Kondo, the scattering-cross section of an electron in exchange interaction with a paramagnetic impurity immersed in a Fermi sea of electrons has a logarithmic infinity as the electron energy approaches the Fermi energy. This problem was examined by means of the Chew-Low method first devised for meson-nucleon scattering. It is found that the singularity is replaced by a resonant scattering close to the Fermi level. California U. Dept. of Physics, La Jolla.

ALGEBRAIC DERIVATION OF THE PARTITION FUNCTION OF A TWO-DIMENSIONAL ISING MODEL, by C. J. Thompson. [1965] [4]p. incl. refs. (AFOSR-66-0274) (AF AFOSR-64-610) AD 629176 Unclassified

Also published in Jour. Math. Phys., v. 6: 1392-1395, Sept. 1965.

In the algebraic formulation of the Ising model, the partition function is expressed as the trace of a power V^M of the transfer operator V, or equivalently, as the sum of Mth powers of the eigenvalues of V. In the derivation of Kaufman, Onsager, and more recently of Schultz, Mattis, and Lieb (SML), the transfer operator is first reduced to a more amenable form for computation and then, in principle at least, diagonalized. For the infinite lattice, only the largest eigenvalue of V is needed, and this is all Onsager and SML compute. Kaufman finds all the eigenvalues and is thus able to write down the partition function for the finite lattice. In the present work we give an alternative derivation of the SML form for V, and show how the Kaufman result can be obtained from this form withoht actual diagonalization. Instead of diagonalizing V, the evaluation of the trace is done directly after assigning a simple representation to V (Contractor's abstract)

PARAMAGNETIC IMPURITIES IN METALS AT FINITE TEMPERATURES, by H. Suhl. [1965] [21]p. (AFOSR-66-0275) (AF AFOSR-64-610) AD 629174 Unclassified

Also published in Physics, v. 2: 39-59, 1965.

Dispersion theory is combined with the Green's function technique to discuss the scattering of electrons by paramagnetic impurities in normal metals at finite temperatures The thermodynamic Green's function is derived from an approximate solution of an equation for a modified (non-unitary) scattering matrix. As a check on the consistency of theory, it is generalized to arbitrary impurity spin S, and shown that in the limit $S \to \infty$, it reduces to ordinary potential scattering of electrons with spin parallel or antiparallel to a localized fixed Zeemann field. Some observations are made on the problem of the residual resistance. The effect of additional non-magnetic scattering is briefly considered. A justification is given for the neglect of multiparticle intermediate states in the dispersion equations. (Contractor's abstract)

HEISENBERG MODEL WITH LONG RANGE INTERACTION, by C. J. Thompson. [1965] [5]p. incl. refs. (AFOSR-66-1520) (AF AFOSR-64-610) AD 641773 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 1977-1981, Dec. 1965.

The functional integral method as used by Siegert in his study of the Ising model with long range interaction, is generalized and applied to the Heisenberg model. Above the Bragg-Williams Curie point, the functional integral expression for the partition function is evaluated by a saddle point approximation. This gives an expansion in powers of the reciprocal range of the interaction which is essentially identical with the Ising model result, in agreement with Brout who used a ring summation approximation. The expansion is not valid through the Curie point, and in its present form, this method seems to be incapable of giving spin waves.

ENTROPY TRANSPORT BETWEEN TWO SUPERCONDUCTORS BY ELECTRON TUNNELING, by K. Maki and A. Griffin. [1965] [3]p. incl. refs. (AFOSR-66-1550) (AF AFOSR-64-610) AD 641781 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 921-923, Dec. 1965.

Some preliminary calculations of this tunneling heat current are reported. The surface thermal resistance depends very much on whether the metals are in the superconducting or normal phases. In addition there is an oscillatory heat flux due to fluctuations in the quasiparticle tunneling between 2 superconductors. The change in chemical potential due to the temperature difference δT can give rise to the ac and dc Josephson supercurrents. However, calculations show that no entropy is carried by these currents, which is in agreement with one's physical expectations.

TOWARDS A QUANTUM MANY-BODY THEORY OF LATTICE DYNAMICS. I. TIME-DEPENDENT HARTREE APPROXIMATION, by D. R. Fredkin and N. R. Werthamer. [1965] [11]p. incl. refs. (AFOSR-66-2233) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-610 and National Research Council) AD 644907 Unclassified

Also published in Phys. Rev., v. 138: A1527-A1536, May 31, 1965.

The phonon is discussed as an example of a collective mode which restores a symmetry property (in this case, translational invariance) to a system whose Hamiltonian is invariant under the symmetry operation, but in whose ground state the symmetry is broken. The crystal lattice is first studied within the time-independent Hartree approximation. It is then shown that allowing small time-dependent changes in the Hartree field generates an equation for the normal modes of vibration. The three $k = 0$ modes with $\omega = 0$ are shown to represent uniform translations of the solid, as expected. The $k \neq 0$ modes are analyzed to extract those three which may be identified as one-phonon modes, and the contribution of these modes to the free energy is computed. The recent theory of Brout is found to be equivalent to the Hartree approximation with the further assumption that the atoms are infinitely heavy. No restrictions are made here on the interatomic potential other than that a hard core is absent. The reduction of the present theory to well-known results in the case of harmonic forces is demonstrated. An extension to include hard cores, analogous to the Brueckner theory, is discussed. (Contractor's abstract)

SUPERCONDUCTIVITY OF Nb_3Ge, by B. T. Matthias, T. Geballe and others. [1965] [6]p. incl. refs. (AFOSR-65-2125) (AF AFOSR-64-631) AD 629089 Unclassified

Also published in Phys. Rev., v. 139: A1501-A1503, Aug. 30, 1965.

Evidence is presented to show that the maximum transition temperature of compounds with the β-w type structure (A_{15}) occurs at the stoichiometric composition A_3B, when B is a nontransition element. The niobium-germanium A_{15}-type compound, which normally forms with excess Nb, has a transition temperature of 6.9°K. It has been found that Nb_3Ge compounds prepared by rapid-quench techniques, in the presence of excess germanium, have transition temperatures as high as 17 K. This large increase in transition temperature is attributed to a closer approach to the stoichiometric 3:1 composition. (Contractor's abstract)

California U. Dept. of Physics, La Jolla.

SUPERCONDUCTIVITY IN THE TIN-GALLIUM SYSTEM, by G. Knapp and M. F. Merriam. [1965] [3]p. incl. diagr. table, refs. (AFOSR-66-0053) [AF AFOSR-64-631] AD 629824 Unclassified

Also published in Phys. Rev., v. 140: A528-A530, Oct. 18, 1965.

Superconducting transition temperatures were measured for a number of Sn-Ga compositions in both the

'quenched' (quick cast) and annealed states. The increases in T_c in the 'quenched' samples are not large (usually about 0.1-0.2°K), and can be accounted for on the basis of internal stresses in the sample. The equilibrium transition temperatures are consistent with the known phase diagram of Predel. Within the Sn solid solution T_c first drops (mean-free-path effect), then rises to 3.9°K. Compositions in the neighborhood of the eutectic show depressed and broadened transitions; these are attributed to proximity effects. (Contractor's abstract)

SUPERCONDUCTING TRANSITION TEMPERATURES IN INDIUM SOLID SOLUTIONS (Abstract), by M. F. Merriam. [1965] [1]p. [AF AFOSR-64-631] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 346, Mar. 24, 1965.

Transition temperatures have been measured in the solid solutions of indium with Hg, Cd, Tl, Sn, Pb, and Bi to higher solute concentrations than previously. The Seraphim empirical rule, $\Delta T_c = k_1 x + k_2 x \ln x$, is not adequate to describe the results. Except for kinks attributed to Brillouin-zone effects, T_c is a linear function of composition in the more concentrated alloys. The slopes of the T_c vs composition lines for the alloy systems not reported previously (in K/at%) are. In-Cd, 0-2% Cd 0.067; In-Cd, 2-5% Cd 0.016; In-Tl 0.0044; In-Bi 0.29. The In-Cd data show a kink at 2% Cd, indicating an apparent Brillouin-zone effect. The results are discussed in terms of Ginsberg's hypothesis. The jump in T_c at the tetragonal-cubic transformation that occurs in most of these alloy systems is also discussed.

SUPERCONDUCTIVITY AND HIGH PRESSURES, by B. T. Matthias. [1965] [6]p. incl. refs. (In cooperation with Bell Telephone Labs., Murray Hill, N. J.) [AF AFOSR-64-631] Unclassified

Published in Physics of Solids at High Pressures, Proc. First Internat'l. Conf., Tucson, Arizona (Apr 20-23, 1965), ed. by C. T. Tomizuka and R. M. Emrick. New York, Academic Press, 1965, p. 225-230. (AFOSR-66-0131)

The occurrence of superconductivity under pressure in otherwise normal metals, and the effect of pressure on the transition temperature, are both considered. Pressure induces superconductivity in Bi, Sb and Te; it seems likely that Ge, Si, As, Be and possibly Ce may show similar behavior. The effects are due either to changes in lattice symmetry or electron configuration, and their importance to the theory of superconductivity is pointed out.

SUPERCONDUCTIVITY IN THE TRANSITION METALS (Abstract), by M. A. Jensen. [1965] [1]p. [AF AFOSR-64-631] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 45, Jan. 27, 1965.

The variation of superconductivity in the transition metals is known to be approximately symmetric about $n = 6$ (n is the number of valence electrons) with peaks near $n = 5$, 7. On looking at the beginning and end of the transition-metal series corresponding to $n = 3$, 10 one finds that superconductivity decreases rapidly at both ends. The theory of superconductivity of Morel and Anderson and the recent ideas of Clogston about the enhancement of the density of states due mainly to electron-lattice interactions are combined to calculate the expected variation of $N(0)V$ X $[T_c = 1.15\,\Theta_D \exp(-1/N(0)V)]$ in the transition metals. By including estimates of the band structure in the calculations, reasonable qualitative agreement between the experimental and theoretical curves for $N(0)V$ from $n = 4$ to $n = 10$ was obtained. There remains a large disagreement between the experiment and theory at the beginning of the transition metals (Sc, Y, Lu), which probably can not be explained by the presence of rare-earth impurities.

COHERENCE MEASUREMENTS WITH TIME SAMPLING OCEAN-BOTTOM SEISMOMETERS, by H. Bradner, J. Dodds and R. Foulks. [1965] [3]p. incl. illus. diagrs. (AF 49(638)1388) AD 629466 Unclassified

Also published in Proc. IEEE, v. 53: 1906-1908, Dec. 1965.

Instruments for obtaining simultaneous records of ocean-bottom seismic motion are described. Preliminary ocean-bottom seismic data with two simultaneous three-component instruments indicates that instrument noise

and water currents may cause small differences in the detailed spectra. The general features of the spectra, however, appear to be the same from proximate instruments. (Contractor's abstract)

EARTH NOISE, 5 TO 500 MILLICYCLES PER SECOND 1. SPECTRAL STATIONARITY, NORMALITY, AND NONLINEARITY, by R. A. Haubrich. [1965] [13]p. incl. diagrs. tables, refs. (AFOSR-65-2898) (AF AFOSR-62-420) AD 618623 Unclassified

Also published in Jour. Geophys. Research, v. 70: 1415-1427, Mar. 1965.

Earth noise below 0.5 cps does not differ significantly from stationary normally distributed random noise for record lengths of the order of hours. Earthquake waves, as well as locally generated ground motion such as that due to wind, produce records which differ significantly from the above. The cross-frequency coherence is a sensitive test for nonstationary effects such as earthquakes, and the more generalized 2-dimensional spectrum appears to be the appropriate one for looking at transient events. For stationary processes, the bispectrum is a convenient method for testing nonlinear interactions, but microseisms measured so far have produced no cases of significant bispectrums. (Contractor's abstract)

EARTH NOISE, 5 TO 500 MILLICYCLES PER SECOND 2. REACTION OF THE EARTH TO OCEANS AND ATMOSPHERE, by R. A. Haubrich and G. S. MacKenzie. [1965] [13]p. incl. diagrs. tables, refs. (AFOSR-65-2899) (AF AFOSR-62-420) AD 628829 Unclassified

Also published in Jour. Geophys. Research, v. 70: 1429-1440, Mar. 1965.

Sources of earth noise have been identified and located for different parts of the frequency band from 5 to 500 mc/s. In the typical microseism bands around 75 and 150 mc/s, sources are associated with storm waves arriving at both distant and local sea coasts. During the winter months the primary-frequency microseisms measured at La Jolla come mostly from the coast north of Cape Mendocino and are due to major storms in the North Pacific. Double-frequency microseism sources are generally within a few hundred kilometers of La Jolla, but more distant sources have also been observed. In addition, both ocean and atmosphere produce local loading which becomes significant at frequencies below the storm microseism band. (Contractor's abstract)

INVESTIGATION OF MICROSEISM SOURCES WITH OCEAN-BOTTOM SEISMOMETERS, by H. Bradner, J. G. Dodds, and R. E. Foulks. [1965] [16]p. incl. diagrs. tables, refs. (AFOSR-66-0427) (AF AFOSR-62-420) Unclassified

Presented at Thirty-fourth annual Internat'l. SEG meeting, Los Angeles, Calif., Nov. 18, 1964.

Also published in Geophysics, v. 30: 511-526, Aug. 1965.

Recordings to depths of 5 km have been made on the Pacific Ocean bottom with self-rising internally recording seismometers. Simultaneous recordings have been made at land stations. The ocean-bottom noise spectrum is between 1 and 5-orders of magnitude higher power than the land spectrum in the region from 0.1 to 9.0 cps. Coherence between 2 simultaneous instruments separated one-quarter km is above the 95% confidence level from 0.1 cps to 0.6 cps. Attempts to associate narrow-beam Love and Rayleigh peaks with large storm-generating areas or with heavy swell striking shore have not produced consistent results. Although some records show the bulk of the microseism peak energy in well-defined modes, the energy is carried in different modes at different times and locations. Some of our data fit a model of microseism generation in a 100-mile strip, by a statistical superposition of incident waves and waves reflected from shore; and the subsequent conversion of the energy to Rayleigh and Love modes propagating away from the generation zone. However, the shapes of the mid-ocean spectra strongly imply additional sources far from shorelines of recognized storms, unless microseisms attenuate far less in the ocean than on land. TIDES OF THE PLANET EARTH, by W. H. Munk. [1965] [4]p. [AF AFOSR-62-420] Unclassified

Published in Science in the Sixties; Tenth Anniversary AFOSR Scientific Seminar, Cloudcroft, N. M. (June 14-15, 1965), ed. by D. L. Arm. Albuquerque, Mexico U. Office of Publiscations, 1965, 134-137.

The nonharmonic method initiated by Lubbock for prediction of ocean tides and the classical harmonic method of Kelvin and George Darwin are reviewed. Modern computers have made possible spectroscopy of tides and the prediction of tides by a response method. Past observations are used to obtain the response curves of a port, and predictions are then obtained by playing the theoretical tide input through the appropriate response filter (done numerically, using computers). There is no time-harmonic expansion, as the complexity of the tide-potential is already built into the input functions. The response method takes full account of Newton-Kepler mechanics, while the harmonic method uses

astronomy only to identify the frequencies. It can also be systematically generalized to include the nonlinear shallow water effect, and it may even be possible to include the response to storms. The developments of new technologies and instrumentations have presented opportunities to study the tidal distortion of the earth; it appears as if the instrumentations will also be able to cope with the distortions of the earth on a geological time scale.

REFLECTING OPTICS FOR CALIBRATION OF SPECTRORADIOMETERS, by R. W. Patch. [1965] [4]p. incl. diagrs. tables. (AFOSR-65-1808) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-650 and Advanced Research Projects Agency) AD 625683 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 55: 392-395, Apr. 1965.

The requirements are given for absolute calibration of a spectroradiometer by means of an extended standard source. In some cases the extended source may be used without auxiliary optics, but in many cases a concave mirror is necessary or desirable. For such a mirror, a relation between incident and reflected steradiancy is derived. Brandenberg's focusing relations for a concave spherical mirror are extended and applied to 4 practical cases, and it is shown that no loss in accuracy of calibration will result from the use of such mirrors provided that the source and the mirror are large enough. Experimental verification is given. (Contractor's abstract)

MATHEMATICAL MODELS OF SYNONYMY, by H. P. Edmundson. [1965] [17]p. incl. diagrs. (AFOSR-65-1387) (AF AFOSR-64-612) AD 621160 Unclassified

Presented at 1965 Internat'l. Conf. on Computational Linguistics, New York, May 19-21, 1965.

A historical summary is made of the concepts of synonymy and antonymy. The roles of part-of-speech and context of a word are considered. The concept of a synonym of a word is shown to require the use of a ternary relation rather than that of a binary relation. Synonymy is defined implicitly, rather than explicitly, by 3 axioms that lead to equivalence relations that partition the set of content words of a language into equivalence classes. Antonymy is defined implicitly by another set of 3 axioms. Several algebraic, geometrical, and topological models of synonymy and antonymy are posed and examined. (Contractor's abstract)

PHYSIOLOGICAL FACTORS IN DECOMPRESSION SICKNESS, by A. T. Cockett, R. M. Nakamura, and R. T. Kado. [1965] [5]p. incl. illus. diagrs. tables, refs. (AFOSR-66-0850) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1387 and National Aeronautics and Space Administration) AD 640806 Unclassified

Also published in Arch. Environ. Health, v. 11: 760-764, Dec. 1965.

A method for the production of experimental decompression sickness -- dysbarism -- is outlined. Results of the experiment indicate that plasma replacement and maintenance of an effective circulating blood volume appear to be the crucial factors in treating moderate decompression with shock. Dextran and whole blood were used to correct the plasma deficit. Hypothermia appears to be useful and may be indicated. Recompression is the treatment of choice.

DC ELECTROMAGNETIC BLOOD FLOWMETER, by R. T. Kado and S. T. Schy. [1965] [2]p. incl. diagrs. (AFOSR-66-1130) (AF 49(638)1387) AD 643758 Unclassified

Also published in Digest Sixth Internat'l. Conf on Medical Electronics and Biological Engineering, Tokyo (Japan), 1965, p. 50-51.

This report describes the construction and use of a DC electromagnetic blood flowmeter as a means of measuring blood flow in the intact blood vessel. Consideration was given the blood flowmeter as an apparatus because

the flow of blood itself like the machine is usually unidirectional and secondly, in the majority of the vascular bed, a diastolic component of two was found. The magnet flowmeter was proven useful because of simplicity of construction and may prove fruitful in many areas of cardiovascular research.

A STEREOTAXIC ATLAS OF THE CHIMPANZEE BRAIN (PAN SATYRUS), by M. R. DeLucchi, B. J. Dennis, and W. R. Adey. [1965] [149]p. incl. illus. diagrs. (AFOSR-65-1503) (AF AFOSR-61-81) AD 620217 Unclassified

The stereotaxic atlas of the chimpanzee brain was designed to provide previously unavailable data on the deep structures of the chimpanzee brain. Extensive illustrative material provides frontal and sagittal sections, as well as a large number of drawings, all of which are accompanied by measurement scales. The greater intelligence of the chimpanzee, and the fact that the complexity of electrical activity of the chimpanzee brain approaches the complex patterns of man have made it highly desirable to be able to manipulate its deep brain system. Analyses of the effects of stimulation, ablation, and recording in the chimpanzee brain are likely to reveal information on brain organization having close relevance to human brain function in health and disease. Also published in IEEE Trans. Bio-Med. Eng., v. BME-12: 8-13, Jan. 1965.

An illustrative example of the spectral analysis of simultaneously recorded electroencephalograms is presented. The first topic is that of auto-spectral analysis, which is very similar to frequency analysis; then cross-spectral analysis is used to show that the major relationship among three of the traces analyzed is a linear one, while a fourth trace is nonlinearly activated. Two hypotheses suggested by this analysis are tested by methods of multivariate spectral analysis, a recently developed extension of the cross-spectral method. Another extension, generator analysis, whose theory has not previously appeared, is presented both theoretically and in application to the same example. It represents a substantial step toward the goal of identifying and localizing the actual biophysical generators which produced the observed electroencephalograms.

A NEUROPHYSIOLOGICAL COMPARISON OF GAMMA-HYDROXYBUTYRATE WITH PENTOBARBITAL IN CATS, by W. D. Winters and C. E. Spooner. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-65-0938) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-246, and Public Health Service) AD 622837 Unclassified

Also published in Electroencephalog. and Clin. Neurophysiol. Jour., v. 18: 287-296, 1965.

The neurophysiological actions of gamma-hydroxybutyrate (GHB) are compared to those of pentobarbital in cats with chronically inplanted electrodes. Observations are performed on gross behavior, EEG activity, and average response to clicks. Studies indicate that the GHB induced state is one of excitation rather than depression. GHB is not found to act in a manner similar to pentobarbital but appears more closely associated with a convulsant state. The electrical activity and behavior are epileptiform. It is proposed that the clinical efficacy of this agent may be based on the induction of a lack of responsiveness rather than by virtue of specific anesthetic properties.

NORMAL SLEEP PATTERNS IN MACQUE MONKEYS, by M. L. Reite, J. M. Rhodes and others. [1965] [12]p. incl. refs. diagrs. (AFOSR-65-0939) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-246, National Aeronautics and Space Administration, and Public Health Service) AD 622601 Unclassified

Also published in Arch. Neurol., v. 12: 133-144, Feb. 1965.

Normal sleep patterns of the Macaca nemestrina monkeys were studied in 6 subjects for 20 nights. Bipolar EEG records were secured from surface and deep electrodes. Eye movements were monitored by EOG and by closed-circuit TV. Clicks were continuously presented at 4-sec intervals. EEG records were divided into the following stages: awake, drowsy, light, intermediate, deep, and paradoxical. Sleep phases were cyclic, with cycle durations of 75 to 85 min, thus resembling human sleep, but the longest segments of deep sleep occurred in the early part of the night. Paradoxical phases occurred during the latter half of the night. Awakening during the night was usually correlated with an initial shift to fast activity in the pontine reticular formation, followed by changes in other deep structures, and lastly, if at all, in cortical areas. PROLONGED EFFECTS OF LSD ON EEG RECORDS DURING DISCRIMINATIVE PERFORMANCE IN CAT; EVALUATION BY COMPUTER ANALYSIS, by W. R. Adey, R. Porter and others. [1965] [11]p. incl. diagrs. refs. (AFOSR-65-0940) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-246, National Aeronautics and Space Administration, and National Institutes of Health) AD 622846 Unclassified

Also published in Electroencephalog. and Clin. Neurophysiol. Jour., v. 19: 25-35, 1965.

The effects of LSD were studied in relation to changes induced in computed averages of epochs of EEG records during a discriminative task performance in a series of 6 cats repeatedly exposed to LSD over a period of many months. Computed averages of rhythmic hippocampal wave trains during approach performance showed an increase in amplitude and regularity following LSD. This modification was maximal about 4 days after LSD, and decayed to control levels after 5 to 7 days. Findings indicate persistent electrophysiological effects of LSD beyond the period of acute drug action. They showed a differential distribution in different brain regions, with maximal changes in the hippocampus, and smaller effects in the entorhinal cortex and the rostral midbrain reticular formation. Differential susceptibility of hippocampal tissue is discussed in relation to a similar sensitivity to the acute effects of both LSD and psychotomimetic cyclohexamines, and to the pattern of propagation of hippocampal after discharges.

THE HIPPOCAMPUS AND THE ORIENTING REFLEX, by M. Radulovacki and W. R. Adey. [1965] [16]p. incl. diagrs. refs. (AFOSR-65-1778) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-246] and National Institutes of Health) AD 626507 Unclassified

Also published in Exper. Neurol., v. 12: 68-83, May 1965.

Averages of hippocampal wave trains are computed from a cat's daily trials in discrimination and in orienting responses. Alerted but nonperforming animals exhibit a wide spectrum of theta wave activity in the range 3 to 7 c/sec on first introduction into the test situation. During T-maze discriminative performances, hippocampal theta waves regularize at 6 c/sec. Orienting behavior is associated with slower and less regular computed averages at 4 to 5 c/sec. Single doses of LSD-25 are followed by prolonged disinhibition of inhibited orienting behavior and by the gradual appearance of a regular EEG average during orientations 5 to 10 days after the drug. Similar results are obtained with CL-400. It is concluded that within a single brain system, there is a clear capacity for participation in related but differing behavioral responses, with induction of greatly differing EEG patterns in discriminative and orienting responses. The possible relation of these wave patterns to the establishment of a behavioral set is discussed.

RECORDING LEAF MOVEMENTS WITH A STRAIN GAUGE, by T. Hoshizaki and K. Yokayama. [1965] [2]p. incl. illus. diagrs. (AFOSR-65-2834) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-246 and National Aeronautics and Space Administration) AD 623494 Unclassified

Also published in Nature, v. 207: 880-881 Aug. 21, 1965.

A small lightweight leaf movement recording system using a strain gauge coupled to an amplifier and a recorder was devised. The need for such a system was dictated by the physical limitations of an orbiting capsule. Such a system is also useful for earthbound experiments. The small size of the sensing unit makes it possible to place several units on a single plant. The monitored plant can easily be placed in a small control chamber and continuous records of several weeks' duration can be obtained when the movements are recorded on a strip chart recorder.

TRANSPORT OF RENIN ANGIOTENSIN BY RENAL LYMPHATICS, by A. T. [K.] Cockett, R. S. Moore, and R. T Kado. [1965] [2]p. incl. diagrs. (AFOSR-66-0854) (AF AFOSR-63-246) AD 641?80 Unclassified

Also published in Surgical Forums, v. 16: 492-493, 1965.

It is suggested that one important role of the renal lymphatics is the transport of renin angiotensin. Vasopressor levels were significantly higher in the renal lymph than in the renal vein plasma when compared in equal volumes. Renal transport of this vasopressor is of primary importance. Renal vein outflow far exceeds lymph flow. The renal ymphatics probably provide an important avenue to assist in sustaining blood pressure.

MEASUREMENT OF OXYGEN TENSION AND SATURATION IN THE DIAGNOSIS OF RENAL ISCHEMIC HYPERTENSION, by A. T. [K.] Cockett, D. R. Cannon and others. [1965] [3]p. incl. tables. (AFOSR-66-1417) (AF AFOSR-63-246) AD 641375 Unclassified

Presented at meeting of the Southern California Chapter of the Amer. Coll. of Surgeons, Palm Springs, Calif., Jan. 24, 1965.

Also published in Amer. Surgeon, v. 31: 691-693, Oct. 1965.

Oxygen tension and oxygen saturation data have been obtained in 3 groups of patients undergoing renovascular or renal surgery. In normal kidneys the oxygen saturation and oxygen tension in the renal vein blood are 90 to 97% and 80 to 113 mm Hg, respectively. In renal ischemia the oxygen saturation in the affected renal vein is 60 to 75%. Oxygen tension is about 60 to 75 mm Hg. In other types of patients with intrinsic renal disease, including chronic pyelonephritis, the oxygen tension and oxygen saturation are less predictable.

THE ROLE OF ARTERIAL PULSATION IN EXPERIMENTAL HYDRONEPHROSIS, by A. T. [K.] Cockett, R. M. Nakamura, and B. I. Rein. [1965] [7]p. incl. illus. (AFOSR-66-1891) (AF AFOSR-63-246) AD 641378 Unclassified

Also published in Invest. Urol., v. 2: 548-554, May 1965.

A method for the development of chronic experimental hydronephrosis is outlined. Histologic changes in the ureters and kidneys associated with hydronephrosis are listed. It would appear that two factors, partial ureteral obstruction and the arterial pulse, are important in the genesis of hydronephrosis. Partial ureteral obstruction alone is less predictable. SPECIFIC IMPEDANCE OF CEREBRAL WHITE MATTER, by P. W. Nicholson. [1965] [15]p. incl. diagrs. tables, refs. (AFOSR-66-2105) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-246 and National Institute of Mental Health) AD 642819 Unclassified

Also published in Exper. Neurol., v. 13: 386-401, Dec. 1965.

A method is described for measuring specific impedances in deep brain structures. It was used to determine the impedance in a large fiber tract in the cat internal capsule. The impedance along an axis normal to the fiber direction was ~800 Ω cm and predominantly resistive at frequencies between 20 c/sec and 20 kc/sec. The impedance along the fiber direction was approximately one-ninth of this. Possible mechanisms of current conduction are examined and it is concluded that unless the oligodendrocyte membrane resistance is $\gtrsim 8\ \Omega\ cm^2$ an extracellular space of ~10% is indicated. TETRODOTOXIN AND MANGANESE ION: EFFECTS ON ACTION POTENTIAL OF THE FROG HEART, by S. Hagiwara and S. Nakajima. [1965] [2]p. incl. illus. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-535 and National Institutes of Health) Unclassified

Published in Science, v. 149 1254-1255, Sept. 10, 1965.

Tetrodotoxin, which effectively suppresses the permeability of various tissues to sodium ions, has no effect on the calcium action potential of the fiber of barnacle muscle, which potential is produced by increase in permeability to calcium ions. Manganese ions, however, suppress the action potential. When applied to fiber of frog cardiac ventricle, tetrodotoxin suppresses the rate of rise of the action potential without affecting the overshoot; the suppressive effect of manganese ion is mainly on the overshoot of the action potential. This suggests that, in the action potential of the cardiac ventricle of the frog, the plateau phase is related primarily to the increase in permeability of the membrane to calcium ions. SPECTROPHOTOMETRIC STUDIES OF GASEOUS NEBULAE. V. MEASUREMENT OF LINE INTENSITIES IN PLANETARY NEBULAE WITH AN ELECTRONIC CAMERA, by L. H. Aller and M. F. Walker. [1965] [14]p. incl. illus. tables, refs. (AFOSR-66-1583) (AF AFOSR-63-83) AD 641447 Unclassified

Also published in Astrophys. Jour., v. 141: 1318-1330, May 1965.

The spectra of several planetary nebulae, IC 351, NGC 1535, NGC 2022, NGC 6309, NGC 6720, NGC 6741, and Anon 21^h29^m = VV 267 have been observed with a Lallemand electronic camera at the coudé focus of the 120-in. reflector in the spectral region between λ 3600 and λ 4400. It is concluded that an image converter can yield as reliable line intensities as can conventional photographic methods. The large scale at the coudé focus enables the observer to measure relative intensities at several points in the nebular image, while the relatively high dispersion makes weaker lines detectable against the continuum of the central star or that of the nebulae itself. Also the linear response of the image tube even for high electronorgraphic plate densities makes possible intensity measurements without the errors introduced by the usual photographic reduction process and considerably extends the range of intensity measurements that can be made as compared with conventional photographic photometry. QUASILINEARIZATION AND ORBIT DETERMINATION, by R. S. Long. [1965] [4]p. incl. tables. (AF AFOSR-63-241) Unclassified

Published in AIAA Jour., v. 3: 1937-1940, Oct. 5.

This paper explains the use of quasilinearization (the generalized Newton-Raphson process) as applied to the problem of determining orbits from various types of observational data, i.e., angular data, range and range-rate. The nonlinear differential equations controlling the orbit are replaced by a set of linear equations whose solutions, obtained numerically, converge to the orbit, at least if the orbit is well determined by the data. Numerical examples show that the convergence is rapid.

THE CRYSTAL AND MOLECULAR STRUCTURE OF [3.3] PARACYCLOPHANE, by P. K. Gantzel and K. N. Trueblood. [1965] [11]p. incl. diagrs. tables, refs. (AFOSR-65-2160) (AF 49(638)719) AD 627512 Unclassified

Also published in Acta Cryst., v. 18. 958-968, May 1965.

[3.3] Paracyclophane ($C_{18}H_{20}$) forms monoclinic crystals with a_o = 9.715, b_o = 8.138, c_o = 8.524A, β = 90.69°, and 2 molecules in the unit cell in space group $P2_1/n$. The structure was refined by full-matrix least-squares methods, and the final parameters include small corrections for molecular libration. The aromatic rings are deformed slightly into a symmetrical boat form, the bending being about 6° at each end, the α-carbons are bent further, by an average of nearly 4°. The 2 rings do not lie directly above one another being displaced about 0.5A from such an arrangement. The bond angles in the side chain are slightly larger than the normal values, and the dihedral angles are also slightly greater than those in n-butane. All bond distances are consistent with those found in other hydrocarbons. There are no short non-bonded intermolecular contacts, and the shortest intramolecular ones are only slightly less than the sum of the van der Waals radii, and thus are consistent with the comparatively small observed distortion of the molecule. The distribution of the strain energy in this and similar molecules is discussed. (Contractor's abstract)

THE CRYSTAL AND MOLECULAR STRUCTURE OF 1,1'-TETRAMETHYLETHYLENEFERROCENE, by M. B. Laing and K. N. Trueblood. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-65-2387) [AF 49(638)-719] AD 627955 Unclassified

Also published in Acta Cryst., v. 19: 373-381, Sept. 1965.

1,1'-Tetramethylethyleneferrocene forms monoclinic plates of space group $P2_1/c$, and 4 molecules in the unit cell with a_o = 7.756, b_o = 10.97, c_o = 15.41, and β = 92.63°. The structure was solved from 3-dimensional Patterson and Fourier syntheses, and was refined by block-diagonal least squares. The two 5-membered rings are tilted 23° with respect to one another, but because of the bridge linking them are staggered only by about 9°, in contrast to ferrocene. The strain in the molecule is apparent also in the fact that the dihedral angles in the bridge are only about 26°, and that the exocyclic bonds are bent about 11° from the ring planes. The bond distances in the bridge are slightly greater than normal. The bond distances in the ring and to the iron atom appear normal. (Contractor's abstract)

METALLIC DIAMONDS, PRESSURE-PRODUCED METALS, by A. J. Darnell and W. F. Libby. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-65-1657) (AF AFOSR-63-245) AD 624175 Unclassified

Also published in Prog. Solid State Chem., v. 2: 1-8, 1965.

The metallic phases of the IVth Group elements and of the binary compounds one and two columns removed from the IVth Group, e.g., boron nitride, aluminum phosphide and zinc selenide are called metallic diamonds. The general nature of the phase diagram is that the melting point of the non-metallic state falls when pressure is applied until the transition pressure is reached, the solid-solid transition to the metallic state then occurs after which the melting point rises again. A technique is described for removing these new materials from the high-pressure apparatus in which they are produced so that their properties can be studied more completely. The technique involves chilling the materials in the metastable form and removing them after pressure is reduced to atmospheric.

NATURE OF THE CHEMICAL REACTIVITY OF RADIOBROMINE ATOMS PRODUCED BY ISOMERIC TRANSITION, by A. R. Kazanjian and W. F. Libby. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-65-1668) (AF AFOSR-64-245) AD 624366 Unclassified

Also published in Jour. Chem. Phys., v. 42: 2778-2783, Apr. 15, 1965.

The hot-atom chemistry of n-propyl bromide has been examined. By comparing the differences and similarities of the (n, γ) and isomeric transition processes, an over-all theory is evolved which accounts for the identical results produced by both nuclear processes in the solid and liquid alkyl halides. The charge developed by the Auger process following internal conversion causes the molecule to explode and gives a neutral recoiling atom which then reacts as the (n, γ) atoms. The neutralization after rupture is rapid in the solid and liquid. In the gas this is not so, and it has been possible to demonstrate experimentally a difference between the retentions in the gas phase. (Contractor's abstract)

THE NATURE OF THE LONG-RANGE INTERACTION IN HEMOGLOBIN, by W. F. Libby. [1965] [7]p. incl. diagr. [AF AFOSR-64-245] Unclassified

Published in Science in the Sixties; Tenth Anniversary AFOSR Scientific Seminar, Cloudcroft, N. M. (June 14-25, 1965) ed. by D. L. Arm. Albuquerque, Mexico U. Office of Publications, 1965, 200-206.

The strong interaction (2.3 kcal/mol) at long distances (25A) occurring between the iron porphyrins is discussed. It is concluded that the oxygenation of hemoglobin as affected by the heme-heme interaction apparently can be explained by a very long range Van der Waals electronic polarizability interaction which is much stronger for hemoglobin than for oxyhemoglobin. This interaction is due to the electronic level structures of the pi electrons in the prophyrin system, hemoglobin having 2 more pi electrons. The particular molecular orbital treatment used gives approximately the polarizabilities required and the quantum theoretical calculations show a Van der Waal's type of interaction to be entirely conceivable. The experimental evidence seems to fit the theory with a pi electron polarizability of about 4000×10^{-24} cc in hemoglobin and with a much smaller polarizability of the pi electron system in oxyhemoglobin. This seems to require that the 2 vinyl groups contribute and be coplanar with the heme platelets in hemoglobin. The Bohr effect of acids and bases

and the effects of added salt are in keeping with the theory that charge repulsion causes a swelling and a rapid drop in the interaction with consequent increase in oxygen affinity.

SPACE CHEMISTRY, by W. F. Libby. [1965] [26]p. incl. illus. diagrs. tables, refs. [AF AFOSR-64-245] Unclassified

Published in Science in the Sixties; Tenth Anniversary AFOSR Scientific Seminar, Cloudcroft, N. M. (June 14-25, 1965) ed. by D. L. Arm. Albuquerque, Mexico U. Office of Publications, 1965, 175-199.

The program of space chemistry at UCLA is aimed at four general areas: high pressure, radiation, high temperature, and vacuum chemistry. Progress has been made only in the first 2 areas although apparatus has been constructed for the third, consisting of 3 plasma torches, one of which goes to the power of half a megawatt. No facilities or progress have as yet been made in vacuum chemistry. In high pressure chemistry, work in organic compounds consists mainly of the study of the effects of high pressure on Coliphage T-4; as a result of being exposed to pressures of 4 kb, the virus was rapidly inactivated by the release of and the uncoiling of DNA. In inorganic chemistry, the problem of artificial metals has been worked on and the production of metals by pressure application to nonmetals followed by subsequent quenching to liquid nitrogen temperature is discussed. A number of new materials have been produced, among them metallic indium antimonide and its alloys with tin. Radiation chemistry has dealt with positive ion chemistry and hot atom chemistry. Gamma ray exposure of both solid and gaseous methane leads to the production of high molecular weight hydrocarbons. Experiments with solutions of hexane in liquid xenon have shown that when ionization takes place, the positive charge reaches the species of lowest ionization potential.

REACTION OF THERMAL CARBON ATOMS, by J. L. Sprung, S. Winstein, and W. F. Libby. [1965] [2]p. incl. table. (AFOSR-65-1675) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-245 and Army Research Office (Durham)) Unclassified

Also published in Jour. Amer. Chem. Soc , v. 87: 1812-1813, Apr. 1965

Carbon fragments from carbon vapor were used to bombard 99.999% zone-refined benzene frozen on a liquid nitrogen cooled surface. Gas chromatographic analysis of the irradiated benzene showed toluene and cycloheptatriene to be among the reaction products. It seems most probable that these products result from the reaction of benzene with thermal carbon atoms. It is believed that the present work provides the first example of reaction of C_1 from carbon vapor with an organic substrate. The results of this experiment also provided the first demonstration of a reaction between an organic substrate and carbon atoms produced with an initial kinetic energy below 0.3 ev.

ON CONTROL SYSTEM EQUIVALENTS OF SOME DECISION THEORETIC THEOREMS, by D. D. Sworder and M. Aoki. [1965] [15]p. (AFOSR-65-2425) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-68 and Office of Naval Research) AD 628625 Unclassified

Also published in Jour. Math. Anal. and Appl., v. 10: 424-438, Apr. 1965.

The paper shows that theorems almost identical to those in statistical decision theory hold for control systems with unknown parameters in obtaining complete classes of control policies, such that control policies not in the complete set need not be considered in optimizing control systems. The paper also shows that some of the basic assumptions needed for these theorems are satisfied in most control situations. This has many implications in control problems. For example, in discussing adaptive control problems Bellman and Kalaba used the assumption that they consider only control policies with Bayes property in deriving the functional equations of dynamic programming. It can now be shown, however, that the set of Bayes control policies form a complete class of control policies under certain conditions, and if sufficient statistics exist, then the set of control policies utilizing sufficient statistics forms a complete class. Thus, some assumptions which have been made arbitrarily in the past can be removed and/or justified in dealing with control systems with unknown parameters. (Contractor's abstract)

THE ANALYSIS AND SYNTHESIS OF COMPLEX CONTROL SYSTEMS WITH VARIABLE CRITERION FUNCTIONS, by C. T. Leondes and J. A. Payne. [1965] [7]p. incl. diagrs. table. (AFOSR-66-2610) [AF AFOSR-65-699] AD 643299 Unclassified

Also published in Proc. IFAC Tokyo Symposium Systems Engineering for Control System Design (1965) p. 425-432.

In many complex control systems it is not possible to initially specify reasonable values for system performance. The use of optimization with respect to a variable criterion function is one method which can be used during the preliminary design stages for such systems. This paper discusses the formulation of this optimizing problem and certain characteristics of the associated computational problem. Also, a particular computational method which has been successfully applied to this type of problem is presented. As an example of optimization with respect to a variable criterion function, a reentry problem is considered. This problem is that of transferring a lifting type aerospace vehicle re-entering the earth's atmosphere from parabolic to satellite conditions by means of aerodynamic braking. Certain results from a numerical solution of this problem are presented, including the optimal trade-off function between heating and acceleration effects. Some characteristics of the computational process are described. (Contractor's abstract)

THE APPLICATION OF AN ALGORITHM FOR SEQUENTIAL OPTIMIZATION OF CONTROL SYSTEMS, by J. F. Sohler. [1965] [91]p. (AF AFOSR-65-699) AD 621223 Unclassified

The subject of this thesis is the application of an algorithm for optimization of nonlinear control problems. The method used is the development of a digital computer program which applies the algorithm to study problems for verification of the technique. Possible extension of the theoretical developments studied is also investigated. The basic problem involves linearization of the results of a nonlinear solution about a nonoptimal control for the problem. The linear solution is derived by application of Pontryagin's Maximum Principle for an optimal system. A geometric approach to the solution results in a gradient technique for arriving at the optimal control for this phase of the problem. The solution of the gradient technique is accomplished by use of an acceleration scheme to provide rapid convergence to the control improvement. The final nonlinear solution is accomplished by applying the linear optimization technique in the controlled manner to the nonlinear problem.

OPTICAL CONTROL PROBLEMS IN BANACH SPACES, by A. V. Balakrishnan. [1965] [29]p. (AFOSR-66-0198) (AF AFOSR-65-700) AD 641165 Unclassified

Presented at Symposium on the Math. Theorem of Optimal Control, University of Mich. Ann Arbor, Mich., Oct. 5-7, 1964.

Also published in SIAM Jour. Control, Series A, v. 3: no. 1, 152-180, 1965.

This paper is concerned with a systematic study of a class of control problems in which the state and input or control variables are allowed to range in Banach spaces. Specifically, the state equation is of the form $\dot{x}(t) = f(x(t), u(t), t)$ where for each t, u(t) and x(t) are Banach space valued. This extension to infinite dimensions is more than of purely mathematical interest. In the first place, control problems involving distributed parameter systems where the state dynamics are described by partial differential equations are conveniently formulated in this way. Secondly, stochastic control problems can also be handled in this way. Thus, the study of control problems in Banach spaces has the merit of providing a measure of unification for a wide range of problems.

TCHEBYCHEFF APPROXIMATION AND RELATED EXTREMAL PROBLEMS, by E. W. Cheney a[illegible] A. Goldstein. [1965] [12]p. (AFOSR-65-1163) (In cooperation with Massachusetts Inst. of Tech., Cambridge, AF AFOSR-62-348) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-77, and Boeing Scientific Research Laboratories) AD 622523 Unclassified

Also published in Jour. Math. and Mech., v. 14: 87-98, Jan. 1965.

Proof is presented for several existence theorems involving convex functionals and the Tchebycheff approximation problem. Conditions are set forth for the supremum and infimum of a convex functional and the existence of a point of minimum norm on a subset of a normed linear space. An abstract problem of Tchebycheff approximation is presented. Given a set X in a linear topological space E and a bounded function λ on X, an element $f \in E^*$ is sought for which the expression $\varphi(f) = \sup_{x \in X} |f(x) - \lambda(x)|$ is an absolute minimum. Such an f is termed a best Tchebycheff approximation to λ.

APPROXIMATION BY GENERALIZED RATIONAL FUNCTIONS, by E. W. Cheney. [1965] [10]p. (AFOSR-65-2428) (AF AFOSR-63-77) AD 627750 Unclassified

Abstract published in Notices Amer. Math. Soc., v. 11: 461, 1964.

Also published in Approximation of Functions, Proc. of the [Eighth] Symposium, General Motors Research Laboratories, Warren, Mich. (Aug. 31-Sept. 2, 1964), ed. by H. L. Garabedian. Amsterdam, Elsevier, 1965. p. 101-110.

Studies are undertaken into the approximation of continuous functions on a given real interval [a,b] by generalized functions. These are functions of the form p/q where p,q vary in fixed subspaces P,Q, respectively, q being subject to the restriction $q(x) > 0$ on [a,b]. Results are sought which correspond to the theorems of existence, uniqueness and characterization in the more familiar case in which p and q are polynomials in x. Theorems which are stated and proved include a characterization theorem (given in the form of two alternation conditions, one necessary and the other sufficient), two uniqueness theorems and a theorem concerning continuity (this being an extension of a theorem of Maehly and Witzgall). These results, and those which will be built upon them, should prove to be of great value in the construction of approximations. (Math. Rev. abstract)

RADIO-FREQUENCY BREAKDOWN IN A DC PARABOLIC POTENTIAL FIELD, by T. A. Karras and E. Lindman, Jr. [1965] [5]p. incl. diagrs. (AFOSR-65-1121) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-567 and National Aeronautics and Space Administration) AD 620485 Unclassified

Also published in Jour. Appl. Phys., v. 36: 18-22, Jan. 1965.

Electrons that are confined in a Penning discharge geometry by electric and magnetic fields are observed to gain energy from a superimposed rf field. By shaping the electrodes in the form of hyperboloids of revolution the prebreakdown motion can be accurately described by the Mathieu equation. Resonances are predicted when the frequency of the electron in the electrostatic well is a multiple of half the rf frequency. Between resonances the Mathieu equation predicts runaway energy gain at considerably higher values of the rf voltage, but breakdown is observed at values much lower than the prediction due to energy gain through collisions with gas atoms. The collision resets the phase of the motion and allows the electron to continually gain energy from the rf field. Breakdown curves calculated for the regions between resonances are found to agree with the experimental ones.

EFFECT OF THE rf VOLTAGE ON THE PUMPING RATE OF AN ION SPUTTER PUMP (Abstract), by R. E. Rowberg and K. R. MacKenzie. [1965] [1]p. [AF AFOSR-64-567] Unclassified

Presented at meeting of the Amer. Phys. Soc., Columbia U., New York, June 23-25, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 598, June 23, 1965.

The electrodes of an ion sputter pump are constructed to conform to the requirements of an rf transfer discharge geometry. By applying rf and dc voltages simultaneously, an increase in pumping speed (1.5 at 5 x 10^{-5} Torr to 2 at 5 x 10^{-6} Torr) is observed over the rate with dc alone. The pump consists of 2 grounded Ti cathodes and a split stainless anode, all contained in a stainless chamber. At the operating frequency of 25 mc/sec and a field of 2 kG, the maximum effect is observed when the rf is 100 v and the dc is 4.7 kv.

MEASURED CHARACTERISTICS OF A PHOTOIONIZATION PLASMA SOURCE (Abstract), by J. Hyman, Jr. and K. R. MacKenzie. [1965] [1]p. [AF AFOSR-64-567] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 28-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 476. Apr. 26, 1965.

A high-energy photon beam emanating from a high-voltage spark discharge is transmitted through a low-pressure gas (P ~ 10^{-2} Torr) to create a column of ion pairs by quantum photoionization. The degree of ionization of the resulting plasma has been measured at $n_+/n_0 \sim 10^{-4}$. The ion number density ~ directly with the density of the gas being ionized. The plasma creation time is of the order of 5 μsec, after which the plasma column expands radially with a measured radial crest velocity of greater than 10^5 cm $(sec)^{-1}$. The plasma disperses by radial diffusion with an approximate e-folding time of 100 μ. The plasma potential and density, and the kinetic energy of the electrons emitted in the photoionization process are measured with plasma-probe

techniques at various radial positions and at various times after formation of the plasma. Results of measurements taken with both He and Ar are presented, along with a discussion of experimental techniques.

THERMODYNAMICS OF THE LIQUID-LIQUID CRITICAL MIXING REGION, by H. H. Schmidt and J. Opdycke. Final rept. Mar. 1958-Dec. 1963. Feb. 1965, 38p. incl. diagrs. tables, refs. (AFOSR-64-1758) (AF 49-(638)284) AD 625455 Unclassified

An improvement was made upon the apparatus used for heat capacity measurements and the measurements were refined to the extent that they can now reasonably be expected to give data of the high order of precision required for crucial tests of theories. The bulk of the report is devoted to a description of the apparatus developed, the art involved in its operation, and the results obtained on 2 particular critical systems. An attempt was made to measure the partial vapor pressure and hence the fugacity of components in a liquid-liquid near-critical mixture as a function of composition.

ON A NECESSARY AND SUFFICIENT CONDITION THAT AN INFINITELY DIVISIBLE DISTRIBUTION BE ABSOLUTELY CONTINUOUS, by H. G. Tucker. [1965] [16]p. incl. refs. (AFOSR-66-0204) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-328 and National Science Foundation) AD 632886 Unclassified

Also published in Trans. Amer. Math. Soc., v. 118, 316-330, June 1965.

The characteristic function f of an infinitely divisible distribution F is uniquely represented as $f(u) =$

$$\exp\left\{iyu - \sigma^2 u^2/2 + \int_{-\infty}^{\infty}\left(e^{iux} - 1 - \frac{iux}{1+x^2}\right) dM(x)\right\}$$

by the function M(x),

$$M(x) = \int_{-\infty}^{x} \frac{1+\tau^2}{\tau^2}\, dG(\tau) \qquad (x < 0),$$

$$= -\int_{x}^{\infty} \frac{1+\tau^2}{\tau^2}\, dG(\tau) \qquad (x > 0),$$

where $G(\tau)$ is the spectral function of the Lévy-Khinchin representation such that $\sigma^2 = G(+0) - G(-0) \geq 0$. The author presents some propositions on Lebesgue properties (absolute continuity, continuous singularity and discreteness) of F in terms of M-functions, and proves the following theorem: "A necessary and sufficient condition that F be absolutely continuous is that at least one of the following five conditions hold: (i) $\int_{-\infty}^{\infty} dM_{ac}(x) = \infty$; (ii) $\sigma^2 > 0$; (iii) $F^{(d)}$ is absolutely continuous; (iv) $F^{(cs)}$ is absolutely continuous; (v) $F^{(d)}$ is continuous singular, $F^{(cs)}$ is continuous but not absolutely continuous, and $F^{(d)} * F^{(cs)}$ is absolutely continuous", where M_{ac}, M_{cs}, and M_d are the absolutely continuous, the continuous singular, and the discrete components of M, respectively, and $F^{(i)}$ denotes the infinitely divisible distribution function produced by the M-function M_i, i = ac, cs, d. SETS OF UNIQUENESS ON THE GROUP 2^ω, by R. B. Crittenden and V. L. Shapiro. [1965] [15]p. incl. refs. (AFOSR-65-2131) [AF AFOSR-64-694] AD 630397 Unclassified

Also published in Ann. Math., v. 81: 550-564, May 1965.

One of the principal results of this paper is a uniqueness theorem for Walsh series, the analogue of the theorem of de la Vallée Poussin for trigonometrical series. Theorem 1: Suppose that the Walsh series $S(x) = \Sigma\, a_k \psi_k(x)$ converges, except possibly on a countable subset of [0, 1], to a finite function f(x) contained in $L^1[0,1]$. Then S(x) is the Walsh Fourier series of f(x). The result affirms a conjecture of Fine (Trans. Amer. Math. Soc., v. 65: 372-414, 1949). (Another proof of this theorem has been given previously by Arutjunjan and Talaljan (Izv. Akad. Nauk SSSR Ser. Mat., v. 28: 1391-1408, 1964) by an approach somewhat different from the one given in this paper.) Theorem 1 is a consequence of a more general uniqueness theorem for a class of formal character series for the group 2^ω, the countable product of cyclic groups of order 2. The set of Walsh functions $\{\psi_k(x)\}_{k=1}^{\infty}$ may be associated in a natural way with the set of continuous characters $\{\bar{\psi}_k(\bar{x})\}_{k=1}^{\infty}$ of 2^ω. A series $\bar{S}(\bar{x}) = \Sigma_{k=1}\, a_k \bar{\psi}_k(\bar{x})$ is said to be in the class $\mathcal{A}$ if the partial sums of order 2^n, $\bar{S}_{2^n}(\bar{x})$, satisfy the condition that $\lim_{n\to\infty} \bar{S}_{2^n}(\bar{x})/2^n = 0$ for each $\bar{x}$ in 2^ω. (Thus, for example, it may be shown that every series with coefficients tending to zero belongs to the class $\mathcal{A}$.) Theorem 2: A necessary and sufficient condition that a Borel set Z^* of Haar measure zero on G be a set of uniqueness for the class $\mathcal{A}$ is that Z^* be a countable set. Theorem 3: Let $Z^* \subset G$ be a countable set and $\bar{S}(\bar{x})$ be a series in the class $\mathcal{A}$. Suppose that (1) $\limsup_{n\to\infty} \bar{S}_{2^n}(\bar{x})$ is finite on $G - Z^*$, and (2) there exists a function $f(\bar{x})$ in $L^1(G)$ such that $\limsup_{n\to\infty} S_{2^n}(x) \geq f(\bar{x})$ on $G - Z^*$. Then $\bar{S}$ is the Fourier series of a function in $L^1(G)$. (Math. Rev. abstract)

SPIN WAVE-SPIN WAVE SCATTERING IN A HEISENBERG FERROMAGNET, by R. G. Boyd and J. Callaway. Jan. 1965, 42p. (Technical rept. no. 3) (AFOSR-65-1185) (AF AFOSR-64-523) AD 613606 Unclassified

Also published in Phys. Rev., v. 138: A1621-A1629, June 14, 1965.

The scattering of one spin wave from another in a perfect simple cubic Heisenberg ferromagnet with nearest neighbor exchange is studied. Two spin waves interact through the portions of the Heisenberg exchange hamiltonian and the magnetic dipole-dipole hamiltonian which are non-diagonal with respect to the spin wave basis. The exchange and dipole interactions are considered separately, ignoring interference of the 2 scattering processes. Principal interest has been centered in the exchange interaction, for which an exact cross section can be derived. The dipole cross section in Born approximation is calculated for the purpose of comparing orders of magnitude. The part of the dipole interaction which changes the number of spin waves, processes not permitted by the exchange hamiltonian, are omitted. The Zeeman energy in an external field is omitted since it commutes with the Heisenberg exchange hamiltonian and the part of the dipole interaction considered; and hence is a constant of motion.

MEASUREMENT OF OPTICAL ABSORPTION IN AN ELECTRIC FIELD, by L. M. Lambert. [1965] [4]p. incl. diagrs. (AFOSR-65-2535) [AF AFOSR-64-523] AD 627960 Unclassified

Also published in Phys. Rev., v. 138: A1569-A1572, May 31, 1965.

Optical absorption by semiconductors and insulators in electric fields has been of interest for several decades. Recently, Franz and Keldysh have independently presented theories which permit an estimation of the magnitude of effects observed. More recently, Callaway developed a more elaborate formulation which permits accurate computation of absorption coefficients. It is the purpose of this work to present the results of an investigation of Callaway's theory. Optical absorption in oriented single crystals of semi-insulating gallium arsenide was investigated over the temperature range 300 to 85 K using non-ohmic contacts and a synchronized pulse-train generator. The Cary 14R recording spectrophotometer was used with a spectral purity between 5 to 9A in the IR no. 1 mode of operation. The fields used varied between 1×10^4 and 1×10^5 v/cm. MULTIPLE-SCATTERING METHODS IN THE THEORY OF SOLIDS, by J. Callaway. [1965] [15]p. incl. refs. (AFOSR-65-2593) [AF AFOSR-64-523] AD 629151 Unclassified

Also published in Phys. Rev., v. 140: A818-A832, Oct. 18, 1965.

The formalism of solid-state scattering theory is applied to the construction of the t matrix for a pair of electrons interacting through a repulsive potential of finite range. Expressions for t are obtained in suitable limits for 3 cases: (1) a potential acting only at a single site and in a single band, (2) a potential acting at a single site but

connecting a pair of bonds, and (3) a potential acting in a single band but extending to first neighbors. The results are applied to the determination of an optical potential which can be used in a study of the range of excited electrons in metals, and to the determination of the ground-state energy of a low-density system. The ground-state energy is examined as a function of spin alignment, leading to the development of criteria for the occurrence of ferromagnetism in the low-density limit. It is shown that for repulsive, finite-range interactions, ferromagnetism does not occur for very low densities, whatever the band structure is. (Contractor's abstract)

PERMANENTS, by M. Marcus and H. Minc. [1965] [15]p. incl. refs. (AFOSR-65-2350) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-698 and AF AFOSR-63-432, and National Science Foundation) AD 629817 Unclassified

Also published in Amer. Math. Monthly, v. 72: 577-591, June-July 1965.

This paper is concerned with a unified theory for the permanent function. The permanent function appears naturally in any combinatorial setting in which a count of the number of systems of distinct representatives of some configuration is required. For example, the permanent is the appropriate function for studying the classical problem of determining the total number of derangements of n distinct items. The permanent function is regarded herein as an analytic expression for the induced inner product in the symmetry class of completely symmetric tensors. Some of the major new results involving the function are obtained via this technique. Included in this paper is an extensive history of the development of the subject over the last 153 years.

MATRIX RATIONAL COMPLETIONS SATISFYING GENERALIZED INCIDENCE EQUATIONS, by E. C. Johnsen. [1965] [12]p. (AFOSR-65-2069) [AF AFOSR-65-698] AD 627631 Unclassified

Presented at International Cong. of Mathematicians. Stockholm(Sweden), Aug. 18, 1962.

Also published in Canad. Jour. Math., v. 17: 1-12, 1965.

A generalization is made of former results for a v, k, λ configuration with incidence equation $AA^T = (k - \lambda) I + \lambda J = B$. For u's rational, $u = (u_1, u_2, \ldots, u_v)$, $uu^T = v$, define $B(u) = \lambda u^T + (k - \lambda)I$. $\mathfrak{B}$ denotes the class of all B(u). It is shown that all matrices in $\mathfrak{B}$, or none, are rationally congruent to the identity I, denoted $\mathfrak{B} \sim I$ or $\mathfrak{B} \sim I$.

MATRIX APPLICATIONS OF A QUADRATIC IDENTITY FOR DECOMPOSABLE SYMMETRIZED TENSORS, by M. Marcus. [1965] [5]p. (AFOSR-65-2100) (AF AFOSR-65-698) AD 630516 Unclassified

Also published in Bull. Amer Math. Soc., v. 71: 360-364, Mar. 1965.

Necessary relations are stated that prevail among coordinates of decomposable tensors in an arbitrary symmetry class of tensors. It is also indicated how these relations can be used to unify and extend a large class of matrix inequalities that includes as special cases the classical Hadamard, Schur, Fan, and Fischer results The main result relating two orthonormal bases in a symmetry class of tensors V_λ^m is as follows Let v_1, ...

v_n and $e_1, \ldots, e_n$ be two orthonormal bases in an n-dimensional unitary space V. Then for each $\omega \in \Delta$ and each t, $1 \leq t \leq n$, $\sum_{i=1}^{n} m_i(\omega)\,(e_i, v_t)^2 = \sum_{\nu \in \bar{\Delta}} m_{t(\nu)}$

$\frac{h}{\nu(\omega)} \left| e^{*}_{\omega}, \frac{h}{\nu(\gamma)} \right|^2 \nu_{\nu}^{*} \Big|^2$, where ω denotes a sequence $(\omega_1, \ldots, \omega_m)$, Δ is the set of all ω whose character χ is identically 1 on the subgroup H over which V_{λ}^{m} is defined, h is the order of H, $\nu(\omega)$ is the product of the factorials of the multiplicities of the distinct integers appearing in ω, and $m_i(\omega)$ denotes the multiplicity of occurrence of i in ω. The proofs are outlined.

Also published in Trans. Amer. Math. Soc., v. 116: 316-329, Apr. 1965.

Let H be a subgroup of the symmetric group S_m, and let χ be a character of H of degree 1, i.e., a homomorphism from H to the multiplicative group of non-zero complex numbers. Then $d_{\chi}(A) = \sum_{\sigma \in H} \chi(\sigma) \prod_{i=1}^{m} a_{i,\sigma(i)}$, while $A = (a_{ij})$ is an m x m matrix, defines a generalized matrix function. Examples: determinants and permanents H = S_m, $\chi \equiv 1$). The authors generalize the Cauchy-Binet theorem and other results in multilinear algebra from determinants to generalized matrix functions, and obtain various inequalities for $d_{\chi}(A)$. Their main result states that $|d_{\chi}(A)| \leq (1/m) \sum_{i=1}^{m} |r_i|^m$ if A is a normal m x m matrix with eigenvalues $r_1, \ldots, r_m$. (Math. Rev. abstract)

PREVIOUS EXPERIENCE WITHIN THE DYAD AND COOPERATIVE GAME BEHAVIOR, by A. A. Harrison and C. G. McClintock. [1965] [5]p. incl. diagrs. tables. (AF 49(638)794)
Unclassified

Published in Jour. Personality and Social Psychol., v. 1: 671-675, June 1965.

The present study was an attempt to explain cooperation within the dyad in terms of reinforcement theory. Two groups of 10 dyads each received monetary gains while engaging in a cooperative reaction-time game; 2 similar groups were not rewarded, but sustained losses. Immediately following this reaction-time game, 1 of the rewarded groups and 1 of the nonrewarded groups played a series of 60 consecutive Prisoner's Dilemma games, a task in which one may either cooperate or compete. The other rewarded and nonrewarded groups of dyads returned after an interval of 1 wk. to participate in the Prisoner's Dilemma. A comparison of Ss who were rewarded during the reaction-time game with Ss who had no previous experience within the dyad indicated that the rewards received during the initial task increased the probability of a cooperative response during the Prisoner's Dilemma game, and that this effect persevered over time. The results also indicated that losses sustained during the reaction-time game did not increase or decrease the number of cooperative responses in the group tested immediately but did increase such responses in the group tested 1 wk later. SOME EFFECTS OF VARIATIONS IN OTHER STRATEGY UPON GAME BEHAVIOR, by C. G. McClintock, P. Gallo, and A. A. Harrison. [1965] [7]p. incl. diagr. tables. (AF 49(638)794) Unclassified

Published in Jour. Personality and Social Psychol., v. 1: 319-325, Apr. 1965.

Internationalist and isolationist Ss played a 2-part modification of the Prisoner's-Dilemma-type game. Though they did not know it, they were actually playing against E, rather than each other. In the 1st part of the experiment, Ss had little control over the payoff matrix. In the 2nd part, Ss had virtually total control over the payoffs. During the 1st part of the experiment, E played a "cooperative" strategy against 1/2 of the Ss and a "competitive" strategy against the other 1/2. The results indicated that neither the strategy played against Ss nor the personality of Ss influenced the number of cooperative choices. However, a significant 3-way interaction indicated that internationalists are more sensitive to changes in their opponents' strategies. (Contractor's abstract)

AN EXPERIMENTAL AND CONCEPTUAL EXAMINATION OF SEVERAL ASPECTS OF INTERPERSONAL BEHAVIOR, by C. G. McClintock. Final rept. Jan. 1965, 119 p. incl. diagrs. tables, refs. (AFOSR-65-0311) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)794 and AF AFOSR-62-347) AD 611180 Unclassified

This report considered 6 major theoretical approaches to the study of small group behavior. They included leadership behavior, cohesiveness, risk-taking behavior, game playing behavior, and social psychological theory and research. Heterogeneity was discovered in the conceptual approaches, while there is an existence of some commonalities. The results indicated a tendency among all the hypotheses classified to use the same sized socila units for the independent and dependent variable of a given hypothesis. The independent and dependent levels of social processes were also found to be at similar levels. There was also a tendency to employ the individual more often as the acting social unit and as the level of social process on the dependent side of a hypothesized relationship. It was noted that the present analysis was based upon a sample of empirical studies selected to represent various conceptual and theoretical approaches to the study of small group behavior.

MATHEMATICS OF A HIERARCHY OF BROUWERIAN OPERATIONS, by T. Bastin. [1965] 29p. (Bound with its AFOSR-65-1883, AD 625488) [AF EOAR-64-63] Unclassified

This paper develops an algebraic system in which a set of operations upon a second set of quantities can themselves be treated as operands for another set. The required algebraic system essentially has a hierarchical structure in respect to the operator/operand relationship.

AN OPERATIONAL HIERARCHY, by A. F. Parker-Rhodes. [1965] 10p. incl. tables. (Bound with its AFOSR-65-1883, AD 625488) [AF EAOR-64-63] Unclassified

This paper describes an unusual algebraic structure, which arises in connection with the following problem. Consider an experimental situation without any means of investigating it except by performing a sequence of operations, each of which restricts the range of operations which can follow it, in such a way that the sequence eventually terminates. The problem is to find out what can be done about the whole class of situations thus characterized.

A CALCULUS FOR A BOOTSTRAP DYNAMICS, by E. W. Bastin. Jan. 1965, 30p. incl. diagrs. table. (AFOSR-66-0415) (AF EOAR-65-78) AD 637560
Unclassified

An outline and conceptual basis are presented for a calculus in which the elements are a finite set of similar entities capable of undergoing interactions, and the process of bringing 2 elements into consideration together constitutes a new element that is of the same kind as the original ones and is capable itself of being brought into consideration with the members of the first set. The elements form a hierarchy and under certain conditions can be simply ordered so that the sets are finite and their order calculable. The simple ordering is used to describe a bootstrap system for interactions between particles and to define the physical quantity of time. A relationship between levels in the hierarchy expresses the recursive nature of each decision by using the total possible number of decisions at each level as the algebraic basis for the set at the next more complex level. The system accounts for dynamic processes in terms of discrete interactions. Its non-formal expression is related to concepts of information transfer

ESSENTIALLY FINITE CHAINS, by J. C. Amson and A. F. Parker-Rhodes. Sept. 13, 1965, 12p. incl. tables. (AFOSR-66-0423) (AF AFOSR-65-78) AD 637840
Unclassified

A sequence whose terms begin with a specific term (the originator) and whose subsequent terms are determined by a specific iteration procedure (the formulator) such that each inherits the structure of its precessor, is called a chain. Examples are given to clarify the meaning of "essentially." The paper examines a number of instances in which an essentially infinite chain becomes essentially finite, and gives the necessary conditions on the dimensionality of the originator for the chains to be essentially finite and specifies the number at which the chain terminates. Where G is a group and F is the process of selecting any proper subgroup of G, the modification to F seems largely independent of the nature of G, except that G should have finite dimension, which permits explication in a setting of finite abelian groups and their endomorphisms.

GROWTH OF BURNING TO DETONATION IN LIQUIDS AND SOLIDS, by F. P. Bowden. Aug. 1965, 7p. (Rept. no. 7) (AFOSR-65-1269) (AF EOAR-64-18) AD 640138
Unclassified

Studies were made of the growth of reaction from initiation through burning to explosion in a homogeneous thin film of nitroglycerine which is enclosed between 2 flat solid surfaces and initiated at its center by an electric spark. Processes leading to fragmentation, deflagration and detonation were followed at μsec framing rates. This report illustrates the importance of habit imperfections in determining the sites at which deflagration starts. The theoretical work was concerned with studies of the explosion process from the viewpoint of thermal explosion theory, and covered initiation by hot spots of various geometries corresponding to initiation by light, hot wires, plates and spheres and the arrival.

CAVITIES AND MICRO MUNRO JETS IN LIQUIDS: THEIR ROLE IN EXPLOSIONS, by F. P. Bowden and M. P. McOnie. [1965] 4p. incl. illus. refs. (AFOSR-66-0116) [AF EOAR-65-24] AD 631103
Unclassified

Also published in Nature, v. 206: 380-383, Apr. 24, 1965.

Strong evidence supported the assumption that the initiation of explosion in liquids by impact or by shock is essentially a thermal process. A small region of the explosive was heated to a temperature at which fast reaction can occur. If the shock is very powerful, the compressive heating of the liquid itself may raise the temperature to a sufficient value. The shock pressure necessary for this may be very high. Pressures of this magnitude are reached in high velocity detonation and serve to sustain the reaction. For mechanical impact and moderate shocks, this is no longer true. It is necessary for some discontinuity, cavity or bubble to be present in the liquid so that the energy of the shock can be concentrated in this region and a localized hot spot can be formed. These discontinuities also influence the growth of explosion and its transformation to detonation. They may be present originally in the liquid or they may be formed by the initiating shock or by the developing explosion.

THE PROBLEM OF CAUSALITY IN S-MATRIX THEORY, by R. J. Eden and P. V. Landshoff. [1965] [21]p. incl. diagrs. refs. (AFOSR-65-1782) (AF EOAR 63-79) AD 625357 Unclassified

Also published in Ann. Phys., v. 31: 370-390, Feb. 1965.

The problem is considered of introducing space and time concepts into scattering theory with a view to stating a causality principle from which it may be possible to derive analytic properties of S-matrix elements. Problems are raised related to: (1) partial localization of interactions in space so that noninteracting terms can be separated out; (2) partial localization in time so that initial and final states can be separated and macroscopic time become meaningful; (3) the use of negative energy states in superpositions to form wave packets; (4) approximations to multiparticle S-matrix elements and their relevance to simple scattering processes, and limiting procedures that may relate experiments to the conventional S-matrix elements.

UNITARITY AND THE EVALUATION OF DISCONTINUITIES. III, by D. I. Olive. [1965] [24]p. incl. diagrs. refs. (AFOSR-65-1864) (AF EOAR-63-79) AD 626827 Unclassified

Also published in Nuovo Cimento, Series X, v. 37: 1422-1445, June 1965.

A discussion is presented which summarizes some of the evidence of the S-matrix theory scheme of singularity structure. A study is presented of the normal threshold model or approximation in which the normal thresholds are the only singularities considered. The internal consistency of the model is investigated by studying a discontinuity scheme for the model, its various properties, and its relation to the physical unitarity relations and crossing. The workings of the multiparticle unitarity equations are shown in their role of evaluating the total discontinuity.

AN ANTISYMMETRIC FORMULATION OF THE OPTICAL MODEL POTENTIAL AND THE EFFECT OF THE NUCLEAR FORCE RANGE, by F. J. Bloore. [1965] [13]p. incl. diagr. table, refs. (AFOSR-65-1865) (AF EOAR-63-79) AD 626104 Unclassified

Also published in Nuclear Phys., v. 66: 217-229, Apr.-May 1965.

It is at first sight plausible that the comparatively large range of the nucleon-nucleon force may considerably reduce the central strength of the real part U of the optical potential in light nuclei below the value obtained inside heavy nuclei. This effect is strongly exhibited in the prescription $U = \langle 0|V|0\rangle$ which arises from a formulation of the scattering problem which treats the incident particle as distinguishable. However, this prescription overestimates U by a factor 5. An antisymmetric formulation is presented which suggests a new non-local form for the potential U. In this formulation the factor 5 is removed. This non-local potential is discussed for infinite nuclear matter and for a finite nucleus. A local potential equivalent to the non-local potential for the finite nucleus is introduced by means of the Born approximation but the results are inconclusive. (Contractor's abstract)

A MODEL REQUIRING LIE GROUP SYMMETRIES, by J. C. Polkinghorne. [1965] [8]p. incl. diagrs. refs. (AFOSR-65-2183) (AF EOAR-63-79) AD 625358 Unclassified

Also published in Ann. Phys., v. 34: 153-160, Aug. 1965.

Cutkosky's model of vector mesons in mutual interaction is rediscussed and extended by the introduction of further particles. The dynamical picture used is one based on the generation of Regge poles in scattering amplitudes in perturbation theory. It is found that particles of spin less than one must belong to representations of the Lie group of which the vector mesons form the adjoint representation. It is also found that the strength of the interaction of the lower spin particles is determined by the strength of the mutual interaction of the vector mesons, at least in the approximation discussed. SINGULARITIES AND DISCONTINUITIES OF THE TRIANGLE GRAPH, AS A FUNCTION OF INTERNAL MASS, by I. J. R. Aitchison and C. Kacser. [1965] 13p. incl. diagrs. refs. (AFOSR-66-0482) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-79 and National Science Foundation) AD 630519 Unclassified

The triangle graph for 3-body production or decay processes is considered as a function of an internal mass. The discontinuities of the graph with respect to this variable are of special importance, since they form the kernel of the integral equation which determines all rescattering effects due to competing 2-body final-state interactions. The main part of the kernel is given by one particular discontinuity, and this is recalculated here by dispersion methods which are basically well understood. The result agrees with that previously found by the use of Cutkosky's rules supplemented by some techniques of homology theory. It is gratifying that the result can be obtained by relatively straightforward methods: and that Cutkosky's rules can indeed be used for calculating the discontinuity in an internal mass variable. A by-product of the calculation is a prescription for calculating the discontinuity of the graph in a given channel from a single-variable representation of it in a crossed channel Applications to 3-particle processes are mentioned. MIXING OF REGGE POLES AND CUTS IN A FIELD-THEORY MODEL, by A. R. Swift. [1965] [10]p. incl. diagrs. refs. (AFOSR-66-0812) (AF EOAR-63-79)
AD 639318 Unclassified

Also published in Jour. Math. Phys., v. 6: 1472-1481, Oct. 1965.

The Regge poles generated by ladder diagrams in $\lambda\phi^3$ theory are mixed with the moving cuts generated by a class of nonplanar graphs containing an internal ladder. Since the contribution from the cut-generating diagram is of order $t^{-2}\ln mt$, where t is the asymptotic variable, the t^{-2} behavior of the pure ladder graphs is examined and the trajectory of the Regge pole near $l = -2$ is calculated. The Mellin transform method is used throughout. The transformed amplitude corresponding to a single cut insertion is given by a product of the form pole-cut-pole, where it is only the second Regge trajectory that mixes with the cut. The cut itself depends on the leading trajectory. This result substantiates the predictions as to form of other work based on unitarity, but differs in that the cut and pole depend on different trajectory functions. Finally, multiple insertions of the cut diagrams are shown to generate an amplitude with 2 moving poles on each sheet of the cut. (Contractor's abstract)

THE RELATION BETWEEN THE REAL PARTS OF THE NUCLEON AND THE DEUTERON OPTICAL POTENTIALS, by F. J. Bloore. [1965] [7]p. incl. diagrs (AF EOAR-63-79) Unclassified

Published in Nuclear Phys., v. 68: 298-304, June 1965

A relation is given between the real parts of the optical model potentials for nucleons and deuterons in infinite nuclear matter. These potentials are expressed in terms of the nucleon-nucleon potential using a formalism in which the identity of the constituent particles is taken into account in a properly antisymmetric way. It is confirmed that the potential experienced by a deuteron of incident energy E is almost twice the potential experienced by a nucleon of incident energy 1/2 E. When reasonable internucleon force parameters are used, the theoretical nucleon potential turns out to be rather too small (Contractor's abstract)

BIOLOGICAL CLOCKS AND THEIR INTERACTION IN INSECTS, by J. Harker. Final rept. Nov. 1, 1965 [35]p. incl. illus. diagrs. tables, refs. (AFOSR-66-1478) (AF EOAR-64-14) AD 635770 Unclassified

The research described in this report falls into four sections: (a) Histological investigations into the activity of the neurosecretory cells in the cockroach suboesophageal ganglion show that no clear changes occur in the stainable secretory material in these cells to parallel the animal's circadian locomotor activity cycle. The nuclei of some of these cells showed a possible circadian cycle of change in volume. (b) A method of bioassaying pharmacologically active extracts of cockroach tissues was set up. After initial trials it was considered that the necessary further development of the apparatus was not warranted. (c) Operations on the nervous system of cockroaches confirmed that the clock mechanism controlling the activity cycle could function without direct nervous connection between the sub-oesophageal ganglion and the corpora cardiaca. (d) The rate of development of Drosophila pupae is affected by factors following a circadian rhythm. The form of the rhythm is determined by both light-on and light-off signals, but the timing of the rhythm is determined by the two signals acting independently of each other. The circadian rhythm of eclosion of Drosophila cultures is shown to be the result of the summation of different individual rhythms of development at earlier stages. (Contractor's abstract)

DESIGN OF THE G-21 MULTI-PROCESSOR SYSTEM, by J. T. Quatse. [1965] [34]p. incl. diagrs. (AFOSR-67-0257) (SD-146) AD 804037 Unclassified

During the summer of 1963, a multi-processor version of the CDC (Control Data Corp.) G-20 (the G-21) was developed for the Computation Center of Carnegie

Institute of Technology. The purpose was to double the memory capacity and processing speed of the existing G-20 system. Since then, the system has continued to evolve as the needs of the Computation Center continue to grow. The purpose of this paper is to describe the memory control electronics which underlie memory time-sharing. The important related engineering problems are discussed in the terms of the current G-21 system.

SOME STUDIES IN GAME PLAYING WITH A DIGITAL COMPUTER, by T. G. Williams. July 1965 [131]p. incl. diagrs. tables. (AFOSR-67-0258) (SD-146) AD 634821 Unclassified

The program described in this dissertation is designed to play a large number of common board and card games. To play a game in this system, it is necessary to describe the objects used in playing the game and the rules of the game to the system. Each object used in the game is represented by a symbol. The properties of that object are kept on a property list associated with that symbol. The rules of the game are represented by a sequence of "if-then" statements. Each situation and each action is described in terms of a primitive function of the system. This system contains a fairly efficient general searching routine which will perform most of the searching necessary for any of the common board games. This routine contains some useful automatic methods for using the results of past searches to reduce the amount of searching actually done. An analysis of the concepts needed to play various classes of games shows that only a few fundamental abilities are needed to play most of the common games. These abilities are included in the system. (Contractor's abstract, modified)

SOL-20, by G. J. Hansen. Apr. 1965 [47]p. (AFOSR-67-2516) (SD-146) AD 660885 Unclassified

This manual is a supplement to the original article A FORMAL DEFINITION OF SOL by Knuth and McNeley. The version of SOL described here, known as SOL-20, was implemented by procedures written in Algol-20 and G-20 machine languages. It is the purpose of this documentation to describe in detail exact differences and changes in syntax between SOL and SOL-20. With some limitations, the full power of ALGOL-20 (the local Carnegie-Mellon University version of the international language ALGOL-60) is available for programming in SOL-20. A SOL-20 program is written using SOL-20 system procedures which implement SOL declarations, expressions, relations and statements

PARAMETER IDENTIFICATION IN CONTINUOUS DYNAMIC SYSTEMS, by A. Lavi and J. C. Strauss. [1965] [13]p. incl. tables, refs. (SD-146) Unclassified

Presented at Symposium on Automatic Control; Systems Science, Cybernetics; Human Factors, New York, Mar. 22-26, 1965.

Published in IEEE Internat'l. Conv. Rec., Pt. 6, 49-61, 1965.

A practical computational procedure is developed for the identification of the unknown stationary parameters in a nonlinear differential equation model of a continuous dynamic system. This procedure employs the quasilinearization technique of Bellman and Kalaba to reduce the implicit nonlinear multipoint boundary value problem to a convergent sequence of linear problems. A solution is presented for the resulting linear multipoint boundary value problem which employs multiple linear regression to suppress data noise and alleviate uniqueness difficulties. An example of the application of the identification procedure to the nonlinear pendulum equation is presented and discussed. In addition, an appendix is included which states and proves several basic theorems on the convergence properties of the quasilinearization technique.

A DIFFERENTIAL INEQUALITY, by Z. Nehari. [1965] [6]p. (AFOSR-65-2152) (AF AFOSR-64-647) AD 629866 Unclassified

Also published in Jour. D'Anal. Math., v. 14: 297-302, 1965.

The purpose of this report is to prove the following result. Let $u = u(x_1, \ldots, x_n)$ have three continuous derivatives for $r < R, r^2 = x_1^2 + \ldots + x_n^2, r \geq 0$), and let $n(\text{grad } u, \text{grad } \Delta u) + (\Delta u)^2 \geq 0$ and $-u\Delta u \leq c < \infty$, where Δ denotes the n-dimensional Laplace operator. If S_ρ denotes the n-sphere of radius ρ about the origin, A_ρ its area and dS_ρ its surface element then

$$\frac{nu^2(0)}{R^2} + (\text{grad } u)^2_{r=c} \leq c + \frac{n}{R^2 A_1} \int_{S_1} u^2(R)dS_1.$$

RESULTS FOR A QUASI-LINEAR HYPERBOLIC EQUATION, by R. C. MacCamy and V. J. Mizel [1965] 2p. (AFOSR-66-2154) (AF AFOSR-64-647) AD 643151 Unclassified

Also published in Proc. Symposium Appl. Math., v. 17: 90, 1965.

The following main results are obtained from solutions of the equation (E) $u_{++} = C^2(u_x) U_{xx}$ on the semi-infinite strip S. Whenever the inequality (I) $\max_{0 \leq x \leq L} |f(x)| < \int_0^\infty C(\xi)d\xi$ holds, (E) has no smooth (C^2) solution satisfying (A), (B), (C) and defined on all of S. In particular (E) unlike $u_{tt} = u_{xx}$ has no smooth periodic solution satisfying (A), (B), (C) and (2) whenever (I) is violated there exists on certain subregions of S a unique smooth stable solution of (E) satisfying (A), (B), (C).

PAIRS OF CARLEMAN-TYPE INTEGRAL EQUATIONS, by R. C. MacCamy. [1965] 5p. (AFOSR-66-2196) [AF AFOSR-64-647] AD 643431 Unclassified

Also published in Proc. Amer. Math. Soc., v. 16. 871-875, Oct. 1965.

This note concerns systems of equations of the type

$$f(x) = \frac{a(x)}{\pi} \int_{-1}^{+1} f(t)(x-t)^{-1} dt - g(x), \quad |x| < 1.$$ The integral is the Cauchy principal value. Assume that $g(x)$ is analytic for x in a region R containing the line segment $\text{Im}X=0$, $-1 \leq x \leq +1$. The idea is illustrated by confining the problem to 2 equations and to the case of a constant matrix a. Let H denote the class of vector-valued functions $f = (f_1, f_2)$ such that the f_i are Holder continuous on $-1 < x < +1$ and satisfy, $f_1(x) = 0(1 \mp x)^{-1+E}$ as $x \to \pm 1$ for some $E > 0$. The main theorem states that: (1) if $\det(I-ia) \neq 0$ the system of singular equations possess a solution $f \in H$. (2) If $\det(I-ia) = 0$ the system of singular equations possess no solution unless $f \cdot g = 0$.

DECAY OF Cs^{129} (Abstract), by J. L. Power, S. Jha, and B. Paliniak. [1965] [1]p. [AF AFOSR-63-278] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 441, Apr. 26, 1965.

The decay of 31-h Cs^{129}, made by (α, 2n) on beryllium iodide and subsequent chemical separation, has been studied by a γ-ray spectrometer, a coincidence scintillation spectrometer, and a Ge(Li) spectrometer. The following γ-rays have been detected: 40, 92, 174, 280, 320, 370, 410, 540, 580, 910, and 950 kev and perhaps also 620, 680, 740, 780, 820, and 865 kev (complex). These values of the γ-ray energies, combined with the results of coincidence studies, suggest levels in Xe^{129} at 320, 410, 580, 950 kev and perhaps also at 660, 780, and 860 kev. The ratio of the intensities of the 370- and 410-kev γ-rays have been estimated to be about 1.7. The results of the measurement of the conversion coefficient of the γ-rays and that of lifetime measurement of the 410-kev state, now in progress, are discussed.

DECAY OF I^{133} (Abstract), by S. Johnston and B. Patnaik. [1965] [1]p. [AF AFOSR-63-278] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 441, Apr. 26, 1965.

The radiations of 21-h I^{133} have been studied with the help of a γ-ray spectrometer, a coincidence scintillation spectrometer, and a Ge(Li) spectrometer. γ-Rays having energies of 530, 620, 710, 860, 1050, 1240, and 1300 kev have been detected. In coincidence with electrons of energy greater than 980-kev, 530- and 670-kev γ-rays were detected. γ-Rays of energies 530, 670, 860, and 1240 kev were observed in coincidence with electrons having an energy greater than 600 kev. These, results and the results of γ-γ coincidence studies tentatively suggest levels in Xe^{133} at 530, 680, 1240, 1390, and 1580. A decay scheme, based on these results and studies in progress is presented.

Carnegie Inst. of Tech. [Dept. of Physics] Pittsburgh, Pa.

DECAY OF La^{132} (Abstract), by G. Julian and S. Jha. [1965] [1]p. [AF AFOSR-63-278] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 82-83, Jan. 27, 1965.

4.5-h La^{132} has been made by the (p, xn) reaction on natural Ba with about 100-mev protons and the chemical separation of La from the Ba target. The radiations from La^{132} have been studied with Li-doped germanium detector and NaI(Tl) scintillation detectors. The positron spectrum was found to have an end point of 3.5 mev. The following γ-rays were detected: 470, 570, 660, 870, 1040, 1220, 1600, 1920, 2120, 2450, 2680, and 3000 kev. In coincidence with the positrons of energy greater than 2 mev, γ-rays having the energy 470, 570, 680, 820, and 1040 kev were observed. In coincidence with the 470-kev γ-ray, 570-, 660-, 890-, 1020-, 1230-, 1660-, and 2000-kev γ-rays were observed. 470- and 890-kev γ-rays were observed in coincidence with the 660-kev γ-ray. A decay scheme is presented.

INELASTIC α-PARTICLE SCATTERING STUDIES OF EVEN-EVEN Se ISOTOPES (Abstract), by R. W. Bercaw, J. S. Vincent, and S. Jha. [1965] [1]p. [AF AFOSR-63-278] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 541, Apr. 26, 1965.

The inelastic scattering of 42.0-mev α particles by the isotopes of selenium, 76, 78, 80, and 82, has been measured with 100-kev over-all energy resolution by means of silicon detectors. The energies of the 1st excited state of Se^{76}, Se^{78}, and Se^{80} were found to be in good agreement with earliest measurements by (p, p'), Coulomb excitation, and other measurements. In Se^{82}, the 1st excited state was found at 0.65 ± 0.05 mev in disagreement with the earlier Coulomb-excitation measurement. The Blair phase relation supports the 2^+ assignment for these levels in all these isotopes. A strong inelastic peak whose diffraction patterns is in phase with the elastic group was found in these isotopes at 2.45, 2.55, 2.70 and 3.05 mev, respectively, indicating that these levels are of the 1st octupole vibrational type.

ANALYSIS OF CATEGORICAL DATA, by G. E. Haynam and F. C. Leone. [1965] 7p. incl. diagrs. tables. (AFOSR-66-2671) [AF AFOSR-63-280] AD 644377 Unclassified

Presented at meeting of the Internat'l. Assoc. Statistics in the Physical Sciences, Berne (Switzerland), Sept. 16, 1964.

Also publisned in Biometrika, v. 52: 654-660, 1965.

The usual method of testing a hypothesis concerning categorical data is to compute a statistic T, which is distributed approximately as χ^2. Acceptance or rejection depends, of course, upon the critical value(s) of χ^2. The exact distribution of T under several different null hypotheses has been computed for both one-way and two-way classifications. These results have been compared with those obtained from the χ^2 approximation, in order to determine when the approximation is valid. Further, the exact power of the T test has been computed for a one-way classification with fixed alternatives. These results are compared with those obtained from a non-central χ^2 approximation. Comparison of true and approximate distributions under the null hypothesis have been made. This research attempted to enlarge the information available on the accuracy of approximations to the null and non-null distributions of T.

Presented at AIAA Second Aerospace Sciences Meeting, New York, N. Y., Jan. 25-27, 1965.

Also published in AIAA Jour., v. 3: 1883-1889, Oct. 1965.

The transient melting ablation of a glassy material is studied both analytically and experimentally. The purpose of the present investigation is to extend the analyses of Ostrach and coworkers by examining in more detail the initial period of melting, by re-examining the thermal boundary condition at the gas-liquid interface, and by considering a spherical body because of its relevance to the tektite problem; tektites are thought to have been spherical originally. Presented herein are a perturbation analysis, which starts from the initial state of conduction; and a long-time analysis, which starts from time-independent ablation. The results of these analyses are then compared with the results of experiments conducted in a vertical wind tunnel; the vertical wind tunnel makes possible the simulation of the deceleration force that acts upon a re-entry body. On the basis of this comparison, it is concluded that the analysis accurately predicts the salient features of the ablation process; and on the basis of experimental observation, a possible mode of melt-wave development is suggested. The paper concludes with comments upon the relationship of this work to the question of the origin of tektites. (Contractor's abstract)

THE THERMAL STABILITY OF COMPLETELY CONFINED FLUIDS INCLUDING MAGNETOHYDRODYNAMIC EFFECTS, by M. Sherman and S. Ostrach. June 1965 [262]p. incl. diagrs. tables, refs. (AFOSR-65-1455) (AF AFOSR-65-194) AD 621523 Unclassified

The current research concerns the determination of the conditions needed to induce a state of convective motion in a fluid where a constant temperature gradient is directed parallel to a body force. The fluid is contained in a rather arbitrary region bounded by rigid walls. The principle of exchange of stability is established for arbitrary regions with a generalized thermal boundary condition on the bounding walls. The thermal stability problem is reduced to an eigenvalue problem for the critical Rayleigh number (the stability criterion) and then is reformulated as a variational principle. A method is developed for estimating upper and lower bounds to the critical Rayleigh number for regions in which the critical Rayleigh number cannot be calculated exactly. An extension of the thermal stability problem to include magnetohydrodynamic effects is presented. Here the fluid and the bounding walls are electrical conductors. A constant magnetic field is applied to the configuration. (Contractor's abstract, modified)

A STUDY OF CYCLONIC TWO-FLUID SEPARATION, by M. T. Lawler and S. Ostrach. June 1965 [138]p. incl. illus. diagrs. tables, refs. (Rept. no. FTAS-TR-65-2) (AFOSR-65-1523) (AF AFOSR-65-194) AD 621524 Unclassified

This study presents a consideration of some of the problems of a 2-phase flow theory in an effort to consider the problem of the separation of a 2-phase fluid mixture in a cyclone separator. A simplified model is proposed and estimates of the rate of discharge of the heavier component are obtained. The discharge mechanisms are discussed and the model indicates the importance of secondary flows in the heavy fluid discharge. It indicates that, at most, the secondary flows are only aided by gravity (not due solely to gravity, as it was previously thought). An experimental separator was designed and built. It was operated in an inverted position to indicate that the secondary flow could overcome an unfavorable body force. Tests were run on this cyclone when operating in a normal position to determine the effect of the variation of certain geometric factors and operating conditions on the flow and separation of a 2-phase mixture. Separation efficiency and pressure drop information is presented for a wide range of operating conditions and geometric configurations. (Contractor's abstract)

NATURAL CONVECTION IN A HORIZONTAL CYLINDER AT LARGE PRANDTL NUMBERS, by E. R. Menold and S. Ostrach. Nov. 1965 [187]p. incl. diagrs. tables, refs. (AFOSR-65-2239) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-194] and National Science Foundation) AD 475885 Unclassified

This work deals with the natural convection of a fluid confined within an infinite horizontal cylinder, at large Prandtl numbers and unit order Grasshof numbers. The fluid motion is generated by means of a cosine temperature distribution imposed circumferentially on the cylinder wall. An arbitrary phase angle is included in this distribution in order to investigate a variety of heating configurations ranging from the heated-from-the-side to the heated-from-below case. The governing equations are solved using a technique only recently applied to problems of this nature, known as the "modified Oseen linearization". The mathematical simplifications inherent in a large Prandtl number analysis make it possible to scrutinize carefully this technique, and both its simplifications and shortcomings are discussed. Key assumptions in the analysis are carefully examined and ambiguities appearing in earlier work are pointed out. An experimental investigation of natural convection phenomena in a viscous silicone oil confined in a horizontal cylinder is made, and the results are compared with theory. The experimental equipment was designed so that a cosine temperature distribution could be maintained on the cylinder wall.

SOME PROBLEMS OF FINITE REPRESENTABILITY, by E. Altman and R. Banerji. [1965] [13]p. incl. refs (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-125, and National Science Foundation) Unclassified

Also published in Inform. and Control, v. 8: 251-263, June 1965.

It has been pointed out that context-free grammars of a certain class have the property that a one-one mapping exists between the structural descriptions of its sentences and the sentences generated by a finite state grammar. Given a grammar, it is decidable whether it belongs to this specific class or not. The grammars of this class can be divided into a countable hierarchy of increasing complexity.

TOWARDS A FORMAL LANGUAGE FOR DESCRIBING OBJECT CLASSES, by R. B. Banerji. [1965] 7p. (AFOSR-66-0420) (AF AFOSR-65-125) AD 632774 Unclassified

Also published in Proc. Second Congress on the Information System Science, Hot Springs, Va. (Nov. 22-25, 1964) Washington, Spartan Books, Inc., 1965, 451-457.

Progress is reported toward the development of a formal language for problem solving that is able to recognize analogies between different universes of discourse to make the description of classes in one universe succinct by the use of names of objects in another universe. The level of attainment in generating short descriptions of concepts by the combination of statements by Boolean operators alone is summarized. A language is described that was generated on the allowance of a few additional freedoms (like permitting objects to be terms) and the addition of variables to the language. The language permits the succinct description of a larger class of concepts and enables the description of the class of all numerals (e.g., in the ternary notation) within set-theoretic framework.

A SYNTHESIS TECHNIQUE FOR NETWORKS CONSISTING OF LOGICAL FUNCTIONS FEEDING A LINEAR SUMMATION ELEMENT, by E. L. Gose [1965] [3]p. incl. diagrs tables (AFOSR-65-1590) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-751 and National Institutes of Health) AD 623500 Unclassified

Also published in IEEE Trans Electron. Comput., v. EC-14 254-256, Apr 1965

Two synthesis techniques for a class of networks for producing real functions of binary inputs are considered, one in which the functions f_i are "ands" and the other in which they are exclusive "ors" The purpose of the present note is to present a synthesis technique which is more general than the 2 preceding techniques. It is valid for the realization of real, including Boolean, functions no matter what f_i are used. The output of the network is the weighted sum of 2^n functions f_i of the input vector $x = (x_1, x_2, \ldots, x_n)$. The network can be represented by $D = FW$ where D is the vector of output values, W is the vector of weights necessary for the realization of the function D, and F is the $2^n \times 2^n$ matrix of elements $f_i(x_j)$. A solution $W = F^{-1}D$ exists if F has an inverse, which it will if none of the functions f_i are linear combinations of the others. An example of the technique is presented.

AN ADAPTIVE NETWORK FOR PRODUCING REAL FUNCTIONS OF BINARY INPUTS, by E. E. Gose. [1965] 14p. incl. diagrs. tables. (AFOSR-65-2686) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-751, Ford Foundation, and Office of Naval Research) AD 629836 Unclassified

Also published in Inform. and Control, v. 8: 111-123, Apr. 1965.

An adaptive network which can produce any real-valued function of its binary inputs is presented. The network can synthesize any boolean function as a special case. The appropriate values of the adjustable parameters may be calculated by the network itself, or they may be calculated by a simple linear operation. The parameters form a uniformly distributed memory for the input-output function. (Contractor's abstract)

ON A LINEAR FORM WHOSE DISTRIBUTION IS IDENTICAL WITH THAT OF A MONOMIAL, by R. G. Laha and E. Lukacs. [1965] [8]p. (AFOSR-65-1963) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-437 and National Science Foundation) AD 626386 Unclassified

Also published in Pacific Jour. Math., v. 15: 207-214, 1965.

The following theorem is proved. Let $\{X_j\}$ be a finite or denumerable sequence of independently and identically distributed nondegenerate random variables and let $\{a_j\}$ be a sequence of real numbers such that the sum $\Sigma_j a_j X_j$ is distributed as αX_1 and (2) $\Sigma_j a_j^2 = \alpha^2$. Then the common distribution of the X_j is normal. The proof is constructed by considering a representation of ln g(t) where $g(t) = f(t) f(-t)$ and f(t) is the characteristic function corresponding to the common distribution of the random variable.

APPLICATION OF THE METHOD OF TWO-TIME GREENS FUNCTION TO THE SPIN-1/2 HEISENBERG FERROMAGNET, by T. Moritz and T. Tanaka. [1965] [11]p. incl. refs. (AFOSR-65-1118) (AF AFOSR-63-445) AD 620831 Unclassified

Also published in Phys. Rev., v. 137: A648-A658, Jan. 18, 1965.

The temperature dependence of spontaneous magnetization at low temperature is studied by treatment of the higher order Green's function. The equation of motion for this higher order function is solved in the approximation which will lead to correct results up to terms of order T^3. It is found that the correction to the magnetization consists of a term of order T^4 and a divergent term and that the correlation function consists of a term of order T^3 and a divergent term. A method extracting a significant part from this divergent term is found by analyzing a system of 2 interacting 1/2 spins. By this method, it is shown that the T^3 term in the magnetization is completely eliminated and that the correlation function $\langle S_j^- - S_j^- - S_k^+ S_1^+ \rangle$ vanishes identically.

STATISTICAL MECHANICS OF AN ASSEMBLY OF QUASIPARTICLES, by T. Morita and T. Tanaka. [1965] [9]p. incl. refs. (AFOSR-65-2780) (AF AFOSR-63-445) AD 629616 Unclassified

Also published in Phys. Rev., v. 138: A1088-A1096, May 17, 1965.

Low-lying excitations in a liquid or a solid are considered to have a long lifetime and to obey the Bose or Fermi statistics. They will be called 'quasiparticles' in general. The low-lying energy levels of the system are considered to be characterized by a set of occupation numbers of the quasiparticles. The expressions for the grand partition function and the distribution function (the average occupation number) of the quasiparticles have the same structure as that for the classical lattice gas, under a nonuniform external field and with two-, three,..., body interactions. Therefore the virial expansion formula for the classical lattice gas

can be applied to the system of quasiparticles. The resulting expression for the distribution function of the quasiparticles is either a Fermi or a Bose distribution function with an effective energy. The expression for the entropy in terms of the distribution function is the same as that for an ideal gas. This shows that Landau's formula for the distribution function of quasiparticles for a Fermi liquid is valid under conditions which are more general and more practical than those given by Landau. Finally the situation in the Husimi-Temperley model is discussed in comparison with that in the Ising model from the point of view of the present formulation.

APPLICATION OF THE METHOD OF QUASIPARTICLES TO THE HEISENBERG FERROMAGNET, by T. Morita and T. Tanaka. [1965] [7]p. (AFOSR-65-2781) (AF AFOSR-63-445) AD 627628 Unclassified

Also published in Phys. Rev., v. 138: A1403-A1409, May 31, 1965.

In recent articles by the present authors, the virial expansion formula was generalized to an assembly of quasiparticles, and the result was applied to a general discussion of the effect of the n-spin-wave interaction on the low-temperature spontaneous magnetization of the Heisenberg ferromagnet. The method, which may be called the method of quasiparticles, seems to give the simplest way of calculating the low-temperature expansion of the spontaneous magnetization. In this paper, (i) the Dyson T^4 term for the Heisenberg ferromagnet is rederived by this method, and (ii) the corresponding expression for the Heisenberg ferromagnet with 3 exchange integrals J_s, J_f, and J_b is derived, for cubic lattices. The result is used to calculate the T^4 term in the spontaneous magnetization for the Heisenberg ferromanget with first- and second-nearest-neighbor exchanges. This suggests a method of calculating the T^5 and T^6 terms in the expansion for these cases and the T^4 term for the Heisenberg ferromagnet with a longer range exchange interaction. FIRST ORDER TRANSITIONS IN SIMPLE MAGNETIC SYSTEMS, by R. A. Farrella and P. H. E. Meijer. [1965] [24]p. incl. diagrs. tables. (AFOSR-65-2805) (AF AFOSR-63-445) AD 629615 Unclassified

Also published in Physica, v. 31: 725-748, May 1965.

The dependence of the critical parameters on the compressibility and the rate of change of the exchange constant is calculated for an Ising-like interaction (long range order only) for spin 1/2, 3/2, 21/2 and ∞. The transition curve consists of a single line in the H-T plane. The complete phase diagram is shown for spin equal to three halves. The same model is studied for a 2 sublattice antiferromagnet with nearest and second nearest neighbor interactions. This model predicts transitions from the paramagnetic to the ferromagnetic state as the temperature is decreased. At a certain field one finds that the substance goes directly from the paramagnetic state to the ferromagnetic state. The phase diagram shows a triple point. An attempt was made to fit the experimental data available for dysprosium. The application of these same ideas to a 2 sublattice ferromagnet is discussed, and it is shown that no triple point exists in this case.

EFFECT OF N-SPIN-WAVE INTERACTION ON THE LOW-TEMPERATURE SPONTANEOUS MAGNETIZATION, by T. Morita and T. Tanaka. [1965] [3]p. (AFOSR-65-2866) (AF AFOSR-63-445) AD 629080 Unclassified

Also published in Jour. Math. Phys., v. 6: 1152-1154, July 1965.

For a Heisenberg model of a ferromagnet, it is known that the commutator of the Hamiltonian $\mathcal{H}$ and the operator $S_0^- = \Sigma_j S_j^-$ is proportional to S_0^-. From this fact, a conjecture is made on the low-lying energy levels of two, three, ..., n-spin-wave problems. With the aid of the conjecture and the assumption that there is no low-lying n-spin-wave bound state, it is concluded that the contributions to the low-temperature expansion of the spontaneous magnetization due to two-, three-, ..., n-spin-wave problems are of $O(T^4)$, $O(T^{13/2})$, ..., $O(T^{5n/2-1})$, respectively. VIRIAL EXPANSION FOR BOSE AND FERMI FLUIDS, by T. Morita and T. Tanaka. [1965] [4]p. [AF AFOSR-63-445] Unclassified

Published in Proc. Ninth Internat'l. Conf. on Low Temperature Phys., Columbus, Ohio. (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9 (Pt. A): 104-107, 1965.

Low-lying excitations in a liquid or a solid are considered to have a long life-time and to obey the Bose or Fermi statistics. They will be called "quasi-particles," in general, in the following. The low-lying energy levels of the system are assumed to be characterized by a set of occupation numbers of the quasi-particles. The expressions for the grand partition function and the distribution function (the average occupation number) of the quasi-particles have the same structure as that for the classical lattice gas, under a nonuniform external field and with 2, 3, etc., body interactions. Therefore, the virial expansion formula for the classical lattice gas can be applied in order to evaluate the partition function for the system of quasi-particles. The result is greatly simplified by assuming that the energy corrections due to the simultaneous excitations of $2, 3, \ldots,$ n quasi-particles are of $0(V^{-1})$, $0(V^{-2}), \ldots, 0(V^{-(n-1)})$, respectively, where V is the volume of the system. The resulting expression for the distribution function of the quasi-particles is either Fermi or Bose distribution function with an effective energy. The expression for the entropy in terms of the distribution function is the same as that for an ideal gas. This shows that Landau's formula for the distribution function of quasi-particles for a Fermi liquid is valid under conditions which are more general and more practical in actual applications.

ALPHA-PARTICLE CONTINUUM STATES, by P. Szydlik and C. Werntz. [1965] [10]p. incl. diagrs. refs. (AFOSR-65-1821) (AF AFOSR-64-566) AD 625681 Unclassified

Also published in Phys. Rev., v. 138: B866-B875, May 24, 1965.

The 2-channel collision matrix for the $t + p \leftrightarrow {}^3He + n$ system is obtained by calculating the amplitudes for isotopic spin 0 and 1 for the scattering of a nucleon and an A = 3 nucleus and combining these amplitudes in the proper linear combinations. The isotopic-spin amplitudes are obtained by making a resonating-group approximation for the continuum wave functions. It is found that with an equivalent central potential representing the nucleon-nucleon force the theory predicts the existence of two isotopic spin-0 bound excited states. These states, a 0^+ and a 1^-, are related to 2 experimentally observed structures in the cross sections. The good agreement of the theoretical and experimental cross sections in an energy region above the experimental peaks is used to establish the semiquantitative correctness of the pure isotopic-spin amplitudes obtained. EXCHANGE MAGNETIC MOMENT IN THREE-BODY NUCLEI (I), by D. W. Padgett, W. M. Frank, and J. G. Brennan. [1965] [21]p. incl. refs. (AFOSR-66-0805) (AF AFOSR-64-566) AD 641768 Unclassified

Also published in Nuclear Phys., v. 73: 424-444, Nov. 1965.

Meson exchange effects are considered in an attempt to explain the nuclear magnetic moment anomaly of the 3-body system. The exchange magnetic moments were calculated for the case of 2-body one-meson exchange and 3-body 2-meson exchange in the ground state of the 3-body system by the methods of static Chew-Low theory. The ground state was assumed to be pure space symmetric ${}^2S_{\frac{1}{2}}$ state. An adjustable hard core radius r_c was used in the form of a cut-off of the radial integrals for interparticle distance less than r_c. The absolute value of the total exchange moment was 0.4, 0.3 and 0.2 n. m. for hard core radii 0.3, 0.4 and 0.5 fm, respectively. The 2-body one-meson exchange process for the hard core radius of 0.4 fm accounts for 0.2 n. m. which is 2/3 of the value reported by Villars. The remaining 0.1 n. m. results from the 3-body 2-meson exchange process. (Contractor's abstract)

VASOPRESSOR AND OXYTOCIC ACTIVITIES IN HUMAN HYPOTHALAMUS, POSTERIOR AND ANTERIOR LOBES OF THE PITUITARY GLAND, by L. Barnafi and H. Croxatto. [1965] [11]p. (AFOSR-65-2845) (AF AFOSR-61-58) AD 629559 Unclassified

Also published in Acta Endocrinol., v. 48: 177-185, 1965.

The distribution and individual variation of vasopressor and oxytocic activities in the hypothalamus, posterior and anterior lobe of the pituitary gland of 13 women and 15 men were studied. The results showed great individual variation of vasopressor and oxytocic activities in the posterior and anterior lobes, whereas in the hypothalamus a relatively constant hormonal activity was found. No significant sex differences were noted with respect to the content of the vasopressor and oxytocic activities in the hypothalamus and posterior lobe. In the anterior lobe of the female, a higher vasopressor activity was found than in males. No relationship could be established between the distribution of these activities and the pathological condition preceding death.

Also published in Compt. Rend. Seances Soc. Biol., v. 159: 1377-1383, 1965.

The neuron preparation was placed in a chamber which allowed a controlled amount of gaseous mixture and a constant temperature to be applied to itself. Results indicated that neurons of the "Gen" type are usually autoactive in air and at temperatures of 24°C. When a mixture of 80% oxygen and 20% nitrogen replaces the air hyperoxia was evident. After plotting the variations of the experiment, it became evident that an increase in membrane potential was observed as hyperoxia increases. Simultaneously, the direct excitability of the membrane decreases. Thus the membrane potential and the excitability changes as functions of the extracellular partial pressure of oxygen.

Also published in Compt. Rend. Seances Soc. Biol., v. 159: 1770-1778, 1965.

Intracellular variations in pO_2 (oxygen tension) of less than 5 mm Hg are sufficient to cause significant changes in membrane potential and frequency of discharge, suggesting that under physiological conditions small fluctuations in pO_2 in the central nerves can act as a regulating influence on certain neurons.

INVESTIGATIONS IN THE FIELD OF RELATIONAL BIOLOGY, by R. Rosen. Final rept. Oct. 1, 1963-Mar. 31, 1965, 4p. (AFOSR-66-0956) (AF AFOSR-64-9) AD 634283 Unclassified

The studies reported herein are concerned with the structure and properties of a class of relational models of simple organisms. Some important problems relating to the behavior of these systems in altering environments are related to the properties of associated sequential machines and thence to control problems in dynamical systems. Questions of realizability of these abstract systems are considered in some detail, and the formulation of a general optimality principle, which would allow us to relate the abstract model to specific physicochemical realizations (i.e., real organisms) is discussed. Some implications of this study, both for important problems in biology, and for the study of nonbiological (i.e., engineering or extraterrestrial) realizations of biological organizations are described.

A NEURAL NET MODEL FOR ESCAPE LEARNING, by H. D. Landahl. [1965] [12]p. incl. diagrs (AFOSR-66-0748) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-370 and Public Health Service) AD 632744 Unclassified

Also published in Bull. Math. Biophys., Special Issue, v. 27: 317-328, 1965.

An escape learning situation is discussed in terms of a neural model in which a stimulus can result in a conditioned excitement and a specific conditioned response. By using the simplest relations between the strengths of conditioning and the number of reinforcements and by introducing a distribution of fluctuations occurring regularly in time, one can calculate the probabilities of various responses, as well as the various latencies, in successive trials. Consequences of the model for various experimental situations are discussed. (Contractor's abstract)

A CONVERGENCE THEOREM FOR LINEAR THRESHOLD ELEMENTS, by H. M. Martinez. [1965] [7]p. (AFOSR-66-0749) (AF AFOSR-64-370) AD 632736 Unclassified

Also published in Bull. Math. Biophys., v. 27: 153-159, June 1965.

"Linear threshold element" is the generic term for a device, natural or artificial, of the input-output type which (1) has a finite number k of input lines and one output line, (2) forms a linear combination $a_1x_1+a_2x_2+\ldots+a_kx_k$ of the input k-tuple $(x_1, x_2, \ldots, x_k)$ and compares it with a threshold quantity θ; and (3) yields one of two outputs depending on whether the linear combination does or does not exceed the threshold θ. Such elements find wide use as means for realizing linear discriminant functions and as analogs for certain features characterizing neurons. Adaptive classification of inputs into one of two categories, as designated by the two outputs, can sometimes be achieved by the suitable adjustment, based on experience, of the parameters $a_1, a_2, \ldots, a_k$ and θ. One such adjustment rule having the characteristics of a steepest descent algorithm is here investigated. Established is a theorem giving the necessary and sufficient conditions that the mean values of the adjusted parameters converge to a solution of the equations required for minimizing the mean square error relative to a quantity associated with classification performance when the element is exposed to a stationary sequence of independent inputs. SOME COMMENTS ON RE-ESTABLISHABILITY, by R Rosen. [1965] [4]p. incl. diagrs. (AFOSR-66-0755) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-9 and Public Health Service) AD 629854 Unclassified

Also published in Bull. Math. Biophys., Special Issue, v. 27: 11-14, 1965.

The present note consists of 2 separate but related parts. In the first, a new graph-theoretic proof is presented that an (M, R)-system must always contain a nonreestablishable component. The second considers some questions concerning the relation between re-establishability and the time-lag structure in (M, R)-systems. It is supposed that the reader is familiar with the terminology of the author's previous work on (M, R)-systems, particularly R. Rosen, Bull. Math Biophys., v. 20: 245-260, 1958.

CATEGORICAL ALGEBRA, by S. MacLane. [1965] [67]p. incl. diagrs. refs. (AFOSR-65-1042) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-520] and National Science Foundation) AD 624371 Unclassified

Also published in Bull. Amer. Math. Soc., v. 71: 40-106, Jan. 1965.

A discussion is presented of developments which use categories and functors. Attention is given to the ubiquity of adjoint functors, the utility of abelian categories, a unified categorical treatment of types of algebras, relative homological algebra via adjoint functors, differential graded objects, and universal algebra via suitable very small categories. Definitions are formed, and propositions and theorems are proposed and proved. Transformations and morphisms are emphasized.

A FAMILY OF SPECTRAL OPERATIONS, by T.-C. Kuo. [1965] [4]p. incl. diagr. (AFOSR-65-2119) (AF AFOSR-64-520) AD 629032 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 53: 658-661, Mar. 1965.

This paper considers the category $\mathcal{C}$ whose objects are epic simplicial maps $f: X \to Y$, where X and Y are simplicial sets (i.e., semisimplicial complexes), Y being regular, and whose morphisms are appropriate pairs of maps. Filtering X by the inverse images of the skeleta of Y gives rise to a spectral sequence E_r for the mod 2 cohomology which is functorial in $\mathcal{C}$, and a spectral operation is defined to be a natural transformation of functors $E_r^{p,q} \to E_t^{a,b}$. A universal example for spectral operations is constructed consisting of an object in the category and a cochain which acts as a fundamental class. The spectral sequence for the universal example is computed for $r < q < 2$ in terms of the cohomology of Eilenberg-MacLane spaces $K(Z_2, n)$. (Math. Rev. abstract)

AUTONOMOUS CATEGORIES AND DUALITY OF FUNCTORS, by F. E. J. Linton. [1965] [35]p. incl. diagrs. refs. (AFOSR-65-2645) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-520 and National Science Foundation) AD 627626 Unclassified

Also published in Jour. Algebra, v. 2: 315-349, Sept. 1965.

In the category $\mathcal{T}$ of based topological spaces and based maps, let $X \wedge A$ be the smashed product and let $\wedge A$ be the functor $\wedge A(X) = X \wedge A$. Given a functor $F: \mathcal{T} \to \mathcal{T}$, consider the collection of natural transformations from F to $\wedge A$, written $\mathrm{Nat}(F, \wedge A)$. If this collection is a set, then it may, in a natural way, be given the structure of a based space, and a new functor $DF: \mathcal{T} \to \mathcal{T}$ is defined by $DF(A) = \mathrm{Nat}(F, \wedge A)$, with an obvious effect of DF on based maps. DF is called the functor dual to F; it turns out, for example, that $D\Sigma = \Omega$, $D\Omega = \Sigma$, where Σ, Ω are the suspension and loop space functors, respectively, and that $D^3 = D$. In the category of modules over a commutative ring, a similar duality may be defined using the tensor product instead of the smashed product. A careful study is made, in a very general setting, of this duality. The role played by the smashed product and the tensor product in the examples above is as left adjoint of $\mathrm{Hom}(A,)$, where $\mathrm{Hom}(A, Y)$ may itself be structured as an object of the category. Thus the set of based maps from A to Y in $\mathcal{T}$ may be structured as a based space, and one then has a natural homeomorphism $\eta_A(X, Y)$: $\mathrm{Hom}(X \wedge A, Y) \cong \mathrm{Hom}(X, \mathrm{Hom}(A, Y))$. So the first essential for this duality in a category $\mathcal{C}$ is that there exist a functor from $\mathcal{C}$ to the category of sets and a lift of the Hom functor (from $\mathcal{C} \times \mathcal{C}$ to sets) to a functor to $\mathcal{C}$. Such a category $\mathcal{C}$ is a special case of an enriched category; it has been variously described as a self-enriched category or an autonomous category. Given an autonomous category, one then seeks a left adjoint of $\mathrm{Hom}(A,)$; but, in view of the enrichment, one can ask for the natural equivalence η_A to be an equivalence of $\mathcal{C}$-objects or of sets. The next problem is that of structuring the collection corresponding to $\mathrm{Nat}(F, \wedge A)$ as an object of $\mathcal{C}$; this raises certain set-theoretical problems which are studied and a theorem is proved establishing the existence of dual functors under suitable hypotheses. (Math. Rev. abstract, modified)

THE OBSTRUCTION TO THE LOCALIZABILITY OF A MEASURE SPACE, by F. E. J. Linton. [1965] [4]p. incl. refs. (AFOSR-66-0250) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-520 and National Science Foundation) AD 632883 Unclassified

Also published in Bull. Amer. Math. Soc., v. 71: 353-356, Mar. 1965.

This paper is to formulate the concept of localizability (in the sense of Segal) in terms of homological algebra. Let m be a finite measure on a ring R of subsets of X such that R contains the union of any disjoint sequence $\{E_n\} \subset R$ for which $\Sigma\, m(E_n) < \infty$. A set $K \subset X$ is measurable [null] if $K \cap E \in R$ $[m(K \cap E) = 0]$ whenever $E \in R$. The measure space (X, R, m) is said to be localizable if the algebra of measurable sets modulo null sets is complete as a partially ordered set. A boolean ring A may be regarded as an A-module, and an ideal J in A as a sub-A-module. The connecting homomorphism $d_{A,J}$: $\mathrm{Hom}_A(A, A/J) \to \mathrm{Ext}_A^1(A, J)$ between the group of A-module homomorphisms $A \to A/J$ and the group of A-module extensions $0 \to J \to ? \to A \to 0$ is called the obstruction to the localizability of the boolean ring A over its ideal J. The main theorem asserts that (X, R, m) is localizable if and only if $d_{R,I}$ vanishes where I is the ideal of null sets in R. (Math. Rev. abstract)

A FAMILY OF SPECTRAL OPERATIONS, by T.-C. Kuo. [1965] [26]p. incl. diagrs. refs. (AFOSR-66-2618) (AF AFOSR-64-520) AD 643130 Unclassified

Also published in Topology, v. 4: 215-240, 1965.

Consideration is given to the category $\mathcal{S}$ whose objects are surjective semi-simplicial maps f: X → Y (and Y satisfies a certain regularity condition). The usual spectral sequence of a map defines functors E_r^{pq}: $\mathcal{S} \to \mathcal{A}$ (abelian groups), and the natural transformations Θ among these are studied. A semi-representability theorem is proven: There is an object $P_r^{pq} \in \mathcal{S}$ and an element $\xi_r^{pq} \in E_r^{pq}(P_r^{pq})$ from which every $\chi \in E_r^{pq}(f)$ is induced, but the way to induce it may not be unique. This reduces problems about Θ's to problems about P_r^{pq}. Also proven are theorems of the bar-construction-, W-construction-, and Eilenberg-Zilber-type which simplify these objects. Results of H. Cartan are used to compute the spectral sequence of P_r^{pq} with Z_p-coefficients, in particular, it is shown that the differentials d^t vanish for $t \geq 2$. For most applications one would need more information about the ambiguity in inducing χ from ξ. This problem is pointed out but not dealt with. (Math. Rev. abstract)

ON SCHWARZSCHILD'S CRITERION FOR THE STABILITY OF GASEOUS MASSES, by N. R. Lebovitz. [1965] [14]p. (AFOSR-65-2072) [AF AFOSR-65-712] AD 627478 Unclassified

Also published in Astrophys. Jour., v. 142: 229-242, July 1, 1965.

A serious obstacle to a deduction of Schwarzschild's criterion for the stability of gaseous masses by way of the linear-stability theory has been the cumbersome nature of the system of differential equations defining the characteristic frequencies and modes of oscillation. However, a recent discovery of a variational principle equivalent to the system of differential equations appears to overcome this obstacle (S. Chandrasekhar, Astrophys. Jour., v. 139: 664, 1964). Here this variational principle is used to show that all the characteristic frequencies are real if Schwarzschild's criterion is satisfied. The demonstration is given for a wide class of equilibrium configurations. The validity of Schwarzschild's criterion is clearly indicated by the results, though inferring stability from the reality of the characteristic frequencies requires a completeness theorem which has not yet been proved.

ON THE ONSET OF CONVECTIVE INSTABILITY, by N. R. Lebovitz. [1965] [4]p. (AFOSR-66-0103) (AF AFOSR-65-712) AD 631381 Unclassified

Also published in Astrophys. Jour., v. 142: 1257-1260, Oct. 1, 1965.

It is shown that for non-trivial neutral modes of disturbance to exist in a spherical mass of gas it is a necessary and sufficient condition that the Schwarzschild discriminant vanishes in a finite radial subinterval of the configuration. A further mathematical justification is given for the physical arguments used to derive the Schwarzschild criterion.

QUASI-FREE PROTON-PROTON SCATTERING IN LIGHT NUCLEI AT 460 MEV, by H. Tyrén, S. Kullander and others. [1965] [143]p. incl. diagrs. tables, refs. (AFOSR-65-1678) (AF AFOSR-64-13) AD 624318 Unclassified

Quasi-free proton-proton scattering is studied in a number of light nuclei at 460 mev using two large identical magnetic spectrometers with 2-directional focusing and a multi-channel electronic detector system. The experiments are done in a symmetric geometry. Summed energy spectra and angular correlation distributions of separated components of the spectra are presented. The experimental results for the lighter nuclei are analyzed by comparing them with theoretical ones obtained on the basis of the distorted wave impulse approximation. Information on the radii and occupation numbers of the 1s and 1p orbitals in the nuclei considered is obtained. (Contractor's abstract)

NEUTRON MONITOR MASS ABSORPTION

COEFFICIENTS AT CHICAGO AND CLIMAX DURING SOLAR CYCLE 19 (1954-1963), by M. A. Forman. [1965] [5]p. incl. diagrs. table, refs. (AFOSR-65-1820) (Sponsored jointly by Air Force Geophysical Research Directorate; and Air Force Office of Scientific Research under AF AFOSR-64-251) AD 625600 Unclassified

Also published in Jour. Geophys. Research, v. 70: 2469-2473, June 1, 1965.

The dependence of the neutron monitor mass absorption coefficient on 11-yr changes in the primary cosmic-ray spectrum was investigated for the monitors at Chicago, Ill. and Climax, Colo., using a modified single regression method. The analysis of hourly intensity and pressure values for 733 days at Chicago and 1000 days at Climax during the period 1954-1963 revealed no significant variation at either station. The mean value of the coefficient at Chicago is -0.938 ± 0.007%/mm Hg; at Climax it is -1.010 ± 0.006%/mmHg. This difference is significant and depends on the altitude characteristics of the nucleonic component. These results are compared with earlier work. (Contractor's abstract)

ELECTRONIC PROPERTIES OF SEMICONDUCTORS AT LIQUID HELIUM TEMPERATURES, by H. Fritzsche. Final rept. Feb. 1965, 9p. (AFOSR-65-0435) (AF AFOSR-62-178) AD 612132 Unclassified

The research effort was devoted to the 3 least studied and least understood transport phenomena in semiconductors at low temperatures which involve the interaction of impurities. These are: (a) impurity conduction, (b) the transition from nonmetallic to the metallic state, and (c) the so-called metallic state of degenerate semiconductors. This work tries to illuminate the detailed physical phenomena which are so important for the increasing number of low temperature solid state devices such as tunnel diodes and junction lasers.

HIGH-STRESS PIEZORESISTANCE AND MOBILITY IN DEGENERATE Sb-DOPED GERMANIUM, by M. Cuevas and H. Fritzsche. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-65-1376) (AF AFOSR-62-178) AD 622853 Unclassified

Also published in Phys. Rev., v. 137: A1847-A1855, Mar. 15, 1965.

The resistivity of germanium containing between N = 3×10^{17} and 10^{19} antimony atoms/cc was measured at 1.2°K under uniaxial compressions of up to 10^{10} dyn cm^{-2}. These stresses are high enough to effect an observable saturation in the piezoresistance, i.e., to transfer all electrons to a single conduction-band valley ([111] compression) or to 2 valleys ([110] compression). Two distinct ranges are observed in degenerate germanium: for $N < 10^{18}$ cm^{-3} the mobility increases with N and shows impurity-band effects; for $N > 10^{18}$ cm^{-3} the mobility decreases and ionized-impurity scattering is the dominant scattering process. The latter range is $N > 3 \times 10^{18}$ cm^{-3} for large [111] compression. The resistivity was measured for current flowing parallel and perpendicular to the stress direction. The mobility anisotropy was found to be $\mu_\perp / \mu_\parallel = 3.9 \pm 0.1$ for $N > 4 \times 10^{18}$ cm^{-3}. This indicates that the mean free path is nearly isotropic. The mobility for electrons in 1, 2, and 4 valleys is compared with Csavinszky's partial-wave treatment of impurity scattering. The change of screening with the number of valleys was taken into account. Csavinszky's theory overestimates the N dependence and the magnitude of the scattering. This is attributed to the failure of the individual-scattering assumption.

EFFECT OF UNIAXIAL COMPRESSION ON IMPURITY CONDUCTION IN p-GERMANIUM, by F. H. Pollak. [1965] [14]p. incl. diagrs. tables, refs. (AFOSR-65-1924) (AF AFOSR-62-178) AD 626803 Unclassified

Also published in Phys. Rev., v. 138: A618-A631, Apr. 19, 1965.

The effect of uniaxial compression along [100] and [111] on impurity conduction was investigated in Ga-doped p-Ge in the concentration range $3 \times 10^{15} < N_A < 9 \times 10^{16}$ cm^{-3} for compensation K = 0.04 and in the range $9 \times 10^{14} < N_A < 4 \times 10^{16}$ cm^{-3} for K = 0.40. The experiments were performed between 300° and 1.2°K. The largest stress applied was 6.8×10^9 dyn cm^{-2}. The analysis of the experimental results deals primarily with the high-stress region ($X > 4 \times 10^9$ dyn cm^{-2}) in which the 2 valence bands, which in the absence of stress are degenerate at k = 0, are nearly decoupled so that the effect of the lower band on the acceptor wave function is treated as a perturbation. In the low-concentration region, inclusion of nonspherical charge distributions, together with the acceptor wave functions calculated from the effective-mass approximation, accounts for the observed stress dependence of the resistivity. At intermediate concentrations a linear relation between the impurity-conduction activation energy ϵ_2 and the acceptor ionization energy ϵ_1 is established. The investigation of the stress dependence of the transition from nonmetallic to metallic conduction yields the stress dependence of the effective Bohr radius. The form of this stress dependence indicates the importance, at high concentrations, of the potential-energy term in the effective-mass Hamiltonian. This term can be neglected at low concentrations. HIGH STRESS BIREFRINGENCE OF PURE AND DEGENERATE n-TYPE Ge (Abstract), by A. Feldman. [1965] [1]p. [AF AFOSR-62-178] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 344, Mar. 24, 1965.

The stress birefringence B of pure and degenerate n-type Ge has been measured at liquid-He temperatures using wavelengths λ of 1.8-2.5 μ and uniaxial compression x of up to 8.5×10^9 dyn cm^{-2} along [111]. B is considered the sum of a lattice contribution B_l and a free electron contribution B_f. $B_l = B$ for pure Ge. The simple degenerate model predicts a saturation of B_f when all electrons are transferred to a single valley. In As-doped Ge, $N \approx 2 \times 10^{18}$ donors cm^{-3}, incomplete saturation is observed. Values for $m_c(1/m_\perp - 1/m_\parallel)$ are obtained that differ from pure Ge. Q_{44}, the stress optical constant for pure Ge equals $\partial B_l/\partial x$. Q_{44} is observed to be linear in λ^{-1} below 77°K.

HIGH-STRESS PIEZORESISTANCE IN DEGENERATE ARSENIC-DOPED GERMANIUM, by M. Cuevas and H. Fritzsche. [1965] [8]p. incl. diagrs. table, refs. (AF AFOSR-62-178) Unclassified

Published in Phys. Rev., v. 139: A1628-A1635, Aug. 30, 1965.

The resistivity of germanium containing between $N = 4 \times 10^{17}$ and 10^{19} arsenic atoms per cc was measured at 1.2°K under uniaxial compressions of up to 10^{10} dyn cm^{-2}. The piezoresistance fails to saturate near the stress at which one expects essentially all electrons to have been transferred to a single conduction band valley ([111] compression) or to 2 valleys ([110] compression). Saturation is approached at much higher stresses. The resistivity was measured for current flowing parallel and perpendicular to the stress direction. For $N \sim 10^{18}$ cm^{-3}, the mobility anisotropy was found to be $\mu_\perp/\mu_\parallel$ 4 ± 0.4, 5 ± 0.6, and 6 ± 0.5 for the 4-, 2-, and 1-valley cases, respectively. The mobility ratio $\mu_\parallel$(Sb), $\mu_\parallel$(As) increases from about 1.5 to 1.9 as the electrons are transferred from 4 valleys to 1 valley. Evidence for the presence of tail states in As-doped germanium and the significance of the large central impurity cell potential of As donors for the interpretation of the piezoresistance are discussed. (Contractor's abstract)

PRESSURE DEPENDENCE OF PHONON ASSISTED INTERBAND TUNNELING, by H. Fritzsche and J. J. Tiemann [1965] [5]p. incl. diagr. table, refs (AFOSR-65-1183) (AF AFOSR-63-148) AD 621411 Unclassified

Also published in Proc. Seventh Internat'l Conf. on the Physics of Semiconductors, Paris (France) (July 19-24, 1964), Paris, Dunod, 1965 p. 599-603

Previous studies have shown general agreement between experimental results and the theories of Keldysh and Kane for interband tunneling. In the present study, a structure is examined in the bias dependence of the relative change of tunneling current with hydrostatic pressure in Sb-doped germanium tunnel junctions at 4.2 K. It is shown that this effect cannot be explained by the Keldysh-Kane theory. Evidence suggests that some characteristic properties of the TA and LA phonons are not incorporated correctly in the theory.

