FINAL TECHNICAL REPORT

DEVELOPMENTAL METHODOLOGIES FOR MEDIUM- TO LONG-RANGE ESTIMATES: PROGRAM DOCUMENTATION FOR SOVIET FORCE EFFECTIVENESS MODEL (U)

September 1976

Sponsored by:

Defense Advanced Research Projects Agency

ARPA Order Number	3233
Program Code Number	P6W10
Contractor	CACI, Inc.-Federal
Effective Date of Contract	March 1, 1976
Expiration Date of Contract	September 30, 1976
Amount of Contract	$135,337
Contract Number	MDA903-76-C-0255
Principal Investigator	Dr. John J. McIlroy (703) 841-7800

PREFACE

This document is one of a series of reports describing the research activities undertaken to complete Defense Advanced Research Projects Agency (ARPA) supported contract number MDA903-76-C-0255, entitled "Developmental Methodologies for Medium- to Long-Range Estimates." These reports describe the project's empirical, methodological, substantive, technical, and theoretical contributions.

The Final Technical Report is presented as a set of documents rather than a single report. They are

- Executive Summary,
- Long-Range Regional Forecasting Models,
- The Soviet Force Effectiveness Model,
- User's Manual for the Long-Range Regional Forecasting Models,
- User's Manual for the Soviet Force Effectiveness Model, and
- Program Documentation for the Soviet Force Effectiveness Model.

The first three volumes substantively describe all research tasks, provide the rationale for research decisions, and report important findings. The remaining four volumes document the two computer programs delivered to the Defense Intelligence Agency/Directorate for Estimates (DIA/DE) for installation on the Defense Intelligence Agency On-Line System (DIAOLS).

The Executive Summary briefly describes the overall project. The volumes on the regional forecasting model and the force effectiveness model, by far the most substantive and complex of the documents, discuss the design and development of each of these models, respectively. The first reviews the regional models, identifies areas where improvements were made for DIA/DE, and presents the findings from sensitivity tests and computer simulations for Europe, the Middle East, Latin America, and Africa. The second fully discusses the development of the Soviet force effectiveness model. The volume is classified.

The remaining four volumes focus on the two computer models delivered to DIA/DE. A user's manual and program documentation have been written that provide all necessary information for using and maintaining the models.

ACKNOWLEDGEMENTS

This report was prepared by:

John J. McIlroy, Ph. D., Project Director
Leo Hazlewood, Ph. D.
Janice Fain, Ph. D.

The study team gratefully acknowledges the assistance and guidance received during the project from Captain Robert R. Hamer, USN, Mr. Joseph P. Longo, Captains Ronald F. Weiss and Randolph R. Brasch, USAF, of the Defense Intelligence Agency/Directorate for Estimates, and Lt. Donald Gaudutis, USA, of the Defense Intelligence Agency/Research Support Operations. The valuable contributions of Major General (USA, Ret) John J. Hayes , Richard E. Hayes, Ph. D., and Margaret D. Hayes, Ph. D., are also thankfully acknowledged. Finally each of the authors extends thanks to Nancy Streeter for editing the volumes and to Sharon O'Rourke, Ethel Glascoe, and Kathy Harris for their many long hours at the typewriters.

TABLE OF CONTENTS

PROJECT OVERVIEW

This User's Manual describes one of two important analytical technologies developed for the Defense Intelligence Agency/Directorate for Estimates (DIA/DE) under Defense Advanced Research Projects Agency (ARPA) Contract No. MDA903-76-C-0255, designed to improve the capability to forecast important factors that define the international military environment and have implications for long-range intelligence estimates. Two user-interactive computer models were developed in this project. The first enhances existing Department of Defense forecasting capabilities (CACI, 1975b, 1974, 1973) by applying social science research methodologies to long-range forecasting of important economic, military, and political variables. The second major product is a model that enables DIA/DE to measure total Soviet force effectiveness for use in estimative intelligence. Together, these efforts constitute technological innovations that enhance the reliability, accuracy, relevance, timeliness, and, therefore, the credibility of long-range forecasting for defense intelligence estimates and planning. This manual describes the user-initiated procedures for the regional long-range forecasting models.

