20. ABSTRACT (Continue on reverse side if necessary and identify by block number) The CACDA Jiffy War Game Programmers Manual is one report of a set of three reports which were produced to document the Jiffy Game which is a Corps level war game run in support of the TRADOC Scenario Oriented Recurring Evaluation System (SCORES). The programmers manual contains descriptions, flow diagrams, and the FORTRAN codes for all the computer routines of the Jiffy Game. The other two reports of the documentation set are the CACDA Jiffy War Game Technical Manual (methodology and data appendixes) and the CACDA Jiffy War Game Users Manual.		

FOREWORD

The Jiffy Game has existed, as a manual war game, since the late 1960's. In its early stages, the game was completely manual; and correspondingly, its assessment methodology was simplistic, based on the firepower scores of a few key weapon systems. In late 1973, USATRADOC established the Scenario Oriented Recurring Evaluation System (SCORES), the standard scenario development process to be based on the Jiffy Game. With the advent of SCORES, it was recognized that the simplistic, firepower score-driven Jiffy Game, although responsive, was not of adequate resolution to produce the quality product expected from SCORES. Thus, the Jiffy Game underwent major methodology modifications, which allowed the gaming of the complete spectrum of conventional weapon systems and upgraded the assessment methodologies to use weapon characteristics instead of firepower scores as the basis for assessments. However, as the level of detail increased, the number of manual calculations and the amount of data required to make the calculations also increased. Finally, it became necessary to automate the assessment calculations to maintain the Jiffy Game's responsiveness. The automation process was completed in May 1975. This methodology was developed principally by MAJ Karl Lowe, assisted by LTC Tom Buff, MAJ Ken Nash, and MAJ Bob Riddick, and was documented in July 1975 with the publishing of the USACACDA SCORES "JIFFY" War Gaming Methodology.

In the fall of 1975, as a quality assurance measure, the Jiffy Game methodology was subjected to sensitivity analysis. A Jiffy Game improvement program was initiated as a result of the analysis. The improvement program consisted basically of three tasks. First, the assessment methodology needed further modification and improvement in certain areas. Second, the capability to maintain on computer files a hierarchy of units consistent with the overall gaming methodology was to be added to the Jiffy Game. Finally, detailed documentation of the revised methodology and all supporting computer programs was to be published. This report was produced as a result of the improvement program as a portion of the Jiffy Game documentation.

The authors of this report wish to acknowledge the SCORES war gaming staff of the Combined Arms Combat Developments Activity (CACDA) who served as consultants during the preparation of this report. Special thanks are given to Mrs. Elizabeth Etheridge who served as technical editor for this report and to Miss Laura B. Weishaar who typed the report.

ABSTRACT

This report is one of a set of three reports produced to document the automated features of the Combined Arms Combat Developments Activity (CACDA) "Jiffy" war gaming process. This process was developed to support the USATRADOCS Scenario Oriented Recurring Evaluation System (SCORES) scenario development and force evaluation efforts. This report consists of descriptions, logic flow diagrams, and the FORTRAN code for all the programs and routines associated with the "Jiffy" war gaming process. The other two reports in the set are the CACDA Jiffy War Game Technical Manual and the CACDA Jiffy War Game Users Manual. The technical manual consists of two parts. Part 1 contains the methodologies used in the automated routines of the Jiffy Game, the computer model run in support of the CACDA "Jiffy" war gaming process, and an unclassified data base. Part 2 contains all classified data and its sources used in the Jiffy Game during secure production runs. The users manual contains a discussion of the manual aspects and the automated features of the gaming process and also presents an unclassified sample run.

CACDA JIFFY WAR GAME
PROGRAMMERS MANUAL

1. SCOPE. This manual was prepared to document the computer programs associated with the CACDA "Jiffy" war gaming process. The documentation of each subroutine, program, and overlay includes a discussion of the functions performed by the routine, a logic flow diagram, a list of variables, and a listing of the FORTRAN code of the routine.

2. GENERAL. The interactive programs and data files that support the CACDA "Jiffy" war gaming process reside in permanent file storage on the Control Data Corporation (CDC) 6400/6500 multiprocessor computer located at Fort Leavenworth, Kansas. The programs are written in FORTRAN and are machine dependent due to extensive use of CDC Extended FORTRAN file handling features. There are basically two groups of programs that support the CACDA "Jiffy" war gaming process:

- a set of four programs that create and maintain the files necessary for force structure generation
- the Jiffy Game program.

The four force structure generation programs are small programs that allow the gamers to build interactively a hierarchy of files based on the Army's concept of Tables of Organization and Equipment (TOE) with which they can generate task organized forces for combat assessments in the Jiffy Game. The Jiffy Game operates on these forces and determines the number of personnel casualties and weapon system losses each force suffers in combat. In addition, the Jiffy Game generates a file containing a history of the forces and the losses they incurred for the combat it has processed.

3. FORCE STRUCTURE GENERATION PROGRAMS.

a. General. A hierarchy of four interactive programs has been developed to provide nontechnical military personnel with the capability to develop systematically a set of data files from which they can generate task organized forces for assessment evaluation in the Jiffy Game. The force structure generation is based on the US Army TOE standard requirements codes (SRCs). The SRCs define the types and quantities of weapon systems found in specific subunit organizations; e.g., an infantry squad or a tank platoon. The first program of the force generation hierarchy interactively develops a data base file of SRCs for each force. Since there is little variation in the composition of these subunit SRCs, the SRC data base, once completed, will be readily available for immediate application to any Jiffy Game-supported study. The second of the force generation programs uses the SRC data base to build interactively a file of the combat units through specification of a unique name and all SRCs that compose each unit. The file of units is then task organized into higher echelon organizations called parent

units. A file of the parent units is created interactively by the third program of the hierarchy. Finally, the information on the SRC, unit, and parent unit files is consolidated into a file of the forces to be considered for combat assessments in the Jiffy Game.

b. File Organization. The type of files used in the force structure generation process and the Jiffy Game HISTORY file are CDC index sequential-random access files. These files are created and manipulated by file handling macros unique to the CDC operating systems. The files used for this application are random access files whose keys are contained in the first 20 characters (two words) of the record (the HISTORY file uses 30 character keys). The keys are arranged in sequential order in the random access index table, which allows sequential, in addition to random, accessing of the records on the file. The record formats for the four force generation files and the HISTORY file are illustrated in figure 1. Before any operations may be performed on these files, they must be created and put into permanent file storage space. This initialization process is accomplished through the execution of a small file creation program, which simply specifies the parameters essential for proper file definition. The FORTRAN programs for the creation of all five index sequential-random access files are contained in appendix A to this volume.

c. Program Descriptions.

(1) SRC program. The SRC program interactively builds the TOE SRC data base file. As noted above, this file is an indexed sequential-random access file. Each record of the SRC file contains an SRC identification word (1 to 10 alphanumeric characters) and up to 22 groups of weapon system item codes (Technical Manual, Part 2, Appendix A, table A-1) and the quantity of each type of weapon system assigned to the SRC. The format of the records of the SRC file is illustrated in figure 1(a). In addition to creating the SRC data base file, the SRC program has the capability to review any SRC that exists in the data base, add new SRCs to the file, change the quantity and/or type of personnel or weapon systems in a given SRC, delete specified SRCs, and list all SRCs with the quantity and type of weapon systems and personnel found in them. A logic flow diagram of the SRC program is provided in figure 2. A listing of the program code and a list of the program variables is contained in appendix B to this volume.

(2) UNIT program. Execution of the UNIT program is the second step in the force structure generation process. The UNIT program accesses the information stored on the SRC file and defines the combat units to be gamed. The program builds an indexed sequential-random access file whose records correspond to the combat units. The format of the UNIT file records is given in figure 1(b). Each record contains the unit name (1 to 10 alphanumeric characters) and up to 22 valid SRCs (the SRCs must exist on the SRC file). The SRCs specified with a unit correspond to the subunit organizations that compose the unit. For example, the SRCs specified for a tank company could possibly be a tank platoon SRC (specified three times) and a tank company headquarters SRC. In addition to building the UNIT file, the UNIT program has the capability to review the SRCs in a unit already on file, add

FORCE COLOR R/B	SRC #	ITEM CODE #1	QTY OF ITEM CODE #1	ITEM CODE #2	QTY OF ITEM CODE #2	...	QTY OF ITEM CODE #22
-----------------	-------	--------------	---------------------	--------------	---------------------	-----	----------------------

(a) SRC File Record

FORCE COLOR R/B	UNIT ID	SRC #1	SRC #2	SRC #22
-----------------	---------	--------	--------	-----	-----	---------

(b) UNIT File Record

FORCE COLOR R/B	PARENT ID	UNIT ID #1	UNIT ID #2	UNIT ID #18
-----------------	-----------	------------	------------	-----	-----	-------------

(c) PARENT File Record

PARENT ID	UNIT ID	FORCE COLOR	SECTOR	CRITICAL INCIDENT	FPS AT 100% STRENGTH	COMBAT INTENSITY LEVEL	PERCENT STRENGTH	BLANK
QTY OF ITEM CODE #1	QTY OF ITEM CODE #2	QTY OF ITEM CODE #3	QTY OF ITEM CODE #80

(d) FORCE File Record

CRITICAL INCIDENT	PARENT ID	UNIT ID	SECTOR	FORCE COLOR	FPS AT 100% STRENGTH	COMBAT INTENSITY LEVEL	PERCENT STRENGTH	QTY OF ITEM CODE #80
-------------------	-----------	---------	--------	-------------	----------------------	------------------------	------------------	----------------------

(e) HISTORY File Record

more SRCs to a unit already on file, delete specified units, delete particular SRCs from specific units, and list all units with their SRCs. A logic flow diagram of the UNIT program is contained in figure 3. A listing of the program code and a list of the program variables is contained in appendix C to this volume.

(3) PARENT program. The PARENT program is the third part of the force structure generation process. The PARENT program is the tool with which the military gamers can task organize interactively the combat units previously defined on the UNIT file into a file of higher echelon organizations, or parent units. The parent units are created by the program with the definition of a unique parent unit name (1 to 10 alphanumeric characters) and the specification of up to 18 valid units within its organization. The format for the records of the PARENT file is illustrated in figure 1(c). In addition to creating the PARENT file, the program may be used to review the units of parent units already on file, add new parent organizations to the file, add new units to existing parent units, delete specified parent units, delete given units of specific parent units, and list all parent organizations with their subordinate units. A logic flow diagram of the PARENT program is presented in figure 4. A listing of the FORTRAN code and a list of the PARENT program variables are contained in appendix D to this volume.

