

AWARD NUMBER: W81XWH-16-1-0604

TITLE: ⁶⁸Ga Bombesin PET/MRI in Patients with Biochemically Recurrent Prostate Cancer and Noncontributory Conventional Imaging

PRINCIPAL INVESTIGATOR: Andrei Iagaru, MD

CONTRACTING ORGANIZATION: The Leland Stanford Junior University
STANFORD CA 94305-2004

REPORT DATE: October 2020

TYPE OF REPORT: Annual

PREPARED FOR: U.S. Army Medical Research and Materiel Command
Fort Detrick, Maryland 21702-5012

DISTRIBUTION STATEMENT: Approved for Public Release;
Distribution Unlimited

The views, opinions and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy or decision unless so designated by other documentation.

14. ABSTRACT Purpose: 68Ga-labeled DOTA-4-amino-1-carboxymethyl-piperidine-D-Phe-Gln-Trp-Ala-Val-Gly-His-Sta-Leu-NH ₂ (68Ga-RM2) is a synthetic bombesin receptor antagonist that targets gastrin-releasing peptide receptors (GRPR). GRPR proteins are highly overexpressed in several human tumors, including prostate cancer (PC). Methods: We enrolled 89 men with biochemically recurrent PC from May 2017 to Sep 2020, 45-81 year-old (mean±standard deviation (SD): 67.8±7.1). Imaging started at 40-89 minutes (mean±SD: 51.1±11.8) after injection of 113.8-151.3 MBq (mean±SD: 139.7±5.1) of 68Ga-RM2 using a time-of-flight (TOF)-enabled simultaneous positron emission tomography (PET) / magnetic resonance imaging (MRI) scanner. T1-weighted (T1w), T2-weighted (T2w) and diffusion-weighted images (DWI) were acquired. Results: All patients had rising prostate specific antigen (PSA) (range: 0.2-124.0 ng/mL; mean±SD: 5.3±14.0) and negative CI (CT or MRI, and 99mTc MDP bone scan) prior to enrollment. The observed 68Ga-RM2 PET detection rate was 69.7%. PSA ranged 0.2-17.2 (mean±SD: 2.0±3.7) in patients with negative scans and 0.2-124.0 (mean±SD: 6.8±3.1) in patients with positive scans. Conclusions: 68Ga-RM2 PET can be used for assessment of GRPr expression in patients with biochemically recurrent PC. High uptake in multiple areas compatible with cancer lesions suggests that 68Ga-RM2 is a promising PET radiopharmaceutical for localization of disease in participants with biochemically recurrent PC and negative conventional imaging.

INTRODUCTION

Prostate cancer (PC) is the most common malignancy in elderly men (1) and the second leading cause of cancer death after lung and bronchus tumors (2). Up to 40% of prostate cancer patients develop biochemical recurrence within 10 years after radical treatments (3) and morphological imaging methods exhibit considerable limitations in detecting relapsed disease early (4). Gastrin releasing peptide receptors (GRPr), part of the bombesin (BBN) family, are overexpressed in several human tumors including prostate cancer.

Combined positron emission tomography (PET) and magnetic resonance imaging (MRI) targeting the GRPr with a ^{68}Ga -labelled bombesin analog receptor antagonist (RM2) is used as a promising diagnostic method for patients with suspicion of PCa recurrence. Here, we evaluate the role of ^{68}Ga -RM2 PET/MRI in patients with biochemical recurrence of PCa and negative conventional imaging.

The main goal of our study is to evaluate if ^{68}Ga -RM2 PET/MRI can improve the diagnostic accuracy of recurrent prostate cancer earlier, when PSA level is still low and no disease is seen by conventional imaging. This would lead to timely and more accurate treatments with impact on overall survival and quality of life.

ACCOMPLISHMENTS

Major goals of the project

Specific Aim 1 (specified in Project Narrative)	Original Timeline	Progress	Date Completed
To compare the diagnostic performance of ^{68}Ga -RM2 PET/MRI to that of conventional imaging (CI) for detecting recurrent prostate cancer.	Months		
Time needed to get protocol approved by HRPO	1-5	100%	03/20/17
Prepare to start enrollment of participants	1-2	100%	05/01/17
Enroll participants	Ongoing	89%	Ongoing

Accomplishments under goals

- 1) *Major activities:* enrolling eligible patients and reviewing ^{68}Ga -RM2 PET/MRI images to investigate its role as stated in #2.

We enrolled 89 participants in the May 2017 - Sep 2020 time frame. June 2017 was effectively the start date for enrollment since we needed time for HRPO approval and to run validation runs locally afterwards. All research activities were halted in March 2020 due to COVID; however, we recently received approval to restart and plan to enroll 2-4 or more participants each month. This will allow us to complete enrollment of the remaining 11 participants.

- 2) *Specific objectives:* The specific objectives of the goals included: obtaining study approvals from the Stanford Institutional Review Board and the DOD CDMRP HRPO, designing the clinical database, enrolling eligible patients, performing ^{68}Ga PET/MRI of the eligible patients, review images.

All of the above have been completed or are in progress, as detailed in #1.

- 3) *Significant results or key outcomes, including major findings, developments, or conclusions (both positive and negative):*

^{68}Ga -RM2 PET/MRI was able to detect findings compatible with prostate cancer recurrence in ~70% of the 89 participants enrolled to date. There were no failures in ^{68}Ga -RM2 synthesis, scanner operation or otherwise.

- 4) *Stated goals not met:*

None

Opportunities for training and professional development

We hired a research fellow as specified in the submission. In addition, other fellows in the Division of Nuclear Medicine and Molecular Imaging are assisting with the enrollment of eligible participants and collecting and analyzing data, respectively. We presented preliminary results at the RSNA, SNMMI and EANM annual conferences. In addition, we had invited talks at SNMMI annual meeting.

Results disseminated to communities of interest

^{68}Ga -RM2 PET/MRI is promising for improving the diagnostic accuracy in patients with biochemical recurrence of prostate cancer and negative conventional imaging. We presented the results at local and regional meetings. We plan to continue to present results at local, national and international meeting in order to disseminate results to communities of interest.

Plans for next reporting period to accomplish goals

We plan to closely monitor study enrollment, with the goal of enrolling 2-4 patients a month in order to meet the study recruitment goal of 100 participants overall.