This project had four objectives:

1. Refine and equalize the existing long-range forecasting models for Europe, the Middle East, Latin America, and sub-Saharan Africa, previously developed under ARPA contracts for the Joint Chiefs of Staff (JCS/J-5).

2. Enrich the existing models by including the People's Republic of China as a major actor in the superpower simulation capability and adding the option to simulate the impact of political regime changes.

3. Develop a model to estimate future Soviet force effectiveness based on the Defense Intelligence Projections for Planning (DIPP) document, including the capacity of the Soviet Union to improve the quality and quantity of its major weapon systems and pose increased threats to U.S. interests.

4. Implement the enriched forecasting models and the Soviet force effectiveness model on the Defense Intelligence Agency On-Line System (DIAOLS) with a user-interactive capability to permit DIA analysts to forecast alternative futures by altering data, superpower behavior, or regime type, and/or forecasting parameters to simulate different courses of action.

ACCOMPLISHMENTS

All phases of the research were completed so that offices with established DIAOLS linkages can access either the CACI regional forecasting models or the Soviet force effectiveness model. As proposed,

- The regional forecasting models have been standardized at comparable complexity for Europe, the Middle East, Latin America, and sub-Saharan Africa, and China has been added to the superpower influence set;

- The capability to influence forecasts by simulating regime changes was added and the models were made user-interactive;

- Sensitivity tests and simulations have been performed with each of the models, and the three programs associated with the regional forecasting models (the preprocessor, forecasting program, and report generator) have been installed on DIAOLS;

- The Soviet force effectiveness model has been developed using information available in the DIPP on the number and characteristics of Soviet weapon systems;

- An equation was developed that selectively aggregates weapon characteristics, interfaces them with DIPP force level information, and generates estimates of Soviet force effectiveness;

- A program for the Soviet force effectiveness model that permits user-interaction with the weapons system data and alternative assumptions about the growth and structure of Soviet forces has been implemented on DIAOLS and is presently available.

The two computer models considerably enhance DIA/DE's forecasting capability, as intelligence estimators can now generate and analyze long-range alternative futures for Europe, the Middle East, Latin America, and Africa, or alternative estimates of Soviet force effectiveness. In each case, the analyst has available a computer technology that permits structures and assumptions of either model to be altered to reflect an insight about the phenomenon being studied. Furthermore, the intelligence estimator has guidelines on how to interface the long-range regional forecasts with estimates of total Soviet force effectiveness. As analysts become more familiar with both models, their sensitivities to the implications of the generated forecasts and estimates will increase. More questions will eventually be asked that will tax the limits of the models. Finally, as they gain currency throughout the intelligence community, demands for increased sophistication and refinement can be expected.

The models produced by this research integrate traditional academic approaches and complex quantitative methodologies to develop tools that can improve intelligence estimates. In addition, the research interfaced qualitative and quantitative techniques that are intermingled in any modeling effort. It also produced vastly improved, standardized, and user-interactive versions of CACI's regional forecasting models.

Moreover, it produced the first generation of a user-interactive Soviet force effectiveness model that relies on highly sophisticated intelligence data. The lessons learned in completing these two major efforts should be intensely scrutinized by potential users.

CACI's past efforts in developing the regional forecasting models have involved collecting and organizing statistical information, applying statistical analytical techniques, examining the implications of data error, designing and constructing forecasting models, designing and developing user-interactive programs, applying regional versus country-specific forecasting equations, and so on. Each effort has clearly improved the reliability and validity of the regional forecasting models, thus advancing considerably the credibility of forecasts.

Even with these advances, continuing technology assessments suggest a number of unmet, yet very necessary, steps which must be taken to ensure that the best possible regional models are developed for the national security community. Some of these are

- Develop worldwide medium- to long-range estimative intelligence technologies. Currently, no model exists for Asia. Limited effort would be required to expand the current system to include that region. Further, the current structure contains the United States, the Soviet Union, and the People's Republic of China as influential superpowers. This set could, and should, be expanded to include Japan and the major Western European countries.

- Develop stochastic mechanisms for superpower interaction simulation. While including additional superpower influences is a substantial step toward improving the realism of a worldwide model, only the independent

effects of the superpowers will have been modeled. The action-reaction nature of superpower behaviors and the impacts of such activity on other nations can now only be indirectly simulated. These aspects can and should be modeled in greater detail.