THEORY OF INDIRECT INTERBAND TUNNELING IN SEMICONDUCTORS, by J. J. Tiemann and H. Fritzsche [1965] [4]p. incl. diagr. table. (AFOSR-65-1375) (AF AFOSR-63-148) AD 622920 Unclassified

Also published in Phys. Rev., v. 137, A1910-A1913, Mar. 15, 1965.

The theory of phonon-assisted tunneling by Keldysh and Kane is extended to incorporate the phonon interaction in a manner that is consistent with the requirements of crystal symmetry. Perturbation theory is used to evaluate the tunneling matrix element. The unperturbed wave functions are taken to be the approximate eigenstates of the pure crystal in a weak uniform field, as presented by Kane. The electron-phonon interaction is treated as the perturbation. Although the magnitude of the tunnel current agrees with experiment, the observed difference between the pressure coefficients of the transverse acoustical and the longitudinal acoustical phonon-assisted tunnel currents is not reproduced by the theory. It is concluded that Kane's reflected wave functions are not sufficiently good approximations for the calculation of phonon-assisted tunneling in germanium. (Contractor's abstract)

PHONON ENERGIES IN GERMANIUM FROM PHONON-ASSISTED TUNNELING, by R. T. Payne [1965] [13]p. incl. diagrs. tables, refs. (AFOSR-65-1899) (AF AFOSR-63-148) AD 626508 Unclassified

Also published in Phys. Rev., v. 139 A570-A582, July 19, 1965.

The line shapes of the peaks in the bias dependence of the second derivative of the phonon-assisted tunnel current with respect to voltage are reported for Sb-doped germanium tunnel junctions between 4.2 and 1.15°K. The antimony concentration is 5 x 10^{18} cm^{-3}. The phonon energies at the point L in the Brillouin zone, determined to an accuracy of ± 0.1%, are E(TA) = 7.766, E(LA) = 27.58, E(LO) = 30.62, and E(TO) = 36.15 in mev. This accuracy verifies the assumptions made in determining the pressure dependence of these phonon energies previously reported by the author. The major contribution to the line shapes is kT broadening. Minor contributions arise from a small bias dependence of the tunnel current per energy interval and from the phonon dispersion near L. Approximate values for the curvatures of the phonon spectrum at L are determined. A lower limit of 1.6 x 10^{-11} sec is found for the lifetimes of these phonons. From double phonon emission processes the energy of the optic phonon at Γ is found to be 37.3 ± 0.2 mev. (Contractor's abstract)

HIGH-SENSITIVITY PIEZOREFLECTIVITY, by W. E. Engeler, H. Fritzsche and others. [1965] [4]p. incl. diagrs. refs. (AFOSR-65-1900) [AF AFOSR-63-148] AD 626082 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 1069-1072, June 28, 1965.

A high-sensitivity piezoreflectance technique is described which promises to be useful in the study of the energy band structure of solids. This technique utilizes oscillatory applied strain and synchronous detection at a frequency that is high in comparison with fluctuations in the photodetectors and other sources of instability. The resulting improvement in stability allows measurements to be made of relative reflectivity changes as small as 3 x 10^{-6}. Results of measurements are presented for Ge, Si, and Cu. The experimental data can be used to determine interband transition energies and deformation potentials, and can provide information about the location of the transitions in the Brillouin zone

EFFECT OF STRESS ON THE EXCESS AND HUMP CURRENT IN Sb-DOPED GERMANIUM DIODES, by S. Fujita, H. Fritzsche, and J. J. Tiemann. [1965] [5]p. incl. diagrs. table, refs. (AFOSR-65-1901) (AF AFOSR-63-148) AD 626080 Unclassified

Also published in Jour. Phys. Soc. Japan, v. 20: 1443-1447, Aug. 1965.

The effects of uniaxial compression and of hydrostatic pressure on the excess and hump current in germanium tunnel diodes have been studied experimentally at 4.2 K. The diodes were formed by alloying indium doped with 3 8% gallium on (100) and (110) faces of germanium bars containing an antimony concentration of 5 x 10^{18} cm^{-3}. The first order change of the current with stress was measured at fixed forward bias voltages. The experiments show that the excess current involves tunneling from the conduction band valleys to gap states on the p-type side of the junction. A large negative stress-induced current change is associated with a current component which is sometimes observed as a hump in the I-V characteristic between 0.5 and 0.65 v bias. A sharp increase of the pressure coefficient marks the onset of the ordinary injection current at 0.74 v. The effect of shear stress on the injection current was found to be zero to first order in the stress. (Contractor's abstract)

STRESS EFFECTS ON IMPURITY-INDUCED TUNNELING IN GERMANIUM, by H. Fritzsche and J. J. Tiemann. [1965] [4]p. incl. diagrs. refs. (AFOSR-65-1902) (AF AFOSR-63-148) AD 626081 Unclassified

Also published in Phys. Rev., v. 139: A920-A923, Aug. 2, 1965.

The effects of uniaxial compression and of hydrostatic pressure on the impurity-induced interband tunneling current in germanium tunnel junctions have been studied experimentally at 4.2°K. The diodes were formed on (100) and (110) faces or arsenic-doped germanium bars. The stress coefficients of the tunnel current were measured at fixed forward and reverse bias voltages. The experiments show that the part of the electron wave function responsible for impurity-induced tunneling is not associated with a particular conduction-band valley. Some structure in the bias dependence of the shear stress coefficients near zero bias remains unexplained. This structure does not appear in the hydrostatic-pressure coefficient. (Contractor's abstract)

A SIZE EFFECT IN NEARLY FREE ELECTRON METALS, by B. G. Smith. [1965] [2]p. incl. diagr.

(AFOSR-66-1303) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-148 and National Aeronautics and Space Administration) AD 641290 Unclassified

Also published in Phys. Ltrs., v. 18 210-211, Sept. 1, 1965.

In the conventional development of the nearly free electron theory of metals the basis set of free electron eigenfunctions is determined by the assumption of periodic boundary conditions in a lattice of infinite dimensions. This clearly unrealistic choice is justified by the intuitive argument that processes of experimental interest will occur in the bulk of the crystal and should therefore not depend upon the particular boundary conditions employed. Intuition does not support this argument for small crystals, e.g., thin films, for which boundary conditions must be more carefully chosen. In this letter is elaborated a consequence of using stationary instead of traveling wave electronic functions.

EXPERIMENTAL STUDY OF LUMINESCENCE AND EXCITATION TRAPPING IN VINYL POLYMERS, PARACYCLOPHANES, AND RELATED COMPOUNDS, by M. T. Vala, Jr., J. Haebig, and S. A. Rice. [1965] [12]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-369], National Science Foundation, and Public Health Service) Unclassified

Published in Jour. Chem. Phys., v. 43: 886-897, Aug. 1, 1965.

The results of an experimental investigation of luminescence and energy trapping in the polymeric systems atactic and isotactic polystyrene and atactic polyvinylnaphthalene are presented. It is shown that the anomalous emission bands observed at 3350A in the polystyrenes and at 4100A in atactic polyvinylnaphthalene are transitions from an excimer state formed by the interaction of nearby chromophores on the same polymer chain. In support of this interpretation, the spectra of a number of model compounds in the diphenylalkane and paracyclophane series are presented and analyzed. The role of charge-transfer-state contribution to the splitting in rigidly helical isotactic polystyrene is investigated and conclusions concerning the microscopic conformations of the polymer chromophores are drawn In addition, the possibility of excitation energy trapping due to conformational changes of the chromophore groups is discussed. NUCLEAR MAGNETIC RESONANCE IN MOLTEN SALTS. II. CHEMICAL SHIFTS IN THALLIUM HALIDE-ALKALI HALIDE MIXTURES, by S. Hafner and N. H Nachtrieb. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-65-0889) (Sponsored jointly by Advanced Research Projects Agency, and Air Force Office of Scientific Research under AF AFOSR-64-624) AD 619184 Unclassified

Also published in Jour. Chem. Phys., v. 42: 631-636, Jan. 15, 1965.

The resonance frequency of the Tl^{205} nucleus in molten solutions of the thallous halides with the corresponding alkali metal halides vary linearly with the mol fraction of the added alkali halide. The direction of the chemical shift depends upon the radius of the alkali cation, being upfield for lithium and sodium halides and downfield for the halides of potassium, rubidium, and cesium relative to the pure thallous halide. For a given mol fraction of alkali halide, δ_{Tl} is a linear function of the alkali cation radius. The results provide information on the nature of the interactions between cations and anions in molten salts. The covalent interaction between Tl^+ and halide ions is decreased by alkali metal ions of small radius and increased by those of large radius. (Contractor's abstract)

[DETERMINATION OF THE CLOSEST APPROACH OF IONS IN IONIC MELTS BY MEANS OF NUCLEAR RESONANCE] Bestimmung des kleinsten Ionenabstandes in ionischen Schmelzen mittels Kernresonanz, by N H. Nachtrieb and S. Hafner. [1965] [4]p. incl. diagr. refs (AFOSR-65-1674) (AF AFOSR-64-624) AD 624333 Unclassified

Also published in Zeitschr. Naturforsch., v. 20a: 321-324, 1965.

At constant magnetic field the resonance frequencies of nuclei in ionic salts increase linearly with temperature in both the crystalline and molten states. The linear temperature-dependence of the chemical shift is ascribed to the excitation of higher paramagnetic electronic states which accompanies the increasing overlap of cation and anion wave functions; both are proportional to the linear increase in the mean squared vibrational amplitudes of ions with temperature. The magnitude of the break in

the chemical shift at the melting point, coupled with a knowledge of the change in the coordination number and the variation in the wave function overlap with internuclear separation, leads to an estimate of the distance of closest approach of neighboring ions in the molten state. For an assumed value of F = 0.9, where F = $(Z_L/Z_S)/(\Delta E_L/\Delta E_S)$, the distance of closest cation-anion approach decreases by 0.18 A as crystalline TlCl melts to form the liquid salt. The overlap of Tl^+ and Cl^- ions in crystalline TlCl at room temperatures is 0.012 on the basis of the NMR frequency of Tl^{205+} and is estimated to be 0.017 from machine calculations based on analytic wave functions for the ground states of the ions. SEARCH FOR A CHARGE-TRANSFER STATE IN CRYSTALLINE ANTHRACENE, by R. S. Berry, J. Jortner and others. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-65-1219) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-781, National Science Foundation, and Petroleum Research Fund) AD 621538 Unclassified

Also published in Jour. Chem. Phys., v. 42: 1535-1541, Mar. 1, 1965.

The calculation of the location of the charge-transfer state in crystalline anthracene is examined. Also reported are the results of spectroscopic experiments designed to find the transition from the ground state to the charge-transfer state. No experimental evidence could be found for this transition, and it is thereby concluded that: (1) The charge-transfer state lies above the first exciton state in anthracene, and (2) the polarization energy in the charge-transfer state is much less than that calculated on the basis of classical considerations. A brief discussion of the nature of the polarization in aromatic crystals is presented, especially with respect to the second conclusion.

REFLECTION STUDIES OF EXCITONS IN LIQUID AND SOLID XENON, by D. Beaglehole. [1965] [3]p. incl. diagr. (AFOSR-66-0310) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-781 and Public Health Service) AD 629813 Unclassified

Also published in Phys Rev. Ltrs., v. 15: 551-553, Sept. 27, 1965.

Reflectivity measurements have been made on liquid and solid xenon at various temperatures to study the effects of lattice order on the optical excitations. The exciton lines are found to broaden on making the transition from solid to liquid phase but otherwise the reflectivity spectra are remarkably similar. This result suggests that all the excitons at both high and low energy have essentially an atomic origin, little influenced by crystalline order.

MOLECULAR RYDBERG TRANSITIONS IN RARE-GAS MATRICES—EVIDENCE FOR INTERACTION BETWEEN IMPURITY STATES AND CRYSTAL STATES, by E. S. Pysh, S. A. Rice, and J. Jortner. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-66-0323) [AF AFOSR-65-781] AD 629812 Unclassified

Also published in Jour. Chem. Phys., v. 43: 2997-3004, Nov. 1, 1965.

As a first step in characterizing molecular Rydberg states in the solid state, the absorption spectra arising from acetylene and benzene inpurity states in solid krypton and argon in the far-ultraviolet region have been obtained. The first member of the acetylene Rydberg series, which appears at 8.155 ev in the gas phase, is observed to be shifted to 8.67 ev in a krypton matrix and to 9.01 ev in an argon matrix. These large energy shifts are discussed, particularly with reference to the optical spectra of rare-gas solids and rare-gas alloys, where similar large blue shifts are observed. The far-ultraviolet spectra of benzene trapped in krypton and argon matrices show a qualitatively different phenomenon. The Rydberg states of benzene are observed to interact with conduction-band continuum states to exhibit anomalous Fano-type line shapes. The Rydberg states repulse the neighboring continuum states to produce sharp decreases in the continuum absorption intensity. These results are discussed in connection with other systems which show Fano-type line shapes. (Contractor's abstract)

A CONJECTURE ON CONFORMATIONS LEADING TO ENERGY TRAPPING IN HELICAL POLYMERS, by I. H. Hillier and S. A. Rice. [1965] [7]p. incl. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-781] and Public Health Service)
Unclassified

Published in Proc. Nat'l. Acad. Sci., v. 53: 973-979, May 1965.

The conformations favorable to "excimer" formation in helical polymers are examined. It is concluded that in polystyrene nearest neighbors participate, while in the α-helix, with benzyl residues, excimer formation is between third or fourth nearest neighbors. This explanation is consistent with experimental observations that denaturation of the α-helix inhibits the anomalous emission associated with "excimer" formation, while it is present in both iso- and atactic polystyrene. CONJECTURE ON THE RATE OF VIBRATIONAL RELAXATION OF A DIATOMIC MOLECULE IN A MONATOMIC LATTICE, by H.-Y. Sun and S. A. Rice. [1965] [5]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-781] and Public Health Service) Unclassified

Published in Jour Chem. Phys., v. 42. 3820-3830, June 1, 1965.

In this paper we use a simple model—a substitutional diatomic molecule in a linear monatomic chain—to examine the problem of intermolecular vibrational relaxation in the solid phase. A binary collision theory of vibrational deactivation is proposed for the relaxation process, with the motion of the collision partners governed by the normal modes of the lattice. The collision frequency is calculated by using an analysis similar to that of the Slater theory of unimolecular reactions. The model calculations predict the relaxation time to be very long compared with the vibrational period of the diatomic molecule. We thus conclude that, in a molecular crystal composed of polyatomic molecules, the excitation energy will be removed by the surrounding medium, not by the transformation of internal energy into lattice modes, but rather by other processes such as the formation of vibration excitons, etc. (Contractor's abstract)

DEEP IMPURITY STATES IN MOLECULAR CRYSTALS: THE OPTICAL EXCITATION OF A SUBSTITUTIONAL ARGON ATOM IN CRYSTALLINE NEON, by S. Webber, S. A. Rice, and J. Jortner. [1965] [13]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-781], National Science Foundation, and Public Health Service) Unclassified

Published in Jour. Chem. Phys., v. 42: 1907-1919, Mar. 15, 1965.

The calculation of the first electronic transition of an argon-atom impurity in a neon lattice is carried out in the Heitler-London scheme. The energy of this transition is taken to be the energy of the argon atomic transition, plus the correction to the SCF 4s orbital energy due to the presence of the crystal. The modification to the SCF 4s orbital is accomplished by the addition of charge-transfer functions on neighboring neon atoms. It is shown that the choice of the SCF atomic function is a very bad starting point for these systems. A general method for choosing basis functions for bound systems is presented. It is shown that for many cases a suitably chosen "model Hamiltonian" may be appropriate to a more complex system, and the case of a dielectrically screened hydrogenic "model Hamiltonian" is worked out for Ar-Ne.

EXCHANGE EFFECTS ON THE ELECTRON AND HOLE MOBILITY IN CRYSTALLINE ANTHRACENE AND NAPHTHALENE, by R. Silbey, J. Jortner and others. [1965] [5]p. incl. diagrs tables. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-781, National Science Foundation, Petroleum Research Fund, and Public Health Service) Unclassified

Published in Jour. Chem. Phys, v. 42 733-737, Jan. 15, 1965.

Results are presented of calculations of the electron and hole band structure of crystalline anthracene and naphthalene in the right binding approximation, and of the

mobility tensor in the constant-free-time and constant-free-path approximations. This treatment differs from previous formulations by inclusion of the effects of intermolecular electron exchange and of vibronic coupling (in the weak coupling scheme). The bandwidths were found to be of the order of 0.02 ev and smaller, and the mobility data were found to be consistent with the band scheme. The predicted mobility in the c direction is found to be in good agreement with experiment, in contrast to previous treatments.

LOW-ENERGY ELASTIC SCATTERING OF ELECTRONS AND POSITRONS FROM HELIUM ATOMS, by N. R. Kestner, J. Jortner and others. [1965] [11]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-781] and Office of Naval Research) Unclassified

Published in Phys. Rev., v. 140: A56-A66, Oct. 4, 1965.

This paper calculates the electron-helium atom pseudopotential, and from that pseudopotential the cross section for low-energy elastic scattering of electrons from helium atoms. The agreement between experiment and theory is good. In addition, the scattering of low-energy positrons from helium atoms is considered. The case of electron-helium atom scattering is chosen only as an example of the use of the pseudopotential as a natural tool for the study of scattering problems. The numerical calculations demonstrate that the results obtained in this way are of comparable accuracy with the results of more tedious and less instructive approaches. In particular, the use of pseudopotential arguments leads to an easily understood physical description. Moreover, because the pseudopotential approach permits the use of variational procedures, even in the presence of bound (i.e., core) states, the necessary calculations are not difficult to carry through. An attempt is made to correlate the observed electronic spectrum of crystalline naphthalene with the observed spectrum of the free molecule. The normal Frenkel exciton theory is extended to include ion-pair states, and the effect of these on the spectrum is taken into account. The observed spectrum can be accounted for in the present analysis, if the ion-pair state is energetically close to the first excited singlet state of naphthalene.

ON THE EQUATION OF STATE OF THE RIGID-SPHERE FLUID, by S. A. Rice and J. Lekner. [1965] [7]p. incl. diagrs. tables, refs. [AF AFOSR-65-781] Unclassified

Published in Jour. Chem. Phys., v. 42: 3559-3565, May 15, 1965.

A well-known integrodifferential equation due to Yvon, Born and Green, Kirkwood, and Bogoliubov (YBGKB) connects the pair and triplet distribution functions $g^{(2)}$ and $g^{(3)}$ of a classical fluid. An expression for $g^{(3)}$ is needed in order that the equation may be solved for $g^{(2)}$. An exact formal expression is known: $g^{(3)}(123) = g_s^{(3)}(123) \exp\left[\sum_{n+1}^{\infty} \rho^n \delta_{n+3}(123)\right]$, where $g_s^{(3)}$ is the superposition of the pair distribution functions, and the terms $\delta_{n+3}(123)$ in the exponent evaluate the correlations between particles fixed at 1, 2, and 3 and n other particles in the fluid. The first term δ_4 is known for hard spheres, and we have numerically evaluated δ_5 for three special configurations in order to approximate the entire series by the simplest Padé approximant, i.e., $\rho\delta_4/(1-\rho\delta_5/\delta_4)$. The YBGKB equation was solved using this approximation for $g^{(3)}$, and the pressure obtained from the contact value of $g^{(2)}$ is in almost perfect agreement with the molecular-dynamics data of Alder and Wainwright up to $p/\rho kT = 6.80$, which is the

Kirkwood upper limit for stability of a fluid of hard spheres. The results obtained with the use of only b_4 in the expression for the triplet distribution function are also presented. The Kirkwood theory of the fluid-solid transition is briefly discussed with reference to the hard-sphere system.

ON THE KINETIC THEORY OF DENSE FLUIDS. XIX. COMMENTS ON AND A REDERIVATION OF THE KINETIC EQUATIONS, by K. Hiroike, P. Gray, and S. A. Rice. [1965] [10]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-781] and Petroleum Research Fund) Unclassified

Published in Jour. Chem. Phys., v. 42: 3134-3143, May 1, 1965.

This paper rederives the Rice-Allnatt kinetic equation and shows that, for the soft-force part of the interaction, the constant friction-coefficient Fokker-Planck operator is the first approximation to a more complex operator. This more complex operator is of the general Fokker-Planck form, but has momentum-dependent friction coefficients. The operator derived herein is identical with the operator obtained from the Prigogine theory in the weak coupling limit. The consistency between the Rice-Allnatt analysis of transport in liquids and the exact perturbation analysis of Prigogine is examined, as is the internal consistency of the Rice-Allnatt analysis. At present, there appears to be no inconsistencies between the two theories.

ON THE QUANTUM-MECHANICAL FOKKER-PLANCK EQUATION, by H. T. Davis, K. Hiroike, and S. A. Rice. [1965] [10]p. incl. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-781], Army Research Office (Durham), Petroleum Research Fund, and National Science Foundation) AD 635004 Unclassified

Published in Jour. Chem. Phys., v. 43: 2633-2642, Oct. 15, 1965.

Taking the Wigner function as the basic N-body distribution function, quantum-mechanical modifications to the Fokker-Planck equation are studied using the two different approaches introduced, respectively, by Kirkwood and Prigogine. The weak coupling limit is studied using the time smoothing technique first introduced by Kirkwood. The results can perhaps form the basis of an approximate treatment of the transport phenomena of pure liquids. The problem of the Brownian motion of a heavy particle is treated employing the perturbation techniques developed by Prigogine and co-workers. It is found that the form of the quantum-mechanical Fokker-Planck equation is identical to the classical equation, but that the friction coefficient contains quantum-mechanical corrections. Finally, it is noted that the weak coupling result obtained by the time-smoothing technique is identical to the approximation of small momentum transfer, if in the latter case the scattering cross section is represented in the Born approximation.

ON THE SINGLET EXCITON STATES OF CRYSTALLINE ANTHRACENE, by R. Silbey, J. Jortner, and S. A. Rice. [1965] [20]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-781], National Science Foundation, Petroleum Research Foundation, and Public Health Service) Unclassified

Published in Jour. Chem. Phys., v. 42: 1515-1534, Mar. 1, 1965.

A detailed analysis of the lower excited states of crystalline anthracene is presented. Starting with zero-order product wavefunctions, the treatment differs from standard formulations in that interactions between molecules are computed directly by the use of π-electron theory, by the inclusion of the effects of extensive configuration mixing, and by the inclusion of long-range interactions out to the convergence limit. It is found that: (1) The computation of interaction energies cannot be reduced to dipole-dipole terms alone. By the use of π-electron theory it is shown that short-range high-order multipole (greater than dipole) interactions make important contributions to both the diagonal and off-diagonal elements of the energy matrix. (2) Long-range interactions of the dipole-dipole type are of importance for distances of the order of the wavelength of light. By application of momentum-conservation conditions, it is shown that the long-range dipole-dipole interactions, including the effects of retardation of the potential, are absolutely convergent. Major contributions to the Davydov splitting arise from molecular separations ranging from 50A to the convergence limit. (3) For the case of allowed singlet-singlet transitions, electron-exchange interactions are small relative to other contributions to the interaction energy. (4) Under the experimental conditions used to date, the Davydov splitting should be independent of crystal thickness. (5) In anthracene, crystal-field mixing of the p and s molecular states has a large effect on the Davydov splitting. Inclusion of mixing with higher excited π states has little effect on the Davydov splitting, but is required in the calculation of the polarization ratios in the vibronic components of the p band. (6) Charge-transfer exciton states play only a minor role in altering the properties of singlet exciton states arising from allowed transitions. (7) The detailed calculations reported herein yield good agreement with the observed Davydov splitting (ΔE) and polarization (P) ratios in anthracene.

This book is primarily concerned with the theory of transport in simple liquids and the extensive development of the equilibrium theory. It attempts to attain 3 goals: (1) the provision of a systematic and coherent description of the theory of liquids, as it now stands, emphasizing the analysis and assessment of the approximations made and the relationship between theory and experiment; (2) the encouragement of further study, by exposing the theory in a manner which directs attention to the fundamental problems, and (3) the provision of an account of the theory suitable as an introduction to research.

STUDY OF THE PROPERTIES OF AN EXCESS ELECTRON IN LIQUID HELIUM. I. THE NATURE OF THE ELECTRON-HELIUM INTERACTIONS, by J. Jortner, N. R. Kestner and others. [1965] [12]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-781] and Public Health Service) Unclassified

Published in Jour. Chem. Phys., v. 43: 2615-2625, Oct. 15, 1965.

A theoretical study is presented of the free and localized states of an excess electron in liquid helium. Electron-helium interactions are treated by the pseudopotential method, while multiple scattering effects on the properties of a quasifree electron in the dense fluid are treated using the Wigner-Seitz model. It is demonstrated that the plane-wave state is not the lowest energy state for an excess electron in liquid helium and that fluid deformation leads to a localized state of lower energy. The large, repulsive helium-atom pseudopotential coupled with the small helium polarization potential lead to electron localization which may be attributed entirely to short-range repulsions. The following experimental observations are adequately interpreted by these results: (a) The energy barrier of liquid helium for electrons, (b) The density-dependent transition from a delocalized state to a localized state of the excess electron, (c) The mobility of an excess electron in normal He^4 and in He^3. Pressure and temperature effects on the electron bubble are also discussed. It is concluded that a pressure-induced transition from the localized to the delocalized state of the excess electron will not occur in the fluid domain even at high pressures. Finally, some speculations concerning the optical properties of the excess-electron center are presented.

Published in Jour. Chem. Phys., v. 43: 2625-2632, Oct. 15, 1965.

A study of the structural changes in liquid helium in the vicinity of an excess electron is presented, using the formal similarity between the pair distribution function of an N-boson system with the wavefunction expressed as the product of pair wavefunctions, and the pair distribution function of a classical fluid. The present model leads to an interfacial surface energy term which is in good agreement with the observed surface tension of liquid helium at 0°K. An important contribution to the bubble energy arises from the volume kinetic energy arising from the excess kinetic energy of the fluid atoms removed from the boundary layer. The bubble radius of 12.4A calculated herein is found to be in excellent agreement with the available experimental data.

Presented at meeting of the Phys. Chem. Div. of the Amer. Chem. Soc., Atlantic City, N. J., Sept. 15-16, 1965.

Abstract published in 150th meeting of the Amer. Chem. Soc. Abstracts of Papers, 1965.

Published in Advan. Chem. Ser., No. 50: 7-26, 1965.

Of the 3 models that have been proposed to explain the properties of excess electrons in liquid helium, 2 are considered in detail: (1) The electron is localized in a cavity in the liquid; (2) The electron is a quasi-free particle. The pseudopotential method is helpful in studying both of these models. The most useful treatment of electron binding in polar solvents is based on a model with the solution as a continuous dielectric medium in which the additional electron induces a polarization field. This model can be used for studies with the hydrated electron. (Contractor's abstract)

THE THEORY OF IONIC AND ELECTRONIC MOBILITY IN LIQUIDS, by S. A. Rice and J. Jortner. [1965] [127]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-781], National Science Foundation, Petroleum Research Fund, and Public Health Service)
Unclassified

Published in Prog. in Dielectrics, v. 6: 183-309, 1965.

This paper reviews the current status of the theory of ionic and electronic mobility in the liquid phase. Progress in the understanding of the behavior of charge carriers in liquids depends on both the theory of the equilibrium state and on certain aspects of the theories of irreversibility and transport phenomena in liquids. For this reason designed material is included to acquaint the reader with the major ideas of the theory of liquids. Emphasis throughout this paper is on the fundamental theory and on the underlying physical processes. Wherever possible the use of parameterized models is avoided as they frequently obscure important aspects of the physical situation by the introduction of ill-defined or ambiguous parameters.

TRIPLET EXCITONS IN CRYSTALS OF AROMATIC MOLECULES, by J. Jortner, S. A. Rice and others. [1965] [15]p. incl. diagrs tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-781], National Science Foundation, and Public Health Service) Unclassified

Published in Jour. Chem. Phys., v. 42: 309-323, Jan. 1, 1965.

The band structure and the Davydov splitting of the first triplet exciton states in crystalline naphthalene, anthracene, and biphenyl are considered. It is found that: (a) An important contribution to the triplet exciton bandwidth arises from intermolecular exchange interaction. These interactions are calculated in the molecular orbital π-electron approximation. (b) Excitation exchange effects due to spin-orbit coupling are negligible. (c) Nonorthogonality corrections, considered within the framework of the symmetric orthogonalization procedure, have been found to be small. (d) Crystal-field mixing of triplet states arising from $\pi \rightarrow \pi^*$ excitations has no effect on the triplet bands. (e) An important contribution to the triplet exciton bandwidth may arise from configuration interaction with charge-transfer states. The dynamics of triplet excitons in aromatic crystals was studied in the two limiting cases of strong and weak scattering. The band model, with the constant mean-free-path approximation, leads to a mean free path of the order of one to two lattice distances and seems to be inappropriate. Trip-triplet annihilation leading to delayed blue fluorescence in crystalline anthracene can be adequately described in terms of a random-walk diffusion model when the effects of charge-transfer interactions are included.

CAPTURE CROSS SECTIONS FOR NEGATIVE IONS IN ROTATING HELIUM II, by B. E. Springett, D. J. Tanner, and R. J. Donnelly. [1965] [3]p. incl. diagrs. (AFOSR-65-2082) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-785 and National Science Foundation) AD 627730 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 585-587, Apr. 12, 1965.

This note presents experimental measurements of capture cross sections for negative ions in rotating helium II and compares them with calculated values. The measured cross section is given by $\sigma = \sigma(E_2) + (E_1)y_1/y_2$, where σ is the cross section, E_1 is the field in the region of length y_1 between the source and the grid, and E_2 is the field in the region of length y_2 between the grid, and the collector. The experimental apparatus is also described. The results are plotted as functions of temperature and applied voltage. The comparisons are in fairly good agreement. There is however a discrepancy in magnitude at low voltages which is throught to be due to the effects of space-charge limitation giving rise to a nonuniform field along the beam.

AUDITORY AVOIDANCE BEHAVIOR AFTER EXTENSIVE AND RESTRICTED NEOCORTICAL LESIONS IN THE RAT, by M. A. Saavedra, T. Pinto-Hamuy, and C. Oberti. [1965] [5]p. incl. diagrs. table, refs. (AF AFOSR-61-84) Unclassified

Published in Jour. Compar. and Physiol. Psychol., v. 60: 41-45, Aug. 1965.

Twleve rats served as controls for 6 experimental groups (extensive lesion groups with and without damage of auditory cortex and 4 groups with restricted ablations centered on frontomotor, somatosensory, visual and auditory zones). The extensive lesion groups did not differ in auditory avoidance behavior; the 4 groups with restricted lesions did not differ among themselves but were significantly inferior to the normal rats and better than the extensive lesion groups. Frontomotor cortex seems to facilitate learning of a general motor response to a tone. The function of auditory and other sensory areas seem to be facilitatory; the effects could be exerted through the motor cortex. (Contractor's abstract)

OCULAR BEHAVIOR IN CHRONIC HIGH MESENCEPHALIC CATS (Abstract), by J. Villablanca. [1965] [1]p. (AFOSR-66-0844) [AF AFOSR-63-317] AD 641474 Unclassified

Also published in Abstracts of Papers presented at Twenty-third Internat'l. Cong. Physiological Sciences, Tokyo (Japan), Sept. 1-9, 1965.

Pupil behavior and ocular movements were studied in chronic cats with mesencephalic transection rostral to the oculomotor nuclei, these events were correlated to the behavioral arousal of the animal, the eeg recorded at mesencephalic and pontine reticular formation, EMG, EKG, and respiration. The findings are as follows: (1) Pupils are midriatic, nictitatings are retracted and slow movements of the eyes are present when the cat is awake. (2) A variable myosis ard closure of the nictitatings is observed, when the cat is lying down as if sleeping; pupils are extremely reactive to acoustical stimuli, and the EMG activity is diminished. (3) An extreme myosis, protruded nictitatings, downward rotation of the eyeballs and phasic movements of the eyes, are seen while the cat displays a deep sleep episode, EMG is silent. Conclusions are drawn from the data. (Contractor's abstract)

THE ELECTROCORTICOGRAM IN THE CHRONIC CERVEAU ISOLÉ CAT, by J. Villablanca. [1965] [11]p. incl. illus. diagrs tables, refs. (AFOSR-66-0845) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-392 and AF AFOSR-63-317, and Rockefeller Foundation) AD 641472 Unclassified

Also published in Electroencephalog. and Clin. Neurophysiol. Jour., v. 19: 576-586, Dec. 1965.

The ECoG of cerveau isole preparation was studied in 16 high mesencephalic, chronic cats which survived for an average of 48 days. Relationships were sought between ECoG and the level of behavioral arousal and with the electrical activity at the brain-stem caudal to the transection. In the acute state, 2 ECoG patterns could be distinguished: spindle bursts or discontinuous slow waves; and continuous, high voltage slow activity. Periods of high voltage, continuous slow synchronized rhythms alternated with ECD in the chronic preparation. These cyclical lapses exhibited electrocortical synchronization which closely resembled the ECoG of slow sleep in the normal cat. Olfactory stimulation desynchronized the ECoG according to stage of the ECSP during which stimulation was presented. Maximal desynchronization was observed during the onset stage of the ECSP. The EEG patterns of the cerveau isole showed no systematic relationship with the level of arousal of the animal, nor with the electrical activity in the brain-stem. However the effect of nociceptive and proprioceptive stimulation revealed the possibility of an extraneural pathway which affected the ECoG of the isolated cerebrum. The possibility of the existence in the forebrain of the cat of an autochthonous tonic, mechanism capable of independently evoking a cyclic alternation between wakefulness and slow sleep is discussed.

PHYSIOLOGICAL PROPERTIES OF THE GIANT AXON FROM DOSIDICUS GIGAS, by M. Luxoro, M. Cannessa, and F. Vargas. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-66-0987) [AF AFOSR-65-788] AD 635353 Unclassified

Also published in Proc Internat'l Union of Physiological Sciences, Twenty-third Internat'l. Cong., Tokyo (Japan) (Sept. 1-9, 1965), Amsterdam, Excerpta Medica Foundation, v. 4: 507-514, 1965.

Action potentials with overshoots between 30 to 55 mv were recorded from internally perfused axons. Concentrations of Na and K in the perfusing fluid and in the external medium were the same, only Ca and Mg were under chemical gradients. Simultaneous movements of Na-22 and Ca-45 were studied under internal perfusion. The ratios of permeability coefficients of the radioactive species at rest (2.2 to 3.9) and during stimulation at 50/sec (2.0 to 3.9) were the same. This finding and the fact that the increase in permeability of Rb-86 is of the same order of magnitude as that of Na-22, suggest that the permeability changes are less specific than previously thought. Na-K-Mg ATPase was isolated from this system. Activation of this enzyme by addition of Mg and a single monovalent cation was observed to a maximal rate at 300 M monovalent cation concentration Below this level, the effect of monovalent cations was additive and the enzyme discriminated between them in accordance with the lyotropic series. Divalent cations may alter the fixed charge of nerve proteins, in this connection, the effect of proteolytic enzymes was studied. Intracellular administration of proteases induced conduction block. Concerning the charge density of the membrane, water movement may provide information As a first step, the filtration coefficient was determined, the results differing from those in the literature Thus, these values are similar to those of other cells like muscle and erythrocytes.

CILIA DEVELOPMENT AND ASSOCIATED PROTEIN SYNTHESIS IN THE SEA URCHIN EMBRYO (Abstract), by W. Auclair and D. M. Meisner. [1965] [1]p. (AFOSR-66-0289) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-964 and Public Health Service) AD 640938 Unclassified

Also published in Biol. Bull., v. 129 397, Oct 1965

The development of cilia during the blastula state of the sea urchin embryo is described. The synthesis of ciliary proteins is followed using C-^{14}-labeled glutamic acid and leucine, is found to be continuous throughout early development. The synthesis of these proteins is inhibited by actinomycin, an antibiotic that shuts off DNA-controlled RNA synthesis, although cilia still appear. It is concluded that normally there is continuous synthesis of ciliary proteins during early development for cilia formation, but it is not essential for the appearance of cilia. There is available in the cells of the embryo enough ciliary protein for the differentiation of cilia even if protein synthesis is stopped

STUDIES ON DISSOCIATING GASDYNAMICS. PART II. HYPERSONIC SMALL PERTURBATION THEORY WITH EQUILIBRIUM DISSOCIATION AND IONIZATION OF AIR FOR BODIES ASSOCIATED WITH POWER LAW SHOCK WAVES, by T. Y. Li and K. W. Chang. July 1965 [37]p. incl. diagrs. refs. (Technical rept. no. AE 6502) (AFOSR-65-0849, pt. 2) (AF AFOSR-64A-416) AD 623777 Unclassified

The inviscid equilibrium hypersonic flow associated with a power-law shock is investigated. An analytical formulation is presented for a pure dissociating gas in thermal equilibrium. In order to obtain a method applicable to a mixture of gases and partly take into account the entropy layer effects, the locally similar solution approach is proposed. (Contractor's abstract, modified)

STUDIES ON DISSOCIATING GASDYNAMICS. PART III. ON THE DISSOCIATED HYPERSONIC LAMINAR BOUNDARY LAYERS, by S. J. Hsia and T. Y. Li. July 1965 [82]p. incl. diagrs. refs. (Technical rept. no. AE 6503) (AFOSR-65-0849, pt. 3) (AF AFOSR-64A-416) AD 621485 Unclassified

Some recent advances are reviewed and an effort is made to gather some useful information from the available literature on the study of laminar boundary layers problems including effects of chemical reactions. Particular attention is directed to the discussion of the effects resulting from the consideration of strong self-induced pressure field, of reacting external inviscid flow and of the thermodynamic properties of the reacting gas mixture. INFRARED ABSORPTION OF STRAINED SILICON, Final rept. Dec. 16, 1965, 2p. (AFOSR-65-2703) (AF AFOSR-63-175) Unclassified

Work accomplished under this contract is reviewed. This includes the development of equipment and techniques necessary for measuring the stress dependence of the absorption coefficient of germanium and silicon at room temperature in the direct absorption edge region. In addition, work was begun on the development of equipment and techniques necessary to extend these measurements to lower temperatures and to the free carrier absorption region.

INFRARED ABSORPTION OF UNIAXIALLY STRESSED GERMANIUM, by J. F. Aschner and E. Erlbach. [1965] [3]p. incl. diagrs (AFOSR-66-1523) (AF AFOSR-63-175) AD 641522 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 108, Jan. 27, 1965.

Also published in Jour. Phys. and Chem. Solids, v. 26: 2078-2080, Dec. 1965.

The changes in the absorption coefficient α of intrinsic germanium have been measured in the region of the indirect absorption edge as a function of uniaxial compressive stress. The stress was applied to the long axis of parallelopiped-shaped samples (2.5 x 0.1 x 0.1 cm), this axis being <111>. The infrared light was incident in a direction perpendicular to the stress, which ranged up to 7000 kg/cm^2. Using the most-recent values of the deformation potential constants, it is found that the energy gap for the conduction-band valley lying in the stress direction decreases with compressive stress while that of the other three valleys increases. Therefore, the changes in α from the unstressed condition should be positive at the lower energies and negative at the higher energies within the absorption-edge region, the changes increasing with stress in both cases. This has been confirmed both experimentally and by performing a calculation similar to that of McLean for the band structure of the deformed crystal. Quantitative comparison between experiment and theory is currently in progress.

POLARIZATION DEPENDENCE OF INFRARED ABSORPTION IN GERMANIUM (Abstract), by J. F. Aschner and E. Erlbach. [1965] [1]p. [AF AFOSR-63-175] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 344, Mar. 24, 1965.

Previously reported measurements on the changes in the absorption constant α for unpolarized light, caused by uniaxially stressing germanium, have been extended to the case of polarized incident radiation. All the measurements were performed at room temperature in the region of the indirect absorption edge. Uniaxial stresses up to 7000 kg/cm^2 were applied in various crystallographic directions. Since germanium has cubic symmetry, no polarization dependence is permitted in the unstressed case and none was found. Uniaxial stress destroys this symmetry, however, thus allowing such a dependence to occur. A pronounced dependence on

polarization was found when uniaxial stress was applied in the <111> direction. Using the theoretical expression for α, it can be shown that this dependence arises from the destruction of the cubic symmetry of the valence and <000> conduction-band structure and/or the matrix element for the direct transition. The authors expect to obtain information on the angular dependence of the matrix elements from these measurements.

THE LOGIC OF DECISION, by R. C. Jeffrey. New York, McGraw-Hill, 1965, 201p. incl. diagrs. tables, refs. (AFOSR-64-2465) (AF AFOSR-64-529) AD 633480 Unclassified

The Bayesian account of deliberation is viewed as providing, in a certain sense, a logic of decision. The text elucidates notions of subjective probability and subjective desirability or utility that form the core of Bayesian decision theory. A new theory of preference between propropositions (the events of mathematical probability theory) is proposed, within which a Bayesian agent's probability and utility functions are determined by features of his preference ranking. The elementary logical operations on propositions (denial, conjunction, disjunction) do the work that is done by the operation of forming gambles in the "classical" theory of Ramsey and Savage. In the new theory, the preference ranking of propositions determines the utility function only up to a fractional linear transformation with positive determinant, and determines the probability function only to within a certain quantization. The present theory is shown to be immune to the St. Petersburg paradox, so that one can reasonably be a Bayesian in the present sense and still have an unbounded utility function. Philosophical questions are considered that deal with uncertain evidence where an observation leads the agent to change his degrees of belief in one or more propositions to new values that fall short of 1. The final chapter suggests how notions of objective probability and desirability might fit into the subjectivistic framework.

NEW FOUNDATIONS FOR BAYESIAN DECISION THEORY, by R. C. Jeffrey. [1965] [12]p. incl. diagr. (AFOSR-66-0417) (AF AFOSR-64-529) AD 632737 Unclassified

Also published in Logic, Methodology and Philosophy of Science; Proc. 1964 Internat'l. Cong., Hebrew U., Jerusalem (Israel) (Aug. 26-Sept. 2, 1964), ed. by Y. Bar-Hillel. Amsterdam, North-Holland Publishing Co., 1965, p. 289-300.

A theory of subjective probability and utility is outlined that is viewed as simpler and more satisfactory than Ramsey's ("Truth and Probability," in Foundations of Mathematics and Other Logical Essays, 1931). The theory is unified in the sense that probabilities and utilities are attributed to precisely the same objects, that is, to members of a class of propositions closed under the finite truth functional operations but from which the impossible proposition is deleted. The theory is noncausal in the sense that neither $[\ ,\ ]$ nor any other such causal notion is taken as primitive. The linear transformation in Ramsey's theory is a fractional linear transformation $U_2 = \frac{aU_1 + b}{cU_1 + d}$ in the present theory. This transformation may change probabilities. Boundedness above and boundedness below are not preferentially significant properties of utility functions in the present theory. The St. Petersburg paradox cannot occur in the agent's preference ranking.

BEHAVIOR OF YOUNG'S MODULUS OF A BETA BRASS SINGLE CRYSTAL FOR VARIOUS QUENCH TEMPERATURES, by M. C. Martin and H. E. Camp. [1965] [4]p incl. diagr. table, refs. (AFOSR-65-1926) (AF AFOSR-62-254) AD 626895 Unclassified

Also published in Jour. Appl. Phys., v. 36, 2154-2157, July 1965.

The standard direct strain method was used to determine the effect on Young's modulus of quenching - brass in a saturated salt solution. The measurements were made on one - brass single crystal with orientation function f(l, m, n) = 0.121. The measurements were performed at the temperatures of 25, -30, -90, and -196 C. From the measurements the reciprocal of Young's modulus was calculated and 2 anomalous points were determined. The increase in Young's modulus for the quench temperature of 275 C was attributed to isolated wrong pairs of atoms. The increase in Young's modulus at the quench temperature of 450 C was attributed to disorder being quenched in. (Contractor's abstract)

ELASTIC STRENGTH OF TIN WHISKERS IN TENSILE TESTS, by B. E. Powell and M. J. Skove. [1965] [2]p. incl. diagr. table. (AFOSR-65-2577) [AF AFOSR-65-180] AD 629850 Unclassified

Presented at meeting of the Amer. Phys. Soc., Chattanooga U., Tenn., Nov. 5-7, 1964.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 255, Feb. 25, 1965.

Also published in Jour. Appl. Phys., v. 36 1495-1496, Apr. 1965.

Tin whiskers were grown on tin-plated steel by the compression method; a period of 4 weeks was required to grow whiskers ranging in length from 1 to 1.5 mm The tensile tests were performed using a pulling apparatus capable of resolving the stress to 2×10^{-6} N and the elongation to 0.1 μ. The average yield strain of the ten strongest whiskers at room temperature was 1% The maximum yield strain was 2.9%, which is comparable to the results obtained in bending tests by other experimenters. Using the orientation obtained from Laue x-ray diffraction patterns, the strain cross section was determined.

SIZE EFFECT ON THE MAGNETORESISTANCE OF COPPER SINGLE CRYSTALS (Abstract), by E. P. Stillwell and M. J. Skove. [1965] [1]p. [AF AFOSR-65-180] Unclassified

Presented at meeting of the Amer. Phys. Soc., Chattanooga U., Tenn., Nov. 5-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 255, Feb. 25, 1965.

The effect of sample dimensions on the transverse magnetoresistance of copper single-crystal whiskers has been observed. Previous observations of this effect have been limited to sodium polycrystalline wires due to the high-bulk magnetoresistance of other metals. In single-crystal samples, the magnetoresistance saturates for certain magnetic-field directions allowing the size effect to be seen. Such an effect was observed in a whisker with axis parallel to the [100] direction in a magnetic field parallel to the [010] direction. The sample cross section was $35.9 \pm 0.6\ \mu^2$ and the resistivity ratio $\rho 300^\circ K/\rho 4.2K$ was 139 ± 1. This gives the electron mean free path in the sample at 4.2°K to be approximately equal to the square root of the sample cross section. A maximum in the resistance at 4.2°K was observed at about 1.5 teslas.

PRODUCTION OF OXYGEN FROM SILICATES IN AN ULTRAHIGH VACUUM, by F. L. Smith [Final rept. June 21, 1962-Apr 7, 1965 Apr 12, 1965 [23]p incl illus diagrs (AFOSR-65-0739) (AF AFOSR-62-426) AD 615706 Unclassified

The object was to determine if an ultrahigh vacuum facilitated the decomposition of silicates into oxygen and silicon oxide (SiO) or silicon (Si) The practical object

was to initiate further research on the possibility of using this oxygen as a lunar resource. An ultrahigh vacuum chamber was constructed capable of obtaining pressures down into the 10^{-12} torr range, and simulating the lunar environment. In order to monitor the results of the experiments, a small mass spectrograph was installed on the ultrahigh vacuum test chamber. Tests were run on silicon dioxide, magnesium silicate, and a tektite (an amorphous silicate). All tests indicate that the ultrahigh vacuum significantly lowered the decomposition temperatures of the silicates. In all cases oxygen production was initiated at 1316°C. At 1472°C the production of oxygen was materially accelerated. The mass spectrograph studied indicates that Si was produced rather than SiO. In view of the very high pumping speed of the diffusion pump and cryopump on the chamber, it is believed that oxygen production is significant in the 1400 to 1650°C range.

BRIDGED POLYCYCLIC COMPOUNDS. XXVIII. THE PROTON MAGNETIC RESONANCE SPECTRA OF SOME DIBENZOBICYCLO[3.2.1]OCTADIENES, by S. J. Cristol, J. R. Mohrig, and D. E. Plorde. [1965] [3]p. incl. diagr. tables, refs. (AFOSR-65-1646) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-79] and National Science Foundation) AD 624373 Unclassified

Also published in Jour. Org. Chem., v. 30: 1956-1958, June 1965.

Proton magnetic resonance spectra for a number of 4- and 8-substituted dibenzobicyclo[3.2.1]octadienes are measured. Correlations of these data lead to generalizations which permit stereochemical assignments for substituents in these systems. It is possible to assign spectral frequencies to each of the four aliphatic protons in these octadienes because their chemical shifts are generally different enough to give separate peaks for each proton. Further evidence for proton assignments is found in observing the effects of substitution upon the position of spectral lines.

PRODUCTION AMPLITUDES. II. PARTIAL-WAVE DECOMPOSITION AND ANALYTIC CONTINUATION IN TOTAL ANGULAR MOMENTUM, by A. O. Barut and Y. C. Leung. [1965] [8]p. incl. diagr. refs. (AFOSR-66-0457) [AF AFOSR-63-30] AD 630446 Unclassified

Also published in Phys. Rev., v. 138 B1128-B1135, June 7, 1965.

The problem of analytic continuation in total angular momentum j of a production amplitude is investigated on the basis of analyticity in one of the momentum-transfer variables z for definite combinations of helicity amplitudes which are free of certain kinematical singularities. On this basis also an upper bound for production amplitudes is obtained which has the same value for all z as the bound of a forward-scattering elastic-scattering amplitude. Furthermore the consistency of the analyticity in the whole cut z plane is investigated For this case the singularities in the j plane extend indefinitely to the right even if only N subtractions are made. These singularities are removed only if the spectral functions satisfy certain integral relations to the effect that they oscillate more rapidly for higher spin. When these conditions are satisfied the essential singularities of the Gribov-Pomeranchuk type need not be introduced The analysis further shows the dynamical role played by the spin variable in an analytic S-matrix theory. INVARIANT AMPLITUDES AND THE INTERPRETATION OF SU(3)- AND SU(6)-TYPE SYMMETRIES, by A. O. Barut [1965] [15]p. incl. table, refs. (AFOSR-66-0820) [AF AFOSR-63-30] AD 641242 Unclassified

Also published in High Energy Physics and Elementary Particles, Lectures Presented at a Seminar, International Centre for Theoretical Physics, Trieste (Italy) (May 3-June 30, 1965). Vienna, International Atomic Energy Agency, 1965, p. 707-721.

Different types of representations of the poincare group, according to the choice of the diagonalized subgroup, and different realizations in each type are reviewed. The construction of invariant and covariant amplitudes are discussed on the basis of a global representation. The 2 ways in which the spin-orbit effects enter into the amplitude are discussed. Then starting with the amplitudes under the exact invariance group of the strong interactions, it is shown that one obtains automatically terms in the amplitude which are SU(3), SU(4) and SU(6) invariant with other terms having definite transformation properties. A criterion is given when these symmetries (especially those of the SU(4) and SU(6) type) are consistent approximate symmetries.

DYNAMICS OF A BROKEN SU_N SYMMETRY FOR THE OSCILLATOR, by A. O. Barut. [1965] [4]p. incl refs. (AFOSR-66-0828) [AF AFOSR-63-30] AD 641237 Unclassified

Also published in Phys. Rev., v. 139: B1433-B1436, Sept. 6, 1965.

All states of a one-dimensional harmonic oscillator are represented by a special unitary representation of the noncompact 2+1 Lorentz group. The direct product of N such representations leads to a degeneracy which is represented by the Group SU_N whereas all states of the N-dimensional oscillator are represented by the noncompact unitary group NU_{N+1}^{N} whose Casimir operator determines the energy spectrum. The anharmonic oscillator is represented by a broken symmetry and mass-splitting formulas are obtained It is shown how new quantum numbers arise from the direct products of basic dynamical groups corresponding to composite structures.

RATINGS OF FAVORABLENESS OF STATEMENTS ABOUT A SOCIAL GROUP AS AN INDICATOR OF ATTITUDE TOWARD THE GROUP, by C. Selltiz, H. Edrich, and S. W. Cook. [1965] [8]p. incl. tables, refs. (AFOSR-66-1159) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-176] and National Science Foundation) AD 640277 Unclassified

Also published in Jour. Personality and Social Psychol., v. 2: 408-415, Sept. 1965.

Earlier studies reporting effects of judges' attitudes on ratings of favorableness of statements have suggested the possible usefulness of such ratings as disguised attitude measures. Studies in which Negroes have been the attitudinal object have used a set of statements, a high proportion of which are unfavorable by current standards. In the hope of making the technique more sensitive as an indicator of attitude, a new set of statements about the position of Negroes was developed, representing a more symmetrical distribution of favorable and unfavorable items. These were administered in 3 different geographical regions to groups of Ss differing in attitude toward Negroes. Two criteria of judges' attitudes were used (a) membership in organizations such that it seemed reasonable to suppose that many of the members would hold specified attitudes about race relations; and (b) scores on a self-respect using these two criteria for classifying judges yielded similar results: scale values assigned to statements by judges with different attitudes differed significantly Difference in ratings of the unfavorable and intermediate statements were systematic, with the prointegration Ss rating them as more unfavorable

INFLUENCE OF JUDGES' ATTITUDES ON RATINGS OF FAVORABLENESS OF STATEMENTS ABOUT A SOCIAL GROUP, by M. Zavalloni and S. W. Cook. [1965] [12]p. incl. tables, refs. (AFOSR-66-1160) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-62-176] and National Science Foundation) AD 640279 Unclassified

Also published in Jour. Personality and Social Psychol., v. 1: 43-54, Jan. 1965.

Replication of a study of Hovland and Sherif confirmed their central hypothesis, that scale values assigned to items are influenced by raters' attitudes. However, the present findings require modification of their more specific hypotheses in 3 respects: (a) ratings by 5 criterion groups spaced along an attitude continuum show a regular order, whereas Hovland and Sherif hypothesized that ratings are influenced by attitudes only in the case of raters with extreme attitudes and high involvement, (b) ratings of unfavorable as well as of neutral items are influenced by raters' attitudes; (c) the prediction that extreme judges make fine discriminations at their own end of the scale and lump together items at the other end is supported only with respect to unfavorable items. Ss were asked to rate the plausibility of 40 statements about segregation. Ss' own attitudes were measured by a self-report inventory. Hypotheses: (a) A statement will be considered a more plausible or effective argument by Ss who agree with the position which the statement supports than by Ss who disagree with that position. (b) Despite the difference in absolute ratings of the arguments between judges with differing attitudes, they will agree on the relative plausibility of the various arguments supporting a given side of the issue. Both hypotheses were strongly supported. (Contractor's abstract)

CLASSICAL CONDITIONING OF ELECTRIC ORGAN DISCHARGE RATE IN MORMYRIDS, by F. J. Mandriota, R. L. Thompson, and M. V. L. Bennett. [1965] [3]p. incl. diagrs. refs. (AFOSR-66-0839) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-550 and Public Health Service) AD 641728 Unclassified

Also published in Science, v. 150: 1740-1742, Dec. 24, 1965.

Weakly electric fish of the African family Mormyridae emit pulses at variable intervals with a distribution skewed toward longer intervals. Fourteen specimens of the genera Mormyrops, Gnathonemus, and Marcusenius were classically conditioned to increase briefly their discharge frequency. The unconditioned stimulus was electric shock and the conditioned stimulus was light. These results are novel in that the overt conditioned response involves neither secretion nor movement. Also published in Cold Spring Harbor Symposia on Quantitative Biology, Cold Spring Harbor, N. Y. (June 4-11, 1965), ed. by L. Frisch. Cold Spring Harbor Laboratory of Quantitative Biology, v. 30: 245-262, 1965.

The mormyromasts, large cutaneous organs that are readily visible on the surface of the skin, were studied by stimulating and recording at their external openings and in their innervating fibers. These organs were apparently electroreceptors. Three types were defined electrophysiologically and were termed large, medium and small pores. At the first two, electrical stimuli evoked potentials that apparently arose in receptor cells. At the third, the responses apparently were generated by the innervating fiber. Transmission from receptor to nerve cell appeared to be chemically mediated at medium and small pores and electrically mediated at large pores. All pores responded to voltage gradients across the skin and were independent of gradients along it. The skin was of high resistance compared to the interior of the body. When stimuli were applied between head and tail, most of the potential drop occurred across skin at the ends of the fish. Thus, although the thresholds of the pores did not vary consistently along the body, head-tail stimuli evoked responses which were of much lower threshold at the two ends than in the middle. Also, the polarity of the potential across the skin was opposite at the two ends and the responses differed accordingly. The anterior pores were somewhat more sensitive than the posterior to head-tail stimuli, and apparently the skin was of relatively higher resistance in this region. The relevance of the findings to electroreception and to receptor responses in general were discussed.

Also published in Amer. Jour. Anat., v. 116: 471-491, May 1965.

Many capillaries are embedded in the cytoplasm of large supramedullary neurons (about 200 to 300μ in diameter). Fewer such capillaries are seen in the smaller neurons (about 80 to 100μ in diameter). The neuron clusters remain unstained after vital staining with trypan blue indicating presence of the blood-brain barrier. Electron microscopic studies show that the capillary lumen is lined by nonfenestrated endothelial cells, pericytes, and a continuous basement membrane. Glial cell processes consisting mostly of astrocytes abut onto the capillary basement membrane separating the capillary from the neuron. The continuous glial investment around blood vessels may play a role in maintenance of the blood-brain barrier. The nucleus in supramedullary cells is roughly circular and contains one large and several small nucleoli. The perikaryon contains neurofilaments, diffusely distributed elements of endoplasmic bodies, and inclusion bodies; but is devoid of elementary neurosecretory granules. The cell body of the neuron is entirely covered by glial cells, often with processes which deeply indent the soma surface. Neither synapses nor arborizing dendrites are found on the cell body. THE PHYSICS AND CHEMISTRY OF GASES AT HIGH TEMPERATURES, by P. Kusch. Final rept. Nov. 1, 1963-Oct. 31, 1965. Nov. 1965, 10p. (AFOSR-66-0166) (AF AFOSR-63-330) AD 628082 Unclassified

An extensive study has been made of the scattering of velocity-selected beams of atomic potassium and potassium chloride by argon and by molecular nitrogen. A detailed investigation of certain hyperfine structures in molecules of deuterated ammonia was made in a beam maser spectrometer. A conventional microwave spectrometer, capable of operation over a wide range of temperatures, was used to study the microwave spectrum of lithium chloride in detail and that of methyl vinyl ether. A reinvestigation of the spectrum of molecular cesium in the optical region was started. The technique of magnetic rotation spectra is being applied to a study of carbon disulfide.

Observations have been made on the spectra of 6328A light scattered from carbon dioxide near the critical temperature and critical density. A technique has been developed for measuring the 2 relaxation times characterizing the disorientation of optically aligned atoms in a vapor. The method consists of alternately exciting pure dipole or pure quadrupole components of the density matrix

which give rise to $\Delta m = 1$ zero-field level-crossing signals. A discriminator against $\Delta m = 2$ signals simplifies analysis of the data. Measurements of these relaxation times will give considerable information on the coupling of an excited atom to its statistical environment. (Contractor's abstract, modified)

Radiation due to the impact of very slow helium ions on the rare gases has been observed The dependence of the cross section on the kinetic energy of the He^+ beam shows unexpected and important features down to the lowest energies studied (5 ev). The absolute cross sections are typically of the order of 10^{-16} cm^2 and in some cases are almost an order of magnitude larger. In at least one case, the radiation has been shown to result from charge exchange with simultaneous excitation. Systematic observations have been made on the spectra of 6328A light scattered from carbon dioxide near the critical temperature T_c and the critical density ρ_c. These studies were made as a function of both scattering angle θ and temperature T using an f/7 collecting lens. A new optical system has been developed which uses a lensless geometry and is capable of defining scattering angles to an accuracy better than ± 10' of arc without any averaging effects of a collecting lens. Specular reflection of x-rays by total reflection can be produced at grazing incidence from a uniform gold film evaporated onto annealed glass. Two designs for utilizing this effect to produce large-area x-ray gathering systems are presented. A magnetic resonance rf spectrometer is being constructed to study the hyperfine structure of the metastable states in potassium, rubidium, and lithium. With this spectrometer, magnetic quenching rather than inhomogeneous field deflection will be used for state selection. A second optical delay line was added to the existing photon-echo apparatus to provide a third excitation pulse. In addition to two-pulse echoes of the type previously studied, this arrangement produces a stimulated photon echo delayed from the third pulse by the time interval between the first two pulses. A precise measurement of the resonant self-broadening of the $(6s^2 6p7s)^3P_1^\circ$ state of lead has determined the collision-induced reaction rate to be $3.2(1) \times 10^{-8}$ $cm^3/sec \times N$. Presented at meeting of the Amer. Phys. Soc., Columbia U., New York, June 23-25, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 596, June 23, 1965.

The Hanle-effect linewidth in fluorescent radiation originating from the $(6p7s)^3P_1^o$ state of lead has been observed over a range of densities from 10^9 to 10^{15} atoms/cm^3 in a 50-cm^3 cell. The signal width was observed to be the same at a given density for the 3 decay branches to the $^3P_2$, $^3P_1$, and $^3P_0$, respectively, except for the $^3P_1^o - ^3P^o$ line at very high densities. As the density was increased from 10^9 atoms/cm^3, a steady narrowing of the signal width was observed up to a density of 4×10^{12} atoms/cm^3 when the linewidth was 81% of the low-density value. Thereafter, the linewidth remained constant up to a density of about 10^{14} atoms/cm^3. The observed data are in good agreement with Barrat's coherence-narrowing theory, suitably modified to take branching into account. At densities above 10^{14} atoms/cm^3, a broadening of the linewidths was observed, which we attribute to collisions. The collision-broadening cross section observed in the density range 2×10^{14} to 8×10^{14} atoms/cm^3 was $\sigma = 1.4(2) \times 10^{-12}$ cm^2.

ELECTRIC-FIELD HANLE EFFECT IN MERCURY AND CADMIUM (Abstract), by W. Happer, Jr., A. Khadjavi, and A. Lurio. [1965] [1]p. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 28-043-AMC-00099(E)]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Oct. 28-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 1096, Oct. 28, 1965.

We have measured the differential Stark shift between m = ± 1 and m = 0 sublevels of the $6s6p\,^3P_1$ state of mercury and the $5s5p\,^3P_1$ state of cadmium excited from the ground state by resonance radiation. In this work, we used level-crossing techniques with parallel electric and magnetic fields. Using both an electric and a magnetic field, one can eliminate any dependence on a knowledge of the effective lifetime of the excited state. The values obtained are $\alpha/h = 2360 \pm 70$ cps/[kV/cm]^2 for mercury and $\alpha/h = 2515 \pm 75$ cms/[kV/cm]^2 for cadmium. Both results are somewhat higher than those measured elsewhere by double resonance and by the method of beats.

ELECTRIC-FIELD LEVEL CROSSING IN MERCURY (Abstract), by A. Khadjavi, A. Lurio, and W. Happer, Jr. [1965] [1]p. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 28-043-AMC-00099(E)]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Columbia U., New York, June 23-25, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 596, June 23, 1965.

Pure electric and combined electric- and magnetic-field level crossings in the $^3P_1$ state of mercury were observed. From these measurements, one can obtain the differential Stark shift between the $\Delta m = \pm 1$ and the $\Delta m = 0$ Zeeman levels in the zero-spin isotopes. This shift is related to the atomic polarizability of the state. In the pure electric-field measurement, the differential Stark shifts are obtained from the linewidth of the crossing and a knowledge of the lifetime of the excited state. This method is subject to the usual coherence-narrowing problem. To avoid this difficulty, combined electric and magnetic fields were used since one need know only the g_J value for the state and the magnetic field at the cell in order to measure the differential shifts. Preliminary results are in agreement with those of Blamont.

EVIDENCE FOR A METASTABLE SEXTET STATE IN NITROGEN (Abstract), by P. Feldman and R. Novick. [1965] [1]p. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 28-043-AMC-00099(E)] and National Aeronautics and Space Administration) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys Soc., Series II, v. 10· 455, Apr. 26, 1965.

The lowest-lying metastable $^6S^0$ state of the nitrogen atom, arising from a $(2s2p^33s)$ configuration, has been postulated as the energy-storage mechanism responsible for the pink region associated with the nitrogen afterglow. The estimated excitation energy of this state is 17.2 ev above the atomic ground state. A search for this state was made using the same experimental arrangement as used in the study of long-lived autoionizing states in the alkali atoms. Molecular nitrogen was admitted into the system through a variable leak and excited by electron bombardment An excitation threshold was observed at about 30 ev. Assuming that an atomic state is formed and allowing 9.8 ev for dissociation, then this corresponds to an energy of 20 ev in the c.m. Quenching of the signal was obtained with both external and magnetic fields.

FINE AND HYPERFINE STRUCTURE OF THE 4P STATE OF Li^7 (Abstract), by R. C. Isler, S. Marcus, and R. Novick. [1965] [1]p. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 28-043-AMC-00099(E)] and National Aeronautics and Space Administration) Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Oct. 28-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10· 1096, Oct 28, 1965.

The average value of the four $\Delta m = 2$ level-crossing signals has been used to obtain the fine-structure interval in the 4P state of Li^7. This interval is 1199.72 ± 0.19 Mc sec. 11% smaller than the corresponding interval in hydrogen. The spacing between the hyperfine crossings is 4.044 ± 0.023 kc sec in terms of the resonance frequency of the proton probe used for measuring the magnetic-field strength. This spacing, which is related to linear combinations of dipole-dipole and core-polarization interactions, scales closely as $1/n^3$ between the 4P and 3P states, just as it does between the 3P and 2P states, thus indicating that the core-polarization interaction itself scales closely as $1/n^3$ in the P states of Li^7.

LEVEL-CROSSING SPECTROSCOPY WITH AN ELECTRIC FIELD: STARK SHIFT OF THE 3^2P TERM IN LITHIUM, by B. Budick, S. Marcus, and R. Novick. [1965] [3]p. incl. diagrs. table, refs. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00099(E), and National Aeronautics and Space Administration) Unclassified

Published in Phys. Rev., v. 140: A1041-A1043, Nov. 15, 1965.

The method of level-crossing spectroscopy has been extended to a study of the Stark effect on the 3P term of lithium. Lithium atoms in a broad atomic beam are subjected to collinear electric and magnetic fields. The field values required to produce a level crossing or degeneracy are determined by observing the change in the angular distribution of the fluorescence resulting from the optical excitation of the 3P term. The magnetic field required to produce the crossing is found to shift to higher values as the electric field is applied. The shift increases as the square of the electric field and is given by $\Delta H = +0.056\,(11)E^2$, where ΔH is in gauss and E is in kv per cm. The coefficient is in good agreement with the value 0.048 obtained from second-order perturbation theory and the Bates and Damgaard approximation. (Contractor's abstract)

LIFETIME OF THE $(6p8s)^3P_1^0$ STATE IN LEAD (Abstract), by E. B. Saloman. [1965] [1]p. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 28-043-AMC-00099(E)] Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Oct. 28-30, 1965

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 1096, Oct. 28, 1965.

Hanle-effect studies have been made in the $(6s^26p8s)$ $^3P_1^0$ state of lead. Pb^{208} atoms were excited to this state by 2053A lead resonance light, and the 5201A cross fluorescent line from this state was detected. The width of the level-crossing signal corresponds to a lifetime for this state of $1.29\,(14) \times 10^{-8}$ sec, where the quoted uncertainty is 3 times the standard deviation. This result is a factor of 4 longer than the result calculated from the oscillator strengths of Corliss and Bozman.

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Nov. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 310, Mar. 24, 1965

A He-Ne laser homodyne spectrometer has been used to observe the line spectrum of 6328A light scattered off a

binary mixture of cyclohexane and aniline near the critical point. The Rayleigh-scattered light, which is broadened by the density fluctuations, was observed at an angle of 22 from the unscattered light. The frequency distribution of the scattered-light approximated a Lorentzian lineshape. The linewidth of the scattered radiation depends linearly on the temperature from 30.32 to the critical temperature of 29.69 C. The line narrows as the critical temperature is approached from above and the rate of narrowing is 230 ± 20 cps/°C. At 29.72 C, the linewidth was observed to be 18 cps. No correction to the linewidth from possible multiple scattering effects have been made as yet.

OPTICAL EXCITATION WITH VERY LOW ENERGY IONS, by M. Lipeles, R. Novick, and N. Tolk. [1965] [5]p. incl. diagrs. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00099(E), and National Aeronautics and Space Administration) Unclassified

Published in Phys. Rev. Ltrs., v. 15: 815-819, Nov. 22, 1965

Radiation due to the impact of very slow helium ions was observed on the rare gases and on some molecular gases. The dependence of the cross section for this process on the kinetic energy of the He^+ beam shows unexpected features down to the lowest energies studied (5 ev). For example, there is a sharp peak at 10 ev for the production of uv photons in Xe. The absolute cross sections are typically of the order of 10^{-16} cm^2 and in some cases are almost an order of magnitude larger. In at least one case the radiation was shown to result from charge exchange with similar excitation. Energy balance considerations show that the reactions studied involve the transfer of a large fraction of the kinetic energy into internal electronic energy. The excitation clearly involves nonadiabatic nonradiative transitions between the levels of the molecular-ion complex formed during the collision. The low-energy peaks in the cross section imply that the molecular energy levels are shifted in energy during the collision until they nearly cross. The experimental apparatus and data obtained are discussed. Curves are given showing the kinetic-energy dependence of the cross sections for the production of photons by He^+ impact on the rare gases.

ELECTRON SPIN RELAXATION IN COPPER TUTTON SALTS AT LOW TEMPERATURES, by F. R. Nash. [1965] [10]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-sc-90789) Unclassified

Published in Phys. Rev., v. 138 A1500-A1509, May 31, 1965.

By means of a pulse saturation technique applied at X-band frequencies, electron-spin relaxation times have been observed as a function of crystal size in the liquid-helium temperature range for the $CuNH_4$ Tutton salt throughout the concentration range 0.02-100%. The concentration range 12-100% exhibits what is thought to be a phonon bottleneck. This is manifest in a marked size dependence of the observed decay constants. Alternative explanations are considered. For the concentration range 0.05 to 5%, size-dependent decay times have also been recorded. There appears to be a correlation between this kind of size effect and contamination by the paramagnetic impurity of iron. Rapid crystal growth is found to alleviate the size effects throughout the range of concentrations studied. The effects of deuteration have been examined in crystals of 1% concentration and it was found that there was an order-of-magnitude difference in the relaxation times of the hydrated and deuterated salts, size for size, below the helium λ point. The hydrated and deuterated CuK Tutton salts at the same concentration showed no such difference. The supposed spin-lattice coupling is concentration-dependent, and its nature has not yet been established theoretically. (Contractor's abstract)

LIGHT SOURCES FOR DOUBLE RESONANCE AND LEVEL CROSSING SPECTROSCOPY, by B. Budick, R. Novick, and A. Lurio. [1965] [9]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under [DA 36-039-sc-90789] and National Aeronautics and Space Administration) Unclassified

Published in Appl. Opt., v. 4: 229-235, Feb. 1965.

The requirements on light sources for double resonance and level crossing spectroscopy are reviewed. A modern version of the Carlo-Löchte-Holtgreven flow lamp is described and its performance for a number of elements is compared with that of sealed-off electrodeless discharge lamps and Schüller-type hollow cathode sources. The electrodeless lamp is particularly effective in the case of the group IIb intercombination lines. The high atomic density available in the flow lamp makes it useful for partially forbidden resonance lines for a number of chemical species including highly reactive metals, such as Ca. The hollow cathode lamp is well suited to the fully allowed resonance lines of a wide range of elements including highly refractory metals.

METASTABLE AUTOIONIZING ATOMIC-ENERGY LEVELS IN CESIUM (Abstract), by R. Novick and G. Sprott. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office

(Durham)], and Office of Naval Research under [DA 36-039-sc-90789] and National Aeronautics and Space Administration) Unclassified

Presented at meeting of the Amer. Phys. Soc., Oklahoma U., Norman, Feb. 25-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10. 184-185, Feb. 25, 1965.

Two metastable autoionizing atomic-energy levels have been observed in a beam of cesium atoms excited by electron bombardment. The excitation energies are 8.5 (± 1.5) and 11 (± 1.5) ev, the latter corresponding to the $(p^5sd)^4F_{9/2}$ state previously observed in K and Rb. The cross section and lifetime for this state are also in agreement with our previous data on these alkali elements. On the other hand, a second long-lived autoionizing state (albeit with a production cross section a factor of 10 smaller) had not been observed in either K or Rb and its excitation energy does not fit into the ^1D level scheme of Beutler and Guggenheimer. A possible configuration for this state may arise from the excitation of a 5p electron from the $(5p^66s)^2S_{\frac{1}{2}}$ ground state to a low-lying f level.

ORDERING IN SOLID HYDROGEN, by A. Danielian. [1965] [6]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham], and Office of Naval Research under [DA 36-039-sc-90789]) Unclassified

Published in Phys. Rev., v. 138: A282-A287, Apr. 5, 1965.

It is shown that in the case of the model for solid orthohydrogen considered, the ground-state superlattice structure, produced by the electrostatic quadrupole interactions, may be derived exactly. It consists essentially of 2 unequal sublattices: one consisting of molecules A in the state M = 0 and the other consisting of molecules B in either of the states M = ± 1, the latter being twice as many as the former. The configuration on each triangular plane, normal to the axis of symmetry of the lattice, is such that each A molecule is surrounded by 6 B molecules, and each B molecule is surrounded by 3 A molecules and 3 B molecules. The transition temperature of the system is found to be 5.8° K in the zeroth approximation and 3° K in a tetrahedral approximation, the latter being in agreement with the experimental estimate. STABILITY CONSIDERATIONS FOR A Rb^{87} MASER OSCILLATOR, by P. Davidovits and R. Novick. [1965] [5]p. incl. diagrs. refs. (Technical rept. no. 2) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 36 039-sc-90789) AD 617219 Unclassified

Also published in IEEE Internat'l. Conv. Rec., Pt. 5: 2-6, 1965.

Self-sustained oscillation was obtained in an optically pumped rubidium maser operating at the Rb^{87} hyperfine transition frequency of 6835 mc/sec. The entire apparatus can be mounted within the volume of one cubic foot. The operating temperature is 60 C, and the overall power consumption is only a few watts. The

anticipated long-term stability is one part in 10^{12}. Preliminary estimates also indicate that the device has far better short-term stability than any other existing frequency standard. The present paper explains the basic principles of the rubidium maser and examines the factors affecting the stability of oscillation. (Contractor's abstract)

A MODEL FOR A HOMOGENEOUS STAR OF MODERATE MASS, by A. H. Bennick and L. Motz. [1965] [6]p. incl. tables, refs. (AFOSR-65-1081) (AF 49(638)1335) AD 619632 Unclassified

Also published in Astrophys. Jour., v. 141: 195-200, Jan. 1, 1965.

A new method for obtaining a set of integration variables which are consistent on both sides of the interface between the central convective core and radiative envelope of a stellar model is derived. It is shown that, once the core size and the composition are chosen, the set of variables is a function of a single free parameter, the ratio of the energy generated by the carbon cycle in the convective core to the energy generated by the proton-proton chain in the core. This set of variables is then used to construct a stellar model that has a convective central core, a radiative zone, and an outer convective layer.

EFFECTS OF A LARGE MAGNETIC FIELD ON ENERGY TRANSFER IN WHITE SWARF STARS, by J. D. Lindstreet. Doctoral thesis [1965] [143]p. incl. diagrs. tables, refs. (AFOSR-66-2779) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)1358 and National Science Foundation) AD 643427 Unclassified

The thesis is concerned with possible effects of a large magnetic field (in the range of ~10^5 to 10^{13} gauss) on the transfer of thermal energy out of a white dwarf star. It is shown that a field at the surface of a white dwarf ~2 x 10^5 gauss is sufficient to produce observable Zeeman splitting of spectral lines, but that when the surface field exceeds about 10^7 gauss, the sigma components of the Zeeman triplet are no longer visible and the line is simply weakened by the field. The possibility that a large surface field would result in significantly increased opacity through absorption by the inverse of the cyclotron radiation process is investigated, and it is shown that this 'cyclotron opacity' would be unobservable except under special conditions. In a white dwarf, heat flow in the interior is carried almost entirely by degenerate electron conduction. It is shown that fields of the order 10^9 or 10^{10} gauss result in substantial magnetoresistivity normal to the direction of the field, and some consequences of this effect for the surface radiation of a white dwarf are discussed. ELECTRON SPIN RESONANCE OF SEMIQUINONES: SPIN-DENSITY DISTRIBUTION AND CARBONYL SIGMA-PI PARAMETERS, by M. R. Das and G. K. Fraenkel. [1965] [11]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-285 and National Science Foundation) Unclassified

Published in Jour. Chem. Phys., v. 42: 1350-1360, Feb. 15, 1965.

The spin-density distributions in the 1,4-benzosemiquinone and 2,5-dioxy-1,4-benzosemiquinone ions have been estimated by measuring the proton and C^{13} splittings and using reasonable choices for the values of the sigma-pi parameters which relate the splittings to the spin densities for C C and C-H bonds. The determination of the signs as well as the magnitudes of the C^{13} splittings was required to obtain the spin densities. With Q_{CH}^{H} = -27.0 G in the relation $a_i^H = Q_{CH}^H \rho_i^\pi$ between proton splitting a_i^H and carbon-atom-pi electron spin density ρ_i^π, the sigma-pi parameters for the C^{13} splitting at a carbonyl position were found to be Q_{CO}^{C} = 17.7 G and Q_{OC}^{C} = -27.1 G. The values of Q_{CO}^{C} and Q_{OC}^{C} depend on the value assumed for Q_{CH}^{H}. Contrary to earlier predictions made on the basis of molecular orbital calculations, the sign of the C^{13} splitting from the 2 position of the p-benzosemiquinone ion was found to be negative. Carbon-13 splittings were also observed in the anthrasemiquinone ion both ethanol and 1,2-dimethoxyethane (DME) solutions. The sign of the 9-position C^{13} splitting changes from +0.70 G in ethanol to -0.47 G in DME solution. By using the sigma-pi parameters for the carbonyl group carbon atom,

the spin densities were determined for this radical and MO calculations performed to reproduce the spin-density distributions. The variation of the splittings in the p-benzosemiquinone ion with solvent composition could be accounted for quantitatively by using the newly determined sigma-pi parameters.

ELECTRON SPIN RESONANCE STUDIES OF DEUTERIUM ISOTOPE EFFECTS. A NOVEL RESONANCE-INTEGRAL PERTURBATION, by M. Karplus, R. G. Lawler, and G. K. Fraenkel. [1965] [2]p. incl. refs. (AF AFOSR-63-285 and AF AFOSR-65-285) Unclassified

Published in Jour. Amer. Chem. Soc., v. 87: 5260-5261, Nov. 20, 1965.

Electron spin resonance (ESR) studies of aromatic radicals previously demonstrated that the replacement of a hydrogen atom by deuterium can produce significant modifications in the proton hyperfine splitting constants (a^H) for ring positions other than the one of substitution. It is proposed that a consistent explanation of these data is provided by a vibrational perturbation of the Hückel resonance-integral parameter B. If the carbon-atom 2pπ orbitals follow the out-of-plane bending motion of the C–H or C–D bonds, the integral B depends on the deuterium or hydrogen position. An equation is given for the energy shift of the Hückel molecular orbital for a deuterated species. Application of the equation to benzene-1-d and cyclooctatetraene-d is discussed. It was found that for both compounds the antisymmetric orbital is unaffected while the symmetric orbital is destabilized, and the magnitude of the effect for $C_6H_5D^-$ indicated that there would be an observable perturbation for $C_8H_7D^-$, in disagreement with experiment. The resonance-integral perturbation model can be applied to other radicals.

MEASUREMENT OF g VALUES IN THE ELECTRON SPIN RESONANCE SPECTRA OF FREE RADICALS, by B. G. Segal, M. Kaplan, and G. K. Fraenkel. [1965] [10]p. incl. diagr. tables, refs. (AF AFOSR-63-285) Unclassified

Published in Jour. Chem. Phys., v. 43: 4191-4200, Dec. 15, 1965.

Measurements have been made of the g values in the electron spin resonance spectra of 20 aromatic free radicals with an accuracy which has not previously been attainable. The largest source of error for both absolute and relative measurements resulted from variations in the difference between the magnetic field at the ESR sample and at the proton NMR probe, located just outside the center of the microwave cavity, which was used to measure the field. Except for the p-benzosemiquinone radical, g values were not found to depend on temperature over the range from room temperature to -100 C. The depencence of the g value on solvent and counterion was also investigated to some extent, and the g value of the perinaphthenyl radical was found to vary markedly with solvent. Agreement with Stone's theory of the g values of aromatic radicals is excellent, except for those radicals in which molecular distortions are expected according to the Jahn-Teller theorem and for radicals in which the unpaired electron is in a nonbonding molecular orbital. Presented at Joint Automatic Control Conf., Stanford, Calif., June 24-26, 1964.

Also published in Jour. Basic Eng., v. 87: 125-134, Mar. 1965. (AFOSR-65-2430; AD 629691)

This paper relates to an approach introduced by Kulikowski for adaptive optimal control of nonlinear systems. In this approach the plant dynamics are represented symbolically by an operator which transforms or maps input time functions into corresponding output time functions. The contributions of the paper arise mainly from the physical considerations associated with such an operator representation, specifically the memory of the plant, and the influence of these considerations upon the formulation. It is shown that the optimal control problem may be formulated in various ways for a given plant and given performance criteria depending upon how the memory of the plant is taken into account. INTERACTION STRESSES OF EDGE DISLOCATIONS WITH OBSTACLES IN A DISCRETE CRYSTAL MODEL, by H. Southworth, Jr. [1965] [23]p. incl. diagrs. refs. (AFOSR-65-2556) (AF AFOSR-63-228) AD 628404 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 1649-1671, Nov. 1965.

The purpose of this work is to determine the effect of the assumption of a discrete as opposed to a continuum structure. New types of behavior found in the discrete analysis which have no continuum counterparts include the following: (1) The discrete dislocation has a non-zero width which changes with interaction geometry. The dislocation widens when the rate of change of interaction stress with decreasing slip plane obstacle distance is negative. When the rate of change is positive the dislocation is found to narrow. (2) The discrete theory allows interaction stress calculation which include the Peierls stress. (3) A critical separation distance between two dislocations of opposite sign on the same slip plane exists where only the critical shear stress for the perfect lattice would prevent their mutual annihilation. This differs little from the dislocation vs free surface interaction. (4) For a dislocation versus a similar dislocation on the same slip plane a certain separation distance is found that cannot be minimized by a uniform shear stress less than the critical shear stress for the perfect lattice. THERMAL EFFECTS OF DISLOCATION VELOCITIES IN A LINEAR CHAIN, by J. H. Weiner. [1965] [8]p. incl. diagrs. refs. (AFOSR-65-2576) (AF AFOSR-63-228) AD 629668 Unclassified

Also published in Phys. Rev., v. 139: A442-A449, July 9, 1965.

The effects of the thermal motion of atoms upon a dislocation in steady motion in a modified Frenkel-Kontorova model are examined. The energy associated with the localized mode due to the dislocation and the energy associated with the nonlocalized modes are considered separately and referred to as the energy of the dislocation system and of the surrounding heat bath, respectively. Several distinct components of the net energy exchange between dislocation system and heat bath are isolated. In particular, one component is found which may be described as a coordinating effect between the thermal motion of the atoms and the dislocation motion, which results in a transfer of energy from the heat bath to the moving dislocation. When model parameter values are chosen so that this component of energy transfer is dominant, the drag on a moving dislocation in the model studied decreases with increase in temperature. Computer simulation of the model lends support to the principal features of the theory. (Contractor's abstract)

DISLOCATION KINK IN A CRYSTAL MODEL, by W. T. Sanders. [1965] [8]p. incl. diagrs. refs. (AFOSR-66-1298) (AF AFOSR-63-228) AD 641383 Unclassified

Also published in Jour. Appl. Phys., v. 36: 2822-2829, Sept. 1965.

A modified Frenkel-Kontorova dislocation model, with a piecewise linear substrate potential is extended to 2 dimensions to describe the entire slip plane of the dislocation with one kink. Accurate solutions are found, with the aid of several analytic techniques and a digital computer, for the static configuration under applied stress. The kink Peierls stress σ_{kp}, the kink width w, and the kink energy F, are determined for a range of values of γ, the perfect crystal shear strength. σ_{kp} is found to be very sensitive to γ, and to have maxima of the order of 10^{-6} to 10^{-5}, in units of the shear modulus. w and E are less sensitive to γ; w ranges from 4 to 30 lattice parameters, while E varies from several hundred to several thousand degrees Kelvin for typical crystal parameters.

WAVE PROPAGATION ALONG WARM-PLASMA (Abstract), by P. Diament, V. L. Granatstein, and S. P. Schlesinger. [1965] [1]p. [AF 49(638)631] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 8, Jan. 27, 1965.

To determine the dispersion relations for waves propagating along homogeneous isotropic, warm-plasma columns surrounded by a dielectric medium, a steady-state, linearized model with temperature introduced through a scalar pressure is adopted. An approximate solution is obtained from a quasistatic analysis and, for comparison, a more rigorous dispersion relation is derived from Maxwell's equations. The quasistatic analysis yields propagating waves with cutoff frequencies corresponding to the Dattner scattering resonances. The rigorous analysis, as exact as the model, yields no resonant frequencies for zero axial wavenumber, but provides dispersion relations for the surface modes, with temperature effects, and for the Dattner modes as well. The quasistatic and exact predictions are compared with each other, with the cold case, and with published theoretical and experimental results on dipole scattering by warm-plasma columns.

A REPRESENTATION OF GAUSSIAN PROCESSES, by K. S. Miller and L. R. Abramson. [1965] [9]p. incl. refs. (AF 49(638)1113) Unclassified

Published in Internat'l. Jour. Eng. Sci., v. 2: 431-439, Jan. 1965.

A problem of great interest which has been treated by many authors is that of determining the properties of the envelope of noise with or without carriers. One theory is that a Gaussian noise current is decomposed into 2 independent orthogonal Gaussian processes with the same variance. This decomposition and the numerous corollaries derived from it are open to criticism on 2 counts. First, they are based on heuristic, nonrigorous, arguments. Second, they are based on a special formulation for stationary Gaussian noise. The authors show that the decomposition together with the associated properties can be deduced in a mathematically sound fashion for any stationary Gaussian process. (Contractor's abstract)

DETERMINATION OF DIRECT CURRENT ARC PLASMA CURRENT DENSITY BY HALL-EFFECT MAGNETIC PROBE, by P.-S. Tschang. [1965] [4]p. incl. illus. diagrs. refs. (AFOSR-65-1745) (Sponsored jointly by Aerospace Research Laboratories, and Air Force Office of Scientific Research under AF 49(638)1395) AD 625977 Unclassified

Also published in AIAA Jour., v. 3, 849-852, May 1965.

A method of determining the current density of the cylindrical plasma column of an electric arc is presented based on the measurement of the self-magnetic field due to the arc drift current. This is accomplished by means of a miniature Hall-effect magnetic probe traversing the column diametrally at approximately 120 cm/sec. The theory of the Hall probe is briefly sketched and the method of data reduction given. The probing unit was tested on the plasma column of the fluid-transpiration arc. Results of several representative probings are presented showing general conformity to theory of the arc self-magnetic field radial profile. The results indicate the fluid-transpiration arc current density to be uniform over a large cross section of the column. The perturbative effects of the probe insertion on the plasma are analyzed. The advantages of using Hall probes as against coil-type magnetic probes are examined. (Contractor's abstract, modified)

EFFECTS OF MECHANICAL AND THERMAL ELECTRODE PROPERTIES ON THE BEHAVIOR OF THE FLUID TRANSPIRATION ARC, by C. Sheer, P. S Tschang, and C. G. Stojanoff. Aug. 1965, 132p. incl. illus. diagrs tables, refs. (ARL-65-163) (AFOSR-66-1452) (Sponsored jointly by Aerospace Research Laboratories, and Air Force Office of Scientific Research under AF 49(638)1395) AD 635872 Unclassified

A triple cathode, single anode arc assembly, designed to produce a symmetrical free-burning plasma jet, was completed and placed into operation. A second arc assembly with a single gas-injection cathode, was also constructed for the double purpose of testing porous anodes and accelerating the acquisition of diagnostic data. Diagnostic instrumentation was developed, based on high speed transient probing with miniature sensing elements. Work was carried forward on the development of porous anodes. Diagnostic experiments include measurements of arc terminal characteristics, current density distribution, temperature variations, potential distribution, plasma luminosity distribution and calorimetry experiments. The influence of forced convection into the negative column near the cathode was separately investigated. A 2-dimensional computer analysis of transpiration cooling of the porous anode was worked out

A KINETIC-THEORETIC DESCRIPTION OF SHOCK WAVE FORMATION, II, by C. K. Chu. Feb. 1965 [10]p. incl. diagrs. (Rept. no. 16) (AFOSR-65-1265) (AF 49(638)1254) AD 621200 Unclassified

Also published in Phys. Fluids, v. 8: 1450-1455, Aug. 1965.

This paper extends the method and results previously obtained for shock waves in 1-dimensional gas to a monatomic 3-dimensional gas. The classical Riemann problem—the flow of a gas in a shock tube—is treated as an initial value problem for the Krook equation, after the Krook equation is first reduced to 2 simultaneous

Krook equations each for a 1-dimensional gas. Results are obtained on the formation of shocks corresponding to Mach numbers of 1.27, 1.5, and 1.75. It is seen that the stronger the shock, the shorter the formation time. The short time behavior of the flow agrees with free flow, while the long time behavior agrees with fluid dynamics. AN ELEMENTARY NUMERICAL TREATMENT OF THE BOLTZMANN EQUATION FOR A SIMPLE GAS WITH PARTICULAR ATTENTION TO WALL INTERACTION, by H. G. Elrod. May 1965, 45p. incl. diagrs. (AFOSR-65-1616) (AF 49(638)1254) AD 618043 Unclassified

Solutions are developed for the Boltzmann equation for a simple gas. Work is especially directed towards providing a better understanding of kinetic-theory predictions for flow phenomena near a wall. The analysis is applied to the elementary subdivision of phase space into 4 quarter spheres. As an example, the 4-group model is then applied to a study of transient couette flow.

TRANSPORT PROPERTIES OF HYDROGEN, by D. Brezing. [1965] [6]p. incl. diagrs tables, refs. (AFOSR-65-2494) (AF 49(638)1254) AD 628015 Unclassified

Also published in AIAA Jour., v. 3. 1422-1427, Aug. 1965.

The transport properties of hydrogen are calculated for a pressure range from 10^{-6} to 10^{2} atm and at temperatures up to 10^{6} K. The lower temperature limit is taken where the equilibrium gas mixture contains less than 1% molecular hydrogen. The Boltzmann formalism, which assumes binary collisions in the expressions for the transport properties of gas mixtures, is applied. Theoretical values, supported by experimental data whenever possible, are used for the atom-atom, atom-ion, and atom-electron collision cross sections. For Coulomb force interactions between charged particles, the Debye length is used as cutoff distance. The collision integrals for all interactions are computed. Values of viscosity, thermal, and electrical transport coefficients, as well as the thermoelectric coefficients, are presented.

IONIZING SHOCK STUDIES IN AN ELECTROMAGNETICALLY DRIVEN SHOCK TUBE, by B. Miller. June 1965, 133p. incl. illus. diagrs. tables, refs. (AFOSR-66-0300) (AF 49(638)1254) AD 621990 Unclassified

A coaxial electromagnetic shock tube was used to study ionizing shocks propagating through hydrogen. An experiment is described which produced plane switch-on ionizing shocks. Studies were conducted covering the sub-Alfvenic, trans-Alfvenic and super-Alfvenic regimes. Data is presented that verifies the existence of switch-on fronts in all these regimes, and demonstrates the significant effect of the initial electric field on the shock jump conditions. The results substantiate the theory of normal ionizing shocks developed by Taussig. A simple physical criterion is employed to choose from among the several theoretically predicted ionizing waves propagating at a given speed. This criterion has strong intuitive support and results in a consistent picture of ionizing shock propagation that is in general agreement without experimental observations. The existence of a small homogeneous plasma sample, behind the ionizing shock wave and before the expansion fan, is demonstrated. Previous failures to find large homogeneous plasma samples are shown to be consistent with the theory of ionizing shock waves. (Contractor's abstract, modified)

STRONG IONIZING SHOCK WAVES, by R. A. Gross. [1965] [20]p. incl. diagrs. refs. (AFOSR-66-0358) (AF 49(638)1254) AD 631379 Unclassified

Presented at meeting of the Amer. Phys. Soc., Calif. Inst. of Tech., Pasadena, Nov. 23-25, 1964.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 273, Feb. 25, 1965.

Also published in Rev. Modern Phys., v. 37: 724-743, Oct. 1965.

The physical effects created by strong shock waves propagating in hydrogen are reviewed and theoretically studied for speeds up to relativistic conditions. In the progression from weak to relativistic shock speeds, various physical phenomena affect the shock wave. Dissociation, ionization, and the presence of an upstream electric field cause several important effects for slow (sub-Alfvenic speed) normal ionizing shock waves. Switch-on shock behavior is extended to slow ionizing waves. The effect of radiation is investigated for both the optically thick and thin cases. Relativistic shock jump equations are solved for wave speeds approaching the speed of light. Thermonuclear shock solutions are examined. The theory of the electromagnetically driven shock tube is reviewed and the corresponding shock tube problem is explored. Wave stability is reviewed. Experimental results on strong ionizing shock waves are reviewed. (Contractor's abstract)

NORMAL IONIZING SHOCK WAVES, by R. T. Taussig. [1965] [12]p. incl. diagrs. refs. (AFOSR-66-0359) (AF 49(638)1254) AD 632228 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Nov. 4-7, 1964.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 217, Feb. 25, 1965.

Also published in Phys. Fluids, v. 8: 1616-1627, Aug. 1965.

Solutions to the steady-state jump equations are obtained for a normal ionizing shock wave propagating into a nonconducting, quiescent gas in an electromagnetic field. Comparison of these solutions to pure magnetohydrodynamic shocks and ordinary gas shocks indicates that ionizing shocks are hybrids having some properties common to both magnetohydrodynamic and gas shocks. Some completely novel effects are produced by the upstream electromagnetic field. The shock velocities are bounded for a given upstream electric field strength where the electric field is assumed parallel to the shock plane. For electric fields larger than a critical value, no steady compressive shocks exist, and for nonzero electric fields 'switch-on' behavior is extended to slow shocks. Solutions analogous to detonation-deflagration waves have been found, and the Chapman-Jouguet condition is applied to them. The complete boundary value problem is solved in the context of an electromagnetic annular shock tube to place the analytic results in the framework of experimentally observable phenomena. U-235 RESONANCE CROSS SECTIONS AND GASEOUS CORE REACTOR CALCULATIONS, by G. W. Tumm. Aug. 1965, 100p. incl. diagrs. tables, refs. (AFOSR-66-0951) (AF 49(638)1254) AD 626757 Unclassified

This report contains (1) Calculation of U-235 resonance cross sections to 40,000°K for conditions applicable to gaseous core nuclear reactors; (2) Comparison between measured cross sections and calculated resonance integrals for U-235; (3) Calculation of the critical mass for configurations representing approximately the so-called "coaxial flow" - and "vortex flow" gaseous core nuclear reactors. The theoretical cross sections calculations compare well with measured quantities, e.g. U-235 resonance integral (300°K): 271.0 barns (measured and 271.7 barns (calculated) k_{eff} for measured critical masses; 1.0065 (for fuel compressed towards cavity center) and 1.0019 (for fuel compressed towards cavity walls). The critical mass calculations for various gaseous core reactor configurations (spherical) show that the fuel requirements of a "vortex flow" reactor is approximately one-half of that needed for a "coaxial flow" - reactor.

IONIZING SHOCK STUDIES IN AN ELECTROMAGNETICALLY DRIVEN SHOCK TUBE, by B. Miller, L. Levine, and R. A. Gross. [1965] [16]p. incl. illus. diagrs. (AFOSR-67-1818) (AF 49(638)1254) AD 656716 Unclassified

Presented at meeting of the Amer. Phys. Soc., Chicago, Ill., Oct. 28-30, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 1145, Oct. 28, 1965.

Also published in Proc. Fifth Internat'l. Shock Tube Symposium, Naval Ordnance Laboratory, White Oak, Silver Spring, Md., Apr. 28-30, 1965, p. 221-236.

A 1-m-long, 7-cm-mean-radius, coaxial electromagnetic shock tube with a 1-cm annulus has been used to study strong ionizing shock waves propagating through hydrogen. The shock tube, shaped-pulse capacitor bank, and associated circuitry are described. Experimental techniques used to successfully obtain uniform breakdown and the launching of plane ionizing shock waves are presented. Diagnostic studies with photomultipliers and magnetic- and electric-field probes are discussed. Constant-speed normal-ionizing shock waves propagating at 2-8 x 10^6 cm/sec have been studied. Variation of the longitudinal magnetic field between 800 and 12,000 (g) produced sub-Alfvénic, switch-on, and super-Alfvénic shock waves. We discuss the influence of the initial gas state, including the electric field, on the shock-jump conditions. The effect of initial conditions on shock-formation time has been observed. Analysis of magnetic-field profiles has led to quantitative shock-width data and to the identification of a switch-on-like shock with an identifiable uniform gas sample and expansion fan. A comparison between theoretical and measured wavespeed and magnetic field as a function of drive current is presented.

HYDROMAGNETIC PLASMA RESEARCH (Abstract), by R. A. Gross and C. K. Chu. [1965] [2]p. (Bound with its AFOSR-65-1266; AD 622527) (AF 49(638)1254) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif. Apr. 29-30, 1965.

Constant speed normal ionizing shock waves propagating in hydrogen at 2 to 8 x 10^6 cm/sec have been studied in detail. Variation of the longitudinal magnetic field

between 800 and 12,000 gauss produced sub-Alfvenic, switch-on, and super-Alfvenic shock waves. Detailed analysis of magnetic field profiles has produced quantitative shock width data, and profiles strongly suggestive of a switch-on shock, an identifiable uniform gas sample and an expansion fan. The influence of the cold gas electric field and the upstream signal speed are evident in the shock speed, the wave profiles, and the shock formation time. The physical effects created by strong shock waves propagating in hydrogen have been studied up to relativistic conditions. The effect of radiation on shock structure has been investigated for both optically thick and thin cases. The relativistic shock jump equations have been numerically solved for wave speeds approaching the speed of light. Work is in progress on the structure of a thermonuclear shock wave. Extensive digital computations have been completed which determine the chemical equilibrium shock jump conditions for an ionizing shock in hydrogen. The formation of a shock wave has been successfully computed from the viewpoint of kinetic theory. Stability and formation of hydromagnetic waves have also been studied numerically.

KINETIC THEORETIC DESCRIPTION OF SHOCK-WAVE FORMATION (Abstract), by C. K. Chu. [1965] [1]p. [AF 49(638)1254] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 24, Jan. 27, 1965.

Numerical results are obtained on the unsteady 1-dimensional flow of a gas in a shock tube from the viewpoint of kinetic theory. The gas is assumed to be governed by the Krook-model equation and the flow is treated as a pure initial value problem of the Krook equation. In a previous paper, the problem was solved by finite differences for a 1-dimensional gas (corresponding to $\gamma = 3$). The present results are calculated for a monatomic 3-dimensional gas ($\gamma=5/3$). An exact reduction procedure is used to replace the Krook equation for the 3-dimensional gas by a pair of simultaneous Krook equations, each for a 1-dimensional gas; this greatly reduces the computation required. The results agree with free flow at small times and with fluid dynamics at large times. The shock-formation time is found. The developed shock profiles are in agreement with steady profiles computed by Liepmann et. al. Rarefaction-wave dispersion and contact-layer diffusion are automatically incorporated in the results.

A KINETIC-THEORETIC DESCRIPTION OF THE FORMATION OF A SHOCK WAVE, by C. K. Chu. June 1964 [45]p. incl. diagrs. tables. (Rept. no. 11) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1254 and National Science Foundation) AD 606511 Unclassified

Also published in Phys. Fluids, v. 8: 12-22, Jan. 1965.

The classical Riemann problem--the flow of a gas in a shock tube--is treated in the context of kinetic theory as an initial value problem for the one-dimensional Krook equation. The only simplifying assumption made is that the gas is one-dimensional: its particles all move in one direction. This corresponds to a gas with an adiabatic constant $\gamma = 3$. A finite difference method is proposed, utilizing the fact that for sufficiently small time intervals, the gas experiences essentially free molecular flow, so that the collision effects can be treated as a first order correction. The conservation laws are not used. The computed results generalize the classical solution: the computed solution agrees excellently with the classical solution, but in addition, has shock structure, diffusion of the contact discontinuity, and dispersion of the expansion wave, all incorporated. The same procedure is used to calculate steady state shock structure, to which the shock developed in the shock tube is compared. It is seen that for the strength of the shock calculated (pressure ratio of tube 10:1, shock Mach number 1.43, $\gamma = 3$), the shock is essentially "fully-developed" after about 20 mean collision times of the low pressure gas.

NORMAL IONIZING SHOCK WAVES, by R. T. Taussig. 1965, 184p. incl. diagrs. refs. (Rept. no. 23) (AF 49-(638)1254) AD 631372 Unclassified

Solutions to the steady state jump equations are obtained for a normal ionizing shock wave moving into a nonconducting, stationary gas in an electromagnetic field. The properties of ionizing shock waves common to pure MHD and to ordinary gas shocks are discussed. Coupling between electromagnetic and dissociation-ionization effects across the shock is analyzed. Numerical solutions are presented for several electric field strengths in molecular hydrogen using accurate thermodynamic properties and assuming that the gas upstream and downstream from the shock is in chemical equilibrium. The steady state problem of a current-driven shock wave is solved in the context of an electromagnetic annular shock tube. The results agree well with experimental evidence. Evolutionary normal ionizing shock wave solutions are selected and their stability determined in perfect fluid. A theory of shock wave stability in a fully dissipative fluid, based on recent work in magnetohydrodynamics, is outlined.

DEACTIVATION OF NEON METASTABLES BY HYDROGENIC IMPURITIES, by T. Marshall. [1965] [6]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-48, and Office of Naval Research) Unclassified

Published in Jour. Appl. Phys., v. 36: 712-717, Mar. 1965.

Measurements are reported of the total cross section for deactivation of neon $^3P_2$ and $^3P_0(2p^53s)$ metastables by inelastic collisions with H_2, D_2, CH_4, and NH_3. Observations were conducted by applying the methods of resonance radiation absorption and microwave diagnostics to the afterglow plasma following a weak pulsed discharge in a neon-hydrogenic impurity mixture. The cross section for $^3P_2$ deactivation by H_2 was found to increase from 0.7×10^{-15} cm^2 at 300 K to 2.5×10^{-15} cm^2 at 650°K. The cross section for ionization of H_2 by $Ne^*{}^3P_2$ collision was found to represent only a fraction of the above. The reaction which dissociates H_2 and partly converts the metastable energy into Hα(6563A) light has been observed in H_2, D_2, CH_4, and NH_3 and may represent a significant contribution to the total deactivation in each case. No Hα light was produced as a result of the destruction of a helium $^3S_1$ metastable by collision with H_2. (Contractor's abstract)

CONDITIONS FOR A DENSITY MINIMUM IN THE UPPER MANTEL, by O. L. Anderson. [1965] [5]p. incl. tables, refs. (AFOSR-65-2924) (AF 49(638)1355) AD 616168 Unclassified

Also published in Jour. Geophys. Research, v. 70: 1457-1461, Mar. 15, 1965.

A number of recent articles have indicated that there is a density minimum in the upper mantle. An example is the article by Clark and Ringwood, where the density minimum is based upon petrology. In this paper the conditions for a density minimum are established using the Mie-Gruneisen equation of state. It is shown that for a homogeneous mantle with a positive value of thermal expansivity, the sign of the density gradient is the same as the sign of the s velocity gradient. The conditions for a density minimum in a nonhomogeneous upper mantle are also discussed. (Contractor's abstract)

THE RELATION BETWEEN REFRACTIVE INDEX AND DENSITY OF MINERALS RELATED TO THE EARTH'S MANTLE, by O. L. Anderson and E. Schreiber. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-65-2925) (AF 49(638)1355) AD 616166 Unclassified

Also published in Jour. Geophys. Research, v. 70: 1463-1471, Mar. 15, 1965.

It is known that the density of many minerals is related to the average index of refraction by a linear law called the Gladstone-Dale law. It is shown that this law is generally applicable only to minerals whose anion is oxygen and whose mean molecular weight is close to 21. Another relationship, called Drude's law, which is deduced from classical dielectric theory, fits the data just as well as the empirical linear law. The correlation between density and index includes the minerals arising from various combinations of SiO_2, MgO, Al_2O_3, Na_2O, and K_2O. An implication is that density controls certain physical properties of oxides, independently of composition or crystal class. This is analogous to the rule found by Birch which relates sound velocity to density and holds for the same groups of minerals. (Contractor's abstract)

LATTICE DYNAMICS IN GEOPHYSICS, by O. L. Anderson. [1965] [11]p. incl. diagrs. tables, refs. (AFOSR-65-2926) (AF 49(638)1355) AD 616167 Unclassified

Also published in Trans. New York Acad. Sci., Series II, v. 27: 298-308, Jan. 1965.

An arbitrary but useful way to classify solid physical properties is into the classes of lattice properties or defect properties. In lattice dynamics the word lattice indicates lattice properties and the word dynamics indicates the importance of thermal vibrations of atoms to those properties. These properties are defined in terms of the set of normal vibrational modes, calculated from a model composed of discrete masses connected by springs in a large array. This information is contained in a fundamental diagram, associated with the particular

model, called the frequency vs wave number diagram. A few conclusions emerge from this method which are independent of the numerical values of the density and velocity distribution used. It is clear that the region of the largest uncertainty in physical properties is 400-1000 km. It is shown that the Debye temperature is insensitive to the density distribution, and can be regarded as known to within 5%, subject only to drastic revisions in the present estimates of the mean molecular weight of the mantle.

MEASUREMENT OF P AND S SOUND VELOCITIES UNDER PRESSURE ON LABORATORY MODELS OF THE EARTH'S MANTLE, by O. L. Anderson and E. Schreiber. Final rept. Dec. 16, 1963-Dec. 15, 1965, Dec. 16, 1965 [74]p. incl. diagrs. tables, refs. (AFOSR-66-0576) (AF 49(638)1355) AD 478109 Unclassified

The techniques of ultrasonic interferometry were used to measure the isotropic sound velocities and their derivatives for polycrystalline specimens of aluminum oxide and magnesium oxide. The pressure derivatives were determined to 4 kbars at room temperature and at -78.5 C. The temperature derivatives were measured at 1 atm. The isothermal pressure derivatives of the bulk modulus and the isothermal temperature derivatives of the bulk modulus were determined. From these data, the critical temperature gradient for velocities, $(dT\ dP)_v$, were evaluated, and the velocity behavior of these materials as a function of temperature and depth in the mantle, are discussed. It was found that, because $(dT/dP)_{v_p} > (dT/dP)_{v_s}$, they exhibit a shear velocity minimum and a less pronounced longitudinal velocity minimum under conditions likely to exist in the upper mantle. An expression was derived, employing the measured values of the bulk modulus B_0 and its pressure derivative B_0', which predicts compression at extremely high pressures. Using the derived expression $\ln(V_0/V) = [1/B_0' \ln(P/B_0) + 1]$ and the values of B_0 and B_0' for MgO and Al_2O_3 reported here, the agreement between the calculated compression and measured compression reported in the literature was within 0.5% to 350 kbars. THE BULK MODULUS-VOLUME RELATIONSHIP FOR OXIDE COMPOUNDS AND RELATED GEOPHYSICAL PROBLEMS, by O. L. Anderson and J. E. Nafe. [1965] [13]p. incl. diagrs. tables, refs. (AF 49(638)1355) Unclassified

Published in Jour. Geophys. Research, v. 70: 3951-3963, Aug. 15, 1965.

The relationship between the sound velocity and density in various oxide compounds at atmospheric pressure is relevant to problems of the earth's interior. Here data on elastic constants of various compounds are collected and analyzed. It is shown that the bulk modulus-volume per ion pair relationship for oxide compounds differ in a remarkable degree from that found for alkali halides, fluorides, selenides, sulfides, and covalent compounds. It is shown that a change of volume has the same effect on the bulk modulus of oxide compounds, whether the volume change is produced by pressure, compositional variation, phase changes, temperature, or porosity. It thus appears that volume is the primary variable affecting the elastic moduli of oxide compounds, and all other variables affect the moduli only insofar as they affect the volume itself. THE PRESSURE DERIVATIVES OF THE SOUND VELOCITIES OF POLYCRYSTALLINE MAGNESIA, by O. L. Anderson and E. Schreiber. [1965] [8]p. incl. diagr. tables, refs. (AF 49(638)1355) AD 615623 Unclassified

Also published in Jour. Geophys. Research, v. 70: 5241-5248, Oct. 15, 1965.

The sound velocities and the pressure derivatives of the sound velocities of a gem-quality sample of polycrystalline MgO were measured by the 'phase comparison' technique. The pressure derivatives found from experiments at pressures up to 4 kb are $dv_s/dp = 4.351 \times 10^{-3}$ km sec/kb and $dv_p/dp = 7.711 \times 10^{-3}$ km/sec/kb. Arguments are presented which indicate that these pressure derivatives hold up to at least 100 kb. These values yield a vanishingly small value of the pressure derivative of Poisson's ratio. The Grüneisen constants of the shear and longitudinal modes are calculated, from which the acoustic Grüneisen

constant is estimated to be 1.60. This agrees very well, with the Grüneisen constant obtained from thermal properties. (Contractor's abstract)

TWO METHODS FOR ESTIMATING COMPRESSION AND SOUND VELOCITY AT VERY HIGH PRESSURES, by D. L. Anderson. [1965] [7]p. incl. diagrs. table, refs. (AF 49(638)1355) AD 623759 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 54: 667-673, Sept. 1965.

Precision sound velocity measurements made at relatively low pressure (less than 10 kilobars) can be used to estimate sound velocity and volume compression at very high pressures. If the parameters of a continuous analytic function are sufficiently accurately determined at low values of the independent variable, the function may be evaluated at high values of the independent variable, the function may be evaluated at high values of the independent variable. Consequently, only materials undergoing compression without phase change are treated. What is new is the presentation of 2 functions suitable for representing volume dependence upon pressure (compression curves) and the evaluation of the parameters in these functions from acoustic data taken at low pressures but with high precision. The parameters are the bulk modulus and its higher derivatives.

THEORETICAL SEISMOGRAMS OF SPHEROIDAL TYPE ON THE SURFACE OF A HETEROGENEOUS SPHERICAL EARTH, by T. Usami, Y. Sato, and M. Landisman. [1965] [20]p. incl. diagrs. tables. (AFOSR-66-1281) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-303 and National Aeronautics and Space Administration) AD 634557 Unclassified

Also published in Bull. Earthquake Research Inst., v. 43: 641-660, 1965.

Theoretical seismograms for motion of spheroidal type on a Gutenberg-Bullen A' earth model have been computed by superposition of normal modes. Contributions from free oscillations having periods between one minute and one hour and from the fundamental to the tenth radial mode have been included. Surface waves attributed to the first three radial modes appear clearly on the theoretical seismograms. Those of the first mode are common on observational seismograms. Waves reflected from, transmitted through and diffracted around the core, are also evident on the theoretical seismogram. The arrival time of these and other body wave phases agrees well with theoretical arrival times computed by the ray method for the same earth model.

SUPPORT OF VISITING SEISMOLOGISTS, by J. T. Kuo. Final rept. Mar. 1, 1962-Aug. 31, 1965 Sept 1, 1965, 8p. incl. diagr. (AF AFOSR-62-303) AD 624453 Unclassified

During the past three years, nine years, nine visiting seismologists from Japan, England and Denmark have been working either jointly with the Lamont seismology staff or individually on many important problems. As a result of their research progress was made in the following areas. (1) earthquake prediction--considering earthquakes as statistical events in a stochastic process, (2) a more detailed understanding of the travel times of body waves through North America for both nuclear explosions and earthquakes, (3) extending the theoretical investigation of wave propagation through complicated structures, such as a corrugated interface and a medium with a hyperbolic type of interface, and (4) a detailed understanding of the dissipation factor 1 Q both in the upper and the lower mantle and in the core. These findings are closely related to the problems of location of seismic events and of differentiation of explosions from earthquakes.

THERMAL EXPANSION AT LOW TEMPERATURES OF HEXAGONAL METALS. Mg, Zn AND Cd, by R. D. McCammon and G. K. White. [1965] [10]p. incl. diagrs. table, refs. (AFOSR-65-1927) [AF AFOSR-62-391] AD 626891 Unclassified

Also published in Philos. Mag., v. 11: 1125-1134, June 1965.

Measurements were made between 2 and 30 K of the linear thermal expansion of single crystals of Mg, Zn and Cd, both parallel ($\parallel$) and normal ($\perp$) to the hexad axis. Values were obtained at liquid oxygen temperatures and at room temperature which agree with previous data. For Mg, the linear coefficient $\alpha_\perp$ is larger than $\alpha_\parallel$ below 30 K, and at the lowest temperatures (< 10 K) $\alpha_\parallel = (0.9_5 T + 0.021 T^3) \times 10^{-9}$ K^{-1} and $\alpha_\perp = (1.2_5 T + 0.036 T^3) \times 10^{-9}$ K^{-1}, the Grüneisen parameter, γ, remains between 1.4 and 1.5. In Zn, $\alpha_\perp$ is negative between 8 and 70 K; $\alpha_\parallel$ is always positive and increases very rapidly between 10 and 40 K. Gamma has a value of 2.0 at room temperature and below 10 K but has a maximum of about 2.8 at $\theta \sim 15$. For Cd, $\alpha_\perp$ is negative from 5 to 40 K, but below this a positive term, assumed to be due to the electron [illegible] predominates, $\alpha_\parallel$ varies with temperature much [illegible] zinc. Gamma is about 2.3 at high and low temperatures and reaches a maximum of 3.4 at $\theta \sim 15$. (Contractor's abstract)

THE THERMAL EXPANSION OF ALKALI HALIDES AT LOW TEMPERATURES, by G. K. White. [1965] [14]p. incl. diagrs. tables, refs. (AFOSR-65-2549) [AF AFOSR-62-391] AD 627622 Unclassified

Also published in Proc. Roy. Soc. (London), v. 286A: 204-217, June 22, 1965.

Linear thermal expansions of 8 alkali halides have been determined at liquid oxygen temperatures and at temperatures from 30 down to 2 K. For temperatures T θ 20, where θ is the Debye temperature, the expansion coefficients are well represented by $\alpha = AT^3 + BT^5$. Values are reported for the Grüneisen parameter $\gamma = 3\alpha V C\chi$, where C/V is the heat capacity per unit volume and χ is the compressibility. For CsBr (b. c. c. structure) γ appears to be nearly independent of temperature, with a value of 2·0 but for the other crystals, which have the rock-salt structure, the parameter γ varies with temperature, chiefly between θ/10 and θ/5. At room temperature, γ lies between 1·45 and 1·7 but at low temperature this generally decreases to a value γ_0 which is ~ -0.1 for RbI, + 0.3 for KCl, KBr and KI and 1.0 for NaCl and NaI. LiF does not show this decrease, γ_0 being 1.7. The values observed for γ_0 are compared with those calculated from elastic constants and their pressure derivatives and the general behavior of γ(T) is observed to conform qualitatively to the predictions of simple theoretical models of Born, Blackman and Barron. Commonwealth Scientific and Industrial Research Organization, Div of Physics, Sydney (Australia).

THERMAL EXPANSION OF GERMANIUM AND SILICON AT LOW TEMPERATURES, by R. H. Carr, R. D. McCammon, and G. K. White [1965] [7]p. incl diagrs. table, refs. (AFOSR-65-2557) [AF AFOSR-62-391] AD 628423 Unclassified

Also published in Philos. Mag., v. 12: 157-163, July 1965.

The linear expansion coefficients (α) of silicon and germanium are reported at temperatures down to θ 50. At temperatures below 16 K, the expansion coefficients are very small but are positive and hence the Grüneisen parameter γ 3αVK C (K is the bulk modulus and C V is heat capacity per unit volume) is positive. At T θ 15, γ has a minimum value of ~0.1 for germanium and ~0.42 for silicon. At higher temperatures α and γ become positive and agree with data of Gibbons. Individual γ-values for the transverse acoustic modes must be reduced considerably by dispersion to account for the deep minimum in γ(T). (Contractor's abstract)

Commonwealth Scientific and Industrial Research Organization. Div. of Physics, Sydney (Australia).

THERMAL PROPERTIES OF SILICA AT LOW TEMPERATURES, by G. K. White and J. A. Birch. [1965] [5]p. incl. diagrs. table, refs. (AFOSR-65-2558) [AF AFOSR-62-391] AD 628424 Unclassified

Also published in Phys. and Chem. Glasses, v. 6: 85-89, June 1965.

At temperatures below 20° K, the magnitude of the negative thermal expansion of vitreous silica is reduced by about 10% with increase in fictive temperature from 1000 to 1400° C. A much greater reduction of 2 to 4 times is produced by fast neutron irradiation (5 x 10^{19} nvt). Corresponding changes in density and the heat capacity (observed at low temperatures) also occur. The negative expansion and other 'anomalous' properties appear to have a common origin in view of the parallel changes in these properties which occur with heat treatment, irradiation, and network-filling additives. Low-frequency transverse optical modes of vibration seem to be responsible but it is puzzling that the anomalous behavior persists at such low temperatures (~ 2°K). (Contractor's abstract)

Commonwealth Scientific and Industrial Research Organization. Div. of Physics, Sydney (Australia).

THERMAL EXPANSION OF MAGNETIC METALS AT LOW TEMPERATURES, by G. K. White. [1965] [11]p. incl. diagrs. tables, refs. (AFOSR-65-2590) [AF AFOSR-62-391] AD 629558 Unclassified

Also published in Proc. Phys. Soc. (London), v. 86: 159-169, July 1965.

Measurements have been made from 2° to 30°K and 60° to 90 K of the thermal expansion of iron, cobalt and nickel, which show that the Grüneisen parameter γ_l for the lattice decreases slightly at low temperatures and that the electronic parameter γ_e (calculated from the ratio of the electronic contributions to expansion and heat capacity) is about 2. 2. Similar measurements below 30 K on α-manganese, chromium, face-centered cubic iron-nickel (35-50% Ni) alloys and $Fe_{0.5}Mn_{0.5}$ indicate a negative term, proportional to T, in the expansion coefficient. This is particularly large in Invar and in α-manganese. For γ-manganese (+ 15% Cu), no negative term is observed in the expansion. Results are discussed in terms of electronic and magnetic contributions (Contractor's abstract)

VOCAL MIMICRY IN TURSIOPS: ABILITY TO MATCH NUMBERS AND DURATIONS OF HUMAN VOCAL

BURSTS, by J. C. Lilly. [1965] [2]p. incl. diagrs. (AFOSR-65-1513) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-415] and National Institutes of Health) AD 623492
Unclassified

Also published in Science, v. 147: 300-301, Jan. 15, 1965.

In addition to its normal underwater sonic communication path, the dolphin, Tursiops truncatus, can be trained to emit sounds from the blow-hole opened in air. By proper rewarding and evocative techniques, such vocal emissions can be changed from the natural patterns. One such group of new sounds is said to resemble the human voice. Aspects of these sounds which are physically determinable, specifiable, and demonstrable are the similarities in numbers of bursts of sound emitted by man and dolphin and in durations of successive emissions. In 92% of the exchanges the number of bursts emitted by Tursiops equalled, ± 1, the number just previously emitted by a man in sequences of 1 - 10 bursts.

STRATEGIES OF FUNCTION DECOMPOSITION FOR ARTIFICIAL INTELLIGENCE, VOL. II, by D. G. Willis. [Final rept.] Sept. 1964-June 1965. July 1, 1965, 152p. incl. diagrs. tables. (AFOSR-65-1612) (AF 49(638)-1454) AD 620186 Unclassified

Preliminary results are reported in 13 research notes on strategies of function decomposition solely from observations of inputs (variable configurations) and outputs (function values). The classes of functions to which the results apply include discrete, finite, deterministic functions as well as arbitrary close discrete approximations to continuous functions of continuous variables. Non-deterministic (i.e., probabilistic) and sequential (i.e., finite automata) functions are not included. The research notes consider (a) decomposition costs and the equivalence of all measures of cost or complexity, (b) the detection of economical decompositions; and (c) generalizing properties of economical decompositions. Efficient procedures are suggested for detecting economical non-composite decompositions of any given partial or total discrete function solely from input and output observations. Composite decompositions become tractable when enough is known or properly conjectured about their sub-functions.

CHARGE-STATE CORRELATIONS IN Ar^+-Ar COLLISIONS, by E. Everhart and Q. C. Kessel. [1965] [3]p. incl. diagrs. (AFOSR-65-2811) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-805] and Army Research Office (Durham)) AD 614545 Unclassified

Also published in Phys. Rev. Ltrs., v. 14, 247-249, Feb 22, 1965.

Single collisions of Ar^+ on Ar at 25 to 150 kev were studied using a coincidence scattering device. For the reaction $Ar^+ + Ar \rightarrow Ar^{m+} + (m+n-1)e$, the charge states m and n of both particles from the same large-angle collision were determined. The probabilities of observing m and n in coincidence were found, and the inelastic energy loss for the (m, n) reaction was determined. No correlation between m and n was found, and an interpretation of the observations was developed.

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Also published in Phys. Rev. Ltrs., v. 14, 484-486, Mar. 29, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 459, Apr. 26, 1965.

In certain Ar^+ on Ar collisions, in particular for 25-kev scattering at 16° and other collisions having the same distance of closest approach, 3 discrete values exist for the inelastic energy loss Q, roughly 90, 380, and 610 ev, all ± 20 ev. Using coincidence methods, it was shown that the 1st and 3rd Q values correspond to events where the distribution after collision among the charge states of one particle is uncorrelated with the charge state of the other particle. However, for the 2nd Q value, the charge-state distributions are found to be correlated. The data are consistent with a model wherein there are only 2 intermediate atomic (perhaps autoionization) levels, A ~ 50 and B ~ 310 ev appearing in each atom after collision. The three Q values correspond to 2A, A + B, and 2B, respectively. Apparently level B begins to appear when the L shells of the 2 argons interpenetrate during the collision.

WIDTHS OF Q-DISTRIBUTIONS IN Ar^+ ON Ar COLLISIONS (Abstract), by E. Everhart and Q. Kessel [1965] [1]p. [AF AFOSR-65-805] Unclassified

Published in Fourth Internat'l. Conf. on Physics of Electronic and Atomic Collisions, Abstracts of Papers, Laval U., Quebec (Canada) (Aug. 2-6, 1965), New York, Science Bookcrafters, Inc., [1965] p. 287.

Large-angle single collisions of Ar^+ ions on Ar targets have been studied at 25 kev using a coincidence scattering apparatus. In these violent collisions there is

considerable interpenetration of the 2 atoms such that the L-shells overlap in some cases. Recent theories have described conflicting models of the mechanism of the interaction. With the data obtained using a coincidence scattering apparatus and the recent measurements designed to measure this distribution more accurately, it should be possible to resolve some of the differences between these models. THIN ELASTIC PLATES AND SHELLS, PILE GROUPS, MAGNETIC FILMS AND NON-LINEAR BENDING, by P. M. Quinlan. Final rept. Mar. 15, 1965, 8p. (AFOSR-65-0738) (AF EOAR-63-21) AD 615440 Unclassified

This research is a continuation of the study of thin elastic shells through the use of double Fourier series, using Dirac delta functions summed to a single series. It extends earlier work on rectangular plates, taking examples from aeroelasticity, and investigates general equations or equilibrium of a thin plate. Included are considerations of non-constant curvature in the case of the bending and buckling of shallow shells of revolution.

THE ν-METHOD FOR RECTANGULAR PLATES, by P. M. Quinlan. [1965] [25]p. incl. diagrs. tables. (AFOSR-66-0211) (AF EOAR-63-21) AD 630448 Unclassified

Also published in Proc. Roy. Soc. (London), v. 288A: 371-395, Nov. 1965.

A comprehensive method is presented for the numerical solution of the rectangular plate problem under a wide range of loadings and boundary conditions. A particular integral is obtained as a double Fourier sine series, which is the complete solution when the plate is simply supported with all edges in the same horizontal plane. This is summed to a highly convergent single series of negative exponentials in the plate variables. The necessary calculus for differentiation and integration is established, from which the particular slopes, moments and shears follow whether for concentrated or line loads or loads distributed uniformly over polygonal regions. By treating a concentrated moment as a force-pair, this case is deduced from that for a concentrated load. The necessary complementary functions and the ensuing simultaneous equations are formulated in a manner suited to programming for an electronic computer. A master program for rectangular plates has been developed in mercury autocode at the university of Sheffield. An illustrative example is included of a concentrated moment acting on a fully fixed rectangular plate. (Contractor's abstract)

CATALYTIC RECOMBINATION IN STEP-FUNCTION FLOWS OF ATOMIC OXYGEN, by A. L. Myerson.

Final rept. Jan. 1965 [25]p. incl. illus. diagrs. tables, refs. (AFOSR-65-0125) (AF 49(638)782)
Unclassified

The research provided a new understanding of the time-dependent thermal behavior of various metallic surfaces to recombination heating caused by step function or pulsed flows of atomic oxygen. Solutions for the absolute value of surface recombination efficiency and the diffusion layer mass transfer of a cylindrical probe in Oseen flow were obtained. A purely mathematical solution to this flow is also underway. A theoretical analysis was made of the effect of pressure gradient on a chemically frozen boundary layer. Relationships were obtained between surface recombination heating and pressure gradients in the boundary layer for both relatively noncatalytic and highly catalytic surfaces.

MECHANISMS OF SURFACE RECOMBINATION FROM STEP-FUNCTION FLOWS OF ATOMIC OXYGEN OVER NOBLE METALS, by A. L. Myerson. [1965] [7]p. incl. illus. diagrs. table, refs. (AFOSR-65-1711) (AF 49-(638)782) AD 627487 Unclassified

Also published in Jour. Chem. Phys., v. 42 3270-3276, May 1, 1965.

Surface recombination on 4 noble metals and titanium dioxide has been studied in flows containing a step-function increase in oxygen atom concentration. This has been accomplished by means of thin film heat-transfer techniques using catalytic and noncatalytic films. It is shown that silver, gold, platinum, palladium, and titanium dioxide all have the same small, but significant, catalytic efficiency during the first 50 or so msec of their initial exposure to atomic oxygen but that oxides are quickly formed on the metal surfaces which determine the catalytic ability during succeeding exposure. In some cases, these oxides are unstable and quickly converted to other oxides of different catalytic efficiency which determine the final catalytic properties of the metal. It is also shown that the better recombination catalysts are those for which the average metal-oxygen bond energies of the oxides are weaker. (Contractor's abstract)

EXPERIMENTAL STUDY OF THE COLLIMATION PROBLEM IN A HIGH-INTENSITY MOLECULAR BEAM, by G. T. Skinner and J. Moyzis. [1965] [7]p incl diagrs. refs. (AF 49(638)793) Unclassified

Published in Phys. Fluids, v. 8 452-458, Mar. 1965

The discrepancy between the experimentally observed beam intensities obtained with nozzle sources, and the intensities predicted by the inviscid theory is generally attributed to viscous effects upstream of the "skimmer." Experiments are described which show the scattering of a 1.2-ev nitrogen beam downstream of a "skimmer" or collimator. Such scattering can only result from collisions with slow molecules, traveling with the beam, coming from the viscous region upstream. Elimination of this scattering was accomplished by limiting the radial extent of the flow field approaching the "skimmer," and beams were obtained having the theoretically available intensity.

