16. DISTRIBUTION STATEMENT (of this Report)  Approved for public release; distribution unlimited.		
17. DISTRIBUTION STATEMENT (of the abstract entered in Block 20, if different from Report)  <div style="text-align: right;"><i>DDC</i> <i>CONFIDENTIAL</i> JAN 6 1975 <i>CONFIDENTIAL</i> <i>C</i></div>		
18. SUPPLEMENTARY NOTES		
19. KEY WORDS (Continue on reverse side if necessary and identify by block number) weight estimation, structural weights, integrated computer programs, preliminary weight estimation, first-order weight estimations, aircraft structure weights, aircraft structural weight optimization, flutter optimization program, structural synthesis		
20. ABSTRACT (Continue on reverse side if necessary and identify by block number)  Three computer programs were written with the objective of predicting the structural weight of aircraft through analytical methods. The first program, the structural weight estimation program (SWEEP), is a completely integrated program including routines for airloads, loads spectra, skin temperatures, material properties, flutter stiffness requirements, fatigue life, structural sizing, and for weight estimation of each of the major

SECURITY CLASSIFICATION OF THIS PAGE (When Data Entered)

## 20. ABSTRACT (CONTINUED)

aircraft structural components. The program produces first-order weight estimates and indicates trends when parameters are varied. Fighters, bombers, and cargo aircraft can be analyzed by the program. The program operates within 100,000 octal units on the Control Data Corporation 6600 computer. Two stand-alone programs operating within 100,000 octal units were also developed to provide optional data sources for SWEEP. These include (1) the flexible airloads program to assess the effects of flexibility on lifting surface airloads, and (2) the flutter optimization program to optimize the stiffness distribution required for lifting surface flutter prevention.

The final report is composed of 11 volumes. This volume (volume VI) contains the methods and program description for the wing and empennage module of SWEEP. Program listings and flow charts are included in the appendix to this volume.

BOOK 2

TECHNICAL DISCUSSION, SECTIONS III AND IV

## Section III

### INPUT DATA PROCESSING AND GEOMETRY ANALYSIS

#### GENERAL DESCRIPTION

The input data processing and geometry calculation for wing, horizontal tail, or vertical tail surfaces are performed by overlay (8, 0) subroutines. Overlay (8, 0) is the first of eight wing and empennage module overlays to be executed by the SWEEP master control program, ØLAY00. Overlay (8, 0) is identified by program ØLAY8.

Overlay (8, 0) consists of program ØLAY8 and 12 subroutines. The subroutines and pertinent general information for each are presented in Table 19. Figure 56 shows the subroutine structure of overlay (8, 0). The logic and computational flow is shown in Figure 57. Source deck listings and detail flow diagrams for each of the 13 overlay (8, 0) routines can be found in the appendix of this volume.

The input data processing function of overlay (8, 0) is performed first by the subroutine CCNTL. The case input data set for the surface to be analyzed is ordered into blank common array D. Pertinent design information from three other sources, arrays XMISC, WD, and SPAL, are then processed into appropriate D array locations. The transfer of data is governed by predetermined tests by subroutine CCNTL.

The second computational function of overlay (8, 0) is performed by geometry subroutines executed under control of subroutine GEØMW. Geometry information is computed to describe the surface characteristics in three dimensions in terms of actual dimensions. Overlay (8, 0) geometry subroutines create the general analysis control data which are used in the detail analysis performed by the seven other module overlays.

#### OVERLAY (8, 0) INPUT DATA

Input data for overlay (8, 0) are stored in labeled common blocks MISC and IPRINT and on mass storage file 1. The case variable data input through input data decks WING, HØRIZØNTAL, and VERTICAL are stored in records 23, 26, and 27 of mass storage file 1. The surface type to be evaluated by the module is specified by program ØLAY00 by code in location 2, array XMISC. Code value 1.0 denotes wing, 2.0 horizontal tail, and 3.0 vertical tail.

Mass storage file 1 also contains three other blocks of data used by overlay (8, 0). Design information created during execution of the data management and the flutter and temperature modules of SWEEP are stored in

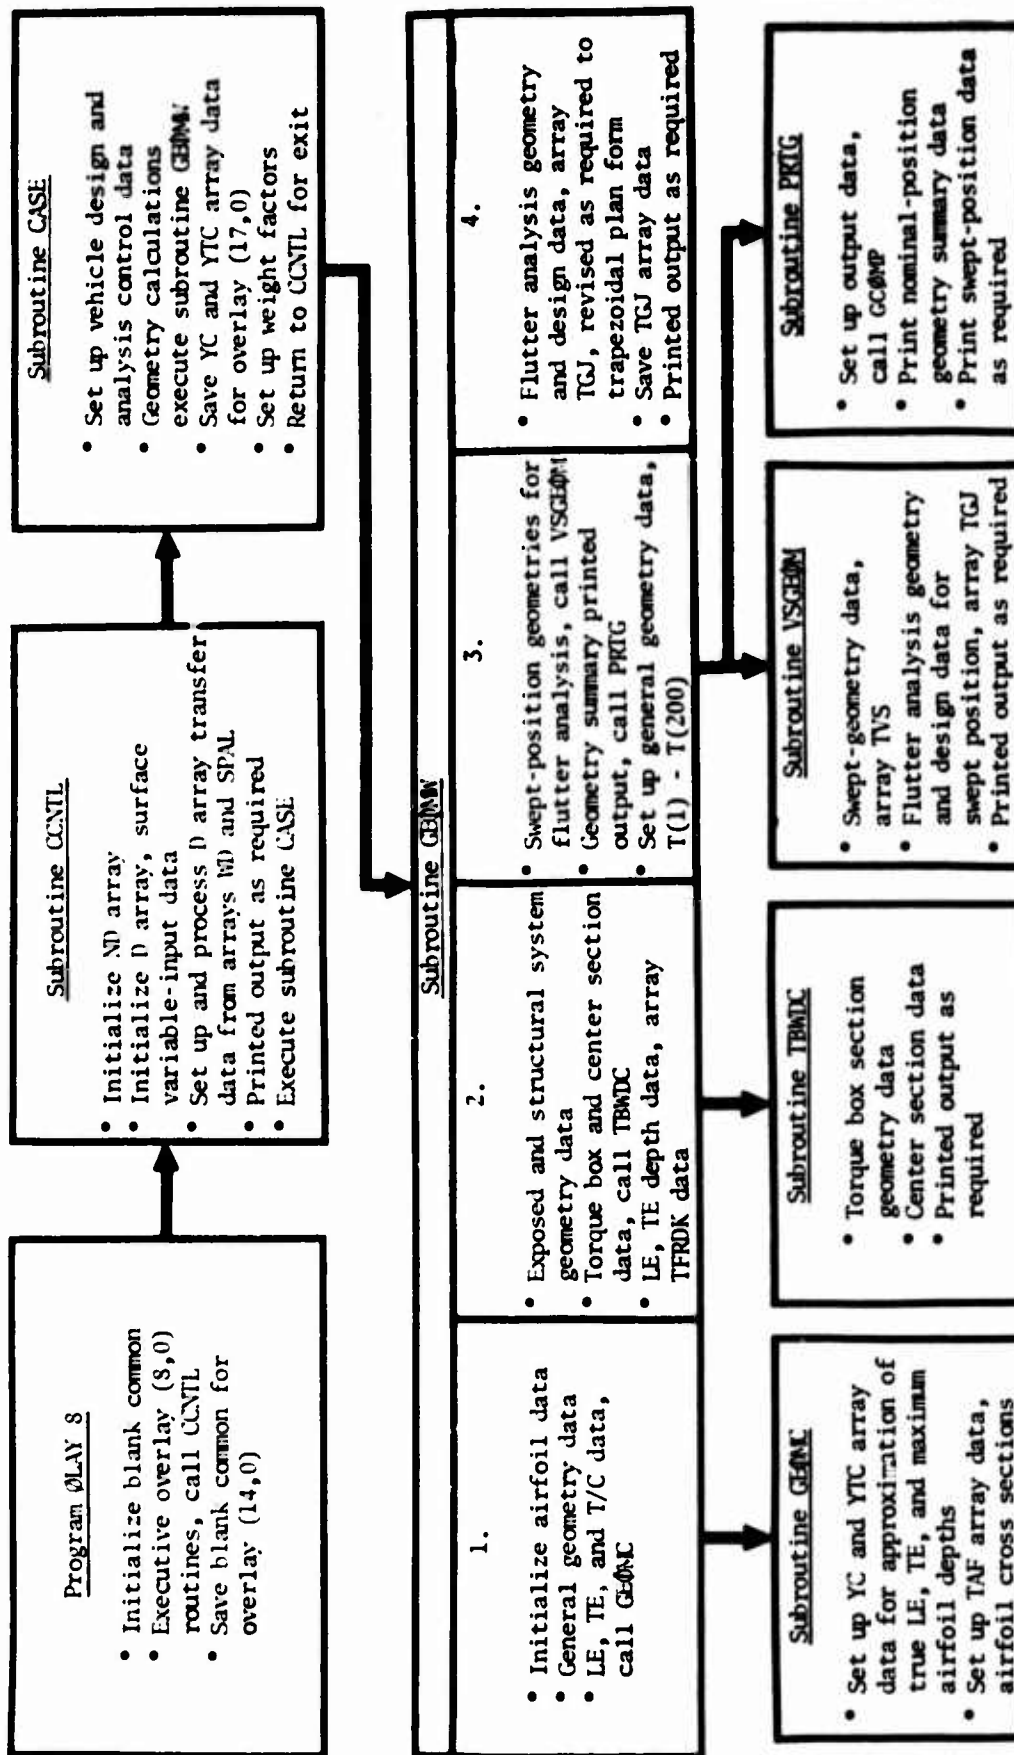

Figure 57. Overlay (8,0) logic flow diagram.

records 21 and 38. These records are ordered into blank common arrays WD and SPAL by subroutine CCNTL for processing into the module variable-data array D.

Design and analysis control information is also transmitted to overlay (8, 0) through array XMISC, labeled common block MISC. Labeled common block IPRINT contains array IP, which contains the code values specified in case control card 1. The information on each column of this card is stored in corresponding IP array locations. IP array data are used by overlay (8, 0) subroutines to determine if computed data are to output as printed data.

#### OVERLAY (8, 0) OUTPUT DATA

Output from overlay (8, 0) computations is transmitted to the seven other module overlays as blank common data and data blocks on mass storage file 1. Overlay (8, 0) output includes the following:

1. Variable data for the surface to be analyzed, transmitted through blank common, array D.
2. Integer constants contained in array ND, transmitted through blank common.
3. Analysis control codes and case integer constants:
  - a. Variable LID, ND(54)
  - b. Variable NMATL, ND(59)
  - c. Variable NCASE, ND(60)
  - d. Variable NCSEC, ND(68)
  - e. Variable NPAGE, ND(85)
  - f. Variable WHVID, T(57)
4. Computed geometry and design data:
  - a. Data in T array locations 1 to 200, transmitted through blank common
  - b. Array TXY data, transmitted through blank common
  - c. Array TGJ data, transmitted through record 10, mass storage file 1

- d. Data in arrays YC and YTC, transmitted through blank common and record 144, mass storage file 1
  - e. Array TFRDK data, transmitted through blank common
5. Printed output, printed under control of print codes, array IP. Samples of printed output can be found in Appendix A, Volume IX, User's Manual.

## OVERLAY CORE MAPS

Storage and retrieval of computed data by overlay (8,0) subroutines are made on the basis of data name references to core locations in blank common. The major arrays into which blank common is divided (Table 3) are used as the reference blank common blocks to which the primary storage arrays are equivalenced. Tables 20 through 41 contain the pertinent information for the arrays used in this overlay.

The overlay (8,0) storage arrays are as follows. Table numbers refer to core maps found in this section.

- AFD, Table 28
- DAF, Table 25
- DLE, Table 22
- DTC, Table 24
- DTE, Table 23
- SPAL, Table 21
- T, Table 34
- TAF, Table 29
- TD, Table 40
- TFRDK, Table 37
- TGJ, Table 36
- TS, Table 41
- TR, Table 50
- TT (GE~~MM~~), Table 45
- TT (TBWDC, AB~~XC~~), Table 51
- TVS, Table 35
- TXY, Table 30
- WD, Table 20
- YC, Table 38
- YLE, Table 32
- YTB, Table 31
- YTC, Table 39
- YTE, Table 33

Core maps for labeled common arrays XMISC and IP can be found in Tables 5 and 6. Mass storage file 1 records used by overlay (8,0) routines are identified in the subroutine descriptions. Table 7 contains pertinent information for all mass storage file 1 records used.

Variable data for the problem case are initialized into the D array by subroutine CCNTL. All information contained in this array remains as initialized by CCNTL during execution of all overlays of the wing and empennage module. Table 8 contains definitions for all data locations of the D array. References to array D by all routines in the wing and empennage module are defined in Tables 11 and 12.

Definitions for data locations of arrays DC and ND can be found in Tables 9 and 10. Subroutine reference information for these arrays are listed in Tables 13 and 14.

TABLE 20. WD ARRAY, WING AND EMPENNAGE VARIABLE DATA,  
 MASS STORAGE FILE 1, RECORD 21

General information for array WD:

Blank common reference location = T(1)

Array size = 200 cells

Array contains the wing and empennage design data to be processed into the wing and empennage variable data D array by subroutine CCNTL.

Array data are stored on record 21, mass storage file 1, created by subroutine DCNTL, overlay (2,0).

Array Location	Description
1	Not used
2	Maximum design weight, lb
3	Basic flight design weight, lb
4	Maximum positive maneuver load factor, subsonic, at BFDW
5	Maximum negative maneuver load factor at BFDW
6	Maximum dynamic pressure, lb/ft <sup>2</sup>
Locations 7-110 contain wing design data.	
7	(X/C) <sub>EA</sub> , equivalent chord element line, structural reference line
8	(X/C) $\Lambda$ , reference chord element line, planform sweep angle
9	Wing weight per side, fraction of BFDW
10	Y-coordinate of pivot
11	X distance of pivot from leading edge
12	$\Lambda_{\text{fwd}}$ , movable panel forward sweep position for pivot analysis, degrees
13	$\Lambda_{\text{aft}}$ , movable panel aft sweep position for pivot analysis, degrees
14	Wing apex station, location reference station for wing relative to fuselage, fuselage station
15	S, planform area, sq ft
16	AR, planform aspect ratio
17	$\Lambda$ , planform sweep, degrees
18	$\lambda$ , planform taper ratio
19	b <sub>1</sub> , body width, distance between shear-tie locations
20	Fuel system weight factor, ratio of fuel system plus trapped fuel to total wing fuel
21	Weight of surface controls in exposed wing panel, lb/side
22	Weight of miscellaneous items in exposed wing panel, lb/side
23	Number of sweep positions for pivot analysis, set to 1.0
24	Code word for Torque-box geometry, same as D(864), set to 2.0

TABLE 21. SPAL ARRAY, WING AND EMPENNAGE FLUTTER ANALYSIS DATA,  
 MASS STORAGE FILE 1, RECORD 38

General information for array SPAL:

Blank common reference location = T(1001)

Array size = 50 cells

Array contains wing and empennage flutter analysis data to be processed into wing and empennage variable data D array by subroutine CCNTL. Array data are stored on record 38, mass storage file 1, created by subroutine DWHVQQ, overlay (2,0); subroutine WHVQQ, overlay (3,0); and subroutine WØDATA, overlay (17,0).

