13. SUPPLEMENTARY NOTES					
14. ABSTRACT The US Army Research Laboratory evaluated the ballistic performance of aluminum alloys (AAs) 7056-T761, 7056-T751, and 7056-T721 produced by Constellium. Ballistic evaluation was performed using armor-piercing and fragment-simulating projectiles to determine the V_{50} ballistic-protection limit (V_{50}) for various thicknesses of material. The V_{50} was then compared with other ballistic-grade AAs, namely AA7085-T711 and AA7085-T721. The results of these experiments were used to validate the acceptance tables for AA7085 and AA7056 included in the updated military specification, MIL-DTL-32375A (MR).

Acknowledgments

The author would like to thank Constellium, and specifically Paul Kobe, for producing and providing, in-kind, the armor-plate samples. The author thanks Donald Little of the US Army Research Laboratory's Armor Mechanisms Branch (ARL-AMB), Phil Davis of Dynamic Science, Inc., and David Churn of Bowhead Science and Technology, LLC, for performing the ballistic experiments in Experimental Facilities (EFs) 108 and 106, as well as John Hogan of ARL-AMB, Hugh Walter of Bowhead Science and Technology, and David Handshoe and William Bryant of Dynamic Science for performing the ballistic experiments in EF-110.

1. Introduction

Aluminum alloy (AA) 7056 is Constellium's next-generation armor offering that can be sourced both domestically and through North Atlantic Treaty Organization member countries. Two tempers were developed: 1) a high-strength variant, 7056-T761, for use as an appliqué against direct-fire threats and 2) a lower strength, higher ductility variant, 7056-T721, for underbody blast protection kits. AA7056-T761 is currently in competition to be used in several Army platforms including the Bradley, Joint Light Tactical Vehicle, and Armored Multi-Purpose Vehicle.

The ballistics goal of this program was to verify that AA7056-T761 and AA7056-T721 met or exceeded the performance of comparable military-specification (mil-spec) 7XXX-series alloy produced by Alcoa, namely 7085-T711 and 7085-T721.¹ The results were used to subsequently add 7056 to the 7085 specification, allowing increased availability of material and pricing competition to benefit the Army. In addition to the 2 tempers outlined for the mil-spec, a third temper, 7056-T751, was also assessed. AA7056-T751 was the original blast temper but was modified slightly during the evaluation period warranting the updated 7056-T721 designation. The properties of the 7056-T751 evaluated were very similar to the 7056-T721 temper, and therefore the data were combined during analysis. Table 1 outlines the average mechanical properties for the evaluated samples.

Table 1 Average mechanical properties of evaluated plates

Alloy/ temper	Direction	Ultimate tensile strength (MPa)	Yield strength, 0.2% offset (MPa)	Elongation (%)	Direction	Ultimate tensile strength (MPa)	Yield strength, 0.2% offset (MPa)	Elongation (%)
7056-T721	L	495.8	446.8	15.0	LT	497.1	442.0	12.9
7056-T751	L	494.5	455.2	14.5	LT	510.3	457.3	12.3
7056-T761	L	568.8	547.5	11.5	LT	573.9	541.0	9.9

Note: L = longitudinal; LT = long transverse

Several thicknesses of the temper variants were provided to the US Army Research Laboratory (ARL) by Constellium. Table 2 is a summary matrix of the evaluated thicknesses subjected to impacts from various munitions including armor-piercing (AP) and fragment-simulating projectiles (FSPs). Additionally, Table 3 provides the required chemistries for AA7056 as well as other common aluminum (Al) armor alloys.

2. Experimental Procedure

The V_{50} is defined as the impact velocity at which the projectile is equally as likely to perforate the target as it is to be arrested. A 0.51-mm (0.020 inch) 2024 T3 Al witness plate was positioned 152 mm (6 inches) behind the target to determine the outcome of each shot. An impact is regarded as a complete penetration (CP), or loss, if the projectile or a resulting target fragment from impact creates a hole in the witness plate through which light can be observed. If an impact does not result in a CP, it is considered a partial penetration (PP), or win. To keep results as consistent as possible, only shots conforming to the following conditions were used to determine the V_{50} : The projectile must be unyawed—less than 2° of total yaw for AP rounds and less than 5° of total yaw for FSPs—and strike the target at least 2 projectile diameters from any previous impact or damage or the edge of the target. Total yaw is defined as the vector sum of the projectile's pitch and yaw. The V_{50} is calculated by the arithmetic mean of an equal number of CPs and PPs within an 18-m/s (60 ft/s) spread for a $2 + 2 V_{50}$, a 27-m/s (90 ft/s) spread for a $3 + 3 V_{50}$, and as small of a spread as attainable for a $5 + 5 V_{50}$.³

Projectile velocities for the determination of the V_{50} were measured using one of 2 methods, as shown in Fig. 1. The first method is an orthogonal flash X-ray system, described in detail by Grabarek and Herr,⁴ that also measures pitch and yaw. The second method uses 3 IR screens and a chronograph. The velocity is calculated using the first and third screens with the middle screen used to check for bad readings. The flash X-ray method was used in situations with projectiles that historically exhibit excessive yaw or if space did not allow for the use of the IR break screens. When the IR break screens and chronograph were used, the projectile velocity was corrected to the target-impact location using a correction factor based on an initial flash X-ray reading at the impact location. The correction was made using Eqs. 1 and 2 in lieu of using air-drag factors.

$$\frac{(\text{x-ray velocity})}{(\text{chronograph velocity})} = (\text{correction factor}). \quad (1)$$

$$(\text{correction factor}) \times (\text{chronograph velocity}) = (\text{corrected velocity}). \quad (2)$$

Fig. 1 Typical experimental setup

3. Experimental Projectiles

3.1 Armor-Piercing Projectiles

The US 0.30-cal. APM2 and 0.50-cal. APM2 plus the Soviet 14.5-mm BS41 are the 3 AP projectiles that were used in this study. These projectiles are shown in Fig 2. The APM2 projectiles have hardened steel cores with a Rockwell hardness of C61-63, whereas the BS41 has a tungsten carbide core. The physical characteristics of these projectiles are listed in Table 4.

