APPROVED FOR PUBLIC RELEASE; DISTRIBUTION UNLIMITED

AIR FORCE ROCKET PROPULSION LABORATORY
EDWARDS AIR FORCE BASE, CALIFORNIA

FOREWORD

The ASC/TMC Preliminary Design Computer Program for air and surface launched missiles was developed under Contract F04611-71-C-0013 by the Thiokol Chemical Corporation, Wasatch Division, Brigham City, Utah. The program was started on 1 October 1970 and completed on 1 September 1972. The Air Force Project Monitor was Lt Louis Fox, MKCD.

Wasatch Division personnel who contributed significantly to development of the computer program and to preparation of this final report are identified in the following tabulation.

<u>NAME</u>	<u>AREA OF RESPONSIBILITY</u>
Management	
J. W. Wilson, A. R. Osburn B. C. Brinton, L. F. Carter, D. P. Dahle	Program Managers Project Engineer and Principal Investigators
Technical	
L. F. Carter	Trajectory, duty cycle, test cases and evaluation study
G. L. Dewey	Aerodynamics
R. A. Ellis, D. P. Dahle	Nozzle design
J. R. Lavery, B. H. Prescott	Nozzle torque
J. A. Boyd	Actuation and roll system
T. L. Nickens	LITVC actuation and pressurization
D. M. Cox	Hot gas TVC
L. H. Erickson	LITVC performance
S. V. Peterson	Jet tabs
V. L. Ruggles	Mass properties

13. ABSTRACT

UNCLASSIFIED ABSTRACT

This final report documents work accomplished under contract F04611-71-C-0013. The program discussion describes the intent and capabilities of the computer program which was developed to (1) evaluate preliminary duty cycles for missile systems, (2) develop specifications for the control system being employed, (3) perform preliminary design analysis on any of the control options, and (4) predict the performance capability of a vehicle utilizing the control system characteristics obtained from the program. The seven potential control inputs are liquid injection thrust vector control, hot gas thrust vector control, gimbal ring, ball and socket, flexible seal, jet tabs, and aerodynamic surfaces. The program has the capability to determine the thrust magnitude required to fly any one of the six types of trajectories where thrust vector and thrust magnitude control is required. The nozzle design capability includes two types of fixed nozzles and five types of movable nozzles. The program also incorporates design capability for pintle nozzle single chamber thrust magnitude control with or without thrust vector control. Two material options are available for case design, metal and filament wound glass. A three dimensional six degrees of freedom trajectory routine is available in the program.

"When U.S. Government drawings, specifications, or other data are used for any purpose other than a definitely related Government procurement operation, the Government thereby incurs no responsibility nor any obligations whatsoever, and the fact that the Government may have formulated, furnished, or in any way supplied the said drawings, specifications, or other data, is not to be regarded by implication or otherwise, or in any manner licensing the holder or any other person or corporation, or conveying any rights or permission to manufacture, use, or sell any patented invention that may in any way be related thereto."

I. INTRODUCTION

This user's manual is provided to assist in preparing input data and interpreting the output of the ASC/TMC Computer Program.

The manual first discusses the overall program logic and how to specify which portions of the program are to be executed. The method of input utilized by the program is discussed including examples. The input requirements are presented for each portion of the program, along with a sample input and resultant program printout.

II. PROGRAM LOGIC

A. PROGRAM FLOW

Figure 1 contains the macro flow chart of the ASC/TMC computer program flow control logic.

Preceding page blank

Figure 1. Program Flow (Sheet 1 of 4)

Figure 1. Program Flow (Sheet 2 of 4)

Figure 1. Program Flow (Sheet 3 of 4)

Figure 1. Program Flow (Sheet 4 of 4)

B. CONTROL INPUT

The first input card for each case is a control card which specifies by a control flag what program subroutines are to be executed.

A flag may be input in each even column of the card from column 2 through 32, namely 2, 4, 6, 8 ... 32.

The flags are divided into three groups:

1. Columns 2, 4 and 6 control execution of the three major sections of the program.
2. Columns 8 through 18 control execution of the requirements section of the program.
3. Columns 20 through 32 control execution of the hardware section of the program.

TABLE I

1. PROGRAM EXECUTION FLAGS

<u>Column</u>	<u>Section</u>
2	Requirements Section
4	Hardware Section
6	Refly Logic Section

<u>Value</u>	<u>Definition</u>
0 or blank	Do not enter this section of the program.
1	Enter this section of the program. Read a set of input followed by a T-card and execute the portions of this section as requested. The input storage locations will not be reset to their initial default values; therefore, only values which change from a preceding case for this section need be input.
2	Do the same as 1, above, except reset the input storage locations to their initial default values.

TABLE I (Cont)

2. REQUIREMENTS FLAGS

<u>Column</u>	<u>Portion of Requirements Section</u>
8	Trajectory Simulation
10	Aerodynamic Coefficients
12	Aerodynamic Lifting Surfaces
14	Roll Control Requirements
16	Punch Duty Cycle
18	Aerodynamic Loading Distribution

<u>Value</u>	<u>Definition</u>
0 or blank	Do not enter this portion of the Requirements Section.
1	Enter and execute this portion of the Requirements Section.

TABLE I (Cont)

3. HARDWARE FLAGS

<u>Column</u>	<u>Portion of the Hardware Section</u>
20	Nozzle Design
22	Liquid Injection Performance and Actuation
24	Hot Gas
26	TVC Actuation, Roll System, and TMC Power Supply
28	Nozzle Torque
30	Jet Tab
32	Weight Summary
<u>Value</u>	<u>Definition</u>
0 or blank	Do not enter this portion of the Hardware Section.
1	Enter and execute this portion of the Hardware Section.

Following is a list of what hardware flags are usually specified
for the types of thrust vector control (TVC) available.

<u>Card Columns</u>																																			<u>TVC</u>
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	
	2																		1							1		1			1				Movable Nozzle
	2																		1		1					1					1				Liquid Injection
	2																		1					1		1					1				Hot Gas
	2																		1						1				1		1				Jet Tabs
	2																		1						1						1				No TVC

SECTION III

REQUIREMENTS

A. INPUT

The Thiokol input routine (CTINP) used in this program is a versatile non-card-column oriented input subroutine. It permits a variable field input in that specific separation characters are sufficient to distinguish the individual input data items. The capabilities of the routine are described below.

1. Blank card columns are ignored, except when reading Hollerith data.
2. Data can be entered in card columns 1 thru 72. Columns 73 thru 80 are ignored.
3. Separate numerical input is distinguished from other similar input by the use of its associated sign "+" or "-" and/or a comma", ". The following three examples are equivalent:

$+4, +3, -2, +5.0$
 $+4, 3, -2, 5$
 $+4, +3, -2 +5$
4. Numerical information for the TVC design program can be input as a normal decimal number (i.e., 1.20, 0.35 or 17), or as a decimal number scaled by a power of 10. The character "E" is used to indicate scaling by a power of 10. A scaled number is written in two parts. The digits preceding the "E" form the basic number. The numbers following the "E"

define the power of 10 by which the basic number is to be multiplied. For example, the number 1.5421 can be written in many ways; the following are some of the possibilities using the "E" format.

Example: $1.5421 = 0.15421 \text{ E } 01 = 1542.1\text{E}-03$

5. Control information is relayed to the input routine through the use of the characters "L" and "T".
- a. The character "L" indicates to the input routine that a starting location for storing data is to be established.

Example: L22 + 4-3

This example would cause the routine to store normalized floating point binary equivalents of +4 and -3 in relative locations 22 and 23, respectively.

- b. The character "T" signals to the input routine that the end of a loading sequence has occurred. The "T" must appear in column 1 of a card. Hollerith information contained on the "T" card will be placed in core. The TVC design program will print the Hollerith information on the "T" card on the top of each page of the output.
- c. If sequential parameters are being input, only the L-number associated with the first parameter need be designated. However, once the sequence format of the input parameters is broken, a new L-number must be designated.

Assume the following information is to be loaded into the relative locations given.

<u>Relative Location</u>	<u>Data</u>
10	2.0
11	17.6
12	-24.3
17	18.1
18	0.001
24	4390000

The two sets of data shown below are equivalent and represent only two of many approaches that could be taken.

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51	52	53	54	55	56

L17	+18.1		+		1E-3		L24		+.439E7																																														
T	ANY MESSAGE PUNCHED HERE WILL BE PRINTED ON OUTPUT																																																						

1. Duty Cycle Input

Duty cycle data are required in three portions of the Requirements Section.

1. Roll control requirements.
2. Punch duty cycle.
3. Aerodynamic loading distribution.

Duty cycle data are also required for the Hardware Section.

These data may be obtained in three ways.

1. By executing the trajectory simulation portion of the program, the duty cycle data will be stored in the proper location and need not be input.
2. Supplying the duty cycle with the Requirements Section input.
3. For the Hardware Section, the user may select Number 1 or 2 above, or supply the duty cycle input with the hardware input.

In the time dependent portion of the duty cycle, discontinuous points may be input by following two rules.

1. The point at which a discontinuity occurs must be input twice.
2. The number of points between discontinuities must be three or more, including the discontinuous points.

Example:

<u>Time</u>	<u>Deflection Angle</u>
0	0
2	1
4	2
4	4
6	4
8	4

The minimum number of points in the time dependent portion of the duty cycle is three.

The following parameters are input for the duty cycle.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Units</u>
7000	$\bar{I}$	Motor thrust impulse for TVC duty cycle stage.	lb-sec
7001	$\bar{I}_v$	Motor vacuum thrust impulse for TVC duty cycle stage.	lb-sec
7002	x_e	TVC duty cycle stage thrust vector point body station.	ft
7003	x_{nf}	Body station of nozzle flange of the TVC design stage. Input in L-680.	ft
7004	δ_{me}	Design maximum vector angle for TVC duty cycle stage. Input in L-681.	deg
7005	I_{SPM}	Main table specific impulse for the TVC duty cycle stage. Input in L-(K_{dc}) 010.	sec
7006	$\bar{\omega}_c$	Slew frequency used in the TVC design stage slew rate calculation.	rad/sec
7007	δ_s	Control system design slew rate for TVC design stage.	deg/sec
7008	$\bar{\delta}_s$	Slew angle for TVC design stage.	deg
7009	$\bar{I}_p$	Pitch control thrust impulse per control motor from TVC duty cycle initiation to stage termination.	lb-sec
7010	$\bar{I}_{\delta p}$	Integral of the pitch angular thrust vectoring velocities from TVC duty cycle stage initiation to stage termination.	deg
7011	$t_{\eta p}$	Stage time at which maximum magnitude pitch thrust vector deflection angle occurs during the TVC design stage ($\bar{\delta}_{pmax}$).	sec
7012	η_p	Ratio of the delivered thrust (F) to vacuum thrust (F_{vac}) at maximum magnitude pitch TVC deflection angle ($\bar{\delta}_{pmax}$).	dim
7013	$\dot{\delta}_{pmax}$	Maximum pitch thrust vector deflection angular rate, for the TVC design stage.	deg/sec
7014	$\bar{\delta}_{pmax}$	Maximum magnitude pitch thrust vector deflection angle, per control motor for the TVC design stage.	deg

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Units</u>
7015	$\bar{I}_y$	Yaw control thrust impulse per control motor from TVC stage initiation to stage termination.	lb-sec
7016	$\bar{I}_{\delta Y}$	Yaw deflection rate integral per vehicle control motor.	deg
7017	$t_{\eta Y}$	Stage time at which maximum magnitude yaw thrust vector deflection angle occurs during the TVC design stage (δ_{Ymax}).	sec
7018	η_Y	Ratio of the delivered thrust (F) to vacuum thrust (F_{vac}) at maximum magnitude yaw TVC deflection angle (δ_{Ymax}).	dim
7019	$\dot{\delta}_{Ymax}$	Maximum yaw thrust vector deflection angular rate, for the TVC design stage.	deg/sec
7020	δ_{Ymax}	Maximum magnitude yaw thrust vector deflection angle, per control motor for the TVC design stage.	deg
7021	$q\alpha'_{max}$	Product of the maximum absolute value of the dynamic pressure-angle of attack for the TVC design stage.	lb-deg/sq ft
7022	$q_{q\alpha'}$	Dynamic pressure at maximum $q\alpha'$ during the TVC duty cycle stage.	lb/sq ft
7023	$t_{q\alpha}$	TVC duty cycle stage time at maximum $q\alpha'$.	sec
7024	C_{Noq}	Aerodynamic normal force coefficient at maximum $q\alpha'$ during the TVC duty cycle stage.	1/deg
7025	$M_{q\alpha}$	Mach number at maximum $q\alpha'$ during the TVC duty cycle stage.	dim.
7026	$\bar{\delta}_{avg}$	Average TVC deflection angle per control motor for the TVC design stage.	deg
7027	K_{dc}	Stage number of the TVC duty cycle stage. Input in L-671.	dim.
7028	D_B	TVC duty cycle stage case diameter from axial force reference area.	in.
7029	A_{FW1}	Stage I vacuum thrust to liftoff weight used in the vehicle characteristics pertinent to roll requirements.	g's
7030	t_B	TVC duty cycle stage time.	sec