All array locations are referenced as T(xxxx) locations in subroutine CCNTL. T array locations identified by an asterisk (\*) are array items used by CCNTL.

Array Location	T Array Location	Description
Locations 1-16 contain design data for T-tail vertical tail flutter requirement analysis. Horizontal tail mass properties values in locations 1-7 may be revised by wing and empennage module with calculated data. Data management module, overlay (2,0), provides initial values from estimated data. These values are replaced with calculated horizontal tail data by subroutine WØDATA, overlay (17,0), at the conclusion of any horizontal tail analysis. This option is executed when a code value of 1.0 is specified in variable data location D(204) for horizontal tail analysis, and included in input data deck HORIZONTAL.		
1	1001	W <sub>HT</sub> , weight of exposed horizontal tail structure and contents, initial value lb/side, replaced with total weight per air vehicle
2	1002	Y <sub>HT</sub> , Y-coordinate of one exposed horizontal tail panel, compatible with weight in location 1, buttock plane station
3	1003	X <sub>HT</sub> , X-coordinate of exposed horizontal tail and contents weight in location 1, fuselage station
4	1004	Z <sub>HT</sub> , Z-coordinate, reference location for horizontal tail mass, initially estimated Z <sub>CG</sub> , changed to Z-coordinate of horizontal tail reference plane at centerline by WØDATA
5	*1005	I <sub>YHT</sub> , pitch inertia of total exposed horizontal tail mass at total mass centroid, lb-in. <sup>2</sup> /air vehicle

TABLE 21. SPAL ARRAY, WING AND EMPENNAGE FLUTTER ANALYSIS DATA,

## VARIABLE DATA SUBARRAYS DLE, DTE, AND DTC

Optimal variable data sets used to define nonlinear planform and cross-section tapers are located in D array locations 1985 through 2052.

- The leading edge data set is assigned sub-array name DLE, locations D(1985) through D(2007), Table 22.
- The trailing edge data set is assigned subarray name DTE, locations D(2008) through D(2030), Table 23.
- Airfoil thickness ratios are specified in D(2031) through D(2052), subarray name DTC, Table 24.

These data sets are processed by subroutine GEOMC to create the required numerical information in arrays YC and YTC. True locations of the leading and trailing edges are defined with 11 control points in terms of either actual Y- and X-coordinates, position relative to the theoretical trapezoidal planform, or combinations of both. The DLE and DTE data sets consist of 23 data items each, 11 spanwise and chordwise points plus a code word to identify the type of input chordwise data. Spanwise control stations can be specified in terms of either actual Y-coordinate values (input value greater than 1.0) or as fractions of the semispan (input values of 1.0 or less). Chordwise locations can be specified in terms of

1.  $+\Delta X$  from the planform trapezoidal leading or trailing edge element line at the control station (code value = 0.0).
2. Fuselage stations (code value = 1.0).
3.  $+X/C$ , fraction of local chord from the leading or trailing edge element line at the control station (code value = 2.0).

Thickness ratios are specified in similar manner; the DTC array consisting of spanwise control station data and local thickness ratios. Maximum airfoil depths are calculated as the product of the thickness ratio times the true local chord.

DLE, DTE, and DTC array data are always processed; zero to 11 control points data may be specified. In the zero condition, linear leading or trailing edges, array items 1, 2, and 13, must be specified as 0.0. The control code value, array item 12, must be specified as either 0.0 or 2.0. The first 0.0 value encountered for items 2-11 will terminate processing of array information and an addition point created, semispan station with 0.0 offset from the trapezoidal planform. If 11 control points are specified, the semispan station will be created as point 12, thus point 11 should always be specified inboard of the tip station.

Item 12 of the DTC array (t/c) serves as the processing control code. A zero value indicates no processing. Any value specified will be located at the centerline station. Processing procedure for items 2-11 and 13-22 are similar to that for the DLE and DTC arrays.

TABLE 22. DLE ARRAY, VARIABLE DATA SUBARRAY FOR NONLINEAR LEADING EDGES

General information for array DLE: Blank common reference location = D(1985) Array size = 23 cells Array used by subroutine GEOMC to create YC array data		
Array Location	D Array Ref Location	Description
1	1985	$Y_1$ , specify 0.0 for Y-coordinate of point 1 at centerline.
2	1986	$Y_2$ , Y-coordinate of control point 2, specify as fraction of semispan or buttock plane station. Must be 0.0 if linear variation, root to tip is desired.
3	1987	$Y_3$ , Y-coordinate of control point 3. Specify 0.0 if only points 1 and 2 are to be used.
4	1988	$Y_4$ , Y-coordinate of control point 4. Specify 0.0 if only points 1-3 are to be used.
5	1989	$Y_5$ , Y-coordinate of control point 5. Specify 0.0 if only points 1-4 are to be used.
6	1990	$Y_6$ , Y-coordinate of control point 6. Specify 0.0 if only points 1-5 are to be used.
7	1991	$Y_7$ , Y-coordinate of control point 7. Specify 0.0 if only points 1-6 are to be used.
8	1992	$Y_8$ , Y-coordinate of control point 8. Specify 0.0 if only points 1-7 are to be used.
9	1993	$Y_9$ , Y-coordinate of control point 9. Specify 0.0 if only points 1-8 are to be used.
10	1994	$Y_{10}$ , Y-coordinate of control point 10. Specify 0.0 if only points 1-9 are to be used.
11	1995	$Y_{11}$ , Y-coordinate of control point 11. Specify 0.0 if only points 1-10 are to be used. If used, locate $Y_{11}$ inboard of tip station.
12	1996	Code word, chordwise data in locations 13-23: 0.0 = $+\Delta X$ from leading edge element line 1.0 = fuselage station 2.0 = distance from leading edge element line expressed as fraction of local chord, $X/C$ .
13	1997	$X_1$ , reference value for X-coordinate of leading at $Y_1$ . Must be 0.0 if leading edge element line is to be used.
14	1998	$X_2$ , reference value for X-coordinate of point 2.
15	1999	$X_3$ , reference value for X-coordinate of point 3.

TABLE 22. DLE ARRAY, VARIABLE DATA SUBARRAY FOR NONLINEAR LEADING EDGES (CONCL)

Array Location	D Array Ref Location	Description
16	2000	X <sub>4</sub> , reference value for X-coordinate of point 4.

20	2050	(t/c) <sub>9</sub> , thickness ratio at Y <sub>9</sub> .
21	2051	(t/c) <sub>10</sub> , thickness ratio at Y <sub>10</sub> .
22	2052	(t/c) <sub>11</sub> , thickness ratio at Y <sub>11</sub> .

TABLE 25. DAF ARRAY, AIRFOIL CROSS-SECTION DATA

General information for array DAF:

Blank common reference location = T(1401)

Array size = 500 cells

Array contains SWEEP permanent data bank airfoil cross-section data, record 36, mass storage file 1. This array is initialized by GEOM. Array data are processed by GEOMC into array TAF based on input data specifications in locations D(143-152).

Array values can be changed only through revision of the SWEEP permanent data bank deck.

Locations 1-99 contain airfoil equation constants, used under a code value of 1.0 through 8.0 is specified for airfoil type code word in location D(143).

Locations 100-500 are used to specify numerical airfoil depths in table format to be used when a code value of 9.0 is specified in D(143) and appropriate control information is included in locations D(145-152).

Refer to Table 26 for equation constants and Table 27 for airfoil ordinate data.

Array Location	Data Bank Value	Airfoil Code D(143)	Airfoil Code D(147-152)	Description

TABLE 25. DAF ARRAY, AIRFOIL CROSS-SECTION DATA (CONT)

Array Location	Data Bank Value	Airfoil Code D(143)	Airfoil Code D(147-152)	Description
<p>Locations 100 to 499 are divided into eight 50-cell blocks for airfoil depth table data. Block 1, locations 100-149, contain the airfoil X/C values, points at which depth data for different airfoils are specified in blocks 2-7. (Block 8 is currently not used.) X/C and depths must be compatible; 3 to 48 points may be specified in items 2-49 of each block. The number of X/C points are specified in item 1, block 1 (location 100). Item 1 of blocks 2-7 may be used by the user as a numerical identification code for the airfoil. Item 50 of blocks 2-7 is used to specify the normalizing factor for each airfoil - the ordinate value of the maximum airfoil depth. Individual airfoil depths may be specified in terms of actual mold line depth values or fractions of the maximum depth. The SWEEP permanent data bank contains no data in locations 100-500.</p>				
100	0.0	9.0	N/A	Number of X/C points in depth table
101-148	0.0	9.0	N/A	X/C values, fraction of chord leading edge to trailing edge.
149	0.0	9.0	N/A	Not used
150	0.0	9.0	1.0	User code number airfoil No. 1
151-198	0.0	9.0	1.0	Depth values for airfoil No. 1 at X/C points specified in 101-148.
199	0.0	9.0	1.0	Maximum depth, airfoil No. 1
200	0.0	9.0	2.0	User code number, airfoil No. 2
201-248	0.0	9.0	2.0	Depth values for airfoil No. 2 at X/C points specified in 101-148
249	0.0	9.0	2.0	Maximum depth, airfoil No. 2
250	0.0	9.0	3.0	User code number, airfoil No. 3
251-298	0.0	9.0	3.0	Depth values for airfoil No. 3 at X/C points specified in 101-148
299	0.0	9.0	3.0	Maximum depth, airfoil No. 3
300	0.0	9.0	4.0	User code number, airfoil No. 4

TABLE 25. DAF ARRAY, AIRFOIL CROSS-SECTION DATA (CONCL)

TABLE 28. AFD ARRAY

<p>General information for array AFD:                  Blank common reference location = T(411)                  Array sign = 6 cells                  Array data set up by subroutine <del>GEOM</del> from data in array DAF based on                  airfoil-type code value in input data location D(143). Array data                  used by subroutine DMAX only if the code value in D(143) is 1.0-8.0.</p>	
Array Location	Description
1	Coefficient A for airfoil depth equation
2	Coefficient B for airfoil depth equation
3	Coefficient C for airfoil depth equation
4	Coefficient D for airfoil depth equation
5	Coefficient E for airfoil depth equation
6	Coefficient F for airfoil depth equation

TABLE 29. TAF ARRAY, AIRFOIL DEPTH DATA

General information for array TAF:	
Blank common reference location = T(431)	
Array size = 350 cells	
Array data created by subroutine GEOMC for use by subroutine DMAX only if code value of 9.0 is specified in input data location D(143).	
Array Location	Description
1	0.0, inboard airfoil control station. Reference airfoil depth data in location 51-98, same as values in 101-148.
2	$Y_1$ , airfoil control station 1. Reference airfoil depth data in locations 101-148. Station value as specified in input data location D(145). If 0.0, station value is set to 2.0. Airfoil code for this station is specified in input data location D(149).
3	$Y_2$ , airfoil control station 2. Reference airfoil depth data in locations 151-198. Station value as specified in input data location D(146), airfoil code in D(150). If D(146) is 0.0, station value is set to b/2 and the airfoil depth data in location 101-148 is moved to 151-198.
4	$Y_3$ , airfoil control station 3. Reference airfoil depth data in locations 201-248. Station value as specified in input data location D(147), airfoil code in D(151). If D(147) is 0.0, station value is set to b/2, and airfoil depth data in locations 151-198 is moved to 201-248.
5	$Y_4$ , airfoil control station 4. Reference airfoil depth data in locations 251-298. Station value as specified in input data location D(148), airfoil code in D(152). If D(148) is 0.0, station value is set to b/2, and airfoil depth data in locations 201-248 is moved to 251-298.
6	b/2, outboard airfoil control station if data is specified in input data locations D(145-148). Reference airfoil depth data in locations 301-348, same as values in 251-298.
7	$\Delta Y_1$ , distance between inboard airfoil control station and station 1
8	$\Delta Y_2$ , distance between airfoil control stations 1 and 2
9	$\Delta Y_3$ , distance between airfoil control stations 2 and 3
10	$\Delta Y_4$ , distance between airfoil control stations 3 and 4
11	$\Delta Y_5$ , distance between airfoil control station 4 and the outboard station
12	Maximum airfoil depth for each data set, GEOMC

TABLE 29. TAF ARRAY, AIRFOIL DEPTH DATA (CONT)

Array Location	Description
Locations 12-23 used to save intermediate calculation data by DMAX during linear interpolation for local depths.	
12	X/C distance from local depth analysis point to forward X/C point of the two points in X/C table that bracket analysis point.
13	Y-distance between analysis point and airfoil control station immediately inboard.
14	$\Delta$ X/C, X/C distance between the two adjacent X/C points that bracket X/C point at which local depth is to be calculated.
15	$\Delta$ Y, Y-distance between the two airfoil control stations that bracket analysis point
16	$R_x$ , ratio of values in location 12 and 14
17	$R_y$ , ratio of values in locations 13 and 15
18	Depth at aft X/C point from outboard airfoil control station reference airfoil depth table.
19	Depth at aft X/C point from inboard airfoil control station reference airfoil depth table.
20	Depth at forward X/C point from outboard airfoil control station reference airfoil depth table.
21	Depth at forward X/C point from inboard airfoil control station reference airfoil depth table.
22	Depth at X/C analysis value for airfoil at outboard airfoil control station
23	Depth at X/C analysis value for airfoil at inboard airfoil control station
24-50	Not used
51-98	Airfoil depth table from array DAF based on airfoil code in location D(149), positioned on plan form at spanwise station in location 1.
99-100	Not used
101-148	Airfoil depth table from array DAF based on airfoil code in location D(149), positioned on plan form at spanwise station in location 2.
149-150	Not used
151-198	Airfoil depth table from array DAF based on airfoil code in location D(150), positioned on plan form at spanwise station in location 3. If D(146) is 0.0, data in location 101-148 is moved to this block.

TABLE 29. TAF ARRAY, AIRFOIL DEPTH DATA (CONCL)

Array Location	Description
199-200 201-248	Not used Airfoil depth table from array DAF based on airfoil code in location D(151), positioned on planform as spanwise station in location 4. If D(147) is 0.0, data in location 151-198 are moved to this block.
249-250 251-298	Not used Airfoil depth table from array DAF based on airfoil code in location D(152), positioned on planform as spanwise station in location 5. If D(148) is 0.0, data in location 201-248 are moved to this block.
299-300 301-348	Not used Airfoil depth table from array DAF based on airfoil code in location D(152), positioned on planform at spanwise station in location 6. Same data as in 251-298. Not used if location D(148) is 0.0.
NOTE	If values are specified in input data locations D(145-148) but corresponding airfoil code values in D(149-152) are negative, 0.0 or larger than 6.0, the program will use the airfoil No. 1 table data in DAF (151-198).

