16. Abstract

To assist in the evaluation of proposed structural inspection programs for commercial jet transport aircraft, a logic was developed to simulate structural defects, failures, and inspections. This logic was incorporated in a computer program entitled Structural Area Inspection Frequency Evaluation (SAIFE). With the objective of quantifying the evaluation process currently used to establish and modify inspection intervals, SAIFE accounts for the following factors: (1) aircraft design analysis; (2) fatigue testing; (3) production, service, and corrosion defects; (4) probability of crack or corrosion detection; and (5) aircraft modification economics. As a five-volume document, this report covers the initial contract effort plus a subsequent parametric analysis as follows: Volume I (entitled Executive Summary) presents the SAIFE logic and documents the methodology for the decision-making processes in the simulation logic. Volume II (entitled Description of Simulation Logic) details the SAIFE simulation logic, presents the background data for the analytical functions and decision-making processes, and includes data for a typical simulation problem. Volume III presents data tabulations derived from historical trends and design input data for a SAIFE demonstration problem. As the user's manual for the SAIFE computer program, Volume IV (entitled Software Documentation and User's Manual) contains detailed computer logic flow diagrams and a complete listing of the program which is written in SIMSCRIPT II.5. Volume V (entitled Results of Model Demonstration) presents the results of the program application to a hypothetical aircraft and compares these results with the service experience of operational aircraft.

PREFACE

Technology Incorporated prepared this third volume of a five-volume report to document the data tabulations for the Structural Area Inspection Frequency Evaluation (SAIFE) in accordance with Article II, paragraph B of Contract DOT-FA74WA-3493. Volume III completes the requirements of Phases IV and V of the contract. The effort is sponsored by the Aircraft Safety and Noise Abatement Division, Systems Research and Development Service of the Federal Aviation Administration.

The principal Technology Incorporated personnel engaged on this program were Mr. Carter J. Dinkeloo, project engineer, who served as principal investigator; Mr. Martin S. Moran, research engineer, who developed the model for the SAIFE computer program; and Mr. Ronald I. Rockafellow, program manager.

The contract monitors for the FAA were Messrs. Herbert Spicer and Charles Troha of the Aircraft Safety and Noise Abatement Division. The technical monitor was Mr. Arnold E. Anderjaska of the Flight Standards Division.

I. INTRODUCTION

The structural area inspection program for a commercial jet transport is initially established and subsequently modified by a subjective evaluation process that depends primarily on the operational experience of similar aircraft. The good safety record of U.S. air carriers indicates that this process has been successful. However, with the increasing size and complexity of second- and third-generation transport aircraft, there is a need to quantify the evaluation process more precisely.

Because of the extreme complexity of the evaluation process, a computer simulation of all critical aircraft service life aspects was judged the most rational means for quantifying the process more exactly. As a five-volume document, this report documents the resultant Structural Area Inspection Frequency Evaluation (SAIFE) simulation logic. SAIFE accounts for the following factors: (1) aircraft design analysis; (2) component and full-scale fatigue testing; (3) production, service, and corrosion defects; (4) probability of crack or corrosion detection; and (5) aircraft modification economics. It treats these factors in a logical sequence that realistically represents the procedure currently used to establish and modify inspection intervals. SAIFE is designed to provide a repeatable method for evaluating proposed inspection programs. However, it is not intended to supplant the Maintenance Review Board or the air carrier use of the Standard Operations Specification -Aircraft Maintenance.

As Volume III, this volume summarizes the approach to the data collection problem and presents in Appendices A and D the input data required for a SAIFE demonstration and parametric study respectively and in Appendices B and C the data tabulations from which the Volume II decision functions were derived. Appendices A, B and C are on the microfiche included with this report. Appendix B presents the results of a maintenance inspector survey, and Appendix C lists the computer-formatted data from the Mechanical Reliability Reports/Service Difficulty Reports (MRR/SDR) submitted by air carriers to the FAA from 1963 through 1973.

II. APPROACH TO THE DATA COLLECTION PROBLEM

As originally intended, the SAIFE demonstration was to represent the structure of a current wide-body jet transport aircraft with up to 4000 structural elements. This requirement, however, was modified because (1) suitable detailed structural data for a single aircraft type were not available and (2) the simulation of a hybrid aircraft would ensure concentrating on the effectiveness of SAIFE in simulating the structural operational experience of an aircraft fleet rather than on the correctness and accuracy of the input data.

