THIS PAGE IS UNCLASSIFIED

The following notice applies to any unclassified (including originally classified and now declassified) technical reports released to "qualified U.S. contractors" under the provisions of DOD Directive 5230.25, Withholding of Unclassified Technical Data From Public Disclosure.

NOTICE TO ACCOMPANY THE DISSEMINATION OF EXPORT-CONTROLLED TECHNICAL DATA

1. Export of information contained herein, which includes, in some circumstances, release to foreign nationals within the United States, without first obtaining approval or license from the Department of State for items controlled by the International Traffic in Arms Regulations (ITAR), or the Department of Commerce for items controlled by the Export Administration Regulations (EAR), may constitute a violation of law.
2. Under 22 U.S.C. 2778 the penalty for unlawful export of items or information controlled under the ITAR is up to two years imprisonment, or a fine of \$100,000, or both. Under 50 U.S.C., Appendix 2410, the penalty for unlawful export of items or information controlled under the EAR is a fine of up to \$1,000,000, or five times the value of the exports, whichever is greater; or for an individual, imprisonment of up to 10 years, or a fine of up to 10 years, or a fine of up to \$250,000, or both.
3. In accordance with your certification that establishes you as a "qualified U.S. Contractor", unauthorized dissemination of this information is prohibited and may result in disqualification as a qualified U.S. contractor, and may be considered in determining your eligibility for future contracts with the Department of Defense.
4. The U.S. Government assumes no liability for direct patent infringement, or contributory patent infringement or misuse of technical data.
5. The U.S. Government does not warrant the adequacy, accuracy, currency, or completeness of the technical data.
6. The U.S. Government assumes no liability for loss, damage. Or injury resulting from manufacture or use for any purpose of any product, article, system, or material involving reliance upon any or all technical data furnished in response to the request for technical data.
7. If the technical data furnished by the Government will be used for commercial manufacturing or other profit potential, a license for such use may be necessary. Any payments made in support of the request for data do not include or involve any license rights.
8. A copy of this notice shall be provided with any partial or complete reproduction of these data that are provided to qualified U.S. contractors.

DESTRUCTION NOTICE

For classified documents, follow the procedures in DOD 5200.22-M, Industrial Security Manual, Section II-19 or DOD 5200.1-R, Information Security Program Regulation, Chapter IX. For unclassified, limited documents, destroy by any method that will prevent disclosure of contents or reconstruction of the document.

TECHNICAL REPORT NO. AFWL-TR-69-38

This document is subject to special export controls and each transmittal to foreign governments or foreign nationals may be made only with prior approval of AFWL (WLRP), Kirtland AFB, NM, 87117. Distribution is limited because of the technology discussed in the report.

FOREWORD

This report was prepared under Program Element 6.16.46.01.H, Project 5710, Subtask RAS 1114 (15.025), and was funded by the Defense Atomic Support Agency (DASA).

Inclusive dates of research were June 1968 to January 1969. The report was submitted 4 March 1969.

Information in this report is embargoed under the US Export Control Act of 1949, administered by the Department of Commerce. This report may be released by departments or agencies of the US Government to departments or agencies of foreign governments with which the United States has defense treaty commitments, subject to approval of AFWL (WLRP), Kirtland AFB, NM, 87117.

This technical report has been reviewed and is approved.

ABSTRACT

(Distribution Limitation Statement No. 2)

Computer codes for predicting material response to shock loading in and above the elastic region of a material require a knowledge of the Hugoniot equation of state. Hugoniot and material data have been compiled from various sources on materials of interest and presented in a form which condenses the needed computer code inputs to an easily accessible source.

