Log: H 05-000860

The Institute for Defense Analyses is a non-profit corporation that operates three federally funded research and development centers to provide objective analyses of national security issues, particularly those requiring scientific and technical expertise, and conduct related research on other national challenges.

About this Publication

This work was conducted under contract DASW01 04 C 0003, Task CA-6-2281, for the Joint Staff, Director for Logistics, Medical readiness Division (J-4 MRD) and the U.S. Army Office of The Surgeon General (OTSG). The publication of this IDA document does not indicate endorsement by the Department of Defense, nor should the contents be construed as reflecting the official position of that Agency.

PREFACE

This study was conducted by the Institute for Defense Analyses (IDA) for the Joint Staff, Director for Logistics, Health Service Support Division (J-4 HSSD) and the U.S. Army Office of The Surgeon General (OTSG) in partial fulfillment of the task order CA-6-2281 and the task titled *Revision of NATO AMedP-8 “Planning Guide for the Estimation of Battle Casualties.”* It documents the technical basis for the nuclear volume of Allied Medical Publication 8 (AMedP-8), detailing the modeling tools used, assumptions made, and data produced during the original AMedP-8 effort.

The authors would like to thank MAJ Gerard A. Vavrina (US Army Nuclear and Chemical Agency); Gene E. McClellan (Applied Research Associates, Inc.); and Jeffrey H. Grotte, Douglas P. Schultz, Julia K. Burr, David C. Hockaday, Alexey Dynkin, and Alison E. Lawrence, all of IDA, for reviewing this paper, Ms. Eileen Doherty for editorial input, Ms. Barbara Varvaglione and Ms. Leslie Norris for document preparation.

EXECUTIVE SUMMARY

This report aims to capture the technical underpinnings (such as underlying algorithms, assumptions, and data) of the most recent version of Allied Medical Publication 8, *Planning Guide for the Estimation of Battle Casualties (Nuclear)* (AMedP-8 Nuclear). It also provides users of AMedP-8 Nuclear with a better understanding of the methodology used to obtain the casualty estimates therein, as well as the underlying assumptions and limitations of those estimates.

The Institute for Defense Analyses completed AMedP-8 Nuclear in 1994 for the Army Office of The Surgeon General, the custodian of this NATO publication; ratification occurred in 1998.

AMedP-8 Nuclear allows the user to estimate casualties by injury type and time of onset given the weapon yield of concern and type, posture and mission of the military unit of interest. Key assumptions of AMedP-8 Nuclear include: out-of-area operation; brigade-sized units in tactical formations; weapons yields of 5, 20, and 50 KT; high-intensity conflict scenario; and personnel whose performance is degraded to less than or equal to 25% of original capability to be considered a “casualty.” The casualty who recovers to greater than or equal to 75% capability was allowed to return to duty (RTD); a RTD whose capability dropped to equal to or less than 25% was considered to be “Sick Again.” Unit personnel who were not casualties were placed into “Capable” performance bands that reflected those who were not affected (“=100%”), those who were combat effective (“>75%- <100%”), and those who were performance degraded (but not casualties) (“>50% - <=75%” and “>25% - <=50%”).

Several notable changes were introduced in this update of AMedP-8 Nuclear, including the use of brigade-sized units, tactical scenarios, the Janus nuclear effects model, and the CHRNEM model. The use of the CHRNEM model represents the single most important factor in the conception and development of this revision of AMedP-8 Nuclear; this combined injury model determines post-exposure performance based on the symptom complexes presented by an individual as a result of exposure to nuclear radiation.

AMedP-8 Nuclear relies on scenario-based casualty estimation. Casualties were estimated for three units in different tactical missions for three different yields of nuclear weapons in both warned and unwarned posture; the units considered were a heavy

brigade, a support brigade, and an infantry brigade; missions were movement to contact, offense, defense, and general support. Not all units performed all missions. The heavy brigade support area points of detonation were chosen by inspection to disrupt missions of movement to contact and a combined offense and defense, not to maximize coverage. Those for the heavy brigade maneuver battalions and combat service support brigade were chosen only to maximize coverage by yield. The infantry brigade points of detonation were chosen to target the airfield.

Scenarios comprise a tactical arrangement of units on the battlefield, based on doctrinal composition. Within each scenario, the smallest tactical units are called icons: each consists of one to several personnel. Each scenario has six cases, or combinations of scenario, weapon yield, and posture. The warned posture is meant to provide increased shielding against nuclear effects. Examples of differences between the two postures include movement of personnel into foxholes and closing of hatches on armored vehicles. Detonation points were chosen by inspection, either to maximize casualties or disrupt the mission, depending on the scenario. The scenarios are: Heavy Brigade, Forward Maneuver Battalion Task Force, Movement to Contact; Heavy Brigade, Forward Maneuver Battalion Task Force, Offense; Heavy Brigade, Forward Maneuver Battalion Task Force, Defense; Heavy Brigade, Brigade Support Area Task Force, Movement to Contact; Heavy Brigade, Brigade Support Area Task Force, Offense and Defense; Light Infantry Brigade, Defense; and Support Brigade, General Support.

The use of a tactical two-sided system-level model developed by Lawrence Livermore National Laboratory, "Janus," allowed for the calculation of thermal radiation, ionizing radiation, and primary blast overpressure exposure of an icon with specified location and protection factor. Janus determines insults in terms of primary blast overpressure, thermal radiation (flash burns) and prompt ionizing radiation, accounting for thermal and ionizing radiation shielding when available and applicable. Exposure estimates produced by Janus were not presented in the AMedP-8 Nuclear manual; these estimates are captured in this report in graphic and tabular form, for all icons, in each of the seven scenarios. The graphic presentation of insults by slant range demonstrates the effect of protection and the effect of warning on radiation exposure of personnel; it also enables comparison of effects across three different weapon yields for a given scenario.

AMedP-8 Nuclear differed from previous versions in its use of a combined injury model based on the symptom complexes displayed by an individual as a result of exposure to nuclear radiation to determine post-exposure performance. The Consolidated Human Response Nuclear Effects Model (CHRNEM) uses an algorithmic approach to

estimate residual performance capability (up to six weeks after exposure) to specified levels of nuclear weapons effects. The Combined subroutine of CHRNEM used exposure levels calculated by Janus to report estimates of performance (over time) for icons in the given scenario.

This report supplements AMedP-8 Nuclear with external information such as the detailed layout and composition of the brigade-size units and the tactical scenarios they comprise; the doctrinal basis for tactical scenarios; estimates of the magnitude of nuclear weapon effects received by personnel in each scenario; estimates of the performance capability degradation experienced by these personnel over time; algorithms and assumptions of the Janus and CHRNEM models; the protection factors used to account for shielding against radiation; the process used to generate the tables in AMedP-8 Nuclear; and anomalies in radiation exposure and performance degradation data. This report presents Janus exposure data subsequently analyzed by the Combined subroutine of CHRNEM, which produces performance values over time for each exposed icon. The CHRNEM computer model estimates the ability of individuals to perform physically demanding or undemanding tasks, but provides worst-case casualty estimates; only demanding tasks were considered in AMedP-8 Nuclear. Data for both types of performance (for both warned and unwarned cases) are provided in this report for possible future data analysis. Estimates are tabulated for each icon in each of the seven scenarios over time, up to thirty days post-exposure.

Summary tables provide an overview of casualties and fatalities for each of the three yields modeled, enabling comparisons among scenarios and protective postures.

This documentation effort provides understanding of how casualty estimates are derived in AMedP-8 Nuclear, as well as their limitations in accessibility and applicability.

Over the course of documentation, we identified accessibility and applicability as two key areas for future revisions of AMedP-8 Nuclear. It may be possible to increase accessibility by changing the document format to include hypertext, graphical data presentation, supporting algorithms, and/or supplementary generic software. In addition, extending the information in AMedP-8 to other situations of interest will certainly expand the utility of this manual.

I. INTRODUCTION

A. AMedP-8 DOCUMENTATION OBJECTIVES

The present report provides (to the greatest detail still available) a record of the production of Allied Medical Publication 8, *Planning Guide for the Estimation of Battle Casualties (Nuclear)*¹ (AMedP-8 Nuclear), by the Institute for Defense Analyses (IDA). This effort at documentation discusses the development of the modern form of AMedP-8 Nuclear, providing necessary background and presenting its status since 1992 (when the most recent revision of AMedP-8 Nuclear was first conceived). Most importantly, the present report reveals the technical basis of the most recent revision of AMedP-8 Nuclear, focusing on underlying algorithms, assumptions, and data.

B. AMedP-8 PURPOSE, CONCEPT, AND ASSUMPTIONS

AMedP-8 Nuclear provides estimates of casualties and remaining operational strength following a nuclear detonation in a brigade-sized unit during an out-of-area contingency operation. These estimates consist of the number, injury type (whether radiation, blast or thermal), and injury severity of patients in several scenarios. The scenarios, in turn, comprise three brigade-sized units—in warned or unwarned postures—that experience single detonations of 5, 20, or 50 KT in the unit area.

AMedP-8 will find a target-audience across the full range of military personnel who use casualty estimates in planning and executing operations. The planning guide was envisioned as especially useful for crisis or contingency planning, where a nuclear detonation is imminent or has occurred, and rapid casualty estimation is necessary for response. For example, AMedP-8 will aid operational planners and commanders, who must assess impact on mission, select courses of action, maintain awareness, and respond to changes in battle tempo, and personnel managers, who must plan for replacements for killed or wounded in action (KIA, WIA), medical casualties, and/or those personnel whose performance is degraded to the extent that warrants replacement or augment. Additionally, it will prove useful for surgeons, medical planners, and logistics managers, who must plan for—and respond to—sudden requirements for supplies (especially medical) of unusual types and numbers.

AMedP-8 is meant to serve as a single reference that leads the user to a table, or to a cell in a table, that provides a supportable estimate of casualties resulting from the unique combination of AMedP-8 units, mission, and yield of interest. The assumptions

¹ STANAG 2475

made in the design and development of this manual must be clearly understood to allow for the proper use of the casualty estimation tables. The most significant of these assumptions are:

- Casualty estimates are based on scenarios consisting of brigade-sized units arranged in tactical formations.
- Missions consist of out-of-area operations. Specifically, the terrain is modeled as a flat, open plain and troops are dispersed over relatively large areas. Urban, forested, or mountainous terrains are not considered.
- Weapon yields are 5, 20, and 50 KT, based upon the assumed low level of nuclear weapon sophistication for the adversary. The 20 KT weapon is assumed to be equivalent to what was developed by the US in 1945. The 5 and 50 KT weapons are only slightly more sophisticated, producing a more compact or a higher yield weapon. Yields chosen were considered reasonable for an out-of-area contingency mission. Delivery means (aircraft, artillery, missile) are not considered explicitly, although all detonations are assumed to be low air bursts at the optimal height of burst.
- This is a high-intensity conflict: units are assumed to continue to execute their missions even after nuclear-weapon attack. The tempo of battle requires all but the most injured personnel to continue operations. An exposed individual must be significantly incapacitated to be evacuated for medical care. This leads directly to the definition of a “casualty.”
- The performance of an exposed individual must be degraded to less than 25% of original capability for him or her to be considered a casualty. However, once an individual is defined as a casualty, he or she must recover to at least 75% of original capability before he or she can “return to duty.”

C. AMedP-8 HISTORY

Although the current revision of AMedP-8 was first conceived in 1992, its history extends back 45 years, to December 14, 1959 and the publication of *A System for Estimating the Medical Load in Nuclear Warfare* by the Walter Reed Army Institute of Research. This new methodology allowed the user to specify the size of a unit and the yield and offset distance of a nuclear weapon to estimate the fraction and types of injuries that would result. Personnel in the unit were assumed to be uniformly distributed in an ellipse that was centered on the offset distance and was of the same size as the unit area. At the time of publication, fewer than 15 years after Hiroshima, the casualty estimation methodology was classified SECRET, and only fifty copies were released.

Four years later, in March 1963, *The Handbook for the Estimation of Battle Casualties (Nuclear)* was published as the implementation of the 1959 methodology for the US Army. *The Handbook* eventually became standard doctrine, used for training throughout US military. Not until February 1976, however, was it published as a NATO document in the original AMedP-8, *Planning Guide for the Estimation of Battle Casualties (Nuclear)*. AMedP-8 Nuclear contained tables which provided estimates, in various categories, of nuclear casualties as a percent of unit personnel produced by individual nuclear detonations on various size units without regard to their composition.

