Preface

The designs presented in this publication are for experiments with some factors at two levels and other factors at three levels. The designs are constructed so that the grand mean, all main effects, and all two-factor interaction effects can be estimated without aliasing among them. It is assumed that all higher-order interaction effects are negligible, and their absence makes it possible to estimate the error variance.

These designs were developed in the Statistical Engineering Laboratory of the National Bureau of Standards under a program sponsored by the Bureau of Ships, Department of the Navy. Revision of the introductory material and of the analysis for six designs was carried out at The Research Triangle Institute under the sponsorship of the Office of Ordnance Research. The work was performed under the direction of W. S. Connor. Professor R. C. Bose served as consultant and contributed to the development of related theory. Shirley Young performed most of the work of constructing the designs and working out the corresponding estimates. Carroll Dannemiller devised an electronic computer program which was used to check the normal equations. A program previously developed by R. C. Burton was used to generate treatment combinations from 3^n factorials. Also, R. C. Burton participated in certain aspects of construction during the summer of 1958. Lola S. Deming supervised the preparation of the manuscript in final form.

OCTOBER 1960.

Fractional Factorial Designs for Experiments With Factors at Two and Three Levels

W. S. Connor and Shirley Young

1. Introduction

This catalog is the sequel to [1]¹ and [2]. It contains fractional factorial designs for use in experiments which investigate m factors at two levels and n factors at three levels. The grand mean μ , all main effects, and all two-factor interaction effects are estimated. All higher order interactions are assumed negligible and their absence allows estimation of the error variance. A design has been constructed for each of the 39 pairs (m,n) included from $m+n=5$ through $m+n=10$, $(m,n \neq 0)$. The design for (m,n) is designated DESIGN 2^m3^n .

It is believed that the method of construction described in section 2 is new. Morrison [3] published several designs which can be constructed by the present method, and his paper was an inspiration to the authors in formulating their method. The objective in forming these fractions was to keep the number of required treatment combinations small while retaining as much orthogonality among the estimates as possible. The designs are neither unique nor exhaustive, and there may be attractive alternative ways of fractionating the 2^m3^n complete factorials.

Section 3 contains a description of the mathematical model, in which it is assumed that all interactions between three or more factors are nonexistent, and of how to estimate the parameters contained in the model. Section 4 contains a discussion of how to test hypotheses and construct confidence intervals. A worked example is presented in section 5.

Section 6 is devoted to six designs, viz, 2^33^3 , 2^53^3 , 2^63^3 , 2^53^4 , 2^33^5 , and 2^53^5 , for which the interaction effects between factors at three levels are defined in a special way.

2. Construction of Designs

The designs are constructed by associating fractions S_1, S_2, \dots, S_t from the 2^m complete factorial with fractions S'_1, S'_2, \dots, S'_t from the 3^n complete factorial. The fractions S_i and S'_i ($i=1,2, \dots, t$) are obtained by conventional methods which have been described, for example, in [4,5]. Fractions are selected so that low order interaction effects, including main effects, are aliased with each other as little as possible. The association is such that every treatment combination in S_i is adjoined to every treatment combination in S'_i , thus forming treatment combinations from the 2^m3^n complete factorial. The resulting fraction from the 2^m3^n complete factorial may be denoted by

$$(2.1) \quad S_1S'_1 \quad S_2S'_2 \quad \dots \quad S_tS'_t$$

To illustrate, consider the 2^33^3 complete factorial, which contains 72 treatment combinations. The three factors with two levels will be denoted by A_1, A_2 , and A_3 , and the two factors with three levels by B_1 and B_2 . One way of fractionating the 2^33^3 complete factorial into two distinct sets S_1 and S_2 is by finding the treatment combinations $(x_1x_2x_3)$, $(x_j=0,1; j=1,2,3)$ having x 's which satisfy

$$(2.2) \quad x_1+x_2+x_3=0 \text{ and } x_1+x_2+x_3=1 \pmod{2},$$

respectively. These sets are as follows:

¹ Figures in brackets indicate the literature references on page 14.

	0	1	1	0	0	1

One way of fractionating the 3^2 complete factorial into three distinct sets S'_1 , S'_2 , and S'_3 is by finding the treatment combinations $(z_1 z_2)$, $(z_k=0,1,2; k=1,2)$, having z 's which satisfy

(2.4) $z_1+z_2=0, z_1+z_2=1, z_1+z_2=2 \pmod{3}$,

respectively. These sets are as follows:

DESIGN $2^3 3^2$ appearing on page 20 of this catalog is a fractional design from the $2^3 3^2$ complete factorial consisting of the following treatment combinations:

Treatment Combinations in the Fraction from the $2^3 3^2$

	A ₁	A ₂	A ₃	B ₁	B ₂	Response	A ₁	A ₂	A ₃	B ₁	B ₂	Response	A ₁	A ₂	A ₃	B ₁	B ₂	Response
	0	0	0	0	0	(85.9)	0	0	1	0	1	(88.9)	0	0	1	0	2	(139.0)
	0	1	1	0	0	(99.3)	0	1	0	0	1	(78.4)	0	1	0	0	2	(153.8)
	1	0	1	0	0	(119.8)	1	0	0	0	1	(42.0)	1	0	0	0	2	(180.0)
	1	1	0	0	0	(115.5)	1	1	1	0	1	(142.0)	1	1	1	0	2	(172.4)
	0	0	0	1	2	(118.3)	0	0	1	1	0	(94.9)	0	0	1	2	0	(184.0)
(2.6)	0	1	1	1	2	(115.4)	0	1	0	1	0	(110.4)	0	1	0	2	0	(93.0)
	1	0	1	1	2	(184.9)	1	0	0	1	0	(92.8)	1	0	0	2	0	(96.9)
	1	1	0	1	2	(161.7)	1	1	1	1	0	(167.2)	1	1	1	2	0	(172.7)
	0	0	0	2	1	(127.6)	0	0	1	2	2	(153.9)	0	0	1	1	1	(125.7)
	0	1	1	2	1	(166.8)	0	1	0	2	2	(184.3)	0	1	0	1	1	(102.7)
	1	0	1	2	1	(158.6)	1	0	0	2	2	(114.3)	1	0	0	1	1	(131.2)
	1	1	0	2	1	(138.6)	1	1	1	2	2	(199.9)	1	1	1	1	1	(223.7)

These treatment combinations may be denoted concisely by

$$(2.7) \quad S_1 S'_1 \quad S_2 S'_2 \quad S_3 S'_3$$

The numbers in parentheses under the column headed "Response" are data that will be used subsequently for a numerical illustration.