Consequently, the data in References 1, 2, and 3 for the DC-10 and B-747 aircraft were used to derive the input data for a hybrid wide-body jet aircraft. For the realistic and typical performance of the SAIFE logic, the SAIFE demonstration was designed for 1369 structural elements. These elements make up the aircraft primary structure which includes the wing from front to rear spar and all of the pressurized portion of the fuselage. The secondary structure, including control surfaces and the empennage, was not included.

As indicated in Volume II, the SAIFE program input consists of two parts. The first, called aircraft data, is constant for all elements throughout the simulation. The second, called element data, is unique to each element requiring a complete set of data specific to the given element. The following sections define and describe the two parts. For the aircraft data, the values used in the demonstration are indicated in the variable descriptions. For the element data, because of the quantity, the values used in the demonstration are presented in Appendix A and the values and data format used in the parametric study are presented in Appendix D.

1. Aircraft Input Data for SAIFE Demonstration

The input parameters which pertain to the aircraft type are listed and described below in the order in which they are read in by SAIFE. The values used in the demonstration are given at the end of each description.

1.1 Model

This parameter identifies the aircraft type under consideration. The aircraft type HYBRID was used for the demonstration.

1.2 Fleet Size

This parameter is the number of aircraft in the fleet being simulated. A fleet of 500 aircraft was used for the demonstration.

1.3 Usage Life

This parameter is the service life in flight hours of the aircraft being simulated. In the demonstration, 60,000 flight hours were used.

1.4 Time of Production Start

This parameter is the time in flight hours relative to the start of the simulation when the first aircraft enters service. This parameter in conjunction with the parameter determining the fatigue test start enables the user to start the fatigue test of the element before, after, or at the same time the first aircraft enters service. A start time of 150 hours was used for the demonstration.

1.5 Production Rate

This parameter is the time in flight hours between aircraft entering service. The demonstration used a value of 50 hours.

1.6 Second Production Rate

If the user chooses to modify the production rate during the simulation, this parameter is the new time between aircraft entering service. A time of 100 hours was used in the demonstration.

1.7 Production Rate Change Time

This parameter is the simulation time when the second production rate takes effect. Note that this time is measured from the time that the first aircraft enters service and not from the start of the simulation. For the demonstration, a change time of 5000 hours was used.

1.8 Time of Fatigue Test Start

This parameter is the time in flight hours relative to the start of the simulation when the fatigue test of an element is begun. This time was set to zero for the demonstration.

1.9 Fatigue Test Acceleration Factor

This parameter is the quotient of the equivalent flight hours divided by the fatigue test hours. A factor of 100 was used in the demonstration.

1.10 Corrosion Growth Rate

This parameter is the corrosion area growth rate in square inches per hour. The growth rate for each element is modified by its associated CRR (corrosion resistance rating). The rate used in the demonstration was 0.002 square inch per hour.

1.11 C7

If a modification is developed because of a fatigue test failure, this parameter is the percentage of the test life when the inspection frequency is increased. In the demonstration, 80 percent was used.

1.12 C28

This parameter is the percentage reduction in the remaining fatigue life of an element when corrosion occurs in a stress concentration. In the demonstration, 20 percent was used.

1.13 C29

This parameter is the percentage reduction in the remaining fatigue life of an element when corrosion occurs outside a stress concentration. In the demonstration, 40 percent was used.

1.14 Life Ratio Mean

This parameter is the mean of the log-normal distribution of the ratio of the actual average fatigue life to the predicted average fatigue life. A value of 1.0 was used for the demonstration.

1.15 Life Ratio Standard Deviation

This parameter is the standard deviation of the log-normal distribution of the ratio of the actual average fatigue life to the predicted average fatigue life. A value of .354 was used for the demonstration.

1.16 A, B

These parameters are the result of fitting an exponential curve to flight load exceedance data. $A\exp(BS_a)$ is the number of flight loads per hour which exceed the load level S_a. A = .284325 and B = -8.80901 were used in the demonstration.

1.17 Initial Inspection Intervals

These parameters are the initial lengths in flight hours of the inspection intervals of the four levels of scheduled inspections. For the demonstration the intervals used were: A-level = 25, B-level = 200, C-level = 1000, and D-level = 12000.