Over the next thirty years, our understanding of the effects of nuclear weapons improved, as did our ability to describe these effects with mathematical models. As an expression of this improved capability, in June 1991 the US, as Custodian of AMedP-8, offered Study Draft 1 of its first revision: *Planning Guide for the Estimation of Medical Resources for the Treatment and Management of Nuclear Patients*. This document integrated a completely new methodology, developed by the Defense Nuclear Agency's Intermediate Dose Program (IDP)². IDP used an empirical model of medical signs and symptoms to estimate performance as a function of time after exposure to radiation. The baseline scenario used for the casualty estimates was a corps-on-corps nuclear exchange across the inter-German border by the Warsaw Pact and NATO nations, resulting in hundreds of thousands of casualties. Although an interesting and evocative application of the IDP methodology, this document was unacceptable to the members of the NATO NBC Medical Working Party, principally because of the scope of the scenario. Most member nations did not field forces of a size equivalent to an Army corps, and felt that the document, as written, was not in line with their national capabilities.

Over the next several years, the IDP concept of modeling performance degradation through symptom complexes and tasks was expanded in the Combined Injury Program (CIP)³ to encompass the thermal and blast effects of nuclear weapons. In 1993, the results of the CIP and IDP were automated in the development of the Consolidated Human Response Nuclear Effects Model (CHRNEM).⁴ This allowed the US to propose a new revision of AMedP-8 in September 1994, the *Planning Guide for the Estimation of Battle Casualties (Nuclear)*. This document was to be fundamentally different from prior editions of AMedP-8, allowing for greater fidelity in the estimate of the numbers and types of casualties and their impact on military operations. Given the

² Anno et al., 1984

³ Levin, 1993

⁴ Levin and Fulton, 1992

yield of concern and the type, posture, and mission of the military unit of interest, the user of this document could estimate the resulting casualties by injury type and their time of onset, as well as the performance capability of unit members as a function of time after exposure. This proposal led to the development of AMedP-8 Nuclear.

D. AMedP-8 REVISION TIMELINES

Revision and ratification of AMedP-8 is governed by the traditions and practices of the North Atlantic Treaty Organization (NATO). Within NATO, the Nuclear, Biological, and Chemical (NBC) Medical Working Group (NBCMedWG) is tasked with developing doctrine and procedures relevant to the medical protection and treatment of military personnel exposed to NBC agents. The NBC Defense Staff Officer of the US Army Office of The Surgeon General (OTSG) serves as the US Head of Delegation for the NBCMedWG, and as such represents US positions and interests. In addition, the United States is Custodian of NATO Standardization Agreements (STANAGS) for the estimation of casualties resulting from the use of NBC weapons. The NATO *Planning Guide for the Estimation of NBC Battle Casualties* is presented in three volumes: Volume 1 – Nuclear (STANAG 2475)⁵, Volume 2 – Biological (STANAG 2476)⁶ and Volume 3 – Chemical (STANAG 2477)⁷. The Custodian is responsible for maintaining the STANAG in a current and relevant form, reviewing each document at least once every three years. Reviews are conducted formally in Custodial Meetings, sponsored by the Custodian and attended by all interested Allies. Revisions to the STANAGS are submitted in Study Drafts that are circulated for comment among the Allies. Once general consensus has been reached that the revised STANAG is complete and correct, it is submitted as a Ratification Draft through the Secretary of the NBCMedWG to the NATO Army Board for distribution, review, implementation, and ratification. Ratification is affirmed and the STANAG is promulgated upon agreement by two-thirds of the member nations that the STANAG will be implemented.

The following timeline was proposed for the publication process of the AMedP-8 revision: Upon OTSG's completion of the manual, the other interested US military entities were allowed sixty days to review and provide comments. The manual was scheduled for presentation at NATO on December 5, 1994. IDA would publish the first Study Draft of the manual, including supporting data, in January of 1995. From the

⁵ STANAG 2475

⁶ STANAG 2476

⁷ STANAG 2477

publication date, NATO would be given up to one year to review and provide comments. Upon NATO approval, assumed to take place in approximately November 1995, the final draft would be published in November 1996.

The actual timeline of revision and ratification was slightly more protracted. The Preliminary Draft was provided to the nations for review at a meeting held on December 8, 1994. This evolved through three Study Draft iterations, until the Ratification Draft was distributed to the members of the NBCMedWG in December, 1997. Upon approval, the Ratification Draft 1 was submitted to the Secretary of NATO NBC Medical Working Group for presentation at the Army Board Meeting on February 9, 1998. AMedP-8 was promulgated as STANAG 2475 in 2000, with ratification by BE, LB, GE, UK, NL, DA, IT, TU, GR and US.

II. CHANGES IN THIS UPDATE OF AMedP-8

A. USE OF BRIGADE-SIZED UNITS

At the time this update was proposed, the existing AMedP-8 addressed variably sized units. The earlier proposal (1991) had suggested using corps-level units, but the NBC Medical Working Group observed that many member nations did not field units of such size. The Working Group determined a brigade to be the acceptable size unit. This guide is based on the premise of brigade-sized deployments and the resulting targets they present.

B. USE OF TACTICAL SCENARIOS

Casualties are estimated for three units in different tactical missions for three different yields of nuclear weapons, in both warned and unwarned posture. The units considered are a heavy brigade, a support brigade (combat service support formation of brigade size) and an infantry brigade. A variety of missions are considered: movement to contact, offense, defense and general support. Not all units perform all missions.

Seven scenarios have been used for casualty estimation:

1. Heavy Brigade, Forward Maneuver Battalion Task Force⁸, Movement to Contact.
2. Heavy Brigade, Forward Maneuver Battalion Task Force, Offense.
3. Heavy Brigade, Forward Maneuver Battalion Task Force, Defense.
4. Heavy Brigade, Brigade Support Area Task Force⁹, Movement to Contact.

⁸ “Forward Maneuver Battalion” and “Forward Maneuver Battalion Task Force” are used interchangeably in this document and its appendices.

5. Heavy Brigade, Brigade Support Area Task Force, Offense and Defense.
6. Light Infantry Brigade, Defense.
7. Support Brigade.

C. USE OF JANUS TWO-SIDED COMPUTER MODEL

The tables used for casualty estimation in the original AMedP-8 were derived from a relatively simple set of algorithms originally published in 1959. By 1992, Lawrence Livermore National Laboratory (LLNL) had created Janus¹⁰, a computer model that included the capability to arrange units as desired on a terrain map, target those units with a selected nuclear weapon, and report on the estimated intensity of resultant exposures. Janus is a tactical “force-on-force” system-level model, allowing two-sided play of tactical units. Units may vary in size from individual infantrymen or vehicles to large aggregates. For the purpose of AMedP-8, these units were static, and arranged in doctrinally accepted configurations based upon unit size and mission. Janus allows for the calculation of exposures to the specified system level.

D. USE OF COMBINED INJURY MODEL

The single most important factor in the conception and development of this revision of AMedP-8 was the completion of CHRNEP, which uses an algorithmic approach to estimate residual performance capability up to six weeks after exposure to specified levels of nuclear weapon effects. The model allows the user to input yield and range, or specific exposure levels of interest, and provides the output of performance as a function of time. LLNL modified the output of this subroutine by extending the normally accepted range of exposure levels (normal limits for primary blast, ionizing radiation and thermal radiation were 0-40 psi, 0-1000 cGy, and 0-80 cal/cm², respectively). For the purposes of AMedP-8, IDA only used the Combined¹¹ subroutine of CHRNEP, taking the exposure levels calculated by Janus (ionizing radiation, thermal radiation, and primary blast exposures) and using the subroutine to report the individual estimates for performance versus time.

⁹ “Brigade Support Area” and “Brigade Support Area Task Force” are used interchangeably in this document and its appendices.

¹⁰ Calloway et al., 1990

¹¹ Levin, 1993

III. THE AMedP-8 SCENARIOS

A. TACTICAL ARRANGEMENT OF UNITS ON BATTLEFIELD

AMedP-8 relies on scenario-based nuclear casualty estimation. Scenarios consist of a tactical arrangement of units on the battlefield, based on doctrinal composition.¹² Within each scenario, the smallest tactical units or systems are called icons, each consisting of one or several personnel (or crew). The seven scenarios listed in Section II.B were used in AMedP-8; each scenario has six sub-scenarios, or cases. A case is a combination of scenario, weapon yield (5, 20, or 50 KT) and posture (warned or unwarned). The scenarios are organized by brigade and discussed in greater detail below.

1. Heavy Brigade

The heavy brigade consists of six battalions and other assigned elements. The battalions are: two mechanized infantry, one armor, one self-propelled artillery, one mechanized engineer, and one support battalion. Assigned elements include air defense intelligence, military police, and smoke generators. The heavy brigade is depicted performing three missions: movement to contact, offense and defense. The formation and separation among units and systems varies in each of the tactical missions.

The heavy brigade personnel manning level used in this document is 4,042 personnel, which includes supporting units such as air defense. There are 443 armored vehicles, 778 wheeled vehicles (trucks) and 9 motorcycles. Of the armored vehicles, 76 are main battle tanks or their derivatives, the rest are armored fighting vehicles, howitzers, mortar carriers etc. Within the truck category, there are 252 light utility (equivalent to the US HMMWV), 224 5-ton cargo, and 144 8-ton cargo. Cargo trucks comprise the remainder of the wheeled vehicles. In the scenarios described below, trucks predominate in the brigade support area and armored vehicles predominate in the maneuver area. All vehicle mixes in the targets were assigned as they would be in the appropriate combat situation.

The area occupied by the brigade is large relative to the area coverage of the nuclear weapons. Additionally, there is a substantial difference in the inherent protection provided by different types of vehicles; maneuver and fire support battalions present hard targets; the support battalion and support elements present soft targets. The casualty

¹² Please see Appendix H for tables of organization and equipment (TOEs) referenced to develop the scenarios.

estimates in this guide consider these differences. Casualties are estimated for different areas of the brigade targeted: the maneuver battalions or the brigade support area.

Maneuver battalions are targeted in the scenarios

- Heavy Brigade, Forward Maneuver Battalion Task Force, Movement to Contact
- Heavy Brigade, Forward Maneuver Battalion Task Force, Offense
- Heavy Brigade, Forward Maneuver Battalion Task Force, Defense

The brigade support area is targeted in the scenarios

- Heavy Brigade, Brigade Support Area, Movement to Contact
- Heavy Brigade, Brigade Support Area, Offense and Defense

Given the near instantaneous time to insult from a nuclear weapon, targeted units are assumed to be static when targeted; and no secondary effects (from moving versus stationary vehicles) which would increase casualties are assumed here.

The heavy brigade and its tactical scenarios are briefly described here (and illustrated in Figures 1, 2, and 3). Further details and relevant data can be found in Appendices A through E. Appendix A pertains to the “Heavy Brigade, Forward Maneuver Battalion Task Force, Movement to Contact” scenario. Table A-1 describes the brigade, at the icon level of detail, in a tactical arrangement; Table A-2 provides similar information, arranged according to icon number. These tables display all icons in the heavy brigade, and are not limited to those targeted in this scenario. Figure A1-1 provides a tactical layout of these icons, labeled by task force; included are the brigade support area, mechanized infantry battalion 1, mechanized infantry battalion 2, and the tank battalion task forces.

The tank battalion task force is targeted in the scenario “Heavy Brigade, Forward Maneuver Battalion Task Force, Movement to Contact,” while the brigade support area task force is targeted in the scenario “Heavy Brigade, Brigade Support Area, Movement to Contact” (see Appendix B). These targets are depicted in Figure 1. Figures 2 and 3 show the areas targeted in the scenarios of the heavy brigade in offense and defense. Once again, the tank battalion task force is targeted in the scenarios “Heavy Brigade, Forward Maneuver Battalion Task Force, Offense” (see Appendix C), and “Heavy Brigade, Forward Maneuver Task Force, Defense” (see Appendix D), but the brigade support area task force is targeted in the scenario “Heavy Brigade, Brigade Support Area, Offense and Defense” (see Appendix E). For each weapon yield, detonation aim points are marked in Figures 1, 2, and 3; circles of differing radii (dependent on yield) have

been used to portray the extent of the nuclear weapons effects on the targeted area, using latent incapacitation as the primary effect; during preparation of AMedP-8, this effect may not have been used for determining aim points (see Section III.C for a discussion on aim points).

The tactical scenarios of the heavy brigade are detailed below.

Heavy Brigade, Forward Maneuver Battalion Task Force, Movement to Contact

The brigade is deployed with two battalion task forces moving on line; the third task force follows, deployed on line across the width of the brigade (see Figure 1). The support elements follow next. Scouts, ground surveillance radar and some combat engineers are leading forward of the two task forces on line. The direct support artillery battalion has one battery traveling with each task force. The direct support engineer battalion has one company moving with each task force. Air defense and smoke generator assets are located with each task force and the support formation. Within this formation, all companies and batteries are traveling deployed on line.