(4) FORCE program. The FORCE program, the final step in the force structure process, interactively creates a file of the forces to be assessed in the combat routines of the Jiffy Game. The FORCE program consolidates the information defined on the files in the previous three steps of the process. The FORCE file consists of records for each unit of both forces. The format of the records of the FORCE file is presented in figure 1(d). The first 10 words of the record define the unit and its combat environment. Although some of these parameters (sector, critical incident, combat intensity) are redefined in the Jiffy Game during the actual gaming, the first 10 words are initialized in the FORCE program. The remaining 80 words (words 11 to 90 on the record) contain the quantity and indicate the type of weapon system in the unit. The position of the word denotes the type of weapon system (item code equals record word number minus 10). The value of the word is the quantity of that type of weapon system. Besides generating the FORCE file, the FORCE program provides the capabilities to add units of a specified new parent unit to the force file using the information stored in the other three files, delete all the units of a specific parent unit from the file, change the unit effectiveness of any unit on the file, and list all parent units with their subordinate units and their corresponding quantities of weapon systems. It should be noted that when a unit is added to the file, the gamer is asked to input its unit effectiveness, which is the percentage of a unit's existing firepower score compared to its 100 percent firepower score. The number of each type of weapon system loaded into a unit equals the number of that weapon allocated to the unit at 100 percent strength multiplied times the unit's effectiveness. For example, if a unit had 16 tanks at

100 percent strength and it was specified to be at 50 percent unit effectiveness, only eight tanks would be loaded into the unit. A logic flow diagram of the FORCE program is contained in figure 5. A listing of the program code and a list of the program variables is contained in appendix E to this volume.

4. JIFFY GAME.

a. General. The Jiffy Game is a two-sided, interactive war game that operates on the FORCE file, the product of the force structure generation process, and determines the personnel casualties and weapon system losses incurred by the units of the two forces on the FORCE file as a result of the five types of combat it plays: indirect fire, minefields, armor/antiarmor, dismounted infantry, and attack helicopter/air defense. In addition to assessing combat, the Jiffy Game handles other administrative functions associated with the war game, such as combat loss apportionment, maintaining the FORCE file, updating the HISTORY file as required, and outputting the statistics of the battles. The Jiffy Game is written in FORTRAN and has utilized some of the features of CDC Extended FORTRAN. The program has been overlaid to fit into 100k words of core on the CDC 6500 for interactive processing. The CPU processing time under the scope 4.2 operating system varies with the size of the forces being gamed, but typical times vary between 10 and 60 CPU seconds per sector of combat gamed.

b. Program Descriptions. A functional flow diagram of the Jiffy Game is presented in figure 6. The following paragraphs describe each overlay and subroutine of the Jiffy Game, discuss the functions performed by the routines, and present their logic flow diagrams, FORTRAN source code listings, and lists of program variables.

(1) OVERLAY 0. The zero level overlay (OVLY0) contains the main program of the Jiffy Game (SUPER) and a few small subroutines, which are accessed by many of the other overlays. These include INIT, INDEX5, LOSS, and DISPLAY. The source code FORTRAN listings and lists of the program variables of the routines in OVLY0 are contained in appendix F to this volume.

(a) SUPER. The primary function of the main program is to serve as a control point from which a gamer can branch to the other overlays. During execution the gamer resides at a control point known as the DECISION POINT. At this point, the gamer has a choice of the nine decisions presented in table 1. Each gamer decision causes SUPER to branch according to the flow diagram of figure 7 and return to the DECISION POINT (block 6), except decision 9. In addition, SUPER performs the following functions:

1. calls INIT for data and array initialization (block 1),
2. displays the game instructions, if requested (blocks 3 and 4),

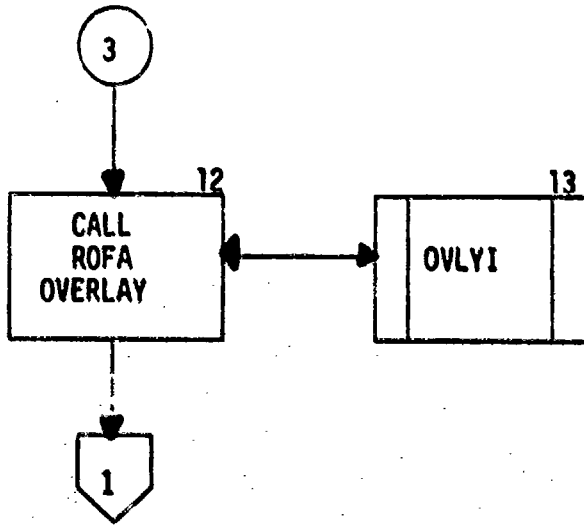

Figure 7. SUPER flow diagram (continued).

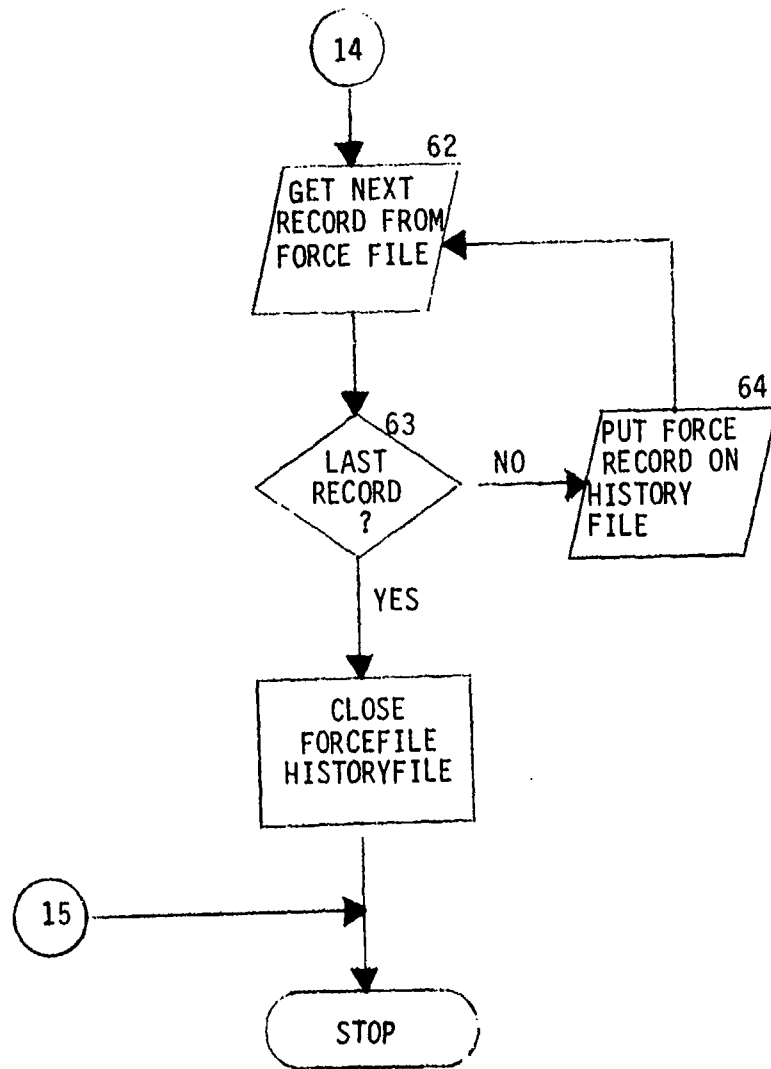

Figure 7. SUPER flow diagram (concluded).

3. inspects the types of weapon systems being played and determines the appropriate combat overlays to which to branch (blocks 14-35),

4. accepts input of TACAIR losses, which are determined external to the Jiffy Game (blocks 18-20),

5. records the forces remaining at the end of a critical incident on the HISTORY file (blocks 60-64),

6. outputs the cumulative battle statistics at the end of a critical incident (blocks 56-59, and

7. provides the gamers with the capability to reinitialize the forces at some previously gamed critical incident on the HISTORY file (blocks 42-55). The FORTRAN source code for SUPER is provided in figure F-1, and a list of the program variables is given in table F-1.

(b) INIT. The logic flow diagram for INIT is presented in figure 8. This routine initializes the arrays in /DATA/ common. Note that the firepower score array (FPS) is initialized from the classified data array (CLDATA). In addition, INIT zeros the SHOTS array and initializes the word packing array variables (PACK). The source code for INIT is provided in figure F-2. All the program variables used in INIT are common variables, and they are defined in table F-1.

(c) INDEX5. This routine is a subfunction that calculates a one-dimensional subscript from a five-dimensional variable. The flow diagram for INDEX5 is given in figure 9. The FORTRAN source listing is contained in figure F-3. A list of the program variables used in INDEX5 is provided in table F-3.

(d) LOSS. This subroutine is used to subtract weapon systems lost in the combat assessment routines from the weapon system arrays for both forces (ELMT). The LOSS flow diagram is presented in figure 10. If the gamer decides not to subtract the losses from the weapon system array, the losses are removed from the loss array (ALOSS). This allows the gamer to replay the combat, if the original assessment is for the same reason invalid. A list of the LOSS program variables is contained in table F-4, and a FORTRAN source code listing may be found in figure F-4.

(e) DISPLAY. This subroutine is called during gaming to display the status of specified units and parent units. The logic flow diagram for the DISPLAY subroutine is given in figure 11. The gamer has the option to display a particular unit or all units within a specified parent unit. The unit status parameters displayed include the unit effectiveness of the parent and subordinate unit(s) and the quantity and type of weapon systems remaining in each unit. The FORTRAN source code for DISPLAY is presented in figure F-5. A list of the program variables is contained in table F-5.