1.18 Inspection Costs

These parameters are the inspection costs in dollars for each of the four levels of inspection. For the demonstration the costs used were: A-level = $1440.00, B-level = $7080.00, C-level = $13563.00, and D-level = $19691.00.

1.19 Sampling Rate

This parameter is the percentage of the fleet to be sampled during a D-level inspection. In the demonstration, 25 percent was used.

1.20 Long List Option

This parameter indicates when the user desires the long list output. The long list was not called for in the demonstration.

1.21 Internal Crack Becomes External

This parameter is the percentage of the element critical crack length at which a crack, which initiated internally, becomes external. In the demonstration, 100 percent was used.

2. Element Input Data for SAIFE Demonstration

Wherever the references did not contain all the information required for each element, the missing data was supplied by interpolating from the data for adjacent elements, by extracting data for similar types of elements, or by using engineering judgment based on the data presented in Volume II of this report and in the MRR/SDR tabulation (Appendix C).

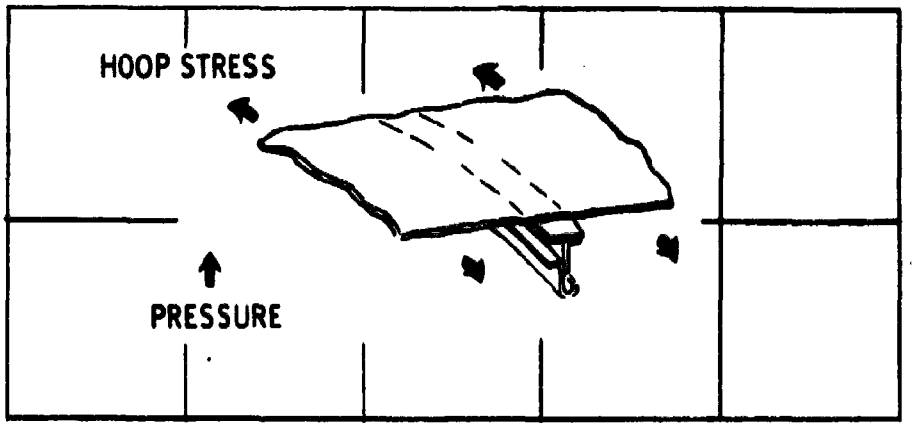
Appendix A is a complete tabulation of the element input data for the SAIFE demonstration. The following sections describe the definition and derivation of the table entries.

2.1 Element Identification

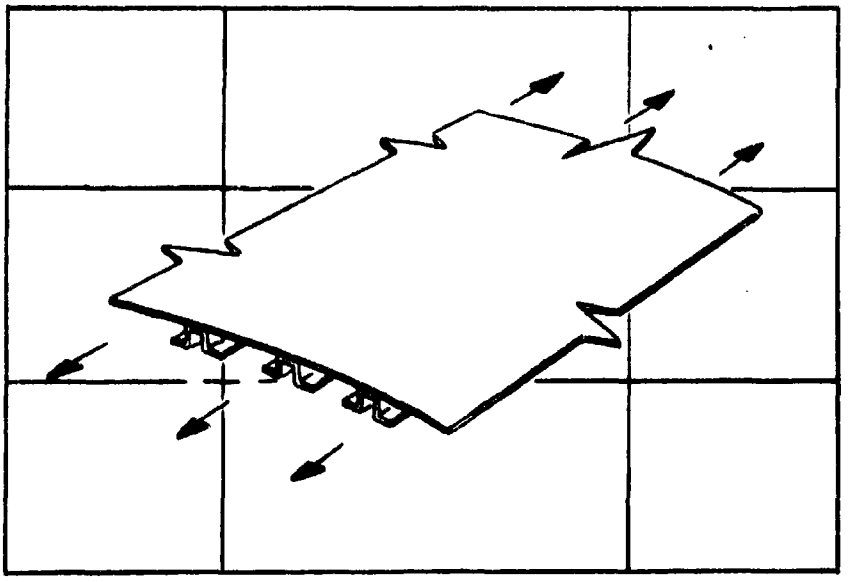
SAIFE is designed to handle as many individual elements in each aircraft as is necessary. Accordingly, the size of each wing or fuselage element was determined by naturally occurring design points such as stringer or frame spacing. The elements were defined to include all the attached skin and the attachment points to adjacent ribs or frames. Figure 1 illustrates two typical elements, a wing stringer element and a fuselage frame element.