Appendix A contains details on unit description, nuclear insults and performance capability estimates for this scenario. Figures A1-2 and A1-3 present a tactical layout of the icons targeted in this scenario, “Icons in Scenario.” Those in the heavy brigade that have not been targeted are labeled “Icons Not Considered.” Detonation aim points are also marked. Icons that have been exposed to weapon effects (“insults”) are listed in Table A-3, for each case of the scenario (5 KT warned, 5 KT unwarned, 20 KT warned, 20 KT unwarned, etc.). For these icons, performance capability by time is estimated in Tables A-4 through A-6.

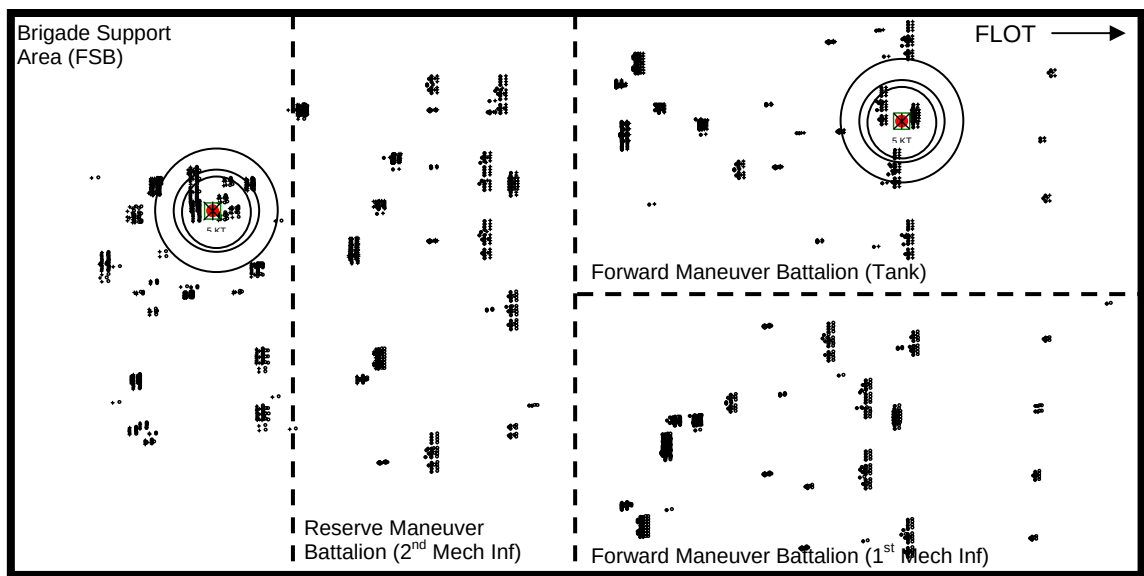

Figure 1. Brigade Layout and Aim Points: Heavy Brigade, Movement to Contact

Heavy Brigade, Forward Maneuver Battalion Task Force, Offense

The heavy brigade in the offense comprises three battalion task forces on line and a brigade support area. This array presented four basic target areas (three battalion task forces with support and the brigade support area), three of which were essentially identical. The battalions were well-dispersed and presented individual targets within the brigade area. Thus, the detailed casualty assessment is presented for a battalion task force and the brigade support area. Figure 2, below, and Figures C1-1 and C1-2 are schematics of the unit deployment. The maneuver force target comprises three company teams on line, with scouts on both flanks. Behind the teams, the battalion mortars are deployed in two sections. A direct support artillery battery is deployed in three groups — two firing platoons and a battery headquarters. An engineer company is also in direct support. The majority of the engineers are maintained in the company formation. The battalion retains a reserve company team and a separate combat trains area. There is a main battalion command post and a tactical command post. The tactical command post is more forward. The battalion anti-armor company is divided among the reserve, center and right flank teams as anti-armor platoons. Air defense and smoke generator assets are integrated into elements of the formation. Appendix C contains detailed unit descriptions, nuclear insults and performance capability estimates for this scenario.

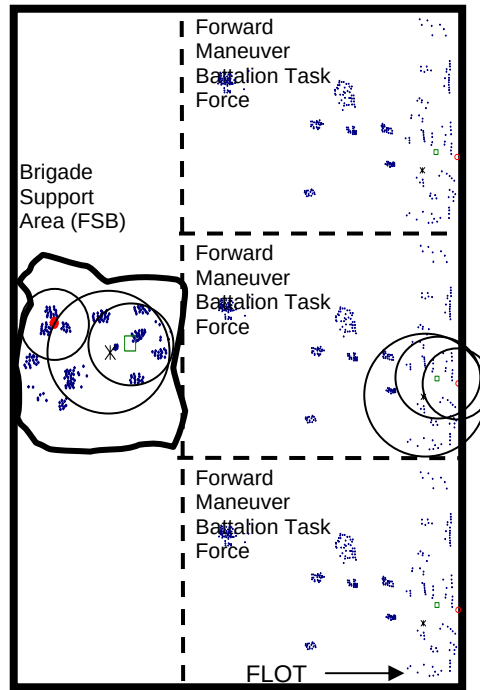

Figure 2. Brigade Layout and Aim Points: Heavy Brigade, Offense

Heavy Brigade, Forward Maneuver Battalion Task Force, Defense

As deployed for the defense, the brigade again provides four elements that may be targeted: three battalion task forces and a brigade support area; a battalion-size reserve is not maintained in this situation. As discussed above, this layout provides two basic formations for casualty estimation, targeting a maneuver unit or the brigade support area. The maneuver unit is described here and a schematic is provided in Figure 3; the brigade support area is described below. In the defense, company teams are not formed; therefore, the armor company is maintained. The battalion is deployed with scouts and ground surveillance radars forward of the main defensive positions. Four companies are deployed on line and one is maintained in reserve. The anti-armor company is not attached out but employed as one of the companies in the main defensive position. The armor company is designated as the reserve. The direct support artillery battery is deployed as two platoons with the battery headquarters collocated with one of the platoons. The battalion mortar platoon is divided into two sections. There is a main command post, a tactical battalion command post, a combat train area, and a combat engineer company. Air defense and smoke generator assets are integrated into elements of the formation. Appendix D contains details on unit description, nuclear insults, and performance capability for the heavy brigade forward maneuver in defense.

Appendix B contains details on unit description, nuclear insults and performance capability for the heavy brigade, brigade support area in movement to contact. Note that corresponding icons (in terms of function) are assigned different icon numbers in movement to contact, compared to offense and defense.

Heavy Brigade, Brigade Support Area, Offense/Defense

The brigade support area was assumed to be the same for the offense and defense mission. The support area is established along a supply route and units are deployed as shown in Figures 2 and 3. The bold outline in these figures indicates the unit boundaries. The support area units include logistical elements for food, maintenance, supply, limited ammunition, transportation, and medical. Also located in the brigade support area are logistical elements of the brigade's organic maneuver battalions. These are two mechanized infantry, one armor, one mechanized engineer, and one self-propelled artillery battalions. The brigade rear headquarters and support battalion headquarters are also located here. An air defense platoon and company headquarters provide point defense from air attack. Appendix E contains details on unit description, nuclear insults, and performance capability for the heavy brigade, brigade support area, in offense or defense. Note that corresponding icons (in terms of function) are assigned different icon numbers in movement to contact, compared to offense and defense.

2. Support Brigade

The support brigade is patterned after a combat service support formation that could support at least one heavy division. The units are stationary and deployed along a main supply route (see Figure 4). Units included are:

- Supply and Service Company
- Heavy Maintenance Company
- Light Maintenance Company
- Missile Maintenance Company
- Direct Support Maintenance Company
- Direct Support Supply Company
- Field Service Company
- Two Truck Companies
- Medical Company
- Direct Support Ammunition Company
- Chemical defense, signal, intelligence, and military police units of platoon size
- Four headquarters elements

Air defense assets are integrated with the units for point defense.

The support brigade has a personnel strength of 2,314 divided equally among those in the open, in tents, and in vans. There are 70 repair or shop vans in which personnel would be working (other wheeled vehicles were not considered in the calculation of personnel casualties). The deployment of the support brigade is assumed to be the same, whether offense or defense. Appendix F contains details on unit description, nuclear insults, and performance capability for the support brigade.

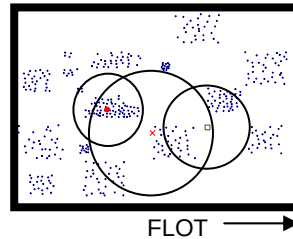

Figure 4. Brigade Layout and Aim Points: Support Brigade

3. Light Infantry Brigade

Light Infantry Brigade, Defense

The light infantry brigade, comprised of three infantry battalions, an artillery battalion and a support battalion, is patterned to emulate an airborne or other light, rapidly deployable infantry brigade; its assigned mission is perimeter defense of an airfield. The brigade is deployed with the three battalions forming a 360-degree defense, as if protecting an aerial port of debarkation in preparation for the receipt of follow-on forces (see Figure 5, below, and Figures G1-1 and G1-2). Each infantry battalion occupies a portion of the perimeter; a company reserve is maintained in each battalion area. The battalion logistical elements are consolidated with the brigade support battalion. This brigade has a strength of 3,454 personnel. Unit vehicles were not considered in this scenario. Appendix G contains details on unit description, nuclear insults, and performance capability for the light infantry brigade.

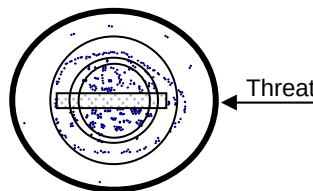

Figure 5. Brigade Layout and Aim Points: Light Infantry Brigade

B. WEAPON FEATURES

A range of yields – 5 KT, 20 KT, 50 KT – was selected to illustrate three conditions: a relatively low technology effort (equivalent to Hiroshima / Nagasaki at 20 KT), and further technological sophistication for increasing yield (50 KT) or decreasing yield (5 KT). In all three cases, weapon yield remained within the range of tactical nuclear weapons (<300 KT).

Chosen yields were considered reasonable for an out-of-area contingency mission, implying that the nuclear threat has a low probability, and that the capability of the enemy to develop and sustain a nuclear weapons program is estimated as limited or absent. Delivery means were not considered, with the assumption that no ground bursts occur. A low air burst was assumed at the optimal height of burst to maximize blast casualties. The actual delivery means are irrelevant for determining resulting casualties.

C. DETONATION POINTS

Points of detonation were chosen for the maneuver forces of the heavy brigade for the missions of movement to contact, offense and defense. The heavy brigade support area points of detonation were chosen by inspection to disrupt missions of movement to contact and a combined offense and defense, not to maximize coverage. Those for the combat service support brigade were chosen only by yield. The infantry brigade points of detonation were chosen to target the airfield (i.e., to destroy the field's capability to function and deny the facility to follow-on forces, not necessarily to destroy the occupying force)¹³.

The coordinates of the detonation are the same as the detonation point because system errors were assumed to be zero. The point of detonation for a specific yield, unit, and mission stays the same in the warned and unwarned postures. Figures 1 through 5 include circles indicating the area in which the planner could reasonably expect to see 50% of the exposed individuals become casualties within 30 days. Note that the range of effects of the nuclear detonations, even up to 50 KT, are generally small, relative to the area of deployment of a heavy brigade, and smaller than, or approximately equivalent to, the area of deployment for the support and light infantry brigades.

D. WEAPONS EFFECTS

In a nuclear attack, personnel will likely be subject to varied weapons effects, or insults, leading to various injuries, and as mentioned above, Janus was used to model

¹³ STANAG 2475, p. 11

these insults. This model determines insults in terms of primary blast overpressure, thermal radiation, and ionizing radiation. These insults are quantified individually: Synergistic interactions are considered when quantifying performance degradation resulting from the combination of the individual insults (see Section IV.C). Janus also accounts for radiation shielding, when available and applicable. The following discussion (derived from AMedP-8 Nuclear) briefly presents the casualty-producing effects of a nuclear weapon and specifies which effects were considered in casualty estimation. It is restated here to provide comprehensive documentation of AMedP-8 Nuclear. A detailed discussion of Janus, including its underlying assumptions and algorithms, can be found in Appendix I.

1. Primary Blast

Blast injuries are the result of two basic mechanisms: either the (modeled) direct action of the blast wave overpressure or the (not modeled) indirect action of flying debris or violent displacement of individuals against other objects. The direct action of the blast wave overpressure pushing the body wall inward results in injuries such as ruptured eardrums and lungs. The indirect action of the high winds associated with blast waves can result in injuries such as lacerations and puncture wounds (missiling injuries) and severe impact or tumbling injuries (translational injuries).

Direct blast effects can contribute significantly to injury and immediate death close to the point of detonation and, thus, to the number of casualties overall. The magnitude and severity of indirect injuries depend heavily on the battlefield environment, exposure, range, burst type, and yield. For larger yields, indirect blast effects extend to greater ranges than primary effects and therefore, in some environments, indirect casualties may be more common than direct ones.