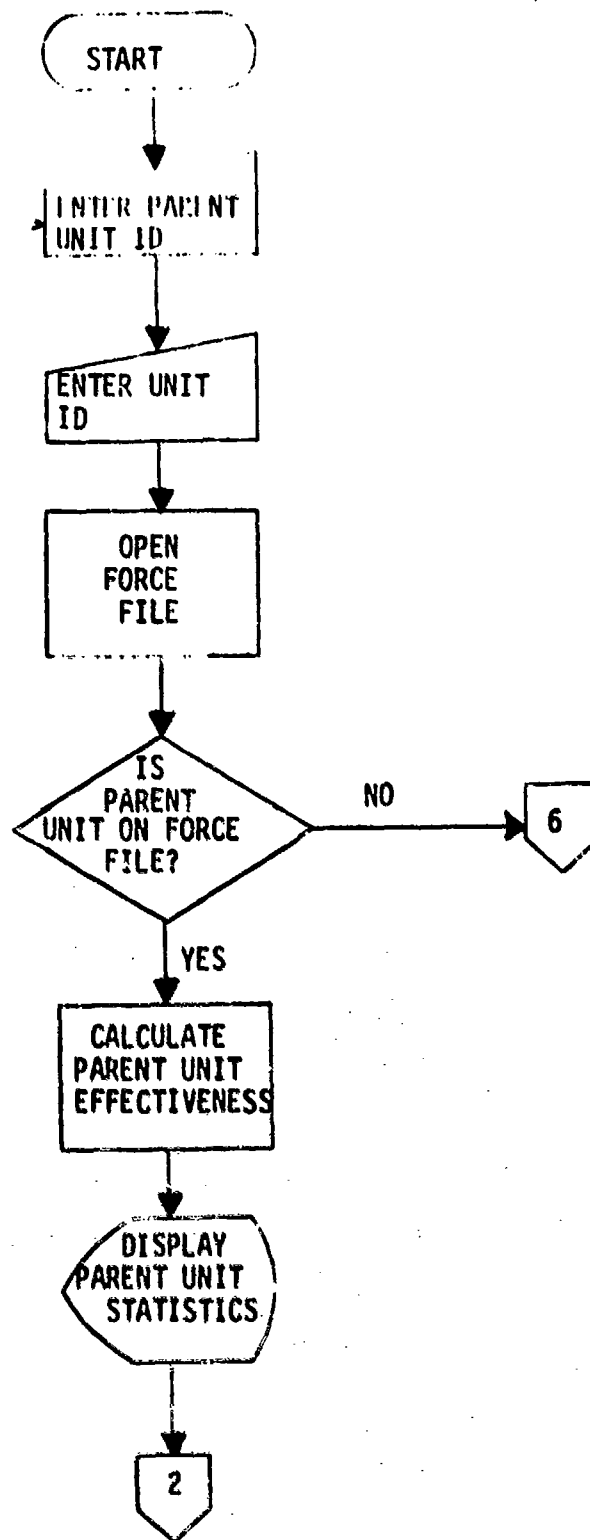

Figure 11. DISPLAY logic diagram.
(Continued next page)

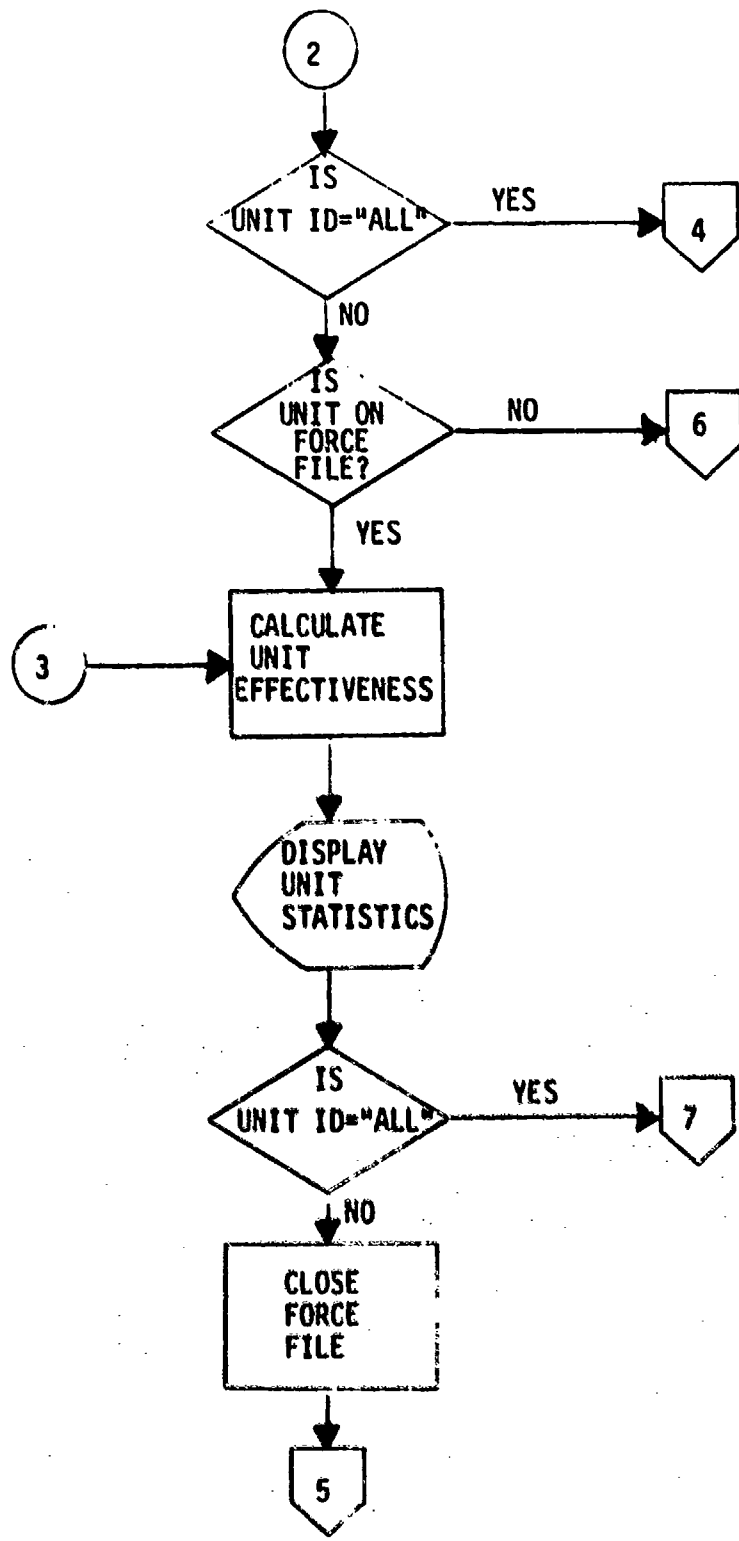

Figure 11. DISPLAY logic diagram (continued).

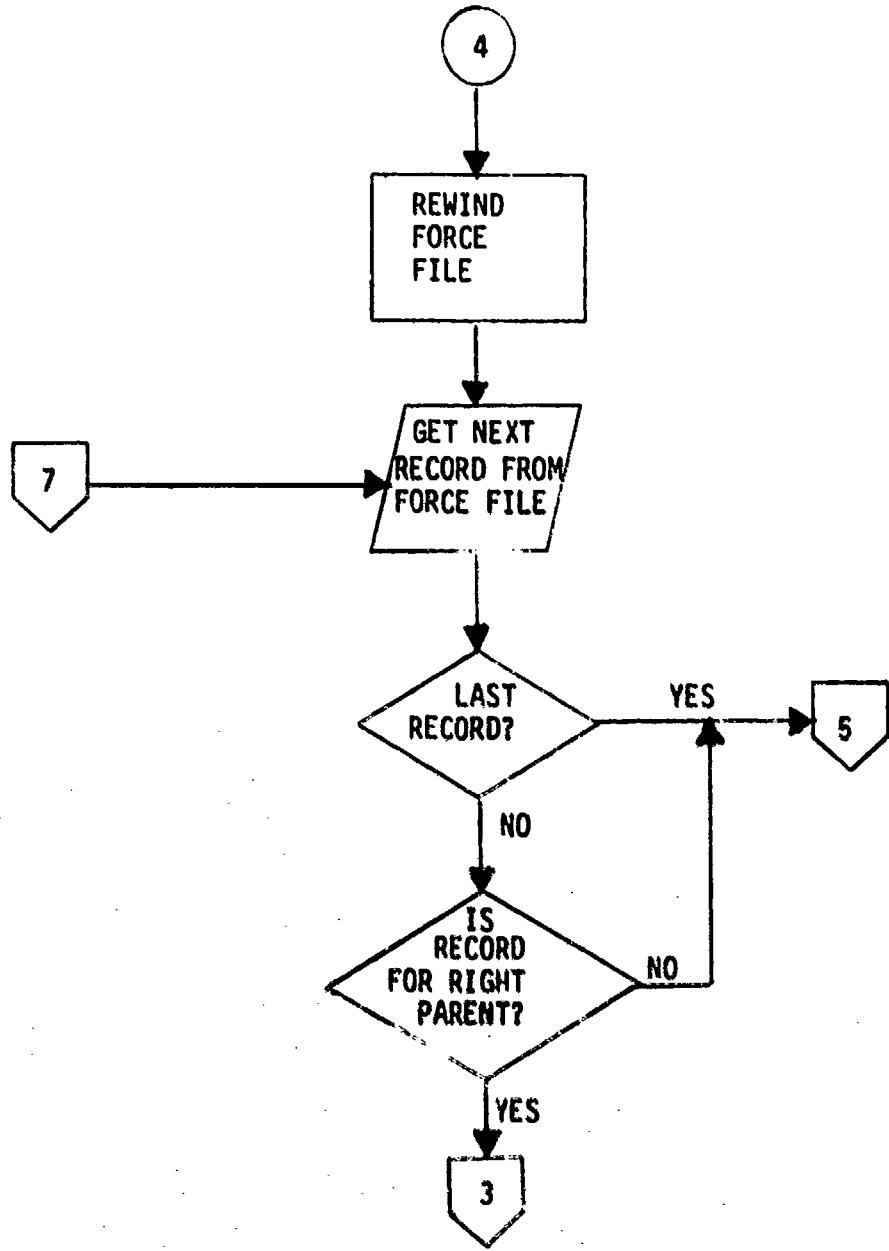

Figure 11. DISPLAY logic diagram (continued).