## TXY ARRAY

The TXY array is the general storage array used by the geometry sub-routines for storage and/or access of computed geometry data. The contents of this array are defined in Table 30. Subarrays YTB, YLE, YTE, and YS are part of array TXY. Subarrays YTB, YLE, and YTE are defined in Tables 31, 32, and 33. YS is defined in Table 30.

Overall control for computations of values stored in the array is centered in subroutine ~~GEOM~~. This subroutine computes values for the general geometry parameters and governs data computations for the subarrays. The contents of array TXY are processed by subroutine ~~GEOM~~ into T array and geometry subarray locations for later use by other module subroutines. The output geometry summary data printed under control of IP (6) by subroutine PRTG are processed from the TXY array into the output data array TD by subroutine ~~GCMP~~.

TABLE 30. TXY ARRAY, GEOMETRY DATA

<p>General information for array TXY:</p> <p>Blank common reference location = T(801)</p> <p>Array size = 500 cells</p> <p>Subarrays:</p> <ol style="list-style-type: none"> <li>1. YS, 11 cells, TXY (490-500), analysis control stations</li> </ol> <p>All dimensions are in inches or as noted.</p>	
Array Location	Description
1	$S'$ , exposed area, sq ft
2	$AR'$ , exposed aspect ratio
3	$\lambda'$ , exposed taper ratio
4	$t/c'$ , thickness ratio at exposed root chord
5	$\sigma'$ , exposed thickness ratio taper
6	$b'/2$ , exposed semispan
7	$b_1/2$ , side of body station
8	$b/2$ , semispan
9	$C_R'$ , exposed root chord
10	$C_T$ , theoretical tip chord
11	$AR_S'$ , exposed aspect ratio, structural reference system
12	$\lambda_S'$ , exposed taper ratio, structural reference system
13	$(t/c)'_S$ , exposed thickness ratio, structural reference system
14	$\sigma_S'$ , exposed thickness ratio taper, structural reference system
15	$b_S'/2$ , exposed structural semispan
16	$b_{1S}'/2$ , side of body structural station
17	$b_S/2$ , structural semispan
18	$C_{RS}'$ , exposed structural root chord
19	$C_{TS}'$ , tip chord, structural reference system

TABLE 30. TXY ARRAY, GEOMETRY DATA (CONT)

Array Location	Description
20	$C_{LE}$ , X-axis intercept for leading edge element line, fuselage station
21	$C_{FS}$ , X-axis intercept for front spar reference line, fuselage station
22	$C_{EA}$ , X-axis intercept for structural reference line Y, fuselage station
23	$C_{RS}$ , X-axis intercept for rear spar reference line, fuselage station
24	$C_{TE}$ , X-axis intercept for trailing edge element line, fuselage station
25	$C_R$ , aerodynamic root chord, X-axis intercept for aerodynamic chord variation equation
26	$C_{RS}$ , structural root chord, X-axis intercept for structural chord variation equation
27	$\tan \Lambda_{LE}$ , slope of leading edge element line
28	$\tan \Lambda_{FS}$ , slope of front span reference line
29	$\tan \Lambda_{EA}$ , slope of structural reference line
30	$\tan \Lambda_{RS}$ , slope of rear spar reference line
31	$\tan \Lambda_{TE}$ , slope of trailing edge element line
32	$\tan AC$ , slope for aerodynamic chord variation equation
33	$\tan AC_S$ , slope for structural chord variation equation
34	$\sin \Lambda_{LE}$ , sine of sweep angle for leading edge element line
35	$\sin \Lambda_{FS}$ , sine of sweep angle for front spar reference line
36	$\sin \Lambda_{EA}$ , sine of sweep angle for structural reference line
37	$\sin \Lambda_{RS}$ , sine of sweep angle for rear spar reference line
38	$\sin \Lambda_{TE}$ , sine of sweep angle for trailing edge element line
39	$\cos \Lambda_{LE}$ , cosine of sweep angle for leading edge element line
40	$\cos \Lambda_{FS}$ , cosine of sweep angle for front spar reference line

TABLE 30. TXY ARRAY, GEOMETRY DATA (CONT)

Array Location	Description
41	$\text{Cos } \Lambda_{EA}$ , cosine of sweep angle for structural reference line
42	$\text{Cos } \Lambda_{RS}$ , cosine of sweep angle for rear spar reference line
43	$\text{Cos } \Lambda_{TE}$ , cosine of sweep angle for trailing edge element line
44	$\text{Tan } (t/c)$ , slope for thickness ratio variation equation
45	$\text{Tan } \Lambda_{.5c}$ , slope of 50% chord element line
46	$C_{.5c}$ , X-axis intercept for 50% chord element line, fuselage station
47	$^{-1}/(\text{Tan } \Lambda_{EA})$ , slope of line normal to structural reference line
48	$C_{sci}$ , X-axis intercept for line normal to structural reference line, fuselage station
49	$\text{Tan } W_{sc}$ , slope for torque-box structural width variation equation
50	$C_{WSC}$ , X-axis intercept for torque-box structural width variation equation
51	$\text{Tan } \Lambda_o$ , tangent of planform reference sweep angle
52	$\text{Sin } \Lambda_o$ , sine of planform reference sweep angle
53	$\text{Cos } \Lambda_o$ , cosine of planform reference sweep angle
54	$C \Lambda_o$ , X-axis intercept for planform reference sweep element line, fuselage station
55-178	Subarray YTB, refer to Table 31
179-287	Subarray YLE, Table 32
288-396	Subarray YTE, Table 33
397-420	Not used
421	$X_{LE}$ , X-coordinate of leading edge element line at side of body
422	$X_{FS}$ , X-coordinate of front spar line at side of body
423	$X_{EA}$ , X-coordinate of structural reference line at side of body
424	$X_{RS}$ , X-coordinate of rear spar line at side of body
425	$X_{TE}$ , X-coordinate of trailing edge element line at side of body
426	$X_{LE}$ , X-coordinate of leading edge element line at pivot station

TABLE 30. TXY ARRAY, GEOMETRY DATA (CONT)

Array Location	Description
427	$X_{FS}$ , X-coordinate of front spar line at pivot station
428	$X_{EA}$ , X-coordinate of structural reference line at pivot station
429	$X_{RS}$ , X-coordinate of rear spar line at pivot station
430	$X_{TE}$ , X-coordinate of trailing edge element line at pivot station
431	$X_{LE}$ , X-coordinate of leading edge element line at tip station
432	$X_{FS}$ , X-coordinate of front spar line at tip station
433	$X_{EA}$ , X-coordinate of structural reference line at tip station
434	$X_{RS}$ , X-coordinate of rear spar at tip station
435	$X_{TE}$ , X-coordinate of trailing edge element line at tip station
436	$X_{.25c}$ , X-coordinate of 25% chord element line at tip station
437-450	Not used
451	$t/c_{RT}$ , thickness ratio at centerline station
452	$t/c_{TIP}$ , thickness ratio at tip station
453	$Y_{IB}$ , inboard thickness ratio control station, from input data location 141
454	$Y_{OB}$ , outboard thickness ratio control station, from input data location 142
455	$D_{IB}$ , maximum airfoil depth at inboard thickness ratio control station from product of t/c in input data location 243 and trapezoidal chord at inboard control station
456	$D_{OB}$ , maximum airfoil depth at outboard thickness ratio control station, from product of t/c data in input locations 243 and 245, and trapezoidal chord at outboard control station
457	$D_{RT}$ , maximum airfoil depth at center-line station Z-axis intercept for depth variation equation
458	$D_{TIP}$ , maximum airfoil depth at tip station
459	TAN D, slope for spanwise depth equation, linear variation, root to tip
460-464	Not used

TABLE 30. TXY ARRAY, GEOMETRY DATA (CONCL)

Array Location	Description
465	S, gross planform area, sq in.
466	b, total planform span
467	$\Lambda_0$ , planform reference sweep angle, radians
468	$(1 + \lambda)$ , planform taper ratio plus 1.0
469	Element line for planform reference sweep angle, fraction of chord
470	$C_{.25c}$ , X-axis intercept for 25% element line, fuselage station
471	$\tan \Lambda_{.25c}$ , slope of 25% element line
472	$\sin \Lambda_{.25c}$ , sine of sweep angle for 25% element line
473	$\cos \Lambda_{.25c}$ , cosine of sweep angle for 25% element line
474	$X_{.25c}$ , X-coordinate of 25% element line at tip station
475-489	Not used
490-500	Subarray Ys. Structural reference stations for the 11 analysis control stations, stored root to tip. Array size = 11 cells.

TABLE 31. YTB ARRAY, TORQUE-BOX GEOMETRY DATA

General information for subarray YTB:	
Blank common reference location = TXY(55)	
Array size = 124 cells	
Array Location	Description
1-11	$Y_{EA}$ (1-11), Y-coordinate of 11 analysis control stations on the structural reference line, root to tip
12-22	$X_{EA}$ (1-11), X-coordinate of 11 analysis control stations on the structural reference line, root to tip
23	$W_{c-s}$ , center-section width at outer panel analysis control station $Y_{EA}(1)$
24-34	$W_{SC}$ (1-11), structural width of torque-box for the 11 analysis control stations, root to tip
35	Not used
36-46	$D_{ave}$ (1-11), average torque-box depth for the 11 analysis control stations, root to tip
47	Not used
48-58	$XA(1-11)$ , cross-sectional area of torque-box for the 11 analysis control stations, root to tip, sq in.
59-69	$C(1-11)$ , true aerodynamic chord at the Y-coordinate station for the 11 analysis control stations, root to tip
70-80	$D_{max}$ (1-11), maximum airfoil depth at the Y-coordinate station for the 11 analysis control stations, root to tip
81	Not used
82-91	$S_{TB}$ (1-10), planform area for the 10 torque-box segments defined by the 11 structural chords, root to tip, sq in.
92	Not used
93-102	$VOL_{TB}$ (1-10), volume for the 10 torque-box segments defined by the 11 structural chords, root to tip, cu in.
103	Not used
104-113	$Y_{CG}$ (1-10), Y-coordinate for the geometrical centroid of the 10 trapezoidal panels defined by the 11 structural chords, root to tip

TABLE 31. YTB ARRAY, TORQUE-BOX GEOMETRY DATA (CONCL)

Array Location	Description
114	$X_{CGC-S}$ , X-coordinate for center-section centroid, average of center-section front and rear spar stations
115-124	$X_{CG}(1-10)$ , X-coordinate for the geometrical centroid of the 10 trapezoidal panels, defined by the 11 structural chords, root to tip

TABLE 32. YLE ARRAY, LEADING EDGE GEOMETRY DATA

General information for subarray YLE:	
Blank common reference location = TXY(179)	
Array size = 109 cells	
Array Location	Description
1-11	$Y_{FS}$ (1-11), Y-coordinate at intersection of the structural chord at each analysis control station and the front spar, root to tip
12	$X_{FSC-S}$ , X-coordinate of center-section front spar at outer panel analysis control station $Y_{EA}$ (1)
13-23	$X_{FS}$ (1-11), X-coordinate at intersection of the structural chord at each analysis control station and the front spar, root to tip
24	$D_{FSC-S}$ , depth of center-section front spar at point defined by values in $Y_{TB}$ (1) and $Y_{LE}$ (12)
25-35	$D_{FS}$ (1-11), depth at the front spar plane for the 11 analysis control stations, root to tip
36-46	$K_{sec}$ (1-11), structural box average to maximum depth factor at each analysis control station, root to tip
47-58	Not used
59-69	$J_{.10}$ (1-11), structural box section J for an assumed web gage value of 0.10 at each analysis control station, root to tip, in. <sup>4</sup>
70-79	$S_{LE}$ (1-10), planform area of leading edge panels bounded by the Y-coordinates of the 11 analysis control stations, the front spar and panel leading edge defined by a straight line joining the intersection points of the true leading edge and the Y-coordinates of the analysis control stations, root to tip
80-89	Not used
90-99	$Y_{CPLE}$ (1-10), Y-coordinate for centroid of panel surface area defined in location 70-79, each panel treated as trapezoidal sections, root to tip
100-109	$X_{CPLE}$ (1-10), X-coordinate for centroid corresponding to $Y_{CPLE}$ (1-10) above, assumed to be along the mid-chord element of each panel, root to tip

TABLE 33. YTE ARRAY, TRAILING EDGE GEOMETRY DATA

Array Location	Description
1-11	$Y_{RS}$ (1-11), Y-coordinate of intersection of the structural chord at each analysis control station and the rear spar, root to tip
12	$X_{RSC-S}$ , X-coordinate of center-section rear spar at outer panel analysis control station $Y_{EA}$ (1)
13-23	$X_{RS}$ (1-11), X-coordinate of intersection of the structural chord of each analysis control station and the rear spar, root to tip
24	$D_{RSC-S}$ , depth of center-section rear spar at point defined by values in $Y_{TB}$ (1) and $Y_{TE}$ (12)
25-35	$D_{RS}$ (1-11), depth at the rear spar plane for the 11 analysis control stations, root to tip
36-46	$D_{max}$ (1-11), maximum depth of structural cross-section of the torque-box at each analysis control station, from YTC(60) values, root to tip
47-58	Not used
59-69	$J_{20}$ (1-11), structural box section J for an assumed web gage value of 0.20 at each analysis control station, root to tip
70-79	$S_{TE}$ (1-10), planform area of trailing edge panels bounded by the Y-coordinates of the 11 analysis control stations, the rear spar and the panel trailing edge defined by a straight line joining the intersection points of the true trailing edge and the Y-coordinates of the analysis control stations, root to tip
80-89	Not used
90-99	$Y_{CPTe}$ (1-10), Y-coordinate for centroid of panel surface area defined in locations 70-79, each panel treated as trapezoidal sections, root to tip
100-109	$X_{CPTe}$ (1-10), X-coordinate for centroid corresponding to $Y_{CPTe}$ (1-10) above, assumed to be along the mid-chord element of each panel, root to tip

TABLE 34. ARRAY, LOCATIONS 1-200, 489-553

General information for array T:

Blank common reference location = 1

Array size = 2060 cells

Locations 1-195 contain general geometry and other miscellaneous data for use by all overlays of wing and empennage module. Data are created by subroutines CASE, GEOMW, and VSgeom of overlay (8,0). Data created by subroutines other than GEOMW are identified by name of that subroutine. Data in locations 489-553 are initially created by GEOMW and reinitialized by overlay (16,0) subroutine WDDATA with data from array TG.