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Units</u>
7031	F_{vave}	TVC duty cycle stage average vacuum thrust.	lb
7032	W_o	TVC duty cycle stage liftoff weight used in the roll control requirements.	lb
7033	R_{PFV}	Ratio of motor chamber pressure to vacuum thrust of the main thrust table of the TVC design stage.	1/sq in.
7034	$\bar{\epsilon}_d$	Nozzle average expansion ratio for TVC design stage. Input in L-(K _{dc}) 013.	dim.
7035	$\bar{A}_t$	Nozzle throat area for the main motor of the TVC design stage.	sq in.
7036	$\bar{\gamma}_d$	Ratio of specific heats of the rocket motor exhaust gases of the TVC design stage.	dim.
7037	P_{ca}	Action time average motor chamber pressure for the TVC design duty cycle stage.	lb/sq in.
7038	C^*	Rocket motor propellant characteristic velocity for the TVC design duty cycle stage.	ft/sec
7039	W_{TVC}	Estimated TVC system fixed weight. Used in TVC design stage for the reflly option. Input in L-677.	lb
7040	W_{exi}	Estimated weight of the TVC system expended weight during the TVC design stage during the original vehicle flight. Input in L-678.	lb
7041	I_{spaug}	Estimated TVC system caused specific impulse augmentation (positive) or degradation (negative). Used in trajectory TVC design program reflly. Input in L-679.	sec
7044	n_m	Number of motors in the stage cluster	dim.
7045	n_c	Number of control nozzles for the cluster motor logic.	dim.
7046	Δ_{dc}	Number of TVC duty cycle t_B data points	dim.
7047	$M_{hzm\max}$	Maximum of the absolute value pitch fin hinge torque for the TVC design stage.	ft-lb

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Units</u>
7048	M_{hymax}	Maximum of the absolute value yaw fin hinge torque for the TVC design stage	ft-lb
7052	$h_{q\alpha'}$	Altitude of TVC duty cycle stage maximum $q\alpha'$.	ft
7053	$P_{q\alpha'}$	Atmospheric pressure of TVC duty cycle stage maximum $q\alpha'$.	lb/sq ft
7054	$\bar{I}_{VM}$	Integral of the vacuum thrust of the input main thrust table in the TVC duty cycle stage. Input in L-(K _{dc}) 005.	lb-sec
7055	$\bar{W}_{MO}$	Initial main weight for the TVC duty cycle stage. Input in L-(K _{dc}) 006.	lb
7056	$\bar{K}_{tM}$	TVC duty cycle stage, the main switching time multiplier. Input in L-(K _{dc}) 009.	dim.
7057	$\alpha_{q\alpha'}$	Angle of attack in pitch at TVC design stage maximum $q\alpha'$.	deg
7058	$\beta_{q\alpha'}$	Angle of side slip in yaw at TVC design stage maximum $q\alpha'$.	deg
7059	P_{cmax}	Maximum main motor chamber pressure in TVC duty cycle stage.	lb/sq ft
7060	$\dot{A}_{tmax}$	Pintle System required throat area rate.	in ² /sec
7061	I_{At}	Integral of the absolute value of the pintle throat area rate.	in
7062	F_{max}	Pintle motor maximum vacuum thrust.	lb
7063	P_{cmax}	Pintle motor chamber pressure at maximum vacuum thrust.	lb/in. ²
7064	E_{max}	Pintle motor expansion ratio at maximum vacuum thrust.	dim.
7065	A_{tmin}	Pintle motor throat area at maximum vacuum thrust.	in. ²
7066	C_{fmax}	Pintle motor vacuum thrust coefficient at maximum vacuum thrust.	dim.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Units</u>
7067	F_{min}	Pintle motor minimum vacuum thrust.	lb
7068	P_{cmin}	Pintle motor chamber pressure at minimum vacuum thrust.	lb/in. ²
7069	E_{min}	Pintle motor expansion ratio at minimum vacuum thrust.	dim.
7070	A_{tmax}	Pintle motor throat area at minimum vacuum thrust.	in. ²
7071	C_{fmin}	Pintle motor vacuum thrust coefficient at minimum vacuum thrust.	dim.
7072	A_{amax}	Motor extinguishment throat area.	in. ²
7073	A_{tmn}	Pintle motor duty cycle minimum throat area.	in. ²
7074	A_{tmx}	Pintle motor duty cycle maximum throat area.	in. ²
7081	Y-CG CANARD	Lateral center-of-gravity of one canard relative to body centerline.	in.
7082	Y-CG FIN	Lateral center-of-gravity of one fin relative to body centerline.	in.
7083	X-CG CANARD	Longitudinal center-of-gravity of a set of canards.	in. , BS
7084	X-CG FIN	Longitudinal center-of-gravity of a set of fins.	in. , BS
7085	WT CANARD	Weight of a set of canards (a set is four).	lb
7086	WT FIN	Weight of a set of fins (a set is four).	lb
7087	CAN	Code number designating existence or nonexistence of aerodynamic canards on vehicle (0 = no canards, 1 = movable canards, 2 = fixed canards).	dim.
7088	FIN	Code number designating existence or nonexistence of aerodynamic fins on vehicle (0 = no fins, 1 = movable fins, 2 = fixed fins)	dim.
7089	I-ROLL	Roll control disturbing moment impulse.	ft-lb-sec
7090	M1	Mach number at upstream side of downstream end of last body section.	dim.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Units</u>
7091	P1	Static pressure at upstream side downstream end of last body section.	psi
7092	X1	Body station of downstream end of last body section.	in. , BS
7093	X0	Body station of upstream end of last body section.	in. , BS
7094	SIGMA	Body surface angle relative to body centerline of last body section.	deg
7095	RMR	Roll moment arm	in.
7096	ROLL TORQUE	Maximum disturbing open roll torque.	in. -lb
7097	OFFSET TORQUE	Maximum disturbing offset roll torque.	in. -lb
7098	VORTEX TORQUE	Maximum disturbing vortex roll torque.	in. -lb
7099	AERO TORQUE	Maximum disturbing aerodynamic roll torque.	in. -lb
7100	t_{Bq}	Stage time at which TVC duty points occur	sec
7199			
7200	$\bar{\delta}_{Pq}$	Pitch thrust deflection angle at t_{Bq}	deg
7299			
7300	$\bar{\delta}_{Yq}$	Output modified yaw thrust deflection angle at t_{Bq} for TVC design stage	deg
7399			
7400	F_q	Delivered motor thrust (F) at t_{Bq} during TVC design stage	lb
7499			
7500	X_{cgq}	Vehicle center-of-gravity at t_{Bq} ; the TVC duty cycle point	ft
7599			
7600	F_{vacq}	Vacuum motor thrust during the TVC design stage ($\bar{F}_{vac}$) at t_{Bq}	lb
7699			
7700	$\dot{W}_q$	Output motor weight flow (W) at t_{Bq}	lb/sec
7799			

2. Aerodynamic Coefficients Input

<u>L-No.</u>	<u>Body Input</u>	<u>Definition</u>	<u>Units</u>
500 thru	BS_n	Body station of each corner on the vehicle outboard profile	in.
541	BD_n	Body diameter at each corner for the particular body station input	in.
Program Accomodates 21 Separate Corners			
542	BS, Sep 1-2	Body station at which the first body separation is desired	in.
543	BS, Sep 2-3	Body station at which the second body separation is desired	in.
544	BS, Sep 3-4	Body station at which the third body separation is desired	in.
548	Ae_1	Nozzle exit area at vehicle launch	sq in.
549	Ae_2	Nozzle exit area for second burn event (program uses this in conjunction with BS, Sep 1)	sq in.
550	Ae_3	Nozzle exit area for third burn event (program uses this in conjunction with BS, Sep 2)	sq in.
551	Ae_4	Nozzle exit area for fourth burn event (program uses this in conjunction with BS, Sep 3)	sq in.
554	BD Ref	Reference body diameter. Normally is diameter of largest cylindrical body section of vehicle	sq in.
555	R_N Input Code	1. Small two stage ballistic missile 2. Large three or four stage ballistic missile 3. Large booster vehicle 4. Small air launched missile	dim.

3. Lifting Surfaces Input

<u>L-No.</u>	<u>Body Input</u>	<u>Definition</u>	<u>Units</u>
560	CANARD	Option to calculate lifting surface parameters for canards 0 No calculations made 1 Calculates and considers surface is movable 2 Calculates and considers surface is fixed	dim.
561	x_{or}	Body station of canard root chord leading edge $(x_{or} \leq x_e - c_R)$	in.
562	c_R	Canard root chord length	in.
563	ϵ_L	Complement of canard leading edge sweep angle $(24^\circ \leq \epsilon_L \leq 70^\circ)$	deg
564	λ	Canard taper ratio $(0 \leq \lambda \leq 0.60)$	dim.
565	τ	Canard thickness ratio $(0.030 \leq \tau \leq 0.120)$	dim.
566	x_H	Canard hinge line body station $(x_H < x_e)$	in.
567	r_b	Average body radius in distance between canard root chord leading and trailing edge	in.
568	ρ	Canard material option code 0 Aluminum 1 Steel	dim.
572	FIN	Option to calculate lifting surface parameters for fins 0 No calculations made 1 Calculates and considers surface is movable 2 Calculates and considers surface is fixed	dim.

<u>L-No.</u>	<u>Body Input</u>	<u>Definition</u>	<u>Units</u>
573	x_{or}	Body station of fin root chord leading edge ($x_{or} \leq x_e - c_R$)	in.
574	c_R	Fin root chord length	in.
575	ϵ_L	Complement of fin leading edge sweep angle ($24^\circ \leq \epsilon_L \leq 70^\circ$)	deg
576	λ	Fin taper ratio	dim.
577	τ	Fin thickness ratio ($0.030 \leq \tau \leq 0.120$)	dim
578	x_H	Fin hinge line body station ($x_H < x_e$)	in.
579	r_b	Average body radius in distance between fin root chord leading and trailing edge	in.
580	ρ	Fin material option code 0 Aluminum 1 Steel	dim.

Also required for lifting surface input are L-No. 554 and 555 from the aerodynamic coefficients input. Please refer to that section for a description of these two L-numbers.

4. Trajectory

For a definition of the trajectory input, please refer to Volume I, Book 1B, Section III.

5. Roll Control Requirements Input

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Units</u>
700	K_{tr}	Control flag where, if non-zero, the parameters $C_{N\alpha}$, $q_{\alpha m}$, and δ_{mx} are obtained from the TVC duty cycle parameters $C_{N\alpha q}$, $q_{\alpha' max}$ and $\bar{\delta}_{pmax}$, respectively.	dim.
701	K_k	*Stage number.	dim.
702	D_B	*TVC duty cycle stage case diameter.	in.
703	F_{vac}	*Nominal input vacuum thrust.	lb
704	W_o	*Stage liftoff weight.	lb
705	F_{vac1}/W_{o1}	*Stage I average vacuum thrust to stage liftoff weight.	dim.
706	$C_{N\alpha}$	**Aerodynamic normal force coefficient at maximum $q_{\alpha'}$.	1/deg 0.05
707	$q_{\alpha m}$	**Maximum absolute value of dynamic pressure - angle of attack product.	lb-deg/sq ft (C)
708	δ_{mx}	**Maximum thrust vector deflection angle.	deg (C)
709	ϵ_{os}	Effective offset distance.	in. (C)
710	η_{vr}	Vortex roll torque per pound of thrust factor.	in. 0.00363
711	$K_{q\alpha}$	Factor of maximum dynamic pressure - angle of attack.	dim. 1.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Units</u>
712	$K_{\theta m}$	Factor of maximum thrust vector deflection angle.	dim. 1
713	K_{od}	Effective offset distance multiplier.	dim. 1
714	K_{os}	Offset roll torque multiplier.	dim. 1
715	K_{vr}	Vortex roll torque multiplier.	dim. 1
716	K'_{ar}	Aerodynamic roll torque multiplier.	dim. 1
717	M'_{rt}	Input roll torque.	in. -lb (C)
718	M'_{os}	Input offset roll torque.	in. -lb (C)
719	M'_{vr}	Input vortex roll torque.	in. -lb (C)
720	M'_{ar}	Input aerodynamic roll torque.	in. -lb (C)
721- 724	B'_{qj}	Input coefficients for computing maximum dynamic pressure - angle of attack, $j = 0, 1, 2, 3$.	dim.
725- 727	$B'_{\delta j}$	Input coefficients for computing maximum thrust vector deflection angle, $j = 0, 1, 2$.	dim.
728- 731	$B'_{\epsilon_{oj}}$	Input coefficient for computing effective offset distance, $j = 0, 1, 2, 3$.	dim.
732	η_{rc}	Ratio of roll control duty cycle to maximum roll torque - duration product.	dim.

*Set from duty cycle.

**See L700

The following is a cross reference of the L-Numbers of values that may be obtained from the duty cycle.

