20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This work contains tabulated data of the Mie volume extinction, absorption, and scattering coefficients, K_{ext} , as a function of the real part, n , and imaginary part, k , of the complex index of refraction for a wide range of particle size distribution. Lognormal particle size distributions, which possessed geometric mean radii from 0.005 μm up to 10 μm in radius, and geometric standard deviation from 1.0 up to 2.5, were used in the calculations. The computations were performed at wavelengths 0.55, 0.6943, 1.06, 3.8, and 10.6 micrometers. Values of real index of refraction from 0.1 up to 6.5 and imaginary index values from ?

0.001 up to 8.0 were used in the calculations. The results are normalized to a total particle mass of $100 \mu\text{g m}^{-3}$ and a particle density of 2.5 g/cm^3 .

The computational results will be used to explore the effect of both the real and imaginary part of the index of refraction on transmission in the $0.55\text{-}1.06 \mu\text{m}$ and $1.06\text{-}10.6 \mu\text{m}$ wavelength range. This will determine the extent to which the real and imaginary index influences transmission through the atmosphere and its consequential effect on electro-optical systems.

SECURITY CLASSIFICATION OF THIS PAGE(When Data Entered)

PREFACE

- The calculations contained in this report constitute a data base which was generated as part of a sensitivity analysis intended to determine how various atmospheric aerosols limit the battlefield effectiveness of military electro-optical surveillance, target acquisition, and communications systems. This data report will be used in subsequent technical reports to address specific atmospheric aerosol optical problems.

The Mie scattering computer code developed by Gerry W. Grams, N.C.A.P., Boulder, CO, was used to produce the computational data and the program was made available by Ron G. Pinnick who, together with D. Hoihjelle and G. Fernandez, gave valuable assistance in the initial stages of the computer programming work. Their help is gratefully acknowledged.

INTRODUCTION

The complex index of refraction is the sole physical parameter which determines the scattering and absorption of an electromagnetic wave by a spherical particle of selected radius at a given wavelength. The scattering theory for spherical particles may be analytically determined by using Mie's [1] general solution. Comprehensive treatment of the application of Mie theory to small particles has already been given [2, 3].

Part I of this study presents tabulated data of the Mie extinction coefficient, σ_E , km^{-1} ; Mie scattering coefficient, σ_S , km^{-1} ; and the Mie absorption coefficient, σ_A , km^{-1} , as a function of the real part, n , and imaginary part, k , of the complex index of refraction for a wide range of particle size distribution and different wavelength. The tabulated values are calculated, normalized to an aerosol mass of $100\mu\text{g m}^{-3}$ and a particle density of $2.5 \times 10^3 \text{ kg m}^{-3}$. Data are presented for five discrete wavelength values of 0.55, 0.6943, 1.06, 3.8 and 10.6 micrometers, respectively.

Calculations are performed for homogeneous spherical particles and logarithmic normal distributions. Davies [4] shows that measured values of particle size distribution can be represented by a series of lognormal distributions. In addition, Whitby et al. [5] obtained a two-component lognormal distribution for freeway aerosol in California; while Sverdrup et al. [6] obtained a bimodal lognormal distribution in the Mojave Desert. Patterson and Gillette [7] show that measurements of desert type and soil derived aerosols can be represented by two or three components of a lognormal distribution. Thus, the lognormal distribution represents natural aerosols measured over a wide range of natural conditions. The lognormal distribution is of the form

$$\frac{dN}{d \ln r} = \frac{1}{2.303} \frac{dN}{d \log r} = \frac{N}{\sqrt{2\pi} \ln \sigma_g} \exp \left\{ -\frac{1}{2} \left[\frac{\ln(r/r_g)}{\ln \sigma_g} \right]^2 \right\} \quad (1)$$

where r_g is the geometric mean radius of the distribution, and σ_g is the geometric standard deviation. The figure shows values of $\frac{dN}{d \ln r}$ as a function of r/r_g for a range of σ_g values from 1.5 to 3.0. Table 1 shows the range of r_g and σ_g values used in the computations.

Table 2 shows the range of real refractive index values, n , and imaginary index, k , used in the calculations.

DATA REPORT FORMAT

The data are presented in ascending value of real refractive index n (from 0.1 up to 6.5) and in ascending value of geometric mean radius

r_g (from $0.01\mu\text{m}$ up to $10.0\mu\text{m}$). Each data output section is designated by a separate table number, with a particle distribution parameter signature as follows:

SG (sigma)	=	0.15000	+	01	(1.5)
RG (microns)	=	0.10000	+	01	(1.0)
M (gm/cc)	=	0.10000	-	09	($100\mu\text{g m}^{-3}$)
RHO (gm/cc)	=	0.25000	+	01	(2.5 gm cm^{-3})

where

SG is the geometric standard deviation σ_g

RG is the geometric mean radius r_g

M is the mass of the particle distribution

RHO is the particle density

PURPOSE OF THE CALCULATIONS

The tabulated data will be used to test the sensitivity of the Mie extinction, scattering, and absorption coefficients to variations in the real and imaginary part of the complex refractive index over the wavelength range from the visible ($0.55\mu\text{m}$) up to $10.6\mu\text{m}$, over a wide range of particle size distributions. An analysis of these data will be discussed in a following report [8].

The data will also be used to predict the range of errors associated with the measurement of the real and imaginary index of particles suspended in a medium from the value of an absorption coefficient. This is of particular relevance to spectrophone type absorption measurements.
