ACKNOWLEDGMENTS

The authors are indebted to R. J. Anderson, C. K. Akers, and G. A. Zigrossi, of the Environmental Sciences Department of Calspan, who participated in the preparation, data acquisition, and data reduction phases of this effort.

We would again like to express our appreciation for the fine cooperation and willing assistance of the staff at the Naval Postgraduate School, particularly to Drs. D. F. Leipper, K. L. Davidson, G. E. Schacher, and C. W. Fairall. Special thanks are due to Captain W. Reynolds and the crew of ACANIA whose willing cooperation and diligent efforts are greatly appreciated.

In particular, we gratefully acknowledge the assistance of J. L. Durham (and his staff) of the Atmospheric Chemistry and Physics Division of the Environmental Protection Agency's National Research Center at Research Triangle Park, North Carolina, in providing wavelength-dispersive X-ray fluorescence analyses of some of our aerosol samples.

Section 1

INTRODUCTION

For the past six years under sponsorship of the Naval Air Systems Command (NASC), Calspan Corporation in cooperation with the Naval Postgraduate School (NPS), the Naval Research Laboratory (NRL), and the Naval Avionics Center (NAC), has been conducting an investigation of the evolutionary processes and physical properties of marine fog and marine boundary-layer aerosols. During the first four years, attention was focused on determination of the formation mechanisms and physical and chemical characteristics of marine fogs occurring off the coasts of California and Nova Scotia. Last year the scope of Calspan's effort was expanded to include investigation of evolutionary processes which control compositional and physical characteristics of marine boundary layer aerosols. Results of these efforts are summarized in References 1-9.

This year, under Contract No. N00019-78-C-0179 from NASC, Calspan continued its contribution to the Navy's marine boundary layer physics program with a combined marine aerosol/fog investigation involving two separate Tasks. Task 1 encompassed analysis and interpretation of marine boundary layer aerosol data acquired by Calspan (Ref. 8) during the NRL-sponsored Transatlantic-Mediterranean Cruise of May-June 1977. Results of that effort are reported in a separate volume (Ref. 10).

As Task 2, Calspan in collaboration with NPS, the Naval Ocean Systems Center (NOSC), NRL and NAC participated in CEWCOM-78 to obtain data describing marine fogs and marine boundary layer characteristics off the coast of California in the vicinity of San Nicolas Island (SNI). Calspan's primary objective during the CEWCOM-78 field effort of May 1978 was to acquire data from aboard the NPS R/V ACANIA with which to assess the representativeness of SNI of clean (natural) marine boundary layer conditions. Under the scope of the contract, these data are provided in this report only in reduced, "data-volume" format.

Calspan's participation in the CEWCOM-78 field experiment was limited to observations from aboard the R/V ACANIA for the period 8 May through 24 May 1978. The ACANIA departed Monterey on 8 May and returned on 25 May. Ship's tracks for the first (8-16 May) and second (18-25 May) halves of the cruise are depicted in Figures 1a and 1b, respectively. (The dates shown along ship's track refer to the 0000 hour (PDT) of the respective days.) As shown by Figures 1a and 1b, measurements were obtained primarily in the vicinity of and upwind of SNI.

The data obtained by Calspan during the CEWCOM-78 field experiment are provided in this report in reduced form, with minimal interpretation, for objective use by other participants in CEWCOM-78 and the scientific community at large. The time histories of various meteorological and aerosol parameters are provided in the form of summary plots for the entire 16-day cruise in Section 3. Numerical values of these data are provided in hourly logs in Appendices A through F.

PLOT OF SHIP'S TRACK FOR THE PERIOD 18 May-25 May 1978

Section 2

INSTRUMENTATION AND OBSERVATIONS

Calspan instrumentation was delivered to Monterey, California, on 2 May 1978 and subsequently installed on the R/V ACANIA, at the heights indicated in Table 1, during the period 3-7 May. The Calspan atmospheric research van was hoisted onto the bow of ACANIA and housed all recorders, a clear-air visibility monitor, and aerosol sampling apparatus. Temperature and dew point instrumentation was mounted on the 20 m tower on the foredeck of the ACANIA; fog microphysics and sea spray sampling instrumentation was mounted on a specially-constructed bow platform; the fog visibility monitor was installed on the roof of the pilot house; and sea surface temperature was monitored from a specially-designed vehicle towed along side the ship. All instruments were calibrated prior to ship's departure, and calibrations were checked frequently during the cruise. Detailed descriptions of the instrumentation may be found elsewhere (e.g., Ref. 1-4).

Throughout the cruise, visibility, sea surface temperature, air temperature and dew point temperature were monitored continuously; true winds, relative humidity, aerosol size spectra (0.01-0.75 μm), and total particulate concentration were recorded hourly. In addition, 120 measurements of the cloud nucleus spectra, 15 hi-vol samples of atmospheric aerosols (for chemical analysis), 23 electrostatic precipitator samples (of aerosols for chemical analysis by size) and 51 droplet samples for analysis of sea spray size spectra were obtained during non-fog periods. Three minor fog events, in which visibility degraded below 6000 m (including six hours of fog with visibility <1000 m), were encountered: 2115-0230 PDT, 13-14 May; 0650-1100 PDT, 14 May; and 0120-1030 PDT, 19 May. During the fog events, 29 measurements of droplet size spectra were obtained.