Array Location	Original Array Location	Variable Name	Description
1	-	STOT	Total surface area per vehicle, sq ft
2	-	SEXP	Total exposed surface area per vehicle, sq ft
3	-	-	R, element line tangent factor, $R = 4(1+\lambda)/AR(1-\lambda)$
4	-	-	D are at $b_1/2$
5	YTB(23)	WCSEC	Center section box width
6	TXY(53)	-	$\cos \Lambda_0$ , cosine of planform reference sweep angle
7	TXY(52)	-	$\sin \Lambda_0$ , sine of planform reference sweep angle
8	TXY(51)	-	$\tan \Lambda_0$ , tangent of planform reference sweep angle
9	TXY(54)	-	$C \Lambda_0$ , X-axis intercept for planform reference sweep element line
10	YC(116)	TCCL	$(t/c)_R$ , thickness ratio at center-line station
11	YC(117)	TCTP	$(t/c)_{TIP}$ , thickness ratio at tip station
12	TXY(8)	BØ2	$b/2$ , semispan
13	-	AC	Arc centroid of torque-box section, average factor
14	-	TAU	$\tau$ , structural chord factor
15	TXY(7)	BS1Ø2	$b_1/2$ , side of body station
16	TXY(16)	B1SØ2	$b_{1s}/2$ , side of body structural station
17	-	SPTIP	STIP, sq ft/vehicle
18	-	GPNZ(1)	Positive gust load factor, 0.0, not used, CASE
19	-	(2)	Negative gust load factor, 0.0, not used, CASE
20	D(85)	DPNZ(1)	Positive design load factor, limit, CASE
21	D(86)	(2)	Negative design load factor, limit, CASE

TABLE 34. T ARRAY, LOCATIONS 1-200, 489-553 (CONT)

Array Location	Original Array Location	Variable Name	Description
22	-	DGWI	Design gross weight for current analysis PRØG, ACPRØG
23	-	-	$R \cdot \sin \Lambda_{EA} \cdot \cos \Lambda_{EA}$ , constant
24	-	SPBØX	ES'BOX, total exposed torque-box planform area, sq ft/vehicle
25	-	SPLE	ES'LE, total exposed leading edge planform area, sq ft/vehicle, GCNTL
26	-	SPTE	ES'TE, total exposed trading edge planform area, sq ft/vehicle, GCNTL
27-36	YTB(82-91)	SPNL(1-10)	STE(1-10), torque-box panel areas, tip to root, sq ft/side
37	TXY(10)	CTIP	CTIP, theoretical tip chord
38	TXY(32)	TANAC	Tan AC, slope for aerodynamic chord variation equation
39	-	YPVT	Yp, Y-coordinate of pivot, VSGEØM
40	-	XPVT	Xp, X-coordinate of pivot, VSGEØM
41	-	YSPVT	Y p, structural reference line station for pivot, VSGEØM
42	-	-	(X/C)FS, equivalent chord element line, front spar
43	-	-	(X/C)RS, equivalent chord element line, rear spar
44	-	-	(X/C)EA, equivalent chord element line, structural reference line
45	-	CPVT	Cp, aerodynamic chord at pivot station, VSGEØM
46	-	-	$\Delta C_p$ , chordwise distance between the pivot and leading edge, VSGEØM
47	-	-	XLEP, X-coordinate of leading edge at pivot station, VSGEØM
48	-	-	YEAP, Y-coordinate of intersection point of structural reference line and line from pivot normal to structural reference line, VSGEØM
49	-	-	XEAP, X-coordinate for point previously defined, VSGEØM
50	-	-	CSCP, X-axis intercept for line from pivot normal to structural reference line, VSGEØM
51	-	XSPVT	X p, X-coordinate of pivot point, structural reference system, VSGEØM
52	TXY(25)	CR	CR, aerodynamic root chord
53	-	YMACP	YMAC, Y-coordinate for exposed panel MAC

TABLE 34. T ARRAY, LOCATIONS 1-200, 489-553 (CONT)

Array Location	Original Array Location	Variable Name	Description
54	-	XMACP	XMAC, X-coordinate of structural reference line for exposed panel MAC
55	-	CMACP	CMAC, mean aerodynamic chord, MAC, exposed panel
56	-	DMACP	DMAC, maximum airfoil depth at Y <sub>MAC</sub>
57	-	WHVID	Factor to calculate totals/vehicle for wing, horizontal tail, and vertical tail, based on number of panels. 1.0 for wing and horizontal tail. 1.0 for 2 vertical tail panels, 2.0 for 1 vertical tail panel, CASE
58	CCI(114)	YIBFL	Inboard Y-coordinate for fuel cell 1, fuel cell 2 if used, FDIS
59	CCI(115)	YØBFL	Outboard Y-coordinate for fuel cell 1, fuel cell 2 if used, FDIS
60	-	-	S <sub>G</sub> , gross planform area, sq in.
61	TXY(2)	-	AR', aspect ratio for exposed panel
62	YTB(114)	XCSEC	XCG CSEC, X-coordinate for centroid of center-section panel
63	TXY(4)	TCP	t/c', thickness ratio at exposed root chord
64	TXY(3)	TRP	λ', exposed panel taper ratio
65	TXY(5)	SIGP	σ, exposed panel thickness ratio taper
66	YC(122)	DMCL	DRT, maximum airfoil depth at center-line station
67	YC(123)	DMTP	D <sub>TIP</sub> , maximum airfoil depth at tip station
68	TXY(29)	TANEA	Tan Δ <sub>EA</sub> , slope of structural reference line
69	-	-	$[1.0 + (\text{Tan } \Delta_{EA})^2]^{1/2}$
70	-	-	(1.0 + λ)
71	-	-	(RS-FS) <sub>↓</sub> , torque box width factor
72	-	-	Not used
73	-	-	Not used
74	-	-	Not used
75	TXY(36)	SINEA	Sin Δ <sub>EA</sub> , sine of sweep angle of structural reference line
76	TXY(41)	CØSFA	Cos Δ <sub>EA</sub> , cosine of sweep angle of structural reference line
77	-	-	(1.0-λ)
78	-	-	(1.0-λ σ)
79	-	-	(1.0-λ')
80	-	-	(1.0-λ' σ')
81	TXY(17)	BSØ2	b <sub>S</sub> /2, structural semispan
82	-	-	b', total exposed span

TABLE 34. . T ARRAY, LOCATIONS 1-200, 489-553 (CONT)

Array Location	Original Array Location	Variable Name	Description
83	TXY(15)	BPSØ2	$b's/2$ , exposed semispan
84	-	-	$(1.0+\lambda')$
85	TXY(18)	-	$CRS'$ , exposed structural root chord
86	-	TSIG	$\sigma$ , thickness ratio taper
87	-	TANDX	$Tan \Delta X_A$ , slope of line defining X distance between the structural reference line and 50% element line
88	-	CCLDX	$C_{\Delta X_A}$ , X-axis intercept for structural reference line offset
89	TXY(9)	CRP	$CR'$ , exposed aerodynamic root chord
90	-	TANDH	$Tan \Delta DIH$ , slope of wing reference plane dihedral
91	-	CCLDH	$C_{DIH}$ , Z-axis intercept for dihedral
92	TXY(45)	TAN5	$Tan \Delta_{5C}$ , slope of 50% element line
93	TXY(46)	CCL5	$C_{\Delta_{5C}}$ , X-axis intercept for 50% element line
94	-	-	$\lambda' \sigma'$
95	-	SCSEC	SC-SEC, 1.0 or center-section panel area, sq ft/vehicle
96	TXY(6)	BEXP	$b'/2$ , exposed semi-span
97	-	WFL(1)	$Y_{CP \text{ fuel}}$ , Y-coordinate for centroid of design fuel, ABDW
98	-	WFL(2)	$W_{\text{fuel design}}$ , design fuel weight, lb/vehicle, ABDW
99	-	WFL(3)	$W_{\text{fuel total}}$ , total fuel weight, lb/vehicle, ABDW
100-110	YTB(59-69)	TBCA(1-11)	$C_{1-11}$ , aerodynamic chord at analysis control stations
111-121	-	YRT(1-11)	$[b_s/2-Y(1-11)]$ , distance along structural reference line from tip station to each analysis control station, root to tip
122	TXY(27)	TANØ(1)	$Tan \Delta_{LE}$
123	TXY(28)	TANØ(2)	$Tan \Delta_{ES}$

TABLE 35. TVS ARRAY

<p>General information for array TVS:                  Blank common reference location = CD(601)                  Array size = 400 cells</p>	
Array Location	Description
<p>TVS (1-20) are for wing in the reference sweep position, exposed geometry outboard of pivot location.</p>	
1	$\delta'_P$ , exposed area outboard of pivot, sq ft
2	$AR'_P$ , exposed aspect ratio
3	$\lambda'_P$ , exposed taper ratio
4	$(t/c)'_P$ , thickness ratio at pivot station
5	$(t/c)_{TIP}$ , thickness ratio at tip station
6	Thickness ratio taper
7	$C'_{RP}$ , aerodynamic chord at pivot station
8	$C'_{TIP}$ , aerodynamic chord at tip station
9	$b'_{P/2}$ , exposed semi-span for movable panel
10	$b'_{1P/2}$ , pivot semi-span
11	$S'_{PS}$ , exposed area outboard of pivot, structural system, sq ft
12	$AR'_{PS}$ , exposed aspect ratio; structural system
13	$\lambda'_{PS}$ , exposed taper ratio; structural system
14	$(t/c)'_{RS}$ , thickness ratio at pivot station, structural system
15	$(t/c)'_{TIPS}$ , thickness ratio at tip station, structural system
16	Thickness ratio taper, structural system

TABLE 35. TVS ARRAY (CCNT)

Array Location	Description
17	$C_{RPS}$ , structural chord at pivot station
18	$C_{TIPS}$ , structural chord at tip station
19	$b_{PS/2}$ , exposed structural semispan for movable panel
20	$b_{PS/2}$ , pivot semi-span, structural system
Locations TVS(21-33) same as T(39-51)	
21	$Y_p$ , Y-coordinate at pivot, name = YPO in subroutine SWPXYP
22	$X_p$ , X-coordinate at pivot, name = XPO in subroutine SWPXYP
23	$Y_{AP}$ , structural reference line station for pivot
24	$(X/C)_{FS}$ , equivalent chord element line, front spar, recalculated with swept position data
25	$(X/C)_{RS}$ , equivalent chord element line, rear spar, recalculated with swept position data
26	$(X/C)_{EA}$ , equivalent chord element line, structural reference line, recalculated with swept position data
27	$C_p$ , aerodynamic chord at pivot station
28	$\Delta C_p$ , chordwise distance between the pivot and leading edge
29	$X_{LEP}$ , X-coordinate of leading edge at pivot station
30	$Y_{EAP}$ , Y-coordinate of intersection point of structural reference line and line from pivot normal to structural reference line
31	$X_{EAP}$ , X-coordinate of point previously defined
32	$C_{SCP}$ , X-axis intercept for line from pivot normal to structural reference line

TABLE 35. TVS ARRAY (CONT)

Array Location	Description
33	$X_{\Delta p}$ , X-coordinate of pivot point in structural reference system
34	$\pm\Delta\Lambda$ , delta angle of movable panel between the nominal and swept position, degrees
35	$\pm\Delta\Lambda$ , value of location 34 in radians
36	$\tan\Delta\Lambda$ , tangent of delta angle
37	$\sin\Delta\Lambda$ , sine of delta angle, name = SINDL in subroutine SWPXYP
38	$\cos\Delta\Lambda$ , cosine of delta angle, name = COSDL in subroutine SWPXYP
39-40	Not used
<p>Locations 41-292 contain calculated data for swept wing geometry.</p> <p>Locations 41-60 are Y- and X-coordinates for indicated nominal chord points in rotated wing position.</p>	
41	$Y_{LEP}$ , Y-coordinate for pivot chord leading edge point
42	$Y_{FSP}$ , Y-coordinate for pivot chord front spar point
43	$Y_{EAP}$ , Y-coordinate for pivot chord structural reference line point
44	$Y_{RSP}$ , Y-coordinate for pivot chord rear spar point
45	$Y_{TEP}$ , Y-coordinate for pivot chord trailing edge point
46	$X_{LEP}$ , X-coordinate for pivot chord leading edge point
47	$X_{FSP}$ , X-coordinate for pivot chord front spar point
48	$X_{EAP}$ , X-coordinate for pivot chord structural reference line point
49	$X_{RSP}$ , X-coordinate for pivot chord rear spar point

TABLE 35. TVS ARRAY (CONT)

Array Location	Description
50	$X_{TEP}$ , X-coordinate for pivot chord trailing edge point
51	$Y_{LETIP}$ , Y-coordinate for tip chord leading edge point
52	$Y_{FSTIP}$ , Y-coordinate for tip chord front spar point
53	$Y_{EATIP}$ , Y-coordinate for tip chord structural reference line point
54	$Y_{RSTIP}$ , Y-coordinate for tip chord rear spar point
55	$Y_{TETIP}$ , Y-coordinate for tip chord trailing edge point
56	$X_{LETIP}$ , X-coordinate for tip chord leading edge point
57	$X_{FSTIP}$ , X-coordinate for tip chord front spar point
58	$X_{EATIP}$ , X-coordinate for tip chord structural reference line point
59	$X_{RSTIP}$ , X-coordinate for tip chord rear spar point
60	$X_{TETIP}$ , X-coordinate for tip chord trailing edge point
61-71	$Y_{1-11}$ , Y-coordinate for the 11 analysis control stations
72-82	$X_{1-11}$ , X-coordinate for the 11 analysis control stations
83	$C_{LE}$ , X-axis intercept for leading edge element line
84	$C_{FS}$ , X-axis intercept for front spar reference line
85	$C_{EA}$ , X-axis intercept for structural reference line
86	$C_{RS}$ , X-axis intercept for rear spar reference line
87	$C_{TE}$ , X-axis intercept for trailing edge reference line
88	$C_R$ , aerodynamic root chord, X-axis intercept for aerodynamic chord variation equation
89	$C_{RSC}$ , structural root chord, X-axis intercept for structural chord variation equation

TABLE 35. TVS ARRAY (CONT)

Array Location	Description
90	$\text{Tan } \Lambda_{LE}$ , slope of leading edge element line
91	$\text{Tan } \Lambda_{FS}$ , slope of front spar reference line
92	$\text{Tan } \Lambda_{EA}$ , slope of structural reference line
93	$\text{Tan } \Lambda_{RS}$ , slope of rear spar reference line
94	$\text{Tan } \Lambda_{TE}$ , slope of trailing edge element line
95	$\text{Tan } AC$ , slope for aerodynamic chord variation equation
96	$\text{Tan } AC_S$ , slope for structural chord variation equation
97	$\text{Sin } \Lambda_{LE}$ sine of sweep angle for leading edge element line
98	$\text{Sin } \Lambda_{FS}$ , sine of sweep angle for front spar reference line
99	$\text{Sin } \Lambda_{EA}$ , sine of sweep angle for structural reference line
100	$\text{Sin } \Lambda_{RS}$ , sine of sweep angle for rear spar reference line
101	$\text{Sin } \Lambda_{TE}$ , sine of sweep angle for trailing edge element line
102	$\text{Cos } \Lambda_{LE}$ , cosine of sweep angle for leading edge element line
103	$\text{Cos } \Lambda_{FS}$ , cosine of sweep angle for front spar reference line
104	$\text{Cos } \Lambda_{EA}$ , cosine of sweep angle for structural reference line
105	$\text{Cos } \Lambda_{RS}$ , cosine of sweep angle for rear spar reference line.
106	$\text{Cos } \Lambda_{TE}$ , cosine of sweep angle for trailing edge element line
107	$b/2$ , semispan
108	$C_{TIP}$ , aerodynamic tip chord