This fractional factorial design involves 36 treatment combinations and is a one-half fraction of the complete factorial. In DESIGN $2^3 3^2$, the expression (2.7) is called the "Experimental Plan," and indicates how the sets S_i and S'_i , which are given under "Construction," are to be associated to form the treatment combinations (2.6).

This form is followed for all of the designs in the catalog, except that the actual formation of the treatment combinations as shown in the Experimental Plan is left to the reader.

3. Estimation of Effects

The response to the treatment combination $(x_1 x_2 \dots x_m z_1 z_2 \dots z_n)$ will be denoted by $Y^*(x_1 x_2 \dots x_m z_1 z_2 \dots z_n)$, which is a random variable with expected value $\eta(x_1 x_2 \dots x_m z_1 z_2 \dots z_n)$ and variance σ^2 . It is assumed that the expected value of the response is expressible as a linear function of certain parameters which are the grand average, main effects, and two-factor interaction effects. It also is assumed that there are no higher order interaction effects.

In the linear function corresponding to a treatment combination, the coefficient of the grand average μ is 1, but the coefficients of the other parameters depend on the treatment combination. If the factor A is at level 0, then the coefficient of the main effect of A, also denoted by A, is -1 ; but if at level 1, then the coefficient is 1. The coefficient of the interaction parameter $A_j A_{j'}$ is the product of the coefficients of the component main effects A_j and $A_{j'}$ as is shown in the following table:

Coefficients of Pure A Effects

Factor levels		Coefficients		
		Main effects		Interaction
A_j	$A_{j'}$	A_j	$A_{j'}$	$A_j A_{j'}$
0	0	-1	-1	1
1	0	1	-1	-1
0	1	-1	1	-1
1	1	1	1	1

(3.1)

For a B factor there are two parameters which correspond to the main effect, viz, the linear effect B and the quadratic effect B^2 . The terms "linear" and "quadratic" apply literally only to equally spaced levels but are formally useful in other cases too. For the levels 0, 1, and 2, the coefficients of B are -1 , 0, and 1, respectively, and the coefficients of B^2 are 1, -2 , and 1, respectively:

For two factors $B_k B_{k'}$, there are four interaction parameters, viz, $B_k B_{k'}$, $B_k B_{k'}^2$, $B_k^2 B_{k'}$, and $B_k^2 B_{k'}^2$. The coefficients of these parameters are the products of the coefficients of the component main effects, as follows:

Coefficients of Pure B Effects

Factor levels		Coefficients							
		Main effects				Interactions			
B_k	$B_{k'}$	B_k	$B_{k'}$	B_k^2	$B_{k'}^2$	$B_k B_{k'}$	$B_k B_{k'}^2$	$B_k^2 B_{k'}$	$B_k^2 B_{k'}^2$
0	0	-1	-1	1	1	1	-1	-1	1
1	0	0	-1	-2	1	0	0	2	-2
2	0	1	-1	1	1	-1	1	-1	1
0	1	-1	0	1	-2	0	2	0	-2
1	1	0	0	-2	-2	0	0	0	4
2	1	1	0	1	-2	0	-2	0	-2
0	2	-1	1	1	1	-1	-1	1	1
1	2	0	1	-2	1	0	0	-2	-2
2	2	1	1	1	1	1	1	1	1

(3.2) For six of the designs, viz, $2^3 3^3$, $2^5 3^3$, $2^6 3^3$, $2^5 3^4$, $2^3 3^5$, and $2^5 3^5$, the coefficients of the interaction effects will be defined in a different way. These definitions will be presented in section 6.

For two factors A and B, there are two interaction parameters, viz, AB and AB². The coefficients of these parameters, too, are the products of the component main effects, thus:

Coefficients of Mixed A, B Effects

Factor levels		Coefficients				
		Main effects			Interactions	
A	B	A	B	B ²	AB	AB ²
0	0	-1	-1	1	1	-1
1	0	1	-1	1	-1	1
0	1	-1	0	-2	0	2
1	1	1	0	-2	0	-2
0	2	-1	1	1	-1	-1
1	2	1	1	1	1	1

(3.3)

These rules will be illustrated for DESIGN 2³3², which is a one-half fraction of the 2³3² complete factorial. In (3.4) the expected responses, $\eta(x_1x_2x_3z_1z_2)$, for all 36 treatment combinations are expressed as linear functions of 27 parameters. The column vector τ contains the following elements in the order given:

$\mu, A_1, A_2, A_3, A_1A_2, A_1A_3,$
 $A_2A_3, B_1, B_1^2, B_2, B_2^2, B_1B_2,$
 $B_1B_2^2, B_1^2B_2, B_1^2B_2^2, A_1B_1, A_1B_1^2, A_1B_2,$
 $A_1B_2^2, A_2B_1, A_2B_1^2, A_2B_2, A_2B_2^2, A_3B_1,$
 $A_3B_1^2, A_3B_2, A_3B_2^2.$

Expected Responses of the Treatment Combinations in Design $2^3 3^2$ Expressed as Linear Functions of the Grand Average and Main and Interaction Effects

1 1 1 1 1	1 1 1 1 1 1 1 0 -2 0 -2 0 0 0 4 0 -2 0 -2 0 -2 0 -2 0 -2 0 -2 0 -2

The first equation is read as

$$\begin{aligned}
 \eta(00000) = & \mu - A_1 - A_2 - A_3 + A_1A_2 + A_1A_3 + A_2A_3 \\
 & - B_1 + B_1^2 - B_2 + B_2^2 + B_1B_2 - B_1B_2^2 - B_1^2B_2 + B_1^2B_2^2 \\
 (3.5) \quad & + A_1B_1 - A_1B_1^2 + A_1B_2 - A_1B_2^2 + A_2B_1 - A_2B_1^2 + A_2B_2 - A_2B_2^2 \\
 & + A_3B_1 - A_3B_1^2 + A_3B_2 - A_3B_2^2
 \end{aligned}$$

and the other equations are read similarly.

For the following discussion it is assumed that the responses $Y^*(x_1 \dots x_m z_1 \dots z_n)$ have variance σ^2 and are uncorrelated.