Also published in Rarefied Gas Dynamics, Proc. of the Fourth Internat'l. Symposium, Toronto U. (Canada) (July 14-17, 1964), ed. by J. H. de Leeuw. New York Academic Press, v. 1: 467-486, 1965

Experimental heat transfer and pressure data are presented which extend from the classical thin boundary

layer regime to near-free-molecule flow with Knudsen numbers based on ambient stream conditions as large as 5. These data are compared with viscous shock layer theory for heat transfer and with theory for the combined effects of wedge angle and boundary layer displacement to define the theoretical range of validity and to identify the low density departures from boundary layer theory. It is noted that low density effects are first evident in the pressure data. It is concluded that the cause of these departures cannot be identified within existing solutions based on the Navier-Stokes relations. It is hypothesized that the departures might stem from second-order Burnett molecular effects. (Contractor's abstract)

PLANETARY RADAR ASTRONOMY, by G. Pettengill. [1965] [11]p. incl. diagrs. table, refs. (AFOSR-65-1765) (AF 49(638)1156) AD 625980 Unclassified

Presented at NATO Advanced Study Inst., Nat'l. Observatory of Athens, Cape Sounion (Greece) Aug. 2-15, 1964.

Also published in Solar System Radio Astronomy, ed. by J. Aarons, New York, Plenum Press, 1965, p. 401-411.

A review is presented of the development of radar astronomy and its application to the study of planetary orbits, surfaces, and rotations. Its most important result is an improved value for the astronomical unit of 149,598,000 ± 500 km. From the strength of the returned echoes, it is possible to exclude the presence of substantial amounts of liquid water on Mercury, Venus, and Mars. Venus appears to have the densest surface, approximately the same as for solid terrestrial rocks. Mercury appears to reflect in most respects like the moon, but Mars has a surface reflectivity which is highly variable and appears to be correlated with surface position. The surface slopes of Venus appear to be less steep than in the case of the moon, while for Mars they are smoother yet. In the case of Venus, rotation has very reliably been established to be 247 ± 5 days retrograde sidereal with an axis oriented very nearly perpendicular to the orbital plane of the planet.

LUNAR RADAR REFLECTIONS, by G. Pettengill. [1965] 15p. incl. diagrs. tables, refs. (AFOSR-65-2269) (AF 49(638)1156) AD 628197 Unclassified

Presented at NATO Advanced Study Inst., Nat'l. Observatory of Athens, Cape Sounion (Greece), Aug. 2-15, 1964.

Also published in Solar System Radio Astronomy, ed. by J. Aarons, New York, Plenum Press, 1965, p. 355-369.

The radar cross section of the moon has been measured over a frequency range of about 10 octaves, stretching from 7.84 m to 8.6 mm. Within the accuracy of measurement, which in only a few cases exceeds a factor of 2, there is no significant frequency dependence. The mean of all measurements yields a value of 0.07 of the geometrical (disk) cross section. The angular scattering law has also been determined over a wide range of frequencies, although the best measurements appear to lie in the region from 70 to 8.6 cm. There is a marked frequency dependence both in the mean surface slopes and in the fraction of surface which appears to scatter roughly. At the longer wavelengths the mean surface slope is about 1 in 7, while in the millimeter region the corresponding value approaches 1 in 2. The division of power between the quasi-specular peak corresponding to normal reflection from large smooth areas and the largely nondirectional scattering from rough areas varies from 4 to 1 (favoring quasi-specular) at 68 cm to 1 to 6 (favoring rough) at 0.86 cm. The measurements described above may be used to deduce a surface dielectric constant of about 3. For most likely surface materials this requires a bulk density of about one-half that of siliceous rocks typical of the earth's

surface. This value is larger than that deduced for the visible lunar surface and undoubtedly corresponds to conditions a few meters below.

RADIOMETRIC OBSERVATIONS OF JUPITER AT 430 MC/S, by H. E. Hardebeck. [1965] [1]p. (AFOSR-65-2812) (AF 49(638)1156) AD 629335 Unclassified

Also published in Astrophys. Jour., v. 141: 837, Feb. 15, 1965.

During January and February of 1964, 17 drift-curves of the planet Jupiter were made. The average black-body disk temperature for the observations was 26,700 K ± 1300°K (standard error), which produces a flux density of $5.80 \pm 0.28 \times 10^{-26}$ watts/m^2/(c/s) at a distance corresponding to a polar semidiameter of 22.75" (4.04 A.U., the mean least Earth-Jupiter distance). This value falls in the range reported by Drake and Hvatum (1960) for 3 sets of measurements at 68 cm during 1959. The present observations represent too few Jovian longitudes for any intensity-longitude dependence to be observed.

A RADAR DETERMINATION OF THE ROTATION OF THE PLANET MERCURY, by G. H. Pettengill and R. B. Dyce. [1965] 2p. incl. diagrs. (AFOSR-65-2868) (AF 49(638)1156) AD 629334 Unclassified

Also published in Nature, v. 206: 1240, June 19, 1965.

Radar observations at 430 mc/s with an aerial gain of 56 dB and a transmitted power of 2 mw resulted in sufficient sensitivity to obtain echoes not only from the nearest part of the planetary disc, but also from more distant regions. By using short pulses of 500 μsec duration it was possible to isolate the echo power from these more distant regions, and to carry out a Fourier analysis of their spectral composition. Since the source of the delayed echoes can quite reliably be associated with a known area of the planetary surface, the magnitude of the apparent planetary rotation can be inferred from the measured spectral dispersion. The rotation was found to be direct with a sidereal period of 59 ± 5 days. The findings of a value which differs from the orbital period indicates that either the planet has not been in its present orbit for the full period of geological time or that the tidal forces acting to slow the initial rotation have not been correctly treated previously.

ENHANCEMENT OF PLASMA DENSITY FLUCTUATIONS BY NONTHERMAL ELECTRONS, by F. Perkins and E. E. Salpeter. [1965] [8]p. incl. refs. (AFOSR-65-2876) (AF 49(638)1156) AD 629336 Unclassified

Also published in Phys. Rev., v. 139: A55-A62, July 5, 1965.

In a plasma in thermal equilibrium, the spectrum of electron density fluctuations that have a wavelength longer than the Debye length has a sharp maximum near the electron plasma frequency. In this paper, the effect of a non-Maxwellian electron velocity distribution on the spectrum of electron density fluctuations is computed for frequencies near the electron plasma frequency. The electron velocity distribution is assumed to be isotropic but not necessarily Maxwellian and the effects of electron-ion collisions are included. The results show how the presence of a small number of energetic electrons can enhance the intensity of the fluctuations near the plasma frequency, provided the Landau damping resulting from these energetic electrons is greater than both the collision damping and the Landau damping caused by the ambient electrons. The results are applied to the ionosphere radar-backscatter experiments, where the energetic electrons are photoelectrons produced by solar uv radiation. In the case of the Arecibo radar experiments, the intensity of the fluctuations near the electron plasma frequency is estimated to be enhanced at plasma frequencies greater than about 4 or 5 mc sec (Contractor's abstract)

ARECIBO RADAR-RADIO TELESCOPE-DESIGN AND CONSTRUCTION, by T. C. Kavanagh and D. H. H. Tung. [1965] 30p. incl. illus. diagrs (AFOSR-66-0399) (AF 49(638)1156) AD 629468 Unclassified

Also published in Jour. Construction Div., ASCE, v 91: 69-98, May 1965.

The design and construction of the radar-radio telescope at the Arecibo, Puerto Rico Ionospheric Observatory

was described. The fixed-dish spherical reflector has an 870-ft radius and a 1,000-ft diameter. The movable feed, capable of scanning the sky to 20 from the zenith, is independently suspended from three reinforced concrete towers using steel cables. Rigid specifications and a low budget required the application of many advanced structural, mechanical, and electronic concepts. The site selection, construction of the towers using slip frames, and erection and suspension of the movable feed are described in detail. (Contractor's abstract, modified)

MOTION OF A TEST PARTICLE IN A PLASMA, by F. Perkins. [1965] [7]p. incl. refs. (AFOSR-66-1443) (AF 49(638)1156) AD 639876 Unclassified

Also published in Phys. Fluids, v. 8: 1361-1367, July 1965.

The motion of a charged test particle in a completely ionized gas without a magnetic field is investigated. The possible trajectories of this test particle are described by a distribution function that spreads out in phase space as time increases. A convergent kinetic equation which accounts for long-range collective effects and short-range collisions in a consistent manner is derived to describe the time evolution of the distribution function. Expressions for the energy loss rate and dynamical friction are calculated from appropriate moments of the kinetic equation, and they show how the Coulomb logarithm, $\ln\Lambda$, varies with the velocity of the test particle. The errors introduced by the use of a convergent kinetic equation are estimated and these indicate that the kinetic equation method gives the test particle's diffusion in phase space only on coarse grained time and spatial scales. For the case of a fast electron, the time scale must be larger than the electron plasma period and the spatial scale larger than e^2/KT. (Contractor's abstract)

A REVIEW OF RADAR STUDIES OF PLANETARY SURFACES, by G. H. Pettengill. [1965] 6p incl. diagrs. refs. (AFOSR-66-1455) (AF 49(638)1156) AD 638242 Unclassified

Also published in Radio Science, v. 69D. 1617-1623, Dec. 1965.

In recent years, radar has been used to study the surfaces of the planets Mercury, Venus, Mars, and Jupiter. In the case of Venus, attenuation in the planetary atmosphere at short wavelengths has also been reported. For Mercury and Venus, where the diurnal rotation is difficult to establish by other means radar has provided a clear-cut determination of the sidereal periods as 59 and 247 days, respectively. Mercury is found to possess surface conditions not unlike those on the Moon. Venus appears to have a surface considerably denser and smoother than the Moon, but displaying several localized regions of scattering enhancement. Mars appears smoother than the other planets, with a marked degree of surface differentiation. Except for one brief period of observation in 1963, Jupiter appears exceedingly inefficient as a reflector of decimetric radio energy. (Contractor's abstract)

RECENT ARECIBO OBSERVATIONS OF MERCURY, by G. H. Pettengill. [1965] [1]p. incl. diagr. (AFOSR-66-1702) (AF 49(638)1156) AD 638230 Unclassified

Also published in Radio Science, v. 69D: 1627-1628, Dec. 1965.

The rotation rate of mercury is derived from recent radar measurements made at the Arecibo Ionospheric Observatory. The best estimate appears to be a sidereal rotation period of 59 ± 5 days in the direct sense. By making use of short pulses, enough echo strength was available from the planetary surface to measure the doppler frequency spectrum at known relative delays.

RESULTS OF RECENT INVESTIGATIONS OF JUPITER'S DECAMETRIC RADIATION, by T. D. Carr, S. Gulkis and others. [1965] 8p. incl. diagrs. refs. (AFOSR-66-2683) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1156, Army Research Office (Durham), National Aeronautics and Space Administration, National Science Foundation and Office of Naval Research) AD 643582 Unclassified

Also published in Radio Science, v. 69D: 1530-1536, Dec. 1965.

The activity of Jupiter's decametric radiation appears to be greatest between 5 and 10 mc/sec, but measurements made below 10 mc/sec are subject to large ionospheric errors. No significant change in rotation period has appeared since 1960. The effect of the satellite Io as reported by Biggs has been corroborated. Marked variations in axial ratio with System III longitude were observed, from which estimates were made of the meridians of the poles. A ray-tracing study was made of the focusing of radiation escaping from possible Jovian field-alined ducts. The effect of asymmetrical stop zones is discussed. A possible explanation of the influence of Io is offered. (Contractor's abstract)

THE GRAVITATIONAL COMPASS, by P. Szekeres. [1965] [5]p. incl. diagrs. refs. (AFOSR-66-0382) (AF AFOSR-63-321) AD 630231 Unclassified

Also published in Jour. Math. Phys., v. 6: 1387-1391, Sept. 1965.

A purely covariant approach to general relativity, using the equation of geodesic deviation, is adopted. The physical interpretation is essentially that due to Pirani, but instead of using clouds of particles to analyze the gravitational field, a 'gravitational compass' is proposed which fulfills the same purpose. Particular attention is focussed on the different roles played by the matter and the free gravitational field. The latter splits up conveniently into a super-position of a tranverse wave component, a longitudinal component, and a 'Coulomb' field, all of which introduce 'shearing' forces on the gravitational compass, while the matter contributes a general contraction. Applications to the Friedmann cosmological models and the problem of interacting gravitational waves are discussed. (Contractor's abstract)

Also published in Inorg. Chem., v. 4: 73-77, 1965.

The Hall voltage, electrical resistivity, and thermoelectric power have been measured as a function of temperature on single crystals of WO_3 in the range 140 - 300 K. Discontinuities appear on cooling at approx +10 and -40 , corresponding, respectively, to a monoclinic-to-triclinic, γ-to--, and a piezoelectric-to-ferroelectric, --to-α, transition. The γ-to-- transition is strongly dependent on the domain characteristics and the impurity concentrations of the individual crystals. Introduction of oxygen vacancies leads to disappearance of the discontinuities at +10 and -40 . (Contractor's abstract)

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10. 488, Apr. 26, 1965.

Single crystals of α-Zn_2SiO_4 containing 0.03 mol% Mn^{2+} were grown from the melt. The electron-paramagnetic-resonance spectra were studied at X-band and K-band frequencies at room temperature for various crystallographic orientations. The spectra are complicated because of 6 nonequivalent Mn^{2+} sites per unit cell, each giving the usual 30 allowed lines centered about a magnetic field corresponding to a g value of 2.00. The crystallographic symmetry has a 3-fold rotation axis that groups the 6 sites into 2 sets. The axial field parameter D for one set of sites is 0.07 cm^{-1}. This relatively large D value accounts for intense forbidden lines ($\Delta m_I = \pm 1$) that were observed. The number of sites is consistent with substitutional replacement of Zn^{2+} by Mn^{2+}.

Also published in Jour. Amer. Chem. Soc., v. 87: 1933-1941, May 5, 1965.

Carbon and oxygen kinetic isotope effect (k_{12}/k_{13} = 1.030 and k_{16}/k_{18} = 1.014) have been determined for decarboxylation of the maleic anhydride adduct of α-pyrone. Subjected to both approximate and exact theoretical analysis, they require a one-center transition state. the C-C bond connecting the labile lactone to the remainder of the molecule is effectively broken in the transition state whereas the C-O connecting bond remains virtually intact. Exact analysis provides a more quantitative description and relates structural to experimental uncertainties. The reliability of these conclusions is shown to depend critically on the use of heavy atom kinetic isotope effects measured at multiple, ad-

adjacent sites. Some more general aspects of the one-center and two-stage descriptions of Diels-Alder addition are discussed. (Contractor's abstract)

THE MECHANISM OF A DIELS-ALDER REACTION. I. A RETRODIENE DECARBOXYLATION, by M. J. Goldstein and G. L. Thayer, Jr. [1965] 9p. incl. diagrs. tables, refs. (AFOSR-65-2196) (AF 49(638)942 and AF AFOSR-63-142) AD 626511 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 1925-1933, May 5, 1965.

The mechanistic problem of Diels-Alder addition is reconsidered and the advantages to be gained from heavy atom kinetic isotope effect studies are indicated. Decarboxylation of the maleic anhydride adduct of α-pyrone is the shown to satisfy applicable criteria for Diels-Alder retrogression: (a) production of cis-1,2-dihydrophthalic anhydride as the kinetically controlled product, (b) adequately first-order kinetics with $\Delta H^* = 33.2$ kcal/mole and $\Delta S^* = 2.69$ e.u.; and (c) identification of the lactonic function as the source of 99.3% of the carbon dioxide liberated. The accepted structures of both reactant and product are confirmed but not that of an isomer of the product, the purported 4,5-dihydrophthalic anhydride, here identified as 1,4-dihydrophthalic anhydride. The dipole moment of the reactant (1.34 D.) is consistent with expectation for the endo isomer.

A KINETIC DESCRIPTION OF THE VAN HOVE CORRELATION FUNCTIONS, by M. Nelkin, J. M. J. Van Leeuwen, and S. Yip. [1965] 24p. incl. diagrs. refs. (AFOSR-65-1961) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-324 and Atomic Energy Commission) AD 626515 Unclassified

Also published in Inelastic Scattering of Neutrons, Vienna, International Atomic Energy Agency, v. 2: 35-58, 1965.

The Van Hove density correlation function $G(r,t)$ for a classical fluid is written as the integral over momenta of an appropriate one-particle distribution function $F(r,\vec{p},t)$. A similar procedure gives the self-correlation function $G_s(r,t)$ in terms of a different distribution function $F_s(r,\vec{p},t)$. It is shown that for moderately dense gases these distribution functions can be calculated from kinetic equations. The kinetic equations are derived from density series expansions of $F(r,\vec{p},t)$ and $F_S(r,\vec{p},t)$. For times short compared to the time between collisions the density series can be used directly. For longer times it is necessary to sum an infinite series of terms in order to properly account for the effects of multiple collisions. The summation of the most dominant terms can be carried out in terms of the solution to an integral equation. If the effects of incomplete collisions can be ignored, the appropriate equation for $F(r,\vec{p},t)$ becomes the linearized Boltzmann equation as used in the theory of sound propagation in gases. The appropriate equation for $F_s(r,\vec{p},t)$ becomes the neutron transport equation. The kinetic equations are directly applicable only to dilute systems; however, they are suitable for a systematic study of dynamical correlations. The essential difference between the 2 equations is the collisional invariants.

DERIVATION OF KINETIC EQUATIONS FOR SLOW-NEUTRON SCATTERING, by J. M. J. Van Leeuwen and S. Yip. [1965] [14]p. incl. diagrs. refs. (AFOSR-65-2956) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-324 and Atomic Energy Commission) AD 627982 Unclassified

Also published in Phys. Rev., v. 139: A1138-A1151, Aug. 16, 1965.

It is shown that for moderately dense classical gases Van Hove's correlation functions $G(r,t)$ and $G_s(r,t)$ can be calculated from kinetic equations. The kinetic equations are derived from the cluster expansion of a one-particle distribution function which describes the propagation of a density-momentum impulse. For times short compared with the time between collisions, the density series can be used directly. But for longer times a different treatment is necessary because of the increasing importance of multiple collisions. Considering only the dominant terms, the series is shown to be the iterated solution of an integral equation. In lowest order, this equation has the form of a linearized Boltzmann equation in which the collision kernel is nonlocal because of the finite extent of the particles, and is

non-Markoffian if the duration of a collision is finite. The present approach permits a systematic treatment of coherent as well as incoherent scattering. In particular, we demonstrate an earlier assertion that the appropriate equations for studying the 2 kinds of scattering are, respectively, the linearized Boltzmann equation and the neutron transport equation. The effects of statistical correlation are introduced approximately in the kinetic equations in lowest order. (Contractor's abstract)

SPECTRAL WIDTH OF THE CRITICAL OPALESCENCE DUE TO CONCENTRATION, by P. Debye, Jr. [1965] 2p. (AFOSR-65-1676) (AF AFOSR-65-750) AD 617017 Unclassified

Also published in Phys. Rev. Ltrs., v. 14. 738-784, May 10, 1965.

It has been found that the spectral line characterizing the light scattered by a binary mixture in the vicinity of its critical point sharpens up extraordinarily with decreasing scattering angle and with decreasing temperature distance. In this case the linewidth is theoretically determined mainly by the diffusion coefficient of the 2 liquids in each other, and the effect indicates that this coefficient tends to zero at the critical point. An attempt is made to explain the effect. Two rules are formulated: (a) For the angle I of scattering characterized by the function $s = 2 \sin 1/2 I$, the scattering line broadens proportional to s^2 with increasing I, (b) The scattering line should broaden proportional to the temperature distance $T-T_c$, where T is the temperature at which the experiment is performed and T_c is the critical temperature.

OBSERVATIONS ON THE MORPHOLOGICAL CHANGES IN THIN COPPER DEPOSITS DURING ANNEALING AND OXIDATION, by L. Bachmann, D. L. Sawyer, and B. M. Siegel. [1965] [5]p. incl. illus. table. (AFOSR-66-0052) [AF AFOSR-65-770] AD 629839 Unclassified

Also published in Jour. Appl. Phys., v. 36: 304-308, Jan. 1965.

Thin copper films were deposited in an ultrahigh vacuum on carbon and silicon monoxide substrates at room temperature. Their morphological changes after annealing and oxidation were investigated by electron microscopy and and electron diffraction. The changes during annealing of very thin deposits (< 50 A mean thickness) are strongly influenced by the substrate. The copper on carbon substrates grows into large crystallites during heat treatment at 500 C whereas on silicon monoxide substrates very little recrystallization occurs. During the annealing of thicker deposits of copper self-diffusion of the metal can take place and the change in structure of the heat-treated film is independent of the substrate. The structures of the cuprous oxide particles formed during exposure to different pressures of oxygen at 150 to 200 C indicate that different transport mechanisms are involved in the oxidation process at very low oxygen pressures from those at pressures above 10^{-2} Torr. Conditions for and methods of aligning a 2-crystal spectrometer are discussed. These include the alignment of rotation axes, crystals, and x-ray beam. The results of a new nondispersive crystal alignment procedure are compared in detail with theory for a typical case of CuKα radiation and calcite crystals. This method is contrasted with other procedures which lead only to pseudo-alignments. It is shown that x-ray methods which are sensitive to vertical divergence do not lead to crystal alignment unless the beam is already perfectly aligned. It is concluded that the x-ray beam can be aligned only after the crystals have been aligned. (Contractor's abstract)

SPECTRAL MEASUREMENTS WITH ALIGNED AND MISALIGNED TWO-CRYSTAL SPECTROMETERS. I. THEORY OF THE GEOMETRICAL WINDOW, by H. W. Schnopper. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-65-1987) (Sponsored jointly by Advanced Research Projects Agency; Air Force Office of Scientific Research under AF 49(638)402, and National Science Foundation) AD 627462 Unclassified

Also published in Jour. Appl. Phys., v. 36: 1415-1423, Apr. 1965.

It is shown in this paper that (1) the geometrical window of the instrument is a function of the alignment of the crystals, the beam, and the rotation axes as well as the vertical divergence; (2) even for the case of perfect spectrometer alignment, errors are introduced into the measurement of the spectral parameters because of the presence of a finite vertical divergence in the x-ray beam; and (3) improper beam and crystal alignment cause inaccuracies in the measurement of spectral parameters. Calculations which predict the effects of vertical divergence and of beam and crystal misalignment on the geometrical window and also on the wavelength position, line shape, linewidth, and line asymmetry of the (1, +1) and (1, -1) curves are made for the case of CuKα radiation reflected from calcite crystals. In particular, it is shown that the error in the measurement of the Bragg angle is 6 1/2 times more sensitive to misalignment of the central ray of the x-ray beam than it is to total vertical divergence.

THEORETICAL FITTING OF THE ARGON K ABSORPTION SPECTRUM ON A ONE-ELECTRON MODEL, by T. Watanabe. [1965] [5]p. incl. diagrs. table, refs. (AFOSR-66-1486) (Sponsored jointly by Advanced Research Projects Agency, Air Force Office of Scientific Research under [AF 49(638)402], and National Science Foundation) AD 636706 Unclassified

Also published in Phys. Rev., v. 139: A1747-A1751, Sept. 13, 1965.

The one-electron model was used to analyze the argon K absorption spectrum near the K edge. It was assumed that the absorption spectrum consists of (1) two Lorentzians due to $1s \rightarrow 4p$ and $1s \rightarrow 5p$ resonant transitions, (2) a modified arctangent to account for the $1s \rightarrow np (n \geq 6)$ and the $1s \rightarrow$ continuum transitions, and (3) a constant background due to the L, M ionizations. The transmission spectrum containing adjustable parameters was constructed on the one-electron model and was then smeared by the experimental window function. The values of these parameters were selected to minimize the x^2 value between the observed transmission curve and the smeared-model transmission curve. The criterion showed that the present model fits the observed curve. Pertinent parameters were interpreted in terms of oscillator strengths and the K-state width. The oscillator strengths (0.00217 and 0.00066) of the $1s \rightarrow 4p$ and $1s \rightarrow 5p$ transitions show fair agreement with the theoretical values (0.00166 and 0.00053). The K-state width parameter is 0.68 ev, which compared well with the value obtained by several different spectral methods as well as the value obtained from the K fluorescence yield. K X-RAY EMISSION SPECTRA FROM THE METAL-ATOMS IN MnO_4^-, CrO_4^{2-}, AND VO_4^{2-} IONS (Abstract), by P. E. Best. [1965] [1]p. (Sponsored jointly by Advanced Research Projects Agency; Air Force Office of Scientific Research under [AF 49(638)402], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 28, Jan. 27, 1965.

New measurements are discussed in terms of electronic-dipole transitions from occupied orbitals in the 1s vacancy in the metal atom. Observed emission lines are attributed to transitions from the metal 3p, the oxygen 2s, and the unresolved valence $1t_2$ and $2t_2$ orbitals. Simple theory accounts semiquantitatively for the relative intensities and energy positions of the lines. The energy separation between the oxygen 2s and the $2t_2$ orbitals in MnO_4^- is 16.0 ± 0.2 ev, a measurement not easily accessible to other techniques. Most of the intensity of the valence emission is attributed to overlap of oxygen 2p with metal 3p orbitals, rather than to metal 4p or 3d covalent mixing in the molecular orbitals.

Mn K X-RAY EMISSION SPECTRA FROM AN Fe^{55} K-CAPTURE SOURCE (Abstract), by H. W. Schnopper. [1965] [1]p. (Sponsored jointly by Advanced Research Projects Agency; Air Force Office of Scientific Research under [AF 49(638)402], and National Science Foundation) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 549, Apr. 26, 1965.

Observations of x-ray emission lines arising from transitions $1s \rightarrow 2p_{3/2,\,1/2}$ ($K\alpha_{1,2}$) and $1s \rightarrow 3p_{3/2,\,1/2}$ ($K\beta'_{1,3}$) in Mn^{55}, produced in the K-capture decay of Fe^{55}, have been compared with those produced by electron bombardment of a pure-Mn target. In each case, the lines have the same energy position, width, index of asymmetry and relative intensity. The complex Kβ' appeared unchanged. These observations justify the use of certain simplifying assumptions in the discussion of x-ray spectra: (1) The sudden approximation appears valid for transitions involving an inner hole. This implies that, upon the production of a K hole, the electron configuration of atom Z (Mn) is relaxed to that of atom Z + 1 (Fe); and (2) The occurrence of the complex Kβ' depends only on the mode of decay of the excited Mn atom and not on the means of production of the inner hole. Kβ' appears either as the result of a 2-electron transition of the type ($3p_{3/2,\,1/2} \rightarrow 1s$, valence → bound orbital or continuum) or as the result of angular-momentum coupling between unpaired valence electrons and the final 3p hole. A 2-crystal spectrometer equipped with calcite crystals ($\lambda/d\lambda \approx 10^4$) was used to record all spectra.

INVERSE COMPTON RADIATION FROM INTERGALACTIC ELECTRONS AND COSMIC BLACKBODY PHOTONS, by J. E. Felten. [1965] 3p. incl. diagrs. refs. (AFOSR-66-1710) (AF 49(638)1527) AD 639025 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 1003-1005, Dec. 27, 1965.

Cosmic microwave radiation is discussed as a possible source of the isotropic component of cosmic x-rays, via the inverse Compton interaction of the microwave photons with fast electrons in our galaxy. It is shown that a more natural explanation of the x radiation may be given in terms of intergalactic rather than galactic electrons, and also that in this model the presence of the microwave photons may provide an explanation for an otherwide puzzling feature in the cosmic gamma-ray spectrum.

Also published in Rarefied Gas Dynamics; Proc. of the Fourth Internat'l. Symposium, Toronto U. (Canada) (July 14-17, 1964), ed. by J. H. de Leeuw. New York Academic Press, v. 1: 48-70, 1965.

The steady-state sound disturbances induced in a monatomic gas by an oscillating plane boundary are examined. Kinetic source terms are developed to represent the effect of particle reflections from the moving boundary. Linearized model equations are employed. Specular reflection and an exp (iωt) time dependence are assumed. The equations are solved with the aid of Fourier transforms. An exact solution is obtained for a model equation which relaxes to a Cauchy distribution. The second model equation relaxes to the Maxwellian velocity distribution but must be solved by approximate techniques. Both solutions exhibit the Navier-Stokes form in the continuum regime and a "free molecule" form when collisions are absent. The Maxwellian solution is in acceptable quantitative agreement with all available data.

SURFACE EFFECTS IN SEEDED COMBUSTION PRODUCTS, by D. L. Turcotte. [1965] [42]p. incl. diagrs. tables, refs. (AFOSR-67-1216) (AF 49(638)1346)
AD 653216 Unclassified

Also published in Proc. Specialists' Meeting, AGARD Propulsion and Energetics Panel, Pisa U. (Italy) (Sept. 6-10, 1965) p. 82-122.

Current-voltage characteristics of a double-probe were obtained in the products of combustion of a seeded, atmospheric-pressure, alcohol-air flame. Sodium hydroxide, potassium hydroxide, and cesium chloride were the seed compounds used. The appropriate continuum sheath theory is developed which predicts ion saturation currents and the resistance to the flow of current between the electrodes. The properties of the combustion products are calculated. It was concluded from the calculation on ion saturation currents that there was electron emission from the electrodes. ELECTRODE INTERACTIONS IN SEEDED COMBUSTION PRODUCTS, by D. L. Turcotte and W. Friedman. [1965] [11]p. incl. diagrs. table. [AF 49(638)1346]
AD 627155 Unclassified

Also published in Tenth Symposium (Internat'l.) on Combustion, Cambridge (Gt. Brit.) (Aug. 17-21, 1964), Pittsburgh, Combustion Inst., 1965, p. 673-683.

The interaction of a lightly ionized plasma with a cold electrode is studied. Current-voltage characteristics have been measured using cooled electrodes in seeded combustion products. Current-voltage characteristics have also been obtained in lightly ionized air in a shock tube. An isothermal theory for the current-voltage characteristics is presented including the voltage drop in the sheath, the boundary layer, and the plasma. The shock-tube experiments exhibit ion saturation and are in reasonable agreement with theory. No ion saturation is observed in the experiments in seeded combustion products. Agreement between theory and experiment is obtained with the voltage drop across the sheath and boundary layer is neglected. The fact that no ion saturation is observed indicates that there is electron emission from the cooled electrodes in the seeded combustion products. Since cooled copper electrodes are not expected to emit electrons and do not emit electrons in the shock tube experiment, the conclusion is that the electron emission is due to the presence of seeded material. ISOTOPE EXCHANGE RATES. I. THE HOMOGENEOUS REACTION BETWEEN DEUTERIUM AND AMMONIA, by S. H. Bauer, A. Lifshitz, and C. Lifshitz. [1965] [9]p. (AF AFOSR-63-103) Unclassified

Published in Jour. Amer. Chem. Soc., v. 87: 143-150, Jan. 20, 1965.

The thermal isotope exchange reaction between deuterium and ammonia (highly diluted with argon) was investigated behind reflected shocks in a single-pulse shock tube. The temperature range covered was 1300° to 1700° K. The reaction orders with respect to ammonia and deuterium, as well as the total reaction order, were determined. The exchange rate was found to be approximately unit order with respect to deuterium and argon, and zero order with respect to ammonia. From the known rates of dissociation of D_2 it is evident that the reaction does not proceed via a 3-center atomic displacement intermediate. A mechanism based on the vibrational excitation of deuterium molecules by argon as the rate-determining step is proposed. (Contractor's abstract)

ELECTROHYDRODYNAMIC FLOW OVER A WAVY WALL, by S. Kuwabara. June 1965 [110]p. incl. diagrs. tables, refs. (AFOSR-65-1768) (AF AFOSR-64-399)
AD 624506 Unclassified

Electrohydrodynamic flow of a simple, isothermal gas without dissipative effects over a wavy wall is investigated by the perturbation method. The unperturbed flow has a uniform velocity and nonuniform distributions of density and electric field, which vanish at infinity. For the subsonic flow, the surface pressure, the stream lines and the electric-field lines are calculated. For the supersonic flow, the linearized solution diverges at infinity. This seems to be due to the nonuniform density distribution of the undisturbed flow. Numerical solutions of an oscillating-piston problem, which is a simplified model for the high supersonic flow, are obtained. Some related problems are also investigated. (Contractor's abstract)

[PVT RELATIONS IN SOLID He^3 AND SOLID He^4 FLOW MEASUREMENTS WITH SUPERFLUID HELIUM], by J. N. Kidder. Final rept. Oct. 1, 1962 - Dec. 31, 1964. Feb. 11, 1965, 9p. incl. diagr. (AFOSR-65-0387) (AF AFOSR-63-74) AD 611763 Unclassified

The gravitational flow of superfluid helium through "large" (internal diam greater than 0.01 cm) capillaries at 0.4% has been studied. The primary purpose of this experiment was to find the form of the pressure gradients as a function of fluid velocity. As expected, a critical velocity, below which the pressure gradient was zero, was observed. Over a small range of velocities the pressure gradient varied nearly linearly with velocity, and at higher velocities it varied as the velocity squared. These results are explained in terms of the creation of vortex rings at the capillary wall. The experiments are being continued with straight glass capillaries instead of spiralled metal ones in hopes of obtaining more consistant results. An improved apparatus has been developed to continue measurements begun at Yale University with Air Force support on the PVT relations in solid helium. Microwave cavities are being used to measure the pressure as well as the density. An experiment to study the propagation of second sound in rotating rectangular resonators is also described. Measurement of the Magnus force on superfluid vortices by this technique is expected.

GRAVITATIONAL FLOW OF SUPERFLUID HELIUM AT 0.45°K, by J. N. Kidder and H. A. Blackstead. [1965] [4]p. incl. diagrs. table. (AFOSR-66-1542) (AF AFOSR-63-74) AD 641263 Unclassified

Also published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31 - Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9 (Pt. A): 331-334, 1965.

Liquid-helium flow at a temperature well below 1°K has been studied to investigate the interaction between the liquid and the capillary walls. The observed pressure gradients at velocities greater than the critical value are similar in form to other measurements of pure superfluid flow at higher temperatures. A simple gravitational flow technique has been used, the fluid being mechanically displaced to induce flow through a round capillary between 2 concentric reservoirs. The experiments have been done at 0.45°K, where the relative normal fluid density is 3×10^{-6}. Calculations indicate that normal-fluid viscosity cannot account for the observed pressure gradients.

THE POLARIZABILITIES AND DIAMAGNETIC SUSCEPTIBILITIES OF POLYHEDRAL BORANES AND HALOBORANES, by A. Kaczmarczyk and G. B. Kolski. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-65-1369) (AF AFOSR-64-589) AD 622854 Unclassified

Also published in Inorg. Chem., v. 4: 665-671, May 1965.

The electronic polarizabilities of the $B_{10}Cl_{10}^{-2}$, $B_{10}Br_{10}^{-2}$, $B_{12}H_{12}^{-2}$, $B_{12}Cl_{12}^{-2}$, $B_{12}Br_{12}^{-2}$, and $B_{20}H_{18}^{-2}$ ions were determined and an attempt was made to relate them to the structural features of the ions. From the magnetic susceptibilities of the $B_{10}H_{10}^{-2}$ and $B_{20}H_{18}^{-2}$ ions a Pascal constant was derived for boron in these systems and used to estimate the magnetic susceptibilities of the above listed hydrides and halides. These estimated values were compared and found to be in good agreement with magnetic susceptibilities calculated from the experimental polarizabilities. The great success of a conducting-sphere model in accounting for the physical properties of these ions is demonstrated, and simple general equations for calculating the polarizabilities and magnetic susceptibilities of polyhedral ions are derived. STRENGTH OF THE RELATIONSHIP BETWEEN THE VALUE OF AN EVENT AND ITS SUBJECTIVE PROBABILITY AS A FUNCTION OF METHOD OF

MEASUREMENT, by D. G. Pruitt and R. D. Hoge. [1965] [7]p. incl. diagr. tables. (AFOSR-65-1584) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1441 and National Science Foundation) AD 623290 Unclassified

Also published in Jour. Exper. Psychol., v. 69: 483-489, May 1965.

This study was designed to evaluate the strength of the relationship between the value of an event and the subjective probability of that event as measured by 3 distinct techniques. A positive relationship was found between these 2 variables under all conditions but diminished in strength as pressures for accuracy increased. The results are discussed in the light of Rotter's criticism of earlier studies. In addition, a comparison was made of the 3 methods of measurement, from which probability ratings emerge as the most reliable technique for studying reactions to objective probability displays.

A QUANTUM FIELD DESCRIPTION OF COMMUNICATION SYSTEMS, by L. F. Jelsma and L. P. Bolgiano. [1965] [8]p. incl. refs. (AFOSR-65-2038) (AF AFOSR-65-2) AD 627488 Unclassified

Also published in IEEE Ann. Commun. Convention Conf. Record, June 1965, p. 635-642.

Basic techniques in quantum field theory are used to determine the statistical properties of a communication system. Since the conceptual model of a communications system is an electromagnetic fields system, the problem is reduced to one in quantum electrodynamics. In the formulation, Maxwell's equations are replaced by the simple operator equations of motion of the forced harmonic oscillator whose solutions are in terms of the destruction operator, the creation operator, and the current density. It is demonstrated that the statistics of field amplitude measurements at the receiver in a communication system are the familiar statistics of Gaussian additive noise. In general the statistics of a communication system depend on the type of measurement made by the receiver.

QUANTUM FIELD THEORETICAL MODELS OF

COMMUNICATION SYSTEMS, by L. F. Jelsma. June 1965, 202p. incl. diagrs. refs. (Technical rept. no. Q52) (AFOSR-66-0294) (AF AFOSR-65-2) AD 628711 Unclassified

Basic concepts in quantum field theory are used to represent communication systems. Maxwell's equations are reduced to the equations of motion of the forced simple harmonic oscillator and quantized in the Heisenberg picture. The state of a communication system is represented by a statistical density operator satisfying the postulate that the system can be in either a vacuum state or a maximum entropy state. Probability functions are derived representing the statistics of a communication system.

PHOTOELECTRON STATISTICS FOR VARIABLE TIME AND BANDWIDTH, by A. Q. Haideri. Sept. 1965, 47p. incl. diagrs. tables, refs. (Technical rept. no. Q53) (AFOSR-66-0308) (AF AFOSR-65-2) AD 628808 Unclassified

The photoelectric measurement of optical signals may be limited both by random fluctuations in signal strength and by the probabilistic nature of the photoelectric detector. The mean square fluctuation, in number of electrons released in a photoelectric detector, illuminated by a coherent light signal in the presence of thermal noise, is calculated. The results are illustrated by a graph which shows how the dependence of the relative fluctuation in number of photoelectrons on signal strength is affected by both the time-bandwidth product and the mean number of photoelectrons per observation time.

MAXIMIZATION OF TRANSINFORMATION IN PHOTODETECTION, by J. C. Murray, Jr. June 1965, 65p. incl. diagrs. refs. (Technical rept. no. Q51) (AFOSR-66-0309) (AF AFOSR-65-2) AD 628807 Unclassified

A photodetector is considered as a communication channel and a study made of the maximum information per degree of freedom I which can be transmitted through the channel. Application of the calculus of variations yields a necessary equation which the input probability must satisfy when I is a maximum. It is found that for large average signal energy this necessary equation is satisfied when the input signal energy has an exponential probability density. The dependence of I, an average signal energy with an input probability of this maximizing form, is calculated numerically.

THE LEADER'S PERCEPTION OF THE MARGINAL MEMBER, by R. C. Ziller. [1965] [6]p. incl. illus. tables, refs. (AFOSR-65-0709) (AF AFOSR-62-95) AD 617241 Unclassified

Also published in Personnel Admin., v. 28: 6-11, Mar.-Apr. 1965.

Results of the research suggest that the leaders of higher rated training teams show more concern for and encourage the development of the members whose performance is marginal. The results also suggest that the leader is most successful in working with these less effective team members if he does not perceive, categorize and condemn the less talented or less motivated members as untrainables or incorrigibles. This positive attitude may be attributed, in part, to greater cognitive complexity or to less narrowly and less rigidly defined standards of acceptance within an evaluation system or style that includes more than dichotomized rating scales such as good-bad and trainable-untrainable. Similar results to these may be expected with regard to similar groups. Thus, it is hypothesized that in any teams compelled by economic or labor conditions to accept and utilize a high percentage of job applicants, the leaders of the more productive teams will be found to possess similar perceptual proclivities with regard to the less desirable employees. Similarly, it is hypothesized that in the early elementary school grades and particularly in schools with a high percentage of underprivileged children, the most successful teachers (in terms of student performance at given minimum standards of achievement by the maximum number of students) are less severe in their adjectival descriptions of the least preferred student. Under these conditions the limitation model of leadership is presumed to apply.

MOTIVATIONAL AND PERCEPTUAL EFFECTS IN

ORIENTATION TOWARD A NEWCOMER, by R. C. Ziller and R. D. Behringer. [1965] [12]p. incl. tables. (AFOSR-65-1582) (AF AFOSR-62-95) AD 624012 Unclassified

Also published in Jour. Social Psychol., v. 66: 79-90, 1965.

Two laboratory experiments are reported which analyze the regular group-member's reaction to the advent of an imminent newcomer under varying characteristics of the host group, the host-group members, and the new member. Recall of biographical information concerning the imminent newcomer serves as the dependent variable. The first experiment concerned the relationship of high and low achievement-motivation members and Negro-White newcomers to interest in the newcomer. It was found that more information was recalled about the White than about the Negro newcomer. The results are interpreted as supporting Allport's theory of prejudice toward Negroes: that the race category tends to be overgeneralized, thereby rendering further information search less salient. The second experiment was designed to study in a more systematic fashion the effects of need achievement on recall of biographical data of a Negro or White newcomer under conditions of varying group size. All 3 independent variables were found to be related to recall, but the effects were interactional.

DOGMATISM AND PREDECISIONAL INFORMATION SEARCH, by B. H. Long and R. C. Ziller. [1965] [3]p. incl. table, refs. (AFOSR-66-1150) (AF AFOSR-62-95) AD 640274 Unclassified

Also published in Jour. Appl. Psychol., v. 49: 376-378, Oct. 1965.

Rokeach's Dogmatism Scale and 4 decision measures of tendencies to reserve judgment were administered to 72 freshmen women. A significant negative relationship was found between dogmatism and each of the 4 decision measures. The non-dogmatic individual tended to delay decision and engage in predecisional search, to require more time for psychophysical judgments, and to respond "don't know" to statements of opinion under conditions of inadequate information. Accordingly, dogmatism was interpreted as a defense mechanism which interferes with processing of predecisional information.

TOWARD A THEORY OF OPEN AND CLOSED GROUPS, by R. C. Ziller. [1965] [19]p. incl. refs. (AFOSR-66-1168) (AF AFOSR-62-95) AD 640276 Unclassified

Also published in Psychol. Bull., v. 64. 164-182, Sept. 1965.

Four characteristics differentiate groups in which membership is in a constant state of flux (open groups) as opposed to groups in which the membership is relatively stable (closed groups): time, perspective, equilibrium, frame of reference, and changing group membership. The significance of these characteristics for social behavior was explored. A number of tested and testable propositions concerning group stability and social behavior emerged from a rapprochement of research, relevant sub-theories, and concepts associated with open and closed-group behavior. The failure to consider the dimension of group stability in most previous social-psychological research poses a question concerning the generality of social-psychological theories which are based upon research which ignores the pervasive dimension of group stability.

AUTOMATIC INDEXING FROM MACHINE READABLE ABSTRACTS OF SCIENTIFIC DOCUMENTS, by P. Zunde. Sept. 1965, 211p. incl. diagrs. tables, refs. (AFOSR-65-1425) (AF 49(638)4236) AD 481148L Unclassified

State-of-the-art of machine indexing is reported. Various proposed machine indexing methods are reviewed and evaluated. Methods for comparing machine and human indexing as well as machine indexing systems among themselves are described. Possible approaches to various problem solutions in machine indexing are indicated. The report describes the design of the formal autoindexing of scientific texts (fast) system. Characteristics of uniterm co-ordinate indexes are investigated and generalizations to scientific indexes made. Laws for the formation of words in the indexing language are derived and verified. The operational principles of the fast system and test results of various system components are reported. Indexes produced by the fast method are compared with those produced by human indexers for inter-indexer and intra-indexer consistency. A method of formal evaluation of indexes using the information theory approach is presented and applied to the fast and conventional indexes. It is concluded that the fast system can produce uniterm co-ordinate indexes adequate to user's requirements better and faster than human indexers can do.

ACTIVE TRANSPORT OF IONS, by E. J. Conway. Final rept. Jan. 27, 1965, 48p. incl. diagrs. tables. (AFOSR-65-0871) (AF 61(052)435) AD 617700 Unclassified

In the present context the interpretation given to active transport of ions is their movement from a lower to a higher chemical or electrochemical potential, work being done in the process. This process can be represented as occurring in 3 stages: (1) The ion attaches itself to a carrier. This attachment involves electrical adsorption to an ion or ions of opposite charge. Also, in order to enter into or cross membrane barriers the complex of ion and carrier may be assumed to be lipoid

soluble. (2) The ions are released from their attachment to the complex by the release in some way of the electric charges attaching to the carrier ions. (3) The release of charge may be considered as accomplished by the activity of the redox pump or alternatively by some special action of an ATPase enzyme, the process occurring in a cyclical manner, and involving the input of free energy. ASTRONOMICAL OBSERVATIONS FROM SPACE VEHICLES. UPPER LIMITS TO THE FLUX OF HIGH ENERGY GAMMA-RAYS FROM SELECTED QUASI-STELLAR AND OTHER SOURCES USING THE CERENKOV TECHNIQUE, by C. D. Long, N. A. Porter and others. [1965] [2]p. incl. table. (AFOSR-65-1840) (AF EOAR-63-80) AD 626092 Unclassified

Also published in Ann. Astrophys., v. 28: 263-264, Jan.-Feb. 1965.

Upper flux limits at the earth for γ rays of energy greater than about 5×10^{12} ev have been established for the quasi-stellar sources 3C 147, 3C 196, 3C 273, the Crab Nebula, and the magnetic variable 53 Cam. They are all of the order 10^{-10} photons cm^{-2} s^{-1}. Corresponding upper energy limits at emission are of the order 5×10^{47} ergs s^{-1} for the quasi-stellar sources, and 5×10^{35} ergs s^{-1} for the Crab Nebula, if γ-ray absorption is assumed negligible. Possible absorption mechanisms are discussed.

DETECTION OF RADIO PULSES FROM EXTENSIVE AIR SHOWERS, WITH A WIDE-BAND RECEIVING SYSTEM, by N. A. Porter, C. D. Long and others. [1965] [3]p. (AFOSR-66-0455) (AF EOAR-63-80) AD 630139 Unclassified

Also published in Phys. Ltrs., v. 19: 415-147, Nov. 1965.

Radio pulses associated with extensive air showers of moderate size physically similar to Cerenkov radiation and consistant with a coherent emission of radiation have been reported. Radio detection methods may therefore be suitable for the detection of very large showers at great distances from the core. To investigate the possibility of wide band operation an experiment was set up in a sheltered valley site with relatively low artificial background using a helical aerial centered at 70 mc/s. The overall beamwidth of the system is 20 mc/s, and the full beam width of the aerial 50°, centered at the zenith. Showers are selected by a plastic Cerenkov particle detector of 4,200 cm^2 sensitive area, set at a threshold particle density of about 7 particles/m^2. The counting rate is about 20 events per hr. It is probable that a significant proportion of these are due to local showers or μ-meson induced events. The system was operated for 37 days, with an effective running time of 650 hr. On 5 of the 12,000 traces recorded, bandwidth limited pulses, at least 5 times the average noise fluctuation, were observed in the expected position. No comparable pulses were observed at any other position on any of the traces, or on the comparison traces. It is concluded that radio pulses associated with air showers may be detected with a wide-band system, in the presence of some interference. The observations are in reasonable agreement with a coherent emission model, but could be due either to a negative excess in the showers or to geomagnetic effects.

ROUGH COMBUSTION IN LIQUID FUEL ROCKET MOTORS, by P. D. McCormack, S. Birch, and L. Crane. Final technical rept. Jan. 1965, 52p. incl. illus. diagrs. tables, refs. (AFOSR-65-1316) (AF EOAR-63-76) AD 619526 Unclassified

A theory for combustion instability based on fuel flow velocity modulation produced by injector vibration is postulated. The research mainly covers the effects of vibration on liquid jet breakup. A theoretical analysis of boundary layer instability in the presence of the tangential mode, leading to a large increase in heat transfer to the combustion chamber walls, is also given.

AN EXPERIMENTAL AND THEORETICAL ANALYSIS OF CYLINDRICAL LIQUID JETS SUBJECTED TO VIBRATION, by P. D. McCormack, L. Crane, and S. Birch. [1964] [38]p. incl. illus. diagrs. (AFOSR-65-2049) (Bound with its AFOSR-65-1316; AD 619526) (AF EOAR-63-76) AD 629243 Unclassified

Also published in Brit. Jour. Appl. Phys., v. 16: 395-408, Mar. 1965.

It is established that the Rayleigh-Weber capillary type instability on liquid jets may be triggered by velocity modulation at the injector. It is shown that by application of mechanical vibration in the appropriate frequency range, such velocity modulation can be induced. A second-order analysis is developed to cover the case of very small initiating modulation amplitudes. With finite velocity modulation it is demonstrated that considerable liquid bunching occurs which results in the formation of disks on the jet. A modified Rayleigh analysis is carried out which qualitatively covers characteristics observed in the region of finite velocity modulation. Vibration acceleration values of 200 g and more are found necessary to enter the region where the liquid bunching mechanism predominates over the surface tension mechanism.

THE TANGENTIAL MODE AND ROCKET ENGINE BURN-OUT, by L. J. Crane, S. Birch, and P. D. McCormack. [1965] [13]p. incl. diagrs. table. (Bound with its AFOSR-65-1316; AD 619528) (AF EOAR-63-76) Unclassified

It is suggested that the impingement of rotating gas on the wall of a cylindrical rocket engine chamber, will result in a 3-dimensional type of boundary layer instability. The formation of the regular and well ordered pattern of Taylor-Görtler vortices, with axes parallel to the chamber wall, is shown to result in a very large, albeit oscillating, increase in heat flux to the wall over that due to normal convection. Görtler's coordinate system and Schlichting's formula for the boundary layer on a smooth plate are used. Observations on heat transfer to the rocket engine wall in the presence of tangential instability indicate a fractional increase in the region of ten. It is concluded that experimental evidence supports the contention that the tangential mode of instability in a rocket engine can initiate this type of disturbance in the boundary layer on the wall, and lead to an independent and significant increase in heat transfer.

THE GENERALIZED KEMMER EQUATION, by L. Castell. [1965] [3]p. (AFOSR-66-1572) (AF EOAR-64-61) AD 639535 Unclassified

Also published in Nuovo Cimento, Series X, v. 39: 344-345, Sept. 1, 1965.

The extension of the ordinary field theoretical concept of an elementary particle to a 'relativistic rotator' which possesses a certain moment of inertia, leads to a new type of first-order relativistic field equations. One of their important features is the fact that one can calculate nontrivial energy level trajectories for arbitrary high spin. Consideration is given to the 5-dimensional Kemmer equation to which different angular momentum states are intrinsically coupled. The resulting energy level trajectories are compared with a simple classical model.

MECHANICAL VIBRATION - A DRIVING MECHANISM FOR COMBUSTION INSTABILITY IN ROCKET ENGINES, by P. D. McCormack, D. Cochrane, and L. Crane. Nov. 1965 [31]p. incl. diagrs. (AFOSR-66-0404) (AF EOAR-65-43) AD 628920 Unclassified

The mixing and burning of gas/air jets in the presence of mechanical vibration of the injector was studied. Initial photographic Schlierer and spectroscopic observations of a H_2/air and coal gas/air flame vibration conditions have been carried out. The vibration obviously enhances the rate of mixing and higher mean flame temperatures result. A closed solution was obtained for the case of a vibrated gas jet mixing with its surroundings, in the near-field (potential core) region. Generally speaking, the theory predicted that the vibration, treated as a source of velocity, would raise the mean axial component of velocity at any point inside the mixing region. This was verified by a hot-wire anemometer investigation. Furthermore, it was established that the vibration drives the vortex shedding mechanism in the flow from an orifice.

SECOND ORDER LINEAR AND NONLINEAR DIFFERENTIAL EQUATIONS, by J. J. Gergen and F. G. Dressel. [1965] [7]p. (AFOSR-66-0081) (AF AFOSR-62-162) AD 640272 Unclassified

Also published in Proc. Amer. Math. Soc., v. 16: 767-773, Aug. 1965.

Herbst proved the following theorem: If u, v are variable independent solutions with Wronskian w of the linear equation $Y'' = w'w^{-1}Y' + qY$, where w and q are given functions of x, then the equation (1) $y'' = w'w^{-1}y' + f(y, y', w, q)$ has general solution $y = F(u, v)$ if and only if f has the form (2) $f = qZ(y) + A(y)(y')^2 + C(y)w^2$, where Z, A, C satisfy (3) $Z'-AZ = 1$, $ZC' + (3-AZ)C = 0$. In Herbst's paper, F is determined only as a solution of a system of four partial differential equations. In the present paper, the authors give a simple characterization of F, and on the basis of information obtained, a method is developed for the solution of (1) when f has the form (2) and Z, A, C satisfy (3). MOLECULAR FORCE FIELD AND CENTRIFUGAL DISTORTION CONSTANTS OF NITROSYL FLUORIDE, by R. L. Cook. [1965] [7]p. incl. tables, refs. (AFOSR-65-2136) (AF AFOSR-64-493) AD 629797 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Also published in Jour. Chem. Phys., v. 42: 2927-2933, Apr. 15, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 491, Apr. 26, 1965.

The microwave spectrum of nitrosyl fluoride, NOF, has been reinvestigated in the microwave region and extended into the millimeter wave region. Some 80 transitions, consisting of both "a"- and "b"-type transitions, have been measured and assigned. These data provide the information required for a centrifugal distortion analysis which yields the following ground-state rotational parameters (mc/sec): A = 95 189.77, τ_{xxxx} = -0.099630, τ_{xxzz} = -0.289581; B = 11 844.12, τ_{zzzz} = -15.586926, $H_{JK} = 2.339 \times 10^{-6}$; and C = 10 508.31, $\tau_{xxzz} = 0.418629$, $H_{KJ} = -4.946 \times 10^{-5}$. Combination of infrared data and microwave data yields the following quadratic potential constants millidynes per angstron,

$f_{r1} = 2.09$, $f_{r2} = 15.08$, $f_{\alpha/d}{}^2 = 1.08$, $f_{r1r2} = 1.85$, $f_{r1\alpha/d} = 0.17$. Here f_{r1} and f_{r2} are the N-F and N-O bond force constants, respectively, and f_α is the bond-bending force constant.

MILLIMETER-WAVE MOLECULAR-BEAM SPECTROSCOPY: ALKALI FLUORIDES, by S. E. Veazey and W. Gordy. [1965] [9]p. incl. illus. diagr. tables, refs. (AFOSR-2137) (AF AFOSR-64-493) AD 629796 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 491, Apr. 26, 1965.

Also published in Phys. Rev., v. 138: A1303-A1311, May 31, 1965.

Rotational transitions of the alkali metal fluorides CsF, $Rb^{87}F$, $Rb^{85}F$, $K^{39}F$, NaF, and Li^7F have been measured in the millimeter- and submillimeter-wave regions where no previous measurements existed. The work was accomplished with a high-resolution molecular-beam absorption spectrometer, previously utilized for study of the other alkali halides. A more reliable oven was constructed and used to vaporize the alkali fluorides at temperatures up to 1100°C. Measurements on rotational transitions as high as $J = 27 \rightarrow 28$ in the first 3 vibrational states gave Y_{01}, Y_{11}, and Y_{21} more accurately, for the most part, than they were previously known, and gave Y_{02} and Y_{12} for the first time. From these Dunham rotational constants were derived potential coefficients, moments of inertia, internuclear distances, and vibrational constants. (Contractor's abstract)

SOME RADIATION EFFECTS ON DNA AND ITS CONSTITUENTS, by W. Gordy, B. Pruden, and W. Snipes. [1965] [6]p. incl. diagrs. refs. (AFOSR-65-2138) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-493 and Army Research Office (Durham)) AD 618434 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 53: 751-756, Apr. 1965.

ESR evidence indicates that hydrogen-addition reactions on the ringed groups, especially on the thymine ring, are possibly of great significance in radiation damage to DNA. The production of secondary free radicals in DNA by H-addition reactions depends upon physical condition as well as upon chemical impurities and probably on the nature and constitution of DNA itself, i. e., upon the relative amounts and the sequence of the different nucleotides in the DNA polymer and upon the number of its strands, whether single or double.

ELECTRON SPIN RESONANCE OF AN IRRADIATED SINGLE CRYSTAL OF THYMIDINE, by B. Pruden, W. Snipes, and W. Gordy. [1965] [8]p. incl. diagrs. table, refs. (AFOSR-65-2139) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-493 and Army Research Office (Durham)) AD 618435 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 507, Apr. 26, 1965.

Also published in Proc. Nat'l. Acad. Sci., v. 53: 917-924, May 1965.

ESR measurements on γ-irradiated single crystals of thymidine show that the free radical detected earlier in the powder is formed by an H addition reaction to the $C_{(6)}$ on the thymidine ring. The hyperfine structure is isotropic and arises from a triplet isotropic splitting of 40.4 G by the 2 equivalent $C_{(6)}H_2$ protons and from a quartet substructure arising from an equivalent isotropic coupling of 20.3 G by the CH_3 protons. The coupling of both sets of protons occurs primarily through hyperconjugation with π-orbital spin density on the ring, most of which is on $C_{(5)}$. The ring is planar with the $C_{(6)}H$ bonds oriented above and below the plane, approximately 35 from the normal to it. The spin density on $C_{(5)}$ is 0.71. The g tensor is axially symmetric, approximately, with principal values of 2.0026 and 2.0042. In powdered samples, production of this radical was enhanced by irradiation in molecular hydrogen.

FREE RADICALS FORMED BY HYDROGEN ATOM BOMBARDMENT OF THE NUCLEIC-ACID BASES, by J. N. Herak and W. Gordy. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-66-0376) (AF AFOSR-64-493) AD 626396 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 54. 1287-1292, Nov. 1965.

The study provides objective proof that free hydrogen atoms combine directly at room temperature with ring carbons not only of thymine but also of uracil and of the purine bases adenine and guanine. In contrast, no corresponding evidence could be found for H-addition on the ring carbons of cytosine. These results are in agreement with work in progress in this laboratory

which shows that the electron spin resonance (ESR) patterns of irradiated single crystals of cytidine do not resemble those expected for free radicals formed by such H addition on $C_{(6)}$ or $C_{(5)}$.

DIPOLE MOMENTS OF HNCO AND HN_3 (Abstract), by D. White and R. L. Cook. [1965] [1]p. [AF AFOSR-64-493] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 491, Apr. 26, 1965.

The dipole moment of HNCO and HN_3 have been precisely measured from the Stark effect of their millimeter-wave rotational spectra. A parallel-plate, semi-free space 30-in. Stark cell with optically ground quartz spacers was employed. Sectional horns and Teflon lenses were used for focusing the millimeter-wave energy. Both molecules are nearly symmetric rotors. Since only a-type transitions were observed, the symmetric top notation is applicable. For a given J transition, the dipole moment of HNCO was found to decrease with increasing rotation about the a axis. As an example, the $J = 3 \rightarrow 4$ transition yields $\mu_a = 1.57$, 1.540, and 1.5000 Debye for the effective K values of 1, 2, and 3, respectively. So far, only the $J = 3 \rightarrow 4$, $K = 2$ transition has been observed for HN_3. For it, $\mu_a = 0.825$ Debye.

ELECTRON SPIN RESONANCE OF ATOMIC As AND P AND OF PH_2 RADICALS IN AN INERT MATRIX AT LOW TEMPERATURE (Abstract), by W. Gordy, R. Morehouse, and J. J. Christiansen. [1965] [1]p. [AF AFOSR-64-493] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 506-507, Apr. 26, 1965.

The ESR of atomic As has been detected in a γ-irradiated Kr matrix containing small concentrations of AsH_3 molecules. The radicals are produced mainly by energy absorbed by the matrix and transferred to the AsH_3. The As^{75} atoms have an isotropic nuclear coupling of 11.1 G and an isotropic g of 1.9975. Similar energy migration of PH_3 molecules in the Kr matrix was found to produce PH_2 free radicals as well as P and H atoms. A coupling constant of 30 G is observed for the P atoms with an isotropic g of 2.0027. For PH_2 the observed P^{31} coupling is 80 G, the H coupling is 18 G, and the average g is 2.0087. The ESR of the PH_2 indicates a bond angle of about 120°. In contrast, small concentrations of NH_3 in the Kr matrix did not produce detectable ESR signals. Atomic P^{31} splitting has been previously measured in the gas to be 20.0 G and in an argon matrix at 4.2°K to be 23.3 G.

ELECTRON SPIN RESONANCE OF γ-IRRADIATED SINGLE CRYSTALS OF CF_3COONH_4 (Abstract), by F. Srygley and W. Gordy. [1965] [1]p. [AF AFOSR-64-493] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 507, Apr. 26, 1965.

Electron-spin-resonance studies of γ-irradiated single crystals of CF_3COONH_4 reveal CF_2COONH_4 free radicals, which are produced by loss of an F from the parent molecule. There are 4 molecules in the unit cell, but there are only 2 distinguishably different orientations of the free radicals. The ESR indicates that the free radicals are planar, with the 2 distinguishable orientations approximately at right angles, 88.5°. The nuclear couplings of the 2 F atoms are equivalent and axially symmetric, with $A_{\parallel} = 188 \pm 3$ G and with $A_{\perp} = 14 \pm 3$ G. Likewise, g is symmetric about the same axis, with $g_{\parallel} = 2.004$ and with $g_{\perp} = 2.007$. The magnetic axes of symmetry are found to be normal to the 2 planes containing CCOO groups of the undamaged molecules in the crystal. Analysis of the nuclear coupling indicates that the 2p spin density on the F is 0.12 and the 2s density is 0.0044. A singlet resonance which may arise from the radical CF_3CO_2 is also observed.

ELECTRON SPIN RESONANCE OF SiH_3, GeH_3, AND SnH FREE RADICALS IN A KRYPTON MATRIX (Abstract), by R. Morehouse, and W. Gordy. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-493] and Army Research Office (Durham)) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 507, Apr. 26, 1965.

Disintegration of XH_4-type molecules by energy migration and transfer in an inert Kr matrix at 4.2°K has been investigated through the ESR of the resulting free radicals. The SiH_4 dissociates into SiH_3 and H; the GeH_4 into GeH_3 and H; but the SnH_4 dissociates into SnH radicals and H atoms. The SiH_3 and GeH_3 have

quartet patterns arising from the equivalent coupling of their protons. The proton coupling is 8.2 G in SiH_3 and 15 G in GeH_3. The SnH radical has a doublet ESR pattern arising from its proton coupling of 32 G. From the shape of the resonance of the polyoriented radicals, the g tensors of SiH_3 and GeH_3 are estimated to be axially symmetric with $g_{\parallel} = 2.0055$ and $g_{\perp} = 2.0032$ for SiH_3 and with $g_{\parallel} = 2.0170$ and $g_{\perp} = 2.0104$ for GeH_3. The g of SnH is isotropic, with a value of 2.0022. The SiH_3 radical has been previously detected in the argon matrix with a component splitting of 7.6 G.

HIGHER-ORDER DISTORTION EFFECTS IN THE ROTATIONAL SPECTRUM OF ISOTHIOCYANIC ACID (Abstract), by J. J. Christiansen, R. L. Cook, and M. Winnewisser. [1965] [1]p. [AF AFOSR-64-493] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 491, Apr. 26, 1965.

The millimeter-wave rotational spectrum of the slightly asymmetric rotor, HNCS has been reported and a number of $K_{-1} = 0$, 1, 2, and 3 transitions were measured and assigned. However, it was not possible to obtain a satisfactory fit of the spectrum even with the inclusion of P^6 distortion terms in the energy expression. Furthermore, the analysis yielded $K_{-1} = 4$ transition frequencies, which were not among the observed frequencies, even though these lines should have sufficient intensity to be detected. This anomalous K pattern has been reinvestigated and it has been found that the introduction of P^8 distortion terms is essential to account accurately for the observed rotational-frequencies. Consideration of these effects has enabled the measurement and assignment of a number of $K_{-1} = 4$ lines. This appears to be the first time that such high-order distortion effects have been observed.

MILLIMETER-WAVE SPECTRUM OF THE SH RADICAL (Abstract), by M. Winnewisser, G. Winnewisser, and W. Gordy. [1965] [1]p. [AF AFOSR-64-493] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 491, Apr. 26, 1965.

The millimeter-wave Λ-type spectrum of the gaseous free radical SH in the $^2\pi_{3/2}$ electronic ground state has been detected with an improved version of the fast-flow millimeter-wave spectrometer. SH radicals were generated with a yield of roughly 50% by the passage of H_2S gas through a rf discharge with 200 W input power. The following transitions between Λ-type doublets in the $^2\pi_{3/2}$ state have been observed and assigned mc/sec, N = 17, J = 35/2 84 855.41; N = 18, J = 37/2 96 791.30; N = 19, J = 39/2 112 753.46; N = 20, J = 41/2 130 653.88, and N = 21, J = 43/2 152 359.74. The preliminary spectroscopic constants are $B_0 = 255\,000$ mc/sec, q = 330 mc/sec, $\delta = -30$, $A = -120 \times 10^5$ mc/sec. The lifetime of the SH radicals has been found to be of the order of 0.5 sec.

SUBMILLIMETER WAVE SPECTRUM OF HBr (Abstract), by G. Jones and W. Gordy. [1965] [1]p. [AF AFOSR-64-493] Unclassified

Presented at meeting of the Amer. Phys. Soc., Chattanooga U., Tenn., Nov. 5-7, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 246, Feb. 25, 1965.

The J = 0 → 1 rotational transitions of HBr^{79} and HBr^{81} have been measured with high precision at the submillimeter wavelength λ = 0.599 mm. The molecular constants derived for HBr^{79} are $\nu_0 = 500\,675.24 \pm 0.26$ mc/sec, $B_0 = 250\,360.78 \pm 0.13$ mc/sec, $eQq = 535.4 \pm 1.4$ Mc/sec, and $C = 0.29 \pm 0.20$ Mc/sec. The corresponding values for HBr^{81} are $500\,519.41 \pm 0.26$ mc/sec, $250\,282.88 \pm 0.13$, 447.9 ± 1.4 mc/sec, and 0.31 ± 0.20 mc/sec, respectively. The lines were observed and measured on the cathode-ray scope.

CRUSTAL STRUCTURE OF GREAT BRITAIN, by M. H. P. Bott and A. L. Lucas. Aug. 3, 1965, 6p. (Scientific rept. no. 4) (AFOSR-65-2929) (AF 61(052)-733) AD 627840 Unclassified

The research aim of this project is the investigation in Great Britain of local variations in crustal structure with particular reference to granite batholiths, and the effects of such variations on the propagation of seismic energy. This investigation is to be carried out by crustal refraction explosion studies. The hardware consists of a ten channel seismometer array with digital magnetic tape recording. The prime consideration during the period of this report has been to get the equipment in the field and operational by September, 1965 in order to take advantage of a series of depth charge explosions in the Irish Sea and St. George's Channel.

THE FERMI MOMENTA OF SOME FACE CENTERED CUBIC RARE EARTH COMPOUNDS, by M. I. Darby and K. N. R. Taylor. [1965] [2]p. incl. diagrs. refs. (AFOSR-65-1896) (AF EOAR-63-75) AD 626363
Unclassified

Also published in Phys. Ltrs., v. 14: 179-180, Feb. 1, 1965.

Using the indirect exchange theory of Ruderman, Kittel (Phys Rev., 96: 99, 1954) and Yosida (Phys. Rev., v. 106: 893, 1957), the Fermi momenta are determined for Re-X compounds where Re is Gd, Tb, Dy, Ho, Tm, or Yb and X is N, P, As, Sb, or Bi. The Fermi momenta are plotted against lattice spacing a_o. The equation of the resulting straight line can be written in the form $k_F = (3\pi^2 \times 1.42)^{1/3} a_o$. This suggests that if the effective number of valence electrons per rare earth ion is taken to be 1.42 for all compounds, then the values of k_F and consequent widely differing paramagnetic Curie points of these compounds can be accounted for entirely by differences in lattice spacings. It is concluded that the use of the indirect exchange theory enables the paramagnetic Curie temperatures of these compounds to be correlated with lattice spacings via their fermi momenta values.

The principal objective of the program was to relate combustion stability to injector design variables through a consideration of droplet dynamics and combustion. The basic model treats the individual droplets as energy and mass sources. Stability or instability is determined by the relationship between energy and mass addition and the characteristics of the chamber or of a disturbance introduced into the chamber. Depending upon such relationships, a disturbance will be either amplified or dumped. A determination of the stability of a system will depend not only upon the frequency response of the energy and/or mass source but may also depend upon its spatial relationship. One of the first efforts in the study was to determine whether propellant droplets would assume specific patterns with respect to a disturbance and whether these patterns could affect the stability of the combustion process.

A RELATIONSHIP BETWEEN ADRENALINE AND THE MODE OF ACTION OF OXYTOCIN AND OESTROGEN ON VASCULAR SMOOTH MUSCLE, by A. L. Haigh, S. Lloyd, and M. Pickford. [1965] [14]p. incl. diagrs. table, refs. (AFOSR-65-2949) (AF EOAR-62-79) AD 628389 Unclassified

Also published in Jour. Physiol., v. 178: 563-576, June 1965.

Hind-leg blood flow was measured in dogs and monkeys, in acute experiments by means of a Pavlov stromuhr in series with the femoral veins, and in chronic experiments by venous occlusion plethysmography. When a reduction in hind-limb blood flow in response to administration of oxytocin was induced by lumbar sympathectomy, the normal dilator response to oxytocin was restored if the oxytocin was given either during a period of stimulation of the peripheral end of the divided lumbar chain, or during an infusion of adrenaline. Infusions of noradrenaline did not restore the normal response to oxytocin. When a reduction in hind-limb blood flow in response to administration of oxytocin was induced by giving an estrogen, the normal dilator response was restored if the oxytocin was given either during a period of stimulation of the sympathetic supply to the limb, or during an infusion of adrenaline provided that in both cases atropine or hyoscine was first given. In no circumstances did nonadrenaline restore the normal response to oxytocin and, in the absence of atropine or hyoscine, adrenaline and nerve stimulation were also ineffective. It is suggested that the fraction of adrenaline released by sympathetic nerves is of functional significance, and is essential for the dilator effect of oxytocin. It is also suggested that estrogens interfere with the manufacture of adrenaline in or its release from the sympathetic nerves, as well as having the previously described effect of increasing the ACh-like content of organs.

PROTON BEAM TECHNIQUE FOR MEASURING THE ION DENSITY IN A PLASMA, by D. P. Duclos. [1965] [4]p. incl. diagrs. refs. (AFOSR-65-2258) (AF 49-(638)1063) AD 626344 Unclassified

Also published in Rev. Scient. Instr., v. 36: 803-809, June 1965.

A technique is described for obtaining localized measurements of the ion density in a plasma which is not affected by the presence of a magnetic field or the absence of thermodynamic equilibrium. The technique consists basically of exciting the ions with a proton beam and relating the measured absolute intensity of certain spectral lines to the ion density. Three requirements are discussed which must be satisfied in order to apply the method to a particular gas. The technique appears to be well suited to measuring the density of helium ions. The possible sources of error are examined and, for helium plasmas, none of the errors are large provided that the gas pressure is less than 1 mm Hg and the temperature is over 10,000°K. A preliminary experiment is described. (Contractor's abstract)

I. STUDIES OF ELECTRICALLY EXPLODING WIRES AND FILMS, by N. C. Chase. II. STUDIES OF CROSSED-FIELD PLASMA ACCELERATORS AND PLASMA DIAGNOSTIC TECHNIQUES, by D. P. Duclos. Final summary rep. Apr. 1, 1961-Sept. 30, 1965, Oct. 1965 [207]p. incl. illus. diagrs. tables, refs. (EOS rept no. 1690) (AFOSR-66-0154) (AF 49(638)1063) AD 628034 Unclassified

The results of experiments designed to produce a directed, metal-derived plasma with high kinetic energy, which might result in development of a high-performance propulsive device, are presented. The plasma source is a small wire, rapidly exploded by discharging through it the energy stored in a capacitor. The experiment was designed to direct and accelerate the plasma in one direction and to produce a high specific impulse. Three experimental methods used in an attempt to achieve the desired result are described. The design of the ballistic pendulum used to measure thrust of kinetic energy, can introduce measurement inaccuracies. Most of the contributing factors resulting in these errors are discussed and an improved pendulum design suggested together with advantages and disadvantages of this type of thrustor. The performance and operating characteristics of dc crossed-field plasma accelerators operated at low (0.001 atm) and high (0.1 atm) channel pressures and an ac low-pressure crossed-field plasma accelerator were determined. The measured to ideal thrust ratio and the efficiency for both dc accelerators were about the same. A technique for measuring the ion density in a plasma which was not affected by the presence of a magnetic field or the absence of thermodynamic equilibrium was developed. The technique consisted basically of exciting the ions with a proton beam and relating the measured absolute intensity of certain spectral lines to the ion density. It was found that the technique is well suited to measuring the density of helium ions at pressures less than about 1 mm Hg and temperatures over about 10,000°K.

PHYSICAL PROPERTY DISTRIBUTIONS IN A LOW-PRESSURE CROSSED-FIELD PLASMA ACCELERATOR, by D. P. Duclos, Y. C. Lin Wu and others. [1965] [7]p. incl. illus. diagrs. refs. (AFOSR-66-0358) (AF 49(638)1063) AD 632183 Unclassified

Also published in AIAA Jour., v. 3: 2026-2032, Nov. 1965.

The physical phenomena that occur in a steady crossed-field accelerator were studied both experimentally and analytically. Experiments were conducted on a

crossed-field accelerator of conventional design employing a single electrode pair and operated with argon at a channel static pressure of about 1-mm Hg and a magnetic field of up to 5000 gauss. Measurements of the current distribution over the anode and cathode surfaces and the potential and electron temperature distributions between the anode and cathode were obtained. An approximate theoretical analysis of the accelerator was developed which accounts for Hall effects, ion slip, viscosity, and elevated electron temperature. From this analysis, the potential current density, and electron and atom temperature distributions were calculated. The calculations agreed reasonably well with the measurements except in the region near the electrode surfaces. As expected, at large values of the Hall parameter, the current distribution was found to be unsuitable for producing a high accelerator efficiency. (Contractor's abstract)

ON THE ACCLERATION OF SPHERES BY ONE-DIMENSIONAL NON-UNIFORM GAS FLOWS, by D. P. Duclos. [1965] [26]p. incl. diagrs. (Bound with its AFOSR-66-0154; AD 628034) (AF 49(638)1063) Unclassified

The problem of determining the velocity given to a sphere, initially at rest, by the sudden expansion of a one-dimensional non-uniform gas flow, due to aerodynamic drag, is considered. The problem is formulated in terms of the mass of gas which has flowed past the sphere, m. The case of uniform flow, where every element of gas moves with the same velocity but the local density at a point varies arbitrarily, is solved. The velocity of the sphere can also be determined when the gas mass velocity V(m, t) is a monotonically decreasing function of m only. In this case, the gas density must have the form

$$\rho(x,t) = \frac{1}{c+dt}\left[G\ \frac{a+bx}{a+dt}\right]$$

where G is any function and a, b, c, and d are arbitrary constants. The velocity of the sphere, due to the non-uniform expansion of a one-dimensional gas into vacuum, is treated analytically. In this case, the terminal velocity of the sphere can be greater than the average gas velocity. (Contractor's abstract)

PHYSICAL PHENOMENA IN CROSSED-FIELD PLASMA ACCELERATORS (Abstract), by M. R. Denison, D. P. Duclos, and Y. C. Lin Wu. [1965] [1]p. (Bound with AFOSR-65-1266; AD 622527) (AF 49(638)1063) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

A 20 kw crossed-field accelerator has been operated with both dc and 60 cycle ac current applied to the channel electrodes and magnet. The working fluid was argon at a channel static pressure of from 1 to 9 mm Hg. The thrust increment produced by the accelerator was about 0.4 times the ideal value for both ac and dc modes of operation. The accelerator operated reliably under ac conditions with very little electrode erosion. The time delay due to breakdown phenomena during voltage reversal was negligible, and nearly sinusoidal current resulted. Further diagnostic investigations have been carried out for dc operation. Measurements were obtained of the current distribution over the electrode surfaces as well as the potential and electron temperature distributions between anode and cathode. These measurements were compared with an approximate theory which accounts for Hall effects, ion slip, viscosity and elevated electron temperature. Agreement was reasonably good except in the region near the electrode surfaces. As expected at large values of the Hall parameter, the current distribution was found to be unsuitable for producing a high accelerator efficiency. Experiments are currently in progress to determine the performance and physical property distributions of a 300-kw dc crossed-field accelerator which is operated at a channel static pressure of 0.1 atm with the Hall parameter limited to about unity or less.

ASTRONOMICAL ORIENTATION OF CRUSTACEA, by L. Pardi. Scientific rept. June 30, 1965, 6p. (AFOSR-65-2010) (AF EOAR-64-55) AD 627404 Unclassified

Previous studies of the solar and lunar astronomical orientation of animals have indicated that in the period in which the sun or moon culminates in the south, the animals compensate perfectly for the apparent azimuthal clockwise motion of the celestial body. However, the closer the azimuth of the sun or moon approaches the north, the more evident become disturbances to orientation. Observations of a group of specimens subjected to an experimental environment in which the sun culminated in the north showed that after the equinox of September, when the sun had barely begun to culminate in the south, the animals began to demonstrate a perfect orientation. The present work was undertaken to ascertain on what basis do the animals "know" that after the equinox of September the sun begins to culminate in the south, that is, at midday its azimuth is exactly that of the Theoretical Line of Escape (TLE)? Results demonstrated that a population with TLE south, in clockwise phase, compensates perfectly for the apparent clockwise motion, while in a population with TLE north, the compensation is imperfect and disturbed. It seems probable that in the populations precisely subequatorial, the affirmed and valid compensation mechanism differs according to the TLE. Work is continuing to confirm this conclusion.

FACTORS CONTROLLING PROTEIN SYNTHESIS, by J. R. Fisher. Final rept. May 25, 1965, 4p. (AFOSR-65-1198) (AF AFOSR-63-233) AD 620235 Unclassified

The purpose of this investigation is to understand the mechanism by which enzyme synthesis is controlled in developing systems. Efforts were made to confirm the RNA induction of enzymes in Ehrlich ascites cells (Niu, Cordova, Niu and Radbill, 1962). Attempts to develop a system of measuring the biological activity of RNA in this respect were unsuccessful. Studies were conducted on xanthine dehydrogenase in developing chick-embryo liver. It was concluded that the appearance of this enzyme is under hormonal control. Injections of prolactin, growth hormone, luteinizing hormone, follicle-stimulating hormone and thyroid-stimulating hormone, individually, or as a mixture, did not give stimulation of activity. It is further concluded that either there is a new factor in the crude extract, or that a proper balance of 2 or more hormones is required. Similar studies were also conducted on mouse Ehrlich ascites cancer cells. First, crude anterior pituitary extract produced an increase in specific activity from 2- to 5-fold. Injections of the same hormones, either individually or in a mixture approximating pituitary tissue, caused a 2- to 7-fold increase in xanthine oxidase activity with only one injection 24 hr before harvest of ascites cells, and a 9-fold increase after a series of three injections.

LEVEL STRUCTURE OF THE ODD-A ISOTOPES OF SAMARIUM, by R. A. Kenefick and R. K. Sheline. [1965] [21]p. incl. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-423, and Atomic Energy Commission) Unclassified

Published in Phys. Rev., v. 139: B1479-B1499, Sept. 20, 1965.

The levels of Sm^{145}, Sm^{149}, Sm^{151}, Sm^{153}, and Sm^{155} have been studied with 0.1% resolution by the (d,p) reaction at 12-mev incident energy. Levels in Sm^{147} have been observed by (p,p') reactions at 12 mev. A large number of previously unknown levels have been observed at excitation energies up to 4 mev. The ground state for Sm^{155} is assigned as the $\frac{3}{2}^-$(521) orbital. The previously unobserved (11/2)$^-$ (505) orbital, whose depopulation is hypothesized to cause the sudden onset of deformation at N = 90, has been tentatively assigned at 65 kev in Sm^{153}. The ground-state Q values observed in the experiments are: $Sm^{144}(d,p)Sm^{145}$, Q +4.533 ± 0.012 mev; $Sm^{148}(d,p)Sm^{149}$, Q = +3.648 ± 0.012 mev, $Sm^{150}(d,p)Sm^{151}$, Q = +3.369 ± 0.016 mev; $Sm^{152}(d,p)Sm^{153}$, Q = +3.645 ± 0.012 mev; $Sm^{154}(d,p)Sm^{155}$, Q = +3.584 ± 0.012 mev.

THEORY OF ISOBARIC-SPIN ANALOGUE RESONANCES, by D. Robson. [1965] [12]p. incl. diagrs. refs. (AFOSR-66-0968) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-440 and Office of Naval Research) AD 635351 Unclassified

Also published in Phys. Rev., v. 137: B535-B546, Feb. 1965.

A theory of isobaric-spin analogue resonances is developed by considering a potential model which has an isobaric-spin-dependent component. The occurrence of isobaric states as compound-nucleus resonances is shown to be a natural consequence of the formalism previously used to explain the excitation of isobaric analogue states by the direct-interaction charge-exchange mechanism. The results are then generalized on the basis of the R-matrix theory of nuclear reactions because of the expectation that isobaric spin is relatively pure within a sphere of dimensions similar to those of the charge distribution. The interpretation of analogue resonances as giant resonances is considered and shown to be different from the conventional optical giant resonances. Formulas are derived which are mainly applicable to the elastic scattering of protons below the Coulomb barrier. The importance of the external and internal regions with respect to the isobaric-spin mixing is investigated for the case of $Mo^{92}(p,p)Mo^{92}$, and results are obtained which verify the importance of external mixing for this nucleus. Various limitations of the theory are discussed and further developments are indicated. (Contractor's abstract)

REACTIONS INVOLVING SIMPLE ISOBARIC ANALOGUE RESONANCES, by D. Robson, J. D. Fox and others. [1965] [3]p. incl. diagrs. (AFOSR-66-0105) (AF AFOSR-65-440) AD 630240 Unclassified

Also published in Phys. Ltrs., v. 18: 86-88, Aug. 1965.

Quantitative applications of the theory of isobaric analogue resonances to a specific class of resonances are reported. It is shown that theoretical treatments which do not take into account the effects of "boundary condition" or external isobaric spin mixing are not in agreement with the experiments performed.

ANALYSIS OF SINGLE EXCITATIONS IN INELASTIC DEUTERON SCATTERING FROM Ni^{60}, Zr^{92}, AND Sn^{120} NUCLEI, by R. K. Jolly. [1965] [13]p. incl. diagrs. tables, refs. (AFOSR-66-0486) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-440, National Science Foundation, and Office of Naval Research) AD 630241 Unclassified

Also published in Phys. Rev., v. 139: B318-B330, July 1965.

Inelastic scattering of 15-mev deuterons from Ni^{60}, Zr^{92}, and Sn^{120} nuclei was studied with adequate resolution to enable identification of almost all states of known spin and parity. Detailed angular distributions of deuteron groups corresponding to well-resolved states of these nuclei was measured and compared with distorted-wave Born approximation calculations for single excitations using a deformed optical-model potential. The theoretical predictions, including Coulomb excitation and for a complex coupling, are found to be quite successful for strongly excited states. The status of the Blair phase rule is discussed in the context of the aforesaid comparison. Spin and parity assignments are made for several new levels. Excitation energies, differential cross sections, and reduced transition probabilities were tabulated and compared with previously known values. (Contractor's abstract)

INTERMEDIATE STRUCTURE AND CHANNEL COUPLING THEORY, by M. E. Haglund and D. Robson. [1965] 3p. incl. diagrs. refs. (AFOSR-66-0973) (AF AFOSR-65-440) AD 635366 Unclassified

Also published in Phys. Ltrs., v. 14: 225-227, Feb. 1965.

A new approach to the investigation of intermediate structure phenomenon is proposed. The conventional shell model with harmonic oscillator functions is not appropriate for describing intermediate structure because the physical boundary conditions involved are ignored, i.e., cross sections are not predicted. The present approach uses the language of R-matrix theory and so involves a complete set of discrete 'compound nucleus' states which are independent of physical boundary conditions. The quantities involved are derived from the dynamics of the situation using the familiar techniques of the shell model, i.e., a set of basis functions is found using a simple potential and the matrix involving 'residual interactions' diagonalized to yield the exact R-matrix. Cross sections are obtained using the usual relation between the collision matrix and the R-matrix by the approximate matrix inversion.

ENERGY FOR SURFACE MOBILITY OF THIN, DISCONTINUOUS GOLD FILMS ON MICA SUBSTRATES, by J. G. Skofronick and W. B. Phillips. Nov. 1965, 2p. incl. diagrs. (AFOSR-66-0975) (AF AFOSR-65-440) AD 635365 Unclassified

Also published in Appl. Phys. Ltrs., v. 7: 249-250, Nov. 1965.

Electron microscopy studies have previously shown that very thin metallic films formed by evaporation are not continuous but consist of an island-like structure upon the substrate. Measurements of the time and temperature dependence of the resistance of discontinuous gold films prepared in vacua on mica substrates were made. Analysis of the data in terms of a dynamic island model indicates that the observed changing resistance of the film is a very sensitive function of the gaps between the islands and the temperature of the substrate and, to a lesser extent, the size of the islands. The model used for the analysis of these data satisfactorily represents the strong systematic dependence of resistance on temperature and time and establishes a value for an activation energy which is interpreted as a threshold for surface mobility of the islands.

Ca^{42}(p, n) REACTION THRESHOLD (Abstract), by H. S. Plendl and J. W. Nelson. [1965] [1]p. [AF AFOSR-65-440] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 479, Apr. 26, 1965.

The Ca^{42}(p, n) threshold was determined by bombarding thick, pressed $Ca^{42}CO_3$ targets with protons from the FSU tandem accelerator and observing the β^+ activity from the superallowed Sc^{42}GS decay as a function of proton energy. The threshold energy, 7394 ± 10 kev, corresponds to a Q value of 7208 ± 10 kev and to a Sc^{42} mass excess in close agreement with the mass excess obtained from the β^+ end-point energy measurement and from the most recent $Ca^{40}(He^3, p_0)$ Q-value determination. The discrepancy between (p, n) and (α, n) threshold results is of the same magnitude as observed previously for Cl^{35}(p, n)Ar^{35} and S^{32}(α, n) Ar^{35}. Probable reasons for this effect are discussed.

DEPENDENCE OF RESISTANCE ON TIME AND TEMPERATURE FOR VERY THIN GOLD FILMS ON MICA (Abstract), by W. B. Phillips, J. G. Skofronick and others. [1965] [1]p. [AF AFOSR-65-440] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 127, Jan. 1965.

The resistance of very thin gold films deposited on baked, cleaved-mica substrates and maintained under high vacuum has been measured as a function of time and temperature. An increase of film resistance by a factor as great as 1000 has been observed in 1000 min after deposition on a substrate kept at room temperature. This effect is independent of applied electric field. At liquid-nitrogen temperature, the time dependence vanishes. Upon warming a film deposited at this temperature, two distinct regions are noted: an initial (reversible with temperature) decrease of resistance followed by a sharp (irreversible with temperature) increase of resistance over several orders of magnitude. The negative temperature coefficient of resistance of the first region is probably due to an increase in the number of conduction electrons in the tail of the Fermi distribution. The second region (above 160°K) may be explained by assuming that the films consist of small "islands" that may move about on the substrate and coalesce with near neighbors, increasing the average distance between islands. This island mobility is strongly temperature-dependent. Calculations based upon this model explain qualitatively the observed increase of resistance with time.

ELECTRON-TRANSPORT MECHANISMS IN VERY THIN, DISCONTINUOUS GOLD FILMS (Abstract), by J. G. Skofronick, W. B. Phillips and others. [1965] [1]p. [AF AFOSR-65-440] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 364, Mar. 24, 1965.

The conductance of very thin, discontinuous gold films prepared in vacua on mica substrates has been measured as a function of temperature and applied electric field. A thermal-activation process reversible below a characteristic temperature, an ohmic region for small applied fields, and an exponential dependence linear with (applied field)$^{\frac{1}{2}}$ for larger fields are observed. An island-gap-island configuration is assumed for the film, and conductance properties are calculated using an approach similar to that of Simmons. If tunneling is assumed in the calculation, the predicted activation does not agree with experiment. If the calculation for tunneling considers only charges passing from one excited level to another, the activation process agrees with experiment but the log conductance vs (applied field)$^{\frac{1}{2}}$ have minima that are not observed experimentally. For conductance

curves calculated by assuming thermionic emission, there is good qualitative agreement with the data; however, the barrier heights over which the charges move appear to be anomalously small considering the bulk properties of gold. This is partially explained by the image effects that are included in the calculation. A typical experimentally determined barrier height is 0.0404 ev.

LOW-LYING ENERGY LEVELS IN ODD-A SCANDIUM ISOTOPES (Abstract), by H. S. Plendl, L. J. Defelice, and R. K. Sheline. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-440] and Atomic Energy Commission) Unclassified

Presented at meeting of the Amer. Phys. Soc., Columbia U., New York, June 23-25, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 610, June 23, 1965.

The reactions $Ti^{46}(p,\alpha)Sc^{43}$, $Ti^{48}(p,\alpha)Sc^{45}$, $Ti^{50}(p,\alpha)Sc^{47}$ were initiated with 9- to 10-mev protons from the FSU tandem accelerator on enriched and natural targets. Reaction products were analyzed at several angles with a Browne-Buechner spectrograph to determine Q values, excitation energies (up to 1550 kev), and absolute cross sections in preparation for complete angular distribution measurements. The Q_{gs} values were found to agree with values calculated from masses to within the experimental error of ± 20 kev. Excitation energies in Sc^{43}, Sc^{45}, and Sc^{47} were determined to within ± 5 kev. Most of the levels reported in previous work were observed; several were resolved into 2 or 3 levels. In particular, the excitation energies of the $d3/2^+$ states were found to be 153 ± 5 kev for Sc^{43}, 12 ± 5 kev for Sc^{45}, 772 ± 5 kev for Sc^{47}, in agreement with concurrent work at Argonne. The results are compared with theoretical predictions.

SCATTERING OF α PARTICLES BY Ca^{40} (Abstract), by C. P. Robinson, J. S. O'Neall and others. [1965] [1]p. [AF AFOSR-65-440] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 539, Apr. 26, 1965.

Angular distributions of elastically scattered α particles by Ca^{40} have been measured at α-particle energies 7.0, 8.0, 10.0, and 15.0 mev. Deviations from Rutherford scattering appear at all energies. Optical-model fits to the angular distribution data are in good agreement at forward angles. Modification of the theory is required to fit the back-angle scattering data. In addition to narrow anomalies (approximately 100 kev wide), measured excitation curves show broad structure after the narrow anomalies are averaged out. Excitation-curve data are discussed in terms of a coupling between single α-particle resonances and more-complicated modes of excitation.

THE ROLE OF LIGHT IN EVOLUTION: THE TRANSITION FROM A ONE QUANTUM TO A TWO QUANTA MECHANISM, by H. Gaffron. [1965] [24]p. incl. diagrs. table, refs. (AFOSR-65-1287) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-190, Atomic Energy Commission, and Office of Naval Research) AD 621465 Unclassified

Also published in The Origins of Prebiological Systems and of their Molecular Matrices, New York, Academic Press, Inc., 1965, p. 437-440

The importance of light's role in evolution is investigated. It is hypothesized that the porphyrin pigments antedated the earliest living cell and that the anaerobic process, photoreduction, preceded and evolved into photosynthesis. The main problem in this evolutionary step was the photolysis of water. It is known that it is impossible to separate H from OH irreversibly and to release them as hydrogen and oxygen with the energy of only one red light quantum. Therefore it is suggested and evidence is presented to show that the main evolutionary step from an anaerobic process to an aerobic process was the transition from a one quantum to a two quanta mechanism.

Work on the specificity of manganese catalysis during the oxidation of ascorbate or of diketogulonate respectively to oxalic acid and threonate has been concluded. The selective catalysis by manganese is not restricted to oxidations sensitized by illuminated flavin, and other dyes, but appears in several types of variously induced autoxidations. The essence is an autocatalytic chain reaction driven by an electron transport system in which the most active role is given to an oscillation between Mn^{3+} and Mn^{2+} ions, often in complex bindings. The same hypothetical mechanism seems to fit all cases studied with the exception of photoxidation induced by fresh chloroplasts, where the conditions appear to be even more complicated. The explanation given earlier for the paradoxical rate enhancement produced by the herbicide DCMU (N-3, 4-dichlorophenyl-N', N'-dimethyl urea) in the flavin sensitized oxidation of diketogulonate appears to hold also in the context of the new much extended observations on the action of manganese. SPECIFIC ACTION OF Mn^{++} IN PHOTOCHEMICAL, ENZYMATIC AND NON-ENZYMATIC REACTIONS (Abstract), by P. Homann. [1965] [1]p. (AFOSR-65-1585) (AF AFOSR-64-662) Unclassified

Presented at Federation of Amer. Soc. of Experimental Biologists Meeting, Atlantic City, N. J., Apr. 9-14, 1965.

Also published in Federation Proc., v. 24. 609, Mar.-Apr. 1935.

Manganese is an essential cofactor of photosynthesis. Manganous ions serve as specific mediators in the reaction between molecular oxygen and a photosensitizer-substrate couple. With 2, 3-diketogulonate as oxidizable substrate, it was found that the specific action of Mn^{++} is also displayed in dark oxidations, when, in place of light, an enzyme, a complex with catalytic activity, or just trivalent manganese serve as oxidation inducing species. Mn^{++} could not be replaced by any other metal as catalyst, and Cu^{++} was found to be highly inhibitory in all systems. Vanadyl sulfate induces an oxidation of diketogulonate, but its action differs from that of Mn^{++}. In view of the unknown role of Mn^{++} for oxygen evolution in plants, manganese is discussed as a catalyst on the basis of a 1-electron carrier mechanism for peroxidase mediated oxidations. Theoretically the peroxy anion O_2^- should be oxidized by free Mn^{++} to oxygen, but O_2^- apparently oxidizes Mn^{++}. This hypothesis might explain the catalytic action of the Mn^{++}/Mn^{+++} couple in any manganese catalyzed oxidation of diketogulonate. (Contractor's abstract)

MANGANESE-CATALYZED OXIDATIONS OF 2, 3-DIKETOGULONATE, by P. H. Homann. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-65-2859) (AF AFOSR-64-662) AD 629845 Unclassified

Also published in Biochemistry, v. 4: 1902-1911, Sept. 1965.

Autoxidations of 2, 3-diketogulonate can be induced by light and a sensitizing dye or by chemical means in the dark provided manganous ions are present in the reaction mixture. 3-(p-Chlorophenyl)-1, 1-dimethylurea specifically stimulates the flavin-sensitized photoreaction, whereas the product formed from 3-(p-chlorophenyl)-1, 1-dimethylurea by a flavin-sensitized photooxidation usually acts as an inhibitor. The action of manganese as a catalyst is discussed on the basis of the mechanism of manganese catalysis in certain peroxidase oxidase reactions as proposed by I. Yamazaki and L. H. Piette (Biochim. et Biophys. Acta, v. 77, 47, 1963). Trivalent manganese appears to be an essential intermediate chain carrier in all oxidations of 2, 3-diketogulonate studied. The surprising specificity of the Mn (II)-Mn(III) couple to catalyze the oxidations of 2, 3-diketogulonate is very probably a result of its oxidation-reduction potential, which allows the oxidation of Mn(II) by O_2^- radicals to supplant chain-breaking removals of O_2^-. A chelation of 2, 3-diketogulonate may enable Mn(III) to accomplish efficiently a splitting of the 2, 3-diketogulonate molecule by attracting an electron. (Contractor's abstract)

ANGULAR AND ENERGETIC STUDIES OF REACTIVE ION-NEUTRAL COLLISIONS (Abstract), by T. L. Bailey, R. L. Champion and others. [1965] [2]p. incl. diagr. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-471] and National Aeronautics and Space Administration) Unclassified

Published in Fourth Internat'l. Conf. on Physics of Electronic and Atomic Collisions: Abstracts of Papers, Laval U., Quebec (Canada) (Aug. 2-6, 1965), New York, Science Bookcrafters, Inc., [1965] p. 237-238.

An apparatus has been constructed for the study of the energetics, and product-ion angular distributions, of ion-molecule reactions and other reactive ion-neutral collisions. The essential parts of this apparatus are an ion gun, which produces a mass- and velocity-selected ion beam; a collision region, containing scattering gas at low density; and a product-ion analyzer and detector system. The apparatus can also be used for the measurement of differential elastic and inelastic scattering cross sections, and for charge-transfer studies at very low energies. Initial studies have been concerned with collisions of Ar^+ and Ar^{++} ions with D_2 molecules. (Contractor's abstract, modified)

ON THE DEGENERACY OF THE TWO-DIMENSIONAL HARMONIC OSCILLATOR, by V. A. Dulock and H. V. McIntosh. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-65-1119) (AF AFOSR-64-471) AD 620486 Unclassified

Also published in Amer. Jour. Phys., v. 33: 109-118, Feb. 1965.

A further study of the degeneracy of the 2-dimensional harmonic oscillator is made, both in the isotropic and anisotropic cases. By regarding the Hamiltonian as a linear operator acting through the Poisson bracket on functions of the coordinates and momenta, it is shown how all possible rational constants of the motion may be generated. Canonical coordinates, which may be visualized geometrically for the isotropic oscillator in terms of the Hopf mapping, place the symmetry group responsible for the accidental degeneracy clearly in evidence. Surprisingly, one finds that the unitary unimodular group SU_3 is the symmetry group in all cases, even including that of an amsotropic oscillator with incommensurable frequencies. The lack of a quantum-mechanical analogy in the latter case is due to a lack of the necessary transcendental roots of the operators involved in attempting to use the correspondence principle, rather than to the lack of a symmetry group for the classical problem.

AN ELECTROENCEPHALOGRAPHIC STUDY OF THE EFFECTS OF MEPROBAMATE ON HUMAN SLEEP, by F. R. Freeman, H. W. Agnew and others. [1965] [5]p. incl. diagrs. tables, refs. (AFOSR-65-2680) (AF AFOSR-62-13) AD 629563 Unclassified

Also published in Clin. Pharmacol. and Therapeut., v. 6: 172-176, Mar.-Apr. 1965.

The effect of meprobamate on human sleep and dreaming was assessed in a double-blind, placebo-controlled study by means of all-night electroencephalography. On nights when meprobamate was ingested in a dose of 400mg at 9:00 p. m. and 800mg at 12:00 a. m., normal subjects spent significantly less time in sleep accompanied by low-voltage fast EEG than when receiving placebo. The time spent in rapid eye movement periods, which are related to visual dreaming, was decreased by meprobamate. This study shows that meprobamate characteristically alters the amount of time spent in each sleep stage and significantly decreases inferred visual dreaming. Comparisons are made between the changes in the human electroencephalogram during sleep produced by meprobamate and those produced by the barbiturates. (Contractor's abstract)

DIGITAL SIMULATION OF RANDOM VIBRATIONS, by D. J. Belz. June 1965 [62]p. incl. diagrs. tables. (AFOSR-65-0608) (AF AFOSR-64-675) AD 469187 Unclassified

A physically realizable stationary, Gaussian, random load is simulated digitally and employed as the forcing function in the equation of motion of a damped, elastic beam whose resistance to deformation is due to bending and stretching. The power residue method for generating pseudo-random numbers is employed for constructing the random functions, whose statistical properties correspond closely to those of pressure signals measured in the noise field of a turbulent, supersonic air jet. The nonlinear equation of motion is solved in finite-difference form with a forcing function representing a time-random concentrated load applied transversely at midspan. From numerical solutions, statistical measures of response at midspan and at the quarter points of the beam are computed. Response autocorrelation functions, power spectra, and probability density functions are obtained for a range of load mean-square values. The technique used in this paper can in principle be applied to more complicated structural components and random-load configurations. (Contractor's abstract)

THE DIMETHYL SULFOXIDE OXIDATION OF 2,3-BIS(BROMOMETHYL)QUINOXALINE, by E. J. Moriconi and A. J. Fritsen. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-65-1452) [AF AFOSR-62-18] AD 622637 Unclassified

Also published in Jour. Org. Chem., v. 30 1542-1547, May 1965.

The reaction of 2,3-bis(bromomethyl)quinoxaline with dimethyl sulfoxide produced in varying amounts 3-methyl-, 3-bromomethyl-, and 3-dibromomethyl-2-quinoxalinecarboxaldehyde, in addition to 2,3-bis(dibromomethyl)quinoxaline, and 2,3-quinoxalinedicarboxaldehyde isolated as the intramolecular hemihydrate. The Hunsberger and Tien general mechanism of dimethyl sulfoxide oxidation can account for the formation of all these products. A similar oxidation of 2,3-bis(iodomethyl)quinoxaline led to 2- and 3-iodomethyl-2-quinoxalinecarboxaldehyde. In the presence of 1,2-epoxy-3-phenoxypropane, dimethyl sulfoxide oxidation of 2,3-bis(bromomethyl)- and 2,3-bis(iodomethyl)quinoxalines led to compounds tentatively identified as dl-1,2-dibromo- and dl-1,2-diiodo-1,2-bis(3-methyl-2-quinoxalyl)ethane; both were dehalogenated to trans-1,2-bis(3-methyl-2-quinoxalyl)ethylene whose structure was determined by independent synthesis and degradation. Bromination of the latter product yielded meso-1,2-dibromo-1,2-bis(3-methyl-2-quinoxalyl)ethane. Dimethyl sulfoxide oxidation of dl-1,2-dibromo-, dl-1,2-diiodo-, and meso-1,2-dibromo-1,2-bis(3-methyl-2-quinoxalyl)ethane led to the same product, bis(3-methyl-2-quinoxalyl)glyoxal. A number of 6- and 6,7-substituted quinoxaline derivatives are also reported.

ANGULAR DISTRIBUTION OF γ-RAYS ARISING FROM $Ge^{70,72}(p,p'\gamma)$ REACTIONS (Abstract), by R. K. Mohindra and D. M. Van Patter. [1965] [1]p. [AF AFOSR-63-401] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 36, Jan. 27, 1965.

To study $(p,p'\gamma)$ radiations, enriched targets of $Ge^{70,72}$ each 3 mgm/cm^2 thick have been bombarded with 5 to 7 mev protons from the University of Pennsylvania tandem accelerator. Transitions from most of the known levels up to 4-mev excitation have been observed in Ge^{70}. Spectra from Ge^{72} become quite complex above E_p 6 mev because of its low (p,n) threshold. The angular distributions of γ-rays of 0.67, 1.04, 1.12, 1.26, 1.51, 1.71, 2.16 mev in Ge^{70} and of 0.63, 0.835, 1.04, 1.20, 1.465, 1.71 mev in Ge^{72} have been studied. The angular distributions show little change with bombarding energy, except for cascade feeding. It has been possible to find the mixing ratios δ for $2_2^+ \rightarrow 2_1^+$ transitions in $Ge^{70,72}$ from the ratio of A_2 coefficients for the cascade and crossover transitions. This ratio should be independent of statistical averaging and cascade feeding, and provides a good method for determining δ in such cases. For Ge^{70}, $\delta = +(5_{-1.5}{}^{+4})$ and for Ge^{72}, $\delta = -(5_{-2}{}^{+10})$ – (the sign of δ is reversed). An earlier radioactivity measurement agrees with our present value of δ for Ge^{72}.

ON THE RELAXATION EFFECT IN THE LIMITING CONDUCTANCE OF ELECTROLYTES, by P. Résibois and N. Hasselle-Schuermans. [1965] [11]p. incl. diagrs. refs. [AF EOAR-62-16] Unclassified

Published in Jour. Chem. Phys., v. 43: 1016-1026, Aug. 1, 1965.

The theory of the relaxation effect in electrolytes is improved by taking into account the interaction of the

solvent with the ions. This is made possible if it is assumed that the ions have a large mass (M) with respect to the solvent molecules (m), in which case the recent developments of the microscopic theory of Brownian motion may be used. It is shown that the results of the classical theory of Onsager-Debye-Falkenhagen are recovered provided that the following conditions are satisfied: $(m/M) \ll 1$, $(e^2C^{\frac{1}{3}}/D_0kT) \ll 1$, in such a way that $(e^2/D_0) \ll \zeta^2/M$ where ζ is the friction coefficient of the fluid. The connection between the various statistical-mechanical approaches which have been recently proposed is also discussed. (Contractor's abstract, modified)

STATISTICAL MECHANICS OF FERROMAGNETISM, by R. Brout. [1965] [61]p. incl. refs. (AFOSR-65-2169) (AF EOAR-63-51) AD 629504 Unclassified

Also published in Magnetism, ed. by G. T. Rado and H. Suhl. Academic Press, New York and London, v. 2A: 43-103, 1965.

A correlation and a compromise between ferromagnetism and the general theory of phase transitions is presented. The principal aim was to extract out of the formalism of statistical mechanics the main qualitative aspects of ferromagnetism as well as semiquantitative estimates of quantities of interest. Topics discussed include the Ising model, Heisenberg model, band theory of ferromagnetism, and random spin systems.

PHASE TRANSITIONS IN MATTER, by R. Brout. [1964] [9]p. incl. diagrs. (AFOSR-65-2951) (AF EOAR-63-51) AD 629237 Unclassified

Also published in Statistical Mechanics of Equilibrium and Non-equilibrium, Proc. Internat'l. Symposium on Statistical Mechanics and Thermodynamics, Aachen (Germany) (June 15-20, 1964), ed. by J. Meixner. Amsterdam, North-Holland Publishing Co., p. 253-261.

This work presents an approach to the theory of condensation which leans heavily on the original ideas of van der Waals and Weiss. The underlying idea is to improve the mean molecular field approximation of van der Waals and Weiss by correcting it for hard cores and, in the solid, for the periodicity of the lattice.

NEUROPHYSIOLOGIC CORRELATES OF SENSORY PERCEPTION, by J. E. Desmedt. Final rept. Feb. 1, 1964-Jan. 31, 1965. Feb. 28, 1965, 5p. (AFOSR-65-0874) (AF EOAR-64-43) AD 617796 Unclassified

The functional capabilities and mode of operation of several parts of the feedback neural circuit related to acoustic sensory processing were investigated in acute experiments carried out chiefly in cats and pigeons. The limited potency of efferent gating of acoustic input in pigeon has been confirmed and substantiated. Functional differences between the systems of cats and pigeons were related to the peculiar features of the fine structural organization of the corresponding synapses in the inner ear. Electrical signs of activity in the efferent olivo-cochlear system were obtained in the congenital deaf albino cat. The effect of hypothermia on the operation of the feedback system was analyzed in the cat and a temperature coefficient was determined for the dissipation kinetics. Neuropharmacological studies were also carried out. It was found that the alcaloid coniine antagonizes the efferent inhibitory process but in a way unlike that of the alcaloid strychnine. Somatosensory and acoustic evoked potentials were recorded from the scalp in normal man with a Mnemotron digital computer, and their features were correlated with psychophysical data obtained for the same stimuli, with particular reference to the signal detection capabilities of the human operator. FUNCTIONAL PROPERTIES OF THE EFFERENT COCHLEAR BUNDLE OF THE PIGEON REVEALED BY STEREOTAXIC STIMULATION, by J. E. Desmedt and P. J. Delwaide. [1965] 26p. incl. illus. diagrs. refs. (AFOSR-65-2527) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-64-43 and National Institutes of Health) AD 629095 Unclassified

Also published in Exper. Neurol., v. 11: 1-26, Jan. 1965.

The function of the efferent cochlear bundle (ECB) has been studied in over a hundred pigeons with the spinal cord transected at C2-C3, local anesthesia and muscle paralysis. The excellent biological status of the animals was carefully assessed throughout the experiments, which

frequently lasted several hours. Electrical responses evoked by click or tone pip were picked up chiefly at the exposed round-window membrane. Bipolar needles were inserted stereotaxically into the brain stem with the ECB as target (histological controls). Repetitive electrical stimulation of the ECB before delivery of the testing sound potentiates markedly the cochlear microphonic receptor potential of the hair cells and inhibits simultaneously the auditory nerve response. This dual effect results in a reduction of acoustic input to the brain. These and other observations suggest that the ECB of the bird is homologous functionally to the olivocochlear bundle of mammals. Important quantitative differences have nevertheless, been found. The potency of the efferent inhibition is much smaller in the pigeon than it is in the cat, which raises the question of its behavioral significance in the former species. The potentiation of the cochlear microphonic component is relatively more prominent in the pigeon and it dissipates more slowly than the simultaneously recorded inhibition of the neurals. Such different kinetics might be related to the peculiar synaptic organization of the bird's inner ear. (Contractor's abstract)

GENERAL EQUATIONS OF EVOLUTION AND KINETIC EQUATIONS FOR NON-UNIFORM SYSTEMS, by G. Severne. [1965] [31]p. incl. diagrs. refs. (AFOSR-66-0392) [AF EOAR-64-52] AD 630141 Unclassified

Also published in Physica, v. 31: 877-907, June 1965.

The methods developed by Prigogine and coworkers are used to establish a rigorous statistical mechanical theory for non-uniform classical systems. The general equations of evolution for the singlet distribution and for the s-body correlation functions are derived, and for the former, an equivalent master equation is written. For large systems these equations are essentially exact: they are non-Markoffian in form and introduce a delocalization in space as well as a displacement in time. The corresponding long time kinetic forms are obtained. In a lowest order approximation, the asymptotic master equation is shown to reduce to the Boltzmann equation, and generalized kinetic equations can immediately be obtained. The resulting formulation of linear transport theory is briefly discussed.

OLIVO-COCHLEAR FUNCTION IN A DEAF ALBINO CAT, by J. E. Desmedt. [1965] [2]p. incl. illus. (AFOSR-65-2968) (AF EOAR-65-57) AD 627941 Unclassified

Also published in Acta oto-laryngol., v. 59: 168-169 [1965].

Experiments suggest that while the innervation of the cochlea may be largely preserved in human congenital deafness it undergoes degeneration in acquired deafness. Albino cats with congenital deafness also disclose a pathological cycle which destroys the organ of corti but only involves the nerve cells in the spinal ganglion to a limited extent and after a considerable latent period. The data suggested that efferent olivo-cochlear axons may be excitable and functional in congenital deafness and they emphasized the potential interest of such cases for the analysis of synaptic interactions within the inner ear.

SULFUR COMPOUNDS IN MORPHOGENESIS, by J. Brachet. Final rept. Sept. 30, 1963-Mar. 31, 1965. May 4, 1965, 5p. incl. refs. (AFOSR-65-1336) (AF EOAR-63-103) AD 621165 Unclassified

The effects of sulfur compounds on morphogenesis and nucleic acid synthesis were investigated. Experimentally it is shown that oxidized lipoic acid inhibits the reduction of ribonucleosides to deoxyribonucleosides, while mercaptoethanol increases DNA synthesis and blocks the methylation of RNA. Such deviations of nucleic acid metabolism could conceivably lead to the synthesis of abnormal proteins and, as a result, to an arrest of cell division and morphogenesis. The experiments made on the incorporation of various amino acids into the proteins of in vivo treated cells or embryos are in good agreement with such an interpretation. A list of resulting publications, with brief summaries, is presented.

INTERACTION OF THREE HYDROGEN ATOMS, by R. G. Wrzesinsky. Final technical rept. Feb. 1, 1965, 131p. incl. diagrs. tables, refs. (AFOSR-65-1684) (AF EOAR-61-22) AD 625500 Unclassified

Using the valence bond method, the 2 lowest energy terms and the corresponding eigenfunctions of the system of 3 hydrogen atoms were calculated. A general survey about the global structure of the energy surfaces is given using a simple calculating procedure. The coupling coefficients are calculated for the non-adiabatic motion of the nuclei, confining to the neighborhood of the constellation the nuclei forming an equilateral triangle. For an investigation of the non-adiabatic H_2 - H scattering problem this constellation is of particular interest due to energy surfaces which are degenerated in the equilateral triangle giving a strong contribution to the coupling effect. DIURESIS INDUCED BY WATER INFUSION INTO THE CAROTID LOOP AND ITS INHIBITION BY SMALL HEMORRHAGE, by J. O. Arndt. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-65-1543) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-62-75 and German Research Foundation) AD 624008 Unclassified

Also published in Pflügers Arch. ges. Physiol., v. 282: 313-322, 1965.

In 5 unanesthetized trained dogs the effect on urine flow of the osmotic stimulus of a slow intracarotid water infusion alone and combined with a mild hemorrhage of 8% of the estimated blood volume was investigated. The blood loss was too small to cause any change in blood pressure or heart rate. In contrast to the effect of intracarotid infusion of 3 ml water/min over a 30 min period no diuresis occurred when this infusion was combined with a slow hemorrhage of 150 ml applied during the first 10 min of the infusion period. In the majority of cases restoration of blood volume by retransfusion of the hemorrhaged blood was promptly followed by water diuresis. In all maneuvers the diuresis was entirely due to a change in free water clearance. The excretion of osmotically active material was unchanged. It is concluded that during a competition of the control systems of osmotic pressure and fluid volume the former is acutely overruled if the homeostasis of fluid volume is jeopardized.

DIURESIS INDUCED BY WATER INFUSION INTO THE CAROTID LOOP OF UNANAESTHETIZED DOGS, by J. O. Arndt and O. H. Gauer. [1965] [12]p. incl. diagrs. tables, refs. (AFOSR-65-1544) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-62-75 and German Research Foundation) AD 623379 Unclassified

Also published in Pflügers Arch. ges. Physiol., v. 282: 301-312, 1965.

In 5 unanaesthetized trained dogs the effect of injection of small amounts of water into a carotid loop on the excretion of urine was investigated. The infusion rates were 3.0, 2.5, and 2.0 ml/min. Infusion time was 30 min, so that a total of 90, 75, and 60 ml of water was injected. Identical water infusions were made into a peripheral vein as controls. Diuresis occurred only with intracarotid infusions, which suggests a central location of osmoreceptors. The diuresis was a function of the amount of water infused and was due solely to an increase in free water clearance. The excretion of electrolytes and the osmotic clearance remained unchanged. Although antidiuretic hormone, ADH, was not determined in the plasma of the dogs, it is probable that the diuresis is due to a reduction of the level of this hormone.

[CONCERNING THE OSMORECEPTOR MECHANISM ACTIVITY IN THE LIVER] Uber einen osmoreceptorisch tätigen Mechanismus in der Leber, by F. J. Haberwich, O. Aziz, and P. E. Nowacki. [1965] [17]p. incl. illus. diagrs. tables, refs. (AFOSR-66-1107) (AF EOAR-64-16) AD 638057 Unclassified

Also published in Pflügers Arch. ges. Physiol., v. 285: 73-89, July 1965.

By a specially devised technique, indwelling catheters have been placed in the portal veins and inferior venae cavae of rats, permitting infusions and sampling in unanaesthetized animals, which can be used and reused for a longer period of time. Not sooner than 2 days after recovery from the operation, the diuretic response of the unanaesthetized animals to infusions of water and salt solutions (0.3;0.6;0.9 and 1.2% saline) into the 2 sites were compared. The infusion rate of 3 ml/hr corresponded to the known normal rate of water absorption from the gut. When the duration of water infusion is limited to 20 min, a diuresis is observed during portal infusion only. If the infusion time is extended to 1 hr, caval infusion also leads to a diuresis after a latent period of approximately 30 min. Since the "caval" diuresis remains below the "portal" diuresis curve cuts below the "caval" diuresis leading to a pronounced oliguria. The diuretic response is diminished with rising concentrations of NaCl in the infusate. The differences between intraportal and intracaval infusion are maintained. Isotonic infusion has no diuretic effect. The higher the control flow rate, the greater is the urinary volume excreted in excess of the control (which reflects the state of hydration). The experimental results indicate the presence of an osmoreceptor mechanism in the liver, whose sensitivity characteristic has been worked out. This mechanism contributes to the control of diuresis through unknown pathways. This osmoreceptor mechanism in the portal circulation may represent the first line of defense against gross disturbances of water balance during water absorption from the gut, which would respond before the cerebral osmoreceptors become involved.

[ON THE ANTIDIURETIC ACTIVITY IN THE LYMPH OF THE CAT] Uber die antidiuretische Aktivitat in der Lymphe von Katzen, by P. Tata, J. Heller, and O. H. Gauer. 1964 [9]p. incl. illus. tables, refs. (AFOSR-66-1142) (AF EOAR-64-16) AD 638057 Unclassified

Also published in Pflügers Arch. ges. Physiol., v. 283: 222-229, Feb.-Apr. 1965.

In cats anesthetized with sodium pentobarbital the thoracic duct was cannulated and the antidiuretic activity (ADA) of lymph was assayed in rats in alcohol anesthesia. The ADA was also determined in the plasma and serum of the same cat. In normally hydrated cats the ADA in plasma was equivalent to about 1μ U/ml Pitressin, whereas in lymph the ADA was not detectable. In cats deprived of fluid for 24 hr the ADA in lymph was about 20% of that in plasma, the latter having an ADA of ca 3μ U/ml Pitressin. One hour after a single injection of high dosages of Pitressin an ADA in the lymph was not detectable. During Pitressin infusions of long duration an ADA could be measured in the lymph. It was about one third to one fifth of that found at the same time in the plasma. Incubation of Pitressin (10μ U/ml) in plasma at 37°C did not result in a loss of ADA. Incubation with lymph or serum under identical conditions led to a reduction of the ADA to about one quarter of the original value within 30-60 min. The very similar ratio of the ADA in plasma and in lymph of dehydrated animals and animals treated with a continuous infusion of Pitressin may depend on the filtration rate of ADA into the interstitium and the rate of its inactivation by the lymph.

PHYCOBILINS, by C. ÓhEocha. [1965] 22p. incl. diagrs. tables, refs. (AFOSR-66-1106) (AF EOAR-63-18) AD 639621 Unclassified

Also published in Chemistry and Biochemistry of Plant Pigments, ed. by T. W. Goodwin, London, Academic Press, 1965, p. 175-196.

The phycobilins are tetrapyrroles which occur as prosthetic groups of photosynthetically-active conjugated proteins (biliproteins) in some groups of algae. None of the phycobilins has been crystallized as yet and our knowledge of them is based mainly on spectral studies, both as free pigments and as constituents of their parent biliproteins. These studies indicate that at least 3 phycobilins occur in nature as prosthetic groups of algal biliproteins, and while a definite structure cannot yet be assigned to any of them, it is possible to make some suggestions on the basis of the known structures of animal bile pigments, or bilins.

PURIFICATION AND N-TERMINAL ANALYSES OF ALGAL BILIPROTEINS, by P. O'Carra. [1965] [4]p. incl. table, refs. (AFOSR-65-1282) (AF 61(052)409) AD 620716 Unclassified

Also published in Biochem. Jour., v. 94: 171-174, Jan. 1965.

R-, B- and C-phycoerythrins and R- and C-phycocyanins were isolated and purified on a preparative scale by calcium phosphate chromatography, ammonium sulphate fractionation and crystallization. The N-terminal residues of these biliproteins were analyzed. Methionine is the only N-terminal residue of all the phycoerythrins, there being about 14 N-terminal residues per molecule of R- and B-phycoerythrins and about 8 N-terminal residues/molecule of C-phycoerythrin. Threonine is N-terminal in C-phycocyanin, and both threonine and methionine are N-terminal in R-phycocyanin. Results suggest that the apoproteins of the various phycoerythrins are closely related, whereas C-phycocyanin has quite a different gross structure, and that R-phycocyanin contains 2 types of sub-unit, one related to C-phycocyanin and the other to the phycoerythrins.

RESEARCH STUDIES FOR SUPERCONIC COMBUSTION, by J. Tamagno. Mar. 1965, 50p. incl. illus. diagrs. table, refs. (GASL Technical rept. no. 518) (AFOSR-65-1311) (AF 49(638)991) AD 619091 Unclassified

A summary is presented of research on supersonic combustion conducted during a 4-yr period by GASL. The research discussed is oriented toward fuels and conditions pertaining to supersonic combustion in ramjet engines. Fields encompassed are: (1) reaction kinetics of a hydrogen air system, (2) diffusion and combustion of reacting gases, and (3) the testing of highly idealized combustion processes. Studies in the latter field indicate the speed range for supersonic combustion ramjets can be lowered to the 3-6 Mach number range. It is concluded that sufficient progress has been made on the understanding and analysis of supersonic combustion processes to give a sound basis for application to the design of a practical ramjet engine.

Presented at AIAA Second Aerospace Sciences Meeting, New York, Jan. 25-27, 1965.

Also published in AIAA Jour., v. 3: 1599-1605, Sept. 1965.

This paper is concerned with the experimental determination of the overall structure of the combustion process which takes place in a jet flow of combustible gas mixture, and with the description of the mathematical procedure which has been successfully applied for analysis and prediction of the above experimental results. The mathematical analysis is valid for both subsonic flows and is based on an axisymmetric flow with diffusion, conduction and finite rate hydrogen-air chemistry based on phenomenological models of turbulent gas transport properties and reaction rates. It was shown experimentally that a supersonic combustible mixture of hydrogen and air with temperatures far below autoignition levels may be burned in stable flame configuration without use of any flame-holding obstructions, but employing instead a small pilot flame It was found that the stability of the resulting combustion configuration could be assured by means of pilot flames with relatively small dimensions and small total energy liberation.

ROCKET MOTOR WITH ELECTRIC ACCELERATION IN THE THROAT, by J. Rosciszewski. [1965] [3]p. incl. diagrs. (AFOSR-65-1437) (AF 49(638)1357) AD 622672 Unclassified

Also published in Jour. Spacecraft and Rockets, v. 2: 278-280, Mar.-Apr. 1965.

A rocket motor with an electric accelerator in the throat which is capable of specific impulses on the order of 1000 to 2000 is examined. Equations defining the flow are developed assuming 1-dimensional flow at low magnetic Reynolds number. It is found that the electric field at the critical section cannot be too large as there are two opposing effects: gas acceleration due to Lorentz force and heat generation due to joule heating. Using the isentropic flow relations the maximum velocities are calculated for K = 0, 0.1 and 0.5 and are found to be 3.6, 4.47, and 8.7 respectively.

ENERGY PARTITION IN THE CURRENT LAYERS IN PLASMA, by J. Rosciszewski. [1965] [3]p. incl. diagrs. (AFOSR-65-1438) (AF 49(638)1357) AD 622673 Unclassified

Also published in AIAA Jour., v. 3: 373-375, Feb. 1965.

Many plasma propulsion systems are based on the principle that the moving current layer sweeps out the gas. In the present paper, this type of discharge layer and the stationary rarefaction or deflagration type are discussed from the gasdynamic point of view. Conservation relations across the discharge layer are derived

from the differential equations for a 1-dimensional nonsteady multifluid model obtained by taking the moments of Boltzmann's equations. It is concluded that: (1) the current layer sweeping up the gas leads to significant losses; (2) the velocity distribution characteristic for an expanding layer leads to smaller losses; and (3) the deflagration type of stationary discharge layer is in principle very efficient and can provide high specific impulse.

SELECTED PROBLEMS OF PLASMA PROPULSION AND POWER GENERATION SYSTEMS (Abstract), by J. Rosciszewski. [1965] [1]p. (Bound with its AFOSR-65-1266; AD 622527) (AF 49(638)1357) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

Theoretical considerations of different kinds of discharge layers lead to the conclusion that the stationary discharge layer should be more efficient than the magnetic piston type of discharge layer. An attempt is being made to find the structure of this kind of layer taking into account ionization phenomena. The multifluid equations are the basis for such calculations. The generalized Ohm's law has been derived taking into account ion current due to the motion of freshly born ions in an electromagnetic field. An analysis of a new concept of steady state fissionable gas power generator has been performed. This system is a combination of the principle of a supersonic wind tunnel with ram-jet nuclear reaction concentrated behind the supersonic diffusor. The fissionable gas expands and passes through an MHD generator. The multistrip integral method has been used to calculate boundary layers. Initial profiles have been obtained on the basis of analysis of singularity at the boundary layer leading edges. The method developed is general and can be used to calculate the flow at an MHD generator entrance or the boundary layer flow with mass injection on blunt or sharp edge bodies.

MAGNETOPLASMA WAVEGUIDE WITH VISCOSITY AND HEAT CONDUCTION, by B. A. Sodek. [1965] [15]p. incl. diagrs. (AFOSR-66-1081) (AF 49(638)1428) AD 640775 Unclassified

Also published in Plasma Phys., Accelerators, Thermonuclear Research (Jour. Nuclear Energy, Pt. C), v. 7. 547-561, Sept./Oct. 1965.

A 2-fluid analysis of the modes of propagation in a magnetoplasma-filled waveguide may be based upon the solution of a pair of coupled partial differential equations for the longitudinal components of the hydromagnetic field. A method of solving these equations, which involves a system of transcendental equations for a set of undetermined parameters, is indicated. Approximate solutions are obtained with pressure, resistivity, viscosity, heat conduction, and current inertia treated exactly, while neglecting certain effects, such as Hall effect. The effects of viscosity and heat conduction on the dispersion relations are shown explicitly.

NON-LINEAR THEORY OF PLASMA DYNAMICS, by R. E. Aamodt. Final thechnical rept. Feb. 1, 1964-Jan. 31, 1965. Mar. 1, 1965, 35p. incl. diagrs. refs. (Rept. no. GA-6179) (AFOSR-65-1054) (AF 49(638)-1356) AD 628018 Unclassified

The effects of the non-linear process of resonant wave-wave scattering for unstable modes in a homogeneous plasma system with a constant external magnetic field are evaluated. It is shown that this particular non-linear mechanism may provide a partial explanation of some existing experimental results, and in addition, provides an experiment to verify the non-linear theory.

NON-LINEAR THEORY OF PLASMA DYNAMICS (Abstract), by R. E. Aamodt. [1965] [1]p. (Bound with its AFOSR-65-1266; AD 622527) (AF 49(638)1546 and AF 49(638)1356) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

Many of the plasma configurations occurring in the Van Allen belt, solar winds, high altitude nuclear explosions, and would-be fusion devices are known to be unstable to initially small excitations. The amplitudes of these unstable excitations grow until limited by the non-linear terms in the equations of motion. The plasma is then fully turbulent and the dynamics are determined by non-linear processes. The important non-linear processes for "weak" instabilities in low - collisionless plasma systems will be discussed and the time development of the energy spectrum described. The concomitant effects on particle containment and coupling to external radiation fields will also be presented.

CHEMICAL REACTIONS ON CLEAN SURFACES USING MODULATED ATOMIC BEAM TECHNIQUES (Abstract), by H. Saltsburg and J. N Smith, Jr. [1965] [2]p. (Bound with its AFOSR-65-2238; AD 627978) (AF 49-(638)1559) Unclassified

Presented at Sixth AFOSR Contractors' meeting on Chemical Kinetics of Propulsion, New York, Sept. 20-21, 1965.

The study of heterogeneous chemical reactions utilizing molecular beam techniques offers certain obvious advantages in terms of reaction mechanism studies but certain difficulties remain. Specifically, studies of such reactions always involve some determination of the surface of the solid Usually, one specifies an adsorption isotherm from which such concentration can be deduced. A technique was developed to prepare and maintain, in steady state, a metallic surface upon which the concentration of impurities resulting from background gas adsorption can be made arbitrarily small. A new surface is created by continuous deposition of metal at a rate which greatly exceeds the background gas impingement rate. Since this is possible even at 10^{-5} torr, these clean surfaces can be prepared in conventional molecular beam machines and have been used for studies of physical scattering. Since the surface concentration of adsorbed species can be varied by varying the ratio of metal deposition rate to background gas impingement rate, these surface concentrations can be controlled independently of the background gas pressure. If one reactant in a heterogeneous reaction is present as the background gas and the other in the molecular beam, mechanistic studies of the classic form can be carried out using metal deposition rates to vary surface concentrations. One can also study reactions between the beam and the surface both on clean surfaces and with known and controllable impurity concentrations. Experimental studies of the H_2-D and D_2-H exchange on nickel surfaces are in progress.

