ALL SYSTEMS HAVE TECHNICAL DEBT!

Software engineers know technical debt when they see it!

This is a legit bug, not cleanup/refactoring/technical-debt-reduction.

Software engineers know technical debt when they see it!

I'd like to re-request merge for this.

The change looks larger and more complex than it really is: it's mostly plumbing and changes to method signatures adding to the line count. It's been in canary for a week without issue.

Landing this will enable WebView to shed some technical debt, which is quite a big benefit for us.

Technical Debt: A Definition

In software-intensive systems, technical debt consists of design or implementation constructs that are expedient in the short term but set up a technical context that can make future changes more costly or impossible.

Technical debt presents an actual or contingent liability that impacts internal system qualities, primarily maintainability and evolvability.

**Kruchten, P. Nord, R. Ozkaya, I.

Crumbling under the load

A successful company in the maritime equipment industry successfully evolved its products for 16 years, amassing 3 million lines of code.

Over these 16 years, it launched many different products; new technologies evolved; staff turned over; and new competitors entered the industry.

Death by a thousand cuts

An IT-service organization landed several major contracts, some of which in emerging software development markets.

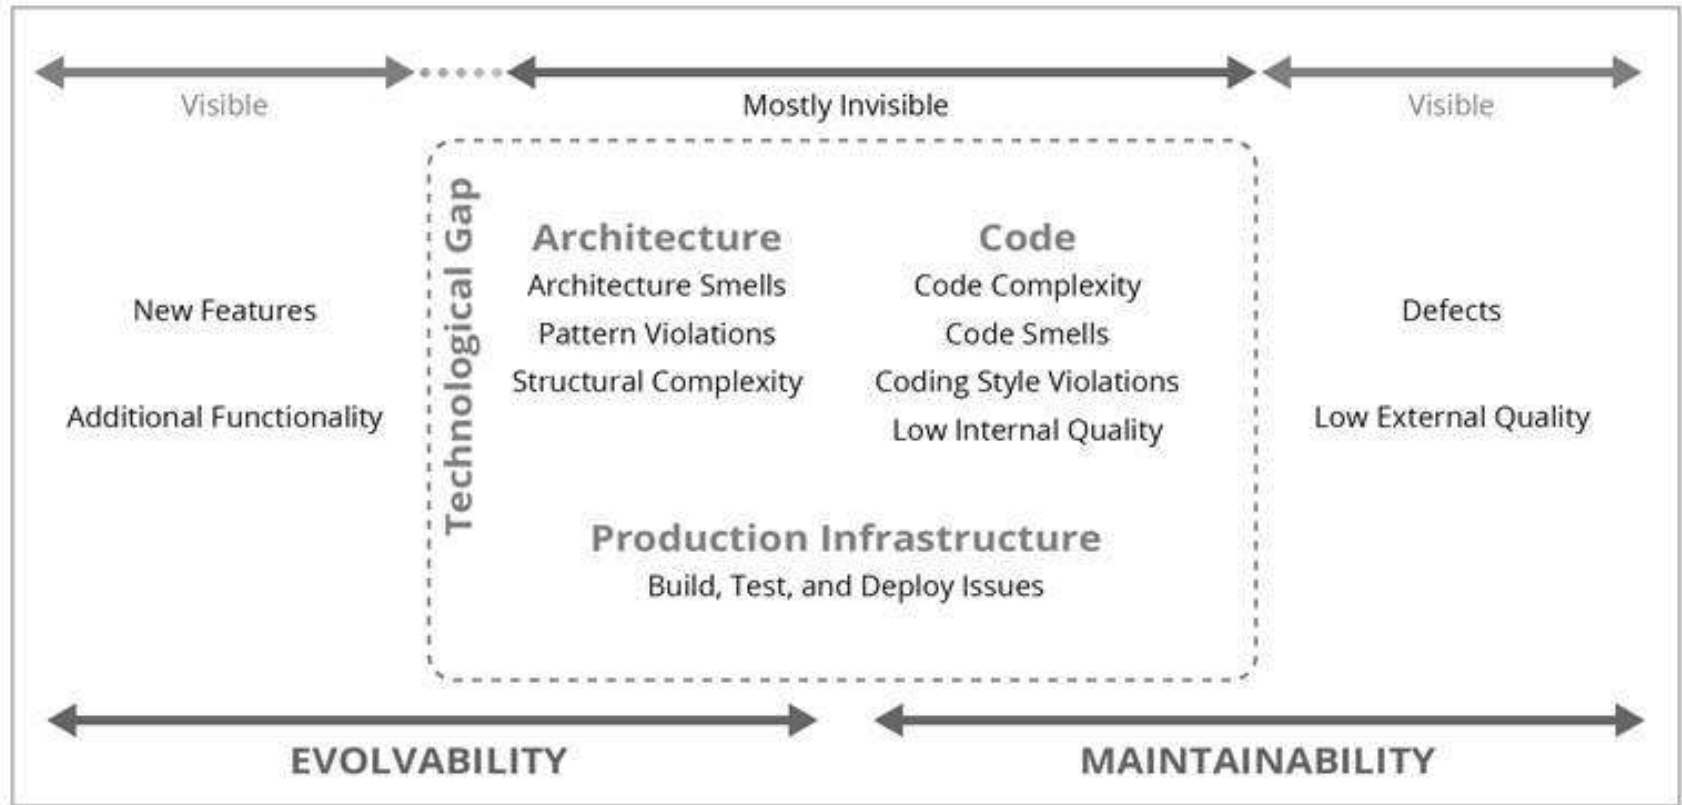

While the IT-service projects were similar in nature, the organization assumed that its new developers were interchangeable across projects.

Hitting the Wall

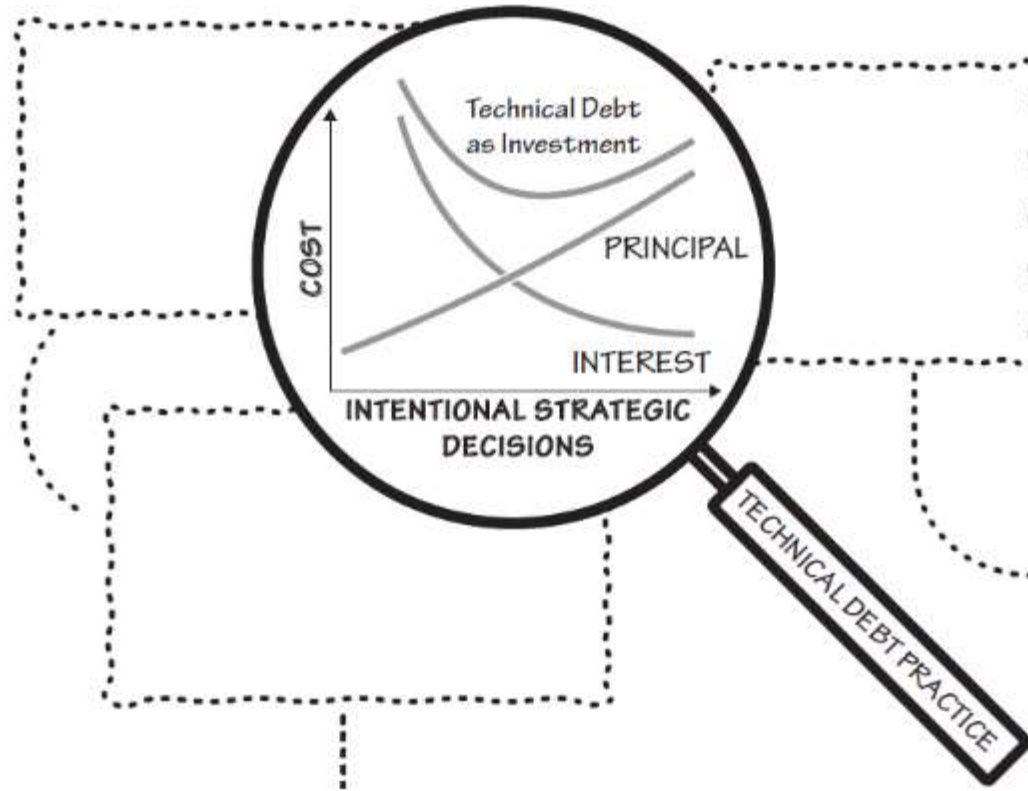

Two large global financial institutions merged. The new management determined that a duct-tape and rubber-band approach, mixing the two IT systems in some kind of chimera, would not work. They had to walk away from years of accumulated technical debt in the original systems.