No protection from static overpressure was included in the estimation of casualties, possibly resulting in overestimation. However, this overestimation was assumed to compensate for the exclusion of indirect blast effects in casualty estimation. Although the effects of overpressure are represented in Janus, the reflection and reinforcement of blast waves in a structure or enclosure were not represented. Personnel in heavy vehicles such as tanks, who are protected from radiation, thermal, and blast wind effects, may be subjected to complex patterns of overpressure. Appendix I details the calculation of blast overpressure in Janus for modeling blast effects.

2. Thermal Radiation

The thermal radiation emitted by a nuclear detonation causes thermal injuries (burns) by direct absorption of the thermal energy through exposed surfaces (flash burns and eye injuries) or by the indirect action of fires in the environment and ignition of clothing (flame burns). Only the effects of flash burns are included in the estimation of casualties. Eye injuries and flame burns are not modeled.

Even though the intense light of a nuclear fireball can cause flash blindness, it is only temporary, lasting about 2 minutes in daylight and from 15 to 35 minutes at night; most affected individuals can continue their mission after the short recovery period, and only those facing the burst are affected. Retinal burns are a distinct possibility in nuclear warfare, but the chances are that an individual would face the explosion in such a way that the fireball would be in their field of vision are slight.

The protective shielding offered by the battle dress uniform and by vehicles and foxholes was included in the casualty estimates. The effects of scattered thermal radiation resulting from various meteorological conditions were not considered. Appendix I discusses the calculation of thermal radiation exposure, and modeling of shielding; Table I-1 provides thermal shielding values corresponding to icon type, used in modeling thermal effects.

3. Ionizing Radiation

Ionizing radiation is emitted in various forms during and after a nuclear detonation, and has been arbitrarily divided into two categories; 1) initial or prompt radiation, which is emitted during the first 60 seconds after detonation and results almost entirely from the nuclear processes occurring at detonation, and 2) residual radiation, which is emitted after one minute and is derived predominately from decay of radioisotopes (the fission products) produced during the detonation. The initial burst is characterized by neutrons and gamma rays; the residual radiation consists of alpha, beta, and gamma rays. Only the effects of initial radiation are included in AMedP-8.

The effect of radiation on a person varies greatly based on the type of radiation to which one is exposed; additionally, all cells and tissues are not equally sensitive to radiation injury. Therefore, predicting radiation effects on various parts of the body, with corresponding doses, is difficult. Most predictions, including the ones in this guide, are based on uniform whole body irradiation.

The Janus model accounts for shielding against radiation, when available (see Appendix I, Table I-2 for transmission factors). Shielding between a nuclear burst and

the target can considerably influence the amount of radiation received by personnel. Foxholes, bunkers, and tanks provide excellent radiation protection. The shielding afforded personnel by vehicles in warned and unwarned posture was included in the estimation of casualties and further discussed in Appendix I.

E. WARNING AND PROTECTIVE POSTURE

The use of protective posture in scenarios is featured in this revision of AMedP-8 nuclear volume. For each tactical mission and weapon yield, casualty estimates were determined independently for warned and unwarned postures assumed by the unit. Each unit is assumed to continue performing its mission in both postures (the normal posture assumed by units in conventional combat is unwarned). Armored vehicles have their hatches open and personnel (crew) may be dismounted from vehicles. The battle dress uniform with T-shirt and bare hands and face is assumed for both postures.

In the warned posture, the unit has had a tactical warning or intelligence indicator that a nuclear attack is possible. Thus, individual icons take appropriate protective measures, allowing them to continue operations. For example, armored vehicle crews are buttoned up and some portion of the dismounted forces are in foxholes, depending on availability and feasibility. The protective posture is meant to provide increased shielding against nuclear effects. Key differences between the warned and unwarned postures, for each scenario, are captured below:

- Heavy Brigade, Forward Maneuver Battalion Task Force, Movement to Contact: all personnel are in vehicles; in warned posture, personnel inside armored vehicles have hatches closed.¹⁴
- Heavy Brigade, Brigade Support Area, Movement to Contact: no difference between warned and unwarned postures.
- Heavy Brigade, Forward Maneuver Battalion Task Force, Offense: in warned posture, hatches are closed and one-third of dismounted personnel are in foxholes.
- Heavy Brigade, Forward Maneuver Battalion Task Force, Defense: in warned posture, hatches are closed and one-third of dismounted personnel are in foxholes; all personnel in HMMWVs are in foxholes (modeled by replacing the Janus shielding factors of HMMWVs with those of foxholes; the icon type and name were not modified).
- Heavy Brigade, Brigade Support Area, Offense/Defense: in unwarned posture, personnel are in vehicles, with unwarned protection factors (for example, hatches are assumed open); when warned, one-third of personnel are in foxholes; hatches are closed for armored vehicles (vehicle protection factors

¹⁴ STANAG 2475, p. 2-8

for thermal and radiation protection were changed to foxhole protection factors, due to movement of personnel from HMMWVs to foxholes).

- Support Brigade: in warned posture, one-third of personnel are in foxholes.
- Light Infantry Brigade: in unwarned posture, all personnel are exposed; when warned, 50% of personnel are in foxholes.

IV. CASUALTY ESTIMATION METHODOLOGY

A. JANUS CALCULATES INSULTS

Janus calculates the thermal radiation, ionizing radiation, and primary blast overpressure exposure of an icon with specified location and protection factor. These exposure estimates, or insults, have not been presented in the AMedP-8 Nuclear manual. As part of the documentation effort, these estimates are presented in graphic and tabular form in Appendices A through G; each Appendix pertains to one of seven scenarios, as discussed in Section III. For each scenario, the corresponding Appendix contains a table (called “Insults”) listing insults by icon, for all cases (combinations of yield and posture). For each yield, insults (blast, radiation, thermal) are graphed against slant range for both warned and unwarned postures. Tables have also been created by insult type (versus slant range), displaying all yields and postures.

RUN_xyz.DAT files (see Appendix J for explanation) were used as the data source to tabulate and graph insults for the scenarios: Heavy Brigade, Forward Maneuver, Movement to Contact; Heavy Brigade, Brigade Support Area, Movement to Contact; Heavy Brigade, Forward Maneuver, Offense; Heavy Brigade, Forward Maneuver, Defense; Light Infantry Brigade, Defense. RUN0_xyz.DAT files were used for the Heavy Brigade, Brigade Support Area, Offense/Defense scenario, since RUN_xyz.DAT files were not recovered during the documentation effort.

The documentation of insults for the Support Brigade was more complicated. For icons in the unwarned posture, graphs of insults displayed unexpected patterns (for all three yields), while in the warned posture insults patterns appeared normal. Further analysis suggested that icon numbers were incorrectly paired with insults estimates in the unwarned cases, but correctly paired in the warned cases. For each yield in the unwarned case, icon numbers were manually reassigned to insult values to the extent possible, with varying degrees of certainty, using the corresponding warned case as a guide. RUN0_xyz.DAT files were used as the data source for insults estimates of the Support Brigade (Appendix F).

Although RUN0_xyz.DAT files were used to make the Insults tables during the preparation of P-8, RUN_xyz.DAT files have been used in the documentation effort, as

discussed above. In theory, for Insult estimates, only minor differences should exist between the two; these differences are specific to the thermal insult values, due to the probabilistic nature of the thermal effects calculation procedure used in Janus (see Appendix I). In general, the distribution of thermal insult values within the unit differs from one Janus run to the next. However, these differences do not affect the casualty estimation (directly based on performance capability estimates, not insults estimates) presented in AMedP-8, and should not compromise the documentation effort.

B. INSULTS CORRELATE TO INJURY SEVERITY CATEGORIES

Exposure ranges and injury severity categories were determined based on studies which evaluate effects of injuries on performance.¹⁵ This methodology is distinct from the combined effects model.¹⁶ Exposure values refer to thermal, blast, and radiation dosages calculated by Janus. These insults were correlated to injury type and grouped into Injury Severity Categories. Injury Severity Category tables found below have been extracted from pages 3-8 and 3-9 of the AMedP-8 Nuclear manual. (Note that US doctrine exposure ranges have been modified slightly as a result of additional US studies.) The combination of insults (blast-radiation-thermal) determines the insult category. For a given nuclear event in a given scenario, Personnel by Insult Category tables were created during the production of the manual, listing the number of people in each insult category. These tables can be found in Sections 4-10 of the AMedP-8 Nuclear manual (each section corresponds to one of seven scenarios).

¹⁵ Levin, 1993

¹⁶ STANAG 2475, p. 2-10

Table 1. Thermal Ranges and Injury Severity Categories¹⁷

Category Number	Exposure Range kJ/m2 (cal/cm2)	Injury Severity Category	Injury Severity Category Abbreviation
1	0-105 (0.0-2.5)	No injury	No Decrement
2	105-168 (2.5-4.0)	First degree burn, bare skin	Threshold 1° Bare Skin Burn
3	168-210 (4.0-5.0)	Second degree burn, bare skin	Threshold 2° Bare Skin Burn
4	210-293 (5.0-7.0)	Third degree burn, bare skin	Threshold 3° Bare Skin Burn
5	293-390 (7.0-9.3)	Skin burn, no uniform burn	Extensive Bare Skin Burn
6	394-524 (9.3-12.5)	50 percent incidence second degree burn over 21 percent of the body in battle dress uniform (BDU) + T-shirt	2°, 21% BSA, BDU+T
7	524-787 (12.5-18.8)	50 percent incidence second degree burn over 21 percent of the body in battle dress overgarment (BDO)	2°, 21% BSA, BDO
8	787-842 (18.8-20.1)	50 percent incidence second degree burn over 21 percent of the body in BDU + T-shirt + spacer	2°, 21% BSA, BDU+T+Air
9	842-1634 (20.1-39.0)	50 percent incidence second degree burn over 21 percent of the body in BDO + spacer	2°, 21% BSA, BDO+Air
10	1634-2531 (39.0-60.4)	50 percent incidence second degree burn over 21 percent of the body in BDO + BDU + T-shirt	2°, 21% BSA, BDO+BDU+T
11	>2531 (>60.4)	50 percent incidence second degree burn over 21 percent of the body in BDO + BDU + T-shirt + spacer	2°, 21% BSA, BDO+BDU+T+Air

¹⁷ from STANAG 2475

Table 3. Radiation Ranges and Injury Severity Categories¹⁹

Category Number	Exposure Range cGy	Injury Severity Category	Injury Severity Category (abbreviated)
1	0-70	Not an injury producing dose; other nuclear injuries will dominate as the primary casualty producer	No decrement
2	70-150	A slight decrease in white blood cell and platelet count; other injuries will result in the soldier becoming a casualty; when affected by other injuries, these patients may be returned-to-duty after 30 days only if their platelet and neutrophil levels increase	Blood Cell Drop
3	150-300	Beginning symptoms of bone marrow damage appear; survival is >90 percent unless there are other injuries; when affected by other injuries, these patients may be returned-to-duty after 30 days only if their platelet and neutrophil levels increase	Bone Marrow Damage
4	300-500	Moderate to severe bone marrow damage occurs; lethality ranges from LD50/60 to LD100/60 to LD50/60; these patients require greater than 30 days recovery, but can eventually return to duty; other injuries would increase the injury severity lethality	LD 50/60, RTD+30d
5	500-800	Severe bone marrow damage occurs; lethality ranges from LD50/60 to LD99/60; death occurs within 3.5 to 6 weeks with the radiation injury alone but is accelerated with other injuries; these radiation casualties will die in 2 or more weeks; with other injuries they may die within 2 weeks	Death in 2-6 wk
6	800-1100	Bone marrow pancytopenia and moderate intestinal damage occur including diarrhea; death is expected within 2-3 weeks; these radiation patients will die in 2 or more weeks; with other injuries they may die within 2 weeks	Death in 2-3 wk
7	1100-1500	Combined gastrointestinal and bone marrow damage occur with hypotension; death is expected within 1-2.5 weeks; these radiation patients will die within 1 to 2 weeks; with other injuries they may die within 6 days	Death 6d-3 wk
8	>1500	N/A	Death 2d-2 wk

C. CHRNEM CALCULATES PERFORMANCE CAPABILITY

The Combined subroutine of CHRNEM uses the Janus exposure data to determine the effect of nuclear injuries on the performance level of personnel at various time points following a nuclear detonation. Details about data processing can be found in Appendix J; details of the CHRNEM model and methodology can be found in Appendix I.