SYMBOLS AND UNITS

RHO	ambient density (ρ_o) (gm/cm ³)
E _s	sublimation energy (ergs/gm)
Γ	Gruneisen coefficient (calculated from $B^S \cdot \beta / \rho_o \cdot C_p$ or observed from shock wave experiments; dimensionless)
C _L	Longitudinal sound speed (cm/microsec)
C _S	transverse sound speed (cm/microsec)
C _B	bulk sound speed (cm/microsec)
R ^S	adiabatic bulk modulus = $\rho_o C_B^2$ (Megabars)
AMU	shear modulus = $\rho_o C_S^2$ (Megabars)
CO	elastic Modulus (Megabars)
YMU	compression at which elastic limit is reached in terms of μ
β	thermal coefficient of expansion (volumetric)
Specific heat (C _p)	given in joules and at constant pressure
S	data pressure points (Megabars)
SCAL	calculated stress (Megabars)
PCAL	calculated hydrostatic pressure or, in the case of a simple least squares fit to P - μ data, a stress term (Megabars)
V, V _o	specific volume at final and initial compression, respectively
ETA	compressional term ρ/ρ_o or V _o /V (dimensionless)
U	calculated particle velocity (cm/microsec)
YADD	linear work hardening term (expressed at $\mu = 0.2$) (Megabars)
μ	$(\rho/\rho_o) - 1$ or $(V_o/V) - 1$ (a nondimensional compression term)
C1, D1, S1	constants in cubic fit $P = C1\mu + D1\mu^2 + S1\mu^3$ for first plastic wave, expressed in Megabars
C2, D2, S2	constants in cubic fit $P = C2\mu^2 + D2\mu^2 + S2\mu^3$ for second plastic wave, expressed in Megabars

NOTE: All data points are referenced as to their source. Further, material properties available and included in this report are referenced as to source.

UNIT CONVERSION RELATIONS

1 gm/cm³ (units of weight density) = 1 dyne-sec²/cm⁴ (units of mass density)

1 gram = 1 dyne-sec²/cm (= 980.7 dynes at acceleration of 1 gravity)

1 dyne = 1 gram - cm/sec²

1 erg = 1 dyne - cm = 10⁷ joules

1 calorie = 4.186 · 10⁷ ergs = 4.186 · 10⁵ mbar-cm³ per unit area

1 tap = 1 dyne-sec/cm² = 1 bar-μsec

1 bar = 10⁶ dynes/cm² = 14.5 psi = 0.987 atmosphere

1 psi = 69,000 dynes/cm² = 0.69 · 10⁷ mbar = 70.31 grams/cm²

1 kbar = 10³ bar = 10⁹ dynes/cm² (where kbar = kilobar)

1 mbar = 10³ kbar = 10¹² dynes/cm² (where mbar = megabar)

1 cal/gram°C = 1 BTU/lb°F

1 ft/sec = 30.48 cm/sec = 30.48 x 10⁻⁶ cm/μsec

SECTION I

INTRODUCTION

The study of shock wave propagation in solids requires a knowledge of the pressure-volume-energy (P-V-E) equation of state of the material under consideration. Typically, the Mie-Gruneisen form of the equation of state is used along with the Rankine-Hugoniot relations expressing the conservation of mass, momentum, and energy. The Rankine-Hugoniot equations are not in themselves adequate to uniquely determine the parameters; therefore, additional knowledge of a material's behavior is necessary. This additional knowledge is given by the Hugoniot of a material which defines all pressure-volume states obtainable through a shock transition.

The Hugoniots included in this report represent data accumulated from various sources and are reduced to a form usable in existing computer codes for predicting material response to shock loading at pressures in and above the elastic region of a material. The purpose of this report is therefore to present the results of various investigations on materials of interest in a form which condenses the needed computer code inputs to an easily accessible source.

SECTION II

HUGONIOT DATA REPRESENTATION

1. FORM OF THE EQUATION OF STATE

The Mie-Gruneisen compressional equation of state can be written as

$$P - P_H(V_H) = \frac{\Gamma(v)}{V} \cdot (E - E_H(V_H)) \quad (1)$$

relating pressure-volume-energy through use of a reference curve, generally chosen as the Hugoniot. In the above equation, P , V , E refer to any equilibrium position admissible in a complete equation of state; P_H , V_H , E_H refer to states existing on the Hugoniot, and $\Gamma(v)$, the Gruneisen coefficient, is assumed to be a function of volume only.

The Hugoniot of a material defines all pressure-volume states obtainable through a shock transition and can be represented in the form

$$P_H = C\mu + D\mu^2 + S\mu^3 \quad (2)$$

where C , D , S are constants, $\mu = \rho/\rho_0 - 1$, and ρ_0 , ρ = initial and final densities, respectively.