<u>Roll Control L-No.</u>	<u>Duty Cycle L-No.</u>
701	7027
702	7028
703	7031
704	7032
705	7029
706	7024
707	7021
708	7014

6. Aerodynamic Loading Distribution Input

The input required for aerodynamic loading distribution comes from two areas:

- 1. The same input required by aerodynamic coefficients.
L-numbers 500 thru 555.**
- 2. Values required from the duty cycle. L-numbers: 7021, 7022,
7024, 7025, 7027, 7052, 7053, 7057, 7058.**

Please refer to the respective section for a description of the values.

B. ERROR MESSAGES

The following errors may occur in the requirements section.

Lifting Surfaces

The lifting surface taper ratio must lie between 0 and 0.6.
The value was XXX.

The complement of the lifting surface leading edge sweep
back angle must lie between 24 and 70 degrees. The value
was XXX.

Interpolation error in setting the slope of the lifting surface
linear lift coefficient. The argument was XXX.

Interpolation error in locating the lifting surface center of
pressure. The argument was XXX.

Interpolation error in obtaining the Reynolds number per
foot. The argument was XXX.

Interpolation error in obtaining the non-linear lift curve
factor. The argument was XXX.

Interpolation error in setting up trajectory data for fins
and canards. The mach number was XXX.

Normal Force Coefficients

No convergence in iteration for supersonic normal force
coefficients.

Interpolation error for subsonic-transonic normal force
parameter eta. The argument was XXX.

Interpolation error for subsonic-transonic normal force
parameter K. The argument was XXX.

C. SAMPLE INPUT

Included in this section and the next, Sample Output, are two test cases that execute all of the Requirements Section except the trajectory portion.

SECTION IV

HARDWARE

A. INPUT

1. DUTY CYCLE INPUT

Duty cycle data required for the Hardware Section may be obtained three ways:

1. By executing the trajectory simulation portion of the program.
2. Supplying the duty cycle input with the Requirements Section input.
3. Supplying the duty cycle input with the Hardware Section input.

For a description of the duty cycle input please refer to the duty cycle input discussion in Section III.A. 1.

The input data for the hardware subroutines are divided into two types, routine input and optional input. Routine data are those which usually are input for each computer run unless stored values are desired. Optional data are those whose values are relatively constant. Typical of the optional data are the empirical constants used in some of the equations; density; strength levels; and moduli of materials used and data input in tabular form, such as the tables defining weights of some of the components. A nominal value for each piece of optional data is stored in the program; the nominal value will be used unless a new value for the parameter is read in from cards. Once a parameter is changed by card for a case, it will remain at the changed

value until again changed or until the user specifies by control card input that the values are to be reset to their initial default values.

This concept of optional data permits running the program with minimum input data for most applications, and yet permits easily changing the optional data should the requirements of a specific case require. The routine and optional input for each of the hardware design subroutines is listed in the tables that follow.

2. NOZZLE INPUT

a. Nozzle Routine Input

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
0	TPNOZ	Nozzle type =1, submerged fixed =2, subsonic splitline =3, external fixed =4, hinged =5, integral =6, submerged inlet, supersonic splitline =7, external inlet, supersonic splitline	--	TPNOZ
1	CONTRL	Thrust vector control =0, no nozzle TVC =1, liquid injection =2, hot gas =3, jet tabs =4, gimbal ring =5, ball and socket =6, flexible seal	--	CONTRL
2	PCLOC	Pivot center location control, 4 or 5 control, 6 =1, at seal =2, forward of seal =3, aft of seal	1 2	PCLOC

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
3	HGVM T	Hot gas valve mounting =1, nozzle mounted submerged pintle valve =2, closure mounted submerged pintle valve =3, plenum mounted submerged pintle valve =4, external pintle valve =5, external jet pipe valve =6, external rotating valve	4	HGVM T
4	TPT	Throat code =1, tungsten =2, graphite =3, plastic =4, actively cooled	3	TPT
5	TPGEO	Exit configuration =1, conical exit =2, contour exit	1	TPGEO
6	TPCSE	Case material =1, metal =2, filament wound glass	1	TPCSE
7	TPBND	Binder type =1, PBAA or PBAN =2, CTPB	1	TPBND

Only one of the following four parameters needs to be input.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
10	DTAVG	Average throat diameter	0 in.→	DIATAV
11*	AT	Average throat area	0 sq in.→	AT
12	DTINT	Initial throat diameter	0 in.→	DIATO
13	ATINT	Initial throat area	0 sq in.→	ATO

*Nonzero input in these locations overrides data from duty cycle. The data are not required if duty cycle values are to be used.

For a conical exit cone, input two of the following: THETAI, LNZN, or EPS (EPS can be either initial expansion ratio, EPSINT, or average expansion ratio, EPSAVG).

For a contoured exit cone, input three of the following: THETAI, DELTH, LNZN, or EPS (EPS is same as defined in the preceding sentence).

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
14	THETAI	Initial angle of contour or half angle of cone Conical Contour	15 deg 23 deg	THETAI
15	DELTH	THETAI minus angle at exit plane (turnback angle)	10 deg	DELTH
16	LNZN	Length, throat to exit	0 in.	ELNZ
17	EPSINT	Initial expansion ratio	0	EPSO
18*	EPSAVG	Average expansion ratio	0	EPSAV
19*	TA	Time of motor operation	0 sec	TA
20*	PC	Average chamber pressure	0 psi	PC
22*	BD	Case diameter	0 in.	DIACSE
23*	XNF	Motor station of nozzle flange face	0 ft	ELXNF

These values are input only if a two level, motor operation is required.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
51	BTA	Boost action time	0 sec	BTA
52	BPCA	Boost phase operating pressure	0 psi	BPCA
53	BXDOT	Boost phase throat erosion rate	0 mils/sec	BXDOT
54	CTA	Coast time (motor shutdown)	0 sec	CTA

*Nonzero input in these locations overrides data from duty cycle.
The data are not required if duty cycle values are to be used.

b. Nozzle Optional Input

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
21	DELMXI	Design thrust vector angle	max. of 3°, δ_{pmax} , δ_{ymax}	DELMXI
If a nonzero value is input, that value is used. If DELMXI = 0, D-DESIGN is used if nonzero; otherwise, the maximum of δ_{pmax} and δ_{ymax} is used. If all four are zero, three degrees are used. (For TYPNOZ = 4, DELMXI is replaced by twice DELMXI.)				
24	ERATIO	Injection port location, EPS/ EPSINT (nozzle types 1 and 3)	0	ERATIO
25	XIRAT	Injection port location, X/LNZ (nozzle types 1 and 3)	0.5	XIRAT
26	XFRAT	Flange location, X/LNZ (nozzle types 1, 5, and 6)	0.3	XFRAT
27	MEOP	Structural design pressure	(C)* psi	POMAXE
If not input, 1.1 x PC-MAX is used if nonzero. If PC-MAX = 0, 1.2 x PC is used.				
28	PA	Ambient pressure	0.0 psi	PA
29	RRATD	Downstream external radius ratio	0.6	RRATD
30	DIABT	Diameter at station 4up (nozzle types 2 and 4)	(C) in.	DIABT
31	THETAC	Inlet angle (nozzle types 2, 3, and 7) (nozzle type 4) (nozzle type 4 with pintle nozzle)	45 deg 3.5 deg 45 deg	THETAC
32	RNOZB2	Radius to inside of flange	(C) in.	RNOZB2
33	FEJDES	Design nozzle ejection load	(C) lb	FEJDES

*C indicates that if value is not input, it will be calculated in the program.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
34	TEC	Chamber temperature Pintle nozzle	6,260°R 6,020°R	TEC
35**	GAM	Isentropic exponent of exhaust gases Pintle nozzle	1.18 1.147	GAM
36**	CSTAR	Characteristic velocity Pintle nozzle	5,200 ft/ sec 5,120 ft/ sec	CSTAR
37	ALUM	Propellant aluminum content Pintle nozzle	16% 12%	ALUM
38	BINDER	Propellant binder content Pintle nozzle	14% 18%	BINDER
39	BLOWCO	Blowing coefficient	(C)*%	BLOWCO

c. Nozzle Optional Input for Cooled Throat

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
56	TWIN	Thickness of porous insert	(C) in.	TWIN
57	TPINS	Allowable throat insert temper- ature	4,000° F	TPINS
58	TMAN	Manifold coolant temperature	140° F	TMAN
59	PRNDTL	Prandtl number of exhaust gas	0.7 ²	PRNDTL
60	VISGAS	Viscosity of exhaust gas	6×10^{-5} lb/ft-sec	VISGAS
61	VISXP	Viscosity exponent of exhaust gas	0.6	VISXP
62	XMWG	Molecular weight of exhaust gas	26	XMWG

*C indicates that if value is not input, it will be calculated in the program.

**The stored value will be used if no value is available from the duty cycle.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
63	CPCOOL	Specific heat of coolant	0.523 Btu/lb° F	CPCOOL
64	ACCOOL	Porous insert flow constant	0.0593	ACCOOL
65	BCOOL	Porous insert flow constant	15.08	BCOOL
66	XMWC	Molecular weight of coolant	17	XMWC
67	HVAP	Coolant heat of vaporization (use 0 if not liquid at manifold)	509 Btu/lb	HVAP
68	CTMC	Coolant tank material code	1	CTMC
69	TSC	Coolant tank shape code =1, toroidal =2, spherical	(C)*	TSC
70	RHOCL	Density of coolant	0.0215 lb/cu in.	RHOCL

d. Nozzle Optional Input for Movable Nozzle

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
71	RMXB	Radial limit line	(C) in.	RMXB
72	XIM	Axial limit line	(C) in.	XIM
73	ANGN	Iteration start angle	(C) deg	ANGN
74	ANGM	Iteration limit angle	(C) deg	ANGM
75	ELMS	Minimum seal gap length Flexible seal Others	0.3 in. (C) in.	ELMS
76	DALL	Iteration closure angle	0.003 deg	DALL

*C indicates that if value is not input, it will be calculated in the program.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
77	DANN	Iteration step angle	3 deg	DANN
78	TFL	Radial nose thickness	(C)* in.	TFL
79	OFLG	Matching flag	1	OFLG

e. Nozzle Optional Input for Ball Seal

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
81	PSIL	Allowable liner pressure load supersonic splitline (Applies only if CONTRL = 5)	5,000 psi	PSIL
82	CAMP	Amplification factor	(C)	CAMP
83	AMPFLG	Amplification factor flag =0, do not modify DELMXI =1, modify DELMXI by CAMP (Applies only to TYPNOZ = 6 or 7)	0	AMPFLG

f. Nozzle Optional Input for Gimbal Ring

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
85	HGR	Height of section (radial)	(C) in.	HGR
86	HRR	Ratio of height to ID subsonic splitline or integral supersonic splitline	0.15 0.08	HRR
87	RBH	Ratio of width to height subsonic or supersonic splitline integral	2 2	RBH
88	RWB	Ratio of wall thickness to width subsonic splitline or integral supersonic splitline	0.25 0.5	RWB

*C indicates that if value is not input, it will be calculated in the program.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
89	RWH	Ratio of wall thickness to height subsonic splitline or integral supersonic splitline	0.15 0.5	RWH
90	DLAX	Allowable axial deflection	(C)* in.	DLAX
91	DLLAT	Allowable lateral deflection	0.01 in.	DLLAT

g. Nozzle Optional Input for Flexible Seal

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
94	HGT	Height of seal	(C) in.	HGT
95	BETA1	Inner seal angle	45 deg	BETA1
96	BETA2	Outer seal angle	55 deg	BETA2
97	SHANG	Shear angle	10 deg	SHANG
98	TMTR	Ratio of metal to rubber	2	TMTR
99	TM	Thickness of metal shim	0.05 in.	TM
100	RHT	Ratio of height to chord	1	RHT
101	FSB	Shim stress factor of safety	1.25	FSB
102	FSH	Rubber shear factor of safety	1.25	FSH
103	EMSLIN	Thickness of insulated splitline structure	(C) in.	EMSLIN
104	BTK	Boot thickness	0.2 in.	BTK

*C indicates that if value is not input, it will be calculated in the program.

h. Nozzle Optional Input for Throat Insert

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
105	TVOID	Plenum height, cooled throat	(C)* in.	TVOID
106	TTIV	Virgin insert thickness at end of firing	(C) in.	TTIV
107	TTIE	Thickness of insert erosion	(C) in.	TTIE

i. Exit Ring Optional Input

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
108	XACT	X distance from throat to point of actuator attachment	(C) in.	XACT
109	RACT	R distance from throat to point of actuator attachment	(C) in.	RACT

j. Nozzle Optional Input for Pintle Nozzle

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
40	PNOZ	Control = 1, design pintle nozzle	0	PNOZ
41	PTYPE	Pintle type = 1, solid tungsten = 2, tungsten shell = 3, ablative sleeve	(C)	PTYPE
42	FMAX	Maximum thrust level	(C)	FMAX
43	PCMAX	Chamber pressure at FMAX	(C)	PCMAX
44	EPSMAX	Expansion ratio at FMAX	(C)	EPSMAX
45	ATMINA	Aerodynamic throat area at FMAX	(C)	ATMINA

*C indicates that if value is not input, it will be calculated in the program.