Fig. 2 AP projectiles

Table 4 AP projectiles' physical characteristics⁵

Projectile type	Projectile			Core		
	Length (mm)	Diameter (mm)	Weight (g)	Length (mm)	Diameter (mm)	Weight (g)
0.30-cal. APM2	35.3	7.85	10.8	27.4	6.2	5.3
0.50-cal. APM2	58.7	12.98	45.9	47.5	10.9	25.9
14.5-mm BS41	52.6	14.94	63.2	32.3	10.9	37.9

3.2 Fragment-Simulating Projectiles

FSPs (Fig. 3) are a family of projectiles that are flat-nosed, right circular cylinders manufactured to MIL-DTL-46593B (MR).⁶ These projectiles are used in material evaluations and acceptance testing to simulate performance against fragments produced from improvised explosive devices and artillery. Both 0.50-cal. and 20-mm FSPs were used for the evaluation of AA7056.

Fig. 3 FSP projectiles

4. Results and Analysis

The experimental results are summarized in Tables 5–14. The individual shot records are provided in Appendix A and Appendix B.

The results of the ballistic evaluation are compared directly against the ballistic performance of AA7085. Figures 4–8 show the AA7056 ballistic data collected by ARL compared with previous AA7085 data.⁷ The data displayed are the V_{50} 's as a function of the plate thickness. Figures 9–13 show the AA7056 ballistic data as compared with the updated 7056/7085 specification MIL-DTL-32375A.¹ In instances where the acceptance curve has changed from the original document (MIL-DTL-32375), the original acceptance curve is shown for reference. Note that the plates are compared on a thickness basis to be consistent with the specifications; however, the densities of the alloys vary slightly. AA7056 has a density of 2.87 g/cm³, whereas AA7085 has a density of 2.85 g/cm³.

Fig. 10 Ballistic limit vs. thickness of AA7056 as compared with MIL-DTL-32375 and the revised MIL-DTL-32375A for the 0.50-cal. APM2 at 0° obliquity

Fig. 11 Ballistic limit vs. thickness of AA7056 as compared with MIL-DTL-32375 and the revised MIL-DTL-32375A for the 14.5-mm BS41 at 0° obliquity

Fig. 12 Ballistic limit vs. thickness of AA7056 as compared with MIL-DTL-32375A for the 0.50-cal. FSP at 0° obliquity

Fig. 13 Ballistic limit vs. thickness of AA7056 as compared with MIL-DTL-32375A for the 20-mm FSP at 0° obliquity

As can be observed in Figs. 4–8, the performance for AA7056 is similar to the existing AA7085 material. It would not be a stretch to consider them one data set to develop an acceptance curve. Therefore, it was decided to use one set of acceptance curves for both materials rather than include individual curves for each material in the specification. For the 0.30-cal. APM2, 0.50-cal. FSP, and 20-mm FSP (Figs. 9, 12, and 13), no changes were made to the original acceptance curves. Using the data presented in this report and additional data that had been generated on AA7085 after the original specification publication, the acceptance curves were adjusted for plate thickness requiring acceptance with the 0.50-cal. APM2 and 14.5-mm BS41 (Figs. 10 and 11). The 0.50-cal. APM2 curves were adjusted because the original curves were too close to the actual V_{50} performance of the plates in those thickness ranges and a high number of material lots were failing acceptance testing. The 14.5-mm BS41 was adjusted because the original curve was based on a limited number of experiments, and an unusually high V_{50} data point for a nominally 76.2-mm plate caused the curve to significantly shift upward. Now, with more data available, a more appropriate acceptance curve has been derived. The new acceptance velocities were calculated by fitting the combined 7056 and 7085 V_{50} data minus 2 standard deviations with Eqs. 3 and 4 for AP and FSP projectiles, respectively.^{8,9}

$$V_A = 1000\sqrt{a + bt} . \quad (3)$$

$$V_A = 1000e^{a+bt} . \quad (4)$$

In Eqs. 3 and 4, V_A is the acceptance velocity, t is the actual thickness of the plate, and both a and b are constants of regression. Table 15 lists the constants of regression for each projectile. The ballistic tables corresponding to the acceptance curves can be found in MIL-DTL-32375A (MR).

Table 15 Constants of regression for the acceptance curves for AA7056 and AA7085 used in MIL-DTL-32375A

5. Conclusions

A ballistic evaluation has been performed on AA7056 in the T761, T751, and T721 tempers. This report has compared the performance of AA7056 against existing mil-spec Al-armor material, namely AA7085. AA7056 performed similar to AA7085 against the mil-spec projectiles at equal thicknesses. This report has also documented the calculations used to derive the acceptance tables included in the updated MIL-DTL-32375A (MR).

INTENTIONALLY LEFT BLANK.

List of Symbols, Abbreviations, and Acronyms

AA	aluminum alloy
Al	aluminum
AP	armor-piercing
ARL	US Army Research Laboratory
CP	complete penetration
EF	experimental facility
FSP	fragment-simulating projectile
ID	identification
IR	infrared
mil-spec	military specification
PP	partial penetration
