INTRODUCTION

Hydrographic Data from Oregon Waters, 1969, is the tenth report during a study to determine the currents and water masses along the Oregon coast. Reports for time periods beginning in 1958 are listed in References.

DATA COLLECTING AND PROCESSING

Data were collected by Oregon State University personnel aboard the R/V YAQUINA and the R/V CAYUSE. Most of the cruises were concerned with surveying hydrographic conditions along a latitudinal track at $44^{\circ}39.1'N$ and studying the Columbia River plume.

Most stations are identified by a letter-number code. Numerals that have a BH, CH, CM, DB, NH, TH or SH prefix are the distance from shore in nautical miles. Thus NH-85 is a hydrographic station 85 miles off the coast from Newport, Oregon. All stations that have other letter prefixes were numbered sequentially with the letter prefix designating either a particular leg of that cruise or designating what work was done on that particular station. Cruise tracks are included to facilitate location of stations.

Sampling methods and analysis techniques used on the Yaquina Long Cruise - 1969 are given starting on page 7.

Explanation

Letter

DB	Off Brookings, Oregon along $42^{\circ}00.0'N$
CH	Off Coos Bay, Oregon along $43^{\circ}20.6'N$
CM	Off Cape Mears, Oregon along $45^{\circ}29.0'N$
DB	On a line between $44^{\circ}48.7'$, $124^{\circ}05.5'$ (DB-1) and $45^{\circ}48.0'$, $127^{\circ}44.0'N$
TH	Off Tillamook, Oregon along $45^{\circ}56.3'N$

Depth

Depth determinations were made by the "depth-difference" method described in the U.S. Hydrographic Office Publication 607(1955). At least once each year three to six calibration casts were made to monitor the pressure coefficients (Q) for unprotected thermometers. Depth estimates have an approximate accuracy of 1.5 percent at 750 m depth. Depths of the second cast are followed by an asterisk if two or more casts were used as a single station.

Figure 1. Positions of hydrographic stations in 1969.

Figure 2. Positions of hydrographic stations in 1969.

Temperature

Thermometer calibrations were done at Oregon State University using the Oceanography Department's improved calibration tank. The standard was a platinum resistance thermometer calibrated by the U.S. Bureau of Standards.

The accuracy of reduced temperature readings is believed to be $\pm 0.02^{\circ}\text{C}$ for the reversing thermometers. All sampling bottles were equipped with two reversing thermometers. Those below 200m also have an unprotected thermometer for determination of thermometric depth.

Salinity

Salinity determinations were made with an inductive salinometer, Model 11, manufactured in Australia by Industria Manufacturing Engineers Pty. Ltd. and a Hytech salinometer, model 6220. The method used for the determinations was described by Brown and Hamon (1961). Substandard water was prepared from seawater that had been collected 100 miles off Oregon and stored for three months prior to use.

Precision of Chemical Data

All precisions are given as two standard deviations.

Oxygen

The modified Winkler method of oxygen analysis as described by Strickland and Parsons (1968) was employed. Precision was estimated to be ± 0.2 ml/L of dissolved oxygen.

Manual Phosphate Analysis

Phosphate was determined on a Beckman DU spectrophotometer and a Hitachi 111 spectrophotometer using a method described in the previous report (Barstow *et al.*, 1969b). This method was used to normalize phosphate values obtained using the Autoanalyzer[®]. Table 1 gives the average slopes and intercepts obtained by plotting manual versus Autoanalyzer^R results for 20% of the samples taken on the 1969 cruises beginning with C6904-C. $C_{\text{reported}} = C_{\text{auto}} \times (\text{slope}) - (\text{intercept})$.

Table 1. Slopes and Intercepts for normalization of automated phosphate analyses

<u>Cruise</u>	<u>Average Slope</u>	<u>Average Intercept</u>
C6901A	-	-
C6902C	-	-
C6903E	-	-
C6904C	0.790	0.10
Y6905B	0.778	0.04
Y6906C	0.968	0.02
C6906F	0.838	0.10
Y6908A	0.953	0.28
C6908A	0.885	0.15
C6908C	0.888	0.14
Y6909A	0.897	0.24
Y6910E	0.891	0.32

Automated Nutrient Analysis

The nitrate+nitrite analysis used on the Autoanalyzer^R is a modification of Armstrong et al. (1967). Two sample tubes, 3.40 ml/minute, were used as described by Hager et al. (1968). Precision was estimated as $\pm 8 \mu\text{M}$.