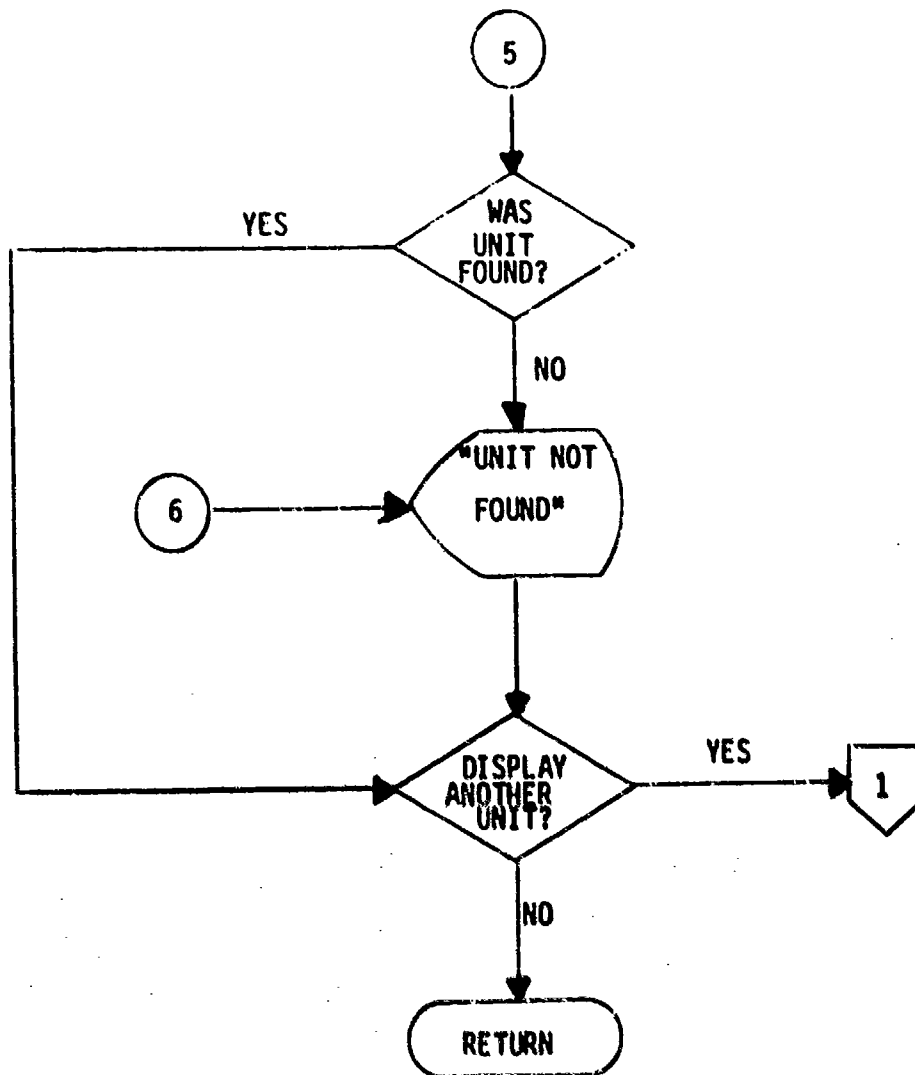

Figure 11. DISPLAY logic diagram (concluded).

(2) OVERLAY 1. The ROFA overlay (OVL 1) is accessed from the main Jiffy Game program at DECISION POINT number 2 (see table 1). The primary function of this routine is to determine and display, for the sector being gamed, the rate of advance of the attacking force; the length of the battle; the total distance covered by the attacker; the maneuver, fire support, and total firepower scores for each force; and the corresponding attacker:defender firepower ratios. To accomplish this, a number of parameters representing environmental and tactical military conditions that influence the nature of the conflict must be input interactively. Since these same factors also influence the other combat assessments, they are initialized here as variables in the blank COMMON area; thus, none of the combat assessment overlays can be accessed until this routine has been executed. The logic flow diagram for OVL 1 is given in figure 12. There are no subroutines contained in this overlay although the INDEX5 function (see paragraph 4b(1)(c)) from OVL 0 is utilized for extracting rate of advance values from the data array. The FORTRAN source code for ROFA is given in figure G-1, and the program variables are listed in table G-1.

(3) OVERLAY 2. Program OVL 2 (TANK) is the third of the combat assessment routines called in the main Jiffy Game program (OVL 0) from DECISION POINT number 3 (see table 1 and figure 7). In this overlay, the losses due to combat involving tanks, other armored combat vehicles, and antitank weapons are calculated and displayed. The overlay contains no subroutines but does call the INDEX5 function (see paragraph 4b(1)(c)) when extracting single shot kill probabilities (SSKPs) for assessments and also the LOSS subroutine (see paragraph 4b(1)(d)) after the losses have been assessed. The SSKP data used in this routine reside on the classified random access file (CLDATA); other data are either contained in the common areas or initialized in the problem itself. The flow diagram for OVL 2 is given in figure 13. The TANK routine cycles through a series of nested DO loops in assessing losses for each possible combination of targets and firers for both forces. The gamer inputs a range band index, which initiates the assessment logic cycle. At the end of each assessment cycle, the gamer either inputs another range band index to continue with another cycle or signals that the assessments are completed. When the assessments are finished, the overall results are displayed, the LOSS subroutine is called, and control is returned to the SUPER overlay. The FORTRAN source code for OVL 2 is given in figure H-1, and the program variables are listed in table H-1.

(4) OVERLAY 3. Program OVL 3 (INFANT) is the fourth combat assessment routine accessed by SUPER (the main Jiffy Game program) from DECISION POINT number 3 (see table 1 and figure 7) and is called whenever both forces contain infantry personnel in the weapon system (ELMT) array. The function of this overlay is to compute and display the losses incurred as a result of dismounted infantry combat for the sector being gamed. There are no subroutines included within this overlay; the LOSS subroutine of OVL 0 (see paragraph 4b(1)(c)) is called at the end of the assessments. Figure 14 contains the logic flow diagram for OVL 3. The routine requires a number of interactive gamer inputs, which set the parameters necessary to carry out a

one-time assessment of ambush and/or conventional dismounted infantry combat casualties suffered by each force. Following the display of the losses and processing of the LOSS subroutine, control is returned to SUPER. Program variables for OVLY 3 are listed in table I-1; the FORTRAN source code is contained in figure I-1.

(5) OVERLAY 4. Program OVLY 4 is the second combat assessment routine accessed by the supervisory Jiffy Game program from DECISION POINT number 3 (see table 1 and figure 7). This overlay consists of a main program (MINE) and a subroutine (FASCAM), which contain the assessment logic for attrition due to minefields. The LOSS subroutine (see paragraph 4b(1)(d)) is also called from the MINE program when all minefield assessments have been processed. Variable lists and FORTRAN source code listings for OVLY 4 are contained in appendix J.

(a) MINE. The primary function of the MINE program is to assess and display the losses suffered by the attacking force to minefields emplaced manually or mechanically (i.e., conventional minefields). MINE also contains the control point at which the type of minefield employed is specified interactively by the gamer. At the end of any minefield assessment, the program returns to this control point; thus, several assessments can be processed employing the same or different types of minefields before control is returned to the supervisory program. The logic flow diagram for MINE is given in figure 15. Only a minimal amount of data is needed to assess minefield losses; most of the necessary parameters are set interactively by gamer inputs. The processing of assessments is terminated from the control point, after which the LOSS subroutine is called and the overlay exited. The FORTRAN source code is given in figure J-1, and the program variables are listed in table J-1.

(b) FASCAM. This subroutine of OVLY 4 contains the logic used to assess losses to minefields composed of scatterable mines (FASCAM). The subroutine is called from the main overlay program (MINE) whenever the gamer specifies that a FASCAM minefield assessment is being processed. The logic flow diagram of FASCAM is given in figure 16. Although the assessment computation logic is essentially the same as for conventional minefields, the FASCAM minefields require a different set of inputs and casualty rate data. The FORTRAN source code for FASCAM is given in figure J-2, and the program variable list is given in table J-2.

(6) OVERLAY 5. Program OVLY 5 (AHAD) is the last of the combat assessment routines called from the supervisory program (SUPER) at DECISION POINT number 3 (see table 1 and figure 7). The purpose of this program is to determine and display losses resulting from combat involving attack helicopters and air defense systems. The overlay contains no subroutines; the INDEX 5 function (see paragraph 4b(1)(c)) is utilized in extracting helicopter single shot kill probabilities, and subroutine LOSS (see paragraph 4b(1)(d)) is called after all assessments have been made. Both the helicopter and AD SSKP's are stored in the classified random access file (CLDATA); several unclassified

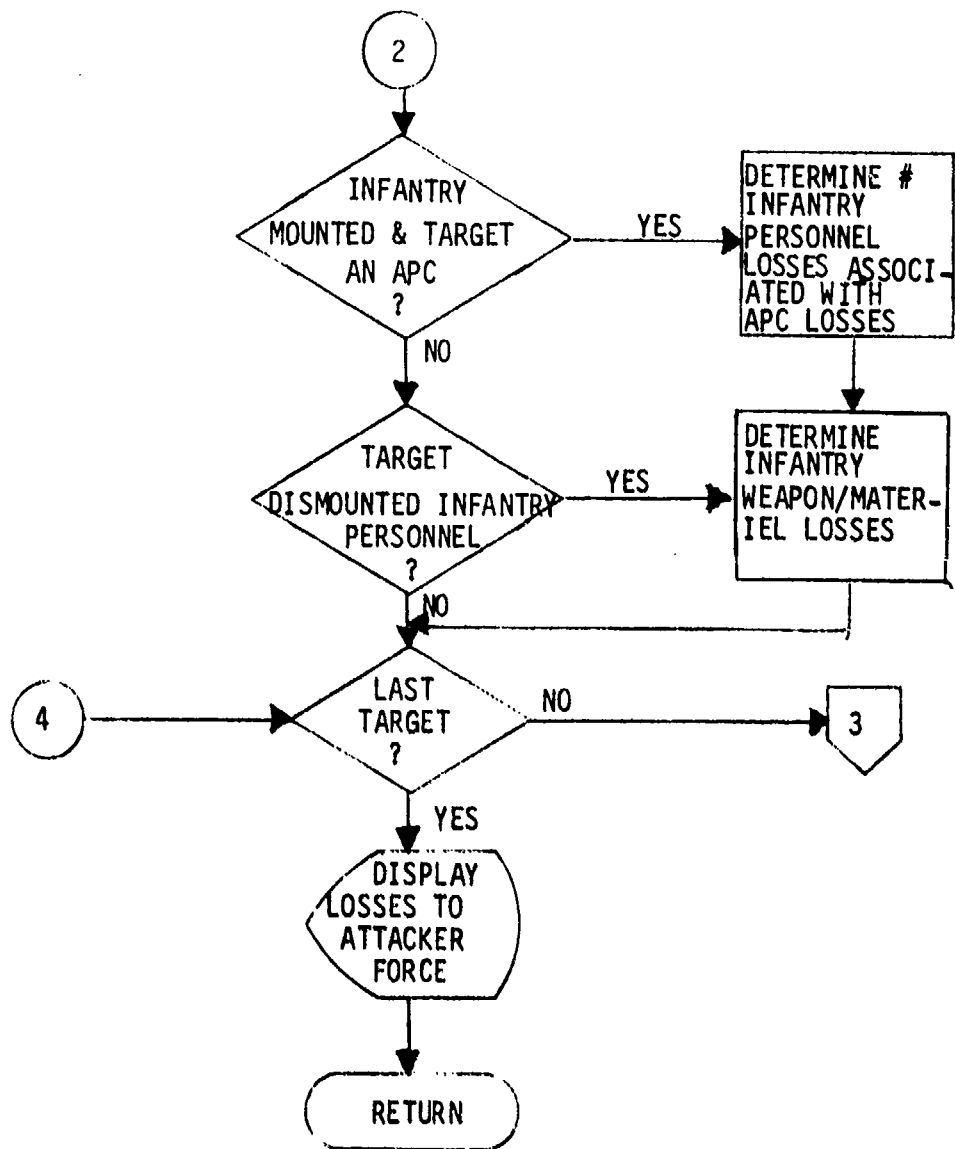

Figure 16. Subroutine FASCAM logic flow diagram (concluded).