Given the nuclear insults from Janus, the Combined subroutine of CHRNEM estimates the ability of individuals to perform physically demanding or undemanding

¹⁹ from STANAG 2475

tasks at various times after exposure. While the AMedP-8 Nuclear manual only considers physically demanding task-related performance capability to provide worst-case casualty estimates, both types of data were calculated during document production. Performance Capability tables in Appendices A through G display these data. According to these data, in some cases the differences in performance capability values for physically demanding tasks and physically non-demanding tasks are quite significant, which may lead to significant differences in casualty estimates. The present documentation effort does not fully analyze and present these implications.

In AMedP-8, performance capability data are captured in three different types of tables for each scenario:

1. Status of Unit Personnel by Yield
2. Status of Unit Personnel by Time Period
3. Casualties Occurring by Time Period

Personnel status after a nuclear detonation is presented in the tables in Sections 4-10 of the AMedP-8 Nuclear manual. Personnel categories such as "fatalities," "casualties," and "capable" found in the tables are based on individual physical effectiveness as determined by the Combined subroutine of CHRNEM. In the combined injury model, the decrement in physical effectiveness is indirectly measured by determining the increased time required to perform a task correctly. Thus, an individual who is described as 50% capable requires twice as much time to perform a task as someone who is 100% capable. This model does not calculate performance capability based on the accuracy of completing a task. Estimates of residual performance (performance capability of a typical soldier who was initially healthy) were based on a typical symptoms and severity complex that would be caused by radiation, thermal, or blast, alone or in a simultaneous combination. Table 4 defines the categories described in Sections 3.0-3.3 of the AMedP-8 Nuclear manual, and listed below. The use of 25% capable as the defining level of a casualty does not restrict an individual from entering the medical system at any other level of performance. Furthermore, the concept of physical effectiveness also applies to personnel who are apparently fit for duty but have been exposed to significant doses of radiation. Within the casualty category, casualties are further separated into subcategories based on a single or a combination of insults that causes their performance capability to drop to 25%. The subcategories of combined effects are: blast, radiation and thermal; blast and radiation; blast and thermal; and radiation and thermal. The individual categories are blast, radiation, and thermal.

Table 4. Performance Capability Categories

Category	Definition
Casualty	>0% but <=25% capable (in medical system until recovery is >=75%)
Fatality	<0.1% capable
Capable	>25% capable
Return-to-duty (RTD)	A casualty who recovers to >=75% capable
Sick Again	A return to duty (RTD) whose capability has dropped to <= 25%

V. AMedP-8 DOCUMENT APPEARANCE

The AMedP-8 nuclear manual is organized into ten sections:

- Section 1. Introduction
- Section 2. Methodology
- Section 3. Casualty Tables- Explanation and How to Use Them
- Section 4. Heavy Brigade, Forward Maneuver, Movement to Contact
- Section 5. Heavy Brigade, Brigade Support Area, Movement to Contact
- Section 6. Heavy Brigade, Forward Maneuver, Offense
- Section 7. Heavy Brigade, Forward Maneuver, Defense
- Section 8. Heavy Brigade, Brigade Support Area, Offense and Defense
- Section 9. Support Brigade
- Section 10. Light Infantry Brigade

Sections 1-3 provide the background and administrative information necessary to use AMedP-8. Sections 4-10 are each specific to one of the seven tactical scenarios, and are essentially identical in construction, including tables that provide the data necessary for casualty estimation. This information is provided in two forms: casualties as a function of time, and casualties by type and intensity of injury.

In each Section, the first four tables are summary tables; they present estimates for all yields and both postures for the appropriate scenario for 1 hour and 1, 7 and 30 days after the detonation. These tables provide a summary of the information on the Status of Unit Personnel for the three yields and two postures for the major time periods included in this manual. For example, Table n-1 (where n is the Section number [4-10] in AMedP-8) presents the status of unit personnel at 1 Hour for 5 KT, 20 KT, and 50 KT, for both unwarned and warned postures. The first four tables in each Section allow the planner to rapidly compare medical workloads for units in the warned and unwarned

postures, across yields. These estimates provide the total number of personnel in each category at that time.

After the initial Summary Table, there are six sets of three tables (one set for each of the combinations of three yields and two warning postures). Estimates for the unwarned 5, 20, and 50 KT yields are presented, followed by similar estimates for the warned situation. For example, Tables 5, 6, and 7 list the specific estimate for the appropriate scenario, in the unwarned condition for a 5 KT detonation. The remaining tables (8 through 22) enumerate the other yield and posture combinations in similar groups of three. Each set of three tables includes two tables of casualties organized by time period, and a third table of casualties organized by type and severity. The tables entitled “Status of Unit Personnel by Time Period” are designed to provide an overview of the unit status at a specified time. Time is particularly important because a person's performance capability may change over time due to the progress of different injuries. The tables entitled “Casualties Occurring by Time Period” provide estimates of the additions to each category – Casualties, Fatalities, RTD, Sick Again – as they occur for each time period. The third in the set, “Personnel by Insult Category” provides an alternative method for categorizing personnel after a nuclear detonation, i.e., by injury and/or by insult level. This type of table provides estimates of personnel exposed to a range of insult levels and the resultant injuries. The tables are keyed to injury levels. An injury level is presented for each of the thermal, blast, and radiation insults to which personnel are exposed. The combination of insults (blast, thermal, and radiation) determines the Insult Category in which personnel are placed.

More detailed information on the content and organization of the AMedP-8 is available in Section 3 of the manual. This section also includes a qualitative discussion of how to estimate situations not explicitly presented in the manual.

VI. SUMMARY AND RECOMMENDATIONS

A. SUMMARY OF CASUALTY SCENARIOS

AMedP-8 Nuclear provides estimates of the numbers, types, and times of casualties resulting from the detonation of one of three different yields of nuclear weapons within seven different tactical targets. This analysis provides an overview of how those casualty estimates were derived, and the limitations of the scenarios presented in AMedP-8. Tables 5, 6, and 7 summarize the results of this analysis.

Table 5. Summary of Casualty Scenarios, 5 KT

Operational Area				Sub-Operational Area				Casualties			
	Length (km)	Breadth (km)	Population	Unit	Length (km)	Breadth (km)	Population	Protective Posture	Immediate Fatalities	Casualty, Surviving	Casualty, Subsequent Fatality

B. RECOMMENDATIONS FOR FUTURE VERSIONS OF AMedP-8 NUCLEAR

Upon the review and analysis performed to document the production of AMedP-8 Nuclear, it became clear that there were several points that were open to revision with the production of a new AMedP-8. The objective of any revisions to the document should be to significantly add to the value of the information provided by making that information more easily accessible, and/or to extend the applicability of information to more situations of interest.

Increasing the accessibility of AMedP-8 implies changing the presentation of information, or the format of the document. Currently information is presented in a series of tables, formatted to permit printing as hard copy. Some reformatting suggestions are:

- Use hypertext to improve user access to information. This would retain the tabular format of the information, but make the electronic access to the data faster by a user interface that requires a minimum of information to have the desired table pop up on the screen.
- Incorporate graphical presentation of data. This would supplement the tables with graphs. Certain types of information may be intuitively easier to grasp graphically (although certain information poses difficulty graphing). Implementing this change could significantly increase the size of AMedP-8. The challenge to the AMedP-8 Custodian is to determine the optimum balance and structure of graphical and tabular data presentation.
- Include supporting algorithms. This would allow the AMedP-8 user to algorithmically estimate performance fraction, fraction ill, time of onset, and/or time of death for any given exposure level. The difficulty in implementing this format change is that there currently are no simple underlying algorithms for the information presented in AMedP-8. It may be possible to derive or develop some supporting algorithms, but this has some significant risk against success.
- Include supplementary generic software. This would allow the AMedP-8 user to estimate casualties for a multitude of situations. The difficulty in implementing this format change is that there currently is no generic software that does this. The closest available tool is the Casualty Estimation (CE) module of the NBC Casualty Resource Estimation Support Tool (CREST). If that is unacceptable, it would most likely be very difficult to develop a completely new software tool that adequately responds to AMedP-8 user-requirements.

IDA recognizes that AMedP-8 is directly applicable to only the limited number of specific scenarios presented. To make information more widely applicable implies adding additional information that responds directly to the specific technical requirements of AMedP-6 and AMedP-7. This could be a compilation of the medical treatment

requirements (from AMedP-6) as applicable to the casualties in AMedP-8, or the derivation of the analytic tools of AMedP-7, which depend on the casualty estimates expressed in AMedP-8.

The scenarios used in AMedP-8 are also limited in extent and applicability. The current AMedP-8 estimates casualties from a limited number of applications of military weapons against a limited selection of deployed military force scenarios. Extending the information in AMedP-8 to more situations of interest is one way to expand the utility of AMedP-8. Additional situations could include:

- Addition of various degrees of injury (negligible, moderate, severe, fatal) subcategories to "casualty" definition. Each type of injury correlates to specific ranges of rad/blast/thermal insults, which in turn drive medical system requirements. For example, in the "Severe Injury" category, personnel survive but require skilled medical care for six weeks or longer.
- Consideration of casualty and recovery processes allowed by low-dose rate exposure in fallout fields
- Consideration of secondary and tertiary blast effects (dynamic pressure effects from nuclear weapons)
- Consideration of flash blindness and flame burns from nuclear weapons
- Inclusion of additional nuclear weapon yields
- Incorporation of multiple nuclear weapon detonations
- Incorporation of additional military deployment scenarios
- Inclusion of additional environments for military operations (urban, forest, etc.)
- Consideration of terrorist use of nuclear weapons against deployed military forces
- Consideration of military and/or terrorist use of nuclear weapons against civilian populations
- Addition of an expanded demographic characterization of population
- Consideration of the impact of protective measures and responses
 - Physical and medical protection
 - Decontamination
 - Medical care

C. CONCLUSION

AMedP-8 Nuclear transformed the ability of NATO Allies to estimate in number and type casualties resulting from nuclear events. It allows for quantification of casualties by degree of exposure, and describes the injuries and their effect on personnel performance by time period. This manual became the model for subsequent manuals on biological and chemical casualties, and led to the development of software tools that estimate medical resources required to manage casualties. The documentation of AMedP-8 Nuclear will provide a starting point for future revisions, and will help users better understand its capabilities and limitations. While acknowledging that it is an imperfect document, and that further work should be pursued to improve its utility, AMedP-8 Nuclear is an achievement of which the Institute for Defense Analyses, the Office of The Army Surgeon General, the United States, and the NATO NBC Medical Working Group should be proud.

Notes:

FLD TRN: In brigade with FSB
 CBT TRN: In battalion near rear
 MAINT: In battalion near rear
 In BSA: BDE HHC
 FSB
 FLD TRN

Assumptions:

* No effort has been made to show the support elements (maint, supply, medic, and mess) that would accompany the tank co when it joined the mech TF and the rifle company that departed, because the total number of vehicles and personnel would be the same for all practical purposes. This will simplify the changes to the JANUS database.

* The ARTY battalion CP has been arbitrarily placed in the TF area as a representative of brigade assets that would be located in the TF area. The number of units could be larger or smaller depending on terrain and mission.

* Icons not considered in scenario

Appendix H: TOE Information

A. Heavy Brigade, Forward Maneuver Battalion and Brigade Support Area, Movement to Contact

Table H-1. Heavy Brigade FM & BSA Movement to Contact

TOE #	Unit
44177L000, modified	Air Defense Arty Battery
63006L000	Forward Support BN HQ&HQ Detachment
42004L100	FSB Supply Co
43009L000	FSB Ordnance Co
08058L100	FSB Medical Co
05336L000	FSB Engineer BN HHQ
05337L000, modified	FSB Eng Co 1, Eng Co 2, Eng Co 3
06366L200, modified	FSB Field Arty Bn HHB
06367L200	Field Arty Batteries 1, 2 & 3

Notes:

- FLD TRN: In brigade with FSB
- CBT TRN: In battalion near rear
- MAINT: In battalion near rear
- In BSA: BDE HHC; FSB; FLD TRN

B. Heavy Brigade, Brigade Support Area Task Force, Offense and Defense

Table H-2. Heavy Brigade BSA Offense/Defense

TOE #	Unit
44177L000, modified	Air Defense Arty Battery
63006L000	Forward Support BN HQ&HQ Detachment
42004L100	FSB Supply Co
43009L000	FSB Ordnance Co
08058L100	FSB Medical Co
05336L000	FSB Engineer BN HHQ
05337L000, modified	FSB Eng Co 1, Eng Co 2, Eng Co 3
06366L200, modified	FSB Field Arty BN HHB
06369L100	Service Battery

Notes:

- FLD TRN: In brigade FSA
- CBT TRN: In battalion rear area
- MAINT: In battalion rear area

There is an additional icon in the Janus scenario; #243, an M110A1. This icon was selected for reasons of convenience to deliver the nuclear warhead, it has zero crew.

