14. ABSTRACT In just over a century, aviation has progressed from a military afterthought to a central component of military operations. In that time, airpower has undergone exponential technological growth. Early aviation pioneers would scarcely recognize the fifth-generation aircraft being produced today. Some consistencies remain, however. Among them is the recognition that air supremacy is an essential first step in the conduct of military operations. From the beginning, airpower advocates maintained that the full strength of air and land forces could not be brought to bear until after they gained air supremacy. This was an accepted norm of airpower thinking with few outlying exceptions. The pressing issue was not if air supremacy should be gained, but how it was to be accomplished or if it was even possible. The US armed forces today acknowledge the necessity of air superiority, at a minimum, before operations can begin. The ultimate goal is to achieve air supremacy to facilitate freedom of maneuver for US ground and naval forces. Given the importance of control of the air, the author's research goal was to determine the degree to which the history, theory, and doctrine of the US Air Force prepare it to obtain air supremacy against a peer or near-peer adversary in a present or near-future conflict. Research results suggest that air supremacy in this case should not be anticipated or expected. The Air Force is highly proficient at the tactical level, but lacks the historical, theoretical, and doctrinal foundation on which to confidently construct a campaign that guarantees success. This work uses a qualitative research method to investigate airpower theory and doctrine in the US Air Force since its inception as the US Army Air Corps in 1907. It supplements these examinations with historical case studies and vignettes from major conflicts involving the US Air Force. Greater attention is given to those conflicts in which aerial combat played a larger role and air supremacy was not a given. World War II receives special attention in the monograph because of its unique historical position as the only war in which the United States competed against peer adversaries for air supremacy. It concludes by assessing the present state of the US Air Force with regards to problems that must be considered and addressed prior to any large-scale conflict. The US Air Force will likely not be able to preserve the current and comfortable state of US air supremacy unless it challenges its own status quo assumptions.

Abstract

A House Built on Sand: Air Supremacy in US Air Force History, Theory, and Doctrine, by Maj E. Taylor Francis, US Air Force, 45 pages

In just over a century, aviation has progressed from a military afterthought to a central component of military operations. In that time, airpower has undergone exponential technological growth. Early aviation pioneers would scarcely recognize the fifth-generation aircraft being produced today. Some consistencies remain, however. Among them is the recognition that air supremacy is an essential first step in the conduct of military operations. From the beginning, airpower advocates maintained that the full strength of air and land forces could not be brought to bear until after they gained air supremacy. This was an accepted norm of airpower thinking with few outlying exceptions. The pressing issue was not if air supremacy should be gained, but how it was to be accomplished or if it was even possible.

The US armed forces today acknowledge the necessity of air superiority, at a minimum, before operations can begin. The ultimate goal is to achieve air supremacy to facilitate freedom of maneuver for US ground and naval forces. Given the importance of control of the air, the author's research goal was to determine the degree to which the history, theory, and doctrine of the US Air Force prepare it to obtain air supremacy against a peer or near-peer adversary in a present or near-future conflict. Research results suggest that air supremacy in this case should not be anticipated or expected. The Air Force is highly proficient at the tactical level, but lacks the historical, theoretical, and doctrinal foundation on which to confidently construct a campaign that guarantees success.

This work uses a qualitative research method to investigate airpower theory and doctrine in the US Air Force since its inception as the US Army Air Corps in 1907. It supplements these examinations with historical case studies and vignettes from major conflicts involving the US Air Force. Greater attention is given to those conflicts in which aerial combat played a larger role and air supremacy was not a given. World War II receives special attention in the monograph because of its unique historical position as the only war in which the United States competed against peer adversaries for air supremacy. It concludes by assessing the present state of the US Air Force with regards to problems that must be considered and addressed prior to any large-scale conflict. The US Air Force will likely not be able to preserve the current and comfortable state of US air supremacy unless it challenges its own status quo assumptions.

I must begin by thanking my wife, Stephanie, for her unwavering and tireless support. Her patience with me during the writing process was remarkable and appreciated. I hope to one day merit the faith she has in me and the encouragement she provides. Dr. Daniel Cox was an outstanding monograph director. He guided me through multiple changes to my topic and a major revision to the structure of the monograph. Our talks in his office allowed me to think out loud and focus my research. His patience, professionalism, and recommendations were instrumental in constructing the final product you see today. Dr. Scott Gorman's wealth of knowledge and expertise both as an airman and an academic played a critical part in the development of this monograph. Whether providing essential reference material or answering grammatical questions, his inputs were invaluable. I owe a huge debt of gratitude to Elizabeth Dubuisson at the Ike Skelton Combined Arms Research Library and Sandy Malladi at the Muir S. Fairchild Research Information Center for their dedication and diligence in tracking down and providing me digital copies of historical Army and Air Force doctrine. I would not have been able to even begin this paper without their assistance. Lastly, thank you to all of my Seminar 3 teammates who listened to my ramblings, offered their insights, and helped make me a better writer.

Author's Notes

The nature of this monograph and research topic require that I make certain grammatical choices. I believe it is worthwhile to discuss them briefly to alleviate any potential confusion on the part of the reader. To begin with, historically, authors have written the term airpower as either one word, as I have, or as two words (“air power”). The general consensus today is to treat airpower as one word and that is how published Air Force doctrine presents it. Thus, I write airpower as one word throughout the monograph. However, if I quote an author who wrote airpower as two words, I maintain fidelity to its original form. Other terms have similarly evolved over time. As late as 1931, control of the air, air superiority, and air supremacy were considered interchangeable terms of equivalent meaning. Today, control of the air is used to describe a spectrum ranging from air parity to air supremacy. Air superiority and air supremacy are also considered to be distinct terms with unique definitions in present doctrine. When quoting or referencing other authors, I use the terms as the author intended. In my own writing, I stick to doctrinal meanings as much as possible. In situations where doctrinal definitions constrained more than they clarified, I use generic terms such as “command of the air” or “control of the air domain.” Finally, I use the term “Air Force” in this monograph to mean “US Air Force.” On the rare occasion I mention another country’s air force, I make the distinction explicit. Since this monograph only concerns the US Air Force, it seems unnecessarily repetitive to state it every time. I hope these minor clarifications guide the reader, alleviate confusion, and aid in understanding of my intent, research, and conclusions.

Introduction

Without air supremacy, I wouldn't be here.

—Dwight D. Eisenhower, Normandy, France, 1944

An ever-growing body of knowledge and technological advancements accompany time's ceaseless procession. Some new technologies, the Roman *corvus* or the Paixhans gun for example, are designed for specific military goals. Others, such as the automobile or the rifled musket, are quickly adapted for military use. The airplane fits neatly into this second category. Following the first short flights at Kitty Hawk in December 1903, militaries around the world adapted the Wright Flyer and subsequent models for use in combat operations. In less than four years, aviation in the United States went from a 120-foot flight on a sand dune to establishment as the Aeronautical Division of the US Army Signal Corps via official order on 1 August 1907. Seven years later, in 1914, federal law created the Aviation Section of the Signal Corps marking the statutory inclusion of airpower into the military organization.¹ The quick and successful adaptation of a new technology by the armed forces is rather mundane, but the power of the airplane lies elsewhere. Unlike previous technologies that changed warfare on land or at sea, the airplane introduced a new warfighting domain and induced a fundamental modification in thinking about war.

Two major challenges accompanied the seismic shift in military capability. The first was organizational, and continued until the National Security Act of 1947 established the US Air Force. The second, and more relevant here, concerned the employment of airpower in support of military objectives. The theory and doctrine surrounding aviation employment, and the interaction between the two, soon became dominant threads in military conceptualization. Giulio Douhet introduced the first holistic theory of airpower with his seminal 1921 work *The Command*

¹ Thomas H. Greer, *The Development of Air Doctrine in the Army Air Arm, 1907-1941* (Washington, DC: Office of Air Force History, 1985), 149.

of the Air. It was followed by Billy Mitchell's *Winged Defense* in 1925. Their ideas were supplemented by other theorists and military leaders such as Hugh Trenchard in the British Royal Air Force and a host of theoreticians at the US Army Air Corps Tactical School (ACTS). These great minds all assumed different postures, but over time two primary paradigms emerged in both airpower theory and doctrine – the decisive power of strategic bombing and the essential nature of air supremacy.