The structural elements to be analyzed are identified by three sets of alpha characters and one set of numeric characters. The alpha characters define the basic element type and general location on the aircraft, while the numeric characters define the specific location of the element by identifying the wing or fuselage station number. For example, an element identified as FUS-STR-TOP-0680 would be a stringer located on the fuselage crown and centered at fuselage station 680.

This identification system offers a great deal of flexibility in laying out the elements on any particular aircraft. The following abbreviations are used for the element identifications in Appendix A.



Fuselage Frame Element



Wing Stringer Element

Figure 1. Typical Aircraft Elements Used in the SAIFE Simulation

ELEMENT ID.

PRIMARY LOCATION	-	FUS	Fuselage

		LSF	Lower Surface Forward
		USA	Upper Surface Aft
		USC	Upper Surface Center
		USF	Upper Surface Forward

2.2 Average Fatigue Life, Predicted

The data for this parameter were extracted from the B-747 Fatigue Integrity Program (Reference 1). If the actual average fatigue life is known, the input for this variable may be zero.

2.3 Average Fatigue Life, Actual

Since the data for this parameter is usually generated by the SAIFE logic, its input value is normally zero. However, if sufficient fatigue test or historical information is available, such information may take precedance over the program-derived data and, therefore, be used as the input for this parameter.

2.4 Crack Growth Rate

The data for this parameter were extracted from the DC-10 Structural Inspection Program (Reference 3) and the DC-8 Inspection and Maintenance Program (Reference 4). Although the crack growth rates in these sources are generally nonlinear, they were approximated by two linear rates: a "slow" rate for the initial portion of the crack growth curve and a "fast" rate for the rest of the curve.

2.5 Crack Length, Critical

The critical crack length is defined as that length where the crack growth rate changes from "slow" to "fast." This length was derived from the same data used to determine the crack growth rates (Section 2.4).

2.6 Crack Length, Safe

The fail-safe crack length is defined as that length where the primary structure can carry only 80 percent of the design load.

2.7 Crack Length, Failure

The failure crack length is defined as that length where the primary structure can no longer carry 1.0g (level flight) loads. Failures that occur in wing elements are catastrophic while those that occur in fuselage elements cause decompression and may or may not be catastrophic.

2.8 Probability of Production Defect

The data for this parameter were derived from an analysis of the MRR/SDR data. This parameter is presented as production defect occurrences per aircraft and is further detailed in Section II, 3.1 of Volume II of this report.

2.9 Service Damage Rate

The data for this parameter were derived from an analysis of the MRR/SDR data and the results of the survey of maintenance inspectors. This parameter is presented as service damage occurrences per flight hour and is further detailed in Section II, 3.3 of Volume II of this report.

2.10 Modification Lead Time

This parameter, the time between the decision to develop a modification and the availability of the modification for installation, includes the time required for design, procuring materials, and fabrication. The computer program requires that calendar days be converted to equivalent flight hours. The conversion is based on an average yearly aircraft utilization of 3000 flight hours. Therefore,

calendar days * 8.2 = simulation flight hours

2.11 Test Modification

This is a decision variable that indicates whether or not a modification will be fatigue tested before its installation. The decision depends on the problem being simulated and is expressed in code as follows for the computer input: 1 to represent that the modification will be fatigue tested and 2 to represent that the modification will not be fatigue tested.

2.12 Inspection Interval

The SAIFE logic automatically decreases inspection intervals according to the results of fatigue tests (TEST DECR) and automatically increases or decreases inspection intervals according to service experience (SERV DECR, SERV INCR). The percentage of increase or decrease is a subjective decision that depends on the criticality of the element being considered.

2.13 Probability of Internal Crack (CRK) or Corrosion (CORR)

These parameters determine the probability that a defect is confined to internal structure and, therefore, can only be detected during an internal inspection. The data for these parameters were derived from an analysis of the MRR/SDR data. These parameters are detailed in Section II, 5.4 of Volume II of this report.

2.14 Inspection Level, Internal and External

The inspection frequency for an element depends on the lowest inspection level assigned to the element. The internal and external parts of an element have different inspection levels assigned to them. It is assumed that when an element is inspected at the lowest level, it will be inspected at all higher levels. The levels used in SAIFE are those that the Airlines Transport Association commonly refers to as A, Preflight; B, Service; C, Phase; and D, Overhaul.