The normal equations are formed from the equations of expectation in the usual way. Let the column vector of expected responses be denoted by η , the matrix of coefficients by X , and the column vector of parameters by τ . Then the equations of expectation may be written concisely as

$$(3.6) \quad \eta = X\tau.$$

Letting y denote the column vector of observed responses, and $\hat{\tau}$ the column vector of estimates, the normal equations are

$$(3.7) \quad Y(\tau) = X'y = X'X\hat{\tau} = C\hat{\tau},$$

for $C = X'X$. The equations may be solved for $\hat{\tau}$ as follows:

$$(3.8) \quad \hat{\tau} = C^{-1}X'y$$

The designs in this catalogue have been constructed so that C is nonsingular and there are not many nonzero elements in C^{-1} . Indeed, for some of the designs C^{-1} is diagonal. Letting f denote the number of treatment combinations in the design, the elements in the principal diagonal can be calculated from (3.9), except when there is a nonzero element off the diagonal in the same row as the element under consideration. In that event special formulas are required. If all of the off-diagonal elements are zero, then the analysis is termed "Completely Orthogonal." The formulas for $B_k B_{k'}$, $B_k B_k^2$, $B_k^2 B_{k'}$, and $B_k^2 B_k^2$ do not apply to the six designs which are discussed in section 6.

Elements in the Main Diagonal of the Inverse Matrix
(except as explained above)

<u>Parameter</u>	<u>Element</u>
$A, A_j A_{j'}$	$1/f$
AB, B	$3/2f$
AB^2, B^2	$1/2f$
$B_k B_{k'}$	$9/4f$
$B_k B_k^2, B_k^2 B_{k'}$	$3/4f$
$B_k^2 B_k^2$	$1/4f$

For DESIGN $2^3 3^2$, appearing on page 20 there are 36 treatment combinations, so that these elements, excluding the first, are $1/24$, $1/72$, $1/16$, $1/48$, and $1/144$, respectively. To estimate the effects of $A_1, A_2, A_3, A_1A_2, A_1A_3, \text{ and } A_2A_3$ requires special formulas, which are given under the heading "Analysis." It is stated that "the matrix $\frac{1}{96} \begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix}$ is used to estimate $\begin{bmatrix} A_3 \\ A_1A_2 \end{bmatrix}, \begin{bmatrix} A_2 \\ A_1A_3 \end{bmatrix}, \begin{bmatrix} A_1 \\ A_2A_3 \end{bmatrix}$,"

by which is meant that the following matrix equations are formed:

$$(3.10) \quad \begin{aligned} \begin{bmatrix} \hat{A}_1 \\ \widehat{A_2 A_3} \end{bmatrix} &= \frac{1}{96} \begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix} \begin{bmatrix} Y(A_1) \\ Y(A_2 A_3) \end{bmatrix}, \\ \begin{bmatrix} \hat{A}_2 \\ \widehat{A_1 A_3} \end{bmatrix} &= \frac{1}{96} \begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix} \begin{bmatrix} Y(A_2) \\ Y(A_1 A_3) \end{bmatrix}, \\ \begin{bmatrix} \hat{A}_3 \\ \widehat{A_1 A_2} \end{bmatrix} &= \frac{1}{96} \begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix} \begin{bmatrix} Y(A_3) \\ Y(A_1 A_2) \end{bmatrix}. \end{aligned}$$

The values of the estimates are as given in (3.11).

Estimates of the Parameters

$$(3.11) \quad \begin{aligned} \hat{\mu} &= \frac{1}{36} Y(\mu) & \hat{B}_1 &= \frac{1}{24} Y(B_1) \\ \hat{A}_1 &= \frac{1}{96} [3Y(A_1) - Y(A_2 A_3)] & \hat{B}_1^2 &= \frac{1}{72} Y(B_1^2) \\ \hat{A}_2 &= \frac{1}{96} [3Y(A_2) - Y(A_1 A_3)] & \hat{B}_2 &= \frac{1}{24} Y(B_2) \\ \hat{A}_3 &= \frac{1}{96} [3Y(A_3) - Y(A_1 A_2)] & \hat{B}_2^2 &= \frac{1}{72} Y(B_2^2) \\ \widehat{A_1 A_2} &= \frac{1}{96} [-Y(A_3) + 3Y(A_1 A_2)] & \widehat{B_1 B_2} &= \frac{1}{16} Y(B_1 B_2) \\ \widehat{A_1 A_3} &= \frac{1}{96} [-Y(A_2) + 3Y(A_1 A_3)] & \widehat{B_1 B_2^2} &= \frac{1}{48} Y(B_1 B_2^2) \\ \widehat{A_2 A_3} &= \frac{1}{96} [-Y(A_1) + 3Y(A_2 A_3)] & \widehat{B_1^2 B_2} &= \frac{1}{48} Y(B_1^2 B_2) \\ & & \widehat{B_1^2 B_2^2} &= \frac{1}{144} Y(B_1^2 B_2^2) \\ \widehat{A_1 B_1} &= \frac{1}{24} Y(A_1 B_1) & \widehat{A_2 B_1} &= \frac{1}{24} Y(A_2 B_1) & \widehat{A_3 B_1} &= \frac{1}{24} Y(A_3 B_1) \\ \widehat{A_1 B_1^2} &= \frac{1}{72} Y(A_1 B_1^2) & \widehat{A_2 B_1^2} &= \frac{1}{72} Y(A_2 B_1^2) & \widehat{A_3 B_1^2} &= \frac{1}{72} Y(A_3 B_1^2) \\ \widehat{A_1 B_2} &= \frac{1}{24} Y(A_1 B_2) & \widehat{A_2 B_2} &= \frac{1}{24} Y(A_2 B_2) & \widehat{A_3 B_2} &= \frac{1}{24} Y(A_3 B_2) \\ \widehat{A_1 B_2^2} &= \frac{1}{72} Y(A_1 B_2^2) & \widehat{A_2 B_2^2} &= \frac{1}{72} Y(A_2 B_2^2) & \widehat{A_3 B_2^2} &= \frac{1}{72} Y(A_3 B_2^2) \end{aligned}$$

4. Tests of Significance and Confidence Intervals

In this section it is assumed that the responses $Y^*(x_1 \dots x_m z_1 \dots z_n)$ are normally and independently distributed, with expected values $\eta(x_1 \dots x_m z_1 \dots z_n)$ and common variance σ^2 . The estimates will, in general, tend to be normal even if the responses are not very normal. If all of the estimates for a design are least squares estimates, then the estimate s of σ is obtained according to the usual theory: the sum of squares for error, S_e , is the total sum of squares, S_t , minus the sum of squares for parameters, S_p . Then s is the square root of $S_e/(f-q)$, where f is the number of treatment combinations in the design and q is the number of parameters to be estimated. The expected value of s^2 is σ^2 . The quantity S_t is Σy^2 , where the summation runs over all observed responses; and the quantity S_p is $\Sigma \hat{\rho} Y(\rho)$, where the summation is over all parameters ρ in τ .