Table 1: CALSPAN INSTRUMENTATION UTILIZED ABOARD R/V ACANIA, MAY 1978

Instrument	Parameter	Height Above Sea Surface
Thermo-Systems Electrical Aerosol Analyzer Mod. 3030	Aerosol size dist. (.01-75 μm)	5.0 m
Royco Model 225 Particle Counter	Aerosol size dist. (.3-5. μm)	5.0 m
Calspan Sea Spray Sampler (gelatin repl.)	Aqueous aerosol spectra (3.-100 μm)	3.0 m
Gardner Small Particle Detector	Total aerosol conc. (>.0025 μm)	5.0 m
Thermo-Sys. Electrostatic Aerosol Sampler, Mod. 3100	Aerosol chemistry by size (>.02 μm)	5.0 m
Hi-Vol and Lo-Vol Filter Samplers (2)	Bulk aerosol chemistry	5.0 m
Calspan Thermal Diffusion Chamber	CCN activity spectra (0.2-2.0% S)	5.0 m
Calspan Fog Droplet Sampler (gelatin repl.)	Fog drop size dist. (3.-100. μm)	3.0 m
Calspan Fog Water Collector (impaction)	Fog water chemistry	3.0 m
EG&G Forward Scatter Meter, Mod. 107	Visibility (60-6000 m)	7.5 m
MRI Integrating Nephelometer, Mod. 2050	Scattering Coeff. (.1-100x$10^{-4}m^{-1}$) Visibility (5-80 km)	5.0 m
Foxboro Temperature System (4 sensors)	Sea surface and air temperature	sea surface, 3.0, 8.5, 20.5 m
Foxboro Dew Point System (1 sensor)	Dew point temperature	14.5 m
Hg Thermometers	Wet/Dry bulb temperatures	5.0 m
Weather Measure Sky Vane	Wind speed and direction	10.0 m

Section 3

REDUCED DATA

To the extent possible, raw data obtained by Calspan during the CEWCOM-78 field experiment are provided in this section and in the respective appendices in reduced form, with minimal interpretation, for objective use by other participants of the study. Appropriate calibration factors were applied, and hourly observations ($\sim$ 5 min. averages centered about the indicated times) of various parameters are provided, where possible, in this volume. Data obtained during known periods of contamination (e.g., by ship's exhaust) or instrument malfunction have been filtered from the records. All indicated times are Pacific Daylight Time.

In this section, plots of the time histories of various parameters for the entire 16-day cruise are provided to acquaint the reader with the general values and temporal/spatial fluctuations of the parameters measured by Calspan during CEWCOM-78. Hourly logs of the numerical values of these parameters may be found in the respective appendices.

3.1 Visibility, Scattering Coefficient, and Total Particle Concentration

Measurements of "clear air" visibility and scattering coefficient were obtained with an MRI Nephelometer. These data are plotted in Figure 2. Hourly measurements of total particle (Aitken) concentration obtained with a Gardner Small Particle Detector are plotted in Figure 3 and compared with scattering coefficient in Figure 4. Numerical values of these data are provided in Appendix A.

3.2 Aerosol Concentrations, 0.01 to 0.75 μm Diameter

Measurements of aerosol concentrations at sizes 0.01 to 0.75 μm diameter were obtained with a TSI Electrical Aerosol Analyzer at 10 to 20 min. intervals during the cruise. Concentrations at selected sizes are plotted as functions of time in Figures 5a and 5b and provided in tabular form in Appendix B.