SCATTERING OF RARE GASES FROM THE [111] PLANE OF SILVER (Abstract), by H. Saltsburg and J. N. Smith, Jr. [1965] [1]p. [AF 49(638)1559] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 69, Jan. 28, 1965.

The angular distribution of thermal neutral beams of rare gases scattered from an epitaxially grown [111] plane of silver has been examined using freshly deposited films and also during continuous silver deposition, the latter condition providing a clean surface. Scattering distributions for He from freshly deposited films are essentially independent of beam energy ($T \cdot 300\,^{\circ}K$) and incident angle, the distribution being sharply peaked at the specular angle The scattering of Ar and Xe ($T = 300\,^{\circ}K$) exhibits a maximum intensity between the normal and specular angle, and a dependence of scattering on incident angle, the deviation from specularity being most pronounced toward glancing incidence For a given incident angle, an increase in beam energy causes a shift of the maximum scattered-beam intensity toward the specular and at beam temperatures of $\sim 1525\,^{\circ}K$ the maximum intensity lies beyond the specular angle. Unlike gold surfaces the scattering from silver during deposition does not differ markedly in prominent features from that on freshly deposited films. However, over long periods of time ($\cdot$ 12h) the directional scattering is degraded in a manner similar to that observed on contaminated gold films.

RESEARCH PROGRAMS FOR ALERTING, DETECTION, AND IDENTIFICATION OF PATHOGENS, by J. R. Gould. Status rept. Oct. 1, 1964-Mar. 31, 1965, 24p. incl. illus. diagrs. tables. (AFOSR-65-1284) (AF 49-(638)1418) AD 620224 Unclassified

The purpose of this program is to assess the feasibility of detecting bacteria by an investigation of their unique metabolic activities, using gas chromatography in conjunction with ultrasensitive detectors for the determination of volatile products or derivatives of products of bacterial metabolism. A standard procedure was developed for the growth of the test organisms and for the extraction and detection of bacterial metabolites. This procedure involves: (1) growth of the bacteria in a synthetic medium in shallow layers at 35°C for 36 hr; (2) extraction of the cultures with ether and concentration of the ether extract 10-fold by evaporation; and (3) injection of the anhydrous extracts into the dual channel gas chromatograph, using a 6 ft x 1/4 in. column of 10% carbowax 4000 terminated with terephthalic acid on 60/80 chromosorb U plus hexamethyldisilazane.

RESEARCH PROGRAMS FOR ALERTING, DETECTION, AND IDENTIFICATION OF PATHOGENS, by J. R. Gould. [Final] status rept. Oct. 1, 1964-June 30, 1965, 54p. incl. illus. diagrs. tables. (AFOSR-65-1728) (AF 49(638)1418) AD 624242 Unclassified

Although a high percentage of the background particulate matter is expected to be bacterial in nature, less than one viable organism per liter is normally present in the atmosphere. Therefore, a method of detecting and identifying the viable agents in the background containing a large number of nonviable agents and nonbiological materials may prove to be very useful information in the event of a BW attack. Such information may be determined by witnessing the presence and uniqueness of excreted metabolic products formed by specific organisms after development in a selective test medium. The methodology, to demonstrate the feasibility of the above, involves the selectivity of a gas-liquid-chromatography in conjunction with ultrasensitive detectors, for the analysis of gases, volatile products, or other products of metabolism that can be converted into volatile derivatives. Using this approach it was found possible to not only distinguish among genera, and among species, but also among the strains of microorganisms investigated. The survey included: Escherichia coli (5 strains), Aerobacteriaerogenes, Pseudomonasaeruginosa, Bacillus subtilis (11 strains), B. pumilus, B. licheniformis, B. polymyxa, B. megaterium, B. circulans, B. globigii, Streptomyces griseus, S. fradiae, S. viridochormogenes, S. albus, and S. griseolutus. Further, it has been demonstrated that the electron capture detector has a detection capability equivalent to the metabolic products of less than two bacteria. There is considerable promise for increased sensitivity inasmuch as only partial extraction of products have been employed, and product conversion has not been attempted. On the basis of present results, it is believed that the technique of gas chromatography is very promising for detecting very small numbers of organisms and also for the detection of metabolic differences among genera, species, and even among strains of a species.

CHEMISORPTION ON SINGLE-CRYSTAL PLANES; NITROGEN ON TUNGSTEN, by T. A. Delchar and G. Ehrlich. Jan. 1965, 37p. incl. illus. tables, refs. (Rept. no. 65-RL-3864 M) (AFOSR-65-1643) (AF 49-(638)1362) AD 624287 Unclassified

Also published in Jour. Chem. Phys., v. 42: 2686-2702, Apr. 15, 1965.

The effects of surface structure on the adsorption of nitrogen are examined by contact-potential measurements on macroscopic planes cut from single-crystal tungsten. The effects of room-temperature chemisorption on the work function are studied on the (100), (111), and (110) faces. It is found that macroscopic surfaces can be prepared showing extreme structural specificity. Previous correlations between the work-function changes and electronegativities are examined and found insufficient. The effects of structure on the surface dipole are, however, correlated by the empirical rule that nitrogen atoms on flat planes lower the work function, whereas on rough surfaces the work function is increased.

ATOMIC DISPLACEMENTS IN ONE- AND TWO-DIMENSIONAL DIFFUSION, by G. Ehrlich. Oct. 1965 [13]p. incl. diagrs. table. (Rept. no. 65-C-039) (AFOSR-65-2769) (AF 49(638)1362) AD 628016 Unclassified

Also published in Jour. Chem. Phys., v. 44: 1050-1055, Feb. 1, 1966. (AFOSR-66-1050; AD 636373)

The statistics of surface diffusion phenomena are developed for the conditions appropriate to measurements in the ion microscope. Examined in detail are: (1) the effect of boundaries (lattice steps) on the mean square displacement in a random walk; (2) the probability density for distances traversed in a 2-dimensional walk along nonorthogonal surface channels; and (3) the distribution of distances for random walks in which the number of jumps is subject to fluctuation, as it is in real systems. Both reflecting and adsorbing boundaries are found to diminish the mean square displacement in the same fashion. The effect of nonorthogonality, and even more so of fluctuations, is to enhance the frequency of small displacements when compared with a Rayleigh distribution.

AN ATOMIC VIEW OF SURFACE SELF-DIFFUSION: TUNGSTEN ON TUNGSTEN, by G. Ehrlich and F. G. Hudda. Oct. 1965, 21p. incl. illus. diagrs. refs. (AFOSR-65-2883) (AF 49(638)1362) AD 627837 Unclassified

Presented at Conf. on Sorption Properties of Evacuated Metal Films, Liverpool, Apr. 1963.

Surface diffusion of tungsten adatoms on several smooth, low index planes of the tungsten lattice has for the first time been followed by direct observation of individual atoms in the ion microscope. Contrary to expectation, the mobility at room temperature is found to increase in the order (211) > (321) ~ = (110) > (310) ~ (111). Migrating atoms are reflected at the boundaries of the (110), (211), and (321) planes; on the latter two, motion along atomic rows is favored over diffusion across lattice steps. From quantitative determinations of the rate of change of the mean square displacement, diffusion coefficients were obtained. Differences in diffusion on the (211) and (321)-planes of very similar structure suggest a weakening of interatomic forces at lattice edges. (Contractor's abstract)

STRUCTURAL RESPONSE TO INTENSE ELECTROMAGNETIC RADIATION, by R. C. Good, Jr. Final rept. Mar. 1, 1961-Feb. 28, 1965. June 1965, 186p. incl. illus. diagrs. tables, refs. (AFOSR-65-0988) (AF 49-(638)1030) AD 616336 Unclassified

An exploding wire apparatus was used to study conversion of electrical energy into strain energy in glass, plastic, and metal samples that had been either irradiated by the electromagnetic waves emitted by the wire or enveloped by plasma formed by the wire. The strain energy left permanent marks on the sample in the form of discoloration, weight loss, erosion, and surface cracks. These were used to confirm the theoretical analysis as to method and to dimensions. Thus, a new method for measuring absorption coefficients was demonstrated. For glass samples, the surface crazed to a depth of 10^{-3} cm. Photomicrographs and profilometer measurements of the surface are presented to support the following conjectures as to the cause of cracking: the energy radiation by the hot wire is absorbed by a thin surface layer of the glass, the associated temperature rise generates thermal stresses, flaws below the glass surface form stress raisers according to the Griffith crack theory, and the cracks subsequently propagate to the surface. The theoretical derivation of the adapted thermoelastic stress theory predicts the dimensions of the cracks and the power levels required if the absorption coefficient is at least 10^3 reciprocal centimeters. Thus, a cracking phenomenon has been postulated and verified experimentally. The resistance of the exploding wire was measured empirically, and a theoretical justification made of its variation. This study added to a characterization of the exploding wire along with spectral, calorimetric, and photographic studies. (Contractor's abstract)

THE DIRECT MEASUREMENTS OF MOLECULAR VELOCITY DISTRIBUTION FUNCTIONS, by E. P. Muntz. Final rept. Mar. 31, 1965, 3p. (AFOSR-65-0808) (AF 49(638)1152) AD 622591 Unclassified

A brief summary of the research conducted is presented. During the investigation it was demonstrated that the Doppler profile of the 5015.67A helium line excited by a beam of 20 kv electrons can be used to measure distribution functions. The first interference free measurements of a distribution function in a free jet expansion were made, and resonance diffusion of the emission by an electron beam was considered relative to a decrease in spacial resolution. The etalon system and the recording system were improved so that nonequilibrium distribution function measurements will be possible in wind tunnel laboratory environments.

SHOCK-TUBE STUDY OF THE THERMAL DISSOCIATION OF NITROGEN, by B. Cary. [1965] [10]p incl. illus. diagrs. tables, refs. (AFOSR-65-1231) (AF 49-(638)1157) AD 622759 Unclassified

Also published in Phys. Fluids, v. 8: 26-35, Jan. 1965.

The dissociation of nitrogen behind shock waves was studied over a temperature range of 6000 to 10,000°K. A time-resolved Mach-Zehnder interferometer measured the density profiles in the reaction zone. Rate expressions based on classical collision theory and the hydrodynamic constraint equations were used to fit the

experimental profiles. Inferred rate constants are presented with N_2, N, Ne, and Ar as third bodies. This work differs from previous studies of nitrogen in that a measurement of the forward dissociation rate was made in N_2 with N_2 as the third body and in that the new data indicates that N is about as effective a third body as N_2. Vibrational relaxation data indicates that to a first approximation there is no significant coupling between vibrational relaxation and dissociation over the temperature range covered. Vibrational relaxation times in N_2-Ne mixtures behind combustion driven shocks indicate that Ne is about 1.4 times as effective as N_2 in vibrationally exciting N_2, agreeing well with predictions of the Landau theory. This agreement between theory and experiment is as good as that obtained for Ar utilizing pressure breaks, vindicating the combustion technique. (Contractor's abstract)

DENSITY OF PULSED PLASMA, by [P. Gloersen] Final rept. June 1965, 17p. incl. illus. diagrs. (AFOSR-65-1732) (AF 49(638)1174) AD 628516 Unclassified

An absorption spectroscopy technique in the vacuum ultraviolet region was developed to measure the ion and neutral particle densities in the exhaust stream of a repetitively pulsed 2-stage coaxial plasma propulsion engine by monitoring their various resonance absorption lines. The development of the plasma accelerator progressed to the point where argon was definitely ruled out as a suitable propellant. Xenon was found to be suitable and efforts were shifted towards extending the measuring techniques for use with xenon and other heavier propellants. In order to provide a better model for coaxial gun operation than hitherto available, some analytical effort was applied to the problem. The special case of the stationary current sheet was brought to a successful conclusion both on the basis of energetics and the application of Faraday's law, starting from first principles. Extension of this analysis to cover the moving current sheet has been only partly successful to date in that a reasonable statement of the energetics could be made, but no consistent means has yet been found for applying Faraday's law.

DENSITY OF PULSED PLASMA (Abstract), by P. Gloersen and S. Collins. [1965] [1]p. (Bound with its AFOSR-65-1266; AD 622527) (AF 49(638)1174) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

The nature of the plasma source (a repetitively pulsed coaxial gun) in which density measurements are to be made has changed considerably over the past year. The present status of the gun performance characteristics and knowledge of the plasma composition are summarized as a basis for describing the density measurements contemplated by means of vacuum ultraviolet absorption spectroscopy. Since the best operation of the gun has been obtained with xenon, attention has shifted away from one aspect of a previous program to determine the oscillator strength of the argon atom. A summary of what is known about the oscillator strengths of the resonance lines of some other rare gases is described.

A DISCRETE ORDINATE TECHNIQUE FOR THE LINEARIZED BOLTZMANN EQUATION WITH APPLICATION TO COUETTE FLOW, by B. B. Hamel and M. Wachman. Nov. 1964 [48]p. incl. diagrs. tables, refs. (AFOSR-64-1593) (AF 49(638)1283) AD 604749 Unclassified

Also published in Rarefied Gas Dynamics; Proc. Fourth International Symposium, Toronto U. (Canada) (July 14-17, 1964), ed. by J. H. de Leeuw. New York, Academic Press, v. 1: 370-393, 1965.

A numerical method for the solution of the linearized Boltzmann equation of hard sphere molecules is developed here, in which approximations are made only in sense of numerical truncations. The distribution function is considered at n discrete points in velocity space, and a closed symmetric set of differential equations is developed which describe the evolution of the distribution function at each of these discrete points. The key point of the method is the approximation, by a finite sum, of the collision integral, utilizing Gauss quadrature (integration) formulas. The method is applied to the problem of linearized Couette flow of hard sphere molecules. Numerical results are obtained for the moments and for the perturbation distribution function at the discrete points.

TWO-FLUID HYDRODYNAMIC EQUATIONS FOR A NEUTRAL, DISPARATE MASS BINARY MIXTURE, by B. B. Hamel. Aug. 1965, 42p. incl. refs. (AFOSR-65-1194) (AF 49(638)1283) AD 470970
Unclassified

Also published in Phys. Fluids, v. 9: 12-22, Jan 1966.

In gas mixtures with roughly equal masses, self collisions and cross collisions between species are of equal importance in the approach of the mixture to a Maxwellian distribution about a single temperature and velocity and the usual Chapman and Enskog transport theory obtains. In a disparate mass mixture, however, the effects of self and cross collisions are not equal and one has an epochal relaxation, with the temperature relaxation occurring on the longest time scale. The clear distinction between a single molecular relaxation time and a hydrodynamic time scale which makes the usual Chapman and Enskog theory possible is absent for the disparate mass case, and a more complex ordering of time scales is necessary to obtain hydrodynamic solutions. In the present work, for neutral, disparate mass mixtures, the Boltzmann collision integrals are replaced by relaxation type kinetic models; terms in the model equation are carried out in the limit where the masses are disparate. A set of 2-fluid transport equations are derived in this way and the properties and limitations of these equations are described.

RESEARCH IN NON-EQUILIBRIUM IONIZATION AND MHD FLOWS (Abstract), by A. Sherman and J. M. Smith. [1965] [1]p. (Bound with its AFOSR-65-1266, AD 622527) (AF 49(638)1465) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

Several studies related to the coupling between non-equilibrium ionization phenomena and the magnetohydrodynamic flow are described. One approach involves preionization of the plasma before the channel. The second involves ionization directly in the channel itself. Several calculations have been made for arbitrary initial conditions. The Hartmann flow problem for infinitely finely segmented electrodes including the Hall effect were solved. Curves showing the velocity profiles are presented. A problem involving a uniform flow and a realistic electrode structure was considered. Accordingly the finite segmented electrode problem, with conductivity taken as a function of the current density, was solved by a perturbation technique. Calculations were based on the first order of perturbation.

ADAPTIVE THRESHOLD LOGIC FOR IDENTIFICATION OF SIMULATED RADAR TARGETS, by A. T Ewald Nov. 1965 [33]p. incl. diagrs refs. (Rept. no. 65TMP-84) (AFOSR-65-2709) (AF 49(638)1520) AD 477861
Unclassified

The application of adaptive threshold logic is considered as a means of establishing simple data transforms that will permit the automatic classification of patterns whose signal properties are too complex to be amenable to explicit analytic description. In an attempt to study the learning characteristics of adaptive logic systems monopulse radar signal returns of multiple targets were computer-simulated to generate different classes of signal patterns. Three levels of pattern complexity were examined. Sum- and difference-transformed data patterns were learned more quickly than the ratio transform for 1- and 2-target patterns. The ratio transform was unsuccessful at the second level of complexity, i.e., the introduction of patterns of three targets one-quarter beamwidth apart versus one target. Difference-transform data produced weight learning plots that exhibited marked oscillation in early trials before converging to a solution. The sum transform showed oscillation in the learning plot similar to the 2-target cases, but of no longer duration. At an S/N of 2, sum and difference transforms were successful in discriminating a 2-target one-quarter beamwidth apart pattern from a five-target, one-quarter beamwidth apart pattern, but exhibited a distribution of weighting functions suggesting that only the first and last few intervals of the radar scan provided useful information.

AN AXIOMATIC CONCEPTUAL FRAMEWORK FOR ASSOCIATION THEORY, by R. F. Reiss. Dec. 1965 [130]p. incl. refs. (AF AFOSR-66-0597) (AF 49(638)1236) AD 630429 Unclassified

A partially developed axiomatic system, called the SSF frame (state-space-function framework), is described, and is intended for use in formulating a general theory of psychological phenomena, particularly a theory based on associationist concepts. The chief primitive entities

of the system are 'states,' 'moments of time,' and 'occurrences' of a state 'at' various moments of time. A class of objects, 'bases,' is introduced for particular groups of states to enable the empirical interpretation of a 'real object' that can have or be in various observed states at various times. The base of a space is a unique object: there cannot be two or more bases in the same space and, by definition, the base of a space cannot be in two states at the same moment. A relation called an 'alinement' enables consideration of the relations between the spaces of x and y. The framework is deterministic; all functions are divided into 'formal' and 'causal,' the latter derived from the former by means of pairing and special interpretations. A main dichotomy of causal functions is that of 'first-order' vs 'second-order' types. The notion of a 'sequential' deterministic system is developed that is consistent with the conceptual framework of state spaces and causal functions. The fundamental temporal property of a causal connection, the 'propagation delay,' is introduced and related with the delays of causal functions. The structure of a sequential function is characterized by 'autopaths' in the co-domain corresponding to subsets of the domain, namely those subsets defined by points in A for a function f AXB-B.

AN EXPERIMENTAL STUDY OF THE CORTICAL REACTIVITY DURING SLEEP AND WAKEFULNESS, by G. F. Rossi, M. Palestini, and others. [1965] [24]p. incl. illus. diagrs. refs. (AFOSR-65-1291) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-62-106 and Consiglio Nazionale delle Ricerche) AD 621599 Unclassified

Also published in Colloq. Internationaux du Centre Nat'l. de la Recherche Scientifique sur l'Aspects Anatomo-Fonctionnels de la Physiologie du Sommeil, Lyon (France) (Sept. 9-11, 1963), Paris, CRNS, No. 127 509-532. 1965.

In intact cats with chronically implanted electrodes, electrical potentials have been evoked in the visual cortex by single stimuli of the optic radiations and of the lateral geniculate body, and in the sensory-motor cortex by stimulation of the pyramidal tract and of the VPL thalamic nucleus. A comparison has been made between the mean amplitude of the responses recorded during wakefulness, light sleep and deep sleep. The amplitude of the cortical responses evoked by the optic radiations or antidromically by the pyramidal tract is larger during deep sleep than during wakefulness in the great majority of cases, no significant difference is found between the responses recorded during light sleep and deep sleep. The recovery cycle of the visual cortex is more rapid during sleep than during wakefulness in most of the cases, it is similar in the two phases of sleep. The amplitude of the cortical responses to thalamic stimulation is larger during deep sleep than during wakefulness in all the cases, it is, however, relatively small during light sleep. The results reported indicate that the reactivity of the cortical neurons is enhanced during both light sleep and deep sleep. Also the thalamic reactivity appears larger during deep sleep than during wakefulness, but is depressed during light sleep. By considering the present findings with previous ones, the hypothesis is advanced of a facilitation of the thalamocortical excitability during the maximal depth of sleep.

EXCITABILITY CYCLE OF THE VISUAL CORTEX DURING SLEEP AND WAKEFULNESS, by M. Palestini, M. Pisano and others. [1965] [8]p. incl. diagrs. refs. (AFOSR-65-2837) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-64-11 and Consiglio Nazionale delle Ricerce) AD 627757 Unclassified

Also published in Electroencephalog and Clin. Neurophysiol. Jour., v. 19. 276-283, Sept. 1965.

The excitability cycle of the visual cortex of intact unanesthetized cats was studied during the states of wakefulness, sleep with EEG synchronization and sleep with EEG desynchronization. The study was made by analyzing the relative amplitudes of 2 potentials evoked in the visual cortical area by the 2 identical stimuli to the optic radiations, separated by a variable time interval The excitability of the visual cortical neurons is higher during sleep than during wakefulness, no significant differences are found between the 2 phases of sleep. The phenomenon is tentatively interpreted by assuming that during sleep the cerebral cortex is released from an inhibitory influence exerted by the reticular activating system. The fluctuations of cortical excitability during synchronized sleep might be due to the varying of the synchronizing thalamo-cortical circuits; its relative stability during desynchronized sleep might be ascribed to an ascending hypnogenic brain-stem influence. Different cortical areas might show different excitability changes during sleep and wakefulness, the excitability changes of the thalamus seem to be partially different from those of the cerebral cortex.

SOME ASPECTS OF THE FUNCTIONAL ORGANIZATION OF THE BRAIN STEM: NEUROPHYSIOLOGICAL AND NEUROSURGICAL OBSERVATIONS, by G. F Rossi. [1965] [6]p. incl. diagr. (AFOSR-66-1141) (AF EOAR-64-11) AD 639522 Unclassified

Also published in Excerpta Med. Internat'l. Cong., Ser. 93: 117-122, Jan. 1965.

The aims of the present report are two: (1) to describe the brain stem mechanisms underlying changes of consciousness as revealed by results of animal experiments; and (2) to analyze whether and to what extent similar mechanisms are at work in man. The report is based largely on personal work in neurophysiological and neurosurgical fields; because of limitations of space it contains only a synthetic account of the most relevant findings.

RELATION BETWEEN BRAIN STEM AND ELECTROCORTICAL ACTIVITY, by G. F. Rossi. Final scientific rept. Oct. 1964-Sept. 1965. Sept. 30, 1965, 11p. incl. refs. (AFOSR-65-2012) (AF EOAR-65-4)
AD 627479 Unclassified

Results are summarized of research on the relationships between brain stem, electrocortical activity and level of consciousness. The findings are subdivided into 7 groups. The research on man included the study of the relation between EEG patterns and depth of sleep; the relation between cerebral potentials evoked by visual stimuli, EEG patterns and degree of awareness; and the electrocortical and behavioral effect of selective barbiturization of the brain stem and frontal brain. Experiments were performed on the rabbit in order to check some of the observations made in man. Other experiments were made on cats to study the sleep inducing effect of electrical stimulation of the cerebral cortex and the influence of the different phases of sleep on the EEG epileptic activity. Finally, the mode of action of a new analgesic drug was experimentally analyzed in the rabbit. (Contractor's abstract, modified)

INDUCTION OF EEG DESYNCHRONIZED SLEEP BY ELECTRICAL STIMULATION OF THE NEOCORTEX, by M. Di Paola, G. F. Rossi, and J. Zattoni. [1965] [14]p. incl. diagrs. refs. (AFOSR-66-1112) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-65-4 and Consiglio Nazionale delle Richerche)
AD 639830 Unclassified

Also published in Arch. Ital. Biol., v. 103: 818-831, 1965.

The effects of cortical stimulation on the occurrence of episodes of EEG desynchronized sleep were studied in chronic experiments performed on free-moving cats. The following neocortical areas were explored: anterior and posterior sigmoid gyri, anterior and posterior lateral gyri, syprasylvian gyrus, anterior sylvian gyrus anterior ectosylvian gyrus. Arousal from sleep as well as induction on the EEG desynchronized phase of sleep were obtained following cortical stimulations performed during EEG synchronized sleep. The type of the response was dependent on the general conditions of the animal at the moment on the stimulation: (1) when the stimulation was performed at the beginning of sleep, arousal occurred; and (2) when the cortical stimulus was applied during a well-developed EEG synchronized stage of sleep, an EEG desynchronized episode was obtained The physical parameters of stimulation did not influence the type of the response. The EEG desynchronized sleep was obtained by all the cortical areas stimulated; the arousing effect was induced by most of the areas. These results might suggest, but do not prove, a phasic cortical participation in the mechanism underlying the onset of the EEG desynchronized phase of sleep.

BRAIN STEM FACILITATING INFLUENCES ON EEG SYNCHRONIZATION EXPERIMENTAL FINDINGS AND OBSERVATIONS IN MAN, by G. F Rossi [1965] [32]p. incl. diagrs. tables. (AFOSR-66-1123) (AF EOAR-65-4) AD 638073 Unclassified

Also published in Acta Neurochirurg., v. 13: 257-268, 1965.

The report presents a critical review of the data supporting the participation of the brain stem in the mechanism of EEG synchronization. It is concluded that in the cat there are sufficient findings supporting an ascending influence facilitating EEG synchronization which arises from the middle pons (probably from reticular structures) and from the region of the nucleus of the solitary tract. It is stressed that there is a good correspondence between these 2 regions and those which, according to the results of anatomical researches, contain most of the reticular neurones having a long axone ascending rostral to the brain stem. It is likely that the EEG synchronizing function of the pontine neurones is mainly tonic while that of the medullary neurones is mainly phasic. Evidence for a brain stem facilitation of EEG synchronization in man is not yet proven, however, some observations seem to support it.

Also published in Jour. Amer. Chem. Soc., v. 87: 5264, Nov. 1965.

Using conventional spectrophotometric methods, we have measured the rates of Cr(II) reduction of cis- and trans-$Co(en)_2A(H_2O)^{+3}$ where en is ethylenediamine and A is either NH_3 or H_2O. In perchlorate media at 7 and 30 °C, these rates were inversely proportional to $[H^+]$, which was varied between 0.1 and 1 M. The first acidity constant of each aquo ion was measured by pH titration under similar conditions. It was concluded that factors involved with outward motion of the trans ligand are not totally absent in the Co(III)-Cr(II) system, but they are much less important than in the similar Co(III)-Fe(II) reductions which proceed at slower rates because of less favorable free-energy change.

GENERAL CONSIDERATIONS CONCERNING APPARENT MOBILITIES IN MIXED ION POPULATIONS. DRIFT VELOCITIES OF MASS-IDENTIFIED N^+, N_2^+, N_3^+, AND N_4^+ IONS IN NITROGEN, by G. E. Keller, D. W. Martin, and E. W. McDaniel. [1965] [12]p. incl. illus. diagrs. refs. [AF 49(638)1392] Unclassified

Also published in Phys. Rev., v. 140: A1535-A1546, Nov. 29, 1965.

This paper summarizes the difficulties inherent in the measurement of ionic drift velocities in gases, emphasizing the need for careful control of the ionization conditions in the ion source and the necessity for mass analysis of the ions at the end of their flight path. Mass analysis provides a positive determination of the molecular composition of the ions reaching the detector, detects the possible presence of a mixture of charge carriers of various molecular compositions, and is essential to help determine whether or not the charge carriers which have a given molecular composition when they arrive at the detector have had that same composition throughout their transit through the drift region. If examination of the arrival-time spectrum shows that a detected species is involved in an ion-molecule reaction scheme such that the charge carrier has spent an appreciable portion of its total drift time in a different ionic form, then the "apparent drift velocity" derived from the measurement of the transit time and drift distance cannot be meaningfully compared with the existing theory. A drift-tube mass spectrometer used to study the drift of mass-analyzed ions is described, and experimental results are presented for nitrogen ions in the parent gas. The drift-tube pressures used here ranged from 0.05 to 0.25 torr. The E/p_0 range covered was 7 to 50 v/cm torr for N^+ and N_3^+ ions and was 7 to 70 v/cm torr for N_2^+ and N_4^+ ions. The drift distance was varied from 9 to 34 cm. The transit-time spectra for N^+ indicate that its drift velocities measured here are the "true" values characteristic of the N^+ ion undergoing no reactive scattering collisions. The zero-field, reduced mobility of N^+ in N_2 is 2.47 cm^2/v sec. Ion-molecule reactions involving the other ions prevented the determination of their true drift velocities, but the measured apparent drift velocities yield useful information about their drift behavior and the reactions linking the various ions.

A COMPARISON OF LIVING SEPIOTEUTHIS SEPIOIDEA AND DORYTEUTHIS PLEI WITH OTHER SQUIDS, AND WITH SEPIA OFFICINALIS, by B. B. Boycott. [1965] [10]p. incl. illus. diagrs. refs. (AFOSR-66-0754) (AF 49(638)1011) AD 643590 Unclassified

Also published in Jour. Zool., v. 147: 344-351, Dec. 1965.

Sepioteuthis is unusual among loliginids in that it has a relatively broad body, fins extending along the length of the mantle, a well developed disruptive pattern and a dynamic response. The resemblances to Sepia are probably convergent associated with the assumption of an ecology similar to that of cuttlefishes. A pattern possibly of display of the ripe testis is described for D. plei and the known chromatic behavior of loliginids is summarized.

ORGANIC PEROXIDES. IV. KINETICS AND PRODUCTS OF DECOMPOSITIONS OF CYCLOHEXANEFORMYL AND ISOBUTYRYL PEROXIDES. BDPA AS A FREE RADICAL SCAVENGER, by R. C. Lamb, J. G. Pacifici, and P. W. Ayers. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-65-2759) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-53, National Science Foundation, and Petroleum Research Fund) AD 627830 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 3928-3935, Sept. 5, 1965.

The kinetics and free-radical efficiencies of the thermal decompositions of cyclohexaneformyl peroxide (I) and isobutyryl peroxide (II) in carbon tetrachloride were determined with excess α, γ-bis(diphenylene)-β-phenylallyl (BDPA) at temperatures between 30° and 85° C. The rate constants and efficiencies obtained by

the excess BDPA method are independent of the ratio of initial concentrations of BDPA to peroxide. Product studies were performed on mixtures obtained from the decompositions of I and II in carbon tetrachloride, and in the same solvent containing excess BDPA. Evidence is presented which indicates that inversion compounds (RCOOCOOR) are formed in the decompositions of both peroxides. Rate constants for decompositions of II in several other polar and nonpolar solvents at 40°C were determined by idometric assay. Results suggest that the homolysis and the rearrangement of peroxide to inversion compound are 2 distinct modes of decomposition.

AD 627828 Unclassified

Also published in Jour. Org. Chem., v. 30 3099-3102, Sept. 1965.

Results of kinetics runs are reported for decompositions of β-allyloxypropionyl peroxide in toluene and p-xylene. The kinetics of decomposition in toluene are approximately first order, although very slight curvatures of first-order plots indicates a small amount of induced decomposition. β-Allyloxypropionyl peroxide decomposes somewhat more rapidly in p-xylene than in toluene, and the kinetic behavior is such as to suggest that there is more radical-induced decomposition in the former. Product studies are reported for decompositions of the --allyloxypropionyl peroxide in p-xylene and in the same solvent containing excess galvinoxyl. The main product formed from the β-allyloxyethyl radical is 3-methyltetrahydrofuran, which indicates that this radical, like the 5-hexenyl radical, undergoes cyclization to give a five-membered ring. AN UNUSUAL SOLVENT EFFECT ON THE AIR OXIDATION OF A STABLE CARBANION, by J. G. Pacifici, J. F. Garst, and E. G. Janzen. [1965] [1]p. incl. table (AFOSR-66-0313) (AF AFOSR-62-53) AD 632589 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87 3014-3015, July 1965.

The extensive data of Russell and co-workers, on the base-catalyzed air oxidation of many organic compounds, has been interpreted in terms of reaction sequences in which a one-electron transfer from a carbanion to an oxygen molecule is a key step. The direction of the solvent effect in less polar ethers and the presence of a distinct metal ion effect in 2-methyltetrahydrofuran suggest that the transition state tends to be more highly aggregated than the reactant ions.

PREDICTION OF DYNAMIC RESPONSE FROM FLUTTER ANALYSIS SOLUTIONS, by F. J. Frueh and J. M. Miller. June 1965, 63p. incl. diagrs. tables, refs. (AFOSR-65-0952) (AF 49(638)1015) AD 620867 Unclassified

This report presents the development of a dynamic response prediction method based on the transformation of classical flutter analysis solutions. This development is accomplished through investigation of the equations of motion of the flutter system for the determination of relationships of this system which are also common to the dynamically responding system's equations of motion. Several special operators are discovered to relate these two systems. Theodorsen incompressible aerodynamics and Ackeret's source pulse aerodynamics are used in the development of the dynamic response prediction method. As a result of these efforts, the analyst may predict an aeroelastic system's dynamic response in a manner independent of the system's basic parameters by merely transforming the solutions of a simple-harmonic-motion, required-structural-damping flutter analysis.

EXPERIMENTAL INVESTIGATION OF THE EFFECTS OF ELASTICITY ON THE STABILITY OF MANNED ROTATING SPACE STATIONS, by J. M. Miller and F. J. Frueh. June 1965, 27p. incl. illus. diagrs. (AFOSR-65-1404) (AF 49(638)1015) AD 620866 Unclassified

An experimental program is presented which investigates the structural dynamic stability of an elastic model of a manned rotating space station. A "cross" model was designed based on the elastic properties of a space station. The model consists of an aluminum bar for each arm to simulate uniform stiffness distribution, steel bars attached to each arm to simulate mass and inertia distribution, a cylindrical hub, nozzles at the arm tips and plastic tubing running from an air supply for simulation of spin up forces. Vibration tests were made for modes and frequencies of the model, and stability tests were made, simulating operational conditions. The instability of the model was demonstrated and the stability criterion were verified.

STIFFNESS DESCRIBER OF A FILAMENT WOUND CYLINDER FOR DYNAMIC ANALYSES, by J. M. Miller. Dec. 1965 [37]p. incl. diagrs. refs. (AFOSR-65-2214) (AF 49(638)1509) AD 626226 Unclassified

This report presents a technique for assembling a Stiffness Describer for Filament-Wound Cylinders (FWC) in the form of a Stiffness Matrix. The technique described provides the dynamicist with the means to analyze FWC. The data that would be required are physical properties such as: Poisson's Ratio, Moduli of Elasticity and Rigidity for the filament and resin, winding angles of plies, geometric data such as cylinder length, radius, overall thickness. The technique described produces a method for representing FWC analogous to that developed for beam-plate complex structures. The deviation of the Stiffness Describer of a FWC entails: writing the load-deflection equations for a shell in matrix form, applying boundary conditions for axial lengths (for assembly purposes), and mathematical modeling of FWC in terms of physical material constants. The expressions used to define structural relationships arose from strain energy considerations for shells and for plies at various angles to the cylinder's axis. The mathematical modeling was based on load paths that occur in composite materials.

STUDY OF THE FACTORS AFFECTING THE EFFICIENCY IN THERMAL ACCELERATION OF PROPELLANTS, by A. C. Ducati. Final technical rept. May 1962-Apr. 1965. Aug. 1965, 171p. incl. illus. diagrs. tables, refs. (Rept. no. FR-085-1161) (AFOSR-66-0495) (AF 49(638)1161) AD 629168 Unclassified

The report describes the experimental and analytical

work conducted to study the various influences affecting the operating characteristics of electrothermal accelerators. A survey of the testing facilities, including vacuum systems, resistance heaters, and liquid metal heaters is given. The experimental work conducted with hydrogen, helium, ammonia, nitrogen, oxygen, and argon at temperatures ranging from 300°-3000°K is described. Conical and annular nozzles are compared with simple cylindrical throats, and the experimental and analytical expressions relative to their behavior are included. Outlined are the development of low pressure arc heaters and the experiments which led, for the first time, to the attainment of specific impulse levels of over 10,000 sec using hydrogen. Performance comparisons between resistance and arc heating and associated anomalies using ammonia are also discussed. The behavior of self-magnetic fields in the arc heater is explained, together with the effects of externally applied magnetic fields ranging from 500 to 12,000 gauss. Included are operation at low mass flow rates and the development of arc heaters working without propellant throughput using electrode vapors or residual ambient gas as the working fluid. (Contractor's abstract)

FACTORS AFFECTING THE EFFICIENCY IN THERMAL ACCELERATION (Abstract), by A. C. Ducati. [1965] [1]p. (Bound with its AFOSR-65-1266; AD 622527) (AF 49(638)1161) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

A tentative synoptic classification grouping the factors affecting the efficiency in thermal acceleration is presented. While a definite separation between the various factors is sometimes difficult, 3 categories have been specified. The first category comprises the factors affecting the energy transfer from the electrical source to the propellant. The second is associated with the conversion of the propellant energy to thrust. The third refers to factors still not completely known or explainable which have been brought to light in recent experiments. Various efforts to identify and measure the factors grouped in the 3 main categories are presented. The effort this year has been directed particularly to the study of various influences determined by operation at very low environmental pressures in the presence of magnetic fields of various intensities. Operation without external propellant flow has been obtained and studied in a wide range of conditions. The presence of parasitic effects affecting the operation at the lower mass flows is indicated as a tentative explanation of abnormal values of thrust measured. Suggestions for further improvements in the testing technique and instrumentation are included.

TOROIDAL PLASMA CONTAINMENT (Abstract), by H. G. Loos. [1965] [1]p. (Bound with its AFOSR-65-1266; AD 622527) (AF 49(638)1226) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

Experiments on the toroidal containment of plasmas with a rotating magnetic field have been continued over a range of phase shifts between the 0-pinch field and the ring-conductor field. For phase shifts of $\pi/2$, $3\pi/2$, etc. we find a quasi-continuous luminous trace on the smear photographs. The discharge tube is not large enough to avoid wall contact, which occurs as a result of the radial plasma oscillation. The latter is due to the phase shift between the 0-pinch field and the ring-conductor field. The smear pictures obtained suggest, however, that uninterrupted containment would occur in this configuration for larger tube size and higher ionization fraction. No instabilities have been found so far. The smear pictures show that the presence of the ring-conductor field at zero 0-pinch field inhibits further ionization at locations close to the ring conductor. This is due to the reduction of the EE component of the tensor conductivity due to a magnetic field perpendicular to the electric field. Hence, in this configuration, as much ohmic heating as possible should be applied before the ring conductor is switched on.

CHARACTERISTICS OF THE ATP-ASE ACTIVITY OF ISOLATED NEUTRONS OF RABBIT, by H. Hillman and H. Hydén. [1965] [5]p. incl. diagr. refs. (AFOSR-65-0958) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-28, National Multiple Sclerosis Society, and Torsten and Rahnar Soderberg's Foundation) AD 617980 Unclassified

Also published in Histochemie, v. 4: 446-450, Jan. 1965.

This study describes a technique which allows the measurement of the maximal breakdown of ATP in single isolated neurons. Isolated and homogenized Deiters' neurons from the lateral vestibular nucleus of rabbit in a Krebs-Ringer solution containing no added Mg^{++}, 1.3 μmol/ml and 5μmol/ml Mg^{++}, broke down ATP at the maximal rate of 0.29 ± 0.20, 2.40 ± 0.20, and 5.95 ± 0.63 $\mu\mu$mol/cell/hr. In 1.3 mm Mg^{++} solution the single cell homogenates took up phosphate at the mean rate of 2.6 ± 0.2$\mu\mu$mol/cell/hr. If the rabbits were injected 1 hr before with 20 mg/kg body weight of 2-amino-1-propene-1, 1, 3 tricarbonitrile (triap), the breakdown of ATP in these latter media was 0.82 ± 0.44, 2.5 ± 0.60, and 6.7 ± 1.1 $\mu\mu$mol/cell/hr, respectively, and the quantity of inorganic liberated did not decrease.

BIOCHEMICAL STUDIES OF NEURONS AND GLIA DURING LEARNING AND DIFFERENT FUNCTIONAL CONDITIONS, by H. Hydén. Final rept. Oct. 1, 1964-Mar. 31, 1965. [May] 1965 [3]p. (AFOSR-65-1486) (AF EOAR-63-28) AD 629340 Unclassified

Two separate investigations are included in this report. First, a study was made with rats of the differentiation in RNA response in neurons early and late during learning. In early learning, nuclear RNA was formed with high adenine and uracil values, i.e., 26 and 28, respectively. Later during learning a 100% RNA/cell increase occurred, but the RNA had changed to a ribosomal type, i.e., A 21 G 35 C 24 U 20. It is concluded that early response with A-U rich RNA production reflects a genic stimulation in a learning situation never before encountered. Similarly, in behavioral tests, vestibular neurons produce nuclear RNA with high adenine and low uracil values when a difficult balancing is being learned. Secondly, a study was made of protein synthesis in isolated neurons and glia during learning. Two separate methods are described for the separation and determination of proteins: (1) an ultramicro method and (2) the use of tricyanoaminopropene to stimulate RNA synthesis in neurons. With these procedures, it is now possible to correlate protein synthesis in isolated neurons with their RNA synthesis and the type of RNA and base composition.

A DIFFERENTIATION IN RNA RESPONSE IN NEURONS EARLY AND LATE DURING LEARNING, by H. Hydén and P. W. Lange. [1965] [7]p. incl. diagrs. table, refs. (AFOSR-65-2517) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-28, National Multiple Sclerosis Society, and Torsten and Rahnar Soderberg's Foundation) AD 628365 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 53: 946-952, May 1965.

The amount and composition of nuclear RNA formed in cortical neurons and in vestibular neurons of the brain stem in 2 types of learning experiments have been determined. Early during transfer of handedness, the cortical neurons produced a small amount of RNA with high adenine and uracil values. Later during the learning period, but still on the rising part of the performance curve, the RNA formed increased in amount, and changed in base composition to an RNA of a ribosomal type. This differentiation in response was interpreted to reflect a genic stimulation of the neurons with an initial synthesis of adenine-uracil-rich RNA. In the phylogentically older vestibular neurons, a highly asymmetric, adenine-rich nuclear RNA was formed in the rats which increased their performance linearly with time during learning. Some animals showed a non-linear performance curve. The nuclear RNA formed in the neurons of these rats had a ribosomal type of base composition.

RESEARCH ON INTRA NEURONAL MECHANISMS FOR INFORMATION STORAGE, by H. Hydén. Mar. 31, 1965 [42]p. incl. tables, refs. (Technical rept. no. 1) (AFOSR-66-0364) (AF EOAR-63-28) AD 628899 Unclassified

Different types of micro-chemical methods used for analysis of neurons and glia are discussed. As an introduction to a discussion of a biochemical response in neuron and glia during learning, a few basic problems are mentioned and some pertinent results are given. The neurons are especially rich in RNA and during a life-cycle in man, there can be discerned a rise, steady level and fall in the RNA content of moto-neurons. During physiological stimulation of the nervous system in mammals, an increase of the RNA content, total proteins and enzyme activities have been found in the neurons, and a decrease in the surrounding glia. To elucidate this phenomenon, a kinetic study and other experiments were carried out. The results showed that the neuron and its glia are coupled as a unit from an energetic point of view. Some RNA data from a study of Parkinson's disease are given to show that one part of the unit can influence the other from a biochemical as well as from a functional point of view.

RHYTHMIC ENZYME CHANGES IN NEURONS AND GLIA DURING SLEEP, by H. Hydén and P. W. Lange. [1965] [35]p. incl. table. (AFOSR-66-2451) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-28 and Swedish State Medical Research Council) AD 641031 Unclassified

Also published in Science, v. 149: 654-656, Aug. 6, 1965.

Rhythmic changes occur in the activities of enzymes in both the neurons and neuroglia isolated from the caudal part of the reticular formation of rabbits killed during sleep and wakefulness. During sleep, enzyme activity is high in the neurons and low in the glia; during wakefulness, this situation is reversed. In the oral part of the reticular formation rhythmic enzyme changes occur only in the neurons. No rhythmic changes occur in the hypoglossal and trigeminal mesencephalic neurons and glia. These findings indicate that the caudal part of the reticular formation reflects in metabolic changes the biological clock behind the sleep rhythm.

MEMBRANE POTENTIALS IN ISOLATED NEURONS IN VITRO FROM DEITERS' NUCLEUS OF RABBIT, by H. Hillman and H. Hydén. [1965] [13]p. incl. illus. diagrs. table, refs. (Sponsored jointly by Air Force Office of

Scientific Research under AF EOAR-63-28, Multiple Sclerosis Foundation, and Swedish Medical Research Council) Unclassified

Published in Jour. Physiol., v. 177: 398-410, Apr. 1965.

Study is made of the penetration of neurons in vitro at 23°C, isolated from the rabbit Deiters nuclei, resting potentials of 39 mV ± 4.3 (n = 120) were recorded in a Krebs-Ringer bicarbonate-glucose saline, containing 50 mM glucose. Membrane potentials decreased from 41 ± 6.4 to 25 ± 6.2 during hypoxia, and recovered to 35 ± 4.6 mV (n = 40) on reintroduction of 95% O_2 5% CO_2. Resting potentials between 7.4 and 23 mV were recorded in the absence of added substrate; they were maximal (39.5 ± 5 mV) with 50 mM glucose at 10 mM, or 100 mM glucose concentrations, the membrane potentials were smaller. Potassium ions (2-5 mM) allowed the maximum resting potential of means between 37 and 49 mV, of 0, 2, 5, 10 and 150 mM medium K^+ concentrations tested. Sodium ions (110 mM) allowed the maximum membrane potentials, of means between 40.5 and 46 mV and 84 mM the minimum, between 25 and 31 mV, of 0, 26, 84, 110 and 150 mM-Na^+ concentrations tested. A ganglioside preparation (0.3 mg/ml of medium) increased the resting potential from means between 42 and 49 mV to means between 50.5 and 56 mV.

BIOCHEMISTRY AND PHYSIOLOGY OF BRAIN DOPAMINE, by A. Carlsson. Final scientific rept. Mar. 13, 1965, 5p. incl. refs. (AFOSR-65-0872) (AF EOAR-64-30) AD 617569 Unclassified

The major part of the brain dopamine, a catecholamine belonging to the monoamine family, occurs in neurons, whose cell bodies are located in the substantia nigra of the brain stem. Their axons ascend in the internal capsule and terminate in the neostriatum. Dopamine is localized also to other neuronal systems in the brain and the retina. Evidence supporting the view that the brain monoamines serve as neurohumoral transmitters has been presented. The functions of the nigro-neostriatal and other dopamine containing pathways are under study, using a multidisciplinary approach.

OCCURRENCE OF DIHYDROXYPHENYLALANINE DECARBOXYLASE IN NERVES OF THE SPINAL CORD AND SYMPATHETICALLY INNERVATED ORGANS, by N.-E. Anden, T. Magnusson, and E. Rosengren. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-65-0960) (AF EOAR-64-30) AD 617978 Unclassified

After transection of the rabbit spinal cord the L-3, 4-dihydroxyphenylalanine decarboxylase activity in the caudal part was reduced by 90-95 and 75-85% when determined in vitro and in vivo, respectively. The drop appeared to be fastest between the second and fifth day, and the activity reached its minimum level after 3 wk. In the rabbit iris the dihydroxyphenylalanine decarboxylase activity fell to approximately 10% of that of the control side in 48 hr after the excision of the superior cervical ganglion. In both tissues the time courses of the disappearance of dihydroxyphenylalanine decarboxylase activity and of noradrenaline were very similar but the amine disappeared somewhat more suddenly and rapidly than the enzyme. Preganglionic sympathectomy did not influence the dihydroxyphenylalanine decarboxylase activity in the iris. The nerve trunk contained only 15-20 times higher activity than the iris. The dihydroxyphenylalanine decarboxylase like noradrenaline probably occurs in the whole neuron but is highly concentrated in the terminals. Postganglionic sympathectomy reduced the dihydroxyphenylalanine decarboxylase activity in the rat submaxillary gland and spleen by 85 and 80%, respectively.

FURTHER EVIDENCE FOR THE PRESENCE OF NIGRO-NEOSTRIATAL DOPAMINE NEURONS IN THE RAT, by N-E Adén, A. Dahlström and others. [1965] [6]p. incl. illus. refs. (AFOSR-65-2520) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-64-30, National Institute of Child Health and Human Development, National Institute of Neurological Diseases and Blindness, and Swedish Medical Research Council) AD 627551 Unclassified

Also published in Amer Jour. Anat., v. 116: 329-333, Jan. 1965.

With the help of the highly specific and sensitive histochemical fluorescence method of Falck and Hillarp for the cellular demonstration of monoamines, the catecholamine-containing cell-bodies within the brain stem have been studied after unilateral removal of a large part of the neostriatum 1 to 28 days after the operation. Most of the catecholamine-containing cell-bodies within the substantia nigra, but no other monamine-containing cell-bodies, appeared to be distinctly increased in fluorescence intensity and somewhat swollen 2 to 4 days after operation while after 3 to 4 wk they showed a marked decrease in fluorescence intensity together with marked degenerative changes. Parallel with the changes in the cell-bodies, there occurred a rapid and marked accumulation of catecholamines within very abundant swollen nerve fibers in the internal capsule. These nerve fibers were traced caudally via the retrolenticular part of the internal capsule down to the crus cerebri. These results together with those in a previous paper seem to provide conclusive evidence for the presence of nigro-neostriatal dopamine neurons

IDENTIFICATION AND CELLULAR LOCALIZATION OF THE CATECHOLAMINES IN THE RETINA AND THE CHOROID OF THE RABBIT, by J Häggendal and T Malmfors [1965] [9]p incl. illus. diagrs table, refs.

(AFOSR-65-2521) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-64-30, National Institute of Neurological Diseases and Blindness, and Swedish State Medical Research Council) AD 629221 Unclassified

Also published in Acta Physiol. Scand., v. 64: 58-66, 1965.

By means of fluorescence microscopical and chemical methods the catecholamines of retinas and choroids were examined in rabbits normally, after treatment with drugs interfering with catecholamine storage, and after bilateral cervical sympathectomy. Dopamine was found to be the dominating catecholamine in the retina, 0.1 - 0.2 μg/g. It was localized to particular neurons. The results support the view that dopamine serves as the transmitter of these neurons. Noradrenaline was found in the choroid, 0.2 - 0.3 μg/g. It was localized to adrenergic vascular nerves.

HISTOCHEMICAL AND BIOCHEMICAL DETECTION OF MONOAMINE RELEASE FROM BRAIN NEURONS, by A. Carlsson, A. Dahlström and others. [1965] [8]p. incl. table, refs. (AFOSR-65-2854) (In cooperation with Karolinska Inst. (Sweden)) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-64-30, National Institute of Neurological Diseases and Blindness, and Swedish State Medical Research Council) AD 628741 Unclassified

Also published in Life Sci., v. 4: 809-816, Apr. 1965.

Treatment of rats kept at 29 C ambient temperature with pargyline resulted in histochemically detectable release of monoamines from the synaptic terminals of the monoamine neurons in the brain, with histochemically detectable lowering of noradrenaline levels and accumulation of 3-O-methylated metabolites. The accumulation of noradrenaline in nerve terminals in the brain following L-dopa administration to rats pretreated with reserpine and nialamide could be largely prevented by agents blocking the amine transport through the nerve cell membrane (desmethylimipramine or protiptyline), as demonstrated both histochemically and biochemically.

THE DISRUPTION OF CONDITIONED AVOIDANCE RESPONSE FOLLOWING SELECTIVE DEPLETION OF BRAIN CATECHOL AMINES, by L. C. F. Hanson. [1965] [12]p. incl. diagrs. tables, refs. (AFOSR-66-2062) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-64-30, National Institute of Neurological Diseases and Blindness, and Swedish State Medical Research Council) AD 643892 Unclassified

Also published in Psychopharmacologia, v. 8: 100-110, 1965.

Selective depletion of catechol amines (CA) in brain, with little or no depletion of 5-hydroxytryptamine, was induced by x-methyl-tyrosine methylester-HCl. Concomitant disruption of conditioned avoidance responses (CAR) was observed in cats (Shuttle box) and rats (Skinner box). Restoration of the CA levels in the brain by L-DOPA resulted in a restoration of CAR. The data support the view that the CA of the brain are essential for CAR. The relative importance of noradrenaline and dopamine is discussed.

COMPUTER EXPERIMENTS IN MOTOR LEARNING, by G. R. Bussey. [1965] [22]p. incl. tables. refs. (AFOSR-67-0702) (AF 49(638)1476) AD 648267 Unclassified

Also published in 1965 Fall Joint Computer Conf., AFIPS Conf. Proc., Las Vegas, Nevada (Nov. 1965), Washington, Sparian Books, v. 27 (pt. 1): 753-774, 1965.

The paper describes a method of achieving motor learning in a computer environment. Two interactive computer programs are presented and described. PUPIL is a coded-input/coded-output general learning program which interacts with TUTOR, and environment simulating program. Test results of experiments involving elementary spatial orientation, locomotion, accommodation and manipulation are discussed. The primary results presented in this report concern an objective measure of performance, known as effective relative intelligence, which was used to evaluate six elementary creative means of response generation.

MINIMUM IMPULSE COPLANAR CIRCLE-ELLIPSE TRANSFER, by H. G. Moyer. [1965] [4]p. incl. diagrs. (AFOSR-65-1360) (AF 49(638)1207) AD 621189 Unclassified

Also published in AIAA Jour., v. 3: 723-726, Apr. 1965.

A technique devised by Contensou and Breakwell for the generation of optimal N-impulse coplanar orbit transfers is investigated. In this procedure, the problem is transformed so that the calculus of variations can be employed. Applying the technique to circle-ellipse transfer it is found that the properties of the solution family are derived in a straightforward, rigorous, and global manner, in sharp contrast with the earlier derivations. The extremal solutions fall into 2 classes: (1) those that correspond to Hohmann-type transfers and (2) those that correspond to 3-point transfers with the middle point at an infinite distance from the center of attraction. For some final orbits, both classes provide candidates for the absolute minimum, and the better transfer can come from either class. For the other final orbits, only extremals that correspond to the 3-point transfer exist.

NECESSARY CONDITIONS FOR SINGULAR EXTREMALS, by R. E. Kopp and H. G. Moyer. [1965] [6]p. incl. diagrs. (Rept. no. RE-229J) (AFOSR-65-2095) (AF 49(638)1207) AD 629021 Unclassified

Presented at AIAA Second Aerospace Sci. Meeting, New York, Jan. 25-27, 1965.

Also published in AIAA Jour., v. 3: 1439-1444, Aug. 1965.

This paper derives a set of necessary conditions for singular arcs. In this case, the classical Weierstrass and Legendre tests as well as the maximum principle fail to determine the nature of the extremal path. In the present analysis the second variation of the function to be minimized is evaluated for explicitly defined control variations. The dominant term of a power series in τ, a parameter of the control variation which is allowed to approach zero in the limit, is calculated and examined for semidefiniteness. Should this term be zero for a particular problem, a new control variation is chosen and the procedure repeated. These control variations all belong to a special class of functions that were constructed with the satisfaction of terminal boundary conditions in mind. These boundary conditions are satisfied by applying secondary control variations that contribute terms to the second variation that are at least one degree higher in τ. The results of the analysis are applied to the specific problem of rocket flight in an inverse square law field. It is shown that, for the time open case, the singular arc (Lawden's spiral) is nonoptimal.

GODDARD PROBLEM WITH BOUNDED THRUST, by H. Munick. [1965] [3]p. incl. diagrs. (AFOSR-65-2331) (AF 49(638)1207) AD 629261 Unclassified

Also published in AIAA Jour., v. 3: 1283-1285, July 1965.

The problem considered is that of finding the thrust program, or control, as a piecewise continuous function of time, so that, with a fixed fuel supply, the summit altitude of a rocket in vertical flight is maximized. Under the assumptions that an optimal control exists and that the upper bound of thrust is at a sufficiently high magnitude, it is proved that the optimal control contains at most 3 subarcs. The analysis extends the previous results of Miele, Leitmann, and others to a larger class of drag functions. One of the drag functions, belonging to the class considered in the present analysis, is shown to correspond to a drag coefficient witnessing a sharp increase in the neighborhood of the speed of sound. OPTIMAL CONTROL, INEQUALITY STATE CONSTRAINT AND THE GENERALIZED NEWTON-RAPHSON ALGORITHM, by R. McGill. [1965] [8]p. incl. diagrs. refs. (AFOSR-66-1192) (AF 49(638)1207)
AD 640781 Unclassified

Also published in SIAM Jour. Control, Ser. A, v. 3: 291-298, 1965.

The generalized Newton-Raphson algorithm has been developed as a tool for efficiently extracting solutions to nonlinear problems of optimal control by means of the modern high speed digital computer. This paper presents the extension of the algorithm to the important class of problems characterized by inequality constraints on the state space. The efficacy of the procedure is demonstrated by a numerical example. The problem solved is nonlinear, but admits of a closed form solution. This makes possible a direct comparison between the solution obtained by the algorithm and the analytic solution.

DISTRIBUTION THEORY AS THE BASIS OF GENERALIZED PASSIVE-NETWORK ANALYSIS, by M. R. Wohlers and E. J. Beltrami. [1965] [7]p. (AFOSR-65-2094) (AF 49(638)1512) AD 629339 Unclassified

Also published in IEEE Trans. on Circuit Theory, v. CT-12: 164-170, June 1965.

The properties of linear time-invariant passive systems are described in the context of generalized function (distribution) theory. The postulatory description of these systems is phrased in both the scattering or wave formulation, and the impedance or voltage-current basis. One conclusion of this paper is that a specific definition of passivity (attributed to G. Raisbeck) leads to a complete description of the system only when the postulate of causality is separately invoked; i.e., this definition of passivity does not imply causality and it is therefore a more fundamental assumption. Another conclusion is that the 2 seemingly different sets of postulates (scattering and impedance) are in many instances identical, the differences arise solely in the assumptions made concerning the domains of the 2 operators. Distribution theory is also used in an essential way to obtain new existence theorems, for both formulations, which are stated entirely on the real-frequency axis ($p = j\omega$). The language herein is deliberately that of generalized function theory, so that the class of admissible systems and the inputs to these systems are broadened. In particular, the results can be applied directly to systems which are described in terms of elementary functions.

COMPUTATIONAL TECHNIQUES FOR THE SYNTHESIS OF OPTIMUM NONUNIFORM TRANSMISSION LINES BASED ON VARIATIONAL PRINCIPLES, by M. R. Wohlers, R. E. Kopp, and H. G. Moyer. [1965] [7]p. incl. diagrs. (AFOSR-65-2338) (AF 49(638)1512)
AD 625948 Unclassified

Presented at Nat'l. Electronics Conf., Chicago, Ill., Oct. 25-27, 1965.

Also published in Proc. Nat'l. Electronics Conf., v. 21: 135-141, 1965.

Synthesis procedures for the design of nonuniform transmission lines are described which employ techniques developed in the theory of optimal systems. The computational procedures, intended for computer use, are based on analytic algorithms derived using variational techniques (calculus of variations, Pontryagin Maximum Principle). Both lossless (L, C) lines and lossy (G, L, C) lines are discussed with application to the design of broadband matching networks, and absorbers. The advantages of this approach include the circumvention of the classic approximation-realization cycle, and the implicit use of max-min type constraints on the values of the line parameters.

ATTITUDE CHANGE AND COMMUNICATION-ATTITUDE

DISCREPANCY, by J. O. Whittaker [1965] [7]p. incl. table, refs. (AFOSR-65-0710) (AF AFOSR-62-188) AD 615357 Unclassified

Also published in Jour. Social Psychol., v. 65, 141-147, 1965.

The results of the experiment indicate that there is a curvilinear relationship between attitude change and communication-attitude discrepancy. Communications presenting stands relatively close to the subject's position result in less change than do those further removed. A point is reached, however, beyond which greater discrepancies result in diminished change These data suggest that there is an optimal discrepancy between the stand of the communication and the position or attitude of the subject which results in maximum change To insure the maximum effect from persuasive communications, assessment of the distribution of attitudes held by the target audience must be made, and the deviation or discrepancy of the position of the communication must be determined on the basis of this distribution

CONSISTENCY OF INDIVIDUAL DIFFERENCES IN PERSUASIBILITY, by J. O. Whittaker. [1965] [8]p. incl. refs. (AFOSR-66-1161) (AF AFOSR-62-188) AD 640698 Unclassified

Also published in Jour. Commun., v. 15, 28-38, Mar. 1965

Previous research has demonstrated the existence of a generalized trait of persuasibility. Some individuals are found to be highly susceptible to persuasive influences, regardless of the issues involved, while others are found to be highly resistant. Unfortunately, however, within most of the studies demonstrating this trait, only one medium of communication has been employed. Some investigators, for example, have used only mass communications, while others have investigated persuasibility solely in direct interpersonal communication situations. On the basis of this previous work, it has been clearly demonstrated that persuasibility as a generalized trait is "medium-free." In other words, we do not know whether those individuals found to be generally susceptible to mass communication influences are also generally susceptible to interpersonal influecnes, or vice versa In this study, susceptibility to autokinetic situation, and the results showed a significant relationship This study is an attempt to extend this work through a comparison of persuasibility in an interpersonal situation

SEX DIFFERENCES AND SUSCEPTIBILITY TO INTERPERSONAL PERSUASION, by J. O. Whittaker [1965] [4]p. incl. tables. (AFOSR-66-1162) (AF AFOSR-62-188) AD 640699 Unclassified

Also published in Jour. Social Psychol., v. 66 91-94, 1965.

Previous studies have found female subjects to be significantly more persuasible than males in mass communication situations. In addition, the present investigation has observed that female subjects in the autokinetic situation appear to be more susceptible to the influence of a confederate's judgments than do male subjects. In that study, however, another hypothesis was under investigation, and conditions were such that no definite conclusions in this regard could be reached. This investigation was conducted to determine if there are sex differences to susceptibility to interpersonal persuasive influences. The hypothesis was that female subjects will show greater susceptibility to the influence of a confederate's judgments in the autokinetic situation than will male subjects Also under investigation in this study is the effect of the sex of the confederate as a variable in persuasion. In this connection it was hypothesized that a male confederate will exert greater persuasive influence over both male and female subjects than will a female confederate.

ON ABSOLUTELY CONTINUOUS FUNCTIONS, by D. E. Varberg. (1965) (11p.) (AFOSR-66-0219) (AF AFOSR-65-35) AD 631385 Unclassified

Also published in Amer. Math. Monthly, v. 72, 831-841, Oct. 1965.

The concept of absolute continuity for functions of a real variable is discussed. This topic has been well explored so most of the results are not new. What is new is the approach, which begins with an elegant inequality discovered lying buried as an innocent problem in Natanson's book (Theory of Functions of a Real Variable). From this inequality many well-known and some new results follow in an almost trivial fashion.

IDENTIFICATION OF LINEAR DYNAMIC SYSTEMS, by Y.-C. Ho and R. C. K. Lee. May 25, 1964, 29p. incl. diagrs. (Technical rept. no. 446) (AFOSR-64-1349) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186616) AD 601844 Unclassified

Also published in Inform. and Control, v. 8, 93-110, Feb. 1965.

This report presents a real time computational scheme for the identification of linear dynamic system parameters. The method is shown to be convergent under stochastic environment for arbitrary initial estimates of the system parameters. Experiments with second- and fourth-order systems further verify the practicality of the method. Applications of the approach to adaptive prediction and filter design are direct and obvious. PARAMAGNETIC RELAXATION OF SOME RARE-EARTH IONS IN DIAMAGNETIC CRYSTALS, by C.-Y. Huang. Aug. 4, 1964, 1v. incl. diagrs. tables, refs. (Technical rept. no. 452) (AFOSR-65-0026) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186616) AD 608278 Unclassified

Also published in Phys. Rev., v. 139, A241-A254, July 5, 1965.

The pulsed-saturation method at 8.9 kmc/sec was used to measure the spin-lattice relaxation rate T_1^{-1} for Eu^{2+}, Ho^{2+}, and Tm^{2+} in CaF_2 for Yb^{3+} in yttrium gallium garnet, yttrium aluminum garnet, and lutetium gallium garnet; for Nd^{3+} in yttrium gallium garnet and yttrium aluminum garnet; and for Sm^{3+} in lanthanum ethyl sulphate at low temperatures. The experimental data in most cases are in satisfactory agreement with the theoretical predictions based on the combined Van Vleck-Orbach theory. Besides the expected conventional processes, a process $T_1^{-1} \propto T^5$ was observed for Eu^{2+} in CaF_2 in the temperature range $15°K < 30°K$. Furthermore, a pronounced anisotropy in T_1 (a factor ~ 6) for Sm^{3+} in lanthanum ethyl sulphate was found both experimentally and theoretically. (Contractor's abstract)

AN ESTIMATION THEORY APPROACH TO PULSE AMPLITUDE MODULATION THEORY, by T. Berger. Jan. 5, 1965, 27p. incl. diagrs. (Technical rept. no. 438) (AFOSR-65-1323) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186616) AD 463887 Unclassified

By generalizing a trivial problem in estimation theory, some interesting results have been obtained for a class of pulse amplitude modulation (PAM) communication channels. In particular, we consider a linear channel with memory perturbed by additive noise which is uncorrelated with the signal statistics. It is shown that, for specified second-order statistics and a mean square error criterion, the Bayes estimation rule for the specific case of zero-mean Gaussian signal and noise statistics is also both the best linear estimation rule and the minimax estimation rule. This fact is used in the theoretical design of sampled-data and continuous time receivers for such PAM systems. In the continuous time case with an infinite observation interval and stationary noise statistics, the receiver thus designed agrees with the optimum linear receiver previously derived for this case by Tufts using a very different approach; the present analysis shows that Tufts's linear receiver is, therefore, also the best nonlinear receiver in the minimax sense.

STABILITY OF A CLASS OF DIFFERENTIAL EQUATIONS WITH A SINGLE NONLINEARITY, by K. S. Narendra and C. P. Neuman. Apr. 28, 1965, 23p. (Technical rept. no. 468) (AFOSR-65-2274) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186616) Unclassified

In this report, the absolute stability of a class of dynamical systems with a single nonlinearity which satisfy neither the Popov nor the extended Popov theorem is investigated in great detail. Specifically, by reexamining the new Lyapunov function introduced recently by the authors and utilizing the Kalman lemma, frequency

domain stability criteria are obtained for the linear plant G(s) in the case of both monotone increasing and odd monotone increasing nonlinearities. For infinite sector problems these criteria are applicable to linear plants whose numerator dynamics have some real non-zero zeros; for finite sector problems these criteria are applicable to systems whose characteristic equation evaluated at the maximum stable feedback gain has some real non-zero zeros or real non-zero poles. The results presented here demonstrate that the stability criteria on the linear plant are even weaker in the case of odd monotone increasing nonlinearities than in the case of monotone increasing nonlinearities. Some examples are presented in order to illustrate the ideas developed

ADAPTIVE DESIGN OF FEEDBACK CONTROLLERS FOR STOCHASTIC SYSTEMS, by Y.-C. Ho. [1965] [2]p. incl diagr. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under Nonr-186616) Unclassified

Published in IEEE Trans. Automatic Control, v AC-10: 367-368, July 1965.

A design procedure is presented for a controller which offers the advantage that there is no approximation whatsoever in the training data. The u(t) used is always the optimal control for the observations given by construction. The approximation comes in only as a result of the finite size of the pattern samples and the form of the controller function assumed. The procedure monotonically improves the approximation One can always increase the number of samples used, the complexity of the function used for approximation; and the dimension of the pattern vector (the number of z's).

DISPERSION OF NONLINEAR SUSCEPTIBILITY, by R. K. Chang. Nov. 1965 [75]p. incl. diagrs. table, refs. (Technical rept. no. 491) (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under Nonr-186616) AD 479875

The dispersion of the optical nonlinear susceptibility of semiconductors with 43m symmetry is discussed. The nonlinear susceptibility measures properties which are peculiar to mixed parity of band wavefunctions and which should contain information about the electronic structure that is complementary to that obtained from the dispersion of linear susceptibility. The magnitude of the nonlinear susceptibility for second-harmonic production has been measured, relative to KDP, in single crystal mirrors of GaAs, InAs, InSb, and ZnTe at 9 different wavelengths. Pronounced maxima in the nonlinear susceptibility as a function of frequency is observed and can be correlated with the structure of the linear dielectric constants. These maxima in the nonlinear susceptibility are connected with critical points in the joint density of states of the band structure The nonlinear susceptibility is complex when the medium is

absorbing at either or both of the fundamental and harmonic wavelengths. In order to know the real and imaginary parts of the nonlinear susceptibility, one must know its phase as well as its magnitude. An experiment is described which determines the phase of the nonlinear susceptibility. This phase has been measured for GaAs, InAs, and ZnTe with the ruby laser. Another part of the talk deals with the verification of several postulates of nonlinear optics, in particular, the nonlinear counterpart of laws for optical reflection and the analog of Brewster's angle for second-harmonic polarization. DISPERSION OF THE OPTICAL NONLINEARITY IN SEMICONDUCTORS, by R. K. Chang, J. Ducuing, and N. Bloembergen. [1965] [4]p. incl. diagrs. refs. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under Nonr-186616) Unclassified

Published in Phys. Rev. Ltrs., v. 15 415-418, Aug. 1965.

The dispersion of the modulus of the nonlinear susceptibility $\chi_4^{NL}(2\omega)$ responsible for second-harmonic generation has been directly measured for the first time. The crystals investigated were several semiconductors having zincblende (43m) symmetry. The frequency range not only includes the absorption-edge region but also extends well inside this region. The experimental arrangement is shown. The intensity of the reflected harmonic beam from the semiconductor is measured f and compared to that produced in transmission through a KDP crystal by the same source. The dispersion results clearly show the influence of the critical points in the density of states The dispersion of the real and imaginary part of $\chi^{NL}(2\omega)$ should provide some information not available from the study of linear properties alone.

A FUNCTIONAL EQUATION METHOD FOR ESTIMATING CONVERGENCE INTERVALS AND TRUNCATION ERRORS IN SMALL PARAMETER NONLINEAR OSCILLATIONS, by R. J. McLaughlin. Dec. 1965, 47p. incl. diagrs. refs. (Technical rept. no. 486) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186616) AD 627646 Unclassified

Most current methods of constructing periodic solutions of quasi-linear differential equations with periodic right-hand sides suffer from 2 important practical defects. Although under appropriate conditions the theory of such equations guarantees the existence of a periodic solution for 'sufficiently small' values of the perturbing parameter, there is usually no indication of how small the parameter must be, and hence no indication whether any particular calculated solution really applies. Secondly, although in principle an exact solution may usually be constructed by infinite iteration of some computation algorithm (assuming the parameter to be sufficiently small), there is usually no indication of the error remaining after only a finite number of iterations, and hence no indication of the accuracy of the approximate solution with which one must be satisfied in practice. The present report describes a method of constructing, from the majorized right-hand side of the original differential equation, a certain functional algebraic equation whose solution is a majorant for the periodic solution of the differential equation. This majorant has the property that its power series expansion majorizes the formal power series expansion of the periodic solution term by term.

LINEAR ELECTRIC SHIFTS IN ENDOR SPECTRUM OF F CENTERS (Abstract), by J. Reichert. [1965] [1]p. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186616]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 489, Apr. 26, 1965.

A linear electric-field shift has been observed in the ENDOR spectrum of F centers in KCl. An ENDOR spectrometer has been constructed in which a uniform dc electric field could be applied to a sample (with fields to about 30 kv/cm) without seriously degrading the sensitivity of the spectrometer. A TE_{102} mode rectangular cavity was modified to permit nuclear radio-frequency fields and dc electric fields to be simultaneously incident on the sample F centers were created by x-ray bombardment (50 kv at 20 ma for 15 h) of KCl crystals at room temperature. All ENDOR spectra with and without electric fields were observed at 2°K. A splitting in the ENDOR lines due to the electric field for the nearest-neighbor atoms (6 sites at [100]) was observed. The angular dependence of the electric-field effect was also measured.

NONLINEAR FEEDBACK SOLUTION TO A BOUNDED BRACHISTOCHRONE PROBLEM IN A REDUCED STATE SPACE, by J. L. Speyer. Dec. 1965 [21]p. incl. diagrs. (Technical rept. no. 492) (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under Nonr-186616) AD 627647 Unclassified

The optimal nonlinear feedback law for both an unbounded and bounded Brachistochrone problem is given. These control laws describe the Brachistochrone problem in a very simple manner. They are derived by using a dimensionless set of state variables which are of lower dimension than the original state space. Also using this reduced state space a 2 dimensional instead of 3 dimensional field of extremals is constructed for the bounded Brachistochrone problem. This illustrates that the state space may be reduced so that the storage of a field of extremal trajectories will not exceed the storage capacity of a practical on board computer. In this way, optimal feedback control may become a practical technique for a larger class of nonlinear systems.

NUCLEAR MAGNETIC RELAXATION IN LIQUID METALS, ALLOYS, AND SALTS, by M. Hanabusa. May 14, 1965 [145]p. incl. diagrs. tables, refs. (Technical rept. no. 470) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186616) AD 474515 Unclassified

Nuclear relaxation phenomena have been studied in systems in which extremely fast modulations of the perturbing interactions by internal motions exist. A comparison of the spin-lattice relaxation time T_1 and the spin-spin relaxation time T_2 has been of particular interest, as well as an investigation of the various possible relaxation mechanisms, including the well-known Fermi contact hyperfine interaction. Comprehensive calculations of relaxation times for all important perturbing interactions have been made on the basis of the Redfield theory. Experiments measured both T_1 and T_2, and examined the dependence of the relaxation times on temperature, isotopic abundance, solute concentration, impurity content, and so on. Whenever necessary, Knight shifts were measured, and the results were used in combination with the relaxation time data. All measurements were made with a coherent pulsed nuclear resonance apparatus, and the sample temperature was controlled by means of a hot air oven. The conclusion is that a strong electric quadrupole relaxation mechanism exists in molten sodium metal and sodium alloys. The data can be explained, if a temperature-dependent molecular association is assumed.

OPTICALLY INDUCED MAGNETIZATION IN RUBY, by J. P. van der Ziel and N. Bloembergen [1965] [6]p incl. diagrs table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186616) Unclassified

Published in Phys. Rev., v. 138· A1287-A1292, May 17, 1965

The magnetization of ruby in a magnetic field at 300 K is changed when the ruby is optically pumped with linearly polarized radiation from a Q-switched ruby laser. With a magnetic field parallel to the trigonal axis, laser light polarized parallel to this axis induces transitions from the spin ± 1 2 levels of the $^4A_2$ ground state to the levels of the $\bar{E}(^2E)$ excited state. The change in M_z is linearly proportional to H except near the anticrossing points of the $^4A_2$ spin levels at 2.07 and 4.14 kG. At these field strengths, there is an enhancement of the magnetization caused by state mixing of the $^4A_2$ wave functions. When H has a small component perpendicular to the z axis, a magnetization is detected parallel to this component in the vicinity of 4.14 kG. The effect requires a long ground-state relaxation time. In a separate experiment, the relaxation of M_z was found to vary from 0.13 μsec in zero magnetic field to a constant value of 0 57 μsec for fields above 60 G. (Contractor's abstract)

PARAMAGNETOELECTRIC EFFECTS IN $NiSO_4 \cdot 6H_2O$, by S. L. Hou and N. Bloembergen. [1965] [9]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [Nonr-186616]) Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 22-25, 1964.

Published in Bull. Amer. Phys. Soc., Series II, v. 9: 13, Jan. 22, 1964.

Also published in Phys. Rev., v. 138: A1218-A1226, May 17, 1965.

Piezoelectric paramagnetic crystals can show a linear dependence of the paramagnetic susceptibility on an applied electric field. This effect has been detected in $NiSO_4 \cdot 6H_2O$ at low temperatures. The thermodynamic inverse effect, the creation of an electric polarization by applied magnetic fields, has also been observed. Both effects are derived from a free energy which for the tetragonal 422 symmetry takes the form $\xi(H_a E_b - H_b E_a) H_c$, where c denotes the tetragonal axis. The quantity ξ has been measured as a function of temperature. It has a pronounced maximum at 3°K, where $\xi = 2.6 \times 10^{-9}$ esu. It passes through zero at 1.38°K. Between 10 and 70°K it decreases approximately as T^{-2}. These features are explained by a microscopic theory which considers the linear variation in an applied electric field of all parameters in the spin Hamiltonian of the four Ni^{++} ions in the unit cell. The dominant contribution comes from the change in the crystal-field splitting D. (Contractor's abstract)

REINFORCED PREFIXED COMMA FREE CODES, by C. V. Ramamoorthy and D. W. Tufts. Aug. 1965, 26p. incl. diagrs. tables. (Technical rept. no 480) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under Nonr-186616) AD 474482 Unclassified

A new class of prefixed comma free codes is considered in which the distance between the prefix of length A and other A-tuple is allowed to vary with the position of the A-tuple. This is particularly useful for systems in which the receiver can predict the position of the synchronizing prefix within a number of digits that is small compared to the work length. This work extends the work of Gilbert, who has considered uniform, distance one, prefixed comma free codes. Our generalization of the constraints on comma free codes leads us to modifications of Gilbert's method of enumerating the number of allowable code words. By treating the state diagram of a code word generator as a signal flow graph the enumeration can be performed by using the flowgraph loop rule developed by Shannon, Mason, and Lorens.

STABILITY OF A CLASS OF DISCRETE TIME SYSTEMS WITH A SINGLE FEEDBACK NONLINEARITY, by K. S. Narendra and C. P. Neuman. June 1, 1965, 33p. incl. diagrs. refs. (Technical rept. no. 473) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186616) AD 473590 Unclassified

In this report, the new Lyapunov function introduced recently by the authors is used in order to derive sufficient conditions for the absolute stability of the sampled-data control system which is composed of a linear time-invariant plant characterized by the transfer function in the forward path and a nonlinear feedback element whose argument is a linear combination of the system state variables. The main contribution of this report is the derivation of frequency domain stability criteria for the linear plant in the case of continuous monotone increasing and odd monotone increasing nonlinear feedback functions which have a continuous and bounded derivative and satisfy certain inequality statements. The frequency domain stability criteria provide a direct, systematic method for the generation of explicit Lyapunov functions. In addition, for the case of certain nonlinear time-varying feedback elements, the Lyapunov function is employed to derive a geometrical method, completely analogous to the Circle Criterion of continuous-time dynamical systems, for determining the range of absolute stability of the sampled-data control system through the examination of the frequency response of the time-invariant plant.

A SUCCESSIVE SWEEP METHOD FOR SOLVING OPTIMAL PROGRAMMING PROBLEMS, by S. R. McReynolds and A. E. Bryson, Jr. Mar. 2, 1965, 5p. (Technical rept. no. 463) (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under Nonr-186616) AD 459518 Unclassified

An automatic, finite-step numerical procedure is

described for finding exact solutions on nonlinear optimal programming problems. The procedure represents a unification and extension of the steepest-descent, and second variation techniques. The procedure requires the backward integration of the usual adjoint-vector differential equations plus certain matrix differential equations. These integrations correspond, in the ordinary calculus, to finding the first and second derivatives of the performance index respectively. The matrix equations arise from an inhomogeneous Ricatti transformation, which generates a linear 'feedback control law' that preserves the gradient histories on the next step or permits changing them by controlled amounts, while also changing terminal conditions by controlled amounts. Thus, in a finite number of steps, the gradient histories can be made identically zero, as required for optimality, and the terminal conditions satisfied exactly. One forward plus one backward sweep, correspond to one step in the Newton-Raphson technique for finding maxima and minima in the ordinary calculus. As by-products, the procedure produces (a) the functions needed to show that the program is, or is not, a local maximum (the generalized Jacobi test) and (b) the feedback gain programs for neighboring optimal paths to the same, or a slightly different, set of terminal conditions.

TEMPERATURE-DEPENDENT CRYSTAL FIELD AND HYPERFINE INTERACTIONS, by W. M. Walsh, Jr., J. Jeener, and N. Bloembergen. [1965] [13]p. incl. illus. diagrs. tables, refs. (In cooperation with Bell Telephone Laboratories, Murray Hill, N. J.) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186616]) Unclassified

Published in Phys. Rev., v. 139: A1338-A1350, Aug. 16, 1965.

The effects of temperature variation on the spin-Hamiltonian parameters of several paramagnetic ions bound in simple crystals have been measured by magnetic resonance techniques. In MgO the g shifts of two F-state ions, V^{2+} and Cr^{3+}, increase and the cubic-field splittings of two S-state ions, Mn^{2+} and Fe^{3+}, decrease with increasing temperature almost exactly as would be expected from thermal expansion alone. The axial crystalline-field splitting of locally compensated Cr^{3+} ions also increases with temperature at a rate attributable primarily to thermal expansion. The absence of appreciable explicit temperature dependence of crystalline-field parameters in MgO is consistent with an effective point-charge model for the source of the lattice potential and cubically symmetric lattice vibrations. In zinc blende, however, the cubic-field splitting of Mn^{2+} decreases more rapidly with rising temperature than may be accounted for by thermal expansion alone, presumably because of failure of the point-charge approximation. The hyperfine couplings of $(V^{51})^{2+}$ and $(Mn^{55})^{2+}$ in MgO decrease with increasing temperature, whereas a much smaller increase would be expected due to thermal expansion. Similar explicit variations of the $(Mn^{55})^{2+}$ hyperfine interaction are found in ZnS, ZnO, CdTe, and $KMgF_3$. The effect may be approximately represented by a power law of the form $A(T) = A(0)(1-CT^n)$ where $n \cdot 3/2$. The significance of this result for nuclear-magnetic-resonance studies of concentrated magnetic materials is indicated. The general nature of the explicit temperature dependence is discussed but no detailed theoretical analysis is possible at this time. (Contractor's abstract modified)

Also published in IEEE Trans. Antennas and Propagation, v. AP-13: 71-78, Jan. 1965.

The radiation characteristics of a linear distribution of electric charge moving with a uniform velocity in a homogeneous electron plasma of infinite extend are investigated for the case in which a uniform static magnetic field is impressed externally throughout the medium. The linear distribution of charge and its direction of motion are assumed to be parallel and perpendicular, respectively, to the direction of the external magnetic field. Of the two possible modes of waves of small amplitude, namely, the modified electromagnetic mode and the modified plasma mode, the uniformly moving charge distribution excites the modified plasma mode. The emitted radiation has no frequencies less than the plasma frequency. For a particular value of the ratio of the gyrotropic to the plasma frequency of the electrons, the frequency and the angular spectrum of the emitted radiation are determined for 2 values of the velocity of the charge. THE CYLINDRICAL ANTENNA WITH ARBITRARY DRIVING POINT, by R. W. P. King and T. T. Wu. Oct. 1964 [40]p. incl. diagrs. (Technical rept. no. 455) (AFOSR-64-2454) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186632) AD 608283 Unclassified

Also published in IEEE Trans. Antennas and Propagation, v. AP-13: 710-718, Sept. 1965.

A new reasonably accurate approximate solution is obtained in trigonometric form of the distribution of current and the admittance of a cylindrical antenna when driven off center. The symmetrical problem (sleeve dipole) with 2 equal generators at the same distances from the center is solved first, then the antisymmetrical

case with equal and opposite generators. A suitable superposition of the 2 results provides the solution for the dipole antenna when driven at an arbitrary point along its length. The results are sufficiently simple to be useful in the study of antennas with active or passive elements located along their length. (Contractor's abstract)

THE LONG YAGI-UDA ARRAY, by R. J. Mailloux Mar. 30, 1965 [68]p. incl. illus. diagrs. tables, refs. (Technical rept. no. 464) (AFOSR-65-1324) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186632 and National Science Foundation) AD 615803 Unclassified

The King-Sandler array theory is used to analyze the excitation of a surface wave along a semi-infinite Yagi array, as well as the scattering of such a wave at the end of the array. A method for approximately analyzing the behavior of finite Yagi arrays is presented which involves the matching of 2 terminal-zone problems for semi-infinite arrays. Before attempting to correlate the new theory with the more rigorous array theory, an experimental study of a 2-element Yagi array was undertaken, and all results are shown to be accurately predicted by the King-Sandler theory. An extensive set of numerical data is presented to compare wave theory with array theory, and once again the agreement is excellent. Finally, the new theory is shown to predict a certain critical point in the data at which the wave solution ceases to exist. This point is also observed to enter dramatically into the King-Sandler solution, thus providing a final contribution to the evidence which links the wave theory to the accepted King-Sandler theory.

ANTENNA AND WAVE THEORIES OF INFINITE YAGI-UDA ARRAYS, by R. J. Mailloux. [1965] [8]p. incl. diagrs. refs. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under Nonr-186632, and National Science Foundation) Unclassified

Published in IEEE Trans. Antennas and Propagation, v. AP-13: 499-506, July 1965.

An integral equation for the propagation constant along an infinitely long Yagi structure is derived by expanding the vector potential function for such an array in terms of the spatial harmonic solutions of wave theory. This equation is shown to be identical with the integral equation derived on the basis of array theory and transformed by the Poisson summation formula. With the identity of array theory and this new wave theory formation established, the wave theory is used to discuss allowed wave solutions and the physical characteristics required of dipoles in order that they support a wave solution. The fundamental integral equation is solved by means of the array theory of King and Sandler; the numerical results are found to agree quite well with previously published data. Finally, the problem of two parallel nonstaggered Yagi arrays is considered, and it is shown that the propagation constant of the composite structure either decreases or increases over that of the isolated array depending upon whether the symmetric or the antisymmetric mode is excited. Some peculiar effects are noted with respect to this antisymmetric solution, and these lead to the existence of conditions under which no unattenuated wave solution is possible. This is referred to as the "cutoff condition." Numerical results are achieved which agree very well with experimental data obtained as part of this research. (Contractor's abstract)

THE BICONICAL ANTENNA IN A RADIALLY STRATIFIED MEDIUM, by J. G. Fikioris. [1965] [14]p. incl. diagrs. refs. (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under Nonr-186632, and National Science Foundation) Unclassified

Published in IEEE Trans. Antennas and Propagation, v. AP-13: 289-302, Mar. 1965.

The theory of a tranamitting biconical antenna in a radially and continuously stratified medium is developed; its input impedance is computed and plotted vs its length for various media and cone angles. The medium extends to infinity and is characterized by a complex dielectric factor $\xi = \epsilon - i\sigma/\omega = \epsilon_0 f(r)$, where r is the radial distance from the center of the antenna. For the "stratification function" the form $f(r) = (kr + a)/(kr + b)$ is considered, where a and b are constant parameters, in general complex. The plots clearly exhibit all effects of dissipation and stratification expected on physical grounds and observed experimentally for dipole antennas. (Contractor's abstract)

THE CIRCULAR LOOP ANTENNA MULTILOADED WITH POSITIVE AND NEGATIVE RESISTORS, by K. Iizuka. [1965] [14]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186632) Unclassified

Published in IEEE Trans. Antennas and Propagation, v. AP-13. 7-20, Jan. 1965.

Studies are made of both the driving-point impedance and the amplitude and phase distributions of the current in a circular loop which is driven by an arbitrary number of delta-function generators and loaded with an arbitrary number of lumped impedances. The only restriction imposed in the present treatment is that the elements (either generator or load) are spaced at equal intervals of $2\pi b \cdot m$ along the circumference where m is

the total number of elements and b is the radius of the loop. The numerical calculations include loads with negative resistance in order to take account of loops loaded with an element like an Esaki tunnel diode, with proper precautions against both self-oscillation and switching effects. A study of such precautions is to be considered separately.

COUPLED DIPOLES IN A DISSIPATIVE MEDIUM. PART I: THEORY. PART II. MEASUREMENTS, by R. W. P. King, S. S. Sandler, and K. Iizuka. July 20, 1965 [35]p. incl. diagrs. tables, refs. (Technical rept. no. 479) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186632 and National Science Foundation) AD 623779 Unclassified

The admittance and impedance of a 2-element array when immersed in an arbitrary dissipative medium are determined from a generalization of the King-Sandler theory of arrays. Numerical results are given for half-wave and quarter-wave dipoles with 2 different thicknesses. The distance between the element is the independent variable. Experiments carried out in a tank filled with a conducting solution to determine the self and mutual admittances of coupled dipoles are described. The agreement between the measured values and the theory is quite good.

RADIATION FROM A PHASED LINE SOURCE IN A MAGNETOIONIC MEDIUM, by H. S. Tuan and S. R. Seshadri. [1965] [12]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham), and Office of Naval Research] under Nonr-186632) Unclassified

Published in Canad. Jour. Phys., v. 43: 1636-1648, Sept. 1965.

The radiation resistance of a circular filament of electric current immersed in an unbounded magneto-ionic medium has been evaluated for the case in which the axis of the loop is parallel to the direction of the external static magnetic field. Numerical values of the radiation resistance have been obtained for two different sizes of the loop and for some typical values of the plasma parameters, for the special case of the dominant mode excitation for which the current is a constant around the loop. Radiation from a prescribed electric current on a filamentary loop in a warm, unbounded plasma has been investigated. The formula for

radiation resistance is obtained in the general case. A numerical example is obtained specifically for the case of radiation from the distribution of a dipole mode of the current on the loop.

SCATTERING FROM A DIPOLE ANTENNA EMBEDDED IN A DISSIPATIVE HALF-SPACE. PART 1. CURRENT DISTRIBUTION, by H. S. Tuan and R. W. P. King. Oct. 1965, 19p. incl. diagrs. refs. (Technical rept. no. 487) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-186632) AD 475454 Unclassified

The current distribution on a half-wave dipole antenna embedded in a conducting half-space is investigated in this report. The dipole antenna is parallel to the plane of the interface between the 2 media. It is illuminated by a diffracted inhomogeneous plane wave with perpendicular magnetic field vector. The current distribution is found mainly consinusoidal with a shifted cosine correction term. A numerical analysis is given for the case where the dissipative medium has average earth constants. Variations of the current due to different angles of incidence are also investigated.

ON FINITE DESARGUESIAN PLANES. I, by R. Brauer. [1965] [7]p. (AFOSR-66-1381) (AF 49(638)1381) AD 640774 Unclassified

Also published in Math. Zeitschr., v. 90: 117-123, Aug. 1965.

A Desarguesian projective plane Π determines its group G of projectivities. Conversely, given the group G, the plane Π may be reconstructed. In principle, any axiomatic description of Π yields a characterization of the projective group G. Of course, these characterizations may appear somewhat artificial from a group theoretical point of view, and other characterizations which are more closely related to group theoretical principles may be sought. This paper concerns the case of finite planes Π. The question then is of interest in connection with the problem of characterizing the simple or nearly simple finite groups. If Π belongs to the Galois field GS(q) with q elements, G is the group G = PGL(q). The final aim is that of giving a characterization of G by means of properties of the centralizer of an involution. This introductory paper deals with a set of postulates for a group G which permit a projective plane Π in terms of G, such that G has a natural representation by collineations of Π. These results are still close to a direct translation of projective geometry into group theory. A later paper will examine the characterizations of G by means of centralizers of involutions. The number q is odd.

HYPERBOLIC CAPACITY AND INTERPOLATING RATIONAL FUNCTION, by J. L. Walsh. [1965] [11]p. (AFOSR-66-1512) (AF 49(638)1591) Unclassified

Also published in Duke Math. Jour., v. 32: 369-380, Sept. 1965.

The object of this note is twofold: (1) to establish some results concerning hyperbolic (non-euclidean) capacity of plane point sets, extending theorems due to Tsuji and Pommerenke and (2) to apply these results in the study of interpolation and approximation by rational functions, including in particular the concept of maximal (greatest geometric degree of) convergence. The sequence of theorems developed in the present note is largely the hyperbolic analog of the discussion previously developed by Walsh, Feketi et al.

ON THE DEGREE OF CONVERGENCE OF EXTREMAL POLYNOMIALS AND OTHER EXTREMAL FUNCTIONS, by J. L. Walsh and A. Sinclair. [1965] [15]p. incl. refs. (AFOSR-66-1513) [AF 49(638)1591] AD 638712 Unclassified

Also published in Trans. Amer. Math. Soc., v. 115: 145-160, Mar. 1965.

Let a given function F(z) be of class L^p, $p > 1$, on an analytic Jordan curve γ in the plane of the complex variable z, and let $p_n(Z)$ be the unique sequence of polynomials in z of respective degree n of best approximation to F(z) on γ in the sense of minimizing $\int_\gamma |F(z) - p_n(z)|^p |dz|$; these minimizing $p_n(z)$ may also be subjected to certain auxiliary conditions of interpolation $p_n(W_k) = u_k$, $k = 1, 2, \ldots, m$, which are independent of n and are not necessarily related to F(z). The object is to study convergence and degree of convergence of the sequence $p_n(z)$ to a possible limit minimizing function and to study various properties of this limit function. This problem is attacked first by studying a general situation in L^p space, and then by specializing to the problem already mentioned. Likewise the analogous problem is treated where best approximation is measured by a surface integral over the interior C of γ.

THE CONVERGENCE OF SEQUENCES OF RATIONAL FUNCTIONS OF BEST APPROXIMATION. II, by J. L. Walsh. [1965] [10]p. (AFOSR-66-1514) (AF 49(638)-1591) Unclassified

Also published in Trans. Amer. Math. Soc., v. 116: 227-237, Apr. 1965.

Unless the poles of a rational function of best approximation are prescribed in advance, the determination of those poles even approximately may be difficult, yet be necessary for a complete study of approximation or convergence. The object of this note is to enlarge the category of those cases where this determination is possible, especially to study approximation on a set having no interior points, and on a set with several components. Here methods are based on the use of geometric degree of convergence, in various forms, including methods developed in the theory of approximating polynomials.

CONVOLUTION TRANSFORMS WHOSE INVERSION FUNCTIONS HAVE COMPLEX ROOTS, by J. Dauns and D. V. Widder. [1964] [16]p. (AFOSR-66-0672) (AF AFOSR-63-393) AD 641526 Unclassified

Also published in Pacific Jour. Math., v. 15: 427-442, June 1965.

The convolution transform is defined by the equation (1.1) $f(x) = G(x-t)\,(t)dt = (G_*)(x)$. If the kernel G(t) has a bilateral Laplace transform which is the reciprocal of an entire function E(s), the E(s) is called the inversion function of the transform. This terminology is appropriate in view of the fact that the transform (1.1) is inverted, in some sense, by the operation E(D), where D stands for differentiation with respect to x: (1.2) $E(D)f(x) = (x)$. It is the purpose of the present paper to prove (1.2) when the roots of E(s) are allowed to be genuinely remote from the real axis.

FROM FRIENDSHIP TO COMRADESHIP: THE CHANGE IN PERSONAL RELATIONS IN COMMUNIST CHINA, by E. F. Vogel. [1965] [15]p. (AFOSR-66-0977) (AF 49(638)1399) AD 619353 Unclassified

Also published in China Quart., No. 21: 46-60, Jan.-Mar. 1965.

In Communist China, personal friendship has been replaced by comradeship, a universalistic ethic which regards all persons as equal under the state. This ethic is necessary to this modernizing society, because it reduces the threat to political control and because it provides a basis of personal relations which makes it possible for persons from different social backgrounds, different geographical areas, and different likes and dislikes to have relationships with each other. The people conform to comradeship largely from fear of being accused or exposed as a threat to national goals by friends or acquaintances.

SPIN DIFFUSION IN THE HEISENBERG PARAMAGNET, by H. S. Bennett and P. C. Martin. [1965] [10]p. (AFOSR-65-1346) (AF 49(638)589) AD 620364 Unclassified

Also published in Phys. Rev., v. 138: A608-A617, Apr. 19, 1965.

Two methods are presented for calculating the spin diffusion coefficient, the long-wavelength low-frequency limit of the spin pair correlation function. These methods are used to evaluate this coefficient in the isotropic Heisenberg paramagnet. In the first method, successively higher correlations are neglected, and eventually an approximate nonlinear integral equation is obtained.

In the second, a dispersion relation and sum-rule moment relations are utilized. Expressions are obtained for the diffusion coefficient both at high temperatures and near the Curie temperature. The two evaluations of the diffusion constant at high temperatures agree with each other extremely well, and are in qualitative agreement with two previous determinations.

NON LOCAL TRANSPORT COEFFICIENTS CORRELATION FUNCTIONS, by P. C. Martin. [1965] [26]p. incl. diagrs. tables, refs. (AFOSR-65-1829) (AF 49(638)-589) AD 625979 Unclassified

Also published in Statistical Mechanics of Equilibrium and Non-Equilibrium, Proc. Internat'l. Symposium on Statistical Mechanics and Thermodynamics, Aachen (Germany) (June 15-20, 1964), ed. by J. Meixner. (Amsterdam) North-Holland Publishing Co., 1965, p. 100-125.

Postulated expressions for transport coefficients are considered as limiting values of correlation functions, with special emphasis on their physical significance. The correlation functions of the densities of conserved variables in steady states manifest all the linearized hydrodynamic properties of these steady states. Thus they contain both the damping of the hydrodynamic modes, their velocity, and their strength. This information appears in the Fourier transform of slowly varying space-time correlation functions in a natural manner. One limit of these functions yields the familiar expressions for transport coefficients when there are no long range forces. This point is presented by generalizing the simple example of a one component substance at very low temperature.

TROUBLE WITH RELATIVISTIC SU(6), by S. Coleman. [1965] [6]p. incl. refs. (AFOSR-65-1830) (AF 49(638)-1380) AD 625989 Unclassified

Also published in Phys. Rev., v. 138: B1262-B1267, June 7, 1965.

A relativistic generalization has been proposed of the SU(6) group, based on the product of U(6) and U(6). The smallest group containing this group and the Poincare group is found. This group has the catastrophic feature that all of its faithful unitary representations contain an infinite number of states for fixed 4-momentum: thus there are an infinite number of particles in every supermultiplet. It is conjectured that similar difficulties afflict every group that contains an internal symmetry group and the Poincare group in such a way that these groups do not commute. The conjecture is proved for a large class of Lie groups (semidirect products of semisimple groups and Abelian groups), under the restrictive assumption that the translations are contained in the Abelian group. MICROSCOPE THEORY OF SUPERFLUID HELIUM, by P. C. Hohenberg and P. C. Martin. [1965] [69]p. incl. diagrs. tables, refs. (AFOSR-65-2801) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1380 and National Science Foundation) AD 628293 Unclassified

Also published in Ann. Phys., v. 34: 291-359, Sept. 1965.

The paper discusses the properties of an interacting condensed Bose system, emphasizing those aspects which do not depend on the weakness of the potential, and which therefore apply to superfluid helium. A physical and mathematical characterization of Bose condensation

is presented in terms of an additional macroscopic quantity, the wave function of the condensed mode, which is defined in terms of microscopic quantities. The hydrodynamic generalization applicable to slowly varying disturbances from equilibrium is then discussed and rigorous microscopic expressions are derived for the parameters of this theory (including dissipative coefficients). The elementary excitation spectrum in this collision dominated regime is exhibited. The Landau quasi-particle theory is examined, as well as the relation of condensation and the excitation spectrum, to the property of superfluidity. Under certain regularity assumptions the form of the long-wavelength excitation spectrum at vanishing temperature is deduced. Finally, techniques are discussed for evaluating properties of the Bose system starting from the interaction potential. (Contractor's abstract)

CORRELATION FUNCTIONS FOR COHERENT FIELDS, by U. M. Titulaer and R. J. Glauber. [1965] [7]p. (AFOSR-66-0018) (AF 49(638)1380) AD 630079
Unclassified

Also published in Phys. Rev., v. 140: B676-B682, Nov. 8, 1965.

A factorization condition which must be satisfied by the first n correlation functions for the electromagnetic field operators has been used to define nth-order coherence. The first-order coherence condition has been shown to imply maximum fringe contrast in interference patterns. In the present paper the authors investigate the mathematical consequences of assuming the condition for maximum fringe contrast. By considering the correlation functions as scalar products and formulating rigorous inequalities for them they are able to show that the assumed condition in turn implies factorization of the first-order correlation function. By extending the same methods they are able to show that all of the higher order correlation functions factorize into forms similar to those required for full coherence, but differing from them through the inclusion of a sequence of constant numerical factors. These coefficients are shown to furnish a convenient description of the higher-order coherence properties of the field. Their values are presented for some typical examples. They derive a number of inequalities satisfied by the coefficients for the case of fields which possess positive-definite weight functions in the P representation. Some inequalities obeyed by the correlation functions for such fields are derived as well.

Also published in Phys. Rev. Ltrs., v. 15: 902-905, Dec. 6, 1965.

A report is made of calculations of the renormalization of the semileptonic weak coupling constants by the U(3) symmetry-breaking interactions. The consideration is based on a phenomenological field-theoretical model of U(3) symmetry breakdown, which is an extension of the idea that the symmetry breakdown is dominated by the nonvanishing expectation value of the scalar field S33. The conclusions depend essentially on meson-pole dominance approximations.

Partial widths of strong and electromagnetic decays of mesons are calculated within the framework of Schwinger's field theory of matter. Results are consistent with present experimental data. The model requires a two-photon-pseudoscalar-meson interaction and a direct four-pseudoscalar-meson interaction. The former is shown to be consistent with the $\pi \to \gamma e^+e^-$ form factor. The latter explains the $\delta \to \eta\pi\pi$ and $\eta \to \pi^+\pi^0\pi^-$ decays, and the coupling constant also agrees with the $\pi\pi$ S-wave coupling constant. Some justification in terms of the heavy scalar-meson nonet is given for the four-meson interaction.

T INVARIANCE AND THE NEUTRON ELECTRIC DIPOLE MOMENT, by D. G. Boulware. [1965] [4]p. incl. refs. (AFOSR-66-0794) (AF 49(638)1380) AD 638824
Unclassified

Also published in Nuovo Cimento, Ser. X, v. 40: 1041-1044, Dec. 1965.

The results of calculations of the neutron electric dipole moments predicted by various models of CP violation are given. It is concluded that Ramsey's proposed measurement of the electric dipole moment should provide a test for the existence of strangeness conserving CP violating interactions.

FIELD THEORY OF MATTER. IV, by J. Schwinger. [1965] [6]p. (AFOSR-66-1315) (AF 49(638)1380) AD 639976
Unclassified

Also published in Phys. Rev., v. 140: B158-B163, Oct. 11, 1965.

The relativistic dynamics of 0^- and 1^- mesons in the idealization of U_3 symmetry is derived from the hypothesis that a compact group of transformations on fundamental fields induces a predominantly local and linear transformation of the phenomenological fields that are associated with particles. The physical picture of phenomenological fields as highly localized functions of fundamental fields implies that the interaction term of the phenomenological Lagrange function can have symmetry properties, expressed by invariance under the compact transformation group, that have no significance for the remainder of the Lagrange function, which describes the propagation of the physical excitations. It is verified that the meson interaction term derived by considering fundamental fermion fields is invariant under the parity-conserving group U(6)XU(6). The implied connection between the $\rho\pi\pi$ and $\omega\rho\pi$ coupling constants is well satisfied. There is a brief discussion of the dynamics of fermion-particle triplets, from which it is shown that the invariance of the similarly derived interaction term implies the mass degeneracy of the singlet and octuplet of 1^- mesons, without relation to 0^- masses. The triplets are also used to illustrate the derivation of gauge - and relativistically invariant electromagnetic properties. The mass degeneracy of the nine 1^- mesons, and of nine 2^+ mesons, can be inferred from the commutation properties of bilinear combinations of the fundamental field.

ON THE METHOD OF DASHEN AND GELL-MANN, by S. Coleman. [1965] [3]p. (AFOSR-67-1381) (AF 49-(638)1380) AD 653809 Unclassified

Also published in Phys. Ltrs., v. 11: 144-146, Oct. 1, 1965.

Dashen and Gell-Mann have proposed (Phys. Ltrs., v. 17: 142, 145, 1965) an ingenious method for obtaining many of the desirable consequences of SU(6) invariance while avoiding the notorious difficulties of a fully relativistic SU(6) invariant theory. They assume that a group called the hybrid collinear group turns one-particle states with the appropriate direction of motion into one-particle states. They phrase this by saying that the other elements of the original group 'leak' while the elements of the collinear group do not. The purpose of this note is to prove that if the hybrid collinear group does not leak, it commutes with the Hamiltonian. Thus the Dashen-Gell-Mann theory contains an internal contradiction which persists if small leakage is allowed.

PHOTON-PHOTON SCATTERING IN TRANSPARENT CRYSTALS (Abstract), by D. Forster and H. Haken. [1965] [1]p. [AF 49(638)1380] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 113, Jan. 27, 1965.

A theoretical investigation of this process is presented, in analogy photon-photon scattering in vacuum. In a crystal, the roler of intermediate virtual electron-positron pairs is taken over by virtual electron-hole pairs. Because of the considerably smaller threshold energy for creation of the latter pairs, the scattering probability is many orders of magnitude larger than in vacuum. We restrict consideration to insulating cubic crystals with an inversion center. By applying the methods of quantum field theory, we carry out the calculation in the fourth order of perturbation theory. In evaluating the scattering diagrams, we assume the energy bands parabolic in wave-vector space and calculate the electronic transition elements in dipole approximation by means of a k·p-expansion. The differential cross section that results is stated in terms of known crystal parameters. Assuming the intensity of both incoming light rays to be 10^7 W/cm^2, we find the intensity of scattered light to be about 10^{-5} W/cm^3 of irradiated crystal volume. Finally, the present quantum-field theoretical treatment of the problem is compared to the semiclassical method, and the nonlinear dielectric susceptibility that couples different lightwaves is calculated

[CODING AND TRANSMISSION IN THE VISUAL SYSTEM], by D. H. Hubel. Final scientific rept. Mar. 1, 1965 [7]p. (AFOSR-65-0458) (AF AFOSR-63-410) AD 614486 Unclassified

The research performed was mainly in the field of single-cell recordings from cat and monkey visual areas. The chief areas explored were (1) monkey lateral geniculate recordings using stimuli of various shapes and colors, and (2) a continuation of work on visual deprivation in immature kittens. Summaries of 3 papers which treat the extension of this work into problems of binocular deprivation, strabismus, and recovery are included. A summary is also included for studies of visual areas II and III in cats (Talbot and Marshall, 1941). The following conclusions are given: (1) Damage produced at the cortical level by monocular closure is not caused by disuse, but appears to depend on the interaction of the 2 pathways; (2) lack of synergy in the input from the 2 eyes is sufficient to cause a profound disruption in the connections that subserve binocular interaction; and (3) capacity of an animal to recover from the effects of early monocular or binocular visual deprivation is severely limited, even for recovery periods of over a year.

BINOCULAR INTERACTION IN STRIATE CORTEX OF KITTENS REARED WITH ARTIFICIAL SQUINT, by D. H. Hubel and T. N. Wiesel. [1965] [19]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1443 and Public Health Service) Unclassified

Published in Jour. Neurophysiol., v. 28: 1041-1059, Nov. 1965.

In 4 kittens the right medial rectus was severed at about the time of normal eye opening, producing an obvious divergent squint. The animals were raised under normal conditions for periods of 3 months to 1 yr. When the 2 eyes were then tested separately no behavioral visual defects were seen. Recordings from the striate cortex were normal, except for a marked decrease in the proportion of binocularly driven cells: instead of about 80%, only 20% could be influenced from the 2 eyes. The cortex appeared normal microscopically. In a given penetration there was a marked tendency for cells driven from a particular eye to occur in long uninterrupted sequences. These results suggest that the strabismus caused cells to shift in their ocular dominance, a given cell coming to favor more and more the eye that dominated it at birth, ultimately losing all connections with the nondominant eye. It was concluded, that a lack of synergy in the input from the 2 eyes is sufficient to cause a profound disruption in the connections that subserve binocular interaction. In 2 kittens an opaque contact occluder was placed over one eye one day and the other eye the next, alternating eyes each day from shortly after birth to an age of 10 weeks. This kept the eyes from working together without introducing the possibility of antagonistic interaction between them. Vision in either eye seemed normal. Penetrations in the striate cortex gave results similar to those obtained in squint animals.

COMPARISON OF THE EFFECTS OF UNILATERAL AND BILATERAL EYE CLOSURE ON CORTICAL UNIT RESPONSES IN KITTENS, by T. N. Wiesel and D. H. Hubel. [1965] [12]p. incl. illus. diagrs. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1443 and National Institutes of Health) Unclassified

Published in Jour. Neurophysiol., v. 28: 1029-1040, Nov. 1965.

In 3 kittens the lids of both eyes were sutured together shortly after the time of normal eye opening, and the animals were raised in normal surroundings to an age of 3 months. In 2 of the animals the responses to visual stimulation were observed in the striate cortex. In marked contrast to what had been predicted from experiments with monocular eye closure, 2/3 of cells responded actively; half of these reacted normally, and half lacked the normal preference for specific stimulus orientations, some showing no preference at all. The remaining 1/3 of the cells were unresponsive. In the third kitten an eye was opened and vision tested. The pupillary response was normal, but behaviorally the animal appeared blind. Histologically the lateral geniculate body showed changes similar to those found after monocular deprivation, but they occurred throughout all layers bilaterally: the Nissl-stained cells appeared pale, cross-sectional areas of cell bodies were reduced by about 40%, and the pale substance between cell nests was greatly reduced in volume. There were no obvious changes in retinas or cortex. It is concluded that at the cortical level the extent of the ill effects of closing one eye depend to a large extent on whether the other eye is also closed. The damage produced by monocular closure is not, therefore, caused simply by disuse but seems to depend on interaction of the 2 pathways.

EXTENT OF RECOVERY FROM THE EFFECTS OF VISUAL DEPRIVATION IN KITTENS, by T. N. Wiesel and D. H. Hubel. [1965] [13]p. incl. illus. diagrs. tables. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1443 and Public Health Service) Unclassified

Published in Jour. Neurophysiol., v. 28: 1060-1072, Nov. 1965.

In kittens, monocular or binocular deprivation by lid suture for the first 3 months of life leads to virtual blindness, marked morphological changes in the lateral geniculate body, and a severe deterioration of innate cortical connections. In 7 kittens whose eyes had been sutured at birth for 3 months, 6 unilaterally and one bilaterally, an attempt was made to assess the extent of recovery by reopening an eye and allowing the animals to live for another 3-15 months. In 2 of the monocular closures the deprived eye was opened and the normal eye closed. In all kittens there was some slight behavioral recovery during the first 3 months, but the animals remained severely handicapped and never learned to move freely using visual cues. There was no morphological improvement in the lateral geniculate body. The impression that atrophy can develop with deprivation beginning at 3 months was confirmed. In monocularly deprived animals a few cells in the striate cortex may have recovered responses to stimulation to the originally deprived eye, but in many of these cells the responses were abnormal. In the binocularly deprived kitten there was a marked increase in the proportion of cells responding abnormally to the eye that was reopened, without any obvious increase in the total number of cells responding to that eye. It is concluded that the animals' capacity to recover from the effects of early monocular or binocular visual deprivation, whether measured behaviorally, morphologically, or in terms of single-cell cortical physiology, is severely limited, even for recovery periods of over a year.

HYPOTHALAMIC SECRETORY FACTOR FOR ADRENOCORTICOTROPIC HORMONE SF/ACTH, by P. L. Munson. Final rept. Aug. 15, 1963-Aug. 14, 1964, Jan. 15, 1965, 4p. (AFOSR-65-0286) (AF AFOSR-63-405) AD 611179 Unclassified

The purpose of this research is to purify the hypothalamic hormone responsible for the increased biosynthesis and secretion of ACTH in stress. This hormone, originally named 'corticotropin releasing factor (CRF)' by Dr. Murray Saffran of McGill University, is now referred to as 'hypothalamic secretory factor for ACTH (HSF-ACTH)'. Because the only feasible guide to yield and specific activity of HSF-ACTH is a rather complicated biological assay system, the studies have included ways to improve and simplify the biological assay for the hypothalamic secretory factor for ACTH are based on a discovery that in the rat anesthetized with pentobarbital, morphine inhibits ACTH secretion to nonspecific stimuli without interfering with the action of HSF-ACTH on the anterior pituitary gland.

A MODEL OF THE NEGOTIATION PROCESS, by O. J. Bartos. Jan. 1965, 41p. incl. table, refs. (AFOSR-65-0076) (AF AFOSR-62-314) AD 617887 Unclassified

A mathematical model of negotiation is described. The basic assumption is that each negotiator always prefers the proposal that has the highest utility for him, the utility being given by the product between payoff and belief in 'acceptability' of the proposal. The belief in acceptability (subjective probability) is, in turn, assumed to change with each speech delivered during the session. it increases whenever a colleague endorses the proposal decreases whenever a colleague fails to join others in endorsing the proposal. It is shown that the model has some desirable properties; it implies that the most frequently endorsed proposal is always believed to be the most acceptable proposal, that a negotiator who is alone in endorsing a proposal ultimately stops endorsing it, that the negotiator who speaks last has the greatest influence, that the very first speaker always endorses the proposal that has the highest payoff for him, that concession always occurs towards the proposal that has the 'next highest' payoff', and that a majority can assure that the acceptance of any proposal that has non-negative payoff to everybody is achieved.

CONCESSION-MAKING IN EXPERIMENTAL CONDITIONS, by O. J. Bartos. [1965] [12]p. incl. diagrs. tables, refs. (SSRI reprint no. 6) (AFOSR-66-1145) (AF AFOSR-62-314) AD 640173 Unclassified

Also published in Gen. Systems, v. 10: 145-156, 1965.

Perhaps due to the prominence that negotiation has gained as a means for settling international and labor-management conflicts, an interest in negotiation has been growing within several disciplines. Numbers of models of bargaining and arbitration have been formulated by authors trained in economics and mathematics; case studies of the actual negotiation process have been made by sociologists, psychologists, and political scientists; and experiments in bargaining and negotiation are being conducted by behavioral scientists of various backgrounds. The accomplishments of these efforts have been many and our understanding of the negotiation process has increased considerably. Yet, curiously enough, a question that is of considerable practical importance and which has been a subject of some theoretical speculation has not been approached in a systematic fashion until recently; namely, is making concessions a good negotiation strategy, or is it better to make few if any concessions?

GENERALIZED POLYNOMIAL IDENTITIES AND PIVOTAL MONOMIALS, by S. A. Amitsur. [1965] [17]p. (AFOSR-65-1402) (AF EOAR-63-70) AD 622913 Unclassified

Also published in Proc. Amer. Math. Soc., v. 114: 210-226, Jan. 1965.

The classical approach to the theory of polynomial identities of a ring R is extended to a more generalized polynomial relation of the form $P(x) = \Sigma a_{i_1} \pi_{j_1} a_{j_2} \ldots a_{i_k} \pi_{j_k} a_{i_{k+1}} = 0$, where π_j are monomials of a set of noncommutative indeterminates and the elements $a_{i_\lambda} \in R$ appear both as coefficients and between the monomials π_j. The main theorem states that a primitive ring R satisfies a polynomial identity if and only if it is isomorphic with a dense ring of linear transformations over a division ring D which is finite over its center, and R contains a linear transformation of finite rank.

ON KERNELS, EIGENVALUES, AND EIGENFUNCTIONS OF OPERATORS RELATED TO ELLIPTIC PROBLEMS, by S. Agmon. [1965] [37]p. incl. refs. (AFOSR-66-1211) (AF EOAR-66-18) AD 639175 Unclassified

Published in Commun. Pure and Appl. Math., v. 18: 627-663, Nov. 1965.

An indirect method of estimating Green's kernels is described. It yields pointwise estimates which hold uniformly in all space variables. Moreover this method uses very little of the properties of elliptic differential

operators and applies to a general class of integral operators which need not be connected with differential problems. Further, the formula of the asymptotic distribution of positive (and of negative) eigenvalues for very general selfadjoint elliptic problems whose spectrum may extend to infinity on both sides of the real line is established using the derived estimates. The corresponding asymptotic results for the eigenfunctions (spectral function) are also established.

ELECTRON DENSITY AND IONIZATION PHENOMENA IN SHOCK WAVES, by W. Low. Annual summary rept. Nov. 23, 1965 [17]p. (AFOSR-66-0634) (AF 61(052)846)
AD 631006 Unclassified

A new shock-tube suitable for microwave and optical measurements was designed and manufactured. It was established that the Mach speed behind a taper section ending in an area change is close to that predicted by the steady state theory, provided measurements are made far enough downstreams, and provided viscous corrections are being made. However, near the transition section, large deviations from the values predicted either by the steady state or linear theory are found. Within 20-50 nozzle lengths there are fluctuations in the Mach speed which are only damped out far enough downstreams. For the inverse problem of a shock flow into an expanding constriction yielding a larger area, one also finds that the Mach speed far enough downstreams approximates the steady state theory. However, near the transition section the fluctuations are not as violent. The optical data show a peculiar intensity dependence on the position behind the shock front.

HYPERFINE INTERACTIONS IN THE GROUND STATE AND 22-KEV STATE OF Sm^{149} IN FERRIMAGNETIC COMPOUNDS OF SAMARIUM, by S. Ofer, E. Segal and others. [1965] [12]p. incl. diagrs. tables, refs. (AFOSR-65 0760) (In cooperation with Massachusetts Inst. of Tech., Cambridge) (Sponsored jointly by Advanced Research Projects Agency; Air Force Office of Scientific Research under AF EOAR-64-24, and [Air Force Office of Scientific Research], Atomic Energy Commission and [Office of Naval Research] under AT(30-1)2098) AD 618352 Unclassified

Also published in Phys. Rev., v. 137: A627-A638, Jan. 18, 1965.

Hyperfine interactions in $SmFe_2$, $SmFeO_3$, Sm metal, and particularly in samarium iron garnet, SmIG, have been studied at various temperatures using the Mössbauer effect in Sm^{149}. Large magnetic hyperfine interactions are observed in SmIG even at room temperature, in contrast with the observed Sm sublattice magnetization. The values or upper limits for the magnetic hyperfine field acting on Sm nuclei in SmIG, $SmFe_2$, and $SmFeO_3$ are given. Experimental results support an assignment of a spin 5/2 for the 22-kev level of Sm^{149}. The origin of the temperature dependence of the hyperfine fields acting on Sm nuclei in SmIG is discussed, including the effects of the molecular exchange field and the electrostatic crystalline field. Comparison is also made with the theory of magnetization of Sm sublattices. Exchange effects are found to be strong and dominant at high temperatures, whereas at low temperatures, crystalline-field effects are found to predominate. These results are in fair agreement with theoretical predictions.

A STUDY OF CONDUCTION ELECTRON POLARIZATION IN FERROMAGNETIC RARE EARTH METALS USING PERTURBATION OF γ-γ CORRELATIONS, by S. G. Cohen, N. Kaplan, and S. Ofer. [1965] [5]p. incl. diagrs. refs. (AFOSR-65-1764) (AF EOAR-64-24) AD 626350 Unclassified

Also published in Proc. Internat'l. Conf. on Magnetism, Nottingham (Gt. Brit.) (Sept. 7-11, 1964), p. 432-436.

The effective magnetic fields H_{eff} at ^{175}Lu and ^{177}Hf nuclei within diamagnetic ions, situated as dilute impurities in ferromagnetic rare earth metals, are determined using the technique of measuring the perturbation of the integral angular correlation of γ-γ cascades

emitted from these nuclei as a function of temperature, both in the presence of an external magnetic field and without an external field. From these results it can be concluded that the effective field in all cases is negative, i.e. opposite to the magnetization, that the magnitude of H_{eff} is proportional to the magnetization, at least in the case of Gd host metal, and that for ^{177}Hf the magnitude of H_{eff} follows very roughly the magnitude of the spin S of the magnetic host. If it is assumed that the main contribution to H_{eff} is due to polarized conduction electrons, it can be shown that within the Kasuya-Yosida model, the effective s-f exchange interaction, J_{s-f}, is negative and of the order of -0.1 ev.

MÖSSBAUER EFFECT IN Dy^{161} IN METALLIC DYSPROSIUM, $DyFe_2$, AND $DyAl_2$, by S. Ofer, M. Rakavy and others. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-65-2562) (AF EOAR-64-24) AD 629236 Unclassified

Also published in Phys. Rev., v. 138: A241-A246, Apr. 5, 1965.

The recoilless absorption spectra of the 26-kev γ rays from Dy^{161m} in Dy^{161} situated in Dy metal, $DyFe_2$, and $DyAl_2$ were measured at various temperatures. A value of (-825 ± 30) mc/sec was found for the magnetic hyperfine constant ($g_0\mu_n H_{eff}$) of the ground state of Dy^{161} in Dy metal at 20°K. This value is in very good agreement with the "free-ion" value calculated for the Dy^{3+} ions in the fully magnetized state ($J_z = J$) from data on electron spin resonance in dilute salts. The internal magnetic field acting on the Dy nucleus in $DyFe_2$ at magnetic saturation is (14 ± 2)% higher than in Dy metal. The magnetic field acting in $DyAl_2$ at magnetic saturation is the same, within the experimental errors, as in Dy metal. The ratio of the magnetic moments of the 26-kev level and the ground state of Dy^{161} was found to be -1.19 ± 0.05. An isomeric shift of (2.5 ± 0.4) mm/sec was found between Dy metal and Dy_2O_3 absorbers. The isomeric shifts of $DyAl_2$ and $DyFe_2$ absorbers relative to a Dy_2O_3 absorber were found to be (0.4 ± 0.4) mm/sec. (Contractor's abstract)

PARAMAGNETIC-RESONANCE SPECTRUM OF COBALT ONE PLUS IN SINGLE CRYSTALS OF CALCIUM OXIDE, by W. Low, and J. T. Suss. [1965] [3]p. incl. tables, refs. (AFOSR-66-1623) (AF EOAR-64-24) AD 639531 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 519-521, Sept. 1965.

The paramagnetic-resonance spectrum of Co^{1+} in single crystals of CaO is reported. Details of this spectrum are discussed. Effective care polarization for Co^{1+} in MgO and CaO and for Ni^{2+} in MgO are compared. The care polarization for Co^{1+} is found to be nearly independent of the crystal lost.

DEGREE OF IONISATION OF Fe LINES IN THE SOLAR SPECTRUM IN THE RANGE 170-220 A, by E. Alexander, U. Feldman, and B. S. Fraenkel. [1965] [2]p. incl. tables, refs. (AFOSR-65-0761) (AF EOAR-64-70) AD 617450 Unclassified

Also published in Phys. Ltrs., v. 14: 40-41, Jan. 1, 1965.

This note gives a preliminary determination of degrees of ionization of Fe lines in the spectral range between 170A and 220A, based on 3 methods of excitation. A comparison is made between the intensity of Fe spectra on 3 pairs of exposures to determine the degree of ionization of Fe lines in this region. It is concluded that it is highly probable that a high percentage of Fe lines appearing in the 170 - 220A range of the solar spectrum originate from degrees of ionization corresponding to Fe IX or less.

NEW LINES IN ISOELECTRONIC SEQUENCES OF ARGON I FROM V VI TO Ni XI AND IN ISOELECTRONIC SEQUENCES OF POTASSIUM I FROM Cr VI TO Cu XI, by E. Alexander, U. Feldman, and B. S. Fraenkel. [1965] [4]p. incl. illus. diagrs. tables, refs. (AFOSR-65-2553) (AF EOAR-64-70) AD 627756 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 55: 650-653, June 1965.

A method of differentiation between highly ionized spectra has enabled extension of the argon I isoelectronic sequences of the $3p^5 4s$ and $3p^5 5s$ levels. A sequence of $3p^5(^2P_{3/2})4d$ and $3p^5(^2P_{1/2})4d$ levels is established. The potassium I isoelectronic sequences of $3p^6 3d$-$3p^6 nf$ transitions are also extended. Lines of the following ions are reported: V VI, Cr VI and VII, Mn VIII, Fe VIII and IX, Co IX and X, Ni X and XI, Cu XI.

CORRELATES OF AMBIVALENCE, RISK-TAKING AND RIGIDITY, by A. Minkowich. Aug. 1, 1965, 90p. incl. tables, refs. (Scientific rept. no. 11) (AFOSR-65-1700) (AF EOAR-64-21) AD 624035 Unclassified

Problems of assessing ambivalence and risk-taking tendencies, and the exploration of their interrelations within a theoretical framework of decision-making behavior were investigated. An attempt was made to interpret within this framework the demonstrated relationships between ambivalence and risk-taking tendencies and the following variables: perceptual rigidity, intolerance of ambiguity, field dependence, dogmatism, anxiety and socialization experiences during childhood. Ambivalence was demonstrated as a generalized trait and was correlated with punitive parental socialization, with anxiety, field dependence, intolerance of ambiguity and low risk of prestige. Experimentally induced guilt resulted in a decrease of ambivalence. Marked sex differences were found for the relationships of ambivalence with financial risk and with styles and content sensitivity in binocular resolutions.

PROCESSES OF MODERNIZATION AND OF URBAN AND INDUSTRIAL TRANSFORMATION UNDER CONDITIONS OF STRUCTURAL DUALITY, by S. N. Eisenstadt. [1965] [11]p. incl refs. (AFOSR-65-2670) (AF EOAR-64-23) AD 629235 Unclassified

Presented at Seventh Latin Amer. Cong. of Sociology, Summer 1964.

Also published in Internat'l. Social Science Council, v. 4. 40-50, Mar. 1965.

In the cases analyzed, there tended to develop, in almost all the institutional spheres, a situation of growing interaction between different groups and strata, of their being drawn together into new common frameworks, of growing differentiation and at the same time lack of adequate mechanism to deal with the problems attendant on such internal differentiation and on the growing interaction between the various groups. This coming together of different groups into common social frameworks may have been intermittent and unequally distributed between different groups and strata of the population. But from all these points of view it is extremely doubtful whether it differed greatly from developments in other modernizing or modern societies at similar levels of modernization which were more successful in establishing relatively stable institutional frameworks. The crucial problem of these societies has been not a relatively small extent of modernization but rather the lack of development of new institutional settings, regulative mechanism and normative injunctions upheld within strategic areas of the social structure and capable of dealing with the various problems, which arose in all these spheres.

"USE AND MENTION" IN THE INFORMATION SCIENCES, by R. A. Fairthorne. [1965] [4]p. (AFOSR-65-2289) (AF 49(638)1427) AD 629367 Unclassified

Also published in Proc. Symposium on Education for Information Science, Warrenton, Va. (Sept. 7-10, 1965), Washington, Spartan Books, 1965, p. 9-12.

The information sciences study certain aspects of the use of language for certain ends. They do not themselves use language for these ends; they only mention such use. Many current confusions and absurdities concerning the proper, and possible, scope and aims of "informational" devices, processes, and studies could be resolved by distinguishing between tools, their users, and their uses. Slovenly use of the word "information" to denote, without definition, anything from pieces to par 'o increase of knowledge gravely aggravates these confusions. The word is not only confusing, but unnecessary, for before people can be informed about anything they must be told or notified about it. Thus the first task of information systems is "Notification," an activity that includes both "dissemination" and "information retrieval".

SOME BASIC COMMENTS ON RETRIEVAL TESTING, by R. A. Fairthorne. [1965] [4]p. (AFOSR-66-0414) (AF 49(638)1427) AD 632181 Unclassified

Also published in Jour. Doc., v. 21: 267-270, Dec. 1965.

One should test only such performance as is necessary to the aim of the system. To define the aim is difficult, because we deal with essentially social systems. Necessary, but not sufficient, conditions can be established for performance. As knowledge grows, so will the conditions known to be necessary. To separate aim and achievement from the values of the aims and achievements, one must consider them in terms of documentation, not of the external applications or intentions. What matter are: what sort of documentary entities are asked for; how they are asked for; how well the system supplies what is asked for when it is asked for in these terms. A documentary system cannot substitute for an author or reader completely. Some ignorance is inevitable. The indexer cannot predict all the ways an item may legitimately interest a user, while the user cannot know his interests beforehand so precisely that he can state exactly what he wants and what he does not want. There are also the inevitable ambiguities of the indexing and request languages themselves.

EXTERNAL MILITARY TECHNOLOGICAL TRANSFER AND STRUCTURAL CHANGE, by D. L. Spencer. Feb. 1965, 30p. incl. tables, refs. (AFOSR-65-0168) (AF AFOSR-64-533) AD 612169 Unclassified

The rapidity of technological change within a country is functionally related to a nation's propensity to borrow technology. Japan, with a celebrated propensity to borrow Western technology, has, in the post-World War II period, again made impressive gains, based in large part on borrowed technology. The United States' military presence in Japan has been an important transmission belt making possible much of this technological transfer, and consequent structural change. This research points to basic conclusions that the impact of an external military is far from the negative image popularly conceived. A military presence endowed with a higher technical civilization can initiate a fillip to a recipient country's structural evolution. Moreover, military aid, contrary to the often made negative contrast with economic aid, has long-term dynamic effects in the transfer of higher level technology which can shift production functions significantly over time. Implications of the United States military presence also can obtain for other countries as well, but with varying levels of intensity depending on the country's national propensity to borrow technology, and other strategic factors.

