ABSTRACT

Travel-time anomalies at LASA, computed from 626 teleseisms with the November 1966 Herrin tables, are separated into various regions and then averaged. Several observations are made concerning the results.

INTRODUCTION

This report presents the results of computing P-wave relative travel-time anomalies at all subarray center instruments at the Large Aperture Seismic Array (LASA) in Montana. The travel-time table used for computing expected times is the Herrin, November 1966 version.

A total of 626 teleseisms are used. As the anomalies are dependent upon event distance and azimuth, all of the results are separated into groups such that the subarrays have anomalies which are consistent within each defined region.

The following description explains the presentation of the results in the Appendix with these reference numbers appearing on the first page therein:

1. Source of expected travel times. In this report, the Herrin table, November 1966 version, is used;

2. Reference subarray, R, selected for computing relative anomalies. In this report, all anomalies are relative to subarray A0. The following relation may be used to change reference stations;

$$A_{i/j} = A_{i/r} - A_{j/r}$$

where $A_{i/j}$ is the anomaly at station i relative to a new reference station j.

3. All expected travel-times in this report have been corrected for the ellipticity of the earth such that the computed anomalies may be used in conjunction with other programs requiring these corrections.

4. An arbitrary geographic name given to the event region.

5. Range of epicentral distance in the event region.

6. Range of epicentral azimuth in the event region.

7. Date and arbitrary name given to each event.
8. Epicentral distance, in kilometers, from the reference subarray, R.
9. Epicentral azimuth, in degrees measured from north to east, from the reference subarray, R.
10. Subarray designator, i.
11. Measured travel-time anomaly, in seconds, at subarray i relative to subarray R for the kth event;

$$A_{i/r}^k = T_i^k - T_r^k - H_i^k + H_r^k$$

where T is the observed arrival time and H is the expected (Herrin 1966) travel time from the hypocenter of the kth event including correction for ellipticities but not for station elevations.

12. A fixed-point zero anomaly indicates that no reading was made at the subarray for that event.
13. The average anomaly at subarray i of N recorded events;

$$\bar{A}_{i/r} = \left(\sum_{k=1}^N A_{i/r}^k \right) / N$$

for the defined region.

14. Standard deviation, or error of estimate, at the ith subarray for N observations:

$$\sigma_i = \left\{ \left[\sum_{k=1}^N (A_{i/r}^k - \bar{A}_{i/r})^2 \right] / (N-1) \right\}^{1/2}$$

for the defined region.

15. Number of observations, N, at station i for the defined region.

16. Total number of epicenters included in the defined region.
17. Epicenter latitude, degrees (USC&GS); plus north, minus south.
18. Epicenter longitude, degrees (USC&GS); plus east, minus west.
19. Event depth, kilometers (USC&GS).
20. Event origin time, hours, minutes, seconds (USC&GS).
21. Standard deviation, or error of estimate, of the kth event in the defined region;

$$\sigma_k = \left\{ \left[\sum_{i=1}^L (A_{i/r}^k - \bar{A}_{i/r})^2 \right] / (L-1) \right\}^{1/2}$$

where L is the number of subarrays recording the kth event not including the reference subarray R.

22. Average error, or bias, of the kth event;

$$E_k = \frac{\sum_{i=1}^L (A_{i/r}^k - \bar{A}_{i/r})}{L}$$

where L is the number of subarrays recording the kth event not including the reference subarray R.

23. Number of subarrays, L, recording the kth event, not including the reference subarray R.

The results in the Appendix are arranged first by general direction (beginning with the northwest and going clockwise) and second by increasing epicentral distance within each directional group (See Table I).

DISCUSSION

The following observations similar to those in a previous report using the Jeffreys-Bullen travel-time tables (Chiburis, 1966), are made concerning the LASA travel-time anomalies using the Herrin, November 1966 tables:

1. The anomaly variations between regions measured at a single subarray are as high as 1.66 seconds. For example, subarray F4 has an average anomaly of +0.74 sec ($N = 19$, $\sigma_{F4} = 0.13$) for the No. Colombia region and an average of -0.92 sec ($N = 12$, $\sigma_{F4} = 0.07$) for the Solomon Is. region.

2. Subarrays which are quite near the reference subarray A0 can have unusually large anomalies. For example, subarray D4 is located 30.75 km from A0 (center instrument to center instrument) and has an anomaly relative to A0 of +0.83 sec. ($N = 7$, $\sigma_{D4} = 0.06$) for the Dominican Republic-Mona Passage region.

3. The center instrument at subarray B2 is only 7.50 km from the center at A0, but it has an anomaly of -0.30 sec ($N = 13$, $\sigma_{B2} = 0.04$) for the Yugoslavia-Albania-Greece-Mediterranean Sea Region. This result suggests that the time anomalies within one subarray (7 km diameter) are far from negligible. Signals recorded within a subarray can be significantly misaligned with anomalies as large as 0.30 sec.

4. The anomalies are not slowly varying functions of either distance or azimuth. For example, subarray F1 has an anomaly of +0.22 sec ($N = 7$, $\sigma_{F1} = 0.09$) computed from events approaching from an east-southeastly direction at 5100 km distance (Virgin-Leeward Is. region), but at 4600 km (Dominican Republic-Mona Passage region) the anomaly is +0.84 sec ($N = 7$, $\sigma_{F1} = 0.07$). Subarray F2, on the other hand, has an anomaly of +0.12 sec ($N = 6$, $\sigma_{F2} = 0.08$) for events bearing 145° at 4800 km (So. Central America), whereas for events bearing 113° at a distance of 5100 km (Virgin-Leeward Is. region) the anomaly is -0.57 sec ($N = 6$, $\sigma_{F2} = 0.06$). Hence, the anomaly at F1 changes by 0.62 sec in a distance range of 500 km, and at F2 it changes by 0.69 sec in an azimuth range of 32° .

5. The maximum anomaly range observed at LASA is 1.94 sec; average anomaly at subarray F2 is -1.01 sec for events occurring in Rumania; average anomaly at subarray E1 is +0.93 for events from the No. Colombia region.

6. The maximum anomaly range for one particular region (North Atlantic Ridge) is 1.43 sec, where the D4 anomaly is +0.47 sec and the F2 anomaly is -0.97.

13 ABSTRACT

Travel-time anomalies at LASA, computed from 626 teleseisms with the November 1966 Herrin tables, are separated into various regions and then averaged. Several observations are made concerning the results.

INSTRUCTIONS

1. **ORIGINATING ACTIVITY:** Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (corporate author) issuing the report.

2a. **REPORT SECURITY CLASSIFICATION:** Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. **GROUP:** Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. **REPORT TITLE:** Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. **DESCRIPTIVE NOTES:** If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. **AUTHOR(S):** Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. **REPORT DATE:** Enter the date of the report as day, month, year, or month, year. If more than one date appears on the report, use date of publication.

7a. **TOTAL NUMBER OF PAGES:** The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. **NUMBER OF REFERENCES:** Enter the total number of references cited in the report.

8a. **CONTRACT OR GRANT NUMBER:** If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, 8c, & 8d. **PROJECT NUMBER:** Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. **ORIGINATOR'S REPORT NUMBER(S):** Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. **OTHER REPORT NUMBER(S):** If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).

10. **AVAILABILITY/LIMITATION NOTICES:** Enter any limitations on further dissemination of the report, other than those

imposed by security classification, using standard statements such as:

- (1) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. **SUPPLEMENTARY NOTES:** Use for additional explanatory notes.

12. **SPONSORING MILITARY ACTIVITY:** Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.

13. **ABSTRACT:** Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. **KEY WORDS:** Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