2.15 Repair Cost at Each Inspection Level: A, B, C, and D

These costs are the average costs (all costs in the data tabulations are expressed in terms of dollars) of repairs to elements with defects detected at each inspection level. These costs were derived from the data gathered by National Airlines (Reference 5). This parameter is detailed in Section II, 8.3 of Volume II of this report.

2.16 Tooling Cost, First Modification (FIRST MOD.)

This cost is the average cost of the tooling to produce parts or assemblies for the first modification of an element. This cost is an estimate.

2.17 Tooling Cost, Additional Modification (ADD. MOD.)

This cost is the average cost of the tooling to produce parts or assemblies for the modification of a previously modified element. This cost is an estimate.

2.18 Installation Cost, First Modification (FIRST MOD.)

This cost is the average cost of installing the first modification to an element on each aircraft. It includes the cost of materials or parts, the cost of labor, and the pro-rated cost of the fixtures and/or special tools required for installation. This cost is an estimate.

2.19 Installation Cost, Additional Modification (ADD. MOD.)

This cost is the average cost of installing a modification to a previously modified element. It includes the cost of materials or parts, the cost of labor, and the pro-rated cost of fixtures and/or special tools required for installation. This cost is an estimate.

2.20 Special Inspection Repair Cost

This cost is the average cost of repairs to elements with defects detected during a special inspection. This cost is an estimate based on the data gathered by National Airlines.

2.21 Corrosion Resistance Rating (COR RES RT.)

The corrosion resistance rating of each element depends on the materials, design details, and location of the particular element.

2.22 Probability of Corrosion Occurring in a Stress Concentration (PROB CORR STRS CON)

The effect of corrosion on the fatigue life of an element depends on whether or not the corrosion occurs in a stress concentration, such as a fastener hole or bend radius. The data for this parameter were derived from the MRR/SDR data. This parameter is detailed in Section II, 3.5 of Volume II of this report.

2.23 Corrosion Occurrence Rate, First and Second

The corrosion occurrence rates for each element were derived from the MRR/SDR data. These rates proved to be nonlinear, that is, low at the start but increasing with flight time. The nonlinear curve for the derived data was approximated by two straight lines, one for a slow initial rate and the other for a faster second rate. The occurrence rates are detailed in Section II, 3.4 of Volume II of this report.

2.24 Corrosion Rate Change Time

This parameter is the time that the corrosion occurrence rate changes from the slow to the fast rate, as discussed in the preceding section.

3. Survey of Maintenance Inspectors

To survey maintenance inspectors about the size of defects that could be detected at each inspection level, a comprehensive questionnaire was formulated and copies were mailed to the responsible personnel of ten air carriers, the FAA, and the U. S. Coast Guard. Except for two air carriers, all parties responded such that 62 complete or partially complete questionnaires were returned.

Although the questions were designed to obtain completely objective information, in many instances, an inspector's estimate of his defect detection ability seemed too optimistic in view of the evidence on detected crack lengths in the MRR/SDR reports.

Two questions, What is the smallest defect that will always be detected? and What is the smallest defect that it is possible to detect?, were intended to determine an upper and a lower bound on the probability of detection versus defect size for each type of inspection. However, the varied responses to the two questions indicated that some inspectors understood the intent of the questions, but others did not.

Since the validity of the answers was uncertain, the questionnaire data was not used to generate quantitative probabilities of detection. However, the shape (log-normal) of the distribution of the responses for the minimum detectable defect size was judged to be representative of the actual population and, therefore, the log-normal mean was used as the minimum detectable length in the probability of detection equations.

The answers to questions #9 and #14 indicate that of all inspector-detected cracks, 30.2 percent were judged to have been initiated by nicks, gouges, dents, or other service-related damage.

In a format with each question enumerated and followed by a summary of the responses, Appendix B lists the results of this survey. These results were used to define the decision functions presented in Section II, 3.3 and 5.6, of Volume II of this report.

4. Mechanical Reliability Report/Service Difficulty Report (MRR/SDR)

All MRR/SDR's pertaining to primary structure and submitted to the FAA from 1963 through 1973 were processed into a computer-compatible format. This format was developed on the basis of work originally performed by Flanagan (Reference 6). After the processed data was supplemented by related data extracted from Service Bulletins, Airworthiness Directives, Structural Repair Manuals, and Illustrated Parts catalogs, the resulting data was sorted by aircraft type, defect type, and MRR/SDR control number. The complete tabulation is presented in Appendix C.