Regarding strategic bombing, Douhet wrote, "In general, aerial offensives will be directed against such targets as peacetime industrial and commercial establishments; important buildings, private and public; transportation arteries and centers; and certain designated areas of civilian population as well."² American airpower theorists mirrored Douhet's sentiments. Mitchell claimed, "To gain a lasting victory in war, the hostile nation's power to make war must be destroyed – this means the manufactories, the means of communication, the food products, even the farms, the fuel and oil and the places where people live."³ Building upon these ideas, along with the experiences of World War I, the Air Corps Tactical School's leading thinkers drove the development of theory and the creation of airpower doctrine in the first half of the twentieth century. The most apt synopsis of their ideas is, "The most efficient way to defeat an enemy is to destroy, by means of bombardment from the air, his war-making capacity."⁴ In the lust for strategic bombing, doctrine lost a critical aspect of Douhet's and Mitchell's thinking, the idea that air supremacy preceded the strategic bombing campaign. Douhet detailed the necessity of "destroying the mobilization, maintenance, and production centers of Nation B's aviation" in order to provide "complete liberty of action to strike at will, with no risk to itself, over all the

enemy's territory, and quickly bring him to his knees."⁵ In the same vein, Mitchell explained that an enemy's production and will to fight could be destroyed by air "in an incredibly short space of time, once the control of the air has been obtained."⁶ Control of the air has been a core concept of airpower theory since its inception.

Over the years, new airpower theorists emerged accompanied by new doctrine, but the two driving factors remained unchanged. The major thrusts of airpower theory and doctrine remained the importance of strategic bombing and the inviolability of air supremacy as a tenet. Air supremacy's theoretical importance varied over time, but in practice it played second fiddle to strategic bombardment until and unless circumstances forced a change. In the incipient days of airpower theory, the only impediment to air supremacy was the adversary's aviation forces. Technologies such as radar did not exist and air defenses were minimal. The greatest threat came from pursuit aircraft, which were often devoted to supporting ground forces or could be overcome, at least in theory, through superior numbers of bombers with defensive armament. Thus, leading minds such as Douhet, Mitchell, and Trenchard were able to assume command of the air would be a given following the nullification of an enemy's pursuit aviation. For these theorists, although air supremacy was essential, it was also expected. In time, technological advancement changed the nature of aerial combat, but concomitant changes in theory and doctrine were not forthcoming. Later theorists, such as John Warden, again emphasized the preeminence of command of the air, but failed to offer much of substance with regards to its attainment. The lack of substance found in theory is mirrored in doctrine. Control of the air is discussed at length doctrinally, but without much depth or consideration for what might be required to gain complete air supremacy.

⁶ Mitchell, *Winged Defense*, 127.

In addition to its theories and doctrine, the history of US airpower played a significant role in its perception and treatment of air supremacy. In World War II, the US Army Air Corps, along with the Royal Air Force, encountered a comparable foe in the German *Luftwaffe* and a formidable opponent in the Imperial Japanese Army Air Service. The battles that ensued in the European and Pacific theaters determined who would control the skies. They were battles for air supremacy that could have been defining moments for the concept. They were moments in which theorists and doctrine writers alike should have examined and wrestled with observations and conclusions to better understand the phenomenon of air supremacy. Instead, World War II aerial warfare became a war of attrition and the massive industrial and demographic advantages of the United States slowly wore down its adversaries' opposition. Thus, those responsible squandered a valuable learning opportunity. Other than World War II, the United States has not found itself in a situation where it actively engaged in significant combat against a peer adversary for control of the air. In Korea and Vietnam there were aerial engagements, but they often occurred at the tactical level and the overall air strategy focused on strategic bombardment. Since Desert Storm in the early 1990s through the present day, the United States gained and maintained air supremacy almost immediately. The lack of peer-to-peer aerial combat for over seventy years impacted the development of airpower theory and doctrine in dramatic and detrimental fashion.

The modern US military is transforming and the concept of multi-domain operations (MDO) is currently the focus of military strategists and planners throughout the Pentagon. The US military's history is dotted with examples of MDO, such as the D-Day landing at Normandy or the South Pacific campaign during World War II. In the past, the services produced multiple volumes of doctrine attempting to bridge the gap between different domains; examples include the AirLand Battle doctrine of the early 1980s and the AirSea Battle doctrine of the 2000s. The focus now is to operate simultaneously across all warfighting domains – air, land, sea, space, and cyberspace – in order to create decisive effects to defeat the enemy. A key component of current and future military doctrine is the assumption of air supremacy. It provides the foundation upon

which the armed forces construct the rest of their operational campaigns. In the future, air supremacy is likely to be equally or even more important than conceived of today in order to allow for action across multiple domains synchronized in time and space.

The problem is that the Air Force has never fully explained in doctrine what will be required to gain and maintain air supremacy against a peer adversary. Further, historic evidence offers little in the way of comparable examples from which to draw conclusions. The events and industrial buildup both before and during World War II were unique to the United States at the time and cannot be replicated today. No other large-scale aerial engagements with peer adversaries exist in the Air Force's history. The result is that there are assumptions governing large parts of Air Force doctrine and airpower theory, and air supremacy in a future war with a peer adversary is far from assured. Everything hinges on the level of control of the air the Air Force can provide. If air supremacy cannot be guaranteed, the ramifications for future American wars are massive. Strategists, theorists, and military experts have written on America's future wars and predicted how they believe events will unfold. However, there is limited research on the role of airpower theory and Air Force doctrine in terms of how they shape current understanding of control of the air and gaining air supremacy. The essential nature of air supremacy to US military operations makes it imperative that military and civilian leaders understand the costs of its establishment, and that they are willing to incur those costs. This paper posits that Air Force doctrine and airpower theory do not sufficiently or realistically address gaining air supremacy against a peer foe. In addition, the Air Force's history fails to provide a comparable example to what it would face in peer-to-peer combat today. The confluence of these inadequacies in history, theory, and doctrine leaves the Air Force ill-prepared to gain air supremacy against a peer adversary today or in the near future.

Methodology and Structure

Modern militaries are shaped by their theory, doctrine, and the context within which the two influence one another. Often, as theorists expound upon their ideas, doctrine is attuned to the prevailing theories of the day. At other times, “doctrine seeks to deal with new phenomena for which theory has not yet been well developed.”⁷ In those cases, doctrine may be the impetus for new theory. Occasionally, doctrine and theory suffer a reduction in influence because of the time, place, or culture in which war occurs. In the information age, technologies and situations can change so rapidly that battlefield adaptation precedes the attendant theoretical and doctrinal changes. Nevertheless, even when codified theory and doctrine are nonexistent, an interplay still occurs between the ideas, concepts, and best practices passed from one generation to the next. In other words, less refined forms of theory and doctrine are present in warfare, even if unacknowledged.

This paper defines theory as a guiding principle, or set of principles, that attempts to provide explanatory structures about phenomena in reality. Theory attempts the Sisyphean task of replicating reality and, thereby, making the future predictable. Despite its chronic and unavoidable shortcomings, “it performs several very useful functions when it defines, categorizes, explains, connects, and anticipates.”⁸ Doctrine is more concrete. Everett Carl Dolman explains, “It is the intent that doctrine will assist the military leader in making the *best* decision, the one that will ensure victory.”⁹ Air Force doctrine discusses the role of theory in doctrinal development, but notes that theory alone should not dictate doctrine and emphasizes that current

⁷ Harold R. Winton, “An Imperfect Jewel: Military Theory and the Military Profession” in *Strategy: Context and Adaptation from Archidamus to Airpower*, eds. Richard J. Bailey, Jr., James W. Forsyth, Jr., and Mark O. Yeisley (Annapolis, MD: Naval Institute Press, 2016), 51.

doctrine “does not present a comprehensive theory for airpower.”¹⁰ Thus, theory, doctrine, and their historical interaction must all be considered to understand the US military’s current conceptualization of airpower.