data arrays are initiated in the program itself. The OVLY 5 logic flow diagram is given in figure 17. The program contains two sets of assessment logic, one for attack helicopter assessments against ground forces and another for air defense assessments against helicopters. The interactive definition of an attack helicopter mission initiates processing of both types of assessments, which are made for each pop-up of the helicopters in the attack cell and consequently may be cycled through several times for each mission. The number of helicopter missions to be assessed for each force is determined by the gamer; the Red helicopter/Blue air defense assessments are completed prior to beginning the Blue helicopter/Red air defense assessments. When all assessments have been completed, the cumulative losses are displayed for both forces, the LOSS subroutine is called, and the overlay exited. The OVLY 5 program variables are listed in table K-1, and the FORTRAN source code is given in figure K-1.

(7) OVERLAY 6. The overlay, OVLY 6, is the first combat assessment routine called by the supervisory program (SUPER) from DECISION POINT number 3 (see table 1 and figure 7). The overlay consists of the main program (CANNON) and one subroutine (CLGP); the function of OVLY 6 is to assess losses due to indirect fire weapon systems. The subroutine LOSS (see paragraph 4b(1)(d)) is also called when all assessments have been made. The routines require three data arrays from the classified random access file (CLDATA) in addition to the data initiated within the program itself. Appendix L contains FORTRAN source codes and program variable lists for OVLY 6.

(a) CANNON. The main program of overlay 6, CANNON, performs nearly all the assessments associated with mortar and field artillery fire and also displays the losses from all indirect fire missions. The logic flow diagram for CANNON is given in figure 18. The routine requires a number of gamer inputs to specify the types of indirect fire missions being assessed and to set parameters that are used in the actual assessment computations. The program cycles through several nested DO loops in making the loss calculations in order to assess all possible target/firer combinations; this is done for each force firing at the opposing force and for each phase of indirect fire combat being assessed. The only indirect fire assessment not included in the CANNON routine is for cannon-launched guided projectiles (CLGP). CLGP missions are available only to the Blue force and are assessed by calling the subroutine CLGP. The losses resulting from each of three major phases of indirect fire combat are displayed separately. When all assessments have been completed, the cumulative losses are displayed, the LOSS subroutine is called, and control is returned to the supervisory program. The FORTRAN source code for CANNON is given in figure L-1, and the program variables are listed in table L-1.

(b) CLGP. Subroutine CLGP is accessed from the indirect fire program to determine losses of Red weapons to Blue CLGP fire. The logic flow diagram for this subroutine is given in figure 19. The only gamer input required is the number of CLGP missions to be assessed; the computed losses

are returned to the main program and displayed from there as part of the indirect fire results. Since there is only one type of weapon that fires CLGP, the routine contains only one major DO loop to assess each possible target in the Red force. The CLGP program variables are listed in table L-2, and the FORTRAN source code is given in figure L-2.

(8) OVERLAY 8. SUPRES, the routine that determines the suppression factors for the attacking and defending forces, is contained in OVERLAY 8. SUPRES is composed of an array of the suppression factors used in the Jiffy Game and a few lines of code that access the data and set the suppression factors for both forces. A list of the program variables and a listing of the SUPRES FORTRAN source code are contained in appendix M. The program logic flow diagram is presented in figure 20.

(9) OVERLAY 9. Program OVLY 9 is called from the Jiffy Game supervisory program (SUPER) at DECISION POINT number 5 (see table 1). This overlay contains no subroutine nor does it call any external subroutines from OVLY0. The purpose of the program is to provide hard copy output of the results for a battle gamed with the Jiffy Game assessment routines. Figure 21 contains the logic flow diagram of RESULT. The routine tabulates the killer/victim results from the ALOSS array and the ammunition expenditures from the SHOTS array. Several tables are created to be output from a high speed printer. These tables display the cumulative results in formats determined to be most meaningful for analyzing and summarizing the outcome of the battle. The OVLY 9 FORTRAN source code is given in figure N-1, and the program variables are listed in table N-1.

(10) OVERLAY 10. OVERLAY 10 (FORCE) is the program by which the gamers manipulate their forces in the Jiffy Game. OVLY 10 is reached by a gamer response of "1" at the DECISION POINT in SUPER (see table 1). After the gamer defines the critical incident and sector, he is presented his choice of the eight force manipulation options in table 2. Upon completion of all but OPTION 0, the gamer is returned to the OPTION point. A response of "0" loads the weapon systems of all units loaded into the defined sector and critical incident into the weapon system (ELMT) array for both forces and returns control to SUPER. The display option (6) provides the gamer the capability to examine the FORCE file in four ways. The four types of displays accessible at OPTION 6 are given in table 3. Subroutine DISPLAY is used for display type 4. The program logic flow diagram for OVLY 10 is contained in figure 22. The FORTRAN program source code for OVLY 10 and a list of the program variables used in the overlay are presented in appendix O.

(11) OVERLAY 11. OVERLAY 11 apportions the personnel casualties and weapon system losses determined in the Jiffy Game combat assessment routines to the units on the FORCE file. The program in OVERLAY 11 is named APPORT. The apportionment is based on an algorithm that considers quantity of losses, number of weapon systems in the unit, and the level of combat intensity of the actions in which the unit was involved during the

Figure 20. SUPRES flow diagram.

Figure 21. OVLY9 (RESULT) flow diagram.
(Continued next page)

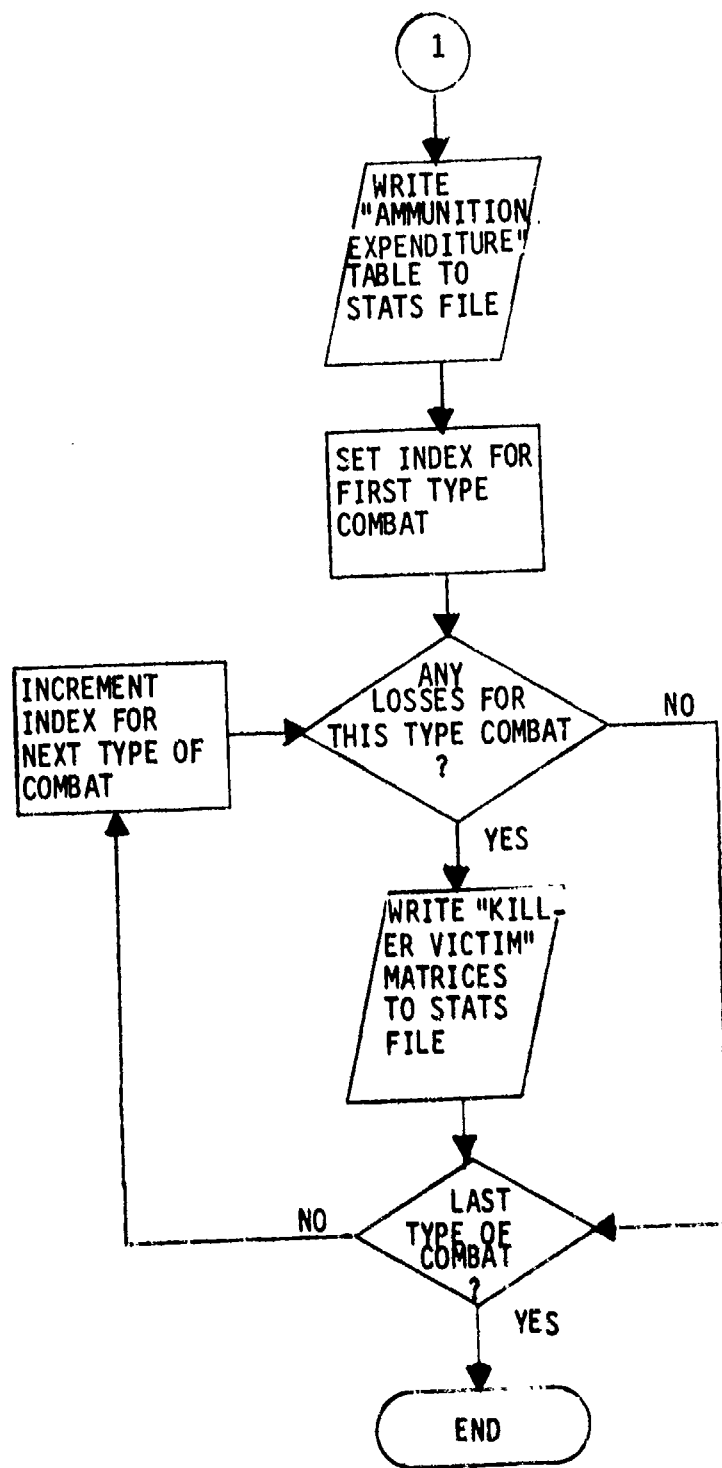

Figure 21. OVL9 (RESULT) flow diagram (concluded).

Table 2. OVLY10 force manipulation options.

Response Code	Option Description
0	Proceed with assessments
1	Load units into sector
2	Remove units from sector
3	Create a new unit
4	Adjust weapons in a unit
5	Attach a unit to a new parent
6	Display a unit
7	Delete a unit from FORCE file

Table 3. Types of displays.

