1.0 INTRODUCTION

The Analysis of Data Base Security and Access Limitation Requirements for the post-1975 Automated TACC Complex was conducted to provide the United States Air Force and other military agencies with detailed information concerning (a) current and completed studies which have addressed the security and access limitation problems and methods of implementation for automated information systems; (b) the determination of a TACC data base baseline; and (c) the identification of the users of TACC data and their access requirements to classified portions of the TACC data base. The data developed were to be used both in the development of incremental growth capabilities in the TACC and in the design of future automation of the TACS.

Data for user information collected during interviews with personnel at Hqtrs. TAC, Shaw AFB, S.C., and PACAF was refined and assimilated with the data obtained through document research and reproduced in the form of a user catalog (CDRL Item A-005). As stated in the user catalog, the user characteristics of access rates, for both average and peak activity periods, and response time requirements were not available and thus could not be obtained, except for a very few files, during the data collection phase of the study. Only sufficient data was collected to enable the meaningful analysis of the user's nature of access of each file, the total number of users with need to access classified data identified by file and the total number of users accessing each file identified by file. This analysis satisfies only those products of analysis listed in the "Tasks 2 and 3 Problem Definition Document, CDRL Item A-002" numbered 11 and 12, plus a part of number 7.

Product of analysis 11 is a matrix (Table 3.2) showing the total number of users with need to access classified data identified by file or file item. Product of analysis 12 is a matrix (Table 3.1) showing the total number of users accessing unclassified files or file items which, when combined with Table 3.2, will show the total number of users accessing each file identified by file or file item. The portions of the product of analysis 7 which are included in each entry in the columns of Tables 3.1 and 3.2 are indications for (a) the nature of access by each user to each of the files or file items and (b) the volume for each access of each file or portion of a file.

2.0 ANALYSIS TECHNIQUES

The analysis procedures were set up to enable the analyst to (a) determine which characteristics and parameters of the data base are relevant for the selection of security techniques, (b) retrieve the applicable data from the previously tabulated data or prepare special listings as necessary, (c) perform the analysis to determine the relative effects on system parameters caused by the various relevant techniques for the protection of classified data.

In order to realize the products of the analysis task (stated in Section 1.0), the information contained in the Data Collection Forms, Sheet 4, was transposed to the format for entry into the User Catalog (CDRL Item A-005). The data contained in the User Catalog was then entered into the matrix shown in Tables 3.1 and 3.2 in Section 3.0. This matrix satisfies the total requirements of products of analysis 11 and 12, and the part of 7 which can be provided with the limited data collected. Conclusions drawn from this matrix are also listed in Section 3.0.

3.0 USER NATURE OF ACCESS ANALYSIS

Tables 3.1 and 3.2 contain matrixes showing the files in the current TACC data base grouped by security classification on the vertical axis and the users on the horizontal axis. User accesses to the data base are indicated to the right of the file, record or item by symbols designating type or nature of access. Accesses to the data base are of three types:

E = Entry

U = Update

I = Information

"Entry" means that the user provides the data. Each Entry consists of data which will add a new record or replace an existing record. Volume for each Entry is the total for that record.

"Update" means that the user is responsible for changing the data within a record. Each Update will change the data in one or more item(s) of a record. Volume for each Update will be the total characters of either an item or record.

"Information" means that the user retrieves data for Information as required in the accomplishment of his assigned operational function. Each Information access will only be one record or item. Volume for each Information access will be the characters for a record or item. Only in special cases when a file is a document(s) will the entire file be accessed on one access.

For purposes of these analyses, it was assumed that any user updating or entering data will also correct the date; therefore, correction is not indicated as a separate access.

Rationale: The present structure of the files, in most cases precludes a user from retrieving one item of data. In the manual

TACC data base files, the records are composed of interrelated items. Also, a record may contain all the items on one sheet of paper. Therefore, in most cases, since the information is contained in the file in the same format as it came into the system, primarily messages, it is physically impossible to retrieve only one item of information. In an automated system the files probably would be structured so that individual items of information could be accessed without disturbing the remainder. Also the information is available for simultaneous use without additional copies being made of the original data.

Internal users of the TACC data base are those functional groups or duty positions included in the current TACC sections of Current Operations, Current Plans, Weather, and ALCC (even though the ALCC may be physically located remote from the rest of the TACC). External users are all other users. External users may be located in other TACS elements, such as the DASC, CRC, and ALCE, in interface elements such as the Joint Force, Army Forces Component (ARFOR), and in tactical airbase (TAB) elements, such as combat wings, the Combat Support Group (CSG) and airborne aircraft.

The following conclusions or factors which may be of value to designers of the Automated TACC are drawn from Tables 3.1 and 3.2:

1. There are only 48 of the 235 files which are not accessed by external users.
2. Two internal users access the TACC data base for information only.
3. Twenty external users access the TACC data base for information only.
4. Twenty-Nine external users access the TACC data base only to enter data into it.

5. External users enter data into 155 of the 235 files.
6. Of the 110 external users, 68 enter data into the TACC data base.

4.0 RECOMMENDATIONS FOR ADDITIONAL STUDY

4.1 Access Rate, Peak Periods and Response Time Study

Since data could not be collected concerning TACC data base under access rates during both average and peak activity periods and user response time requirements, a study is recommended to develop this data which is much needed for SEEK FLEX design purposes. Hughes recommends that an activity model be developed based on the force model documented in the Tabulation Reports, CDRL Items A-003 and A-005, which could be used to realistically estimate users' access and response time requirements. Access and response time requirements data thus developed would be compatible with the type of operation which the modelled forces are capable of executing.

4.2 Alphanumeric Display versus Graphic Display Trade-Off Study

The results of the Data Base Security Study indicate that a considerable amount of the data base is textual, tabular or mixed data. In order for the data base to properly interface with the user, the display of this data base to the user must be properly organized for effective use. Consideration of the use of graphic data based upon the pictorial data already used at the TACC could perhaps reduce the number of alphanumeric type displays and enhance the direction of tactical operations. The cost of alphanumeric displays is considerably smaller than the cost of graphic displays. A study is recommended based upon the common data base study proposed in A-004, Section 11, to determine

the user positions and the alphanumeric displays required for each of these positions. A trace-off study of the graphic display capability at each of these positions warranting such facilities versus the alphanumeric display at each user position to determine if a graphic display capability in terms of cost and effectiveness in addition to alphanumeric displays is a suitable addition to the automated TACC of the post-75 time frame.