Phosphates were determined using the Grasshoff modification described previously (Barstow et al., 1969b). It is a modified ascorbic acid method of Armstrong et al (1967). Precision was estimated as $\pm 0.6 \mu\text{M}$.

Rejection of questionable nutrient data and adjustment of observed zero nutrient values

The precision and accuracy of nutrient data were quite variable from day to day. Obvious wild points have been rejected by visual inspection. In addition, a crude statistical technique was applied to the deep data (500-1000m) from stations NH65, 85, 105, 125, 145, and 165. We assumed that seasonal changes in nutrient concentrations below 500m are insignificant. Mean concentrations and average deviations from the mean were calculated for each cruise for each of the depths, 500, 600, 800 and 1000m. We rejected all nutrient values lying more than four average deviations from the mean. At some stations all four of the nutrients treated gave values more than two average deviations from their

means; all the values for that nutrient have been omitted from that station. This method gave excellent agreement with subjective, visual evaluations. A few points were eliminated on the basis of subjective evaluation, by examining relative coherence between all the nutrient values and the AOU at a given station and depth.

Because of the mechanics of our computer data processing, we add a one in the last significant figure to all observed zero values of the nutrients. Thus a zero value phosphate becomes 0.01 and a zero nitrate becomes 0.1.

pH

An Orion model 801 digital pH meter was used on all cruises for pH determinations except for Y6909A when a Beckman pH meter, model 7600, with expanded scale was used. Precisely weighed Beckman pH 7.41 buffers were employed. The method used is that of Park (1966), with values corrected to in situ temperature but not in situ pressure. Precision was ± 0.02 pH units except for Y6909A when it was ± 0.03 pH units.

Alkalinity

Alkalinity was determined on fresh samples using the method of Anderson and Robinson (1946). Precisely weighed Beckman pH 4.00 buffers were employed. Precision is about ± 0.04 milliequivalent/liter.

Computations

All hydrographic data were processed with the aid of the CDC 3300 computer. Auxiliary temperature corrections and index corrections obtained from laboratory thermometer calibrations were applied with a computer program. Property values at standard depths are determined by three-point parabolic interpolation. (Two observed property points above the standard depth and one point below were interpolated parabolically: the result was averaged with similar interpolation by using one observed point above the standard depth and two points below). The specific volume anomaly, dynamic height, and sigma-t were computed by using interpolated properties. The same computer program has been used in all Oregon State University hydrographic data reports.

Weather codes and cloud cover clouds were adopted from the National Oceanographic Data Center Manual "Processing Physical and Chemical Data from Oceanographic Stations," Publication M-2 (Rev. Aug. 1964).

YALOC 69 CHEMICAL DATA COLLECTING AND PROCESSING

Water Sampling

All water samples (except those from the bottom tripping water bottles) were collected in plastic (polypropylene) water bottles made by the National Institute of Oceanography (NIO), Wormley, Surrey, England. The order of sampling was oxygen, pH, salinity, and nutrients.

Salinity

Salinity determinations were made with a Hytech inductive salinometer, model 6220. The salinometer was standardized with substandard seawater (salinity about 35.00 ‰), and frequently checked against Copenhagen water. The average accuracy of the salinity determinations was about ± 0.003 ‰; the precision of salinity determinations at any one station was about ± 0.002 ‰.

Oxygen

The Winkler method described by Strickland and Parsons (1965) was used for samples drawn from the NIO water bottles. The precision of this method was ± 0.03 ml O_2 /l.

Samples from the bottom tripping water bottles were analyzed by a modification of Carpenter's (1965) oxygen method. Calibrated 30 ml Erlenmeyer flasks were used instead of the 125 ml flasks recommended by Carpenter (1965). The concentrations of the oxygen reagents were changed so that the addition of 0.5 ml of each reagent would result in the final concentrations recommended by Carpenter (1965). Solid sodium sulfate was added to the manganous chloride reagent to decrease the solubility of oxygen in this reagent. Oxygens determined by this method agreed to within ± 0.04 ml O_2 /l with oxygen measured by the method of Strickland and Parsons (1965).