TRANSIENT PHOTODECARBOXYLATION INTERMEDIATES, by J. D. Margerum. [1965] [2]p. incl. diagrs. table. (AFOSR-65-2371) (AF 49(638)1264) AD 626351 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87: 3772-3773, Aug. 20, 1965.

A new type of excited state acid-base reaction is described in which 6 different carboxylate ions in aqueous solutions are photolyzed with near ultraviolet light and dissociate efficiently into carbon dioxide and a carbanion. The starting compounds all had nitrophenylacetate structures. The transient intermediates were nitrophenylcarbanions, 5 of which were identified by their absorption spectra and rate of decay following flash photolysis. Acid-anion structures are believed to stabilize these reactive intermediates, which have typical lifetimes of between one and sixty seconds. Photolysis products were identified and corresponded either to the addition of a proton to the carbanion or to the formation of a bibenzyl type structure. 4,4'-Dinitrobibenzyl was formed in high yield from the photolysis of 4-nitrophenylacetic acid in aqueous base.

ON THE ASYMPTOTIC BEHAVIOR OF ELECTROMAGNETIC FIELDS SCATTERED FROM CONVEX CYLINDERS NEAR GRAZING INCIDENCE, by W. P. Brown, Jr. [1965] [49]p. incl. diagrs. refs. (AFOSR-65-2104) (Bound with its AFOSR-65-2211; AD 623849) (AF 49-(638)1439) AD 627713 Unclassified

Also published in Jour. Math. Anal. and Appl., v. 15: 355-385, Aug. 1966.

The work reported in this paper concerns the determination of an asymptotic expansion of the electromagnetic field scattered from a convex cylinder near grazing incidence. A systematic procedure for the generation of such an expansion is formulated from the concepts of boundary layer theory. The general form of mth term in the expansion is derived for all points within a domain that includes the immediate vicinity of the point of grazing incidence and the penumbral region in the neighborhood of the shadow boundary. Boundary and matching conditions for the determination of the unspecified coefficients in the expansion are formulated. Finally, explicit representations for the initial term in the expansion are given for all points within the transition domain.

DISPERSION EFFECTS IN LASER AMPLITUDES, by G. F. Smith, W. P. Brown, Jr., and C. R. Giuliano. Final scientific rept. Oct. 1, 1964-Sept. 30, 1965 [105]p. incl. illus. diagrs. refs. (AFOSR-65-2211) (AF 49-(638)1439) AD 623849 Unclassified

It has been shown that the rytov approximation is severely limited in its applicability to long distance optical propagation in the atmosphere. A new and powerful boundary layer calculational technique has been developed and applied to the problem of scattering of electromagnetic waves from convex cylinders near grazing incidence. Multigigacyle acoustic waves were generated in crystalline solids by giant pulse ruby laser radiation; several unsuccessful attempts were made to probe these waves with bragg-scattered gas laser radiation. However, multiple wavelength shifts in stimulated Brillouin scattering from quartz were observed; it was established, by time resolved interferometry, that these shifts result from an iterative process.

ON THE VALIDITY OF THE RYTOV APPROXIMATION IN OPTICAL PROPAGATION CALCULATIONS, by W. P. Brown, Jr. [1965] 23p. incl. diagrs. refs. (Bound with its AFOSR-65-2211; AD 623849) (AF 49(638)1439) Unclassified

The applicability of the Rytov approximation to the calculation of the characteristics of optical propagation in a weakly inhomogeneous random medium is investigated. The condition that the mean square value of the second term in the associated perturbation expansion be smaller than that of the first is adopted as a criterion for the validity of the Rytov approximation. It is shown that there is a very severe range limitation on the validity of the Rytov approximation for optical propagation in the lower portions of the earth's atmosphere. The equivalence of the validity conditions for the Rytov and Born approximations contradicts the statements of Tatarksi and Chernov who contend that the Rytov approximation is superior to the Born approximation.

It is conjectured that the Rytov and Born approximations have the same domain of validity for all γ.

THE USE OF THE HYDROGEN-OXYGEN REACTION IN EVALUATING VELOCITY CONSTANTS, by R. R. Baldwin, D. Jackson and others. [1965] [11]p. incl. diagrs. tables, refs. [AF EOAR-63-31] Unclassified

Published in Tenth Symposium (Internat'l.) on Combustion, Cambridge (Gt. Brit.) (Aug. 17-21, 1964), Pittsburgh, Combustion Inst., 1965, p. 423-433.

Studies of the H_2/O_2 reaction have given information on some of the reactions of the radicals H, O, OH, and HO_2 with hydrocarbons, CO, and H_2O_2 in the region of 500°C. The inhibiting action of hydrocarbons on the second limit has given Arrhenius parameters for H + RH in the case of ethane, propane, n- and i-butane. More restricted information on the reaction of O and OH with these hydrocarbons is also obtained. Studies of the yields of CO_2 and H_2O in slowly reacting $H_2/CO/O_2$ mixtures enables the ratios k_{OH+CO}/k_{OH+H_2} and $k_{HO_2+CO}/k_{HO_2+H_2}$ to be evaluated. Studies of the decomposition of H_2O_2 sensitized by H_2 give the relative rates of $OH + H_2$ and $OH + H_2O_2$, as well as the ratio of the rates of $H + H_2O_2 = H_2O + OH$ and $H + H_2O_2 = H_2 + HO_2$. Study of the reduction of this sensitizing effect by traces of added O_2 enables the ratio of the rates $H + H_2O_2 = H_2$ and $H + O_2 + M = HO_2 + M$ to be determined. (Contractor's abstract)

F-CENTER ENERGY LEVELS AND WAVEFUNCTIONS FOR A POINT-CHARGE CESIUM CHLORIDE STRUCTURE (Abstract), by L. F. Oden and E. F. Steckmann. [1965] [1]p. [AF AFOSR-64-634] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10. 76, Jan. 27, 1965.

The ground-state and first excited-state energies and wavefunctions have been calculated for an electron bound to a negative-ion vacancy in a rigid cesium chloride structure consisting of point charges for 7 different values

of the lattice constant. The potential energy of the electron was expanded in a series of Kubic harmonics, and Schrödinger's equation was separated by an expansion of the wavefunction in a series of Kubic harmonics of the appropriate symmetry type. The resulting simultaneous second-order radial differential equations were integrated numerically by a power-series expansion. The energy difference between the ground state and the first excited state was obtained as a function of the lattice constant, and the results were found to be consistent with an Ivey-type formula. A comparison of results is made with other methods of approximation and with experimental data.

TWO NOVEL TETRACYCLO-OCTANES, by P. K. Freeman, V. N. Mallikarjuna Rao, and G. E. Bigam. [1965] [2]p. incl. diagrs. (AFOSR-66-0299) (AF AFOSR-65-34) AD 628852 Unclassified

Also published in Chem. Commun., No. 21: 511-512, Nov. 10, 1965.

A method is described for the generation of tetracyclooctanes by way of appropriate tricyclic carbene intermediates. The carbenoid decomposition of the p-toluenesulfonylhydrazone of tricyclo[3.2.1.$0^{3,6}$]octan-2-one generates, tetracyclo[3.3.0.0.$^{2,8}0^{3,7}$]octane(IV) and tetracyclo[3.3.0.0.$^{2,8}0^{3,6}$]octane(VI). Catalytic hydrogenation of IV produces tricyclo[3.3.0.$0^{3,7}$]octane; similar treatment of VI yields tricyclo[3.3.0.$0^{2,7}$]-octane.

THE SURFACE AREA OF LIQUIDS IN CIRCULAR TUBES, by T. A. Erickson. [1965] [5]p. incl. diagrs. tables, refs. (AFOSR-65-2259) (AF 49(638)1121) AD 625994 Unclassified

Also published in Jour. Phys. Chem., v. 69: 1809-1813, June 1965.

The surface area of a liquid in a circular tube approximates to about 2% the area represented by an oblate spheroid that has the tube radius and the meniscus height as its major and minor semiaxes, respectively. Over much of their range, the tables of Bashforth and Adams appear to represent coordinates of an ellipse within about 4%. (Contractor's abstract)

FORCED VAPORIZATION OF WATER, by T. A. Erickson. [1965] [4]p. incl. diagrs. tables, refs. (AFOSR-65-2260) (AF 49(638)1121) AD 625363 Unclassified

Also published in Humidity and Mixture, Internat'l. Symposium on Humidity and Moisture, Washington, D. C. (May 20-23, 1963), ed. by A. Wexler, New York, Rheinhold Publishing Corp., v. 3: 351-354, 1965.

The usual Hertz-Knudsen relation derived for the rate of evaporation of pure liquids is given by $n = (2\pi MRT_s)^{-1/2}(P_s - P)$. The rate of evaporation is shown to be represented as well, if not better, by a relation derived from a classical thermodynamic treatment of the forced vaporization of water as a steady-rate process. On the basis of this derivation, the mass flow is described by the equation $n = N_A^{-1} \ln(P^0/P)$. (Contractor's abstract)

THEOREM-PROVING BY COMPUTERS, by B. Kallick. Final rept. Jan. 1, 1964-Dec. 31, 1964. Jan. 31, 1965, 63p. incl. refs. (Rept. no. IITRI H6008-5) (AFOSR-65-0338) (AF 49(638)1349) AD 611815 Unclassified

The subject is the development of efficient theorem-proving algorithms, amenable to computer implementation, through the application of the theory of mathematical logic. The approach taken is via the Herbrand theorem and consists in expressing the theorem as the negation of a prefix formula of predicate calculus and of finding an inconsistent set of instances of this formula. The following problem is dealt with: in searching for an inconsistent set of instances and having already generated certain instances of a formula, how can the information in the matrix of the formula be utilized to determine the most appropriate way of generating the next instance. In this regard, the idea of expressing the matrix in disjunctive normal form and generating instances so as to construct inconsistent sub-paths is considered to be a useful technique and worthy of continued study. A partial solution to the following problem is also obtained: how can the information that a given disjunctive term of the matrix

has figured in an inconsistent sub-path be utilized to avoid the repetition of identical computation the next time that term is encountered. A proof procedure is described which is capable of deciding certain known solvable subcases of the decision problem. It is conjectured that the procedure yield a new solvable subcase.

INVESTIGATION OF THE CHARGE-TO-MASS RATIO OF ELECTRICALLY SPRAYED LIQUID PARTICLES, by J. J. Hogan and C. D. Hendricks. [1965] [6]p. incl. illus. diagrs. tables, refs. (AFOSR-65-1428) (Sponsored jointly by the Air Force Office of Scientific Research under AF AFOSR-64-107 and National Science Foundation) AD 621466 Unclassified

Also published in AIAA Jour., v. 3: 296-301, Feb. 1965.

An analysis of the charge-to-mass ratios (specific charges) of particles generated by the electrical atomization process is presented. The study involves the surface energy of the dispersed system of particles, the effects of space charge on the source, and the effects of conductivity on the atomization process. Experimental data are presented in support of these theories. It appears that a dynamic equilibrium is established by which the space charge evaporation rate, voltage drop across the liquid meniscus, and surface energy extremum of the dispersed system of particles act simultaneously to establish the radius and specific charge of the emitted particles. A colloidal suspension in glycerine is experimentally shown to produce particles of high specific charge (400 coul/kg) when electrically dispersed under appropriate conditions. PRODUCTION OF UNIFORM-SIZED LIQUID DROPLETS, by N. R. Lindblad and J. M. Schneider. [1965] [4]p. incl. illus. diagrs. (AFOSR-65-2496) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-107 and National Science Foundation) AD 626521 Unclassified

Also published in Jour. Scient. Instr., v. 42: 635-638, Aug. 1965.

A method for producing a stream of uniform-sized liquid droplets and individual droplets is discussed in detail. The method is based on the principle that a cylinder of liquid (jet) is dynamically unstable under the action of surface tension. When a capillary wave of a prescribed wavelength is applied to the jet, the jet will disintegrate into a stream of uniform-sized droplets. Since the droplet size depends on the capillary tube through which the liquid flows, the size can be easily varied. A piezoelectric transducer is used to produce the capillary wave on the jet. The apparatus will produce droplets in a range between 25 and 350 μ m in radius. The method is unique in that the droplet size can be precisely controlled and individual droplets can be produced at will. (Contractor's abstract)

AN APPARATUS TO STUDY THE COLLISION AND COALESCENCE OF LIQUID AEROSOLS, by J. M. Schneider, N. R. Lindblad, and C. D. Hendricks. [1965] [7]p. incl. illus. diagrs. (AFOSR-65-2498) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-107 and National Science Foundation) AD 628451 Unclassified

Also published in Jour. Colloid Sci., v. 20: 610-616, Aug. 1965.

An apparatus used to study collision and coalescence of liquid aerosols and some of the physical quantities enhancing or hindering these processes is described. The relative trajectories, collision, and coalescence of 2 oppositely charged water droplets are shown for the droplets approaching at right angles. The droplets were 96 μ and 79 μ in radius and had velocities at impact of 330 cm/sec and 110 cm/sec, respectively. It was found extremely difficult to make the 2 droplets collide when both were highly charged with the same sign of charge. However, droplets highly charged with the opposite sign of charge had a high collision rate. (Contractor's abstract)

CHARGED COLLOIDAL SIZED PARTICLES FOR PROPULSION (Abstract), by C. D. Hendricks. [1965] [1]p. (Bound with its AFOSR-65-1266; AD 622527) (AF AFOSR-64-107) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

A statement of the general worth and competitive state of colloid propulsion is presented. A short summary of the various methods of producing colloids for propulsion is given. The conclusions reached are: (1) colloid propulsion has a useful part to play in the overall electric propulsion field if beams of particles can be produced; (2) the most promising beam production technique appears to be electrical spraying through capillaries. Experimentally obtained curves of specific charge as a function of various parameters in a capillary spraying system are presented. The parameters of interest are field strength at the capillary tip, liquid density, conductivity, surface tension, and mass flow rate. The results of a study of electrokinetic pumping of insulating liquids are also presented. Pumps of this type contain no mechanical impellers or moving parts other than the pumped liquid. Aerospace applications of such pumps are discussed and some limitations are pointed out.

Recent emphasis on the use of electronic digital computers has focused attention on a number of practical problems which were hitherto treated on an 'existence' basis. One problem which arises in computer analysis of electrical networks is the listing of all trees in the network. Any practically useful scheme must find all the trees of the network without generating duplicates (for practical networks the number of trees exceeds the fast memory of any computer and, hence, slows down search for duplicates). Also, the trees must be generated by replacement of one branch at a time in order to keep track of signs (for active network analysis). A practical procedure satisfying these conditions is presented. PROPERTIES OF LOSSY COMMUNICATION NETS, by W. Mayeda and M. E. Van Valkenburg. [1965] 6p. incl. diagrs. (AFOSR-66-0245) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-931 [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 640930 Unclassified

Also published in IEEE Trans. Circuit Theory, v. CT-12: 334-338, Sept. 1965.

A communication net is considered in which the edges are lossy in the sense that flow through the edge is attenuated. Such a model describes many power or information transmission systems. The classical problem for such a net is that of maximizing the flow from a source to a sink. The solution to the problem for the lossless case is well known; the lossy case has been considered only recently by Fujisawa. In determining properties of the lossy communication nets, a saturated edge is defined as one in which the edge flow is equal to the capacity of that edge. The concept of the saturated cut set is introduced to obtain relationships that must be satisfied by the terminal capacities. If $\underline{\tau}_{pq}$ is the source terminal capacity (maximum flow at the source vertex to receive maximum flow at q) and $\underline{t}_{pq}$ is the sink terminal capacity (maximum flow that can be received at q when the maximum flow is sent from p to q) then $\underline{\tau}_{ij} \geq \underline{t}_{kj}$ or $\tau_{ij} \geq \tau_{ik}$, for any vertices i, j, and k. The property analogous to the S-submatrix property in the lossless case is also obtained. All results given reduce to known results when the loss of every edge becomes zero. This includes the maximum flow-minimum cut theory of Ford and Fulkerson, which is applicable only in the lossless case. (Contractor's abstract)

SYNTHESIS OF INTERCONNECTED LINEAR TIME-VARYING SYSTEMS, by W. R. Perkins. [1965] [3]p. incl. refs. (AFOSR-66-0391) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-931 and Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under DA 28-043-AMC-00073(E)) AD 640927 Unclassified

Also published in Proc. Nat'l. Electronics Conf., v. 21: 694-696, 1935.

The development of general analysis and synthesis methods for linear, time-varying systems has proved to be very challenging. The major difficulty is that most

time-varying differential equations cannot be solved in closed form analytically. Recently an approach based on an operator algebra has been introduced by Stubberud. This method does not require differential equation solution, and permits synthesis of a class of control systems. The main difficulty is the considerable labor involved in manipulating the time-varying operators. The purpose of this paper is to develop a simple state-variable method that is useful in the synthesis of time-varying systems, and that requires neither the solution of differential equations nor the manipulation of time-varying operators. GENERATION OF DIRECTED TREES, 2-TREES AND PATHS WITHOUT DUPLICATION, by A. Paul, Jr. Jan. 1965, 44p. incl. diagrs. refs. (Rept. no. R-241) (AFOSR-65-0259) (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under DA 28-043-AMC-00073(E)) AD 610149 Unclassified

The increasing number of applications of graph theory to the solution of problems in many fields make it desirable to have available complete knowledge of the properties of these graphs. Since many problems in electrical networks, switching circuits, and communication nets can be formulated in terms of directed graphs, it is appropriate to study their properties. In this paper, procedures are developed for generating the directed trees, 2-trees and paths of a directed graph. Unlike other methods for generating these subgraphs, the procedures developed here avoid generating duplicate elements thus they eliminate the necessity of repeated search to select a complete set of elements. Proofs are given to verify that all elements of the set of directed trees, 2-trees or paths are generated and that no duplicate elements occur. Examples are given to illustrate the procedures in detail. The procedures are amenable to digital computer application. (Contractor's abstract)

ON MINIMAL-VARIANCE CONTROL OF LINEAR SYSTEMS WITH QUADRATIC LOSS, by M. K. Sain. Jan. 1965, 45p. incl. diagrs. refs. (Rept. no. R-240) (AFOSR-65-0541) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 28-043-AMC-00073(E)) AD 610776 Unclassified

The problem of minimizing the variance of a quadratic performance index, in the presence of control noise whose properties are known a priori, has been studied for linear, constant systems with open-loop control. The expected value of the performance index is constrained to be a positive number, which cannot be less than the optimal mean index when variance is free. Solution is by means of the calculus of variations, which is applied to an equivalent noise-free problem. The necessary (Euler) equations are integro-differential and have a kernel matrix derived from output correlation functions. In general, these equations contain a forcing vector which depends upon the third-moment properties of the noise process. For systems in which the state vector can be chosen as the output, the existence of an inverse for the kernel matrix can be related to the total state controllability of an equivalent linear, noise-free plant which incorporates statistical data from the disturbance process. A maximum estimate for the number of eigenvalues is given, and is refined for the special case of single-input, state-output control. Necessary and sufficient conditions for a unique solution can be found in specific examples. (Contractor's abstract)

OPTIMUM CONTROL OF LINEAR SYSTEMS WITH TIME LAGS, by G. S. Tahim. Jan. 1965, 39p. incl. diagrs. refs. (Rept. no. R-242) (AFOSR-65-0542) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1383, Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 28-043-AMC-00073 (E)) AD 610777 Unclassified

The problem of optimal control of a system governed by linear differential-difference equations with constant coefficients is studied. The performance index is the integrated square error plus weighted control and the final time is infinite. An important question that arises in the study of the optimization problem is the existence of the optimal solution. In the case of dynamic systems governed by ordinary linear differential equations it is known that the existence of the optimal solution is related to the concept of controllability. The controllability conditions for such systems are also known. In this thesis the necessary and sufficient conditions for complete controllability of a system of linear differential-difference equations with constant coefficients are established. For single input systems, with the help of these conditions, the optimal control problem is related to classical frequency domain problem of improving the sensitivity of the overall system with respect to parameter variations. In order to extend the relation between the optimization problem and the sensitivity improvement for multiple input systems, a sensitivity matrix is defined and its relationship with optimization is established. AN ALGEBRAIC STUDY OF SHOCK STRUCTURE, by B. L. Hicks and S. M. Yen. Feb. 1965, 23p. incl. diagrs. table. (Rept. no. R-244) (AFOSR-65-0543) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 457806 Unclassified

Far up- and downstream of a shock front the structure of a shock must conform to the Navier-Stokes equations. At these boundaries, therefore, the viscosity

coefficient $\tilde{\mu}$ and Prandtl number $\tilde{Pr}$ must have values appropriate to the medium and the conditions there. For a monatomic gas, $\tilde{Pr}$ must equal 8/9, and the derivatives of $t_\perp$ (the lateral temperature) and of dn/dx (the density gradient) are calculable. We can use these conditions to test the accuracy of various theoretical shock structures proposed and to find approximate macroscopic properties of shock structures for any monatomic gas without solving the Boltzmann equation. We have developed the corresponding first order theory in algebraic form by modifying the Mott-Smith expressions for $t_\perp$ and dn/dx in a simple way such that the modified functions will satisfy the auxiliary conditions and will thus agree with the known transport characteristics of monatomic gases. By using the number density n as the independent variable, we are able to find the macroscopic shock structure on the basis of given asymptotic values of $\tilde{Pr}$ alone, while the spatial distribution of properties depends on both $\tilde{Pr}$ and $\tilde{\mu}$. Comparisons are presented of the shock structures for monatomic gases calculated according to the first order algebraic theory, Mott-Smith, and Navier-Stokes. The first order theory reproduces the Navier-Stokes results in the low Mach number range and supplies a simple representation of the Navier-Stokes model. At high Mach number, the correction of the properties to the Mott-Smith model amount to at most less than 20% of stress τ/p_1 or of the heat flux q. The shock thickness is much smaller than Camac's experimental value for argon. A second order calculation may be made by including as an additional condition the matching of any experimentally determined shock thickness. As an example calculations are given for argon. TRANSIENT RESPONSES OF BUTTERWORTH AND CHEBYSHEV FILTER NETWORKS, by G. Kishi. Feb. 1965, 39p. incl. diagrs. (Rept. no. R-194) (AFOSR-65-0891) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1383, [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 458645 Unclassified

Transient responses of the Butterworth and the Chebyshev filter networks are calculated for both suddenly impressed and suddenly removed sinusoidal input signals with angular frequency ω_c. The transient responses of these networks are treated in terms of the in-phase and the quadrature components, and these functions together with envelope functions are presented under the assumption of narrow bandwidth for the following cases: (1) For the n-th degree Butterworth filter networks with mid-band angular frequency ω_0 and half-power (or 3db) transmission band $\omega_0 \pm \omega_b$, the cases of n = 3 to 7, $\omega_c = \omega_0$ and the cases of n = 3 to 5, $(\omega_c - \omega_0)/\omega_b$ = 0.2, 0.4, 0.6, 0.8, 1.0, and half-gain points. (2) For the n-th degree Chebyshev filter networks with mid-band angular frequency ω_0 and $A_p$db transmission band $\omega_0 \pm \omega_b$, the cases of n = 3 to 7, $\omega_c = \omega_0$, and A_p = 0.01, 0.03, 0.1, 0.3, 1db, and the cases of n = 3 to 5, A_p = 0.03db and $(\omega_c - \omega_0)/\omega_b$ = 0.2, 0.4, 0.6, 0.8, 1.0.

ANALYSIS AND SYNTHESIS OF LOSSY COMMUNICATION NETS, by K. Onaga. Mar. 1965, 59p. incl. diagrs. refs. (Rept. no. R-245) (AFOSR-65-0892) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1383 and [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 467234 Unclassified

The property of optimum maximum flows in lossy communication nets is investigated. A lossy communication net is a weighted linear graph in which an edge capacity, C, and an efficiency factor, ρ, are associated with each edge. The flow through an edge is limited by its edge capacity, and the flow, ψ, entering an edge capacity, and the flow, ψ, entering an edge suffers a loss of $(1-\rho)\psi$ in passing through the edge so that only the amount $\rho\psi$ emerges from the other end of the edge. A basic saturated cut set (BSC) of an optimum maximum flow (most economical maximum flow) is characterized in terms of a transfer inclusion relation. Based on this characterization, a method of locating the BSC's of the optimum maximum flows is developed. Decomposition of an optimum maximum flow into optimum semi-flows with respect to a basic saturated cut set reduces the task of flow assignment. The properties of sending terminal capacity matrices, $\overline{T}$, and receiving terminal capacity matrices, $\underline{T}$, of a lossy net are studied in terms of principal partitioning. Synthesis procedures for lossy bi-tree nets from given $\overline{T}$ or $\underline{T}$ matrices are developed. The success of these methods is due to the fact that a bi-tree net has a single path between any pair of nodes. (Contractor's abstract)

RUBIDIUM SPIN RELAXATION IN THE RARE GASES: A STUDY UNDER ULTRACLEAN CONDITIONS, by F. A. Franz. Feb. 1965, 34p. incl. diagrs. tables, refs. (Rept. no. R-246) (AFOSR-65-0893) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 458872 Unclassified

Also published in Phys. Rev., v. 139: A603-A611, Aug. 1965.

The spin relaxation of an optically pumped rubidium vapor induced by rubidium-rare gas atomic collisions has been investigated in an ultraclean environment. The experiment was performed under conditions such that the partial pressure of non-rare gas impurities was less than 1×10^{-8} Torr, and that the time between Rb-Rb spin exchange collisions was short compared to the spin relaxation time. The cross sections for disorientation of rubidium were found to be considerably smaller than previously reported values. This fact is attributed primarily to the low degree of impurity contamination in the present work. When compared to already existing values for cesium and sodium, it is seen that the

disorientation cross sections of these 3 alkali metals have a remarkably similar dependence on buffer gas atomic number. The new experimental values are also compared to recent theoretical calculations.

A DYNAMIC PROGRAMMING OF OPTIMUM FLOWS IN LOSSY COMMUNICATION NETS, by K. Onaga. Mar. 1965 [19]p. incl. diagrs. table. (Rept. no. R-247) (AFOSR-65-0894) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1383, and [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 459639 Unclassified

A flow $\bar{t}$ with the sending flow value $\bar{T}$ at the source and the receiving flow value $\bar{t}$ at the sink is said to be optimum if there is no flow which has less sending flow value than $\bar{T}$ while having the same receiving value $\bar{t}$. A necessary and sufficient condition of optimality is obtained. Based on this characterization a dynamic programming of optimum flows in a lossy communication net is devised and demonstrated by an example.

RESEARCH IN NETWORK, LINEAR GRAPH AND COMMUNICATION NET THEORIES IN JAPAN, by W. Mayeda. Mar. 1965, 10p. (Rept. no. R-248) (AFOSR-65-0895) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1383, and [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 460353 Unclassified

This report introduces some research groups in Japan that are in the fields of network, linear graph and communication net theories. In the Hokkaido and the Tohoku Universities, the groups are researching the synthesis of networks consisting of n-wire lines. In the Yamagata University, analysis of electrical networks by linear graphs is studied. In the Tokyo Institute of Technology, network synthesis is very active. Communication nets are studied in the Electrical Communication Laboratory and the Electrotechnical Laboratory. The filter design group is active in the Nippon Electric Co. Network theory is a very popular research subject in the Osaka University and the Kyushu University. (Contractor's abstract)

PHOTO CURRENT SUPPRESSOR GAUGE DEVELOPMENT, by W. L. Schuemann. Final rept. Mar. 1965 [21]p. incl. diagrs. (Rept. no. R-249) (AFOSR-65-0896) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 460535 Unclassified

A type of ionization gauge called the photo current suppressor gauge has been developed at the Coordinated Science Laboratory of the University of Illinois during the past 3 yr. This gauge is capable of effectively suppressing the photoelectric current (x-ray current) from the ion collector, thereby considerably extending the range of ionization-type gauges. Simple suppressor gauges have a limitation similar to the x-ray limit of the Bayard-Alpert gauge ($\sim 1 \times 10^{-13}$ Torr. Slightly more complicated suppressor gauges probably would not be limited by an x-ray effect above 1×10^{-16} Torr, though this has not been experimentally verified. These gauges have a higher sensitivity than typical inverted gauges, are only slightly more complicated, and can use the same power supplies and electrometers.

DIELECTRIC PROPERTIES OF A WEAKLY TURBULENT PLASMA, by Y. H. Ichikawa. Apr. 1965, 23p. incl. diagrs. (Rept. no. R-251) (AFOSR-65-1142) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 462330 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 523, Apr. 26, 1965.

Generalization of the Herring-Yoshikawa theory has been developed to take into account the dynamical effect of turbulent fluctuation on the dielectric properties of weakly turbulent plasma. According to the hydrodynamic description of electron plasma, the turbulent fluctuation gives rise to appreciable modification of the dielectric properties in the low frequency region and at the frequency of twice of the electron plasma frequency. An expression of the static dielectric constant shows that the characteristic correlation distance of the weakly turbulent plasma becomes longer than the Debye distance of corresponding homogeneous plasma in thermal equilibrium state. Contrary to the hydrodynamic scheme, the integral equation has been derived for the induced fluctuation in the kinetic description of the plasma. This integral equation suggests that the turbulent fluctuation may modify the dielectric properties of the turbulent plasma also at the electron plasma frequency. (Contractor's abstract)

OPTIMAL MATCHING OF LINEAR TIME-VARYING NETWORKS, by R. J. Tracy. Apr. 1965, 26p. incl. diagr. (Rept. no. R-252) (AFOSR-65-1143) (Sponsored

jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E))
AD 614800 Unclassified

The calculus of variations is used to obtain the optimal load network for a linear time-varying n-port network excited at each port by arbitrary signals. The given network is represented using a state variable description; use of a matrix of Lagrange multipliers in the variational process then leads directly to the state variable description of the adjoint matching network. The choice of anticipative or non-anticipative load networks is considered. The general result is then specialized to obtain the usual condition required for matching time-invariant networks in the periodic steady state. Conditions which guarantee the existence of an optimal match are obtained from the second variation. Finally, the entire matching process is interpreted in terms of the lossy and lossless parts of the network response. (Contractor's abstract)

A PROCEDURE FOR SYNTHESIS OF SWITCHING NETWORKS, by A. C. McKellar. May 1965, 42p. incl. diagrs. tables. (Rept. no. R-253) (AFOSR-65-1456) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E); and National Science Foundation) AD 618333 Unclassified

A procedure is described which yields a realization of a sequential machine as any asynchronous switching network. The basic idea is to perform an operation on the flow table which corresponds to opening a feedback loop of some realization. Repetition of such operations leads to the specification of a combinational network which is considered to be a solution to the problem. In addition to being iterative, the procedure is capable to being implemented on a digital computer. Necessary and sufficient conditions for the existence of asynchronous cascade and parallel realizations are given and methods of obtaining such realizations are explored. It is shown that the steady state behavior of a sequential machine is useful in this regard. (Contractor's abstract)

OPTIMAL CONTROL OF LINEAR SYSTEMS WITH TIME LAG, by T. E. Mueller. June 1965, 42p. incl. diagrs. refs. (Rept. no. R-254) (AFOSR-65-1457) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E))
AD 618332 Unclassified

New results are given which permit a numerical solution of the optimal regulator problem for systems governed by linear differential-difference equations in which the optimization interval is finite. An iterative algorithm which assures convergence to the optimum is derived from the necessary and sufficient conditions for optimality. This algorithm requires neither the choice of an initial control nor the choice of a convergence parameter. The conditions for optimality are derived in 2 forms: an integral equation and a coupled set of differential-difference equations. Numerical examples for this are presented. (Contractor's abstract)

OPTIMIZATION OF SYSTEMS WITH PULSE-WIDTH-MODULATED CONTROL, by D. E. Kirk. June 1965, 66p. incl. diagrs. tables, refs. (Rept. no. R-255) (AFOSR-65-1458) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) Unclassified

A new procedure for optimizing the performance of pulse-width-modulated systems is given for plants which may be nonlinear and time-varying. A modified Bolza performance index is employed. The optimization is formulated as a multiple-arc problem of the calculus of variations. Necessary conditions for optimal control are given in the form of a nonlinear two-point boundary value problem. The method of steepest descent is applied to obtain numerical solutions. A computational procedure is found which is especially suited to this type of problem. Special features of the procedure are automatic step size adjustment, and the generation of a sequence of performance indices which is monotonic. Examples which illustrate the range of application are given. (Contractor's abstract)

SELF-DIAGNOSIS OF ELECTRONIC COMPUTERS: AN EXPERIMENTAL STUDY, by E. G. Manning. July 1965, 72p. incl. diagrs. tables, refs. (Rept. no. R-259) (AFOSR-65-1703) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00072(E); and National Science Foundation)
AD 620248 Unclassified

The problem considered is the development of design principles which will permit the design of self-diagnosing computers. A self-diagnosing computer is one for which there exists a self-diagnosis procedure, defined as an experiment having one of two outcomes: (a) all transistor-diode logic is entirely failure-free; or (b) card or module x has a failure of type y. Also, the procedure must be sufficiently fast to permit execution every few hr, using non-technical personnel. So little is known about the problems involved in making a computer self-diagnosing, that it is appropriate to first attack a more restrictive, experimental problem. Consequently, an attempt was made to derive a self-diagnosis procedure for the execution-phase hardware (main control, arithmetic unit, and decoders) of an existing machine (the CSX-1). The principal experimental tool was the sequential analyzer

system which allows digital simulation of the class of sequential machines generated under failure from a given machine.

NETWORK SYNTHESIS TO MINIMIZE MULTIPARAMETER SENSITIVITY, by S. C.-h. Lee. Aug. 1965 [173]p. incl. diagrs. refs. (Rept. no. R-262) (AFOSR-65-1705) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 619726 Unclassified

The concept of sensitivity group is introduced in giving a new definition of multiparameter sensitivity which is more general than that of Goldstein and Kuo. Some theorems on the multiparameter sensitivity for RLC network are given. From these theorems, the sensitivity groups of any RLC network can be directly determined from the network. The multiparameter sensitivity of any RLC network can thus be easily obtained. The new definition makes it possible to compare 3 RLC networks of different topology realizing the same network functions with respect to multiparameter sensitivity. In particular, RC ladder networks are compared with non-seriesparallel structures which are synthesized by an extension of a procedure due to H. B. Lee. It is shown that the new networks always have smaller values of multiparameter sensitivity than 2 classes of equivalent ladder networks. Numerical examples computed on CDC 1604 and IBM 7094 are given to illustrate the method. (Contractor's abstract)

COMPUTER COMPILER. PART I - PRELIMINARY REPORT, by G. Metze and S. Seshu. Aug. 1965, 36p. incl. diagrs. (Rept. no. R-264) (AFOSR-65-1707) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 28-043-AMC-00073(E); and National Science Foundation) AD 619738 Unclassified

A technique is proposed for the automatic system design of a digital computer. The desired computer is described in a FORTRAN-like language. This information is read by a (system) compiler which produces a microinstruction flow-chart optimized according to the given criterion. This output is given to another (logic) compiler which produces the logic circuit diagram of the desired machine. The basic concepts and the proposed input language are discussed in this preliminary report and an example of the input for a full-fledged computer is given.

GROUND STATE OCCUPATION PROBABILITIES FOR OPTICALLY PUMPED ALKALI METAL ATOMS, by F. A. Franz. Aug. 1965 [63]p. incl. diagrs. tables, refs. (Rept. no. R-265) (AFOSR-65-1708) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 620249 Unclassified

Calculations of the relative populations of the ground state Zeeman sublevels of an optically pumped alkali atom are presented. Two modes of optical pumping-zero mixing and complete mixing in the excited state-and 3 modes of alkali relaxation-uniform, Zeeman, and electron randomization-are considered. Calculations of the sublevel relative populations for an alkali atom of nuclear spin 3/2 are then made in terms of experimentally measurable parameters for all 6 combinations of pumping and relaxation modes. The numerical results are summarized in tables as functions of pumping and relaxation rates. (Contractor's abstract)

A TOPOLOGICAL TECHNIQUE FOR ANALYSIS OF ACTIVE NETWORKS, by J. T. Barrows, Jr. Aug. 1965, 32p. incl. diagrs. refs. (Rept. no. R-266) (AFOSR-65-2218) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 621925 Unclassified

This paper presents a generalization of Fuessner's method for the analysis of active networks. This method makes it possible to determine system functions of any network in a simple and straightforward manner. In the usual topological analysis of networks it is necessary to list all possible trees or co-trees and the signs of their tree admittance products as well as determining the set of 2-tree products and their signs for the network function in question. Usually 2 graphs, a current and a voltage graph, are used to implement this process when dependent sources are present in the network. The method presented here utilizes solely the original topology and the assigned branch current directions to determine these terms and their sign. Justification of the technique is given for the case of 1 and 2 dependent sources present in a network with the summary of the method for each case. The analysis of a network with an arbitrary number of dependent sources is seen to follow directly. Finally an example of a network with 2 dependent sources is given which illustrates the method. THE USES OF PLATO: A COMPUTER-CONTROLLED TEACHING SYSTEM, by D. L. Bitzer, E. R. Lyman, and J. A. Easley, Jr. Oct. 1965 [29]p. incl. illus. diagrs. refs. (Rept. no. R-268) (AFOSR-65-2286) (Sponsored jointly by Advanced Research Projects Agency, and [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 623526 Unclassified

The use of a high-speed digital computer as a central control element provides great flexibility in an automatic teaching system. Using a computer-based system permits versatility in teaching logics since changing the type of teacher merely requires changing the computer program, not the hardware. In addition, having access to the decision-making capacity of a large computer located as one unit permits complicated decisions to be made for each student. Such capacity would be prohibitively expensive to provide by means of decision-making equipment located at each student station. The results of exploratory queuing studies show that the system could teach as many as a thousand students simultaneously without incurring a noticeable delay for any student's request. The educational results thus far have been extremely encouraging. However, reliable conclusions on educational achievement must await the results of more thorough experiments now in progress which include larger numbers of students learning under a variety of conditions. The adaptability and usability of the system for a variety of purposes in education and the behavioral and physical sciences have been clearly demonstrated. (Contractor's abstract)

THE PSEUDO-SHOCK: A NON-LINEAR PROBLEM OF TRANSLATIONAL RELAXATION, by B. L. Hicks. June 1965, 32p. incl. diagrs. tables, refs. (Rept. no. R-236) (AFOSR-65-2297) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 618328 Unclassified

The Boltzmann equation was solved by Nordsieck's Monte Carlo method for the case of translational relaxation of a gas of elastic spheres whose initial velocity distribution function is given. The Mach number describes the

relative separation of the 2 peaks of the bimodal distribution function and therefore controls the degree of initial departure from equilibrium. Calculations were made for M = 0.5, 1, 2, 4, and 6, which includes a range of initial conditions from very close to very far from thermal equilibrium. It was also shown that in a Krook model of our relaxation process, the ratio of the 2 collision numbers is somewhat smaller than 2 late in the relaxation and approaches 2 asymptotically.

ON THE GENERALITY OF SWITCHING NETWORKS WITH RESTRICTED NON-LINEARITY, by A. C. McKellar. July 1965, 13p. (Rept. no. R-258) (AFOSR-65-2298) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E); and National Science Foundation) AD 618331 Unclassified

The generality of special types of asynchronous realizations of sequential machines is considered and compared with the synchronous case. It is shown that linear asynchronous networks are essentially combinational. On the other hand, every sequential machine can be realized as a network whose output and feedback functions are linear in the feedback inputs. It is proven that more feedback loops are required to do this than are required by known synchronous realizations. A relationship is established between asynchronous networks which are quadratic in their feedback inputs and synchronous networks which are linear in their feedback inputs. (Contractor's abstract)

STOCHASTIC FLOW OF MESSAGES AND ITS EFFICIENT TRANSMISSION THROUGH COMMUNICATION NETS, by K. Onaga. Nov. 1965, 13p. (Rept. no. R-269) (AFOSR-65-2757) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)1383 and [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E))
AD 624255 Unclassified

Efficient transmission of stochastic flow of messages through store-and-forward type communication nets is discussed in this paper. In order to express quality or performance of flow ψ quantitatively, the penality index P (ψ) is defined as the sum of total time delay D (ψ), total transmission cost K (ψ), and total transmission redundancy R (ψ) with certain proportions of penalty. A necessary and sufficient condition of minimum penalty flow for the fixed flow value is obtained and is demonstrated by a simple example. (Contractor's abstract)

ELEMENTARY COMPLETE TREE TRANSFORMATION, by W. Mayeda. Dec. 1965, 19p. incl. diagrs. (Rept. no. R-272) (AFOSR-66-0496) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-931 and [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E))
AD 625201 Unclassified

It is known that a passive electrical network without mutual couplings can be analyzed by knowing all possible trees of a linear graph corresponding to the network. Since there exists a reasonably simple method of generating all possible trees of a linear graph without duplications, analysis of such a network by a computer becomes simple. When a pair of linear graphs is used, an active network can be analyzed by knowing all possible complete trees each of which is a tree of both linear graphs. At present there is no simple method of generating all possible complete trees without duplications. Hence, in order to obtain all possible complete trees by a computer, one of the best available methods at present is to generate all possible trees of each linear graph to obtain 2 collections of trees, then intersecting the 2 collections. It is not difficult to design an active network such that there are more than 1000 trees in each of a pair of linear graphs corresponding to the net, but there are less than 100 complete trees. Hence to obtain a simple method of generating all possible complete trees is undoubtedly important for anlaysis of active networks by a computer.

SET OF CUT SETS AND OPTIMUM FLOW, by W. Mayeda and M. E. Van Valkenburg. Nov. 1965, 14p. incl. diagrs. (Rept. no. R-270) (AFOSR-66-0498) (Sponsored jointly by Air Force Office of Scientific

Research under AF AFOSR-65-931, and [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 625200 Unclassified

An important unsolved problem in the theory of communication nets is the enumeration of the properties of a set of edge flows necesaary to give a required terminal flow from one vertex to another. For example, there is no simple method for obtaining a set of edge flows to give maximum terminal flow. The relationship of these flows and the conditions necessary to obtain maximum flow are important practical problems in systems in which edge flow is limited; in the telephone system for example. Clearly an improvement would result if it were possible to reduce some edge flows and still maintain the same terminal flow. The method presented stems from the work of Ford and Fulkerson which relates maximum terminal flow to the cut set separating the terminals. A new set of cut sets called a 'set of M-cut sets' is introduced from which it is possible to improve edge flows while maintaining maximum terminal flow.

REPLAB—A LESSON IN SCIENTIFIC INQUIRY USING THE PLATO SYSTEM, by D. L. Bitzer, E. R. Lyman, and J. R. Suchman. Dec. 1965 [34]p. incl. illus. diagr., tables, refs. (Rept. no. R-260) (AFOSR-66-0507) (Sponsored jointly by Advanced Research Projects Agency; and [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E)) AD 627076 Unclassified

One of the teaching techniques employed in the Illinois Studies in Inquiry Training project was a lesson, REPLAB, (Responsive Environment Programmed Laboratory), written for use with the PLATO computer-controlled teaching system. The lesson was designed to develop inquiry skills and to study inquiry styles of individual students. A film, showing an event involving a bimetallic strip was presented to the students by means of a computer-activated projector. The students answered questions about the event posed them via the PLATO 'electronic book.' Answers to some of the questions could be found by careful observation of the film, others by obtaining further information from results displayed on their 'electronic blackboards' by the computer in response to their inquiries in the PLATO experiment laboratory, property laboratory or condition laboratory. One set of questions in the question sequence tested the students' ability to go beyond the data they had obtained from the computer and formulate theories. The detailed record of the REPLAB student responses provided by the PLATO system gave data for a correlation of variables in the REPLAB lesson with those from pre-tests and post-tests given the students. HIGH RESOLUTION RADIO FREQUENCY MEASUREMENTS OF FARADAY ROTATION AND DIFFERENTIAL ABSORPTION WITH ROCKET PROBES, by H. Knoebel, D. Skaperdas and others. Dec. 1965 [131]p. incl. illus. diagrs. tables, refs. (Rept. no. R-273) (AFOSR-66-0508) (Sponsored jointly by [Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research] under DA 28-043-AMC-00073(E); and National Aeronautics and Space Administration) AD 627903 Unclassified

A highly essential system for lower ionosphere radio propagation measurements, using probe rockets, developed by the Coordinated Science Laboratory, is described in detail. Unique features include: (1) feedback around a closed loop consisting of the rocket and ground stations employed in a null-seeking technique, which increases absorption measurement accuracy and (2) artificial rotation of the ground gased antenna which extends the range over which Faraday rotation can be resolved from layer reflection phenomena. The rocket borne and ground station equipment has been shown to work reliably during a series of 14 rocket measurements made from both land-based facilities and the NASA seagoing mobile launch platform during the International Quiet Sun Years. Complete engineering information is given in the hope that other investigators may easily duplicate the measurements. Data processing techniques for smoothing and improving the accuracy as well as some typical data are described.

SENSITIVITY CONSIDERATIONS IN OPTIMAL SYSTEM DESIGN, by R. A. Rohrer and M. Sobral, Jr. [1965] [6]p. incl. diagrs. (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under DA 28-043-AMC-00073(E)) Unclassified

Published in IEEE Trans. Automatic Control, v. AC-10 43-48, Jan. 1965.

The sensitivity of a control system is usually taken to be the normalized variation of some desired characteristic with the variation of plant or controller parameters. Rather than the usual absolute sensitivity described above, a new definition of relative sensitivity is introduced for the optimal control problem, wherein the system performance is always compared with its optimum under the given circumstances. The implications of the relative sensitivity and its relevance to optimal system design are discussed in detail. Moreover, a theoretical approach to the problem of system optimization when plant parameters are subject to change or are incompletely specified is presented.

THE PARAMETER VARIATION PROBLEM IN STATE FEED-BACK CONTROL SYSTEMS, by W. R. Perkins and J. B. Cruz, Jr. Oct. 1963, 24p. incl. diagrs. (Rept. no. R-182) (AFOSR-5198) (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under DA 36-039-AMC-02208(E)) Unclassified

Presented at Joint Automatic Control Conf., Stanford, Calif., June 24-26, 1964.

Also published in Jour. Basic Eng., v. 87: 120-124, Mar. 1965.

The plant-parameter variation problem in multivariable linear systems described by state-vector equations is formulated using a new sensitivity measure. This formulation involves a direct comparison of open-loop and state-feedback performance in the presence of parameter variations and provides a bssis for guaranteeing the superiority of the feedback design. Results are obtained for both continuous and discrete multi-input, multi-output systems. Furthermore, it is shown for single-input, multi-output plants that a low-sensitivity design is also an optimal feedback-control design with respect to a quadratic performance index. This provides a new interpretation of a similar result previously obtained by Kalman. (Contractor's abstract)

DISTRIBUTED NETWORK SYNTHESIS FOR A CLASS OF INTEGRATED CIRCUITS, by R. A. Rohrer, J. A. Resh, and R. A. Hoyt. [1965] [13]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under DA 36-039-AMC-02208(E)) Unclassified

Published in IEEE Internat'l. Conv. Rec. Pt. 7: 100-112, 1965.

A general approach to the synthesis of series R-shunt C distributed networks is presented. The synthesis technique relies on the projection of port signal requirements onto the network interior in a manner compatible

with the physical constraintes imposed. The theoretical approach culminates with an iterative technique for going from signal processing requirements—in either the time or the frequency domain—directly to the element va' .es.

HIGH TEMPERATURE GAS KINETIC STUDY OF NITROUS OXIDE DECOMPOSITION PERFORMED WITH A SHOCK TUBE AND QUADRUPOLE MASS-FILTER, by D. Gutman. May 1965, 79p. incl. illus. diagrs. tables, refs. (Research rept. no. 2) (AFOSR-66-0952) (AF AFOSR-64-588) AD 634399 Unclassified

A quadrupole mass-filter was built and coupled to a shock tube in order to study high temperature gas kinetics. The chemical kinetics of the decomposition of nitrous oxide was studied with this apparatus in order to establish the mechanism of the reaction at temperatures above 1000°K. Several instrumentation problems unique to shock tube mass-spectrometry were solved. The most serious problem, that of a rapid-pumping ion source, was overcome by the design and construction of an unusually thin ion source. The thermal decomposition of nitrous oxide was studied by shock-heating a mixture of 4% N_2O in argon and monitoring the ion currents corresponding to all of the principal species involved in the reaction: N_2O, N_2, O_2, NO, and O. In each run with the shock tube, the mass-filter was tuned to follow the concentration of a single species. Because enough runs were made with all of the species, a run for each species at the same temperature was made for several temperatures.

INVESTIGATION OF WALL TURBULENCE USING A DIFFUSION-CONTROLLED ELECTRODE, by J. E. Mitchell and T. J. Hanratty. July 1965, 149p. incl illus. diagrs. tables, refs. (Rept. no. 1) (AFOSR-65-1199) (AF AFOSR-65-547) AD 619304 Unclassified

This study was performed to demonstrate that a diffusion-controlled electrode technique can be used to measure the average and fluctuating shear stresses at a pipe wall and to obtain a better understanding of the structure of turbulence near the wall. The technique was established after compensations for 2 effects, also common to the hot wire anemometer, were determined. The problem of non-uniform flow across the electrode was solved by determining experimentally a correction factor, whereas the problem of the time response of the electrode to fluctuations in the shear stress was handled by numerically solving the governing equations. The data for fully developed turbulence showed that the limiting velocity intensity at the wall was 0.32, based on the local average velocity, and that it was independent of Reynolds number. The circumferential scale was found to be very small near the wall but the longitudinal scale did not decrease from the values reported for the center of a pipe. Some velocity disturbances near the wall appeared to be as large as the local average velocity. A simplified model for a low frequency disturbance near the wall was investigated and found to be promising although several of the assumptions were not well substantiated.

WEAK TOPOLOGIES ON THE BOUNDED HOLOMORPHIC FUNCTIONS, by L. A. Rubel and A. L. Shields. [1965] [4]p. (AFOSR-65-1411) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-406] and National Science Foundation) AD 621258 Unclassified

Also published in Bull. Amer. Math. Soc., v. 71, 349-352, Mar. 1965.

G is a region in the complex plane such that there is a nonconstant bounded holomorphic function on G. The algebra of all such functions is denoted by $B_H(G)$. $H_\infty(G)$ denotes the Banach algebra that arises when $B_H(G)$ is endowed with the supremum norm, and β denotes the strict topology of all bounded analytic functions in G. In this note a number of intrinsic complex-variables methods are introduced and used in conjunction with the theory of topological linear spaces to investigate the structures of β and $B_H(G)$. The main new tool used is the balayage, or sweeping, of measures. Main results are presented, without proof.

IRRADIATION-INDUCED BROADENING OF THE F-ABSORPTION BAND IN KCl, by H. Mizuno and W. B. Fowler. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-65-2589) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-179 and AF AFOSR-65-803, and Atomic Energy Commission) AD 627747 Unclassified

Also published in Jour. Phys. Soc. (Japan), v 20: 1888-1894, Oct. 1965.

Earlier workers observed that in the initial stages of room temperature F-band irradiation of additively-colored, freshly-quenched alkali halide crystals a low energy broadening of the F band appeared. Here this broadening in KCl was measured and similar results for 2 very different sodium concentrations were obtained. This indicates that sodium FA centers are not responsible for the effect. The resonance broadening due to the dipolar interaction of 2 F centers was calculated. It was found that this mechanism could account for the observed phenomenon if most of the F centers were about 3 nearest neighbors apart, or if 5% of them were about 2 nearest neighbors apart. Published experimental

results indicate that in the early stages of irradiation few of the F centers are this close together, although a number as small as 5% is not necessarily ruled out. Other possible explanations of the experimental results are discussed. (Contractor's abstract)

BOUND STATES ON STACKING FAULTS (Abstract), by R. M. Thomson and Z. Usmani. [1965] [1]p. [AF AFOSR-62-179] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Nov. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 309, Mar. 24, 1965.

The electronic singularity at a stacking fault in a solid has a strong similarity to Shockley's theory of surface states. It is reasonable to suppose that, within the Wigner-Seitz cell surrounding an atom near a stacking fault, the local potential for the valence electrons is nearly unchanged by the presence of the stacking fault, since there is no long-range strain associated with the stacking fault, and the correct number of nearest neighbors is present. However, the long-range order has an abrupt singularity, and we suppose with Shockley that this can have an important effect on the criterion for the existence of bound states. We build the theory within the Slater-Koster framework, but in the Bloch representation, reducing the problem to the solution to a determinantal equation. The criteria for the presence of surface states are discussed on the basis of preliminary qualitative considerations and simplified models.

ELECTRIC-FIELD IONIZATION OF THE EXCITED F CENTER IN KCl, by G. Spinolo and W. B. Fowler. [1965] 25p. incl. diagrs. tables, refs. (AF AFOSR-62-179 and AF AFOSR-62-215) Unclassified

Based on Luty's original observation that excited F centers could be ionized by applied electric fields, Euwema and Smoluchowski calculated the probabilities for 2 effects, a low-temperature tunneling effect and a higher-temperature Schottky effect. This research extends the Euwema and Smoluchowski theory and reports on luminescence measurements of both effects for the KCl F center. The results are analyzed on the basis of the "large-orbit" picture of the relaxed excited state developed by Fowler. The Schottky data fit the theory very well, and yield an effective dielectric constant about equal to the static dielectric constant. The tunneling data are in qualitative agreement with the theory. OPTICAL PROPERTIES OF DEFORMED SEMICONDUCTORS (Abstract), by M. Meyer, T. Ninomiya, and M. H. Miles. [1965] [1]p. [AF AFOSR-62-179] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 344, Mar. 24, 1965.

Optical absorption of deformed germanium and silicon have been measured at room and liquid-nitrogen temperatures. Deformed crystals containing predominantly edge or screw dislocations exhibited an almost temperature-independent absorption tail extending from the intrinsic edge. The tail was independent of the Fermi level, varied as the inverse square of the wavelength, and its magnitude depended markedly upon the direction that the light was propagated relative to the slip plane. Surface-plating techniques were employed to minimize impurity contamination. Hall measurements down to liquid-nitrogen temperature demonstrated the reliability of these techniques. Forwardscattering of the transmitted radiation through silicon was observed, using an infrared-sensitive plate. Sufficient scattering was observed to account for the apparent optical absorption measurements and its anisotropy features. The scattered radiation of light incident normal to the surface and parallel to the slip planes showed narrow lobes extending in the direction of the normals to the slip plane. A tentative model of refraction due to a varying dielectric constant across the slip plane is used to interpret the results. This variation is supposed due to the strain fields surrounding the dislocation arrays in slip planes.

NUCLEAR MAGNETIC RESONANCE IN LIQUID COPPER AND ANTIMONY METALS, by R. L. Odle and C. P. Flynn. [1965] [2]p. incl. refs. (AFOSR-65-2594) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-633, and Atomic Energy Commission) AD 629868 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 1685-1686, Nov. 1965.

The Cu^{63} resonance in solid copper was observed to narrow in the neighborhood of 650°C. The line width was not limited by the excessive field inhomogeneity and was found to narrow to an eventual width of 0.3 ± 0.1G. The width to be anticipated if the low temperature result, $T_1T = 1.27$ sec°K may be extrapolated to 1350°K is 0.18G The value of 0.37G obtained from the Korringa relationship and the observed Knight shift is in somewhat better accord with experiment. The Knight shift of solid copper increased by 5 ± 1.5% on heating from room temperature to the melting point. The nuclear resonance of

Sb^{121} in liquid antimony was observed at T = 630°C. The line is a Lorentzian of width 2.6 ± 0.5 gauss and the Knight shift of 0.72% is close to the values 0.79% and 0.72% found in the neighboring liquid metals indium and tin. The measured line width is reasonably close to the value of 1.9G obtained from the Knight shift and the Korringa relation.

DIFFUSION OF VANADIUM^{48} AND IRON^{59} IN VANADIUM, by R. F. Peart. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-66-1535) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-633, and Atomic Energy Commission) AD 641780 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 1853-1861, Dec. 1965.

Measurements have been made of tracer diffusion coefficients of V^{48} and Fe^{59} in single crystals of vanadium over the temperature range 849-1830°C. The V^{48} results show temperature dependent diffusion characteristics that are represented by activation energies of 94 kcal/mol above 1356°C and 72 kcal/mol below this temperature, and those for Fe^{59} by an activation energy of 70 kcal/mol in the temperature range 840-1170°C. No single explanation of these results is offered but the low temperature data appear to be consistent with the operation of a vacancy mechanism of diffusion.

AN INTERNAL FRICTION STUDY OF VACANCIES IN A QUENCHED Au-Ni SOLID SOLUTION, by J. R. Cost. [1965] [5]p. incl. diagrs. refs. (AFOSR-66-1601) (AF AFOSR-64-633) AD 641786 Unclassified

Also published in Acta Metall., v. 13: 1263-1267, Dec. 1965.

Changes in the vacancy concentration in a quenched Au-30 at-% Ni alloy are followed using isothermal internal friction measurements of the Zener relaxation rate. Analysis of the vacancy annealing yields a value of approximately 21 kcal/mol for the energy for vacancy motion. From this energy of motion, typical rates of shifting of the Zener peak temperature are obtained. This peak shift is used to interpret a previously unexplained internal friction peak observed in this alloy. (Contractor's abstract)

ELECTRON CAPTURE BY α AND F CENTERS IN KBr, by R. S. Crandall. [1965] [5]p. incl. diagrs. refs. (AFOSR-65-2032) (AF 49(638)529) AD 627632 Unclassified

Also published in Phys. Rev., v. 138: A1242-A1246, May 17, 1965.

Photoconductivity measurements are made on KBr containing α, F, and F' centers to determine the electron-trapping probability (probability per unit time that one defect per cm^3 traps an electron) of this F center and α center or negative-ion vacancy. The electron-trapping probability of the α center increases from 3×10^{-7} cm^3/sec at 118°K to 6×10^{-4} cm^3/sec at 24°K. The electron-trapping probability of the F center increases from 3×10^{-7} cm^3/sec at 118°K to 4×10^{-6} cm^3/sec at 24°K. The initial capture of an electron by an α center results in the formation of an excited F center. The binding energy of this excited state is found to be 0.130 ev, corresponding to the first excited state of the F center. Electron capture of an F center is interpreted as occurring through the formation of an excited F' center. The binding energy of this state is found to be between 0.04 and 0.08 ev.

PHOTOCONDUCTIVITY OF KBr CONTAINING F CENTERS, by R. S. Crandall and M. Mikkor. [1965] [3]p. incl. diagrs. refs. (AFOSR-65-2157) [AF 49-(638)529] AD 629033 Unclassified

Also published in Phys. Rev., v. 138: A1247-A1249, May 17, 1965.

The quantum efficiency or number of conduction-band electrons produced per adsorbed photon in the region

of the L bands at 21 °K in KBr was found to be nearly unity. Photoconductivity measurements indicated that the L bands are due to electronic transitions to energy levels which are in the conduction band and that the K band is composed of two or more overlapping optical-absorption bands, of which the higher energy ones are due to electronic transitions to the conduction band. The temperature dependence of the L-band photoconductivity below 45 K can be explained by the temperature dependence of the mobility. (Contractor's abstract)

Illinois U. Dept. of Physics, Urbana.

L CENTERS IN POTASSIUM BROMIDE, by H. K. Rockstad. [1965] [6]p. incl. diagrs. table, refs. (AFOSR-65-2557) (AF 49(638)529) AD 627?9 Unclassified

Also published in Phys. Rev., v. 140: A311-A316, Oct. 4, 1965.

The absolute quantum efficiency for the destruction of L centers and the formation of anion vacancies in KBr at 76 K has been found to be 0.61 ± 0.07 when the U optical absorption band is bleached by 225-mμ radiation absorbed at the maximum of the U band. The quantum efficiency decreases significantly as the energy of the absorbed photons increases. It is suggested that the high-energy tail of the U band is due to a secondary band and that the quantum efficiency of this band is 61% of that of the primary U band. Previous results concerning the formation of isolated anion vacancies and interstitial hydride ions and interacting pairs of these entities are confirmed. However, the oscillator strengths of the perturbed α bands are found to be equal to that of the unperturbed α band. (Contractor's abstract)

THE MOSSBAUER EFFECT OF Fe^{57} ON THE SURFACE OF TUNGSTEN, by J. W. Burton. [1965] [85]p. incl. diagrs. tables, refs. (Technical note no. 2) (AF 49(638)1048) AD 609315 Unclassified

The Mössbauer effect of Fe^{57} on the surface of polycrystalline tungsten was measured over a temperature range of 80 - 500 °K, and at angles of 0° and 60° with respect to the normal. The Mössbauer spectra consist of 3 unresolved lines, the middle one agreeing with measured spectra of Fe^{57} in the bulk of tungsten, and the outer 2 being attributed to surface effects. The asymmetry of the surface spectra, the angular dependence of the shape, and the magnitude of the splitting of the 2 surface lines indicate an electric field gradient at the surface of 2.4×10^{16} V/cm^2 directed along the normal. An effective Debye temperature of 406 ± 12 °K is found for the bulk, from a study of the temperature dependence of the intensity of the Mössbauer absorption. The effective Debye temperature for the surface is 354 ± 30 °K along the normal, and 255 ± 30 °K parallel to the surface. The angular dependence of the total intensity of the 2 surface lines agrees with a simple theory for an atom bound above the top layer of the host lattice. The isomer shift with respect to iron at 300 °K is 0.51 ± .0002 cm/sec in the bulk, and .018 ± .002 cm/sec on the surface.

VARIATIONAL TREATMENT OF HIGH-FREQUENCY TRANSPORT PROBLEMS IN SOLIDS, by N. K. Hindley and F. Garcia-Moliner. [1965] [10]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-328, and Office of Naval Research) Unclassified

Published in Phys. Rev., v. 140: A343-A352, Oct. 4, 1965.

A variational method of solving the Boltzmann transport equation in a magnetic field is extended to high-frequency problems. The variational functional does not have an extremum at the solution, but a saddle point. It is shown that the approximations to the conductivity satisfy a sum rule which is also satisfied by the exact result, provided reasonable trial functions are used. Alternative variational principles have been formulated by several authors and some of these are discussed. The variational equations used in this paper can also be derived by Blount's method, and this casts more light on their nature. It is shown that when the current carriers are not degenerate and the band is parabolic, the use of Sonine polynomials in the carrier energy as trial functions has certain formal advantages, but that in actual calculations simple powers of the energy give the same results. The method is applied to a calculation of the frequency-dependent magnetoconductivity for mixed ionized-impurity and polar optical-phonon scattering, using parameters appropriate to n-InSb at 77 °K. The results are used to calculate the Faraday rotation and ellipticity as a function of magnetic field at a frequency of 35 Gc/sec. It is suggested that measurements of the Faraday ellipticity can give useful information about the scattering mechanisms in a material. (Contractor's abstract)

K BAND IN COLORED ALKALI HALIDE CRYSTALS, by D. Y. Smith and G. Spinolo. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-66-1307) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-599 and National Science Foundation) AD 641770 Unclassified

Also published in Phys. Rev., v. 140: A2121-A2128, Dec. 1965.

Recently the results of a number of experiments relating to the K band in colored alkali halides have been reported and several new speculations have been put forth concerning this absorption. A comparison of the known properties of the band with the predictions of various

theories leads to the conclusion that the available experimental evidence supports the original suggestion of Mott and Gurney that the K band is an absorption of the F center to a series of higher excited states. To provide a semiquantitative theoretical test of this explanation the Simpson model for the F center was investigated in detail. The model problem was solved for the most important higher bound states, and transition energies and oscillator strengths for transitions to these states were calculated. It was found that for reasonable choices of parameters the model predicts an optical absorption spectrum that is strikingly similar to the composite F- and K-band absorption. Several experimental tests of the Mott-Gurney model are suggested and the possibility of K-band-like absorptions associated with other centers is discussed. (Contractor's abstract)

OPTICAL ABSORPTION AND PHOTOCONDUCTIVITY IN THE K BAND OF SOME COLORED ALKALI HALIDES, by G. Spinolo and D. Y. Smith. [1965] [4]p. incl. diagrs. refs. (AFOSR-66-1308) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-599 and National Science Foundation) AD 641771 Unclassified

Also published in Phys. Rev., v. 140: A2117-A2120, Dec. 1965.

The optical absorption of various alkali halides colored by different methods was measured in the K-band region at liquid-nitrogen and liquid-helium temperatures. Particular attention was devoted to RbCl, in which the K band is well resolved at liquid-helium temperature. It was found that the K band in RbCl is neither symmetric nor Gaussian and that the band has a relatively long high-energy tail. Photoconductivity studies on RbCl demonstrated that there is appreciable photoconductivity only in this high-energy tail. It is concluded that these data support the Mott-Gurney model of the K band which attributes the main part of the K absorption to allowed transitions of the F center to a series of bound excited states beneath the conduction band. (Contractor's abstract)

EFFECTS OF TASK CHARACTERISTICS ON GROUP PROCESS, by C. G. Morris, II. July 1965 [133]p. incl. diagrs. tables, refs. (Technical rept. no. 2) (AFOSR-65-1519) (AF 49(638)1291) AD 624034 Unclassified

This study is a laboratory investigation of the effects on group interaction and leader behavior of 2 group task characteristics: task "type" (production, discussion, problem solving) and level of task difficulty (high, medium, low). Incidental evidence on the effects of the ordinal position of tasks is presented. Results show that task type significantly affects the distribution of more than 60% of the group or leader activity. Level of task difficulty does not greatly affect group or leader activity. Ordinal position significantly differentiates the first task from the other three. Methodological implications of the study are discussed.

ROLE ASSIGNMENT AND ATTITUDINAL COMMITMENT AS FACTORS IN NEGOTIATION, by N. J. Vidmar and J. E. McGrath. Aug. 1965, 78p. incl. diagrs. tables, refs. (Technical rept. no. 3) (AFOSR-65-1557) (AF 49(638)1291) AD 625387 Unclassified

This study investigated the effects of role assignment and attitudinal commitment on task performance and attitudes in negotiation groups. Negotiation groups were studied in a laboratory situation using subjects from real reference groups negotiating on a meaningful subject. The findings fall into 2 main categories: (1) negotiation groups composed of 2 members from one reference group, with one negotiator having a cross-role assignment, were able to set forth more impartial solutions than standard negotiation groups composed of members representing their own reference groups; and (2) within a standard negotiation group the less committed the negotiators were to their respective reference groups, the better the group performed.

SOCIAL MOTIVES AND DECISION-MAKING BEHAVIOR IN INTERPERSONAL SITUATIONS, by W. J. Higgs and J. E. McGrath. Sept. 1965, 145p. incl. diagrs. tables, refs. (Technical rept. no. 4) (AFOSR-65-1558) (AF 49(638)1291) AD 625487 Unclassified

An attempt was made to incorporate stable motivational states into the prediction of behavior in interpersonal

studies. From the literature on group processes 3 kinds of behavior were identified and tentative mappings into corresponding motives were made: (1) The first part investigated whether Ss would consistently describe their motives in terms of the 3 behavior areas. Items yielded 3 factors: affiliation, prominence, and achievement. (2) The second part constructed reliable scales for measuring these factors. (3) The third part was a partial investigation of the relevance of the scales to interpersonal behavior (specifically, a 2-person game situation).

FAST NEUTRON IRRADIATION-EFFECTS ON $GaAs_{1-x}P_xP$-N DIODE LASER THRESHOLD CURRENTS, by J. H. Doede, R. H. Vonderohe and others. [1965] [2]p. (AFOSR-65-1377) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)417 and Atomic Energy Commission) AD 640782; AD 621308 Unclassified

Presented at Internat'l. Symposium on Laser-Physics and Applications, Berne (Switzerland), Oct. 12-15, 1964.

Also published in Zeitschr. Angew. Math. and Phys., v. 16: 99-100, 1965.

Two of the major problems associated with the construction of laser diodes from ternary system material are the chemical purity and the inhomogeneous polycrystalline nature of the final product. Both effects increase the current density necessary for laser action. In this investigation, 4 $GaAs_{1-x}P_x$ diodes of various phosphorus substitution percentages were bombarded with fast neutrons in order to determine the dependence of threshold current densities on the total neutron flux. It appeared that surface damage effects of the laser cavity masked any information concerning the crystalline homogeneity effects on laser current thresholds. Present investigation is being made of irradiations of the initial crystal material and subsequent polishing into laser cavities to remove such surface effects.

MEMORY WITHOUT RECORD, by H. Von Foerster. [1965] [45]p. incl. diagrs. tables, refs. (AFOSR-67-0311) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-7 and National Institutes of Health) Unclassified

Also published in Learning, Remembering and Forgetting, Proc. of the First Conf., v. I. The Anatomy of a Memory, ed. by D. P. Kimble, Palo Alto, Science and Behavior Books, Inc., p 386-433, 1965

A mathematical description is given of possible modes by which memory is effected. The description is based on precise, quantitative definitions of the concept of uncertainty and the concept of order. The numerology of information theory is applied to some known features of the nervous system to derive an estimate of the amount of information necessary to specify a brain, based on a specification of the universe of brain in terms of a finite number of states and the probability of their occurrence. The number of states of the universe is estimated, i.e., the number of different networks that can be composed by directionally connecting n elements. The question as to what differentiates one network from another is approached from 2 different points: (a) purely structurally, where the operational modalities of the nodal elements are ignored, and (b) where the operational modalities of the nodal elements are considered in a structurally defined network. The description supports an hypothesis that the nervous system be viewed as if it were a computer whose internal orgamzation changes as a result of its interaction with an environment that possess some order. The changes occur in such a way that some constraints in the environment that are responsible for its orderliness are mapped into the computer's structure. This homomorphism "environment-system" reveals itself as "memory" and permits the system to function as an inductive inference computer.

COMPUTER DESIGN OF LINEAR FREQUENCY SELECTIVE NETWORKS, by D. A. Calahan. [1965] [6]p. incl. refs. (AFOSR-66-0388) (AF AFOSR-63-177) AD 641489 Unclassified

Also published in Proc. IEEE, v. 53: 1701-1706, Nov. 1965.

An efficient algorithm is proposed for the computer synthesis of linear networks of arbitrary configuration. Given a circuit approximately realizing a network function T(s), the element values are perturbed until T(s) is precisely realized. In the process, positive elements may be "grown" across nodes as required, or may be forced to desired values. Examples in the areas of passive and active filter design are given, and limitations of the procedure are discussed. Also, the method is shown to be related to the theory of equivalent networks. ON CLASSIFICATION AND SUPERPOSITION PRINCIPLES FOR NONLINEAR OPERATIONS, by A. Inselberg. May 1965, 73p. incl. refs. (Technical rept. no. 4) (AFOSR-65-1712) (AF AFOSR-64-7) AD 624268 Unclassified

Superpositions (ways of expressing a solution of an equation as a function of other solutions of the equation) for nonlinear operators are discussed. For operators having certain kinds of superpositions, a unique

representation involving their superposition and additively linear operators is given. Equivalence classes of operators are obtained, each class being composed of operators having a given superposition. Generalized translations of operators are defined in terms of the superpositions. The classification of operators is further extended, and a number of well-known nonlinear differential operators are shown to belong to certain of these extended classes.

A STUDY OF A FAMILY OF COMPLEX SYSTEMS, AN APPROACH TO THE INVESTIGATION OF ORGANISMS' BEHAVIOR, by C. C. Walker. June 1965, 250p. incl. diagrs. table, refs. (Technical rept. no. 5) (AFOSR-65-1713) (AF AFOSR-64-7) AD 624864
Unclassified

This paper examines a family of complex systems defined with reference only to theoretically basic characteristics of the systems' parts and their interrelationship. The systems considered are intricate structures built up of simple electrical devices, called elements, which interact with one another. Each element has 2 possible element-states, with its present state determined from states of other elements and from its previous state by a fixed transformation. Given a particular transformation, a system is constructed by taking 100 elements embodying that transformation and joining them at random. The system's behavior is studied by examining its cycles under operation. Then a different system is built using the same elements and the sampling of behavior repeated. Systems are compared, and it is found that for many transformations, details of structure are evidently unimportant in the occurrence of certain types of behavior.

AUTOMATIC ADJUSTMENT IN A CONTINUOUS ENVIRONMENT, by A. M. Andrew. Sept. 1965, 19p. incl. diagrs. table. (Technical rept. no. 8) (AFOSR-65-2283) (AF AFOSR-64-7) AD 624548
Unclassified

Control devices, biological or otherwise, which are able to adjust their own internal parameters are discussed. It is shown that under certain circumstances, the adjustment process must depend on experimental fluctuations superimposed on either the parameters or the control signals. A study is made of a post office problem (automatic determination of postage) to illustrate the way in which "effective fluctuations" attributed to the parameters can best be computered from fluctuations of the control signals. A mathematical comparison is made of 2 ways in which a self-improving controller may operate, i. e., with and without an explicit model of the environment. For a simple control task, the 2 are shown to be almost exactly equivalent. (Contractor's abstract)

A TECHNIQUE FOR THE ANALYSIS OF MUSICAL INSTRUMENT TONES, by M. D. Freedman. Oct. 1965, 137p. incl. diagrs. tables, refs. (Technical rept. no. 6) (AFOSR-65-2293) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-7 and National Insitutes of Health) AD 627181 Unclassified

A technique is described for analyzing the transient part of a musical tone. The analysis was made on the Illiac II computer, via analog-digital conversion. The analysis procedure consists of 4 steps: (1) determination of an adequate mathematical specification for an equation which represents the sound pressure wave, (2) determination of the constants in the equation for a given tone (inharmonic partials are detected and provided for in the specification function), (3) verification mathematically and by resynthesis of the tone using the Illiac II, and (4) iterating, if necessary, to improve the results. Examples of the analyses of the tones of 5 instruments are presented. Results provide a basis for the synthesis of tones and for the creation of new tones. By extension, the results are applicable to the analysis and synthesis of any signal possessing a certain degree of regularity. Use of the derived representation function to approximate unknown signals is illustrated. The method accounts for cascaded attacks, nonexponential attacks, attacks whose transient regions overlap, decays associated with inharmonic frequencies, and frequency changes.

TABLE OF THE STIRLING NUMBERS OF THE SECOND KIND S (N, K) FOR N, K UP TO 100 AND FOR VALUES OF S (N, K) EQUAL OR SMALLER THAN 10^{109}-1, by A. M. Andrew and H. Von Foerster. Dec. 1965, 182p. incl. diagrs. tables. (Technical rept. no. 6) (AFOSR-66-2373) (AF AFOSR-64-7) AD 641081 Unclassified

A printout is given for a program for computing Stirling numbers of the second kind that uses the recursive formula $S(n, k) = S(n-1, k-1) + k \cdot S(n-1, k)$ for $k > 2$, and $S(n, k) = 1$ for $k = 1$. Computed values are given for $S(n, k) < 10 (\exp 109)-1$, $1 \leq k < n \leq 100$. In an introduction, the use of Stirling numbers in various combinatorial problems is discussed, together with an explanation of the use of the table of computed values. Application of the table is described to obtain the following sums for multi-valued logical systems: (a) the number of functions represented by a particular morphogram, and (b) the number of morphograms that may be constructed that admit k different values in an m valued system; a "morphogram" is defined as a particular distribution of possible value occupancies $o_1, o_2, o_3 \ldots$

TUNNELING FROM METAL TO SEMICONDUCTORS, by P. V. Gray. [1965] [8]p. incl. illus. diagrs. refs. [AF AFOSR-64-7] Unclassified

Published in Phys. Rev., v. 140: A179-A186, Oct. 4, 1965.

Conductance and differential capacitance have been measured as a function of frequency and of bias on a number of silicon-silicon-dioxide-aluminum sandwiches. The results indicate that information about the density and energy of states near the silicon-silicon-dioxide interface may be deduced from these measurements. Conductance is due to electron tunneling transitions between the aluminum and silicon. Analysis of the tunnel current is given in terms of a single-particle WKB approximation. A simplified formula is derived to explain tunneling between the metal and the intrinsic semiconductor bands. A preliminary analysis of tunneling to impurity bands is discussed. Experimental data are shown which display details of impurity-band spreading near the valence-band edge of silicon samples containing 10^{18} and 10^{19} boron atoms/cm^3. Tunneling from silicon-silicon-dioxide interface states is analyzed by defining a tunneling lifetime and using this concept to explain the observed frequency dependence of the conductance and capacitance measurements. Quantitative experimental values are obtained giving the density of interface states vs energy. These results are in close agreement with those obtained by Statz et al, from inversion-layer conductance studies. (Contractor's abstract)

STIMULATED CATHODELUMINESCENCE-LASING ACTION IN n-TYPE GaAs AT 4.2°K AND 77°K BY FAST ELECTRON BOMBARDMENT, by P. D. Coleman and G. E. Bennett. [1965] [14]p. incl. illus. diagrs. (AFOSR-65-2056) (AF AFOSR-65-272) AD 627727 Unclassified

Also published in Proc. Seventeenth Nat'l. Aerospace Electron Conf., Dayton, Ohio, May 10-12, 1965, p. 316-331.

An experimental study in pumping bulk n-type GaAs was conducted by bombarding the material with a 15 to 50 kv pulsed electron beam. Hole-electron pairs were created which can recombine by a radiative process across the band gap of the semiconductor. This work demonstrates that bulk semiconductors can readily be pumped with electron beams in the 20 to 40 kv range. There is reason to believe that doped insulator laser materials could also be pumped by this method.

HARMONIC GENERATION IN HCN BY MULTIPLE QUANTUM CONVERSION, by D. P. Akitt and P. D. Coleman. [1965] [7]p. incl. diagrs. (AFOSR-65-2058) (AF AFOSR-65-272) AD 627724 Unclassified

Also published in Jour. Appl. Phys., v. 36: 2004-2010, June 1965.

A nonlinear, quantum-mechanics experiment in third-harmonic generation by a traveling wave, multiple photon interaction in HCN gas is presented. The J = 0, J = 1 rotational levels of HCN are used to multiply from 34.7 to 104 Gc/sec with a peak power output at 104 Gc/sec in excess of 1.5 W. The interaction takes place in a length of RG 96/U waveguide. Harmonic power output is plotted against fundamental power input for interaction lengths varying from 0.5 to 3.0 m in 0.5-m steps and gas pressures from 250 to 450 Torr. These data are compared with a theoretical analysis. (Contractor's abstract)

QUANTUM THEORY OF OPTICAL BEATING IN PHOTOCONDUCTORS, by C. M. Penchina. [1965] 7p. (AFOSR-65-1191) (AF AFOSR-65-714) AD 620638 Unclassified

Also published in Proc. Seventh Internat'l. Conf. on the Physics of Semiconductors, Paris (France) (July 19-24, 1964), Paris, Dunod, 1965, p. 965-971.

The quantum theory of optical beating in photoconductors is examined. A model is considered in which electrons initially in a nearly filled band are optically excited to the next higher empty band. It is assumed that the energy gap between these 2 bands is much greater than kT. For ohmic material with a steady bias voltage, the change in current is proportional to the number of electrons excited by the radiation. Thus, to determine the photosignal, the total number of electrons excited by the radiation is calculated as a function of time. Results demonstrate that the recombination lifetime τ limits the resolution with which a photoconductive detector can distinguish between 2 light beams.

LOCATION OF THE SOURCE OF RECOMBINATION RADIATION IN Ga($As_{1-x}P_x$) p-n JUNCTIONS BY ELECTRON BOMBARDMENT, by C. M. Wolfe, M. D. Sirkis and others. [1965] [1]p. incl. diagrs. (AFOSR-65-2073) (Sponsored jointly by Air Force Cambridge Research Labs.; and Air Force Office of Scientific Research under AF AFOSR-64-714) AD 627566 Unclassified

Also published in Jour. Appl. Phys., v. 36: 2087, June 1965.

The location of the source of recombination radiation is determined experimentally. Highly polished rectangular laser junctions were conductively mounted with the junction short-circuited on one side and with the opposite side exposed to free electron bombardment. Electron-hole pairs were injected uniformly at the junctions and on either side into n-type and p-type material. From observations of the sample at various beam current strengths, it was concluded that recombination radiation proceeds more efficiently and with shorter lifetime in material processing acceptor states; that is, in the junction region and slightly into the p-type side. Efficient recombination does not extend from concentration increases sharply. Efficient recombination radiation does not extend at all from the junction into the n-type side.

GROWTH AND DISLOCATION STRUCTURE OF SINGLE-CRYSTAL Ga($As_{1-x}P_x$), by C. M. Wolfe, C. J. Nuese, and N. Holonyak, Jr. [1965] 12p. incl. illus. diagrs. table, refs. (AFOSR-66-1636) (Sponsored jointly by Air Force Cambridge Research Labs.; and Air Force Office of Scientific Research under AF AFOSR-65-714) AD 641185 Unclassified

Also published in Jour. Appl. Phys., v. 36: 3790-3801, Dec. 1965.

The preparation of single-crystal GaAsP by halide vapor transport is described. That dislocation free GaAsP can be achieved was verified experimentally for whiskers grown by the vapor-liquid-solid method. In the growth of monocrystalline ingots for device purposes, growth mechanics and the resulting crystal habit are strongly influenced by degenerate Zn, Te, and Se doping. Since n-type crystals require higher supersaturations, single-crystal growth is easier to obtain with Zn doping. The as-grown dislocation structure of ingots with low-index natural facets is examined by decoration and etching. Typical densities are 5×10^3 $10^6/cm^2$. From their simple crystallographic orientations different dislocations are identified. <211>, <111> and <100>, <110>, edge dislocations are observed in <110> polygonization walls. Values of mobility and carrier density are evaluated from a device point of view. Laser diodes with threshold currents as low as 3000 A cm^2 at 33.3% GaP have been obtained from this material

A DISTORTION ANALYSIS OF THE MOS TRANSISTOR, by R. F. Pfeifer and C. T. Sah. June 1965, 26p. incl diagrs. (AFOSR-66-1340) (AF AFOSR-65-714) AD 641306 Unclassified

The experimental results verify the theoretical expressions considerably well when the equations are evaluated within their respective regions of validity. The deviation from the V_G dependence I_{dl} which is seen to extend into the saturation region by an amount greater than the modulation width of the input signal is assumed to be due to the approximation of zero drain conductance at the edge of the saturation region. The practical results of this experiment indicate that the MOS transistor can perform satisfactorily as a low distortion amplifier when operated in the saturation mode provided that the input signal is maintained at a sufficiently low level.

EVOLUTIONARY PATTERN RECOGNITION SYSTEMS, by A. H. Klopf. Nov. 1965 [70]p. incl. diagrs. tables, refs. (AFOSR-66-1342) (AF AFOSR-65-978) AD AD 637492 Unclassified

An adaptive network is proposed which is capable of self-organization on 2 levels, a fundamental level involving the structure of the system and a secondary level involving a set of variable weights within the structure.

The system was simulated on a digital computer and its behavior investigated for the purpose of developing evolutionary processes by which systems could adapt structurally to their environment. The system was studied, first, as a non-evolutionary network; adaptation could occur only through variation of the weights. An empirical equation was established relating the structural parameters of this system to its capabilities. The evolutionary system, possessing the capability of structure modification, was then investigated. Several heuristics were developed which allowed the system to significantly improve its performance in a pattern recognition task through structure modification. (Contractor's abstract)

ELECTRONIC COMMUTATOR DETERMINATION OF E° OF FORMATION AND RELATED THERMODYNAMIC QUANTITIES FOR MOLTEN LEAD CHLORIDE, by T. B. Warner and R. L. Seifert. [1965] [6]p. incl. illus. diagrs. refs. (AFOSR-65-2099) (Sponsored jointly by Air Force Office of Scientific Research under AF 49-(638)313 and Atomic Energy Commission) AD 628269 Unclassified

Also published in Jour. Phys. Chem., v. 69: 1034-1039, Mar. 1965.

The electronic commutator method for determinging E° of formation of molten halides has been improved and applied to obtain the following equations for E°, $\Delta G°$, $\Delta H°$, $\Delta S°$, and $\Delta C_p°$ of formation of liquid lead chloride in the temperature range 493-866°. The equation for E° reproduces the data within the experimental precision of 0.2 mv. The larger error limits in brackets are based on consideration of maximum probable temperature inhomogeneity in the melt and other possible systematic errors. The figures in brackets are average standard errors calculated for t = 493-750 and 750-866°, respectively; X = (t - 700)/100. E° (mv) = $1158.90 - 54.11X + 0.833X^2 + 0.062X^3 + 0.116X^4$ [± 0.8 mv, ± 1.2 mv]; $\Delta G°$ (kca /mol) = $53.451 + 2.496X - 0.038X^2 - 0.0029X^3 - 0.0054X^4$ [± 0.035 kcal, ±0.053 kcal]; $\Delta H°$ (kcal/mol) = $77.737 + 0.748X + 0.122X^2 + 0.2140X^3 + 0.0160X^4$ [± 0.12 kcal, ± 0.24 kcal]; $\Delta S°$ (e.u.) = $-24.957 + 0.768X + 0.086X^2 - 0.2140X^3$ [± 0.14 e.u., ± 0.19 e.u.]; and $\Delta C_p°$ (cal/mol deg.) = $10.41 - 0.34X - 0.075X^2$ [± 0.47 cal, ± 0.76 cal].

CONTACT POTENTIAL DIFFERENCE BETWEEN SILVER NITRATE AND SILVER, by J. L. Copeland and R. L. Seifert. [1965] [6]p. incl. diagrs. refs. (AFOSR-65-2110) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)313] and Atomic Energy Commission) AD 629075 Unclassified

Also published in Jour. Electrochem. Soc., v. 112: 831-836, Aug. 1965.

The silver nitrate-silver contact potential was determined from 190° to 280°C by the Zisman dynamic condenser method. At the melting point of the salt the contact potential of liquid silver nitrate relative to silver is -530 mv, with a temperature coefficient of 0.14 mv/deg, and that of the solid salt is -608 mv. The discontinuity of 78 mv at the melting point is attributed primarily to a greater excess surface concentration of silver ions in the liquid than in the solid salt. (Contractor's abstract)

APPROXIMATE NATURAL ORBITALS FOR FOUR-ELECTRON SYSTEMS, by G. P. Barnett, J. Linderberg, and H. Shull. [1965] [9]p. incl. tables, refs. (In cooperation with Uppsala U., Sweden) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-362] and National Science Foundation) Unclassified

Presented at Internat'l. Symposium on Atomic and Molecular Quantum Theory, Sanibel Island, Florida, Jan. 18-23, 1965.

Published in Jour. Chem. Phys., v. 43: S80-S88, Nov. 15, 1965.

Approximate natural orbitals for 4 electron wavefunctions for Be as calculated by Boys, Matsen, Watson, and Weiss, and LiH as calculated by Ebbing are obtained by diagonalization of the appropriate first-order reduced density matrices. The formalism for carrying out the process is extended to the case of a nonorthogonal basis. Occupation numbers are presented and compared for the functions reported. In addition, truncated natural expansions reproducing the original functions are tabulated. Natural-orbital occupation numbers, the orbitals

themselves, and the natural expansions are shown to have considerable value in comparing these functions. The nature of the approximations used in the individual functions is clarified by the analysis, and considerable insight is afforded to the nature of the physical system.

AUTO- AND CROSS-CORRELATION FUNCTIONS USED AS TOOLS FOR INFORMATION RETRIEVAL IN ELECTRON DIFFRACTION STRUCTURE STUDIES, by M. Traetteberg and R. A. Bonham. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-65-0682) (AF AFOSR-64-602) AD 614534 Unclassified

Also published in Jour. Chem. Phy v. 42: 587-596, Jan. 15, 1965.

Three radial distribution functions [f(r)], the power spectrum, the diagonal power spectrum, and the sharpened radial distribution function have been introduced, and it is shown that these functions might be useful tools in extracting molecular information from a gas electron diffraction experiment. The two kinds of power spectra are based on short-interval auto- and cross-correlation functions of the molecular intensity function, while the sharpened radial distribution function is defined as the Fourier sine transform of the product of the molecular intensity function and the antidamping function $\exp[-\alpha(s_{max}-s)]$. The similarity between the power spectrum and the sharpened radial distribution function has been pointed out. By examples based on experimental data and numerical calculations based on theoretical data it is shown that the modified f(r) functions introduced here give better resolution between neighboring peaks than the radial distribution function that is normally applied in electron diffraction structure studies. The errors introduced in r_{ij} values determined from the various f(r) functions, due to additive random errors in the molecular intensity function, have been studied by numerical analysis, and it has been shown that accurate structural parameters can be extracted from sharpened f(r) functions. PRELIMINARY ELECTRON-DIFFRACTION STUDY OF H_2 AT SMALL SCATTERING ANGLES, by R. A. Bonham and T. Iijima. [1965] [2]p. incl. diagr. (Contribution no. 1246) (AFOSR-65-1673) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-602], Atomic Energy Commission, and U.S. Educational Commission in Japan) AD 624184 Unclassified

Also published in Jour. Chem. Phys., v. 42: 2612-2614, Apr. 1, 1965.

Sector electron-diffraction patterns of H_2 and He were obtained over the range $1 < s < 8$. The chamber pressure was maintained at 2×10^{-4} mm Hg. Comparison of experimental intensity curves with theoretical curves indicated that the intensity curve for H_2 was in much better agreement with the curve calculated by using the Weinbaum wave function than with the curve deduced from the independent atom model. This result implies that the scattering experiment is sensitive mainly to the contraction of volume occupied by a fixed percent of the electrons in the molecule when a chemical bond is formed.

ON A POSSIBLE METHOD FOR CORRECTING ATOMIC WAVEFUNCTIONS FOR RELATIVISTIC EFFECTS, by R. A. Bonham. [1965] [2]p. (Contribution no. 1282) (AFOSR-65-2148) (AF AFOSR-64-602) AD 629022 Unclassified

Also published in Jour. Chem. Phys., v. 43: 1434-1435, Aug. 1965.

The primary effect of relativity in nonrelativistic atomic structure calculations is to increase the effective mass of the atomic electrons. The effect will be largest for the innermost electrons, but the electron exchange interaction will tend to spread the mass changes around among the other electrons in the system. This suggests that a possible way to include relativistic corrections in nonrelativistic calculations is to employ a different effective mass for each electron based on the Hartree one-electron energy ϵ_1 for that electron as a first approximation. The use of this technique is investigated for the case of K-shell electrons in He-like atoms.

CORRECTIONS TO THE INCOHERENT SCATTERING FACTORS FOR ELECTRONS AND X-RAYS, by R. A. Bonham. [1965] [5]p. incl. table, refs. (Contribution no. 1269) (AFOSR-65-2395) [AF AFOSR-64-602] AD 625931 Unclassified

Also published in Jour. Chem. Phys , v. 43. 1460-1464, Sept. 1965.

The usual use of the closure relation in the derivation of the incoherent scattering factor for electrons and x-rays involves approximations and introduces errors in the final result. Corrections through third order for these errors are given. The correction terms are found to be of a simple form and can be quite important not only in the limit of low energy for the incident electron or x-ray beam but also for atoms of large atomic number. The magnitudes of the corrections for Ne and Ge are given for 40-kv electrons. In the x-ray case corrections are given for Ge for Cu K-α x radiation. (Contractor's abstract)

SMALL-ANGLE SCATTERING FROM METHANE, AMMONIA AND WATER BY FAST ELECTRONS, by T. Lijima, R. A. Bonham and others. [1965] [4]p. incl. diagrs. refs. (Contribution no. 1295) (AFOSR-66-0311) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-602 and Atomic Energy Commission) AD 629849 Unclassified

Also published in Bull. Chem. Soc. Japan, v. 38: 1757-1760, Oct. 1965.

The total differential scattering cross sections for the 40 kv electron from the methane, ammonia and water molecules obtained experimentally over the $1 < s < 8$ s range have been compared with the theoretical results. Good agreement with the theoretical results have been obtained in the case of methane. In the cases of ammonia and water the results are in qualitative agreement with the theoretical predictions, but uncertainities in both the theory and experiment prevent a detailed comparison from being made in these cases.

INTERATOMIC AND INTERMOLECULAR SCATTERING IN GAS ELECTRON DIFFRACTION, by Y. Morino, K. Kuchitsu, and R. A. Bonham. [1965] [2]p. incl. diagr. (Contribution no. 1286) (AFOSR-66-0586) (AF AFOSR-64-602) AD 632733 Unclassified

Also published in Bull. Chem. Soc. Japan, v. 38 1796-1797, Oct. 1965

The effect of interatomic and intermolecular scattering on the total intensity of electrons scattered from a narrow beam of atoms or molecules is considered. Interatomic or intermolecular effects at sample pressures of the order of 10 mm Hg will usually not create any difficulty in the analysis of electron diffraction data. The potential function V(r) may be obtained experimentally by carrying out electron diffraction experiments with high beam pressures. This appears to be a feasible experiment provided gas pressures greater that 1 atm can be obtained while conditions for an optimum diffraction experiment are maintained.

INELASTIC ELECTRON SCATTERING FROM ATOMS AND MOLECULES AT MEDIUM ENERGIES, by R. A. Bonham. Final rept. 1962-1965, 8p. incl. illus refs. (AFOSR-66-0605) (AF AFOSR-64-602) AD 630393 Unclassified

Achievements include the calculation of the effect of chemical binding on gas electron diffraction patterns and the experimental observation of this effect in the molecules H_2, NH_3, CH_4 and H_2O. Recent theoretical studies carried out in this and other laboratories indicate that these experimental measurements may yield estimates of total chemical binding energies and possibly some detailed information about electron charge distribution in simple molecules. New techniques were developed for the solution of the molecular and atomic integrals needed in the calculation of theoretical electron diffraction intensity curves for comparison with experiment. Partial wave elastic scattering factor calculations were carried out for a number of atoms and new least squares and auto correlation techniques were devised for the refined analysis of electron diffraction data in order to obtain precise molecular parameters. In addition the molecular structures of the compounds $C_6Cl_4H_2$, C_6Br_6, cycloheptatriene and perylene were carried out to test these newly developed techniques.

MASKING-LEVEL DIFFERENCES AS A FUNCTION OF INTERAURAL DISPARITIES IN INTENSITY OF SIGNAL AND OF NOISE, by J. P. Egan. Dec 1965 [7]p incl. diagrs. tables, refs (AFOSR-66-1341) (AF AFOSR-66-448) AD 640850 Unclassified

Presented at Sixty-eighth meeting of the Acoust Soc of Amer., Austin, Tex., Oct. 21-24, 1965

Also published in Jour. Acoust. Soc. Amer., v 38, 1043-1049, Dec. 1965.

A marked release from masking, or masking-level difference (MLD), results when a monaural signal is presented with perfectly correlated (in-phase) binaural noise, NO—Sm, rather than with monaural noise, Nm—Sm. Furthermore, with NO—SO, when the sinusoid in one ear is reduced in intensity, rather than being removed entirely, a smaller MLD than for NO—Sm should result. Two experiments were conducted In the first, MLD's were determined as a function of the intensity of the noise in the nonsignal ear with the interaural conditions of NO, N_π, and NU as parameters. For NO, there is some release from masking even when the noise in the nonsignal ear is as much as 40 dB down from that in the signal ear. In the second experiment, MLD's were determined as a function of the ratio of the energies of the left- and right-ear sinusoids with correlated noise, NO. With SO, MLD's increase as the interaural disparity in intensity of the signal increases The large MLD obtained with S_π decreases with increasing interaural disparity in intensity of the signal. In both experiments, the signal (500 cps, 0.25 sec) was presented to the listener in one or the other of two temporal intervals, against a background of white noise. (Contractor's abstract)

MASKING-LEVEL DIFFERENCES AND THE FORM OF THE PSYCHOMETRIC FUNCTION (Abstract), by J. P. Egan, W. A. Lindner, and D. McFadden. [1965] [1]p. [AF AFOSR-66-548] Unclassified

Presented at Sixty-eighth meeting of the Acoust. Soc. of Amer., Washington, D. C., June 2-5, 1965.

Published in Jour. Acoust. Soc. Amer., v. 37: 1181, June 1965.

Psychometric functions were determined for various interaural conditions; these functions show the relation between the detectability and the energy of the signal. The signal was presented in one of two temporal intervals against a continuous noise. The relation between d' and signal energy E is approximately $d' = m (E/N_0)^k$, where m and k are constants for a particular function; $0 < d' < 4$. The data indicate that k is constant for a particular observer and that m depends upon interaural conditions. Therefore, $MLD = (10/k)\log(m_i/m_0)$, where m_i is the constant for condition i, and m_0 corresponds to a reference condition. Consequently, an MLD is independent of the d' chosen for determination of that MLD. Also, the form of the psychometric function is independent of the interaural condition. This result indicates that "release from masking" may be considered equivalent to a decrease in the noise at the input, rather than reduction in the amount of uncertainty for the observer concerning the parameters of the input.

LEGRENDRE TRANSFORMATION AND CHARACTERISTICS OF THE MAGNETOGASDYNAMIC POTENTIAL EQUATION, by F. Cap. [1965] [9]p. incl. diagrs. tables. (AFOSR-65-1431) (AF 61(052)675) AD 622652 Unclassified

Also published in Plasma Phys., Accelerators, Thermonuclear Research, v. 7: 69-77, Jan.-Feb. 1965.

For the potential equation of the 2-dimensional stationary potential flow of a plasma of infinite conductivity, a method of characteristics is derived which is set up in analogy to the Prandtl-Busemann method of gas dynamics. The differential form of the potential equation is subjected to a Legendre transformation in order to obtain a linear differential equation whose characteristics are determined once for all. Polar co-ordinates are introduced and solutions are obtained graphically which are in good agreement with the numerical curves. A graphical method for the solution of magnetogasdynamic 2-dimensional stationary flow problems can thus be based on the characteristic curves and the velocity curve.

ON THE RELATION BETWEEN LOUGHHEAD'S PAPER ON ONE DIMENSIONAL STEADY MHD-FLOW AND THE CAP THEORY, by G. Kerer. [1965] 7p. (Technical note no. 5) (AFOSR-65-1799) (AF 61(052)-675) Unclassified

Loughhead treated the set of 4 magnetogasdynamical equations (induction equation, equation of motion, continuity equation, and Poisson equation) under the assumption of infinite electrical conductivity and adiabatic behavior, and obtained 4 families of characteristics for the basic equations. Use of the 1-dimensional unsteady potential equation, yields only two. In this note it is shown that Loughhead's characteristics can be reduced to those of 1-dimensional unsteady flow. Two of Loughhead's 4 equations result in the relationship, H = const ρ and thus only 3 are essential. Two of these equations are shown to be identical if Poisson's equation is substituted into them.

MGD FLOWS OF FINITE ELECTRICAL CONDUCTIVITY (Abstract), by F. Cap, H. Friedel and others. [1965] [1]p. (Bound with its AFOSR-65-1266; AD 622527) (AF 61(052)675) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

A general method for the numerical treatment of the MGD fundamental equations for arbitrary values of the magnetic Reynolds number is discussed. This method, which can be used for both pure initial value and for mixed initial and boundary value problems, allows for a stepwise independent solution of the flow equations and of the induction equation. The first form is a totally hyperbolic system which can be treated by the method of characteristics. The induction equation, which is parabolic under the pertinent conditions, is solved by a net method using the same lattice as for the flow equations. It is intended to use this method for studying shock interaction with a magnetic field. Under the condition $R_M << 1$, the equations governing the flow of a conduction gas are basically the same as for ordinary non-isentropic gasdynamic flows, with the exception of an additional force term (the Lorentz force) and an intrinsic entropy source (due to ohmic heating of the gas). For the supersonic case, there exist 4 real characteristic directions for constructing a numerical integration method based on a lattice with constant mesh size. The use of this method is illustrated by application to the flow of a conducting gas through a divergent nozzle under the accelerating action of crossed electric and magnetic fields.

ON THE THEORETICAL BASIS OF INFORMATION RETRIEVAL SYSTEMS, by E. de Grolier. Final rept. Sept. 1965, 211p. incl. table, refs. (AFOSR-65-2720) (AF 61(052)505) AD 628183 Unclassified

This report is an extensive survey of and commentary on research and developments in the fields of information retrieval and linguistics and the applicability of results to the formulation of information retrieval languages and machine translation. Commentary is weighted toward imparting an awareness of many of the special requirements of a reasonably efficient IR language, the complexities involved in translating from one language to another (be it natural language, IR language, or other synthetic languages), and the difficulties inherent in describing concepts and representing meanings. Real and putative relations which have been made between logic, linguistics, and information retrieval are explored in some detail. An extensive discussion is included of classification from a theoretical point of view, under topic headings: classifications of language, traditional bibliographic classifications; the British classification research group; Ejnar Wahlin's system, Gardin's Syntol; the problem of categories in classifications; the "integrative levels" approach; and the problem of "relations." Activities in the United States, Europe, and the Soviet Union are considered.

CHARACTERIZATIONS OF TAME SURFACES IN E^3, by C. E. Burgess. [1965] [18]p. incl. refs. (AFOSR-65-1396) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)253] and National Science Foundation) AD 622750 Unclassified

Also published in Trans. Amer. Math. Soc., v. 114, 80-97, Jan 1965.

Some conditions under which a surface is tame in E^3 are considered. Using Bing's theorem that a surface is tame if its complement is 1-ULC, it is shown that a connected 2-manifold K is tame in E^3 if it can be locally spanned, with a disk, at each point from each side of K. This result is then generalized to a 2-manifold in a 3-manifold. The characterization of tame surfaces includes Harrold's theorem that a surface is tame in E^3 if it is locally peripherally unknotted, but it is not required that the boundary of a spanning disk should be tame or that at each point of K there should be 2 spanning disks that have the same boundary and are on opposite sides of K. This makes it possible to give conditions under which a surface is tame from one side.

QUANTUM HARD-SPHERE GAS, I, by M. Luban. [1965] [5]p. incl. refs. (In cooperation with Pennsylvania U., Philadelphia) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-42 and Atomic Energy Commission) Unclassified

Published in Phys. Rev., v. 138: A1028-A1032, May 17, 1965.

The problem is posed of finding an operator, defined for all relative distances of 2 particles, which plays the role of a Hamiltonian such that the subsequent eigenvalue problem has as its only solutions precisely the eigenfunctions for 2 hard spheres, each of core diameter a. This operator is explicitly constructed. Its crucial aspect is that, despite its being defined for all relative distances r_{12}, its eigenfunctions serve as a complete set for expressing a 2-particle wave function only in the restricted interval $r_{12} > a$. Subsequent papers of this series will be devoted to the application of these results to the problem of quantum hard-sphere gases.

THE REDUCTION OF A FUNCTION NEAR A NON-DEGENERATE CRITICAL POINT, by M. Morse. [1965] [5]p. (AFOSR-66-0670) (AF AFOSR-63-357) AD 641510 Unclassified

Also published in Proc. Nat'l. Acad. Sci., v. 54. 1759-1763, Dec. 1965.

In a classical paper (Trans. Amer. Math. Soc., v. 27: 345-396, 1925), the author proved the following theorem. Let $x \to f(x)$: $x \to R$ ($f(0) = 0$) be a real-valued function of class C'' in an open neighborhood x of the origin in E_n. If the origin is a non-degenerate critical point of f of index k, there exists a C'-diffeomorphism ω: $U \to X$ of an open neighborhood U of the origin such that $\omega(0) = 0$ and

$$f(\omega(x)) = -x_1^2 - \cdots - x_k^2 + x_{k+1}^2 + \cdots + x_n^2, \quad x \in V.$$

A pseudo-quadratic form is a real-valued function on an open neighborhood V of the origin of E_n of the form $\Gamma(x) = a_{ij}(x)x_ix_j$, $a_{ij}(x) = a_{ji}(x)$, a_{ij} of class C^∞. A pseudo-linear form is an E_n-valued function ω on an open neighborhood of the origin in E_n of the form $\omega_i(x) = c_{ij}(x)x_j$, c_{ij} of class C^∞. In this paper the author analyzes this proof in terms of the pseudo-group of pseudo-linear diffeomorphisms and equivalence classes of pseudo-quadratic forms. (Math. Rev. abstract)

POLES IN THE VERTEX FUNCTION, ZEROS OF THE PROPAGATOR, AND BOUNDS OF COUPLING CONSTANTS, by Y. S. Jin and S. W. MacDowell. [1965] [8]p. (AFOSR-66-0450) (AF AFOSR-64-42) AD 630361 Unclassified

Also published in Phys. Rev., v. 137: B688-B695, Feb. 1965.

Extending the arguments by Goebel and Sakita, it is shown in a general framework that a pole of the proper vertex function does not lead to a pole in the scattering amplitude. Connections between zeros of the propagator, poles of the proper vertex function, and upper bounds on the coupling constant are discussed in rather general terms as well as in terms of the Zachariasen model. By making use of the analytic continuation of the partial-wave scattering amplitude into the complex angular-momentum plane, a possible physical interpretation of the vertex function is given. MESON COUPLING IN THE INTRINSICALLY BROKEN

U(6) SYMMETRY SCHEME, by K. Bardakci, J. M. Cornwall and others. Feb. 1965 [4]p. incl. refs. (AFOSR-66-0461) (AF AFOSR-64-42) AD 630511 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 264-267, Feb. 1965.

The implications of the groups U(6) and W6 for trilinear meson interactions are discussed. It is shown that good values for parameters like the $\omega\sigma\pi$, $\omega\sigma\pi$, $K^*K\pi$, and $K^*\sigma K$ coupling constants are obtained from U(6) symmetry. Based on the U(6) values of these parameters, it is possible to calculate the decay rates for $\omega \to \pi^+ + \pi^- + \pi^0$ and $K^* \to K^* + \pi + \pi$ reactions and obtain results in agreement with experiment. The selection rule $\varphi \not\to \rho + \pi$ is also obtained. A systematic method is given for the construction of interactions that are both U(6) and Lorentz invariant. A method for handling the intrinsic symmetry breaking due to kinetic enery is also given.

Institute for Advanced Study. [Dept. of Mathematics] Princeton, N. J.

SOME SIMPLE CONSEQUENCES OF SU(4) SYMMETRY, by C.-H. Woo and A. J. Dragt. [1965] 2p. incl. refs. (AFOSR-66-0462) (AF AFOSR-64-42) AD 630362 Unclassified

Also published in Phys. Rev., v. 138: B945-B946, Aug. 1965.

The electromagnetic properties of the nucleons and N^*, as well as the meson-baryon coupling constants, are examined within the framework of an SU(4) symmetry combining spin and isospin. The motivation is to examine the consequences of such a symmetry at low energies without having to worry about the large mass differences within the SU(3) multiplets in the corresponding SU(6) theory. The coupling-constant ratios are in qualitative agreement with the experimental values The arbitrariness in the proton-neutron magnetic-moment ratio is discussed. In the model where the electromagnetic interaction of the baryons is mediated by the vector mesons in the adjoint representation of SU(4), the magnetic-moment ratios agree with the SU(6) results. QUANTUM EFFECTS ON THE ACCURACY OF MOMENTUM MEASUREMENTS, by C.-H. Woo. [1965] [4]p. incl. diagrs. (AFOSR-66-0464) (AF AFOSR-64-42) AD 630369 Unclassified

Also published in Phys. Rev., v. 139 B1103-B1106, Aug. 1965

It is shown in 2 examples that to measure the momentum of a particle with great accuracy, allowing for large uncertainties in the position, it is still necessary to consider additional quantum effects. For the case of measurements by electromagnetic means, the uncertainties in the measurability of field strengths and of charge-current densities should be considered. Within the framework of the Bohr-Rosenfeld analysis, uncertainties in the field measurements do not limit the accuracy of momentum measurements. What happens when the Bohr-Rosenfeld approximations are not made is an open question. (Contractor's abstract)

PHASE REPRESENTATION AND HIGH-ENERGY BEHAVIOR OF THE FORWARD SCATTERING AMPLITUDE, by Y. S. Jin and S. W. MacDowell. [1965] [7]p. incl. refs. (AFOSR-66-0466) (AF AFOSR-64-42) AD 630365 Unclassified

Also published in Phys. Rev., v. 138: B1279-B1285, June 7, 1965.

By making use of the phase representation, the relation between the high-energy behavior of the symmetric forward scattering amplitude F(x) and the asymptotic properties of the ratio $\cot\delta = \mathrm{Re}F/\mathrm{Im}\,F$ is discussed. Starting assumptions are dispersion relations and the Greenberg-Low bound. Lower bounds as well as upper bounds are derived. Under the assumption of the Froissart bound, it is shown that $\cot\delta$ cannot stay indefinitely greater than an arbitrarily small positive number. Also if the total cross section decreases steadily to a finite limit, but slower than const/E, the real part must tend to $-\infty$. The results are discussed in connection with those of Khuri and Kinoshita. The unsymmetric case is also treated by the same methods.

AUTOMATIC SUBJECT RECOGNITION IN SCIENTIFIC PAPERS: AN EMPIRICAL STUDY, by J. O'Conner. [1965] 25p. incl. tables, refs. (AFOSR-66-0422) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1300 and Office of Naval Research) AD 626555 Unclassified

Also published in Jour. Assoc. Comput. Mach., v. 12: 490-515, Oct. 1965.

Two subject index terms (toxicity and penicillin) from an operating retrieval system were studied intensively to determine how well a computer could assign them. The humanly produced indexing for the system was used as a standard, with some checking for indexer errors. Thesaurus rules failed to identify one fourth of the toxicity papers. A new rule, using "connection forms," worked for almost all of the non-thesaurus papers. The combined rules identified toxicity papers as well as or better than the human indexers. However, these rules falsely selected as many papers as they correctly identified. False selection was reduced to this level by the use of two new indexing rules; relative frequency, and two methods previously proposed but not tested. The latter are emphasis measures by syntactic centrality and by first sentence-first paragraph position. The rules for reducing false selection did not work as well for penicillin as for toxicity. Comparisons are made with previous empirical studies. Some possible limitations of thesaurus methods, statistical association, etc., are indicated. Some affirmative suggestions are also made. STRENUOUS MUSCULAR EXERTION IN THE POLAR CLIMATE AND ITS EFFECT UPON HUMAN WORK CAPACITY AND TOLERANCE TO COLD, by K. L. Andersen, B. Hellstrom, and R. Eide. Final rept Jan. 31, 1965, 31p. incl. illus. diagrs. tables, refs. (AFOSR 65-1565) (AF EOAR-64-58) AD 623919 Unclassified

The physiology of 8 men who participated in a polar ice cap expedition was investigated with regard to work capacity and cold tolerance. Several tests were administered to the subjects before and after the expedition such as tests of cold tolerance and excercise fitness. A delay in the retesting made it difficult to accurately evaluate the results, but in general the study confirms earlier observations on how a period of cold exposure and hard physical work affects aspects of physiology underlying tolerance to cold.

UPTAKE OF C^{14}-L-LYSINE INTO SEGMENTS OF NORMAL RAT SCIATIC NERVE, by G. S. L. Appletauer, C. Benech and others. [1965] [15]p. incl. diagrs. tables. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-64 and Rockefeller Foundation) Unclassified

Published in Exper. Neurol., v. 12: 215-229, July 1965.

The uptake of activity along tibial and peroneal fibers of the sciatic nerves of normal rats was studied at periods ranging from 1 to 13 days after a single intrathecal injection of L-Lysine-C^{14}. The pattern of uptake was similar in tibial and peroneal fibers of 3-4 mo and 7-8 mo old animals. Younger animals incorporated three to four times more activity than older ones. The average specific activity of the whole nerve kept approximately constant during the duration of the experiment. A proximodistally decreasing gradient of specific activity was found as early as 24 hr and persisted at the thirteenth day. Peaks of activity appeared in the most proximal segment at days 1-3 and 7-10. Curves of the specific activity for each nerve segment are presented. The characteristics of the peaks of activity were studied in plottings of the second derivative of the activity vs nerve length and vs time. The results are briefly discussed in relation to endoneural transport mechanisms. (Contractor's abstract)

CONDITIONING OF MIDBRAIN BEHAVIORAL RESPONSES, by N. Ross, M. Pineyrua and others. [1965] [16]p. incl. illus. diagrs. refs. (AFOSR-66-0751) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-332 and Rockefeller Foundation) AD 643008 Unclassified

Also published in Exper. Neurol., v. 11 263-276, Mar. 1965.

An acoustic stimulus was associated with the electrical stimulation of midbrain areas (reticular formation, central gray substance and stratum proximum of the superior colliculus) according to the trace and avoidance conditioning techniques. Habituation, reinforcement, differentiation and extinction were studied in cats with chronically implanted electrodes. Conditioned responses of attention, fear and flight patterns were obtained. It is suggested that these conditioned responses depend on the activation of the central neural mechanisms of emotion. No definite motivation was ascribed to the attention response, and intensely negative motivation was attributed to both emotional responses. (Contractor's abstract)

IBERIAN PENINSULA CRUSTAL STRUCTURE FROM SURFACE WAVES DISPERSION, by G. Payo. [1965] [17]p. incl. diagrs. table, refs. (AFOSR-65-2889) (AF 61(052)657) AD 624173 Unclassified

Also published in Bull. Seismol. Soc. Amer., v. 55: 727-743, Aug. 1965.

Phase velocity of Rayleigh waves traveling from Toledo to Málaga have been determined from 7 selected earthquakes. The direction of approach of the wave front in relation to the ground particle motion at the standard Spanish stations (Toledo and Málaga) and at Porto (Portugal) is discussed. Also these 3 observatories are considered as a triangular array to determine the phase velocity through the Iberian Peninsula region; this result is compared with the dispersion data determined by the 2 stations at Toledo and Málaga. Two similar crustal-mantle structures, named IB1 and IB2, have been obtained for this region, by modifying the models Dorman 8021 and CANSD respectively, and by means of the partial derivatives of the phase velocity with respect to the parameters of the layers. Both models IB1 and IB2 are almost identical and their corresponding dispersion curves fit the data with an error less than 0.1 km/sec. The crustal thickness given by these structures is about 33 km. Group velocities of Love and Rayleigh waves from near earthquakes have been also studied. Some Algerian earthquakes yielded a dispersion curve for the arm of the Mediterranean Sea between Algeria and Spain. The curve appears almost typically oceanic. (Contractor's abstract)

SEISMIC MAGNITUDE AND SPECIFIC ABSORPTION COEFFICIENT IN THE IBERIAN REGION, by J. M. Munuera. July 1965 [16]p. incl. diagrs. tables, refs. (AFOSR-66-0430) (AF 61(052)657) AD 637674 Unclassified

Also published in Rev. Geofis., v. 24: 313-328, Oct.-Dec. 1966. (AFOSR-67-1200)

This report presents the magnitude scale used by Spanish Seismological Survey (SSS) for near earthquakes inside the area 5° E-10° W, 35°-44° N, which has been deduced from shear waves and with an explicit term for the specific absorption. The way for computation this coefficient is the difference between a theoretical expression for log E and other empirical one, which was previously determined for the Toledo Observatory. The method requests this base-station, besides the new standard calibration made for the other 4 stations handled and also abundant events and the corresponding m values as preliminary deduced by Laboratorio Central del

Servicio de Sismologia (LCSS), Madrid, since 1961 up to 1964. We have obtained: $Q = (62.5° + 67) \pm 32$ for $1.5 \leq \Delta° \leq 7.5$; the average $Q = 300$ is assumed for the whole crust in the said area.

[THE ACTIVITY SEISMIC OF THE REGION OF THE PENINSULA IBERICA UP TO YEAR OF 1960] La actividad sismica en la region de la peninsula Iberica hasta fines de 1960, by J. M. Munuera. [1965] [20]p. incl. diagrs. tables, refs. (AFOSR-67-0560) (AF 61-(052)657) AD 647669 Unclassified

Also published in Rev. Geofis., no. 95: 265-284, July-Sept. 1965.

This paper comments on the array of several seismic features corresponding to the Iberian Peninsula region which were deduced from handling 3307 earthquakes of possible epicentral location. Results and methods are compared with other different studies on seismicity. The ratio between both seismic and elastic energies, assuming an invariable focal volume, is deduced as $q = 2.98 + 0.37m$, for the Lomnitz factor, and $\epsilon = 6.88 \times 10^{-5}$, for the mean unitary elastic strain. The Iberian seismicity appears as intralpine, at majority, though there is also seismicity on the Platform. The flux line $\varphi = 6\text{-}7$ agrees with alignments of the intermediate and deep shocks and with the usual drawing of the Western Mediterranean Alpine Geosyncline. The average for the return period is 50 yr, more or less, which agrees with the cummulative energy release period deduced from the Benioff curve. Maximal seismic density shows migration, for the different epochs, and regression of frequency vs magnitude is a parabolic curve.

DIFFUSION FLAMES AND SUPERSONIC COMBUSTION, by I. Da Riva. Final rept. Apr. 1, 1963-Apr. 1, 1965, 21p. incl. diagrs. refs. (AFOSR-65-1604) (AF EOAR-63-43) AD 622581 Unclassified

This report presents a summary of work done on the behavior of reacting gases in supersonic combustion. The work undertaken comprises 3 areas: diffusion flames, combustion in the boundary layer, and combustion in a subsonic jet of fuel discharging in a supersonic coflowing stream of oxidizer. The structure of laminar diffusion flames has been analyzed in the limiting case of large, though finite, reaction rates. It is shown that the chemical reaction takes place only in a very thin region where convection effects may be neglected. The boundary layer flow past a hot wall is studied noting that the density at the outer edge of the boundary layer is much higher than the density close to the wall.

HETEROGENEOUS COMBUSTIONS AND FLAMES STRUCTURES, by C. S. Tarifa. Final rept. Apr. 1, 1963-Mar. 31, 1965. [58]p. incl. diagrs. tables, refs. (AFOSR-65-1791) (AF EOAR-63-44) AD 625015 Unclassified

The problem of flame spread along the fuel surface of a liquid fuel is studied by considering a model in which the flame propagates along the surface of a fueld contained in a channel. The theoretical model is compared with experiment, and it is reported that the agreement is fairly good, although for small values of temperature, the theoretical results are smaller than the experimental values. In the investigation of flame structures, the hydrogen-oxygen diffusion flame with spherical symmetry is studied and the theoretical results are compared with the experimental data obtained by burning oxygen or hydrogen injected through a porous sphere into a hydrogen or oxygen atmosphere. An application is made to the combustion of oxygen droplets in a hydrogen atmosphere.

ACTION OF ANTIDIURETIC HORMONE ON THE DC RESISTANCES OF THE ISOLATED TOAD SKIN (Abstract), by G. Whittembury, F. Fragachan, and F. Rawlins. [1965] [1]p. (AFOSR-65-1515) (AF AFOSR-64-620) Unclassified

Presented at Ninth annual meeting of the Biophys. Soc., San Francisco, Calif., Feb. 24-26, 1965, p. 117.

Abdominal skins from Bufo marinus bathed in Na_2SO_4-Ringer were impaled with microelectrodes, in vitro. With the micropipette tip located in a cell of the stratum germinativum, the DC resistance (Ro) between the cell and the outer bathing solution and the resistance (Ri) between the cell and the inner bathing solution were measured. Addition of ADH produced no change in Ri, but Ro diminished both in the K and Na containing solutions. After changing the inner solution, Ri was higher in the Na than in the K containing solutions. The changes observed in the potential difference steps suggest that alteration of one of the bathing solutions induces changes in the cell composition and presumably in the characteristics of the membrane facing the other side.

SODIUM EXTRUSION AND POTASSIUM UPTAKE IN GUINEA PIG KIDNEY CORTEX SLICES, by G. Whittembury. [1965] [19]p. incl. diagrs. tables, refs. (AFOSR-65-1516) (AF AFOSR-64-620 and AF AFOSR-61-85) AD 623499 Unclassified

Also published in Jour. Gen. Physiol., v. 48: 699-717, Mar. 1965.

Slices from the cortex corticis of the guinea pig kidney were immersed in a chilled solution without K and then reimmersed in warmer solutions. The Na and K concentrations and the membrane potential V_m were then studied as a function of the Na and K concentrations of the reimmersion fluid. It was found that Na is extruded from the cells against a large electrochemical potential gradient. Q_{10} for net Na outflux was ~ 2.5. At both K concentrations larger than 8 mm, the behavior of K was largely passive. At the outset of reimmersion (V_m > E_K), K influx seemed secondary to Na extrusion. Na extrusion would promote K entrance, being limited and requiring the presence of K in the bathing fluid. At bath K concentrations below 8 mm, K influx was up an electrochemical potential gradient. Thus a parallel active K uptake is apparent. Q_{10} for net K influx was ~ 2.0. Dinitrophenol inhibited net Na outflux and net K influx, Q_{10} became < 1.1 for both fluxes. The ratio between these fluxes varied. Thus at the outset of reimmersion the net Na outflux to net K influx ratio was ~ 1. After 8 min it was < 1. (Contractor's abstract)

[SODIUM EXTRUSION AND SODIUM FOR POTASSIUM EXCHANGE IN KIDNEY CELLS] Movimiento de sodio y potasio en celulas renales, by G. Whittembury. [1965] [2]p. incl. tables. (AFOSR-66-2639) (AF AFOSR-66-620) AD 645096 Unclassified

Also published in Acta Cient. Venezolana, v. 16: 140-141 [July-Aug.] 1965.

Slices from the cortex corticis of the kidney of Guinea pigs were immersed in a chilled medium without potassium and then reimmersed in media of various compositions. Sodium, potassium, chloride, tissue water and extracellular space were determined using conventional methods. The use of cell ion concentrations per solid weight shows under some experimental conditions, an active electrogenic sodium extrusion which is accompanied by a passive chloride efflux. This extrusion of sodium does not require potassium in the bathing medium. In other experimental conditions, a sodium for potassium exchange mechanism is noted.

EPR IN Gd^{3+} IN BaO (Abstract), by J. Overmeyer and R. J. Gambino. [1965] [1]p. [AF 49(638)1198] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 58, Jan. 28, 1965.

Paramagnetic resonance studies have been performed on single crystals of barium oxide doped with gadolinium. For the $\Delta M_S = -\frac{1}{2} \leftrightarrow +\frac{1}{2}$ transition, the observed linewidths (full $\Delta U = 0.3$ G at 77°K) are among the narrowest found in alkaline earth oxide lattices, and the nuclear hyperfine structure due to Gd^{155} and Gd^{157} is completely resolved. This part of the spectrum is described by $g = 1.9916 \pm 0.0003$, $A^{155} = 3.7 \pm 0.1 \times 10^{-4}$ cm^{-1}, $A^{155}/A^{157} = 0.76 \pm 0.1$. The cubic field splitting appears to be small, as expected from the trend observed for Gd^{3+} in CaO and SrO lattices. Unless crystal imperfections are responsible, the data are further evidence of the inadequacy of current theories of the splitting of the $^8S_{7/2}$ ground state.

PREPARATION OF ATOMICALLY CLEAN SURFACES OF Si AND Ge BY HEATING IN VACUUM, by F. Jona. [1965] [2]p. incl. illus. (AFOSR-65-2029) (AF 49-(638)1201) AD 625993 Unclassified

Also published in Appl. Phys. Ltrs., v. 6: 205-206, May 15, 1965.

Low-energy electron diffraction patterns indicate that atomically clean surfaces of silicon and germanium can be obtained with heat treatments in vacuo. For silicon, the temperature is lower and the duration shorter than heretofore reported. For germanium, it is demonstrated that ion bombardments are not necessary. In both cases, the surfaces obtained are not planar but often pitted, sometimes heavily.

VAPOR TRANSPORT AND THERMODYNAMIC EQUILIBRIA IN THE GERMANIUM-GALLIUM-IODINE SYSTEM, by R. F. Lever. [1965] [13]p. incl. diagrs. tables, refs. (AFOSR-65-2570) (AF 49(638)1201) AD 629291 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 1629-1641, Nov. 1965.

Thermodynamic information is used to correlate the composition of germanium-gallium solid solutions with the temperature pressure and composition of a gas mixture with which the solid is in equilibrium. At temperatures below 1000°K, and gallium concentrations in excess of 10^{16} atoms/cm^3 of solid, the dominant gas phase species are GaI, GeI_2 and GaI_3 with the mol fraction of GeI_2 in the gas mixture becoming very small at gallium concentrations greater than 10^{18} atoms/cm^3 and temperature below 900°K. Epitaxial gallium doped germanium layers were grown and their composition found to be close to the calculated equilibrium composition. The growth rate agreed quantitatively with that predicted on the assumption that gaseous diffusion was the rate limiting process. The very low mol fraction of GeI_2 prevents rapid quasi equilibrium single crystal growth of heavily doped material at low temperatures. (Contractor's abstract)

OBSERVATIONS OF "CLEAN" SURFACES OF Si, Ge, AND GaAs BY LOW-ENERGY ELECTRON DIFFRACTION, by F. Jona. [1965] 14p. incl. illus. diagrs. tables, refs. (AFOSR-66-0271) (AF 49(638)1201) AD 629298 Unclassified

Also published in IBM Jour. Research and Develop., v. 9: 375-389, Sept.-Nov. 1965.

The {100}, {110} and {111} surfaces of silicon, germanium and gallium arsenide, cleaned in ultra-high

vacuum by heat-treatments alone or by ion bombardments followed by anneals, were studied with the display-type low-energy electron diffraction technique. Most surface structures reported in the literature by others could be reproduced, namely, Si (111)7, Ge 111 8, GaAs (111)2, and GaAs (100)1. Some, however, could not, namely, Si (111)5 and Ge (111)12. Two unreported structures were found to exist, even simultaneously, on the GaAs (100) surface and 6 different structures were detected on Si (110) surfaces after annealing treatments at different temperatures. The significance of a 'clean' state of semiconductor surfaces, as identified by the observation of low-energy electron diffraction patterns, is discussed. (Contractor's abstract)

Experimental evidence is presented for the fact that atomically clean surfaces of germanium and silicon can be produced by heating alone at moderately high temperatures in good vacuum. The evidence is provided by observation of well-defined low-energy electron diffraction patterns similar to those obtained by Lander and Morrison with surfaces cleaned by ion bombardment followed by annealing and a variety of chemical treatments Prior to their introduction into the vacuum system, the germanium samples were solution-polished, while the silicon samples were vapor-polished Well-resolved patterns of the Ge(111) -8 and Ge(100)-4 structures were observed after several hours heating at temperatures between 850 and 900 C. Very clear patterns of the Si(111)-7 structure were obtained after only 1 hr treatment at 850°C Ge(110) and Si(110) surfaces were also investigated. The cleaning procedure described here may often be more convenient than the procedures described in the literature.

PREPARATION AND CRYSTAL CHEMISTRY OF DIVALENT EUROPIUM COMPOUNDS, by M. W. Shafer [1965] [8]p. incl. diagrs. tables, refs. (AF 49(638)1230) Unclassified

Presented at Tenth Conf. on Magnetism and Magnetic Materials, Minneapolis, Minn., Nov. 16-19, 1964.

Published in Jour. Appl. Phys., v. 36. 1145-1152, Mar. 1965.

The discovery that the europium chalcogenides are a particularly simple and important group of magnetic materials has resulted in considerable work being done on the synthesis of these materials. Several methods of preparing pure EuO have been investigated and the results are reported. The method which resulted in the best EuO is when an excess of europium metal is reacted with Eu_2O_3 at 800°C and then distilled off at 1150° in a high vacuum. Chemical analyses, microstructures, and magnetization measurements were used to determine the stoichiometry of EuO_3 as a function of temperature. The results indicated that the rock salt phase can accomodate about 4 mol % trivalent europium in solid solution at 1300°C. Very little (< %) europium metal was found to go into the EuO phase, but by the addition of 5% to 7% the paramagnetic Curie temperature θ was increased from 73° to 79°K. A number of new divalent europium compounds have been prepared and their magnetic properties investigated. Ferromagnetism was found in the silicates Eu_2SiO_4 and Eu_3SiO_5, the aluminates $Eu_3Al_2O_6$ and $Eu_5Al_2O_8$, and the phosphate $Eu_3(PO_4)_2$. Other divalent europium compounds in which the europium concentration is lower but which had simple well-known crystal structures were also investigated. These included $EuThO_3$, $EuZrO_3$, and $CsEuF_3$ with the perovskite structure, EuF_2 with the fluorite, $EuWO_4$ with the scheelite, Eu_2CaWO_6 and Eu_2SrWO_6 with the cryolite, and Eu_2ZrO_4 with the K_2NiF_4 structures. None of these compounds were shown to be ferromagnetic despite the fact that the nearest-neighbor Eu-Eu distances were less than 4.5A, the distance determined from the chalcogenide series to be the critical one for a positive ferromangetic Eu-Eu interaction. The absence of ferromagnetism in these compounds is discussed in relation to the fact that, except in $CsEuF_3$, the coordination number of the Eu^{+2} ion is not six as it is in the chalcogenides. The assumption that the ferromagnetic interaction takes place via overlap of 5d orbitals is considered and discussed in relation to their structures. (Contractor's abstract)

SPECIFIC HEAT SINGULARITY IN MnF_2, by D. T. Teaney. May 31, 1965 [3]p. incl. diagr. table. (AFOSR-65-2580) (AF 49(638)1379) AD 628728 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 898-900, May 1965.