<u>L.No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
46	FMIN	Minimum nonzero thrust level	(C)*	FMIN
47	PCMIN	Chamber pressure at FMIN	(C)	PCMIN
48	EPSMIN	Expansion ratio at FMIN	(C)	EPSMIN
49	ATMAXA	Aerodynamic throat area at FMIN	(C)	ATMAXA
50	ATEXTA	Aerodynamic throat area required for motor extinguishment	(C)	ATEXTA
55	EXT	Control = 0, do not design for motor extinguishment = 1, design for motor extinguishment	0	EXT
80	GTYPE	Grain type = 1, constant surface area = 2, variable surface area	2	GTYPE
92	ATMXA	Maximum aerodynamic throat area	(C)	ATMXA
93	ATMNA	Minimum aerodynamic throat area	(C)	ATMNA
1068	RPTIP	Pintle tip radius	(C)	RPTIP
1069	TB	Total burn time	(C)	TB
1070	NSTT	Number of struts	3	XNSTT
1071	BETAST	Strut angle	(C)	BETAST
1072	PHYD	Hydraulic supply pressure	3,000	PHYD
1073	LLVDT	Length of feedback (LVDT)	1.75	XLLVDT

*C indicates that if value is not input, it will be calculated in the program.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
1074	ODLVDT	Outside diameter of feedback (LVDT)	0.5	ODLVDT
1075	ABAL	Percent of pintle tip which is area balanced	(C)*	ABAL
1076	BREXP	Propellant burn rate exponent	0.75	BREXP
1077	CDB	Boost discharge coefficient	0.97	CDB
1078	CDS	Sustain discharge coefficient	0.87	CDS
1079	CDEXT	Extinguishment discharge coefficient	0.85	CDEXT
1080	BXDOTP	Pintle erosion rate during boost conditions	(C)	BXDOTP
1081	SXDOTP	Pintle erosion rate during sustain conditions	(C)	SXDOTP
1082	ODP	Outside diameter of pintle	(C)	ODP
1083	STR	Maximum pintle stroke	(C)	STR
1084	STRDOT	Pintle velocity	(C)	STRDOT
1085	INTMC	Integral of STRDOT	(C)	XINTMC
1086	LPNT	Total pintle length	(C)	XLNT
1087	RIDSRT	Radius to inside diameter of pintle insert	(C)	RIDSRT
1088	L1200	Axial length from pintle tip to 1,200°F isotherm	(C)	XL1200

*C indicates that if value is not input, it will be calculated in the program.

k. Nozzle Optional Input Equation Constants

14	Available	783	0	0	2445	0.333
15	Available	785	0	0	2446	0.25
			Units	lb/cu in.	lb/cu in.	

The L-No. given preceding the density is for the virgin density. Add one to that L-No. for the corresponding char density. The backup thickness L-No. is given preceding its value. (Backup thickness is the same as CN343 thru CN357.) The backup thickness stored is based on a 60 sec firing. Erosion for materials 13 and 14 is proportional to the calculated erosion for material 1 by the ratios CN340 and CN341, respectively (e. g., erosion (13) = erosion (1) * CN340). The desired ratios must be input for CN340 and CN341. Char calculation is identical to that calculated for material 1.

Erosion for material 15 is proportional to material 2 by the ratio CN342. Char calculation is identical to that calculated for material 2.

L-No.	Symbol	Value
2429	CN340	1
2430	CN341	1
2431	CN342	1

TABLE 5
NOZZLE OPTIONAL INPUT FOR STRUCTURAL RINGS

The L-No. given are for the density. Additional L-No. are consecutive from left to right.

TABLE 9
NOZZLE OPTIONAL INPUT FOR
SPECIAL INSULATION RINGS

	L-No.	Material code	X to centroid	R to centroid	Axial length	Radial thickness	Weight	Symbol suffix
<u>Base Symbol</u>			<u>XC</u>	<u>RC</u>	<u>LA</u>	<u>TR</u>		
Splitline insulator	1025	*	C	C	C	C	--	SLI
Cavity insulator	1031	*	C	C	C	C	--	CI
Splitline filler	1037	**	C	C	C	C	--	TRI
Fixed adapter insulator	1043	***	C	C	C	C	--	AI
Exit ring insulator	1049	***	C	C	C	C	--	ERI
Fixed ring insulator	1055	***	C	C	C	C	--	FRI
	Units	--	in.	in.	in.	in.	lb	

The L-No. given are for the material code. Additional L-No. are consecutive from left to right.

* Uses backup code at 7-8 in Table 3 if not input.

**DESIG 252 uses backup code at 5-7 in Table 3; if not input, other DESIGS uses backup code at 7-8.

*** Uses liner code at 3-4 in Table 3 if not input.

TABLE 10

NOZZLE OPTIONAL INPUT FOR
SPECIAL MATERIALS AND EXIT RING WALLS STATIONS

Special Materials

<u>Definition</u>	<u>L-No.</u>	<u>Value</u>	<u>Units</u>
Density of honeycomb core	1061	0.00266	lb/cu in.
Honeycomb inner facing material code	1063	10	--
Honeycomb outer facing material code	1064	10	--

Honeycomb structure is obtained by specifying a structural material code of 20 in Table 6 .

Exit Ring Walls

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
1065	TBWL	Wall thickness, axial	(C) in.	TBWL
1066	THWL	Wall thickness, radial	(C) in.	THWL

TABLE 11
NOZZLE OPTIONAL INPUT FOR PINTLE NOZZLE DESIGN

STTI	Strut insulation	1453	1.5	7	I	--
SSR	Strut support ring	1456	1.25	2	S	--

The L-No. given is for the safety factor. Additional L-No. are consecutive from left to right excluding the insulation or structure column.

* I means the material specified by the material code is found in the insulation materials table.
S means the material is found in the structural materials table.

TABLE 12

NOZZLE OPTIONAL INPUT FOR PINTLE NOZZLE DESIGN,
COMPRESSIVE YIELD STRENGTHS OF MATERIALS

Material	L-No.	Compressive Yield Strength as a Function of Temperature									
		L-No. 1487 Material Code		Temperature (°R)							
		540	860	1,260	Compressive Yield Strength		1,660	2,060	3,460	4,960	6,460
Graphite cloth phenolic	1495	1	10,000	8,500	5,000	3,700	3,300	0	0	0	0
Tungsten	1504	6	100,000	100,000	76,000	55,500	40,500	14,000	5,000	100	
Available	1513	0	0	0	0	0	0	0	0	0	
Available	1522	0	0	0	0	0	0	0	0	0	
17-7 PH steel	1531	11	160,000	150,000	114,900	35,500	0	0	0	0	
Waspaloy	1540	12	112,000	108,000	106,000	104,000	78,000	0	0	0	
Available	1549	0	0	0	0	0	0	0	0	0	
Available	1558	0	0	0	0	0	0	0	0	0	

L-No. 1487 is given for the first temperature. The rest of the L-No. 's given is for material code and compressive yield strength. Additional L-No. 's are consecutive from left to right.

The first four lines of the table are reserved for insulation materials. The last four lines are for structural materials.

3. TORQUE INPUT

a. Nozzle Torque Optional Input

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
5750	CTR1	O-ring friction coefficient due to compression	2.5	CTR1
5751	PBP1	Ratio of base to free stream static pressure	0.5	PBP1
5752	MU	Friction coefficient (steel on Teflon)	0.05	XMU
5753	TAMP	Internal aerodynamic torque amplification factor	(C)*	TAMP

Equation Constants

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
5754	TFT2	Friction torque multiplier (subsonic split external/ ball and socket)	2	TFT2
5755	TFT2S	Friction torque multiplier (subsonic split external, submerged and external SSSL/gimbal)	2.5	TFT2S
5756	TFT1	Friction torque multiplier (integral movable, submerged and external SSSL/gimbal)	1	TFT1
5757	GMAX	Nozzle movable portion acceleration	1	GMAX
5758	CT2	Gravitational torque	0	CT1
5759	CT2	Flexible bearing seal torque multiplier for boot torque	0.15	CT2

*C indicates that if value is not input, it will be calculated in the program.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
5760	CT3	Effective shear modulus for steel shims	-0.2595×10^{-6}	CT3
5761	CT4	Effective shear modulus for glass shims	-0.29×10^{-6}	CT4
5762	CT5	Flexible bearing boot torque	1	CT5
5763	CT6	Flexible bearing boot torque	0	CT6

4. LIQUID INJECTION INPUT

a. Liquid Injection Performance Routine Input

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
2020	--	TVC = 0, biaxial TVC is not required =1, biaxial TVC is required	1	BATVC
2021	--	Method TYPINJ 1, 2, 3, 4 TYPINJ 5-11 = 1, standard method = 2, alternate method	1 2	OPTMTD
2022	TYPINJ	Injectant =1, Freon 113 =2, Freon 114B2 =3, Freon 114I2 =4, N ₂ O ₄ =5, Sr (ClO ₄) ₂ + H ₂ O =6, Pb (ClO ₄) ₂ + H ₂ O =7, Sr (ClO ₄) ₂ + CH ₃ OH =8, Sr (ClO ₄) ₂ + C ₂ H ₅ OH =9, N ₂ H ₄ =10, UDMH =11, 50-50 N ₂ H ₄ /UDMH	4	TYPINJ

The following three parameters are input only if standard method is requested.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
2023	NQUADU	Number of quadrants being utilized	4	XNQ
2024	DTIME	Integration interval	1 sec	DTIME
2025	BETA-Q	Angle spanned per quadrant by injectant ports	75 deg	BETA

The following seven parameters are input only if the alternate method of calculation is specified. If they are not input here, they will be set from data in the duty cycle.

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
2026	DEL-AVG	Average thrust deflection angle of duty cycle	0 deg	DELA VG
2027	FS/FPV-A	Ratio of side force to primary vacuum thrust at average thrust deflection angle	0	FSFAAV
2028	FS/FPV-M	Ratio of side force to primary vacuum thrust at maximum thrust deflection angle	0	FSFAMX
2029	WDOTP-MAX	Maximum flow rate of primary motor	0 lb/sec	WAMXDT
2030	ISPVAC	Primary motor vacuum specific impulse	0 sec	XISPPM
2031	IV	Total vehicle vacuum thrust impulse	0 lb-sec	XIV
2032	KDELT	Ratio of control thrust impulse to total vehicle vacuum thrust impulse	0	XKDEL

LITVC Actuation

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
2040	--	Hydraulic fluid =0, injectant not used as hydraulic fluid =1, injectant used as hydraulic fluid	0	CNTFLD
2041	--	Pressurization =0, select minimum weight system =+1, warm gas pressurization =-1, integral warm gas pressurization =+2, cold gas pressurization =-2, integral cold gas pressurization	0	PRESTP
2042	--	Actuator =0, select minimum weight system =1, warm gas motor pump =2, electric motor pump =3, cold gas blowdown =4, warm gas blowdown =5, electromechanical	0	TLITVC
2043	--	Cold gas tank shape =0, select minimum weight =1, spherical tank =2, toroidal tank	0	TCGSHP
2044	--	Injectant tank shape =0, select minimum weight tank =1, spherical tank =2, toroidal tank	0	TNKSHP
2045	--	Tank material =0, select minimum weight =1, steel tanks =2, titanium tanks =3, fiberglass tanks	0	TNKMAT

b. Liquid Injection Performance Optional Input

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
3230	NPV	Number of pintle injector valves utilized per quadrant	(C)*	PVQN
3231	IF	Control thrust impulse	(C) sec	XIF
3232	KONE	Empirical constant to determine unexpendable injectant	0.03	XKBT
3233	KTWO	Empirical constant to determine injectant total requirements	0.03	XKPB
3234	KTRI	Empirical constant to determine injectant total requirements	0.1	XKUL

LITVC Actuation

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
4180	CV	Orifice coefficient for pintle	0.98	CVP
4181	SF	Safety factor for injectant tank	1.5	FSIT
4182	SFCG	Safety factor for cold gas tank	1.5	FSCGT
4183	FU	Ultimate tensile strength of tubing	100,000 psi	FUL
4184	FUG	Ultimate strength of warm gas tubing	27,000 psi	FUWGL
4185	FY	Yield strength	60,000 psi	FYL
4186	FYG	Yield strength of warm gas tubing	17,000 psi	FYWGL
4137	HAD	Adiabatic head	556,000 ft	HADL
4188	MW	Molecular weight of warm gas	19.24	XMWWG
4189	NSFGT	Safety factor for gas tubing	4	FSGL
4190	NSFIT	Safety factor for injectant tubing	4	FSIL
4191	NSFT	Safety factor for hydraulic tubing	4	FSHL

*C indicates that if value is not input, it will be calculated in the program.