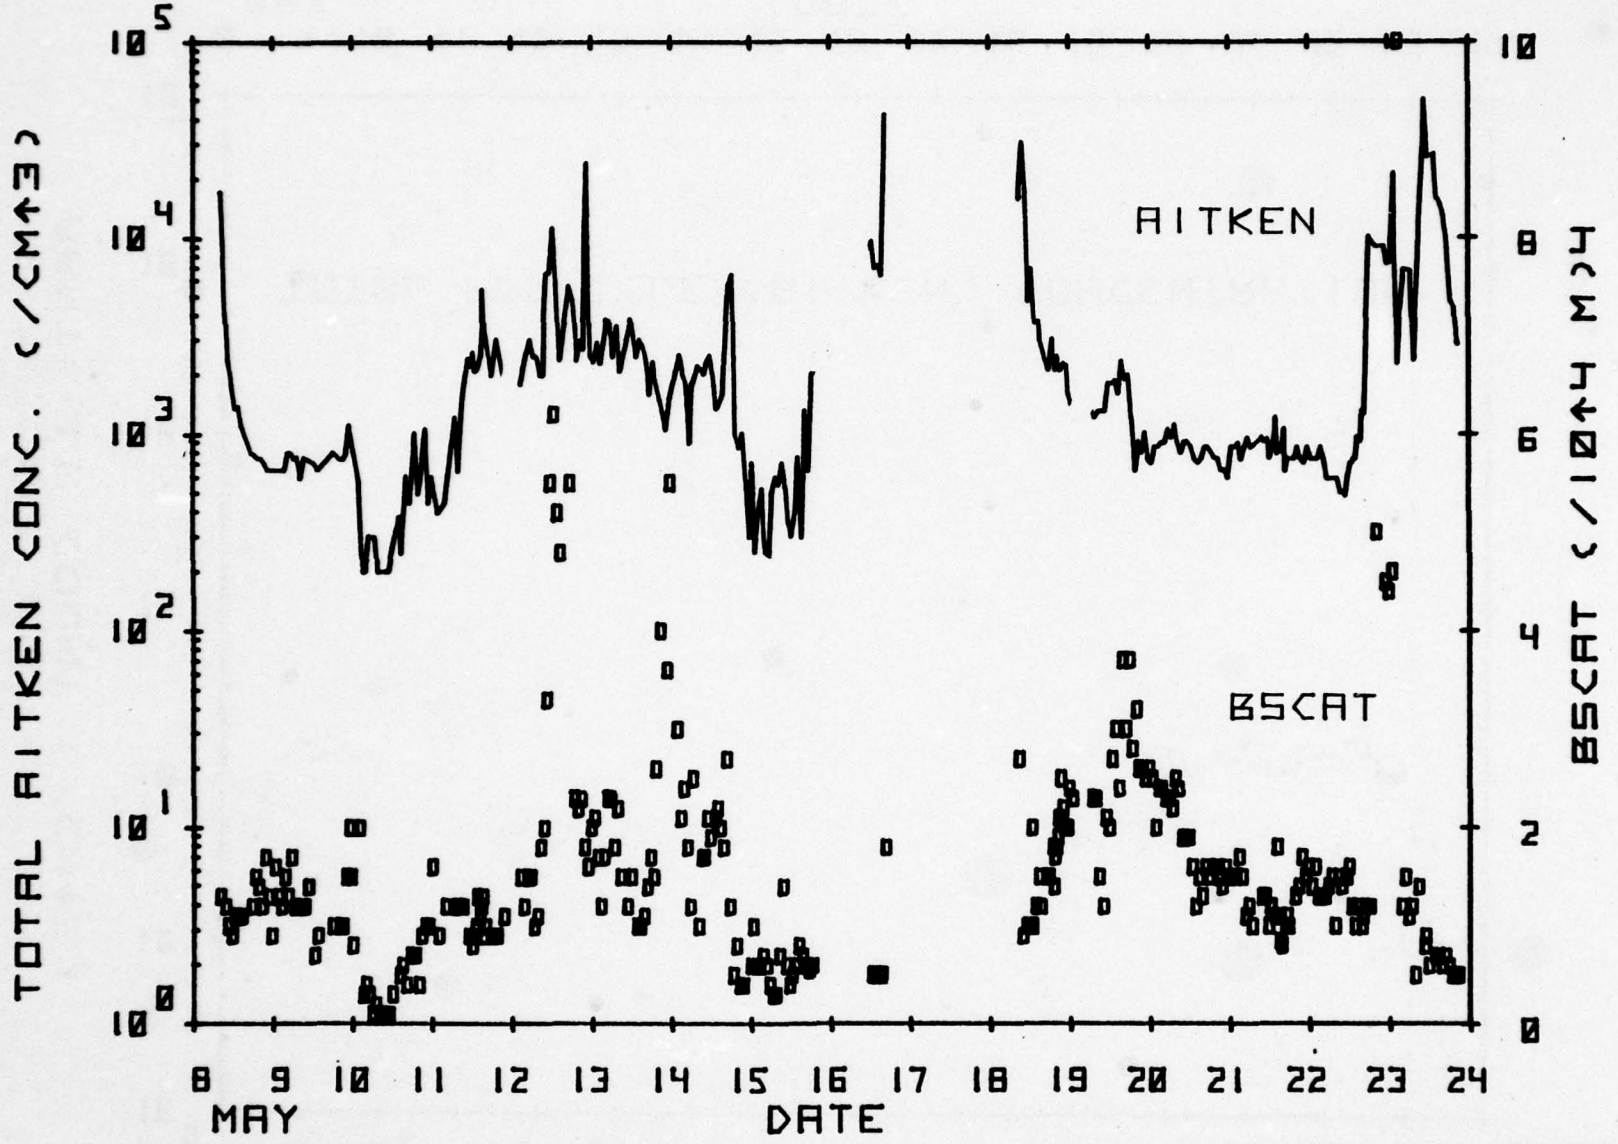

Figure 4: Aitken Nucleus Concentration and Scattering Coefficient as Functions of Time During CEWCOM-78