Qualitative research undergirds this monograph, though the author incorporates quantitative data where it facilitates comprehension. The monograph begins with a doctrinal survey that traces control of the air through its century-long development. Section three consists of a historical review of airpower theory. Throughout the first two sections, the author intersperses historical case studies and vignettes from the Air Force’s major conflicts to augment abstract ideas with practical examples. Space constraints, along with the large volume of data and analyses stemming from any major conflict, necessitate that these case studies be treated at the surface level. This quick review is still sufficient to highlight the impact of history on the theoretical and doctrinal understanding of airpower. The author concludes by examining the degree to which history, theory, and doctrine prepare the Air Force to gain air supremacy against a peer adversary in the immediate future. For the earlier sections on doctrine and theory, the author uses primary sources supplemented with secondary expert analyses. The final section on contemporary airpower relies on contemporary works addressing future warfare that, by their nature, contain more conjecture and less certainty. The author incorporates his own beliefs and premonitions into the last section, but is careful not to present conjecture as truth. Risk is inherent when discussing the future and time may prove this monograph’s conclusions inaccurate. Accepting that risk, the author concludes that the unfolding and interaction of airpower history, theory, and doctrine lead the Air Force down a primrose path with severe consequences.

Air Supremacy in Airpower Doctrine

Wars now happen so quickly that what is not ready at the outset will not be made ready in time...and a ready army is twice as powerful as a half-ready one.

—Austrian Field Marshal Heinrich Hess, *The Franco-Prussian War*

The integration of aircraft into militaries worldwide outpaced airpower's doctrinal incorporation. Prior to World War I, no doctrinal publication concentrated on the use of air forces and airpower's treatment in doctrine was sparse and restrictive. The US War Department's 1914 *Field Service Regulations* mentions "aero squadrons" and "aeroplanes" only in terms of their use as reconnaissance and observation assets. No mention of aircraft exists in the discussion on combined arms or fire superiority. It explicitly states, "During combat the aero squadron will operate...for the purpose of reporting [the enemy's] dispositions, the approach of reinforcements, or the beginning of his withdrawal."¹¹ The war of attrition taking place in the trenches of France led to innovative leaps in the use of aviation. In August 1914, the Germans used a zeppelin for the aerial bombardment of Liege leaving nine civilians dead.¹² The French retaliated by bombing German zeppelin hangars eight days later.¹³ A single August week in 1914 provided practical applications that would shape and dominate airpower theories and doctrine to the present. The United States learned a lot about aircraft employment from both allies and enemies during World War I. Lacking a true guiding doctrine, "the Air Service took over and applied the training methods and tactics which the Allies had developed in the course of the air battle with the Germans."¹⁴ Out of this war, the first US Army Air Corps doctrine would develop.

Aircraft of the time engaged in air-to-air combat, referred to epochally as pursuit aviation, and aerial bombardment. Both approaches demonstrated monumental advances in modern warfare, but only one would lead the way forward following the Great War. Some indications existed that control of this new domain would be the driving force of early doctrine. Airmen drawing lessons from their experiences over Europe “agreed that the first and foremost principle emerging from the war was that air supremacy was the primary aim of an air force.”¹⁵ General John Pershing noticed the initial tendency of the air services to attach too much importance to deep attacks against enemy forces leaving friendly forces vulnerable. As a result, it became essential “to concentrate our attention on the enemy’s aviation and to make every effort to obtain superiority over it...Once in command of the air, the enemy’s artillery and ground troops became the object of their attacks.”¹⁶ Though some suggest that the overall results of American airpower in World War I “were somewhat less than impressive,” the preponderance of US productivity came from their pursuit aircraft who shot down 781 enemy aircraft and seventy-three enemy balloons while losing only 289 airplanes and forty-eight balloons themselves. Defeat of enemy air forces and command of the air was a more significant contribution than the 150 bombing raids and 275,000 pounds of ordnance dropped.¹⁷ Indeed, *Training Regulation (TR) 440-15* issued by the War Department in January 1926 recognized the important role of airpower in the early stages of any future war. It claimed that the “offensive power of the Air Service should be ready for instant use...primarily to secure the control of the air.”¹⁸ Many of those who fought in World War I recognized the primacy of air supremacy. The idea made its way into

doctrine to include an extensive, if general, outline of how pursuit aviation should be employed to completely command the air. Nevertheless, competing priorities existed both during and after the war and the focus of doctrine soon shifted away from command of the air.

Aviation was a secondary feature of the US military prior to World War I, but its proponents envisioned a greater role for airpower in combat. The early twentieth century fascination with the impact of “will” and moral factors in the outcomes of war, driven in large part by French theoreticians such as Ardant du Picq and Ferdinand Foch, shaped how the US planned to use airpower.¹⁹ The Bolling Commission, established by Secretary of War Newton Baker, recommended in August 1917 that an ideal air force would be composed of 62.5% bombers and 37.5% fighters.²⁰ That same year, Lt Col Edgar Gorrell produced a strategic plan that “was a truly striking forerunner of the doctrine which matured years later.”²¹ Gorrell made an impassioned argument for the use of strategic bombing against the Germans using a drill as his metaphor of choice. A drill can only bore so long as its shaft remains intact. Gorrell argued that an army, like the drill, is defeated if the supporting national effort, its “shank,” is broken.²² Aerial bombardment of the strategic deep area was the key to success in war. These ideas were taking root as the United States entered World War I. The realities of war did not correlate to expectations, but the limited timeframe of US involvement allowed the ideas to remain relevant and flourish. Despite the minimal impact of US strategic bombing, Mitchell believed in October 1918 all that remained was “to attack the interior of Germany” and that “if the war lasted, air power would decide it.”²³

Post-World War I

The years following the war were a time of reflection and growth for US aviation. However, with only the short-lived events of World War I to draw from, the reflection was as much abstract as it was concrete. In 1935, *TR 440-15* explained, “The power of air forces has not as yet been fully tested...The effect...and the extent to which they will influence warfare is still undetermined.”²⁴ The necessity of pursuit aviation, “regarded as the basic arm of the air force,”²⁵ conflicted with the vision of an air force that would win wars by striking strategic enemy centers in the deep area. It mirrored the struggle between an Air Corps that sought independence and an Army that still controlled its funding and mission. Doctrine reflected the competing interests.

The 1935 edition of *TR 440-15* was shorter than in 1926, but with an important new section, “Doctrines of Employment,” that detailed the utility of air forces against both air and land-based targets. It did not give clear precedence to either, but hinted at a hierarchy by claiming air-to-air engagements would be constant while strategic attacks were of “varying importance” and should primarily be focused against enemy air forces.²⁶ As in 1926, doctrine mentioned control of the air as a critical capability of the air forces, but this time it included an important caveat. Earlier, air forces were expected to gain total control of the air. By 1935, Army doctrine dictated, “complete control of the air...is unlikely ever to be accomplished.”²⁷ In the buildup to World War II, the Army replaced *TR 440-15* with *Field Manual (FM) 1-5*. First published in 1940, *FM 1-5* used different wording than *TR 440-15*, but conveyed the same message of constant air-to-air operations since complete control of the air was “seldom practicable.”²⁸ The

effects of World War II on aviation doctrine were remarkable. January 1943 brought a new *FM 1-5* that added “local air superiority” to an otherwise verbatim recitation of the paragraph downplaying complete control of the air.²⁹ By July, the Army released *FM 100-20* to supersede *FM 1-5*, which began by stating in all capital letters, “THE GAINING OF AIR SUPERIORITY IS THE FIRST REQUIREMENT FOR THE SUCCESS OF ANY MAJOR LAND OPERATION...AIR FORCES MUST BE EMPLOYED PRIMARILY AGAINST THE ENEMY’S AIR FORCES UNTIL AIR SUPERIORITY IS OBTAINED.”³⁰ Doctrine underwent significant changes, but the pendulum had already started to swing away from the traditional Army approach.

World War II

As the doctrine leading up to World War II remained consistent, the members of the Air Corps Tactical School advocated for an independent Air Force and a novel use of airpower. Their mission was, in part, “to coordinate individual notions into a unified and consistent body of doctrine.”³¹ World War II offered the chance to move from the theoretical to the tangible. Starting in August 1941, the Air War Plans Division (AWPD) wrote and refined a series of war plans outlining the US air strategy in World War II. While not official doctrine, these documents, beginning with *AWPD-1*, fulfilled the doctrinal role of defining how the United States would fight the air war in Europe. After 1947, they became foundational documents in the development of Air Force doctrine and thinking.³² *AWPD-1* is an evident expression of contemporaneous airpower theory that favored strategic bombing over aerial supremacy. It reinforced the standard

Army belief that “air superiority within a theater may be highly variable and...never absolute,”³³ but contradicted itself by saying land operations were not expected until “an overwhelming air superiority has been achieved.”³⁴ The statements held limited import to the authors for whom the singular focus was strategic bombing, a departure from *FM 1-5*. The document began by identifying the long-range bomber as being “of vital importance,” and encouraged reducing the number of pursuit aircraft, which “could only be attained at the expense of our bomber aviation...our real striking force.”³⁵ In a not-so-subtle stake to their claim, the writers emphasized, “If the air offensive is successful, a land offensive may not be necessary.”³⁶ As in 1917, war provided the opportunity to create unofficial doctrine that extolled airpower and attempted to remove it from the shadow of Army influence.