To test the null hypothesis H_0 that the parameter ρ is zero, $H_0: \rho=0$, against the alternative hypothesis $H_1: \rho \neq 0$, Student's t with $(f-q)$ degrees of freedom is used as follows:

$$(4.1) \quad t = \hat{\rho} / \sqrt{\hat{v}(\hat{\rho})}, \text{ with } (f-q) \text{ d.f.}$$

where $\hat{v}(\hat{\rho})$ is the estimated variance of $\hat{\rho}$. For a least squares estimate $\hat{\rho}$, the variance $V(\hat{\rho})$ is σ^2 times the appropriate element in the main diagonal of the inverse matrix, C^{-1} . For some estimates, this can be calculated from (3.9), and for others, read from the matrices which are presented under "Analysis." For example, in DESIGN 2³3² the variances of A_1, A_2, A_3, A_1A_2 , and A_1A_3 are $3/96 \sigma^2$ where $3/96$ is read from the matrices. The estimated variance $\hat{v}(\hat{\rho})$ is obtained from $V(\hat{\rho})$ by replacing σ^2 by s^2 . A two-sided confidence interval with confidence coefficient $1-\alpha$ for ρ is defined by the following limits:

$$(4.2) \quad \hat{\rho} \pm t_{1-\frac{\alpha}{2}} \sqrt{\hat{v}(\hat{\rho})}, \text{ where } t_{1-\frac{\alpha}{2}} \text{ has } (f-q) \text{ d.f.}$$

If this interval includes zero, then the hypothesis H_0 is accepted; otherwise H_0 is rejected. It should be noted that all values in the interval are consistent with the data.

It may be desired to carry out a test for several estimates simultaneously. For example, it may be desired to test that all two-factor interactions for the A factors are zero; or that the linear and quadratic effects for some factor B are zero. This can be done by an F-test.

5. An Example

Some data corresponding to DESIGN 2³3² are given in (2.6). They are taken from a publication by W. J. Youden [6]. Youden was concerned with comparing various methods of producing tomato plant seedlings prior to transplanting in the field. Comparison was made by planting in the field and then weighing the ripe produce. Thus, the observations were pounds of tomatoes.

Although Youden used five methods of production, we shall select only three: flats, fibre pots, and fibre pots soaked in one percent sodium nitrate solution. Other factors considered were different soil conditions, different sizes of pots, different varieties of tomato, and different locations on the field. The factors and their levels are recorded below:

Factors and Levels for a Tomato Experiment

<i>Factors</i>	<i>Levels</i>									
Soil condition, A_1	<table style="border: none;"> <tr> <td style="border: none;">{</td> <td style="border: none;">Field soil</td> <td style="border: none;">0</td> </tr> <tr> <td style="border: none;">}</td> <td style="border: none;">Plus fertilizer</td> <td style="border: none;">1</td> </tr> </table>	{	Field soil	0	}	Plus fertilizer	1			
{	Field soil	0								
}	Plus fertilizer	1								
Size of pot, A_2	<table style="border: none;"> <tr> <td style="border: none;">{</td> <td style="border: none;">Three-inch</td> <td style="border: none;">0</td> </tr> <tr> <td style="border: none;">}</td> <td style="border: none;">Four-inch</td> <td style="border: none;">1</td> </tr> </table>	{	Three-inch	0	}	Four-inch	1			
{	Three-inch	0								
}	Four-inch	1								
Variety of tomato, A_3	<table style="border: none;"> <tr> <td style="border: none;">{</td> <td style="border: none;">Bonny Best</td> <td style="border: none;">0</td> </tr> <tr> <td style="border: none;">}</td> <td style="border: none;">Marglobe</td> <td style="border: none;">1</td> </tr> </table>	{	Bonny Best	0	}	Marglobe	1			
{	Bonny Best	0								
}	Marglobe	1								
Method of production, B_1	<table style="border: none;"> <tr> <td style="border: none;">{</td> <td style="border: none;">Flat</td> <td style="border: none;">0</td> </tr> <tr> <td style="border: none;">}</td> <td style="border: none;">Fibre</td> <td style="border: none;">1</td> </tr> <tr> <td style="border: none;">}</td> <td style="border: none;">Fibre + NO₃</td> <td style="border: none;">2</td> </tr> </table>	{	Flat	0	}	Fibre	1	}	Fibre + NO ₃	2
{	Flat	0								
}	Fibre	1								
}	Fibre + NO ₃	2								
Location on field, B_2	0, 1, 2									

The object of the experiment was to evaluate the effects of these factors on the yield of tomatoes.

The Y 's are the inner products of the column vector y with the column vectors of X . They can be conveniently calculated by forming summary tables of the kind often used in analyzing complete factorials. For example, $Y(A_1)$, $Y(A_2)$, and $Y(A_1A_2)$ are obtained from the following table, which contains sums of nine responses:

		A Summary Table		<u>Total</u>
		Size of Pot (A_2)		
		<u>0</u>	<u>1</u>	
Soil Condition (A_1)	0:	1118.2	1104.1	2222.3
	1:	<u>1120.5</u>	<u>1493.7</u>	<u>2614.2</u>
Total:		2238.7	2597.8	4836.5
Diagonal totals:		2611.9,	2224.6	

From the entries in this table we find

$$Y(A_1) = 2614.2 - 2222.3 = 391.9$$

$$Y(A_2) = 2597.8 - 2238.7 = 359.1$$

$$Y(A_1A_2) = 2611.9 - 2224.6 = 387.3$$

The complete list of 27 distinct Y 's is given below:

Values of the $Y(\rho)$'s

$Y(\mu) = 4836.5$	$Y(B_1) = 373.6$
$Y(A_1) = 391.9$	$Y(B_1^2) = -50.2$
$Y(A_2) = 359.1$	$Y(B_2) = 445.5$
$Y(A_3) = 581.7$	$Y(B_2^2) = 257.9$
$Y(A_1A_2) = 387.3$	$Y(B_1B_2) = -118.9$
$Y(A_1A_3) = 354.7$	$Y(B_1B_2^2) = -347.3$
$Y(A_2A_3) = 60.3$	$Y(B_1^2B_2) = 100.5$
	$Y(B_1^2B_2^2) = 620.9$
$Y(A_1B_1) = -155.0$	$Y(A_2B_2) = 13.3$
$Y(A_1B_1^2) = -490.4$	$Y(A_2B_2^2) = -175.5$
$Y(A_1B_2) = 51.1$	$Y(A_3B_1) = 175.4$
$Y(A_1B_2^2) = -46.1$	$Y(A_3B_1^2) = -2.4$
$Y(A_2B_1) = 14.2$	$Y(A_3B_2) = -190.3$
$Y(A_2B_1^2) = -40.8$	$Y(A_3B_2^2) = -273.9$

From the Y's the estimates are calculated as indicated in (3.11). The estimates are given below bracketed by their 0.95 confidence interval limits.