TABLE 35. TVS ARRAY (CONT)

Array Location	Description
109	$X_{LET}$ , X-coordinate of leading edge at tip station
110	$X_{FST}$ , X-coordinate of front spar at tip station
111	$X_{EAT}$ , X-coordinate of structural reference line at tip station
112	$X_{RST}$ , X-coordinate of rear spar at tip station
113	$X_{TET}$ , X-coordinate of trailing edge at tip station
114	$S_G$ , planform area, swept position, sq ft
115	AR, aspect ratio
116	$\lambda$ , taper ratio
117	$(t/c)_R$ , thickness ratio at centerline
118	$(t/c)_{TIP}$ , thickness ratio at tip station
119	Thickness ratio taper
120	$C_R$ , aerodynamic chord at centerline
121	$C_{TIP}$ , aerodynamic chord at tip station
122	b/2, semispan
123	$b_{S/2}$ , structural semispan
124	$S'$ , exposed area outboard of side of body station, sq ft
125	$AR'$ , exposed aspect ratio
126	$\lambda'$ , exposed taper ratio
127	$(t/c)'_R$ , thickness ratio at side of body station
128	$(t/c)_{TIP}$ , thickness ratio at tip station

TABLE 35. TVS ARRAY (CONT)

Array Location	Description
129	Exposed thickness ratio taper
130	$C_R'$ , aerodynamic chord at side of body station
131	$C_{TIP}'$ , aerodynamic chord at tip station
132	$b'/2$ , exposed semispan
133	$b_1/2$ , side of body station
134	$\delta_S'$ , exposed area outboard of side of body station, sq ft
135	$AR_S'$ , exposed aspect ratio, structural system
136	$\lambda_S'$ , exposed taper ratio, structural system
137	$(t/c)_{RS}'$ , thickness ratio at side of body station structural system
138	$(t/c)_{TIPS}'$ , thickness ratio at tip station, structural system
139	Exposed thickness ratio taper, structural system
140	$C_{RS}'$ , structural chord at side of body station
141	$C_{TIPS}'$ , structural chord at tip station
142	$b_{S/2}'$ , exposed semispan, structural system
143	$b_{1S/2}'$ , side of body station, structural system
144	$\Lambda_{LE}'$ , sweep of leading edge element line, degrees
145	$\Lambda_{FS}'$ , sweep of front spar reference line, degrees
146	$\Lambda_{EA}'$ , sweep of structural reference line, degrees
147	$\Lambda_{RS}'$ , sweep of rear spar reference line, degrees
148	$\Lambda_{TE}'$ , sweep of trailing edge element line, degrees
149	0.0, not used

TABLE 35. TVS ARRAY (CONT)

Array Location	Description
150	$\Lambda_{0.25C}$ , sweep of quarter chord element line, degrees
151	$C_{0.25C}$ , X-axis intercept for quarter chord element line
152	$\tan \Lambda_{0.25C}$ , slope of quarter chord element line
153	$\sin \Lambda_{0.25C}$ , sine of quarter chord sweep angle
154	$\cos \Lambda_{0.25C}$ , cosine of quarter chord sweep angle
155	$X_{LE1}$ , X-coordinate of leading edge at side of body
156	$X_{FS1}$ , X-coordinate of front spar at side of body
157	$X_{EA1}$ , X-coordinate of structural reference line at side of body
158	$X_{RS1}$ , X-coordinate of rear spar at side of body
159	$X_{TE1}$ , X-coordinate of trailing edge at side of body
160	$X_{LEP}$ , X-coordinate of leading edge at pivot station
161	$X_{FSP}$ , X-coordinate of front spar at pivot station
162	$X_{EAP}$ , X-coordinate of structural reference line at pivot station
163	$X_{RSP}$ , X-coordinate of rear spar at pivot station
164	$X_{TEP}$ , X-coordinate of trailing edge at pivot station
165	$X_{LET}$ , X-coordinate of leading edge at tip station
166	$X_{FST}$ , X-coordinate of front spar at tip station
167	$X_{EAT}$ , X-coordinate of structural reference line or tip station
168	$X_{RST}$ , X-coordinate of rear spar at tip station
169	$X_{TET}$ , X-coordinate of trailing edge at tip station

TABLE 35. TVS ARRAY (CONT)

Array Location	Description
170-180	$Y_{\Lambda}(1-11)$ , structural reference station for 11 analysis control station, root to tip
181-191	$(\Delta Y_{\Lambda}/Y_{\Lambda}')_{1-11}$ , analysis control stations expressed in terms of fraction of exposed span, root to tip
192-202	$C(1-11)$ , aerodynamic chord at the analysis control stations, root to tip
203-213	$D_{MAX}(1-11)$ , maximum airfoil depth at the analysis control stations, same as YTB(70-80), root to tip
214-224	$(t/c)_{1-11}$ , thickness ratio of the analysis control station, root to tip
225-235	$Y_{FS}(1-11)$ , Y-coordinate at intersection of the structural chord at each analysis control station and front spar, root to tip
236-246	$X_{FS}(1-11)$ , X-coordinate at intersection of structural chord at each analysis
247-257	$Y_{RS}(1-11)$ , Y-coordinate at intersection of structural chord at each analysis control station and rear spar, root to tip
258-268	$X_{RS}(1-11)$ , X-coordinate at intersection of structural chord at each analysis control station and rear spar, root to tip
269	$D_{MAX}$ , maximum airfoil depth at centerline
270	$D_{MAX TIP}$ , maximum airfoil depth at tip station
271	$D_{MAX b_1/2}$ , maximum airfoil depth at side of body station
272	$D_{MAX P}$ , maximum airfoil depth at pivot station
Locations 273-292 contain planform geometry parameters for wing panel outboard of pivot, aerodynamic for first set and structural for second set.	

TABLE 35. TVS ARRAY (CONT)

Array Location	Description
273	$S_p'$ , exposed area outboard of pivot station, sq ft
274	$AR_p'$ , exposed aspect ratio
275	$\lambda_p'$ , exposed taper ratio
276	$(t/c)_p$ , thickness ratio at pivot station
277	$(t/c)_{TIP}$ , thickness ratio at tip station
278	Exposed thickness ratio taper
279	$C_p$ , aerodynamic chord at pivot station
280	$C_{TIP}$ , aerodynamic chord at tip station
281	$b_{p/2}'$ , exposed semispan
282	$b_{1P/2}$ , pivot semispan
283	$S_{PS}'$ , exposed area outboard of pivot station, structural system sq ft
284	$AR_{PS}'$ , exposed aspect ratio, structural system
285	$\lambda_{PS}'$ , exposed taper ratio, structural system
286	$(t/c)_{PS}$ , thickness ratio at pivot station, structural system
287	$(t/c)_{TIPS}$ , thickness ratio at tip station, structural system
288	Exposed thickness ratio taper, structural system
289	$C_{PS}$ , structural chord at pivot station
290	$C_{TIPS}$ , structural chord at tip station
291	$b_{PS/2}'$ , exposed structural semispan

TABLE 35. TVS ARRAY (CONT)

Array Location	Description
292	$B_{1PS/2}$ , pivot semispan, structural system
293	Not used
Locations 294-312 contain general geometry parameters, factors, and intermediate calculation data computed and saved during calculations for the foregoing data items.	
294	$-1/(\tan \Lambda_{EA})$
295	$C_{SC_i}$ , X-axis intercept for line normal to structural reference line
296	$[-1/(\tan \Lambda_{EA}) - \tan \Lambda_{FS}]$
297	$[-1/(\tan \Lambda_{EA}) - \tan \Lambda_{RS}]$
298	$\tau$ , geometric factor, structural to aerodynamic chord ratio
299	$(RS-FS)\perp$ , ratio of front to rear spar distance along the structural chord to the structural chord, based on equivalent chord data for front spar, rear spar, and structural reference line
300	$R$ , geometric factor to compute tangent of an element line sweep angle from tangent of sweep angle of reference line
301	$[1 + (\tan \Lambda_{EA})^2]^{1/2}$
302	$R \sin \Lambda_{EA} \cos \Lambda_{EA}$
303	$C_{SC}$ , X-axis intercept for line normal to structural reference line at the side of body station.
304	$C_{SC TIP}$ , X-axis intercept for line normal to structural reference line at tip station
305	$Y_{LE_i}$ , intermediate calculation data

TABLE 35. TVS ARRAY (CONCL)

Array Location	Description
306	$Y_{TE_i}$ , intermediate calculation data
307	$Y_{IBGJ}$ , inboard flutter factor control station, nominal span data required for calculation of corresponding point on swept planform
308	$Y_{\phi BGJ}$ , outboard flutter factor control station same as above
309	$Y_{IBGJ}$ , inboard flutter factor control station on structural reference line for swept planform
310	$Y_{\phi BGJ}$ , outboard flutter factor control station on structural reference line for swept planform
311-312	Intermediate calculation data
313	$X_{0.25C b_1/2}$ , X-coordinate of quarter chord at side of body station
314	$X_{0.25CP}$ , X-coordinate of quarter chord at pivot station
315	$X_{0.25C TIP}$ , X-coordinate of quarter chord at tip station
316-400	Not used

TABLE 36. TGJ ARRAY, FLUTTER ANALYSIS DATA

General information for array TGJ:			
Blank common reference location = T(1761)			
Array Size = 200 cells			
Array data calculated by subroutines GEOMW and VSGEOM for use by flutter requirement calculation subroutines GJCAL and GJTT in overlay (16,0). Data based on geometry and flutter analysis specifications. Two 100-cell blocks are created as required. 1-100 for fixed panel, wing in nominal position, 101-200 for wing in swept position. Array data stored in record 10, mass storage file 1 by GEOMW and read by GJCAL. Array data printed by GEOMW under control of IP(7).			
Array Location	Original Array Location	Name, Subroutine GJCAL	Description
Locations 1-7 contain input data values. The second D array locations are from the optional geometry data set for flutter analysis.			
1	D(240,340)	-	S, area, sq ft
2	D(241,341)	ARG	AR, aspect ratio
3	D(244,342)	-	$\lambda$ , taper ratio
4	D(242)	-	$\Lambda$ , sweep
5	D(243,344)	-	t/c, thickness ratio
6	D(245,345)	-	$\sigma$ , thickness ratio taper
7	D(246,343)	-	$b_1$ , center-section span
8	T(81)	BSØ2	$b_s/2$ , structure semispan
9	T(96)	BEXP	$b_1/2$ , exposed semispan
10	T(83)	BPSØ2	$b_s'/2$ , exposed structural semispan
11	T(15)	BSIØ2	$b_1/2$ , side of body station
12	T(89)	CBI	$C_R'$ , exposed root chord
13	-	DEI	$D_p$ , average depth at $b_1/2$
14	T(64)	TRP	$\lambda'$ , exposed taper ratio
15	T(63)	TCP	$(t/c)_R'$ , thickness ratio at exposed root chord
16	T(65)	SIGP	$\sigma'$ , exposed thickness ratio taper
17	T(14)	TAU	$\tau$ , structural chord factor
18	T(71)	RSFS	$(RS-FS)_\perp$ , structural box width factor
19	SINØ(3)	SINEA	$\sin \wedge EA$
20	CØSØ(3)	CØSEA	$\cos \wedge EA$
21	T(42)	-	(X/C)FS, equivalent chord
22	T(43)	-	(X/C)RS, equivalent chord
23	T(44)	-	(X/C)EA, equivalent chord

TABLE 36. TGJ ARRAY, FLUTTER ANALYSIS DATA (CONT)

Array Location	Original Array Location	Name, Subroutine GJCAL	Description
24	T(13)	AC	Arc centroid of torque box sections
25	SINØ(6)	SINØØ4	Sin $\Lambda$ .25C
26	CØSØ(6)	CØSØØ4	Cos $\Lambda$ .25C
27-37	T(111-121)	YS(1-11)	Structural reference line distance from tip, root to tip
38-48	T(542-552)	TBW(1-11)	Torque-box width, root to tip
49-59	T(530-540)	TBD(1-11)	Torque-box average depth, root to tip
60-70	T(100-110)	TBCA(1-11)	Aerodynamic chord, trapezoidal planform, root to tip
71	D(252)	VFK	Flutter speed margin
72	D(253)	VFQ	Critical flutter dynamic pressure
73	D(254)	VFG	Material modulus of rigidity at critical flutter condition
74	D(249,259)	VFT	Material temperature at critical flutter condition
75	D(312)	GJFAC	Flutter requirement calibration factor
76	D(313)	GJYI	Inboard control station, flutter factor
77	D(315)	GJYØ	Outboard control station, flutter factor
78-88	T(511-521)	-	Y $\Lambda$ (1-11), structural station values, analysis control stations
89-99	T(500-510)	-	YEA(1-11), Y-coordinates, analysis control station
100	-	-	Not used
Data in locations 101-200 created by VSGEØM only if input data locations D(200) and D(320) are not zero.			
101	TVS(114)	-	S, area, sq ft
102	TVS(115)	-	AR, aspect ratio
103	TVS(116)	-	$\lambda$ , taper ratio
104	TVS(144)	-	$\Lambda$ , sweep
105	TVS(117)	-	t/c, thickness ratio
106	TVS(119)	-	$\sigma$ , thickness ratio taper
107	-	-	b <sub>1</sub> , center-section span
108	TVS(123)	-	b <sub>s</sub> /2, structural semispan
109	TVS(132)	-	b <sub>1</sub> /2, exposed semispan
110	TVS(142)	-	b <sub>s</sub> <sup>1</sup> /2, exposed structural semispan
111	TVS(133)	-	b <sub>1</sub> /2, side of body station
112	TVS(130)	-	C <sub>R</sub> , exposed root chord

TABLE 37. TFRDK ARRAY, GEOMETRY ARRAY FOR MASS PROPERTIES CALCULATIONS

<p>General information for array TFRDK:                  Blank common reference location = T(1986)                  Array size = 60 cells                  Array contains front and rear spar depth data for use by overlay (14,0) subroutine LETEI.                  Array data is created by subroutine GEOMW, overlay (8,0).</p>	
Array Location	Description
1-10	Tan $KD_{LE}$ (1-10), slopes of straight lines passed through adjacent depth values evaluated at a point 0.025 times true aerodynamic chord, aft of true leading edge, on chord at each analysis control station.
11-20	$CKD_{LE}$ (1-10), Z-axis intercepts for corresponding depth variation lines defined by aforementioned slopes.
21-30	Tan $KD_{FS}$ (1-10), slopes of straight lines passed through adjacent depth values for airfoil point defined by intersection of front spar reference line and Y-coordinates for analysis control stations.
31-40	$CKD_{FS}$ (1-10), Z-axis intercepts for corresponding depth variation lines defined by aforementioned slopes.
41-50	Tan $KD_{RS}$ (1-10), slopes of straight lines passed through adjacent depth values for airfoil point defined by intersection of rear spar reference line and Y-coordinates for analysis control sections.
51-60	$CKD_{RS}$ (1-10), Z-axis intercepts for corresponding depth variation lines defined by aforementioned slopes.