As the war unfolded, the air planning team refined their ideas multiple times culminating in *AWPD-42*, a final effort produced to meet President Franklin Roosevelt’s request “to get complete control and domination of the air.”³⁷ The plan, entitled *Requirements for Air Ascendancy*, began by defining air ascendancy as, “the conditions of air strength...under which it will be possible for our several armed forces to complete the defeat of our enemies.”³⁸ Such a fluid definition gave the planners freedom in setting force ratios and timeframes for gaining air ascendancy. On the other hand, it failed to provide a solid foundation from which leaders could ascertain when President Roosevelt’s requirements were achieved. Contrasting *AWPD-1*, which downplayed numerical superiority, *AWPD-42* stresses that “our numerically superior air forces

must deplete the air forces of the enemy.”³⁹ However, in the same mold as *AWPD-1*, the planners pursued a strict strategic bombing regimen with aircraft factories as their primary target set. Details of the air offensives in both Germany and Japan concentrate on the bombing campaigns and downplay any air-to-air attrition. A section entitled “Factors involved in conducting these air operations” lists four issues related solely to the bombing campaign.⁴⁰ *AWPD-42* reduced air campaigns to strategic bombing missions; everything else was considered support. In his comments, General Dwight Eisenhower supported *AWPD-42* as proposed and emphatically noted, “This is an air war until the ground forces gain a lodgment in Europe...Build air power first.”⁴¹ At the same time *FM 100-20* preached the necessity of air superiority, *AWPD-42* clarified how it would be obtained – not in the air, but via strategic bombing.

Korea and Vietnam

Two years after World War II concluded, the US Air Force was statutorily recognized as its own branch of the armed forces responsible for its own doctrine. The arduous process took five years and resulted in the controversial *Air Force Manual (AFM) 1-2* in 1953. The manual divided air operations into “heartland” actions, strategic bombing against a country’s center, and “peripheral” actions, everything else including air-to-air combat.⁴² It included a section on control of the air, defined as the ability to “effect planned degrees of destruction while denying this opportunity to the enemy,” but downplayed its value.⁴³ Doctrine now expressed the paradigm shift of nuclear warfare. Nuclear weapons no longer made air supremacy essential and the manual

stated, “lack of control of the air must not...deter commitment of the entire striking force.”⁴⁴ A lack of consensus led to further revisions and a more complete *AFM I-2* in 1955. It stated in plain terms, “Air forces are employed to gain and exploit a dominant position...The desired dominant position is control of the air.”⁴⁵ The updated version differed in two primary ways. First, it claimed that control of the air was a requirement during both peacetime and war. Second, it emphasized an effects-based approach to air supremacy indicating that passive or geographically dislocated measures could achieve a dominant position if they influenced enemy behavior.⁴⁶ In the Cold War era where deterrence reigned, peace was as important as war. Thus, control of the air was as much about humanitarian endeavors like the Berlin Airlift or flood relief in Pakistan as it was about delivering nuclear weapons to strategic targets. Command of the air still mattered, but it took on a whole new meaning.

The Korean War preceded the publication of *AFM I-2*, but it never contributed to Air Force doctrine. The US government focused on a land-based campaign in Korea and the Joint Chiefs of Staff opposed any attacks against North Korea’s cities in an attempt to mitigate civilian enmity and the financial burden of rebuilding.⁴⁷ Serving as a premonition of the future, US airpower “easily destroyed the small North Korean air force, thus establishing local air superiority over Korea in the opening weeks of the war.”⁴⁸ With enemy air forces defeated and unable to commit more than minor bombing runs against limited North Korean industrial targets, the Air Force spent most of the Korean War conducting close air support. It strengthened the conception that air superiority was critical for successful ground operations. Army General Albert Wedemeyer testified before Congress, “In future warfare the essential weapon is air. We must

have undisputed control of the air...I can't emphasize that too strongly.”⁴⁹ However, for the Air Force many valuable lessons were lost. The United States F-86 Sabres destroyed 810 enemy aircraft while losing only seventy-eight. General George Stratemeyer worried that such shocking numbers “might lead to an erroneous conclusion that such a feat could be duplicated at will in a future conflict.”⁵⁰ In other words, Korea should have sounded alarms about the dangers of a myopic focus on strategic bombardment. Instead, the looming Soviet nuclear threat took precedence over everything else and the Air Force prepared for only one type of war.⁵¹ The Soviet menace and the lack of strategic bombing north of the Yalu River allowed the Air Force to ignore the lessons of Korea and continue pursuing its vision of the uncontested bomber winning wars from the air. *AFM I-2* was the doctrinal reflection of this failure to evolve.

This remained the dominant mindset as the United States entered into another limited war in Vietnam in the mid-1960s. The 1964 *AFM I-1* was built around strategic superiority via deterrence and nuclear attack. For the first time, “control of the air” was not used in Air Force doctrine. Local air superiority is mentioned in passing. Consistent with previous doctrine, this was “best accomplished by multiple attacks against enemy airbases,” though air-to-air combat was necessary to a lesser degree.⁵² This approach guided the United States into Vietnam. General William Westmoreland based his 1965 Commander's Estimate around his belief that “the basic strategy of retaliatory and punitive air strikes against North Vietnam...will bring about the desired

results.”⁵³ His premise proved faulty. Only 6% of the bombs employed by B-52s were dropped on North Vietnam during the war, and bombarding “cities in support of a minor policing and support operation in 1965” was unrealistic.⁵⁴ Another significant factor in Vietnam was the large-scale introduction of surface-to-air missiles (SAM) into combat for the first time, bringing an end to the days when the pursuit fighter was the bomber’s biggest threat. During the war, Americans lost 2,561 airplanes and 3,587 helicopters to enemy action, many a result of SAM attacks.⁵⁵ After Vietnam, “air superiority lessons, as well as air-to-air and tactical lessons, had to be learned all over again.”⁵⁶

Post-Vietnam and the Modern Era

As early as 1971 “Air Force leaders recognized they had just come through a reckoning and lost.”⁵⁷ That same year, the new *AFM 1-1* was not substantively different from 1964. The biggest transition surrounded targeting practices during nuclear conflicts, an indication that Vietnam had not shifted the strategic and doctrinal focus.⁵⁸ Regarding control of the air, little changed beyond addressing the importance of early attack against the enemy’s “air order of battle,” which now included SAM along with aircraft.⁵⁹ Outside of doctrine, the Air Force altered its concept of tactical aviation, which had been designed for a tactical nuclear war. This approach “proved costly to the ongoing war in Vietnam.”⁶⁰ Vietnam retaught the lessons of World War II.

Fighter aviation is indispensable to control of the air; the bomber is not invincible. Those ideas were slow to be incorporated into doctrine.

Within a decade, the Air Force had started to adapt. The F-15C air superiority fighter gained initial operational capability in 1979. Three years later, General Charles Gabriel became the first fighter pilot to be named Chief of Staff of the Air Force.⁶¹ Doctrine was changing as well. The 1984 *AFM I-1* contained three times more pages than its 1971 counterpart and the results were evident. It delineated air superiority from the larger air supremacy, which it defined as “when a commander is free to employ his aerospace assets at a time and place of his choosing, and enemy forces are incapable of effective interference.”⁶² As before, it emphasized the prioritization of air superiority above all else, but pointed out that “the ultimate goal of counterair is air supremacy.”⁶³ Perhaps the most glaring evidence of a culture shift was the lack of discussion on nuclear war. In 1971, *AFM I-1* devoted two chapters to tactical and strategic nuclear conflict. Thirteen years later, doctrine did not even mention nuclear war.