- Explore and apply methodologies to enrich regional forecasts. Constraining the analyst's perspective to define sets of countries geographically has, to some extent, made modeling more difficult. One solution is to estimate country-specific parameters, an approach that has worked extremely well with the economic sector of the current model. However, when data are insufficient or inadequate, the relationships among environmental variables should be modeled for similar types of countries. These procedures should produce increasingly accurate forecasts.

The lessons learned from modeling Soviet force effectiveness should also be intensely evaluated. As expected, the data in the DIPP are more readily available for larger weapons. Consequently, a force effectiveness model favoring the available data was developed. Thus, the effectiveness of general purpose forces (naval, tactical air, and ground) is less well assessed by the current model. During the project, CACI continually clarified DIA/DE's specific interests on Soviet force effectiveness. For example, the distribution of off-line and on-line systems became important, as did the distinction between nuclear and non-nuclear weapons. Furthermore, distinctions as to the role of specific weapons (either offensive or defensive) sometimes became important in considering weapon effectiveness.

The current Soviet force effectiveness model discriminates between nuclear and non-nuclear weapons and off-line and on-line systems. It is also capable of aggregating different weapon systems to simulate specific missions. Other advances can readily be made.

- Identify forces by geographical region, permitting combinations of offensive and defensive capabilities in specific locations such as Europe, South Asia, and China.

- Evaluate Soviet force effectiveness of weapons in both an offensive and defensive role. This would considerably enhance the intelligence estimator's knowledge of the dimensions of force effectiveness and the overall effectiveness of specific forces analyzed in the DIPP.

- Develop measures of U.S. force effectiveness for offensive and defensive systems, located in selected geographical areas, to compare with Soviet force effectiveness measures. Such an analysis could eventually develop new technologies for quantitative net assessment.

Technology assessment is an ongoing process in which model builders and model users review and try to improve the range and quality of existing products. CACI's long-range forecasting models have been subjected to precisely this kind of scrutiny. This discussion identified new areas where further improvements should be made. The same is true of the Soviet force effectiveness model. As more users become acquainted with it, technology assessment will begin. The resulting feedback will contribute to the growth that must continue if forecasting and estimation capabilities within the Department of Defense are to become part of the policy-planning process in the national security community.

SOVIET FORCE EFFECTIVENESS PROGRAM SUMMARY

Program Type:	Interactive
Program Objective:	Computation of the effectiveness of user-selected Soviet weapon systems for the years 1972-1981
Program Features:	A user is permitted to • Select weapons by DIPP table or by assigned mission, • Examine questionable data values, • Change any data values (except in the permanent weapon data files), and • Add new weapons.
Program Input:	• DIA DIPPOLS file • CACI weapon attribute file • User-supplied information from the terminal during program execution
Program Output:	Tables showing the effectiveness of selected Soviet weapons for the years 1972-1981.
Program Language:	FORTRAN
Computer System:	DIAOLS
Developer:	CACI, Inc.-Federal
Program Operations:	Shown in Figure 1