Measurements are reported of the specific heat of a classic magnetic system, MnF_2. The results demonstrate clearly the essential similarity between magnetic and gaseous systems and are in encouragingly good agreement with theoretical predictions, especially with respect to the strength of the singularity.

MAGNETIC PROPERTIES OF CuF, by R. J. Joenk and R. M. Bozorth. [1965] [2]p. incl. diagr. (AFOSR-65-2582) (AF 49(638)1379) AD 629292 Unclassified

Presented at Tenth Conf. on Magnetism and Magnetic Materials, Minneapolis, Minn., Nov. 16-19, 1965.

Also published in Jour. Appl. Phys., v. 36 1167-1168, Mar. 1965.

The moment of a pressed powder sample of monoclinic CuF_2 was measured from 4.2° to 300°K in fields to 25 kG. $\chi(T)$ indicates an AFM transition at T_N = 69°K, and analysis gives $g \sim 2.3$ and Θ 200°K. T_N and Θ are consistent with magnetic ordering of the first kind with AFM exchange interactions J_1 (corner-bc) 34°K and J_2 22°K. Weak ferromagnetism of anisotropic exchange origin is expected on the grounds of symmetry; the measured ferromagnetic moment is $\sigma_0 \approx 1$ G cm^3/mol, corresponding to a canting angle $\varphi \approx 0.01°$. Assuming magnetic dipolar anisotropy and estimating principal axes and values for the anisotropic g tensor, we find the spin axis to be about 2° from c and 99° from a in the ac plane with anisotropy field $H_A \sim 2000$ Oe, and the weak moment to be parallel to the monoclinic axis b with canting field $H_{DM} \sim 1000$ Oe. Pseudodipolar anisotropy may be expected to change the orientation, but not the order of magnitude of these fields. The uniform mode AFM resonances are not degenerate in general, but both would be expected to occur at $\nu/c \sim 9$ cm^{-1} using these values. (Contractor's abstract)

ANOMALOUS SPLITTING OF ν^{55} IN ANTIFERROMAGNETIC $RbMnF_2$ (Abstract), by D. T. Teaney and J. S. Leddy. [1965] [1]p. [AF 49(638)1379] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Nov. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 315-316, Mar. 24, 1965.

In the course of studying the Mn^{55} NMR in the cubic antiferromagnet $RbMnF_2$, under certain conditions a splitting of the resonance line into 2 components clearly resolved in frequency was observed. The general features of the NMR have been found to be in excellent agreement with the pulling theory: at 4.2°K, the field variation of the single ν^{55} line fits precisely a theoretical curve that extrapolates to 686.2 mc/sec in the high field-unpulled limit. However, in the vicinity of 680 mc/sec, the experimental curve breaks into 2 branches, one approaching 680 mc/sec from below and the other from above. The effect immediately suggests some kind of mode crossing, as it is unable to excite resonance close to 680 mc/sec and the branches remain separated by about 75 kc/sec. The linewidth of 280 kc/sec shows no variation, and the intensities of the 2 resonances qualitatively sum to that of the single line above and below the branching. The frequency of the anomaly is insensitive to temperature below 4.8 K and varies with angle from 680 mc/sec for the applied field along <110> to 678.5 mc/sec for the field along <100>. The temperature dependence above 4.8 K is presented, and possible explanations for the effect are discussed.

EFFECT OF ELECTRON CONCENTRATION ON MAGNETIC PROPERTIES OF NdS-EuS (Abstract), by M. J. Freiser, F. Holtzberg and others. [1965] [1]p. [AF 49(638)1379] Unclassified

Presented at meeting of the Amer. Phys Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 32, Jan. 27, 1965

The NdS-EuS system shows a strong increase in the positive value of the paramagnetic Curie temperature (θ) as a function of electron concentration similar to that found in the semiconducting region of the LaSe-EuSe and GdSe-EuSe systems. The θ value increases from 20 K for EuS to a maximum of 41 K for $Nd_{0.1}Eu_{0.9}S$ followed by a gradual decrease to θ 0 at $Nd_{0.9}Eu_{0.1}S$. Pure NdS was found to be antiferromagnetic with T_N 11 and θ -18°K; however, effects of the crystalline field may influence θ in the neodymium-rich samples. For high europium concentrations, Nd^{3+} behaves similarly to Gd^{3+} in donating an excess electron to the 5-d band, which strengthens ferromagnetic exchange interactions between Eu^{2+} ions. Low-temperature saturation moments indicate that Nd is not coupled to the ferromagnetic Eu^{2+} lattice. The effective magnetic moment from the Curie-Weiss law varied linearly with composition and is consistent with $J = \frac{9}{2}$, $g_J = 8/11$ for Nd^{3+} and $J = \frac{7}{2}$, $G_J = 2$ for Eu^{2+}. Under the assumption that the conduction electron coupling is additive to the europium coupling in insulating EuS, the data for Nd in EuS is found to be consistent with La in EuSe and Gd in EuS up to 25% concentration

A CLASS OF MONOTONE RICCATI MATRIX DIFFERENTIAL EQUATIONS, by W. T. Reid. [1965] 8p. incl. refs. (AFOSR-65-0655) (AF AFOSR-63-438) AD 641702 Unclassified

Also published in Duke Math. Jour., v. 32. 689-696, Dec. 1965.

Necessary and sufficient conditions for a solution W(t) of the real Riccati matrix differential equation $W' = A(t) + D(t)W + WB(t) + WC(t)W$, $S \leq t < S_1$, to have non-negative elements throughout $[S, S_1]$ whenever W(s) has non-negative elements were obtained. Conditions for the extensibility of such solutions on the interval $[s, \infty]$ were also investigated. For the particular equation with A, B, D, identically zero, there were established extensions of classical results of Perron and Frobenius on the dominant proper value and associated proper vector of an irreducible, non-negative constant matrix. SOUND DISPERSION IN BINARY MIXTURES OF HOLOMETHANE GASES, by R. R. Boade and S. Legvold. [1965] [5]p. incl diagrs. tables, refs. (AFOSR-65-2779) (AF AFOSR-62-319) AD 629531 Unclassified

Also published in Jour. Chem. Phys., v. 42 539-573, Jan. 15, 1965.

Sound dispersion has been experimentally examined in all binary combinations of the halomethane gases, CH_2F_2, CHF_3, CF_4, CCl_2F_2, and $CHCl_2F$. Concentrations of 25%, 50%, and 75% were examined in each combination. The experimentally determined vibrational relaxation time of each mixture was related to the equation $\tau^{-1} = X^2\tau_{AA}^{-1} + (1-X)^2\tau_{BB}^{-1} + X(1-X)(\tau_{AB}^{-1} + \tau_{BA}^{-1})$. A single relaxation time was observed in all the mixtures and the above equation was found to be valid when the relaxation times of the individual gases in the mixture were similar and when their vibrational specific heats were similar. Values of $(\tau_{AB}^{-1} + \tau_{BA}^{-1})$ were deduced from the data and compared with values calculated from an extended version of the Schwartz and Herzfeld theory. A Lennard-Jones 7-28 interaction potential was used for the calculations and appears to be an appropriate potential for these molecules. (Contractor's abstract)

SOUND ABSORPTION IN SUBSTITUTED METHANE-INERT-GAS MIXTURES, by E. B. Miller, R. R. Boade, and S. Legvold. [1965] 2p. incl. tables (AFOSR-65-2862) (AF AFOSR-62-319) AD 628830 Unclassified

Also published in Jour. Chem. Phys., v. 42 2982-2983, Apr. 15, 1965.

Velocity dispersion in the substituted methane gases CF_4, CHF_3 + CCl_2F_2 with the noble gases Ar, Ne, and He, was previously reported. The velocity measurements were made with a Pierce-type acoustic interferometer in conjunction with a Brown chart recorder, which provided a plot of oscillator plate current vs the separation between the sound source and the reflector. The present work is a result of re-examining these charts in order to determine the frequency dependence of the acoustic absorption coefficient and thus to obtain relaxation data in an alternative manner.

TERMINAL REPORT FOR THE FIFTH RARE EARTH RESEARCH CONFERENCE, Iowa State U., Ames, Aug. 30-Sept. 1, 1965, by S. Legvold and W. R. Moore. [1965] 32p. (AFOSR-66-0764) (AF AFOSR-65-812) Unclassified

The rare-earth compounds containing oxygen, sulfur, selenium and tellurium were discussed with emphasis on their structural chemistry and reactions they undergo. Spectral data, which included optical spectroscopy, chemical bonding, orbital energy differences and interactions of rare-earth ions with their crystalline environments, was presented and discussed at length. In the field of metallurgy it was found that the alloying behavior of the rare earths with a common partner was not easily predicated because of the variation in crystal structure and stoichiometries. Research was also presented on electrolysis and dependance of temperature upon density.

NEW DEVELOPMENTS IN FACET DESIGN AND ANALYSIS, by U. G. Foa. [1965] [13]p. incl. refs. (AFOSR-65-2674) (AF 61(052)121) AD 629265 Unclassified

Also published in Psychol. Rev., v. 72 262-274, July 1965.

In multivariate research design the systematic definition of the set of variables in terms of more basic sets, the facets, leads to the prediction of the empirical interrelationship among the variables. Two principles are suggested for predicting the results from the facet structure of the variables: the principle of contiguity and the semantic principal components. The application of these concepts to a number of studies in different behavioral areas suggests that they have predictive power. It is further shown that facet elements can be classified into specific and nonspecific to the set of variables and that variables containing specific elements tend to be related to the set of variables more than variables containing nonspecific elements. Systematic design alone does not guarantee correct prediction of empirical results. In fact, for a given area of behavior several alternative formalizations appear possible, and they will usually lead to different hypotheses. While the choice of a given facet design rather than another may depend on the intuition of the investigator, it appears also to be related to the psychology of concept formation and to the influence of language on this process.

"MULTISTORE" A PROCEDURE FOR CORRELATIONAL ANALYSIS, by E. von Glasersfeld, P. P. Pisani, and J. Burns. Informal rept. Jan. 1965, 80p. incl. diagrs. tables, refs. (Rept. no. ILRS-T10, 650120) (AFOSR-65-0584) (AF EOAR-64-54) AD 615486 Unclassified

Also published in Automazione e Antomatisimi, v. 9: 5-28, Mar.-Apr. 1965.

A short introduction to correlational theory is given, and a new procedure for correlational analysis for single sentences in English is described. It shows how grammatical, syntactic, and semantic data can be handled in 1 coherent program by means of a specially organized memory called "MULTISTORE." The system eliminates the need for comparisons of indices and ascertains the compatibility of elements by inserting the indices that characterize each element into preestablished individual columns, each of which has its own fixed combination rules based on the rules of word-order in current English. The system yields a complete listing of the operative correlations, roughly corresponding to syntactic connections and their hierarchical structure in a given sentence. Summary flow charts and an example of the procedure are also given.

ENGLISH PREPOSITIONS IN MACHINE TRANSLATION, by J. Burns. Informal rept. Jan. 1965 [15]p. incl. diagr. (Rept. no. ILRS-T9, 650115) (AFOSR-65-0861) (AF EOAR-64-54) AD 617793 Unclassified

Also published in Beitrage Sprachkunde und Informationsverabeit, v. 7: 50-61, Dec. 1965 (Title varies)

The problem of the analysis of prepositions, part of a project for analyzing English-language sentences by computer, is considered. The system used in this investigation is based upon the recognition of correlata, their arrangement in correlations and the characterization of their correlators. The problem is one of many involved in the attempt to make a translation-algorithm approximate the relevant procedures of the human translator. The project is directed toward future application in machine translation from English into other languages.

AUTOMATIC ENGLISH SENTENCE ANALYSIS PART I. RESEARCH OF THE LINGUISTICS GROUP. PART II. RESEARCH OF THE MATHEMATICS GROUP, by E. von Glasersfeld and P. P. Terzi Final rept Mar. 1, 1964-June 30, 1965 [120]p. incl. diagrs. tables, refs. (Rept. no. ILRS-T11, 650630) (AFOSR-65-1908) (AF EOAR-64-54) AD 622570 Unclassified

Part I: The Linguistics Group describes work on the Multistore Procedure for analysis of English sentences. Previous reports are given as abstracts and subsequent developments are described. Machine-economics have been introduced in various aspects of the procedure; the general table of correlators has been refined, a corpus of texts has been key-punched and processed to provide data for analysis of explicit correlators, this analysis is partly completed The procedure for reclassification of intermediate products is described Part II: The Mathematics Group reports work on aspects of the structure of language Considering the sentence as codification of thought, and thought as a complex of mental items between which certain relations hold, the report considers the source of these mental items, under three headings: (1) sense-perceptions, (2) reflections, (3) inter-personal communication The structure of language is found to be characterized by the way in which relations between mental items are codified (Contractor's abstract)

FURTHER RESULTS ON Cu REPRECIPITATION AND

ELECTROLUMINESCENCE. by G. Bonfiglioli and A Mojoni. [1965] [2]p incl illus (AFOSR-65-1897) (AF EOAR-63-87) AD 625704 Unclassified

Also published in Phys. Ltrs., v. 15 300-301, Apr. 15, 1965.

An extension is presented of previous work (Phys. Ltrs., v. 13 197, 1964) dealing with the connection of electroluminescence (EL) of ZnS(Cu) single crystals to Cu reprecipitation and related thermal aging effects. Annealings were performed on a new group of specimens at a lower temperature (250 C) Precipitation was successfully followed through hardness measurements. Optical microscopy in dark-field showed patterns of decorated dislocations even at early 300 C annealing stages of EL specimens. Thermally treated specimens under microscopic observation, showed peculiar patterns of bright, mostly straight lines composed of many thin lines just after quenching, growing thicker with annealing to produce a typical pattern with C_3 symmetry when cuts normal to c-axis were used.

PROBLEMS RELATED TO VISUAL PERFORMANCE OF PILOTS, by A. Fiorentini and L. Ronchi. Annual summary rept. Dec. 20, 1965, 112p. (AF 61(052)850) Unclassified

The report is divided into four sections. The first section is devoted to the study of the small eye movements during voluntary monocular fixation of a bright point in a completely dark field, and of the determiners of these movements, the autokinetic movements of the point and their possible relationships with the eye movements; and the perceived direction of a bright point as a function of retinal locus. Fixation of a point fixed in the visual field is compared with fixation of a point whose image is stabilized on the retina and with attempted fixation in the dark. The second part deals with some aspects of the perception of light signals. The third part deals with the reliability of electroretinographic response, in relation to changes in recording resistance, influence to previous exposure to sunlight, and lack of centrifugal control. In the fourth session the response of the eye to a step pattern of illumination is described in term. of the increment threshold for a small light patch added to the pattern at various distances from the illumination step.

LOW TEMPERATURE ELASTIC CONSTANTS OF POTASSIUM, by W. R. Marquardt and J. Trivisonno. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-65-1193) (AF AFOSR-65-862) AD 621606 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 273-278, 1965.

The adiabatic elastic constants of single crystal potassium were measured as a function of temperature from 195°K to 4.2°K by the ultrasonic pulse-echo technique. The measured elastic constants at 4.2°K (in units of 10^{10} dyn-cm^{-2}) are as follows: C = 2.86, C′ = 0.377, C_n = 6.65, and B_S = 3 66. The shear constants C and C′ are interpreted in terms of Fuchs' electrostatic contribution to the shear stiffnesses of the alkali metals Significantly, this work yields an elastic anisotropy, C/C′, at 4.2°K which is in agreement with Fuchs' theoretical calculation. The results are also compared to Bender's values of the elastic constants at 83°K and with Swenson's isothermal compressional data.

[MAGNETO-ACOUSTIC ABSORPTION IN SOLIDS] by J. Trivisonno. Final rept. [1965] 8p. incl. refs. (AFOSR-65-1483) (AF AFOSR-62-224) AD 621130 Unclassified

The elastic constants of 3 alkali metals were measured as a function of temperature. The ultrasonic pulse-echo technique was used to measure potassium in the temperature range 4.2° - 195°K and sodium in the range 78° - 300°K. Results were in good agreement with other published data. Single crystals of rubidium were grown by a modified Bridgeman technique in an argon atmosphere; elastic constants were not obtained, however, due to an inability to orient crystals by x-ray techniques. Magneto-acoustic measurements were made on crystals of potassium at 10, 30, and 50 mc/sec to obtain dimensions of Fermi surface; change in attenuation with magnetic field was also measured. Ultrasonic attenuation measurements were also conducted on magnesium single crystals at 10 - 290 mc/sec. A list of the publications and theses emanating from this grant are presented.

POLYMORPHISM IN HYDROGEN IODIDE, by F. A. Mauer, C. J. Keffer and others. [1965] [2]p. incl. table, refs. (AFOSR-65-1243) [AF 49(638)1430] AD 621656 Unclassified

Also published in Jour. Chem. Phys., v. 42: 1465-1466, Feb. 15, 1965.

The crystal structure of hydrogen iodide was investigated over the temperature range 4.2° - 180°K, using CuKα radiation, λ = 1.54051A. Values of the Bragg angle were plotted as a function of temperature in an effort to detect any anomaly in the thermal expansion. The results showed that the pattern obtained at temperatures up to at least 120°K could be indexed on the basis of a face-centered tetragonal cell; a face-centered cubic arrangement existed from 130 - 180°K, but at 180°K there was some splitting of lines presumably resulting from spottiness of the powder pattern caused by grain growth.

The infrared spectra of tetrahydrofuran and tetrahydrofuran-d_8 are reported between the limits 10 and 300 cm^{-1}. The rather complex spectrum obtained for this molecule is interpreted in terms of the theory of pseudorotation of a puckered ring. The spectroscopically derived value of the parameter mq_0^2 is (8.56 ± 0.13) x 10^{-40}g · cm^2 for the ground, ν = 0, radial state and (8 48 ± 0.15) x 10^{-40}g · cm^2 for the excited, ν = 1, radial state The conclusions drawn from the far-infrared spectra are quite consistent with the existing Raman and thermodynamic data.

OPTIMAL ESTIMATION OF INITIAL CONDITIONS FOR NUMERICAL PREDICTION, by R. H. Jones. [1965] [6]p. (AFOSR-66-0221) (AF 49(638)1302) AD 638835 Unclassified

Also published in Jour. Atmos. Sci., v. 22. 658-663, Nov. 1965.

A numerical-statistical forecasting method is presented in which statistical techniques are used on the errors of numerical predictions. This, in effect, uses earlier numerical predictions to obtain best estimates of the initial conditions. A technique is given whereby the method can be applied by estimating the necessary parameters, and it is shown that this procedure converges to the optimal estimate. (Contractor's abstract)

A REAPPRAISAL OF THE PERIODOGRAM IN SPECTRAL ANALYSIS, by R. H. Jones. [1965] [12]p. incl. diagrs. refs. (AFOSR-66-0264) (AF 49(638)-1302) AD 639016 Unclassified

Also published in Technometrics, v. 7: 531-542, Nov. 1965

The purpose of this paper is to revive interest in the periodogram approach to time series analysis which, at present, is only of historical interest and is seldom used. During the late 1940's, when it was realized that the smoothed periodogram could be used to estimate the spectral density of a stationary time series, the method was impractical because of the amount of computations. This is no longer the case, but not realized by many applied workers. In this paper the smoothed periodogram is considered from the point of view of its spectral window. The results are compared with two standard spectral windows by a method which avoids defining a bandwidth. The spectral windows are normalized so that they have the same variance, and plotted. The user can then choose the window which best suits his needs. Rejection filtering, trigonometric regression and cross-spectral analysis are discussed. An example is given in which the spectra and cross-spectrum of a bivariate time series are estimated. (Contractor's abstract)

AN EXPERIMENT IN NON-LINEAR PREDICTION, by R. H. Jones. [1965] 5p. incl. diagrs. (AFOSR-66-0656) (AF 49(638)1302) AD 639987 Unclassified

Published in Jour. Appl. Meteorol., v. 4 701-705, Dec. 1965.

The role of statistics in numerical weather prediction should be to aid in the handling of random errors and disturbances. The actual prediction is a problem in dynamics. When the initial conditions are observed with error, there is information in the past forecasts which could increase the accuracy of the numerical predictions. The techniques of control theory provide an optimal method for combining past forecasts with current observations. This paper demonstrates the method on simulated non-linear time series.

ON ISOMETRIC IMMERSIONS IN EUCLIDEAN SPACE OF MANIFOLDS WITH NON-NEGATIVE SECTIONAL CURVATURES, by P. Hartman. [1965] [16]p. (AFOSR-65-1969) [AF 49(638)1382] AD 626302 Unclassified

Also published in Trans. Amer. Math. Soc., v. 115: 94-109, Mar. 1965.

Isometric immersions of a complete d-dimensional manifold $M = M^d$ in a Euclidean space are considered. The following theorem is proved. Let $M = M^d$ be a complete Riemann manifold of class C^2 such that all 2-dimensional sections have non-negative curvatures. Let $\phi : M^d \to E^{d+\delta}$, $S = \phi(M^d)$ be a C^2 isometric immersion of M^d in $E^{d+\delta}$, $\delta > 0$, such that the relative nullity function ν is a positive constant. Then S is ν-cylindrical. The proof depends in part on a generalization, involving simultaneous gradient mappings, of the implicit function theorem, in the large, for gradient mappings presented in a former paper. The implicit function theorem is further generalized.

GENERALIZED LYAPUNOV FUNCTIONS AND FUNCTIONAL EQUATIONS, by P. Hartman. [1965] [19]p. (AFOSR-66-0266) [AF 49(638)1382] AD 638692 Unclassified

Also published in Ann. Matem., v. 69. 305-320, 1965.

Some results of Minty and Browder on the existence of solution of functional equations are generalized by replacing the notion of monotony by one involving a Lyapunov function. In the last section, analogous arguments are used to obtain an existence theorem for an initial value problem belonging to an ordinary differential equation on Hilbert space.

SELF-SIMILAR HYDRODYNAMICS WITH VORTEX SHEETS, by R. C. Alexander. June 1965, 118p. incl illus. diagrs. tables, refs (AFOSR-65-0642) (AF 49-(638)496) AD 620323 Unclassified

The problem of vortex sheets caused by the motion of sharp obstacles with respect to fluid may be treated with the aid of a similarity law. The subject is given further breadth by including the Helmholtz instability phenomenon. This is accomplished by posing a problem in which the plane interface of a 2-dimensional jet is subjected to a self-similar disturbance. Unity of the analysis is achieved by a semi-inverse approach which treats all problems asymptotically in the neighborhood of rolled-up vortex sheets, or as time $t \to \infty$. A suggested iterative technique for finding total solutions is given.

ON THE FLOW PAST A SEMI-INFINITE FLAT PLATE, by C. Kaplan. June 1965 [29]p. incl. diagrs. (AFOSR-65-0975) (AF 49(638)496) AD 623326 Unclassified

The Navier-Stokes equations for 2-dimensional flow are linearized around a dominant uniform stream velocity. The concept of field modes in fluid mechanics is then applied to the problem of viscous incompressible flow over a semi-infinite flat plate fixed in an unbounded uniform stream. One result is that the usual notion of a displacement thickness leads naturally to a displacement boundary beyond which the streamlines of the viscous flow past the flat plate are indistinguishable from the streamlines due to potential flow past this boundary.

THE HALL EFFECT IN THE TWO-DIMENSIONAL FLOW ALONG AN INSULATING PLANE, by H. Hasimoto and G. S. Janowitz. June 1965, 31p. incl. diagrs refs. (AFOSR-65-1201) (AF 49(638)496) AD 620324 Unclassified

Two-dimensional flow of a conducting gas interacting weakly with an external inhomogeneous magnetic field was considered. It was proven that for flow over an insulating wall, the total drag force is reduced by the Hall effect, and the total transverse force is zero. General expressions for the Hall current and the induced transversal flow are obtained for the case of flow with small Hall parameter over an infinite insulating plane. Examples are given for the dipole magnetic field. An inversion of the transversal flow, varying with the dipole orientation was found. It was suggested that there is a transversal deflection of the flow behind a magnetized body in the flow of a plasma. (Contractor's abstract)

GENERALIZED LARGE DEFORMATION BEHAVIOR FOR FACE-CENTERED CUBIC SOLIDS: NICKEL, ALUMINUM, GOLD, SILVER AND LEAD, by J. F. Bell. [1965] [22]p. incl. diagrs. tables, refs. (AFOSR-65-1738) (AF 49(638)1067) AD 625967 Unclassified

Also published in Philos. Mag., v. 11: 1135-1156, June 1965.

The stage III deformation of 318 single crystal tests of 40 experimentalists in aluminum, nickel, gold, silver, lead, and copper is quantitatively compared, through the Taylor aggregate theory, with a generalized linearly temperature-dependent stress-strain law for completely annealed polycrystals. From calculations dependent upon a knowledge of stage II parameters, and from independent direct stage III calculations, the single crystal deformation of these 6 f. c. c. metals is found to be in close agreement with prediction. This parabolic linearly temperature dependent stage III deformation is found to be independent of purity, of strain rate, of type of test, and of initial orientation when the resolved shear strain is calculated for single slip. The universal constant, $\tau_0 = 58.0$ Kg/mm^2, from the polycrystalline deformation is found to be determinable from the single crystal tests of all 6 metals at temperatures varying from 4.2°K to 1173°K, with single crystal parabolas grouped according to lattice spacing and atomic volume.

THE DYNAMIC PLASTICITY OF METALS AT HIGH STRAIN RATES: AN EXPERIMENTAL GENERALIZATION, by J. F. Bell. [1965] 23p. incl. diagrs. tables, refs. (AFOSR-66-0336) (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)-1067, Army Research Office (Durham), and Ballistics Research Laboratories) AD 631388 Unclassified

Also published in Behavior of Materials under Dynamic Loading (ASME), Huffington, ed. by J. Norris, 1965, p. 19-41.

Extended quasi-static impact experiments and indirect dynamic impact experiments are critically compared with direct dynamic experiments. The success of the direct dynamic experiments in establishing the applicability of the finite amplitude wave theory to a variety of metals is described. The fact that in such direct experiments diffraction grating measurement of dynamic plastic strain and wave speeds in the symmetrical free-flight impact of polycrystals may be used to predict the stage III deformation of nearly 400 aluminum, copper, nickel, lead, gold, and silver crystals in the metal physics literature is evidence of the generality of these results. Recent experiments on initially work-hardened metals are discussed. These data include a brief description of the success of the writer's linearly temperature-dependent generalized parabolic stress-strain law governing strain rate independent finite amplitude wave propagation in predicting dynamic ultimate strength data of numerous earlier experimentalists. DISTRIBUTION OF CORPUS CALLOSUM AND ANTERIOR COMMISSURE IN CAT AND RACCOON, by F. F. Ebner and R. E. Myers. [1965] [13]p. incl. diagrs. refs. (AFOSR-65-2743) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-61-38 and National Institutes of Health) AD 629560 Unclassified

Also published in Jour. Compar. Neurol., v. 124: 353-365, June 1965.

The distribution of the forebrain commissures was studied using the Nauta-Gygax silver technique. Following total forebrain commissure transaction in the cat the striate cortex or visual area I was remarkably free of degenerating fibers, while peristriate or visual area II showed dense degeneration. Somatic sensory arm and distal hindlimb areas appeared degeneration free while proximal leg and face areas revealed heavy degeneration. The somatic motor area of the anterior sigmoid gyrus contained dense numbers of degenerating fibers. The auditory areas of ectosylvian gyrus showed moderate degeneration over their entire surface except the most ventrally situated cortical areas which were degeneration free. Fibers from the corpus callosum also terminated in the dorsolateral portions of the head of the caudate nucleus. The anterior limb of anterior commissure distributed mainly to the inner granular layer of the olfactory bulb. In addition, it disseminated considerable numbers of fibers in the anterior olfactory nucleus. The accessory olfactory bulk was degeneration free. The distribution of the forebrain commissures in the raccoon was very similar to the cat. The outstanding feature of the commissural pattern in the raccoon was the total absence of degenerating fibers in the lobular complex relating to the digits of the forepaw. (Contractor's abstract)

SPECTRA OF DOUBLY AND TRIPLY IONIZED YTTERBIUM, Yb III AND Yb IV, by B. W Bryant. [1965] [9]p. incl. illus. diagrs. tables. (AFOSR-65-2875) (AF 49(638)1497) AD 629333 Unclassified

Also published in Jour. Opt. Soc. Amer., v. 55: 771-779, July 1965.

The emission spectrum of ytterbium was photographed under varied conditions from 600 to 11,000A in order to obtain a complete description of the spectra of the doubly and triply ionized species. The main transition arrays of these species were identified, and where feasible, the analysis was carried through. All 41 energy levels, 28 odd and 13 even, belonging to the $4f^{14}$, $4f^{13}5d$, $4f^{13}6s$, $4f^{13}6p$, and $4f^{13}7s$ configurations of Yb III have been experimentally determined along with the appropriate quantum numbers. Eleven of 20 possible $4f^{13}6d$ levels and their quantum numbers have also been determined. Many Yb III levels are supported by intermediate coupling calculations. The ionization potential of Yb III was determined to be 25.4 ± 0.5 ev from the Rydberg formula. The two ^2F $4f^{13}$ levels of Yb IV have been determined in addition to 20 of a possible 107 $4f^{12}5d$ levels, of which a few are expected to be spurious. (Contractor's abstract)

SINGLE PARTICLE EXCHANGE IN 3 PARTICLE FINAL STATES OF THE REACTION K^+p AT 2.26 BEV/C, by F. Bomse, J. Cole and others. [1965] [20]p. incl. diagrs. (AFOSR-65-1953) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-63-234], Atomic Energy Commission, and National Science Foundation) AD 626786
Unclassified

Studies were made of the production differential cross sections and decay angular distributions of the K^* and N^* resonances produced in the reactions: $K^+P \rightarrow K^*P \rightarrow K^0\pi^+p$ and $K^+p \rightarrow N^*K^0 \rightarrow K^0\pi^+p$. The incident K meson laboratory momentum was 2.26 bev/c. The spin-space density matrix elements of the K^* and N^* were calculated. They indicate a strong preference for vector meson exchange in the production of both resonances. The N^* data is consistent also with the predictions of Stodolsky and Sakurai (Phys. Rev. Ltrs., v. 11, 90, 1963). Results of a study of the differential production cross sections incorporating absorptive effects in the single particle exchange model are also presented. THE EFFECTS OF ELECTRICAL CONDUCTANCE OF WALL MAGNETOHYDRODYNAMIC CHANNEL FLOW WITH HEAT TRANSFER, by U.-P. Hwang, W. Tripp and others. [1965] [51]p. incl. diagrs. refs (Special rept. no. 52) (AFOSR-65-1312) (AF AFOSR-64-463) AD 619101 Unclassified

Also published in Kansas State U. Bull., v. 49, Mar. 1965.

The purpose of the report is to present the detailed as well as critical review of some mathematical and physical aspects of the MHD flow. This review should benefit the beginning investigators in this field. First, the details of the pioneering work by Hartmann and Lazarus on the subject of channel flow are described. The modified Hartmann flow with the electrical conductance of walls investigated by Chang and Lundgren, and by Chang and Yen are then reviewed. The effect of electrical conductance of the walls for both the thermally and hydrodynamically fully developed region was investigated very recently by Alpher, Yen, and Snyder. While their treatments are reviewed generally, only Snyder's approach is presented in detail.

FINITE DIFFERENCE ANALYSIS OF FORCED-CONVECTION HEAT TRANSFER IN ENTRANCE REGION OF A FLAT RECTANGULAR DUCT, by C.-L Hwang and L.-T. Fan [1965] [22]p. incl. diagrs. tables, refs. (AFOSR-65-1481) (AF AFOSR-64-463) AD 623199 Unclassified

Also published in Appl. Sci. Res., v. 13A: 401-422, 1965.

The laminar forced-convection heat transfer in the entrance region of a flat rectangular duct is studied. In this region temperature and velocity profiles are simultaneously developed. The basic governing equations of momentum, continuity, and energy are expressed in finite difference form and solved numerically by use of a high speed computer for a mesh network superimposed on the flow field. All fluid properties are assumed to be constant. The cases of uniform constant wall temperature and of uniform constant heat flux from wall to fluid are considered. Nusselt numbers are reported for Prandtl numbers in the range of 0.01 to 50. The exact solution of the energy equation obtained by means of the numerical method is compared with the results of approximate solutions.

EFFECTS OF VISCOUS DISSIPATION OF HEAT TRANSFER PARAMETERS FOR FLOW BETWEEN PARALLEL PLATES, by C.-L. Hwang, P. J. Knieper, and L.-T. Fan. [1965] [12]p. incl. diagrs. refs. (AFOSR-66-0056) (AF AFOSR-64-463) AD 632742 Unclassified

Also published in Zeitschr. Angew. Math. und Phys., v. 16: 599-610, Sept.-Oct. 1965.

In this investigation the effects of viscous dissipation on the temperature profile in the thermal entrance region between parallel plates are presented. The flow is laminar and the velocity profile is fully developed. The heat flux at the walls is considered constant. The heat generation parameter is introduced and its relation with Eckert number and Brinkman number is discussed. The derivation of the boundary condition that the constant of the heat flux at wall is equivalent to unity in dimensionless form, is presented in detail because such expression has never been presented in literature. The finite difference analysis and numerical method are presented in detail to show the application of Thomas method to the solution of the linear simultaneous equations derived from the energy equation. An advantage of Thomas method as compared with the usual matrix inversion method or Gaussian elimination method is the significant reduction in computer storage requirement and computing time.

HEAT TRANSFER TO AN MHD FLUID (Abstract), by L.-T. Fan and C.-L. Hwang. [1965] [2]p. (Bound with its AFOSR-65-1266; AD 622527) (AF AFOSR-64-463) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

Research progress and future plans for analytical and numerical investigation of heat transfer accompanying the flow of a magnetohydrodynamic fluid between parallel plates are summarized, including, heat transfer accompanying the flow of an MHD fluid in the flat duct under the condition of the fully developed Hartmann velocity profile, forced-convection heat transfer accompanying the flow of a non-MHD fluid on the entrance region of a flat duct where the temperature and velocity develop simultaneously, and numerical values of various parameters of the forced convection heat transfer to an MHD fluid in the entrance region where both the velocity and temperature are not fully developed. A critical survey of the recent literature on the effects of the electrical conductance of walls on MHD flow and heat transfer was made. An analysis of the residence time distribution of a tracer in the MHD fluid flowing between parallel plates was made in order to study the dynamic and dispersion characteristics of the system.

NONBENZENOID AROMATIC SYSTEMS. I. SYNTHESIS OF 1-VINYLAZULENE AND CERTAIN SUBSTITUTED 1-VINYLAZULENES, by R. N. McDonald and W. S. Stewart. [1965] [4]p. incl. diagrs. refs. (AFOSR-65-0537) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-145 and National Science Foundation) AD 61[illegible]91 Unclassified

Also published in Jour. Org. Chem., v. 30: 270-273, Jan. 1965.

One of the principal goals in these studies has been to determine the effects of an azulene ring system on a carbonium ion center. It is considered to be of interest to determine whether the effect of changing the site of the α-carbinyl carbonium ion is directly related to the calculated π-electron densities for this nonbenzenoid aromatic system. One approach to such studies is to follow the rates of addition of some acid, HA, to vinyl azulenes. The synthesis of 1-vinylazulene, cis- and trans-2-phenyl-1-vinylazulene, and trans-2-phenyl-3-vinylguaiazulene by the Wittig reaction are reported. Their physical and spectral properties, and their reactivities (or lack thereof) are discussed.

TASK PREDICTABILITY IN THE ORGANIZATION, ACQUISITION, AND RETENTION OF TRACKING SKILL, by D. Trumbo, M. Noble and others. [1965] [12]p. incl. diagrs. refs. (AFOSR-65-2659) (AF AFOSR-62-17) AD 629566 Unclassified

Also published in Jour. Exper. Psychol., v. 70: 252-263, Sept. 1965.

Two hundred fifty male students were assigned to 4 conditions of task predictability, 3 retention intervals, and 2 levels of training in a 4 x 3 x 2 design. Predictability was determined by irregular step-function tasks that differed in the proportions of systematically repeating (predictable) targets, ranging from fixed to random sequences. Integrated absolute error served as a performance criterion. In addition, 6 indexes of temporal-spatial patterning were obtained. Results showed greatest improvement and greatest absolute retention losses for the fixed task and a fixed-direction task added to the design. Intermediately predictable tasks did not differ in error from the random task; however, differences in response organization were found among all tasks. Results suggest the nature of changes in response organization, and indicate that timing may be most crucial for acquiring and maintaining skill.

NUMBER OF ALTERNATIVES AND SEQUENCE LENGTH IN ACQUISITION OF A STEP-FUNCTION TRACKING TASK, by D. Trumbo, M. Noble, and L. Ulrich. [1965] [7]p. incl. diagr. table. (AFOSR-65-2668) (AF AFOSR-64-526) AD 629856 Unclassified

Also published in Perceptual and Motor Skills, v. 21: 563-569, Nov. 1965.

The roles of 2 task parameters, sequence length (N) and number of alternatives in the population from which the sequence was drawn (K), were examined in a tracking

task. The tasks were irregular step-function inputs wherein N was defined as the number of targets (steps) in a repeating sequence and K was defined as the number of alternative target positions. N and K were varied independently in a 3 x 3 factorial design with 9 Ss per cell. The major findings were that tracking performance, as measured by integrated error scores, is affected by increases in N, but not proportionately, while neither K nor the N x K interaction was significant. Relations of the results to verbal learning data are discussed.

VERBAL CODING AND DISPLAY CODING IN THE ACQUISITION AND RETENTION OF TRACKING SKILL, by D. Trumbo, L. Ulrich, and M. E. Noble. [1965] [8]p. incl. diagrs. table, refs. (AFOSR-66-1157) (AF AFOSR-64-526) AD 641623 Unclassified

Also published in Jour. Appl. Psychol., v. 49 368-375, Oct. 1965.

One-hundred twenty Ss were trained on a pursuit tracking task with an irregular step-function input. Cues for coding the task were introduced via pretraining and rehearsal of a numerical code and by display overlays in a 2 x 2 x 3 design, 3 levels of specificity of cues were provided by the overlays with the most specific condition providing a numerical code like that of pretraining. The results showed that both pretraining and display coding facilitated early reduction of tracking error, but that neither these nor rehearsal of the numerical code affected retention performance after 1 week. Taken together, these findings suggested that the verbal and display cues were used in the early coding of the task, but were less important later in practice and at retention.

ANALOG COMPUTER METHODS FOR SCORING CONTINUOUS PERFORMANCE RECORDS, by D. Trumbo and M. E. Noble. [1965] [8]p. incl. diagrs. (AFOSR-66-2093) (AF AFOSR-64-526) AD 642949 Unclassified

Also published in Perceptual and Motor Skills, v. 21 707-714, Dec. 1965.

Methods for scoring continuous records of tracking performance with analog signal correlator and frequency analysis systems are described. An index of lead-lag obtained from the correlator output is compared with discrete lead-lag scores obtained by hand scoring oscillographic records for three tasks which differ in amount of task coherence. The results indicate relatively high agreement between the two scoring methods and support the use of the correlator as the more efficient method. Sample data from the analog frequency analysis system are compared for operators with high and low integrated error scores. The results indicate consistently greater power in the response than in the input at the fundamental for both good and poor Ss, indicating a tendency to overshoot the target with the primary movement, but relatively more power in the initial odd harmonics for the better Ss. Ratios of target spectra to response spectra provide transfer functions for the human operator.

THE PREPARATION AND INFRARED EXAMINATION OF THE 2-, 3-, and 4-CYANOPYRIDINE COMPLEXES OF COPPER(I), SILVER(I), AND GOLD(I) PERCHLORATES, by F. Farha, Jr. and R. T. Iwamoto. [1965] [5]p. incl. tables, refs. (AFOSR-65-1656) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-220 and Petroleum Research Fund) AD 624326 Unclassified

Also published in Inorg. Chem., v. 4 844-848, June 1965.

The preparation of the bis 2-, 3-, and 4-cyanopyridine complexes of copper(I), silver(I), and gold(I) perchlorates and the tris 3-cyanopyridine complex of silver(I) perchlorate is described. Because both the nitrile group and the pyridine group in the cyanopyridine are capable of coordinating strongly with these ions, the IR spectra of the complexes were examined to determine the coordination site of the metal ions. In 3- and 4-cyanopyridine, the metal ions are bound to the pyridine nitrogen, and in 2-cyanopyridine they are bound to the nitrile nitrogen.

MECHANISM OF INORGANIC REACTIONS, by R. T. Iwamoto. Final scientific rept. Oct. 15, 1965, 6p. incl. refs. (AFOSR-65-1913) (AF AFOSR-63-220) AD 626137 Unclassified

Under this project, information has been sought which is fundamental to understanding better the mechanism of inorganic oxidation-reduction reactions by the use of nonaqueous solvents and of electrodes in place of either the oxidant or the reductant. Contents include studies on the problem of comparing electromotive force series

in various solvents the nature of ion-solvent and ion-ion interactions, the determination of the formation constants of aquo-copper(II) complexes in acetone, anion solvation, the effect of the secondary solvation sphere, and the electrochemical behavior of a selected group of metal ions in acetic acid. Acetylacetone is found to be the only nonaqueous solvent examined in which copper (II) perchlorate is reduced in one step as in water.

The exact solution of the Percus-Yevick equation for the radial distribution functions for a mixture of hard spheres is evaluated. The Laplace transforms found by Lebowitz are inverted numerically to obtain the radial distribution functions for a two-component mixture of hard spheres under varying conditions of size ratio, mol fraction, and number density Results are presented graphically. The distribution functions should portray valid information about the geometrical structure of fluid mixtures.

The objective of the research was the attack on 2 important photochemical problems through the use of radioactive tracer techniques. These problems are (1) the reaction of methylene with olefins utilizing CHT from the photolysis of CHT CO, and (2) the reactions of energetic hydrogen atoms (2 8 ev) with alkanes, using T atoms from the photolysis of TBr Trace levels in bulk components was utilized. In addition, isotopic differences in the reactions themselves have been evaluated. The most important results of the research have depended heavily on the development of techniques for gas chromatographic separation of isotopic isomers of olefins and alkanes

KINETIC ISOTOPE EFFECTS IN RECOIL TRITIUM REACTIONS THROUGH MEASUREMENT OF ISOTOPIC MOLECULE YIELDS, by E. K C. Lee, J. W Root, and F. S Rowland. [1965] [15]p. incl diagrs tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-534 and Atomic Energy Commission) Unclassified

Published in Chemical Effects of Nuclear Transformations Proc. of the Symposium on Chemical Effects Associated with Nuclear Reactions and Radioactive Transformations, Vienna (Austria) (Dec 7-11, 1964), Vienna, International Atomic Energy Agency, v. 1 55-71, 1965

Direct gas chromatographic separation of isotopic tritiated molecules has made it possible to obtain new data on both the intermolecular and intramolecular kinetic isotope effects on the hot displacement reaction These data provide results for several new systems, as well as confirming some of the experimental isotope effects determined previously by indirect competition methods The intermolecular kinetic isotope effect in

atom displacement reactions 1h and 1d

$$T^* + CH_4 \rightarrow CH_3T + H \qquad 1h$$

$$T^* + CD_4 \rightarrow CD_3T + D \qquad 1d$$

has been shown to be 1 33 ± 0.04 for the ratio (CH_3T CH_4) (CD_3T CD_4) in experiments carried out in CH_4 - CD_4 mixtures. The intramolecular kinetic isotope effect in the replacement of an alkyl group by an energetic tritium atom has been shown to be 1.25 ± 0.04 for the ratio CH_3T/CD_3T from CH_3CD_3. The 4 isotopic isomer molecules of propylene-t have been separated by gas chromatography and a similar separation carried out for several other tritiated butenes. Application of this analytical method to the olefinic radioactive products from recoil tritium reactions with gaseous propane, isobutane, n-butane and neo-pentance has provided information about the origin of these products The propylene-t formed from reactions of tritium with propane is about half CH_2TCH CH_2, indicating that the primary mechanism of its formation is by secondary decomposition of an excited molecule, rather than by a simultaneous double displacement of 2H atoms The separation of the products C_2H_3T, C_2H_2DT, C_2HD_2T and C_2D_3T from recoil tritium reactions with CH_3CD_3 has shown the major yields to be only of the 2 molecules, C_2H_2DT and C_2HD_2T. The ratio of C_2HD_2T C_2H_2DT is about 1.6. Taken with the other experiments concerning the origin of tritiated olefins from alkanes, these results show an isotope effect in the elimination of HD from $CH_2TDC_3^*$ vs CH_3CD_2T. The probable explanation for this effect is related to the energy deposition in the replacement of H vs D in very high energy reactions.

THE INSECT CORNEAL NIPPLE ARRAY, by C. G. Bernhard, W H. Miller, and A. R. Møller. [1965] [63]p incl. illus. diagrs. refs. (AFOSR-65-2730) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-62-13, National Institute of Neurological Diseases and Blindness and Swedish Medical Research Council) AD 627825 Unclassified

Also published in Acta Physiol. Scand., v. 63; Suppl. 243 9-79, 1965.

Also published in Gen. Systems v. 11, 63-91, 1966. (AFOSR-67-0913)

In electron microscopic studies it was found that the corneal surface of the facets of certain insect compound eyes is completely covered with congruent cone-shaped protuberances. This nipple array was found in different species of moths, butterflies, netflies, mosquitos, and caddisflies but not in species of bees, houseflies, and dragonflies. The function of this nipple array was elucidated by microwave experiments on scaled dielectric models and by spectrophotometric investigations on insect corneas. The results were confirmed by the application of a mathematical model. It is concluded that the nipple array acts as an impedance transformer to match the characteristic impedance (inverse of refractive index) of air to that of the lens material (chitin) and thus functions to decrease reflection from the corneal front surface and concomitantly increase the transmission of light through the cornea over a broad wavelength range. The biological significance of the nipple array for camouflage and increased visibility is discussed.

EFFECT OF DRUGS ON THE STORAGE GRANULES OF ADRENERGIC NERVES, by U. S. von Euler and F. Lishajko. [1965] [15]p. incl. diagrs. tables, refs. (AFOSR-65-1541) (AF EOAR-62-14) AD 624007 Unclassified

Also published in Pharmacology of Cholinergic and Adrenergic Transmission; Proc. Second Internat'l. Pharmacol. Meeting, Prague (Czechoslovakia) (Aug. 20-23, 1963), New York, Pergamon Press, 1965, p. 245-260.

A number of drugs have been tested on the spontaneous NA-release rate in isolated adrenergic nerve granules and on the ATP-dependent uptake of NA. The spontaneous loss of NA from granules is prevented or inhibited by NA (0.05-0 1 mm) and by ATP (1-5 mm) owing to NA-uptake balancing the release. ATP also has a marked protective effect. The L-isomer of NA is more active than the D-isomer in this respect, suggesting a preferential storage of the L-isomer.

UPTAKE OF CATECHOLAMINES BY THE HEARTS OF RABBITS TREATED WITH SEGONTIN, by B. R. MacKenna. [1965] [10]p. incl. diagrs. table, refs. (AFOSR-65-1550) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-64-31 and Swedish Medical Research Council) AD 623374 Unclassified

Also published in Acta Physiol. Scand., v. 63 413-422, 1965.

A single i. v. injection of 8 mg/kg of Segontin caused a fall in the NA content of rabbit hearts to approx 8% of their normal value in 2 hr. After 4 hr the tissue content of NA started to rise again, and after 24 hr it had recovered to approx.1/3 of its normal value. An i. m. injection of 0.75 mg/kg NA 2 hr after Segontin treatment caused a temporary rise in the NA content of the heart to the normal value. NA was increased in the coarse particle fraction, the high speed sediment, and in the particle free supernatant fraction of the heart after homogenization, indicating that the exogenous NA was temporarily filling the available storage sites. An i. v. infusion of NA caused an uptake of NA into the heart previously depleted by Segontin, followed by a rapid and then slower release of the NA. The uptake of l-NA and d-NA and also of l-A and d-A showed stereochemical specificity in favor of the l-isomers. Phenoxybenzamine blocked the uptake of NA into the heart of rabbits depleted by Segontin, whereas dichlorisoproterenol had only a small blocking effect. Phenoxybenzamine by itself reduced the NA content of all fractions of the heart.

UPTAKE AND EXCHANGE OF CATECHOLAMINES IN RAT TISSUES AFTER ADMINISTRATION OF d- AND l-ADRENALINE, by T. C. Westfall. [1965] [7]p. incl. diagrs. table, refs. (AFOSR-65-1551) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-64-31, National Institutes of Health, and Swedish Medical Research Council) AD 623373 Unclassified

Also published in Acta Physiol. Scand., v. 63 336-342, 1965.

The effect of d- and l-adrenaline (A) on the catecholamine (CA) content of heart and liver of the rat was studied at various times following i. m. administration. It was observed that both isomers are readily taken up by these tissues and exchanged for the normal neurotransmitter, noradrenaline (NA). The present experiments also present evidence for the uptake of both d- and l-NA into subcellular storage granules. The fall in the NA content of the organs was accompanied by an increased urinary excretion of NA. A slight steric preference for the storage in favor of the l-isomer is also shown.

Karolinska Inst Dept. of Physiology, Stockholm (Sweden)

ON THE OCCURRENCE OF TYRAMINE IN THE RABBIT BRAIN, by L -M Gunne and J Jonsson [1965] [6]p incl diagrs refs (AFOSR-66-1125) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-64-31 and Swedish Scientific Research Council) AD 639538 Unclassified

Also published in Acta Physiol. Scand., v. 64: 434-438, 1965.

After chromatographic separation on a strong cation exchange resin no tyramine could be detected in an extract of 6 pooled rabbit brains. This indicates that the whole brain content of tyramine must be below 10 ng/g wet tissue weight. This observation does not support the concept that tyramine should be an important metabolic precursor of noradrenaline in the brain.

1366

Karolinska Inst. Dept. of Physiology, Stockholm (Sweden)

UPTAKE OF CATECHOLAMINES IN THE RABBIT HEART AFTER DEPLETION WITH DECABORANE, by U. S. von Euler and F. Lishajko. [1965] [4]p. incl. tables, refs. (AFOSR-65-1553) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-65-52 and Swedish Medical Research Council)
AD 622770 Unclassified

Also published in Life Sci., v. 4: 969-972, 1965.

After 80 - 90% depletion of the rabbit heart with decaborane, injection of noradrenaline (NA) causes an increase of the amine content to near normal values. The amines taken up show normal distribution between the high speed sediment and supernatant, indicating a dynamic equilibrium between the particulate and the supernatant fractions. The amines taken up leave the heart gradually in approx. 20 hr. When either the l- or d-isomer of adrenaline (A) is injected together with l-NA, 2 - 3 times more of l-A than of d-A is taken up for the same amount of l-NA. The 2 isomers appear to leave the stores at a similar rate.

Karolinska Inst. Dept. of Physiology, Stockholm (Sweden)

THE ADRENERGIC INNERVATION OF THE VAS DEFERENS AND THE ACCESSORY MALE GENITAL GLANDS, by N. O. Sjostrand. [1965] [82]p. incl. illus. diagrs. tables, refs. (AFOSR-65-1919) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-65-52 and Swedish Medical Research Council)
AD 626660 Unclassified

Also published in Acta Physiol. Scand., Suppl., 257, v. 65: 1-82, 1965.

The adrenergic innervation of the vas deferens and the accessory male glands of some mammals, and the presence of adrenaline and chromaffin cells in these organs were investigated. The results are presented in 3 sections. (1) The effect of ganglionic blocking agents on the motor response of the isolated guinea-pig vas deferens to hypogastric nerve stimulation. (2) The catecholamine content of the accessory male genital organs of different species and the effect of sympathetic denervation upon this content. and (3) The cellular localization of the catecholamines. From the results it is concluded that: (1) The vas deferens and the accessory male genital glands of the examined species – in contrast to the general pattern of adrenergic innervation in mammals – are innervated by short adrenergic neurons and have an exceptionally rich adrenergic innervation, and (2) Adrenaline in the internal male genital organs is mainly stored in "chromaffin" cells.

STEREOSPECIFIC CATECHOLAMINE UPTAKE IN RABBIT HEARTS DEPLETED BY DECABORANE, by U. S. von Euler and F. Lishajko. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-65-2050) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-65-52 and Swedish Medical Research Council)
AD 627476 Unclassified

Also published in Internat'l. Jour. Neuropharmacol., v. 4: 273-280, Sept., 1965.

After 80 - 90% depletion of its noradrenaline (NA) content following decaborane, the rabbit heart may take up both NA and A to the normal capacity upon injection of amines. The amines taken up are well retained for several hr, but gradually disappear in the course of about 20 hr. The high speed sediment and supernatant of a homogenate of the heart contain approximately constant proportions of NA, irrespective of the total amount, indicating a dynamic equilibrium between these pools. When the D- or the L-isomer of A are given together with L-NA, simultaneously and in equal amounts, the uptake of L-A is 2 - 3 times larger than that of D-A, relative to the uptake of L-NA. This ratio is unchanged over a period of from 1 min-4 hr after the injection of the amine mixture. It is suggested that the uptake is partly stereospecific but that once taken up in the specific stores, the L- and D-isomer are released at approximately the same rate.

Karolinska Inst. Dept. of Physiology, Stockholm (Sweden)

REFILING OF NORADRENALINE STORES IN THE PRINYLAMINE-DEPLETED RABBIT HEART AFTER INJECTION OF OCTOPAMINE AND TYRAMINE, by U. S. von Euler and F. Lishajko. [1965] [4]p. incl. diagr. (AFOSR-65-2051) (AF EOAR-65-52)
AD 627473 Unclassified

Also published in Life Sci., v. 4: 1421-1424, 1965.

Under normal conditions only small amounts of octopamine or tyramine are converted to noradrenaline (NA) in vivo or in the isolated perfused heart. After depletion of the stores with prenylamine, it is found that both these amines are capable of rapidly restoring the NA content in the rabbit heart to a considerable extent. Similar refilling effects were observed with dopamine, phenylethylamine, l-dopa and l-tyrosine but not with phenylalanine. Synephrine caused a refilling with noradrenaline and adrenaline. It is assumed that the amines studied could act partly by being converted to noradrenaline, not only by releasing performed transmitter.

DISTRIBUTION AND FUNCTION OF ADRENERGIC NERVES IN THE RABBIT FALLOPIAN TUBE, by J. Brundin. [1965] [53]p. incl. illus. diagrs. tables, refs. (AFOSR-65-2510) (AF EOAR-65-52) AD 628115 Unclassified

Also published in Acta Physiol. Scand., Suppl 259, v. 66: 5-57, 1965.

The distribution and function of the adrenergic nerves in the rabbit oviduct were studied by several experimental procedures. Catecholamine estimations revealed high amounts in the ampulla-infundibulum, indicating that the adrenergic innervation was rich in the isthmus and sparse in the rest of the organ. Pretreatment with estrogen and progesterone did not alter the oviduct content of noradrenaline but influenced the weight of the organ. In non-mated estrous and anestrous rabbits a mean isthmic opening pressure of about 30 mm Hg indicated that the isthmus was actively closed. Electrical stimulation of the hypogastric nerves immediately below the inferior mesenteric ganglia increased the opening pressure of the isthmus The various degrees of constriction in the isthmus, obtained at different stimulation frequencies, could be reproduced by different doses of noradrenaline injections. The similarity of the distribution of adrenergic nerves in the rabbit oviduct and in the human Fallopian tube is pointed out on the basis of certain functional gynecological disorders

Karolinska Inst. Dept of Physiology, Stockholm (Sweden)

RELEASE OF CARDIAC NORADRENALINE BY DECABORANE IN THE HEART-LUNG PREPARATION OF GUINEA PIG, by A Oliverio [1965] [6]p. incl diagr. table (AFOSR-66-0790) (AF EOAR-65-52) AD 633331 Unclassified

Also published in Biochem. Pharmacol., v 14: 1689-1692, Nov. 1965.

Merrit et al reported the ability of decaborane ($B_{10}H_{14}$) to deplete noradrenaline from the rat brain. Recently Euler and Lishajko have found that decaborane (10^{-5}M) releases catecholamines from isolated adrenergic nerve granules A striking decrease of the noradrenaline content in the rabbit organs 24-48 hr after the administration of 4 mg/kg of this drug has been shown by the same authors. The depletion of the heart catecholamines was found to be 80-90%. The action of decaborane was previously studied in vivo by i.p or s.c. administration. With this procedure it is difficult to follow the first phase of the depletion process In an attempt to gain further information on the problem the effects of acute administration of decaborane on the release of ^{3}H noradrenaline from the heart were studied using the heart-lung preparation of guinea pig.

Karolinska Inst Dept. of Physiology, Stockholm (Sweden)

CATECHOLAMINE DEPLETION AND UPTAKE IN ADRENERGIC NERVE VESICLES AND IN RABBIT ORGANS AFTER DECABORANE, by U S von Euler and F. Lishajko. [1965] [8]p. incl diagrs table, refs. (AFOSR-66-0998) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-65-52, National Institutes of Health, and Swedish Medical Research Council) AD 634551 Unclassified

Also published in Acta Physiol Scand., v 65: 324-330, 1965.

Decaborane ($B_{10}H_{14}$) increases the release rate of noradrenaline (NA) from isolated nerve vesicles in concentrations of 10^{-5}M and stronger. The NA retention in nerve vesicles incubated in the presence of NA and of ATP is decreased by decaborane 10^{-4}M, which also inhibits the ATP_4-dependent NA uptake in partially depleted vesicles In a dose of 4 mg kg i p decaborane gradually decreases the catecholamine stores in various organs of the rabbit Between 24-48 hr after the decaborane injection the NA content in the heart is about 10-20% of the normal value Injection of NA, 0.3 - 0.4 mg/kg i.m., increases the NA content in the heart to near normal in 1-2 hr, whereafter it falls to the previous low value in some 20 hr. The NA taken up by the rabbit heart after depletion with decaborane is distributed between the high speed sediment and the supernatant in the same proportions as found in the normal heart suggesting a dynamic equilibrium between the vesicles and the non-vesicular pool

Karolinska Inst Dept of Physiology, Stockholm (Sweden).

ADRENOMEDULLARY RESPONSE TO 2-DEOXYGLUCOSE IN THE HYPOTHYROID, EUTHYROID, AND HYPERTHYROID RAT, by D G Johnson [1965] [7]p. incl diagrs table, refs. (AFOSR-66-1000) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-65-52, Public Health Service, and Swedish Medical Research Council) AD 634580 Unclassified

Also published in Acta Physiol. Scand., v 65: 337-343, 1965.

Hypothyroid animals show an increased hyperglycemic response to 2-deoxyglucose (2-DG) administration, while hyperthyroid animals show a decreased response when compared to euthyroid controls This quantitative difference in response is reflected in a much greater depletion of the adrenaline content of the adrenals of the hypothyroid animals, while the hyperthyroid animals appear less depleted than euthyroid controls Estimation of urinary catecholamine excretion following 2-DG administration indicates that the hypothyroid rats excrete much larger amounts of adrenaline than the other groups The hearts of all animals treated with 2-DG contain increased absolute and relative amounts of adrenaline, with the largest absolute increase being seen in the

hyperthyroid animals. These results suggest that the adrenomedullary response to cellular glucopenia is modified by the thyroid status This action may be exerted either at the level of the adrenal medulla itself or on the blood glucose receptor neurons of the hypothalamus

ACCELERATION OF NORADRENALINE TURNOVER IN THE MOUSE HEART BY COLD EXPOSURE, by A. Oliverio and L Stjarne [1965] [5]p. incl diagrs refs. (AFOSR-66-1126) (AF EOAR-65-52) AD 639827 Unclassified

Also published in Life Sci., v. 4: 2339-2343, 1965.

The rate of disappearance of tritiated noradrenaline (^{3}H-NA) from the hearts of mice was markedly increased by cold exposure This indicates that local NA synthesis in the sympathetic nerves of the heart may be feed-back regulated by changes in nervous activity However, even the severest tolerable cold-exposure accelerated the NA disappearance rate, and thus possibly NA synthesis, at the most 2-3-fold Since cold exposure may not be an adequate stimulus to produce a maximum activity in the cardio-accelerator nerves, it is conceivable that other types of stimulation might further accelerate the NA turnover in the heart

ON THE STATIC RESPONSE OF ANNEALED ALUMINUM, by M. J Kenig and O W Dillon, Jr [1965] [9]p incl. diagrs. table, refs (AFOSR-67-2447) (AF 49(638)1306) AD 660386 Unclassified

Presented at Ninth Midwestern Mechanics Conf. Wisconsin U., Madison, Aug 16-18, 1965.

Experimental data on biaxially stressed, commercially pure (1100 alloy) annealed aluminum loaded in tension and torsion are presented Very slow loading is used so that the duration of each test is about 6 weeks. The first derivative of the resulting stress-strain relation is discontinuous. At discrete values of the average stress small increases in load cause large irreversible changes in strain. At these stresses, the material is said to be mechanically unstable. The main point of this paper is the demonstration that at unstable loads a single "yield surface" in stress space corresponds to two surfaces in strain space Therefore, compliances used in incremental theories of plasticity are discontinuous and the regions of applicability of such theories are restricted

Unclassified

Also published in Ann. Endocrinol. (Paris), v. 26: 385-392, Aug. 1965.

Kopriwa and Leblond's autoradiographic procedure was successfully adapted to the study of the basophil cells of the rat adenohypophysis under the following conditions: I P injection of 1 microcurie of H3-proline/g, B.W., 4 u sections of appropriately fixed and embedded pituitaries stained with P A S and coated with a photographic emulsion, counting of individual silver grains, after 30 days of exposure, in the emulsion overlying the whole adenohypophysis, as well as in the thyrotroph and gonadotroph cells In material from intact animals the incorporation of H3-proline, rapid during the first hr after the injection, slows down to a relatively constant rate during the subsequent 17 hr Thyroidectomy, performed 4 weeks prior to the injection, resulted in markedly enhanced incorporation of the tritiated amino acid by the thyrotrophs, and in depressed incorporation by the gonadotrophs. These changes are interpreted in terms of altered synthesis of the corresponding pituitary hormones.

Also published in Federation Proc., v. 24, Mar.-Apr. 1965.

The effect of cold on the activity of the 3 glands was studied by concurrent assays of pituitary and plasma Thyroid Stimulating Hormone, plasma thyroxine and plasma corticosterone In short term studies, temperatures from 13 C to -10 C caused increased TSH secretion and progressively greater corticosterone responses Intervals from 2 5 min to 64 days were then used for a detailed study of acute and long-term changes following continuous exposure to 5 C Plasma TSH reached an initial peak at 40 min, a second at 12 hr, and then remained slightly elevated Depletion of pituitary TSH after 1 day gave way to supernormal concentrations after 5 days followed by a return to normal A significant rise in plasma thyroxine was not recorded before 24 hr; longer exposure led to low levels (60-70%), suggesting increased inactivation or decreased binding of T-4 to plasma proteins Maximum plasma corticosterone was reached in 20 min Slightly elevated values, seen after a few days, gradually returned to normal The 40 min plasma TSH response was unaltered by prior adrenalectomy High post-thyroidectomy levels were further increased at 5 C

TWO METHODS FOR DETERMINING THE CORTICOSTERONE-BINDING CHARACTERISTICS OF TRANSCORTIN (Abstract), by F. Labrie, M. Norman and others. [1965] [1]p (AFOSR-66-2468) (AF AFOSR-65-511) AD 643250
Unclassified

Presented at Eighth annual meeting of the Canad. Fed Biol Soc., Ottawa U., Ontario (Canada), June 9-11, 1965

Also published in Proc Canad Fed. Biol Soc., v 8: 40, 1965

Thyroxine-induced enhancement of plasma corticosterone binding by transcortin was evidenced, in previous studies, by equilibrium dialysis and gelfiltration The binding capacity of transcortin being a function of the total number of its binding sites (NS_t), and of its association constant (K_t), the observed effect of thyroxine was analyzed in these terms by two related methods respectively involving combined dialysis and gel-filtration, and dialysis alone for determining the equilibrium of corticosterone with plasma proteins for increasing concentrations of the steroid. Graphic solution of the first method was obtained from the regression of the reciprocals of the transcortin-bound corticosterone concentrations over the reciprocals of the unbound corticosterone concentrations, the slope corresponding to $1/K_t$; and the intercept on the 'Y' axis, to $1/K_tNS_t$ For the second approach, the total corticosterone concentration was plotted vs the unbound moiety. The slope of the rectilinear component of the resulting curve gave the ratio of albumin-bound corticosterone to its unbound moiety Extrapolation of this linear component to the 'Y' axis yielded NS_t, whereas $1/K_t$ was obtained by extending to the 'X' axis a perpendicular dropped from the intercept of the curve by a line parallel to its linear component and originating at $NS_t \cdot 2$ on the 'Y' axis. Similar results were obtained by the 2 methods, showing a markedly predominant effect of thyroxine on the number of binding-sites of transcortin

SURFACE STATES IN PURE PALLADIUM, by R W. Zuehlke Final rept. Oct 1, 1962-Mar. 1, 1965 July 1965 [15]p incl. diagrs. refs. (AFOSR-65-1482) (AF AFOSR-63-114) AD 623341 Unclassified

Magnetic susceptibility studies on small crystal (112A - 500A) palladium blacks and studies of the interaction of adsorbed nitric oxide with palladium surfaces through magnetic susceptibility and standard adsorption techniques have been made. The observed dependence of the magnetic susceptibility of palladium on particle size is consistent with a postulate of a band of electronic surface states lying slightly above the bulk 4-d band. Sorption studies indicate that nitric oxide is adsorbed at room temperatures to slightly more than monolayer coverage in both a physisorbed and a weakly energetic chemisorbed state. In addition, a complex cooperative electronic rearrangement apparently occurs over a small temperature range around room temperature and at monolayer coverage. (Contractor's abstract)

COMPUTATIONAL, PHONOLOGICAL AND MORPHOLOGICAL LINGUISTICS AND RETRIEVAL STUDIES. GRAMMARS AND TEXT ANALYSIS, by D. J. Hillman. Aug. 23, 1965, 20p incl. refs. (Rept no. 1) (AFOSR-65-1892) (AF AFOSR-65-724) AD 621128 Unclassified

The role of grammatical analysis in processing text for document and message retrieval is explored and certain requirements are formulated. The utility of transformational grammars in text analysis is examined by considering whether transformations are (a) meaning-preserving, (b) truth preserving, and (c) information preserving. The inquiry reveals that transformations themselves do not preserve meaning, truth, or information content. Such grammars provoke methodological irrelevancies, leading to a strong negative recommendation concerning their use in text processing. It is suggested that questions of structure for document and message retrieval be explored from a different point of view which combines approaches from statistics, syntax, and semantics. Criteria for measuring the simplicity of a grammatical model are discussed (Contractor's abstract)

VECTOR FIELDS AND INFINITESIMAL TRANSFORMATIONS ON ALMOST-HERMITIAN MANIFOLDS WITH BOUNDARY, by A. L. Hilt and C.-C Hsiung. [1965] [26]p. incl. refs. (AFOSR-65-1035) (AF 49(638)1009) AD 619352 Unclassified

Also published in Canad. Jour. Math., v. 17: 213-238, Mar.-Apr. 1965.

An investigation is made of vector fields and infinitesimal transformations on almost-Hermitian manifolds with boundary. Riemannian manifolds are considered, as well as Lie derivatives over the manifolds, local boundary geodesic co-ordinates, and integral formulas. A Killing vector field on a compact orientable Riemannian manifold is discussed, and almost-Hermitian, almost-semi-Kählerian, and almost-Kählerian structures are defined. Contravariant analytic vector fields are given consideration on an almost-Hermitian manifold M^n with boundary B^{n-1}, together with their relations to Killing, projective Killing, and conformal Killing vector fields. Covariant analytic vector fields on an almost-Hermitian manifold with boundary are studied as well as vector fields on an almost-Kählerian manifold with boundary.

FINE CONTROL OF PHOSPHOPYRUVATE CARBOXYLASE ACTIVITY IN ESCHERICHIA COLI, by J. L Cánovas and H. L. Kornberg. [1965] [4]p incl. diagrs table, refs (AFOSR-65-0957) (AF EOAR-63-17) AD 617990 Unclassified

Also published in Biochim. et Biophys. Acta, v. 94: 169-172, Jan. 1965.

Studies with mutants of S typhimurium and E coli which fail to grow on glucose-salts media unless such media are supplemented with intermediates of the tricarboxylic acid cycle have shown that the carboxylation of phosphoenolpyruvate (PEP) is necessarily involved

in the maintance of the cycle. However, the quantities of phosphoenolpyruvate carboxylase, detected were in insufficient quantities to maintain the reaction. A considerably higher efficiency of isotope incorporation was observed when E. coli were incubated with acetate, ATP, and CoASH in addition to PEP, $H^{14}CO_3^-$ and Mg^{2+}. It is pointed out that PEP is an essential for the reaction and that the enzyme activity needed for the carboxylation of PEP is enhanced by the presence of CoASAc This compound is in return a product of PEP catabolism and is completely combusted in the scheme. The result is that a control system is established based on the particular needs of the orgamsm for oxaloacetate to enter the tricarboxylic acid cycle.

THE UTILIZATION OF ACONATE AND ITACONATE BY MICROCOCCUS SP., by R A. Cooper, K Ihaba, and H. L. Kornberg. [1965] [7]p. incl. diagrs. tables. refs. (AFOSR-65-2516) (AF EOAR-63-17) AD 627825 Unclassified

Also published in Biochem. Jour., v. 94: 25-31, Jan. 1965.

An organism, identified as Micrococcus sp., was isolated by elective culture on aconate, it also grew on itaconate. Washed suspensions of the aconate-grown organism readily oxidized intermediates of the tricarboxylic acid cycle, aconate and succinic semialdehyde, but not itaconate. Itaconate-grown cells oxidized tricarboxylic acid-cycle intermediates, succinic semialdehyde and itaconate, but not aconate. Succinate-grown cells oxidized neither itaconate nor aconate Extracts of aconate-grown cells catalyzed the formation of succinic semialdehyde and carbon dioxide, in equimolar amounts, from aconate. In the presence of NAD or NADP, succinic semialdehyde was oxidized to succinate with concomitant reduction of the coenzyme. Extracts of itaconate-grown cells catalyzed the formation of pyruvate and acetyl-CoA from itaconyl-CoA. Key enzymes involved in the formation of succinate from aconate, and of pyruvate and acetyl-CoA from itaconate, were distinct and inducible; their formation preceded growth on the appropriate substrate.

THE BIOSYNTHESIS OF ALANINE BY CLOSTRIDIUM KLUYVERI, by I G. Andrew and J. G. Morris. [1965] [4]p. incl. diagr. tables, refs. (AF EOAR-63-17) Unclassified

Published in Biochim et Biophys. Acta, v. 97: 176-179, Jan. 1965.

This communication reports the operation of the pyruvate synthase system in clostridium kluyveri, an anaerobic organism which grows on a medium containing only acetate and ethanol as organic carbon sources despite the absence of isocitrate lyase and hence of the glyoxylate cycle. The strain of C. kluyveri used, was isolated from canal mud by anaerobic enrichment culture on the synthetic medium, without yeast extract and with acetate, ethanol and carbonate as sole carbon sources It was maintained by frequent subculture at 37° in this medium Results indicate the operation in C. kluyveri of a ferredoxin-dependent mechanism for the carboxylation of acetyl-coenzyme A, which results in the rapid production of alanine in the growing organism.

THE UTILIZATION OF GLYCOLLATE BY

MICROCOCCUS DENITRIFICANS: THE β-HYDROXYASPARTATE PATHWAY, by H. L. Kornberg and J. G. Morris [1965] [10]p. incl. diagrs. tables, refs. (AF EOAR-63-17) Unclassified

Published in Biochem. Jour., v. 95, 577-586, June 1965.

Micrococcus denitrificans utilized glycollate as sole carbon source for aerobic growth. Glyoxylate was utilized less well, and though glycine alone did not support growth it enhanced growth on glyoxylate. During growth on glycollate, ^{14}C was incorporated from [2-^{14}C]glycollate into glycine and thence into aspartate, malate and glutamate. No phosphoglycerate was labelled at the earliest times. Glyoxylate was the first product of glycollate utilization, and glycollate oxidase was inducibly formed on transfer of the organism to glycollate-containing media. Extracts of glycollate-grown M. denitrificans contained negligible glyoxylate-carboligase activity and only low tartronate semialdehyde-reductase activity. erythro-β-Hydroxyaspartate is a key intermediate in glyoxylate utilization by this organism. Enzymes catalyzing (a) the synthesis of erythro-β-hydroxyaspartate from glyoxylate and glycine, and (b) the conversion of erythro-β-hydroxyaspartate into oxaloacetate, were inducibly formed during growth on glycollate and on other substrates yielding glyoxylate. Methods for the assay of these enzymes were developed. It is concluded that in M. denitrificans the biosynthesis of cell materials from glycollate is accomplished by the "β-hydroxyaspartate pathway," a novel metabolic route that may also perform a catabolic role in glyoxylate oxidation.

THE EFFECT OF ADDED ELECTROLYTES ON THE E.S.R. AND OPTICAL ABSORPTION OF METAL-AMMONIA SOLUTIONS, by M. C. R. Symons. Final rept. Jan. 1965, 12p. (AFOSR-65-1938) (AF EOAR-62-64) AD 627274 Unclassified

The electron spin resonance of solutions of alkali metals in liquid ammonia was studied as a function of the concentration of metal and of added alkali metal halides. When the concentration of metals is small ($< 10^{-2}$m) there are small negative deviations in the g-factor for added chlorides and bromides but very large negative deviations for added iodides, the shifts for a given salt molality being then a function of the cation. These shifts are enhanced at higher metal concentration and higher temperatures, and are accompanied by a marked increase in line-width. The visible and near IR absorption spectra of some of these solutions was measured and the appearance of a shoulder in the 12,500 cm^{-1} region was confirmed. These results are discussed in terms of a specific interaction between unpaired electrons and iodide ions. Evidence that solvated electrons are quite strongly confined to cavities in the solvent is summarized, and a simple model is suggested which links the optical properties of solvated electrons to those of F centers in alkali-halide crystals and to those of solvated halide ions.

DERIVATION OF MAXWELL'S EQUATIONS. THE ATOMIC FIELD EQUATIONS, by S. R. de Groot and J. Vlieger. [1965] [16]p. (AFOSR-65-1084) (AF EOAR-62-99) AD 619607 Unclassified

Also published in Physica, v. 31, 125-140, Feb. 1965.

From the electromagnetic equations for fields produced by point particles, the field equations, taking into account the existence of stable atoms, are derived in covariant form. These atomic field equations involve, besides the field tensor (e, b), an atomic polarization tensor (p, m) or alternatively the field tensor (d, h) = (e + p, b - m). The atomic polarization tensor is given as a function of atomic positions and velocities of proper electric dipole, quadrupole, and magnetic dipole moments, and of time derivatives of these quantities. The proper atomic multipole moments are defined in Lorentz frames in which the atoms are momentarily at rest.

Leyden U. Lorentz Inst. (Netherlands)

DERIVATION OF MAXWELL'S EQUATIONS. THE STATISTICAL THEORY OF THE MACROSCOPIC EQUATIONS, by S. R. de Groot and J. Vlieger. [1965] [14]p. incl. refs. (AFOSR-66-1541) (AF EOAR-62-19) AD 638071 Unclassified

Also published in Physica, v. 31, 254-268, Mar. 1965.

The macroscopic Maxwell equations are derived in covariant way from the "atomic field equations." The latter were themselves obtained previously from the field equations of electron theory for point particles, by means of a covariant multipole expansion. In the statistical derivation an appropriate averaging procedure is used in a so-called "fluxion space," i.e., the space spanned by the atomic positions, the atomic multipole moments and the first and higher time derivatives of these variables, on which the fields may depend. Retardation of the fields is also taken into account.

AIR FORCE SCIENTIFIC RESEARCH BIBLIOGRAPHY. VOL. III, 1959, by G. V. Hooker, D. C. Yates and others. 1965, 693p. incl. refs. (AFOSR-700-5) (CSO-680-66-4) AD 626600 Unclassified

This bibliography includes abstracts of all technical reports, journal articles, books, symposium proceedings, and monographs produced and published by scientists supported in whole or in part by the Air Force Office of Scientific Research during the calendar year 1959. The Air Force Office of Scientific Research supports fundamental research in the five major scientific disciplines: physics, chemistry, engineering

sciences (subsuming mechanics and propulsion), life sciences (both biological and behavioral, but not medical), and mathematics (including during the period of this bibliography, the information sciences). Thus, these abstracts are multi-disciplinary, their common link being their support by AFOSR. References, reports, and clues to the existence of reports were found by searching the indexes and report collection of the Air Force Office of Scientific Research Technical Library, and the collection of the Defense Documentation Center. Detailed searches were made of each contract file in the several AFOSR Directorates. In addition, cover-to-cover searches were made of over 200 scientific journals issued mostly in the time period 1959-1962. This volume of the bibliography consists of approximately 2300 references. A detailed subject index, arranged alphabetically, and a special subject classification for mathematics, are provided. In addition, there are a contract index, AFOSR control number index, and a personal author index.

DERIVATION AND SOLUTION OF THE EQUATIONS OF COMPATIBILITY OF A GAS, by R. Berker. Final rept. May 3, 1965, 129p. incl. refs. (AFOSR-65-1227) (AF 61(052)710) AD 621251 Unclassified

A gas is considered which has no viscosity and which is thermally nonconducting. By eliminating all unknown quantities, other than the velocity, which govern the motion of the gas, equations of motion are obtained which contain only the velocity and the known external force. The particular cases of steady motion, plane motion, and rotationally symmetric motion are examined. The inverse method is then applied in order to obtain new solutions of the equations of motion. The gas of Prim and the perfect gas are considered; and finally the methods developed are applied to steady plane motion, the streamlines of which are isometric curves, and rotational Prandtl-Meyer flows around a corner, performed by a gas which is neither perfect nor a gas of Prim.

THE THERMODYNAMICS OF VAPORIZATION IN THE BERYLLIUM OXIDE-BORON OXIDE SYSTEM, by P. E. Blackburn and A. Büchler. [1965] [6]p. incl. diagrs. table, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 49(638)1171, Advanced Research Projects Agency, and Army Research Office (Durham)) Unclassified

Published in Jour. Phys. Chem., v. 69, 4250-4255, Dec. 1965.

Vaporization and the phase relationships in the beryllium oxide-boron oxide system were studied by Knudsen effusion using a vacuum balance and a mass spectrometer and by differential thermal analysis. Gaseous beryllium metaborate, $Be(BO_2)_2$, was identified mass spectrometrically in the vapor above the system. Solid $Be_3B_2O_6$ (mp 1495 ± 5°) was found to be the only condensed mixed oxide. The following thermodynamic values were obtained for the formation of gaseous metaborate from beryllium oxide and gaseous boron oxide $BeO(c) + B_2O_3(g) = Be(BO_2)_2(g)$ (ΔH_{1500} - 22 ± 5 kcal/mol; ΔS_{1500} - 6 ± eu/mol). For the formation of solid $Be_3B_2O_6$ from the condensed oxides, $3BeO(c) + B_2O_3(l) = Be_3B_2O_6(c)$ (ΔH_{1500} - 23 ± 5 kcal/mol; ΔS_{1500} -13 ± 3 eu/mol). The metal-anion bond strengths in the gaseous lithium and beryllium metaborates show the same relation to each other as the bond strengths in the corresponding chlorides, thus further confirming the pseudohalide character of the gaseous metaborates. RESEARCH ON ELECTROMAGNETIC PLASMA ACCELERATION (Abstract), by A. S. Penfold and R. M. Rosen. [1965] [1]p. (Bound with AFOSR-65-1266, AD 622527) (AF 49(638)1251) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

This research is concerned with the behavior of plasma produced by electrodeless discharges in magnetic fields of the traveling-wave type. The plasma is highly ionized and relatively tenuous, and an attempt is made to attain acceleration with no slip between the plasma and the field. The desired result is a series of pinched plasma toroids moving at speeds which equal or exceed the speed of the traveling wave. The entire process of production and acceleration is nonsteady. A 10-phase traveling-wave machine consisting of an outer coil and an inner (ferrite loaded) coil, which together define an annular region for acceleration, has been constructed. Because of the hazards accompanying the use of mercury, initial operation of the accelerator was accomplished using argon gas. Significant amounts of thrust were observed when, and only when, the electrical tuning of the accelerator was close to ideal. The speed of the beam, measured at a point about 25 cm downstream from the accelerating channel, was observed to be about one-sixth of the field speed. No evidence of plasma pinching was seen. Following these tests the mercury feed system was assembled and installed. The behavior of the plasma in the fringing region of the field is of particular interest since undesirable effects occur there. A method for nearly all the undesirable effects has been discovered.

FLUID MECHANICS AND HEAT TRANSFER UNDER LOW GRAVITY, PROCEEDINGS OF A SYMPOSIUM, Palo Alto, Calif., June 24-25, 1965, ed. by H. Cohan and M. Rogers. [1965] [477]p. incl. refs. (AFOSR-65-1841) [AF 49(638)1496] AD 633580 Unclassified

The proceedings contain 16 papers presented at the Symposium. These papers are concerned with analytical and experimental work covering a wide spectrum of the present state of knowledge and the art in fluid mechanical containment, fluid transfer, and fluid behavior under low gravitational conditions. The volume therefore serves not only as a useful reference for the workers in the field but should prove a useful tool in charting the paths for future research and development in the field of fluid mechanics and heat transfer under low gravitational conditions.

U(12) AND VECTOR MESON DECAYS, by F. Hussain. [1965] [2]p. (AFOSR-65-1349) (AF EOAR-62-87) AD 622900 Unclassified

Also published in Phys. Ltrs., v. 15, 78-79, Mar. 1, 1965.

The group U(12) has recently been suggested as the covariant generalization of the SU(6) group structure. Using a unique expression for the 3 meson vertex, it was found that the decay of $\omega \to \rho\pi$ is forbidden. In the present note the following ratios for decay rates are found: $\frac{R(\omega \to K\bar{K})}{R(\omega \to 2\pi)} \frac{3}{57} \frac{R(\rho \to 2\pi)}{R(K^* \to K\pi)} 3.3$. The selection rule $\omega \not\to \rho\pi$ was obtained in SU(6) by λ' quark spin conservation. Relations obtained by total quark spin conservation in SU(6) were not always easily interpreted because of the presence of orbital angular momentum. In U(12) this difficulty does not occur.

SU(6) IN A BARYON BOOTSTRAP MODEL, by R. H. Capps. [1965] [3]p. incl. refs. (AFOSR-65-1350) (AF EOAR-62-87) AD 621599 Unclassified

Also published in Phys. Rev. Ltrs., v. 14, 31-33, Jan. 4, 1965.

In the SU(3)-invariant, reciprocal bootstrap model, it is difficult to treat the B_8 and B_{10} multiplets on equal footing by including scattering states of the type P_8B_8. The purpose of this note is to construct a simpler baryon bootstrap model. The standard model is first complicated by adding to it a vector meson singlet and octet, and then simplified by neglecting the $B_8 - B_{10}$ mass difference and taking all the mesons to have a common mass small enough for the static model to be used. Certain properties of SU(6) can then be used to find a solution to the bootstrap problem.

U-SPIN AND THE MASS SPLITTING OF UNITARY MULTIPLETS, by G. Feldman and P. T. Matthews. [1965] [12]p. incl. diagrs. (AFOSR-65-1780) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-62-87 and National Science Foundation) AD 626334 Unclassified

Also published in Ann. Phys., v. 31, 469-480, Feb. 24, 1965.

The relations between the masses in a unitary multiplet are derived from the U- and I-spin properties of the mass splitting interactions. Various simple rules—the Parallelogram Law and the nth Difference Rule—are derived. It is shown that the Gell-Mann-Okubo formula is just an equal spacing rule for particles within a U-multiplet.

WEAK INTERACTIONS, by P. T. Matthews. [1965] [15]p. incl. refs. (AFOSR-65-1781) [AF EOAR-62-87] AD 626333 Unclassified

Also published in Proc. Roy. Soc. (London), v. 285A: 214-228, Apr. 1965.

The present status of weak interactions is review with particular reference to the implications of a current-current interactions, the $\Delta Y/\Delta Q$ rule for currents, and the $\Delta I = 1/2$ rule for non-leptonic transitions. The properties of leptons and the exchange of intermediate charged vector bosons are considered. With regard to semi-leptonic processes, hypercharge conserving reactions and hypercharge changing semi-leptonic decays are reviewed. Problems are discussed as a result of the equation $\Delta Y = 1$ for non-leptonic decays. In the paper it is assumed that intermediate bosons exist but $\Delta Y = \Delta Q$ semi-leptonic transitions do not.

MASS SPLITTING IN A BOOTSTRAP MODEL OF FOUR MULTIPLETS, by R. H. Capps. [1965] [8]p. incl. tables, refs. (AFOSR-65-1852) (AF EOAR-64-46) AD 626343 Unclassified

Also published in Phys. Rev., v. 137, B1545-B1552, Mar. 22, 1965.

A bootstrap model of the pseudoscalar meson octet (P), vector meson octet (V), baryon octet (B), and baryon $J^P = 3/2^+$ decuplet (B*) is considered. A simple dynamical equation, used previously to predict the mass-splitting of the P and V multiplets, is applied to the B and B* multiplets. The approximations used are crude, but the calculated results agree closely with the experimental baryon masses. The main reasons for this agreement are expressed simply in terms of various Clebsch-Gordan coefficients of SU_3. The terms in the equation that are not linear in the mass splitting lead to an appreciable violation of the Gell-Mann-Okubo formula for the V mesons, and to negligible violations of the corresponding formulas for the B and B* multiplets. Matrix ND^{-1} dispersion relations are used to clarify the basic physical assumptions involved in the dynamical equation.

ON THE COVARIANT EXTENSION OF SU(6), by J. M. Charap and P. T. Matthews. [1965] [13]p. incl. refs. (AFOSR-65-1853) (AF EOAR-64-46) AD 626341 Unclassified

Also published in Proc. Roy. Soc. (London), v. 286A, 300-312, July 1965.

The covariant generalizations of SU(6) invariant interactions are considered within the framework of $U(6) \otimes U(6)$. This group, in general, appears to lead to parity doubling for the mesons, but not the baryons. However, the parity doubling interpretation implies indefinite metric, which can be avoided by using the Bargmann-Wigner equations to eliminate the offending terms. These equations relate sets of terms, which would together make multiplets of U(12), and the multiplets correspond physically to those of SU(6). Five different Yukawa interactions are derived, invariant with respect to $U(6) \otimes U(6)$, all of which have the SU(6) static limit. The linear combination of these is found which is invariant for U(12).

ITERATED CROSSED BOX DIAGRAM IN THE COMPLEX ANGULAR MOMENTUM PLANE AND BETHE-SALPETER EQUATION, by [illegible]. [1965] [15]p. incl. diagrs., refs. (AFOSR-65-1554) [AF EOAR-64-46] AD 626345 Unclassified

Also published in Commun. Math. Phys., v. 1, 112-126, 1965.

The analytic properties of the iterated crossed box diagram are considered in the complex angular momentum plane by using the partial wave Bethe-Salpeter equation. It is shown that the kernel of the Bethe-Salpeter equation is of the Hilbert-Schmidt type in the domain $\Delta(1, s)$: $1 \le s$, $\mathrm{Re}\, l > -3/2$, $\mathrm{Im}\, s \ne 0$ having a simple pole at $l = -1$. This pole produces in the whole amplitude a singularity found by Gribov and Pomeranchuk since the kernel is not of finite rank.

INELASTIC BOUND-STATE SCATTERING IN SEPARABLE APPROXIMATION, by J. T. Cushing. [1965] [11]p. (AFOSR-65-1855) [AF EOAR-64-46] AD 626335 Unclassified

Also published in Nuovo Cimento, Series X, v. 36, 905-915, Apr. 1, 1965.

The inelastic contributions to the scattering amplitude describing the scattering of an elementary particle from a bound state are calculated explicitly from the Fadeev equations for separable interactions. The inelastic terms are then combined with the previously calculated elastic amplitude and the analytic properties of the complete amplitude are investigated in the static limit. The trajectories of the singularities of the partial-wave amplitude are shown to be bounded in the right-half plane of the total angular momentum. The model is applied to the scattering of a spinless elementary particle from a spinless compound one. The resulting amplitude is bounded by a finite power of $\cos\theta_1$ and independent of $\cos\theta_2$, where θ_1 and θ_2 are the scattering angles of the scattered elementary particle and ejected bound particle, respectively. The possible applicability of the separable approximation used is discussed.

ELECTROMAGNETIC INTERACTION OF MESONS RESULTING FROM A BROKEN SYMMETRY, by G. S. Guralnik. [1965] [14]p. incl. diagrs. (AFOSR-65-1856) [AF AFOSR-64-46] AD 626498 Unclassified

Also published in Nuovo Cimento, Series X, v. 36, 1002-1015, Apr. 1, 1965.

The Nambu, Jona-Lasinio broken symmetry theory restated in terms of Green's functions in the presence of an external current source. Using these Green's functions, it is possible to calculate the lowest-order effects of electromagnetic interactions on the initially massless pseudoscalar mesons induced by the broken symmetry. It is found that the uncharged meson acquires no mass and hence the results are consistent with the Goldstone theorem applied to the fully interacting system.

A MODEL FOR THE CONNECTED PART OF THE THREE-BODY AMPLITUDE, by J. T. Cushing. [1965] [20]p. incl. diagrs. refs. (AFOSR-65-1857) (AF EOAR-64-46) AD 626037 Unclassified

Also published in Nuovo Cimento, Series X, v. 38 463-482, July 1, 1965

A model involving separable interactions is proposed for the scattering of 3 free particles into 3 free particles. The analyticity in the total angular momentum j and total energy s of the scattering amplitude is investigated. It is found that a Sommerfeld-Watson transformation cannot be used to yield information on the asymptotic behavior of the complete amplitude as a momentum transfer becomes infinite. On the basis of this and previous work on the same model for the bound-state parts of the 3-body amplitude, the analytic properties of all the 3-body amplitudes are summarized. The Regge mechanism of asymptotic dominance appears valid only for the elastic bound-state scattering amplitude and even here there is competition between a pole and a cut

VECTOR MESONS AND COMPLEX ANGULAR MOMENTUM, by M. Martinis and K. Ahmed. [1965] [19]p. incl. diagrs. refs. (AFOSR-65-1859) [AF EOAR-64-46] AD 626342 Unclassified

Also published in Nuovo Cimento, Series X, v. 38 1021-1039, July 1, 1965

The analytic behavior in the complex angular momentum plane of the amplitude for a vector meson coupled to a scalar nucleon through a conserved current is examined. The graph with the exchange of two vector mesons is considered. This graph is iterated in the vector meson or s channel. The partial wave projection of the lowest order graph, 4th order, has a simple pole at $\ell = 1$, which is obtained after an analytical continuation from higher ℓ. When the singular part of the graph at $\ell = 1$ is taken as the kernel of the Bethe-Salpeter equation it is found that for $s \geq 6\mu^2$ its solution has two simple moving poles in the neighborhood of $\ell = 1$ in the ℓ-plane. However, the Regge trajectory has two branches which intersect each other at the branch point $s = 6\mu^2$.

U(12) SYMMETRY AND THE JOHNSON-TREIMAN RELATIONS, by J. M. Charap and P. T. Matthews. [1965] [2]p. incl. refs. (AFOSR-65-1860) [AF EOAR-64-46] AD 626339 Unclassified

Also published in Phys. Ltrs., v. 16 95-96, May 1, 1965

It has been shown by Johnson and Treiman on the basis of SU(6) that $\sigma(K^+) - \sigma(K^-) = \sigma(K^0) - \sigma(\bar{K}^0) + \sigma(\pi^+) - \sigma(\pi^-)$ and $\sigma(\gamma^+) - \sigma(\pi^-) = \sigma(K^0) - \sigma(\bar{K}^0)$, where $\sigma(M)$ stands for the total cross section of mesons M on protons. Though these relations were shown valid in the covariant U(12) theory when the forward scattering amplitudes were restricted to the four regular ones, the same assumption implied zero polarization in several processes where the polarization was known to be large. In this paper irregular forward scattering amplitudes are considered in U(12) theory as well as the regular. There are thirty different possibilities of which twelve contribute to $\sigma(M) - \sigma(\bar{M})$. The relevant parts of each of these has the form of pure F-type baryon current coupled to the pure F meson current. Thus each term separately satisfies the Johnson-Treiman relations, which therefore remains valid in general in this theory.

U(12) IRREGULAR COUPLING FOR $p\bar{p}$ ANNIHILATION, by F. Hussain and P. Rotelli. [1965] [2]p. incl. refs. (AFOSR-65-1861) (AF EOAR-64-46) AD 626336 Unclassified

Also published in Phys. Ltrs., v. 16 183-184, May 15, 1965.

Using irregular couplings, $p\bar{p}$ annihilation at rest into two pseudoscalar particles is considered in the U(12) symmetry scheme. Under the assumption the ratio of annihilation rates, $\frac{\sigma(K^+K^-)}{\sigma(\bar{K}^0K^0)}$, is calculated to be $\neq 1$

It is observed that the meson exchange mechanism proposed by Sawyer leads to the Johnson-Treiman relations

and hence in the model to the result 4 1 since the annihilation process is just the crosschannel Since the Johnson-Treiman relations were shown to hold in U(12) for all couplings, the result is independent of a model and appears as evidence for the validity of the approximate invariance of strong interactions in the $\tilde{U}(12)$ theory.

NEUTRINO-INDUCED INTERACTIONS AND $\tilde{U}(12)$ SYMMETRY, by I. J. Ketley. [1965] [3]p. incl. diagrs tables, refs. (AFOSR-65-1862) (AF EOAR-64-46) AD 626340 Unclassified

Also published in Phys. Ltrs., v. 16 340-342, June 1, 1965.

In $\tilde{U}(12)$ theory, the for . factors associated with baryon-baryon and baryon-baryon resonance currents have been shown uniquely related. Using a current x current formulation for the weak interactions of leptons and hadrons, this relationship is used to obtain form factors applicable to neutrino interactions, and in particular to the processes $\nu(\nu) + N \to 1^-(1^+) + N$ and $\nu(\bar{\nu}) + N \to 1^-(1^+) + N^*$. Equations for the vector and axial-vector currents are solved and used to compute cross sections for the above interactions. The elastic cross sections have a maximum near s - 5 as usual computation gives with similar form factors, but for very high energies there is a logarithmic behavior. The results for the inelastic process are similar to those using SU(6) to find the relative magnitude of the form factors. Again for high energies the cross sections increase logarithmically.

SPONTANEOUS BREAKDOWN OF SYMMETRY IN AXIOMATIC THEORY, by R. F. Streater. [1965] [9]p. incl. diagr. refs. (AFOSR-65-2694) (AF AFOSR-64-46) AD 628739 Unclassified

Also published in Proc. Roy. Soc. (London), v. 287A 510-518, 1965.

Two results are proved the first is that it is possible to prove Goldstone's theorem in a Wightman theory in which there is a conserved current with a meaning for a sharp time and which generates a broken symmetry. The second is that for such theories there exist infinitely many positive linear functionals on the algebra of quasi-local operators, that are Lorentz invariant and lead to a theory with positive energy. That is, the vacuum functional is non-unique. These 2 results are illustrated in the theory of the free massless neutral scalar field

ON THE NONLINEAR PROPERTIES OF RETARDED PRODUCTS, by R. F. Streater. [1965] [17]p. incl refs. (AFOSR-65-2799) [AF EOAR-64-46] AD 628343 Unclassified

Also published in Ann. Phys., v. 33 311-327, July 1965

A set of functions t is given that satisfies the unitarity equations appropriate for time-ordered functions of n current operators, n 4, 5, . . . In terms of functions t, r is defined for each order n which correspond to the generalized retarded functions of axiomatic local quantum field theory Using the technique of generating functionals, the corresponding 'products of operators' T and R are defined. The t and r are well defined as distributions in momentum space, possibly not tempered, and the time-ordered and retarded operators are also distributions in momentum space, and as operators in Fock space have reasonable domains of definition It is found that the commutator between any two retarded operators can be expressed as sums and differences between retarded operators of order n + m. The various r-functions coincide in some region of momentum space, and any given r coincides with the t-function in the region of momentum space appropriate to the function r. The R-operators trivially satisfy the Steinmann relations. Thus many of the 'linear' properties of the retarded operators that follow from causality and Lorentz invariance also follow from unitarity, when no locality is assumed.

GENERALIZED GOLDSTONE THEOREM, by R. F. Streater. [1965] [2]p. (AFOSR-66-0102) (AF EOAR-64-46) AD 630140 Unclassified

Also published in Phys. Rev. Ltrs., v. 15, 475-476, Sept. 13, 1965.

The paper of Goldstone, Salam, and Weinberg (Phys. Rev., v. 127, 965, 1962) gave a very simple proof of an important theorem on broken symmetry. If $\varphi_1(\cdot) \to \varphi_2(\cdot)$ is a transformation of fields such that $\varphi_1(\ ) \cdot 0 \neq 0$ and such that the transformation is generated by a conserved current, then there must be zero mass particles in the theory with the quantum numbers of φ_1. (The proof depends on the absence of states of negative norm.) In this paper it is shown that a significant generalization, along the same lines, can be proved: namely, if a local conserved current generates a transformation $\varphi_1(\cdot) \to \varphi_1(\cdot)$ between fields corresponding to particles of different mass, then there must be states in the theory with arbitrarily small mass (again in the absence of states of negative norm). The theorem is applied to the proton-neutron mass difference.

VECTOR MESONS AND COMPLEX ANGULAR MOMENTUM-II, by K. Ahmed and M. Martinis. [1965] [6]p. (AFOSR-66-0103) [AF EOAR-64-46] AD 630138 Unclassified

Also published in Nuovo Cimento, Series X, v. 39, 246-251, Sept. 1, 1965.

It is shown that the leading singularities in the complex angular momentum plane for the process $\pi^+\pi^- \to \pi^+\pi^-$ mediated by the vector mesons occur near $j = 1$. Only sixth-order Feynman graphs have been considered. One then finds that the analytic part of the sixth-order continued partial-wave amplitude has a purely imaginary contribution near $j = 1$. Singular part of the amplitude when iterated, gives two Regge poles in the neighborhood of $j = 1$.

UNITARITY AND THE BOUND-STATE PROBLEM IN ALMOST LOCAL FIELD THEORY, by M. Martinis. [1965] [18]p. incl. refs. (AFOSR 66-1544) [AF EOAR-64-46] AD 639822 Unclassified

Also published in Nuovo Cimento, Series X, v. 40, 132-149, Nov. 1965.

The results of this study are divided into 3 sections. The first one demonstrates the possibility of imposing the condition of almost locality on a 4-point matrix element. This is done in order to obtain certain restrictions on the functions appearing in the Haag expansion of an almost local field. Disregarding possible end-point singularities it is possible to show that in a certain finite energy region these functions satisfy equations similar to physical unitarity. Assuming that the F-functions appearing in the Haag expansion possess analytic properties it is possible to find a model (given in the second section) which explicitly shows how the end-point singularity can be cancelled by the threshold behavior if the energy region is restricted to the elastic region. In the last section it is shown how the bound-state problem may be incorporated into the spirit of almost local field theory. The problem is analyzed in the case of AB elastic scattering where B represents a 2-particle bound state of A.

MASS SPLITTING AND UNITARITY, by G. Fraser. [1965] [3]p. (AFOSR-66-1544) [AF EOAR-64-46] AD 639818 Unclassified

Also published in Phys. Ltrs., v. 19, 521-531, Dec. 1965.

Recently several authors have calculated ratios of amplitudes for various proton-antiproton annihilation modes at rest on the basis of a broken inhomogeneous U(12) symmetry scheme. Their calculations neglect mass splitting within the baryon octet. Although the mass-splitting between the observed particles is small, the splitting within the baryon octet is large. For stopped proton-anti proton reactions, this suppresses intermediate states composed of behavior baryon-anti-baryon pairs. This will have an effect on the observed process because of unitarity. This note presents a method for estimating these effects using the inverse reaction matrix formalism of Matthews and Salam.

FREQUENCY SHIFT IN HIGH-INTENSITY COMPTON SCATTERING, by T W. B Kibble [1965] [14]p incl. diagrs. refs (AF EOAR-62-87)and AF EOAR-64-46) Unclassified

Presented at Conf. on Quantum Electrodynamics of High-Intensity Photon Beams, Durham, N C , Aug. 26-27, 1965.

Published in Phys. Rev., v 138 B740-B753 May 10, 1965.

The frequency shift predicted by Brown and Kibble, and by Goldman, for a photon scattered out of an intense beam by a free electron is re-examined. It is shown that the effect has a very simple classical interpretation, as a Doppler shift arising from the nonzero average velocity of the electron in the beam. The discrepancy between this prediction and the recent perturbation calculation of Fried and Eberly is shown to arise from the use, in the latter, of a pure monochromatic beam rather than a wave train of finite length. It is shown that the effect should arise for a quantized photon beam as well as for a classical one. The question of energy-momentum conservation is discussed. With the help of a one-dimensional model which exhibits all the essential features of the effect, it is shown that the extra energy and momentum which are generated in the scattering process are taken up by the beam itself in the form of an extremely small shift in the average momentum of a photon in the beam The possibility of experimental detection of the effect is briefly discussed. REDUCTION OF REPRESENTATIONS OF SU_{mn} WITH RESPECT TO THE SUBGROUP $SU_m \otimes SU_n$, by C R. Hagen and A J Macfarlane. [1965] [11]p incl. tables, refs. (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-64-46 and Atomic Energy Commission) Unclassified

Published in Jour Math. Phys , v 6 1355-1371, Sept 1965.

With a view to application to theories such as the Wigner supermultiplet theory of nuclear structure and its recent extension into the domain of particle physics, the reduction of representations of the special unitary group SU_{mn} into representations of its $SU_m \otimes SU_n$ subgroup is considered Proof is given of the result, that, in the case of a representation of SU_{mn} of plurality type p_{mn}, this reduction yields only those irreducible representations of $SU_m \otimes SU_n$, whose SU_m and SU_n parts have plurality types p_m and p_n equal to p_{mn} modulo m and modulo n, respectively A practical method of obtaining reductions is described and a tabulation of results in the case of SU_6 and $SU_2 \otimes SU_3$ is made The

method depends on the use of a very concise version of the Weyl character formula for unitary groups which does not seem to have been used elsewhere. (Contractor's abstract)

SCIENCE AND TECHNOLOGY IN THE EMERGING NATIONS, by A. Salam [1965] [10]p. [AF EOAR-64-46] Unclassified

Published in Science in the Sixties, Tenth Anniversary AFOSR Scientific Seminar, Cloudcroft, N. M. (June 14-25, 1965), ed. by D. L. Arm. Alburquerque, Mexico U. Office of Publications, 1965, p. 32-41.

An historical background of science and technology is presented and the fact is pointed out that the history of science has gone through cycles in which many cultures and lands have played a part. Scientific and technological development in emerging nations is discussed, using the author's native Pakistan as an example. Pakistan presents the picture of an ancient civilization, not too distantly in a scientific and a cultural lead. After military submission, its defeat was followed by an introduction of newer technological ideas and the harnessing of its rivers for agricultural growth. The importation of technology was beneficial only in part, however, for it was not accompanied by an educational system that would enable the further mastery of newer technologies. After initial prosperity, there was inevitable over-population and resultant hunger and poverty. This pattern repeated itself around the world. A foremost necessity for developing countries is the acquiring of basic skills for the operation of a technological economy with priority on the exploitation of natural resources, and the creation of a more and more productive agriculture.

PHOTOSYNTHETIC MECHANISMS UNDER SUB-OPTIMAL CONDITIONS, by C. P. Whittingham. Final rept. Oct 1965 [28]p. incl. diagrs. tables, refs. (AFOSR-65-2649) (AF EOAR-65-2) AD 625495 Unclassified

Investigations have been made with Chlorella on the conditions which optimize the formation of glycollic acid as a product of photosynthesis in Chlorella. Maximum production is observed at low partial pressures of carbon dioxide, high light intensities or high pressures of oxygen. The influence of oxygen partial pressure, as well as carbon dioxide partial pressure has been studied in detail. A transition from 20%-100% oxygen resulted in increased formation of glycollate and an associated decrease in the size of the sugar phosphate pools of the photosynthetic cycle. With respect to steady state photosynthesis, the percentage incorporation of carbon dioxide into glycollate is greater at higher partial pressures of oxygen, again associated with a smaller pool size of sugar phosphate intermediates. Suggestions have been made that the sucrose formed in photosynthesis is derived through a pathway in which glycollic acid or some related compound is an intermediate. Glycollic acid has been shown to be approximately equally labelled in its 2 carbon atoms. Thus sucrose derived from triose phosphate (predominantly labelled in the 1C atom) or alternatively derived from glycollate would be expected to have different labelling patterns. Hence the labelling pattern of sucrose formed in Chlorella has been investigated under a wide range of conditions. It has been shown that under high partial pressures of oxygen the labelling pattern of sucrose is such that in part it may be derived from a pathway involving glycollate. In the presence of 20% oxygen it was not possible to establish whether sucrose was formed.

THE AUDITORY APPARATUS OF THE HETEROMYIDAE (RODENTIA, SCIUROMORPHA), by A. Pye. [1965] [14]p. incl. illus. diagrs. refs. (AFOSR-65-2519) (AF EOAR-63-30) AD 627624 Unclassified

Also published in Jour. Anat. (London), v 99, 161-174, 1965.

The structure of the ears of the family Heteromyidae is discussed in relation to the phylogeny and classification of the family. A successful histological technique for the intra-vitam fixation and processing of the ears is described The results indicate that, in the more advanced members of the family, the middle ear and especially the cochlea of the inner ear have become extremely modified. The supposed phylogenetic line can thus be followed in the structure of the ears alone. The possible functions of these special modifications cannot be assessed until more is known of the general cochlear physiology.

THE DIAMETERS OF THE FIBRES OF THE PERIPHERAL NERVES OF OCTOPUS, by J Z. Young [1965] [37]p. incl. illus. diagrs. tables. refs (AFOSR-65-1788) (AF EOAR-63-2) AD 625707 Unclassified

Also published in Proc. Roy. Soc. (London), v. 162B· 47-79, Mar. 1965.

The diameters and numbers of fibers have been measured throughout the peripheral nervous system. The nerves of the muscles that act upon the outside world contain few fibers, having very large medium-sized fibers but no very small ones. Thus the muscles of the head receive 6000 fibers, the largest of 30 μm diam The eye muscles receive 3300 fibers, reaching 24 μm The stellar nerve fibers are more numerous (150,000), but smaller (20 μm) The preganglionic fibers joining the c. n. s. to the stellate ganglia are fewer than the postganglionic ones (4000, ~ 16 um) The fibers to the chromatophores are numerous (30,000) and of medium diam (~ 12 μm). The visceral motor and vasomotor nerves, however, contain hundreds of thousands of minute fibers (< 3 um). The significance of these numerous small fibers can hardly be to obtain great resolution of movement in such acts as secretion of saliva. Presumably the great number has a special significance. The fibers to the muscles of the buccal mass are more numerous and smaller than the somatic motor fibers, but fewer and larger than those for the viscera The muscles of the arms and suckers have 3,000,000 fibers, all < 6 μm, originating from neurons within the arms

SOME OBSERVATIONS ON THE FOOD INTAKE AND LEARNING IN OCTOPUS VULGARIS, by M. Nixon. [1965] 11p. incl. diagrs. tables (AFOSR-65-2841) (AF EOAR-63-2) AD 628370 Unclassified

Also published in Pubbl Staz Zool Napoli, v 34 329-339, 1965

Octopus vulgaris seems able to learn to attack a rectangular shape when the correct response is rewarded

by actual food (1.6 g of fish a day for animals weighing 200-350 g) whereas animals given a taste of fish at each trial only responded initially to the shape and did not maintain their attacks. Octopuses that were completely starved only attacked the shape infrequently. However, the 'attack system' of the animals was not impaired after starvation and virtual starvation lasting 12 1 2 days in the laboratory, for when shown a live crab it was attacked by the octopuses All of the animals that were starved or virtually starved lost weight but the animals given 1.6 g of fish a day all gained weight

OCTOPUS OPTIC RESPONSES, by B B. Boycott, J Y. Lettvin and others. [1965] [10]p incl illus. refs. (AFOSR-65-2525) (AF EOAR-64-42) AD 628743 Unclassified

Also published in Exper Neurol., v. 12: 247-256, July 1965.

A study of responses in Octopus vulgaris visual system was carried out. Gross recordings were made in the free swimming animal responding to brief flashes of light A simple negative electroretinogram was recorded within the eye beginning at 8 msec peaking at 20-25 msec With the animal resting, the amplitude of the ERG could be increased by gentle tactile stimuli which produce no movement or pupil change. Immediately behind the retina, an oscillating potential was recorded beginning 15 msec after the flash and lasting for about 40 msec with a frequency of about 150 per sec This was believed to be produced by synchronized volleys in the optic nerve fibers travelling at about 1 m per sec In the optic lobe, one could record the ERG. the arriving oscillatory volley and a gross response starting at 30 msec after the flash and peaking 20 msec later

FURTHER OBSERVATIONS ON FORCES EXERTED BY OCTOPUS VULGARIS, by N. Dilly and M. Nixon. [1965] [6]p incl diagrs table. (AFOSR-65-2526) (AF EOAR-64-42) AD 629299 Unclassified

Also published in Pubbl. Staz. Zool. Napoli, v. 34: 340-345, 1965.

Octopuses kept isolated in tanks with heavy lids, for learning and other experiments, may escape, especially when recently arrived in the aquarium (Taki, 1941; Boycott, 1954, Dilly, Nixon and Packard, 1964). During training experiments octopuses can sometimes be seen to move the building bricks of their home. A further impression of the force they are capable of exerting is appreciated when an octopus is placed in a straight sided jar with a wooden lid for induction with urethane anesthetic solution. Two observations of the pushing force of small animals (Dilly, Nixon and Packard, 1964) suggested that this was approximately half of the pulling force of animals of similar weight

THE NERVOUS PATHWAYS FOR POISONING, EATING, AND LEARNING IN OCTOPUS, by J. Z. Young. [1965] [15]p. incl. illus. diagrs. tables. (AFOSR-66-1884) [AF EOAR-64-42] AD 643909 Unclassified

Also published in Jour Exper. Biol., v. 43: 581-593, Aug. 1965.

Octopuses, after removal of the lip, kill and eat crabs apparently normally They learn to attack a strange figure moving in the visual field The pair of nerves that originates from cells at the back of the superior buccal lobe is shown to be responsible for the discharge of secretion from the posterior salivary glands. If this pair of nerves in interrupted the octopus does not poison a crab after catching it. It still eats, however, and learns to attack a strange figure. If both interbuccal connectives have been severed the octopus does not remove the flesh properly from crabs. It does not learn to attack a strange figure. Any operation on the central nervous system that interrupts the pathway from the interbuccal connectives to the lateral superior frontal and optic lobes prevents learning to attack a figure that has been seen. If such cuts pass through the middle of the superior buccal lobe the octopus does not poison crabs but may tear them open and then clean and eat them. With cuts still farther back the animal poisons, cleans, and eats crabs, but still does not learn to attack.

INFLUENCE OF PREVIOUS PREFERENCES ON THE

MEMORY OF OCTOPUS VULGARIS AFTER REMOVAL OF THE VERTICAL LOBE, by J. Z. Young. [1965] [9]p. incl. diagrs. refs. (AFOSR-66-1885) (AF EOAR-64-42) AD 644131 Unclassified

Also published in Jour. Exper. Biol., v. 43: 595-603, Aug. 1965.

Octopuses from which the vertical lobe had been removed attacked a vertical rectangle more readily than a horizontal one when both shapes were moved vertically. During discrimination training the results differed markedly according to which figure was rewarded with food. When a vertical rectangle was positive the excess of attacks at this figure increased both within and between sessions, the animals showing considerable ability to learn. When a horizontal rectangle was the positive figure the responses to it were at first 'paradoxical', the negative shape being attacked more often. There was then improvement within each session, but little if any between the sessions. Octopuses without the vertical lobe quickly ceased to attack crabs shown at 4 min intervals when shocks were given for attacks, and the effect could still be detected 4 hr later. When crabs were shown at 8 min intervals, and shocks given for attacks, there was no decline in attacks over 14 trials. Fifteen hr later, however, some residual signs of the shocks were evident when trials were resumed at 8 min intervals. Although all of the animals at first attacked they soon stopped doing so. After a further 15 hr all attacked again but soon ceased to do so after receiving shocks. Normal animals, by contrast, all ceased to attack the crabs shown at 8 min intervals after receiving 4 or 5 shocks. The memory is much more retentive in normal animals, so that 2 days after receiving shocks the octopuses seldom attacked the crabs.

SPLIT-BRAIN PREPARATIONS AND TOUCH LEARNING IN THE OCTOPUS, by M. J. Wells and J. Z. Young. [1965] [16]p. incl. illus. diagrs. tables. (AFOSR-66-1887) (AF EOAR-64-42) AD 643910 Unclassified

Also published in Jour. Exper. Biol., v. 43: 565-579, Aug. 1965.

A vertical longitudinal cut through the supraoesophageal part of the brain does not prevent discrimination between rough and smooth cylinders. It does prevent correct response by the opposite side after training on one side of the animal. Octopuses with intact supraoesophageal lobes, trained on one side, discriminate when tested with the same objects of the other side, split-brain animals do not. In this situation, the performance of one side of the octopus can be used as a control for the effect of a brain lesion in the other. Removal of large parts from the supraoesophageal brain does not prevent touch-learning. Octopuses with the brain intact or with the vertical lobes removed do not show marked rough/smooth preferences. In animals with large lesions to the inferior frontal system there is a preference for rough, so that rough+/smooth- is an easier discrimination than vice versa.

THE POSITIVE AND NEGATIVE LEARNING PROCESS IN OCTOPUS VULGARIS LAMARCK. INFLUENCE OF THE VERTICAL AND MEDIAN SUPERIOR FRONTAL LOBES, by H. Maldonado. [1965] [19]p. incl. diagrs. tables, refs. (AFOSP-66-2006) (AF EOAR-64-42) AD 643913 Unclassified

Also published in Zeitschr. Vergleich. Physiol., v. 51: 185-203, 1965.

A block diagram was constructed, in order to clarify the functions of the vertical and median superior frontal lobes of the brain, for the process by which Octopus vulgaris builds up to the values of a command to attack an object in its visual field. This model incorporates Young's idea of a balanced action of the median superior frontal-vertical lobe system and attributes precise functions to these lobes. Animals trained for some days to attack a given figure (positive) and not to attack another one (negative) underwent operative procedures to remove either the vertical or the median superior frontal lobe. According to the hypothesis animals without the vertical lobe should have a better post-operative performance with positive complexes than those without the median superior frontal lobe. With a negative figure the animals without the vertical lobe should show a poorer post-operative performance than the animals lacking the median superior frontal lobe. The animals' performance both before and after operation was studied in order to compare the effects of removing the vertical or median superior frontal lobe.

CONDUCTION VELOCITY AND DIAMETER OF NERVE FIBERS OF CEPHALOPODS, by T. M. O. Burrows, I. A. Campbell and others. [1965] [2]p. (AFOSR-66-2009) (AF EOAR-64-42) AD 643512 Unclassified

Presented at meeting of the Physiological Society, London U. Coll. (Gt. Brit.), Mar. 26-27, 1965.

Also published in Jour. Physiol., v. 179: 39-40, July 1965.

This relationship has been tested in Octopus, Sepia and Loligo, including fibers of a range of diameters in each species. Velocity was measured at 20°C on nerves kept at their natural lengths. Estimates were from the passage of impulses past at least 2 points. The smallest fibers were from the salivary duct nerves of Octopus, medium sized fibers were from arm, fin and mantle nerves of all 3 species, and the largest, from giant fibers of the stellar nerves of Sepia and Loligo. For the small and medium fibers, measurements were made from the foot of the compound action potential and the diameters of the largest fibers in the nerves were estimated from measurements of fresh and fixed nerves. The action potentials and diameters of the giant fibers were recorded individually.

THE BUCCAL NERVOUS SYSTEM OF OCTOPUS, by J. Z. Young [1965] [17]p. incl. illus. diagrs. refs. (AF EOAR-64-42) Unclassified

Published in Philos. Trans. Roy. Soc., London, v. 249B: 27-44, 1965.

The operations of killing and eating food by an octopus are under the control of a series of nervous centers. The poison center lies most posteriorly and is probably activated first, since it lies close to endings of fibers from the arms. The fibers of the nerves to the posterior salivary gland run without synapse from the superior buccal lobe to the glands, passing first far forward and then back along the duct. There is thus no peripheral synapse on this path, perhaps because no continuing rhythmic operations are involved in the secretion, and no reflex guidance is needed. The actual injection of the poison by the salivary papilla is controlled through the subradular ganglia. The cerebro-subradular connectives arise from the front of the superior buccal ganglia, near the entrance of the labial nerves, and run direct to the subradular ganglia, bypassing the inferior buccal ganglion. The interbuccal connectives also arise from the front of the superior buccal lobe and run to the inferior buccal ganglion. The inferior buccal ganglion sends nerves to the muscles of the jaws and radula and to the anterior salivary glands, buccal palps and oesophagus. Through the sympathetic nerve it communicates with the gastric ganglion. The inferior buccal ganglion has a complicated internal structure. From its outer surface arise numerous strands of the juxtaganglionic tissue, which end at the surfaces of the buccal sinus. The proportion of large cells decreases in the sequence posterior buccal, superior buccal, inferior buccal, subradular and gastric ganglia.

1449

THE CENTRES FOR TOUCH DISCRIMINATION IN OCTOPUS, by J. Z. Young [1965] [23]p. incl. illus. diagrs. table, refs. (AF EOAR-64-42) Unclassified

Published in Philos. Trans. Roy. Soc. London, v. 249B: 44-67, 1965.

The inferior frontal system, concerned with learning chemotactile discriminations, shows 4 distinct regions. The posterior buccal lobes contain both large and small cells and are the center of the system. They receive fibers from the arms (without interweaving), from the lips, and from the buccal mass. They send fibers downwards to the arm centers and backwards to the optic and superior frontal vertical systems. This is therefore probably both a reflex center for response to some simple chemotactile stimuli and also the main output pathway for the whole system. In the lateral inferior frontal lobes the fibers from the arms interweave and mix with those from other sources. Their efferent fibers pass to the posterior buccal lobes and to the same destinations as the efferent fibers of the posterior buccal lobes. The organization of the lateral inferior frontal thus allows responses to combinations of chemotactile inputs. The median inferior frontal lobe receives the same input as the lateral inferior frontals, and its interweaving bundles allow for further spreading and combination between efferents. Its efferent axons pass only to the subfrontal lobes. The subfrontal lobes, besides the input from the median inferior frontal lobe, receive fibers from below. Their cells are mostly very small, with axons ending within the lobe. A few larger cells with axons running to the posterior buccal lobes carry the output. The tactile system is thus essentially similar to the visual one, with a pair of lower centers (posterior buccal and lateral inferior frontal) and a pair of upper ones (median inferior frontal and subfrontal). Embryologically these all differentiate from a single lobe, and the small cells of the upper lobes form a continuous layer with the relatively fewer small cells of the lower lobes. The main difference between the visual and tactile systems is the absence from the latter of a differentiated region corresponding to the optic lobe. From the evidence of Wells the change that constitutes a memory record occurs in the region of the posterior buccal lobe that contains both large and small cells. This region is under the influence of the circuit through lateral and median inferior frontal and subfrontal lobes.

ON THE SINGULAR CONFIGURATIONS OF STATICALLY DETERMINATE STRUCTURES, by F. Buckens. [1965] [14]p. incl. diagrs. (AFOSR-65-2427) (AF EOAR-62-107) AD 627553 Unclassified

Also published in Internat'l. Jour. Mech. Sci., v. 7: 301-314, May 1965

This paper shows how singular configurations of statically determinate plane structures can be determined. When the structure is a linkage, such configurations entail degrees of freedom 'in the small,' which make it act as a mechanism for infinitesimal motions. Their practical importance comes from the fact that large constraints are induced in the members of the linkage when external forces act upon such structures, if their configuration is very close to a singular one. Different degrees and orders of singularity are considered, which respectively correspond to the rank and stationarity of a given determinant, and a few examples are given.

DYNAMIC BEHAVIOR OF SHELLS UNDER THERMAL STRESS, by F. Buckens. 1965, 109p. incl. diagrs. refs. (AFOSR-66-0898) (AF EOAR-63-49) AD 634109 Unclassified

The effect of initial stress and in particular of thermal stress on the dynamical behavior of thin shells (vibration and propagation of bending waves) is studied. The case of a circular cylindrical is considered in detail, and several effects of initial stress and distributed moment evaluated. Methods of determining initial thermal stress and deflection are given and their effects on natural frequencies and modes considered. Local effects on the velocity of propagation of bending waves are studied in detail and quantitative evaluations are obtained. Comparison with experimental results is given.

ON THE INFLUENCE OF THE ELASTICITY OF COMPONENTS IN A SPINNING SATELLITE ON THE STABILITY OF ITS MOTION, by F. Buckens. [1965] [32]p. incl. diagrs. (AFOSR-65-2740) (AF EOAR-65-66) AD 628247 Unclassified

When a rigid body in free space is spinning around one of its principal axes, besides the three translational modes with zero frequency and one rotational mode of zero frequency around the spin axis, one may consider two rotational modes of small amplitudes of oscillations around the two remaining axes, which will be called nutational modes. Their frequencies do not vanish and are only real if the spinning motion is stable. If now the body is allowed to be slightly elastic, the frequencies of the nutational modes will be altered, but at the same

time there will appear new frequencies corresponding to the so-called elastic modes. Natural stability of such systems and stability of spinning motion in magnetic and gravitational fields are important questions and must be considered when designing spin stabilized satellites. This investigation is conceived on a general basis and brings up only the broad features of a rather complex problem.

AN EMPIRICAL METHOD FOR THE ESTIMATION OF BOND DISSOCIATION ENERGIES, by A. Van Tiggelen, J. Peeters, and P. Burke. [1965] [4]p. incl. tables. (AFOSR-65-2167) (AF EOAR-63-42) AD 629027 Unclassified

Also published in Chem. Eng. Sci., v. 20: 529-532, June 1965.

An empirical formula for the calculation of bond dissociation energies D(A-B) is suggested: $D(A\text{-}B) = (1/2\alpha)[\alpha_A D(A\text{-}A) + \alpha_B D(B\text{-}B)]$ where α_A and α_B are constants characteristic of radicals A· and B· while α is either α_A or α_B, whichever has the smaller value. Values of α for 34 organic and inorganic radicals have been determined and tabulated. From values of D(A-B), heats of reaction Q can be calculated. Activation energies E for substitution reactions can then be evaluated with the help of Polanyi's relation: $E = (\text{const})_1 - (\text{const})_2 \cdot Q$. (Contractor's abstract)

THEORETICAL AND EXPERIMENTAL STUDY ON REACTION KINETICS IN FLAMES, by A. Van Tiggelen. Final technical rept. Oct. 1965, 13p. (AFOSR-65-2240) (AF EOAR-63-42) AD 628144 Unclassified

The existence of fundamental flammability limits is discussed. In case of a chain reaction mechanism the latter are predicted theoretically but the experimental are probably different from the theoretical limits. Other considerations are related to the a priori evaluation of dissociation energies. A formula is proposed which is based on two empirical parameters which characterize any kind of radical. An experimental study of lifted turbulent flames is reported; it links the stability of such flames with the characteristic turbulence parameters: intensity and scale. The location of the anchoring place of the flame corresponds to the locus where a stoichiometric composition is attained. Burning velocities, flame temperatures and flame thickness have been measured for methane-oxygen flames, extending from very rich to very poor mixtures at different degrees of dilution with nitrogen. The kinetical parameters which can be derived from these data strongly suggest the following branching reaction: $H + O_2$ yields $OH + O$.

The velocity of flame propagation, the combustion gas temperature, and the reaction zone thickness was measured for more than 300 mixtures of different combinations of methane-oxygen-nitrogen. This experimental study confirmed the results of investigations, made by other workers, on the structure of the reaction zone of flames propagated in these particular mixtures. It was possible to derive the apparent activation energy as well as the partial orders with respect to the fuel and to oxygen.

THE STABILIZATION MECHANISM OF LIFTED DIFFUSION FLAMES, by L. Vanquickenborne and A. Van Tiggelen. [1965] [11]p. incl. diagrs. tables, refs. (AFOSR-66-1800) (AF EOAR-63-42) AD 639573 Unclassified

Also published in Combustion and Flame, v. 9: 59-69, Dec. 1965.

Measurements on gas composition, gas flow velocity, intensity and Eulerian scale of turbulence have been made in a free jet of methane emerging from a conventional circular burner into an unconfined atmosphere. From the experimental data it appears that the base of a lifted diffusion flame anchors in a region where a stoichiometric composition is attained. Accepting the assumption that the turbulent burning velocity V_t equals the gas flow velocity in this region, an experimental relation is obtained between V_t and the parameters of turbulence. Finally the stabilization conditions are discussed; blow off and drop back of the flame are explained by the interaction between aerodynamic flow patterns and burning velocity.

NEUROMUSCULAR TRANSMISSION WITH SPECIAL REFERENCE TO MYASTHENIA GRAVIS, by D. Elmqvist. [1965] [34]p. incl. table, refs. (AFOSR-65-1547) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-12; Muscular Dystrophy Association of America, Inc., Public Health Service, and Swedish Medical Research Council) AD 624010 Unclassified

Also published in Acta Physiol. Scand., v. 64, 3uppl. 249: 1-34. 1965.

Investigations with repetitive stimulation of the normal neuromuscular junction have shown several weak links in the chain of events leading to the release of acetylcholine quanta: (1) The pool from which acetylcholine quanta is directly released is only sufficient for a few impulses. (2) The fraction of this pool which is released by a nerve impulse is influenced by the ionic environment and by previous activity. (3) The rate at which transmitter release can continue with repetitive stimulation is governed by the mobilization of acetylcholine quanta into this pool. (4) The store of transmitter from which acetylcholine quanta are mobilized to become available for release has a limited size and is only slowly replenished, probably by the formation of new quantal units. Mobilization can therefore only keep up with intense release for a short period of continuous rapid stimulation. (5) The synthesis of acetylcholine in the nerve terminal can be insufficient due to the lack of substrate or due to the presence of inhibiting drugs such as hemicholinium, and acetylcholine content of the quantal packets may be reduced. Studies of the neuromuscular transmission in myasthenia gravis demonstrated that this series of events can be affected by pathological conditions. The results indicate that in myasthenia gravis there is a deficiency in the amount of acetylcholine in the transmitter quantum, probably brought about by a defect in the quantum formation mechanism or by the presence of a false transmitter.

PRESYNAPTIC ACTION OF HEMICHOLINIUM AT THE NEUROMUSCULAR JUNCTION, by D. Elmqvist and D. M. J. Quastel. [1965] [20]p. incl. diagrs. table, refs. (AFOSR-65-1581) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-12 and Swedish Medical Research Council) AD 623376 Unclassified

Also published in Jour. Physiol., v. 177: 463-482, Apr. 1965.