## YC AND YTC ARRAYS, OVERLAY (8,0)

The YC and YTC arrays, Tables 38 and 39, contain computed surface leading edge, trailing edge, airfoil and spanwise depth variation data. True leading and trailing edge position data are derived from input specifications by subroutine GEØMC, organized and stored in array YC for use by subroutine CAERO. Required spanwise depth variation data are computed from thickness ratio specifications and derived true aerodynamic chord data, by subroutine GEØMC, organized and stored in array YTC for use by subroutine DMAX.

YC array locations 1 through 92 and YTC array locations 47 through 60 are used to store data computed by subroutines CAERØ, DMAX, ABØXC, and TBWDC so that pertinent informations commonly available to all subroutines. Data from these arrays are also used by subroutine GCØMP during data processing for printed geometry summary output.

Data contained in arrays YC and YTC are required for geometry computations by subroutine CTØT in overlay (14,0), (15,0), and (17,0). In these overlays subroutine CTØT requires the original information contained in locations 1 through 92 of the overlay (8,0) YC array to be located in locations 41 through 132; YC array locations 1 through 40 are used to store calculated data by subroutine CTØT. Information in locations 1 through 46 of array YTC are used by subroutine CTØT as originally created; locations 47 through 60 are not used.

Overlay (8,0) YC and YTC information is transmitted to overlays (14,0) and (15,0) by the operating system. System features allow for blank common save and initialization when program execution is transferred from one overlay to another. This is accomplished by the BUFFER OUT instruction in the exiting program to save blank common and the BUFFER OUT instruction in the incoming program to reset blank common. Subroutine WLETE in overlay (14,0) rearranges the YC array data for use by subroutine CTØT of overlays (14,0) and (15,0).

Subroutine CASE, overlay (8,0) saves YC array data as originally calculated and YTC array data in locations 1 through 50 on record 144, mass storage file 1, as a 200-cell block. This information is created in overlay (17,0) by subroutine WØDATA for use by subroutine CTØT of that overlay.

TABLE 38. YC ARRAY, OVERLAY (8,0)

General information for array YC: Blank common reference location = T(201) Array size = 150 cells Array data in locations 1 through 92 are created by GEOMC when either linear or non-linear leading edge options are used. Created data sub-set size = number of input control stations plus 1. Data in locations 1 through 92 are used in overlays (14,0), (15,0) and (17,0) for true aerodynamic and structural chord calculations. The arrangement of data used from this array along with the storage of and data items calculated are different from that of overlay (8,0). Descriptions for array YC used in overlays (14,0), (15,0) and (17,0) can be found in Section V.	
Array Location	Description
1-12	$Y_{LE(1-12)}$ , Y-coordinates for the up to 11 input control stations used for defining locations of the true planform leading edge. The tip station value is added to the data set.
13-24	$X_{LE(1-12)}$ , X-coordinates corresponding to the stations defined in locations 1 through 12. The tip station coordinate is assumed to be for the leading edge element line of the theoretical trapezoidal planform.
25-35	Tan LE(1-11), slope of the straight lines passed through adjacent points defined by the X-, Y-coordinates above.
36-46	$C_{LE(1-11)}$ , X-axis intercepts for the straight lines defined by the slopes and X-, Y-coordinates above.
47-58	$Y_{TE(1-12)}$ , Y-coordinates for trailing edge, similar to locations 1 through 12 above.
59-70	$X_{TE(1-12)}$ , X-coordinate for trailing edge, similar to locations 25 through 24 above.
71-81	Tan TE(1-11), slope of trailing edge lines similar to locations 25 through 35 above.
82-92	$C_{TE(1-11)}$ , X-axis intercept for trailing edge lines similar to locations 36 through 46 above.  Locations 93 through 150 are used to store the data items indicated, calculated during the section geometry analysis at each analysis control station:
93	$X_{LE_1}$ , X-coordinate at the true leading edge for $Y_1$ defined in location 100, CAERØ.

TABLE 38. YC ARRAY, OVERLAY (8,0) (CONT)

Array Location	Description
94	$X_{LEO_i}$ , X-coordinate at the leading edge of the trapezoidal planform for $Y_i$ defined in location 100, CAERØ
95	$X_{FS_i}$ , X-coordinate at the front spar for $Y_i$ defined in location 100, CAERØ
96	$X_{EA_i}$ , X-coordinate at the structural reference line for $Y_i$ defined in location 100, CAERØ
97	$X_{RS_i}$ , X-coordinate at the rear spar for $Y_i$ defined in location 100, CAERØ
98	$X_{TEO_i}$ , X-coordinate at the trailing edge of the trapezoidal planform for $Y_i$ defined in location 100, CAERØ
99	$X_{TE_i}$ , X-coordinate at the true trailing edge for $Y_i$ defined in location 100, CAERØ
100	$Y_i$ , Y-coordinate value to be used by subroutine CAERØ to calculate aerodynamic chord data found in locations 93 through 99 and 102 through 106. Set up by ABØXC, GEØMW, GEØMC.
101	$X_i$ , X-coordinate for the analysis point on the plane defined by $Y_i$ above. Set up by ABØXC, GEØMW, GEØMC.
102	$C_i$ , true aerodynamic chord at $Y_i$ , $X_{TE_i} - X_{LE_i}$ , CAERØ
103	$(x/c)_i$ , fraction of chord above for point defined by $Y_i$ and $X_i$ , $(X_i - X_{LE_i})/C_i$ , CAERØ
104	$C_o$ , aerodynamic chord for trapezoidal planform at $Y_i$ , $X_{TEO_i} - X_{LEO_i}$ , CAERØ
105	$(X/C_o)_i$ , fraction of trapezoidal chord above for point defined by $Y_i$ and $X_i$ , $(X_i - X_{LEO_i})/C_{o_i}$ , CAERØ
106	Intermediate calculation data, CAERØ
107	Intermediate calculation data, GEØMC
108	Intermediate calculation data, GEØMC
109	Intermediate calculation data, GEØMC

TABLE 38. YC ARRAY, OVERLAY (8,0) (CONCL)

Array Location	Description
110	$Y_{FS_i}$ , Y-coordinate at intersection of the structural chord at each analysis control station and the front spar, ABØXC
111	$X_{FS_i}$ , X-coordinate at intersection of the structural chord at each analysis control station and the front spar, ABØXC
112	$D_{FS_i}$ , airfoil depth at the front spar-structural chord intersection point defined in locations 110 and 111, ABØXC
113	$Y_{RS_i}$ , Y-coordinate at intersection of the structural chord at each analysis control station and the rear spar, ABØXC
114	$X_{RS_i}$ , X-coordinate at intersection at the structural chord at each analysis control station and the rear spar, ABØXC
115	$D_{RS_i}$ , airfoil depth at the rear spar-structural chord intersection point defined in locations 113 and 114, ABØXC
116	$t/c_{RT}$ , same value as in TXY(451), GEØMC
117	$t/c_{TIP}$ , same value as in TXY(452), GEØMC
118	$Y_{IB}$ , same value as in TXY(453), GEØMC
119	$Y_{ØB}$ , same value as in TXY(454), GEØMC
120	$D_{IB}$ , same value as in TXY(455), GEØMC
121	$D_{ØB}$ , same value as in TXY(456), GEØMC
122	$D_{RT}$ , same value as in TXY(457), GEØMC
123	$D_{TIP}$ , same value as in TXY(458), GEØMC
124	Tan D, same value as in TXY(459), GEØMC
125-139	Not used
140	Set to 0.10 by TBWDC to be used by ABØXC to calculate the Section J for an assumed web gage value as indicated.
141	Set to 0.20 by TBWDC to be used by ABØXC to calculate the Section J for an assumed web gage value as indicated.
142	$K_{sec}$ , section average to maximum depth factor, TBWDC
143-150	Not used

TABLE 39. YTC ARRAY

<p>General information for array YTC:                  Blank common reference location = T(351)                  Array size = 60 cells                  Array data locations 1 through 46 are created by GEOMC when either linear or nonlinear depth variation options are used. Created data subset size = number of input control points plus 1.                  This array is used in overlays (8,0), (14,0), (15,0), and (17,0).                  Locations 47 through 60 are used only in overlay (8,0). Subroutine CTOT of overlays (14,0), (15,0), and (17,0) uses array locations 1 through 46 only for maximum airfoil depth calculations.</p>	
Array Location	Description
1-12	$Y_{t/c}(1-12)$ , Y-coordinates for the up to 11 input control stations used for defining spanwise thickness ratio variations. The tip station value is added to the data set.
13-24	$D_{max}(1-12)$ , maximum airfoil depth at the control stations defined in locations 1 through 12. The depths are calculated from the input (t/c) specifications and true aerodynamic chords calculated from the leading and trailing edge data sets in array YC. The added tip station depth value is based on data derived from the basic input specifications for thickness ratio distributions, locations 141, 142, 243, and 245 of the variable data block, array D.
25-35	$\tan D_{max}(1-11)$ , slope of the straight lines passed through adjacent maximum depth values of the corresponding Y-coordinates of the data sub-sets in locations 1 through 24.
36-46	$C_{D_{max}}(1-11)$ , Z-axis intercepts for corresponding linear depth variation lines defined by the slopes, $D_{max}$ and Y-coordinates above.
<p>Locations 47 through 60 are used to store the data items indicated, calculated during the section geometry analysis at each analysis control station.</p>	
47	$Y_i$ , Y-coordinate of local airfoil depth calculation point by subroutine DMAX, setup by AB0XC, GEOMW, TBWDC
48	$X_i$ , X-coordinate of local airfoil depth calculation point by subroutine DMAX, setup by AB0XC, GEOMW, TBWDC
49	$D_i$ , calculated local depth at coordinates defined by $Y_i$ and $X_i$ above, calculated by DMAX
50	$D_{max_i}$ , maximum depth of airfoil at $Y_i$ above, calculated by DMAX

TABLE 39. YTC ARRAY (CONCL)

Array Location	Description
51	Intermediate calculation data, polynomial airfoil depth equation calculation by DMAX
52	Tan D, same value as in YC(124) and TXY(459), GEØMC
53	DRT, same value as in YC(122) and TXY(457), GEØMC
54	D <sub>tip</sub> , same value as in YC(123) and TXY(458), GEØMC
55	Intermediate calculation data, delta Y, GEØMC. Changed by DMAX to ratio of average torque-box depth to the maximum depth along the structural width of the torque-box section at each analysis control station. Used by ABØXC.
56	Not used
57	C <sub>i</sub> , true aerodynamic chord at coordinates defined by Y <sub>i</sub> and X <sub>i</sub> above, DMAX.
58	ΔC <sub>i</sub> , distance between the coordinate point X <sub>i</sub> and the true leading edge point X <sub>LE<sub>i</sub></sub> on the local airfoil defined by Y <sub>i</sub> , X <sub>i</sub> -X <sub>LE<sub>i</sub></sub> , DMAX
59	(X/C) <sub>i</sub> , fraction of chord above for calculation of local depth, ΔC/C <sub>i</sub> , DMAX
60	D <sub>max<sub>i</sub></sub> , maximum depth of structural cross-section of the torque-box at each analysis control station, numerically selected by ABØXC based on calculated values of local depths along the structural width.

## OUTPUT DATA ARRAYS TD AND TS

Arrays TD and TS are used by print subroutine PRTG as the data array for printed output of geometry summary data. Array TG data are organized by subroutine GCOMP primarily from data previously computed and stored in arrays TXY, T, and TVS. Table 40 describes the contents of array TD. The original array locations for transferred information are included. Items without original array locations indicated are computed by subroutine GCOMP.

Array TS (Table 41) consists primarily of data processed by subroutine PRTG from the contents of array TD.

TABLE 40. TD ARRAY, PRINTED OUTPUT GEOMETRY DATA

General information for array TD: Blank common reference location = CD (1101) Array size = 600 cells		
Array Location	Original Array Location	Description
1	D(242)	Input planform sweep, degrees
2	D(138)	Input planform sweep reference chord
3	D(240)	Input planform area, sq ft
4	D(241)	Input planform aspect ratio
5	D(244)	Input planform taper ratio

## SUBROUTINE DESCRIPTIONS

### PROGRAM ØLAY8

Deck name: ØLAY8  
Entry name: ØVERLAY(SHALPHA,8,0)  
Called by: Program ØLAY00  
Subroutines called: CCNTL

Program ØLAY8 is the main overlay (8,0) program. The only function of this routine is to initialize blank common, to execute the overlay subroutines, and to save blank common before the next overlay, (14,0), is loaded into core.

### SUBROUTINE CCNTL

Deck name: CCNTL  
Entry name: CCNTL  
Called by: Program ØLAY8  
Subroutine called: CASE, READMS

Subroutine CCNTL is the first wing and empennage module subroutine to be executed. The primary function of this subroutine is to process module input data, variable data array D, for the surface type to be evaluated. Array D is initialized from the appropriate mass storage record for the problem-records 23, 26, and 27 for the wing horizontal tail and vertical tail, respectively. These records, 2060 data cells, contain the initial SWEEP permanent data bank values for the surface plus the contents of the input variable data blocks for each surface, input data decks WING, HORIZONTAL, and VERTICAL.

Subroutine CCNTL then revises the contents of array D with data from the following sources:

1. Array WD, mass storage file 1, record 21, Table 20
2. Array SPAL, mass storage file 1, record 38, Table 21
3. Array XMISC, label common block MISC, Table 5

Data transfer into array D is governed by the original contents of Array D status resulting from the merging of variable data block values into the initial SWEEP permanent data bank values. Specific data items and array D location that may be adjusted by subroutine CCNTL are presented in Table 42. The data source and specific control locations are also listed. Actual transfer of information is made only if the value in the tested cells have been initialized to zero.

Subroutine CCNTL prints the following blocks as printed output data if column 3; case control card 1 is specified with a zero value -- array IP(3):

1. Contents of the D array region affected by the data transfer options, values before the processing operations are executed
2. Contents of array WD
3. Contents of array SPAL
4. Contents of all locations of array D after the data transfer operations have been executed

Subroutine CCNTL initially sets blank common to 0.0 before the foregoing operations are performed. It also initializes locations 1-20, 59, 60, and 85 of array ND with required integer values.

Subroutine CCNTL executes subroutine CASE before returning control to program ØLAYS. Subroutine CASE is executed for processing of general vehicle design data and for computations of surface geometry information.

#### Subroutine Variables

Table 43 contains the variable referenced by subroutine CCNTL. References to arrays D and T are made by actual location references by this subroutine. References to array SPAL are made as T array references, T(xxxx); T array locations 1001-1050 contains the values found in array SPAL.

#### Labeled Common Variables

Array IP, labeled common block IPRINT.  
Array XMISC, labeled common block MISC.  
Array R, XMISC array locations 85-100.

#### Mass Storage File Records

Reads record 21, array WD  
Reads record 23, variable data, wing  
Reads record 26, variable data, horizontal tail  
Reads record 27, variable data, vertical tail  
Reads record 38, array SPAL

#### Error Messages

None.