Reactive Phosphate

Reactive phosphate was measured by the method described by Strickland and Parsons (1965). Precision was $\pm 0.1 \mu M$. Analyses were started within 2 hours after the nutrient samples had been drawn.

Figure 3. Cruise track for YALOC-69.

Reactive Silicate

Reactive silicate was measured by the method described by Strickland and Parsons (1965). Precision was $\pm 2 \mu\text{M}$.

Nitrate

Nitrates were measured on frozen samples using a Technicon Auto-analyser^R and the nitrate method of Hager, Gordon, and Park (1968). This method measures nitrate plus nitrite. The samples were analyzed ashore, 2 weeks after the cruise returned. Precision was $\pm 1 \mu\text{M}$.

pH

An Orion model 801 digital pH meter, with a precision of ± 0.1 mv, was used for pH measurements. The pH samples were drawn into 5 ml plastic syringes, fitted with stainless steel needles. The syringes were placed in a water bath at 25°C for 10 to 15 minutes, and the pH sample was then injected into a Beckman #46850. The precision of the pH measurements was ± 0.005 pH units. All measurements were made at $25.0 \pm 0.1^\circ\text{C}$.

The electrode was standardized with a buffer containing 0.008695 m KH_2PO_4 plus 0.03043 m Na_2HPO_4 . This buffer has $\text{pH} = 7.413$ on the NBS pH scale at 25°C . (Bates, 1964). The slope of the glass electrode response was determined from potential measurements in the 7.413 buffer and in a 0.05 m potassium hydrogen phthalate buffer which has $\text{pH} = 4.008$ at 25°C (Bates, 1964). The measured slope was 58.63 mv/pH at 25°C . The potential of each sample was read from the Orion pH meter and the pH calculated from the equation (Bates, 1964),

$$\text{pH} = 7.413 + \frac{E_{\text{sw}} - E_{7.413}}{58.63}$$

where E_{sw} and $E_{7.413}$ are the potentials measured in seawater and in the 7.413 buffer.

Alkalinity

Alkalinities were determined by a modification of the method of Anderson and Robinson (1946). To remove most of the liberated carbon dioxide, 5.998 ml of 0.009994N was added to 20.0k ml of seawater, and water saturated air bubbled through the mixture for 5 minutes. All measurements were made at $25.0 \pm 0.1^\circ\text{C}$ with an Orion model 801 digital

pH meter. The value $f_H = 0.741$ was used for the empirical coefficient in Anderson and Robinson's (1946) equation for alkalinity. This value is based on unpublished experiments made in this laboratory.

A glass electrode, saturated calomel electrode pair (Beckman #40498 and 39170), was used to measure pH standardized with a 0.05 m potassium hydrogen phthalate buffer that had pH = 4.007 (25°C) when compared with the NBS 0.05 m potassium hydrogen phthalate buffer (185-d). The slope of the glass electrode response (58.91 mv/pH) was determined from potential measurements in the two standard buffers (4.007 and 7.413). Potential measurements were converted to pH values by equation:

$$\text{pH} = 4.007 - \frac{E_{\text{sw}} - E_{4.007}}{58.91}$$

where E_{sw} and $E_{4.007}$ are the measure potentials in seawater and in the 4.007 buffer.

ACKNOWLEDGEMENTS

This work was supported by Office of Naval Research contract N00014-67-A-0369-0007, National Science Foundation grants GA1281, GA12113 and GA1435, and Bureau of Commercial Fisheries contract 14-17-0002-333. Professor Mishikawa was supported by the Universidad Autonoma de Baja California, Mexico, during his participation in Cruise Y6908A. Work at sea was under the supervision of the hydrographic group; Bruce Wyatt, Peter Kalk, James Washburn, Lyndal Brixius, and Dennis Barstow. Ronald Jones and Douglas Coughenower analyzed most of the salinity and oxygen samples.

13. ABSTRACT Salinity, temperature, oxygen, phosphate, and nitrate observations were taken by Oregon State University on 16 hydrographic cruises in the Northeastern Pacific Ocean during 1969. Alkalinity, pH and silicate were taken on special occasions. Nine cruises were taken along the Newport line. The rest were special cruises made off Depoe Bay, Oregon, in the Columbia River plume, and off Peru. (