The Technical Debt Landscape

Principle: Technical debt is not synonymous with bad quality

We need an Actionable Description

One of two modules was upgraded.

- Unfortunately, the second module required months of unplanned work, due to close-coupling between the modules
- Developers disregarded the scoping rules, due to schedule / budget, which led to module coupling
- Impact: 12 KSLOC unplanned work

Technical debt is a software design issue that:

Exists in an **executable system artifact**, such as code, data model, build scripts, automated test suites;

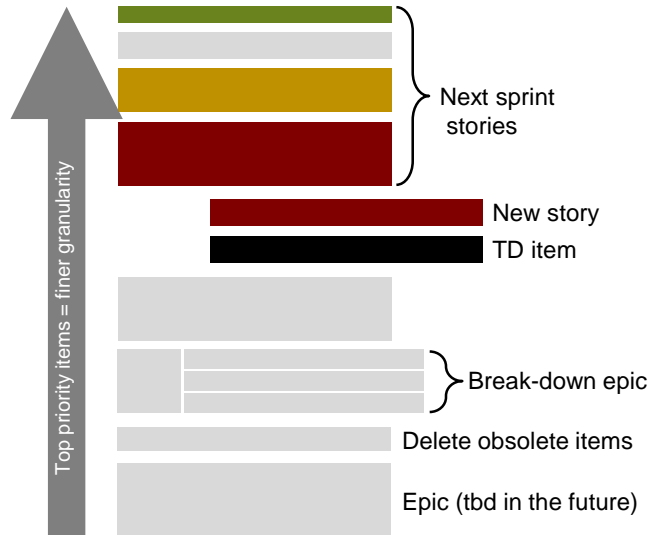

Is traced to **several locations** in the system, implying issues are not isolated but propagate throughout the system artifacts;

Has a **quantifiable and increasing** effect on system attributes (e.g., increasing defects, negative change in code quality).

Essential Software Development Artifacts include Technical Debt

	Visible	Invisible
Positive Value	New features and added functionality	Architectural, structural features
Negative Value	Defects	Technical Debt

Technical Debt Items

Name	Connect #Gateway-1631: Remove empty Java packages
Summary	The re-architecture of the source code to support multiple adaptor specifications has introduced a new Java packaging scheme. Numerous empty Java package folders across multiple projects.
Consequences	No impact to functionality; however, may lead to confusion for users implementing enhancements or modifications to the source code.
Remediation approach	New and existing classes have been moved into these new package folders; however, the previous package folders have been left in place with no class files.
Reporter / assignee	Gateway developers

What is the nature of YOUR debt

Deployment & Build	<u>Out-of-sync build dependencies</u>
	<u>Version conflict</u>
	<u>Dead code in build scripts</u>
Code Structure	<u>Event handling</u>
	<u>API/Interfaces</u>
	<u>Unreliable output or behavior</u>
	<u>Type conformance issue</u>
	<u>UI design</u>
	<u>Throttling</u>
	<u>Dead code</u>
	<u>Large file processing or rendering</u>
	<u>Memory limitation</u>
	<u>Poor error handling</u>
	<u>Performance appending nodes</u>
	<u>Encapsulation</u>
	<u>Caching issues</u>
Data Model	<u>Data integrity</u>
	<u>Data persistence</u>
	<u>Duplicate data</u>
Regression Tests	<u>Test execution</u>
	<u>Overly complex tests</u>

Record technical debt similar to user stories, defects, vulnerabilities, and the like.

Start with a simple *issue type* labeled *technical debt*. This practice pretty quickly helps recognize specific aspects of your technical debt.