C. Heavy Brigade, Forward Maneuver Battalion, Defense

Table H-3. Heavy Brigade FM Defense

TOE #	Unit
44177L000, modified	Air Defense Arty Battery(-)
05337L000, modified	Eng Co 1
06366L200, modified	Field Arty BN HHB
06367L200	Field Arty Battery 1

Notes:

- CO TN: In company rear area
- CBT TN: In battalion rear area

Assumptions:

No effort has been made to show the support elements (maint, supply, medic, and mess) that would accompany the tank co when it joined the mech TF and the rifle company that departed, because the total numbers of vehicles and personnel would be the same for all practical purposes. This will simplify the changes to the Janus data base.

The artillery battalion CP has been arbitrarily placed in the TF area as a representative of brigade assets that would be located in the TF area. The number of icons could be larger or smaller depending on terrain and mission.

D. Heavy Brigade, Forward Maneuver Battalion, Offense

Table H-4. Heavy Brigade FM Offense

TOE #	Unit
44177L000, modified	Air Defense Arty Battery(-)
05337L000, modified	Eng Co 1
06366L200, modified	Field Arty BN HHB
06367L200	Field Arty Battery 1

Notes:

- CO TN: In company rear area
- CBT TN: In battalion rear area

Assumptions:

No effort has been made to show the support elements (maint., supply, medic., and mess.) that would accompany the tank co when it joined the mech. TF and the rifle

company that departed, because the total numbers of vehicles and personnel would be the same for all practical purposes. This will simplify the changes to the Janus data base.

The artillery battalion CP has been arbitrarily placed in the TF area as a representative of brigade assets that would be located in the TF area. The number of icons could be larger or smaller depending on terrain and mission.

There are 9 additional icons in the Janus scenario, which are extra and have zero crew. The units are 57, 58, 148, 183, 184, 215, 288, 289, and 292. These icons are indicated as “Additional Units in Janus Scenario” in the table with an asterisk, and have not been graphed in the unit layout chart.

E. Light Infantry Brigade

TOE information was not found during the documentation process for the Light Infantry Brigade.

F. Support Brigade

Table H-5. Support Brigade

TOE #	Unit
42447L-010	QM Supply Co
42414L	FSC
43209L	Direct Support Maint Co
55718LL	Lt Maint Co
63426L	HHD CSB
9483L	DS Ammo Co
43007L	Light Ord Maint Co
43008L	Heavy Ord Maint Co
09008L100	Ord Missile Maint
42007L100	Supply & Service Co
0857L100	Med Co

Note: During the documentation process, for all scenarios, location data were converted from UTM coordinates to Cartesian coordinates by placing the coordinate axes such that all icons were located in quadrant I.

Appendix I: The Janus and CHRNE Models

A. THE JANUS MODEL

The Janus model rests on the assumption that the main causes of destruction in a nuclear event are thermal radiation, nuclear (ionizing) radiation, and blast overpressure. Dynamic overpressure effects (both translational and missile), though significant,²⁰ are neglected, and each icon is evaluated individually for exposure to thermal radiation, ionizing radiation, and primary blast.

1. Calculation of Thermal Radiation Exposure

All thermal radiation effects are based on whole-body exposure. Mitigation of a thermal insult in the prone position is neglected, and personnel who are partially out of, say, a tank receive whole-body, not partial, exposure.

A point source for heat emission is assumed and the fraction of total yield converted to thermal radiation (the thermal partition f) is fixed at 0.35.²¹ For a given slant range S (in km) to a point visibility V (in km), and yield W (in KT), the thermal radiation Q (in calories per square-cm) is calculated:^{22,23}

$$Q = (7.96Wf/S^2) (1 + 1.9S/V) (e^{-2.9S/V}), \text{ with thermal partition } f = 0.35$$

The output of this equation, Q , does not take into account shielding effects from various sheltering structures (tanks, trucks, foxholes, vans, etc.).

Thermal shielding is modeled using a probabilistic methodology. For each icon type, the user is required to input a "Probability Crew is Exposed to Thermal," as a percent (the probability values for these casualty estimates are listed in Table I-1). All personnel assigned to an icon receive the same thermal insult. For each icon type, the probability of receiving thermal insult is based on the percent of personnel typically exposed in a given posture (warned or unwarned).

For example, if icon M1A1 is in the unwarned posture, and 2 out of 4 personnel are generally exposed, then 50% of the personnel receive thermal exposure. Given a certain number of personnel of an icon type (e.g. tank), 50% of those prone to thermal insult will receive a nonzero dose. If, in fact, equal distribution is not the case for some icon type, then the average number of personnel per icon was used. This is the case for the M577, M2, and 57-AMB, for example.

²⁰ Glasstone and Dolan, 1977

²¹ Glasstone and Dolan, 1977, p. 313

²² The height-of-burst (HOB), or the height of maximal surface destruction, is assumed to give the distance H (in km) from the origin of the explosion to the surface, and is calculated by the equation:

$HOB=H=0.060W^{1/3}$, where W represents weapon yield in KT of TNT.

The HOB is assumed to be less than a ¼ mile.

²³ Calloway et al., 1990, pp. 80-89, 162-171

For the M113, the CEV, and all systems categorized as trucks in Table I-1, the maximum number of people who can be exposed is not fixed. Therefore, for the M113 and the CEV, the thermal probability was based on professional judgment and the distribution of numbers of personnel in icons of those types. For all systems categorized as trucks, canvas was assumed off and glass was assumed down. In this state, trucks offer a small amount of shielding; the probability of exposure would be less than 100%. Based on professional judgment, a 90% probability of exposure was selected.

Professional judgment was also used for a number of other considerations, including the shielding afforded by foxholes, tents, and vans. Data show that 5% of the thermal insult is reflected inside foxholes. To adapt this data to the probabilistic methodology employed by Janus, a 5% probability was selected. Tents were assumed to provide shielding with sides rolled down; so, a 25% probability was selected. Vans were assumed to be completely closed with the possible exception of an open door or window that would expose a small fraction of the people inside; a 5% probability was selected.

Table I-1. Icon Shielding Categories and Thermal Probabilities

Unit	Icon Type	Icon Detail	Shielding Category		Probability Crew is Exposed To Thermal (%)	
			(Unwarned/Warned)		Unwarned	Warned

[#]Entries PNA and PA designate the availability of protection; they refer to protection not available and protection available, respectively.

2. Calculation of Ionizing Radiation Exposure

Ionizing radiation effects are based on whole body exposure. Given the slant range S (in km), the neutron dose D_n (in rads) delivered by weapon of yield W (in KT) is calculated:²⁴

$$D_n = (17952W/S^2)(e^{-S/0.208})$$

Similarly, the gamma dose D_g (in rads) is calculated:

$$D_g = (720W/S^2)(e^{-S/0.308})$$

And the total dose of nuclear radiation, D_T , (in rads) by:

$$D_T = D_n + D_g$$

The output of these equations, D_T , neglects shielding effects; transmission factors are used to express shielding. The transmission factor refers to the fraction of the ambient unshielded dose that is received by personnel within a shelter (inputs are percents). The radiation transmission factors in Table I-2 were used in the estimation of casualties. They were developed by randomly modifying classified factors provided by the U.S. Army Nuclear and Chemical Agency. The factors are the same for unwarned and warned postures since only whole body exposure is included in Janus. Table I-2 provides the shielding categories for the types of shelters in the units.

Note: The preceding equations were taken from *The Janus Algorithms Guide*²⁵ for documentation purposes. Based on analysis performed during the documentation process, these equations cannot be used to reproduce the Janus ionizing radiation exposure data.

²⁴ Calloway et al., 1990, pp. 80-89, 162-171

²⁵ Calloway et al., 1990

Table I-2. Radiation Transmission Factors

Shielding Categories	Transmission Factors	
	Neutrons	Initial Gamma
Foxholes	.33	.100
Van	.95	.950
Tent	1.00	1.000
Exposed/dismounted	1.00	1.000
Tank	.28	.100
APC	.82	.370
Earth Shelter	.06	.015
Wood Frame Building	.72	.820
Masonry Building	.12	.150
Multi-Story Brick Apartment	.75	.640
Trucks	1.00	.800

3. Calculation of Blast Overpressure

Given D= the range to ground 0.0 (in feet), the peak overpressure at the surface, p(D) (in psi) was calculated for high, middle and low overpressure regions:²⁶

High overpressure region (greater than or equal to 15 psi):

$$p(D) = e^{19.64181 - 2.62779 \ln D}$$

Middle overpressure region (greater than 10, less than 15 psi):

$$p(D) = -0.01295 * D + 24.10062$$

Low overpressure region (less than or equal to 10 psi):

$$p(D) = e^{13.87363 - 1.65411 \ln D}$$

Shielding of blast effects was not modeled, nor was missiling, tumbling, or cratering.

Note: The preceding equations were taken from *The Janus Algorithms Guide*²⁷ for documentation purposes. Based on analysis performed during the documentation process, these equations cannot be used to reproduce the Janus blast overpressure data.

B. THE CHRNEM MODEL

The AMedP-8 Nuclear planning guide uses an innovative method of casualty estimation: in addition to defining casualties according to dose-based injury categories, it uses human performance criteria. By defining casualties in terms of human performance, AMedP-8 specifies the time of onset of injuries and resulting degree of incapacitation.

CHRNEM,²⁸ a sign/symptom-based model that provides quantitative estimates of post-exposure performance degradation for individuals performing physically demanding or undemanding tasks, was used to estimate performance as a function of exposure to a particular type of nuclear insult (blast, radiation, or thermal) or a combination of insults, and time-after-exposure.

The prompt environment of a nuclear weapon explosion causes multiple injuries via exposure to ionizing radiation, thermal radiation, and blast overpressure. These injuries, either alone or in combination, are debilitating to a degree dependent on the weapon yield, height of burst, proximity to detonation point, and degree of protection of an individual. The Defense Nuclear Agency's Intermediate Dose Program (IDP)²⁹ and subsequent human response programs, sponsored by successor agencies Defense Special Weapons Agency (DSWA) and Defense Threat Reduction Agency (DTRA), provide algorithms and means of making reasonable assessments of human injuries caused by nuclear weapons.

The Combined subroutine in CHRNEM that evaluates the combined nuclear weapon effects considers ionizing radiation injuries at free-in-air doses of up to 1000 cGy, primary blast injuries from overpressures up to 40 psi, and burn injuries from thermal radiation fluence up to 80 calories per square centimeter.

Doses³⁰ of ionizing radiation between 100 and 500 cGy (FIA) degrade performance, but even at doses of 450 to 500 cGy, the typical soldier is expected to survive at least six weeks. At even higher doses, the length of survival may be shorter but a soldier could continue to perform his duties. Radiological studies³¹ show that symptoms of exposure to ionizing radiation follow a pattern. Early (prodromal) symptoms peak at around two hours for mid-level doses; this peak occurs earlier, and more severely, for high doses (>500 cGy), and later, and less severely, for low doses (<200 cGy). After a quiescent period, more symptoms emerge. A person who receives high doses (>1500 cGy) of radiation might experience a transient behavioral incapacitation somewhat like fainting. After the period of incapacitation, the person may continue to perform assigned duties, although performance may be degraded.

Overpressures greater than 20 psi can cause serious blast injury to the air-containing organs, i.e., the lungs and gastrointestinal tract. Performing a physically demanding task after blast injury exaggerates the effect of the injury and could result in death at

²⁸ Levin and Fulton, 1992

²⁹ Anno et al., 1994

³⁰ The relative biological effectiveness (RBE) for neutrons is assumed to be equal to one, i.e., gamma radiation and neutrons have the same biological impact per cGy.

³¹ Dore and Anno, 1990

overpressures of 40 psi. Injuries to the auditory system, injuries from flying debris and injuries from being tumbled by the blast are not considered in AMedP-8 Nuclear.

For thermal radiation effects, estimates were made on burn area given burn depth (severity), using a cylindrical model, based on the assumption that it is equally likely that a soldier will be burned from any side. With this model, the percent of bodily surface area burned is given by:³²

$$A = [\arccosine (Q/Q_t)]/\pi$$

Here, Q_t is defined as the threshold value for a second degree burn (cal/square-cm), and Q as the thermal flux (integrally numbered from 1.0 to 50.0 cal/square-cm) to which the cylinder is exposed³³. Three threshold burn values (Q_t) were used: 2.60, 7.40, and 15.40 cal/square-cm for “Bare skin,” “BDU & T-shirt,” and “BDU & T & Airspace,” respectively. Corresponding data values calculate percent area burned.

Burn injuries of up to 45% of body area or from thermal radiation fluence of up to 80 calories per square centimeter were considered. Burn injuries of this magnitude would cause performance degradation, but the survival time for the typical soldier with burns over 35% of the body would be at least six weeks.