## SUBROUTINE CASE:

Deck name: CASE  
Entry name: CASE  
Called by: Subroutine CCNTL  
Subroutine called: GEOMW, WRITMS

Subroutine CASE is the first analysis subroutine of the wing and empennage module to be executed. This subroutine performs the following computations:

1. Processes total vehicle and design fuel data.
2. Computes values for the four basic flight design weights located in array D locations 102-105, array DGWI, and variable DGWØ.
3. Determines proper code values for control codes LID and WHVID.
4. Processes design load factor and dynamic pressure data.
5. Executes the geometry calculation subroutine through subroutine GEOMW.
6. Saves the contents of array YC on record 144, mass storage file 1 for later use by overlay (17,0).
7. Processes general weight factors into array T, locations 177-195.

Subroutine CASE tests the input values of the general surface and component weight factors. This test is for zero values; any zero value are set to 1.0 so that valid calculated weight information will result from downstream computations.

### Subroutine Variables

Named variables referenced by subroutine CASE are identified in Table 44. The calculated variables from this subroutine are all necessary for downstream computations. Computed values are not revised by other subroutines.

### Labeled Common Variables

None.

Mass Storage File Records

Writes record 144, array YC.

Error Messages

None.

## SUBROUTINE GEØMV

Deck name: GEØMV  
Entry name: GEØMV  
Called by: Subroutine CASE  
Subroutines called: ABØXC, CAERØ, DMAX, GEØMC, PRTG, TBWDC, VSØEM

Subroutine GEØMV is the basic geometry calculation and analysis control routine. This subroutine governs the execution of all geometry analysis routines of overlay (8,0). Data computed by subroutine GEØMV are stored in the overlay (8,0) output arrays TXY, T, TGJ, TFRDK, YC, and YTC. Input data for subroutine analysis are all contained in array D. Mass storage file 1, record 36, is used to initialize the contents of array DAF, airfoil cross-section data array.

Data contained in arrays TXY, T, TFRDK, YC, and YTC are used by overlays (14,0), (15,0), and (16,0). These array data are transmitted to the downstream array as blank common data. Array TGJ information is used by subroutine GJCAL, overlay (16,0). TGJ data are transmitted to overlay (16,0) through record 10, mass storage file 1.

The sequential order of computations by GEØMV is as follows:

1. Initialize array DAF from record 36, mass storage file 1. Create array AFD data from DAF, based on the input value of airfoil type code AFID, D(143).
2. Compute surface planform geometry data stored in array TXY.
3. Execute subroutine GEØMC to create data required in arrays YC, YTC, and TAF.
4. Execute subroutine TBWDC to create detail geometry parameters associated with the 11 analysis control stations.
5. Create array TFRDK data (Table 37) for use in overlay (14,0).
6. Execute subroutine VSØEM to create data for arrays TVS and TGJ, as required.
7. Execute subroutine PRTG for output print of geometry summary data. This execution is governed by the code value specified in column 6, case control card 1, IP(6).
8. Create required array T data (Table 34).

9. Create required design data for array TGJ, locations 1-100 (Table 36). Save TGJ data on record 10, mass storage file 1.
10. Print contents of arrays TGJ and TT, based on code value of column 7, case control card 1, IP(7).

Subroutine GEØMV uses array TT for storage and retrieval of data during computations for the preceding items 2, 5, 8, and 9. Table 45 contains the definitions for TT array locations used in these calculations.

The data items stored in T(42), T(43), and T(44), equivalent chord element line values for the front spar, rear spar, and structural reference line locations, are computed for use by the flutter requirements analysis sub-routines. The empirical equations used for flutter requirement estimation are based on the assumption that the spar and bending/torsional reference line for the structural box are located on constant element lines. Input specifications allow the user to locate these reference lines off element lines. The values in T(42), T(43), and T(44) are derived based on the following assumptions:

1. Front spar location; T(42). The equivalent element line is the chord position that will result in a leading edge area forward of the front spar between structural reference stations 1 and 11 and equal to the leading edge area defined by the true front spar reference line.
2. Rear spar location; T(43). Similar to the assumptions for the front spar, except that the area is that part aft of the rear spar.
3. Structural reference line location; T(44). The equivalent structural reference position is the element line with the same sweep angle as the true structural reference line.

The flutter requirement equations also assume constant taper planforms and structural torque-box cross sections. Thus, for surface designs with blended leading edges, cranked trailing edges, or nonlinear spanwise depth variations, flutter analysis geometry parameters must be recomputed based on linear approximations for aerodynamic chords and torque-box depths. Variable-data item GJS, D(340), is used at the control code to initiate these computations. The aerodynamic chord values, TGJ(60) through TGJ(70), are based on theoretical planform chords. Depth variations are based on input data values for thickness ratio, (t/c), and taper,  $\sigma$ . Input data values in D(344), GJTC, and D(345), GJSIG, are used if nonzero values are input. If zero values are specified for these items, the data in D(243), TCIB, and D(245), WSIG, are used.

### Subroutine Variables

Table 46 contains the variables referenced by subroutine GEMV.

### Labeled Common Variables

Array IP, labeled common block IPRINT.

### Mass Storage File Records

Reads record 36, array DAF, airfoil cross-section data.

Writes record 10, array TGJ, flutter requirement analysis data.

### Error Messages

None.

TABLE 45. TT ARRAY, GEOMV

General information for array TT:

Blank common reference location = T(1317)

Array size = 20 cells

Array contains miscellaneous intermediate calculation data. Definitions found in the following are for the following computations:

- Column 1. Equation constants for front spar, structural and rear spar reference lines, TXY(21) - TXY(23) and TXY(28) - TXY(30).
- Column 2. Structural chord values in TXY(18), TXY(19), and TXY(26).
- Column 3. TFRDK array data.
- Column 4. Revised theoretical trapezoidal geometry data for flutter analysis, TGJ array data, when analysis control code GJS, D(340), is specified as a nonzero positive value (theoretical Planform area for flutter analysis).
- Column 5. Equivalent chord element line values in T(42) - T(44).

## SUBROUTINE GEØMC

Deck name: GEØMC  
Entry name: GEØMC  
Called by: Subroutine GEØMN  
Subroutines called: CAERØ

Subroutine GEØMC processes input variable data defining (1) the true positions of the surface leading and trailing edges, (2) the spanwise variations of airfoil maximum depths, and (3) the reference airfoil cross sections and locations, if required.

This subroutine is used to process data contained in arrays DLE, DTE, and DTC, (Tables 22 through 24) to create the required information for arrays YC and YTC (Tables 38 and 39). Array YC and YTC are used by subroutines CAERØ and DMAX to compute local chord and maximum thickness values at any spanwise station  $Y_i$ .

Airfoil cross section and location information contained in arrays AFN and YAF are processed only if the airfoil type control code AFID, location D(143), is specified as 9.0. Data in array TAF (Table 29) is created based on these input array specifications. Airfoil cross-sectional data stored in array DAF (Table 25) are used to create normalized airfoil ordinate table data in array TAF. Array TAF is used by subroutine DMAX during the linear interpolation computations for airfoil depths at any point on the surface planform, defined by coordinates  $(Y_i, X_i)$ . The reference  $(x/c)$  values for the ordinate table data are moved to locations 1-48 of array DAF for use by subroutine DMAX. The code word containing the number of airfoil ordinate points, NAF, is created from the value in DAF (100).

Subroutine GEØMC prints the contents of array TAF under control of column 4, case control card 1, IP(4), only if data for this array is processed. Arrays YC and YTC are always printed under control of IP(4).

### Subroutine Variables

Variables referenced by subroutine GEØMC are listed in Table 47. The primary output of this subroutine is the contents of arrays TAF, YC, and YTC and the value in code word NAF.

Labeled Common Variables

Array IP, labeled common block IPRINT.

## SUBROUTINE VSGEOM

Deck Name: VSGEOM  
Entry Name: VSGEOM  
Called by: Subroutine GEOMW  
Subroutines called: SWPXYP.

Subroutine VSGEOM is the geometry analysis routine that computes swept wing planform data. This subroutine is always executed by subroutine GEOMW. However, VSGEOM calculations are only made if two input control data are specified as nonzero numbers; i.e., DYPVT, location D(200), and DLLMDA, location D(320). Subroutine VSGEOM creates array TVS data (Table 35), the pivot information stored in T(39) through T(51) (Table 34), and the flutter requirement analysis data in locations 101 through 200 of array TGJ (Table 36).

The swept planform for which VSGEOM computations are made is for the movable wing position that is critical for flutter. The position is specified in location D(320), DLLMDA. DLLMDA is treated as the angular sweep increment (negative or positive, but not zero) from the reference theoretical position. Values for the general planform geometry parameters found in array TXY are computed and stored in array TVS. Pertinent swept position coordinates are computed by subroutine SWPXYP. The theoretical planform parameters, S, AR, and  $\lambda$ , are based on the computed theoretical root chord, tip chord, and semi-span. The semispan for the swept station, TVS(107), is assumed to be the swept position Y-coordinate of the intersection point of the structural reference line and the tip chord, TXY(8), TXY(433). The theoretical root and tip chords are determined as the chordwise distance between the 0- and 100-percent chord element lines in the swept position.

The flutter analysis data in array TGJ are based on information stored in arrays TVS, YTB, and the variable input data array D. Initial clear for array TGJ is made by subroutine VSGEOM.

The contents of array TVS is printed by subroutine VSGEOM under control of column 7, case control card 1, IP(7).

### Subroutine Variables

Variables referenced by subroutine VSGEOM are listed in Table 48. The primary input variables are stored in arrays TXY and D.

### Labeled Common Variables

Array IP, labeled common block IPRINT.

## SUBROUTINE TBWDC

Deck name: TBWDC  
Entry name: TBWDC  
Called by: Subroutine GEOMW  
Subroutines called: ABØXC, DMAX

Subroutine TBWDC is the geometry analysis routine used to compute the structural station and panel data contained in subarrays YTB, YLE and YTE of array TXY (Tables 31 through 33). Required torque-box data used by other analysis routines are as follows:

1. Structural analysis control station coordinates,  $Y_{\Lambda 1-11}$ ,  $Y_{1-11}$ , and  $X_{1-11}$ .
2. Structural chord of torque-box at each control station,  $W_{1-11}$
3. Average section depth at each control station,  $D_{ave 1-11}$
4. True aerodynamic chord at each control station,  $C_{1-11}$
5. Front spar depth at each control station,  $D_{FS1-11}$
6. Rear spar depth at each control station,  $D_{RS1-11}$
7. Structural distance from tip chord to each analysis control station, measured along structural reference line,  $Y_{\Lambda 1-11}$

Values for these items are computed and stored in TXY array locations. Calling subroutine GEOMW processes the information into the appropriate storage locations of array T (Table 34). Subroutine GCNTL, overlay (14, 0) uses data stored in subarray YTB to create the control station geometry data stored in array TG. Array TG is used by overlays (14, 0), (15, 0), (16, 0), and (17, 0).

Two options are available for locating the spanwise positions of the 11 analysis control stations. The option to be used is determined by the code value specified in control word DYID, location 864, array D. A zero value results in location of the 11 equally spaced stations between the station values defined by input data locations D(246) and D(139), variable YØBD. A

nonzero value for DYID results in processing of control station data in input data locations D(865) - D(876), variable data subarray DYS. Processing of input station values are dependant upon the nonzero value of DYID and the magnitude of the values specified in DYS.

DYID code values of 1.0, 2.0, and 3.0 direct subroutine TBWDC to use the following processing options:

- Code value 1.0 = computed input station values to be referenced to the side of fuselage station,  $Y_1 = (\text{value in D(246)})/2.0$ . If input station values in DYS are 1.0 or less, the fractional values are applied to the span segment between the stations defined by D(246) and D(139).
- Code value 2.0 = computed input station values to be referenced to the planform centerline,  $Y_{1-11} = \text{input Y - coordinates 1-11}$ . If the input station values in DYS are 1.0 or less, the fractional values are applied to the span segment between the center-line and the station defined by D(139).
- Code value 3.0 = input control stations along the structural reference line, actual station values.

The code value of 3.0 for DYID is also interpreted to mean that 11-station geometry data for the structural box included in data locations D(876) - D(919), subarrays DTBW, DTBD, DFS, and DRS, are to be used in lieu of computed data. However, if only the station values in DYS are to be used, the  $W_1$  location, D(876) or DTBW (1), must be set to 0.0. Input data in subarrays DTBW, DTBD, DFS, and DRS are not processed when the DYID code value is 0.0, 1.0 or 2.0.

Subroutine ABØXC is used to compute required geometry data at each control station. These computations are always executed, even if the desired data is input. ABØXC calculation results are used by subroutine TBWDC to develop necessary station data not included as input.

Subroutine TBWDC also computes center-section geometry data that are stored in array YTB, YLE, and YTE. Width, average depth, depth at the front and rear spars, and the planform geometric centroid station are computed for the center-section.

The code value for NCSEC, torque-box analysis type is created based on code word DYID and the input torque-box data sets. This code is a special code used to evaluate constant-section, constant load structures (center-section type). The code value is used by subroutine SECTD, overlay (10,0) to bypass evaluation for stations 1-10 and to use design values computed for station 11 for all stations. The code value for NCSEC is set to 1 for all normal outer panel type geometries. DYID code value of 3.0 directs subroutine TBWDC to examine  $W_1$ , as previously explained. If  $W_1$  contains a positive value, the value for  $W_2$  is examined. If  $W_2$  is nonzero, TBWDC assumes a complete set of torque-box geometry is input; it continues processing of data for outer panel type analysis. If  $W_2$  is specified as 0.0, the value for NCSEC is set to 2. This code condition directs TBWDC to set all station 2-11 values for  $W$ ,  $D_{ave}$ ,  $D_{FS}$ , and  $D_{RS}$  equal to the values specified for station 1.

Subroutine TBWDC prints heading data for the output from subroutine DMAX under control of IP(5). This DMAX output set is computed data for center-section geometry.

#### Subroutine Variables

Variables referenced by subroutine TBWDC are listed in Table 49. Computed data stored in arrays TR and TT are defined in Tables 50 and 51.

#### Labeled Common Variables

Array IP, labeled common block IPRINT.

#### Mass Storage File Records

None.

#### Error Messages

None.