Events since then only furthered the Air Force’s approach to air supremacy. The United States gained air supremacy in a matter of weeks during Desert Storm. Operation Deny Flight established such overwhelming air supremacy that allied aircraft did not fire a single air-to-air missile during Operation Deliberate Force over Bosnia.⁶⁴ The United States faced no aerial opposition in either Operation Enduring Freedom or Operation Iraqi Freedom. By 1992, an official joint definition of air supremacy existed, but *AFM I-1* pithily summarized it as, “absolute

control of the air.”⁶⁵ Of interest, this contradicted a 1990 Air Force white paper that defined control of the air as air superiority instead of air supremacy.⁶⁶ Despite the definitional differences, both publications agreed that dominance of the air domain was a primary function of the Air Force.⁶⁷ Over the intervening years to the present, the Air Force has come to further clarify the difference in air superiority versus air supremacy by stating that superiority allows operations “at a given time and place without prohibitive interference by the opposing force,” while supremacy is a higher degree of superiority in which enemy forces “are incapable of effective interference anywhere in a given theater of operations.”⁶⁸ Concurrently, the Air Force softened its traditional stance regarding air supremacy claiming, “While air...supremacy is most desirable, it may exact too high a price. Superiority...may provide sufficient freedom of action to accomplish assigned objectives.”⁶⁹ As the Global War on Terrorism gained priority, that qualification disappeared from subsequent doctrine. By 2011, the Air Force emphasized that US forces possessed and benefitted from air supremacy in ongoing current operations.⁷⁰

One can trace the thread of air supremacy as it winds its way through the evolution of Air Force doctrine. Even in its earliest manifestation, doctrine recognized the value of air supremacy. It has remained a central pillar of Air Force thinking to the present. Initially, strategic bombing

was the chosen method for obtaining air supremacy. The lessons of Vietnam and the advent of surface-to-air missiles changed that approach. Today, the Air Force stresses that the platform and the mission are irrelevant; rather, “the outcome of the mission, the effect achieved, is what’s important.”⁷¹ Doctrine is one piece of the puzzle. It is shaped by history and informed by theory. Next, this paper examines the impact of airpower theory on control of the air as a concept.

Air Supremacy in Airpower Theory

Anyone writing airpower theory today has a great deal of rewriting to do, because some large conceptual weeds have been allowed to prosper in airpower’s intellectual garden.

—Colin S. Gray, *Airpower Reborn*

The importance and definition of control of the air ebbed and flowed as doctrine evolved, but were unaccompanied by concomitant theoretical changes. Strategic bombing dominated airpower theory “ever since Mitchell’s later years at least down to the Vietnam War – even down to the end of the Cold War.”⁷² Several authors, among them Robert Pape and Barry Watts, argue that airpower theory remained stagnant from the halcyon days of Douhet and Mitchell despite the immense technological advancements and operational changes encountered by the Air Force.⁷³ This created an environment in which there was “a tendency to over-emphasize long range bombardment, and to ignore the versatile application of Air Power.”⁷⁴ A brief review of airpower theory shows the consequences of such an environment.

Early Theorists

Discussions of airpower theory often begin with Douhet and Mitchell while another leading thinker, Sir Hugh Trenchard, is marginalized. Trenchard never wrote a book espousing

his theories, but his experiences in World War I shaped other early innovators.⁷⁵ His belief in the importance of courage and élan guided his advocacy for relentless offensive airpower. As commander of the British Royal Flying Corps, his views dominated British air forces, which operated “a continual air offensive over the western front” from 1917-1918.⁷⁶ The airplane’s role in the unremitting offensive, first practiced in World War I, shaped early airpower theorists.

Most famous among these theorists were Douhet and Mitchell, both of whom specified the importance of air supremacy to their theories of airpower.⁷⁷ For them and their contemporaries, air supremacy was that level of control that allowed bombers to hit their strategic targets with acceptable attrition rates. It was assumed that the only competition for control of the air came from an enemy air force. Radar did not exist to provide early warning to ground forces and surface-to-air fires were almost nonexistent. The 1914 *Field Service Regulations* claimed, “Aeroplanes are safe from hostile fire at altitudes of 4,000 feet or more.”⁷⁸ The only threat was other airplanes and those were best destroyed on the ground or by removing industrial capacity to replace those lost through combat or crashes. Later, the advent of radar and high-speed interceptors undercut the assumptions on which Douhet based his theory.⁷⁹ Until then, the only real debate was whether to follow Douhet’s approach that rested “on the belief that infliction of high costs can shatter civilian morale, unraveling the social basis of resistance” or a Mitchell model that saw aircraft as “an entirely new method of subduing industrial centers.”⁸⁰ Either way, strategic bombardment subordinated pursuit aviation. Douhet claimed that pursuit aircraft only

offered “a temporary superiority” and were incapable of providing command of the air.⁸¹ For him, command of the air depended on bombers and belonged to he who prevented air offensives against his territory while conducting air offensives against the enemy.⁸² There was no discussion of how this applied to geographically isolated parties like the United States. Mitchell saw more value in pursuit aircraft than Douhet, but believed more deeply in the bomber, writing, “To afford Bombardment close pursuit protection is unnecessary and a waste of Pursuit aviation.”⁸³ The lessons of World War I, as reflected in doctrine, favored pursuit aircraft to gain air superiority and air supremacy. Douhet and Mitchell argued for bombers and they wielded greater influence.

The interwar period saw the rise of the first airpower theorists as well as increased attention on aviation and increased politicization. The desire among many within the Army Air Corps to gain recognition as a separate branch influenced their approach to theory development. The best case for aviation independence could be made by promoting the ability to achieve an objective in a cheaper and more efficient manner than the army or navy.⁸⁴ The Great War’s expense in lives and money was still fresh, and cheap bloodless wars were what the aviation community promised. In the United States, the theorists of ACTS led this charge. These men built upon the early theorists’ ideas to create their airpower theory. The ACTS theorists’ composition and contributions were such that they “cannot be attributed to any one person or even any one group of persons,” but perhaps their most lasting legacy is the industrial web theory.⁸⁵ Understanding that Mitchell’s “hundreds of [airplanes] in one formation” and Douhet’s “offensive capacity the like of which has never before been imagined” were unrealistic, ACTS

theorists focused their attention on scientifically identifying targets.⁸⁶ They proposed that a country's industry was like a web with critical nodes whose destruction would have amplified effects. By striking these targets, "a relatively small force [could] bring an enemy's war production to a halt with almost surgical precision."⁸⁷ As before, the industrial web theory downplayed control of the air. This reflected the dominant concept of the time that "a well organized, well planned, and well flown air force attack will constitute an offensive that cannot be stopped," stated axiomatically as, "The bomber always gets through."⁸⁸ The industrial web theory and the plans derived from it guided the United States through World War II. It traded mass for precision, but otherwise was a derivation of earlier theories. Like those, it proclaimed the bomber as the proper vehicle for command of the air by destroying factories and airdromes while downplaying the role of pursuit aircraft.⁸⁹

World War II

World War II supplied the proving ground for the airpower theories that blossomed post-World War I. For the first time, the US Army Air Forces would battle an equivalent adversary for air supremacy. It was a conflict in which, unlike World War I, airpower played a prominent role. Initial implementation of airpower theory was a disaster. Many of its assumptions including the irrelevance of fighter escort, the quality of bombing accuracy, and the ability to accurately select and identify targets proved false.⁹⁰ After two years at war, by early 1944, "the Allies had not just

⁸⁸ Futrell, *Ideas, Concepts, Doctrine*, 64; Marshall de Bruhl, *Firestorm: Allied Airpower and the Destruction of Dresden* (New York: Random House, 2006), 12. The quote, "The bomber always gets through" is credited to British Prime Minister Stanley Baldwin in 1931 before becoming a rallying cry of airpower advocates.

⁸⁹ Futrell, *Ideas, Concepts, Doctrine*, 65.