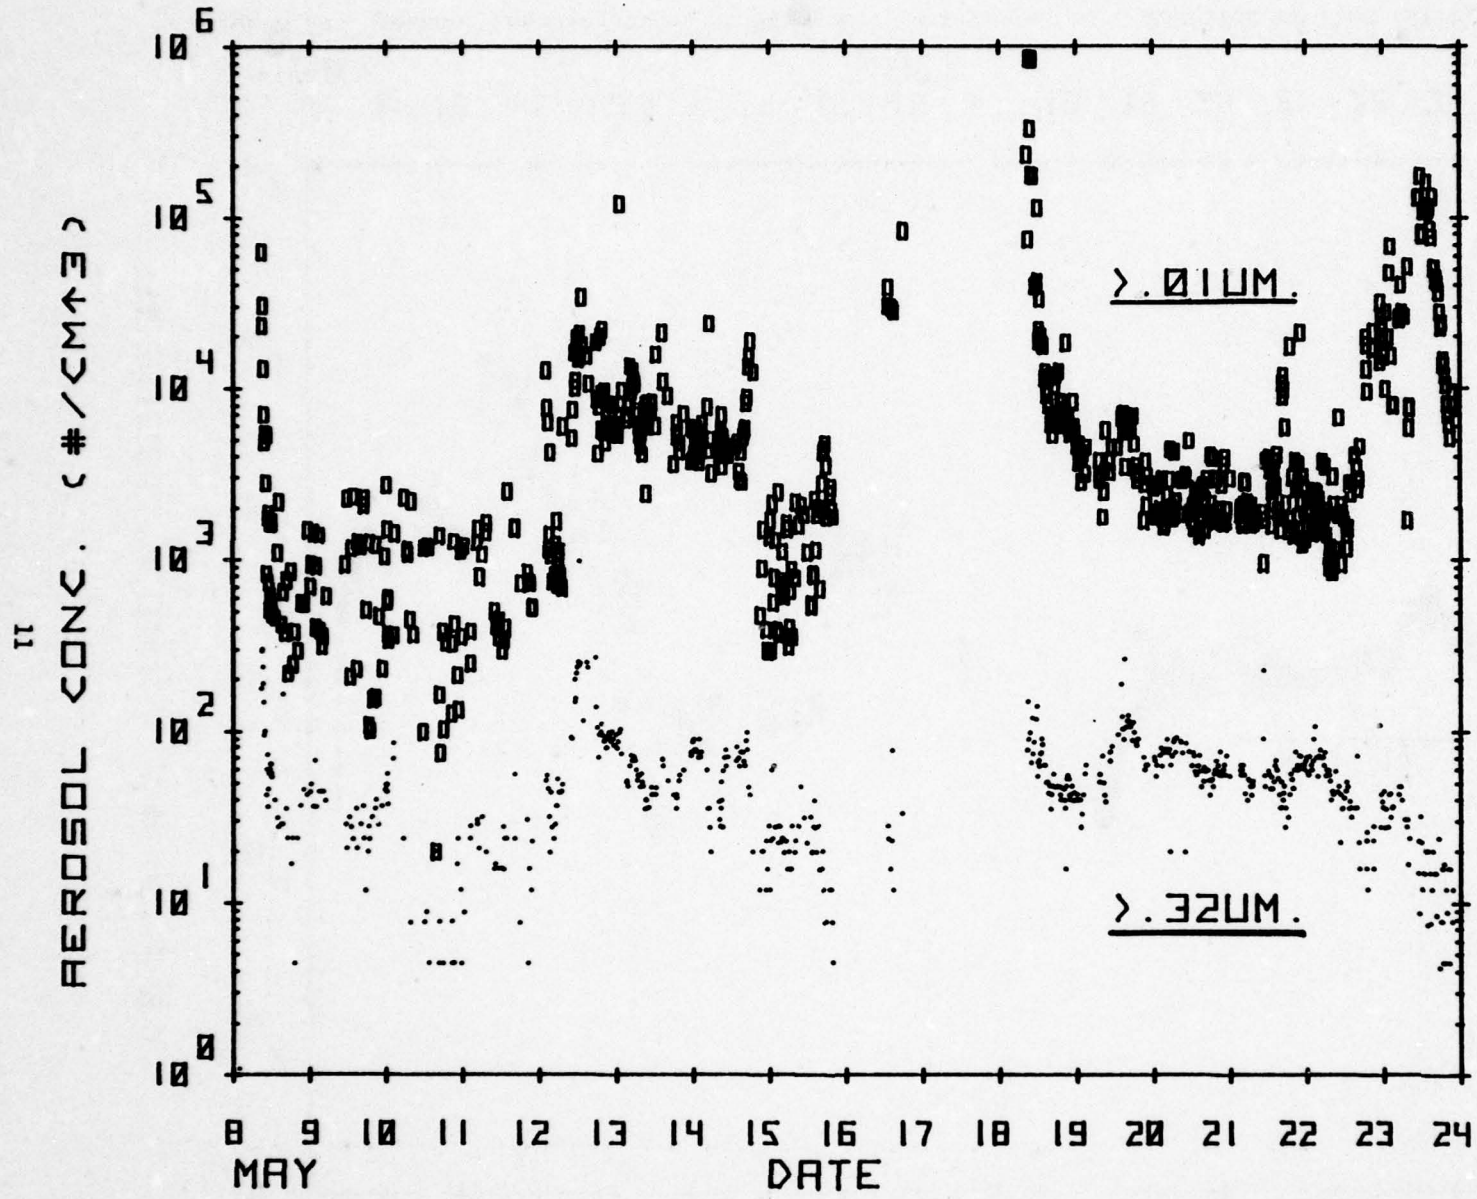

Figure 5a: Aerosol Concentrations at Sizes >0.01 μm and >0.32 μm Diameter as Functions of Time During CEWCOM-78