Estimates and Confidence Limits

124.9,	$\hat{\mu}=134.3, 143.8$	3.9,	$\hat{B}_1=15.6, 27.2$
1.6,	$\hat{A}_1=11.6, 21.7$	-7.4,	$\hat{B}_1^2=-0.7, 6.0$
-2.5,	$\hat{A}_2=7.5, 17.6$	6.9,	$\hat{B}_2=18.6, 30.2$
4.1,	$\hat{A}_3=14.1, 24.2$	-3.1,	$\hat{B}_2^2=3.6, 10.3$
-4.0,	$\hat{A}_1A_2=6.0, 16.1$	-21.7,	$\hat{B}_1B_2=-7.4, 6.8$
-2.7,	$\hat{A}_1A_3=7.3, 17.4$	-15.5,	$\hat{B}_1B_2^2=-7.2, 1.0$
-12.3,	$\hat{A}_2A_3=-2.2, 7.9$	-6.1,	$\hat{B}_1^2B_2=2.1, 10.3$
		-0.4,	$\hat{B}_1^2B_2^2=4.3, 9.1$
-18.1,	$\hat{A}_1B_1=-6.5, 5.2$	-11.1,	$\hat{A}_2B_2=0.6, 12.2$
-13.5,	$\hat{A}_1B_1^2=-6.8, -0.1$	-9.1,	$\hat{A}_2B_2^2=-2.4, 4.3$
-9.5,	$\hat{A}_1B_2=2.1, 13.7$	-4.3,	$\hat{A}_3B_1=7.3, 18.9$
-7.3,	$\hat{A}_1B_2^2=-0.6, 6.1$	-6.7,	$\hat{A}_3B_1^2=-0.03, 6.7$
-11.0,	$\hat{A}_2B_1=0.6, 12.2$	-19.5,	$\hat{A}_3B_2=-7.9, 3.7$
-7.3,	$\hat{A}_2B_1^2=-0.6, 6.1$	-10.5,	$\hat{A}_3B_2^2=-3.8, 2.9$

The analysis of variance is as follows:

<u>Source of Variation</u>	<u>D.F.</u>	<u>Sum of Squares</u>	<u>Mean Square</u>	<u>F</u>
Parameters	26	50404	1939	3.06
Error	<u>9</u>	<u>5708</u>	634	
Total	35	56112		

This value of F may be compared with the upper 0.95 point of the F(26, 9) distribution which is 2.89.

Until now nothing has been said of the fact that there are both qualitative and quantitative factors in this example. The analysis has been carried out, effects estimated, confidence intervals placed on the estimated effects, and an analysis of variance test performed, all ignoring the fact that we have both qualitative and quantitative factors. This has been done to illustrate the calculations.

The breakdown of the total sum of squares by sources of variation is given in the following analysis of variance table:

<u>Source</u>	<u>D.F.</u>	<u>S.S.</u>	<u>M.S.</u>	<u>F</u>
Pure A Effects	6	20297	3383	5.33**
Mixed Effects				
$A_1B_1, A_1B_1^2$	2	4341	2171	
$A_1B_2, A_1B_2^2$	2	138	69	
$A_2B_1, A_2B_1^2$	2	32	16	
$A_2B_2, A_2B_2^2$	2	435	218	
$A_3B_1, A_3B_1^2$	2	1282	641	
$A_3B_2, A_3B_2^2$	2	2551	1275	
Pure B Effects:				
B_1, B_1^2	2	5851	2925	4.61*
B_2, B_2^2	2	9193	4597	7.25*
$B_1B_2, B_1B_2^2$	4	6284	1571	
$B_1^2B_2, B_1^2B_2^2$				
Error	<u>9</u>	<u>5708</u>	<u>634</u>	
Total	35	56112		

*Significant at 0.05

**Significant at 0.01

From these analyses, all main effects are significant, except for the size of the pot. No two-factor interaction effects are significant.

6. Six Special Designs

Designs $2^3 3^3$, $2^5 3^3$, $2^6 3^3$, $2^5 3^4$, $2^3 3^5$, and $2^5 3^5$, have been treated differently from the other designs in this catalogue. The pure B effects have been defined differently from the definitions in section 3. They are denoted by $L(B)$, $Q(B)$, $L(B_k B_{k'})$, $Q(B_k B_{k'})$, $L(B_k B_k^2)$, and $Q(B_k B_k^2)$. In the linear function, which is the expected response to a treatment combination, the coefficients of the B effects depend on the levels of the B factors as follows:

(6.1) Coefficients of Pure B Effects

Factor levels		Coefficients							
		Main effects				Interaction effects			
B_k	$B_{k'}$	$L(B_k)$	$Q(B_k)$	$L(B_{k'})$	$Q(B_{k'})$	$L(B_k B_{k'})$	$Q(B_k B_{k'})$	$L(B_k B_k^2)$	$Q(B_k B_k^2)$
0	0	-1	1	-1	1	-1	1	-1	1
1	0	0	-2	-1	1	0	-2	0	-2
2	0	1	1	-1	1	1	1	1	1
0	1	-1	1	0	-2	0	-2	1	1
1	1	0	-2	0	-2	1	1	-1	1
2	1	1	1	0	-2	-1	1	0	-2
0	2	-1	1	1	1	1	1	0	-2
1	2	0	-2	1	1	-1	1	1	1
2	2	1	1	1	1	0	-2	-1	1

The main effects are the same as before, i.e., $L(B)=B$ and $Q(B)=B^2$. However, the interaction effects are different from the effects of section 3, but are related to them by the following matrix equation:

$$(6.2) \quad \begin{bmatrix} L(B_k B_{k'}) \\ Q(B_k B_{k'}) \\ L(B_k B_k^2) \\ Q(B_k B_k^2) \end{bmatrix} = \frac{1}{6} \begin{bmatrix} -3 & 3 & 3 & 9 \\ -1 & -3 & -3 & 3 \\ -3 & 3 & -3 & -9 \\ 1 & 3 & -3 & 3 \end{bmatrix} \begin{bmatrix} B_k B_{k'} \\ B_k B_k^2 \\ B_k^2 B_{k'} \\ B_k^2 B_k^2 \end{bmatrix}.$$