⁹⁰ Conrad C. Crane, *American Airpower Strategy in World War II: Bombs, Cities, Civilians, and Oil* (Lawrence: University Press of Kansas, 2016), 35; MacIsaac, *Strategic Bombing in World War Two*, 17.

lost air superiority over Germany but were also losing the air war.”⁹¹ The United States adapted its escort tactics and allowed its new P-51 and P-47 aircraft to offensively engage the *Luftwaffe* instead of defensively escorting bombers. The Americans realized that attacking factories limited industrial production, “but would mean nothing unless the *Luftwaffe* force in being also underwent wastage.”⁹² The results were tremendous. From January to March 1944, the Germans suffered 3,450 claimed losses and a resultant loss in experienced aircrew as well.⁹³ It was only after these air-to-air victories that bombing campaigns, such as those on the German oil industry, started to be more effective. In December 1944, German industry still produced 3,155 aircraft, easily capable of covering air-to-air materiel losses. Concurrently, the decimation of their oil industry that began in May 1944 began to have an effect.⁹⁴ The aircraft being built could not be manned or fueled. As Conrad Crane notes, the US Army Air Forces “quickly made up its losses in men and materiel” and “[German] pilot replacements could not keep up with their losses while the American buildup continued.”⁹⁵

A similar story unfolded in Japan. The Japanese gained a greater appreciation for airpower during the war, but it paled in comparison to US industrial and combat capability. The Japanese produced 65,300 aircraft over the course of the war, but lost 50,000, the majority in non-combat incidents.⁹⁶ The United States lost only 27,000 aircraft and by 1943 had gained numerical superiority in the Pacific.⁹⁷ Even when numerically inferior, the United States inflicted a higher

⁹⁷ *Ibid.*, 68.

number of Japanese losses, and an ever-increasing shift in experience exacerbated the difference. The Japanese had 35,000 pilots at war's end, but average experience was only 100 hours. In contrast, the average US pilot had 600 flight hours by 1945.⁹⁸ Japan's strategy failed to consider control of the air as a critical component, which compounded these resource disadvantages. Materiel deficiencies would have been difficult for Japan to overcome in the best case. Leaving no room for air supremacy in their strategy guaranteed "there was no way in which they could...reverse the growing predominance in the air of a basically stronger opponent."⁹⁹ The strategic incendiary bombing of Japan followed, but long after air supremacy had been achieved.¹⁰⁰ At its essence, the World War II air campaigns in Europe and the Pacific demonstrated the industrial and demographic power of the United States in a war of attrition far more than they supported the underlying airpower theories of the time.

The Nuclear Age

On the surface, World War II was a glorious validation for airpower. It proved "decisive in the war" and "its victory was complete."¹⁰¹ Field Marshal Montgomery declared, "In global war today...airpower is the dominant factor. Therefore, the first object in our strategy...must be to win command of the air."¹⁰² Airpower theories, though, were found wanting. William Head explained, "In the aftermath of World War II, airmen had to reevaluate the old theories...The lessons of the war seemed to indicate...that bombing technology and the quantity of bombers had

not been sufficient...to allow air power to be as decisive as possible.”¹⁰³ In reality, airpower theorists never inculcated those lessons. Deficiencies were never challenged and its basic premises continued to guide airpower theory.¹⁰⁴ The advent of nuclear weapons and the corresponding growth of deterrence theory were the most prominent shifts following the war. David MacIsaac writes, “The atomic bombs had the effect of turning the [post-war] reports into instant ancient history in the minds of most people.”¹⁰⁵ The advent of Intercontinental Ballistic Missiles and limited war reduced the importance of air supremacy in the realm of military theory.¹⁰⁶ Within airpower theory, nuclear weapons solidified the importance of strategic bombing assets. Changes in airpower theory, exemplified by Thomas Schelling among others, were new arrangements of the same old songs.¹⁰⁷

After the dawn of the nuclear age, the most important advances were in technology and tactics instead of theory. Vietnam introduced the SAM and the birth of precision-guided munitions (PGM). As technology improved, the accuracy and effectiveness of PGMs increased. Coupled with the Air Force’s emphasis on precision delivery – tactical maneuvering to maximize the likelihood of a non-precision weapon hitting its target – PGMs and other technological advances such as stealth aircraft eventually played a central role in the advancement of airpower theory. However, that change would not occur for another twenty years.

The most prominent airpower theorist in the interval was John Boyd, but his OODA Loop theory was inconsequential and ignored by Air Force leaders in its own time. It was derived from air-to-air tactics, and as Boyd expounded upon his theory later in life, it became more a

theory of war than of airpower in an operational or strategic sense.¹⁰⁸ During this period, the Air Force “lost the theoretical foundation that had given the profession its meaning.”¹⁰⁹ Strategic bombing and nuclear deterrence dictated airpower theory until Warden’s ideas appeared in the 1980s and 1990s.

John Warden and Desert Storm

Warden’s proposals delivered the first major shift in airpower theory since World War II. In many ways his ideas contained direct links to earlier warfare theorists.¹¹⁰ Like them, he believed that command of the skies should be the preeminent military objective (Warden preferred the term “air superiority”), and that air-to-air combat was the least efficient means of achieving this end.¹¹¹ In the ACTS theorists’ footsteps, Warden posited that enemies were “closed systems that can be disrupted or paralyzed by destroying key targets.”¹¹² Aligned with Boyd, Warden envisioned strategic paralysis through airpower as the most effective means of victory.¹¹³ Warden’s theory brought these ideas together in a coherent form that incorporated the significant post-Vietnam technological advances. Stealth aircraft, PGMs, and advanced data links promoted “simultaneous and devastating air attacks...[that] could disorganize and confuse an enemy to the point of mental paralysis.”¹¹⁴ The new capabilities were central to Warden’s ideas. In the 1990s, one F-117 could accomplish an attack that required a thousand B-17 sorties during World War

II.¹¹⁵ Warden viewed all systems as composed of five concentric rings of increasing importance from outside to inside. Leadership, exemplified by the government, was the central and most vital ring whereas fighting forces, the military and law enforcement, constituted the outermost ring.¹¹⁶ Warden theorized that if a military destroyed centers of gravity on the inner rings, the enemy would be paralyzed and victory obtained. This could be done via a single strike against the innermost ring or through simultaneous parallel attacks at multiple levels.

For Warden, air supremacy was essential before attacks occurred. Per Warden, no offensive since 1939 succeeded without first gaining air supremacy.¹¹⁷ He differentiated between local air superiority and air supremacy with the former only being acceptable in circumstances involving short-duration missions.¹¹⁸ Warden's theory was the first to incorporate the systemic changes following the "revolution in military affairs." He made important contributions, among them the ideas that ground and naval forces can play important roles in achieving air supremacy and that the air campaign may be either the supporting or the supported effort.¹¹⁹ These factors disguise the reality that Warden's theory is largely an updated version of previous airpower theories incorporating new weaponry and capabilities – strategic bombardment 2.0.

Warden was able to apply his theory soon after its publication in his role as one of the creators of Instant Thunder, the air campaign of Operation Desert Storm. On the surface, Desert Storm appeared to be a good proving ground for his ideas. More than 700 aircraft along with a modern and formidable air defense system composed the Iraqi Air Force.¹²⁰ The anticipated challenge never manifested. The coalition began the war with 1,800 aircraft dwarfing Iraq's 700

by almost three-to-one.¹²¹ The tremendous US technological superiority in both aircraft and munitions accentuated Iraq's numerical shortcoming. Throughout the war, the Iraqi Air Force rarely engaged coalition forces in the air and the air campaign devolved into avoiding ground-based air defenses while destroying Iraqi aircraft on the ground. As a result, the United States benefited from "low-risk attack options that required neither traditional air superiority as a prerequisite nor electronic warfare and fighter-escort support."¹²² The United States established air superiority in two days and in less than two weeks General Norman Schwarzkopf declared air supremacy.¹²³ Warden believed his theory validated, but debates about its validity began in Desert Storm and continue today.¹²⁴ The events of Desert Storm cannot be considered a near-peer air war, but its conclusions validated the paradigm of effects-based bombing after establishing air supremacy.

Subsequent Air Force campaigns merit little attention here. Operation Deliberate Force was previously discussed. Air supremacy during Operation Allied Force in 1999 was never threatened, and the greatest threat to US pilots came from enemy SAM systems. The United States had three aircraft downed by Serbian SAM systems during the two conflicts, but did not lose an aircraft to enemy air-to-air action. The United States maintained a 48-0 advantage in air-to-air victories.¹²⁵ Enemy aircraft were less likely to fight than to be used as decoys to lure US aircraft into SAM range.¹²⁶ Victory from the air in Allied Force was so complete that John Keegan considered it a turning point in history proving "that a war can be won by air power

alone.”¹²⁷ In Operations Enduring Freedom, Iraqi Freedom, Odyssey Dawn, and Inherent Resolve no enemy air opposition existed other than the occasional man-portable air defense system useful primarily against helicopters and easily overflowed by fixed-wing aircraft. Advancements in training, aircraft and weapons technology, tactics, and geopolitical factors created a world in which no one has contested US airpower for nearly thirty years.

