FOREWORD

This is the final report on the Low-Low Altitude CAT research work conducted under Contract Number F33615-68-C-1468 (LO-LOCAT Phase III). The report was prepared by The Boeing Company, Wichita Division, for the Air Force Flight Dynamics Laboratory, Wright-Patterson Air Force Base, Ohio.

The LO-LOCAT Phase III project was part of Advanced Development Program 682E (ALLCAT) and was under the direction of ADP 682E Program Director, Mr. E. Brazier, and the Technical Coordinator, Mr. Neal V. Loving. Mr. Jan Garrison, FBE, was the Air Force Project Engineer.

The research effort was conducted under the Boeing supervision of Mr. F. K. Atnip, Program Manager. Mr. C. F. Peterson was the Project Pilot. Mr. D. B. Marshall was in charge of instrumentation, Mr. H. H. Depew directed the data processing effort, Mr. J. D. Gault was in charge of data analysis, and Mr. W. B. Moreland (Boeing-Seattle) directed the meteorological forecasts and analysis. Airplane maintenance and inspection were the responsibility of Mr. J. Strain and Mr. J. Bonawitz, respectively.

Mr. Gerald A. Comstock piloted the observer airplane over the Peterson Field, Colorado, high mountain route and was also backup pilot for this program. While acting in this latter capacity during a data gathering flight over the Griffiss AFB, New York route, Mr. Comstock was fatally injured in a forced landing following an engine flameout.

Authors of this report, other than those shown on the cover, were Messrs D. E. Gunter and K. R. Monson.

The report was submitted by the authors 17 August 1970. It was reviewed by Mr. Jan Garrison and Dr. T. Swaney (Boeing) who made many constructive comments and suggestions.

This technical report has been reviewed and is approved.

GORDON R. NEGAARD, Major, USAF
Chief, Design Criteria Branch
Structures Division
Air Force Flight Dynamics Laboratory

ABSTRACT

This report presents procedures, analysis methods, and final results pertaining to the LO-LOCAT Phase III program. Approximately 150 hours of low altitude (100 - 1000 feet) turbulence and associated meteorological data were recorded from 16 August 1968 through 30 June 1969. The original program was curtailed by approximately six weeks due to the crash of the T-33 research airplane. A model of the turbulence environment at low-level is presented in terms of gust velocity primary peaks, level crossings, amplitude samples, rms values, and gust maxima, as well as derived equivalent gusts, turbulence scale lengths, and power spectra. Mathematical expressions for turbulence spectra, scale length, and primary peak statistics are shown. Correlations between atmospheric gust velocities and meteorological and geophysical phenomena are evaluated. It was found that gust velocity magnitude at low altitude is most affected by atmospheric stability and terrain. Gust velocity rms values above 1.5 fps may be approximated by truncated Gaussian distributions. For wavelengths less than 15,000 feet, turbulence spectra are best represented by the von Karman mathematical expressions. The turbulence, sampled for 4-1/2 minute intervals over a distance of approximately 32 miles at absolute altitudes below 1,000 feet, was found to be basically stationary, isotropic, and homogeneous. A high percentage of Phase III data were recorded over high mountains since very little high mountain data were recorded under contour flight conditions at low level during Phases I and II. Phase III data are compared with data from Phases I and II and with data from other low altitude programs.

This report consists of two volumes with each volume divided into two parts. Parts I and II of Volume I give the techniques and results of data analysis. Part I of Volume II provides the details pertaining to data acquisition, instrumentation, calibrations and checks, data processing, and data quality. Data tabulations and plots and a log of pertinent information concerning the program are also presented in Volume II Part I. Part II of Volume II contains the power spectral density and other frequency data plots.

(Distribution of this abstract is unlimited.)

v	Lateral gust velocity (feet/second); positive-right
w	Vertical gust velocity (feet/second); positive-upward

APPENDIX IX

GUST VELOCITY POWER SPECTRA AND ASSOCIATED DATA

This appendix contains the power spectra plots of the gust velocity components for selected turbulence samples. Plots are shown indicating the homogeneity and isotropy characteristics of the turbulence, and the coherency between the individual gust velocity components. Comparisons of experimental power spectra to theoretical spectra are also shown. The above information is presented in the following figures in the order of test and leg number. Only those turbulence samples considered to be homogeneous are shown.

The following is a brief explanation of each set of data, how it was obtained, and the definition of abbreviated notes and scale identification.