The inverse equation is

$$(6.3) \quad \begin{bmatrix} B_k B_{k'} \\ B_k B_k^2 \\ B_k^2 B_{k'} \\ B_k^2 B_k^2 \end{bmatrix} = \frac{1}{4} \begin{bmatrix} -3 & -3 & -3 & 3 \\ 1 & -3 & 1 & 3 \\ 1 & -3 & -1 & -3 \\ 1 & 1 & -1 & 1 \end{bmatrix} \begin{bmatrix} L(B_k B_{k'}) \\ Q(B_k B_{k'}) \\ L(B_k B_k^2) \\ Q(B_k B_k^2) \end{bmatrix}.$$

The reason for introducing these new interaction effects is that there is more orthogonality among them than among the effects of section 3. The normal equations are easier to solve. If it is desired to estimate $B_k B_{k'}, \dots, B_k^2 B_{k'}^2$, this can be done by using (6.3).

The elements in the main diagonal of the inverse matrix can be calculated from (6.4), except when there is a nonzero element off the diagonal in the same row as the element under consideration. In that event, special formulas are required.

Elements in the Main Diagonal of the Inverse Matrix (except as explained above)

	<i>Parameter</i>	<i>Element</i>
	$A, A_j A_{j'}$	$1/f$
(6.4)	$AB, L(B), L(B_k B_{k'}), L(B_k B_{k'}^2)$	$3/2f$
	$AB^2, Q(B), Q(B_k B_{k'}), Q(B_k B_{k'}^2)$	$1/2f$

As before, f denotes the number of treatment combinations in the design.

Design 2²3⁴

There are two factors at 2 levels and four factors at 3 levels. 52 effects are estimated from 162 treatment combinations. This is a $\frac{1}{2}$ fraction.

Experimental Plan

$$S_1 S'_1 \quad S_2 S'_2 \quad S_1 S'_3$$

Analysis

The matrix $\frac{1}{3} \begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix}$ is used to estimate $96 \begin{bmatrix} A_1 B_1 \\ A_2 B_1 \end{bmatrix}$, $96 \begin{bmatrix} A_1 B_2 \\ A_2 B_2 \end{bmatrix}$, $96 \begin{bmatrix} A_1 B_3 \\ A_2 B_3 \end{bmatrix}$, $96 \begin{bmatrix} A_1 B_4 \\ A_2 B_4 \end{bmatrix}$,
 $288 \begin{bmatrix} A_1 B_1^2 \\ A_2 B_1^2 \end{bmatrix}$, $288 \begin{bmatrix} A_1 B_2^2 \\ A_2 B_2^2 \end{bmatrix}$, $288 \begin{bmatrix} A_1 B_3^2 \\ A_2 B_3^2 \end{bmatrix}$, $288 \begin{bmatrix} A_1 B_4^2 \\ A_2 B_4^2 \end{bmatrix}$, $144 \begin{bmatrix} \mu \\ A_1 A_2 \end{bmatrix}$, $144 \begin{bmatrix} A_1 \\ A_2 \end{bmatrix}$.

Design 2⁴3⁶

There are four factors at 2 levels and six factors at 3 levels. 131 effects are estimated from 486 treatment combinations. This is a $\frac{1}{24}$ fraction.

Experimental Plan

$S_1S'_1$ $S_2S'_2$ $S_3S'_3$ $S_4S'_4$ $S_5S'_5$ $S_6S'_6$ $S_7S'_7$ $S_8S'_8$ $S_9S'_9$

Analysis

The matrix $\frac{1}{6480}$
$$\begin{bmatrix} 14 & 1 & 1 & -1 & -1 & 1 & 1 & 1 \\ 1 & 14 & -1 & 1 & 1 & -1 & -1 & -1 \\ 1 & -1 & 14 & 1 & 1 & -1 & -1 & -1 \\ -1 & 1 & 1 & 14 & -1 & 1 & 1 & 1 \\ -1 & 1 & 1 & -1 & 14 & 1 & 1 & 1 \\ 1 & -1 & -1 & 1 & 1 & 14 & -1 & -1 \\ 1 & -1 & -1 & 1 & 1 & -1 & 14 & 14 \end{bmatrix}$$
 is used to estimate
$$\begin{bmatrix} \mu \\ A_1A_2 \\ A_1A_3 \\ A_1A_4 \\ A_2A_3 \\ A_2A_4 \\ A_3A_4 \end{bmatrix}$$

and the matrix $\frac{1}{96}$
$$\begin{bmatrix} 11 & 1 & 1 & -1 \\ 1 & 11 & -1 & 1 \\ 1 & -1 & 11 & 1 \\ -1 & 1 & 1 & 11 \end{bmatrix}$$
 is used to estimate $54 \begin{bmatrix} A_1 \\ A_2 \\ A_3 \\ A_4 \end{bmatrix}, 36 \begin{bmatrix} A_1B_1 \\ A_2B_1 \\ A_3B_1 \\ A_4B_1 \end{bmatrix}, 36 \begin{bmatrix} A_1B_2 \\ A_2B_2 \\ A_3B_2 \\ A_4B_2 \end{bmatrix},$

$36 \begin{bmatrix} A_1B_3 \\ A_2B_3 \\ A_3B_3 \\ A_4B_3 \end{bmatrix}, 36 \begin{bmatrix} A_1B_4 \\ A_2B_4 \\ A_3B_4 \\ A_4B_4 \end{bmatrix}, 36 \begin{bmatrix} A_1B_5 \\ A_2B_5 \\ A_3B_5 \\ A_4B_5 \end{bmatrix}, 36 \begin{bmatrix} A_1B_6 \\ A_2B_6 \\ A_3B_6 \\ A_4B_6 \end{bmatrix}, 108 \begin{bmatrix} A_1B_1^2 \\ A_2B_1^2 \\ A_3B_1^2 \\ A_4B_1^2 \end{bmatrix}, 108 \begin{bmatrix} A_1B_2^2 \\ A_2B_2^2 \\ A_3B_2^2 \\ A_4B_2^2 \end{bmatrix}, 108 \begin{bmatrix} A_1B_3^2 \\ A_2B_3^2 \\ A_3B_3^2 \\ A_4B_3^2 \end{bmatrix},$

$108 \begin{bmatrix} A_1B_4^2 \\ A_2B_4^2 \\ A_3B_4^2 \\ A_4B_4^2 \end{bmatrix}, 108 \begin{bmatrix} A_1B_5^2 \\ A_2B_5^2 \\ A_3B_5^2 \\ A_4B_5^2 \end{bmatrix}, 108 \begin{bmatrix} A_1B_6^2 \\ A_2B_6^2 \\ A_3B_6^2 \\ A_4B_6^2 \end{bmatrix}.$

Design 2¹³

There is one factor at 2 levels and there are seven factors at 3 levels. 114 effects are estimated from 243 treatment combinations. This is a $\frac{1}{8}$ fraction.