The MRR/SDR data represents the largest amount of available data on structural deficiencies detected in transport aircraft. Although the sample size alone of this data offers the potential for its statistical validity, there are two questions concerning such validity: Are all pertinent defects reported? and Is significant data lost because of incomplete reports or narrative type of entries?

The variation in the number of MRR's prepared for each aircraft type and submitted by each air carrier implies the possibility that the various air carriers use different criteria in deciding when an MRR should be submitted. This possibility, however, was ignored, and the MRR data was assumed to be representative because of its large sample size.

Although many items in the MRR/SDR's were not documented, as indicated by the UNK (unknown) entries in the Appendix C tables, the filled-in entries were assumed to be representative of all reports, again because of the large sample size.

During the 11-year period (1963 through 1973) covering the data sample, the jet transport fleet varied as hundreds of new aircraft were added and scores of others were retired or sold outside the United States. Nevertheless, to derive crack and corrosion defect occurrence rates, the data sample was assumed to represent 1406 aircraft and 45,791,114 flight hours on the basis of the data in the annual volumes of the FAA Statistical Handbook.

The Appendix C data was used to define many of the functions presented in Section II, 3, 4, 5, and 7, of Volume II of this report.

4. DC-8 INSPECTION AND MAINTENANCE PROGRAM, VOLUME ONE, Air Transport Association of America (ATA), New York Avenue, N.W., Washington, D.C., October 1957.

5. Excerpts from the Air Transport Association of America (ATA) Annual Engineering and Maintenance Conference, held in Phoenix, Arizona, September 1968.

6. Flanagan, S.E., A SYSTEM FOR DESCRIBING STRUCTURAL DEFECTS FOUND IN LARGE COMMERCIAL AIRLINERS, an unpublished FAA paper, January 31, 1974.

APPENDIX A

ELEMENT INPUT DATA FOR A SAIFE DEMONSTRATION PROBLEM

PRECEDING PAGE BLANK - NOT F

ELEMENT IDENTIFICATION ABBREVIATIONS

PRIMARY LOCATION	-	FUS	Fuselage
		WNG	Wing
		WSC	Wing Center Section
AIRCRAFT ELEMENT	-	ACC	Access
		DOR	Door
		MFR	Main Frame
		SPR	Spar
		STR	Stringer
		SWB	Spanwise Beam
		WIN	Window
RELATIVE LOCATION	-	AFT	Aft
		CEN	Center
		FWD	Forward
		BOT	Bottom
		SID	Side
		TOP	Top
		LSA	Lower Surface Aft
		LSC	Lower Surface Center
		LSF	Lower Surface Forward
		USA	Upper Surface Aft
		USC	Upper Surface Center
		USF	Upper Surface Forward

COLUMN HEADER DEFINITIONS

AVERAGE FATIGUE LIFE	-	Either Predicted (PRED.) or Actual is input with the other being left as zero
CRACK GROWTH RATE	-	Slow Rate from Initiation to Critical (CRIT.) Length Fast Rate from Critical Length to Failure (FAIL.)
MOD LEAD TIME	-	Lead Time required for Mod Installation. Input as Flight Hours Equivalent to days: Day * 8.2 = Flt. Hr.
TEST MOD	-	1 = Mod is Fatigue Tested 2 = Mod is not Tested
INSPECTION INTERVAL	-	Factor by which Inspection Intervals are Automatically Increased (INCR.) or Decreased (DECR.)

PROBABILITY OF INTERNAL	-	**Probability that a Crack (CRK.) or Corrosion (CORR.) is Internal**
INSPEC LEVEL	-	Lowest Inspection Interval that includes the Internal (INT) Surface of an Element and the Lowest Inspection Interval that includes the External (EXT) Surface
COST	-	**All Costs are in Dollars**
PROB CORR STRS CON	-	**Probability of Corrosion Occurring in a Stress Concentration**