An initial burst of theorizing accompanied the birth of aviation and its rapid application to warfare, but a dramatic decline followed World War II. Airpower theory always centered around what made it most unique – the ability to strike strategic targets in the enemy’s deep area. A corollary to that focus has always been the necessity of air supremacy. The need for long-range fighters in World War II, the introduction of nuclear weapons and SAMs afterwards, and the explosion of PGMs and stealth technology in the Gulf War all shaped airpower theory. In general, theoretical updates did not follow historical experience. Lessons learned sometimes resulted in changed tactics or upgraded technologies, but rarely in challenges to theoretical assumptions. In reality, the last serious threat to US air supremacy was in 1944. It is no surprise that airpower theory stagnated during this period as well. This lethargy will shape the United States’ ability to gain air supremacy in a large-scale conflict.

Air Supremacy Today and Tomorrow

If feedback on the consequences of our actions comes rarely and is of a kind that can be easily ignored, immunizing marginal conditionalizing is a marvelous method for dispelling all doubts about our competence.

—Dietrich Dörner, *The Logic of Failure*

Looking to the future is necessary, but perilous. Ideas that seem logical one day might seem ludicrous the next. For example, the economic growth of Japan in the 1980s led George Friedman and Meredith Lebard to predict the United States would war with Japan. They

¹²⁷ John Andreas Olsen, ed., *Airpower Reborn: The Strategic Concepts of John Warden and John Boyd* (Annapolis, MD: Naval Institute Press, 2015), 2.

dismissed China because of its inability to produce a blue-water navy.¹²⁸ The purpose here is not to forecast what the future Air Force will look like nor to suggest its optimal use. Others have addressed those topics. John Arquilla suggests the modern Air Force is a relic of the past. He argues that strategic bombing failed as a paradigm and, as a result, the Air Force should disassociate from the concept. Instead, it should serve in close air support and intelligence gathering roles supporting ground forces. In other words, the Air Force should dismiss the past century and return to its World War I infancy as a form of airborne artillery for the Army.¹²⁹ Others argue that today's "gray zone" wars are the model for future conflicts that will not require large-scale aerial combat. Tactical lift, surveillance and reconnaissance, and on-call strike or interdiction will be the coin of the future realm.¹³⁰ One could point to the skies over Syria as foreshadowing a new reality in which no one controls the air. Freedom of action is guaranteed by military and diplomatic agreements that have little to do with combat capabilities. All of these ideas rest on the implicit assumption that the air is controlled either by force or by agreement supported by the threat of force. Given the Army's recent transition from counterinsurgency to large-scale combat operations, it is important to examine the Air Force's ability to provide the expected air supremacy. The space and cyber domains will factor in any future calculation, but are beyond the scope of this research. Whatever shape future wars take, command of the air domain will remain a *sine qua non* of US military operations in the present and near future.

Industry

History, insofar as it contributes to future expectations, gives cause for concern. The last considerable challenge to US air supremacy was in World War II. No threat from enemy aircraft

has existed since 1991 and, since 2003, even surface-to-air threats have been nonfactors.¹³¹ This does not imply that the Air Force is tactically ill-prepared for large-scale conflict. Large force exercises that arose post-Vietnam, most famously Red Flag, are designed to ensure that Airmen are ready for such an eventuality. However, tactics are only one piece of the puzzle. The Air Force's greatest advantage in World War II, the one that led it to victory, was not tactics or strategy, but industry. The United States cannot expect a similar advantage in the future.

The much-touted industrial shift that powered the United States' victory began well before US entry into the war. Aircraft production increased by 1,471% between 1940 and 1942.¹³² Almost two years before Pearl Harbor, the United States was already transforming its aviation industry. It is foolhardy to think the United States would have an unmolested, two-year preparation period before its next large-scale conflict. Still, the drastic increase that began in 1940 was insufficient. The explosion of production continued during the war. From 1942 until war's end, the United States alone manufactured 190,600 combat aircraft, 150% of the 121,200 produced by Germany and Japan combined.¹³³ In comparison, Lockheed Martin delivered 91 F-35 aircraft in 2018 and hopes to increase its production to 160 per year by 2023.¹³⁴ The F-35 consists of over 300,000 individual parts produced by more than 1,400 domestic and international companies.¹³⁵ Significant logistical and production advancements make such processes possible today unlike in the 1940s, but there is a limit to the maximum output of this system. The notion of

consolidating or centralizing the products, and concomitant intellectual property, of 1,400 companies in a manner that increases production to anything near World War II levels is unrealistic. Perhaps the losses incurred in gaining air supremacy will be less in a future war than in World War II, but they will be significant.

In a similar vein, the introduction of the P-51 Mustang with its extended range is considered a turning point in World War II's aerial conflict.¹³⁶ The P-51 began as a concept in 1940 and by 1944 it changed the war in Europe, "a feat that would have been quite beyond the capacity of the German aero-industry."¹³⁷ Another rapid development came twenty years later with the addition of a 20mm cannon to the F-4 during the Vietnam War. Initial development occurred in June 1964 and the first production F-4E was flown in June 1967.¹³⁸ Despite the timeline's rapidity, some argued that Secretary of Defense Robert McNamara's new requirements made it longer than necessary.¹³⁹ Producing an aircraft from scratch takes longer than modifying a current one, and the pressures of war drive increased flexibility, spending, and production timelines unavailable in peacetime. In a future war the United States will continue to modify and upgrade its existing fleet of aircraft. Nevertheless, the F-22 and F-35 took twenty years from prototype to production.¹⁴⁰ The idea for a new long-range strike-bomber first surfaced in 2004. Congressional funding began in 2011, a contract for the B-21 was awarded in 2015, and the Air Force expects initial operational capability around 2025 barring unforeseen setbacks.¹⁴¹ The B-21 is following the same twenty-year timeline seen earlier. Current industrial practices preclude the

¹⁴¹ Ibid., 4.

speed of production that proved critical to US victory in World War II. Further, the scale of industrial production in World War II would take several years to achieve, if it is even possible today. World War II was the United States' only competition for air supremacy against a peer adversary. Airpower history, theory, and doctrine in the 1940s did not prepare the United States for air supremacy in World War II. Unlike that war, the Air Force cannot expect industrial production to provide the defining advantage in the future.

Technology

Airpower pioneers and theorists are forward-looking. Mitchell wrote, "In the development of air power, one has to look ahead and not backward to figure out what is going to happen, not too much what has happened."¹⁴² This proclivity often manifests as an obsession with technology. "The Air Force could be said to worship at the altar of technology," according to Carl Builder.¹⁴³ The emphasis on technology as the Air Force's savior exists today. Its *Air Superiority 2030 Flight Plan* prioritized cutting-edge technologies and modernizing acquisition processes to more quickly incorporate technological advancements. It demands that "failure to adopt agile acquisition approaches is not an option," and these changes allow the Air Force "to more rapidly infuse advanced technologies into the force."¹⁴⁴ The report does not limit itself to technological solutions, but they compose the dominant theme. The section addressing doctrine, organization, training, materiel, logistics, personnel, facilities, and policy (DOTMLPF-P) includes no doctrinal or training recommendations. Instead, topics include new acquisition paradigms, investment in "game-changing" technologies and the infrastructure to assess them, and the pursuit of low-cost technologies to allow for "rapid fielding of larger quantities of capability."¹⁴⁵ Technological

¹⁴⁵ *Ibid.*, 8.

pursuit is so ingrained in Air Force thinking that its “non-materiel” plans devolve into proposals surrounding improved pursuit and acquisition of technological materiel.

Inarguably, technology will be an important element of a future air war. Space and cyber assets will become increasingly important in gaining and maintaining air supremacy, though their precise value will depend on the specific cultural, physical, and geopolitical factors of the war. Additionally, the unique capabilities of space and cyber assets are offset to a degree by their unique vulnerabilities. Advances in robotics and drone technology make concepts like swarming more plausible and tactically relevant in a future war, both for the United States and its potential adversaries.¹⁴⁶ The United States no longer enjoys the extreme technological advantage it is accustomed to. China in particular has devoted significant resources to closing the technology gap in recent decades.¹⁴⁷ It hopes to use technological equivalency, or near equivalency, to deter US actions in the Indo-Pacific Region. Should deterrence fail, it desires not just to compete with the United States, but to defeat them. It is pursuing technological, doctrinal, and organizational modifications to convert this plan to reality.¹⁴⁸ The Air Force cannot lose sight of other factors in a myopic pursuit of technology as its single savior without detrimental effects to its potential for air supremacy in war with a peer adversary.