Experimental Plan

$$S_1 S'_1 \quad S_2 S'_2 \quad S_2 S'_3$$

Analysis

The matrix $\frac{1}{3} \begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix}$ is used to estimate $216 \begin{bmatrix} \mu \\ A_1 \end{bmatrix}$, $144 \begin{bmatrix} B_1 \\ A_1 B_1 \end{bmatrix}$, $144 \begin{bmatrix} B_2 \\ A_1 B_2 \end{bmatrix}$,

$$144 \begin{bmatrix} B_3 \\ A_1 B_3 \end{bmatrix}, \quad 144 \begin{bmatrix} B_4 \\ A_1 B_4 \end{bmatrix}, \quad 144 \begin{bmatrix} B_5 \\ A_1 B_5 \end{bmatrix}, \quad 144 \begin{bmatrix} B_6 \\ A_1 B_6 \end{bmatrix}, \quad 144 \begin{bmatrix} B_7 \\ A_1 B_7 \end{bmatrix}, \quad 432 \begin{bmatrix} B_1^2 \\ A_1 B_1^2 \end{bmatrix}, \quad 432 \begin{bmatrix} B_2^2 \\ A_1 B_2^2 \end{bmatrix},$$

$$432 \begin{bmatrix} B_3^2 \\ A_1 B_3^2 \end{bmatrix}, \quad 432 \begin{bmatrix} B_4^2 \\ A_1 B_4^2 \end{bmatrix}, \quad 432 \begin{bmatrix} B_5^2 \\ A_1 B_5^2 \end{bmatrix}, \quad 432 \begin{bmatrix} B_6^2 \\ A_1 B_6^2 \end{bmatrix}, \quad 432 \begin{bmatrix} B_7^2 \\ A_1 B_7^2 \end{bmatrix}.$$

Design 2²3⁸

There are two factors at 2 levels and eight factors at 3 levels. 164 effects are estimated from 486 treatment combinations. This is a $\frac{1}{4}$ fraction.

Experimental Plan

$$S_1 S'_1 \quad S_2 S'_2 \quad S_1 S'_3$$

Analysis

The matrix $\frac{1}{3} \begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix}$ is used to estimate $432 \begin{bmatrix} \mu \\ A_1 A_2 \end{bmatrix}$, $432 \begin{bmatrix} A_1 \\ A_2 \end{bmatrix}$, $288 \begin{bmatrix} A_1 B_1 \\ A_2 B_1 \end{bmatrix}$,

$$288 \begin{bmatrix} A_1 B_2 \\ A_2 B_2 \end{bmatrix}, \quad 288 \begin{bmatrix} A_1 B_3 \\ A_2 B_3 \end{bmatrix}, \quad 288 \begin{bmatrix} A_1 B_4 \\ A_2 B_4 \end{bmatrix}, \quad 288 \begin{bmatrix} A_1 B_5 \\ A_2 B_5 \end{bmatrix}, \quad 288 \begin{bmatrix} A_1 B_6 \\ A_2 B_6 \end{bmatrix}, \quad 288 \begin{bmatrix} A_1 B_7 \\ A_2 B_7 \end{bmatrix},$$

$$288 \begin{bmatrix} A_1 B_8 \\ A_2 B_8 \end{bmatrix}, \quad 864 \begin{bmatrix} A_1 B_1^2 \\ A_2 B_1^2 \end{bmatrix}, \quad 864 \begin{bmatrix} A_1 B_2^2 \\ A_2 B_2^2 \end{bmatrix}, \quad 864 \begin{bmatrix} A_1 B_3^2 \\ A_2 B_3^2 \end{bmatrix}, \quad 864 \begin{bmatrix} A_1 B_4^2 \\ A_2 B_4^2 \end{bmatrix}, \quad 864 \begin{bmatrix} A_1 B_5^2 \\ A_2 B_5^2 \end{bmatrix},$$

$$864 \begin{bmatrix} A_1 B_6^2 \\ A_2 B_6^2 \end{bmatrix}, \quad 864 \begin{bmatrix} A_1 B_7^2 \\ A_2 B_7^2 \end{bmatrix}, \quad 864 \begin{bmatrix} A_1 B_8^2 \\ A_2 B_8^2 \end{bmatrix}.$$

Design 2¹³₉

There is one factor at 2 levels and there are nine factors at 3 levels. 182 effects are estimated from 243 treatment combinations. This is a $\frac{1}{62}$ fraction.

Experimental Plan

$$S_1 S'_1 \quad S_2 S'_2 \quad S_2 S'_3$$

Analysis

The matrix $\frac{1}{3} \begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix}$ is used to estimate $216 \begin{bmatrix} \mu \\ A_1 \end{bmatrix}$, $144 \begin{bmatrix} B_1 \\ A_1 B_1 \end{bmatrix}$, $144 \begin{bmatrix} B_2 \\ A_1 B_2 \end{bmatrix}$, $144 \begin{bmatrix} B_3 \\ A_1 B_3 \end{bmatrix}$,
 $144 \begin{bmatrix} B_4 \\ A_1 B_4 \end{bmatrix}$, $144 \begin{bmatrix} B_5 \\ A_1 B_5 \end{bmatrix}$, $144 \begin{bmatrix} B_6 \\ A_1 B_6 \end{bmatrix}$, $144 \begin{bmatrix} B_7 \\ A_1 B_7 \end{bmatrix}$, $144 \begin{bmatrix} B_8 \\ A_1 B_8 \end{bmatrix}$, $144 \begin{bmatrix} B_9 \\ A_1 B_9 \end{bmatrix}$, $432 \begin{bmatrix} B_1^2 \\ A_1 B_1^2 \end{bmatrix}$,
 $432 \begin{bmatrix} B_2^2 \\ A_1 B_2^2 \end{bmatrix}$, $432 \begin{bmatrix} B_3^2 \\ A_1 B_3^2 \end{bmatrix}$, $432 \begin{bmatrix} B_4^2 \\ A_1 B_4^2 \end{bmatrix}$, $432 \begin{bmatrix} B_5^2 \\ A_1 B_5^2 \end{bmatrix}$, $432 \begin{bmatrix} B_6^2 \\ A_1 B_6^2 \end{bmatrix}$, $432 \begin{bmatrix} B_7^2 \\ A_1 B_7^2 \end{bmatrix}$, $432 \begin{bmatrix} B_8^2 \\ A_1 B_8^2 \end{bmatrix}$,
 $432 \begin{bmatrix} B_9^2 \\ A_1 B_9^2 \end{bmatrix}$.