A description of the Hugoniot in terms of measurable quantities can be obtained from the so-called "jump" conditions which are statements of conservation of mass, momentum, and energy across a shock front:

$$\rho_0 U_s = \rho (U_s - U_p) \quad \text{conservation of mass} \quad (3)$$

$$P - P_0 = \rho_0 U_s U_p \quad \text{conservation of momentum} \quad (4)$$

$$P U_p = 1/2 \rho_0 U_s U_p^2 + \rho_0 U_s (E - E_0) \quad \text{conservation of energy} \quad (5)$$

where

ρ = density

U_s , U_p = shock velocity, particle velocity, respectively

P = pressure

E = energy

and the subscript, o, refers to the undisturbed states.

By combining equations (3), (4), and (5), the Rankine-Hugoniot equation is obtained relating energy to pressure and volume on the Hugoniot curve

$$E_H - E_o = 1/2 (P_H + P_o) (V_o - V_H) \quad (6)$$

Combining equations (1), (2), and (6),

$$P = P_H(V_H) \cdot \left(1 - \frac{\Gamma(v)\rho}{2}\right) + \Gamma(v) \cdot \rho \cdot (E - E_o) \quad (7)$$

In PUFF-type codes $\Gamma(v)$ is assumed to be a constant, and E_o is set to zero. Equation (7) then becomes

$$P = (C\mu + D\mu^2 + S\mu^3) \cdot \left(1 - \frac{\Gamma\mu}{2}\right) + \Gamma\rho E \quad (8)$$

This, then, is a general equation of state used to describe material response under dynamic loading.

2. EXPERIMENTAL DETERMINATION OF THE HUGONIOT

The above equations, however, are not sufficient to establish an equation of state for a material without experimental data. This additional information is generated through experimental measurements of the Hugoniot. Several forms of Hugoniot data are used of which two will be considered here.

We have seen that one form of the Hugoniot is $P_H = C\mu + D\mu^2 + S\mu^3$. From equation (3) we see that

$$\rho/\rho_o = \left(\frac{U_s}{U_s - U_p}\right)$$

and from equation (4), if any two of the parameters P, U_s , or U_p can be measured, the third can be determined and a point on the Hugoniot can be found. A series of such measurements then defines equation (2)

Another form for the Hugoniot may be found by solving equations (3) and (4) for shock velocity and particle velocity.

$$U_s = \left[\left(\rho / \rho_o \right) (P - P_o) / (\rho - \rho_o) \right]^{1/2} \quad (9)$$

$$U_p = \left[(\rho - \rho_o) / \rho \right] U_s \quad (10)$$

If a simultaneous experimental determination of U_s and U_p is made, there is sufficient information to establish a point on the Hugoniot. A series of such measurements will then define the entire curve.

For most materials a linear relationship has been noted where

$$U_s = C_o + \lambda U_p \quad (11)$$

$C_o = U_s$ intercept at zero pressure

$\lambda =$ slope of shock/particle velocity data

This alternate form may also be used to represent Hugoniot data. C_o approximates the bulk sound speed given by

$$C_B^2 = C_L^2 - 4/3 C_S^2$$

where

$C_L =$ longitudinal sound speed

$C_S =$ transverse sound speed

When U_s and U_p are linearly related, equation (2) can be written explicitly in terms of C_o and λ . If equations (11) and (4) are combined and P_o is negligibly small compared to P , then

$$P = \rho_o U_p (C_o + \lambda U_p) \quad (12)$$

Equation (10) can be written in the form

$$\rho_o / \rho = 1 - \left[U_p / (C_o + \lambda U_p) \right] \quad (13)$$

Eliminating U_p between equations (12) and (13),

$$P = \frac{\rho_o C_o^2 \mu(\mu + 1)}{[1 + \mu(1 - \lambda)]^2} \quad (14)$$

where $\mu = \rho/\rho_o - 1$. This then gives the user two forms of the Hugoniot representation. One form gives a least squares fit to the data points reported in the form

$$P_H = C\mu + D\mu^2 + S\mu^3$$

The second form is the relationship

$$U_s = C_o + \lambda U_p$$

SECTION III

MATERIAL PROPERTIES

1. DISCUSSION OF MATERIAL STRENGTH

The analytic functions for the Hugoniot so far discussed describe a material's hydrostatic behavior. In some cases this hydrodynamic treatment is a good approximation in the pressure regions of interest. For strong materials with high elastic moduli it is necessary to include elastic response in the calculations. In this treatment the Von Mises yield criterion is used to describe an elastic region which, when exceeded, results in plastic or hydrodynamic response of the material.