By the use of intracellular electrodes a presynaptic effect of HC-3, hemicholinium no. 3, was shown at the mammalian neuromuscular junction. This effect was demonstrable only when the transmitter was released from the motor nerve terminals at a high rate and consisted of a progressive decline in the size of the miniature end-plate potentials and in the quantal components of the end-plate potentials as the transmitter was released. Releasing the transmitter by nerve stimulation or by increased potassium ion concentration were equally effective in eliciting the phenomenon. Postsynaptic chemosensitivity as measured by bath application of carbachol was the same before and after the quantal units had become small as a consequence of stimulation of transmitter release in the presence of HC-3. The effect is attributed to an inhibition of ACh synthesis by HC-3, the quanta becoming smaller in size as the presynaptic stores of ACh become depleted. It is suggested that the amount of releasable ACh in the motor nerve terminals can be estimated from the sum of all end-plate potentials and/or miniature end-plate potentials that can be elicited after blockade of ACh synthesis.

POTASSIUM INDUCED RELEASE OF TRANSMITTER AT THE HUMAN NEUROMUSCULAR JUNCTION, by D. Elmqvist. [1965] [6]p. incl. diagrs. refs. (AFOSR-65-2515) (AF EOAR-63-12) AD 627621 Unclassified

Also published in Acta Physiol. Scand., v. 64: 1-6, 1965.

When the release of ACh quanta from the human intercostal motor nerve terminals, recorded as miniature end-plate potentials (m. e. p. p. s), was enhanced by raising the potassium ion concentration, the increased rates were only sustained if release rates were limited to not more than 150 m. e. p. p. s/sec either by not using higher concentrations of KCl than 30 mM, or by reducing release with increased magnesium and lowered calcium concentrations when higher potassium ion concentrations were used. If higher rates of release were allowed to occur in the presence of 40 to 50 mM KCl, the release rates subsequently declined to very low levels. The total number of quanta released by 40 or 50 mM KCl corresponded to the amount of ACh estimated to be present in the motor nerve terminals.

SPONTANEOUS ACTIVITY AT A MAMMALIAN NEUROMUSCULAR JUNCTION IN TETRODOTOXIN. by D. Elmqvist and D. S. Feldman. [1965] [2]p. (AFOSR-66-1129) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-12, Public Health Service, and Swedish Medical Research Council) AD 639622 Unclassified

Also published in Acta Physiol. Scand., v. 64: 475-476, 1965.

The results indicate that although the nerve could not propagate an action potential and thus not release ACh in response to stimulation, the depolarization dependent transmitter release was still unimpared in the presence of tetrodotoxin. The ability of the muscle end-plate to respond to transmitter liberated from the nerve terminals was demonstrated even though the concentration of toxin used was 10^3—10^2 times greater than that necessary to block nerve and muscle conduction. The m. e. p. p. s. observed in the presence of the toxin were, as in the normal, mainly the result of an increase in the sodium conductance of the end-plate membrane. It therefore appears that the sodium conductance increase induced by the transmitter is unaffected by the toxin and does not require all the steps needed to produce the conductance increase during the action potential. It is also possible that the sodium pathways are entirely separate for chemically and electrically induced conductance changes.

CALCIUM DEPENDENCE OF SPONTANEOUS ACETYLCHOLINE RELEASE AT MAMMALIAN MOTOR NERVE TERMINALS, by D. Elmqvist and D. S. Feldman. [1965] [11]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-12, Public Health Service, and Swedish Medical Research Council) Unclassified

Published in Jour. Physiol. (London), v. 181: 487-497, Dec. 1965.

Spontaneous release of ACh from the rat-diaphragm motor-nerve terminals, manifest as miniature end-plate potentials (m. e. p. p. s.), was greatly reduced below the resting rate by prolonged exposure to calcium-free solutions. The presence of a chelating agent (EDTA) made the decline in rate greater; after 6 hr m. e. p. p. s were often abolished. Micro-electrophoretic local application of calcium induced return of activity after a latency of 250 msec. Concentrations achieved were about 10^{-3}-10^{-4} m at the nerve terminals. Restoration of calcium to the bath in these concentrations also restored activity. In muscle exposed to EDTA, caffeine or ouabain caused a rapid further decline in m. e. p. p. frequency. When EDTA was not present, these agents induced a rate increase even though Ca^{2+} was absent. $BaCl_2$ and $SrCl_2$ were able to restore and maintain activity completely abolished by prolonged calcium deprivation with EDTA. It is concluded that calcium is a necessary co-factor for the spontaneous release of ACh at the motor nerve terminals. Intracellular strongly bound stores are capable of supplying sufficient calcium to maintain activity.

EFFECTS OF SODIUM PUMP INHIBITORS ON SPONTANEOUS ACETYLCHOLINE RELEASE AT THE NEUROMUSCULAR JUNCTION, by D. Elmqvist and D. S. Feldman. [1965] [8]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-63-12, Public Health Service, and Swedish Medical Research Council) Unclassified

Published in Jour. Physiol. (London), v. 181: 498-505, Dec. 1965.

The ability of G-strophanthin to influence neuromuscular transmission in voluntary strated muscle has been known since 1955 but the mechanism of this action is not clear. It was then observed that prolonged exposure to high concentrations of ouabain caused a rapid release of acetylcholine recorded as miniature end-plate potentials. The parameters of this effect were therefore investigated. Quabain and sodium azide induce after a latency of about 30 min a rapid release of acetylcholine packages from the motor-nerve terminals. Increased concentrations of calcium but not of magnesium block the ouabain-induced augmented release of ACh packages. The effects of ouabain on transmitter release are explained by its calcium mobilizing and sodium pump inhibiting effect.

THE RELATIVE ABUNDANCE OF NUCLEI HEAVIER THAN HELIUM IN PRIMARY COSMIC RADIATION NEAR THE GEOMAGNETIC EQUATOR, by O. Mathiesen and A. Stenman. [1965] [21]p. incl. diagrs. tables, refs. (AFOSR-65-1844) (AF EOAR-64-35) AD 625702 Unclassified

Also published in Arkiv Fysik, v. 29: 145-165, Nov. 26, 1965.

Photometric measurements were made on 89 tracks of heavy primary particles ($Z > 2$), which were found in an

emulsion stack exposed at Guam near the geomagnetic equator. The measurements were corrected for different emulsion effects. The standard error in the charge determination was found to be about 0.25 units of charge. The charge calibration was made by measurements of δ-ray and blob densities and by studying suitable breakup events. The observed spectrum was divided into 3 groups: L($3 \leq Z \leq 5$), M ($6 \leq Z \leq 9$), and H ($Z \geq 10$). These were extrapolated to the top of the atmosphere. The following deductions were made: (1) The ratio $N_L(0)/N_M(0) = 0.05 \pm 0.08$. A comparison of this value with determinations of the ratio at other latitudes suggests that the energy spectrum of L nuclei may possibly be steeper than that of M nuclei. Some of the hypotheses proposed to explain the energy dependence of $N_L(0)/N_M(0)$ are discussed. Of these, the 3-dimensional diffusion model of particle propagation is found to be capable of accounting for the observed energy dependence, assuming that "soft" magnetic clouds are responsible for the diffusion mechanism. (2) The amounts of C and N nuclei relative to O nuclei at the top of the atmosphere are 1.4 ± 0.4 and 0.3 ± 0.1 respectively. (3) The ratio $N_H(0)/N_M(0) = 0.31 \pm 0.09$. This value is within the statistical limits of error consistent with determinations of the ratio at other latitudes.

CELLULAR LOCALIZATION OF MONOAMINES IN THE UPPER BRAIN STEM OF THE PIGEON, by K. Fuxe and L. Ljunggren. [1965] [27]p. incl. illus. tables, refs. (AFOSR-66-0736) (AF EOAR-64-5) AD 633571 Unclassified

Also published in Jour. Compar. Neurol., v. 125: 355-382, 1965.

With the help of a highly sensitive and specific fluorescence method developed by Falck and Hillarp, in combination with a pharmacological approach, it has been possible to demonstrate the presence in birds of specific neurons of 2 distinctly different types, which in all probability form and store a primary catcholamine and 5-hydroxytryptamine, respectively. The amines are in low concentrations in the cell bodies and axons but stored in very high concentrations in the terminals, especially in the abundant varicosities. At least three large ascending monoamine systems appear to be present within the upper brain stem. Many— if not most of the ascending fibers arise in all probability from cell bodies within the mesencephalon and run rostrally mainly in the medial forebrain bundle. Two of the neuron systems produce and store a primary catecholamine, one probably giving rise mainly to terminals within the hypothalamus and the preoptic area, the other within the corpus striatum. The remaining

system produces and stores 5-hydroxytryptamine. The modified ependyma seems to consist —at least partly— of 2 types of cells forming and storing either a primary catecholamine or 5-hydroxytryptamine.

NORADRENALINE AND CHOLINESTERASES IN CONCOMITANT NERVE FIBRES IN THE RAT IRIS, by B. Ehinger and B. Falck. [1965] [4]p. incl. refs. (AFOSR-66-1135) (AF EOAR-64-5) AD 639525 Unclassified

Also published in Life Sci., v. 4: 2097-2100, 1965.

Burn and Rand have suggested that the sympathetic nervous system operates by way of a cholinergic link in the liberation of nervous catecholamines (CA). The direct histochemical demonstration of high concentrations of CA in the terminal sympathetic neurons which can be liberated upon the stimulation of the sympathetic nerves and the rapid disappearance of noradrenaline in the tissues after sympathetic denervation demonstrate that the sympathetic nerve endings are the principal peripheral store of CA. Recently, Leaders advanced the hypothesis that there may be local peripheral interaction between adrenergic and cholinergic neurons. The arguments brought forward for this as well as the Burn and Rand hypotheses are however mainly circumstantial only. In order to obtain direct morphological evidence relevant to the two hypotheses, a combination of the fluorescence method of Falck and Hillarp for the demonstration of CA and the cholinesterase technique of Koelle has been worked out on whole amounts of the rat iris.

ON THE CONTROL OF VENTRICULAR FIBRILLATION DURING HYPOTHERMIA, by K. C. Nielsen and C. Owman. 1965, 13p. incl. diagrs. refs. (Communication no. 6) (AFOSR-65-1110) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-66-14 and Swedish Medical Research Council) AD 637482 Unclassified

Preliminary results are presented of studies on the possible role of adrenergic mechanisms in the production of ventricular fibrillation during hypothermia. The pattern of adrenergic innervation in the heart ventricles was investigated by means of a histochemical fluorescence method. In the hibernating animal studied (hedgehog) few, if any, adrenergic nerves were found in the ventricular muscle tissue, whereas the blood-vessels were supplied by a system of adrenergic nerve terminals. This contrasts with the cat ventricles, in which adrenergic nerves enclose both the muscle fibers and the vessels. One group of cats were pretreated with segontin (N-(3'-phenyl-propyl-(2'))-1, 1-diphenyl-propyl-(3)-amine), which causes a severe depletion of noradrenaline from the adrenergic nerves to the heart muscle, whereas noradrenaline more or less remains in the nerves to the heart vessels. The animals were then cooled to a rectal temperature of 17.8°—17.2°C and re-warmed to 24°C. None of these animals developed ventricular fibrillation. The same number of control cats died in ventricular fibrillation at 22° to 1[illegible]°C rectal temperature. Blockage of the adrenergic beta-receptor with INPEA (N-isopropyl-p-nitrophenyl ethanolamine) prevented ventricular fibrillation in cats cooled to 17.2°—17°C rectal temperature. These animals were returned to normothermia and kept for long-term survival.

[STUDY OF EYE MOVEMENT DURING THE PARADOXICAL PHASE OF SLEEP IN THE CAT] Etude de la motricite oculaire au cours de la phase paradoxale du sommeil chez le Chat, by M. Jeannerod, J. Mouret, and M. Jouvet. [1965] [13]p. incl. illus. diagrs. table, refs. (AFOSR-65-2672) (AF EOAR-62-67) AD 629218 Unclassified

Also published in Electroencephalog. and Clin. Neurophysiol. Jour., v. 18: 554-566, 1965.

The rapid eye movements (REM) occurring during the stage of sleep with fast cortical activity, or paradoxical stage of sleep (PP), have been studied by the electro-oculographic method in chronically implanted cats which were either normal or had brain lesions. In the normal cat, during the PP, the eye movements are either isolated, in small groups (like during visual observation) or in bursts (more than 5

movements); these bursts are specific to the PP. The sped of isolated movements during sleep is slightly slower than that of isolated movements during visual observation. Results suggest that an oculomotor system, triggered by the pons, is responsible for the eye movements during sleep. A schematic organization of such a system is proposed.

[SUPPRESSION OF IEFFERENT SLEEP STATES] La suppression des differents etats de sommeil, by P. Vimont-Vicary. 1965. 95p. incl. illus. diagrs. tables, refs. (AFOSR-66-0567) (AF EOAR-62-67)
AD 632874 Unclassified

Cats with chronically implanted electrodes were selectively deprived of paradoxical sleep for 1-26 days by the swimming pool and electric shock techniques. The "need for paradoxical sleep" was demonstrated by the progressive diminution of the intervals between attempts to enter this phase. Deprivation of this phase of sleep for more than a week produced somnolence, muscular hypotony, sexual excitement, tachycardia, and a picture resembling hallucinations. At the end of this deprivation there was a selective paradoxical sleep "rebound," and up to 60% of the first 6 hr was spent in this phase of sleep. Substances with an inhibitory effect on paradoxical sleep, such as atropine, monoamine oxidase inhibitors, and reserpine, were studied, and the results are discussed in light of a neurohumoral hypothesis of sleep.

THE EFFECTS OF CHRONIC BRAIN-STEM LESIONS ON CORTICAL AND MUSCULAR ACTIVITY DURING SLEEP AND WAKING IN THE CAT, by J. A. Hobson. [1965] [22]p. incl. illus. diagrs. tables, refs. (AFOSR-66-1113) (Sponsored jointly by Air Force Office of Scientific Research under AF EOAR-62-67, Fonds de Developpement de la Recherche Scientifique, and National Institute of Mental Health) AD 639516 Unclassified

Also published in Electroencephalog. and Clin. Neurophysiol. Jour., v. 19: 1-15, July 1965.

The effects of total sections and lesions of the brain-stem on some aspects of cortical and muscular activity in relation to sleep and waking have been studied chronically in cats. The periodic muscular atonia of sleep is progressively inhibited as lesions are placed more caudally in the ponto-mesencephalic brain-stem. The pontine reticular formation is necessary and sufficient for its occurrence. Cortical desynchronization and waking are inhibited as lesions are placed more rostrally in the infrathalamic brain-stem, while desynchronized sleep appears normally. The posterior hypothalamus plays a particularly important role in the desynchronization of waking and the pontine brain-stem in the desynchronization of sleep, but their final common path may be the same. The coordination of tonic cortical and muscular activity, especially as manifested in desynchronized sleep, is disrupted by any total section and unaffected by any partial lesion of the brain-stem. The nervous structures involved are thus diffusely distributed in the ponto-mesencephalic brain-stem. The phasic electrical activity of desynchronized sleep disappears from structures anterior to the mid-brain after any lesion of the dorsal pons or mesencephalon. Such activity may be related to the difference in pattern of firing of brain-stem and cortical units that distinguishes desynchronized sleep and waking and underlies the difference in arousal thresholds between these two states by the mechanism of occlusion. (Contractor's abstract)

[TRIGGERING THE OCULOMOTOR SYSTEM DURING SLEEP] Mise en jue du système oculomoteur pendant le sommeil, by J. Mouret, M. Jeannerod and M. Jouvet. [1965] [9]p. incl. diagrs. tables, refs. (AFOSR-66-0876) (AF EOAR-65-94) AD 633323 Unclassified

Also published in Confinia Neurologica, v. 25: 291-299, 1965.

Rapid eye movements during paradoxical sleep have been studied in the cat, and lesions have been made in various parts of the central nervous system to investigate their effects on oculomotor activity during both paradoxical sleep and arousal. Some observations on eye movements in normal human subjects and in patients with CNS pathology have been cited and compared with the findings from the experimental animal. The possible diagnostic use of oculographic recordings during sleep is suggested.

NUCLEAR MAGNETIC RESONANCE SPECTROSCOPY OF SOME SELENIUM COMPOUNDS, by T. Birchall, R. J. Gillespie, and S. L. Vekris. [1965] [8]p. incl. diagr. tables, refs: (AFOSR-65-1670) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-516 and National Research Council of [Canada]) AD 624331 Unclassified

Also published in Canad. Jour. Chem., v. 43: 1672-1679, June 1965.

Selenium nuclear magnetic resonance spectra have been observed for a number of selenium compounds. Chemical shifts and coupling constants with hydrogen and fluorine have been obtained. Various systems involving selenium compounds have been studied. It was found that a mixture of $SeOF_2$ and $SeOCl_2$ contains SeOClF and that rapid selenium exchange occurs between $SeOCl_2$ and $SeOBr_2$ presumably via the intermediate SeOClBr. The reactions of selenium tetrahalides with sulfur and selenium trioxides and with boron trifluoride were studied. It was observed that antimony pentachloride, tin tetrachloride, arsenic trichloride, quinoline, and potassium chloride produce considerable shifts in the resonance of selenium oxychloride. These shifts can be interpreted in terms of the acid-base behavior of the solutes.

SOLUTIONS IN NON-AQUEOUS SOLVENTS, by R. J. Gillespie. Final rept. [1965] [8]p. incl. diagrs. refs. (AFOSR-66-0629) (AF AFOSR-64-516) AD 630795 Unclassified

The broad long-term objective of this work was to extend the knowledge of highly acidic non-aqueous solvent systems and to use such solvents for the study of the formation and reactions of new ionic and molecular species which are unstable in water and other more familiar solvents. Fluorosulfuric acid was studied in considerable detail. Some of the more important conclusions were: (1) Fluorosulfuric acid is more acidic than sulfuric acid and it is, therefore, the most highly acidic solvent that has been studied; (2) The autoprotolysis ions $H_2SO_3F^+$ and SO_3F^- conduct by a proton-transfer mechanism; (3) Iodine can be oxidized in this solvent to the hitherto unknown I_2^+ ion which gives the blue color formerly attributed to I^+, which does not appear to be stable; and (4) Phenol and anisole protonate on the aromatic ring and not on oxygen. A similar study of the HF solvent system has been initiated, but has not progressed so far. The behavior of the acid SbF_5 has been studied in some detail and evidence has been obtained for the formation of the new dimeric ion $Sb_2F_{11}^-$. This work has considerably extended our knowledge of highly acidic non-aqueous media and has shown the importance of these solvents in the study of new species, particularly positive ions, that are unstable in more basic media.

THE FLUOROSULFURIC ACID SOLVENT SYSTEM. II. SOLUTIONS OF ANTIMONY PENTAFLUORIDE, ANTIMONY TETRAFLUORIDE MONOFLUOROSULFATE, AND ANTIMONY PENTAFLUORIDE—SULFUR TRIOXIDE MIXTURES, by R. C. Thompson, J. Barr and others. [1965] [10]p. incl. diagrs. tables. (AFOSR-67-0545) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-516], Defence Research Board of Canada, and Petroleum Research Fund) AD 647880 Unclassified

Also published in Inorg. Chem., v. 4: 1641-1649, Nov. 1965.

Conductometric, cryoscopic, and nuclear magnetic resonance studies on solutions of SbF_5, SbF_4SO_3F, and SbF_5—SO_3 mixtures in fluorosulfuric acid show that there exists a series of acids with the general formula $H[SbF_{5-n}(SO_3F)_{1+n}]$ where n = 0, 1, 2, and 3 which increase in strength with increasing values of n. The acid $H[SbF_2(SO_3F)_4]$ is a strong acid of the fluorosulfuric acid solvent system. Dimeric and probably higher polymeric forms of these acids are also present in the solutions and nmr studies show that polymerization occurs through fluorosulfate bridges. The fluorosulfuric acidium ion, $H_2SO_3F^+$, has been shown to have an abnormally high conductivity in this solvent and it is concluded that it conducts by proton transfer. (Contractor's abstract)

THE PARABOLIC OXIDATION KINETICS OF BETA-ZIRCONIUM, by C. J. Rosa and W. W. Smeltzer. [1965] [6]p. incl. illus. diagrs. table. (AFOSR-65-0787) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-515] and Defence Research Board of Canada) AD 614556 Unclassified

Also published in Acta Metall., v. 13: 55-60, Feb. 1965.

An investigation is reported on the oxidation properties of β-zirconium at 950°C in oxygen for periods extending to 100 hr. The kinetics were determined by a volumetric technique and may be represented by a parabolic relationship after a period of rapid oxidation. The thickness of the zirconium dioxide scale and the underlying layer of α-zirconium-oxygen solid solution were determined by metallographic techniques. Parabolic diffusion relationships derived from a 3-phase oxide-metal model account for the kinetics of oxidation, scale growth and oxygen solution in the metal. (Contractor's abstract)

BREAKAWAY PHENOMENA IN THE OXIDATION OF ZIRCONIUM AT 850 AND 950°C, by G. R. Wallwork, C. J. Rosa, and W. W. Smeltzer. [1965] [14]p. incl. illus. diagrs. refs. (AFOSR-65-0788) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-515] and Atomic Energy of Canada, Ltd.) AD 616466 Unclassified

Also published in Corrosion Sci., v. 5: 113-120, Feb. 1965.

An investigation is reported on the deviations from parabolic oxidation kinetics to more rapid rates for zirconium at 850° and 950°C. Stresses in the oxide and in metal containing oxygen in solid solution induced cracks in both phases and permitted increased localized oxidation. Small voids were observed at the metal/oxide interface in metallographically prepared sections of oxidized specimens and a duplex scale was formed by cracking between these voids. A distinctly different type of scale was produced where the metal had cracked. Growth of this type of scale was induced by injecting small amounts of water vapor in the oxygen atmosphere and resulted in catastrophic failure of the specimens. (Contractor's abstract)

OXIDATION OF METALS AND ALLOYS, by W. W. Smeltzer. Final rept. Oct. 31, 1963-Oct 31, 1965, 1v. incl. illus. diagrs. tables, refs. (AFOSR-65-2236) (AF AFOSR-64-515) AD 629841 Unclassified

Research studies were conducted to obtain a more detailed understanding of the oxidation mechanism of zirconium and iron-nickel alloys, and the diffusion and thermodynamic properties of oxygen for the above systems. Emphasis was placed on precise measurements of reaction kinetics, and measurements of thermodynamic properties of oxides by the electromotive solid galvanic cell technique. Studies were initiated on the properties of ionic diffusion in metal oxides utilizing measurements of oxygen exchange by mass spectrometry and electrical conductivity. A brief summary of the completed investigations are presented; the full reports are appended.

THE REACTION OF ZIRCONIUM WITH CARBON DIOXIDE AND CARBON MONOXIDE AT 850°C, by R. J. Hussey and W. W. Smeltzer. [1965] [7]p. incl. diagrs. tables, refs. (AFOSR-65-2543) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-515] and Defence Research Board of Canada) AD 622931 Unclassified

Also published in Jour. Electrochem. Soc., v. 112: 554-560, June 1965.

An investigation has been made of the kinetics, the chemistry, and the solid-state processes for the reaction of Zr with CO_2 and CO at 850°C. In CO_2 at 10 cm Hg pressure, the kinetic curve showed an initial decreasing rate, an intermediate increasing rate, and a final decreasing rate. The ratio of carbon to oxygen uptake by Zr in CO_2 was dependent on time and varied from 0.19 to 0.04 over a period 1-48 hr. Carbon produced in the early stages of reaction was incorporated into the oxide and led to formation of a needle-like phase of a ternary lower oxide or a solid solution at the metal/oxide interface. Due to a high ratio of carbon to oxygen uptake in CO this phase developed to a distinct intermediate layer between the oxide scale and metal substrate. The kinetic curves in this gas exhibited a continuously decreasing oxidation rate; eventually breakaway occurred, possibly due to the presence of the secondary phase at the metal-oxide interface. In the range of parabolic oxidation for both CO_2 and CO, the rates were similar in magnitude to that found in oxygen. Comparison of oxygen gradients demonstrated that the extent of oxygen solutions in the metal was the same for oxidation in these gases. (Contractor's abstract)

EFFECT OF MAGNETIC-FIELD NONUNIFORMITIES ON THE FOCUSING OF A SECOND-ORDER DOUBLE-FOCUSING MASS SPECTROMETER, by R. C. Barber. [1965] [6]p. incl. diagrs. (AFOSR-65-1067) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-159] and National Research Council of Canada) AD 620553 Unclassified

Also published in Canad. Jour. Phys., v. 43: 716-721, Apr. 1965.

The results of a numerical calculation investigating the effect of magnetic-field nonuniformities on the focusing of a second-order double-focusing mass spectrometer are reported. Because the image formed in previous experiments was so sharp, the aberrations were studied in the present investigation in finer detail than in former experiments. For each of the magnetic-field configurations considered, 9 ion trajectories were traced. Attention was confined to ions moving in the midplane of the magnetic field, and it was assumed that the field abruptly terminated at the boundaries.

THERMAL EXPANSION OF β-SUCCINIC ACID AND α-ADIPIC ACID IN RELATION TO THEIR CRYSTAL STRUCTURES, by J. L. Amoros, M. L. Canut, and E. Neira. [1965] [12]p. incl. diagrs. tables, refs. (AFOSR-66-1611) (AF EOAR-62-92) AD 639520 Unclassified

Also published in Proc. Roy. Soc. (London), v. 285A: 370-381, May 1965.

The thermal expansion quadrics of β-succinic acid and α-adipic acid have been determined by x-ray Weissenberg method. In adipic acid, x-ray measurements have been made between -100 and +100°C and in succinic acid between -150 and +130°C. In these monoclinic crystals, the minimum expansion corresponds to the c axis, which coincides with the direction of the hydrogen-bonded molecular columns. In other directions along which van der Waals forces prevail thermal expansion is greater, being maximum perpendicular to the (100) planes, the direction of the obtuse bisectrix of the molecular packing angle. The thermal expansion is quantitatively explained by assuming an increase in the angular vibration of the molecules. (Contractor's abstract)

INFLUENCE OF ELECTRIC AND MAGNETIC FIELDS ON THE MICROWAVE DIELECTRIC CONSTANT OF A LIQUID CRYSTAL WITH A POSITIVE DIELECTRIC ANISOTROPY, by E. F. Carr. [1965] [5]p. incl. diagrs. table, refs. (AFOSR-65-0789) (AF AFOSR-64-605) AD 616472 Unclassified

Also published in Jour. Chem. Phys., v. 42: 738-742, Jan. 15, 1965.

The dielectric constant and loss in the anisotropic and normal liquid phases of anisal-p-aminoazobenzene were measured at frequencies of 6 and 24 kmc/sec. Measurements were made with an external magnetic field parallel and perpendicular to the microwave electric field at both frequencies while the measurements in the presence of an external electric field were made at only 6 kmc/sec with the external electric field parallel to the microwave electric field. Results in the presence of an external magnetic field were similar to those for p-azoxyanisole and anisaldazine which have a negative dielectric anisotropy. Measurements in the presence of an external electric field indicate that the alignment of the molecules due to low frequency ac fields is comparable to that produced by magnetic fields providing saturation is reached. Disturbances which were due to an electric field appeared to have an appreciable effect on the alignment when dc fields were applied, but this was not observed for ac fields with frequencies between 20 and 300,000 cps. (Contractor's abstract)

INFLUENCE OF ELECTRIC AND MAGNETIC FIELDS ON THE MOLECULAR ALIGNMENT IN THE LIQUID CRYSTAL ANISAL-p-AMINOAZOBENZENE, by E. F. Carr. [1965] [6]p. incl. diagrs. table. (AFOSR-66-1627) (AF AFOSR-64-605) AD 641784 Unclassified

Also published in Jour. Chem. Phys., v. 43: 3905-3910, Dec. 1, 1965.

The molecular alignment was studied for anisal-p-aminoazobenzene in the presence of external magnetic and ac electric fields. Measurements of the dielectric loss at a microwave frequency of 24 kmc/sec were used to indicate the extent of the molecular alignment. For the external fields parallel to each other, the degree of molecular alignment which could be obtained for a 370 kc/sec electric field was the same as that which could be produced by a magnetic field. For the magnetic and electric fields perpendicular to each other, the ratio of E/H corresponding to a random orientation of the molecules in the plane of E and H was obtained. As the magnetic field was changed from 500 to 3000 G the ratio of E/H remained constant within the limits of

experimental error. The value obtained for E/H could not be explained by assuming that the processes responsible for the molecular alignment were associated with only the anisotropy in the dielectric constant and the permeability. (Contractor's abstract)

INHIBITION OF THE THERMAL REACTION BETWEEN HYDROGEN AND OXYGEN, by D. R. Blackmore, D. R. Clark, and R. F Simmons. Final rept. Mar. 1, 1965 [28]p. incl. diagrs. refs. (AFOSR-65-1239) (AF EOAR-62-88) AD 621216 Unclassified

The kinetics of the inhibiting action of HBr and HCl on the thermal reaction between hydrogen and oxygen was investigated. HBr was found to be a very effective inhibitor of the reaction, while HCl was relatively inefficient. The kinetic characteristics of the inhibition were examined, and it was shown that in the case of HBr the primary inhibition step is: $H + HBr \rightarrow H_2 + Br$. Only a fraction of the bromine atoms produced in this reaction react to give chain termination, however, and the majority react to give chain propagation by: $Br + H_2 \rightarrow HBr + H$. It is suggested that chain termination occurs by: $Br + HO_2 \rightarrow HBr + O_2$. The corresponding mechanism is also operative when HCl is the inhibitor, but a second primary inhibition step is also important in this case: $OH + HCl \rightarrow H_2O + Cl$. The reason for the marked difference in efficiency of HBr and HCl is discussed.

INHIBITION OF THE SECOND LIMIT OF THE HYDROGEN-OXYGEN REACTION BY HYDROGEN BROMIDE AND HYDROGEN CHLORIDE, by D. R. Blackmore, G. O'Donnell, and R. F. Simmons. [1965] [8]p. incl. diagrs. refs. (AFOSR-66-1791) (AF EOAR-62-88) AD 639518 Unclassified

Also published in Tenth Symposium (Internat'l.) on Combustion, Cambridge (Gt. Brit.) (Aug. 17-21, 1964), Pittsburgh, Combustion Inst., 1965, p. 303-310.

The effect of hydrogen bromide and hydrogen chloride on the second limit of the hydrogen-oxygen reaction has been studied over a wide range of mixture composition and vessel diameter using barium bromide- and barium chloride-coated vessels, respectively. Hydrogen bromide has been found to be a very efficient inhibitor, and, in contrast, the same quantity of hydrogen chloride has only a small effect on the explosion limit; hydrogen bromide is approximately 400 times more effective as an inhibitor than hydrogen chloride. The mechanism of the inhibition is discussed, and with hydrogen bromide it is concluded that the primary termination reaction is a removal of hydrogen atoms by the hydrogen bromide. ONE-DIMENSIONAL COMPRESSION OF A COLLISIONLESS GAS, by G. A. Bird. [1965] [9]p. incl. diagrs. (AFOSR-65-2475) (AF EOAR-64-65) AD 629301 Unclassified

Also published in Jour. Fluid Mech., v. 21: Jan. 1965.

A highly rarefied gas, initially in equilibrium, is compressed by an infinite plane piston. The resulting flow is considered when the gas is unbounded and also when the gas is bounded by a second stationary wall. In the first case, the density ahead of the piston is specularly and diffusely reflecting surfaces. In the second case, the average temperature of the gas is found as a function of the wall separation for specularly reflecting surfaces. This (non-equilibrium) temperature is compared with that generated in the corresponding continuum flow which involves multiple shock wave reflexion. It is shown that, for a given average density gradient, the free molecule temperatures are very much higher than the continuum temperatures. (Contractor's abstract)

THE EQUILIBRIUM STATE OF A SHOCK-HEATED ATMOSPHERE, by G. A. Bird. [1965] [8]p. incl. diagrs. (AFOSR-66-0101) (AF EOAR-64-65) AD 631162 Unclassified

Also published in Astrophys. Jour., v. 141: 1455-1462, May 15, 1965.

Equations are developed to describe an atmosphere heated by an arbitrary distribution of shock waves. Solutions are obtained for an atmosphere with a steady outward mass motion ("solar wind") in which the heat supplied by the shock waves is balanced by the convective heat loss due to this motion. The boundary conditions for the solution are those appropriate to the outer

solar atmosphere. It is found that there is a strong "self-regulating" property of shock-heated atmospheres, in that very large changes in the initial heat input are compensated by the subsequent changes in shock strength. This means that, for a very large range of shock strengths and frequencies, the temperature profile is similar to that predicted by the "constant shock strength hypothesis." The maximum coronal temperature varies by only a few per cent from 1,600,000°K while the initial heat input varies by a factor of thousands. However, the outward mass flux increases continuously with the initial heat input and, for very large initial inputs, the maximum temperature also rises appreciably. (Contractor's abstract)

SHOCK-WAVE STRUCTURE IN A RIGID SPHERE GAS, by G. A. Bird. [1965] [8]p. incl. diagrs. (AFOSR-66-2063) (AF EOAR-64-65) AD 643479 Unclassified

Also published in Rarefied Gas Dynamics; Proc. of the Fourth International Symposium, Inst. for Aerospace Studies, Toronto (Canada), (July 14-17, 1964), ed. by J. H. de Leeuw. New York, Academic Press, v. 1: 216-222, 1965.

Consideration is given to a gas composed of rigid sphere molecules, initially in thermal equilibrium between 2 infinite, plane, parallel and specularly reflecting walls. A Monte Carlo approach is used to study the shock wave which is formed when one wall impulsively acquires a uniform velocity towards the other. The method essentially consists of carrying out a "numerical experiment" with a model gas on a very fast computer. Shock wave density profiles are presented for shock Mach numbers from 1.5 to 30. These are compared with the profiles predicted by various analytical methods.

THE STRUCTURE OF POWERS OF NON-NEGATIVE MATRICES, by A. L. Dulmage and N. S. Mendelsohn. [1965] [13]p. incl. diagrs. refs. (AFOSR-65-1405) [AF AFOSR-62-235] AD 622856 Unclassified

Also published in Canad. Jour. Math., v. 17: 318-330, 1965.

The structure of powers of a reducible non-negative matrix is discussed in terms of properties of the directed graph of the matrix. The structure of the subdiagonal blocks in powers of reducible matrices is considered. The main theorem states: Let A be a reducible non-negative matrix with constituents $C_1, C_2, \ldots, C_m$ and let $F_1, F_2, \ldots, F_m$ be the row (or column) sets of these constituents. Let r and s be a pair of integers $1 \leq r < s \leq m$. Then exactly one of the following four alternative holds: (1) $C_{rs}^{(k)} = 0$ for all k; (2) for some k, $C_{rs}^{(k)} \neq 0$, but there exists N such that $C_{rs}^{(k)} = 0$ for $k > N$; (3) there exists N such that $C_{rs}^{(k)} > 0$ for $k > N$; and (4) corresponding to every integer N and to every pair i, j, with $i \in F_r$ and $j \in F_s$ there exists $k_1 > N$, $k_2 > N$ such that $a_{ij}^{(k_1)} = 0$ and $a_{ij}^{(k_2)} > 0$.

ONE-PARTICLE SINGULARITIES AND SU(3), by H. D. Doebner and G. C. Hegerfeldt. [1965] 4p. incl. diagrs. (AFOSR-65-0648) [AF 61(052)658] AD 614845 Unclassified

Also published in Ann. Physik, v. 15: 412-414, July 1965.

In an SU(3)-invariant Lagrangian field theory, it is easy to derive relations between coupling constants, which enter as numerical coefficients of certain field operator products. In an alternative way, based on the asymptotic formulation of field theory, it is possible to define products of coupling constants in terms of residues in the amplitude A(s, t) corresponding to known one-particle singularities. The equivalence of these definitions has not been proved, and it is therefore interesting to note that SU(3)-relations between coupling constants can be derived using SU(3)-predictions for the residues of one-particle poles in A(s, t).

APPROACH TO ELECTRON-PION SCATTERING, by H. D. Doebner and D. Simon. [1965] [23]p. incl. diagrs. refs. (AFOSR-65-0649) [AF 61(052)658] AD 614843 Unclassified

It is shown that a usual Mandelstam representation completed with a suitable choice for pole terms and single dispersion integrals, obtains straight-forward from unitarity using quantum electrodynamics and the resonance structure of the pion provides a method to discuss electron-pion scattering on the same lines as strong interaction theory. The double spectral functions are constructed from a system of integral equations in a strip approximation, and corrections are calculated to the one-photon exchange amplitude, expressed by integrals over the imaginary part of the form factor in the annihilation channel. To have results which are not available from second order perturbation theory at least the second step of the strip approximation or inelastic processes must be discussed. The first step strip approximation is not expected to give an essential correction to the one-photon exchange amplitude.

UNITARITY AND REDUCTION FORMULAS. [1965] 23p. incl. diagrs. refs. (AFOSR-65-0650) [AF 61(052)-658] AD 615151 Unclassified

A theorem is proved in the example of boson-fermion scattering, showing that the splitting of T in T_i^1, T_i^0 corresponds to a natural decomposition of the unitarity condition for T and that it can be deduced from unitarity alone. Reality conditions for T_i^1, T_i^0 are then derived from q-space properties without reference to x-space. Necessary and sufficient conditions for T, constructed from T_i^1, T_i^0 being unitary are given next. They are essential for iteration methods which are then developed which leads to a determination of elastic amplitudes starting with one-particle-exchange-contributions, i.e. pole terms and form factors, and the whole contribution from inelastic processes as input force.

FLUCTUATION IN GASES. MATHEMATICAL PROBLEMS IN QUANTUM FIELD THEORY, by G. Ludwig. Final rept. Jan. 1, 1965, 1v. incl. diagrs. refs. (AFOSR-65-0652) (AF 61(052)658) AD 616782 Unclassified

The investigations resulted in: (1) the completion of the derivation of the Boltzmann equation in μ-space including a study of the influence of binary correlations on the collision term; (2) a further improvement of the derivation of the master equation for binary collisions, the ζ-equation, by demonstrating that the macroscopic truncation of the time propagator U(t) can be replaced by exp ($V\tau$) for short times τ, and (3) a better understanding of the behavior of the solutions of the ζ-equation considering two simple boundary problems, one plate and two parallel plates, and taking the first two moments of ζ into account only.

CHEMICAL SYNTHESIS WITH ION BEAMS, by S. Singer, N. G. Kim and others. [1965] [5]p. incl. diagr. refs. (AFOSR-65-1433) [AF 49(638)913] AD 622674 Unclassified

Also published in Jour. Phys. Chem., v. 69: 799-803 Mar. 1965.

A method of chemical synthesis by gas phase ion-molecule reactions analogous to known liquid phase reactions is described. The synthesis of nitrobenzene by the reaction of NO_2^+ and benzene is reported. The interaction of a beam of NO_2^+ ions, with maximum energies of 1 ev, with gaseous benzene gave nitrobenzene in high yield. A 1-ma ion current consisting of 99% NO_2^+ was formed by electron impact with nitrogen dioxide in a concentric dual-anode magnetron.

THE EQUATIONS OF COMPRESSIBLE TURBULENT GASES, by A. J. Favre. Final rept. Jan. 1965, 78p. incl. diagrs. refs. (AFOSR-65-1229) (AF 61(052)772) AD 622097 Unclassified

The statistical equations for a compressible gas are developed in a general form. All the properties are considered to be turbulent and are separated into macroscopic quantities and fluctuations. First, a complete set of equations is derived from the general form, taking as the fundamental macroscopic quantities the mean values of the velocity, the temperature, the density and the pressure. Second the choice of the most convenient fundamental macroscopic quantities is discussed, which leads to the proposed use of the mean values of the mass-weighted velocity, the internal energy per unit volume, the density, and the pressure. The latter leads to much simpler and physically more significant equations. (Contractor's abstract, modified)

VACUUM EFFECTS ON THE TENSILE AND CREEP PROPERTIES OF ALUMINUM, by H. Shen, S. E. Podlaseck, and I. R. Kramer. [1965] [6]p. incl. diagrs. tables. (AFOSR-65-2737) (AF 49(638)1455) AD 629019 Unclassified

Also published in Trans. Metall. Soc. AIME, v. 233: 1933-1938, Nov. 1965.

The tensile and creep properties of aluminum in vacuum was investigated. It was found that the general effect of a vacuum environment was to reduce the rate of work hardening. Results obtained from creep tests showed that lowering the test pressure from 2×10^{-4} to 10^{-7} torr

produced a decrease in the activation energy as much as 500 cal/mole. An attempt is made to explain these effects in terms of how the surface-stress field of a specimen may be affected by a vacuum environment during plastic deformation. (Contractor's abstract)

EFFECT OF VACUUM ON THE MECHANICAL BEHAVIOR OF METALS, by I. R. Kramer and H. Shen. Final scientific rept. Oct. 1, 1964-Oct. 1, 1965, 15p. incl. diagrs. (Rept. no. RR-70) (AFOSR-66-0007) (AF 49-(638)1455) AD 628794 Unclassified

The fatigue life of Aluminum 1100 has been studied as a function of pressure, stress, frequency, and temperature. The data indicate that the amount of fatigue improvement and the frequency effect observed in vacuum decrease with increasing stress amplitude. The results of resonant frequency measurements, showing the correlation of the fatigue improvement and the frequency effect with the rate of change in the resonant frequency, suggest a possible new method to detect the rate of damage formation for fatigue studies. Iron has been used for studying the various effects of vacuum on BCC metals. Results reveal that vacuum has greater effect on the fatigue life of iron than on the fatigue life of aluminum. As for the tensile studies, the stress-strain curves of iron and recrystallized molybdenum wire specimens have been studied in vacuum. It is found that in the case of iron, only the stress at the Luder's band region is subject to the effect of vacuum. However, the amount of change is dependent on the strain rate. When a very slow strain rate 9×10^{-7} sec^{-1}, is used, the decrease may amount to as much as 1200 psi. The effects of vacuum on the ultimate tensile stres and the total elongation of molybdenum at high temperatures are attributed to a decrease in the rate of oxidation. (Contractor's abstract)

VALIDITY OF MANY-BODY APPROXIMATION METHODS FOR A SOLVABLE MODEL. I. EXACT SOLUTIONS AND PERTURBATION THEORY, by H. J. Lipkin, N. Meshkov, and A. J. Glick. [1965] [11]p. incl. diagrs. tables. (AFOSR-65-0775) (In cooperation with Weizmann Inst. of Science, Rehovoth (Israel)) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-46 and Office of Naval Research) AD 616057 Unclassified

Also published in Nuclear Phys., v. 62: 188-198, Feb. 1965.

In order to test the validity of various techniques and formalisms developed for treating many-particle systems, a model is constructed which is simple enough to be solved exactly in some cases, but yet is nontrivial. The construction of such models is based on the observation that bilinear products of creation and annihilation operators can be considered as generators of Lie groups. Thus the problem of finding eigenvalues can be greatly simplified by the additional integrals of the motion which are present if the Hamiltonian is constructed so as to commute with invariants of the group. In the present case, the model consists of N fermions distributed in two N-fold degenerate levels and interacting via a monopole-monopole force. It is shown that the model Hamiltonian is easily expressed in terms of quasi-spin operators and exact eigenvalues are obtained. In addition, eigenvalues are calculated with ordinary perturbation theory using values for the number of particles and interaction strength which are appropriate to the more realistic problems of finite nuclei. In subsequent papers we consider the results obtained by various other approximation methods for comparison with the exact results presented here. (Contractor's abstract)

VALIDITY OF MANY-BODY APPROXIMATION METHODS FOR A SOLVABLE MODEL. II. LINEARIZATION PROCEDURES, by N. Meshkov, A. J. Glick, and H. J. Lipkin. Oct. 1963 [26]p. incl. diagrs. (Technical rept. no. 332) (AFOSR-65-0776) (In cooperation with Weizmann Inst. of Science, Rehovoth (Israel)) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-46 and Office of Naval Research) AD 601035; AD 640662 Unclassified

Also published in Nuclear Phys., v. 62: 199-210, Feb. 1965.

The validity of methods used in the study of many-particle systems is investigated by using the same approximation in treating a simple model for which exact solutions are available. The model consists of N fermions distributed in two N-fold degenerate levels and interacting via a monopole-monopole force. The excitation energy of the first collective state above the ground state is calculated using the following methods. the method of linearized equations of motion, linearization with the inclusion of renormalized single-particle energies, and a new self-consistent linearization method. The results of these approximation methods are then compared with exact results and with the results of ordinary perturbation theory found in a previous paper. It is found that renormalization of the single-particle energies leads to a considerable improvement of the results over that obtained with the ordinary linearization method, especially for small numbers of particles. Further improvement is obtained with self-consistent linearization method. The possibility of applying the latter method to more realistic problems is briefly discussed. (Contractor's abstract)

VALIDITY OF MANY-BODY APPROXIMATION METHODS FOR A SOLVABLE MODEL. III. DIAGRAM

SUMMATIONS, by A. J. Glick, H. J. Lipkin, and N. Meshkov. Oct. 1963, 32p. incl. diagrs. refs. (Technical rept. no. 334) (AFOSR-65-0777) (In cooperation with Weizmann Inst. of Science, Rehovoth (Israel)) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-46 and Office of Naval Research) AD 601260; AD 640817 Unclassified

Also published in Nuclear Phys., v. 62: 211-224, Feb. 1965.

The model N-fermion system studied in 2 previous papers is reconsidered in order to investigate the range of validity of diagrammatic many-body perturbation theory and various selective summations of higher order graphs. The familiar random phase approximation or bubble graph sum is shown to be the first term in an expansion in powers of 1/N for which the coefficients are arbitrary functions of NV/ϵ, where V is the interaction strength and ϵ is the level separation of the non-interacting system. However, the 1/N expansion converges very slowly (if at all) for $N \leq 40$. Other corrections to the bubble sum which do not fit into such an expansion are shown to be much more important than the 1/N corrections for small N. These are the exchange and self-energy graphs which correct for counting errors and violations of the exclusion principle when enumerating the states that a given particle can occupy. With these terms a rather good approximation to the excitation energy can be obtained, though the results are not quite as good as that obtained with fourth-order perturbation theory for small N, or for the whole range of N with the self-consistent linearization procedure described in a previous paper. POSSIBILITY OF LONG-RANGE SPIN POLARIZATION IN A DEGENERATE ELECTRON GAS, by A. Bardasis, D. S. Falk and others. [1965] [3]p. (AFOSR-65-1760) (Sponsored jointly by Advanced Research Projects Agency; Air Force Office of Scientific Research under [AF AFOSR-62-46], and National Science Foundation AD 625774 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 298-300, Mar. 1, 1965.

A conclusion of Dreyfus, et al that it is possible for an induced long-range spin-density distribution to exist in a nonferromagnetic metal is investigated as it contradicts the Ruderman-Kittel theory that the spin density generated at large distances from a localized spin perturbation is of an oscillatory nature. The 2 theories are reconciled by considering the spin density contribution by the nonevanescing waves. It is concluded that the nonevanescing waves contribute a long-range polarization which just cancels that coming from the evanescing waves, thereby leaving only the expected Ruderman-Kittel spatial dependence.

SOFT X-RAY EMISSION SPECTRUM OF METALS, by A. J. Glick and P. Longe. [1965] [3]p. incl. diagrs. refs. (AFOSR-65-2931) (Sponsored jointly by Advanced Research Projects Agency; Air Force Office of Scientific Research under AF AFOSR-62-46) AD 629149 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 589-591, Oct. 4, 1965.

The variation with frequency of the intensity of soft x-ray emission gives information on the width of the conduction band and on the conduction-electron density of states. There are however complications due to electron-electron interactions which produce a tail in the spectrum and give rise to collective behavior. Previous attempts to incorporate such interactions into the theory were not successful. It is shown here by application of the technique of diagrammatic many-body theory that these earlier treatments had overlooked important interference terms. When these are retained, agreement with experiment is excellent.

Also published in Phys. Rev., v. 137: A783-A787, Feb. 1, 1965.

A current flowing in a superconducting film has a

tendency to break pairs similar to the effect of paramagnetic impurities in a superconductor. The effect of the current on the tunneling density of states for a normal-superconductor tunneling junction has been computed by the Green's function method of Abrikosov, Gorkov and Maki and found to be identical (for a short mean free path) to that of paramagnetic impurities. A simple relationship between the current parallel to the junction and the equivalent paramagnetic impurity concentration is derived. Passing various amounts of current through the sample in the one experiment gives the same information as is obtainable in the other experiment only by preparing different samples with various impurity concentrations. PARTICLE-MIXTURE THEORY AND APPARENT CP VIOLATION IN K-MESON DECAY, by H. Ezawa, Y. S. Kim and others. [1965] [4]p. incl. refs. (AFOSR-65-1345) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-500] and National Science Foundation) AD 622644 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 673-676, Apr. 19, 1965.

A model based on the idea of particle mixtures is proposed which is consistent with CP conservation and which leads to the 2-pion-decay mode of the $(K^\circ, \bar{K}^\circ)$ system. A set of partner particles is introduced with the requirement that the primed particles mix with the unprimed ones rather weakly, depending upon their mass difference, which is required to be much less than or of the order of 1 mev. Furthermore, the primed particles are inhibited from having very strong interactions with the usual strongly interacting particles so that not only their production cross section is very low, but also their decay to pions and leptons is much slower than that of the $(K^\circ, \bar{K}^\circ)$ system.

QUANTUM MECHANICS OF A MANY-BOSON SYSTEM AND THE REPRESENTATION OF CANONICAL VARIABLES, by H. Ezawa. [1965] [25]p. incl. diagrs. refs. (AFOSR-65-1776) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-500 and National Science Foundation) AD 625571 Unclassified

Also published in Jour. Math. Phys., v. 6: 380-404, Mar. 1965.

A method is presented for treating the assembly of interacting bosons under Bose-Einstein condensation. The method is a quantum mechanical adaptation of the theory of small oscillation. The interaction between condensed particles determines the stability of this oscillation. When it is stable and its amplitude is not macroscopic, the Bogoliubov approximation is valid. In this way, the method provides a validity criterion for the Bogoliubov approximation as well as an estimation of the errors thereby committed. The method is applied to the Huang model, the assembly of bosons interacting through a hard core plus weak attractive potential, and it is concluded that Huang's treatment is well founded. The mathematical background of the approximation is discussed by invoking the representation theory of canonical variables of an infinitely large system. (Contractor's abstract, modified)

PROOF THAT SCATTERING IMPLIES PRODUCTION IN QUANTUM FIELD THEORY, by S. Ø. Aks. [1965] [17]p. incl. diagrs. refs. (AFOSR-65-1817) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-500], National Aeronautics and Space Administration, and National Science Foundation) AD 625569 Unclassified

Also published in Jour. Math. Phys., v. 6: 516-532, Apr. 1965.

A proof of the necessity of production processes in quantum field theory is carried out in the axiomatic framework. It is shown that a field theory that is assumed to have a nontrivial scattering amplitude violates crossing symmetry, if production processes are absent. The proof is based on the rigorous analytic properties of the scattering amplitude, particularly the analyticity in the invariant-scattering variables s, t and u. In the course of the proof it is shown that the conclusion is valid for a scattering amplitude satisfying the requirements of an S-matrix theory embodied in the Mandelstam representation.

SELECTION RULES FOR PARAFIELDS AND THE ABSENCE OF PARA PARTICLES IN NATURE, by O. W. Greenberg and A. M. L. Messiah. [1965] [13]p. incl. tables, refs. (AFOSR-65-1818) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-500 and National Science Foundation) AD 625572 Unclassified

Also published in Phys. Rev., v. 138: B1155-B1167, June 7, 1965.

Green's parafield quantization is reviewed. It is shown, both for a single field and for sets of fields, that all Fock-like representations of Green's trilinear commutation rules are realized by Green's ansatz with anticommuting (commuting) Bose (Fermi) component fields for para-Bose (para-Fermi) fields. Restrictions on the form of the interaction Hamiltonian density $H_I(x)$ are derived from the requirement that $H_I(x)$ be a paralocal operator. From these restrictions on H_I, selection rules on the S matrix are proved to all orders of perturbation theory. The most important such rule prohibits all reactions in which the total number of para particles of order $p > 1$ in the initial and final states is one. This last selection rule, together with experimental information, leads to the conclusion that no presently known particle can be para.

Also published in Phys. Rev. Ltrs., v. 14: 929-932, May 31, 1965.

An indication of an enhancement at about 730 mev was shown recently in the recoil spectrum of the proton in $\pi^- + p$ reactions (Bull. Amer. Phys. Soc., v. 9: 629, 1964). There has been no indication of such an enhancement in a direct 2 or 3 pion invariant mass plot. An investigation is made of the existence of such a resonance, which does not decay with a large branching ratio to a 2 or 3 pion system, but can be observed in a recoil system and is produced with an appreciable cross section. The possible decay modes of the resonance are studied for different assignments of its quantum numbers. The order of magnitude of corresponding partial widths are estimated by assuming dominance of low mass intermediate states. Four possible quantum numbers are assigned, 0^{+-}, 0^{-+}, 0^{++}, and 1^{++}.

PARTIAL WAVE DISPERSION RELATIONS FOR PIONIC DISINTEGRATION OF DEUTERON, by K. V. Vasavada. [1965] [47]p. incl. diagrs. tables, refs. (AFOSR-65-2793) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-500 and National Science Foundation) AD 627744 Unclassified

Also published in Ann. Phys., v. 34: 191-237, Sept. 1965.

A dispersion theoretic approach is made within the framework of partial wave dispersion relations to understand the pionic disintegration of the deuteron at low energies. The reaction amplitude is expressed in terms of 6 independent Lorentz invariant scalar functions which are free from kinematical singularities, and the partial wave helicity amplitudes are obtained. Dispersion relations are written after removing kinematical singularities. After some approximations, the dispersion relations become soluble integral equations of the Omnes-Muskhelishvilli type. The contribution of the left hand single nucleon exchange cuts is evaluated exactly. The left hand anomalous contribution is evaluated approximately by replacing the cuts by poles in the appropriate channels. Analytic continuation in the deuteron mass gives the contribution of the right hand anomalous cut. Part of the right hand cut due to the 2 protons intermediate state is taken into account by using the experimental energy dependent phase shift parameters for proton proton scattering. The intermediate state containing 2 nucleons and one pion is effectively replaced by one particle and a resonance, and model amplitudes are used to evaluate the contribution. The results of this calculation are numerically evaluated on an IBM 7090 computer. For the angular distribution and the total cross section, at a reasonable agreement is obtained with the results from low energy experiments. (Contractor's abstract)

LONG-RANGE ELECTROMAGNETIC FORCES ON NEUTRAL PARTICLES, by G. Feinberg and J. Sucher. [1965] [15]p. incl. diagrs. (AFOSR-65-2794) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-500] and Atomic Energy Commission) AD 627679 Unclassified

Also published in Phys. Rev., v. 139: B1619-B1633, Sept. 20, 1965.

The long-range forces, i.e., those falling off as a power of the distance, which may act between pairs of particles, one of which is neutral and spinless are considered. It is shown that these forces may easily be calculated from the discontinuity function in the momentum transfer of the scattering amplitude for the 2 particles. The 2-photon exchange force between 2 neutral, spinless systems, and the 3-photon exchange force between a charged and a neutral, spinless system were investigated. In the former case, the potential behaves as r^{-7} for large r, in contradiction to the London expression for the Van der Waals force, and in agreement with the result of Casimir and Polder. For the latter case, the potential is odd under charge conjugation and hence can convert a K_2 meson to a K_1 meson. It is found that the potential behaves as r^{-7}. It is found that such long-range electromagnetic interactions are presently unobservable in particle physics. (Contractor's abstract)

K_{e3} DECAY AND UNIVERSALITY IN CABIBBO'S THEORY OF LEPTONIC DECAYS, by S. Oneda and J. Sucher. [1965] [3]p. incl. table. (AFOSR-66-0444) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-500] and National Science Foundation) AD 630230 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 927-929, Dec. 13, 1965.

It is shown that the use of $|c^2-1| \lesssim 1\text{-}5\%$ where C is a renormalization factor, and the most recent 'best' va value' of the K_{e3} decay rate, together with the inclusion of hitherto neglected form-factor effects in the determination of Cabibbo's bare coupling constant for β decay (G cos θ) from this rate, may yield a value of cos θ which is in quite close agreement with that experimentally determined from β decay.

FEYNMAN RULES AND FEYNMAN INTEGRALS FOR SYSTEM WITH HIGHER-SPIN FIELDS, by C. S. Lam. [1965] 10p. (AFOSR-66-0799) [AF AFOSR-64-500] AD 641617 Unclassified

Also published in Nuovo Cimento, Series X, v. 38: 1755-1764, Aug. 16, 1965.

It is known that Feynman rules for many systems may be expressed by replacing the interaction Hamiltonian in the Dyson formula by minus the interaction Lafrangian, provided we also make suitable covariant changes of the time-ordered functions between some fields. The general conditions for which this is valid are investigated and the result is stated. In case this is not valid, a general, straight-forward procedure for computing the extra vertices is given which is considerably simpler than the usual Dyson-Wick procedure. This procedure is illustrated by an explicit example dealing with charged vector electrodynamics. It also follows from these investigations that the integrand for the Feynman path integral is not always simply the exponential of i times the action. This simple prescription fails whenever an extra vertex for the Feynman rule occurs, and the correct expressions in these cases are given. (Contractor's abstract, modified)

POLARIZATION OF A DECAY PARTICLE IN A TWO-STEP PROCESS: APPLICATION TO $K^- + p \rightarrow \pi^0 + \Sigma^0$, $\Sigma^0 \rightarrow \gamma + \Lambda$, by M. H. Cha and J. Sucher. [1965] [8]p. incl. diagrs. (AFOSR-66-0801) [AF AFOSR-64-500] AD 641626 Unclassified

The phenomenology of 2-step processes of the Type $A+B \rightarrow C + D$, $D \rightarrow E + F$ is studied for the particular case when among the final particles only F is observed. Formulas convenient for the computation of the polarization of F in terms of the parameters describing the production process are presented, and the connection between the polarization of F and that of D, when D is not observed, is clarified. Numerical results are obtained for the angular dependence of the Λ polarization in the process $K^- + \text{proton} \rightarrow \pi^0 + \Sigma^0$, $\Sigma^0 \rightarrow \gamma + \Lambda$ at a variety of incident energies.

MOMENTUM-SPACE ANALYTICITY PROPERTIES OF THE BERGMAN-WEIL INTEGRAL FOR THE THREE POINT FUNCTION, by G. Källen and J. S. Toll. [1965] [18]p. incl. refs. (AFOSR-67-1537) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-500 and National Science Foundation) AD 655166 Unclassified

Also published in Jour. Math. Phys., v. 6: 1885-1901, Dec. 1965.

The momentum-space analyticity domain of the Bergman-Weil integral representation of the vertex function or 3-point function is investigated using the assumption that thresholds can be introduced simply as lower limits of integration for the mass variables in the representation. It is shown that this assumption leads to a regularity domain which is larger than the domain following from general physical assumptions of Lorentz invariance, local commutativity and reasonable mass spectrum. To simplify the discussion it is assumed that the vertex function is regular when all 3 complex variables lie in the same half-plane. Standard techniques for the evaluation of Feynman diagrams have proved to be inconvenient for this investigation and new methods have been developed taking explicit advantage of the fact that there are only 2 external vectors and, hence, will work in a 2-dimensional Lorentz space.

Further, the vanishing of the masses for certain internal lines has also been exploited. The techniques used here might be of interest also in other connections. (Contractor's abstract)

A PROOF OF THE MEROMORPHY OF THE SCATTERING AMPLITUDE FOR THE HARD-SPHERE POTENTIAL, by S. Y. Shieh. Mar. 18, 1965, 7p. (Technical rept. no. 446) (AF AFOSR-64-500) Unclassified

For the amplitude of the hard-sphere potential, the author proves that (1) there are l poles from the l^{th} partial wave amplitude and (2) the l poles from l^{th} partial wave amplitude lie outside a circle of radius $\sqrt{2/3(2l-1)}$, with the center of the circle at the origin of the k-plane. These 2 facts establish that there is no accumulation point of these poles. Combining these results with a proof of the convergence of the expansion series, the meromorphy of the scattering amplitude as function of the momentum k is attained, the positions of these poles being independent of the angular variable cos θ.

ELECTRON-PHONON RENORMALIZATION EFFECTS IN HIGH MAGNETIC FIELDS. THE DE HAAS-VAN ALPHEN EFFECT, by M. Fowler and R. E. Prange. Mar. 10, 1965, 25p. incl. diagrs. refs. (Technical rept. no. TR-443) (AFOSR-65-1192) (AF AFOSR-65-735) AD 620189 Unclassified

Also published in Physics, v. 1: 315-328, 1965. (AFOSR-66-1343; AD 641094)

When a metal is placed in a sufficiently strong magnetic field, it is to be expected that the effective mass of the electrons due to electron phonon interactions will be modified. The condition that the field will be strong enough to have an effect is that the cyclotron frequency be comparable to phonon frequencies. It is expected that such effects may be observable with experimentally realizable fields in some special cases. The amplitude dependence of the de Haas-van Alphen effect was calculated as a function of temperature and magnetic field. This amplitude can be interpreted as giving a field dependent effective mass. The amplitude was calculated numerically for several cases of interest. It is found that the field effects are rather smooth and depend most directly on the electron selfenergy function for pure imaginary values of the frequency. (Contractor's abstract)

PHONONS IN CRYSTALLINE SOLIDS AND DILUTE BOSE GASES, by A. Bardasis, D. S. Falk, and D. A. Simkin. [1965] [7]p. incl. refs. (AFOSR-65-2108) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under [AF AFOSR-65-735] AD 627973 Unclassified

Also published in Jour. Phys. Chem. and Solids, v. 26: 1269-1275, Aug. 1965.

Phonons in a crystalline solid and a dilute Bose gas are treated from a uniform point of view. In each of the cases, the potential is expanded about ionic equilibrium positions, with the important difference that in the gaseous state these positions are allowed to move. This motion leads to an additional term in the kinetic energy part of the gas Hamiltonian, resulting in a dispersion relation for long wavelength density fluctuations identical to that obtained by Bogoliubov (JETP, v. 1: 83, 1955). The usual lattice phonon spectrum is also reproduced. The limitations of the viewpoint when applied to liquids and Fermi gases are discussed. (Contractor's abstract)

EXCHANGE EFFECTS IN FERROMAGNETIC RESONANCE WITH NON-LOCAL CONDUCTIVITY, by L. L. Hirst and R. E. Prange. Jan. 12, 1965 [30]p. incl. diagrs. table, refs. (Technical rept. no. 429) (AFOSR-65-2109) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under AF AFOSR-65-735) AD 627971 Unclassified

Also published in Phys. Rev., v. 139: A892-A900, Aug. 2, 1965.

A solution is obtained for the surface impedance of a ferromagnetic metal with a wave-number-dependent

conductivity function, by an extension of the method of Reuter and Sondheimer. Computed curves are given for some specific cases. It is concluded that exchange effects are large under suitable low-temperature conditions, but there are too many unknown parameters to allow a very accurate value of the exchange constant to be deduced from resonance experiments. For extreme anomalous conductivity, exchange effects depend on the combination (exchange constant) X (conductivity)$^{2/3}$.

THEORY OF INELASTIC SCATTERING OF ELECTRONS, by A. J. Glick. [1965] [10]p. incl. diagrs. refs. (AFOSR-66-1294) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under [AF AFOSR-65-735]) AD 641095 Unclassified

Presented at Symposium on Quantitative Electron Microscopy, Washington, D. C., Mar. 30-Apr. 3, 1964.

Also published in Lab. Invest., v. 14: 787-796, June 1965.

A brief summary of the theory of inelastic electron scattering by thin films is first presented. Then, it is shown that the scattering properties of the target material can be expressed in terms of the dynamic (frequency- and wave number-dependent) dielectric constant of the material. Thus, to determine the inelastic scattering theoretically, one must calculate the dielectric constant; an example of such a calculation is given for a model scattering medium. The resulting cross-section is analyzed and the features in the cross-section are discussed for various types of scattering materials. Surface and lattice effects and how they modify the cross-section are considered. Conversely, the feasibility of using the observed experimental cross-sections to work back and quantitatively explore the basic electron excitation spectrum of the target material is also discussed.

A FINITE DIFFERENCE ANALOG OF THE NEUMANN PROBLEM FOR POISSON'S EQUATION, by J. H. Bramble and B. E. Hubbard. [1965] 14p. incl. refs. (AFOSR-65-2352) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-454 and National Science Foundation) AD 629528 Unclassified

Also published in SIAM Jour. Numer. Anal., v. 2: 1-14, 1965.

In a bounded connected plane region R with smooth boundary C, let u be the solution of (a) $\Delta u = -f$ in R, (b) $\partial u/\partial n = g$ on C. Introduce a square lattice of side h, and attempt to find a discrete approximation U to u on the lattice points in R and at the intersections of C with the sides of the squares. To determine U on this slightly irregular lattice, construct, as follows, a system of difference equations with diagonally-dominant coefficient matrix of positive type: (1) Assign the value of U at one interior point; (2) At the remaining interior lattice points, approximate (a) by standard 5 point formulas which may have O(h) errors at points adjacent to C, but $O(h^2)$ errors everywhere else; and (3) Approximate the boundary condition (a) by an $O(h^2)$ formula previously developed by the authors. Now let the error be e = u - U. By exploiting a discrete form of Green's theorem, a discrete Neumann's function, and the known

properties of a discrete Green's function for R, the authors prove that $|e| = O(h^2|\log h|)$ if $u \in C^4$ in R. An explicit example is used to prove that this estimate is sharp. The authors also discuss modifications of the proof to permit occurrence of corners on C.

ON THE DIFFERENCE EQUATION $y(x+1) - y(x) = f(x)$, by S. C. Chu and J. B. Diaz. [1965] [4]p. (AFOSR-66-0562) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-63-400 and Naval Ordnance Laboratory) AD 641531 Unclassified

Also published in Jour. Math. Anal. and Appl., v. 11, 478-481, July 1965.

The following problem was considered by Euler to find a solution $y(x)$ of the difference equation $y(x+1) - y(x) = f(x)$. Euler derived a formula for a solution of the equation which may be valid when the function $f(x)$ has period one and is expandable in a Fourier series. The purpose of this note is to solve the equation in an extremely simple manner for all functions $f(x)$ of period one and to apply the basic idea involved to the solution of other difference equations. A brief resume of Euler's method of solution is given, for the purpose of comparison.

COMPLEMENTARY INEQUALITIES III: INEQUALITIES COMPLEMENTARY TO SCHWARZ'S INEQUALITY IN HILBERT SPACE, by J. B. Diaz and F. T. Metcalf. [1965] [20]p. incl. refs. (AFOSR-66-0663) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSP-63-400 and Naval Ordnance Laboratory) AD 633544 Unclassified

Presented at Seventieth annual meeting of the Amer. Math. Soc., Miami, Fla., Jan. 23-27, 1964.

Abstract published in Notices of Amer. Math. Soc., v. 11: 92, Jan. 1964.

Also published in Math. Ann., v. 162: 120-139, 1965

The Schwarz inequality implies that $|(Ax, Bx)|^2 \leq (Ax, Ax)(Bx, Bx)$, where x is an arbitrary vector of the Hilbert space, A and B are operators on the Hilbert space itself. Under certain circumstances there exist complementary inequalities to the Schwarz inequality Previous papers have been concerned with complementary inequalities for finite sums of real numbers and for definite integrals. The purpose of this paper is to prove operator inequalities of this general "complementary" nature, which include as special cases several other complementary inequalities appearing in the literature Several complementary inequalities are discussed and further extensions involving several operators and vectors are presented. Variations and comparisons with many references are observed.

THE TRANSPORTATION OF MAGNETIC LINES OF FORCE BY A HIGHLY CONDUCTING FLUID, by J. M. Burgers. [1965] [22]p. incl. diagrs. refs. (AFOSR-65-1471) (AF AFOSR-64-141) AD 622642 Unclassified

Presented at SIAM National Meeting, Washington, D. C., May 13-14, 1964.

Also published in Jour. Soc. Indus. and Appl. Math., v. 13. 184-205, Mar. 1965.

The transportation of magnetic lines of force by a moving medium of a high electrical conductivity can lead to the appearance of a boundary surface between moving fluid, devoid of a magnetic field, and a region with a strong magnetic field but without motion of the fluid. Equations describing the relation between particle motion and the magnetic field are developed, and some of the problems connected with the appearance of a separating surface are considered. The problem of how such a field arises when the motion is started from rest is treated, and simplification of the basic equations results in a model which illustrates the case when the gas is set in motion by a shock wave. Particle motion inside the Earth's magnetosphere is given special consideration as an example.

NOZZLE FLOW OF A FULLY IONIZED PLASMA BASED ON TWO FLUID THEORY, by S. I. Pai and C. K. Tsao. [1965] [11]p. incl. diagrs. (AFOSR-65-2055) (AF AFOSR-64-141) AD 627742 Unclassified

Also published in Zeitschr. Angew. Math. und Phys., v. 16: 360-370, 1965.

Two fluid theory is used to analyze the 1-dimensional steady channel flow of a fully ionized plasma, and results are compared with those of single fluid theory. At a low rate of discharge, the 2 theories give very similar results, however the 2 fluid theory gives a more detailed picture of the flow-field of the plasma. It shows that the temperature of electrons is much larger than that of ions at high discharge rates. A special numerical example is presented of subsonic nozzle flow of a fully ionized gas. It is found that at the critical point where the local mach number of plasma reaches unity, the ion temperature and ion pressure both drop to zero, and ion velocity reaches its terminal value for a given initial pressure.

ON SOLUTIONS OF THE GENERALIZED BI-AXIALLY SYMMETRIC HELMHOLTZ EQUATION GENERATED BY INTEGRAL OPERATORS, by R. P. Gilbert and H. C. Howard. [1965] [12]p. incl. refs. (AFOSR-65-2111) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-400 and National Science Foundation) AD 629791 Unclassified

Also published in Jour. Reine und Angew. Math., v. 218: 109-120, 1965.

Bergman's integral operator method is used to investigate solutions of the partial differential equation

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{2\mu}{x}\frac{\partial u}{\partial x} + \frac{2\nu}{y}\frac{\partial u}{\partial y} + k^2 u = 0, \quad \mu, \nu > 0.$$

This equation is referred to as the generalized bi-axially symmetric Helmholtz equation, following Weinstein who first considered fractional-dimensional space in potential theory. One is led to consider this equation initially by seeking "monochromatic" solutions $U(X, Y, t) \equiv U_1(X, Y)e^{\pm ikt}$ of the $(m+n = (2\mu+1) + (2\nu+1))$-dimensional wave equation $\frac{\partial^2 U}{\partial x_1^2} + \ldots + \frac{\partial^2 U}{\partial x_m^2} + \frac{\partial^2 U}{\partial y_1^2} + \ldots + \frac{\partial^2 U}{\partial y_n^2} = \frac{\partial^2 U}{\partial t^2}$ which depend solely on the variables $X^2 = (x_1^2 + \ldots + x_m^2)$, $Y^2 = (y_1^2 + \ldots + y_n^2)$. The generalized bi-axially symmetric Helmholtz equation and cases $\mu = 0$ and $k=\mu=0$ have been the object of many investigations; here, further properties of solutions to the generalized bi-axially symmetric Helmholtz equation with $k > 0$ are investigated by using Bergman's operator method. In particular, information concerning the location of singularities and the growth of solutions is obtained. (Math. Rev., abstract)

SOME INEQUALITIES FOR GENERALIZED AXIALLY SYMMETRIC POTENTIALS WITH ENTIRE AND MEROMORPHIC ASSOCIATES, by R. P. Gilbert. [1965] [7]p. incl. refs. (AFOSR-65-2113) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-400, National Science Foundation, and Naval Ordnance Laboratory) AD 630585 Unclassified

Also published in Duke Math. Jour., v. 32: 239-246, June 1965.

Solutions to the partial differential equation of generalized axially potential theory (GASPT), $\frac{\partial^2 \varphi}{\partial x^2} + \frac{\partial^2 \varphi}{\partial y^2} + \frac{k}{y}\frac{\partial \varphi}{\partial y} = 0$, $k > 0$, may be generated by a given integral operator $A_k[f(\sigma)]$ maps analytic functions of the complex variable σ onto solutions of the GASPT equations $u(x, y)$.

The function $f(\sigma)$, which is mapped onto $u(x, y)$ is called the A_k-associate of $u(x, y)$. In this paper certain inequalities are obtained concerning entire and meromorphic GASPT functions that are independent of the associate function. This is done by making use of the inverse operator A_k^{-1}.

ON THE LOCATION OF SINGULARITIES OF A CLASS OF ELLIPTIC PARTIAL DIFFERENTIAL EQUATIONS IN FOUR VARIABLES, by R. P. Gilbert. [1965] [11]p. incl. refs. (AFOSR-65-2114) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-400 and National Science Foundation) AD 630208 Unclassified

Also published in Canad. Jour. Math., v. 17: 676-686, 1965.

The location of singularities is investigated for solutions to the elliptic equation $T_4[\Psi] \equiv \frac{\partial^2 \Psi}{\partial x_\mu \partial x_\mu} + A(r^2) x_\mu \frac{\partial \Psi}{\partial x_\mu} + C(r^2)\Psi = 0$, where $A(r^2)$, $C(r^2)$ are entire functions of the complex variable $r^2 = x_\mu x_\mu$ ($\mu = 1, 2, 3, 4$). The procedure makes use of an integral operator $B_4[f]$ which maps holomorphic functions of three complex variables onto harmonic functions of four variables. It is established that certain functions $H(X)$, generated by the operator $B_4[f]$ are regular provided that X is not contained in a given set of intersections.

ON SOLUTIONS OF THE GENERALIZED AXIALLY SYMMETRIC WAVE EQUATION REPRESENTED BY BERGMAN OPERATORS, by R. P. Gilbert and H. C. Howard. [1965] [15]p. incl. refs. (AFOSR-65-2344) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-400, National Science Foundation, and Naval Ordnance Laboratory) AD 629792 Unclassified

Also published in Proc. London Math. Soc., v. 15: 346-360, Apr. 1965.

Bergman's integral-operator method is used to investigate solutions of the partial differential equation $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{2\nu}{y}\frac{\partial u}{\partial y} + k^2 u = 0$. This equation is referred to as the generalized axially symmetric wave equation, following Weinstein who first considered fractional-dimensional space in potential theory. One is led to consider this equation initially by considering "monochromatic" solutions, $U(X;t) = U(X)e^{\pm ikt}$, of the $(n=2\nu+2)$-dimensional wave-equation $\frac{\partial^2 U}{\partial x_1^2} + \cdots + \frac{\partial^2 U}{\partial x_n^2} - \frac{\partial^2 U}{\partial t^2} = 0$ which depend solely on the variables $x=x_1$, $y=(x_2^2+\cdots+x_n^2)$. The generalized axially symmetric wave equation and the particular case $k=0$ have been the object of many investigations, here, further

properties of solutions to the generalized axially symmetric wave equation with $k > 0$ are investigated by using Bergman's operator method. In particular, information concerning the location of singularities and the growth of solutions is obtained.

INTEGRAL OPERATOR METHODS FOR GENERALIZED AXIALLY SYMMETRIC POTENTIALS IN (n+1) VARIABLES, by R. P. Gilbert and H. C. Howard. [1965] [18]p. incl. refs. (AFOSR-66-0200) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-400 and National Science Foundation) AD 633542 Unclassified

Also published in Jour. Australian Math. Soc., v. 5: 331-348, 1965.

The integral operator method of Bergman is used to investigate solutions of the partial differential equation $\frac{\partial^2 u}{\partial x_1^2} + \cdots + \frac{\partial^2 u}{\partial x_n^2} + \frac{\partial^2 u}{\partial \rho^2} + \frac{s}{\rho}\frac{\partial u}{\partial \rho} = 0$, where $s > -1$. In particular, information concerning the growth and location of singularities of solutions of the partial differential equation is obtained. Equations of the form (1.1) with $s=1, 2\ldots$ arise from the $(n+k+1)$-dimensional Laplace equation $\Delta_{n+k+1} u = 0$ in the "axially symmetric" coordinates $x_1, \ldots x_n, \rho$.

SOME RESULTS IN INTERMEDIATE PROBLEMS FOR EIGENVALUES, by A. Weinstein. [1965] [19]p. incl. diagrs. tables, refs. (AFOSR-66-0212) (AF AFOSR-64-400) AD 641721 Unclassified

Also published in Proc. Internat'l. Symposium on Appl. Anal. Math. Phys., Cagliari-Sassari (Italy) (Sept. 28-Oct. 4, 1964), Rome, Edizioni Cremonese [1965] 218-234.

Considering a completely continuous symmetric operator T in a Hilbert space H, assume that T is negative definite so that the eigenvalues can be written in increasing order; this allows the eigenvalues to be defined by minimum rather than by maximum problems. In the numerical applications, T more often is positive definite instead of being negative. Usually the inverse operator is considered which in applications is a differential equation with appropriate boundary conditions. The problem of upper bounds is considered as solved by the Rayleigh-Ritz method; to find lower bounds, the method of intermediate problems is used. Tables of some numerical results obtained by the method of intermediate problems are presented, some of which can be found in the literature and some of which are published here for the first time. Included also are results which were obtained by various modifications and extensions of the basic theory of intermediate problems and which have already been published in various periodicals and reports.

ANALYTIC PROPERTIES OF THE ELASTIC UNITARITY INTEGRAL, by S. Ø. Aks, R. P. Gilbert, and H. C. Howard. [1965] [9]p. incl. refs. (AFOSR-66-0557) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-400 and National Science Foundation) AD 633543 Unclassified

Also published in Jour. Math. Phys., v. 6: 1626-1634, Nov. 1965.

In this paper, certain results concerning the singularities of holomorphic functions with integral representations are used to investigate the analytic properties of the elastic unitarity integral of the quantum theory of fields. In particular, it is shown that each of the Landau singularities of the scattering amplitude is an actual singularity. It is also shown that if the scattering amplitude is not identically zero it must have a natural boundary on the unphysical sheet.

A COMPLEMENTARY TRIANGLE INEQUALITY IN HILBERT AND BANACH SPACES, by J. B. Diaz and F. T. Metcalf. Jan. 1965, 15p. (Technical note no. BN-383) (AFOSR-66-2096) (AF AFOSR-64-400) Unclassified

Published in Proc. Amer. Math. Soc., v. 17: 88-97, Feb. 1966.

If non-zero vectors $x_1 \ldots, x_n$ of a Hilbert space satisfy $0 \le r \le (\mathrm{Re}(x_i, a))/\|x_i\|$ for a unit vector a, then $r(\|x_1\| + \cdots + \|x_n\|) \le \|x_1 + \cdots + x_n\|$, where the equality holds if and only if $x_1 + \cdots + x_n = r(\|x_1\| + \cdots + \|x_n\|)a$.

Consequently, it is obtained that $r(\|x_1\| \cdots \|x_n\|)^{1/n} \le \frac{1}{n}\|x_1 + \cdots + x_n\|$. This is a generalization of an inequality obtained by H. S. Wilf for complex numbers. The authors give elementary proofs and obtain similar inequalities for Banach spaces. (Math. Rev. abstract)

MULTIVALUED HARMONIC FUNCTIONS IN FOUR VARIABLES, by R. P. Gilbert. [1965] 19p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of

Scientific Research under AF AFOSR-64-400, and Office of Naval Research) Unclassified

Also published in Jour. D'Anal. Math., v. 15: 305-323, 1965.

In the investigation of multivalued harmonic functions of 4 variables use was made of the theory of algebraic surfaces, and of rational and algebraic functions. The following theorem was proved: If H(X) is a harmonic function in 4 variables defined by integral representation, and $\sqrt{2}[X] \sim 0$ is a 2-cycle which meets each $D\mu[X]$ in just 2 points, then H(X) has a representation in terms of Weierstrass E-functions.

A TRANSFORM RELATED TO THE POISSON INTEGRAL FOR A HALF-PLANE, by D. V. Widder. Mar. 1965, 16p. (Technical note no. BN-392) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-400 and National Science Foundation) Unclassified

Published in Duke Math. Jour., v. 33: 355-362, June 1966.

The author considers the inversion of the integral transform $f(x) = \int_0^\infty t\varphi(t)[z^2 + t^2]^{-1}\, dt$. By a simple change of variables this can be reduced to the Stieltjes transform. It then follows from a now classical formula of the author that $\varphi(t) = L_t f = \lim_{n\to\infty} L_{n,t} f$ almost everywhere if $L_{n,t} = -\theta \prod_{k=0}^{n} (1-\theta^2/4k^2)$. Here $\theta = t(d/dt)$. The main result of the paper is that if it happens that $f(x) = x^{-\alpha} \sum_0^\infty a_k x^k$, $0 < x < \rho$, then the inversion formula above reduces to the following: $\varphi(t) = \frac{2}{\pi} t^{-\alpha} \left\{ \sin\frac{\pi\alpha}{2} \sum_{k=0}^{\infty} (-1)^k a_{2k} t^{2k} - \cos\frac{\pi\alpha}{2} \sum_{k=0}^{\infty} (-1)^k a_{2k+1} t^{2k+1} \right\}$ for $0 < t < \delta$, where δ depends upon ρ. If $\rho = \infty$ then $\delta = \infty$. A parallel formula holds when $f(x) = x^{-\alpha} \sum_0^\infty a_k x^{-k}$, $\rho < x < \infty$. (Math. Rev. abstract)

UNSTEADY THREE-DIMENSIONAL LAMINAR JET MIXING OF A COMPRESSIBLE FLUID, by S. I. Pai. [1965] [5]p. incl. diagrs. (AFOSR-65-1472) (AF AFOSR-65-141) AD 622924 Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 24, Jan. 27, 1965.

Also published in AIAA Jour., v. 3: 617-621, Apr. 1965.

The fundamental equations of an unsteady 3-dimensional laminar jet mixing of a compressible fluid are discussed These equations are of continuity, motion, energy, and state; they are simplified by introducing 2 stream functions. Finally, the unsteady jet flow that deviates slightly from an unsteady uniform flow is studied in detail. It was found that, for arbitrary 3-dimensional jets, the velocity and temperature distributions tend to be axisymmetrical at large time-from-start and far downstream. Numerical examples are given. NONLINEAR MECHANICS OF UNIVERSAL PLASMA INSTABILITIES, by H. Lashinsky. Aug. 1965 [18]p. incl. illus. diagrs. refs. (Technical note no. BN-411) (AFOSR-65-1737) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-141 and Atomic Energy Commission) AD 625033 Unclassified

Presented at Seventh Internat'l. Conf on Ionization Phenomena, Belgrade (Yugoslavia), Aug. 22-27, 1965.

Certain nonlinear mode-competition phenomena observed in experiments on the universal plasma instability in a thermal plasma device, the Q-machine, are analyzed by extending the usual phase-plane methods of nonlinear mechanics, the phase-plane coordinates in this case being the mode energies. Ion Landau damping of the universal instability provides an experimental means for selective control of the mode amplitudes. The results of mode-competition experiments using this technique are in agreement with the theoretical analysis, and the relevance of the results to similar phenomena in gas lasers and lumped-parameter vacuum-tube circuits is discussed. OPTICS OF THE INTEGRATING SCHLIEREN INSTRUMENT, by P. C. T. de Boer. [1965] [8]p. incl. diagrs. refs. (AFOSR-65-2052) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-65-141] and Office of Naval Research) AD 627159
Unclassified

Also published in Rev. Scient. Instr., v. 36: 1135-1142, Aug. 1965.

An analysis is presented of the optics encountered in the integrating schleiren arrangement. Expressions were developed for the signal which will be received on the phototube, both for the instrumentation using an inclined knife edge and for that with a vertical knife edge. A simple method is described for calibrating the density scale; the method involves displacing the knife edge over a known distance and measuring the resulting signal. The influence of certain diffraction phenomena on the measurements is briefly discussed, and it is concluded that Fresnel diffraction occurring in the edges of the light beam is one of the factors determining the resolving power. Another factor important for the resolving power is the divergence of the incident light. The advantage of the vertical knife edge is the very high sensitivity which can be obtained. INVESTIGATION OF THE UNIVERSAL INSTABILITY IN A THERMAL PLASMA DEVICE (Q-MACHINE), by H. Lashinsky. Sept. 1965 [20]p. incl. illus. diagrs. tables, refs. (Technical note no. BN-415) (AFOSR-65-2053) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-141 and Atomic Energy Commission) AD 627261 Unclassified

Also published in Plasma Physics and Controlled Nuclear Fusion Research; Proceedings of the Second Conf., Culham (Gt. Brit.), (Sept. 6-10, 1965), Vienna, International Atomic Energy Agency, v. 1: 499-514, 1966. (Title varies)

A Q-machine is used to study the universal instability due to the joint effect of the finite ion Larmor radius and the density gradient perpendicular to the magnetic confining field. A Q-machine is well suited for such an investigation since it produces a plasma that is essentially quiescent. The experimentally determined basic characteristics of the instability are found to be in good qualitative agreement with the linear theory of the universal instability. The effect of column length on the real part of the frequency and on the imaginary part is examined. The latter effect is due to ion Landau damping and the method is excellent for studying the Landau damping mechanism itself. A number of nonlinear effects are revealed in the experiments, which are analyzed by generalizing standard methods of nonlinear mechanics.

NONLINEAR MODE INTERACTIONS IN UNIVERSAL PLASMA INSTABILITIES, by H. Lashinsky. [1965] [3]p. incl. illus. diagr. refs. (AFOSR-65-2054) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-141 and Atomic Energy Commission) AD 627477 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 508, Apr. 28, 1965.

Also published in Phys. Rev. Ltrs., v. 14: 1064-1066, June 28, 1965.

By regarding the plasma column of a thermal plasma device (Q-machine) as a bounded, spatially distributed oscillator with velocity-distributed constituent elements, the nonlinear behavior of the universal instability can be analyzed through an extension of the methods of nonlinear mechanics. Nonlinear mode interactions are considered in a 2-mode system with incommensurate mode frequencies. To investigate the stability of simultaneous oscillation in 2 modes, the phase-plane topology methods of nonlinear mechanics are used. In addition it is shown possible to set up an experimental situation in which only 2 modes oscillate by an appropriate adjustment of the sheath conditions and the column length. Results of such a 2-mode experiment are given.

DIVERGENT TRANSPORT COEFFICIENTS AND THE BINARY COLLISION EXPANSION, by L. K. Haines, J. R. Dorfman, and M. H. Ernst. Oct. 1965, 38p. incl. diagrs. refs. (Technical note no. BN-419) (AFOSR-65-2741) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-65-141, Army Research Office (Durham), and Netherlands Organization for the Advancement of Pure Research) AD 631808
Unclassified

The binary collision expansion for the viscosity of a 2-dimensional gas of hard disks is discussed. A divergence appears in the first correction to the Boltzmann equation result. The calculations presented here are exact and free of the difficulties that appear in the earlier discussion of Kawasaki and Oppenheim. The coefficient of the divergence is computed and found to be

precisely the same as that found by Sengers by an entirely different method. The origin of the divergence is shown to be exactly the same as that found by Dorfman and Cohen. (Contractor's abstract)

FUNCTIONS AND INTEGRALS CONNECTED WITH SOLUTIONS OF THE DIFFUSION OR HEAT FLOW EQUATION, by J. M. Burgers. May 1965, 96p. incl. diagrs. (Technical note no. BN-398) (AFOSR-66-1946) (AF AFOSR-65-141) AD 640445 Unclassified

The paper contains an investigation of the properties of certain functions connected with solutions of the ordinary diffusion or heat flow equation $\partial\psi/\partial x = J(\partial^2\psi/\partial y^2)$, when the function ψ must become zero on a boundary curve in the x, y-plane, the most important case being that where the boundary curve is a parabola $y = x^2/2t$ (J and t being constant parameters). In the first part of the paper, the functions of interest are defined, and various properties of these functions are derived from a study of the partial differential equation and the behavior of its solutions when the boundary curve is subjected to variations. In the second part, the boundary curve is always a parabola. A transformation of the field makes it possible to change this boundary into a straight line, the differential equation obtaining a slightly more complicated form. In the third part, certain multiple integrals are evaluated, depending upon these functions defined.

TRANSPORT COEFFICIENTS FOR DENSE GASES, by J. R. Dorfman. [1965] [23]p. incl. diagrs. (AFOSR-66-0334) (AF AFOSR-66-1015) AD 630588 Unclassified

Presented at Fourth Eastern Theoretical Physics Conf., Stony Boook, N. Y., Nov. 26-27, 1965.

A convergent theory for the density dependence of transport coefficients for a moderately dense gas is discussed. Since the terms in the original density expansion depend upon the dynamics of successively higher numbers of particles, one can classify the divergences that appear in terms of the associated dynamical events. The most divergent terms are always determined by sequences of binary collisions. The summation of the most divergent terms produces a collision damping which keep the interval between successive binary collisions to within a few mean free times. The resummed expression for the viscosity due to Kawasaki and Oppenheim was partially evaluated. One can say that terms proportional to $n^{d-1} \log n$, where d is the number of dimensions, appear in the density expansion, however, the precise coefficients of the logarithm have not yet been established.

THERMAL EFFECTS ON THE FLUORESCENCE LIFETIME AND SPECTRUM OF MgO:V^{2+}, by B. Di Bartolo and R. Peccei. [1965] [7]p. incl. diagrs. table, refs. (AFOSR-65-2774) (Sponsored jointly by Air Force Materials Laboratory; and Air Force Office of Scientific Research under AF AFOSR-62-317) AD 629266 Unclassified

Also published in Phys. Rev., v. 137: A1770-A1776, Mar. 15, 1965.

The vibronic spectrum associated with the $^2E \rightarrow {}^4A_2$ transition at 8700A of MgO:V^{2+} has been investigated as a function of temperature. The position and the width of the purely radiative (R) line associated with this transition were measured from 4 to 460°K, and the total intensity of the fluorescence spectrum from 77 to 650°K. At low temperatures, vibrational satellites are observed only on the low-energy side of the pure electronic transition, corresponding to spontaneous phonon emission; at higher temperatures, they also appear on the high-energy side, corresponding to phonon abosrption. With increasing temperature the vibronic bands become more intense relative to the pure electronic transition, the peaks broaden, and multiphonon processes enter and form a fluorescence continuum extending from 7000 to 500A. The fluorescence lifetime of the ^2E level, which is 50 msec and nearly temperature-independent at 77°K, decreases rapidly above 200°K to ~ 0.03 msec at 800°K. The enhancement of the transition probability of the vibronic bands, determined from the relative increase in the integrated area after correction for the temperature dependence of the absorption strength, can account for the major temperature dependence of the fluorescence lifetime, without requiring the presence of any purely nonradiative transitions. EXPERIMENTAL ELECTRIC CURRENT DISTRIBUTIONS IN MGD CHANNEL FLOWS (Abstract), by M. A. Hoffman. [1965] [1]p. (Bound with AFOSR-65-1266; AD 622527) (AF AFOSR-64-306) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

Experimental investigations of the distribution of currents to electrodes in linear MGD channels have been carried out. The experiments have been performed with 2 electrode configurations: (1) continuous electrodes and (2) segmented electrodes. In each case the electrodes were finely subdivided so that the current distribution to the electrodes could be determined. As expected, current concentrations were measured at the edges of the electrodes. However, the concentrations were less pronounced than the current density singularities predicted by theories assuming constant electrode potential (as well as uniform gas properties and gas velocity).

A semi-empirical theory including a current-dependent electrode potential shows reductions in the current concentrations similar to those in the experiments. Therefore it appears that electrode and sheath voltage drops will tend to limit the current concentrations on the electrodes in some current ranges. This implies that operation in the diffuse current mode without the arc breakdowns which would be expected from the predicted current singularities of the constant electrode potential theory should be possible in MGD generators.

PROPERTIES OF NONEQUILIBRIUM PLASMA AT LARGE HALL PARAMETERS (Abstract), by J. L. Kerrebrock. [1965] [1]p. (Bound with AFOSR-65-1266; AD 622527) (AF AFOSR-64-306) Unclassified

Presented at Eighth AFOSR Contractors' meeting on Ion and Plasma Propulsion Research, Los Angeles, Calif., Apr. 29-30, 1965.

The aim of this program is to determine the properties of nonequilibrium plasmas in strong magnetic fields. It appears from the experiments conducted to date that the effective Hall parameter and conductivity of the plasma may deviate considerably from the values which would be expected for a homogeneous plasma. Theory and the present experiments both indicate that this deviation may be due to the presence of wave-like disturbances which are amplified at large Hall parameters. Measurements of the root-mean amplitude of the electrical fluctuations in the plasma show a strong increase with increasing Hall parameter, while the effective conductivity and Hall parameter both decrease from their expected values. The measurements of Hall voltage have also lead to a direct determination of the electron density in the nonequilibrium plasma. From the electron density, the electron temperature can be inferred, and hence the electronic energy loss rate. The loss rates so determined agree reasonably well with those expected from elastic collisions and resonance radiation.

PLASTIC DEFORMATION AND FAILURE OF SILVER-STEEL FILAMENTARY COMPOSITES, by H. R. Piehler. [1965] [5]p. incl. illus. diagrs. (AFOSR-65-0916) (AF 49(638)775) AD 616803 Unclassified

Also published in Trans. Metall. Soc. AIME, v. 233: 12-16, Jan. 1965.

Continuous 7- and 19-filament close-packed silver-steel filamentary composites were tested in tension. For purposes of comparison, the tensile behavior of the composite was predicted from the measured properties of the individual components. It was assumed that the axial strain is the same in both components and that the contribution of each component to the composite flow stress is proportional to its volume fraction. Good agreement was obtained between the observed and predicted tensile behavior. However, the composite elongation at fracture was about twice that observed when the individual steel wires were tested alone. Composites in which the filaments were widely spaced failed by the consecutive fracture of the filaments. In composite with closely spaced filaments, a composite instability preceded fracture. These effects are explained in terms of a lateral restraint to the necking of the filaments which develops in the deforming composite.

MECHANICAL BEHAVIOR OF COMPOSITE MATERIALS, by J. W. Mar and L. A. Shepart. Final summary rept. Sept. 1, 1965, 13p. (Rept. no. 94-6) (AFOSR-65-1936) (AF 49(638)775) AD 627173 Unclassified

This study was conducted to develop an understanding of the interaction of stronger and more ductile phases in determining the mechanical behavior and fracture of metallic composites. It was directed to composites in which the strong phase constituted the major volume fracture. The following aspects were particularly emphasized: (1) the relationship of the properties of individual phases to their behavior in a composite; (2) the effect of the shape, size and volume fraction, distribution, and spacing of the phases upon the properties; and (3) the thermodynamic properties, i.e., phase relationships solubilities, and interfacial tensions of the composites.

EXPERIMENTAL INVESTIGATION OF THERMAL DIFFUSION EFFECTS IN LAMINAR AND TURBULENT SHEAR FLOW, by H. Thomann and J. R. Baron. [1965] [13]p. incl. illus. diagrs. (AFOSR-65-1151) (AF AFOSR-62-407) AD 618575 Unclassified

Also published in Internat'l. Jour. Heat and Mass Transfer, v. 8: 455-466, Mar. 1965.

An experimental investigation was conducted to determine the order of magnitude of thermal diffusion across a laminar and a turbulent shear layer. A short length of a cooled free jet was passed through stationary gas and subsequently recaptured into a continuous circulating system. Various mixtures of helium and nitrogen were investigated. With temperatures of 78°K in the jet and 310°K in the surrounding chamber, steady-state helium concentrations in the laminar jet were as much as 7% smaller than in the surroundings. The experimental results are in good agreement with a simplified analysis. With a turbulent shear layer between the jet and surroundings, the helium concentration inside the jet increases to within 0.1% higher than the chamber level. The thermal diffusion ratio (i.e. thermal to mass concentration diffusion coefficients) in the turbulent shear layer was thus at least 2 orders of magnitude

smaller than in the laminar case and of opposite sign. It is suggested that similar separation effects are to be expected for other steady flows with closed streamlines, such as base flows and flows past cavities. (Contractor's abstract)

EXPERIMENTS ON BLUNT BODY FLOWS WITH CENTRAL INJECTION, by A. F. Gollnick, Jr. May 1965, 68p. incl. illus. diagrs. tables, refs. (Technical rept. no. 105) (AFOSR-65-1149) (AF AFOSR-64-641) AD 621525 Unclassified

Blunt nosed models incorporating axisymmetric contoured injection nozzles were tested at Mach numbers of 7.46 and 4.80. Nozzle contours were computed by means of an inviscid, incompressible analysis and designed to generate hemispherical and ellipsoidal interfaces between the injectant and external flow fields. Shock and interface displacement measurements were in substantial agreement with earlier data, provided a consistent definition of injection mass flow rate was used. Injection produced substantial reductions in equilibrium surface temperatures. Helium proved to be a more effective injectant in this respect than air. In the hypersonic range, Mach number appeared to have no effect on the results. It appeared that in most cases the injectant separated from the nozzle near the throat, producing considerable mixing within the injection cap, accompanied by unsteadiness and asymmetry of the bow shock and interface. It was found that separation data could be correlated on the basis of a previously developed throat flow rate parameter and that separation could be successfully postponed by increasing the throat area. RADIATION COUPLED WEDGE FLOW USING METHOD OF INTEGRAL RELATIONS, by M. C. Jischke. Apr. 1965, 34p. incl. diagrs. table, refs. (Technical rept. no. 112) (AFOSR-65-1727) (AF AFOSR-64-641) AD 624554 Unclassified

The radiation coupled supersonic flow past a wedge or cone is formulated using the first approximation of the method of integral relations. Solutions obtained for wedge flow of an optically thin, i.e., nonabsorbing, gas indicate a temperature decrease and density increase along the surface with a corresponding shock wave decay. Radiation effects on velocity and pressure are relatively small. Anomalous behavior of the transparent gas far downstream of the leading edge suggests a criterion for estimating the region of validity for the optically thin gas approximation. RADIATION EFFECTS IN THE STAGNATION REGION BOUNDARY LAYER, by J. Shwartz. Nov. 1965, 47p. incl. diagrs. tables, refs. (Technical rept. no. 119) (AFOSR-66-0129) (AF AFOSR-64-641) AD 628547 Unclassified

The radiation coupled boundary layer of an emitting and absorbing gas at the stagnation region of a blunt body is considered. Solutions are obtained for a wide range of optical thicknesses and radiation intensities, including the radiative effects of the adjoining shock layer. The solutions indicate the decrease in temperatures, their gradients, and the related conductive heat transfer to the wall as well as the net radiant energy contribution. The results are shown for a range of optical thicknesses from thin to effectively thick, with the major effects of radiation found to exist for the former extreme. (Contractor's abstract)

AXISYMMETRIC, LAMINAR, BINARY SHEAR LAYER WITH THERMAL DIFFUSION AND DIFFUSION-THERMO EFFECTS, by K. Y. Chien. [1965] [7]p. incl. diagrs. (AFOSR-66-0570) (AF AFOSR-64-641) AD 631154 Unclassified

Also published in Internat'l. Jour. Heat and Mass Transfer, v. 8 1507-1513, 1965.

Consideration is given to the thermal separation of components across the shear layer between a cold jet mixture (of helium and nitrogen) and a hot ambient gas, both initially at the same concentration levels. An asymptotic steady state solution is obtained assuming the layer to be thin relative to the jet radius. As a consequence of

small inhomogeneity the momentum equation may be decoupled from energy considerations and a priori known velocity profiles result with the customary assumption of constant product of density and viscosity. Iterative integration of the concentration and energy relations is completed on the basis of the steady state condition of zero mass transport across the dividing streamline using similarity co-ordinates. Reasonable agreement with available experimental data results from use of the modified hard sphere model for the thermal diffusion ratio. (Contractor's abstract)

RADIO AND TELEVISION IN THE SOVIET UNION, by F. G. Durham. June 1965, 122p. incl. illus. diagrs. refs. (Rept. no. C/64-10) (AFOSR-67-0955) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under AF 49(638)1237) AD 651556 Unclassified

This paper can be divided into 6 major sections. The first one deals with the broadcasting network within the Soviet Union. Here the author discusses radiobroadcasting, broadcasting stations, television broadcasting, number of television stations, and radio and television in rural localities. The next section covers production and repair of radio and television sets and also covers future radio and television sets and subscription fees. The third section treats the Administration of Soviet Radio and Television-the structural apparatus of the Broadcasting Administration and its functions. In the fourth chapter, the author discusses programs and hours of radio and television broadcasting. Here the author also goes into educational TV in the USSR, radio and television in Dnepropetrovsk, Ukrainian SSR, and recording of broadcasts. The fifth section pertains to Intervision which is the central network connecting the television broadcasting systems of the major socialist countries. In the final section, the author studies the size of the audience, the nature of the audience, and audience feedback and listening behavior.

AMATEUR RADIO OPERATION IN THE SOVIET UNION, by F. G. Durham. June 1965, 71p. incl. illus. diagr. refs. (Rept. no. C/64-10A) (AFOSR-67-0956) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under [AF 49(638)1237]) AD 651559 Unclassified

A study was made of amateur radio operation in the Soviet Union. The importance of amateur radio activity in Soviet society is shown. The reader learns about the Administration of Soviet Amateur Radio Activity, and RADIO, the official journal of Soviet amateur radio activity. This leads to a discussion on the amateur radio operator and his technical training, call signs, and frequency allocations. A discussion is given of the types of amateur communications being encouraged in the Soviet Union such as short wave, vhf, and uhf, and single-sideband communications. Contests, titles and awards for Soviet amateur radio operators are noted. Other topics discussed include participation of amateur radio operators in such activities as tracking artificial earth satellites; the military significance of radio amateurism in the Soviet Union; radio equipment, exhibitions of amateur built equipment, and foreign contacts of Soviet amateur radio operators.

Massachusetts Inst. of Tech. Center for International Studies, Cambridge.

NEWS BROADCASTING ON SOVIET RADIO AND TELEVISION, by F. G. Durham. June 1965, 63p. incl. diagrs. tables, refs. (Rept. no. C/64-10b) (AFOSR-67-0957) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under AF 49(638)1237) AD 651568 Unclassified

The paper specifically deals with news broadcasting on Soviet radio and television. It begins by discussing the Soviet conception of the functional role of broadcasting media and news. It emphasizes of what extreme importance is the position which news broadcasting occupies in the process of informing the individual Soviet citizen. This leads into a study of radio news broadcasting. The first part of this section deals with the mechanics of news broadcasting in the Soviet Union. The reader learns about schedules, planning, the news-gathering apparatus, and party influence. In the next section it turns to a study of the content of the news broadcasts; into their characteristics, forms, and the different types of news. After this it discusses television news broadcasting; on times of broadcasts, forms of news broadcasts on television and the preparation of news for television.

THE FILM INDUSTRY IN COMMUNIST CHINA, by A. P. L. Liu. July 1, 1965, 92p. incl. diagr. tables, refs. (Rept. no. C/65-5) (AFOSR-67-0959) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under AF 49(638)-1237) AD 651567 Unclassified

The monograph deals with the development of a centralized movie industry in Communist China. A brief review is given of the state of movie industry in pre-Communist China. Then a detailed description of the Communist nationalization of the movie industry is given. A network of movie showing was quickly established under the Communist leadership. Movie attendance went up slowly over the years but most of the growth was due to organizational effort rather than voluntary attendance. The Communists selectively imported and censored foreign films. As to the domestic film industry the regime

still faces the problem of producing an adequate number of high-quality feature films. The problem of producing films appealing to the peasantry is especially serious.

CHINESE ATTITUDINAL REACTIONS TO FORCED COMPLIANCE: A CROSS-CULTURAL EXPERIMENT IN THE THEORY OF COGNITIVE DISSONANCE, by P. Hiniker. May 1965, 66p. incl. tables, refs. (Rept. no. C/65-18) (AFOSR-67-0969) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under AF 49(638)1237) AD 651566 Unclassified

This paper is a report of experimental research on Chinese psychological reactions to forced compliance conducted by the author in Hong Kong between the months of January and October 1964. It represents an attempt to provide empirical answers to the questions posed by 2 mutually contradictory theories pertinent to Chinese reactions in a forced compliance situation, viz. the Theory of Cognitive Dissonance and a Characterological Theory about Chinese behavior. The former is about the tendency of people to maintain consistency between their cognitions, evaluations, and behaviors and how people react once this consistency is disrupted. The latter is about the behavior characteristics of Chinese resulting from their culture of Confucianism. The author finds that the experiment supports the Characterological Theory in general, but only part of the Dissonance Theory is supported. For example, for the Chinese and American subjects alike, increased inducement produces increased compliance. But unlike that of the American subjects, the internalized attitudes of the Chinese were affected neither by increased inducement nor by consequent increased compliance. However the author does not conclude that this experiment has large implications for dissonance theory as a whole but he does contend that the experiment has direct implications for the cross-cultural applicability of dissonance due to forced compliance.

THE USE OF TRADITIONAL MEDIA FOR MODERNIZATION IN COMMUNIST CHINA, by A. P. L. Liu. Oct. 1965, 96p. incl. illus. diagr. tables, refs. (Rept. no. C/65-24) (AFOSR-67-0961) (Sponsored jointly by Advanced Research Projects Agency; Air Force Office of Scientific Research under AF 49(638)1237) AD 651558 Unclassified

This is a very general description of how the Chinese Communist Government reforms 4 traditional entertainment media for the purpose of Communist propaganda. However, the author also discusses the general pattern of grass-root communication in traditional China in order to provide a historical perspective of the paper. The Communists made several serious efforts to reform the traditional theater but ended up in unsatisfactory results. Then the regime turned to the traditional art of story-telling and poems. To complement that, the regime also organized people for collective singing. The ironic result, as the author points out, is that the regime meant to exploit the effectiveness of these media as traditionally being "people's art" but the regime's exploitation destroys this unique quality of "people's art".

BOOK PUBLISHING IN COMMUNIST CHINA, by A. P. L. Liu. Oct. 1965, 92p. incl. diagr. tables, refs. (Rept. no. C/65-25) (AFOSR-67-0962) (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under AF 49(638)-1237) AD 651563 Unclassified

This is a general study of the organization of the book publishing industry in Communist China. First the paper reviews briefly the private industry of publishing in pre-Communist China. Next the Communist nationalization of the publishing enterprise is described. Then the author discusses the publishings of the following categories of books: works of Mao Tse-tung and other Chinese Communist leaders, belles lettres (modern and classical), history and economics, science and technology, dictionaries, popular reading materials, children's readers and specially designed books for the minority races in China. The author also discusses briefly China's translation of books from foreign countries, especially the Soviet Union and China's export of books to foreign lands. Finally the author discusses the general reading preferences among the Chinese public today and notes the popularity of classical literature.

RATIONAL APPROXIMATIONS ON FINITE POINT SETS, by P. Fox, A. A. Goldstein, and G. Lastman. [11]p. incl. tables. (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-62-348 and General Motors Research Laboratories) Unclassified

Published in Approximation of Functions, Proc. of the [Eighth] Symposium, General Motors Research Laboratories, Warren, Mich., (Aug. 31-Sept. 2, 1964), ed. by H. L. Garabedian. Amsterdam, Elsevier, 1965, p. 57-67.

Two new algorithms are described for rational Cebysev approximation on finite point sets. It is assumed that both numerator and denominator depend linearly on the free coefficients. These algorithms differ from those previously given for the same problem in that they terminate in a finite number of cycles. The rational approximation obtained is constrained in the sense that the denominator is bounded below by, say, $\delta > 0$. With a

small additional effort other linear equalities can be imposed as additional constraints. To implement the algorithms, a method for solving systems of linear inequalities is required. (Math. Rev. abstract)

Massachusetts Inst. of Tech. [Computation Center] Cambridge.

THE NUMERICAL SOLUTION OF BOUNDARY VALUE PROBLEMS, by J. W. Lucey. May 14, 1965, 114p. incl. diagrs. tables, refs. (AFOSR-65-1279) (A. AFOSR-63-341) AD 621201 Unclassified

The marchout method is extended to the numerical solution of second order 2-dimensional inhomogeneous problems and the one velocity neutron transport equation. In the method the solution is expanded in a full set of vectors which are used in an unstable difference equation. The error growth is controlled, however, by periodic matrix transformations which insure the completeness of the vector set. The error in the solution is determined by the frequency of these transformations and may be preset. The method has its greatest advantage in relation to the computational speed of conventional methods in elongated meshes, such as multigroup diffusion calculations or low order discrete ordinate or P_N calculations with many spatial mesh points. THE INTERIOR ELASTIC STRESS FIELD IN A CONTINUOUS CLOSE-PACKED FILAMENTARY COMPOSITE MATERIAL UNDER UNIAXIAL TENSION, by H. R. Piehler. June 1965, 33p. incl. diagrs. tables, refs. (Technical rept. no. 132-1) (AFOSR-65-1426) (AF 49(638)1463) AD 624572 Unclassified

Using symmetry arguments, boundary conditions are established which must hold on the lines of symmetry between neighboring filaments in an oriented filamentary composite. These conditions serve to set the problem as a special case of the mixed boundary value problem of elasticity. The composite is assumed to deform such that the normal strains in the direction of the filament axes are the same in both media. The equations of elasticity are then solved in polar coordinates so that the solution has the appropriate sixfold symmetry. The in-plane stresses are vanishingly small for the epoxy-fiberglass composite. For the silver-steel composite, the in-plane stresses reach about 3% of the average axial stress. When the filaments are close together, the periodic portions of the stress field are most important. As the filaments are more widely spaced, the stress field becomes more circularly symmetric. The phasing of the stress field is such that the radial stress is compressive at the point where the filaments are closest together and tensile at the point where the filaments are farthest apart. In all cases, the composite Young's modulus varies linearly with filament fraction. (Contractor's abstract)

THE OPERATION OF BRITTLE FRACTURE MECHANISMS IN DUCTILE METAL COMPOSITES, by J. P. Kershaw and L. A. Shepard. Dec. 1965, 17p. incl. illus. diagrs. refs. (Rept. no. ASRL TR 132-3) (AFOSR-66-1669) (AF 49(638)1463) AD 638621 Unclassified

Experiments with W-Fe-Ni and Fe-Ag composites are described. The former consists of continuously bonded rounded tungsten grains in a FCC solid solution matrix of W-Fe-Ni, while the latter consists of a regular grain structure with silver dispersed in the grain boundaries and through the grains. Griffith cracks, concentrated slip, and the effects of twin intersection in these composites are described. It is concluded that the softer matrix phase provides a mechanism whereby the stress concentrations in the harder phase are relieved, thus leading to ductile behavior of the composite. (Contractor's abstract)

Massachusetts Inst. of Tech. Dept. of Aeronautics and Astronautics, Cambridge.

EFFECT OF TUNGSTEN COMPOSITION ON THE MECHANICAL PROPERTIES ON THE W-Ni-Fe HEAVY ALLOY, by J. W. O'Neil and P. N. Salyer. Dec. 1965, 30p. incl. illus. diagrs. tables, refs. (Rept. no. ASRL TR 132-2) (AFOSR-66-1670) (AF 49(638)1463) AD 638620 Unclassified

The ductility and strength of W-Ni-Fe composites over a wide range of volume % W was investigated at room temperatures. A series of composites was prepared (40% W to 95% W), sintered in the presence of the liquid phase and tested in tension. The sources of strength and ductility of the W-Ni-Fe composite was determined as related to the measured dihedral angle, mean particle diameter, tungsten mean free path, tungsten contiguity and volume % W. Similar stress-strain curves were obtained for all specimens tested which showed liquid phase sintered microstructure. These test results indicate that the volume % has very little effect upon the composite strength. For W-Ni-Fe composites where the tungsten mean free path is greater than the measured particle diameter (approximately 85% to 96% W), the maximum strain and maximum stress at necking dropped off rapidly. THE FLUTTER OF AN INFINITELY LONG CYLINDRICAL SHELL, by E. H. Dowell. Jan. 1965, 67p. incl. diagrs. refs. (Rept. no. ASRL TR 112-3) (AFOSR-65-0639) (AF AFOSR-62-363) AD 616321 Unclassified

The aeroelastic stability of an infinitely long, isotropic cylinder with the outer surface exposed to an inviscid flow is re-examined. The cylinder behavior is described by the shell equations of Goldenvieser, while the aerodynamic forces are described by the classical linearized potential theory. For a cylinder whose length is long compared to the critical wavelength, the model presented should adequately describe the stability boundary. Rather extensive numerical results for flutter velocity and dynamic pressure indicate the effects of Mach number, thickness, and density. An important consequence of the study is the indication that the aerodynamic loading on the cylinder is of the "slender body" type when the axial wavelength is large compared to the circumferential wavelength It may be expected that a similar result will hold for cylinders of finite length. (Contractor's abstract)

1600

Massachusetts Inst. of Tech. [Dept. of Aeronautics and Astronautics] Cambridge.

VIBRATIONS OF FREELY-SUPPORTED ORTHOTROPIC CYLINDRICAL SHELLS UNDER INTERNAL PRESSURE, by P. R. DiGiovanni and J. Dugundji. Feb. 1965, 70p. incl. diagrs. tables, refs. (Rept. no. ASRL TR 112-4) (AFOSR-65-0640) (AF AFOSR-62-363) AD 617269 Unclassified

The influence of orthotropicity and internal pressure on the natural frequencies of a thin cylindrical shell whose ends are freely supported is found using the shell equations of Washizu. Other common shell theories are also presented. Calculations are performed for 4 constant thickness orthotropic cylinders, 2 stiffened cylinders, and a basic isotropic cylinder. For these calculations, only the special cases of axial and circumferential stiffening were considered It is noted that there is a difference in the behavior of the frequencies for the n 0, n - 1, and n 2 modes. The effects of circumferential stiffening and axial stiffening on the frequencies for the different modes are discussed, as well as the effects of internal pressure on the frequency for cases of stiffening.

THE STABILITY OF AN UNSTEADY KELVIN-HELMHOLTZ FLOW, by R. E. Kelly. [1965] [14]p. incl. diagrs. refs. (AFOSR-66-0329) (AF AFOSR-63 156) AD 631136 Unclassified

Also published in Jour. Fluid Mech., v 22· 547-560, July 1965.

The investigation concerns the stability of an interface between 2 inviscid fluids of different densities which flow parallel to each other in an oscillatory manner. When the difference in the mean speeds is below the steady, critical speed for instability but is large compared to the amplitude of the fluctuations, parametric amplification of waves at the interface occurs, and the interface exhibits a resonance of a subharmonic nature. The paper concludes with a discussion of the stability of unsteady shear layers on the basis of the results. (Contractor's abstract)

Massachusetts Inst. of Tech. Dept. of Aeronautics and Astronautics, Cambridge.

STABILITY OF A PANEL IN INCOMPRESSIBLE, UNSTEADY FLOW, by R. E. Kelly. [1965] [6]p. incl. diagrs. refs. (AFOSR-66-0330) (AF AFOSR-63-156) AD 631135 Unclassified

Also published in AIAA Jour. v. 3· 1113-1118, June 1965.

The stability of an infinite panel is investigated when the panel is immersed in an airstream whose velocity is composed in part of an unsteady component that oscillates periodically with respect to time. The analysis indicates that neutrally stable waves in the panel can undergo parametric amplification due to the flow oscillation and therefore grow exponentially with time. It is also shown that the unsteadiness has a destabilizing effect on the mode of instability which is a result of dissipation in the panel. Finally, the possibility of stabilizing a membrane in a steady flow by varying its tension periodically with respect to time is discussed (Contractor's abstract)

MOLECULAR BEAM VELOCITY DISTRIBUTION MEASUREMENTS, by P B. Scott Feb. 1965 [169]p. incl.

illus. diagrs. tables, refs. (Fluid Dynamics Research Lab. rept. no. 65-1) (AFOSR-65-0192) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-131 and Office of Naval Research)
AD 614230 Unclassified

The energy accommodation of molecules during reflection from a solid surface can be measured as a function of angle of incidence, reflection angle, and incident velocity by molecular beam methods described in the report. The velocity distribution of the rebounding beam of molecules is measured, and compared to the velocity distribution of the incident molecular beam. The measurement is made by the time of flight method. A rotating thin disc with a notched edge acts as a shutter to allow a molecular beam to pass only for a short period. The molecular beam density at a distance L downstream of the shutter is sensed by electron beam ionization and ion collection. It is shown that the thermodynamic fluctuation effect limits the signal resolution of the instrument. Preliminary measurements of the incident molecular time of flight distributions show agreement with the Maxwellian theory in the case of a helium beam, and a deficiency of low velocity molecules for nitrogen and argon beams. Preliminary reflected beam measurements using a polycrystalline nickel surface show that at high target temperatures the thermal accommodation coefficient of air is 0 68 and of helium is 0. 06. METHOD FOR DETERMINING ACCOMMODATION COEFFICIENTS FROM DATA IN THE TEMPERATURE-JUMP RANGE WITHOUT APPLYING TEMPERATURE-JUMP THEORY, by H. Y. Wachman. [1965] [2]p. incl. tables, refs. (AFOSR-65-1157) (AF AFOSR-64-131)
AD 620487 Unclassified

Also published in Jour. Chem. Phys., v. 42. 1850-1851, Mar. 1, 1965.

An alternative method to temperature-jump theory (TJ) is outlined for experimental determination of the thermal accommodation coefficient. It is based on Langmuir's theory of heat conduction from thin wires, and is designated the mean-free-path method. It has the advantage that it eliminates the need for the TJ method assumptions regarding extension of temperature gradients to solid boundaries and the questionable relation between the accommodation coefficient and the temperature discontinuity. Applicability of the method is demonstrated within the 0. 2 mm pressure range.

ON THE TORSIONAL OSCILLATIONS OF A PLANE WITH LARGE SUCTION, by R. E. Kelly. [1965] [4]p. incl. diagr. (AFOSR-66-0328) (AF AFOSR-64-156)
AD 631156 Unclassified

Also published in Zeitschr. Angew. Math. und Phys., v. 16: 516-519, July 25, 1965.

It is well known that torsional oscillations of a disk induce an axial flow towards the surface of the disk. Due to centrifugal effects, this flow is composed of a steady as well as an unsteady component. This note concerns how suction applied at the disk surface affects the magnitude of this steady inflow. When suction is applied at the disk surface a balance is provided in the outer region between the vorticity and the inflow due to the wall suction and the inflow due to the non-linear terms becomes of secondary importance.

SYMMETRIC DEFORMATION OF A RADIALLY-

CONSTRAINED THIN CIRCULAR RING UNDER INERTIA LOADING, by L. L. Bucciarelli, Jr. and T. H. H. Pian. July 1965, 30p. incl. diagrs. (Rept. no. ASRL TR 127-1) (AFOSR-65-1619) (AF AFOSR-64-347) AD 622150 Unclassified

This paper presents a derivation of the equations governing the elastic deformation of a thin circular ring which is acted upon by inertia loading along a direction in the plane of the ring. The ring is constrained such that no radial outward displacements are permitted. The resulting nonlinear equations are reduced to a convenient form which enables the application of a systematic iterative scheme for its solution. Analysis of a ring of a thickness-radius ratio of 0.01 is made. The snap-buckling behavior of the ring is indicated by a load-deflective curve. The paper also provides a simple linear analysis which is applicable to the calculation of the initial portion of the load-deflection curve. (Contractor's abstract)

ELEMENT STIFFNESS-MATRICES FOR BOUNDARY COMPATIBILITY AND FOR PRESCRIBED BOUNDARY STRESSES, by T. H. H. Pian. [1965] [21]p. incl. diagrs. tables, refs. (AFFDL TR 66-80) (AFOSR-67-1940) (AF AFOSR-64-347) Unclassified

Also published in Proc. Matrix Methods of Structural Mechanics, Wright-Patterson Air Force Base, Ohio, Oct. 26-28, 1965, p. 457-477.

A method for the derivation of element stiffness matrices based on the principle of minimum complementary energy employing assumed stress distribution is described. Two different types of elements are considered: (1) one which is constrained at the entire boundary, and (2) one which has prescribed stresses along the boundary. The result shows that by using sufficiently large number of terms for the assumed stress distribution, a converging stiffness matrix can be obtained. Example calculations for rectangular panels in plane stress condition and for square plates in bending indicate an improvement in structural analysis when the element stiffness matrices satisfy complete boundary compatibility and boundary stress conditions.

SYNTHESIS OF MONOHALOCYCLOPROPANES AND 1-HALOOLEFINS VIA PHENYL-(DIHALOMETHYL)MERCURY COMPOUNDS, by D. Seyferth, H. D. Simmons, Jr., and G. Singh. [1965] [3]p. incl. diagr., table, refs. (AFOSR-65-1259) (Sponsored jointly by Air Force Office of Scientific Research under AF AFOSR-64-502 and Army Research Office (Durham)) AD 617596 Unclassified

Also published in Jour. Organometal. Chem., v. 3 337-339, Apr. 1965.

Previous studies of the synthesis of gem-dihalocyclopropanes using $C_6H_5HgCX_2Br$ compounds as CX_2 sources were extended to an investigation of the utility of $C_6H_5HgCHXBr$ compounds in the preparation of monohalocyclopropanes. It was found that both compounds (X=Cl and Br) serve excellently in the preparation of monohalocyclopropanes. A further similarity of $C_6H_5HgCHXBr$ reagents to $C_6H_5HgCX_2Br$ compounds is seen in their reactions with triethylsilane. A new, general synthesis of vinylic bromides and chlorides based on (dihalomethyl) mercurial chemistry was developed $C_6H_5HgCHXBr + (C_6H_5)_3P + RR'C{=}O$ yields $RR'C{=}CHX + C_6H_5HgBr + (C_6H_5)_3PO$. This general procedure also is applicable to the preparation of olefins of type $RR'C{-}CX_2$ from aldehydes and ketones. This method does not involve use or intervention of a strongly basic reagent as do previously available methods.

HALOMETHYL-METAL COMPOUNDS. II. THE PREPARATION OF GEM-DIHALOCYCLOPROPANES BY THE REACTION OF PHENYL(TRIHALOMETHYL)-MERCURY COMPOUNDS WITH OLEFINS, by D. Seyferth, J. M. Burlitch and others. [1965] [12]p. incl. diagrs. table, refs. (AFOSR-65-2388) (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-502], Army Research Office (Durham), and Public Health Service) AD 623707 Unclassified

Also published in Jour. Amer. Chem. Soc., v. 87 4259-4270, Oct. 5, 1965

Phenyl(trihalomethyl)mercury compounds react with olefins to give gem-dihalocyclopropanes in high yield.

This new procedure does not involve trihalomethide ion as an intermediate, nor does it require basic reaction conditions. Thus the mercurial route allows the preparation of gem-dihalocyclopropanes from olefins which contain base-sensitivity functional groups, which react with trihalomethide ion, or which are only poor nucleophiles. A number of examples are given to illustrate these advantages of the mercurial route in these specific cases over the Doering-Hoffmann and Wagner routes. The conversion of cis and trans olefins to gem-dihalocyclopropanes by the mercurial route occurs with retention of configuration. (Contractor's abstract)

THE CHEMISTRY OF CARBANIONS. X. THE SELECTIVE ALKYLATION OF UNSYMMETRICAL KETONES, by H. O. House and B. M. Trost. [1965] [11]p incl. diagrs. tables, refs. (AFOSR-67-1423) (AF AFOSR-64-573) AD 654121 Unclassified

Also published in Jour. Org. Chem., v. 30: 2502-2512, Aug. 1965.

Solutions of enolate anions which retain their structural and stereochemical integrity can be prepared by reaction of the corresponding enol acetates with 2 equivalents of methyllithium in 1, 2-dimethoxyethane. By use of this procedure it is possible to effect the selective alkylation of unsymmetrical ketones at either the more or less highly substituted α-position, utilizing the appropriate enol acetate derivative of the ketone. Selective alkylations of 2-heptanone, 2-methylcyclopentanone, 2-methylcyclohexanone, and 1-decalone are described. The proportion of cis-fused 9-methyl-1-decalone obtained from alkylation of 1-decalone can be significantly enhanced by use of the very reactive alkylating agent, trimethyloxonium 2, 4, 6-trinitrobenzenesulfonate. THE CHEMISTRY OF CARBANIONS. IX. THE POTASSIUM AND LITHIUM ENOLATES DERIVED FROM CYCLIC KETONES, by H. O. House and B. M. Trost. [1965] [8]p. incl. diagrs. tables, refs. (AFOSR-67-1427) (AF AFOSR-64-573) AD 654278 Unclassified

Also published in Jour. Org. Chem., v. 30 1341-1348, May 1965.

The compositions of the enolate anion mixtures derived from 2-methylcyclopentanone, 1-decalone, trans-2-decalone, and cis-2-decalone have been studied Equilibrium among the isomeric enolate anions derived from each ketone did not occur unless an excess of the free ketone was present. This was particularly true for the lithium enolate anions where a substantial excess of unionized ketone was required before rapid equilibration was observed. As a consequence, it is possible to prepare different enolate anion mixtures from an unsymmetrical ketone reflecting either kinetic or thermodynamic control by the appropriate choice of reaction conditions and quantities of reactants. THE CHEMISTRY OF CARBANIONS. VIII. THE INTRAMOLECULAR ALKYLATION OF KETYL RADICAL ANIONS, by H. O. House, J.-J. Riehl, and C. G. Pitt. [1965] [4]p. incl. diagrs. refs. (AFOSR-67-1433) (AF AFOSR-64 573) AD 654253 Unclassified

Also published in Jour. Org. Chem., v. 30. 650-653, Feb. 1965.

The reactions of $Ac(CH_2)_4Cl$ and $Ac(CH_2)_5Cl$ with Li in liquid NH_3, sodium-phenanthrene, and sodium-naphthalene radical anions, and with Cr(II) ion were examined. Treatment of $Ac(CH_2)_4Cl$ with Cr(II) acetate yielded the starting material, but the other 2 reducing systems converted $Ac(CH_2)_4Cl$ and $Ac(CH_2)_5Cl$ to the desired cyclic carbinols (n=2 and 3), and to the corresponding saturated acyclic ketones, $Ac(CH_2)_3Me$ and $Ac(CH_2)_4Me$. The secondary alcohols corresponding to the saturated acyclic ketones were also formed in the reduction with Li in liquid NH. The yields of the desired cyclic carbinols were low with the corresponding saturated acyclic ketones being the major products. In an effort to suppress formation of the saturated acyclic ketones, the reductions of some quaternary ammonium salts were examined but only the corresponding amines were obtained. The results implied that the acyclic products were derived, in part, by opening of the intermediate alkoxy radical to form another radical followed by further reduction.

PARALLELIZABILITY AND FLAT MANIFOLDS, by J. A. Thorpe. [1965] [5]p. incl. diagr. (AFOSR-65-1034) [AF 49(638)42] AD 619749 Unclassified

Also published in Proc. Amer. Math. Soc., v. 16: 138-142, Feb. 1965.

The object of this paper is to improve upon the result that every simply connected flat Riemannian manifold is parallelizable by weakening the assumption of simple connectivity. An orientable flat Riemannian manifold X is considered, and a condition is found on the holonomy group of X sufficient to guarantee parallelizability. If the orientability assumption on X is omitted, the same condition is sufficient to insure (n-1)-parallelizability.

DIFFERENTIAL OPERATORS IN THE MANIFOLD OF SOLUTIONS OF A NON-LINEAR DIFFERENTIAL EQUATION, by I. Segal. [1965] [61]p. [AF AFOSR-62-229] Unclassified

Published in Jour. Math. Pures et Appl., v. 44. 71-105, Jan.-Mar.; 107-132, Apr.-June, 1965.

The field quantization is carried out rigorously for nonlinear abstract differential equations in a Banach space. The contents of the paper may conveniently be divided into two parts. The first part is mostly analytical and deals with the abstract differential equation $du/dt = Au + K_t(u)$, or its integrated version, $u(t) = W(t-t_0)u_0 + \int_{t_0}^{t} W(t-s)K_s(u(s))ds$. The second part contains the construction of the quantized field associated with the integrated version, in which it is now assumed that $\{W(t)\}$ is a group defined for $-\infty < t < \infty$, $K_t(u) = K(u)$ is independent of t and smooth in u, and that all the solutions u of (1) exist for $-\infty < t < \infty$. Thus u(t) depends on u_0 smoothly.

