20. ABSTRACT (Continue on reverse side if necessary and identify by block number)

This report consists of seven sets of charts containing monthly or seasonal isopleth analysis of fog, supercooled fog, freezing temperatures, thunderstorms, supercooled stratus and the freezing level on a worldwide basis. In addition the frequency of fog is presented in tabular format by station on a worldwide basis for the mid-season month.

Introduction

The charts presented in this study are the result of an extensive effort to provide naval activities a worldwide summary of the distribution of low level phenomena that directly affect aircraft and marine operations. They are designed to be used as a guide by military planners but people in the fields of scientific research, commerce, agriculture and transportation may also find them helpful. The study includes maps of frequencies of fog, supercooled fog, surface temperatures freezing or below, supercooled stratus and low cumulus, days with thunderstorms and the average height of the freezing level.

The data are taken from several sources in order to obtain worldwide coverage. Problems arose because of the inconsistency of formats, variations of codes, and differences in the way the parameters were summarized. Analyses of the same parameter from different sources in overlapping areas often do not agree. In addition, the scarcity of data in the Southern Hemisphere and parts of the Northern Hemisphere limits the analyses. Because of these data problems, and because fog and cloudiness are often very localized in nature (particularly in mountains or near coastlines), the maps should be interpreted in a qualitative way. The isopleths should be used to separate areas of similar characteristics rather than to identify a point as having a specific value.

A description of the chart follows:

Fog

Monthly maps of the percent frequency of the occurrence of fog in any form over marine areas are presented. The period of record for each ocean basin is:

North Atlantic	1856 - 1971
Indian	1854 - 1972
North Pacific	1854 - 1974
South Pacific	1854 - 1976
South Atlantic	1854 - 1976

The source of data was Tape Data Family-11, Surface Marine Observations, on file at the National Climatic Center. These data contain observations from ship logs, ship weather reporting forms, published ship

observations, automatic data buoys, teletype reports and on cards purchased from several foreign meteorological services. The quality of instruments ranges from those found aboard a 19th century whaling ship to the most sophisticated electronic equipment used on ocean weather ships. Observer qualifications vary from deck hand to trained meteorologist.

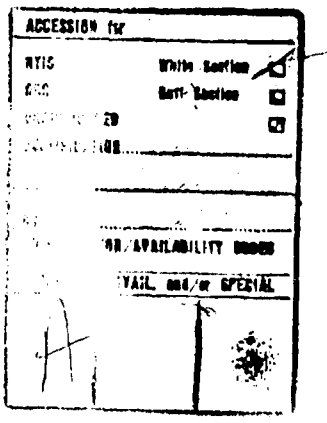
Percent frequency of fog was plotted by 1 degree latitude-longitude squares. Fog for this study is defined by the World Meteorological Organization synoptic observation present and past weather codes as follows:

North Atlantic - present weather (WW) codes 10, 11, 12, 28, 40-49, 50-59, and past weather (W) code 4

All other ocean basins - present weather (WW) codes 10, 11, 12, 28, 40-49, and past weather (W) code 4

The meaning of the codes is:

Present Weather	
10	Mist
11	Patches of shallow fog or ice fog
12	More or less continuous shallow fog or ice fog
28	Fog or ice fog during preceding hour, but not at time of observation
40-49	Fog or ice fog at time of observation. These ten codes describe different conditions, such as whether the sky is discernible, whether rime is being deposited, or whether the fog has become thinner or thicker during the past hour.



CHANGE 1

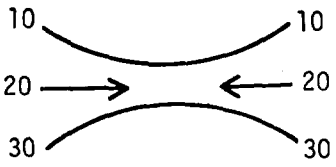
2

50-59	Drizzle. These ten codes describe different conditions, such as whether the drizzle is intermittent, continuous, freezing, slight, moderate, heavy, or occurring with rain.
Past Weather 4	Fog, ice fog or thick haze during the preceding six hours

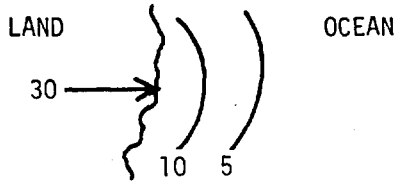
The inclusion of drizzle in the definition of fog in the North Atlantic resulted from a comparison of hourly data with synoptic 6-hourly data.