LITVC Actuation (Cont)

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
4192	PA	Atmospheric pressure	14.7 psi	PAMB
4193	PLINE	Pressure loss in injectant lines	25 psi	PRESLA
4194	PSU	Hydraulic supply pressure	3,000 psi	PS
4195	PFREE	Nozzle free stream pressure at injector	25 psi	PFREE
4196	TI	Temperature of injectant (initial)	530	TEMI
4197	VHO	Velocity of hydraulic oil	240 in./sec	VELHO
4198	VINJ	Velocity of injectant flow	200 ft/sec	VELINJ
4199	WPT	Weight of pressure transducers	1 lb	WPT
4200	ETAMP	Efficiency of warm gas motor pump	0.35	ETAMP
4201	RHOG	Density of warm gas	0.000463 lb/cu in.	RHOG
4202	RHOH	Density of hydraulic oil	0.03 lb/ cu in.	RHOH
4203	RHO1T	Density of steel tank material	0.283 lb/ cu in.	RHOTTB (1)
4204	RHO2T	Density of titanium tank material	0.17 lb/ cu in.	RHOTTB (2)
4205	RHO3T	Density of fiberglass tank material	0.07 lb/ cu in.	RHOTTB (3)
4206	SU1	Ultimate strength for steel tank	232,000 psi	SUITAB (1)
4207	SU2	Ultimate strength for titanium tank	110,000 psi	SUITAB (2)
4208	SU3	Ultimate strength for fiber-glass tank	92,000 psi	SUITAB (3)

5. HOT GAS PERFORMANCE INPUT

a. Hot Gas Routine Input

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
2000	VALX _i	Valve type =1, ablative pintle, sonic injection =2, ablative pintle, supersonic injection =3, ablative pintle, sonic injection (PL) =4, noneroding pintle, supersonic injection =5, noneroding pintle, sonic injection (PL) =6, jet pipe valve, sonic injection =7, jet pipe valve, supersonic injection =8, rotating cylinder valve	--	HGVAL
2001	ETAV	Valve cyclic rate	cps	ETAV
2002	AL _i	Pintle type =1, pressure balanced pintle =2, nonpressure balanced pintle	--	ALX
2003	AT _i	Actuator type =1, conventional actuation =2, reverse actuator	--	ATX
2004	BM _i	Pintle type =1, pintle without balancing =2, pintle balanced with chamber pressure =3, pintle balanced with pintle tip pressure	--	BMX
2005	EC _i	Exit configuration approximation =1, conical exit =2, contour exit (local angle) =3, contour exit (average angle)	--	ECX

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
2006	PT _i	Pintle type =1, clearance type pintle =2, seating type pintle	--	PTX
2007	SO _i	Servoactuator =1, 3 way servoactuator =2, 4 way servoactuator	--	SOX
2008	MM _i	Pintle mounting = 1, externally mounted pintle valve =2, closure mounted pintle valve =3, leg mounted pintle valve =4, plenum mounted pintle valve	--	XMMX
2009	AO	Geometric orifice flow area (input only if desired to duplicate performance of an existing valve)	sq in.	AOI

b. Hot Gas Optional Input

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
2450	ALPHACAPO	Flag to specify method of calcu- lating thermal diffusivity for actuator cap insulation =1, calculate using average of thermal diffusivity =2, calculate using average of temperature	1	ACAPO
2451	ALPHACAPI	Flag to specify material used in actuator cap insulation =4, other =5, silica cloth =6, carbon cloth =7, asbestos =8, V-44	8	ACAPX

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
2452	ALPHAHOUE	Flag to specify method of calculating thermal diffusivity for valve housing =1, calculate using average of thermal diffusivity =2, calculate using average of temperature	1	AHOUE
2453	ALPHAHOU	Flag to specify material used in valve housing =4, other =5, silica cloth =6, carbon cloth =7, asbestos =8, V-44	5	AHOUX
2454	ALPHALEGO	Flag to specify method of calculating thermal diffusivity for leg insulation =1, calculate using average of thermal diffusivity =2, calculate using average of temperature	1	ALEGO
2455	ALPHALEGI	Flag to specify material used in leg insulation =4, other =5, silica cloth =6, carbon cloth =7, asbestos =8, V-44	5	ALEGX
2456	ALPHALINO	Flag to specify method of calculating thermal diffusivity for duct insulation =1, calculate using average of thermal diffusivity =2, calculate using average of temperature	1	ALINO

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
2457	ALPHALIN	Flag to specify material used in duct insulation =4, other =5, silica cloth =6, carbon cloth =7, asbestos =8, V-44	6	ALINX
2458	ALPHAS	Valve orifice exit angle	3 deg	ALPHAS
2459	ALPHATIPO	Flag to specify method of calculating thermal diffusivity for pintle tip shell =1, calculate using average of thermal diffusivity =2, calculate using average of temperature	1	ATIPO
2460	ALPHATIP	Flag to specify material used in pintle tip shell =1, tungsten =2, molybdenum =3, tantalum =4, other =5, silica cloth =6, carbon cloth =7, asbestos =8, V-44	1	ATIPX
2461	BEX	Bypass nozzle expansion angle	0 deg	BEX
2462	CDP	Sonic discharge coefficient (primary nozzle)	0.99	CDP
2463	CDV	Valve flow coefficient	(C)	CDV
2464	CMS	Secondary nozzle flow coefficient	0.854	CMS
2465	CSTARP	Characteristic velocity (primary flow)	5,200 ft/sec	CSTARP
2466	CSTARS	Characteristic velocity (valve flow)	5,200 ft/sec	CSTARS

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
2467	DNI	Nozzle throat diameter (flag) =1, initial nozzle throat diameter =2, average nozzle throat diameter =3, final nozzle throat diameter =4, nozzle throat diameter at DEL-M3	2	DNX
2468	dt	Time increment for integrations	0.05 sec	DTIME
2469	EDPT	Pintle tip erosion rate	0.025 in./sec	EDPT
2470	EPSD	Area ratio, duct to valve orifice	3	EPSD
2471	EPSV-N	Injection angle measured between the valve centerline and the upstream nozzle wall surface	90 deg	EPSVN
2472	ERRDL	Erosion rate of duct liner	0.01 in./sec	ERRDL
2473	ETA-NS	Injection port flow coefficient	0.96	ETANS
2474	CFB	Bypass nozzle thrust coefficient	(C)	CFB
2475	GAMMAP	Ratio of specific heats for nozzle exhaust	1.18	GAMM 'P
2476	GAMMAS	Ratio of specific heats (valve gases)	1.18	GAMMAS
2477	GPRIME	Empirical constant	0.7	GPRIME
2478	OPTION	Flag =1, use iterative method for ETA-A =2, direct calculation for ETA-A	1.0	OPTION
2479	PERCENTLE	Percent leakage	5%	PERCNT
7480	RHOC	Approximate density of composite closure material	0.1 lb/cu in.	RHOC
2481	RHOLIN	Density of duct liner material	0.0652 lb/cu in.	RHOLIN

<u>L-No.</u>	<u>Symbol</u>	<u>Definition</u>	<u>Value</u>	<u>Fortran Symbol</u>
2482	RHOSH	Density of duct shell material	0.176 lb/cu in.	RHOSH
2483	REX/DSTARP	Valve orifice radius divided by nozzle throat diameter	(C)	RXDSP
2484	ST	Tensile strength of duct shell	93,000 lb/sq in.	ST
2485	TB	Time to web burnout	(C) sec	TB
2486	TF	Gas flame temperature	6,140° R	TF
2487	TIC	Initial cap backside temperature	540° R	TIC
2488	TIH	Initial housing backside temperature	540° R	TIH
2489	TIL	Initial leg backside temperature	540° R	TIL
2490	TIP	Initial backside pintle tip temperature	540° R	TIP
2491	TOC	Final cap backside temperature	660° R	TOC
2492	TOH	Final housing backside temperature	900° R	TOH
2493	TOL	Final leg backside temperature	660° R	TOL
2494	TOP	Final backside pintle temperature	1,460° R	TOP
2495	XMACHS	Valve injection Mach number	1.0	XMACHS
2496	N	Propellant burn rate exponent	0.3	XNPEX
2497	NV	Number of hot gas valves	4.0	XNV
2498	TFV	Hot gas valve flow time	(C) sec	TFV

5802	XJTAB	Center-of-gravity (jet tabs)	0 in.*	XJTAB
5803	XMNACT	Center-of-gravity (movable nozzle actuation)	0 in.*	XMNACT
5804	XROLLC	Center-of-gravity (roll control system)	0 in.*	XROLLC
5805	XCTHR	Center-of-gravity (cooled throat system)	0 in.*	XCTHR
5806	CNBWM	Multiplier for the aft nozzle base weight	1.0	CNBWM
5807	ELPSRA	Ellipse ratio of the aft closure	1.4	ELPSRA

*These values are calculated if they are not input.

B. ERROR MESSAGES

1. NOZZLE

The following errors may occur in the nozzle design calculations.

An invalid specification has been made for
nozzle type

An invalid specification has been made for
TVC code

An invalid specification has been made for
pivot center location

An invalid specification has been made for
hot gas valve mounting code

An invalid specification has been made for
throat type

An invalid specification has been made for
exit configuration

An invalid specification has been made for
case type

An invalid specification has been made for
nozzle designator code

Insufficient input to determine throat area

Insufficient input to determine expansion ratio

Unable to converge in iteration for initial cone
angle

Root not bounded in iteration for initial ex-
pansion ratio

Unable to converge in iteration for initial ex-
pansion ratio

Unable to converge in iteration for cone turn-
back angle

Root not bounded in iteration for initial cone
angle

Insufficient input to determine action time

Insufficient input to determine chamber pressure

Insufficient input to determine case diameter

Percent submergence for this plenum configuration is to face of exit ring rather than face of flange

Insufficient input to determine contour exit cone

An invalid expansion ratio has been specified

Unable to converge in iteration for Mach number

An invalid specification has been made for throat type

Ejection load near zero or instantaneous chamber pressure greater than structural design pressure-- use output cautiously

Unable to converge in iteration for nozzle inner limit angle

Input liner load per unit area incompatible with design--value calculated

Theoretical force amplification factor calculation inaccurate with this design, the factor is set to unity

Unable to make radius to outer liner edge less than the mean spherical radius

Unable to converge in iteration for step change in angle in iteration loops

Flexiable seal is elastomer shear stress critical

Unable to converge in iteration for radial height of section

Calculated seal deflection inaccurate. To bring into accurate range reduce elastomer layer thickness or increase total seal thickness

Unable to close gimbal ring design within constraints--height increased

Gimbal ring is at constrained limit size

Unable to converge in iteration for actual Y-moment of inertia of gimbal ring section

Unable to converge in iteration for actual X-moment of inertia of gimbal ring section

C
Rings are solid

Input radius to inside of flange incompatible with design

Flange adapter added to locate flange at specified radius. Percent submergence is calculated to junction of adapter and primary structure.

Exit cone exceeds maximum diameter limit

Unable to converge in iteration for honeycomb structure

Extrapolation has occurred in the following table. The argument was xxx

Standard tubing wall thickness vs outside diameter

Extrapolation has occurred in the following table. The argument was xxx

Standard tubing wall thickness vs outside diameter

Extrapolation has occurred in the following table. The argument was xxx

Cold gas regulator valve weight vs gas flow

Solution for minor radius of toroidal coolant tank is imaginary

Solution for minor radius of toroidal gas tank is imaginary

Unable to converge in iteration for Mach number at station 11

Material not found in strength versus temperature table for pintle nozzle

Error in strength versus temperature table for pintle nozzle

Invalid designator no. for pintle design

Insufficient input for pintle design

Unable to converge in iteration for pintle nozzle throat area

TLID was increased to prevent interference in pintle design

LSM , LAPA and TKCSIN were increased to prevent interference during actuation in pintle design

Unable to converge in iteration for stroke calculation

GTYPE = 2. Both ATMXA and ATMNA were not input ATMXA and ATMINA were used. Stroke calculation may be in error

RBH, ratio of width to height of gimbal ring, violates limits. Limit value used

Contour exit is invalid in given envelope cone exit used

2. TORQUE

The following errors may occur in the torque calculations.

An incorrect nozzle type has been specified for torque. The value was xxx

No result was found for the cubic solution for shock angle in external aerodynamic equations

Iteration for the maximum deflection angle for attached shock required for external aerodynamic torque did not converge

Iteration for Mach number required for external aerodynamic torque did not converge

3. LIQUID INJECTION

a. Performance

The following errors may occur in the LITVC performance calculations.

An invalid injectant type has been specified. Freon 113 was used

The specified injectant will not meet the maximum TVC requirements

The specified number of valves per quadrant is not compatible with the performance curves
The number of valves used was xxx

The average thrust deflection angle is too small for the alternate method.

An advanced injectant system is not available.
See note below.