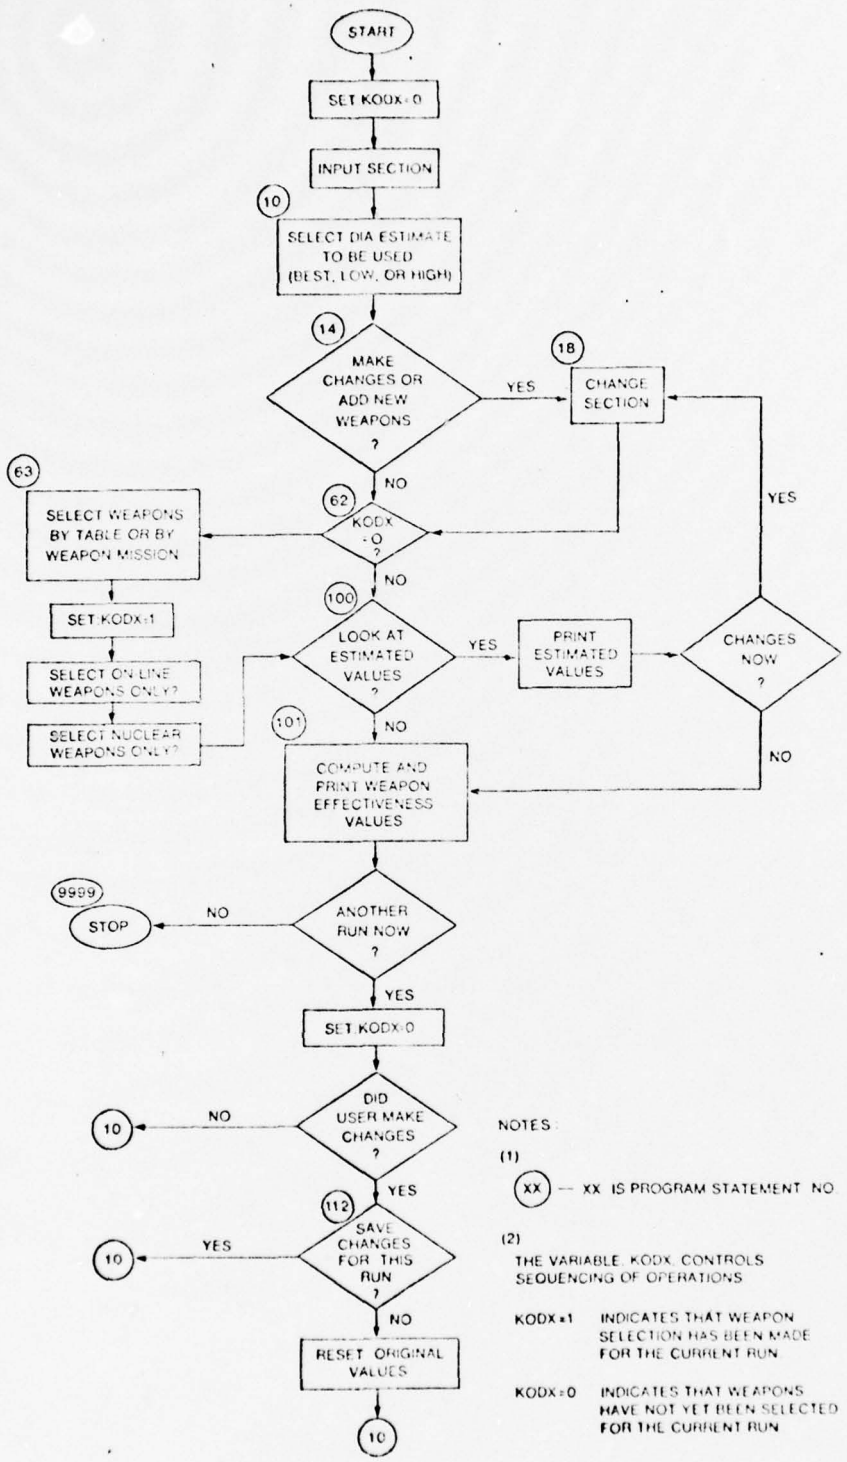

Figure 1. Operational Flow Diagram of the Soviet Force Effectiveness Program

PROGRAMMER'S NOTES

1. The variables are defined in Table 1.

2. The 36 tables whose ID's are stored in array TLIST (see lines 2061-3065 in subroutine IPUT) are read from the DIA file. The three DIA estimates are stored in the single array, IW. Table names to be entered by the user are stored in array NTAB1 (see lines 160-170 in the main program).

3. The DIA DIPP tables are read at each program execution. No program changes are required when changes in the DIA estimates of the numbers of weapons currently in the files are made.

4. If new weapons are added to the DIA files, the following changes are needed:

   - The names and attributes of the new weapons must be added to the attribute file, 'CONDATA1.'
   - The numbers of weapons in the tables must be updated (array 'NTAB2').
   - The initial value of 'NWP' must be reset.
   - If more than five new weapons are added the dimensions of arrays WPNID, IW, XW, and XWAST must be increased.

5. The starting year for the computations is 1972. It is controlled by the variable, 'STARTYR', which is set to 72 in a data statement (line 140). Changing this value will change the starting year.