The analyzed charts include three different types of lines. A solid line indicates adequate data coverage to insure reasonable confidence in the analysis. A dashed line indicates questionable data and a lack of confidence in the analysis. A short and long dashed line in the Southern Hemisphere indicates the geographical limit of observations. It was not possible to analyze the very sparse data south of this line.

For some areas the gradient of the contours did not permit the drawing of all lines. In the open ocean areas this problem was handled by breaking a contour and putting arrows on both ends of the break, i.e.,



Along coastlines isolated maxima or minima are represented by a value and an arrow pointing to the coastal location of the percent frequency, i.e.,



CHANGE 1

Supercooled Fog

Monthly probabilities of supercooled fog are presented. The maps are derived from the percent frequencies of fog in any form and from the percent frequencies of freezing surface air temperatures. These latter two quantities were assumed to be independent in order to obtain initial estimates of probabilities of supercooled fog. Because independence is not always valid, the initial estimates were then subjectively analyzed. This procedure results in the worldwide qualitative distribution of supercooled fog.

Supercooled Stratus and Low Cumulus

These seasonal charts were perhaps the most difficult to prepare because of the lack of adequate data. Cloud observations include summaries of low clouds, but low clouds can, in some cases, include middle level clouds. For this reason the seasonal charts presented herein were not inferred from cloud summaries only. Primary sources of data are "Probability of Vertical Penetrable Optical Path for High Intensity, High Contrast Optical Targets," U. S. Department of Commerce (1966), aircraft icing potential, freezing level and cloud data in "Marine Climatic Atlas of the World, Volume I-VIII, U. S. Navy.

Since the charts show isopleths of inferred supercooled low clouds, they should be used primarily in a qualitative sense.

Other Maps

The maps depicting the monthly and seasonal distribution of thunderstorms were taken from "World Distribution of Thunderstorm Days," World Meteorological Organization (1956). This publication has served as a standard reference. Some slight modifications were made in light of new data.

The monthly charts of the percent frequency of occurrence of surface air temperature freezing and below and the seasonal charts of the average height of the freezing level are gleaned mostly from preparatory work done for previous studies. Some of these studies are "Marine Climatic Atlas of the World," Volume I-VIII, U. S. Navy; "Selected Meridional Cross Sections of Heights, Temperatures and Dew Points of the Northern Hemisphere," H. L. Crutcher (1970); "Climate of the Upper Air, Part I - Southern Hemisphere," J. Taljaard et al. (1969); "Selected Level Heights, Temperatures and Dew Points for Northern Hemisphere," H. L. Crutcher and J. M. Meserve (1970).

DISTRIBUTION OF FOG AT LAND STATIONS

Fog, like many meteorological elements, can vary greatly from time to time and from place to place. It also differs in type and intensity to such an extent that generalizations about fog can be misleading. Weather reporting practices are such that frequencies of fog based on synoptic reports may not agree with similar studies based on hourly aviation observations. When fog occurs with precipitation, the precipitation code for present weather always takes precedence in synoptic reports, thus negating the reporting of fog under these circumstances. Since there is no present weather code that can be used to report the simultaneous occurrence of fog and precipitation, all studies of fog based on synoptic observations must be evaluated with knowledge of the reporting procedures.

In addition to the World Meteorological Organization (WMO) codes for reporting fog at the time of observation (WW codes 40-49), codes 10,11,12, and 28 have been used for present weather. Past weather (code 4) has been used as described below. Present weather is defined as that occurring at the time of observation, while past weather describes the character of the weather during the past six hours. Past weather code 4 is used to report the occurrence of fog and also to report thick haze or thick smoke during the past six hours. There seems to be no "best" way to tabulate only the occurrence of fog since the reporting procedures for synoptic observations just do not permit the identification of fog under all circumstances.

Definitions of the codes used are:

WW Code (present weather)	Definition
10	light fog, visibility 5/8 mile (1 km) or more.
11	patches of shallow fog or ice fog.
12	more or less continuous shallow fog or ice fog.
28	fog or ice fog during preceding hour, but not at time of observation.
40-49	fog or ice fog at time of observation with visibility less than 5/8 mile (1 km). These ten codes describe different conditions, such as whether the sky is discernible, whether rime is being deposited, or whether the fog has become thinner or thicker during the past hour.

Ten past weather codes are available to the observer to describe the general character of the weather during the six hours preceding the actual time of observation. Past weather code 4 indicates the occurrence of fog, ice fog, thick haze, or thick smoke during the past six hours.