Performance is evaluated based on the levels of each type of symptom caused by exposure to the insults specified. There are seven categories of symptoms:

UG - Upper gastrointestinal

LG - Lower gastrointestinal

FW - Fatigability and Weakness

HY - Hypotension

IB - Infection and bleeding

FL - Fluid loss and electrolyte imbalance

OW - Pain (from burns) (appropriate for thermal burns only)

Symptom levels for numerous radiation levels and times were assessed by expert physicians and doctors;³⁴ performance is directly related to these symptoms.³⁵ The first six symptoms are applicable for each of radiation, blast and thermal injuries. The seventh symptom “pain” was added to more thoroughly address burn effects in the combined model for estimating performance.

The Defense Nuclear Agency contracted Pacific-Sierra Research Corporation (PSR) to develop the methodology³⁶ used in CHRNEM to quantify the level of injury and the remaining performance capability of soldiers exposed to nuclear environments. PSR developed this methodology while generating the nuclear radiation response data

³² Levin, 1993, p. 24

³³ Note that in the cylindrical model the maximum percent area that can be burned is 50%.

³⁴ Baum et al., 1984

³⁵ Anno et al., 1984

³⁶ Anno et al., 1984

contained in CHRNEM. Subsequently, Technico Southwest Inc.³⁷ used the methodology to add the effects of blast and thermal injury to radiation injury and to produce the CHRNEM combined injury software tool.³⁸

The CHRNEM model is used to estimate the effects on soldier performance of nuclear injury producing insults such as radiation, blast and thermal flux. The model used for estimating performance vs. time is deterministic, not probabilistic, and is based on physicians' estimates of symptoms exhibited and performance expected of the initially healthy soldier who would survive for the 1000 hours (approximately 6 weeks) encompassed by the CHRNEM study. Performance estimates are given at 37 time points, from 0.1 to 1000 hours after injury.

Performance is measured in terms of time to complete a task. The performance index P is defined as the ratio of normal time to complete a task to the time to complete a task after injury. Therefore, P equals one represents the normal time to complete a task and P less than one indicates a longer than normal time to complete the same task. If a soldier's performance is greater than or equal to 75%, then the soldier is considered combat effective. If performance is between 25% and 75%, the soldier is considered to be performance degraded; and if performance is less than or equal to 25%, the soldier is considered combat ineffective and is defined as a casualty in AMedP-8 Nuclear.

CHRNEM data files were obtained from previous study data by running multiple linear regressions of the form:³⁹

$$P = B_0 + B_1X_1 + B_2X_2 + \dots B_6X_6$$

Each X_i corresponds to one of the first six categories of symptoms, with the coefficient B_i to be determined. To ensure P values within the interval [0,1], the logit transformation of P was first performed:

$$P \Rightarrow \ln [P/(1-P)]$$

The solution of which is the sigmoid function:

$$P = 1 / \{1 + \exp [-(B_0 + B_1X_1 + B_2X_2 + \dots B_6X_6)]\}$$

A least-squares estimate of each coefficient was entered in the data files. Algorithms and metrics for the blast effects and the thermal transmission effects were taken from the most recent techniques available. A three-dimensional logarithmic interpolation routine was used for performance estimation at various insult levels.

It is important to note that effects of nuclear weapon detonations are modeled based on healthy, fully motivated soldiers. CHRNEM estimates the capability of the typical soldier to perform a physically demanding task (e.g. a loader) or a physically undemanding task (e.g. gunner or driver) from 6 minutes (0.1 hour) to 6 weeks (1000 hours) after injury. Physically demanding tasks are affected more strongly by injury than are physically undemanding tasks. Use of the physically demanding tasks alone, as is

³⁷ CHRNEM software and the models that predict combined injury, incapacitation, and death were developed by Technico Southwest, Inc. under Defense Nuclear Agency contract DNA 001-88-C-0207.

³⁸ Levin, 1993

³⁹ Levin, 1993, p. 38

done for AMedP-8 Nuclear, will yield conservative results, overestimating the performance degradation and the resulting casualty estimates.

C. LIMITATIONS OF THE MODELS

The models used for casualty estimation rely on assumptions and simplifications of human response to the multidimensional effects of nuclear weapons. As such, they possess various limitations. For example, estimates on the impact of a thermal insult on effectiveness consider only the percent of body burned (area burned), not the specific body parts burned. Burned hands and face are represented only by a small percent of skin area burned and therefore have a small impact on performance capability; operationally, burned hands and face most likely have a major impact on task performance. A number of other important limitations exist.

AMedP-8 was produced based on the assumption that all individuals in an icon receive the same exposure and have the same post-event performance degradation. In the CHRNEM model, the assumption of equal pre-exposure performance for all individuals is made when calculating degraded performance levels. For example, differences due to age, health, and previous injuries of individuals are neglected.

To effectively relate nuclear insult to individual performance degradation, the task for which performance is being determined should also be considered. Categorizing all tasks as being either physically demanding or undemanding, as is done in the Combined subroutine methodology, may be simplistic. For example, tasks that require continuous concentration (e.g., monitoring of radar screens) may not fit into these gross categories.

Moreover, only individual performance degradation is estimated, not unit performance degradation. To estimate operational strength, command elements at higher levels are more likely to be interested in performance capability of units rather than individuals. Unit performance capability levels cannot be derived from individual performance levels without further information regarding the nature of degraded personnel. For example, loss of the surgeons of a mobile surgical hospital would render the unit completely ineffective at accomplishing its primary mission.

In the casualty estimation process, fatalities were defined as icons whose performance was reported to be zero during at least one time point of measurement (1 hour, day 1, day 2, etc.). However, an icon may reach a performance capability equal to zero at some time period not measured and reported, and therefore not be considered a fatality. Equating the number of fatalities listed in the tables in the ratification draft with the number dead (or KIA) is inaccurate: an icon categorized as a fatality remained so later, even if the performance capability value increased—due to healing or natural recovery—to a non-zero value. Thus, the casualty estimation ignores the possibility a person with zero performance capability may not be dead: an assumption that may, in fact, have various operationally significant repercussions, especially for treatment and evacuation planning.

Further, it is assumed that those who are less than or equal to 25% capable are admitted to hospitals. In reality, individuals who are greater than 25% capable may go into a holding area, receive prompt treatment and return to duty (RTD). However,

definitions used in this effort allow personnel to be "out of duty" only when they are less than or equal to 25% effective. Furthermore, in each scenario, certain individuals have performance values approaching 25% from above. Depending on the nature of injuries and intensity of combat, in reality, these individuals also may enter the medical system. Here again, casualties are generally underestimated.

Lastly, performance capability values do not reflect medical treatment, only natural recovery. With treatment, there may be fewer fatalities and a greater number of RTDs. One of the more important and uncertain factors that limits our ability to predict the performance capability of personnel is recovery from radiation injury. Ample evidence exists that recovery occurs; only the rate and the degree are uncertain. There is also reasonable certainty that some residual injury remains after recovery. Recovery rates currently in use are simply educated guesses. Because of this uncertainty as to recovery and residual injury, it may be advisable to disregard recovery entirely in estimates of troop effectiveness and accept whatever recovery occurs as a bonus or built-in safety factor.

Appendix J: Processing Data from Models

A. DATA PROCESSING OVERVIEW

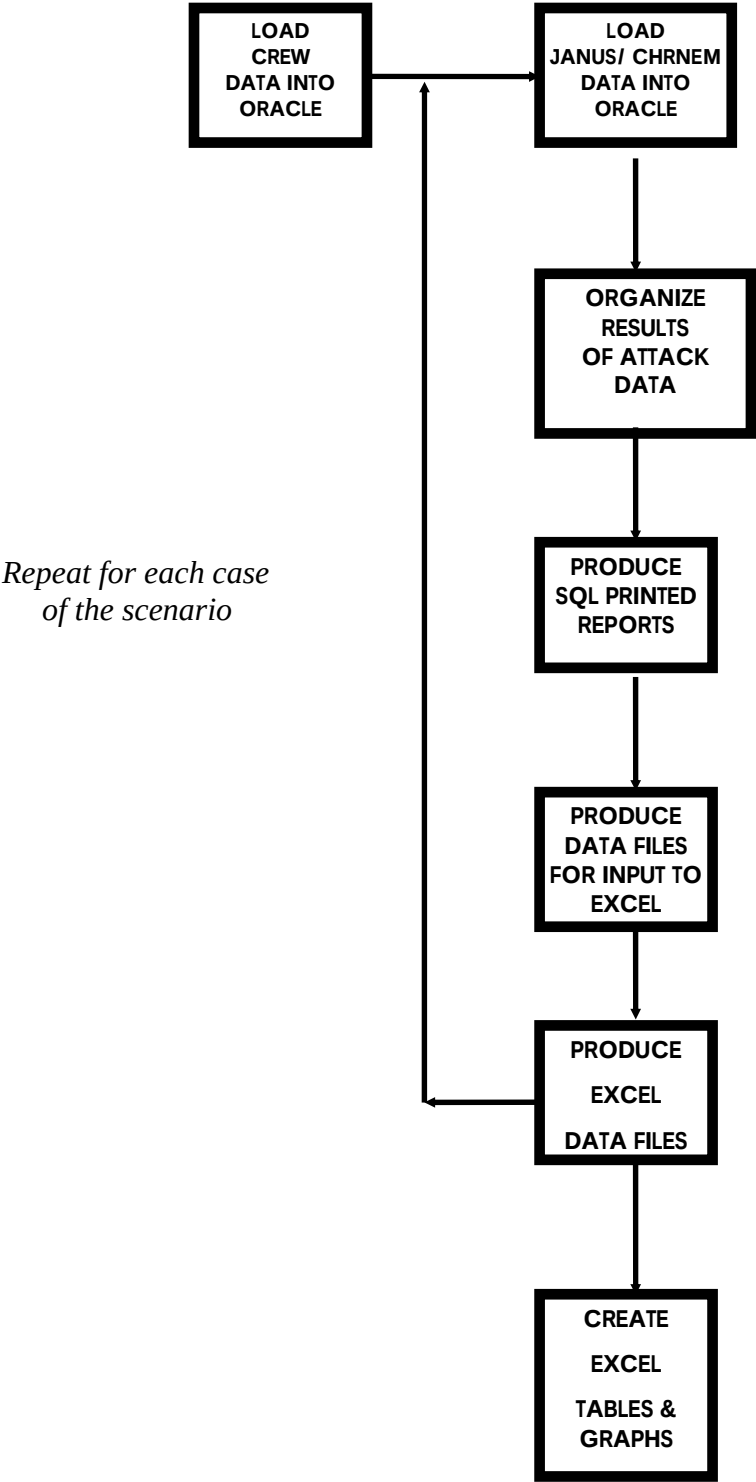

IDA used the Janus and CHRNEM models to assess the effects of nuclear weapons on seven scenarios, with each scenario consisting of six cases. Table J-1 lists the seven scenarios; for each scenario, the six cases were 5 KT unwarned (1U), 20 KT unwarned (2U), 50 KT unwarned (3U), 5 KT warned (1W), 20 KT warned (2W), and 50 KT warned (3W). For each case, Janus produced two files: one corresponding to one hour of exposure and one corresponding to multiple days of exposure, both labeled as combined_response.dat. The combined_response.dat file for one hour of exposure (the results of running a 1-hour battle to determine the nuclear effects on personnel up to one hour post-detonation) was named RUN0_xyz.DAT; x referred to the letter of the scenario; yz to the case (1W, 2W, etc.), as indicated above. The combined_response.dat file for multiple days of exposure was named RUN_xyz.DAT; the second file contained the results for each day of a sixty-day battle. Each file resulted from a single run; two runs had been made because the program required equal report (exposure) time intervals for a run. Data were processed through an Oracle procedure MED_CAS to tally the number of medical casualties and fatalities.

Table J-1. Scenarios

LABEL	UNIT TYPE	Area Targeted	Mission
Q	Heavy Brigade	Forward Maneuver	Movement to Contact
R	Heavy Brigade	Forward Maneuver	Offense
S	Heavy Brigade	Forward Maneuver	Defense
T	Heavy Brigade	Brigade Support Area	Movement to Contact
V	Heavy Brigade	Brigade Support Area	Offense or Defense
W	Support Brigade	N/A	N/A
X	Light Infantry Brigade	N/A	Defense

Figure J-1 presents a flow chart of the post-processing procedure MED_CAS as used for one scenario. First, the associated number of crew for each unit in the scenario was loaded into the data table CREW. Then, for each case within the scenario, the Janus data were loaded into the ORACLE database tables. Casualties, fatalities, etc., were computed, and results were presented in several formats. This procedure created 1) SQL printed reports, 2) data files for input to EXCEL, and 3) EXCEL tabular reports. Data for only one case at a time were loaded into the database tables and processed. Output report files and data files were created and saved for each case. EXCEL reports were created after all cases of a given scenario had been processed.