APPENDIX C

SUMMARY OF MECHANICAL RELIABILITY REPORT/SERVICE DIFFICULTY REPORT DATA SUBMITTED FROM 1963 THROUGH 1973

PRECEDING PAGE BLANK - NOT F

AIRCRAFT DATA ABBREVIATIONS

OPERATIONS

AAA	ALLEGHENY AIRLINES
AAL	AMERICAN AIRLINES
ASA	ALASKA AIRLINES
AST	[illegible] AIRWAYS
AWF	AIRWAYS INTERNATIONAL
CAL	CONTINENTAL AIRLINES
CAP	CAPITAL INTERNATIONAL AIRWAYS
CIT	CITY INTERNATIONAL AIRLINES
DAL	DELTA AIR LINES
EAL	EASTERN AIR LINES
FAL	FRONTIER AIRLINES
FIL	THE FLYING TIGER LINE
HAL	HAWAIIAN AIRLINES
NAL	NATIONAL AIRLINES
NEA	NORTHEAST AIRLINES (MERGED WITH DELTA)
NWA	NORTHWEST AIRLINES
OVA	OVERSEAS NATIONAL AIRWAYS
PCA	OZARK AIRLINES
PAA	PAN AMERICAN WORLD AIRWAYS
PSA	PACIFIC SOUTHWEST AIRLINES
RAL	AIRLIFT INTERNATIONAL
SAA	SATURN AIRWAYS
SEA	SEABOARD AIRWAYS
SWA	SOUTHWEST AIRLINES
SCA	SEABOARD WORLD AIRWAYS
TWA	TRANS WORLD AIRLINES
UAL	UNITED AIRLINES
UTA	UTAH [illegible]
WAL	WESTERN AIRLINES
WAL	WORLD AIRWAYS

PRIMARY LOCATIONS

WNG	WING
WSC	WING CENTER SECTION
FUS	FUSELAGE

AIRCRAFT ELEMENTS

RIB	RIB
STR	STRINGER
SPAR	SPAR
TIP	TIP
ACC	ACCESS
PYL	PYLON
SPA	SPARWISE REAR
MFR	MAIN FRAME
AFR	AFTFRAME
[illegible]	[illegible]
FLR	FLOOR
RBL	RAFT
PWS	PRESSURE

RELATIVE LOCATIONS

LED	LEADING EDGE
FWD	FORWARD
CEN	CENTER
AFT	AFT
TED	TRAILING EDGE
CAP	CAP
FRM	FRAME
TOP	TOP
SID	SIDE
BOT	BOTTOM
MFR	REAR
AFR	AFR
INB	INBOARD
OTB	OUTBOARD

STATION LOCATION:

NUMERICAL VALUE MEASURED IN INCHES RELATIVE TO SOME FIXED POINT ON THE AIRCRAFT

FOR WING:

ZERO REFERENCE IS THE POINT OF ATTACHMENT OF THE REAR SPAR TO THE FUSELAGE FRAME. ALL STATION LOCATIONS ARE MEASURED FROM THE ZERO REFERENCE TOA POINT ON THE REAR SPAR. THIS POINT BEING DETERMINED BY THE DEFECT'S STATION PROJECTION ONTO THE REAR SPAR.

FOR FUSELAGE:

THE ZERO REFERENCE POINT IS AN ARBITRARY DATUM USUALLY AT OR FORWARD OF THE NOSE. ALL STATIONS ARE MEASURED ALONG AN IMAGINARY LINE PASSING LONGITUDINALLY DOWN THE CENTER OF THE FUSELAGE

FOR WING CENTER SEC:

THE ZERO REFERENCE POINT IS TAKEN AS THE EXACT CENTER OF THE WING CENTER SECTION. ALL STATIONS ARE MEASURED FROM THE ZERO REFERENCE TO A POINT WHOSE PROJECTION IS ALONG THE REAR SPAR

AIRCRAFT DATA ABBREVIATIONS (CONT)

TYPE:

CH	CRACK
CO	CORROSION

LOCATION:

IN	INTERNAL
EX	EXTERNAL

DIRECTION:

CH	CHORDWISE
SP	SPANWISE
RA	RADIALLY
CF	CIRCUMFERENTIALLY

INSPECTION METHOD:

VIS	VISUAL
EDY	EDDY CURRENT
ULS	ULTRASONIC
DYE	DYE PENETRANT
MAG	MAGNIFIED VISUAL
BOR	BORESCOPE
LSO	LIGHT SOURCE
XRY	X-RAY
MAP	MAGNETIC PARTICLE
OTH	OTHER

INSP. INTERVAL:

PRFL	PRE-FLIGHT
SERV	SERVICE
PHSE	PHASE OR PERIODIC
OVHL	OVERHAUL
SPEC	SPECIAL OR FLEET CAMPAIGN

CAUSE:

FATG	FATIGUE
INGR	INTERGRANULAR CORROSION
PITT	PITTING CORROSION
STCO	STRESS CORROSION
IMPT	IMPACT
EXFO	EXFOLIATION

CORRECTIVE ACTION:

REP.	REPAIR
REPL	REPLACE
SRM	STRUCTURAL REPAIR MANUAL
FA	ENGINEERING AUTHORIZATION
EO	ENGINEERING ORDER
AD	AIRWORTHINESS DIRECTIVE
RB	RATING BRANDING

ORIGIN:

LAV	LAVATORY
PVREP	PREVIOUSLY REPAIRED
GALLY	GALLEY
CORSN	CORROSION
RADII	BEND RADIUS

APPENDIX D
REVISED PROGRAM INPUT DATA
FOR SAIFE DEMONSTRATION PROBLEM

This appendix provides the revised program input used in the final demonstration which was run by the FAA National Field Office. Input data is listed for the aircraft, a representative sample of elements (154 elements out a total of 2076 in the complete airplane) and the full demonstration elements (complete fuselage and wing minus one wing and one side of the fuselage) in the order given. The original input was revised by adding the additional input items called for by the revised model and by revising the original input values where indicated by a an additional review of design and service data.

Aircraft Input Data.

The aircraft input variables are as defined in and are listed in the order given in the revised User's Manual (Volume IV Book 2). Some of the original element input data items which did not vary between elements were changed to aircraft input and vice versa as a matter of convenience or increased flexibility. It should be noted that the program can be easily revised to shift element input data items to aircraft input and vice versa to fit the particular situation being simulated. Also some additional input items were required by the revised computer model. The values for inspection, repair and modification costs were completely revised based on a review of airline engineering and maintenance conference reports. These costs were shifted from element to aircraft input as the same costs applied to all elements.

Element Input Data

The element input variables are as defined in and are listed in the order given in the revised User's Manual (Volume IV Book 2). The major changes and additions to the original element input data are described below:

Element Identification - The element identification was changed to be as follows, to allow for separate element types for fuselage main frames, doors and windows which are primarily loaded by flight loads and to allow for separate element types for critical splices:

PRIMARY LOCATION	-	FUS	Fuselage
		WNG	Wing
		WSC	Wing Center Section
AIRCRAFT ELEMENT	-	ACC	Access
		DOR	Door
		FRM	Frame

USF Upper Surface Forward

Predicted Life - The predicted lives were changed to more closely reflect the variation of fatigue life and stresses throughout the structure. It was recognized that the forward portion of the wing box typically has lower stresses and that fuselage frame elements are typically less affected by manuevers and gusts than the stringer elements.

Crack Growth Rates and Crack Lengths - These input data were changed to more closely reflect the actual data and additional variables were added to include dwell at the crack stopper and subsequent crack acceleration. Different crack lengths were input for cracks initiating internally than for crack initiating externally where appropriate. The crack length, at which interval cracks became external, was added as an input variable to provide more realism.

Modification Lead Time and Inspection Interval Factors - These variables were shifted to aircraft input as they did not vary between elements.

Loading Spectrum Parameters AMEAN and B - These parameters were varied between element, types and individual elements to account for the variation in type and severity of loading spectra and was based on an industry power spectral density analysis for a narrow body jet transport.

10% SAMPLE INPUT DATA

The following input data represents a 10% sample of the structural elements of a hybrid aircraft. The first five lines of the input data represent aircraft input data which are constant for all structural elements. The order of the aircraft data is that described in Volume 4, Appendix A. After the aircraft data, the structural element input data are repeated in groups of six lines. Each group of structural element data begins with a unique name. The structural element input data are in the order described in Volume 4, Appendix A.

FULL AIRCRAFT INPUT DATA

The following input data represents the structural elements of a hybrid aircraft. The first five lines of the input data represent aircraft input data which are constant for all structural elements. The order of the aircraft data is that described in Volume 4, Appendix A. After the aircraft data, the structural element input data are repeated in groups of six lines. Each group of structural element data begins with a unique name. The structural element input data are in the order described in Volume 4, Appendix A.