In figure 1 the Hugoniot elastic limit (HEL) of a material is the elastic limit in stress-strain space. The stress-strain curve is taken to lie above the hydrostat by a value equal to $2/3 Y_0$, where Y_0 is the yield strength in simple tension. In this report the Hugoniot elastic limit is found by either of two methods. In the first case the HEL is observed directly by noting the amplitude of the elastic precursor in a shock wave experiment when a material is stressed above its elastic limit.

Figure 1. Typical Stress-Strain Curve

In the second case an estimate of the HEL may be calculated from Y_0 and the elastic modulus. The elastic modulus is the slope of the stress-strain curve in the elastic region given by

$$\rho_0 C_B^2 + 4/3 \rho_0 C_S^2$$

where

$$\rho_0 C_B^2 = \text{bulk modulus}$$

$$\rho_0 C_S^2 = \text{shear modulus}$$

The Hugoniot elastic limit is then

$$HEL = (\rho_0 C_B^2 + 4/3 \rho_0 C_S^2) \cdot YMU$$

where YMU is the value of μ at the elastic limit. Since the Von Mises yield criterion offsets the stress-strain curve from the hydrostat by $2/3 Y_0$,

$$HEL = \rho_0 C_B^2 \cdot YMU + 2/3 Y_0$$

and

$$YMU = (1/2) Y_0 / \rho_0 C_S^2$$

If $U_s - U_p$ data are available, a hydrostatic pressure is calculated using equation (14) and the value $2/3 Y_0$ is added to the calculated hydrostat. Should the experimental points still diverge from the predicted stress, a purely empirical work hardening term, YADD, is calculated to give a final fit:

$$P = C\mu + D\mu^2 + S\mu^3 + 2/3 Y_0 + 2/3 \left(\frac{\mu - YMU}{0.2 - YMU} \right) \cdot YADD$$

Work hardening is assumed to be a linear function of the strain and YADD is its value at $\mu = 0.2$. P is now a stress term taking into account material strength and work hardening properties.

2. SIGNIFICANCE OF THE $U_s - U_p$ RELATIONSHIP

As has been noted, the Hugoniot of many materials can be represented by a linear $U_s - U_p$ relationship, $U_s = C_0 + \lambda U_p$.

Departures from linearity can usually be traced to porosity, material strength properties, or phase transitions. Phase transitions, for example, whose effect may be difficult to observe in the $p-v$ plane are quite noticeable in the $U_s - U_p$ plane.

Since the constant term, C_0 , can be determined by direct measurement of the acoustic wave velocities in an isotropic medium, the zero particle velocity intercept may then be used to fit the data. Thus, the Hugoniot equation of state of many materials may be described by ρ_0 , C_0 , and λ . As has been previously discussed, use of the yield strength, Y_0 , and a work hardening term, YADD, improve the accuracy of the curve fit.

In some cases an adequate fit to the stress-strain data cannot be achieved using equation (14) and a $U_s - U_p$ relationship. Several reasons for this discrepancy should be noted. In low pressure regions, material strength properties tend to invalidate the use of equation (14). Also for some materials the $U_s - U_p$ relationship is not linear and has not been treated in this report.

For such cases a simple least square fit can be calculated for stress versus compression. In all cases the linear term is the bulk modulus. Since a least squares fit to the stress- μ data is used, in these cases it is not applicable to calculate a YADD.

All table data are explained under the section on symbols and units.

13. ABSTRACT

(Distribution Limitation Statement No. 2)

Computer codes for predicting material response to shock loading in and above the elastic region of a material require a knowledge of the Hugoniot equation of state. Hugoniot and material data have been compiled from various sources on materials of interest and presented in a form which condenses the needed computer code inputs to an easily accessible source.