Display Index	Type Display	Information Displayed
1	Lists all parent units on FORCE file	Parent ID, force designator, Parent unit effectiveness, sector and critical incident
2	Lists all parent units in defined sector and critical incident	Parent ID, force designator and Parent unit effectiveness
3	Lists all units attached to a specific parent unit	Parent ID, Unit ID, force designator, unit effectiveness, sector and critical incident
4	Lists all weapon systems in a specific unit or Parent unit	Parent ID, Parent unit effectiveness, Unit ID, unit effectiveness, quantity and type of weapon systems.

assessment period. The combat intensity level for each unit in a given sector during a critical incident is input interactively by the gamers. The APPORT overlay also compiles the cumulative combat statistics of all sectors for the entire critical incident. The cumulative loss and ammunition expenditures are kept on the HISTORY file. The overlay also provides the gamers with the capability to display any specified parent unit or unit after the apportionment process by calling the DISPLAY subroutine. Figure 23 is the APPORT logic flow diagram. A list of the program variables along with a listing of the FORTRAN source code is contained in appendix P, table P-1 and figure P-1, respectively.

(12) OVLY 12. OVERLAY 12 (BUILD) contains a single program, which is a duplicate of the SRC program (see paragraph 3c(1)). A copy of the SRC program was included in the Jiffy Game overlays to provide the gamers the capability to create interactively new units in a force with existing or new SRCs during actual processing of the Jiffy Game. BUILD allows the gamers to develop new SRCs. The program logic flow diagram for BUILD is identical to the flow diagram presented for the SRC program (figure 2). The FORTRAN source code for BUILD is contained in appendix Q, figure Q-1. The BUILD program variables are presented in table Q-1.

APPENDIX B
SRC PROGRAM LISTING

APPENDIX B

SRC PROGRAM LISTING

A listing of the FORTRAN code of the SRC program with a list of the program parameters is contained in this appendix. The list of variables is presented in table B-1. The FORTRAN source code of the program is given in figure B-1.

Table B-1. List of variables for SRC program.

Variable	Description
ACHG	Weapons to change (delete)
AERR	Weapons not found to change (delete)
AHOLD	Keeps the force type
AJ	Quantity of weapon to be added
AM	Weapon to be added
ARRAY	Work storage array (SRC File)
ARRAY (1)	Force type (key)
ARRAY (2)	SRC name (key)
ARRAY (3)	First weapon on record
ASRC	SRC name specified
ICK	Action code
IDO	Weapon listed
IEND	Number of weapons to be changed (deleted)
IFIT	FIT array (SRC File)
K	Number of weapons not found
NN	Weapon position on record
NY	Answer to question

APPENDIX C
UNIT PROGRAM LISTING

APPENDIX C

UNIT PROGRAM LISTING

This appendix contains the FORTRAN code and a list of the variables of the UNIT program. The list of variables is contained in table C-1. The FORTRAN program is presented in figure C-1.

Table C-1. List of variables for UNIT program.

Variable	Description
AERR	SRC's already existing in unit
ARRAY	Work storage area (SRC File)
ARRAY (1)	Force type (key)
ARRAY (2)	SRC name (key)
ARRAY (3)	First weapon on record
BBERR	SRC's which do not exist
BCHG	SRC's to be added (deleted)
BERR	SRC's to be added
BFRC	SRC not on file
BHOLD	Keeps the force type
BRRAY	Work storage area (Unit File)
BRRAY (1)	Force type (key)
BRRAY (2)	Unit Name (key)
BRRAY (3)	First SRC on record
BUNIT	Unit name specified
I	SRC position on record
ICK	Action code
IFIT	FIT array (SRC File)
K	Number of SRC's not found
M	Number of SRC's already existing
N	Number of SRC's to be added
NEND	Number of SRC's to be changed (deleted)
NFIT	FIT array (Unit File)
NN	Number of SRC's which do not exist
NY	Answer to question

```

APPENDIX D
PARENT PROGRAM LISTING

APPENDIX D

PARENT PROGRAM LISTING

Appendix D contains a list of the variables used in and a listing of the FORTRAN source code for the PARENT program. A list of the program variables is given in table D-1, and the program code is presented in figure D-1.

Table D-1. List of variables for PARENT program.

Variable	Description
BBERR	Units which do not exist
BERR	Units which are to be added
BRRAY	Work storage area (Unit File)
BRRAY (1)	Force type (Key)
BRRAY (2)	Unit Name (Key)
BRRAY (3)	First SRC on record
CCHG	Units to be added (deleted)
CERR	Units already existing
CFRC	Parent specified
CHOLD	Keeps the force type
CRRAY	Work storage area (PARENT file)
CRRAY (1)	Force Type (Key)
CRRAY (2)	Parent name (Key)
CRRAY (3)	First unit on record
I	Unit position on record
ICK	Action code
K	Number of units not found
LEND	Number of units to be changed (deleted)
LFIT	FIT Array (Parent File)
M	Number of units already existing
N	Number of units to be added
NFIT	FIT array (Unit File)
NN	Number of units which do not exist
NY	Answer to question

FORCE PROGRAM LISTING

APPENDIX E

FORCE PROGRAM LISTING

A list of the variables used in the FORCE program is given in table E-1. A listing of the FORTRAN source code of the FORCE program is contained in figure E-1.

Table E-1. List of variables for FORCE program.

Variable	Description
AA	Keeps force type
AFOR	Work storage area (Parent File)
AH	Used to check for correct force
AHOLD	Keeps force type
ARRAY	Work storage area (Force File)
ARRAY (1)	Parent Unit (key)
ARRAY (2)	Unit (key)
ARRAY (3)	Force type (number)
ARRAY (4)	Sector
ARRAY (5)	Critical Incident
ARRAY (6)	FPS @ 100%
ARRAY (7)	Combat value
ASCENE	Force to be deleted
ASRC	Work storage area (SRC File)
ATOT	Force specified
AUID	Work storage area (Unit File)
CV	Combat value specified
FPS	Firepower score
ID	Weapon number (1-80)
IDO	Weapon listed
IFIT	FIT Array (Parent File)
JFIT	FIT Array (Unit File)
KFIT	FIT Array (SRC File)
LFIT	FIT Array (Force File)
NUMFOR	Number of forces added
TYPE	Force type specified

```

APPENDIX F
OVLYO PROGRAM CODES AND LISTS OF VARIABLES

APPENDIX F

OVLYO PROGRAM CODES AND LISTS OF VARIABLES

This appendix contains the FORTRAN source codes of all the programs, subroutines, and subfunctions of OVLYO. Table F-1 is a list of all common variables used in the Jiffy Game. Table F-2 is a list of the program variables used in SUPER, the Jiffy Game main program. The SUPER source code is given in figure F-1. The initialization subroutine, INIT, source code is presented in figure F-2. Since all the variables used in INIT are common variables, they are defined in table F-1. Table F-3 contains the list of INDEX5, the subfunction used to convert a five subscript variable to a single subscript variable, program variables; and the FORTRAN source code for INDEX5 is given in figure F-3. Table F-4 contains a listing of the program variables used in the LOSS subroutine, which reduces the forces' weapon system arrays by whatever losses have been incurred in a particular type of combat (i.e., indirect fire, armor, etc.). Figure F-4 presents the LOSS program source code. The FORTRAN source code and list of program variables for the DISPLAY subroutine are contained in figure F-5 and table F-5, respectively. The DISPLAY subroutine interactively outputs the quantities and types of weapon systems contained in gamer specified units to the game console during processing.

Table F-1. Jiffy Game common variables.
(Continued next page).

Variable	Description
ACI	Critical incident identifier
AH	HISTORY file record array
ALOSS	Weapon loss array
APOS	Attacker tactical deployment factor
ARRAY	FORCE file record array
ASCENE	Critical incident mnemonic
ASECT	Sector number
ATIME	Length of critical incident (HR)
BRRAY	SRC file record array
CFPR	Maneuver firepower ratio
CKILL	Crew kills
CREWS	Number of crewmen killed per weapon system
D	Number of weapons subject to loss apportionment
DPOS	Defender tactical deployment factor
ELMT	Array of weapon systems in sector
FPR	Total firepower ratio
FPS	Array of weapon system firepower scores
FSFPR	Fire support firepower ratio
FSSF	Fire support suppression factor
IA	Index for attacker force

Table F-1. Jiffy Game common variables (concluded).

Variable	Description
ID	Index for defender force
IENGAG	Index for tactical situation
IFIRST	Rate of advance calculation flag
IFIT	File information table for SRC file
IHIST	File information table for HISTORY file
IMOUNT	Index for attacker mobility
IP	Index for tactical situation table
IRUN	Index for type of run
ITERRN	Index for type of terrain
IVIS	Index for visibility
IYBUF	HISTORY file I/O buffer
KEY	Data file random access key
LFIT	File information table for FORCE file
MINES	Minefield flag
MYBUF	FORCE file I/O buffer
NYBUF	SRC file I/O buffer
PACK	Word packing variables
PLT	Infantryman materiel loss rates
PSN	Tactical deployment factor
SF	Suppression factor
SHOTS	Round expenditure array

Table F-2. Program variables for SUPER.

Variable	Description
AKEEP	Temporary storage variable
I	Subscript of firer weapon system
IFLAG	Logic flag
INX	Input response variable
IWP	Index for weapon system
IXNAX	Batch run constant
J	Index for force color
JRUN	Batch run constant
K	Subscript of target weapon system
KIND	Force color
M	File status integer
MM	File status integer
XLOS	Number of weapon systems

APPENDIX G

OVLY 1 PROGRAM CODE AND LIST OF VARIABLES

APPENDIX G

OVLY 1 PROGRAM CODE AND LIST OF VARIABLES

This appendix contains the FORTRAN source code and variable list for OVLY 1 (ROFA). This program sets a number of parameters used throughout the combat assessment routines and calculates the attacker's rate of advance, firepower scores for both forces, and attacker:defender firepower ratios. Table G-1 lists the ROFA program variables; figure G-1 is the FORTRAN source code listing.

Table G-1. Program variables for OVLY1 (ROFA).