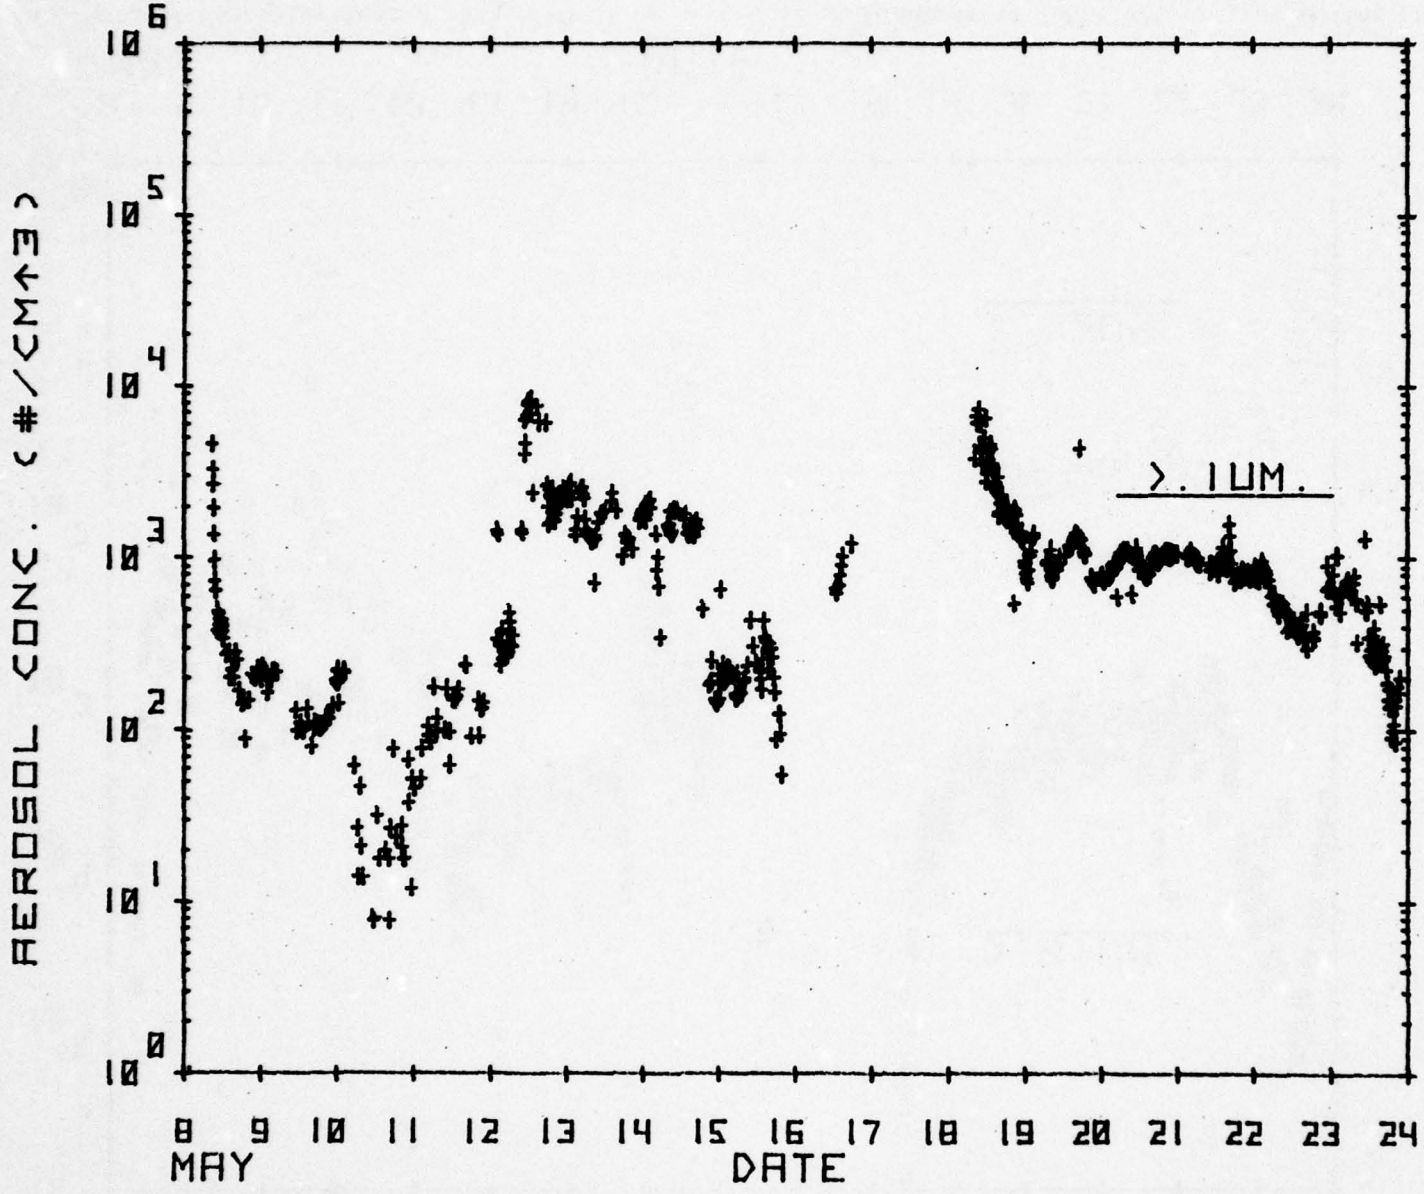

Figure 5b: Aerosol Concentrations at Size >0.1 μm Diameter as a Function of Time During CEWCOM-78

3.3 Giant Aerosols and Sea Spray

During the cruise more than 50 observations of giant, sea spray aerosols were obtained using Calspan's aqueous-aerosol sampler. The sampler is an impaction device employing gelatin replication to obtain permanent replicas of the droplet population at sizes >1.0 μm diameter. Analyses require tedious microscopy, but the technique provides reliable data which are unavailable by other means. Previous studies (i.e., Ref. 7 and 10) have shown these aerosols to play an important role in visibility restriction in the marine boundary layer.

Under the scope of our contract, analysis of these data was limited, but examples of the kind of data obtained are shown in Figure 6. Each spray-drop size distribution in Figure 6 is annotated with the time of acquisition (T), mean radius (R) in microns, number concentration (N) per cubic centimeter and calculated visibility (V) (in kilometers) attributable to that droplet population. The data plotted in Figure 6 were obtained, under westerly wind conditions, as the ACANIA cruised crosswind, just upwind of the northwestern tip of SNI. (The ship was stopped and headed into the wind for these measurements obtained on ship's bow.) The data for the period 1908 to 2030 PDT were obtained within 1 to 2 km upwind of SNI, with the closest approach (i.e., 1 km) occurring at 1940 PDT. The second data set, acquired during the period 2140 to 2230, was obtained at a distance $\sim$ 4.5 km upwind of SNI. Details of these 10 droplet spectra may be found in Appendix C.

3.4 Cloud Condensation Nuclei (CCN)

Approximately 120 measurements of the CCN spectrum from 0.2 to 1.0% S were obtained during the cruise. These data could not be reduced under the scope of our contract.

3.5 Aerosol Chemistry

Two types of aerosol collections (for subsequent chemical analyses) were performed during the CEWCOM-78 cruise: hi-vol collections on fluoropore teflon membrane filters (0.5 μm pore size) for analyses of bulk aerosol chemistry and TSI Electrostatic Precipitator samples on cellulose acetate