The following fog tables were prepared in four parts (A,B,C, and D). Each part gives the relative frequency of fog at land stations for the four synoptic hours (00,06,12 and 1800 GMT) during the mid-season months of JAN, APR, JUL, and OCT. These frequencies tabulated for each part were computed based on the following weather codes:

11	patches of shallow fog or ice fog.
12	more or less continuous shallow fog or ice fog.
28	fog or ice fog during preceding hour, but not at time of observation.
40-49	fog or ice fog at time of observation with visibility less than 5/8 mile (1 km). These ten codes describe different conditions, such as whether the sky is discernible, whether rime is being deposited, or whether the fog has become thinner or thicker dur[illegible] the past hour.

Ten past weather codes are available to the observer to describe the general character of the weather during the six hours preceding the actual time of observation. Past weather code 4 indicates the occurrence of fog, ice fog, thick haze, or thick smoke during the past six hours.

The following fog tables were prepared in four parts (A,B,C, and D). Each part gives the relative frequency of fog at land stations for the four synoptic hours (00,06,12 and 1800 GMT) during the mid-season months of JAN, APR, JUL, and OCT. These frequencies tabulated for each part were computed based on the following weather codes:

PART "A" was derived using present weather codes 10,11,12,28,40-49, plus past weather code 4.

PART "B" was derived using present weather codes 10,11,12,28,40-49.

PART "C" was derived using present weather codes 40-49.

PART "D" was derived using present weather codes 40-49, plus past weather code 4.

Significant differences in percentages can occur at some locations because of the coding and reporting procedures. Three examples of instances which are not unusual or isolated are shown in the table below.

	"C"	.0	.0	.0	missing
	"D"	92.3	94.0	90.2	missing

At Nakhon Phanom the percent frequence of fog at 00Z in Part "A" is 86.6 but in Part "D" is only 19.8. The unchanged percentage of Part "B" compared to Part "A" would lead to the conclusion that the difference in values between Parts "A" and "D" can be attributed to codes 10,11,12, and 28. Examination of the individual observations revealed that the entire difference is caused by the present weather code 10 being reported (properly) for shallow fog. Comparison of Parts "A" with "B" and "C" with "D" at 00Z shows that past weather code 4 is rarely reported if the present weather fog codes are not reported. A similar situation exists at Chumphon.

Observers at Laoag often report present weather code 05 (haze) along with past weather code 4 (occurrence of fog, smoke or haze during the past six hours). This proper reporting procedure results in high percentage in Parts "A" and "D." The zero percentages in Parts "B" and "C," which do not consider past weather, lead to the conclusion that the high percentages in "A" and "D" are caused by either smoke or haze. Close examination of individual observations shows the predominance of haze as previously stated.

The National Climatic Center's Synoptic Data File (Tape Deck 9685) covering the period 1966 through 1975 was the exclusive data source for all parts. All reporting stations are summarized and listed by WMO block-index number. A two-letter indicator code for state or country follows each station name. The geographic areas are shown by a world map, and state/country indicators are explained by a table of identifiers. For additional station information (e.g., latitude, longitude, and elevation) refer to WMO Publication No. 9, "Weather Reporting: Volume A-Observing Stations" or "Air Weather Service Regulation 105-2, Volume II, "Weather Station Index."

A selection criteria was developed to test the available data for each station. Stations listed had at least six years of acceptable record for each synoptic hour. An acceptable record required a minimum of 20 valid observations for each hour during a month (i.e., 20 observations for the 00 GMT hour for the first month, 20 observations for the 06 GMT hour...). Some stations reported only the three daylight synoptic observations during part, or all of the period. An exception to the selection criteria was made in these cases in order to provide better areal coverage. The following WMO block numbers indicate the areas where this condition occurred most often. (Note: The WMO block-index is a five-digit number. The first two numbers are the block number; the last three digits are the station number.)

Block Numbers	Missing Hour (GMT)
01-16, 40, 60-62	00
17,42,43,76,78,80,82,83,85,87	06
93	12
43,48,64,65,91,96,97,98	18

It is suggested that users first identify the area of interest from the map provided, then examine the tables for stations within that block number. These tabulations provide a broad representation of fog occurrence for land stations throughout the world. No general study such as this can provide answers to specific questions. Individual station summaries should be consulted for such details.