Attrition and Air-to-Air Combat

Other factors abound that will determine the Air Force’s ability to maintain higher degrees of control of the air against a peer. Strategic bombardment was the foundational paradigm of the Air Force. History has not borne out all of strategic bombardment’s promises to win wars through airpower alone, but airpower still provides unique deep strike capabilities

¹⁴⁶ Freedman, *The Future of War*, 247-248.

¹⁴⁷ Eric Heginbotham et al., *The US-China Military Scorecard: Forces, Geography, and the Evolving Balance of Power, 1996-2017* (Santa Monica, CA: RAND Corporation, 2015).

unavailable via other means. Some historical truths remain consistent, however. The Air Force has long relied on its deep strike ability to establish air supremacy because of the increased efficiency deep strike provides. Warden spelled it out in *The Air Campaign* writing, “The most difficult and costly place to attack the aircraft chain is in the air.”¹⁴⁹ He and others are correct if the problem is one of materiel. History suggests otherwise. The decisive factor is not the materiel; it is the airmen who employ it. Defeat in the air is more than the loss of an aircraft. It typically results in the loss of the pilot, whether killed or taken prisoner. It is easier to replace materiel than the knowledge and skill of a pilot gained through experience. Enemies such as China and Russia have demographic advantages against the United States. They also have industrial advantages to the degree that their centralized governments can dictate top-down production processes. As in World War II, their ability to continue producing materiel will be impossible to eradicate. In contrast, their ability to produce experienced and capable pilots will be exponentially more difficult as the war progresses. The Air Force’s strategic bombardment capability will be important in gaining air supremacy, especially concerning enemy integrated air defense systems. Yet their expertise in the air-to-air environment might play a greater role in gaining and maintaining air supremacy in a future war just as it did in the past.

This does not imply a Jominian-Mahanian decisive battle in the air, a practical impossibility even if it were desirable. Even so, one must contend with inherent risks of aerial combat that exist on a smaller scale than a singular decisive engagement. During World War II, air planners estimated a 20% per month average rate of attrition, including higher initial losses.¹⁵⁰ In Korea, General Hoyt Vandenberg stressed bombing north of the Yalu River would reduce the Air Force to the point that it could not operate at full strength in any other theater.¹⁵¹ Neither the Air Force nor the US public are accustomed to this level of attrition. Public polling indicates that

¹⁴⁹ Warden III, *The Air Campaign*, 35.

¹⁵⁰ US Department of War, *AWPD-42*, 7.

¹⁵¹ Futrell, *Ideas, Concepts, Doctrine*, 301.

civilians are more inclined to support air strikes than ground invasions while simultaneously recognizing that the odds of victory are lower if an “air only” strategy is pursued.¹⁵² These findings illuminate a public conception that air campaigns result in less casualties than ground invasions, and the public accepts a more challenging strategic situation in exchange for fewer casualties. At the same time, Americans see the Air Force as the most important military service both in general and specifically in a war against Russia or China by more than a two-to-one margin.¹⁵³ The public values the Air Force’s contributions to national defense, but perceives airpower as resulting in relatively fewer casualties. The increase in attrition rates associated with peer-to-peer air war would create problems replacing personnel and materiel. Worse, it risks loss of public support if the public responds negatively to unexpectedly high rates of loss.

Attacking the enemy in the air is a high-risk endeavor, but exploits the United States’ significant advantage in technology and airmanship. This presents a dilemma for the United States. The Air Force’s doctrine and theory rely on strategic bombardment as the primary means of establishing air superiority and air supremacy. History shows the limitations and pitfalls of this approach. It points instead to rapid industrial production and innovation in winning a war of attrition as the means of gaining air supremacy against a peer adversary. Current production rates in both personnel and materiel do not support high attrition rates. Wartime production increases could supplement these losses, but it is doubtful they would occur quickly or in large quantities. History also validates the United States’ long-held technological advantage as a key to air supremacy. The technology gap is decreasing, but the Air Force still maintains its technological obsession. The Air Force’s ability to gain and maintain air supremacy against a peer adversary cannot be assumed. This is vital for today’s ground forces that are reliant on maneuver warfare. General Shelford Bidwell claimed, “A sustained armored offensive was almost impossible in the

¹⁵² Alan J. Vick, *Proclaiming Airpower: Air Force Narratives and American Public Opinion from 1917 to 2014* (Santa Monica, CA: RAND Corporation, 2015), 132.

¹⁵³ *Ibid.*, 126.

face of attack by an air force with command of the sky.”¹⁵⁴ The Department of Defense must account for the impact of this paradigm shift as it transitions to multi-domain and large-scale combat operations.

Conclusion

Winning air superiority is difficult and one of the surest ways to fail is to think you can take the parsimonious approach and just go for local superiority.

—John Warden, *The Air Campaign*

Aviation changed the conduct of warfare. General Pershing admitted in his memoirs, “the usefulness of our Air Service...could hardly be overestimated.”¹⁵⁵ From its inception airpower and the protection it provides became an essential aspect of military thinking. On the whole, however, it is poorly understood. This is in part because of US dominance of the air domain. The United States has not lost a member of its ground forces to aerial attack since the Korean War.¹⁵⁶ Air supremacy will be more difficult to gain and exploit in the future, but is likely to maintain its preeminent position in the conduct of military operations. Little can happen without first establishing long-term air superiority at a minimum.

Thus, air supremacy in the future requires detailed investigation. Jasjit Singh writes, “The struggle of air superiority is a campaign and not a battle: it is a highly complex operation, becoming even more so as the conflict environments get more sophisticated.”¹⁵⁷ Dominance of the air domain is more difficult to visualize than in other domains because it cannot always be easily depicted on a map and because of the vast spaces it encompasses.¹⁵⁸ It is challenging to see

air supremacy the same way as a ground campaign. This approach is helpful, however, because airpower must gain control of enemy airspace in order to have decisive effects. Local air superiority in friendly territory provides minimal benefit to long-term objectives.¹⁵⁹ One reason for US struggles in Vietnam was the inability to gain air supremacy over enemy territory, despite its dominance in South Vietnam.¹⁶⁰ The concept of an air campaign is not new, but its conduct may need to be reconsidered in light of future conflicts.

In 2007, Colin Gray warned that America was too comfortable with benign aerial environments and that “one should not assume...air domination...by divine right.”¹⁶¹ Today, airpower theory and doctrine disregard Gray’s admonition. They fail to incorporate the realities of historical experience. New ideas are warranted. Gray further argued that airpower theory can only exist as one part of a general theory of war.¹⁶² Shifting gears, he proposed his own airpower theory in 2015, but its twenty-seven dicta read more as a laundry list of airpower capabilities rather than a general theory of airpower.¹⁶³ Future airpower theory may follow or diverge from the trails blazed by Gray and others. Regardless, it must continue to develop and evolve.

Current Air Force publications hedge on its ability to provide complete air supremacy and argue that localized and temporary air superiority might be all that is needed or available in the future.¹⁶⁴ It is possible the Air Force recognizes this flaw. In September 2018, Dr. Heather Wilson, Secretary of the Air Force, stated, “We know now from analysis...the Air Force is too

small for what the nation expects of us.”¹⁶⁵ Cynics may see this as a political move to garner financial resources, but it is a positive first step. To be complete, evolution in airpower theory and doctrine must parallel policy proposals to meet national strategies. As in World War II, theory and doctrine are misguided and not sufficient enough to guarantee air supremacy against an equal opponent.

It is unclear to what degree other military branches understand this and what impact it would have on their doctrinal approaches to warfare. Airpower theory and doctrine are at odds with precedence. This creates an environment in which the United States cannot assume air supremacy against a peer adversary. This fact has been overlooked during the past eighteen years of counterinsurgency warfare. It is time to address it. Dolman reminds us, “Organisms that dominate their niche will be successful only so long as the environment remains stable, and the longer an environment is perceived as stable...the more catastrophic the collapse...when change inevitably occurs.”¹⁶⁶ The Air Force has maintained air supremacy in a stable environment for decades. Its proficiency at the tactical level is unparalleled. Failure to revisit the theory and doctrine that underlie its approach to war could result in failure to control the air. Should that foundational pillar of US military operations be lost, the collapse might well be catastrophic.