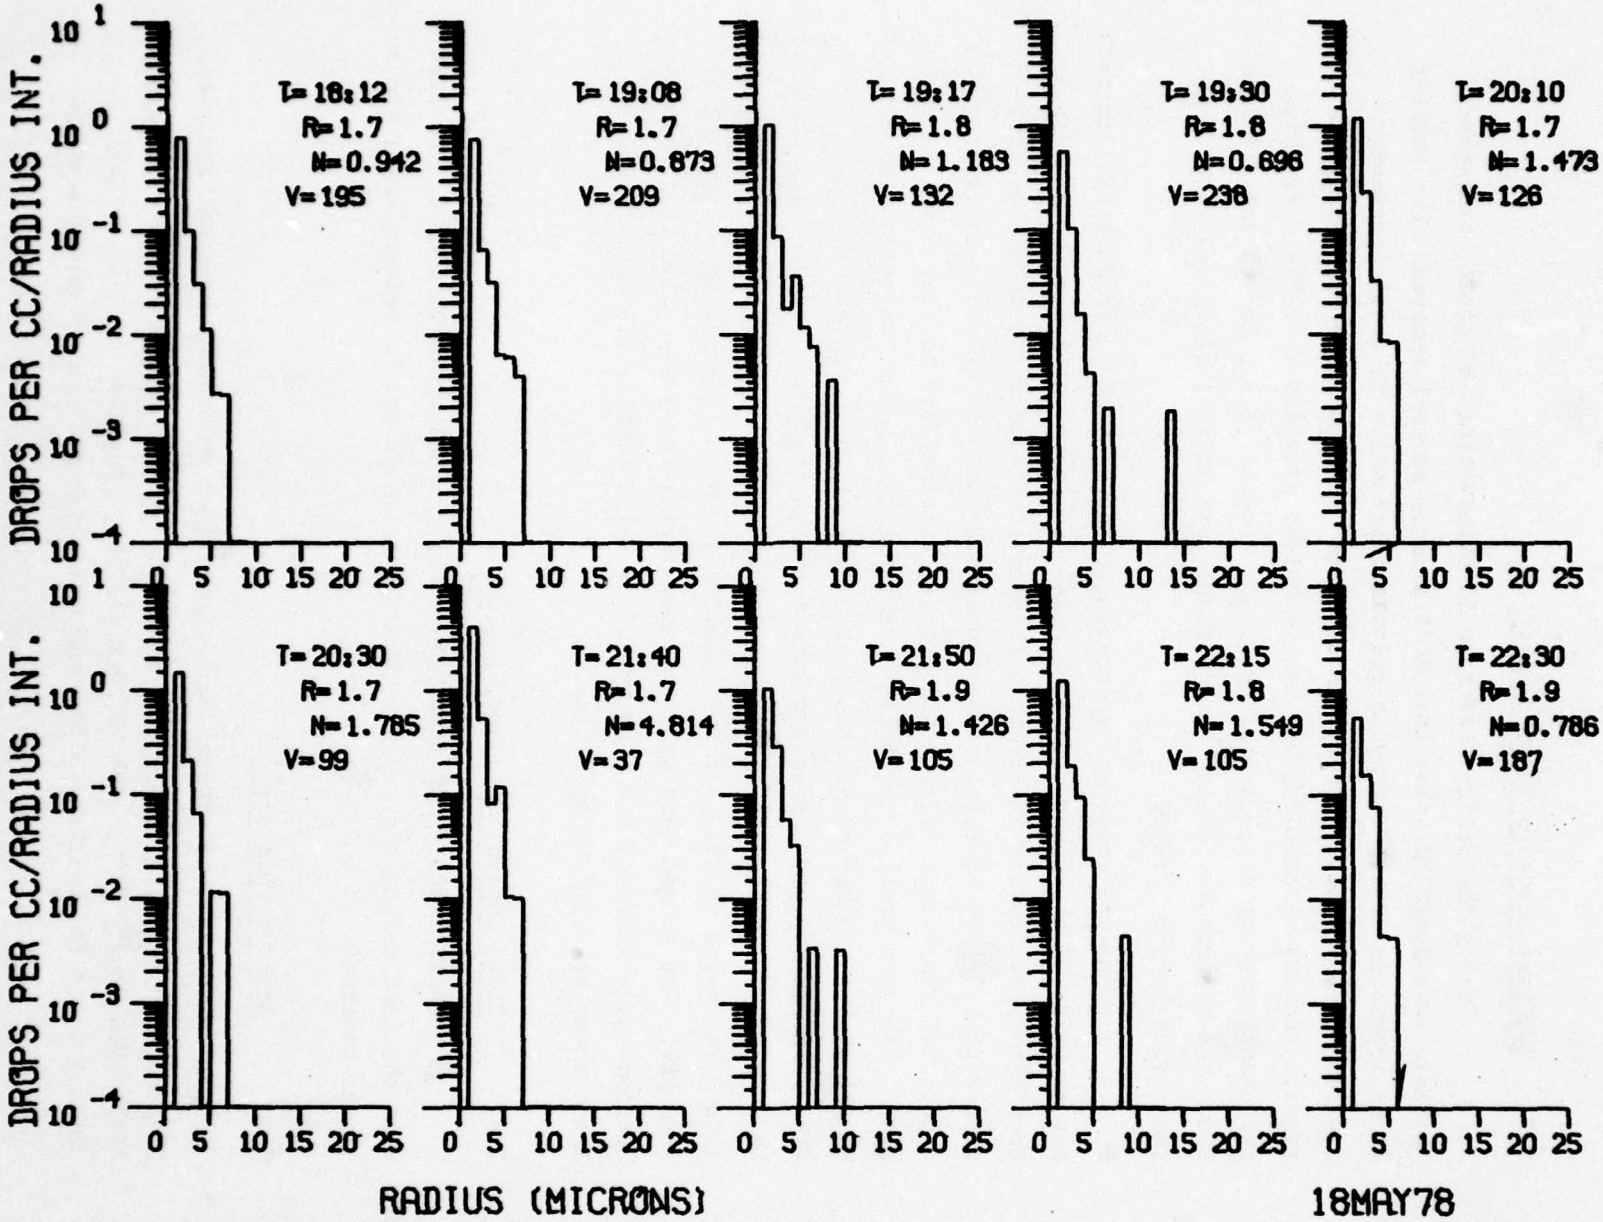

Figure 6: Examples of Sea Spray Size Spectra (>1.0 μm diameter) Obtained on 18 May 1978 During CEWCOM-78

substrates for compositional analysis of individual particles. The teflon filters were analyzed by wavelength-dispersive X-ray fluorescence (XRF) at The Environmental Protection Agency's (EPA) National Environmental Research Center at Research Triangle Park (RTP), N. C., and the assistance provided by J. L. Durham of EPA's Atmospheric Chemistry and Physics Division at RTP is gratefully acknowledged. Results of the XRF analyses are presented in Table 2.

The electrostatic precipitator samples were earmarked for compositional analysis (as a function of particle size) via energy dispersive X-ray in Calspan's Scanning Electron Microscope. Analysis of these samples was not within the scope of our current contract.

3.6 Fog

During CEWCOM-78, three minor fog events, in which visibility degraded below 6000 m (including six hours of fog with visibility < 1000 m), were encountered by ACANIA: 2115-0230 PDT, 13-14 May; 0650-1100 PDT, 14 May; and 0120-1030 PDT, 19 May. During the fog events, 29 measurements of droplet size spectra were obtained. Visibility records for the three fog events are reproduced in Figures 7, 8, and 9. (Because of a requirement for the ACANIA to return downwind to SNI, the visibility data for the period 0315-0650 in the fog of 19 May may be contaminated by ship's heat and exhaust.)

3.7 Winds

True wind direction and speed for the CEWCOM-78 cruise are plotted in Figures 10 and 11, respectively. These values were computed from measured relative winds and ship's speed and heading. Numerical values may be found in Appendix D.

3.8 Air and Sea Surface Temperatures

Sea surface temperature and air temperature at 3.0, 8.5 and 20.5 m above the surface were monitored continuously with Foxboro thermistors. These data are logged at hourly intervals in Appendix E. Temperature data for the sea surface and the 20.5 m height and the temperature difference between these two levels are plotted as functions of time in Figure 12.