6. An annotated program listing is attached.

TABLE 1

Definitions of Variables

Variable	Definition
WPNID(I)	Ith weapon identification code
IW(K, I)	Integer characteristics of the Ith weapon K = 1-5, mission codes K = 6, on-line code K = 7, nuclear code K = 8, not currently used K = 9-18, DIA's best estimates of the numbers of Soviet weapon I for the years 1972-1981 K = 19-28, DIA's low estimates K = 29-38, DIA's high estimates
XW(K, I)	Attributes of the Ith weapon K = 1, Number of warheads K = 2, Yield K = 3, Payload K = 4, CEP K = 5, Reliability K = 6, Velocity K = 7, Vulnerability
XWAST(K, I)	Set to '*' if the corresponding attribute is estimated
NTAB1(K)	Name of the Kth of 12 DIA tables into which the weapons are organized
NTAB2(K)	Numbers of weapons in the Kth table
LTAB(K)	Starting index of the Kth table

Continued

Table 1
Variables Definitions
Continued

Variable	Definition
SMAX, VMAX	MAXIMA of velocity, vulnerability
NATT(K)	Name of the Kth weapon attribute
KODS(I)	Selection code for the Ith weapon 1, weapon selected for printing; 0, weapon not selected
IWO(L), JWO(L), XWO(L), IAO(L)	Storage arrays for initial weapon attribute values and their indices
KODN(I)	Code: 1, the user has changed the numbers of the Ith weapon 0, no changes in the numbers of this weapon have been made
IC(J)	User-entered weapon numbers for the Jth year
CACIFILE, DATFILE, INDFILE	Names of input files
DUMMY, IFLAG, ISRT, IPMAX, INDMAX, RPTFILE, FACFILE, NPREFIX	Common variables needed by the 'SUBATT' and 'SEEK' subroutines
NWP	Number of weapons read from DIPP files
MAXN	Maximum array size for weapon data (allows space for five new weapons to be added by the user)
NAT	Number of weapon attributes
NTB	Number of DIA tables
NMS	Not currently used
STARTYR	Starting year (last 2 digits)

260 EQUIVALENCE (KW,KKW)
```

Names of the three data files are set. The CACI file, CONDATA1, contains weapon attribute data. UDATRAND and UINDEX are DIA files.

```
262 CACIFILE="DIPP/CONDATA1;"
264 DATFILE="DIPP/UDATRAND;"
266 INDFILE="DIPP/UINDEX;"
```

The array, IYEAR, contains the numerical values of the years for which computations are made. It is used only in printing headings for the output.

```
267 IXY=STARTYR+1899
268 DO 269 I=1,10
269 269 IYEAR(I)=IXY+I
```

Initial values of the local variables, MC, LS, and KODX, are set. MC is the number of changes made by the user in this run. KODX = 0 indicates that the weapons have not yet been selected.

```
270 MC=0
276 KODX=0
```

Array KODN is set to 0. KODN(I) = 0 indicates that the numbers of the Ith weapon have not been changed.

```
277 DO 278 I=1,NWP
278 278 KODN(I)=0
```

Weapon data will be placed into arrays WPNID, IN, and XN. The index of the first weapon in each table is computed and stored in LTAB.

```
280       LTAB(1)=1
290       DO 9 K=1,11
300     9 LTAB(K+1)=LTAB(K)+NTAB2(K)
```

The subroutine, IPUT, is called to read all input files.

```
320 CALL IPUT(MAXW,NAT,NTB,CACIFILE,NWP,STARTYR)
```

Various format statements are used primarily to read the user's responses.

```
330     1 FORMAT(1X,17A4)
340     2 FORMAT(A2)
350     3 FORMAT(A4)
360     4 FORMAT(A1)
370     5 FORMAT(A11)
```

The user is requested to specify the DIA estimates to be used in the computations. The beginning and ending indices, LS and LE, are set to select the weapon numbers from array, IN.

```
372 PRINT,"YOU MUST SPECIFY WHICH DIA ESTIMATES YOU WILL USE"
374 10 PRINT,"ENTER 'BE' (BEST), 'LO' (LOW), OR 'HI' (HIGH),"
375 READ 2,IES
