NOTICES

REPORT NUMBERING SYSTEM - The numbering of technical project reports issued by the Naval Air Development Center is arranged for specific identification purposes. Each number denotes of the Center acronym, the calendar year in which the number was assigned, the sequence number of the report within the specific calendar year, and the official 2-digit correspondence code of the Command Office or the Functional Department responsible for the report. For example: Report No. NADC-73018-60 indicates the fifteenth Center report for the year 1973, and prepared by the Crew Systems Department. The numerical codes are as follows:

CODE	OFFICE OR DEPARTMENT
00	Commander, Naval Air Development Center
01	Technical Director, Naval Air Development Center
02	Program and Financial Management Department
03	Anti-Submarine Warfare Program Office
04	Remote Sensors Program Office
05	Ship and Air Systems Integration Program Office
06	Tactical Air Warfare Office
10	Naval Air Facility, Warminster
20	Aero Electronic Technology Department
30	Air Vehicle Technology Department
40	Crew Systems Department
50	Systems Analysis and Engineering Department
60	Naval Navigation Laboratory
81	Technical Support Department
85	Computer Department

PRODUCT ENDORSEMENT - The discussion or instructions concerning commercial products herein do not constitute an endorsement by the Government nor do they convey or imply the license or right to use such products.

20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This report consists of a table and accompanying illustrations which describe aircraft and weapons system functions displayed on the head-up displays in the A-7E, F-5, F-14, F-15, F-111A, CL-84, and AV-8A aircraft. Corresponding display formats as given in MIL-D-81641(AS) and MIL-STD-884B are included for comparison.

INTRODUCTION

The head-up display (HUD) was developed to facilitate the transition between instrument and visual flight. The use of a HUD is becoming increasingly common. In spite of the existence of a Military Specification and a Military Standard which are written to promote consistency and to minimize occurrence of incompatible methods of presenting information, inconsistencies do exist. The following tables were prepared in order to facilitate comparison between existing head-up display formats, so that in the selection of symbols for future head-up displays inconsistencies will be minimized.

The tables included in this report contain data on displays found in the A-7E, F-5, F-14, F-15, F-111A, CL-84, and AV-8A aircraft. Data from the Military Specification pertaining to head-up displays, MIL-D-81641(AS), and the relevant Military Standard, MIL-STD-884B are included. The information in the tables was taken from the references listed. Where available, the NATOPS Manual (U.S. Navy) or Technical Orders (USAF) were considered the primary source. Information from secondary sources was included in the tables where it indicated additional functions or alternative ways of displaying the same functions.

DESCRIPTION OF THE TABLES

Descriptive parameters are listed at the left edge of the tables. Functions are listed across the top edge. Functions are presented alphabetically and are consecutively numbered. Where there is more than one means of displaying a function for a given aircraft, additional columns are used. The function name is the same, and the same number is used with the notation "(cont)" to indicate continuation of the description. Explanation of the parameters, as necessary, is given below. Blanks in the body of the tables indicate that the parameter is not relevant or the required information was not available.

Function - In general, displays present standard aircraft or weapons information and the function names reflect this. There are two types of exceptions. One is where a function is peculiar to an aircraft; e.g., wing sweep in the F-14. The other exception concerns functions without qualifying adjectives where there should be a qualifier. An example is the use of the term "air-speed" without the accompanying "indicated," "true" or "calibrated." In such cases, a separate heading without the qualifier was included in the tables.

Figure No. - Refers to the figure which shows the display elements as described in the tables. In order to limit the number of figures, references are sometimes made to a figure showing a display similar to but not identical in format to the display described. For example, the number of scale graduations or intervals may be different, but the relationships among scale marks, numerals, pointers and labels are the same. It is possible to determine from the table entries and the figure how the display looks. Numerals in circles on the figures refer to the function number in the tables. Arrows from these encircled numerals point to display elements which are used for the function

whose number is given. Sometimes a figure number is given in a table entry for a function and the number of that function does not appear on the figure. This is either because the figure portrays only that function, the figure is self-explanatory or the relationship is completely explained in the notes for that function. In some cases, one of the above conditions holds yet there is a numeral on the figure. This is due to the conservative nature of the authors' approach.

Form of Display - The components of a functional display, as shown in the corresponding figure, were classified as scales (vertical, horizontal, or circular), ladders, digits, letters, alphanumerics, or symbology.

Display Label - Any letter(s) used to label the display are indicated. In the corresponding figure, a single letter has been drawn to indicate the position of a single letter label; two letters have been drawn to show the position of a double letter label. In each case, the letter(s) in the actual label may differ from those used in the figure.

Range of Variable - The range of parameter values which may be displayed is given.

Range Displayed - The range of parameter values which is displayed at a given time is indicated.

Direction of Increase - The direction of increasing parameter values is given in relationship to the appropriate scalar display. For a vertical scale, parameter values increase as one reads up the scale, down the scale, or both; for a horizontal scale, values increase as one reads to the left, to the right, or both. For a circular scale, values increase in a clockwise or a counter-clockwise direction.

Fixed Scale - "Yes" indicates the scale remains stationary; "no," the scale acts as a moving tape.

Scale Values Marked - "Yes" indicates scale graduations are labeled with numerals to indicate parameter values.

Scale Graduations - The change in parameter value for the smallest graduation on a scale is given.

Moving Reference - "Yes" indicates a reference mark changes its position on the screen in some manner.

Modes - With certain exceptions, modes are listed as named in reference sources (see mode list). In cases where the table entry does not correspond exactly to the mode list, the table entry will encompass more than one mode and will contain the word common to these modes. The only further exception is the use of the word "attack" to include all modes in the A-7II where a weapon is used.

Notes - When a function description has been obtained from a secondary reference source (reference 4 or reference 6) this is indicated by inclusion of the source number in the "notes" section.