Power Spectra

The ordinate scale, "Normalized PSD," is the power normalized by the square of the time series standard deviation. The abscissa, "Spatial Frequency," was usually computed by dividing frequency by ground speed; however, true airspeed was used when ground speed data were not available.

Scale length values, L , were determined from equations derived from von Karman's mathematical spectra expressions. The wind angle, WA , is that measured with respect to the ground track of the airplane. Angles were positive when directed from the left of the ground track. An angle of zero degrees is defined as a direct tail wind.

Homogeneity

The "Homogeneity Check PSD Ratio" was obtained by dividing the unnormalized power spectra of the middle third of the data sample by the unnormalized power spectra of the entire sample. This ratio will approach unity for a turbulence sample having perfect homogeneity.

Coherency

The "u-w Coherency" and the "v-u Coherency" is a measure of the statistical independence between the lateral and vertical and the lateral and longitudinal gust velocity components, respectively. Ideally, the components should be statistically independent and their coherency equal to zero. However, due to statistical variations in the power spectra and cross spectra calculations and noise in the experimental data, the coherency can only approximate zero.

Experimental to Mathematical Comparisons

Plots of "Experimental to von Karman PSD Ratios" and "Experimental to Dryden PSD Ratios" show the relationship of the experimental spectra to mathematical

spectra for each gust velocity component. A ratio equal to unity is indicative of perfect agreement between experimental and mathematical spectra.

Isotropy

The "u-v PSD Ratio" and "w-v PSD Ratio" are indicative of the isotropic characteristics of the turbulence. This relationship was obtained by dividing the unnormalized power spectra of the vertical and longitudinal components by that of the lateral component. Perfect isotropy is indicated when the w-v PSD ratio is equal to unity throughout the frequency range and the u-v PSD ratio is equal to 2.0 at the low frequencies and 0.75 at the high frequencies. This is discussed in detail in Section V of Volume I.

13. ABSTRACT This report presents procedures, analysis methods, and final results pertaining to the LO-LOCAT Phase III program. Approximately 150 hours of low altitude (100 - 1000 feet) turbulence and associated meteorological data were recorded from 16 August 1968 through 30 June 1969. A model of the turbulence environment at low-level is presented in terms of gust velocity primary peaks, level crossings, amplitude samples, rms values, and gust maxima, as well as derived equivalent gusts, turbulence scale lengths, and power spectra. Mathematical expressions for turbulence spectra, scale length, and primary peak statistics are shown. Correlations between atmospheric gust velocities and meteorological and geophysical phenomena are evaluated. It was found that gust velocity magnitude at low altitude is most affected by atmospheric stability and terrain. Gust velocity rms values above 1.5 fps may be approximated by truncated Gaussian distributions. For wavelengths less than 15,000 feet, turbulence spectra are best represented by the von Karman mathematical expressions. The turbulence, sampled for 4-1/2 minute intervals over a distance of approximately 32 miles at absolute altitudes below 1,000 feet, was found to be basically stationary, isotropic, and homogeneous. A high percentage of Phase III data were recorded over high mountains since very little high mountain data were recorded under contour flight conditions at low level during Phases I and II. Phase III data are compared with data from Phases I and II and with data from other low altitude programs.

INSTRUCTIONS

1. **ORIGINATING ACTIVITY:** Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (*corporate author*) issuing the report.

2a. **REPORT SECURITY/CLASSIFICATION:** Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. **GROUP:** Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. **REPORT TITLE:** Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. **DESCRIPTIVE NOTES:** If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. **AUTHOR(S):** Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. **REPORT DATE:** Enter the date of the report as day, month, year; or month, year. If more than one date appears on the report, use date of publication.

7a. **TOTAL NUMBER OF PAGES:** The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. **NUMBER OF REFERENCES:** Enter the total number of references cited in the report.

8a. **CONTRACT OR GRANT NUMBER:** If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, 8c, & 8d. **PROJECT NUMBER:** Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. **ORIGINATOR'S REPORT NUMBER(S):** Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. **OTHER REPORT NUMBER(S):** If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).

10. **AVAILABILITY/LIMITATION NOTICES:** Enter any limitations on further dissemination of the report, other than those

imposed by security classification, using standard statements such as:

- (1) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. **SUPPLEMENTARY NOTES:** Use for additional explanatory notes.

12. **SPONSORING MILITARY ACTIVITY:** Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.

13. **ABSTRACT:** Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. **KEY WORDS:** Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries in cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