Figure J-1. Data Processing Flow Chart

1. *Creating Oracle Data Tables*

Before data could be loaded into the Oracle database and processed, the following tables needed to be created:

Table J-2. List of Tables for Oracle Processing

TABLE NAME	DESCRIPTION	SOURCE OF DATA
INSULT	The insult for each affected icon and the time at which the icon becomes a fatality, casualty, etc.	Janus RUN0_xyz.DAT and computations based on data in table EFFECT.
EFFECT	The non-demanding and demanding degradation at each exposure time for each affected icon.	Janus RUN0_xyz.DAT and RUN_xyz.DAT.
CREW	Number of crew in each icon.	
LU_BIN	Lookup table for bins indicating type of insult inflicted.	Manually loaded with binary indicators and their descriptions indicating whether an icon suffered a type of effect. For example, 111 means icon suffered blast + radiation + thermal and 100 means unit suffered only blast.
LU_RADIATION	Lookup table for ranges of values that define the radiation bins.	
LU_BLAST	Lookup table for ranges of values that define the blast bins.	
LU_THERMAL	Lookup table for ranges of values that define the thermal bins.	
LU_COMBINED_BIN	Lookup table for labels for the combined radiation/blast/thermal bins and an indicator of whether an icon falling into that bin becomes a casualty.	
CASES	Lookup table describing the scenario cases in terms of icon type, mission, aim point, posture and yield.	

2. *Creating Views of the Data Tables*

Views were created from the data tables to facilitate presentation of the computation results. The views tally the total number of people by type of insult and by time period that fall into a specific category. The following views were created and their names describe their contents:

- CASUALTY_BY_TIME
- FATALITY_BY_TIME
- RETURNS_BY_TIME
- SICK_BY_TIME
- IN_SYSTEM_PART1
- IN_SYSTEM_PART2
- IN_SYSTEM_BY_TIME

The status of an icon crew at a given time was defined in terms of its relatively degraded ability to perform demanding tasks (degraded performance, demanding or PD). PD values were categorized as follows:

- Fatality $\rightarrow$ PD = 0.0
- Casualty $\rightarrow$ $0.0 < \text{PD} \leq 0.25$
- Return to Duty $\rightarrow$ PD ≥ 0.75 after being a casualty
- Sick Again $\rightarrow$ $0.0 < \text{PD} \leq 0.25$ after returning to duty
- In Medical System $\rightarrow$ Icon has been a casualty but not returned to duty, or icon has returned to duty but has become sick again

Oracle SQL*Loader was used to load the data.

3. *Loading Data into the Oracle database*

Crew data for the given scenario were loaded into data table CREW. The following items were included:

- Icon number
- Number of people in crew

Next, data for the selected case were loaded. The following data were loaded from the Janus file RUN0_xyz.DAT into table INSULT for each affected icon:

- Icon number
- Icon type
- Thermal flag (to indicate if icon was affected)
- Blast exposure value
- Radiation exposure value
- Thermal exposure value
- Burn area

The following data were loaded from the Janus files RUN0_xyz.DAT and RUN_xyz.DAT into table EFFECT for each affected icon:

- Icon number
- Exposure time
- Performance, Non-Demanding
- Performance, Demanding

4. *Tabulating Results*

Values for each affected icon were created via the MED_CAS procedure, and results were stored in table INSULT:

1. Insult flag to indicate whether icon was affected by blast, radiation and/or thermal exposure
2. Number of people in crew as shown in the CREW table
3. Time icon becomes fatality
4. Number of people who become fatalities in the first hour
5. Time icon becomes casualty
6. Time icon returns to duty
7. Time icon becomes sick again
8. Time icon leaves unit medical system (becomes fatality or return to duty)
9. Time icon returns again to duty (returns to duty after becoming sick again)
10. Time icon leaves medical system after becoming sick again
11. Number of bed days used by the icon, (number of people in the crew times the number of days they are in medical system)
12. Combined index to indicate the level of thermal, blast, and radiation received by the icon

This procedure was also used to compute the following values for each affected icon and time period, and results were stored in table EFFECT:

1. Quartile the degraded performance (demanding) falls into, at that time

5. *Creating Printed Reports*

The procedure MED_CAS was used to create the following SQL printed reports for each case:

1. Number of Fatalities by Type Injury for Each Time Period
2. Number of New Casualties by Type Injury for Each Time Period
3. Number of People Returning to Duty by Type Injury for Each Time Period
4. Number of People Sick Again by Type Injury for Each Time Period

5. Number of people in Medical System by Type Injury at End of Each Time Period
6. All People in Each Effectiveness Category at End of Each Time Period
7. Number of Affected People in Each Effectiveness Category at End of Each Time Period
8. Number of Capable People in Each Effectiveness Category at End of Each Time Period
9. Number of People in Each Thermal/Blast/Radiation Effect
10. Insult on Icons by Insult Flag
11. Stages of Effect on Units by Unit Number

6. *Displaying Tabular Results in Excel*

EXCEL reports were created by running NUC.XLS against the data files produced by the SQL code: namely, SNAP.xyz, NEW.xyz, and BINS.xyz. The user was asked to select the scenario and the types of reports desired. For each case of a scenario, the user received three types of reports: 1) a SNAPSHOT report of the cumulative counts at each time period, 2) a NEW report of new counts in each time period, and 3) a PEOPLE report of the count of crew in each thermal/blast/radiation bin. In addition, the user could obtain summary reports across all six cases of the scenario. Reports were created in an EXCEL spreadsheet, which could be printed or graphed. The file NUC.XLS created spreadsheets automatically for the user.

7. *Anomalous Data*

The CHRNE performance model produced inaccurate performance capability (PC) data for icons exposed to insults outside the Combined subroutine limits (0-40 psi, 0-1000 cGy, 0-80 cal/cm²). Three types of errors were identified.

For icons exposed to very high radiation insults, PC exceeded 0.25 at approximately one hour, and equaled zero at approximately one day. Based on guidance from the U.S. Army Medical School and Center, personnel with very high radiation insults are unlikely to have this PC pattern. Instead, their PC would be between 0.0 and 0.25 (casualty) by day one, and eventually become 0.0 (fatality): the time at which the icon becomes a fatality is a function of its radiation exposure (calculated via Janus). Errant data was modified to conform to the expected PC patterns, as described in the following table. For all icons whose PC (demanding) exceeded 0.25 at exposure time ~1 hour but whose PC (demanding) was 0.0 at exposure time of approximately 1 day, the following algorithm was added to the Oracle code:

Table J-3. Corrections to Performance Data

Radiation Insult, r (rads)	Exposure time, t (hrs.)	Performance Capability (Demanding)- Modified
$1000 < r \leq 2000$	$1.0 < t < 407$	0.15
$1000 < r \leq 2000$	$T \geq 407$	0.0
$2000 < r \leq 5000$	$1.0 < t < 191$	0.15
$2000 < r \leq 5000$	$T \geq 191$	0.0
$5000 < r \leq 20000$	$1.0 < t < 95$	0.15
$5000 < r \leq 20000$	$t \geq 95$	0.0
$20000 < r < \text{infinity}$	$t \leq 1.0$	0.15
$20000 < r < \text{infinity}$	$t > 1.0$	0.0

For icons exposed to radiation insults above the Combined subroutine limit, the following anomaly was observed: When comparing data for warned and unwarned postures, some icons exhibit higher performance levels when exposed to thermal radiation exposure than when unexposed (primary blast and ionizing radiation insults were identical). Table J-4 provides examples of this phenomenon. For these icons, performance values without thermal exposure were modified to equal performance values with thermal radiation exposure, due to the lack of algorithms to better estimate performance in this situation.

Table J-4. Data Inaccuracies-Example 1

Scenario, Yield	Icon #	Icon Type	Unwarned		Warned	
			Thermal Insults (cal/cm²)	Performance Levels	Thermal Insults (cal/cm²)	Performance Levels
T1	916	3	366.6	0.178	0	0
T1	918	3	0	0	50.9	0.095
Q1	89	9	36.8	0.176	0	0
Q1	128	15	40.6	0.152	0	0
Q1	129	15	32.7	0.203	0	0
W1	163	15	45.8	0.12	0	0
W1	172	15	0	0	43.1	0.136

Note: Table contains original data from Janus and CHRNEM output files.

For icons exposed to insults well outside the Combined subroutine limits, PC values abnormally rose from 0.000 then dropped back to 0.000 from one reported time point, to a later time point. For example, for one icon with insult values of 14 psi, 81,299 rads and

81.9 cal/cm² for primary blast, ionizing radiation, and thermal radiation, respectively, the performance capability at these time points was:

Table J-5. Data Abnormalities-Example 2

Time (hr.)	Performance Capability (Demanding)
0.10	0.000
0.20	0.373
0.30	0.305
0.40	0.241
0.50	0.188
0.98	0.000

LLNL agreed that this representation of effectiveness at high doses is incorrect, and personnel subject to the above insults would have a performance capability of 0.000 from the time of exposure. The performance data, however, were not altered during the production of the AMedP-8 nuclear manual or the documentation effort. The original data are presented in the appendices of this documentation.

For icons exposed to insults outside the Combined subroutine limits, the following anomaly was also observed: Performance levels were not proportional to insults, when comparing icons within a scenario; indirect variance of the two variables was expected, but not observed. Examples of this phenomenon are:

Table J-6. Data Abnormalities- Example 3

Scenario, Yield, Posture	Icon #	Blast Insults (psi)	Radiation Insults (rads)	Thermal Insults (cal/cm²)	Performance Capability (Demanding)
V1U	234	38	467003	0.0	0.060
V1U	63	14	70159	0.0	0.000
Q1U	122	8	6937	0.0	0.179
Q1U	129	8	8618	32.7	0.203
Q1U	92	9	10030	0.0	0.000
Q1U	218	8	10357	32.1	0.207

Note: Table contains original data from Janus and CHRNEM output files.

Error sources were indeterminate; consequently, corrections were not possible. Based on review of the Janus output, correction of this error most likely would result in unchanged total casualties and fatalities, but the numbers in each category would possibly differ.

An anomaly was also observed in the Janus data. Some icons unexpectedly received different non-zero thermal radiation insults for the unwarned and warned postures. In Janus, thermal exposure is calculated in a probabilistic manner; an icon either receives the thermal insult appropriate to its slant range or receives no thermal insult, based on the

Probability Crew is Exposed to Thermal (see Appendix I, Table I-1). Therefore, the thermal insults for unwarned and warned posture for an icon would be expected to be the same, or one (possibly both) would be zero (except when an icon is subject to a different Probability of Exposure to Thermal due to a change in posture). Examples of this phenomenon are:

Table J-7. Data Abnormalities-Example 4

Scenario, Yield	Icon #	Icon Type	Unwarned Thermal Insults (cal/cm²)	Warned Thermal Insults (cal/cm²)
T2	220	SMFLAT (59)	22.2	22.3
T2	950	TRUCK (34)	1240.1	1392.1
T2	976	SMFLAT (59)	89.3	100.0
T2	981	SMVAN (63)	244.7	336.2
T2	992	TR-VAN (93)	369.3	848.7
T5	220	SMFLAT (59)	37.1	73.7
T5	950	TRUCK (34)	2012.1	2250.7
T5	976	SMFLAT (59)	214.7	239.2
T5	981	SMVAN (63)	532.1	728.0
T5	992	TR-VAN (93)	675.0	1637.3

Note: Table contains original data from Janus output files.

During the production of the AMedP-8 nuclear manual, numerous parameters in Janus were examined in an effort to detect the cause of this phenomenon, but no satisfactory explanation was found. For most cases, performance values calculated from this insult data were not significantly affected, and would not affect casualty estimates.

13. SUPPLEMENTARY NOTES					
14. ABSTRACT In 1994, the Institute for Defense Analyses (IDA) was tasked to assist OTSG in developing a new version of AMedP-8 "Planning Guide for the Estimation of Battle Casualties (Nuclear)." This task employed then-current modeling and simulation tools to estimate over time the numbers and types of patients, as a result of a nuclear weapon detonation. As part of the current task for OTSG, IDA has documented the efforts of 1994-2000 that produced AMedP-8 Nuclear. The documentation describes the Janus nuclear effects model and CHRNEM Combined injury model with regard to model inputs and assumptions; presents detailed descriptions of the tactical scenarios used in AMedP-8 Nuclear; includes exposure and performance capability data used to produce AMedP-8 Nuclear but not presented in that document; contains tables summarizing casualty scenarios from AMedP-8 Nuclear; and recommends areas for revision to be considered for future versions of AMedP-8 Nuclear.