Design 2³3

There are three factors at 2 levels and three factors at 3 levels. 43 effects are estimated from 72 treatment combinations. This is a $\frac{1}{8}$ fraction.

Experimental Plan

$S_1S'_1 \quad S_2S'_2 \quad S_3S'_3 \quad S_4S'_4$

Analysis

The matrix $\frac{1}{180} \begin{bmatrix} 4 & 1 \\ 1 & 4 \end{bmatrix}$ is used to estimate $\begin{bmatrix} L(B_1) \\ L(B_2B_3) \end{bmatrix}$, $\begin{bmatrix} L(B_2) \\ L(B_1B_3) \end{bmatrix}$, $\begin{bmatrix} L(B_3) \\ L(B_1B_2) \end{bmatrix}$,

and the matrix $\frac{1}{540} \begin{bmatrix} 4 & -1 \\ -1 & 4 \end{bmatrix}$ is used to estimate $\begin{bmatrix} Q(B_1) \\ Q(B_2B_3) \end{bmatrix}$, $\begin{bmatrix} Q(B_2) \\ Q(B_1B_3) \end{bmatrix}$, $\begin{bmatrix} Q(B_3) \\ Q(B_1B_2) \end{bmatrix}$,

and the matrix $\frac{1}{1296} \begin{bmatrix} 30 & 0 & -3 & -3 & 3 & -3 \\ 0 & 10 & -3 & 1 & 3 & 1 \\ -3 & -3 & 30 & 0 & 6 & 0 \\ -3 & 1 & 0 & 10 & 0 & -2 \\ 3 & 3 & 6 & 0 & 30 & 0 \\ -3 & 1 & 0 & -2 & 0 & 10 \end{bmatrix}$ is used to estimate $\begin{bmatrix} L(B_1B_2^2) \\ Q(B_1B_2^2) \\ L(B_1B_3^2) \\ Q(B_1B_3^2) \\ L(B_2B_3^2) \\ Q(B_2B_3^2) \end{bmatrix}$.

Construction

Sets of Treatment Combinations from the 2³

Set	S_1	S_2	S_3	S_4
$x_1+x_2=0$	0	1	1	
$x_1+x_3=0$	1	0	1	

Treatment Combinations

S_1	S_2	S_3	S_4

and the matrix $\frac{1}{6480} \begin{bmatrix} 24 & 0 & 3 & 3 \\ 0 & 8 & -3 & 1 \\ 3 & -3 & 24 & 0 \\ 3 & 1 & 0 & 8 \end{bmatrix}$ is used to estimate $\begin{bmatrix} L(B_4) \\ Q(B_4) \\ L(B_3B_5^2) \\ Q(B_3B_5^2) \end{bmatrix}, \begin{bmatrix} L(B_5) \\ Q(B_5) \\ L(B_3B_4^2) \\ Q(B_3B_4^2) \end{bmatrix},$

and the matrix $\frac{1}{7776} \begin{bmatrix} 30 & 0 & -6 & 0 & -3 & 3 \\ 0 & 10 & 0 & -2 & 3 & 1 \\ -6 & 0 & 30 & 0 & -3 & 3 \\ 0 & -2 & 0 & 10 & 3 & 1 \\ -3 & 3 & -3 & 3 & 30 & 0 \\ 3 & 1 & 3 & 1 & 0 & 10 \end{bmatrix}$ is used to estimate $\begin{bmatrix} L(B_1B_2^2) \\ Q(B_1B_2^2) \\ L(B_2B_3) \\ Q(B_2B_3) \\ L(B_1B_3) \\ Q(B_1B_3) \end{bmatrix},$

and the matrix $\frac{1}{7776} \begin{bmatrix} 30 & 0 & 6 & 0 & -3 & -3 \\ 0 & 10 & 0 & -2 & -3 & 1 \\ 6 & 0 & 30 & 0 & 3 & 3 \\ 0 & -2 & 0 & 10 & -3 & 1 \\ -3 & -3 & 3 & -3 & 30 & 0 \\ -3 & 1 & 3 & 1 & 0 & 10 \end{bmatrix}$ is used to estimate $\begin{bmatrix} L(B_3B_4) \\ Q(B_3B_4) \\ L(B_4B_5^2) \\ Q(B_4B_5^2) \\ L(B_3B_5) \\ Q(B_3B_5) \end{bmatrix},$

and the matrix $\frac{1}{7776} \begin{bmatrix} 30 & 0 & -6 & 0 & 3 & -3 \\ 0 & 10 & 0 & -2 & 3 & 1 \\ -6 & 0 & 30 & 0 & 3 & -3 \\ 0 & -2 & 0 & 10 & 3 & 1 \\ 3 & 3 & 3 & 3 & 30 & 0 \\ -3 & 1 & -3 & 1 & 0 & 10 \end{bmatrix}$ is used to estimate $\begin{bmatrix} L(B_3) \\ Q(B_3) \\ L(B_1B_2) \\ Q(B_1B_2) \\ L(B_4B_5) \\ Q(B_4B_5) \end{bmatrix}.$

Construction

Sets of Treatment Combinations from the 2^5

Set	S_1	S_2	S_3	S_4
$x_1 + x_2 + x_3 + x_4 + x_5 = 1$	1	1	1	1
$x_1 + x_2 + x_3 = 1$	0	1	1	0
$x_3 + x_4 = 1$	1	0	0	0

Treatment Combinations

S_1	S_2	S_3	S_4
00100	00010	10000	00001
11100	11010	01000	11001
01011	01101	11111	01110
10011	10101	00111	10110

Sets of Treatment Combinations from the 3^5

Set	S'_1	S'_2	S'_3	S'_4
$z_1 + z_2 + z_3 + z_4 + z_5 = 0$	0	0	0	1
$z_1 + z_2 + 2z_3 = 0$	1	2	0	0

Treatment Combinations

S'_1	S'_2	S'_3	S'_4
00000	02100	01200	00001
21000	20100	22200	21001
