DESCRIPTION OF MATERIAL

CONTRACT OR GRANT NUMBER: W911NF-09-1-0109

INSTITUTION: University of Medicine & Dentistry of New Jersey

PRINCIPAL INVESTIGATOR: Janine Santos

TYPE REPORT: Final Report

DATE RECEIVED: 10/20/16 9:59AM

PERIOD COVERED: 5/25/09 12:00AM through 8/24/13 12:00AM

TITLE: Final Report: Molecular mechanism of hTERT function in mitochondria

ACTION TAKEN BY DIVISION

(x) Report has been reviewed for technical sufficiency and IS ☒ IS NOT ☐ satisfactory.

(x) Material has been given an OPSEC review and it has been determined to be non sensitive and, except for manuscripts and progress reports, suitable for public release.

(x) Performance of the research effort was accomplished in a satisfactory manner and all other technical requirements have been fulfilled.

(x) Based upon my knowledge of the research project, I agree with the patent information disclosed.

Approved by SSL\MICHELINE.STRAND on 11/4/16 1:11PM

Report Title

Final Report: Molecular mechanism of hTERT function in mitochondria

ABSTRACT

Human telomerase reverse transcriptase (hTERT) is localized to mitochondria, as well as the nucleus, but details about its biology and function in the organelle remain largely unknown. Using multiple approaches our studies revealed that mammalian TERT is mitochondrial, co-purifying with mitochondrial nucleoids and tRNAs. We demonstrate the canonical nuclear RNA [human telomerase RNA (hTR)] is not present in human mitochondria and not required for the mitochondrial effects of telomerase, which nevertheless rely on reverse transcriptase (RT) activity. Using RNA immunoprecipitations from whole cell and in organello, we show that hTERT binds various mitochondrial RNAs, suggesting that RT activity in the organelle is reconstituted with mitochondrial RNAs. In support of this conclusion, TERT drives first strand cDNA synthesis in vitro in the absence of hTR. Finally, we demonstrate that absence of hTERT specifically in mitochondria with maintenance of its nuclear function negatively impacts the organelle. Our data indicate that mitochondrial hTERT works as a hTR-independent reverse transcriptase, and highlight that nuclear and mitochondrial telomerases have different cellular functions.

Scientific Progress

The studies funded by this award allowed better understanding of the role of TERT in mitochondria. Large strides were made in terms of its biochemical properties in the organelle as well as about the impact to normal cell biology upon overexpression or depletion of the mitochondrial content of the enzyme. Some of future studies spearheaded by the work funded through this award are still hampered because of the lack of reagents to understand and isolate the mitochondrial versus nuclear function of the protein. Nevertheless, we now know that in the mitochondria only the catalytic component of telomerase is present, interacting with different types of nucleic acids, including DNA and RNA. The papers published during the time the award was funded attest for the advancement of the field and the productivity of the group.