Variable	Description
ADIST	Attacker's covered distance
CFPS	Ground combat firepower score
F	Fraction of sector Red force massed
FPRM	Maneuver firepower ratio
FSFPS	Fire support firepower score
I	Weapon system index
IEL	Force index
IFPR	Rate-of-advance firepower ratio index
INX	Input response variable
ISTART	Do-loop index
ITABLE	Engagement type index
J	Force index
JVIS	Rate-of-advance visibility index
K	Weapon system index
KIND	Force color
RATE	Rate-of-advance data array
RMIN	Minimum attacker firepower ratio
ROA	Rate-of-advance (KM/HR)
ROA1 ROA2	Intermediate ROA calculation variable
STALE	Rate of advance index determiner
TFPS	Total firepower score

NOTE: All COMMON variables are defined in table F-1.

```

OVLY 2 PROGRAM CODE AND LIST OF VARIABLES

APPENDIX H

OVLY 2 PROGRAM CODE AND LIST OF VARIABLES

This appendix contains the FORTRAN source code and variable list for the OVLY 2 (TANK) program. TANK contains the assessment logic for the gaming of combat involving tanks, armored vehicles, and antitank weapons. The program variables are listed in table H-1, and the FORTRAN source code listing is in figure H-1.

Table H-1. Program variables for OVLY2 (TANK).

Variable	Description
A	Acquisition data array
ACQ	Acquisition discriminator
AKILL	Current losses to weapon systems
ATCREW	Number of infantrymen killed per antitank weapon
BLUE	Blue weapon system cumulative losses
CLOST	Crewmen losses
ELMTS	Total number of targets
ELS	Total number of firers
FDF	Fire distribution factor
FIRE	Expected number of completed firings
I	Firer weapon index
IFIND	SSKP data block index
IFLAG	Flag for displaying/suppressing table header
INDX	SSKP data entry index
INX	Input response variable
IPSN	Positioning units index for attacker/defender
ISUP	Suppression degradation factor index
ITYP	Ammunition type index

Table H-1. Program variables for OVLY2 (TANK) (continued).

Variable	Description
J	Firer force index
JJ	Attacker/defender firer force index
JPSN	Positioning units index for contact
K	Target weapon index
KFLAG	Initial contact flag
KIND	Force color
KK	Category type index
KT	Expected number of completed firings firer index
L	Target force index
LL	Attacker/defender target force index
M	Weapon system (firer) index
MAXR	Range index
N	Weapon system (target) index
NBR	SSKP single integer index
OPERA	Weapon system operational availability
PKILL	Target's survival probability against firer
PLOSS	Current losses to weapon systems
RED	Red weapon system cumulative losses
ROUNDS	Ammunition fired per target
SKILL	Loss apportionment factor denominator

Table H-1. Program variables for OVLY2 (TANK)(concluded).

Variable	Description
SS	Defilade SSKP/Final SSKP
SSKP	Weapon system single shot kill probability
SSS	Fully exposed SSKP
SUPDEG	Suppression degradation factor coefficient
TKILL	Targets killed
V	Visibility degradation factors
VICTIM	Firer's target
VISDEG	Visibility degradation factor
WTS	Weapon system category weights
XN	Weapon system engagements

NOTE: All COMMON variables are defined in table F-1.

APPENDIX I
OVLY 3 PROGRAM CODE AND LIST OF VARIABLES

APPENDIX I

OVLY 3 PROGRAM CODE AND LIST OF VARIABLES

This appendix contains the FORTRAN code and variable list for the OVLY 3 (INFANT) program. INFANT is the routine that assesses dismounted infantry combat between the opposing forces. Table I-1 lists the program variables, and figure I-1 is the FORTRAN source code listing.

Table I-1. Program variables for OVLY3 (INFANT).
(Continued next page.)

Variable	Description
A	Ambush personnel casualty rate
AIL	Infantry attacker losses
AT	Personnel allocated to infantry attack
ATRIT	Personnel casualties for ambushed unit
D	Defender's personnel casualty rate
DIL	Infantry defender losses
DT	Personnel allocated to infantry defense
DTRIT	Personnel casualties for ambushing unit
F	Fraction of maneuver forces committed
FAC	Casualty rate resolution factor
GFPR	Ground combat firepower ratio
GFPS	Ground combat firepower scores
HR	Hours of combat for assessment
HRC	Hours of conventional combat
I	Target weapon index
IAA	Attacker index in ambush
IEL	Defender index
IFLAG	Logic flag
INDEX	Target weapon flag

Table I-1. Program variables for OVLY3 (INFANT)
(Concluded).

Variable	Description
INX	Hours of infantry attack
J	Force index
KIND	Force color
L	Target force index
STALE	Casualty rate index determiner array
TABLE	Ground combat personnel casualty rate
TABLE3	Ambush personnel casualties

NOTE: All COMMON Variables are defined in table F-1.

APPENDIX J

OVLY 4 PROGRAM CODES AND LISTS OF VARIABLES.

APPENDIX J

OVLY 4 PROGRAM CODES AND LISTS OF VARIABLES

This appendix contains the FORTRAN listings and variable lists for the main program, MINE, and the subroutine, FASCAM, of the OVLY 4 program. The MINE routine assess attacker force losses to conventional minefields, and the FASCAM subroutine makes the assessments for FASCAM minefields. The MINE program variables are listed in table J-1, with the FORTRAN source code listing in figure J-1. For the FASCAM subroutine, table J-2 and figure M-2 give the program variable list and the FORTRAN code, respectively.

Table J-1. Program variables for MINE (continued next page).

Variable	Description
AFRONT	Minefield frontage input variable
AKILL	Attacker weapon system kills
ATDEN	Antitank minefield (MF) density per square meter
ATFAC	Percent tank losses by antitank mines
BMPL	Mine planter platoons
CLOST	Crewmen losses for productive time lost due to enemy
FROBY	Minefield frontage bypassed by attacker
FRONT	Potential minefield frontage
HOURS	Hours required to lay MF strip
HRMAN	Man-hours available for emplacement of mines
HRREQ	Man-hours required to manually emplace mines
IND	Type of mine employment index
INX	Input response variable
J	Antitank mine density index
K	Target weapon system index

Table J-1. Program variables for MINE (concluded).

Variable	Description
KIND	Force color
KK	Infantry weapon system index
NUMEN	Number men to emplace mines
P	Percent of force entering minefield
PERCAS	Percent AP mines personnel casualties
PERCOV	Percent of unit's front covered by mines
PHR	Man hours available
PLOSS	Total victims killed
PMFNBY	Percent of MF not bypassed by attacker
RNMPH	Mine planter hours available
STRIPW	Minefield strip width
TRZONE	Terrain trafficable by armor
WDEGF	Work degradation factor
X	Mine density input variable

NOTE; All COMMON variables are defined in table F-1.

Table J-2. Program variables for FASCAM.

Variable	Description
AKILL	Attacker weapon system kills
CLOST	Crewmen lost
FATCAS	Percent tank casualties by FASCAM mines
FPCAS	Percent personnel casualties by FASCAM mines
FROBY	Minefield frontage bypassed by attacker
FRONT	Minefield frontage
II	Type of FASCAM delivery system
INX	Input response variable
J	Force index
K	Target weapon index
KK	Target weapon index
P	Percent of force entering minefield
PERCOV	Percent of units front covered by mines
PLOSS	Total victims killed
PNFNBY	Percent of MF not bypassed by attacker
TRZONE	Terrain trafficable by armor

NOTE: All COMMON variables are defined in table F-1.

APPENDIX K

OVLY 5 PROGRAM CODE AND LIST OF VARIABLES

APPENDIX K

OVLY 5 PROGRAM CODE AND LIST OF VARIABLES

This appendix contains the FORTRAN source code listing and variable list for the OVLY 5 (AHAD) program. The AHAD routine processes assessments for combat in which attack helicopters are firing at ground maneuver units while being engaged by air defense weapons. The FORTRAN source code listing of AHAD is given in figure K-1; the program variables are listed in table K-1.

Table K-1. Program variables for OVLY5 (AHAD) (continued next page).

Variable	Description
AC	Number of helicopters entered in cell
ACAV	Helicopter operational availabilities
ACCREW	Helicopter crewmen losses
ACKILL	Mission helicopter losses
ACLOST	Popup helicopter losses
AHKILL	Cumulative probability of survival against helicopters
AIRLOSS	Total helicopter losses
AKILL	Helicopter survival probability against all AD
AOFA	Number of avenues of approach
APOP	Helicopter ordnance success rates of fire
CELL	Helicopter attack cell configuration array
CLOST	Ground weapons crewmen losses
EXP	Total number of helicopter exposures to AD fire
FDF	Fire distribution factor
FRAC	Loss apportionment factor
GFKILL	Mission ground force losses
GIS	Mounted/dismounted infantry materiel loss factor
GNDLOS	Total ground force losses

Table K-1. Program variables for OVLY5 (AHAD)(continued).

Variable	Description
H	Hours of flying time for helicopters
HELI	Number of helicopters remaining in a force
I	Ground weapon system index
IABORT	Mission abort flag
IECM	Electronic countermeasure index
IEL	Infantry weapon loss calculation index
IFLAG	Display header flag
II	Ground weapon system index
IN	AD firer index
INX	Input response variable
ITGT	Ground weapon target type index
ITYP	Ordnance type index
IWP	Infantry weapon index
J	Ground force index
JFLAG	Helicopter crew loss display flag
JPSN	Positioning units index for contact
K	Helicopter type index
KIND	Force color
KK	Helicopter type index
KTRL	AD weapon control status factor index

Table K-1. Program variables for OVLY5 (AHAD)(continued).

Variable	Description
L	Helicopter force index
N	Cell popup index
NN	Cell popup counter index
NPOP	Number of helicopter popups per sortie
NPOPOP	Number of cell popups
OPAV	Weapon system operational availability
ORD	Helicopter ordnance loads
ORDEXP	Helicopter ordnance expenditure
PA	Helicopter percent acquisition factor
PHKILL	Weapon system survival probability against helicopter
PK	Helicopter probability of kill array
PKILL	Helicopter survival probability against AD weapon
POPORD	Helicopter per popup ordnance expenditure
PROB	Helicopter averaged PK against target
PROB1	Helicopter PK against target in defilade
PROB2	Helicopter PK against target in open
ROUNDS	Total helicopter rounds fired.
S	AD weapons suppression factor
SA	Helicopter sorties available
SFACT	Suppression factor coefficient

Table K-1. Program variables for OVLY5 (AHAD)(concluded).

Variable	Description
SH	Helicopter suppression factor
SHKILL	Loss apportionment denominator for helicopters
SKILL	Loss apportionment denominator for AD weapons
SSK	AD single engagement kill probabilities
TMASK	Terrain masking factors
TNOW	Current total number of helicopters in cell
TSTART	Initial total number of helicopters in cell
V	Visibility degradation factor
VICTIM	Total ground weapon system targets for helicopters
VKILL	Ground weapon systems killed by helicopters
WEAPC	AD weapon control status factors
WEIGHT	AD target weighting factor

NOTE: All COMMON variables are defined in table F-1.

OVLY 6 PROGRAM CODE AND LIST OF VARIABLES

APPENDIX L

OVLY 6 PROGRAM CODE AND LIST OF VARIABLES

This appendix contains the FORTRAN source code listings and variable lists for the main program, CANNON, and subroutine, CLGP, of the OVLY 6 overlay. OVLY 6 is the routine that assesses indirect fire combat losses. CANNON contains the logic for assessing all true indirect fire missions; subroutine CLGP assesses only cannon launched guided projectile (CLGP) missions. Table L-1 is the program variable list for CANNON; table L-2 is the list for CLGP. The FORTRAN source code is given in figure L-1 for CANNON and figure L-2 for CLGP.

Table L-1. Program variables for CANNON
(Continued next page).

Variable	Description
ACQ	Acquisition factor
ADSF	Air defense suppression mission flag
AKILL	Target survival probability against all firers
AT	Number of homogeneous area targets.
BMT	Battery missions per tube
CBTLEV	IDF combat level required
CLEV	IDF combat level
CLOST	Crewmen lost
CM	Total CLGP missions fired
CM50	CLGP missions fired by weapon 50
CM53	CLGP missions fired by weapon 53
DE	Fraction of IDF systems deployed
F	Fraction of missions which are targeted
FAC	Fire allocation constant
FDF	Fire distribution factor
FDT	Fractional damage table
FLAG	Flag for type of IDF mission
FPF	Length of final protective fires (minutes)
HOURS.	Length of IDF mission (hours)
HR	Length of IDF support (hours)

Table L-1. Program variables for CANNON (continued)

Variable	Description
HRARTY	Length of artillery support (hours)
I	Firer weapon integer index
ICAT	IDF weapon category index
ICB	Counterbattery mission flag
ICS	Close support mission flag
IFLAG	Mission flag index
II	Firer weapon mapping index
INX	Input response variable
IOP	Suppression factor index
IPOINT	Output header flag
IS	AMMO array index
ISHOT	Ammunition expenditure index
ITP	Dual purpose ICM flag
I50	Weapon 50 CLGP fire flag
I53	Weapon 53 CLGP fire flag
J	Firer's force integer index
K	Victim weapon integer index
KIND	Force color
KK	Target mapping index
L	Victim's force integer index

Table L-1. Program variables for CANNON (concluded).

Variable	Description
MAP	IDF target mapping array
MW	Military worth array
MWTH	Military worth
OPERA	Operational availability
PERSF	Personnel fire missions flag
PKILL	Target survival probability against firer
PLOSS	Total victims killed
PDK	Percent of knowledge
PREP	Lengths of prep/counter-prep fires (minutes)
ROF	Rate of fire
RPM	Rounds per mission
S	Suppression factor
SKILL	Loss apportionment factor denominator
SUPR	Weapon suppression constants
TBAT	Tubes per battery
TGT	Elements per target
TKILL	Target losses to IDF systems

NOTE: All COMMON variables are defined in table F-1.

Variable	Description
AKILL	Target losses to CLGP fire
BMT	Battery missions per tube
CM	Total CLGP missions fired
FD	Fraction damage
FDF	Fire distribution factor
I	Firer weapon index
IPSN	Positioning units index for contact
J	Firer force index
K	Target weapon index
KK	Infantry weapon index
L	Target for index
MAX	Maximum CLGP mission to fire
OA	Operational availability
PLOSS	Total victims killed
PREC	CLGP SSKPs and GLLD suppression factor
R	Number of CLGP rounds fired
T	Number of targets available to CLGP firer

NOTE: All COMMON variables are defined in table F-1.

APPENDIX M
OVLY 8 PROGRAM CODE AND LIST OF VARIABLES

APPENDIX M

OVLY 8 PROGRAM CODE AND LIST OF VARIABLES

This appendix contains the FORTRAN program source code and list of program variables for OVLY 8 (SUPRES), the suppression overlay. SUPRES determines the overall and fire support suppression factors for both the attacking and defending forces. Table M-1 contains a list of the SUPRES program variables. Figure M-1 is the program source code.

Table M-1. Program variables for SUPRES.

Variable	Description
FACT	Suppression factor data array
I	Array index
STALE	Limits of firepower ratios which index suppression factor data

NOTE: All COMMON variables are defined in table F-1.