TABLE 50. TR ARRAY, TBWDC

General information for array TR: Blank common reference location = T(1301) Array size = 16 cells Array locations used for storage and retrieval of intermediate calculation data by subroutine TBWDC during calculations for torque-box, leading and trailing edge planform area parameters.	
Array Location	Description
1-4	Values calculated data in locations 5, 6, 7, and 8 for loop index $i$ value = 1-11, used as $i-1$ data when index value = 2-11
5	$\Delta C_{LEi}$ , leading edge panel delta chord between front spar and true trailing edge at each analysis control station Y-coordinate, YC(95)-YC(93)
6	$\Delta C_{TEi}$ , trailing edge panel delta chord between rear spar and true trailing edge at each analysis control station Y-coordinate, YC(99)-YC(97)
7	Delta chord parameter used to compute X-coordinate of leading edge panel $i$ centroid
8	Delta chord parameter used to compute X-coordinate of trailing edge panel $i$ centroid
9	$\Delta Y_{\Lambda i}$ , length of torque-box panel $i$ , $Y_{\Lambda i} - Y_{\Lambda i-1}$
10	$\Delta Y_i$ , length of leading and trailing edge panel $i$ , $Y_{EAi} - Y_{EAi-1}$
11	Factor for leading and trailing edge area calculation, $0.5 \Delta Y_i / 144.0$
12	$\lambda_i$ , panel tapes ratio for torque-box, leading edge, and trailing edge panel centroid calculations, $C_i / C_{i-1}$
13	$Y_{cpi}$ , centroid distances from the inboard end of the panels defined by the parameters in locations 9 or 10 and 12, each panel treated as trapezoidal sections, $y_{cp} = f(\Delta Y, \lambda)$
14-20	Not used

TABLE 51. TT ARRAY, TBWDC AND ABØXC

General information for array TT: Blank common reference location = T(1317) Array size = 20 Array locations used for storage and retrieval of geometry data by sub-routines TBWDC and ABØXC.	
Array Location	Description
1	Y <sub>IB</sub> for analysis control station calculations by TBWDC, 0.0 or b <sub>1</sub> /2. Also ΔYΛ <sub>i</sub> . Y <sub>i</sub> , storage for data save by ABØXC
2	Y <sub>OB</sub> for analysis control station calculation by TBWDC, span control factor times b/2. Also exposed structural span. X <sub>i</sub> , storage for data save by ABØXC
3	Structural station value factor, 1.0 or cos ΛEA for input swept or unswept station values, TBWDC C <sub>i</sub> , true aerodynamic chord at the analysis control station Y-coordinate in TT(11), calculated by ABØXC for use by TBWDC
4	D <sub>max<sub>i</sub></sub> , maximum depth of airfoil corresponding to C <sub>i</sub> above, calculated by ABØXC for use by TBWDC
5	Not used
6	D <sub>FS<sub>i</sub></sub> , airfoil depth at front spar, ABØXC
7	D, intermediate local airfoil depth value calculated by DMAX, same as YTC(49), ABØXC
8-10	Not used
11	YEA <sub>i</sub> , Y-coordinate of analysis control station, setup by TBWDC
12	XEA <sub>i</sub> , X-coordinate of analysis control station, setup by
13	A <sub>i</sub> , calculated cross-sectional area of structural torque-box section at analysis control station i, calculated by ABØXC for TBWDC
14	W <sub>SC<sub>i</sub></sub> , structural width of torque-box section at analysis control station i, calculated by ABØXC for TBWDC
15	D <sub>ave<sub>i</sub></sub> , average depth of structural torque-box section of analysis control station i, A <sub>i</sub> /W <sub>SC<sub>i</sub></sub> , calculated by ABØXC for TBWDC. Also storage for intermediate data calculated by ABØXC.

TABLE 51. TT ARRAY, TBWDC AND ABØXC (CONCL)

Array Location	Description
16	Storage for intermediate data calculated by ABØXC and for $D_{i-1}$ value during area integration loop
17	Y-coordinate for front spar at analysis control station $i$ during initial calculations by ABØXC and during area integration, Y-coordinate of point $(Y_i, X_i)$ on structural chord
18	X-coordinate for front spar at analysis control station $i$ during initial calculations by ABØXC and during area integration, X-coordinate of point $(Y_i, X_i)$ on structural chord
19	Y-coordinate for rear spar at analysis control station $i$ during initial calculations by ABØXC and during area integration, $\Delta Y$
20	X-coordinate for rear spar at analysis control station $i$ during initial calculations by ABØXC and during area integration, $\Delta X$

## SUBROUTINE ABØXC

Deck name: ABØXC  
Entry name: ABØXC  
Called by: Subroutines GEØMW, TBWDC  
Subroutines called: DMAX

Subroutine ABØXC is the analysis routine used to compute geometry parameters for the torque-box at specified analysis control stations. Torque-box data are evaluated for section cuts normal to the structural reference line at each station  $Y_{\Lambda_i}$ .

The location of the analysis control station at which structural section information is to be computed is specified by the coordinates  $(Y_i, X_i)$ . The calling subroutines must store these values in TT array locations 11 and 12. Computed data to be used by the calling subroutines are stored in the following locations:

- Array TT, locations 3, 4, 13, 14 and 15, torque-box cross-section data (Table 51)
- Array YC, locations 110-115, front and rear spar data (Table 38)
- Array YTC locations 55 and 60, torque-box depth data (Table 39)
- Array YC, locations 93, 95, 97 and 99, aerodynamic chord data at the structural reference Y-coordinate,  $Y_i$ , output from subroutine CAERØ (Table 38). These values are created by the call to CAERØ from subroutine DMAX during the last execution of DMAX by subroutine ABØXC.

Structural cross-section area is determined by numerical integration of finite trapezoidal sections computed along the structural chord. The number of chordwise sections is specified by the value in AFCC, location 153, array D. The airfoil depths at each point are determined by subroutine DMAX; the coordinates of DMAX depth evaluation points are specified in locations 47 and 48 of array YTC.

Subroutine ABØXC prints local station evaluation data based on the cord value in column 5, case control card 1, IP(5). The output is printed in conjunction with printed output from subroutine DMAX.

### Subroutine Variables

Table 52 contains the variables referenced by subroutine ABØXC. Array TT is also used by subroutine TBWDC for storage and retrieval of calculated data (Table 51.) Data required by the ABØXC calls from subroutine GEØMW are items stored in TT(14), TT(15), YTC(60), and YC(104).

### Labeled Common Variables

Array IP, labeled common block IPRINT.

### Mass Storage File Records

## SUBROUTINE DMAX

Deck name: DMAX  
Entry name: DMAX  
Called by: Subroutines ABØXC, GEØMW, TBWDC  
Subroutines called: CAERØ

Subroutine DMAX is used to compute local airfoil depths at specified coordinates  $Y_i$ ,  $X_i$ . One of two evaluation procedures are used to compute local depths,  $d_i$ :

1. Evaluation of a polynomial equation of the form

$$z_i = \left[ ax_i^6 + bx_i^5 + cx_i^4 + dx_i^3 + ex_i^2 + fx_i \right]^{1/2}$$

to obtain the ordinate value as a fraction of the maximum airfoil depth  $D_{\max,i}$ , where a, b, c, d, e, and f are polynomial coefficients for one of six types of standard airfoils. These values are stored in the airfoil data block of the SWEEP permanent data bank, mass storage file 1, record 6. The appropriate coefficient sets are moved into array AFD (Table 28) from array DAF by subroutine GEØMW (array DAF is initialized from record 36). Control code AFID values of 1-8 results in execution of this option. Currently polynomial coefficients for six types of airfoils are available. Thus, values for variable input data code for airfoil type, AFID, array D location 143, is restricted to 1.0 to 6.0 for polynomial type evaluation.

2. Interpolation of numerical values of normalized airfoil ordinates. A linear interpolation method is used to determine depths as the specified chordwise location  $(X/C)_i$  from a table of depths at known  $(X/C)$  locations. This option allows for specifying different airfoil shapes at up to four spanwise control stations. Values for stations between these control stations are based on linear interpolation of the airfoil ordinates at the control stations. Depth information and control station data are stored in array TAF (Table 29). Values for  $(X/C)$  control points are stored in locations 1-48 of array DAF. This option is executed when the evaluation type code AFID is specified as 9.0. Use of this option requires reference airfoil type and location data in variable data array D locations 145-152, subarrays YAF and AFN.

The two procedures described herein result in airfoil depth values expressed as a fraction of the maximum depth at any spanwise station  $Y_i$ . The actual depth is determined by the product of this depth value  $Z_i$  and the maximum depth value  $D_{\max_i}$ . The value of  $D_{\max_i}$  is determined by subroutine DMAX from the appropriate spanwise linear  $D_{\max}$  variation data stored in array YTC, locations 1-46. Subroutine CAERØ is used to evaluate the properties of the local chord at the specified station  $Y_i$ .

Printed output of calculated data from subroutine DMAX is controlled by column 5 of case control card 1, IP(5). Two types of data are printed. The standard output consists of the pertinent data evaluated at the specified station, the coordinates, chordwise parameters, and calculated depth values. The second output block is printed when option 2 is executed. This block consists of the TAF array data used for during the linear interpolation calculations.

#### Subroutine Variables

Table 53 contains the variables referenced by subroutine DMAX. The input coordinate values are located in YTC(47) for  $Y_i$  and YTC(48) for  $X_i$ . The primary output is stored in array YTC, locations 49, 50 and 57-60 (Table 39). Arrays AFD, DAF, TAF, and TXY contain data used by DMAX, Array YC contains the values for the local chord, as evaluated by subroutine CAERØ (Table 38).

#### Labeled Common Variables

## SUBROUTINE CAERØ

Deck name: CAERØ  
Entry name: CAERØ  
Called by: Subroutines DMAX, GEØMC, GEØMW  
Subroutines called: None

Subroutine CAERØ is used to compute aerodynamic chord information at any spanwise station  $Y_i$ . It computes X-coordinates at the five basic spanwise control lines:

- Leading edge reference line, trapezoidal planform
- Front spar reference line
- Structural reference line
- Rear spar reference line
- Trailing edge reference line, trapezoidal planform

If nonlinear leading or trailing edge planform is specified, this subroutine performs the necessary interpolation of blended leading edge or cranked trailing edge geometry data to compute the actual location of the true leading and trailing edges.

Local chordwise distances and chord fraction information are also computed. Computed data are used primarily by subroutine DMAX.

### Subroutine Variables

A summary of variables used and calculated is presented in Table 54. Input constants are contained in arrays TXY and YC. Station coordinates for the chordwise computations are specified in locations YC(100) for  $Y_i$  and YC(101) for  $X_i$ . Primary output is stored in YC array locations 93-99 and 102-106.

### Labeled Common Variables

None.

### Mass Storage File Records

None.

### Error Messages

None.

TABLE 54. VARIABLE REFERENCES, SUBROUTINE CAERØ

Variable Name	Size (Cells)	Common Ref Loc	Variable Description			Table Ref
			Type	Used	Calc	
I	1	-	I	U	C	-
ND	100	6121	I	U	-	3,9,13
T	2,060	1	R	U	-	3
TXY	500	T(801)	R	U	-	30
YC	150	T(201)	R	U	C	38

## SUBROUTINE SWPXYP

Deck name: SWPXYP  
Entry name: SWPXYP ( $Y_i, X_i, YP_i, XP_i$ )  
Called by: Subroutine VSGEOM  
Subroutines called: None

Subroutine SWPXYP is used by subroutine VSGEOM to determine the swept planform coordinates  $YP_i$  and  $XP_i$  of the point  $(Y_i, X_i)$  on the reference planform. The coordinates  $(YP_i, XP_i)$  are computed for the specified angular rotation of the planform about the pivot axis in D(320), variable DLIMDA. The pivot coordinates  $(Y_p, X_p)$  are stored in array TVS, locations 21 and 22, named  $YP\emptyset$  and  $XP\emptyset$  in subroutine SWPXYP. Values for  $(YP_i, XP_i)$  are based on the geometric relationships of a line of given length,  $L$ , rotated  $\pm\Delta\Lambda$  degrees, where  $L$  is the distance between the pivot point  $(Y_p, X_p)$  and the known point  $(Y_i, X_i)$ .

### Subroutine Variables

Table 55 contains the variables referenced in subroutine SWPXYP. Variables  $C\emptysetSDL$  and  $SINDL$  are the values for the cosine and sine of the angle of rotation. The primary input and output from subroutine SWPXYP are through the specified arguments. Array TT, locations 1-7, is used to store necessary computed values. Definitions for the array TT variables are as follows:

TT(1) =  $\Delta Y_i, Y_i - Y_p$   
TT(2) =  $\Delta X_i, X_i - X_p$   
TT(3) =  $L$ , distance between pivot point and analysis point  
TT(4) = sine of sweep angle for line  $L$  before rotation  
TT(5) = cosine of sweep angle for line  $L$  before rotation  
TT(6) = sine of sweep angle of line  $L$  in rotated position  
TT(7) = cosine of sweep angle of line  $L$  in rotated position

Specifications for point  $(Y_i, X_i)$  must not be the same as the pivot point  $(Y_p, X_p)$ ; i.e.,  $L = 0$ . This condition will result in program error resulting from division by zero. Subroutine SWPXYP does not test for this condition.

### Labeled Common Variables

## SUBROUTINE PRTG

Deck name: PRTG  
Entry name: PRTG  
Called by: Subroutine GEOMW  
Subroutines called: None

Subroutine PRTG is the routine that organizes and prints the geometry summary data for the surface being evaluated. The printed output data (Figures 58 and 59) are printed under control of column 6, case control card 1. This code word, stored in location 6, array IP, is tested by subroutine GEOMW; subroutine PRTG is executed if the code value is zero, print geometry summary data. An additional page of summary data is printed for variable sweep wing designs if location D(320) variable DLLMDA, is specified as a non-zero number. The data on this page (Figure 60) consist of geometry parameters for the wing in the swept position.

Subroutine PRTG uses subroutine GCOMP to organize the contents of array TD. Array TS data are created from the data set stored in array TD before output. Swept planform data are retrieved from array TVS during outprint printing.

Subroutine PRTG prints the contents of array TXY before exit under control of column 7 of case control card 1.

### Subroutine Variables

Table 56 contains the variables referenced by subroutine PRTG. Array R contains the contents of the two case title cards. These titles are printed on each summary page.

### Labeled Common Variables

Array IP, labeled common block IPRINT  
Array R, XMISC array locations 85-100  
Array XMISC, labeled common block MISC

## SUBROUTINE GCØMP

Deck name: GCØMP  
Entry name: GCØMP  
Called by: Subroutine PRTG  
Subroutines called: None

Subroutine GCØMP is used to process computed geometry data into array TD for output as printed summary data by subroutine PRTG. This subroutine is executed by subroutine PRTG only when a code value of zero is specified in column 6 of case control case card 1, IP(6), printed geometry summary data required. Data for the TD array (Table 40) are retrieved primarily from arrays D and TXY. Much of the data values are transferred directly; minor recalculations are made, only to conform to output block requirements.

Subroutine GCØMP calculations and the contents of array TD do not affect any downstream subroutine computations except that of subroutine PRTG.

### Subroutine Variables

Variables referenced by subroutine GCØMP are presented in Table 57. Data in array TS, locations 1-88 are initially set up by GCØMP, but are not used. Subroutine PRTG subsequently uses these locations for storage of geometry parameters for control stations 1-11 (Table 41).

### Labeled Common Variables

None. .

### Mass Storage File Records

None.

### Error Messages

None.

## Section IV

### SUBROUTINE REFERENCE TABLES FOR OVERLAYS (9,0), (10,0), (14,0), (15,0), (16,0), (17,0), AND (18,0)

Subroutine reference tables for wing and empennage module overlays other than overlay (8,0) are found in this section. Table 58 lists all module routines in alphabetical order with references to corresponding external reference or subroutine variable reference tables. Tables 59 through 154 includes the general overlay and individual subroutine variable data reference information for overlays (9,0), (10,0), (14,0), (15,0), (16,0), (17,0) and (18,0).