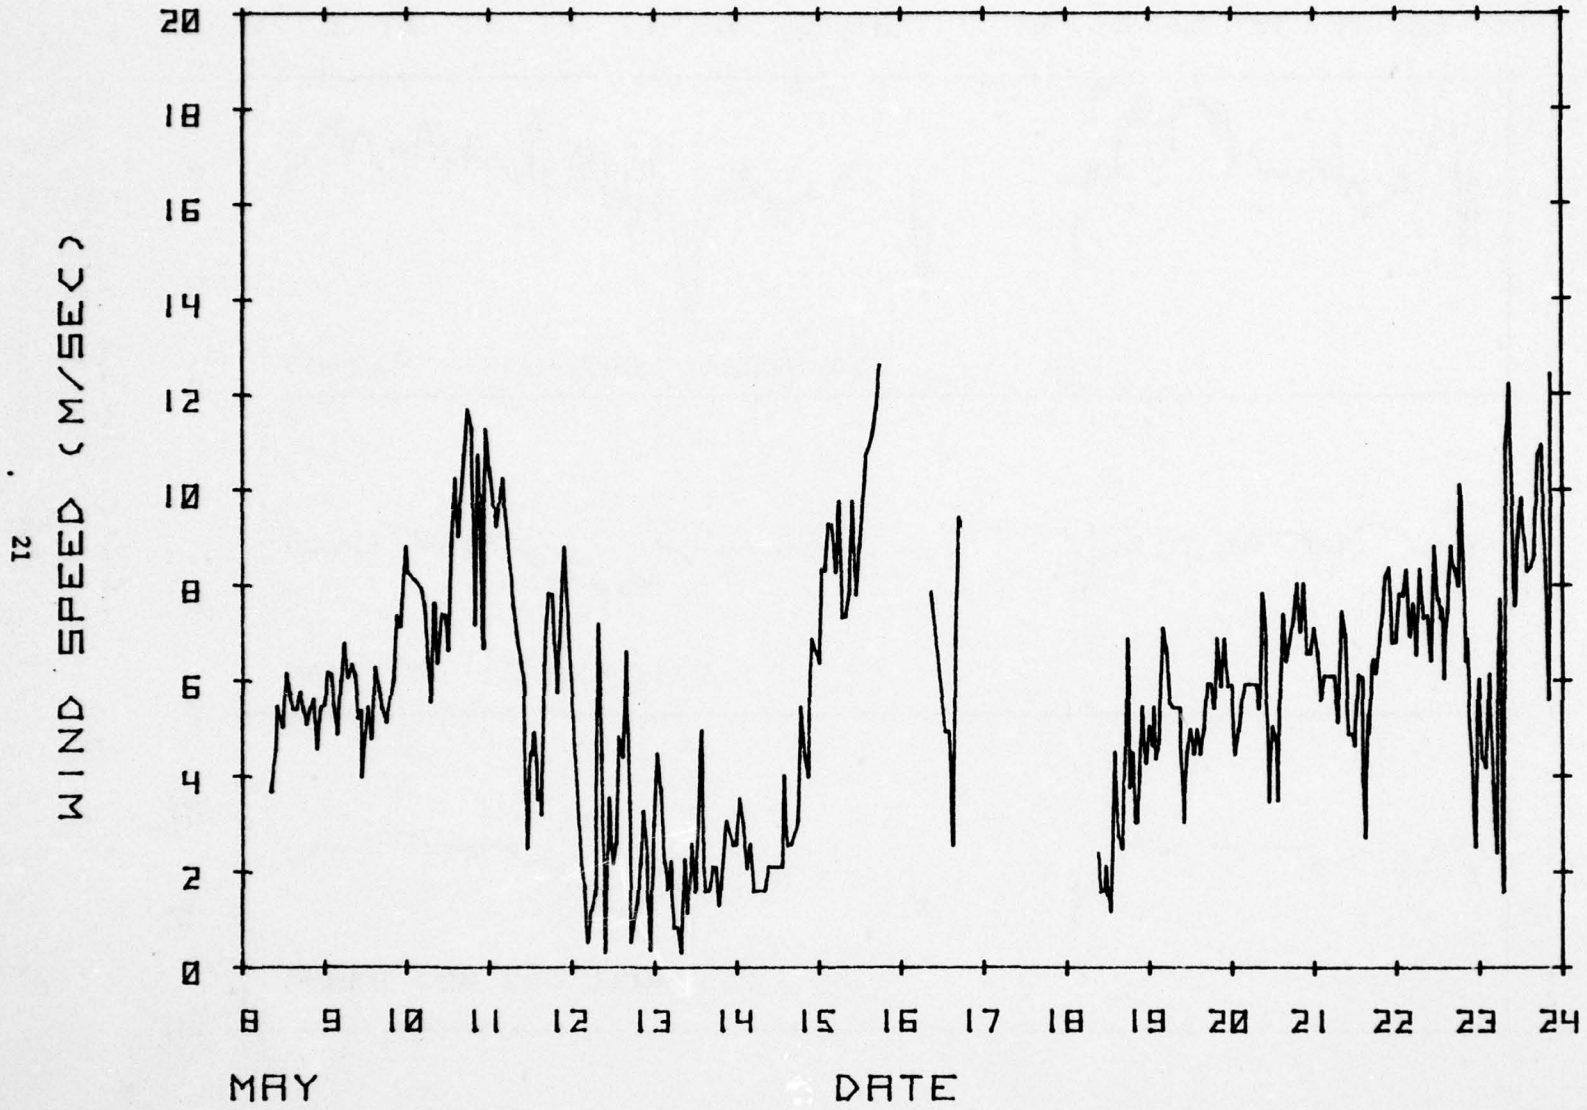

Figure 11: Wind Speed Measured From Aboard ACANIA During CEWCOM-78

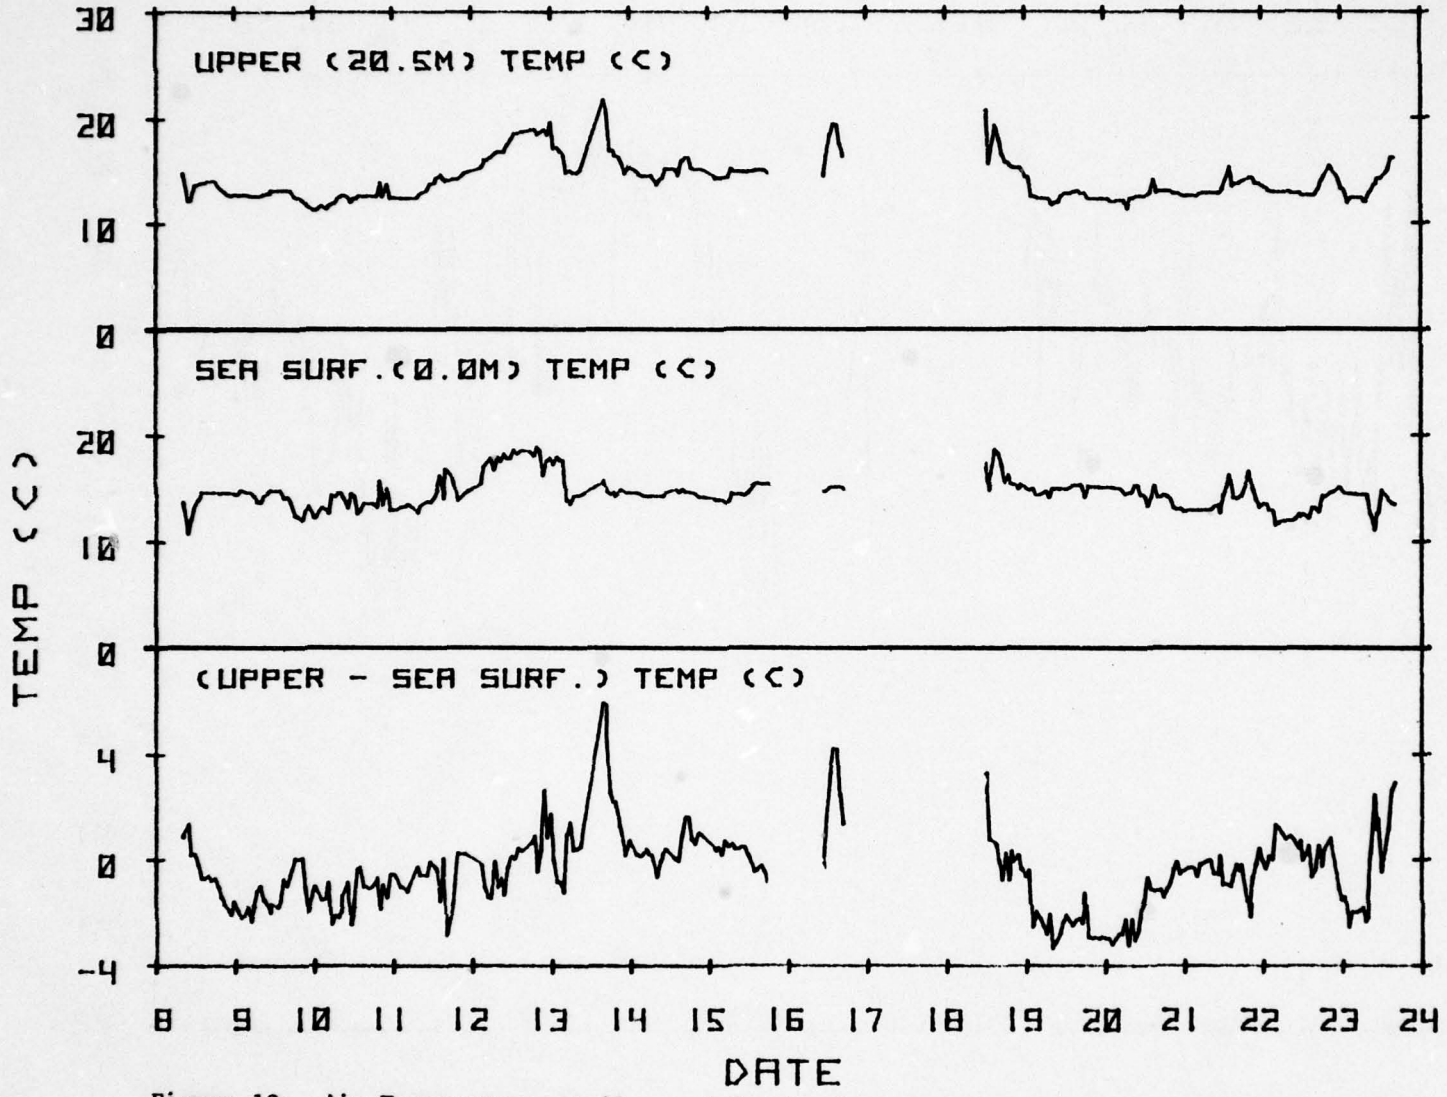

Figure 12: Air Temperature at 20 m and Sea Surface Temperature During CEWCOM-78

3.9 Humidity and Refractive Index

Wet-bulb and dry-bulb temperatures were monitored in the air-sampling intake system used for the nephelometer and aerosol instrumentation. Air intake was on the bow of the ACANIA at a height of $\sim$ 5 m above the sea surface. The Hg thermometers used in the intake system were cross-calibrated against the Foxboro temperature system and a secondary standard thermometer. Air temperature and computed dewpoint data are plotted as functions of time in Figure 13.

From the wet-and dry-bulb temperature data, relative humidity and mixing ratio were also computed. Plots of hourly values of relative humidity and mixing ratio as functions of time are provided in Figures 14 and 15, respectively.

Atmospheric pressure was also recorded from the ship's aneroid barometer on an hourly basis and varied from 1012 to 1022 mb during the cruise. These data, combined with temperature and water vapor pressure, were used to compute atmospheric refractive index through the following expression:

$$N = \frac{77.6\ P}{T} + 3.73 \times 10^5 \frac{e}{T^2}$$

where, N is refractive index in N units defined by $N = (n-1) \times 10^6$; and
n is 1.003;
P is atmospheric pressure (mb); an average of 1017 mb was used;
T is air temperature (^oK); and
e is vapor pressure (mb).

Computed refractive index as a function of time during the cruise is plotted in Figure 16.

The log of numerical values for dry-bulb, wet-bulb and dewpoint temperatures, relative humidity, mixing ratio, and refractive index may be found in Appendix F.