Extrapolation has occurred in the following table. The argument was xxx

Freon force ratio vs flow ratio performance

Extrapolation has occurred in the following table. The argument was xxx

N₂O₄ force ratio vs flow ratio performance

Extrapolation has occurred in the following table. The argument was xxx

Duty cycle time points

The integration interval has been specified as zero. 0.05 has been substituted

Extrapolation has occurred in the following table. The argument was xxx

Freon and N₂H₄-UDMH force ratio vs secondary specific impulse performance

Extrapolation has occurred in the following table. The argument was xxx

N₂O₄ force ratio vs secondary specific impulse performance

Extrapolation has occurred in the following table. The argument was xxx

SR (ClO₄)₂ plus H₂O force ratio vs secondary specific impulse performance

Extrapolation has occurred in the following table. The argument was xxx

PB (ClO₄)₂ plus H₂O force ratio vs secondary specific impulse performance

Extrapolation has occurred in the following table. The argument was xxx

SR (ClO₄)₂ plus C₂H₅OH force ratio vs secondary specific impulse performance

Extrapolation has occurred in the following table. The argument was xxx

SR (ClO₄)₂ plus CH₃OH force ratio vs secondary specific impulse performance

b. Actuation

The following errors may occur in the LITVC actuation calculations

The injectant cannot be used as the hydraulic fluid

Extrapolation has occurred in the following table. The argument was xxx

Weight of injectors vs equivalent flow of water

Extrapolation has occurred in the following table. The argument was xxx

Standard tubing wall thickness vs outside diameter

Spherical tanks will not fit in the specified envelope

The solution for the toroidal tank radius is imaginary

Toroidal tanks will not fit in the specified envelope.

Extrapolation has occurred in the following table. The argument was xxx

Weight vs volume of blowdown accumulator

Extrapolation has occurred in the following table. The argument was xxx

Mass fraction vs gas horsepower

Extrapolation has occurred in the following table. The argument was xxx

Weight of warm gas relief valve vs gas flow rate

Extrapolation has occurred in the following table. The argument was xxx

Weight of hydraulic tee filters vs flow rate

Extrapolation has occurred in the following table. The argument was xxx

Weight of disconnects vs outside diameter of tubing

Extrapolation has occurred in the following table. The argument was xxx

Cold gas regulator valve weight vs gas flow

An invalid system has been specified. An attempt will be made to select a system

No valid system could be selected

An invalid system has been specified. No corrective action can be taken

Extrapolation has occurred in the following table. The argument was xxx

Volume vs weight of self-pressurizing reservoir

Extrapolation has occurred in the following table. The argument was xxx

Weight of electric motor pump vs output horsepower

Extrapolation has occurred in the following table. The argument was xxx

Weight of warm gas motor pump vs hydraulic horsepower output

4. HOT GAS

The following errors may occur in the hot gas calculations

Extrapolation has occurred in the following table. The argument was xxx

Valve experimental flow coefficient vs ratio of valve geometric area to orifice geometric area

Extrapolation has occurred in the following table. The argument was xxx

Ratio of pintle diameter to valve orifice diameter vs valve orifice diameter for noneroding valve

Extrapolation has occurred in the following table. The argument was xxx

Ratio of pintle diameter to valve orifice diameter vs valve orifice diameter for ablative valve

Iteration for ratio of valve flow area to nozzle throat area vs time did not converge

Extrapolation has occurred in the following table. The argument was xxx

Duty cycle time table

Unable to integrate for burning time extension resulting from valve operation

Unable to integrate for total vehicle vacuum thrust impulse from stage ignition to termination

Unable to integrate for total weight of injected gases

Extrapolation has occurred in the following table. The argument was xxx

Thermal diffusivity vs temperature

Extrapolation has occurred in the following table. The argument was xxx

Pintle valve weight vs pintle diameter for noneroding, plenum mounted pintle valve

Iteration for ratio of valve sonic flow area to primary nozzle flow area (performance calculated) failed.

Iteration for geometric orifice flow area did not converge

Extrapolation has occurred in the following table. The argument was xxx

Pressure balancing constants

Extrapolation has occurred in the following table. The argument was xxx

O-ring cross section vs pintle diameter

Extrapolation has occurred in the following table. The argument was xxx

O-ring gland length vs pintle diameter

Extrapolation has occurred in the following table. The argument was xxx

Ratio of feedback length to maximum theoretical stroke vs maximum theoretical stroke for ablative pintle

Unable to integrate for weight of propellant gases injected in either the pitch or yaw plane

Extrapolation has occurred in the following table. The argument was xxx

Valve experimental flow coefficient vs ratio of valve geometric area to orifice geometric area

5. JET TABS

The following errors may occur in the jet tabs performance calculations

Extrapolation has occurred in the following table. The argument was xxx

Total thrust decrement vs pitch or yaw deflection angle

Extrapolation has occurred in the following table. The argument was xxx

Ratio of thrust deflection angles vs
tab angular position

Extrapolation has occurred in the following table. The argument was xxx

Ratio of jet tab upstream surface area to
nozzle exit flow area vs maximum vector angle

An incorrect nozzle type has been specified
for jet tabs. The value specified was xxx

6. ACTUATION

The following errors may occur in the actuation calculations

TMC & TVC hydraulic supply pressures not equal

Roll system not required

Extrapolation has occurred in the following table. The argument was xxx

Wall thickness of standard hydraulic lines

Extrapolation has occurred in the following table. The argument was xxx

Diameter of standard hydraulic lines

Cold gas minimum tank pressure low --
use 1.2 * cold gas regulated pressure +
minimum

TVC & roll generated ballistics not equal program
uses TVC generator for sizing roll system

TVC & TMC system not reqd - common roll &
TVC generator not applicable

Extrapolation has occurred in the following table. The argument was xxx

Weight of servopump vs pump flow

Extrapolation has occurred in the following table. The argument was xxx

Displacement of rotary actuator

Extrapolation has occurred in the following table. The argument was xxx

Gas generator mass fraction vs gas horsepower

Extrapolation has occurred in the following
table. The argument was xxx

Pump weight vs pump flow rate for variable
delivery pumps

Extrapolation has occurred in the following
table. The argument was xxx

Weight of turbine and gearbox vs
hydraulic horsepower output

Extrapolation has occurred in the following
table. The argument was xxx

Weight of servoactuator vs actuator energy

Extrapolation has occurred in the following
table. The argument was xxx

Rotary actuator weight vs output torque

Extrapolation has occurred in the following
table. The argument was xxx

Volume vs weight of self-pressurizing reservoir

Extrapolation has occurred in the following
table. The argument was xxx

Weight of hydraulic tee filters vs flow rate

Extrapolation has occurred in the following
table. The argument was xxx

Weight of hydraulic disconnects vs outside
pipe diameter

Extrapolation has occurred in the following
table. The argument was xxx

Weight of electric motor pump vs output horsepower

Extrapolation has occurred in the following
table. The argument was xxx

Weight of warm gas motor pump vs hydraulic
horsepower output

Extrapolation has occurred in the following
table. The argument was xxx

Weight of warm gas relief valve vs gas flow rate

Extrapolation has occurred in the following
table. The argument was xxx

Weight vs volume of blowdown accumulator

Extrapolation has occurred in the following table. The argument was xxx
 Rotary electromechanical actuator weight vs output horsepower

Extrapolation has occurred in the following table. The argument was xxx
 Linear electromechanical actuator weight vs output horsepower

Extrapolation has occurred in the following table. The argument was xxx
 Cold gas nozzle weight vs nozzle flow

Extrapolation has occurred in the following table. The argument was xxx
 Cold gas regulator weight vs system flow rate

7. WEIGHT SUMMARY

The following error may occur in the weight summary calculation

Error Code	Line* Number	Subroutine Name	Description
1	XXX	TP200	$X_i = X_{i-1}$ for a call to the integration subroutine TP221
2	XXX	TP200	The calculated weight was zero. CG and moments will not be calculated for this line number.
1	XXX	TP201	$ELO < -A$ $ELO > A$ $ELI < -A$ $ELI > A$
2	XXX	TP201	
3	XXX	TP201	
4	XXX	TP201	
5	XXX	TP201	$A = 0$
6	XXX	TP201	The calculated weight was zero. CG and moments will not be calculated for this line number.

*Line numbers used by subroutines TP200 and TP201 are working areas only. They will be in the range of 194 to 200.

C. SAMPLE INPUT

Included in this section and the next, Sample Output, are four test cases that execute all of the Hardware Section.

T HARDWARE TEST CASE NO. 2

[illegible]

D. SAMPLE OUTPUT

This section contains the printout of the program resulting from the input specified in the previous section, Sample Input.

The printout of the first test case contains all of the resulting printout of that case.

In the printout of test cases 2, 3 and 4, the printout of the duty cycle and nozzle have been deleted since an example may be found in the first test case.

DEFINITION OF SYMBOLS

BDST	INST	EPS	X	R	M	PS	FSE	MOD	XDOT	TLE	FSC	ILC	TLV	TL	TBU	A	TBM	TB	TTOT	L	NO.
BDST	BOUNDARY STATION SYMBOL																				
INST	INTERMEDIATE STATION SYMBOL																				
EPS	EXPANSION RATIO AT STATION																				
X	AXIAL DISTANCE DOWNSTREAM OF THROAT (IN)																				
R	RADIUS FROM AXIS (IN)																				
M	MACH NUMBER																				
PS	STATIC PRESSURE																				
FSE	FACTOR OF SAFETY, FROSION																				
MOD	EROSION RATE MULTIPLIER																				
XDOT	EROSION RATE OF LINER (MILLS PER SEC)																				
TLE	ERODED LINER THICKNESS (IN)																				

SOME VALUES IN TABLE ARE NOT OPTIONAL INPUT, SEE DIAGRAM IN USERS MANUAL FOR THIS NOZZLE DESIGNATOR

NOTE--- IF XDOT IS INPUT AT THROAT, XDOT AT EACH STATION WILL CHANGE BY THE RATIO (XDOT THROAT INPUT/XDOT THROAT CALCULATED) EXCEPT AT STATIONS WHERE XDOT IS ALSO INPUT. USE MOD TO CHANGE THROAT XDOT ONLY.

SECTION V

TRAJECTORY REFLY

If the user wishes to simulate the vehicle trajectory after the hardware design subroutines have evaluated the TVC system hardware weights and thrust perturbations, the reflly option can be used. Essentially the same data are necessary for the trajectory reflly as for the original trajectory simulation. All data input in the previous trajectory input are available for the reflly option; however, any data read in by cards for the reflly option will supersede the data stored previously. Thus, any data can be modified for the reflly of the trajectory. Typical of data that might be changed for the reflly would be a change in print interval.

APPENDIX A
TRAJECTORY OUTPUT DEFINITIONS

Printout formats, both schematic and machine printed, for output print are presented in this appendix. The X's and O's shown in the schematic formats represent spaces for integers and minus signs, respectively. The numbers and letters appearing at the left side of the printlines are always printed with their respective printline. The definitions of these output parameters are present as they appear left to right for each printline.

Printline	Symbol	Definition	Units
A	t	Instantaneous time (L5000)	(sec)
	S	Missile ground range. Distance along the surface of the earth measured clockwise from the launch vertical to the local vertical down range (L5018)	(ft)
	h	Missile geometric altitude. Distance between the surface of the reference body and the missile measured along the local vertical. Positive away from the reference body (L5028)	(ft)
	V _e	Missile earth referenced velocity (L5046)	(ft/sec)
	V _I	Missile inertial velocity (L5050)	(ft/sec)
	a _{Xb}	Component of vehicle acceleration due to total thrust and aerodynamic forces. Positive in the direction of the coordinate axes of b system (L5504)	(g's)
	M _y	Mode type	(dim)
AA	T _y	Type of flight	(dim)
	S _s	Missile slant ground range. Distance along earth surface from the launch vertical to the local vertical slantwise (L5025)	(ft)
	S _c	Missile cross ground range. Distance along the surface of the earth measured clockwise from launch azimuth (L5028)	(ft)
	φ	Instantaneous down range angle. Angle between the launch vertical and the local vertical on the down range azimuth point (L5375)	(deg)
	ζ	Cross range angle. Angle between local vertical and vertical on firing azimuth down range location. Positive if positive is left of firing azimuth (L5358)	(deg)
B	θ _m	Desired missile attitude Euler angle relating the m and i system (L5722)	(deg)

Printline	Symbol	Definition	Units
B	$\dot{\theta}_m$	Desired vehicle pitch Euler angular rate (5772)	(deg/sec)
	α	Instantaneous pitch angle of attack; positive if the vehicle centerline is above the air velocity vector (L5301)	(deg)
	γ_1	Pitch flight path angle. Angle between the earth referenced velocity vector and the local tangent plane. Positive away from the earth (L5321)	(deg)
	γ_{1I}	Inertial pitch flight path angle. Angle between the inertial velocity vector and the local tangent plane. Positive away from the earth (L5330)	(deg)
	a_{zb}	Components of vehicle acceleration due to total thrust and aerodynamic forces. Positive in the direction of the coordinate Z axes of b system (L5506)	(g's)
	$\dot{v}_e$	Time rate change of missile earth reference velocity (L5047)	(ft/sec ²)
BA	ψ_m	Desired missile attitude Euler angle relating the m and i systems (L5723)	(deg)
	$\dot{\psi}_m$	Desired vehicle yaw Euler angular rate (L5773)	(deg/sec)
	β	Angle of side slip. Positive if the vehicle centerline is left of the air velocity vector when viewed from the rear of the vehicle (L5315)	(deg)
	γ_2	Azimuthal flight path angle. Angle between the horizontal projection of the earth reference velocity vector and the local north. Positive clockwise from north (L5323)	(deg)
	γ_{2I}	Inertial azimuth flight path angle. Angle between local north clockwise to the projection of the inertial velocity vector on the local tangent plane (L5331)	(deg)