```

OVLY 9 PROGRAM CODE AND LIST OF VARIABLES

APPENDIX N

OVLY 9 PROGRAM CODE AND LIST OF VARIABLES

This appendix contains the FORTRAN code listing and variable list for the OVLY 9 (RESULT) program. RESULT is the program used to record the overall results of a sector or critical incident battle. The OVLY 9 program variables are listed in table N-1; the FORTRAN source code listing is in figure N-1.

Table N-1. Program variables for OVLY9 (RESULT).
(Continued next page.)

Variable	Description
AKILL	Unpacked ALOSS killer/victim variable
COSCOM	Equipment repairable at Corp level
DIV	Equipment repairable at Division level
FOS	Percent of repairable equipment at Corp Level
I	Killer weapon index
II	Victim index for killer/victim matrix output
IK	Weapon code index counter
IKILL	Data indices for killer
INX	Victim equipment recoverability category index
IPP	Combat posture index for recoverability data
IT	Victim weapon index
ITH	Killer equipment recoverability category index
IVICT	Data indices for victim
J	Victim force index
K	Loss category index
KAT	Killer category index
KIND	Force color

Table N-1. Program variables for OVLY9 (RESULT) (continued).

Variable	Description
L	Killer weapon index beginning
LL	Victim weapon index beginning
M	Killer weapon index end
MAP	Index to aggregate killer weapon systems
MI	Victim nomenclature index
MM	Victim weapon index end
PREC	Percent (function) of Red systems recoverable
RECOV	Percent of recoverable equipment
RECV	Total recoverable equipment
REP	Total recoverable equipment
REPAIR	Total recoverable equipment
REP10	Equipment repairable in ten (10) days
REP2	Equipment repairable in two (2) days
REPS	Equipment repairable in five (5) days
SUM	Victim losses cumulated over all killers
TABLE7	Losses by category of killer
THEA	Equipment repairable at Theater level
THER	Percent of equipment repairable at Theater level

Table N-1. Program variables for OVLY9 (RESULT) (concluded).

Variable	Description
TKILL	Sum of losses recoverable/nonrecoverable
TLOSS	Total losses to killer category KAT
TOTAL	Sum of all losses incurred by unit
VCLASS	Victim nomenclature
XKILL	Weapon system losses
XNREP	Total nonrepairable equipment
XREP	Total repairable equipment

NOTE: All COMMON variables are defined in table F-1.

OVLY 10 PROGRAM CODE AND LIST OF VARIABLES

APPENDIX 0

OVLY 10 PROGRAM CODE AND LIST OF VARIABLES

This appendix contains the FORTRAN program source code of FORCE, the force manipulation overlay (OVLY 10), and a list of the program variables used in the overlay. The FORCE program variable list is given in table 0-1, and the program source code is presented in figure 0-1.

Table 0-1. List of program variables for FORCE.

Variable	Description
AJ	Quantity of weapons to adjust
CIL	Combat intensity level factors
CV	Relative effectiveness
I	Do-loop index
IFLAG	Logic flag
IJ	SRC record weapon index
INX	Gamer response variable
J	Force designator
JJ	FORCE record weapon index
KIND	Force color
M	Indexed-sequential file status variable
MM	Type of weapons to adjust
PAR	Parent unit ID
PARENT	Parent unit ID
TFPS	Total firepower score
UEFF	Unit effectiveness
UNIT	Unit ID
XCI	Critical incident name
XSECT	Sector number

NOTE: All COMMON variables are defined in table F-1.

APPENDIX P
OVLY 11 PROGRAM CODE AND LIST OF VARIABLES

APPENDIX P

OVLY 11 PROGRAM CODE AND LIST OF VARIABLES

Appendix P contains the program source code listing and a table of the program variables for OVLY 11 (APPORT), the Jiffy Game loss apportionment overlay. The list of program variables is contained in table P-1. The listing of the FORTRAN program source code is presented in figure P-1.

Table P-1. Program variables for APPORT. (Continued next page).

Variable	Description
AIRKO	Quantity of given type weapons lost to TACAIR being apportioned to unit
AKO	Quantity of given type weapons lost to ground actions being apportioned to unit
CBTINT	Combat intensity factor
CIL	Combat intensity level factor
CLOST	Number of crew personnel lost
CUMLOS	Parent unit loss array
DAIR	Quantity of weapon systems subject to apportionment for TACAIR losses
I	File record word index; weapon system index
ICIL	Combat intensity level index
IFLAG	Logic flag
IHOLD	Automatic CIL allocation indicator
II	Weapon system index
INT	Gamer response variable
J	Force identifier
JJ	Force identifier
K	File record word index
KIND	Force color

Table P-1. Program variables for APPORT (concluded).

Variable	Description
M	Index-sequential file status variable
PAREFF	Parent unit effectiveness
PARENT	Parent unit identifier
PARFPS	Parent unit firepower score
PARINIT	Initial firepower score of parent unit
PERS	Number of non-infantry personnel casualties
TFPS	Total firepower score
UEFF	Unit effectiveness
XL	Packed weapon system losses to all type of combat
XN	Unpacked weapon system losses to all types of combat

NOTE: All COMMON variables are defined in table F-1.

APPENDIX Q
OVLY 12 PROGRAM CODE AND LIST OF VARIABLES

APPENDIX Q

OVLY 12 PROGRAM CODE AND LIST OF VARIABLES

This appendix contains the FORTRAN source code and a listing of the program variables for OVLY 12 (BUILD), an overlay which creates and maintains the SRC file during interactive processing of the Jiffy Game. Table Q-1 is a list of the program variables of the overlay, and figure Q-1 is a listing of the program's source code.

Table Q-1. Program variables for BUILD.

Variable	Description
AHOLD	First word of SRC record
AJ	Quantity of weapons being entered
ASRC	SRC identifier
I	SRC record word index
IID	Weapon system item code
INX	Gamer response variable
M	Index-sequential file status variable
MM	Weapon item code being entered
NN	Weapon item code word index

NOTE: All COMMON variables are defined in table F-1.
