The Pricing of Computer Services: A Bibliography

This bibliography consists of references to the literature on pricing of computer services. A table of categories provides indexing of the bibliography on the bases of authors, editors, titles, etc., with cross references to the original entry. The bibliography will be revised at a later date to include classification according to content along with additional critical annotations and abstracts.

Key Words: bibliography, pricing, installation management, transfer pricing, cost accounting, economics, computers, data processing, accounting.

This bibliography has been prepared as part of the doctoral research of the author. The objective is provide a set of references which can be maintained in an on-line system and updated to support future research into the management of computing facilities and installations.

No comparable document has been identified during the literature survey thus far. As a result, this paper is being released in the working paper series of The College of Industrial Management, Georgia Institute of Technology prior to the completion of the annotations. A subsequent revision will include annotations and more comprehensive indexing according to reference content.

The bibliography includes topics from the literature of accounting, economics, and computing. The intent was to identify papers of value to both practitioners and theoreticians. Ancillary topics have been included if sufficiently relevant. As in other such collections, errors of exclusion were considered more serious than errors of

inclusion. All articles which appear to be topical are included without regard to quality. The inclusion of annotations or abstracts is intended to give more insight into the particularly interesting and worthwhile articles.

The literature searched included both current abstracts, such as Computer and Control Abstracts and The Engineering Index, and reference bibliographies from the papers collected. This effort is on-going and current journals and abstracts will be used to update the files for future editions.

Readers of this bibliography aware of papers not included but of interest are requested to forward this information to the author so that an even more comprehensive bibliography might be developed prior to completion of the project. If available, copies of the reference would facilitate the annotation process.

A Method of determining the use of the processor, the channel, and the disk device is described. Controlled experiments are performed with an IBM 370/155 in a dedicated environment using a software monitor, configuration utilization evaluator (CUE). The accounting data collected by systems management facility (SMF) during these experiments are used to calculate the utilization of the processor, the channel, and the disk device. The calculated numbers compare favorably with those measured by the disk device. [ACQ 349 /Section: 2]

The paper categorizes MIS costs according to type and traceability. The proposed cost accounting system for MIS utilizes cost traceability and behavior as the primary variables for classification. Computer utilization is viewed as a system of interrelated activity involving top management, the computer center, and computer users. Quantitative mechanisms for integrating interfaces activity are discussed and the needs and objectives of a control system for system development are analyzed. Three enhancements are suggested: measures of service quality, motivation of users to provide accurate estimates of job requirements, and a means of bringing together the separate control systems for system development and usage administration.