Printline	Symbol	Definition	Units
BA	a_{yb}	Component of vehicle acceleration due to total thrust and aerodynamic forces. Positive in the direction of the coordinate Y axes of the b system (L5505)	(g's)
	η_{bt}	Acceleration load factor transverse to the velocity vector (L5170)	(g's)
BB	ϕ_m	Desired missile attitude Euler angle relating the m and i systems (L5724)	(deg)
	$\dot{\phi}_m$	Desired vehicle roll Euler angular rate (L5774)	(deg/sec)
	P_m	Instantaneous desired roll turning rate (L5403)	(deg/sec)
	Q_m	Instantaneous desired pitch turning rate (L5401)	(deg/sec)
	R_m	Instantaneous desired yaw turning rate (L5402)	(deg/sec)
	μ	Instantaneous vehicle longitude. Value is positive or negative west or east of Greenwich, England, respectively (L5362)	(deg)
	ρ	Instantaneous vehicle latitude positive north of the equator $-90^\circ \leq \rho \leq 90^\circ$ (L5367)	(deg)
C	W	Total instantaneous missile weight (L5093)	(lb)
	$\dot{W}$	Total expended instantaneous missile mass flow weight (L5094)	(lb/sec)
	F	Total instantaneous thrust acting along missile centerline. Positive when thrust vector points forward along missile centerline (L5122)	(lb)
	F_v	Instantaneous total vacuum thrust (L5123)	(lb)
	$ F/\dot{W} $	Instantaneous effective specific impulse (L5115)	(sec)
	F_x	Components of total vehicle thrust parallel to the coordinate axes of the b system (L5141)	(lb)

Printline	Symbol	Definition	Units
	η_{bn}	Acceleration load factor normal to the velocity vector (L5171)	(g's)
CA	$\dot{I}_{YY}$	Time rate change of pitch moment of inertia	(ft-lb-sec)
	M_{DQ}	Perturbing moment about vehicle center-of-gravity in pitch (L5205)	(ft-lb)

Printline	Symbol	Definition	Units
WA	$\bar{I}$	Output motor thrust impulse for TVC duty cycle stage	(lb-sec)
	$\bar{I}_v$	Output motor vacuum thrust impulse for TVC duty cycle stage	(lb-sec)
	x_e	Output stage thrust gimbal body station numbers, for the TVC duty cycle (Lk431)	(ft)
	x_{nf}	Input body station of nozzle flange. Used in the TVC design program (L0680)	(ft)
	δ_{m2}	Input maximum vector angle design limit also output in TVC design duty cycle (L0681)	(deg)
WB	I_{spm}	Input main specific impulse used to compute vehicle weight flow. If zero, weight flow is determined from the input weight flow. Also output in the TVC duty cycle (Lk010)	(sec)
	$h_{q,\alpha}$	TVC duty cycle stage altitude at maximum $q_{\alpha'}$	(ft)
	$P_{q,\alpha}$	TVC duty cycle stage atmospheric pressure at maximum $q_{\alpha'}$	(lb/ft ²)
	ω_c	Input stage pitch control systems forcing frequency for the thrust vector deflection second-order transfer function (Lk437)	(rad/sec)
	$\dot{\delta}_s$	Output control system design slew rate for TVC design stage	(deg/sec)
	δ_s	Output pitch slew angle for TVC design stage	(deg)
WC	I_p	Pitch control thrust impulse from stage initiation to the time being printed (L5739)	(lb-sec)
	$\bar{I}_{\dot{\delta}_p}$	Sum of pitch angular thrust vectoring velocities from stage initiation to the time being printed corrected for dither (L5116)	(deg)
	$t_{\eta p}$	Output stage time at which maximum magnitude pitch thrust vector deflect on angle occurs during the TVC design stage (δ_{pmax})	(sec)

Printline	Symbol	Definition	Units
WC	η_p	Ratio of the delivered thrust [F] to vacuum thrust [F _v] at maximum magnitude pitch and yaw TVC deflection angle [δ_{pmax}]	(dim)
	$\dot{\delta}_{pmax}$	Output maximum pitch thrust vector deflection angular rate, respectively for the TVC design stage	(deg/sec)
	$\bar{\delta}_{pmax}$	Output maximum magnitude pitch thrust vector deflection angles respectively, per control motor for the TVC design stage	(deg)
WD	$\bar{I}_Y$	Input moment of inertia multiplier (Lk475)	(dbi)
	$\bar{I}_{\delta y}$	Sum of yaw angular thrust vectoring velocities from stage initiation to the time being printed corrected for dither (L5117)	(deg)
	$t_{\eta y}$	Stage time at which maximum magnitude yaw thrust vector deflection angle occurs during the TVC design stage (δ_{Ymax})	(sec)
	η'_y	Ratio of the delivered thrust (F) to vacuum thrust (F _v) at maximum magnitude yaw TVC deflection angle (δ_{Ymax})	(dim)
	$\dot{\delta}_{Ymax}$	Maximum yaw thrust vector deflection angular rate, for the TVC design stage	(deg/sec)
	$\bar{\delta}_{Ymax}$	Maximum magnitude yaw thrust vector deflection angle, per control motor for the TVC design stage	(deg)
WE	$q\alpha'_{max}$	Output product of the maximum absolute value of the dynamic pressure-angle of attack for the TVC design stage	(lb-deg/ft ²)
	$q_q\alpha'$	Output dynamic pressure at maximum $q\alpha'$ during the TVC duty cycle stage	(lb/ft)
	$t_{q\alpha'}$	Output TVC duty cycle stage time at maximum $q\alpha'$	(sec)

Printline	Symbol	Definition	Units
WE	$C_{n\alpha}$	Output aerodynamic normal force coefficient at maximum $q\alpha'$ during the TVC duty cycle stage	(1/deg)
	$M_{q\alpha}$	Output Mach number at maximum $q\alpha'$ during the TVC duty cycle stage	(dim)
	$\bar{\delta}_{ave}$	Output average TVC deflection angle per control motor for the TVC design stage	(deg)
WF	K_{dc}	Output stage number of TVC duty cycle stage (L0671)	(dim)
	D_B	Output TVC duty cycle stage case diameter from axial force reference area	(in)
	A_{FWI}	Stage I vacuum thrust to liftoff weight used in the vehicle characteristics pertinent to roll requirement (L0675)	(g's)
	t_{Ba}	Output TVC duty cycle stage time	(sec)
	F_{vave}	Output TVC duty cycle stage average vacuum thrust	(lb)
	W_o	Output TVC duty cycle stage liftoff weight used in the roll control requirements	(lb)
WG	R_{PFV}	Output ratio of motor chamber pressure to vacuum thrust of the main thrust table of the TVC design stage	(1/in ²)
	ϵ_d	Input and output nozzle expansion ratio used in the separated flow nozzle thrust equations (Lk013)	(dim)
	A_t	Output nozzle throat area for the main motor of the TVC design stage	(in ²)
	α'_d	Input nozzle half angle used in the separated flow nozzle thrust equation (Lk016)	(deg)
	P_{ca}	Output action time average motor chamber pressure for the TVC design duty cycle stage	(lb/in ²)
	C^*	Output rocket motor propellant characteristic velocity for the TVC design duty cycle stage	(ft/sec)

Printline	Symbol	Definition	Units
WH	W_{TVC}	Input and output estimated TVC system fixed weight. Used in TVC design stage for the reflly option (L0677)	(lb)
	W_{exi}	Input estimated weight of the TVC system expend weight during the TVC design stage during the original vehicle flight (L0678)	(lb)
	I_{spaug}	Input and output estimated TVC system caused specific impulse augmentation (positive) or degradation (negative). Used in trajectory TVC design program reflly (L0679)	(sec)
	P_{cmax}	Output maximum main motor chamber pressure used in separated flow equations	(lb/ft ²)
WI	n_m	Output internally calculated number of motors in the stage cluster (Lk380)	(dim)
	n_c	Output internally calculated number of control nozzles for the cluster motor logic (Lk381)	(dim)
	n_{dc}	Output of number TVC duty cycle t_B data points	(dim)
	M_{hzmax}	Output maximum of the absolute value pitch fin hinge torque for the TVC design stage	(ft-lb)
WJ	M_{hymax}	Output maximum of the absolute value yaw fin hinge torque for the TVC design stage	(ft-lb)
	I_{vM}	Calculated input vacuum corrected main table time adjusted thrust integral for k-th stage	(lb-sec)
	W_{MO}	Input initial main weight for the k-th stage (Lk006)	(lb)
	K_{tM}	Output for the TVC duty cycle stage, the main switching time multiplier	(dim)
WK	A_{tmax}	Pintle system required throat area rate (L7060)	(in ² /sec)
	I_{At}	Integral of the absolute value of the pintle throat area rate (L7061)	(in)

Printline	Symbol	Definition	Units
WK	$A_{x\max}$	Motor extinguishment throat area (L7072)	(in ² /sec)
WL	$F_{\max}$	Pintle motor maximum vacuum thrust (L7062)	(lb)
	$P_{c\max}$	Pintle motor chamber pressure at maximum vacuum thrust (L7063)	(lb/in ²)
	$\epsilon_{\max}$	Pintle motor expansion ratio at maximum vacuum thrust (L7064)	(dim)
	$A_{t\max}$	Pintle motor throat area at maximum vacuum thrust (L7065)	(in ²)
	$C_{f\max}$	Pintle motor vacuum thrust coefficient at maximum vacuum thrust (L7066)	(dim)
WM	$F_{\min}$	Pintle motor minimum vacuum thrust (L7067)	(lb)
	$P_{c\min}$	Pintle motor chamber pressure at minimum vacuum thrust (L7068)	(lb/in ²)
	$\epsilon_{\min}$	Pintle motor expansion ratio at minimum vacuum thrust (L7069)	(dim)
	$A_{t\min}$	Pintle motor throat area at minimum vacuum thrust (L7070)	(in ²)
	$C_{f\min}$	Pintle motor vacuum thrust coefficient at minimum vacuum thrust (L7071)	(dim)
WO	t_{Bq}	Output stage time at which TVC duty points occur	(sec)
	δ_{Pq}	Pitch thrust deflection angle at t_{Bj}	(deg)
	δ_{Yq}	Output modified yaw thrust deflection angle at t_{Bq} for TVC design stage	(deg)
	F_q	Delivered motor thrust (F) at t_{Bq} during TVC design stage	(lb)
	X_{cgq}	Output vehicle center-of-gravity at t_{Bq} ; the TVC duty cycle point	(ft)
	$\bar{F}_{vacq}$	Output vacuum motor thrust ($\bar{F}_{vac}$) during the TVC design stage at t_{Bq}	(lb)

Printline	Symbol	Definition	Units
W0	$\dot{W}_q$	Output motor weight flow ($\dot{W}$) at t_{Bq} the TVC duty cycle point	(lb/sec)

APPENDIX B
TRAJECTORY INPUT CODES FOR PARAMETER FLAGS

3006

This appendix delineates the logic control flags used in the trajectory routine. These codes control the kind and sophistication of the desired trajectory simulation.

1. MODE CONTROL TABLE FLAGS

The mode table controls the degree of sophistication that is obtained in the simulation of missile flight. Options such as rigid body with and without thrust vector control are controlled by the mode table. The desired option or mode is determined by the type of mode input M_y in the mode control table row, i.e. L600, L603, ..., L627.

Flight Simulation Mode

M_y

4	Point Mass 3 Degrees of Freedom
5	Rigid Body 6 Degrees of Freedom

2. ATTITUDE CONTROL TABLE FLAGS

The desired missile attitude will be computed by one of the many types of flight methods. The type of attitude control desired will be determined by the "type of flight" input T_y in the attitude control table row, i.e. L310, L317, ..., or L394.

Types of Flight

T_y

1	Commanded Turning Rates
2	Gravity Turn
4	Velocity Steering
6	Rail Launch
7	Constant Altitude
9	Constant Normal Load Factor
10	Intercept Guidance
11	Homing Guidance

3. SWITCHING CODE

Quantities which can be involved as switching functions or in the hunting procedure are assigned a code number. These codes are delineated as P-numbers corresponding to all output parameters. The code number is input in the appropriate space on the load sheer (generally delineated symbolically as σ) and the program determines the parameter which corresponds to the code number. The parameter and not the code input is used in program equations and logic.

The input parameter code is designated by inputting the L-number (delete the "L" of the parameters). These parameters can be used only as independent variables in the hunting procedure.

If the sigma code number is input negatively, the absolute value of the parameter is then utilized in the program equations and logic.

4. THRUST MODULATION CONTROL TABLE FLAGS

The thrust control law type is determined from a sequential input thrust modulation control type, input Fy in the thrust modulation control table row, i.e. L800, L810, ..., L860.

Thrust Control Law Mode

Fy	
1	Specific Velocity-Time Profile
2	Constant Mach Number
3	Proportional-to-Commanded Turning Rate Profile
4	Minimum Velocity During Commanded Turning Rate Profile
5	Constrained Dynamic Pressure
6	Axial Acceleration Proportional to Line-of-Sight Rate

Thrust dynamic mode is input in the thrust modulation control table row, i.e. L803, L813, ..., L863.