ON THE SUBSPACE OF THE L^p INVARIANT UNDER MULTIPLICATION OF TRANSFORM BY BOUNDED CONTINUOUS FUNCTIONS, by A. Figa-Talamanca. [1965] [15]p. (AFOSR-66-0009) (AF AFOSR-63-335) AD 630396 Unclassified

Also published in Rend. Sem. Matem. Univ. Padova, v. 35: 176-189, 1965.

The author extends a result of Helgason (Ann. Math., v. 64: 240-254, 1956) from L^1 to L^p, $1 < p < 2$: the only subspace of $L^p(-\infty, \infty)$ which is invariant under multiplication of transforms by bounded continuous functions is the zero subspace. From this the author can obtain a result of Hormander on multipliers (Acta Math., v. 104: 93-140, 1960). He makes some remarks on the case $p > 2$ (which is quite different) and gives a negative answer to a problem of Helgason (op. cit.): for $p > 2$ it is false that the subspace of $L^p(-\pi, \pi)$, invariant under multiplication of the Fourier coefficients by bounded sequences is also invariant under permutation of Fourier coefficients. (Math. Rev. abstract)

REGULAR BOUNDARY POINTS IN MARKOV CHAINS, by A. W. Knapp. [1965] [6]p. (AFOSR-66-1538) (AF AFOSR-63-335) AD 641465 Unclassified

Also published in Proc. Amer. Math. Soc., v. 17: 435-440, Apr. 1965.

In the present work the author studies the nature of the set of regular boundary points in Markov chains. If P is the transition matrix of a transient Markov chain, then a function (column vector) h is harmonic if it has the mean value property h = Ph, superharmonic if h ≥ Ph. Doob and Hunt have developed a Martin boundary theory for such a chain and they showed that, in terms of the space they construct, there is the usual sort of Poisson-integral representation theorem for the integrable non-negative superharmonic functions. In this framework 2 questions are asked: Is the set of regular points a Borel set, and is the set necessarily nonempty? The answers are yes to the first and no to the second.

ANTI-LOCALITY OF CERTAIN LORENTZ-INVARIANT OPERATORS, by I. E. Segal and R. W. Goodman. [1965] [10]p. (Sponsored jointly by Air Force Office of Scientific Research under [AF AFOSR-64-342] and National Research Council) Unclassified

Published in Jour. Math. and Mech., v. 14: 629-638, July 1965.

An operator T on $L_2(E_n)$ is said to be anti-local provided that if f and Tf both vanish in a given region, then f is identically zero. The operators $T = (m^2I - \Delta)^{\lambda}$, where Δ is the self-adjoint formulation of the Laplacian on $L_2(E_n)$, are shown to be anti-local when n is odd and λ is a non-integral real number. The proof utilizes the Laplace transform to compare T with a known anti-local operator (the Hilbert transform) for n = 1, and reduces the problem for arbitrary odd n to the case n = 1. This result is applied to a problem in the quantum theory of fields. Let K_m^+ denote the Hilbert space of positive energy solutions of the Klein-Gordon equation, $(\Box - m^2)\varphi = 0$, m > 0. There exists (within unitar. equivalence) a unique symmetric free quantum field over K_m^+, that is, a quadruple (K, W, ν, Γ), where K is a complex Hilbert space. W is a continuous map from K_m^+ into the unitary operators on K satisfying the Weyl relations $W(\iota)W(\varphi) = \exp[\frac{1}{2}i\,\mathrm{Im}(\iota,\varphi)]$ $W(\iota+\varphi)$ (ι, φ arbitrary in K_m^+), ν is a cyclic vector in K for $W(\varphi)$, $\varphi \in K_m^+$, and Γ is a suitably restricted representation of the unitary group of K_m^+ by unitary operators on K. The following problem arises: How does one utilize the map $\varphi \to W(\varphi)$ to generate a von Neumann algebra of operators on K corresponding to a given space region R at a given time t? The convention in the general theory of quantized fields is discussed. (Math. Rev. abstract, modified)

ON THE STABILITY OF BAROCLINIC FLOWS AS A FUNCTIONAL OF THE VELOCITY PROFILE, by J. Pedlosky. [1965] [7]p. incl. table. (AFOSR-65-2115) (AF AFOSR-64-492) AD 629031 Unclassified

Also published in Jour. Atmos. Sci., v. 22: 137-145, Mar. 1965.

The stability of all baroclinic flows whose mean state consists of a uniform vertical shear (Eady's problem) plus a small but arbitrary deviation in the zonal velocity is obtained as a functional of the velocity profiles. It is shown that the growth rate of the disturbances is not everywhere an analytic function of the deviation of the profile from uniform shear. The change of stability due to the velocity deviation is obtained by a study of the growth rate at the neutral curve of Eady's problem. Only the vertically antisymmetric and the horizontally symmetric component of the velocity deviation affects the stability of the flow. For large wavelengths it is shown that only the horizontal curvature of the velocity profile alters the stability, and a general condition for a long wave stability cut off is obtained in terms of the curvature. If the curvature is negative the flow is stabilized. The effect of the velocity deviation on the structure of the amplified eigenfunction is displayed. An example, in which the mean flow is horizontally asymmetric about the horizontal mid-point is presented. The Reynolds stress of the amplified baroclinic wave is computed and its vertical structure shown to have a boundary layer character while transporting, horizontally, mean zonal momentum toward the current maximum, increasing the kinetic energy of the mean flow. A NOTE ON THE WESTERN INTENSIFICATION OF THE OCEANIC CIRCULATION, by J. Pedlosky. [1965] [3]p. (AFOSR-66-0242) (AF AFOSR-64-492) AD 641732 Unclassified

Also published in Jour. Marine Research, v. 23: 207-209, Sept. 15, 1965.

The purpose of this paper is to provide a simple physical explanation for the westward intensification of the oceanic circulation found in the several dynamically different existing theoretical models of Stommel 1948, and Carrier and Robinson 1962. It has the advantage of showing why the western oceanic boundary is singled out as the boundary-layer region that closes the interior Sverdrup solution. Consider the fundamental characteristics of Rossby waves. Energy at small scales will be transmitted to the east while energy at large scales will move to the west. For slow, large-scale geophysical systems, such as the ocean, the group velocity of Rossby waves is the significant signal velocity. Now, suppose energy of varying scales is put into the ocean, perhaps by the action of a wind stress. The short-scale components will move toward the eastern boundary of the ocean, where they will be reflected as components of a large east-west scale. Meanwhile, the large-scale components will move toward the western boundary, where they will be reflected as small-scale motions. Thus, it is the western boundary that acts as a source of small-scale motions. This is the fundamental reason for the preference for the westward intensification.

EFFECTS OF ROOT RADIUS, STRESS, CRACK GROWTH AND RATE ON FRACTURE INSTABILITY, by F. A. McClintock. [1965] [14]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research under AF 18(600)457 and National Science Foundation) Unclassified

Published in Proc. Roy. Soc. (London), v. 285A. 58-71, Apr. 6, 1965.

Of various criteria for fracture at the root of a notch, the energy, local stress, and displacement criteria have limited validity. More appropriate is the history of both stress and strain over a small region ahead of the crack, as required for fracture by the coalescence of holes. Expressions are given for crack initiation, growth, and subsequent instability in anti-plane strain of a non-hardening material. Instability is shown to depend primarily on those strain increments arising from crack growth at constant load rather than on those from increasing load at constant crack length. Thus final instability conditions are similar for single and double-ended cracks, round notches, and cracks cut under constant load. Round notches may give instability, restabilization, and final instability. The growth and coalescence of holes in front of a crack in a linearly viscous material is studied for both tensile and anti-plane-strain cracks. The absence of residual strain eliminates instability, but the crack continually accelerates.

RANDOM VIBRATION OF COUPLED OSCILLATORS AND COUPLED STRUCTURES, by T. D. Scharton. Oct. 1965, 134p. incl. illus. diagrs. refs. (AFOSR-66-0156) (AF 49(638)1314) AD 630794 Unclassified

It is proved that the time average power flow between 2 linearly coupled linear oscillators excited by independent white noise sources is proportional to the difference in the time average energies of the oscillators. This proportionality is valid even when the oscillators are strongly coupled if the oscillator energies are defined correctly. The validity of power-flow energy-difference proportionality in systems of more than 2 oscillators is hypothesized. Some conceptual difficulties involved in formulating a coupled mode model of coupled structures are discussed. An experimental investigation of a beam-beam structure demonstrates that the coupled oscillator power flow calculation can be used to predict power flow and energy sharing in coupled continuous structures excited with broadband noise. HEAT TRANSFER FROM ARGON AND XENON TO THE END WALL OF A SHOCK TUBE, by H. S. Friedman and J. A. Fay. [1965] [8]p. incl. illus diagrs. refs. (AFOSR-66-1089) (AF 49(638)1396) AD 617055 Unclassified

Also published in Phys. Fluids, v. 8. 1968-1975, Nov. 1965.

Heat transfer from argon and xenon to the end wall of a shock tube has been measured by using a thin-film transfer gauge whose temperature rise is monitored by an infrared photocell. Experiments were carried out at initial pressures between 1 and 10 mm Hg in argon and between 0.75 and 2 mm Hg in xenon. For the range of incident shock Mach numbers tested between 9 and 13 in argon and 13 and 18 in xenon, partial ionization would exist behind the reflected shock wave if thermodynamic equilibrium was achieved. By extrapolation of measured ionization rates for these gases, it was concluded that no ionization occurred behind the reflected shock wave in argon but that equilibrium was achieved in xenon, at least for the period during which the heat transfer was measured. Calculations of the heat transfer, made in accordance with existing theories for the corresponding thermodynamic state of the gas, were found to be in good agreement with the experimental measurements.

ON THE METHODS OF GALERKIN, RITZ AND KRYLOV-BOGOLIUBOV IN THE THEORY OF NON-LINEAR VIBRATIONS, by D. E. Newland. [1965] [14]p. incl. diagrs. table, refs. (AFOSR-65-1014) (AF AFOSR-63-154) AD 617855 Unclassified

Also published in Internat'l. Jour. Mech. Sci., v. 7: 159-172, Mar. 1965.

The conditions for equivalence of the Galerkin method and the Ritz minimizing method are reviewed. It is then shown that Galerkin's method may also lead to a result which, for steady state vibrations, is the same as the first approximation of Krylov-Bogoliubov. Both the Ritz method and the first approximation of Krylov-Bogoliubov may therefore be thought of as special cases of the general Galerkin method. The difference between them lies in the different ways in which the describing differential equations are expressed, in the different forms of the approximate solution used, and in the different choice of Galerkin weighting functions. As an example of these differences, the free vibration of a centrifugal pendulum is considered. The exact solution is compared with approximate solutions by the Ritz minimizing method and the method of Krylov-Bogoliubov, and the three results are seen to be in close agreement.

MECHANISMS OF COMBUSTION INSTABILITY, by T.-Y. Toong, R. F. Salant and others. [1965] [12]p. incl. illus. diagrs. refs. (AFOSR-65-2206) (AF AFOSR-63-209) AD 624834 Unclassified

Also published in Tenth Symposium (Internat'l.) on Combustion, Cambridge (Gt. Brit.) (Aug. 17-21, 1964), Pittsburgh, Combustion Inst., 1965, p. 1301-1313.

Mechanisms involved in triggering, amplification, and suppression of acoustic waves, due to presence of flames are studied. Experiments performed demonstrate strong interactions between acoustic and flame oscillations can exist through flow oscillations, and that these interactions are due to energy transport between various oscillation modes through both linear and nonlinear couplings. Intensity of interactions can be altered by varying flow velocity through an organ pipe. Under reduced-flow conditions, linear coupling is eliminated and flame exhibits periodic self-sustained oscillations. However, with imposed acoustic excitation of sufficiently large amplitude, interactions again become important, due to nonlinear effects. Nonlinear coupling between longitudinal acoustic oscillations and tangential or radial flow and flame oscillations is also observed. Supporting evidence is presented, which shows that the onset of the above mentioned self-sustained oscillations of diffusion flames is due to instability of travelling Tellmien-Schlichting disturbance waves. ANALYSIS OF TRANSONIC FLOW BY MEANS OF PARAMETRIC DIFFERENTIATION, by P. E. Rubbert. Nov. 1965, 153p. incl. diagrs. refs. (Fluid Dynamics Research Lab. rept. no. 65-2) (AFOSR-65-1932) (AF AFOSR-65-156) AD 626058 Unclassified

A general method of solving nonlinear partial differential equations was developed and applied to the problem of inviscid transonic flow about airfoils. Solutions are given for nonlifting airfoils at all transonic Mach numbers, including those flows with detached shock waves, and extensions to include lifting and unsteady flows are discussed. Results are given for subsonic and supersonic flow, and for flows at Mach number unity which are in general agreement with other theoretical results and with experiment. Inadequacies in the numerical technique prevented the accurate computation of shock movements, but preliminary results indicate a rearward movement of the shock impinging on the airfoil surface with increasing airfoil thickness, and exhibit the commonly observed rapid accleration behind the shock. The well known local linearization result of Spreiter and Alksne is shown to be an approximation to the present theory for subsonic flow. (Contractor's abstract)

SUPERSONIC STEADY AND UNSTEADY FLOWS OVER SLENDER AXISYMMETRIC BODIES WITH CONTINUOUS OR DISCONTINUOUS SURFACE SLOPES, PART I, by J. J. Kacprzynski. Dec. 1965, 81p. incl. diagrs. tables, refs. (Fluid Dynamics Research Lab. rept. no. 65-3) (AFOSR-66-0132) (AF AFOSR-65-156) AD 630425 Unclassified

This report contains the first part of an investigation aimed at finding methods for calculating steady and unsteady inviscid flows past slender 3-dimensional bodies of general shape, with continuous or discontinuous slope, but with continuous cross-sectional area. The method is an extension of an approximation proposed by Lighthill (1948) in which the solution is based on the solution of Laplace transformed potential equation and is expressed by Bessel functions. Several characteristic functions, which lead to combinations of Bessel functions, have been introduced and calculated. Considered are cases of axial steady flow and cross-flow past a body with discontinuities in slope, as well as unsteady flows for Mach numbers high enough so that it is possible to assume that $B^2 = (M^2 - 1) \simeq M^2$. The latter investigation induces flows with general unsteady boundary conditions, the body with a harmonically vibrating surface and the gust entry problem. (Contractor's abstract)

[ELECTRIC AND MAGNETIC PROPERTIES OF MATTER], by A. von Hippel. Final rept. Nov. 1965, 52p. (Technical rept. no. 204) (AFOSR-65-2210) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-184110) AD 622090 Unclassified

A brief history of the Laboratory for Insulation Research is given, from its inception as part of the Electrical Engineering Dept. 25 years ago up until the present when it ceases to exist as a separate entity due to the creation of the interdepartmental Center of Materials Science and Technology. The scope of the research in modern materials and dielectrics is outlined. Appendices I and II are extensive bibliographies of material research reports from pre-World War II to the present, one a chronological listing and the other, a publication breakdown according to subject field. There are 3 other appendices, including one which lists students awarded degrees and their subjects.

CONDITION FOR MAXIMUM RESONANCE ABSORPTION PEAK IN A SINGLE-LINE MOSSBAUER ABSORBER, by U. Shimony. Feb. 1965, 6p. incl. diagrs. table. (Technical rept. no. 197) (Bound with its Technical rept. no. 196) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-184110) AD 613577 Unclassified

For certain scientific and engineering applications of the Mossbauer absorption technique to accurate velocity measurements, measurements should be made in the shortest time possible. For a single-line absorber the thickness that gives the maximum absorption peak is a function of the resonant to nonresonant absorption coefficients and can be found from a table or a curve. This can also serve for absorbers with several peaks of equal intensities.

THE CRYSTAL STRUCTURE OF $Bi_2Ti_4O_{11}$, by G. Jensen. Apr. 1965, 22p. incl. diagrs. tables, refs. (Technical rept. no. 198) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-184110) AD 614797 Unclassified

The unit cell of the compound $Bi_2Ti_4O_{11}$ is face-centered monoclinic and contains 4 formula units. Its space group is C 2/c with all atoms in general positions, except for oxygen atoms lying on twofold axes. A phase transition is observed at 250°C, and the structure of the high-temperature modification is discussed. The unit cell of a related structure, probably stabilized by impurities, is also reported. (Contractor's abstract)

THE DIELECTRIC SPECTRA OF WATER-ETHANOL MIXTURES IN THE MICROWAVE REGION, by D. E. Buck. June 1965, 17p. incl. diagrs. tables, refs. (Technical rept. no. 200) (Sponsored jointly by Air Force Materials Laboratory; Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-184110) AD 618409 Unclassified

The dielectric constant and loss were measured at 8.5, 3.0, 1.0, and 0.3 kMc/sec for solutions of ethanol and water as a function of concentration and temperature. The mixtures exhibit a distribution of relaxation times as opposed to single time constants for the pure components. The distribution of time constants was resolved as the superposition of 2 dispersions, each having a single time constant. The intensity and time constant of the 2 dispersions were found as a function of temperature and concentration and explained in terms of a mechanism in which hydrogen bonds are broken and allowed to reorient. In addition, the dielectric constant and loss were measured for water from 5° to -5°C, and no abnormal behavior was noted at 4°C or in the supercooled state. (Contractor's abstract)

MAGNETIC ANNEAL EFFECTS IN SOME GARNETS, by R. P. Hunt. Apr. 1965, 44p. incl. diagrs. refs. (Technical rept. no. 199) (Sponsored jointly by Air Force Cambridge Research Lab.; Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-184110) AD 615370 Unclassified

Many properties of polycrystalline and reduced single crystal yttrium iron garnet (YIG) have been attributed to the presence of Fe^{2+} ions which provide mobile electrons that can diffuse locally through the lattice. This electron-diffusion process was studied by means of several low-temperature torque experiments on silicon-doped YIG of the form $Y_3Fe_{5-\delta}Si_\delta$ with $0 < \delta < 0.18$.

Silicon-doped YIG, which contains mobile electrons, shows an induced anisotropy proportional to the doping when magnetically annealed at low temperatures. The kinetics and temperature dependence of this anisotropy were investigated. The garnet also demonstrates a constant high field component of rotational hysteresis which is both temperature and frequency dependent. The intrinsic, unannealed anisotropy behaves in a novel way. At room temperature it coincides with that of normal YIG, but between 150° and 300°K [K_1] increases above that of pure YIG. Below about 150°K, the curves develop asymmetry and are no longer cubic. At 4.2°K, the easy axis has shifted to the [100] direction in the case of 3% doping. (Contractor's abstract)

MOSSBAUER STUDIES ON IRON IN THE PEROVSKITES $La_{1-x}Sr_xFeO_3$(0 x 1), by U. Shimony and J. M. Knudsen. Feb. 1965, 39p. incl. illus. diagrs. tables, refs. (Technical rept. no. 196) (Bound with its Technical rept. no. 197) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-184110) AD 613577 Unclassified

Mossbauer spectra of the perovskite series $La_{1-x}Sr_xFeO_y$(0.0 x 1.0, y 3) were obtained with Fe^{57} as the photon-emitting and absorbing nucleus and analyzed in detail. The Neel temperature of anti-

antiferromagnetic $LaFeO_3$ decreases with increasing Sr concentration, in agreement with previous reports. That of antiferromagnetic $SrFeO_{2.5}$ (brownmillerite structure) also decreases as oxygen is introduced to transform it to perovskite $SrFeO_3$. Characteristic Fe^{4+} lines, identified for compounds of high x, have isomer shifts between +0.10 and +0.20 mm/sec relative to a source of Co^{57} in stainless steel Type 310. However, spectra of compounds of intermediate x indicate the existence of an intermediate $Fe^{3+} \rightarrow {}^{4+}$ state, and a correlation between the total isomer shift of a compound and its Fe^{4+} content was attempted. With increasing x a significant discontinuity in the total isomer shift, corresponding to a transition from magnetic order to disorder, was found. Line widths vary around 0.40 mm/sec (compared with 0.26 mm/sec, the narrowest line obtainable in the present setup) and show broadening in a sample fired for a short time. The temperature effect was used to calculate the specific heat.

REFRACTIVE INDEX OF $BaTiO_3$ ABOVE THE CURIE POINT, by J. M. Ballantyne. [1965] [2]p. incl. diagr. refs. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under Nonr-184110) Unclassified

Published in Phys. Rev., v. 138: A646-A647, Apr. 19, 1965.

The temperature dependence of the optical thickness of a pure $BaTiO_3$ crystal is measured interferometrically to an accuracy of 1 part in 10^5, and found to change by 5 parts in 10^4 over the 129-220°C temperature range. The resulting change in refractive index with temperature is calculated by applying a correction for thermal expansion of the crystal.

ANGULAR DISTRIBUTIONS FROM SHELL-MODEL FORBIDDEN (d, p) TRANSITIONS TO SPIN 5/2 STATES IN Ca^{43}, Ca^{45} AND Ti^{47}, by T. A. Belote, W. E. Dorenbusch and others. [1965] [7]p. incl. diagrs. tables, refs. (AT(30-1)2098) Unclassified

Published in Nuclear Physics, v. 73: 321-327, Nov. 1965.

The (d, p) transitions to the ground state and first excited states of Ca^{43}, Ca^{45} and Ti^{47} have been measured at deuteron energies near 7 mev. The similarity between the shapes of the angular distributions to the weak 374 kev 5/2 - level in Ca^{43}, the 176 kev level in Ca^{45} and the 5/2 ground state of Ti^{47} suggests that these transitions proceed through a direct-reaction mechanism. BALLOON OBSERVATION OF THE X-RAY SPECTRUM OF THE CRAB NEBULA ABOVE 15 KEV, by G. W. Clark. [1965] [3]p. incl. tables. (Sponsored jointly by [Air Force Office of Scientific Research], Atomic Energy Commission, and [Office of Naval Research] under AT(30-1)2098, and National Aeronautics and Space Administration) Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 91-94, Jan. 25, 1965.

A source of cosmic x-rays with energies above 15-kev was observed in a balloon flight. It was concluded that the x-rays probably came from the Crab nebula. The x-ray spectrum of the Crab nebula was determined approximately in the energy range from 15 to 60 kev. The results provide evidence against the idea that the x-rays from the Crab nebula are the blackbody emission from the surface of a neutron star.

EXACT BOOTSTRAP SOLUTIONS IN SOME STATIC MODELS OF MESON-BARYON SCATTERING, by K. Huang and F. E. Low. [1965] [22]p. incl. diagr. tables, refs. (Sponsored jointly by [Air Force Office of Scientific Research], Atomic Energy Commission, and [Office of Naval Research] under AT(30-1)2098) Unclassified

Published in Jour. Math. Phys., v. 6: 795-816, May 1965.

The exact bootstrap solutions to four well-known models of meson-baryon scattering in the nonrecoil, one-meson approximation are studied. The models are the neutral scalar theory, the charged scalar theory, the symmetric scalar theory, and the neutral pseudoscalar theory. A bootstrap solution is defined to be a solution satisfying Levinson's theorem of potential scattering. It is found that the existence of a bootstrap solution depends crucially on the high-energy conditions, which enter the problem through a cutoff function and through subtractions in the dispersion relations. In all the models considered there is no bootstrap solution with no subtraction. With one subtraction there exists more than one bootstrap solution. However, the requirements that (a) the meson-baryon coupling constant should be different from zero, and (b) there should be no inelastic threshold below the elastic threshold, render the bootstrap solution unique. Positions of bound states and their coupling constants depend on 2 arbitrary parameters, which may be taken to be the cutoff momentum and the subtraction constant. (Contractor's abstract)

EXACT BOOTSTRAP SOLUTIONS TO THE LOW EQUATION, by K. Huang and A. H. Mueller. [1965] [10]p. incl. diagrs. refs. (Sponsored jointly by [Air Force Office of Scientific Research], Atomic Energy Commission, and [Office of Naval Research] under AT(30-1)-2098) Unclassified

Published in Phys. Rev., v. 140: B365-B374, Oct. 25, 1965.

Inquiry is made whether the Low equation for meson-baryon scattering in the static one-meson approximation possesses bootstrap solutions, defined to be those solutions satisfying Levinson's theorem of potential scattering. The Low equation is allowed to have arbitrary subtractions and arbitrary bound states, except that the baryon must be the lowest bound state. A 2-parameter family of cutoff functions, including the case of no cutoff, is introduced. Consider 2 x 2 and 4 x 4 crossing matrices of certain general forms, with the Chew-Low theory included as a special case of the latter. To answer the question raised, a simple technique is used based on the crossing relation on the imaginary energy axis. It is shown that for all the crossing matrices considered the unsubtracted Low equation does not possess a bootstrap solution, regardless of the choice of bound states and cutoff function. Further study is made of the case of one subtraction for 2 x 2 crossing matrices to find some necessary bootstrap conditions. These restrict the crossing matrix, determine the form of the cutoff function, and require that in the baryon channel the baryon be the only bound state, while in the other channel there be at most one bound state. These results are generalizations of those obtained earlier by Huang and Low.

INELASTIC DEUTERON SCATTERING AND (d, p) REACTIONS FROM ISOTOPES OF Ti. II. Ti^{47} (d, p)Ti^{48}, by P. D. Barnes, C. K. Bockelman, and O. Hansen. (Sponsored jointly by [Air Force Office of Scientific Research], Atomic Energy Commission, and [Office of Naval Research] under AT(30-1)2098) Unclassified

Published in Phys. Rev., v. 138: B597-B607, May 10, 1965.

The (d, p) reaction from a target of isotopically separated Ti^{47} has been studied at 6-mev bombarding energy. Proton spectra were recorded simultaneously at 24 scattering angles with an over-all energy resolution of 15 kev by means of a broad-range, multiple-gap, heavy-particle spectrograph. Fifty-five proton groups, corresponding to levels in Ti^{48}, were observed. To 40 of these (d, p) groups, transition strengths and values of the orbital angular momenta of the transferred neutrons were assigned by means of a distorted-wave analysis of the differential cross sections. A sum-rule analysis shows that virtually all of the $1f_{7/2}$, $2p_{3/2}$, and $2p_{1/2}$ single-particle strengths and 25% of the $1f_{5/2}$ strength were observed. A level scheme for Ti^{48} is proposed and the available spectroscopic information on the low-lying levels is discussed in terms of current nuclear models. (Contractor's abstract)

INELASTIC DEUTERON SCATTERING AND (d, p) REACTIONS FROM ISOTOPES OF TITANIUM. III. Ti^{49}(d, p) Ti^{50}, by P. D. Barnes, C. K. Bockelman and others. [1965] [6]p. incl. diagrs. tables, refs. (Sponsored jointly by [Air Force Office of Scientific Research], Atomic Energy Commission, and [Office of Naval Research], under AT(30-1)2098) Unclassified

Published in Phys. Rev., v. 140: B42-B47, Oct. 11, 1965.

Fifty-six levels in Ti^{50} have been excited by the (d, p) reaction on Ti^{49} at 6-mev bombarding energy. The differential cross sections for the proton groups were measured at 23 scattering angles. A distorted-wave analysis of the experimental results yielded values of the orbital angular momenta of the transferred neutron and transition strengths for 44 of the observed transitions. A sum-rule analysis indicates that all of the $1f_{7/2}$, $2p_{3/2}$, and $2p_{1/2}$ single-particle strengths and 60% of the $1f_{5/2}$ strength were observed. The present data are compared to other experimental evidence on Ti^{50}, and a level scheme for Ti^{50} is proposed. The spectroscopic data are discussed in terms of the shell model with residual interactions. The results for the transitions to the ground state and 3 lowest excited states of Ti^{50} are shown to be in disagreement with seniority conservation. (Contractor's abstract)

MEASUREMENT OF TOTAL ATTENUATION CROSS SECTIONS IN ALUMINUM AND GOLD FOR 14.4-KEV GAMMA RAYS, by J. Alonso and L. Grodzins. [1965] [4]p. incl. illus. diagrs. table, refs. (Sponsored jointly by [Air Force Office of Scientific Research], Atomic Energy Commission, and [Office of Naval Research] under AT(30-1)2098) Unclassified

Published in Phys. Rev., v. 17. A975-A978, Feb. 1, 1965.

Total attenuation coefficients of aluminum and gold for 14.4-kev gamma rays have been measured using a resonant (i.e., Mössbauer) detector to reduce forward scattering and background corrections. The results are 390.7 ± 0.7 and 59,290 ± 70 barns per atom for aluminum and gold, respectively. These values imply photoelectric cross sections of 371.0 ± 0.7 and 58,220 ± 70 barns/atom, respectively. The results are in agreement with other, less precise, measurements in this energy region. Present theoretical estimates of these cross sections are high by 5% for aluminum and 35% for gold. (Contractor's abstract)

MÖSSBAUER SCATTERING: THE GYROMAGNETIC MOMENTS OF FIRST 2^+ IN W^{182} AND W^{186} AND Os^{186} AND Os^{188}, by Y. W. Chow, L. Grodzins and others. [1965] [5]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098)) Unclassified

Published in Phys Rev. Ltrs., v. 15 369-373, Aug 23, 1965.

A technique for measuring magnetic moments, μ, of excited state by precessing the Mössbauer angular

distribution with an external magnetic field is described. The method is applied to the first 2^+ states in W and OS isotopes and the gyromagnetic ratios, $g_R = \mu/I$ measured are: W^{182}, 0.233 ± 0.027; W^{184}, 0.25 ± 0.03, W^{186}, 0.34 ± 0.03; OS^{186}, 0.32 ± 0.015, and OS^{188}, 0.310 ± 0.027. The agreement with the theoretical predictions of Nilsson and Prior is excellent and indicates both the correctness of the pairing-force model and the absence of net spin polarization effects.

MÖSSBAUER STUDY OF A NEW $LiFeO_2$ POLYMORPH AND $CuFeS_2$ (Abstract), by M. Schieber, N. Blum, and E. R. Bauminger. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, [Atomic Energy Commission], and [Office of Naval Research] under [AT(30-1)2098]) Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Also published in Bull. Amer. Phys. Soc., Series II, v. 10. 473, Apr. 26, 1965.

A new type of γ-$LiFeO_2$ (γ_s) has been prepared. Mössbauer absorption data are reported for this compound as well as for β-$LiFeO_2$ and for natural $CuFeS_2$ over the temperature range 16 –300 K. γ_s is prepared by a slow heat treatment of the more usual form of γ-$LiFeO_2$(γ_r). γ_s has the smallest unit cell volume of all the known $LiFeO_2$ species, for γ_s, a = 4.0457A and c = 8.6901A, while for γ_r a = 4.0527A and c = 8.7306A. Mössbauer spectra in an external field H_0 = 35.7 kOe and for H_0 = 0 at both 80 and 286 K show nearly identical line-intensity ratios of 3:2:1, which indicates an isotropic distribution of the internal-field directions. This suggests that the measured spontaneous magnetization σ_0 0.5 emu/g is probably due to impurities rather than to any departure from pure antiferromagnetism. β-$LiFeO_2$ has a Mössbauer spectrum similar to that of α-$LiFeO_2$ and shows evidence of long-range order only at liquid-helium temperatures. The saturation value for the internal field at the iron nucleus in $CuFeS_2$ is 345 kOe.

NEW MEASUREMENT OF THE A MAGNETIC MOMENT, by D. A. Hill, K. K. Li and others. [1965] [5]p. incl. diagrs., table, refs. (Sponsored jointly by Air Force Office of Scientific Research, Atomic Energy Commission, and Office of Naval Research under AT(30-1)2098)) Unclassified

Published in Phys. Rev. Ltrs., v. 15: 85-89, July 12, 1965.

Polarized Λ's produced in the reaction $\pi^+ N \rightarrow \Lambda + K^+$ pass through a strong longitudinal magnetic field and the angle of precession of the Λ polarization vector is measured. The precession can be observed by virtue of the asymmetry in the decay $\Lambda \rightarrow p + \pi^-$ in which the π meson tends to be emitted opposite to the Λ spin direction. The result obtained for Λ was $-0.77 \pm 0.27\ \mu_N$, which is consistent with other results.

NONEXISTENCE OF "PURE BOOTSTRAP" SOLUTIONS TO THE CHEW-LOW THEORY, by K. Huang and A. H. Mueller. [1965] [3]p. incl. diagr. (Sponsored jointly by [Air Force Office of Scientific Research], Atomic Energy Commission, and [Office of Naval Research] under AT(30-1)2098)) Unclassified

Published in Phys. Rev. Ltrs., v. 14: 396-398, Mar. 15, 1965

Using an existing definition of a bootstrap solution it was found that there is no bootstrap solution to the Chew-Low theory if the scattering amplitudes satisfy unsubtracted dispersion relations. This result holds for arbitrary pole terms in the Low equation and is shared by any static model in the one-meson approximation with a 2 x 2 real crossing matrix $A_{\alpha\beta}$ having the properties $A^2 = 1$ and $|A_{11}| < 1$. The result also holds when the model is generalized to include inelastic channels.

PROMPT NEUTRONS FROM THORIUM PHOTOFISSION by C P. Sargent, W. Bertozzi and others

[1965] [13]p. incl. illus. diagrs. tables, refs. (Sponsored jointly by [Air Force Office of Scientific Research], Atomic Energy Commission, and [Office of Naval Research] under AT(30-1)2098) Unclassified

Published in Phys. Rev., v. 137: B89-B101, Jan. 11, 1965.

The distribution in angle and velocity of the prompt neutrons from the bremsstrahlung-induced photofission of Th^{232} in the photon energy region near threshold have been measured. Using knowledge of the fission-fragment angular distribution, the data have been interpreted in terms of the neutron distribution relative to the fragment axis. The measurement allows a quantitative estimate of the fraction of neutrons which are not emitted by fully accelerated fragments. The result for this fraction is 0.07 ± 0.09. Assuming isotropic neutron emission in the fragment center-of-mass frame, the analysis also determines some characteristics of the neutron energy spectrum in this frame. The spectrum has an average energy $\bar{\eta} = 1.14 \pm 0.06$ mev and a second central moment $\sigma^2(\eta) = (0.77 \pm 0.06)\bar{\eta}^2$. If it is represented by an evaporation-type spectrum with some distribution of temperatures, there is no significant contribution from temperatures equal to or greater than $\bar{\eta}$. A similar analysis has been made of data on prompt neutrons from the spontaneous fission of Cf^{252} obtained by Bowman, Thompson, Milton, and Swiatecki, and the results compared with those for Th^{232} photofission. QUANTIZED VORTEX RINGS IN SUPERFLUID HELIUM, A PHENOMENOLOGICAL THEORY, by K. Huang and A. C. Olinto. [1965] [11]p. incl. diagrs. tables, refs. (Sponsored jointly by [Air Force Office of Scientific Research], Atomic Energy Commission, and [Office of Naval Research] under AT(30-1)2098) Unclassified

Published in Phys. Rev., v. 139: A1441-A1451, Aug. 30, 1965.

Rayfield and Reif (RR) and Careri, Cunsolo, and Mazzoldi (CCM) have done some experiments involving ion complexes moving through liquid helium in a constant uniform electric field. The results of RR give direct and compelling evidence that the ion complexes become attached to quantized vortex rings, the existence of which was conjectured by Feynman and Onsager. Their experiments, however, do not yield details concerning the interactions between ion complex and vortex ring. The results of CCM, on the other hand, exhibit a wealth of gross and fine structures, but they do not seem to be immediately understandable in simple terms. This paper attempts to understand all the results of RR and CCM in terms of a phenomenological theory of quantized vortex rings. It is hypothesized that an ion complex can create a vortex ring only if its velocity v and effective radius R satisfy the condition $6\pi vR = nh/m$, $(n = 1, 2, 3, \ldots)$, where h is Planck's constant and m the helium mass. The number 6π is semiempirical. An experiment is suggested to test this hypothesis directly. After creation, the interaction of the vortex ring and the ion complex is described phenomenologically, with all parameters determined directly by experiments. This leads to a definite model that describes in detail the history of an ion complex in liquid helium. The determination of parameters makes extensive use of experimental data, but only one number from CCM. The model then reproduces quantitatively all the data of CCM. (Contractor's abstract)

QUANTUM THEORY OF ELECTRON GAS PLASMA OSCILLATIONS IN A MAGNETIC FIELD, by N. J. Horing. [1965] 63p. incl. refs. (AFOSR-65-0730) [AF 19(604)7344] AD 616042 Unclassified

Also published in Ann. Phys., v. 31: 1-63, Jan. 1965.

The response function for an electron gas in an external magnetic field is investigated by the method of Green's functions using the random phase approximation. The spectrum of plasma oscillations and associated damping are obtained. The dispersion relations for wave vectors both perpendicular and oblique to the magnetic field are studied as power series, and semiclassical models are employed in study of the plasma modes. Detailed formulas for natural damping, which take full account of the influence of the magnetic field, are given for all plasma modes considered.

NATIONAL MAGNET LABORATORY, by B. Lax and F. Bitter. Final rept. July 1, 1960-Oct. 31, 1964 Feb. 15, 1965, 43p. incl. tables, refs (AFOSR-65-0733) (AF 19(604)7344) AD 615152 Unclassified

A summary of work done at the National Magnet Laboratory, founded at the Massachusetts Institute of Technology by the Air Force Office of Scientific Research, is presented. The laboratory provides continuous magnetic fields of 255 kgauss, 100 kgauss stronger than available elsewhere. The number and variety of high field magnets and the ease and flexibility of their use are unequalled in the world. The fields of study have included solid state, low temperature and plasma physics. Within these areas such phenomena as superconductivity, magneto-optical effects, cyclotron and magnetic resonance, and transport effects in metals, semimetals and semiconductors were investigated.

ANALYSIS OF THE EIGENSTATES OF Pr^{3+} IN $LaCl_3$ USING THE ZEEMAN EFFECT IN HIGH FIELDS, by R. Sarup and M. H. Crozier. [1965] [6]p. incl. tables, refs. (AFOSR-65-0734) [AF 19(604)7344] AD 614852 Unclassified

Also published in Jour. Chem. Phys., v. 42: 371-376, Jan. 1, 1965.

The Zeeman effect of the absorption and fluorescence spectra of Pr^{3+} in $LaCl_3$ was studied at liquid nitrogen and liquid helium temperatures in magnetic fields up to 69 kgauss. Both linear and quadratic effects were observed, and these are used to establish unequivocally the crystal quantum numbers of the observed energy levels. Crystal-field theory is used to calculate the magnetic behavior of the energy levels, and good agreement is found with experiment, but some systematic deviations are also noted. The second-order effect was found useful in understanding the nature of these deviations, and it appears that a crystal-field calculation fitted to the energy levels does not yield the eigenstates giving the best agreement with the observed behavior in high magnetic fields. PLASMONS IN A MAGNETIC FIELD, by N. J. Horing. [1965] [10]p. (AFOSR-65-1170) [AF 19(604)7344] AD 622641 Unclassified

Also published in Proc. Seventh Internat'l. Conf. on the Physics of Semiconductors, Paris (France) (July 19-24, 1964), Paris, Dunod, 1965, 107-116.

A summary is presented of the results of calculations on plasmons in a magnetic field. The calculations are based on a Green's function formulation of the random phase approximation for the inverse dielectric function of an electron gas in a magnetic field. The Green's function can be obtained in closed form, and the resulting inverse dielectric function has been used to write the plasmon dispersion relation and damping constant in relatively tractable forms which are not encumbered by unwieldy summations over Landau eigenstates.

PROGRESS IN MAGNETO-OPTICAL EFFECTS, by B. Lax. [1965] [17]p. incl. diagrs. table, refs. (AFOSR-65-1171) [AF 19(604)7344] AD 622640 Unclassified

Also published in Proc. Seventh Internat'l. Conf. on the Physics of Semiconductors, Paris (France) (July 19-24, 1964), Paris, Dunod, 1965, 253-269.

A review is presented of the recent progress in magneto-optical phenomena in semiconductors and metals. The situation on the Faraday rotation and Voigt effect is improved but not yet complete. The progress in semimetals has shown the promise of the magneto-reflection technique, which should lead to further exploration of new materials at very high fields. The cross-field phenomenon which is suited for semiconductors provides a more sensitive tool for investigating high gap materials. The emphasis in the future of magneto-optical phenomena is most likely to shift from absorption to emission. It is expected that with these new tools and techniques, magnetooptical phenomena will be fruitfully exploited for both basic and applied research from the far infrared to the optical and ultra-violet regions in semiconductors and semimetals

ROTATORY DISPERSION OF DIRECT EXCITON IN GERMANIUM, by Y. Nishina, J. Kolodziejczak, and B. Lax. [1965] [5]p. incl. diagrs. (AFOSR-65-1172) [AF 19(604)7344] AD 622757 Unclassified

Also published in Proc. Seventh Internat'l. Conf. on the Physics of Semiconductors, Paris (France) (July 19-24, 1964), Paris, Dunod, 1965, 867-871.

Since the oscillatory behavior of the interband Faraday effect was observed in Ge at room temperature, much interest has been focussed on how the Coulomb interaction between the excited electron and the hole would influence the line shapes of the rotatory dispersion. In order that this problem might be answered quantitatively with some experimental evidence, it was necessary to measure the rotatory dispersion for a single energy state of a direct exciton in a pair of nondegenerate conduction and valence bands This paper presents the experimental results on the Faraday rotation and the Voigt effect of the direct excitons at Γ points in Ge near liquid helium temperature. Good agreement was obtained between the experimental results and those calculated for the Faraday rotation in the photon energy range up to 0 900 ev.

MUTUAL INDUCTANCE BRIDGE FOR AC SUSCEPTIBILITY MEASUREMENTS AT LOW FREQUENCIES, by E. Maxwell. [1965] [2]p. incl. diagrs. (AFOSR-65-1379) [AF 19(604)7344] AD 621191 Unclassified

Also published in Rev. Scient. Instr., v. 36 553-554, Apr. 1965.

A mutual inductance bridge for measuring ac magnetic susceptibility at low frequencies, using standard components, is described. The equivalent of a decade mutual indicator is achieved by using a commercial decade autotransformer in combination with a small fixed mutual inductor. The Gertsch RT-61 transformer is used at 30-400 cps and lower, while the RT-60 is used at - 1 kc. Both transformers have a nominal accuracy of 0.001%, which is more than sufficient in this use. A low-noise preamplifier followed by a lock-in amplifier is used for null detection.

DE HAAS-VAN ALPHEN EFFECT IN PYROLYTIC AND SINGLE-CRYSTAL GRAPHITE, by S. J. Williamson, S. Foner, and M. S. Dresselhaus. [1965] [5]p. incl. diagrs. refs. [AF 19(604)7344] Unclassified

Published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9(Pt. B) 771-775, 1965.

The de Haas-van Alphen oscillations in the magnetic susceptibility of pyrolytic graphite have been observed for the first time and a comparison made with those of single-crystal graphite. These preliminary measurements were performed at temperatures between 1.2° and 4.2° with fields up to 55 kgauss applied along the c-axis. The usual beat pattern attributed to majority electron and hole carriers was found to be identical for both pyrolytic and single-crystal graphite between 1.5 and 20 kgauss. This equality between the pyrolytic and single-crystal graphite frequencies, f_M, and effective masses, m^*, is significant in establishing the graphite band parameters, because the most complete band parameter determination has been made by combining magneto-reflection data in pyrolytic graphite with Shubnikov-de Haas data on single-crystal graphite. Low-temperature de Haas-van Alphen measurements also yield a comparison of the local order in pyrolytic graphite with that in single-crystal graphite. Furthermore, the oscillations of unusually low frequency discovered by Soule (IBM Jour. Res. Develop., v. 8 268, 1964) were confirmed by observation in both graphites. The existence of such low f_M oscillations is shown to be consistent with existing band structure calculations.

HIGH-MAGNETIC-FIELD BUBBLE TRAPPING IN LIQUIDS (Abstract), by M. H Crozier. [1965] [1]p. [AF 19(604)7344] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 305, Mar. 24, 1965.

The author observed the occurrence of a pressure barrier preventing the free movement of bubbles up a column of water in a vertical solenoid magnet operated in the range 165-200kgauss This effect is caused by the body force acting on this diamagnetic liquid due to the field, which results in the occurrence of a local minimum and maximum in the hydrostatic pressure. The corresponding effect can occur in paramagnetic liquids such as liquid air even in a standard 20-kgauss electromagnet, and the "burp" associated with the escape of a large bubble from the trap presents a problem in some experiments. By formulating the theory of the trapping process, one is led to predict that at slightly higher fields our solenoid would also produce a bubble trap in liquid helium, which could give rise to irregularities in the results of low-temperature experiments at very high fields unless bubbles are prevented from forming.

MAGNETIC PROPERTIES OF InAs DIODE ELECTROLUMINESCENCE, by F. L. Galeener, I. Melngailis and others. [1965] [6]p. incl. diagrs. refs. [AF 19-(604)7344] AD 624878 Unclassified

Also published in Jour. Appl. Phys., v. 36 1574-1579, May 1965.

Spontaneous and laser electroluminescence of InAs diodes have been studied in magnetic fields up to 109 kgauss. The peak of the emitted energy shifts linearly with magnetic fields above 20 kgauss at a rate which depends on the carrier concentration of the n-type base material. If the energy shift is described as $\Delta E = \beta heH/m^*c$, the value of m^* is the same as that measured at the Fermi level in bulk n-type material The emission from one laser diode exhibited a splitting which corresponds to a g factor of about 7 for the electron. Evidence was obtained that the laser threshold current is reduced by the component of magnetic field perpendicular to the junction current.

OSCILLATORY RF MAGNETORESISTANCE SIZE

EFFECT IN GALLIUM (Abstract), by S. Foner and E. J. McNiff, Jr. [1965] [1]p. [AF 19(604)7344] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 351, Mar. 24, 1965.

Munarin and Marcus observed an oscillatory dc magnetoresistance in gallium at low temperatures with field-modulation techniques. This effect was periodic in H, inversely proportional to thickness, and for certain orientations, increased in amplitude for H as high as 14 kgauss. The authors observed a similar effect in the differential rf absorption of gallium (detected with audio field modulation) from 8 to 30 mcps. The size effect agreed within experimental error with Munarin and Marcus and could be followed to 43 kgauss for H along the a axis. Large superimposed de Haas-Shubnikov oscillations tended to obscure the data above this field. The classical penetration depth was much less than the sample thickness for the frequencies and fields employed. Preliminary transmission studies of rf radiation through gallium crystals have also been made as a function of frequency, field, and orientation. The results of these and related experiments are discussed.

FARADAY EFFECT IN SOLIDS, by H. S. Bennett and E. A. Stern. [1965] [14]p. incl. refs. (AFOSR-65-0604) [AF 49(638)1468] AD 614558 Unclassified

Also published in Phys. Rev., v. 137: A448-A461, Jan. 18, 1965.

Expressions for the weak-field Faraday effect in cubic materials are presented for the cases of transmission and reflection. These expressions contain the elements of the complex conductivity tensor. General quantum-mechanical expressions for the diagonal and off-diagonal elements of the frequency-dependent conductivity tensor are computed for arbitrary external magnetic fields and in the zero-wave-vector limit with the aid of dispersion relations. Sum rules for the conductivity tensor elements are also derived. The high-frequency limits of the conductivity elements are shown to reduce to the free-electron-gas results. A simple physical interpretation of the effect of the magnetic field on the conductivity tensor is given, and this shows that 2 effects could contribute to the Faraday effect. These are the Zeeman splittings of the energy levels and the changes of the matrix elements. A calculation of the Faraday effect in the effective-mass approximation is performed. Special attention is given to the contribution of the spin-orbit interaction to 1st order, and it is shown that for practically all nonferromagnetic metals this can be an appreciable effect on the interband part. The spin-orbit effect should be observed as a rapid variation in a comparatively small frequency range. The intraband is not affected by spin-orbit effects to 1st order. (Contractor's abstract)

MEASUREMENTS ON NIOBIUM-TIN SAMPLES IN 200-kG CONTINUOUS FIELDS, by D. B. Montgomery and W. Sampson. [1965] [4]p. incl. diagrs. table. (AFOSR-65-1181) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49(638)1468] and Atomic Energy Commission) AD 621303 Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Also published in Appl. Phys. Ltrs., v. 6: 108-111, Mar. 15, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 359, Mar. 24, 1965.

Measurements are made of the critical current as a function of applied magnetic field on several samples of niobium-tin at 4.2 K in dc fields as high as 201 kgauss. The measurements allow a determination of the upper-critical field, even of the best material, to within a few percent. The data also reveal the marked deviation of some materials at high fields from the defect-limited currents of the Lorentz-force model, and indicate a parabolic approach to Hc_2.

NONLINEAR SHIELDING IN RARE-EARTH CRYSTAL FIELD INTERACTIONS, by A. J. Freeman and R. E. Watson. [1965] [1]p. (AFOSR-65-1380) (AF 49(638)-1468) AD 622620 Unclassified

Presented at Tenth Conf. on Magnetism and Magnetic Materials, Minneapolis, Minn., Nov. 16-19, 1964.

Also published in Jour. Appl. Phys., v. 36: 928, Mar. 1965.

Configuration interaction methods were used to estimate the leading nonlinear and linear shielding terms in a number of rare earth ions: Ce^{3+}, Tb^{3+}, Er^{3+}, Tm^{3+}, Ho^{3+}, Dy^{3+}, and Yb^{3+}. Calculations were made as a function of crystalline field strength since the nonlinear shielding is dependent on the strength of the applied external field. Nonlinear shielding of V_2 and V_4 external fields were determined as a function of atomic number as were their effects on apparent V_2, V_4, and V_6 crystal field parameters. It is concluded that antishielding rather than shielding of the V_4 field occurs, but only by a few % at most, the V_2 field is always shielded. For the heavy rare-earth ions, the shielding effects are much smaller than for the lighter ions, with the apparent V_4 and V_6 shielding being very small. The most severe nonlinear effects arise when relatively strong V_2 and V_4 fields contribute to a relatively weak V_6 field

GENERATION OF INTENSE MAGNETIC FIELDS, by D. B. Montgomery. [1965] [8]p. incl. diagrs. refs. (AFOSR-65-1980) (AF 49(638)1468) AD 626328 Unclassified

Presented at Tenth Conf. on Magnetism and Magnetic Materials, Minneapolis, Minn., Nov. 16-19, 1964.

Also published in Jour. Appl. Phys., v. 36: 893-900, Mar. 1965.

The current and future status of high-field superconducting magnets is reviewed. Presently, superconducting magnets to 60 kgauss and a few even to 100 kgauss are within the reach of most research budgets. The potential of niobium-tin materials gives promise of future superconducting fields to 200 kgauss. Other methods of generating fields, such as water-cooled continuous magnets, millisec pulse magnets, and long-pulse cryogenic magnets, will find their principal use in reaching even higher fields, supplementing superconducting magnets, or in circumventing problems which preclude the use of superconductors. Pulse magnets are presently capable of producing millisec fields up to 500 kgauss and long pulses to 250 kgauss. Some design considerations of the magnets discussed are presented. INTERFEROMETRIC MEASUREMENT OF MICROWAVE HELICON DISPERSION AND THE HOLE DAMPING EFFECT IN INTRINSIC InSb, by J. K. Furdyna. [1965] [4]p. incl. diagrs. refs. (AFOSR-65-1982) [AF 49-(638)1468] AD 627480 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 635-638, Apr. 19, 1965.

Helicon wave propagation is investigated in intrinsic InSb at 35 Gc/sec in the temperature range from 200° to 400°K in magnetic fields up to 100 kgauss. Well-defined Rayleigh-type interference patterns indicate that the hold contribution to the helicon dispersion is negligible in practically the entire available field region, and in this sense the role of the slow carriers is similar to that of the fixed positive ions. However, even at moderate fields, the hold plasma provides the dominant damping mechanism of the helicons. Results, obtained by using the classical helicon model, agree moderately with the known dc mobilities. The inadequacy of the model in the proximity of the quantum regime is a likely cause for the discrepancy. Rayleigh patterns are also obtained by varying the concentration via temperature at fixed field, with more accurate results.

LOW-TEMPERATURE ANTIFERROMAGNETIC RESONANCE IN αFe_2O_3, by S. Foner and S. J. Williamson. [1965] [3]p. incl. diagr. refs. (AFOSR-65-1984) (AF 49(638)1468) AD 627197 Unclassified

Presented at Tenth Conf. on Magnetism and Magnetic Materials, Minneapolis, Minn., Nov. 16-19, 1964.

Also published in Jour. Appl. Phys., v. 36. 1154-1156, Mar. 1965.

Antiferromagnetic resonance (AFMR) at 35, 70, and 121 Gc/sec in single-crystal synthetic and natural α-Fe_2O_3 from 4.2 to 280°K has been observed The usual low-field AFMR as well as the spin-flop resonance mode are observed with pulsed magnetic fields applied parallel to the c axis. The data extend from well below the spin reorientation transition temperature T_M (about -10 C) to well above T_M. The spin-flop mode joins smoothly with the canted high-frequency mode above T_M. The usual AFMR terminates abruptly at T_M. The 3 modes observed here for the first time in α-Fe_2O_3 require either high fields or high frequencies or both for observation. The effects of the Dzyaloshinsky-Moriya field H_{DM} on the spin-flop resonance, the usual AFMR, and possible effects of spontaneous sublattice magnetizations are discussed. (Contractor's abstract)

SHIFT OF LANDAU LEVELS IN CROSSED ELECTRIC AND MAGNETIC FIELDS, by Q. H. F. Vrehen. [1965] [4]p. incl. diagrs. refs. (AFOSR-65-1988) [AF 49-(638)1468] AD 626824 Unclassified

Also published in Phys. Rev. Ltrs., v. 14: 558-561, Apr. 5, 1965.

In mutually perpendicular strong electric and magnetic fields, a resonance is observed in the optical absorption below the direct-gap band edge in germanium. It is interpreted as the transition between the zeroth Landau levels in the valence and conduction bands. The variation of the position and intensity of this resonance with E/H is in good agreement with a theory of Aronov which treats the optical absorption in crossed fields in the effective-mass approximation. It is shown likely that the whole phenomenon of optical absorption below the gap in crossec fields in germanium can be reasonably described in the effective-mass approximation, up to the highest electric fields attainable.

Presented at Tenth Conf. on Magnetism and Magnetic Materials, Minneapolis, Minn., Nov. 16-19, 1964.

Also published in Jour. Appl. Phys., v. 36 1169-1170, Mar. 1965.

The antiferromagnetic sublattice magnetization below the Morin transition temperature T_M 260 K, are parallel and antiparallel to the trigonal axis of rhombohedral α-Fe_2O_3. Experiments at 80 K, using the Mössbauer technique together with high external magnetic fields on both polycrystalline and single-crystal samples, show that the directions of the sublattice magnetizations flop from along the crystallographic [111] direction into the basal (111) plane. H_c is found to be 67.5 ± 3 kOe. In the polycrystalline sample, this behavior is exhibited through the occurrence of a maximum in the width of the outer lines of the Mössbauer spectrum plotted as a function of H_0. In the single crystal, which is oriented so that the γ rays propagate along the [111] direction, the magnetic transition is clearly observed as a sudden qualitative as well as quantitative change in the appearance of the Mössbauer hyperfine spectrum, below the critical field, the $\Delta m = 0$ lines are the strongest components of the 6-line spectrum. MAGNETOABSORPTION OF THE INDIRECT TRANSITION IN GERMANIUM, by J. Halpern and B. Lax. [1965] [9]p. incl. diagrs. table. (AFOSR-65-1991) [AF 49(638)1468] AD 626866 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26 911-919, May 1965.

The indirect transition magnetoabsorption in germanium at 1.7 K was studied in the Faraday configuration with the magnetic field perpendicular to the (100), (111) and (110) faces respectively and at fields of up to 74 kilogauss. The main features in the Landau transition spectrum are due to transitions from the states at the top of the valence bands to the electronic ladders in the conduction band. The periodicities obtained in the spectra enabled us to determine the effective masses of the conduction band electrons, the values obtained are in good agreement with those determined from cyclotron resonance. A fine structure corresponding to the spacings of the ladders in the valence bands was observed superposed on the gross structure due to transitions to successive electronic levels. This fine structure was analyzed and a number of valence band levels were identified. Values of the free electron g-factor were deduced and correlated with theory. (Contractor's abstract)

NONLINEAR AND LINEAR SHIELDING OF RARE-EARTH CRYSTAL-FIELD INTERACTIONS, by A. J. Freeman and R. E. Watson. [1965] [10]p. incl. diagrs. tables, refs. (AFOSR-65-2000) [AF 49(638)1468]
AD 627775 Unclassified

Also published in Phys. Rev., v. 139: A1606-A1615, Aug. 30, 1965.

Both nonlinear and linear shielding effects are investigated for the rare-earth ions Ce^{3+}, and Tb^{3} through Yb^{3+} inclusive. The method of single substituted configuration is employed and is shown to avoid the difficulties associated with the traditional single-determinant perturbation-theory approach. Results based on both methods are compared; significant differences in linear-shielding predictions are found to be introduced by the inexact traditional approach. Calculations for the nonlinear 5p → 4f effects have been done, and results displayed, as a function of the strength of V_c. The relevance of these effects to experiment is examined qualitatively. OBSERVATION OF A FAR INFRARED RESONANCE LINE IN ANTIFERROMAGNETIC CoO, by R. C. Milward. [1965] [2]p. incl. diagr. (AFOSR-65-2021) (AF 49(638)1468) AD 627618 Unclassified

Also published in Phys. Ltrs., v. 16: 244-245, June 1, 1965.

Using the technique of Fourier transform interferometry, far IR absorption was studied in single crystal CoO in the antiferromagnetic state. A sharp absorption peak was observed at a frequency of 142.3 ± 0.5 cm^{-1} at liquid helium temperature in 2 independently obtained CoO crystals, which closely corresponds with one of a pair of degenerate modes of antiferromagnetic resonance predicted by Tachiki (Jour. Phys. Soc. Japan, v. 19: 454, 1964). This resonance, however, shows anomalous behavior in the presence of external magnetic fields up to 100 kg and cannot be positively identified as an antiferromagnetic resonance mode. At higher temperatures, absorption measurements show that the resonance line broadens and almost disappears at nitrogen

temperature, being centered at slightly lower frequency and non-observable at room temperature.

NONLINEAR TWO-FLUID EQUATIONS FOR A SUPERCONDUCTOR, by R. Meservey. [1965] [2]p. (AFOSR-65-2022) [AF 49(638)1468] AD 627617 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 248-249, 1965.

The phenomenological equations of motion obtained from Eckart's variational principle (Phys. Rev., v. 54: 920, 1938 and Phys. Fluids, v. 3: 421, 1961) are given as applied to the 2-fluid model of a superconductor. The resulting equations yield a source term for the normal electrons and the explicit form of the osmotic-pressure term suggested by London (Superfluids, v. 1: 59, 1950).

PROGRESS IN SEMICONDUCTOR LASERS, by B. Lax. [1965] [14]p. incl. diagrs. refs. (AFOSR-65-2023) [AF 49(638)1468] AD 627481 Unclassified

Also published in IEEE Spectrum, v. 2: 62-75, July 1965.

The progress in semiconductor lasers is reported in an attempt to bridge the gap between those references concentrating on the injection laser and more recent results on optical photon and electron pumped semiconductor lasers. The history of the semiconductor laser is briefly reviewed from the first speculations of solid state masers in 1954. The basic requirements of any laser are discussed as they apply to semiconductors. Recent developments are considered as well as applications and a variety of magnetic phenomena investigated in connection with semiconductor lasers. It is concluded that rapid progress has been made in semiconductor lasers, a dozen new materials having emerged in 2 1/2 yr as effective media for generating coherent radiation in the infrared from about 0.6 to 8.5 μ. Still the science is just taking its first few steps

MAGNETIC ANISOTROPY IN ANTIFERROMAGNETIC CORUNDUM-TYPE SESQUIOXIDES, by J. O. Artman, J. C. Murphy, and S. Foner. [1965] [6]p. incl. diagrs. tables, refs. (AFOSR-65-2025) (Sponsored jointly by Air Force Office of Scientific Research under [AF 49-(638)1468], and Office of Naval Research) AD 627620 Unclassified

Also published in Phys. Rev., v. 138 A912-A917, May 3, 1965.

Evaluations of the magnetic dipolar anisotropy K_{MD} are made for the antiferromagnetic Cr, Fe, Ti, and V sesquioxides isomorphous to α-Al_2O_3. In the first 2 systems, the fine structure anisotropy K_{FS} is found by subtracting K_{MD} from the total anisotropy K obtained from antiferromagnetic-resonance (AFMR) data. In Shull magnetic configuration type (c), of which Cr_2O_3 is the prototype, K_{MD} was found to be very sensitive to lattice geometry. An analysis is also made for α-Fe_2O_3. The α-Fe_2O_3 spin flip near 250° K is predictable on a thermodynamic basis. The K_{FS} results in the Cr and Fe cases show little correlation with the corresponding quantities derived from EPR in diluted magnetic systems. The results of variation of lattice parameters are given for possible application to temperature and stress experiments and to diluted crystals. Since the antiferromagnetic properties of the Ti and V oxides currently are not clear, the appropriate K_{MD} calculations are presented for each of the 3 possible spin configurations.

EFFECTIVE CONDUCTION-ELECTRON-LOCAL-MOMENT EXCHANGE INTERACTION IN METALS: RARE-EARTH INTERBAND MIXING, by R. E. Watson, S. Koide and others. [1965] [12]p. incl. diagrs. table, refs. (AFOSR-65-2027) [AF 49(638)1468] AD 628338 Unclassified

Also published in Phys. Rev., v. 139: A167 A178, July 5, 1965.

The effective diagonal-exchange parameter $J_{eff}(0)$ which determines the exchange splitting of a metal's Fermi-surface conduction electrons, has been

investigated with a model involving simple orthogonalized-plane-wave conduction-electron orbitals and rare-earth ion cores. The positive exchange integral and negative interband mixing contributions to $J_{eff}(0)$ have been estimated for the rare earths as a function of nuclear charge Z. The results indicate that interband mixing may dominate, causing a net negative conduction-electron polarization, in agreement with a number of experiments. The interband mixing, and hence the sign of $J_{eff}(0)$, is found to be very sensitive to conduction-electron character. The results also indicate that, for ions other than spherical Gd, the parameter $J_{eff}(0)$ will vary strongly with conduction-electron k direction and may even involve a variation in sign. Such anisotropies in $J_{eff}(0)$ and the nondiagonal $J_{eff}(Q)$ parameters should be a significant source of anisotropies in the Ruderman-Kittel-Yasuya-Yosada conduction-electron spin distribution. LINE SHAPE AND AMPLITUDE OF GIANT QUANTUM OSCILLATIONS IN ULTRASONIC ABSORPTION, by Y. Shapira and B. Lax. [1965] [9]p. incl. diagrs. refs. (AFOSR-65-2031) [AF 49(638)1468] AD 627482 Unclassified

Also published in Phys Rev., v. 138. A1191-A1199, May 17, 1965.

The line shape of the giant quantum oscillations and the dependence of the amplitude of these oscillations on ultrasonic frequency, magnetic field, and temperature are calculated on the basis of the theory of Gurevich et al (Soviet Phys.-JETP, v. 18: 403, 1964). Expressions for determining cross sections of the Fermi surface, effective masses, g factors, matrix elements of the electron-phonon interaction, and electron relaxation times, by the use of giant quantum oscillations, are given. Measurements of the line shape and amplitude of the giant quantum oscillations in gallium are presented and compared with theory.

LOW FREQUENCY FIELD MODULATION DIFFERENTIAL MAGNETOMETER; APPLICATIONS TO THE DE HAAS-VAN ALPHEN EFFECT, by A. Goldstein, S. J. Williamson, and S. Foner. [1965] [10]p. incl. diagrs. table, refs. (AFOSR-65-2559) [AF 49(638)-1468] AD 627777 Unclassified

Also published in Rev. Scient. Instr., v. 36: 1356-1365, Sept. 1965.

Low frequency field modulation techniques (FMT) for measurements of differential magnetic susceptibility are discussed and specific applications to the de Haas-van Alphen effect are analyzed. The method utilizes a small ac modulating field which is superimposed on a large applied dc magnetic field. Differential changes in magnetization of the sample are synchronously detected with the aid of a suitable arrangement of pickup coils. The FMT is applicable to a wide variety of magnetic measurements and is particularly valuable for de Haas-van Alphen or magnetic transition studies at high magnetic fields. Advantages of this technique include: simplicity, versatility, direct applicability to axial high field water-cooled and superconducting solenoids or transverse magnets, high differential sensitivity ($d\sigma/dB = 3 \times 10^{-6}$ emu/gG), convenient access to the sample environment, and use of standard commercially available electronic components. Details of the detection coil assembly, sample rotation devices, and low temperature accessories are presented along with a general discussion of the

data processing techniques. Modifications for transverse field modulation and accurate orientation of the dc or modulation field with respect to the sample are also discussed. (Contractor's abstract)

DIELECTRIC CONSTANT OF ^{3}He IN THE CRITICAL REGION, by C. E. Chase and G. O. Zimmerman. [1965] [3]p. incl. diagr. refs. (AFOSR-65-2566) [AF 49(638)1468] AD 628345 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 483-485, Sept. 13, 1965.

A systematic study was undertaken of the equation of state of ^{3}He, for the purpose of investigating certain quantum corrections in detail. A dielectric-constant technique was employed in which the density of a very thin layer of fluid (about 2×10^{-2} cm thick), contained between the plates of a condenser, is derived from the measured change in capacitance as the condenser is filled. Measurements are reported of the density along the critical isotherm, which we believe to be substantially free from the objections of previous methods. The measurements show that $\delta = 3.49 \pm 0.1$ over a very wide range of pressure, confirming the existence of substantial deviations from the law of corresponding states. Considerable asymmetry was also found between the high-density and low-density sides of the critical isotherm.

CONDUCTION-ELECTRON POLARIZATION IN METALS, by R. E. Watson and A. J. Freeman. [1965] [4]p. incl. diagrs. (AFOSR-65-2567) [AF 49(638)1468] AD 628189 Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Abstract published in Bull. Amer. Phys. Soc., Series II, v. 10: 339, Mar. 24, 1965.

Also published in Phys. Rev. Ltrs., v. 14: 695-698, Apr. 26, 1965.

The conventional free-electron Ruderman-Kittle-Kasuya-Yosida (RKKY)-theory of conduction-electron polarization yields a spin density $\rho(r)$ given by $\int \chi(Q) J(Q) [e^{iQ \cdot r} + e^{-iQ \cdot r}] dQ$, where $Q = k - k'$ is the vector difference of k vectors. The conduction-electron local-moment exchange integral $J(Q)$ is commonly treated as being constant or as a local-moment form factor and any difference between theory and experiment is often ascribed to the susceptibility function $\chi(Q)$. The authors determined the Q dependence of $J(Q)$ and find strong differences from either the constant or form-factor assumptions. Repercussions on the spin density are found to be severe. The spin density of the origin with respect to that at a typical near-neighbor or next-nearest-neighbor position in a metal may differ markedly from the traditional RKKY result. Numerical results are reported for exchange integrals determined using the $Gd^{3+}4f^7$ wavefunction to represent a local spin distribution and conduction electrons represented by plane waves orthogonalized to the entire Gd^{3+} core.

SUPERFLUID FLOW IN A VENTURI TUBE, by R. Meservey. [1965] [4]p. incl. diagrs. [AF 49(638)-1468] AD 629192 Unclassified

Also published in Phys. Fluids, v. 8: 1209-1212, July 1965.

It is shown from Bernouilli's equation that a Venturi tube or Pitot tube as ordinarily used will have practically no level difference with irrotational fluids. A quantitative solution is given in the case of a Venturi tube of various dimensions. The observed level difference with water follows simply from the rotational acceleration term of the Navier-Stokes equation. This result for irrotational fluids is discussed with respect to experiments using liquid helium and superconductors. (Contractor's abstract)

ZEEMAN EFFECT IN THE 4f - 5d SPECTRUM OF Ce^{3+} IN CaF_2, by M. H. Crozier. [1965] [3]p. incl. diagrs table. (AFOSR-65-2584) (AF 49(638)1468) AD 627954 Unclassified

Also published in Phys. Rev., v. 137: A1781-A1733, Mar. 15, 1965.

The Zeeman effect of the Ce^{3+} ion with tetragonal charge compensation in CaF_2 has been studied at 4.2°K. An absorption line at 3131.6A has been split with fields of 60 kG, and although all the components cannot be resolved, there is good agreement with electron paramagnetic resonance results for the ground state. Axial stress results identify the upper state as having crystal quantum number $\mu = \pm 1\ 2$. The occurrence of $4f^n - 4f^{n-1}5d$ spectra in the trivalent rare earths is discussed. In an appendix, a result is established concerning the use of the Zeeman effect to identify the $\mu = \pm 1/2$ and $\mu = \pm 3\ 2$ components of a cubic Γ_8 level split by a tetragonal distortion. EQUATION OF STATE ON ^{4}He IN THE CRITICAL REGION, by L. Tisza and C. E. Chase. [1965] [3]p. incl. diagrs. refs. (AFOSR-65-2585) [AF 49(638)1468] AD 629186 Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965

Abstract published in Bull. Amer Phys. Soc., Series II, v. 10: 532, Apr. 26, 1965.

Also published in Phys. Rev. Ltrs., v. 15: 4-6, July 5, 1965.

Tisza pointed out several years ago that the thermodynamic functions are nonanalytic at the critical point and presumably exhibit branch-point singularities. Recently a great deal of progress has been achieved in providing mathematical description of such singularities. In order to integrate these results with the formalism of thermodynamics, it is necessary to choose a set of natural variables, that are within the scheme of a single fundamental equation and are adapted to the intrinsic symmetry of the system. There is evidence of a near symmetry in the critical region of fluids, the thermodynamic role of which has not been sufficiently appreciated. This asymmetry is masked if the traditionally favored independent variables are used. To demonstrate this thesis, the authors analyzed the measurement of Edwards and Woodbury who determined the orthobaric densities of ^{4}He to within 36 mdeg of T_c for the liquid and 50 mdeg for the vapor.

ULTRASTRONG MAGNETIC FIELDS, by F. Bitter. [1965] [10]p. incl. illus. diagrs. (AFOSR-65-2587) [AF 49(638)1468] AD 628259 Unclassified

Also published in Scient. Amer., v. 213: 64-73, July 1965.

Methods that produce, for brief periods, magnetic fields with strengths in the neighborhood of 10 million gauss and that appear capable of achieving fields exceeding 100 million gauss are described. In creating these ultrastrong magnetic fields (fields > 10 million gauss), an implosion technique is employed which depends on the principle of flux compression. A magnetic field of a certain flux density is produced inside a metal cylinder which is surrounded by a ring of high explosive timed to go off when the pulsed field reaches its peak. The subsequent implosion of the cylinder compresses the magnetic flux, thereby raising the field to several million gauss. The direct magnetic effects of ultrastrong fields and how they might be used to create extremely high pressures is discussed.

BLOCH ELECTRONS IN EXTERNAL ELECTRIC AND MAGNETIC FIELDS, by H. C. Praddaude. [1965] [5]p. (AFOSR-66-0083) [AF 49(638)1468] AD 629182 Unclassified

Also published in Phys. Rev., v. 140: A1292-A1296, Nov. 15, 1965.

The Schrödinger equation for a Bloch electron in external electric and magnetic fields is rewritten with the help of redundant variables, the wave function being obtained when a limiting process is carried out. The connection with the standard effective-mass approximation is discussed, and an application to the case of crossed electric and magnetic fields is carried out for the simple case of 2 parabolic bands in order to examine the

singularity $\frac{1}{2}m^*(E/B)^2$ that appears in the energy in the effective-mass approximation when $B \to 0+$. It is concluded that below a certain value of E/B the character of the solution changes and the effective-mass formula is then not applicable. (Contractor's abstract)

UPPER CRITICAL FIELDS OF Nb-Ti ALLOYS: EVIDENCE FOR THE INFLUENCE OF PAULI PARAMAGNETISM, by Y. Shapira and L. J. Neuringer. [1965] [7]p. incl. diagrs. refs. (AFOSR-66-0223) [AF 49(638)-1466] AD 629195 Unclassified

Also published in Phys. Rev., v. 140: A1638-A1644, Nov. 29, 1965.

Resistivity, flow-resistance, and ultrasonic-attenuation measurements were carried out on Nb-37 at.% Ti and Nb-56 at.% Ti in dc magnetic fields up to 150 kG. The transition temperatures and the dependence of the upper critical field on temperature were measured by the resistive method. The transition temperatures are: T_c = 9.2 ± 0.2°K for Nb-37 at.% Ti and T_c = 9.0 ± 0.2°K for Nb-56 at.% Ti. Flow-resistance measurements gave the following values for the Ginzburg-Landau-Abrikosov-Gor'kov upper critical field at T = 0: 112 ± 7 kG for Nb-37 at.% Ti and 188 ± 9 kG for Nb-56 at.% Ti. Changes in the ultrasonic attenuation were observed near the upper critical field. The data support the view that the Pauli paramagnetism plays a role in determining the upper critical field. However, the effect of the Pauli paramagnetism is found to be smaller than predicted by Maki. (Contractor's abstract)

FLUX CREEP AS A DOMINANT SOURCE OF DEGRADATION IN SUPERCONDUCTING SOLENOIDS, by Y. Iwasa and D. B. Montgomery. [1965] [3]p. incl. diagrs. (AFOSR-66-0224) [AF 49(638)1468] AD 629189 Unclassified

Also published in Appl. Phys. Ltrs., v. 7: 231-233, Nov. 1, 1965.

This report gives experimental evidence that the mechanism of unstable flux creep arising from thermal instabilities is responsible for the current degradation commonly observed in superconducting solenoids. Transient flux creep was induced in a sample by means of suitable magnetic field pulses. With the sample carrying a transport current, the resistivity arising during flux creep produced transient joule heating, and when the current was large enough, the heating was sufficient to exceed the local critical temperature, thereby resulting in a quench. The experiments point up the critical role played by flux creep and confirm the extreme sensitivity of flux creep to thermal perturbations. However, it remains unanswered as to why coils do not always quench in the sensitive zone (near 15 kilogauss), why currents are often less than 23 A, especially in large coils, and why coils in general, are more subject to instabilities.

THE MINIMUM PROPAGATING CURRENT OF A COMPOSITE SUPERCONDUCTOR, by J. E. C. Williams. [1965] [2]p. incl. diagr. (AFOSR-66-0227) [AF 49(638)-1458] AD 629190 Unclassified

Also published in Phys. Ltrs., v. 19: 96-97, Oct. 1, 1965.

Stekly (Avco-Everett Report 210, March 1965) has shown that it is possible to stabilize an inherently unstable superconductor at its short sample current by shunting it with sufficient normal material. Stable operations can also be achieved, however, at currents below the short sample value with less normal material. It is the purpose of this letter to show that this leads to an increased overall current density in some instances which should be considered in coil design. Superconductors of high pinning strength, like NbZr, if operated at a minimum propagating current, will give lower overall current density at full stabilization than at low values of the loading parameter. Where coils of minimum weight or minimum volume are needed, this is an important consideration.

EFFECTS OF HIGH MAGNETIC FIELDS ON THE ULTRASONIC VELOCITY AND ATTENUATION IN Nb-25% Zr, by Y. Shapira and L. J. Neuringer. [1965] [4]p. incl. diagrs. refs. (AFOSR-66-0228) [AF 49(638)1468] AD 629185 Unclassified

Also published in Phys. Rev. Ltrs., v. 15: 724-727, Nov. 1, 1965.

The report contains the observation of changes in the velocity and attenuation of ultrasonic waves propagating in the superconducting and normal states of Nb-25% Zr, caused by the presence of a high dc magnetic field. These changes are abrupt near the upper critical field H_{c2}, determined by magnetization measurements. The conventional interpretations of the changes in the ultrasonic attentuation and the velocity near H_{c2} do not apply to this high-field super-conductor because the effects of the magnetic field necessary to destroy superconductivity are large. On the other hand, the velocity and attenuation changes observed in the superconducting state agree with the predictions of the Alpher-Rubin theory (Jour. Acoust. Soc. Amer., v. 26: 452, 1954) which was originally derived for impure metals in the normal state. As expected, the theory also accounts for the results in the normal state. The results for changes in

shear wave velocity and absorption and changes in longitudinal wave attenuation near the upper critical field are reported. It is noted that there are some deviations from theory.

DE HAAS-VAN ALPHEN EFFECT IN PYROLYTIC AND SINGLE-CRYSTAL GRAPHITE, by S. J. Williamson, S. Foner, and M. S. Dresselhaus. [1965] [19]p. incl. illus. diagrs. tables, refs. (AFOSR-66-0270) [AF 49-(638)1468] AD 629184 Unclassified

Also published in Phys. Rev., v. 140: A1429-A1447, Nov. 15, 1965.

The de Haas-van Alphen (DHVA) oscillations were observed in the differential susceptibility of well annealed pyrolygic graphite (PG) with the low-frequency field-modulation technique. Observation of a long period, minority-carrier DHVA oscillation in PG and SCG confirms Soule's discovery of such an oscillation in SCG and provides a sensitive test for the Slonczewski Weiss band model. The minority-carrier oscillation in PG is qualitatively but not quantitatively similar to the one in SCG. This oscillation is attributed to magnetic energy levels passing through the Fermi level near the Brillouin-zone corner at $k_z = \pi/c$, where $\theta = 0°$ there is no extremal area of the Fermi surface at zero field, when spin-orbit interactions are neglected. This interpretation is supported by the calculation of an oscillatory free energy and by the excellent agreement for PG between the predicted values and experimental results for the period, effective mass, period anisotropy, and phase. The phase is not the value which would be predicted from a free-electron model for either a maximal or a minimal cross-sectional area. (Contractor's abstract)

[MAGNET RESEARCH AND DEVELOPMENT, AND SOLID STATE RESEARCH PROGRAMS, by B. Lax] Quarterly technical status rept. no 22, Oct 1-Dec 31, 1965 [34]p incl illus. (AFOSR-66-0273) (AF 49-(638)1468) AD 638343 Unclassified

The Laboratory's work for the quarter on magnet research and development and solid state research is presented. A record field of 226 kG in a new 1¼" bore magnet was achieved. The current density and heat flux at the center are the largest ever sustained in a water-cooled magnet. The upper critical field of several samples of V_3Ga was in the range of 180-195 kG far lower than previously estimated. A new theory of crossed field magnetoabsorption for degenerate bands and large electric fields has been developed. A combined experimental and theoretical treatment of magnetoabsorption and Faraday rotation in Insb has provided very accurate values for the band parameters. The high field magnetic susceptibility of iron and nickel was measured up to 148 kG. The RF periodic size effect in single crystal gallium has been found to be the basis of an accurate and convenient technique for measuring high magnetic fields. New results on internal fields and magnetic properties of solids were obtained using the Mossbauer effect in high fields. Temperatures down to about 25 millidegrees were reached using the adiabatic demagnetization apparatus. The complete Fermi surface of thulium metal was determined using augmented plane wave calculation of the energy bands. The computed bands have an s-d character resembling those of the transition metals. A calculation of the contribution of core polarization to the hyperfine fields of 4d ions of transition metals has been made by the spin-polarized Hartree-Fock method.

FERRIMAGNETIC STRUCTURE OF MAGNETOELECTRIC $Ga_{2-x}Fe_xO_3$, by R. B. Frankel, N. A. Blum and others. [1965] [3]p. incl. diagr. (AFOSR-66-0277) [AF 49(638)1468] AD 629188 Unclassified

Also published in Phys. Rev. Ltrs., v. 15, 958-960, Dec. 20, 1965.

High-magnetic field Mössbauer and magnetic-moment experiments have been performed with $Ga_{2-x}Fe_xO_3$.

This magnetic system is of considerable interest because it is piezoelectric, weakly magnetic, and magnetoelectric. The crystal structure has been determined and a magnetic ordering inferred. The magnetic-moment measurements were made using a vibrating sample magnetometer in fields up to 75 kOe. The samples used for the Mössbauer absorption experiments consisted of ^{57}Fe enriched powders, grown from a flux, embedded in lucite, and having x = 0.8 and 1.2. A mosaic absorber made of small x-ray oriented single crystals was also studied. Measurements were made over the temperature range 4.2° to 320 K and in external magnetic fields up to 130 kOe. At low temperatures the zero-external field-absorption spectra indicate that there are at least 2 magnetically nonequivalent sites. In a large external field, the hyperfine spectrum lines corresponding to $\Delta m = 0$ vanish, while each of the outer lines (corresponding to $\Delta m = \pm 1$) splits into 2 well-resolved components of unequal intensity. Detailed analysis of the experimental results for both the single crystal and polycrystalline absorbers indicates that at zero external field all spins lie in the a-c plane (c < a < b), that the observed moment is due to ferrimagnetic rather than to a canted spin structure, and that the spins are unequally divided between the 2 sublattices.

MAGNETIC BUBBLE TRAPPING IN LIQUIDS, by M. H. Crozier. [1965] [3]p. incl. diagrs. table. (AFOSR-66-1322) [AF 49(638)1468] AD 639888 Unclassified

Also published in Jour. Appl. Phys., v. 36, 3802-3904, Dec. 1965.

In a high magnetic field, a liquid is subject to forces due to its para- or diamagnetism which contribute to the hydrostatic pressure at each point. It is shown that this contribution may give rise to a local pressure minimum at which bubbles in the liquid will accumulate. This effect is often produced in commercial liquid nitrogen with a standard laboratory electromagnet, because of the paramagnetism caused by a small oxygen content, and can cause experimental problems. The corresponding effect caused by diamagnetism has now been observed in water with a high-field solenoid operated in the range 165-205 kG, and it is predicted that a bubble trap will likewise occur in liquid helium when a magnet of this design is operated at slightly higher fields. Such an effect can produce irregularities in the results of low-temperature experiments in high magnetic fields unless bubbles are prevented from forming.

Anniversary AFOSR Scientific Seminar, Cloudcroft, N. M., (June 1965), ed. by D. L. Arm. Albuquerque, Mexico U. Office of Publications, 1965, 138-161.

This discourse reviews the extent and scope of high magnetic-field research and magnetospectroscopy that has evolved during the last decade. The activity and productivity has far exceeded the expectations of even its most ardent participants. Only a few years ago such phenomena as the Mössbauer effect, coherent radiation with lasers, and high field superconductivity did not exist. But each of these now has become a prominent area of research which will play an important future role under the heading of high magnetic fields. However, there are many which have not been mentioned which promise to enrich this field of science even further.

CALCULATION OF THE MAGNETIC SUSCEPTIBILITY IN GRAPHITE (Abstract), by M. S. Dresselhaus, S. J. Williamson, and G. F. Dresselhaus [1965] [1]p [AF 49(638)1468] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 110, Jan. 27, 1965.

Recent measurements by Williamson et al of the magnetic susceptibility in single-crystal and pyrolytic graphite have confirmed the long-period oscillations first reported by Soule. Using the band parameters obtained from the magnetoreflection experiment, the circular cross-sectional area of the Fermi surface $k_z = \pi c_0$ has been computed, and the result is within 15% of the observed long-period oscillation in pyrolytic graphite. At this point in the zone, there is neither an extremum in the cross-sectional area of the Fermi surface nor a stationary value of the cyclotron effective mass, but there is a 2-fold degeneracy of the energy levels. A calculation of the temperature dependence of the magnetic susceptibility in the low-field limit is discussed in connection with this long-period oscillation.

A CLOSED-LOOP COOLING SYSTEM FOR SUPERCONDUCTING BUBBLE CHAMBER MAGNETS, by H. H. Kolm. [1965] [4]p. incl. diagrs. [AF 49(638)1468] Unclassified

Published in Proc. Internat'l. Symposium on Magnet Technology, Stanford U., Calif., (Sept. 8-10, 1965), ed. by H. Brechna and H. S. Gordon. Springfield, Clearinghouse for Federal Scientific and Technical Information, Dept. of Commerce, 1965, 611-614.

Widespread effort is being devoted to the cryogenic problems associated with the design of large superconducting magnets to be used with bubble chambers, MHD generators, fusion experiments, energy storage inductors, and as external booster coils to surround high-filed copper and aluminum magnets. A new method of maintaining a structure at liquid helium temperature is described, and its advantages over the bath immersion technique is pointed out. The new method relies on the reluctance of liquid helium to solidify at pressures substantially above its critical point (2.3 atm). At 4.2°K and about 100 atm, helium has a very low viscosity and is incapable of undergoing phase change, therefore representing an ideal heat transfer medium which can be circulated through a system of small diameter tubing permeating the superconducting structure. The high-pressure helium is cooled by a heat exchanger immersed into a remotely located storage dewar containing boiling helium at atmospheric pressure: the helium loop also contains a circulating pump. The superconducting magnet is surrounded only by a single-wall vacuum jacket containing a radiation shield cooled by circulation of liquid nitrogen, this vacuum jacket is connected to the remote storage dewar. The system permits effective use of the total enthalpy during cool-down, and it achieves heat transfer which is stable with respect to local thermal perturbations; these 2 fundamental advantages are discussed. Two prototype systems are described and their schematic illustrations are given.

COVALENCY IN IRON-SERIES FLUORIDES (Abstract), by D. E. Ellis, A. J. Freeman, and R. E. Watson. [1965] [1]p. [AF 49(638)1468] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 33, Jan. 27, 1965.

Investigations of the role of covalency in iron-series fluorides have been continued, using the cluster model as applied to $KNiF_3$. Previous work suggested 3 factors that needed to be understood: (1) the nature of the orbitals that yield an accurate cluster description, (2) the accuracy of evaluating matrix elements for a given 1-electron Hamiltonian, and (3) the definition and use of a rigorous 1-electron Hamiltonian. Although factor (1) is the most interesting physically and includes, for example, s-p hybridization, the role of the other 2 factors must be understood more completely first. It has been found that estimates of covalency are very sensitive to (2), particularly as regards the inclusion of multicenter integrals involving overlap densities. The present paper reports results of further investigations into factors (2) and (3). Particular emphasis in (3) is placed on including effects of the proper renormalization of the molecular orbitals, inclusion of metal-ligand overlap terms in the Hamiltonian and the role of self-consistency in the Hamiltonian. These are found to significantly affect the theoretical predictions of experimental quantities.

CROSSFIELD MAGNETOABSORPTION IN GALLIUM ARSENIDE (Abstract), by Q. H. F. Vrehen. [1965] [1]p. [AF 49(638)1468] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10. 534, Apr. 26, 1965.

The oscillatory behavior of the interband optical absorption in a semiconductor in a magnetic field is changed in 2 respects by a transverse electric field. First, the photon energies at which transition occur shift to lower values and, secondly, the intensity of normally allowed transitions is reduced, whereas normally forbidden transitions now get a finite-transition probability. Experimentally, these effects were first studied in germanium with a modulation technique. Both allowed and forbidden transitions show up in the differential spectrum. Using this same technique, which is more sensitive for the detection of oscillations than a standard absorption measurement, the authors found magnetooscillations interband absorption in gallium arsenide at room temperature and in magnetic fields from 40 to 64 kOe. A preliminary analysis of the data yields for the reduced mass of the electron and hole involved in the transition a value of (0.04 ± 0.005) times the electron mass.

DISSIPATION IN TYPE II SUPERCONDUCTORS IN THE MIXED STATE IN ALTERNATING MAGNETIC FIELDS (Abstract), by E. Maxwell and W. P. Robbins. [1965] [1]p. [AF 49(638)1468] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10. 359, Mar. 24, 1965.

The authors investigated the dissipative effects in some indium-bismuth alloys in the mixed state by observing the out-of-phase component χ'' of the ac magnetic susceptibility while the specimen was subjected to a continuously swept superimposed dc field. Observations were made at different sweep rates for a number of field amplitudes and frequencies. $\chi'' \cong 0$ below H_{c1}. At H_{c1} there is a local maximum in χ'' associated with the initial field penetration. Between H_{c1} and H_{c2}, there is a plateaulike region in which the dominant dissipative mechanism appears to be flux. At H_{c2}, there is a maximum in χ'' probably associated with hysteresis effects. Above H_{c2}, are some minor features that could be due to surface superconductivity. In the plateaulike region, χ'' is a function of $(dH\ dt)_{dc}$ which is consistent with a simple viscous-flow model in which the viscous resistance is large determined by the steady-flow velocity imposed by the swept dc field.

FAR-INFRARED ANTIFERROMAGNETIC RESONANCE IN SINGLE-CRYSTAL COBALTOUS OXIDE (Abstract), by R. C. Milward. [1965] [1]p. [AF 49(638)1468] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Nov. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 315, Mar. 24, 1965.

Using the technique of Fourier transform interferometry, one of a pair of degenerate modes of antiferromagnetic resonance, recently predicted by Tachiki to occur at frequencies of 192 and 554 cm^{-1} at 0 K, has been observed at 142.3—0.5 cm^{-1} near liquid-helium temperature, in 2 independently obtained CoO crystals. The true linewidth at half-absorption is estimated to be 3.5 cm^{-1}. At higher temperatures, the line broadens, being centered at 141—1 cm^{-1} at 80 K, with a half-width ~ 10 cm^{-1}, and is nonexistent at 295 K ($\sim T_N$). An external magnetic field of 42 kG applied parallel to a [100] axis and the direction of light propagation produces no observable shift in position of the resonance line at the lowest temperature, but causes the appearance of a satellite absorption peak at ~ 146.5 cm^{-1}. No explicit theory for the magnitude and magnetic-field dependence of such an effect has yet been formulated with which to compare the experimental findings. The far-infrared absorption spectrum of CoO shows 2 other broad absorption lines centered at about 167 and 188 cm^{-1}, which are existent both above and well below the Néel temperature.

HELICON-WAVE PROPAGATION IN n-TYPE InAs AT MICROWAVE FREQUENCIES (Abstract), by J. K. Furdyna. [1965] [1]p. [AF 49(638)1468] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 545, Apr. 26, 1965.

Helicon-wave propagation was investigated in n-type InAs at 35 Gc/sec, in the temperature range from 78 to 300 K in magnetic fields up to 100 kG. A microwave analog of the Rayleigh refractometer was used in the measurements. This arrangement is in many ways superior to the Fabry-Perot dimensional resonance technique used in previous helicon experiments in this frequency range, particularly in the presence of considerable losses. Moreover, this approach permits a quantitative study of the helicon-damping processes. Interference patterns consisting of as many as 10 full oscillations between 40 and 100 kG were observed at temperatures as high as 300 K, allowing a precise determination of the electron concentration. In addition, the quantity $e/(m^* \langle \tau^{-1} \rangle)$ was obtained from the envelope of the interference pattern. The latter quantity is close to the known electron mobility, but shows a slight dependence on the magnetic field. This variation arises possibly due to the proximity of the quantum limit, which may render the semiclassical model used in the present analysis not fully satisfactory at the highest fields.

INTERBAND TRANSITIONS IN PYROLYTIC GRAPHITE AT THE ZONE CORNER (Abstract), by J. G. Mavroides and M. S. Dresselhaus [1965] [1]p. [AF 49(638)1468] Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10. 109, Jan. 27, 1965

Using the magnetoreflection technique, interband transitions associated with the Brillouin-zone corner (point H) have been studied in pyrolytic graphite in the photon-energy range $0.06 < \hbar\omega < 0.50$ ev, using magnetic fields up to 110 kG. Oscillations of relatively strong intensity in the magnetoreflection are identified with allowed transitions between the lowest 6 magnetic-energy levels for each of the doubly degenerate energy bands at point H. An analysis of these transitions on the basis of the Slonczewski-Weiss band model gives accurate values for 2 band parameters, $\gamma_0 = 3.18 \pm 0.02$ and $|\Delta| = 0.009 \pm 0.003$ ev. With these band parameters and $E_F = 0.019$ ev, a value of $(3.7 \pm 0.6)\ 10^{11}$ cm^{-2} is obtained for the cross-sectional area of the Fermi surface at the plane $k_z = \pi/c_0$. In addition to these relatively strong oscillations, 4 weaker forbidden interband transitions are observed and correspond to the selection rule $\Delta_n = 0$.

MAGNETIC ANISOTROPY IN ANTIFERROMAGNETIC α-$(Cr_{1-f}Al_f)_2O_3$, by J. O. Artman, J. C. Murphy, and S. Foner. [1965] [2]p. incl. diagrs. refs. [AF 49(638)-1468] Unclassified

Presented at Tenth Conf. on Magnetism and Magnetic Materials, Minneapolis, Minn., Nov. 16-19, 1964.

Published in Jour. Appl. Phys., v 36: 986-987, Mar. 1965.

In antiferromagnetic crystals the results of AFMR when combined with other data, yield the anisotropy K. By subtracting the magnetic dipolar anisotropy (K_{MD}) from K, the fine structure anisotropy K_{FS} is found. For Cr_2O_3, the K_{MD} computation of Tachiki and Nagamiya, 0.059 cm^{-1}/ion, had been accepted as a basis for further analyses. However, in the course of computing K_{MD} by modern machine methods for various sesquioxide antiferromagnets, this value has been found to be inappropriate. The Shull magnetic structure (c) to which Cr_2O_3 belongs is one in which the magnetic geometry effectively is almost cubic. The computed K_{MD} value thus is sensitive to small changes in lattice geometry. Presently accepted room-temperature crystal parameters yield $K_{MD} = 0.0088$ cm^{-1}/ion, 1/6 the former result; consequently Cr_2O_3 AFMR data have been reanalyzed. The temperature behavior of K_{FS} and K_{MD} in pure Cr_2O_3 and in $(Cr_{1-f}Al_f)_2O_3$ crystals is discussed. Similar K_{MD} calculations have been made for the Ti, V, and Fe sesquioxides. In the case of α-Fe_2O_3 a prediction has been made, with the use of AFMR data, the spin-flip near 263 K. The experimentally found decrease of this spin-flip temperature with increasing f in the $\alpha(Fe_{1-f}Al_f)_2O_3$ system is discussed in the light of existing information. (Contractor's abstract)

MEASUREMENT OF THE ABSOLUTE VALUE OF THE PENETRATION DEPTH USING FLUX QUANTIZATION, by R Moservey. [1965] [4]p. incl. diagrs. [AF 49-(638)-1468] Unclassified

Published in Proc. Ninth Internat'l. Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v LT9 (Pt. A)· 455-458, 1965.

The aim of the study is to develop a precise and absolute measurement of the penetration depth λ and the flux quantum in superconductors A rectangular loop consisting of 2 superconducting plates is separated by an insulating layer of thickness δ and shorted at the edges by 2 thin superconducting links. The loop is part of an external circuit fed from a current source. If 1 flux quantum Φ_0 is added to the flux inside this rectangular loop, the relation $\Phi_0 = \mu \cdot \Delta H \cdot W[\delta + 2\lambda]$ is attained where μ is the permeability, ΔH is the change in the field inside the insulator between successive units of flux, δ is the insulator thickness, and W is the width of the loop. Assuming that μ 1 and $\Phi_0 = hc/2e$, one can obtain λ from a measurement of ΔH, δ, and W. For Al_2O_3 insulating layers about 50A thick, $d = \lambda/10$, so that a relatively inaccurate value of $\delta(\pm 20\%)$ leads to an error in λ of only 1%. In the present measurements it was found that, at a current slightly above where resistance first appeared, the voltage across the shorting links was periodic with magnetic field, it was this effect which was measured and not the periodicity in the critical current. The method appears to give good results for the penetration depth, but leads to an apparent temperature dependence of the flux quantum.

OPTICAL ABSORPTION IN GERMANIUM IN HIGH ELECTRIC AND MAGNETIC FIELDS (Abstract), by Q. H. F. Vrehen and A. Frova. [1965] [1]p. [AF 49-(638)1468] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 343, Mar. 24, 1965.

A sensitive method for measuring the change in the optical absorption in a semiconductor, due to the presence of a high electric field, was developed by Frova and Handler. This technique was used to measure the electric-field-induced absorption in germanium in the presence of a high magnetic field for photon energies just below the direct gap-band edge. Electric fields up to 7×10^4 v/cm and magnetic fields up to 62 kG in the longitudinal configuration and up to 95 kG in the transverse configuration were used. In what follows, absorption stands for the difference in absorption coefficient with and without the electric field. In the longitudinal configuration, then, the main effect of the magnetic field is to shift the absorption curve to slightly higher photon energies. In the crossed-field configuration, the shape of the absorption curve changes markedly. For photon energies near the gap, the absorption increases over that in the case without a magnetic field; for lower energies, there is a strong decrease in the absorption as compared to the zero magnetic-field case

OSCILLATORY FARADAY ROTATION OF THE INDIRECT TRANSITION IN GERMANIUM (Abstract), by J. Halpern. [1965] [1]p. [AF 49(638)1468] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 545, Apr. 26, 1965.

The oscillatory Faraday rotation of the indirect transition in germanium has been observed on transmission. The experiments were carried out at magnetic fields of up to 103 kG and at helium temperatures on a heat-sunk sample. From the position of the indirect energy gap, the temperature was determined as 8 K. The sample was intrinsic, with a carrier concentration $n < 10^{13}/cm^3$. The data were taken with the direction of propagation (and the magnetic field) perpendicular to a (110) face. Comparison of the Faraday rotation with the corresponding transmission as a function of wavelength shows that there are oscillatory curves corresponding to both the exciton absorption and to the Landau steps. The entire indirect transition rotation is superposed on a very large dispersive tail that probably arises from the $\Gamma_{25'} \rightarrow \Gamma_{2'}$ direct-energy-gap transition. At the temperatures and magnetic fields in question, the oscillatory effects are of the order of 2% of the total rotation.

SOUND PROPAGATION IN ^{4}He NEAR THE CRITICAL POINT (Abstract), by R. C. Williamson and C. E. Chase. [1965] [1]p. (Sponsored jointly by Advanced Research Projects Agency, and Air Force Office of Scientific Research under [AF 49(638)1468])

Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 532, Apr. 26, 1965.

Recent measurements of the velocity of 1-mc/sec sound in ^{4}He close to the critical point have been extended to include several isotherms both above and below T_c. Measurements at 4.5° and 5°K can be combined with direct measurements of density and isothermal compressibility to yield the specific-heat ratio γ. The authors have also recalcalculated the adiabatic compressibility along the critical isobar and isotherm using an improved empirical equation of state, previously reported results in the liquidlike phase ($P > P_c$ or $T < T_c$) are only slightly affected, but the compressibility in the gaslike phase is appreciably changed.

SUPERFLUID BEHAVIOR IN A VENTURI TUBE (Abstract), by R. Meservey. [1965] [1]p. [AF 49(638)-1468] Unclassified

Presented at meeting of the Amer. Phys. Soc., Washington, D. C., Apr. 26-29, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 532-533, Apr. 26, 1965.

In a venturi tube, the level difference in the standpipes is commonly used to measure the velocity of water flowing in a pipe. It has been suggested that the venturi tube would be useful in measuring the flow velocity of a persistent current of superfluid helium. However, for irrotational flow it is easily shown that there is almost no level difference for reasonably long standpipes. A quantitative solution of the problem is given and its application to superfluid helium and superconductors is discussed.

ULTRASONIC ATTENUATION IN Nb-20% Ti AND Nb-40% Ti ALLOYS TO 150 kG (Abstract), by Y. Shapira and L. J. Neuringer. [1965] [1]p. [AF 49(638)1468] Unclassified

Presented at meeting of the Amer. Phys. Soc., Kansas City, Mo., Mar. 24-27, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10 359, Mar. 24, 1965.

The attenuation of 10-mc/sec ultrasonic shear waves propagated in Nb-20% Ti and Nb-40% Ti alloys (nominal composition, weight percent) was measured in a parallel dc magnetic field up to 150 kG. The measurements were performed between 1.4 and 8 K. A dip in the attenuation was observed at high magnetic fields. The field at which this dip occurs was determined as a function of the temperature. At 1.5°K, this dip appears at 90 kG for Nb-20% Ti, and at 132 kG for Nb-40% Ti. These fields are close to those at which the onset of resistivity occurs in alloys of similar composition. The magnitude of the dip at 4.2°K is ~ 0.15 db/cm for Nb-20% Ti and ~ 0.25 db/cm for Nb-40% Ti. The dip in the absorption coefficient in shape from the absorption edge that was found at the upper critical field of Nb-25% Zr.

ULTRASONIC PROPAGATION NEAR THE CRITICAL POINT IN HELIUM, by C. E. Chase and R. C. Williamson. [1965] [4]p. incl. diagrs. refs. (Sponsored jointly by Advanced Research Projects Agency; and Air Force Office of Scientific Research under [AF 49(638)1468] Unclassified

Published in Proc. Ninth Internat'l Conf. on Low Temperature Physics, Columbus, Ohio (Aug. 31-Sept. 4, 1964), ed. by J. G. Daunt, D. O. Edwards and others. New York, Plenum Press, v. LT9(Pt. A): 657-660, 1965.

A logarithmic singularity in the specific heat at constant volume at the critical point has been reported to occur in argon (Bagatskii, M. I., Voronel, A. V., and Gusak, V. G., Soviet Phys., v. 16: 517, 1963) and oxygen (Voronel, A. V., Chaskin, Y. R. and others, Soviet Phys., v. 18: 598, 1964). Such a result is in direct contradiction to standard theory, according to which constant volume must remain finite at the critical point. It can readily be shown that these results imply the existence of a corresponding singularity in the adiabatic compressibility, accompanied by a zero in the sound velocity and large absorption. Accordingly, a study was undertaken of the sound velocity at 1 mcps in the critical region of helium. Results on the ultrasonic velocity and absorption and on the adiabatic compressibility are consistent with the presence of a logarithmic singularity in the specific heat at constant volume.

ANISOTROPY OF THE DE HAAS-VAN ALPHEN EFFECT IN PYROLYTIC GRAPHITE (Abstract), by S. J. Williamson, S. Foner, and M. S. Dresselhaus. [1965] [1]p. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [AF 49(638)1468], Unclassified

Presented at meeting of the Amer. Phys. Soc., New York, Jan. 27-30, 1965.

Published in Bull. Amer. Phys. Soc., Series II, v. 10: 109-110, Jan. 27, 1965.

Measurements of de Haas-van Alphen frequencies have been made as a function of the angle θ between the

applied field B_0 and the c axis in pyrolytic graphite. The audiofrequency field-modulation technique with synchronous detection at the fundamental and higher harmonics was used to monitor the differential susceptibility at temperatures between 4.2° and 1.2°K. Majority-carrier oscillations were observed for θ as large as 80°, and the results are qualitatively the same as obtained by Shubnikov-de Haas measurements on natural single-crystal graphite by Soule, McClure, and Smith. However, despite close agreement for $\theta = 0$, quantitative differences are evident for larger values of θ. The anisotropy also yields information about interlayer order.

Also published in Electroencephalog. and Clin. Neurophysiol. Jour., v. 18: 192-195, Feb. 1965.

Measurements from clusters of nerve cells provide clues to the functional relationships of cells in the central nervous system. Action potentials from individual cells are distinguished from each other by waveform, of which there are several clearly defined groups. A description is given for a method by which action potentials recorded simultaneously can be sorted in a moderate-size computer in real-time and on-line.

PENETRATION OF AN ION THROUGH A MONOLAYER OF SIMILAR IONS ADSORBED ON A METAL, by J. W. Gadzuk and E. N. Carabateas. [1965] [4]p. incl. diagrs. refs. (AFOSR-65-0905) (Sponsored jointly by Air Force Aeronautical Systems Division, Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)) AD 613113 Unclassified

Also published in Jour. Appl. Phys., v. 36 357-360, Feb. 1965.

A fractional monolayer film of ions is formed by the adsorption of a gas onto a metal substrate. These ions form a discrete dipole layer, the potential across it being the change in electron work function of the surface. As additional ions are brought to the surface, they penetrate only a fraction f of the potential across the dipole layer. In this work the penetration coefficient f valid for the entire range of coverages is derived for 2 limiting types of films, immobile and mobile. By considering thermal effects, a penetration coefficient for partially mobile films is also derived. The values obtained for the penetration coefficient are applicable to any substrate-adsorbate system The theoretical expressions for the penetration coefficient are evaluated for cesium on tungsten and compared with the data of Taylor and Langmuir. INTERPRETATION OF THE ANOMALOUS SURFACE REFLECTION OF X-RAYS, by B. E. Warren and J. S. Clarke. [1965] [2]p. incl. diagrs. (AFOSR-65-0906) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)) AD 613112 Unclassified

Also published in Jour. Appl. Phys., v. 36: 324-325, Jan. 1965.

When an x-ray beam falls upon a polished surface at an angle greater than the critical angle θ_c, there is besides the normal reflected beam an abnormal beam at a smaller angle with the surface. The abnormal beam makes an angle with the surface which is close to the critical angle θ_c. It is proposed that this abnormal beam is caused by scattering of the primary beam at close distances to the surface. The scattered radiation will be strongly reflected if its angle of incidence is slightly less than θ_c. This proposal is analyzed, and the identification of the scatterer is partially discussed

NEGATIVE-ENERGY PLASMA WAVES AND INSTABILITIES AT CYCLOTRON HARMONICS, by A. Bers and S. Gruber. [1965] [2]p. incl diagrs. refs. (AFOSR-65-1144) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), and National Science Foundation) Unclassified

Also published in Appl. Phys. Ltrs., v. 6: 27-28, Jan. 15, 1965.

Electrostatic plasma waves are studied which are associated with an unperturbed particle distribution function of the form, $f_0(v) = \delta(v_\perp - v_{0\perp})\delta(v_\parallel - v_{0\parallel})/2\pi v_{0\perp}$. An important characteristic of these negative waves is that they exist for small densities ($\omega_p \ll \omega_c$). Hence a plasma which contains even a small fraction of its particles in the form above may exhibit instabilities at cyclotron harmonics. The dispersion plots for stable waves with the above form are given. It is determined

which of these are negative energy waves and then shown that these lead to instabilities in the presence of a dispersive medium.

Unclassified

The exact expression for the quantization error as a function of the parameters defining the quantizer, the error-weighting function, and the amplitude probability density of the quantizer-input signal is presented. An algorithm is developed that permits the determination of the specific values of the quantizer parameters that define the optimum quantizer. This algorithm is then extended so that optimum quantizers can be determined for the case in which the quantizer-input signal is a message signal contaminated by noise. In each of these cases the algorithm is based on a modified form of dynamic programming and is valid for both convex and nonconvex error-weighting functions. Examples of optimum quantizers designed with the first of these 2 algorithms for a representative speech sample are presented. The performance of these optimum quantizers is compared with that of the uniform quantizers.

Hyperfine-structure measurements by optical detection of Zeeman-level crossings in the $6s6p\,^3P_1$ state were made with natural-linewidth precision in 3 radioactive isotopes of mercury. The magnetic dipole (A) and electric quadrupole (B) interaction constants in mc/sec implied by these measurements are: Hg^{195} (9.5-h half-life) $A(^3P_1) = 15813.46 \pm 0.23$, Hg^{195*} (isomer, 40 h) $A(^3P_1)$ -2368.04 ± 0.08, $B(^3P_1)$ -782.45 ± 0.86, Hg^{193*} (isomer, 11 h) $A(^3P_1) = -2399.69 \pm 0.06$, $B(^3P_1)$ 724.8 ± 90.0. The g_J factor for the $^3P_1$ state of Hg^{199} is obtained from a new level-crossing measurement. The value, including second-order Zeeman and Zeeman-hyperfine corrections, is $g_J' = 1.486118 \pm 0.000016$. The Bohr-Weisskopf hfs anomaly is also found and calculated to be $^{195}\Delta^{199}(^3P_1) = 0.1476$ (76%). The contribution to the anomaly from the $S_{1/2}$ electron is extracted and used to estimate admixture coefficients in the single-particle model of the nucleus with configuration mixing.

SUPERPOSITION IN A CLASS OF NONLINEAR SYSTEMS, by A. V. Oppenheim. Mar. 31, 1965, 62p. incl. diagrs. refs. (Technical rept. no. 432) (AFOSR-65-1147) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 614483
Unclassified

Many nonlinear systems can be interpreted as linear transformations between vector spaces under appropriate definitions for the vector operations on the inputs and outputs. The class of systems which can be represented in this way, is discussed here. This class, referred to as the class of homomorphic systems, is shown to include all invertible systems. Necessary and sufficient conditions on a noninvertible system such that it is a homomorphic system, are derived. A canonic representation of homomorphic systems is presented. This representation consists of a cascade of 3 systems, the first and last of which are determined only by the vector space of inputs and the vector space of outputs, respectively. The second system in the canonic representation is a linear system. Necessary and sufficient conditions are presented under which all of the memory in the system can be concentrated in the linear portion of the canonic representation. A means for classifying homomorphic systems, suggested by the canonic representation, is discussed. This means of classification offers the advantage that systems within a class differ only in the linear portion of the canonic representation. Applications of the theory are considered for a class of nonlinear feedback systems. (Contractor's abstract)

NONEQUILIBRIUM ELECTRIC CONDUCTIVITY OF TWO-PHASE METAL VAPORS, by A. W. Rowe and J. L. Kerrebrock. 1965 [2]p. incl. diagrs. (AFOSR-65-1220) (Sponsored jointly by Aeronautical Systems Division, and Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)) AD 616162
Unclassified

Also published in AIAA Jour., v. 3: 361-362, 1965.

Rankine cycle nuclear-electric power systems, using alkali metal working fluids and MHD generators in place of turbines, show promise of producing considerably high power per unit of system mass. Attainment of adequate electric conductivity in the alkali metals at temperatures accessible to reactors is a major problem. An approximate theory of wet nonequilibrium gas has been developed: This theory was tested by comparison with experiments conducted in a high-temperature potassium loop. It is concluded that: (1) nonequilibrium ionization is difficult to attain in alkali metal MHD generators with wet vapor unless droplet growth is stimulated; (2) electrical techniques may be useful for study of droplet nucleation and growth, and (3) the successful operation of the high-temperature loop is an indication that alkali-metal systems might be operable at higher temperatures than are now proposed.

ANTIFERROMAGNETIC RESONANCE LINEWIDTH IN MnF_2 NEAR THE TRANSITION TEMPERATURE, by J. C. Burgiel and M. W. P. Strandberg. [1965] [11]p. incl. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E)) AD 616092 Unclassified

Also published in Jour. Phys. and Chem. Solids, v. 26: 865-875, 1965.

The antiferromagnetic resonance (AFMR) linewidth of MnF_2 is studied near the Néel temperature. In the presence of an applied magnetic field, the linewidth diverges approximately as $|T - T_N|^{-5/6}$. In the absence of an applied field, the line-width is larger and diverges approximately $|T - T_N|^{-4/3}$. The linewidth is independent of the direction of the magnetic field and is the same for both branches of the AFMR spectrum. Though qualitative attempts to explain the temperature dependence both in the presence and absence of an applied magnetic field are made, a detailed theoretical explanation is still lacking. Above T_N, the electron paramagnetic resonance (EPR) in MnF_2 is observed. For H parallel to c at temperatures near T_N, the linewidth increases approximately as $|T - T_N|^{-3/8}$. A smaller increase occurs for H perpendicular to c.

PLASMA ROTATION IN A HOLLOW CATHODE DISCHARGE, by D. L. Morse. [1965] [6]p. incl. illus. diagrs. refs. (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), and National Science Foundation) Unclassified

Also published in Phys. Fluids, v. 8: 516-521, Mar. 1965.

Langmuir probe measurements of the external plasma generated by a hollow-catnode discharge, operated in argon, indicate the presence of a flutelike density perturbation, or wave of plasma, rotating with a left-handed sense about the magnetic field. The velocity of rotation is found to be closely related to the Hall drift speed of particles in the measured outward radial electric and axial magnetic fields. Azimuthal electric fields are found whose net effect is to increase the outward radial transport of plasma across the magnetic field. A discussion of this phenomenon in terms of a previously described theory is given.

THOMSON SCATTERING COMPUTATIONS FOR LABORATORY PLASMAS, by E. T. Gerry and R. M. Patrick. [1965] [3]p. incl. diagrs. (AFOSR-65-1466) (In cooperation with Avco Corp., Everett, Mass., under AF 49(638)1129) (Sponsored jointly by Air Force Office of Scientific Research, [Army Research Office (Durham)], and Office of Naval Research under DA 36-039-AMC-03200(E), Atomic Energy Commission and National Science Foundation) Unclassified

The Salpeter theory is applied to calculation of the Thomson scattering of a laser beam from typical laboratory plasmas. It is proposed to use this scattering as as means of determining the properties of plasma. The character of the scattered spectrum depends upon the ratio of the Debye length to the length in the plasma over which the scattered radiation adds coherently. The inverse of this ratio, α, depends only on the plasma temperature and the electron density.

CAUSATIVE FORMS IN JAPANESE, by S.-Y. Kuroda. [1965] [21]p. (AFOSR-65-1468) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under [DA 36-039-AMC-03200(E), National Institutes of Health, and National Science Foundation) Unclassified

Also published in Foundation of Language, Dordrecht (Netherlands), D. Reidel, v. 1: 30-50, 1965.

Clarification is made of some of the syntactic formalisms involved in causative formation by means of the morpheme sase, a causative auxiliary, which serves to derive causative sentences from simple ones. Six transformations are introduced and clarified in the grammar: intransitivization; ni- and o-causitivizations; recurring-object deletion; o-adjustment; and implicit understanding. A conspicuous result of this study is that what is revealed in English as a generative-grammatical feature, namely the category of pseudo-intransitive verbs, in a sense, also reflects itself as a generative-grammatical feature in Japanese, although on the whole it seems of a very different structure. This supports the view that generative-grammatical features might also be, not arbitrary features possessed by particular languages by chance, but well-rooted in the essential structure of human behavior.

ASPECTS OF THE THEORY OF SYNTAX, by N. Chomsky. Cambridge, Massachusetts Inst. of Tech. Press, 1965, 251p. incl. diagrs. refs. (Special technical rept. no. 11) (AFOSR-65-1570) (Sponsored jointly by Air Force Electronic Systems Division; Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 616323 Unclassified

Generative grammar is a finite set of rules which enumerate an infinitely large number of grammatical sentences in a language. It is an approach to linguistic theory and to the structure of particular languages. The development of generative grammar is reviewed and a reformulation of its theory is proposed. Emphasis is placed on syntax. Semantic and phonological aspects are considered only when they apply to syntax. Background of the theory is discussed, essential points are summarized and clarified, defects in earlier versions of the theory are considered, and residual problems are raised and discussed briefly.

THE EVOKED VOCAL RESPONSE OF THE BULLFROG: A STUDY OF COMMUNICATION BY SOUND, by R. R. Capranica. Cambridge, Massachusetts Inst. of Tech. Press. [1965] [110]p. incl. illus. diagrs. tables, refs. (Special technical rept. no. 12; Research monograph no. 33) (AFOSR-65-2224) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 623315 Unclassified

The research attempts to bridge the existing gap between the naturalistic observations of sound communication in anurans and the anatomical and physiological findings in their auditory nervous system. The motivation for this research concerns the author's interest in the neural representation of complex meaningful sounds - stimuli for which the nervous system is presumably designed to process. Such a representation, although suggested by electrophysiological recordings of patterns of activity in various neural centers, requires a behavioral confirmation that these, in fact, are the principles by which information is processed within the intact animal. To this end, vocal behavior has been evoked from the males of laboratory colonies of bullfrogs (Rana catabeiana) in response to a restricted class of natural and synthetic sounds. The evoked vocal responses, having the signal characteristics of the bullfrog's mating call, were highly selective. To playbacks of the mating calls of 34 different species of frogs and toads, only the mating calls of certain male bullfrogs would evoke calling from the laboratory animals. By employing a standardized experimental technique, quantitative measures of evoked calling have been obtained for a large number of synthesized bullfrog mating calls.

Unclassified

Also published in Nature, v. 206: 97-99, Apr. 3, 1965.

An investigation of the response of cells in the dorsolateral tract of the cat to C fibers was carried out. The fundamentally different effects of A and C stimulation on the dorsolateral column (DLC) cells are emphasized. The A fibers, after a short intense burst, turn the cell off, which is probably the result of the negative feedback exerted by the A's on themselves as seen by the negative dorsal root potential. The C fibers, on the other hand, turn the postsynaptic cell on after the repetitive discharge, which may be the effect of the positive feedback of the C's on the A's as seen by the positive dorsal root potential. It is evident from these results that both A and C fibers converge on many of the dorsal horn cutaneous cells. Furthermore, the C fibers produce a disproportionately large delayed discharge. There are prolonged inhibitory and excitatory effects after the arrival of mixed volleys. Therefore, the overall pattern will depend on the balance between the numbers of myelinated and unmyelinated fibers carrying the afferent volley.

The force density in polarizable and magnetizable fluids in nonuniform motion is evaluated in a way that is consistent with the special theory of relativity. The derivation is based on a generalization of the principle of virtual work. For application of the principle, it is necessary to know the energy density and power-flow density in a local rest frame of the fluid element under consideration. These are obtained from thermodynamic information and an extrapolation of the Poynting theorem applied to a rigid, nondeforming medium. Two different formulations of electrodynamics of moving and deforming media are compared. It is shown that they lead to the same force density if the same thermodynamic information is used in each of them. A simple model for the force density is obtained, starting from the E-H formulation.

The history of both physics and mathematics shows that the only escape from an antiquated metaphysic is into the metaphysic subsumed by the systematic context of the symbols requisite to convey experience in its achieved distinction. In the so-called mental sciences, the necessity of this process becomes obtrusive. Chapter one of this paper is the description of it as obvious in psychology; chapter two, of its subtle appearance culminating in explicit formulation in physics. These chapters are intended to provide the systematic context for the symbols Mind and Matter. The notions intended are conjugate abstrate analyzing all entities concrete in experience. They are such that, on account of the giveness of fact, neither can be supposed without the other. Chapter three relates these notions so as to formulate, symbolically, 'Minding' and 'Mattering' as exhibited in the development of propositionalizing issuing in the logical structure of mind. This thesis of von Domarus which sets forth the notions needed for an understanding of psychology, psychiatry, and finite automata has been translated into English by McCulloch, who has added a 3 page introduction to it entitled AEKTON.

THERMAL AND CHEMICAL ASPECTS OF THE THERMONUCLEAR BLANKET PROBLEM, by W. G. Homeyer. July 29, 1965, 114p. incl. diagrs. tables, refs. (Technical rept. no. 435) (AFOSR-65-2278) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), and National Science Foundation) AD 619669 Unclassified

A theoretical study was made of the blanket that must surround a thermonuclear plasma to provide energy conversion and removal, neutron and γ-ray shielding, and regeneration of the tritium burned in the D-T reaction. Power distributions and heat transfer were calculated and materials problems analyzed for blanket assemblies that A. J. Impink, Jr. has shown are capable of tritium regeneration. The blanket arrangement chosen as a model consisted of a molybdenum vacuum wall in the form of a long cylindrical shell, cooled by fused Li_2BeF_4 and surrounded by an annulus, 55 cm thick, consisting of fused Li_2BeF_4 and graphite to channel the flow of coolant. Nuclear heating was calculated on a digital computer for neutron flux distributions calculated by Impink. In vacuum walls of 1, 2, and 3 cm of molybdenum, 16, 25, and 31%, respectively, of the D-T neutron energy are absorbed. The total heat liberated in the inner blanket is 17.5 mev per fusion. The absorption of secondary γ rays accounts for half of the total heating and almost all of the heating of the vacuum

wall. Heat transfer and thermal stress limit the thermonuclear power to 400-500 w/sq cm of neutron energy incident on the molybdenum first wall, which is 2 cm thick. A total blanket thickness of approximately 120 cm will reduce the power loss caused by nuclear heating in the magnet of 2% of the total power. (Contractor's abstract, modified)

FUSION REACTOR BLANKET EXPERIMENT, by P. S. Spangler. July 13, 1965, 173p. incl. illus. diagrs. tables, refs. (Technical rept. no. 437) (AFOSR-65-2279) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E 03200(E), and National Science Foundation) AD 619671 Unclassified

The behavior of 1-14 mev neutrons was measured in cylinders, 46 cm in diameter and 38 cm thick, to evaluate previous theoretical calculations on neutron economy and tritium production in proposed fusion reactor blankets. The cylinders were constructed from 0.5-in. graphite slabs and 1-in. layers of solid lithium-beryllium fluoride salt encased in aluminum pans. The neutron spectrum was measured with a series of threshold detectors: U-238 (n,f), P-31 (n,p), Fe-56 (n,p), I-127 (n,2n), and F-19 (n, 2n). The spectra in the graphite assemblies are characterized by a sharp peak near 14 mev, with a smaller, broader peak at 3 mev. Farther from the source, the 14-mev peak is attenuated more than the 3-mev peak. Adding 3-cm Mo to the base of the assembly shifts the 3-mev peak to lower energies and increases its size at the expense of the 14 mev peak, because of the Mo-92 (n, 2n) reaction. Addition of the lithium-beryllium fluoride has no effect, because of the similarity in the scattering properties of the salt and the graphite. The removal of neutrons through the Li-6 (n,t) reaction was not observed, because of the small size of the assembly and the low (1-3% isotopic content of Li-6 in the salt. Preliminary measurements indicate the feasibility of directly measuring the tritium produced in the assemblies by the Li-6 (n,t) and Li-7 (n,tn) reactions. (Contractor's abstract)

STUDY OF A THERMONUCLEAR REACTOR BLANKET WITH FISSILE NUCLIDES, by L. N. Lontai. July 6, 1965, 101p. incl. diagrs. tables, refs. (Technical rept. no. 436) (AFOSR-65-2280) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), and National Science Foundation) AD 619670 Unclassified

The use of fissile nuclides in a fusion power reactor heat-extraction blanket is investigated from the point of view of tritium regeneration and power production. The existence of a stable, steady-state D-T plasma in a cylindrical configuration is postulated. Nuclear reaction rates are analyzed with the aid of theoretical methods and multigroup, multiregion computer codes developed by A. J. Impink, Jr. Codes developed by W. G. Homeyer have been used to calculate nuclear heating rates. Optimization studies of several blanket configurations show that a blanket with a thin Mo first wall, a narrow, fused $(LiF)_2BeF_2$ first-wall coolant region, and ~50 cm 21%C and 79% fused (LiF-BeF_2-UF_4) primary attenuator region with 17 to 27 mole per cent $(U^{238})F_4$ and ~50% Li^6 enrichment is feasible and practical. The calculated tritium regeneration is adequate. The total heat recovery is approximately twice that in a nonfissile blanket; approximately 90% of the heat is liberated in the primary attenuator region. The heating rate in the first wall and in the coolant region is independent of the UF_4 salt composition. The thermonuclear power limit is ~5 mw/m^2 of neutron energy incident on the first wall. The performance of blankets with a UF_4 fused-salt coolant region has been found to be marginal; fissioning metallic first-wall configurations are not feasible. (Contractor's abstract)

GAMMA-RAY SPECTRA IN FUSION BLANKET MOCK-UPS, by L. M. Petrie Jr. July 20, 1965, 106p. incl. illus. diagrs. tables, refs. (Technical rept. no. 438) (AFOSR-65-2281) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), and National Science Foundation) AD 619672 Unclassified

Gamma-ray spectra have been measured in cylinders, 18 in. in diameter and 15-16 in. thick, to evaluate previous theoretical calculations of gamma-ray spectra in proposed fusion reactor blankets. The cylinders were constructed of 0.5 in. graphite slabs and 1-in. thick layers of lithium-beryllium fluoride salt mixture contained in aluminum pans. Molybdenum plates were used to approximate first walls, 0-1.25 in. thick. The cylinders were irradiated by 14-mev neutrons produced by bombarding a tritium target with a beam of deuterons from a 150-kv Cockroft-Walton accelrator. The target was positioned on the center line of the cylinder, 5.25 in. from its base. The γ-ray spectra were measured by collimating a beam of γ rays leaking out of the side of the blanket mock-up and by using a sodium iodide scintillation crystal as a detector. The γ-ray spectra from the graphite assemblies are characterized by a large peak at 4.43, a smaller peak at 6.87, and a still smaller peak at 4.95 mev. The spectra in the salt assemblies are characterized by large peaks at 6.63 and 5.13 mev, and several smaller peaks. The relative magnitude of these peaks at different depths in the assemblies are in agreement with previous theoretical calculations. Varying the thickness of the first wall had no observable effect on the spectrum. The absolute

magnitude of the measured spectrum differs from previous theoretical calculations by a factor of approximately 4. (Contractor's abstract)

NEUTRON ECONOMY IN FUSION REACTOR BLANKET ASSEMBLIES, by A. J. Impink, Jr. June 22, 1965, 257p. incl. diagrs. tables, refs. (Technical rept. no. 434) (AFOSR-65-2282) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), and National Science Foundation) AD 619668 Unclassified

The conceptual design of a blanket assembly for a hypothesized fusion power reactor is considered from the point of view of neutron economy. Requirements and limitations imposed on the blanket by the plasma and by other components of the reactor system are analyzed, and the conceptual arrangement of a suitable blanket utilizing a refractory metal first wall and fused-salt cooling is presented. Neutron transport and scattering models are compared in terms of applicability to the present problem. Multigroup, multiregion formulations for neutron transport and scattering in various energy regimes are developed; solutions are obtained by a combination of analytical and numerical methods. A multigroup treatment of resonance absorption and scattering is outlined, and a method of calculating approximate absorption cross sections in the resonance energy region is derived. Comparison of theoretical predictions with published experimental measurements in several test cases has been made to determine the adequacy of the models and computational procedures. Calculated tritium breeding ratios and neutron-induced reaction rates in a variety of permutations on the basic blanket configuration are summarized and compared. It is shown that the proposed blanket design is adequate from the point of view of neutron economy.

THE COMPUTATION PROBLEM WITH SEQUENTIAL DECODING, by J. E. Savage. Feb. 16, 1965, 77p. incl. diagrs. refs. (Technical rept. no. 439; Lincoln Lab. technical rept. no. 371) (AFOSR-65-2296) (In cooperation with Massachusetts Inst. of Tech., Lincoln Lab., Cambridge) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 621713 Unclassified

Fano Sequential Decoding is a technique for communicating at a high information rate and with a high reliability over a large class of channels. However, equipment cost and variation in the time required to decode successive transmitted digits limit its use. The work is concerned with the latter limitation. Others have shown that the average processing time per decoded digit is small if the information rate of the source is less than a rate R_{comp}. This report studies the probability distribution of the processing time random variable and applies the results to the buffer overflow probability, i. e., the probability that the decoding delay forces incoming data to fill and overflow a finite buffer. It is shown that the overflow probability is relatively insensitive to the buffer storage capacity and to the computational speed of the decoder, but quite sensitive to information rate. In particular, halving the source rate more than squares the overflow probability. These sensitivities are found to be basic Sequential Decoding and arise because the computation per decoded digit is large during an interval of high channel noise and grows exponentially with the length of such an interval. A conjecture is presented concerning the exact behavior of the overflow probability with information rate. This conjecture agrees well with the (limited) experimental evidence available. A SIMPLE DERIVATION OF THE CODING THEOREM AND SOME APPLICATIONS, by R. G. Gallager. 1965 [16]p. incl. refs. (AFOSR-65-2401) (Sponsored jointly by Air Force Office of Scientific Research, Army Research Office (Durham), and Office of Naval Research under DA 36-039-AMC-03200(E), National Aeronautics and Space Administration, National Institutes of Health, and National Science Foundation) AD 621832 Unclassified

Also published in IEEE Trans. Inform. Theory, v. IT-11: 3-18, Jan. 1965.

Upper bounds are derived on the probability of error that can be achieved by using block codes on general time-discrete memoryless channels. Both amplitude-discrete and amplitude-continuous channels are treated, both with and without input constraints. The major advantages of the present approach are the simplicity of the derivations and the relative simplicity of the results, on the other hand, the exponential behavior of the bounds with block length is the best known for all transmission rates between zero and capacity. The results are applied to a number of special channels, including the binary symmetric channel and the additive Gaussian noise channel.

A problem in the practical application of the Volterra series to non-linear theory is the synthesis of systems with a given set of Volterra kernels. A method is described for determining whether a given Volterra kernel can be synthesized exactly by using only a finite number of multipliers. A method for the synthesis of such kernels is also presented. The use of the techniques discussed here is illustrated by examples. (Contractor's abstract)