Take Advantage of Tool Support

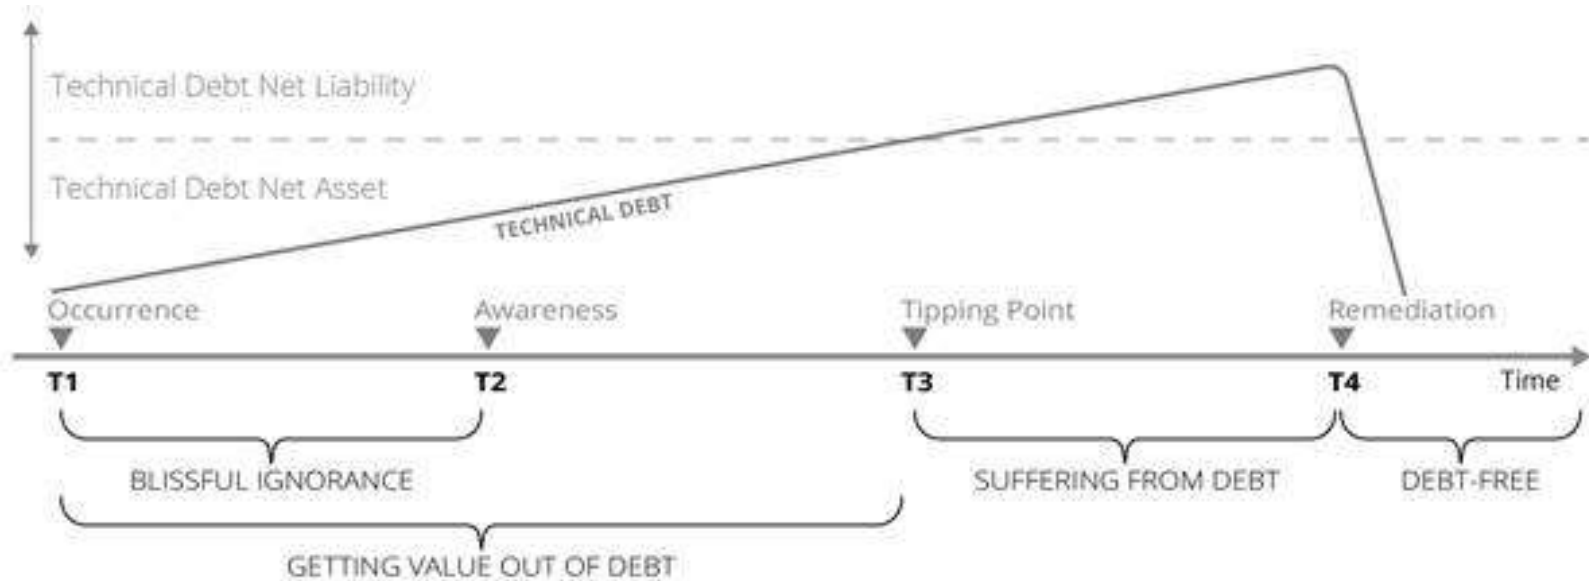

Tools can help assess aspects of software complexity and structural quality.

This is only a starting point!

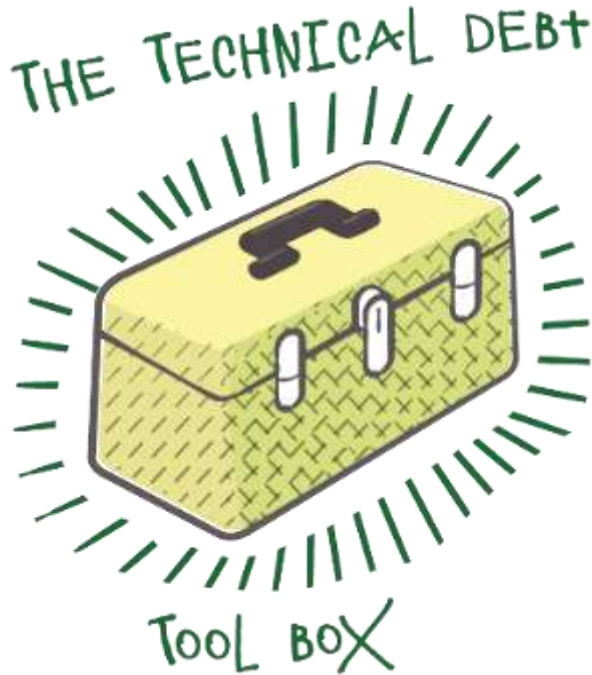

Information from these tools needs to be coupled with an understanding of:

- Number of defects and their locations
- Areas where systems change a lot
- Areas developers avoid
- Architecture decisions
- Risk liability