If TMC = 0, perfect i.e. $P_c = P_{cc}$
 If TMC = 1, solves P_c equation

5. SHAPER FLAG

K_{sh} Input shaper control flag where: if it equals zero, (dim)
 ignore routine

1. Maximize range,
2. Maximize payload to a given range, or
3. Determine payload to a circular orbit (L0598)

The shaper routine utilizes a generalized attitude control table and sets up the hunting procedure to: 1) maximize range for a given payload, 2) maximize payload to a given range, or 3) isolate the payload weight for a given circular orbit.

6. HUNTING PROCEDURE FLAGS

One by One

P_1 Input flag to specify hunt procedure if nonzero (P1) (dim)
 (L0073)

K_a Input isolation-maximization control function. If (dim)
 zero, isolation is specified and if nonzero, maximization of the dependent variables will occur used in hunting procedure (P1) (L0076)

$K_a = 0$, isolation

1, maximize

$P_1 < 0$, minimize

K_S Input stage print control function. A nonzero value (dim)
 is required to print the trajectory at the termination of each stage during the hunting procedure (L0074)

Multi Variable

P_2 Input flag to specify hunt procedure (P_2). If (dim)
 $P_2 = 0$, by-pass hunt procedure 2; $P_2 = 1$, use a
 linear response; $|P_2| = 2$, use a quadratic response
 surface where +2 maximizes and -2 minimizes; $|P_2| = 3$,
 use an incomplete quadratic response surface
 where +3 maximizes and -3 minimizes. (L0084)

$P_2 > 1$, maximize

$P_2 < 1$, minimize

$|P_2| = 1$ liner model, (isolation), 2, quadratic model = 3
 incomplete quadratic model

7. STAGE START FLAGS

K'_k Input stage start control function. If 1, 2, 3, or 4, (dim)
 the run starts at the initiation of the first, second,
 third, or fourth stage, respectively if input zero
 set equal to 1 (L0003)

K_{dc} Input and output stage number of TVC duty cycle (dim)
 stage (L0671)

8. IMPACT CONTROL FLAG

K_γ Input glide phase termination control function. A (dim)
 value of plus 1 will specify impact after apogee,
 while a minus 1 will specify impact before apogee
 (L0040)

9. SPECIAL PRINT FLAGS

PL-DA Input flag where nonzero values are required if (dim)
 GB,K,KB, printlines DA, GB, K, KB, N, O are desired (L0200-209)
 N,O

T_{mj} Input maximum print region flag (L0260, 262), etc. (dim)

T_{mj} ~ maximum/minimum control flag

> 0 maximum

< 0 minimum

$|T_m|$ = 0 each stage

= 1, 2, 3, or 4 delineated stage

= 5 all stages

K_{TPF} Input titled print flag, if nonzero (L0683) (dim)

A format of printline A, B, C, and D is printed at the top of each page.

10. WEIGHT CARRYOVER FLAGS

K_{NOK} Input complementary thrust-weight table weight carryover flag for the k-th stage. If K_{Ok} and K_{NOK} are nonzero, separation has occurred with regards to the complementary weight. If K_{Ok} is nonzero and K_{NOK} is zero, the total vehicle weight at the termination of the k-1 stage is used as the initial weight of the k-th stage (Lk107) (dim)

K_{Ok} Input main thrust-weight table weight carryover flag for the k-th stage. If zero, separation has occurred with regards to the main and complementary weights. If nonzero, the main weight at the termination of the k-1 stage is used as the initial main weight of the k-th stage (Lk012) (dim)

11. AUTO PILOT FLAGS

K_b Input thrust control flag. If zero, control thrust is determined from instantaneous vehicle thrust. If 1, the control thrust is obtained from the instantaneous main stage thrust, if 2 control thrust is non-existent (Lk434) (dim)

f_{Gik} Input attitude control system gain control flag. (dim)
 If equal to zero, input gains are utilized; if not equal to zero, the automatic gains, calculated from vehicle control response frequency and damping ratio, i.e. ω_v and ζ_v , are utilized for the j-th control zone, $i = 1, 2$, or 3; and k-th stage, $k = 1, 2, 3$, or 4 (Lk456, 465, etc).

12. NOZZLE BASE DRAG FLAG

K_{BD} Input flag which stipulates that the main nozzle exit area will be used in the base drag calculations when splitting main and complementary tables to allow for up to 47 thrust time points. (Lk108) (dim)

13. ROLL CONTROL FLAG

K_{rc} Input roll control system flag (Lk405) (dim)
 If $K_{rc} = 1$ Auxiliary roll thrusters are used
 If $K_{rc} = 2$ Aerodynamic control fins are used

APPENDIX C
FINAL PROGRAM REVIEW BRIEFING CHARTS

The briefing charts given at the final program review at RPL in June 1972 are shown in this appendix. These charts basically show how to prepare input for the Advanced ASC/TMC Preliminary Design Digital Computer Program. Delineated are instructions for the input executive control cards, trajectory operation philosophy, required input as a function of kind of trajectory simulation desired, generated duty cycle, and required hardware input peculiar to the pintle nozzle design.

ADVANCED ASC/TMC PRELIMINARY
DESIGN DIGITAL COMPUTER PROGRAM

EXECUTIVE CONTROL (1ST CARD) FORTRAN INPUT

THREE PHASES

EXECUTIVE CONTROL CARD COLUMN

1. REQUIREMENT ANALYSIS WHICH ESTABLISHES DESIGN DUTY CYCLE WITH USE OF TRAJECTORY CODE	2 EQUAL 1
2. HARDWARE DESIGN WHICH CALCULATES TVC/TWC SYSTEM COMPONENT SIZES AND WEIGHT FROM DESIGN DUTY CYCLE CALCULATED IN PHASE 1	4 EQUAL 1
3. REFLY INCLUDES NEWLY DESIGNED HARDWARE DATA IN TRAJECTORY ROUTINE TO EVALUATED PERFORMANCE	6 EQUAL 1

DUTY CYCLE

REQUIREMENTS SECTION ESTABLISHES THE FOLLOWING DESIGN DUTY CYCLE DATA

1. PITCH/YAW TVC REQUIREMENTS
 - MAXIMUM TVC ANGLE & ANGULAR INTEGRALS
 - TVC SLEW RATE
 - EXTERNAL AERODYNAMIC CONDITIONS AT NOZZLE
 - TIME HISTORY OF DEFLECTION ANGLES, THRUST, MISSILE CENTER-OF-GRAVITY, & GAS FLOW RATE THROUGH NOZZLE
2. ROLL CONTROL REQUIREMENTS
 - MAXIMUM ROLL TORQUE & TORQUE INTEGRALS
3. AERODYNAMIC CONTROL SURFACE
 - MAXIMUM CONTROL TORQUE & TORQUE INTEGRALS
 - FIN SIZE, WEIGHT, AND CENTER-OF-GRAVITY
4. TMC REQUIREMENTS
 - MAXIMUM & MINIMUM THROAT AREA, THRUST & CHAMBER PRESSURE
 - REQUIRED TIME RATE CHANGE OF THROAT AREA & RATE INTEGRAL
 - EXTINGUISHMENT THROAT AREA & CHAMBER PRESSURE

* TVC DUTY CYCLE DATA IS
STORED IN L7000 THROUGH
L7899

* EXECUTIVE CONTROL CARD
COLUMN 8 EQUAL 1

TRAJECTORY ANALYSIS METHOD

1. FLY POINT MASS TRAJECTORY WITH USE OF HUNTING
PROCEDURE TO SHAPE FLIGHT PATH AND EVALUATE
PARAMETERS SUCH AS VELOCITY HISTORY AND
STEERING COEFFICIENTS
2. FLY RIGID BODY WITH CONTROLS AND ROLL REQUIREMENTS
TO EVALUATE DUTY CYCLE REQUIREMENTS

DATA INPUT ROUTINE
(CTINP)

- VARIABLE FIELD, INDIVIDUALLY ADDRESSED DATA FIELDS
- L FOLLOWED BY ADDRESS IDENTIFIES DATA LOCATION
- SEPARATE NUMERICAL INPUT IS DISTINGUISHED FROM OTHER SIMILAR INPUT BY THE USE OF ITS ASSOCIATED SIGN "+" OR "-" AND/OR A COMMA ",",
- BLANK CARD COLUMNS ARE IGNORED, EXCEPT WHEN READING HOLLERITH DATA
- "T" IN COLUMN 1, SIGNALS END OF DATA
- COLUMNS 2 THROUGH 72 OF T-CARD ARE USED FOR TITLE MESSAGE

TRAJECTORY INPUT PARAMETER UNITS

LINEAR - FEET

TIME - SECONDS

ANGLE - DEGREES

WEIGHT - POUNDS

FORCE - POUNDS

FREQUENCY - RADIANS PER SECOND

SWITCHING LOGIC

TO TERMINATE A CONDITION

1. SPECIFY A P-NUMBER (SIGMA CODE)
2. SPECIFY CORRESPONDING VALUE OF THAT PARAMETER (K-VALUE)

EXAMPLE:

TO TERMINATE THE FIRST ATTITUDE CONTROL ZONE AT

$$V_e = 170 \text{ ft/sec}$$

$$\text{Set } L_{211} + 5504 \quad L_{312} + 170$$

$$(\sigma_{f1}) \quad (V_e) \quad (K_{f1}) \quad (170 \text{ ft/sec})$$

TRAJECTORY INPUT/OUTPUT

L-NUMBERS

0 to 999	Non Stage Input
1000 to 1999	Stage I Input
2000 to 2999	Stage II Input
3000 to 3999	Stage III Input
4000 to 4999	Stage IV Input
5000 to 5999	Output Parameter P-Number

TRAJECTORY INPUT

• Non Stage Dependent

1) *	Initial Conditions	L 0 - L 43
2)	Weight Jettison Table	L 49 - L 72
3)	Hunting Procedure	L 73 - L 167
4) *	Print Time	L 168 - L 309
5) *	Attitude Control Table	L 310 - L 406
6) o+	Wind Profile	L 407 - L 499
7)	Shaper	L 598 - L 599
8) o+	Mode Control Table	L 600 - L 629
9) \$	Target Dynamical Condition	L 630 - L 669
10) o+	TVC Duty Cycle Criteria	L 670 - L 699
11) #	Thrust Modulation Control Table	L 800 - L 869
12) #	Specific Velocity Time Profile	L 870 - L 899

* Mandatory all runs

o Mandatory for duty cycle with TVC

+ Mandatory for duty cycle with aerodynamic controls

\$ Mandatory for target dependent flight

Mandatory for TMC duty cycle

TRAJECTORY INPUT

k - Stage Number, i.e.
1, 2, 3, or 4

• Stage Dependent

1) **	Main Thrust-Weight Table	Lk000 - Lk099
2)	Complementary Thrust-Weight Table	Lk100 - Lk184
3) *	Axial Drag Coefficient Table	Lk185 - Lk219
4) *	Body Aerodynamic Normal Force Coefficient Table	Lk220 - Lk297
5) o+	Aerodynamic Damping Coefficient Table	Lk298 - Lk379
6) o+	Pitch/Yaw Control Data	Lk380 - Lk474
7) o+	Center-of-Gravity and Inertia Data	Lk475 - Lk637
8)	Roll Control Data	Lk638 - Lk666
9)	Aerodynamic Rolling Moment Coefficient Table	Lk667 - Lk699
10) +	Aerodynamic Movable Control Fin Table	Lk700 - Lk799

-
- * Mandatory all runs
 - o Mandatory for duty cycle with TVC
 - + Mandatory for duty cycle with aerodynamic controls
 - \$ Mandatory for target dependent flight
 - # Mandatory for TMC duty cycle

PUNCH DUTY CYCLE

EXECUTIVE CONTROL CARD
COLUMN 16 EQUAL 1

THE TVC DUTY CYCLE DATA IN THE REGION L7000 THROUGH L7799 IS PUNCHED

AERODYNAMIC LOADING DISTRIBUTION

Executive Control Card
Column 18 Equal 1

L500 The data describing the body of revolution in the AERODYNAMIC COEFFICIENTS region
through L555 must be input.

The following duty cycle data must be available:

L7021	$q\alpha'_{\max}$	Product of maximum absolute value of q and α
L7022	$q_{q\alpha'}$	q at maximum $q\alpha'_{\max}$
L7024	$C_{N\alpha q}$	Aerodynamic normal force coefficient at maximum $q\alpha'$
L7025	$M_{q\alpha}$	Mach Number at maximum $q\alpha'$
L7027	K_{dc}	TVC stage number
L7052	$h_{q\alpha'}$	Altitude at maximum $q\alpha'$
L7053	$P_{q\alpha'}$	Atmospheric pressure at maximum $q\alpha'$
L7057	$\alpha_{q\alpha'}$	Angle of attack at maximum $q\alpha'$
L7058	$\beta_{q\alpha'}$	Angle of side slip at maximum $q\alpha'$
